I searched the Internet for an advice, alas nothing found. If I can not make it run on the bare system I'll force it with DOS-Box or Qemu.

The other emulators work fine so far: Hercules (for IBM main frames), Emu28, Emu42, Emu48, and vTI. This evening I will try VirtualPC 2007, V41, Nonpareille, emu41, emu71, and Mini-VMac (for OS7). Some others I'll try end of next week.

"... and virtual _is_ real." (George Clinton in a song written by Prince)

Ciao.....Mike

Re: HP200LX Connectivity Pack under Windows 7

*Message #4 Posted by **Dave Britten** on 18 Feb 2010, 2:28 p.m.,*
in response to message #3 by Mike (Stgt)

Virtual PC 2007 should work on Windows 7 32-bit, but I think you need the SP1 release of VPC. (There's no SP2 version of it yet, is there?)

Re: HP200LX Connectivity Pack under Windows 7

*Message #5 Posted by **Mike (Stgt)** on 19 Feb 2010, 7:55 a.m.,*
in response to message #4 by Dave Britten

AFAIK there is no SP2 for it, and I assume never will be. I only tried it with one VHD and it vPC did not reflect if the additions are installed or not as it does not allow to directly link directories from the host as disks to the guest.

I'll be back in one week - there are 3 days carneval in Basle now.

BTW - thanks for your reply!

Ciao.....Mike

Re: HP200LX Connectivity Pack under Windows 7

*Message #6 Posted by **Han** on 19 Feb 2010, 2:16 p.m.,*
in response to message #1 by Mike (Stgt)

Is there a specific feature of the connectivity pack you wish to use? Or do you simply need some means to transfer files? If you only need to transfer files, Hyperterminal works just fine.

Re: HP200LX Connectivity Pack under Windows 7

*Message #7 Posted by **Mike (Stgt)** on 2 Mar 2010, 8:20 a.m.,*
in response to message #6 by Han

Yes, there is a specific feature on the real HP200LX (and 100LX) that the Connectivity Pack does not have: this LX-kind of task switching, where you may virtually open more than one application. So i wish there was an "EmuLX" as close as possible to the real HW (like Emu42 from Christoph Giesselink).

Last week I tried this and that. I was not able to get the CPack200 to work on a bare Win7 Starter Edition (7 = holy number, Win7 = holy sh.t), at minimum DOSBox is necessary. There I still have to solve the keybord issue (it's a swiss one), Win7 switched back every now and then to german keybord but that's fixed now. Virtual PC 2007 works too, alas the direct link to directories is waaay too slow. VMware Player works too. But, best of all is Hercules.

Ciao.....Mike

in response to message #5 by Chuck

Chuck, you need to install Windows for Workgroups.

Re: OT: Computer Archeology 2010

*Message #7 Posted by **Chuck** on 18 Feb 2010, 8:23 p.m.,*
in response to message #6 by Marcus von Cube, Germany

Thanks Marcus. I vaguely remember that 3.11 for WG had some nice improvements. Unfortunately I don't know if I still have all my 3.11 disks. Time for a trip up to the attic.

Re: OT: Computer Archeology 2010

*Message #8 Posted by **Johnny Bjoern Rasmussen** on 19 Feb 2010, 11:22 a.m.,*
in response to message #7 by Chuck

Thanks for your replies, folks :-)

Too bad that none of you yet can attend. The most likely will be for some people from Germany as you Franck and you Marcus to attend but I fully understand you. I don't think that I would be travelling very far to another meeting.

My elder brother and I will be here with some of my HP's. I also have two old Memotech MTX-500, a Psion XP, a TI-59 and some other non-HP's... A friend of mine collecting old CPU's and some of the old IBM classisc will also be here. Finaly some of my working collegues will probably show up also to look at us geeks :-) I have sent an invitation to a danish classic-computer-club though they have not responded yet.

So come on girls and guys - until now we will be only a few nerds...

BTW if some of know the whereabouts of any similar events in near by countries like Germany, Netherlands or eg. Sweden I will like know.

Thanks!

Johnny

Interesting HP41CV?

*Message #1 Posted by **Dimitri Simitas** on 16 Feb 2010, 9:45 p.m.*

Reading through the archives slowly I came across this and reminded me of a auction.

Calculator Modifications

&

Odd HP-41CV

Think it being done this way really offer advantages.

Dimitri

Edited: 16 Feb 2010, 9:47 p.m.

Re: Interesting HP41CV?

*Message #2 Posted by **Timo** on 17 Feb 2010, 3:24 a.m.,*
in response to message #1 by Dimitri Simitas

It sure is interesting!

However, I'm not really suprised by the speed modification. Lately I've stumbled accross another site giving some information about programming and a bit of personal HP-41 history of the owner.

See here.

The site is only in German, but it is stated there, that the owner of said HP-41 ordered a company to modify his calculator for greater speed. The modification also included a micro-switch on the side of the calculator that could be used to switch it back to normal speed if required.

But I agree, the extend of these modifications is impressive, I wonder at which price it will sell...

Edit: Found ths same page in English language format. Link is updated.

Edited: 17 Feb 2010, 3:26 a.m.

Re: Interesting HP41CV?

*Message #3 Posted by **Klaus** on 20 Feb 2010, 3:48 a.m.,*
in response to message #2 by Timo

<Shameless mode on> I am offering a HP-41CY with the turbo modification in the ad section

<RPN mode on> There are many programming quirks on the HP-41, you should know about labels (local and global), label searching, memory layout etc. to develop programs. You can even use synthetics or

machine language to speed up your programs. The turbo switch doesn't make bad programs good, it just makes a bad program faster.

HP logo upside down = DY, happened a long time ago

*Message #1 Posted by **Don Shepherd** on 15 Feb 2010, 10:03 p.m.*

A thread recently discussed the logo for one of the proposed re-purposed scientific calculators included the HP logo turned upside-down, or DY for do-it-yourself. Turns out that idea happened a long time ago.

Re: HP logo upside down = DY, happened a long time ago

*Message #2 Posted by **Dave Shaffer (Arizona)** on 15 Feb 2010, 11:59 p.m.,*
in response to message #1 by Don Shepherd

Somewhere in this set of very interesting articles, it is pointed out that some early computers were called instrument controllers in order to get past US government rules (in the 1960s).

I started working at NASA in 1979 as a contractor, and our group used an HP mini-computer which was prominently labelled as an instrument controller for that very reason, so it took a long time to finally be allowed to buy a "computer" if you worked for Uncle Sam. I think the big computer centers did not want to lose their influence (and tithe from the users).

Re: HP logo upside down = DY, happened a long time ago

*Message #3 Posted by **Steve Simpkin** on 16 Feb 2010, 8:03 p.m.,*

> Somewhere in this set of very interesting articles, it is pointed out that some early computers were called instrument controllers in order to get past US government rules (in the 1960s).

This still occurs!!! The company I work for sells emergency radio/911 dispatch equipment to state and federal governments. We happen to utilize Windows computers to run the user interface software. These computers run dedicated software 24/7 for 7-10 years. The do not need virus software, they are not connected to the internet nor do they ever get updates to the OS over their lifetime. In some cases (the State of California for example) we have to officially label the Windows computer an "interface controller". If they are called a "computer", they immediately fall under the responsibility of the State IT department who will update them on a weekly or monthly basis just like every other computer they have in their inventory. This would be a bad thing so we have to play games like calling them something other than a computer so they will not be messed with.

HP-97 Print Intensity Mystery

*Message #1 Posted by **Michael de Estrada** on 15 Feb 2010, 5:21 p.m.*

I had been working on two HP-97s, swapping parts in an attempt to obtain one complete and fully functional unit. At one point I tried swapping the two printer assemblies, when I noticed some odd behavior. Prior to the swap, the print intensity on both printers was normal, however, afterwards the print intensity became very light and thin on one printer but very dark and thick on the other. I swapped paper rolls, but there was no change. So, I read the HP-97 service manual, and found out that there is a resistor R8 that controls print intensity, which is located on the printer PCA. This PCA is connected to the printer by a cable and by connector pins to the main logic PCA. The thing is, when I swapped the printer assemblies, the printer PCAs remained with their respective printers and were not interchanged. So, since the intensity resistance was not changed in the process, why did the intensity change? As soon as I returned the printers to their original locations, the print intensities returned to normal. I am trying to understand the inner workings of these calculators and would like to know if anyone on this forum has encountered this behavior and determined the cause.

Re: HP-97 Print Intensity Mystery

*Message #2 Posted by **Randy** on 15 Feb 2010, 7:05 p.m.,*
in response to message #1 by Michael de Estrada

You kept the printer PCA together with the printer but the PIK which drives the printer did not swap since it is on the main logic PCA.

I'll bet if you keep the PIK's with their original printer assemblies, intensity will remain the same.

Re: HP-97 Print Intensity Mystery

*Message #3 Posted by **Michael de Estrada** on 15 Feb 2010, 7:50 p.m.,*
in response to message #2 by Randy

Thanks for the info. I see where the pinouts from the PIK connect to the printer PCA. There must be some variability in PIK outputs which require each printer to be adjusted for its PIK that accounts for the range of resistance values. I thought that it had something to do with variability in the thermal print heads. So, would swapping the resistors accomplish the same thing, or is there more to it than that? Changing a resistor is a lot easier than an IC.

Re: HP-97 Print Intensity Mystery

*Message #4 Posted by **Katie Wasserman** on 15 Feb 2010, 10:26 p.m.,*
in response to message #3 by Michael de Estrada

I've had good (but not dramatic) results with resistor changes on the 97 printer board. It's certainly easy enough to try.

Re: HP-97 Print Intensity Mystery

Squaring the circle: all-MCODE Bessel functions

*Message #1 Posted by **Ángel Martin** on 15 Feb 2010, 2:05 p.m.*

It's done at last: an All-MCODE implementation of the Bessel functions IBS and JBS, for any real integer and any real argument.

Not an easy feat by my standards, I had to go around numerous issues and limitations to coax the venerable coconut to pull this off! (no doubt my poor programming skills :)

So if you're intrigued by it or interested in 30-year old technology warping its sensible limits, then make sure you check out the forthcoming version of the SandMath module, soon at a TOS near you :)

Also a new mini-white paper on the Bessel functions is ready, including source code listings and even a FOCAL version for complex arguments and complex indexes.

Can you spell J[(1+i),(-1-i)]?

Cheers, "AM

Re: Squaring the circle: all-MCODE Bessel functions

*Message #2 Posted by **PeterP** on 15 Feb 2010, 4:55 p.m.,*
in response to message #1 by Ángel Martin

do you ever sleep Angel? Your output these last few months has been nothing short of astonishing!

Congratulations

Peter

Re: Squaring the circle: all-MCODE Bessel functions

*Message #3 Posted by **JMBaillard** on 16 Feb 2010, 4:58 a.m.,*
in response to message #2 by PeterP

Hi,

my HP48 returns:

J1+i(-1-i) = -8.88878423739 + 2.2945020794 i

Best regards, Jean-Marc

Re: Squaring the circle: all-MCODE Bessel functions

*Message #4 Posted by **Ángel Martin** on 16 Feb 2010, 7:29 a.m.,*
in response to message #3 by JMBaillard

Excellent answer and correct result.

Here's validation of the ZJBS output then: 1, ENTER^, ZENTER^, ZNEG, ZJBS
-> -8,888784241+J2,294502076

and here's the answer from Wolfram Alfa:

-8.888784237348673979366870033718529955861649282410490734 00... +
2.294502079363192545304966249871363891874295540911034807 61... i

I was never entirely comfortable using the 48, I guess it shows ;-)

Best wishes,
ÁM

Edited: 16 Feb 2010, 7:35 a.m.

Re: Squaring the circle: all-MCODE Bessel functions

*Message #5 Posted by **JMBaillard** on 17 Feb 2010, 4:54 p.m.,*
in response to message #4 by Ángel Martin

Hi,

I've also written a "JNZ" program for the HP-41 and it yields:

-8.888784232 + 2.294502069 i

Roundoff-errors are more important, but my preference still goes to the HP41!

All the Best, Jean-Marc.

Re: Squaring the circle: all-MCODE Bessel functions

*Message #6 Posted by **Ángel Martin** on 18 Feb 2010, 2:29 a.m.,*
in response to message #5 by JMBaillard

Let it be publicy said that your 41 Math library is nothing short of sensational, Jean-Marc. You have single-handedly built an impressibe body of programs, all posted here in the museum and obligued reference.

I checked your Bessel functions entry but didn't see the complex treatment. Did I miss it somehow or is not posted yet?

http://www.hpmuseum.org/software/41/41besslj.htm

Yes rounding errors become more apparent when there's only 9 significant digits instead of ... 13, or 15? I'm not even sure what's the precission in the 48X anymore.

Incidentally I found this problem to be less of an issue when doing complex numbers calculations. I'm probably wrong but it somehow seems to be a more forgiving environment. I now realize I should have used the 13-digit precision mainframe routines in some of my 41Z functions, and will revise them eventually.

The exception to this "benign rule" has been the Lambert W function. Using the ZSOLVE program I can't always find the right root for the functional equation that defines W(z). I also

tried with your program "ROOTZ", but the same issue occurs.

http://www.hpmuseum.org/software/41/41cmpxf.htm

Have you tried using ROOTZ to calculate the Lamber W function with it?
The equation to solve is Exp[W(z)]*W(z)-Z0 = 0, and I'm using the following code to define it:

```
LBL "*W"
ZEXP
LASTZ
Z*
ZRCL
4
Z-
END
```

where the function's complex argument Z0 is stored in complex register ZR4, and the evaluated guesses of the equation z are in the complex stack register "Z" upon entry.

It fares well for "small" Z0 values (say 1+i) but starts acting up when the argument "grows" - say (5+5i).

In truth, I wonder to what extent one can use the secant method in the complex plane - where the mere concept doesn't hold up very gracefully.

Cheers, ÁM

Edited: 18 Feb 2010, 2:53 a.m.

Re: Squaring the circle: all-MCODE Bessel functions

*Message #7 Posted by **Paul Dale** on 18 Feb 2010, 4:22 a.m.,*
in response to message #6 by Ángel Martin

I've done complex Lambert's W for my 20b scientific firmware :)

My references to the algorithm sources are:

```
http://en.wikipedia.org/wiki/Lambert_W_function
http://ioannis.virtualcomposer2000.com/math/LWExpansion.html
http://ioannis.virtualcomposer2000.com/math/LWCalculating.html
```

These are quite probably not up to date.

I used the algorithms from the wikipedia page.

Start with the approximation under 7.2 and then refine it using Halley's method under 7.1 (I limited my maximum iterations to 20).

- Pauli

Edited: 21 Feb 2010, 4:34 a.m.

Re: Squaring the circle: all-MCODE Bessel functions

*Message #8 Posted by **Ángel Martin** on 21 Feb 2010, 1:58 p.m.,*
in response to message #7 by Paul Dale

Thanks for the references Paul. So you wrote the firmware extensions for the 20B in machine code as well? Hmm, that makes me consider purchasing the machine, despite

I'm sure I won;t understand half of it (never been a financial guy).

Cheers, 'AM

Re: Squaring the circle: all-MCODE Bessel functions

*Message #9 Posted by **Paul Dale** on 21 Feb 2010, 3:53 p.m.,*
in response to message #8 by Ángel Martin

I've written everything so far in C. The 20b uses an ARM CPU and compilers for that are easy to get. I'm using HP-GCC.

Execution time = 33s )
```

```
With respect to the Lambert W functions, "ROOTZ" seems to work well
provided we choose 2 initial guesses close to Ln(z) [ if z # 0 ]

For example, if z = 5 + 5i , try z0 = 1.9 + 0.8 i and z1 = 2 + 0.9 i

With the subroutine

LBL "W"
STO 11
X<>Y
STO 12
X<>Y
XEQ "E^Z"
RCL 12
RCL 11
XEQ "Z*Z"
RCL 10
RCL 09
XEQ "Z-Z"
RTN

"ROOTZ" returns  w(5+5i) = 1.501424530 + 0.477488825 i after 6 or 7
iterations.

But Newton's method has a better convergence,
and it is used in the following routine:

LBL "LAMBZ"
STO O1

and for example,  5  ENTER^  XEQ "LAMBZ" gives

  w(5+5i) = 1.501424530 + 0.477488825 i

( the same result as "ROOTZ" with one iteration less )

Likewise  w(7+9i) = 1.796464032 + 0.591616466 i

"RTZ4" should give even faster results...

My contribution to the HP-41 programs has not stopped:
Since 2007, I've sent about 80 ( yes, eighty ) new or updated pages
and I'm surprised not to see them in the MoHPC!

Perhaps will I create my own website, but it's impossible for the moment:
my access provider has many problems since the end of October
and it still does not work normally!

Best Regards,
Jean-Marc.
```

Re: Squaring the circle: all-MCODE Bessel functions

*Message #11 Posted by **Ángel Martin** on 21 Feb 2010, 4:04 a.m.,*
in response to message #10 by JMBaillard

Hi Jean-Marc,

Excellent news, thanks for looking into this. Yes, ZSOLVE now works fine for Lambert

W using the better initial estimation as you suggest, using the logarithm instead of my crude choice.

I'm impressed by the short execution times of your programs in general, also JNZ. Not bad at all considering you're not using MCODE routines. Are you programming the standard definition doing the summation, or other approximation perhaps?

Shame to hear that your newer contributions aren't posted yet - I hope that gets corrected soon! BTW, I didn't find the reference you gave on the "Some MCODE routines for the 41" - is that another one not posted as well? I was curious to see if you used the standard mainframe routines or the 13-bit extended precision to program the complex functions.

Thanks again for your inputs.

*Message #14 Posted by **Ángel Martin** on 17 Feb 2010, 1:48 a.m.,*
in response to message #2 by PeterP

Thanks Peter, it was just rounding off some loose ends in the SandMath - but I admit it's taken me farther (and longer) than what I originally thought.

Now I'm preparing some mini-papers to document the highlights of the module. As addictive as 41 MCODE is, it'll be good to rest for a while!

Cheers, 'AM

Better fitting case for a HP-41C?

*Message #1 Posted by **Dimitri Simitas** on 15 Feb 2010, 1:24 p.m.*

Title pretty much says it all. The case seems to be sized for a HP-41C with card reader (foam in the bottom) but too big to fit in my laptop bag pocket. Anyone know of any alternatives?

Dimitri

in response to message #1 by Dimitri Simitas

For some of my HP-41 units (the CY's;-) I use the HP-55 zipper case,
which fits exactly, and also looks better than the original case.

HTH

in response to message #1 by Dimitri Simitas

The spice cases are a decent fit.. from time to time you will see a HP 41 with a black case similar to the ones shipped with SPICE units.

*Message #6 Posted by **Timo** on 16 Feb 2010, 4:25 p.m.,*

in response to message #3 by Allen

It's just a guess, but couldn't the zipper case of an HP-48 series unit do the job as well? It might be a bit too long but placing a piece of foam inside it could make a HP-41 fit right into it?

They might also be a bit easier to find. However, I'm not totally sure about the dimensions though...

Actually the case for the calculator has foam due to length I want a shorter case that fits the length right.

Dimitri

Educalc made a black leather one that fit the classics & 41. It had their name embossed onto it and a slot for a business card. Kind of hard to find now if you don't have a time machine.

Serial no of HP48GX

*Message #1 Posted by **matti** on 15 Feb 2010, 3:25 a.m.*

Hi all

Can you explain this serial no of HP48GX (black LDC) ID144023xx

ID is for Indonesia but then 1 or 14 for manufacturing year? is it then 1991? 2004?

(http://www.hpmuseum.org/collect.htm#numbers)

thanks, matti (Finland)

Re: Serial no of HP48GX

*Message #2 Posted by **Frido Bohn** on 15 Feb 2010, 3:56 a.m.,*
in response to message #1 by matti

Hi Matti,

the structure of the HP48 serial numbers can be found in the FAQ for this device (Section 2.20).

As I interpret this, your machine was manufactured in Indonedia in the 44th week of the year 1991.

Best regards
Frido

Re: Serial no of HP48GX

*Message #3 Posted by **Frido Bohn** on 15 Feb 2010, 4:10 a.m.,*
in response to message #2 by Frido Bohn

Hi again,

Sorry, I was wrong.

> Quote:
>
> As I interpret this, your machine was manufactured in Indonedia in the 44th week of the year 1991.

For sure, it shoul be 2001 instead of 1991.

1) The HP48GX was introduced first 1993

2) The kind of serial number for your machine was introduced 1997.

All to read in the HP48-FAQ.

Re: Serial no of HP48GX

*Message #4 Posted by **Nacho** on 15 Feb 2010, 4:14 a.m.,*
in response to message #2 by Frido Bohn

Hello,

48GX started production in 1993 in Singapore not Indonesia, and black units appeared during year 2000 so your calc was made in 2001 week 44.

Regards

In praise of dirty calculators-- again.

*Message #1 Posted by **Michael Meyer** on 14 Feb 2010, 2:05 p.m.*

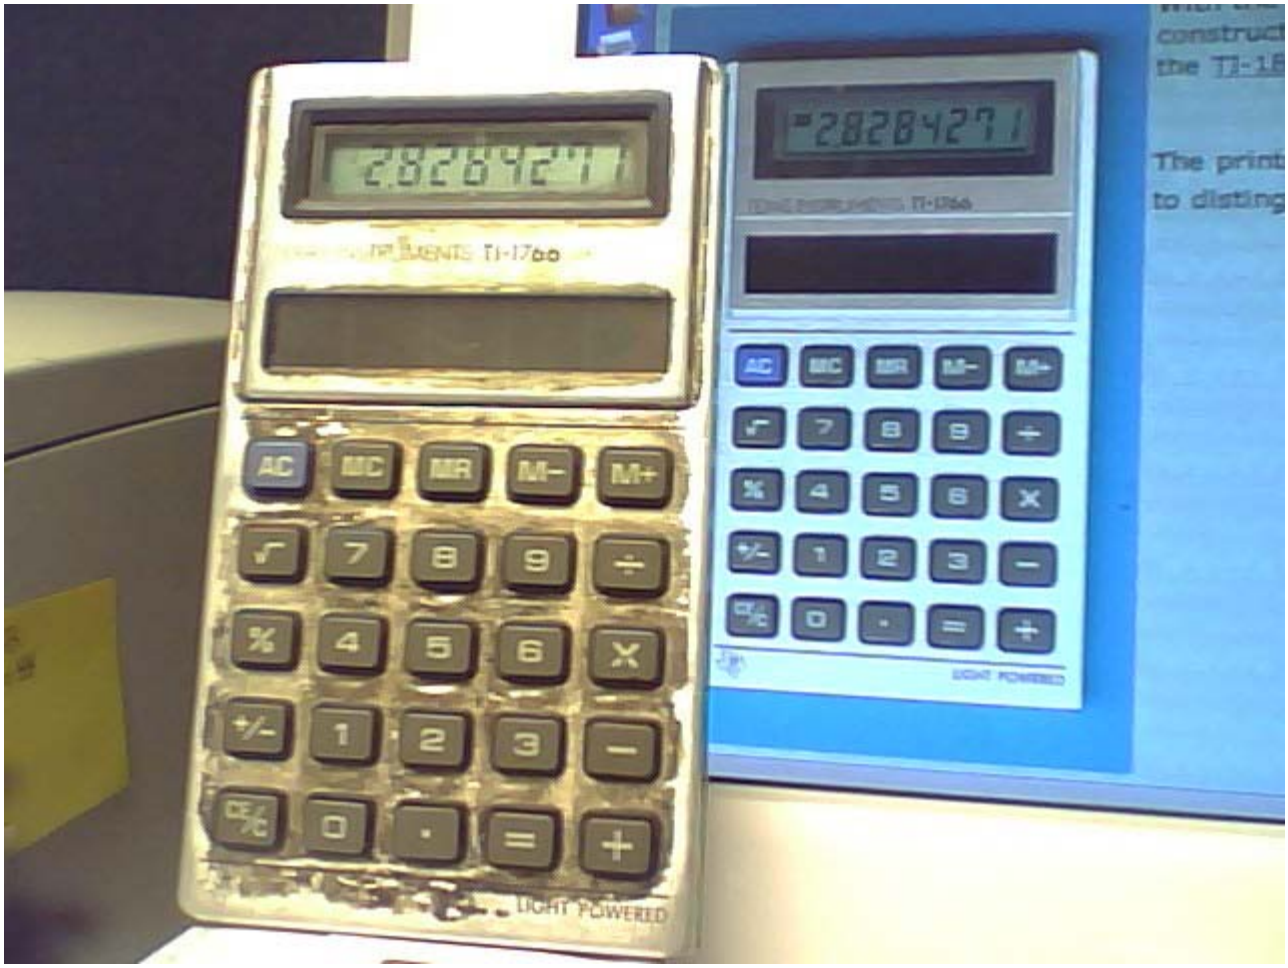
I bought an SR-52 from TOS. It's pristine... not a mark on it, rubber feet have no wear, and there's no wear near the switch as always develops on this model.

It appears that someone spilled something on this calculator, as all the keys were sticking and some wouldn't even press. I'm guessing that it was put back in its box without the battery, as there's no corrosion whatsoever. And no battery. After a good bath of the case and all the keys, and a new foam sheet behind the keys, it works perfectly. Nice.

Re: In praise of dirty calculators-- again.

*Message #2 Posted by **Joerg Woerner** on 14 Feb 2010, 3:18 p.m.,*
in response to message #1 by Michael Meyer

This is now really a dirty calculator:



(FYI: 26.5 years in use)

Regards, Joerg

Re: In praise of dirty calculators-- again.

*Message #3 Posted by **Michael Meyer** on 14 Feb 2010, 3:53 p.m.,*
in response to message #2 by Joerg Woerner

Nice. O.K....Joerg. As you know, my point is that the dirty calculators I've bought have often turned out to be little or even unused, and often clean up nicely. Let's see you clean that one up to look new....<grin>. That one looks well used... not just dirty! Nice photo.

Moral question: once fixed, can I call this calculator mint or even NIB? I guess I could just tell its story... There isn't even a mark on the red plexiglas... it really looks new! The blank magnetic cards were never removed from their package.

To Joerg & Dr. Mike Re: dirty calculators

*Message #4 Posted by **db (martinez, ca.)** on 14 Feb 2010, 10:48 p.m.,*
in response to message #3 by Michael Meyer

"once fixed, can I call this calculator mint or even NIB?"

Dr.Mike; I guess you could call it one of those but here's a way to make sure. Someone posted the following in about 2000 or 2001 so you might have seen it then. Five or so of the more cynical definitions are mine.

-EBAYese to English DICTIONARY-
Hard to Find = It's the only one I'm auctioning today.
Rare = "It's the only one I'm auctioning this week.
Very Rare = It's the only one I'm auctioning this month.
Unique = It's the only one I'm willing to sell.
Seller Prefers Paypal = I want your money and I want it NOW.
Mint = It looks more-or-less like it did when I bought/inherited/salvaged/found/stole it.
Minty = It's mint (q.v.), except for the funny green sauce I dribbled on it while eating lamb chops the other night.
M.I.B. = Mint In Box, but the item and box got slammed in the tailgate at the flea market.
New in Box (NIB) = I bought this with the sole intent of selling it for many times what I paid for it.
Nice = Looks great - doesn't work.
Complete = Except for the valuable, hard-to-find bits required to make it work.
Not Tested/Sold As-Is = 12VDC? 120VAC? There's a difference?
Like New = Like running over it with a car could really be that bad for it.
With Extras = I didn't feel like auctioning the manual, battery door, and case separately.
Buyer protection on eBay = We have your money. What's your problem?
I'm no expert on this.... = broken
I don't have batteries to test it = broken
I don't know how to test it = broken
It worked last time my dad used it = broken
Reserve Price = Cost of an item in Heaven - the SELLERS Heaven.
No Reserve = none needed in light of the outrageous miniium bid.
Buy It Now = ...for twice what it's worth, or risk paying three times as much to stave off snipers.

Joerg; That's a great idea you have there - wiping the dirt off your hands on a T.I. first, before using an RPN calculator. I'm going to start doing that! ;-)

Re: To Joerg & Dr. Mike Re: dirty calculators

*Message #5 Posted by **Michael Meyer** on 15 Feb 2010, 5:10 p.m.,*
in response to message #4 by db (martinez, ca.)

Thanks for the list!!! I guess it's a moot point. I was playing with the new toy last night and decided I couldn't let it go any time soon anyway. I've bought several SR-52's over the years, and most were severely damaged by age and corrosion. The keyboards seemed especially prone to damage, relative to TI-59's. This one is like having a brand new one in my hands, and every key works perfectly... Even the two I've successfully restored aren't as sweet as this one. It does read cards, but needs the reader re-built due to dents in the drive wheel. (I'll probably break it somehow in the process...)

I noticed that the sticker on the back is different than any other SR-52 I've seen. It's in 3 languages, and the calculator was assembled in Holland rather than U.S.A.

Damn hobby... is collecting. I haven't sold a single calculator yet...

Re: To Joerg & Dr. Mike Re: dirty calculators

*Message #6 Posted by **ClausB** on 28 Feb 2010, 10:10 a.m.,*
in response to message #5 by Michael Meyer

Two questions about my formerly dirty SR-52:

I found this loose piece between the LED board and the main board. See bottom of picture. Does it go somewhere in the calculator?

There is a 10K resistor soldered between two other components. See horizontal resistor in picture (ignore blue wires - it came with those in place of battery contact springs). Is the resistor a factory mod or some hack?

Thanks!

Re: To Joerg & Dr. Mike Re: dirty calculators

*Message #7 Posted by **Michael Meyer** on 3 Mar 2010, 8:31 p.m.,*
in response to message #6 by ClausB

Claus- I'm not really sure. The resistor doesn't appear in my 52's, and I've never seen that other piece before either. I do know that the TI-59's went through lots of different re-designs, and it wasn't unusual for TI to add things- like the resistor shown- to the circuits, so that probably holds true with the SR-52 as well. It looks like that like the loose piece was used to insulate something, perhaps the battery contacts themselves? I guess.

Re: To Joerg & Dr. Mike Re: dirty calculators

*Message #8 Posted by **ClausB** on 4 Mar 2010, 8:49 p.m.,*
in response to message #7 by Michael Meyer

Thanks for checking. This one's date code is 0776DTA. Are yours later or earlier models?

Re: To Joerg & Dr. Mike Re: dirty calculators

Re: To Joerg & Dr. Mike Re: dirty calculators (No my SR-52s are not dirty :-)

*Message #15 Posted by **Alberto Fenini** on 8 Mar 2010, 4:16 p.m.,*
in response to message #12 by Etienne Victoria

Dear all, if it can be of any help, I'm attaching a picture of my two SR-52s

This one has S/N : 942058 (top label) and LTA4176 (bottom label)

I use it for spares, and it was not working since it has arrived.

The second one has S/N 014131 (top label) and 4775DTA (bottom label)

Frankly speaking, there has been a time when both were on the table open up, and I *may*have swapped the bottom covers.

Both have the battery contacts broken, has anyone ever replaced them and with what ?(BTW, I have the same problem on a couple of TI59).

Also, the card reader works (I mean the card goes through without problems) but not logically.

What could I try in order to fully restore it ?

Thanks for help everybody, Alberto

Re: To Joerg & Dr. Mike Re: dirty calculators (No my SR-52s are not dirty :-)

*Message #16 Posted by **ClausB** on 9 Mar 2010, 7:01 a.m.,*
in response to message #15 by Alberto Fenini

It appears that your case backs are not swapped. The lower picture is of the older 52, judging by the date codes on the ICs (YYWW on the ICs, WWYY on the case).

My 52 came with wires soldered onto the broken contacts (see photo in top post above). I removed them and soldered on two coil springs from the battery compartment of a broken toy. I'll post a picture later.

Re: To Joerg & Dr. Mike Re: dirty calculators (No my SR-52s are not dirty :-)

*Message #17 Posted by **Alberto Fenini** on 9 Mar 2010, 9:15 a.m.,*
in response to message #16 by ClausB

Thank you very much, I think your is a brilliant idea, I'm also interested in getting back to work the card reader, from both the SR52 and my TI59s. As for HP's I have understood that other than the gummy wheels, some capacitors should also be replaced. Have you ever did it ? Thank you very much for help, Alberto

I just tried it with my PC-100A and it works!

Re: To Joerg & Dr. Mike Re: dirty calculators (No my SR-52s are not dirty :-)

*Message #19 Posted by **Etienne Victoria** on 9 Mar 2010, 3:32 p.m.,*
in response to message #15 by Alberto Fenini

Good evening Alberto !

Thank you for the pictures and information!

Unfortunately, I cannot help you on the electronic repair of the SR-52 card reader as I only repaired it mechanically (basically the card reader wheel):

here.

My card reader then read & wrote cards during 3 years and then refused to write them.

Having no service manual and not much time to investigate, I gave up trying for now.

I wish you the best in your restoration!

Etienne

Re: To Joerg & Dr. Mike Re: dirty calculators (No my SR-52s are not dirty :-)

*Message #20 Posted by **Alberto Fenini** on 9 Mar 2010, 4:57 p.m.,*
in response to message #19 by Etienne Victoria

ciao Victoria,

thank you very much for help, and congratulations for your website, it's very nice and helpful.

You should only update the old link
http://perso.orange.fr/etienne.victoria/Spice_decimal to the new link
http://etienne.victoria.free.fr/Spice_decimal/

I'll do some tests on my card reader and I'll let you know. take care and thank you very much again Alberto

Re: To Joerg & Dr. Mike Re: dirty calculators (No my SR-52s are not dirty :-)

*Message #21 Posted by **Etienne Victoria** on 10 Mar 2010, 5:38 a.m.,*
in response to message #20 by Alberto Fenini

Thank you Alberto!

I'll update the links this week-end.

My "site" is more a compilation of various repair procedures I have used and my knowledge of website construction/maintenance is near zero :-)

I just save my Aperture images in my Mac's (site) folder and sync it.

Thanks again and have a nice day.

Etienne

Dirty calculators (+ site updated with HP-97 reed switch procedure)

*Message #22 Posted by **Etienne Victoria** on 13 Mar 2010, 4:50 a.m.,*
in response to message #20 by Alberto Fenini

Hi Alberto!

I have corrected the bad link on the "site" and also updated the email button.

Have also added a couple of (ugly as usual) pictures on the Topcat printer reed switch replacement procedure.

As I work also this week-end, I will try to comment the pictures next week.

Cheers to all!

Etienne

Re: To Joerg & Dr. Mike Re: dirty calculators

*Message #23 Posted by **ClausB** on 5 Mar 2010, 11:50 a.m.,*
in response to message #6 by ClausB

Yay! It works!

Another of this 52's problems was that an exponent digit would not light up. I experimented and found that the digit driver had failed. The SN97311 IC has 7 drivers and one of them tested open. I wired an NPN transistor and a 2K resistor across it and now the digit lights up. It's not perfect - an 8 is a little dimmer than a 1 - but it's better than pressing [2nd] [log] to see what the digit should be!

Re: To Joerg & Dr. Mike Re: dirty calculators

*Message #24 Posted by **Michael Meyer** on 5 Mar 2010, 12:43 p.m.,*
in response to message #23 by ClausB

Wow... I'm impressed. My abilities to restore these devices stops at the level of mechanical engineering (contacts, card reader, batteries, wiring, etc.) and basic chip exchanges. Nice job. Let me know if you'd like some TI-59 and SR-52 "guts"... I have parts I don't think I'll ever use.

Re: To Joerg & Dr. Mike Re: dirty calculators

*Message #25 Posted by **ClausB** on 5 Mar 2010, 5:44 p.m.,*
in response to message #24 by Michael Meyer

Thanks. I'm pleased it works. I suppose the best repair would be to replace the driver chip but I could find no data on the web, let alone any parts. I don't know how the SN97311 differs from the SN27882 used in other TIs.

Your offer of spare parts is very kind. I just replaced those blue wires with two battery contact coil springs from a broken toy. I should have asked here first for the right parts!

Re: To Joerg & Dr. Mike Re: dirty calculators

*Message #26 Posted by **Michael Meyer** on 7 Mar 2010, 7:42 p.m.,*
in response to message #25 by ClausB

I don't think I'd consider the original contacts to be "the right parts." They were so flimsy and prone to corrosion. Most of the "parts" boards I have are missing the contacts!

Re: To Joerg & Dr. Mike Re: dirty calculators

*Message #27 Posted by **ClausB** on 27 Feb 2010, 8:31 a.m.,*
in response to message #4 by db (martinez, ca.)

Hi, all, I'm new to calculator collecting. I've accumulated some over the years: my original TI-59; an HP-41C with card reader and printer; a TI-58 with PC-100A; my wife's HP-45; a TI-55; an HP-33e; an SR-40. Recently I've added more from eBay: an SR-56 like I had in '77; a TI-57; a Sperry like my first calculator ever; an MBA; an SR-52.

Many thanks to Joerg and Viktor and the MoHPC for their fine sites in helping me to restore these machines.

I used eBay because I don't know where else to look. Any suggestions?

On topic: The SR-52 keyboard was filthy and the poor photo on eBay did not show that. Some keys were gummed up badly. Disassembly and thorough cleaning restored it. The gumminess seemed to come from the faceplate glue leaking out. Some traces of glue are evident UNDER the brown factory coating! I thought the -52s had high quality. Anyway the keys work well now with no bounce, as with the -56. Can't say that for the later TIs - lots of keybounce there.

Edited: 27 Feb 2010, 8:34 a.m.

Re: To Joerg & Dr. Mike Re: dirty calculators

*Message #28 Posted by **Marcus von Cube, Germany** on 27 Feb 2010, 4:12 p.m.,*
in response to message #27 by ClausB

The key bounce of later machines is unavoidable. The plastic construction with welded wires simply sucks. That's sad truth.

Re: To Joerg & Dr. Mike Re: dirty calculators

*Message #29 Posted by **Michael Meyer** on 27 Feb 2010, 6:29 p.m.,*
in response to message #27 by ClausB

Interesting. I'd wondered if the sticky and stuck keys was from glue from the face plate. The sticky substance took quite a soaking in "goo-gone" and scrubbing with a toothbrush to remove from the keys. There was no sign of any other substance inside the calculator. Your observation confirms what I'd only suspected!

Re: To Joerg & Dr. Mike Re: dirty calculators

*Message #30 Posted by **ClausB** on 27 Feb 2010, 8:44 p.m.,*
in response to message #29 by Michael Meyer

Same here. Inside was clean. Even the foam sheet was reusable.

You got yours at TOS? What is TOS? Are there other places better than eBay?

Re: To Joerg & Dr. Mike Re: dirty calculators

*Message #31 Posted by **Michael Meyer** on 27 Feb 2010, 11:37 p.m.,*
in response to message #30 by ClausB

I've personally never found a calculator anywhere else but on eBay. I've looked at garage sales and at thrift stores, but the thrift store people tell me that the people who work there usually have pre-arranged deals to sell donated calculators to people they know, so they never reach the sales floor. I don't have time to check out estate sales, unfortunately.

>
> I guess I could just tell its story...

A good deal on TAS often is about items not well pictured. So, let some pictures sell your calculator.

Edit: I forgot something:

can I call this calculator [...] NIB?

I would expect an untouched item in this case, e.g. a sealed box.

Thomas,

How much do you ask for it?

I would Buy-It-Now or do you want to trade it for an RPN calculator?

Regards,

Joerg

For $44.95, I could send you some pencils and paper and maybe even throw in a 33S!!

Re: xThink Calculator

*Message #3 Posted by **Jean-Michel** on 14 Feb 2010, 3:37 p.m.,*
in response to message #2 by Dave Shaffer (Arizona)

Dave, I don't share your point of view. This software looks innovative. More to say, no need to ask if it's algebraic or RPN, and to start endless discussions about shifted or unshifted keys, menus, size of the enter key, locations of keys and so on. This is math as it should be: paper, pencel, equations and results. No calculator. Regards.

Re: xThink Calculator

That's an understatement!

> Quote:
>
> More to say, no need to ask if it's algebraic or RPN...

Maybe it's both? It obviously uses algebraic notation, but I don't see an equals key at the bottom menu, just Enter! (Return) (There is an equals sign on the results line, though).

Re: xThink Calculator

*Message #5 Posted by **DaveJ** on 14 Feb 2010, 3:39 p.m.,*
in response to message #1 by hpnut

Cute, but you'd have to rely on the recognition technology to be 100% reliable. It won't be of course, so the time you spend double checking every calculation with what it recognises, it would have been faster to just use a regulator calculator.

A classic case of a product with a neat technical solution to a problem that didn't exist.

Dave.

in response to message #5 by DaveJ

Dave: As a long-time user of MathJournal, which is xCalc's "big brother," I have a lot of experience comparing MJ to calculators. All I will say is that you can't really appreciate the power of xCalc or MathJournal unless you spend some time with them. While the recognition of written mathematics is not as finely honed as the recognition of handwriting, there are a few simple "penmanship rules" that, if used with either application, greatly enhance accurate recognition.

Regarding your confidence in an accurate answer, I would like to point out that estimating the approximate result in your head is a wise action when using ANY calculation tool; slide rule, calculator or xCalc...

Re: xThink Calculator

*Message #9 Posted by **Steve S** on 20 Feb 2010, 5:19 p.m.,*
in response to message #8 by hpnut

hpnut: Interesting article. I think that the tablet's graphic UI has a lot of potential; it's a shame that it hasn't been better promoted by Microsoft and its industrial partners.

IMO, one of the biggest features (and advantages) of applications like Calculator (xCalc) and MathJournal is the free format input. You can scribble a calculation at some location on the page, add notes or observations (in MJ, even data plots!) and then go on to write other calculations later on the page.

BUT... if you look back and suddenly realize that you forgot something, or you decide that you want to do another calculation and place it near your first calculation (for comparison), Calculator

and MJ will allow you to do this! This is one significant reason why free format is so useful. It is also the reason why I say that you can't really appreciate these types of tools without a little 'hands on" time.

As much as I love my HP calculators (and I have a few of them), the engineer in me has to admit that this is really the future of computing...

Cleaning HP48 keys NON-INTRUSIVELY

*Message #1 Posted by **Angus** on 13 Feb 2010, 11:02 p.m.*

I just got my HP48G back, and all that seems to be wrong w/it is that the B key doesn't work and the C key is flaky. I'm *praying* that the problem can be remedied by buying fresh batteries (it's giving low batteries warnings) but I'd be surprised if that works. All I've read about maintaining these calculators involves opening a device that was not designed to be opened, and I'm quite certain that'll leave me w/a non-calculator.
I'm hoping that the problem is a dusty contact. Is there any measure I can take to clean it w/out opening it up?

Re: Cleaning HP48 keys NON-INTRUSIVELY

*Message #2 Posted by **Dave Britten** on 14 Feb 2010, 1:02 p.m.,*
in response to message #1 by Angus

It might be a problem with the keyboard ribbon cable rather than the keys themselves. If you press firmly on the bezel beneath the screen, does the key response improve?

I tried opening a 48G once to repair some issues, and honestly, I don't think it was worth the trouble. The thing looks like a mess now, so I just use it as an alarm clock. The 48G can be had cheaply enough that you might be better off just looking for another one. Or, alternatively, a 48S/SX, which are also relatively inexpensive.

Yes, that does seem to be it. If I push down on the bezel I can use the B key. Well that's good. God help me if it fails during the midterm, though. What should I be doing about this?

Inexpensive!!?? Where? Looking on eBay they go for 100s of $! I paid the better part of 200$ new 15 years ago for mine (Canadian!) My friend tried to sell one on eBay for 1$ and didn't get any bites. I wonder what she did wrong?

BTW, fixthatcalc doesn't do the 48G :(

Have you looked lately? A check today of recent completed auctions shows prices in the $30 - $70 range for excellent to mint 48G's.

Re: Cleaning HP48 keys NON-INTRUSIVELY

*Message #6 Posted by **Dave Britten** on 14 Feb 2010, 9:14 p.m.,*
in response to message #4 by Angus

The 48GX - and frequently the 48G+ - will normally sell for at least $100. And any model with a good pile of accessories will sell for a lot. Survey software and memory cards are typically the most popular, and can push prices above $200. But a loose 48G or 48SX will often go for $50 or less. I recently got a 48SX with a 32KB card, HP EQ Library card, Pocket Professional Mathematics card, and the manuals for all of it for about $60. That was a little outside the norm, but good deals are out there.

Barcode generator for Optical Wand?

*Message #1 Posted by **Timo** on 14 Feb 2010, 10:52 a.m.*

I was just reading a PDF about the optical wand for the HP 41 series calculators.

And I started to wonder whether anyone has ever developed a software tool for converting program listings (maybe devloped on a HP-41 PC-emulator) into a barcode that can be printed and loaded into the HP-41 using the optical wand?

Using such a tool all you'd have to do is enter the program once on a PC, run the software and the result would be the barcode. This way you could store your programs either as a listing or barcode on your PC and print them out to upload them into the HP anytime you need them.

All I know is, that back in the "active days" of these calculators you could send a program listing to HP and they would print a barcode interpretation for you for relatively affordable amounts of money. Maybe this service has been ported to a software solution already?

Looking forward to your replies, Timo

*Message #2 Posted by **Winfried Maschke** on 14 Feb 2010, 2:58 p.m.,*
in response to message #1 by John Robinson

Don't do it ;)
The two halfes of the plug are glued together and are not easy to open. It is possible only with violence.
This picture shows a new one from a printer (without pcb) which is the same like the plug of the wand and was never glued together. Maybe it helps you: http://maschke.de/hp41/a560.jpg

Pictures of Time Module for HP 41 series?

*Message #1 Posted by **Timo** on 13 Feb 2010, 12:41 p.m.*

Hi,

I recently got my hands on a time module for my HP 41CV, complete with manual and keyboard map. Only downside is that the company that used the time module in its active days removed the original plackards from the module and replced them with some paper stickers showing company internal designations.

I'd like to restore the look of the module by replacing the stickers with new plackards that look like the old original markings of the module.

Could anyone with a time module post some pictures of the plackards on the front and bottom of the module so that I know what exactly was written on them?

Thanks a lot in advance and best regards, Timo

HP38G/39G/48SX/48GX./49G Emulator now availble for iPhone/iPod Touch

*Message #1 Posted by **Steve Simpkin** on 13 Feb 2010, 12:03 p.m.*

An enhanced version of the m48 HP48GX emulator is now available for the iPhone/iPod Touch that adds emulation for the HP38G, HP39G, HP48SX and HP49G. This version also features program/library import/export, many skins, save/load multiple calculator states, optional landscape layout, QWERTY keyboard, a http based file server, a file system manager and much more.

I have developed almost a hundred engineering utilities, formulas and nano Apps over the past 19 years for my HP48SX and now I can finally have them available in my shirt pocket wherever I am.

At $20, it is expensive for an iPhone App but it was well worth it for me. See:
http://www.mksg.de/m48plus/m48plus.html

Re: HP38G/39G/48SX/48GX./49G Emulator now availble for iPhone/iPod Touch

*Message #2 Posted by **Eric Smith** on 13 Feb 2010, 2:11 p.m.,*
in response to message #1 by Steve Simpkin

Given that both m48 and m48+ are using GPL'd code, where is the source code?

Re: HP38G/39G/48SX/48GX./49G Emulator now availble for iPhone/iPod Touch

*Message #3 Posted by **Egan Ford** on 14 Feb 2010, 11:04 a.m.,*
in response to message #2 by Eric Smith

I emailed the author for the source to m48 a while ago and it was sent to me. Just ask for it.

Re: HP38G/39G/48SX/48GX./49G Emulator now availble for iPhone/iPod Touch

*Message #4 Posted by **Eric Smith** on 14 Feb 2010, 12:23 p.m.,*
in response to message #3 by Egan Ford

I'll do that. It doesn't meet the GPL license requirements, though:

> Quote:
>
> 3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:
>
> a) accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
>
> b) Accompany it with a written offer, valid for at least three years, to give any third part, for a charge no more than your cost of physically performing source distribution, a

> complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
>
> c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

Option 3 is not applicable to m48+ because it is sold commercially, and not applicable to m48 because there is no upstream party that can provide the "corresponding source code". Note that all three options require that something actually be provided with the binary distribution, if only a written offer, which could be on the About page in the application.

Random Number Generation Challenge (sort of)

*Message #1 Posted by **Namir** on 13 Feb 2010, 9:07 a.m.*

Hi All,

I am trying to write a random number generator on my HP41CX such that I use the built-in time module to generate either an initial seed for a sequence of random numbers, or generate random numbers outright. Using the values for the current time (and also date) has the potential of generating unique initial seed values.

I think the solution involves the values of time, date, and possibly some sort of a counter.

The simpler the solution the better. So let's put our math thinking caps, shall we!

Namir

PS: I am also trying to solve the same problem with Excel. Of course using VBA code I have a lot of options for more complex/elaborate solutions and more speed.

Edited: 13 Feb 2010, 9:16 a.m.

Re: Random Number Generation Challenge (sort of)

*Message #2 Posted by **Vladan Dugaric** on 13 Feb 2010, 9:54 a.m.,*
in response to message #1 by Namir

From http://www.hpmuseum.org/software/41/41ranjm.htm

```
01  LBL "RNG4"
02  DATE
03  TIME
04  +
05   E49
06  *
07  PI
08  MOD
09  LN1+X
10  R-D
11  FRC
12  END
```

That's what I use.

This one will always make a new random number, it does not have the capability of regenerating a given sequence. It is a good starting point for both functions, though, since the routine can be used as a seed, then plugged into another RNG from the same URL that just uses a given seed.

Vladan

Edited: 13 Feb 2010, 9:57 a.m.

Re: Random Number Generation Challenge (sort of)

*Message #4 Posted by **Namir** on 14 Feb 2010, 11:58 a.m.,*
in response to message #1 by Namir

Here is the VBA code for a class (which I call CVirtTime) that performs random number generation using a "virtual clock" that is not affected by the speed of the computer running the code. This virtual clock will advance the virtual time each time you call method NextRand() which generates uniform random numbers between 0 and 1. You must initialize the instance of the class using either InitMyTime or InitTime. The first method allows you to specify any time and date you want (and therefore you can duplicate the sequence of numbers generated). The method InitTime initializes the class instance using the current system date and time. Using this method you cannot replicate the sequence of random numbers. Once you initialize the class instance the virtual clock "ticks" as fast as the number of calls to method NextRand().

```
Option Explicit

Private m_nSec As Integer

  Dim t As Date

  t = Now
  m_nSec = Second(t)
  m_nHour = Hour(t)
  m_nMin = Minute(t)
  m_nDay = Day(t)
  m_nMonth = Month(t)
  m_nYear = Year(t)
  m_fCounter = 0
  PI = 4 * Atn(1)
End Sub

Public Function NextRand() As Double
  Dim X As Double

  ' manage the virtual time and date
  If m_nSec = 60 Then
    m_nSec = 0
    INC m_nMin

    If m_nMin = 60 Then
      m_nMin = 0
      INC m_nHour

      If m_nHour = 24 Then
        m_nHour = 0
        INC m_nDay

        If m_nDay = 30 Then
          m_nDay = 1
          INC m_nMonth

          If m_nMonth = 12 Then
            m_nMonth = 1
            INC m_nYear
          Else
            INC m_nMonth
          End If

        Else
          INC m_nDay
        End If

      Else
        INC m_nHour
      End If

    Else
      INC m_nMin
    End If

  Else
    INC m_nSec
  End If

  X = (5773 * AbSin(137 * m_nSec) * AbCos(173 * m_nMin) * AbSin(137 * m_nHour)) + _
      (2377 * AbSin(237 * m_nDay) * AbCos(117 * m_nMonth) * AbCos(m_nYear))
  m_fCounter = m_fCounter + 1
```

```
  If m_fCounter > 1E+99 Then m_fCounter = 0
  X = X + Abs(Sin(m_fCounter) + Log(1 + m_fCounter))
  NextRand = X - Int(X)

End Function
```

Calculating the value for variable X is more of an art than a science (at least in my humble opinion). You can develop so many different kinds of expression to calculate X--some better than others. I tried using the modulo operator in a "creative" way, but found that using sin and cos function works rather well.

Beautiful example Jean-Marc, thanks for sharing it.

There is another implementation on the SandMath module, functions SEEDT and RAND written by Håkan Thörngren "a few years ago" - and published on PPCJ back then. I like it because it uses a memory buffer to store the seed(s). Also the time module is used to obtain an initial seed if the input is zero.

Cheers, ÁM.

in response to message #4 by Namir

Namir, having read Donald Knuth I have the feeling that you are on the wrong track. From the top of my head, he states that having a complicated function does not make the pseudo random sequence any better. As a result: There are simple workable solutions like the Linear Congruential Method:

$$x_n \equiv a \cdot x_{n-1} \pmod{p}, \quad n \geq 0, x_0 \in \mathbf{Z}_p.$$

(from the pages cited below.)

Useful link: http://random.mat.sbg.ac.at/ (I'll have to check the pages for myself but they look promising.)

*Message #9 Posted by **Namir** on 15 Feb 2010, 5:48 a.m.,*
in response to message #8 by Marcus von Cube, Germany

Marcus,

Sure the equation you mentioned is very popular and I used it to write typical pseudo-random number generators. My basic approach in this thread is to use the computer's system date and time as an automatic initial seed OR as a way to generate uniform random numbers outright. Since PC's run fast, a system date/time based algorithm risks of generating large arrays of the same random number. This problem prompted me to think of a using a counter to avoid generating the same numbers. Then, I

thought of creating a class for a virtual clock that can be initialized by the actual system clock and then run at it's own pace and totally independent of the actual CPU speed. Thus, my virtual clock ticks each time you generate a random number.

The equation I am using uses all of the components of date and time.

> Quote:
>
> PS: I am also trying to solve the same problem with Excel. Of course using VBA code I have a lot of options for more complex/elaborate solutions and more speed.

I found that many random number generating routines performed poorly with regards to having too much repitition when I required 100's of 1000's of numbers. A very good one I found for Excel was Mersenne-Twister. On the site there are links to several implementations and also an Excel add-in.

Woodstocks - the new gold standard?

*Message #1 Posted by **Michael de Estrada** on 11 Feb 2010, 6:11 p.m.*

It seems like Woodstocks are becoming the hardest vintage pocket HPs to find in good and complete condition, especially the continuous memory models. Here's a case in point:

HP-29C

Edited: 11 Feb 2010, 6:13 p.m.

Re: Woodstocks - the new gold standard?

*Message #2 Posted by **Xavier A. (Brazil)** on 11 Feb 2010, 7:19 p.m.,*
in response to message #1 by Michael de Estrada

Hello,

The same seller showed few months ago a 'customed' HP-67 for use in flight about the same price, or perhaps more - without any success, like this HP-29c for sure.

It is just a market observer who has noticed that hp-65, 67 and 29c are the best sellers of the brand HP.

But for me, it is the most beautiful box HP ever realized...

Re: Woodstocks - the new gold standard?

*Message #3 Posted by **Michael Meyer** on 11 Feb 2010, 7:55 p.m.,*
in response to message #2 by Xavier A. (Brazil)

I will have to say-- It took me about 8 years and 3 HP-29C's to finally get a working one. Total cost $400-600 (I don't remember each price anymore). Two had irreparable circuit damage and one had a bad case and keyboard but a functioning circuit.

Just in my opinion, for that rare a model in functioning condition AND in a box, $600 or even $800 might not seem that out of line these days. $1000 is, I agree, on the high end, but maybe not that terribly out of line if someone is that serious about finding a working one in a box.

I see that HP-10's have sold for around the $500 range without even knowing if they work, and a working 25C just went for $400 and an HP-27 for around $1000. The new-in-box 41CX's go for about $1000.

I can't even imagine what an HP-70 would go for these days... though I wish I had one. Some day. Yes, maybe the new "gold standard" after all. Wonder if it'll last.... (see my thread about calculator values).

*Message #5 Posted by **Martin Pinckney** on 12 Feb 2010, 10:39 a.m.,*
in response to message #1 by Michael de Estrada

I am a fan of Pioneers - use them every day. But if I did get a classic LED HP, the 29c is the one I would like to have.

Alas, at these eB** prices I will just have to get lucky at a thrift store...

Re: Woodstocks - the new gold standard?

*Message #6 Posted by **Michael de Estrada** on 12 Feb 2010, 11:54 a.m.,*
in response to message #5 by Martin Pinckney

I have a near perfect HP-29C in my collection and it's one of my favorites. IMO the Woodstocks were the best design of the LED pocket calcs; best pocketability, best as hand held, easiest to swap battery packs in the field. They retained the ruggedness of their classic predecessors withough the excess bulk, and their introduction of continuous memory allowed for long battery time. Unfortunately, their stupid charging system has resulted in very few remaining in working condition, which is why IMO prices have risen so dramatically. Most Classics on TAS are in working condition, whereas most Woodstocks are not.

in response to message #6 by Michael de Estrada

Hello!

> Quote:
>
> IMO the Woodstocks were the best design of the LED pocket calcs

Absolutely! The problem is, that they will stop working eventually even if you charge them correctly. Like my HP25 did overnight. That's why I will never pay "moon prices" for any of them, it's only a matter of time when the last of them will die. Unfortunately, they are not built to last. It a bit like proton decay - only faster.

Greetings, Max

I've GOT to find my manuals for my 25c - they're around here somewhere...

I'm planning on getting rid of it, 'cause I just can't see those red LLLLEEEEEDDDDD's anymore!

Re: Woodstocks - the new gold standard?

*Message #9 Posted by **David Hayden** on 12 Feb 2010, 2:50 p.m.,*
in response to message #7 by Maximilian Hohmann

I agree also. The woodstocks had a wonderful form-factor because you could hold and operate it in one hand.

Does anyone know of any current manufacturers who make something similar? By that I mean a scientific programmable that can be held and operated in one hand?

May I add to that the color scheme? Is it just me, or do others find the two-tone scheme to have more curb appeal than earlier and later all-black models?

*Message #11 Posted by **Michael Meyer** on 12 Feb 2010, 2:26 p.m.,*
in response to message #6 by Michael de Estrada

Michael--their stupid charging system and the fact that, when the batteries do leak or outgas, they have a direct route to destroying the circuits. I've seen extensive battery leakage in the classics not destroy the circuits as much due to the separate battery compartment. Corrosion still claims its share of Woodstocks. And Spices. And, unfortunately, Stings as well.

*Message #12 Posted by **Jim Horn** on 12 Feb 2010, 5:28 p.m.,*
in response to message #11 by Michael Meyer

As my first calculator was an HP-25 which I still have and really enjoyed, I agree with all the above postings. As mine no longer works - and not just because the battery pack is long since dead and I don't have the wall-wart charger - I'm curious about the charging system induced failures mentioned. Are they something that can be repaired? If not perhaps I should consider creating a replacment processor board - all the physical convenience of the '25 but with modern speed, constant memory, increased programming, etc.

Hi Jim! Eric Smith and Rich Ottosen created the next best thing with the DIY-RPN machine. It has 21, 22, 25C, 27, 29C, 32E, 33C, and 37E emulations built in, with matching keyboard "overlays." Mine measures about 5 1/4" x 2 3/4" x 3/4" and weighs 4.1 oz. including the two coin cell batteries. It screams "geek" :-)

Brian

*Message #15 Posted by **Mike Morrow** on 13 Feb 2010, 12:31 p.m.,*
in response to message #6 by Michael de Estrada

I also like the Woodstock form factor. It's far better than, say, the terribly awkward landscape format of the Voyagers.

My idea of the closest thing to perfection in a LED calculator would be an HP-34C in Woodstock format, which would not have been too difficult to package. Both the HP-29C and the HP-34C have the same number of keys, switches, and display digits. I consider the Woodstock's combined battery/compartment door design to be the best that HP ever used. In this "ideal" machine, the designers used a little basic common sense to implement a decent charging system that won't destroy the machine, along with a competently designed battery compartment that can't admit chemical contamination from the battery into the calculator insides.

That would be perfection in an LED calculator!!

I consider the HP-34C, as a calculator, to be a great step forward from the HP-29C. I like the HP-34C even better than the HP-67 that I've had for 33 years. But its very flimsy mechanical design, including the battery compartment, was a great step backward from the Woodstocks.

HP has a long tradition of unsatisfactory design practices, unfortunately.

> HP has a long tradition of unsatisfactory design practices, unfortunately.

Really? I'd say you're applying 20-20 hindsight and ignoring the fact that most of the design work was cutting edge.

IMO, with the notable exception of the spice mechanical design, when their practices are viewed in proper context, that is at the time they where done and the market which they targeted, they did a really great job overall.

My challenge to anyone who believes otherwise: Name another company that produced calculators in the seventies and eighties that have had the longevity of HP's. Just think about the number of them still in use today...

Re: Woodstocks - the new gold standard?

*Message #17 Posted by **Mike Morrow** on 13 Feb 2010, 7:07 p.m.,*
in response to message #16 by Randy

Perhaps. My first Woodstock was a HP-21 that I purchased in 1976.

So...there's not too much hindsight in my statements, then. My statements aren't those of a person who was NOT a contemporary HP user 34 years ago. I did NOT know how criminally stupid HP's design of the charging system was. That design incompetency was even reflected in the HP-67 that I purchased in 1977.

I deserved better. HP knew better. They failed their customers.

But, I will admit that overall HP did a better job than TI did with respect to reliability, a third if a century ago.

I am not sure what "a really great job overall" means. I am waiting for someone to explain how a firm which did superb design in many areas could have been totally inept in power supply design. Could it have been that power supply design wasn't considered to be very difficult and got short-changed during development?

> Quote:
>

The Sharp's go on forever.

Re: Woodstocks - the new gold standard?

*Message #19 Posted by **Maximilian Hohmann** on 14 Feb 2010, 3:05 a.m.,*
in response to message #18 by Palmer O. Hanson, Jr.

Hello!

> Quote:
>
> The Sharp's go on forever.

Not all of them. I have several Tamaya NC2 and NC77 astro navigation calculators that were made by Sharp in the 70ies based on "normal" scientific calculators like the EL-8018. Some do not work at all, and the two of them that do work show the same display problems: all digits dimly lit all the time.

From my calculators from the 70ies only those made by Aristo (Dennert&Pape) still work with no exception. But they were the second most expensive to HP then.

Regards, max

Re: Woodstocks - the new gold standard?

*Message #20 Posted by **Randy** on 14 Feb 2010, 6:23 a.m.,*
in response to message #19 by Maximilian Hohmann

"criminally stupid"

"totally inept"

Such harsh condemnation...

In context: HP's experience with rechargeable AA's in the classics lead them to what they did with the Woodstocks. They didn't leak and they didn't have charging problems. At the time, HP's calculator line was under tremendous attack from the other manufacturers and the Woodstocks were HP first product ever to be targeted at the open, retail market. Cost cutting had to be done. The form factor had been established.

An open challenge to all: redesign the charging circuit of a Woodstock without resorting to external devices and achieved with components available in 1975. Don't just say you could do thus and so, really do it. Then show us how it fits into the case.

Re: Woodstocks - the new gold standard?

*Message #21 Posted by **Mike Morrow** on 14 Feb 2010, 12:43 p.m.,*
in response to message #20 by Randy

HP was fully conscious of the severe damage that could occur when a Woodstock or an HP-67 was operated on AC charger without a good battery pack in place. It's stated in the warning found in the user manuals.

HP designed very expensive hardware. The HP-67 cost the 2009 equivalent of $1600, and even the "cheapest" HP-21 cost the 2009 equivalent of $290. This deliberate design defect could have been eliminated with charging system changes that likely would have added only a couple of 1977 dollars per unit. That HP did not resolve a fault that would destroy high-dollar hardware for a highly probable simple user error indicates to me that the day of very significant *deliberate* HP quality short-cuts goes back at least to 1977. In contrast, today's HP50g is an amazingly competent and trouble-free machine for the price, one that is very hard to inadvertently and innocently destroy in normal usage.

As an old long-time HP calculator user, I can't help but smile at the frequent lament of many for those (fictional) old glory days of HP calculator quality. Most of these people who buy into that mythology weren't even alive back in the days that they claim were HP's quality zenith.

Really? Where you working there at the time? Part of the design team that made the decisions?

67 fry without a batteries in place? Is that something you know to be true or just something you read on the Internet? Care to explain what parts fail in the 67 when used with just the charger?

Re: Woodstocks - the new gold standard?

*Message #23 Posted by **Michael de Estrada** on 14 Feb 2010, 4:47 p.m.,*
in response to message #22 by Randy

I found this prior post in which you specifically stated that it was unsafe to operate the HP-67 from the AC adapter/charger without a battery in place:

> Quote:
>
> Classic safety clairification Message #13 Posted by Randy on 7 Nov 2009, 1:26 p.m., in response to message #8 by Michael de Estrada
>
> It is *NOT* safe to operate a 65 or 67 from the AC adapter without a good battery in place. The battery is the only load on the constant current supply such that without the battery, you have 16 volts open circuit exactly as mentioned. But, there is a danger to the card reader sense amplifier/motor controller - as it is connected directly to the battery terminal and therefore sees that 16 volt source when there is no battery in place.
>
> The original IC, 1826-0158 was used in the 65 and was susceptible to over-voltage damage. The part was redesigned as the 1826-0322 which appeared in the 67,97 and 41 readers. While it was supposedly better able to withstand the over-voltage stress, I wouldn't tempt fate.
>
> Thanks to Tony Duell for explaining this quite clearly several years ago as it isn't obvious without seeing the schematics.

*Message #24 Posted by **Randy** on 14 Feb 2010, 5:39 p.m.,*
in response to message #23 by Michael de Estrada

I'm aware of what I've written about the 67. What I was hoping for was Mr. Morrow to respond with his seemingly extensive knowledge of what happens to a 67 since he thinks HP was "fully conscious of the severe damage" that occurred.

IMO, one part that had been redesigned to prevent damage - does not warrant the vitriol in this thread. Pick on the Woodstocks all you like but my power supply redesign challenge still stands...

Re: Woodstocks - the new gold standard?

Re: Woodstocks - the new gold standard?

*Message #30 Posted by **Mike Morrow** on 14 Feb 2010, 11:07 p.m.,*
in response to message #22 by Randy

No, but I did spend $450 in 1977 for an HP-67. And I read the manual then, and later.

Apparently you are unaware of the following statement on page 312:

"CAUTION Operating the HP-67 from the ac line with the battery pack removed may result in damage to your calculator."

Or, do you think HP was just making a baseless warning?

Or, do you think a HP-67 whose card reader no longer works after AC charger use without battery in place does not constitute real damage?

None of this comes from your bugaboo "internet" that you ranted about "internet style." So just what the hell is your point??? Whatever it is, HP in 1976 disagrees with you. I guess you know better than HP. You've just lost a lot of credibility.

Re: Woodstocks - the new gold standard?

*Message #31 Posted by **Randy** on 15 Feb 2010, 6:16 a.m.,*
in response to message #30 by Mike Morrow

If you're foolish enough to spend $450 on a calculator an then not follow the instructions in the manual, that pretty much covers the credibility issue, doesn't it?

You made my point better than I ever could have, thank you.

If that were the only mention of the problem in the handbook I would contend that it was an inadequate warning. Who reads the Service and Maintenance section until he has a problem? However, on page 27 the end of the first paragraph in Section 1 Getting Started states:

> Quote:
>
> ... Whether you operate from battery power or from power supplied by the charger, *the battery pack must always be in the calculator.*

where the italics are in the manual. I'm not sure there really an option to use battery power which is not from the battery pack. Are we discussing a user who might try to apply external battery power through the charger connector?

A very similar warning appears on page 11 of the HP-27 Owner's Handbook and on page 9 of the HP-22 Owner's Handbook.

Earlier, Randy wrote

> Quote:

I would suggest that if the designers couldn't fit reasonable power supply circuitry into some predetermined case size (somebody's dress shirt pocket maybe) then they should have considered making the machine

somewhat larger. Would a quarter of an inch have been enough?

in response to message #15 by Mike Morrow

The battery compartment would be easy... have it completely enclosed and thus "external" to the calculator, thread the two contacts in as nuts and bolts extending on either side, then connect the circuit board to the internally projecting contacts with leaf springs. Easy. It would remain functionally the same, but immune to leakage and outgassing. (Except the two easily replaceable posts.)

The charging circuit I will leave to others here who are far more qualified.

Classic display segment intermittent - cause?

*Message #1 Posted by **Mark Henderson** on 11 Feb 2010, 5:30 p.m.*

Hi - I recently added a nice HP-70 to my collection. It's in good shape overall, working.

When first powered up the "c" segment in each digit is off (identifying segments from "a" at top, clockwise). I've seen posts about this kind of fault (usually display driver?).

However, after about 5-10 minutes from cold power-on, the segment will behave correctly, for about 10 minutes, then the segment will extinguish again, and stay off (until the calc is switched off and left for a few hours).

So it seems to be some sort of "warm up" behavior. I'm going to go in with a scope etc and see what's going on, but from the collective experience of the forum, what might be wrong, or where should I start looking?

Cheers

Re: Classic display segment intermittent - cause?

*Message #2 Posted by **Randy** on 12 Feb 2010, 4:33 p.m.,*
in response to message #1 by Mark Henderson

A bad anode driver is a likely culprit. Part number is 1820-1024 which is unique to the 70. While other classics use different part numbers in that position, they might function as they all share the same pin outs.

Re: Classic display segment intermittent - cause?

*Message #3 Posted by **Mark Henderson** on 12 Feb 2010, 7:58 p.m.,*
in response to message #2 by Randy

Probably wishful thinking on my behalf, but I was wondering if this could be a bad solder joint or similar on the inductor?

Re: Classic display segment intermittent - cause?

*Message #4 Posted by **Mark Henderson** on 27 Feb 2010, 7:25 p.m.,*
in response to message #3 by Mark Henderson

Well I finally opened up my HP-70 and did a full restore. Sure enough, the intermittent segment behavior (above) was just a very obvious dry solder joint - fixed in 10 seconds! Now I have a very clean, 100% functional HP-70!! Used Novus plastic cleaners for the first time, and very impressed.

Calculator sale value-- will it persist?

*Message #1 Posted by **Michael Meyer** on 11 Feb 2010, 12:04 a.m.*

I certainly didn't begin collecting calculators for their financial value, and when they were less expensive years ago, I especially enjoyed repairing and restoring these wonderful antiques.

I can't help but notice that many of these machines are worth much more than I paid for them. Not bad, in the sense that the things I enjoy have appreciated in value much more than what many people collect... figurines, beanie babies, etc. (On the down side, it makes it harder to collect the models I'm missing.)

So, I was wondering. Do you think the value of these HP (and some other) calculators will continue to increase or will the value suddenly drop off when most of us who were alive when they were new...well, "drop off"?

Re: Calculator sale value-- will it persist?

*Message #2 Posted by **Walter B** on 11 Feb 2010, 2:46 a.m.,*
in response to message #1 by Michael Meyer

My guess is it will drop off at the time you stated. As you can see in this forum, many of us have fond memories to different vintage models. We were young when they were launched. We saw them in the shops, but couldn't afford them. We saved money for many months to be able to buy a model with a function set you get for 15 bucks today. So we really cared for our babies. And using, owning or collecting them today brings back those memories. These personal memories will die with us. No problem - the next generations will have their "babies" as the previous had.

Re: Calculator sale value-- will it persist?

*Message #3 Posted by **Thomas Radtke** on 11 Feb 2010, 10:41 a.m.,*
in response to message #1 by Michael Meyer

Calculators and computers have a serious problem unseen with earlier collector items: At some point, they will go bad and are hard if not impossible to repair. E.g., a dead woodstock is worth nothing but a few spare parts, and TAS prices reflect that. So, their value is limited in time.

Some calculators might survive generations of users enjoying them, and since classic HPs are really special in many respects, you'll probably always find people interested in *using* them.

From time to time, I look at the C64 and Amiga followings. There are quite active guys born in the 80th using and enjoying the 64!

My personal conclusion: An extraordinary piece of harware will always sell as long as it is working. The price just reflects the ratio of potential buyers to objects on sale. I can't see the number of potential buyers of classic HPs decreasing any time soon. If they are in use now, where computers are ubiquitous, there's no reason why people should gave up on them.

I have been told a few times by older Mech Engineers and Machinists "never trust a Engineer without a HP" and they are regarded by most as being the creme of the crop. Hence my interest in them since they seem to be respected by people who I look up to. However I am sure I am not the only young guy in a manufacturing field to hear these comments.

As I figure it the number of units out there will slowly drop as the number of people wanting them may go down the demand for the available HPs will go up.

Dimitri

*Message #5 Posted by **Martin Pinckney** on 11 Feb 2010, 11:13 a.m.,*
in response to message #1 by Michael Meyer

My take is that there will always be a relatively small group of hard core collectors who will be willing to pay big bucks for mint specimens, but eventually the value of all other vintage calculators will drop off at the time you suggested.

I can cite my experience with Nikon film cameras of a certain era. After the world finally went digital in a big way, these cameras and their lenses suddenly dropped to about 1/3 their previous value on eB**, excepting absolutely mint cameras and certain rare lens types.

Re: Calculator sale value-- will it persist?

*Message #10 Posted by **Juergen Keller** on 11 Feb 2010, 1:47 p.m.,*
in response to message #1 by Michael Meyer

When looking at another interesting device, the CURTA calculator, I didn't notice that prices collapsed. I guess many of the buyers are too young to have actively used CURTAs in their younger days; they just buy these calculators out of curiosity and admiration. Probably this is also true - at least partly - for HP calculators ...

Re: Calculator sale value-- will it persist?

*Message #11 Posted by **Michael Meyer** on 11 Feb 2010, 2:33 p.m.,*
in response to message #10 by Juergen Keller

Juergen-- you make an interesting observation. I think the value of cameras dropped because people were just then ceasing to use them. Now, the only value is to collectors, and that will sort out on its own, and to collectors, some models should slowly get more valuable, I suppose.

It's of interest to me because I don't plan to part with most of my calculators until I part from them... but will I out-live their value? Hopefully I have a few years to figure that out. But I don't think I'm any closer to getting rid of them.

I know that I've bought many calculators from people selling an estate, and they're often please to have them go to an "appreciative" home.

Re: Calculator sale value-- will it persist?

*Message #12 Posted by **DaveJ** on 11 Feb 2010, 6:12 p.m.,*
in response to message #1 by Michael Meyer

Fads for old gear like this usually start out with those who worshiped the gear when they were younger as we all know. But then I suspect it's common for those with a generic collector mentality in similar fields eventually grow to dominate. It's at this point the industry become a bit self perpetuating.

So I think it will be around a for a lot longer than we imagine, absent some external factor that brings fear or big change to the market and possible eventual collapse.

Dave.

Re: Calculator sale value-- will it persist?

*Message #13 Posted by **Michael Meyer** on 11 Feb 2010, 8:06 p.m.,*
in response to message #12 by DaveJ

Dave, that makes a lot of sense to me. I'm thinking about other kinds of antiques... cars, furniture, certain

books, etc. that continue to be collectible long after the original users are gone. Perhaps it just becomes widely known that they are of value and that maintains their value as an antique.

Part of me is glad that these calculators have gone up in value. Part of me is sad, because it makes it a very tough hobby for someone with limited resources who wants to enjoy these fine machines.

Re: Calculator sale value-- will it persist?

*Message #14 Posted by **tim m.** on 11 Feb 2010, 10:17 p.m.,*
in response to message #13 by Michael Meyer

I agree with the sentiment as well. I wasn't around when the Classics debuted; my interest stems from a general interest in antiques with a bit of bias for vintage electronics due to being an engineer.

HP41 MLDL2000 new version of M2kM

*Message #1 Posted by **Meindert Kuipers** on 10 Feb 2010, 3:35 p.m.*

Hello all,

I have just uploaded a new version of the MLDL2000 Manager M2kM to my website. Most important additional feature is the possibility to disassemble a ROM image to SKD41 syntax and format for editing and re-assembly with SDK41. I have also fixed some issues with Class 0 mnemonics.

Be aware that this is still BETA, and that I do need your feedback in case you discover any undesirable features.

Download is at my website.

Meindert

So I got the printed HP35 manual

*Message #1 Posted by **Dimitri Simitas** on 9 Feb 2010, 6:55 p.m.*

I asked and got one pretty quick, Friday after lunch and it came today with UPS.

Since there was talk about HP's spiral bound manuals used in the past. I thought you may be interest to know the value of the manual is apparently 1.88$ printed in China.

Which makes me wonder why HP choises to ship them on request. Time on a 800 number, the call takers wage, the UPS shipping, must add up unless really few ask for the manuals?

Dimitri

Re: So I got the printed HP35 manual

*Message #2 Posted by **Thomas Radtke** on 10 Feb 2010, 4:38 a.m.,*
in response to message #1 by Dimitri Simitas

You're talking about the 35s.

Time on a 800 number, the call takers wage, the UPS shipping, must add up unless really few ask for the manuals?
... which is probably the case.

The green argument doesn't count as long as the product ships in a plastic blister instead of a cardboard box.

Re: And how about the 50g!

*Message #3 Posted by **Maarten Ambaum (Reading, UK)** on 10 Feb 2010, 5:55 a.m.,*
in response to message #1 by Dimitri Simitas

Not bad. I just got a 50g and they still include a short paper manual with a more extensive manual on a CD. However, both these manuals are practically USELESS if you are interested in programming RPL, or want to use any of the more advanced features (USB connecting to a Mac, for example; how advanced is that?). Thankfully, there are many active users who have posted their own programs, manuals and tutorials - the short HPMuseum RPL tutorial is more informative than the corresponding chapter in the user manual. Perhaps HP should be straightforward about it and just provide a command reference (including system RPL) and refer to the web community for advanced manuals.

The 50g also came in a plastic shell which requires heavy machinery and protective clothing to open it (this time I am not joking!). It took me about 20 minutes, opening the shell trying not to damage the calculator. I have heard that they changed this ridiculous packaging for the new models. Does anyone have evidence of this?

They also packaged with it some el cheapo MP3 player. Do they really believe that more people will buy the calculator if they include some not asked for cheap gimmick? It hardly advertises this calculator as a "serious piece of kit". The marketing guys at HP really must go on a basic marketing course.

Re: And how about the 50g!

*Message #4 Posted by **Thomas Radtke** on 10 Feb 2010, 6:12 a.m.,*
in response to message #3 by Maarten Ambaum (Reading, UK)

They also packaged with it some el cheapo MP3 player.

Interesting. Should be at least an iPod Shuffle to reach the target audience (students). Otherwise, it is more distracting than attracting since you have to dispose ist somehow ;-).

Cheap Gimmick?

*Message #5 Posted by **Frank Boehm (Germany)** on 10 Feb 2010, 7:03 a.m.,*
in response to message #3 by Maarten Ambaum (Reading, UK)

I think MPEGLA etc. royalties are probably more expensive than a printed manual.
Nice set of priorities on HPs' side :)

Re: And how about the 50g!

Agreed. And perhaps more to the point? - The marketing guys are running the program rather than the product development guys?

Re: And how about the 50g!

*Message #7 Posted by **Egan Ford** on 10 Feb 2010, 3:54 p.m.,*
in response to message #3 by Maarten Ambaum (Reading, UK)

Perhpas you purchased the MP3 player and the 50g was the freebee. :-)

I know that you made the comment in jest, I'll still point out that even if your HPGCC binaries were 100k each (a big over estimate), a 1GB card will hold 10,000 of them. They load very quickly from SD, so to me, the large binary size is a non-issue on the 50g.

Re: 50g RPL programming manual (was: Re: And how about the 50g!)

> both these manuals are practically USELESS if you are interested in programming RPL

Yes, for some stupid reason HP do not include the necessary manual on CD. It is available on the website: HP 48gII and 50g Graphing Calculator Advanced User's Reference Manual (V2). It has only recently been updated to include references to the 50G, it used to only refer to the 48GII / 49G+ !!! This manual provides instruction and examples for RPL programming and a complete command and function reference.

Re: 50g RPL programming manual (was: Re: And how about the 50g!)

Thanks for that link!

Re: 50g RPL programming manual (was: Re: And how about the 50g!)

*Message #12 Posted by **Ed Look** on 11 Feb 2010, 2:33 p.m.,*
in response to message #11 by Walter B

I thank you, too.

I had been using the 50g and 49g+ on the basis of what I remember from the 48g/g+ and THEIR AUR, which was a pretty good manual, but I suspect there are things specific to the 49g+/50g series that not in there.

Re: 50g RPL programming manual (was: Re: And how about the 50g!)

*Message #13 Posted by **David Hayden** on 12 Feb 2010, 11:00 a.m.,*
in response to message #12 by Ed Look

Walter and Ed, note that the 49G Advanced User Reference PDF includes hyperlinks in the document while the 50G version does not. This makes the 49G version a lot easier to navigate through. I have both documents on my computer but I always go to the 49G manual first.

You probably know this already, but get HPUserEdit or Debug4x so you can develop your code on a PC. It's vastly easier than trying to develop and debug directly on the calculator.

Re: 50g RPL programming manual (was: Re: And how about the 50g!)

*Message #14 Posted by **Ed Look** on 12 Feb 2010, 9:19 p.m.,*
in response to message #13 by David Hayden

Actually, stepping through a program with the "SST" softkey isn't so bad if you can put up with a long program. I'm not good enough with RPL that I could print or display a program and spot what's wrong just by reading through it.

But you're right, HPUserEdit has been invaluable to me, even if more for converting 50g programs to 48g or vice versa. Next time I need to program any of the 50/49 or 48's I'll use HPUserEdit before I waste battery power tapping it out on the calcs.

As for hyperlinks, eh... I'm old-fashioned enough that they don't do much for me. I am sort of upset that for the 49g and 50g, the AUR really can only read onscreen (this is why I first reach for the 48G AUR).

HP-29C Behavior that is odd!

*Message #1 Posted by **Jeff Davis** on 7 Feb 2010, 11:18 a.m.*

I have a really nice HP-29C calculator and it was working 100%. I sold it on e-bay and shipped it to France where the buyer stated that the unit was intermitent. Once the unit was returned, true enough the unit would not turn on every time the on switch was toggled. The switch from the top side looks kind of dirty down inside. Could the switch just be dirty or bad? Please let me know your thoughts.

Suggestions for HP41C

*Message #1 Posted by **Dimitri Simitas** on 6 Feb 2010, 10:06 p.m.*

I was wondering what you would all consider a fair price for a good working HP-41C would be?

Also wondering the availability of the Machine Design, Stress Analysis pacs and the Mechanical Engineering, Physics and Fuild Dynamics Solution Books?

I'd be looking to acquire this over the course of my mechanical design program. So no real rush, I would be starting with the calculator though as the rest require it for use.

Thank you in advance.

Dimitri

Many "fair price" discussions are found in the forum archives. Eventually, a "fair price" for an object depends on the buyer and his/her desire to own said object.

> Quote:
>
> Also wondering the availability of the Machine Design, Stress Analysis pacs and the Mechanical Engineering, Physics and Fuild Dynamics Solution Books?

The pacs show up every once and a while on TAS. For the books, please find the answer here together with lots of other interesting information, saving you many bucks d:-). I strongly recommend this DVD if you're willing to read.

Thank you for the quick reply Walter. I've been watching Ebay so far, but I realize sometimes Ebay is not a clear indication of market value. Calculators are not like cars that have a "Blue Book" value making it easy to establish a base price and go from there.

Yes I know of the DVD, and it will be ordered shortly, just waiting on my paycheck. I hate running a balance on my credit card.

Dimitri

IMO, eB** is the *best* indicator of market value, with the proviso that the market is the worldwide universe of collectors and users who are "internet comfortable".

Of course there are many other markets, and eB** may indeed not be the best indicator for those markets.

Re: Suggestions for HP41C

> I don't know, Ebay makes prices increase in my mind due to the ease of access for the items.

Where buyer and seller can easily find each other, and can freely enter into a buy-sell agreement, and throw on top of that multiple transactions of similar items, to me that defines

market value.

Local markets may vary, however.

Re: Suggestions for HP41C

*Message #7 Posted by **Frido Bohn** on 8 Feb 2010, 3:24 p.m.,*
in response to message #1 by Dimitri Simitas

Hi Dimitri,

just finished to buy an HP41C via an e..y-auction. I was pretty lucky that the guy sold it as damaged, but it resulted to be in perfect condition. The seller obviously avoided to use the right kind of batteries and failed to test the 41 adequately.

The price for which I finally won the auction was 41.41 Euros - the only price for which an HP41 should be purchased - that is about $58.
I would estimate from my observations in the German area that the usual price for an 41C is about $150, for an 41CV about 200$, and for an 41CX about $350. All being in a fair mint condition.

Regards
Frido

Thank you for the reply, in Canadian dollars including shipping I got the HP-41CV for just under 200$ so I think I did good.

That is a pretty good deal for that calculator of yours!

Dimitri

Dear Dimitri: I am looking for an excellent Card Reader for my HP41CX; could you tell me, please, where can I buy it. I have more than 50 navigation programs and I can't charge into my HP41CX because the card reader is out of service. I live in Argentina, Buenos Aires. My email is amolinari@sgp.gov.ar or alfalima@fibertel.gov.ar.- Thank you in advance for your consideration.-

I have seen a few on Ebay the last little while however I do not have one myself yet.

If yours stopped working check Ebay there are repair services available.

Dimitri

Re: Suggestions for HP41C

*Message #11 Posted by **Frido Bohn** on 11 Feb 2010, 3:50 p.m.,*
in response to message #9 by Aldo Luis Molinari

Hola Aldo Luis!

I would strongly recommend to look for a repair of the card reader. Typically, the gear roller is worn down after so many years, and a "new" card reader could develop the same problems.
If you look at the Repair Instructions for the 82104A Card Reader, you may feel encouraged to do it for yourself.
I have done this for myself, and thereafter the device was fine as ever before.

Saludos
Frido

Feeling older

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 6 Feb 2010, 9:39 p.m.*

The Hi and Lois comic strip in today's paper has the son saying

> Quote:
>
> With these new phones you can surf the internet, make movies, play music ...

and the father replying

> Quote:
>
> It makes me feel old. I once thought it was amazing that my pocket calculator could tell time.

That illustrates why selling pocket calculators is not easy these days, and why selling retro versions will be even more difficult. What pocket calculators can do just isn't Gee-Whiz anymore.

Re: Feeling older

*Message #2 Posted by **Chuck** on 6 Feb 2010, 10:04 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

How very true. However, I still don't have a cell phone and doubt I ever will; and I'm not yet to my fifth decade. I still think there is a future calculator out there that will be Gee-wiz for me. And if it makes a phone call, well..... :)

Re: Feeling older

*Message #3 Posted by **Ed Look** on 8 Feb 2010, 1:52 a.m.,*
in response to message #2 by Chuck

I see college kids too often using their cell phones AS THEIR CALCULATORS... in science courses, no less.

Unfortunately, the cell phone calc programs generally are only glorified 4-bangers. My son informs me that his i-pod touch CAN download a scientific calculator, but he hasn't done it (nor, I guess, many of his friends). Of course, these same students don't seem to wear watches, neither. Yep, you guessed it- they use their cell phones. Don't they know that to tell time on a phone, you have to first pull it out of your pocket, pocketbook, backpack, briefcase, or whatever, but with a watch, all you have to do flip your wrist?... and they brag about being oh, so lazy...

... lazy??... I enable the clocks on my HP-48g's, 49g+, and 50g. The clocks really aren't all that accurate, but when you've had your nose stuck for a long time into the LCD screens, it's nice to be able to just

glance up at the upper right and see how long it's been, even if the time itself might be a few minutes off.

And why do I use these big bricks instead of the more pleasurable to use simple programmable scientifics (HP-33s, 35s)? I need to look at or use data often from a periodic table. I've got 'em on the walls, inside books (within arm's reach), or maybe even on the computer screen. But if I've got to do some calculations on the calculator with that information, I won't even have to shift my eyes- just a couple of the proper keypresses and I can call up the necessary information, enter it on the stack, and off I go. (And I complain about kids not using books anymore...)

I have done so for the past dozen years.

> Quote:
>
> Don't they know that to tell time on a phone, you have to first pull it out of your pocket,....

Exactly, where it's less liable to get scratched, bashed, fall off due to a broken strap, etc. I have a growing collection of old and functioning cell phones, but have lost at least 1 watch (my first - an LED - got it from my dad when I was in school), and irrepairably damaged a further 3. Now I just keep some for occasions.

> Quote:
>
> (And I complain about kids not using books anymore...)

I certainly can't be the one complaining, I use a computer for work all day, and instead of pulling out a book I often just google the info.

Just my 2p worth

Frontline (US PBS news show) last week aired "Digital Nation". One of the topics was how kids are learning differently because of the Net. Your statement *is* the status quo for many kids today.

Frontline is free to watch on pbs.org. If you have XBMC (Linux/XBOX), Boxee

(Windows/Mac/Linux), or Plex (Mac) then you can see it there too. Depending on the episode Frontline is free/fee on iTunes.

That's my personal experience as well. While I love books, and own many, many, many of them, I tend to resort to "my Google brain" first especially while seated at a computer (which is 85+% of the time at work).

And this has been my academic experience as well. I was an undergrad back in the late '80s, early '90s, and then completed an evening Master's program from '06-'08. When I wrote a research paper as an undergrad, it involved hours of meticulous research, searching terminals for possibly relevant articles, and painstaking evaluation of the article by digging up, looking through, and photocopying the physical publications. Writing a research paper now, the difference is completely striking: just go to google scholar and you can get dozens of candidate references in a heartbeat, and text searches within the content can confirm an article's relevancy in about 1/20th the time. As a result, my papers had more and better references, and needed less time to research; the process was entirely paperless and didn't require schlepping to the library and fighting for terminals.

I wouldn't describe this, however, as a learning process, but rather a research process, as researched material isn't necessarily learned. (And this applies for both my early and later experiences.) I may check out that episode to see how this impacts learning in general.

Take your son's iPod Touch, start up the Calculator, tip it on the side. It will turn into a scientific calculator. Your son will say "wow".

It happened with my son, who also told me he won't be downloading i41cx+ any time soon :) At least it knows it exists... Maybe he will go for it when I show him the printer which can email printouts.

That is because they spent 500$ on a cell phone, and can't afford a calculator. Both my cellphones have been gifts, both have always been in silence all mode and the current one is in my locker while I am on campus. Everyone keeps telling me I need to carry it on for "emergencies" funny how their idea of one so far doesn't match my idea of a real emergency.

Between a calculator and a cellphone, I would keep the calculator if I had to pick one. And I am only 22.

I realize you are probably joking, but you can find any number of simple scientifics - all algebra, of course :(- for less than $10 on sale.

I used to have half a dozen Casios, TIs, even an HP, handy when I taught physics and astronomy labs, so that whining students couldn't avoid doing the lab assignment by claiming "I don't have my calculator!" I just finally gave them all to the local high school science teacher.

Years ago in primary school kids learned basic math: add, subtract, multiply, divide, etc. and computers were learned and used by the college kids at the universities. Now it's reversed: they learn to use computers in primary school, and we have to teach basic math to our college kids. Sad.

Re: Feeling older

*Message #14 Posted by **Ed Look** on 10 Feb 2010, 12:09 a.m.,*
in response to message #13 by Chuck

You ever hear a bitter laugh?

I just did... from my own mouth, Chuck.

What you said is so sadly, pathetically true. Unfortunately, there's more evil that that: those kids who are using computers in primary school later become poor secondary school students and even worse college students, assuming they even get that far.

A student once told me she couldn't afford the required texts, all the while her earrings, necklaces, rings, and watch, all nice stuff, was dangling, jingling, and twinkling as she spoke. So, I gave one earring a gentle flick of the finger. She responded, "Oh, my boyfriend gave me these." I replied, "Next time he comes around, tell him you want textbooks!" No response came from her on that.

Incidentally, these same primary level pupils are also using calculators- FOR BASIC ARITHMETIC!! No wonder they can't do math anymore.

Re: Feeling older

*Message #15 Posted by **Norman Dziedzic** on 10 Feb 2010, 8:33 a.m.,*
in response to message #14 by Ed Look

I think some teachers are getting the message. My 3rd grader's teacher is doing basic drills like I remember doing. Sadly this is not part of the regular curriculum.

My 5th grader is in an advanced math class and while a calculator was required on the list of supplies (TI 30XA basic scientific), he said they rarely use it.

The tests that are written well do not require calculators.

Re: Feeling older

*Message #16 Posted by **Michael Plant** on 10 Feb 2010, 9:08 a.m.,*
in response to message #15 by Norman Dziedzic

This is an issue here (BC, Canada), as well. Calculators are now required in grade seven and graphing calculators in grade 11 (although the graphing calculators are not allowed on any tests).

When I was a student, we were never required to own a calculator and were not allowed to use them in class until grade nine. I can't for the life of me understand why students "must" buy or rent from the school a $150 calculator to learn math that many of my classmates did without a calculator at all 25 years ago. I imagine the argument must be something like the students in grade 11 are taught how to use the calculator to prepare them for physics 11 and 12, calculus 11 and 12 and math 12.

I think that the reality is that the education boards across North America have been seduced by getting on for 20 years of successful TI marketing. It doesn't hurt that textbooks include instructions on how to accomplish many tasks using a TI-83 Plus, either.

Is anyone familiar with the undergraduate level chemistry text, Experiments in Physical Chemistry by Shoemaker and Garland and another person depending on edition?

When I first got it for *COLLEGE*, the third guy was Steinfeld, and there was a page on programming a... get this... HP-45 to a least squares fitting of your data! Now, there were no more HP-45's (except as "vintage" among collectors, I suppose) sold by the time I got to college, and the page looked like it was lifted by the authors from an earlier edition of their own book.

Alas, I looked in later editions and the page was replaced by a larger and more in-depth section on using spreadsheets (although Quattro Pro and Lotus 1-2-3 was included, despite the [relative??] unavailability of these two programs) and mathematics programs like Mathematica, Maple, etc. And in later editions, the chapter on programming mainframes for chemical calculations appear to be gone, too. I guess, why bother if you have access to Mathcad or Gaussian on a PC?

And, it seems to me that programming as we know it... ahem, as *I* know it... might be brushed aside by the likes of LabVIEW. The GUI takes over the universe, with his henchmen the mouseclick and drag'n'drop!!! To books... or, er, was that, arms?... old folks! We are under siege!

*Message #18 Posted by **Don Shepherd** on 10 Feb 2010, 9:54 p.m.,*
in response to message #17 by Ed Look

We are fond of reminiscing about the "good old days," but in some ways the good old days weren't so good. Yes, overnight turnaround of your punch card jobs meant that you tended to "desk check" your program first (and I'm sure that went away decades ago), but 5 second turnaround sure beats 12 hour turnaround. Are the C++ programs being written today orders of magnitude better or worse than the old FORTRAN programs we wrote 30-40 years ago?

Probably not. Do programmers today have that "magical" feeling that we had when we implemented a neat algorithm or found a new way of doing something in code? Probably not. The industry has changed drastically, but then again, what hasn't? It's the natural order of things. Luckily, we still have our vintage machines to play around with, because HP built them to last. I'm thankful for that.

I'm more concerned about the fundamental change in human interaction these days. Walk around a college campus and you will find that maybe 90% of the students you encounter are either talking on their cell phone or engrossed in whatever is coming out of their i-whatever. You used to be able to walk around and say "hi" to people; they don't even hear you anymore. I think that bodes bad for the future. But, I don't know, every generation has survived since we've been tracking these things, and I'm sure this one will too.

As a professional programmer for the past 25 years, I thought I'd comment.

> Quote:
>
> Are the C++ programs being written today orders of magnitude better or worse than the old FORTRAN programs we wrote 30-40 years ago? Probably not.

Much of the code is orders of magnitude slower, but this hidden because the hardware is more orders of magnitude faster. Studies have shown that the number of bugs per thousand lines of code is relatively constant, so the higher level languages, where you can get more done with few lines, tend to have fewer bugs for the same amount of functionality. The people who design software languages and tools are slowly starting to realize that they need to think about security and bug prevention, not just functionality. I'm honestly amazed that people put up with the poor quality of software that we deliver.

> Quote:
>

Don, I could not agree more! With the exception of some embedded design. (how few even code directly in machine language any more?) there are few left who experience that euphoria. Once felt, it's hard to go back to sloppy code. Then again, the world no longer has to get to the moon and back on 32,000 bits of RAM. We no longer have to, and likely not go back so soon because of it!

Don,

Fully agree on you with regards to 'the good old days'. And I'm pretty sure that our parents who were brought up only on paper and pencil and - maybe - a slide ruler - also thought why the heck do kids need calculators in grade nine, we didn't need them, now, did we?

On the social side thought I'd like to throw things I heard/read from researches in 'generational culture and value' that is quite interesting. It would indicate that why baby boomers and generation x was a lot about 'I' millenium kids and later are much more a 'we' generation. Some say they are actually socially far more connected than we ever were - just not in person, but via facebook, twitter, sms, etc. Now, we might say, that this is not the same, but then thats the same as the people back in eary 20th century said that no-one needs a car or a phone - you can just walk or ride there or write a letter. And I'm pretty sure that our parents did'nt quite understand at all why anyone would ever need a computer or a cell-phone. I think one can go back quite a while and see how the advent of new technologies has changed how people interact with each other in in general conduct their lives. And I'm also pretty sure that for many generations, parents bemoaned the fact that 'the good old days' are gone. The one thing that I do believe is changing, is the cycle time of new technologies. It took I think some 30 years or more to have 25% of the US population with TV. But only 7 to get a cell-phone. However 'a generation' of human life is still round-about 30 years. So relative to our life-span, the impact of technology in how we live our life as drastically increased - we have n-times more change in technology per unit of life (say a decade) today than we had 50 years ago. Which, btw, all boils down to the exponential impact of Moores law and its derivatives. If you like looking at charts for this, Ray Kurzweil and his books and presentations (can be found via Google :-)) have plenty of hard data for this.

Cheers

Peter

David and Allen and Peter, all well said! Thanks.

My current thrill is re-purposing my 12c+, with Katie's help. Katie re-purposed it to be a base 12 machine, and I took her code and modified it to create a base 16 machine that does arithmetic in base 16, complete with a display of the hex letters, ala 16c. You've never seen this on a 12c before!

Re: Feeling older

*Message #24 Posted by **Walter B** on 11 Feb 2010, 8:34 a.m.,*
in response to message #23 by Don Shepherd

Hi Don,

great to see this! Looks like another repurposing project. For sure you reassigned some keys of this calc allowing you to reach this display. Any details available?

Re: Feeling older

*Message #25 Posted by **Don Shepherd** on 11 Feb 2010, 12:40 p.m.,*
in response to message #24 by Walter B

Walter, here is the C++ code from Katie that I modified to get the hex characters on the 12c+. Cyrille has already defined the lcd segment pattern for several letters in one of the other files in the development environment. My 12c+ will now do hex arithmetic, using the TVM keys and CHS as ABCDEF. Unfortunately, it won't do anything else! But, hey, this is way cool.

I have learned that repurposing is not easy. It took installation of an older SDK from IAR and about 150 emails (exaggerating only slightly) and several phone conversations with Katie to get this little thing to work. If you already know C++, it will help. But this is a good way to learn it!

Hello,

I am familiar with it, and I keep a copy, given to me by a friend back in university days.

Mine is Shoemaker and Garland only, and includes methods to check computations using,IIRC, the rule of 9's; there was also advise on keeping significant figures, tracking the decimal point on a slide rule. The section ended with notes on using HP precision timers. An old edition, it seems. Last but not least, another section detailed guidelines on report contents and style, which are still useful to me.

We do not check calculations anymore, and too often I find young engineers who are unable to keep significant figures or make reasonable guesses. Computing power has become too cheap, too accessible, and too many people take it for granted.

Juan, I am of the calculator generation; my high school class was the first in my high school allowed to use calcs for exams.

An older colleague is of the slide rule generation (though he claims he first did math with chisel and stone tablet) and he can make quick estimates before people my age can finish it in our heads, and before those even younger can get started figuring what the problem was, and I'm not joking.

I will say that misuse of the calculator, particularly in secondary and earlier educational levels have ruined the ability for the present generation to quickly size up things mathematically... in general. I'm sure (hope??) there are exceptions.

Re: Feeling older

*Message #28 Posted by **Juan J** on 13 Feb 2010, 8:37 p.m.,*

Hello Ed,

Although I am a late comer of sorts, I belong to the calculator generation as well.

Loke you, I have met people able to figure out estimates before I can finish calculations in my head. It never ocurred to me that it would become even worse. But it has.

A calculator is but your brain's extension, nothing else. It deals with the repetitive stuff out for you, allowing you to work smarter. Sadly, this is misinterpreted today and a calculator is deemed as a black box that thinks and provides answers.

I never used a chisel and a stone tablet but I did do a lot of pencil and paper arithmetic in high school in the mid 1940's. We were expected to multiply six to eight digit numbers and get the exact answers. Now, that was dogwork, but it did eestablish an ability to do arithmetic accurately. I was in a small school with only 55 in my graduatiing class. I didn't take trigonometry or solid geometry in high school because the school had a minimum class size of ten and that was hard to meet. When

I was a junior some seniors came up with the idea to let some of the better juniors double up in math by taking advanced algebra and trigonomtry in the same year as a way to get enough trigonometry students. But we still could only get nine.

After Sputnik there was a push to get more mathematics in the lower grades but some of the effort was not well done. My wife was teaching fifth graqd in an Ohio school system in 1966-67. The system provided some assistance with the idea of estimation. My wife came home totally frustrated because in trying to encourage the students the instructor called every estimate a "good" estimate, where "good" apparently meant as good as the partiular student could manage.

Palmer- And as we can see now even in the news, this problem is now out of control. Some entire school systems have toyed with not grading or flunking kids for fear of wounding their self-esteem. Do you deserve self-esteem if you can't divide... by hand?

To use your intellect is the most human, most basically human of things. If you do not develop your mind, and mathematics is only a small part of that, then that much of your personhood is stunted.

Feeling good does not necessarily contribute to this.

I hope someday soon this can be changed. It seems, too, that necessity is not necessarily the mother of invention...

Juan- I tell students to try to NOT just consider devices, especially convenient ones, as merely black boxes that do their magic and one doesn't have to understand, but that to be truly educated, whatever their major, they should at least have some somewhat more than rudimentary understanding of how things might work.

Consider computers on science fiction shows, or analytical instrumentation on a police show. Generally, someone punches in some data, or nowadays, scans it in, and then way before the next commercial break, the machine spits out the very useful and cool results. Most people seem to treat their things that way. What do most users know about their cell phones, televisions, computers, or what do most students know about their calculators? And if one day it stops connecting you to your friend in another city, stops bringing you your favorite show, stops getting you to your online game, or spitting out the answer to the test question, what do you do? Granted most of today's devices cannot truly be repaired from home, this attitude denies one of even the slightest chance of being able to something for oneself.

Everyone- I suppose this is one reason why I like scientific programmable or even graphing calculators; they are small and light enough to hold in my hand, bring anywhere, and programming them reduces some of that impenetrable black box quality I might have attributed to them. I'm not really any kind of true programmer, but maybe this is why I like programming (I hate debugging, but that's another matter).

Pay no attention to that man behind the curtain.

I don't believe that it was so good years ago. At the University of Minnesota in 1949 I was asked to help tutor a student in physics. I agreed only to find out that she was enrolled in "Physics without Mathematics". How does one study physics without mathematics? One teaches at the elementary general science level; i.e., hot air rises, water runs down hill, etc.

When I was in Navy OCS in 1953 I was asked to help a college graduate with celestial navigation. We weren't studying the basics but rather were learning to make the appropriate measurements with a sextant and obtain the solution using tables and working our way through a printed form. I managed to get the student to solve some of the early textbook problems. Then we had a problem in which interpolation between the entries in the tables was required and the student exclaimed "I've never been able to do fractions."

I believe that too many students continue to be moved through the education system without learning to master even basic arithmetic and the presence of calculators in the elementary and high school classrooms doesn't materially affect that situation one way or another. It may serve to help them balance their checkbooks. I also believe that the presence of calculators is appropriate and helpful in the advanced classes taken by students planning to study engineering and the sciences in college, just as it was useful and appropriate for them to use slide rules in earlier days.

> Palmer, given the year you cited, I find the story about the college grad and his issues with fractions not so easy to believe!

I suspect that I should have continued the story to explain that I found that the individual could do the simple fractions associated with interpolation but struggled with more complicated fractional expressions; for example something such as 4/15 - 1/7 . But even though he could do the simple

fractions he still struggled with the very concept of interpolation.

At the time I didn't find the situation "not so easy to believe" because of an earlier incident as a teaching assistant at the University of Minnesota in 1951. I found that a trigonometry student (actually two of them from the same high school) seemed to understand trigonometric concepts but couldn't get the correct answers to the problems which involved using the log and log-trig tables. His problem was that he couldn't do the addition and subtraction with any consistency.

There is a a lot of material in this forum which I find "not so easy to believe". Examples: inability to agree on the value of -3^2; inability to cope with parentheses; inability to cope with an ENTER key of a different shape or in a different position; and on and on.

A different example is the story of the Spitfires which didn't reach Malta which appeared in the earlier thread on Metric versus U.S. I had been a bit of a buff about WW II aircraft and something about the story made me uneasy. Some research showed me that the aircraft involved were probably Hawker Hurricanes rather than Supermarine Spitfires.

These are great!

Oh, that damned unary minus thing. I have a teacher in my child's school who insists that subtraction is not the same as a negative number and insists on writing them differently. Ugh! (That is what I have always detested about the 32sii and its progeny the 33s & 35s. There is nothing useful or even consistent about the "high" minus sign and the "subtraction"--or whatever they call them--in these machines. We can't always worship every HP product or every part of one...)

I know an intelligent little girl, who is now a college student, who years back in junior high/high school argued with her mother over a math problem. Her mother, graduated with a degree in mathematical physics major at a very distinguished university, happened to notice an incorrect approach to a problem. She tried to explain the correct method to her daughter, who essentially just folded her arms and declared that this was what the teacher showed her and that the teacher must be right and knows more than her mother.

Believe it or not, the mother lost the "argument".

Easy to believe

>
> Believe it or not, the mother lost the "argument".

Now that's a story that is really easy to believe, and from two points of view.

First, "a graduate with a degree in mathematical physics major at a very distinguished university" is likely to be a pedant, particularly when dealing with individuals that she perceives as being her inferiors, and she is also highly likely to even understand that she is a pedant. See the Big Bang show on Monday nights on CBS.

Second, the daughter was hardly the first child in all of history to challenge parental authority.

Well not surprising kids believing the teacher. I always questioned my teachers. I hope to raise my kids the same way.

I don't have a 33s or 35s handy at the moment, but on the 32sii I only see the difference in the exponent and in program mode when you enter a negative number. I like the high "-" sign in the exponent I think that's easier to read. In program mode, it's extremely rare to need a negative number and small integers are much more memory efficient if entered as [##] [+/-].

Re: Not so easy to believe

*Message #40 Posted by **bill platt** on 12 Feb 2010, 11:12 a.m.,*
in response to message #39 by Katie Wasserman

Hi Katie:

The dumb part appears in the equation editor. In fact, the 32sii formally invokes a "unary minus" which takes precedence over exponentiation. However there is a bug with it and it doesn't work correctly when the unary minus is the leading digit (or something like that--I think Craig Finseth has it well-described).

see http://h10032.www1.hp.com/ctg/Manual/bpia5305.pdf page 104

compare to http://h10032.www1.hp.com/ctg/Manual/c00059731.pdf page 106--one good thing about the 33s is that they got rid of the unary minus precedence. But they kept the confusing idea of minus sign being different from subtraction.

In one or both of these models, hitting +/- is supposed to invoke the "high minus" but it isn't consistent--and the LCD is partially to blame: the initial position doesn't have the same pixels as the rest of the screen.

Ah yes, the very funky equation editor. I never really liked the idea of having an algebraic equation solver on an RPN calculator anyway. The 42s implemented the solver the "right" way.

-Katie

Re: Not so easy to believe

*Message #42 Posted by **bill platt** on 12 Feb 2010, 12:24 p.m.,*
in response to message #41 by Katie Wasserman

...and the 27s implemented the solver the right "other" way.

27s sign handling is simple and effective. So is 48 series, though slightly different (the parsing from command line is slightly different):

```
48G:  type: '48---6' and <ENTER>
parsed to line 1: '48-6'
27s command line: type: 48---  and when you type the third minus,
it
 reverts to a single minus (it toggles)
27s solver: type: A=48---6xL
it stays that way--the signs negate out and solve correctly.

48G:  type '48-6 and then use +/- to toggle the sign of |6|
27s command line: type: 48-6 and use +/- to toggle a single or
double
 minus ahead of |6|
27s solver: +/- key is invalid. {as it should be!}
```

Best regards, Bill

Re: Not so easy to believe

*Message #43 Posted by **Thomas Okken** on 15 Feb 2010, 10:38 p.m.,*
in response to message #34 by bill platt

> Quote:
>
> Oh, that damned unary minus thing.

Unfortunately, I can't provide any references, but I seem to remember that every single book on programming and compiler design I read when I was a kid unanimously stated that unary minus had higher precedence than everything else, and even as a 14-year old I couldn't help noticing that *mathematics* textbooks did not follow that convention, e.g.

$$\ln(1+x) = \sum_{n=1}^{\infty} (-1)^{n+1} \frac{x^n}{n} \text{ for } -1 < x \leq 1$$

I've never seen a math textbook that omitted the parentheses around the -1 in formulae like that. I suspect some compiler pioneer once created a parser that had the bogus unary minus implementation, probably based on the idea that the minus is part of the number, and hordes of parser and textbook writers since then simply copied that mistake.

*Message #44 Posted by **bill platt** on 16 Feb 2010, 10:57 a.m.,*
in response to message #43 by Thomas Okken

Hi Thomas,

That's it! It makes sense!

I've wondered this forever--how on earth did the calculator design get all flubbed up with unary minus? It looks like you've found the One Little "Bug" that refuses to die.

Maybe that first compiler writer hated parenthesis. Uh-oh I better not go there...;-)

It's funny you should mention the maths textbook thing, because the last time this unary minus ended up being discussed here in a very long thread (with some defending the unary minus and others opposing) I went and pulled all my maths books down, all the way back to the algebra books and found just what you did: to a man, all the mathematicians put a parenthesis if they want that sign to have precedence. In fact it wasn't even discussed as such. Why should it be: of course powers have precedence over subtraction: powers are repetitive multiplication as in a^3 = a*a*a and so -a^3 is -(a*a*a)because of that fundamental law of algebra etc...

> Actually it was a French war correspondent, Bernard Fall, who pointed out the facts to me in his book, "hell in a very small place"

Is a French war correspondent a good source for "facts" about the effects of what happened at Dien Bien Phu? At the time the Chinese Communists had been fought to a standstill in Korea and the British were winning the battle in Malaysia. The fall of Dien Bien Phu was considered to be the result of a poor choice of a battleground based on a bad estimate of the enemy's capabilities. Some analysts consider the loss at Dien Bien Phu to signal the end of French influence as an effective fighting force. Encyclopedia Britannica offers the following

> Quote:
>
> ... In the spirit of the Truman Doctrine the United States had been pouring in aid for the anti-Communist cause, and in the end was largely financing the war while French, colonial. and French-led Indochinese troops did the fighting. There were many

> promises by the French commanders that the war could be won; but the situation became progressively more hopeless until, with the fall of the fortress at Dien Bien Phu in May 1954, it was irretrievable.
>
> ---
>
> where I admit that the phrase "many promises by the French commanders that the war could be won" sounds a lot like what happened to us later.

32s won't power on

*Message #1 Posted by **Dave Britten** on 6 Feb 2010, 6:05 p.m.*

I've just acquired a 32s that looks to be in great condition, with the small problem that it won't turn on. The keyboard seems to be in good shape, and I tried the standard first approach of pressing on the bezel beneath the screen. I opened it up to check the circuit board, and there aren't any cracks, which isn't surprising, given the unit doesn't bear any nasty dents or other signs of abuse.

The strange thing is when I put in the batteries, the LCD appears to receive power continuously, as there's the faint "glow" of the pixels which can be seen in an LCD that is powered, but blank.

Are these symptoms indicative of any common ailments in a Pioneer?

Re: 32s won't power on

*Message #2 Posted by **Allen** on 6 Feb 2010, 7:25 p.m.,*
in response to message #1 by Dave Britten

I had a 17bii with the same problem. The best I could determine was the CPU was not seeing the XTAL clock, and was not properly executing the boot-loader.

I've also seen the contrast set all the way down so the screen only appeared to be broken. For the pioneers with a BEEP function, you can test this by resetting and pressing [0] [/] to see if the screen is broken but not the CPU. For the others, it requires measuring the current.

I do hope you get it working.

Re: 32s won't power on

*Message #3 Posted by **Dave Britten** on 6 Feb 2010, 8:45 p.m.,*
in response to message #2 by Allen

Hmm, I don't see anything resembling a crystal on this 32s board. Odd. The only component besides the CPU is a fairly substantial beige item marked "226 10K". A resistor of some sort? It measures a lot higher than 10K Ohms - more like 16 Mega Ohms. Though if I reverse the polarity on the meter, it reads about 30 Mega Ohms.

Maybe I'll try to dig up a small magnifying lens and examine the wiring to the CPU.

Re: 32s won't power on

*Message #4 Posted by **Norman Dziedzic** on 6 Feb 2010, 7:26 p.m.,*
in response to message #1 by Dave Britten

You might try this: http://www.fixthatcalc.com/try.php

Or, perhaps, the contrast is set so low that you cannot see it? To adjust that, hold on key and press + or - to try

to adjust the contrast.

Re: 32s won't power on

*Message #5 Posted by **Ingo Paschke** on 8 Feb 2010, 5:28 a.m.,*
in response to message #1 by Dave Britten

I have a 17 BII I bought on eBay as working that showed the same symptoms. I also disassembled it and nearly gave up on it. It turned out that a stuck key was the cause. I smacked it against my flat palm, and it's been flawless ever since.

Re: 32s won't power on

*Message #6 Posted by **Dave Britten** on 8 Feb 2010, 12:12 p.m.,*
in response to message #5 by Ingo Paschke

You know what, the 1 key DOES feel like it has no spring to it, and may be stuck... Hmm... I'll give this a try later when I'm home from work.

Re: 32s won't power on

*Message #7 Posted by **Dave Britten** on 8 Feb 2010, 5:37 p.m.,*
in response to message #5 by Ingo Paschke

Yup! It's definitely a stuck key problem! I undid the three metal twist connectors that hold the board against the keyboard ribbon cable as a quick way to disconnect all the keys with a little prying force, and I saw a bunch of 1s on the screen (along with a lot of weird flickering, since I was also loosening the lower zebra stripes on the LCD).

Now, the followup question: how to unstick a key on a Pioneer? I'll try the palm slap a few times, but assuming that doesn't work, should I attempt to drill the metal backing with a very thin bit and push the key outward with a toothpick? I don't fancy taking my chances with the 50 or so heat stakes that hold the keyboard in place.

Re: 32s won't power on

*Message #8 Posted by **Dave Britten** on 9 Feb 2010, 11:23 a.m.,*
in response to message #5 by Ingo Paschke

Well, good news, it's working beautifully now. I used up all the least invasive options for popping the stuck key, so I had to suck it up and pop the heat stakes. Fortunately the design of the Pioneers is such that the heat stakes aren't responsible for the pressure fit against the keyboard ribbon cable and LCD connectors (unlike the 28S, which is practically ruined as soon as you open it).

Somehow, the plastic dome under the 1 key was staying down when pressed, and not springing back up, though it could be pushed back up manually. I was about five minutes away from transplanting the keyboard mechanism from a 10B, when I figured I'd try experimenting a bit. I took my pocket knife, and made a tiny vertical incision radially at the lower edge of the plastic dome. It was just enough to reduce the tension holding the dome in its depressed state, and now it pops back up on its own like it should! The 1 key is a bit softer than the rest of the keyboard now, and makes a faint popping sound when pressed, but it actuates perfectly, with no bounce, and no hesitation. And best of all, no sticking.

To put the whole mess back together, since the heat stakes weren't available to provide rigidity to the keyboard anymore, I packed the case with a few rows of weather stripping to hold the keyboard plate against the front of the case. It's doing an admirable job of holding the keyboard in place, though I don't

doubt there's a better way to do it.

So there you have it, another 32S rescued. And I almost found a use for my 10B, too. ;)

Re: 32s won't power on

*Message #9 Posted by **Ingo Paschke** on 9 Feb 2010, 3:10 p.m.,*
in response to message #8 by Dave Britten

Congratulations! And thanks for the interesting description of your repair.

I'm glad I could solve my keyboard-problem without taking the keyboard apart. For me, it was hard enough to open the case without causing too much damage :-).

Re: 32s won't power on

*Message #10 Posted by **Dave Britten** on 9 Feb 2010, 4:32 p.m.,*
in response to message #9 by Ingo Paschke

Yeah, the case was rather tough to open, but not nearly as difficult as a 48, and certainly not as destructive as a 28. The keyboard plate wasn't very hard to remove either, just time consuming, what with all the heat stakes.

Maybe if I can score another similarly damaged unit, I'll attempt some photos of the repair process. Might be a nice way to get a super cheap 42S...

HP29C strange behavior

*Message #1 Posted by **Alberto Fenini** on 5 Feb 2010, 6:31 p.m.*

Hi everybody
I have just received two HP29C, and one seems to have some life in it
I'm powering the unit with an external battery pack
as the unit is switched on, the **Error**message appears

it blinks once, and then ANY key pressed produces the following output

Switching to program mode is working

but then again, pressing any key (in prgm mode) will produce the following output

Further pressing will increase the program line counter, but the rest of the display shows what you see in the picture
Has ever happend to someone else ?
Thanks in advance for help, and have everyone a nice weekend, Alberto

Re: HP29C strange behavior

*Message #2 Posted by **Joel Setton (France)** on 6 Feb 2010, 8:49 a.m.,*
in response to message #1 by Alberto Fenini

Hi Alberto,

The cause could be one shorted key in the keyboard. Did you try swapping the keyboard between your two units? Or with another Woodstock?

IHTH!

Joel Setton

Re: HP29C strange behavior

*Message #3 Posted by **Alberto Fenini** on 9 Feb 2010, 3:51 p.m.,*
in response to message #2 by Joel Setton (France)

Thank you very much for your suggestion, actually I had already tried, and with the other keyboard the unit doesn't even power on. I may have a HP25 spare keyboard, but I believe pinout is different, I'll keep you posted, take care Alberto

Re: HP29C strange behavior

*Message #4 Posted by **Randy** on 9 Feb 2010, 5:41 p.m.,*
in response to message #3 by Alberto Fenini

The cause is most likely a bad ACT or ROM. The only way to troubleshoot is to replace all the chips one at a time with known good parts, starting with the ACT.

FWIW, all Woodstock keyboards are the same pinout. The only difference is the 27 which lacks the second toggle switch. So, putting a 27 keyboard on a 29C logic board would work but it would be stuck in prgm mode.

Re: HP29C strange behavior

*Message #5 Posted by **Eric Smith** on 11 Feb 2010, 4:13 p.m.,*
in response to message #4 by Randy

Oddly enough, the HP-21 wires the keyboard columns differently than the other Woodstock models, but this is done on the logic board, and the keyboard is, as you say, identical.

This was a bit of a surprise when I first was trying to get the HP-21 working in Nonpareil.

Re: HP29C strange behavior

*Message #6 Posted by **Eric Smith** on 11 Feb 2010, 4:24 p.m.,*
in response to message #1 by Alberto Fenini

The code you are seeing in program mode is an illegal program step with the hex code FF. This suggests to me that probably one of the RAM chips has gone bad.

Chip failures in Woodstock series calculators are often the result of having the external power adapter plugged in with no battery pack installed, a bad battery pack, or the pack making poor/no electrical contact for mechanical reasons or due to contact corrosion.

Re: HP29C strange behavior

*Message #7 Posted by **Alberto Fenini** on 12 Feb 2010, 5:17 p.m.,*
in response to message #6 by Eric Smith

That's also my guess, since the previous owner has admitted that he has tested the unit powering it without the battery pack (that was dead anyway) installed. The second unit is behaving like this :

the models have close serial numbers, the interior if the model that has a fixed number on the display is :

while the interior of the unit with the "random zeroes" is like this :

really I wouldn't know what to take from one unit to transplant to the other ... thanks in advance for any suggestion ! take care and have a great weekend, Alberto

Re: HP29C strange behavior

*Message #8 Posted by **Eric Smith** on 13 Feb 2010, 4:21 a.m.,*
in response to message #7 by Alberto Fenini

The RAM chips are the 16-pin ceramic-packaged ICs. I'm not completely convinced that I would transplant anything, given the both units act like they have bad chips. :-(

Re: HP29C strange behavior - IT WORKS !

*Message #9 Posted by **Alberto Fenini** on 14 Feb 2010, 8:42 a.m.,*
in response to message #8 by Eric Smith

Thanks for the suggestion, I have cleaned both mother boards, and transplanted the "violet" chips onto the motherboard hosting the "withe chips". This unit is now fully working, and it retains data too ! The other seems dead ... I'll keep working on this in the next days. Take care and have a nice weekend Alberto

*Message #12 Posted by **Alberto Fenini** on 15 Feb 2010, 8:02 a.m.,*
in response to message #11 by Eric Smith

Thank you guys, that now brings me back to the other one. I'll load some pics later today. The unit now working is the one that originally had the "white" chips. When turned on, showed always the some number. Since this is the older, I started reworking on the other one, the one that showed some highlighted zeroes on the display. Took away all the chips, the powersupply board, cleaned throughly in and out and polished to get the board to shine conditions. (well, you'll see the pics). To my surprise, when I have resoldered all the components, except the ram chips which I have installed on the other unit, this was not even turning on anymore. My guess is that the powerunit, has some bad contacts. Differently fomr the other, which has the power-involved-components directly mounted on the board, this has the components soldered on a mini board which is then connected to the mainboard. Since the machine was showing something before, I'd like to bring it back at least to that condition and then start some investigation. Does anyone has ever tried to feed power to the machine bypassing those components ? Take care Alberto

Re: HP29C strange behavior - IT WORKS !

*Message #13 Posted by **Eric Smith** on 15 Feb 2010, 8:16 p.m.,*
in response to message #12 by Alberto Fenini

What part number do your calculators have for the ROM/anode driver? That's the 18-pin chip under the display. I expect they would be 1818-0378 or 1818-0431. I've been trying to get a 1818-0378 (or any other than the 1818-0431) to dump the ROM.

Re: HP29C strange behavior - IT WORKS !

*Message #14 Posted by **Michael Meyer** on 15 Feb 2010, 10:23 p.m.,*

in response to message #13 by Eric Smith

Eric-- I have one with an 0432, but it's clearly a replacement on a dead board. Does that even make sense? Do you want it?

Re: HP29C strange behavior - IT WORKS !

*Message #15 Posted by **Eric Smith** on 16 Feb 2010, 12:30 a.m.,*
in response to message #14 by Michael Meyer

Unless I've gotten my part numbers confused, the 1818-0432 is the ROM/anode driver for a 19C, and if one was installed by mistake in a 29C, that would certainly keep the 29C from working.

I don't specifically need a broken 29C, but in general I am interested in getting broken units of any pre-Saturn models to have extra parts for reverse-engineering purposes.

Mysterious HP-19C power-on behavior-- solved with interesting cause.

*Message #1 Posted by **Michael Meyer** on 5 Feb 2010, 10:47 a.m.*

Well, I got back to my two 19C's with problems powering on after sitting for a few days. They would both power on with a regulated supply, but not with battery packs. I soldered a "c" shaped wire over the battery contacts with no luck. Couldn't figure it out-- very frustrating.

Both battery packs-- rebuilt with brand new Energizer Ultimate Lithium batteries... show full voltage.

When I switched to NiMH batteries, both calculators work fine. I haven't had time to investigate further, but I'm guessing that they may have changed the formulation of the batteries or that I got a bad batch... they seemed to work fine in all of my other calculators and have historically had enough amperage!!

Any thoughts? When Energizer came out with "Advanced Lithium" (Cheaper), did they change the "Ultimate Lithium" formulation?

Re: Mysterious HP-19C power-on behavior-- solved with interesting cause.

*Message #2 Posted by **Michael de Estrada** on 5 Feb 2010, 11:05 a.m.,*
in response to message #1 by Michael Meyer

Yes, cheap batteries can be a problem. Not just lithium, but also NiCad and even alkaline. Case in point, I have a digital camera that works off both rechargeable or disposable AA batteries. I have been using name brand alkaline AA's, but replaced them with some cheap store brand batteries that would not work at all, even though they all checked out fine with a voltmeter. I tested different cells from the lot, but none of them would work. As soon as I returned to some name brand cells, the camera worked fine. Not being any sort of battery expert, I'm not sure what the problem was, but in any case your situation is very credible.

Re: Mysterious HP-19C power-on behavior-- solved with interesting cause.

*Message #3 Posted by **Katie Wasserman** on 5 Feb 2010, 11:15 a.m.,*
in response to message #1 by Michael Meyer

I run one of my 19C calculators on Energizer lithium cells too with no problems. However I have seen problems with the cells themselves at times. The "button" on the end of the cell is often a bit shorter than the ones on alkaline cells and sometimes the rim of the cell makes contact with the spring (or whatever) in the battery case instead of the button. The effect of this is to have an open in the batter pack, a bypassed cell or, worst case, a shorted cell that can get dangerously hot.

-Katie

Re: Mysterious HP-19C power-on behavior-- solved with interesting cause.

*Message #4 Posted by **Michael de Estrada** on 5 Feb 2010, 12:41 p.m.,*
in response to message #3 by Katie Wasserman

You bring up another very good point in that the choice of battery form can also contribute to this problem.

I was having mysterious intermittent contact problems with some of my Woodstocks when using high top (button) AA cells, and the problem was completely solved by replacing them with flat top AAs. Also, the damage to the battery contacts in Spices is IMO often due to the use of regular high top AAs.

*Message #6 Posted by **Michael Meyer** on 5 Feb 2010, 1:09 p.m.,*
in response to message #3 by Katie Wasserman

Lithium batteries aren't supposed to be "cheap"... they're the most expensive and I buy them because, so far, there have been no reports here of them ever leaking. Alas, companies always seem to find a way to make things cheaper.....

Katie-- one pack was altered with extra springs so that all four batteries can be inserted as bare cells and "float" between springs. The other pack was soldered together and only had two springs to push the end cells against the calculator contacts. THAT'S what was so baffling. I "knew" that the batteries were making contact, and I'd switch the packs around, and eventually BOTH of the calculators would turn on and work fine, only to fail to turn on and to act squirrely a few days later!

I never suspected the cells themselves due to my long history of success with them....

Re: Mysterious HP-19C power-on behavior-- solved with interesting cause.

*Message #7 Posted by **BobVA** on 5 Feb 2010, 1:58 p.m.,*
in response to message #1 by Michael Meyer

I'd guess it's either a contact problem, or high resistance in the cells. NiCd and NiMh cells have very low internal resistance and consequently can deliver high surge currents (like when a motor starts or a circuit powers up) without a voltage sag. In cells with greater internal resistance, a large current demand may cause a brief voltage sag and subsequent malfunction of digital electronics.

I took a quick look at the data sheets for Energizer lithium and compared it to the data for their NiMh AA batteries. I noticed that the internal resistance of the lithium batteries is about 3 - 5 times higher than that of the NiMh.

Without some detailed measurements it's tough to say that's the cause, though. Another possibility would be one out-of-spec cell (low power, high IR, etc) that's causing the problem.

Interesting that it's an 19C being fussy. I wonder if there's something that draws a lot of current on power-up (like some big capacitors in the power supply or motor drive circuitry)?

Cheers, Bob

Re: Mysterious HP-19C power-on behavior-- solved with interesting cause.

*Message #8 Posted by **Michael Meyer** on 5 Feb 2010, 2:32 p.m.,*
in response to message #7 by BobVA

Thanks, Bob.

Again, strangely, once the calculators would power on corrrectly, they'd work fine, including the printers. And they'd work just fine and turn on and off until put away for a few days. Then, it would take a long time and lots of strange behaviors before they'd power up again! It was really baffling me!

Probably a capacitor to recharge and causing a voltage drop in the batteries?

Re: Mysterious HP-19C power-on behavior-- solved with interesting cause.

*Message #10 Posted by **Michael Meyer** on 5 Feb 2010, 5:33 p.m.,*
in response to message #9 by Marcus von Cube, Germany

Marcus-- that was my very first thought when I posted this puzzle last month. It makes sense that the batteries ALMOST provide enough power and the calculators eventually power up and "stay up". I'll test the batteries for their shorted current capacity against some older lithium cells also. I'm still a bit baffled. They could power the LED's and printer just fine once the calculator(s) would "start"... you'd think they'd turn them on o.k.!

Re: Mysterious HP-19C power-on behavior-- solved with interesting cause.

*Message #11 Posted by **Katie Wasserman** on 5 Feb 2010, 6:34 p.m.,*
in response to message #10 by Michael Meyer

The other possibility is that the voltage is too high. Lithium cells with no load are 1.7V so the calculator when shut off -- but the 19C is never really "off" -- sees 6.8 volts. This might be causing the CMOS to "latch up" preventing the calculator from turning on.

Here's an easy test for that...

Remove one of the cells from the pack and replace it with a metal screw or something that's just the right size. The calculator will see a more reasonable 5.1 volts with no load and probably around 4.8 volts when it's running.

-Katie

Still a mystery to me!

*Message #12 Posted by **Michael Meyer** on 6 Feb 2010, 3:43 p.m.,*
in response to message #11 by Katie Wasserman

Katie... you could be right, and I had thought about that. But I'm afraid it might take some more time to solve this puzzle because they are both starting up easily while I try to figure this out.

I tested each of the lithium cells... they put out between 6 and 7 amps each, and over two amps in the packs. So, providing enough power wouldn't seem to be the problem. And, of course, both calculators ran perfectly last night. I ran them both for quite a while, printing listings, etc.

This morning, one would not turn on. When I hooked up the pack externally with leads, the calculator turned on. Some kind of stubborn contact problem? Or no over-voltage problem because they haven't sat long enough.

I'll have to wait a few days and then see if they'll start if hooked up externally and if not, if they'll start with 3 cells fed in instead of 4.

If it's still a problem with the battery contacts, why would they work so reliably once turned on, only to quit and be so stubborn after a few days? And why would NiMH cells work when the lithium cells are causing problems? Your answer could be correct. I'll give your over-voltage theory a try when they stop working again....

Such a strange, annoying, and stubborn mystery that I should be smart enough to figure out!

Re: Mysterious HP-19C power-on behavior-- solved with interesting cause.

*Message #13 Posted by **BobVA** on 6 Feb 2010, 5:13 p.m.,*
in response to message #11 by Katie Wasserman

Too high a voltage is an interesting hypothesis. It would be certainly be worse with a four cell pack (I've had no problems using Li primaries in Woodstock 2 cell packs).

Let us know what you find out!

Cheers, Bob

Katie is probably right.

*Message #14 Posted by **Michael Meyer** on 7 Feb 2010, 5:13 p.m.,*
in response to message #11 by Katie Wasserman

Well, it's Sunday. I completely rebuilt one 19C battery pack; cutting away the inside front frame (as I've done with the other to allow standard cells to be removed and inserted), installing new springs and even a curved m-shaped gold-plated contact which connects the middle two cells but doesn't block the stock circuit board "prongs" in the 19C.

Results: The calculator turns on with NiMH cells, but not Lithium cells.

Complete disclosure: One of the two calculators seems to be fine, now, with lithium cells. I'll let it sit a month or so and re-check it. Also, this stubborn calculator would turn on with lithium cells when connected externally. Still, I can't believe poor contact alone would explain this phenomenon, especially with a completely rebuilt pack.

Well, all of this is interesting.... but most important... I have red LLLEEEDDD's. I think I'll just have to use this one to do my taxes instead of the 97.....

Re: Katie is probably right.

*Message #15 Posted by **Michael Meyer** on 22 Feb 2010, 8:37 p.m.,*
in response to message #14 by Michael Meyer

Quick follow-up: Both of my 19C's turn on perfectly, even after a week of sitting idle, with NiMH cells rather than lithium cells. Thanks for all the input, and I'd love to hear if

anyone else has trouble with this model using the lithium batteries.

Re: Katie is probably right.

*Message #16 Posted by **Katie Wasserman** on 22 Feb 2010, 9:16 p.m.,*
in response to message #15 by Michael Meyer

Thanks for the followup! I'm always concerned about over voltage issues with several lithium cells in series, that extra 0.2 volts can add up fast.

-Katie

Re: Katie is probably right.

*Message #17 Posted by **BobVA** on 24 Feb 2010, 2:00 p.m.,*
in response to message #16 by Katie Wasserman

Indeed - great remote diagnosis! Thanks for the follow-up.

I use my 19C a lot so I'm using NiMH in it now. If I ever change it to a shelf queen, I'll be certain to take Katie's caution into account.

HP-15C Enter Key Behaviour

*Message #1 Posted by **Timo** on 5 Feb 2010, 4:10 a.m.*

Hello everyone,

after only reading the helpful forum topics for a while I'm now in need of a littel help as well.

I recently bought a HP-15C. It is in absolutely fantastic condition, near mint. Not a scratch on the whole calculator. The keys have no backlash, i.e. they do not rattle when you shake the calc, and all the markings are perfectly intact. They all have the typical klick and feel - except the enter key. When I pressed the enter key I noticed that the displacement between the fully released and fully depressed position is only about 1/3 to 1/2 of that of all the other keys. It also does not have the same destinct keybreak the other keys have.

I've read a similar description in another post here in the form, (See here) relating the enter key behaviour to the fact that it is hinged at the bottom and presses on two separate metal discs. However, the topic did not completely answer my one and only question: Is this a normal behaviour for a HP-15C enter key and if not, can this easily be fixed in any way?

I'm looking forward to you replies, thanks in advance! Timo

Re: HP-15C Enter Key Behaviour

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 5 Feb 2010, 6:33 a.m.,*
in response to message #1 by Timo

Hi, Timo;

I have disassembled some Voyagers and I actually pressed the lower metal disk under the ENTER key while the calculator was turned ON, both in normal (RUN) and program mode. I do not remember observing any reaction at all, and pressing only the upper disk, the one that is actually pressed when the ENTER key acts, provides necessary action. You can see in the picture how I managed to make them work outside the case...

Click to enlarge

Taken from Randy´s post (link you shared):

> Quote:
>
> The rubber sheet between the snap discs and the keys gets holes worn through the rubber from the key pin that pushes on the snap disk. This results in keys that are lower than surrounding key. They otherwise work okay, they just don't have the correct or same physical travel as the others. This is most common on the right hand side of the keyboard, i.e. the heaviest use keys (0 and . seem to go first).

I have an HP15C, bought new in the 80´s, and both [g] and [STO] keys have this problem: no keybreak (and no 'snap' feeling) the other keys have. But they work pretty fine once you press them the same way as the other

keys.

I sincerely would not care much about it, but this is only the way IO see it.

Cheers.

Luiz (Brazil)

Edited: 5 Feb 2010, 6:34 a.m.

Re: HP-15C Enter Key Behaviour

*Message #3 Posted by **Timo** on 5 Feb 2010, 7:49 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Thanks for the feedback Luiz,

I wasn't actually worried. As far as I can tell, the enter key is not lower than the others. And it does produce a notceable "klick" but not as destinct as the other keys. It's simply not that crisp regarding its behaviour, generally spoken.

I was just wondering wether this is a general spciality of the enter key alone on the 15C? After all, it's by far the largest key on the keyboard and the only one with a slightly weird feel to it. I think it would be quite odd if it was a sign of wear since the calculator is in such a fine condition...

Thanks once again and best regards!

Now, that's funny!

I wonder

*Message #4 Posted by **Frank Boehm (Germany)** on 5 Feb 2010, 4:31 a.m.,*
in response to message #2 by Katie Wasserman

if they are really worth 120USD each. Maybe HP decided to use massive 24k gold keycaps (plastic coated)?

Re: Interesting Pairing

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 5 Feb 2010, 6:58 a.m.,*
in response to message #2 by Katie Wasserman

I have seen those calcs announced for sale a few weeks ago and wonder which company was producing them. Did not care for their looks, did notice the logo...

Luiz (Brazil)

Re: Interesting Pairing

*Message #6 Posted by **Martin Pinckney** on 5 Feb 2010, 10:43 a.m.,*
in response to message #2 by Katie Wasserman

Someone pointed out this offer months ago. Makes one wonder:

1. Is Newegg's website management so incompetent that after all this time, no one has noticed the error, or

2. Their sales department so incompetent that no one has noticed they received no sales of this item, or

3. They conceived this as a joke, or

4. They figured at the MSRP of $6 each they would only have to sell one 3-pack to some idiot to equal 300 at the regular price so why not give it a go?

Re: Interesting Pairing

*Message #7 Posted by **Michael Meyer** on 5 Feb 2010, 1:15 p.m.,*
in response to message #6 by Martin Pinckney

With all the cuts to my reimbursement due to insurance cut-backs and Medicare (30% cut this year!), etc., I've been joking that I should raise my rates to a million dollars an hour.

Then if could get only ONE patient to pay their bill.....

Re: Interesting Pairing

*Message #8 Posted by **DavidShenk** on 5 Feb 2010, 10:20 p.m.,*
in response to message #2 by Katie Wasserman

I love the one review:

Pros: If you've ever been jealous of the people who owned the first calculators in the 1970's, this is your chance to relive all the fun. These are basic 4-function calculators, and they cost $120 each! Now when one of your friends brags about having bought a calculator in the 1970's for a hundred bucks, you can respond that you paid $120 this MORNING!

Cons: These calculators redefine the low end of price vs. performance.

Redefine it, indeed!

in response to message #3 by Reth

> Quote:
>
> BRILLIANT! I wish a could touch it!
> Cheers

Thanks Reth. So do I as I haven't seen it in person yet!

I have seen pics of the battery contacts and there is no corrosion whatsover. I am buying it from the original owner who used it lightly , took great care over it when he bought it and then stored it in it's box thereafter. Also I am not buying it from one of those 'professional' sellers on eBay who mark up the price and make it look better than it is.

I had to laugh to myself recently when one was sold recently with this description " HP41cx Calculator AND (my emphasis) unopened mint condition accessories" . The calculator wasn't new but it looked OK and it sold for $580 !

I can't tell about any broken posts in my machine but all of display works so there is no reason to suspect that they are broken or cracked.

Not that I have ever seen a new HP 41 , but this one did seem to stll have a bright black look about it , not one whose colour has faded over time.

I did really want a HP41cx but in the end the apparent 'new' condition of this one won me over.

Nigel

Re: Hp 41C in excellent condition

*Message #5 Posted by **Maarten Ambaum (Reading, UK)** on 4 Feb 2010, 5:33 a.m.,*
in response to message #4 by Nigel Bamber

A bit cruel to show these photos here - I am jealous. Are you going to reveal how much you paid for it? Perhaps we should try and let people guess first and give a price (a near new HP41c?) to the one with the best guess. I'd say 110 pounds.

Re: Hp 41C in excellent condition

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 4 Feb 2010, 7:44 a.m.,*
in response to message #1 by Nigel Bamber

Congratulations, Nigel!

Made me remember the day I bought my HP41C (80's, NIB), still with me but needing some refurbishment (broken posts, mostly).

But I still like the CX more...

Cheers.

Luiz (Brazil)

Re: Hp 41C in excellent condition

*Message #8 Posted by **Jim Horn** on 4 Feb 2010, 7:31 p.m.,*

in response to message #7 by Vieira, Luiz C. (Brazil)

Oh, do I remember opening my '41C in August, 1979 (SN 1932A...)! A friend and I bought one each the day they came out before the word got out and they became scarce. I later replaced the 8 pin DIP RAMs with the '41CV's parts so mine is now a 'CV with all the original bugs (such as access to *any* register via indirection). Still works great, too.

When I was interviewed to work at HP Santa Rosa, someone mentioned the then-brand-new HP-41C. I answered that I really enjoyed mine. The interviewer was astonished that I had one and asked about it. When I said it was in my car outside, we promptly marched out and got it. While they grilled / interviewed me the rest of the day, there was a small mob of HP engineers playing with my '41 in the cubicle they had it in. I'm still not entirely sure they hired me for my electrical engineering skills or to get a '41 in house right away...

Plexiglas replacement

*Message #1 Posted by **Alberto Fenini** on 2 Feb 2010, 7:54 a.m.*

ciao a tutti !

I'm trying to restore a security cradle for the woodstock units, I have had the locker replaced (the key was missing) but it still has the red plexiglass broken. Browsing on the web I have found this company, http://www.acrylite-shop.com/US/us/index.htm , it's an Italian company but sells worldwide.

The question is, would it be a good replacement ? Could it be useful for other restoring purposes (calculator display, HP-01 display) ?? Any advice or any other ideas for restoring/replacing plexiglass parts would be really appreciated !

take care, Alberto

Re: Plexiglas replacement

*Message #2 Posted by **Katie Wasserman** on 2 Feb 2010, 6:14 p.m.,*
in response to message #1 by Alberto Fenini

I've made several replacement printer windows for the Topcats and the 82143A and 82162A printers using 1/16" Plexiglas. This material is thin enough to score with a knife and break. I then file down the edges to match the original window. It works and looks fine, I don't bother with the top lift edge nor the 3 little bumps that keep the paper away from the window, but this would be easy to add if you wanted perfection.

-Katie

Re: Plexiglass replacement

*Message #3 Posted by **Alberto Fenini** on 2 Feb 2010, 7:03 p.m.,*
in response to message #2 by Katie Wasserman

ciao Katie,
thank you very much for your reply, did you replace some of the red plexiglass ? Do you know I can math the same color that is used for the classic, or woodstock display ? (btw, it looks to me the all the hp led display share the same color)
take care, Alberto

*Message #4 Posted by **Katie Wasserman** on 2 Feb 2010, 10:59 p.m.,*
in response to message #3 by Alberto Fenini

I haven't used red Plexiglas to replace windows in calculators but I do have some around for other projects of mine and it's a pretty good color match for typical LED windows used in older calculators. 1/16" might be a little on the thick side but some manufactures of acrylic sheet make 1/32" and may sell that in red too.

Early (Buggy) HP-35 - Insides

*Message #1 Posted by **Mark Henderson** on 1 Feb 2010, 4:27 p.m.*

I have just got an early HP-35 into my collection - one with "The Bug "- exhibits all the bugs documented here on MoHPC. It's a Type/Model 2 (dot on 5 key, "Hewlett Packard" without the 35, S/N is 1230A).

It has intermittent power switch and battery "switch" contacts, and since the label had already been damaged, I disassembled and cleaned it up a little.

Very interested to see some "tinplate" EMI shielding in the case bottom and around the display - I haven't seen this in other Classics (HP-45, HP-55) - was this the norm for this generation? Do other 35s have this (I have a Type/Model 4 but have not opened it yet)?

Looks just like tricks I've had to play on my own products to get through FCC, but this wasn't as much an issue in the 70s, or was it??

Cheers

My 45 does have this shielding around the LED, too. Opened it not too long ago.

*Message #3 Posted by **Joel Setton (France)** on 2 Feb 2010, 3:24 p.m.,*
in response to message #2 by Thomas Radtke

Folks,

At the time the Classics were launched, the FCC limits for radiated EMI were not as low as they are now. However, the "tinplate" shields may have been included in these calculators to improve their immunity to spikes and static coming from the outside. HP imposed a high level of immunity to static discharge, even though this was not a regulatory requirement. It was an HP quality requirement, and one of the reasons why HP products were among the most reliable on the market. Of course, that was then.

My interpretation is that these shields were included in the earliest units which needed them for protection against electrostatic discharge spikes, then removed at a later time when the noise immunity of the MOS ICs improved. At that time, MOS-LSI chips were a new and delicate technology!

FWIW...

Joel Setton

HP - Quo vadis?

*Message #1 Posted by **Frido Bohn** on 1 Feb 2010, 10:14 a.m.*

Dear all,

have you seen the calculator which HP shows in its newsletter of December 2009 above the header "The HP-41 system – 30 years old" Calculator Newsletter 16 (December 2009)?
It's only me, who has the impression, it's not the HP-41?
If a lack of consciousness for the past is indicative for a poor future, then we may not expect too much for the calculator branch of HP.

Regards
Frido

Re: HP - Quo vadis?

*Message #2 Posted by **Thomas Radtke** on 1 Feb 2010, 10:45 a.m.,*
in response to message #1 by Frido Bohn

It's a 35 for sure.

Enough has been said about HPs strategies in the calculator market. The targets are education and financial business (12C(P)). Engineering and science is obviously out of scope, and so the company doesn't really care about the 41 legacy.

Re: HP - Quo vadis?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 1 Feb 2010, 11:17 a.m.,*
in response to message #2 by Thomas Radtke

> Quote:
>
> The targets are education and financial business (12C(P)). Engineering and science is obviously out of scope (...)

I wonder why.

I am an electrical engineer and I 'act' as a teacher lately, mostly because in Brazil it is hard to do what I like most: R&D. I can point out many reasons for that, but the main ones relate to '$'! R&D demand 'risky' investments, but today´s management demands 'risky' to be measured. I was (re)viewing some specials related to NASA and the Moon, but a particular mentioning from one of the engineers working with the lunar module called my attention. They were asked to predict budget and scheduling for the modules, but, he says, budget and scheduling are 'best guesses' based on previous experiences. How can someone give a 'best guess' based on no previous experiences? Delays and unexpected expenses should be taken as lack of experience instead of lack of knowledge.

Now we are facing another 'reality': once developers do not prove it is profitable, forget it! No matter if it will benefit mankind, it must benefit sponsors bank accounts. And were are the engineers and scientists? I wrote developers, it does not mean they are engineers neither scientists. CAD/CAE/CAM and HDSL need only commands to produce mechanical parts and integrated circuits.

Guys, I am waiting for an answer, don´t have any! I am teaching, and my students are supposed to be system analysts, pedagogues, physicians ('Computer Science Applied to Medicine') and managers. No scientists, no engineers.

Who´s gonna turn ideas into reality in the near future?

Cheers.

Luiz (Brazil)

Hi Luiz,

spoken out of my heart, as we say in german.

> Quote:
>
> Now we are facing another 'reality': once developers do not prove it is profitable, forget it!

And here I think about the 42s. What was the reason to cease production? Too few sales, I suppose. So, here it has been proven that such a machine doesn't sell.

In my career I worked together with a lot of engineers and scientists, about 100 I estimate. Two of them were working with a no-name calculator, one had a 15C, and I was using a 32SII. All others were doing fine w/o any calculator.

Sad but true, HP is right. To me, using a calculator means convenience and safety, but I'm used to check Excel results ;-). Others just generate numbers with computer programs, visualize them and thats it.

Re: HP - Quo vadis?

*Message #5 Posted by **Walter B** on 1 Feb 2010, 12:21 p.m.,*
in response to message #4 by Thomas Radtke

Yes, there is a lot of belief in numbers a computer puts out today. To my experience, what is lacking is the ability to reason or to check results for plausibility, to perform coarse estimates etc. The need for even simplest mental arithmetic or order-of-magnitude estimation has decreased significantly, so this knowledge is decreasing, too. People tend to believe what Excel displays.

Re: HP - Quo vadis?

*Message #6 Posted by **Bart (UK)** on 1 Feb 2010, 1:59 p.m.,*
in response to message #5 by Walter B

I think the problem is not only the faith in the numbers produced by computers (GIGO*

machines), but also that nubers are the be-all and end-all of problem solving.

Someone once said that if we cannot quantify something, we do not understand it. With computers it is so easy to quantify things, that there seems to be a misguided belief that we fully undertand it.

*GIGO: Garbage In, Garbage Out

This is pretty much my experience also in my field of electronics design and associated software,

mechanical and acoustics design I've worked in.

In my case it's a lot more than 100 engineers over the last 20 years, and I've always taken an interest in what calculator they have on their desk.

Very few HP's, and very few programmable or graphic calculators in general at all. 5% tops, and I'm being generous here. When I've asked them why they have a programmable or graphic calc, the answer is always the same - "I don't need one, it's just the one I used at school".

The other 95% either have nothing at all, a basic non-programmable scientific, or even a 4-Banger.

Same personally for me, I have no need for anything but a basic scientific.

This is why I've been saying that any scientific HP brings out should have significant retro appeal, it will be the only way to generate mass interest in such a machine.

Dave.

Re: HP - Quo vadis?

*Message #11 Posted by **Richard J. Nelson** on 2 Feb 2010, 11:08 a.m.,*
in response to message #4 by Thomas Radtke

Why was the HP-42S discontinued?

I was working at EduCALC as the New Product/Technical Support manager at the time. This was back in the days when HP actually had staff to "support" dealers - Oh, they are called resellers now.

We were very upset at EduCALC because the HP-42S was a best seller. The HP rep told us that EduCALC sold more HP-42s than all the other sellers combined. We knew how many we sold and based on doubling or tripling our sales numbers it was obvious that the volume of sales did not justify the continued manufacturer of the HP-42S.

Trivia question. What vital feature was omitted on the HP-42S?

The answer to this question could also explain why the HP-42S was not more successful.

*Message #18 Posted by **Thomas Radtke** on 1 Feb 2010, 3:06 p.m.,*
in response to message #17 by martin pinckney

Ok, at least I know very little about these matters. I just observe that nearly all calculator companies jumped on the educational train, leaving professionals behind. Probably with Casio an exception with one or two models. That leads to believe there's no longer money to earn.

Another observation: Past models could easily been brought back to market, like the 15C. It hasn't been done and I refuse to believe that HP didn't had even a single thought about that.

They have thought about it, they even paid for an industry survey on what model people would like to see.

I still don't know why they haven't released the 15C, it's a complete no-brainer from almost any perspective.

Dave.

Re: HP - Quo vadis?

*Message #20 Posted by **Rainer Wiedemann (Germany)** on 2 Feb 2010, 3:06 a.m.,*
in response to message #2 by Thomas Radtke

They (HP) can't obviously distinguish an HP-35 with LED display from an HP-41 with LCD anymore, perhaps, because all of the know-how was transferred to China in the past and therefore has gone forever (together with the engineers).

In RPN tip #16 HP even redefines Euler's constant as 2.1. Since the article's author was using an HP-35S, my first thought was, he found another bug, wouldn't have wondered so. But my 35S did right. I suppose, he must have been using an updated ROM code, adding some new features to the 35S.

Maybe I should follow HP's invitation for the Educator outreach: "What would you like to see HP calculators do to improve? We can't wait to hear from you! Send an email to: Calceducation@hp.com"

OK, but unfortunately I don't speak Chinese ...

Regards,

Rainer

I never quite understood what the difference between "education" and "science/engineering" is. I haven't changed my calculator needs when I changed from being a "student" to a "scientist."

Most students like gadgets and would be glad to buy a top-of-the-range calculator if it has the proper wow-factor. Think of Apple laptops: expensive but my students still get them. It's all marketing. If students knew that a HP15cII or a HP42sII is the Roll-Royce of calculators, they would probably get it. They just don't know (and, needless to point out, they don't exist as yet ....)

There's a varity of graphing cals on the market. Students apparently love it, I don't. They take too much space on the desk :-). At the same time, many of these calculators are not very powerfull, with the 50g an exception. And how about ergonomics? If I want to do a R<>P conversion, I have to remember where the angle or where y is left. Not that easy with a Casio. In general, this textbook entry thing is more of an obstacle to a professional.

Of course, I can only speak for myself.

Speaking only for the USA, math classes up to the university level can have entire curricula based around specific calculators. It is not uncommon for students to be required to purchased a specific calculator model for their class.

In this sense, the calculator is less used as a tool than it is as a teaching instrument.

"Type this in and you will see a hyperbola." "Oooh ..."

Its odd, should allow highschool students only scientific so the can learn math not short cuts. I was in while scientific only for tests and graphing was ok in class, almost required actually the way it was taught. The schools did however buy enough that one TI-83 could be shared by 2 students in class however. Most of us bought our own as it made it easier. Now they "strongly" recommend the purchase.

". . company doesn't really care about the 41 legacy." Business is about the future. From a classical business perspective the past doesn't mean much because the customer has paid for the product. It is the NEXT sale that is important.

If HP had zero interest in the "past" they wouldn't have approved the publication of the article. As the author of the article I mentioned that HP had published my enthusiastic opinion regarding the HP-41 in three major articles. My interest is that we concerned users should also try to understand the constraints that HP has. HP provides us with many valid complaints, but to dwell on a decision that you too would make if you had to live by the same rules (that they have to follow) isn't very constructive. We try to bridge this understanding with the annual conferences because we all want HP to continue to make the best possible machines.

Corporate memory is an important concern and this came up at HHC 2009. See: http://holyjoe.net/hhc2009/Corporate_Memory.pdf

I agree, however, that there is no excuse for not knowing the difference between and HP-35A and an HP-41.

Well the HP-35S is allowed in the US (not so sure about other areas) for the the FE and PE exams, since they seem bent on exam security, I don't see why you couldn't talk them into a pre-programmed scientific based on the HP-35S if HP cared about getting the Engineering side of things back on track. Especially when there are services to pre-program your HP-35S for you.

Yes, and so were the 33S and the 32S* calculators. Unfortunately, there haven't been any bufixes for the 35s, which would be the first thing one could expect. So, one 'crossover-machine' exists, but is not really usable by professionals.

*Message #37 Posted by **Thomas Radtke** on 5 Feb 2010, 1:08 p.m.,*
in response to message #36 by Dimitri Simitas

There is a certain evolution within some series of models, e.g. 48S to 48G or 32S up to the last version of the 32SII, but generally it's difficult to have a new calculator based on old software. The CPU might have become unavailable or outdated, old IDEs are no longer available and so on. So, very often it is easier to rewrite a new firmware from scratch, thereby introducing new bugs.

Especially with C++ and Java, reusable code becomes an issue. Now, we're waiting for some good classes from HP ;-).

Oh, and don't forget that the mix of RPN and Alg has caused a new level of complexity!

Wow, I'm defending HP!

Its my first RPN calculator, so no complexity problems for that as I made sure it was set on RPN on the Monday evening I bought it. Last semester (my first, 2nd time in college) and I used it for my Calculus Mid-term Wednesday morning that same week, as in our Monday morning class my Prof said no Graphing calculators. At the time I only had my TI-83 from high school. And it had to be a HP as I was told by a few "Never trust a engineer without a HP on his desk" while working as a machinist.

Look what I found for $50 USd; off topic but I think you will like the photos.

*Message #1 Posted by **Geoff Quickfall** on 31 Jan 2010, 6:18 p.m.*

Hello all,

Been away from the computer for awhile here. No new HP calcs other then the 30b prototype to play with and 5 upgraded HP42s's.

Renovating the house, working, family, the book and now my 1973 Celica is going undergoing a ground up restoration. Bought it in 1974 in High School and it does not have a sticky accelerator pedal!

In any case all the business doesn't stop one from looking around and now to the off-topic topic:

Found this Scientific instrument at the local junk store for $50 USd. A Barograph circa 1940! Fully functional with spare barograph paper, used papers, working eight day clock, key, ink bottle, and spare nib. Now another project for restoration!

Here are the befores which will be followed at a later date with the afters:

Here is the Barograph as found with masking tape holding all the top 5 panel glass case together. The glass is all heavy plate glass and the cabinet is mahogany:

Another view with the two section drawer slightly open exposing a recorded chart labelled "Kaohsiung to Vancouver, B.C." Other charts include "Tokyo to Vancouver" and "Vancouver to Keelung". Obviously this was part of a ships meterology room!

Look what I found for $50 USd; off topic but I think you will like the photos.

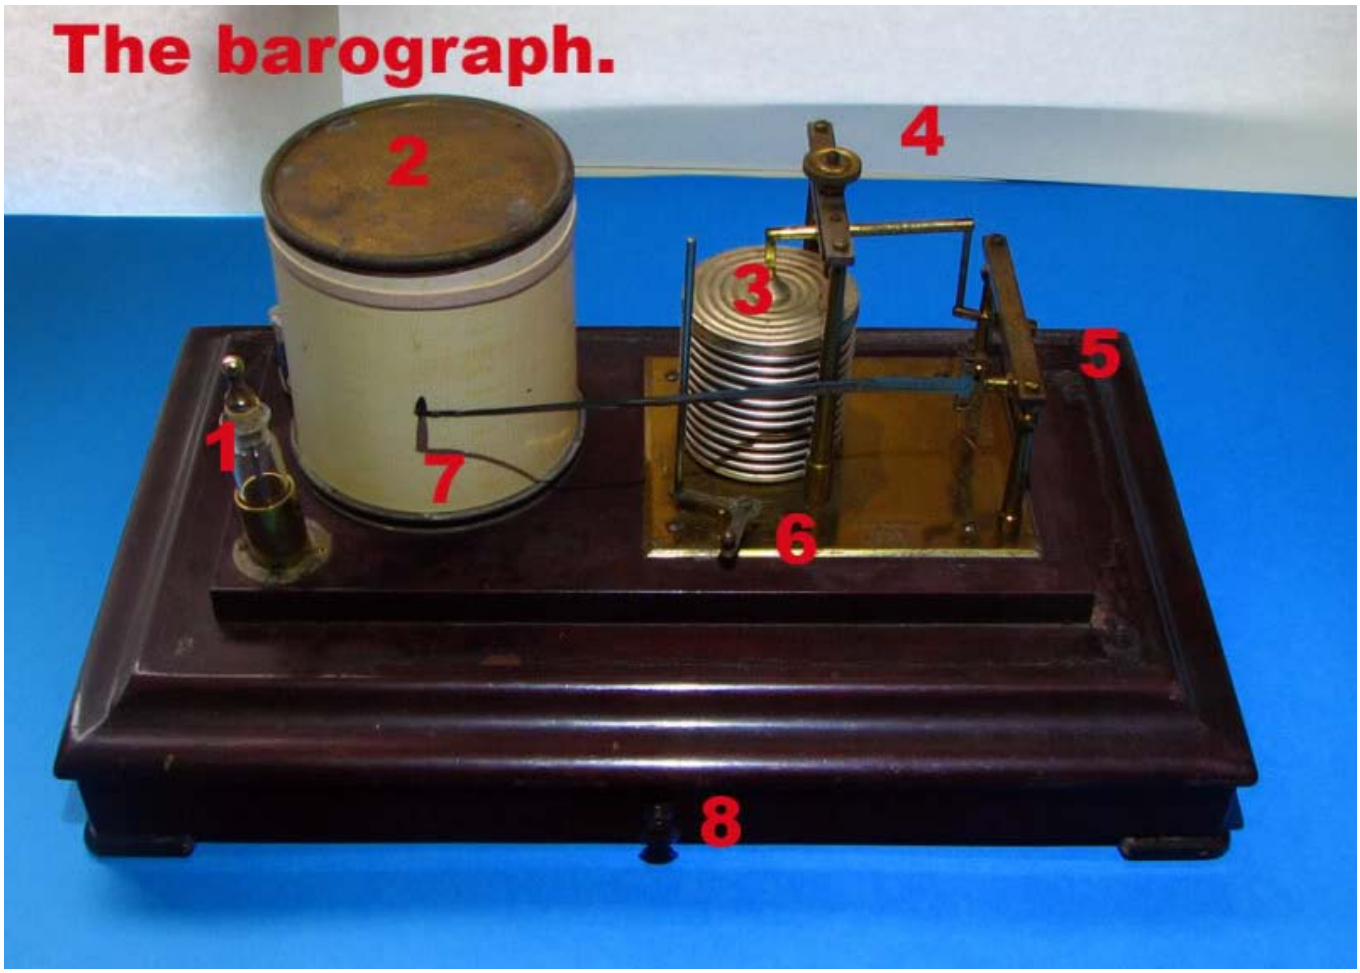
This view is with the glass top removed:

Look what I found for $50 USd; off topic but I think you will like the photos.

A numbered explanation of the major components:

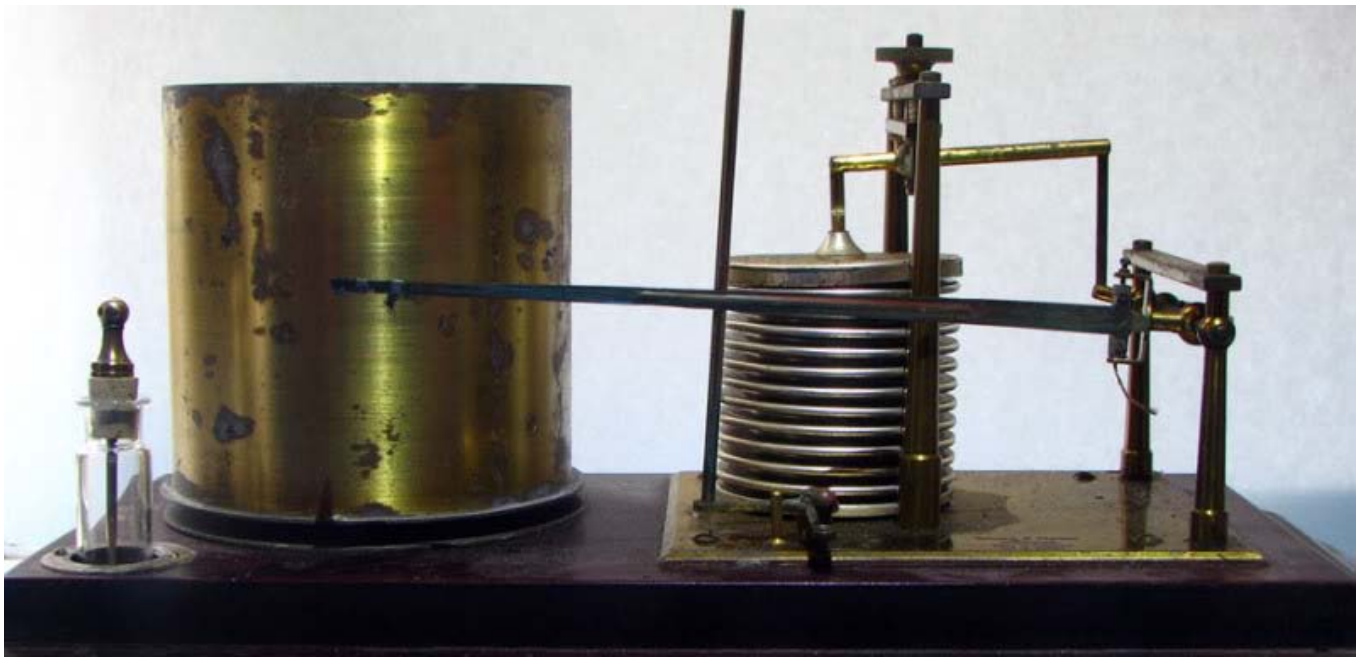
1 ink bottle
2 chart canister and clock mechanism within
3 11 diaphramed stack
4 the adjusting knob to synchronize the reading to a base measurement
5 system of levers to transfer and amplify the pressure change from the stack to the pen and chart
6 lever for retracting the pen arm from the chart cannister
7 the pen arm and nib, this one is corroded and non functional, but replacement has been secured
8 the two section drawer containing used and unused charts.

Look what I found for $50 USd; off topic but I think you will like the photos.



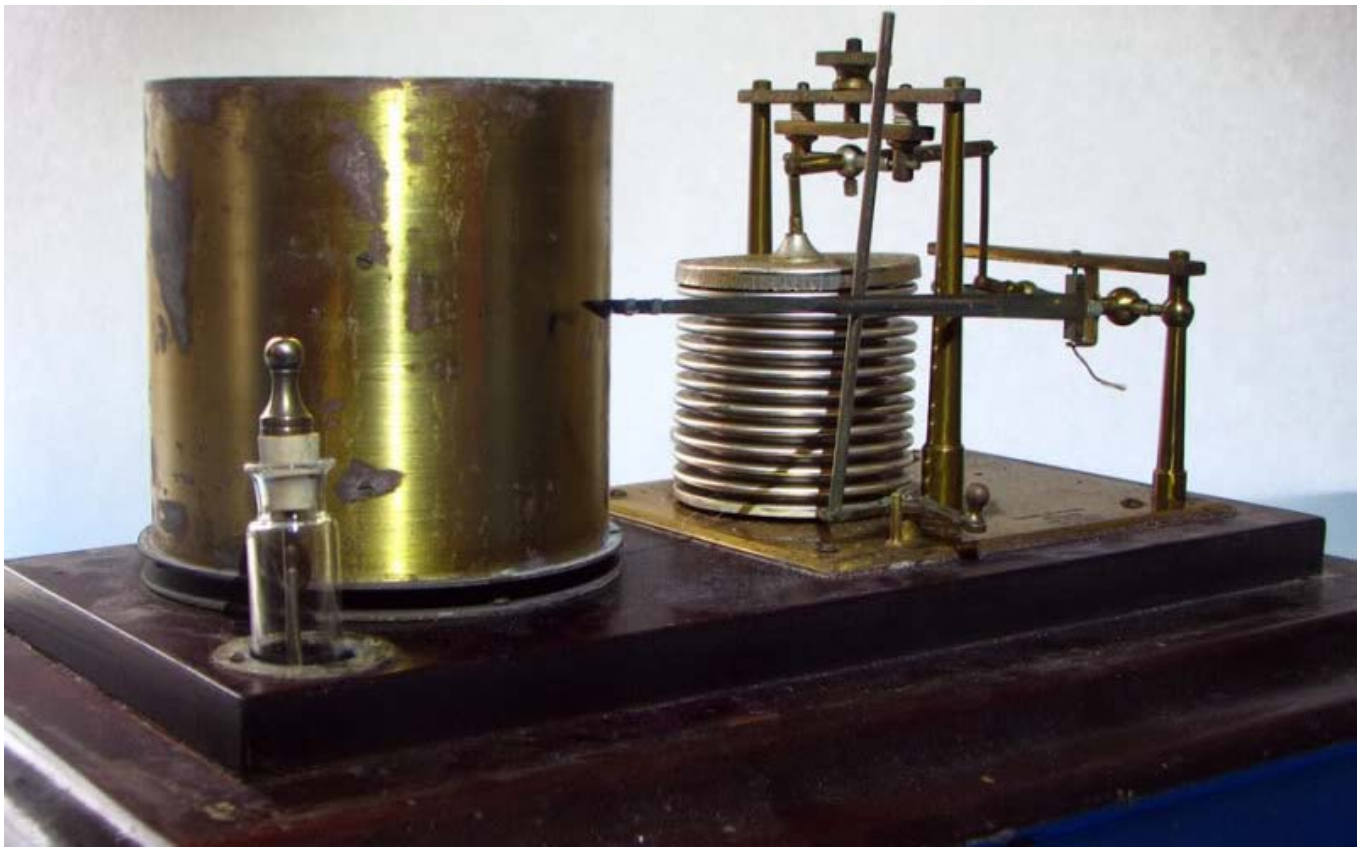
The following shots are around the barograph with the top case removed and the lid and chart removed from the chart canister:

front:

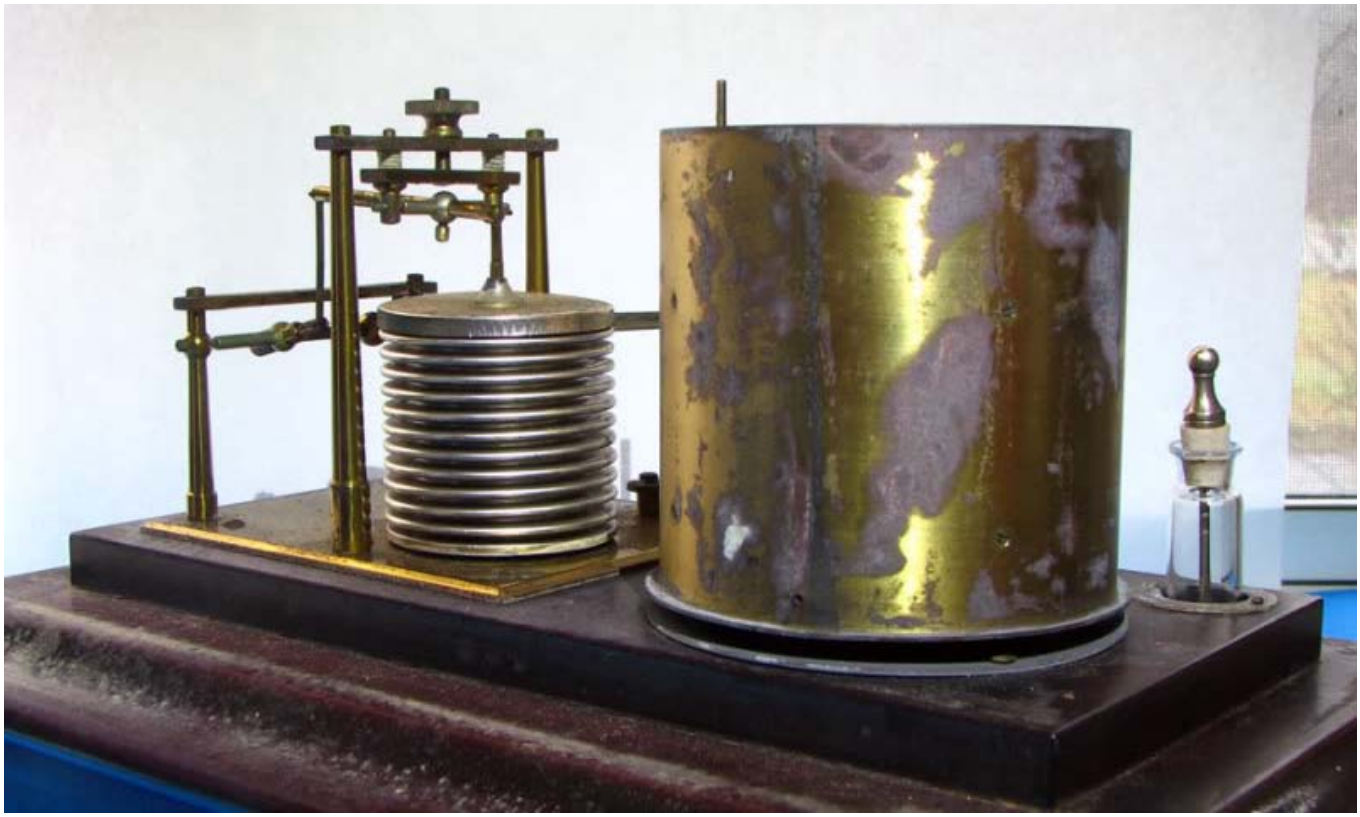


front quarter left:

Look what I found for $50 USd; off topic but I think you will like the photos.

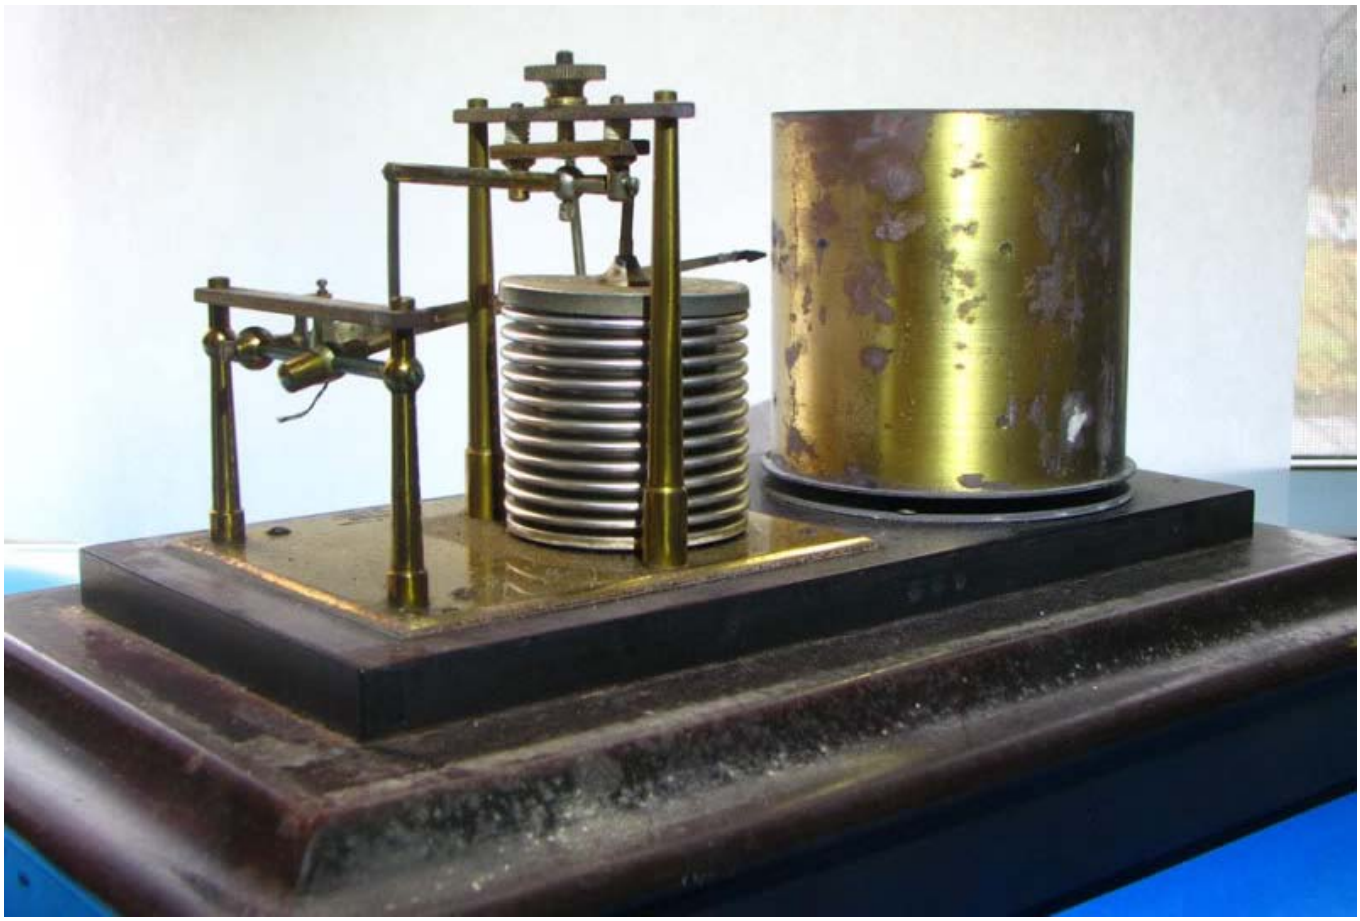


rear quarter right:



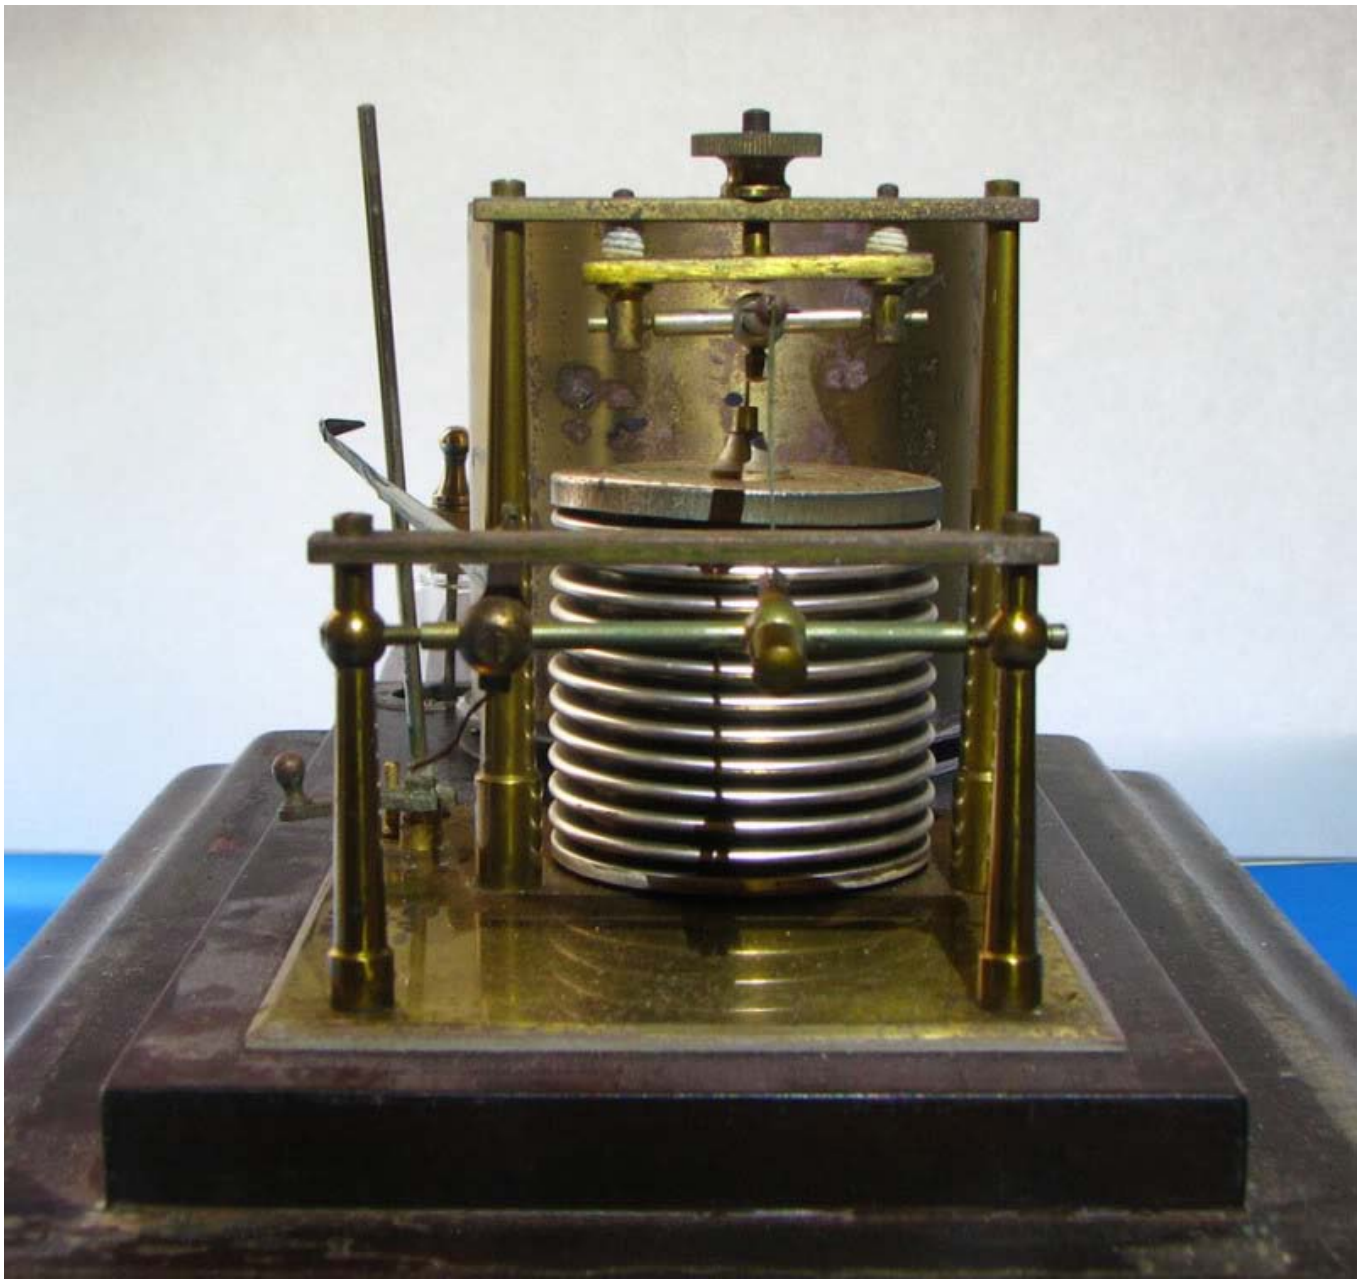
rear quarter left:

Look what I found for $50 USd; off topic but I think you will like the photos.



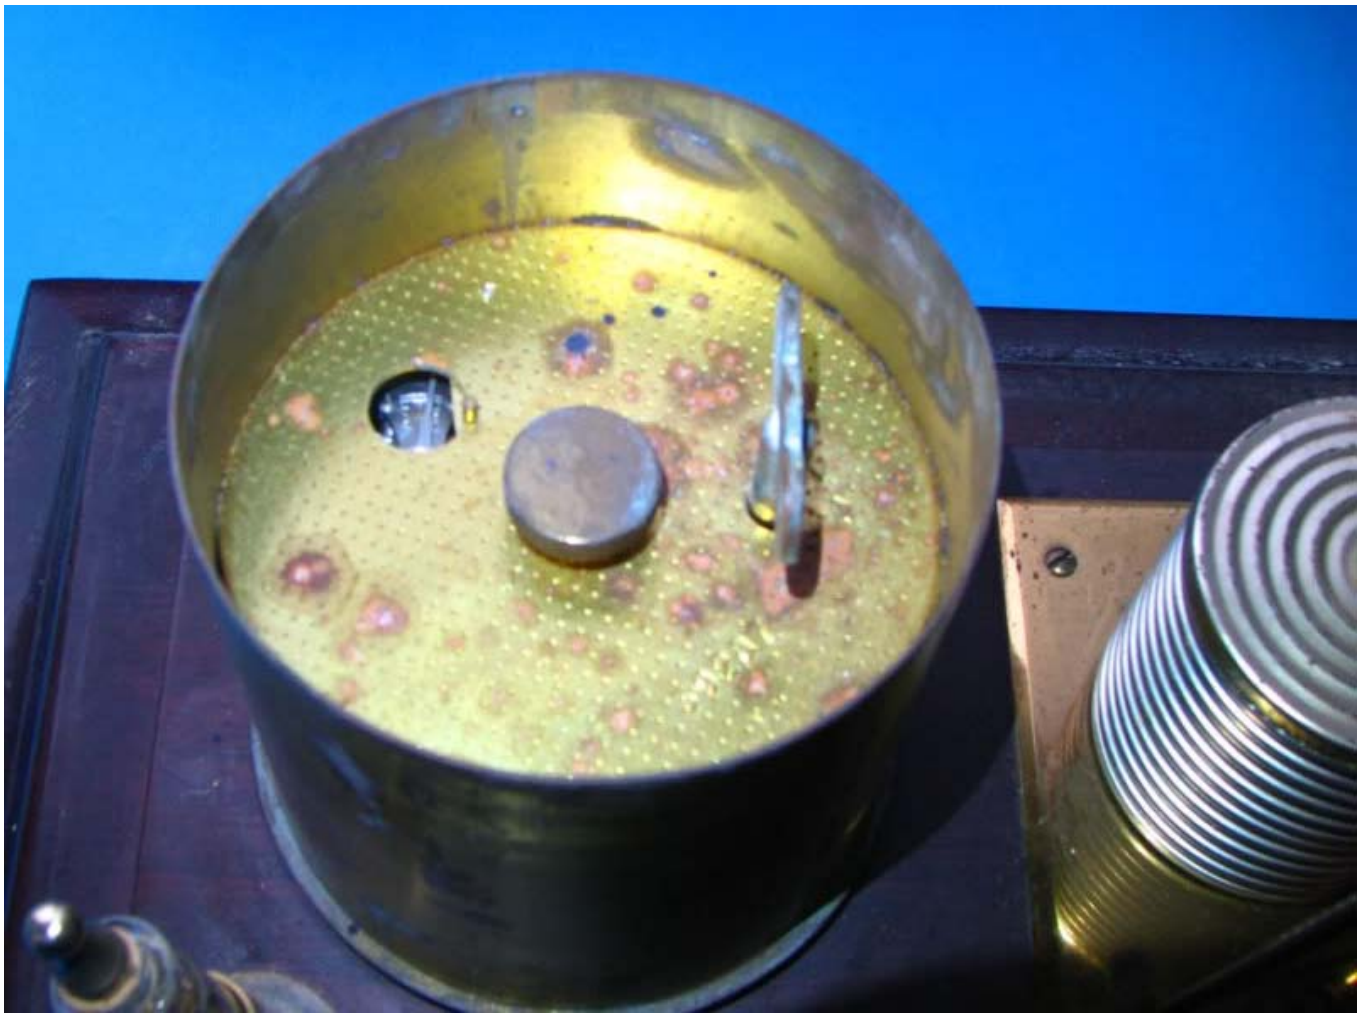
edge on from lever side:

Look what I found for $50 USd; off topic but I think you will like the photos.

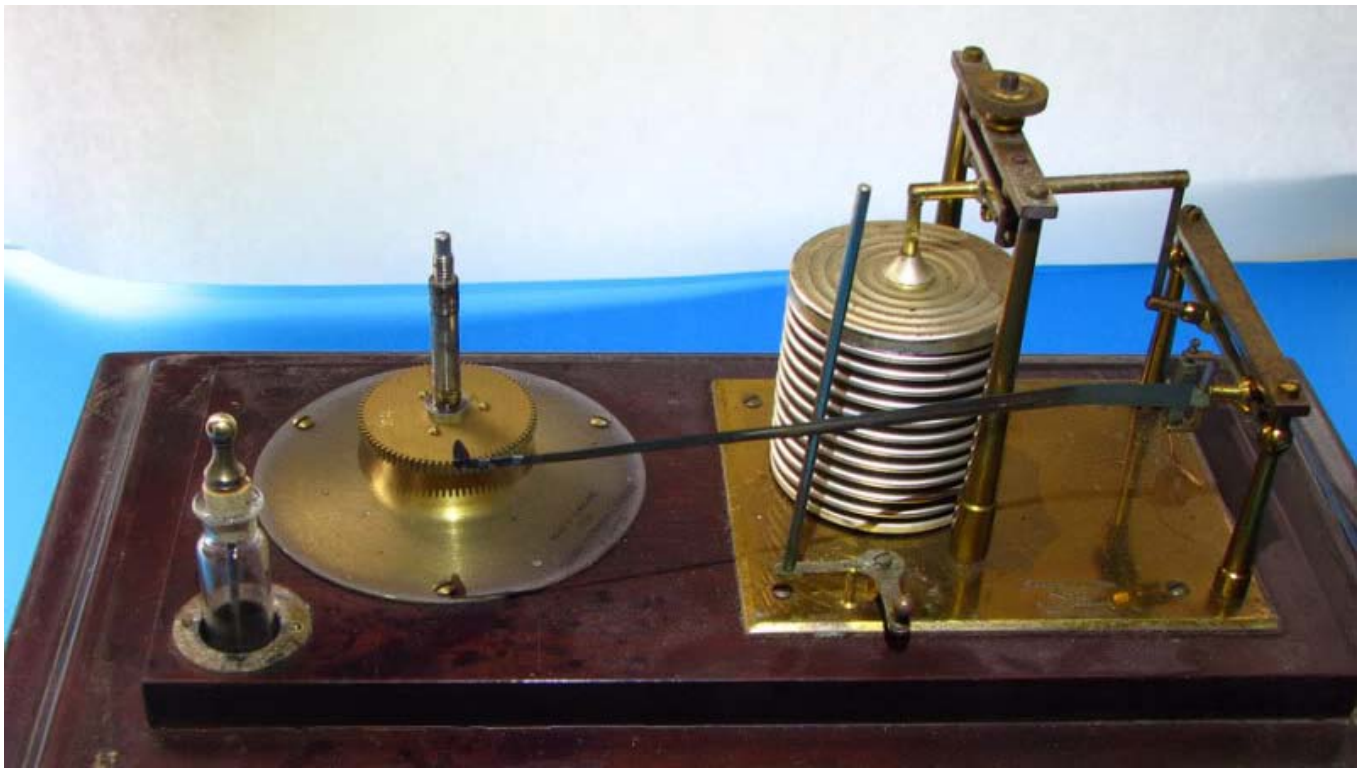


By removing the top lid from the chart canister one exposes the winding key and fast slow adjust:

Look what I found for $50 USd; off topic but I think you will like the photos.

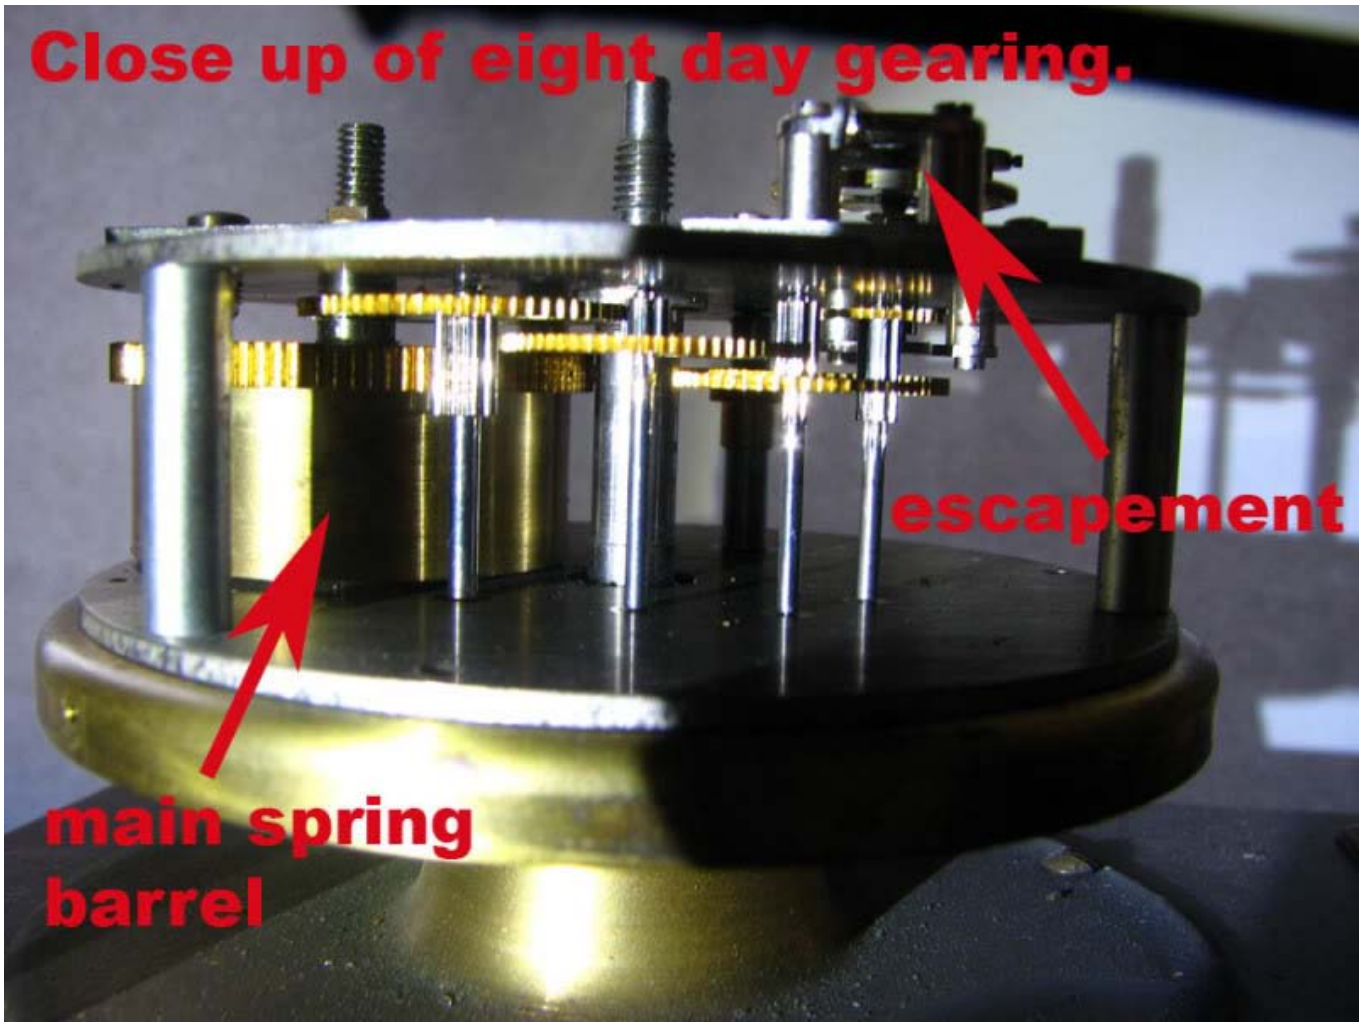


Removing the centre screw knob in the above picture allows the entire canister containing the clock to be removed:

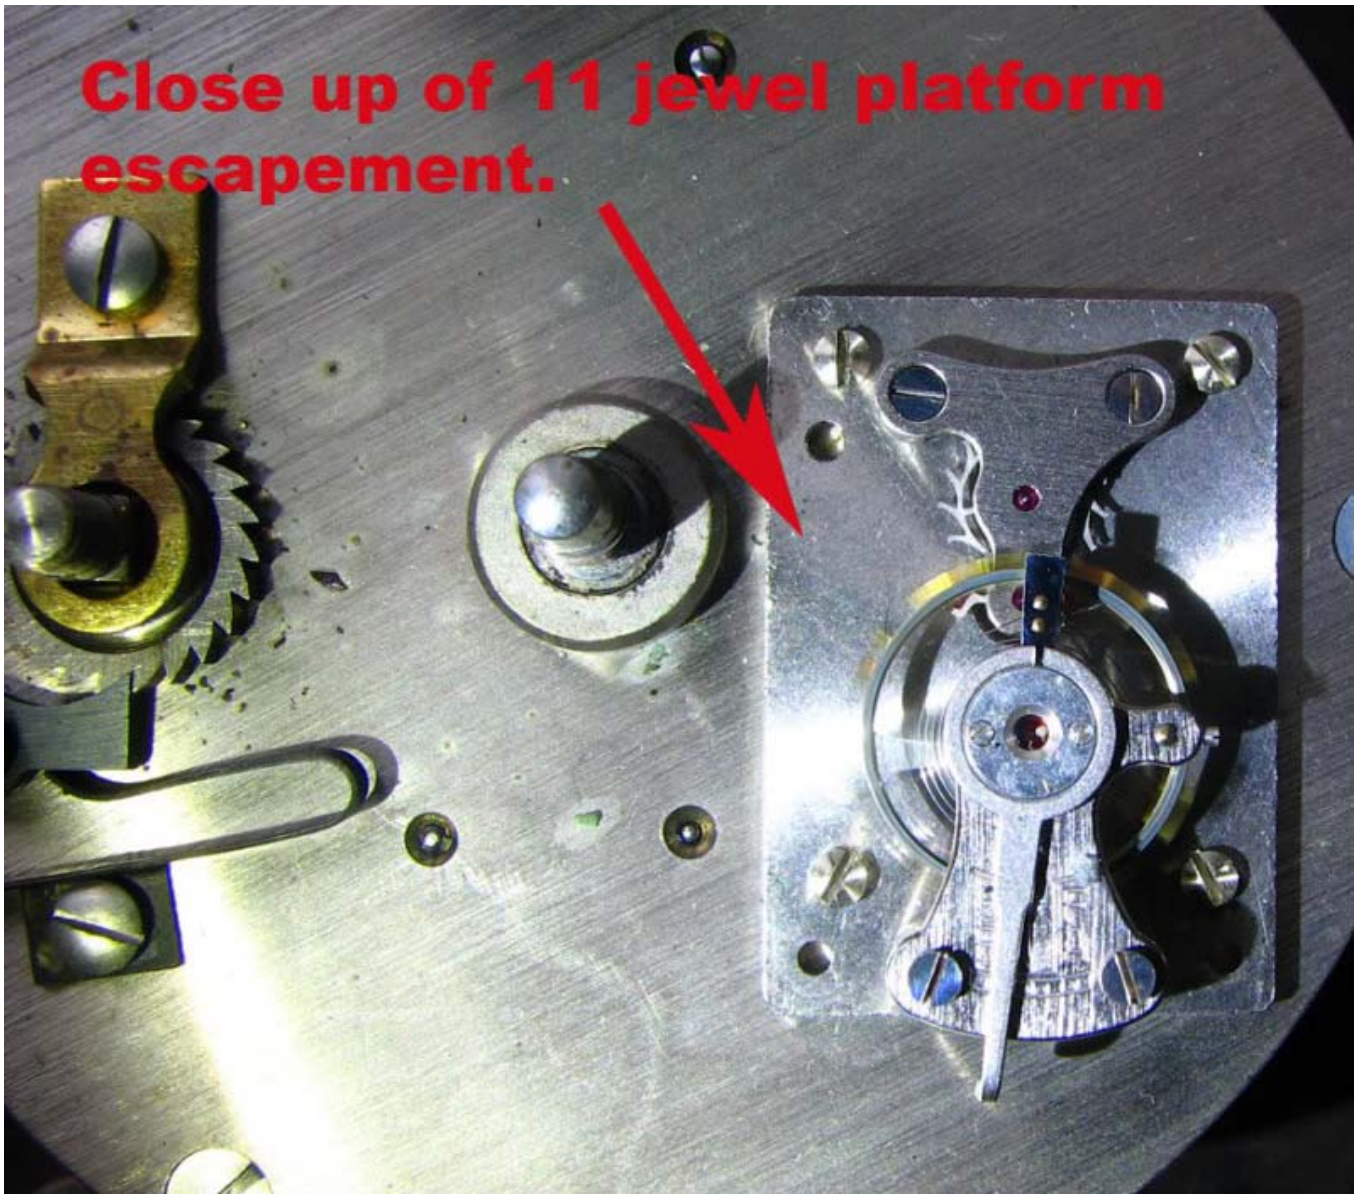


Continuing with the disassembly, eight tiny screws in the side of the canister exposes the clock mechanism gears and platform escapement:

Look what I found for $50 USd; off topic but I think you will like the photos.



Look what I found for $50 USd; off topic but I think you will like the photos.



I have placed the clock mechanism without canister back on to the base for ease of storage:

Look what I found for $50 USd; off topic but I think you will like the photos.

The inscription on the clock mechanism:

Look what I found for $50 USd; off topic but I think you will like the photos.

The inscription on the brass base plate:

Well there you have it, another project which will require the following:

```
1  case restoration and finish
2  brass strip, clean and relaqueur
3  new pen nib and correct ink
4  new charts
5  clock mechanism cleaned, adjusted and oiled.
```

I will do the work here and if your interested I will post the results. Of course this is for free time between writing the book (almost done), home, work, car, dog, life...

If you want more info on barographs start with wikipedia:

wikipedia barograph link

for parts if you have one:

parts link

The above link to the parts supplier is incredible, I already ordered new ink, charts, nib and the book and it arrived from England in 5 days!

Cheers, Geoff

in response to message #1 by Geoff Quickfall

Hi, Geoff;

I did not only like the photos, I also liked to see the instrument itself. I always tell my students that knowing the destiny does not mean knowing the path, or, in terms of knowledge and technology, knowing current, updated technology does not mean knowing technology itself, one must know the path, the history, the origin. All digital versions of analog devices are only possible after mastering the physical phenomenon they deal with.

A beautiful instrument, indeed! I like it!

Thanks for sharing!

Luiz (Brazil)

Re: Congrats! (was: Look what I found for $50 USd; off topic but I think you will like the photos).

*Message #3 Posted by **Geoff Quickfall** on 31 Jan 2010, 8:37 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Luiz,

Thanks for the response. I have two nephews, one an engineer and neither of them recognize pre 1980.

The engineer is a computer programming professional with an Engineering degree, electrical major and I tried showing him my functioning 9825A.

Chuckled at how primitive it was. Not the response I was expecting as these are the progenitors to his sophisticated systems. Also tried to explain (I taught courses at University during my post-grad studies) that the tech of today is the unsophisticated primitive of the future.

It may start to sink in....

Cheers, Geoff

*Message #4 Posted by **David Hayden** on 1 Feb 2010, 9:38 a.m.,*
in response to message #3 by Geoff Quickfall

That's a beautiful instrument Geoff. Like others, I look forward to any news you may post on the restoration.

Regarding your nephew, he shouldn't discount the early technology. There's a lot he can learn from it. I know because I'm also a computer programmer with an electrical engineering degree. People have lost sight of how fast computers are today and I have occasionally taken on projects at work that others thought couldn't be solved in a realistic amount of time. Knowing the basics of computers can help one write stunningly fast software. After all, a quad-core PC running at 3GHz executes a little less than 12 billion instructions per second. You can get a lot done in 12 billion steps... :)

Beautiful piece. It will look magnificent once fully restored. >>

in response to message #5 by tim m.

Hello Tim,

I agree, nice high grade 11 jewel movement. The balance spring is elinvar with a non compensated balance. Interestingly the standard for an eight day barograph is a one hour deviation at the end of the period. When you consider one rotation of the barrel is 7 days then an extremely accurate clock is not a requirement as it would not be indicated by the scale of the chart.

The movement is standard 18000 beats per hour (5 beats per second) or 2.5 herz. With my vibrometer I will adjust this to within minutes per week as long as the temperature does not deviate to much in the house and that should not be a problem.

Over 40 clocks reside here, most American eight day ranging from 1812 to 1900.

Two hundred and fifty watches, 150 restored Omegas, Longines, Mido, Universal, Wakmann-Breitling, and others including the HP-01.

Here is a restored Georgian Bracket (ca 1812) clock I did a couple of years ago that you would be interested in:

in response to message #6 by Geoff Quickfall

Hello Geoff,

I have seen you restoring a few abused watches to mint (or very good) condition. Dumb question: how can you tell a worthy restoring project from an abused beyond repair item? Is it always possible to turn an ugly duckling into a swan?

Just curiosity.

JuanJ

Re: Beautiful piece. It will look magnificent once fully restored. >>
*Message #9 Posted by **Geoff Quickfall** on 31 Jan 2010, 10:18 p.m.,*
in response to message #8 by Juan J

Hello Juan

Most if not all of my collection are museum restorations. I pay particular attention to finding new-old-stock parts whenever possible.

Before on the right, after on the left (hopefully that was obvious)! The dial was redone, the hands stripped, relumed and painted, crystal polished with diamond polishing paste, movement cleaned, lubricated and timed, case finish redone in the brushed sunburst pattern. All the gaskets in crown, pushers and case were replaced.

Look what I found for $50 USd; off topic but I think you will like the photos.

Notice the SST on the case back. It is the Boeing version, not the British/French Concorde.

Look what I found for $50 USd; off topic but I think you will like the photos.

The above before and after is of a rare Glycine chronograph. 100 were made in 1965 and only 5 are known to exist. This one is featured in a book about Glycine comming out in March.

Here is a link to an article I did on restoring another Glycine watch from bad to good (five it time to download):

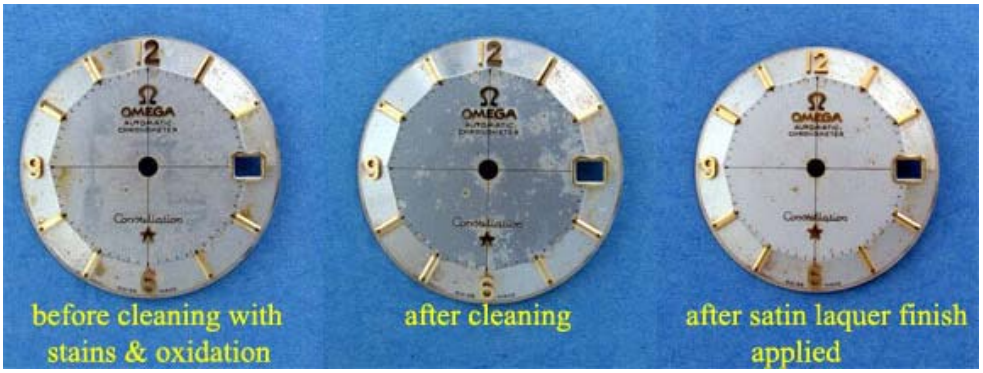
glycine repair article

As Tim has pictured above (hi Tim) you get a general feeling about what is classic and restorable. Of course this takes time as my early restorations were no name Swiss with nice movements. I personally look for complication, be it day-date-month, moonphase, chronograph, chronometer and etc. One must educate oneself as this is expensive and there are a lot of non-restorable watches being sold!

Here is a 1960 Omega Constellation that I restored a year ago:

Look what I found for $50 USd; off topic but I think you will like the photos.

some of the dial work done to the watch as part of the restoration:



So educating oneself is important, I have reference material on watch houses which includes case and movement numbers, style of hands and etc...

It is like knowing which HP calculator is worth spending time on. Do you cannabalize an HP10B for parts for the HP 42S in your collection or vice-versa.

Cheers, Geoff

Great find, Geoff! Please post when this is restored. I am curious to find out if it is accurate against today's techonlogy.

Re: Look what I found for $50 USd; off topic but I think you will like the photos.
*Message #12 Posted by **Geoff Quickfall** on 1 Feb 2010, 3:29 p.m.,*
in response to message #11 by Eddie W. Shore

The problem with setting the mechanism is getting the response of the nib to vertically match the correct chart readings.

From what I understand this is done by adjusting the lever system. There is a gross adjustment knob which I have already set to a meterology station at the airport. That is I set the nib to correspond to the reading of 29.98 inches on the y axis of the chart recieved from the met report.

I will chart the error when I am around the machine by comparing it to hourly met reports from the airport. At least I can determine the vertical error at that point. As it is now it would seem to almost be spot on.

Cheers, Geoff

SandMath - Reloaded

*Message #1 Posted by **Ángel Martin** on 31 Jan 2010, 12:18 p.m.*

Sunday News:-

A new version of the SandMath will soon come available at TOS, this time with the following new additions:

1. Digamma function, for any real number where it's defined
2. LogGamma function, for all real numbers where Gamma>0
3. Improved Bessel functions - with extensive MCODE inplementation.

The last one in particular is a hard nut to crack - I sat forth with the intention to implement it all in MCODE but soon enough I got a reality check (a few, actually)... it's about 80% MCODE for the first kind and 50% for the second kind. The speed gains are obvious in the first kind group, and not so much for the others given the 9-digit precission default mode.

Nevertheless it's a vast improvement over the previous all-User code versions, but I won't attempt something similar in a long time! (laborious and pesky as only MCODE can be...)

Almost forget: a new overlay has been designed for the SandMath module, with function launchers and color-coded function groups... will post samples as soon as I catch my breath.

Cheers, 'AM

PIL-box <- EMU41 <- Dosbox <- Linux

*Message #1 Posted by **Geir Isene** on 30 Jan 2010, 4:29 p.m.*

I have seen a post here some time back with a successful PIL-box <- EMU41 <- Dosbox <- OSX setup. Has anyone had success with Linux (Ubuntu)?

I have this EMU41.INI

```
--------------------

; emu41.ini        emu41 init file

[MODULES]
; page size filename
0  12 rom41cx.bin
3   4 cxfcn2d.bin
5   8 cxtime2c.bin
6   4 prter1e.bin
7   4 hpil1h.bin
; ------------
8  12 adv41b.bin
10  4 xio1a.bin

[DEVICES]
DISPLAY
HDRIVE1
HDRIVE2
LPRTER1
DOSLINK
XIL COM1:

--------------------
```

And this .dosboxrc

```
--------------------

[serial]
serial1=directserial realport:ttyUSB0
serial2=disabled
serial3=disabled
serial4=disabled

[dos]
keyboardlayout=no

[sdl]
mapperfile = .mapper.txt

[autoexec]
mount d: /home/noosisegei/G/Tech/Dos/
d:
cd bnu
bnu
cd ..
c:
```

The bnu runs but no success getting the PIL-box up and running :-(

Re: PIL-box <- EMU41 <- Dosbox <- Linux

*Message #2 Posted by **Egan Ford** on 2 Feb 2010, 7:56 p.m.,*
in response to message #1 by Geir Isene

Hello Geir,

I just got a chance to test this. Yes, it works with Ubuntu just fine.

A few notes:

1. I tested Ubuntu 9.04. Ubuntu 9.04 did not work properly with the PIL-Box until after I upgraded the kernel. There is a known issue with FTDI USB chips and Ubuntu 9.04. I do not know if 9.10 fixed it. On my 9.04 system I am using 2.6.30-02063006-generic.
2. For best performance you'll want to set the latency timer to 2. E.g. echo 2 >/sys/bus/usb/devices/5-1:1.0/ttyUSB0/latency_timer. The 5-1:1.0 will vary, use lsusb or dmesg to find the right hub.
3. I do not recall if this was necessary, but chmod 666 /dev/ttyUSB0 just in case.
4. No : after the COM1, e.g. XIL COM1, not XIL COM1: (perhaps it makes no difference).
5. I commented out all [DEVICES] but XIL for testing.

I just formatted a tape with NEWM 100. Fast and no probs. Contact me directly (egan@sense.net) if you need me to send you my EMU41.INI and my dosbox.prefs file.

Good luck.

HP gee-whiz question (batteries)

*Message #1 Posted by **megarat** on 29 Jan 2010, 2:29 a.m.*

Hey all,

I'm looking to solve a piece of trivia that goes beyond my own scope with HP calcs: which HP calculator was the first to use off-the-shelf batteries that still exist, abundantly, today? I mean batteries that I can buy at the corner pharmacy, not via special order from Rat Shack.

Is it really the Voyagers, or am I missing something earlier? Would it be the 41C series?

I'm less interested in outliers like the HP-01 or the computer-esque models (e.g., 71B). And I almost want to disqualify anything that uses N-cells because, as I understand it, the "standard size" of the cells has changed and they're now less convenient to replace with some models, e.g., the 28S/28C.

Edited: 29 Jan 2010, 2:33 a.m.

Re: HP gee-whiz question (batteries)

*Message #2 Posted by **Mohammed Hadi** on 29 Jan 2010, 3:40 a.m.,*
in response to message #1 by megarat

The 41C series uses type N cells which probably match the CR-2032 coin cells (modern hp calcs, some car remote keys and PC motherboards) in terms of local store availability. Just make sure you get the 1.5V rating as they come at severl voltage levels.

Re: HP gee-whiz question (batteries)

*Message #3 Posted by **Martin Pinckney** on 29 Jan 2010, 9:34 a.m.,*
in response to message #2 by Mohammed Hadi

I think N cells are 1.5v period, unless rechargeable substitutes, in which case they would be either 1.2v or 1.25v, depending on how the manufacturer rates them.

Re: HP gee-whiz question (batteries)

*Message #4 Posted by **Mike Reed** on 30 Jan 2010, 1:17 p.m.,*
in response to message #2 by Mohammed Hadi

I don't have any at hand to measure, but as I remember it, the 'N' cells I put in my several HP-41's (when I had them) were cylindrical, about the diameter of a AAA battery, but about 1/2 it's length. They were not disc shaped at all - not even remotely like a CR-2032. These N cells were and still are widely available in the USA. I just saw a blister pack of 4 at my local pharmacy (chemist shop, for Euro friends) for less than $5.

Re: HP gee-whiz question (batteries)

*Message #5 Posted by **Martin Pinckney** on 30 Jan 2010, 10:46 p.m.,*
in response to message #4 by Mike Reed

Mike, Mohammed said they matched "in terms of local store availability", not any physical features.

Re: HP gee-whiz question (batteries)

*Message #6 Posted by **Mohammed Hadi** on 31 Jan 2010, 6:08 a.m.,*
in response to message #5 by Martin Pinckney

Thank you Martin for responding on my behalf. And thank you also for correcting my information regarding the N cell rating.

Re: HP gee-whiz question (batteries)

*Message #7 Posted by **Martin Pinckney** on 31 Jan 2010, 2:49 p.m.,*
in response to message #6 by Mohammed Hadi

There is a 12v battery that is very close to the N cell in physical dimensions. A23 I think.

As I understand it (I'm certainly no authority on the subject): the "standard physical dimension" of N-cells went through a change sometime in the 90s, to be very slightly thicker.

Someone told me this by way of explanation for why it was so difficult to remove the batteries from my (then-) HP 28c. Validation pending. Perhaps this is complete bollocks and that N-cells have always been a bugger to change on the HP 28-series (or that my own unit was an outlier), but it's the only data I have.

Can anyone confirm/verify/refute?

It depends on where in the world you are. From my point of view, N-cells are off-the-shelf and abundant, as here in the UK I can get them at my local Tesco, in the Tesco brand even. I prefer Duracell and recently ordered some here.

By the way, the 12V remote batteries are slightly smaller than the N cell, but the best advice is "always read the label".

Symbolic Calculus 50g

*Message #1 Posted by **Shu Y Pong** on 28 Jan 2010, 8:40 p.m.*

I am trying to figure out how to get the 50g to take the time derivatives symbolicly for r in dynamics problems. so r dot and r double dot as a function of theta. So the question is, is there a way to make the calculator see theta symbolicly as some unknown function of time instead of as a constant so that when it takes the derivative it executes the chain rule as it would if theta were a function instead of getting zero because it thinks theta is a constant. for instance if r = sin(theta) then r dot = cos(theta)*theta dot. instead the calculator just gives zero or if you take it with respect to theta then you just get cos(theta)

Edited: 28 Jan 2010, 8:43 p.m.

You have to tell the calculator that theta is a function of t.

If you type in d/dt(cos (theta(t))) then you will get the result you expect. I get

cos(theta(t)) * d1 theta(t)

O.T. runaway car

*Message #1 Posted by **designnut** on 28 Jan 2010, 1:36 p.m.*

I experienced a mechanical accelerator stick on the highway, I turned the key off which locked the steering, so it was off, jiggle the pedal, on, steer a little until I gained control. The present problem is a potentiometer element losing it's end bonding to contacts. Lose the ground and people waiting at a light get a surge forward. Lose the upper contact and nothing happens until the pedal is fully on. Our toyota has an engine off key position which can be used to gain control. Those with a button start must press and hold it 3 seconds to stop. Best you know your options and make sure family is advised. Sam

in response to message #1 by designnut

Aha!

It's the damned "keyless entry" crap that has Toyota in a corner!

We have a manual Camry and can turn it off immediately. We have not had a problem with the "fly by wire" accelerator pedal.

Have you really experienced this porblem with the accelerator?

Here is the correspondence I had with Toyota some months ago:

Recently you contacted Toyota. Below is a summary of your contact message and our response.

Thank you for allowing us to be of service to you.

Subject Brake Override Sysytem on 2007 Camry

Discussion Thread Response (JSpe) 12/11/2009 02:46 PM Mr. Platt,

Thank you for your email to Brian Lyons, it has been forwarded to Toyota's Customer Experience Center for a response.

Your feedback to Toyota about your 2007 Camry is greatly appreciated, and we apologize for any concerns caused by the Potential Floor Mat Interference with Accelerator Pedal Safety Recall notification Toyota has issued regarding possible interference between the floor mat and the accelerator pedal on certain Toyota and Lexus models.

The brake override system you mention would prevent operation of a manual transmission in way described in your email. Please understand that the recall has just been issued, the application of the brake override system is still being researched. Once you receive your notification in the mail, please speak with your local Toyota dealership to see if any changes have been made and how the may affect the repairs that need to be completed on your vehicle.

If we can be of further assistance, please utilize the following link to find a variety of avenues to contact our offices, http://www.toyota.com/help/. Your email has been documented at our National Headquarters under file #0912119660.

Jay Spencer

Customer (Entered by JSpe) 12/11/2009 02:18 PM Dear Mr. Lyons,

I am the owner of a 2007 Camry with manual 5 speed transmission. I find the car to be pretty good. But I am concerned about this latest recall, and the plans being suggested, specifically:

"In addition, as a separate measure independent of the vehicle-based remedy, Toyota will install a brake override system onto the involved Camry, Avalon, and Lexus ES 350, IS350 and IS 250 models as an extra measure of confidence. This system cuts engine power in case of simultaneous application of both the accelerator and brake pedals."

As I mentioned, I am owner of the rather rare 5-speed manual version of the Camry. I like to drive it, and I frequently heel-toe and double-clutch on downshift. It seems to me that if a brake override system were installed, my car would not function properly. Will this new "feature" be installed on all future Toyota manual transmission cars?

I am further concerned that something more is going on with this story. My dealer tells me that the Root Cause Analysis showed the problem to be extra floormats--stacked on top of factory ones. The extra ones, which are specifically not authorized, slide around. It seems to me that this could (and probably does) happen on many types of cars, and further, that this is an operator problem. Why wouldn't Toyota stand up against this? I understand pleasing your customers and all, but I am a pleased customer, and having driven my car over 65k miles, I just cannot see how there is any sort of legitimate claim against Toyota, unless there is in fact something else going on. Is GM behind this? Is there actually something else that Toyota engineering is concerned about but not mentioning? I wonder.

I do hope that something will be done to prevent the loss of functionality of the manual transmission car. (It is bad enough now that we have clutch interlocks. In the old days, if you stalled in a flood, you could literally drive the car out of it on the starter motor--I know from experience. Now you have to lose your car in a flood--which happened to my father once).

I hope to hear from you with an answer to my concerns regarding manual transmission heel-toe and downshift.

Best regards,

Bill Platt

*Message #4 Posted by **designnut** on 28 Jan 2010, 3:37 p.m.,*
in response to message #3 by bill platt

Bill et al. My runaway was a Ford rental of long ago. I have not had any throttle problem with a 2009 Camry. I have read that the Japanese made controls are much better in failure rate. The US failure rate is about one in a thousand. I do not believe the floor mat causation as several have reported runaway with no

accelerator usage at all, like waiting at a light, or reversing.Some have stated they had no floor mat at the time of the incident. The Camry has a computer memory of conditions at the time of a crash, like the black box in aircraft. These should give important parameters. Sam

*Message #5 Posted by **Jon S Canale** on 28 Jan 2010, 4:40 p.m.,*
in response to message #4 by designnut

I think my Pontiac Vibe is included in this recall, being basically a Toyota Matrix under the hood.

I for one am not impressed with the hype of Toyota's magical "quality" levels. We had both a 2003 Vibe 5-spd (mine), and a 2004 automatic (wife's). At 5 years young and 65k miles, my 2003 was diagnosed with a bad manual transmission ($4k to fix), and while they were looking, an oil leak (another $2k to fix). From what I could find online, neither the transmission nor the oil leak are unheard of through the Vibe, Matrix, Corolla lineup. Needless to say, I was not spending $6,000 to fix this 5 year old car and traded it in on a used Ford. (With full disclosure to the dealer!)

My wife now drives the Ford and loves it, while I have her 2004 Vibe with an automatic transmission that does not "feel right" to me either. I may be looking for a replacement for that one as well.

Sorry, but I had to complain about this!!!

I'm not buying any more Toyota's, I can tell you that!

Re: O.T. runaway car

*Message #6 Posted by **db (martinez, ca.)** on 28 Jan 2010, 10:34 p.m.,*
in response to message #5 by Jon S Canale

re: "I'm not buying any more Toyota's, I can tell you that!"

I just heard that some fords are being recalled. It seems that ford bought parts from the same supplier that toyota did. Thank globalization; someone somewhere sold both manufacturers wear prone accelerator pedals. It's hard to buy something worth buying, that has an american nameplate, that is made in the us. The best 4wd is a subaru - made in the usa. The two best trucks are toyota and ford - both made here. Skill tools are now made in china, as are most RPN calculators. All i have been buying lately is building materials so thankfully; i can choose wood and it's all been from here in the good ol' us of a. Kinda worried about that hickory though; i think that it's from the "confederate states of america".

> I just heard that some fords are being recalled. It seems that ford bought parts from the same supplier that toyota did. Thank globalization; someone somewhere sold both manufacturers wear prone accelerator pedals. It's hard to buy something worth buying, that has an american nameplate, that is made in the us.

Pedal manufacturer:
http://www.ctscorp.com

and a couple press releases:
http://www.ctscorp.com/publications/press_releases/nr100127.htm.

http://www.ctscorp.com/publications/press_releases/nr100129.htm.

If you can assume these pedals are being correctly built to Toyota's specs, then this is a Toyota design problem. Toyota is not saying there is a manufacturing defect on CTS's part.

I heard on today's news that a new pedal, made of a different type of nylon that is not as "susceptible to moisture" (which is what is believed to "cause", or contribute to, the sticking) has been released to manufacturing.

I also heard Toyota doesn't believe the pedal to be the main problem, but is addressing it nonetheless.

*Message #8 Posted by **Marcus von Cube, Germany** on 29 Jan 2010, 1:58 p.m.,*
in response to message #7 by Matt Kernal

We had a mention of the case her in Germany today. Some Toyotas here are recalled. In the U.S, 19 people's deathes are attributed to the failure.

What I do not understand is why drivers are unable to turn the engine off or to set the gearshift to neutral. With a manual shift, I don't see a problem to stop the car even if I can't stop the engine.

Re: O.T. runaway car

*Message #9 Posted by **bill platt** on 29 Jan 2010, 2:10 p.m.,*
in response to message #8 by Marcus von Cube, Germany

There are only three manual transmission Camrys in the US and I own one of them ;-)

Seriously, there are probably ony 0.1% manuals in the US.

And when you consider the keyless entry 3 second aspect, and the fact that the keyless entry is de rigeur for fashionable people and standard on all but the base model, and the fact that the base model is less than 10% of sales (or something like that) then you can see where the problem comes from.

Of course an automatic tranny driver could knock the gearshift out of gear, except for one problem: unlike habitual manual drivers, the automatic driver is not accustomed to touching that thing except for parking--and being interested in automatic, want the easy weay out, no thinking etc....

I'm ranting but I think you know what I mean about "automatic" drivers....

Re: O.T. runaway car

*Message #10 Posted by **Matt Kernal** on 29 Jan 2010, 2:11 p.m.,*

in response to message #8 by Marcus von Cube, Germany

In the US, there are a lot more Automatic transmissions (vs Manual) installed in the affected cars, except for maybe the Corollas in the "economy" class of vehicle. BTW, I prefer the "stick" in my car.

The problem on the "higher end" cars, is that they don't have regular key-operated ignition switches any more, but rather, a Start-Stop pushbutton that is enabled by close (radio) proximity of the key fob that can stay in your pocket. The problem is that people try to turn off the car, but continually keep pushing the button (from panic no doubt), rather than holding it down for the required 3 seconds to actually turn off the engine.

I agree with you Marcus.. I don't understand what is so hard about shifting into Neutral? Also, applying the brakes can overcome the engine. I don't get it (unless people are in too much of a panic, or don't have enough time to think).

Edited: 29 Jan 2010, 2:19 p.m.

AUDI 5000 ;-))

*Message #11 Posted by **Joerg Woerner** on 29 Jan 2010, 3:03 p.m.,*
in response to message #8 by Marcus von Cube, Germany

Marcus,

Living now for almost four years in the US and driving a lot of rental cars both in Germany and here, I can tell you:

The cars here are different!!!

You can't switch an automatic transmission easily in Neutral while driving! The shifter is blocked from most movements if you are not touching the brake pedal, don't have the ignition on and so on. Differs from car to car. Recently I drove a Hyundai and it took me some time to stop the engine on the parking lot of an Outback Steakhouse (thw steak was okay). You had to push the gearshift in PARK before you could turn the engine off and pull the key. try this at 65 mph (I'm in NY State).

WHY these differences? Remember the Audi 5000 (Audi 100 in good old Germany) and its "sudden unintended accelerations"?

Cheers, Joerg

Remember the seat belt recall? They used the same similar line. Actually for the seat belts they went as far as to say it was the users ("fat Americans") who lodged food into the latch mechanism. Anything to save face.

Dimitri

Last July we rented a new Corolla for a trip. At one point I had to hit the brakes a little harder than usual, not a panic stop though, and inspite of ABS, I locked up all four wheels on dry pavement. It wasn't a problem, but obviously the ABS was no good on this car that only had one or two thousand miles on it.

in response to message #3 by bill platt

As a heel+toe double-clutcher, I understand where you're coming from. However, you don't *have* to submit to the recall.

As far as the clutch interlock, I've found that it's usually a pretty easy job to just disable the switch. I agree that it can be very handy to crank in gear (in my case, it was to load the car onto a trailer). Just be sure all potential drivers know about it before they turn the key!

Re: O.T. runaway car & interlocks

*Message #16 Posted by **Karl Schneider** on 29 Jan 2010, 1:13 a.m.,*
in response to message #3 by bill platt

For brake interlocks on automatic transmissions, you can thank the "unintended acceleration" incidents of the mid-1980's US Audi 5000 models, which invariably were caused by driver error -- foot on the gas instead of the brake, whose pedals were close together.

Clutch interlocks on manual-transmission cars are fairly new. Depressing the clutch on startup is a good idea for several reasons, but it should not be made compulsory such that emergency capabilities are disabled. If the switch fails, can the car be started? I also hope that push-starting for dead batteries and failed starters is not affected by clutch interlocks.

Not too far-fetched, maybe:

"On Wednesday, G.M. began offering discounts and no-interest financing specifically to Toyota owners.

“We’re responding to the concerns of many Toyota owners who have asked our dealers for help,” said a G.M. spokesman, Tom Henderson. “We’re reacting by offering a solution.”

Re: O.T. runaway car & interlocks

*Message #17 Posted by **Mike Reed** on 30 Jan 2010, 1:39 p.m.,*
in response to message #16 by Karl Schneider

I had a 2003 Toyota Corolla LE, automatic, in which my daughter had put clear plastic floor-mats over the carpet floor-mats that came with the car. On at least 3 separate occasions, while using "passing gear" for extra power to climb a hill, the accelerator pedal did in fact become hooked on the floor-mats, and wouldn't stop accelerating. A vigorous kick to the pedal freed it. Removal of the clear plastic mats fixed it - no problems since. In case of runaway acceleration, turn off engine BEFORE going to neutral, if at all possible, else don't go to neutral. Going to neutral first can result in a quick engine overspeed, and that can result in a thrown rod, broken crank or other lesser maladies... Expensive.

18 people reported dead. I'd prefer a broken engine.

Re: O.T. runaway car & interlocks

*Message #19 Posted by **bill platt** on 30 Jan 2010, 5:23 p.m.,*
in response to message #17 by Mike Reed

The problem with engine shutdown as the 1st option is that it isn't possible!

You have to wait 3 seconds because of the push-button! That is a a long time!

The real problem here is the Law of Unintended Consequences.

Consequence #1: keyless start does not have a safe effective kill switch (with is innately part of a normal key operation) Consequence #2: many automatic transmissions are difficult to safely shift out of gear while moving. Furthermore, there is wide variation from design to design. Finally, shifting the automatic, especially towards neutral, is not part of SOP and is not taught, practiced or envisioned by drivers. In an emergency situation, this lack of training becomes fatal.

My dentist drove his wife to the airport and she got out taking the key fob with her. He was in

fear of it stopping. I read they blame moisture in the throttle for the problems and are adding a shim as a fix. That is not entirely consistent with the low failures of The Japanese made Denso control. Color me skeptical. Sam

Re: O.T. runaway car

*Message #21 Posted by **Eric Rechlin** on 30 Jan 2010, 7:11 p.m.,*
in response to message #1 by designnut

Just hit the brakes, that's all it takes.

There's not a car sold in the US (unless modified in an unsafe fashion, perhaps by massively upgrading the engine while leaving the brakes stock) where the brakes cannot stop the car, even when the throttle is wide-open.

Yes, it may take some force, but all these deaths seen in these Toyota-related incidents could have been prevented if the driver would have just slammed on the brakes.

Here's some hard proof, from the March 2010 issue of Car and Driver magazine:

Toyota Camry V-6:
70-0 mph, closed throttle: 174 feet
70-0 mph, full throttle: 190 feet
100-0 mph, closed throttle: 347 feet
100-0 mph, full throttle: 435 feet

As you can see, while the stopping distance is increased somewhat, the car still stops just fine.

Yes, Toyota has a defect that should be addressed, but it's not the big deal that some people are making of it.

(for the record, I do happen to own a Type 44 Audi -- the vintage affected by the totally driver-caused "unintended acceleration" scare in the mid-80s -- and I'm not afraid of it)

Eric

Re: O.T. runaway car

*Message #22 Posted by **designnut** on 30 Jan 2010, 8:16 p.m.,*
in response to message #21 by Eric Rechlin

It is unwise to stop on a roadway, really bad news,one must get out of the traffic flow so some control of the car is needed. I had good success with the key on/off override. I suggest that the computer controlled cars have a rev limiter function built in, I am not certain. At full throttle engine vacuum boost is depends on the reserve and you get limited applications of the brake thereafter. Hard to keep control and not lose braking. Like the Boy Scouts, Be Prepared. Sam

Re: O.T. runaway car

*Message #23 Posted by **Garth Wilson** on 30 Jan 2010, 9:46 p.m.,*
in response to message #21 by Eric Rechlin

> Quote:
>
> Just hit the brakes, that's all it takes.

The lack of vacuum from having the throttle open will make it require more pedal pressure; but even a small woman should be able to put a couple hundred pounds on the pedal, which is always enough. I fault our driver's training though. It does not deal with how to manage mechanical failures like pilot instruction does. My wife had the vacuum fail one time, and she thought the brakes went out. Fortunately she did not crash. Then her mother told her she should pump the pedal, which of course does nothing but waste valuable braking time in that case. (There was no hydraulic failure.) She also didn't remember that the emergency brake is called that for a reason-- that it's not just for parking, but it's a direct mechanical linkage to the rear brakes that is 100% good even if the hydraulics were to fail completely. The bottom line is that there are various ways to stop that car, but driver's training doesn't teach you.

Re: O.T. runaway car

*Message #24 Posted by **Martin Pinckney** on 30 Jan 2010, 10:43 p.m.,*
in response to message #23 by Garth Wilson

All good advice, but for the emergency brake part - it almost always goes to the rear wheels only, and will NOT stop a car with a runaway engine. Many have proven this by driving around with the emergency brake on, until they finally smelled the burning shoes...

Re: O.T. runaway car

*Message #25 Posted by **Garth Wilson** on 31 Jan 2010, 3:42 a.m.,*
in response to message #24 by Martin Pinckney

If you apply it as intended (which means hard), it will be impossible to drive with it on. It will lock up the back wheels. If you have front-wheel drive and enough torque to break traction in 1st gear, then you might be out of luck for 1st gear, but not for gears used to reach higher speeds.

Re: O.T. runaway car

*Message #26 Posted by **designnut** on 31 Jan 2010, 11:52 a.m.,*
in response to message #25 by Garth Wilson

Toyota has blamed floor mats, now they call it a sticking accelerator. The fix is to increase the spring tension. When people experience sudden acceleration while waiting for a light, it is not a sticking pedal. They blamed water condensation. They don't have a clue. Heres their "fix" <The repair that U.S. regulators cleared is a "selective spacer," or shim, that would be inserted into the gas-pedal assembly to increase tension within the pedal to prevent the accelerator from remaining in a depressed position. Toyota has told dealers that it can produce as many as 120,000 of the shims a day.> I don't buy it, I hope you don't either. Sam

in response to message #27 by Martin Pinckney

Years ago a transformer failed at Collins Radio. There was corrosion next to a nylon bobbin. Collins chemists traced it to silicon mold release used in the bobbin manufacture. Silicon is incompletely polymerized and with heat and pressure releases monoatomic fluorine which is corrosive. Washing in alcohol made the parts usable. Silicon is notable a non-stick agent, so any attempt to cement parts to a nylon housing might meet with failure. I read the part is made of nylon. Sam

In 2005 after Hurricane Wilma came through, the electric coop on Marco Island got the power back on in record time - just two days if memory serves. Then a few days later it failed again. The reason? Salt carried by the high winds from the Gulf had been deposited on insulators causing them to ground out.

We were treated to the spectacle of the Fire Department going all over the island washing off the insulators with the high pressure hoses. An inelegant but very effective low-tech solution.

Could be a great platform for a HP-71B emulator too.

Re: OT: Apple iPad

*Message #5 Posted by **Juergen Keller** on 28 Jan 2010, 1:58 p.m.,*
in response to message #1 by Don Shepherd

Do you really have to pay to get the SDK? I thought you only have to register and pay if you want to run your programs on an iPhone etc. (and not in the emulator which is good enough to learn iPhone programming). And then you get a possibility to sell your programs easily in the App Store and earn money (if you are lucky, much more than $99).

Well, Apple has cool gadgets but they also know very well how to earn money. Now, they sell eBooks, too,

which is a fast growing market ...

Regards,
Juergen

Re: OT: Apple iPad

*Message #6 Posted by **Don Shepherd** on 28 Jan 2010, 3:09 p.m.,*
in response to message #5 by Juergen Keller

Juergen, I think you have to pay the $99 to be an individual developer and get the SDK. From whatever Apple web page I was at, it certainly seemed that the SDK was not free. I may be wrong.

I am not interested in making apps for others to use, I'm just interested in seeing how it is programmed and playing around with it. But it looks like that will cost me $99 (plus the cost of an Apple computer to develop the app on).

You are right, Apple knows how to make money! Always has.

Don

Re: OT: Apple iPad

*Message #7 Posted by **Juergen Keller** on 28 Jan 2010, 3:46 p.m.,*
in response to message #6 by Don Shepherd

On http://developer.apple.com/iphone/, they say the following:

> Quote:
>
> To access iPhone SDK 3.1.2 and additional technical resources and information, log in with your Registered iPhone Developer Apple ID and password, or sign up as a free Registered iPhone Developer today.

I think you mix up something. Signing up as a Registered iPhone Developer is free, but if you want to distribute your program over App Store you have to join the iPhone Developer Program for $99.

As far as I heard from colleagues they have some good and useful tutorials. Give them a try and enjoy :-)

Cheers, Juergen

Still much cheaper than software develpment for Windows used to be. MS development tools used be quite expensive. Meanwhile there a few free tools from MS (Visual Basic Express comes to my mind.)

Re: OT: Apple iPad

*Message #9 Posted by **fbronner** on 28 Jan 2010, 8:17 p.m.,*
in response to message #8 by Marcus von Cube, Germany

Yes Visual express may be free, but as soon as you want to make something a little bit more professional you have to pay for it. And the license is pretty expensive.

Whereas the XCode is the same version whether you develop for iPhone, iPad or OS X.

As a footnote, if you want to develop only for OS X, its free since XCode comes with it. Its only to develop and deploy to iPhone or iPad you need the registration.

> Times have changed. For the worse.

Yes and no, I would say (regarding the term "worse"). As a convinced Macintosh user for over 20 years, I had great expectations in this thing. Technologically, these are more or less met: Fast processor, large enough and seemingly very responsive touchscreen, long battery life, UMTS, WLAN and Bluetooth wireless capability, GPS sensor. Apart from the missing OLED display that some rumours attributed to the iPad. And the missing USB (and FireWire and DVI and PC card) interface.

But unfortunately, it turns out to be a kingsize iPhone and not a Macintosh. None of my programs will run on it. Only "apps". That have to be uploaded through the iTunes store, even if I program them myself. The same with all documents for the eBook-reader (probably). And so on. So its a lifestyle/consumer product, not a computer. I'm glad that I found a replacement logic board for my titanium PowerBook, that I originally wanted to replace with an iPad when it broke. This way, I can wait until the iPad evolves into something that really replaces my notebook computer...

And regarding its use as a "pocket" calculator: Why is everybody thinking in terms of emulators only? This thing really offers the opportunity to be much more than that: A truly customisable calculator. With hundreds of keys if necessary. All unshifted and without the need to navigate through those awful menus. What I would like to see is something like a "CDK" (calculator development kit). A toolbox that can be used to create ones own calculator by dragging and dropping keys and display elements into the most convenient positions. With a library of mathematical functions in the background that can be assigned to the keys at will. This should not be much harder to implement than an emulator?

Greetings, Max

I'm confused, are you saying that if you develop an app yourself and want to use it on your own iPad, you

have to load it via the iTunes store?

It's always been this way on the iPhone. Why should it change with the maxi-iPhone?

You can use the SDK to develop applications for the simulator on the Mac. If you want to run them on a device, you have to register. It costs you $99/year to be able to push to the device (thru a cable or thru itunes if you sell/give away in the appstore).

For instance, there are a couple of applications I have developped which I use only on my iPhone and my wife's iPhone. I created what is known as an Ad-hoc version which can be installed by having the user drop the application and related certificate in their iTunes.

For the iPad, as consumer and developer we have a shared directory which can be used to exchange information between the iPad and the computer. So we could possibly put PDF files in that directory to be read by a special purpose PDF reader.

Actually this document exchange schemes opens the door to a lot of potentially interesting apps.

Hopefully. If one can't directly push one's documents onto the iPad to use the device as an eBook-reader, then it is definitely going to be no-no for me. Like the Amazon Kindle, where you have to upload your _own_ documents onto your _own_ reader through Amazon and pay for the service. No way!

Greetings, Max

So in a roundabout way, Don is right, it costs $99 to develop an app for your iPad. What's the use of developing an app without eventually putting it on the target platform?

Maxi-iphone? Seems Apple didn't get consult with women when they named their new table. Google "IPad jokes"

They still have time to change the name :-)

in response to message #1 by Don Shepherd

I've been a tablet PC user for several years - currently a Fujitsu Stylistic ST-5030D which runs Windows XP Tablet. Main use is as a reference computer for all my project materials. I keep linked PDF's of all project files for a particular project. I can quickly look at drawings, specifications, change orders, etc, in the office and in the field.

Having said that, I have been waiting for the iPad hoping that it would stir up the marketplace. But have to admit, I wes not too impressed - just a large iTouch/iPhone. No easy way to put my own generated content on it - which is my main use.

But, I do think the real opportunity for it will be in the colleges/universities. I can forsee a university including an iPad in the tutition and the students would purchase/download all the text books and other study material thru iTunes. The textbook publishers would love it - it would totally eliminate the used textbook market (which the publishers hate), since there would be no way to transer the textbook to another user. Also, no sharing of text books - every student would need to purchase a textbook, since most students would not be willing to loan out their iPad to another student to study from.

Will text book prices come now - doubt it. They might actually go up since it's a closed market place.

A lot of colleges are already distributing course material on the iPhone/iTouch/podcasts and I think the iPad could accerate that trend.

By the way, Poqet, in conjunction with Fujitsu, had the first "PAD" touch screen tablet with their PoqetPad which ran MSDOS. This was introduced in 1991. I had one and it had the virtual pop-up keyboad to type on. It was used mainly in vertical markets, such as inventory.

Bill,

Yes, you can put generated content in a shared directory. When connected to a computer the shared directory appears as a drive on your desktop.

You just have to make sure you are putting stuff you have some sort of reader for.

Well, if you can't develop an application on your own, say on a Mac PC with the Apple furnished SDK, and load it directly on the iPad and execute it, then I have no use for the iPad. I thought it would be an interesting platform to learn to develop something for. But I will never agree to use a third party service just to load my app on a computer I own anyhow. I can't imagine anybody with any sense would do that.

Re: OT: Apple iPad

*Message #23 Posted by **Egan Ford** on 29 Jan 2010, 7:36 p.m.,*
in response to message #22 by Don Shepherd

You do not need to use a 3rd party service. You pay $99 for a cross compiler. You cross compile it. You create a bundle and drop it on iTunes and then you sync. No 3rd party service needed. If you think your app is worth something, well you've paid the $99 you might as well published it for others and perhaps get a bit of coin back.

OR

You jailbreak it and do it anyway you like.

Re: OT: Apple iPad

*Message #24 Posted by **Don Shepherd** on 29 Jan 2010, 8:57 p.m.,*
in response to message #23 by Egan Ford

Egan, as far as I'm concerned, iTunes "is" a third party. The first party would be my Mac computer I would develop on, the second party is the iPad I would own, and those are the only two parties I want. And, from what I've gathered from this thread, that $99 would have to be paid every year, for example, if I wanted to change my app a year down the road. If that's the way Apple currently works, count me out, that's not a price I'm willing to pay.

Re: OT: Apple iPad

*Message #25 Posted by **Egan Ford** on 30 Jan 2010, 9:23 a.m.,*
in response to message #24 by Don Shepherd

Let me be a bit clearer. When I said iTunes, I meant the iTunes application, not the iTunes Store. You can develop an app and create an ipa bundle and then drag and drop it onto iTunes and then sync with your phone. If you desire, you can share that bundle with your family and friends (if you have their iPhone ID) and like you they simply just need to drag and drop onto the iTunes app. I do not see how this is third party. Many PDAs/Phones use some type of OS app to install apps on the device. I know this was true with my Palm and my WinMo devices. The 50g has an OS app too.

As for the $99 tax, I do not think Apple is really interested in the hobbyist market. The $99 tax entitles you to create iPhone/iPad/iTouch binaries and publish them on the App Store. Unfortunately, whether or not you publish you still pay $99. The $99/year is a subscription model. I suppose that if you never update Xcode or your i* OSes, and never publish, then I'd expect that you could continue to create ad hoc bundles for yourself and friends. But who is not going to upgrade their OS at least once a year.

Bottom line your code does not have to leave your laptop or i* device, however there is no free ride. Before you throw in the towel over principle, register and download the free Xcode SDK. You'll be able to create free-to-redistribute OS/X apps and i* apps for use in the simulator. You may unlock some hidden talent, and while developing your personal-not-to-be-shared-super-

secret-app you may stumble across that killer app. So far you're out $0 (if you already own a Mac and your *time* is worthless :-). Publish the killer app for $99, recoup your $99 and then some.

*Message #26 Posted by **Don Shepherd** on 30 Jan 2010, 11:05 a.m.,*
in response to message #25 by Egan Ford

Thanks for the explanation, Egan. I appreciate your insight into how this whole thing works. Obviously, I've been out of the loop for awhile (like 30 years!). The Apple model with software development, i-whatever, and $99 developer/subscription fee bears no resemblance to the PC (and Mac) world of 20 or 30 years ago, which is what this old fossil is used to.

Around 1987 or 88, I developed an air traffic control simulator on my Macintosh. I forget what model of Mac that was on; it was something between the original 128k Mac (which I bought in 1984) and a PowerBook Mac laptop. But in those days, you could buy a Microsoft QuickBASIC compiler, write and compile your code and create the executable, put it on a floppy disk and sell it to whomever you wanted for whatever price you wanted. And then they could run it on their Mac. I'm sure the MS compiler cost around $100, probably. I did have to pay Apple some amount of money to license MacinTalk, which was the Apple speech synthesis application that my app used, and that was a yearly fee. I only paid it once because a year after I started selling it, I stopped. My advertising expenses always exceeded by sales receipts, and it just wasn't "fun" anymore. The things that made it worthwhile were (1) it was fun to learn how to develop a Mac application, (2) since I was the designer and implementor, I could write it exactly as I wanted, and (3) I met lots of great people who bought it and had suggestions about how to make it better, many of which I implemented. I am still friends today with one gentleman who lives in San Francisco and who was one of my first customers. So it was fun and I never regretted it. I still have a copy of the source code (but it won't run on anything I currently own).

So when I saw the neat-looking iPad, I thought it would be nice to develop an air traffic control simulation that would run on that nice platform, with all of it's innovative user-interface features. Like, if you tilt the thing, all the planes will fall to one side of the radar screen! But, seriously, I thought it would be cool to see what is required to code on that platform. Of course, that would require an Apple PC, which I don't currently own. And the $99 fee I could live with as long as it was a one-time fee and I wouldn't have to keep paying it in future years, because, despite the iStore, I have no interest in selling whatever it is I create, I'm just doing it for fun and to learn. But apparently Apple isn't predisposed to "fun" and the individual programmer who just wants to learn and play. Not that they ever were, really, but my experience base, even with the PC, is you buy a language compiler once, you don't keep "re-buying" it in the future.

So I'll wait and see. I'm not saying I will never do this, but I'm not going to sink money into buying an Apple computer to develop on, buying the iPad, paying the $99, and then find I must continue paying $99 forever.

That's just too high a price for "fun."

And I don't know what "jailbreak" means, but it sounds like something I wouldn't want to do.

Me neither, that's why I haven't bought an iPhone until now. If I have to "crack" something that I buy before I can use it to full capability, I'm not interested.

The 1988 Macintosh you mention must have been a Mac II. Big ugly grey box, but lightyears ahead of the Windows PCs of that time. That's the Mac that got me started too - I was ph.d. student then and it was the only machine (available to us at least) that was able to run "Mathematica". Is your air traffic control simulation still somewhere to be found? I have an old PowerBook 150 somewhere that should be able to run it.

Greetings, Max

In general OS/X Mac development today is really no different than Apple II development 30 years ago. The APIs are well documented and the development tools are free (e.g., BASIC in the 70's and C/C++/Objective-C today) and the code generated royalty free.

The iPhone, iPod, iPad is different. It follows the traditional consumer electrics model. If you think $99/year is bad look at the costs to be an official Nintendo, XBox, Playstation, PSP, etc... developer. These platforms all have closed development models, high fees, rigid approval processes, etc... Makes i* development look like a breeze. And the volume of Apps in the App Store proves it. IMHO, i* development compared to other embedded machines in its class (close proprietary embedded systems) is superior.

Bottom line Apple stopped being a computer company when the iPod was released. They even changed their name from Apple Computer Inc. to Apple Inc. to reflect that. Apple wants to be the next Sony, Nokia, etc...

> Quote:

You can still do that today, except that you pay nothing for Xcode.

I think that is why most of us still do it. I still write Apple II programs for my Apple //c for fun. Lately I have been using the cc65 C cross compiler. But I dabble in Forth and ASM as well.

> Quote:

> I still have a copy of the source code (but it won't run on anything I currently own).

There are a number of great vintage Mac emulators. My 2nd computer was a Mac 512K. I use vMac to emulate it. Every now and then I'll write a program for it for fun. Apple's support site still contains Apple II and vintage Mac OS files free for download and use. More vintage Mac abandonware can be found here: http://www.macintoshgarden.org/. For PowerMac emulation use SheepShaver.

What you are really buying/year is the license to develop, execute, and publish on the i*. Again when you start to think of the i* more like a Nintendo DS or PSP and less of a computer and given the history it makes sense.

Of course there are alternatives, Linux and WinMo are "open" and have a different model. MS wants you to create apps for WinMo so that more OEMs have to license WinMo to run your apps. Apple, Nintendo, Sony, and the rest of the consumer electronic giants do not license their tech to anyone. It's a closed model, you sign an NDA, they approve/reject your code, etc... E.g., Nintendo has to approve your retail artwork--if you suck at drawing, you are out.

Linux is the light at the end of the tunnel. I've had two embedded Linux PDA's and run Linux on everything but my MacBook. My job is Linux-based. I really like Linux, but so far Linux on my PDA's and desktop have been seriously lacking in one way or another. Android/Chrome OS may change that, but it sure is taking a long time. I got the iPhone because of the apps, not because of Apple. BTW, same reason I abandoned Mac for Windows years ago--Apps.

Linux has numerous advantages, but a big disadvantage shared by WinMo--it has to support multiple devices making app development a challenge. E.g. I could not run a EMU48 on my WinMo device because it had a keyboard and no stylus. Sony, Nintendo, Apple, etc... keep it all inside, the apps and the experience are awesome.

> Quote:
>
> So I'll wait and see. I'm not saying I will never do this, but I'm not going to sink money into buying an Apple computer to develop on, buying the iPad, paying the $99, and then find I must continue paying $99 forever.

There are other reasons to buy a Mac. I'd make recreational i* development your last priority.

> Quote:
>
> That's just too high a price for "fun."

Can you put a price on "fun"? :-)

> Quote:
>
> And I don't know what "jailbreak" means, but it sounds like something I wouldn't want to do.

Every closed consumer electronic device has some sort of hack to allow hobbyists to develop applications without any restrictive license or costs and/or to repurpose. This is true of the PSP, Playstation, Nintendo DS and Wii, iPhone, iPod, iPod Classic, XBox, TI83, etc... E.g., the 50g has a hacked firmware to run HPGCC3 code! BTW, when the "open" Android phone first released it needed a Jailbreak to run unauthorized apps. How ironic. Unsure of the current state of things.

Each platform hack is different, some require a hardware mod, others a software mod. To *jailbreak* an i* requires that an unauthorized program be added to your list of programs so that you can install more unauthorized programs. It's just software and it is reverseable. Given the smorgasbord of authorized apps today, fewer and fewer jailbreak.

BTW, this computer hacking mentality goes all the way back to the late 50's. Open vs closed, the individual vs the institution, etc... is nothing new. (Read the book "Hackers" by Levy for the complete history--a must read IMHO).

Bottom line the embedded space is still mostly closed. Development of i* products compared to many other non-traditional-computer consumer electronic products is actually not that bad. Protecting profits is clearly the motivator--not necessarily a bad thing.

*Message #33 Posted by **Eric Smith** on 4 Feb 2010, 1:31 a.m.,*
in response to message #31 by Egan Ford

Android didn't ever need a "jailbreak" to run unathorized apps. From day 1 there was a setting to allow loading apps from web sites other than the Android Marketplace.

The Android "jailbreak" is to get root access to the phone. The main reason to do that is to run a tethering application.

This is in comparison to the Apple iPhone ,iPod Touch, and iPad, where it is not possible to load non-App-Store applications without a jailbreak.

Thanks for the clarification. IIRC, root access was also needed to run a number of applications that had to run as 'root', e.g. Screenshot, Tweaks, etc... But your point is understood, Android development not as restrictive as iPhone.

The message I was trying to get across is that just because its Linux it is not necessarily 100% open.

Re: OT: Apple iPad

*Message #35 Posted by **Frido Bohn** on 1 Feb 2010, 8:23 a.m.,*
in response to message #21 by Thomas Radtke

Dear all,

I absolutely agree that times have changed. Well, this is not just a revolutionary insight, as times always tend to change. And if it is for the worse, time will tell. So we have somewhat that resembles an incursion, doesn't it?

Apart from the specifics of the iPad, the market strategy to embed software and hardware to one sole product is not just new. It is essentially the strategy of Apple.
The separation of hardware and software was first established successfully by the IBM-PC/MS-DOS system. This was the opposite of the strategy which was followed by companies like Commodore, Atari, Sinclair and also Apple. The main advantage of the open system for the consumer was the pricing, the disadvantage surely the poor coordination between hardware and software, as we all have stories to tell. However, the disadvantage resulted in an explosion of creativity, as many skilled people took the chance to

engage their capabilities in the development of that insufficient system. You may make me eat my words, but I believe that the drawbacks of the open system was the surge for platforms as Linux and even for the whole internet stuff, which never had such a broad distribution if there were not the kind of people who showed interest to make things work better. If the initial development of the internet was to be promoted by companies it probably never would have been any more than a military network system or a high-cost amusement for well-to-be people.
When I look at the discussion on the iPad software-development, I have the strong impression that the pendulum swings back in terms of end-user creativity. A situation appears to arise where some companies try to dominate the computer(-like) market by the coerced embedment of hardware and software again. Even worse, they appear to impede the end-user of being creative. Or is there any standard to encourage own programming in devices including iPad, Kindle or the like? Instead, I am confronted with a frightening juridical apparatus, euphemistically called "licensing" before I am able to test my skills with a "hello world" program. Today, programming isn't even chic or trendy, for the masses it is the pastime of socially impaired nerds. This aggravates the situation which finally will lead us to a pure-consumer attitude where creativity and one's own initiative is unwanted.
Instead, the handling with computers will be restricted to the use of "apps" in a "cloud" environment where all activities will be controlled by a handful of companies and monitored by some unknown authorities with unknown purposes – welcome, brave new world!

Sorry for the long reply. If I had more time it would have been shorter for sure (based loosely on Goethe).

Frido

*Message #37 Posted by **Egan Ford** on 3 Feb 2010, 11:14 a.m.,*
in response to message #36 by Dimitri Simitas

I expect that we will see an abundance of *Pads this year and Apple has set the price. I expect to see ASUS and others with something around $199-$299 before year-end.

I am going to guess that Apple's profits will be on the 30% they snag off of every iApp and media sale. Apple can afford to drop the price to be competitive. The competition however has to make its profit on the device alone. It may either be expensive or lacking in features (usability features IMHO) or quality.

If you want a tablet that is also a hobby (i.e. you install it, set it up, troubleshoot it, virus scan it, update it, etc...) then the value would be on the non-Apple devices. I dumped my Linux-based PDA's for an iPhone because I was tired of it being a hobby.

I expect that most people here will be more attracted to non-Apple tablets because of the technical nature of the audience here. If you recall when the iPod released it was a subset of most other MP3 players, cost more, and you had to use iTunes. But it was so easy to use and relatively trouble free. It was the MP3

player for everybody else. There are more non-techies than techies. People that just want a thing and not a hobby. The iPad with its high price, lacking features (e.g. Flash video, open development model, front facing camera, etc...) will still be the better seller. And all those that provide content via Flash (like many already) will be rushing to develop apps and HTML5 content.

Metric vs. US model of HP 50g

*Message #1 Posted by **Eric Smith** on 28 Jan 2010, 1:01 a.m.*

From the HP 50g Data Sheet (HP #4AA1-0865ENUC, June 2007), I see that those of you in the rest of the world get a much smaller model of the HP 50g than the one here in the US:

Size (L x W x D) 7.24 x 3.47 x 0.98 cm (18.4 x 8.8 x 2.5 in)

It is surprising that there isn't more difference in mass: 196g for the metric model vs. about 250g for the US model, assuming that the specified weight of 8.8 oz was measured in a 1G field.

Since the metric model is too small, and the US model is absolutely huge, I think I'll stick with my HP-48GX. :-)

in response to message #6 by Walter B

The fact that the US has not converted is frustrating to me. In all of my science classes in school in the 1970's we used the metric system exclusively. However in university engineering classes the professors used our US / British based units. 30 years later we are still in limbo using a mix of both systems. What will it take to finish the conversion? Maybe we are waiting for the US to win a football World Cup. ;-)

Regards,

John

*Message #11 Posted by **Norman Dziedzic** on 3 Feb 2010, 8:37 a.m.,*
in response to message #10 by John B. Smitherman

>What will it take to finish the conversion?

The sad reality is that it will probably take the US losing a war and having our factories bombed to a point of destruction equivalent to what happened in Europe in the World Wars.

Doing a real change to the metric system takes real money. Imagine all the lumber mills changing all of their hard tooling to make plywood in 5mm, 10mm etc. sizes. Also the steel mills will have untold amounts of tooling to change. Every paper maker will have to change all it's dies to make A4 paper vs. 8.5x11" and then all the envelope manufacturers have to change their tooling to accept the A4 paper in different folded configurations. Every machine that processes paper will have to be changed.

How about changing every road sign in the US AND where it is placed so we don't have stupid signs that say "1.61 km to Exit"

The auto industry does most thing in metric because they change their tooling every few years and they would pay that cost regardless of the dimensions of the parts. They convert to US units for their advertising and marketing specs printed here but they design and build in metric.

The bottled beverage industry is more and more a metric dominated field. For a long time it was the lonely 2 liter pop bottle that was the only purely metric consumer product here in the states. Now most plastic water bottles and many wine bottles are in true ml designations. But guess what, the hard tooling for plastic blow molding wears out from constant temperature cycling of hot plastic and cold air. Since they are changing it on a regular basis anyway it can be made metric easily.

I'm not sure but I'd venture to say that most of our toys here that come from China are made to standard metric dimensions.

We can talk about history, or tradition of bullheadedness but, just like the calculator market, it comes down to cold hard cash.

> We can talk about history, or tradition of bullheadedness but, just like the calculator market, it comes down to cold hard cash.

While both may be true, OTOH there may be a lot of cash saved. Thinking of global players producing material for more than only the US of A: they may discard their Imperial tools after next maintenance interval. And there are further advantages: e.g. paper may be cut in A0, where from A1, A2, etc. are easily made by cutting in halves repeatedly. No heaps of waste paper anymore. - No need to memorize strange conversion constants, in particular in geometry. Etc. as discussed here ad nauseam.

For the traffic signs, let the miles die last - nobody will care.

John, I wouldn't hold my breath waiting for the US to convert to metric. Just ain't gonna happen. We know our inches and feet and pounds and we like them. We teach our kids about the metric system in school, but it is soon forgotton because it is rarely used here. We put up with liters sometimes, but we don't like them.

I live In Iowa, USA and would much prefer if all measurements were metric. I like liters, not quarts.

Re: Metric vs. US model of HP 50g

*Message #15 Posted by **bill platt** on 3 Feb 2010, 6:07 p.m.,*
in response to message #14 by Britt

Any engineer in the US, especially if younger than what--50 or so?--is perfectly happy in either

system. It's what we do. The measurement system is trivial and arbitrary compared to the real problems.

Liters are no "better" than quarts, and in fact they are so similar in absolute size that, like the meter and the yard, you can be roughly familiar with either from the other.

What I like most about or customary units is that they are almost all one syllable words.

```
quart
pound
inch
foot
yard
slug
ounce
peck
pint
rod
chain
league
furlong (oops, 2 syls)
bushel (oops, 2 syls)
gallon (oops)

compare to
litre
kilogram
newton
centimetre
meter
millimeter
gram (finally!)
pascal  (ok I guess that is shorter than PSI but it doesn't mean
anything unless you say newtons per square meter...)
```

How about the so-called "Gimli glider," an Air Canada jet that ran out of fuel and nearly crash-landed but for the skill of the pilots, due (in part) to confusion between US and Imperial gallons. It's a great story about compounding of errors. Makes one wonder why the 50g has both "mi" and "miUS" where 1_mi = .999998_miUS . Love that old engineering joke about "furlongs per fortnight" ! cheers, Glenn

I corresponded with a British lady when they made their conversion to metric, She called her new decimal system of currency metric. I remember changing a pound note to coins, I got 9 coins and looked stunned, so the lady said I have given you 5 shillings and 4 half crown. live nd learn. Then there was the octagonal thruppence for telephones. They got over it, why can't we? Sam Levy in San Diego

Re: Metric vs. US model of HP 50g

*Message #20 Posted by **bill platt** on 28 Jan 2010, 12:30 p.m.,*
in response to message #19 by designnut

But the old currency was actually easier to divide and handle in your head. 10 divides evenly only one way. 12 divides into thirds, 4ths, halfs, 6ths. The 20/12 system made possible all sorts of equal divisions.

In decimal, it is "easier" except that it isn't.

As physicists would say, choice of base system is "trivial."

So then why is base 10 so good? Only because you are used to it!

I actually flew the "Gimli Glider" before it was retired from service last year.

Fuelling in an imperial measure with metric units in an aircraft with correct sensing fuel gauges as well as fuel flow guages.

1. First, while sitting in the cockpit, the fuel guy hands you a receipt in gallons or litres of Jet A fuel loaded.

2. This gets converted by multiplying with a specific gravity (S.G.)to kilograms of fuel. The guages are in kilograms in Canadian Aircraft. The S.G. is temperature specific and varies each day. The fuel remaining in a tank is usually cold from altitude to landing and the S.G. will not be the same as the loaded fuel. Fortunately the fuel remaining in tank after landing is usually a percentage of the fuel loaded for the next flight and therefore has a small error to the total calculations.

3. Add the fuel on board (FOB) at landing to the converted to kilograms fuel boarded (TENDERED FUEL) and you have the total fuel.

4. Ways to check fuel consumption in the air. Five hour (Toronto to Vancouver B767) flight times on average 5000 kg/hour and you will burn 35,000kgs. The average varies due to weight of aircraft, winds and etc. This plus operational taxi fuel, holding fuel, alternate fuel, approach fuel, 5% slop fuel and you may have 45000 kgs on board. So if all goes correctly and you arrive on sched as planned then you should have approximately 10000 kgs remaining. The guages will do an analog or digital calculation based on sensors in the tank, temperature and display kilograms remaining (Fuel in tank). The computers using fuel flow will calculate the fuel in tank by taking the original FOB and subtracting the fuel flow versus time (calculated fuel in tank). This is all displayed info in the aircraft.

NOW for the Gimli glider:

1. New aircraft to the fleet and relatively new to Canada operations and the MOT (our FAA). Also the first Aircraft in Canada at AC with metric guages.

2. Fuel guages inoperative at the gate so no display of fuel. Fuel guages at the wing fuelling points also unservicable. Fuel flow system inoperative so no calculated remaining fuel indication. Not a problem usually, as one has drip sticks that will measure the depth of the fuel in the three tanks and can be accessed after fueling. The sticks WERE in inches at the time of purchase. The Air Canada charts had been converted to metric so the inches on the sticks had to be converted to cm on the chart by maintenance in conjunction with the fueller who was delivering fuel by the litre which had to be converted to kilograms with an S.G. The mistake was made at the conversion of depth of fuel in inches to cms by maintenance.

3. No indications in the air as to actual fuel via guages on tanks or fuel flow on board and since the error was made at the drip stick measurement, the incorrect total fuel on board was delivered to the pilots. They followed the book by using the maintenance procedure to measure fuel in tanks with the drip sticks. As a result, they did their rough math of X amount of fuel divided by the average for the flight and came up with sufficient. This would normally be compared to the onboard system which will display insufficient fuel but did not due to a KNOWN technical problem which pecipitated the drip stick measurment by maintenance.

4. Rectification. Well every where we go we get fuel loaded in litres except for the US. All guages on the aircraft are metric. Conversion is done from gallons to kilograms based on the S.G. No aircraft can be dispatched with a multiple fuel indication failure now. At least one of the systems must be in place as a check against the fueler, aircraft, pilots and maintenance.

The aircraft should be controllable in any loss of all engine circumstance, the skill entered when the F/O new of a decomissioned airforce runway which was obtainable in the glide, otherwise this aircraft would have landed in a field. Instead it was repaired and flew until 2008. By the way, an B767 should glide about 90 miles if at 30,000 feet.

Kind of an extremely reduced synopsis of the situation. But it sure does indicate how complicated a simple system can become:

Inches to cms, cms via a chart to kilograms, fuel boarded in gallons converted via SG to kilograms. Broken fuel guages system including the fuel flow system and both sets of guages; cockpit and wing fuel point.....

Cheers, Geoff

p.s. I am doing this from memory as I was at Canadian Airlines at the time of the incident. The problem is the fuel was boarded ultimately in pounds and labeled kilograms. So 27000 pounds incorrectly labeled 27000 kilograms would equate 12,244 kilograms. Well short of the required fuel!

Re: Metric vs. US model of HP 50g

*Message #27 Posted by **Dave Shaffer (Arizona)** on 30 Jan 2010, 4:57 p.m.,*
in response to message #26 by Geoff Quickfall

Geoff,

Could they have been warned, or at least curious, at how long (or how far down the field they went) until Vrot? Do you calculate that for every take off? Must depend to some extent on mass of the plane. Would the missing ~13000 kg have made a noticeable difference (depends on the mass of a 767, I guess)?

I time every takeoff when I'm riding commercial. If we ever get to 40 seconds before the plane actually lifts off, I'm getting ready to run for the exits! Does that sound about right?

All my own take offs & landings are in C150/172/177 - where a few hundred pounds DOES make a difference.

Re: Metric vs. US model of HP 50g

*Message #28 Posted by **Geoff Quickfall** on 30 Jan 2010, 7:26 p.m.,*
in response to message #27 by Dave Shaffer (Arizona)

Hi Dave.

40 seconds sounds about right for a heavy weight takeoff for any airliner. It depends on thrust to weight to lift ratios.

For example 777 engines on a 737 then 40 seconds would be to long ;-)

Vr (or V rotate) can take a while at a max takeoff weight.

Getting back to the 767 the entire feel of the aircraft is artificially induced via feedback to the control column by what is known as the Q-feel. In the C150/172/... this feedback is due to the direct input of the airflow on the control surface through cables to the control wheel. In small, medium and heavy airliners the feel is artificial.

So having less weight in the aircraft would have made it marginally more nimble but not noticeable through the controls. Also Vrot should have been reduced due to the lighter actual weight. Vr would have been calculated based on:

```
1  weight
2  temperature
3  air pressure
4  runway surface condition
5  wind
6  climb gradient
7  V2 calculated speed
```

As such and combined with whether the crew elected to takeoff off with a calculated 'reduced thrust'(see below) then the difference in weight would have been masked by the other conditions. Suffice to say, every takeoff off at the same takeoff weight, based on the above list would result in a different feel.

reduced takeoff is the thrust calculated to safely get the aircraft airborne while considering runway length,

stoppability on the runway prior to V1 and numerous other factors including runway contamination. In effect if all parameters allow it, it results in a thrust setting set lower then max power to save on engine wear. Again a short description!

Cheers, Geoff

p.s. the 777-300 that I fly weighs approximately 725000 pounds at max takeoff (Vancouver - Sydney non stop) and a shortage of 17000 lbs would not make any difference in the feel of the aircraft at takeoff thrust!

Edited: 30 Jan 2010, 8:04 p.m.

*Message #29 Posted by **David Hayden** on 30 Jan 2010, 9:30 p.m.,*
in response to message #26 by Geoff Quickfall

Geoff,

Do you know if the maintenance crew was aware that the fuel gauges and flow sensors were broken, and thus how critical their measurements and conversions were? I wonder if they were being sloppy because they thought that all the other systems would catch any error.

Re: Metric vs. US model of HP 50g

*Message #30 Posted by **Geoff Quickfall** on 30 Jan 2010, 10:20 p.m.,*
in response to message #29 by David Hayden

Without casting dispersions, not the intent here as the entire procedure was new.

The reason one 'drips' the tanks is because any single element in the fueling system is suspect. New aircraft, new systems, new requirements for trouble shooting.

To put it in perspective a few definitions are required.

1 MEL or the minimum equipment list. This is a list of items which are required for the dispatch of an aircraft. For example on a two engined aircraft there are 4 generators. One in each engine, one in the Auxilary Power unit (a small get engine used for ground or air power and adjunct to pressurization if required do to abnormal operations) and a RAT (ram air turbine) which deploys automatically or manually in flight to supply both hydraulic back up and electrical power in the event of a loss of both engine generators and APU. The question arises, one generator is not working due to a known fault. Do you ground the aircraft. Well, here there is no need as you can run the APU in the air and on the ground to cover for the failed generator. Flights will be restricted to over land only and subject to other rules, to much to cover here. Also one generator through switching is sufficient to run the entire aircraft if required. So the MEL may say "fix at main base within x days and run the APU to cover the failed engine systems.

2 the Fuel system (767): composed of six pumps, three tanks, Fuel gauges for 'total in tank', 'fuel flow', 'fuel used', system for inflight and onground determination of amount, calculating system for total fuel minus fuel used, on board display, fuel wing area display for ground personel and more.

3 The MEL by Boeing and AC state that a drip is required if any single system has failed. This will cover the aircraft to the next maintenance cycle as dictated in the MEL. The crew would have determined that a drip was required and directed maintenance to proceed with the external drip.

The point is that the drip was done as per the MEL to cover what in affect was a total system indication failure. It would not have been done on a functional system. Aircraft today do not dispatch on total system failures regardless of the drip test availability thanks to this incident. In fact, if any single gauge is U/S (unservicable) a drip is required.

So my assumption is that due diligence was exercised by maintenance as per the MEL and that the conversion error was due to other failures; metric ignorance, misplaced decimal position (calculator or hand done conversion?) or something else....

Cheers, Geoff

I think that was more pilot error anyways. Yes there are some that refer to the old Imp. Gal but 99% of the people I met always use the American Gallon here in Canada.

I learned the metric system first due to the governments regulations that prohibited teachers from teaching the SAE/Imp system (thankfully reversed in the last year or so). Then I learned the Imperial system in high school. I now don't understand what makes the SI system so much "better". Its a measurement system be it meters, inches or corn cobs if its got a base measurement and a standard increment rate, does one become better then the other?

Exactly that's the point: SI is a measurement SYSTEM - the Imperial collection is a heap of mostly unconnected measures. As I said in another post in this thread, this was discussed in this very forum several times ad nauseam already.

in response to message #32 by Walter B

> Quote:

> the Imperial collection is a heap of mostly unconnected measures.

3 teaspoons to a tablespoon. 2 tablespoons to a ounce. 8 ounces to a cup. 2 cups to a pint 2 pints to a quart. 4 quarts to a gallon.

3 grains to a inch. 36 grains or 12 inches to a foot. 36 inches or 3 feet to a yard. 5,280 feet or 1760 yards to a mile. (which is a 15 minute walk)

7000 grains or 16 ounces to a pound.

It all interrelates, and the above is simply from memory. Its just another system. Based on the grain (weight, distance and fluid volumes) but still a system non-the-less.

Dimitri

Re: Metric vs. US model of HP 50g

*Message #35 Posted by **Walter B** on 5 Feb 2010, 12:56 a.m.,*
in response to message #34 by Dimitri Simitas

Well:

Distance: 1km = 1000m, 1m = 1000mm, 1mm = 1000µm, 1µm = 1000nm, ...

Area: 1km^2 = 100ha, 1ha = 100a, 1a = 100m^2, 1m^2 = 100dm^2, 1dm^2 = 100cm^2, 1cm^2 = 100mm^2, ...

Volume: 1m^3 = 1000dm^3, 1dm^3 = 1liter = 1000cm^3, 1cm^3 = 1000mm^3, ...

Mass: 1Mt = 1000kt, 1kt = 1000t, 1t = 1000kg, 1kg = 1000g, 1g = 1000mg, 1mg = 1000µg, ...

Force: 1N = 1 kg*m/s^2

Pressure: 1Pa = 1 N/m^2

Energy, work: 1J = 1 N*m = 1 V*A*s

Power: 1W = 1 N*m/s = 1 V*A

I could go on ... but it's sufficient to see the *slight* difference between a system and a so called "system", isn't it?

Edit: For everyday "household" use 1m = 1 big step, 1km = 15 minutes comfortable walk, 0,3l = a big cup or a good glass of juice, 0,5l = a good jar of beer, 1l = the same in Bavaria :-) , 1kg = the "weight" of 1l Bavarian beer, 10N = the weight of the same ;-) , 2kJ = the energy contained in 100g of Swiss chocolate = 1 bar of chocolate, etc.
Off household approximation: Speed of light = 3e8 km/s = 30 cm/ns d:-)

I get what you are saying however once you learn a system it makes no difference. At least for me in using both, going from one to the other or at the same time if I need to. Numbers are numbers if they are defined you can work with them even if its not terribly efficient adding .654" to 142.56mm if both are given.

Just 'cause everybody's doin' it don't make it right.

We get along just fine. And we actually are (along with Canadians bet even moreso than them) the only engineers on the planet who 1. can work in multiple units and 2. Are able to directly utilize a vast body of previous work without having to convert everything.

Seriously, when we trade internationally, we use metric. We make a lot of metric stuff in the U.S. and always have. Note that it is in "customary" measure that you find all the odd

stuff. In engineering we are heavily metric in the U.S.

How you measure your milk, or your fuel or count your potatoes is trivial. But changing the rules is anything but trivial. That's why it is smart for us to let sleeping dogs lie. Besides, it ain't like we have 20 or 50 millions--we are a huge country with 300 millions. We are a big market. If people want to sell to us and we want it in gallons, by god, they'll find a way to sell it to us :-)

Till you look at the costs of R&D pure metric solutions from scratch, which would probably not be done so you'd end up with many 6.35mm, 25.4mm etc dimensions.

Dimitri

in response to message #44 by Dimitri Simitas

That article is superficial and doesn't address how these things work in practice.

In fact, why would you redesign the whole system just to be "metric?" You wouldn't. Rather, you'd make hard conversions within tolerances for some parts, and direct soft conversions for others, with a tolerance matching the existing but specified in the new units.

The interfacing parts could be designed in metric units, while the bulk of the legacy platform would, as you say, have "25.4mm" parts labeled as such.

There would not be any reason to convert all of the design drawings. Political and non-scientific people love to make a lot of hay about this metric "disaster" of the Mars thing. In fact it wasn't a "metric" issue as much as it was poor

documentation. Assuming kilograms when grams or tonnes is improperly labeled, or cm vs mm, is just as much of a problem.

In the 1970s we "mated" with the Russians in space. I think we can handle it :-)

Yep, either not written correctly or not read correctly. But it's just sooo much easier to blame a system...

> Quote:
>
> Assuming kilograms when grams or tonnes is improperly labeled, or cm vs mm, is just as much of a problem.

Or... just plain getting it wrong: integrating an electronic box some years ago I noticed it had an error in the speed. I determined that the supplier had multiplied going from knots to m/s rather than divided. this may seem an imperial to metric conversion error at first glance, but the factor used was correct but the maths was wrong - they could have made the same error going from km/h to m/s or even just from km to m.

*Message #51 Posted by **bill platt** on 9 Feb 2010, 11:24 a.m.,*
in response to message #50 by Eric Smith

Right, it isn't SI--but it *is* metric, and it correlates to water so nicely, which the Joule does not, yet the Celsius units do...and so it is another case where you can see "metric" being arbitrarily inconsistent--no unit system is perfect. Metric is great, use it all the time, but it ain't the end-all be-all that some would have us believe.

Another unit which is metric but not SI is the liter. *Gasp in horror*. "What! Yes it is! Yes it is! Frenchmen use it! It must be!" (No, it's not...sorry.)

Re: Metric vs. US model of HP 50g

*Message #52 Posted by **Walter B** on 9 Feb 2010, 5:26 p.m.,*
in response to message #51 by bill platt

IMHO, what we compare is SI and anything else, and the recommendation is to take SI. It may be called "go metric" in the US of A, but then "metric" is just another word for SI.

With that said, there were (and are) of course predecessors of SI, too. Way back, our forefathers used cubits (Ellen) and spans (?) and other strange measures like different miles. These were dropped in the process of nationbuilding and later to facilitate trade. Some names survived like in our pound equalling 500g. And there are some (actually very few) handy non-SI units for household use like the liter being exactly 10^-3 m^3, or the Zentner (= 50kg). You will notice, however, *very* simple conversions to SI there. So in real life, though only a minority knows it's called SI, everybody here moves smoothly within this system.

The Calorie is a relict of an older set of units. Like many other "practical" units it turned out to be less than practical in science, so it was discarded by an international agreement some decades ago.

So, if the US of A wants to support international trade by making it easier, it's obvious what to do. If it's not done, however, that's a statement, too. Anyway, an error won't become any better by being kept d;-)

P.S.: Admittedly SI is far from perfection, but it's the most perfect system we know so far. If you have something better, stand up and show.

Re: Metric vs. US model of HP 50g

*Message #53 Posted by **bill platt** on 9 Feb 2010, 7:11 p.m.,*
in response to message #52 by Walter B

Hi Walter,

My point was that calorie and liter are both *metric* but not SI. Calories are great with thermodynamics. Joules are great with electricity. Oh well.

Metric is a larger sphere than SI. Metric includes MKS, cgs, calories, liters etc that are not strictly part of the "systeme."

Also, American business uses a lot more metric than the rest of the world seems to realize. I've worked on a lot of projects that were metric. In terms of total number, maybe 30% of them. I've worked on projects that were 100% metricated from engineering to shop level, and on others that were engineered in mm and shop in inches(stupid but it works if done right). One job had a special scale made up to read a metric drawing in feet inches (now that's really being a foot-dragger!). American firms export lots of equipment around the world. Some of it was designed in feet / pounds, but a lot is also metricated. Our federal highway administration has been doing its roadway engineering in metric since the 1970s. Roads are labeled in miles (why change? We all know what a mile feels like. There is no need to relate it to your height, or the length of your boat or whatever...).

Where there is money to be made, business goes--and so if metric is specified, business complies. Vive la free-market!

The "metric pound" of 500g is more confusion actually (rather than 454g). Leave a pound a pound and it is better...but yes these things happen.

Hi Bill,

as written earlier already, I see the miles as you do.

For our pound (Pfund), it's just an handy unit people use at the grocers etc. - bad luck you use the translation in English. Both have a long tradition, almost no confusion in real life observed.

Referring to your understanding of "metric": You don't have to repeat all errors and detours the rest of the world made on its way to SI. No problems with liters etc. being just nice names for units fitting perfectly into SI. But please leave the calories and their siblings were they are: in the dustbin of history.

HTH,

Walter

*Message #55 Posted by **Marcus von Cube, Germany** on 10 Feb 2010, 8:47 a.m.,*
in response to message #54 by Walter B

We "metricians" aren't free from detours: In plumming almost all measures are in "Zoll" (inches). And the diameter of my bike's wheels is much easier remembered in Zoll than in mm.

What I'll never get into my head is "miles per gallon": We deal with "liters per kilometer" which is reciprocal to the imperial way of thinking. You answer the question "How far will I get with the contents of my fuel tank?" while we ask "What will it cost me to get to my destination?" Different

question - different answer.

Re: Metric vs. US model of HP 50g

*Message #56 Posted by **bill platt** on 10 Feb 2010, 10:42 a.m.,*
in response to message #55 by Marcus von Cube, Germany

Hi Marcus,

We actually do use gallons per mile too--but not for little tiny cars. We use that for big machines (ships, trains etc).

Sort of reminds me of the choice of wave number or frequency...

That's funny about bicycle wheels. Here, we used to talk about 20" 24" 26" (three types: schwinn, raleigh, and balloon) 27" and 28".

But then with road racing, we started to use the European designations 700c, which ultimately supplanted the 27". At first, we would have 27" clincher training wheelsets and tubular race sets, and it would be a pain, having to slightly adjust the brake shoes. With 700c they matched the tubulars.

Ultimately, if you were in the business (rather than an ordinary Joe on the street) the metric rim diameter became the only proper way to do businees. 700c=622, 27"=630, 28"=635. These rim diameters are molded into the sidewall of all tires. Similarly, this would eliminate the chance for confusion between Schwinn 26" and standard (Raleigh) 26"....

So ironically, in the US, except for some overall sizing for marketing (17" frame, 26" wheels), we've gone completely metric. I along time ago switched from thinking about 23" to 24" frames to thinking about 58 to 60cm. Crankarms: 172,5mm, handlebars: Cinelli model 66-42(42cm), seatpost: Campagnolo 27,2 etc. Of course chain will always be 1/2" x (? or ? depending on track or road) and pedal threads will always be 9/16" because that is that....

> What I'll never get into my head is "miles per gallon": We deal with "liters per kilometer" which is reciprocal to the imperial way of thinking.

Just another way to look at it, take for example a trip from Toronto to Barrie is 60mi/100km. My truck burns 15mi/gal or 15.5l/100km.

That's 60mi/15gal=4 gal or 15.20$

While its in SI

.155klx100km = 15.5l and the same cost.

Yes I chose those 2 cities for conivance but the same applies for any distance.

Dimitri

Ha ha, and I'm used to thinking in km per liter :). I also buy my car tyres as 15" by 195mm. Talk about a mix! :)

Re: Metric vs. US model of HP 50g

*Message #59 Posted by **bill platt** on 12 Feb 2010, 11:01 a.m.,*
in response to message #58 by Bart (UK)

Tyres here in the US are normally designated in mixed units:

205/70R16

205 means 205mm wide, 70 is the aspect ratio (dimensionless) and 16 is the diameter in inches. There are "millimetric" diameter tires in which case you'll see something like 205/70R415 etc but these are uncommon.

Yes I realize that now thanks. Always avoided powers that made the equation look large. That is what I was taught in school, 1km not 1000m or 1x10^3m. Similar to why I have always used asin/acos/atan instead of the power to the negative 1.

Dimitri

> How about the so-called "Gimli glider," an Air Canada jet that ran out of fuel and nearly crash-landed but for the skill of the pilots, due (in part) to confusion between US and Imperial gallons.

umm, no. As this NewYork Times article title clearly states its was a **metric** conversion error:

JET'S FUEL RAN OUT AFTER METRIC CONVERSION ERRORS
By RICHARD WITKIN (The New York Times)
July 30, 1983
"The carrier said that fuel had been measured manually with special "drip sticks" because the electronic gauging system aboard the plane, Air Canada's first metric aircraft, was not working properly. But in converting the fuel volume determined from the stick readings into total fuel weight, the wrong conversion factors were used. The net result was that the pilots apparently thought the figure for fuel weight on board was in kilograms when it was really pounds. Since one kilogram equals 2.2 pounds, the plane took off with about half the fuel that it should have had."

"Gimli glider" (was Re: Metric vs. US model of HP 50g)

*Message #67 Posted by **Bart (UK)** on 5 Feb 2010, 5:17 a.m.,*
in response to message #66 by bt_schmidt

> Quote:
>
> As this NewYork Times article...

You actually believe anything the press has to say? (I'm a bit pessimistic about the press, taking news items with a grain of salt*)

Referring to Geoff Quickfall's (an airline pilot in Canada) good description of the probable sequence of events (elsewhere in the thread), it indeed seems conversion problems had a role to play. But, I would put the ultimate blame on the procedures of the day, i.e. allowing a commercial passenger aircraft to take off without operative on-board fuel indication. Perhaps this came from an old view of "that's how we did it in the old days anyway" (referring to the assumed adequacy of drip sticks).

However, with high volume air travel requiring ground personnel to service many aricraft per day and airlaines demanding shorter turn around times, the amount of conversions to and fro (volume to weight conversions, different unit conversions), i.e. increased ground personnel & aircrew work load, old procedures may not be adequate. Unfortunately it takes these kind of incidents (and many with more tragic consequences) to highlight and change inadequate procedures (the last point 4 in Geoff's post).

*From my Dutch backgroud: "take with a grain of salt" is to not take too seriously/literally

*Message #70 Posted by **Kiyoshi Akima** on 28 Jan 2010, 1:44 p.m.,*
in response to message #69 by Norman Dziedzic

Even within one country, unit confusion can cause problems.

During WWII, the British decided to fly some Spitfires off a carrier to the island of Malta. Because of U-boats and Luftwaffe bombers, the Navy wasn't too keen on sailing one of their big carriers in the confines of the Med, so they asked the Air Force how close they needed to get. The RAF replied "xxx miles." The RN said "Righto" and dropped them off xxx *nautical* miles from the island.

Amazingly, four of the twelve Spits made it.

There is a fairly long discussion of the several missions to supply Spitfires to Malta with British aircraft carriers and with the American carrier Wasp in Wikpedia but there is no mention of the incident that you describe. Would you please provide a reference for this story?

Re: Spitfires and Malta

*Message #73 Posted by **Les Bell** on 7 Feb 2010, 5:25 a.m.,*
in response to message #72 by Palmer O. Hanson, Jr.

Aviation flight planning these days is done pretty much exclusively in nautical miles, knots, etc. (the exception being the old Soviet Union, which was metric to the extent of even having altimeters calibrated in metres). I've never worked any other way.

However, I went back and checked in my father-in-law's navigation textbook, which he used when training as an RAF navigator in 1944 (he flew in night fighter Mosquitos, towards the end of WW II). Although it mentions statute miles, nautical miles and kilometres when introducing measurement of distance, all the calculations after that are done in nautical miles and knots.

But then I pulled my copy of "Air Publication 1565E and Air Publication 2280 A, B & C - Pilot's Notes - Spitfire VA, VB and VC Aircraft and SeaFire IB, IIC and III Aircraft" (1943) off the shelf. It quotes speeds for cruise, stall, aerobatics, etc. in m.p.h. EXCEPT in the Addendum for the Seafire, where the notes on "Deck landing" quote speeds in knots.

(On the other hand, my "Pilot's Notes" books for the Mosquito - which date from 1949 - give all speeds in knots.)

So, it's *possible* that the RAF was still working in m.p.h at that time while the Royal Navy used knots. I'd be surprised if they made such a fundamental flight planning error, though.

Best,

--- Les
[http://www.lesbell.com.au]

Hurricanes, not Spitfires

*Message #74 Posted by **Palmer O. Hanson, Jr.** on 9 Feb 2010, 11:25 p.m.,*
in response to message #73 by Les Bell

I couldn't verify the Spitfire story but I did find a very similar story about sending Hurricanes to Malta from the H.M.S. Argus on November 17, 1940.

Here's an idea on what went wrong: Models of the Hurricanes revised for flight from aircraft carriers appeared later in the war but were not available in 1940 so far as I have been able to tell. The Hurricanes flown from the H.M.S. Argus had been designed for flight from land. Could they have taken off with less than full tanks to reduce the distance to take-off to that available on the carrier.

One of the interesting things that I discovered during my reading was that the pilots who flew Hurricanes did not have a high regard for the Spitfires, and vice versa. That was reminiscent of the

mutual disregard of other machines by the pilots of F-100's and F-101's in the late 1950's. And, of course, that is similar to the mutual disregard of the TI and HP communities for the other company's machines.

HP41 Mcode: SELPF arguments

*Message #1 Posted by **Meindert Kuipers** on 27 Jan 2010, 12:11 p.m.*

While working on my disassembler I decided to add some comments to the SELPF instrcution, but I could not find any substantial info about the meaning of the arguments. 9 seems to be the printer, and anything below 9 belongs to HP-IL. Does anyone have more info about this instruction?

Thanks, Meindert

Re: HP41 Mcode: SELPF arguments

*Message #2 Posted by **Raymond Del Tondo** on 27 Jan 2010, 12:56 p.m.,*
in response to message #1 by Meindert Kuipers

Hi Meindert,

please take a look into the Zenrom manual;-)

IIRC the SELPF argument addresses the peripheral, and may be followed by data word(s) .

The data word LSB indicates the end of the data sequence, which means control will be passed back to the mainframe.

HTH

Raymond

Re: HP41 Mcode: SELPF arguments

*Message #3 Posted by **Meindert Kuipers** on 28 Jan 2010, 2:05 a.m.,*
in response to message #2 by Raymond Del Tondo

Thanks for the tip, it confirms what I already suspected,

Meindert

Re: HP41 Mcode: SELPF arguments

*Message #4 Posted by **PeterP** on 28 Jan 2010, 3:14 p.m.,*
in response to message #1 by Meindert Kuipers

i think one of the most complete list of SELPF is part of the HEPAX manual which can be found on this dvd as well as on TOS I believe.

Cheers

Peter

OT: Retro programmable makes comeback.

*Message #1 Posted by **Egan Ford** on 26 Jan 2010, 11:33 p.m.*

http://www.bigtrakisback.com/index_2.htm

Originally released in '79 with 16 programming steps this 2010 replica will have 32 programming steps! Replica also 1/2 scale.

Perhaps another '79 programmable will make a come back.

Re: OT: Retro programmable makes comeback.

in response to message #1 by Egan Ford

These were great. While I was no teen (30 at the Time), I had one with the dump trailor given to me for Christmas. I took it to work and programmed it to go from my desk to my secretary's desk where it would stop, flash lights and make siren sound, dump its trailor and then return to my desk. I would put whatever I wanted to deliver to my secrtary and use the truck to deliver it. Needless to say, not much work actually got done as eveyone would sit around and watch it do its thing.

Thanks for the link and the memory.

Bill

TI RPN Simulator

*Message #1 Posted by **db (martinez, ca.)** on 26 Jan 2010, 10:54 p.m.*

Joerg; I see you are ebabying one of those. Before it goes: the folks here might find it interesting if you could post a photo of the printed output from a short program, or maybe a short before/after, using it on one of your 59 series. Here i am burning up your time but that's the kind of thing that would go well on the articles page. It's been a common enough recurring topic over the years.

Re: TI RPN Simulator

special characters on hp71b + hp-il + 82162a ?

*Message #1 Posted by **John Ioannidis** on 26 Jan 2010, 5:12 p.m.*

I'm trying to do the HP41's equivalent of BLDSPC and ACSPC.

I tried creating a character with CHRSET, it displays fine on the display (DISP CHR$(128)), but prints nothing when I do PRINT CHR$(128).

What am I missing?

Re: special characters on hp71b + hp-il + 82162a ?

*Message #2 Posted by **Raymund Heuvel** on 26 Jan 2010, 6:51 p.m.,*
in response to message #1 by John Ioannidis

Hi

The 71B CHARSET characters are not equivalent to any printer. The format is 8 * 6 bits.

The 82162A uses 7 bits for characters.

Closest approach: use only 7 bits of the CHARSET character set. Assuming a 82162A, put the device in Graphics Mode, get the correct substring of CHARSET$ and send it to the printer.

Future Value Problem, right?

*Message #1 Posted by **Anthony Baldwin** on 25 Jan 2010, 7:45 p.m.*

I'm trying to understand how to approach this problem using an HP12C.

Suppose you deposit $2,500 at the end of year 1, nothing at the end of year 2, $750 at the end of year 3, and $1,300 at the end of year 4. Assuming that these amounts will be compounded at an annual rate of 9 percent, how much will you have on deposit at the end of five years?

When I enter CF0 as 0

n=5

I=9

CFj1 as 2500

CFj2 as 0

CFJ3 as 750

CFJ4 as 1300

CFj5 as 0 (since it in year 5 there's no mention of a deposit).

Shouldn't I be able to solve for FV? I'm not getting a result (other than 0, even if I don't enter CFj5 at all).

Please advise.

Thanks.

AB

Re: Future Value Problem, right?

*Message #2 Posted by **Don Shepherd** on 25 Jan 2010, 8:41 p.m.,*
in response to message #1 by Anthony Baldwin

Anthony, I'm certainly no expert in these things, but reviewing the 12c manual, it seems that cash flows (CF0, CF1-) are related to NPV, not the TVM functions. I'd read the manual on NPV, it seems like that's what you want to use, not FV.

Re: Future Value Problem, right?

*Message #3 Posted by **Dave Britten** on 25 Jan 2010, 10:04 p.m.,*
in response to message #2 by Don Shepherd

After your enter your cash flows and calculate NPV, just store that value in PV and solve for FV as usual.

I get -5,837.03 as expected. (Make sure PMT is 0.)

Disclaimer: I majored in computer science, not finance! This approach might not work in all cases.

Re: Future Value Problem, right?

*Message #4 Posted by **Peter A. Gebhardt** on 25 Jan 2010, 8:53 p.m.,*
in response to message #1 by Anthony Baldwin

Anthony,

I can't resist: "At least enough money to buy an HP 17b+ ..." ;-))

Now for the serious part of my answer:

Because your trusty 12c doesn't have a routine for calculating NFV directly (thats the FV counterpart in he world of irregular cash-flows), you should be able to help yourself, by calculating

NFV == NPV*(1+9/100)^5

Best regards,

Peter A. Gebhardt

Re: Future Value Problem, right?

*Message #5 Posted by **Chuck** on 25 Jan 2010, 9:20 p.m.,*
in response to message #1 by Anthony Baldwin

Here's a possible, albeit inelegant way (I've only used the 12C about 5 times so dont know the "business" way to do it).

```
2500 STO 1
1.09 STO x 1
1.09 STO x 1

750 STO + 1
1.09 STO x 1

1300 STO + 1
1.09 STO x 1

RCL 1
```

I'm sure there's a better way. However, on the Casio 9860, put {2500, 0, 750, 1300,0} into List1, 9% into I% and press NFV; Voila. I'm still getting used to the Casio (versus HP's), but it's a pretty versatile little bugger.

Chuck

Re: Future Value Problem, right?

*Message #6 Posted by **David Hayden** on 25 Jan 2010, 9:25 p.m.,*
in response to message #1 by Anthony Baldwin

I know barely enough finance to balance my checkbook, but it seems to me that you can calculate this one by

hand. You just have to consider the deposits individually. Note that everything is deposited at the *end* of the year, so we're really talking about a 4 year span (from the end of year 1 to the end of year5). Also I'm assuming that the compounding period is 1 year. The problem states the rate, but not the compounding period.

```
$2,500 earns 9% for 4 years.  2500*1.09^4 = 3528.95
$750 earns 9% for 2 years.    750*1.09^2 = 891.08
1300 earns 9% for 1 year. 1300*1.09 = 1417
```

Summing to totals gives $5837.03 at then end of 5th year.

Dave

Re: Future Value Problem: what about a program to compute it?

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 25 Jan 2010, 11:01 p.m.,*
in response to message #1 by Anthony Baldwin

Hi;

some years ago I was asked about how to compute the net future value in an HP12C, as the NFV is available in almost all other financial calcs after the HP12C and with more computing power: HP18C, 19B, 17B, 19BII, 17BII, and so. (I am not sure if the HP27S has it). The solution is trivial and already mentioned: compute NPV (net present value) with the given cash flow data and apply compound interest rate to the computed NPV (as PV) given that [n] (number of periods) matches the summation of all Nj. So, after entering all cash flow data and given [i] (interest rate), the program should automatically compute NPV, store the summation of all Nj in [n] then compute [FV], thus NFV. The program computes the summation of all Nj in the stack prior to store it in [n]. Then [PMT] is set to zero prior to compute FV. Here is the listing:

```
f [NPV]
RCL [n]
0
RCL g [Nj]
+
RCL g [CFj]
Rv
RCL [n]
g [x=0]
g [GTO] 13   if 12C Platinum: GTO 013
Rv
g [GTO] 04   if 12C PLatinum: GTO 004
+
STO [n]
0
[PMT]
[FV]
x<>y
[n]
Rv
CHS
g GTO 00   if 12C Platinum: GTO 000

Obs:
Rv    - roll-down key
x<>y  - x exchange y key
Key the program in starting at step #01, otherwise [GTO] data should be adjusted.
```

If everything is fine, last step is #22. To compute NFV, just follow the cash flow routine to store data, key the interst rate and press [i], then press

```
[GTO] 00
[R/S]
```

The expected NFV should be in the display. Please, let me know if it works as expected.

Cheers.

Luiz (Brazil)

Edited: 25 Jan 2010, 11:30 p.m.

Re: Future Value Problem, right?

*Message #8 Posted by **cyrille de Brébisson** on 26 Jan 2010, 9:23 a.m.,*
in response to message #1 by Anthony Baldwin

hello,

this is not a FV, but a NFV (Net Future Value) Problem.

you can either move to a calcualtor that suports NFV, may I propose the 20 or 30b?

if you are dead set on using the 12c, you can calculate the NPV (Net Present Value). then plug the NPV as PV in the TVM calculation, and use the TVM functions to calcualte FV.

regards, cyrille

Re: Future Value Problem, right?

*Message #9 Posted by **Eddie W. Shore** on 26 Jan 2010, 9:45 a.m.,*
in response to message #1 by Anthony Baldwin

I confirm with the others: enter the cash flow, compute the NPV, use the result for PV (I change signs first), then compute the FV.

I used the 17BII+ (silver) to verify the results of $5,837.03.

A warning: TVM´s [FV] after entering cash flow data

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 26 Jan 2010, 1:01 p.m.,*
in response to message #1 by Anthony Baldwin

Hi, all;

just to remind that computing TVM´s [FV] as for NFV right after entering cash flow data with [CFo] and [CFj] and computing [NPV] is only valid when none of the cash flow repeats. If at least one of the cash flows has [Nj] > 1, than [n] must be adjusted prior to compute NFV with [FV].

Cheers.

Luiz (Brazil)

Edited: 26 Jan 2010, 8:44 p.m.

Re: Future Value Problem, right?

*Message #11 Posted by **tony (nz)** on 26 Jan 2010, 3:57 p.m.,*
in response to message #1 by Anthony Baldwin

Hi this just worked on my trusty Victor 12c clone:

0 CF0 1300 CFj 750 CFj 0 CFj 2500 CFj

9 ENTER 1.09 / CHS i

NPV = 5837.029025

Should work on a genuine 12c

The method is general: string the payments out in the past, so the present is future wrt the payments, and use a negative discount rate equivalent to the interest rate. Then NPV becomes NFV.

Cheers Tony

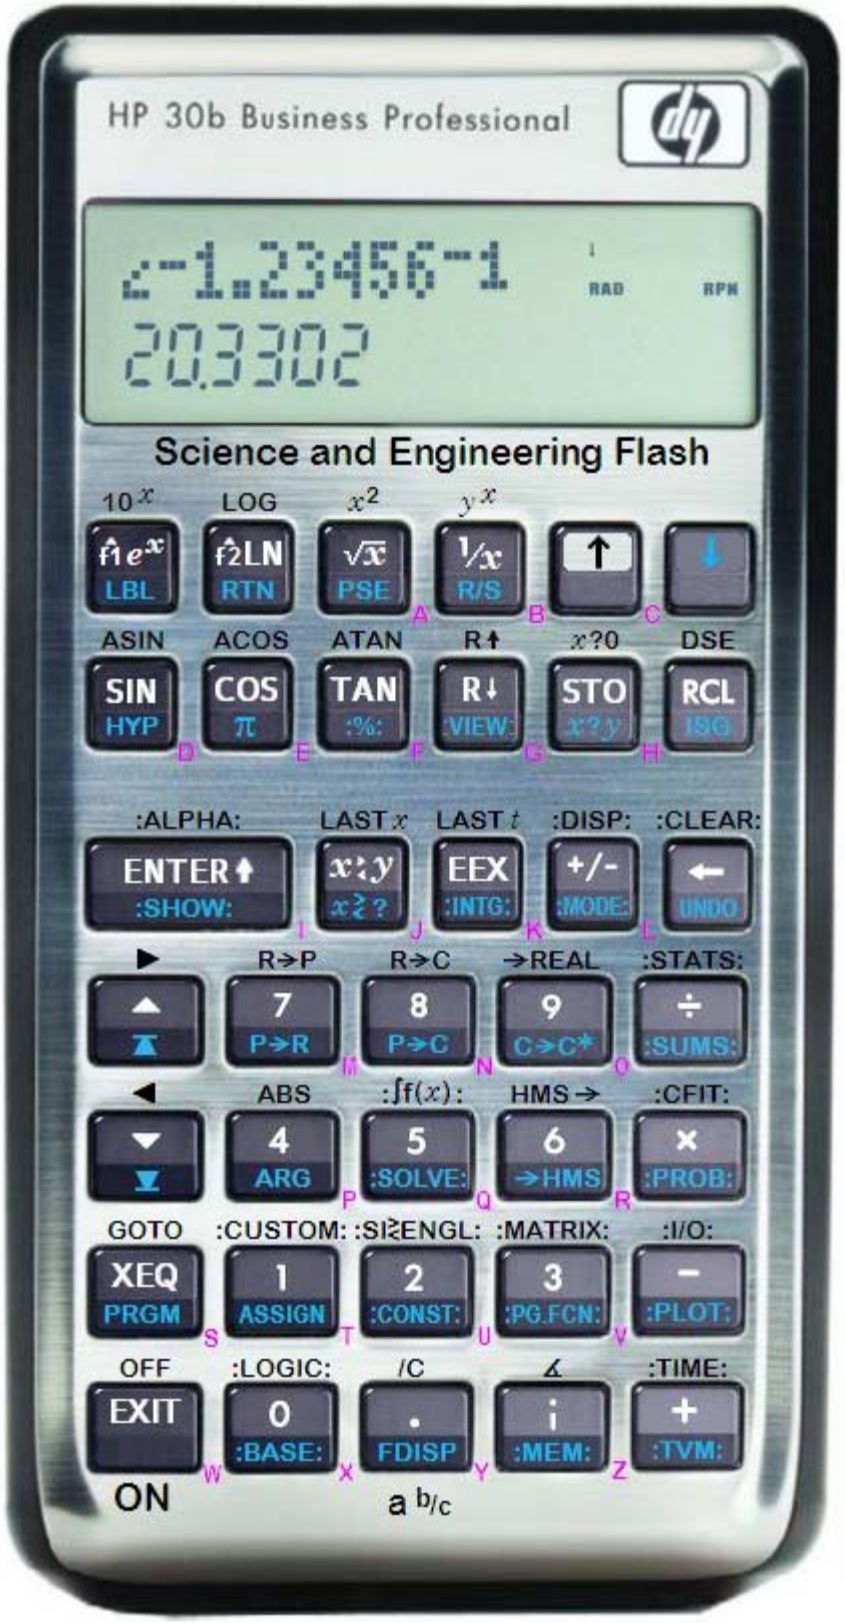
30b Repurposing Concept

*Message #1 Posted by **Jeff O.** on 25 Jan 2010, 1:09 p.m.*

Here is my 20b repurposing concept updated and applied to the 30b:



I'm not sure that both the up-shifted and down-shifted legends would fit between the keys as I depicted on my 20b concept, so I went ahead and put the blue legends on the sloped key faces. This makes the key-relabelling problem that much more difficult, but, if a way can be found to put new primary legends on the key tops, it should be possible to put the blue legends on the sloped face. I have an idea for how it might be done (nothing fancy, still a sticker or overlay concept) but for now will just assume that it could be done.

Based on the discussion of the 30b regarding the memory allocation for storage registers and such that allows only

300 or so bytes of program memory, I don't know how feasible this concept is. I believe it has been mentioned that someone at HHC 2009 had a 20b with a micro-SD card slot connected. Could programs be stored in and executed from an SD card? If so, the 2 kB of ram might be enough for data. If 300 or so bytes is indeed the limit, there would not be much point in creating a machine with the 41C/42S programming paradigm. If that is the limit, something with the capability of maybe the 11C might be doable, perhaps with only a single shift key to keep things simpler.

Paul reports below that significant program memory is possible with a very capable design.

in response to message #5 by Thomas Radtke

> Quote:
>
> Does the 30b's LCD has an Arrow Up annunciator?

No, it has exactly the same display as the 20b.

Re: 30b Repurposing Concept

*Message #8 Posted by **Thomas Radtke** on 25 Jan 2010, 5:06 p.m.,*
in response to message #7 by Katie Wasserman

Thanks, Katie.

I suppose that will more or less rule out using a second shift key in any repurposing project.

Re: 30b Repurposing Concept

*Message #9 Posted by **Egan Ford** on 25 Jan 2010, 5:08 p.m.,*
in response to message #8 by Thomas Radtke

The shift indicator could blink for the 2nd shift. The dot matrix could say '2nd shift, alpha, etc...'

Re: 30b Repurposing Concept

*Message #10 Posted by **Katie Wasserman** on 25 Jan 2010, 5:15 p.m.,*
in response to message #8 by Thomas Radtke

There are two "=" annunciators, a large one and a small one. You could use the small one for the 2'nd shift or the "BEG" symbol which is directly underneath the down arrow and is not likely to be needed for anything else.

Re: 30b Repurposing Concept

*Message #11 Posted by **Paul Dale** on 25 Jan 2010, 5:40 p.m.,*
in response to message #1 by Jeff O.

It is quite possible to have more than 300 bytes for program space. The CPU has 2048 bytes of non-volatile RAM. This can be divided up as desired. The low level support routines need a few bytes but it really isn't all that many.

Walter & I have been (slowly) working on a 20b repurposing and ours has 500 merged program steps (each of two bytes since we've so many commands available). In addition we've 100 registers (16 digit BCD using 8 bytes each). These don't include the stack.

We've also got more than one shift by ignoring the built in annunciator and using the dot matrix portion of the display to show 'f', 'g' and 'h' as required.

Yes, we'll be switching to the 30b for the nicer keyboard.

- Pauli

Re: 30b Repurposing Concept

*Message #12 Posted by **Walter B** on 25 Jan 2010, 6:58 p.m.,*
in response to message #11 by Paul Dale

OK, some more facts:

Menu labels are underlined. There are 3 hotkeys. Participants of HHC2008 may know some features, but there's new stuff, too. Display shows the calc in programming mode.

The function set of the 34S is based on the one of the HP-42S RPN Scientific. This set is extended to completely include the functionality of the HP-16C (we even added and expanded some commands), the fraction mode of the HP-32SII, statistical distributions as featured by the HP-21S, and even more mathematical, statistical, scientific and engineering functions like

- Euler's Beta function, incomplete Beta and Gamma, the error function, Fibonacci number

calculation, Lambert's W as well as
- many distributions and their inverses like Binomial, Poisson, exponential and geometric, Gaussian with arbitrary mean and standard deviation, Weibull for reliability analysis,
- extended date and time calculations based on a real time clock,
- nearly 50 fundamental physical constants taken from NIST,
- over 50 different conversions between SI and Imperial units,
- extended Latin (i.e. Spanish, Portuguese, French, German, Norwegian, Swedish, Finnish, Czech, etc.) as well as Greek upper and lower case fonts in two sizes.

We had to drop matrix math due to display restrictions.

All features are subject to change without notice, but were pretty stable in the last months. Comments etc. are most welcome.

Re: 30b Repurposing Concept

*Message #13 Posted by **Gene Wright** on 25 Jan 2010, 7:42 p.m.,*
in response to message #12 by Walter B

Looks great!

Be even better if/when put on the 30b physical unit!

Re: 30b Repurposing Concept

*Message #14 Posted by **Walter B** on 26 Jan 2010, 1:59 a.m.,*
in response to message #13 by Gene Wright

Gene,

thanks for your kind words. As mentioned above, we'll use the 30b for its rotate-and-click keys. IMHO, however, matte black is a better background for label prints than shiny metal. Maybe we can sandblast a 20b plate and use it then on the 30b, since dimensions seem to match.

Walter

Re: 30b Repurposing Concept

*Message #15 Posted by **Tim Wessman** on 26 Jan 2010, 8:56 a.m.,*
in response to message #14 by Walter B

Unfortunately not. :-(

The 30b uses a different process. The LCD is completely enclosed and protected under a clear window, and the inside had to be different to give a little more space for fitting a real keyboard. They aren't compatible.

TW

Time to get a real 30b in our hands d:-) When will it be available?

Re: 30b Repurposing Concept

*Message #17 Posted by **Paul Dale** on 25 Jan 2010, 10:33 p.m.,*
in response to message #12 by Walter B

Extra programming features:

- As mentioned, 500 merged programming steps.
- 100 registers that hold either reals or integers depending on the current mode.
- Almost any command that takes a register can also take a stack element and/or can be done indirectly. LBL being the main exception to both.
- Extended conditional tests: all six comparisons of X against 0, 1 or any register or stack element (possibly indirect for both). Complex equality and inequality comparisons against the same.
- 100 user flags and 11 flag set/clear/flip and test operations. None of these flags are used for system purposes. Sieve of Eratosthenes without using any registers anyone?
- 100 numeric labels + three character alpha labels. 8 levels of nesting for subroutines. Solve, integrate, summation and product of functions using any of these labels. Only a single program space with three hot keys definable. Three character alpha labels are the only non-merged commands -- they take two steps not one.
- Save and restore the entire stack to registers as a single operation.
- Register move, swap, clear and sort commands.
- Store and recall arithmetic (including min and max). Complex support for basic arithmetic store and recall to register pairs.
- If you're not using complex arithmetic, there is an I register to make converting HP-34c, 32S, 33S and 35S programs easier.
- 31 character alpha register with some supporting operations. Not quite as rich as the 42s yet.

All implemented except for the low level hardware driving (works on a desktop PC in a text window). Still a few bytes left of non-volatile RAM and several kbytes of flash.

- Pauli

Re: 30b Repurposing Concept

*Message #18 Posted by **Katie Wasserman** on 26 Jan 2010, 7:04 a.m.,*
in response to message #17 by Paul Dale

This sounds like awesome software design, I can't wait to try it!

Just a word of caution about a problem that I found in all the ARM-based HP calculators (12C+, 20b, 30b). The power supply is not well designed and can/does lead to memory loss when the batteries get low. The 2 CR2032 cells are in parallel with no steering diodes so once one cell goes bad the 2nd cell will follow suit soon thereafter. In the process of changing out one cell you can easily short the contacts and lose memory too. Finally, the low battery warning code should be given careful consideration and re-design, it does not work well in any of these machines.

-Katie

in response to message #17 by Paul Dale

Pauli and Walter,
I continue to be very impressed by what you have accomplished. It sounds like you have made progress recently and are pretty close. Now that the 30b will (hopefully) soon be available, there is a worthwhile platform on which your design can be implemented. I guess I will have to buy two 30b's, one to load your "34s" on and one for my as yet un-alphanumerically designated Science and Engineering flash. I'd like to think there is room for both, as I think we have somewhat different goals, maybe. I won't presume to state your goals, but mine are as follows:

- relatively uncluttered keyboard, not that yours is cluttered, but it is quite busy :-)
- complex numbers entered as on the 35s, stored and handled just like the 42s (with display improvements as described in my 20b repurposing post)
- easily useable as an engineering/scientific by having the basic functions e^x, ln, square-root, $1/x$, SIN, COS and TAN as un-shifted key functions. (I realize that these functions are of course only one shift away on your design.)

Aside from the above, a major goal is that there be some way to upload and download programs. Otherwise there is not much point to my design since the 35s has most if not all of the functionality I desire. I'd be willing to hack the calculator, buy special cables and hardware and software, but it would be nice if a cable connected to those six-little holes on the back could do the job.

Best regards and good luck with the 34s,

Jeff

in response to message #19 by Jeff O.

Jeff,

as you wrote, there will be room for more than one repurposing project. And each and every design is biased by personal preferences and experience of its designers, as it has been stated many times by different forumers here. So let's run it the biological way: may many species rise and compete d:-) There isn't anyone completed and ready yet, so far. Still some work to be done.

Enjoy designing (and checking and redesigning and ... d;-)),

Walter

I also think the design is great, but what is different about the 30b display that makes the 42s matrix math impractical?

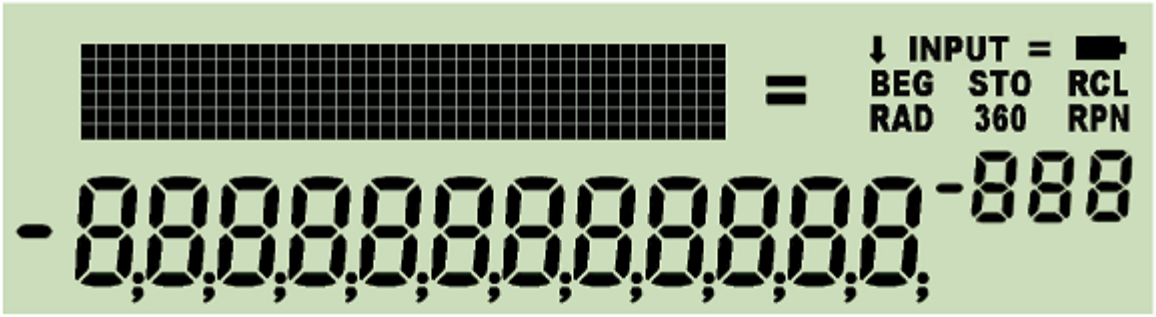
The 42S has a dot matrix LCD 131 pixels wide and 16 high, allowing for 22 characters in each of 2 display lines, or 6 soft key labels in the lower line . OTOH, the LCD of the 20b and 30b looks like this:



No way to display a comparable number of soft keys. No space for reasonable matrix descriptors. Too tight in many ways :-(

Refurbished HP calcs?

*Message #1 Posted by **DaveJ** on 24 Jan 2010, 2:58 a.m.*

I noticed this refurbished 12C

Quote:
"These refurbished calculators come directly from HP distribution and have been refurbished by HP. As said by HP distributing, "These are better than new because each has been fully and personally hand tested." Some will have blemishes (usually a scuff on the casing), but include a warranty to work like new."

I didn't know HP refurbished calcs?

Dave.

HP-42S work-around for sticking to low contrast LCD problem

*Message #1 Posted by **Lyuka** on 22 Jan 2010, 2:40 p.m.*

Hi all. (It might be good news for DavidShenk.)

I recently bought an HP-42S which has LCD contrast problem that seems to be identical to the case of the previous thread 'An HP-42S fix success, and a contrast problem'.
I tried another way to generate the LCD bias voltage, and the work-around seems to work well so far.

for more information - A work-around for sticking-to-low-contrast LCD problem of the HP-42S

Regards,
Lyuka

"The Swiss Army Knife for nerds"

*Message #1 Posted by **David Hayden** on 22 Jan 2010, 8:15 a.m.*

I thought you'd get a chuckle out of this. I posed on my facebook page the comment "who would have thought that a hand-held calculator could solve 'killer' difficulty Sudoku puzzles in 0.1 seconds?"

I received several responses, but the best was from my wife: "The HP programmable calculator is the swiss army knife for nerds. Smooch!"

Isn't that the truth? Just like a Swiss Army knife, my HP calculators are kept close by at all times. They're tools to help with little problems that arise from time to time.

Dave

I unfortunately always find myself *not* in need of an advanced calculator. Too bad, considering I have one or two thousand calculators on hand <g>

Also being a nerd (kinda) myself

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 22 Jan 2010, 11:10 a.m.,*
in response to message #1 by David Hayden

Borrowing not only Frank Boehm´s title but also the fact that I could count on one calculator or almost a hundred (based on current count...) when I needed, I have been using them either on single expression solving or in writing large programs for complex problem solving. I cannot agree more on the swiss army knife title.

I actually perform daily, fast calculations by mind (even some two-digit square roots of integers with non-integer square roots) or with pencil and paper, just for the sake of giving brain cells some activity. Anyway, I consider programming a very straightforward, 'mind stretching' activity, and I like achieving the most from the least resourceful tool.

'Swiss army knife for nerds'. I like it! But I have the feeling of reading this kind of reference somewhere else, IIRC as a reference to a Linux resource for programmers.

Cheers.

Luiz (Brazil)

Good evening!

For me as well, the Swiss army knife and the programmable calculator are very similar: I always (*) carry both of them with me and never find a reason to use either of them. Probably haven't opened the knife in five years (luckily they really are made from stainless steel) and used a calculator for real calculations in ten, other than to play around with it.

Greetings, Max

(*) At work, I have to leave the knife in the car because they won't let me take it through airport security. Not long, and the calculator will have to stay in the car as well, because some idiot will find a way to use it as an explosive device.

> Since I bought my HP28S in 1990 (and she's still running perfectly today)[...]

"and she's still running", I believe is the central lemma of this thread. Depending on the language area, a calculator may be a "he", "she" or "it". In my language (German) it would be a "he". However, this leads to the conclusion that some users attribute a personality to their handhelds. Of course, not just any calculator, only certain calculators are ennobled with personality. From my point of view, I could not believe that army knives have that strong appeal. The calculator-nerd feels better as long as he knows, his favourite handheld is in the vicinity. For me its the HP41, and although "he" is not indispensable for my daily work, it is good to know "he" is within reach. As the years go on, I hope I won't end up like Gollum in "The Lord of the Rings", who conducted dialogues with his "precious".

Have a nice day!

If you are an accountant, probably.

But if you need a scientific then it's not even close to being amazing.

Anything with EEX as a shift is next to useless in my book, but YMMV.

WHEN are HP going release one of these new platform calcs as a scientific??

Dave.

Re: "The Swiss Army Knife for nerds"

*Message #22 Posted by **Bruce Bergman** on 23 Jan 2010, 11:37 p.m.,*
in response to message #21 by DaveJ

Perhaps!

But remember, this thing is very customizable. You could, for example, assign the EEX key to any key you want, including face keys.

There's a limit to how many you can do that with (10), but still, it's pretty cool to be able to re-assign keys, kind of like with the 41c.

Oh, and since this one is easily flashable, you could create your own scientific with not a lot of effort. Granted, you'd need some kind of overlay for the keys, but it's a much easier proposition than the 20b. And we do already have the basis for a 43s with the 20b, so it wouldn't be difficult to put it on the 30b.

thanks, bruce

That too is included! It's not a full keyboard overlay, but it at least allows you to scribble on the top four rows of keys.

I believe someone looked into using one of those cell-phone skin companies to see if they could get an overlay for it. Can't remember what came of that...

thanks, bruce

I believe that someone was me regarding a company called Skinit. I sent the following inquiry to them last October:

I would like you to make skins for a product that you do not have listed, the Hewlett Packard HP20B calculator. It must overlay the entire keyboard with holes cut for the keys so that custom key labels can be added above and/or below the keys. Is this possible?

I received the following reply:

Thank you for your interest in Skinit. Unfortunately we do not support that device at this time and we do not provide launch dates in regards to new devices being added to the website. I would not recommend buying a skin that does not specifically fit your device on our website. We cut each skin individually for each device and ordering a different skin will cause the skin to not fit. We would like to inform you that we keep updating our website regularly by adding new devices and skins, so we would request you to check back later if we have not listed your particular device on our website. We apologize for the inconvenience caused to you and appreciate your patience in this matter.

I have not checked back to see if they added the 20b.

...

You could do it using laser etched stainless steel, or thin (0.5mm) PCB material. These are easy and fairly cheap to obtain custom made from various places.

Dave.

Keyboard Complaints

*Message #1 Posted by **Tim Wessman** on 22 Jan 2010, 12:10 a.m.*

No, not the kind you are thinking about.

Anyway, as I've been investigating keyboards and users more and more since I'll now be directly impacted by any good or bad keyboard we make (don't be ridiculous and infer stuff here - I am just musing as I educate myself about consumers and competition) I've been kind of surprised as I've talked with people about different keyboards.

For example, I've heard from many people that use little chiclet keys on phones how annoyed they are at the HP keyboards. I've often heard how they are "tiring to press","slow" and so on.

The 20b is a good example of this. If you put it side by side with pretty much any other calculator in the 30$US range, it matches up perfectly well. The internals are identical. Sure if you compare it to a BA2prof, or a 35s it sucks, but some people honestly seem to hate rotate&click keys.

I had someone trade me back a 30b for a 20 because they "liked the color better, but the keyboard was too hard to press". This same person much prefers anything that has a solid rubber mat of keys like you get on those nasty 50 cent calcs . . . yuk!

It sure seems to me more and more as I listen to end users, that it completely depends on what you use daily. If you are used to the way a cell phone feels, a lot don't seem to recognize that a 'quality HP keyboard' (lets not get into that old vs new debate, we all here know the truth) is quality and they don't like it.

Has anyone else run into other complaints like this from users/students? I sure seem to have been running into plenty of people that have a lot of complaints against the 'good' keyboards I ask them to try. Is it truly just a matter of what you are used to?

TW

Re: Keyboard Complaints

*Message #2 Posted by **Thomas Radtke** on 22 Jan 2010, 1:45 a.m.,*
in response to message #1 by Tim Wessman

Tim,

I prefer old HP keyboards but have no problems with Casio, Sharp, and most TI calculators.

I took the 20b without any expectations to hand, immediately noticing that entries failed that worked on any Casio I tried. Even the 30s does not have any problems. It's probably the shape of the keys that leads to this problem. You simply don't know where to press it ;-).

However, the 20b is one of very few calculators I know of where I have to be extremely careful about entering numbers. It is an outstanding bad design in this respect.

Thomas

Re: Keyboard Complaints

*Message #3 Posted by **Peter A. Gebhardt** on 22 Jan 2010, 4:04 a.m.,*
in response to message #1 by Tim Wessman

Tim,

Thx. to you and HP taking care of and recognizing the importance of keyboard "quality".

Let me propose, that instead of doing customer surveys with people today not having experienced "good old engineering" quality at least once in their lives, you might instead thrive to take (as an example) at least the keyboard quality of Pioneers as a yardstick.

(Even my 10b - ID912 ... has better keyboard quality than most of the other makes & brands - not talking of 17bII's and earlier models ... - but we shouldn't start these rants ;-)))

More experienced users than me would be able to point to the manufacturing dates which can serve as a timemark - after which quality deterioated.

Best regards,

Peter A. Gebhardt

Re: Keyboard Complaints

*Message #4 Posted by **Jon S Canale** on 22 Jan 2010, 8:15 a.m.,*
in response to message #3 by Peter A. Gebhardt

I like click keyboards - HP quality click keyboards. Can't stand the soft touch chicklet types. But my first experiences were on an HP25c and 11c, both of which are going strong today (well not the 25c - has been retired for a while). I had an original TI SR-50 which also had click keys, and wasn't bad while it lasted, but the keyboard died after a few years (bouncing key input). I did buy a newer TI 30XIIS and can't stand it - misses keystrokes every time I use it. Will throw it on the floor and stomp on it one of these days! I also bought a 35s when they first came out. Not too bad, but gets discouraging to see all the discussion of problems with it, and no hint that HP is ever going to respond. Wouldn't mind so much if HP does a 30b scientific - the 35s might just get left out on the desk until it disappears.

Re: Keyboard Complaints

*Message #5 Posted by **Tim Wessman** on 22 Jan 2010, 9:55 a.m.,*
in response to message #3 by Peter A. Gebhardt

First, this really has nothing whatsoever to do with anything within HP, policies, ongoing reasearch, blah blah blah, but is just me musing in my own spare time as I contemplate things. I really don't want anyone to read more into this than is really there. . .

I know the frustration of missing keys, but that really isn't the direction I was going with this. Nor is quality which we all *truthfully* know will never be back to how it was before. Consumer products simply aren't build like professional tools.

I have set down a 15c, 20s, 48 and 1-2 other 'good keyboards' in front of people. They sit and click them and complain about how hard they are to push and tire out their fingers. They are also 'loud' and 'slow' and 'push too hard on your fingers' and probably a few more negative things I've heard I am forgetting.

I have seen sentiments like this expressed online in product reviews for things like the 10bII and 50g where there has been no mention of missing keys or anything like that. Rather, it seems to me that there is a rising group of people who truthfully dislike keys that give any sort of feedback and they do like cellphone keys.

People who used and grew up on older HP keyboards complain to no end that they aren't good, but those just being introduced often are more likely to complain that it isn't a cell phone. :-(

TW

So there you have it, folks: You can forget about HP ever responding to our comments about producing a truly quality calculator again. Apparently they are just not interested. But then, some of you with bean counter experience have been telling us that all along.

But Tim, you can see that, in spite of your protestations about "not going there", folks here still do, because it's an issue that remains important to them.

> Quote:
>

Gee, thanks for putting things in my mouth that were not being said. Really classy.

Unfortunately it is a reality that **all modern corporations** aren't interested in the .5% of customers. They are interested in the 99.5% (numbers pulled out of my bum there). That whole 'volume production' thing.

That is why a specialized company can sell a US$1000 "acoustically tuned volume knob made out of some rare African wood" to a small group of people and be successful.

This is why smaller niche markets can be successfully exploited by smaller companies.

It is basic economics and modern business.

> Quote:
>

And it is important to me and everyone else that builds the things, but reality is reality when dealing with economics. Please see Gene's comment below.

The whole point of my comment was that it has surprised me how there are so many people now that don't seem to recognize a quality keyboard ala classic HPs and *don't like them*. That is what is so surprising to me.

> Quote:
>
> I must be out of he loop. every cell phone I have owned has had tactile feedback keys.

So you would be happy if HP made a calculator with a cell phone keyboard? Every time I've asked any calculator nut regarding that they respond just as I do, which is with disgust.

Hi Tim,

I agree with you about small vs large companies.

Perhaps an easy way to see this in action is to look at:

1. HP Market Capitalization in 1973 or so,

2. HP Market Capitalization now.

Even inflation adjusted, I think you'll find something in the orders of magnitude there--in other words to your point, HP was a "small company" when it developed the 35. It is no longer small.

Please excuse my ignorance, Tim. What exactly was so expensive with Pioneer calculator keyboards?

Re: Keyboard Complaints

*Message #11 Posted by **Martin Pinckney** on 22 Jan 2010, 11:40 a.m.,*
in response to message #10 by Thomas Radtke

This kind of question comes up over and over. Those with bean counter experience tell us that producing a keyboard like the Pioneers would cost $___ more per calculator, so it won't happen.

The rest of up respond, "So what? We would gladly pay $___ more to get a truly useful tool."

But from Tim's comments, it seems the bean counters are correct.

Sorry, Tim, I just can't resist.

A tutorial on Cost-Volume-Profit analysis (which I taught for years) would be useful at this point.

Raise the price $10. We techies here (myself included) by an extra 10K units. We are all happy.

By price being raised $10, total demand drops by 50K units.

Result: Less overall revenue and higher costs of production. Stock price goes down. Management and shareholders are unhappy. Management is fired. Division is sold to a company in Mongolia who replaces units with gummy bear keys. Make a fortune.

Techies here are unhappy. Blah blah.

That's how things like this are often decided.

Economic analysis is fairly rigorous, as my graduate degree in it reminds me.

P.S. These are made up numbers but they represent the issue.

> Raise the price $10.

That was my point. Where's this kind of money in pioneer keyboards? I'd like to understand why e.g. 20b keys aren't hinged (that's a few gramm of plastic and a few minutes of drawing in Catia) and why they sit on rubber domes instead of plastic domes. Is there really more than a $1 difference?

I have a different theory. Price is not calculated so that it reflects the product, but to reflect what the target audience is willing to pay. Then the fun starts by cutting costs wherever possible to maximize profit. So, the argument "I'm willing to pay a dollar more" is completely invalid. The company already takes the estimated maximum. Right?

Re: Keyboard Complaints

*Message #14 Posted by **Michael Plant** on 22 Jan 2010, 1:34 p.m.,*
in response to message #13 by Thomas Radtke

I'd imagine that the increase in cost lies in the mechanics of the keyboard, not in the materials. Adding in the hinges would increase the complexity of manufacture - HP would need to add a step or more into the process and purchase and program robots to perform those additional operations. All factors that add to the cost.

Caveat: when I say imagine, I mean it! Nothing I've written above is based on anything other than idle speculation on my part.

Re: Keyboard Complaints

*Message #15 Posted by **Gene Wright** on 22 Jan 2010, 2:36 p.m.,*
in response to message #13 by Thomas Radtke

And, the raise the price $10 would occur because of the supply chain.

Totally made up example here having nothing to do with any private information...

If I make a product costing $5. The distributor MAY buy it for $8 who sells it to a retailer for $16. They then sell it for $39.99.

If my costs go up to $6, the ending MSRP may go up to $44.99 because of that assuming the end retailer will even CARRY the product any more.

A major retailer may well say ... this product must be at $39.99 or less. I don't care what kind of improvements you have put into it, the public won't buy it. The problem is that it

doesn't matter if the retailer is sniffing glue or not, they rule the world. What are your options then? Sell online only through your own website? Perhaps. Volume would be a lot less than using retailers/distributors.

Tough world out there. Not enough customers seem willing to pay premium prices...unless they are Apple customers, of course. ;-)

Yeah, but Apple can actually take the money because they deliver high end products in terms of quality. You see: It pays! ;^)

Yes, I got your arguments. What's left is some dissapointment because the niche I'm in isn't served anymore. Buying an HP means an option for RPN. No more and no less. That's not enough at some point when the firmware gets below a certain standard like with the 35s.

Thanks anyway for making your points clear.

Re: Keyboard Complaints

*Message #18 Posted by **Gene Wright** on 22 Jan 2010, 3:43 p.m.,*

Keep in mind that not only do I not work or speak for HP, I did not stay in a Holiday Inn Express last night either.

Well, 35s firmware aside, I would say there are more reasons for HP than just RPN.

I've picked up and used a lot of TI models, and dislike the experience intensely. If you haven't used a TI BAII Plus in a while, find one and try a problem on it for a change. Yuk.

Something else to think about is not just where HP was in the 1970s, but perhaps where they were just 10 years ago.

Rubber keys.

FHB* colored machines.

then machines that were hollow and clicked so loudly they woke the neighbors up and missed keys 80% of the time.

Compared to where they were 10 years ago, I believe there have been great improvements in quality. More to go? Sure, but the trajectory seems to be up from a long dive leading to the FHB* machine.

OK, thanks for illustrating what I was referring to when I said "Those with bean counter experience tell us that producing a keyboard like the Pioneers would cost $___ more per calculator, so it won't happen."

Now what do you think of this? HP's PDF brochures available on their website refer to "HP quality". So they are marketing something that's not really there and they don't expect people to pay for it anyway? For the moment, forget the financial calculators. Who is the target market for the 35s? General consumers? Is it not scientists and engineers? People who need a reliable product, no?

Did not the same "rules" of Cost-Volume-Profit analysis also apply when the Pioneers were made? (Or any other HP era). Or did they just now start to apply?

I just don't buy this argument.

I will provide an anecdote. Recently I hired a new field surveyor (technician, not professional, just as a reference point). I noticed he had both a 48gx and 35s in his kit. When I asked him about the 35s, he replied, "it's OK for a cheapie calculator". Is that the reputation HP is trying to maintain?

End of rant.

in response to message #21 by Martin Pinckney

Who is the target market for the 35s? General consumers? Is it not scientists and engineers? People who need a reliable product, no?

GENE: Maybe, maybe not. I'm not privy to that. It may well be test-takers, for all I know. They may be unwilling to pay $90 for an item when substitutes are available for less. I don't know how many of them are willing to pay the CURRENT HP 35s price, so it is difficult to know what a price increase of $X would do. But it is a pretty firm law of economics that when price goes up, demand goes down.

Did not the same "rules" of Cost-Volume-Profit analysis also apply when the Pioneers were made? (Or any other HP era). Or did they just now start to apply?

GENE: It has to do with another principle of economics in that case...the availability of substitutes. Pretty firm ground there as well. More substitutes today. Less demand at the same constant dollar price. etc.

I just don't buy this argument.

GENE: Then I would politely suggest you enroll in an economics course and express those arguments with the experts in the field. I'm really not trying to be ugly here, so don't take it that way, but I believe these arguments are close to the truth.

I will provide an anecdote. Recently I hired a new field surveyor (technician, not professional, just as a reference point). I noticed he had both a 48gx and 35s in his kit. When I asked him about the 35s, he replied, "it's OK for a cheapie calculator". Is that the reputation HP is trying to maintain?

GENE: If it were, I would guess they would have exited the market a long time ago. Are there target markets where such qualities are treasured / demanded? Sure, you've mentioned one and our group here is another. So, yes, it is a different world, a different environment and a different company. No use denying that. Fortunately, we have choices. We can buy TI. We can buy Casio. We can buy HP and lament the differences between a product costing $100 in todays dollars vs. a product from 20 years ago costing $300 in todays dollars.

End of rant.

Perhaps being a little ugly, but why would I want to express my arguments to "experts" in an academic setting? I'm talking the real-world of professional who need professional-quality tools for their work. That may be why we have the inferior HP we have today: too many marketing and production cost analysis "experts" calling the shots.

It about leadership. There are many anecdotes existing about how Bill Hewlett went against the experts advice during the early calculator years. And lest you argue that the times are different now, that the age of cheap consumer electronics means we will never return to the type of product that defined HP, well let me point out that the times are always changing, and in recent years there is a trend to return to high-quality products in many fields. I think what many of us have been asking HP for is the leadership to dare to do this again for professional calculators.

I feel that one of the questions we're asking is whether the current HP calculator group leadership cares enough, sees *some* demand, and has the guts to go after it. They'd honestly have to be ready for the possibility that the sales might not cover their costs and that if not, hopefully it doesn't "tank" the group. There are honest ways to try for that not to happen, however, like some clever marketing to the professionals. Then, if they do a great machine, promote it to the max and it only sells a thousand units, they will at least have fought the honorable fight.

The HP-35S is sold in one place in the city (Toronto) for 83$. A HP-39G sits on the same shelf beside it for 17$ more.

Then HP has really lost that which set them apart in the early years.

They rose to the challenge:

> Quote:
>
> After the HP 9100 was demonstrated to Bill Hewlett he suggested that they should make one in one tenth the volume, ten times as fast and at one tenth the cost.

And for the HP35:

> Quote:
>
> He later reduced his suggested volume even further to "shirt pocket-sized".

If they (HP) cannot rise to the challenge to make a keyboard at a price that will keep the 50k cheapskates happy AND the quality that keeps the the 10k techies happy, then they have lost (become too big for?) the magic that made them great in the first place. Maybe they didn't always meet those challenges fully (or sometimes cheated a bit), but they managed to produce a products that made users happy.

Of course if HP has become too big to care for techie markets and wishes to concentrate on the cheap and nasty market sector, they'll make way for products like BWK. And they will continue to lose that other part of the magic that made them great - coming out with cutting edge products. On the handheld side, perhaps Casio is taking that over with the Classpad 300 series? (Wasn't the cancelled Expander something in that line?)

Note: qoutes are from HP Museum's "HP 9100A/B" page.

If you have a PDA running WinCE or an emulator, you're in to try the free MathExpander software. It's strictly educational and was never developed beyond a point without obvious bugs. But the geometry module is a nice thing to play with for an hour or two ;-).

About the 'old HP': Effectively, serious calculator development stopped after the Pioneers. Why did that happen? Everyone agrees that e.g. the 42S was a great machine. Obviously, it didn't sell to match the production costs. Now, where's the expected reward to try it again?

Re: Keyboard Complaints

*Message #29 Posted by **David Hayden** on 22 Jan 2010, 8:11 a.m.,*
in response to message #1 by Tim Wessman

Hi Tim,

I wonder how much of the problems with the keyboards these days is software and not hardware. When keys don't register, is it because the electrical contact wasn't made, or because the user was pressing too fast and overran the (zero length?) buffer? I personally suspect that a lot of the problems HP has with keyboards is the latter.

Here's another thought: would people care about the tactile feedback if the keypress always registered? How many complaints that say "I don't like the keyboard" are really saying "it didn't register the keys I pressed?"

The best way to find out about this stuff is to get real-time feedback from potential customers. That means setting up a usability lab or taking it on the road to schools. If you haven't already, I strongly encourage you to read "Don't Make Me Think" by Steve Krug. It's about website usability but applies equally to calculators. The gist is that the makers of the product are uniquely UNQUALIFIED to judge its usability, but getting good data from real-world users isn't that hard.

Finally, let me make a plug for User mode improvements. Assignable keys are of little use when you can't easily tell which keys are assigned to which functions. We need keyboard overlays and/or keys that display their function when held down (like the 41 did).

Thanks for asking and for caring.

Dave

Exactly. On my 20b, I can carefully press any key in a way that I receive a tactile feedback (from the rubber-dome, I suspect) but get nothing on the LCD. Pressing harder, the key registers. Same with one key on my 35s. Now, *that* is really disturbing.

Some thoughts on various keyboards:

Pioneers - Very nice feel and actuation, and I've never had any issues with these. Even my heavily worn 32sii with some keys that have broken free from the hinges works quite well.

12c (manufactured around 2002) - Very nice feel overall, though it seems a bit cramped somehow. The Enter key feels like it needs a little too much force to press.

28c, 28s, 19bii, etc - Too much key travel, and too stiff. The raised edge around the right half makes it difficult to press the bottom row of keys with one's thumb.

48sx - Just about perfect.

48gx - Like the 48sx, but the keys require a bit less force to press. Some of these have a cheaper feel than the 48sx.

49g - Let's just forget this ever happened.

50g - Too stiff for my liking. And yet they still feel a bit mushy somehow. I've also had weird issues with keys I haven't even pressed being actuated. I'll be typing some numbers, and suddenly the calculator thinks I've hit TAN or something. Weird. Also, the cursor keys are still MUCH too stiff.

35s - Very nice feel, though the keys have a bit of side-to-side wobble. Mechanically, they're great, but I'm sure everyone knows the issues with missed key-presses.

Personally, I find the TI-style keys more tiring to use. You have to be much more deliberate to make sure you press the key squarely. I can type much more quickly (and accurately) on my 48sx than on my TI-86. Also, the cheaper TIs, like the 36X, have lots of trouble with missed keystrokes if you type quickly.

Hi folks,

I used quite daily for over twenty years a CASIO fx-602P I still have in very good condition before starting to collect HPs that made me fascinated in my youth, before I had money enough to buy some, and also before their prices decreased enough! What I can say is that, even if the keyboard of this Casio don't give any special feedback at key strokes, I'm pretty sure I never miss any key stroke nor

had any bouncing key, like I have on a TI-58C I bought a few years ago. More to say, as the effort to press the keys is less important, I can type quicker on this kind of keyboard than on an HP one with rotate-and-click principle. Perhaps am I afraid to break something on my HPs keyboards when typing as fast as on my Casio? It may be part of the reason, but not totally. I keep thinking HP keyboards are a little bit slower, due to this sligtly greater effort they need. That beeing said, I agree with you on the point of the good feeling they give to the user. One really have the impression of a professional device when using an HP. One last thing: let's admit there's no perfect keyboard, just for the reason that even the best we, HP fans, would declare as so, could be hated by someone else. One evidence of this is the perpetual evolution of HP keyboards. Even if they keep the "rotate-and-click", the shape of the keys, the effort to press and the travel of the keys continuously change, model after model.

Speaking of keyboards, I type this text on the tactile keyboard of my iPod: no movement of keys at all, as there are no physical keys, just the elasticity of the end of my finger, and that works! The click and the enlarged symbol of each key pressed gives the user the confirmation his entry has been registered, if ever needed. Let's live with today's tools, but also not forget good old ones :-)

Kind regards, J.-M.

I do have to ask a dumb question. If the business economics is such big deal regarding whether to spend the pennies on "quality improvements" or not, I'm have a real hard time understanding if HP is serious about the calculator business at all, because I DON'T SEE THEM ANYWHERE! TI, Casio, and Sharp calculators are everywhere. MAYBE, I'll see a 12c or business calc. in an office supply store.

Where does HP sell it's cheaper calculators, even its algebraic models? The ONLY place I ever see them is online.

Has HP just lost the market so entirely that stores are not willing to use shelf space for them anymore? (<--<< this is the dumb question, perhaps...)

(I haven't set foot into a university bookstore for a hundred years - do they still sell HP there?)

When the 33S came out, they were originally released on Amazon, and Walmart. In fact perhaps Walmart even got before Amazon--I can't remember exactly any more. They continued to be offered at Walmart for quite some time--though there was a long period where they were *sold out* from Walmart. Eventually they all got marked down to $39.87 or less and then gone. I remember this being around the time the 35S was coming out.

I can't remember whether the 35S was at Walmart. I bought mine early on wherever I got it--complete with zip case and printed manual.

I've been searching everywhere here in Kuwait for a place to buy an hp calculator with no luck. hp printers... sure, they're everywhere. So are computers, screens, ...etc., even the mighty Z800 workstation. Not calculators though. In comparison, TI calcs are carried by all major office supplies stores while Casio cals are short of being peddled at street corners.

I have the authority if I choose to exercise it to enforce an NCEES-like calculator restriction upon a class of Electrical Circuits Principles here at Kuwait University (800-900 students annually). I'm hesitant to do so however in the absence of the worthiest of that short list (35s) from the local market.

For the record, my 15c was bought locally 25 years ago.

Calendar withdrawls

*Message #1 Posted by **Bruce Bergman** on 21 Jan 2010, 7:46 p.m.*

Having been without my HHC 2009 wall calendar for almost a month now, I'm still experiencing withdrawl symptoms. ;)

Does anyone have any suggestions for a nice calculator-themed wall calendar? Or something techy and classy?

thanks! bruce

Re: Calendar withdrawls

*Message #2 Posted by **hugh steers** on 21 Jan 2010, 8:12 p.m.,*
in response to message #1 by Bruce Bergman

there's a blank on my wall i keep looking at :-)

an idea i had a while back is that there are a number of online calendar printers where you upload your photos and they print them.

if we were to create such a calendar and make it public, people could order their own. it would be a bit DIY but doesn't involve someone committing to a print run and all the hassle involved.

it probably wouldn't be any cheaper per unit but it could work. also each person could, theoretically, personalise it. eg add birthdays etc.

to make it easy, im thinking it would really just be a set of photos, one per month and the regular month day matrix.

?

Re: Calendar withdrawls

*Message #3 Posted by **Bruce Bergman** on 21 Jan 2010, 8:18 p.m.,*
in response to message #2 by hugh steers

Yup, I've had exactly the same idea. In fact, after now browsing the web for about an hour looking for something decent (and finding nothing that really appeals to me), I think there's much merit to your idea.

You know, this just illustrates how professional the two HHC calendars were. They both were extremely well done, interesting both visually and informationally, and were collectors items. I hope that that group who created them will considering doing another two year series for this year's conference. And yes, I realize it's eight months away. ;-)

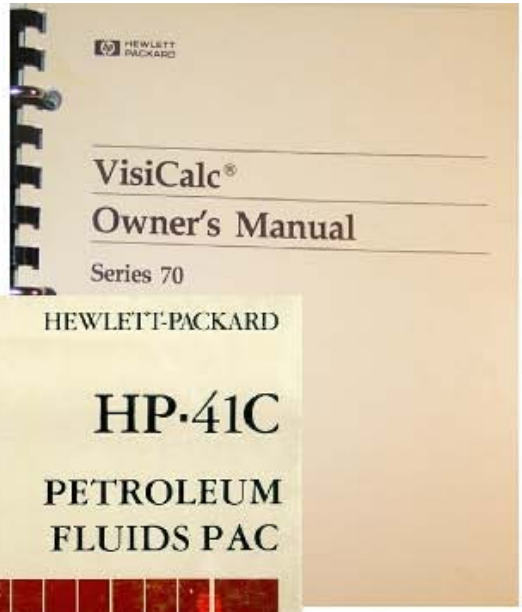
thanks, bruce

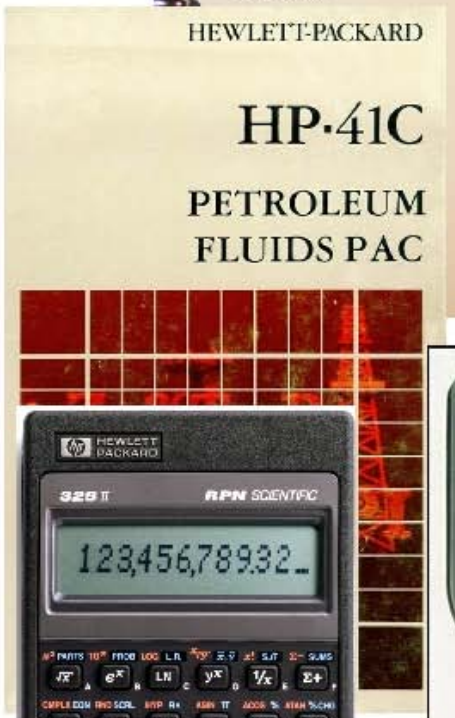
Calendar Withdrawl... me too

*Message #4 Posted by **Jake Schwartz** on 23 Jan 2010, 9:39 a.m.,*
in response to message #3 by Bruce Bergman

Hi,

Thanks so much for the kind words. The fatal flaw with the last calendar was mostly its poor *timing*. The originally-intended theme was "HP Calculator People" where Richard Nelson and I were going to devote each image page to a well-known HP calculator developer (such as Bill Wickes, etc.) and the projects to which each one contributed. Richard wanted to give each one a chance to tell us (so we could include in the calendar) info on what he/she is doing now. Unfortunately, hardly any of those who were asked by email responded in a timely manner. In fact, I believe he *still* has yet to receive responses from enough of them to fill twelve months, so that particular idea is still impractical. The only page I did as a sample to show Richard was the one for Eric Vogel (32S, 32SII, HP75 Visicalc, HP200LX, etc.) :





In any case, it was late Summer when it was realized that the theme had to be changed and time was running out. Richard decided to ask the HHC2008 conference attendees whether to do a slight enhancement on the previous years' theme or skip altogether. The vote was to enhance the theme, so we did the second one when we got home. They didn't get out of the printer until January 4th or so, so the timing was around 4 months too late for casual HP fans to want one by that point. The number printed was hundreds, and copies went to all the HHC2008 attendees and additional sales were only in the dozens. Needless to say, the sales fell short of the costs by many hundreds of dollars. Had it all been sorted out by, say, August, I think that the project might at least have broken even and Richard wouldn't be so sour on doing any more for fear of further losing his shirt. For what it is worth, copies of that 2009 calender are

still available at half price at http://www.pahhc.org/2009/Calendar.htm.

Thanks, Jake Schwartz

*Message #5 Posted by **David Hayden** on 23 Jan 2010, 5:48 p.m.,*
in response to message #4 by Jake Schwartz

Jake, you've got mail :)

I'll look into whether it's possible to create a calendar at webshots/snapfish/whatever and then make it available for other people to purchase directly. There wouldn't be any money to be made from this, but there wouldn't be any money to be lost either :)

Dave

Another 30b program!

*Message #1 Posted by **hugh steers** on 21 Jan 2010, 6:19 p.m.*

Following Don's initiative, here's another 30b program ive only just got working. there's probably still a few rough edges, but it basically works. I've been trying to come up with something to show off the 30b's raw performance. so here is integer factorization (always a good one).

It searches for a factor but, is unfortunately unable to spot if the number is prime. i could expand it to test this first, i guess.

The tough bit was getting it to deal with numbers up to (10^12)/2, which it deals with in about 1 minute.

```
; Pollard Rho factoring
; HP30b calculator

; usage: enter a composite odd number
; run the program
; if it finds a factor (not necessarily the least), it will stop

; NOTE: the program does not terminate if the number is prime,
;        except rarely with zero.

; Examples:
; 102691        (2 sec, 103)
; 1022117       (3 sec, 1013)
; 1071514531    (15 seconds, 32719)
; 1598880187    (21 seconds, 39989)
; 2620119269    (21 seconds, 39989)
; 4292870399    (65 seconds, 65519)
; 499898489929  (63 seconds, 707071)

Re: Another 30b program!

*Message #2 Posted by **Katie Wasserman** on 21 Jan 2010, 7:04 p.m.,*
in response to message #1 by hugh steers

Hugh,

Very nice! I haven't digested this all yet but have a suggestion for speeding it up.

If you move the most called subroutines to the top of the code (branch around them at the start) and have nothing else except this code in the calculator it will run faster.

You're using the command SUP. What'sup with that! :)

-Katie

Re: Another 30b program!

*Message #3 Posted by **hugh steers** on 21 Jan 2010, 7:12 p.m.,*
in response to message #2 by Katie Wasserman

thanks. i just realised a few more optimisations whilst reading your pi program. for example 1 EEX is not needed and the use of obscure labels would help.

you're right, my notation is out of date. im using X<>Y instead of SWAP and ENT for Input. SUP was originally SHIFT+UP. Actually i think it's clearer to go with Don's way of having IP, ABS etc and then people know how to enter them rather than the keystrokes.

so you're saying it always looks from the start of the program rather than from the current position. also,

couldn't it make a label cache, it's not like they move around.

Re: Another 30b program!

*Message #4 Posted by **Gene Wright** on 21 Jan 2010, 7:57 p.m.,*
in response to message #3 by hugh steers

I believe it always looks from the TOP of program memory, regardless of where the branch / call originates.

HP41C strange display behaviour

*Message #1 Posted by **Alberto Fenini** on 21 Jan 2010, 2:03 p.m.*

Hi everybody,
I have received a second HP41C unit, and I did some repair on it.
One of the internal battery contacts was ruined and I have restored it with a thin metalic film soldered over the original contact.
It worked out, since now the unit is turning on.
However, the display is not able to light up all the segments, making it unreadble and unusable.
I have warmed and re-soldered the display contacts, both on the keyboard side and on the display back, but nothing.
For example the ALPHA label is not showing up on the display, even if the unit is in alpha mode.
What could I check without destroying the machine ?
Thanks for help, take care Alberto

Re: HP41C strange display behaviour

*Message #2 Posted by **John Robinson** on 21 Jan 2010, 6:37 p.m.,*
in response to message #1 by Alberto Fenini

Hi Alberto, it is possible to disassemble the display itself, but first you would nened to desolder it and remove it from the calc. There is a black metal spring "clip" along the top and bottom of the display. By removing that gently, the display should come apart into four pieces, the circuit board, the glass "display" and two ribber "zebra" connectors. You should clean the contacts on teh circuit board, glass display and clean the zebra connectors all with a good electronics cleaner, say an electolube product, then reassemble gently, and resolder it back it.

Cheers, John

example of 30b program

*Message #1 Posted by **Don Shepherd** on 21 Jan 2010, 1:03 p.m.*

Another poster mentioned writing a program to determine the solvability of the famous 15 puzzle, based upon the ordering of the number tiles initially and the position of the empty square. Essentially, the puzzle is solvable if the row number of the empty square + the number of "inversions" is even, otherwise it is not solvable. Inversions are the number of cases in which a number to the right of a given cell are less than that cell. For example, for cell values 9, 8, 7, 10, there are 3 inversions (8<9, 7<9, and 7<8).

The 30b code is below. Prior to running, you must fill the stats registers 0-15 with the arrangement of the number tiles, and the empty space has value 0. The program uses indirect addressing to get the values of the cells.

Note: I edited the code on 1/23/2010 to use the ISG looping instruction, which reduced the size of the code from 127 bytes to 119 bytes, which is not insignificant when you only have 290 bytes total. Note also that if R0 contains a fractional part, the fractional part is ignored when you use R0 for indirect addressing, which is great.

```
0
sto 0       determine the row# of the empty cell (=0)
lbl 00
rcl data    get cell(r0 index)
gf 01       found the empty cell
1
sto + 0
goto 00     keep looking
lbl 01
4
rcl + 0     row# of empty cell = IP((index+4)/4)
4
/
IP
sto 3       r3 contains the number of inversions, starts with row# of empty cell
.014
sto 1       loop 1 goes from 0 to 14
lbl 02
rcl 1
1.001
+
sto 2       loop 2 goes from (loop 1 index + 1) to 15, you're going to compare two cells to
check for inversions
lbl 03
rcl 2
sto 0
rcl data    get cell value in loop 2
input       necessary because next command will pop the stack and you need this value in x
gf 04       if loop 2 value is 0, ignore it
rcl 1
sto 0       get loop 1 value now
roll down   need to get loop 2 value back in x
rcl data    get cell value in loop 1
?<
gf 04       no inversion, continue loops
1           yes, an inversion was detected, add 1 to inversion count
sto + 3
lbl 04      test to end loop 2
isg 2
goto 03
isg 1       test to end loop 1
goto 02
rcl 3       done looping, if #inversions is even, puzzle is solvable, else not
2
/
```

```
fp
gf 05
rcl 3      so inversions will be in x when you get the message (fyi)
msg Unsolv.  (limited to 8 characters)
stop
lbl 05
rcl 3
msg Solvable
stop
```

Re: example of 30b program

*Message #2 Posted by **hugh steers** on 21 Jan 2010, 5:19 p.m.,*
in response to message #1 by Don Shepherd

Hi,

nice program.

how do you "rcl data". i'm writing a program right now, but i've run out of registers 0-9. is there a secret register i could use, like this "data"?

i need just one more.

Re: example of 30b program

*Message #3 Posted by **Don Shepherd** on 21 Jan 2010, 6:02 p.m.,*
in response to message #2 by hugh steers

Hugh, "data" is just the stats registers, of which there are 100 and indexed by register 0. In this case, I load my numbers into the stats registers before running the program, then RCL DATA gets me the contents of whichever stats register R0 points to. Or you can RCL CASHFL and use those if you want. 100 registers, shared between stats and cash flows.

Re: example of 30b program

*Message #4 Posted by **Gene Wright** on 21 Jan 2010, 6:02 p.m.,*
in response to message #2 by hugh steers

"Data" are the 100 cash flow / statistics registers.

You access these indirectly by storing the location index which goes from 0 to 99 in memory register 0 and then doing a STO DATA or RCL DATA.

"Data" starts at one end of the registers while Cashfl starts at the other.

Edited: 21 Jan 2010, 6:03 p.m.

Re: example of 30b program

*Message #5 Posted by **hugh steers** on 21 Jan 2010, 6:06 p.m.,*
in response to message #4 by Gene Wright

Understood thanks.

i guess i should read the manual :-)

*Message #6 Posted by **Katie Wasserman** on 21 Jan 2010, 6:59 p.m.,*
in response to message #5 by hugh steers

I added a 30b program to the many digits of pi article, if you want to look at another example of using the Data registers.

-Katie

Re: example of 30b program

*Message #7 Posted by **hugh steers** on 21 Jan 2010, 7:06 p.m.,*
in response to message #6 by Katie Wasserman

Thanks. looks like a neat program. right now my unit is stuffed full of half-working efforts :-)

Actually, there are some serious drawbacks to the global nature of the labels. is that why your labels are chosen like you have. like 81, 82 etc for program 8 or similar?

Re: example of 30b program

*Message #8 Posted by **Gene Wright** on 21 Jan 2010, 7:58 p.m.,*
in response to message #7 by hugh steers

well, tradeoffs again

With 10 spots in the program catalog, imagine the complaints if each program were limited to 10 labels (10 x 10 = 100) since only 100 were available?

With 290 bytes available, I really don't think 100 labels all of which are global is that bad. :-)

Re: example of 30b program

*Message #9 Posted by **hugh steers** on 21 Jan 2010, 8:05 p.m.,*
in response to message #8 by Gene Wright

Indeed. that's why i'll have to stop calling them LBL 01, LBL 02 etc. its not the amount, but choosing separate namespaces.

i like the idea of using program-number+label as a convention as much as possible to avoid conflicts.

but like you say, it would be wrong to enforce this. because sometimes 10 isnt enough.

Re: example of 30b program

*Message #10 Posted by **Katie Wasserman** on 22 Jan 2010, 1:32 a.m.,*
in response to message #9 by hugh steers

Yes, I try to write 30b program using labels in the form: prog_number+sequence_number if possible. Also, I usually assign them to the shift-hold number key. Shift-hold 8, would run the program in location 8, for example.

As far as showing programs on this forum, I like Don's short-cut method, but it

doens't capture all that you might be programming. Functions on the Math menu certainly make sense to abbreviate, but I'm less sure about things like clearing various memory elements using commands on the Reset menu and Memory menu. (Disturbingly you can clear parts of memory using the Memory menu which would normally only be used to read how much memory you've used, or to review the basic 0-9 registers contents.)

-Katie

the 35s pol<>rec program

*Message #1 Posted by **db (martinez, ca.)** on 21 Jan 2010, 12:07 a.m.*

An old friend just got a 35s and the p<>r program is the only thing he needs right now. I gave my 35 to my honey's daughter (gonna make her a purple haired RPN user) and can't find that great short program that someone here wrote. It was something like 12 or so lines and lot's prettier than the one i made. Could one of you post a copy or a link? TIA - db

Re: the 35s pol<>rec program

*Message #2 Posted by **Paul Dale** on 21 Jan 2010, 2:05 a.m.,*
in response to message #1 by db (martinez, ca.)

Try this:

```
P001  LBL P
P002  FS? 10
P003  GTO P011
P004: Rv
P005  Rv
P006  eqn REGZ+i*REGT
P007  ARG
P008  LASTx
P009  ABS
P010  RTN
P011: CF 10
P012  XEQ P004
P013  SF 10
P014  RTN

R001  LBL R
R002  FS? 10
R003  GTO R012
R004: Rv
R005  Rv
R006  eqn [REGZ*SIN(REGT),REGZ*COS(REGT)]
R007  [1,0]
R008  x<>y
R009  *
R010  eqn LASTx*[0,1]
R011  RTN
R012: CF 10
R013  XEQ R004
R014  SF 10
R015  RTN
```

Submitted to the software library eons ago and still no sign of it :-(

HP-35s in Hex mode

*Message #1 Posted by **Joel Setton (France)** on 20 Jan 2010, 4:55 p.m.*

Folks,

I guess I'm not the first person trying to use the 35s to do hexadecimal arithmetic... But the thing is next to useless! Looking at the example of a simple addition (page 11-5 in the user's guide), why does the 35s require a hex terminator, i.e. three additional keystrokes after every number?

Once HEX mode is selected, couldn't they make it work this way: 1 2 F [enter] E 9 A +

This is just plain-vanilla RPN... In decimal mode, arithmetic operators (such as + - * /) terminate the number being entered before performing the operation. Why not in hex mode? Didn't anyone at HP test this before releasing the code to production?

Beats me.

Joel Setton.

Re: HP-35s in Hex mode

*Message #2 Posted by **Don Shepherd** on 20 Jan 2010, 5:44 p.m.,*
in response to message #1 by Joel Setton (France)

Joel, it is well known that number bases were not implemented well on the 35s. It is what it is and will not likely change.

Re: HP-35s in Hex mode

*Message #3 Posted by **Martin Pinckney** on 20 Jan 2010, 9:20 p.m.,*
in response to message #1 by Joel Setton (France)

Try the 27s. In Hex mode, it provides soft keys for A-F. Effortless.

Re: HP-35s in Hex mode

*Message #4 Posted by **Joel Setton (France)** on 21 Jan 2010, 6:47 a.m.,*
in response to message #3 by Martin Pinckney

Right. I also have an HP-20S which is close to the 27s in this respect, but they are both (ewww...) algebraic. Ah, well.

Joel Setton

*Message #5 Posted by **Dave Britten** on 21 Jan 2010, 7:22 a.m.,*

in response to message #4 by Joel Setton (France)

Get a 32sii (or 32s). The number base handling is nearly identical to the 20s, the only difference being you have to switch bases using a menu, which amounts to one extra keystroke.

That said, the 20s is a surprisingly capable machine, and you can do some rather interesting tricks with INPUT, SWAP, and LAST. For example, here's a MOD program that uses no storage registers:

```
LBL F
=
(
SWAP
INPUT
=
/
LAST
)
IP
*
LAST
=
(
SWAP
-
LAST
=
RTN
```

Re: HP-35s in Hex mode

*Message #6 Posted by **Martin Pinckney** on 21 Jan 2010, 3:03 p.m.,*
in response to message #4 by Joel Setton (France)

Well, I forgot to mention the 42s also has an excellent implementation, with soft keys for A-F. But as Dave pointed out, the 32sii method is pretty slick, too.

Re: HP-35s in Hex mode

*Message #7 Posted by **Ken Shaw** on 21 Jan 2010, 12:37 p.m.,*
in response to message #3 by Martin Pinckney

Lack of RPN on the 27S is it's big drawback.

That aside, the ease-of-use is amazing. R-P conversions, base conversions, etc., are all very intuitive.

I think it's very under-appreciated.

32sii: FLOOR function

*Message #1 Posted by **Dave Britten** on 20 Jan 2010, 10:27 a.m.*

I recently had a need for a FLOOR function on my 32sii (i.e. largest integer less than or equal, or "round down"). This is what I came up with, but I'm curious if anybody has something more efficient.

```
LBL F
SF 4
ENTER
FP
x=0?
CF 4
CLx
x<=y?
CF 4
FS? 4
COS
-
IP
CF 4
RTN
```

This one checks to see if X has a fractional part, and if X is less than zero. If both conditions are met, it uses COS to transform the 0 to a 1 before subtracting, thus correcting for IP rounding in the wrong direction for negative numbers. Can it be done in fewer steps/bytes?

Re: 32sii: FLOOR function

*Message #2 Posted by **Bart (UK)** on 20 Jan 2010, 11:22 a.m.,*
in response to message #1 by Dave Britten

Here's my attempt:

```
F001 LBL F
F002 ENTER
F003 FP
F004 x<>0?
F005 x<0?
F006 CLx
F007 x>y?
F008 COS
F009 +/-
F010 +
F011 IP
F012 RTN
```

Done on the 35s, should work if the 32sii has x<>0 (x not equal to 0).

Edited: 20 Jan 2010, 11:26 a.m.

Re: 32sii: FLOOR function

*Message #3 Posted by **Dave Britten** on 20 Jan 2010, 11:36 a.m.,*
in response to message #2 by Bart (UK)

Looks like it has the same issue that was present in my first version I did last night: the program will still

subtract 1 if the input is a negative integer. e.g. -6 -> -7

Mine was a lot shorter before I had to add all that flag nonsense to fix that. :) My broken version, just for reference:

```
LBL F
0
x>y?
COS
-
IP
RTN
```

Re: 32sii: FLOOR function

*Message #4 Posted by **Bart (UK)** on 20 Jan 2010, 12:14 p.m.,*
in response to message #3 by Dave Britten

Oh, yeah, that was what line 3/4 was supposed to handle, then I had to fix something else (6/7 i think) and it all went to pot. Back to the "drawing board" then.

Edited: 20 Jan 2010, 12:21 p.m.

Re: 32sii: FLOOR function

*Message #5 Posted by **Marcus von Cube, Germany** on 20 Jan 2010, 12:23 p.m.,*
in response to message #4 by Bart (UK)

If you can live with a limited range (below 1E12) why not just add 9E11, IP and subtract again?

Re: 32sii: FLOOR function

*Message #6 Posted by **Bart (UK)** on 21 Jan 2010, 4:37 a.m.,*
in response to message #5 by Marcus von Cube, Germany

From the further responses, there are some very good solutions (Katie coming up with some wonderful stuff as usual).

Re: 32sii: FLOOR function

*Message #7 Posted by **Didier Lachieze** on 20 Jan 2010, 12:24 p.m.,*
in response to message #3 by Dave Britten

This one seems to work on my 35s:

```
F001 LBL F
F002 ENTER
F003 FP
F004 0
F005 x>y?
F006 COS
F007 +/-
F008 REGZ
F009 +
F010 IP
F011 RTN
```

Re: 32sii: FLOOR function

*Message #8 Posted by **Glenn Shields** on 20 Jan 2010, 9:06 p.m.,*
in response to message #7 by Didier Lachieze

What an elegant solution. After seeing the responses to the 2*2 bug, the keyboard layout, and all the other known quirks of the 35s, this thread shows the continued need for and enjoyment of RPN keystroke programming. Sure the 50g has this function built-in, and has i/o for all the fantastic RPL programming one can create and use, but it is still lots of fun to create and debug an RPN program without worrying about having enough ENDs and << >> in all the right places! And the 35s has the new register capabilities and auto goto line renumbering, which adds to the appeal (even with all the bugs). I am sorry that programs can't be saved, because as soon as I got mine, I wrote two programs, one being the "mastermind" game of guessing four numbers, and the other the 15-puzzle test of solvability, both using indirect addressing- a lot of fun. And BTW, did anyone notice that the data-packing program secretly uses the "0" register? That's enough to keep the rate of gray cell decay to a smaller number than if we never had this buggy machine. Cheers, Glenn

Re: 32sii: FLOOR function

*Message #9 Posted by **Bart (UK)** on 21 Jan 2010, 4:54 a.m.,*
in response to message #8 by Glenn Shields

I find the 35s a very nice calculator to use despite the bugs. For instance, I like the complex input, it's just a pity there's no easy way to do P<>R conversion and extracting RE and IM parts (but program routines can easily be used for this). We all agree on the need for an external comms capability (I have a number of programs too that could do with saving/restoring (~15k mem used - I'm sure there are many on this forum with more)). Although I ahve the listings for them all, I'd hate to type them in again (it took me 2 days to type in Egan's game (of 700+ lines/~3k IIRC)) - and with the buggy lenth/checksums, mistakes would easily creep in!

Re: 32sii: FLOOR function

*Message #10 Posted by **Egan Ford** on 21 Jan 2010, 2:47 a.m.,*
in response to message #7 by Didier Lachieze

AFAIK there is no way to recall a stack register on the 32sii. At least I could not find it in the manual. Here is a modified version that *should* work on the 32sii.

```
F001 LBL F
F002 IP
F003 LASTx
F004 FP
F005 0
F006 x>y?
F007 COS
F008 x<>y
F009 Rv
F010 -
F011 RTN
```

Here's another without COS:

```
F001 LBL F
F002 IP
F003 LASTx
F004 FP
F005 0
F006 x>y?
F007 y^x
F008 x=0?
F009 *
F010 -
F011 RTN
```

Edited: 21 Jan 2010, 3:10 a.m.

Re: 32sii: FLOOR function

*Message #11 Posted by **Didier Lachieze** on 21 Jan 2010, 4:50 a.m.,*
in response to message #10 by Egan Ford

Nice ones. Here is another version for the 32sii:

```
F001 LBL F
F002 IP
F003 LASTx
F004 FP
F005 1
F006 +
F007 IP
F008 1
F009 -
F010 +
F009 RTN
```

And a shorter version working on the 35s but not on 32sii as it doesn't support the SIGN function:

```
F001 LBL F
F002 IP
F003 LASTx
F004 FP
F005 SGN
F006 x>0?
F007 CLx
F008 +
F009 RTN
```

Re: 32sii: FLOOR function

*Message #12 Posted by **Maarten Ambaum (Reading, UK)** on 21 Jan 2010, 5:35 a.m.,*
in response to message #11 by Didier Lachieze

Didier (et al.), Some nice solutions here. I assume you are aware of the INTG function on the 35s, which, as far as I can see, is precisely the floor function. I agree it is not as much fun as doing it yourself.

Re: 32sii: FLOOR function

*Message #13 Posted by **Didier Lachieze** on 21 Jan 2010, 6:00 a.m.,*
in response to message #12 by Maarten Ambaum (Reading, UK)

> Quote:
>
> I agree it is not as much fun as doing it yourself.

This is the point, it's fun to do some RPN programming! and as the topic is related to the 32sii I was using my 35s to try to find solutions that could apply to the 32sii which doesn't have a built-in FLOOR and which I don't have. The latest program from Egan in 8 steps is clearly the best one so far.

Re: 32sii: FLOOR function + 30b request

*Message #14 Posted by **hugh steers** on 20 Jan 2010, 3:30 p.m.,*
in response to message #1 by Dave Britten

Yes indeed. can we have floor added to the 30b too!!

the usual offerings are IP and FP. IP (integer part) truncates to zero, so IP(-2.9) = -2, IP(-2.1) = -2, IP(2.1) =

2, IP(2) = 2, IP(-2) = -2.

fine, but also floor is useful, so in the above we have FLOOR(-2.9) = -3, FLOOR(-2.1) = -3, FLOOR(2.1) = 2, FLOOR(2) = 2,FLOOR(-2) = -2 etc.

this came up again because recently i needed ceil(x) (ceiling), which is conveniently defined by ceil(x) = -floor(-x).

so ceil and floor are not both needed, but it would be nice to have one of them and also the existing IP, otherwise a test and branch are required.

Re: 32sii: FLOOR function + 30b request

*Message #15 Posted by **Katie Wasserman** on 20 Jan 2010, 4:04 p.m.,*
in response to message #14 by hugh steers

What I just posted on this thread will work on the 30b too and you can save the display state. Here's some not so pretty code demonstrating that:

```
STO 8
RCL Mode
STO 9
3
0
0
STO Mode
RCL 8
.
5
-
RND
RCL 9
STO Mode
ANS
Stop
```

Re: 32sii: FLOOR function + 30b request

*Message #16 Posted by **Gerson W. Barbosa** on 24 Jan 2010, 7:17 a.m.,*
in response to message #14 by hugh steers

> Quote:
>
> so ceil and floor are not both needed, but it would be nice to have one of them and also the existing IP, otherwise a test and branch are required.

In order to avoid any test, we can define floor(x) as

```
floor(x) = IP(x) + IP(FP(x) + 1) - 1
```

The corresponding RPN program will be

```
F01 LBL F
F02 IP
F03 LASTx
F04 FP
F05 1
F06 +
F07 IP
```

```
F08 1
F09 -
F10 +
F11 RTN
```

Not the shortest one though.

Re: 32sii: FLOOR function + 30b request

*Message #17 Posted by **hugh steers** on 24 Jan 2010, 9:04 p.m.,*
in response to message #16 by Gerson W. Barbosa

i like it. i didnt think it was expressible in terms of IP & FP, but you're right.

I think a test is always a disaster because the jump causes a delay.

Re: 32sii: FLOOR function

*Message #18 Posted by **Katie Wasserman** on 20 Jan 2010, 4:02 p.m.,*
in response to message #1 by Dave Britten

What's wrong with:

```
FIX 0
.5
-
RND
ALL (may not be needed)
```

-Katie

Re: 32sii: FLOOR function

*Message #19 Posted by **Gerson W. Barbosa** on 20 Jan 2010, 9:26 p.m.,*
in response to message #18 by Katie Wasserman

> Quote:
> ---
> What's wrong with:
>
> ```
> FIX 0
> .5
> -
> RND
> ALL (may not be needed)
> ```
>
> -Katie
>
> ---

0 -> -1

-1 -> -2 . . .

```
A01 LBL A
A02 ENTER
A03 IP
A04 x<=y?
A05 GTO B
A06 1
A07 -
B01 LBL B
B02 x<>y
B03 Rv
B04 RTN
```

This works, but takes up an extra label (not a problem on the 32S-II as one would run out of memory long before running out of labels...)

Gerson.

Re: 32sii: FLOOR function

*Message #20 Posted by **Egan Ford** on 21 Jan 2010, 3:32 a.m.,*
in response to message #19 by Gerson W. Barbosa

Same without 2nd label:

```
F01 LBL F
F02 ENTER
F03 IP
F04 x<=y?
F05 RTN
F06 1
F07 -
F08 RTN
```

Y will contain original arg. Could cause a problem if used in a program.

Re: 32sii: FLOOR function

*Message #21 Posted by **Dave Britten** on 21 Jan 2010, 7:59 a.m.,*
in response to message #20 by Egan Ford

Very nice. Leaving the original argument in Y allows adding one extra label, which gives you a version of the program that behaves like a built-in command, i.e. no trashing T, and LASTx works as expected:

```
LBL R
RUp
STO i
RDown
XEQ F
x<>y
SIN
CLx
RCL i
RDown
RTN
```

Then you can have a "clean" version for interactive use, and the smaller, faster version for program loops.

Re: 32sii: FLOOR function

*Message #22 Posted by **Gerson W. Barbosa** on 21 Jan 2010, 11:33 a.m.,*
in response to message #20 by Egan Ford

Here is a 32S-II 9-step program that preserves X and Y, but does not preserve L:

```
F01 LBL F
F02 IP
F03 LASTx
F04 FP
F05 x<0?
F06 COSH
F07 IP
F08 -
F09 RTN
```

The forensics algorithm for the 10s

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 19 Jan 2010, 10:20 p.m.*

I had a good weekend for collecting by finding a Pickett N-500S in very good condition for two dollars, a old paper reactance slide rule by Shure for a dollar, and a HP-10s for three dollars.

I ran Mike Sebastian's forensic algorithm on the 10s. The answer is 9.000000002124 . The eight zeroes after the decimal point makes the result better than any other HP machine listed at Mike's site. Am I doing something incorrectly or is the 10s really that good?

Re: The forensics algorithm for the 10s

*Message #2 Posted by **Gerson W. Barbosa** on 19 Jan 2010, 10:46 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

> Quote:
>
> The answer is 9.000000002124 . The eight zeroes after the decimal point makes the result better than any other HP machine listed at Mike's site.

The HP-30S, also listed at the site, returns 9.000000000, for which Rodger Rosenbaum has provided an explanation:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=85973

Edited: 19 Jan 2010, 10:48 p.m.

Re: The forensics algorithm for the 10s

*Message #3 Posted by **Palmer O. Hanson, Jr.** on 20 Jan 2010, 4:25 a.m.,*
in response to message #2 by Gerson W. Barbosa

The end of Rodger's dissertation states:

> Quote:
>
> So finally, this is why the HP30S gets exactly 9.00000000000000000 when running the calculator forensics test. To see the real error, one should subtract the input argument of the test from the final result. That is, do:
>
> arcsin(arcos(arctan(tan(cos(sin(9))))))-9
>
> On the HP30S, the result is 0, leading one to believe that the HP30S is *really* accurate. But redo the test as:
>
> arcsin(arcos(arctan(tan(cos(sin(9.1))))))-9.1

> to foil its rounding near integers and see a result: 4.833288903E-11
>
> Not all that great for a calculator that can do 24 digit calculations, eh?

I did the Rodger's 9.1 version of the forensics algorithm on my 10s and received 9.100000002602 . Does that suggest that the 10s isn't doing any of the funny arithmetic that Rodger was writing about?

Re: The forensics algorithm for the 10s

*Message #4 Posted by **Gerson W. Barbosa** on 20 Jan 2010, 7:03 a.m.,*
in response to message #3 by Palmer O. Hanson, Jr.

> Quote:
>
> Does that suggest that the 10s isn't doing any of the funny arithmetic that Rodger was writing about?

Yes, apparently the 10s isn't doing any trick to make it look more accurate than it really is, otherwise it would return 9.00000000000 in the original test. Assuming the algorithms are correct, it is possible internal calculations are carried out with 15 or 16 digits internally. On classic 12-digit HP calculators intermediate results are rounded to the number of digits of the display, so the forensic results will be a bit away from 9, even though the algorithms are flawless:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=103151

It looks like HP is back to its original philosopy (see Katie's result for the 30b below).

Re: The forensics algorithm for the 10s --> 30b

*Message #5 Posted by **Katie Wasserman** on 19 Jan 2010, 11:25 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

The 30b comes in at 8.99999864267, the same as the Pioneers (20S, 32S, etc.).

TI-59 LED intensity

*Message #1 Posted by **Michael Meyer** on 19 Jan 2010, 2:12 p.m.*

Quick question: anyone know how to adjust the brightness of a TI-59's LED's? I have a couple of them with dim displays.

I just bought another cheap 59. I was considering it for "drop testing" until I saw that another one sold for $175!!!

Thanks.

Re: TI-59 LED intensity

*Message #2 Posted by **Joerg Woerner** on 19 Jan 2010, 2:27 p.m.,*
in response to message #1 by Michael Meyer

Operate it with 4.5V instead of 3.6V...

Regards, Joerg

Re: TI-59 LED intensity

*Message #3 Posted by **Michael Meyer** on 19 Jan 2010, 3:48 p.m.,*
in response to message #2 by Joerg Woerner

Thanks, Joerg! Actually, I run them all at 4.5+ volts (lithium celled packs), but this one is still mounted to the PC-100C it came on today in the mail. I'll try it at home with lithium cells. It needs its card reader rebuilt also. The good news: I've never seen corrosion in the units that were left on printers. That's always nice. This one I got today, for $25, with keys in printer, had no battery pack stuck in the printer, and the contacts there are in perfect shape. Another nice find....

O.K. Any OTHER way to adjust LED brightness?

Re: TI-59 LED intensity

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 19 Jan 2010, 4:54 p.m.,*
in response to message #3 by Michael Meyer

Hi, Doc; are you well?

By inspecting Spike de Wal´s TI59 diagram, one finds out that the battery voltage, indicated as -3.7V, directly feeds the two SN27882 (pin #1), the two IC´s closer to the LED display and responsible for its multiplexing control signal (select which digit). Each segment (SA, SB, SC, etc.) is 'lit' by the TMC0501, which is fed by Vgg (-15.7Vcc, pin #27) and Vdd (-10Vcc, pin #26). Because the voltage from the TMC 0501 that lits each segment is more negative than the voltage in the SN27882, they must be common anode.

In order to increase the brightness in such multiplexing display, either you increase the current across

the load (the LED´s) or change the cyclic ratio. The second option means to redesign the circuit, and the first one may harm the LED´s. In any way, the output voltage from the (small) power board might be checked for the values presented here. Chances are that you may find lower voltages as for the Vgg and Vdd.

Or you can try to change the LED display. Although plausible, I´d not bet on this because I do not think the LED´s would dim after time.

In time: I completely disassembled three TI59 card readers and reassembled one of them with the best of them. I found out that the one in best working conditions had a different layout in the head terminals, and the other two had gooey 'rubber roller' (is it the correct term for that stuff?), and I ended up with a few good components. Because I have another TI59 under repair, I'll try to wire the whole reader with pieces of flat cable used in high speed IDE hard disks (I always forget how many conductors it has...). I'll record the whole operation in pictures and let you all know ASAP. All of this will be done after delving into the so well known 41CX motherboard...

Cheers.

Luiz (Brazil)

Edited: 19 Jan 2010, 4:58 p.m.

Re: TI-59 LED intensity

*Message #5 Posted by **Michael Meyer** on 19 Jan 2010, 5:12 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Thanks, Luiz! I'm well. I certainly wouldn't waste too much time on the TI-59... except out of interest in its repair. I bought so many of them so cheaply when I first started collecting that I have lots of parts, including some card reader assemblies. And for you, I'd be happy to send you a fully functioning 59. With their prices rising, I've been trying to add a few more to the "pile" just for fun, but I have plenty of them.....

Let me know if you want a bunch of 59 parts or just a working one... spend your time on those wonderful HP's!

Michael

Re: TI-59 LED intensity

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 19 Jan 2010, 7:42 p.m.,*
in response to message #5 by Michael Meyer

Hi, Doc;

you see, the only two TI´s I feel confident about using and repairing are the TI58C and TI59. The TI58 seems to be almost like the TI59, but the TI58C has a different circuit. The reason is simple: technology timeline and history. I almost worship these two models because they were way ahead of their time when they appeared. Their printer (PC100C) was external and could be shared amongst models (HP had the printerless HP67 OR the HP97 with built-in printer, and the affordable HP34C), they could also share the Solid State Software Library (ROM modules, available later only with the HP41) and they had plenty of memory. They were fast too, but if we inspect the diagrams (again) we´ll notice that they had a 4-bit data bus (RAM TMC0589, A.L.U. TMC 0501 and C.U.'s TMC 0582/0583) that would allow many operations to be performed in less cycles. Standard and Library ROM's use a serial access (Q1, Q2 control lines)

similar to the one found in the HP41. That´s what I like most: to inspect their 'guts' and assimilate them (am I a BORG? Should resisting be futile?)

Click to enlarge (big one, 1.2Mb)

My first calculator ever was a TI57 (still have it, still works) and I used it in the first one and a half years of the University. A fellow mate. The first TI59, along with the PC100C, was a gift from a a former colleague (retired teacher) at the university, and it worked for almost two years. The other two were bought at local e-bay (mercado livre), but none of them are working. The one in the picture (rightmost, over the pale box) is just the empty case. The TI58C (over the PC100C box) works fine, but has a problem with the memory. I was given an old unit and will try to make one fully working out of the two.

The next pictures show one of the card readers. I tried to replace the gooey roller but I could not find a fine replacement so far. All of the other components seem fine (after a 'heavy' cleanup).

Click to enlarge Click to enlarge

I cannot lie to you, doc (afterall, you are a psychologist, why should I?). I'd love to have a working TI59 as part of the 'family'. As you can see in the pictures, there´s a lot of magnetic cards waiting for being read and listed so I can register their contents and operation. I like to 'reverse engineer' these programs and retrieve their flowchart and 'working mechanics'. My brain cells take this kind of activity as relaxing... (should I look for help?)

Well, doc, I guess that the next step is to send you an e-mail with my actual address, right? Can I use the regular e-mail from the MoHPC contact form? Is yours updated? Mine is not, so I must contact you first, if using a valid MoHPC contact e-mail.

Thank you very much. And if there is anything I can do you for, you know you can count on me the same way.

Cheers.

Luiz (Brazil)

Try mlmeyer (at) cox.net. The TI-59 took me all the way through college ('79-'83), and I was able to re-write every computer assignment for it, even with alpha-numerics. (Boy, did that take some time, but you got quick at it...) Let me know if you want a printer with that :).

You have mail (hopefully)...

in response to message #8 by Vieira, Luiz C. (Brazil)

The PC-100C's printhead is really prone to light printing and sticking. Cleaning it with a cotton swab is easy... open the latch and wipe with alcohol. Close the latch and advance some paper through it.

It also does make the very coolest sound when printing...

Re: You have snail mail (hopefully)...

*Message #10 Posted by **Marcus von Cube, Germany** on 21 Jan 2010, 4:46 p.m.,*
in response to message #9 by Michael Meyer

And it's pretty fast because a line is printed in parallel without a moving head. Mine had a problem with the driver circuit after maybe a year of use. A friend of mine helped me repair it. On a later occasion when I tried to revive it, the processor seemed to have given up. It locked the calculator completely. :(It was a PC-100A which worked with both my SR-56 and the TI-59 acquired later. The TI no longer reads cards and the keyboard is bouncy.

History...

Mine took me through graduate school and beyond. Yes, alpha-numerics was a big plus for using the printer cradle. I was a huge fan of the 59 ... until I got into HP's.

SR-52 repair

*Message #13 Posted by **Michael Meyer** on 21 Jan 2010, 3:51 p.m.,*
in response to message #12 by Etienne Victoria

I'm impressed. I bought about a half dozen SR-52's years ago. Of those, I was only able to get one to work reliably after rebuilding the card reader. Another works intermittently... won't read cards well. The others had various faults to the keyboards, readers, etc. from corrosion. The SR-52's keyboard plate and connections seem especially prone to destruction from outgassing. I've kept this in mind as they appear online in auctions. I hope that people paying top dollar for an unknown SR-52 don't discover this the hard way.

Re: SR-52 repair

*Message #14 Posted by **Garth Wilson** on 21 Jan 2010, 5:05 p.m.,*
in response to message #13 by Michael Meyer

If you ever design anything like that, do the customer the favor of leaving the rubber out if possible. Something like a sprocket advance with a row of holes in the card like movie film has along the edge would make for a system that would not rot or turn to goo.

*Message #15 Posted by **Eric Smith** on 23 Jan 2010, 4:54 a.m.,*
in response to message #13 by Michael Meyer

While we're on the subject, does anyone happen to have the SR-52 service manual? I obtained a paper copy from TI back in 1977 or so, but unfortunately it's long gone.

TI-59 card reader repair

*Message #16 Posted by **Michael Meyer** on 21 Jan 2010, 5:36 p.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

I repaired several at about the same time by gluing a rubber plumbing washer on the motor, powering it externally, and simply grinding it down to the right size visually. IIRC, you can adjust the tension on the roller when it's reinstalled. I had good luck with this, but as I joked in an earlier thread, I ended up finding my own advice when looking to see if anyone had found an easier or better way to do this....

This is true for the TI-59. The SR-52 roller has to be exactly the right size and at exactly the right tension, making it very difficult to replace. There's no way to adjust it except to start over....

48G series ROM question

*Message #1 Posted by **Ed Look** on 18 Jan 2010, 6:16 p.m.*

Funny, someone just posted a thread about the HP-35s ROM.

I just had the occasion to use both my 48G and 48G+ the last couple of days. I have some constants I need stored on them and wanted to dig them out to put on my 50g. I noticed that the preloaded constants in the constants library of the 50g (naturally, I suppose) appear to be more up to date than those in the 48G machines' constants library.

I know that for most work, the differences appear generally in decimal places that aren't all that important. But still, it's nice to have the updated (and assumed more correct) numbers.

Is/was there a ROM update for the 48G series? I further suppose that any corrections to constants would appear in such an update. I did a quick poke around and did not even find an oblique reference to a 48G ROM or other kind of update.

Re: 48G series ROM question

*Message #2 Posted by **Dave Britten** on 18 Jan 2010, 6:25 p.m.,*
in response to message #1 by Ed Look

There were a few different ROM revisions, although the ROM in those machines is not user-upgradeable. I'm assuming it's a mask ROM chip.

The comp.sys.hp48 FAQ has info about the different versions. Section 3 has ROM info.

http://www.faqs.org/faqs/hp/hp48-faq/part1/

Re: 48G series ROM question

*Message #3 Posted by **Ed Look** on 18 Jan 2010, 6:56 p.m.,*
in response to message #2 by Dave Britten

Thank you, Dave. This does answer all my questions. Too bad it's not a flashable ROM. Even though I have the 49g+ and the 50g, I still use my 48g machines from time to time.

Almost O.T.: rarity and prices...

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 18 Jan 2010, 10:28 a.m.*

Hi, all;

I hope you forgive me, but I could not help thinking that this is something you would like to see. It relates to HP calculators and their prices, so it is not exactly off topic. The page is in Portuguese, so you can use any web translator to see it in English and any currency conversion to check the final price.

Enjoy!

Luiz (Brazil)

Hi, Gerson;

As far as I know, the only Voyager that was not commercialized in Brazil was the HP16C. Neither the HP41CX, not a Voyager though.

Cheers.

Luiz (Brasil, né?)

(P.S. - if you do not speak Portuguese and are curious about it, 'né' is a contraction of 'não é', which could be translated to 'isn't it'. Just if you are curious about it...)

Re: Almost O.T.: rarity and prices...

*Message #12 Posted by **Bart (UK)** on 19 Jan 2010, 12:05 p.m.,*
in response to message #11 by Vieira, Luiz C. (Brazil)

> Quote:

> Just if you are curious about it...

Actually, yes. Thank you for the explanation. My curiosity was aroused as the word also is used in Afrikaans (South Africa) and has a similar meaning (there is a large Portuguese community there so was probably taken over from them).

Re: Almost O.T.: rarity and prices...

*Message #13 Posted by **Gerson W. Barbosa** on 19 Jan 2010, 3:34 p.m.,*
in response to message #11 by Vieira, Luiz C. (Brazil)

Hello Luiz,

> Quote:
>
> 'né' is a contraction of 'não é', which could be translated to 'isn't it'

Interestingly this translates every possible English question tag, so I'd say 'né' is equivalent to "isn't it true?". A nice example of the law of least effort, another one is "você" (you) which once used to be "Vossa Mercê" (Your Mercy), which people have now turned into "'ocê" or even "'cê". Now can you understand this "Cê sá sessonz passna Saváss?" ? I learned this during my three-month stay in the beautififul capital of your home state a couple of years ago :-)

By the way, to me your usage of 'né' above doesn't look like a real question tag, instead it looks like "Brazil, of course!.

Regards from Curitiba (Brasil, claro!)

Gerson.

Re: Almost O.T.: rarity and prices...

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 19 Jan 2010, 4:09 p.m.,*
in response to message #13 by Gerson W. Barbosa

Our place, guys, please! ;-)

Hi, Gerson;

At first I thought about using 'isn't that so', for I meant 'não é mesmo' with 'né', as I aways write 'Brazil' and this time, because I was addressing a country mate, I wrote 'Brasil' (não é mesmo?). I ended up reducing it even more, did not work well...

The hardest part is finding a regular expression in a non-native tongue that has the closest meaning possible to the 'native tongue' expression. As if one can master Portuguese in Brazil the way it is in Portugal... I aways think 'Lucky me!' when I feel conscious of the fact that I was born in a country were Portuguese is spoken. Or else, I'd never dare trying to learn it. As the number of rules were not enough to confuse the speakers, there are even more exceptions... d8^D

Cheers.

Luiz (Brasil, Brazil, Brésil, Brasilien, Brazilië, etc...)

> and destroy trying to restore, if I look at my posts

I cannot agree with you, sorry! You are looking for directions and advice by posting here prior to go ahead, so I'd guess it is a matter of 'bad luck', although I do not believe in luck and bad luck. It is just circumstantial. I am fighting like hell to bring a 41CX mainboard back to life (not mine, it belongs to a friend) and I will give up only when there is no resource at all I can use. Unfortunately I was 'off duty' related to HP activities for the past two years (contingencies) but I am now back to it and I decided to 'warm my brain up' by fixing some of my own pieces before getting back to the CX mainboard. So far, I managed to repair one 82143A printer, one 82104A card reader, two HP41CV and one HP21. I'm setting my workbench up to go ahead with the CX mainboard, but I had to delay the 'fight' for these days because of the end-of-semester extra activities (university). The board is still there, and my brain is fuming by the tease of working on it. Sure I will, just waiting for the very moment...

Success, my friend! There are many hearts here beating with yours.

Luiz (Brazil)

Thanks for your understanding...

Luiz

Re: It´s been sold so far... And about Coburlin´s HP10C

*Message #20 Posted by **Michael Meyer** on 19 Jan 2010, 2:08 p.m.,*
in response to message #17 by Vieira, Luiz C. (Brazil)

I understand... it's so hard to give up on restoration. I've wanted an SR-11 for years. Bought two that were both too badly corroded to restore (internal batteries) years ago, though I tried. Last week I bought two online. $0.99 for one, that came broken in the mail leaking horrible corrosion (but came with a beautiful TI-1500.. an unexpectedly pretty little calculator in perfect shape) and a $5 SR-11 that came--- get this--- with no batteries inside. YEAH!! a perfect SR-11. Finally.

I can bring myself to throw away the 99 cent ones, but it's still not easy. But the HP's... it's really really hard to give up on those....

Re: It´s been sold so far... And about Coburlin´s HP10C

*Message #21 Posted by **Alberto Fenini** on 19 Jan 2010, 5:15 p.m.,*
in response to message #20 by Michael Meyer

Thanks everybody for the thumbs up ! That was really bad luck, but, it so nice when you succeed that I won't give up very easily... By the way, I want to thank Ignazio Cara that is going to take care of my LCD baby ... thanks Ignazio !!

HP 97 keyboard and more issue.

*Message #1 Posted by **Ignazio Cara (Italy)** on 18 Jan 2010, 9:54 a.m.*

Hi guys, I need your help with a faulty Topcat HP-97, serial number 2008B65177 and mother board 97S like. When turned on, show 0.00 at the display, but it don't receive input by the keyboard in RUN mode, display light-off if any key was depressed in PRGM mode. If something is sent to the printer, show 'Error' and if a card is inserted in the reader appear incongruous data on the display and the driving motor not start. I have tried to make some substitution among the electronic component taken from a working PCB. Step by step I have replaced the PIK 1820-1952 with a 1820-1723 (is it compatible?), the ACT, the ROM 0, ROM 3 and ROM 6. Nothing to do, the calculator show always the same issue. I have tested the voltages Vss and Vgg. With a Vbat = 5,20 I have read the following values: Vss= + 6.00 and Vgg = - 11.61. Unfortunately I do not have an oscilloscope to check the SYNC, STR, RCD, Ô1 and Ô2. What other measures can I do with a multimeter to see what does not work? Thank in advance for your kindly help.

Edited: 18 Jan 2010, 9:55 a.m.

Re: HP 97 keyboard and more issue.

*Message #2 Posted by **Ignazio Cara (Italy)** on 18 Jan 2010, 10:53 a.m.,*
in response to message #1 by Ignazio Cara (Italy)

Sorry, but I have forgot to say that the display-keyboard assembly, printer and card-reader works flawlessly if installed with another main PCB.

Re: HP 97 keyboard and more issue.

*Message #3 Posted by **Randy** on 18 Jan 2010, 5:16 p.m.,*
in response to message #1 by Ignazio Cara (Italy)

Has the behavior changed in any way with the parts that have been exchanged?

Same question, different way: Are the current symptoms identical to the original symptoms?

Re: HP 97 keyboard and more issue.

*Message #4 Posted by **Ignazio Cara (Italy)** on 19 Jan 2010, 2:13 a.m.,*
in response to message #3 by Randy

Hi Randy, I'm very glad to hear from you, thanks. No, nothing is changed before yesterday. I have changed the zener CR10 and now the Vss and Vgg are 6.27 and -12,01 Volts respectively. I don't remember how many times I have checked the PCB, my next action will be change the CRC as well. After this attempt, the dark night. You have any idea about this? Many thanks for your efforts.

Ignazio

Re: HP 97 keyboard and more issue.

*Message #5 Posted by **Randy** on 19 Jan 2010, 8:43 a.m.,*
in response to message #4 by Ignazio Cara (Italy)

PIK and CRC should have been the last IC's to swap, ALL the roms would have been my first choice.

All roms and the ACT are by far the most common failure parts.

Re: HP 97 keyboard and more issue.

*Message #6 Posted by **Ignazio Cara (Italy)** on 19 Jan 2010, 9:43 a.m.,*
in response to message #5 by Randy

My next action will be to change ROM 1, 2 and 5 (550, 551 and 229), becouse the ROM 0, 3 and 6 have been already changed. as so as the ACT. I'll keep you informed, for now thank you very much.

Ignazio

MCODE (what else?): Creating a new ROM from the 41 --> Transfer?

*Message #1 Posted by **Geir Isene** on 18 Jan 2010, 3:12 a.m.*

Up until now, I have created the ICEBOX rom within the SDK41 (many thanks to Warren Furlow). But as I am now exploring doing the work on the 41 itself, I wonder what the best solution is for creating the final rom image; I make the rom with David Assembler, then I.... What is the best way of getting that final rom out into the ICEBOX.ROM image file on the PC. Bear in mind I do have the PIL BOX (finally got around to using that, works great).

Edited: 18 Jan 2010, 3:14 a.m.

Re: MCODE (what else?): Creating a new ROM from the 41 --> Transfer?

*Message #2 Posted by **Mike (Stgt)** on 18 Jan 2010, 8:16 a.m.,*
in response to message #1 by Geir Isene

It depends what HW you have at hand and what you consider as "best way". I would save the page (or two?) to a LIF-disk (real or emulated), read this disk on a DOS system and apply a converter. If this is too simple use a disassembler and store the listing to disk instead of printing it. Then you still need a converter.

Ciao.....Mike

(edited)Re: MCODE (what else?): Creating a new ROM from the 41 --> Transfer?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 18 Jan 2010, 10:12 a.m.,*

Hi, Geir;

> Quote:
>
> I make the rom with David Assembler, then I.... What is the best way of getting that final rom out into the ICEBOX.ROM image file on the PC.

When you say you make the ROM with David assembler you refer to a complete 4K- page or part of it (i.e. some functions)? If you complete a 4K ROM, then I guess the image itself is ready to run, like *a regular one, right*? Then you apply the same procedure you have already applied with any other ROM image.

If you are using Diego´s NoV-32 or NoV-64, there is an affordable way to transfer files from the modules to the PC once you have the hardware to (PIC programmer): try here.

Hope this is what you are talking about.

Success! (many of us, including me, are willing to see and use this new ROM...)

Luiz (Brazil)

Edited: 18 Jan 2010, 1:21 p.m. after one or more responses were posted

Re: MCODE (what else?): Creating a new ROM from the 41 --> Transfer?

*Message #4 Posted by **Geir Isene** on 18 Jan 2010, 12:47 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Ah, the RAM2ROM - I had forgot about that one. Anyone knows if it can be used with the NoV-64 burning a page from the fourth RAM block?

Re: MCODE (what else?): Creating a new ROM from the 41 --> Transfer?

*Message #5 Posted by **Diego Diaz** on 18 Jan 2010, 2:07 p.m.,*
in response to message #4 by Geir Isene

Hi,

RAM2ROM was writen to work with NoVRAM and NoV-32 processor.

Migrating this program to NoV-64 shouldn't be difficult, just allow me a few days to check for the coding differences.

Best from Spain.

Diego.

Re: MCODE (what else?): Creating a new ROM from the 41 --> Transfer?

*Message #6 Posted by **Geir Isene** on 18 Jan 2010, 3:04 p.m.,*
in response to message #5 by Diego Diaz

Great. That would be the most elegant solution.

Re: MCODE (what else?): Creating a new ROM from the 41 --> Transfer?

*Message #7 Posted by **Meindert Kuipers** on 18 Jan 2010, 12:15 p.m.,*
in response to message #1 by Geir Isene

You may tweak the ROM in the HP41 with DAVID, but I would recommend to feed this back into the original SDK41 source, so the changes are commented and you have more than a 'write-only' product.

User code is a bit tricky, AFAIK this can only be generated on the HP41 for inclusion in ROMs with the proper tools (M2K ROM has these). Documenting is SDK41 sources will soon be possible when my disassembler in M2kM fully support SDK41 mode, so the User Code disassembly listings can be copied and inserted in an SDK41 source.

I must comment that M2K ROM has anice collection of tools, but most of it is not original work. Many routines are based on Assembler 3 and the Eramco MLDL ROM.

Re: MCODE (what else?): Creating a new ROM from the 41 --> Transfer?

*Message #8 Posted by **Ángel Martin** on 18 Jan 2010, 2:37 p.m.,*
in response to message #1 by Geir Isene

I'm afraid I must not be getting the point because to me preparing a ROM is as simple as writing the MCOde (or user code) on a Excel sheet, then use a program Diego wrote a few years back to convert the MCODE instructions (in ASCII) to a ROM file.

I admit that User code is a bit trickier, as it requires compiling the distances. I use the HEPAX emulation on V41 to read the important bytes directly using HEXEDIT.

So once I've got the ROM file I could (but I don't because I don't need it) run D41 to list it using the reference you all seem to consider the standard (for good reasons, I'm sure).

Or I can use the disassembler in the MLDL2k. There are many ways to skin a cat...

Cheers, Ángel

*Message #9 Posted by **Geir Isene** on 18 Jan 2010, 3:07 p.m.,*
in response to message #8 by Ángel Martin

I am actually looking at doing MCODE'ing on the HP-41 itself (like when I am on vacation :) - complete the rom using David Assembler and then transfer that rom to a PC. The RAM2ROM utility from Diego would do the trick given that I can get a version that can accommodate for the two extra RAM blocks of the NoV-64 over the NoV-32.

Re: MCODE (what else?): Creating a new ROM from the 41 --> Transfer?

*Message #10 Posted by **Håkan Thörngren** on 20 Jan 2010, 7:48 a.m.,*
in response to message #9 by Geir Isene

Ouch, you are really trying to program MCODE on the hp41? I guess people did that back when they did not really have much computers.

Back then, I quickly redesigned my 6502 assembler on my Commodore 64 to do MCODE programming. Then I downloaded the results to my home built MLDL using a parallel cable that simulated the hp41 bus running WROM instructions to the ram page. I believe it took some 37 seconds to get it down. The assembler itself was very quick, being written in 6502 assembler, but reading them from the slow 1541 floppy was not (as source was too big to fit in memory). I also had an EPROM burner to do more lasting images that I just plugged into the MLDL.

I never did any programming on the hp41 itself, just paper and pen, then to the C64.

Today I would not even dream on trying it either. But if you think it is fun, why not? Then the David Assembler should be way to go.

If I where to do it on vacation with limited resources, I think I would get a small netbook and use some tools on that one instead.

As always there is the trouble of transferring to and from the hp41, it has always been like that...

in response to message #10 by Håkan Thörngren

Wow. MCODE on a C64... very cool.

Well, my idea of MCODE'ing on the 41 is mostly for fun but also to do simple test runs of small routines. Right now I am working on a better random number generator, and the 41 is with me everywhere (unlike my laptop).

Re: MCODE (what else?): Creating a new ROM from the 41 --> Transfer?

*Message #12 Posted by **Ángel Martin** on 20 Jan 2010, 2:55 p.m.,*
in response to message #11 by Geir Isene

To me the key to a better random number generator is in the seed. Using the timer to create a true random seed makes the trick, and what a poetic justice, considering that Hakan has posted to this thread.- as he wrote that routine!

It's in the SandMath module, see functions SEEDT and RAND.

Cheers, ÁM

Re: MCODE (what else?): Creating a new ROM from the 41 --> Transfer?

*Message #13 Posted by **Håkan Thörngren** on 25 Jan 2010, 12:58 a.m.,*
in response to message #11 by Geir Isene

I never tried programming MCODE directly on the HP41, as I could not afford the David assembler. Sounds like a cool thing to do though.

I tended to write my code using paper and pen, then transferring it to the computer. If working directly on the HP41, I think a printer could be very addition as well (something I could not afford in the past either).

Please report back later with your experiences.

Re: MCODE (what else?): Creating a new ROM from the 41 --> Transfer?

*Message #14 Posted by **PeterP** on 28 Jan 2010, 3:19 p.m.,*
in response to message #9 by Geir Isene

While I do all my MCODING in SDK, if I would make anything on the 41 I would export it via emu41 to a HDRIVE1 and save it as a rom file, which is pretty fast.

Cheers

Peter

Ha, don't be put off by these negative nellies ;), with hypothetically unlimited time & resources, anything is possible.

Option 1: dig out the CPU die from under the resin blob (if you find an ingenious method of doing so without destroying stuff you need to keep, let me know), get a new CPU die, programme it and put it in place of the old one (again if you find an ingenious method of doing so with hobbyist tools, let me know).

Option 2: cut out the resin blob and some surrounding parts, create a piggy-back board that replaces what you cut out (including a new programmed CPU) that "pins-out" onto the cut tracks.

Option 3: Get (make ?) a blank complete 35s PCB, populate it with the neccessary components (including a new programmed CPU) and replace the one in the 35s.

Moral of the story: it requires replacement of the CPU as it contains built-in 256K ROM - not EPROM, FLASH or any re-programmable memory.

in response to message #10 by Walter B

In my book anything below 1E-9 is "extremely improbable" and "considered not to occur". 1E-16 is so many orders of magnitude less than that and so close to zero, that as an engineer I say "close enough to zero to = zero" :-)

Re: Hypothetically - How would you flash a 35s?

*Message #12 Posted by **Paul Dale** on 18 Jan 2010, 3:46 p.m.,*
in response to message #11 by Bart (UK)

Extremely improbable events take place around us all the time.

Want something with a probability less than 1E-9? Toss a coin thirty times recording the results in order. My 15c tells me that that was a 9.3E-10 probability event.

Want to get to 1E-16? Toss the coin some more (twenty four more times).

1E-100? 333 times.

Interestingly enough, someone at Digitial Equipment Corporation (DEC) agreed with you. Back in the early 1980's, I was working with DECUS (DEC's User Society) and was on the board. I remember hearing from DEC about a group that was tasked with essentially accomplishing ANY project that came their way. Literally. The mission from Ken was to accept any job, any task and any project. With seriousness and sincerity.

The catch was that the group was allowed to couch all responses in terms of time, money and resources. If someone wanted to go to Mars, it might cost them $80B, take 100 years and half the USA propulation, but they would work on a way to make it happen.

I don't remember them ever actually beginning any project, but I know that they did respond to a few companies with proposals. I'm sure that if they still existed, they could take on this project too. :)

thanks, bruce

I think you mean user programs, not flashing the ROM. In that case, I'd investigate a machine to press the keys to enter whatever you want. For starters, I'd try modifying a desktop pen plotter. The pen moves in two dimensions and can be made to go up/down. Sounds like a mechanical finger to me!

You'd need some sort of jig to hold the calculator in exactly the right place. Plus software to parse the input file and output the plotter movement commands. You'd need to be mindful of timing issues to avoid getting ahead of the calculator.

Option 2: kidnap Cyrille and force him to use a TI 83 until he agrees to put some form of external I/O on the 35s. :)

Several years ago, I had given some thought to doing just what you proposed - for programming a HP-42S. Unfortnuatelly, I never ran across any usable old pen ploters at the ham radio flea markets or the Trenton Computer Fest. If I could find a small letter size pen plotter, I figured I'd cut out a rectangular the size of the calculator in the middle of the plotter, put some foam backing in it, and then use the plotter to program the calculator. Getting the key pressure right would be the hardest part - would hate to destroy a good HP-42S.

Another though I had, was using one of those single board robot arms that were around several years ago. I had one many years ago, and if I remember right, was programmed using the FORTH language.

Bill

Just get yourself a Lego Mindstorms kit. If it can solve a Rubik's Cube (http://www.youtube.com/watch?v=3QOvEG27Gt4) then you can probably make it program your calc. I have not looked into the NXT, but the first gen could be programmed with FORTH (pbForth) and C. I used LegOS (now BrickOS) on mine with an H8 C cross-compiler. That was much better than using the native macro programming.

Re: Hypothetically - How would you flash a 35s?

*Message #21 Posted by **Martin Pinckney** on 18 Jan 2010, 2:53 p.m.,*
in response to message #19 by Bill (Smithville, NJ)

I know this thread is mostly in jest, but to use a pen plotter as described would entail a lot of work to reprogram it to for the required motions. To begin with, the normal up and down range of motion of the pens is probably not sufficient for the task.

I recall watching these things work, processing AutoCAD drawings, and they often exhibited seemingly very odd behavior. For instance, it might write some text, drawing the outline of the characters, then go and draw lines for 15 minutes, then come back and fill in the outline of the characters. Surely this was caused by AutoCAD, not the plotter itself. But it caused me to wonder what strange algorithm might be used.

In any event, by the time you figured out how to program the plotter, wrote a program to translate characters in a program listing into correct pen motions corresponding to the calculator's keys, made the physical modifications to the plotter, debugged it ... well, you get the idea.

Still, there are stranger things folks spend time on. Like responding to inane comments in a calculator geek forum...

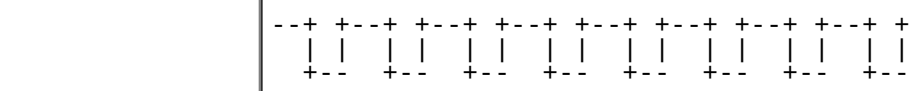
Yes, that would probably make the suggestion useless. But it got people thinking, and Egan's idea of using the Lego system is probably workable.

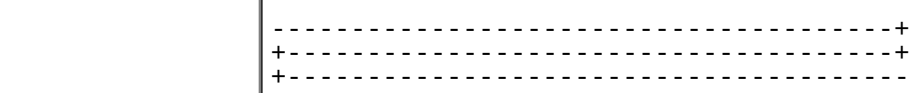
> Quote:

Surely this was caused by AutoCAD, not the plotter itself. But it caused me to wonder what strange algorithm might be used.

I acquired a large surplus HP plotter for free many years ago. It turned out that the Windows printer driver had a nasty habbit of drawing thick lines like this:



instead of like this:



In other words, it would draw the width of the line, move forward one pen-width, and draw the next width. It would be substantially faster to draw the length of the line, then move over one pen width and draw another length. In a fit of frustration I decoded the plotter language, worked out the geometry, and created a filter program that detected the case and converted from one format to the other.

> Quote:
>

I'm not so sure. If any commercial outfits have large software programs for the 35s, something like this could be a real time saver.

No argument there!! :)

Re: Hypothetically - How would you flash a 35s?

*Message #23 Posted by **Bill (Smithville, NJ)** on 19 Jan 2010, 6:45 a.m.,*
in response to message #22 by David Hayden

For most plotters today, I agree that the up/down motion probally would not be enough to do the key presses. But I seem to remember that some of the early plotters had a pretty good pen motion up/down.

I don't think programming the plotter would be that difficult. Just program it to make a "DOT" at a specific x-y location. Map the x-y locations to the specific key of the calculator.

As to AutoCad plotting, we had noticed the same thing at our office. I think they try to optimize

the total pen movement - also, if it is a multi-pen plotter, then you want to minimize pen changes. Optimizing it would be like the traveling salesman problem.

A friend of mine has a computerized sheet metal forming shop and his machine exhibits the same behaviour as the plotter. It'll move the sheet metal back and forth and do punching, cutting, folding in a seemly random order.

The Lego Mindstorms look like a great idea. And a lot of fun!.

Bill

*Message #24 Posted by **Norman Dziedzic** on 19 Jan 2010, 7:21 a.m.,*
in response to message #21 by Martin Pinckney

I recall the old hp plotter language (HPGL) to be very simple with instructions like PU (Pen Up) PD (Pen Down) And a pretty simple X/Y coordinate system for positioning. I'm not sure the plotter would have the force required to depress the keys. The pens are very light and pressing hard would rip the paper.

That said, the real thing to find to do this would be a small SCARA robot but it would be much more costly.

Re: Hypothetically - How would you flash a 35s?

*Message #25 Posted by **Bart (UK)** on 18 Jan 2010, 11:03 a.m.,*
in response to message #18 by David Hayden

Ah, yes, I see now, the reference to "flash" in the title mislead me.

I had been thinking of using some transistor controlled unit connected in parallel to the keyboard lines (this would also prevent keypad wear). This would be easier on the 35s than on the Pioneers, as the 35s can be easily opened. However, it may still take hours as one has to ensure enough delay between "keypresses" to prevent the missed keys problem (could use feedback from the "busy" annunciator line?).

This does not provide backup - although I do most of my developing in spreadsheets anyway so have copies of the code.

Re: Hypothetically - How would you flash a 35s?

*Message #26 Posted by **Richard Reed** on 18 Jan 2010, 11:46 a.m.,*
in response to message #25 by Bart (UK)

I don't have a 35s, and given the long bug list, if I had one I would want a ROM re-program if I could get one.

Now that I have admitted my prejudice, it might be understandable why I wouldn't do much work to add automated programming on 35s, but maybe if you could override some of the bugs with user code it would be worthwhile.

MCODE tools: Asking for your opinion

*Message #1 Posted by **Geir Isene** on 17 Jan 2010, 12:03 p.m.*

Premise: There are 4*4K available space to load with excellent MCODE programming tools.

Problem: I am looking at the following as the top tools (all 4K) to use for MCODE'ing:

```
David Assmbler
David Assmebler Labels Rom
Dissassembler 4D
Dissassembler 4D Labels Rom
ML ROM
```

Which 4 out of the list of 5 would you recommend (or are there other tools you would include instead)?

Re: MCODE tools: Asking for your opinion

*Message #2 Posted by **Meindert Kuipers** on 17 Jan 2010, 12:27 p.m.,*
in response to message #1 by Geir Isene

I always have David (with the Labels, another 4K) when doing mcode experiments. The ML ROM is a collection of tools which is nice to have, but not vital. In general I use the MLDL2000 for mcoding (what else ..;), in combination with SDK41. SDK 41 is my official source with comments and easy to maintain. For small and quick changes I do inline modification with David, otherwise I simply change the source, run assembler and linker and upload the new code with M2kM

Meindert

Re: MCODE tools: Asking for your opinion

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 17 Jan 2010, 1:11 p.m.,*
in response to message #1 by Geir Isene

Hi, Geir;

in the few exploratory experiments I've made, I used David Assembler + Labels (you 'see what you get') and Meindert´s M2KROM.rom. As he says, it is a slightly modified ML ROM but I think M2KROM is better than ML ROM. I also have used MLDL2000 for must of the hardwork because it has plenty of space and you can easily 'plug it in' and save your work in the computer hardisk. Diego´s NoV-series are a 'must have', too, and they occupy 'no space at all'. I have a NoVRAM and a NoV32 along with the two MLDL2000 units.

Anyway, I must confess I began 'stepping into' MCode with HEPAX' HEXEDIT, but HEPAX is a 16K-ROM, and you are mentioning only 4K-ROM, right? For me, it is easy to use if you are a beginner because it shows current memory contents before changing and you see, side by side, what you had and what you are adding . As you get skills, the other tools may give you a different perspective.

If I have to choose, I'd have HEPAX HEXEDIT and David´s ASSM with labels in the same ROM, with a few complementary tools. As I have not yet gone so far in MCoding, I can only think of insertion and copy-paste plus some tools to help building MCODE+USERCODE ROM´s.

Cheers.

Luiz (Brazil)

Re: MCODE tools: Asking for your opinion

*Message #4 Posted by **Geir Isene** on 17 Jan 2010, 1:27 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Where do I get the M2KROM?

I am looking at filling 4 pages in my NoV-64 with the MCODE tools, so yes - I do have the HEPAX as well :-)

Edit: Found the M2KROM.

30b missing the mod function?

*Message #1 Posted by **hugh steers** on 17 Jan 2010, 8:26 a.m.*

Hi,

Does the 30b have a MOD function, i cant find it? If missing, presumably this would be easy to add to the ROM.

NOTE: i know there is IP and FP, but these are not quite the same. i want to perform A * 10^k mod M, eg with k = 12 and A a 12 digit number. usually MOD is able to do this.

any thoughts?

Re: 30b missing the mod function?

*Message #2 Posted by **Don Shepherd** on 17 Jan 2010, 10:07 a.m.,*
in response to message #1 by hugh steers

Hugh, the 30b doesn't have a mod function. The following snippet will do it, however: / ans(lastx) swap fp(math up) = x

Don

Re: 30b missing the mod function?

*Message #3 Posted by **hugh steers** on 17 Jan 2010, 2:47 p.m.,*
in response to message #2 by Don Shepherd

thanks for your idea but unfortunately this wont always work.

for example 12345678 EEX 12 mod 7 (correct answer 2)

this works on HPs with the MOD function because it can deal with the 12 zeros in a clever way. unfortunately, this is exactly what i need for my algorithm!

Re: 30b missing the mod function?

*Message #4 Posted by **Don Shepherd** on 17 Jan 2010, 3:32 p.m.,*
in response to message #3 by hugh steers

Yeah, I see what you mean. I tried it on my 33s and it worked.

Don

*Message #5 Posted by **Dave Britten** on 18 Jan 2010, 10:36 a.m.,*
in response to message #3 by hugh steers

This raises an interesting question: what *is* the algorithm behind the built-in MOD function present on various models? I searched around Google for a bit, but didn't find any that looked promising.

Re: 30b missing the mod function?

*Message #6 Posted by **cyrille de Brébisson** on 18 Jan 2010, 10:59 a.m.,*

in response to message #7 by Don Shepherd

request seconded!

However, there is a problem with moving and adding things to the menus. presumably this would go on the math menu; after ABS maybe. But this practice will break people's programs who are performing MATH menu UP or DOWN commands.

I have a quick suggestion before things start to go bad. maybe HP should promise to only add things to the *end* of menus and people writing program macros always emit key sequences to go _down_ the list and never to trail up a list, otherwise the counts could change and things go bad.

actually, the operation i really want from a calculator is the following:

mulmod(a,b,M) = a*b mod M

with no loss of precision when a, b, and M are 12 digits of mantissa.

alternatively, the implementation of a fused multiply add (FMA), so

FMA(a,b,c) = a*b + c. without loss of precision where possible.

in floating point, then, code mulmod in terms of this as:

```
q = IP(a*b/M)
r = FMA(a,b,-q*M)
return r
```

right now, im having a problem with squares. A^2 - B overflows and i lose accuracy (think of A and B as 12 digit mantissas). causes my program to fail sometimes. unfortunately, its not fixable without some kind of extra precision. FMA would fix it, but so could the MOD function (given some hassle).

i started asking myself why, all of a sudden, i am having these problems with the 30b and not older models. the answer is that the other models are too slow to get this far. i've been writing some factorization programs and both (2 different) algorithms have failed as the numbers get close to 12 digits.

but actually, this is what we're going to get, in the absence of any extra precision helper functions. do the older calculators factor 12 digit numbers, and if so, how (apart from trial division!)

so my conclusion is that the 30b (and presumably future models with program capability) have reached the stage where their performance warrants several new numerical primitives in order to really exploit their ability for scientific and engineering applications.

interesting.

Re: 30b missing the mod function? --> Other functions

*Message #9 Posted by **Katie Wasserman** on 18 Jan 2010, 1:38 p.m.,*
in response to message #8 by hugh steers

Hugh,

I agree that adding built-in functions to the 30b is problematic because of the menu navigation needed. Adding functions to the end of the menu items creates its own set of problems since you then have to potentially have many DOWN steps eating up what little program memory there is. However, there are some keystroke combinations that currently exist but don't really do anything useful and could be used for "special" added functions. These are: [STO/RCL] [+,/,*,-] [=]. [RCL] [=] recalls the value of the last menu item, I think that the other commands are waiting for their creator to assign a purpose to them. Because these commands don't do anything, it's hard to realize they exist, but in program mode you'll seem them.

-Katie

Re: 30b missing the mod function? --> Other functions

*Message #10 Posted by **hugh steers** on 18 Jan 2010, 1:47 p.m.,*
in response to message #9 by Katie Wasserman

hey, yes RCL = does recall the last menu. useful. and the others can be programmed, as you say.

how about having a (single digit) number, n, pressed immediately after menu navigate to the `n'th item. this would fix the problem of new additions and the extended UP or DOWN required.

also, whilst we're in request mode :-) ...

more registers!!! i can only find 10, are there more? like .0 etc.

how about .0 through .9 are local to a subroutine! ie "call" pushes them and "rtn" pops them back.

Re: 30b missing the mod function? --> Other functions

*Message #11 Posted by **Katie Wasserman** on 18 Jan 2010, 3:02 p.m.,*
in response to message #10 by hugh steers

There are the 100 indirect registers, of course. You access them with [STO/RCL] [Data/CshFl] and use register 0 as the pointer.

I don't know if there are 8 or 10 bytes per register but there's no memory left. 100 indirect registers + 10 basic ones + 15 stack (mostly in ALG/Chain mode) + many used in the built-in menus + 290 byes of program memory take up all of the 2K of non-volatile RAM.

-Katie

Re: 30b missing the mod function? --> Other functions

*Message #12 Posted by **hugh steers** on 18 Jan 2010, 7:34 p.m.,*
in response to message #11 by Katie Wasserman

Thanks. it would be nice to have a shorter way of accessing those 100 cashflow registers in a program - even if that meant overlapping. ie you can't do both at the same time.

Re: 30b missing the mod function? --> Other functions

*Message #13 Posted by **Bart (UK)** on 19 Jan 2010, 5:15 a.m.,*
in response to message #11 by Katie Wasserman

Katie,

From your description I deduce that the 100 indirect registers are independent of program memory? (Unlike e.g. the 35s where using indirect registers reduces program memory).

I think this is a pity as although it's nice to know that you have these registers over and above programs, I don't see myself making use of more than a dozen and rather have 1k of program memory. (I hardly use them on the 35s).

Re: 30b missing the mod function? --> Other functions

*Message #14 Posted by **Don Shepherd** on 19 Jan 2010, 5:37 a.m.,*
in response to message #13 by Bart (UK)

> Quote:
>
> the 100 indirect registers are independent of program memory

That is true, unfortunately. The indirect registers are also independent from the 10 standard registers, 0-9. There is no way to get > 290 bytes for program lines. The indirect registers share the same space with cash flow/stats data only, and you cannot get more than 290 bytes of program line space.

Re: 30b missing the mod function? --> Other functions

*Message #15 Posted by **Gene Wright** on 19 Jan 2010, 7:24 a.m.,*
in response to message #14 by Don Shepherd

Keep in mind that these are statistics / cash flow registers.

Their use as indirect registers is a secondary use.

Re: 30b missing the mod function? --> Other functions

*Message #16 Posted by **Bart (UK)** on 19 Jan 2010, 7:35 a.m.,*
in response to message #15 by Gene Wright

Ok, I'm sort of starting to form a picture of the layout of the program/working memory. Thus the indirect registers need to be separate (otherwise using cash flow/stats formulas would overwrite programs). One would have to keep in mind then that using indirect registers will overwrite cash flow/stats data. I assume the manual will explain which registers are used for what data.

edit: i.e. so you could use your own program to manipulate the data further as required.

Edited: 19 Jan 2010, 7:37 a.m.

Re: 30b missing the mod function? --> Other functions

*Message #17 Posted by **Don Shepherd** on 19 Jan 2010, 12:32 p.m.,*
in response to message #16 by Bart (UK)

Gene is right, the 100 registers are really for stat data and cash flow data. Cash flows and stat data share that space, I believe, and the allocation of the 100 registers between stat data and cash flow data is automatic. You could have 30 x/y pairs of stat data and 20 amt/freq pairs of cash flows, and the system keeps track of what you've got. And you can reference (or over-write) that data via indirect addressing in your program if you want.

But you can't use that space for program lines.

Re: 30b missing the mod function?

*Message #18 Posted by **Patrice** on 18 Jan 2010, 10:45 p.m.,*
in response to message #8 by hugh steers

Hello,

Did you investigated about transforming you problem to avoid floating point loss of precision?

if I understand well your problem, you have:

> Quote:
>
> mulmod(a,b,M) = a*b mod M

which I would rewrite as:

```
mulmod(a,b,M) = (a*b) mod M
```

I would transform this as :

```
mulmod(a,b,M) = ((a mod M) *(b mod M)) mod M
```

which will not overflow

Patrice

Re: 30b missing the mod function?

*Message #19 Posted by **hugh steers** on 19 Jan 2010, 8:59 a.m.,*
in response to message #18 by Patrice

unfortunately a and b are already < M.

eg let a = 16777331, b = 453320069

what is a*b (mod 1071514531)

All these numbers fit just fine on the calculator, and so does the answer.

Re: 30b missing the mod function?

*Message #20 Posted by **Katie Wasserman** on 17 Jan 2010, 12:53 p.m.,*
in response to message #1 by hugh steers

I don't think you'll be able to do this easily on the 30b, it sure would be nice to have a remainder function. I wish all calculators had that but surprisingly few do.

Well, then, that would explain why he no longer needs his 15c!

For the uninitiated, a DC50 is a customized 50g in a hard case with surveying software

installed. Designed to replace the 48gx, which was the mainstay generic data collector for many years (as opposed to dedicated units sold by the instrument companies).

Our company used to use 48gx's up until 5 years ago, when we switched to a dedicated unit. About $3200 with GPS software installed, compared to about $800 for a GX with surveying card and 1 MB RAM card.

Dave,

The inside joke is you push the on button again to turn that sucker off. You're excused for not knowing this. Mr. eBay however most definitely is not. I have half a mind of bidding for that sorry mess just to give it a decent burial, or put it on a pedestal like that savaged Toyota pickup on the British TV show Top Gear. That's a thought! How about a virtual pedestal at the hp museum for the most savaged but perfectly working hp calc?

By the way, I'm not convinced the gentleman mentioned earlier is the owner of this 15c. The (ab)user might simply be an employee of his company.

Regards,

HP-45, strange key response

*Message #1 Posted by **Thomas Radtke** on 16 Jan 2010, 9:12 a.m.*

I really don't want to open my 45 again (did that twice to successfully clean a key contact and the switch contacts), so I ask here if I can safly ignore this problem: One of the keys shows a strange behaviour. When only slightly pressed, just a fraction of a degree, there is a clicking noise with high frequency. Further pressing it down gets to the normal key click and the machine responds as expected. So, there are two pressure points on the rolldown button.

I can almost not feel the first click, and it woudn't be disturbing if it only would not be of notable audibility.

My question: Will I get a problem with this key due to what ever causes that click? If so, can I do something about it?

Thanks!

Re: HP-45, strange key response

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 16 Jan 2010, 10:02 a.m.,*
in response to message #1 by Thomas Radtke

Hi, Thomas;

I have an HP15C with an opposed problem: two keys have no sound, no click at all, but they work pretty well.

You see, with the Spices, HP41 and Voyagers, the keyboard has a rubber sheet between the keys and the keyboard. In this HP15C, the two keys made a small hole in the rubber sheet right under them, mostly because the keys have just a small 'flat tip' that punctuate the metal cap (dome?).

The earlier series of calculators had a plastic sheet between the keys and keyboard, and I'd guess that in your case, the plastic is probably being briefly dragged over the metal contact (hence the hi-pitch noise, like a 'squeak',I guess) before the metal contact is actually pushed down.

Can you try to identify if this is what happens?

Cheers.

Luiz (Brazil)

Re: HP-45, strange key response

*Message #3 Posted by **Thomas Radtke** on 16 Jan 2010, 11:18 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz,

thanks for your answer! It feels and sounds very much like a stiff piece of plastic the key rubs along, or a

part of the metal dome. It is very constant.

From opening it before, I know that the domes (or 'bridges') do look heavily used. Don't remember if there was a protecting sheet of plastic between keys and domes.

I'll probably hope for the best and leave the 45 as it is, as long as someone points out that the key must be repaired. The back lable already has some slight marks from removing it before.

Thomas

Re: HP-45, strange key response

*Message #4 Posted by **Randy** on 16 Jan 2010, 11:46 a.m.,*
in response to message #3 by Thomas Radtke

The obvious:

- Crud on the back or front of the plastic keytop
- Something sticky inside the hole where the keytop sits in the case top

The not so obvious:

- Small stress fractures developing in the metal flex strip. Really not much you can do until it breaks completely

There should be a thin piece of clear plastic sheet between the keytops and the keyboard assembly. The sheet is held in place with the plastic frame that sits atop the pc board. Two small projections hold the frame in place by engaging though the board and into the back plate of the calculator. The sheet has been called the "sneeze guard" in some old posts.

FWIW, the next time you open it, don't replace the two screws under the label. The case will never know the difference and it makes re-entry a non-decision.

Re: HP-45, strange key response

*Message #5 Posted by **Thomas Radtke** on 16 Jan 2010, 12:38 p.m.,*

Great idea!

Thomas

Re: HP-45, strange key response

*Message #6 Posted by **Thomas Radtke** on 18 Jan 2010, 5:30 a.m.,*
in response to message #1 by Thomas Radtke

I did it, opened it again.

Pushing the dome is like pushing any other dome. They are equal. The key is also clean, no obvious problems.

Putting everything together again, the click is still there. Mysterious.

Re: HP-45, strange key response

*Message #7 Posted by **Randy** on 18 Jan 2010, 9:06 a.m.,*
in response to message #6 by Thomas Radtke

Those spot welds that attach the strip - have they blown through the top or are they flush? I cannot tell based on the photo... they look questionable. If one has given way, it will allow extra flexing of the strip and might be the cause of the click.

HP actually replaced complete strips during service, sometimes the welds where not as good as the production work. The fact that the faces have so much pitting is a sign of heavy use, perhaps it is on it's second set of key strips which would explain the welding.

Re: HP-45, strange key response

*Message #8 Posted by **Thomas Radtke** on 18 Jan 2010, 9:20 a.m.,*
in response to message #7 by Randy

> Quote:
>
> Those spot welds that attach the strip - have they blown through the top or are they flush?

I could inspect them with a microscope. With my bare eyes (and finges) I can't decide.

Would you do anything about it? Would a drop of superglue do the job?

Re: HP-45, strange key response

*Message #9 Posted by **Randy** on 18 Jan 2010, 9:56 a.m.,*
in response to message #8 by Thomas Radtke

Press lightly on the strip and see if it flexes at the welds. If it pops up around that area, that's the source of the click.

I've had no luck with glue, mixed success with soldering.

OT: Sequential Boolean Analyzer

*Message #1 Posted by **Katie Wasserman** on 16 Jan 2010, 12:16 a.m.*

I came across an interesting single-chip processor in the General Instruments Microelectronics 1977 Data Catalog. They call it a Sequential Boolean Analyzer (SBA) and list it as "preliminary information", I have no idea if it was ever manufactured.

What's interesting about this chip is that it's a 1-bit RPN machine with many 30 i/o pins, a 16-level stack and supplementary storage. They specifically don't tell you if this is a microcoded design or implemented in hardware, but it's an interesting read from a theoretical design standpoint. Here's the pdf

I've never heard of an SBA before, are there other such implementations in hardware (or software)?

-Katie

Re: OT: Sequential Boolean Analyzer

*Message #2 Posted by **Norman Dziedzic** on 16 Jan 2010, 1:10 a.m.,*

I don't understand all the terminology in it but this sounds like something pertinent:
http://comjnl.oxfordjournals.org/cgi/content/abstract/12/3/259

Re: OT: Sequential Boolean Analyzer

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 16 Jan 2010, 8:45 a.m.,*
in response to message #1 by Katie Wasserman

Hi, Katie;

thanks for pointing this guy out. The first thoughts that came to my mind were:

- DSA (Digital Signal Analysis) and
- fast 'D/A converter' interpolation

I vaguely remember the first '1-bit D/A converter' inscription in a CD-player (a Sony 5-disc CD-carroussel, perhaps?) I saw in the 80´s and I wondered, at that time, that a set of 1-bit D/A converter/analyzer chips might have been introduced. Never had those thoughts anymore until now.

Would the RPN-structure enhance performance? The block-diagrams suggest it can be used as part of a fast process controller, and I can only understand output directly connected to the input when internal compensation occurs, and in this case, the 1023-word programming would find purpose if fast enough.

Based on the 80´s 'technology shift' that began to endorse fixed, fast and easily programmable/customizable hardware, I'd bet in a mid-term, well-balanced HW/SW implementation. My memory only points to the HP28 as one of the first well-know implementing of RPN-like stack through SW.

Cheers.

in response to message #1 by Katie Wasserman

If memory helps, it somehows reminds me about the Motorola MC 14450 1-bit CPU, a rare IC that puzzled me around 1980, when I was a CMOS specsheet avid addict. However, I hadn't used it nor know any real application of it.

Re: OT: Sequential Boolean Analyzer

*Message #5 Posted by **Katie Wasserman** on 17 Jan 2010, 1:33 p.m.,*
in response to message #4 by Andrés C. Rodríguez (Argentina)

The MC14450 was an interesting processor too, here's the datasheet. This was really manufactured and I'm sure used somewhere, I don't thank that the SBA had the same traction.

What really caught my eye on the SBA chip was that section of the datasheet on stack manipulation commands, essentially: Enter, Swap [typo on this], Dup, Drop you don't see that much outside of HP calculator manuals!

> Quote:
>
> My memory only points to the HP28 as one of the first well-know implementing of RPN-like stack through SW

I never really through about that. I was certainly amazed when the HP28C came out with it's radically different and very advanced functionality. At the time, I happened to giving a talk at the HP offices in NY (about artificial intelligence) and was given one of the first HP-28C's as compensation. It was great fun to play with and very quickly disappointing because it had just 2K of RAM.

This same GI MicroElectronics Data Catalog lists their PIC as preliminary information too, which makes for a nice dichotomy of extreme success and likely failure. Stack-oriented machines just didn't make it. HP's 3000 line of computers were HW stack machines until PA-RISC came out and then it emulated the "classic 3000" instructions in SW. This happened at roughly the same time as the 28C came out.

HP 12C Questions

*Message #1 Posted by **Randy Wood** on 15 Jan 2010, 9:18 p.m.*

Hello to all, I recently acquired a 12C for home use, because I took my 11C to the office to use in place of my 41C which is acting up, and my 35 won't hold a battery charge for long. The 12C did not come with a manual. I had assumed, being familiar with HP calculators, that I could figure out the basic functions of the 12C. All I really need for home use is basic arithmetic (balancing the checkbook, etc.). I know, it is like swatting a mosquito with a sledgehammer, but I much prefer the RPN operation to "other" calculators. The 12C passes the self-check and the keyboard check tests, so I assume that it is fully functional. However, I can't figure out how to get it to display any digits to the right of the decimal point. For example, I can type in 125.36, but when I push the ENTER key,it only displays 125. On my scientific HPs, I can set the number of digits to the right of the decimal point using the FIX key. I can't believe that a financial calculator cannot display dollars and cents! Also, whenever the 12C is on, the word BEGIN is appears in small letters at the bottom of the display; is this normal?

Re: HP 12C Questions

*Message #2 Posted by **Jeff O.** on 15 Jan 2010, 9:37 p.m.,*
in response to message #1 by Randy Wood

I believe that the number of digits past the decimal point is set by pressing the yellow shift key ("f"), then the corresponding number key for the desired number of digits. Try pressing the blue ("g") shift key, then the "8" key to get rid of the "BEGIN" annunciator in the display.

...

in response to message #2 by Jeff O.

Jeff, thanks! That is exactly what I needed. Works like a charm now.

Re: HP 12C Questions

*Message #4 Posted by **Don Shepherd** on 15 Jan 2010, 10:34 p.m.,*
in response to message #1 by Randy Wood

Randy, you say you recently "acquired" the 12c. Did you purchase it in a store, or get it from a friend or something? I ask this because 12c's have always come with a great manual, so I'm thinking you didn't buy this in a store, correct?

And since you said it passed the self-test, I'm thinking this is not one of the newer what we call the "12c+" which uses the ARM processor, has a small 6-pin connector in the battery compartment, has a problem with the self-test, and has an extra wide battery door to accomodate 2 CR-2032's. Yours must be an older 12c, correct?

You'll probably want to acquire the manual to get maximum benefit from the 12c. I suspect it's available

online from HP.

Re: HP 12C Questions

*Message #5 Posted by **Randy Wood** on 16 Jan 2010, 7:35 p.m.,*
in response to message #4 by Don Shepherd

Don, you are correct, it is not a new calculator. From some of the other correspondence in this forum, I am somewhat reluctant to admit that I bought it on ebay, for what I consider to be a reasonable price ($26). I only have the calculator and the case. Thank you for your suggestion regarding the manual; I was able to download not only the user's guide, but also the quick start guide, from the HP website.

Re: HP 12C Questions

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 16 Jan 2010, 12:28 a.m.,*
in response to message #1 by Randy Wood

Hi;

it´s been more and more difficult to 'dig' specific information at HP calculators site...

The HP12C Manuals can be downloaded from this address.

About the standard (default) operating modes: you can set the HP12C to 'factory condition' by clearing all memory contents. If you are sure there is nothing stored in the calculator you need to keep, just do this: (if you own and use an HP11C, you already know the procedure...)

- with the calculator turned to off, press AND HOLD the [-] key;
- while holding the [-] key, turn the calculator ON;
- release the [-] key.

If everything goes fine, you would see [Pr Error] in the display of your calculator.

If you want your HP12C to show numbers in scientific notation, press:

```
[f] [.]
```

This is a scientific notation with all possible digits in the mantissa being shown. It is like the HP11C´s

```
[f][SCI][7] (or [8] or [9])
```

There is no way to control how many digits to be shown in the HP12C while in scientific notation (same as in the HP16C)

Hope this helps a bit more.

Cheers.

HP 35S --- 2*2 lin. solve bug

*Message #1 Posted by **Maarten Ambaum (Reading, UK)** on 15 Jan 2010, 10:57 a.m.*

It appears that registers G...L are used internally in the 2*2 lin. solve in an unusual way. If there is anything other than a real number in these registers (a complex number or a vector) the linear solver returns "no solution." Kind of interesting, as these registers are not overwritten after using the linear solver, which appears to indicate that these registers are not actually used.

Another one for the bug-list. I haven't checked the 3*3 lin. solve function. Does anyone have an idea how such an unusual behaviour might occur?

Re: HP 35S --- 2*2 lin. solve bug

*Message #2 Posted by **Thomas Radtke** on 15 Jan 2010, 12:03 p.m.,*
in response to message #1 by Maarten Ambaum (Reading, UK)

> Quote:
>
> Does anyone have an idea how such an unusual behaviour might occur?

Yes, by careless programming.

HP: Please replace the 35s by an emulator of the 32SII/42S/15C or similar. It's not about having a bug or two, it's about having more bugs anyone could ever remeber. This machine kills your reputation in providing reliable tools.

HP-35 Hewlett-Packard Integrity

*Message #3 Posted by **Hiawatha Wheelwright** on 15 Jan 2010, 5:11 p.m.,*
in response to message #2 by Thomas Radtke

> Quote:
>
> The [original] HP-35 had numerical algorithms that exceeded the precision of most mainframe computers at the time. During development, Dave Cochran, who was in charge of the algorithms, tried to use a Burroughs B5500 to validate the results of the HP-35 but instead found too little precision in the former to continue. IBM mainframes also didn't measure up. This forced time-consuming manual comparisons of results to mathematical tables. A few bugs got through this process. For example: 2.02 ln ex resulted in 2 rather than 2.02. When the bug was discovered, HP had already sold 25,000 units which was a huge volume for the company. In a meeting, Dave Packard asked what they were going to do about the units already in the field and someone in the crowd said "Don't tell?" At this Packard's pencil snapped and he said: "Who said that? We're going to tell everyone and offer them a replacement. It would be better to never make a dime of profit than to have a product out there with a problem."

From hp museum's HP-35 page.

Yes, this story is often quoted. Many people who bought the HP 35 kept their buggy calculators rather than exchange for a new, bug free one :-)

Re: HP 35S --- 2*2 lin. solve bug

*Message #5 Posted by **Palmer O. Hanson, Jr.** on 16 Jan 2010, 10:11 p.m.,*
in response to message #1 by Maarten Ambaum (Reading, UK)

My first idea was that the 35s program used a methodology somewhat like that in the "Solution of Simultaneous Equations" program on pages 15-12 through 15-20 of the *hp 33s use's guide* which solves the 2x2 case by placing zeroes and a one in appropriate positions of the 3x3 solver. But some testing tells me that doesn't seem to be true.

The 3x3 equation seems to work properly even if a vector or a complex number is stored somewhere in registers M through Z. But, neither the 2x2 nor the 3x3 equation will solve with complex number inputs, even though the following comment from page 9-7 of the *HP35s User's Guide* would seem to indicate that it should:

> Quote:
>
> When you evaluate an equation and are prompted for variable values, you may enter complex numbers.

So, I conclude that the programmer recognized that his programs would not work with complex numbers and included a trap to alert a user of an unacceptable input, which resulted in a failure of the 2x2 solution if there was a leftover complex number in registers G theough L.

Strange stuff indeed.

Edited: 17 Jan 2010, 9:43 p.m.

in response to message #5 by Palmer O. Hanson, Jr.

Thanks for your replies.

> Quote:
>
> So, I conclude that the programmer recognized that his programs would not work with complex numbers and included a trap to alert a user of an unacceptable input, which resulted in a failure of the 2x2 solution if there was a leftover complex number in registers G theough L.

Why would a programmer consciously reduce the functionality of the calculator? Surely, it would be easy to include an error check and actually give a useful error message.

I could explain it in terms of messy programming: use the non-real parts of some of the registers (i.e. the imaginary parts of registers G...L or the parts that store the second or third components of any vector in registers G ... L) as working memory. Alternatively, the processor has a strange way of allocating memory to the non-real parts of any register, such that it could interfere with some internal working memory (which I assume the processor has.) Either way, a bug it is.

I already saw this bug appeared on Paul Dale's HP-35S bug list - this forum is remarkably active!

Re: HP 35S --- 2*2 lin. solve bug

*Message #7 Posted by **Thomas Radtke** on 19 Jan 2010, 6:40 a.m.,*
in response to message #6 by Maarten Ambaum (Reading, UK)

Abusing apparently free space has some tradition. Some Motorola 68000 programs failed on 32-bit versions of this CPU due to programmers used bits 24 to 31 of its address registers for their own purpose.

Re: HP 35S --- 2*2 lin. solve bug

*Message #8 Posted by **Paul Dale** on 19 Jan 2010, 7:10 a.m.,*
in response to message #6 by Maarten Ambaum (Reading, UK)

I added it right away.

Re: HP 35S --- 2*2 lin. solve bug

*Message #9 Posted by **Palmer O. Hanson, Jr.** on 19 Jan 2010, 10:26 p.m.,*
in response to message #1 by Maarten Ambaum (Reading, UK)

Whatever the source of the problem is if the user encounters it he can easily bypass it by simply entering a real number in memories G through L. That doesn't seem to be an overwhelming situation.

Re: HP 35S --- 2*2 lin. solve bug

*Message #10 Posted by **Bart (UK)** on 20 Jan 2010, 5:00 a.m.,*
in response to message #9 by Palmer O. Hanson, Jr.

And I think Maarten agrees with you, he said:

> Quote:
>
> Kind of interesting,...

And was probably just wondering what others thought could cause this:

> Quote:

> Does anyone have an idea how such an unusual behaviour might occur?

However, it is a bug nevertheless, and does add to the perception that the code and algorithms were not tested properly. I certainly would not trust this model on a space mission (should I ever find myself lucky enough to be an astronaut :-))

Re: HP 35S --- 2*2 lin. solve bug

*Message #11 Posted by **Thomas Radtke** on 20 Jan 2010, 5:53 a.m.,*
in response to message #10 by Bart (UK)

Right, it was me who (again) complained about the countless bugs. Problem is, when you find 10 bugs soon, there are likely many more. And you have to remember each of them in any situation. I can't and I don't feel like HPs beta tester.

I won't use the 35s for any professional task involving health or money, and I wouldn't like to see anyone using such a machine in my company.

Re: HP 35S --- 2*2 lin. solve bug

*Message #12 Posted by **Maarten Ambaum (Reading, UK)** on 21 Jan 2010, 5:00 a.m.,*
in response to message #11 by Thomas Radtke

Bart (UK) is right; I was just interested to see if anyone had an idea how such a bug might come about.

And Thomas:

> Quote:
>
> I won't use the 35s for any professional task involving health or money, and I wouldn't like to see anyone using such a machine in my company.

That all depends whether you believe the 35s is any worse than other models by other manufacturers. I am not so sure.

I still highly recommend this model for anyone out there: it is the best RPN scientific that HP has on offer - in case you hadn't noticed: HP stopped selling the 42s quite a while ago, so that is not a realistic option, however much I'd like to have a 42s (did you all notice that the form factor of the 20b and 30b is precisely the same as the 42s? Surely a sign that the 42s will be reborn soon!)

Let's compare the 35s with the somewhat ridiculous scientifics that most of my students now use: the number of errors they make when typing in equations far outweigh the small chance to hit on a bug in the 35s. I'd recommend a proper RPN calculator anytime above any of those calculators.

Re: HP 35S --- 2*2 lin. solve bug

*Message #13 Posted by **Thomas Radtke** on 21 Jan 2010, 5:35 a.m.,*
in response to message #12 by Maarten Ambaum (Reading, UK)

Yes Maarten, nothing to say about using it in education. Students will love to find any bugs. You bet, I was happy about every error I found in the Bronstein-Semendjajew back in the 80th :-D.

I don't compare it with any calculator out there as I don't know any current model intimately. But I do compare it with the 32SII and know what others have to say about the 15C and 42S models. It cannot be that more recent products are actually worser when it comes to calculations.

What I'm missing on the 35s package is one of the usual HP stickers, saying "not for professional use." ;-)

About the rebirth of a 42S model I share what others said: It won't happen since there's no market. And the 30b seems not to be a good platform due to the limited LCD and memory. But maybe Thomas Okken can say something about that :^).

Re: HP 35S --- 2*2 lin. solve bug

If we accept the idea that the code and algorithms were not tested properly shouldn't we ask why? I suggest that one of the reasons was a desire to release the machine as a part of the celebration of the 35th anniversary of the original HP-35.

Re: HP 35S --- 2*2 lin. solve bug

*Message #15 Posted by **Jon S. Canale** on 20 Jan 2010, 10:09 p.m.,*
in response to message #14 by Palmer O. Hanson, Jr.

So HP didn't release the machine because they thought there was a need for it and they were going to fill that hole, but to pat themselves on the back for a good job done 35 years prior?

And not even to make money, but just to have some souvenirs for the show, ie, it was a total marketing event!

That would explain it all! Marketing designed and tested the machine! (It does LOOK good, sitting on the desk I'd say!!!)

Re: HP 35S --- 2*2 lin. solve bug

*Message #16 Posted by **Bart (UK)** on 21 Jan 2010, 5:09 a.m.,*

Which HP calc emulator? Which phone?

*Message #1 Posted by **vq** on 15 Jan 2010, 3:59 a.m.*

I plan to buy a new mobile phone and one of things I want to use it for is HP calculator emulation. Currently, these models are in my favorit list: iPhone 3GS/HTC Touch Pro2 (with hardware keyboard) / HTC HD2 (the largest screen on the market afaik). Which one would you recommend with respect to the HPcalc emulation? Which emulators are the best for iphone/WinMobile? Thanks in advance

Re: Which HP calc emulator? Which phone?

*Message #2 Posted by **bt_schmidt** on 15 Jan 2010, 7:48 a.m.,*
in response to message #1 by vq

Elia Freedman, CEO of Infinity Softworks, has been writing and selling calculators for mobile devices for the last dozen years. I remember paying something like $59 some years ago for his PowerOne Financial calculator for use on my Palm V

Elia's January 2010 blog entry talks to the selection of the mobile platform(s) from a developer/business viewpoint.

Developer's Perspective: Strengths/Weaknesses of Mobile Platforms, Jan 12, 2010, Elia Freedman

PS. I have no connection with Infinity Softworks other than having bought PowerOne RPN calculators for my many Palm handhelds and for my iPhone which replaced them.

Re: Which HP calc emulator? Which phone?

*Message #3 Posted by **hugh steers** on 15 Jan 2010, 2:34 p.m.,*
in response to message #1 by vq

Hi,

I have a HTC touch pro 2, which is similar to the HD2. the screen is the best bit 800x480. the keyboard is nice (if you want keyboards) however, WinMo sucks *big* time. I have a nice version of Tom Okken's free42 running on it, although be advised this is a simulator and not an emulator - although you can run most 42s programs fine.

More and more people are acquiring the iPhone and this is turning into a solid platform. there are many calculators for it already.

Also, it depends on the cost differences etc. Over here in the UK, the retailer Tesco are offering some very good deals on iPhone 3GS.

So it depends on your preferences.

> Currently, these models are in my favorit list: iPhone 3GS

I use the following on my iPhone (in order of most frequently used):

1. 42s. 42S simulation based on Free42, includes virtual printer and the ability to save/restore programs. X-L stack display.
2. i41CX+. IMHO, by far the best 41CX emulator on any platform. Includes printer, import/export of programs, data, HEPAX data, modules. Supports overlays, X-L stack view, enhanced virtual 41CX hardware with support for iPhone features (accelerometer, compass, GPS). 100% 41CX compat--based on Nonpareil.
3. m48. Port of EMU48 to iPhone, all the rest of the 48 emulators are based on x48. 48GX emulation.
4. SCI-15C. Eric's Nonpareil-based 15C emulation.
5. RPN-12C/15C/16C. More Voyager emulators.
6. Free42. Another Free42 iPhone port directly from Thomas.
7. GO-21. HP 21 simulator.
8. I also have a sliderule (iSlideRule) and an abacus.

Others I have not tried:

1. 10BII
2. 17BII+
3. 12C Platinum.
4. RPN Calc 42s. This is a direct rip-off of 42s.

If you search the App store for RPN or calculator you will find many more. AFAIK there isn't a mobile platform with more HP emulation choices.

Edited: 15 Jan 2010, 6:14 p.m.

Calc12C+ is available on the iPhone as a free download for a limited time. It is a 12C and 11C emulator with a bunch of other features added on ;-)

Re: Which HP calc emulator? Which phone?

*Message #6 Posted by **Mark Hardman** on 18 Jan 2010, 12:32 a.m.,*
in response to message #1 by vq

I have a HTC Touch Pro 2 running the following:

1. Christoph Giesselink's Emu42PPC

This allows me to emulate HP-17B, HP-17BII, HP-27S, HP-28S and HP-42S. There is an excellent 640x480 VGA skin for the HP-42S. This I consider to be the best HP42 emulation available at this time. (Thanks Erik!)

2. Christoph Giesselink's Emu48PPC

Emulations supported are HP-38G, HP-39G, HP-40G, HP-48SX, HP-48GX and HP-49G. The HP-49 has a particularly good VGA skin. (Thanks Beemer)

3. eV41 HP-41 Emulator available from TOS

4. The Lygea Pocket 12C SE and Pocket 15C SE ($)

Of the 14 emulators, 12 of them are free--provided you have the capabilities and patience for dumping some of the ROMs. Can anyone with an iPhone match this?

For my part, Windows Mobile is reliable.

markHardman

> Can anyone with an iPhone match this?

1. EMU42. Currently the iPhone has Free42 (42S simulation with printer). IMHO Free42 is a 42S+ and runs much faster than EMU42. However, the purist will want the ROM-based EMU42. I do not think it would be much of an effort to port EMU42 to the iPhone since EMU48 has been ported. I.e. the effort to remove Windows APIs has been done. Perhaps I'll do it myself someday.
2. EMU48 has been ported to the iPhone and is open source (I have the source). It would not take much effort to add the rest of the calcs listed, but at this time only the 48GX (highest demand) is supported.
3. i41CX+ is vastly superior to eV41. E.g. printer, phone HW integration (compass, accelerometer, etc...), HEPAX support, overlays, ease of use.
4. Lygea is a simulator. There are many Voyager simulators and emulators for the iPhone (I count at least 11 12Cs to choose from). Purists will prefer the ROM-based emulators for identical results. ROM-based emulators are available for the 11C, 12C, 15C, and 16C.
5. From my list above there are others like the 21, 10BII, and 17BII+. Since HP published a ROM-based 12C for the iPhone I would not be surprised to see others like the 30B someday.

So no, the iPhone cannot exactly match Windows Mobile given your list, but then Windows Mobile cannot match the iPhone given my list.

IMHO, everybody is a winner here.

> Quote:
>
> For my part, Windows Mobile is reliable.

I suffered through Windows Mobile for 18 months. IMHO, the iPhone has been much more reliable. WM has the challenge of supporting many different HW platforms and you never know if its WM or the HW that is the problem. At least with the iPhone I have one neck to choke.

Re: Which HP calc emulator? Which phone?

*Message #8 Posted by **John Ioannidis** on 31 Jan 2010, 1:14 p.m.,*
in response to message #1 by vq

I use "RPNcalc" on my Android-based phone. I particularly like that the author did not try to copy the look of an existing calculator, but rather tailored it to the new technology.

My only real complaint is that there is no haptic feedback when you "press" the keys. Yes, the keys change color when you press them, but my fingers are not transparent!

HP 35s Hardcase Issue

*Message #1 Posted by **Luke Hoffmann** on 14 Jan 2010, 3:15 p.m.*

Hello everyone!

It has been a couple of years since my last post (my pipl search still pulls up my two posts which is quite fun). I recently purchased a second HP 35s as my first one mysteriously disappeared during my break from Purdue.

Sadly, the new one didn't come packaged with a paper manual, just a 'Quick Start Guide'. I understand the cost-cutting measure; thankfully I still have my original manual.

What has been a sad realization is that the right-hand hardcase strap is sewn about a cm too high (or keeping with the 35's convention, it is about 0.00001 KM too high ;) The left hand strap is in an oh-so-perfect position. The trouble is my damned right-handedness.

So, my question is: What say you? Also, what should I do? I purchased the calc from Amazon (no one here in Lafayette seems to carry it anymore which is sad...but I convinced one of the bookstores to order one :) The CNA is 93700925 for anyone interested, and the CNA sticker is straight but not centered (the first CNA sticker was at a 30 degree angle...so we're seeing an improvement from release at least).

Thank you for keeping this place alive...sorry for my long post. I must admit I am a neophyte when it comes to the real deep uses of the 35...but at 23 years old, I can proudly say that I don't even remember what an equals sign does.

Luke

How good are you with a needle and thread????

There should be a note in the Quick Start guide that a full printed manual is available by calling HP. That was the case two years ago when I got mine. (Bottom of page 24?)

Serial number is advancing - mine is CNA 75000967 - but supposedly there have been no rom changes.

Re: HP 35s Hardcase Issue

*Message #3 Posted by **Luke Hoffmann** on 14 Jan 2010, 3:42 p.m.,*
in response to message #2 by Jon S Canale

Not very good!

I sent an email to the HP support abyss. Hopefully I'm able to get a replacement for the hardcase. I wasn't able to find any online as replacements.

I'm glad that I still have my hard manual though ;) I can't remember my original CNA...I remember it was fairly low. I spoke with someone in house at HP a while back and he said that there were no plans for any revisions to any of their calcs for the foreseeable future. Whether this was true or he was talking out of his bum, I don't expect anything big from HP in the calc realm any time soon.

in response to message #4 by bt_schmidt

Lol...well, I'll stick to my 12c thank you. But that does look like a purchase I might make just to further convince my wife than senility can set in during someone's twenties XD

Some people collect guns, comic books, ex-wives...I collect calculators I have no use for (yet is what I tell the Mrs.). They're so damn awesome though.

I'm still waiting for the HP 50g.1 with a large enter key. I'd buy it for that alone.

in response to message #10 by bill platt

This is just the number listed in the Quick Guide that you call to order a manual. I don't think anything has changed on that front. Having said that, I called and ordered mine a few months back and the manual came - completely free of charge - very quickly. You need your calculator in front of you because the service rep will ask you for the serial number.

HP 34c battery voltage voltage

*Message #1 Posted by **Hiawatha Wheelwright** on 14 Jan 2010, 11:54 a.m.*

I have a new hp34c that came with 1.5 volt off-the-shelf alkalines installed. I was concerned about any physical stress that the slightly too-long batteries may have been causing on the PCB, so I bought a pair of rechargable tip-less NiCds. The battery clips in the calculator have been flattened out because of the alkalines, and I did not want to bend them back out, so I padded the extra space with some tin foil and the new NiCds are a perfect fit.

But I am now concerned that they are 1.2 volts instead of 1.5 volts. Will this slightly lower voltage be a problem for the calculator? hpmuseum's battery spec page recommends a pair of radio shack NiCds which are also 1.2 volts.

Re: HP 34c battery voltage voltage

*Message #2 Posted by **Marcus von Cube, Germany** on 14 Jan 2010, 12:32 p.m.,*
in response to message #1 by Hiawatha Wheelwright

NiCd always are rated 1.2V. This was equally true for the original batteries in the calculator. So 2.4V is certainly ok.

Re: HP 34c battery voltage voltage

*Message #3 Posted by **designnut** on 15 Jan 2010, 1:55 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Whenever you see the word NiCad think instead Nimh. The are more modern without the memory effect of Nicad. I have had such good results with the low self discharge Sanyo Eneloop cells I can recommend them for any service. They hold enough charge tto last over a year. Sam

Re: HP 34c battery voltage voltage

*Message #4 Posted by **Hiawatha Wheelwright** on 15 Jan 2010, 1:56 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Great, thanks.

Oddly enough, I let it charge for about 6 or 7 hours and the low battery indicator still comes on when I power up the calculator.

Re: HP 34c battery voltage voltage

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 15 Jan 2010, 10:16 a.m.,*
in response to message #4 by Hiawatha Wheelwright

Hi;

Chances are that the connection for the charger is faulty. I repaired (and replaced) many of the flex circuit that connects both the batteries and the charger input to the power board. If you have the means

to, please check if the charger is actually feeding the power board.

Success!

Luiz (Brazil)

HP-41: Has anyone used the Laitram rom?

*Message #1 Posted by **Geir Isene** on 14 Jan 2010, 5:47 a.m.*

If so, what do you think about this takeover rom?

Re: HP-41: Has anyone used the Laitram rom?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 14 Jan 2010, 6:47 a.m.,*
in response to message #1 by Geir Isene

Hi, Geir;

right after building the MLDL2000 and adding a NoVRAM and a NoV32 to the 'troup', I had the change to get to know about the so many modules that existed for the HP41. I can tell I am one of the 'newest' users of these extensions amongst the 'older' worshipers of the HP41 system, though...

About the Laitran: I read about it, took a look at the manual but I was actually a lot interested on HEPAX, CCD-family, AECROM, FORTH ROM, Advantage, amongst some others. I must confess I never give it a try because it seemed to me that the proposed functionality was not something I was seeking for.

I'll get closer to it and let you know.

Cheers.

Luiz (Brazil)

Re: HP-41: Has anyone used the Laitram rom?

*Message #3 Posted by **Ángel Martin** on 14 Jan 2010, 11:48 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

I actually got one on eBay (at a very affordable price) and sold it later on - that should give you an indication of my appreciation for it... all that ado for nothing much, in my opinion.

Re: HP-41: Has anyone used the Laitram rom?

*Message #4 Posted by **Brian Walsh** on 14 Jan 2010, 12:19 p.m.,*
in response to message #1 by Geir Isene

Yes, I have one buried away in a box along with its special touchpad overlay. In my estimation it was a solution in search of a problem.

J.M. LaPeyre (I think that's the spelling) made his fortune in shrimp processing (Bubba Gump?) and a special staggered tread industrial stair/ladder (called the LaPeyre Stair), and he hired Dave Conklin and co. for the project. J.M. himself demonstrated the product at the 1985 users conference in Atlanta, and if memory serves Dave was there.

Re: HP-41: Has anyone used the Laitram rom?

*Message #5 Posted by **Marcus von Cube, Germany** on 14 Jan 2010, 12:29 p.m.,*
in response to message #4 by Brian Walsh

Can someone explain, in a few words, what this ROM is about?

Re: HP-41: Has anyone used the Laitram rom?

*Message #6 Posted by **Raymond Del Tondo** on 14 Jan 2010, 1:01 p.m.,*
in response to message #5 by Marcus von Cube, Germany

AFAIR all possible functions are accessible with a few key strokes.

HTH

Raymond

Re: HP-41: Has anyone used the Laitram rom?

*Message #7 Posted by **Geir Isene** on 14 Jan 2010, 2:26 p.m.,*
in response to message #6 by Raymond Del Tondo

Correct. It's a takeover rom where 16 keys are active and with combinations of keys, all HP-41 functions are available with very few keystrokes (2?).

Reminds me...

Maybe one of you MCODE experts could write something that allows multiple KEYS files, so USER keyboards could be swapped out quickly like on the 71. Without it, I think you would have to run a program with lots of PASN's and it would be slow and take more memory. I haven't reviewed this recently so I may be forgetting something.

Re: Reminds me...

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 14 Jan 2010, 5:52 p.m.,*
in response to message #9 by Garth Wilson

Hi, garth;

Ángel´s first 4K 41Z had a programmable, complex-addressed USER keyboard through a single MCODE function. Anyway, any pair of consecutive USER assignment (or after packing the existing ones) will ocupy a main RAM register, as we know.

For me, the best cost-benefit relation is the use of sofkeys (HP19, HP28, HP42S, HP48-series and so), and in some applications, like the ones in the HP41 Advantage Pack, such feature is simulated (not the softkeys themselves, something close to). The HP32S also takes advantage of the ALPHA keyboard with the addition of the small arrows pointing to the active keys.

The main issue of the USER keyboard is to remember what is assigned to which key, and I believe the [NULL] feature in the HP41 was one of the solutions to help the user to 'check before using' a particular key in user mode. If we have a set of USER keyboards, I guess the user would have to retain more information, though.

Please, these are just my own considerations about the subject. I neither have an answer, nor a solution to propose, but I really would like to have another possibility for the multiple user defined keyboards.

Cheers.

Luiz (Brazil)

Re: Reminds me...

*Message #11 Posted by **Geir Isene** on 14 Jan 2010, 6:30 p.m.,*
in response to message #10 by Vieira, Luiz C. (Brazil)

Right. When I program FOCAL I do as the Advantage module (this I advice in the FOCAL coding standard).

The Laitram keyboard overlay is some crazy piece of thingymawiz

I am looking forward to using 41Z after I get one of the modules that can hold such images. But as for the RAM space taken by key assignments, I'm thinking of KEYS files in extended memory or one of the newer plug-in modules with more RAM file

space. Then only the active assignments take any of main RAM.

> Quote:
>

The HP32S also takes advantage of the ALPHA keyboard with the addition of the small arrows pointing to the active keys.

I do this on the 41 with local alpha labels as well as with GEYKEY and GEYKEYX. Useful functions, although not the same thing.

For this reason, I frequently change key overlays on the 71. I only have one for the 41 that I could write on (I should have bought a bunch when they were available), plus the special-use ones that came with the 41 and its modules. The guide for the text editor is on the back.

Re: Reminds me...

*Message #13 Posted by **Ángel Martin** on 15 Jan 2010, 2:13 a.m.,*
in response to message #10 by Vieira, Luiz C. (Brazil)

Both the 41Z and the SandMath modules have their own "USER function files" - very comparable to Garth's example with the 71B.

On the 41Z (either 4k or 8k version) it's called ZKEYS; on the SandMath it's called MHKEYS. Either one will remap the User keyboard to a pre-assigned function set, pertinent to the module in question.

As much as this is a good approach, I find this technique a little taxing on the user: because there are that many functions, there's a lot of toggling the USER mode on and off to also access the native 41C functions (or else lot of XEQ-Spelling). It also uses up a chunk of main memory with the key assignments "buffer" .

That's why I wrote the Complex Keyboard function (ZKBRD) on the 41Z (8k version). It provides access to many more functions than available on the basic layout, it does NOT conflict with the native or the user assignments, and it doesn't take any memory register. A charm, if you ask me. The cost of course is a lot of programming behind the scenes to make it happen.

Take it for a spin and you'll see what I mean.

Cheers, "AM

SandMath 6 -> NoV: Error

*Message #1 Posted by **Geir Isene** on 12 Jan 2010, 5:24 p.m.*

A bit hyperactive here today...

I tried using the Modfile utility under Wine on Linux to extract the two ROM images from the Sandmath.mod (version 6) from TOS. It extracts the upper and lower ROM file but one of them have the extension .rom.rom (note two extensions). I rename it by removing the last ".rom" and try to compile it using the Clonix config to assemble it into a burnable HEX file for the NoV-64. But, it just won't assemble (6 errors I believe it was). Could anyone send me the two correct ROM files (upper and lower) so I can try them - in case the Modfile utility under Wine is acting up on me? (e-mail = g @ isene . com {remove spaces})

Re: SandMath 6 -> NoV: Error

HP-IL a summary QRG/top 10 commands

*Message #1 Posted by **Geir Isene** on 12 Jan 2010, 5:19 p.m.*

Many modules, lots of functions, little storage space (in my mind).

Having reached a target with the ICEBOX, it's time for me to move over to doing more HP-IL stuff. Never been doing much of that and I wonder if any of you would care to give your top 10 useful HP-IL functions. There are plenty of useful functions across modules like Extended IO, Extended IL, Paname, CCD OS/X, HP-IL Devel as well as the HP-IL module itself. It would be good to have a shortlist of the best functions... Anyone?

Re: HP-IL a summary QRG/top 10 commands

*Message #2 Posted by **Egan Ford** on 12 Jan 2010, 5:40 p.m.,*
in response to message #1 by Geir Isene

CCD OS/X Cat 0 is a must for me. I wish it existed outside of CCD OS/X.

Re: HP-IL a summary QRG/top 10 commands

*Message #3 Posted by **Raymond Del Tondo** on 13 Jan 2010, 7:40 a.m.,*
in response to message #2 by Egan Ford

Hi,

the CCD OS/X already _is_ the extremely compacted version;-)

In the original CCD module, the UI code ran across (back and forth) both 4K pages.

@Geir:
I once assembled a ROM for Christoph Klug called the "Extended IL Plus" or "-EXT IL+" ,
which includes many interesting functions of various other ROMs.

Cheers

Raymond

in response to message #5 by Raymond Del Tondo

I'm not certain but I believe it's not for free - a shame, it'd be an excellent source to learn more MCODE tricks...

Re: HP-IL a summary QRG/top 10 commands

*Message #7 Posted by **J-F Garnier** on 13 Jan 2010, 3:23 p.m.,*
in response to message #1 by Geir Isene

Hi Geir,

For serious HP-IL usage, the Extended I/O ROM is highly recommended. Then the Extended IL ROM (Skwid) can be considered. I do not recommend the HP-IL Devpt ROM, except for HP-IL low level investigations. The Paname ROM also has many HP-IL interesting functions but is more dedicated for use with the HP82162 and HP82905 printers, and HP82163 video interface.

For the top 10 commands, it really depends on what you plan to do with HP-IL. If you are using only mass storage and printer operations, then the most used functions will likely be:

** Mass Storage Operations:

- NEWM, WRTP/READP, WRTA/READA, DIR (CAT 4), PURGE for mass storage.

- If you have several mass storage units, the COPYFL and MCOPY functions of the Ext I/O ROM will be useful.

- if you have a drive with capacity > 128KB (for instance the HP9114), then the SNEWM, SWRTP, SDIR and SCOPYFL variants from Ext-IL ROM are interesting, plus the WRTXM/READXM, WRTCAL/READCAL.

** Printer Operations:

- PRP and LIST for program listing.

- the MCPRP and MCLIST multi-colomn variants from the Ext-IL ROM.

- PRX, PRA, ACA, PRBUF, ADV for general purpose printing operations.

Then if you plan to use HP-IL for instrument control, the Extended I/O ROM is a must with many useful functions. The most important functions (from HP-IL module or Ext I/O) could be: NLOOP, FINDID/FINDAID, SELECT/RCLSEL, ID/AID, SPOLL, TRIGGER, CLRDEV/CLRLOOP, REMOTE/LOCAL/NOTREM, plus all the INA/OUTA variants, plus the low level HP-IL commands...

Finally, let me mention the 44468A Data Acq/Ctrl ROM if you have a HP3421 Data logger.

J-F

I just looked through a test program I used in the 80's when I used the 41 the most, which was for controlling equipment. Here are the top HPIL commands used, in order of frequency:
SELECT (32 times)
OUTA (24 times)
IND (13 times)
ACA (10 times)
ACX (10 times)
MANIO, REMOTE, CLRDEV, INSTAT (one time each)

Some of these were in subroutines that would have gotten run multiple times per set of tests.

A program used to control an EPROM programmer used:
ACA (13 times)
OUTXB, OUTA, SELECT, and ADV (12 times each)
REMOTE and NOTREM (2 times each)

A program used to check battery life on many units at once used:
OUTA (5 times)
ACA (4 times)
SELECT (3 times)
IND (2 times)
MANIO, ACX, and REMOTE (one time each)
There's also an AIP, and at the moment I can't figure out what it is, although it may not be and IL function.

Re: HP-IL a summary QRG/top 10 commands

*Message #10 Posted by **Geir Isene** on 14 Jan 2010, 5:00 a.m.,*
in response to message #9 by Garth Wilson

Nice. Thanks for this. It's exactly what I was looking for.

Now that I am diving more into the HP-IL, I have the idea that the combo CCD OS/X + Paname would do most anything (except low level debugging as in the DEVIL rom). Paname has a bunch of the Ext IO type of functionality as well as the printer/plotter/video functions.

Re: HP-IL and the EXT-IL-PLUS

*Message #11 Posted by **Christoph KLug** on 16 Jan 2010, 9:43 a.m.,*
in response to message #10 by Geir Isene

Dear HP-41 & HP-IL enthusiasts..

A lot of helpfully commands and routines for controlling HP-IL with HP-41 handhelcomputer for real

world interface applications, you find in my two books HP41 Input/Output Board & IL2000 Interface System.

Beside the IL-Module the EXT-I/O module has a key function. And of course the CCD-Module. And the best extension for this advanced module configuration is the EXT-IL-PLUS module - which is described in detail in my book, mentioned above.

If you are interested to get the EXT-IL-PLUS please contact me...

Best regtards - Christoph Klug

48sx compared to 50g

*Message #1 Posted by **Hiawatha Wheelwright** on 12 Jan 2010, 5:10 p.m.*

I have an HP-48sx and I'm considering upgrading to the 50g - how similar or different are they? All that that guy at HP support told me was that "everything you can do on a 48 you can do on a 50" but he really didn't get into specifics.

Re: 48sx compared to 50g

*Message #2 Posted by **Norman Dziedzic** on 12 Jan 2010, 5:28 p.m.,*
in response to message #1 by Hiawatha Wheelwright

You might try this: http://www.hpcalc.org/hp49/docs/misc/49vs48.zip

It is for the 48gx vs. 49g but pretty close to what you want.

Re: 48sx compared to 50g

*Message #3 Posted by **Dave Britten** on 12 Jan 2010, 8:11 p.m.,*
in response to message #1 by Hiawatha Wheelwright

Yeah, the 50g can do anything the 48SX can do, but I find that the 50g is much more cumbersome to use. The keyboard and menu layouts are a huge step backward compared to the 48. For example, MTH, PRG, and CST are all shifted keys on the 50g. Ugh! It's also a bit fiddly about working with the HP infrared printer, though most folks probably won't care about that detail.

I own both a 48SX and a 50g (among numerous others), and it's the 48SX that I keep on my desk at work. You don't have to take my word for it, though - download Debug4x and play around with the included 50g emulator a bit to get a feel for it. It does have some very nice added functionality compared to a 48, but for me, it's not worth the huge usability sacrifices.

True enough, at least as it comes from the factory, but please note that the USER keyboard can be anything you like... and if you use Prof. Dr. Rautenburg's lovely KEYMAN (and perhaps TOPKEYS as well), the sky's the limit. It allows both "long-hold" and "double-press" actions in addition to the usual no-shift, shift, and shift-hold modifiers, and allows all the shifted combinations with them as well, so one key can do a couple of dozen different things instead of just six or seven-- which leads to a different set of usability

issues if these capabilities are over-used, naturally. These libraries are not specific to the 50g, but are also available for the 48GX.

These libraries are not specific to the 50g, but are also available for the 48GX.

Yes, that does work, but it leads to another non-optimal situation. If you use the user keys to group a set of related functionality that's used somewhat infrequently, you're out of luck. In my case, I've got some custom menus, user keys, and a custom Enter that speed up number base work. Being forced to leave the user keys on to remedy the very poor standard keyboard layout would prevent me from having this number-base-oriented keyboard layout ready when I need it. Either that or I'd be stuck with it full-time, which isn't really a workable option.

On a related note, I think adding the shift-and-hold key mappings was a bad idea. Anybody that's tried to go backward multiple pages in a menu on the 50g will know what I'm talking about. (Shift+Prev is actually Last Menu, so you have to keep alternately pressing and releasing the shift key, then the Prev key, or else you'll end up somewhere else entirely.) Plus some of the shifted functions on the number keys open up soft-key menus, but some open up choose boxes. And of those that open choose boxes, a select few will open soft-key menus if you do shift-and-hold. There's no real rhyme or reason to it, either.

And speaking of menus, why are there so many duplicates that differ just enough to be confusing? Try this on a 50g: hit Left-Shift, MTH, then pick HYP. Page through the menu with NXT, and notice it has the 6 hyperbolic trig functions, plus EXPM (e^x - 1) and LNP1 (ln(x + 1)). All well and good. Now hit Right-Shift, TRIG (on the 8 key), then pick HYP again. Once again, here are the 6 hyperbolic trig functions, but in a different order. Then hit NXT and notice this version of the menu doesn't have the two logarithmic functions! Now hit SYMB, then pick the TRIG menu. It's COMPLETELY different from the TRIG menu you get from Right-Shift, 8.

There are plenty of other examples of poorly thought-out menus. For instance, the SYMB key also has menus for CALC and ALG. These are, of course, completely different from the shifted CALC and ALG menus on the 4 key. Left-Shift, MATRICES (the 5 key) is quite different from MTH, MATRX, and MTH, CMPLX bears almost nothing in common with Right-Shift, CMPLX (the 1 key).

All in all, it makes for a very frustrating experience when you have to remember which of several subtly different versions of the same menu has the function(s) you're looking for. The 48 designers had the right idea - put the (mostly) numeric stuff under MTH, the symbolic manipulation functions under ALGEBRA/SYMBOLIC, low-level stuff in PRG, and give a couple more menus for stats, time, units, plotting, etc. In my opinion, if the 48SX had an un-shifted "clear stack" key like the 48GX, it would be perfect. (Let's just say I'm not fond of the 48GX having EDIT/VISIT and PURGE on adjacent same-

shifted keys. I've fat-fingered it a couple times with LASTARG disabled...)

*Message #6 Posted by **cyrille de Brébisson** on 13 Jan 2010, 7:10 p.m.,*
in response to message #3 by Dave Britten

hello,

take a 50g, enable real mode, RPN mode, diable pull down menus (flag -117) and you have something that will behave prety much exactly like a 48SX, but much much faster, and with a larger screen and more memory...

you can always move keys that you use a lot on top of the keybaord with user key assignement....

regards, cyrille

The main key to move is the ENTER key, which I found difficult, since ENTER is an operation and can't be explicitly assigned to a key. I think I've done it by assigning the silly 'X' key in the center to an empty command, counting the stack in a variable and checking the stack pre- and post-, executing DUP as appropriate and then fixing the stack.

Richard

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 12 Jan 2010, 9:08 p.m.,*
in response to message #1 by Hiawatha Wheelwright

Hi;

I´d go for:

- USB comm port
- upgradable O.S.
- up to 2GBytes RAM (SD card)
- programming enhancements (somethings you can do with the 50G that cannot be done with the 48S)
- the 50G is way faster!

I experienced having to adapt some programs that ran O.K. in the 48SX and failed in the HP50G, mostly due to lists handling. Not that functionality was removed, in fact it was 'corrected'. A couple of functions (cannot remember now, should research to find) return a different number of elements to the stack in both the HP48S

(48G and 49G as well) and the 50G. After the programs failed in thee 50G, I executed them with debug and then I realized that the HP50G did not need to detect a particular circumstance in lists handling because it maintained coherence with empty lists, while the 48G returned something different.

The programs dealt with fuzzy logic and were first written for the HP48S, but I needed some features in the 48G. Then they were ported to the HP49G (more memory), and later they failed to work with the HP50G. After being rewritten they worked fine and a lot faster.

Cheers.

Luiz (Brazil)

To that I'd add - better (bigger & clearer) screen

The keyboard takes some getting used to, the moved ENTER key being the most irritating one. Otherwise it's quite a good and capable machine.

To that I'd add:

1. The 50g can be easily replaced if lost or broken.
2. The 50g can be programmed in C (if you are into that type of thing). (http://sense.net/~egan/hpgcc/)

If you are running Windows then download and install Debug4x and give it a try. If OS/X or Linux then try x49gp (http://x49gp.svn.sourceforge.net/viewvc/x49gp/README.QUICKSTART).

Just to keep things in perspective, usually there are 10 or so 48sx's listed on eB** at any given time. I checked recent completed auctions, and found the average final selling price to be about $60. Some of these are near mint calculators, some have some wear but include accessories.

The 50g regularly sells for $150 new, but can sometimes be found for less than $100 "like new" on eB**.

The 48gx usually commands higher prices, but the OP specifically mentioned the SX for comparison.

My point is the the 48sx can also be easily replaced, so IMO the more significant comparisons are feature set, speed, and build quality.

IMHO this is in part due to the success of the 50G. Prior to the 50G, and in particular at the time of the bad rubber key 49G, I saw 48SX/GX selling for over $200 IIRC.

Re: 48sx compared to 50g

*Message #13 Posted by **Bill Platt** on 13 Jan 2010, 1:23 p.m.,*
in response to message #12 by Bart (UK)

What I remember was 48GX going over $200 and even $300 for a short time, while 48G maybe $100, and 48SX $20 or $30 up to $60. Similarly, you could pick up 28C for $15 and a 28S for $25.

Re: 48sx compared to 50g

*Message #14 Posted by **Pal G.** on 13 Jan 2010, 2:20 p.m.,*
in response to message #12 by Bart (UK)

For the record, near the end of last year I bought one 48G for $34 including shipping, and another 48G for $41, including shipping. They are both in great shape, and twice as fast as my 48SX. (Incidentally, the 48Gs are a bit faster than the 48GX).

I do like my 50G, but I think I like the 48Gs a bit more.. label organization, keyboard buffer, the fact you can lay it on a desk and type, etc..

Cheers.

*Message #15 Posted by **Ed Look** on 13 Jan 2010, 11:36 p.m.,*
in response to message #14 by Pal G.

Initially, I had gotten a 49g+ to replace my 48G and 48G+, since I found that despite the joy of using the 48G/G+ machines, they were on the fragile side. I did find, as some did, that the 49G+ was more cumbersome to use... but only at the start. Once you get used to it, it becomes as enjoyable as the 48G series units. Yeah, I might still enjoy using my 48G/G+ units slightly more, but that's like me still preferring my (now not really functional) 34C over the 32SII, 33s, and 35s- I believe this is based more on sentiment.

Then I got a 50g and it seems to be a noticeable improvement over the 49g+: it seems more solid and sturdy, as the 49g+ seemed to me only slightly less fragile than any of the 48 series calculators; there was the inclusion of an improved SD card capability; and apparently, more speed, particularly when it came to searching the SD card.

I tend to like the 50g more over the 48G or G+.

(Now if someone with the requisite skills would port over the Trek48 game to the 50g/49g+...)

Re: 48sx compared to 50g

*Message #16 Posted by **Egan Ford** on 14 Jan 2010, 10:29 a.m.,*
in response to message #11 by Martin Pinckney

Sure, but the 50g is still easier to replace. You can have a 50g same day or next day from several sources, e.g. I can drive to my local university bookstore and have a 50g in hand in less than 30 minutes. There is no guarantee that a working 48-anything will be on eBay exactly when you need it.

And lets not forget the memory card that many existing SX/GX owners require--not as easy to replace.

Re: 48sx compared to 50g

*Message #17 Posted by **Patrick Rendulic** on 14 Jan 2010, 1:06 a.m.,*
in response to message #1 by Hiawatha Wheelwright

In comparision to the 48SX the 50G surely is an improvement.

BUT there ARE features on the 48SX or the 48GX who have been badly implemented in the 50G. The haptics on the 50G are not so good. And what bothers me most is the keyboard layout, menu system, etc. . Even after 6 months of 50G use I still don't feel at home and it is always a pleasure to do something on the 48.

Re: 48sx compared to 50g

*Message #18 Posted by **Bart (UK)** on 14 Jan 2010, 5:24 a.m.,*
in response to message #17 by Patrick Rendulic

As a compromise, get the 48G/GX/G+. Quite affordable on auction sites now (I got a mint condition 48GX for ~£30). They have libraries built-in that the 48SX had as optional plug-in RAM. The 48G+ has the same on-board RAM as the 48GX. All have IR and RS232. I don't see much use for X-pandability as the cards tend to cost more than the calculator. I like the 48G/GX/G+ features over the 48S/SX but prefer the colour scheme of the S/SX. Of course the 50G has much more built-in. And upgradable ROM. And easy to interface with current PCs (both SD card and USB), making it easy to back up your programmes and data or install updated/modified libraries, user cummunity developed features (e.g. C or Lua programming), etc.

Re: 48sx compared to 50g

*Message #19 Posted by **megarat** on 14 Jan 2010, 2:17 p.m.,*
in response to message #1 by Hiawatha Wheelwright

For my own data point, I owned both the 48SX and the 49G+ (admittedly not the 50G; I got the 49G+ for ~US$50 when the 50G came out), and I just couldn't engender any joy for the 49G+. I agree that it's too cumbersome, and I would also add that w/r/t size, it's huge, feeling like a small textbook in my hands, and it's also not so miserly with battery use (which was I feature I adored with the 48SX).

I should admit that my calculator needs aren't that great, however, so it was probably a losing proposition for the 49G+ from the start. After a reasonable effort, I ended up selling it for the US$50 that I purchased it for, and kept using the 48SX at work.

Eventually I did end up selling the 48SX, because I came to regard it as overkill for my own calculator needs, and longed for the sleek simplicity (especially with storing values into registers) of my 15c. But I still have a big warm heart for the 48SX, and I regard it as their last great calculator.

Yeah, I know ... I do (mildly) regret getting rid of the HP 48sx, but:

I wasn't using it professionally; I was devoting my spare time to other hobbies; and lastly, I always have this compulsion to try to find "proper homes" (whatever they may be) for items of mine that aren't being used appreciably. Something that's designed to be used, when it just sits on a shelf or in a drawer, it feels like waste. Maybe I've watched "Toy Story" too many times.

I do wistfully check out the 48sx scene on eBay from time to time, however.

EDIT: Oh, and if I get rid of something I'm not using, it allows me to free up that money for something new.

in response to message #21 by megarat

I own : HP48SX hp48GX HP48G+ HP49G HP49G+ HP50.

i think HP50 is BAD calculator :

1- the general quality is bad, bad plastic. 2- i don't like the design. 3- the keyboard does't works correctly. 4- the screen protection are smooth plastic. 5- the weight is too low. 6- the screen as too poor resolution.

in my opinion (only MY opinion) HP50 is like a toy, it's a low cost calculator, hp decided to produce a new calculator for a very low cost for THEM and an big price for US.

Seriously, i continue to work with my 48gx. If hp decide to produce a new calculator in HIGH QUALITY i will return to HP but from now i've seen that TI NSPIRE calculator is made in a good quality, good case, nice design, good plastic, big screen, 16 grayscale lcd, correct price and probably assembly language programming in 1 or 2 month. So i LOVE HP CALCULATOR but if they don't produce quickly a NEW GOOD QUALITY CALCATOR i'm going to TI calculator.

Here, my colleague think like me.

the only good thing of this calculator is the speed.

Fabrice

in response to message #22 by fabrice

Everyone is certainly entitled to his/her opinion. There are lots of folks on this forum who love the 50. I am not a fan of RPL, but I respect it's power and admire those who use it productively to solve problems. And I admire HP as well for continuing to produce programmable calculators that are second to none. The 30b is the latest example.

The TI NSpire was designed for students, not engineers. It has lots of features, but the tiny keys and lack of good screen contrast would be a major turn-off to many people. And the onboard programming language--TI Basic--is crippled by lack of any command to provide input during the running of a program (presumably, to prevent students from playing games during math class). I don't know of any engineer who would seriously consider the NSpire as his/her working calculator.

Re: 48sx compared to 50g

*Message #24 Posted by **Mike Morrow** on 18 Jan 2010, 12:35 p.m.,*
in response to message #22 by fabrice

It was alleged of the HP50G:

1. "quality is bad, bad plastic"? You evidently have never used the TI-89. The HP50G is

mechanically an adequately sturdy device.
2. "don't like the design"? That's not too descriptive. It's like saying "I don't like the weather we had in the 1990s."
3. "keyboard doesn't work"? I've somehow missed this extreme defect for the three years that I've had a HP50G.
4. "screen protection are smooth plastic"? Your HP48GX LCD has absolutely NO protection at all. Try dropping something on the screen, even something light from a low height. A permanent mark will likely remain. The HP50G has far superior LCD protection.
5. "weight is too low"? What advantage is a heavy handheld? In fact, there's not much difference in a 48 (with three AA-cells) and a 50G (with four AA-cells).
6. "screen as too poor resolution"? The HP50G LCD is a tremendous advance in clarity, and some advance in resolution, compared the extremely poor contrast slow LCDs of most 48-series units.

Then, "big price for US"? Check the prices of competing products. The HP50G is very inexpensively priced for its capability (currently about $125 from Amazon). It's always less expensive than the TI-89 Titanium. I have one HP48SX and two HP48GX machines, with various memory cards, all purchased as new equipment 15 to 20 years ago. The HP50G provides a tremendous value in capability compared to the 48-series.

Plus:
1. Have you noticed the distictions and advantages of HP50G inexpensive SD memory card capability versus the bulky, bizarre, proprietary, hard to use, poorly-powered and backed up, low-capacity, extremely expensive "Epsom-type" memory cards of the HP48-series?
2. Have you noticed that you can't upgrade the firmware in your 48GX?
3. Have you noticed that the HP48GX provides no debugging or development tools such as are standard on the 50G?
4. Have you noticed that you can't apply external power to the 48-series?

My personal opinion: The HP50G is, *all* particulars examined, without any doubt the best handheld calculator ever made by HP, or by anyone else. Of course, the HP50G is not nearly perfect, nor is it the best in a number of specific areas. It's just simply the best *OVERALL*.

I have used HP calculators since the original HP-35 was released in 1972. I have more than 30 in my collection that I purchased for professional use when they were current production, between 1976 and 2009.

My three 48-series machines now collect dust...I'm just not willing to revert to using devices that are inferior to the similarly-sized HP50G.

If RPL is too highlevel for you then consider SysRPL. Still too highlevel? Then go for Saturn or ARM assembly. All of the above can be done on-board.

As for easier than 41 M-CODE. Well it depends on how easy M-CODE is for you. :-)

I'm not a big fan of RPL either, powerful though it is.

That's one of many reasons that the HP42S remains at the top of my list, with the HP50G, both for differing reasons.

It's too bad there couldn't have been both an RPL and an RPN programming environment on the HP50G. I miss my GTO statements!

Hi Mike,
Yes, it would have been nice if 50g's Operating Mode menu item had the following choices:
RPN
RPL
Algebraic*

Where RPN meant a classic RPN environment with a fixed stack height and the 41C/42S programming paradigm. RPL would mean the standard RPL environment which the current (somewhat mis-labelled) “RPN” mode choice activates. Another setting for stack height would be activated in RPN mode.

With the above said, although I am no expert (so all experts please pardon any stupid statements regarding the operation of the 50g), I think there several ways that an RPN programming environment could be had on the 50g:
1. buy hrastprogrammer’s 41X or 42X emulators for the 50g.
2. write your own 50g application in RPL to create an RPN environment
3. write your own 50g application in C to create an RPN environment
4. write your own whole new rom for the 50g to create an RPN calculator that could do anything you wanted, probably.

* - I have no need for the Algebraic choice, but I won't require that they get rid of it :-)

I started down this path twice. The first was to port Free42 to the 50g, but its too large. The 2nd was a native RPN that used the 50g key assignments as-is. I'll probably never finish the 2nd. Hugh's Reckon may be the ticket.

> Quote:
>
> It was alleged of the HP50G:
>
> 1. "quality is bad, bad plastic"? You evidently have never used the TI-89. The HP50G is mechanically an adequately sturdy device.
> 2. "don't like the design"? That's not too descriptive. It's like saying "I don't like the weather we had in the 1990s."
> 3. "keyboard doesn't work"? I've somehow missed this extreme defect for the three years that I've had a HP50G.
> 4. "screen protection are smooth plastic"? Your HP48GX LCD has absolutely NO protection at all. Try dropping something on the screen, even something light from a low height. A permanent mark will likely remain. The HP50G has far superior LCD protection.
> 5. "weight is too low"? What advantage is a heavy handheld? In fact, there's not much difference in a 48 (with three AA-cells) and a 50G (with four AA-cells).
> 6. "screen as too poor resolution"? The HP50G LCD is a tremendous advance in clarity, and some advance in resolution, compared the extremely poor contrast slow LCDs of most 48-series units.
>
> Then, "big price for US"? Check the prices of competing products. The HP50G is very inexpensively priced for its capability (currently about $125 from Amazon). It's always less expensive than the TI-89 Titanium. I have one HP48SX and two HP48GX machines, with various memory cards, all purchased as new equipment 15 to 20 years ago. The HP50G provides a tremendous value in capability compared to the 48-series.

Plus:
1. Have you noticed the distictions and advantages of HP50G inexpensive SD memory card capability versus the bulky, bizarre, proprietary, hard to use, poorly-powered and backed up, low-capacity, extremely expensive "Epsom-type" memory cards of the HP48-series?
2. Have you noticed that you can't upgrade the firmware in your 48GX?
3. Have you noticed that the HP48GX provides no debugging or development tools such as are standard on the 50G?
4. Have you noticed that you can't apply external power to the 48-series?

My personal opinion: The HP50G is, *all* particulars examined, without any doubt the best handheld calculator ever made by HP, or by anyone else. Of course, the HP50G is not nearly perfect, nor is it the best in a number of specific areas. It's just simply the best *OVERALL*.

I have used HP calculators since the original HP-35 was released in 1972. I have more than 30 in my collection that I purchased for professional use when they were current production, between 1976 and 2009.

My three 48-series machines now collect dust...I'm just not willing to revert to using devices that are inferior to the similarly-sized HP50G.

Try a >2001 48GX with black LCD and SpeedUI it will make you change point of view ;)

In terms of hard/soft I must agree but please make them (48 and 50)work outside in bad conditions and a 48 with 15years is far more reliable than a new 50.

Some users make more importance to build quality than hard/soft capabilities...

Regards,

Nacho T

OT: Dennis (db) - Your bid is welcome!

*Message #1 Posted by **Joerg Woerner** on 12 Jan 2010, 1:28 p.m.*

Dennis,

I browsed some days ago your wonderful collection of non-HP RPN calculators and noticed that you feature only one product from Texas Instruments. I agree that the RPN module for the TI-59 was just a marketing gag but - don't underrate Texas Instruments.

We all remember the TI-88 and still speculate why it failed. Within few years TI bounced back and introduced some really interesting products. You remember the TI-78 and the TI-81?

Between these two calculators and the mind-boggling PLT SHH1 another TI project kept under the radar screen!

What I learned so far: It is based on Far Eastern technology and was tested probably only on the European market. A fellow collector in Hungary offered me recently an untouched product and I couldn't resist! I am not sure how this rare calculator made it over the iron curtain but it finally is back!

Dennis, Wall Street ruined the economy - I have to sell this unbelievable piece of Texas Instruments history on our favorite auction site. I can't think about a better place than your home for it.

LINK to your auction. Your bid is welcome.

Regards, Joerg

Re: OT: Dennis (db) - Your bid is welcome!

*Message #2 Posted by **db (martinez, ca.)** on 12 Jan 2010, 10:43 p.m.,*
in response to message #1 by Joerg Woerner

Joerg;

I do have an RPN module for the 59. I guess i should take a photo of it and post it on my hillbilly RPN site, but since i never got into playing with it; about all i would be able to write is "here's a link to Datamath for a real description". I've done that a couple of places, like your good write up of the Corvus 500 technonlgy and Mostek history page here. I never thought the TI rpn rom was a "marketing gag". I may be wrong but i saw it as a service to their customers (and an attempt to sell TIs) by letting you folks over there on the dark side use all those HP 67 users library programs.

About the Disney calculator: That's real truth in advertising. IMHO, i think that every calculator with an equals key should have Mickey Mouse embossed on it!

I hope you've been enjoying your balmy weather up there. I think that we are about to enjoy a series of warm-but-wet storms out here - the kind that makes me glad i'm near the top of the hill and etched into bedrock.

Re: OT: Dennis (db) - Your bid is welcome!

ICEBOX version 1H released

*Message #1 Posted by **Geir Isene** on 12 Jan 2010, 11:14 a.m.*

It's released on the ICEBOX page.

This is the rom to have if you own a NoV-32 or NoV-64. To sum up:

The functions N100, N101, N102, N200, N201, N202 and N103 allows for fast switching between the various ROM and RAM blocks in the NoV modules (N102, N103, N202 and N203 is for the NoV-64). These functions can be assigned to keys to make it lightning fast to switch blocks. Switching the RAM blocks are instant (the last digit) while switching ROM blocks (the first digit) requires the calc to be powered off and back on to effectuate the switch.

The function NX writes the content of X into address 4100 (the address that holds the NoV-32/64 config).

The function N? shows the current config (the content of address 4100)

NBS (NoV Block Switch) makes it easy to switch to a new config and restore Main Memory to a file named "N" in the new RAM block in one function. NBS is a prompting function that only accepts input in the ranges 000-003, 100-103 and 200-203. An input outside these ranges results in "DATA ERROR". If the file "N" or the function HGETA are not found, a "NONEXISTENCE" is displayed. If you switch the ROM block (first of the three digits prompted for), the message "CALC OFF" is briefly displayed to remind you that you need to turn the calc off and on to complete the ROM block switch.

SAVEN saves Main Memory to a file called "N" in the current HEPAX RAM block.

GETN restores Main Memory from the file "N" in the current HEPAX RAM block.

And there are lots of other function suitable for various purposes. The user manual is your friend :-)

Re: ICEBOX version 1H released

*Message #2 Posted by **Diego Diaz** on 13 Jan 2010, 2:14 a.m.,*
in response to message #1 by Geir Isene

Hi all,

Just a note to NoV-32 and NoV-64 users:

To gain full functionality of "NSG" (see here) a modified version of the NoV code is required:

Please mail me or Geir's in order to get the updated file.

NoV-32 modifications will be ready in short.

As soon as I get both files modified an update notice will be published at http://www.clonix.org

Oh! ...and Geir: Thanks for this great piece of software. :-)

Cheers.

Diego.

Re: ICEBOX version 1H released

*Message #3 Posted by **Geir Isene** on 13 Jan 2010, 5:33 a.m.,*
in response to message #2 by Diego Diaz

You are welcome.

The function earlier known as "NSG" became "NBS" just before the release (same function, different name).

A tribute to Diego Diaz and Ángel Martin

*Message #1 Posted by **Geir Isene** on 12 Jan 2010, 10:52 a.m.*

Not to forget a lot of other brilliant contributors on this forum and elsewhere, but I would like especially thank Diego Diaz and Ángel Martin for their excellent work.

The combination of a hardware wizard and MCODE guru has made it possible for me to have renewed joy in my old hobby. Oh, I just love Mcoding :-)

Thanks guys and please continue. I wish I had your skills.

Re: A tribute to Diego Diaz and Ángel Martin

*Message #2 Posted by **Ángel Martin** on 12 Jan 2010, 11:39 a.m.,*
in response to message #1 by Geir Isene

Thanks for the praise Geir (I'm blushing), but I'm far from being a MCODE guru! There are others out there with the real skills, I'm just sort of persistent (read: stubburn) and not afraid to try (and try, and try... :-)

And congrats to you as well - it's a small comunity but sure enough it's a great one.

Best, ÁM

Edited: 12 Jan 2010, 11:41 a.m.

Re: A tribute to Diego Diaz and Ángel Martin

*Message #3 Posted by **Geir Isene** on 12 Jan 2010, 11:47 a.m.,*
in response to message #2 by Ángel Martin

You are being modest ;-)

The documentation you provide for your projects have taught me much MCODE.

Re: A tribute to Diego Diaz and Ángel Martin

*Message #4 Posted by **Diego Diaz** on 13 Jan 2010, 1:42 a.m.,*
in response to message #1 by Geir Isene

Hi Geir, Ángel,

Thanks so much for your kind words. I sincerely take Ángel's and will add:

Try... and fail, and re-try... and re-fail... and so on... ;-)

However, IMHO, the key is enjoying the process.

Keep up the good job.

Diego.

30b programming environment

*Message #1 Posted by **Don Shepherd** on 11 Jan 2010, 5:27 p.m.*

OK, the 30b is out and will probably be available in a couple of months. While it is a financial calculator, it is programmable, like the 12c. It certainly has more capability than the 12c, but there are some things for an RPN programmer to watch out for. Here are a few of its features:

1. Programming commands are printed on a plastic overlay that may be placed over the top four rows of keys. These commands are entered by holding down the shift key while pressing the corresponding key, and they are only effective in program edit mode while entering your code (except R/S, of course, which has its usual meaning in run mode).
2. Any of ten user programs can be assigned to any key--shifted, unshifted, or shift+hold (with a couple of exceptions). This gives you a lot of flexibility in running your programs.
3. Subroutines - Call/Return, big improvement over the 12c.
4. Text prompts, another big improvement over the 12c.
5. Solver. Not programmable, but you actually write a small program to use it.
6. Conditionals, 6 of them. This will take some getting used to for the RPN programmer, because they don't work like other RPN programmable calculators. ?< means y<x here, not x<y. You'll have to be careful when adapting code from other calcs to the 30b. These tests don't use the traditional "do if true" rule; they use GotoT and GotoF based upon the condition code set by the conditional statement and placed on the stack. GotoT and GotoF pop the condition code off the stack before transferring.
7. Indirect addressing of 100 registers (shared with stats and cash flow). R0 = index, accessed via RCL DATA and STO DATA (or RCL/STO Cashfl).
8. Ten regular registers, 0-9. STO/RCL arithmetic with all 10, 290 bytes total program space, but STO 1 takes 2 bytes and STO + 1 takes 3 bytes.
9. You can step-execute your code one line at a time while debugging, and you can goto a label while editing.
10. SIN/COS/TAN for you engineers.
11. The ARM is FAST!!

Re: 30b programming environment

*Message #2 Posted by **hugh steers** on 11 Jan 2010, 6:45 p.m.,*
in response to message #1 by Don Shepherd

Hi Don,

Yes indeed. I'm currently working on a few 30b sample programs to illustrate the programming capabilities for an article in HPCC Datafile.

Although the program capability is described as "macros", the machine is nevertheless quite capable as a programmable device.

As you've mentioned, the ace in the pack is the raw speed of the machine and the availability of scientific functions. so i'm hoping to come up with some examples for the 30b that simply are not feasible for other HP models.

I do think this machine represents capability that's been lacking for some time, and i'm very pleased to see it. the 35s got reception but, for me, this model is superior.

happy programming!

Re: 30b programming environment

I agree, Hugh, it is. The prime factor example Gene listed demonstrates that, and it is fast.

Here is what the programming overlay looks like. Top quality all the way, they did a great job.

These tests don't use the traditional "do if true" rule; they use GotoT and GotoF based upon the condition code set by the conditional statement and placed on the stack. GotoT and GotoF pop the condition code off the stack before transferring.

Ooh, I like. This is actually more like how the RPL machines behave.

I was a little worried when I read the marketing brochure talking about "macros", but it looks like this will be just as programmable as any other machine. I'll be getting one for sure.

Now I wonder if they'll do a scientific on this 'Neo-Pioneer' architecture...

Re: 30b programming environment

*Message #5 Posted by **Katie Wasserman** on 11 Jan 2010, 7:12 p.m.,*
in response to message #1 by Don Shepherd

Don,

Good list!

Let me add a bit....

0. It's not pure RPN, so that you need to Enter a number to get it onto the stack, same as you would for RPL. For example: 3 Enter x multiples whatever was previously in X by 3, or you could simply do: 3 x, but to get 3 squared you'd need: 3 Enter Enter x.

8. ..... Other commands like: Lbl, GTO, GF, GT, Call, Disp take two byes. Effectively the calculator allows for about 150-200 program lines.

-Katie

in response to message #5 by Katie Wasserman

Here's the N-Queens benchmark for the 30b. Run time is about 11 seconds for this totally non-optimized program when running in Prog slot 0. See Pascal's Benchmarks for many other examples

```
RCL Mode -- get the mode pseudo register
STO 9    -- and save it for later restoration
3
0
0
STO Mode -- set 0 RPN mode and 0 decimal places
8
STO 1    -- 8x8 board
0
STO 2    -- X value in grid
STO 3    -- number of solutions counter
STO 4    -- Y value in grid
Lbl 00
RCL 2
RCL 1
?=
GT 04   -- go if done
1
STO + 2
RCL 2
STO 0    -- set the X index into the Data array
RCL 1
STO Data -- store N in Data[X}
Lbl 01
1
STO + 3
RCL 2
STO 4
Lbl 02
1
STO - 4
RCL 4
GF 00
RCL 4
STO 0
RCL Data -- Data[Y]
RCL 2
STO 0
Rv (roll down)
RCL Data -- Data[X]
-
Input (i.e., Enter)
GF 03
Math
Down
Down
Down
=       -- this is ABS (yuk)
RCL 2
RCL 4
-
-
GT 02
Lbl 03
RCL 2
STO 0
RCL Data
1
-
STO Data -- Data[X]-1 --> Data[X]
GT 01
1
```

```
STO - 2
Gto 03
Lbl 04
RCL 9
STO Mode -- restore the original mode
RCL 3
Stop
```

120 bytes 246 checksum

Massimo
```

Re: 11 seconds for the N-queens benchmark is incredible!

*Message #10 Posted by **Gene Wright** on 12 Jan 2010, 5:53 p.m.,*
in response to message #9 by Massimo Gnerucci (Italy)

Ah, I said "faster" :-) Not "as fast". I saw the incredible timing using assembly on my favorite machine. Sadly, I can't program it myself in assembly. ;-)

And, I also saw the 12c+ time of about 23 seconds. I'd be shocked if the time could be cut in half.

The 30b CERTAINLY seems to be the fastest HP calculator on this test when programmed in normal user code.

Re: 11 seconds for the N-queens benchmark is incredible!

*Message #11 Posted by **Massimo Gnerucci (Italy)** on 12 Jan 2010, 5:58 p.m.,*
in response to message #10 by Gene Wright

Sure! But that's on a 355 KHz CPU in a 30+ y.o. architecture... ;-)

Greetings,
Massimo

Re: 11 seconds for the N-queens benchmark is incredible!

*Message #12 Posted by **Xerxes** on 12 Jan 2010, 5:44 p.m.,*
in response to message #8 by Gene Wright

The HP-12C+ is actually listed with ~23 seconds. Probably the 12C+ is even faster than the 30B with a small modification of the test code.

Re: 11 seconds for the N-queens benchmark is incredible!

*Message #13 Posted by **Katie Wasserman** on 12 Jan 2010, 6:11 p.m.,*
in response to message #12 by Xerxes

Actually, I tried that modification and it's still 23 seconds. I was really trying to imitate the benchmarks program you listed not optimize them. I could speed up the 12C+ a little as well as the 30b with reprogramming.

There are a lot more options as to how to program this on the 30b so I'm sure it will beat the 12C+ for this benchmark and many others, but not everything. For example, sequential access to the cash flow registers are much faster on the 12C+ because of the auto increment/decrement of the register pointer and the time needed for branches is much more consistent and potentially a lot faster on the 12C+ depending on how the code is arranged on the 30b.

They are both extremely fast calculators.

-Katie

Edited: 12 Jan 2010, 6:21 p.m.

in response to message #6 by Katie Wasserman

hello,

a trick, to run it faster... set the calculator in test-system mode and then set the slow clock to 25000. then redo your test... I am sure that we can smoke more calcualtors this way...

cyrille

Re: 30b programming environment

*Message #16 Posted by **Katie Wasserman** on 13 Jan 2010, 9:29 p.m.,*
in response to message #15 by cyrille de Brébisson

This speed gain is pretty modest a bit more than 1 second faster but the cost in battery life if you forget to take the system out of test mode is very large. I don't recommend using test mode -- unless there's some really good stuff in there that we don't know about yet!

-Katie

Edited: 13 Jan 2010, 9:29 p.m.

Re: 30b programming environment

*Message #17 Posted by **Eddie W. Shore** on 12 Jan 2010, 9:43 a.m.,*
in response to message #5 by Katie Wasserman

Then the 30b has effectively twice the memory of an 12c (Non-platinum).

Regarding the new GT and GF commands, I do not recall seeing them on the 50g. If they wanted the programming to be closer to RPL, couldn't HP just have IF-THEN-ELSE-END structures?

In any case, the 30b is going to be my birthday present. :)

Edited: 12 Jan 2010, 9:45 a.m.

Re: 30b programming environment

*Message #18 Posted by **Tim Wessman** on 12 Jan 2010, 9:52 a.m.,*
in response to message #17 by Eddie W. Shore

I think the best explanation I've seen regarding 20/30b operation comes from Gene(?) that they are an RPL machine with a 4 level stack. Programming was really designed to be able to use the solver and to pull your commonly used commands onto keys. Of course, everyone wasn't happy with just that so. . .

TW

Re: 30b programming environment

*Message #19 Posted by **Gene Wright** on 12 Jan 2010, 10:07 a.m.,*
in response to message #18 by Tim Wessman

Key thought: Always remember that this is essentially a macro capability with lots of nice programming features added in. That allows you to do some amazing things...

700 digits of PI computed VERY fast. N-queens problem solved faster than ANY other HP except the 50g and 200lx. Wow. Prime factor program, base 2-10 conversion program, lunar lander program, number guessing program, etc.

But, you will run out of space with only 290 bytes available. Trade offs.

Hopefully, the verdict will be that these trade offs work. I believe those who have used it already would answer: "YES".

It is a fun machine to use. Very nice financial features. Programmable in a much more useful way than the 12c.

Edited: 14 Jan 2010, 4:32 p.m. after one or more responses were posted

Re: 30b programming environment

*Message #20 Posted by **Don Shepherd** on 12 Jan 2010, 12:57 p.m.,*
in response to message #19 by Gene Wright

Gene's right. But, frankly, what would be the appeal if all it could do was record keystrokes and play them back? That's boring, and it limits you to financial functions only (yes, I know it's a financial calculator, but I can ignore all those financial keys and assign cool programs to them anyhow!). The beauty of the way it turned out is that you can do what YOU want it to do, whether that's something financial, number theory, games, or just experiment around and have some fun. You couldn't do that with a macro program only.

And yes, I am VERY happy with the way it turned out. It can be whatever you want it to be, limited only by your imagination (and 290 bytes!).

Don

in response to message #1 by Don Shepherd

A good keyboard, native ARM code, keyboard overlays, it sounds like HP is really heading in the right direction here.

If/when they do a scientific calculator like this, I just hope that they add more programming space and a USB interface. 32k of programming space isn't useful if you have to enter the programs by hand.

Nice job HP!

HP9830A

*Message #1 Posted by **Dylan Watkins** on 11 Jan 2010, 10:54 a.m.*

I have sort of inherited an old calculator. Now 42, when I was 6 or 7 my brother an I used to play moon landing on it. My father also attempted to teach us BASIC. My dad put it in the back of his garage when he bought his first Mac and it has sat there ever since under its cover. Is there a market for this sort of thing? I have the 9866B printer also. I haven't as yet stumbled across any cassettes or cables. Have an HP45 calculator as well.

Re: HP9830A

*Message #2 Posted by **DavidShenk** on 11 Jan 2010, 1:27 p.m.,*
in response to message #1 by Dylan Watkins

Hi Dylan,

Yes, there are people interested in those old calculators. However, I think a little less so than hp's smaller calculators because of their size and expense shipping them around. If it is something you'd like to sell, I would try putting up a free classified here at the museum to see who would be interested. It would be helpful to plug it in and test it out some first, then post with the details of what works, included accessories, etc. Even if it isn't working, the parts could be important to fix another machine.

I don't think they come up for sale very often, even on the large auction site, but can go for several hundred dollars if in working condition.

Dave

Re: HP9830A

*Message #3 Posted by **Tony Duell** on 12 Jan 2010, 5:03 a.m.,*
in response to message #1 by Dylan Watkins

I would strongly advise against just plugging it it to see if it works. If the power supply has failed in storage (and it can happen), you could wipe out every IC in the machine.

It is fairly easy to test the power supply first (you need a voltmeter and a screwdriver, nothing more) which will at least protect against that problem.

The desktop machines are much more repairable than the handhelds. In general any HP9830 can be got going again, the chips are still fairly easy to find, and there's nothing custom in there other than the ROMs. However, tracing the fault can be difficult, this is probably not a machine that can be fixed by somebody with no knowledge of electronics. However, I can give it a go :-)

The HP9830 is one of my favourite machines, it is in many ways one of the first personal computers.

HP-35s: Better in ALG mode?

*Message #1 Posted by **Silvio A. Bensi** on 11 Jan 2010, 10:46 a.m.*

As other people here, I have been frequently experienced wrong calculations with my 35s. In order to find out if there is a hardware problem, I tried the following test: 1 ENTER 2 + 3 + ... 9 + I tried to type it as faster as I can and the calculator failed about 9 in 10 (Note: My 50g never failed in this test). Then I changed do ALG mode and typed as fast as before: 1+2+...9 The unit passed the test all the times.

I also observed that the calculator execute 253! faster in ALG mode. Forgive me the experts, but is it possible that an algebric calculator software have been adapted to work in RPN?

Sílvio A. Bensi

Interesting question, which perhaps suggests some more. Because most of us, I believe, have assumed that the 35s ROM is based on modifying the 32s/32sii code, which was definitely RPN, not algebraic.

in response to message #4 by Martin Pinckney

Well, I believe the 35s uses a different processor than the earlier 32s or 32s2, so they had two choices: Emulation, which I don't believe was done, or write something new.

Which begs the question: why, then, duplicate the base functionality (with enhancements, of course) of the earlier machines? Why not give us something better? (The Solver comes to mind).

*Message #7 Posted by **Gene Wright** on 11 Jan 2010, 3:02 p.m.,*
in response to message #6 by Martin Pinckney

The 35s **does** have a solver, just not the 17b2 style.

Whether or if there will be a 42s style machine ever again has been debated and discussed more than once. No need to go there again. Really. :-)

Yes, of course I know it has a solver. You've made my point, though. The 17b/27s style solver is so superior to the 32sii style, if you are re-implementing the code, why give us the old inferior solver? Especially with all that memory, the named variables feature could really take off.

Re: HP-35s: Better in ALG mode?

*Message #9 Posted by **Eddie W. Shore** on 12 Jan 2010, 9:50 a.m.,*
in response to message #8 by Martin Pinckney

Agree. I like the 17b solver - especially with the Let, Get, Sum, and If commands avaiable for use.

While on the 17b, just go the Silver 17bII+ a few days ago - (a) love the look and (b) keyboard is superior to the Gold 17bII+.

Enhancing something that has been accepted by many users is not a bad idea. It's about getting some continued return for the time invested in 'learning' a calculator. No need to learn a completely new concept.

I think this is what HP did right. From 28C to 50G, from 34C to 35s, or even 18C to 17BII+ we saw some proven concepts developing.

No clue why the 42S concept hasn't been considered for a rebirth yet.

Anyway, the large bug list keeps the 35s in beta state ... since 2007.

The same reason for most products, it's a matter of development effort vs (perceived) potential market.

A 42S style machine would require a LOT of development effort, for what market exactly?

The 35S has the exam market, the 50G and others cover the educational graphics calc market.

A new 42S would satisfy the fanboys and maybe a small niche here or there, but meet no other real market need in today's environment.

Dave.

By educational market I of course also mean university engineering courses. The number of people who buy graphics calcs outside of school/university for use in the professional market is a small percentage compared to sales for use in educational institutions. This "professional" market is what a 42S calc would be aimed at, which is not very big in the scheme of things.

TI have around 80% of the market for graphic calcs I believe, with HP the second biggest, that's still a big market for HP. HP might even have a bigger market share than TI if you are talking about the professional engineering education sector. That's why HP concentrate on education and finance, they are the two big markets, the rest is dregs.

Dave.

> Casios at the Wallyworld. (I don't have a clue about calculator preference down under....)

I think that 80% figure I've heard might actually only be the non-university educational market (which is the biggest educational segment by far), and that would be US only too (HP's main market?). Casio are of course huge outside the US. Sharp I don't rate as much of a major player, certainly forth on the list.

Regardless of the figures the point is the same, a 42S remake would not really be a hit in any educational sector, and it won't be finance of course, so that leaves it up the creek without a proverbial paddle as far as HP marketing are concerned. Which is why you haven't and won't see a new 42S from HP. But if it makes the fanboys feel any better, I've heard a rumor the release is imminent!

Down under sales hardly rank on any pie chart I suspect, but in any case I'd guess Casio and TI would battle it out.

Dave.

Re: HP-35s: Better in ALG mode?

*Message #16 Posted by **Don Shepherd** on 12 Jan 2010, 4:16 a.m.,*
in response to message #15 by DaveJ

Dave, I agree about the HP-42 not being resurrected. TI does not have 80% of the graphing calculator market in the non-university educational area in the US; it has 100%. I think you could count the number of HP calculators used in the US public schools on one hand.

I have the Casio CFX-9850G and Sharp EL-9900. Go for HP! Even my 28S is better (apart from screen size).

Neither can do C(335,167) (I don't know whether the current 9850GC+ can), and the Casio can do eg. C(90,7) but the Sharp can only handle n or r <= 69 (we can guess what they implemented) - and this is Sharp's current top offering. This is frustrating for me as I use programs requiring n or r > 100 (but results are < 1E99). I have to add my own routine, but this slows execution down of course. At least the Sharp gives an answer fot LN(-2) and LOG(-2) in complex mode. I prefer it's interface and programming style to the Casio.

Fortunately I bought these just to play with. For serious stuff, stick with HP!

Re: Casio & Sharp (Was Re: HP-35s: Better in ALG mode?)

*Message #19 Posted by **Katie Wasserman** on 12 Jan 2010, 6:38 p.m.,*
in response to message #18 by Bart (UK)

The Casio fx-9860g can do C(335,167), at least in the latest firmware. It's a very capable calculator for real and imaginary numbers and matrix manipulation. However, it has no symbolic math capability nor bignum processing and limited RAM (64K). The back-lit display is awesome -- I've never seen a better display on any calculator -- the keyboard kind of stinks, but is typical for many non-HP-click calculators.

I think it's a serious calculator.

Tim --

I find "lost" hard to believe. It seems to me that most of the HP-32SII code was directly ported to the HP-33s and its different microprocessor, introducing some math bugs. Some further changes were obviously made for the HP-35s (entry of base integers; input-buffer processing), but I'd expect that most of the corrected HP-33s code was carried over.

Re: HP-35s: Origin of source code?

*Message #28 Posted by **Ángel Martin** on 12 Jan 2010, 2:59 a.m.,*
in response to message #25 by Karl Schneider

What is lost, the code or the knowing what to do with it?

There are some aspects of cost-cutting and expense reduction that are only apparent with time, and one ot them is how the companies gradually lose the know-how and become more and more dependent on subcontractors. There's no going back after a while, not even if it were a market and money to pay for it.

You'd frown at this but even the storage space (both physical and virtual) gets trimmed, and there it goes... the commented source code into the trash bin lost forever and ever... but that's not a problem since there was nobody left around who could make sense out of it anyway.

In my opinion, the chances to se a rebirth of the 42S are less than nill.

Perhaps that's part of the "problem."

If you want a 42, just buy an Ipod and off you go. Why should HP bother with making hardware for such a niche product?

On the other hand, interestingly, HP has itself released Ipod apps for the 12C and 12Cp. And they aren't cheap--$25 or so.

*Message #33 Posted by **Norman Dziedzic** on 11 Jan 2010, 6:07 p.m.,*
in response to message #1 by Silvio A. Bensi

What you are seeing sort of makes sense to me. In ALG mode, the only key that really does something is ENTER. All of the other keys are simply used to append something to the string that the calculator is building at the time.

In RPN mode, almost every key is an operation, even numeric keys have to see if pressing them should lift the stack or append to the current x register. So there is probably syntax checking with every key press. But, they should have implemented a better key buffer in the RPN mode than exists now. Other problems can probably be attributed to this as well.

Not sure why the factorial is faster (I have tried it as well). But I also tried a comination nCr(2500,200) which seemed to run about the same speed on both...

Very Interesting

Quite plausible. Also, I suspect that people are not seeing dropped keystrokes in RPN mode on the 33s because it's quite a bit faster than the 35s, and it would require superhuman typing speed to trigger that behavior.

Re: HP-35s: Better in ALG mode?

*Message #35 Posted by **Patrick Rendulic** on 14 Jan 2010, 1:12 a.m.,*
in response to message #34 by Ivan Nejgebauer

Oh yes, the dropped keystrokes ... .

My 35s still drops them. For sure, because several times a year I retrieve it from my drawer to see whether it cured itself. Then after a minute or so, it disappears again.

I cannot use this piece of CRAP, because it would interfere with my work. That's why I still use the 32sii.

HP, when are you going to step selling those faulty units?

Re: HP-35s: Better in ALG mode?

*Message #36 Posted by **Norman Dziedzic** on 12 Jan 2010, 8:38 a.m.,*
in response to message #33 by Norman Dziedzic

Silvio,

I noticed that if I take the calculator out of the clamshell case and put it on a hard surface, that I get much

better results for your test.

I also did a multiplication test and it was almost 100% (Fill the stack with 2's and then hit multiply (X) 10 times. This was 100% when I was on the hard surface.

Maybe this is a combination of hardware/software messing things up here. The + key is way down in the corner. Maybe there is something mechanical not quite right?

Re: HP-35s: Better in ALG mode?

I can attest to that. I have two 35s samples and one of them has an incosistent audible and tactile response on the upper left part of the keyboard, especially the R/S key, which feels and sounds more like the stiffest of the four arrow keys. No operational side effects though (yet).

Re: HP-35s: Better in ALG mode?

*Message #38 Posted by **Sílvio A. Bensi** on 12 Jan 2010, 10:10 p.m.,*
in response to message #36 by Norman Dziedzic

Norman

I made other tests and I am convinced that it is a software matter, although I am sure that the keys sometimes (though rarely) fail. I tried again the sequencial multiplication test. With calculator in hands and pressing keys alternating both thumbs the machine failed 5 times in 5 in RPN mode and 0 in 5 in ALG mode. With calculator on a table and using only the index finger, the calculator failed 2 times in 5 in RPN mode and 0 in 5 in ALG mode. Under the same testing, the 50g never failed. I also experimented many sequences of multiplications with 3-digit ramdom numbers and then there was no significant difference between ALG and RPN mode. The machine failed just 1 or 2 times in 10, in both modes. Conclusion: I can not use 2 or 3 fingers to make calculations in RPN mode, specially when 1-digit numbers are involved :(

HP 35s keyboard weirdness

*Message #1 Posted by **Hiawatha Wheelwright** on 10 Jan 2010, 10:30 p.m.*

I am a new owner of an HP-35s. I've skimmed over the list of known bugs, and believe I may have a bit more info on one of them.

There have been a handful of times when I have entered a calculation without looking at the screen, only to see a result that was egregiously large and obviously wrong. I assumed that this was the result of the known "dropped keystroke" bug, where occasional binary operations would be missed by the calculator.

But it just happened again and this time I saw what happened. I had entered a single digit, pressed +/- to change the sign, and then pressed the multiply key. The multiplication was not performed, and after a noticeable delay (maybe a bit less than one second) the digit "4" appeared next to the existing number.

ie

```
x-register display          keystroke
32                             2
2  (32 now in Y)              +/-
-2                             *
-24  (32 still in Y)
```

At this point, entering another digit bumped the -24 up into Y and the 32 into Z. Has anyone come across anything like this? Seems like very odd behaviour but I will certainly be keeping an eye open to see how this manifests again in the future. I am currently theorizing that the binary keys in the right column will under some circumstances be processed as the corresponding digit in the second column, but the fact that the next digit did a preceding push doesn't quite fit that. Almost as if the * got processed as a 4 followed by some sort of no-op.

*Message #3 Posted by **David Hayden** on 11 Jan 2010, 6:41 a.m.,*
in response to message #1 by Hiawatha Wheelwright

To track this down and make it reproducible, I'd try focusing on the delay. Does the 35s do garbage collection? Based on the tiny amount I know about it, I'd suspect not, but who knows.

Or maybe something wacky in the keyboard software.

Re: HP 35s keyboard weirdness

*Message #4 Posted by **John B. Smitherman** on 11 Jan 2010, 9:26 a.m.,*
in response to message #1 by Hiawatha Wheelwright

Hi Hiawatha. I believe that others have experienced erratic behavior from the 35s as discussed here:

this thread

I'm hoping that HP finds the resources to tweak the 35s someday.

Regards,

John

Re: HP 35s keyboard weirdness

*Message #5 Posted by **Eddie W. Shore** on 11 Jan 2010, 9:43 a.m.,*
in response to message #1 by Hiawatha Wheelwright

I followed the steps presented and I got the correct answer of -64. Was there a keystroke after the 32?

Re: HP 35s keyboard weirdness

*Message #6 Posted by **Hiawatha Wheelwright** on 12 Jan 2010, 12:12 a.m.,*
in response to message #5 by Eddie W. Shore

Just to add to the list: Today during a couple of calculations, I got some dropped digits. ie, I'd hit a numeral, get a keyclick, yet the digit didn't show up in the display. Second time would be fine.

Re: HP 35s keyboard weirdness

*Message #7 Posted by **Bart (UK)** on 12 Jan 2010, 5:02 a.m.,*
in response to message #6 by Hiawatha Wheelwright

That could be due to the lack of a keyboard buffer. However, I have not yet been able to reproduce the error you listed in the first post yet.

Mysterious HP-19C power-on behavior

*Message #1 Posted by **Michael Meyer** on 10 Jan 2010, 9:43 p.m.*

I have two HP-19C's that have the exact same strange behavior. I've had trouble with the batteries on both, or so I thought. I will get them working, then a few days later, they don't turn on. I didn't realize until today that I didn't need to "fiddle around" with the battery packs. After a few minutes of removing them, adjusting the cells, etc., they would finally turn on.

Today, I just spent time turning the power switch on and off. After a few minutes, and some intermittent powering up, they both power up reliably.

Any idea what component has begun to fail in both? I assume it's a capacitor. Has anyone else had observed this strange behavior?

Re: Mysterious HP-19C power-on behavior

*Message #2 Posted by **Michael de Estrada** on 10 Jan 2010, 9:54 p.m.,*
in response to message #1 by Michael Meyer

Have you cleaned the power switch contacts?

Re: Mysterious HP-19C power-on behavior

*Message #3 Posted by **Michael Meyer** on 10 Jan 2010, 10:18 p.m.,*
in response to message #2 by Michael de Estrada

Once they're on, the switches seem quite reliable. I can sure try. The keyboards are heat-staked, so it could be a challenge...

Re: Mysterious HP-19C power-on behavior

*Message #4 Posted by **Michael de Estrada** on 10 Jan 2010, 11:34 p.m.,*
in response to message #3 by Michael Meyer

Oh, so it uses the same keyboard design as the Woodstocks? I've never opened mine, so I didn't know, and just asumed that the contacts could be accessed w/o tearing the keyboard apart. I have found similar behavior on other calcs with dirty power switch contacts. It's like a milli-volt drop test - the current eventually overcomes the high contact resistance and closes the circuit.

Re: Mysterious HP-19C power-on behavior

*Message #5 Posted by **Katie Wasserman** on 11 Jan 2010, 12:12 a.m.,*
in response to message #3 by Michael Meyer

I haven't taken my 19C's apart in a while (I have 2 also). But I think you might be able to drip a bit of DeoxIT into the switch contact area from the back of the heat-staked keypad. I've done this a few times with woodstocks that have the same problem and it's worked well.

-Katie

Re: Mysterious HP-19C power-on behavior

*Message #6 Posted by **Michael Meyer** on 11 Jan 2010, 1:11 a.m.,*
in response to message #5 by Katie Wasserman

Hi Katie! That's exactly what I did tonight. Both calcs are turning on fine now, as expected. I'll let you know their behaviors in a couple of days. The stuff seeps through to the front, so I'll have to repolish them also to get the switches looking right again.

Still showing same behavior!!!! Any other ideas?

*Message #7 Posted by **Michael Meyer** on 11 Jan 2010, 11:29 p.m.,*
in response to message #6 by Michael Meyer

Thanks Michael and Katie. Both calculators still show the exact same behavior... taking many attempts to finally turn on, then turning on flawlessly after that!!!!

Any other thoughts??

Re: Still showing same behavior!!!! Any other ideas?

*Message #8 Posted by **Michael de Estrada** on 11 Jan 2010, 11:57 p.m.,*
in response to message #7 by Michael Meyer

Do you have a regulated DC power supply you can connect directly to the battery contacts? I've gotten weird behavior with some of my battery packs that did not seem to make consistent contact. Worth a try. Also, is continuous memory being retained? I assume you are getting no display in either program or run mode. Finally, try placing the printer in manual mode before you switch it on. As soon as you switch it on, even though you get no display, hit PRX, and see if there is any printer activity.

HP-35 and HP-80: Flashing display differences?

*Message #1 Posted by **Mark Henderson** on 10 Jan 2010, 4:40 p.m.*

The HP-80 has a (charming) behavior of flashing digits on the display briefly when calculating, for example, SQRTx, much like a programmable Classic while running a program. The HP-35 (and other Classics) don't do this for pre-programmed functions).

Since the HP-80 and HP-35 were basically the same electronics (HP-80 with more ROMs), does anyone know why the different behavior? Seems to me SQRTx (et al) would be implemented the same way on both?

Re: HP-35 and HP-80: Flashing display differences?

*Message #2 Posted by **tim m.** on 10 Jan 2010, 5:08 p.m.,*
in response to message #1 by Mark Henderson

I'm presuming that the ROM implementations are different in each calculator, resulting in the distinct behaviors.

-Tim

Re: HP-35 and HP-80: Flashing display differences?

*Message #3 Posted by **Mark Henderson** on 11 Jan 2010, 10:09 a.m.,*
in response to message #2 by tim m.

Certainly there are differences, I'm interested in why this behavior in the HP-80 (flashing the display) when it isn't present in other Classics, particularly it's closest neighbors (HP-35, HP-45).

Re: HP-35 and HP-80: Flashing display differences?

*Message #4 Posted by **Eric Smith** on 11 Jan 2010, 1:49 p.m.,*
in response to message #3 by Mark Henderson

As Tim said, the difference is in the ROM code. If you want to know *why* the ROM code is different, I suppose you'd have to track down the engineers that wrote it and ask them.

MLDL2000 Manager software: new BETA version

*Message #1 Posted by **Meindert Kuipers** on 10 Jan 2010, 7:19 a.m.*

I have just published a new BETA version of the M2kM software. It can be downloaded from my website .

The disassembler is completely changed internally, and the listing allows for much more customization. Apart from the disassembler there are no other changes in M2kM (I hope). As this is still a BETA version, please give me you feedback about the disassembler. Be aware that the disassembler also works if you do not have an MLDL2000.

The one thing I have to add to the disassembler is full SDK41 compatible disassembly, that will be part of the final release.

Meindert

Re: MLDL2000 Manager software: new BETA version

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 10 Jan 2010, 8:07 a.m.,*
in response to message #1 by Meindert Kuipers

Thanks, Meindert;

will give it a try and let you know ASAP.

In time: many of the original X-Functions do not work in the MLDL2000 'emulation': ALENG works but ANUM, ATOX works but AROT... I have a complete Work/NoWork list, and I did not include the ones dealing with X-Memory, of course. Is it possible that Page #3 has some kind of hardware disabling in the HP41C/CV scheme? Or should some of the 'unreported' X-Memory areas exist and are used as scratch pad for these functions? Do you happen to know something about it?

Cheers.

Luiz (Brazil)

(so far, MLDL2018A is working flawlessly...)

Re: MLDL2000 Manager software: new BETA version

*Message #3 Posted by **Meindert Kuipers** on 10 Jan 2010, 8:41 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Luiz,

I suspect that this is due to the CX bankswitching, which is somewhat different from the external ports. The MLDL2000 switches the banks in pairs, so bank 2 and 3 are switched together, and 4 and 5. I would first try to fill all banks of a page with the same contents, and then try again, let me know if this works (or not) and what the offending functions are.

Meindert

Re: MLDL2000 Manager software: new BETA version

*Message #4 Posted by **Meindert Kuipers** on 10 Jan 2010, 12:15 p.m.,*
in response to message #3 by Meindert Kuipers

Luiz,

I have checked the pages for the HP41CX: Bank 2 of Page 3 (CX XFuncftions ROM) maps to Bank 2 of Page 5, and that is not done in the MLDL2000. Keep a copy of Page 5, Bank 2 also in Page 3, Bank2. My documentation states that bankswitching is not supported in pages <6, but looking at my code it should work in exactly the same way as the bankswitching in the higher ports.

Good luck with further testing!

Meindert

Re: MLDL2000 Manager software: new BETA version

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 10 Jan 2010, 3:06 p.m.,*
in response to message #4 by Meindert Kuipers

Hi, Meindert;

Sorry, I did not notice you wrote a complementary message! I read Monty´s follow-up and wrote him an answer. Based on what you observed, my conclusions were wrong and the problem seems easier to be solved. I will test your configuration and post results later

Imagine hacking the HP41 O.S... What about adding Angel´s complex features and HEPAX functionality altogether in the first pages, as part of the system? If the OS can be rewritten with the use of bank switching, chances are that it would fit in the first page alone. Well, if the guys who wrote the O.S. did not write it so, chances are that it is not actually a good idea, though.

So much for the dreaming, let me get back to my teacher activities (have not concluded the end-of-semester paperwork yet... It sucks big time!)

Cheers.

Luiz (Brazil)

Re: MLDL2000 Manager software: new BETA version

*Message #6 Posted by **Monte Dalrymple** on 10 Jan 2010, 12:05 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

It may have something to do with the fact the the C/CV mainframe
ROMs start searching for functions in Page 4, completely
ignoring Page 3?

Monte

Re: MLDL2000 Manager software: new BETA version

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 10 Jan 2010, 2:50 p.m.,*
in response to message #6 by Monte Dalrymple

Hi, Monte;

once I loaded pages 0, 1 and 2 of the CX mainframe in a CV mainboard through MLDL2000, I considered that the O.S. reads page #3 as it addresses it through the system software. Fact is when I first used MLDL2000 (some years ago) I loaded page #3 of some CV units (coco- and halfnut) with some different ROM images. These ROM list their contents with CAT 2 (hence the system 'sees' it) but once you try to execute anything there you get NONEXISTENT.

When I loaded the CX ROM set (few weeks ago) in the MLDL2000 and powered a coconut CV without the ROM IC´s with it, it behaves accordingly, as a CX, except that the time functions return blank display and X-memory functions either return file-not-found errors, as expected, or no reaction at all (EMDIR, for example, always returns [124.0000] to the X-register and no message at all, like [DIR EMPTY]). Many features, like program size in CAT1, ROM headings in CAT 2 and the fully-operating CAT 6, were observed.

When I decided to test the extended functions that might work, the following ones did not work at all:

```
ANUM
AROT
CLKEYS
CLRGX    (CX only, right?)
GETKEY
PASN
PCPLPS
POSA
PSIZE
STOFLAG
X...NN   (none of these)
```

These ones worked fone:

```
ALENG
ATOX
SIZE?
RCLFLAG
REGMOVE
REGSWAP
X<>F
XTOA
SigmaREG?  (also a CX-only, and works!)
```

I could see no pattern that might connect each of the working (or the nonworking) functions with each other. The only thing I could think of is the use of RAM scratch area that was not there. You see, I never accepted too well the concept of X-Memory discontinuity as physical, I aways took it as existing RAM area for system scratch in some X-Function/Memory 'maneuvers'. I'd gladly accept any other concise explanation, though.

This is all I can remember now. I did not have the time to test the emulation in an actual CX mainboard this weekend, will do it in the days ahead. I am trying to repair a faulty one for ages (I actually have it waiting for an actual definitive go-nogo repair procedure), and will soon post about the results here.

Cheers.

Luiz (Brazil)

Edited: 10 Jan 2010, 2:57 p.m.

Re: MLDL2000 Manager software: new BETA version

*Message #8 Posted by **Monte Dalrymple** on 10 Jan 2010, 10:38 p.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Luiz,

As to your first question, the CAT function searches everything from Page 3 on, but the XEQ function starts at page 4 (C/CV). This is why a Page 3 function shows up but can't be executed.

I ran into this issue when writing functions for my new design and it took me a while, watching a trace, to figure out the problem. I ended up having to map my new functions into Page 7 at startup.

As far as the CX X functiuons, everything shows up in the CAT because the function entries are all in Page 3. However, most of the functions jump fairly quickly to an address in Page 5, after switching to Bank 2. So, if the bank switching isn't done correctly the code will end up in neverland. That's why most of your CX X functions aren't working. The ones that do work remain in Page 3. For proper operation, the bank select for Page 5 must be updated while executing in either Page 3 or Page 5, but only Page 5 actually has multiple banks.

The CAT function is only capable of searching Bank 1, and that is why it has to be done this way.

Hope that clarifies things,
MOnte

Re: MLDL2000 Manager software: new BETA version

*Message #9 Posted by **Meindert Kuipers** on 11 Jan 2010, 5:55 a.m.,*
in response to message #8 by Monte Dalrymple

Monte is totally correct here. Luiz, I do not expect the MLDL2000 to work in this configuration. Remember, it always switches the odd and even banks. That means that bank 2 of Page 2 must also have valid contents (system ROM 2) when ENBANK is executed in Page 3 as Page 2 will also be switched.

In the case of the 41CX, bank 5 is also switched when ENBANK is executed while in Page 3, and the MLDL2000 will fail to do this. New firmware is required to implement and it is not very difficult, but I have no time to do that this week (travelling again).

Meindert

Re: MLDL2000 Manager software: new BETA version

*Message #10 Posted by **Monte Dalrymple** on 12 Jan 2010, 10:34 p.m.,*
in response to message #8 by Monte Dalrymple

Luiz,

And I just noticed that the last CX OS code (Rev NFL) jumps directly into Page 3 in several spots. Clearly the authors needed more space than was available in Pages 0-2. This means that the CX X functions must be available in Page 3 or "bad things" will likely happen.

Monte

Re: MLDL2000 Manager software: new BETA version

*Message #11 Posted by **Ángel Martin** on 12 Jan 2010, 9:59 a.m.,*
in response to message #1 by Meindert Kuipers

Greetings Meindert - I just downloaded the newer code and will take it for a spin in a couple of days - feedback will come then.

Thanks for keeping the 41-flame on!

48G keyboard weirdness

*Message #1 Posted by **Lincoln** on 8 Jan 2010, 5:50 p.m.*

Hi, Got a 48G on eBay recently. Worked fine for a little while, but now the enter key is flaky, and in a strange way. Sometimes it won't work at all, sometimes it works, and a lot of times it will work if I keep it pressed down for anywhere between 1 and 10 seconds. Unfortunately, most of the time that it works it will count as multiple presses, usually two.

Any hints?

Re: 48G keyboard weirdness

*Message #2 Posted by **Han** on 8 Jan 2010, 7:17 p.m.,*
in response to message #1 by Lincoln

Does pressing down on the bezel between the screen and the first row of menu keys help? If so, you may simply have an air-gap between the PCB and the keyboard connectors.

Re: 48G keyboard weirdness

*Message #3 Posted by **Lincoln** on 8 Jan 2010, 7:44 p.m.,*
in response to message #2 by Han

I tried that and it doesn't seem to make any difference. It's the occasional delayed activation that confuses me.

Re: 48G keyboard weirdness

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 9 Jan 2010, 8:17 a.m.,*
in response to message #3 by Lincoln

Hi, Lincoln;

because the key has a 'motion irregularity', it seems to me it is a mechanical problem. The delayed activation may also be related to this as well.

Anyway, to remove any chance of software causes, can you save all of your data and clear calculator memory? You can also hardware reset the calculator by using the small hole in the back of it. Then you can try the key again and see what happens.

Not too much of a help, I know...

Success!

Luiz (Brazil)

in response to message #4 by Ángel Martin

> Quote:
>
> so much for self-explamatory, intuitively obvious software... which is what I'd sworn it was :(

Hi, Ángel;

I cannot help telling you that there is no such thing as 'intuitively obvious software'... After studying semiotics I got to the conclusion that everything is obvious once known. As you created the MMI (Man-Machine Interface), it is obvious for you, of course! And it will be for all of us... once we get to know it! 8^)

I remember struggling to understand ISG/DSE and flags for the first time in my life after buying an HP41 in the 80's. I was a regular engineering student in an university with only one computer to serve its own needs. We had to program in FORTRAN with punched cards and wait for about a week to have the results (or to see the list of errors) of our code. Suddenly I had an alphanumeric display (easy) with keystroke programming (easy), subroutines (easy), indirect addressing (easy) flags (what are those for?) and loop control through ISG and DSE (What?!!??).

Took me almost a week to figure the whole calculator out, with no help at all, just reading the manual (it was in English and I was not so proficient as I am today...). And I remember the HP survey about the learning curve:

```
How long did it take for you to master the HP41?
```

And the last option was

```
More than eight hours
```

I felt embarrassed with myself... Now I teach people how to use these features and how they work.

So please, do not blame yourself. Allow us to get in touch with your thoughts first by reading the manual. THEN... we´ll talk about this again 8^D

Cheers.

Luiz (Brazil)

Re: New 41Z Manual available at last

*Message #8 Posted by **Ángel Martin** on 9 Jan 2010, 3:54 a.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Hi Luiz, it's interesting how our computer education went paralell ways: I too suffered the FORTRAN punched-card days, and also learned the 41 from a second language (hard to recall now but sure it was).

The good news is that the 41Z doesn't add radical new concepts to the 41 OS, it just extends them (ok, I'll admit it stretches them a bit, perhaps) but following the same game rules (when applicable).

Once you read the complex stack section and get the knack of the complex keyboard it should be crystal clear (famous last words).

That said, go ahead and send the feedback back to me, criticism included - this is for all us to enjoy, no worries to hurt any feelings.

Best wishes, AM

HP-41 turn-on behavior

*Message #1 Posted by **Paolo Cipollone** on 8 Jan 2010, 6:01 a.m.*

Hi all,

my first post here, though I have been visiting the museum for years. I recently got a non-working 41 and, after dealing with the broken posts and zebra contacts issues, the calc is working like new. Anyhow now and then, after sitting unused for a while, the first press of the 'on' button will not wake up the machine. On a second attempt it will usually come up alive, and from then on every subsequent on/off cycle will perform flawlessly, even with very light pressure.

Any hint? Thanks, Paolo

Re: HP-41 turn-on behavior

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 8 Jan 2010, 12:31 p.m.,*
in response to message #1 by Paolo Cipollone

Ciao, Paolo;

can you identify which model you have? A CV or a CX, coconut or halfnut?

Thanks.

Luiz (Brazil)

Re: HP-41 turn-on behavior

*Message #3 Posted by **Paolo Cipollone** on 8 Jan 2010, 1:00 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz,

sorry for not clarifying. It is a fullnut 41CV.

Paolo

Re: HP-41 turn-on behavior

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 8 Jan 2010, 7:26 p.m.,*
in response to message #3 by Paolo Cipollone

Paolo;

the main reason I asked about the internal structure is that the fullnut (or coconut) may suffer from bad contact. The keyboard and LCD assembly are connected to the mainboard through a series of contacts provided by a zebra connector (I know of two different types) or a conductive polymer. In any case, if one of (or a group of) the contacts fail, the calculator does not turn on. In some cases, [MEMORY LOST] may occur.

If, at the first press of the [ON] key the 'supposed' faulty contact is established, then in the second press the calculator will turn on and will react to the [ON]-key pressing for as long as it happens briefly. If it rests for a while, chances are that the contact fails again.

These are just considerations based on the fact that the calculator is a fullnut and it has been serviced. I'd search for cracks in post or, mostly, in the receded area around the hole for the top, longer screws. This area cracks easily, and chances are that they really break if the screw is forced too much. I 'sense' the pressure over the case with my fingers, but it is a bit hard to explain. I'll add some pictures later and try to use words and images, maybe I'll succeed.

Not too much of help, but it seems to me it is not hard to repair.

Success!

Luiz (Brazil)

Re: HP-41 turn-on behavior

*Message #5 Posted by **Paolo Cipollone** on 9 Jan 2010, 4:59 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Hi Luis,

and thanks a lot for your interest (and thanks to Bruce, too.) The zebra contact issue was solved in a 'definitive' way, that is with wires soldered between the keyboard and the mainboard, and that was done by a pro. I know this could be questionable by 'collector' standards :), but I feel the calc is way better than new right now, at least from that point of view. Bad contact could still be there in the part under the display, though. Anyway, there is no sign of malfunction even by (lightly) twisting the calc or pressing in different areas. Bruce was asking about programs etc., but no, often the symptom has arised after a 'on+backarrow' procedure. The one thing I didn't try yet is leaving the batteries out for enough time as to provoke a 'memory lost', a real cold restart. In what would this differ from an 'on+backarrow' sequence?

Again, thank you very much, Paolo

Re: HP-41 turn-on behavior

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 9 Jan 2010, 6:46 a.m.,*
in response to message #5 by Paolo Cipollone

Ciao, Paolo;

the 'system' memory loss depends on existing system regular operation. In some circumstances, [ON]/[backspace] is disregarded and the calculator does not clear its own memory.

I prefer the 'hardware' memory loss, because it gives you the closest factory condition. In terms of final memory contents (RAM), once you see [MEMORY LOST] I cannot think of any differences between both, though.

When needed, I open the calculator and short the terminals of the two 'big' electrolytic capacitors in the mainboard. I cannot tell you which one first, but I choose the bigger one first (IIRC, this is the one with the power line). A few days ago I found myself in one particular case: a halfnut simply locked itself inside its own and lost the keys... The display froze with [0.0000] with no visible cause and stayed like like this, no reaction.I removed the batteries for a while, put them back, turned the calculator back ON and nothing changed. I tried the [ON]/[backspace] and nothing. No response at all.

It worried me a lot because it was a halfnut, and they are not serviceable the way the coconuts are. Then I opened opened the calculator and shorted the only two electrolytic capacitors it has. Working fine after about a week or so.

I also have one HP41Cx (halfnut) that has a troubled [4] key. It fails to work when pressed by the first times, but once it starts working flawlessly it stays like this until the calculator rests for a while. Like if there is some kind of dirty stuff that moves away when pushed (a gel?) but gets back when left untouched. Does it exist or it is just my pride trying to solve a mystery? :^(

Hope this helps a little bit...

*Message #7 Posted by **Paolo Cipollone** on 9 Jan 2010, 8:13 a.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Ciao Luiz,

seems like your '4' key has something resembling my 'on' key... Anyhow, I just took the batteries out of the 41. I'll wait till reinserting them produces a 'Memory lost' and let you know what happens after that.

Thanks, Paolo

Re: HP-41 turn-on behavior

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 9 Jan 2010, 8:24 a.m.,*
in response to message #7 by Paolo Cipollone

Paolo;

wait for a few days, maybe a week, OK? The power consumption for the HP41 is so small that it takes a while till the capacitors go bellow the minimum operating voltage. That´s why I go straight discharging the capacitors...

Cheers.

Luiz (Brazil)

in response to message #10 by Aldo Luis Molinari

Aldo,

The best source I know of most reliable card readers (HP-82104A) for HP-41C/CV/CX is from a guy called Richard Anthony, in the US. He repaired/serviced all my card readers, and they work brilliantly. He's on eBay with the id of 'plasmoid'. He doesn't always have a card reader on sale, but drop him a line with what you want (from an active eBay item), and he will most likely be able to procure it. Considering the quality, his prices are very reasonable.

Regards,

Philippe

Any programs in the calculator? Any timers active?

I used to prank my friends by putting in an "OFF" program and have it run after midnight. Drove them crazy the next morning. ;)

Doesn't sound like your situation, but I thought I'd offer.

thanks, bruce

Re: HP-41 turn-on behavior

*Message #14 Posted by **Paolo Cipollone** on 11 Jan 2010, 6:45 a.m.,*
in response to message #13 by Bruce Bergman

Well, I left the batteries out for about 12 hours and got my 'memory lost'. After that the probblem is still there. I discovered that the amount of time needed to get the 'false start' is completely random. Sometimes it will sit for hours and restart promptly (even with *very* light pressure of the 'on' key), sometimes, thirty seconds after an on/off cycle it will need two 'on' key presses. It is definitely a very insignificant 'problem', but I still wonder what may cause it.

Thanks, Paolo

Opening HP41C

*Message #1 Posted by **Alberto Fenini** on 7 Jan 2010, 4:17 p.m.*

Hi all, I'd like to clean and repair my newly arrived HP41C, particulary the Enter key, that is firm on the left side, but is weak on the right side of the button. I tried to open the unit, but it looked to me the keyboard unit is much like the woodstock one, soldered and tied together. Is there any way of disassembly the keyboard and get access to the underneath surface ? Thank you very much for help, Alberto

Re: Opening HP41C

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 7 Jan 2010, 5:29 p.m.,*
in response to message #1 by Alberto Fenini

Ciao, Alberto;

as you mentioned, the keyboard is locked in place by melting plastic posts. The only way I know is to cut the borders of each one. I am trying small screws, like the ones used in glasses, to fix the keyboard in place after removing. Will talk about this later and add some pics, now I have to leave...

Cheers.

Luiz (Brazil)

Re: Opening HP41C

*Message #3 Posted by **John Robinson** on 8 Jan 2010, 3:12 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

I have successfully disassembled the 41 keyboard by "popping" off the top of the heatstakes with a small screw driver. The plastic that comes off is kinda donut shaped. By doing this instead of shearing off the whole top of the heatstake with a knife, the centre of the heatstake remains. To reassemble, I use "hot" glue, while maintaining pressure on the keyboard from behind.

I actually squish down the glue with my finger (after licking it first) to set the glue quicker and force a little more around the heatstake.

I have done this on five or six 41 calcs now and it works a treat !!

Cheers, John

Simulate "load" (or whatever) of batteries in classics hooked to chargers?

*Message #1 Posted by **Paul Brogger** on 7 Jan 2010, 11:34 a.m.*

Here's a question that's probably been asked before . . .

I'm not wanting to keep NiCds in my LED H-P's. I actually use them so infrequently, they just go bad on me. Besides, it's considered bad practice to keep batts in collectibles.

However, I *would* like to fire 'em up at a moment's notice to show 'em off.

Buuut, I've heard numerous times not to run (most? all?) H-P's on wall power without the batteries in place.

Soooo . . . Is there a way to fake the charging circuit into 'thinking' there *are* batteries installed, while running on wall power? (Some sort of r/c circuit in place of the batteries?)

It'd sure be cool to be able to flick a power strip switch and have the half-dozen LED calcs (in my little book shelf display) light up all at once!

Edited: 7 Jan 2010, 11:40 a.m.

Re: Simulate "load" (or whatever) of batteries in classics hooked to chargers?

*Message #2 Posted by **Maximilian Hohmann** on 7 Jan 2010, 11:56 a.m.,*
in response to message #1 by Paul Brogger

Hi!

The easiest and safest way would be to modify the charger in a way that it outputs only 2.5 Volts. This can be achieved with a Zener diode and a resistor. But if I had to do this, I would use the power cord of the HP calculator and connect it to a dedicated, regulated power supply set for 2.5V.

As I have several calcultors from the '20 series, the only ones that you really can kill by connecting the charger without the battery in place, I keep one functional battery pack (always externally charged!) that I use with one calculator at a time.

Greetings, Max

Re: Simulate "load" (or whatever) of batteries in classics hooked to chargers?

*Message #3 Posted by **Mark Henderson** on 7 Jan 2010, 1:06 p.m.,*
in response to message #2 by Maximilian Hohmann

It seems to be a common misconception that you shouldn't run Classics from the AC adapter without a battery inserted - from the schematics (available here on MoHPC) it is 100% clear that the battery is DISCONNECTED from the calc when you plug in the adapter - so there is absolutely no issue in leaving

the battery out.

Caveat - the HP-65 and HP-67 require a good battery in place to provide the start-up current for the card reader motor.

Later series calcs (like the Woodstocks) absolutely DO require a good battery in place to avoid damage.

Also, the Classics run on 3x NiCd cells so nominally 3.6V, not 2.5V as above.... 2.5V is probably referring to Woodstocks and later 2 cell calcs....

> Quote:
>
> 2.5V is probably referring to Woodstocks and later 2 cell calcs....

Yes, of course. But I think I wrote somewhere that only the '20 series calculators (Woodstocks as you call them) really have this kind of problem.

Re: Simulate "load" (or whatever) of batteries in classics hooked to chargers?

*Message #5 Posted by **Paul Brogger** on 7 Jan 2010, 1:44 p.m.,*
in response to message #3 by Mark Henderson

I used the word "classics" perhaps too loosely. I meant "H-P LED models". I'm talking specifically of: an HP-45, HP-67 & 97, HP-21, HP-31E and 34C.

Is there something that might be installed in place of batteries to simulate whatever is required for safe charger-connected operation?

(Alternatively, if I just connected the appropriate DC supply voltage to each unit's battery connections, and left the chargers out of the picture, would that work?)

Re: Simulate "load" (or whatever) of batteries in classics hooked to chargers?

> Quote:
>
> Alternatively, if I just connected the appropriate DC supply voltage to each unit's battery connections, and left the chargers out of the picture, would that work?

Of course! But be very careful, the polarity of the battery connectors is not marked very visibly, especially in Woodstocks!

Re: Simulate "load" (or whatever) of batteries in classics hooked to chargers?

in response to message #3 by Mark Henderson

> Quote:

> Caveat - the HP-65 and HP-67 require a good battery in place to provide the start-up current for the card reader motor.

According to Randy, you may actually damage the card reader circuitry, even if you don't operate the card reader, if you operate the calculator from the AC adapter without a battery pack installed. This is because the card reader circuit is connected directly to the battery terminals, and sees the 17vdc output from the charging side of the AC adapter. I simply connect a regulated DC power supply (3.75vdc) to the battery terminals when I use my HP 65/67.

Re: Simulate "load" (or whatever) of batteries in classics hooked to chargers?

*Message #8 Posted by **Katie Wasserman** on 7 Jan 2010, 3:07 p.m.,*
in response to message #1 by Paul Brogger

I keep batteries in all the calculators in my collection so that I can "fire 'em up at moment's notice". My solution to the battery self-discharge and leakage/corrision issue was to use AA or AAA Energizer lithium cells.

My HP's classic calculators with AA nicad battery packs now have battery packs that use made out of AAA plastic battery holders modified to match the contact positions in the calculator battery compartment. The same is true for the Topcats. The Woodsock and Spice calculators make it easy change to lithium cells. All the non-HP calculators in my collect have had similar changes to accommodate Energizer lithium cells.

I've seen no ill effects from making these changes to over 200 calculators after several years.

You could use actual battery cells like the Sanyo low self discharge Nimh cells if you rebuild the battery packs. They do retain their charge for a year. I have them in the HP50s now. Sam

Re: Simulate "load" (or whatever) of batteries in classics hooked to chargers?

*Message #12 Posted by **John Robinson** on 8 Jan 2010, 3:19 a.m.,*
in response to message #11 by Katie Wasserman

The low discharge rate batteries from Sanyo are called "eneloop". There are other similar cells from other manufacturers too. These cells are supposed to keep 80% of charge after a year when not in use. The only downside is the maximum mAh I have found for these so far is 2000mAh where as "normal" NiMH cells can be up to 2500 mAh these days, maybe more.

As far as I know these are only available in AA size, I have not seen any other sizes.

Cheers, John

Wow. According to my calculations, you have more invested in lithium cells alone than I have in all my calculators and peripherals! And my wife thinks I have expensive hobbies.

Re: Simulate "load" (or whatever) of batteries in classics hooked to chargers?

*Message #14 Posted by **Michael Meyer** on 8 Jan 2010, 10:39 a.m.,*
in response to message #13 by Martin Pinckney

I guess that does add up. I've put them in most of my calculators. Fortunately, many only take two (Woodstocks), and some take 4 (Stings). I've found 8 packs of batteries for about 14 USD with coupons. That's about $1.75 per cell. At an average of 3 per calculator, and maybe 40 in my collection with these cells is $210.

I think NiMH cells aren't that much cheaper, though old NiCd packs for cordless phones are easily found in drug stores on clearance for $1. That's how I re-celled all my TI's, though those packs are now going on 10 years old already. I, too, like being able to "fire up" any calculator I pick up without messing with chargers and charging...

I still like Katie's approach. Lithium cells have at least a 15-year life, and I'll bet more... I still have some from 10 years ago showing full strength. But, with Katie hopefully living a long and healthy life, she just might have to re-cell them all once or twice...

Re: Simulate "load" (or whatever) of batteries in classics hooked to chargers?

*Message #15 Posted by **Eric Smith** on 9 Jan 2010, 12:16 p.m.,*
in response to message #1 by Paul Brogger

My inclination would be to put a 1N4728A zener diode across the battery terminals. This should limit the voltage to 3.3V. That will still allow the NiCD batteries to charge properly, but when a charger is connected without batteries, the zener will limit the voltage and the zener and the existing series resistor will dissipate the excess.

I'd rather use a 2.8V-3.0V zener, but I can't find any in axial lead packages with suitable current ratings. I'm fairly certain that limiting the voltage to 3.3V would be sufficient to protect the chips. I haven't tested it,

though.

classic chassis with a crack

*Message #1 Posted by **Alberto Fenini** on 6 Jan 2010, 5:18 p.m.*

Hello everybody, while restoring one of my pieces, an HP70, the chassis has shown a crack.
I was actually trying to complete disassemble the unit in order to polish the keyboard and to restor the trim line.
For the Murphy law, a task done several ways on very common units, or duplicate units, has not worked on the one I care more about ....
I have read, can't remember where, that there is a liquid that can close thin cracks making them almost invisible.
Does anyone remember the name of this thing ?
Thanks for help, Alberto

My HP 35s keyboard improvements

*Message #1 Posted by **kiril t** on 6 Jan 2010, 1:13 p.m.*

I love the new HP 35s and would make a couple of minor changes to the keyboard. I think these changes make an already fantastic product even better. (The original unmodified image is from hpcalc.org)

In this picture I have replaced the left-shift and right-shift keys with a modern take on 'f' and 'g'. I believe this change is an improvement given the key label placements, which are above and below the primary labels; not to the left or right of them.

The +/- key has been replaced with CHS which I prefer for aesthetic, logic, and consistency reasons. I consider it more correct.

Although I would like to repaint the keys on my 35s, I'm not certain just how to go about it.

For the yellow and blue backgrounds on the 'f' and 'g' keys, I'm considering using enamel paint and letraset rub-on letters. I am not certain how to do the CHS key, although I have a few ideas in mind.

I'm new to the HP world and to this forum - are there people who do this sort of repair or customization work on calculator keys, and have these proposed changes already been discussed somewhere? If there is a custom shop I could send my calculator to in order to have these changes done professionally, I would do so.

Many thanks!

Edited: 6 Jan 2010, 3:09 p.m.

*Message #2 Posted by **Glenn Shields** on 6 Jan 2010, 4:01 p.m.,*
in response to message #1 by kiril t

Amen, brother. You hit the main ones, but more would include (these have been mentioned before) MILE and KM in lower case, give L.R two periods, and for sure put A...F as hex labels. It's funny how this buggy little beast has such a love/hate relationship with us!

Regards, Glenn

Re: My HP 35s keyboard improvements

*Message #3 Posted by **Norman Dziedzic** on 6 Jan 2010, 4:37 p.m.,*
in response to message #2 by Glenn Shields

My quibble is with the the time conversions symbol to decimal hr. on the keyboard.

All the other conversions have an arrow pointing to the new units but what should read ->HR (like on my

32Sii) reads HMS-> so the symbol tells you where you're coming from but not where you are going!

I would also switch R/S and Sigma+ which is more like the 41 but maybe that's just me.

Re: My HP 35s keyboard improvements

*Message #4 Posted by **Paul Brogger** on 6 Jan 2010, 5:33 p.m.,*
in response to message #2 by Glenn Shields

Move the cursor "compass" keys (up, down, left, right) one row down, leaving a six-key row below the LCD that would be labeled with "A"-"F" for hexadecimal input . . .

Oh. You're talking about changes that are actually *possible* using an existing 35s? Well, then, I guess you've got most of them.

Really, very nice looking! HP will do well to consult their rabid fan base when designing the keyboard for their HP-35sII+ Ultra Turbo Palladium LX Commemorative Special Edition.

(Personally, I think the "f" & "g" would invoke extraneous and misleading -- albeit historical -- UI elements, just as do the left & right arrows. I'd like to see simply a yellow patch on the keyboard face immediately above the upper shift key, and a blue patch on the front face of the lower shift key.)

Edited: 6 Jan 2010, 5:54 p.m.

I miss a dedicated store key instead of a roll key. Is there anyone that can't convert inches to cms or F to C degrees? I think that is trivial. Sam

Re: My HP 35s keyboard improvements

*Message #6 Posted by **Norman Dziedzic** on 6 Jan 2010, 11:57 p.m.,*
in response to message #5 by designnut

I like the conversions although in my field, more appropriate would be (in) -> (mm) but I digress. Yes it's trivial but there is always the case of messing up the conversion factor when you type it in. Also F->C is a two step conversion so 2 chances to type in the wrong thing.

But, all the conversions could be Under a couple menus and that would free up a lot of space.

And Yes, Yes, Yes to a dedicated Store function.

Re: My HP 35s keyboard improvements

*Message #7 Posted by **Martin Pinckney** on 7 Jan 2010, 9:40 a.m.,*
in response to message #6 by Norman Dziedzic

I too find conversions useful. But there are so many possible choices to put on a pocket calculator, that no matter what ones the designers include, each user will want something different. That's one reason I like the rich conversion capabilities of the 48 series.

Also a good conversion program for the 42s.

Edited to correct typo.

in response to message #8 by Reth

Reth, I was referring to a program Thomas Okken has published on his website. It is available here, and the documentation, if you want to get an idea what it's like, is here.

I confess I have used it on Free42, but have not yet gotten it onto my physical 42s. The files he offers are RAW files, and he has a conversion program to turn text files into RAW, but I need the opposite, to enter his programs into my 42s.

Anyone know how to do this?

Re: Also a good conversion program for the 42s.

*Message #10 Posted by **Martin Pinckney** on 7 Jan 2010, 3:15 p.m.,*
in response to message #9 by Martin Pinckney

Never mind, I figured it out. Just load the program into Free42, go to "Preferences" on the top menu, and select to write the printer output to a text file, then on the Free42 keyboard, PRINT PRP, and Voila!

Edited to correct typo.

Edited: 8 Jan 2010, 8:51 a.m.

Re: Also a good conversion program for the 42s.

*Message #11 Posted by **Reth** on 8 Jan 2010, 2:48 a.m.,*
in response to message #9 by Martin Pinckney

Thanks, Martin, now I know what you meant. BTW I'd modify that program for use in 42S iPhone app by adding functionality similar to the HP48's and using the 2 display lines.
Cheers

I thought the same thing but then something occurred to me - how would you represent the shift keys in a black&white printed manual? I suspect this problem is the reason that the shift keys are labeled.

I agree with the poster who said they'd like to see a dedicated STO key. I think that "more complicated" calculators should add to, but not remove from, "less complicated" ones. Of course this isn't always possible, but to me, STO/RCL are such basic features that they should have top priority for key space.

*Message #19 Posted by **bill platt** on 7 Jan 2010, 6:31 p.m.,*
in response to message #18 by Walter B

Just curious--

how do you go about making these amazing "pictures" of non-existent calculators? It looks like you somehow modify a bitmap photo--and yet it all looks so clean and natural.

Re: My HP 35s keyboard improvements

*Message #20 Posted by **Walter B** on 8 Jan 2010, 1:44 a.m.,*

in response to message #19 by bill platt

Thanks, Bill, for your kind words. But the base is as usual: 5% inspiration plus 95% transpiration d:-)

@Paul: You're right, it all comes down to the "real estate challenge". Recent designs have Rv unshifted, but had to drop other goodies. Even by repeated counting you won't get more keys than there are on a given calculator d;-)

I'm missing something here. What would the extraneous and misleading UI elements be?

David wondered how to represent the shift keys in a black&white printed manual - it seems to me that if the L/R shift labels are replaced with f/g on the keys, the LCD display indicators, and in the manuals; that would solve all the problems. How would it be misleading? Did 'f' and 'g' used to have some other meaning than just to differentiate the shift keys? That's all they seem to do on the 16C that I have.

in response to message #23 by George Bailey (Bedford Falls)

Hmm, the more I stare at my HP-35s the more changes I'd like! I like all the suggestions above.

One area that annoys me is not having all the "stack manip" keys close together - for example Rv and X<>Y so far away from ENTER..

And STO should definitely be unshifted!!

Re: My HP 35s keyboard improvements

*Message #25 Posted by **Paul Brogger** on 7 Jan 2010, 7:40 p.m.,*
in response to message #24 by Mark Henderson

I agree re: stack manipulation keys. Re: Walter's 2nd design (Thanks, Walter!), Roll Down shouldn't be shifted any more than STO.

What it comes down to is: Most of us will agree on the large Enter key. Beyond that, we'll all have our favorites which will, one way or another, clash with someone else's ideas re: highest priorities for limited keytop real estate.

(I think I'm beginning to see why H-P doesn't ask us! ;-) Keep the passion, folks!

the unusually prominent bit operations would make this a handy pocket sized 16C. I often need hex and oct when debugging code and this might serve as a handy device for calculating with this.

to answer the "WORD" question, i presume this is to set the word size for the bit operations.

Question:

When a single person can produce such an interesting pre-prototype in such a short type, then why can't HP produce "the dream calculator"?

Re: OT: The uCalc is born

*Message #14 Posted by **Walter B** on 7 Jan 2010, 2:58 a.m.,*
in response to message #13 by Patrick Rendulic

Many forumers ask and have asked this question. Maybe the reason is a single person is free to do what (s)he wants, more persons need to synchronize and agree on their tasks, taking some fraction of their work capacity away, and persons in big companies ... :(

Re: OT: The uCalc is born

*Message #15 Posted by **DaveJ** on 7 Jan 2010, 3:16 a.m.,*
in response to message #14 by Walter B

> Quote:
>

And indeed that is the case with the uCalc. I've had many people tell me I'm wasting my time on the uCalc as no one would want it. But they forget the most important thing - *I* want a credit card calc, and that's always enough reason for the midnight engineer!

Dave.

Re: OT: The uCalc is born

*Message #16 Posted by **DaveJ** on 7 Jan 2010, 3:11 a.m.,*
in response to message #13 by Patrick Rendulic

> Quote:
>
> When a single person can produce such an interesting pre-prototype in such a short type, then why can't HP produce "the dream calculator"?

Well, for starters there is no such thing as a single "dream calculator", everyone has (often vastly) different dreams.

Second problem is that HP (like most companies) are marketing driven, they will only produce products that they think have the best chance of making them the largest financial return. That is not always the "best" possible product, in fact a lot of the time it's simply figment of some marketing or management fools imagination!

The 35S, and recent open platform calcs show HP still actually people with a clue who at least make some of the decisions, it's encouraging.

Thirdly, they are big, and design by committee doesn't work well at all. I can turn around a product from concept to pre-production in weeks, but it takes a big company like HP weeks just to do the paper work and have the meetings just to get to the planing stage.

If you've worked in a big engineering company you'll know that Dilbert is REAL!

Dave.

Two Interesting BigNum Stories (Via Slashdot)

*Message #1 Posted by **Les Bell** on 5 Jan 2010, 5:53 p.m.*

Surprised these weren't posted earlier, as they came via Slashdot yesterday.

1. HP Patents BigNum Implementation

This one concerns a patent issued to HP, and specifically Cyrille de Brebisson. Apparently, there may be prior art which would invalidate the patent - specifically, in Knuth's "Semi-Numerical Algorithms" as well as other papers stretching back to 1912.

The Slashdot story is at http://yro.slashdot.org/story/10/01/04/2321226/HP-Patents-Bignum-Implementation-From-1912?art_pos=23 and the patent itself is viewable at http://www.wikipatents.com/7523150.html-1.

2. Pi to 2.7 Trillion (Approx) Decimal Digits

Now *that's* a BigNum! Slashdot discussion is at http://science.slashdot.org/story/10/01/05/006243/New-Pi-Computation-Record-Using-a-Desktop-PC?art_pos=19 while Fabrice Bellard's page on how he did it is at http://bellard.org/pi/pi2700e9/.

Best,

--- Les
[http://www.lesbell.com.au]

And the winner is...

LINUX !

(OS speaking, of course it is also an excellent human performance)

Very good news, thank you.

OT: Two Interesting BigNum Stories (Via Slashdot)

*Message #4 Posted by **DavidShenk** on 7 Jan 2010, 12:28 a.m.,*
in response to message #1 by Les Bell

There are quite a few songs written about pi, here is a favorite.

Getting more OT, musician John Boswell's Symphony of Science uses Auto-Tune software to create songs from the spoken words of Carl Sagan, Stephen Hawking and others. With the idea of promoting science, all songs are free to download.

Dave

Re: Two Interesting BigNum Stories (Via Slashdot)

*Message #5 Posted by **cyrille de Brébisson** on 7 Jan 2010, 9:10 a.m.,*
in response to message #1 by Les Bell

darn it, you guys saw that...

I obviously did not know about the prior art when I filed the application...

what is the stangest is that the thing got accepted!

one of the PB is that HP is telling us NOT to look for prior art and NOT to look in publications to see other's inventions/idea. the reason for this is that in court, when comes time to defend a patent, if the other party can show that you had knowledge of their stuff, it can be damaging to you....

anyhow, I have now made /. twice, once for good (developer friendly 20b) and once for bad (stupid patent)...

cyrille

MCODE: Where these last posts are heading: A function called "NSG"

*Message #1 Posted by **Geir Isene** on 5 Jan 2010, 1:48 a.m.*

Here is what I want to do - to do is to create a function in the ICEBOX 1H that does this:

NSG (NoV Save/Get) is a prompting function allowing only 100-103 and 200-203 as input.

```
1. It first saves the input.
2. It then calls SAVEN (ICEBOX function to save Main Memory to file "N" in
   HEPAX RAM of the current RAM block).
3. It then switches ram block to the one specified by the users input (from
   the prompt)
4. It then restores Main Memory from another file named "N" in the new block.
```

It is simply a function that does a whole swich of bank and memory.

Problem is that when I calls the HSAVEA (from SAVEN), it kills the whole return stack and never gets back to do tasks 3 and 4.

Any idea on how to solve this?

Re: MCODE: Where these last posts are heading: A function called "NSG"

*Message #2 Posted by **Håkan Thörngren** on 5 Jan 2010, 2:58 a.m.,*
in response to message #1 by Geir Isene

I am not sure I follow fully, but if it does not get back to you, maybe it does not end with a RTN?

Before running an instruction, 00F0 is pushed on the stack. This is the return address for main loop NFRPU. If the instruction uses up all the stack, it will blow the return address and cannot end with a RTN, instead it may jump to 00F0 directly.

Is this what is happening?

Maybe it is doing something else at exit as changing the whole memory is a quite dramatic behavior and it may feel some further cautious actions are needed before giving back control.

If it does not return using the stack, then it is not easy. Maybe you can plant something to indicate that you need to do step 3-4 in some safe RAM (IO buffer, Extended Memory, SS0 or even the HEPAX ram), then pick it up using code in a poll vector.

Re: MCODE: Where these last posts are heading: A function called "NSG"

*Message #3 Posted by **Ángel Martin** on 5 Jan 2010, 3:11 a.m.,*
in response to message #1 by Geir Isene

Obvious tricks are placing code in the same QUAD so the port-independent calls can use reduced stack levels. Or better yet, use GOTO ADR's instead.

Beyond that (which of course it's not always possible) you may have to modify SAVEN to store the stack addresses upon initialization and to restore it when it ends - so that they are preserved - and force a return instead of ending via NFRU.

Hope this prompts some ideas...

Edited: 5 Jan 2010, 3:11 a.m.

Re: MCODE: Where these last posts are heading: A function called "NSG"

*Message #4 Posted by **Geir Isene** on 7 Jan 2010, 4:37 a.m.,*
in response to message #1 by Geir Isene

Excellent response. I feel fortunate to have access to people like you for my hobby.

It seems that HSAVEA eats up the whole return stack and leaves the calc in 00F0 "manually".

I have therefore opted to cut down on the functionality here and have the function do:

1. Prompt for input (100-103, 200-203) 2. Write the inputted number to address 4100 (switch the NoV block)
3. Restore Main Memory for that block by calling HGETA with the file name "N"

Thanks for the knowledge. ICEBOX v. 1H due out within 24 hours.

Re: MCODE: Where these last posts are heading: A function called "NSG"

*Message #5 Posted by **Geir Isene** on 7 Jan 2010, 12:31 p.m.,*
in response to message #4 by Geir Isene

Now there is another little tricky thingy;

The function writes the input NoV bank config (100-103, 200-203) to address 4100 and then goes straight on to do a HGETA to restore Main Memory from a file named "N" - supposedly then from the new block... But here's the catch, it reads the "N"-file from the block previous to writing the new config into 4100. It seems the NoV-64 didn't get around to actually do the block switch before the HGETA asked for the "N"-file to read it and restore the memory, hence it takes the wrong "N"-file.

I should perhaps interject a pause before the function goes ahead and does the HGETA? But - I tried to interject a call to the mainframe function PSE, but that did not change anything...

Any ideas?

Edited: 7 Jan 2010, 12:50 p.m.

Re: MCODE: Where these last posts are heading: A function called "NSG"

*Message #6 Posted by **Diego Diaz** on 8 Jan 2010, 9:04 p.m.,*
in response to message #5 by Geir Isene

Hi Geir, and very happy new year!

Seem like this one is on my side of the fence... :-)

Originally, the control word at H'4100 was designed to behave in two different ways, depending on whether it swaps RAM or ROM blocks.

RAM Blocks are switched "on the fly" during Phi1 pluse #32 of the cycle inmediately *following* the WROM (H'040) instruction.

ROM Blocks are switched after power cyclig the HP-41. This is intentional, as a way to avoid situations in which the iddle ROM block can be loaded with image(s) in address(es) that may conflict with phisical ROM(s)

E.g. you have your card reader in place and have a configuration into ROM block 1 that (consequently) leaves page #E free. However, you may have page #E loaded with any other ROM image into ROM block 2. If you're allowed to swap ROM blocks on the fly your calc will crash...

I may take a more detailed look if needed but, a first glance, it looks like if you need to swap ROM's if won't work within a program. On the other hand if the requirements for HGETA are only RAM swapping then I think that a simple NOP (H'000) after the WRT (H'040) should be enough.

Hope this helps.

Best wishes from the Canary Islands.

Diego.

> ... On the other hand if the requirements for HGETA are only RAM swapping then I think that a simple NOP (H'000) after the WRT (H'040) should be enough.

It didn't help. Here is a clarification of what happens:

```
0. Address 4100 contains 100
1. XEQ"NSG"
2. I enter "102" at the prompt
3. The NSG function then writes 102 to address 4100,
    does the NOP and jumps to the program GETN
    which simply writes "N" to the Alpha register and
    calls HGETA to restore memory from the file named "N".
4. One would suspect that HGETA gets the file "N"
    from Block #2 (h102), but it instead reads the file
    from Block #0 (h100).
```

But, if I do this manually, i.e. I do XEQ"N102" and then XEQ"GETN" (which would be the same as the function "NSG"), id oes behave correctly (reading the file "N" from the new, switched-to block.

Hm....

Re: MCODE: Where these last posts are heading: A function called "NSG"

*Message #8 Posted by **Diego Diaz** on 10 Jan 2010, 1:07 a.m.,*
in response to message #7 by Geir Isene

Hi again,

Yep, I have to correct myself:

It is the RAM power control register (internal to the NoV-64) which is updated "on the fly". The RAM block swapping takes effect after the next "STAND BY"... This is why it works as expected when the operation is performed manually.

I'll check for a suitable solution to allow RAM swapping while keeping ROM conflict protection.

Will mail you back in a few days with a modified code to test.

Best wishes.

*Message #10 Posted by **Diego Diaz** on 10 Jan 2010, 3:02 p.m.,*
in response to message #9 by Geir Isene

Hi Geir,

Well, it looks like if it wasn't that hard...

You've got mail. ;-)

Please let me (us) know if it works OK with ICEBOX 1H and NoV-64.

If it does I'll include it also in the NoV-32 code and place an upgrade notice in my page with the new code.

Cheers.

SUCCESS :-)

*Message #11 Posted by **Geir Isene** on 12 Jan 2010, 8:57 a.m.,*
in response to message #10 by Diego Diaz

Alright; It WORKS.

And the ICEBOX 1H is just around the corner.

Thanks Diego!

Re: SUCCESS :-)

*Message #12 Posted by **Diego Diaz** on 12 Jan 2010, 9:26 a.m.,*
in response to message #11 by Geir Isene

Hi Geir,

Good to know I can contribute a bit to this new release of your ICEBOX project ;-))

Cheers!

Diego.

PS: will mail you again with the updated file for the NoV-32.

Re: SUCCESS :-)

*Message #13 Posted by **Geir Isene** on 13 Jan 2010, 5:34 a.m.,*
in response to message #12 by Diego Diaz

In the ICEBOX v. 1H, the function mentioned here as "NSG" is named "NBS" (NoV Block Switch).

HP300s smartcalc error

*Message #1 Posted by **Scott Smith** on 5 Jan 2010, 12:31 a.m.*

Hi,

When I do the following calc on my smartcalc I get the wrong ansswer. Any ideas anyone?

The calc is 78724*pi*.075^2*.5

I get an answer of 800 instead of around 695.

Thanks

Scott

Re: HP300s smartcalc error

*Message #2 Posted by **Scott Smith** on 5 Jan 2010, 12:42 a.m.,*
in response to message #1 by Scott Smith

further to this if I multiply by .500000001 instead of 0.5 I get the correct answer.

Looks like I am back to my 48 or 30s

Re: HP300s smartcalc error

*Message #3 Posted by **Hubert Weikert** on 5 Jan 2010, 11:31 a.m.,*
in response to message #2 by Scott Smith

Hi,

With my 300s I get 221*(329/800)*PI, which converts with S<=>D to 695.5839564

Hubert

Re: HP300s smartcalc error

*Message #4 Posted by **Norman Dziedzic** on 5 Jan 2010, 1:49 p.m.,*
in response to message #3 by Hubert Weikert

Funny,

For 221*(329/800)*PI I get 285.527...

Did you copy something down wrong?

Re: HP300s smartcalc error

*Message #5 Posted by **Scott Smith** on 5 Jan 2010, 4:36 p.m.,*
in response to message #4 by Norman Dziedzic

Hi Guys,

I too get 285.382 from the above formula.

I have done this eqn over and over again on my 300s and always get 800. I have even saved intermediate values in registers and still get the wrong answer.

My 38G gives me the correct answers, so too does my 35s and 48.

Looks like I got a dud.

Re: HP300s smartcalc error

*Message #6 Posted by **Tim Wessman** on 5 Jan 2010, 7:26 p.m.,*
in response to message #5 by Scott Smith

I repeated it on my emulator. I'm not sure if it is the actual code used in the unit though, or a reimplementation. . .

I suspect it is a setting of some kind causing the problems. Not sure which one though.

TW

Re: HP300s smartcalc error

*Message #7 Posted by **Hubert Weikert** on 6 Jan 2010, 3:58 p.m.,*
in response to message #4 by Norman Dziedzic

Sorry, I had not checked what I wrote!

The correct term is (221+329/800)*PI, which results in 695.58...

The error depends on the setting of the fraction mode (SET UP/down). My calc is in MATH (MthIO) format mode.

setting ab/c (Mixed) gives 695.58...

setting d/c (improper) gives 800, thats the erroneus display.

Hubert

Re: HP300s smartcalc error

*Message #8 Posted by **Bart (UK)** on 6 Jan 2010, 12:56 p.m.,*
in response to message #1 by Scott Smith

Hi,

I have tried this by doing = between each multiplication (and S<=>D where necessary) and in the second last step have 1391.167193. Multiply this by 0.5 (i.e. display is "Ans x 0.5") and it returns 800 as well.

However, the correct answer is displayed if the equation is done in reverse.

edit: taking the last step as "Ans / 2" also gives 800

Edited: 6 Jan 2010, 1:00 p.m.

Does this mean this device is unable to calculate 1391.167193 / 2 ? That's elementary math! :(Hard to believe.

Fix Spice with unsoldered chips?

*Message #1 Posted by **Paul Brogger** on 4 Jan 2010, 4:03 p.m.*

I've a once-working 31E with unsoldered chips. I'd like to make it my desktop device -- just 'cause it's got RRREEEDDD LLLEEEDDDs! (*Who* was/is it that got known for gushing over LEDs so profusely?)

It needs a power pack too, and both clips are broken off of the little battery/recharger connector PCB, and a nearby piece of the back case is missing. Unfortunately, it exhibits the infamous "2 disease", which I attribute to having used alkaline cells rather than Ni-Cds. (I think forcing alkalines into a Spice can lead to - or exacerbate - lots of problems!)

I assume my approach should be: solder the chips to the circuit board and connect some sort of two-cell power pack? (Maybe a cordless phone pack with two Ni-Cds?) I'd rather have it portable, than rechargeable, if I'm faced with that as a trade-off.

Any further advice or options?

Thanks.

What exactly do you mean?

Re: Fix Spice with unsoldered chips?

*Message #3 Posted by **Paul Brogger** on 4 Jan 2010, 4:56 p.m.,*
in response to message #2 by Michael de Estrada

I can only vaguely remember, as I haven't used this calc for years. But there's been some discussion of this elsewhere -- you may wish to do a little searching.

IIRC, when actually pressing digits (any keys?), the display briefly flashes with "22222222..." all the way across. I don't think there's any other manifestation, and when the key is released, the display goes back to normal.

There has been some discussion re: the cause. It did seem to me, way back when I was paying attention, that the only common thread appeared to be that afflicted calculators (all Spice models) had at least once been run on disposable (alkaline) batteries.

Someone will surely correct me if I'm off base.

I did find this - older - discussion. Apparently, the problem only occurs when there's one or more "2" in the display -- then "ghost" 2's start showing up with keypresses.

I have a dozen working Spices, and I've never seen this phenomenon on any of them.

Re: Fix Spice with unsoldered chips?

*Message #5 Posted by **Paul Brogger** on 4 Jan 2010, 6:20 p.m.,*
in response to message #4 by Michael de Estrada

I'm curious -- have you ever run any of them on disposable AA batteries (rather than NiCd rechargeables)?

Thanks

Re: Fix Spice with unsoldered chips?

*Message #6 Posted by **Michael de Estrada** on 4 Jan 2010, 6:50 p.m.,*
in response to message #5 by Paul Brogger

No. However, many of them were probably used this way by their previous owners, since the battery contacts were either bent or broken due to the use of high-top AA cells. I only use flat-top AA NiCads.

Re: Fix Spice with unsoldered chips?

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 4 Jan 2010, 5:34 p.m.,*
in response to message #3 by Paul Brogger

Hi, Paul;

the "2 disease" term was first used by Norm (AKA Captain Zener) after seeing many 2´s being randomly shown in the display of some Spices while performing a few regular operations, mostly while running programs. Same models with same internals might have or not the so called '2´s disease', different models with different internals might also have it or not. No pattern was established or observed at that time. In one particular case, IIRC, one calculator without the '2´s disease' came up with it after being serviced. I do not recall the actual circumstances, but it seems to me that something wrong happened and the '2´s disease' was then classified as a hardware flaw.

Norm firmly believed it was a design flaw, and I disagreed with him by defending it as a design characteristic, instead. We never got to a consensus, and I believe that only the guys who designed the firmware have the answer.

As all calculators ended up operating accordingly, no further mentioning was made till now.

That´s all I can tell without 'digging' the archives.

Cheers.

Luiz (Brazil)

in response to message #7 by Vieira, Luiz C. (Brazil)

Ahh, yes. And it was that same Norm (or, "Captain Zener") who had the hilarious habit of waxing poetic about RED LEDs!

Hello out there, Norm -- wherever you are!

Re: Fix Spice with unsoldered chips?

*Message #9 Posted by **Randy** on 4 Jan 2010, 8:35 p.m.,*
in response to message #1 by Paul Brogger

Solder the chips and the LED array into place. I normally clean the leads of the IC's first as they will be oxidized and not want to solder well at all which is why they don't like to work with pressure alone.

If you want a charger and battery, shoot me an email, I can fix you up...

Re: Fix Spice with unsoldered chips?

*Message #10 Posted by **Mike T** on 14 Jan 2010, 5:40 p.m.,*
in response to message #9 by Randy

Use a decent (temp controlled) soldering iron and remember that the chips are very very sensitive to static so use an antistatic mat and wrist strap. I killed my original HP33C trying to repair it - took me 18 years to get another!

E-ink is cool, but these watches probably have the build quality of Seiko/Casio junk or worse. I wouldn't be seen wearing one.

Call me when they use 316 stainless, the watchband segments are not pressed sheet metal (i.e, has real forged links) and when they have scratch-free sapphire crystals.

Bite your tongue, Bill! ;-)

I still wear a 1981 Seiko H357 5030 Duodisplay. More practical in many ways than the typical Rolex, and much less attractive to thieves and street robbers.

In fairness, though, I doubt that modern Seiko quality is equal to early 1980's Seiko quality. In fact, my repairman said as much in the early 1990's.

Hi Karl,

>>>More practical in many ways than the typical Rolex

How? You always have to baby Seikos so they don't scratch. Their stainless steel is much softer/dentable, and their crystals scratch easily (some more expensive models do have sapphire crystal, but fairly rare.

My Rolex sub I've had since 1992 looks almost new and I went thru 3 Seikos in 5 years before that.

>>> much less attractive to thieves and street robbers.

I generally don't go into bad areas, don't use public transit, etc. When I travel I can have a firearm reasonably handy. In California, it's legal to drive with an unloaded shotgun/rifle, and a handgun can be transported locked in case (but readily opened quickly with practice).

Hello!

> Quote:
>
> Buy a Rolex and get a hand gun free!

:-) But honestly, I find the idea of killing a man to protect a stupid watch quite irritating. Especially a Rolex, 95 percent of which are fakes and the other 5 percent being worn by people one does not really want to be associated with (at least in my part of the world).

But yes, these seem to be the subtle cultural differences that still exist in the twentyfirst century.

Greetings, max

Now something about watches!

*Message #8 Posted by **geoff quickfall** on 5 Jan 2010, 12:44 p.m.,*
in response to message #1 by Gerry Schultz

Hello all!

Now were talking, off topic of course, but still, why not.

Rolex is probably one of the best mass produced watches on the market. Not much one can add to that, other than comparing them to Seiko mid to low cost is apples and oranges.

Upto the 70's Seikos were beautifully engineered in a very Swiss way. Production was then switched to a mass produced stamped method in which the mechanism parts were stamped robotically, therefore requiring softer metals for the stamping process as opposed to a milling process.

Seiko still uses these methods on their lower end range but the high end is every bit comparable to the best Swiss mass produced.

It is like any company that has a range of value products. Rolex was very smart in it's marketing. It made no lower quality watch called a Rolex, they were called Tudor, in affect an ETA movement in a Rolex case.

Don't want to get into a Rolex history versus Seiko but Seiko is the only watch company that make ALL it's watch parts from screws to lubricants to crystals, balance springs and etc.

Both the history of Seiko and Rolex require books but here are some Seikos from what I consider the height of their company during the 60's and EARLY 70's prior to the shift by the entire worlds watch industry to cheaper methods of production of mechanical or digital watches.

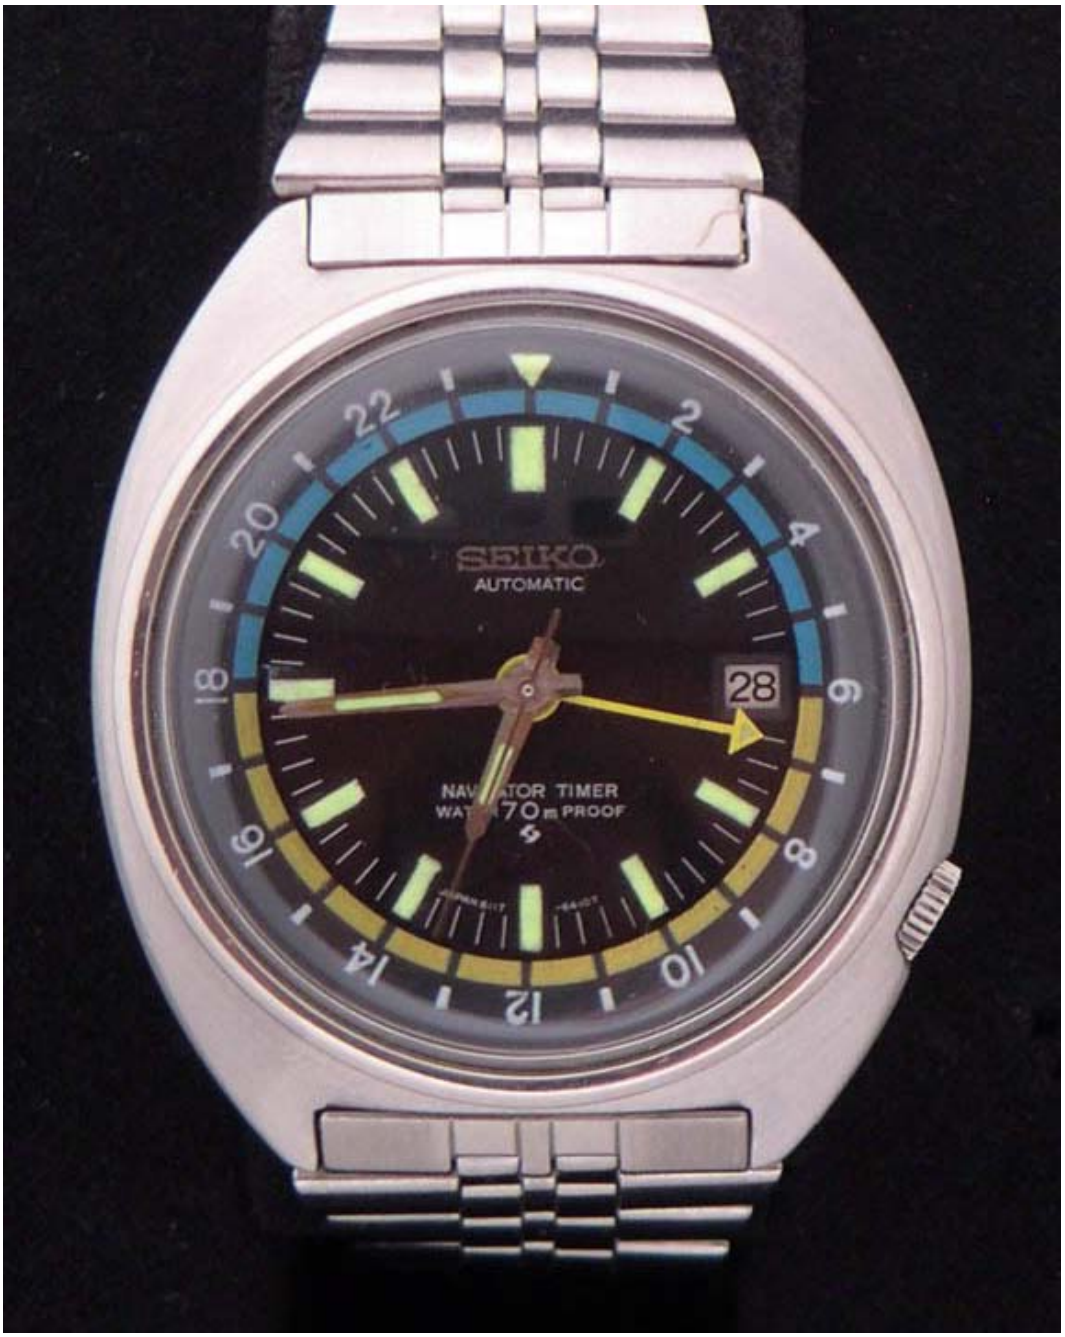
Just a short note about the cost of Seiko in the 60's when they became known as a 'cheap' watch, which should apply to the cost and not the manufacture. The watch was priced in Japan for the Japanese market. In the early 60's the watch at 25 USD was three months salary to a resident of Japan and yet was chump change to an American at the local base PX store at Haneda or Fukuoka.

In short I think the vintage Seiko (60's and early 70's)is extremely underated and good value for collection. Just a note, at the moment, I have 250 Swiss watches, over 150 are now fully restored, the rest are rainy day projects for retirement and all are considered part of the pension plan. They are all complicated movements and are considedered collectable. Here are just the Seikos:

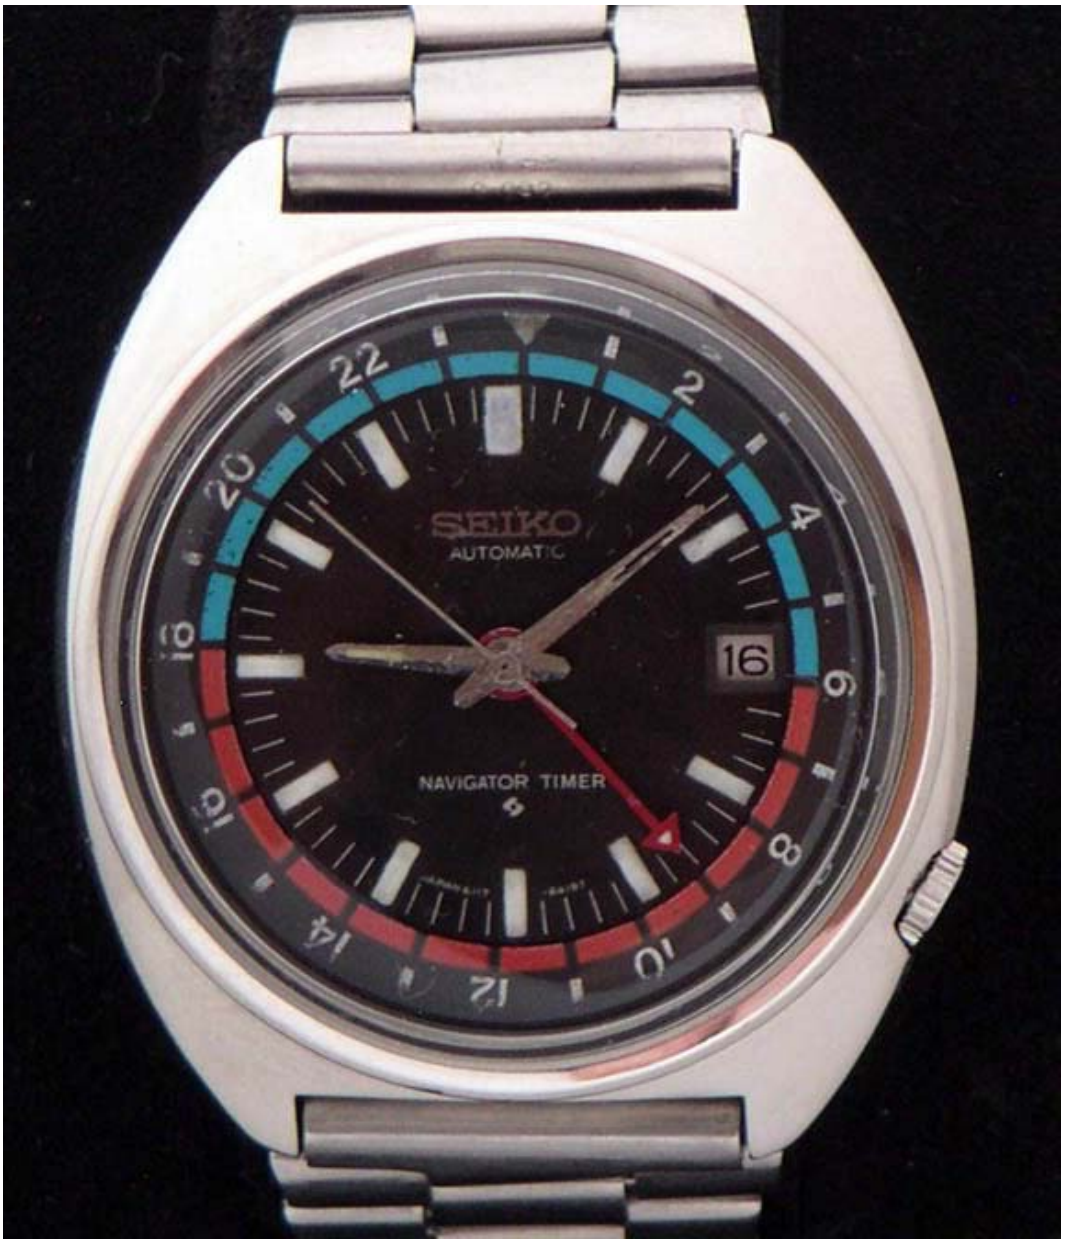
Presmatic 33 jewel qutomatic chronometer with Swiss certification, instantaneous day and date change at midnight, fully adjusted to positions and temperatures, fully stainless steel. A beautiful movement and the high end of Seiko in 1966 fully comparable to any Rolex of the time for production values.

World timer from 1964, 17 jewel automatic with world time indication from 24 hour hand.

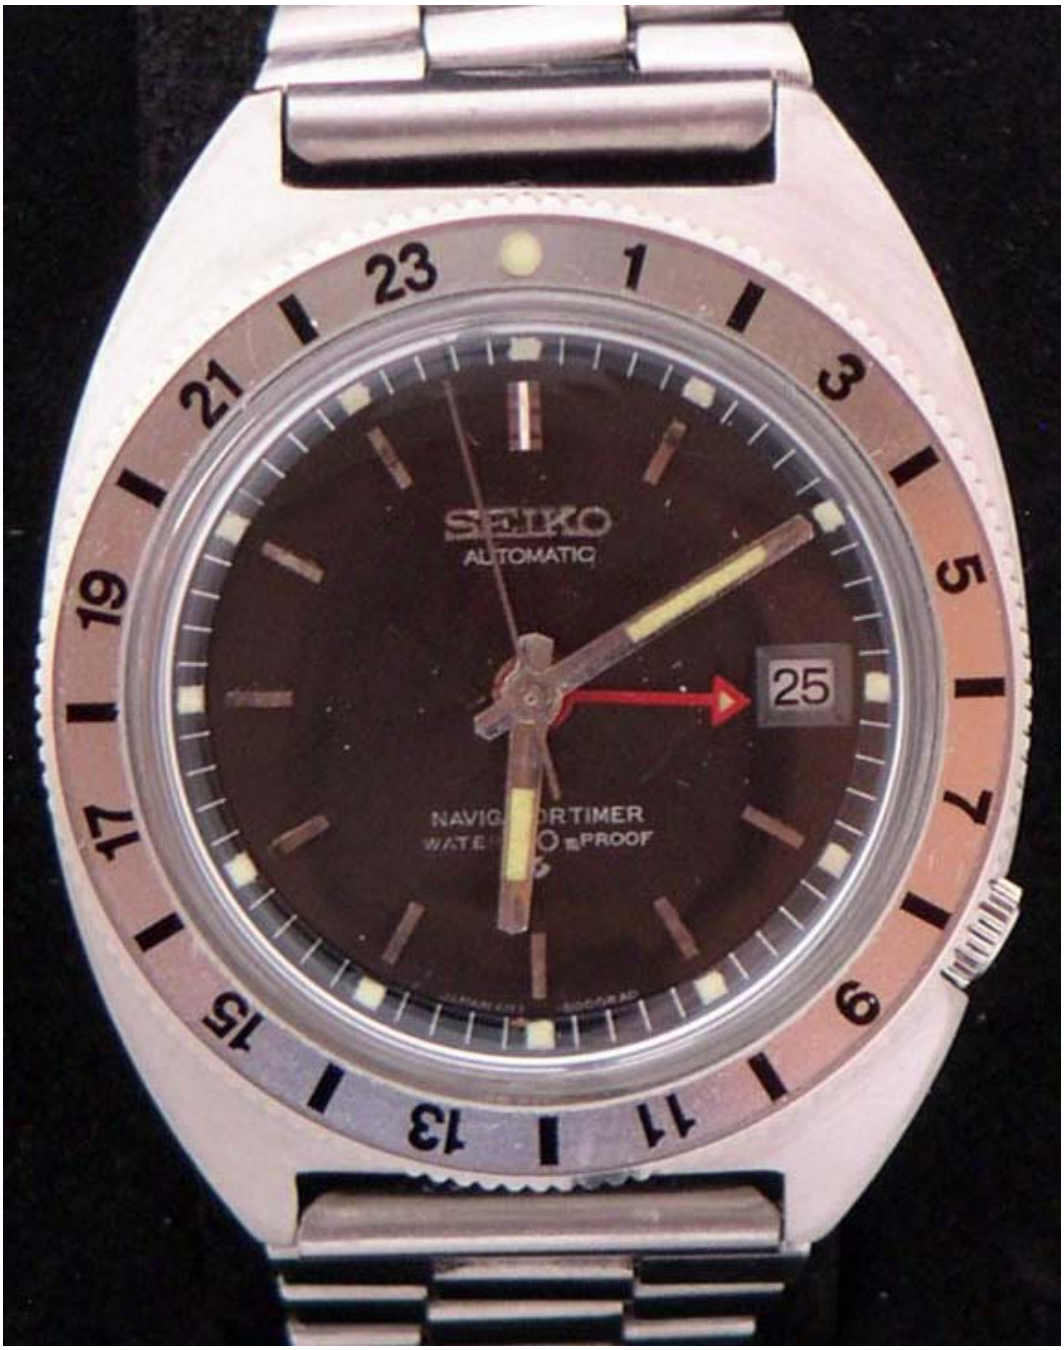
Navitimer 1969



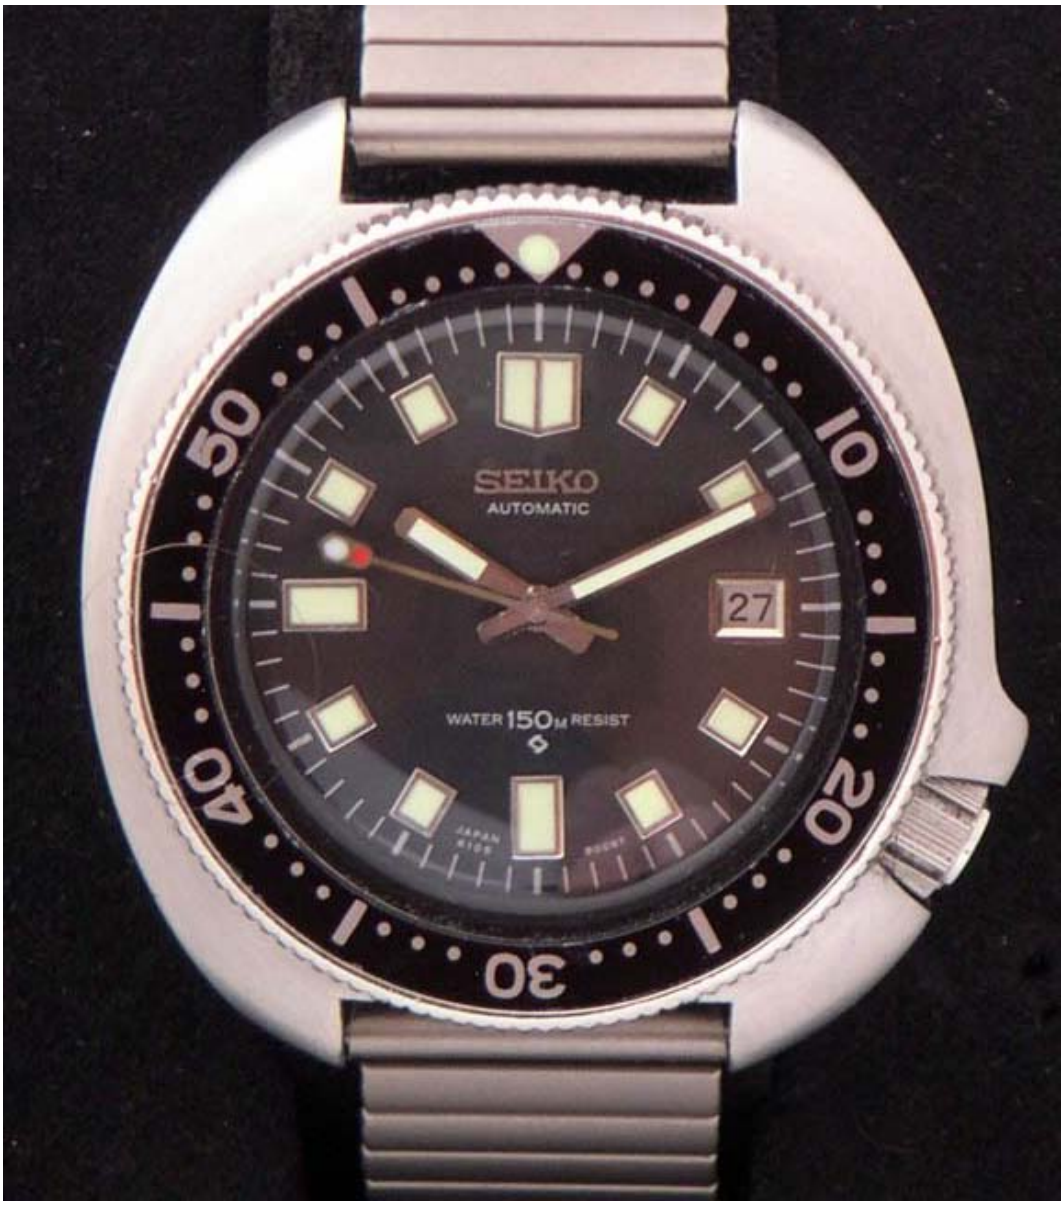
Navitimer 1969



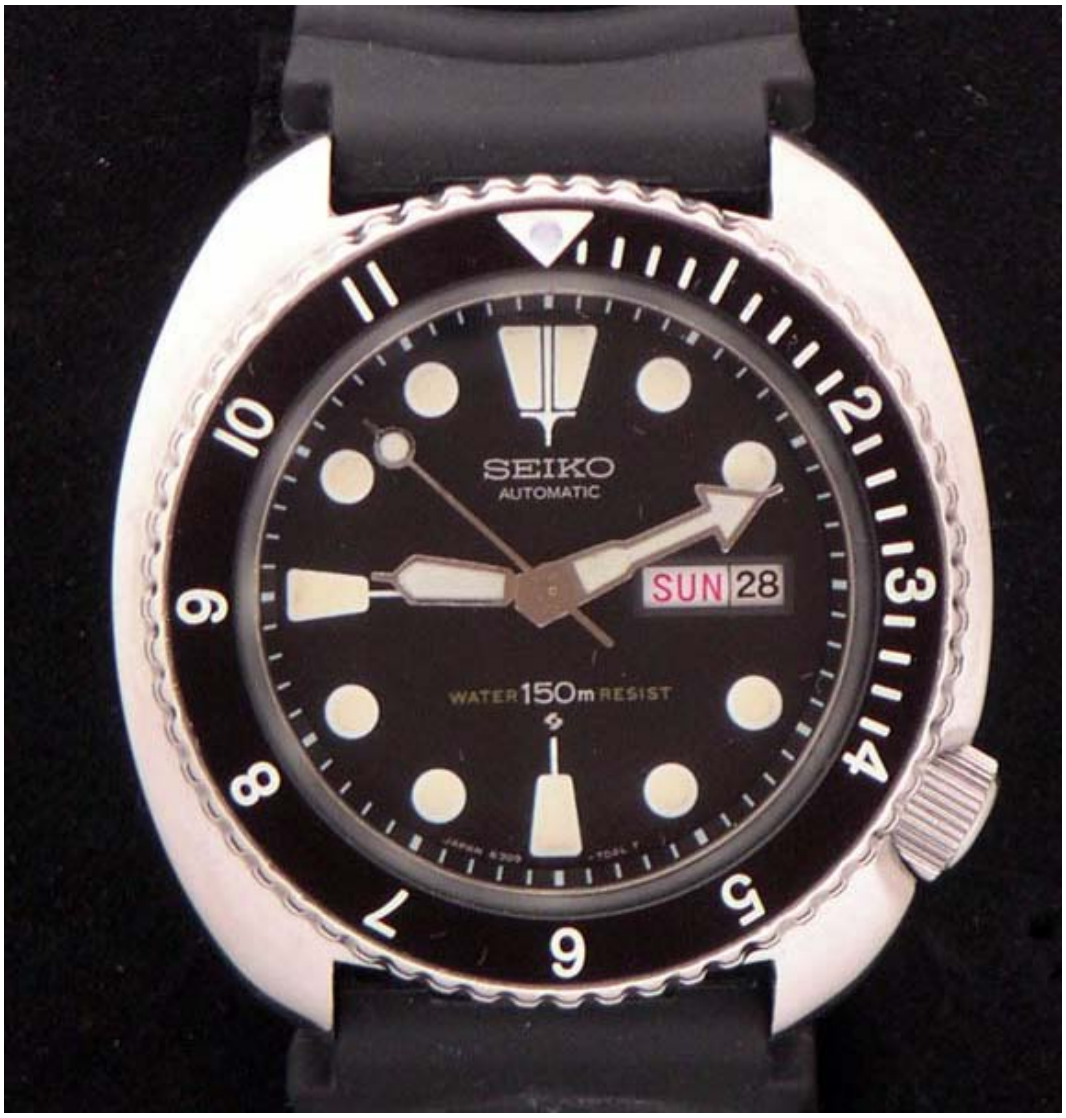
Version one of Navitimer 1968



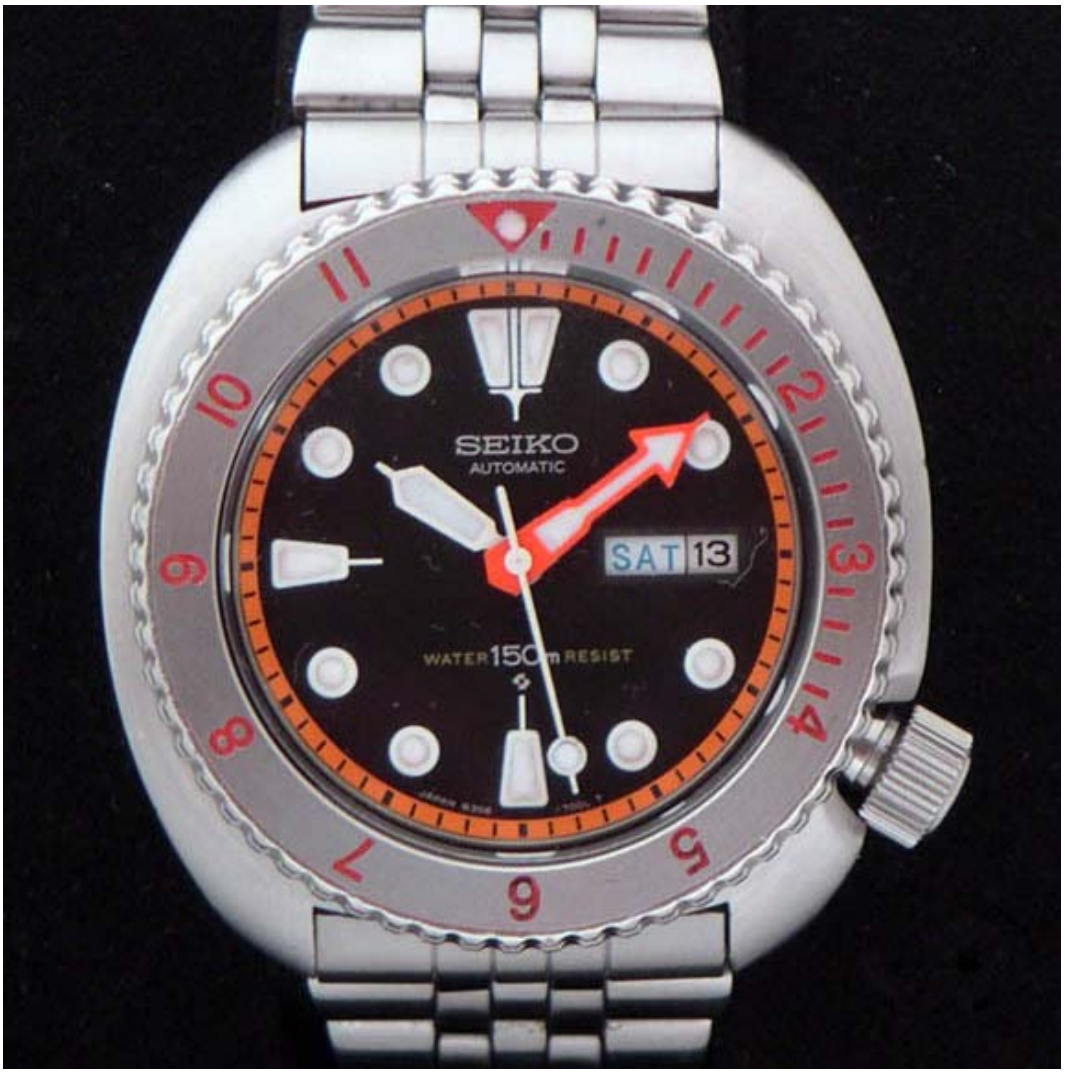
Diving watch, 6105, a cult watch to Seiko collectors with 21 jewel automatic movement. If you have seen Apocolypse now Martin Sheen is wearing one of these. It cost 25 USd at the Px and was the number one unofficial grunt watch during the Vietnam war with the same specs as a Rolex diving watch of the same era selling for 400 USd.



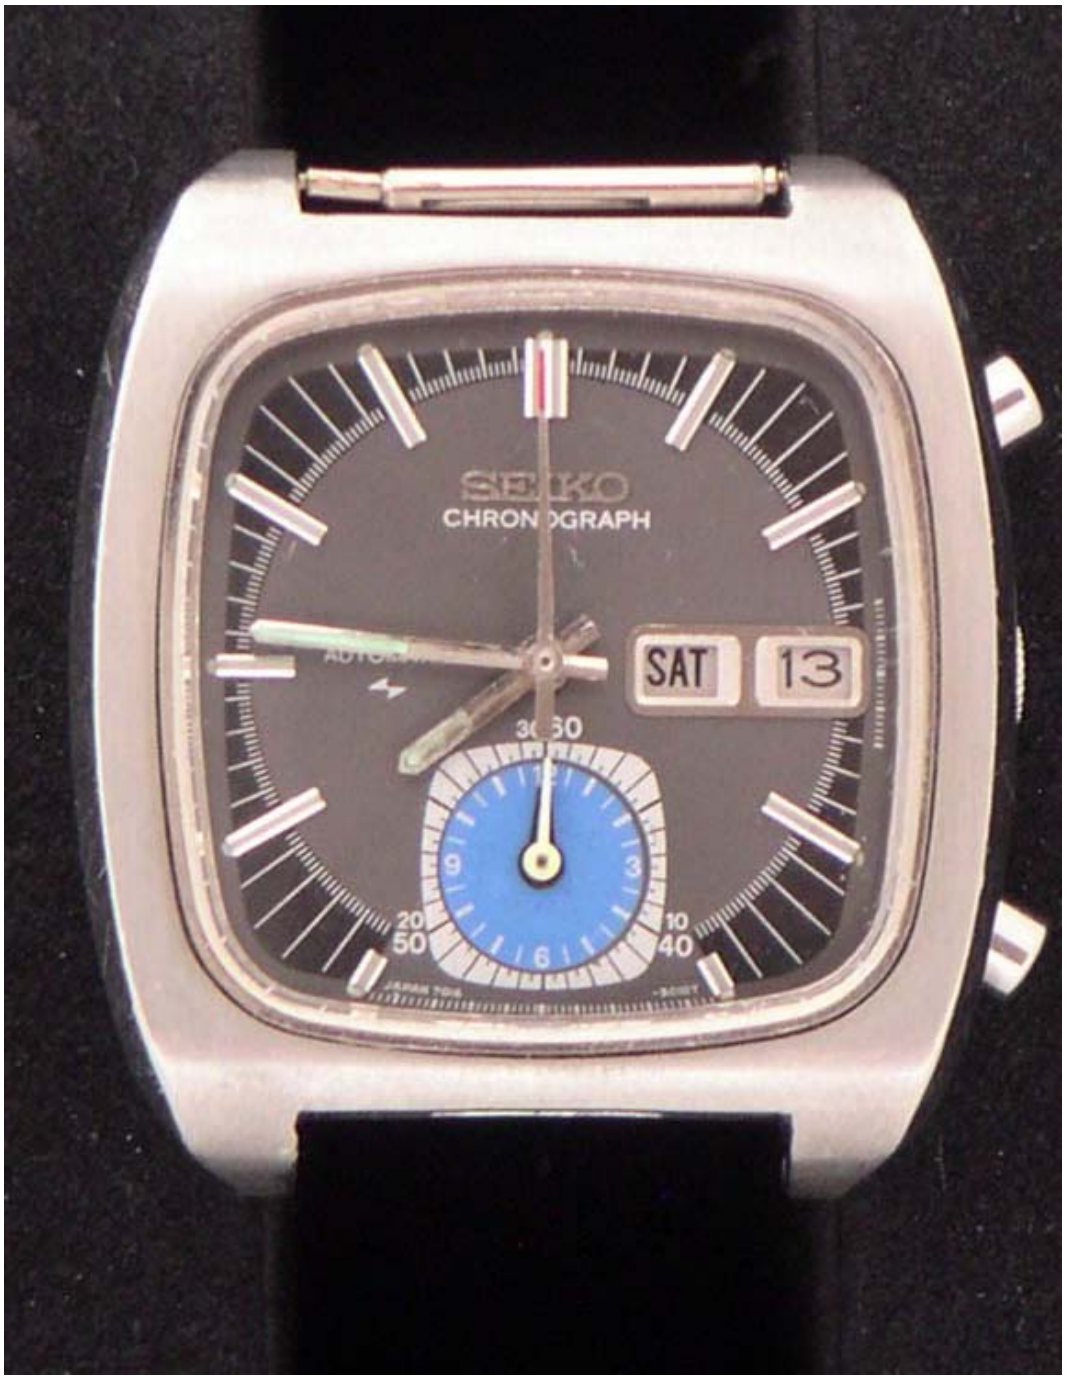
The next production version of the 150M diving watch:



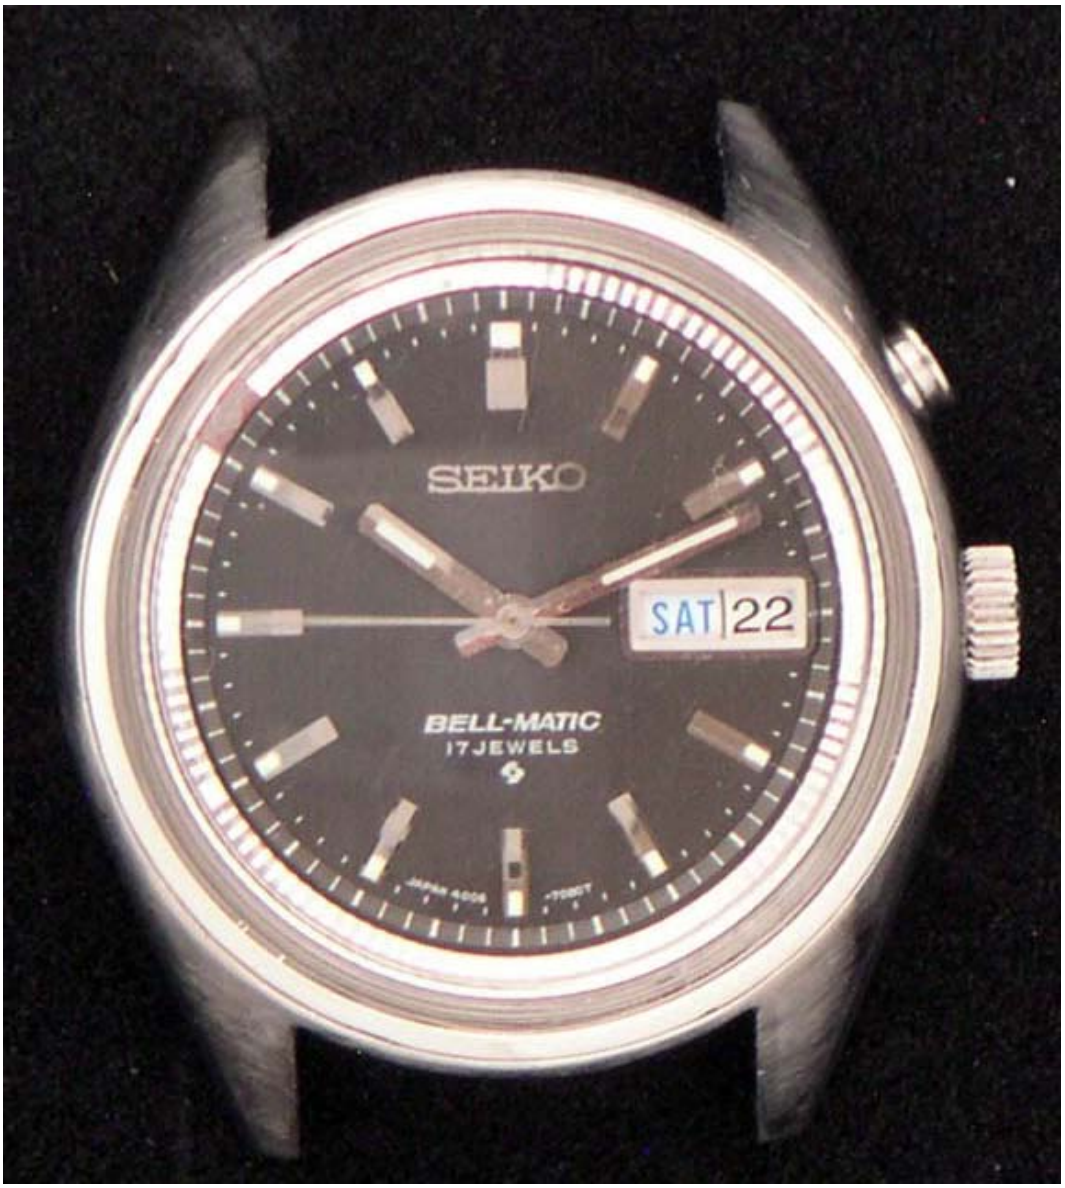
Similar watch to the above modified by me with the orange hands and 12 hour ring for timezones:



The smallest automatic 30 minute and 12 hour display chronograph in the world in 1974 when it was manufactured. It also has a dual display at the 6 for the chronograph, a feature only reproduced today by Patek Phillipe with bot the 30 minute and 12 hour display on the same register. Also a single zero setting function with instant timing (flyback), a function found on very expensive Swiss chronographs of the time:

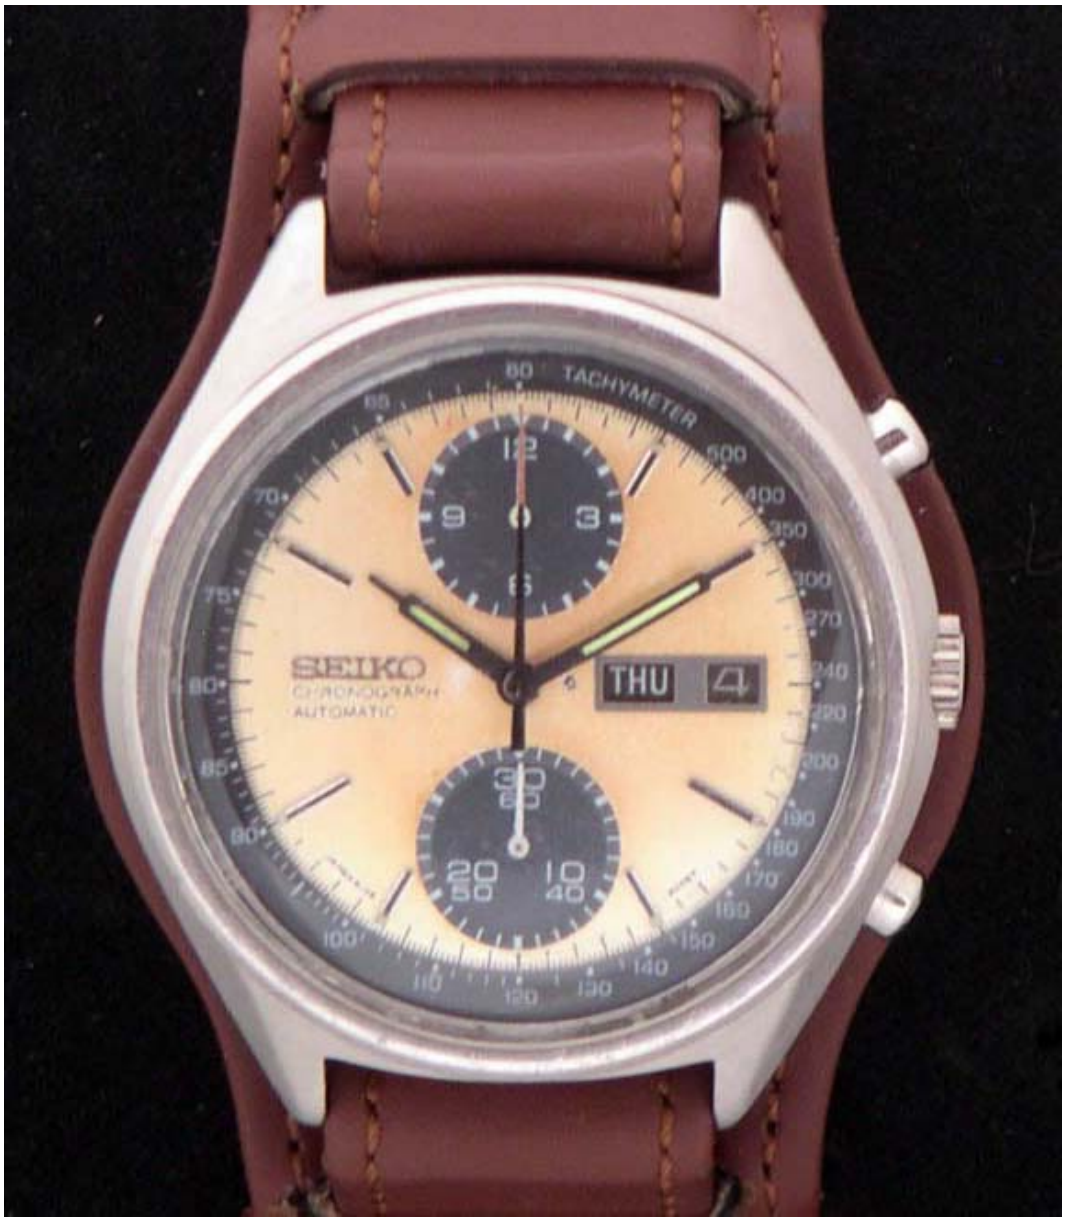


One of the first automtic alarm watches in the world,

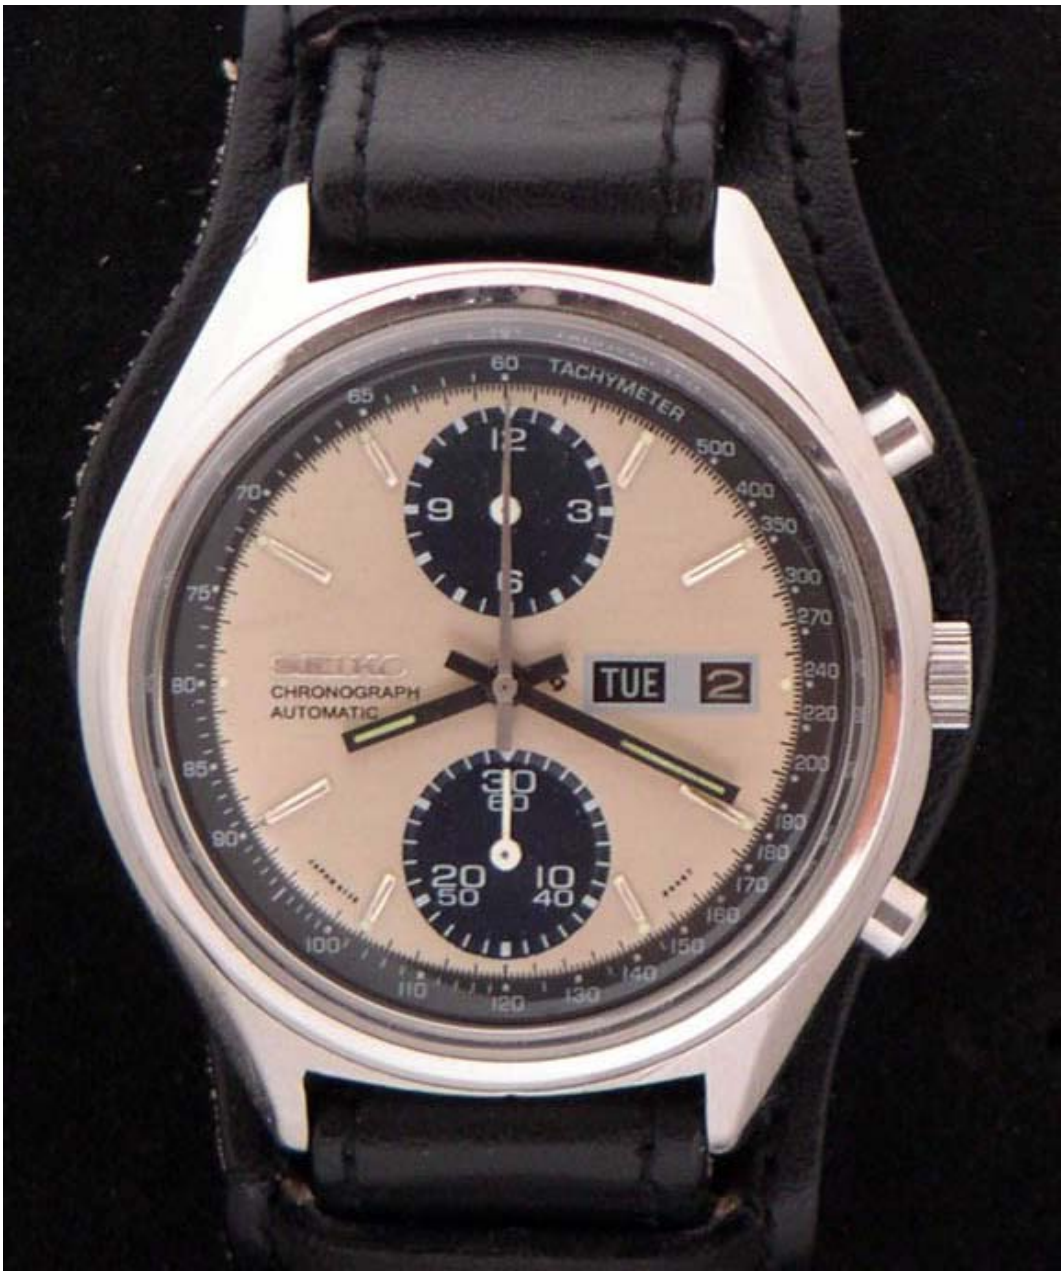


2 weeks after Zenith and Hamilton Buren anounced the automatic Chronograph Seiko came out with theirs and it included a quick set day and date! This is the 12 counter version called a Bullhead.

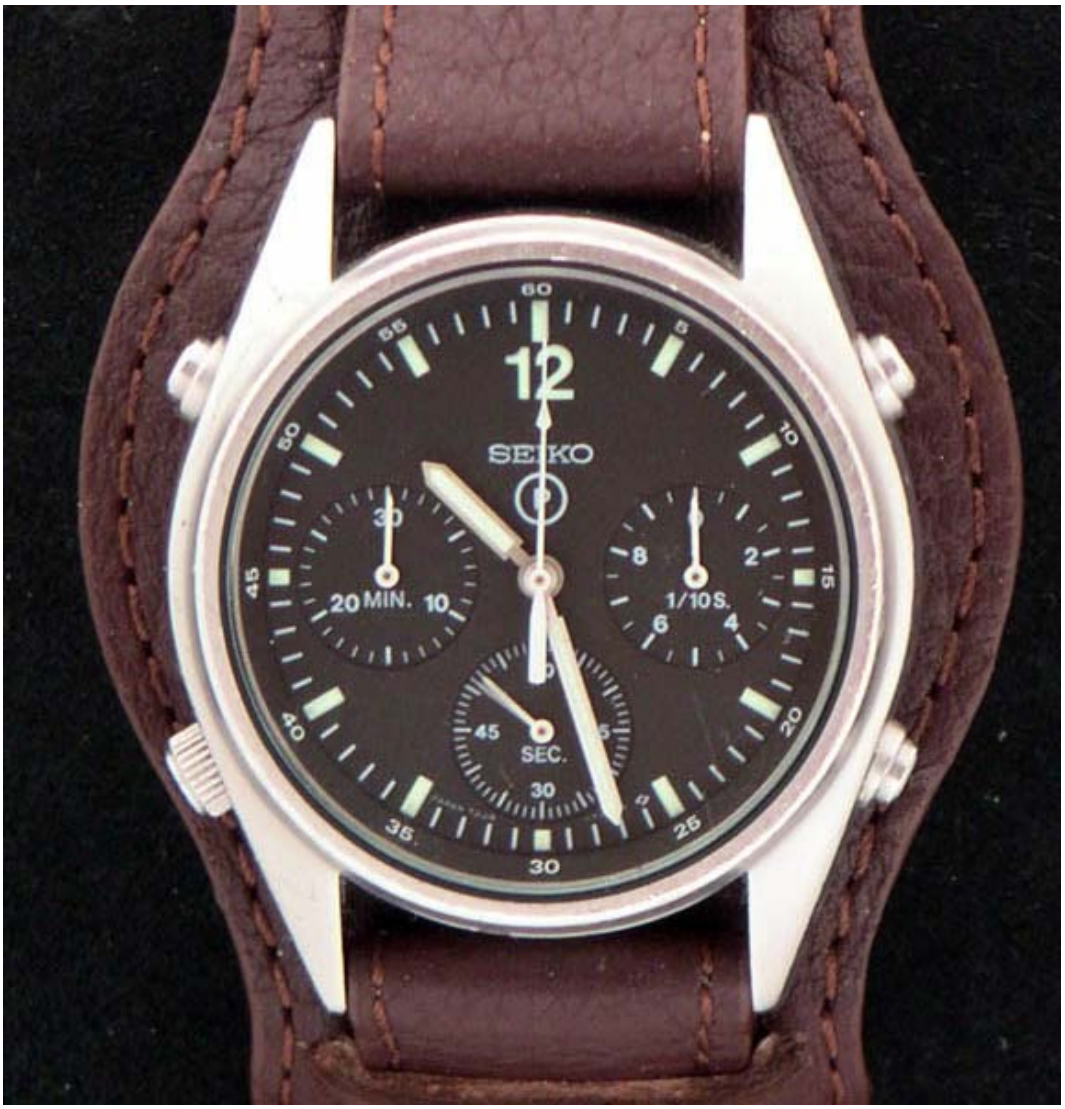
TACHYMETER
SEIKO
CHRONOGRAPH
AUTOMATIC



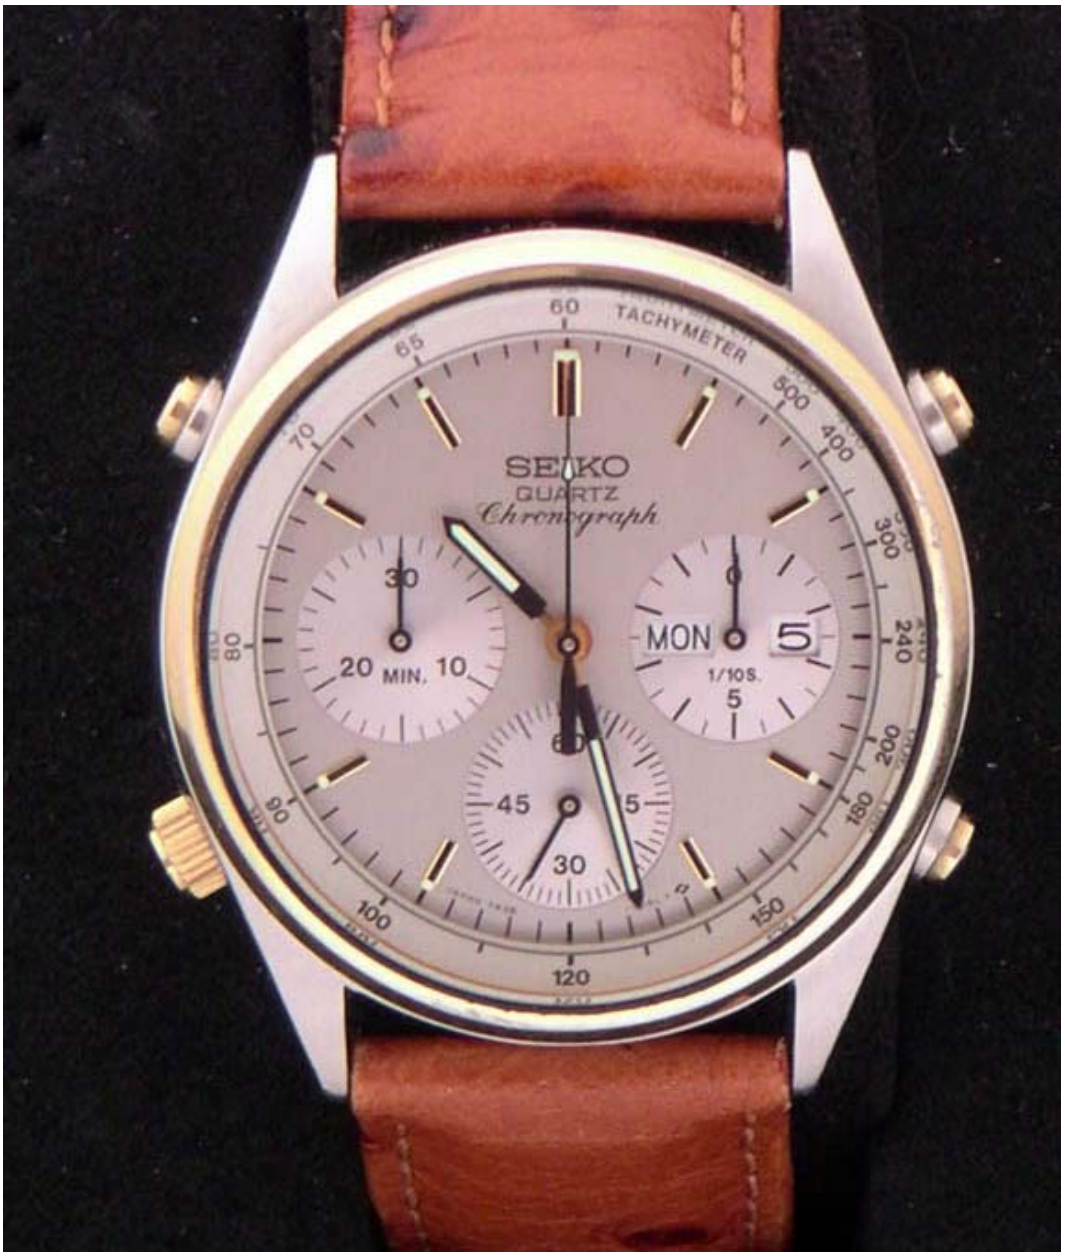
TACHYMETER
SEIKO
CHRONOGRAPH
AUTOMATIC
THU
4



Even the quartz versions can be high end. Here is a military RAF issue quartz driven analogue chronograph. The first analogue chronograph watch made anywhere and with 15 jewels. A feat only Jaeger LeCoutre matched 5 years later:



A civilian version with day and date:



Just a few of my Seikos but my collection includes mostly Swiss complicated movements:

Geoff- Are we a compulsive group or what?

I bought a few Seiko Kinetic watches when they came out, but ended up only wearing one... a Titanium Sports 100. Glow-in-the-dark face, day-date, water resistant, and no battery. I've worn the same watch for about ten years now. Not a scratch on the crystal. I have a doctor friend down the hall who wears the same watch. For about 10 years also..... It was about $350 when I bought it. I gave one of my other Kinetic watches to my son, who loves it. Still have a couple in the drawer, but I never seem to want to vary...

My watch does a battle scar. I was playing with a new camera flash a couple of years ago and flashed the watch, which of course, glowed brightly. On the second flash, I managed to vaporize some of the paint from the hands... I had the crystal cleaned (after an embarrasing explanation to the watchmaker who hadn't actually seen anyone do this before) but it still has a bit of a dark "cloud" on the face. Gives it character....

Re: Now something about watches!

*Message #10 Posted by **Martin Pinckney** on 5 Jan 2010, 4:42 p.m.,*
in response to message #8 by geoff quickfall

Geoff,

Thanks for defending Seiko, and in a very knowledgeable way. For those of us who cannot afford a multi-thousand dollar Rolex, they make a pretty good watch. I first heard of the brand in the late 60's, when a man my father built a dock for gave one to my dad. He told my dad it cost only $15 in Japan, and he could get as many as he wanted (He was an airline pilot with PanAm).

My current watch is a military-style Kinetic. I always wore automatics until this one, because I do not like having a battery-dependent watch. Now I have quartz accuracy in an automatic!

I have an old Bell-Matic that was given to me as a gift in 1975. Unfortunately the alarm-setting stem keeps breaking, rendering it useless.

Now a question for you: what defines "higher end" for Seiko? I mean, how do you tell? Price alone? I see many brand new Seiko quarts models that go for around $100 on eB**. My Kinetic had a "list price" of about $350, if memory serves, but we got it for less than $200 at a "factory outlet".

Better Seikos sometimes have sapphire crystals. The bands on the higher end ones seem more substantive. The $250+ up "dive watches" are pretty good and are better than the 'dressy' watches - the cases seem harder and less likely to ding/scratch.

Seikos come in different grades and have categories/subbrands for premium watches - Lassale, etc. I think one of the higher lines is Grand Seiko. In fact some there are very very expensive "Spring drive" Seikos w/'continuous motion' movement - a mechanical freewheeling movent with quartz regulation: no "ticks", timing is regulated by drag. These are expen$ive.

And for those Eurosocialists assailing this capitalist pig for owning a Rolex, I will gladly note that they do increase in value even as you wear them. I paid under $1K for my Rolex sub, used, in 1993. Today I can get $3200+ out of it anytime I want. Yeah, every 5 years it takes $150 for upkeep. I'd be in the hole for a dozen $200 Seikos at this point; they just don't hold up (various 'dive models' excepted). [My biggest mistake in the 1990s was not buying more of these, and more guns, which have rocketed in value.]

Back to theme/topic:

These e-Ink watches with appropriate programming, a good case + crystal, and some capacitor sensing interface could make a good calc watch. The keyboard could be smaller and "dynamic": fewer keys displayed, depending on mode. During numeric entry just numbers could show until F key or operator key hit, etc. That way things wouldn't be too crowded. There's certainly enough compute power in this watch module to do a decent RPN sci cal...

> And for those Eurosocialists assailing this capitalist pig for owning a Rolex, I will gladly note that they do increase in value even as you wear them. I paid under $1K for my Rolex sub, used, in 1993. Today I can get $3200+ out of it anytime I want.

There is a regular half page ad in one of our (Australian) big newspapers from a company that buys used collectible watches, mostly Rolex, but some Seiko and other exotic brands too I think. They show photos and have these mouth wateringly high prices next to them that are "minimum for any condition" or something like that.

> Quote:
>
> These e-Ink watches with appropriate programming, a good case + crystal, and some capacitor sensing interface could make a good calc watch. The keyboard could be smaller and "dynamic": fewer keys displayed, depending on mode. During numeric entry just numbers could show until F key or operator key hit, etc. That way things wouldn't be too crowded. There's certainly enough compute power in this watch module to do a decent RPN sci cal...

Calc watches are hard. A usable keyboard just takes up so much room. You could do it with a full touch screen interface, but then you can't see the display as you type. Always compromises...

Dave.

> Now a question for you: what defines "higher end" for Seiko? I mean, how do you tell? Price alone? I see many brand new Seiko quarts models that go for around $100 on eB**. My Kinetic had a "list price" of about $350, if memory serves, but we got it for less than $200 at a "factory outlet".

As Bill notes, I think Geoff is talking about the "Grand Seiko" line, which are stunning and are priced accordingly (Rolex, but not Patek Phillipe, territory).

I have the watch collecting bug as well. My collection is very modest compared to Geoff's, though. My other compulsion is fountain pens...

First Pocket Calculator with LED Display?

*Message #1 Posted by **Joerg Woerner** on 4 Jan 2010, 11:21 a.m.*

Happy New Year!

I just came across a Sanyo ICC-804D calculator - squeezing the four chip design of the ICC-0081 into a very tiny package. Most astonishing to me is the display, it uses very bright and large LED modules! There is no manufacturing date visible but the chips sport 1971 date codes.

One question comes up immediately:

Which pocket calculator introduced the red LED display? Was it the Busicom LE-120A of this Sanyo ICC-804D? I know that the LE-120A was ANNOUNCED early in 1971 but when was it available? Any proof about the first ICC-804D availability?

Any suggestions and comments are welcome.

Regards, Joerg

Re: First Pocket Calculator with LED Display?

*Message #2 Posted by **Katie Wasserman** on 4 Jan 2010, 12:38 p.m.,*
in response to message #1 by Joerg Woerner

Joerg,

I love my ICC-804D, it's very cool with the dot-segment LED's and flip up display cover! The chips in mine are dated in 1971 too (7139, 7140, 7137 and 7146) and there's no indication of the date of manufacture.

*Message #3 Posted by **Joerg Woerner** on 7 Jan 2010, 11:38 a.m.,*
in response to message #2 by Katie Wasserman

Katie,

Please read my comment about the two versions - do you have V1 or V2?

Regards, Joerg

Re: First Pocket Calculator with LED Display?

*Message #4 Posted by **Katie Wasserman** on 7 Jan 2010, 1:20 p.m.,*
in response to message #3 by Joerg Woerner

Joerg,

The one I have appears to be identical to the one you show in your picture (I don't know if you're calling that V1 or V2) with reed contact switches and chips with the same part numbers.

-Katie

Re: First Pocket Calculator with LED Display?

*Message #5 Posted by **Frank Boehm (Germany)** on 4 Jan 2010, 3:38 p.m.,*
in response to message #1 by Joerg Woerner

Busicom won, but probably only by 2-3 months. Sales started in mid 1971 (advertisements started in June). What I find amusing is the fact, that Sanyo was able to fit a 2-3 year old chipset (4 chips) into this housing, even using reed relais for the keys, a modular design and solid construction. Obviously it was way more expensive to manufacture than the TI or MOSTEK single chip design...

I need to reply to myself.

*Message #6 Posted by **Frank Boehm (Germany)** on 5 Jan 2010, 11:10 a.m.,*
in response to message #5 by Frank Boehm (Germany)

The LE-120A with serial# 880 has a chip date code of 7120; the version 1 ICC-804D I have has a date code of 7134 (not sure about the serial# though). 3 months of market lead time sounds about right then :)

Btw. the earliest TI single chip (TMS0105NC) I have has a date code of 7139 - that's only half a year later than MOSTEK...

Re: I need to reply to myself.

*Message #7 Posted by **Joerg Woerner** on 5 Jan 2010, 3:57 p.m.,*
in response to message #6 by Frank Boehm (Germany)

Frank,

A TMS0105 from 7139? What calculator?

Regards, Joerg

Re: I need to reply to myself.

*Message #8 Posted by **Frank Boehm (Germany)** on 5 Jan 2010, 5:22 p.m.,*
in response to message #7 by Joerg Woerner

this one:
http://computermuseum.informatik.uni-stuttgart.de/dev/f_schau/

Sidenote: the earliest TMS0103 I have is built into a Commodore C110 (first model with "G" serial number); if I remember correctly, it has a date code of 7147.

Sidenote 2: the Canon LE10 is dated around this time as well, but that's a 2 chip solution (but I think it offers 16 digit precision, like the ICC-804D)

Sidenote 3: what a huge leap the HP 35 & HP 80 were - amazing

Sanyo ICC-804D Version 1

*Message #9 Posted by **Joerg Woerner** on 7 Jan 2010, 11:37 a.m.,*
in response to message #6 by Frank Boehm (Germany)

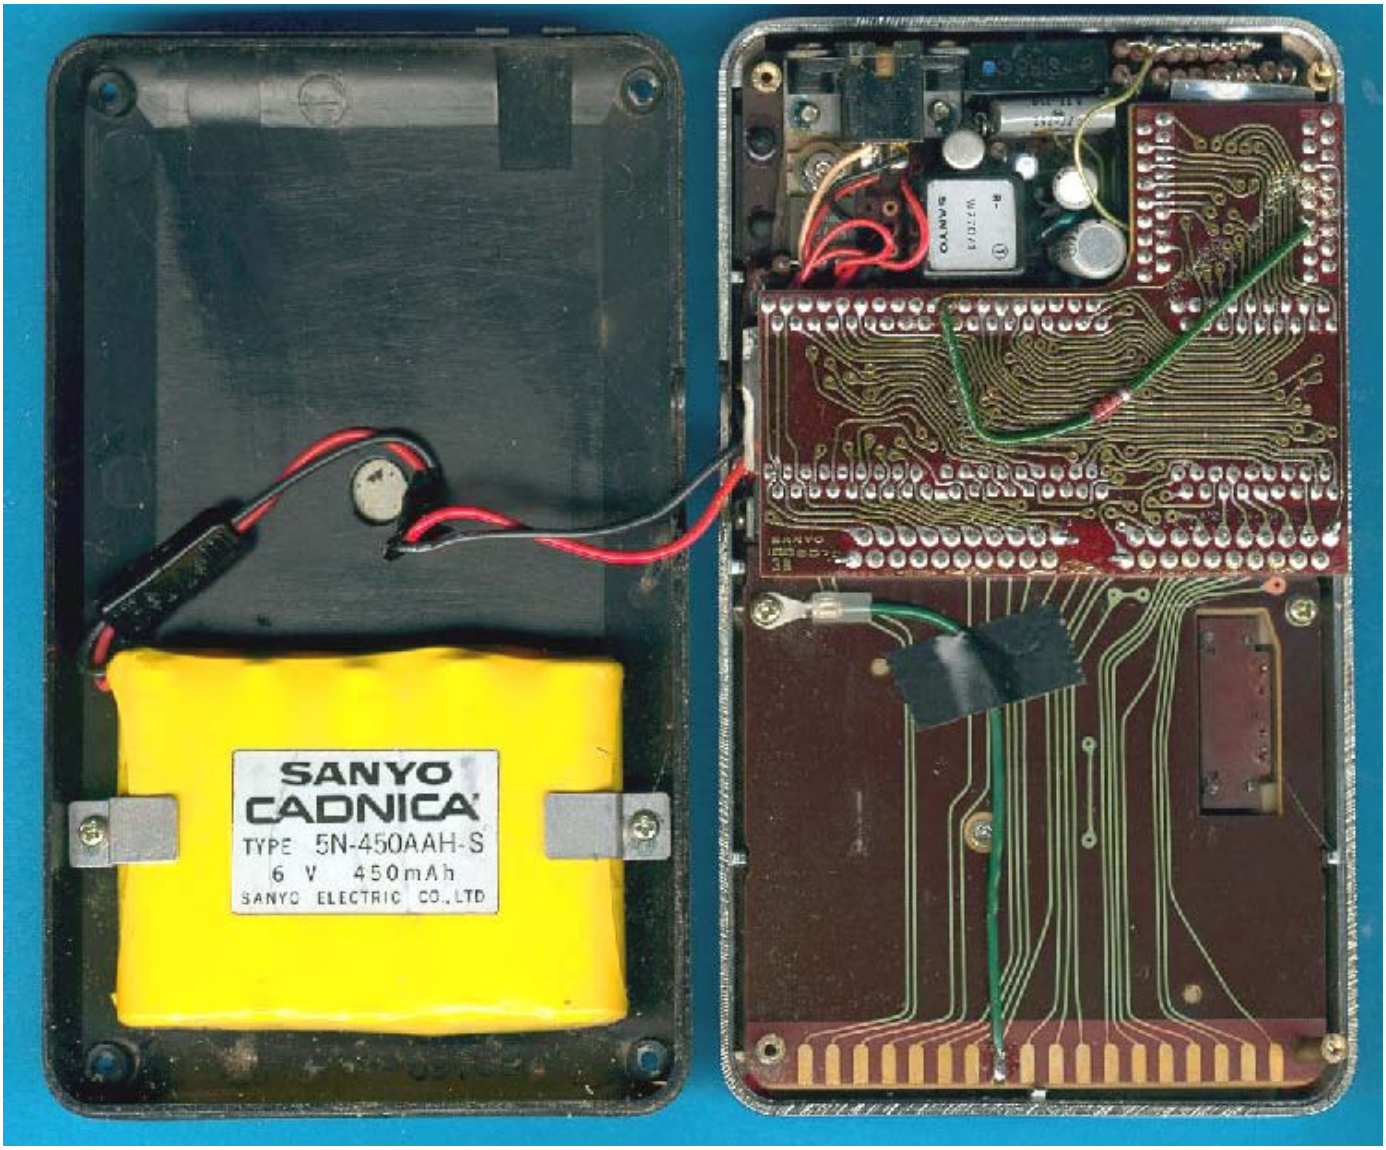
Frank,

What are the differences between Version 1 and Version 2? Mine has reed contact switches and chips 8001,2,3, and 5 - all date coded around 7135.

I remember that Peter's (Muckermann) ICC-804D had a 8006 chip date coded 7146 instead the 8005 of mine.

His serial number: C7066953 Mine: 7054775.

And inside they look completely different, Peter's model seem to use a far cheaper keyboard:



Would you mind to shed some light on the two (or even more) versions of the ICC-804D.

Regards, Joerg

Re: Sanyo ICC-804D Version 1

*Message #10 Posted by **Frank Boehm (Germany)** on 7 Jan 2010, 5:08 p.m.,*
in response to message #9 by Joerg Woerner

The version 1 had reed relais (therefor little magnets attached to every key); the version 2 used spring contacts - way cheaper and far less reliable (the reed relais probably will work fine the next 5000 years <g>).
It's possible to distinguish between these two versions without openening them by listening to the keyboard, version 1 makes a very silent "bling" when a button is pressed, version 2 makes somewhat scratchy noises, followed by klick.
The chipset is the same, but some chips were replaced by bugfixed versions (postfixes like A B C...) or even a higher number. The chipset seems to have been prone to failure, I have seen plenty of Sanyo calcs (all using this chipset) with replaced chips.

HEPAX VASM listing?

*Message #1 Posted by **Geir Isene** on 4 Jan 2010, 11:07 a.m.*

Has anyone seen the HEPAX VASM listings?

Re: HEPAX VASM listing?

*Message #2 Posted by **Meindert Kuipers** on 4 Jan 2010, 12:47 p.m.,*
in response to message #1 by Geir Isene

I do not think the commented sources exist, a disassembly listing is the best that can be done,

Meindert

And... (was: HEPAX VASM listing?)

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 4 Jan 2010, 12:59 p.m.,*
in response to message #1 by Geir Isene

... MLDL´s disassembling is fast and configurable. I also added some extra XROM names in the XROM.TXT file to help debugging lists with self references.

Cheers.

Luiz (Brazil)

Re: And... (was: HEPAX VASM listing?)

*Message #4 Posted by **Geir Isene** on 4 Jan 2010, 1:42 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Could you send me?

Re: And... (was: HEPAX VASM listing?)

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 4 Jan 2010, 2:01 p.m.,*
in response to message #4 by Geir Isene

Hi, Geir;

if you see the ROM.TXT file that comes with the 1.50 and 1.51 versions of the mldl2k.exe you will see:

```
// File format:
// XROM 25,01 [FUNCTION] comment
// File must be in same directory as executable
// All lines not starting with  XROM  are ignored and treated as comments
// Single or double quotes can be used. lines may be empty
// Spaces are treated as delimiters, use quotes when there are spaces in the name
// otherwise the quotes may be ignored
// XROM numbers must be 2 digits!
```

```
// Anything after the function name is printed as coment in the disassembly listing
// A label starting with : will be treated as the title of the XROM and will be used
// as comment for functions that do not have their own comment. Do not use quotes
here
// This type of label may be repeated and will be used for XROM's after it

// for example for group headings
// the table is scanned sequentially
// Extended Functions, XROM 25
XROM 25,00        :Extended Functions ROM
XROM 25,00        "-EXT FCN 1C"
XROM 25,01    "ALENG"                    XFUN: Returns numbers of chars in ALPHA
XROM 25,02    ANUM
XROM 25,03    APPCHR
XROM 25,04    APPREC
....
```

The only thing you need to do is to add the listing with the XROM numbers and the names of the functions you need. Also, you can remove the list with the XROM you do not need. If you tell me which ones you need, I can add to the existing XROM.TXT and send it back to you. I actually added some XROM to the original and saved four different XROM.TXT files so far, each for an specific group of modules. The default comes with:

```
Extended Functions and CX Ext. Fcn (XROM 25)
TIME and CX TIME (XROM 26)
PRINTER 2E (XROM 29)
HPIL MASS ST and CTL FNS (XROM 28)
Extended IO Fcn (XROM 23)
PLOTTER (XROM 17 & XROM 18)
HP-IL DEV (XROM 22 & XROM 24)
WAND (XROM 27)
DAVID Assembler (XROM 02)
```

As you can see, there are no repeating XROM numbers, and I guess only the first occurrence would show up. I think these are Meindert´s first choices for a general purpose disassembling, but chances are that other XROM other than these ones appear, than I decided to modify the original XROM.TXT and suppress the ones I'd not use in some cases as I added others I would need. Let me know if you need a custom XROM.TXT and shich XROM functions you need listed.

Hope this helps.

Cheers.

Luiz (Brazil)

Re: And... (was: HEPAX VASM listing?)

*Message #6 Posted by **Meindert Kuipers** on 4 Jan 2010, 2:08 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

The disassembler uses a simple text search, and returns the first XROM match found, unless the XROM number is found in its own ROM, or in the other ROM in case of an 8K ROM, this always takes preference (or at least that is how it should be, but I realize now that I have never actually tested this ...). Of course, this only makes sense when disassembling user code.

The new version of the disassembler is even more configureable, and it is nearly finished, apart from the option of disassembling according to SDK41 (useful for re-assembly ...)

Meindert

Re: And... (was: HEPAX VASM listing?)

*Message #7 Posted by **Geir Isene** on 4 Jan 2010, 4:14 p.m.,*
in response to message #6 by Meindert Kuipers

As I have awkward access to a Windows computer, and running MLDL2K.exe under Wine is funky) - anyone care to send a listing of the HEPAX module? (g@isene.com)

EDIT: Never mind - I got around the quirkiness and have a working program running under wine on my Linux laptop. I will traverse the HEPAX listings and see if I can make it do what I want it to :-)

Edited: 4 Jan 2010, 4:40 p.m.

HP-01 stylus

*Message #1 Posted by **Alberto Fenini** on 4 Jan 2010, 10:23 a.m.*

ciao a tutti,

well, this could be of interest to someone. has anybody tried to convert a regular pen or pencil (Cross for example could be a nice candidate) into an HP-01 stylus replacing the internal with sone nylon stuff ?

Take care, and thanks in advance for the reply, Alberto

Re: HP-01 stylus (with pics)

*Message #2 Posted by **Alberto Fenini** on 4 Jan 2010, 2:24 p.m.,*
in response to message #1 by Alberto Fenini

And this the result (at least not a final one), I have found in a drawer a cheap copy of a Cross pen (it was an expo gadget). You can have a look at refill here

note that the writing point and the end have already gently been removed. Now depending on the budget you can use a real cross, but what the heck, this was just a try ....
The idea is to get a new refill usable with the HP-01.
I took a "cannula" from an empty compressed air can, and a very thick toothpick

Then with a Dremel I have thinned the wood until it could be gently but firmly pressed into the cannula. The cannula was cutted the same length the orignal refill was (remember some of the refill goes into the platic cap)

Now, all you need to do, is to put things together and back in the pen

and here you are : you can see the pen in closed position and in open position

The next step is to substitute the wood part (that was the only thing available at home now) with a piece of nylon, I think a 0.9 mm thick nylon rope would just do the job. Also the length of the wood/nylon point needs to be trimeered, but I'll do that later.... I'll keep you posted, any idea or comment always welcome !!

HP97 restore project

*Message #1 Posted by **Alberto Fenini** on 4 Jan 2010, 10:21 a.m.*

Dear All, Happy New Year !

I know has been said over and over and over so forgive me, but, can I put a working ACT from an HP25 into a non working HP-97 ? The HP-97 is the version produced after the HP-97S was available.

as always, thanks for help, Alberto

Re: HP97 restore project

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 4 Jan 2010, 12:34 p.m.,*
in response to message #1 by Alberto Fenini

Ciao, Alberto;

As far as I know, the only ACT that is not compatible with the others is the one found in the HP27. The HP27 uses V-MOS IC´s, and its components cannot be used in other C-MOS circuitry.

Can you compare the printed code over the ACT you want to use and the one you want to replace? I have changed ACT chips from HP25 and HP21 units with no problems. I also red about an HP67 using an ACT from a HP25 donor.

Cheers.

Luiz (Brazil)

Edited: 5 Jan 2010, 5:14 a.m. after one or more responses were posted

Re: HP97 restore project

*Message #3 Posted by **Alberto Fenini** on 4 Jan 2010, 4:43 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

ciao Luis, the working ACT from HP25 is : 1820-1523, while the one I think has to be replaced is 1820-1596, what do you think ? Take care Alberto

Re: HP97 restore project

*Message #4 Posted by **Michael Meyer** on 4 Jan 2010, 7:35 p.m.,*
in response to message #3 by Alberto Fenini

I think it should work. I've transplanted several to 67's, and I think the 97 has the same ACT, but I'm not certain. You may have to be the one to let the rest of us know for sure....

Re: HP97 restore project

*Message #5 Posted by **Randy** on 4 Jan 2010, 8:36 p.m.,*
in response to message #4 by Michael Meyer

Yes, the 67, 97 and 29C use the same ACT. The ACT from a 25 *should* work.

The 21 ACT will not work as it lacks the I/O expansion signals.

Re: HP97 restore project

*Message #6 Posted by **Alberto Fenini** on 5 Jan 2010, 4:12 a.m.,*
in response to message #5 by Randy

Very good, I'll try later today or tomorrow and keep you posted, has anybody tried desoldering with hot air ? Cheers, Alberto

Re: HP97 restore project

*Message #7 Posted by **Randy** on 5 Jan 2010, 8:22 a.m.,*
in response to message #6 by Alberto Fenini

> Quote:
>
> Very good, I'll try later today or tomorrow and keep you posted, has anybody tried desoldering with hot air ? Cheers, Alberto

That will not work for through hole devices, way too much heat required, you'll destroy the board in the process. Solder wick or a vacuum desoldering station is the only way.

Re: HP97 restore project

*Message #8 Posted by **Eric Smith** on 5 Jan 2010, 12:46 p.m.,*
in response to message #5 by Randy

> Quote:
>
> The 21 ACT will not work as it lacks the I/O expansion signals.

That might be true of part number 1820-1396, though I've never tried it. All other ACTs that might be found in an HP-21 should work in most ACT-based calculators other than the 27.

There are some compatibility issues between certain ACT part numbers and old firmware in the 67/97, and possibly a few other models. The 1820-1596 ACT is known to have these issues.

Re: HP97 restore project

*Message #9 Posted by **Randy** on 5 Jan 2010, 1:21 p.m.,*
in response to message #8 by Eric Smith

> Quote:
>
> ...That might be true of part number 1820-1396, though I've never tried it.

I have, that's why I posted it. Your post also explains why there are other ACT's in early

67's and 97's. Thank you for the info!

BTW, are there DNS issues with brouhaha? Can't seem to load anything.

Re: HP97 restore project (mother board)

*Message #10 Posted by **Alberto Fenini** on 6 Jan 2010, 5:47 p.m.,*
in response to message #8 by Eric Smith

And here we go, that's what I did today ...

old ACT

ACT from HP25 soldered on HP97

how far I went .....

Since the result wasn't what exactly I had expected, I have re-soldered the original ACT chip, and surprise surprise, I'm now in the situation where a flickering and random bunch of zeroes will light up for a second when the switch goes from off to on ...too fast to take a picture...
I can also hear the printer making noise if this is of any importance.
However, since on both units (I'm using a working HP97 to test progresses)the printer gear needs to be replaced,I have to keep the printer switch in manual mode.

I have then decided to divide the project in two sections : **motherboard repair** and **display with keyboard repair**

At this point, I'd like to hear some suggestions from all of you. What can I do with the described behavior ? On the **motherboard** I have re-soldered most of the chips, and I could do it radically, if anyone would suggest that a bad contact could be the reason of this behavior.

As for the **display/keyboard unit**, when used with the working motherboard, it reamins completely off .... Would you suggest replacing the chips ? I have noticed that the transistor arrays (1858-0044)are exactly the same used on the printer card, so I could easily have a source for them. I know these to work since I have swapped the printer unit back and forth in the past.

Or would you suggest that the 1820-1629 could be responsible for the display remaining black ??

Any, and I mean any, suggestion will be of great help, and I'll be glad to try it out.
Take care, Alberto

MCODE: Bright idea for executing an address instead of a GOTO ADR (h1E0)?

*Message #1 Posted by **Geir Isene** on 4 Jan 2010, 9:18 a.m.*

I need to execute an address in C[6:3] instead of simply jump to it like I would with a GOTO ADR (h1E0) instruction. Håkan, Angel or any other MCODE wiz have any idea of how to best accomplish this?

I could perhaps push the next address onto the return stack before I execute a GOTO ADR, but how do I get that address?

Edited: 4 Jan 2010, 9:23 a.m.

Re: MCODE: Bright idea for executing an address instead of a GOTO ADR (h1E0)?

*Message #2 Posted by **Monte Dalrymple** on 4 Jan 2010, 11:22 a.m.,*
in response to message #1 by Geir Isene

GOSUB 0097

This mainframe location (0097) contains GOTOC. So the subroutine call to this location will jump to the address in C[6:3] and the return at the end of the function will return to the instruction after the GOSUB?

Monte

Edited: 4 Jan 2010, 2:17 p.m. after one or more responses were posted

Re: MCODE: Bright idea for executing an address instead of a GOTO ADR (h1E0)?

*Message #3 Posted by **Geir Isene** on 4 Jan 2010, 2:00 p.m.,*
in response to message #2 by Monte Dalrymple

Yes. The hex word for GOTO ADR is 1E0, there is no GOSUB ADR.

Re: MCODE: Bright idea for executing an address instead of a GOTO ADR (h1E0)?

*Message #4 Posted by **Meindert Kuipers** on 4 Jan 2010, 12:46 p.m.,*
in response to message #1 by Geir Isene

Geir,

This is really simple as you thought. Just build the address and do the GOTO ADR. The create a return address, first do a ?NC XQ PCTOC [00D7]. I will leave it to you to study the VASM listings as an exercise how this works ;) Add a bit to this address you have been given, and then use PUSHADR to get this on the return stack, get the target address back and do your GOTO ADR.

Meindert

Re: MCODE: Bright idea for executing an address instead of a GOTO ADR (h1E0)?

*Message #5 Posted by **Geir Isene** on 4 Jan 2010, 1:46 p.m.,*
in response to message #4 by Meindert Kuipers

Excellent! Just what I needed.

Re: MCODE: Bright idea for executing an address instead of a GOTO ADR (h1E0)?

*Message #6 Posted by **J-F Garnier** on 4 Jan 2010, 2:28 p.m.,*
in response to message #5 by Geir Isene

The method given by Monte in his (edited) post is much simpler. I used a similar trick on several microprocessors that do not have indirect gosub or call.

J-F

Re: MCODE: Bright idea for executing an address instead of a GOTO ADR (h1E0)?

*Message #7 Posted by **Meindert Kuipers** on 4 Jan 2010, 2:57 p.m.,*
in response to message #6 by J-F Garnier

I made it too complex, I must admit that I did not read Monte's first reply in too much detail, the instruction is indeed a ?NC XQ 0097 after putting the needed address in C. The GOSUB that Monte mentioned took me off guard, as I use this mnemonic typically for a 3-byte relocatable call.

Meindert

Re: MCODE: Bright idea for executing an address instead of a GOTO ADR (h1E0)?

*Message #8 Posted by **Geir Isene** on 4 Jan 2010, 4:03 p.m.,*
in response to message #7 by Meindert Kuipers

0097? That's one address before the function RSTKB... Makes little sense. Sure about the address?

Re: MCODE: Bright idea for executing an address instead of a GOTO ADR (h1E0)?

*Message #9 Posted by **Meindert Kuipers** on 4 Jan 2010, 4:15 p.m.,*
in response to message #8 by Geir Isene

The trick is that you are calling this address as a subroutine, so the return address is pushed on the stack when executing ?NC XG 0097. With the target address in C, your program jumps to the GOTO ADR function it finds at 0097, and will then immediately jump to your desired address, with the stack loaded with your return address (the line after your ?NC XQ 0097)

Meindert

Re: MCODE: Bright idea for executing an address instead of a GOTO ADR (h1E0)?

*Message #10 Posted by **Monte Dalrymple** on 4 Jan 2010, 4:18 p.m.,*
in response to message #8 by Geir Isene

The address is correct. The GOTOC at this address immediately jumps to C[6:3], which is the entry to your subroutine. The fact that the next in-line instruction is the first in the RSTKB routine has nothing to do with anything. This is just a convenient, known address that contains a GOTOC. Think of it as a waypoint that you have to go through to get to your final destination. Getting to the waypoint via a subroutine call takes care of getting the return address on the stack.

Monte

Re: MCODE: Bright idea for executing an address instead of a GOTO ADR (h1E0)?

HP12C - SST in RUN-Mode doesn't work correctly

*Message #1 Posted by **twanke** on 4 Jan 2010, 6:45 a.m.*

A week ago I bought a new HP12C. Everything is working fine except SST-function in RUN-Mode. When the SST-button is holded down the program line should be shown, and on release of the button this line should be excecuted. But when I press down the button the line is not shown and the instruction is excecuted even before releasing the button.

Does anybody had this problem before? Can I resolve this problem by my own or do have to send the calculator for repair?

Thanks in advance for Your help.

Thomas.

Re: HP12C - SST in RUN-Mode doesn't work correctly

*Message #2 Posted by **Don Shepherd** on 4 Jan 2010, 7:45 a.m.,*
in response to message #1 by twanke

I think Katie Wasserman reported this problem before. It is a bug in the new ARM-based 12c+. I believe Cyrille fixed it with a new version of the firmware, but you would need a special cable for your PC in order to install it. I'd call HP support and see if they can maybe send you a new unit.

Re: HP12C - SST in RUN-Mode doesn't work correctly

*Message #3 Posted by **twanke** on 4 Jan 2010, 9:56 a.m.,*
in response to message #2 by Don Shepherd

Thanks a lot. I will contact HP. Let's see if they've a good customer support in the handheld, calculator devision.

Thomas.

Re: HP12C - SST in RUN-Mode doesn't work correctly

*Message #4 Posted by **Katie Wasserman** on 4 Jan 2010, 11:49 a.m.,*
in response to message #3 by twanke

It is indeed fixed in a later release along with a few related bugs and the self tests are now working like they should be (for the most part). I don't know if this release has yet made it into production, but you can check the version date by holding down [ENTER} + [g] when you turn on the calculator. Then press [2] followed by any other key and you'll see the version date. The last release that I have is 2009-11-19, but there might be something newer than that. See this thread for a discussion of the SST bug, it was fixed in a version dated 2009-07-24.

-Katie

Re: HP12C - SST in RUN-Mode doesn't work correctly

*Message #5 Posted by **twanke** on 5 Jan 2010, 5:49 a.m.,*
in response to message #4 by Katie Wasserman

Thanks a lot as well.

I'm new to HP Calculators and this forum and I'm surprised how helpful you are (and how deep you are all in this topic).

I really like the 12C a lot from the first minutes I used it. I hope I can solve the bug-problem fast.

By the way I read something about a 15C. Is this model in development? I really would buy one imediately!

Thomas.

Re: HP12C - SST in RUN-Mode doesn't work correctly

*Message #6 Posted by **Dan Grelinger** on 5 Jan 2010, 9:29 a.m.,*
in response to message #5 by twanke

'The' HP-15C was released in about 1981, and produced until about 1989. They command a premium on the primary internet auction site, and there are rumors that HP is going to release an updated version of this model.

Re: HP12C - SST in RUN-Mode doesn't work correctly

*Message #7 Posted by **twanke** on 5 Jan 2010, 9:58 a.m.,*
in response to message #6 by Dan Grelinger

Thank's Dan, for the information. As soon as they release the new version of the 15C I will buy one. The 12C has such a nice form factor, quality keyboard and simple, ergonomic user interface.

Have a nice day

Thomas.

> The 12C has such a nice form factor, quality keyboard and simple, ergonomic user interface.

Unfortunately, it has the "landscape" keyboard layout which has proved to be less than optimal for a **handheld** calculator. I've used the HP-15C and HP-12C both for 24 years. The layout is cute, but it definitely "bites the big one" for real, actual, practical use as a **handheld**, regardless of two-handed or one-handed keyboard use.

Doubtless, HP learned from the Voyager landscape experiment that keyboards in that configuration should not be utilized on later machines (other than the never ending legacy of HP-12C mutants).

I doubt that HP will make the mistake of bringing back the HP-15C. Such a model would likely use the original HP-15C ROM image, which would be a tremendous step backward from its 1988 replacement, the excellent HP 42S. That is still the finest RPN calculator ever made (by very large margin over the HP-15C), now more than 22 years later.

Re: HP12C - SST in RUN-Mode doesn't work correctly

*Message #9 Posted by **Katie Wasserman** on 6 Jan 2010, 12:01 p.m.,*
in response to message #8 by Mike Morrow

I too like the 42S more than the 15C, but I don't think it would be a mistake to bring back the 15c with the original firmware but with a much, much faster processor. There are a lot of people here and elsewhere that would love to buy one or two 15C+ calculators. It would cost HP very little to manufacture given the 12C+ and would almost certainly sell 100K+ units easily (bring back the 15c). There's a good bit of money in this.

Re: HP12C - SST in RUN-Mode doesn't work correctly

*Message #10 Posted by **Michael de Estrada** on 6 Jan 2010, 12:37 p.m.,*
in response to message #9 by Katie Wasserman

I keep hearing this arguement as to which was best; the 15c or 42s. They are very different machines and should not be compared. The 15c was simple to use with all its capabilities accessible directly from the keyboard without the need to run through endless menus and had a large clear numeric display. The 42s is a small computer with almost limitless capabilities, but as a daily user it is cumbersome just like the 28s, 48S and 50g. As far as which is best as a hand-held calc, I'd say neither; Woodstocks rule in this regard.

Re: HP12C - SST in RUN-Mode doesn't work correctly

*Message #11 Posted by **twanke** on 6 Jan 2010, 1:19 p.m.,*
in response to message #10 by Michael de Estrada

I've got a 50g but I don't use it every day. So it is a bit more difficult in use with the endless capabilities and menus and flags etc. The 15C would be the perfect machine for me. All the functions it has are just written on the keyboard which is for me also part of the UI. So there is no need in running and search in menus or even looking in the manual. It has enough functions and capabilities and is simple enough as a daily driver. I might buy two as well.

Have a nice day

Thomas.

Dropped HP41CX (carpeted floor), no longer working

*Message #1 Posted by **jim540** on 2 Jan 2010, 9:27 p.m.*

I dropped my HP41CX, and now it no longer works. Thankfully it was on a thick carpeted floor, and only from a height of 18" (I was sitting on the couch), but it will not turn on now. I took the back off, and all I could find wrong is 2 of the 4 "nibs" that hold the battery contact section in place were cracked, but still in place (but no longer straight-up). I carefully checked all contacts on the PWB's and the battery contact section and can find nothing else wrong. Any suggestions?

Re: Dropped HP41CX (carpeted floor), no longer working

*Message #2 Posted by **Allen** on 3 Jan 2010, 12:27 p.m.,*
in response to message #1 by jim540

If you firmly hold the two halves together (around the display), does the unit return to normal?

":Drop testing" a TI-59

*Message #3 Posted by **Palmer O. Hanson, Jr.** on 4 Jan 2010, 7:25 p.m.,*
in response to message #1 by jim540

As a long time TI guy I just have to offer the following quote from the Service Manual for the TI-58/59 which tells how to check for a faulty resonator:

> Quote:
>
> ... perform "drop test" by: starting the diagnostic program, dropping the calculator approximately 6 inches onto a hard surface while the program is still running. If calculator goes into preload or gets wrong answer to diagnostic program, replace resonator.

Back in the early 80's I wouldn't do that with MY TI-59. But a friend who had easier access to a replacement since he was an instructor in the TI Productivity Program did it and his calculator passed. He went ahead and did the test from 12 inches and 18 inches and the calculator still passed. He didn't try a higher drop. He was dropping the calculator on his desk top. Maybe that wasn't a hard enough surface to really stress a TI-59.

Re: ":Drop testing" a TI-59

*Message #4 Posted by **Michael Meyer** on 4 Jan 2010, 7:44 p.m.,*
in response to message #3 by Palmer O. Hanson, Jr.

O.K.... I've collected about a dozen TI-59's, some from parts from several calculators. I've rebuilt keyboards, card readers, etc.

What's a "resonator"? (Or am I going to feel stupid for asking?...)

Re: ":Drop testing" a TI-59

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 4 Jan 2010, 9:32 p.m.,*
in response to message #4 by Michael Meyer

Hi, Doc;

although general, this may help.

in response to message #4 by Michael Meyer

It's a little circular two-lead device that controls the clocking of the digital circuitry of the TI-58/59 series. It's a type of primitive quartz crystal, though I'm not sure quartz was actually used.

TI keyboard repair

*Message #7 Posted by **Marcus von Cube, Germany** on 5 Jan 2010, 2:36 a.m.,*
in response to message #4 by Michael Meyer

Michael, how did you rebuild the TI keyboards? Is there a way to "debounce" them?

Re: TI keyboard repair

*Message #8 Posted by **Michael Meyer** on 5 Jan 2010, 12:01 p.m.,*
in response to message #7 by Marcus von Cube, Germany

Gosh... it's been awhile. I was never able to strip one apart... if I recall correctly, they're held together with adhesive tape. I have transplanted working keyboards to non-working logic boards. I've removed the keys from the calculator to wash them and the cases and returned them one-by-one to their original locations. (Usually) Then I've replaced the deteriorated foam with a sheet of very thin foam of the type that people wrap items in for shipping. Generally, they have worked well.

Fortunately, these calcs are still pretty cheap. I bought a working one with manuals, a printer, and lots of modules just a few weeks ago for $5 from that auction site....

Re: ":Drop testing" a TI-59

*Message #9 Posted by **Garth Wilson** on 5 Jan 2010, 3:48 a.m.,*
in response to message #4 by Michael Meyer

Ceramic resonators are much more accurate than an RC-governed oscillator, but not nearly as accurate as a crystal. The cost is much lower than that of a crystal too. See for example http://dkc3.digikey.com/PDF/US2010/P1490.pdf . I can't think of any reason the TI-59's clock source would need to be more accurate than an RC would make it though. Does anyone know what the approximate clock frequency was?

Re: ":Drop testing" a TI-59

*Message #10 Posted by **Bart (UK)** on 5 Jan 2010, 5:25 a.m.,*
in response to message #9 by Garth Wilson

From a document by Spike de Wal:

> Quote:
>
> Phi_1 & Phi_2 Clocksignals:
>
> This is a 2-phase (non-overlapping) clock that switches between Vss and Vgg. It is derived from a 455KHZ MF filter through the TMC0301-chip but some models of the TI59 have deviating ratings like 462KHZ. The Clock operates in two modes:
> • Calculating (fullspeed)
> • Display or IDLE-mode (lowspeed)

TI-58/59 Resonator (was: Re: ":Drop testing" a TI-59)

*Message #11 Posted by **Bart (UK)** on 6 Jan 2010, 5:09 a.m.,*
in response to message #10 by Bart (UK)

Looked at my TI-58 last night (currently open for repair), it has "384" marked on it, implying 384kHz.

Edited: 6 Jan 2010, 6:06 a.m.

Re: ":Drop testing" a TI-59

*Message #12 Posted by **Bart (UK)** on 5 Jan 2010, 5:16 a.m.,*
in response to message #4 by Michael Meyer

Resonator is often used as a synonym for oscillator. As I see it the TI58/59 has two: the clock generator and the power supply. I don't know if the 59's card reader circuit has a resonant circuit. I would guess the "drop test" as described by Palmer refers to the clock generator.

Re: ":Drop testing" a TI-59

*Message #13 Posted by **Michael Meyer** on 5 Jan 2010, 12:07 p.m.,*
in response to message #12 by Bart (UK)

But why would any of those components be more succeptible to impact? I would think that, other than literally breaking a component, the only thing that would shut the calculator down would be a mechanical interruption of the circuit such as bouncing the contacts off the battery, interrupting the switch, etc.

I guess I'm not understanding why the clock circuit would be any more likely to fail than knocking a pin from an IC or breaking a diode or something...

Or am I just taking all of this too literally?

Re: ":Drop testing" a TI-59

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 5 Jan 2010, 12:38 p.m.,*
in response to message #13 by Michael Meyer

Hi, Doc;

most (if not all current) components are actually sealed, meaning no 'empty spaces', like the ones found in vacuum tubes, are left inside of them. In fact, solid state 'everything' is a tendency, as we saw mechanics being continuously replaced by electronics (see CD´s, MPwhatever, etc.). Even solid state relays are replacing the mechanical ones.

The picture below shows the HP21 oscillating circuit (I am not sure if this is a resonator; does not look like a crystal, though)

As you can see, the little thing is composed by a conductive piece inside of a glass tube and 'touched' by the opposed contact terminals. The inside of the glass tube has vacuum (or is filled with some inert gas), and it is somehow easy to break or get loose after some time. Soldering by itself may damage the component if not controlled accordingly.

Hope this helps (and is accurate...)

Lui z(Brazil)

Edited: 5 Jan 2010, 12:42 p.m.

Correction (I decided not to edit...)

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 5 Jan 2010, 2:31 p.m.,*
in response to message #14 by Vieira, Luiz C. (Brazil)

Please, read 'solid state' instead of 'sealed' in the first sentence:

> Quote:
>
> most (if not all current) components are actually sealed(...)

Re: ":Drop testing" a TI-59

*Message #16 Posted by **Bart (UK)** on 6 Jan 2010, 6:02 a.m.,*
in response to message #14 by Vieira, Luiz C. (Brazil)

Hi,

I looked at my TI-58 last night (it's open for repair), and the resonator is a platic cube similar to this:

Except it's blue and marked "384" which I'm guessing implies 384kHz.

Bart.

Edited: 6 Jan 2010, 6:06 a.m.

Re: ":Drop testing" a TI-59

*Message #17 Posted by **Vieira, Luiz C. (Brazil)** on 6 Jan 2010, 10:10 a.m.,*
in response to message #16 by Bart (UK)

Hi, Bart;

the one I found in my TI59 is different, but I have a TI59 carcass that has a resonator that looks like this one pretty much. Please, see the pictures below.

This is the resonator present in my working TI59

This is the resonator present in a TI59 carcass

This is just to compare the two calcs (click to enlarge)

As I could not find a similar component, either the TI58C has another oscillating circuit or the resonator has a different body. I did not even find a component with a color scheme of the kind orange-gray-yellow (384)

Cheers.

Luiz (Brazil)

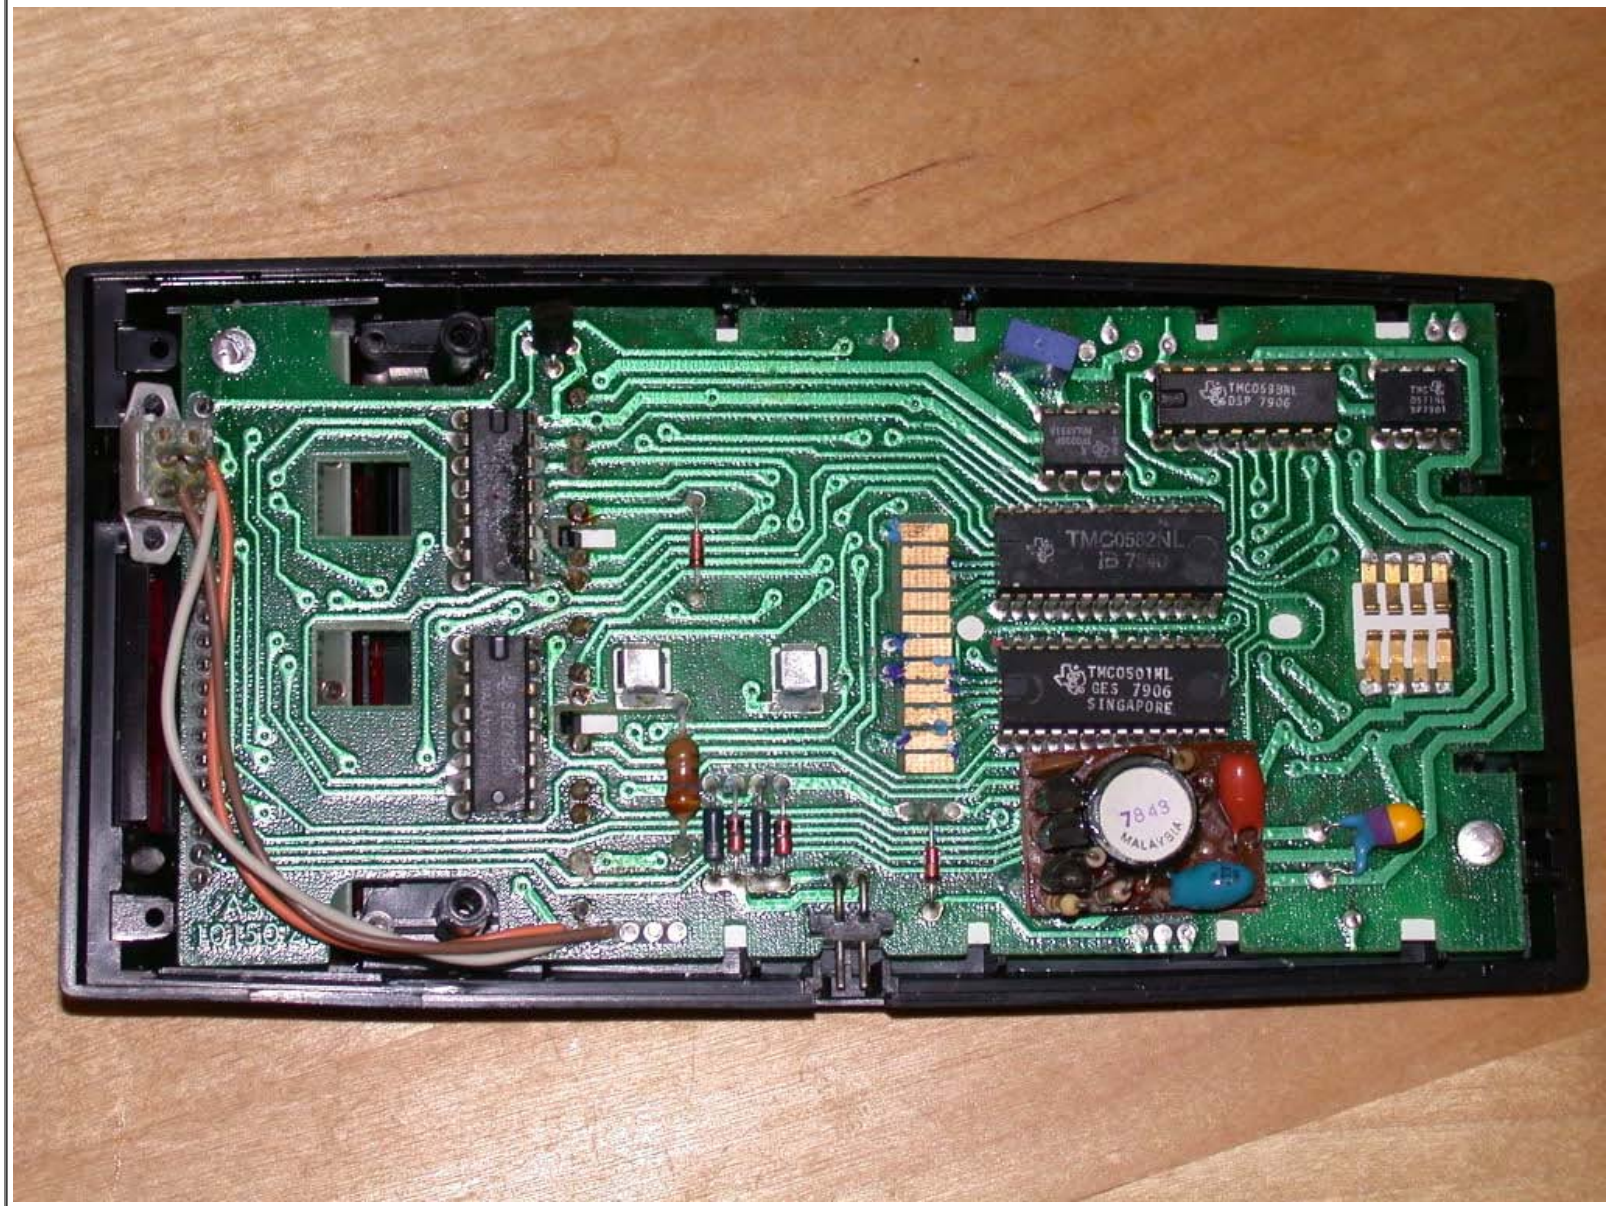
Edited: 6 Jan 2010, 10:11 a.m.

Re: ":Drop testing" a TI-59

*Message #18 Posted by **Bart (UK)** on 6 Jan 2010, 12:42 p.m.,*
in response to message #17 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Interesting to see different versions of a machine. Here's a picture of my 58:



The blue "box" next to the 8-pin DIP is the resonator.

And yes, the blue stuff you see on the tracks is from corrosion due to battery leakage - the reason I have it apart. Whether I'll be successful at repairing it only time will tell - it's one of the "as and when I have the time for it" projects. So I follow and learn much from these threads.

Thanks,
Bart

Re: ":Drop testing" a TI-59

*Message #19 Posted by **Vieira, Luiz C. (Brazil)** on 6 Jan 2010, 1:45 p.m.,*
in response to message #18 by Bart (UK)

Hi, Bart;

The one you see in the picture is a TI58C (is yours a 'C', too?), and it also had some blue powder (seems to be copper oxide, is that so?). Now, please, have a look at the picture pointed by this link.

TI58C and TI59 corrosion compare(Big pic: about 1.9 Mbytes)

The TI59 board (right side) has a lot of oxidation, and the TI58C board (left) seems cleaner, right? They had both about the same oxidation level before I left the TI58C resting for about 20 hours in a solution of 30 to 40% alcohol vinegar with hot water (could touch it without feeling pain...). You can see some of the copper oxide in the TI58C´s PC100A contacts, and also notice the missing copper (parts totally destroyed).

Battery leakage is mainly basic (PH), and the alcohol vinegar is acid, so they react with each other and the remains of the reaction (a salt, right?) is easily removed with a paint brush, current water and neutral detergent. As you can see, I removed the LED display, power supply and some components (transistors, elect. caps, "SSS" module contacts, etc.) prior to clean it up.

I have been doing this for some time (woodstocks and these TI's, mostly) and have successfully removed copper oxide from them. In one particular case, a TI59 board with extensive oxidation damage, had the remains of many copper tracks being dissolved or popped out of the mainboard.

The hot water accelerates the reaction, but after some time its temperature raises down and the reaction decelerates as well. Anyway, I always keep my eyes over the board during the process and never let it stays for more than 20-22 hours.

Hope this helps.

Cheers.

Luiz (Brazil)

Re: ":Drop testing" a TI-59

*Message #20 Posted by **Bart (UK)** on 7 Jan 2010, 5:28 a.m.,*
in response to message #19 by Vieira, Luiz C. (Brazil)

Thanks Luiz for the good advice! Mine is not a 'C'. The casing and keyboard assembly are in very good condition, so I hope I can get it to work again.

Bart

There is also the 'deoxit'...

*Message #21 Posted by **Vieira, Luiz C. (Brazil)** on 7 Jan 2010, 6:02 a.m.,*
in response to message #20 by Bart (UK)

... but I never used it (actually, I´ve never even saw a bottle of it...). Chances are that it is locally applicable.

About the TI58 and TI58C: as you surely know, the constant memory implies another power supply design and low-power RAM chips, hence a

different PC board layout at least to accommodate the 'new guys'. I read (at Joerg or Viktor site, cannot be sure about it) that current through these RAM in low-power state ('resting') is almost in the same range as the one observed in internal, natural battery discharge. I also see that the TI58 has the ON/OFF switch connected to the same position as the ON/OFF switch of the TI59; the TI58C has it connected to the opposed side of the PCB.

Cheers.

Luiz (Brazil)

Edited: 7 Jan 2010, 6:37 a.m.

Re: ":Drop testing" a TI-59

*Message #22 Posted by **Bart (UK)** on 5 Jan 2010, 12:44 p.m.,*
in response to message #13 by Michael Meyer

Although the ceramic resonator relies on mechanical piezo-electric properties [ref], I would assume that the resonator would be relatively immune to the shock from the described drop test. Perhaps the TI part had a known failure mode that made it susceptible to such shocks?

I agree that contact bounce from the battery terminals could also be a likely cause of errors in such drop tests.

Re: ":Drop testing" a TI-59

*Message #23 Posted by **Michael Meyer** on 5 Jan 2010, 2:06 p.m.,*
in response to message #22 by Bart (UK)

I get it now... thanks.

Palmer's post didn't actually say that dropping the calculator would break the resonator. It said that the drop test could detect a faulty one:

"Quote: ... perform "drop test" by: starting the diagnostic program, dropping the calculator approximately 6 inches onto a hard surface while the program is still running. If calculator goes into preload or gets wrong answer to diagnostic program, replace resonator."

THAT makes sense to me, now that I understand the principal of the ceramic resonator. If it were mechanically faulty, which I can see happening from the "right" kind of impact, this test would DETECT it.

O.K... and I was just about to sacrifce a TI-59 to see how far I'd have to drop it and what would break first.....

Re: ":Drop testing" a TI-59

*Message #24 Posted by **Vieira, Luiz C. (Brazil)** on 5 Jan 2010, 2:35 p.m.,*
in response to message #23 by Michael Meyer

Hi, doc;

if the resonator has a bad contact inside of it, chances are that operating the calculator after a while might heat it up enough to disconnect the resonating part of it and cause a malfunction. By dropping the calculator, it would misplace it for good, I guess.

Cheers.

Luiz (Brazil)

More information fro0m the Service Manual

*Message #25 Posted by **Palmer O. Hanson, Jr.** on 7 Jan 2010, 9:58 a.m.,*
in response to message #22 by Bart (UK)

Quote:

Perhaps the TI part had a known failure mode that made it susceptible to such shocks?

I agree that contact bounce from the battery terminals could also be a likely cause of errors in such drop tests.

I think that you are correct about a "known failure mode". The quoe that startd all of this was part of a larger section devoted to repair and modification of existing boards. A more complete quote is:

```
If the calculator has a -3 thru -6 board, the following modifications must be performed:
*  Add a 10 Meg resistor across pins 3 and 5 of the clock chip.
*  Check CR7- must be two PG 1992 diodes in series
*  Check resonator:  Replace if yellow, uncoatd resonator is found.  If rectangular resonator is used, perform "drop test" by:
starting diagnostic program, dropping calculator approximately 6 inches onto a hard surface while program is still running.  If
calculator goes into pre-load or gets wrong answer to diagnostic program, replace resonator.
*  Check Pot - must be 1.0K, 1.5K or 2.5K with a 1.21K resistor in parallel.
*  Check C7 - add 22 uf 15v capacitor if missing.
*  Check for proper capacitor(s) for each clock chip. for
     240 - 75pf between pins 4&5 of clock chip.
         - 75pf between pins 3&5 of clock chip.
     300 - 75pf between pins 3&5 of clock chip.
     301 - 33pf between pins 3&5 of clock chip.
*  And on and on with change affecting card reading and display.
```

When I first saw all of this back in the early 1980's my first thought was that those were the kind of instructions which can be generated when working with a large production run

On resonator frequencies from page 4 of the Service Manual

Quote:

The ceramic resonator Z1 resonates at a frequency of 455 Khz +/- 1%, which establishes a stable frequency source for the clock circuit. U11 divides the 455 kHz by two to produce a 227.5 kHz +/- 1% two-phase clock with a 20% "active" time. (The TI-58 can use a 384 kHz reonator which is the preferred part.)

Back in the 1980's when I was the editor of TI PPC Notes I received a letter from a Canadian who had what he called a "5/6 speed TI-59". It turned out that he had a TI-59 in which a TI-58 resonator had somehow been installed. As a result of looking into that we were told that the TI-58C uses a resonator with a frequency of about 404 kHz.

Re: More information fro0m the Service Manual

*Message #26 Posted by **Mike Morrow** on 7 Jan 2010, 9:31 p.m.,*
in response to message #25 by Palmer O. Hanson, Jr.

My first HP was an HP-67 that I bought in 1977. Later in 1977 I also bought a TI-59 and PC-100A. The TI-59 was in fact a much more advanced, sophisticated, and capable machine than the HP-67, especially with the solid-state software modules and the PC-100A. However, I went through five TI-59s and three PC-100s (ending up with a PC-100C) between 1977 and 1980. The TI hardware was just too "iffy" to trust for any critical application. The programs I wrote for use on my nuclear submarine had to be on the much more reliable HP hardware of my personal HP-67, and a Navy-purchased HP-97.

There were some significant differences between the PCBs of all of the five TI-59 units that I used. That seemed to indicate to me that there were many continuing problems with the TI hardware. Still, I'm fond of the TI-59.

After the fourth TI-59 failure (and my unit just past the warrantee for the last replacement), I wrote directly to the TI CEO (Mark Shepard, IIRC) describing the history of failures. I'm sure he never saw my letter, but I received a call from a TI engineer. TI covered the cost of shipping the TI-59 and PC-100A back to them while they sent new units that the engineer claimed had been thoroughly run thru testing and burn-in. The replacements were still working 18 months later when I "loaned" it to my brother in college (never to be seen again). :-(

Reliability

*Message #29 Posted by **Michael Meyer** on 8 Jan 2010, 10:51 a.m.,*
in response to message #27 by Garth Wilson

I, too, must have been lucky. I bought mine in high school in 1978 and it lasted flawlessly through college. It was "babied", however, and always kept in a padded case. I had ended up with one of those wonderfully padded SR-52 cases with two inside pockets.

I'm still considering a "drop testing" one of my now many 59's just for fun... I mean, study, to see what kind of physical tolerance they really have. I doubt they could go through snow blowers like the HP-25's....

I bought a TI-58 before the TI-59. Shortly after, I traded the TI-58 to a shipyard engineer for his old obsolete HP-35. I still have it, an early red-dot 1143A version. It was in used condition but complete with the manual and all accessories.

I didn't know then that there was anything special about the red-dot version. I'm happy with that trade that I made 33 years (one-third of a century!) ago. I suspect that the TI-58 has been in a landfill somewhere for most of that time.

The 20s is apparently faster than the 32sii

*Message #1 Posted by **Dave Britten** on 2 Jan 2010, 11:19 p.m.*

I wrote a small program for calculating prime factors of a given number, based loosely on the one found here:

http://www.hpmuseum.org/software/67pacs/67factor.htm

For kicks, I made a version for both the 32sii, and the 20s. Despite the 20s being algebraic, there was actually very little that needed to be adapted for this particular program. Both are available here:

http://dave.brittens.org/HP20s/PrimeFactors.txt
http://dave.brittens.org/HP32sii/PrimeFactors.txt

For both programs, enter a positive integer, then XEQ F. Execution pauses when a factor is found. Press R/S to find the next factor. When 0 is displayed, there are no more factors.

Interestingly enough, the 20s seems to produce results noticeably faster. Using the input 869,103,111, the 32sii finds the last factor (4,561) in about 1:20 total. The 20s takes just under 1:00.

Anybody have an original 32s lying around and care to see how it clocks in? I'm assuming a 21s will have the same speed as a 20s.

Re: The 20s is apparently faster than the 32sii (but not the 32s)

*Message #2 Posted by **Karl Schneider** on 3 Jan 2010, 4:22 a.m.,*
in response to message #1 by Dave Britten

Dave --

My HP-32S (1990 model with recessed display) takes 56 seconds to obtain all four factors.

Since it lacks the "<=" and ">=" tests, a small workaround was necessary:

```
   32SII:              32S:

Z24      x<=y?      Z24      x>y?
Z25      GTO Z      Z25      GTO V
Z26      RCL X      Z26      GTO Z
Z27      STO F      V01      LBL V
Z28      XEQ X      V02      RCL X
Z29      CLx        V03      STO F
Z30      RTN        V04      XEQ X
                    V05      CLx
                    V06      RTN
```

Here are my checksums on the HP-32S, which are not the same as those on the HP-32SII for the same instructions:

```
LBL F   714D   10.5
LBL Y   0116   19.5
LBL Z   E93C   39.0
```

```
LBL V   721A    9.0
LBL W   63E1   15.0
LBL X   5878   15.0
```

Between two models having the same microprocessor, why does the more-advanced one tend to run somewhat slower? For example, it has also been claimed that the HP-11C is marginally faster than the HP-15C. I speculate that the lengthier microcode of the more-advanced models causes machine-level instructions to take a bit longer to be found from op-codes. However, more-knowledgeable folks might have a better answer.

Addendum:

Thinking about this a bit more, I'd assume that the ROM contents include some kind of index -- an address lookup table that points to where the instructions for a given op-code reside in ROM. That would speed things up, but access is probably still a bit slowed by larger ROM contents.

Another factor is overloading of operations. Consider the HP-11C versus the HP-15C:

On the HP-11C, "*" only multiplies two real-valued scalars.

On the HP-15C, "*" can multiply two real-valued scalars, two complex-valued scalars, two matrices, or a real scalar and a matrix. Under the microcode for "*" (hex op-code FC), conditional tests for the types of both arguments and status of flag 8 must be performed before the multiplication is done.

Regarding the HP-32S and HP-32SII, the display and memory management are almost the same. The difference in functionality is mostly the HP-32SII's equations and fractions -- not nearly as substantial as the difference between the HP-11C and the HP-15C. Thus, the difference in execution time between 76-80 seconds (HP-32SII) and 56 seconds (HP-32S) is surprising to me. I had 207 bytes of other programming in the HP-32S at the time of the test, so I can't necessarily credit fast GOTO's.

It's actually not a huge surprise, since the two machines - according to Wikipedia, at least - both run a 640 KHz CPU. The 32sii has a more complicated display system and memory management, plus more opcodes as you mentioned. That translates to more overhead to lug around - overhead which is evidently more expensive than managing the AOS input of the 20s.

I was under the impression that the segmented-display Pioneers had a slower CPU than the dot-matrix ones, which is why I initially found the results unexpected. But given the hardware details, things seem to

fall into place.

And a similar algorithm on my 48GX executes in under half a minute, despite the machine "feeling" slower than the Pioneers. Must be just an illusion caused by the overhead of drawing to that huge bitmapped display!

*Message #7 Posted by **Ed Look** on 3 Jan 2010, 6:31 p.m.,*
in response to message #6 by Martin Pinckney

While I may use Wikipedia myself for a few things, I do not like to recommend it to students. It is true I have never seen any scientific or mathematical pages incorrect... though there may have been some incomplete ones... this is not true for other subjects. Until someone has the ability, or more properly, the maturity, to judge the correctly the content, one should be circumspect in recommending Wikipedia.

Besides, it is an open system, allowing for frequent modification. Except maybe for the Ten Commandments and Boltzmann's original formulation of the second law of thermodynamics, nothing is set in stone... but electronic ether flux is too far toward the other extreme.

I am personally careful about anything I see in Wikipedia. This extends even to scientific and technical pages.

Re: Now OT: The 20s is apparently faster than the 32sii (but not the 32s)

*Message #8 Posted by **Dave Britten** on 3 Jan 2010, 7:38 p.m.,*
in response to message #7 by Ed Look

That's kind of my sentiment as well. There's a good body of knowledge there, but it should be treated as a starting point before branching out to more reputable sources. I refer to it a lot, but I've never once used it as a source for an academic paper. I have done some minor article writing and editing, though.

Hi Dave,

I would make the following small comment regarding Wikipedia:

> Quote:
>
> There's a good body of knowledge there

changes to:

There's a good body of information there,

...as knowledge requires understanding and human insight. Wikipedia is full of information, the veracity of which is by the definition of Wikipedia always open to question to a greater degree than is the case with reputable sources.

Or to put it another way: if you need to calculate the strength of something that life depends on, do you go to Wikipedia, or Timoshenko?

> Except maybe for the Ten Commandments ... nothing is set in stone

Good thing you said "maybe" there. The Ten Commandments are more commonly set in type these days, a process which is prone to human fallibility. Witness the "Wicked Bible" or "Adulterous Bible", a 1631 reprint of the King James Bible, which included the memorable injunction:

Thou shalt commit adultery.

Oops. (See http://en.wikipedia.org/wiki/Wicked_Bible for the full story.)

Best,

in response to message #1 by Dave Britten

Dave, thanks for posting this. I don't have a 32S, but I wanted to see how my 35S would perform. Your program found all factors in 1:17 on my 32sii, and in 1:27 on my 35S.

On the 32Sii, it ran in 1:16 if I started the program with R/S instead of with XEQ F.

Re: The 20s is apparently faster than the 32sii

*Message #13 Posted by **Ed Look** on 4 Jan 2010, 4:01 p.m.,*
in response to message #12 by Hiawatha Wheelwright

Yeah, it's good to get back on topic.

I have both the 20S and the 32SII. Maybe I should try timing them, too, though I've never ever tried to program my 20S.

But I have tried some simple addition algorithm that's supposed to lead to convergence on the 32SII, 33S, 35S, and 50g. Yeah, the 32SII is the slowest, and the 33S is surprisingly fast, though significantly slower than the 50g (why did I even bother testing against this one??). I did not make it a scientific test; I started the program and went off somewhere, checking them only intermittently, so I have no absolute numbers, but what the 50g may take about an hour will take very many hours on the smaller calculators, especially the 32SII.

How about 4 seconds?

*Message #14 Posted by **Gene Wright** on 6 Jan 2010, 10:20 p.m.,*
in response to message #12 by Hiawatha Wheelwright

Not bad huh?

Was not using a 50g, no C programming.

Sound interesting?

Re: How about 4 seconds?

*Message #16 Posted by **Gene Wright** on 8 Jan 2010, 11:17 a.m.,*
in response to message #15 by David Hayden

The truth is out there. Either no one is looking or no one has found it yet. Soon as someone does, I'll talk.

The old PPC Journal had a 10 digit prime number "worst case" test they used. The number was 9,999,999,967, the largest 10 digit prime, I believe.

What did this in 4 seconds determines this to be prime in less than 50 seconds.

HP 30b

*Message #19 Posted by **Walter B** on 9 Jan 2010, 4:14 p.m.,*
in response to message #18 by Gene Wright

Ok, that's good news, though a scientific calc with similar features would have been even better. But one could bring forward the argument that after all financial people caused the world economic crisis, not scientists, thus financial people need a proper calc more urgently.

I want to repeat a question I asked here weeks earlier, but didn't get an answer then: Does the 30b feature the same interface the 20b does, allowing some customization?

Since you mentioned the improved keyboard in the linked articles, one could think of mating a 30b keyboard with 20b electronics else.

(Edited to include the link.)

Re: HP 30b

*Message #20 Posted by **Gene Wright** on 9 Jan 2010, 4:27 p.m.,*
in response to message #19 by Walter B

Yes. Same interface. No need to mate a 30b keyboard with 20b electronics. Just use a 30b.

Prime factor routine factors 9,999,999,967 as prime in a bit over 50 seconds. Try that with the 32s, 32s2, or even the 35s.

Not bad for a business calculator.

P.S. I assume HP made a business calculator because more people buy them. So, let's say 12 man months of effort to sell tons of calculators or for something much much smaller. Easy choice, but I'm guessing.

Re: HP 30b

*Message #21 Posted by **Jeff O.** on 10 Jan 2010, 4:54 p.m.,*
in response to message #20 by Gene Wright

I guess I can admit now that my 20b repurposing proposal was really intended as a 30b repurposing proposal. I had considered concepts for the 20b, but with its relatively poor keyboard, it did not seem worth the trouble. With its metal-dome keyboard, the 30b would be a worthwhile candidate, I think.

Re: HP 30b - 9,999,999,967 returned prime in 40 seconds now...

*Message #22 Posted by **Gene Wright** on 10 Jan 2010, 5:00 p.m.,*
in response to message #21 by Jeff O.

How long does the 20s, 35s take on that?

I'm surprised so far such a small amount of interest. ;-)

Business machine, yes. RPN programmable with many scientific functions? yes.

*Message #24 Posted by **Norman Dziedzic** on 10 Jan 2010, 6:16 p.m.,*
in response to message #23 by Norman Dziedzic

I had to step away, it was done when I got back. Time is something less than 51 minutes on the 35s

Re: HP 35s t<51 minutes

*Message #25 Posted by **Gene Wright** on 10 Jan 2010, 6:21 p.m.,*
in response to message #24 by Norman Dziedzic

So, the new model is maybe 70-80 times faster.

Interesting. ;-)

Re: HP 30b

*Message #26 Posted by **Walter B** on 10 Jan 2010, 5:15 p.m.,*
in response to message #21 by Jeff O.

For sure the 30b will approach good ol' HP quality better than the 20b does. If we extrapolate this series of 2 (a bit keen ;) I admit), then we'd get a model with this keyboard and a better, i.e. more versatile display next. Already the 30b, however, shall be sufficient to demonstrate successfully where repurposing may lead us to.

Ceterum censeo: HP, launch a 43S (you still have the chance to be the first).

Walter

Re: How about 4 seconds?

*Message #27 Posted by **David Hayden** on 11 Jan 2010, 6:49 a.m.,*
in response to message #17 by Jeff O.

Does anyone know (and can they say) anything about the reason for the 30b's speed improvements? Faster processor? Native (i.e., not Saturn) code?

I'm hoping, and assuming, that HP is porting their Saturn assembly code to ARM so they can get rid of the Saturnator emulator. That would greatly speed up the calculators. A 32-bit address space would simplify them greatly and allow for much more memory too.

Dave

Re: How about 4 seconds?

*Message #28 Posted by **Tim Wessman** on 11 Jan 2010, 10:28 a.m.,*
in response to message #27 by David Hayden

Yes people could talk about the 30b, it has been announced. It is running native code also. No emulation.

I'm actually pretty sure the 4 second time would be cut in half if it wasn't being dropped down from 30MHz to 15MHz. Somewhere in there is a trigger to drop speed to save power when a program is taking a long time. I haven't checked to see what that threshold is.

The math library in the 20/30b isn't so much "ported" (which I will interpret here as rewriting it from one system to another) but rather was remade in platform independent C using the original math library as a base.

You wouldn't want to attempt to recreate all the saturn code in something like a 50g in C

or ARM either. There are a lot of things that are very much keyed to the old processor, and frankly, there are better ways to do things in a lot of ways. Those systems were generally limited by technology and memory in a way modern systems aren't. It is much more important to have platform independence and maintainability than saving a few nibbles here or there.

30b review at hpcc.org ... join and get Datafile!

This review lays out the differences and improvements to the 30b compared to the 20b.

There will (eventually) be 40 learning modules online, 6 of which are dedicated to programming.

So, read the review and ask questions.

30b prime factor program...

*Message #30 Posted by **Gene Wright** on 11 Jan 2010, 12:48 p.m.,*
in response to message #29 by Gene Wright

Here is the program that now determines 9,999,999,967 to be prime in about 40 seconds. Must be run in RPN mode, of course.

Byte count: 141 bytes (1/2 of total available) Checksum: 232

Usage: Enter program catalog by pressing shift Prgm. With this program selected / displayed, key number to factor and press = =. (Yes, that's twice). Displays running while checking factors. If number is prime, displays "Prime" and shows original number. If a factor is found, displays the factor. Press R/S to continue displaying factors. Zero is displayed when all factors have been found.

Sadly, this is faster than the prime factor program that will be in the learning modules. Of course, it is much newer than that one.

FYI...This is not my code.

Re: 30b prime factor program...

*Message #31 Posted by **Katie Wasserman** on 11 Jan 2010, 1:18 p.m.,*
in response to message #30 by Gene Wright

I didn't write this either, but will just mention a few things that might make it more understandable to those of us who haven't programmed on a 30b yet.

- There are no line numbers in the editor but there is a checksum and byte count (Gene you should include that.)

- This is a keystroke macro language not a typical RPN language so to get the IP fucntion on the Math menu, for example, you'd press: Math, Up, Up, =. The = essentially means to execute that function and put the result in the X register.

- Comparison functions like, ?>=, push a 1 if true on to the stack or a 0 if false. Almost always these are followed by a GT or GF function, Go-if-True or Go-if-False. These functions pop the stack and branch if the value is non-zero or zero, respectively.

- Label searches start at the beginning of memory. If you have a lot of code prior to the branch target this will substantially increase execution time for programs that do a lot of looping. To minimize this the code starting at Lbl 02, in this example, has been put at the beginning of memory and that's why you see the funky goto 06 at the top of the code, it branches to the start of the main code.

- you see "on" in a couple of places in the code, this is a CLx. The shared button reads ON/CE.

-Katie

*Message #35 Posted by **Don Shepherd** on 11 Jan 2010, 2:03 p.m.,*
in response to message #30 by Gene Wright

I didn't write this code either! Actually, that honor goes to Dave Britten at the beginning of this thread, who adapted his code from the original code on the HP-67 math pak. From Dave's code, Tim Wessman wrote this code for the 30b, which I then modified (at Katie's suggestion) to move the most used subroutines to the top of the code so it would execute faster on the 30b. Whew.

Here is a hand-written annotation of the algorithm, before I rearranged the order of subroutines to make it run faster. The version that Gene listed above in this thread finds the primality of 9,999,999,967 in 40 seconds on the 30b. The annotated one in my link takes about 54 seconds.

I also wrote a version that eliminates all multiples of 7 from the pool of potential factors, but that did not reduce the execution time on the 30b, unfortunately, because most multiples of 7 are also multiples of either 2 or 3 or 5, which are already excluded.

in response to message #36 by Walter B

Walter, here is the lowdown on the mode settings. When you RCL Mode, you get a 12-digit number. Lets call it: abc,def,ghi,jkl.

- a = 1 for Standard TVM mode, 2 for Canadian TVM mode
- b = 1 for Semi-annual mode, 2 for Annual mode
- c = 1 for Actual day count mode, 2 for 360 day count mode
- d = 1 for thousands separators not visible, 2 are visible
- e = 1 for decimal separator ., 2 for decimal separator ,
- f = 1 for mm.ddyyyy mode, 2 for dd.mmyyyy mode
- g = regression type, 1-7 for: ax+b, a*ln(x)+b, b*e^(ax), b*x^a, b*a^x, a/x+b, and ax^2+bx+c
- h = 1 for 2 variable stats, 2 for 1 variable stats, 3 for 1 variable frequency
- i = 1 for radian mode, 2 for degree mode
- j = 1 for Chain mode, 2 for Algebraic mode, 3 for RPN
- kl = Fix setting, 00-11, 13=Fix -1

Re: Ok, 30b review link...

*Message #38 Posted by **Gene Wright** on 14 Jan 2010, 10:20 a.m.,*
in response to message #37 by Don Shepherd

Good job, Don! :-) Walter, ask anything you like about the 30b. More...more!

Note on the MODE stuff.

As the review says (or tries to say), you don't have to key the entire 12 digits to change a setting and a value that is outside the valid range is ignored.

So, 302 shift sto shift mode will change to fix 2 and RPN mode.

114 shift sto shift mode would change to chain mode and leave the display setting unchanged since 14 is an invalid value.

And, yes, I too want an unshifted store key.

Re: Ok, 30b review link...

> Quote:
>
> Good job, Don! :-) Walter, ask anything you like about the 30b. More...more!

May I ask also? :^)

- Is the bottom half of the case beveled the way the 20b is?

- How flexible is this Canadian Mortgage mode? Say, can I specify monthly payments with annual compounding? Does it mean the first payment gets full interest, the last one 1/12 of the interest when in Begin mode?

30b Canadian Mortgages...

*Message #40 Posted by **Gene Wright** on 14 Jan 2010, 12:04 p.m.,*
in response to message #39 by Thomas Radtke

The external case / shape is the same.

Canadian mortgage mode allows you to specify a value for P/YR and a value for C/YR. These can be set to a combination of any valid individual values.

I don't know exactly how amortizing a Canadian mortgage works, but the computations work and match what I expect.

From the PPC ROM manual description of FI routine:

Canadian Mortgage: Find the monthly end-of-period payment necessary to fully amortize a 25 year, $85,000 loan at 11% compounded semiannually.

Steps on the 30b:

Shift MODE up. INPUT. .... Changes to TVM Canada Shift P/YR ... displays P/YR of 12 Down...displays C/YR default of 12. 2 INPUT...changes C/YR to 2. ON/CE 300 N 11 I/YR 85000 PV 0 FV PMT

Displays -818.15.

Full precision is -818.149794116

Agrees with PPC ROM. ;-) And, yes, I really do check HP financial calculations against the 12c first :-) and then the PPC ROM FI routine. Too much trouble pulling out my HP 92.

Re: Ok, 30b review link...

*Message #41 Posted by **cyrille de Brébisson** on 14 Jan 2010, 8:52 p.m.,*
in response to message #39 by Thomas Radtke

hello,

Internally, all calcualtions are done using a per period interest rate.

in normal mode, the per period interest rate is calculated by

dividing the rate by the number of periods.

in canadian mode, the periodic interest rate is calculated using the following formula: I=(i/c/100+1)^(c/p)-1 (actually, to be more precise: exp-1((c/p)*lnp1(i/c/100)) but who cares...)

therefore, you can have any valid combinaison of ppyr and cpyr...

after that, it's TVM as usuall...

regards, cyrille

Re: The 20s is apparently faster than the 32sii

*Message #45 Posted by **Bart (UK)** on 5 Jan 2010, 6:33 a.m.,*
in response to message #1 by Dave Britten

I don't have a 32sii, but in this thead I noted that the 20S was faster than the 35s, for that particular implementation. I quite like the 20S, it was a nice machine for it's price/size, and the 99 merged program steps is about right to briefly implement repetative or iterative formulas. There seems to be nothing like it on the market today. For programability it's either a 35s or an overkill graphics calculator. (The Sharp EL-5250 is the only other non-graphics programmable that I know of, but is not available in much of Europe).

Re: The 20s is apparently faster than the 32sii

*Message #46 Posted by **Thomas Radtke** on 5 Jan 2010, 8:40 a.m.,*
in response to message #45 by Bart (UK)

Casio has some programmables of which the fx-4500pa is an evergreen for good reasons. Not a bad calculator if you don't mind the entry system and hard to read keyboard legends.

Programmable non-graphic scientifics (Was: Re: The 20s is apparently faster than the 32sii)

*Message #47 Posted by **Bart (UK)** on 5 Jan 2010, 10:02 a.m.,*
in response to message #46 by Thomas Radtke

Thanks, doing some more research I found Casio have more programmable models. the FX-50F+ which I've found on UK online stores and the FX-5800P which is not available in the UK, but in Germany and Switzerland for about the same price as a 35s (on the plus side it does seem to have connectivity options).

Re: Programmable non-graphic scientifics (Was: Re: The 20s is apparently faster than the 32sii)

*Message #48 Posted by **Marcus von Cube, Germany** on 5 Jan 2010, 2:53 p.m.,*
in response to message #47 by Bart (UK)

I have a fx-5800P in front of me. The connectivity is only between identical machines. The cable is a standard Casio connectivity cable but that does not mean that you can mix and match devices.

Still better than no connectivity at all.

Re: Programmable non-graphic scientifics (Was: Re: The 20s is apparently faster than the 32sii)

*Message #49 Posted by **Bart (UK)** on 5 Jan 2010, 6:20 p.m.,*

I got jinxed: Need help from an Mcode/NoV pro

*Message #1 Posted by **Geir Isene** on 1 Jan 2010, 6:52 p.m.*

So, the newly released ICEBOX.ROM version 1G works nicely under M41. When I try to burn it into my NoV-64, it simply doesn't show up. Nothing is in the specified page (checking with Hexedit, there are only zeros - but the rom file is verifiably not empty as I checked it in a text editor). No errors when running ClonixCfgWin.exe and assembling the HEX image. I have tried to burn my NoV-64 with only the ICEBOX1G in page #C or page #D in either flash block. I tried to burn it together with other rom images. Still the same.

Here is where it's good to have a community like this - I hope there are someone here who can try the new image into their own NoV-32/64 (or MLDL) and check if they get a similar result and if possible give me a pointer to what is wrong with the rom. The rom and the source code are on the ICEBOX page.

Any help is highly appreciated.

Re: I got jinxed: Need help from an Mcode/NoV pro

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 1 Jan 2010, 9:04 p.m.,*
in response to message #1 by Geir Isene

HI, Geir;

I have already downloaded it from your homepage but I have not uploaded it to the MLDL yet. Will do that and post about it ASAP!

In time: I do not have a NoV64, but I would like to know in which page did you load the ICEBOX1G ROM image. Didi you try loading it in lower addresses (8 or 9)? Just a guess. Some modules who access inner functionality seem to work better when first seen by the system.

Cheers.

Luiz (Brazil)

I tried the same pages as the ICEBOX version 1F...

Seriously weird.

Works with MLDL2000: config listed

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 2 Jan 2010, 1:00 a.m.,*

in response to message #1 by Geir Isene

Hi, Geir;

I loaded the ICEBOX1G.ROM (MLDL2018A, firmware updated) and it listed OK in the HP41. The ROM mapping is like this:

```
Page#  image
  5    HEPAX 1D (4 banks)
  8    SRAM (dir empty)
  9    SRAM (dir empty)
  A    Advantage 1D (bank #1
  B    Advantage 1D (banks #1 & #2)
  C    CCD OSX
  D    ICEBOX 1G
  E    DAVID ASSM
  F    MNFR LBLS (David Assembler labels)
```

The ICEBOX 1G appears accordingly and its functions are listed as well. Because I prefer the block catalog feature, I usually leave regular CCD or the reduced CCD-OSX configured somewhere, and in this particular case, ICEBOX 1G header and its functions show perfectly well.

I tested just two functions for functionality and both worked fine: BLNG? and KALNG?. In time: BLNG? emits a very brief tone that can be suppressed with CF 26. Is it normal? There is no mention to such tone in the manual.

Again, I do not own a NoV64, but I'd ask you to confirm if the NoV64 accepts a functionality available with MLDL2000 configuration: to enable or disable a particular image. Again, I do not know if it is possible in the NoV64.

Hope this helps.

Cheers.

Luiz

On the BLENG? tone, I will look into it - it's an ineritance from the TOOLBOX.ROM.

Re: I got jinxed: Need help from an Mcode/NoV pro (why: faulty USB stick... duh)

*Message #6 Posted by **Geir Isene** on 2 Jan 2010, 5:46 a.m.,*
in response to message #1 by Geir Isene

I have to chalk this up to a faulty USB stick... :-(

Extensive testing shows this to be the most likely reason.

Re: I got jinxed: Need help from an Mcode/NoV pro (why: faulty USB stick... duh)

*Message #7 Posted by **Diego Diaz** on 4 Jan 2010, 8:29 p.m.,*
in response to message #6 by Geir Isene

Hi Geir,

First, Happy New Year and congrats on your ICEBOX job! ;-)

I've checked it on my NoV-64, and runs as expected. (just the functions relative to block swapping within the NoV-64 memory).

It's certainly wierd that the USB connector leads you to such misfunction... eventually it either shouldn'n be able to perform the programming of the module, or failed the verification process.

Good you have it fixed :-) keep on enjoying your toys!!

Cheers

Diego.

A certain upbeat and infectious tune has stuck with me ever since hearing it in the 1970's on "easy-listening" radio or music service. However, I did not learn until very recently that its title was "Eine Schwarzwaldfahrt" (A Walk in the Black Forest).

It was an international instrumental hit in 1965 for Horst Jankowski, so I'm sure that many others of a certain age who populate this readership will also remember it. Links to a recorded track or performance are readily available on the various YouTube sites.

ICEBOX.ROM version 1G released + Happy New Year

*Message #1 Posted by **Geir Isene** on 31 Dec 2009, 10:59 a.m.*

Here's the release notes:

In version 1G, I added the functions N200, N201, N202 and N203 to complete the direct bank switching for the NoV-64. A function NXXX was also added to take a number in X and write it directly to address 4100 - in this way, the user doesn't have to go via HEX>NNN and WROM to write a new setting to 4100 (makes for easier bank switching in FOCAL programs). I also added the functions SAVEN and GETN to save and restore main memory to HEPAX RAM (using the file name "N", these functions call HSAVEA and HGETA respectively). They make it possible to assign the saving and restoring ov main memory to keys.

Go to the ICEBOX page to get the rom image, the source code and the updated user manual.

And; Have an excellent 2010!

Re: ICEBOX.ROM version 1G released + Happy New Year

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 31 Dec 2009, 11:18 a.m.,*

The best way to save a HEPAX block to mass storage?

*Message #1 Posted by **Geir Isene** on 30 Dec 2009, 3:15 p.m.*

The purpose is to save 4K blocks of a NoV-64 to mass storage.

There are several modules and ways to accomplish this. Which is the easiest and best way?

Re: The best way to save a HEPAX block to mass storage?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 30 Dec 2009, 7:24 p.m.,*
in response to message #1 by Geir Isene

Hi, Geir;

when I want it fast, I use the 9114A (needs HPIL) with HEPAX WRTROM (READROM to retrieve) to save a copy of a complete ROM 4K block in a floppy disk. This is also reliable.

In time: I found some problems using WRTROM with a 82242 IR module connected to the HP41. Many data were altered in the NoVRAM module and I had to completely erase and program it again, including the NoVolatile RAM. I am investigating possible causes.

If you have a MLDL2000, you can also configure the NoV64 to leave one or two pages unused (free addresses) and configure the MLDL2000 to use the free addresses with two SRAM 4K blocks in the MLDL2000 itself. Then, use HEPAX COPYROM to make a copy of the 4K page in NoV64 (source) to one of the available MLDL2000 SRAM (I suggested two because most modules use two pages at the same time). Then connect it to the computer and save it as a .rom file.

These are the two ways I have been using.

Cheers.

50g easter eggs

*Message #1 Posted by **Glenn Shields** on 30 Dec 2009, 12:46 p.m.*

Here is something on a lighter note, regarding hidden surprises:

In some on-line HP50g review, someone mentioned an easter egg in the fast 3D area, but that the reader was invited to discover this for himself. Is anyone aware of this? The easter egg site only mentions "RULES" and "MINEISBETTER" is getting old.

Happy New Year to all, Glenn in West LA

Re: 50g easter eggs

*Message #2 Posted by **Glenn Shields** on 2 Jan 2010, 2:30 a.m.,*
in response to message #1 by Glenn Shields

Ok, I figured out that "HpMad" is listed for the 49g. Trying this on the 50g produced an "unplayable" Tetris game, moving so fast that is a blur. Is this because it is not adapted to the processing speed of the 50g? Just curious because of so many functions listed in the AUR which are holdovers from the 49 and 48. Thanks in advance! a last minute Cheers on 1/1/10 - Glenn in West LA

Re: 50g easter eggs

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 2 Jan 2010, 3:55 a.m.,*
in response to message #2 by Glenn Shields

Hi;

I was aware of the existence of some easter eggs, but I never knew any. Thanks!

Luiz (Brazil)

Re: 50g easter eggs

*Message #4 Posted by **Glenn Shields** on 2 Jan 2010, 5:17 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Thanks, Luiz. I know these games are just small entertainment, a break from some "real" work or serious play, but fun anyway. There is an old 2003 post in the archives which dealt with this fast Tetris game already. The speed is mentioned, the question is just why? I was able to get 1. (a real number) point! What was Cyrille thinking? Happy Jan 2nd

Re: 50g easter eggs

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 2 Jan 2010, 5:22 a.m.,*
in response to message #4 by Glenn Shields

Hi, Glenn;

if we consider that the designers had the calculator´s bare hardware at hand, they could slow it down enough to play a little bit... Why not?

Cheers.

Re: 50g easter eggs

*Message #7 Posted by **Glenn Shields** on 6 Jan 2010, 2:02 p.m.,*
in response to message #6 by Bill Zimmerly

Thank you Bill, I remember seeing your review when I was considering getting the 50g. All the posts and reviews have been so helpful in getting up to speed with this machine, in addition to the (printed) user guide and AUR. You just can't get enough tips and tricks.

One tricky thing about RPL programming is knowing when stack items will get "consumed" by tests etc. I have come up from older calcs (32s, 20s) and the 33s and 35s now, and after delving into the 50g, a little refresher is needed now and then on rpn line programming.

To the point, I found a reference in hpcalc.org about the HpMad game for the 49g, along with the cryptic reference to other hidden eggs in the fast 3D area. So whatever this is, does it apply to the 50g? And the other thing is, do you need the reflexes of a fly (a la Jeff Goldblum) to play the HpMad game?

Cheers, Glenn

HP nut CPU and illegal instruction sequences

*Message #1 Posted by **Håkan Thörngren** on 30 Dec 2009, 5:19 a.m.*

Does anyone know how the 41 nut cpu behaves when it comes to instruction sequences that should be avoided?

The David assembler manual basically says that AND and OR should not follow an arithmetic instruction that can have a carry out of the highest bit of the register.

The HP internal doc states that various instructions, most flag instructions (plus AND and OR) should not follow an arithmetic class 2 instruction. What is an arithmetic class 2 instruction here? Is it any class 2 instruction, even such as C=0 which does not even affect carry? Are relational compare instructions such as A<C affected as well (it probably does an internal subtraction)? What about C#0?

The HP description does not feel right, I have done things that should be avoided in the past without getting any ill effects I could see. I feel a little bit puzzled by this.

In short, what should I look out for? Should I trust David, HP or are there other interpretations on what should be avoided?

I have no answer but I am following...

Re: HP nut CPU and illegal instruction sequences

*Message #3 Posted by **Eric Smith** on 30 Dec 2009, 1:34 p.m.,*
in response to message #1 by Håkan Thörngren

Note that HP had three generations of Nut CPU chips, 1LA5, 1LE3, and 1LF5 (and more if you count some of the later Voyager variants), so it is remotely possible that bugs might have been fixed in the later ones. On the other hand, they probably didn't have any significant justification for investing the engineering effort to fix the bugs, so it is more likely that they kept the logic design of the core the same.

I think this clarifies some points...

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 30 Dec 2009, 9:22 p.m.,*
in response to message #1 by Håkan Thörngren

Hi, Håkan;

A recent addition to T.O.S. (Doug Wilder´s QuinTable.pdf) brings the following relevant notes:

> Quote:
>
> ```
> 3. NOT (C=-C-1) always sets carry.
> 4. AND and OR misbehave if carry is set.
> 5. POP misbehave in DEC mode: increments msd if in the range A-F.
> 6. G register misbehave if PT=13
> Copyright 1987, 2005 STC, W.D.Wilder
> ```

No specific explanation about the reasons or internal structure, but it gives some extra info.

Cheers.

Luiz (Brazil)

Guess what, you get to test! get your head out of your ass and test your surmise, don't be stupid, test your premise: Sorry,

It ain't that hard to test your code, don't be afraid, just try it, it can only crash your calc and you can revive via MEMORY LOST.

don't be afraid, i love 41c. Don't be afraid.

Doug

PS: JUST TRY IT

Re: HP nut CPU and illegal instruction sequences

*Message #6 Posted by **Håkan Thörngren** on 4 Jan 2010, 1:13 a.m.,*
in response to message #5 by Doug

I hoped there were some deeper insights available in this issue. In that case I will need to fire up my MLDL and HP41 and try some stuff out myself.

I am not afraid, I had far fewer MEMORY LOST messages doing MCODEing than I did with synthetics... :)

It is just that I do not have my MLDL anywhere close to me at the moment, so it will have to wait. Anyway, I have some good starting points what to look at when I get around to it.

Re: HP nut CPU and illegal instruction sequences

*Message #7 Posted by **Ángel Martin** on 4 Jan 2010, 2:47 a.m.,*
in response to message #6 by Håkan Thörngren

I know nothing beats the real thing but V41 does an excelent job as surrogate of a HW MLDL. It supports the Hepax module quite flawlessly (others maybe too but I haven't tried them).

Bad news if you're not using Windoze, though - but maybe you've got another system available fot these purposes.

Best wishes, AM

Re: HP nut CPU and illegal instruction sequences

*Message #8 Posted by **Monte Dalrymple** on 4 Jan 2010, 11:04 a.m.,*
in response to message #6 by Håkan Thörngren

My paper "Inside the NUT CPU" over on the unmentionable site may provide some insights.

I was never able to figure out the "not after class 2" restriction. If I had to guess, I would say that it has something to do with a carry affecting the instruction similar to how it is used for the conditional jumps... but that is just a guess.

I do not consider the G=13 case to be a bug. As I explain in the aforementioned paper, the results are exaclty what falls out of a straigtforward bit-serial implementation of the normal case.

In all cases, it is important to remember that this design is from an era when every single transistor counted, so a designer would spend time minimizing the number of transistors. Add to this the bit-serial operation, and most of the "bugs" that have been documented can be easily explained.

Because emulators typically do not atempt to mimic this bit-serial operation, it is unlikely that they will duplicate out-of-the-norm cases. Even with my NEWT design, which retains the bit-serial operation, I didn't ever try to verify all of the abnormal cases. For example, arithmetic operations, in decimal mode, when the register contents are not valid decimal numbers. Odds are that the results will be the same, because the arithmetic functions are the same, but I never bothered simulating these cases.

Monte

Re: HP nut CPU and illegal instruction sequences

*Message #9 Posted by **Håkan Thörngren** on 5 Jan 2010, 1:56 a.m.,*
in response to message #8 by Monte Dalrymple

I have so far studied old HP documentation, Doug Wilder´s QuinTable.pdf, David's assembler manual, the Monte Dalrymple's "Inside the NUT CPU" and "NEWT Microprocessor Technical Manual".

The G register and pt=13 thing I have stumbled over myself by accident way back before I even

saw it documented. It is well explained in the Newt paper as well as David's assembler manual.

David also explains the C=C|A and C=C&A bugs, but the description is not the same as I saw in QuinTable.pdf. I will need to experiment with it myself a bit on real hardware.

Non-BCD numbers in decimal mode arithmetics behavior is tested by the service module. I found this out when I tried the service module on my emulator. (I did it wrong initially).

Anyway, I feel there is a reasonable complete understanding of many of the things going on. The darkest corner seems related to the class 2 (arithmetic) instructions being followed by certain other instructions mystery.

Many thanks, I will keep the information I have collected so far in mind when I can power up my MLDL later for some experiments.

*Message #10 Posted by **Eric Smith** on 5 Jan 2010, 12:50 p.m.,*
in response to message #9 by Håkan Thörngren

On the Saturn CPU, decimal arithmetic with non-BCD digits is non-commutative. I haven't tested this with the Nut or earlier CPUs, but it's on my todo list.

in response to message #3 by Tim Wessman

HI,

Sorry for my naïve remark, I have never touch a HP50g.

How can a single (binary) flag be the director of a three-state positon (USB - IRDa - SERIAL) ? Is this flag more than binary (set or down) or is there samewhere another trick I am missing ?

Thank to elucidate this and bring me the light of understanding.

Re: HP50g switch between USB to SERIAL

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 31 Dec 2009, 5:37 a.m.,*
in response to message #5 by C.Ret

Hi;

flag 78 controls only cable selection (USB or Serial).

Cheers,

Luiz (Brazil)

Edited: 31 Dec 2009, 6:48 a.m.

Re: HP50g switch between USB to SERIAL

*Message #7 Posted by **Don Shepherd** on 31 Dec 2009, 6:56 a.m.,*
in response to message #5 by C.Ret

I am not familiar with how the 50g works, but perhaps the flag is not binary. Perhaps it can be 1, 2, or 3.

Re: HP50g switch between USB to SERIAL

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 31 Dec 2009, 7:45 a.m.,*
in response to message #7 by Don Shepherd

Hi;

all flags in the HP50G (all-purpose, user flags or system flags) are binary: cleared (0) or set (1). They can be tested with one of two possible answers: true (1) or false (0). One single bit only.

Cheers.

Luiz (Brazil)

Re: HP50g switch between USB to SERIAL

*Message #9 Posted by **Tim Wessman** on 31 Dec 2009, 10:04 a.m.,*
in response to message #5 by C.Ret

Sorry about that.

The only problem with setting it problematically is that flag 78 doesn't show up in the flag list. Flag 33 sets either IR or wire, and then if 33 is clear so wire is active, 78 set means serial instead of USB.

NiCd Lady Company Review (battery rebuild)

*Message #1 Posted by **Egan Ford** on 29 Dec 2009, 7:22 p.m.*

Following a tip from this forum I sent in my 82161A battery to NiCd Lady Company (http://www.nicdlady.com/) to be rebuilt.

The process was fairly straightforward:

1. Check their list for your battery (http://www.nicdladyonline.com/rebuilding/photo-power.html). BTW, the prices are either outdated or updated. The chart indicates that I should have paid $28.
2. Blindly send in your battery with a letter requesting that they rebuild your battery. Put in the letter your return address, phone number, and email address.
3. Pray it does not disappear.

A few days after I did this I got an email stating that they were backlogged and to expect an email or call in 6-8 weeks.

8 weeks later I was informed via email that my battery was rebuilt. I was asked to call to make arrangements for payment.

I called, handed over a VISA number, and was charged a total of $19.95 for the rebuild and return shipping.

A few days later it arrived. Clearly all the batteries were replaced and the case looks like it was opened and closed by a surgeon. Excellent workmanship.

I just tested the battery in my cassette drive. Finally NEWM 100 does not fail.

$19.95 was the cheapest price I could find (unless I wanted to do it myself), and the return shipping was included. If you do not mind waiting (I was in no hurry), then give NiCd Lady a go.

Edited: 29 Dec 2009, 7:27 p.m.

Most people do not renew Nicad cells, rather they opt for NiMh cells. I have had such good experience with Sanyo Eneloop low discharge rate cells. I used to keep 2 4 cell chargers busy trying to keep up with self discharge, now a dozen AA and AAA cells suffice and seldom need recharge. I have shells that allow AA to fill the need for D cells, handy. We use few primary cells any more. You can reliably take a camera that has set around for months and expect it to perform. Sam

HP 42S simulators on ipod touch--I answered my own question

*Message #1 Posted by **bill platt** on 28 Dec 2009, 1:46 p.m.*

I have read this thread:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv019.cgi?read=159080#159080

and so I think I understand that basically:

1. Thomas Okken wrote a stand-alone simulator of the 42S functionality (as distinct from an emulator which requires a ROM image) and compiled it to run on the iPod and iPhone, naming it "Free42". (also compiled to run on Palm, WinCE, and Windows under separate releases)

2. Byron Foster ported Thomas' Free42 to create an extension of Thomas' tool, adding some new ideas which are not strictly compatible in every case with an original HP 42S. He named it "42s RPN Calculator."

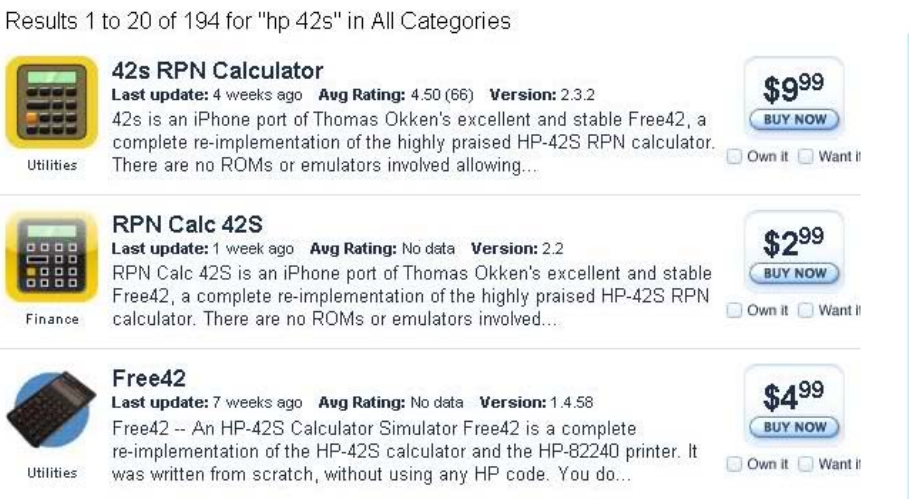
3. Another port of Thomas' Free42 appears on the ipod apps page: "RPN Calc 42S."

This last app seems to use text in the description which is mostly identical to Byron's version. Does anyone have any background on this? I now see that Thomas describes this at his own web-page, as being a release of one of Byron's earlier edits, by a third party. I guess this is something that can happen with GNU licensing?

Here is what the descriptions are:

http://appshopper.com/search/?cat=&search=hp+42s

and here is a screen capture if the link changes (what I saw):



As far as emulators go, I know Thomas knows all about emulators--and I though he had made some of them, but perhaps most of them all come from Christophe. 42S emulation: http://hp.giesselink.com/emu42.htm

Edited: 28 Dec 2009, 2:03 p.m.

Re: HP 42S simulators on ipod touch--I answered my own question

Free42 is not based on Emu42. Emu42 emulates the Pioneer platform and requires the 42S ROM. Free42 is a cleanroom implementation of the 42S.

BTW, RPN Calc 42S is just a ripoff of 42s RPN Calculator. 42s (iPhone version) is GPL (open source). Any can take the source, compile, and publish. It's legal, however sleazy.

Thomas could grant Byron a different license to avoid this type of sleaziness.

Re: HP 42S simulators on ipod touch--I answered my own question

*Message #3 Posted by **bill platt** on 28 Dec 2009, 7:46 p.m.,*
in response to message #2 by Egan Ford

Hi Egan,

Thanks for the clarification. I know about the emulators being different from the simulators. I have the 27S and the 48GX emulated on my computer, and I run the light version of Hrastprogrammer's 41E on my 48GX.

This 42S simulator is the first simulator I have run. It is really amazing to be able to finally explore the 42S without having to buy one!

Very interesting about the licensing.

For sure. They are, however, significantly faster, and often you may edit programs in a more comfortable environment than on the "real thing". And you may save your programs on a mass storage device easily (ola Luiz ;). The best of both worlds would be a 43S with an SD or passive USB interface and real keys with tactile feedback.

Item ceterum censeo: HP, launch a 43S.

Walter

(Edited to correct a typo)

Hi Walter,

Perhaps some enterprising and talented individuals who frequent this forum might wish to attempt to implement your 43S in an emulator as an experiment. I certainly would be one of the first to seek or purchase a copy. Perhaps HP could be shown how it should be done :-)

in response to message #2 by Vieira, Luiz C. (Brazil)

Did you take time to test the board?

Michel

Re: HP-41CX motherboard

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 7 Jan 2010, 8:40 p.m.,*
in response to message #3 by Michel Beaulieu

Hi, Michel;

I am finishing my 'homework' till this very weekend related to the end of the school semester (final

grades and all related paperwork, as you probably know...) then I'll get back to the board.

A few days ago I bought an HP41CV with a single ROM chip. It is a ILG9xxx (cannot see the rest of the code) and I will inspect your CX board to see if there is such kind of ROM chip. Anyway, the idea is to remove the three (or the single) system ROM (0, 1 and 2) then emulate them in the MLDL2000. If the problem persists, I'll remove the other three (X-FCN, Time and CX FCN/TIME) and do what I did with my own CV. If the calculator goes OK in any case, I'll put one ROM at a time back to the board and see which of them causes the problem. If I have a replacement, then I´ll proceed with the change.

My very concerns are related to removing and placing back any MOS chips, mostly when they are so exclusive. All care we have each time it is done is never enough... Grounding ourselves, grounding the devices (soldering iron), discharging electrolytic capacitors, grounding the power lines (BATT+ and BATT-) and using a hairdryer to 'blow' the air around and reduce active ions (works fine, just do not point it to the components too very often) must be performed calmly and sequentially. Takes time, but compensates. These are the main reasons I did not do it so far: everything must be dedicated to that. A CX motherboard demands to be treated like that!

Cheers.

Luiz (Brazil)

O.T. What kind of math?

*Message #1 Posted by **designnut** on 27 Dec 2009, 12:29 a.m.*

A car GPS navigator has coordinates for our location and our destination. It has spatial map of streets. How does it find an optimal path so quickly? If we blunder or choose not to follow the suggested direction it plans a new route before the next corner. It was a gift, a MIO 300. It has been used for a year and once it sent us in a wrong direction, we knew better and went our way, It quickly corrected. It has a 400 Mhz processor. What is it doing? Sam

Re: O.T. What kind of math?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 27 Dec 2009, 3:31 a.m.,*
in response to message #1 by designnut

GRAPH analysis, most certainly. It probably uses a modified Dijkstra´s algorithm, by suppressing unavailable path (congestion, void access, etc.) anytime it happens and giving the best route in no time.

Cheers.

Luiz (Brazil)

(In time: are you the same Sam who sent me some very interesting texts, about three years ago? If so, please, let´s get in contact again. I had been 'off line' for some reasons, health-related mostly, but *it seems to me I'm back, now*. e-mail: lc_vieira (at) quantica [.] com dot br)

Edited: 27 Dec 2009, 4:30 a.m.

Re: O.T. What kind of math?

*Message #3 Posted by **hpnut** on 27 Dec 2009, 4:50 a.m.,*
in response to message #1 by designnut

Sam,

a lot depends on the accuracy of the map data itself. I was in Australia last year, just couldn't find a restaurant in Melbourne that was supposed to be listed in the map. Turned out that the restaurant had closed ;-)

hpnut in Malaysia

Re: O.T. What kind of math?

*Message #4 Posted by **C.Ret** on 27 Dec 2009, 7:08 p.m.,*
in response to message #1 by designnut

Hi,

Yes, the GPS has the latitude and longitude coordinates of your position acquired nearly every seconds and the latitude/longitude coordinates of your destination.

The road navigation GPS also have now on board map with the most detail of roads, intersections and a large bunch of points of interest. These maps are vectorial maps since they are draw using latitude/longitude coordinate, length and heading of road leg, as well as coordinate of intersection, town, point of interest, also contain street name, the road nomenclature, road categories and same other data concerning one-way roads and other circulation constrains.

This makes a lot of digital data, making that the full country maps are weighting several Go now. All this stuff is present in the map to allow precise drawing in the very probable case you decide to zoom in. But all these data are not used to compute a route.

One may be surprise that route computation is so quick at initial full trip computation as well as on road computation, as soon as the driver leave the planned route. Even with low speed processor (which generally share time with several internal functions concerning GPS signal processing, display and other user interface touch screen, etc… a GPS with 400 Mhz processor seems to be a power full one) and huge among of data in the vetorial map. These amazing little boxes still use a fraction of second to compute or re-compute the route !

The algorithm's performance and the math involved there are of secondary importance. The high computation speed is mainly due to pre-compute link tables stored in the maps, which make that the GPS have not to carry the full process of a complete Drijska's method, not to run all the heuristic, nor to evaluate a mountain of combinations. The GPS is mainly using a pre-computed look-up table that summarizes and regroups directions of the map at the appropriate scale.

This make that the computation of a trip following main roads or highways even on a long distance is much more fast than the computation of a short trip of a few tens of miles in a map's region were no pre-computed table exist (or only incompletely).

The same, when the driver leave the planned route. The GPS rapidly compute a new partial route to the next node present in the already scanned pre-computed links table, never (or rarely) the GPS have to compute a full new route from crash. Sometime, depending of the region where you are travelling in, the GPS propose strange route on the fly with illogic or unnecessary detours.

Of course, the exact process vary from one model or brand of GPS. As well, the efficiency greatly relies of the data organization into the map and how well is all the system organizes altogether. For sure, the pre-compute links table are build up during map compilation using the Dijstra method or one dedicated method deduce from it.

HP 12-C on the Android

*Message #1 Posted by **Dale Wyckoff** on 26 Dec 2009, 11:01 p.m.*

In October palmheads asked about HP-15c/12c for the Android. Bruce Bergman responded with "Coming. Stand by." Does anyone have an idea as to the status of this app? I'd love to have a 12-C on my Droid!

Re: HP 12-C on the Android

*Message #2 Posted by **Bruce Bergman** on 27 Dec 2009, 1:54 a.m.,*
in response to message #1 by Dale Wyckoff

Ha! That goes to show that I should keep my big mouth shut! ;-)

Actually, I haven't heard anything on it since October either. I suspect there have either been some issues or higher priorities. I, for one, have been working to put something RPN-ish on the Palm Pre, but getting into their developer program is like pulling teeth. It's almost like some of these companies don't want you to create apps for their phones.

Anyhow, hopefully someone will produce something for the Android platform soon. Maybe the rumors of the Nexus One going on sale next week will spur some interest. I'm just as interested as y'all.

thanks, bruce

in response to message #1 by Dale Wyckoff

RPNCalcPro in the Android Market now has a HP-12c lookalike financial mode (updated today) in landscape view. Looks pretty good to me! It also has a scientific calculator & a basic RPN calc mode.

It doesn't have the programmable abilities of a real 12c, but for most people who cares. The key layout & functionality looks the same to me.

It doesn't looks exactly the same aesthetically (ie exactly the same look as a 12c), but still looks like a HP calc thanks to the natural look of RPNCalcPro. Key layout is the same which is important!

Very happy to see it!

*Message #1 Posted by **Vassilis Prevelakis** on 25 Dec 2009, 4:46 p.m.*

Hi,

I am back. After some time off for family reasons.

The SUN Ultra1 that was hosting Series80.org has given up the ghost, so I have moved to a commercial hosting service. I am also in the process of moving DNS registrars, so further hiccups are likely.

Please be patient, the new provider has much better connectivity and (hopefully) uptime than the old SUN.

Happy holidays to all.

**vp

Hi, Vassilis;

good to 'read' from you!

I have been 'off line' for a while (almost two years!) and got back recently, too.

Welcome back! I hope everything is fine with you, now.

Cheers.

Back to MLDL2000: I did it again...

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 24 Dec 2009, 2:13 p.m.*

Hi, guys;

after a couple of hours of labor (a lot of criteria involved), I finally got to this:

Now I can set the CPLD power as I wish. The externally-accessible jumper connects to J7. In the above picture, the CPLD is powered in RUN and STANDBY mode (pins 2-3 connected). In order to run a CX configuration in a CV with no ROM installed, the jumper must be positioned to the right (pins 1-2 connected).

Well, it works! I always liked the CX functionality, did not care too much for the clock, but I miss the X-memory. I configured HEPAX 1D to page #6 and it worked fine so far, so I still have all four ports (eight pages) to work with and left address for the HPIL. The HEPAX RAM offers all X-memory functionality and some more, so I'll stick to it so far. The CX functionality now goes for the main memory extras. One of them I did not find anywhere but in the CX (I intend to add it somehow in a future ROM module) is showing the amount of bytes accupied by a program in the display while CAT 1 is running.

I documented all of the MLDL2000 operations (pictures). I'll add them to my photobucket later and then share them. I also took the time to add the small jumper which allows USB power line to charge the goldcap while the MLDL2000 is connected. Now I need no longer to open the MLDL2018A again (hope so...).

Cheers.

Luiz (Brazil)

***&*%$%#@#@...**
*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 24 Dec 2009, 3:41 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

I forgot to save about 3000 lines of hand-written, old-timer programs already keyed in and stored in the SRAM through HEPAX... Lost them all <:-C

At least I'll leave it as a strong advice: SAVE WHATEVER IS STORED IN SRAM PRIOR TO MAINTAIN THE MLDL2000. Connect it to the computer and download the SRAM contents first.

Cheers...

Where can one get new three-pronged plugs for Classic series chargers? >>

*Message #1 Posted by **tim m.** on 24 Dec 2009, 1:02 a.m.*

Mine's a bit dodgy, having been inexpertly repaired by the prior owner many moons ago. I'd like to splice a new plug onto the cable, if possible.

-Tim

Gently used would be the best you could hope for... and they usually come attached to the rest of a standard 82002 charger...

Re: Where can one get new three-pronged plugs for Classic series chargers? >>

*Message #5 Posted by **Mark Henderson** on 26 Dec 2009, 4:51 p.m.,*
in response to message #4 by Randy

I just bought some old chargers and plugs but don't have them in my hands yet. Depending on the state of the parts I might have a connector spare. Definitely not NOS, I'll let you know more hopefully this next week.

How to get a txt file on the stack (50g)

*Message #1 Posted by **ferroburak** on 22 Dec 2009, 6:48 p.m.*

Hi, How to get a txt file on the stack (50g)? Thanks.

Re: How to get a txt file on the stack (50g)

*Message #2 Posted by **Gerson W. Barbosa** on 22 Dec 2009, 7:02 p.m.,*
in response to message #1 by ferroburak

hpcalc.org is a good source for anything HP-48/49/50g related, in case you don't know it yet.

You can find a text editor/viewer suitable to your needs here:

http://www.hpcalc.org/hp49/apps/editors/

Regards,

Gerson.

For the records: just to show we care...

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 24 Dec 2009, 3:36 p.m.,*
in response to message #1 by ferroburak

Hi, Gerson;

I cannot help answering Ferroburack. I know you (and many others) completely know the 'how to' in order to answer him, but... what'a heck, it´s Xmas...

- start with a " ([right-shift][×])
- press [ALPHA] twice (dafault to lock the keyboard in ALPHA mode)
- key in the string you want
- press [ALPHA] again (to deactivate ALPHA mode) and press [ENTER]

Merry X-mas.

MCODE: Using the HP-16C as a tool

*Message #1 Posted by **Geir Isene** on 22 Dec 2009, 8:37 a.m.*

As a calculator nerd, my little beauties are solutions in search of a problem. It's not that I have an external need for calculators - at least not to the level I use them. I love using them and are in constant lookout for new ways of putting them to use.

I used to have an HP-16C. It burned to ashes along with some 90 other calcs. But I never got around to really using this cool little chap. Not until I acquired another recently.

My first and foremost passion is the 41. I love MCODE-ing it and finally figured out a good use for the 16C: To calculate jump codes for the 41 MCODE.

I imagine this must be one of the things I have done in life that has the least audience. Few people program any MCODE and I guess few of those have an HP-16C - and of those two or three left, there just might be one person interested in this program. But what the heck - I did it because I enjoyed it.

In case you care, go here: My HP-41 page.

Re: MCODE: Using the HP-16C as a tool

*Message #2 Posted by **Mark Storkamp** on 22 Dec 2009, 9:09 a.m.,*
in response to message #1 by Geir Isene

I have a 16C, and I've had a 41 of one type or another since they first came out. But I've never had the hardware needed to do MCODE programming. Now that I've got the i41CX+ on my iPod, is it possible to do MCODE programming on that? Are there any good sources for learning how to?

Re: MCODE: Using the HP-16C as a tool

*Message #3 Posted by **Ángel Martin** on 22 Dec 2009, 11:19 a.m.,*
in response to message #2 by Mark Storkamp

Programming MCODE does not require any hardware these days... I don't know about the iPhone emulator but on Windows you can use V41 loaded with the HEPAX Module (all virtual, of course).

It's just a matter of getting started, then the adiction takes on ;-)

MCODE: Using the HP-16C as a tool (Thanks!)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 22 Dec 2009, 9:14 a.m.,*
in response to message #1 by Geir Isene

Hi, Geir;

I am one of these few...

Thanks! Helps a lot.

Cheers.

Meindert, guys: I think you´re gonna like this!

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 22 Dec 2009, 5:45 a.m.*

Hi, all;

I must confess I had some 'second thoughts' when asking information about the HP41 system ROM versions. With no further ado:

- I took a coconut mainboard and removed the three ROM IC's; everything else was kept in place
- The HP41CV was assembled and the MLDL2000 was set in place;
- Then I programed the MLDL2000 with a CX configuration: NFL ROM set + X-FCN + Time + CX time/FCN accordingly.

It worked flawlessly: an HP41CV with a CX configuration. Of course, no clock activity and no X-Memory present.

The key point is to keep the CPLD continuously powered. In fact, for as long as the USB is plugged and active (connected), the calculator goes OK. If it is simply disconnected by the software, the calculator no longer works because the CPLD is fed according to MLDL´s J7 set (CPLD power control) or continuously through the USB port. I did not test yet, but if the CPLD is fed continuously through the HP41 batteries (J7: 1-2), the coconut may work with the MLDL2000 and without any ROM in the mainboard.

The good news is that you can use this arrangement to test your calculator and identify faulty ROM´s. And you can use the MLDL2000 to emulate the faulty ROM. In any case, this is another way to have a faulty HP41CX coconut back to life if a ROM is missing.

Now I'll try a 41CV with no RAM IC´s and point the first block address to a MLDL2000 SRAM 4K bank. I know that by simply pointing the first block address to a SRAM will cause address conflict, so I´ll program the MLDL2000 to consider the SRAM as ROM. Yep, I´ll check if the HP41 can 'see' a contiguous 4K-RAM bank, and if goes OK, then we will have all main and extended RAM at once through the MLDL2000.

Unfortunately there is no way to emulate both ROM and RAM at the same time in one single MLDL2000. The possible solutions are:

- keep ROM 0 chip in place and emulate the others;
- use two MLDL2000 (with a port extension, of course; not practical at all)
- convince either Meindert or Diego to provide such configuration trough either an MLDL2000 or a NoVRAM; this way one could run a 41CX (without a clock so far...) with external ROM/RAM.

Not a X-mas gift, instead some news to work with.

Cheers.

Luiz (Brazil)

Re: Meindert, guys: I think you´re gonna like this!

*Message #2 Posted by **Meindert Kuipers** on 22 Dec 2009, 11:56 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Luiz,

You are the best! This is a configuration that I have thought of as a theoretical option, and now it becomes reality!

Replacing RAM IC's with the MLDL2000 will not work, as the MLDL2000 does not know how to emulate the RAM chips. This is not impossible to implement, and it is on my list of todo's and requires some pretty tricky coding of the CPLD, especially when it is mixed with ROM emulation. Also a second MLDL2000 will not help here.

The CPLD must be powered when the HP41 starts. The reason is that the CPLD cells must be loaded from internal EEPROM cells, and that takes up to 200 microseconds after powerup. During this time the CPLD will not respond to any HP41 cycles. I have new CPLD firmware with reduced the power that could be used for this. A possibility could be a modified ROM 0 to compensate for the fact that the CPLD starts slower than the HP41. Replacing the first two words in ROM 0 with NOP should actually do it, but then the HP41 would always do a DSWKUP, which would probably mess up the partila key sequencing. More work to try out for you Luiz!

I have some time during the Christmas holidays to play with this myself, although I will not remove any ROMs form any of my precious 41's.

Meindert

Re: Meindert, guys: I think you´re gonna like this!

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 22 Dec 2009, 12:30 p.m.,*
in response to message #2 by Meindert Kuipers

Hi, Meindert;

thanks for your feedback. I aprreciate it! (being called the best by the best... 8^) I'm flattered!)

For the records: this HP41 mainboard had some issues, and I was almost sure they were related to a faulty ROM. It seems to me I was right...

Now for the mistakes. Please, replace the text:

> Quote:
>
> Now I'll try a 41CV with no RAM IC´s and point the first block address to a MLDL2000 SRAM 4K bank. I know that by simply pointing the first block address to a SRAM will cause address conflict, so I´ll program the MLDL2000 to consider the SRAM as ROM.

for the text:

> Quote:
>
> Now I'll try a 41CV with no RAM IC´s and point **its** first **I/O** block address to a MLDL2000 SRAM 4K bank. I know that by simply pointing the first block address to a SRAM will cause address conflict, so I´ll program the MLDL2000 to consider the SRAM as **I/O**.

I messed up terminology and components big time! I wrote that text at 5:45AM after being working all night with many subjects. I tested the MLDL2000 configuration at 5:00 AM because I needed a break, so this was my 'relaxing activity'. Sorry!

Now let´s see: if the HP41 uses I/O addressing to access RAM chips, and the I/O uses an 8-bit wide data pattern (one byte), this is the very organization you provided the MLDL2000 with, right? Why not to address one of the MLDL2000 SRAM blocks as I/O in the first I/O address range? This is were the main RAM is addressed in the HP41, right?

I surely need to read and reason a lot more prior to jump into conclusions, but I'll do that carefully. No rush...

Cheers.

Luiz (Brazil)

Edited: 22 Dec 2009, 12:53 p.m.

Re: Meindert, guys: I think you´re gonna like this!

*Message #4 Posted by **Meindert Kuipers** on 22 Dec 2009, 2:21 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

I will not comment on the other remarks ;) Today is my wife's birthday, so I will be signing off and have a glass of wine.

To be precise,the HP41 RAM registers are addressed not as I/O but as a peripheral with RAMSLCT, so it will respond to READ and WRIT instructions. The MLDL2000 ignores these instructions, and this is not to be confused with the I/O as defined in the MLDL2000, which is simply a set of I/O registers mapped in ROM space. The HP41 RAM registers use a 56 bit serial datapath, and the information is transferred through the DATA line. The MLDL2000 can read the DATA line, but not write to it, although hardware circuitry is there to support it, the functionality is simply not implemented in the CPLD. Again, this type of useage is anticipated, but not (yet) implemented.

Keep up the good work!

Meindert

OK, then!

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 22 Dec 2009, 3:44 p.m.,*
in response to message #4 by Meindert Kuipers

Thanks again, Meindert. You have already mentioned these facts at the MLDL2000 Specifications, I mean, the ability of reading but writing to the DATA line. I forgot about that.

Time to put the system ROM images in SRAM and picking on them. Now we can go ahead messing up with the HP41 O.S. and hacking it from the core... Does it make the HP41 a 'repurposeable' development platform?

Cheers.

Luiz (Brazil). 'Roger and out'!

Oops! Forgot to wish your wife my best!

Woodstock Security Cradle - Keys lost

*Message #1 Posted by **Alberto Fenini** on 21 Dec 2009, 3:31 p.m.*

Hi Everybody, this time I'm trying to open a security cradle that came with an HP-25 (the calculator wasn't in the security cradle) without having the keys. Does anybody has ever succeded in this ? Thanks for your precious help, Alberto

Re: Woodstock Security Cradle - Keys lost

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 21 Dec 2009, 4:00 p.m.,*
in response to message #1 by Alberto Fenini

Hi, Alberto;

I remember quite well, back in the 80's, when a key maker gave up trying to open an HP29C security cradle without the original key. He claimed never seeing such 'key bay' (is that correct?) in his 30+ years as a key maker, and he was afraid that it had an extra safety mechanism (kind of a pin in the end of the key cursor) to release the whole system.

I wish you success, and if you actually find such mechanism, please let us know.

Luiz (Brazil)

Edited: 21 Dec 2009, 4:00 p.m.

knockoffs

*Message #1 Posted by **JDonley** on 20 Dec 2009, 7:11 p.m.*

Have there been any knockoffs of the classic HP calcs? I cannot imagine wasting time and money counterfeiting old calculators, but it certainly wouldn't be much of a technological challenge. I bought a batch of counterfeit high end tools 5 or so years ago that not one person in a thousand could tell they weren't the real thing. They were bought on E-***.

don

I was wondering the same thing. I recently visited Saudi Arabia, and the amount of knock-off ipods, iphones and other tech gadgets they had selling there was amazing.

Re: knockoffs

*Message #3 Posted by **Namir** on 21 Dec 2009, 9:05 a.m.,*
in response to message #1 by JDonley

The closest knockoffs that I have seen are imitation of the HP-45 and HP12C by other vendors selling machines with identical functionality to the 45 and 12 but under different names. I have seen at least 3 non-hp models imitating the 45 and 2 models (by Victor and Aurora) for the 12C. Only HP has full knowledge whether or not these vendors violated any patent or copyright. I don't get the impression that these quasi-knockoffs were hot sellers.

in response to message #4 by Gene Wright

I remember in 1978 I bought in Baghdad a Sanyo calculator that was a replica of the HP-45 and I bought one. I don't remember the model number cause I left the country soon after. Sanyo was selling a set of scientific calculator models at the government run electronics outlet stores. I was at one of these stores by accident when I saw the new models and recognized the model with the ENTER key and other stack operation keys. I bought one right there and then!

Re: knockoffs

*Message #9 Posted by **Walter B** on 22 Dec 2009, 2:05 a.m.,*
in response to message #6 by db (martinez, ca.)

Ok, it's RPN and it shares many functions with the HP45. I would neither call it a knockoff nor a clone, however. Else one may call many many scientific calculators clones of others, since they share their function set.

Re: knockoffs

*Message #10 Posted by **db (martinez, ca.)** on 22 Dec 2009, 10:01 p.m.,*
in response to message #9 by Walter B

Walter;
Very true. If the Sanyo RPN and the whole Corvus class of calculators is a "knockoff" of the hp45, then the hp32e is nothing more than a knockoff of a non-hp RPN made in Texas. From what i've heard; the scene was really a bunch of guys who all knew each other, who traded jobs, outsourced parts and even borrowed tools among hp, Fairchild, National Semiconductor, Mostek and others - and were just paid to one-up each other. Was a great time and place to be in, i think.

TI has a knock-off competitor: Sentry. They make TI-83/84 clones and put stickers on them saying "compares to xxx" model. I've been curious as to exactly how similar, so I just picked one up recently. I'll let you know if it's truly a "clone" or not.

thanks, bruce

Re: knockoffs

*Message #12 Posted by **Don Shepherd** on 21 Dec 2009, 3:49 p.m.,*
in response to message #11 by Bruce Bergman

Hey Bruce, I've seen a few TI-83 Plus wannabe's too. I think Meijer carries the Sentry, and Walgreens had a pathetic 83 wannabe too that was just miserable. I know lots of folks here hate TI's, but the 83 Plus is the gold standard of school graphing calcs, like the 12c is the gold standard of financial calcs. There is no capable substitute for the gold standard in either case.

Re: knockoffs

*Message #13 Posted by **Dave Boyd** on 22 Dec 2009, 2:25 a.m.,*
in response to message #11 by Bruce Bergman

If you are referring to this, then a close inspection reveals that, far from being a clone of the TI-93 (which it does claim to "compare to"), it appears to be a clone of the venerable Casio FX-7000G or one of its derivatives, at least from the pics -- I haven't seen one in the flesh. Here's a pic of the Casio for comparison: http://mycalcdb.free.fr/merci/casio_fx-7000G_20090128.jpg

And for good measure, here's a review (and pic) of the Durabrand 828, which looks like another clone of the Casio, and therefore almost identical to the Sentry... but is in fact a clone of the Citizen SRP-320G... which was a clone of the Casio. I have one (a Durabrand, that is), and a more cheaply-made feeling and appearing calculator I have never held. So little attention was paid to the ergonomics that the shift key colors do not correspond to the shifted function legend colors.

After looking a bit further, I'm tempted to replace this entire post with a link to this page where all this information and more can easily be found. Pity I found it after typing all this.

I suppose that in the Far East, where these units are made, neither TI nor HP are common enough to clone, whereas Casio rules the roost and is therefore the clone fodder of choice. Odd that I've never seen a clone of a Sharp...

Re: knockoffs

*Message #14 Posted by **Bruce Bergman** on 22 Dec 2009, 10:22 a.m.,*
in response to message #13 by Dave Boyd

Yup, you are indeed right. My purchase arrived last night and I was playing with it here and there for a couple of hours. It's definitely not a TI-clone; not even a basic TI-83 clone. It is extremely light and cheap feeling, but surprisingly not too bad in terms of quality. The keys work good and have some feedback, the screen is easy to read, and they actually include a perfect-bound manual with 136 pages in it. On the bad side, the printing on the face of the keyboard is really poor and crammed in there. In some cases, I can't even tell what key does what function. They printed a legend on the top of the calc,

but even that is a bit confusing.

I'll take your word about it being a Casio clone (it looks like the keyboard layout is the same, for sure), but it doesn't even seem like a true Casio clone. I've got about a half dozen Casio units here, and none of them have this rather unusual programming function that the Sentry has. It's really kind of a strange unit.

But, definitely not a TI clone, no matter what sticker they put on the outside. ;-)

thanks, bruce

Sharp EL-506P. Copied verbatim, cloned, knocked-off etc. Appears in all shapes, forms and sizes. Recognizeable by the ->BIN, ->OCT, ->HEX, ->DEC above the /, *, -, + keys and the single variable stats mode entered with 2ndF-ON/C. I wrote a manual for such a clone here.

HP30b - leapfrogging the competition ...

*Message #1 Posted by **Peter A. Gebhardt** on 20 Dec 2009, 6:04 p.m.*

Just received notice (via HP support forum) that the HP30b Business Professional shall become available soon.

After looking at the specs here

http://www.despec.biz/index2.php?option=com_sobi2&sobi2Task=dd_download&fid=6505&no_html=1

it seems to me, that HP ist again taking the lead position in the most versatile financial calculators category.

It's the combination of features that would eventually make it the best HP financial calculator to date.

Being able to combine the latest in stochastic finance with long asked for capital budgeting functions, gives us in the finance industry "real options" and more ...

I suppose some of the forists took part in product development by adding knowledgeable advice - if and when you are already freed fom non-disclosure agreements conc. this product (now that it is common knowledge), we certainly would be interested in hearing some background and "inside knowledge" from you ;-))

Best regards & Thanks to the HP calculator team!

Peter A. Gebhardt

> What is the "rotate-and-click" key technology?

From LINK

"HP calculators HP 39G+, HP 39GS, HP 40 GS, HP 48GII, HP 49G+, HP 10BII, HP 12c, HP 12c Platinum, HP 12c Presentation, HP 17BII+, HP 33S have special keyboard contacts that give positive "tactile feedback" so you know the button has been depressed. The rotating design ensures contact even when pressed off-center, which prevents missed input strokes."

Dave.

Re: HP30b - leapfrogging the competition ...

*Message #4 Posted by **Walter B** on 20 Dec 2009, 7:16 p.m.,*
in response to message #1 by Peter A. Gebhardt

Hmmh, the LCD, the keys and their labels look *identical* to those of the 20b :-/ Of course, menu contents may differ. Scanning the datasheet, the only significant technical difference seems to be the improved tactile feedback. That's an advantage for sure compared with the 20b, but is this all? They claim the 30b being programmable, but I don't find any label for this on the keyboard :-(

Does anybody know more? And is allowed to speak?

O.T. planned obsolescence

*Message #1 Posted by **db (martinez, ca.)** on 19 Dec 2009, 10:01 p.m.*

This has nothing to do with calculators but it has got to be one of the most meticulously crafted cases of planned obsolescence in history. My history anyway. Maybe someone here (Juan Demin or Katie) will appreciate it.

I went cross country skiing at Ebbits pass yesterday. Was beautiful. But: There were two of us. During the day, both of Eric's new Asolo boot tops started separating from the soles. We used my duct tape to keep them together. I lorded it over him a bit that MY 23 year old Asolo "Extremes" had been across the Sierra a couple of times, up and down Shasta, over the White mountains, into the Cascade and Sweetwater ranges, and down countless ski lift runs, not to mention being used with crampons and as climbing boots - with no problems. OK, I really rubbed it in that my boots, which are older than him, were still in fine shape even after breaking two of my precious bones. Then at the end of the day, less than 100 meters from the road, i felt something funny and looked down. My right foot wasn't attached to my ski. Then i noticed that between my foot and ski was a separate sole. It had just come completely un-done. I shrugged, strapped the skis to my pack and started slogging downhill to the road on foot. Less than 20 meters later i felt something strange on my left foot. The same thing had happened to it! With hundreds, or maybe thousands of kilometers on them; they both self destruct within about 50 feet of each other. Those crafty Italians: they must have planned it that way.

Re: O.T. planned obsolescence

*Message #2 Posted by **Garth Wilson** on 19 Dec 2009, 10:20 p.m.,*
in response to message #1 by db (martinez, ca.)

In my very first EE class in school, the teacher warned against making things so well that the customer would never have to come back and buy another from you. I would have put up an argument but didn't feel like I was in a position to. I usually give a supplier only **one** chance. If the product doesn't last as I think it should, I'll buy from a different company the next time. The same company won't get my business twice. OTOH, if it does last, I'll buy from them again when I need to supplement (not replace, unless it's to take advantage of improved technology), and I'll recommend it to others.

Edited: 19 Dec 2009, 10:22 p.m.

*Message #4 Posted by **bill platt** on 19 Dec 2009, 10:25 p.m.,*
in response to message #1 by db (martinez, ca.)

My Asolo Snowfield have vibram soles which both started to come off the midsole at exactly the came time. This happened a few years ago, after 20 years of skiing on them, and one good Sierra trip but nothing like your history. Fortunately all it took was a good cobbler, and the original vibrams were bonded back onto the midsole good as new.

I will feel like a part of me is missing if these boots ever actually wear out irreparably.

Re: O.T. planned obsolescence

*Message #5 Posted by **David Hayden** on 20 Dec 2009, 8:50 a.m.,*
in response to message #1 by db (martinez, ca.)

db,

The fact that three of the four boots failed in the same way yesterday forces me to wonder if there was something about the conditions on that particular day that caused the adhesive (or whichever component it was) to fail. I know this sounds odd since, as you point out, your boots survived 23 years of use, but the fact remains that both of your boots and one of your son's failed within hours in the same way.

So here's a thought exercise: assume the failure wasn't a coincidence, but the result of some unusual condition. What was it?

Returning to calculators, I think we assume that they will become obsolete, but not because of the materials failing. Rather, we assume that technology will march forward and a new model will be so superior to the old one that we'll retire the old one. This is the opposite of other durable goods like ovens and toasters. I expect them to wear out over time and the replacement will be very much like the old one. I'd never dream thinking "hey look at the features of the new Maytag freezer, we should get rid of this tired old one and buy a new one!".

It seems to me that automobiles are a toss-up. Some people regularly buy new models because of the features or looks or prestige. Others own them until they break down (me included - my current car has 284,000 miles on it (457,000 km, thanks to the trustee UNITS menu of my HP calculator which is within arms reach :)).

An extreme example of "replace before it's worn out" is clothing. Most people get new clothes in the latest styles long before the old ones show any sign of physical wear. Again, I'm the opposite here, preferring to wear clothes until the tears are so obvious that they must be replaced.

Dave

Re: O.T. planned obsolescence

*Message #6 Posted by **Thomas Okken** on 20 Dec 2009, 12:32 p.m.,*
in response to message #5 by David Hayden

Quote:

> So here's a thought exercise: assume the failure wasn't a coincidence, but the result of some unusual condition. What was it?

Modern de-icing agents perhaps? You'd expect winter boots to be made to withstand exposure to regular salt, but how do old boots stand up to calcium chloride, potassium chloride, magnesium chloride, diethylene glycol, etc.? I could imagine that walking through slush containing such substances, somewhere on the way from your hotel to the trail head, is what did the damage.
Or maybe three boots failing in one day was just coincidence. I'm not really into logical jargon, but I'm sure there is a fancy-sounding term for this, "anecdotal evidence fallacy" or something. :-)

- Thomas

That's true for everything electronic. How many of us do NOT have ancient personal computers towed away that work as well today as they did when they were made, some nearly 30 years ago? I've still got Radio Shack TRS-80 Model III, IV, and 100 units, a couple of TI-99/4 complete sets, a 1986 Tandy PC (with Deskmate), a couple of old lap tops, etc. etc., plus various other electronic marvels like old DVD and CD players that I just can't seem to put in the trash.

I'd feel better trashing some of that stuff if only it was failed or otherwise a little bit worn out! But it's not.

Re: O.T. planned obsolescence

Thank you Dennis…!!! For sure I appreciated this tale very much!!! And it also let me to know about the place you've been in the internet...Wow great!!!! You know, I am still thinking of Yosemite for next season...Are you in? Back to your story, even though I am sure you've always traveled the world wearing both boots at the same time, there are many things that affected them in different way…starting from manufacturing… I would say that this is rather a coincidence than a programmed obsolescence…and probably the coincidence woke up with your "lord it over" attitude…jaja My interest in HP calculators started once with those navigation cards and modules. My collection is small: programmable top of the line with navigation software (from 65 to 50g) and I enjoy doing some navigation planning or celestial navigation with them (even in the GPS age) in my 21 years old sailboat...which, I hope, has no planned obsolescence for the next 10 years... Regards, juan

HP Classic with new electronics (a la uCalc/uWatch?)

*Message #1 Posted by **Mark Henderson** on 16 Dec 2009, 5:34 p.m.*

I love the uCalc and will certainly order one when it's ready (my inner geek wants the uWatch, too, but I know I wouldn't wear it...).

I'm in a frenzy of HP Classic restoration right now and it occurred to me that it would be *quite* easy to make a uCalc/uWatch PCB that replaces a Classic CPU board and then it would be possible to have a fully custom/open source calc that used the incomparable Classic keyboard, form-factor and, yes, warm LED glow - for desktop use mainly.

(I'm back to using Classics for all my daily calc-ing and just loving the user interface...).

Is that too abhorrent to the HP faithful? Or kinda cool? Who wants one? Which classic to base it on?

Re: HP Classic with new electronics (a la uCalc/uWatch?)

*Message #2 Posted by **Thomas Radtke** on 16 Dec 2009, 5:40 p.m.,*
in response to message #1 by Mark Henderson

There are lots of dead Woodstocks, one of them not far away from me ;-(. If anyone sells a repairing kit, I'll certainly buy one.

Edited: 16 Dec 2009, 5:40 p.m.

Re: HP Classic with new electronics (a la uCalc/uWatch?)

*Message #3 Posted by **DaveJ** on 16 Dec 2009, 6:13 p.m.,*
in response to message #1 by Mark Henderson

This was discussed this some time back in terms of using a new platform HP, like the 35S or 12C casing. With a drop-in PCB and LCD replacement, or possibly even a 7 segment LED display.

Just like the uWatch and uCalc, I like something novel, so for me it would be a nice LED display :)

I don't know about using an old casing that aren't readily available, as you'd be painting yourself into a supply corner there.

But for me such a project is down the list, uCalc first as a warm-up, then the perpetual uWatch2.

Dave.

Re: HP Classic with new electronics (a la uCalc/uWatch?)

*Message #4 Posted by **Mark Henderson** on 16 Dec 2009, 6:54 p.m.,*
in response to message #3 by DaveJ

Yes, I agree your efforts should ideally be focused on uCalc right now!

And good point about the supply issue - I'm sitting on multiple 45s and could easily see myself converting one :-)

I'm also an electronics buff, so possibility of me and others helping with a hardware port in the future is not out of the question...

But first things first! Keep up the great effort. Let us know if we can help.

Cheers

Mark

I"m finding that having a lovely red LED glow from my Classics works just fine on my desk since plugging in is just not a problem, well worth it! And my office gets dark in the evenings, so the LEDs are much more visible.

I see some modern watches that have an LCD display and a bright backlight (red) that actually looks almost like LEDs - so I suppose it might be possible to have an LCD that is low power in good light, and brightly back-lit in poor light, and with the visual appeal of LEDs??

Geoff doesn't show us his prototype is 5"x3"x1" ;)

Most "pocket" calculator images are taken under an angle you can't see its extension in the third dimension properly. Think of the conical shapes of the Classics etc. Compare an ad of the 19C with the original shape: Such pictures have a long tradition.

For Walter.B, side by side comparison to an unmodified HP-15C 8-)

Hey!

Where are the so necessary indicators? USER, GRAD/RAD, C, f & g...

It is really good looking, but I still like LCD´s. People claim that one can read LED-based displays in the dark easily... OK, and what else? Memorize the keyboard? I´m sorry again, but... what then? Would you take a note, look at something else, use the

information, locate yourself... in the dark?

I never found any significant use for a calculator in the dark. A torch, perhaps... maybe to lighten up the place so the calculator can be used accordingly. But then... LED´s are no longer necessary.

I remember how hard it was to use LED-based instrumentation in the field. Batteries discharging too fast, the need of creating a shadow with the hand to see the numbers, heavier/larger equipments to hold high-capacity batteries... LCD´s removed these three problems at once.

And let´s face it: Voyager´s digits shape is one of the best.: good looking, easy to use.

My points, only.

Cheers!

Luiz

LOL, yes it's all about the LEDs! Yesterday a 20-something kid in my office spotted my 1972 HP-80 on my desk and couldn't believe an LED calc! He loved it! Some things are just meant to be...

Here's an example of the LCD/fake LED tech being put into some watches (note all the little flags etc. so that HP-15C-types display can work, too...

LEDS!!!!! and night time viewing...

*Message #16 Posted by **Geoff Quickfall** on 18 Dec 2009, 3:09 p.m.,*
in response to message #15 by Mark Henderson

Well for watches the true LED for me; versus OLED as pictured above, although I did purchase the First Fossil OLED watch. I find the display rather disappointing.

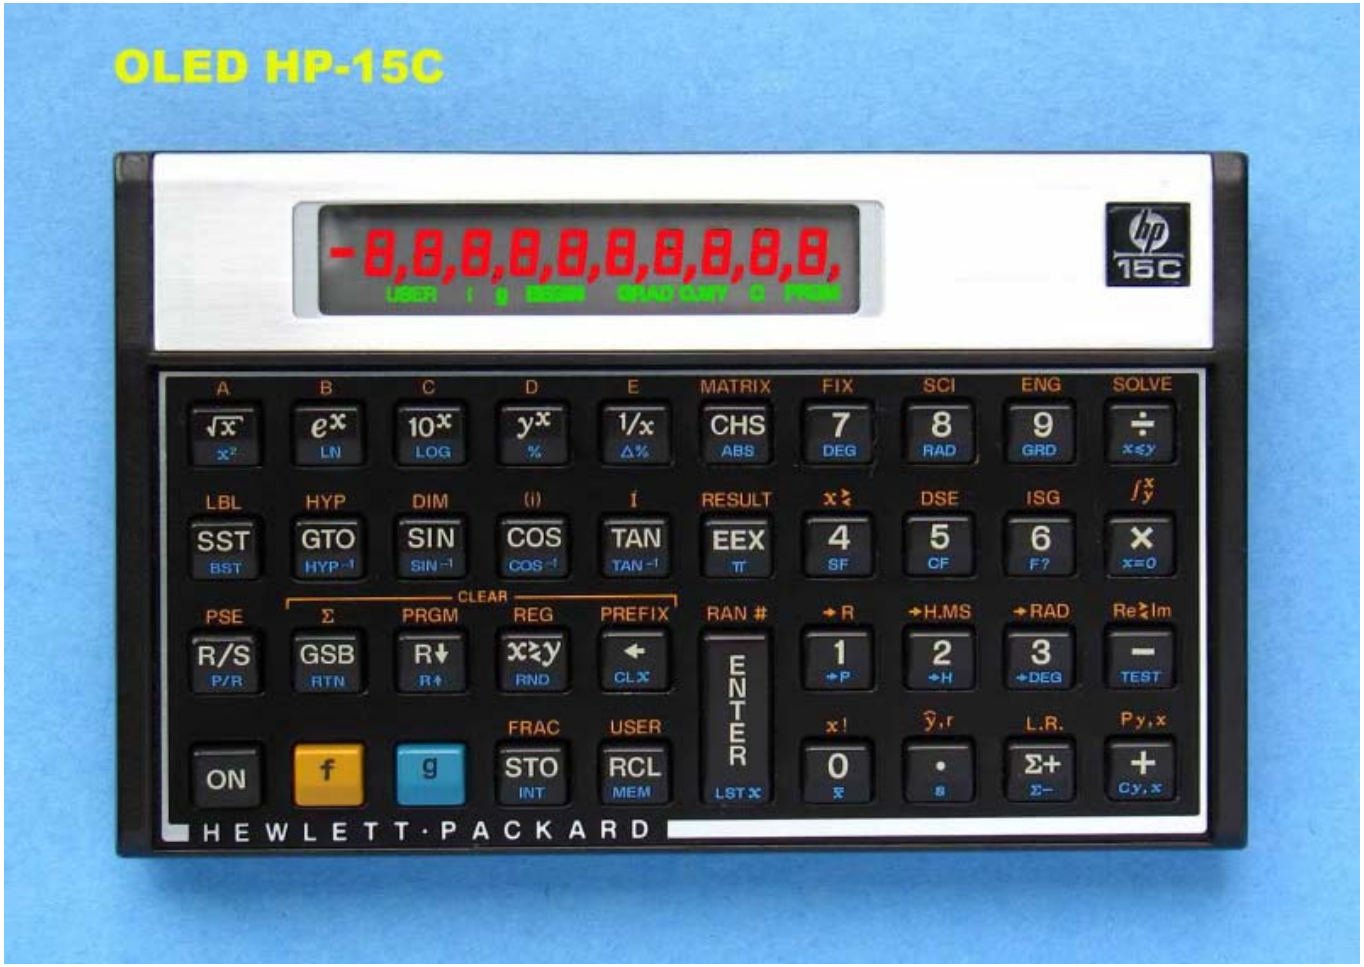
The collection has grown as these get restored but I do like the LED watch:

As far as night viewing goes, the HP-01 is my cockpits, lowlight environment (actually daytime and nightime). Especially with the raised tactile buttons that allow a simple memorization of key mapping. The display is bright and RED allowing for no disruption of night vision adaptation; a requirement in the South Pacific flights with no full moon. Radar returns do not show icing or ice crystals so running with the cockpit lights off and the background lighting on low is imperative at night for cloud avoidance.

I use the HP42S for my cockpit as it is slimmer then the 41CX (my favourite LCD calculator) but at night I need to shine a map light on the display. The HP-67 however does not need a map light and with my programs mapped to the top 5 buttons I have access again to a simple memorization of key mapping.

As far as the HP-15C LED version, well using an alpha/numeric display such as in the 9825a, increased memory, a timer/clock function it was done for fun 8-)

However, my favourite creation would be an OLED backlit:



```
-  a colored alpha numeric two line OLED display (backlit ability)
-  increased memory and speed
-  a dynamic timer/clock/beep(alarm) function
-  15C physical format
-  USB facility
```

Excuse the colour choices, but a two line HP42S display with alpha on a similar menu type would be good.

Enjoy but don't stare at the OLED display too long

8-)

Geoff

in response to message #18 by geoff quickfall

Hi Geoff, guys;

a couple of years ago I also draw this HP50G keyboard TTF. There is also this PDF file with explanations.

I was invited then to talk about the HP50G at a state university and I could not find a suitable, publicly available font for the HP50G keyboard. So I draw it and used with the other ones to build a presentation about it. I think it looked OK, will find it and post a link about it.

In time: have you, the lucky 'MoHPC DVD set' buyers, had a look at the 'Voyagers in Brief'? I know that there are some corrections to be made, mostly noted in the small, 12-page PDF I posted about it a couple of months ago. Since nobody mentioned anything about it, neither through e-mail, I decided to ask. Please, feel free telling me anything about it. I intend going ahead with the 2nd. Edition and fill the gaps that were left there.

Cheers.

Luiz (Brazil)

For Geoff Q., take the other side d8-)

*Message #22 Posted by **Walter B** on 18 Dec 2009, 4:48 p.m.,*
in response to message #12 by geoff quickfall

Hi Geoff,

I doubt I'm worth a subject ;) Anyway, you're missing the point for you're still not showing the 3rd dimension. I bet your LED 15C carries a 1" rucksack for the batteries, though needing a swap every 2 hours of operation. You should call it a 15SC since it will feature a semi-continuous memory with the LEDs taking all the energy. But you're right, it will serve well as short-time flash light in a cockpit a 2 a.m. over Tuvalu ;) Enjoy!

Re: For Geoff Q., take the other side d8-)

*Message #23 Posted by **Michael Meyer** on 18 Dec 2009, 5:36 p.m.,*
in response to message #22 by Walter B

Killjoy. Maybe one of those super-thin rechargeable lithium cells could fit in the back, like the ones in cell phones. With mAH ratings that they get these days, I'll bet it'd run the led's for 10-12 hours on a charge!

Re: For Geoff Q., take the other side d8-)

OT: Holes in Stainless

*Message #1 Posted by **Paul Brogger** on 16 Dec 2009, 1:09 p.m.*

Someone here should be able to help . . .

I'm trying to drill a small hole in the blade of a (Victorinox) Swiss Army Knife. That stuff is *tough!* Can someone suggest the right kind of drill bit to use?

The backstory:

My favorite pocket knife has been a SAK "Tinker", and lately a slightly enhanced model (the name of which escapes me) that's basically a Tinker with a saw. I'm using that thing ALL the time. (No, I don't want a multi-tool -- tried 'em and never made the switch.)

Anyway, the one missing feature on Swiss Army Knives until lately has been one-hand opening. It seems I'm always wanting to open a blade while holding something else in my left hand. So I took to carrying a simple, one-blade pocket knife with a locking, one-hand-opening blade.

So then I had *two* knives in my pocket. But just lately I looked, and lo & behold, Victorinox now offers one-hand blades. So I bought a "One Hand Trekker". Way cool, but a bit larger than I'd like.

Only *then* does it occur to me that I could probably add a lug (or whatever it's called) to the large blade on my old Tinker and open it with one hand. So, I've ground out an opening in the side edge (aluminum & plastic) next to the large blade on my Tinker, and started to drill a ~1/16" hole for some sort of projecting lug with which to deploy the blade.

Buuuuut, none of my drill bits will *touch* the blade. My pseudo-Dremel tool's cutting disk grinds nicely into it, so I made two shallow cross-cuts in the surface to locate the drill bit. But despite that, I can't get a bit to bite. It's pretty amazing stuff!

Anyway, if anyone's got any ideas, I'm all eyes.

Ask a dentist!

Re: OT: Holes in Stainless

*Message #3 Posted by **Eric Smith** on 16 Dec 2009, 1:42 p.m.,*
in response to message #1 by Paul Brogger

Yes, it's very difficult to machine hardened steel. It's normally machine first then hardened. You probably need a diamond drill bit, or cubic boron nitride, and it still won't be easy.

Re: OT: Holes in Stainless

*Message #4 Posted by **bill platt** on 16 Dec 2009, 1:44 p.m.,*
in response to message #1 by Paul Brogger

You also risk cracking the whole blade.

Re: OT: Holes in Stainless

*Message #5 Posted by **Michael** on 16 Dec 2009, 5:21 p.m.,*
in response to message #4 by bill platt

No, thats (nearly) not possible. Michael

Re: OT: Holes in Stainless

*Message #6 Posted by **bill platt** on 16 Dec 2009, 7:30 p.m.,*
in response to message #5 by Michael

And how is it that you think that? I have a cracked Spyderco. Cracked at the thumb hole.

What is the ductility of hardened tool steel? Not much. What is the difference between brittle ceramics and tough metal? Ductility--of which tool steel is closer to ceramics. What causes ceramics or any brittle material to fail? Cracks. What causes cracks? Well, drilling holes for one.

Re: OT: Holes in Stainless

*Message #7 Posted by **bill platt** on 16 Dec 2009, 1:45 p.m.,*
in response to message #1 by Paul Brogger

Why not etch the surface, and then adhesively bond a lug? There are super adhesives for metal bonding. Used in aerospace.

Re: OT: Holes in Stainless

*Message #8 Posted by **Jeff Brower** on 16 Dec 2009, 2:03 p.m.,*
in response to message #1 by Paul Brogger

As you've discovered grinding is almost the only way to get through hard steel. Depending on how hard it is carbide drills might work but an EDM machine will "burn" it's way through hard material with ease.

If you have a buddy with a machine shop and an EDM that would be the way to go.

Re: OT: Holes in Stainless

*Message #9 Posted by **Maximilian Hohmann** on 16 Dec 2009, 2:54 p.m.,*
in response to message #1 by Paul Brogger

Hi!

Superglue or laser drilling. Or both.

Greetings, Max

Re: OT: Holes in Stainless

*Message #10 Posted by **Hugh Evans** on 26 Dec 2009, 4:06 p.m.,*
in response to message #9 by Maximilian Hohmann

Laser would be okay. The CA (Superglue) is a very poor choice as it is excellent in tension but its' sheer strength is a joke. If you're going to use an adhesive use some form of epoxy.

Re: OT: Holes in Stainless

*Message #11 Posted by **Eric Smith** on 26 Dec 2009, 7:52 p.m.,*
in response to message #10 by Hugh Evans

For laser you probably need a "fiber laser". The more common CO2 laser doesn't work well on metals, though it can be used to etch the surface of anodized metals.

Re: OT: Holes in Stainless

*Message #12 Posted by **Martin Pinckney** on 16 Dec 2009, 3:07 p.m.,*
in response to message #1 by Paul Brogger

Harbor Freight Tools sells sets of diamond-coated bits to work in Dremel-like tools. They are cheap, and I suspect they might wear out pretty quick. Real diamond bits probably cost more than the knife.

You could keep wearing out the regular reddish-brown Dremel grinding bits until you get through.

Have you tried solid carbide bits?

Re: OT: Holes in Stainless

*Message #13 Posted by **tim m.** on 16 Dec 2009, 3:57 p.m.,*
in response to message #12 by Martin Pinckney

Solid carbide bits would be my suggestion. Buy a few of them, though, in case you wear them out.

-Tim

Re: OT: Holes in Stainless

*Message #14 Posted by **Norman Dziedzic** on 16 Dec 2009, 11:32 p.m.,*
in response to message #13 by tim m.

I used to be a machine tool designer. Solid Carbide is generally the best but I suspect that your hole will be small and so the drill will be small as well and break very easily if not used properly. If you try to use a small solid carbide bit in a hand tool you will likely break at least a few getting through the blade.

For the best chance of success, everything should be fixtured and as rigid as possible. You should use a real drill press or at least the Dremel version. If possible, the drill should be guided by a bushing and a continuous stream of coolant should be used. See this page for more information on drilling with a bushing. This may be overkill but definitely helps.

Having the proper drill RPM and feed rate is also important for doing the least damage to the metal. If I am right that the hole is small, then faster will be better. **Wear Eye Protection!** That is so important, I'm going to say it again **Wear Eye Protection!**

If you know someone with a machine shop, they will know the right RPM and feed rate. A high speed steel (HSS) drill could also be used but you will get a better hole with the solid carbide if used right.

Safety when drilling (esp. into metal)

*Message #15 Posted by **Karl Schneider** on 17 Dec 2009, 1:08 a.m.,*
in response to message #14 by Norman Dziedzic

Good advice, there. Recently, I bought a pair of safety goggles for drilling a 3mm hole in a dense metal assembly to remove an ignition-key cylinder. I ended up breaking the bit in two places, but nothing hit me. Later, I decided to wear those goggles while pushing a sharp-edged lockwasher onto a steering shaft against a strong spring. The washer shot out and hit my lips once, without injury.

How do you think he can pay for those @#%$ calculators?!

Re: [OT] Don't get caught ;-)

*Message #20 Posted by **Karl Schneider** on 18 Dec 2009, 1:50 a.m.,*
in response to message #16 by Matt Kernal

Hi, Matt --

Ha, ha! I was going to leave the OT post for several days, then remove it, not really expecting any responses. I hadn't even considered the car-theft angle...

The "dense metal assembly" in one of my 1980's cars had three stripped holes for the screws that hold switches in place, and had to be replaced. The attempt to remove the lock cylinder by drilling was prescribed procedure, as no accessible release pin was provided. My objective to transfer the cylinder to the new assembly was not met, and I had to buy another cylinder, as well. The lockwasher and spring had to be removed in order to remove the assembly.

The price of parts wasn't too bad, and all's well that ends well -- successful repair with no injuries. However, it took a fair amount of time and trouble that would not have been necessary with better quality and design of several parts -- something Spice-series restorers can certainly relate to.

As for "those @#%$ *(mostly-1980's)* calculators", I've spent more acquiring much of my limited collection than that car is worth now. But, 1980's stuff is generally good stuff; that's why I still have it, or bought it later...

Matt & Karl,

Ignition key problems reminds me of my solution a few years ago. I had bought a car that had a really bad ignition key cylinder. For a few weeks I just hot-wired it. Then I found a complete steering wheel assembly from a junk yard that had a good cylinder but no key for it. To get a new key made, I just hot wired the car drove it to a lock smith, took the junk yard steering wheel assembly in and requested that a key be made. They made a couple of keys for me, and then in front of the shop, I swapped out the steering columns, connected the ignition wires to the cylinder, used my new key to start the car and drove away. During all of this, several people walked by and never questioned what I was doing. Amazing!

Bill

Hello, my english is verry bad - so please ask!!

When i remember back to my time at University.... Usually a knife blade has HRC(Rockwell) of 55-60. Your Schweizer Taschenmesser has HRC 56.(http://en.wikipedia.org/wiki/Swiss_Army_knife) You need something to drill over the HRC of your blade, in Germany this material is standard for drilling and its called HSS(High Speed Steel (EN ISO 4957 HS)). You have to be careful because the blade would not look nice when the heat raises too high!

I don't know if U.S. HSS is the same as German, but it would be way too soft for this task.

Re: OT: Holes in Stainless -- Thanks!

*Message #26 Posted by **Paul Brogger** on 20 Dec 2009, 12:21 a.m.,*
in response to message #1 by Paul Brogger

I'm a bit late getting back.

"Case hardened", eh? I thought the dig on Swiss Army Knives is that it's hard to get a good edge on stainless. I'm certainly a babe in the woods re: metallurgy, but it never had occurred to me that stainless steel could be tempered. It's obviously plenty hard, alright -- certainly harder than the "316" stainless used for the deck fastenings on my sailboat! (I guess that's what I'd been expecting -- what a surprise!)

The Super Glue suggestion isn't realistic, is it? I'd say that Super Glue stuff has never lived up to its hype, as far as I'm concerned -- but perhaps I've misused it.

I trust there are metal bonding adhesives that would work with proper etching, etc., but I'm not sure I'm up to that. I may look around some more.

Carbide bits sure are spendy, and the cautions re: eye protection are well taken.

Actually, I'm liking my "One Hand Trekker" so much, I doubt I'll be following through on this little idea. But a big thanks to all who contributed. One can always count on the MoHPC Forum for an informed discussion of

. . . whatever!

Hi, Karen;

This is not actually a pure technical nor a finacially-oriented suggestion, instead an honest feedback, as you asked for.

I am a university teacher in Brazil and, apart of what happens here (and you have probably read in newspapers), there are many local initiatives regarding environment protection. I for one keep anyhting that works at home, I consider 'waste' only things I cannot work with, or others cannot use in anyway. So, my point is: don´t you know anyone (student, researcher, teacher, etc.) that could use this laptop with a replacement motherboard? As you have already bought a new one, it is probably worth for someone else to pay for the replacement motherboard and set an arrangement with you. OR... you may simply allow yourself to make it a gift. A Xmas gift, why not? <]8^)

Please, read this as an honest suggestion. I'd do that in a heart beat. (some folks here know I have already done some things close to this one)

Best regards.

Luiz (Brazil)

OT!: hp motherboard

*Message #3 Posted by **Dan Grelinger** on 16 Dec 2009, 12:53 p.m.,*
in response to message #1 by Karen Smearsoll

This problem affected some Dell models as well. The replacement motherboard offered by Dell included a fix for the problem. I would assume that the HP model would as well. Conversely, I recently read the results of an extensive survey on laptop reliability, and HP was at, or near, the worst for all manufacurers included in the survey. (Someone told me it was the Compaq influence). If I had to make the decision, I would do it based on

cost. Is the cost of the repair less than the unit can be sold, like on ebay? If so, I'd do it. If not, there is little reason to do so.

Re: OT!: hp motherboard

*Message #4 Posted by **Marcus von Cube, Germany** on 16 Dec 2009, 1:30 p.m.,*
in response to message #3 by Dan Grelinger

Dan, even if the repair cost is close to the value of repaired laptop, Luiz' argumentation still holds. I second his opinion.

OT: uCalc proto

*Message #1 Posted by **DaveJ** on 15 Dec 2009, 2:42 a.m.*

Here is the latest uCalc prototype design.

Almost laid out, just a few more things to take care of and then it's prototype time :-D

Final specs have turned out to be:

- PIC24FJ256GA106 processor, 256KB/16KB
- 3 Axis Tilt Sensor
- Piezo transducer
- 24 key touch panel with on/off switch on back
- 8KB EEPROM
- Micro SD Card
- Dual CR1620 battery
- IR LED
- 128 x 32 dot matrix reflective display
- 3.3mm thick for the first proto run to save cost, production should be 3mm.

Was hoping to have it in time for xmas, but I've been slack.

The front panel will look exactly as shown (but black), unless I change something at the last minute.

I'm using a more risky touch panel approach to lower cost and complexity, don't know if it's going to work reliably. Guess the prototype will answer that. In fact the whole thing has now been optimised for the lowest cost. With this new approach I'm actually not limited to 24 keys, but 24 works nicer for technical reasons.

Comments before I push the GO button?

Dave.

Awesome!

Is there a matching IR photo transistor, or is the IR LED for use as a remote control only? Why is there tilt sensor, do you have any specific ideas in mind -- or is it just for potential use in gaming?

-Katie

Originally I had a full IRDA transceiver, but that got trimmed back for cost reasons.

No real idea in mind for the tilt sensor, although might be fun for games or menu navigation.

I contemplated being brutal and leaving both the features out, but I caved in :)

Dave.

*Message #12 Posted by **Katie Wasserman** on 15 Dec 2009, 10:22 a.m.,*
in response to message #7 by DaveJ

Dave,

Function buttons are great as is expending the alphabetical keys, but having the buttons above the display makes little sense since your fingers will block the display when you press them. Is it hard to change the PCB layout in order to put the keys below the display?

-Katie

Not just hard, impossible I'm afraid.
It has to do with the physical size of the LCD behind the panel.

Dave.

Re: OT: uCalc proto

> Would it make sense to have the W, X, Y, Z keys access diretly to the corresponding stack registers? (Well W standing in for T...)

That is a nice possible benefit if you have a big font. But the screen is capable of displaying 4 lines of at least 16 characters anyway.

Dave.

Re: OT: uCalc proto

*Message #16 Posted by **BruceH** on 15 Dec 2009, 11:57 a.m.,*
in response to message #7 by DaveJ

The only thing that I would suggest is to swap plus and divide over since addition and subtraction are likely to be used more often and having them on the edge of the keypad means less chance of getting something else by mistake.

Re: OT: uCalc proto

*Message #17 Posted by **Juergen Keller** on 15 Dec 2009, 2:02 p.m.,*
in response to message #16 by BruceH

I second this suggestion. What are the dimensions of the front panel?

> this saves a key and keeps complex out of your face if you dont want them.

A very good suggestion.

I would also request that pressing the point twice between numbers could be used to implement a fraction input as used on the HP-33S and HP-35S models.

From the HP-35S User's Guide: To enter a fraction, press "." twice: once after the integer part of a mixed number and again between the numerator and denominator of the fractional part of the number. To enter 2 3/8, press 2.3.8 . To enter 5/8, press either .5.8 or 0.5.8 .

This should not interfere with your suggested use of pressing "." twice (without numbers between the presses) to enter "i".

Re: OT: uCalc proto

*Message #22 Posted by **DaveJ** on 15 Dec 2009, 3:53 p.m.,*
in response to message #19 by Chuck

> Quote:

>
> CHUCK

It will have anything someone programs into it, just like the uWatch. It will be open source, so will evolve into whatever the community wants.

It already has an "I" alpha key.

Dave.

Re: OT: uCalc proto

*Message #23 Posted by **Walter B** on 15 Dec 2009, 7:17 p.m.,*
in response to message #7 by DaveJ

One more remark: I dunno how you did program the hyperbolics - it looks like you have to press SHIFT ARC COS HYP for ACOSH. That would deviate from the expected sequence SHIFT ARC HYP COS. If I got this right, some label rearrangement may be favourable to take care of this.

Re: OT: uCalc proto

*Message #24 Posted by **DaveJ** on 15 Dec 2009, 7:31 p.m.,*
in response to message #23 by Walter B

The labels don't imply any actual entry order. That's up to what you want to do in software.

Dave.

Re: OT: uCalc proto

*Message #25 Posted by **Walter B** on 15 Dec 2009, 7:47 p.m.,*
in response to message #24 by DaveJ

So how shall ACOSH be entered?

Re: OT: uCalc proto

*Message #26 Posted by **Paul Dale** on 15 Dec 2009, 8:01 p.m.,*
in response to message #24 by DaveJ

I think Walter is suggesting that HYP should be on the 0 key and SIN, COS and TAN on the 1, 2 & 3 keys.

Or better, HYP on X-Y, ARC on 0 and SIN, COS and TAN on 1, 2 & 3.

Makes the entry order more natural.

So to enter ACOSH, you press these keys:

```
SHIFT X-Y 0 2
```

- Pauli

in response to message #1 by DaveJ

How do you control the display decimal digits? Is fix vs scientific notation automatic?

Re: OT: uCalc proto

*Message #30 Posted by **DaveJ** on 15 Dec 2009, 11:36 p.m.,*
in response to message #29 by Michael de Estrada

Anything not directly available on the keypad gets done in the menus.

I decided to add base number stuff on the 2nd shift, so no room left for FIX, SCI and other stuff I'm afraid.

Dave.

Re: OT: uCalc proto

*Message #31 Posted by **Bart (UK)** on 16 Dec 2009, 4:37 a.m.,*
in response to message #30 by DaveJ

Even though I'm an engineer (electronics), I'd rather have SCI than <ENG & ENG>, I never use them. I

take the value as per SCI setting and mentally convert to milli, micro, pico or units, Kilo, Mega.

And the only time I've used FIX is on the 35s because of the stupid scrolling display.

Just my opinion.

Re: OT: uCalc proto

*Message #32 Posted by **DaveJ** on 16 Dec 2009, 5:10 a.m.,*
in response to message #31 by Bart (UK)

I find it abhorrent to have to do a mental calculation or conversion after a calculator has given you a result, kind of defeats the purpose of having a calculator I think. If I'm using a calculator then I expect it to give me the result I expect. So I use the ENG key daily, although I hate calcs with those fixed ENG modes, I want the choice of when to convert to ENG display and when not.

SCI and FIX are more "mode" like than ENG in this instance, so don't deserve a primary key IMO.

But each to their own!

Also remember, it's trivial to make a stick on overlay to have any key layout you like.

Dave.

Re: OT: uCalc proto

*Message #33 Posted by **Bart (UK)** on 16 Dec 2009, 7:03 a.m.,*
in response to message #32 by DaveJ

If you do the mental calc daily it becomes trivial, order of magnitude convertion is soooo easy anyway :).

As I said it's my opinion, I don't mind if SCI is a menu item, it's not as if I change it for every calculation (like you said, more a mode change)- unlike those that use ENG.

As you say, it's easily reconfigurable and that's what I like most about it. Even though it's not "programmable" like traditional programmable calcs, I assume I can put in my own routines (that I would normally have programmed into the RAM of a programmable calc) and assign them to keys I don't normally use, or the F keys or add them to the menu.

Re: OT: uCalc proto

*Message #34 Posted by **hugh steers** on 16 Dec 2009, 9:24 a.m.,*

IIRC, that wasn't due to wonky minds but due to stubborn minds keeping wonky units, wasn't it? d;-)

Re: OT: uCalc proto

*Message #43 Posted by **Bart (UK)** on 17 Dec 2009, 5:18 a.m.,*
in response to message #42 by Walter B

Mistakes I've come across in aerospace equipment (which although not fully certified, were in advanced stages of development, delivered for fitment to flight test aircraft):

Multiplying instead of dividing by 1.94 when converting from knots to m/s.
Using the wrong sign for ascending/descending.
Swapping the reference axes around.

And these are just some that I can recall off hand.

Well said!

That is one reason I am so drawn to the 48 series - the units management, at least in theory, makes mental checking of the result less necessary. If only it weren't so difficult to learn ...

Re: OT: uCalc proto

*Message #45 Posted by **Bart (UK)** on 17 Dec 2009, 5:25 a.m.,*

So you believe everything your calculator spits out, not even caring to do a quick mental check as to the order of magnitude? (That's what you seem to be saying).

By the way, all I was saying was it's easy enough to mentally go from say 1E-8 to 0.01E-6 or 10E-9 without pressing buttons.

Edit: but I caved in: keep the <ENG and ENG> buttons, I'll leave them as unused as on all my other calcs that have them :)

That's what everyone says when this subject is bought up, but it always misses the point.

The calculator is a calculating tool, if it doesn't easily give you the result you expect from it, formatted the way you want it, then it's not as good a tool as it could be.

If you have to do extra conversion in your head then your chance of error is greater, regardless of how easy it is. Mentally checking your result and knowing what to expect etc, is really a separate issue.

> Quote:
>
> By the way, all I was saying was it's easy enough to mentally go from say 1E-8 to 0.01E-6 or 10E-9 without pressing buttons.

Sure, but that's not the point.
I bet you'd get a tad annoyed if your scientific calculator gave you "0.0000000123" all the time instead of scientific notation, or engineering notation all the time when you wanted scientific etc. There is nothing wrong with wanting your tool to give you the exact result you expect.

BTW, a good engineering calc will have a primary ENG key, so it's only one key press. And when you get used to hitting it subconsciously it really is a valuable function you

don't want to live without. But YMMV.

> Quote:
>
> Edit: but I caved in: keep the <ENG and ENG> buttons, I'll leave them as unused as on all my other calcs that have them :)

I will keep the ENG keys, thanks, the joy of being the product designer :-P
And that weird parallel key stays too, ain't I just evil!

Dave.

in response to message #46 by DaveJ

> Quote:
>
> formatted the way you want it,

And this part of the thread started because I merely said ENG format is not MY kind of format. (The mental thinking bit was only a justification, not the point in itself). But I concede because I understand there is a large contingent out there that does use it. That's the reason you should keep it on there - not just because you're the product designer. As I said early on in this thread, I'm happy with what I see, let's see some hardware.

> Quote:
>
> That's what everyone says when this subject is bought up, but it always misses the point.

A statement which you negate by:

> Quote:
>
> if it doesn't easily give you the result you *expect* from it,

How can you expect anything if you haven't done some mental reasoning?

By the way, in another post in this thread I mention errors in equipment, I found those errors because whilst doing on-aircraft checking (on ground of course) other equipment dependent on the information were reacting, and whilst seemingly correct, I was always asking myself "is this more or less what I was expecting?". Some were obvious (wrong direction) others more subtle (over or under reaction).

Re: OT: uCalc proto

in response to message #47 by Bart (UK)

> Quote:
>
> How can you expect anything if you haven't done some mental reasoning?

Not the actual quantitative number but the *formatting* of the number.

Like I said, as an example you might get pretty annoyed if your calc always gave you 0.000000123 instead of scientific notation.

Just like as an engineer I get annoyed sometimes when I don't get my result in engineering notation, because that's the *formatting* I've come to expect and work more naturally with, even if it is a small difference I can easily convert mentally. But note that I don't always want engineering notation, which is why I like my ENG key and having the choice, instead of an ENG mode which forces it down my throat when I don't want it.

Dave.

They are capacitive touch sensors, so nothing to wear out apart from the silkscreen PCB overlay. It's the only risky part of the design, it actually may not work reliably or at all, that's what the first prototype is designed to suss out. If I'm lucky it'll work first go and I should have something close to a finished product, if not then it's tweaking time, or on to plan B.

Dave.

Well, given all the signs, and almost everything is in place to enable such a product. It is more likely than not it will come out eventually. But internal politics is a funny business.

I think if HP don't take the opportunity that is staring them in the face and go ahead with the 15C then they should get out of the calculator business altogether.

Dave.

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 14 Dec 2009, 6:56 p.m.,*
in response to message #1 by Jose Gonzalez Divasson

Hi;

In Brazil it is not that different! (No, I am not the seller.)

R$720.00 =~ US$415.00

Not sold yet... Just as a comparison, Brazilian 'minimum' salary runs about R$460.00 a month (about R$5,520.00 or US$3,163.00 a year). A regular worker would need to work about a month and a half to buy it. The package includes the calculator, protective cover and three batteries (no manual).

Cheers.

Luiz (Brazil)

Use of Armor-All?

*Message #1 Posted by **tim m.** on 13 Dec 2009, 6:20 p.m.*

I saw this mentioned in another thread discussing proper cleaning of screen-printed keypad surrounds. I was wondering if anyone has used Armor-All on the cases of their Classic series calculators and could tell what effect--if any--the product had. Outside of my car, I've used Armor-All on plastics with good results and was thinking of using a smidge on my 35.

-Tim

Re: Use of Armor-All?

*Message #2 Posted by **Michael Meyer** on 13 Dec 2009, 6:31 p.m.,*
in response to message #1 by tim m.

Tim, I think you'll be pleased with the results. I spray a very light amount on a clean, non-abrasive rag and wipe lightly over the entire machine-- display, case, between keys, etc. Then lightly buff off any excess. I began to do this many years ago, and none of the calculators I've cleaned/polished with this method have had any problems. I've even used heavier amounts to removed the discoloration resulting from harsher cleaners or alcohol when they've hurt the finish on calcs I've bought.

Let us know how it turns out! Michael

Re: Use of Armor-All?

*Message #3 Posted by **Hal Bitton in Boise** on 13 Dec 2009, 9:28 p.m.,*
in response to message #1 by tim m.

Ditto...
I used it on a 67 a while back, with beautiful results.
best, hal

Re: Use of Armor-All?

*Message #4 Posted by **tim m.** on 13 Dec 2009, 11:11 p.m.,*
in response to message #3 by Hal Bitton in Boise

Thanks for the suggestions, all.

I just applied a light coat of Armor-All to the case and keyboard (which I had previously cleaned); both are much shinier and nicer-looking now. I avoided applying to the display crystal, as I was worried that transparent plastics would be clouded by the product. I had previously polished the crystal with Poly-Watch and it looks good now as-is.

-Tim

Re: Use of Armor-All?

*Message #5 Posted by **db (martinez, ca.)** on 14 Dec 2009, 1:19 a.m.,*
in response to message #4 by tim m.

Tim;
Keep us posted on the condition of the case please. I've had universally bad feedback, and bad results the time i tried it, using armor all on old padded dashboards. For that type of soft plastic in a hot sunny place; armor all seems to make it look like new, then it shrinks and cracks. The case may be a different plastic and it sure gets less sun but I'd like to know how your experiment turns out in a year - before i try it with mine ;-)

Re: Use of Armor-All?

*Message #6 Posted by **tim m.** on 14 Dec 2009, 3:42 a.m.,*
in response to message #5 by db (martinez, ca.)

Check Message #2. Seems at least one member here has had good results over many years. Perhaps the trick is only the lightest of applications.

I've also used the stuff in my car, which is now five years old with vinyl and plastic un-cracked.

-Tim

Re: Use of Armor-All?

*Message #7 Posted by **Katie Wasserman** on 14 Dec 2009, 3:45 a.m.,*
in response to message #5 by db (martinez, ca.)

Den-

I've been using Novus #1 plastic polish/cleaner for years -- it's never damaged anything. The perfect thing to clean and restore that "new look" to calculators. It's cheap and easy to find (online at least).

-Katie

Re: Use of Armor-All?

*Message #8 Posted by **db (martinez, ca.)** on 14 Dec 2009, 9:58 p.m.,*
in response to message #7 by Katie Wasserman

Hey KT;
Yes; that Novus polish is great. I got a pack with the coarse, medium and fine and it is - fine. I even used it on the screen for a.....Novus.

Tim;
The bad results with armor all that i had was on sun baked plastic, not new or newish stuff. It's treated Dr. Mike OK. I'll figure then that it'll work well on a relatively pampered calculator case for me too.

Re: Use of Armor-All?

*Message #9 Posted by **bill platt** on 14 Dec 2009, 10:44 p.m.,*
in response to message #7 by Katie Wasserman

Hi Katie,

Maybe the Novus would be good for scratched automobile speedometer screens. Mine is all scratched from people wiping dust off...can never understand why they don't make the screen vertical!

Plastic cleaners and polish

*Message #10 Posted by **Karl Schneider** on 14 Dec 2009, 11:21 p.m.,*
in response to message #9 by bill platt

> Quote:

> Maybe the Novus would be good for scratched automobile speedometer screens. Mine is all scratched from people wiping dust off...can never understand why they don't make the screen vertical!

Bill --

The mounting of gauges on older cars tended to be more plain and strightforward in that respect, but modern cars have recessed clusters behind a curved screen for the same reason we discussed in a very recent thread: to prevent reflective glare -- from sunlight or headlights behind, passing through the rear windshield.

I recently used Meguiar's Clear Plastic Cleaner to remove fine scratches from an instrument cluster screen. They also sell separate Clear Plastic Polish and Clear Plastic Detailer.

-- KS

Re: Plastic cleaners and polish

*Message #11 Posted by **tim m.** on 14 Dec 2009, 11:46 p.m.,*
in response to message #10 by Karl Schneider

Another option would be Poly-Watch, which is designed for polishing acrylic (not celluloid) watch crystals. The stuff works very well for removing light surface scratches with a few minutes' worth of elbow grease.

hp50g grobs

*Message #1 Posted by **Glenn Shields** on 13 Dec 2009, 1:35 p.m.*

I'm a new member and HP50g "trainee," got the printed manuals from hpcalc, noticed a few examples with a long hex number for a graphic (20-4 in user guide or 2-39 in AUR). Tried to relate the pixels with the hex digits, but can't figure out the connection; tried putting rows of pixels as 0's and 1's and going to hex, but still a mystery. Any help would be greatly appreciated.

Re: hp50g grobs

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 13 Dec 2009, 2:58 p.m.,*
in response to message #1 by Glenn Shields

Hi, Glenn;

Please, have a look at page 22-30 (HP50G UserÂ´s Manual). Chances are that the example there elucidates better.

Cheers.

Luiz (Brazil)

Re: hp50g grobs

*Message #3 Posted by **Glenn Shields** on 13 Dec 2009, 5:39 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Thanks for the quick response, Luiz, I need to read that part again, slowly. In the AUR "walker" example, it states that the programmer first compiles the image interactively in the Graphics environment, then returns it to the command line. Even if I could do this, I am still wondering, for example, what part of "E3001400...2800" represents his eye, or if this long number was recorded "after the fact". Meanwhile I will be hitting the books!

It is an honor to be a part of this forum. I am more of a hobbyist, though I do have a BA in math. One of my tests of the new calc was to have it cycle through the rand.# generator given with the 15C (7 digit decimal x 997, FP) and do this 500,000 times to complete the cycle. My old 20s took a day and a half, but the 50g did it in hours! Looking forward to more interesting posts.

Cheers!

*Message #4 Posted by **Dave Britten** on 13 Dec 2009, 6:23 p.m.,*
in response to message #3 by Glenn Shields

Check out comp.sys.hp48 sometime. You'll find more technical discussion about the 48/49/50 series there. Which isn't to say that you shouldn't stick around here too!

Re: hp50g grobs

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 13 Dec 2009, 6:51 p.m.,*
in response to message #3 by Glenn Shields

Hi again, Glenn;

Thanks for your very welcome words. Although I'm also a guest (and also honored to be) here, I think I know exactly what you mean. So, if you folks allow me, 'Welcome!'.

About GROBs: James Donnelly's 'The HP48 Handbook' is one of the must concise and serious source of basic information about the HP48 and its 'daughters'. From his book, p.34:

> Quote:
>
> ---
>
> ### Graphics Object Structure
>
> A graphics object is structured as follows:
>
> `<header><length><height><width><data....>`
>
> <header> This is a five nibble (1/2 byte) field that distinguishes a graphics object from any other object type, and has a fixed value of #02B1Eh.
>
> <length> This field is a five-nibble quantity that contains the distance in nibbles from the start of the length field to the nibble past the end of the object. This length is #Fh + the number of data nibbles.
>
> <height> This field is a five-nibble quantity that specifies the height of the graphics image in pixels.
>
> <width> This field is a five-nibble quantity that specifies the width of the graphics image in pixels.
>
> <data> The data nibbles begin at the upper-left corner of the graphics object and proceed left-to-right, top-to-bottom. Each row must contain an integral number of bytes, so the data may be padded with garbage bits. The bits in each nibble are written in reverse order, so the leftmost displayed pixel in a nibble is represented by the least-significant bit of the nibble.
>
> If you are preparing a graphics object on a personal computer, remember that the HP 48 CPU reads data from memory into registers in reverse order, so the first four fields are written backwards. For example, the header is written ElB20.
>
> Graphics objects may be entered into the command line on the HP 48. To enter a blank graphics object, type GROB *width height*, where *width* and *height* specify the size in pixels.
>
> ---

I hope this is a bit more helpful.

Cheers.

Luiz (Brazil)

Edited: 13 Dec 2009, 6:54 p.m.

I forgot to mention...

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 13 Dec 2009, 7:40 p.m.,*
in response to message #3 by Glenn Shields

... three of the most important publications: Willian C. WickesÂ´ 'HP48 Insights'. It has three volumes, the two first ones about the HP48S and the third one about the HP48G.

These three books are available at the MoHPC DVD set.

Cheers.

Luiz (Brazil)

Another example from DonnellyÂ´s book

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 14 Dec 2009, 1:06 a.m.,*
in response to message #3 by Glenn Shields

From DonnelyÂ´s 'The HP48 Handbook' we can also pic the following example (p. 35).

To enter a graphics object which represents the letter "G" in the small font, type:

```
GROB 4 5 E010D090E0
```

The bit-mapped representation of the resulting graphic can be understood like this:

On a personal computer, the graphics object looks like this:

```
E1B20   B1000   50000   40000   E010D090E0
header  length  width   height  data
```

Now, consider a blank graphics object the size of the HP50G display with the "G" from above in the upper-left corner. The graphics object looks like this on a personal computer:

```
E1B20                                 header
FAA00                                 length (changed for the HP50G)
38000                                 width
05000                                 height (changed for the HP50G)
E0000000000000000000000000000000000   row 1
1000000000000000000000000000000000    row 2
D0000000000000000000000000000000000   row 3
9000000000000000000000000000000000    row 4
E0000000000000000000000000000000000   row 5
0000000000000000000000000000000000    row 6
........
2720 total data nibbles (HP50G LCD) ...
........
0000000000000000000000000000000000    row 80
```

I think that these examples are much better to actually 'see' how the GROB is built.

Cheers.

Luiz (Brazil)

41Z Keyboard Overlay - The Final Cut

*Message #1 Posted by **Ángel Martin** on 13 Dec 2009, 12:30 p.m.*

Here it is, intuitively obvious and easy to use :-)

Don't miss revision 9, already posted at TOS.

Enjoy.

Edited: 13 Dec 2009, 12:39 p.m.

Re: 41Z Keyboard Overlay

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 13 Dec 2009, 12:39 p.m.,*
in response to message #1 by Ángel Martin

I have just downloaded it and will try it out tonight.

Congrats again, Ãngel.

Luiz (Brazil)

P.S. - Will the new 41Z have its own User Manual? The one available there is the same one from previous 41Z, with no mention to the new features and keeping the initial remark that the pack offers a humble two-level complex stack, etc...

Edited: 13 Dec 2009, 12:43 p.m.

Re: 41Z Keyboard Overlay

*Message #3 Posted by **Ángel Martin** on 13 Dec 2009, 1:16 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Manuals are always the last component, right?

I actually plan on updating the older one (re-doing it really) - let's see if the xmas break allows some spare time for the task.

Until then... use your intuition!

:)

Hint: to access the RED functions... press "Z" twice.

Edited: 13 Dec 2009, 1:17 p.m.

Here is the iPhone version for i41CX+ courtesy of Antonio (Al Software):

You can snag it here: http://alsoftiphone.com/i41CXplus/Overlays/

Thanks Ángel and Antonio!

Re: 41Z Keyboard Overlay - The Final Cut

*Message #5 Posted by **Egan Ford** on 14 Dec 2009, 3:05 p.m.,*
in response to message #1 by Ángel Martin

I am not having any luck with the new 41Z on i41CX+. On startup I get a complex number printed on the printer. Varies based on the stack and registers would be my guess.

The blue Z does nothing but Sigma+. Is there something I need to execute to get started?

Thanks.

Re: 41Z Keyboard Overlay - The Final Cut

*Message #6 Posted by **Ángel Martin** on 15 Dec 2009, 9:27 a.m.,*
in response to message #5 by Egan Ford

Hi Egan, yes you need to assign the function ZKBRD to the Sigma+ key - that enables the complex keyboard as per the overlay.

Printing the Z complex stack level is done by default on start-up. I don't have a printer and obviously neither does V41 but the behavior should be consistent. The rom works well in the real machine as well.

four complex stack levels are: U, V, W, Z (from top to bottom). Complex level Z corresponds with the real stack Y (Imaginary part) and X (real part). Note that real Z, T are just scratch, as they're not "reliable". All is done in the complex stach, in a dedicated memory buffer.

Best wishes

Display technology

*Message #1 Posted by **David Hayden** on 13 Dec 2009, 1:17 a.m.*

I was at a bookstore recently and marvelled at an electronic book reader that used e-ink technology. This is a low power, high resolution, highly reflective display technology.

It got me thinking how wonderful such a thing would be on a calculator. Does anyone know of any other interesting display technologies?

Re: Display technology

*Message #2 Posted by **DaveJ** on 13 Dec 2009, 2:06 a.m.,*
in response to message #1 by David Hayden

Yes, the contrast ratio of eINK is much better than normal LCD's.

There are several eINK type display technologies becoming available, unfortunately all of them are extremely pricey for DIY designs.

Dave.

Re: Display technology

*Message #3 Posted by **Eric Smith** on 13 Dec 2009, 2:22 p.m.,*
in response to message #2 by DaveJ

I own several e-ink devices, and while the stuff does have a power advantage over LCDs (under some circumstances), and possibly other advantages, contrast ratio is NOT one of them. The best you can currently get with the stuff is black on medium grey. It's fine under bright illumination, but I find that under typical room lighting that a good reflective LCD (e.g., hp 50g) is more readable than e-ink.

It is also extremely slow to update. Even the newer e-ink that is supposed to be faster than the previous generation is still extremely slow. I think if people had a calculator using e-ink they'd be very likely to complain about it. I'm not talking about animation, which would be impossible. Just pressing a number button or ENTER^ would take a noticeable fraction of a second for the display to update, vs. the nearly instantaneous update everyone is used to having with LCD (and with LED before that).

I expect that eventually e-ink technology will improve to where it has a good contrast ratio and fast refresh, but it ain't there yet.

Re: Display technology

*Message #4 Posted by **DaveJ** on 13 Dec 2009, 4:39 p.m.,*
in response to message #3 by Eric Smith

How did you get'em?
Dev kits are thousands of dollars.

Dave.

Re: Display technology

*Message #5 Posted by **Eric Smith** on 13 Dec 2009, 7:38 p.m.,*
in response to message #4 by DaveJ

Built into e-book readers. They use the same panels as the dev kits. The early Sony readers used the earlier technology panel. The newer Sony readers and the Kindle use the current technology, which has slightly better contrast ratio, and is slightly faster, but still nowhere near as good as LCD.

Re: Display technology

*Message #6 Posted by **BruceH** on 15 Dec 2009, 7:25 a.m.,*
in response to message #3 by Eric Smith

Agreed with Eric here.

Previous discussions around this topic have concluded that the most likely use for e-ink displays in calculators would be to provide keycaps or menu labels that can be changed on the fly when the calculator goes from one mode into another, for example. Mode changes are much less frequent than display updates so would make sense from a power consumption point of view.

Putting the e-ink display into the keycaps would be tricky and expensive, I suspect. However, if the front bezel were made from transparent perspex then the menu labels could all be generated via an e-ink display attached to the underside, which would be a lot simpler from a technical point of view.

Really really OT

*Message #1 Posted by **Don Shepherd** on 12 Dec 2009, 8:45 p.m.*

Since we've been talking about the good old days lately, look at this.

Love song at it's finest!

Re: Really really OT

*Message #2 Posted by **Michael Meyer** on 12 Dec 2009, 11:00 p.m.,*
in response to message #1 by Don Shepherd

May not be ENTIRELY off topic. I was spending some time just looking at an HP-25 that I restored. Admiring its subtle curves and beautiful case design. This seemed as good a thread to make these comments as I've seen.

I've been trying to explain to people what it was like when I was in junior high and high school. They just see a calculator when I show them an HP-25 or TI-59. (My HP-25 was stolen. Probably why I have...several...of them now. Well, quite a few.)

I (we, I assume for many of us) didn't have access to a personal computer back then. And though there were lots of calculators in the late 70's, there were few programmables. Looking at an HP catalog was, for me, sort of like looking at a Playboy magazine... except I didn't have to hide it. Great passion for and longing for these amazing devices. And what I saw on the pages and in office machine stores was still out of reach, but maybe slightly more obtainable. Every model was uniquely amazing... spiritual. I saved lawn money for months.

When I bought my HP-25, it was instantly my most prized possession. I knew the keys so well that I could operate it in the dark (thanks to the LED's). I carried it everywhere, sharing programs with good teachers. My best friend had an HP-19C, and we wrote wonderful programs and games together. Another had an SR-52 that I could borrow for days at at time. Later, with a TI-59, I could write every FORTRAN assignment (done on punch cards) for my own, "personal", computer. Later, in college, I re-wrote every computer assignment for my own machine. It had enough program space to allow structured programming. I was lucky... I treated my 59 well, and it still works perfectly today. (Along with guite a few others I've restored).

I suspect most people, even those from my "era" cannot understand this relationship, but I try to explain it folks in these terms.

My wife probably wouldn't be pleased if I pursued anything from Playboy today. But she tolerates my calculators, and pretends to be interested.

You guys (and gals) "get it". Sort of like a beautiful old love song. A love song from an era gone by, but one that conveys a passion from that era that still applies to my collection. I know that there are simulators and emulators available... just as there are pictures of pretty girls. But being able to hold them in my hands and admire their beauty in real life... is the better love story than a fantasy...though the fantasy is not forgotten.

in response to message #2 by Michael Meyer

Wonderful post, Michael. HP calculators in their heyday were indeed things of beauty. To be able to actually write a program to perform something meaningful on a handheld device, at a time when programming computers meant using hardware worth hundreds of thousands of dollars--and, thus, unavailable to the common man--was something special. No calculator today, from any manufacturer, can come close to that experience. That's why members of this forum constantly hearken back to the HP of old. It was special, and it will not return.

Likewise, Kris Kristofferson and Rita Coolidge were the HP-25's of their day. Beautiful, talented, almost magical. Watching their performance from 1972 today, I am reminded of how pure and sweet love can be. Today's "music" cannot compare. Whenever I hear a car go by with its amplifier turned up so the whole world must hear the speakers rap noise (I can't honestly call it music), I just want to listen to Kris and Rita again.

You hear the rap over the sound of the (flatulence)-muffler?

I have to laugh & sigh at the same time about the "era-gone-by".

We did things with our programmable HP-65s (and models on up the line) that are still difficult to do on a computer without software that costs, in today's dollars, as much or more than our HPs did back then.

Even our calculator games would fail today. They required imagination.

(ps. I CAN do some of those things on computers with inexpensive software - HP calculator emulators!)

Seems each time and its technical possibilities educate its generation. As long as we had text-only computer games (like "maze" or "dungeon", don't remember the exact name), imagination was inevitably required for the fun. The better the graphics became the less imagination was necessary. It's like what happened to brains after the transition from slide rule to electronic calculators: reduced capability for order-of-magnitude estimations since it is not required anymore. Instead, the next generation is able to sms at speed of light d:-)

So, I read my post to my wife. She laughed at me. She said that I can have any of the women from Playboy that I want. She suggested that I send my post to them and that would probably do the trick. She said something about me wanting HP catalogs to read the articles, not to look at the pictures.....

No comments on this one...

Regarding MLDL2000 'cosmetics' & more

*Message #1 Posted by **Jeff Davis** on 12 Dec 2009, 9:52 a.m.*

I was wondering if these plastic cards might be available for purchase. Please let me know.

Re: Regarding MLDL2000 'cosmetics' & more

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 12 Dec 2009, 6:44 p.m.,*
in response to message #1 by Jeff Davis

Hi, Jeff;

I was wondering about that when I started that thread: would someone try a 'form factor' cut and printing layout? Anyway, when I bought the two MLDL2000 units, I remember Meindert announced just a few complete units (less than 100 with the 82104A case), so I am not quite sure if these cards will be produced somehow. That's why I described how they were made.

Cheers.

HP 85B tape drive

*Message #1 Posted by **Leonard Adcock** on 11 Dec 2009, 3:11 p.m.*

I am trying to revive an HP85B to use as a controller for an old V curve tracer. The tape drive seems to be OK and has a good capstan roller, but it gives a STALL error 74 every time I issue a CAT, CTAPE or ERASETAPE command. I managed to find a second tape drive and that one gives the same error. The tape indicator light comes on (briefly) and the tape give a little jump and then the error occurs. Anybody got any ideas about what is going on and how to fix it?

Re: HP 85B tape drive

*Message #2 Posted by **Rik Bos** on 12 Dec 2009, 3:42 p.m.,*
in response to message #1 by Leonard Adcock

Hi,

The stall error is problably caused by a hanging tape, or due to loosing magnetic coating from the mylar carrier. Check your tape for blank spots wher the coating is removed. This is a problem for a lot of original HP tapes, #M tapes lasts longer.

-Rik

Re: HP 85B tape drive

*Message #3 Posted by **Leonard Adcock** on 14 Dec 2009, 4:02 p.m.,*
in response to message #2 by Rik Bos

I am using some new tapes I got from Athana. They are supposed to be direct replacements for the original. There seems to be a bit of drag when I move the drive wheel with a finger.

Which 3M tape do you have in mind? Is it the DC1000?

OT: basic arithmetic functions

*Message #1 Posted by **Thomas Klemm** on 10 Dec 2009, 8:44 p.m.*

Recently I purchased a new mobile phone (SAMSUNG SGH-C180) and as always I was curious about the features of the calculator. The manual was short with the description:

> Quote:
>
> Perform basic arithmetic functions.

Here's the menu:

```
*    .
#    + - x / % ( )
```

Just an ordinary four-banger, I was thinking first. But then I realized it conforms to algebraic notation:

```
2+3*4 = 14
(2+3)*4 = 20
```

Up to 16 places can be displayed, however at most 6 places after the decimal point:

```
1000*1000*1000*1000*1000 = Out of range
1000*1000*1000*1000*1000-1 = 999999999999999
(1000*1000*1000*1000*1000*1000-1000)/1000 = 999999999999999
(1000*1000*1000*1000*1000-1)/1000 = 999999999999.999

355/113 = 3.141593
355000000000/113 = 3141592920.353982

1234567890+0.123456 = 1234567890.123456
12345678901+0.123456 = 12345678901.1235
123456789012+0.123456 = 123456789012.123

9876543210+0.123456 = 9876543210.123455
98765432109+0.123456 = 98765432109.1235
987654321098+0.123456 = 987654321098.123
```

Extracting the square root can be done iteratively since you can edit the last computation:

```
(3/1+1)/2 = 2
(3/2+2)/2 = 1.75
(3/1.75+1.75)/2 = 1.732143
(3/1.732143+1.732143)/2 = 1.732051
(3/1.732051+1.732051)/2 = 1.732051
```

Error messages are nice:

```
1/0 = Can't divide by zero
```

But then I stumbled over the following:

```
23+17% = Syntax Error
```

Only after a while I found out how to use the *percentage* operation:

```
23%17 = 6
355%113 = 16
```

- Who'd consider *modulo* a basic arithmetic function?
- Have you ever noticed the use of **%** for this operation in a calculator? (I know it's common in many computer languages.)

Kind regards
Thomas

Re: OT: basic arithmetic functions

*Message #2 Posted by **hugh steers** on 10 Dec 2009, 9:03 p.m.,*
in response to message #1 by Thomas Klemm

im thinking the calculator in your phone is working in binary IEEE754 and compiled with the usual runtime mathlib.

you could check by calculating, say 1/17 and then multiplying and subtracting the significant figures. if it's binary, the numbers will go on and on and you will get garbage after 16 digits. if it's decimal, you will hit the zeros.

Re: OT: basic arithmetic functions

*Message #3 Posted by **Thomas Klemm** on 15 Dec 2009, 4:35 p.m.,*
in response to message #2 by hugh steers

First I was in doubt since e.g. 1/17*17-1 would just result in 0 as expected. Only after a while I came up with the following expression:

```
(1-(1000000-999999.999999)*1000000)*10000000000000
```

Using Python results in:

```
-76144933.700561523
```

While the calculator of my phone would yield:

```
-76144933.700562
```

I couldn't get any more places since the input field is limited to 50 characters.

So it seems intermediate results are calculated using binary while the result is rounded to 6 places after the decimal point.

Of course HP-calculators using BCD don't encounter problems with this expression.

Restoring Classics: 409 removed some lettering!

*Message #1 Posted by **Mark Henderson** on 10 Dec 2009, 3:36 p.m.*

I'm a long-time HP calcaholic and just getting started now buying and restoring Classic series calcs. Befroe starting my first project (a pretty sad HP-55) I read up everything on this site and elsewhere. I was able to get the dead 55 running in just a few minutes (a broken trace - I am an EE so this is my area of expertise), much to my delight. The keyboard and display work perfectly, so "all" that was left was the cosmetic restoration. In the mean time I'm using it as my daily calc and LOVING it.

After complete disassembly I prepared to wash the case halves in a diluted 409 solution. After soaking in the solution for just a few minutes, I pulled out the case top and to my HORROR several of the pad-printed legends (gold/blue) were dissolving away!!! I've not read this anywhere? Previously the letters were in GOOD shape. not all of them dissolved, but now it looks really shabby :-(My long term intent is to create a new overlay (if successful I will post here).

Has anyone else seen this problem? I'm getting 3-4 other Classics ready for restoration, but I'm really nervous about this step.

Mark

Re: Restoring Classics: 409 removed some lettering!

*Message #2 Posted by **Michael Meyer** on 10 Dec 2009, 4:43 p.m.,*
in response to message #1 by Mark Henderson

Mark,

Just now collecting or just now getting to the classics? I'm sure you've read about the "dangers" of being "bit" by this "bug".....

How horrible about the lettering! I've never tried 409... and won't ever, now.

I've had great luck with just dishwashing liquid and gentle rubbing under water with my fingers. Afterwards, I polish with Armor-All car vinyl spray... a very light coat, wiped nearly completely off with a clean rag. Restores the shine and, actually, when rubbed hard, removes grime and restores the finish. I've never seen the painted letters removed with this.

I've had no luck trying to restore the letters :(An overlay would be fantastic. I've replaced some model number face-plates with scans printed onto self-sticking paper. You might be able to replace the lettering in this manner, though it will never be perfect....

You know what this means... you have to find another HP-55, one for show, and one to use.

Happy Programming, Michael

Re: Restoring Classics: 409 removed some lettering!

*Message #3 Posted by **Marcus von Cube, Germany** on 10 Dec 2009, 5:09 p.m.,*
in response to message #2 by Michael Meyer

Mark, if CDs can be printed on by ink jet printers, why not the faceplate of your calc (or a replacement?)

Re: Restoring Classics: do and do-not:

*Message #4 Posted by **geoff quickfall** on 10 Dec 2009, 5:18 p.m.,*
in response to message #2 by Michael Meyer

Actually, and unfortunately that you have not seen it, it has been mentioned.

first the nevers:

```
-  Never, never use a harsh cleaner, (409, Fantastic, etc).
-  Never rub the or brush the silk screening.
-  Never use an abrasive.
```

secondly the how too:

```
-  use an extremely dilute soap solution.  A drop or two of dish
   detergent in a gallon of luke warm water.
-  if a brush is required let soak and use an artists brush or
   makeup brush (wifes with permission)
-  dab the area to be cleaned, never brush it
-  rinse
-  when drying, dab the area, do not rub or
-  let airdry
-  mask off the keyboard and apply a matte laqueur finish.
```

the why it happens:

```
-  solvents in the air (lab environment, alchohol based etc) and
   UV light slowly destroy the in house fixing agent used on the
   silkscreen.
-  although the silkscreening looks good, it is extremely
   compromised.
-  Using the matte spray will consolidate the silkscreen material.
-  the matte spray is optional
```

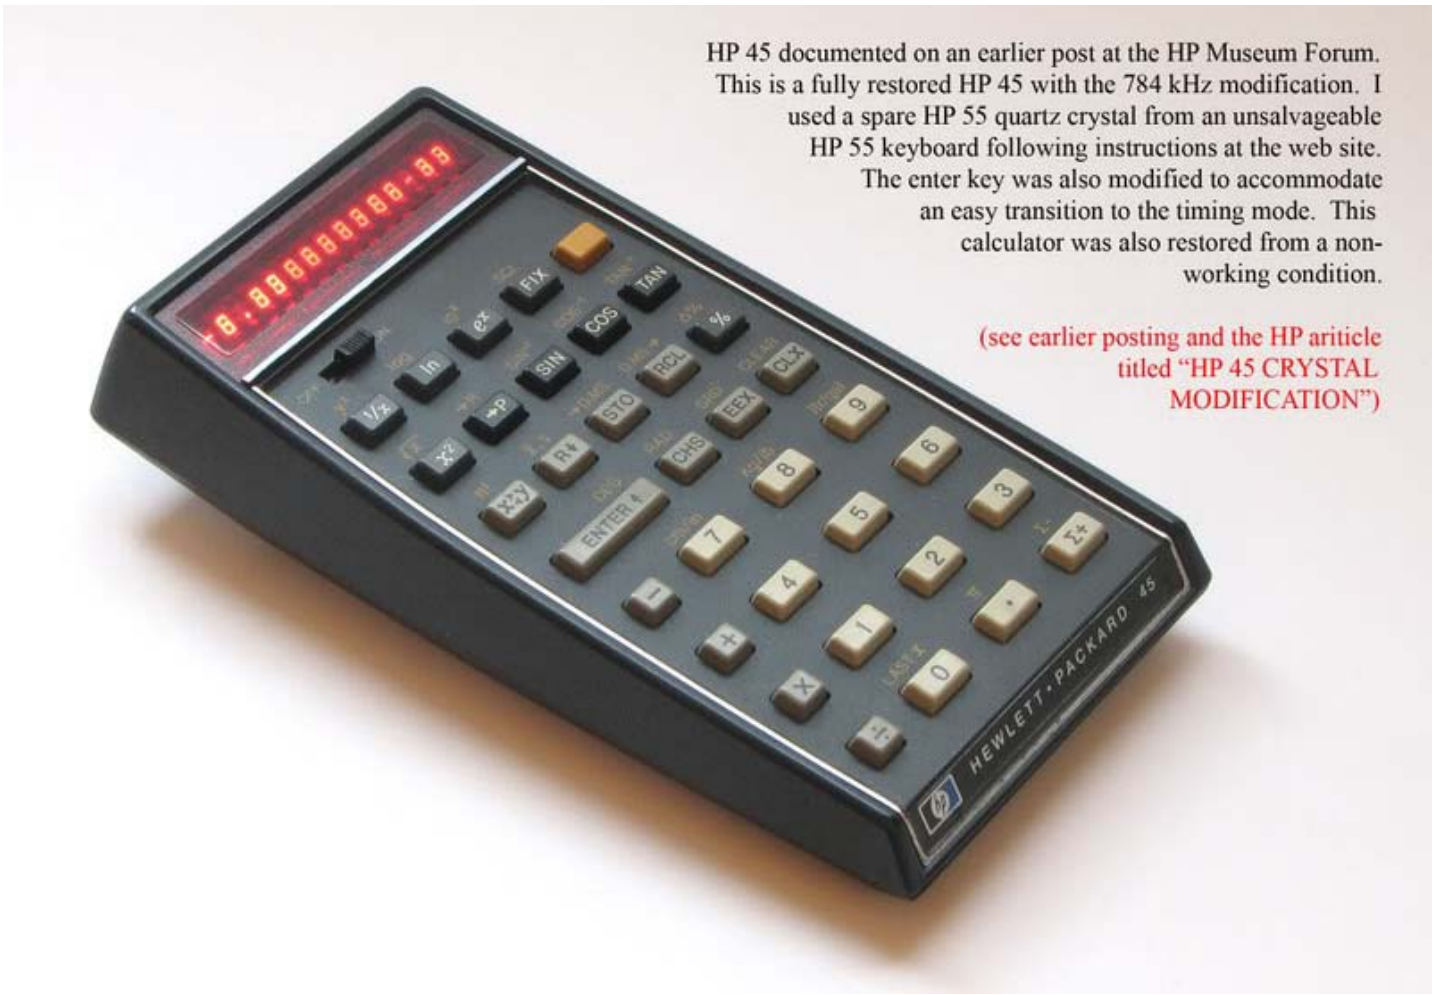
Many restorers here have used armoral (vinyl and plastic reconditioner, but I do not as I don't know the long term affect it will have. Also it does nothing to stabilize the silk screen from futher decomposition under UV. Of course if you have cleaned it and are not using it except for display then the matte spray is not required.

It is interesting to note that even my HP-55 was faded looking after treating its keyboard with kid gloves. The following have all been restored and stabilized with matte laqueur.

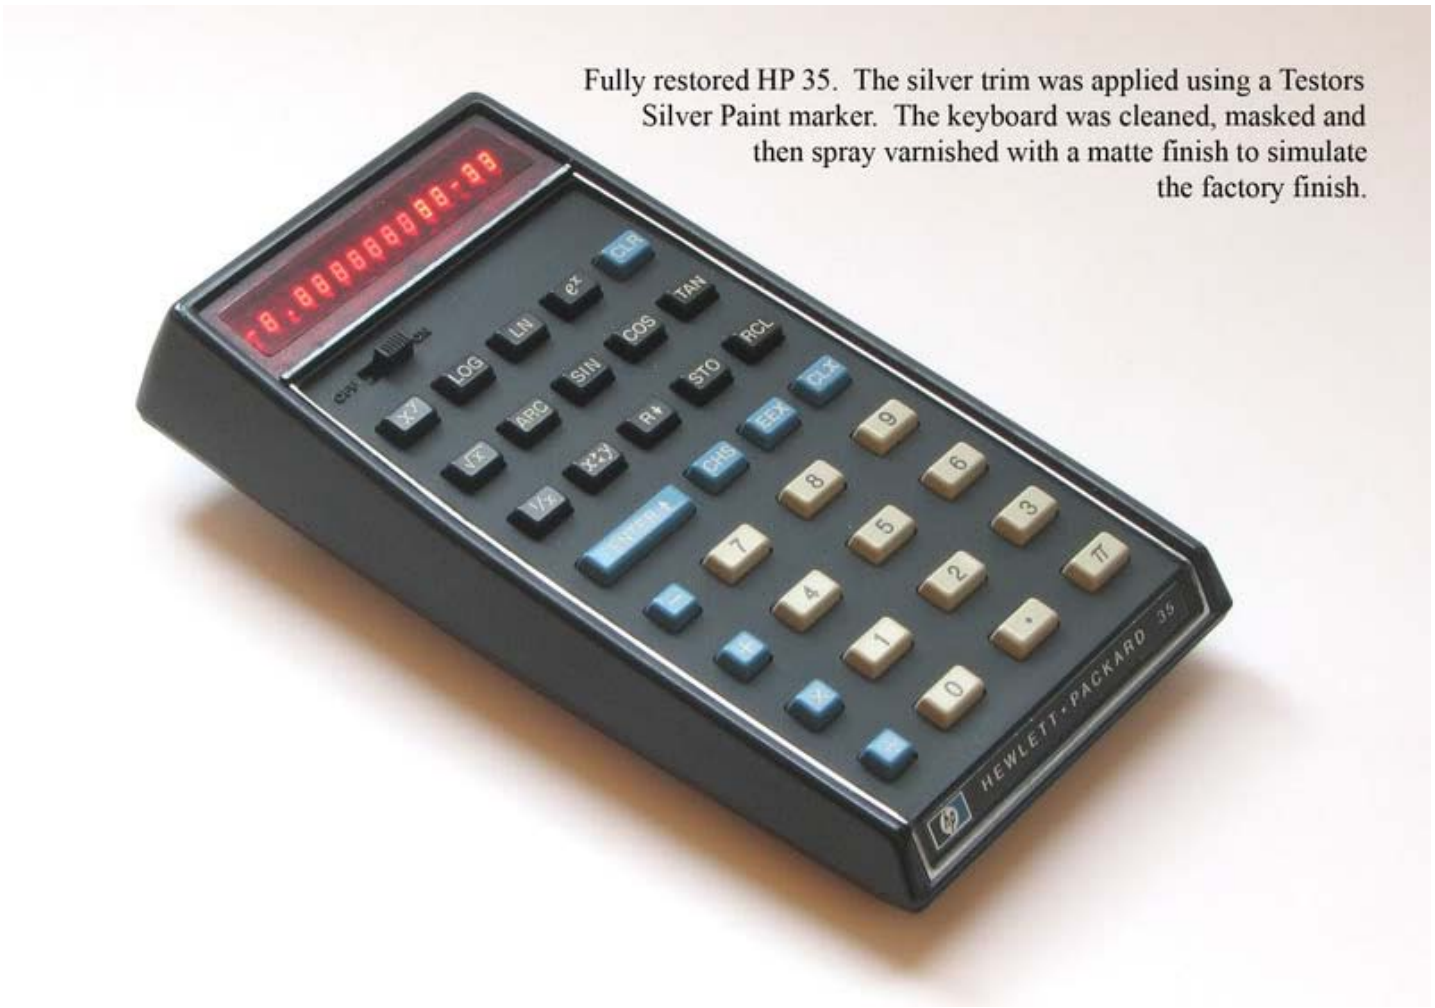
The Woodstocks are notorious for faded and washed out silkscreening!

Cheers, Geoff

Fully restored HP 55. Outer keyboard cover removed, cleaned masked and then spray varnished flat. The original had major white bloom damage on the keyboard original finish. The silver trim was missing and restored with a Testors Silver paint marker. The lens cover was polished using Polywatch to remove scratches. The electronics were washed in vinegar and alcohol to remove vertigre and dirt.
HEWLETT • PACKARD 55



HP 45 documented on an earlier post at the HP Museum Forum. This is a fully restored HP 45 with the 784 kHz modification. I used a spare HP 55 quartz crystal from an unsalvageable HP 55 keyboard following instructions at the web site. The enter key was also modified to accommodate an easy transition to the timing mode. This calculator was also restored from a non-working condition.
(see earlier posting and the HP ariticle titled "HP 45 CRYSTAL MODIFICATION")
HEWLETT-PACKARD 45



Fully restored HP 35. The silver trim was applied using a Testors Silver Paint marker. The keyboard was cleaned, masked and then spray varnished with a matte finish to simulate the factory finish.

in response to message #4 by geoff quickfall

Geoff,

My restorations are pretty, but not that pretty!!! Nice job! I especially like the furry model in the last photo... must have been a prototype.

I think there's a spot on that HP-55 that you missed... you'll have to do the whole thing over again. Just kidding.

Thanks for the great information and photos. I've been reluctant to spray the keyboards, not trusting my own skill with such a permanant sealant. It looks like a superior method, though, from your photos...

Michael

This is a lesson that I learned earlier this year as well - took the print right off the "Alpha" key on an old Casio (fx-4000p). Fortunately, I "got away with" using it on the HP's that I had already cleaned with it.

Mike

*Message #8 Posted by **Mark Henderson** on 11 Dec 2009, 2:36 p.m.,*
in response to message #4 by geoff quickfall

Geoff (and others) -

Thanks for the detailed response and incredible restoration photos - gives me great hope and inspiration!

In the post-mortem I came to the conclusion you stated - some of the keyboard areas appear to have been exposed to different contaminants (e.g. top row, lots of finger-borne contaminants) which have weakened the printing in various ways. Some of the legends were completely unaffected, some were almost removed... I will be much more careful in future... I do see that some of your 55 legends are faded, mine look very similar now, too.

I may just spray it and live with the "faded" look, however I've had some early success in creating an overlay artwork that looks much better than I expected, so next experiment will be to see if I can use inkjet dry transfer materials to put this artwork onto plastic.. If it works I can see creating artworks for all the Classics as required...

Meanwhile I've accumulated a few 45s and 80s to also restore - this is fun!

Cheers

Mark

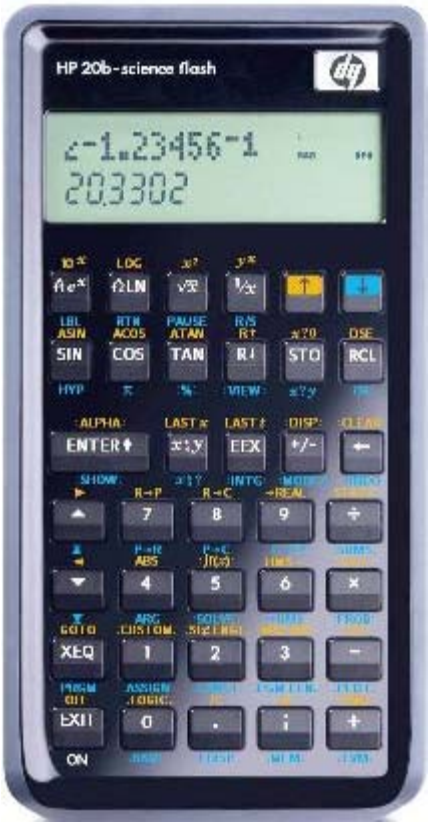
My concept for a 20b repurposing project

*Message #1 Posted by **Jeff O.** on 10 Dec 2009, 12:33 p.m.*

There hasn't been much discussion lately regarding concepts for repurposing the 20b. But I started thinking about it a while back and put some time and effort into developing my concept for such a project, so I figured I'd go ahead and present it for review and comment. Here's my concept for what it might look like:



(Sorry for the illegibility of some of the legends. The gold legends above the x, - and + keys are :CFIT:, :I/O: and :TIME:, respectively.

Salient points:

- command set, programming paradigm, etc. are intended to be basically the same as the 42S with maybe some 35s features thrown in. Alpha capabilities for program and variable names would be included if at all possible, but that capability will likely depend on memory constraints.
- on the keyboard, legends which represent menus are surrounded by colons and legends not surrounded by colons are direct functions. (I'm pretty sure that this was originally proposed by Pavneet Arora, and I like the idea so I used it, but full credit goes to Pavneet.)
- commands in menus would be displayed in the 6 x 43 dot-matrix area, two commands per "page". The two leftmost keys in the top row would be the soft keys used to access the commands. (Note that the 6 x 43 grid provides two 6 x 21 arrays, with one "blank" column of pixels between them. The 42S utilizes 7 x 21 pixel arrays to display its soft-key labels, but the characters are only 5 pixels high. So 6 x 21 ought to work.) Might look something like this:

- menus would be limited to at most 6 commands if possible, to enable all of their functions to be accessed either directly after calling up the menu or by scrolling up or down only one time.
- Complex number entry would be as on the 35s, i.e. key in real component or magnitude, press “i” or the angle symbol, then key in the imaginary component or angle.
- Complex number display: My preferred plan would be to display the real (or magnitude) in the 7-segment display area and the imaginary part (or angle) in the dot-matrix area. I believe that it would be possible to display at least four significant figures of any number in this area. Based on the display simulations I did, and tests using the ability of the 20b to display a message when it is first turned on, I think it might look okay. I tried to simulate this as best I could in the above large image. If numbers just don’t look right displayed in dot-matrix area, I would propose the method used by the 15C: a parallel, unseen stack that would hold the imaginary component or angle. In this case I would work in the Re<>Im and (i) commands of the 15C to either swap the real and imaginary parts or temporarily display the imaginary, respectively.
- there would be no polar or rectangular display mode. Complex numbers would be entered in either form and would be stored and displayed in whatever form they were entered. Two numbers in different display modes could be used in functions using two arguments. (The form of the result in such cases would be a selectable option by the user.) This leads to a new suite of polar/rectangular/complex/real conversion functions, as follows:
    - R->P: Rectangular to Polar conversion. If stack x and stack y both contain real numbers, treats stack x as real and stack y as imaginary components and returns the magnitude and angle (in current angular mode) to stack x and stack y, respectively. If stack x contains a complex value in rectangular form, converts it to a complex value in polar form. Otherwise takes no action.
    - P->R: Polar to Rectangular conversion. If stack x and stack y both contain real numbers, treats stack x as magnitude and stack y as angle (in current angular mode) and returns the real and imaginary components to stack x and stack y, respectively. If stack x contains a complex value in polar form, converts it to a complex value in rectangular form. Otherwise takes no action.
    - R->C: Rectangular to Complex conversion. If stack x and stack y both contain real numbers, treats stack x as real and stack y as imaginary components and assembles a rectangular-form complex value in stack x. Otherwise takes no action.
    - P->C: Polar to Complex conversion. If stack x and stack y both contain real numbers, treats stack x as magnitude and stack y as angle and assembles a polar-form complex value in stack x. Otherwise takes no action.
    - ->REAL: Complex to real. If stack x contains a complex value, places the imaginary component (if rectangular-form) or angle (if polar-form) in stack y, and real component or magnitude in stack x. Otherwise takes no action.
    - C->C*: Complex Conjugate. If stack x contains a complex value, replaces that value with its complex conjugate. Otherwise takes no action.
- Assuming numeric display looks okay, when a real value is in the x register, the dot-matrix area would be used to display the y, z, t or Last x register (or other stack levels if a different stack height is selected), or perhaps the time of day as I would hope to include time functions.

The biggest question I have concerns available memory. If I understand correctly, the 20b has 128 KB of flash for the calculator firmware, which I presume (hope) would be adequate for the functionality I am proposing. But there is only 6 KB of RAM, of which only 2 KB is battery backed. The other 4 KB goes away every time the processor shuts down, which happens after every operation. So the stack, storage registers, program data and various status flags all have to fit in the 2 KB battery-backed memory, which does not sound like nearly enough to me. The 20b

offers several “access points” into its system. Could external RAM be accessed via any of those? If not, would 2 KB be enough for just data and status? If so, could programs be developed on a PC, and get flashed into the flash memory with the calculator firmware? (I have no clue how feasible that would be; it is just the only way around the memory limitations of which I can conceive if it is not possible to somehow expand the 2 KB of continuous RAM.)

I did consult with Paul Dale regarding his scientific 20b firmware project. Paul kindly provided details on his work (actually his and Walter B’s), and we communicated back and forth a few times. The work is very impressive, and would produce a very capable device. But I thought that there could be room for something with a little less capability. I did not thoroughly study Walter's documentation for his and Paul’s project, so I probably copied many of the ideas or concepts. If so, I give full credit to Paul and Walter.

Conceptualization and visualization is as far as I can go with this project as I have no skills related to the development of the code or loading and running it on a 20b. To those who do possess those skills, would it be possible to repurpose the 20b as described above? If so, does anybody care to take a crack at it? I started fleshing out some of the other details regarding menu structure, etc. which I would be happy to share. But I thought it might be wise to see if it is even possible before completing that and presenting it.

Best regards,
Jeff

.

> on the keyboard, legends which represent menus are surrounded by colons

I saw those, wondered what they were, and eventually guessed correctly, so the cue worked for me. I wonder however if a right-facing arrow or triangle or elipsis might be better since these are all used in window applications to indicate another menu.

> Quote:
>
> commands in menus would be displayed in the 6 x 43 dot-matrix area, two commands per “page”.

Rather than having separate pages that you have to scroll through with the navigation keys, consider two dedicated soft keys. Combined with the two shift keys, you have 6 soft functions. If you add the shift-and-hold, you get 10 functions.

To make this useable, you'd have to display the shifted function when the shift key is pressed (or pressed and held), but that should be easy. This would simplify entry and might let you free up some functionality in the navigation keys.

> Quote:
>
> there would be no polar or rectangular display mode. Complex numbers would be entered in either form and would be stored and displayed in whatever form they were entered.

This is a very interesting idea and I'd love to see it. Way to think outside of the box.

The sticking point unfortunately remains the key top legends.
The rest can be fixed with a nice template overlay, but the key tops still show those weird financial thingos...

Dave.

No overlay is required. I've successfully removed the legends from a set of 20b keys. I'll get my wife to engrave legends which I'll paint by hand to finish things.

Sadly, no time for non-essentials at this time of year so the project is stalled at least until January :-(

You still need an overlay for the secondary functions that aren't on the key tops. But that's not nearly as hard as the keys themselves.

Removing existing legends and hand painting is so medieval! Someone needs to model the key and produce a blank duplicate.

Dave.

Actually, I'm planning on engraving the face plate too. Again, no overlay.

I agree but it was a heap faster than making moulds for the three different keys and casting some blanks.

Hello Jeff,

That would be a nice feature set. Your design made me wonder whether anyone could make light plastic overlays that could rest on the surface within the lip.

What im thinking is, overlays could accommodate an evolutionary product. Let’s say there was a repurposing project. It’s highly likely that elements of the layout would change from one release to the next (sadly inevitable!). So, each major release would come with its own function overlay. Could these be made at low cost? I don’t know.

Now, if it happened that the project layout was stable, you could just glue your overlay to the unit and be done with it!

?

In the SDK for the 20b the readme.doc file says:

> Quote:
>
> If you represent a company that has a need for large volumes, please contact cyrille@hp.com as HP might be able (depending on the cases) to make a special manufacturing run with your program pre-loaded and/or modification to the calculator color and artwork.

I suppose that means that if enough of us wanted your design you could ask HP to customize the keys and faceplate. I wonder how much a "large volume" is?

I have a vague recollection that it was of the order of 2k units for a custom screen printing and over 10k for a different LCD. No idea what the per unit price would be for either in these quantities.

I cannot imagine hitting either of these marks or even getting close.

*Message #11 Posted by **Katie Wasserman** on 10 Dec 2009, 10:38 p.m.,*
in response to message #10 by Paul Dale

2000, that's less than 4 percent of the promised-to-purchase units on the "bring back the HP 15C" site. Since HP has so far not brought back the 15C (even though it would be easy given the 12C+ architecture), you might easily get the minimum number of units. I think there is a lot of pent-up demand for a small, inexpensive calculator that does a good job with complex numbers, etc..

IMHO the number of potential orders at "bring back the HP 15C" site is heavily exaggerated, not up-to-date and unreliable. I'd bet if the HP 15C is re-realized it won't sell even 10% of what the site claims. Cheers

*Message #13 Posted by **DaveJ** on 11 Dec 2009, 4:13 p.m.,*
in response to message #12 by Reth

I disagree.
Demand for products like this is usually under stated until the product is actually available, and then all the buyers come out of the woodwork.

If the price point is right they'll sell in the 6 figure range, easily.

Dave.

*Message #14 Posted by **Reth** on 11 Dec 2009, 9:22 p.m.,*
in response to message #13 by DaveJ

I'll be glad to be proven wrong. I'd buy what I promised just to support the project. That is if the new HP-15C is only quicker than the original. If it has IO, more memory and mnemonics it's another story.
Cheers,
Reth

Re: My concept for a 20b repurposing project

*Message #15 Posted by **Jeff O.** on 11 Dec 2009, 7:30 a.m.,*
in response to message #1 by Jeff O.

Jeff

Thanks to all for your kind comments.

I considered adding discussion of the keyboard and keytop labelling issue, but was trying to keep my post as short as possible. Too bad that such a relatively low-tech issue should be the one that generates the most discussion and may be the biggest stumbling block. For the record, my concept for the keyboard is typical, a sticker or overlay with the labels and holes for the keys. At the HHC 2009 conference, Cyrille mentioned a company called “Skinit”. They make decorative custom skins for lots of electronic devices. They ignored me when I inquired about a custom skin for the 20b, but maybe Cyrille could get their attention. If “Skinit” can’t do it, I believe Tim Wessman produced stickers for the 50g (prior to his joining HP), so there must be a way. For the keys, first I would not try to put the blue legends on the slanted fronts of the keys; that looks too hard. Those legends would go on the keyboard below the keys. For the key tops, I tried to keep as many stock legends as possible, but my design would require 16 keys to have new legends on the top of the key. As Paul mentioned, he successfully removed the legends from his keys. To put them back (without custom engraving), the only ideas I have are either small stickers or custom rub-on transfers sealed with clear lacquer.

Hi Jeff!

Looks great, but do you really think any serious effort towards the 20b pays off? While I like the LCD and

keytops, the fact that the keys are not hinged and do not register reliably along with the case being quite wobbly at pressing outer keys is a show stopper here.

A final product would probably cost more than a 32SII oder even 42S on TAS.

Maybe I got you completely wrong.

Thomas

Re: My concept for a 20b repurposing project

*Message #17 Posted by **Jeff O.** on 11 Dec 2009, 12:46 p.m.,*
in response to message #16 by Thomas Radtke

Hi Thomas,

I guess my goal is to create something that fixes the one major shortcoming of the 42S (lack of I/O) plus improves its complex number capabilities by adding the "i" key from the 35s. In the past, I have developed concepts that were basically complete flights of fancy which would have required complete new hardware development or major hacking of the 35s hardware. I'm not crazy about the key-press feel of the 20b, but it does offer a complete package with keyboard, display and reconfigurable processor.

As for cost, if everyone who wanted to repurpose their 20b had to get all of the hardware and software tools, the cost would likely exceed the cost of a 32sii or 42S at TAS. But if it is some sort of community effort, I'd think the cost could be kept reasonable.

Jeff

Yeah, I know... but I find it amazing that such a market does exist: I mean, how many of these will they ever sell?

Now, if we can find more interesting uses for those skins, and if they will market the front bezel too...

Greetings,
Massimo

Re: My concept for a 20b repurposing project

*Message #21 Posted by **Martin pinckney** on 11 Dec 2009, 3:15 p.m.,*
in response to message #1 by Jeff O.

A modest suggestion:

Since the 20B already has many "scientific" functions printed on the sloping key faces, and no functions at all printed in the spaces above the keys, why not design the repurposing project to retain all the keycap legends, then only an overlay is needed. So you would have both scientific and business capabilities in the same calculator, like the 27S. (Maybe call it a 20BS?)*

I know this approach limits the number of function possible, but it makes the project much more easily doable.

Re: My concept for a 20b repurposing project

*Message #22 Posted by **hugh steers** on 11 Dec 2009, 3:29 p.m.,*
in response to message #21 by Martin pinckney

this would be my pitch too - keep the keycaps the same. i know it could be better with new caps, but it would make the overlay project feasible.

on 15C functionality; it would take quite a while to replicate all that. however comprehensive complex support is very possible.

one of the big drawbacks of this unit is that the "customers" cannot flash their units without special connectors. this would make it a serious problem for people to load up the latest firmware. furthermore, there is no easy way to get user programs on or off the machine (assuming it could support programming).

Re: My concept for a 20b repurposing project

*Message #23 Posted by **Martin Pinckney** on 11 Dec 2009, 5:48 p.m.,*
in response to message #21 by Martin pinckney

Before anyone else points it out, I just realized one problem with my approach - the one shift key is already used for the sloped faces - so some way would have to be devised to get another shift function.

Re: My concept for a 20b repurposing project

*Message #24 Posted by **Jeff O.** on 12 Dec 2009, 11:58 a.m.,*
in response to message #21 by Martin pinckney

Hi Martin,
One of my goals was to create a "scientific four-banger," with as many the most used scientific functions as possible being primary key functions, and the rest only one shift away. I don't think I can "waste" a bunch of primary functions on financial functions :-)

Re: My concept for a 20b repurposing project

*Message #25 Posted by **db (martinez, ca.)** on 11 Dec 2009, 10:22 p.m.,*
in response to message #1 by Jeff O.

Jeff;
Looks like a good general purpose layout you came up with. It should please most folks. DO IT!

The only suggestion/request you'll get from me is; to make it available in a normal, readable-by-my-computer format that can be downloaded by mere mortals. I think that the 20b is a nice (and cheap) little platform but i don't have time to sink hours into some comp-u-nerd's proof that he is smarter than me. I just want to load it and use it.

Re: My concept for a 20b repurposing project

*Message #27 Posted by **John B. Smitherman** on 12 Dec 2009, 10:27 a.m.,*
in response to message #1 by Jeff O.

Hi Jeff. This looks like an ambitious project and I wish you good luck.

Did you consider moving the +,-,x,/ keys over to the left in order to group them with the Enter key? That is where HP placed them with their original designs. I'm not sure when HP changed the placement but they were on the left on the 34c and then on the right with the 32sii. I prefer having them grouped with the Enter key.

Regards,

John

Re: My concept for a 20b repurposing project

*Message #28 Posted by **Jeff O.** on 12 Dec 2009, 11:49 a.m.,*
in response to message #27 by John B. Smitherman

Hi John,
No I did not consider moving the +,-,x,/ keys over to the left. I actually like the idea, but it would add even more complexity to the key labelling problem.

Re: My concept for a 20b repurposing project

*Message #29 Posted by **Thomas Radtke** on 12 Dec 2009, 12:13 p.m.,*
in response to message #28 by Jeff O.

You would just have to swap the keytops due to labelling and the half-height ON key :^).

Re: My concept for a 20b repurposing project

*Message #30 Posted by **Andrew H.** on 13 Dec 2009, 3:49 a.m.,*
in response to message #1 by Jeff O.

This might be wandering slightly off topic, but it was triggered by the positioning of the i-key where the = was previously. This is one of those small things that just works (and it immediately makes it apparent that this calculator handles complex numbers).

One of the reasons it appealed to me is that I've recently been contemplating the 20b's keypad layout. While I think that its functionality is outstanding (particularly the inclusion of the probability distributions), I find its keypad layout to be underwhelming. Like Jake Schwartz (http://www.pahhc.org/2008/Improving%20Keystroke%20Efficiency.pdf), I'd like to see all a calculator's mathematical functions on its keypad (where one can find them) rather than in menus. After all, they're a calculator's raison d'etre.

The trouble with this approach is that the keypad can quickly become a dog's breakfast: it becomes very important to group like keys with like so that users can actually find them.

Rather than try to design the keypad of an entirely new 20b-based calculator as Jeff has, as an exercise I have rearranged the 20b's keypad with this in mind. The result is as follows.

```
  P/YR     |IRR|    |NPV|   |Amort| |Bond|   |CshFl|
    N       I/YR      PV       PMT      FV       up
 x P/YR   |IConv| |BrkEv| |Depr|   |Date|    |INS|

                    y^x      e^x    (10^x)   |Data|
    f        g     sqrt     1/x       %      down
                    x^2      LN       LOG      DEL

     |Reset|     |Memory| |Mode|   |%calc| |Stats|
      INPUT          (        )      EEX      +/-
        ANS        (R up)     BEG      END      ABS

      HYP       SIN       COS       TAN        F
      STO        7         8         9         /
     AHYP      ASIN      ACOS      ATAN      INV F

  (-> H.MS) [TOTAL -- PART -- %TOTAL]    chi2
     RCL        4         5         6         *
   (-> H)       !        nCr       nPr    INV chi2

  (-> RAD)    [OLD ---- NEW -- DELTA%]      t
     <-         1         2         3        -
  (-> DEG)     RND      RAND       pi      INV t
```

```
          [CST ---- PRC ---- MAR]       n
ON/CE       0          .          =       +
 OFF    (INTG)    (FRAC)    (SHOW)     INV n
```

Notes

1. All the functions in the Math menu now appear on the keypad, and the Math menu itself has been eliminated.
2. HYP and AHYP would work as for the 11C and 15C.
3. For clarity, menus are enlosed in vertical lines || rather than colons ::.
4. Functions in brackets () are not found on the 20b: they are potential additions.
5. -> H.MS and -> H are very useful on a business calculator for summing times in hours and minutes.
6. The 3-variable solver equations enclosed in square brackets on the bottom 3 rows are suggestions; other possibilities are P -- NOM% -- EFF% (from the IConv menu) and DATE1 -- DATE2 -- DELTADAYS (from the Date menu).
7. Almost all the keys of a standard 4-banger calculator (including STO and RCL but except for %) are found in the bottom 5 rows.
8. Pi belongs on the 3 key - where else?
9. The back space and CE keys are grouped together.
10. Factorial-based functions are grouped together.
11. The display of the 20b only has one secondary-function-active indicator, which would be displayed whenever either the gold (f) or the blue (g) keys was active.
12. It might be worth considering DF1 and DF2 registers and associated keypad short-cuts (e.g. STO . 1 to set DF1) for repetitive calculations of the chi2-, t-, and F-distributions.

My questions are:

1. Is this an improvement; and
2. Is HP paying enough attention to keypad layout?

Re: My concept for a 20b repurposing project

*Message #31 Posted by **Walter B** on 13 Dec 2009, 4:51 a.m.,*
in response to message #30 by Andrew H.

Hi Andrew,

Short answers: 1. Yes, in some parts. 2. Not always.

More feelings: Nice layout carrying some new ideas. Your layout reminds me of the 22S, though its function set aims to the 27S. - I miss some (for me) vital keyboard operations like Sigma+ and its relatives. Your mileage varies obviously. - Keyboard layout is often influenced, if not governed by personal preferences and applications used frequently by the designers. Layouting a math-bussiness calc is even harder than a pure scientific or pure business calc.

How do you browse menus without the up and down arrows?

All this is my opinion only. YMMV

Re: My concept for a 20b repurposing project

*Message #32 Posted by **Andrew H.** on 13 Dec 2009, 6:46 p.m.,*

in response to message #31 by Walter B

Walter,

I'd replace = with SIGMA+ if I were to include it, but I didn't consider doing so because I didn't want to deviate from the approach that the designers of the 20b had taken. Part of the reason for undertaking the exercise was to see whether just rearranging the keypad layout without necessarily adding any additional functionality might significantly improve the 20b. In doing so, it became apparent that the keypad could naturally accommodate additional functions (e.g. 10^x).

The up- and down-arrow keys are at the top right of the keypad. This is consistent with the position of the cursor keys on the 35s and the 50g. You might have noticed that I have erroneously indicated that INS is a menu.

You're quite right about the influence of personal preferences, which is why I've tried to be guided by the principle of grouping like with like, even if it has resulted in a deviation from what has been common practice in the past. An example of this is placing the <- key above the ON/CE key.

SpeedUI - Important update to v. 9.08

*Message #1 Posted by **Raymond Del Tondo** on 9 Dec 2009, 5:46 p.m.*

Hello all,

thank you for your patience.

SpeedUI 9.08 is a bugfix release only,
but it's strongly recommended to update
from an older version, since the v 9.08
fixes some display and keyboard related bugs,
as well as one serious bug in the MsgBox library,
which caused a crash.

Many thanks to the users who submitted the bug reports:-)

The new SpeedUI 9.08 package has just been uploaded to
www.hpcalc.org
and
www.hpmuseum.org

It may take some time until hpcalc.org will be updated,
so the alternative route is to download SpeedUI 9.08
from the HP Museum of calculators.
Here's the direct link:
http://www.hpmuseum.org/guest/deltondo/sui_908.zip

For those who don't know SpeedUI,
please take a look into the overview PDF:
http://www.hpmuseum.org/guest/deltondo/speedui.pdf

Have fun:-)

Raymond

Advice on HP-25 repair, please.

*Message #1 Posted by **Michael Meyer** on 9 Dec 2009, 5:29 p.m.*

I have a beautiful HP-25 (aren't they all?) with problems. It turns on and will accept numbers fine and actually programs fine. It pauses briefly and shows 0.000000000 and freezes if I try to do anything with the stack: enter, operators, etc.

I have replaced the ACT and tried Katie's 20K resistor fix with no luck.

What's next? It seems as if it would be a chip problem, and there's only two main chips left to swap...

Thank you, smart people!

Re: Advice on HP-25 repair, please.

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 9 Dec 2009, 6:26 p.m.,*
in response to message #1 by Michael Meyer

Hi, doc;

I have one wit exactly the same problem.

It turns out that the basic stuff - display/keyboard scan, number and program input - seem to be native ACT resources. The heavy-duty performance seems to be related to the external ROM, and if I am not wrong, it is one of the IC´s that go under the LED display assembly.

I tried with another HP25 with a bad RAM IC and it worked fine. At least I was able to identify the problem...

Not too much of a help, I know...

Success!

Luiz (Brazil)

Re: Advice on HP-25 repair, please.

in response to message #2 by Vieira, Luiz C. (Brazil)

Well, I replaced the ROM(0) chip under the display. Then, the calculator would go blank with the execution of any function!

Running out of de-soldering wick and hope, I replaced the vertical ROM chip from a dead board.

To my pleasant surprise... it works!!!! Programs, runs, etc.!!!

SUCCESS!!!

Thanks, as always, for the hints!!!

Re: Advice on HP-25 repair, please.

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 9 Dec 2009, 8:28 p.m.,*
in response to message #3 by Michael Meyer

Hi, Doc;

good news are always welcome!

Now that you mentioned the ROM(0) chip, together with the ACT it provides the basic operation, not the ACT alone as I mentioned... my fault! The HP21 has just this single ROM with all it does, but in the HP25 its features must be shared with both ROM's. When anything goes wrong with ROM(0), almost nothing works. And when the calls for the functions stored in the other ROM are triggered, a display full of zeros is the sign that there is no answer from the (absent) routine.

Congrats again.

Luiz (Brazil)

TVM bug in HP 20b?

*Message #1 Posted by **Daniel Castro** on 9 Dec 2009, 2:36 p.m.*

Hello all,

This is my first post in this forum though I have been following it for some time. I have detected a strange behavior on the HP 20b doing a NPV calculation when the I/YR is 0%. As an example see the following scenario:

P/YR:12

PV:-1000

PMT:500

FV:0

I/YR:0

In this case the resulting N on my calculator is –1000 ??

Repeating the scenario with I/YR: 0.0000000001 gets the right solution N=2 (the same result obtained with the 50g or the 17BII in the first scenario, i.e. I/YR=0)

My firmware is an old one (6.24.2008). Could someone here check if this error is also present with newer firmware versions?

Thank you in advance

Re: TVM bug in HP 20b?

*Message #4 Posted by **Gene Wright** on 10 Dec 2009, 12:27 p.m.,*
in response to message #3 by Tim Wessman

Good news:

1) Solving for N when the interest rate is zero is a division problem: PV divided by PMT = N. That's a lot less work than keying in the information into the TVM registers. It DOES require recognizing the I% is zero and changing how you operate, but I've taught my students for years to do just that.

2) The NPV function itself works FINE with a 0% interest rate. This is confined to the TVM functions / registers (N, I%/YR, PV, PMT, and FV) only.

Bad news:

1) Yes, it does give the wrong answer to N when the interest rate is zero.

As Tim said, Oops.

> Solving for N when the interest rate is zero is a division problem: PV divided by PMT = N.

Yes, maths are amazing :D

Obviously I don't think many people ever use the financial functions for such calculation on real life (I myself found it while playing with the calculator). That might also be a reason about why nobody has informed about the error before (or at least I couldn't find anything on Google before posting here). All in all, this is not a problem that will cause a probe to crash on Mars surface, but a bug is a bug ;).

> Quote:
>
> 2) The NPV function itself works FINE with a 0% interest rate.

Yes, NPV calculation in cash flow analysis works fine, as it does any other TVM analysis with I%=0. As a matter of fact the buggy scenario is a particularization of a payback analysis on a cash flow with an initial investment, constant inflows and no interests (or flows increasing evenly at I% rate). Luckily the payback function on the Cash Flow works fine AFAIK.

My intention was to check with others if this bug was still present on the new firmware version, as I have the old one (including the logarithm bug) and wanted to know if it worth the time to build a serial cable to upgrade it... now I see I can live without the cable unless HP decides to correct this and release the new firmware on their SDK.

Anyway, thank you to you all for taking the time to check this. I will contact HP's customer support to let them know about the bug.

Re: TVM bug in HP 20b?

*Message #6 Posted by **Gene Wright** on 11 Dec 2009, 4:40 p.m.,*

in response to message #5 by Daniel Castro

Actually, HP knows about it by now. They search this forum often. I **know** they know about the error. :-)

And, please don't take anything I said OR how I said it as indicating that some bugs don't matter. They do and this is certainly a bug that should be fixed. Quite!

I wanted to make sure that anyone finding this thread later through a google search also saw that this is a very special case error which, although it should be fixed, occurs in a very easily recognized circumstance AND that can be avoided by a procedure that is MUCH easier to do anyway.

No worries! Good catch! Now, find something else! :-)

Seems that by then the error will be fixed by HP. Luckily this is easily detectable, so as you say I do not think this bug will cause too much trouble. All in all, calculators are a wonderful tool but nothing substitutes common sense...

To be fair with the 20b, even after this it is still my preferred calculator for work as it covers 90% of my daily needs, it's easy to carry and work with, pretty fast, can switch from RPN to algebraic in case someone borrows it, and it is cheap enough to not committing suicide in case it is stolen. Sure, the keys are not up to the quality of vintage models or even modern ones as 50g (hope to see this improved in future revisions…) but I suppose HP had to reach a compromise to get a certain price point on retail.

> Quote:
>
> Now, find something else! :-)

Hope not :D. In any case, HP had a great idea about adding a serial interface for updating the firmware. Good move! Let's see if HP can keep it on future mid-range models.

Re: TVM bug in HP 20b?

*Message #8 Posted by **Tim Wessman** on 11 Dec 2009, 7:40 p.m.,*
in response to message #5 by Daniel Castro

Yes, we know about it now. Thanks for the report! We much prefer people reporting on it here to be fixed rather than calling support. Makes it much easier to just get it done. :-)

At first glance, it looks like there is code to detect an I of zero, but it should be returning (pv+fv)/(i*FV-PMT*(1+i)*beg) but is returning the wrong variable so it is actually pv+fv coming back.

I'll investigate why this is happening to make sure it doesn't break something else, and give it a thorough testing next week.

Re: TVM bug in HP 20b?

*Message #9 Posted by **Daniel Castro** on 16 Dec 2009, 3:53 p.m.,*
in response to message #8 by Tim Wessman

Thank you Tim, it seems that I will have to build my serial cable to reflash the firmware sooner than I thought ! ;) This is what I call super technical service.

Talking about the serial cable, does someone in this forum know where in Europe can I get the 6 pin pogo connector for interfacing with the 20b? It is proving to be more difficult to find than I expected.

Re: TVM bug in HP 20b?

*Message #10 Posted by **Eric Smith** on 16 Dec 2009, 4:36 p.m.,*
in response to message #9 by Daniel Castro

It's custom made, not a standard connector. Perhaps you could make your own with six pogo pins and some low-melting-point plastic (e.g., Shapelock).

hp 35s Odd Behaviour: Fractions in Complex Numbers

*Message #1 Posted by **Mohammed Hadi** on 9 Dec 2009, 7:16 a.m.*

Yesterday was a good hp day for me. My first hp calc since I lost my 15c 21 years ago arrived (35s) along with a 12c for my wife (an economics professor, this would be her first brush with RPN). To top it all, the broken 41CV that I got for free from a friend the other day sprang to life after some battery corrosion cleaning and an unconventional workaround the broken bottom screw posts.

Anyway, I was playing with the 35s and noticed the following odd behaviour: I tried to input -1/3 i -1/3 by typing ". 1 . 3 CHS i . 1 . 3 CHS ENTER". What I got back was "0.3333i-0.3333" instead of "-0.3333i-0.3333"!

What gives?

Has this been discussed before?

Re: hp 35s Odd Behaviour: Fractions in Complex Numbers

*Message #2 Posted by **Bart (UK)** on 9 Dec 2009, 7:27 a.m.,*
in response to message #1 by Mohammed Hadi

Interesting. It works correctly when entering "0.3333333 CHS i 0.3333333 CHS ENTER". You've discoverd another bug?

Re: hp 35s Odd Behaviour: Fractions in Complex Numbers

*Message #3 Posted by **Paul Dale** on 9 Dec 2009, 4:28 p.m.,*
in response to message #1 by Mohammed Hadi

Added to the HP-35s bug list.

>
> Why does everyone shun and hate me so?

Although many are apparently putoff by the chevron key layout and lack of a big ENTER key, I consider those complaints to be trivial. Even the tiny decimal point doesn't bother me. If speed of program execution and number base support are important to you--and they are to me--the 33s beats the 35s hands down.

Re: hp 35s Odd Behaviour: Fractions in Complex Numbers

*Message #10 Posted by **Ángel Martin** on 10 Dec 2009, 7:19 a.m.,*
in response to message #1 by Mohammed Hadi

maybe some things are not meant to be combined, like fraction input on complex numbers... but of course that should be clearly mentioned.

As much as I like it, the "i" functionality isn't as rugged as one would expect. Try for instance entering real and imaginary parts both with more than 9 decimal places (or mantissa length) and you'll also see it doing strange things.

Cheers, ÁM

OT: Do 12 yrs old kids need graphing calcs?

*Message #1 Posted by **Frank Rottgardt** on 8 Dec 2009, 5:06 p.m.*

Interesting and funny article.

Funny article about TI graphing calcs

Re: OT: Do 12 yrs old kids need graphing calcs?

*Message #2 Posted by **Dan Grelinger** on 8 Dec 2009, 5:41 p.m.,*
in response to message #1 by Frank Rottgardt

The article was amusing, but the comments were the most significant highlight (lowlight?).

In the early '80s (the day of the TI-58/59 and HP-41), while a student in a large university's engineering program, I listened to a professor suggest that it was a shame that the school did not require the purchase of programmable calculators by its students. "10 years ago, students wouldn't have thought of completing an engineering degree without the help of a well-made $100 slide rule. It is not too big of a burden to expect them to spend $100 today on a programmable calculator."

I certainly did not need such a tool my freshman year (My TI-30 worked just fine), but I attempted to complete my sophomore year without one, with poor results. I had a tough time justifying $80 for my TI-58C in the fall of 1982, but when my parents (a CPA father and a math major mother) found out I was planning on getting through my junior year engineering classes with a "$10 calculator", they encouraged me to spend my money on something better.

It made a big difference in my academic performance, and I enjoyed my engineering classes all the more. Is this article a corollary? Maybe not. But the tongue-in-cheek arguments sound familiar.

Dan

Re: OT: Do 12 yrs old kids need graphing calcs?

*Message #3 Posted by **Joerg Woerner** on 8 Dec 2009, 9:18 p.m.,*
in response to message #2 by Dan Grelinger

I bought my first Texas Instruments SR-50A at age 15 and the TI-58 at age 17 (couldn't afford the TI-59) and used them heavy.

We are now a family of six (49, 49, 20, 18, 15 and 14) and use SIX Texas Instruments TI-84 Plus S.E.!

Guess what, the two youngest know more about the Graphing calculators than we parents and/or even the two elder brothers.

Our daughter started age 12 to use her TI-84 and she knows every hidden functions in the dozens of menus.

Regards, Joerg

Re: OT: Do 12 yrs old kids need graphing calcs?

*Message #4 Posted by **Don Shepherd** on 8 Dec 2009, 9:29 p.m.,*
in response to message #3 by Joerg Woerner

Sounds like an educated family, Joerg.

There seems to be a bias on this forum against kids using calculators in school, particularly graphing calculators. My experience as a math teacher is that the kids who lack what we would call the basic arithmetic and math skills are NOT the ones using the graphing (or other) calculators. No, the graphing calcualtors are, by and large, used by the kids with excellent math and arithmetic skills who want to explore more sophisticated math concepts, and the TI-84+SE is an excellent tool to do just that.

Here in the US, most kids in the middle grades (kids aged 11 to 14) do not use graphing calculators very much, it's the older kids (16-17) who benefit most from them, I'd say.

I've always known that some kids do use calculators as a crutch for not knowing the basics, but those kids are in the minority. By the way, I rarely take my TI-Nspire CAS to school, I find my trusty TI-83+ a tool that just works well.

Re: OT: Do 12 yrs old kids need graphing calcs?

*Message #5 Posted by **Bart (UK)** on 9 Dec 2009, 5:41 a.m.,*
in response to message #4 by Don Shepherd

Hi Don,

It's good to hear from you that kids that use graphing calcs are generally good at arithmatic and maths skills. I know that technology is very much part of our world these days so I let my 8yr old check her maths on a 20S (don't worry, I'll make sure she can use "real" HPs too - she can do basic 4-banger RPN on the 35s). But I try to make sure she understands what she is calculating.

But when they start using calculators in class at primary school level I do worry that there's the potential for them to become button pushers without undertanding the underlying maths.

Re: OT: Do 12 yrs old kids need graphing calcs?

*Message #6 Posted by **Don Shepherd** on 9 Dec 2009, 9:39 a.m.,*
in response to message #5 by Bart (UK)

> Quote:

> But when they start using calculators in class at primary school level I do worry that there's the potential for them to become button pushers without undertanding the underlying maths.

Agreed, Bart. I haven't spent any time in the primary school (grades 1-5 locally) classroom, but I suspect calculators are rarely, if ever, seen there. The early grades are where the kids are supposed to learn the basics. By middle school, most kids know how to do the basic operations with pencil and paper, and these kids can sometimes benefit by using calculators to explore more advanced concepts.

I think it is the responsibility and duty of the teacher to know when and how to use calculators, or any tool for that matter, in the classroom. Many older teachers don't want anything to do with electronic calculators or computers; they don't understand them and will not use them. And they really do a disservice to the kids who might, like Seth, get really motivated by them and want to explore advanced concepts.

Re: OT: Do 12 yrs old kids need graphing calcs?

*Message #7 Posted by **Chris Haltiner** on 9 Dec 2009, 9:13 a.m.,*
in response to message #4 by Don Shepherd

My son's 7th grade GT math class requires a TI-84+ SE. If you don't have one, they are provided, but only for classroom use. I was surprised to see how comfortable he was with the calculator while we were waiting for him to take the SAT. (They allow these things now on the SAT!)

For him, the calculator is a tool for a specific use--he doesn't give it anywhere the thought (or respect) that I gave my HP-41CV back in high school. Adding to what Don mentioned, these kids are using the calculators, much like computer software like Excel, as just another tool to turn to when solving a problem. Knowing when and how to apply the tool is the skill being acquired.

There must have been a time they were expensive. My dad never let me touch his slide rule, but I could play with the first Sharp LED scientific he owned - even though they were pricey at the time too.

Anyone on the forum able to recall what actual prices of good slide rules were?

Re: OT: Price of slide rules. (was Do 12 yrs old kids need graphing calcs?)

*Message #10 Posted by **John Noble** on 9 Dec 2009, 9:49 a.m.,*
in response to message #9 by Bart (UK)

I have a late '40s vintage K&E 4081-3 (10" log log duplex decitrig in their parlance). It's probably the most common general purpose "high end" model. The same slipstick in the 1962 catalog is (I think) the 68-1210, and the list price was $28.50.

According to an inflation calculator I found online, that works out to about $200.00 in today's dollars. ISTR Pickett's prices for an equivalent model in that late '60s was in the $15-20 range.

Their metal rules aren't as luxurious as a bamboo Hemmi or a mahogany K&E, but they were cheaper to produce.

You can find a bunch of vintage K&E documents here.

FWIW, I bought a cute little NIB "As Used on the Apollo Missions!" Pickett N600ES 5" rule (new old stock) for about $50.00 a couple of years ago, along with several NOS (but not retail packaged) N500ES 10" rules for $15/each.

> Anyone on the forum able to recall what actual prices of good slide rules were?

I purchased my K&E Log Log Dplex Decitrig <4081-3> in early 1947 for twenty dollars. I never found it necessary to get anything else.

I remember that sometime in the 1960's I saw my first Sterling all plastic log log slide rule but I can't remember the price. Peter Hopp's book describes the Sterling's as "... cheap plastic slide rules ..." I have several Sterling No. 594 Decimal Trig Log Log slide rules in my collection which carry a copyright 1965 nomenclature. The Pickett Microline 140 was another all plastic slide rule which must have carried a lower price. It seems to me that one nice thing about the all plastic slide rules was that the user wouldn't have to mess around with the adjusting screws.

*Message #12 Posted by **Garth Wilson** on 10 Dec 2009, 10:27 p.m.,*
in response to message #9 by Bart (UK)

> Quote:
>
> Anyone on the forum able to recall what actual prices of good slide rules were?

My grandfather gave me his K&E N4080-3 log log duplex trig slide rule with a leather case that is still in beautiful condition, and said it was a $50 slide rule. I think it's made of mahogany. I wonder how much of that number, if it was accurate, was for that outstanding leather case. You don't find many things made to that level of quality anymore. That was near the end of my years of using a slide rule, somewhere close to 1980.

Before that I used a less-prestigious metal Pickett N902-ES. I think I got it at a supermarket, but it did have a very smooth viscous sliding motion as long as I periodically put a tiny amount of Tri-Flow lubricant on it. I think I paid about $4.50 for it. The case was imitation leather and required care in handling to keep it from delaminating and shredding.

I also got a bamboo pocket slide rule, a Scientific Instruments Company (SIC) model 4500, whose less-expensive leather case had a clip and it fit in your shirt pocket, taking the space of maybe three pens. I think I paid closer to $10 for that one after it was somewhat yellowed on part of one side from having sat in the display case for many years with the sun shining on it in the afternoons.

Can anyone tell us if there was a push to get slide rules into schools after President Kennedy presented his vision to put a man on the moon by the end of the decade, and there was more push for engineering?

I was on the board of a private K-8 school for six years in the 1990's, one where my wife has taught for about 19 years. It was kind of funny to see the ideas about computers as they were becoming somewhat common. Schools wanted to look modern, so computers were perceived as a necessity even when they weren't very useful to students-- at least *yet*, and especially for lower grades.

< to be continued possibly in another more-relevant thread about misapplications of technology >

And 30 years after the birth of the PC, they are still not very useful to students. We're still waiting for the "killer app" that will revolutionize education. We'll still be waiting in another 30 years.

I don't know that it is a "killer app" but the word processing capability has been widely used in classes in English composition and in writing term papers for many years. That certainly is a big improvement over the handwritten and typewitten (not even electric in most cases) methodology which was commonplace when I was in high school and college. But, I admit that one doesn't need a full up PC to do those tasks. Furthermore, I admit that too many word processor users don't seem to undersatand that a spell checker in not a context checker.

Palmer

Not in raw dollars uncorrected for inflation.

IMHO, the best (in quality and capability) and most expensive engineering slide rule ever made is the Dietzgen N1725. I bought one new in 1969 for $35. That equates to $206 in 2009. I still have it, but the last time I used it for actual professional work was 1974. That's when it was replaced by a TI SR-50 ($150 in 1974, or $658 in 2009!).

Re: OT: Do 12 yrs old kids need graphing calcs?

*Message #17 Posted by **tim m.** on 9 Dec 2009, 12:51 a.m.,*
in response to message #2 by Dan Grelinger

I had a TI-86 that I used junior and senior year of high school. I also used it a bit in my freshman year of college, but for the rest of college (and graduate school), my poison of choice was MATLAB. My TI graphing calc has been used for basic arithmetic only and has now been supplanted by the HP-35 I picked up a few weeks ago. :)

Not MY kids...

*Message #18 Posted by **John Noble** on 8 Dec 2009, 6:27 p.m.,*
in response to message #1 by Frank Rottgardt

This is just another reason my wife (a pubic school teacher) and I plan to educate our children ourselves.

My kids won't get anywhere near a calculator while they're learning math, though I do have a couple of "new old stock" Pickett slide rules stashed away for when the time is right. :-)

But I wear a wind-up mechanical watch, listen to vinyl records, and still work out problems with pencil and paper. If anyone finds out, I'll be kicked out of GenX for sure...

Re: Not MY kids...

in response to message #18 by John Noble

I don't know your definition of GenX (1970 and later?) but for me, from the Generation that Has No Name (between Boom and X) I hear you. There seem to be many who bought into the tech world hook line

sinker. Then there is me, with no cable, no cell, no laptop (yet) yes, record-player, yes tape recorder, yes HP-15c. No Graphing calculators for the kids just yet.

Maybe we won't get kicked out after all. At least there are two of us.

Re: Not MY kids...

*Message #20 Posted by **John Noble** on 9 Dec 2009, 12:28 a.m.,*
in response to message #19 by bill platt

Well, I predate the first Moon landing by a couple of years, but my parents were definitely Boomers ('45 and '48) so I must be GenX. 1970 places you right at the beginning, by the common definition.

But we are *old* GenX. The world of our youth was more like our parents' than that of those just a few years younger. When I was a kid, we rode in the backs of pickup trucks without anyone getting arrested, had three TV networks, played records, **dialed** phones, watched Cronkite, were annoyed by Guy Lombardo on New Year's Eve, laughed at little Japanese cars, and read about (but were never allowed to approach) computers that filled rooms.

Just a few years later, everything was different.

And so our approach to technology is different. In my case, I wind my watch every morning (and get a time hack from my NTP-synced computer about once a week), look stuff up in a paper dictionary (but have several hundred ebooks sourced from the Gutenberg Project and compiled/formatted with my own custom software), play vinyl records from my large collection (but was a very early employee of an Internet-connected, MP3-playing jukebox company), and tend to work out problems on paper (but I own a HP-12C, 33S, and 35S--and program all of them ... or write a program on my Linux-running, wireless-having, always-on submini Netbook).

Having learned things the hard way through necessity (like when I used to do speaker enclosure designs with a sheet of log/log paper, a pencil, and a simple scientific calculator), I find I have a much better grasp of what's going on under the hood than a lot of the younger people I've worked with. It has been a big advantage for me, and I'd like to pass it on to my kids.

But I do wonder if this isn't wrong-headed since technology is rapidly getting so complex that it takes lots of automation, not to mention blind faith, to do anything with all these neat toys. Maybe I shouldn't worry about it. After all, if we figured it out so will our kids.

Hi John,

My experience is a lot like yours. I feel last the Last Victorian sometimes. (I remember the children I baby-sat making the "wrong noises" when playing cowboys and indians--they used the "eeeoow" sound from Star Wars with a six-shooter toy! We of course new what a six sounded like:0).

To the younger generation's credit, the young 20s who have come out of good colleges, (and that doesn't mean only Harvard -- can mean all sorts of "third tier" schools) whom I have worked with, are just as sharp as a tack can ever be. They carry TI-84s but rarely use them. They write databases instead. And they conceptualize very well, just with different tools.

The "good old days"

That's the way it was when I wrote my first digital program for a RemRand 1103 at the University of Minnesota in 1960. The 1103 didn't just fill a room, it filled a building. Users punched their programs onto paper tape using a Flexowriter. They submitted their paper tapes (very respectfully, I might add) to a computer operator. When the program was completed the output was another paper tape which the users printed out with the Flexowriter.

We were required to estimate the run time of our programs. If the run time exceeded our estimate by very much the operator aborted our program.

I carry no fondness for thos so-called "good old days".

You may not miss those days just like I don't miss dealing with cassette tape "mass" storage for the TRS-80 Model 1 circa 1978, but I'll bet your experiences had a profound effect on your

approach to technology just as mine did for me.

I run into this when working with younger programmers. They seem to be happy to grab whatever libraries they can find on the 'net, abstract them to death under umpteen layers of OOP, and assume the whole thing will run fine since they can just throw more hardware at it if necessary.

Having been scarred by my suffering with machines with 4k of RAM and 500kHz processors (and more recently, microcontrollers with 1k or less), I run screaming from this approach even though it works acceptably as often as not. In some ways this mirrors the mindset of Depression era survivors who hoard even in times of plenty.

But my project success rate is a **lot** better than the industry standard 50% so I think I'll keep petrifying my opinions until I reach curmudgeon Nirvana.

And I still don't think graphing calculators (or computers, mostly) have a place in primary or early secondary education. Now get off my lawn!

:-)

Yipes. I feel like a newborn! My first programming experience was a high school assignment to program either (I forget, I'm either really or not really a newborn) an income tax or a 3D tic tac toe game using punch cards on an IBM 1130. Needless to say, I found the DEC 20, PDP 11, and various VAXs a couple of years later in college to be almost infinitely more easy to program... even if my programs actually stunk. (I sure got used to debugging, even if I STILL hate it!)

Shortly after that, or during that time, I discovered my beloved HP-34C and that as a real JOY to program, and in addition, easier than any computer. It might have helped my health, as it enabled me to get some sleep on nights I had calculation-intensive assignments. (Unfortunately, I don't remember it being allowed for exams...)

Re: Not MY kids...

*Message #27 Posted by **Seth Morabito** on 8 Dec 2009, 10:20 p.m.,*
in response to message #18 by John Noble

Please don't go overboard! Moderation in all things...

I speak from a great deal of personal experience. In grade school, I detested mathematics. I hated it because it was inflicted upon me, and I never developed a knack for mental arithmetic, no matter what tricks I tried. The fact was, I was quite slow with numbers. In fifth grade, speed of mental calculation was valued over everything else, and I simply crossed my arms and said "No, I refuse. If this is what math is, I want no part of it." So, while I excelled at every other topic, I declared that math was dead to me.

It wasn't until a year later in remedial math that I discovered that a calculator could relieve me of the burden of simple arithmetic, and I saw how wrong I was about math. It wasn't mathematics I hated: it was rote memorization and drills and mindless nonsense. The calculator literally opened up the world of math to me, and I found that I took to geometry, algebra, trigonometry, and calculus like a fish takes to water. It was night and day!

To this very day I hate arithmetic. It is mindless, and I still use a pocket calculator for everything but the most basic addition. It wasn't until I really got to use a calculating tool that I had the freedom that I needed to see that math could really be enjoyable.

Re: Not MY kids...

*Message #28 Posted by **Don Shepherd** on 8 Dec 2009, 10:33 p.m.,*
in response to message #27 by Seth Morabito

Great point of view, Seth (I think I met you at HCC 2007).

As a math teacher, I frequently look out at my students and the look on their faces is something like "what in the world are you talking about....this is all nonsense that we won't possibly use in real life." And I try to be honest with them and tell them they are right about that much of the time (especially box and whiskers plots and stem and leaf graphs, which I despise). But I do know, from experience in the real world, that there are math principles that you will need to know about, and so I stress those.

Capturing the attention of today's electronic generation is always a challenge. The Pythagorean theorem is just much less interesting than the latest Nintendo DS game. The trick is to find ways to make it interesting to the kids. For most public school teachers, with 150 kids per day, it is almost impossible to do that. For me, with 13 students per day, spread across three classes, it is much easier. I love my job. The only catch is, it is a volunteer position!

Don

Seth, your experience is something we should all pay attention to. Indeed, why slash about with a buggy when when you can ride a bicycle or fly a plane instead.

At some point, maybe in freshmen college, one of us (was it me? was it Brian? Judy? Craig? can't remember) made the quip, "biology is actually chemistry, chemistry is actually physics, physics is definitely maths, and maths, well, that's philosophy for sure."

To your point, arithmetic, while it contains all the fundamental building blocks of Algebra and ultimately all of mathematics, yet is not, in its rote form, anything like the beauty, the utter beauty, of higher maths.

(Ironically, I think that while the "new maths" approach to arithmetic may be inefficient, there is something to be said for the obverse which sadly, is not used much even now: that is exactly what I said above; namely, that Algebra (distributive, associative, commutative etc) are already learned in 3rd grade, but without fancy names. I often wonder if there would be many more successful Algebraists (and fewer MacIntosh worshippers ;0) if only this disconnect were dealt with more effectively.

That sounds dangerous. If you can't get a reasonably close estimate in your head, you won't know when the answers the calculator gives you are garbage resulting from human error.

When our boys were in high school and a graphing calculator was supposedly required, they said the only real graphics that went on in class were games played in such a way so as to make the student appear to be hard at work. I'd say if the kid needs help to visualize the function graphed, then he probably doesn't understand what the graph is telling him anyway, so no learning has taken place.

*Message #31 Posted by **Dave Britten** on 8 Dec 2009, 6:30 p.m.,*
in response to message #1 by Frank Rottgardt

As someone who was equipped with various scientific and graphing calculators throughout school, I can see both sides of this one. On the one hand, if the teacher is doing no more than making them crunch numbers like automatons, then there's no real value.

Now, instruct a student how to REALLY use a calculator, and they'll gain an advantage. I was the type that had no trouble writing programs in class to simplify my work. If the students in class can make inferences and use the machine in novel ways without constant handholding, all the better. But if your lectures sound like, "Now, press Y=, enter this equation, press Window, enter this range, and press Graph," then you're doing it wrong.

I say, tell them to buy whatever calculator they like, and they can read the manual for themselves if they want to learn how to apply the tool.

...And then use a 48GX for all your classroom demos, of course. ;)

Re: OT: Do 12 yrs old kids need graphing calcs?

*Message #32 Posted by **Mike Morrow** on 8 Dec 2009, 10:14 p.m.,*
in response to message #1 by Frank Rottgardt

I think the answer to the question that is the title of this thread is NO. I base that on my ancient experience. When I entered Georgia Tech as a freshman in electrical engineering, the only required "calculator/computer" was a decent slide rule. The year was 1970.

I bought my first scientific calculator (a TI SR-50) six months after graduation in 1974. Many, many of my professional peers in the engineering world did not have their own electronic calculator then, or for several years afterwards.

Yet, somehow we survived in our profession, and managed to produce some useful output. That leads me to have little doubt that advanced calculators are not *needed* by 12 year olds.

A completely different question is "Are graphing calculators useful in the mathematical education of a 12 year old?" I suspect that the answer is YES...such calculators certainly can be an educational asset. Every generation uses tools that were not available to earlier generations.

Re: OT: Do 12 yrs old kids need graphing calcs?

*Message #33 Posted by **Crawl** on 8 Dec 2009, 11:28 p.m.,*

The real tragedy is that these kids who are buying Ti84's will just eventually have to buy a TI89 later. They might as well just buy those first instead.

Re: OT: Do 12 yrs old kids need graphing calcs?

*Message #34 Posted by **designnut** on 8 Dec 2009, 11:53 p.m.,*
in response to message #33 by Crawl

Do you drive a horse and buggy? Don't feel that what was good enough for you is fine for your kids. You are forming their matrix of beliefs, let them form their own. One writer above in this thread showed the younger the kid the faster he was at using the new gadgets. TI has an integrated teaching system that is easier for teachers so they will use it. It is so sad that HP lost all advantage at a critical period, forever lost. Now they are doomed to algebraic. Sam

> TI has an integrated teaching system that is easier for teachers so they will use it.

Bingo.

The "easier" part, that is.

Do keep in mind that teachers don't determine curriculum in any meaningful way. TI sells their system to the powers that be as a pre-packaged course that even mediocre teachers can walk the kids through.

Re: OT: Do 12 yrs old kids need graphing calcs?

*Message #36 Posted by **Thomas Radtke** on 9 Dec 2009, 5:44 a.m.,*
in response to message #1 by Frank Rottgardt

Sort of a coming out: Without my Casio fx-81p, I probably never had developed any interest in math due to a dyscalculia. A calculator helps you to experiment with numbers, which is essential for people like me to understand them.

What I really don't understand is the goal of this textbook style entry method. Intermediate results are hidden when entering long expressions, and thus your insights are reduced to the final result.

I'm quite sure I'd have gained a lot more of improvement with a PRN calculator.

Re: OT: Do 12 yrs old kids need graphing calcs?

*Message #37 Posted by **designnut** on 9 Dec 2009, 10:03 a.m.,*
in response to message #36 by Thomas Radtke

Tom, exactly my experience with RPN. You are able to pause in mid problem and change units or correct yourself, not easy at all in algebraic. I learned relations I would not have known with algebraic. Algebraic hides the nuts and bolts to pursue one number. A friend said his calculations seldom result in one number. I know how to do repeated calculations using the repeating register, I edon't know how in algebraic, it may ne possible. I find RPN faster and more versatile. I rewrote all the teextbook formulas for easier use in the calculator. Sam

The idea that "Algebraic hides the nuts and bolts ..." is really not true for the so-called A.O.S. machines but is a persistent myth in the RPN community.

> Quote:

For real versatility in repeated calculations I find that it is difficult to do better than the playback modes in the graphing calculators where the user isn't limited to only repeating the value from the t register.

OT: uCalc Processor

*Message #1 Posted by **DaveJ** on 8 Dec 2009, 1:27 a.m.*

For those not interested in credit card calc design, please tune out now.

Working on my uCalc project and am still stuck on what processor to use.

I was all set to have a big fat 512K/32K+ PIC32 in there (layout half done already), but realised I ultimately won't be happy with the battery life. 2 months at best stand-by from a single CR1620 cell.

The AT91SAM7L128 as used on the new HP platforms is an option, but it's only 128K/6K (less SRAM than the uWatch), and requires an external RTCC, and it's not cheap. Could gets years standby out of that option though.

The 64KB/8KB PIC24FJ64GA104 is looking good. It's cheap, got an RTCC, and is the same as used in the uWatch. It's an XLP chip, so standby power would be the shelf life of the battery. Only problem is the current uWatch firmware already maxes out this chip, and the uCalc will need bitmap fonts for the 132x32 display.

The MSP430F5437 has 256KB/16KB, RTC, and around 3 years standby.

Other options looks fairly miserable.

I guess it comes down to what's most valuable, computing power or standby battery life?

Battery life for continuous operation is looking to be around several hundred hours.

(No, rechargable and/or solar is a miserable option IMO)

Opinions?

Dave.

Re: OT: uCalc Processor

*Message #3 Posted by **Katie Wasserman** on 8 Dec 2009, 2:45 a.m.,*
in response to message #1 by DaveJ

How about a PIC with more memory like the PIC24FJ128GA106, it's 128KB/16KB. According to the spec

with the RTCC running it's only draws 7uA -- 10 times more than the XLP -- but that's still more than a year of power down clocking with a CR1620. How many i/o pins do you need for your design?

-Katie

Edited: 8 Dec 2009, 2:46 a.m.

Re: OT: uCalc Processor

*Message #4 Posted by **DaveJ** on 8 Dec 2009, 3:03 a.m.,*
in response to message #3 by Katie Wasserman

Typical is under 4uA for that part which isn't that bad actually.

Don't need that many I/O, a 44pin job will do nicely.

But silly me just realised an obvious way I can have my cake (PIC32) and eat it too (shelf life), just needs some more parts...

Dave.

Wristwatch Gadget [OT ish]

*Message #1 Posted by **MikeT.** on 7 Dec 2009, 3:05 p.m.*

Anybody who thought that the HP01 was a technological masterpiece might be interested in this wristwatch phone. The two way radio has been superseded by a video phone but it still looks like looks like the perfect accessory for any budding Dick Tracy...

Even though I've become rather used to the advances in technology these days, and despite the fact that it is a bit on the large side, this is still an impressive bit of kit. I find the number of features that the manufacturer has managed to cram into such a small device amazing and rather like the way that you change the display and select the mode by dragging you finger sideways over the display. (I wonder if it will be possible to load your own applications..?)

Mike T.

Re: Wristwatch Gadget [OT ish]

*Message #2 Posted by **Anders Peterson** on 7 Dec 2009, 5:24 p.m.,*
in response to message #1 by MikeT.

Very cool. I wonder if they will be releasing a shoe next :)

I honestly saw this already in some list of gadget gifts for the holidays last week, and it did not phase me (or interest me). However, giving it proper consideration, it is a pretty impressive accomplishment. This is part of the future we were supposed to have seen already. Will flying cars and intelligent housekeeping robots be next? I think this thing missed its chance to make a splash by not being released before the end of the 20th century (or at least before the proliferation of bluetooth headsets). Phones are already tiny, and can do a zillion different things (email, internet browsing, run 42s simulators, etc.). People probably don't want to give all that up for a wrist strap.

Re: Wristwatch Gadget [OT ish]

HP ALERT for HP49G+/HP50

*Message #1 Posted by **Mike Reed** on 7 Dec 2009, 10:31 a.m.*

Just received this alert from HP:

Recommended Driver Alert Dec 04 2009

HP Graphing Calculators - USB Setup (ver 1.3) Products: HP Graphing Calculators OS: Microsoft Windows 7 (32-bit), Microsoft Windows Vista (64-bit), Microsoft Windows 7 (64-bit), Microsoft Windows XP x64, Microsoft Windows Vista, Microsoft Windows XP

Description: This installer package installs the operating system drivers for all HP Graphing calculators that support USB connectivity. These drivers are required to use the connectivity kit software with the graphing calculators.

This is the same package that has been up at hpcalc.org for a while now. So if anyone had installed that already no need to download again.

Faulty disk drive in 9114B ?

*Message #1 Posted by **inaki** on 7 Dec 2009, 10:23 a.m.*

Hi. I have been checking an old 9114B disk drive with a 71B. The 9114B unit seems to work, but it fails when I send any command.

I have noticed that the disk drive makes the usual seek when the unit is started but does not perform any test at all when I put a disk on it. The manual claims the unit should perform a 5 seconds extra test when the disk drive is loaded with a disk. By the way, the test light is ON for a couple of seconds only, not the claimed 6 seconds.

When I send de command DEVICEID I get back the string 'HP9114B'. So it looks like the logic in the unit is working.

However, when I use the command INITIALIZE I can see the unit trying to do something but the head does not move at all. The led on the front of the disk drive is off all the time. It never lights up. If I remove the diskette and send the INITIALIZE command I get the expected 'No media' error so it seems that it is working to some extents.

I have checked that the heads are able to move up and down smoothly when the disk drive is first powered up.

I have even tried with preformated 720KB diskette. But all commands fail.

By the way, I have been using HD diskettes with the hole taped, not true DD diskettes. May this be a problem?

The unit has some dirt on it but I have seen much more dirty disk drives units working.

Any guess ?

Re: Faulty disk drive in 9114B ?

*Message #2 Posted by **Eric Smith** on 7 Dec 2009, 3:22 p.m.,*
in response to message #1 by inaki

I don't remember whether the 9114B uses a mechanical or opto switch to sense disk presence. Is your tape over the hole opaque?

Re: Faulty disk drive in 9114B ?

*Message #3 Posted by **Gerry Schultz** on 7 Dec 2009, 4:25 p.m.,*
in response to message #1 by inaki

inaki:

I recently bought a 9114B drive and ended up removing the diskette drive to fix sticky ejecting so I remember some of the actions my unit took at power up. With the top cover of the 9114B removed, if you turn the unit off and put in a disk and then power up, does the diskette platter spin and the head move back and forth? If the floppy is not spinning and the heads aren't moving and the disk access disk is off, then I suggest you remove and re-connect the the ribbon cable connectors at the drive and on the circuit board ends just in case there is a

dirty connector.

It would be interesting to hook my 9114B to my 71B, disconnect the floppy drive ribbon cable and see what the 71B reports when I try an INITIALIZE command. In the meantime, check that there aren't any broken wires around the head position motor. How clean is the diskette drive itself? Is a floppy disk hard to insert or eject from the diskette drive mechanism? I'm trying to get an idea of the condition of the drive itself.

There are a couple of good articles at this website covering 9114B repair, like #78 by Steve of Australia and #876 by PeterP. These may not cover your specific issue but it can help you get an idea of what can go wrong with the 9114.

At this point, I wouldn't worry about double verses hi-density floppies as right now you just need the drive to work. After it's working then should worry about selecting the proper media.

I'll play with mine tonight and get back to you.

Gerry

> At this point, I wouldn't worry about double verses hi-density floppies as right now you just need the drive to work. After it's working then should worry about selecting the proper media.

DD drives often won't recognize HD media at all, because the presence detect sensor expects the rigid shell of a disk to be present exactly where the HD sense hole is found on an HD disk.

If the drive isn't sensing the presence of the disk, it will exhibit exactly the symptoms that were described.

That's why you can't just "worry about selecting the proper media" later.

Re: Faulty disk drive in 9114B ?

*Message #5 Posted by **Gerry Schultz** on 7 Dec 2009, 7:35 p.m.,*
in response to message #4 by Eric Smith

Eric, your right, I had forgotten about that. And, as I remember, the diskette presence sensor in the drive is where the double density, hi-density hole is in the floppy. So, inaki, if you only have hi-density floppies available to you, be sure to cover the right-side hole. Then see if you still get a 'no media' error when you try to initialize a diskette.

Thanks Eric for keeping me straight. Inaki, let us know how it goes.

Re: Faulty disk drive in 9114B ?

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 7 Dec 2009, 6:20 p.m.,*
in response to message #1 by inaki

Hi, inaki;

I have a 9114B unit (a gift) and after not being used for some time (about half a year) without charging the battery, it came up with many faults related to the disk drive itself. Battery charged OK, all 4 LED´s lit (battery charge and power), but when I tried any operation that would power the disk drive, all LED´s went down and I got some error message (cannot remember which one).

For shortening the text: it was the battery. It charged OK but had some internal problem (high internal impedance) so it could no longer maintain high current (or current peaks). Hence, with no power to activate the driver, the unit either reset or sent an error condition back to the IL controller (the HP41, in this case). This is the non-definitive battery I used at that time. Now it has a 2800mAh instead

After that, I always keep the battery charged because it is a sealed lead-acid, and the main recommendation is to keep them always at maximum charge; if discharged, charge them ASAP.

Success!

Luiz (Brazil)

Edited: 7 Dec 2009, 6:22 p.m.

Re: Faulty disk drive in 9114B ?

*Message #7 Posted by **inaki** on 8 Dec 2009, 6:06 a.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Thanks for your thoughts guys!

After checking everything I checked the power by measuring the current the unit takes when in standby mode, when using logic commands without resource to disk, and finally when using commands that involve the disk.

When the 9114B is in standby mode or receiving commands that do not involve the disk it takes a small amount of current. But when the disk drive is involved the current taken raises a lot, up to 1,5A (in my measurements, but probably is higher than this).

After reading the Luiz message I decided to replace the battery with a regulable lab power supply. I started with 7.3V and 1A, just not enough to feed up the disk drive. The symptoms were exactly the ones mentioned in my first message. Then I raised the lab power supply limit to 2A.

And voila, the disk drive started to work! The initial startup test was performed as expected with the heads moving up and down. The led on the front of the disk drive was alive!.

It was the time to test commands from my 71B. Bingo! I was able to initialize the diskette!

So my guess is that Luiz put the hammer in the nail here. The battery may be good enough to feed the logic but not enough to feed the disk drive in every work, even when the 3 leds in the front show full battery.

As a side comment. If ones tries to use a power supply that bypasses the battery as I did for the tests, it must be a power supply able to raise current to about 2A (for about 7.5V). I tried to use some higer voltage, up to 9V, without problem. However it would be mandatory to check the power regulators specifications to see whether it is wise to use a higher voltage power supply.

As I could see for this case, and others related to 9114B in this forum, it seems a bad battery can cause a lot of trouble.

Thanks for your help!

Broken Rom/Ram switch on RAMCARD

*Message #1 Posted by **bill platt** on 7 Dec 2009, 12:07 a.m.*

I just broke the switch on my Klotz 128k card.

Has anyone ever successfully repaired something like this?

Re: Broken Rom/Ram switch on RAMCARD

*Message #2 Posted by **Doug** on 7 Dec 2009, 4:49 a.m.,*
in response to message #1 by bill platt

geeze bill, don't you have microscopic waldows yet?

Re: Broken Rom/Ram switch on RAMCARD

*Message #3 Posted by **Han** on 7 Dec 2009, 7:27 p.m.,*
in response to message #1 by bill platt

Aren't there several types of 128K Klotz cards? Anyway, you should be able to repair it. None of the Klotz cards I have ever come across were ever covered (i.e. the card was literally a PCB board with SMD chips mounted; nothing for shielding). I am sure you can find the part from companies like Digikey and Mouser.

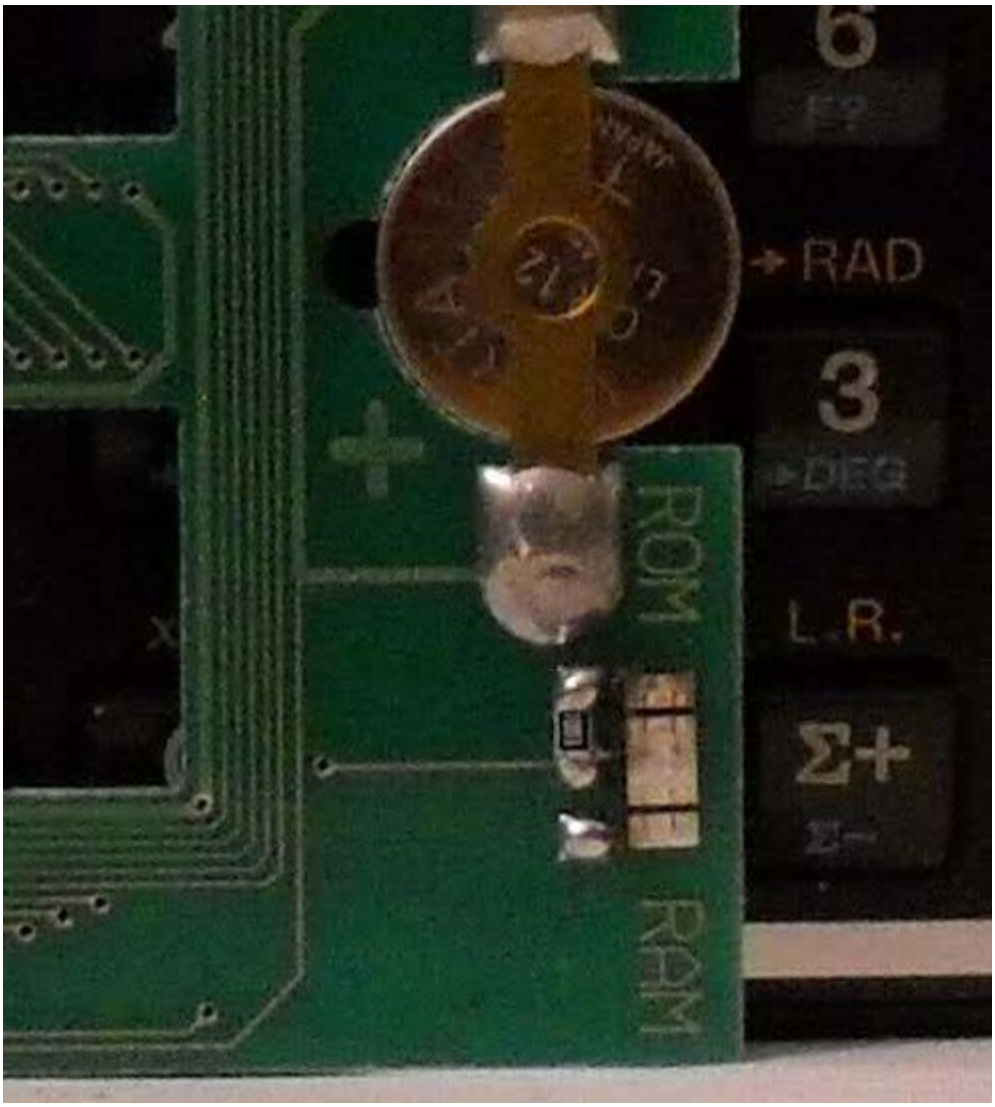
Do you have a photo of your card?

Re: Broken Rom/Ram switch on RAMCARD

*Message #4 Posted by **Bill Platt** on 7 Dec 2009, 8:10 p.m.,*
in response to message #3 by Han

Hi Han,

Here it is:



Re: Broken Rom/Ram switch on RAMCARD

*Message #5 Posted by **Han** on 8 Dec 2009, 4:38 p.m.,*
in response to message #4 by Bill Platt

Bill,

Stuff you may already know:

Looks like a surface-mount toggle or switch. I do not know if there are standard packagings, or if that particular component is still even manufactured. I will see if I can dig up any Klotz cards I own and check if there is any packaging markings on the toggle. Do you still have the original toggle? It may indicate what type of packaging it is.

Worst case scenario is that you will have a RAM card that cannot be write-protected as long as you make sure to resolder the circuit for RAM mode.

OT: Objectified

*Message #1 Posted by **Egan Ford** on 6 Dec 2009, 11:36 a.m.*

PBS (US) recently broadcast the documentary film below:

http://www.pbs.org/independentlens/objectified/film.html

I found that some of the statements could easily be echoed here, e.g. "wear-in not wear-out". I also found it interesting that consumer electronics are on a 11 month refresh cycle. There is a much talk of consumerism.

Perfect timing for the holiday shopping season.

Re: OT: Objectified

Re: OT: Objectified

*Message #7 Posted by **bill platt** on 6 Dec 2009, 8:26 p.m.,*
in response to message #1 by Egan Ford

That's very interesting.

I like the last film, where the one guy talks about what is essentially the moral imperative of good design. Then the later guy points out (via GPS tom-tom or whathaveyou) that bad design is ubiquitous, yet we don't make a big fight about it.

But I am a cynic about product design. Too much of it is about looks or change for change's sake, rather than for design. My new Toyota has bad reflections in the windshield, the seats are too high, I bang my head on the A-pillar even though the car is larger than the old Corolla in my driveway, the cupholders are sitting on a huge empty box that simply takes up space, the little doors on the storage bins get jammed easily and won't open,

and on and on. I like my Toyota, the engineering is good, but the design sucks, if you know what I mean. It is too American for my tastes, ironically enough.

Bad design: Like why are VCR/DVD players unusable without an easily lost or misplaced remote control? Why can't you page the damn thing like a portable phone? Why can't *all* the functions be accessed from the front panel for when the remote is lost? I asked these questions over a decade ago--nothing changes for the better.

Like portable phones. 5.8 Ghz or some nonsense like that is somehow "progress" when in fact it makes them almost unusable. They are static all the time, and you cannot "peak" the signal by walking just a half step, as you could when the frequency was 49 MHz.

DTV broadcast, when 90% of television is distributed by cable, why waste untold millions switching the last of the broadcast world to a whole new technology that is finicky and impossible to use with weak signals? Utterly stupid.

Cell phones. Don't get me started. How many %#$#^ing flip phones have you broken because of that stupid 28S hinge?

Texting. There's a moron's fantasy for you. Let's pay more, to get less baud rate, and waste our time looking like OCD button-pushers all damn day. Talk about useless user interface design! You can send Morse code on a Bug faster than texting--heck, you don't even need a paddle key to beat the stupid cell phone text!

Design has no hope of changing the world. Never has, never will. We design good stuff, and the bad stuff wins out. Thank you, Bill Gates.

And Apple Mac is the solution? Oh, it's so clean, so fresh, so cool, so modern, but it can't do a damn thing. Nothing useful will run on it. Brilliant!

Linux, Ha! Great for servers but again, what good is it for real work?

In computing especially, design is a total hodgepodge Shamopedia 10,000 monkeys writing Shakespeare kind of fractured absurdity.

I like my 18th century furniture. Still works after a quarter of a millennium. Sort of like the Skin Horse. He may be shabby, but at least he ain't in the trash bin wit hall the mechanical toys.

Re: OT: Objectified

*Message #8 Posted by **Martin Pinckney** on 6 Dec 2009, 8:51 p.m.,*
in response to message #7 by bill platt

Excellent rant, Bill. Well, there are many examples of good design still out there, but they are hard to find amongst the sea of bad design.

I'll bet, though, that you will get several posters who will argue that "good" design has to be realistically re-defined for the realities of the present. Including the short design cycle, and meeting the demands of marketing.

So this discussion might not be so Off Topic after all, given the many laments expressed here over HP's downhill slide from good design principles.

Re: OT: Objectified

*Message #9 Posted by **Thomas Okken** on 6 Dec 2009, 11:26 p.m.,*
in response to message #7 by bill platt

I agree with some of the points of Bill's rant, and I have no opinion on some others, but there are a few that I have a different take on...

> Quote:
>
> Why are VCR/DVD players unusable without an easily lost or misplaced remote control?

The first VCRs I used, in the early '80s, were completely usable without the remote, but I hated the fact that many functions were *only* available on the front panel. I thought it was a big improvement when VCRs started using on-screen menus, so you could do everything while comfortably seated on the couch, instead of having to squat on the floor in front of all that equipment. Also, I've never, ever lost or misplaced a remote... where would they go? They're either in my hand or on the coffee table. I did used to worry about battery life, but I find that all the remotes I've had over the last 15 years or so will run 3 years or more on one set, so that's not a big concern, either. Bottom line: I, for one, am actually happy with the way modern TVs, VCRs, and DVD players work.

> Quote:
>
> Texting. There's a moron's fantasy for you. Let's pay more, to get less baud rate, and waste our time looking like OCD button-pushers all damn day.

If you just want to send someone a brief message, without interrupting whatever they're doing, texting is perfect, and I'm pretty sure most people can type two or three lines of text using T9 text entry *much* faster than they'd ever be able to using a morse key. One could argue that texting is obsolete because you can use full-blown email on iPhones and the like, but still, I've used text messaging, and I thought it was useful, and pretty well designed, too, not to mention cheap.

> Quote:
>

>
> Linux, Ha! Great for servers but again, what good is it for real work?

I use Macs and Linux boxes at work, and when I need to use something that will run only on Windows, I use VMware or Parallels -- and that isn't often. Not that I have anything against Windows, mind you; I do use it at home, and if I feel I need it at work, I'll get an admin to install it on one of my machines there, but for the most part, I find that all of Windows, Mac, and Linux, are very good for getting work done. I also find that, with each passing year, it makes less and less of a difference which OS I use; they keep on borrowing good ideas from each other, and in the long run, they all improve.

> No, and no, but I'm not a shut-in, and do have a lot of friends who are married and/or do have children, so I'm not completely unfamiliar with the chaos factor that is inherent in a multi-person household... and even said friends don't have this problem of disappearing remotes. The most common strategy appears to be to put the remotes on top of the TV when not in use, where the little tykes can't reach them.
> To answer your third question: a lot of people get annoyed at the clutter and find themselves wishing they had just one remote that could control *all* of their audio/visual equipment, and then they get a fancy universal remote. Me, I've studied the offerings and found them wanting; if it weren't such an incredibly minor issue to begin with, I'd download some software and try using my HP-48G, but something tells me that that would get annoying, too. ;-)

Yes, but word processing and spreadsheets are commodity items. That isn't what matters. It is the real software, whether for graphic design, or industrial design, or engineering etc that matters.

Word processors stopped gaining meaningful improvements in the late 1980s--or maybe early 1990s. Spreadsheets don't improve in a good way either--they just get dorked up from bad coding (as happened a few years back to excel when it did completely faulty maths for certain particular combinations.)

I know generally what specialized software is written for the Mac (not much) and most everything else is written for Windows. While one of my specialized programs is being upgraded to Mac, none are written to run on a unix or linux platform. Too bad, too. I liked old unix best of all for platform stability.

Re: OT: Objectified

*Message #16 Posted by **Bart (UK)** on 7 Dec 2009, 11:27 a.m.,*
in response to message #15 by bill platt

It depends on your definition of "real work" then. For me, sometimes real work can be done without a PC, e.g. design verification testing, equipment intergration etc. Tabulating results, writing reports, making quotes etc. may not be seen as real work, but all forms part of it. the work is not complete without it.

Quote:

and most everything else is written for Windows

The problem is that software vendors are reluctant to spend money developing on platforms with fewer users, and this lack of software in turn discourages users to move to other platforms. Instead software vendors just invent new features for the sake of new features.

Quote:

Word processors stopped gaining meaningful improvements in the late 1980s

True, there's not much I can do on Word-2003 that I couldn't do on WP 5.1. Perhaps just that windows interface makes it a bit easier - although sometimes not.

Quote:

(as happened a few years back to excel when it did completely faulty maths for certain particular combinations.)

Has happened to calculators too. I always attempt to check answers via an independent means (e.g. is it in the order of what I expect and check with a few widespread datapoints. For real critical stuff, actually thoroughly check the results). I do find VBA quite handy in Excel though.

edit: for clarity: WP5.1 = WordPerfect 5.1, a word processor from the early nineties where everything just "works as it should" - like old HP calcs.

I STILL use WP 5.1 (in a "command prompt" window; used to be a DOS window!) if I want to do simple things quickly with a word processor: column handling, in particular - with my PC AT keyboard, which has the function keys on the left (where they belong for WP 5.1!). Find and replace for formatting codes is also FAR superior in old WP 5.1.

Agreed. Most people seem to live to buy any shiny thing their friends have with no regard to any real value. I do have to mention though that Intel Macs are pretty adaptable. I run WinXP Pro on Bootcamp currently. I've run AutoCAD, ArcGIS ArcView, and MathCAD, as well as applications for older devices using serial connections which work just fine through an serial/usb adapter. It's not a bad way to learn some basic UNIX either. It's also my entertainment center, and the whole thing fits in a carrier should I need it somewhere other than my desk where it takes up very little room. Did I mention that it was nice to look at too? :)

Bill;
I almost always agree with your posts. No exception here.
IMHO, technology is not improving as a whole. I think that everything is getting over-computerized. Now, with the crutch of handhelds that have the power of PCs; anyone can get a job doing math. I believe nearly all the art has left the sciences. We are far enough into this downward spiral that the middle managers don't even know the difference between thought and just pressing enter. Surveying used to take a three man field crew and one man in the office to do good work. It now takes one or two men in the field with two or three in the office to generate regular mistakes. And no one even notices that we have slid backwards.
Glad i made my stack when the making was good.
Anyway; keep posting. You 'splain it better than i do. - d

The reason for this is likely the rakish slope of the windshield that improves aerodynamics for fuel efficiency, and also helps prevent damage from rocks. Cars of the 1980's and prior had very upright windshields.

> Quote:
>
> Bad design: Like why are VCR/DVD players unusable without an easily lost or misplaced remote control?

My complaint is with modern remote controls themselves -- wobbly buttons of every shape, size, and orientation, often failing to respond because they weren't pressed on-center.

Here's a more fundamental problem -- The US' transitioning of broadcast channels to digital, when US manufacturers don't even make their own digital television sets -- forcing purchase of more imported

goods. Sure, we essentially quit making analog sets years ago, too, but at least there's still a basis of tried-and-true design and know-how.

I like the Porsche 911 windshield (not the 996), and the original Saab 900. Both are very streamlined and yet the windshields are reasonable.

The glare is exacerbated because of this nonsense fancy interior designer "feature"--a stupid cut-out to tuck the clock into!

"Designers" (actually product marketers) feel the need to reinvent the wheel and call it progress. I'd rather invent something new.

Judging by that photograph, I'd say that the main problem with Bill's new Toyota seems to be the light-colored plastic that the dash is made of.
I've owned cars with pretty straight (vertical) windshields, like the first generation VW Golf, and with rather flat (horizontal) windshields, like the Toyota Yaris, and several models somewhere in between. I never had a problem with reflections in the windshield in any of them, other than when I left maps or other pieces of paper on top of the dash... But every single car that I've ever owned has had dashboards made of *black* plastic.

Our first one had a cord. You could always find it.

> Quote:
>
> My new Toyota has bad reflections in the windshield

Someone else mentioned aerodynamics to improve mileage; but the problem with the flatter modern windshields is that they increase your need for air conditioning, which takes gas. I had a couple of deceptively large diesel Peugeot 504's however, a '75 sedan that got 30 & 37 mpg and an '81 station wagon

that got 28 & 35mph with nearly 200,000 miles and never even a tune-up. When we moved, even the queen-size sofa-sleeper went all the way in, not hanging over the rear bumper. Can you get anything like that anymore? BTW, the well designed sunroof meant we seldom needed the air conditioning.

> Quote:
>
> DTV broadcast, when 90% of television is distributed by cable, why waste untold millions switching the last of the broadcast world to a whole new technology that is finicky and impossible to use with weak signals?

So we would get fed up with the poorer picture quality and the long time required to change channels, and quit watching TV.

> Quote:
>
> You can send Morse code on a Bug faster than texting

That was demonstrated on the Jay Leno show. Morse won, and the guys operating it weren't super fast either. I'd like phones to be made big enough to use though (and with a decent earphone speaker!), and then a QWERTY keyboard would be a little more practical.

> Quote:
>
> Linux, Ha! Great for servers but again, what good is it for real work?

I use it all the time, except for a couple of things I still do in DOS. 90% of my computer problems vanished when I dumped Windows. I won't use Windows again. It's not worth my health. I was always angry with the computer when I had Windows.

42s Statistics Problem

*Message #1 Posted by **Norman Dziedzic** on 6 Dec 2009, 10:59 a.m.*

I recently got an old 42s from a colleague and am having blast playing around with it but now it cannot seem to do any statistical functions.

All Statistics functions as well as trying to clear the statistics registers gives me an "Invalid Type" response.

Unfortunately, I did not get a manual with this. Could I have inadvertently erased the statistics registers themselves?

Thanks

Re: 42s Statistics Problem

*Message #2 Posted by **Randy** on 6 Dec 2009, 11:21 a.m.,*
in response to message #1 by Norman Dziedzic

You're most likely in complex mode. Try shift-STO to toggle out of complex.

Re: 42s Statistics Problem

*Message #3 Posted by **Michael de Estrada** on 6 Dec 2009, 11:35 a.m.,*
in response to message #1 by Norman Dziedzic

Try MODES SIZE 25 and see if that fixes it. You should now have 25 storage registers (R00 thru R24). Registers R11 thru R23 are used for statistics summations, unless they have been relocated by the "summation registers" command. I'd strongly recommend that you buy the MoHPC CD with the HP 42s manual on it (CD #1).

Re: 42s Statistics Problem

*Message #4 Posted by **Norman Dziedzic** on 6 Dec 2009, 12:54 p.m.,*
in response to message #3 by Michael de Estrada

Thanks,

It was a combination of SIZE and the variable (Sum)Reg being messed up. I used to have a 41CX so a lot is similar but that was like 15 years ago so I can't remember it all.

Stat summation registers

*Message #5 Posted by **Karl Schneider** on 6 Dec 2009, 3:19 p.m.,*
in response to message #4 by Norman Dziedzic

Norman --

It seems that you've got it figured out, but here's some background for everyone:

For those HP's that do statistics using the summation method (instead of maintaining all input data, such as the RPL-based models, HP-17B/BII, HP-27S, and HP-71B), a set of six numbered storage registers was utilized for summation.

Most legacy models use a fixed set of registers. The HP-11C and HP-34C used R0-R5, as those would be the last to be deallocated for programming storage. The HP-15C uses R2-R7, because R0 and R1 must be preserved for matrix indices.

The HP-41 utilizes a set of six consecutive registers, user-selectable by the (Sigma)REG function. The HP-41CX added (Sigma)REG? -- which is not available in the X-Functions module -- to allow the user to identify the first summation register. The user is responsible for allocating a sufficient number of registers for numerical storage (SIZE), and that the selected value of (Sigma)REG allows for six summation registers.

The HP-42S, for compatibility with the HP-41, did the same. Both (Sigma)REG and (Sigma)REG? are standard in the HP-42S.

The HP-32S and its descendants do this better than all the others: They use the pool of unallocated RAM for the statistical registers. Each summation value can be recalled individually, but values are set and updated only via CLEAR(Sigma), (Sigma)+, and (Sigma)-.

Not quite, on the the 32sii they are writable via indirect data access. Registers A-Z are indirectly accessible as 1 thru 26, 27 is the "i" register itself and 28 thru 33 are the statistics registers. This turns out to be extremely useful in some programs. I believe that this feature was new on the 32sii and was not on the 32S, but it continued with the 33s and 35s. The 35s skips the "i" register because it has the "I" and "J" indirect registers. It also requires negative numbers to indirectly address the fixed location registers (A thru Z corresponds to -1 thru -26) and the statistics registers correspond to indirect -27 thru -32.

Mea culpa -- forgot about the indirect addressing.

Yes, having six easily-clearable "scratch" registers available for intermediate results without using lettered registers is helpful, but the required indirect-access storage could be a nuisance.

It could be but sometimes it's a big help when you use Sigma+ and Sigma- along with them. Take a look at how I use these registers here.. This program has nothing to do with statistics but makes use of the the extra memory to store processing variables and leaves the registers (1) - (26) available for results.

It would have been a better design if the statistics registers had been 27 through 32 and the i register had been 33.

I agree. HP put a lot of thought, planning and engineering into the 32sii (complex numbers excluded) and this seems to have been a bad decision. However it may have been a deliberate attempt to semi-isolate the statistics registers so that users wouldn't overwrite them so easily when programming.

HP-32S/SII Stat summation registers

*Message #11 Posted by **Karl Schneider** on 9 Dec 2009, 2:59 a.m.,*
in response to message #9 by Palmer O. Hanson, Jr.

> Quote:
>
> It would have been a better design if the statistics registers had been 27 through 32 and the i register had been 33.

Maybe so, but the more fundamental shortcoming is the insufficient RAM. 2 kB -- the amount provided on the original HP-28C -- was too stingy on that model with matrix functions and symbolic algebra, but would have been ideal on the HP-32S/SII. The 390 bytes on the HP-32S and 384 bytes on the HP-32SII do not allow the user to store a library of useful programs and equations, even though the paradigm is well-suited for that purpose. It's as though H-P deliberately "de-contented" the HP-32S/SII to prevent it from siphoning additional sales from the HP-42S.

It makes little sense that storage space for a variable is "deallocated" by setting its value to zero. This means that functions such as SOLVE and INTEG can cease to work for no apparent reason simply because the user had stored a non-zero value in a register. This can't happen on an HP-42S or a pre-Saturn model, where, if space for a register is allocated, it can be used; if it isn't, it can't.

With 2 kB of RAM, the 26 letter variables and the indirect register should have been allocated permanent space of 27 * 8 = 216 bytes. The remaining 2048 - 216 = 1832 bytes for statistical summation (48 bytes), programs, and equations would have been more

than enough for most users.

This isn't an issue on the HP-33s and HP-35s, now that RAM is so cheap that quantities beyond what is practical can be provided. Unfortunately, those newer models don't measure up to the HP-32SII in many ways.

Re: 42s Statistics Problem

*Message #12 Posted by **Thomas Okken** on 6 Dec 2009, 11:43 p.m.,*
in response to message #1 by Norman Dziedzic

It sounds like REGS was made complex. The numbered storage registers on the HP-42S are actually elements of a matrix variable named "REGS", and that matrix can be either real or complex. When it is complex, the statistics functions won't work, giving you the "Invalid Type" message, but you can fix that quickly by doing CLV "REGS", followed by SIZE 0025 to re-create REGS as a real matrix.
If REGS is a real matrix, but one of the summation registers contains an ALPHA string, trying to use the statistics functions will give the "Alpha Data Is Invalid" message, but CLSigma will fix that problem.

[O.T.] A collector's question

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 5 Dec 2009, 10:15 p.m.*

In November I purchased a calculator which had no manufacturer or model number on the front. The label on the back was BASIC SLIDE RULE with a serial number and the statement "Assembled in Mexico of U.S. and Foreign Parts". I could not find a similar calculator in the Ball/Flamm "Collector's Guide to Pocket Calculators".

On return to Florida I found that the calculator was mechanically very similar to my Sears Electronic Slide Rule. The Sears Electronic Slide Rule has more second functions for the keys and uses the right hand switch to select degrees or radians for the trig functions, while the BASIC SLIDE RULE offers fewer second functions and uses the right hand switch to select the display format. The Ball/Flamm book notes that the Sears Electronic Slide Rule was "... probably made by Rockwell, has interesting case and key style, similar case to the [Sears] M8". The Rockwell idea makes sense because both my BASIC SLIDE RULE and my Sears Electronic Slide Rule use a blue fluor display for the numerical value but use a red LED dot in the upper right hand corner of the display to indicate a negative value, and use a red LED dot in the upper left hand corner of the display to indicate overflow. That characteristic appeared in several early Rockwell calculators. I cannot read the label on the Sears Electronic Slide Rule but the Ball/Flamm book states that it was made in Mexico.

Does anyone know what entity marketed the BASIC SLIDE RULE ?

Re: [O.T.] A collector's question

*Message #2 Posted by **Katie Wasserman** on 6 Dec 2009, 3:35 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Philippe's calculator site says that the BASIC SLIDE RULE was indeed marketed by Sears.

Re: [O.T.] A collector's question

*Message #3 Posted by **Palmer O. Hanson, Jr.** on 7 Dec 2009, 8:54 p.m.,*
in response to message #2 by Katie Wasserman

> Quote:
>
> Philippe's calculator site says that the BASIC SLIDE RULE was indeed marketed by Sears.

I went to that site hoping to find a picture but one wasn't available there. But using your idea I searched "Sears BASIC SLIDE RULE" which lead to http://www.eepcworld.de/Taschenrechner/s/SEARS%20BASIC%20SLIDE%20RULE.jpg which does have a picture which shows no nomenclature on the front. That seems curious since the Sears Electronic Slide Rule and the Sears M8 which use a very similar case have the nomenclature embossed on the front.

Thank you for your help.

HP97 restore project

*Message #1 Posted by **Alberto Fenini** on 5 Dec 2009, 6:37 p.m.*

Hello everybody, this time I'm dealing with an HP97. It is in very good cosmetic condition, but it doesn't work ... I have already taken apart all the main components, which I will restore later (the printer group, the card reader) and I'm concentrating on the two main boards. I have already re-soldered all the points, and the only thing I have on the display is a faint (very faint) zero in different positions whan I press some of the keys like the SST, BST . I have tried with the power supply only, the battery only and the combination of both power sources. Does anybody have a good idea ? Take care,and thanks in advance for your replies, Alberto

Re: HP97 restore project

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 5 Dec 2009, 8:29 p.m.,*
in response to message #1 by Alberto Fenini

Ciao, Alçberto;

I do not have much experience with Topcats, but I have an HP97 and it had a nonworking card reader(/writer). The rest of it works fine, so I never had to deal with its internals. About the card reader, I had to adjust the many contact lids (three, IIRC), and it is not that hard.

Again, be careful when using the charger. The HP97 has a different power circuit when compared to the HP67. In the HP67, the charger has three wires (unregulated Vcc, regulated Vcc and common), but the HP97 uses a two-wire AC adapter. So, it depends on batteries installed to work safely. In the 80's, I once had my first HP82143A (HP41 peripheral printer) damaged just for plugging the AC adapter and turning it ON without batteries. I did not have to wait for a 'twice in a lifetime' to remember it for good!

The behavior you describe actually leads to a bad ACT (main processor), but as you have a good experience with the HP25, go ahead. And keep in mind that the Woodstocks and Topcats share the same ACT processor (except for the HP27, which uses V-MOS technology). In most cases a 'transplantation' is feasible.

Success!

Luiz (Brazil)

Re: HP97 restore project

*Message #3 Posted by **Alberto Fenini** on 9 Dec 2009, 11:07 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Unfortunately not much of a success till now.
Since I have a working HP97, I tried mixing the pieces, and that's how it went.
The keyboard/diplay of the faulty unit is not working, even when installed on the knowing working base.
I have soldered the display flat cable directly to the pcb, but with no improvements at all.
The base unit (of the supposed faulty machine) with the known working display units has some life in it ... the display says 0.00 for a second or two, than shuts off ...
I went for the IC replacement, but to my surprise the IC used on the HP97 (mine is an HP97 post release of

the HP 97/S production)do not share the same ACT then Woodstock's one, I'll post the list later today.
It must be said that the faulty unit was in nice cosmetic condition, with no corrosion at all, but both motherboards shows some opaque areas, like some solvent was dropped over ... I have ordered some deoxidation spray and I'll test it.
If anyone has a suggestion, meanwhile my soldering stuff has got broken and I have ordered a new low power one, I'll be happy to read them. Take care Alberto

A little gem in the DVD 7

*Message #1 Posted by **J-F Garnier** on 5 Dec 2009, 8:17 a.m.*

I received the new DVD 7 of the Museum, and was very pleased to find a set of documents I was looking for since a long time: *the HP-75C Source Code Listings.*

These source code files are particularly famous because they are commented from place to place with dialogs between Roo-man the Expert and Joey the Novice. Thanks to the OCR'ed files, you can search for 'Joey' for instance to find these dialogs.

Thanks to Janick Taillandier for providing the scan files to the Museum! BTW Janick was a great contributor to the JPC Rom for the HP-71B at the time. [Janick, si tu lis ce forum, je te salue!]

Cosine for fun

*Message #1 Posted by **Chuck** on 4 Dec 2009, 12:35 a.m.*

A fellow colleague of mine asked her calculus class what the graph of y=Cos(x)^Cos(x) might look like (for real valued results). A TI84 didn't show any of the "interesting" part. A TI89 showed a little of it. With Mathematica I was able to show "almost all" of it (with some effort), but unfortunately I haven't tried it on an HP yet (I'll have to dig out my HP50 from storage this weekend).

What was interesting is that for expressions like (-1/3)^(-1/3) [hint] the TI84 gave the real valued root, but the Casio fx9860g gave the first complex valued root, agreeing with Mathematica (which is why it took some effort with Mathematica to graph the real parts).

For a "fun" weekend time waster see if you can get a "mostly complete" graph from 0 to 2pi.

Edit: don't trust Wolfram Alpha entirely on this one.

Edited: 4 Dec 2009, 12:40 a.m.

Re: Cosine for fun

*Message #2 Posted by **Bart (UK)** on 4 Dec 2009, 5:56 a.m.,*
in response to message #1 by Chuck

If it's plotting the real values of the results of Y=Cos(x)^Cos(x) for x=0 to 2pi, then on the 48G:
PLOT menu:
Equation = 'RE(Cos(x)^Cos(x))' *edit#2:* should read EQ: 'Y=RE(Cos(x)^Cos(x))' [does not seem to make a difference though]
Independent variable = X
X-scale =0, 360
Y-scale automatic
Output graph:
click here.

Edit: the above was in DEG mode, similar results are obtained in RAD mode for X=0 to 6.2832 (2pi).

If the absolute value of the eqution is used ('Y=ABS(Cos(x)^Cos(x)'), the following is obtained:
ABS(Cos(x)^Cos(x).

Re: Cosine for fun

*Message #3 Posted by **Marcelo Vanti (Brasil)** on 4 Dec 2009, 7:53 a.m.,*
in response to message #2 by Bart (UK)

Hello, I don't know why my hp 50g can't plot the middle part of the graph.I used the same settings that Bart. The table function results in indefinite values for the corresponding x, but if I evaluate the function in

the stack it gives the correct result. So I had to plot the following program: << x cos dup ^ RE >>. That's works.

Re: Cosine for fun

*Message #4 Posted by **Marcelo Vanti (Brasil)** on 4 Dec 2009, 8:16 a.m.,*
in response to message #3 by Marcelo Vanti (Brasil)

Hello again ,
Finally, I did the plot using on the Plot Setup of the 50g
EQ: << RE(cos(x)^cos(x))>>.
But, if I try without the markers program, then it doesn't work.
Anybody know why?
Marcelo

Re: Cosine for fun

*Message #5 Posted by **Chuck** on 4 Dec 2009, 7:30 p.m.,*
in response to message #2 by Bart (UK)

The interesting part is where pi/2 < cos(x) < 3pi/2 because here the values of cos(x) are negative (between -1 and 0), causing negative numbers to be raised to negative number.

This can cause complex or imaginary results: such as (-.5)^(-.5) = -1.414i, which can not be graphed on the real coordinates system (don't just graph the real part of the solution)

....or negative results such as (-1/3)^(-1/3) = -1.4422
....or positive results such as (-2/3)^(-2/3) = 1.3104

It all depends on the numerator and denominator being odd or even, and the irrationality of the numerator and denominator.

So, depending on the value of cos(x) in this region the graph should bounce from positive and negatives, but not be connected anywhere due to the complex results.

The trick was to get a graph to show this behavior. Some calculators will only show the complex values (or roots), and others give the real valued roots.

For instance, the value of (-2/3)^(-2/3) will either be real or complex depending on the calculator or math software: Hp's and TI's give the real root, while Mathematica and the Casio Fx9860g will only give the complex root.

The trick was to find the values of x that produces real roots (both positive and negative). After some trial and error, this is what I came up with:

The middle portion is the non continuous positive-negative-complex behavior. It should be filled-in completely, but I only used fractions as large as -38/39 (i.e. (-38/39)^(-38/39) which gives a positive value) and this will occur for radians of about 2.91 and 3.368, hence the large gap. Had I used values closer to 1, i.e., 257/259 the gap would have been smaller.

Anyway, fun problem, but I think I spent way to much time kicking it around. :)

Have great weekend.

CHUCK

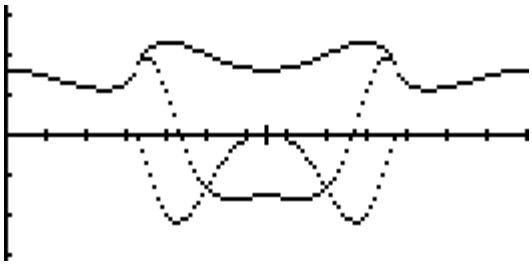
Re: Cosine for fun

*Message #6 Posted by **Dave Britten** on 4 Dec 2009, 2:09 p.m.,*
in response to message #1 by Chuck

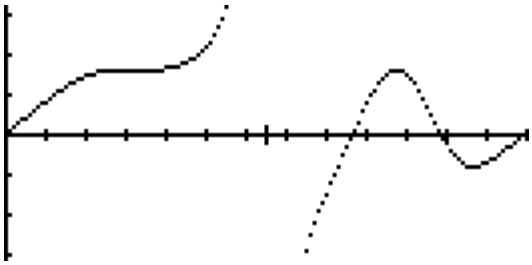
Here's a screen grab of three superimposed graphs:

RE(COS(X)^COS(X))
IM(COS(X)^COS(X))
ABS(COX(X)^COS(X))



XRNG: (0, 2*PI), YRNG: (-2, 2)

And here's a graph of RE(SIN(X)^COS(X)), which happens to be discontinuous at x=PI:



XRNG: (0, 2*PI), YRNG: (-2, 2)

Re: Cosine for fun

*Message #7 Posted by **Chuck** on 4 Dec 2009, 7:39 p.m.,*
in response to message #6 by Dave Britten

Dave, your graphs are similar to what Wolfram|Alpha gives: individual graphs of the real part a the first root, or the imaginary part of the first root. However, I'm looking for the graph for just the entire real roots, not just the real portion.

That is...there are three cube roots of (-3) or three values (-1/3)^(-1/3). Two are complex, one is real: graph the real one. The problem is, some CAS give only the first complex value making graphing the real root impossible (and other values have no real root). I hope I make sense. :(

HP-38E chips layout

*Message #1 Posted by **Alberto Fenini** on 3 Dec 2009, 1:57 p.m.*

Dear all,

I have received an HP38E which may be worth to restore, but it was in pieces when it came to me, and it is a "non soldered" one, does any one of you have a picture where I can see the chips layout ? Particulary, I need to see the orientation of the three small ICs, again, thanks in advance to everybody, take care all of you, Alberto

Re: HP-38E chips layout

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 3 Dec 2009, 2:50 p.m.,*
in response to message #1 by Alberto Fenini

Ciao, Alberto;

I hope this picture helps you:

Details of the HP38E chips alignment

Although the unit is of the soldered type, position and alignment is the same. Because it is the E-series, the three 8-pin DIL chips (ROM and RAM) have all pins in common, meaning that there is no specific order for them. If it is a 38C, the upper-leftmost chip should be the RAM (continuous power supply).

Please, let us know if you succeed.

Luiz (Brazil)

Edited: 3 Dec 2009, 2:51 p.m.

Re: HP-38E restore project

*Message #3 Posted by **Alberto Fenini** on 5 Dec 2009, 8:22 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Thank you very much for the picture, it has been really useful, and may be could be of interest what I have done : as first step I have completely dissambled the unit, and with a soft iron brush (dremel) cleaned the pcb

to avoid any possible bad contact.
Then, with a light solution of warm water and Marseille soap the I have washed, rinsed and brushed (this time with a plastic brush) the keys and the skeleton

All the plastic items have been then polished with a teflon polisher

At this point, feeding power with cables, I have performed a self test, which proved that the contatc problems beetween pcb and ICs were fixed. However, the display has been soldered to the PCB, using a 16W solder wich has not melted the plastic foil.Display RED plastic was removed for separate polishing

Now comes the interestegin part, I have tried to restore the battery contacts at best, and your suggestion will be very helpful at this point.
I have drilled the old rivets, and separate the foil that hold the contacs, this has been cleaned till bringing the copper at view, and lightly soldered. Then, using some NICD Battery terminals (which I usually remove) I have cutted something close to old battery contacts, and I have soldered them from the battery caveau side. One more step, I have inserted a very small screew and soldered the backside. Finally, I have soldered the plastic foil for best contact

Last but not least, assembled back the unit, inserted a pack of fresh batteries and re-executed the self test.

How does it look ? Again, thank you very much to everybody and in this case to Vieira, Luiz C. (Brazil)!
Take care Alberto

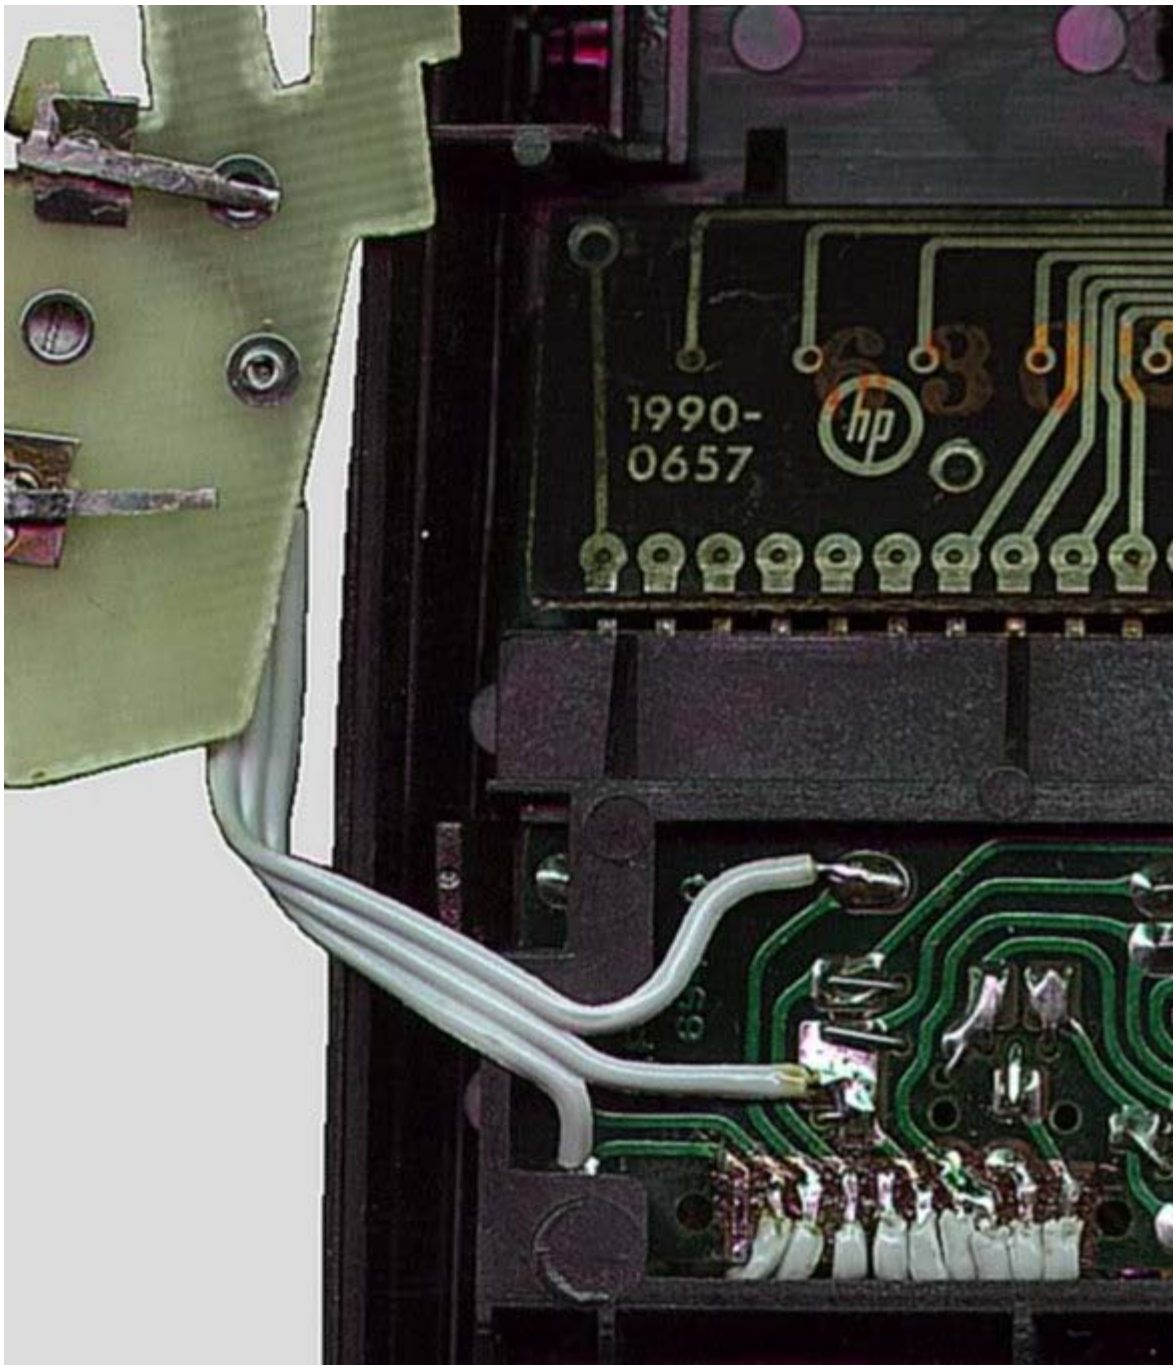
HP-38E restore project: CONGRATULATIONS!

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 5 Dec 2009, 8:51 a.m.,*
in response to message #3 by Alberto Fenini

Beautiful! That's the least I can tell about!

I'm glad to know that your HP38E is working. This is the HP12C's platform, and if you actually know them both, the HP38E/C misses Bond and Depreciation. The HP38E/C actually offers storage arithmetic to registers R0 to R6 while the HP12C restricts it to R0 to R4. Some features are added, others are suppressed...

The solution for batteries' contacts is, at least, fancy! Both functional and brainy. In the picture below you can see I soldered two metal stripes in order to replace the original contacts (broken). Your solution is perfect.



The steel used in NiCad packs seems to be a very good solution because it is oxide resistant and is flexible enough. It's a pity it is not shaped accordingly, should be bent as you did.

What else to say? Just 'Thank you for allowing my posts to be useful'.

Best regards.

Luiz (Brazil)

HP50G SD card is popping out

*Message #1 Posted by **Patrick Rendulic** on 2 Dec 2009, 1:01 p.m.*

Am I the only one who owns a HP50G where the SD card is popping out all the time (after transporting the calculator)?

Why didn't HP provide a free roll of duct tape?

If HP is reading this: please fix this in a future update!

Re: HP50G SD card is popping out

*Message #2 Posted by **Michael Plant** on 2 Dec 2009, 1:25 p.m.,*
in response to message #1 by Patrick Rendulic

I don't know if you are the only one, but I don't have this problem. My HP50G travels just fine with an SD card in the calculator. Have you tried different SD cards? With luck you'll find that you've got a dodgy card... Having said that, my notebook computer has an SD card reader that REFUSES to lock the SD cards in place. This means that in order to use it I have to hold the card in place while transferring files. Doesn't matter what card I use, either.

Re: HP50G SD card is popping out

*Message #3 Posted by **Patrick Rendulic** on 2 Dec 2009, 1:34 p.m.,*
in response to message #2 by Michael Plant

The card I am using is a 512MB from Toshiba. I got it with a used MP3 player. I will copy the content to a different card and will see whether this solves the problem.

Re: HP50G SD card is popping out

*Message #4 Posted by **Ed Look** on 2 Dec 2009, 1:29 p.m.,*
in response to message #1 by Patrick Rendulic

Mine stays in unless I take it out. In fact, the card appears to be just ever-so-slightly higher than flush with the bottom contour of the calculator, so that it should NOT be easy to accidentally pop it out.

You may have a faulty holding mechanism in your calculator's slot.

Re: HP50G SD card is popping out

*Message #5 Posted by **Patrick Rendulic** on 2 Dec 2009, 1:38 p.m.,*
in response to message #4 by Ed Look

I suppose that the mechanism releases the card when the calculator gets a shock along its long side. That's how I carry it in my bag, in a vertical position. So it is possible that when putting the bag on the ground the shock is sufficient to release the card. I will try with a different card. The only problem is that it is getting

harder to find "pure SD" cards ;).

Re: HP50G SD card is popping out

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 2 Dec 2009, 1:35 p.m.,*
in response to message #1 by Patrick Rendulic

Hi;

I have two HP5G's and one HP49G+, and it never happened with any of them. I'd quote Ed Lock:

> Quote:
>
> (...) the card appears to be just ever-so-slightly higher than flush with the bottom contour of the calculator, so that it should NOT be easy to accidentally pop it out.

Same for me.

About the duct tape: I want mine, too! Not necessarily to fix the card in place... B^)

Cheers.

Re: HP50G SD card is popping out

*Message #7 Posted by **designnut** on 2 Dec 2009, 5:02 p.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

I have used SD cards hundreds of times, cameras,readers, HP50's. Never had a flaw. Press it in past what you think is enough and it locks on release. Press again and it releases. Are you pressing it in far enough? Sam

Re: HP50G SD card is popping out

*Message #8 Posted by **Mike Morrow** on 2 Dec 2009, 4:59 p.m.,*
in response to message #1 by Patrick Rendulic

SD cards don't physically lock or latch in any way into the inserted position. The card is held in only by friction in the slot...a fully inserted SD card can be removed by simply grasping the card edge with fingernails, tweezers, etc. and pulling outward.

Inserting a card compresses a sort of spring wire in the slot that catches upon full card insertion. Later, pressing the card releases the spring wire, which then pushes the card out of its slot.

Something in your HP50G is allowing that spring wire to release without the normal inward card push. And no, that's not normal for the HP50G or the similar HP49g+. I've never experienced it with my two well-travelled machines, the oldest being more than six years old.

HP17b & it's offsprings - Random Number Generator - How?

*Message #1 Posted by **Peter A. Gebhardt** on 2 Dec 2009, 12:30 p.m.*

Loooking into the "HP-17B Business Finance and Accounting (Step-by-Step Solutions)" on the new v7 DVD set which arrived today here in Germany (Thx. to Dave & all contributors!), I realized for the first time, that neither the keyboard nor the solver do offer a "Random Number" function.

One might argue: "If you didn't know it by now, you even might never need it ..." ;-)

Anyway. Could anybody recommend a good solver equation to generate random numbers?

Best regards,

Peter A. Gebhardt

Edited: 2 Dec 2009, 12:31 p.m.

Re: HP17b & it's offsprings - Random Number Generator - How?

*Message #2 Posted by **Don Shepherd** on 2 Dec 2009, 12:54 p.m.,*
in response to message #1 by Peter A. Gebhardt

Peter, this may not be exactly random, but in the absence of any timer function, I prompted the user to enter any old multi-digit number, then took LN of that and used FP and IP to get the first 2 digits after the decimal point. That gave me a number between 00 and 99, and that's what I wanted. Like I said, it may not be "purely" random, but I got what I needed.

Re: HP17b & it's offsprings - Random Number Generator - How?

*Message #3 Posted by **Peter A. Gebhardt** on 2 Dec 2009, 1:32 p.m.,*
in response to message #2 by Don Shepherd

Don,

Re: HP17b & it's offsprings - Random Number Generator - How?

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 2 Dec 2009, 1:14 p.m.,*
in response to message #1 by Peter A. Gebhardt

Halo, Peter; wie geht´s?

I was interrupted while writing my followup so I did not see Shepherd´s wise and practical suggestion.

Anyway, you can search the MoHPC set and, under HP25 Applications or HP33/34 Applications and some others, you'll find many pseudo Random number generators. They mainly use an updated seed (which happens to be the last generated random number) to compute a new one. Although the HP28S has a RAND function (also a pseudo-number generator), it offered a way to enhance the randomizing process because it allowed the internal clock to be read and placed in the stack as a number, hence you could use this value as a seed to change the Random number. I am not sure if the HP17B has a time function which returns current clock as a number, but I know that it has a clock. If possible, you could use the current clock as a seed to generate a asynchronous pseudo Random series.

Hope this helps.

Luiz (Brazil)

Peter A. Gebhardt

Re: HP17b & it's offsprings - Random Number Generator - How?

*Message #9 Posted by **Don Shepherd** on 2 Dec 2009, 8:14 p.m.,*
in response to message #1 by Peter A. Gebhardt

Peter, Luis is right, the 17bii+ does have a clock and the solver has a CTIME function that returns the current time. For instance, at PM 9:13:28, if you enter equation A=CTIME and solve for A, A will be 21.1328, so you could probably use that number in some way to generate a random number rather than prompting the user to enter some number, which is never elegant.

RNDU & RAND for HP17b & it's offsprings - Random Number Generator

*Message #10 Posted by **Peter A. Gebhardt** on 3 Dec 2009, 4:11 a.m.,*
in response to message #1 by Peter A. Gebhardt

With a little help from my friends (from this forum) ... :-)

(Example) Pseudorandom Generator for 17b

```
Uniform Distribution with Seed: RNDU = FP(9821*G(RNDU)+.211327) *) **) ***)
"True" Distribution w/o Seed: RAND = FP(9821*G(RAND)*CTIME+.211327)
```

Other approaches can be found by looking at

http://en.wikipedia.org/wiki/Random_number_generation

Best regards,

Peter A. Gebhardt

Re: RNDU & RAND for HP17b & it's offsprings - Random Number Generator

*Message #11 Posted by **John B. Smitherman** on 3 Dec 2009, 6:33 p.m.,*
in response to message #10 by Peter A. Gebhardt

Hi Peter. I entered your equations into my yellow / gold 17bii+ (s/n 61801536) and it doesn't seem to work. When I run either equation they return 0.211327. Either I have done something wrong or there is a difference between the 17b and 17bii+. Any ideas?

Regards,

John

Re: RNDU & RAND for HP17b & it's offsprings - Random Number Generator

*Message #12 Posted by **Peter A. Gebhardt** on 3 Dec 2009, 7:45 p.m.,*
in response to message #11 by John B. Smitherman

John,

I've tested on a 17bII (s/n: 3610M00859) and a 17bII+ (gold, s/n: CNA42903649).

The only difference: the 17bII when started with seed == 0 in RNDU or RAND respectively, does return 0 at the first key press.

After pressing CALC do a CLR DATA first.

Best regards,

Peter A. Gebhardt

Re: RNDU & RAND for HP17b & it's offsprings - Random Number Generator

*Message #13 Posted by **Don Shepherd** on 3 Dec 2009, 10:41 p.m.,*
in response to message #12 by Peter A. Gebhardt

Peter, are you sure you tested on a 17bii+ unit? I got the same results as John, running on both the old 17bii+ (gold) and newer 17bii+ (retro silver). I haven't tested on my 17b or 17bii yet, but I have no doubt it will work on those because their solver works differently (that is, better) than the solver in the plusses. The plus solver has that problem with an extra pass at the beginning of the equation evaluation, and I'd bet that that is the reason your equations don't work, at least on John and my plus units.

Don Shepherd

Re: RNDU & RAND for HP17b & it's offsprings - Random Number Generator

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 4 Dec 2009, 6:44 a.m.,*
in response to message #13 by Don Shepherd

Hi;

in my HP17BII+ (gold, SN CN33015xxx), after pressing [CALC] the calculator returns [INVALID EQUATION] and the cursor stops at R in G(RAND). I checked the equation many times, added separators in all arithmetic operations, and the error is marked in the same place.

I´ll try with the HP17BII later.

Cheers.

Luiz (Brazil)

Re: RNDU & RAND for HP17b & it's offsprings - Random Number Generator

*Message #15 Posted by **Peter A. Gebhardt** on 4 Dec 2009, 7:13 a.m.,*
in response to message #14 by Vieira, Luiz C. (Brazil)

Luiz,

try to use a different variable name instead of RAND on both sides of the equation. If the error persists then you might have a problem because of the L() & G() issues with the early 17bII+'sses.

Checked s/n definition @Graig Finseth's site (http://www.finseth.com/hpdata/serial.php): ccywwnnnnn - your unit is apparently from 2003 and contains an older ROM version which was already reported of having problems in this area. Pls. scan the archives for more information.

There is another obvious problem with the 2nd formula which was pointed out by John already, but somewhat misinterpreted by me:

The uninitialized G(RAND) as long as it evaluates to 0 (zero) returns a fix SEED of .211327 for RAND ...

After you've entered the equations (or after an Error with L() & (G) as encountered here),

pls. make sure that you CLR ALL variables while in SOLVE but not in CALC mode (clearing variables for ALL equations!)

BUT BE CAREFUL NOT TO DELETE ALL YOUR EQUATIONS !!!

Best regards,

Peter A. Gebhardt

Edited: 4 Dec 2009, 12:16 p.m.

Re: RNDU & RAND for HP17b & it's offsprings - Random Number Generator

*Message #16 Posted by **John B. Smitherman** on 7 Dec 2009, 11:46 a.m.,*
in response to message #15 by Peter A. Gebhardt

Thanks Peter. It's still a "no-go" after trying different sequences using the CLR DATA function. I've decided that there must be differences in ROM's that keeps this from working correctly. :-(

Thanks and regards,

John

Re: RNDU & RAND for HP17b & it's offsprings - Random Number Generator - 17bii+ Version

*Message #17 Posted by **Marcus von Cube, Germany** on 7 Dec 2009, 12:52 p.m.,*
in response to message #10 by Peter A. Gebhardt

Here is a version that works on my 17bii+ (silver):

```
RNDU = L(SEED:FP(9821*SEED+.211327))
```

Solve for RNDU! Problem: RCL SEED should return the same value as RCL RNDU but it doesn't. Is the equation evaluated more than once?

Re: RNDU & RAND for HP17b & it's offsprings - Random Number Generator - 17bii+ Version

*Message #18 Posted by **John B. Smitherman** on 7 Dec 2009, 1:58 p.m.,*
in response to message #17 by Marcus von Cube, Germany

Thanks Marcus, it works. I agree, I'm not sure what's going on with RCL SEED and RCL RNDU.

Regards,

John

Re: RNDU & RAND for HP17b & it's offsprings - Random Number Generator - 17bii+ Version

*Message #19 Posted by **Don Shepherd** on 7 Dec 2009, 2:34 p.m.,*
in response to message #17 by Marcus von Cube, Germany

> Quote:
>
> Is the equation evaluated more than once?

Yes, a minimum of two times, and more if it iterates, which it frequently does on the 17bii+'s. See article 830. The solver in the plusses does not work like the solver in the 17b or 17bii. It is illogical, and my attempts to ask HP to clarify exactly how it does work have not been successful. I'm convinced there is no one currently within HP who knows how the plus solver currently works.

Re: RNDU & RAND for HP17b & it's offsprings - Random Number Generator - 17bii+ Version

*Message #20 Posted by **Marcus von Cube, Germany** on 7 Dec 2009, 3:45 p.m.,*
in response to message #19 by Don Shepherd

But this still doesn't explain, why SEED and RNDU differ in value. If I set SEED to 0 and solve for RNDU, then RNDU is set to 0.2113... (the last constant in the expression) which I do expect, but SEED is set to a different value: 0,6538. I'm puzzled.

Re: RNDU & RAND for HP17b & it's offsprings - Random Number Generator - 17bii+ Version

*Message #21 Posted by **Don Shepherd** on 7 Dec 2009, 4:18 p.m.,*
in response to message #20 by Marcus von Cube, Germany

Marcus, you are right to be puzzled. If anyone at HP can diagnose this and is listening, we'd love to hear from you.

Re: RNDU & RAND for HP17b & it's offsprings - Random Number Generator - 17bii+ Version

*Message #22 Posted by **John B. Smitherman** on 7 Dec 2009, 4:30 p.m.,*
in response to message #21 by Don Shepherd

I tried running the self-test to see if it would report the ROM version at the end of the test but no luck. Are you aware of any sequence of button pushes that would provide this?

John

Re: RNDU & RAND for HP17b & it's offsprings - Random Number Generator - 17bii+ Version

*Message #23 Posted by **Don Shepherd** on 7 Dec 2009, 5:17 p.m.,*
in response to message #22 by John B. Smitherman

John, I just went through by 17bii+ "file" and I could not find any reference to a key sequence that will give you a version number or ROM number. If there is such a sequence, I'm not aware of it.

Don

Re: RNDU & RAND for HP17b & it's offsprings - Random Number

Generator - 17bii+ Version

Re: RNDU & RAND for HP17b & it's offsprings - Random Number Generator - 17bii+ Version

*Message #25 Posted by **Peter A. Gebhardt** on 9 Dec 2009, 10:42 a.m.,*
in response to message #20 by Marcus von Cube, Germany

Marcus,

> Quote:
>
> But this still doesn't explain, why SEED and RNDU differ in value. If I set SEED to 0 and solve for RNDU, then RNDU is set to 0.2113... (the last constant in the expression) which I do expect, but SEED is set to a different value: 0,6538. I'm puzzled.

as expected above findings could not be reproduced on my 17bII+. My results:

```
Keys       Display
----------------------
0 SEED     SEED=0.0000
RNDU       RNDU=0.2113
RCL SEED   SEED=0.2113
RNDU       RNDU=0.6538
RCL SEED   SEED=0.6538
RNDU       RNDU=0.1212
RCL SEED   SEED=0.1212
...
```

Best regards,

Peter A. Gebhardt

Re: RNDU & RAND for HP17b & it's offsprings - Random Number Generator - 17bii+ Version

*Message #26 Posted by **Marcus von Cube, Germany** on 9 Dec 2009, 10:56 a.m.,*
in response to message #25 by Peter A. Gebhardt

So you must have a different version of the solver in your machine. Mine is a silver

(newer?) release.

Peter, your results look fine. You can simply use the formula and you will get the desired pseudo random sequence on your machine.

Re: RNDU & RAND for HP17b & it's offsprings - Random Number Generator - 17bii+ Version

*Message #27 Posted by **Peter A. Gebhardt** on 8 Dec 2009, 1:36 p.m.,*
in response to message #17 by Marcus von Cube, Germany

Marcus,

your solution does work only for a single SEED / RNDU combination. (On my Gold 17bII+)

Pressing RNDU a 2nd time shows a value outside 0 ... 1

Best regards,

Peter A. Gebhardt

Re: RNDU & RAND for HP17b & it's offsprings - Random Number Generator - 17bii+ Version

*Message #28 Posted by **Marcus von Cube, Germany** on 8 Dec 2009, 5:47 p.m.,*
in response to message #27 by Peter A. Gebhardt

I tested it with my silver 17bii+ and it looked correct. Can you set SEED to 0 and post the first few RNDU results here?

```
Keys      Display
--------------------
0 SEED    SEED=0.0000
RNDU      RNDU=0.2113
RCL SEED  SEED=0.6538
RNDU      RNDU=0.1222
RCL SEED  SEED=0.3473
RNDU      RNDU=0.5160
RCL SEED  SEED=0.1911
```

Marcus

Re: RNDU & RAND for HP17b & it's offsprings - Random Number Generator - 17bii+ Version

*Message #29 Posted by **Peter A. Gebhardt** on 8 Dec 2009, 6:16 p.m.,*
in response to message #28 by Marcus von Cube, Germany

Marcus,

Now I understand - you are using a 2-step process.

What I'm after is, storing the 'seed' (or even none) into RNDU once and then proceed (by only pressing RNDU again) to get the next value in sequence - and so on ...

```
Keys      Display
--------------------
0 RNDU
RNDU=0.2113
```

```
RNDU=0.6538
RNDU=0.1222
RNDU=0.3473
RNDU=0.5160
...
```

That's the way the formula in Message #10 works on both units of mine. It does even work, if you use an initial RNDU outside { 0 ... 1 }

Best regards,

Peter A. Gebhardt

Edited: 8 Dec 2009, 6:19 p.m.

Re: RNDU & RAND for HP17b & it's offsprings - Random Number Generator - 17bii+ Version

*Message #30 Posted by **Marcus von Cube, Germany** on 9 Dec 2009, 2:18 a.m.,*
in response to message #29 by Peter A. Gebhardt

This is how it *should* work, but it doesn't do on the 17bii+. I tried to overcome the situation by adding the seed variable. Normally, the modified sequence should be identical to the original formula if you only set SEED once and press RNDU multiple times. Because of reasons yet to determine, this isn't the case on the "+". The formula gets evaluated twice with each step but returns the RNDU result of the first step. Therefore, SEED (checked with RCL SEED) and RNDU differ. If you can live with the fact that the formula returns every other result of the pseudo random sequence, just press RNDU in each step.

Deoxit: now that I have it, how do I use it?

*Message #1 Posted by **Michael Meyer** on 1 Dec 2009, 6:31 p.m.*

I just got a bottle of Deoxit D100L (100% solution). I also picked up some small syringes, so I can drop small amounts on pinpoint areas.

Let's say that I drop a small amount into an HP-25 keyboard hole for a misbehaving key. Do I need to rinse the stuff out, or is it safe to just drip a tiny bit into the holes?

If I clean a whole circuit board, what is the best way to do this? (The stuff is so expensive). I was thinking about using a zip-lock bag (not supposed to hurt plastic) so that I can re-use the bag to clean many boards.

If I choose to dilute the solution, what solvent should I use-- just water?

Thanks... I couldn't find the answers to this, even on the Deoxit site and forum.

Re: Deoxit: now that I have it, how do I use it?

*Message #2 Posted by **Allen** on 1 Dec 2009, 7:09 p.m.,*
in response to message #1 by Michael Meyer

IIRC, the deoxit gold is better for cleaning. The standard RED solution is good for prevention/treating. I have many battery terminals of my calculators (in my collection) treated with Deoxit.

IMHO, The best application is with a lint-free brush.

You don't need much- literally only a few hundred atoms thick will suffice for treating surfaces. Any more and it just becomes a dust magnet. Although, I've never used it as a "bluk" cleaning solution to dip boards in....

Re: Deoxit: some early success

*Message #3 Posted by **Michael Meyer** on 1 Dec 2009, 10:49 p.m.,*
in response to message #2 by Allen

Well, the HP-25 with a couple of poor keys works perfectly now. I used a syringe and put a micro-drop in the holes of the failing keys, let it soak a few hours, then flushed them with a little contact cleaner.

I also used the syringe to coat the board of a badly corroded HP-10. I'll report on it in a few days.

Still wondering what solvent I could use to soak a whole board...

*Message #4 Posted by **Katie Wasserman** on 1 Dec 2009, 11:18 p.m.,*
in response to message #3 by Michael Meyer

MCM Electronics sells the full line (I think) of this stuff. I use it in the pen and the 25ml needle tip

bottle for all the cleaning/repairing that I do. They also have it in a spray can of various concentrations. Often it's on sale for half price, nothing now but keep checking: here

Upgrade to HP Museum DVD Set Version 7.0

*Message #1 Posted by **Gerry Schultz** on 1 Dec 2009, 6:04 p.m.*

I just got my upgrade copy of the HP Museum DVD 7.0 and am loving it! You guys did a great job and am very happy with the results.

One question though, what's the difference between the upgrade and full version of the DVD disks? I compared it to my copy of version 6.0 and it appears that this upgrade version is complete. Is this correct?

Thank you all for all the hard work to produce such a great set of discs.

Gerry

HP 42S - intermittent rows nonfunctional

*Message #1 Posted by **Rob Welch** on 1 Dec 2009, 2:24 p.m.*

I've been a heavy user of my 42S for over 20 years now. To my dismay, I'm starting to see a chronic problem. Most of the time, I lose a row or column of keys. I'll lose the 123 row or the 963 column. The calculator has always been either in the old leather case HP used to sell or in use, so it's clean. Is there a way to fix this without having to crack open the case? I've already sprayed contact cleaner in the case and that had no effect other than to make the calculator greasy for a day or so. I sure am jonesing for RPN. I'm tired of getting a result of zero.

Re: HP 42S - intermittent rows nonfunctional

*Message #2 Posted by **Steve Simpkin** on 1 Dec 2009, 3:11 p.m.,*
in response to message #1 by Rob Welch

This is likely a problem with deformed rubber at the keyboard connector contacts. This is usually repairable without removing the keyboard overlay.

See the recent thread: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=160128#160128

Also see http://www.hpmuseum.org/guest/brogpion.htm

Re: HP 42S - intermittent rows nonfunctional

*Message #3 Posted by **geoff quickfall** on 1 Dec 2009, 3:49 p.m.,*
in response to message #1 by Rob Welch

Hello Rob,

Take a look at this posting. It will show you the foam rubber keyboard to logic PCA contact failure. This is the rubber that needs replacing.

I have done 5 42S upgrades to 32 K as well as restoring about 10 other pioneer models all suffering the degraded foam problem. I use a foam mouse pad as a donor.

opening a 42S

The method I use is credited to Tony Duell and I find the easiest way to enter the calculator. Others prefer to use a credit card inserted between the shells and used to pry the shells apart.

Good luck, and it is an easy fix in the scheme of things.

Cheers, Geoff

An HP-42S fix success, and a contrast problem

*Message #1 Posted by **DavidShenk** on 1 Dec 2009, 2:15 a.m.*

I bought a "dead" 42s from TAS for $20 USD with shipping, so I was happy with that. After putting batteries in it, I got a constant on and off beeping. I looked that up and most opinions pointed to a bad RAM chip. I've now done a few upgrades on these, so I decided to upgrade this one. After taking it apart, I put the batteries in it one last time and it now wouldn't even beep. I finished the upgrade and it now works! Very happy with that. (Side note: It had a Toshiba RAM chip in it, the only one of those I've seen so far)

Now I notice that I can only see the display if I'm looking at the screen from a very low angle. If you look at it straight on, it literally looks off. No problem I thought, but when I went to adjust the contrast, nothing. The contrast will not change at all, and seems to be stuck in low :(

This is a version A with the flush display, S/N 2942S30206 and it passes it's self test.

Has anyone else run into this, or have any ideas?

Dave

Re: An HP-42S fix success, and a contrast problem

*Message #2 Posted by **Lyuka** on 1 Dec 2009, 7:48 a.m.,*
in response to message #1 by DavidShenk

Hi Dave

LCD drive voltage is made by on-board step-up converter and it should be 7.0V(light) ~ 8.3V(dark) normally. How much is the voltage at the 10u/16V tantalum capacitor near the crystal resonator?

My first guess is a broken solid-tantalum capacitor.

Regards, Lyuka

Re: An HP-42S fix success, and a contrast problem

*Message #3 Posted by **DavidShenk** on 1 Dec 2009, 11:26 a.m.,*
in response to message #2 by Lyuka

Thanks, I'll check that when I get back from work.

I neglected to mention that batteries had leaked in it at one point. It doesn't look too bad as only a few copper traces were green. I cleaned those some, but could probably do a better job. I've only taken the back off of the calculator, so I don't know if there could be some hidden damage on the other side of the board due to that.

Dave

Re: An HP-42S fix success, and a contrast problem

*Message #4 Posted by **DavidShenk** on 1 Dec 2009, 9:31 p.m.,*
in response to message #2 by Lyuka

I'm getting 4.52V across the 10uF capacitor. That looks to be quite a bit lower than the "light" voltage of 7.0 and that seems about right as you can barely see the display.

Replace the 10uF cap then?

Dave

Re: An HP-42S fix success, and a contrast problem

*Message #5 Posted by **Lyuka** on 1 Dec 2009, 10:36 p.m.,*
in response to message #4 by DavidShenk

Hi Dave

It seems that 4.52V is just below the battery voltage. It implies that
1) the inductor is not in open-mode failure.
2) the Ta capacitor is not in short-mode but may be in high-leakage state that is just before short-mode failure.
3) the SiSB diode may be in short-mode failure.
4) the FET switch in the processor may not working or in open-mode failure.

Replacing both capacitor and diode would be better.

Regards, Lyuka

Re: An HP-42S fix success, and a contrast problem

*Message #6 Posted by **DavidShenk** on 2 Dec 2009, 12:19 p.m.,*
in response to message #5 by Lyuka

Lyuka,

Thank you so much for your help. I have already ordered some of the capacitors, but am having a little trouble getting the right diode. Does this look like one that would work?:

LL4148 Fast Switching Diode, SMD 1N4148

Dave

Re: An HP-42S fix success, and a contrast problem

*Message #7 Posted by **Lyuka** on 2 Dec 2009, 2:34 p.m.,*
in response to message #6 by DavidShenk

Hi Dave

1S4148 is a Si-switching diode and is not suitable for this purpose.
I recommend to use one of small signal Si-Schottky diode with main characteristics of

```
Vrrm >= 30V, If >= 0.1A, Vf <= 0.4V (@If=10mA, Tj=25C), SOT-23 package
```

such as, for instance, STMicroelectronics's BAR42FILM or BAR43FILM. (You may be able to

purchase it at Digi-Key.)

Regards, Lyuka

Re: An HP-42S fix success, and a contrast problem

*Message #8 Posted by **DavidShenk** on 2 Dec 2009, 3:36 p.m.,*
in response to message #7 by Lyuka

I think I found what you are referring to here. Unless I'm looking at the wrong component on the board, this doesn't look anything like the diode just under the 10uF Ta capacitor. But I see a place where something like this could fit, just to the left of the diode, still under that capacitor. There is currently nothing there now. You're suggesting that I remove the other diode and replace it with this sot-23 package in that other spot?

Dave

Re: An HP-42S fix success, and a contrast problem

*Message #9 Posted by **Lyuka** on 2 Dec 2009, 4:33 p.m.,*
in response to message #8 by DavidShenk

Dave

> Quote:
>
> You're suggesting that I remove the other diode and replace it with this sot-23 package in that other spot?

Exactly. Just as I've replaced both capacitor and diode of one of my HP-42S.

Lyuka

Re: An HP-42S fix success, and a contrast problem

*Message #10 Posted by **DavidShenk** on 2 Dec 2009, 5:05 p.m.,*
in response to message #9 by Lyuka

Thank you so much. Actually, I've been referring to one of your photos while talking to you back and forth because my 42s is at home. I didn't realize that was your site until you sent the link.

Your website has been a great help to me and I'm sure many others. Thank you for taking the time to document what you're doing, and with nice, clear photos!

Dave

Lyuka

Contrast problem continues...

*Message #12 Posted by **DavidShenk** on 4 Dec 2009, 9:10 p.m.,*
in response to message #5 by Lyuka

I have just replaced both the cap and the diode without any effect on the display. I get 4.49V across the cap, similar to before.

Maybe there is something else I could try, but I'm wondering if it's possible to change the value of the cap or other component so that at least the display is "stuck" in a usable contrast setting.

Dave

Re: Contrast problem continues...

*Message #13 Posted by **Lyuka** on 5 Dec 2009, 2:35 a.m.,*
in response to message #12 by DavidShenk

Dave,

That's too bad.
There seems to be a problem of the switching regulator in the processor, or PCB traces between the diode and the processor.

The last hope is that the factor of the problem is outside of the processor. Let us check the PCB again.
Remove the battery and make both contacts connected for several seconds and remove the connection, then check the continuity by an ohmmeter of a DMM.

```
 1) D1(-), U1-116(Vcc)(+) should be near the value of 27 Ohm (series
resistance of the inductor L1)
 2) D1-A(-), U1-117(+)    should be less than 0.1 Ohm
 3) D1-K(-), U1-119(+)    should be less than 0.1 Ohm
```

Note: (+) : positive measurement voltage side, generally red lead of the DMM, (-) : negative measurement voltage side, generally black lead of the DMM

1) possible problem is short circuit between U1-116 and U1-117 which will make the voltage stacked to Vcc.
2) possible problem is breakage of the trace which will make the voltage stacked to just below the Vcc by loss of switching.
3) possible problem is braakage of the trace which may cause loss of voltage control but I'm not sure.

Good luck.

Lyuka

similar problem

*Message #14 Posted by **geoff quickfall** on 3 Dec 2009, 1:08 p.m.,*
in response to message #1 by DavidShenk

Hello David and Lyuka,

I have a similar problem, I just upgraded the Toshiba RAM to 32 K on an HP42S #3012Sxxxxx with the flush display and version A.

The contrast does work but the display itself is weak. Unlike yours David, the contrast works but when it is backed off to allow the digits to display the display is noticeably lighter then my newer models.

Was this a function of the older displays (less inherent contrast between digits and background) or could this also be remedied by the diode and capacitor change?

My calculator also resided in the case and was in pristine condition and fully functional (no bad foam contact).

Cheers, Geoff

P.S. Lyuka, could you provide the part number for the capacitor that you used. Thanks

some added specs:

```
the capacitor:

-  calculator off gives 4.6 volts
-  calculator on with low contrast 6.3 volts
-  calculator on with high contrast 7.6 volts
```

Edited: 3 Dec 2009, 1:20 p.m.

Re: similar problem

*Message #15 Posted by **DavidShenk** on 3 Dec 2009, 1:28 p.m.,*
in response to message #14 by geoff quickfall

Here is the link to the capacitor that I ordered. I believe (hope) this is the right one, but maybe Lyuka could confirm that.

I'll report my results here when I've replaced the cap and diode. I think I'll get them in 3-4 days.

Dave

Re: similar problem

*Message #16 Posted by **Geoff Quickfall** on 3 Dec 2009, 1:36 p.m.,*
in response to message #15 by DavidShenk

OOPs,

just sent you an email and you posted the answer here!

so I have ordered the TA and the diodes also.

Cheers, Geoff

Re: similar problem

*Message #17 Posted by **Lyuka** on 3 Dec 2009, 3:17 p.m.,*
in response to message #14 by geoff quickfall

Hi,

The contrast of the LCD of my HP-42S #3005Sxxxxx with flash display and version A is relatively weak than that of #3242Sxxxxx with matte display.

Voltage at the 10uF capacitor at Ta=25C, Vbattery=4.70V

```
  Serial#/revision  : light  usual  dark
  #3005Sxxxxx/Rev.A : 6.27   7.40   7.71  [V]
  #3242Sxxxxx/Rev.C : 6.39   7.52   7.58  [V]
```

The capacitor that I used was TDK C3225JB1C106M (EIA X5R characteristic), but TDK C3225X7R1C106M that Dave mentioned has wider temperature range and is good enough.
Please take care not to make short circuit by the shield plate at the back of the housing, though there is a bumper near the diode and capacitor,

Cheers.
Lyuka

Re: similar problem

*Message #18 Posted by **Geoff Quickfall** on 3 Dec 2009, 3:56 p.m.,*
in response to message #17 by Lyuka

Mine sounds very close to yours vis a vis the voltage. This is probably typical for the early displays.

It is readable, just not as contrasting. So the upgrade will probably not help. Still I will order the parts for backup.

I agree with David, your site is fantastic, as are your descriptions.

Many thanks

Done

*Message #19 Posted by **Geoff Quickfall** on 5 Dec 2009, 2:00 p.m.,*
in response to message #18 by Geoff Quickfall

Well I ordered the following parts from DigiKey and recieved them the next day (yesterday).

So, I swapped out the diode and the capacitor for the following as per Lyukas instructions. Although the 42S was in specs for the voltage across the original capacitor the swap out did improve the contrast between the alpha/numeric display and the background and boosted the overall ability for the display to contrast to dark.

I did this to include it in the book with photos as I am trying everything I see posted.

Here are the parts I ordered including the capacitor using the X5R characteristic:

```
497-2518-1-ND
DIODE SCHOTTKY 30V 100MA SOT-23
SCHED B: 854110 ECCN: EAR99
LEAD: LEAD FREE ROHS: ROHS COMP
COUNTRY/ORIGIN: MALAYSIA

445-1400-1-ND
CAP CER 10UF 16V X5R 20% 1210
SCHED B: 853224 ECCN: EAR99
LEAD: LEAD FREE ROHS: ROHS COMP
COUNTRY/ORIGIN: JAPAN
BOX 1 SHIPPED USAV WEIGHT
```

Thanks Lyuka, and Dave (hope your trace tracking works out for you)

Cheers, Geoff

Re: Done

*Message #20 Posted by **Lyuka** on 5 Dec 2009, 10:17 p.m.,*
in response to message #19 by Geoff Quickfall

Hi Geoff,

That's good :-)

The swap out you did also improved the long term reliability and reduced the power supply current, I think.
In my case I_idle reduced from 440uA to 380uA, I_standby reduced from 14.0uA to 13.5uA.
(Ta=24, V_battery=4.73V, f_osc=65.536kHz, Serial#=3005S0xxxx)

Note:
The recommended parts for this replacement (which Geoff used) are

```
SiSB diode : STMicroelectronics, BAR42FILM
10uF  MLCC : TDK, C3225X5R1C106M
```

It's also recommended to add 1uF MLCC (TDK C3216X7R1E105K) as a bypassing capacitor, on to the pad between the RAM and the processor, to improve the stability.

Cheers, Lyuka

In Praise of Dirty Calculators

*Message #1 Posted by **Michael Meyer** on 30 Nov 2009, 3:03 p.m.*

I'm not sure I've seen anyone post this, but I am a fan of dirty calculators.

I just bought a "heavily used" HP-35 for $32 USD. It turned out not to be heavily used, just heavily dirty. It cleaned up to one of the nicest in my collection.

It's been my experience that some of the dirtiest calculators were also the least used, so the key action is still excellent. The corrosion damage is a gamble on any machine, even ones that look clean in the pictures. I, personally, would rather take my chances on 3 unknowns for the same price as 1 advertised as working. Especially if they're dirty.

Re: In Praise of Dirty Calculators

*Message #2 Posted by **Dave Britten** on 30 Nov 2009, 4:25 p.m.,*
in response to message #1 by Michael Meyer

Definitely. A cosmetically flawed calculator can be a great advantage for the buyer (within reason, of course). My 17bii was an excellent deal, as it was missing the case, and had some minor paint flaking on the face plate. It works just as good as new, though. The 48SX I keep on my desk at work has a couple minor scuffs on the screen, but everything else cleaned up great with a little alcohol, and it feels sturdier than any 48G/GX I own. Recently, I bought a heavily discounted 12c from a local office supply store that was closing down. All they had left was the display model (manufactured some 7 years ago), but with a few minutes' cleaning, it looked - and worked - like it had just come out of the box.

Now I just need to score a similar deal on a 32sii!

Re: In Praise of Dirty Calculators

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 30 Nov 2009, 11:45 p.m.,*
in response to message #1 by Michael Meyer

Hi, Doc;

I bought a Commodore N60 clone a few months ago. Check this out:

Click to enlarge

Now it looks like this (did not complete the electronics so far):

Click to enlarge

Yep, the [x^2] key is sideways... and there are two [DIR1] keys, no [SPD1]. Some of the keys were retouched with fine-tip pen marker (will provide a better finishing later).

I also like the 'heavy duty' appearance, but not always I see 'good guts'...

Cheers.

HP41 system ROM related - versions and compatibility

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 30 Nov 2009, 9:53 a.m.*

Hi, all HP41 addicted!

After causing many (very good) reactions after bringing the ROM-images subject up, I would like to know about the many HP41 system ROM versions and their compatibilities. Most of the discussion lies on the coconut, because the halfnut series do not allow 'mixing' the system ROM´s as they are not accessible separately. I confess I did not research the Forum archives, but I actually do not remember reading about this specific subject.

The system ROM versions I'm aware of (thanks to W. Furlow) are:

```
ROM 0   1   2
    D   D   E
    F   E   F
    G   F   L
    H
    N
```

Each system ROM is stored in one single chip (coconut series), so they could possibly be mixed with each other. My questions to those who have already dealt with these ROM´s are:

- what are the valid combinations?
- which of them are specifically for the CX?
- which, if any, can be used with either the C/CV and the CX?

This would depend both in observing actual configurations or in official documentation. I have some 41C/CV I could check for a few samples, and also three CX, but these would be just a few samples. The possible combinations are in vaster number than the actual working combinations, so I decided to ask.

Thanks again!

Luiz (Brazil)

*Message #2 Posted by **Bill Zimmerly** on 30 Nov 2009, 10:20 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Is there a command that will return this information?

Re: HP41 system ROM related - versions and compatibility

*Message #3 Posted by **Raymond Del Tondo** on 30 Nov 2009, 10:35 a.m.,*
in response to message #2 by Bill Zimmerly

REVX? will return the appriorate info;-)

Actually the revision is at the end of each system ROM page.

HTH

Raymond

Re: HP41 system ROM related - versions and compatibility

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 30 Nov 2009, 11:04 a.m.,*
in response to message #2 by Bill Zimmerly

Not in a command available at the basic system ROM (C/CV or CX). Ángel´s Toolbox has OSREV? command, and as Raymond mentioned, HEPAX, David Assembler and many other specialized ROM offer editors and viewers that allow inspecting the ROM addresses with this information (xFFB to xFFE, x being the block # from 0h to Fh).

Cheers.

Luiz (Brazil)

Thanks Luiz and Raymond.

Re: HP41 system ROM related - versions and compatibility

*Message #6 Posted by **Allen** on 30 Nov 2009, 7:43 p.m.,*
in response to message #5 by Bill Zimmerly

FYI, the Service ROMs All have the ROM command (press the [-] key).

Per above discussion, the later editions of "Extend your HP 41" that Wlodek wrote has all of this information already captured in nice list format. (See the table of contents on the Version 7 DVD)

Also, on the latest 41CX rom, there are 2 sets of ROM characters: NFL and DCC.

Re: HP41 system ROM related - versions and compatibility

*Message #7 Posted by **Eric Smith** on 30 Nov 2009, 2:15 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

HP-41C, HP-41CV: DDE, FDE, GFF, HFF

HP-41CX: NFL

Combinations other than these probably won't work properly. When versions of two of the ROMs changed at the same time (FDE->GFF, and GFF->NFL to produce the CX), there were patches that included jumps from one ROM to another.

Re: HP41 system ROM related - versions and compatibility

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 30 Nov 2009, 2:52 p.m.,*
in response to message #7 by Eric Smith

Hi, Eric;

thanks for your (so necessary) answer. I found an HFF version set in a halfnut. Will any of these combinations be found in one of the both types and not in the other (coconut and halfnut)?

One extra question. Although it leads to a logical conclusion, chances are that the answer is 'NO': is the CX 'F-version' ROM1 the same CV 'F-version' ROM1? I mean, do these carry the same code and are interchangeable?

Cheers and thanks again.

Luiz (Brazil)

Re: HP41 system ROM related - versions and compatibility

*Message #9 Posted by **Eric Smith** on 30 Nov 2009, 10:19 p.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

The halfnut was only manufactured with the final ROM revision for each model (HFF, NFL). I haven't seen HFF in a non-halfnut, but it may have existed. The vast majority of 41C and 41CV units have GFF or HFF.

I'm moderately certain that mainframe ROM 1F contains the same code in the C/CV and CX.

Note that the CX mainframe has a total of 24K of ROM using two 1LG9 chips. Beyond the hard-addressed "mainframe" ROM, there are three more 4K ROM blocks in pages 3 and 5, for the CX time and extended functions. The CX mainframe ROM won't work correctly without these.

What is it that you're trying to do?

Re: HP41 system ROM related - versions and compatibility

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 30 Nov 2009, 11:13 p.m.,*
in response to message #9 by Eric Smith

Hi, Eric;

I am almost sure you were around here when I posted this message (long time ago... that HP15C is still working fine!). I actually have some related ideas because I have two 41 MBoards behaving strangely and I would like to mix their ROM IC´s so I could test one with each other´s. But I needed to know what was I doing prior to go ahead mixing ROM´s without coherent information. These babes beep, show garbage and freeze randomly. Sometimes they accept one or other key, then I loose them again.

I tried their RAM chips in other coconuts, and they work fine. Then I tested their capacitors (value) and diodes, and they are also fine. Now I would like to identify their ROM and try changing one with the other. In fact, I have a 41 MBoard with connectors for all RAM and ROM (six 8-pin DIL) so I can build a 41C anytime and test RAM and ROM chips. RAM chips are easy to test, but for testing ROM chips I needed this kind of information.

Now the last part of info is: IC's ID# for each version, so I can test them accordingly.

Cheers.

Luiz (Brazil)

> Now the last part of info is: IC's ID# for each version, so I can test them accordingly.

I've found very little information on part number vs. ROM ID. Some is on this page. I'd certainly like to add more (and corrected) information.

Re: HP41 system ROM related - versions and compatibility

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 1 Dec 2009, 7:03 a.m.,*
in response to message #11 by Eric Smith

Hi, Eric;

I'll do the following, then: take notes of whatever I find and, if there is anything not in your indeed very complete and comprehensive lists, I´ll post again and let you know. This is the least I MUST do to thank you for your support 8^)

Best regards.

in response to message #1 by Vieira, Luiz C. (Brazil)

```
Which would the purpose of this topic?
Can we change ROM's of HP41 or that is only a waste of time or Luiz would be building a
super HP41LV to give a present us in Christmas? :-)
```

Edited: 1 Dec 2009, 10:52 a.m.

It is not a waste of time.

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 1 Dec 2009, 5:30 p.m.,*
in response to message #14 by Saile (Brazil)

For sure.

I searched the archives to see if this kind of subject was previously mentioned amongst others or not, so I decided to bring it up mostly to shed some vintage subjects in the air. Good to see that calculators like the HP97 and other vintage ones are still in use and serving people well. They also call for follow-ups.

I am sure that some people found purpose in this topic.

Luiz

HP-25 erratic behaviour

*Message #1 Posted by **Alberto Fenini** on 30 Nov 2009, 6:38 a.m.*

ciao a tutti ! (greetings to everybody), one of my HP25 is actually behaving quite funny. When turned on, random "0"s are shown on the display, keyboard is insensitive at all and there is no way to get further than that.

It can be the first led, the last, occasionally two zero's show up, but the unit stays like that until switched off. When switched on again the digit that turns on change position, but that's totally randomic.

It has been cleaned, the three bottom ICs have been desoldered and resoldered, and the mother board has undergone a cleaning process with vinegar and water, but no improvements ....

Has anybody ever experienced something like this ? As always, thanks in advance for advice and help, take Alberto

Re: HP-25 erratic behaviour

*Message #2 Posted by **Ignazio Cara (Italy)** on 30 Nov 2009, 7:15 a.m.,*
in response to message #1 by Alberto Fenini

Ciao Alberto, The CPU of your beloved calculator is dead! You could only replace it with one from a donor machine (all the Woodstock except 21 and 27).

Take care.

Ignazio

Re: HP-25 erratic behaviour

*Message #3 Posted by **Alberto Fenini** on 30 Nov 2009, 8:00 a.m.,*
in response to message #2 by Ignazio Cara (Italy)

ciao Ignazio, how are you ?

Thanks for the reply, in your opinion, can I use a old CPU (the one with the gold plate on top) to replace what looks like a newer one (the IC body is all in gray plastic), is the pin-out the same ?

Take care and thanks again, Alberto

I once had... (was: HP-25 erratic behaviour)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 30 Nov 2009, 9:21 a.m.,*
in response to message #1 by Alberto Fenini

(Ciao, Alberto!)... an HP27 (not mine) behaving almost like your HP25, except that I could make it work when the battery pack was almost at the complete insertion point, I mean, with just a fraction of the pressure it makes when completely inserted. After being totally inside the compartment, the HP27 simply 'lost its e-mind'.

I checked all solder points and tracks and found one broken track in the lower part of the PCB, between the CPU and the ROM (the HP27 PCB layout closely matches the HP25´s). Eventually the broken track had its edges in touch depending on the battery position and pressure. It worked pretty fine after restoring the copper track.

Success!

Luiz (Brazil)

Re: HP-25 erratic behaviour

*Message #5 Posted by **Hal Bitton in Boise** on 30 Nov 2009, 10:41 a.m.,*
in response to message #1 by Alberto Fenini

Hi Alberto,
Perhaps this is not the problem in your case (or perhaps you have already checked it), but when my 29C was exhibiting the exact symptoms you describe, poor electrical contact within the battery pack was the culprit (causing under-voltage to the calc). If you have re-celled the battery pack and no longer have that soldered strip between the cells, the spring in the far end of the pack must be kept really clean (I use a pencil eraser and alcohol swab) for good electrical contact. I give likewise treatment to the button contacts on the calculator, and the ends of the cells they contact. Lastly, after I insert the battery pack, I sometimes have to "set" it by pushing it as if to remove it, but stopping just shy of the release point, then easing off the pressure.
It's worth a try.
Best regards, Hal

Re: HP-25 erratic behaviour

*Message #6 Posted by **Alberto Fenini** on 2 Dec 2009, 10:30 a.m.,*
in response to message #1 by Alberto Fenini

First of all I'd like to thank everybody for the suggested tricks, that's what I ve done meanwhile : I have desoldered all the ICs and brushed the PCB to reveal the copper, I have then checked for broken traces, but found none. Resoldered the ICs recovered from a spare HP25 e cleaned with a soft brush and some alchool (isoprop...) to remove the soldering stuff. At this point, if power supply was attached with wires from a Woodstock battery packs, the unit didn't even light up,while if the board was mounted back in the shell and the battery pack inserted it worked !!! Then ... I did the most stupind thing I could have ever done ... I have attached an external charger (with the battery pack still inserted) and numbers have began to show randomly on the display. Since then, the unit looks like dead ..... shame on me .... However, I do have learned a lesson, and I'd like to thank everybody for the hints received. Take care Alberto

Re: HP-25 erratic behaviour

*Message #7 Posted by **Steve Simpkin** on 2 Dec 2009, 2:06 p.m.,*
in response to message #6 by Alberto Fenini

Once again, shame on HP for allowing such a marginal charging power supply design to be released with their otherwise outstanding product. The term penny wise, pound foolish comes to mind.

Aaaaaaargh 8-(

*Message #8 Posted by **Geoff Quickfall** on 2 Dec 2009, 2:45 p.m.,*
in response to message #7 by Steve Simpkin

Well, a functional keyboard, good case, spare battery pack and toss the charger. Wait for a functional, cosmetically crippled machine and replace.

TOSS THE CHARGER or keep it for posterity and your collection but never use it again!

Cut the battery pack central spine and insert fully charged NiCds using an external battery charger. Thats how I keep mine running. The 29C has been running for over a year that way and all my programs are still intact.

Cheers, Geoff

Re: Aaaaaaargh 8-(
*Message #9 Posted by **Alberto Fenini** on 2 Dec 2009, 3:14 p.m.,*
in response to message #8 by Geoff Quickfall

eeheheh, I had replaced the battery pack with NicD batteries, wich I usually recharge with the external battery charger, I admit it, it was a foolish thing, but it was also 2 AM in the morning, not that this excuse me in any way....

Re: Aaaaaaargh 8-(
*Message #10 Posted by **Michael de Estrada** on 2 Dec 2009, 3:18 p.m.,*
in response to message #8 by Geoff Quickfall

My approach is to use a duplicate model Woodstock as a charger for all my battery packs that I use in the other calcs. I never turn this calc on and only plug the charger into a live electrical outlet when I'm using it to charge a pack. Worst case I will eventually damage this calc in which case I will still have another one in perfect cosmetic and functional condition. I leave charged packs in my 25c and 29c, and swap them out when they get low. I have also found that flat top AA NiCads work better than high tops, apparently providing more consistent continuity with the calc's contacts and the springs.

Re: Aaaaaaargh 8-(

*Message #11 Posted by **Alberto Fenini** on 2 Dec 2009, 3:28 p.m.,*
in response to message #10 by Michael de Estrada

to be very honest with you all, I did it twice (attaching the charger to the calculator) and the first time I have recovered the unit by resoldering (or at least re-passing) all the soldering points, I'll try later on and I'll keep you posted)

Re: it worked out !!!

*Message #12 Posted by **Alberto Fenini** on 3 Dec 2009, 2:01 p.m.,*
in response to message #8 by Geoff Quickfall

Hello everyone, the resoldering operation has worked out, and the unit is back to life !! I believe (but that's just my opinion) the most of the problems were due to a broken (even if not totally) link between the two points of contact for the baterries and the main pcb !!! Anyway, lesson learned, I'll toss all the chargers ! Take care and thank you very much to all of you, Alberto

Re: it worked out !!! (one tip...)

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 3 Dec 2009, 2:56 p.m.,*
in response to message #12 by Alberto Fenini

Ciao, Alberto;

I only connect the charger when I turn the calculator ON and it gives at least one single flash in the display, meaning that the batteries are in contact. If I see no sign of life, I remove the batt pack, charge it briefly, place it back and try again. If then I see no sign of life, I charge it with an external charger while trying to find the problem.

Laporte´s analysis is complete and perfect, should follow it with no remarks. Anyway, I prefer counting on the original calculator charger. Even if it is a Woodstock. I do not like too much to remove and reinsert battery packs, something may end up broken...

Cheers.

Luiz (Brazil)

Edited: 3 Dec 2009, 3:02 p.m.

Yahooooooo!

*Message #14 Posted by **Geoff Quickfall** on 4 Dec 2009, 8:43 p.m.,*
in response to message #13 by Vieira, Luiz C. (Brazil)

My HP-29C exhibited the same problem, an intermittent contact between the battery contact rivet and the trace to the PCA.

Even after resoldering I had to desolder and soak the contact in some dilute acid to allow for a non-contaminated solder connection.

Great job, Cheers, Geoff

Somehow late, but... (edited for credits)

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 2 Dec 2009, 3:27 p.m.,*
in response to message #1 by Alberto Fenini

Hi, all;

most of you have already seen this, and I actually never thought of posting it based on the thread subject. Anyway, here it goes: HP21 power supply schematics and a suggestion for operation without batteries. NOTICE THAT THE POWER SUPPLY IS DIFFERENT OF THE ONE USED IN THE C-SERIES! (before editing: *Not mine, do not remember who is the author, will post credits as soon as I find.*)

Credits go to 'bh' (?); see below, please.

('head' extracted from original drawing, no changes)

Cheers.

Re: Somehow late, but... (edited for credits)

*Message #16 Posted by **Thomas Okken** on 2 Dec 2009, 8:57 p.m.,*
in response to message #15 by Vieira, Luiz C. (Brazil)

Hi Luiz,

How is the power supply in the C series different from the one for the regular Woodstocks?
I'm asking because I used to own an HP-25, which was transformed into an HP-25C during a just-out-of-warranty repair... I kept on using the same charger as before, and never had a problem.

- Thomas

Re: Somehow late, but... (edited for credits)

*Message #17 Posted by **Vieira, Luiz C. (Brazil)** on 2 Dec 2009, 9:10 p.m.,*
in response to message #16 by Thomas Okken

Hi, Thomas;

the C-series must provide a continuous supply for the C-MOS RAM, and as we can see in the original HP21, all lines are down when the switch is OFF. The C-series must have something connected straight to the batteries, something like a diode + capacitor, that is not disconnected when the calculator is OFF (the capacitor should maintain the RAM data while changing batteries, for example). The same happens with the Spices: the power supply of the C-series is not the same as the E-series.

I know that the HP29C has a totally different power supply (separated board), and I guess the same with the HP19C (extra current for printing).

Cheers.

Luiz (Brazil)

Edited: 2 Dec 2009, 9:30 p.m.

Re: Somehow late, but... (edited for credits)

*Message #18 Posted by **Lyuka** on 2 Dec 2009, 11:32 p.m.,*
in response to message #15 by Vieira, Luiz C. (Brazil)

Hi.

At first glance, the schematic has some at least three mistakes of drawing around the output oscillator. Be careful when you utilize the schematic.

Cheers.
Lyuka

Re: Somehow late, but... (edited for credits)

*Message #19 Posted by **Vieira, Luiz C. (Brazil)** on 3 Dec 2009, 12:19 a.m.,*
in response to message #18 by Lyuka

Hi, Lyuka;

thank you!

Would you, please, point them out? I never needed to repair Woodstock´s power supply, so I never checked if it matches the actual circuit. In fact, I once noticed that the toroidal input and load coils were shorted in the circuit (forgot about that...), and I failed to remove the connection.

Thanks again!

Luiz (Brazil)

Edited: 3 Dec 2009, 12:23 a.m.

Re: Somehow late, but... (edited for credits)

*Message #20 Posted by **Tony Duell** on 3 Dec 2009, 4:27 a.m.,*
in response to message #19 by Vieira, Luiz C. (Brazil)

Off the top of my head, there are at least the following errors :

1) The oscillator and regulator transistors should be NPN not PNP. The part number 4-xxx is a shortened form of 1854-0xxx which indicates an NPN transistor. Not to mention the fact that a PNP transistor with its emitter connected to the -ve supply rail (ground in this case) is unusual to say the least. The circuit couldn't work with PNP transistors here. As an aside, the 6xx part of the transistor number is almost certainly a data code (1976), and is not important.

2) Both transformer windings are shown as shorted (this has already been mentioned).

3) But actually the transformer is either 1 tapped winding (autotransformer) or 3 windings with a common connection. If you desolder the transformer from the PCB you'll find DC continuity between all the pins.

4) The diode connected to the base of the regulator transistor is a zener diode (not suprisingly).

Is this the place to put in a plug for the HPCC schematics CD-ROM? It contains schematics of all woodstocks (and then some...)

Re: Somehow late, but... (edited for credits)

*Message #21 Posted by **Tony Duell** on 3 Dec 2009, 4:29 a.m.,*
in response to message #20 by Tony Duell

And another one...

5) He specifies 'Capacitors in microfarads' and then labels the oscillator feedback capactior '2000K'. I can assure you that capacitor is not 2000uF, or 2000KuF (=2F!). It might well be 2000pF (2nF), but I would have to check.

Re: Somehow late, but... (edited for credits)

*Message #22 Posted by **Lyuka** on 3 Dec 2009, 5:23 a.m.,*
in response to message #20 by Tony Duell

Tony

Thanks Tony. What you mentioned are what I thought as errors.

Regards,
Lyuka

Re: Somehow late, but... (edited for credits)

*Message #23 Posted by **Jacques Laporte** on 3 Dec 2009, 8:07 a.m.,*
in response to message #20 by Tony Duell

Right, this circuit won't work at all.

The oscillator on the HP-25 uses a NPN 4-550 and the regulator (Zener at its base) uses another NPN 4-071 (HP parts 1854-0550 etc).

The cap is a 2nf in series with a 56 ohm resistor.

Re: Somehow late, but... (edited for credits)

*Message #24 Posted by **Bart (UK)** on 3 Dec 2009, 10:06 a.m.,*
in response to message #20 by Tony Duell

Jacques Laporte has drawn out the PSU of the HP25 and posted it on his website here, see Fig. 10 about halfway down.

Thank you Jaques for sharing your knowledge! :-)

Machine accuracy behaviour of the hp-35s and other models

*Message #1 Posted by **Mohammed Hadi** on 30 Nov 2009, 2:16 a.m.*

I wonder how the 35s handles round-off errors due to number truncation. I tried the following keystrokes on an hp-15c(*) emulator (by Torsten Manz) to calculate (1/3 * 3 - 1) ^ (1/3)^3 :

3 1/x 3 x 1 - 3 1/x 3 y^x y^x

and it gave 0.3570 instead of 0.

Could someone please try this sequence on a 35s and report the result? I'm curious to know what results are produced by other hp models and which models avoided this "error".

(*) My hp-15c was stolen 22 years ago. An hp-35s is on its way to me now and would be my second hp calculator ever! I've been lost in a Casio-infested wilderness for those past 2 decades!

Re: Machine accuracy behaviour of the hp-35s and other models

*Message #2 Posted by **Javier Goizueta** on 30 Nov 2009, 4:15 a.m.,*
in response to message #1 by Mohammed Hadi

Hi Mohammed:

Your sequence of operations, 3 1/x 3 x 1 - 3 1/x 3 y^x y^x, will produce an "INVALID y^x" error in a 35s, but will give a valid (complex) result on a 42S, 50G etc. which have more consistent complex numbers support than the HP35-S.

My real 15C, in complex mode, gives 0.4233339636 + 0.04948064389i.

If we change the test to avoid complex numbers to (1 - 1/3 * 3) ^ ((1/3)^3) :

1 3 1/x 3 * - 3 1/x 3 y^x y^x

For this, the 35S gives 0.359381366382 which is the best possible result when each step is computed to 12 digits of precision; the same result can be obtained with a 42S, 50G, etc.

The 15C yields 0.4262158830 which again is the best result to 10 digits.

Note these calculators do not have hidden digits and each operation uses the previous 12/10-digit result. e.g. after the second operation the number is 0.999999999999, not 1/3 so we should not expect a final result of 0. (but you could get it with a 50G in exact mode)

The 35S has the good arithmetic of the RPL 12 digits models, some functions, e.g. trinogometric, have worse precision.

Maybe you intended to compute ((1 - 1/3 * 3) ^ (1/3))^3

1 3 1/x 3 * - 3 1/x y^x 3 y^x

Which is 1.00000000003E-12 on the 35S and other 12-digit models and 1.000000002E-10 on the 15C.

Re: Machine accuracy behaviour of the hp-35s and other models

*Message #3 Posted by **Bart (UK)** on 30 Nov 2009, 4:23 a.m.,*
in response to message #1 by Mohammed Hadi

Hi Mohammed,

I just tried this on my 35s and got an "Invalid y^x" for the last y^x as the numbers are (-1e-12)^(3.70370370369e-2).

However, doing a complex y^x, I get
3.56951358148e-1 ***i*** 4.17216301054e-2

Bart

edit: to do a complex y^x on the 35s, add 0i0 to both no.'s

Edited: 30 Nov 2009, 4:24 a.m.

Re: Machine accuracy behaviour of the hp-35s and other models

*Message #4 Posted by **Mohammed Hadi** on 30 Nov 2009, 5:37 a.m.,*
in response to message #3 by Bart (UK)

Thank you all for your quick responses. By the way, Bart, it was my unsubstantiated guess that 0i0 addition or simply starting with 3i0 1/x ... will do to avoid the eventual INVALID y^x response. You seem to suggest that explicit complex"ing" is needed throughout the sequence.

In any case, my whole point was how to protect an unsuspecting student who's not well-versed in limited precision pitfalls from blindly accepting totally erroneous results when using hp calculators. In contrast, my Casio fx-991ES will give a correct zero result for the original expression above.

Maybe I should prepare a one-hour lecture about the dark side of calculators for my Introduction to Engineering course.

Re: Machine accuracy behaviour of the hp-35s and other models
*Message #5 Posted by **Bart (UK)** on 30 Nov 2009, 6:28 a.m.,*
in response to message #4 by Mohammed Hadi

And therein lies the fallacy of calculators like the fx-991es in that they artificially correct for rounding errors. What else is it "correcting" for that we *don't* know about? I think there are many of us here (older generation I guess) that are aware of the fact that calculators and computers cannot completely represent some numbers, and prefer calculators not to lie about rounding errors.

There have been threads about the fact that students seem to blindly accept calculator results nowadays. Some even referencing the use of slide rules where one has to figure out the order of the result oneself.

I think it is a good idea that all users of calculators (and computers used for calculating) have such a lecture that you're suggesting.

Re: Machine accuracy behaviour of the hp-35s and other models
*Message #6 Posted by **Mohammed Hadi** on 30 Nov 2009, 6:49 a.m.,*
in response to message #5 by Bart (UK)

Wouldn't it be nice if along with the final result, a calculator would actually tell you (say, via a horizontal bar chart at the display bottom) to how many digits the result is accurate? "Hmmm... 3.176334798 but only 1 significant digit preserved... maybe I should rearrange my expression."

Re: Machine accuracy behaviour of the hp-35s and other models
*Message #7 Posted by **Gerson W. Barbosa** on 30 Nov 2009, 8:08 a.m.,*
in response to message #5 by Bart (UK)

> Quote:
>
> And therein lies the fallacy of calculators like the fx-991es in that they artificially correct for rounding errors. What else is it "correcting" for that we *don't* know about?

How would CASIO *fx-991 ES* evaluate ln ln(1618 + 10^{-7}**.** e^{e}8/3)? I hope it doesn't try to correct the "rounding error". The HP-15C gives the correct 10-digit answer: 1.999999998.

Some interesting threads on calculator accuracy started by Rodger Rosenbaum:

Re: Machine accuracy behaviour of the hp-35s and other models
*Message #8 Posted by **Mohammed Hadi** on 30 Nov 2009, 8:35 a.m.,*
in response to message #7 by Gerson W. Barbosa

Thank you Gerson for the links. I'll have a look at them later. My fx-991ES by the way got the same 10-digit answer.

I really dislike the 991ES now. After going through the 35s manual, I realized that calculating the equivalent of two parallel complex impedances will take twice the keystrokes on the Casio compared to the 35s (20 keystrokes vs. 10!).

I don't understand completely the process by which the Casio fx-991ES (a.k.a. fx-115ES) usually displays such impressive numerical accuracy, but in the example problem cited by Gerson, the actual 14-digit result produced by the Casio, displayed only to 10 significant digits, (1.999999998), can readily be determined (by subtracting 1.99999) to be 1.9999999975828.

The HP Saturn series and later all yield (at 12 digits) 1.99999999758.

Whatever tricks the Casio folks are using, they seem pretty impressive for a US$17.48 calculator that also has rudimentary numerical integration, differentiation, and SOLVE functions and a pretty decent LCD for a calculator of this class.

I see no reason to dislike the fx-991ES/115ES at all. It has outstanding features for a non-programable, non-graphing machine of its class and cost. I carry one to work along with my HP42S and HP50G.

Hi,

I think casio work to about 14 or 15 places and round to display. this is standard with most of their modern model. actually, i'd like to see HP extend their working precision too. issues regards guard digits etc are separate.

i did a write up of the casio 991es a while back here, http://www.voidware.com/calcs/fx991es.htm

as i said in the article, it's pretty good for the money, although i didnt like the lack of key buffering on long expressions. i wonder if anyone else had the same problem.

That's remarkably correct: on the HP-200LX I get 1.999999997582797. So, if ln ln(1618 + 10^{-7}. **(**e^e8/3+ 289)) returns 2 exactly that will be just the correct 10 digit-result (internally it should be 1.99999999999983). On the other hand, if 3/(7/10 - 307/439) returns 4390 exactly it is possible the calculator performs an algebraic simplification prior to giving the final answer. None of my HP calculators returns an exact numerical answer for this example. The HP-200LX, for instance, returns 4,389.999999999788 and the HP-50g returns 4390.0000026. However '3/(7/10 - 307/439)' EXPAN will return 4390.

It looks really nice, judging by this picture. Of course, the displayed result, which is equivalent to 1/2*(1 + e^{pi}), is correct:

The fx-991ES/115ES gives 2 exactly, to the 14 digits of precision that it is capable.

My HP-25 also gives 2, fwiw.

> Quote:

> On the other hand, if 3/(7/10 - 307/439) returns 4390 exactly it is possible the calculator performs an algebraic simplification prior to giving the final answer. None of my HP calculators returns an exact numerical answer for this example.

The fx-991ES/115ES gives 4390 at 10 digits. It gives 4389.9999999966 to the 14 digits of precision that it is capable.

My HP-25 gives 4389.999990, fwiw.

I'm pretty impressed with the accuracy of this inexpensive machine. As someone who paid the 2009 equivalent of US$670 in 1972 for a four-function Bomar 901, I'm simple-minded enough to be impressed by what today's machines can do at almost give-away cost!

Re: Machine accuracy behaviour of the hp-35s and other models
*Message #13 Posted by **Gerson W. Barbosa** on 1 Dec 2009, 1:49 p.m.,*
in response to message #12 by Mike Morrow

> Quote:
>
> My HP-25 gives 4389.999990, fwiw.

Same on my HP-15C. That's because intermediate results are rounded to 10 digits:

```
              10-digit    guard
keystrokes    mantissa    digits  exponent
.7
ENTER
307
ENTER
439
/             6.993166287    015    E-01   ;307/439
              6.993166287           E-01   ;rounded to 10 digits
-             6.833713000    000    E-04   ;0.7-6.993166287E-01
              6.833713000           E-04   ;rounded to 10 digits
3
x<>y
/             4.389999990    000    E+03   ;3/6.833713000E-04
              4.389999990           E+03   ;rounded to 10 digits
```

If a 10-digit RPN calculator had *five* guard digits and *did not* round intermediate results to ten digits the final answer would be the same as those on CASIO fx-991ES/11ES:

```
              10-digit    guard
keystrokes    mantissa    digits  exponent

.7
ENTER
307
```

```
ENTER
439
/             6.993166287    01594    E-01   ;307/439
              6.993166287             E-01   ;displayed result
-             6.833712984    06000    E-04   ;0.7-6.99316628701594E-01
              6.833712984             E-04   ;displayed result
3
x<>y
/             4.389999999    99657    E+03   ;3/6.83371298406000E-04
              4.390000000             E+03   ;displayed result
```

On one hand the HP method is consistent to what actually is on the display (considering the digits of the mantissa the user always has access to). On the other hand, CASIO's approach allows for greater accuracy during chain calculations, even though the displayed result sometimes is not what it appears to be (4389.9999999966 is different than 4890 albeit closer to it than 4389.999990).

> Quote:
>
> I'm pretty impressed with the accuracy of this inexpensive machine.

It performs quite well in the so-called Forensic Test. It passes Hugh Steer's Torture Test - Trigs *magna cum laude* and does very well on the other Torture Tests. Another problem I would put to it would be Kahan's Integral, that is, integrate sqrt(x)/(x-1)-1/ln(x) between 0 and 1:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=83262 (messages #3 to #8)

The exact result is 2 - ln(4) - EulerGamma or, numerically,

```
2 - ln(4) - 0.577215664901533 = 0.036489973978576
```

According to Hugh Steer's review, the fx-991es is slow on integration, so this might not be a good idea...

> Quote:
>

Same here. Perhaps because as late as 1979, soon after I had finished high-school, I still used a logarithm table to do my calculations :-)

On the fx-991ES/115ES, naturally the expression sqrt(x)/(x-1)-1/ln(x) causes a "Math ERROR" at the boundaries of integration (0, 1). And apparently, the method of numerical integration used (Gauss-Kronrod) evaluates the expression at the boundaries.

Integrating instead from 10^-10 to 1+10^-10, with the default integration tolerance of 10^-5, the displayed 10-digit result is entirely correct: 0.03648997398.

But, the full 15-digit result is 0.0364899739808399.

It took 140 seconds to produce that result.

All things considered, that performance is not too bad for a US$17.48 machine.

Note: This post was edited to add the name of the integration method that the manual cites, and report a re-calculation with slightly changed limits of integration, using the default integration tolerance value. A slightly shorter execution time resulted.

That is impressive! I read that post thinking that the 33s (only slightly pricier) would be able to best that, but not even close. I tried with display set to "All", but I had to give up after about 20 minutes of integrating (can't risk the batteries with a physics final next week).

Thee 33s matched the Casio's time almost exactly when I set the display Fix6, but with far less accuracy. Sure the display result was fine - 0.036490 But the 12 digit answer was poor - 0.0364899763890

I wonder how the TI-36X II would fare with this. I always though of it as the best bang for-your-buck calculator, but to be fair, I never really gave Casio a chance.

> Quote:
>
> I tried with display set to "All", but I had to give up after about 20 minutes of integrating (can't risk the batteries with a physics final next week).

That was the best thing to do. It takes about 2 hours and 45 minutes for the 33s to return 0.0364899739831 in level X and 3.64899739885e-13 in level Y. This places the answer between 0.0364899739827 and 0.0364899739835, however the correct 12-digit answer, 0.0364899739786, is out of these bounds. In this article Prof. Kahan explains why this one is a difficult integral for numerical integrators. At page 30 he suggests a variable change:

Consider the original expression

```
(sqrt(x)/(x-1)-1/ln(x))*dx
```

by substituting x = y^2, the integrand becomes

```
(y/(y^2-1)-1/ln(y^2))*2ydy =

(y/((y-1)*(y+1))-1/(2*ln(y)))*2ydy =

(2*y^2/((y-1)*(y+1))-y/ln(y))*dy
```

This improves the accuracy but it still takes too long when the calculator is set to FIX 10 and higher:

When integrating 2*SQ(Y)/((Y-1)*(Y+1))-Y/LN(Y) between 0 and 1 on the HP-33s retuns 0.0364899739768 in 1 minute and 34 seconds (FIX 9), which is correct to 10 significant digits. If the display is set to FIX 10 it will take about 50 minutes before the calculators shows a worse answer: 0.0364899739936.

If the display is set to FIX 10 it will take about 50 minutes before the calculators shows a worse answer: 0.0364899739936.

On the fx-991ES/115ES, there is a significant speed-up in results from integrating g(x)=2*x^2/((x-1)*(x+1))-x/ln(x) compared to integrating f(x)=(sqrt(x)/(x-1)-1/ln(x)).

Integrating g(x)=2*x^2/((x-1)*(x+1))-x/ln(x) from 10^-10 to 1+10^-10, with the default integration tolerance of 10^-5, the displayed 10-digit result is entirely correct: 0.03648997398.

The full 15-digit result is 0.0364899739779277.

It took 66 seconds to produce that result.

43m14.25s for my HP-50g to return 3.64899739837E-2... It appears the Gauss-Kronrod integration method you have mentioned, which are used on many modern calculators, is faster and more accurate than the Romberg method that have been being used on HP calculators since 1979, starting with the HP-34C, if I am not wrong. That was the best option then given the HP-34C memory constraints.

*Message #20 Posted by **Steve Keeley** on 2 Dec 2009, 8:47 p.m.,*
in response to message #19 by Gerson W. Barbosa

I didn't bother trying to integrate this on any of my calculators.

I went to WolframAlpha and pasted "integrate sqrt(x)/(x-1)-1/ln(x) between 0 and 1" into the box and it returned:

2-gamma-log(4) ~0.036489973978576520559023667001244432806840395339565892952872746128345029282945897851326282715415875401...

Plus a graph of the integral.

Instantly.

But I suppose that's cheating.

>
> Plus a graph of the integral.

The first 16 digits match the answer I got on my HP-200LX, therefore chances are the WolframAlpha result is correct :-)

The graph is somewhat misleading though, as you can see by copying and pasting "plot sqrt(x)/(x-1)-1/ln(x) between 0 and 0.015" to WolframAlpha.

A real XXIst century calculator would be able to solve this integral symbolically but it has yet to be released...

After adjusting the expression I used in the fx-115ES to replace a multiplication by a reciprocal with a simple division, the speed was further improved to only 57.5 seconds. The full 15-digit result very minimally changed to 0.0364899739779289. I also found in another experiment that the result was the same and the execution time only minimally increased after setting the "integration tolerance" to 10^-10, compared to using the default value of 10^-5.

I tried to get a 10-digit result for integration of the original function f(x)=(sqrt(x)/(x-1)-1/ln(x)) on my HP42S with ACC set to 10^-10. After more than two hours of run time, I gave up.

Although Hugh's review said that integration was slow in this Casio model, I believe that must be a comparison only to other Casio models. The evidence shows that fx-991ES/115ES quadrature is blazingly fast (more than two orders of magnitude for this example!) compared to that of any HP handheld.

I don't know much about the Gauss-Kronrod quadrature method, but it would be a most welcome replacement (or better, a selectable option) for the methodolgy traditionally implemented for the last third of a century on HP calculators.

*Message #27 Posted by **Gerson W. Barbosa** on 3 Dec 2009, 7:14 p.m.,*
in response to message #26 by Mike Morrow

Have you seen Hugh Steer's torture test: integration? The 48G overall score was 100% while fx-991es got 92%. It appears the problem with HP calculators for this particular integral is not the integration method but the loss of accuracy at the extremes of the integration interval (because they round intermediate results to the number of digit of the display, as we know). This might explain why the performance of the 33s dramatically decreases when the display mode is changed from FIX 9 to FIX 10 (I would guess the HP-42S would have no problem for ACC=1e-9 but I haven't checked this yet).

Numerical integration: Casio fx-115ES, TI-82, HP-42S, and HP-32SII

Ya learn something every day! I was puzzled about what you were doing in this thread, because I have the predecessor fx-115**M**S, which looks almost identical. It uses Simpson's Rule for integration, just like the 1981 Casio fx-3600P of mine.

A on-line review for the fx-115ES confirms that the new model upgraded to Gauss-Kronrod. Maybe there was more to the fx-115 replacement than met the eye.

Upscale TI models have used Gauss-Kronrod for many years. My 1993 TI-82 generally outperforms my HP models on integration, other than that the user must ensure that the integrand function is defined at the endpoints:

```
fnInt(sqrt(X)/(X-1)-1/ln(X),X,1E-12,1-1E-12,1E-12)

.036489974 (displayed in 54 seconds)
0.036489973978679 (revealed)
```

> Quote:
>
> I tried to get a 10-digit result for integration of the original function f(x)=(sqrt(x)/(x-1)-1/ln(x)) *(for 0 <= x <= 1)* on my HP42S with ACC set to 10^-10. After more than two hours of run time, I gave up.

It should be noted that the ACC parameter on the HP-42S is not the same as FIX on the "lesser" RPN models (prior to the HP-33s) -- or even the accuracy factor on non-HP calcuators using Gauss-Kronrod. ACC is a *multiplicative* (not absolute) uncertainty factor applied to the integrand function. With the value of the function f(x) well below 0.1 for 0 < x < 1, the uncertainty of the function at almost all points for ACC = 1E-10 is well below 1E-11. This tight tolerance drives a large number of function evalulations, in order to achieve calculated estimates of the integral that do not change by more than the small total-integral uncertainty as ever-more evaluations are taken.

On my -- er, perhaps *loathsome* -- HP-32SII, I got 0.0364899740909 in 605 seconds with a FIX 9 setting. The deviation from the correct answer of 0.036489973978576 is 1.123E-10 -- well within the maximum error of 0.5 * 1E-9 * (1-0) = 5E-10 estimated for FIX 9.

In order to get a corresponding answer on the HP-42S, I set ACC to a value such that the mean value of the function times ACC approximately equaled the FIX 9 uncertainty: ACC = 5.00E-10 / 0.0365 = 1.37E-08. This yielded an integral of 0.036489974091, with an estimated error of 4.99963E-10, in about 1000 seconds.

Please see my sole contribution to the HP Articles Forum (#556) for more information.

Have you checked that on your fx-115MS? Simpson 3/8 is slightly better than the ordinary Simpson's Rule and yet the results are not good on TurboPascal:

```
Program Simpson_3_8;
var a, b, h, s1, s2, x: real;
                     n: integer;

function f(x: real): real;
begin
  f:=Sqrt(x)/(x-1)-1/Ln(x)
end;

begin
```

```
  ClrScr;
  Write('A, B, N: ');
  ReadLn(a, b, n);
  n:=3*n;
  h:=(b-a)/n;
  s1:=0;
  s2:=0;
  x:=a+h;
  repeat
    s1:=s1+f(x+2*h);
    s2:=s2+f(x)+f(x+h);
    x:=x+3*h
  until x>a+(n-3)*h;
  s2:=s2+f(x)+f(x+h);
  WriteLn(3*h/8*(f(a)+f(b)+2*s1+3*s2))
end.

A, B, N: 1e-11 0.9999999 10000
  3.6495766224E-02
```

The second function doesn't give a better result:

```
f:=2*x*x/((x-1)*(x+1))-x/Ln(x)

A, B, N: 1e-11 0.9999999 10000
  3.6496234630E-02
```

That's an excellent reference! I looked it up when I was checking wheter the integrating methods were the same on all HP calculators. I ought to have provided the link myself as it might be useful to those who didn't know it yet.

Regards,

Gerson.

Re: Numerical integration: Casio fx-115ES, TI-82, HP-42S, and HP-32SII

*Message #30 Posted by **Karl Schneider** on 5 Dec 2009, 2:16 a.m.,*
in response to message #29 by Gerson W. Barbosa

Hi, Gerson --

> Quote:
>
> Have you checked that on your fx-115MS? Simpson 3/8 is slightly better than the ordinary Simpson's Rule

For the few estimations I did, the fx-3600P result matched the fx-115MS result, although the latter computed much faster. Basic Simpson's Rule requires that the number of subdivisions be even; both models allow the user to specify the number of subdivisions as 2 raised to an integer power *k* from 1 to 9.

> Quote:
>
> That's an excellent reference! I looked it up when I was checking wheter the integrating methods were the same on all HP calculators

Thanks. It may end up as my one and only article, as I have no topic in mind for another.

Re: Machine accuracy behaviour of the hp-35s and other models

*Message #31 Posted by **Thomas Okken** on 7 Dec 2009, 12:34 a.m.,*
in response to message #26 by Mike Morrow

> Quote:
>
> I tried to get a 10-digit result for integration of the original function f(x)=(sqrt(x)/(x-1)-1/ln(x)) on my HP42S with ACC set to 10^-10. After more than two hours of run time, I gave up.

I tried this with Emu42 (with the "Authentic Calculator Speed" option turned off!), and it returned 3.64899740064e-2, after evaluating the function 16383 times. Free42 returned 3.64899740835e-2 after 4095 evaluations.

Running Emu42 with "Authentic Calculator Speed" turned on, I observed 224 evaluations in one minute, which suggests that the complete integral should take 73 minutes, but I didn't actually wait for it to finish, nor did I try this on my real 42S.

I wonder how many evaluations this takes with Gauss-Kronrod quadrature. Is the Casio faster because of its quadrature algorithm, or because of faster hardware?

I won't let ignorance keep me from speculating. I firmly believe the speed (and accuracy) of numerical integration on the Casio fx-115ES/991ES stems from the G-K algortithm.

The best HP hardware (HP50G) has been reported in this thread as requiring about fourty times longer than this cheap Casio for the problems we've been playing with in this thread.

Who, outside Casio, knows anything about the Casio hardware? Physically it appears to be just a single IC under goop (powered by a solar cell or one LR44). I've found no discussions of it anywhere on the web. It is an excellent performer for US$18, and it's the first non-RPN calculator in 35 years that I could use regularly if I had to.

> You seem to suggest that explicit complex"ing" is needed throughout the sequence.

Yes, I think that if it had the capability to automatically look for complex results upon real result error, it would have slowed down the processing of the 35s even more. It is already heavily criticised for being one of the slowest HPs in recent years (most Pioneers & even Voyagers beat it).

Although the same processor as the 33S, it is slower I guess due to more features and broader data type handling. From information gleaned on the web and processor data sheet, it seems HP is already running it at ~6MHz - 33% above recommended for 3V (assuming the 2 batteries are in //). (I have NOT verified this with my own measurements, e.g. oscilloscope).

I would only hope HP sees enough of a market to release an updated HP35s with a faster processor (perhaps emulated on an ARM like the new 12C) and fix a few more serious bugs (e.g. keyboard buffering, program size/checksum etc.).

Can't hurt!

Other things to point out to your classes (you probably do already, but some students need to be beaten over the head several times to get important points): significant figures (as others have already mentioned, some students tend to believe EVERY digit that the calculator produces). Also, the sensibility of answers (i.e. do they make sense). I once had a student in physics class determine that the stopping distance of a car going 50 mph was 0.3 mm! I asked him if he had ever stopped his car in so short a distance, and he had to agree that his answer didn't seem quite right.

Re: Machine accuracy behaviour of the hp-35s and other models
*Message #35 Posted by **Mohammed Hadi** on 30 Nov 2009, 12:31 p.m.,*
in response to message #34 by Dave Shaffer (Arizona)

Actually I do spend a fair amount of time on the topic in my Numerical Analysis course (300 level). Recently, however, my examples are becoming less and less relevant, what with MATLAB defaulting to double precision and Windows/Mac OS's now firmly moving into 64-bit. It never occured to me to use calculators to highlight truncation effects, most probably due to my Casio's "You Can't Handle the Truth" attitude. This thread has pointed me to a treasure trove of intriguing examples for my students. Who knows... I might even be able to win a few of them over to the RPN camp.

Would this even be meaningful to the student if he didn't even catch on that 0.3mm was a miraculously short stopping distance for even just a person (let alone a car) travelling at 50mph?

Re: Machine accuracy behaviour of the hp-35s and other models
*Message #40 Posted by **Dave Shaffer (Arizona)** on 9 Dec 2009, 9:39 a.m.,*
in response to message #39 by Bart (UK)

Bart,

Your last sentence was my original point - the student hadn't bothered to think/realize that 0.3 mm was indeed awful short!

Re: Machine accuracy behaviour of the hp-35s and other models
*Message #41 Posted by **Herbert Crepaz (UK)** on 30 Nov 2009, 4:30 a.m.,*
in response to message #1 by Mohammed Hadi

Hi Mohammed,

```
The first term ( 1/3 * 3 - 1 ) calculates on my HP 35s to -1*10^-12.
So if this term is raised to the power of (1/3)^3 it results in INVALID y^x
(it seems there is no complex number support for y^x)

On my HP 42s the end result is 0.356951358148 + i 0.0417216301054

You can find a test of calculator functions accuracy on this website:
http://www.voidware.com/calcs/torturetest.htm

Cheers,
Herbert
```

Re: Machine accuracy behaviour of the hp-35s and other models
*Message #42 Posted by **Bart (UK)** on 30 Nov 2009, 4:40 a.m.,*
in response to message #41 by Herbert Crepaz (UK)

Hi Herbert,

> Quote:
>
> (it seems there is no complex number support for y^x)

See my psot just before yours. Although not as good as the 42S and the RPL (28/48/49/50) models, it does have some complex support. It's better than the 32S/SII/33S in my opnion and with some manipulation, the 35S can do quite a bit of complex stuff.

Regards, Bart

edit: by the way: y^x is the way to get a sqrt for a neg number on the 35s

Edited: 30 Nov 2009, 4:41 a.m.

Re: Machine accuracy behaviour of the hp-35s and other models
*Message #43 Posted by **Herbert Crepaz (UK)** on 30 Nov 2009, 5:00 a.m.,*
in response to message #42 by Bart (UK)

Hi Bart,

Thanks for the neat trick with adding 0i0.

I sent my post before I updated the messages page just to see that there were already 2 similar comments. I saw your comment only after I had posted mine already.

But I agree, the HP 35s is in good hands a capable machine.

Herbert

Dosbox + EMU41 problem

*Message #1 Posted by **Geir Isene** on 29 Nov 2009, 5:18 p.m.*

Running EMU41 in Dosbox under Ubuntu 09.04:

It starts and after about two seconds, on top of the bottom part (the f1 - f12 buttons) it prints out the content of the Mcode registers and on the last line it prompts "Cmd: " and with a blinking cursor.

Any takers?

Re: Dosbox + EMU41 problem

*Message #2 Posted by **Marcus von Cube, Germany** on 29 Nov 2009, 5:40 p.m.,*
in response to message #1 by Geir Isene

A "secret" debugger?

Re: Dosbox + EMU41 problem

*Message #3 Posted by **Egan Ford** on 29 Nov 2009, 8:20 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Nothing secret about it. It's in the EMU41 docs. Run 'emu41 /d' to get to the debugger. The prompt is 'Cmd:'. CTRL-Z from EMU41 will also dump you into the debugger. Perhaps you pressed CTRL-Z to background DOSBox but had the focus on DOSBox.

This is unrelated to DOSBox. IIRC, corrupt ROM images can also dump you into the EMU41 debugger. Try a fresh install of EMU41.

Edited: 29 Nov 2009, 8:21 p.m.

HP 34C repair

*Message #1 Posted by **aurelio** on 29 Nov 2009, 3:21 p.m.*

Hello! i'm trying to repair a hp34c with the flat connection cable broken 'cause of the corrosion (battery leakage) I tried to repair it witha flat cable but maybe I wrong something (it still doesn't work, and I hope to have no done more damages) Anyhow I've found a previous topic and a reply by Jon where he told to have picture showing theconnections. I ask him, please, or anybody knows the pictures or istructions to identify the connections, where are the three points to connect. Thank-you

here's the topic link http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=65902

in response to message #8 by Vieira, Luiz C. (Brazil)

Thank you Luiz for your help! I have quite a good new: now the calculator at least wake up! When I switch on on power up and shows me something in the display: most of the segments don't light (Don't know if it is a problem of display) but it try tho show: "program error" , the message which usually appears after you replace the battery pacK, I tried to key each number of the keyboad to get something, but what the display shows is irregular and nosense, partial characcers, blanks...I don't know if this dipends on the display, ton he flat cable, on the other components, or on the blue oxidation on the pin of the ICs. If Iwould like to replace the flex circuit, do you have a picture of the other side? I mean the other end of the flat THANK YOU Luiz

Re: HP 34C repair

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 30 Nov 2009, 7:27 p.m.,*
in response to message #9 by aurelio

Hi, Aurélio;

of course I can provide other pictures, just gimme a couple of hours (if I do not find the pictures, I'll take new ones...).

One question: can you tell if your calculator has the IC´s soldered in place or if they are just assembled over a flex-circuit surface (solderless-type). These solderelss units usually have this problem with the LED display, and it is just bad contact.

If you need further info or images, just let me know. And as soon as I have the picture I´ll post again (have no Spice opened now, and I do not remember which HP38 is the one with the flat cable...)

Cheers.

Luiz (Brazil)

Re: HP 34C repair

*Message #11 Posted by **aurelio** on 1 Dec 2009, 5:34 a.m.,*
in response to message #10 by Vieira, Luiz C. (Brazil)

Hi Luiz, now I'm quite far from my home and I'll be away from the calculator till to friday, anyway as I can remember the ICs the BIG one and the three small, ROMS I think, are soldered on the printed circuits (I have to check it better). I don't undrstand why the spices have only one board (circuits+keyboard toghether) I could not see the rear of the ICs (when usually the pin are soldered'cause of that)

Pictures and all your tips and help are welcome, of course, THANK-YOU a lot Aurelio

Edited: 1 Dec 2009, 7:30 a.m.

Re: HP 34C repair

*Message #12 Posted by **aurelio** on 5 Dec 2009, 11:39 a.m.,*
in response to message #11 by aurelio

Hi Luiz! Just reopened the calculator and seen that the ICs are mountend on a board, but the pins don't pass though the board (I don't se any hole. It seems anyhow that somebody (maybe the previous owner) made any soldering point 'cause I see that some pin have been touched. There is a sign o The big IC It seems that somebody touched it with a soldering iron. The rear of the board have the keyboard contacts. This is not separated as in the woodstocks.....On this surface there is a plastic sheet with the other side of the contact.....

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 5 Dec 2009, 1:04 p.m.,*
in response to message #12 by aurelio

Hi, Aurélio;

please, see if your calculator looks like this one:

Details of the HP38E chips alignment

Although it is an HP38E, the HP34C has the same arrangement. The IC´s are soldered directly over the conductive tracks (a bit thicker there) so they do not pass through the PCB.

I'll take a picture (the one I promised I would... sorry!) showing the contacts and post it here later, OK? In the meantime, I tnink you'd like to have a look here, because Alberto Fenini took great pictures of his HP38E, and the last ones show the battery contacts. The

same for the HP34C.

'I'll be back!'

Meeting held yesterday in western Denmark

*Message #1 Posted by **Johnny Bjoern Rasmussen** on 29 Nov 2009, 6:45 a.m.*

I held a meeting yesterday at my work. I had promoted the meeting one month ago with a number of posters in my town, at my work and at the local libraries but no one turned up. A borring way to spend a saturday afternoon. I didn't want to promote the meeting here as I think there are very few danish readers but mabye I should have done so anyway? Have anyone here tried the same? Does anyone have some good advices for next time...

Cheers!

Johnny Bjoern Rasmussen, Denmark

Edited: 29 Nov 2009, 10:08 a.m.

Re: Meeting held yesterday in western Denmark

*Message #2 Posted by **David Hayden** on 29 Nov 2009, 10:09 a.m.,*
in response to message #1 by Johnny Bjoern Rasmussen

You might try to setup a table at a computer show that has a wider audience, especially if there is a show about older computers. One disadvantage of this is security. If you have a lot of people walking past your table, some of your things might grow legs and jump into somebody's pocket.

Another idea is to try to target your advertisement to people who are more directly interested, such as local antique computer clubs etc.

Good luck! I would have enjoyed it. :)

Dave

Re: Meeting held yesterday in western Denmark

*Message #3 Posted by **Sören Nilsson** on 29 Nov 2009, 3:12 p.m.,*
in response to message #1 by Johnny Bjoern Rasmussen

Hi Johnny,

I'm quite new collector of old calculators (and other old electronics) and I might have showed up if I had got the chance to know about your meeting. Denmark is just a few hours away (I live 3km north of Gothenburg in Sweden).

Maybe I show up next time.

Best regards, /Sören

Re: Meeting held yesterday in western Denmark

Why the theta choice for complex number display in polar form on the HP35s ?

*Message #1 Posted by **Mohammed Hadi** on 29 Nov 2009, 12:19 a.m.*

This is regarding the theta symbol used which is barely distinguishable from numeral 8. I'm wondering why hp chose this symbol instead of the more useful symbol used in the Casio fx-991ES (fx-115ES in the US).

If you look-up any introductory electrical circuits textbook for example, you'll find that complex numbers in polar form are written as

magnitude (angle symbol) phase

where the angle symbol is similar to a numeral 7 rotated (not flipped) by 180 degrees.

Now, this symbol should be easily reproducable by the 35s display and clearly distinguishable as a phase/angle separator.

Re: Why the theta choice for complex number display in polar form on the HP35s ?

*Message #2 Posted by **Thomas Radtke** on 29 Nov 2009, 4:14 a.m.,*
in response to message #1 by Mohammed Hadi

Several inconveniences indicate that this calculator has not been made by people who would acually use it.

Re: Why the theta choice for complex number display in polar form on the HP35s ?

*Message #3 Posted by **Walter B** on 29 Nov 2009, 6:20 a.m.,*
in response to message #2 by Thomas Radtke

It's a real pity HP falls back behind previous better solutions. Compare with the 42S.

Ceterum censeo: Hp, launch a 43S.

Re: Why the theta choice for complex number display in polar form on the HP35s ?

*Message #4 Posted by **Thomas Radtke** on 29 Nov 2009, 9:00 a.m.,*
in response to message #3 by Walter B

> Quote:
>
> Compare with the 42S.

You can't. It's a different concept. I might be unfair since I never had the original 42S in my hands, but from what I know, there's a lot of stuff hidden in menus, while the 3x concept makes most functions available straight from the keyboard. HP even went (mostly) back from menus when issuing the 32SII.

But ... I know your mileage differs significantly ;-).

Re: Why the theta choice for complex number display in polar form on the HP35s ?

*Message #5 Posted by **Walter B** on 30 Nov 2009, 4:32 p.m.,*
in response to message #4 by Thomas Radtke

Hallo Thomas, ich hab' da garnicht über Rechnerleistung gesprochen sondern ausschließlich über ein Anzeigeformat ;) Und da finde ich es halt einfach traurig, dass die Kollegen gegenüber HP-eigenen, besseren Lösungen deutlich abfallen. Man muss da eigentlich das Rad nicht mehr neu erfinden ...

(Explaining my previous post)

Hi Walter. Why indeed did HP feel the need to reinvent the 32sii? When I look at the 32sii, 33s and 35s I'm really baffled.

Regards,

John

I´d go further and say that *this calculator has not been made by people who actually* ***understand what is it for*** (perhaps *making money* is what they had in mind...).

Again, Gene Kranz, former NASA´s operation director, said that engineers, mathematicians and scientists (same order of importance each) must exist to provide the technology and its products that financial market needs to survive. China and Japan alone put about half a million engineers and scientists in the market each year. This is about the rest of the occidental world engineers in the same period of time (USA alone goes about 60.000 a year).

I totally agree with him. We need more people who understand about the things instead of people who 'understand' how to sale things.

Cheers.

Unfortunately, math books use the theta symbol for angles, and many of the calculators are aimed right at the high school education market (HP consulted with a group of math teachers on the 48G/GX). So even though I agree that it would make more sense, I suspect that familiarity won out.

Kind of like the way familiarity with the TI 83 seems to make it so hard for HP to gain market share in the education market today. :(

Re: Why the theta choice for complex number display in polar form on the HP35s ?

Message #10 Posted by ***Karl Schneider*** *on 30 Nov 2009, 3:45 a.m.,*
in response to message #9 by David Hayden

It's just plain incorrect to use theta (or alpha, beta, gamma, or phi) as an angle symbol. All of the above Greek letters are commonly used to represent *variables containing the numerical value of an angle*, not to indicate that an angular value follows.

I included this point in a document I prepared about the HP-35s, which I sent to HP's calculator division.

Re: Why the theta choice for complex number display in polar form on the HP35s ?

*Message #11 Posted by **Gerson W. Barbosa** on 29 Nov 2009, 11:00 a.m.,*
in response to message #1 by Mohammed Hadi

I wish this was the only issue regarding the HP-35s. It is item #17.3 in this comprehensive bug/annoying features list.

Besides getting rid of all bugs a new version should round the mantissa so that the exponent is always visible, the way it is done on the HP-33s (Item #10 in Paul Dale's list).

It would also be great if keyboard layouts followed a pattern on all HP scientific calculators like they used to (at least for arithmetic operators, +/-, EEX and the ENTER keys). Anyone who often switches from the HP-50G to the HP-33s or HP-35s know what I mean.

Regards,

Gerson.

I am in favor of clarity even at the expense of departing from convention a bit. I favor a taller period so it shows up better. I suggest a little creativity in symbol formation to fit the small readout with emphasis on visibility. It would be a minor adaptation for the user, but more clarity forever. Sam

Topcat HP-97 with very dim LEDs

*Message #1 Posted by **Michael de Estrada** on 27 Nov 2009, 9:32 p.m.*

I just bought the HP-97 in very nice physical condition but with the usual card reader gummy wheel and printer gear problems. I can fix those issues, but am stumped by something I've never seen before. The entire LED array is extremely dim. I tried boosting the voltage at the battery contacts with my DC power supply but it doesn't brighten the way it does on other calcs. All the segments are there and all work properly. All are exactly the same low level of brightness. I have two other Topcats, and the displays are much brighter. Is there some part of the circuitry that is at fault, and how can I fix this? Thanks.

Michael

Re: Topcat HP-97 with very dim LEDs

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 27 Nov 2009, 9:48 p.m.,*
in response to message #1 by Michael de Estrada

Hi;

I do not remember quite well the LED circuit, but it surely is multiplexed. Is there a way to compare (oscilloscope) the sweep waveform, mainly the cyclic relation? I cannot see another possibility, given that the voltage levels are OK.

Have you checked the HP97 Service Manual (MoHPC CD#11)?

Success!

Luiz (Brazil)

Re: Topcat HP-97 with very dim LEDs

*Message #3 Posted by **Katie Wasserman** on 27 Nov 2009, 10:34 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

The display multiplexer (aka cathode driver)is essentially a one-of-15 decoder. It wouldn't' matter what rate you ran this at, each display would still be on for 1/15 of the time -- if it were too slow you'd see flicker. A dim display means that you have:

1) a bad cathode driver chip (likely) 2) a bad ground connection going to the cathode driver chip (very unlikely) 3) a bad resistor (R2) on the display board that limits the current draw through the display (this is epced to be either 200K or 330K). I'd try changing this first because it's easy.

-Katie

Re: Topcat HP-97 with very dim LEDs

*Message #4 Posted by **Michael de Estrada** on 28 Nov 2009, 12:12 a.m.,*
in response to message #3 by Katie Wasserman

I don't see a 200K or 330K resistor, the largest I see is an 18K in a cluster of 3 near the top of the PCB that is part of the keyboard. Which is the cathode driver chip? The resistors checked out to their values, so I don't see any point in changing them.

Re: Topcat HP-97 with very dim LEDs

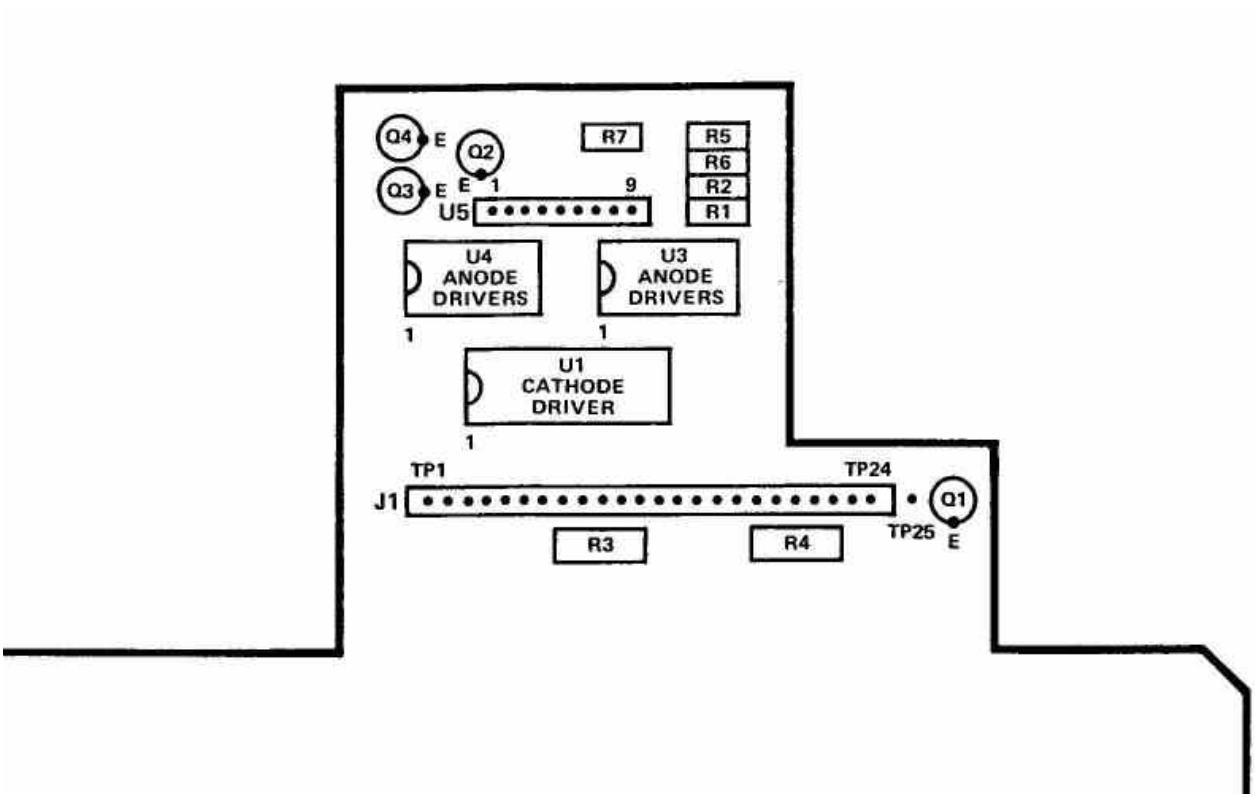
in response to message #4 by Michael de Estrada

Here's the layout from the 97 service manual, it sounds like you might have a somewhat different layout. I know that they changed the main PCB layout in the 97 over time, but I have no idea if the display PCB layout changed too.



Edited: 28 Nov 2009, 9:42 a.m.

Re: Topcat HP-97 with very dim LEDs

*Message #6 Posted by **Michael de Estrada** on 28 Nov 2009, 11:05 a.m.,*
in response to message #5 by Katie Wasserman

My layout matches the layout in the service manual, except that there are only 3 resistors on the top right side, instead of 4 and there is a small cap (?) just below the right side of U4. The S/N is 1909Axxxxx, 4th year of production, so HP may very well have made some changes.

Update: I just got the Museum DVD set V7 and looked at the HP-97 Service Manual. It is now clear that my PCB version has all the resistors except R2, however, the P/N on the cathode driver U1 is the same. Also, the manual troubleshooting guide makes no mention of my condition, namely, all LED segments/digits working correctly but just very dim. So maybe there is something else at work here? I do know that on my other Topcats if I increase the voltage at the battery terminals, the display will get brighter, but on this one it seems to have no effect. Anyway, I'm waiting for a replacement printer idler gear replacement to arrive, so I can run the diagnostic program to see if it reveals anything.

*Message #7 Posted by **Bart (UK)** on 29 Nov 2009, 1:25 p.m.,*
in response to message #3 by Katie Wasserman

> Quote:
>
> It wouldn't' matter what rate you ran this at,

But it could be the pulse width that's the problem, again only visible with an oscilloscope.

Edit: perhaps R2 is missing since production but the original owner may not have realised the display was dimmer than it was supposed to be.

Edited: 29 Nov 2009, 1:27 p.m.

Re: Topcat HP-97 with very dim LEDs

*Message #8 Posted by **Michael de Estrada** on 4 Dec 2009, 3:47 p.m.,*
in response to message #7 by Bart (UK)

I have since acquired another HP-97, and the keyboard PCB layout matches the one with the dim display LEDs, namely, no R2 and other configuration differences from the design shown in the HP service manual. However, the LED display on this unit operates with normal brightness, so I can only assume some component is faulty on the first unit. I swapped keyboards and now have one complete fully functional unit. Upon further examination, I've determined that there are many other differences between the service manual and the units I've been working on. The logic boards are arranged very differently; in many cases the ICs are rotated 180 degrees such that pin 1 is on the opposite side, resistor/transistor differences etc. I wonder if anyone else has noticed these differences, and if there are other circuit diagrams and component lists for these revisions.

Re: Topcat HP-97 with very dim LEDs

*Message #9 Posted by **Katie Wasserman** on 4 Dec 2009, 4:14 p.m.,*
in response to message #8 by Michael de Estrada

There was a substantial redesign on the main PCB when the 97S was released. This was done to accommodate the 16-pin DIP header that connects to the pod, but the same board was used in all subsequent basic 97 calculators as well. There's more about this here..

Re: Topcat HP-97 with very dim LEDs

*Message #10 Posted by **Michael de Estrada** on 4 Dec 2009, 5:25 p.m.,*
in response to message #9 by Katie Wasserman

Yes, both of my units are like the 97S main PCB. For now I'm done messing with these units. The unit that inherited the dim display, is missing the battery door and printer tear-off bar and won't write cards, so it's a spare parts unit for now. Thanks for the info.

All rightmost keys on HP 22s not working.

*Message #1 Posted by **gerry martinez** on 27 Nov 2009, 5:44 p.m.*

Very strange, all the keys from "E+" down to the "+" sign do not work. Every other key works. This calculator has been with me since I started highschool in 1986 so I'd like to repair it if possible? Any ideas? Many thanks.

Re: All rightmost keys on HP 22s not working.

*Message #2 Posted by **Lyuka** on 27 Nov 2009, 9:48 p.m.,*
in response to message #1 by gerry martinez

Hi.

Most key-problem of the Pioneer-series are caused by deformed rubber at the contacts. Please take a look at this very recent thread.

ON key worn out on an HP32S2 - is there still hope?

Regards, Lyuka

Re: All rightmost keys on HP 22s not working.

*Message #3 Posted by **Lincoln R.** on 30 Nov 2009, 11:59 p.m.,*
in response to message #1 by gerry martinez

Try pressing down on the faceplate (firmly but not so hard as to dent it or break the plastic) below the LCD but above the keys, and see if that makes the offending keys work again. If it does, you need to disassemble the calculator, and add some extra padding behind the keyboard contacts. Refer to the excellent instructions here on how to open the unit, and what you need to do to make the keys work again:

in response to message #6 by Peter A. Gebhardt

Peter,

Have you found a bug related to the additional 'German' financial functions?

Regards,

Re: 17bII german manual?

*Message #8 Posted by **Marcus von Cube, Germany** on 29 Nov 2009, 5:35 p.m.,*
in response to message #7 by BruceH

I've sent him the page from my German 17bii manual, so he will be able to report about his findings. I

assume, that there are errors in the latest incarnation of the manual (17bii+).

Re: 17bII german manual?

*Message #9 Posted by **Peter A. Gebhardt** on 29 Nov 2009, 9:21 p.m.,*
in response to message #7 by BruceH

Bruce,

apparently HP (Kinpro China?)OCRed the old 17bII manual as a base for the new 17bII+ manual.

One of the apparent errors in (re)printing is showing up in the equation for the added "STAFF" menu (in FINANCE only for the German Version ROM). I'm currently checking the equation with sample calculations on the 200LX (against the one derived from the "broken 17bII+ version" which I'm using since about one year now), because I ran in some rare discrepancies of results. Therefore my request for the "real one" to verify.

I trust Tim Wessman to provide a PDF of the 17bII manual on the HP website, once he has a copy at hand.

As soon as I can be sure of my findings, I'll report here again.

Best regards,

Peter A. Gebhardt

Edited: 30 Nov 2009, 3:32 p.m.

Re: 17bII german manual?

*Message #10 Posted by **Peter A. Gebhardt** on 30 Nov 2009, 12:45 p.m.,*
in response to message #7 by BruceH

Bruce,

looking at p.297 (German manual for 17bII+ 1st printing, June 2003), solving for ENDW (FV) results in 179.895,65 - which is wrong, as one could easily prove with a 17bII (s/n: 3610M00859) or a 17bII+ (gold, s/n: CNA42903649)

The correct result should be 179.085,65 instead.

If you now try to use the corrected equation from said manual on p.237 (or the one from the 17b page Marcus sent to me) on the 200LX (BIOS 1.02A), one of the subterms used is described as being:

```
#PP = 1 - T * R/J div 360 + FP(N) mult R/J div #I/J
```

The 200LX then produces 180.397,71 (being even more off the correct result)

I fixed this by using:

```
#PP = RND( 1 - T * R/J div 360 + FP(N) mult R/J div #I/J : 3 )
```

Because I didn't encounter a similar discrepancy yet, independent tests & verification of my fix are appreciated.

Best regards,

Peter A. Gebhardt

PS: In the description on p.276 of said manual, it refers to "international usances" in adding the last RATE (PMT) to the ENDW (FV) in case T=0. That in turn does mean, that if you are in BEG mode (because of making/receiving payments on the first day already), then in fact you make/receive **one more** payment then calculated by #J mult R/J.

To correct for this, you have to add the following line to the end of the equation:

```
IF(T=0:-RATE:0)
```

Are HP and TI cables interchangeable

*Message #1 Posted by **ferroburak** on 26 Nov 2009, 7:11 p.m.*

Are HP and TI cables interchangeable? Thanks.

Re: Are HP and TI cables interchangeable

*Message #2 Posted by **Tim Wessman** on 26 Nov 2009, 7:21 p.m.,*
in response to message #1 by ferroburak

No. The 50 uses a standard mini-USB, a propriatary serial, an IrDA port, and an SD card.

TW

Re: Are HP and TI cables interchangeable

*Message #3 Posted by **Crawl** on 26 Nov 2009, 9:46 p.m.,*
in response to message #2 by Tim Wessman

And while you might wonder if at least the USB cables are interchangable, they are not.

Re: Are HP and TI cables interchangeable

*Message #4 Posted by **Marcus von Cube, Germany** on 27 Nov 2009, 4:51 a.m.,*
in response to message #3 by Crawl

The standard mini-USB cables are interchangeable. I keep one mini USB cable plugged into a USB hub all the time and just change the equipment on the far end of the cable, be it a TI or an HP or whatever fits the plug.

IIRC, modern TI graphic calcs come with a mini-USB to mini-USB cable. This is special because USB is meant to be master (PC) to slave (calc) only. They must have done some magic here. Here is an article about this "USB-on-the-go": http://www.usb.org/developers/onthego/

Edited: 27 Nov 2009, 4:55 a.m.

Re: Are HP and TI cables interchangeable

*Message #5 Posted by **Crawl** on 27 Nov 2009, 9:34 a.m.,*
in response to message #4 by Marcus von Cube, Germany

Ah, you're right. The last time I tried using a generic USB cable with a TI it didn't seem to fit, but I tried again and it did.

Re: Are HP and TI cables interchangeable

*Message #6 Posted by **Bart (UK)** on 27 Nov 2009, 4:43 a.m.,*

in response to message #2 by Tim Wessman

And if you thought you could slap a standard RS-232 with modified connector onto the 50G, you can't. Read this.

If you wish to use a serial cable, Eric Rechlin sells one on his commercial site, HP50G RS-232 cable. I have one and it works.

HP42S battery failure

*Message #1 Posted by **Colin McKenzie** on 26 Nov 2009, 4:47 p.m.*

For some time my 42S refused to operate more than a few seconds and checking with a ohmeter showed the battery terminals resistance around 38 ohms. I used the forum to find out how to open it (had to drill out the plastic pillars)and soon found the pcb mounted electro was the culprit. I think the value is around 100uF. replaced with two 68uF in parallel and it has now come to life.Also explains why the battery change over caused loss of memory.

Max degree of polynomial a hp 50g can solve?

*Message #1 Posted by **ferroburak** on 25 Nov 2009, 4:59 p.m.*

Hi, I wonder maximum degree of polynomial a hp 50g can solve.

For example can it solve a 4th degree equation? Will this calculation have significant error?

Re: Max degree of polynomial a hp 50g can solve?

*Message #2 Posted by **Arnaud Amiel** on 26 Nov 2009, 3:50 a.m.,*
in response to message #1 by ferroburak

Numerically, you can get all the digits for most polynomials up to a very high order. Symbolically, you will need to use programs to solve above order 2. In that case, there is no error.

Arnaud

HP-25 battery pack

*Message #1 Posted by **Steven Green** on 24 Nov 2009, 5:27 p.m.*

I recently acquired another HP-25, actually in working condition, minus the battery pack. Does anyone know where I could buy a replacement battery holder? I don't need the batteries as AA NiMH batteries work just fine.

Failing that has anyone built one from scratch?

Re: HP-25 battery pack

*Message #2 Posted by **Paul Dale** on 24 Nov 2009, 5:51 p.m.,*
in response to message #1 by Steven Green

I've thought about trying to cast these in polyethylene resin for my use. Would there be a wider interest? I've only got two woodstocks & one battery holder. However one of the calculators isn't 100% reliable so my motivation isn't high.

Prices at auction for obviously broken calculators with intact battery holders seem insane.

- Pauli

Re: HP-25 battery pack

*Message #3 Posted by **Steven Green** on 27 Nov 2009, 4:56 a.m.,*
in response to message #2 by Paul Dale

Good idea Paul!

I thought of making some kinda mold and casting my own, but didn't know what plastic to use. So if you make some I'd be happy to buy one or two off you!

Another idea I was toying with was to make one out of hardwood. It'd be slow, but with patience I reckon you could to it. Wood would be strong enough for the job easy. I'd make for a special looking battery pack too!

Re: HP-25 battery pack

*Message #4 Posted by **Paul Dale** on 27 Nov 2009, 5:35 a.m.,*
in response to message #3 by Steven Green

I'd use Easycast if I ever do do some. It should be strong enough and it is quick and (relatively) painless to use. If it isn't up to the task, at least the moulds would be ready for experimentation with other casting compounds.

Wood sounds like a very interesting idea. It would be very slow and painful I expect. I've done plenty of woodworking but not any wood carving so I'd rate it beyond my current skill set.

- Pauli

Re: HP-25 battery pack

*Message #5 Posted by **db (martinez, ca.)** on 27 Nov 2009, 11:34 a.m.,*
in response to message #4 by Paul Dale

This could be a solution; if only we could get Jay into old calculators. If not; my suggestion would be to wait a couple of years till this technology is at every street corner. When 3d printing becomes available at affordable prices it will change **everything**.

Re: HP-25 battery pack

*Message #6 Posted by **Michael de Estrada** on 27 Nov 2009, 12:31 p.m.,*
in response to message #5 by db (martinez, ca.)

I believe this works only with solid pieces, as you must scan the exterior surfaces on all sides. In the case of the battery pack, as a minimum you would have to split it into 2 separate parts. Also, you would have to fabricate a spring to maintain pressure on the electrical connection with the fixed contacts on the calculator and to provide continuity with the two battery cells. Quite complicated, actually.

Re: HP-25 battery pack

*Message #7 Posted by **Paul Dale** on 27 Nov 2009, 3:34 p.m.,*
in response to message #6 by Michael de Estrada

Casting the battery pack will require two pieces and the spring too.

- Pauli

Re: HP-25 battery pack

*Message #8 Posted by **Steven Green** on 27 Nov 2009, 8:12 p.m.,*
in response to message #4 by Paul Dale

Wood it is then!

It'll be fun even if it doesn't work out. Everyone needs a summer pastime. This one is mine. Too hot outside for much else.

The thing about Woodstocks is that swapping out a battery pack is super easy, so I simply share among the various models, except the HP-25c and HP-29c so that I don't lose the programs.

Re: HP-25 battery pack

*Message #10 Posted by **Andreas Grund** on 28 Nov 2009, 7:26 a.m.,*
in response to message #9 by Michael de Estrada

Would be great to get Woodstock battery cases, however, I am afraid, tooling for plastic injection is pretty expensive. Since I am in the same situation - more Woodstocks than battery cases - I help myself with

handmade cases from standard AAA battery cases, which are cheap. With basic tools they can be converted into a Woodstock battery case, not so beautiful, but functional.

Re: HP-25 battery pack

*Message #11 Posted by **Paul Dale** on 28 Nov 2009, 4:56 p.m.,*
in response to message #10 by Andreas Grund

Do these stay in without tape?

I wouldn't injection mould - way too expensive. Making a mould out of silicon rubber is pretty straightforward and casting in polyethylene resin also.

*Message #12 Posted by **Andreas Grund** on 29 Nov 2009, 5:04 a.m.,*
in response to message #11 by Paul Dale

Paul,

No tape, the battery cases are just kept in place by the spring force. A mechanical lock as with the original ones would be better of course, some day I try.

How to work Hp50g programs on computer?

*Message #1 Posted by **ferroburak** on 24 Nov 2009, 2:15 p.m.*

Hi, Is there any way to work Hp50g programs on computer?(By means of a simulator or any other things)

I need this for my numerical analysis homework. Thanks.

Re: How to work Hp50g programs on computer?

*Message #2 Posted by **Tim Wessman** on 24 Nov 2009, 2:48 p.m.,*
in response to message #1 by ferroburak

Install debug4x. You're welcome.

TW

Re: How to work Hp50g programs on computer?

*Message #3 Posted by **Egan Ford** on 24 Nov 2009, 3:00 p.m.,*
in response to message #1 by ferroburak

If you are running Linux or OS/X then try x49gp (http://x49gp.svn.sourceforge.net/viewvc/x49gp/README.QUICKSTART). debug4x also works with Wine on both OS/X and Linux.

Re: How to work Hp50g programs on computer?

in response to message #3 by Egan Ford

I want to try Calcolo Numerico 1.2

But couldn't undersand how to use debugger. Can you elaborate on this matter? Thanks.

the question I try to solve

*Message #5 Posted by **ferroburak** on 24 Nov 2009, 4:37 p.m.,*
in response to message #4 by ferroburak

Here's my question

f(x)= 1 +5x - cos(0.3x^1/2)^-1

Find it's root between 2.5 and 3.5 by bisection and regula falsi methods.

Actually I would appreciate any tool to do this.

Thanks.

Re: the question I try to solve

*Message #6 Posted by **Crawl** on 24 Nov 2009, 5:12 p.m.,*
in response to message #5 by ferroburak

Now, you're not trying to get us to do your homework for you, are you?

It doesn't matter, I guess, since the problem as given has no solution. The first root is at x=0 and the next one isn't until x=27.161003... (when 0.3*sqrt(x) is close to pi/2).

NO!

*Message #7 Posted by **ferroburak** on 25 Nov 2009, 4:29 a.m.,*
in response to message #6 by Crawl

Hi,

I didnt say I wanted a solution for my hw. I just wanted to be more precise about what I'm asking. (I also think there is a mistake in the question but that's not the issue..)

I want to learn how to solve such an equation with debugxx or any other program that is available on pc. (better be hp 50g since I will start using it in a week!)

Thanks.

Re: NO!

*Message #8 Posted by **Crawl** on 25 Nov 2009, 8:49 a.m.,*
in response to message #7 by ferroburak

There are a lot of ways to solve problems like that with the HP50g.

One document to help with that is here.

For the problem you gave, you might need to divide the given function by x to prevent a solver from simply finding the x=0 root.

I found the x=27.161... root by graphing. Using common sense, I knew the zero had to be close to (pi/(2*.3))^2=27.4. For most values of x, the function you gave is close to 5x, but when cos(...) is near zero, 1/cos(...) can take on any value, so that's when there will be a root. I set the window x range from 0 to 30 (25 to 30 gives a zoomed in view) and the y range from -5 to 150 (again based on y~5x). You move the cursor near to the zero you want, hit FCN, then ROOT.

If your class requires you to use specific methods (like method of false position) then I assume they might want you to write a program yourself.

Re: NO!

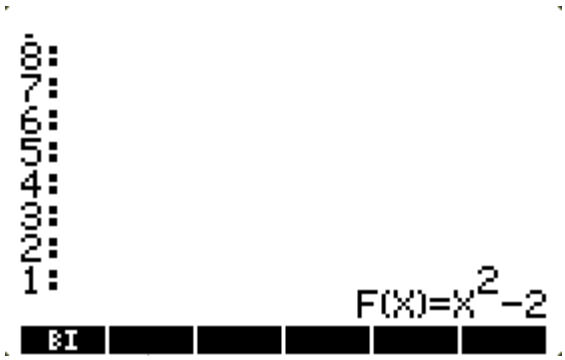
*Message #9 Posted by **Crawl** on 25 Nov 2009, 2:32 p.m.,*
in response to message #8 by Crawl

Well, it turns out I had time today to write a quick HP50g bisection program. Of course, you can do this easily on this calculator.

This is the program.

I saved it as BI.

It assumes a function saved to variable F has been defined. Let's assume we want to find the square root of 2 with the function x^2-2. You enter it on the stack like so.



Then hit DEF (left shift on the 2 button)

Then you need to have the root bracketed. Put the limits on levels 1 and 2 of the stack. It doesn't matter which is which. 1 and 2 bracket the root in this case.

With the variable menu open (press the VAR key), every time you press the BI softkey, a bisection is performed. If you press it repeatedly, it (slowly) converges.

Of course, you could also write a program to iterate automatically.

Programming a method of false position solver could be an exercise for you.

By the way, while the HP50g is a great calculator, it has a learning curve. The sooner you start to use it, the better. Going through the manual can help, of course, but a fun way to gain experience with it is to do challenges posted to the board, like the recent University calculator challenge, or Valentin's challenges.

Re: NO!

*Message #10 Posted by **C.Ret** on 26 Nov 2009, 4:30 a.m.,*
in response to message #9 by Crawl

Thank you for your contribution and great animated GIFs.

It seems to me too that no debugger or compilater is required for this roots seeking problem.

With great interest, I was comparing your bisection program BI with one of my own HP28'S' program library. I found a very close looking program there.

I still have two questions about your code; why are you storing the mean value in 'N' , is there any purpose anywhere for further use?

Why not arranging the use of local variables A B and N in a more comprehensive way without using any STO command such as :

```
« -> A B
       «  A B + 2 /  ->  N
            « A F SIGN N F SIGN ==
              « N B » « A N »
              IFTE
            »
       »
»
```

In your original code, 0 is affected to N with no further use

The second question; Why are you putting the IF statement at the end of the test, just before the THEN instruction, not at the beginning of it ? I already notice this way used by a lot of HP49 and HP50 code writers! Is there a technical issue there, not to follow the original and more comprehensive syntax structure: « IF test THEN clause1 ELSE clause2 END »

There is my an alternative bisjection program peek out of my aged private library, which will run on HP50g as well has it hat does on HP28S so many times:

```
« -> a b                        @ pickup a & b from stack
    «  a b + 2 /                @ compute mid point (n)
       IF
          DUP                   @ leave a copy of n in the stack
          F                     @ compute sign of F(n)
          a F                   @ compute sign of F(a)
          * 0 >                 @ indirectly compare signs
       THEN b                   @ leave n & b in stack
       ELSE a SWAP              @ leave a & n in stack
       END
    »
»
'BIJ' STO
```

OR whith out any local variable structure (only stack manipulations):

```
« DUP2 + 2 / DUP F 4 PICK F * 0 > «ROT» «SWAP» IFTE DROP »
```

An alternative to write down an automatic iterative program, would be to use the SOLVER environment and pressing a key during for-looker's loops, the HP will display intermediate A and B values in the run!

These programs remembers me a lot of fun stuff from high school age!

> Quote:
>
> Perhaps they are keeping in line with the RPN idea of arguments first then operation?

Yeah, that's all it is. When I'm "thinking in RPL", that's the syntax that makes the most sense to me.

As for storing 0 in N, that's just how I declare local variables. It seems to me that having all local variables allocated up front is the easiest way to do it.

Given a choice between various programming philosophies -- ease of writing, ease of reading, "elegance" -- I'll choose ease of writing.

Re: NO!

*Message #13 Posted by **Egan Ford** on 26 Nov 2009, 1:30 p.m.,*

It may be historical. One of the roots of RPL is Forth, so it makes perfect sense. Forth does not give you an option, its always 'test' IF. Of course, Lisp is also a root of RPL and Lisp uses the more conventional 'IF' syntax, i.e. IF 'test'. However, neither Lisp nor Forth 'test' syntax matches the conventional a opr b (Forth: a b opr, Lisp: opr a b).

I've written a few identical programs in Forth and Lisp so that I could compare them to RPL. No question RPL is more Forthy and less Lispy. I'd prefer that RPL was more Forthy. Sometimes rigidness makes it easier for groups to collaborate. And, it would be more consistent with the rest of RPL that does not have multiple ways to do some function.

Perl is a great example of flexibility taken to extreme. "There's more than one way to do it." is a Perl motto. I'm fairly certain that no two Perl programmers will truly ever understand each other. I believe this because I lead a team of Perl programmers. I often hear, "why did he do it this way?", "what does this do?", "perhaps we should have used Python...", etc... I was once accused of my Perl code looking like it had come from a C programmer. Well it did. I took the statement as a complement.

If you have not taken a look at Forth, then give it a go. Forth is freely available for just about every platform from the late 70's until today.

Re: NO!

*Message #14 Posted by **Pal G.** on 26 Nov 2009, 11:08 p.m.,*
in response to message #10 by C.Ret

I am busy learning UserRPL, and am intrigued by your two quite different bisection programs, which produce identical results. Did you write it structurally first, then later decide to write it again in "stack manipulation" form, or does a "stack manipulation" decompiler exist?

Re: NO!

*Message #15 Posted by **C.Ret** on 27 Nov 2009, 3:50 a.m.,*
in response to message #14 by Pal G.

@ Crawl

You are right in your programming philosophy and nothing is wrong with your code or style.

Allocated all the variables at beginning of the program/function makes sense to me too. I use to make it systematically in the old style BASIC line program such as the one on my Commodore C128D computer, this greatly help organize data and memory. It si also sparing running -time or the bad behavior when "out of memory error" runs, which is quite easy to occur on simplest 8-bits computer.

It is true that the IF…THEN…ELSE...END statements are not as Reverse Polish notation as the IFT or IFTE are. These two last are much more real post-pone operators like the majority of RPL instructions.

Egan points out similarity between UserRPL and FORTH which indeed have IF/ELSE/THEN/ whith a much more “Reverse Polisch” behaviour.

@ Egan Ford

Thank you for our interesting input and thoughts. I was not aware that userRPL and FORTH have so much in common. Again, you indicate me a good subject of studies and I will certainly past my for-coming weekend in learning a lot of new stuff by reading and experimenting of few bits in FORTH.

At first, the IF/ELSE.THEN syntax in FORTH pulzze me. FORTH have so much common syntax and stack operation (i.e. DUP DROP, etc…) . That’s perhaps why the syntax of IF/ELSE/THEN misleads me at first before I realize that the END statement was “missing”. It is fact it is not a lack in FORTH, it is RPL which have one extra statement, making the IF statement useless.

In FORTH

```
  DUP 6 < IF DROP 5 ELSE 1 - THEN ;
```

In UserRPL

```
 IF DUP 6 < THEN  DROP 5 ELSE 1 – END
```

These two lines have the same effet on the top value in the stack. Oppositely to FORTH the IF statement in RPL have no effect and the following variation of the code are equivalent: (changing position of IF/ELSE/THEN statements in FORTH will lead to a catastrophe)

```
IF DUP 6 < THEN DROP 5 ELSE 1 - END
DUP IF 6 < THEN DROP 5 ELSE 1 - END
DUP 6 IF  < THEN DROP 5 ELSE 1 - END
DUP 6 <  IF THEN DROP 5 ELSE 1 - END
```

Amazing ! I never realize that.

@ Pal G.

Exactly, I generally first wrote first version of code using local variable or algebraic expression or what ever format is convenient depending of source of information. It this first phase, the function/programs are generally like prototypes and the first effort is to avoid any mistake or wrong transcription from the sources. Then after playing with it and using this 'first generation' of code, I sometime rewrite most useful section of code in a more compact manner.

This is not systematic the great majority of code stay in the 'easy to write it' format. Only portion of code I use often will be 'compilated' into more 'compact' format. It is also copy to another part of the memory (I greatly use sub-directory to organize multiple project on my HP28S and share code have to be move to the top of the sub-directory tree.

Since HP28S lacks any export/import capabilities with external PC, printing and saving 'compact code' documentation will help re-typing it into the calculator. This appends time to time.

As far as I know, there is no "stack manipulation" decompiler on the HP28S, perhaps it may be one develop by the HP48/49/50 active community on these calculators or PC (since these are much more connected than old style HP28C/S).

I pointed him to comp.sys.hp48 in a previous thread, including a link to it on Google groups if he doesn't have a news reader.

Missing the point?????

*Message #27 Posted by **Vieira, Luiz C. (Brazil)** on 25 Nov 2009, 7:32 p.m.,*
in response to message #24 by ferroburak

Hi, ferroburak;

by no means I intended to patronize a discussion about who can or cannot post about this or that subject. I actually was trying to make sense of things, since I was not following discussions here for about a couple of years (I started posting here in 2001). I tracked some subjects related to the old models that are of my own interest at the forum archives so I could get closer to what is going on, but I found just a few references (MCODE programming, maintenance, etc.). Then I saw many entries about subjects I am not much interested about, but you see, a forum is a place where people share subjects of common interest, and I just miss the ones I like most.

About your request: I see no problems posting here about the new models, what I see is that there are many follow-ups. And once again, I am just another contributor.

Have you tried this HP48-dedicated group? I found some HP50G-related discussions. And please, this link is just another possibility of having your questions being answered, I am not pointing you there, OK? Since the first time I posted here, anybody is welcome sharing whatever knowledge one has about HP calculators. And this has not been changed.

Cheers.

Luiz (Brazil)

Re: Missing the point?????

*Message #28 Posted by **Martin Pinckney** on 27 Nov 2009, 4:21 p.m.,*
in response to message #27 by Vieira, Luiz C. (Brazil)

From the heading at the top of this Forum:

> Quote:
>
> This forum is for discussion of HP calculators including usage, repairs, sources of replacement parts, general information etc.

Says nothing about being limited to older models. In point of fact, there have been *many* threads about using current models, participated in by lots of members. It seems to me that this complaint comes up primarily

when the OP is a newcomer. Am I wrong?

Re: Missing the point?????

*Message #29 Posted by **Bart (UK)** on 27 Nov 2009, 5:41 p.m.,*
in response to message #28 by Martin Pinckney

> Quote:
>
> It seems to me that this complaint comes up primarily when the OP is a newcomer. Am I wrong?

Martin, my personal experience is that you are indeed wrong (said as a straight answer to your question, no malice intended). I joined this forum less than a year ago and have always received friendly replies.

What gets peoples backs up is when someone uses the forum instead of the manual (ferroburak did not even bother to read up how to clear the screen) or to get instant answers to homework tasks.

The answers that have been posted in this thread actually testify of the willingness of this forum's members to help. Many other forums would have ignored or flamed him/her long ago.

To ferroburak: please feel free to use the forum as a supplement to the manual, not a substition (easy way out). Many enjoy a challenge (hence the posting of mini-challenges and the numerous replies) but are wary when they see questions that they know are answered in the manual - yes we have read them, that's what helped us on the road to becoming proficient users in the first place!!

Re: Missing the point?????

in response to message #1 by Mike (Stgt)

Hi, Mike

If you can turn on the 32sII by pressing ON key while gently pressing the frame between LCD and the LN key,
the deformed rubber in the calculator may be the cause. And it could be fixed by the procedure as follows.

Repairing the HP 32sII with faulty keypad

Regards, Lyuka

Re: ON key worn out on an HP32S2 - is there still hope?

*Message #4 Posted by **Sören Nilsson** on 24 Nov 2009, 4:17 p.m.,*
in response to message #3 by Lyuka

I had this problem two years ago. So I followd Lyuka instruction how to repair it. The most tricky part was to open the calculator. But if you look on Lyuka site how to open a HP42S you can do the same on your HP32SII.

When you unmount the CPU-board you have to twist back some (6?) metal "ears". These are not made to be twisted to many times. When you mount the CPU-board back, you can press the board down a little when twisting the ears back in position.

Best regards, /Sören

Tnx everybody for the reply, yes - the ON key still has the "klick", nearly not to hear but remarkable in the finger tips. It _is_ used for years but at least on the outside it may be cleaned. So I will try with your hints to fix it inside too.

I am quite astonished by the "press genly near the LN key" trick. Works 100%.

Ciao.....Mike

2012 - Is this the End?

*Message #1 Posted by **Joerg Woerner** on 24 Nov 2009, 7:56 a.m.*

HP Aficionados,

I expected these two calculators not before 2012:

HP CalcPad 200

and

HP CalcPad 100

Will you trash now your iPhones???

Regards, Joerg

BTW:

This is the latest TI calculator - just for reference:

Edited: 24 Nov 2009, 7:58 a.m.

I think I'll pass (out) on these.

*Message #2 Posted by **Frank Boehm (Germany)** on 24 Nov 2009, 9:20 a.m.,*
in response to message #1 by Joerg Woerner

I wonder how much engineering time went into the TI calculator, probably gazillions of hours were spent by the marketing guys whether to use *this* colour or something completely different (like baby blue)...
Concerning the HPs: they could have at least implemented Bluetooth. nd I'm not sure what they are good for. Extended keyboard replacement for laptops?

Re: I think I'll pass (out) on these.

*Message #3 Posted by **Bart (UK)** on 24 Nov 2009, 9:44 a.m.,*
in response to message #2 by Frank Boehm (Germany)

> Quote:
>
> Extended keyboard replacement for laptops?

Yes, I believe they are meant as numeric keypad extensions for laptops lacking a dedicated numeric pad. Comes with calculator software apparently (four banger stuff I think). See pdf specs.

Actually, I was looking for sometning like this about 15 years ago. I was entering lots of numbers into spreadsheets on a laptop.

Edited: 24 Nov 2009, 9:46 a.m.

Expect Armageddon looking different

*Message #4 Posted by **Walter B** on 24 Nov 2009, 9:24 a.m.,*
in response to message #1 by Joerg Woerner

I've seen a model 200 this morning on TAS, but had no specs at that time. After checking them now, however, it's just a most simple algebraic 4-banger even lacking SQRT or exponential notation - as they write: ideal for the mobile professional in business, finance, retail - that's all, besides the function as keyboard extension, of course.

No real reason to get rid of real tools d:-)

Ceterum censeo: HP, launch a 43S.

Edited: 24 Nov 2009, 9:28 a.m.

Re: 2012 - Is this the End?

*Message #5 Posted by **Martin Pinckney** on 24 Nov 2009, 9:54 a.m.,*
in response to message #1 by Joerg Woerner

I've had a CalcPad 200 for several weeks now. Got it off eB** for $8.99 with free shipping! HP lists them for $30, I think.

It's definitely a cheapo product, but it serves the purpose. And at that price, why not get one?

Re: 2012 - Is this the End?

Because I haven't found it in the UK yet.

Re: 2012 - Is this the End?

*Message #7 Posted by **Brian Walsh** on 24 Nov 2009, 10:41 a.m.,*
in response to message #1 by Joerg Woerner

I like the idea! But here's what HP must provide:
- RPN logic
- scientific functions (32/42/etc.)
- TVM functions (12C)

I also hope the Word and Excel buttons will be changed to more generic names and hope they also work with OpenOffice, which I use.

Down the road wish list:
- Flash memory so different feature sets can be downloaded from the PC. I want my 41 or 42! Some will want a full 12C. Others will want a 15C or 16C.
- Provide soft keys with function labels on the display, to accommodate different personalities.
- Keystroke programming
- User defined keys

Re: 2012 - Is this the End?

*Message #8 Posted by **Tim Wessman** on 24 Nov 2009, 6:26 p.m.,*
in response to message #7 by Brian Walsh

Why the "must provide"? You can't really have a keyboard with a bunch of specialized functions not supported by any OS. This really is just a keyboard keypad with a few extra features. You seem to be wanting a completely reprogrammable keypad ala iphone or something.

As for the buttons, they are not generic because they are hardcoded to spit out "Win-R excel.exe" and so on. Kind of a silly decision, but someone decided having it work on any computer (granted, windows only) with no drivers or needing to install custom software was a higher priority.

To get it to work with openoffice, you'd have to make a link from excel.exe to your software of choice.

Will it change in a future revision? No idea. Kind of depends on how these ones are received I think.

Sorry, I should have made it clear that I was making a big joke. I remember enough French to know that it meant something like "schoolboy".

It reminded me of the infamous Chevy Nova automobile. The name sounds great in English, but it means "doesn't go" in Spanish.

For non-native English speakers on the forum who might not know the word, e-coli is a bacteria. There are several forms, but some contaminate food and then cause great "abdominal distress" when eaten. Add the "er" suffix and an "e-colier" is something that makes, creates or produces e-coli.

in response to message #1 by Joerg Woerner

Since Apple landed a huge success with it's iPod (and colorful iMac) line of products, it seems to me, that anybody else in the marketing of electronics prefers to market gadgets instead of usefulness ...

Steve Jobs would certainly have rejected such a product during it's first presentation to him - with one and only one question:

"Where do you put it while working with your laptop on an airplane?"

'nuff said ...

Best regards,

Peter A. Gebhardt

Edited: 24 Nov 2009, 5:21 p.m.

*Message #15 Posted by **Tim Wessman** on 24 Nov 2009, 6:19 p.m.,*
in response to message #14 by Peter A. Gebhardt

I'm the first to admit this isn't something that will be useful for everyone, and most likely not the vast majority of the people in the world, but if you need to enter a lot of numbers in on a laptop it works quite well.

It is mainly targeted towards people needing a number pad on a laptop. Also has 2 USB ports for expansion, a few hotkeys to launch common MS applications, and to launch the hp calculator manager software which allows you to run whichever default calculator you'd like. . .

Mainly, its just a new category HP has never played in and there isn't much risk of trying to expand, is there?

I never thought I'd use it, but I've found myself using it a few times, and there is a person on my row who loves it.

Re: 2012 - Is this the End?

*Message #16 Posted by **Peter A. Gebhardt** on 24 Nov 2009, 6:47 p.m.,*
in response to message #15 by Tim Wessman

Tim,

this HP-gadget competes with already available cheap SE Asia pads - but does neither deliver a Wow! effect, nor does it "evangelize" for a new "grassroot movement" fostering future HP calculator business - as a relaunch of the (say) HP-42s with (at least!) USB would do.

That's what makes me sorry about HP spending engineering time and other resources for it. Maybe even putting the SKU in HPs Database and/or updating it's website cost more than it's expected net profit ...

Best regards,

Peter A. Gebhardt

Re: 2012 - Is this the End?

*Message #17 Posted by **Martin Pinckney** on 24 Nov 2009, 8:00 p.m.,*

*Message #20 Posted by **Bart (UK)** on 25 Nov 2009, 5:04 a.m.,*
in response to message #14 by Peter A. Gebhardt

Then he may have lost out on an opportunity. Very limited vision if one thinks laptops are only used on airplanes. As I mentioned previously, there was a time in my life when it would have been useful, sitting in remote locations on a little fold-out table entering lots of numbers on a laptop. There wasn't enough space for a full keyboard, but such a keypad would've been ideal.

Re: 2012 - Is this the End?

> Quote:
>
> Very limited vision [...]

Apparently people with such a limited vision are most successful. Think about Microsoft being way behind other companies regarding GUI or the Internet several years ago. To fix your number 1 position, finally deny all standards in favor of your own system (OpenGL and Java are good examples).

Re: 2012 - Is this the End?

*Message #22 Posted by **Bart (UK)** on 25 Nov 2009, 6:38 a.m.,*
in response to message #21 by Thomas Radtke

Actually, I think Steve Jobs did not have limited vision. Xerox did. That's why Xerox dumped the GUI idea while Apple and others took the idea over from them.

He may not have seen opportunity in a keypad - it probably won't be near as good a seller as the iPod - but I also cannot believe that he would think laptops are used mosly on airplanes.

The only reason Microsoft is successful is Bill Gates' marketing strategy of the Borg :-).

I was at Stanford in the early 80's and we had a lot of the goodies that Xerox's Palo Alto Research Center (PARC) came out with. I'm simply stunned at the number of billion dollar ideas PARC created and XEROX let get away. In addition to the GUI, they created laser printers, the mouse, ethernet, a really cool LISP workstation, etc. They are even generally credited with with inventing the personal computer

In other words, picture a world where one company invented the IBM PC, networking the HP laserjet, the Apple Mac and Microsoft Windows, oh, and the Xerox copier of course. If Xerox had decent management, they probably would have gotten so big that the government would have broken them up. Isn't it amazing how bad management can ruin a good idea.

Which would mean writing out sheets and sheets of data only to have to type it in again? I don't think so!! I'm much too lazy for that :-).

I soon found a better alternative, a specialised data logger that would store 99 points of data and download via RS232. Much better.

A stand alone numeric keypad still has its uses though. At times I have thought about hacking up a 102-keyboard to make my own.

MLDL2000 'cosmetics' & more

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 22 Nov 2009, 5:16 p.m.*

Hi, all;

right after building my first MLDL2000 (some years ago) I found it tricky to change the µswitches (select SR settings), and I was afraid of using the wrong tool and wear the little things out after a while. As a test, I cut a small piece of transparent acetate (normally used in custom wirebound printings) and it proved a very good choice, given that sharp edges are kept so you can use the edges to safely push the small switches. Then I decided to cut another piece of the same acetate with the dimensions of a regular magnetic card. Needles to say it was intended to fit in the tracks designed to hold an actual magnetic card. The results were unexpectedly good, given that the little acetate card actually composed a good-looking MLDL2000. In time: I tested with another acetate card with a smooth edge (the edgy tip was cut out) and I was not able to use it for pushing the µswitches.

Now that I built the second unit, I did the same and remembered I did not share this particular information. Please, check the pictures (click in any picture to enlarge).

The acetate card in place

The acetate card slides sideways

Using the acetate card

Sorry taking too long to disclose it... And I hope it is of use.

Cheers.

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 23 Nov 2009, 6:18 p.m.,*
in response to message #6 by Ángel Martin

Hola, Ángel; thanks for your follow-up.

I am wondering about how to print it...

The final layout might be easily drawn with any currently available, vector-based drawing software (CorelDRAW! being one of the well known Windows-based, not sure about its Linux/Mac counterpart). After that, the printer should be able to print over acetate, and I guess this would not be the problem. Ink could be silver, gold or even white, printed over transparent acetate. I thought about asking Diego what did he use to print Clonix and NoV-series labels; any ideas?

If I find a non expensive way to produce a bunch if them, I'd gladly pack and send them to the ones that are interested.

Cheers.

Luiz

#2 key problem, china mfr, hp12c, and/or others

*Message #1 Posted by **stephen levine** on 22 Nov 2009, 12:35 p.m.*

#2 key clicks, but does not register unless pushed aggressively. Before trying to maybe fix the problem I thought I would ask here. I have a suspicion that this might not be amenable to repair. The serial number: CN31506945, China.

This belongs to my wife only 2/3 years old. I have an old 10c - more than 20 years old - which has a nice feel to it which the new ones lack.

Stephen

Re: #2 key problem, china mfr, hp12c, and/or others

Hi;

is it a regular HP12C or a Platinum? The regular model has keys that are separated pieces, while the Platinum models (including Prestige) have the keys integrated to the upper half case, except for the [f] and [g] prefix keys which are still separated pieces. I have seen many Platinum with loose keys after breaking the two plastic tags in their base, making it hard to get it working normally again.

Cheers.

Luiz (Brazil)

Just checked - Platinum, but I do not know if I understand the difference that you discuss. I have not had the thing apart - yet. I am trying to find out if the click mechanism and switch are integrated into a tiny sealed unit that not possible to repair with my fat fingers.

Re: #2 key problem, china mfr, hp12c, and/or others

You should probably ask HP for a replacement.

in response to message #1 by stephen levine

Since the internal construction of the 12C has changed so many times in the last several years, I don't know what is inside. It might be salvageable but you'll need to open it to find out. Here's how:

Place the unit face down on a soft surface. Remove the battery door and battery. Remove the the two small Phillips screws found there. Carefully lift up/peel off the four rubber feet. Remove the four screws. Lift the back off. Looking carefully at the right side of the unit, look for two small springs standing on end inside black vertical tubes. Remove them and set aside noting that the longer one goes in the tube nearest the display.

Now, have a look at the circuit board. If the unit has a small hole in the board behind each key location, great, you should be able to repair it. If it is a solid board with no openings, it's toast.

If you find the small holes behind each key, you'll need a method to get a few drops of isopropyl alcohol or contact cleaner (no silicone!) inside the hole then press the key a few times to flush out the key contacts. An eyedropper or pipette of some sort will do in a pinch. Repeat at least 2-3 times.

Install the springs and reattach the back with the six screws and reinstall the feet. Should be okay. Repeat the process if needed.

in response to message #6 by stephen levine

The Platinum is not easily repaired, not what I described above as that only applied to the gold 12C, sorry I did not clarify.

Repair is possible but you have to trim off heat stakes and then glue it back together or possibly suitable screws. Not sure about it though since I've only had one or two of them apart and the results ended up in the circular file.

This AM I operated. I think the #2 key works (better?) now. I am not sure exactly, what, if anything I did, made this happen. The keys are more or less sealed and not repairable by normal humanoids. I did clean out some minor pieces of dust and unrecognizable schmutz.

In case anyone else has occasion to open the Platinum HP12c up I offer these additional comments:

I used a 5/32" drill bit to take off the (thermo)plastic flanges on the stakes - by rotating the bit in my fingers. That was simple and easy. One caution is that one of these (upper left looking at the opened unit) holds the Reset clip to the board. Don't lose the clip. And do not forget to put back during reassembly. I refastened the clip by using ABS primer to dissolve the shavings from the flanges - using that as a glue/welding material. I used (this is slightly obscure) 1/8" foam glazing tape stuck to the back cover to hold the pcb in place when reassembled. I think I voided the warranty. But it has worked for going on 15 minutes now.

Thanks everyone for giving enough information to overcome initial trepidation. A little learning is a dangerous thing. . .

Stephen

Another University of Houston calculator contest

*Message #1 Posted by **David Hayden** on 22 Nov 2009, 10:45 a.m.*

If you're looking for something to do over Thanksgiving while trying to avoid the in-laws and Crazy Cousin Harry, here's another calculator contest from the university of Houston: University of Houston 2008 calculator contest for TI 89/92

I'll post my answers and comments in reply.

Enjoy! Dave

Re: Another University of Houston calculator contest

*Message #2 Posted by **David Hayden** on 22 Nov 2009, 12:34 p.m.,*
in response to message #1 by David Hayden

Here are my answers, done on a 48gii. Corrections, comments and improvements are gratefully accepted.

1. Plugging in the numbers leads to [[4 -2 1] [9 3 1] [196 14 1]] * [a b c] = [6 3.5 29]. Since the calculator lets you "divide" matrices, I did this: [6 3.5 29] [[4 -2 1] [9 3 1] [196 14 1] / OBJ-> DROP + + EVAL

Answer: 3.443181

2. 20931601446 FACTOR Result is 347*227*37*19*7*3^3*2

3. 21456326 ENTER 3241157 GCD yields 1 So no common factors.

If the GCD were greater than 1, then applying FACTORS to it would yield the common prime factors.

4. Of course this depends on the current date, but the TIME menu makes quick work of it.

DATE 2.162097 DDAYS 24 * 3600 *

5. Graph the the function y=x+cos(30x)-1 from .9 to 2.1. There are 8 solutions that are clearly within the region and 2 (or is it 3?) that are near the boundaries.

Closer investigation with ROOT and ZOOM shows that the root near 1 is too small. Using ZOOM, BOX2 shows that there are two roots just slightly less than 2.

Answer is 10.

6. 37* (sum of digits) + 8 * (product of digits) > 45742. The sum of the digits given is 24 and the product is 960, so if you have a digit x, then the formula become 37(24+2x+1) + 8(960x(x+1)) > 45742.

I programmed the formula and ran through the digits 0-8. Smallest result that's less than 45742 occurs with 2.

Answer: 2

7. The formula for each term is (-1^(x+1)) / x. So program it as
0. 1. 1000. FOR X -1 x 1 + ^ X / + NEXT

8. << DUP INV SWAP 2 / + >>
'P8' STO
1. ENTER P8 P8 P8 P8

Result is 1.4142135... So answer to problem is 3.

9. If I remember my math right, the sum is approximately ln(n-0.5), so n is about 148. Armed with this I wrote a program to compute the sum, flubbed it with an off-by-one error and tried again. I ended up with this:

```
%%HP: T(3)A(R)F(.);
\<< 0. 1. \-> S X
  \<<
    DO X INV 'S' STO+ 1. 'X' STO+
    UNTIL S 5.5 >
    END X 1. -
  \>>
\>>
```

Plugging numbers in yielded 137 as the answer.

10. 11201 ENTER NEXTPRIME NEXTPRIME NEXTPRIME etc.

11. Solve 2x-sin(x)-10 = 0. Answer 4.5102

12. Starting with $5, each time she talks to someone, she adds $4, so the sums are 5, 9, 13, etc. Each value mod 4 = 1. So the first value that she'll have in the range is 2,134,565 and they continue to 2,134/585. Now when the problem says "strictly between" do they mean that the end points are not included? That determines whether the last one is included or not.

13. f(x) = cos(1/x)
g(x) = f(f(f(f(x))))

I graphed 10*g(x)+9 and found 4 roots in the range. From the graph window, From the graph window, Press FCN, move the cursor near a root and press ROOT. When it gets the value, press ENTER to copy the root the stack. Repeat for the other roots. Exit he graph window, press "+" 3 times and you have the sum of the roots. I got 0.3183757

14. Ratio of cicumference to area is 4/D.

To compute the sum of the ratios I wrote this program:

```
%%HP: T(3)A(R)F(.);
\<< { 1. 2. 3. 4. 5. 6. 7. 8. 9. 10. 11. 12. 13. 14. 15. } ADD INV \GSLIST 4. *
\>>
```

Plugging in values until I narrowed it down to the one closest to 1/100, I got a program input of 5992, which means the max circumference was 6007.

15. Enter the polynomial and press FACTOR. The hardest part of this one was avoiding typo's.

16. If everyone turned in their money then 43 + 81X + 22Y + 630 = 2887. Where X > 20 and Y < 5. Simplifying gives 81X + 22Y = 2214. There are no integer solutions to this.

The total money in the room is the money collected plus the money m still in their pockets, so 81X+22Y = 2214+m. Recast this as 2214-22Y = 81X-m. Modulo 81 gives (I think) (2214-22Y) mod 81 = 81-m. I wrote this program to generate the m for each value of Y (1-5)>

```
%%HP: T(3)A(R)F(.);
\<< 1 5
  FOR X 2214 X 22 * - 81 MOD 81 SWAP -
  NEXT
\>>
```

Running it showed m=2 when Y=5.

17. Divide by 19 to get 7140766 factors of 19. Divide it by 31 to get 4376598 factors of 31. Now you've double counted the factors of 31*19 = 589. There are 230347 of those. So there are 11287017 unique factors of 19 and 31 between 1 and 135674561. 135674561-11287017 = 124387544.

But that isn't the right answer, because they want value of x between 1 and 135674561 EXCLUSIVE, so you have to remove 1 and 135674561. Therefore the answer is 124387542.

18. Here is a brute force program that works, but it's ugly. It tries every combination of adding and subtracting the numbers:

```
%%HP: T(3)A(R)F(.);
\<< -54 54
  FOR X54 -74 74
    FOR X74 -112 112
      FOR X112 -131 131
        FOR X131 -172 172
          FOR X172 -191 191
            FOR X191 -213 213
              FOR X213 -261 261
                FOR X261 -436 436
                  FOR X436
                    IF X54 X74 + X112 + X131 + X172 + X191 + X213 + X261 + X436 + 406 ==
                    THEN X54 X74 X112 X131 X172 X191 X213 X261 X436 9 \->LIST
                    END
                  872 STEP
                522 STEP
              426 STEP
            382 STEP
          344 STEP
        262 STEP
      224 STEP
    148 STEP
  108 STEP
\>>
```

There is one solution: 54-74-112+131-172+191+213-261+436

19. The general question of how many ways to form an amount from specific coins was the subject of a previous thread. Running my program, which took forever even on an emulator, gave an answer of 28050. There must be an easier way for to have been given on a test for high school kids.

20. Three stacks to the moon would stand 384402*3 km high, which is 1.153206E12 mm. At 0.11mm per dollar bill, that's 1.04836909E13 bills. The debt would have to grow by a factor of 1.13337199 to reach that value.

1.00016^n = 1.1333719. n = 782.55, so the smallest number of full days is 783.

high school kids.

There is.

You could do it with 149 quarters.

Or 148 quarters. The missing quarter could be made up with 5 nickels, or 3, or 1 (and the difference in dimes).

Or 147 quarters. And the 2 missing quarters could be made up with 10 nickels, or 8, 6, 4, 2, or 0.

There is 1 way to do it with 149 quarters.

3 ways to do it with 148 quarters.

6 ways with 147.

8 with 146.

11 with 145.

13 with 144.

16 with 143.

And so on, down to 371 ways for 1 quarter, and 373 ways for 0.

Every other one adds 2 ways, while the alternate add 3 ways (which is due to the nickels being even or odd).

So you just add 1+3+6+8+11+13+16+...+371+373.

You could think of this as two separate series, each adding 5 each time.

1+6+11+16+...+371=75+5*(1+2+...+74) = 75 + 5 * (74^2+74)/2 = 13950

And

3+8+13+...+373=3*75+5*(74^2+74)/2==13950+2*75=14100

And the total =4*75+5*(74^2+74)=28050.

Very nice!

I am ashamed to tell it took 2h26m49s for my pure brute force Pascal program to find the solution on the HP-200LX... I couldn't help remembering these verses:

"Why to think, to imagine? The machine will do it for us." ("Por que pensar, imaginar? A máquina o fará por nós." in the original Portuguese)

Re: Another University of Houston calculator contest

*Message #5 Posted by **Gerson W. Barbosa** on 23 Nov 2009, 4:22 p.m.,*
in response to message #2 by David Hayden

"Houston, we have *too many* problems here!". Fortunately all of them are solved :-)

A small suggestion to number 9:

A better approximation for the sum is ln(n)+0.5772 (where 0.5772 is the Euler-Mascheroni constant). So you can try $e^{5.5-0.5772}$ ~ 137. Summation, instead of a program, might be an option:

```
'SIGMA(n=1,137,1/n)' EVAL --> 5.50084178581
```

Gerson.

HP41 ROM images related: I didn´t see that comming...

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 21 Nov 2009, 9:55 p.m.*

Hi, all;

I was checking the ROM images that are stored in my computer when I also decided to check the ROM versions of three different 82143A printers' interfaces. One of the printers is complete, the other two may be combined to assemble one working unit (there is only one mechanics).

I loaded the three images, one at a time, in three MLDL2000 SRAM addresses: 08, 09 and 0A. Then I listed the ROM images and saw that they were of the same 1E version. But then I decided to upload each one of them to the computer, and after opening the three images I found this:

```
ROM Filename    : D:\HP41-related\HP41_ROM_images\printer_1E_0.rom
-----------------hex---dec---------------
  XROM          : $01D  029
  # Functions   : $019  025
  ROM Name      : -PRINTER-
  Pause Entry   : $28B
  Program Entry : $000
  Sleep Entry   : $000
  OFF Entry     : $000
  Service Entry : $26B
  ON Entry      : $23B
  MemLost Entry : $233
  ROM Revision  : PR-@@
  Checksum      : $36E  CHECKSUM NOT GOOD, should be $3BA
  NOPs Counted  : 77

ROM Filename    : D:\HP41-related\HP41_ROM_images\printer_1E_1.rom
-----------------hex---dec---------------
  XROM          : $01D  029
  # Functions   : $019  025
  ROM Name      : -PRINTER-
  Pause Entry   : $28B
  Program Entry : $000
  Sleep Entry   : $000
  OFF Entry     : $000
  Service Entry : $26B
  ON Entry      : $23B
  MemLost Entry : $233
  ROM Revision  : P@-@@
  Checksum      : $36E  CHECKSUM NOT GOOD, should be $067
  NOPs Counted  : 93

ROM Filename    : D:\HP41-related\HP41_ROM_images\printer_1E_2.rom
-----------------hex---dec---------------
  XROM          : $01D  029
  # Functions   : $019  025
  ROM Name      : -PRINTER-
  Pause Entry   : $28B
  Program Entry : $000
  Sleep Entry   : $000
  OFF Entry     : $000
  Service Entry : $26B
  ON Entry      : $23B
  MemLost Entry : $233
  ROM Revision  : PR-1E
  Checksum      : $36E  CHECKSUM NOT GOOD, should be $06A
  NOPs Counted  : 251
```

Three different NOP counts, three different checksum (the three of them not good), three different ROM versions, and they are reported Printer 1E.

Now I'm stuck! I'm willing to check all ROM images that share the same ROM version # because now I see that they may be different inside... Any other related event?

It seems that the rabbit took a deeper warren...

Cheers.

Luiz (Brazil)

Re: HP41 ROM images related: I didn´t see that comming...

*Message #2 Posted by **Eric Smith** on 21 Nov 2009, 10:45 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

It appears that whatever process you used to transfer the ROMs from the printer modules to the MLDL is not reading them correctly. The '@' signs in the module name/version are indicative of reading zeros instead of valid data, which is consistent with the varying NOP count. I suspect that if you read the same module multiple times, you will not get consistent data.

Re: HP41 ROM images related: I didn´t see that comming...

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 22 Nov 2009, 2:11 a.m.,*
in response to message #2 by Eric Smith

Hi, Eric;

good point, indeed. I am using an HP41 halfnut with both an MLDL2000 (configured with HEPAX in page #5) and one printer module connected to it. I'll repeat the process and copy the same printer ROM to other different SRAM blocks and see what happens.

Cheers.

Luiz (Brazil)

Re: HP41 ROM images related: I didn´t see that comming...

*Message #4 Posted by **Meindert Kuipers** on 22 Nov 2009, 6:00 a.m.,*
in response to message #2 by Eric Smith

Up and downloading may not always be reliable, be sure to check the process with Verifym (or use autoverify), or use the data only when opening the ROM file from disk. If this happens more often, you should reduce the communication speed in the Preferences dialog, or tweak the other communications parameters.

Meindert

HP41 ROM images related: started it all over again

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 22 Nov 2009, 8:03 p.m.,*
in response to message #4 by Meindert Kuipers

Hi, Meindert;

thanks again for your (always necessary and welcome) advise.

I transferred all HP41 related data I have about the HP41 (>4GB) to a laptop (Acer, could not afford an HP) and then I started it all over: I set comm speed to 181.82kbps (32), JTAG speed to 146.3kbps (40, half of the default speed), USB Timeout to 1000 msecs, FLASH prgm and Sector erase timeout to 2000 msecs. Then I uploaded the 1.51 firmware version to the MLDL2018A again and erased all its memory. Now I am (slowwwwly) uploading all ROM images again. Well, now I think I am eliminating some, if not all, future issues.

In time: I used HEXEDIT to inspect the interrupt locations and ROM versions of the three printer ROM I mentioned in the beginning of this thread, from within the interfaces themselves, i.e., their original ROM data, not their images, and found out they have identical values stored on them. The discrepancies I found were not from the ROM modules. Lotta work to do, then...

Best regards.

Luiz (Brazil)

Edited: 22 Nov 2009, 8:07 p.m.

Re: HP41 ROM images related: started it all over again

*Message #6 Posted by **Meindert Kuipers** on 23 Nov 2009, 11:39 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Do not make the settings too slow, especially be careful with the JTAG speed, as some of the programmed delays depend on it. I usually run eveything on the highets speed, but if your USB port is a bit slow, or if you hav emany other active devices on a USB hub, sometimes data is missed.

For up and downloading: there is a backup function in M2kM. A saved backup can be edited like any MOD file, and then restored, so you do not have to handle each ROM image individually.

Meindert

Re: HP41 ROM images related: I didn´t see that comming...

*Message #7 Posted by **Doug** on 7 Dec 2009, 7:02 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Luiz, Could you send me your modifications to preliminary 43A study? I like to share advancements in thinking. Maybe you can add some notes to the prelim study? I haven't had much time lately to study 43A as they all got melted but i do love this device. Do you remember when the big thing was to grind down the return cam so that we could get full graphic image dump on 2" wide paper? Good machine that can do startling images on thermal paper. Oops, i just drove up the price of old 43A printers. Doug

Re: HP41 ROM images related: I didn´t see that comming...

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 7 Dec 2009, 11:38 a.m.,*
in response to message #7 by Doug

HI, Doug;

thanks for your reply.

(un)fortunately the differences in the ROM images happened to be caused by a comms glitch, and after the problem was solved all three ROM images downloaded perfectly identical to each other.

And yes, I remember the 'Hanukkahs' (at least I remember people using this names) shown in some club publications. One of them called my attention: it was a boat in the sunrise, in one of the HP Key Notes.

As I mentioned, I have a fully working and two-to-build-one 82143A´s. They have some differences in their PCB layout, will take pictures and, as I have them taken, I'll share them at photobucket. In the meantime, if you want to have a look at some of the other pics, be my guest:

Gentle beasts they are, these HP82143A...

Cheers.

7470A Plotter Pens/Paper?

*Message #1 Posted by **Egan Ford** on 21 Nov 2009, 8:21 p.m.*

The HP manual says to use HP pens and paper, but all HP printers I have owned have always said "HP Ink and Paper".

So, what are my options? It is possible to still get HP pens? Are there other pens that work?

Thanks.

These pens are long out of production (by HP), however, there are usually some of these available on 'the auction site'. Many times, the foil envelopes are still sealed, and the pens seem to perform well (even though they are often over 15 years old). There are other brands, and the 'name brand' ones seem to work well.

The plotter paper is very, very smooth - I presume this helps prolong the life of the fiber tipped pens. There may be modern equivalents available, although I don't think paper smoothness is rated. .

in response to message #3 by Martin Pinckney

There are different widths available as well (3 mm and 7 mm are common sizes, I believe).

HP 17BII+ Financial Calculator simulator available for iPhone

*Message #1 Posted by **Steve Simpkin** on 21 Nov 2009, 1:24 p.m.*

http://appshopper.com/finance/17bii-financial-calculator

Current summary of HP calculator simulator/emulators available for iPhone:

HP-10bii, HP-11C, HP-12C, HP-12C Platinum, HP-15C, HP-16C, HP-17bii+, HP-21, HP-41C/CX, HP-42S, HP-48GX, HP-28C (partial simulation)

Many of the above are available in several versions from multiple software authors (including HP!). There are also many non-HP RPN calculators available.

Please add any to the list that I may have missed.

Re: HP 17BII+ Financial Calculator simulator available for iPhone

*Message #2 Posted by **Anders Peterson** on 21 Nov 2009, 6:50 p.m.,*
in response to message #1 by Steve Simpkin

You got them all as far as I can tell. I have seen all of them except the 28c, and the strange "b"-type calculators you mentioned :) What is the name of that app that partial simulates a 28c?

My favorite part of browsing the appstore's selection of RPN calculators, especially the free ones, is the reviews by people who think they aren't operating correctly. An excerpt from a great recent review written for the SCI-15C app (an emulator): "You should add an update that runs this calculator in a way similar to all other calculators (Making sense)."

Re: HP 17BII+ Financial Calculator simulator available for iPhone

*Message #3 Posted by **Steve Simpkin** on 21 Nov 2009, 7:19 p.m.,*
in response to message #2 by Anders Peterson

The HP-28-like App is called "Halcyon Calc".

There is also an obscure, partially implemented HP-32Sii simulation Web App. It is at http://www.kronenberg.org/rpn/

> Quote:
>
> "You should add an update that runs this calculator in a way similar to all other calculators (Making sense)."

I agree with them. Why most of these HP calculators for the iPhone don't even have a proper "=" key. Now what good is a calculator without a "=" key?

Rounding errors

*Message #1 Posted by **BruceH** on 21 Nov 2009, 11:08 a.m.*

Just to emphasise that rounding errors aren't just limited to calculators here's something culled from the Interweb...

> Quote:
>
> There are mutterings about Motorola doing an unannounced, covert update on their Droid camera because so many people are reporting that the autofocus, which has been a bit rubbish, is now suddenly working.
>
> The actual situation is (I think) quite funny.
>
> Android Engineer, Dan Morrill said: There's a rounding-error bug in the camera driver's autofocus routine (which uses a timestamp) that causes autofocus to behave poorly on a 24.5-day cycle. That is, it'll work for 24.5 days, then have poor performance for 24.5 days, then work again. The 17th is the start of a new "works correctly" cycle, so the devices will be fine for a while. A permanent fix is in the works.

Re: Rounding errors

*Message #2 Posted by **Lyuka** on 21 Nov 2009, 12:00 p.m.,*
in response to message #1 by BruceH

24.5 days means 2^31 [ms]

It is probably an old singed and unsigned or wrap-round bug but not rounding errors.

The source or related article is Slashdot IT Story

Re: Rounding errors

*Message #3 Posted by **Paul Dale** on 21 Nov 2009, 5:27 p.m.,*
in response to message #2 by Lyuka

So it isn't so much a rounding error as an integer overflow.

Still, I cannot fathom a reason why the autofocus code would care about the time. Especially at this level of accuracy -- maybe at the hour mark to attempt to judge day and night but not at the ms level.

- Pauli

Re: Rounding errors

*Message #4 Posted by **David Hayden** on 22 Nov 2009, 10:41 a.m.,*

> Still, I cannot fathom a reason why the autofocus code would care about the time. Especially at this level of accuracy -- maybe at the hour mark to attempt to judge day and night but not at the ms level.

I have minimal knowledge of how autofocus works, but that never stopped me from speculating before.... :)

The routine might do something like this:

```
- Check to focus
- Move the focus knob for a little while.
- Recheck the focus.
- If you've passed the focus point, then interpolate based on how
  long you were turning the knob and go back accordingly.
```

Now if you get the time from a millisecond counter and mistakenly interpret it as a signed value, you'll think that the time interval was negative and all hell breaks loose.

Again, this is purely speculation, but I think it illustrates how time might factor into their calculations.

In this case, we actually have an algorithmic error.

The new DVD Set Version 7

*Message #1 Posted by **Namir** on 21 Nov 2009, 9:12 a.m.*

Hello All,

The main page for this site caught my eyes yesterday, as I caught a glimpse of the announcement that there is a new DVD set (version 7.0) out!! Of course not significant time passed by before I ordered the double DVD.

Just wanted to remind fellow site members/visitors that the new DVD set is out. It is worthwhile documentation to have.

I want to thank the site curator and any other person who helped scan new (and previous) documents for their efforts and label of love.

Namir

Edited: 21 Nov 2009, 9:14 a.m.

Wrist-PDA for Dave

*Message #1 Posted by **bill platt** on 19 Nov 2009, 10:18 p.m.*

A badly written old article, but topical natheless:

http://ezinearticles.com/?The-Death-of-the-Wrist-Watch?&id=302792

Re: Wrist-PDA for Dave

*Message #2 Posted by **Johnny Bjoern Rasmussen** on 20 Nov 2009, 3:31 p.m.,*
in response to message #1 by bill platt

Quite OT: I found the Ruputer OnHand PC very interesting but the size of the thing made it fit a gorilla arm much better than a human arm. I never got the watch/computer/pda/whatever never the less... I have had an Timex Data Link USB which was okay. I really liked it and used it as my PDA. Sadly it became faulty after 6 months so I sent it to Timex HQ in the US for warranty repair. They kept the watch though and I never heard a single beep from Timex or the watch again :-(

Ruputer OnHand PC

Cheers!

Johnny

HP41 ROM module versions: anyone?

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 19 Nov 2009, 6:30 a.m.*

Hi, all HP41 users and addicts! ;-)

Just to add a time reference: do you remember this?

Those of you who deal with ROM images (MLDL, Clonix and related stuff) know that there are different versions for the same application/program set. I am trying to locate and store these different versions with the sole purpose of studying and learning (35YO+ technology and still going!). I have some different versions of some common ROM images and I still need to download a few ones (stored in actual hardware), but there are some 'gaps' in some version sequences I do not know if were filled with actual, commercial versions or if they never left the labs. There is also the OS ROM versions, and based on what I saw, each of the three basic ROM has its own version flag, which leads to another question (coconut related): is there any information regarding compatibility and/or restrictions or these three OS 'packs' (one IC each) can live together in any possible combination?

Because Meindert´s MLDL2000 has room enough to store up to 253 4K-word ROM images (FLASH ROM), I think most of these images may find their place over there at the same time. I checked TOS and found only one version of most available ROM (did not check all of them), but it does not mean it is the only one stored there. I will send an e-mail to TOS webmaster and ask about this.

Most of us here know of one single place where many HP41 ROM modules found shelter, but this particular source is void, no ROM image will be disclosed from there. Anyway, I believe that the ones that were lucky enough being out here are in hands that might be interested on sharing such data base, mostly because it is 35YO and will serve no commercial purpose. As an example, I have a working Extended IO module with a checksum value that does not match, but I also have a ROM image of another Extended IO, same version, with a valid checksum value. Well, it is somehow easy to change the checksum value, but what if the ROM contents are actually faulty? Only with another version or an original blueprint to check for possible errors.

We surely know that the MoHPC is not the place to exchange ROM images because of also very well known reasons, and I (as all of you, I guess) completely agree with Dave´s thoughts about that. Some of the ROM images I have stored here with me were downloaded from actual hardware, but I also happen to have ROM images I downloaded from the www. I took into consideration that if they are publicly available, chances are that they are public. So, if anyone wants to share this sort of information in an off-line fashion, I'd also gladly share the ROM images I have. Please, use the following e-mail address:

lc_vieira (aT) QUANTICA punto Com [dot] br

In time: I had some issues trying to download a card reader ROM image by using a NoVRAM and a MLDL2000 and did not get the results I wanted to. Because of evident physical issues, I used the NoVRAM to capture the card reader ROM image first, then I tried to copy it to a single SRAM block in the MLDL2000, but somehow the card reader image disturbed the HP41 operation. I happen to have 1E ROM version already stored (the one with that interesting bug already mentioned here some years ago), but I want to keep a copy of the 1G version. Anyone wishing to discuss this as well?

Cheers.

Luiz (Brazil)

Re: HP41 ROM module versions: anyone?

*Message #2 Posted by **Ángel Martin** on 19 Nov 2009, 9:53 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi Luiz, quite a complex subject you raise here... I have enough problems keeping track of the revision for the few modules I have done, so let alone getting into the vast universe!

Seriously though, this is quite a daunting activity. And which one is that site you refer to as the "shelter of all ROM modules"? Not sure I follow that either. Do you mean those copies each one of us has got along the years? If so, we can contribute them to a 'central library' but who'll be the "librarian"?

Sorry, more questions than answers...

Edited: 19 Nov 2009, 9:54 a.m.

Re: HP41 ROM module versions: anyone?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 19 Nov 2009, 10:36 a.m.,*
in response to message #2 by Ángel Martin

Ola, Ángel; ¿que tal?

I agree with you that it would be somehow an extensive, time-consuming activity, but I think it's worth gathering all of these images together. At least the ones with common interest from known sources that have already disclosed such information so there is no copyright infringement. I already have my homepage but it needs both completion and refinement, as you can see. It is mainly intended to be used by my students, but I'll get it finished and enlarged soon. I see no problems holding either the images or links to the publicly available ROM, provided that it is not an infringement.

Cheers.

Luiz (Brazil)

Re: HP41 ROM module versions: anyone?

*Message #4 Posted by **Diego Diaz** on 19 Nov 2009, 12:36 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hi Luiz, Ángel,

Rom images have been of my concern since I started my first Clonix development and I keep a nice bunch of'em some of which (the most common) are bundled with the Clonix/NoV software for the users to play with.

The ROM pacs listing from M. Wherli at www.hp-collection.com might be a good starting point to start filling up the gaps which eventually will turn narrower as time goes by... ;-)

I for one keep several copies of the ROM images I've collected, in different places and media. However, I never took the task of classifying them by version nr. (nor by any other concept...) just

"dropped them into the bag".

The easiest method I can think of to check out differences between ROM images is an HEX editor. WinHEX.exe is the one I use.

I'm not sure I quite understand the issue you mentioned regarding Card Reader ROM. What sort of "interaction" with the HP-41 may interfere with the ROM extraction process?

Will keep in contact and mail you back with a detailed list of the images I've got as I get back home.

Cheers.

Diego.

Re: HP41 ROM module versions: anyone?

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 19 Nov 2009, 1:11 p.m.,*
in response to message #4 by Diego Diaz

Hi, Diego;

first of all, I think that the NoV32 decided to behave accordingly after some clearing and writing. I erased the RAM by loading NovClr32.HEX at least three times, then I erased the PIC18LF252 (it needed some extra erasure to be considered cleaned by ICProg Blank check...), then I loaded HEPAX plus David Assembler with Labels by using the last update you offered at www.clonix41.org instead of the one you sent me. I loaded the module with NoV32-H0.HEX and it behave as a dummy module,i.e., CAT 2 showed nothing after plugging it in three HP41 (one halfnut, two coconut). Is that OK?

I´ll try loading the card reader 1G image today later after having the NoV32 behaving accordingly. What I did before updating the NoV32 as it is now was:

- load NoV32 with HEPAX and David Assembler (was unstable);
- separate page B from HEPAX chain (following HEPAX manual instructions: BFE7, BFE8 and AFE8 = 000, etc...)
- copy card reder ROM to page B with COPYROM;

At this point the HP41 behaves erratically and I had to remove the NoV32 and write a program to copy the card reader image from page B to page E or F. Then:

- configure MLDL2000 with one SRAM address at page E (or F), or any other one that is not in use by NoV32 mapping;
- plug both NoV32 and MLDL2000;
- copy the card reader image from page B (NoV32) to page E (MLDL2000);
- connect the MLDL2000 to the computer and download the card reader image.

I think RAM2ROM.HEX allows copying NoV32 nonvolatile RAM contents to the computer without the need of such maneuver, but I have never used it. Is that what it is for? Sorry to ask, it came to my mind right now.

The erratic behavior of the Hp41 was mainly activating ALPHA mode instead of ALPHA entry after [XEQ][ALPHA] after the card reader image was copied. I simply could not enter any key with [XEQ _] in the display, but I could erase it character by character with the backarrow instead of clearing the hole LCD contents. Also, after executing the program to copy the card reader image from page B to page E, I found it in SRAM 63 of the MLDL2000. I pointed page E to SRAM 00

by programing the MLDL2000, and it ended up in SRAM 63... The program I wrote was:

```
LBL 00
00B000BFFFE000
CODE
COPYROM
```

I simply pressed [R/S] and saw no error message until it finished itself. Please, if there is an easier, safer way to transfer the card reader image to the computer, let me know.

Cheers.

Luiz (Brazil)

Re: HP41 ROM module versions: anyone?

*Message #6 Posted by **Meindert Kuipers** on 19 Nov 2009, 2:10 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I have both a cardreader 1D and 1E and thus the ROM images you want ;)

I have experienced the same issue. Problem is that when coying the CR rom to a lower page, the entry points become active, and this calls for strange behavior. My setup is a bit different, as I have an external MLDL2000 (my breadboard setup) and can combine a physical CR with the MLDL2000, and copying works, until you have both images active.

I copied the CR image from page E to page B, using the MOVE routine in M2K ROM. Note that the SRAM page you need in B can be mapped but disabled (so it can not be read by the '41, but still accepts WROM's).

I will transfer the images to your computer in a few minutes ...

Meindert

Re: HP41 ROM module versions: anyone?

*Message #7 Posted by **Meindert Kuipers** on 19 Nov 2009, 2:22 p.m.,*
in response to message #6 by Meindert Kuipers

Forgot to mention: keep in mind that the CR code is very hardcoded to page E, and any active CR image in another page than E will cause very strange behavior ....

Meindert

Re: HP41 ROM module versions: anyone?

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 19 Nov 2009, 9:09 p.m.,*
in response to message #6 by Meindert Kuipers

Hey, Meindert; dankje!

I actually thought of building a kind of port extender (just connectors and cable) so I could connect MLDL2000 into port 3 and do exactly what you mention: set a disable SRAM page

prior to copy it. Then I would just transfer it to the computer and copy it back to MLDL2000 in a FLASH position. I´d keep both copies in the computer and in the MLDL2000.

Thanks for clarifying about the weird behavior. I considered that if the card reader could only be placed in port #4, why not to write its code already hardwired? I am not sure about this, but in this case, even internal jumps could point to physical, actual positions instead of relative addressed. I do not know if, in this case, the mcode is simpler or smaller.

Thank you very much, both for the explanation and for the ROM images... 8^)

Cheers.

Luiz (Brazil)

Re: HP41 ROM module versions: anyone?

*Message #9 Posted by **Ángel Martin** on 20 Nov 2009, 1:13 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

I haven't checked this for sure but I'd assume that the card reader code is indeed had-wired to page E. Any MCODE programmmer will do that to save space and achieve faster response from the system, and HP had the best MCODErs for sure :)

As per obtaining the CardReader image, I did it using COPYROM in the HEPAX, of course. Although this wouldn't work if your HEPAX emulation isn't functional?

Best, 'AM

Re: HP41 ROM module versions: anyone?

*Message #11 Posted by **Diego Diaz** on 21 Nov 2009, 5:33 p.m.,*
in response to message #10 by Vieira, Luiz C. (Brazil)

Hi again,

Good to know you got your NoV-32 operative again. :-)

Regarding RAM2ROM it's certainly intended to dump ROM images from any RAM page into a NoVRAM (or the upper 16k in a NoV-32) to a .ROM file in your PC.

The details can be found here.

This utility was considered somehow "experimental" so it never was properly documented, anyhow, if it shows to be useful I'll add some detailed procedures in the next update.

Hope this helps.

Diego.

PS: Please note, the related .HEX file referred to as RAM2ROM.HEX in the thread above was later renamed to RAM2ROM1.HEX in the update archive.

Edited: 21 Nov 2009, 5:41 p.m.

From a time I was 'off duty'...

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 21 Nov 2009, 6:15 p.m., in response to message #11 by Diego Diaz*

Hey, Diego; ¡muchas gracias!

I was searching for this very piece of info! Did not cross my mind having it as a post at the archives...

You see, in such cases when an image has been successfuly copied into any NoVRAM RAM page and disturbs calculator operation (like the Card Reader ROM), RAM2ROM seems to be the only way to copy such image to the computer.

Thanks again!

Luiz (Brazil)

Edited: 21 Nov 2009, 9:22 p.m.

Re: HP41 ROM module versions: anyone?

*Message #13 Posted by **Meindert Kuipers** on 22 Nov 2009, 5:56 a.m., in response to message #11 by Diego Diaz*

Do not forget that M2kM will read the resulting HEX file (and save it a ROM or MOD)

Meindert

Re: HP41 ROM module versions: anyone?

There is also an online version of this listing: HP-41 Module Database

Might be a good place for ROM images, too!

Cheers, Juergen

Re: HP41 ROM module versions: anyone?

*Message #15 Posted by **Ángel Martin** on 20 Nov 2009, 1:19 a.m.,*
in response to message #14 by Juergen Keller

Hi Juergen, your on-line DB is an excellent place to get this done. Do you have the capability to also store the images there? If so, this can be the answer to Luiz' request.

I also have dozens of images lying around in different directories across several computers (some of them quite rare)... and wouldn't mind getting them all tidily stored once and for all. Should compile a list during the week-end...

Best, 'AM

HP41 ROM module versions: that would be great!

*Message #16 Posted by **Vieira, Luiz C. (Brazil)** on 20 Nov 2009, 8:02 a.m.,*
in response to message #15 by Ángel Martin

Hi Ángel;

this would really be great! I am not sure if the images I was able to collect would not be amongst the ones you have. In any case, I´ll save a copy of the ones I find amongst the actual modules I have with me and list them here, too. A few weeks ago I bought two 82242A (IR module) and their ROM versions are the same of the other IR module I already have: three IR modules, same ROM version in all of them...

In time: I downloaded a small MCODE from TOS that allows copying ROM images stored in any of the four different banks. Is there any other resource that allows such copies?

Cheers.

Luiz (Brazil)

Re: HP41 ROM module versions: anyone?

*Message #17 Posted by **Vieira, Luiz C. (Brazil)** on 20 Nov 2009, 8:04 a.m.,*
in response to message #14 by Juergen Keller

Hi;

just to second Ángel´s words: if it is possible to save ROM images, even if there are no direct links for them instead of a regular directory list, that would be great.

And congratulations! The data base is really impressive.

Cheers.

*Message #21 Posted by **Vieira, Luiz C. (Brazil)** on 7 Dec 2009, 11:28 a.m.,*
in response to message #20 by Doug

Hi, Doug;

thanks again for your thoughts! I also believe that after 30 years, being worried about copyrights over a 30YO development is almost (if not total) nonsense. Anyway, who knows what goes on someone else's mind...

My worries go to the possibility of someone tells that this or that ROM images should not be publicly available and then take legal actions. Not that it would be harmful, only boring... and time wasting.

And, o'course, I also crazy love the HP41 and related stuff!

Thanks!

Luiz (Brazil)

*Message #23 Posted by **Vieira, Luiz C. (Brazil)** on 8 Dec 2009, 1:07 a.m.,*
in response to message #22 by Doug

Hi, Doug;

I started this post some days ago, and now it is in the archives, so it has been broken. Never mind. And yep, W. Furlow has written very good stuff, indeed.

My idea is just to locate and put together all possible/available ROM images from HP41 modules and allow them to be downloaded freely (that´s why I was concerned about copyrights). A timeline may arise from this, and also many research material. Although it is a 35 YO technology, it still has its many possibilities. Ángel Martin rewrote his own 4K-wide 41Z a couple of months ago and added many extra functionalities plus an improved 4-level complex stack. Now we count on a new 8K-wide 41Z ROM image. I still have one idea or two about MCoded ROM modules, but I need to study a bit more so I can show some results prior to ask for help too soon.

If we only could bag all HP41's known and publicly available ROM's I believe we'd actually bag a hole chapter in technology history.

Cheers.

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 18 Nov 2009, 10:06 p.m.*

I have been working with Joerg Woerner on an SR-52 issue and visited the SR-52 site in his DataMath Museum. Among other things I found statements such as

> Quote:
>
> If you call the SR-52 a pocket calculator you need really huge pockets.
>
> By the way, the SR-52 was the thickest calculator ever with a whooping 1.8".
>
> If you are interested in "huge pocket calculators" you should view the Canon Palmtronic F-7.

While looking through my collection for other large pocket calculators I stumbled on the the Sanyo ICC 807D which has about the same volume as the SR-52 but which feels much heavier in my hand. There have been frequent threads in this forum discussing things such as form factors, how the calculator feels in one's hand, etc., but I don't recall any that addressed the density of the calculator which is, I think, what heft is all about. So here is my challenge:

The Sanyo ICC 807D has a weight of about 15 ounces and a volume of about 23 cubic inches yielding a density of about 0.652 ounces per cubic inch. Does anyone know of a more dense handheld calculator?

Later in this thread Katie noted that my weight seemed low and asked if my unit had batteries installed. Oops!

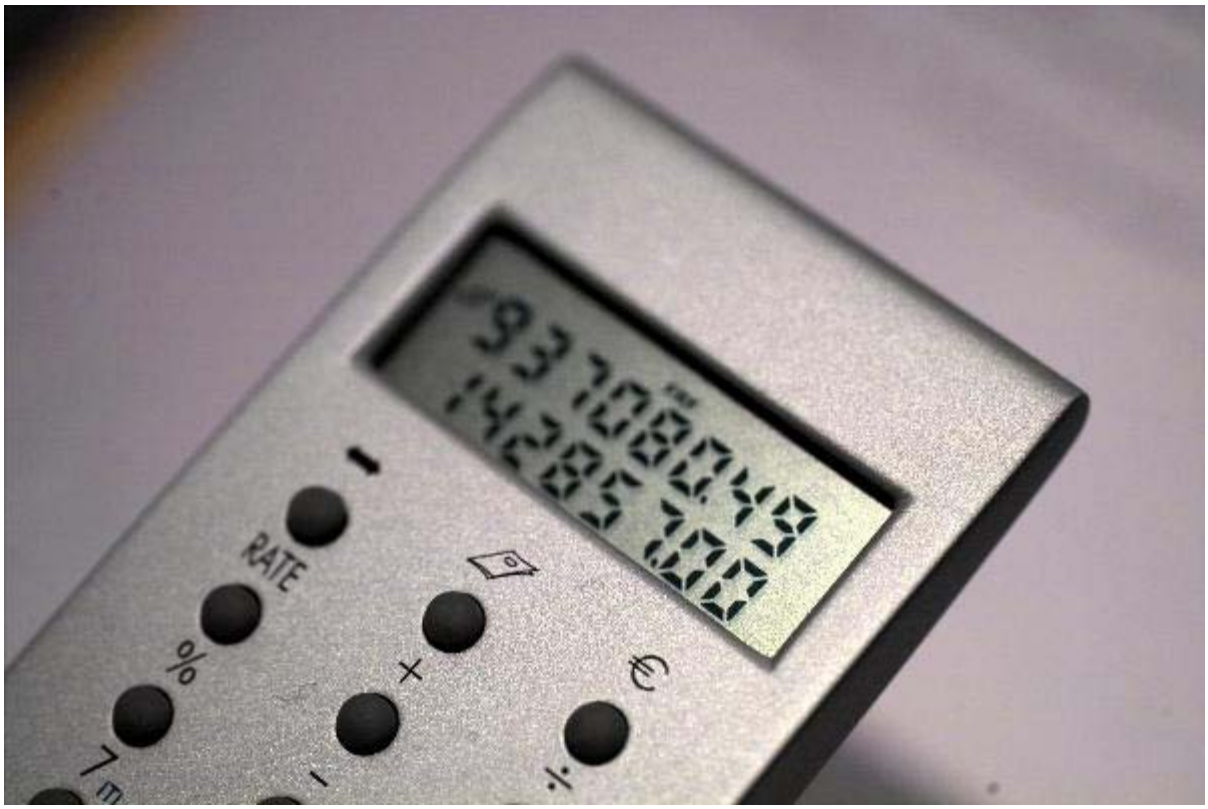
Good morning!

> Quote:
>
> Does anyone know of a more dense handheld calculator?

I have no scales and rulers that measure in "oz." an "in." (and have so far been unable to figure out how the "units" function of the HP48 works), therefore I cannot provide any numbers for comparison, but I can offer a few candidates.

This little no-name titanium coloured currency converter must be the most dense calculator in my collection:



Subjectively, it feels like a piece of matter ejected from a neutron star. Mass and dimensions (the thickness is difficult to measure because it has an airfoil shape) are 200g 11,5 x 4,7 x 0,8 cm^3. This results in a density of 4,65 g/cm^3 which is almost equal to that of the titanium that it mimicks.

Two other calculators with above-average density are the Aristo M27 (one of my three top favorites, it is bareley larger than the five AA batteries that it holds and feels very solid, but figures from the internet give a density of only 1,5 g/cm^3) and the silver-plated Sinclair Sovereign.

And the most likely candidate from HP would be the HP-01 although I do not want to immerge mine in water to determine its volume.

Greetings, Max

The HP48G does not have density conversion (that I can find anyway). However, it has mass & volume conversions: 1 oz = 28.3495 g and 1 in^3 = 16.387 cm^3.
this gives a conversion of 1 oz/in^3 = 1.73 g/cm^3.

As you have given many measurements in g/cm^3 it is easier to convert Palmer's 1 measurement:

0.652 oz/in^3 = 1.128 g/cm^3

Put it in oil then ;-)

I have approximated density of a metal slide rule ;-) and the Casio fx-190 (a ruler shaped programmable) and both only go up to 1.9g/cm^3 and 1.6 g/cm^3 respectively.

If we go past metal slide rules to mechanical calculators I note that the Friden's we used in the early sixties really had a lot of heft -- backbreaking, if you had to move them -- but of course no one considered them to be portable.

A fairly heavy portable calculator is the Addometer made by the Reliable Typewriter and Adding machine Co. and that was for onnly addition and subtraction. One of my three has the right hand wheel working with eighths not tenths.

*Message #9 Posted by **Katie Wasserman** on 19 Nov 2009, 3:31 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

The ICC-807D and it's identical cousin the ICC-810 sure have a lot of heft. Although I haven't calculated it, I'll bet that the Sinclair Sovereigns come close in density. The Canon Pocketronic is no slouch in this area either. If you want to talk "big" and "heavy" battery powered monsters (no pocket I know will hold them) what about all the Compucorp/Monroe 300 series beasts. I think that the only possible candidate from HP would be the '01' watch.

-Katie

Re: Heft

*Message #10 Posted by **Maximilian Hohmann** on 19 Nov 2009, 3:53 a.m.,*
in response to message #9 by Katie Wasserman

Hi!

I'm on standby today and have the time to take some measurements...

> Quote:
>
> I'll bet that the Sinclair Sovereigns come close in density.

Black Sovereign (unfortunately, I don't have a silver plated one (yet...)): mass=88g (with batteries), volume=62cm^3, density=1,41 g/cm^3

> Quote:
>
> If you want to talk "big" and "heavy" battery powered monsters (no pocket I know will hold them) what about all the Compucorp/Monroe 300 series beasts

Size and weight are misleading here: I just took the measurements of a Compucorp 324G Scientinst. Mass=1674g (including the four original NiCd D-size cells!), volume=1552cm^3, density=1,07g/cm^3. It almost swims on water!

So my heavy-metal calculator from the post above still "outperforms" the closest competitor by a factor of three.

Greetings, Max

Re: Heft

*Message #11 Posted by **Bart (UK)** on 19 Nov 2009, 5:38 a.m.,*
in response to message #10 by Maximilian Hohmann

So would density be the only measurement of "hefty"? A lead ingot of 8cmx3cmx3cm (~800g) could be described as hefty, but a small lead fishing weight (10 - 50g) probably not. So perhaps there's a minimum size and/or weight? Perhaps from "bigger than Voyager size" and "1/4 kg and up"? Max's titanium calculator being an exception, as although still less than half the weight of Palmer's Sanyo ICC 807D, the small size belies it's weight and will surprise many an unwary person picking it up for the first time!

Re: Heft

*Message #12 Posted by **Maximilian Hohmann** on 20 Nov 2009, 3:42 a.m.,*
in response to message #11 by Bart (UK)

Good morning!

> Quote:
>
> So would density be the only measurement of "hefty"?

Difficult to say (and even more difficult for me, because in german there is no exact translation for "hefty"). I think the whole topic is about subjective expectation based on experience. After years or decades of handling calculators, one expects a certain sensory feedback when touching/picking up such an object. A pleasant surprise, if it is "heftier" than expected and an unpleasant one, if it gives a "plasticky" sensation (like the awful HP Quick Calc that looks like a solid metal object, but feels like hollow plastic with a keyboard, that even Ti would be ashamed of...).

So probaly the objectively measurable physical property "density" comes closest to the subjective "heftiness". And as we have seen, calculators with a density of 0.652 ounces per cubic inch or about 1,5g/cm^3 (=1 1/2 times the density of water) produce a sensation of heftiness. Others like the Compucorpses are not very dense (they would float on salt water!), but they are heavy objects - heavy enough for the designers to have given them a carrying handle - and therefore also cosidered "hefty".

Greetings, Max

NB: If DaveJ follows this thread: I would very much wish that his uCalc be a "hefty" calculator :-)

NNB: Another candidate for the group of hefty calculators might be the Berkey Keystone 350 (I only got mine this week from "typenkorb" and have not taken measurements yet). It feels very hefty, probably due to the large voltage converter needed to drive the Panaplex display (ah! Panaplex - the best display ever made!).

Re: Heft

*Message #13 Posted by **Quan** on 19 Nov 2009, 8:45 a.m.,*

So, does it mean that the calculation results from high desity calculators carry more weight than the low density calculators?

Only kidding :)

Re: Heft

*Message #14 Posted by **Katie Wasserman** on 19 Nov 2009, 10:47 a.m.,*
in response to message #10 by Maximilian Hohmann

Max,

I took some measurements too.....

> Quote:
>
> Black Sovereign (unfortunately, I don't have a silver plated one (yet...)): mass=88g (with batteries), volume=62cm^3, density=1,41 g/cm^3

The gold one weights in at 92.7 g batteries included and I measure it at 65 cm^3 --> a slightly different density of 1.426 g/cm^3

My Sanyo ICC-807D is 430cm^3 and weights 531g (18.7 oz are the batteries in yours Palmer?) --> 1.221g/cm^3

So the Sovereign is the winner.

41Z Red Shift taking shape.

*Message #1 Posted by **Ángel Martin** on 18 Nov 2009, 1:31 a.m.*

After a few iterations on the same theme here's the alternative solution to the Complex Keyboard implementation for the 41Z module.

http://picasaweb.google.com/nowake92/V41#5404573563260808114

The "Z" key is the only function assigned from the 41Z module, leaving all other available for your favorite ones. So no more need to get in and out of USER mode to toggle between complex or real functions... This uses less memory and expedites the function access as well.

After it's pressed the display shows "CMP: Z_", and the keyboard is redefined to allow for the appropriate key to be pressed. Obvious mapping applies, like SIN will complete the prompt to "ZSIN", etc. Prompting functions will ask for the suffixes as appropriate, i.e. "ZRCL _ _".

Use the yellow shift to access shifted functions, like ASIN as follows: "Z", SHIFT, SIN.

Pressing "Z" twice will display "HYP Z_", to give you access to the complex hyperbolics - using SIN, COS, TAN and SHIFT appropriately. Watch the function name being built as you choose the keys...

The function name will be displayed upon key entry - and NULLed if the key is kept depressed over the time-out period.

The bitmap image will be included in the posted documentation at TOS in a few days.

Enjoy, ÁM

I think my colorblind friends would have a hard time distinguishing the mustard color from light green. I wonder if blue would be better.

Re: Red Shift turning into Green!

*Message #4 Posted by **Ángel Martin** on 19 Nov 2009, 7:12 a.m.,*
in response to message #3 by Garth Wilson

Colorblindness is a serious handicap for calculator usage, no doubt about it - but this green is quite different from the original yellow-gold used on the 41.

I considered using light blue, but that's already taken by the alpha letters. One choice is to swap the green and the blue, will do it to sse the effect.

BTW, I can't get the imaged displayed on the message - I tried GIF and JPG formats, using the [image:] syntax guidelines but to no avail... any ideas?

Re: Red Shift turning into Green!

*Message #7 Posted by **Raymond Del Tondo** on 20 Nov 2009, 7:12 p.m.,*
in response to message #3 by Garth Wilson

After all the color is not really important, since you can derive the shift plane from the position

above the specific key, or, the other way round, pressing the one or other shift key always means the upper left _or_ upper right position above the key, respectively.

It's a similar thing with the key legend colors of the HP-48G series.
Many people complained they couldn't distinguish the colors
under certain conditions, which may be even true;-)

But, there's a relation behind the position of the key legends and the shift plane.
The left shift key relates to the key legends printed on the upper left of the key, or the menu mode where applicable.
The right shift key relates to the key legends printed on the upper right of the key, or choose/input form mode where applicable.

Not too difficult IMHO;-)

HTH

Raymond

Re: Red Shift turning into Green!

*Message #8 Posted by **Ángel Martin** on 21 Nov 2009, 2:12 a.m.,*
in response to message #7 by Raymond Del Tondo

Well said Raymond. It's hard to believe that with such a logical and simple scheme people found issues to complain about on the 48 series design, but I guess that's what people do best - finding issues LOL >)

Here on the 41Z there are a couple of compromises made, as the "Z" key isn't a real SHIFT function, but it doubles up as one. The guiding idea is that the 41Z uses the same keys as the " real" 41C, thus there's no real need to use the USER mode with multiple key assignments.

So on the 41Z keyboard, those keys without green shifted legend indicate the complex function is exactly the same as the real one. X=0? will invoke Z=0?, x=y? will call Z=W?, and so forth. Same with the "white legends" (on the key face) - which will call the complex counterpart function: SIN, COS, TAN, LN, LOG, SQRT, 1/x, x<>y, STO, RCL, ENTER^, etc.)

But it goes beyond that. For instance, pressing "Z" and any numeric key produces a complex number with the digit as real part and zero as imaginary. This is just a shortcut, and arguably not very useful (although it comes handy to do quick complex arithmetic) but it doesn't require any assignment on the digit keys, which remain used as real numbers if "Z" doesn't precede them.

The real missed opportunity is with the emulators, though. All these arrangements refer to the basic design, static on the physical machine - but on a modern emulator the key assignments (and the legends after pressing the "Z" key) should dynamically change, making absolutely obvious what functions are available when. Or maybe not, it's after all a matter of opinion :-)

Cheers, 'AM

PS, Here's the rub of a design exceeding its purpose: make the yellow SHIFT key turn green when presssed TWICE - as well as the shifted legends on all the other keys would change color and text ... so SHIFT-SHIFT means "Z". How's that for a complex keyboard? But IT WORKS!

Edited: 21 Nov 2009, 2:23 a.m.

Re: 41Z Red Shift taking shape.

*Message #9 Posted by **Garth Wilson** on 19 Nov 2009, 5:57 a.m.,*
in response to message #1 by Ángel Martin

This sounds great!

By any remote chance, would it also increase the number of user key assignment possibilities?

Re: 41Z Red Shift taking shape.

*Message #10 Posted by **Ángel Martin** on 19 Nov 2009, 7:14 a.m.,*
in response to message #9 by Garth Wilson

It does indeed: the "Z" key enables a second USER keyboard to all effects, so you can have all your normal key assignments undisturbed. That's exactly the beauty of this design :)

Re: 41Z Red Shift taking shape.

*Message #11 Posted by **Andrés C. Rodríguez (Argentina)** on 21 Nov 2009, 1:33 p.m.,*
in response to message #1 by Ángel Martin

Hi!

I suggest you to keep "red shift" red, as it allows for a wordplay for the doppler shift of light from stars, which helps to calculate their speed.

I'm far from being an astronomer, so please disregard missing details, the words "red shift" just rang a bell on me, and "green shift" don't. Blue shift (or violet shift) may be OK.

Just my 0.0002 $

Re: 41Z Red Shift taking shape.

*Message #12 Posted by **Ángel Martin** on 22 Nov 2009, 2:39 a.m.,*
in response to message #11 by Andrés C. Rodríguez (Argentina)

Hola Andrés, yes I´m aware of the Red Shift term as it´s used in astronomy (and other fields), and in fact it was a subliminal nod to that what made me use it initially ;-)

Unfortunately the red-over-black combination has a very poor contrast and becomes very hard to read, so I jettisoned the idea after a couple of initial attempts (I could read the ¨complaints¨ from a mile long...). I used green instead of blue to ¨respect¨ the blue alphabet on the Alpha keyboard, but I also think blue is a better fit for the ¨second shift¨ - maybe it´s all these years seeing the other models, although there must be a reason why they chose it to begin with.

So I´ll try the blue when I can get more ¨graphic designer¨time (she´s a very busy person). The alpha letters should be changed to another color for consistency sake, maybe green so effectivelt swapping the scheme.

Eventually we´ll call it the ¨Blue Shift¨, which also has connotations in jazz music (anyone out there also plays sax?)

Saludos, ÁM

The article's subject -- TI's angst over teenage hackers "repurposing" their TI-83's -- gives a good indication of how capable and well-supported is that platform for customization.

It would be great if HP supported enhancement of the HP-10bII (is that the new one with the reprogramming capability?) as well as TI has the TI-83/84. (Excepting TI's apps signature requirements, that is.)

Heck, I haven't paid any attention of late -- maybe HP *does* support development well?

Apparently, the phrase has been around a while, but became popularized in the 1995 movie *Clueless* with Alicia Silverstone.

I must be clueless
*Message #8 Posted by **bill platt** on 18 Nov 2009, 6:43 p.m.,*
in response to message #7 by DavidShenk

I don't think I've seen that movie....

Silverstone...is she the one from "Married with Children?"

You don't have to answer. I am truly clueless:-)

in response to message #8 by bill platt

Hi, Bill;

The actress from Married with Children may be Applegate; Silverstone (Alicia) is probably well remembered from this movie or this other one.

Cheers.

Luiz (Brazil)

Can you tell I have an 18-year-old daughter? I've "learned" all sorts of expressions.

Last weekend, I was visiting my son for the KU/Nebraska (American) football game. I asked some of his friends what they call students who work extra hard and even study ahead. They were unaware of any term for them! "Nerd" was the best they could do.

In "my day", those students were called "gunners". It was a very useful description, since I was competing with pre-med, and then other medical students. Sometimes, even I was a "gunner"....

Re: I must be clueless
*Message #13 Posted by **Mike Morrow** on 18 Nov 2009, 9:11 p.m.,*
in response to message #12 by Michael Meyer

I've never heard "gunner" used with that meaning. I was an EE undergrad from 1970 to 74, and an EE grad student in 1980. Maybe I predate that, or maybe it never was used at Georgia Tech.

Re: I must be clueless

*Message #14 Posted by **bill platt** on 18 Nov 2009, 9:54 p.m.,*
in response to message #13 by Mike Morrow

I've heard "gunner" for that.

And the participial phrase, "he's gunning for Summa Cum Laude" or such.

*Message #15 Posted by **Kiyoshi Akima** on 19 Nov 2009, 4:00 p.m.,*
in response to message #13 by Mike Morrow

When I was working with EEs they tended to divide themselves into two camps: analog or digital. Except for some of the older ones, who considered themselves either "Wave Heads" or "60-cycle Boys." And the latter was not a sexist term, since there were almost no female engineers back then.

One of the wave heads used to go around saying "All you need to be a digital engineer is two toes." I could never quite get him to understand that you only need one... toe.

I was an AeroE working with both analog and digital EE's. I grouped them all together as "twidgets".

Must be my lucky day.

*Message #1 Posted by **Stuart Sprott** on 17 Nov 2009, 5:44 a.m.*

I have owned a HP42 since 1990. Being a surveyor it has had some heavy use. It has never failed me.

Eventually I moved onto the HP48 and then progressed right up to the HP50. In the mean time the HP42 has always been a sort of reserve calculator. Now that I have a HP50, I find that it has been ages since I have used the HP42. In fact about 18 months. That is when I found that the batteries were flat.

I made a mental note to get batteries but being slack I did not follow up. To day I did get some batteries and installed them. Much to my surprise I found that all my old programs were still there!!!

So you can get lucky sometimes.

HP-42S: "Glueck", dann "Unglueck/Pech".

*Message #3 Posted by **Karl Schneider** on 18 Nov 2009, 12:13 a.m.,*
in response to message #1 by Stuart Sprott

Glueck = Good Luck
Unglueck or Pech = Bad Luck (to varying degrees)

I've had the same situation twice recently, when switching on an HP-42S for the first time in many months.

The first one was a pre-1990 flat-display model showing a low-battery indicator, and retaining a fair amount of stored programming. I replaced all three cells quickly, knowing that some HP-42S have been known to lose contents of Continuous Memory during routine battery changes. All my CM was retained. It was the second successful battery replacement of that unit.

Then, one of my post-1990 recessed-display models would not even turn on after many months. It had many of the same stored programs, I believe. After quickly replacing the battery, no such luck: "Machine Reset" displayed upon power-up with the new battery, and all my CM was lost.

One can't let the battery get too discharged, or the capacitor that helps to retain CM will also get discharged.

Battery life can be extended on Pioneer-series models with time clocks (HP-17B, HP-17BII, HP-27S) by

putting them into "coma" mode when not in use, shutting off the clock: Turn off by simultaneously pressing the keys in the upper and lower right corner positions along with the on/off key in the lower left corner.

The HP-42S can also be put into coma mode, but I doubt that doing so has much effect.

The HP-41 tends to preserve CM well. If the battery is low ("BAT" indicator on), the CX/Time Module clock will not operate, and trying to do so will turn the unit off. However, the CM is fairly safe. Needless to say, electronic backup is possible with the HP-41.

Karl,

I wouldn't call the second case an "Unglück" - that's a too big word IMHO for such a memory loss though it may have caused you a lot of work reentering these routines. But since you had them all documented properly, ... d;)

Re: HP-42S: erst "Glück", dann "Pech".

*Message #5 Posted by **Bart (UK)** on 18 Nov 2009, 7:17 a.m.,*
in response to message #4 by Walter B

From my Dutch background, I would have interpreted "Pech" as "bad luck" and "Unglück" more as "accident", i.e. something heavy fell on your 42S and destroyed it.

Edit: perhaps if one first connected a 4.5V source in parallel to the battery before removal. Terminals of Pioneers are reasonably accessible with small crocodile clips, I think.

Hi, Walter --

Yes, there is indeed a difference in severity indicated by the two words, but I forgot offhand which was the 'minor setback' and which was the 'major misfortune'. 'Unglück' is too strong a word in this case. It's all coming back to me now...

I ought to back up the code to a Free42 *.raw file before I lose the program on the other HP-42S.

Pech brings opportunity

*Message #9 Posted by **Bart (UK)** on 24 Nov 2009, 7:03 a.m.,*
in response to message #3 by Karl Schneider

I had Pech with my car today, it did not start due to a dead battery.

However, I had the opportunity to play with my recently TAS aquired 99p Casio fx-7000GB while on the bus. Entering the m-of-n reliability formula, I discovered it did not have nCr (or nPr) - no big problem as it does have x!. Even so, it is still faster than the 35s.

The advantage of the 35s though is high values of n. The fx-7000G is limited to n<=69 (as n! < 10e99). The 35s happily calculates ${}_{285}C_{283}$ (even though n>253 results in n! > 10e499).

Re: Pech brings opportunity

*Message #10 Posted by **Gerson W. Barbosa** on 24 Nov 2009, 7:46 a.m.,*
in response to message #9 by Bart (UK)

> Quote:
>
> The 35s happily calculates ${}_{285}C_{283}$ (even though n>253 results in n! > 10e499).

You can find RPN programs for combination and permutation in this old thread. Perhaps they can be converted to Casio fx-7000GB.

Re: nCr program for fx-7000G (GA/GB) (Corrected)

*Message #11 Posted by **Bart (UK)** on 24 Nov 2009, 5:42 p.m.,*
in response to message #10 by Gerson W. Barbosa

Hi Gerson,

Thanks for that link. I took Eamonn's (well commented) 31-line HP-25 program and converted it for the fx-7000G.

```
"N"?->N:"R"?->R
R<(N-R)=>R->X:(N-R)->X
1->D:1E-3->C
Lbl 1
X=0=>Goto 2
C*N->C:C/D->C
N-1->N:D+1->D
Dsz X:Goto 1
Lbl 2:C*1E3
```

I've tested it for a few datapoints (including C(90,7)) and it seems to give the correct answers.

EDIT:
Errata:

It seems that the comparison R<(N-R) doesn't work and (N-R) is always put to X. So I have modified it:

```
"N"?->N:"R"?->R
N-R->X:R<X=>R->X
1->D:1E-3->C
Lbl 1
X=0=>Goto 2
C*N->C:C/D->C
N-1->N:D+1->D
Dsz X:Goto 1
Lbl 2:C*1E3
```

This has also saved me 6 steps. Also I thank you all for thought provoking discussions.

Re: nCr program

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 25 Nov 2009, 10:26 a.m.,*
in response to message #12 by Ángel Martin

Hi, Ángel;

I did not check for this, so I decided to ask first: can this code replace current SandMath-5 nCr code, I mean, enough room and compatible structure? This way, updating current

SandMath-5 would be possible... or not?

Thanks.

Luiz (Brazil)

Re: nCr program

*Message #14 Posted by **Ángel Martin** on 25 Nov 2009, 2:32 p.m.,*
in response to message #13 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Yep, same place, same FAT entry, and compatible with everything else in the module. In fact, this rewrite has one less word of code so we also gained some space :)

It wasn't too difficult, I guess I lucked out this time...

Best wishes, AM

Re: nCr program

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 25 Nov 2009, 2:46 p.m.,*
in response to message #14 by Ángel Martin

OK, Thanks!

I'll update mine and save it with a different revision code (next letter in the current version)... If you have a different code for it, please, let me know.

That´s the first ROM image I update myself! <=^) (and another one to the collection)

Cheers!

Luiz (Brazil)

Re: nCr program

*Message #16 Posted by **Bart (UK)** on 25 Nov 2009, 6:39 p.m.,*
in response to message #12 by Ángel Martin

Ángel,

Thank you for sharing your code. Unfortunately I am not a 41-er or MCODE-er, but I see the Museum CD has "M-Code for beginners" book on it. Your code has both nCr and nPr with error trapping, so I may well come back to this in the future.

Regards,
Bart

Re: nCr program - MCODE

*Message #17 Posted by **Karl Schneider** on 27 Nov 2009, 5:23 a.m.,*
in response to message #12 by Ángel Martin

Hi, Angel --

I've been interested in your HP-41 Sandbox product, but never took the initiative.

Combination and permutation (nCr, nPr) are a good illustation of all that goes into a rigorous implementation of a straightforward calculation:

1. Check that both n and r are verifiable non-negative integers
2. Check that n >= r
3. Design the algorithm such that any answer within the range of displayable values (inlcuding exponents) will be provided.
4. Overflow results should be identified as quickly as possible.

I can't interpret your MCODE comments well enough to tell if the program will compute combination (nCr) by the shortest method possible -- namely, using the greater of r or (n-r) to cancel the largest number of multiplicands within n!.

Example:

```
10C7 =  10! / [7!(10-7)!]    7 > 10-7, so
     =  (10*9*8) / (3*2*1)   using 7! for cancellation
     =  10/3 * 9/2 * 8/1
     =  120

        Longer way, using 3! for cancellation:

     =  (10*9*8*7*6*5*4) / (7*6*5*4*3*2*1)
     =  10/7 * 9/6 * 8/5 * 7/4 * 6/3 * 5/2 * 4/1
     =  120

10C2 =  10! / [2!(10-2)!]    10-2 > 2, so
     =  10*9 / 2*1           using 8! for cancellation
     =  10/2 * 9/1
     =  72
```

The chain of multiplication should proceed right-to-left, with the largest quotients, so that overflow conditions are identified sooner.

HP calc's take this approach, I believe, because statistical combination or n and r always seems to take longest when r = n/2 -- doesn't matter whether r! or (n-r)! is used for cancellation, so more quotients are multiplied than if r is near either zero or n.

-- KS

Re: nCr program - MCODE

*Message #18 Posted by **Marcus von Cube, Germany** on 27 Nov 2009, 10:05 a.m.,*
in response to message #17 by Karl Schneider

Karl, since we know that nCr and nPr are integers, it seems like a good idea to round the result to the nearest integer at the end of the calculation. Through the divides, rounding errors might have crept in.

Re: nCr program - MCODE

*Message #19 Posted by **Ángel Martin** on 27 Nov 2009, 10:22 a.m.,*
in response to message #17 by Karl Schneider

Hi Karl, glad to see you posting on this topic.

Good points indeed about the rigor that should be used when writing this type of functions, be that MCODE or not. It's just good programming practices (GPP) but frequently get overlooked or abandoned for different reasons (not enough available space, being tricky or simply lazyness).

I have made a few improvements to the posted code that didn't get done precisely for lack of space. The SandMath is packed to its seams so I had to re-arrange some blocks to make it fit.

It now *uses the minimum of {r, {n-r}} to expedite the calculation time*. It also checks that n>r, and that neither one of them is zero. This last requirement is admitedly not universally accepted but I decided to do it this way to follow a more purist approach. Finally, The program would take the integer parts, and will force them to be positive.

The "Out of Range" condition is checked at every multiplication, so it's determined as soon as possible. The algorithm works within the nummeric range of the 41. (like it'll calculate 335C167 without problems). The chain of multiplication proceeds right-to-left, with the largest quotients first.

I'm not doing any rounding as I'm not completely in agreement with such an action - probably my own apprehension but I'm yet to find any result with fractional part.

Will post the listing in a new article in the corresponding section of this forum.

Best wishes, ÁM

What about C(7,3) = (7/1) * (6/2) * (5/3) ?

On my 15C, I get 35.00000001 as a result. The built-in function returns 35 as an integer.

Re: nCr program - MCODE

*Message #21 Posted by **Ángel Martin** on 27 Nov 2009, 4:12 p.m.,*
in response to message #20 by Marcus von Cube, Germany

Heres's straight (copy - pasted) from my V41:

35,00000000

my MCODE function calculates it as:

5/1 * 6/2 * 7/3

Cheers, AM

in response to message #21 by Ángel Martin

AM, you're lucky. :) It depends on the arrangement of the numbers. I'm pretty sure there will be combinations that lead to non integer results.

Re: nCr program - MCODE

*Message #23 Posted by **Ángel Martin** on 28 Nov 2009, 8:01 a.m.,*
in response to message #22 by Marcus von Cube, Germany

You're quite right Marcus... here's one that suffers from the non-integer illness:

C(33,7)=4.272.047,999

whereas the result should be of course 4.272.048,00

So I guess some rounding is in order after all?

Always fascinating this calculator world...

Re: nCr program - MCODE

*Message #24 Posted by **Marcus von Cube, Germany** on 28 Nov 2009, 8:06 a.m.,*
in response to message #23 by Ángel Martin

I'm asking myself what will happen for larger results? Due to the limited precision there might creep in quite reasonable errors. Have you (or anybody else) checked with a symbolic calc like the 50g? This cannot be overcome with rounding to the next integer because these errors might occur at numbers >= 10^10.

>
> Always fascinating this calculator world...

You can avoid the rounding error by doing two multiplications before you start dividing. So C(33,7) is computed as:
27*28/2*29/3*30/4*31/5*32/6*33/7

where the operations are performed from left to right. The result of each step is guaranteed to be an integer (I think!). You start by multiplying two consecutive integers k*(k+1). One of these is odd, so dividing by 2 gives an integer. Multiply again by (k+2) and you're guaranteed to now have a factor of 3 in the numerator, etc.

Good lateral thinking (actually not so lateral but very much to the point). I'm however weary of the prime numbers in the sequence, won't that throw the whole idea to the drawing board again?

Maybe my intuition isn't what it should though...

Re: nCr program - MCODE

>
> Maybe my intuition isn't what it should though...

I think it's still okay. Basically it computes C(28,2), then C(29,3) then C(30,4) ... to C(33,7). Each of these is an integer and since each one results from a single multiplication followed by a division, the results must be integral also.

Not exactly a PhD proof I suppose.... :)

Dave

Re: nCr program - MCODE

*Message #29 Posted by **Egan Ford** on 28 Nov 2009, 3:04 p.m., in response to message #27 by Ángel Martin*

> Quote:
>
> Maybe my intuition isn't what it should though...

This may or may not help. But...

Take, say, 7 consecutive integers. Now take the set of all integers. Since every 7th integer is divisible by 7, and every 6th by 6, etc..., then if you have 7 consecutive integers then somewhere you overlap with the sequence of one in every 7 numbers. Same for 6, 5, etc...

E.g. take the sequence:

29, 30, 31

Two prime numbers. Based on the argument above at least one of the three must be divisible by 2. Same for the number 3. In this case its 30 for both.

As you continue to multiply the next number in the sequence you can be certain that the product will be divisible by the number of elements in your sequence, e.g.:

29, 30, 31, 32

4 must divide one of them. 32 in this case.

29, 30, 31, 32, 33

5 must divide one of them. Again 30.

It gets interesting with the 6th number:

29, 30, 31, 32, 33, 34

6 must divide one of them. Again 30, but 30 is all used up with 2*3*5. No worries. 1 divides 29, 2 divides 32, 3 divides 33, 4 divides 32, 5 divides 30, 6 divides 30. As you continue to multiply numbers you gain more factors and once multiplied

you lose any memory of what number provided what factor.

Re: nCr program - MCODE

*Message #30 Posted by **Werner** on 29 Nov 2009, 7:39 a.m.,*
in response to message #23 by Ángel Martin

```
I'm totally unfamiliar with MCODE, but I think your code
performs the division, then the multiplication.
If you were to calculate C(33,7) as
33/1*32/2*31/3*30/4*29/5*28/6*27/7,
all intermediate results are integers (and they would
always be, except when they grow larger than 1e13)

A link somewhere above lead to an RPN program I posted
for the 41,
that will return integer results if the result < 1e10
(without the need to rounding),
and will not overflow if the final result < 1e99 even if
an intermediate result is larger,
as is the case with C(336,168).  That trick is probably
not necessary in MCODE.

Hoping my 41CX Found a good home

*Message #1 Posted by **Norman Dziedzic** on 16 Nov 2009, 9:59 p.m.*

I think it was about 10 years ago, after serving me well through college and grad school, I auctioned my 41CX thinking not much of it.

Shortly thereafter, I realized I could not live without RPN and bought a 32SII on auction and a manual for it.

Now years later after playing with some online emulators I get a 35s and have the hp bug again. Kicking myself for selling the 41CX. I had a Memory Card, the Math/Stat Card, the original box and even the receipt from the original computer nerd store (at least around Chicago): Elek-Tek. Everything in Mint condition.

I nearly hit a co-worker when he casually told me his sister lent him a 15C and he lost it. <ARGH!>

Glad I found this site and some others to bring back the memories and hoping my old 41CX is in a good spot.

nOrM

in response to message #2 by Martin Pinckney

Not sure I could afford it back now ;-)... and it wouldn't be "mine."

I'm starting out asking friends for unused hp calculators to see what I get. Maybe pick up some of the currently available models that are more affordable.

Re: Hoping my 41CX Found a good home

*Message #4 Posted by **Egan Ford** on 17 Nov 2009, 2:04 a.m.,*
in response to message #3 by Norman Dziedzic

There are some great 41CX emulators for phones, PDAs, and computers. I know its not the same as touching an actual 41CX. But its still a 41CX and they usually come with all the modules.

Re: Hoping my 41CX Found a good home

*Message #5 Posted by **Dan W** on 18 Nov 2009, 6:43 p.m.,*
in response to message #4 by Egan Ford

Do you have a record of the serial number? Who knows, maybe someone here has it.

Re: Hoping my 41CX Found a good home

*Message #6 Posted by **Norman Dziedzic** on 19 Nov 2009, 7:32 p.m.,*
in response to message #5 by Dan W

That was sort of my hope.

Alas, I do not have the serial number. I do remember I included the Sales Receipt from Elek-Tek in the box when I shipped it (not sure if I mentioned that in the auction or not).

I'm slowly starting my own collection with more affordable and recent models. So far I have 32SII, 35s, 38g, as well as a 12c and 10BII on the way.

My luckiest find so far is a friend overseas with a 42s sitting a drawer that he didn't want and will ship to me without cost. He will be getting some Chicago professional Sports Team wear for him and his kids :-).

[OT] A couple Casio "Slim" calcs available (for RPN apps)

*Message #1 Posted by **Matt Kernal** on 16 Nov 2009, 3:36 p.m.*

This is an FYI post, so please take it for what its worth (or not). :-) I have nothing to gain from this financially, or otherwise.

I was intrigued with last week's thread "Is the HP33S the only game in town", in which the Casio FX-9860G Slim calculators came up again. Between the good endorsements (fast, nice display, etc..) and Hugh and Nigel's RPN implementations (Reckon, CasioRPN), I thought it was time to find one for myself for the RPN fun of it.

After seeing them go for around $100 at Amazon, Walmart, etc.. I end up at the the "auction sight". It turns out there is a guy in Indiana, a machinist by trade, that writes and sells Casio FX-7400G calcs with his own preloaded Machine Shop Calculations program(s). Apparently, he's tried out his programs on the hi-end FX-9860G and Slim models and for whatever reason, decided against going that direction.

So.. he has a couple Slim models available for $65 and an "upright" FX-9860G for $55. All are Buy-It-Now sales including shipping (inside the US). The downfall is none include manuals or USB cables, so it makes for a so-so deal overall.

I am expecting mine to arrive in a couple days, so I can't say yet if it is really in "like new" condition. But if you want to take a chance on a Slim model, look for "fx-9860", leaving off the "G" suffix.

<We now return you to your regular scheduled programs>.

Re: [OT] A couple Casio "Slim" calcs available (for RPN apps)

*Message #2 Posted by **Bruce Bergman** on 17 Nov 2009, 1:52 p.m.,*
in response to message #1 by Matt Kernal

Geeks (wwww.geeks.com) occasionally has them for about $50-$60, new in box. You just have to check their site frequently. Once they get up there, they only last for a few days or a week at most.

Great calc, BTW.

thanks, bruce

Re: [OT] A couple Casio "Slim" calcs available (for RPN apps)

*Message #3 Posted by **Matt Kernal** on 17 Nov 2009, 5:23 p.m.,*
in response to message #2 by Bruce Bergman

Yeah, a couple days ago, I clicked on their "Alert Me" icon to notify me when they are in stock again (but I couldn't wait :-).

Did you update your Slim OS from ver. 1.xx to 2? Version 2 for the Slim isn't available from Casio any more, but luckily Hugh put a copy of it on his voidware site. Apparently, it brings it up to fx-9860GII level, less the "surds" functionality. If you need surds, I've also read there is modded version of the

9860GII OS that will install on the Slim, but you'll give up the Slim's Help functionality (maybe because the 9860GII doesn't have Help?).

Back in June, Katie posted here about updating the OS to 2.00, but I'm not sure which version she used.

If you update to ver. 2, I understand you then need to also use their ver. 2 FA-124 PC comm. software.

The important thing for me is to install install one/both of the RPN apps :-)

Re: [OT] A couple Casio "Slim" calcs available (for RPN apps)

*Message #4 Posted by **Katie Wasserman** on 17 Nov 2009, 5:34 p.m.,*
in response to message #3 by Matt Kernal

> Quote:
>
> Back in June, Katie posted here about updating the OS to 2.00, but I'm not sure which version she used.

Casio had the upgrade to version 2.00 for the "slim" model on their website for free download. Some weeks later they changed their mind and took it off. 2.00 runs considerably slower than version 1.xx but adds a lot of functionality like: complex valued matrices and strings.

For reference, here's Casio's Upgrade Site

-Katie

Re: [OT] A couple Casio "Slim" calcs available (for RPN apps)

*Message #5 Posted by **John B. Smitherman** on 17 Nov 2009, 9:25 p.m.,*

HP 42s Stack Save/Restore Tool

*Message #1 Posted by **Dave Britten** on 16 Nov 2009, 1:51 p.m.*

After using 42s on my iPod for a while now, I was getting sick of having to code stack save/restore routines at the beginning and end of every program. So I decided to do something about it!

http://dave.brittens.org/HP42s/StackSave.html

Without repeating myself too much, there are two programs: SAVE and RESTORE. You only have to set a few options before calling either. For example, suppose I were writing a program to calculate a logarithm to any base, which uses two values from the stack and returns one. (An overly simple, contrived example, I know.) At the beginning of the program, I would do this:

```
"LOG"
CF 91
CF 92
XEQ "SAVE"
```

Then at the end of the program, these steps:

```
2
STO "_A"
RDown
1
STO "_O"
RDOWN
"LOG"
CF 91
XEQ "RESTORE"
```

The result would be the T and Z registers from before the program was run being rolled down to Z and Y, with the T register being copied as is the norm for built in functions.

There are some run-time options to control the number of arguments your program takes from the stack, the number of outputs it returns, how to deal with LAST X, and whether or not to save and restore REGS.

Anyway, try it out, see if you can break it, and hopefully my quick and dirty writeup will make a little bit of sense. :)

-Dave

The next feature to implement in the 42s is Undo and Redo. Will probably be out in time for a stocking stuffer.

However, the functionality is not the same as your program, so may not provide the same utility.

Re: HP 42s Stack Save/Restore Tool

41 MCODE: RCL Math Summarized

*Message #1 Posted by **Ángel Martin** on 16 Nov 2009, 3:56 a.m.*

Greetings

Just to let you know that the RCL extensions are complete now, and implemented in the SandMath module (where else...)

Here's a recap of the extended functionality:

1. RCL Math operation includes +, -, *, /, and ^(Power)
2. Operation can be changed during data entry (i.e. change from + to *)
3. Can revert to standard RCL (no math) by pressing the radix key
4. Supports RUN and PRGM modes (suffix is taken from next prgm line)
5. Supports INDirect addressing (RUN mode only)
6. Supports field lengh extender (EEX key) for register over 99 (RUN mode only)
7. Supports shortcut access for address 01 to 10 (top two rows, A-J)
8. Allows NULLing the entry if the last key is kept depressed over the time-out period - same as standard functions.

All in all an interesting usage of partial data entry routines, and a few of other mainframe routines to make the operation intuitive and friendly to use.

Hope you enjoy it as much as I do...

Best, ÁM

Re: 41 MCODE: RCL Math Summarized

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 16 Nov 2009, 4:13 a.m.,*
in response to message #1 by Ángel Martin

Ola, Ángel; ¿que tal?

Congratulations again! You are doing so many things with MCode and I can only envy you... 8^) the best possible, if any! Wishing you always the best achievements, my friend!

Just to ask: although obvious, based on all of your previous publications 'where' we all know it happens, will you also disclose the blueprints with these new implementations? In time: is it still being called SandMath5 or was it re-baptized?

Thanks for sharing your MCode with us.

Cheers.

Luiz (Brazil)

*Message #3 Posted by **Ángel Martin** on 16 Nov 2009, 4:17 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Howdy Luiz, thanks for your kind feedback :).

I think I should rev the module to keep a clean tab of which version has what. So SandMath_5.5 it will be.

And sure enough I'll include the commented source code - believe me, I have no intention to keep it to myself after all the pain to get it done!

Best, Ángel

An idea for repairing Spice series machines with keyboard problems

*Message #1 Posted by **Lincoln R.** on 14 Nov 2009, 11:24 p.m.*

I have an idea on how to solve the issue of erratic behavior and keys not working on the Spice series calcuators. To me it seems the problem with these older solderless models is that the foam between the keyboard PCB and the metal plate is getting old and flattening out, not making good contact between the 2 layers. It might be possible to get rid of this sticky foam, using some kind of adhesive remover, and replace it with a sheet of rubber, maybe adhesive stuff like the bottom foot on the new HP-35s. This wouldn't flatten out as badly as the foam would, and if it was the correct thickness, should give the pressure needed to make good contact.

I'll try this out on my spotty 33E and let people know how it works out.

I tried something else...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 15 Nov 2009, 5:32 a.m.,*
in response to message #1 by Lincoln R.

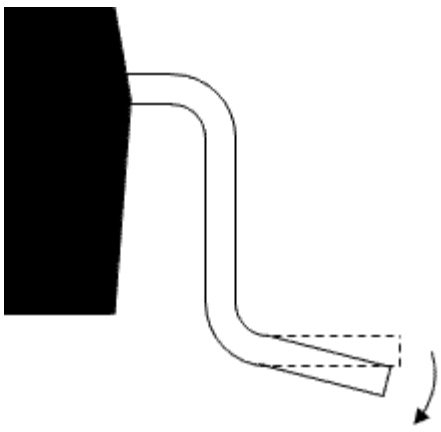
... and had some good results.

Hi, Lincoln;

because of both the HP38C and the HP34C, I devoted some time trying to maintain Spices the best way possible. I have some solderless and other soldered units, and all of the solderless have bad contact in the LED display from time to time.

I once reasoned about the three following procedures which significantly reduced bad contact behavior in the IC´s. In fact, I never saw 'Pr Error' anymore since then.

- polish the contacts of the flex circuit - I use metal polisher and a cotton swab;
- apply a thin coat of any micro oil over the contacts - I use a very thin coat of WD40 spread with a clean cotton swab; it does not avoid the IC´s terminals to touch the surface of the flex circuit and also protects the remaining surface of the tracks against oxidation (not highly efficient, just a reasonable protection)
- slightly bent the tip of the IC´s terminals; look at the drawing below.



With these three basic procedures you may achieve so many good results you´ll probably not need to replace the foam. My four solderless Spices work pretty fine, but sometimes one segment or a whole digit misses. I simply tap it gently in my hand sideways and up/downways and it gets back to normal. The LED display contacts are in the edge and I also slightly bent them, one in the opposed direction of the other (as experts do with saw teeth).

Hope this helps.

Success!

Luiz (Brazil)

Re: An idea for repairing Spice series machines with keyboard problems

*Message #3 Posted by **Randy** on 15 Nov 2009, 10:12 a.m.,*
in response to message #1 by Lincoln R.

The foam is one aspect of the problem, a bigger one is the oxidation of the IC leads from battery outgassing.

So I clean the leads of the IC's and LED array then solder the thing together. End of all problems.

Until the keyboard starts to fail... which it will with continued use.

*Message #4 Posted by **Lincoln R.** on 15 Nov 2009, 11:11 a.m.,*
in response to message #3 by Randy

Ah, OK. Yeah, this entire thing got blasted with Deoxit when I got it, which probably took care of the IC lead corrosion, as well as fixing the problem with some of the LEDs being dim.

Re: An idea for repairing Spice series machines with keyboard problems

*Message #5 Posted by **geoff quickfall** on 15 Nov 2009, 6:50 p.m.,*
in response to message #4 by Lincoln R.

Hello Lincoln,

Sometimes the oxidation actually affects the metal contacts. That is, it is not always a residue that prevents contact but also a surface oxidation of the metal on the contact.

This may require a mechanical removal. Using a fiber glass pen has always worked. It is a mild abrasive, that is very controlable, vis-a-vis how much surface you would like to remove. A clean with denatured alcohol and brush and away you go.

I have restored 6 spice versions this way, all solderless and with depressed foam. The same technique has resurected strange LED dropouts and displays.

Cheers, Geoff

Re: An idea for repairing Spice series machines with keyboard problems

*Message #6 Posted by **Randy** on 15 Nov 2009, 6:51 p.m.,*
in response to message #4 by Lincoln R.

DeOxit: Best thing you can do for a Spice. Great stuff that really works.

WD40: Worst thing you can do for anything calculator related. The only thing it does well is to displace water. Every other aspect of the stuff is a disaster. Had a 42S once that got wet... rather than just take the batteries out and let it dry for a day, the owner sprayed WD40 into the keyboard. End of story and no, it was not a happy ending.

Re: An idea for repairing Spice series machines with keyboard problems

*Message #7 Posted by **Paul Dale** on 15 Nov 2009, 7:07 p.m.,*
in response to message #6 by Randy

I agree WD40 should never ever ever be used for anything. If you think you should use some, don't. Wretched stuff.

Well, it is good for its intended purpose but nobody uses it for just that.

Never heard of this stuff. How do you use it on a Spice keyboard?

- Pauli

Re: An idea for repairing Spice series machines with keyboard problems

*Message #11 Posted by **Randy** on 15 Nov 2009, 7:38 p.m.,*
in response to message #10 by Paul Dale

Remove the IC's from the unit and soak overnight in a puddle of the stuff, it dissolves the oxidation. Reassemble.

Caig Website

PS: I initially thought the stuff was right up there with snake oil. I was wrong, it really does work. That's not to say I agree with all the claims they make but it does play well with calculators.

- Pauli

Re: An idea for repairing Spice series machines with keyboard problems

*Message #13 Posted by **Randy** on 15 Nov 2009, 8:22 p.m.,*
in response to message #12 by Paul Dale

I misunderstood... sorry. Not much you can do for a plastic dome Spice keyboard that is intermittent. The problem is always a cracked metal trace that runs through the flex dome. With use, they fracture. Not something that is repairable.

This is why HP later redesigned the Spice keyboard with the metal snap dome design of the 41 - as it was a known reliability problem.

Re: An idea for repairing Spice series machines with keyboard problems

*Message #14 Posted by **Michael de Estrada** on 16 Nov 2009, 1:02 p.m.,*
in response to message #11 by Randy

I have been using white distilled vinegar to disolve the green crud. It seems to work very well and not damage the circuit board or ICs. Does this stuff work better/safer/cleaner?

Re: An idea for repairing Spice series machines with keyboard problems

*Message #15 Posted by **Randy** on 16 Nov 2009, 4:51 p.m.,*
in response to message #14 by Michael de Estrada

The only difference would be that it would not oxidize solder the way vinegar does. Oh, one other difference, a 25 ml bottle costs about $35 US...

*Message #16 Posted by **geoff quickfall** on 15 Nov 2009, 9:28 p.m.,*
in response to message #6 by Randy

YEP

WD-40, only good for displacing water! Had a friend "oil" a 200 year old Georgian Bracket clock with it! It stopped 5 days later. $560 dollars later I had it running.

DeOxit, must try it, does it preclude a mechanical cleaning and how harsh is it on the traces?

Cheers, Geoff

WD-40 in small (a drop) amounts is great for volume control knobs in vintage transistor radios though. Stops all scratchy volumes dead, a real fix!

Re: An idea for repairing Spice series machines with keyboard problems

*Message #17 Posted by **Randy** on 16 Nov 2009, 7:32 a.m.,*
in response to message #16 by geoff quickfall

DeOxit attacks oxidation. It's plastic safe and non-hazardous, non-flammable. Among other things, it's very good at dissolving/softening green corrosion on classic battery contacts without resorting to abrasion.

Re: An idea for repairing Spice series machines with keyboard problems

New (Cheap!) Voyager Emulators For iPhone

*Message #1 Posted by **Anders Peterson** on 14 Nov 2009, 9:22 p.m.*

I just found a newly released 15c emulator, called RPN-15C, in the appstore. The previously available ones seemed nice, but I was waiting for RLM's simulator to come out. However, when I saw this one and its 4 dollar price tag, I had to download it.

I don't have either of the other iPhone 15c emulators, so I can't compare, but this app works great (key clicks even work on my 1st gen iPod Touch). It has a semi-classic skin (with some additions like visible stack and portrait version), and a fully customizable skin as well.

My biggest complaint would be that the keys are somewhat small and that can't be customized. There are also some small cosmetic flaws, like a couple of the gold-shifted labels run down over the top of the key which looks weird.

The same company, ameloconsulting, also has released versions of the 11c, 12c, and 16c, all between 2 and 4 dollars US. Worth checking out in my opinion.

Re: New (Cheap!) Voyager Emulators For iPhone

*Message #2 Posted by **Egan Ford** on 14 Nov 2009, 11:59 p.m.,*

Click on the medallion. Click "User Defined". Click the right arrow next to User Defined. Use the slider to increase the size of the keys.

I find SCI-15C a bit more snappy and accurate with the keys. I keep missing 'g'. However I like all the features of RPN-15C. E.g. the stack view and the portrait view.

Re: New (Cheap!) Voyager Emulators For iPhone

*Message #3 Posted by **Anders Peterson** on 15 Nov 2009, 12:08 a.m.,*
in response to message #2 by Egan Ford

> Quote:

Thank you. I completely missed that.

I also just discovered there is also some sort of a macro function. Seems like overkill on an already programmable calculator, but I haven't tried it out yet.

Re: New (Cheap!) Voyager Emulators For iPhone

*Message #4 Posted by **Anders Peterson** on 15 Nov 2009, 3:45 p.m.,*
in response to message #1 by Anders Peterson

Just another note of interest. It appears that this company has one more trick up their sleeves. Their 11c, 12c, 15c, and 16c emulators are out, but there is one app still awaiting approval, an app that combines all four emulators into one!

Here is the website: http://sites.google.com/site/ameloconsulting/

Re: New (Cheap!) Voyager Emulators For iPhone

*Message #5 Posted by **Nigel Bamber** on 17 Nov 2009, 5:11 p.m.,*
in response to message #4 by Anders Peterson

Just downloaded the 15c from the App store to my Itouch whilst flying 30000 ft in the air on a Delta flight. Technology is amazing these days.

Seems a cool implementation. I like the portrait view as well as the fact you can customise the colours of the keyboard AND it's cheap . Still to try out the macro feature.

Nigel (posted from the clouds) !

Re: New (Cheap!) Voyager Emulators For iPhone

*Message #6 Posted by **Anders Peterson** on 17 Nov 2009, 5:58 p.m.,*
in response to message #5 by Nigel Bamber

There is a bug with the programming and macros. If you use STO in either of them, it will result in an Error 3 being returned from all registers from 1 to .0. I contacted the developer, and he said that he believes it should be an easy. Apparently, it is only present in the 15c emulator.

Anyway, I am otherwise really enjoying the app.

UPDATE:

I just heard from the developer. He has found and fixed the bug, and will be submitting an update to Apple shortly.

Re: New (Cheap!) Voyager Emulators For iPhone

*Message #7 Posted by **Anders Peterson** on 17 Nov 2009, 6:00 p.m.,*
in response to message #5 by Nigel Bamber

The macro function is great by the way. It works exactly like the programming, except it is much easier to read the lines of symbols and numbers rather than keycodes. Plus you can give your macros actual alphanumeric names.

Re: New (Cheap!) Voyager Emulators For iPhone

*Message #8 Posted by **Dave Britten** on 23 Nov 2009, 3:05 p.m.,*
in response to message #4 by Anders Peterson

ClassicRPN is available as of today. Curiously, the price of the individual simulators has increased a few dollars. However, at $9.99, ClassicRPN is still cheaper than all four individual simulators' original prices combined.

uCalc

*Message #1 Posted by **DaveJ** on 14 Nov 2009, 6:19 p.m.*

I thought I'd start a new thread on this design. So those who don't want to talk about credit card calc design, please ignore.

Two basic design options are presenting themselves:

1) Less powerful design (say PIC18) with high contrast 8 digit 14 segment LCD display window 45mm x 8mm. Thickness can be no less than 4mm.

2) More powerful design (say PIC24 or PIC32) with lower contrast 35mm x 9mm 128x32 dot matrix display window. This would allow 4 lines of 16 characters with an 8x8 font. Bigger fronts are of course possible to compensate for the lower contrast. This is the same display as for the uWatch MK2. Thickness can be no less than 3mm. More expensive by at least $10 in parts cost.

Both designs would be standard credit card dimensions, entirely solar powered (need to get samples and test, but looks possible), possibly have super cap power backup, a standard ICSP programming header on the edge, and a Micro SD card is also possible. And other edge mounted stuff is also possible, like a rocker switch, IR LED etc.

Micro USB connector is only possible on the 4mm 14sgement LCD design.

I see backlight as being pointless on both.

Either design could of course have a powerful processor and Micro SD card etc, but I think all that power is kinda pointless on the limited 8 digit 14segment display design.

Either design can have either a membrane overlay or capacitive touch sense keypad. As many keys as can fit.

The membrane option adds some thickness due to the material and the domes (say 0.5mm minimum), but is possibly much cheaper once NRE is taken out, and people could in theory design their own own to have whatever key overlay they like (it just sticks on the panel).

The cap touch sense is the thinnest option, and no NRE for the overlay. But it does use more power (likely not an issue), and would not have any tactile or key "feel". A flat stick-on adhesive graphic overlay would be an option, allowing users to add their own stick-on custom overlay.

So, a few questions:
1) Who would buy such a thing? (cost say $60-70 approx)
2) What display/thickness option and why?

My initial thought is that thickness should be the main criteria, as much as I love high contrast 7 segment displays. So the more expensive 128x32 dot matrix and cap touch panel seems the best option.

Case is entirely resin fibreglass with a choice of funky colours top/bottom.

I've got all the parts bar the solar cell and am getting rather excited! :->

Discussion please...

Dave.

Re: uCalc

*Message #2 Posted by **Eric Smith** on 14 Nov 2009, 6:53 p.m.,*
in response to message #1 by DaveJ

What is the thickness (3mm or 4mm) you are describing? Surely not the thickness of the entire watch?

I'd buy either one, but I think I'd rather have the dot matrix display and more powerful processor. On the other hand, I do also want the USB interface. Why can't the micro-USB connector be put on the dot matrix version? If that would make it slightly larger (in any dimension), I think I'd still want it.

Yes, it's the thickness of the entire calculator, no protruding bits. It's not a calc watch, it's a credit card calculator, two different projects.

[quote] I'd buy either one, but I think I'd rather have the dot matrix display and more powerful processor. On the other hand, I do also want the USB interface. The Micro USB connector could be added to the 3mm dot matrix version, but it would require a rather ugly cut-out, and not sandwiched neatly between the top and bottom panels.
The dot matrix version could of course be thicker to accommodate just the USB connector. But given that this is a credit card calc, you have to weight up the trade-off.

Dave.

Re: uCalc

*Message #4 Posted by **Eric Smith** on 15 Nov 2009, 1:19 p.m.,*
in response to message #3 by DaveJ

Rather than adding a micro-USB connector, just put four conductive pads at one corner, and route out a slot, so that the corner of the calculator plugs into a USB connector (on a USB extension cable) directly. Some thin "USB key" flash memory devices work this way. 3-4mm may be too thin, though.

Re: uCalc

Ah, neat idea!

Dave.

Re: uCalc

*Message #6 Posted by **Katie Wasserman** on 14 Nov 2009, 7:08 p.m.,*
in response to message #1 by DaveJ

I'm sure I'm in the minority here, but I'd much prefer the higher contrast larger digit display. I don't really want to play chess on a calculator just calculate (and maybe program) so all those pixels and higher speed aren't needed. Besides

> Quote:
>
> 35mm x 9mm 128x32

means each pixel is roughly 270um square (40% smaller than the uWatch LCD) you're going to need a magnifying glass -- if not a microscope -- to play chess on this display.

4mm would make it about one half the thickness of the humble HP 6S solar -- which I think is the thinnest "HP labeled" calculator ever made. Not to mention the only solar powered one.

$60 would be a great price for this!

Re: uCalc

I've found another option, a 44mm x 12mm display window that has a 16 character x 2 line character based only display. Just like the uWatch, but only bigger. It is also only 2mm thick, so the 3mm calc is possible with this option.

Dave.

Re: uCalc

*Message #9 Posted by **Paul Dale** on 14 Nov 2009, 7:51 p.m.,*
in response to message #1 by DaveJ

I'd buy either. Probably more than one.

I'm in a real bind over which I'd prefer. I view a credit card sized calculator as being something to carry around for spur of the moment calculations. It needs to be thin to fit comfortably into wallets etc. It will also need a decent display because these calculations get done in all manner of places & I like segmented displays. The more I think about this point the more I'm leaning towards the thinner with dot matrix display -- an eight digit display is pretty small after all. Still I like contrast.

Either CPU would be fine. I'm not going to be playing chess on it :-) Although it could be the first solar powered chess computer to my knowledge.

Much as I'd like a thinner keyboard, tactile response is more important to me. The power use is moot since there is no battery and the solar panel is adequate. However, I'm not super fussed over this point -- i.e. either is good.

I don't see a huge need for USB connectivity if a micro SD card is present. Without the card, then USB becomes important. So put in a micro SD card.

And RPN only ;-)

- Pauli

The more I think about this point the more I'm leaning towards the thinner with dot matrix display -- an eight digit display is pretty small after all. Still I like contrast.

The dot matrix display can of course be turned into a large readable 8 digit display, it's a just a firmware thing.

The full 4 lines by 16 characters will be incredibly small, I've a got prototype running and you really have to concentrate to see it.

> Quote:
>
> I don't see a huge need for USB connectivity if a micro SD card is present. Without the card, then USB becomes important. So put in a micro SD card.

The USB is useful for firmware updates. Without a USB port, the user has to have a PICkit programmer to change the firmware.

You could you could have a Micro SD bootloader to do firmware updates from the SD card without the USB port, but I don't think Microchip provide such a thing, so it would have to be written.

Apart from firmware upgrade, I agree, I don't see the point is you have a Micro SD card.

> Quote:
>

Re: uCalc

*Message #15 Posted by **Gerson W. Barbosa** on 14 Nov 2009, 9:31 p.m.,*
in response to message #1 by DaveJ

What I've always wanted is a credit card-sized RPN basic scientific calculator (no programmibility, no I/O). Something like that - except for the awful layout:

Solar-powered and high-contrast 7-segment display, as thin as possible.

Re: uCalc

*Message #16 Posted by **Paul Dale** on 14 Nov 2009, 9:51 p.m.,*
in response to message #15 by Gerson W. Barbosa

But with this design, there is no space for the solar cell :-(I also think there are too many keys for fat fingers to press.

BTW, the segmented display is 8 digits total & you're showing a ten digit number.

I think I've fully convinced myself that the dot matrix is the only way to go. I really don't think 8 digits is enough. Sign, two exponent digits and an exponent sign leaves four digits for the mantissa :-(

- Pauli

*Message #17 Posted by **Gerson W. Barbosa** on 15 Nov 2009, 9:29 a.m.,*
in response to message #16 by Paul Dale

> Quote:
>
> But with this design, there is no space for the solar cell :-(

This comes from my own RPN calculator, written in Delphi (don't need it anymore, as nice emulators/simulators became available). Of course, on the real thing the display need not be that wide.

> Quote:
>
> BTW, the segmented display is 8 digits total & you're showing a ten digit number.

I was thinking of a display capable of showing numbers like

$-1.234567890_{x10}{}^{-34}$

the **x10** annunciator and exponent digits being lit when needed. I am not sure whether such display is commercially available though. BTW, the 10-digit number I showed previously was carefully chosen: when divided by pi it is a near integer and each two-digit group is the number of a fine HP calculator, the HP-01 watch in the center :-)

Regards,

Gerson.

> 2) More powerful design (say PIC24 or PIC32) with lower contrast 35mm x 9mm 128x32 dot matrix display window. This would allow 4 lines of 16 characters with an 8x8 font. Bigger fronts are of course possible to compensate for the lower contrast. This is the same display as for the uWatch MK2. Thickness can be no less than 3mm. More expensive by at least $10 in parts cost.

#2 would be more interesting and offer more flexibility. e.g. multiline stack, easier to program, etc... #1 is just an RPN version of many existing credit card calcs. I guess we all have different needs. I have a calc on my phone (many of them). I'm looking for a gadget--something to repurpose.

However...

If the layout is going to be a mini Voyager, well then #1.

> Quote:

That might just be the most important aspect.
If it's going to be popular with people of all sorts, then I think it needs to be more versatile than a 8 digit display. Something people might want to repurpose. Otherwise it's just going to be yet another credit card calculator (albeit the worlds first(?) scientific one). I think it does need to be "gadget" like.

If I was designing it just for myself, then I don't care about programmability and gadget factor, so I'd want just want a high contrast display and scientific functionality.

Dave.

First dreary eyed rough draft of what the uCalc will look like before I head to bed and actually think about it...

This is with the bigger 16x2 line character based LCD.

No thought what so ever put into shift functions or menu/program stuff yet.

Picture this credit card size and 3mm thick.

Dave.

Not bad considering it is a first draft. However, I think the hardware designer and the industrial designer should NOT be the same person :-) I would certainly buy one, better if it cost under US$ 50.00 (so that I don't have to pay an infamous 60% import tax...) I am quite sure there is a market for a credit card-sized RPN calculator.

Looking forward to the real product.

Gerson.

RPN would not be the main feature, the fact it's a credit card sized *scientific* calculator would be the novel thing. I doubt too many people would get too excited about a credit card RPN 4-Banger. And it's open source and reconfigurable too.

Dave.

I thought the fx-98 was that already.

For me a ***programmable*** credit card sized scientific would be the novel thing (ALG or RPN, but prefer an RPN option). Why else have the memory card/IO?

Now if you're counting votes: I'd be happy with the micro SD without USB connector (can use a multicard reader USB pen). As long as I can save/restore programmes, I'm happy.I prefer the dome keypad and think a dot-matrix display would be better for alpha characters.

Can you shift the numbers over one position. Place the basic operations vertically. Put ENTER vertically between the numbers and the sci funcs. Put X<>Y and +/- above the ENTER.

Please?

I like the old school typewriter looking keyboard.

*Message #31 Posted by **Mike T.** on 15 Nov 2009, 6:34 p.m.,*
in response to message #29 by DaveJ

The voyager layout couldn't have been all that bad - after all the HP12C is still going strong!

Obviously an exact copy of a voyager keyboard isn't possible (or desirable) - but the key layout needs to work and be 'logical' with similar functions grouped together vertically or horizontally.

For example -
sin,cos,tan / sin-1,cos-1,tan-1
deg,rad,grd
fix,sci,eng
ln,log,yX / eX,10X,1/x
int,frac,abs
enter,chs,eex,clX
+,-,/,* (obviously!)
gto,gsb,rtn
sto,rcl (defiantly unshifted!)
sst,bst

Fitting that in, and more importantly deciding what to leave out, is probably going to be the hardest part of this project...

Just my 2c worth.

Hello Dave,

A credit-card RPN calculator is a good idea. I'd buy one.

The current prototype picture seems to be missing a y^x key, unless I'm mistaken.

Re: uCalc

*Message #33 Posted by **Walter B** on 15 Nov 2009, 5:33 p.m.,*
in response to message #32 by Paul Guertin

Attractive design for a first draft.

Proposal: replace 10^x with y^x.

Remarks:

- Don't understand yet how you differentiate between STO and RCL. Same for E and PI. Some prefix keys may be inevitable.
- Please use math symbols wherever possible, e.g. for SQRT.
- Credit card scientific is a nice idea. With its RPN option it's even nicer. A nice toy. Maybe a bit too small to be really useful.
- IMHO tactile feedback is a must.
- I'll definitively not play chess with this.

Too early to make a purchasing decision. I know some projects progressing well for quite long time but not showing up with a functional prototype yet. I'd rather see one finished than many dreams started.

I don't want to spoil all the fun you have, but considering I can get a credit card sized calc off ebay for $1, I would not pay $60 - rather $10 for an RPN version.

Secondly, a true credit card calc would have to stay alive in a wallet in my back pocket. Can that even be done?

Anyway, cheers to this great idea!

Every other credit card calc on the market is a 4-Banger.
This has nothing to do with it being RPN, it's the fact that it's a full *scientific* calc, and it'll probably play chess too :->

If there is a scientific credit card calc on the market then let let me know and I'll stop all this foolishness!

> Quote:
>
> Secondly, a true credit card calc would have to stay alive in a wallet in my back pocket. Can that even be done?

No idea, that needs to be tested.
Gotta think outside the square too, credit card calcs don't necessarily have to go in your wallet...

Dave.

While it is true that there are no scientific credit card sized calculators on the market, it isn't true that there haven't been any. The Casio fx-98 for example -- a photograph was posted in the recent form factor thread.

It will be the first RPN capable credit card sized calculator and likely the first in this form factor to play chess and the first solar powered chess computer.

The Casio fx-98 is from 1985. The Casio fx-48 is from 1978, and is even smaller than the fx-98, but has no solar cell. The Radio Shack EC-4009 is an enhanced fx-98.

Both my 31-year old fx-48 and 24-year old EC-4009 still function perfectly, and show no LCD deterioration.

As far as having a micro-SD capability, how would that be possible (especially write operations) in a calculator that is solar-cell-powered only?

You are likely right, I'll only have a few mA available. Maybe enough for a very slow read cycle, but probably not enough for writing. I've haven't looked into low power SD card operation though.

Same with the USB interface which has to run at 8MHz primary and faster internally. Probably not possible with just the one small solar cell.

Dave.

USB supplies copious amounts of power, so there shouldn't be a problem.

A non-writable micro SD card isn't a lot of use but still allows importing things. Could the supercap be used to allow slow writes?

For me, a credit card sized calculator definitely would have to fit in a wallet. Otherwise it would have no appeal to me whatsoever. I would grab a 15C if I only needed a rather small one - or use my phone that I already carry around. So, not-for-wallet-use would be an absolute show stopper.

BTW, the Kadio KD-1005 credit card sized calc was a door prize at this year's conference. Maybe Gene Wright knows where to buy them...

HP 15C style as described above but with a clock (dynamic functions similar to the HP 41C) and alarm. At least 32kb of memory, with the standard RPN like keystroke programming.

Sort of like a supercharged HP-15C (HP41C cross HP 42S hybrid) in a 15C package for the shirt pocket, not my back pocket wallet. 8-)

UWatch is working perfectly!

Cheers, Geoff

*Message #51 Posted by **hugh steers** on 15 Nov 2009, 7:10 p.m.,*
in response to message #50 by geoff quickfall

here is my take on this idea,

firstly, although cc ucalc would be cool, it certainly wouldn't be anything new or indeed have much going for it against historical offerings.

having something as small as a credit card is, i think, not totally necessary. for example, something the size of a voyager is small enough already. In the past i have owned two calculators the size of credit cards. one was a casio (4 banger) and i can't even find a picture of it on the internet. it was literally the dimensions of a real cc, about 1mm thick. i put it in my wallet with my actual cards. after a while it snapped.

the other one was a very beautiful all metal design by sharp. about 2mm thick. i can't find any reference to it on the internet either. it was solar and very, very elegant. i used to carry it in my back pocket and eventually it took on the curvature of my bum - but it still worked perfectly. to this day, i do not know what happened to it. i would like to advance the proposition that what we want here is something not already done; a calculator the size of a voyager (ie pocket sized) with a powerful programming language. a scientific is not enough. we have that already.

as Geoff says, a supercharged 15c!

Re: uCalc, my two cents with spam

*Message #52 Posted by **DaveJ** on 15 Nov 2009, 7:34 p.m.,*
in response to message #51 by hugh steers

To me the Voyager is NOT pocket size, never has been, never will be. Yet many seem to see it as the "ideal" pocket size, I'm not sure why...

The Casio FX-98 is more what I think a true pocket calc should be. The only one that comes close to this these days is that cheap no-name asian one discussed some time back.

The credit card size fixation is only because, well, it's something to shoot for. I could go smaller or I could go bigger. Same for the thickness. To me the project is just an exercise in clever product design which is what I enjoy doing.

IMO a voyager size calc HAS been done before, and you can still buy them, but a credit card size scientific programmable calc hasn't, so I think the CC is actually the more novel idea. Not as practical maybe, depending upon your viewpoint, but it's the more novel.

I don't anticipate anyone actually putting it in their wallet and bending the thing, obviously it won't survive as the LCD glass will likely just crack.
So what's the point?, I dunno, it's just cool. I like someone's idea of hanging it around your neck as nerd bling!

The problem is, if you ask a hundred different people you'll get a hundred different answers about what they want :->

Then of course, if you say do a Voyager size calc then there is not as much point making it so thin, so you make it thicker and start adding features, and then you decide you might as well have batteries and a nice alloy case, and then people will want proper tactile keys again, and... etc...

Dave.

Dave, if it fits in my shirt pocket without extending a few inches above the pocket, it's pocket size. The Voyager's are pocket size. The 35s, 33s, 17bii+, all those are not pocket size.

12c going in my pocket.

12c already in my pocket.

I'm intrigued by what you are doing, and I commend you for it, but the thought of a calculator the size of a credit card with 8 buttons going across it, I don't know, these old fingers probably can't do that. The few credit card sized calcs I have seen and used I eventually threw away because (a) the buttons were too close to each other for these old fingers, and (b) the LCD display was generally so tiny that I had trouble reading it. They were just impractical, from a usability perspective. The Voyager buttons are easy to press and the display is, to me, just right. And the 12c, while a financial calculator, is RPN keystroke programming at it's simplest and is the finest made today.

But I'll follow your project because I am intrigued and you know what you're doing!

Don

The actual fact it can fit in someones pocket is, to me, moot.

"Pocket size" to me isn't just about fitting in some shirt pocket, it's about being generally as small as can be so it doesn't take up as much room wherever you put it. In a pocket, on the desk, sitting on a catalog or datasheet etc

The voyager just isn't small enough IME. The Casio FX-260 solar is smaller than a voyager for example, and that ain't the only one on the market.

> Quote:
>

and see how it pulls the shirt down.

I'm with Dave on this one. Although the Voyagers and Pioneers are probably the most pocketable HPs, they are still bulky to always have with you everywhere (and no, I don't carry my 48/50 like a Smith & Wesson).

That's why I like the CC uCalc idea, it can be put in the pocket and all but forgotton about (until needed of course!). Now for me to whip it out and do some k-of-n reliabilty calc or other useful stuff in my field (whilst in a meeting / at a customer), I'd like keystroke programmability. 8K would probably suffice. No RTC needed for me.

Dave might be able to answer this (at least in time anyway).

How much headroom is there in the power supplied by the solar cell? I.e. will this be usable indoors? I've found a 4mm thick one but there are complaints about the solar cell not powering it unless there is lots of light. Interestingly, the 7mm thick one doesn't have these complaints.

- Pauli

Re: uCalc

*Message #59 Posted by **DaveJ** on 16 Nov 2009, 6:03 a.m.,*
in response to message #58 by Paul Dale

The one I'm looking at is rated at 12mA @ 1.5V
22mm x 7mm x 1.6mm
The price of the solar cell alone is twice the price of those entire calcs!

Claims to work indoors, but I'll have to get samples to actually test it.

I'd be surprised if I don't have enough juice to run any size processor at 32KHz/250KHz, plus the LCD under any light. If it doesn't work indoors in poor light then the project is probably the tube. I've gone off batteries now!

An RTC might be possible with a supercap just running a seperate RTC chip.

Dave.

Crotch moistening stuff for the fanboys: :->

Well, what do you know...
Change the horizontal key spacing to 8.5mm and the dimensions look perfect for a Voyager style key layout, with extras. Almost as if it was destined to be in a credit card size (this is a true credit card size, not the bigger FX-98/Kadio size)

Yes, complain all you like about the key assignments, it's an example, albeit one I don't mind...

Dave.

> You forgot the stylus holder, which you will need with keys that small.

It's bigger than the uWatch key spacing which had 8mm x 5mm, and I find that perfectly usable, considering the size of course.

I can go back to a bigger layout, but then bye-bye voyager compatability. A more standard 11-12mm layout would give 21 keys in the bank. That's 4-banger territory. Functions can be in menus of course, just like the uWatch, but that kinda sucks.

It's the size of a credit card remember, there are trade-offs...

Dave.

in response to message #62 by DaveJ

It has probably been brought up before, but, why the alpha assignment starting at the bottom with A and working upwards.

Not refering to HP (although they all follow the same standard), but my Aircraft FMS and the ACARS keypad are:

```
A   B   C   D   E
F   G   H   I   J
K   L   M...
```

This would be the first keypad I have seen with the alphabet starting with Z (zee or zed) first and working towards A.

Cheers, Geoff

The membrane makers agree. They couldn't give me a quote, said the 8.5mm spacing was too close.

So it's bigger spacing and/or back to cap touch sense.

I think reality should probably kick in here. Such a spacing is fine on a calc watch, but with the relative luxury of credit card size, a bigger spacing should be aimed for. After all, 25 keys works on the uWatch with all it's powerful features.

My cap touch sense chip supports 24 keys...

Dave.

I believe it is possible to design a usable layout for a non-programmable, RPN scientific calculator with as few as 20 keys. I uploaded an "HP4S" design to this forum a while ago, but I cannot find it at the moment. I think I still have the picture at home, and will upload it again tonight.

in response to message #73 by DaveJ

Dave,

Your original layout had 4 rows x 8 columns. If you drop the 'F' keys above the display (a silly place for keys, IMO) you'll have roughly a 10mm x 10mm space for each key. That's approximately the same spacing that HP uses on the top rows of the 20b -- which is quite usable aside form the lack of key clicks.

Assuming a double height ENTER, that leaves 31 keys, more than enough for a programmable scientific calculator especially if you use 2 shift keys.

-Katie

executive market

*Message #77 Posted by **hugh steers** on 16 Nov 2009, 5:22 p.m.,*
in response to message #1 by DaveJ

half joking observation, for amusement.

Ok Dave, the shocking truth is that you are turning into a calculator manufacturer!

Indeed! But not mass market like HP, TI, Casio, Sharp etc, what you want to address is the exclusive market, the executive market, the celebrity market and the specialist market; the kind of market segment also occupied by designer labels in the fashion industry.

Someone noticed that the head of RBS UK uses a 12C (from photo). But hey, that's not going to impress nowadays. He needs an upgrade. What about city finance types. What do they use when not at their PCs? Their iphones maybe? Surely they'd prefer a more executive device, with buttons on it.

Suppose im an architect, out in the field talking to my clients about a multi billion development. do I pull out a TI or one of the new, low end, HPs when they ask about cost alternatives. No! Either I have to juggle a clumsy laptop or maybe, just maybe, use an old style HP. Those days are numbered. this guy is your customer!

What im talking about is a definite but small market segment of high quality and expensive, executive calculators. Think Hi-Fi, where you get all these little companies, of just a few people, but they're making a business in the expensive but exclusive high end.

Forget low end. You've no chance. You're only route is expensive high end, but superb quality hand held calculators. These must excel in screen, keyboard and build materials. We're talking stainless steel or titanium case construction. Proper metal domed keys and hi-res greyscale screen, that's also good in sunlight and retailing around $500. Really that's still cheap in comparison to smart phone prices, which people seem happy to spend.

Synopsys: Blinged up, supercharged 15c+12c+16c with bigger screen, alpha, usb interface and two programming languages; voyager classic and modern procedural.

… the hard part is dreaming up the model numbers :-)

Would anyone buy one?

yeah, what Hugh said!

Re: executive market

*Message #81 Posted by **DaveJ** on 16 Nov 2009, 6:55 p.m.,*
in response to message #77 by hugh steers

Careful Hugh, you are starting to sound like another Hugh I know! :->

To answer your question first, who'd buy one? Well, not me, nor anyone else on this forum I'm fairly sure. This has actually been discussed a bit not too long ago.

What does that mean? Well, several things are guaranteed with such an approach:
1) Lots of NRE cost
2) No short or mid term return on any investment
3) High risk
4) A very unhappy wife!

Something like what you propose is getting into the steampunk/designer/art category, and really that's something I am not ashamed to say I suck at.
I do really like that sort of stuff, and I'd love to design such a "designer" calculator, but believe I really lack to skills to do so even if I wanted to. I could probably learn, but those kinds of designs take lots of time and NRE.

Don't get me started on high end Hi-Fi stuff, please!

I can't see my calculator designs ever being "commodity" low end designs sold in stores, they will always be niche market higher priced calcs. And the key to getting a niche market is to make something novel.

The reality is that the risk/reward for the high priced high end market is astronomical compared to my current "good enough" calculators for a (much) bigger niche market (e.g. geek toys, uWatch, uCalc) where I am practically guaranteed to get my money back and then some.

Dave.

I vote for superconductive Niobium strips - really cool d8)

Re: uCalc

*Message #85 Posted by **DaveJ** on 17 Nov 2009, 3:32 p.m.,*
in response to message #1 by DaveJ

Here is another go, this time with 24 keys which fits my cheap and low power touch sensor chip.

10mm key spacing.

3 more keys could be added if the membrane idea is possible again.

I rather like this one.
Two shift functions (press once or twice), with the 1st shift your most common functions, and the 2nd shift mostly base conversion stuff.

6 menu keys like the uWatch, but not directly under.

Dave.

Yeah, unfortunately you can't have everything on the dedicated keys. So I was selfish and chose what is most useful to me :->
All the other stuff gets booted to the menu system, which actually worked quite well on the uWatch.

Of course, depending upon what key topology I eventually use, if you want to change the overlay you might be able to. There could ultimately be multiple versions on offer.

The solar cell is on it's way, so I can see what's possible...

Dave.

The two line display lends itself to Free42, I'd be interested in playing with a port if the key configuration is compatible, or can be made to be compatible with a different overlay.

Re: uCalc

*Message #92 Posted by **Anders Peterson** on 18 Nov 2009, 8:28 a.m.,*
in response to message #90 by DaveJ

I can understand the limitations of such a small piece of hardware. Still it is always nice to have a "E+" (pretend the E is a sigma) key, and dedicated stats registers. I suppose I could be asking too much, and maybe I am spoiled, but all my RPN calcs have had that :)

Anyway, very cool project, and I'm sure it will be a fantastic calculator one way or another.

Re: uCalc

*Message #93 Posted by **Katie Wasserman** on 18 Nov 2009, 9:59 a.m.,*

> Quote:
>
> all my RPN calcs have had that

I wish that were the case for all the RPN calculators that I have, I'm referring to the 17Bii, 20b in particular. Unfortunately, the ones with list-based stats don't have Sigma+ and dedicated stats registers and are harder to use for simple statistics. List-base stats are really only useful on larger data sets and I doubt that anyone would work with those on a calculator.

Hi, Dave. Sometime ago I reached at your incredible watch! It was a great surprise to me see that someone could have done such work! After the surprise, I think about your project and could only complain about it hasn't programm capabilities and, of course, the R/S key. As you are a geneous in this area, I believe, in my opnion, that two models: one with chess and other games and another programmable, with other great functions, like timestop, watch and calendar, as in your watch. A usb connection is great, as you say, in the case of firmware upgrades and to receive programs (somthing like the 41C modules, but only the files being transfered to calc). I would just try do not crow the keyboard and use some function keys and a soft menu associated to them... of course, in programs I could use such capability too (like 48 series). Any way, even it was done of wood, I would by one, as it is a piece of human inteligence, fitting or not into my wallet (in my college time, I was very proud of carrying my 15C in a special wallet). Put me in you your list! Artur

> Cheers, Bob

Everyone is going to have quite different requirements, that is why it's almost certainly not possible to please a majority with the layout and functionality.

The good thing is that it is open source, so if you don't like the way it works then you can change it to suit your needs.

And hopefully you'll just be able to stick on an overlay to get any look or key layout you like.

This should be interesting, I'm looking forward to getting the solar cells in the next day or so and playing around. Then hopefully some prototypes will emerge that should be pretty close to the final product.

Dave.

There effectively is no enclosure, the board itself becomes the case. It should actually look like a credit card, this isn't just what the font panel will look like, it what the entire calculator will look lke:

3mm thick if my plan works.

Dave.

Here we go! All the fun starts with a proper display. If you need some small fonts (6 or 7 pixels high) there are proposals also beyond Luiz' work.

Well, so much for solar power

*Message #107 Posted by **DaveJ** on 19 Nov 2009, 8:30 p.m.,*
in response to message #1 by DaveJ

I just tried my solar cells, and well, it was pretty disappointing. These are supposed to be primo parts, with the cost to boot. But all I could manage, even with 5 of them in parallel was 170uA short circuit current at my work desk (which is surrounded by big windows).

My 132x32 graphic display alone needs 140uA @ 3V.

In full sun and outside in the shade or near a window they are fantastic, I could run a LED torch direct, but that doesn't help much.

Could possibly work with some form of storage like lithium ion, but if it's flat you have to wait for it to charge up first. Not exactly a good practical solution though.

So it's looking like solar is only fully practical with maybe the 14 segment display and a flea power processor. And then you'd have to scrap the touch chip anyway.

sigh

Dave.

Can I ask how big your solar cells are? It doesn't sound right. If you only need 140 micro-Amps, then there are cells that should be able to deliver that that are only 1mm on a side. You'd then have to hook up about 4 (probably 5 to be on the safe side) in series to get over 3 volts.

Re: Well, so much for solar power

*Message #120 Posted by **John Noble** on 20 Nov 2009, 3:05 p.m.,*
in response to message #119 by Crawl

In full sunlight with 16% efficiency monocrystalline solar cells, the theoretical output should be around 160uW/mm^2 ... but under typical domestic indoor lighting, a quick guesstimate (based on photographic exposure values) tells me that you might get 160nW/mm^2 (in photo parlance, 10EV difference or about 1/2^10). This ignores the cell's spectral response and possible non-linear output vs. illumination level.

From this I'd expect a 5 X 20mm panel to put out c. 16uW or less in your living room and up to 16mW at noon in your front yard.

This all reminds me of when I used to wait tables in a coffee shop (late shift). We had a lot of college students who came in for late night cramming sessions, and one night one of them kept lighting his butane lighter and holding it over his work. Finally, I came over to see what he was doing. He said he couldn't get a square root on his solar powered calculator unless he flicked his Bic. Good thing he didn't try any big factorials--he would have had to burn the place down...

DATASHEET

These were the best ones I could find on the market.

I need say 200uA @ 3V (600uW) to run the LCD and processor. At least double and maybe more for the touch chip.

Like I've said, it may be possible with the 8 character 14 segment display, a flea power micro, and membrane keypad that takes no power. But the usefulness is limited, and the membrane keypad requires $400+ NRE.

Dave.

in response to message #121 by DaveJ

Yeah, the incredible dynamic range of your eyes can be misleading when trying to estimate where/when PV cells will work.

Lithium primary cells store a lot of power, but you'd have to make arrangements for removal/replacement and that might add bulk.

Maybe a Li-poly, or Li-Ion coin cell, with USB charging? They'll hold a charge for quite a while and there's plenty of single chip battery management solutions.

Cheers, Bob

in response to message #107 by DaveJ

Another thought, the 14 segment display and a second smaller 7 segment display in the two and a half digits to four digits range. This would solve the lack of digits nicely.

Not a bad idea at all.
I like separate exponent displays.
I took a quick shot of some segments I was able to light up with static charge on the 14segment display to show the contrast:

It's darker than the image shows, very nice contrast.

Disadvantages of a 14 segment display version, apart from only 8 digits + exponent, are increased thickness (4mm + membrane/domes), lower power processor (say MSP430 or PIC nanowatt), plus significant NRE cost for the membrane metal dome keypad. But complete solar power would be possible I think.

Dave.

Me too, ever since I first got my now long dead Casio FX-602P. Are 2.5 - 4 digit LCD displays available in a size that will fit?

> Quote:
>
> Disadvantages of a 14 segment display version ...

These aren't really disadvantages if the alternative is something that cannot work :-)

If the keypad NRE is going to be too bad, I'm sure some donations would be possible. I certainly would be willing too.

*Message #126 Posted by **Marcus von Cube, Germany** on 21 Nov 2009, 11:30 a.m.,*
in response to message #125 by Paul Dale

I'll opt for the battery (or even dual) powered version, especially if programming or list based operations are involved. A low profile Li cell with a slot-in mechanism would be fine for me.

solar power plus rechargeable coin cell?

*Message #127 Posted by **designnut** on 21 Nov 2009, 11:12 p.m.,*
in response to message #126 by Marcus von Cube, Germany

I have a watch that uses a coin lithium solar rechargeable cell. it shuts off in the dark, keeps time and resets from WWWB time signals. I see coin rechargeables seem available, even to the CR2032 size used by HP calculators. Even a small rechargeable might suffice. sam

HP41 Coconut: LCD blanks in Standby mode

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 14 Nov 2009, 9:05 a.m.*

Hi, all;

as you may have noticed, I am struggling to get back as a regular contributor, but I'm still trying to find balance while remembering how to ride the bike... Takes some time, though.

Well, now for the question: does anyone remember (or know) which capacitor in the HP41 coconut (fullnut) acts as timer for the LCD module while the calculator is in standby mode? I have an HP41C that suddenly decided to behave like this: LCD contents flashes briefly when contents change, otherwise it is blank. I remember reading about this some years ago, but I did not find the posts about this (it´s been a long time not riding the bike...). The mainboard can be seen here

Thanks!

Luiz (Brazil)

Re: HP41 Coconut: LCD blanks in Standby mode

*Message #2 Posted by **Randy** on 14 Nov 2009, 10:09 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

It's the small red 470 pf cap on the lower left side of the board.

Older display drivers with the square caps, not the later epoxy blob covers, use a 0.01 uf capacitor in this position. Using the wrong cap will cause problems. There is more info about this in 41C service manual available from TAS. Look for page 41C-13 dated 11/21/79.

Re: HP41 Coconut: LCD blanks in Standby mode

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 14 Nov 2009, 10:55 a.m.,*
in response to message #2 by Randy

Thanks a mil, Randy!

I´ll soon grab the soldering iron and transplant a new one ;-)

Cheers!

Luiz (Brazil)

HP41C Coconut: OK, now! 8^)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 14 Nov 2009, 12:36 p.m.,*
in response to message #2 by Randy

Hi Randy, guys;

before going ahead with the replacement, I decided to inspect the mainboard and found some remaining varnish covering part of the contact related to the 470pF capacitor. It was probably OK but I consider that the PCB shifted sideways enough to isolate the contact. After cleaning and polishing, I rebuilt it and it is working fine.

Thanks, Randy!

Cheers.

HEPAX chain broken - and fixed

*Message #1 Posted by **Geir Isene** on 14 Nov 2009, 7:22 a.m.*

Equipment = HP41CX with NoV-64 and HEPAX file system in blocks 8, 9, A and B. ICEBOX in C and CCD OS/X in D. Blocks E and F open for plugin modules in port 4.

I discovered two days ago that although I could do Cat 9 and Cat A and run the programs in that part of HEPAX memory, these programs would not show up in HEPDIR. I discovered this as I was trying to purge one program residing in HEPAX memory in block 9 and the operation errored and told me it could not find the file. HEPDIR would show programs in block 8 and B only. Blocks 9 and A was left out of the chain.

I consulted the HEPAX manual and found the way to remove a block from the HEPAX chain. It says to write h300 to address xFF3 and h000 to xFE7 and xFE8. If the block is part of the HEPAX file system, the address xFF3 should contain h200. In my broken chain of HEPAX blocks all these addresses (8FF3, 9FF3, AFF3 and BFF3) contained h200 as it should - presumably to indicate the block is a HEPAX block.

This must be known somewhere, but I just couldn't find it: The addresses xFE7 and xFE8 does the actual chaining of the HEPAX file system. The address xFE7 shows the previous block in the HEPAX chain while xFE8 shows the next block. The first block in the chain will have xFE7 contain h000 and the last block will have h000 in the address xFE8.

In my HEPAX file chain, the addresses would be like this:

8FE7 = h000
8FE8 = h009

9FE7 = h008
9FE8 = h00A

AFE7 = h009
AFE8 = h00B

BFE7 = h00A
BFE8 = h000

Needless to say my broken HEPAX chain had different values at these addresse, stringing blocks 8 and B together while leaving blocks 9 and A in limbo. Block 8 had h000 and h00B while block B had h008 and h000. How this happened I don't know. I would suspect a HEPAX bug.

This also shows how it is possible to use blocks in the middle of the HEPAX chain for other purposes. It also show how you can protect a HEPAX block from having programs in there deleted - simply by leaving that block out of the chain.

Don't know if this is redundant or valuable to anyone. Just wanted to write it down somewhere.

HEPAX chain broken: I have a closer problem

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 14 Nov 2009, 8:40 a.m.,*
in response to message #1 by Geir Isene

Hi, Geir;

I have a NoV-32 that has some weird behavior, too. It installs in block 8 everytime I turn the HP41CV ON, and this breaks the chain in a different way:

```
8FE7 = h00B
8FE8 = h009

9FE7 = h008
9FE8 = h00A

AFE7 = h009
AFE8 = h00B

BFE7 = h00A
BFE8 = h008
```

It seems to create an endless loop, but it keeps blocks 9 and A in the chain. Both HEPROOM and HEPDIR return

```
H:NO FILE SYS
```

Even though, CAT 2 shows HEPAX RAM contents, and the programs stored there run with no problems, as if they are stored in regular ROM modules in normal operation.

HEXEDIT allows to edit their contents and system gets back to normal operation after correcting 8FE7 and BFE8 to 000. It goes OK up until the calculator is turned OFF and back ON. In fact, it never turns back ON regularly, I need to press and hold [CLx] while pressing and releasing [ON] at least three times. The display then shows:

```
[CLX       ]
```

and the calculator is back ON, but the chain is broken again (same 8FE7/BFE8 loop). I loaded NoVRAM and NoV32 firmware with no success.

Any suggestions?

Cheers.

Luiz (Brazil)

*Message #3 Posted by **Geir Isene** on 14 Nov 2009, 8:50 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Try starting the HEPAX file system at block 9 with 9FE7 = h000 and end it at B with BFE8 = h000 and see what happens.

Re: HEPAX chain broken: I have a closer problem

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 14 Nov 2009, 9:11 a.m.,*
in response to message #3 by Geir Isene

OK, Geir, thanks; I got it. I'll try it right now.

But what about block 8? Should add 300 to disable it? You see, I once 'found' that HEPAX installed itself in block F... I happened to have CCD-OSX installed and tried CAT all blocks after block B. Surprise! CAT F brought -HEPAX 1D- instead of expected NO ROM!

I´ll post a followup ASAP. Thanks again.

Luiz (Brazil)

HEPAX chain broken: did not succeed!

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 14 Nov 2009, 12:42 p.m.,*
in response to message #3 by Geir Isene

Hi, Geir;

I finally managed to have my HP41C back to work and I tried the suppress block #8 from the HEPAX chain. Because of a simple fact I cannot change the contents of the block #8: HEPAX refuses to go to a lower block, so if I try HEXEDIT 8000 I get

```
HEPAX ROM
```

as expected.

I had the NoV32 reloaded this morning but I´ll try again in another computer. I saw some updates at Diego´s CLONIX homepage and I'll see if there is anything new to try.

Best regards.

Luiz (Brazil)

Re: HEPAX chain broken: did not succeed!

*Message #6 Posted by **Diego Diaz** on 16 Nov 2009, 6:16 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Hi Geir, Luiz,

Good to see your posting back... ;-)

And sorry to join this thread somewhat late but I've got no daily access to the net here.

Most weird behavious like these described inhere are due to "garbage" left behind into any RAM page.

Erasing RAM contents usually turns things back to normal... and then re-progam with latest update.

Let us know the results.

Best wishes from Caribbean Sea.

Diego.

Re: HEPAX chain broken: did not succeed!

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 16 Nov 2009, 8:38 p.m.,*

in response to message #6 by Diego Diaz

Hi, Diego;

thanks for your answer. And yep, I´m trying to keep the status quo as a regular contributor again... Thanks! 8^)

I actually loaded the module with novclr32.hex and tried to check RAM contents after that, but HEPAX was setting itself again at page #8, so when I tried to use CLRAM (with the 'OK' in the ALPHA register) for page #8 I got [HEPAX ROM] instead of having it cleared.

I have already done some extra 'housekeeping', and my NoV32 unit seems to feel better now after being configured with the Novram-H.exe instead of being configured with the (expected) nov-32-h.exe In fact, I actually opened the module and made a soldering cleanup, because a couple of years ago I found a broken tag after trying to use it with no success (weird behavior at that time). Anyway, it is not totally stable. I programmed it with David Assembler and related labels in pages E and F, but everytime I turn the calculator ON it sees only David Assembler (CAT 2), and I have to turn it off, remove and reinsert the module, turn it on, try CAT 2 again, up until it sees HEPAX. I tried it in all four ports and different calculators (halfnut and coconut), but it happens the same. This NoV32 is the same one that had never accepted the second RAM bank, remember? Is there any chance that a faulty RAM IC does that? I thought about removing it and have the NoV32 reduced to a NoVRAM, but I am not sure about which RAM holds the second bank. To be honest, I opened the NoV32 case so many times that I think it will not survive another 'surgery', but I am worried about the need to remove and reinsert it so HEPAX comes to life.

I will load it with the new SW available (dated 2007) at your site and let you know, OK?

Best regards and thanks again.

Luiz (Brazil)

Re: HEPAX chain broken: did not succeed!

*Message #8 Posted by **Diego Diaz** on 16 Nov 2009, 11:55 p.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Hi,

Certainly a SW version update is advisable. I cannot remember how old is your NoV-32 but I'm pretty sure it's from the very early batch. Some improvements in the RAM chips swaping were introduced after that.

If NoVRAM-H.HEX is working as expected then the RAM chip #0 is definitely OK. However, chip #0 turns to be chip #1 in the NoV-32 implementation; therefore, we cannot yet discard a HW malfunction on the other RAM chip.

I can mail you a modified NoVRAM.HEX for testing purposes if you think it can be any help.

Just in case you cannot manage to get your NoV-32 back to fully operating condition, I'll gladly repair/replace it when I get back to the Canary Islands.

Cheers.

Diego.

Re: HEPAX chain broken: did not succeed!

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 17 Nov 2009, 4:54 a.m.,*
in response to message #8 by Diego Diaz

Hi, Diego;

I´m worried about the fact that I extended a surely private conversation to a public domain. Sorry... It was about midnight and I was tired, I should have asked to go ahead with e-mails. Well, let´s do it, then...

linux_lcv [AT] yahoo [punto] com [period] br

Please, send the modified NoVRAM.HEX to this e-mail as well.

About replacing or repairing this NoV32: please, do not worry about this. I would rather buy a new unit and keep this one for testing purposes. It´s been a way of testing calculators as well, so it´s worth having a programmable, all-purpose module. It usually works fine when programmed with common ROM´s (applications) or other controlling ROM´s: CCD, AECROM, M2KROM, David Assembler... But if I want non-volatille RAM i must load HEPAX, and then... And I also have a NoVRAM that works flawlessly, a perfect gem, and two MLDL2000 also fully working.

Cheers!

Luiz (Brasil)

RPN-like STO/RCL on RPL calculator

*Message #1 Posted by **David Hayden** on 13 Nov 2009, 10:07 p.m.*

One thing I missed when moving from a 41CV to a 50G was the ease of storing and recalling variables. To store 123 in register 01 on the 41CV you just type "123 STO 01" (6 keystrokes). You can even use the top two rows of keys as shortcuts for registers 01-10 so the keystroke count is really 5 (1 2 3 STO SIGMA+). On the 50G, the variables are named and they have to be quoted, so the same thing would be something like 1 2 3 ' alpha R 0 1 STO - a whopping 9 keys.

Now it's true that once you've defined a variable, it's accessible from the VAR menu with one key to recall it and 2 keys to store into it (LS followed by the key for the variable), but if you aren't actually IN the VAR menu, then you add 3 keystrokes to get to the VAR menu and back (VAR to get there, LS (hold) PREV to get back).

To get around this, I created the following UserRPL programs STOn and RCLn. If you type "123 1 STOn" then it stores 123 into variable R1. Similarly "1 RCLn" will recall variable R1. If you type "123 'myvar' STOn" then it behaves just like STO, storing 123 in 'myvar'.

More specifically, STOn/RCLn examine the value on level 1 of the stack. If it's a positive integer or a real number greater than zero with no fractional part, then STOn/RCLn will store/recall the variable Rn where "n" is the value on level 1. If there are fewer than 2 values on the stack or if the conditions above aren't met, then STOn/RCLn just call STO/RCL.

With this behavior, you can assign the programs to the STO and RCL keys and your calculator will behave the way I want it to... :)

Here are the programs:

```
«
@ STOn/RCLn RPN-like STO and RCL functions
@ If the stack depth is 2 or more
@ and level 1 is a positive integer or real
@ with no fractional part, then store
@ level 2 in variable Rn where "n" is the
@ integer on level 1.  Pop 2 levels
@
@ If the conditions aren't as mentioned above, then
@ call STO. C-like pseudo code is:

@ if (depth > 1 &&
@     (type == 0. && fractionalPart == 0 && value >= 0||
@      type == 028&& value >= 0) {
@   construct string "Rn";
@   convert it to an identifier
@   store it.
@ } else {
@   STO
@ }

@ The pseudo code relies on C's short-circuit
@ "and" operation. I'll do short-circuit AND
@ like this (for 'A == 0 && B == 1"):
@ A 0 ==
@ IF DUP THEN
@    B 1 == AND
```

```
@ END

DEPTH 1 >
IF DUP THEN
  OVER TYPE 0. ==   @ Is it REAL?
  IF DUP THEN
    3. PICK FP 0. == AND
    3. PICK 0. Š AND
  END
  IF DUP NOT THEN
    DROP
    OVER TYPE 28. ==
    IF DUP THEN
      3. PICK 0 Š AND
    END
  END
END
AND

IF THEN
  RI STR
  "'R" SWAP + "'" +
  OBJ
END
STO
»
'STOn' STO

@ Here is RCLn
«
DEPTH 0. >
IF DUP THEN
  OVER TYPE 0. ==   @ Is it REAL?
  IF DUP THEN
    3. PICK FP 0. == AND
    3. PICK 0. Š AND
  END
  IF DUP NOT THEN
    DROP
    OVER TYPE 28. ==
    IF DUP THEN
      3. PICK 0 Š AND
    END
  END
END
AND

IF THEN
  RI STR
  "'R" SWAP + "'" +
  OBJ
END
RCL
»

'RCLn' STO
```

Re: RPN-like STO/RCL on RPL calculator

*Message #2 Posted by **Stuart Sprott** on 14 Nov 2009, 6:15 a.m.,*
in response to message #1 by David Hayden

David,

I have done much the same thing. I created a matrix called "Regs", it is a 32*1 matrix. That means there are 32 registers. You can make it whatever you like. When created it was full of zeros.

Then I wrote two programs, STOi and RCLi. If you want to say store 2.5 into register 6, then key in 2.5 then

enter 6 and run program STOi. If you want to recall the number in register 9, enter 9 press RCLi. These two programs are assigned to to keys I normally dont use. The two programs are listed below.

STOi << > a b << Regs b a PUT 'Regs' STO >> >>

RCLi << > a << Regs a GET >> >>

Re: RPN-like STO/RCL on RPL calculator

*Message #3 Posted by **Gerson W. Barbosa** on 14 Nov 2009, 7:17 a.m.,*
in response to message #2 by Stuart Sprott

A similar approach, from the *HP-28S Owner's Manual*, page 300:

Registers Versus Variables

Fixed-stack calculators can deal efficiently only with real, floating-point numbers for which the fixed, seven-byte register structure of the stack and numbered data register memory is suitable (the HP-41 introduced a primitive alpha data object constrained to seven-byte format). The HP-28S replaces numbered data registers with named variables. Variables, in addition to having a flexible structure so that they can accomodate different object types, have names that can help you remember their contents more readily than can register numbers.

If you want to duplicate numbered registers on the HP-28S, you can use a vector:

```
{ 50 } 0 CON 'REG' STO
```

creates a vector with 50 elements initialized to 0;

```
<< 'REG' SWAP GET >> 'NRCL' STO
```

creates a program NRCL that recalls the *n*th element from the vector, where *n* is a number in level 1;

```
<< 'REG' SWAP ROT PUT >> 'NSTO' STO
```

creates the analogous store program NSTO.

Re: RPN-like STO/RCL on RPL calculator

Stuart,

I considered this approach, but the values in a matrix must all be the same type, so you can't, for example, store a list in one position and a program in another. I could have gotten around this by using a list, but I thought that would be somewhat slower if the list was very large. Also, if you wanted to store in R100-

R120, you'd have to create items 1-99 in the list anyway.

> Quote:
>
> Then I wrote two programs, STOi and RCLi. ... These two programs are assigned to to keys I normally don't use.

I did something similar in an earlier version, but then it occurred to me that with a little extra code, the program could determine if it should do its thing or just call STO/RCL. Then I could assign it to the STO and RCL keys

Obviously a lot of the code is in this functionality, so removing it will greatly reduce the size of the program.

Re: RPN-like STO/RCL on RPL calculator

*Message #5 Posted by **Paul Dale** on 14 Nov 2009, 6:29 p.m.,*
in response to message #1 by David Hayden

How about a sysRPL version that takes the number as a postfix argument to STO & RCL?

I.e. 123 STO 0 will store 123 in register 0.

Then allow programs and algebraics after the STO & RCL :-)

Is the HP33S is the only game in town?

*Message #1 Posted by **John Noble** on 13 Nov 2009, 9:24 p.m.*

So, I've been working on some amateur astronomy programs with my HP33S and while it gets the job done I'm getting a little tired of jumping through hoops due to (among other things) lack of numbered GOTOs.

But when I look around for alternatives, all I see is the HP35S (a step backward, by many accounts, though it would scratch my GOTO itch), and Casio's fx-5800P. The latter looks like a pretty cool machine, but it's costly to get in the USA. There don't seem to be *any* other programmable scientific calculators on the market. Given my intended use (at night, outside in the damp), a nice old vintage HP isn't my idea of a wise investment.

I really don't want a graphing calculator. I had a HP49G+, but learning RPL just wasn't on the agenda so I sold it to a fellow forum poster. A trip through the manuals for TI's and Casio's graphing calcs was interesting, but it's just so much simpler to XEQ A and get on with my life than to mess around with menus.

I can't be the only one who needs to crunch a few numbers and display a result or two when out in the field, can I? I'd kill for a HP35S that had firmware I could trust, a real time clock, and the ability to save and load programs--heck, I'd even deal with magnetic strips if I had to. A (dimmable!) red backlight would be a bit much to ask, right? :-)

I suppose I'm just bellyaching, but I hold some hope that I'm wrong about the alternatives.

Re: Is the HP33S is the only game in town?

*Message #2 Posted by **Katie Wasserman** on 14 Nov 2009, 12:35 a.m.,*
in response to message #1 by John Noble

You said that you looked at TI's and Casio's graphics calculators, but I'd like to suggest that you re-examine Casio's fx-9860gii or the fx-9860g slim. Both have a fantastic back light which would be great outdoors at night, are pretty easy to program in their BASIC-like language and there are even a couple of (non-programmable) RPN calculators that people on this forum have programmed using Casio's SDK in C++:

from Nigel J Dowrick

Casio fx-9860 slim. One of the best (if not THE best) non-HP calculators out there. And you can download one of the several RPN implementations for it too. Don't argue; just get it. ;-)

thanks, bruce

Katie, Bruce--thanks for the suggestions.

Yes, I have looked hard at Casio's various fx-9860 models. I actually have the PDF manual up in another window as I write this, and I looked at a fx-9860GII (and its little brother fx-9750GII) in person at Best Buy yesterday. They are very appealing, and the price (c. $65.00 for the fx-9860GII at Fry's) is nice.

After mulling it over, however, I decided that my 33S probably serves my needs better. It's smaller, lighter, has greater battery life, is cheaper, and requires the bare minimum of fiddling in the dark.

My math requirements are fairly lightweight: for example, the main program I use computes the altitude and azimuth of a target given the target's right ascension and declination and the observer's latitude, longitude, date, local time, and time zone. The math is limited to HR<->HMS, trig functions and their inverses, IP/FP, and basic arithmetic. My first cut at it runs to c. 200 instructions and uses 6 labels; only two of the labels are executed directly by the user (setup and main program). In use, I just hit XEQ A, enter no more than three numbers, and get my alt/az coordinates in the display.

If I want something more powerful, I have a couple of excellent planetarium applications for my iPod Touch that do everything but look through the scope for me. But I'm getting tired of dropping my nice $300 iPod in the dirt, and if I forget to look away when turning it on I trash my carefully acquired night vision--there's no way to suppress the "Slide to Unlock" screen.

I've gone on at some length to describe my peculiar needs, but I think there are a lot of people with similar demands: a small, rugged, and not too expensive device that can automate numerical solutions in the field with a minimum of fuss.

I still might grab a fx-9860 just to play with it, though. :-)

What is it exactly that turns you off about the HP-35s? I cannot see a single point where it lacks behind the 33s, but a great deal of improvements. And the pouch makes it a reliable travel companion. I used to travel with a 28S or 15C, but trusting vintage collectibles to airline companies is probably not a very good idea. So, what stinks about the 35s?

Get ready for an onslaught!

Just for starters, it is MUCH SLOWER than the 33s at executing programs, and its handling of different bases is horrendous.

Re: Is the HP33S is the only game in town?

*Message #7 Posted by **John Noble** on 14 Nov 2009, 1:32 p.m.,*
in response to message #5 by marais

I'm relying on what seems to be the consensus take here on MoHPC: slower than a 33S, some math bugs--the usual well-known list.

Is the consensus mistaken? I'd love to be wrong about this.

Add missing keystrokes (a hardware, not a software problem) to the list.

missing keystrokes

*Message #10 Posted by **marais** on 14 Nov 2009, 6:00 p.m.,*
in response to message #9 by Thomas Radtke

Missing keystrokes are almost always a software problem that can be remedied. What's so peculiar about the 35s keys? Mine doesn't show that behaviour, but it's a late model.

Re: missing keystrokes

*Message #11 Posted by **Bart (UK)** on 15 Nov 2009, 3:59 p.m.,*
in response to message #10 by marais

One broken key has been reported (up arrow if I'm not mistaken). The more commonly known missing keystroke problem is the lack of an input buffer (S/W). I have confirmed this by typing when the calculator is busy, e.g. 253!. Other HPs come up with the typed numbers in the display. The 35s doesn't.

Marais,

one key of my 35s (CNA72102360) stopped beeing registered despite an audible click. This has nothing to do with software. It's a matter of how hard the key is pushed.

Thomas

Re: Is the HP33S is the only game in town?

*Message #14 Posted by **Paul Dale** on 14 Nov 2009, 6:24 p.m.,*
in response to message #5 by marais

Nothing stinks about the 35s.

I find it is pleasant enough to use (except for base stuff which really is dismal). Speed is okay and much faster than the classic HPs, I don't own a 33s so I cannot compare with that.

Yes there are some bugs, but they are easy enough to avoid. I've never encountered the lock up the calculator ones.

Recently I fed some of them to my TI-59. They have been written somewhere early 80th and could still be read. Not a bad choice, except for the need to maintain the card reader and the current it draws ;^).

in response to message #1 by John Noble

The calculator is the wrong piece of equipment.

Use a PC or a miniature computer, with software. You can get compilers and GUI interfaces for all sorts of programs, from Basic to C etc etc.

I like my calculators, but for doing anything other than trivial stuff or simple stuff for portable use, I go to the computer.

If portability is key, then a small machine is key. Maybe an Ipod or Iphone even.

I haven't had a need to do any non-trivial work on a compact device lately. Is the Iphone the only small device any more? What happened to Windows CE and Palm OS? Maybe they are already obsolete and you should use the Iphone platform.

Maybe the best thing s the tiny sub-laptops with ATOM processors. You have a real computer, only small. Put the BASIC< C++ or whatever on there and write your programs and never look back.

Just my silly ideas. I'd like to hear what you decide.

With respect, a calculator is the *perfect* piece of equipment since you don't have to pay the price in size, weight, cost, battery life, durability, or ergonomics to get a bunch of unnecessary power for the task at hand. My 33S spits out an answer in about two seconds, and the result is both accurate and easy to read. I can hold it in one hand, battery life is measured in months rather than hours, and I'm pretty sure it will survive field use. If I kill it, I'm only out $40 for a new one.

As for software, I don't have to muck around with compilers and a bunch of UI overhead if I want to add features to my keystroke programs. I do this sort of thing for a living, and I'm happy to avoid it when dealing with my hobbies.

> Quote:

I have an iPod Touch, and I referred to some shortcomings above. To add to those shortcomings, winter is fast approaching and I don't think the iPod's touchscreen will work very well at all with gloves.

> Quote:
>

I was a longtime Palm/WinCE user and used them pretty heavily. Both were (and are) terrible platforms compared to Apple's Touch/iPhone. Apple got a lot of things right with their OS X port for small devices.

> Quote:
>
> Maybe the best thing s the tiny sub-laptops with ATOM processors. You have a real computer, only small. Put the BASIC< C++ or whatever on there and write your programs and never look back.

I'm actually typing this on a Atom-powered ASUS eeePC running Ubuntu's excellent Netbook Remix Edition 9.10 Linux distribution. It's a terrific subnotebook, and it's a wonderful platform for my favorite planetarium application (Stellarium). It's a lousy choice for a night under the stars, however: battery life is too short, it's too fragile, and unless I want to drag a table along with me I don't know where I'd put it. In a mud puddle, maybe? :-)

> Quote:
>

Are you kidding? this forum has plenty of users that, well, *use* their HP calculators on a daily basis for "non trivial" work.

> Quote:
>
> Given my intended use (at night, outside in the damp), a nice old vintage HP isn't my idea of a wise investment.

This sentiment is expressed often on here. I admit I do not quite understand it, since *all* my HP calculators are out of production (Pioneers 38g and 48sx), and all of them are for me to use, not collect. Perhaps I wouldn't subject a mint 29c or 15c to such use (if I had one), but my point is I would not rule out an older calc if it otherwise meets my requirements. That's just me.

I don't doubt it. But the fact that, as far as I can determine, there are exactly three "real" programmable scientific calculators on the world market speaks for itself.

Of those three, Casio doesn't even bother to market their seemingly excellent fx-5800P in the USA. HP really has one and a half models, and we probably owe the existence of *those* to the various PE exams' requirements.

You wrote:

"But the fact that, as far as I can determine, there are exactly three "real" programmable scientific calculators on the world market speaks for itself."

Have you considered the Corner Office ATC-139 which seems to be a repackaged version of the Durabrand 828 which was a repackaged version of the Casio fx-7000G which was the first graphing calculator?

It's not much of a graphing calculator since it only uses a small portion of the screen for graphing, but it can serve as a respectable scientific calculator with some interesting attributes:

16 digits- what other machine can do that?

26 memories

400 program steps

10 program areas

Hyperbolics and base changes

Shirt pocket size - about the same size as the Voyagers - slightly longer, slightly narrower and slightly thinner.

A sturdy slip on cover

Really low price

Re: Is the HP33S is the only game in town?

*Message #21 Posted by **Don Shepherd** on 15 Nov 2009, 9:26 p.m.,*
in response to message #20 by Palmer O. Hanson, Jr.

Oh God, Palmer, I bought one of those about a year ago when Walgreens had them on sale for like $5 or something. It was horrible! I couldn't figure out how the programming language worked because the "manual" that described it was a fold-out sheet with a font so tiny I couldn't even begin to make it out. I even tried enlarging it on my copy machine and it

was still too small.

I took it back. Even $5 was too much to pay for that nightmare.

The packaging said something like "just like a TI-83." Believe me, it was nothing like a TI-83.

Of course it isn't "just like a TI-83" because it is really a repackaged fx-7000G. Among other things that illustrates how great the fx-7000G was for its time.

The manual I received was NOT a fold-out sheet but the printing was certainly small. But so is the printing for the manuals for all the low cost machines, unless you happened to get one of the 33s machines when they were on fire sale a couple of years ago.

I admit that I had an advantage in using it since I quickly remembered how to program the old Casios and I still had my old fx-7000G manual.

But if one wants a low cost programmable scientific calculator which is truly shirt-pocket size then a Durabrand 828 (no longer available at Wal-mart) or a Corner Office ATC-139 (to my surprise not available at the Wallgreen's here in Brevard) may be the right machine. The only pockets that the 33s, the 35s or any of the TI graphics will fit into are those on the overcoats we saw on Russian infantrymen back in the big war.

Palmer

*Message #23 Posted by **Don Shepherd** on 16 Nov 2009, 11:17 p.m.,*
in response to message #22 by Palmer O. Hanson, Jr.

Yeah, Palmer, after I wrote that I went rummaging through my closet and, lo and behold, I found that calc. Turns out I didn't return it after all, and it cost about $21, not $5, and you are right, the manual was a little booklet, not a fold out sheet, but the printing was tiny.

One of the problems I had with that calc, as I reminded myself as I was trying to figure out how to turn it on, was that the color of the shift keys did not correspond to the color of the keycap legends. That was maddening, trying to figure out which shift key went with which function in a different color. After about 3 minutes, I

finally figured out how to turn it on. It had some mode settings at the top in which the font was the tiniest I have ever seen. The display was OK once I figured out how to turn it on, but between the unreadable mode text and the shift key color discrepancy and the manual with the font so tiny I couldn't read it, I lost interest in that calc very quickly. It made me appreciate my HP's and my TI's.

The most interesting calc I have come across in the past few months has been the Canon FN-600, which I think Joerg posted a picture of a few months ago. It is a clamshell and when folded is a tad bigger than a credit card, and is about .5 inch thick. The 2-line display is huge, with big lcd numbers and text. It is designed for the person who wants to figure out what his mortgage payment will be but doesn't want to have to remember all the funky sign rules associated with standard TVM. It is a neat shirt pocket size calc. If it were RPN and programmable I would be in hog heaven, but alas.

I picked one up on eBay, from a seller in Korea, for about $62.50, shipping included. His current BIN price is $79.50 (shipping included) and he offers a Best Offer option as well. Another programmable is the Sharp EL-5250, also available out of Korea via eBay.

I have both and find the Casio easier to use and more powerful (it's also got much, much greater memory than the Sharp - 28.5KB vs 4KB). It also features Natural Text display whereas the Sharp does not.

Thanks for the tip. I tracked down the seller and will keep him(?) in mind.

$70-80 would get me one of Casio's graphing models with change left over, and from my quick gloss of the fx-5800P's manual, it doesn't seem that much different in either programming or operation (aside from graphing). Actually, a fx-7400GII is only $35 or so from Office Depot and, again, it doesn't seem that much different from the fx-5800P in actual use (i.e. amount of menu hunting to get stuff done). The fx-7400GII is about the same size as a scientific but suffers by comparison in battery life, I think.

Feel free to set me straight if I'm drawing too many parallels between these models.

Like many others here, I'm sure you'll enjoy the Casio 9860G Slim. The batteries in mine have lasted ages, even with lots of uploading of successive versions of my RPN program! It's also enormously fast compared to the HP-33S or HP-35S. However, don't dismiss out of hand the TI-8x series of machines (I'll get flamed for this!). A TI-83 came into my hands recently. It has a lovely clear display (not as good as the Casio) and a powerful programming language (better than the Casio) which is well integrated with the main calculator screen. The TI-8Xes are impressive. Their main disadvantage for you is probably their size and weight.

Re: Is the HP33S is the only game in town?

*Message #27 Posted by **John Noble** on 16 Nov 2009, 12:52 a.m.,*
in response to message #1 by John Noble

I'm now the proud owner of a shiny new HP35S. I had to see for myself why this calculator has been such a source of controversy around here, and I had a pretty bad GOTO itch that needed scratching.

Now that I've played with it for an afternoon while porting and entering my astrogeek program, I think I can live with it.

On the plus side, GOTO is even more helpful than I expected: I was able to build in some bounds checking tests with nice user friendly error messages without eating up any labels or doing a million flag checks. Nice! Program space is effectively doubled (or more) without undue programming contortions--I can now foresee running out of memory before I run out of labels. Otherwise, it's just like programming a 33S with legible keys. Both give identical answers when running my program.

The case is interesting. I don't know if I like it yet, but I appreciate the pocket for program cheat sheets, etc.

My wife thinks it's the best looking calculator she's ever seen. That's gotta count for something, even if it's coming from the owner of 3 graphing TIs (yes, I married a woman who owns a TI-92+). My uncle's HP97 is *my* standard for beauty, but I was young and impressionable when I first played Lunar Lander on it back in the late '70s.

On the minus side, the 35S runs my program a little more than half as fast as my 33S. Execution times are at the edge of "acceptable", while the 33S almost feels snappy. I'm not happy about the inoperative program checksums, of course.

In the "neutral" category are things like shifted STO (mildly annoying), and XEQ __ ENTER vs. XEQ __ (rather more irritating but I'm already getting used to it).

Thanks for the suggestions, everyone. I very nearly bought a fx-9860GII along with the 35S, but I really have too many electronic toys as it is. I know I'm unique in the MoHPC community in this respect, so have pity on me.

;-)

*Message #28 Posted by **Mike Morrow** on 16 Nov 2009, 9:15 a.m.,*
in response to message #27 by John Noble

Compromise, and buy an $18 Casio fx-115ES (a.k.a. fx-991ES) at the local Walmart, just for its "toy" value. It's not programmable, it's not RPN. Still it's an amazing scientific non-graphing calculator for its price. It's surprisingly well built, has an excellent two-line LCD, has outstanding numerical precision, has numerical integration and differentiation, elementary SOLVE, complex, and matrix functions, has 40 conversion factors and 40 physical constants, is solar/battery-powered, etc.

It's interesting to see what's going on outside the HP arena. I'd love to see an RPN equivalent at a comparable price.

Re: Is the HP33S is the only game in town?

*Message #29 Posted by **John Noble** on 16 Nov 2009, 10:18 a.m.,*
in response to message #28 by Mike Morrow

That looks like a cool little calc, but what's the "=" key for?

:-)

A cheaper/smaller RPN calc would be most welcome, but I simply won't buy a non-programmable calculator. I don't write programs very often on my daily driver (HP-12C), but a short little program can save a lot of labor.

32s problems

*Message #1 Posted by **Lincoln R.** on 13 Nov 2009, 3:46 p.m.*

So, I've obtained a rather well-worn HP 32s (case isn't scratched up, but there's definite wear in the texturing on the edges, and the paint is worn off the metal faceplate around the display bezel and in a few other places). This one was made in the USA in 1988, and all the keys still click properly, but the top row and right column don't register unless you press down below the LCD (I understand the keyboard contacts are located here). I can probably fix this, I've read old posts on here where people have gotten success by adding some paper/tape/whatever behind the rubber strip that presses the keyboard connector onto the PCB, but I'm wondering:

Is the process described in "Pioneer Internals" involving drilling the top 4 heat stakes the best way to disassemble it?

Can I possibly repaint the damaged areas of the faceplate without it looking cheesy?

I don't care *that* much about the cosmetics, I bought it to use, as I need something smaller than my 48G to carry with me.

Re: 32s problems

*Message #2 Posted by **Paul Brogger** on 13 Nov 2009, 5:36 p.m.,*
in response to message #1 by Lincoln R.

The drill-the-heat-stakes-and-pry-it-apart method has worked for me a number of times. You'll want to experiment, drilling only as much material as necessary to start prying the thing apart a the top. Done right, when you stick it back together, you won't see a thing.

I found a permanent marker at an art supply store -- a sort of taupe color -- which worked *pretty* well on scratches on my old brown Pioneers. (Better than paint, at least.)

I suppose a person with an air brush could match the color and finish, and spray through a custom mask, with holes only showing the scratched parts through. (Easy for me to say!)

Good luck. The plain-vanilla 32s has always been my favorite from a design standpoint. What a clean machine!

Re: 32s problems

*Message #3 Posted by **Lincoln R.** on 14 Nov 2009, 12:42 a.m.,*
in response to message #2 by Paul Brogger

Paul,

Thanks for the advice, I was able to open the unit without a problem. I may have slightly bent the metal backing of the keyboard in convincing the bottom heat stakes to let go, but it fits together fairly well. The top didn't want to stay together, but I found a couple of appropriately sized screws to solve that issue. The calculator now works fine (also, on this model, the pad behind the keyboard connector is not a rubber strip

(which would have worked well), but gray stuff that looks like closed-cell poly foam. I put some rolled up double-sided tape behind it.

Now I just have to ask myself... is it worth buying an old 10b just to get the cover to keep a fairly rough-looking machine from getting more battered. At the moment, 10b's seem fairly worthless, so it might be a good idea just for the extra battery door, etc.

Re: 32s problems

*Message #4 Posted by **Randy** on 14 Nov 2009, 8:32 a.m.,*
in response to message #3 by Lincoln R.

You most likely did not bend the plate. The early Pioneers had stamped recesses in the plate for each key and the plates were not flat so I would not be concerned.

The original series of Pioneers, which included the 32S, had cases that received a redesign about a year into production. The way to tell the difference is to look.

Does the keyboard has six .062" pins extending from the keyboard side (at the four corners and two mid case) that engage in corresponding holes in the case back? These pins help to hold the case halves together at the edges. If so, this is the *later* design and any 10B will have a compatible case back. If you don't see pins, the case used a latching detent design which is the original design and trying to exchange the back with the later design will result in a loose back that is only held in place by the eight heat stakes.

HTH...

Re: 32s problems

*Message #5 Posted by **Lincoln R.** on 14 Nov 2009, 10:36 a.m.,*
in response to message #4 by Randy

I have 8 plastic pins, 2 up at the top, 2 on the 2nd row down of heat stakes that's visible with the PCB on, and 4 on the very bottom row of heat stakes, but I don't see anything they engage into on the back, and there are 2 plastic latches about 2/3 of the way down on the sides of the back cover.

I wasn't actually talking about exchanging backs because mine's in good shape, I was more talking about the vinyl slipcover these came with, and stuff like the battery door. Not sure what's up with those pins, this calculator had never been opened before I opened it, unless HP or someone did it and actually replaced/re-heatstaked the covers, but I don't think HP ever serviced Pioneers like that, and

*Message #2 Posted by **Marcus von Cube, Germany** on 13 Nov 2009, 2:51 p.m.,*
in response to message #1 by Saile (Brazil)

The General LBC seems to be quite rare and the unit on auction is in very good shape and rather complete. Think of a 41 with HP-IL module, Printer and tape drive...

If you're the "lucky buyer", will you try to fix the broken display?

Re: A happy buyer :-)

*Message #3 Posted by **Juergen Keller** on 13 Nov 2009, 3:52 p.m.,*
in response to message #2 by Marcus von Cube, Germany

There are even the service manuals included, so you have all the information to keep this thing running in the future ...

Saile, congratulation to this great buy! The orange keys and the light grey case look rather unique compared to other HP calculators. Your collection has a new eye-catcher :-)

alternate documentation for 50G

*Message #1 Posted by **Glenn Becker** on 13 Nov 2009, 9:59 a.m.*

Hi all -

I was wondering if there are alternatives to the HP documentation for the 50G ... something a little more lively, like the Grapevine books for the 48GX, etc.

If anyone knows of any and can recommend (or not), I'd be interested in hearing about it.

Thanks,

Glenn

Update to m48 HP48GX emulator for the iPhone

*Message #1 Posted by **Steve Simpkin** on 12 Nov 2009, 2:27 p.m.*

A new update (V1.1) is available for the "m48" HP48GX emulator for the iPhone/iPod Touch. Markus Gonser's iPhone port of Emu48 now includes 15 new skins (some are variations of the same theme) and a number of new options. The previous skin was very nice but I couldn't read the small lettering for the secondary functions of each key. The new Emu48 Real48 skin fixes that for me. One big advantage of this App over the other two HP48GX emulators available for the iPhone is that the active key press area covers a larger area than just the small key button graphic. There is no "dead area" between keys. If you touch anywhere on the keyboard section of the the screen you will *always* get a key press of the closest button. This makes the keyboard much more reliable for a touch screen calculator. Try entering 1234567890 quickly on all three emulators and you will see what I mean.

Now when the update that allows programs and libraries to be imported and exported (similar to i41CX+ and 42s) is available, this will truly be a complete and powerful tool.

Changes noted by the author: - Skins are now changeable and I already have added some new skins to the app. - More skins can be downloaded from within the app (Make sure to check out the "m48 Starship" after downloading the "m48 Multiskin Standard" package. I have probably watched to much Start Trek during programming that skin :-) Also check out the skin from Staffan Sevón, which he kindly provided! - Added sound support. - New interpolation method for the LCD. Even for non integer ratios of lcd re-size, the result should look acceptable now. - Added more information sections, some of them are online and will be updated frequently: News, Tips'n'tricks, FAQ - Added settings pane, including many settings regarding Emulation, Graphics and Audio. - bugfix: permanent lowercase mode should behave now properly - bugfix: "static" which sometimes appeared should be removed

See more information at his website: http://www.mksg.de/

*Message #3 Posted by **Reth** on 13 Nov 2009, 3:54 p.m.,*
in response to message #1 by Steve Simpkin

m48 Minimal skin makes it usable, which is a big step ahead. LS & RS need to be made visible - probably the arrows should be made white. I like the "alpha" solution. Can't wait for the I/O support. Congratulations for the author.

A useful HP-50G program to keep the DIRs clean...

*Message #1 Posted by **Bill Zimmerly** on 12 Nov 2009, 2:17 p.m.*

Everyone has their personal preferences for organizing their homes, rooms, offices, etc. - even the directories and files on personal computers. I am a neat freak and like things to be highly organized. The way in which the directories and objects on my HP-50G are organized makes it easy for me to locate important things.

I like every directory from HOME on down to be organized like this: alphabetically with directories first and all other objects afterwards.

I like programs to clean up after they are run by making sure that the flags are restored to their pre-run state and I want the VAR menu to always be displayed.

I'm also an automation freak. On my Linux workstations, I have a collection of useful scripts that I wrote that make working with the system very easy. Likewise so for my HP-50G, I have written a series of useful programs that keep things organized the way I like them.

Here is a program I wrote (that resides in HOME) to relist all directories and objects to my liking. I'm posting it here so others may find usefulness with it too...

<< "Relisting the Directory..." 1. DISP {} DUP 'xA' STO 'xB' STO VARS OBJ-> 1. SWAP START DUP 1. ->LIST SWAP VTYPE IF 15. == THEN xA + 'xA' STO ELSE xB + 'xB' STO END NEXT xA SORT xB SORT + ORDER {xA xB} PURGE 2. MENU >> 'ReList' STO

I have it in the HOME's CST list, so it can run in any subdirectory and clean up whatever is the "current" directory.

P.S. Nobody is perfect, so I welcome suggestions for improvement.

Edited: 12 Nov 2009, 2:20 p.m.

Re: A useful HP-50G program to keep the DIRs clean...

*Message #2 Posted by **Dave Britten** on 12 Nov 2009, 3:19 p.m.,*
in response to message #1 by Bill Zimmerly

I use a very similar program on my 48GX. It's actually multiple programs - one of them to do the actual sorting, and one to recursively traverse the whole directory structure.

SORTALL: This is the program that sorts all directories beneath the current directory. It works by stepping through each directory in the current directory, and then running itself from within those directories. After that, it sorts the current directory, and goes back up one level. Run it in HOME to sort everything (except the hidden directory).

```
<< 0 { } \-> P DIRS
  << 15 TVARS 'DIRS'
STO DIRS SIZE
    IF
    THEN 1 DIRS
SIZE
```

```
      FOR P DIRS P
GET EVAL SORTALL
      NEXT
    END PATH 1 DISP
SORTDIR UPDIR
  >>
>>
```

SORTDIR: This is the program that actually does the sorting. The main version lives in HOME, and sorts into an alphabetical list of directories, followed by programs, followed by everything else. The "everything else" isn't alphabetized, to save time.

```
<< 8 TVARS DUP
  IF SIZE 1 >=
  THEN SORT ORDER
  ELSE DROP
  END 15 TVARS DUP
  IF SIZE 1 >=
  THEN SORT ORDER
  ELSE DROP
  END
>>
```

The reason this is a separate program is because I have a different version of SORTDIR stored in some directories where I want special sorting rules. For example, I have a directory with some custom units, and a CST menu. I hide all the actual unit variables by sorting them after an object with a null name, since CST provides better functionality than VAR does for unit menus, where it's rather easy to accidentally overwrite them. Then I have another directory where I only sort a couple program names to the front, and leave everything else as-is.

>
> P.S. Nobody is perfect, so I welcome suggestions for improvement.

Bill,
You can replace "xA + 'xA' STO" with "'xA' STO+"

On the non-programming side, here's a trick for sorting things when the sort order isn't alphabetic. Prefix the name with a number. For example, sometimes I need one subdirectory for each month, so I call them 01Jan 02Feb 03Mar etc.

Thanks for sharing this utility.

Dave

HP17b Solver Function

*Message #1 Posted by **Roland Storz** on 12 Nov 2009, 10:08 a.m.*

Hi all,

does anybody know whether the functionality of the HP17b Equation Solver is available for the iphone / ipod touch?

Both the i41cx+ and the 42s emulation are unquestionably excellent, however, me personelly I do miss the easy to use solver function of the 17b. In my eyes specifically the solver function of the 42s is not that efficient compared to the 17b.

Any advice?

Cheers, Roland

Re: HP17b Solver Function

*Message #2 Posted by **Dave Britten** on 12 Nov 2009, 3:45 p.m.,*
in response to message #1 by Roland Storz

I would like having this myself, but I've not seen any 17bii simulators, unfortunately.

There were, however, a number of devices produced by HP that feature the same HP Solve:

17b - Probably the cheapest option, but missing L() and G(). (...and RPN!)
17bii - Same as the 17b, with L() and G() added.
17bii+ - Same as the 17bii, but there were some changes that cause L() and G() to behave differently. I'd stay away from this one.
18c - No L(), G(), or looping.
19b/19bii - Includes trig functions, I believe.
22s - Has trig and scientific functions, but no finance, and missing L(), G(), and looping.
27s - Same as 17bii, but no cash flow lists, and it apparently only uses iteration, not algebraic simplification.
95LX - About the same as the 19bii, plus you can back-solve in Lotus 1-2-3. Can be found cheaply from time to time.
100LX - About the same as the 95LX, but some ROM versions have a bug with reading cash-flow lists.
200LX - About the same as the 95LX, but no bugs that I'm aware of. Most feature complete, but can be pricey.
OmniGo - Pretty sure it had the same solver, but was missing some features.

There was also a Windows (3.1) version for some older models of OmniBook, I believe.

You might also consider downloading one of the 48GX emulators for iPhone/iPod. The 48 has an algebraic solver that's somewhat similar to HP Solve, but without L(), G(), and looping.

in response to message #2 by Dave Britten

> Quote:
>
> 17b - Probably the cheapest option, but missing L() and G(). (...and RPN!)

Dave, the 17b does have L() and G(). At least mine does. The manual was missing a description of those functions, but they were in the ROM.

> Quote:
>
> 17bii+ - Same as the 17bii, but there were some changes that cause L() and G() to behave differently. I'd stay away from this one.

The + has a whole different solver, and it does not work like the solver in the original 17b and bii. See this articlefor a discussion of the differences in these solvers.

Re: HP17b Solver Function

*Message #4 Posted by **Martin Pinckney** on 12 Nov 2009, 4:32 p.m.,*
in response to message #3 by Don Shepherd

Also, I would point out that the 22s solver is quite different from the others in many ways, not the least of which is having no alpha capability, other than single letter variables.

Re: HP17b Solver Function

*Message #5 Posted by **Dave Britten** on 12 Nov 2009, 4:47 p.m.,*
in response to message #4 by Martin Pinckney

Yeah, looks like it's more akin to the 32sii, 33s, and 35s solvers, i.e. nothing terribly remarkable.

Re: HP17b Solver Function

*Message #6 Posted by **Bruce Bergman** on 12 Nov 2009, 9:59 p.m.,*

16 segment Led display would mimic a HP-41 display?

*Message #1 Posted by **Giuseppe Marullo** on 11 Nov 2009, 6:03 p.m.*

Hi all, just out of curiosity, is there anyone that tried to mimic HP-41 display "feeling" using LED displays?

I need some form of output, since I have to mess with led display anyway and I would like something more cool that the expensive serial 5x7 matrices you see today.

It seems somewhat easier to find 16 segment instead of 14 segment that should be the most similar used on the 41.

Any advice?

Giuseppe Marullo

PS: no, I don't plan to emulate a 41 on a fpga, even if...

Re: 16 segment Led display would mimic a HP-41 display?

*Message #2 Posted by **Lyuka** on 12 Nov 2009, 2:06 a.m.,*
in response to message #1 by Giuseppe Marullo

Hi.

How about using LiteOn's LTP-4323G (Alphanumeric 16seg. LED display) or LTP-3784G (14seg.) and Maxim's MAX6945 (LED-driver/Key-scanner) ?

However, if its cost won't be a matter, I'd like to use Avago's HDSP-2503 or HDSP-0962 for industrial application,
for the feel of former HP's reliable instruments :-)
(I like VFD display of HP|Agilents's 34401A or 53131A and so on by the way.)

Regards, Lyuka

Edited: 12 Nov 2009, 5:31 a.m.

Re: 16 segment Led display would mimic a HP-41 display?

*Message #3 Posted by **Giuseppe Marullo** on 12 Nov 2009, 4:24 p.m.,*
in response to message #2 by Lyuka

Hi.

>How about using LiteOn's LTP-4323G (Alphanumeric 16seg. LED display) >or LTP-3784G (14seg.) and Maxim's MAX6945 (LED-driver/Key-scanner) ? Exactly, I wanted to know if 16 segment would make a difference compared to 14 segment. I think there is another nuisance, no 14 or 16 digit display I am able to find has the comma, just the dot.

>However, if its cost won't be a matter, I'd like to use Avago's >HDSP-2503 or HDSP-0962 for industrial application,

Nice, but expensive as you said and while easy to interface you need to have a char rom anyway, so they are not straightforward as it seems at first glance.

>for the feel of former HP's reliable instruments :-) >(I like VFD display of HP|Agilents's 34401A or 53131A and so on by >the way.)

I prefer Leds, but just because of their tolerance to mechanical abuse, VFDs are great.

Giuseppe Marullo

Form factor for calculators

*Message #1 Posted by **David Hayden** on 11 Nov 2009, 3:45 p.m.*

In another thread, Mike Morrow wrote:

> Quote:
>
> The HP 42S is not the answer to everything, I suspect.
>
> But...after 21 years, nothing in its form factor has appeared that is an advance, an improvement, or even a simple equal in capability.
>

>
> At least those are inexpensive!

Looking at HP's current lineup of scientific calculators there is very little variety in the form factor. What form factor do you like? Would you buy multiple calculators in different form factors for different needs?

One of my favorites was the 29C because you could hold it in one hand and reach all the buttons with your thumb. The hinged design of the 28C looks like it was very handy too.

Re: Form factor for calculators

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 11 Nov 2009, 3:54 p.m.,*
in response to message #1 by David Hayden

Woodstocks (21,22,25,27,29C) were very good in form factor, however today's tren would be a slimmer body, to be carried in a shirt pocket (not in Mr. Hewlett legendary pocket, I mean).

HP41: very good too; Voyagers and Pioneers almost optimal.

Today models: 17B II silver (almost equal to HP42 and other Pioneers). HP 48/49/50 and HP35S are too large.

Re: Form factor for calculators

*Message #3 Posted by **Walter B** on 11 Nov 2009, 4:28 p.m.,*
in response to message #2 by Andrés C. Rodríguez (Argentina)

I concur. Just want to add the 20b to today's models being handy. Could be even handier without the double shell on its back.

Re: Form factor for calculators

Spoken like somebody who's never used a 28C! ;)

In fairness, it's pretty nice when you've got a big, flat surface to work on, but anything else becomes a huge pain. Handheld operation is awkward at best.

And don't get me started on broken battery doors...

Re: Form factor for calculators

*Message #5 Posted by **Bart (UK)** on 11 Nov 2009, 5:26 p.m.,*
in response to message #4 by Dave Britten

I've had a 28S for 20 years. It is fine to use as a handheld with the second keyboard folded all the back. All keys were not quite accessible using one handed thumb method though (but I daresay that neither are the 48/49/50). I did make sure that I'd pre-programmed all the formulas that I would need to avoid having to use the second keyboard though.

Indeed the battery door was probably the most stupid design to come out of HP. I have had to repair mine with an extra strip over the door. I still enjoy using it.

Re: Form factor for calculators

*Message #6 Posted by **Dave Britten** on 11 Nov 2009, 5:31 p.m.,*
in response to message #5 by Bart (UK)

Yes, software-wise, the 28C and 28S are very good. Having loads of keys greatly speeds typing, though I find the form factor is sub-optimal for anything but a desk or table. I like 'em, but I'd rather just use my 48SX or 48GX. Wouldn't mind getting ahold of a 19BII with the improved battery door, though.

Re: Form factor for calculators

*Message #7 Posted by **Bart (UK)** on 12 Nov 2009, 10:09 a.m.,*
in response to message #6 by Dave Britten

I wonder if one could swap out the insides, not minding the darker plastic of the 19BII (obviously I'm not in the finance sector and don't care much for financial calcs). I remember reading a historic HPCC article about using a drill to open the 28C - a bit destructive.

Re: Form factor for calculators

*Message #8 Posted by **Ron Ross** on 12 Nov 2009, 12:40 p.m.,*
in response to message #7 by Bart (UK)

Ah, but that is the bueaty of an Hp 19Bii. It has trig functions and units conversions. And it is both RPN and Algebraic selectable. Many Hp19Bii owners gripe about this calculator no longer being available and that the Hp17Bii being a poor substitute.

For my own preference, I like the Voyager format in size but accept the Hp42s due to its superiority over the Hp 15c in most areas.

My dream calculator would be to take the existing NEW Hp 17Bii and stuff the Hp50G rom into it minus the Graphing abilities. Power it with three button cells and provide an external power jack, USB port and SD card slot. Let the market and Hackers develop the rest. The power jack would drive the external periphials. Hp has the case and would only need to modify I/O points to stuff this technology into an existing line. I would pay $150, probably more for such a POCKET CALCULATOR!!!!

Notice """HP""""", that I suggest a pocket calculator ie TW and Cryille!!!!!

Hp's present Hp17Bii is an existing platform that is the closest match to what I would want. Admittedly, if Hp releases an Hp15c for sake of vintiage appeal, I will indeed buy one also, if it is at a similar price to the existing Hp12c line (ie don't rob me for being an engineer, HP).

Re: Form factor for calculators

*Message #9 Posted by **Walter B** on 12 Nov 2009, 1:00 p.m.,*

I like that, but let me guess not RPL. Or does (could) it have a choice (like the current RPN/ALG)?

Re: Form factor for calculators

*Message #11 Posted by **Walter B** on 13 Nov 2009, 1:50 a.m.,*
in response to message #10 by Bart (UK)

It's designed to work for RPN and ALG like the 17bii and the 35s. Not for RPL, however, because I think that's overkill. The 44s is meant to be a small keystroke programmable scientific without graphics. It's a member of a set of 4 drafts I designed based on a Voyager, a Pioneer, the 17bii, and the 35s.

BTW, I looked up the old files and found these drafts are older than I wrote: they were published in two articles in DATAFILE V27, including a complete menu system for the command set of the 44s.

Ceterum censeo: HP, launch a 43s (please check the files and you'll know why).

Walter

I've had the same in mind: graphics is best done on a PC. A powerful compact RPL calc would be ideal in my mind.

I looked at the financial calc details: 17BII+ lots of program memory, basic math (LN EXP etc) but no trig functions. 20B has trig/hyp trig functions but no program memory. Nothing that has the "best of both"!!

Re: Form factor for calculators

*Message #13 Posted by **Walter B** on 13 Nov 2009, 1:55 a.m.,*
in response to message #12 by Bart (UK)

OK, but what needs to be done is "only software", as my late boss used to say. Plus a proper layout, but that's no witchcraft d8-)

Edited for this P.S.: The presence of an interface allowing the input of this "software" is a necessary requirement, of course. That puts the 20b and 12c+ on the list.

Yep, that's my holy grail calc format too.

Of course, I could always just design my own if I needed to.
Such a thing would be much easier than the Mk2 uWatch, that's for sure.

A thin alloy box (smaller than a Voyager) design with a PCB touch panel keypad, and maybe changeable key overlays, running from a couple of CR2032's would be pretty easy. No one else would probably want one though, so it wouldn't exactly set the world on fire.

Dave.

in response to message #16 by DaveJ

Take a Voyager. Any Voyager. Put it in your left shirt pocket with the near bulletproof metal back facing out and the medallion up.

To use, simply reach in with your right hand, thumb on the medallion, index finger on the back and slide out. In parallel raise your left hand to greet your number crunching companion. When they meet, place the Voyager on your curved left index and middle fingers, and then with purpose press the ON button with your left thumb. Proceed to thumb-board your way through your most challenging problems. When complete, reverse the process until your Voyager rests against your left breast.

That my friends is the perfect form-factor. Now if Dave will make me a credit-card size version of the 15C, well then I may find a new traveling companion.

in response to message #19 by Paul Dale

You know, I was thinking about that the other day. None of my calculators have a hole to use with a lanyard. If they did, then I could wear it around my neck. Just in case.

I do not think my wife would let me out of the house with such a rig. May be an idea to get out of holiday shopping that I must explore.

I guess holsters are still a possibility for the shirt pocket free crowd. I remember my first HHC, Richard had a 50g strapped to his waste like a sixshooter. I chuckled and hoped the programming challenge would be quick-draw style. I am fairly certain that Darth Vader had at least 2 RPNs on his utility belt--he had no shirt pocket either.

That's similar to the way we carried our slide rules in the olden days. The only thing that identified us as engineering students more than that was carrying a drawing board and T-square.

After some quick thought, how does 5mm thick sound?
That's for an all alloy or stainless steel case, your choice of W x D.

Sounds easily do-able on first thought, unless feature creep takes over.

Could be made thinner, but I'm factoring in use of standard CR2032 batteries.

Dave.

That would be the upper limit I suspect and thinner would be better. My ideal would be to fit into my wallet beside or in place of a credit card or three.

> Quote:
>
> Could be made thinner, but I'm factoring in use of standard CR2032 batteries.

Unless the battery isn't directly adding to the thickness, using CR2016 batteries would pull it down to 3.4mm thick which would be a lot better.

Would solar be an option instead of a battery? Yeah, I know feature creep which must be avoided especially in a small volume like this.

I've already got what might be a suitable LCD, but it's only 8 digits. It is however the 14 segment type with apostrophe. 52mm x 22m x 3mm. That makes credit card DxW doable.
That would result in say a 4.8mm thick calc, but it would have a big (7mm high) readable 14 segment display and suck almost no juice. Two displays could be joined for a landscape calc, with a bit of a gap in the middle.

Biggest power consumer would be the the touch panel solution.

Solar power chews up panel space that could otherwise have buttons.

I've got a tiny sub 2mm thick graphic LCD on hand, but the contrast is really lousy. 7-segment high contrast is the go IMO.

Dave.

Hi.

I own such a thin one - Sharp's EL586 water-proof, dual-powered 10digits, scientific calculator.

Its geometry is 141.5x73.8x3.5[mm] (5.6x2.9x0.14 [inch]).

I have used the calculator putting it on the moving-arm of the drafter, in the late 80's.
I wish it had been an RPN programmable.

Regards, Lyuka

I don't think I've seen a credit card calculator in portrait form factor (i.e. they are always landscape).

24 "buttons" seems fairly standard and I'm sure would be sufficient. The 4-banger designs of couple of years back were all based on 20 buttons and they got pretty complex (as in scientific and programmable). The buttons are often laid out in a 6x4 grid (but not always e.g. the Citizen W11S).

Most (all) include a small solar cell beside the display as well.

Thicknesses range from 2mm up and the suggested 4.8mm should be okay.

- Pauli

I think I've come up with a way to make this thing cheaply, using the off-the-shelf LCD I've got, and 4.1mm thick or maybe less.

So picture a credit card size (WxH) calc (actually slightly wider for a portrait calc), just over 4mm thick, with a high contrast 8 digit 14segment display running from a single CR2016 battery replaceable as a "slot in" on the bottom end, along with a standard 0.1" header connector for programming on the bottom edge as well.

No need for an expensive case, it will be an entire sandwich FR4 fiberglass design, with your chose of color on the bottom.

The only major choice is whether to go for a stick-on membrane keypad which would increase the height a bit, possibly afford some extra protection for the glass LCD, but does not add to the power consumption. Or a touch panel interface that does not increase the thickness, but does chew the battery more.

It's actually looking quite easy and cheap, there must be a catch...

Dave.

Sounds ideal., wider is probably livable, taller wouldn't be. Why the portrait fixation? I've never seen a credit card calculator that wasn't landscape...

How much thicker? The feel would be slightly better with a membrane. To avoid the power consumption of the keyboard, would it be possible to have a separate off/on switch?

No real reason, it's just that the display I have is almost the exact width of a credit card.

I'll need to try a few actual PCB variations to see what works best.

> Quote:
>
> How much thicker? The feel would be slightly better with a membrane. To avoid the power consumption of the keyboard, would it be possible to have a separate off/on switch?

Not much. Sample membranes I have are around the 0.5mm mark or so, depends on the dome size really.

Separate on-off switch should be easy. In fact my current design thinking makes it easy to add buttons all around the outside edge!

Dave.

All the credit card calculators I've ever seen have a small display in the top right, solar panel in the top left and keys below. The display you mentioned would suite this style well. Is the display backlit?

> Quote:
>
> In fact my current design thinking makes it easy to add buttons all around the outside edge!

Please don't do that :-) A couple of buttons or slide switches would be more than adequate.

I did try to see how a SafeWord token could be repurposed into a calculator (see the Gold 3000 on https://www.snapgear.com/index.cfm?skey=1106). Fourteen buttons, eight character 14 segment display and a not very capable processor.

Here is the LCD

No backlight, although a side LED could be added.
Although if you do solar power then there won't be enough light to light the LED when you need it :->

I'm actually liking the solar power thing, I've found a suitable solar cell, although at present it would be the most expensive part of the calc. Plenty of juice in a 22mm x 7mm solar cell

After playing with the screen on a credit card, it's obvious the landscape format is the best. with as you say solar cell in the top right.

No need for side switches if solar powered. Perhaps a super cap to maintain charge when the light dims.

Total thickness could be as small as 4mm now.

This is getting rather exciting, I shall christen the idea, surprise surprise, the uCalc!

Dave.

*Message #34 Posted by **Paul Dale** on 13 Nov 2009, 5:19 a.m.,*
in response to message #33 by DaveJ

I agree no LED if solar powered. I'm assuming that a solar cell will replace the battery

completely.

A super cap sounds like a good idea to cover the odd shadowing etc. Some non-volatile memory ought to be possible too -- quite a few PICs have EEPROM on board. Will there be enough juice to program this?

A slide switch might still be useful -- program/run mode or deg/rad/grad. Not vital of course.

Can the keyboard be squeezed out to 28 keys (4 rows of 7)? There ought to be space and having more than 26 keys is good for letters.

How about the uCCC for a name? Or uCCCalc?

Yep, should be plenty. Or external EEPROM like the uWatch maybe, oodles of PCB space available.

> Quote:
>

>
> Can the keyboard be squeezed out to 28 keys (4 rows of 7)? There ought to be space and having more than 26 keys is good for letters.

The cheapest touch chip is the 24key one, the 32key one is triple the price.

Will have to see how the PCB layout works. Recommended key spacing is 8mm

Membrane might ultimately be the cheapest and simplest option here, although requires some NRE, but not required for getting a full prototype running though. In that case, as many keys as will sensibly fit, and the user could more easily change it to alter the key layout and look.

> Quote:
>

Damn, now I'm feature creeping...
I can make it thinner by 1mm by using the same LCD as my uWatch MK2, but without the backlight assembly.

That's a 128x32 graphic display about 35mm x 10mm window.

Much lower contrast than the 7 segment display, and 5 times the cost, but you get full dot matrix flexibility and 1mm thinner as compensation.

I could in theory now make this 3mm thick (+membrane), but a membrane keypad would probably need a thicker front panel, so say 3.3mm. Although you could pot it for extra rigidity and maintain 3mm perhaps.

Dave.

Re: Form factor for calculators

*Message #37 Posted by **Paul Dale** on 13 Nov 2009, 6:23 a.m.,*
in response to message #36 by DaveJ

I much prefer the look of non-dot matrix displays and the higher contrast. Still, thinner is better.

Is contrast a big issue for a solar powered calculator? How much light will be required to power the device? WIll that offset the lower contrast?

- Pauli

How about this switch ? It is 3.7mm square and only 0.35mm thick. A little expensive -- about US$0.16 each.

You would have to add your own overlay adding a little thickness.

Yeah, the problem with these sorts of switches is the cost adds up. Considering you need a custom overlay anyway, you might as well pay a bit more and get a tactile dome overlay and have the contacts on the PCB. I need actually get a quote for that option.

Dave.

I'd be happy to have something just like that fx-98 pictured above in RPN. Casio made a slightly smaller and thinner credit card scientific in 1978, the fx-48. It was not solar powered, and although it has only 22 keys (compared to the fx-98's 38 keys), it provides most of the functions found on the later fx-98.

In 1985, Radio Shack sold the EC-4009, a slightly enhanced version of the fx-98 that included permutaion and combination functions above the parenthesis keys.

I still have my EC-4009 and my fx-48, both still working. I wish I had a few of the EC-4009 units that I gave away as gifts 25 years ago.

Credit card sized calculators are the only hand-held calculators whose usability is *not* significantly degraded by having a landscape layout. In fact, I believe that it's quite helpful.

Easier, yes, more attractive, I doubt it. Based on the exposure of my previous uWatch, a sexier looking Mk2 would no doubt make front page of every geek blog on the planet. Can't see the same thing happening for a credit card calc though. Even if it would probably be the worlds first credit card size scientific/programmable/RPN/open source calc.

But, oh... this has just given me a possible idea for the design of the MK2 uWatch! guess that'll make it iteration #50 or so...

> Quote:

> Why don't you EEVBlog your ruminations and trials of this. It might be interesting to follow your progress and I'll bet that you get some good feedback as well.

I thought about that way back, but I go through so many thought processes and iterations that it would turn into an endless blog, and people would probably come to conclusion that I'm nuts :-> I can picture the complaints now "20 bloody blog episodes on this damn watch and you still haven't done the first prototype!"

Dave.

I don't blame them.

That is why no one gave my uWatch a second thought until I actually produced a real prototype, and then people went ballistic.

The same is happening to the uWatch MK2, no prototype yet, so little interest. Not easy or cheap to prototype such a thing though, so it's harder to get off the ground.

The uCalc on the other hand would be cheaper and easier to prototype, so hopefully will come off much sooner than the uWatch. I've actually got all the parts except the solar cell, so all I need is some PCBs and a working prototype that looks like the real thing is complete.

Dave.

All you need to do is make a programmable magnetic stripe that your new calc will program for whatever credit card you want to use at any given instant (and have this new calc be thin enough that it will fit through the swipe machine at the checkout stand).

Seriously, though, in this day and age of everything programmable and portable, I am surprised that nobody has invented the universal credit card replacement - the only thing that the checkout stand needs is the info in the magnetic strip. There should be any number of ways to read your choice of MasterCard, VISA, Discover, AmEx info into the cash register when you check out - maybe a mini USB connector from the store that plugs into your

"credit card calc" [the calc would even keep a running track of your balance(s)]. Then you could get rid of all of that plastic in your wallet and replace it with something more useful.

In fact, years ago, I had a dongle not much bigger than a pencil eraser that I could use at Mobil gas stations for charging a fillup - it was "connected" to my AmEx account. Nowadays, you'd use bluetooth, I guess.

With a sharp enough graphics display, I suppose you could display a barcode that the store checkout laser reader would scan for your account info.

Interesting idea but where would you put the golden credit card company logo on? :)

In fact, that's the reasoning behind the chips in modern bank cards: They contain multiple "applications" and are, as a benefit, much more secure because everything that goes into and out of the chip is encrypted. A useful CC sized device would be able to talk to such a chip and return the stored info about your recent transactions.

I too carry a calc in my shirt pocket every day and use it many times daily. A 60 page spiral memo-pad, pens, glasses and an Aurora N1000, which is a hinged case calc (clamshell). Form factor.....<1/2 inches thick. It has to use RPN, which the FN1000 does. The battery compartment cover is secured by a small Phillips screw, therefore none of the 19B case problems. The clamshell is the selling point to me, as I work in a less than pristine environment. If I worked in an office environment, a 17BII or a 10B would be the calc I would carry. Clamshell, RPN, fits in shirt pocket and a keypad similar to 17B11, which unfortunately the FN1000 does not have.....would be perfect for me.

I'm almost certainly a minority here but I've often wondered whether it would be possible to get Casio to OEM its databank calculator watches with the minor firmware change to make them scientific and RPN. If so there would be a modern equivalent to the (in)famous HP-01 but without the tremendous development costs as it would be essentially an existing off-the-shelf product save for that bit of customization (the firmware plus key overlay and manual/packaging).

Too bad HP hasn't done that. They *have* done so for decades with other products - Epson and Canon printers sold as HP with custom firmware, for example.

Just dreaming...

Jim Horn (my HP-01 is too limited and my Casio scientific watch lost its "8" key)

> I'm almost certainly a minority here but I've often wondered whether it would be possible to get Casio to OEM its databank calculator watches with the minor firmware change to make them scientific and RPN. If so there would be a modern equivalent to the (in)famous HP-01 but without the tremendous development costs as it would be essentially an existing off-the-shelf product save for that bit of customization (the firmware plus key overlay and manual/packaging).

You aren't the only one, in fact there are countless people who want the Casio CFX-400 scientific calc watch re-introduced.

Casio still sell the databank version that has the exact same case and keys as the original, all it needs as you say if the firmware, LCD,and key overlay.

For those that aren't aware, the Casio CFX-400 is one of the most highly sort after retro watches, they regularly go for over $1000 on ebay. Even dead ones fetch many hundreds. And this is for a watch that you could originally buy for $20.

Hmm, perhaps it's video blog time! Casio might listen like Microchip did!

Dave.

in response to message #58 by DaveJ

Casio has already released many older watches in their retro-series. Maybe we could convince them to do so with an (improved) calculator watch.

[Completely OT] Capeesh

*Message #1 Posted by **Antonio Maschio (Italy)** on 11 Nov 2009, 12:27 p.m.*

Hi,

I'm Italian, and today I learned that you Americans (and possibly you British) people sometime do use the word "capeesh?" for "did you understand?". Since it comes from the Italian "capisci" [Ka'peeshee] that means the very same thing, I'd like to know how frequently do you use such word, or if you don't use it at all.

For the curious, I found it here.

-- Antonio

*Message #2 Posted by **Brent Hillebrenner** on 11 Nov 2009, 12:38 p.m.,*
in response to message #1 by Antonio Maschio (Italy)

In my opinion, most Americans learned of the word watching mafia movies like the Godfather. As for how often it's used... I live in Texas and it isn't uncommon to hear it but it's not part of the everyday vocabulary. Now on the east coast (New York, New Jersey, etc.) it is probably fairly common.

Regards,

Brent

Widely used in the past. I don't think it's used much today.

See Wiktionary (link)

Re: [Completely OT] Capeesh

*Message #8 Posted by **Norris** on 11 Nov 2009, 5:25 p.m.,*
in response to message #7 by Ken Shaw

"Capeesh?" is clearly a recognized word used in spoken American English, and is included in at least some standard dictionaries. It is probably most commonly used in urban areas in the northeastern US, which have the largest Italian-American communities. I agree with Wictionary that it often (though not always) has threatening overtones.

I would not expect the word to be widely used or recognized in British English, Australian English, Indian English, etc. But I could be wrong; sometimes American movies and TV shows (which definitely use this word) are powerful vectors of American English (for better or worse).

Re: [Completely OT] Capeesh

*Message #9 Posted by **Matt Kernal** on 11 Nov 2009, 2:18 p.m.,*
in response to message #1 by Antonio Maschio (Italy)

Like Capeesh, another commonly used word that sounds completely foreign to everyday spoken English is "Gesundheit", the German response to someone that just sneezed. It means something like "may God grant you health". I know it surprised some some German friends when they heard one of us Yanks say it to them :-). Same response with "Kindergarten" (German for childrens school).

Ciao Antionio (as Walter B. would say :-)

p.s. Here is a free online text-to-speech synthesizer, if you want to hear (an attempt at) how a word is pronounced: http://cepstral.com/demos/ Try it using difference "voices" (gender and accents). I tried Antonio's "capisci" using Itailian. Note: I haven't tried Bill's Klingon sentence above yet ;-)

Another intruder from German to (American?) English is "kaput". In German, "kaputt" means broken.

Re: [Completely OT] Capeesh

*Message #11 Posted by **Norris** on 11 Nov 2009, 7:33 p.m.,*
in response to message #10 by Marcus von Cube, Germany

American English includes many colorful words of German origin, which often became known in the US via Yiddish. Kaput may be one of these.

Other examples include words like dreck, gelt, klutz, kvetch, lox, mensch, nosh, shtick, and shpiel.

*Message #14 Posted by **Brent Hillebrenner** on 11 Nov 2009, 7:59 p.m.,*
in response to message #10 by Marcus von Cube, Germany

On Topic

Mensch!!! Meine 15c ist kaput! Nach zwanzig jahren!!!

Ist das richtig? Capeesh?

Re: [Completely OT] Capeesh

*Message #15 Posted by **Marcus von Cube, Germany** on 12 Nov 2009, 10:29 a.m.,*
in response to message #14 by Brent Hillebrenner

Not bad! Except that the 15c is not a girl. ;)

The word 'kaput' itself is kaput, at least for a German reader: We write it with a double 't': "kaputt".

We use the word sometimes for ourselves: "Mann, bin ich kaputt!" is the proper phrase after a

marathon run.

Re: [Completely OT] Capeesh

*Message #16 Posted by **George Bailey (Bedford Falls)** on 13 Nov 2009, 8:00 a.m.,*

> Quote:
>
> "Gesundheit"...It means something like "may God grant you health".

Thankfully, there's no god in "Gesundheit". It just translates as "health".

I'm not sure that American English is the language with the most adopted words. German is strong in that regard, too. Plus, they make their own new "English" words, that sound English but really are not: "Handy" for cell phone.

I once read a story from an American who visited a gynecologist in Italy. Sitting in the waiting room, she discovered some sign in English with many mistakes in it. When she kindly tried to point out the mistakes to the physician, he replied: "You may be expert for American English, I'm expert for Italian English!"

HP-200lx

*Message #1 Posted by **Geoff Quickfall** on 10 Nov 2009, 8:52 p.m.*

Hello,

I aquired a 4MB 200LX with a 440mb PCMIA card at HCC2009.

Now here's the rub. I have the following:

```
-  connectivety kit with the 3.25 disks and books.
-  PC with Windows XP and 3.25 drive.
-  PC with Windows 98 and 3.25 drive.
-  4MB 200LX with a 440mb PCMIA card.
```

Questions:

```
-  Will the DOS prompt through Windows XP work with the 3.25 (I
   know I should try this myself and I will but I thought I would
   ask first ;-)
-  Would it work better on the Windows 98 machine (it's in the
   garage).
-  Has anyone used the 200LX with Windows XP and the connectivety
   kit.
```

I think the last question says it all. Thanks for your input ahead of time!!

Cheers, Geoff

Re: HP-200lx

*Message #2 Posted by **Dave Britten** on 10 Nov 2009, 10:10 p.m.,*
in response to message #1 by Geoff Quickfall

I've never tried the connectivity pack on XP, so I'm not sure how it'll handle DOS serial I/O. It will likely run it, at least. You might want to use 98 for that.

If you want the easiest approach, get a compact flash card (the 200LX will use most cards up to 256MB without a special driver) and use a PCMCIA slot adapter. Then find a cheap USB CF reader for your PC. It'll be loads faster than serial I/O too.

Re: HP-200lx

*Message #3 Posted by **Chan Tran** on 10 Nov 2009, 10:36 p.m.,*
in response to message #2 by Dave Britten

I should work in the dos box of the XP machine. If not take the win98 out of the garage, reformat it and run real DOS on it.

Re: HP-200lx

*Message #4 Posted by **Egan Ford** on 10 Nov 2009, 10:54 p.m.,*

in response to message #3 by Chan Tran

> Quote:
>
> I should work in the dos box of the XP machine. If not take the win98 out of the garage, reformat it and run real DOS on it.

Or try DOSBox. DOSBox for Windows can use your Windows COM ports as DOS COM ports. You may need to install and run bnu.com first.

Re: HP-200lx

*Message #5 Posted by **Bill (Smithville, NJ)** on 11 Nov 2009, 8:20 a.m.,*
in response to message #1 by Geoff Quickfall

Hi Geoff,

Great new toy - and the 4mb version is nice. As to your question - do you want to use the connectivity pack to actually transfer files between the PC and the HP-200LX or do you just want to make use of the HP-200lx Emulator (APP200) to use the HP-200lx applications on the PC?

If transfer files, then like Dave said, most of the smaller CF and Memory Sticks will work just fine with the appropriate addaper. I've used up to 256mb with no problem. Makes transferring to/from PC very easy.

As to the emulator, I just tested the APP200 on my XP, and it works fine from the command line - with only one small quirk. The program switches to full screen only. So no running it and another program, but it does run fine. I've used it this way in the past to program/debug some very long equations that I then loaded onto a HP-17Bii or HP-19Bii. A lot easier to edit them on the PC.

There are a ton of info on the WEB about the HP-200LX, and most standard DOS programs run fine on it.

Since I know you are very skillful at HP Calculator repairs, you may want to try the backlight modification for the 200LX screen. See following link:

HP-200LX Backlight

If you do the backlight, I;d like to know how it turns out.

Have fun with your new toy.

Bill

Re: HP-200lx

*Message #6 Posted by **Peter A. Gebhardt** on 11 Nov 2009, 9:24 a.m.,*
in response to message #5 by Bill (Smithville, NJ)

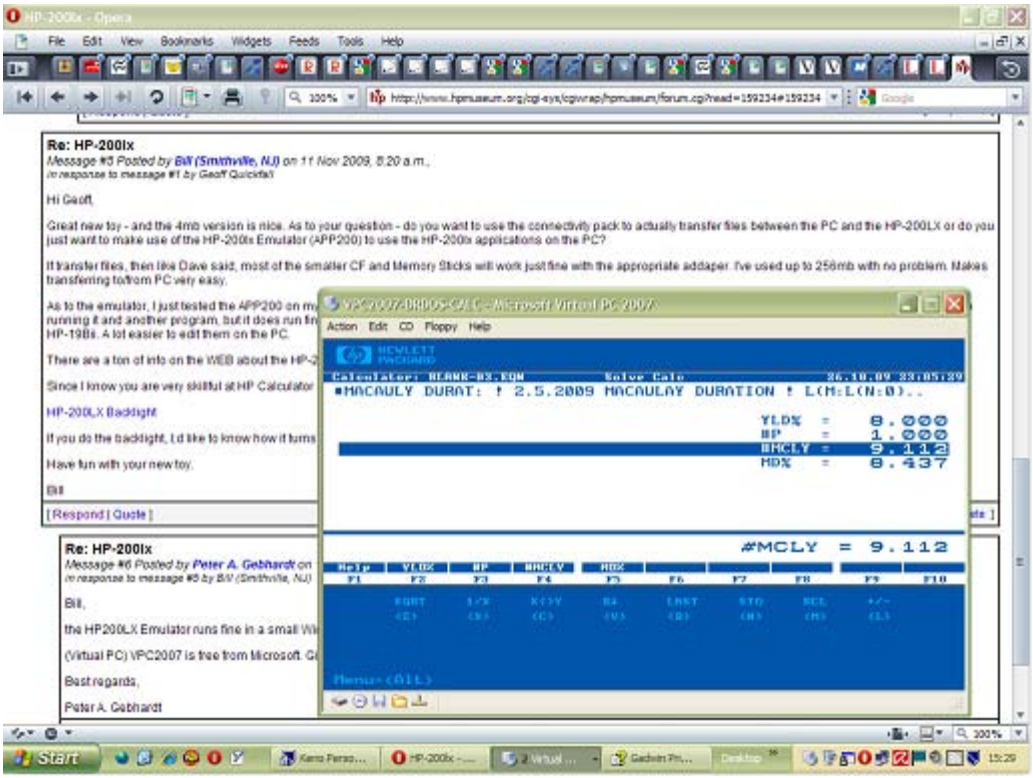
Bill,

the HP200LX Emulator runs fine in a small Window under VPC2007 & XP Home SP3.

(Virtual PC) VPC2007 is free from Microsoft. Give it a try.

Best regards,

Peter A. Gebhardt



Edited: 11 Nov 2009, 9:39 a.m.

Re: HP-200lx

*Message #7 Posted by **Bill (Smithville, NJ)** on 11 Nov 2009, 10:51 a.m.,*
in response to message #6 by Peter A. Gebhardt

Peter,

Thanks for info on VPC2007. I'll have to download it and try it out. I usually just use a true dos machine for the emulator - my favorite being the HP Omnibook 430.

Bill

Thanks all, boy does DOSbox bring back memories!

*Message #8 Posted by **geoff quickfall** on 12 Nov 2009, 3:26 a.m.,*
in response to message #1 by Geoff Quickfall

While I am waiting for my PCMCIA adapter card I thought I would try Egan's suggestion.

After loading DOSbox and the calling it I tried to install the three original disks. After succesfully mounting A: drive and then calling "INSTALL" I kept getting:

The files must be decompressed before installing, please .....

So I thought I would try the Windows XP command prompt. I called up drive A: and then "INSTALL". The application installed correctly to the point where it gives you the option of identifying the correct com port or closing and then manually configuring the com ports. I chose the latter.

Back to Windows by typing exit on the Windows command prompt. I then called up DOSbox and mounted the

correct C: directory with the connectivity applications APP200. The program ran perfectly under DOSbox and emulates the 200lx applications.

Serial RS232 cable and attached to the PC and the 200Lx. I have tried all the comm ports (1 and 2) with all variations and the two machines will not talk.

Now it has been awhile since I had to play with coms, serial cables and etc.

Any simple suggestions dealing with the first message:

```
Unable to decompress the files....
which was not a problem on the Windows command prompt
but was a problem on the DOSbox command prompt.

Will not connect ...
```

Signed; learning DOS again, ;-)

Edited: 12 Nov 2009, 3:26 a.m.

Re: Thanks all, boy does DOSbox bring back memories!

*Message #9 Posted by **Egan Ford** on 12 Nov 2009, 9:28 a.m.,*
in response to message #8 by geoff quickfall

Google for bnu.com, install and run that in DOSBox. Make sure you have your Windows COM port as DOSBox COM1 (its in the prefs file toward the end.)

*Message #11 Posted by **Thomas Chrapkiewicz** on 13 Nov 2009, 12:33 a.m.,*
in response to message #1 by Geoff Quickfall

Hello Geoff:

As we'd discussed; a fine machine.

FWIW, the way I use mine is via the PCMCIA card slot - one can purchase a PCMCIA-CcompactFlash card adapter and copy files to/from your pc via the CF card. I've only used up to a 256MB card; not sure what the size limitation of the card in this machine is. Regards, TomC

OT -- Ulimate Calculator Design Artcile

*Message #1 Posted by **Katie Wasserman** on 10 Nov 2009, 6:42 p.m.*

For those of you in the IEEE Computer Society, the November 2009 issue of "Computer" has as its end page an article by Neville Holmes. He describes the follow-on to the pocket calculator calling it a "forumulator". It seems like he's suggesting implementing something close to APL on a iPhone-like device and gives some specifics that would make it a good learning tool.

If nothing else it's interesting to read an opinion of what the ultimate calculator should be from someone who doens't (I think) frequent this forum.

-Katie

Why not 49g+?

*Message #1 Posted by **ferroburak** on 10 Nov 2009, 12:38 p.m.*

Hi

I'm using casio 9750g but due to its inability to perform Laplace transform I will buy a hp calculator.

I'm adivised to buy a 50g but I found 49g+ much cheaper. (Series no CN3xxxx)

Considering I'm a student, will I face a lot of problems if I opt for 49g+? Thanks.

Re: Why not 49g+?

*Message #2 Posted by **Tim Wessman** on 10 Nov 2009, 12:48 p.m.,*
in response to message #1 by ferroburak

What is the serial number on the unit?

The early models had keyboard that would break after a while, and the black plastic strip around the edge would crack.

TW

49g+

*Message #3 Posted by **ferroburak** on 10 Nov 2009, 1:14 p.m.,*
in response to message #2 by Tim Wessman

CN33305379 is the serial number.

Re: 49g+

*Message #4 Posted by **Tim Wessman** on 10 Nov 2009, 4:05 p.m.,*
in response to message #3 by ferroburak

I think that will be one of the bad keyboard ones. I wouldn't buy it to save money. . .

TW

Re: Why not 49g+?

*Message #5 Posted by **Bill Zimmerly** on 10 Nov 2009, 3:08 p.m.,*
in response to message #1 by ferroburak

Hi ferro! Do I get a "finder's fee"? (Just kidding.) Actually, you can get less expensive used HP-50Gs on Amazon and on EBay as well if cost is a big concern. (But whatever you pay, it is a better deal than the 49 because of the SD card and extra memory.)

Re: Why not 49g+?

*Message #6 Posted by **Marcus von Cube, Germany** on 10 Nov 2009, 4:09 p.m.,*
in response to message #5 by Bill Zimmerly

Bill, he is talking about a 49g+, not a 49. The former is technically almost and software wise totally identical to the 50g. The 50g adds a serial interface, more battery power a better look and a more solid feel. I'd opt for a used 50g.

Re: Why not 49g+?

*Message #7 Posted by **David Hayden** on 10 Nov 2009, 5:37 p.m.,*
in response to message #1 by ferroburak

If cost is a big concern, you might also consider a 48gii which is nearly identical to the 50g in terms of software. There are actually two different versions of this calculator, but the old version can be gotten new on ebay for under $50.

You can distinguish the old vs new 48gii by the packaging and the top edge of the calculator. The new ones have two connectors along the top edge (one for serial and one for USB) while the old ones have just one connector (serial only). The packaging on the new ones mention USB support on front while the old ones only mention serial. Also, the old ones use 3 batteries and the new ones use 4.

Differences between the old and new 48gii (off the top of my head) USB support, Equation library, 256k vs 80k memory

Differences between the new 48gii and the 50g: 1.5M flash memory, SD card support, Larger display, faster processor(?)

Re: Why not 49g+?

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 10 Nov 2009, 8:10 p.m.,*
in response to message #7 by David Hayden

Hi, David;

> Quote:
>
> Differences between the new 48gii and the 50g: 1.5M flash memory, SD card support, Larger display, faster processor(?)

For me, one of the most important features in the HP50G is the upgradable O.S. and, as a consequence, the chance to add resources as part of it. Latest upgrade added SmartStream driver/applications, previously available only for the HP40G.

Cheers.

Luiz (Brazil)

Edited: 10 Nov 2009, 9:25 p.m.

Re: Why not 49g+?

*Message #9 Posted by **John B. Smitherman** on 10 Nov 2009, 10:18 p.m.,*
in response to message #1 by ferroburak

Here's an old note from Eric Rechlin on com regarding the 49G+ keypad: link

Per Eric's note you'll want to avoid the early versions of the 49G+. If you buy the 50G you are guaranteed to get the latest and best keypad.

Regards,

John

Re: Why not 49g+?

*Message #10 Posted by **Chan Tran** on 10 Nov 2009, 10:39 p.m.,*
in response to message #9 by John B. Smitherman

Since the 50g is better why not get the 50g. Brand new for $130-$150, lots cheaper than most text books and last a long time. Back when I was in school I wouldn't mind paying for the $200 25c, although I had a tough time paying for tuition and books.

Re: Why not 49g+?

*Message #11 Posted by **Crawl** on 11 Nov 2009, 12:22 a.m.,*
in response to message #10 by Chan Tran

That's the way I think of it. If you will be a technical professional, the 50g won't just be something to use for a class, it could be a tool that could last you for years of your career. And it's not like there's that much money to save by getting an older or inferior model. So why skimp?

thanks

*Message #12 Posted by **ferroburak** on 11 Nov 2009, 3:58 a.m.,*
in response to message #11 by Crawl

Thanks I ordered Hp 50g.

Re: thanks

*Message #13 Posted by **David Hayden** on 11 Nov 2009, 10:52 a.m.,*
in response to message #12 by ferroburak

If you aren't familiar with the HP48 and it's successors, then I suggest that you skip the printed manual that comes with the calculator and go right to the "Users Guide" that comes on the CD that accompanies the calculator. The Guide has much more detail. The printed Manual is more like a pocket guide - useful as a refresher when you already know most of what the calculator can do, but frustrating as a teaching tool to learn the calculator from scratch.

At least that was my experience having bought a 50G after using a 41CV since 1983 and having paid no attention to what had happened to calculators since then.

It's an amazing machine. You won't be disappointed.

Dave

Re: Why not 49g+?

*Message #14 Posted by **Mike Morrow** on 11 Nov 2009, 9:44 a.m.,*

in response to message #11 by Crawl

I agree completely with that outlook, but mostly on the basis of how extremely inexpensive for the capabilities provided such things as the HP 50G are.

But economic, "investment", or simple utility prospects in the long term for any particular computational device made in the last 50 years are not too good. Examples:

(1) In my senior year of high school (1969) I bought what I still consider to be the best slide rule ever made (Dietzgen N1725L), for $35. That's the equivalent of about $210 today. I justified that on upcoming engineering school. (It was the only "calculator/computer" required of engineering students at Georgia Tech in 1970.) My last real professional use of it was in 1974.

(2) In 1977, I spent about $600 on a new HP-67 and associated accessories. That's about $2200 today. I justified it based on assumed long-term professional use. That last real professional use occurred in 1980, after which it was replaced by an HP-41C.

Nothing computational or electronic keeps its value unless a cult following developes around it. Something better and cheaper will soon follow, with the only exception in the known universe being the HP 42S. :-)

I have been entertaining myself recently with a cheap device (Casio fx-115ES, a.k.a. fx-991ES) purchased at Wal-Mart for less than $18. It's amazing what computational capability is available for almost nothing now-a-days.

Adams would agree. 42 is the answer to everything.

Re: Why not 49g+?

*Message #16 Posted by **Mike Morrow** on 11 Nov 2009, 11:55 a.m.,*
in response to message #15 by Egan Ford

The HP 42S is not the answer to everything, I suspect.

But...after 21 years, nothing in its form factor has appeared that is an advance, an improvement, or even a simple equal in capability.

One has to resort to larger, heavier, RPL machines. :-(

At least those are inexpensive!

`42` is the answer to Life, the Universe and Everything

Re: Why not 49g+?

*Message #19 Posted by **Chan Tran** on 11 Nov 2009, 9:15 p.m.,*
in response to message #14 by Mike Morrow

But you would not trade either your slide rule or your 67 for my 50G right? If I were you they are as valuable to me now as then. They are useful now just as then. Very few things you can invest that retain their value that well.

Re: Why not 49g+?

Direct current circuit analysis program

*Message #1 Posted by **ferroburak** on 9 Nov 2009, 7:20 p.m.*

Hi, I wonder if there is a DC circuit analysis program (like Circuit4) program for Hp calculators. Thanks in advance.

Re: Direct current circuit analysis program

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 9 Nov 2009, 8:49 p.m.,*
in response to message #1 by ferroburak

Hi, Ferroburak;

I do not know the Circuit4 program (any source of information?), but based on the fact that you are an aerospace engineering student, I would like to ask what sort of resource you would need in a DC analysis program. I mean, will you enter a circuit description based on nodes/mash, the kind of active(source)/passive(load) component and their location and solve for current/voltage unknowns? There are many programs that might fill your needs here, if you are searching for HP49/HP50 application programs. If you want to go ahead with Electrical Engineering for these calculators, try here, too.

Hope this helps.

Luiz (Brazil)

Re: Direct current circuit analysis program

*Message #3 Posted by **Crawl** on 10 Nov 2009, 10:17 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

One circuit analysis tool that's fun (and free) is the analog circuit simulator at Falstadt.com. It has trouble with extremely complex circuits, but I imagine a program running on a pocket calculator would, too. I can't directly compare it to circuit4 because I haven't used that (though it does look cool). It looks like they'd be similar in that you'd build the circuits graphically (rather than something like pSpice).

Edited: 10 Nov 2009, 10:20 a.m.

Thanks for the tip and the link! (N.T.)

General Electric CE 93 RPN calculator - and more...

*Message #1 Posted by **Joerg Woerner** on 9 Nov 2009, 3:16 p.m.*

Short question:

While doing some research on a General Electric CE 93 RPN calculator Picture of CE 93 (rebadged Omron 12sr) before selling it on eBay, I found three matching websites with Google:

1) Serge Devidts - Only about 10 different calculator models were sold under the General Electric brand, most of them with the Genius logo.

2) Dennis Belillo - Sold in Australia among other places

3) Katie Wasserman - Manual in English and German languages

This makes to me no sense, maybe you can help me!

General Electric is a "huge" brand in the US, most auctions with GE calcs show up in Australia. I grew up in Germany and NEVER noticed a GE calculator there. Sure, my CE 93 has a Rosetta Stone manual, too - but WHY? ??

Any ideas about the GE calculators?

By the way - my other General Electric calculator, a CE 80 is clearly an OMRON design, too.

Thanks and Regards,

Joerg

Indefinite integral calculation with 49g+/ 50g

*Message #1 Posted by **ferroburak** on 9 Nov 2009, 6:11 a.m.*

Hi, Can these calculators perform indefinite integral calculation?(Integrals with no upper lower limits) Thanks in advance.

Edited: 9 Nov 2009, 6:12 a.m.

Re: Indefinite integral calculation with 49g+/ 50g

*Message #2 Posted by **Bart (UK)** on 9 Nov 2009, 7:36 a.m.,*
in response to message #1 by ferroburak

Yes. Whether it meets your requirements, please read the manuals here, or ask a more specific question which I'm sure forum members with more integration experience will be happy to answer.

Edit:
You can also try the newsgroup **news:comp.sys.hp48**. If you don't have a news reader or browser support for news, try access via Google groups.

Re: Indefinite integral calculation with 49g+/ 50g

*Message #3 Posted by **Mike Morrow** on 9 Nov 2009, 9:09 a.m.,*
in response to message #2 by Bart (UK)

Better yet, get the most up-to-date version. The HP site referenced above has only the older AUR edition 1.1 (HP 49g+) from 20 March 2006. The latest is edition 2 (HP 50G) from 14 July 2009. AUR edition 2 has 40 more pages than edition 1.1.

From HPCALC.ORG, here is the latest HP 50G Advanced User's Reference (AUR). (693 pages)

You might as well get the other reference document, the HP 50G Advanced User's Guide (AUG). (887 pages)

At HPCALC.ORG, very nice spiral-bound two-sided copies of the AUR are available for $15, and the AUG is $25. Extremely reasonable!

All told, you'll have almost 1600 pages to browse. The AUR is more important and useful than is the AUG.

Tim,

You should push this up the management chain at HP. It's an embarrassment for the company and if someone high enough up the chain realizes it, they'll fix it.

I can understand that it might take a week to get something posted, but it shouldn't take

more than that if people are doing their jobs.

Welcome to the wonderful world of working for a big company. :) :)

42S on iPod Touch: OFF function behavior (bug?)

*Message #1 Posted by **Andrés C. Rodríguez (Argentina)** on 8 Nov 2009, 2:10 p.m.*

I bought this fine calculator simulator, the most important app in my iPod Touch yet. I am very satisfied with it. However, I have some checking to suggest.

The real HP-42 has (of course) a keyboard operation to turn it off. As this has little sense for a simulator, the respective position in the keyboard has been replaced with an "options" label, and it activates a configuration menu. This is acceptable, although I found myself "turning off" the calculator when a calculation has finished; only to see i'm now at such menu instead of leaving the application. Just a little annoying; but nothing serious.

The issue is worse when you execute XEQ "OFF" from the keyboard or even inside a program. Instead of leaving the application, or staying there in "off" state, or even doing no action at all; the "OFF" function does the same that the keypad operation now on its place: it goes to the configuration menu. This is not only annoying but plainly weird.

I don't think anything similar happens to Free42, although I had't tried it yet. It doesn't seem to have a configuration menu there.

[Disclaimer: I apologize in advance if my imperfect command of the English language prevents this message to convey its intended friendly meaning.]

Edited: 8 Nov 2009, 3:52 p.m.

Re: 42S on iPod Touch: OFF function behavior (bug?)

*Message #2 Posted by **Dave Britten** on 8 Nov 2009, 5:21 p.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

Yes, Free42 will close itself when pressing the Off key sequence, or executing the OFF command. One time, it just blanked the screen for a moment, then came right back, but it hasn't done it since.

In Free42, you just tap the calculator display to bring up the options, rather than pressing Off.

Re: 42S on iPod Touch: OFF function behavior (bug?)

*Message #3 Posted by **Reth** on 9 Nov 2009, 4:11 a.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

Why is the OFF command so important to you? Why would you turn a SIMULATOR off like you would with the real calculator? To save batteries?
OFF command is implemented differently on simulators, but it is generally meaningless on them.
42s is far more than "fine simulator" of the HP-42s. It is a giant leap ahead of its origin. Extremely fast, a lot more accurate, practically unlimited in memory, printer facilities independent or printer or paper, IO, brilliant, readable display etc. etc.
I'd suggest you go get reasonably familiar with the thing you are criticizing before you post. It's another thing if you have questions for things you don't understand. Then you should ask politely rather than using words like

"annoying", this community here is very helpful, the best one can get.

Re: 42S on iPod Touch: OFF function behavior (bug?)

*Message #4 Posted by **Dave Britten** on 9 Nov 2009, 10:22 a.m.,*
in response to message #3 by Reth

As they say, old habits die hard. I've often found myself reaching for Shift-Off as well, so having it do something reasonably similar to exiting or turning off is nice. The Palm version of Free42 handles it rather well, in that both the Off key and the OFF command actually turn off the Palm. As soon as you turn it back on, you're right where you were in Free42. Not sure if the Apple API allows programs to throw the device directly into sleep mode, though, so this might not be an option.

Having the OFF command not behave as expected isn't a big loss - I can't imagine the command is used all that much in programs. But it's hard to deny that having OFF open the preferences is at least a little bizarre.

Re: 42S on iPod Touch: OFF function behavior (bug?)

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 9 Nov 2009, 10:43 a.m.,*
in response to message #3 by Reth

Reth: Please read the disclaimer at the bottom of my message. I have been a member of this community for more than 10 years, and so do agree with your view about the excellent quality of most people here. Excuse me if I annoyed someone using a word that means "small inconvenience"; perhaps using my mother tongue can make me more precise with adjectives. I also apologize for not being polite enough for your high standards, whatever they are.

I paid the price for the application, I think it's excellent, I gave praise to it, I recommended it to many other persons. That said, I think a "quasi-bug" (even if it does not block normal use or cause errors in calculations) or a "behavior quirk" are to be commented, so the developers can take care of them.

It seems that the opcode for OFF was retained and linked to the simulated press for the respective key... only that the key function has changed. It's not unfair to mention the undeniable fact that the "OFF" function does something very different from expected. Just that.

This is not the same than asking a simulator to do, for instance, hardware diagnostic tests by pressing three "keys". That would be a different thing (even if it may have a nice, retro-looking efect).

Other parts of the answer deserve no comment.

in response to message #7 by Andrés C. Rodríguez (Argentina)

Andres,

There is/was no need for any kind of disclaimer. Your command of English puts a lot of native-English speaking people I know to shame. I had the privilege of sitting next to you at an HHC in San Diego and found your verbal English skills be very good as well (not to mention your excellent HP programming abilities!). You are a class act, Andres.

Re: 42S on iPod Touch: OFF function behavior (bug?)

*Message #9 Posted by **Andrés C. Rodríguez (Argentina)** on 9 Nov 2009, 2:55 p.m.,*
in response to message #8 by Matt Kernal

Hi Matt, nice to hear from you, and thanks for your positive comments (even as exaggerated and generous as they are).

I hope to make my point clear: 42S is an excellent product, I use it everyday. There was just a detail to mention, so it can be taken care of.

By the way, I don't have a clear use for OFF in a simulator, other than consistency with the simulated original. I know there are differencies ann improvements, so 42S is not supposed to be an emulator, running a HP 42 ROM image, or something similar. Dynamic range, for instance, is larger. Internal digits precision seems to be higher. Speed is much faster, undoubtedly. Import/export via browser is nothing short as genius work. Perhaps I will soon give a try to Free42, which I used on a PocketPC years ago; and see if I like it more or less... or just have both, I'm sure they are excellent!

Re: 42S on iPod Touch: OFF function behavior (bug?)

*Message #10 Posted by **Egan Ford** on 9 Nov 2009, 3:13 p.m.,*
in response to message #9 by Andrés C. Rodríguez (Argentina)

> Quote:

Based on following statement, I believe that the author of 42s has no plans to be consistent with the original:

> Quote:
>
> Thomas Okken will be releasing a Free42 port for the iPhone that will adhere much more strictly to the HP-42S, and will be more consistent with his other platform ports.
>
> While I want to preserve base HP-42S functionality. I would like to exercise a little license. I personally believe that the catalog listing not being exactly the same as the 42S is not a big deal, I know opinions will vary. There are potentially new commands to come given the time and the will such as UNDO, REDO, GPS, etc... All of these would need to be added to the catalog.

The source of this statement is from the 42s forums after I raised an issue about changing the catalog. IOW, 42s is no longer keystroke compatible with the 42S. The purest in me would like an option to choose. However, I've always felt that Free42 would be a great base for a new RPN. I wouldn't mind seeing a total departure from the 42S look to something like the 32SII or 35s, i.e. two shift keys.

Perhaps 42s should be renamed to 42s+ since it is an evolution of the 42S.

Re: 42S on iPod Touch: OFF function behavior (bug?)

*Message #11 Posted by **Andrés C. Rodríguez (Argentina)** on 9 Nov 2009, 3:48 p.m.,*
in response to message #10 by Egan Ford

Egan, if that's the 42S direction, which may of course be valid, then it may be appropriate to remove the ON and OFF functions altogether.

What called my attention was that the OFF function maps to the HP-42 keyboard place where OFF used to be; but since there is now an "options" menu in that place, the menu is called when OFF is intended. I found that confusing. Perhaps mapping OFF to STOP will do (at least in a first approach).

Best regards,

Andrés

Re: 42S on iPod Touch: OFF function behavior (bug?)

*Message #12 Posted by **Bart (UK)** on 9 Nov 2009, 6:07 p.m.,*
in response to message #3 by Reth

Well Reth, let me tell you...

I have a Nokia 5800 and have 2 calculator simulators on it, both without an OFF function implemented. I run them in full screen mode (otherwise I need a magnifying glass) and then there are no 'phone menus available. The only way to exit is to TERMINATE them using the red physical key. This not only exits in an un-elegant way, but also directly to the home screen - leaving the "applications menu" open in the background. I then have to go into the "applications menu" afterwards to close it. I do find it anoying, anoying, anoying :-)

I would really like to have Free42 complete with OFF function, for the 5800.

Re: 42S on iPod Touch: OFF function behavior (bug?)

*Message #13 Posted by **Byron Foster** on 9 Nov 2009, 6:22 p.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

> Quote:

Just a little annoying; but nothing serious.

Hi Andres, I felt that the ON/OFF function was redundant given the standard operation of the iPhone/iPod with the button at the bottom of the device. Also, ON/OFF can only be half implemented at best sense the application can never actually turn the device off. And, it makes for a convenient mechanism to go to the options view. This is my thinking anyway.

> Quote:
>

This is not only annoying but plainly weird.

Version 2.3.1 has some work in this area, but probably not to your satisfaction. There was a problem where if you performed XEQ "OFF" it would take you to the options view, then when you went back to the calc view, the keyboard was still active.

You're right though, the effect of running "OFF" is quirky. The current behavior was easy to implement, but has some sloppy side effects. Given time I'll revisit this, and probably do what you say and just have OFF do nothing.

This is all assuming Apple some day puts the application back up on iTunes...

Re: 42S on iPod Touch: OFF function behavior (bug?)

*Message #14 Posted by **Andrés C. Rodríguez (Argentina)** on 9 Nov 2009, 6:38 p.m.,*
in response to message #13 by Byron Foster

Byron:

Thank you for your answer and, in first place, let me congratulate you for a magnificent piece of software.

To the point:

a)I find the "options" location a little confusing for me, as I am very used to Pioneers and tend to finsh my work turning the calculator off. But it's just me; and if it is a good choice for others, it's all right.

b) I strongly feel that XEQ OFF (via the XEQ key) or a program step which reads "OFF" should not call the menu. I understand it may not be possible / desirable to turn off the device, or even to exit the application; so I suggest that it may just STOP or something similar.

Please take these as mere suggestions from a satisfied user, and please dsregard any idiomatic mistake.

Best regards

Re: 42S on iPod Touch: OFF function behavior (bug?)

> Thank you for your answer and, in first place, let me congratulate you for a magnificent piece of software.

Thanks, However Thomas Okken deserves the bulk of the credit for creating Free42.

> Quote:
>
> b) I strongly feel that XEQ OFF (via the XEQ key) or a program step which reads "OFF" should not call the menu. I understand it may not be possible / desirable to turn off the device, or even to exit the application; so I suggest that it may just STOP or something similar.

You're right, this really is a bug, and I filed it as such here:

http://code.google.com/p/free42iphone/issues/detail?id=37

Another possibility is that the OFF command does in fact quit the application. It's just that the OFF command isn't mapped to the standard key sequence of the HP-42S. Hmm, I think I like that solution.

42S back on App Store! Re: 42S on iPod Touch: OFF function behavior (bug?)

*Message #17 Posted by **Thomas Okken** on 10 Nov 2009, 12:42 a.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

Hi Andrés,

Handling OFF, whether the Shift-EXIT key sequence or the XEQ "OFF" command, is a tricky issue in an HP-42S simulator!

In Free42 for Windows, Linux, Mac, and Pocket PC, OFF simply exits the application. In Free42 for PalmOS, it turns the device off, but doesn't exit the simulator, so that when you turn it back on, you're still in Free42.
On the iPhone, the situation is a bit difficult, since iPhone applications aren't supposed to exit on their own initiative, and they also aren't able to turn the device off... so what *should* OFF do then?
Byron Foster's approach in his **42s** port of Free42 is to bring up the "Options" screen instead. That seems like an excellent choice to me, but of course it's not going to work so well if you're running a program that executes OFF, or if you're used to pressing Shift-EXIT to shut down the simulator.
In my own **Free42** for the iPhone, OFF exits the simulator, in flagrant defiance of iPhone user interface guidelines. I'm already steeling myself for the complaints from people that are used to Byron's **42s** and expect the Options screen to come up instead. :-)
I guess both **42s** and **Free42** should have a setting that allows users to decide how they want OFF to behave. In a perfect world, the available options would include all of: (1) turn off the device, (2) exit the simulator and return to the home screen, and (3) bring up the Options screen.

- Thomas

Re: 42S on iPod Touch: OFF function behavior (bug?)

*Message #18 Posted by **Egan Ford** on 10 Nov 2009, 1:43 a.m.,*

Same thing the 42S does. Display off, emulator app still running. i41CX+, 11C, 12C, 15C, 16C, and all the 48GX emulators behave this way.

Re: 42S on iPod Touch: OFF function behavior (bug?)

*Message #19 Posted by **Andrés C. Rodríguez (Argentina)** on 10 Nov 2009, 8:37 a.m.,*
in response to message #17 by Thomas Okken

Hi, Thomas. Of course, my congrats for Free42, i42S, and others are also (and in first term) for you. These applications were very important for me at the time I decided to buy my iPod Touch, and are very, very good.

Decimal to octal conversion for the HP-12C

*Message #1 Posted by **Kalevipoeg** on 8 Nov 2009, 12:24 p.m.*

Probably some of you are interested in mechanical calculators too. Watch this: http://www.youtube.com/watch?v=LGQTocT0Xr4

Therefore I tried to write a short program for the HP-12C this morning. Here it is.

Decimal to octal conversion on the HP-12C

```
01  STO 0
02  8
03  STO 1
04  0
05  RCL 0
06  X=0?
07  GTO 22
08  8
09  /
10  ENTER
11  INTG
12  STO 0
13  -
14  RCL 1
15  *
16  1
17  0
18  STO*1
19  RDN
20  +
21  GTO 05
22  RDN
23  GTO 00
```

Usage: Integer decimal number [R/S]

On the other hand, the stack registers are enough.

Decimal to octal conversion for the HP-12C ver.2.

```
01  0
02  X<>Y
03  8
04  X<>Y
05  X=0?
06  GTO 28
07  8
08  /
09  INTG
10  ENTER
11  RDN
12  RDN
13  LST X
14  FRAC
15  X<>Y
16  *
17  LST X
18  RDN
19  +
20  X<>Y
21  1
```

```
22  0
23  RDN
24  RDN
25  RDN
26  *
27  GTO 04
28  RDN
29  RDN
30  GTO 00
```

Usage: Integer decimal number [R/S]

Laplace transforms

*Message #1 Posted by **ferroburak** on 8 Nov 2009, 11:48 a.m.*

Hi, What is the best calculator/package for Laplace transforms in HP series? Thanks in advance.

Re: Laplace transforms

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 8 Nov 2009, 12:52 p.m.,*
in response to message #1 by ferroburak

Hi;

The ones that would help you right away are the HP49G+ and HP50G. Both offer Laplace transforms and their inverses as internal resources (should check OS and CAS version). If you want alternatives, there are some HP41 programs (a complete set, by Raymond D. Moore) that allow you to numerically evaluate Laplace transforms in expressions with up to seventh order polynomials .

Hope this helps.

Luiz (Brazil)

Re: Laplace transforms

*Message #3 Posted by **ferroburak** on 8 Nov 2009, 1:44 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

I have matlab on my computer but it's slow at showing Laplace results.(4 core pc..) I wonder how much it takes for Hp50g.

Note: I'm an aerospace engineering student. I consider buying a used Hp50g (around 90$). Do you think it's worth this price?

Thanks for your help.

Also the 48 series with the addition of one of the Sparcom Mathematics Pacs cards. Then there's programs on HPCalc.org

True rarity, perhaps? (I'd never seen or heard of the Casio fx-5400p).

Two particularly-interested bidders? One interested bidder and a shill?

Viktor Toth's site shows that it was produced in 1987 only, which conceivably pegs it as a short-lived HP-71B imitator:

http://www.rskey.org/detail.asp?manufacturer=Casio&model=fx-5400P

Don't confuse price with (practical) value or quality.

```
It is for two reasons (and probably more):
1)  Maybe not many around, (71B's are much easier to find)
2)  It's worth that to at least one person on this fine planet.

This astonishment of what things are worth, and what people are
willing to pay is crazy.  Just be happy it wasn't your pocket change
(which is a third reason: some peoples pocket change is more than
others).
```

EDIT: Crud, Karl won the race. :)

Yes. It's quite simple. It was worth $465 to one person.

HP's are not the only calculators out there.

Lambert W (HP-12C+)

*Message #1 Posted by **Gerson W. Barbosa** on 7 Nov 2009, 11:50 p.m.*

I have found a way to compute the the Lambert W function without using the solver, but only in the range (-1/e, 1]. However, the method allows the second branch to be computed all through the valid range, as shown below:

```
--------------------

Lambert W (2nd branch), -1/e =< x < 0

01 CHS
02 1/x
03 STO 0
04 ENTER
05 ENTER
06 ENTER
07 STO 1
08 LN
09 *
10 RCL 1
11 x<>y
12 -
13 x=0
14 GTO 19
15 CLx
16 RCL 0
17 LST x
18 GTO 07
19 LST x
20 RCL 0
21 /
22 CHS
23 GTO 00
                          12C+            actual

-0.367879441 R/S ->  -1.000000000     -1.000030530
-0.367       R/S ->  -1.070791879     -1.070791887
-0.3         R/S ->  -1.781337023     -1.781337023
-0.000000001 R/S -> -23.897019580    -23.897019585

(actual results obtained with Egan Ford's LAMBERTWB function in his special functions library -
See message #6 in
  this thread).

W-1(-1/x) = -(...x*ln(x*ln(x*ln(x*ln(x))))...)/x     (yet to be proved)

--------------------
```

The principal branch, at least in the range (-1/e, 1], can be computed with the following program:

```
--------------------

Lambert W (principal branch), -1/e > x >= 1

24 STO 0
25 ENTER
```

```
26 ENTER
27 ENTER
28 STO 1
29 e^x
30 /
31 RCL 1
32 x<>y
33 -
34 x=0
35 GTO 40
36 CLx
37 RCL 0
38 LST x
39 GTO 28
40 LSX x
41 GTO 00

                                  12C+           actual

 0.999999999 GTO 24 R/S ->  0.567143290     0.567143290
 0.5         GTO 24 R/S ->  0.351733711     0.351733711
 0.000000000 GTO 24 R/S ->  0.000000000     0.000000000
-0.3         GTO 24 R/S -> -0.489402227    -0.489402227
-0.367       GTO 24 R/S -> -0.932399183    -0.932399185

(occasionally the program will loop for certain arguments, as for 1, due to rounding errors -
in this case stop the program, the answer should be in register 1)

--------------------
```

Except for arguments whose convergences are very slow, these should work on the 12C as well. Also, by filling the stack with the desired argument and iterating two keystrokes until convergence is reached, this should work even on a non-programmable RPN calculator. The method may not be so practical but is somewhat interesting.

Gerson.

Re: Lambert W (HP-12C+)

*Message #2 Posted by **Namir** on 8 Nov 2009, 8:23 a.m.,*
in response to message #1 by Gerson W. Barbosa

Gerson,

Thanks for the program and for the reference. I have often come across the Lambert function, but did not stop to read about it. Your program and the Wikipedia reference gave me the info I need to implement the Lambert function (if and when I feel like doing that). The approximations are interesting.

Namir

in response to message #2 by Namir

Hello Namir,

Thanks for your interest!

> Quote:

> The approximations are interesting.

Actually these are supposed to be exact solutions (except for accumulated rounding errors, mainly at the extremes of the convergence intervals). I've just found this paper which sheds some light on the subject (Iteration, pages 18 and 19).

The programs have been rewritten:

```
-------------

01 CHS                20 STO 0
02 1/x                21 STO 1
03 STO 0              22 4
04 STO 1              23 EEX
05 LN                 24 CHS
06 RCL 0              25 1
07 *                  26 0
08 RCL 1              27 STO 2
09 x<>y               28 RCL 0
10 -                  29 RCL 1
11 x=0                30 e^x
12 GTO 15             31 /

Re: Lambert W (HP-12C+)

*Message #4 Posted by **Crawl** on 10 Nov 2009, 12:22 p.m.,*
in response to message #3 by Gerson W. Barbosa

I was playing with that a little.

It seems like

y(n+1)=x/exp(y(n))

converges to W(x) up to about 2.7 (probably supposed to be e). If you use

y(n+1)=(x/exp(y(n))+y(n))/2

it converges much faster in the previous range (because the oscillations are suppressed)(though it

doesn't necessarily speed the convergence for negative argument), and also extends the range substantially, to about 60 (probably supposed to be 3*exp(3)).

y(n+1)=(x/exp(y(n))+2*y(n))/3

converges all the way to 5*exp(5)~742.

It's probably possible to use this or a similar idea to get an arbitrarily wide range of convergence.

In fact

y(n+1) = (x/exp(y(n)) + (y(n))^2)/(1+y(n))

seems to converge over the entire range. You just need a good seed for y(0). Maybe x for x < 1, log(x) for x>1. Or just the natural log of x+1 for all x.

That's great! A good estimate for x>1 might be ln-ln(ln(x)). Perhaps your first expression and another initial estimate should be used for x<1.01 so that only a few iterations are needed in that range.

Some examples (Excel 2007)

$$y_{n+1} = (x/\exp(y_n) + y_n^2)/(1+y_n)$$

x = 1.001

n	y_n
0	6.90925457110691

Re: Lambert W (HP-12C+)

*Message #6 Posted by **Crawl** on 10 Nov 2009, 9:00 p.m.,*
in response to message #5 by Gerson W. Barbosa

I notice y(n+1)=log(x/y(n)) converges to the second branch quickly if x is very small, but converges very, very slowly if y~-1. I thought a bit about speeding up the convergence, but am not quite there.

Incidentally, look at the end of this paper.

> Quote:

> Finally, in an eloge near the beginning of the two volumes of Lambert's mathematical papers (published in Zurich in 1946 and 1948) we find that Lambert had dreams of building a machine to do symbolic calculation (while Pascal's machine merely did arithmetic). Thus his wishes anticipated those of Lady Ada Lovelace by roughly one century, and the actuality of symbolic computation systems by roughly two.

I'd think Lambert would have to be impressed by the HP50g.

Re: Lambert W (HP-12C+)

*Message #7 Posted by **Crawl** on 10 Nov 2009, 11:11 p.m.,*
in response to message #6 by Crawl

Okay, I think I have a good improvement to

y(n+1)=log(x/y)

Try

y(n+1)=(log(x/y)+1)*y/(1+y)

And maybe y(0)=log(-x)

Small x test

x=-.000001

Converges to -16.6265089014 in only three iterations. Takes 10 iterations for the other method.

Medium x test

x=-0.18

Converges to -2.7127679118 in only four iterations. Takes about 27 iterations to converge with other method.

Large x test

x=-0.36787944

Converges to -1.00007980968 in 17 iterations. Using qbasic and 100,000 iterations with the other method, has only converged to -1.00007975...

The HP-12C program below uses your formula and y(0)=ln(x+2)-ln(ln(x+2)) for all x. It's very fast on the 12C+. Running times are acceptable on the original 12C.

```
Lambert W function (principal branch)

> Quote:

> I think this forum is the first place I've ever heard of the Lambert W.

That's where I first heard of it too. I think it was Valentin Albillo who first mentioned it here.

I like its being capable of providing analytical solutions to some problems that would otherwise require a numerical solver, like the ridget hurler example in the HP-15C manual:

$h = 5000(1 - e^{-t/20}) - 200t$

The problem consists in solving the equation for t when $h = 0$. If Lambert W were used, the solution would be simply

$t = 20W(-5/4\ e^{-5/4}) + 25$

Or $t = 9.284255090$, when evaluated with the HP-12C program above.

Edit to correct a typo.

Need help with HP 48sx file transfer

*Message #1 Posted by **Martin Pinckney** on 7 Nov 2009, 8:25 p.m.*

I am trying to install some libraries on my 48sx, and having some issues. The first time I try to upload a file to the 48, it works OK, but try another file, and I get a dialog box that says "There was insufficient memory to complete this operation." Not sure if this message is coming from HP48 Explorer or Windows.

If I close HP48 Explorer and reopen it, it works again the first time, then repeats the problem.

Restarting HP48 Explorer each time is a workaround, but this should not be necessary, Any suggestions? Thanks.

What exactly is "HP48 Explorer" ?

Re: Need help with HP 48sx file transfer

*Message #3 Posted by **Martin Pinckney** on 7 Nov 2009, 9:23 p.m.,*
in response to message #2 by Michael de Estrada

HP48 Explorer is the Windows file transfer utility by Chris Mumford available from HPCalc.org. An alternative to the HP software.

Re: Need help with HP 48sx file transfer

*Message #4 Posted by **Michael de Estrada** on 7 Nov 2009, 10:08 p.m.,*
in response to message #3 by Martin Pinckney

OK, I was not aware of this. I have always used a DOS computer and Kermit. Does it work with the serial RS232 port?

Re: Need help with HP 48sx file transfer

*Message #5 Posted by **Martin Pinckney** on 7 Nov 2009, 11:35 p.m.,*
in response to message #4 by Michael de Estrada

I am using a Belkin USB-RS232 converter, which is seen by HP48 Explorer as COM5. That part seems to work OK.

Re: Need help with HP 48sx file transfer

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 7 Nov 2009, 10:01 p.m.,*
in response to message #1 by Martin Pinckney

Hi, Martin;

what version of Windows are you using? I am not quite sure if the HP48 Explorer works fine under XP, but I remember testing it OK with W95 and W98. Do you have an old PC running one of these to try it out?

Sorry not being of much help... :^(

Re: Need help with HP 48sx file transfer

*Message #7 Posted by **Chan Tran** on 7 Nov 2009, 10:50 p.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

The 48sx doesn't have sufficient memory to do the transfer. Doing the transfer in binary mode instead of ACSII mode save some memory. But since the SX only has 32K RAM it could run out of memory.

Re: Need help with HP 48sx file transfer

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 7 Nov 2009, 11:17 p.m.,*
in response to message #7 by Chan Tran

Hi, Chan Tran;

since he says the operation succeeds after closing and opening the HP48 Explorer, do you believe the message is genuinely related to the HP48SX being out of memory? It seems to me it is something else, related mostly to the computer's O.S.

Any ideas?

Cheers.

Luiz (Brazil)

in response to message #1 by Martin Pinckney

Martin,

I've never had any problems using Kermit with any 48/50 connected to any PC (Windows, Mac, Linux, UNIX). Have you considered using that?

Kermit HOWTO:

1. Get Kermit for your platform (Google it).
2. Put all your HP files in a single directory, start up Kermit from that directory.
3. Type the following commands (BTW, you can put this in the Kermit initialization file (read the docs)):

```
C-Kermit>set line COM5: (or whatever)
C-Kermit>set speed 9600
C-Kermit>set carrier off
C-Kermit>set parity none
C-Kermit>robust
C-Kermit>server
```

4. Setup the SX for binary or ASCII.
5. From the SX, enter the filename you want in single quotes, e.g. 'FOO', then KGET.
6. Repeat last two steps until you have all the files.
7. Ctrl-C Kermit server mode. 'exit' to exit.

Re: Need help with HP 48sx file transfer

*Message #13 Posted by **Martin Pinckney** on 10 Nov 2009, 1:10 p.m.,*
in response to message #12 by Egan Ford

Thanks, Egan, and everyone for your suggestions. I read the section in the Owner's Manual on Kermit, and it states "To transfer data to and from a computer, the computer must be running a program that implements Kermit protocol." My guess is, that's what HP48 Explorer does.

So the manual seems to say that Kermit is a protocol, but Egan, you seem to be suggesting that there are programs called Kermit.

Re: Need help with HP 48sx file transfer

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 10 Nov 2009, 3:00 p.m.,*
in response to message #13 by Martin Pinckney

Hi, Martin;

Kermit is a protocol and also a set of programs. Please, have a brief intro here. It is also free.

From wikipedia:

Quote:

Naming and copyright

Kermit was named after Kermit the Frog from The Muppets. The program's icon in the Apple Macintosh version was a depiction of Kermit the Frog. A backronym was nevertheless created, perhaps to avoid trademark issues, KL10 Error-Free Reciprocal Microprocessor Interchange over TTY lines.

Kermit is an open protocol - anybody can base their own program on it, but some Kermit software and source code is copyright by Columbia University.

Sorry, I could not resist

Cheers.

*Message #16 Posted by **Egan Ford** on 10 Nov 2009, 10:49 p.m.,*
in response to message #15 by Martin Pinckney

The free DOS version works fine in Windows, but you may be limited to COM1:-COM4:. I have not used it in a while.

For all non-Windows users C-kermit is free. I could not find C-kermit for Windows.

Re: Need help with HP 48sx file transfer

*Message #17 Posted by **Christoph Giesselink** on 11 Nov 2009, 4:08 p.m.,*
in response to message #15 by Martin Pinckney

I agree with Egan that the DOS Version works fine on XP.

I personally find that the Kermit protocol is too slow for many cases. In the early beginng of my SysRPL career it took me about 30 min. to restore the 100kB of my 48SX home directory. In the last 10 years I use a XModem Library on the SX. Now the restoring process takes about 2-3 min. over XModem.

Another way is to use Emu48 on the PC as Kermit program. I just load the file I want to send with "Load Object..." into Emu48, bound the COM port with the real 48SX in the Emu48 settings dialog to Wire. And then you have the choice, start the Kermit-server on real calculator

or on the emulated one. I prefer the server on the real calc and using the SEND command on the emulated one.

Do other brands also have buggy calcs?

*Message #1 Posted by **Jean-Michel** on 6 Nov 2009, 4:25 p.m.*

Hello all,

whereas I have the complete list of the bugs of the HP-35s, since it is well documented in this forum, I have no idea of the fact that programmable scientific calculators from other brands (TI and CASIO for the most well-known of them) could also have some bugs, and what kind of bugs they could be.
For instance, I wonder if the top of the range TI-89 and CASIO fx-9860g have bugs or not. I already hear some of you warning me that these calculators should not be compared to an HP-35s, but rather to an HP-50g, but I simply do not have informations of the bugs an HP-50g may have, that's why I mention the 35s.

Sorry for asking such a question here, but where else could I do it, and thank you advance for your answers.

Kind regards.
Jean-Michel.

Re: Do other brands also have buggy calcs?

*Message #2 Posted by **Michael Meyer** on 6 Nov 2009, 4:42 p.m.,*
in response to message #1 by Jean-Michel

Seems like a very fair question to post here. But the answer looks pretty clear: just search the internet and you'll find a lot of sites with bugs and bug lists for those models.

Re: Do other brands also have buggy calcs?

*Message #3 Posted by **Namir** on 6 Nov 2009, 11:33 p.m.,*
in response to message #1 by Jean-Michel

Last year my son called me from AZ and mentioned that his TI inspire failed to solve an Euler ODE!!! He mentioned that his TI-89 Titanium DID solve the same problem correctly. When he arrived for Xmas, I updated his OS for the nspire and we tried again. It failed again. We tried it on my TI nspire and that did not work too. We contacted TI and explained the problem. We heard nothing back from them.

It shows that even the best machines have bugs!

Namir

Re: Do other brands also have buggy calcs?

*Message #4 Posted by **Eric Smith** on 7 Nov 2009, 1:04 a.m.,*
in response to message #3 by Namir

I don't think I'd say that finding a bug in a TI necessarily shows that "even the best machines" have bugs.

:-)

Any complex system has bugs. This is not unique to software, but it most visible in software because we built software systems of greater complexity than most other kinds of systems.

Re: Do other brands also have buggy calcs?

*Message #5 Posted by **Namir** on 7 Nov 2009, 7:14 a.m.,*
in response to message #4 by Eric Smith

I agree with you Eric. That is why operating system and even browsers (also complex enough) have vulnerabilities which hackers exploit.

The interesting thing though is that the TI-89 Titanium was able to solve my son's problem, while the TI nspire failed. That is why the TI-89 has become inseparable from my son.

It shouldn't have to be. This is just an excuse perpetuated by manufacturers to reduce NRE and maximise profit.
"It's not perfect but good enough" is being used as an excuse to release rubbish.

Aircraft have complex safety critical systems with complex software. Would we accept the kind of bugs there that we see in consumer equipment?

Of course it's more expensive, but producers are more concerned with quarterly profits than quality products. What is better - having to buy several calculators to get the correct answers in all circumstances or one more expensive one that does everything right?

Re: Do other brands also have buggy calcs?

*Message #7 Posted by **Thomas Radtke** on 7 Nov 2009, 8:42 a.m.,*
in response to message #6 by Bart (UK)

You would have to test a complex system by arranging for any possible state it might be in to make sure all bugs are found. Is that possible for a modern calculator?

Re: Do other brands also have buggy calcs?

*Message #8 Posted by **Bart (UK)** on 7 Nov 2009, 3:07 p.m.,*
in response to message #7 by Thomas Radtke

It is not about testing all possible states. That can take a lifetime, even for hardware - imagine

testing a modern high density FPGA for all possible input/ouput combinations!

It is about the development effort, properly executing the process of developing the system from requirements to testing and production. There is the idea that it's time consuming and expensive - but there always seems to be time & money go back and fix things a hundred times (or upsetting end users) rather than do it properly in the first place. I mentioned aircraft safety critical systems, but developing everything to that level would be "over the top". However, there are simpler processes to follow that could produce low bug-count systems for consumer use.

Coming back to testing, a properly thought out and executed test plan can ensure wide coverage without endless test effort. How difficult can it be to test the length/checksum function for programs on the HP35s?

Re: Do other brands also have buggy calcs?

*Message #9 Posted by **Eric Smith** on 7 Nov 2009, 6:01 p.m.,*
in response to message #8 by Bart (UK)

> Quote:
>
> It is not about testing all possible states. That can take a lifetime,

A lifetime? For an even moderately complex product it would take an astronomical number of times longer than the current age of the universe.

This is why code coverage analysis was invented. While it helps, it doesn't completely solve the problem.

Re: Do other brands also have buggy calcs?

*Message #10 Posted by **Richard Reed** on 7 Nov 2009, 9:12 a.m.,*
in response to message #6 by Bart (UK)

I have to agree with Bart, if I'm correct that he thinks it's a matter of expense.

Software and hardware QA are not new anymore, and there is no practical reason for the complexity of these systems to grow any faster than the methods available to test them.

The expense of testing has not become greater in proportion to other costs in the product life cycle, so if new products are actually more buggy, it's a result either of decisions not to test them as thoroughly as warranted by their complexity, or simply of being in an earlier stage of "incremental improvement" than other products in the comparison.

The decision not to test adequately would be a decision to cheapen the product.

Richard

Re: Do other brands also have buggy calcs?

*Message #11 Posted by **designnut** on 7 Nov 2009, 2:39 p.m.,*
in response to message #10 by Richard Reed

Aye there's the rub. I have no doubt they consider their tests adequate. Perfection takes a lot longer and time pressure doesn't permit perfection. I was reminded of the Mt. Palomar telescope, when the shop was asked how far short of perfection the mirror was, said about 100

years. Sam

Re: Do other brands also have buggy calcs?

in response to message #11 by designnut

> Quote:
>
> ...how far short of perfection the mirror was...

But how short of perfection did it need to be to meet the purpose of the telescope? *That* should be captured in the requirements. Once the requirements have been properly established, the design should endeavour to meet those requirements 100%. To use "it's not perfect, but good enough" as an excuse not to meet the requirements means wanting to release an inferior product.

Well defined requirements will also minimise requirement creep. Any "nice-to-have's" that pop up during design should be kept aside as new requirements for a possible product upgrade.

Re: Do other brands also have buggy calcs?

*Message #13 Posted by **Eric Smith** on 7 Nov 2009, 5:55 p.m.,*
in response to message #10 by Richard Reed

> Quote:
>
> Software and hardware QA are not new anymore, and there is no practical reason for the complexity of these systems to grow any faster than the methods available to test them.

The practical reason why the complexity of the systems is increasing rapidly (and faster than testing) is that customers always expect newer products or models to have more features.

If you take the previous model of a product which contained 200,000 lines of code, add some features, and the new model contains 250,000 lines of code, you have NOT increased the testing problem by 25%. The increase is exponential, but improvements to testing performance and even to testing methodology are on a much shallower curve.

Until customers stop demanding added features, or a breakthrough is made in software verification, software quality will continue to deteriorate.

Re: Do other brands also have buggy calcs?

> Until customers stop demanding added features, or a breakthrough is made in software verification, software quality will continue to deteriorate.

IMO customers don't "demand" new features, software companies invent new features to generate sales of "improved" versions.

Most customers I know would just be happy if the "old" versions could be made bug free.

Re: Do other brands also have buggy calcs?

*Message #15 Posted by **Eric Smith** on 8 Nov 2009, 2:30 a.m.,*
in response to message #14 by Martin Pinckney

Customers "demand" new features because they buy software that is marketed touting new features. If they stopped doing that, and instead complained to the software companies about how bug-ridden the software is, things would be different.

It's called "voting with your wallet".

The reality is that most people simply put up with the bugs.

Re: Do other brands also have buggy calcs?

*Message #16 Posted by **bill platt** on 8 Nov 2009, 12:52 p.m.,*
in response to message #14 by Martin Pinckney

In CAD software, there is a hugely important customer-driven evolution. Once you can do "a" with the software, you soon realize that if it could do "a + b" automatically, you'd save another 200 hours per year of modeling effort etc etc. Maybe word processors, spreadsheets, programmable toaster ovens and calculators suffer from "feature bloat," but in commercial CAD software, while there is "feature bloat" with respect to the parts of the package you don't use, there is always improvement (meaning, can it make the work go faster) to be done for your own use.

The packages that don't keep up with the customer demands, fall away and disappear. sometimes this is to the consternation of the customers, who have invested in knowing how to use the package. The CAD software market really depends on collaboration. Examples of what I am talking about would be Solidworks, Rhinoceros, Aerohydro, AutoCAD.

"Adequately" is a judgement call; there is no a priori objective standard for "adequate".

The amount and type of product testing done is a business decision, based on guesses as to how much the quality of the software will affect sales.

Re: Do other brands also have buggy calcs?

*Message #18 Posted by **Eric Smith** on 7 Nov 2009, 5:51 p.m.,*
in response to message #6 by Bart (UK)

Note that high-end automobiles now contain many times more lines of code than the latest aircraft avionics. This is because for the aircraft avionics they know that they will have to extensively test every feature and many combinations of features under a very large range of system conditions (both plausible and implausible), and they still won't catch all the bugs. For the automobile the testing requirements are much lower, with exceptions for only a few subsystems.

With regard to aircraft software you write:

> Quote:
>
> Of course it's more expensive,

I'm not sure from your post that you have any idea just how much more expensive it is. We're not talking about 50% more expensive, or even 200% more expensive. We're talking about at least two orders of magnitude more expensive. You will NEVER see that level of testing put into a consumer product, because there is no possible business justification for it.

Re: Do we have to believe buggy calcs are inevitable?

*Message #19 Posted by **Bart (UK)** on 7 Nov 2009, 10:56 p.m.,*
in response to message #18 by Eric Smith

There seems to be too much of a focus in this thread on testing. *My* argument is that planning receives too little attention. It is in the requirements capture and detailed software planning stages that the opportunity for "doing it right first time" exists. By the time testing is being done, it's at the point of "going back to fix it". So often I see programs where coding is done directly from poorly defined high level requirements because "there isn't money for that" or "there isn't time because we have to get something on the table". It's like having a big jellyfish on top of a thin pole, and with each test-and-fix iteration the jellyfish becomes bigger and more difficult to keep on the pole. Adequate high & low level requirements capture and detailed software planning & design can create the right size pole.

As to the effort and expense of aircraft software you are right when it comes to safety critical software. I did say in an earlier post that this was over the top for consumer products. Also, a big chunk of this added time and cost is due to the supporting documentation and independent verification required for safety critical systems. This is not needed for non safety critical software. Because of this, that type of aircraft software is considerably more complex than the safety critical stuff, but when developed well still has good performance - and is not that expensive. Some of those that complain about the expense usually under-estimated the cost at the bid stage and ended up paying several times what need have been, to fix it - i.e. it comes back to bad planning. Or didn't apply the process from the beginning and had to go back and re-do it.

On generic PC's I can understand problems exist because the software house has no control over the hardware platform that the software will be used on. However, calculator manufacturers have complete control over the whole platform.

Flawed calcs & consumer products vs. old HP's

*Message #20 Posted by **Karl Schneider** on 8 Nov 2009, 12:48 a.m.,*
in response to message #19 by Bart (UK)

Bart --

That's a fine "mini-essay" with some very good points.

Several explanations for bug-ridden, flawed, and poorly-designed calculators and other consumer gadgets have been discussed in this space:

- Relentless pace of advancing technology renders today's novelty tomorrow's obsolete relic. *Why spend the money, time, and effort to make a first-class product that would be replaced in only a few years?*
- Race-to-the-bottom price competition, enabled by low-cost microprocessors as well as the cheap labor of globalization, leaving little margin for quality engineering.
- Re-emphasis from "substance" (sensible, quality products) toward "style", gimmickry, and short-term profit.
- Today's cheap, expedient way to fix errors by releasing patches to software and firmware via the internet.

It didn't used to be that way:

Even by modern standards, there was nothing simple about the detailed functional specifications of the HP-15C and HP-42S in particular. Yet, these models are known for near-perfection in operation, and excellence of design. Both pioneered new territory in certain ways, but -- with only a few trivial exceptions -- every feature performs exactly as designed. The vast majority of their functional designs themselves are also excellent.

This could not have happened by accident: Not only was the functionality carefully thought through, but systematic, methodical procedures must have been employed to ensure that nothing would be overlooked. Rigorous and comprehensive testing ensured that the original product release did not require significant revision or re-design. I'm always astounded how well the HP-15C and HP-42S were executed in their basically-single incarnations.

I believe that certain methods and practices of the not-too-distant past have been forgotten or discontinued in the development of much of today's consumer technology.

*Message #21 Posted by **Bart (UK)** on 8 Nov 2009, 12:56 p.m.,*
in response to message #20 by Karl Schneider

Your bullet points explain what I was getting at in my first post - manufacturers maximising profit at the expense of quality, and then trying to smooth the waters by saying "ooo, it's a complex system...it's not going to be perfect you know".

Were the sales figures of the Pioneers and 48 series so poor that HP calculator devision felt they had to stoop to inferior competitors low quality to stay profitable?

*Message #22 Posted by **Don Shepherd** on 8 Nov 2009, 2:28 a.m.,*
in response to message #19 by Bart (UK)

Good points, Bart.

This kind of says it all.

When I became a programmer in 1974, a critical aspect of that job was "desk checking" the program, which meant going through it line-by-line and ensuring that it was logically correct, even before compiling. I'm afraid that is no longer done. In fact, testing is sometimes left for beta testers these days.

I agree that the requirements definition process is absolutely critical to the development of a succesful project. But that's just one phase. What is really needed is smart people and knowledgeable and supportive management at every phase of the life cycle, and that's always tough to get.

Re: Do we have to believe buggy calcs are inevitable?

Yup, that's what my "mini-essay" was all about.

What also gets my back up though is that the users are then persuaded to accept serious bugs are inevitable. By serious I mean bugs that prevent the equipment from performing to a hard and fast requirement. i.e. a calculator not adequately (or not at all) performing a function that is part and parcel of the machine. Examples are Namir's TI-inspire problem and the program length / checksum function of the HP35s.

>
> Nothing new can be trusted....

If you're referring to the long-standing floating-point math results provided by MS Excel 2000 and later versions, here's a thread from 2007 that links to an earlier lengthy one from 2002:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=107533#107533

A link is provided by Gunnar Degnbol to a 2006 draft paper by W. M. Kahan about Excel mathematics.

There was a well-publicized display bug in Excel 2007, which apparently was patched by KB943075.

No matter how well you design the software before you start writing it, you will still wind up with bugs in it that won't get caught until testing. That might be testing by your QA department, or testing by your customers.

If you start from a good design, you'll have fewer bugs, but not zero.

I recently got a Casio FX-3900PV that locks up all the time.

Casio's are usually bullet proof in terms of firmware, but this programmable model locks up all the time if you say pick up the calculator and accidentally press random buttons. You just see "busy" on the display and even the OFF button won't work.

No wonder is has a handy reset button on the back!

Dave.

University of Houston Calculator Contest

*Message #1 Posted by **David Hayden** on 6 Nov 2009, 3:38 p.m.*

The following appeared on comp.sys.hp48 recently. I thought this community might enjoy it. Please note that I was not the orignal poster. ----------

I came across an interesting site for the annual University of Houston Mathematics Contest for high school students (http:// mathcontest.uh.edu/). One of the contests is a calculator test. I tried the 2009 test:

http://mathcontest.uh.edu/Exams09/calculator.pdf

It was interesting. The 20 questions range from reasonably easy to downright hard to completely ridiculously and confusing.

The contest is supposed to be one hour, but I took closer to two. Unfortunately, after I finished, I realized that there is no answer key given, so I couldn't check my results, but it was still a fun challenge.

Enjoy, -wes

Re: University of Houston Calculator Contest

in response to message #1 by David Hayden

Eeek, that test would be quite a challenge in an hour.

A high end graphing calculator would help a lot evaluating the relatively long series.

- Pauli

in response to message #2 by Paul Dale

If you look at the chapter names of the PDF (I viewed it with Preview on my Mac) a TI-83 is recommended.

Some of my answers

*Message #4 Posted by **Crawl** on 6 Nov 2009, 6:57 p.m.,*
in response to message #1 by David Hayden

I didn't do the whole thing, but here are most of them.

1. << 950774 DO 1 - DUP ISPRIME? UNTIL END>>

Gives

950753

2. 5*7^5+5*7^4+2*7^3+4*7^2+2*7+6=552426

Straight forward; I probably should have written a program to make it go a little faster.

3. This one is based on Euler's constant.

exp(7.2-0.577) = 752

You can then manually find the sum to 752 = 7.200616 to 751 = 7.19928

So the answer is 752

4 900/(pi/2) = 572.95

571 * pi/2 = 896.9247...

So the answer is 3.4287130x10-6

5. By graphing, we find they intersect at 1.2476143603 and -3.39730397 so -2.14968960968

6. Derivative has real roots -.707250032311, -4.29559733134, 4.61929258455

f has values -362.723, 104704.599751, 232366.502395

can be confirmed with graphing

So the answer is 232366.5023

7. 7351344 = 2^4 * 3 ^ 3 * 7 * 11 * 13 * 17

11 factors

You can include or not include any of them. (2^11 values of i)

so 2^22 points

Answer: 4194304

8. <<1 1 14 FOR X 3 X ^ INV 1 + X 1 + ^ * NEXT>>

Answer=3.12155183

9. Use DROITE, the line is Y = 1/3(x-7)+4

take the atan Answer=.321750554

10. -2689/890=-3 19/890

Might be slightly more difficult to get an exact answer if your calculator does not have a CAS; otherwise this is trivial.

11. 310,000.00 I must not get this one. It seems like a simple division problem. Maybe it's a trick question.

12. There are 47 years

<< 71 1 47 FOR X DUP .06 * FLOOR + NEXT >>

Gives 980 (would have been 1098 without the FLOOR), then subtract 39

Answer=941

14.

<< 1 0 0 -> X S J << 2 47 FOR J J ISPRIME? IF THEN X 1 + 'X' STO X 2 / DUP FLOOR == IF THEN X 1 + DUP 2 ^ + 2 / J * S + 'S' STO END END NEXT S >> >>

Answer=17610

15 << .5 2 51 FOR X DUP 1 SWAP - * 3 * NEXT >>

Answers= 0.634247256816, 0.6959330221, 0.634830753538

16 <<0 1 200 For X X ISPRIME? IF THEN X INV 2 ^ + END NEXT>>

Answer= 0.4514999600419

I also confirmed that there are as many primes as there were supposed to be.

17. Solve e(-x^2) = 10^-9 x=4.55228138815 Odds of being right for one = 1-4.55../9 = 0.494...

Odds of being right for all 10 is that to the 10th power.

8.6885627195x10-4

> Answer: 4194304

I already see that I did that totally wrong.

It's

5 * 4 * 2 * 2 * 2 * 2

(The prime exponent plus 1)

so 320 factors.

And 10240 points.

One more

*Message #6 Posted by **Crawl** on 6 Nov 2009, 8:26 p.m.,*
in response to message #5 by Crawl

19.

This is much easier than it first seems.

The square root of 1100 is 33.1...

The 25th prime is 98.

That means if any number less than 1100 is not divisible by the first 25 primes then it itself must be prime.

<< 0 -> X

<< 2 1100 FOR J

J ISPRIME? IF THEN X 1 + 'X' STO END NEXT X >> >>

That gives 184 primes less than 1100

So the answer is 159.

It would be harder if they asked if they weren't divisible by, say, the first 5 primes (up to 11). Then you'd have to include numbers like 13^2=169, 17^2=289, 13*17=221, etc.

Most of the rest

*Message #7 Posted by **Crawl** on 7 Nov 2009, 10:56 a.m.,*
in response to message #6 by Crawl

13. I really hated this one. It's not a math problem; it's a "can you penetrate our impenetrable writing" problem. Too bad those being judged can't sometimes turn around and judge the judges.

Anyway, I guess the idea is that to 6 pm she has gone 67 mph for 2 hours, so she's gone 134 miles. For the next 40 minutes she's able to drive the full 75 mph, so that gets her another 50 miles ahead, for 184 total. I presume that for 25 minutes she just drove in a big circle, so at 7:33 she's still 184 miles from Houston (and 55 from Dallas). Then for 20 minutes she drove for 64 mph, getting her another 21.333... miles ahead. So, it's now 7:53 and she has 33.666... miles to go. She can go that distance at 75 mph, so it takes her 0.448888... hours = 26.93333.... minutes to go the rest of the way.

She arrives at about 8:20.

17. I already answered this one, but just as a note, they never specified that the trial numbers would be chosen with *uniform* random distribution in the interval.

18. We could do this with a financial function trivially if not for the alternating deposits. There are 126 6-month periods in 21 years.

<< 0 1 126 FOR X 1 .04 12 / + * 600 + 1 .04 12 / + * 900 + NEXT >>

Gives 295356.71 as the answer.

A refinement could be to round down fractions of a penny.

If it wasn't for the compound interest, the total would have been 189000.

Re: One more

*Message #8 Posted by **David Hayden** on 9 Nov 2009, 1:39 p.m.,*
in response to message #6 by Crawl

There's an evil twist to problem 19, which is probably intentional:

> Quote:
>
> 19. Give the number of **positive integers** that are no larger than 1,100 and are not divisible by any of the first 25 prime numbers.

The number 1 is positive, less than 1,100 and not divisible by any of the first 25 primes, so it counts too. Therefore the correct answer is 160, not 159.

Re: Some of my answers

102400 actually. You missed a zero. But thanks for the solution. I did it completely wrong, in a complete different way from either your right answer or your wrong one. I thought they were plotting only the prime factors.

Re: 2009 UH calc test: Some "old-school" answers

*Message #10 Posted by **Karl Schneider** on 7 Nov 2009, 2:31 p.m.,*
in response to message #4 by Crawl

"Crawl" --

Thanks for your answers. Certainly, a modern calc with built-in graphing, fast processing, and mathematical functions such as prime number and maybe LCM, LCD, etc. would helpful for this exercise.

Still, even a venerable HP-34C, HP-11C, or HP-15C is useful for some of the problems requiring more than straightforward transcedental functions:

Question 3

Find the smallest natural number k so that 1 + 1/2 + 1/3 + 1/4 + ... + 1/k > 7.2

I'd forgotten all about the Euler-Mascheroni Constant, which had been discussed in the Forum, and was surely was intended to be utilized for analyzing this harmonic series. As "Crawl" pointed out, the "rate of divergence" equation will give a very accurate estimate of k. However, ignoring the error 'epsilon' in the equation will lead the user to assume that the correct answer is 753, not 752 (for which 'epsilon' is about 0.00072418).

Directly-calculated solution -- the sum is not too difficult to automate using ISG:

```
Program:          Execution:

LBL A             1.99901
RCL I             STO I
INT               7.2
1/x               GSB A
-                 ...
x < 0?            RCL I
RTN               INT
ISG (or ISG I)    (752.)
GTO A
RTN
```

Question 5

Give the sum of the x coordinates for the points of intersection of the graphs of

$f(x) = \sin(x) + 2x$
$g(x) = 5 - x^2$

SOLVE in the HP-34C and HP-15C will tackle this, but they will find only one root at a time, so the guesses that define initial search ranges must be selected intelligently. Don't forget RADian mode:

```
Program:    Execution:

LBL B            0
RAD            ENTER
2                2
+              SOLVE B
*           (1.247614363)
5              STO 0
-               -3
x<>y           ENTER
SIN             -4
+              SOLVE B
RTN         (-3.397303973)
              RCL+ 0
            (-2.149689610)
```

Question 6:

Approximate the largest value of $f(x) = -x^8 + 787x^4 + 673x^3 + 521x^2 + 840x + 12$.

$-x^8$ is a symmetrical term dominant for larger-magnitude values of x, reducing the sum of the remaining terms (except at x = 0). Since all the coefficients for the lower-order terms are positive, it's reasonably clear that, when x > 0, the lower-order terms all contribute positively in a monotonically-increasing sum, providing the maximum function value. Therefore, there is indeed only one root for the derivative of the complete function for x > 0, indicating a local maximum; the largest value is the function evaluated at that point.

Using SOLVE between 0 and 10 to find the root of the derivative yields 4.619292584, consistent with what "Crawl" found. Programming the derivative using Horner's Method will speed things up:

```
Program:     Execution:

LBL 0            0
*              ENTER
*               10
*             SOLVE 0
-8              ...
*            (4.619292584)
3148           ENTER
+              ENTER
*              ENTER
2019             *
+                *
*                *
1042            CHS
+               787
*                +
840              *
+               673
RTN              +
                 *
                521
                 +
                 *
                840
                 +
                 *
                 12
                 +
            (232,366.5024)

(coefficients merged for clarity)
```

Question 10

Give the y coordinate of the solution to the system

```
 31x - 29y = 43
-51x + 19y = 16
```

in reduced fraction form.

The approach, of course, is to utilize

$$\text{inv}\begin{bmatrix} a & b \\ c & d \end{bmatrix} = \frac{1}{ad - bc}\begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$$

and multiply to solve for x and y.

Answers can be checked with the HP-15C determinant and matrix solutions.

Specifically, you can this by hand by loading 96942 on the stack and then executing DUP 7 MOD - 7 / repeatedly. The digits appear after the MOD function, beginning with the least significant digit.

>
> So the answer is 232366.5023

You can also get the answer to this one directly with TABVAR

> Quote:
>
> 8. <<1 1 14 FOR X 3 X ^ INV 1 + X 1 + ^ * NEXT>>
>
> Answer=3.12155183

I think this is the most interesting problem on the test because it stresses the precision of the calculator in approximate mode, especially when you consider the last factor is (1+1/3^14)^15

Running Crawl's program in exact mode and then executing ->NUM gives 3.12155183809. Running it in

approximate mode gives the same value.

What if we do it with logarithms? First I rewrote the expression as (4/3)^2 *
(10/9)^3 *
... *
(3^(n-1)+1) n
(---------)
(3^(n-1)^n)
... *
((3^14+1)/3^14))^15

Taking the logarithm you get 2(ln(4)-ln(3)) +
3(ln(10)-2ln(3)) +
...
n(ln(3^(n-1)+1) - (n-1)ln(3)) +
15ln(3^14-1) - 14ln(3))

Evaluating this expression gives 1.138833025985 and takeing e^x gives the final answer of 3.12155183085

> Quote:
>
> 9. Use DROITE, the line is Y = 1/3(x-7)+4
>
> take the atan Answer=.321750554

You can also do this without DROITE. The slope of a line through two points is deltay/deltax, so the slope of the first line is 1/3. From there you can see that acute angle of the perpendicular with Y axis is the same as the angle of the original line with the X axis.

>
> Answer=17610

Sometimes I can be very dense. I don't see the pattern in the numbers here so I had no hope of solving the problem. Can someone please explain the pattern to me?

I thought I was clever when I solved this as two financial calculations with payment and interest every 2 months at a rate of 4.006666662, one with a $600 payment and the other with a $900 payment, but the

$900 dollar account doesn't run for 126 periods, it only runs 125.5. Ooops...

> Quote:
>
> 19.
>
> This is much easier than it first seems.

Very nice catch. You can use NEXTPRIME to tighten up the code a little, but your insight is what makes the problem easy.

20. What the heck?!?! This looks downright impossible to me. The men choose 13 of the 25 primes. The women choose 18 of the 74 composites. The 32nd woman chooses a number larger than the largest composite chosen so far and the sum of ALL the numbers is a multiple of 103....

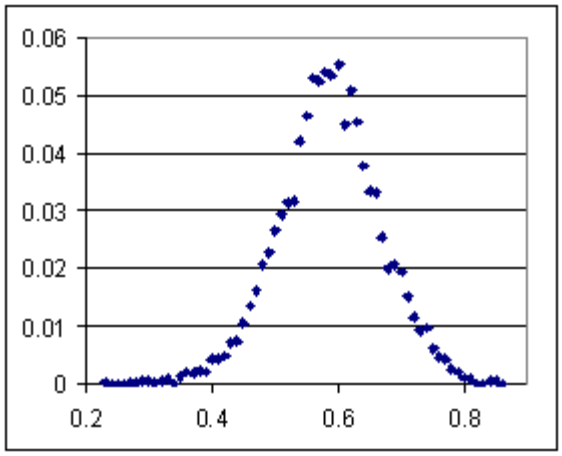
My guess is that the probability is zero because you can't get a multiple of 103, but I don't know why

Re: Some of my answers

*Message #12 Posted by **Crawl** on 8 Nov 2009, 7:23 p.m.,*
in response to message #11 by David Hayden

The pattern of the numbers for #14 is every other prime.

For number 20, I ran a monte carlo simulation, and the answer must be close to 0.6.



What I did there was run 100 trials, then counted how often the critera could be met (it could fail in different ways -- if the number needed to reach the next 103 multiple was a prime, if the number needed was smaller than another composite, if the number needed was greater than 100, etc.). Then I did that a few thousand times and made a histogram.

But I haven't solved it exactly.

Re: Some of my answers

*Message #13 Posted by **Crawl** on 9 Nov 2009, 1:12 p.m.,*
in response to message #12 by Crawl

To give an example of how this could be possible, assume the men just chose the first 13 primes in order, from 2 to 41. Those sum to 238. Then assume the 18 women chose the first 18 composites in order, from 4 to 28. Those sum to 305. The total sum is 543. The next multiple of 103 is 618. 618-

543=75. 75 is a composite number, within the range, and is larger than any other chosen composite. So in this case, it was possible.

Now imagine that the first 12 men chose the first 12 primes in order, 2-37. But the 13th man chose 43 instead of 41. And the 18 women chose the same composites as last time. Then the sum will be 545. And 618-545=73, which is prime, so it's not possible in this case.

But you can't check all possible combinations like this exhaustively. There are C(25,13)*C(74,18)=3.77x10^23 of them.

Free42 for iPhone/iPod Touch just landed

*Message #1 Posted by **Dave Britten** on 6 Nov 2009, 2:12 p.m.*

Not to be confused with Byron Foster's port named "42s", Thomas Okken just released his own port, and it hit the iTunes store sometime yesterday ($4.99 USD). Seems to work very nice so far, though not all the printing and import/export functionality is there yet. The built in web server works great for importing and exporting programs in the .raw format.

Also, it looks like there's a good amount of dead space around the screen and keyboard that could be used to increase the size of the keys.

All in all, it's very solid for an initial release, and I haven't uncovered any bugs yet. Definitely a worthwhile addition to my iPod.

> Free42 for $4.99. Probably going to confuse a few people. :-) How about Fee42? Or Open42?

I *knew* that this was going to come up, so I addressed the question in the new FAQ section on the Free42 home page. :-)
While I was first developing Free42, it was actually called **Fake42**. I changed the name to Free42 just before I published version 1.0 -- I thought the "Fake" part sounded a bit cheesy, and I also wanted to emphasize the GPL aspect. If I had anticipated the iTunes App Store business model back then, maybe I would have called it **Open42** instead!

- Thomas

Re: Free42 for iPhone/iPod Touch just landed

*Message #7 Posted by **Anders Peterson** on 7 Nov 2009, 3:14 p.m.,*
in response to message #1 by Dave Britten

Seems nice. I got the desktop software just a few weeks ago, and it is fantastic. Does anyone know why the previous iPhone app that was based on Free42 (42s) disappeared from the app store just a little while before the new one came out? Did the developers have a falling out perhaps?

Re: Free42 for iPhone/iPod Touch just landed

*Message #8 Posted by **Dave Britten** on 7 Nov 2009, 3:59 p.m.,*
in response to message #7 by Anders Peterson

No, it was just some silly red tape with Apple, as I understand it. Byron seemed to think it would be reappearing very soon.

Re: Free42 for iPhone/iPod Touch just landed

*Message #9 Posted by **Thomas Okken** on 10 Nov 2009, 2:00 a.m.,*
in response to message #1 by Dave Britten

> Quote:
>
> Also, it looks like there's a good amount of dead space around the screen and keyboard that could be used to increase the size of the keys.

Good point! Byron's version does a better job of using the screen real estate available on the iPhone.
My version does support skin switching, and if you download the free42.tgz source code package and install the Hofferth skin (it's in the iphoneskins directory), you'll get pretty much the same skin as in 42s, but I still have to implement non-integral display scaling, so the display looks a bit squished for now. Once I have that sorted out, I'll start offering a skins package specifically for the iPhone and iPod touch on my web site, and maybe also compile one or two additional skins into Free42 itself.

- Thomas

Re: Free42 for iPhone/iPod Touch just landed

in response to message #1 by Dave Britten

Does anyone know what's up with the new, third 42s app that's out there? It looks like a total rip off of the first one (42s), even the icon and description text is almost identical. At first I thought it was a "lite" version or something, but that appears not to be the case since it lists a different developer.

It is a total rip-off of Byron Foster's 42s; it's a slightly older version, and the only other thing that's different is the name.
I wrote a review that explains the situation, but it hasn't showed up in iTunes yet. I guess that takes a few days.

UPDATE: My review just showed up on iTunes. I'm posting it here, too:

> Quote:
>
> This is an exact copy of a slightly older version of Byron Foster's 42s app. C. A. Vijayan charges less money for it than Mr. Foster, but he has contributed nothing to the project, and you won't get any support from him, either, even if he did provide an email address or a web site. If you want 42s on the cheap, by all means get this one, but if you want to support the developers that did the actual work, get Byron Foster's 42s (with the nifty UI features) or my Free42 (basic port of the Unix version) instead.

Of course I realize that releasing something under the GPL means that anyone can take your code and start selling it for himself.
But even so, *this* feels sleazy... and the part where he actually asserts "(C) 2009 Infowise" really gets my goat.
(For what it's worth, the *only* contribution of "C A VIJAYAN" is to change the title of the app.)

Yes, from "42s RPN Calculator" to "RPN Calc 42s" !. Even the website pointed to within the calculator points back to the 42s site, for support from either Thomas or myself. A parasite of the tape worm variety me thinks.

Re: Free42 for iPhone/iPod Touch just landed (UPDATED)

*Message #13 Posted by **Anders Peterson** on 18 Nov 2009, 8:22 a.m.,*
in response to message #12 by Byron Foster

That is absolutely terrible that someone can get away with that. I reported it to Apple, but I suppose they will not care if he is not breaking any rules. Still, there has to be some way to prevent someone from making an exact copy and going so far as to steal the icon and app description. Anyway, thanks for the information. I certainly won't be buying that app.

Re: Free42 for iPhone/iPod Touch just landed (UPDATED)

*Message #14 Posted by **John Collis (New Zealand)** on 18 Nov 2009, 3:17 a.m.,*
in response to message #11 by Thomas Okken

Thanks for updating us on this. This goes against the whole spirit of Open Source. Supporting the people that do the work is really important.

Personally, I've been a long time user of Byron's 42s and it's my number one calculator on the iPhone, used virtually every day.

I probably will also buy Thomas' version also to support him. It's simply obvious how much effort he has put into Free42.

HP67 doesn't turn on without battery pack?

*Message #1 Posted by **Gabriele Zaverio** on 6 Nov 2009, 12:16 p.m.*

Hi there,

I have this HP67 I recently restored by changing the gummy wheel. The battery pack leaked acid, so I removed it.

I also have the original HP main charger.

The calculator won't turn on using the main charger.

Does she require the battery pack to turn on correctly?

It seem working by feeding the calc with a 4.5V source from the battery pack contacts.

Thank you all,

Gabriele Zaverio Freaknet Computer Museum http://museum.dyne.org asbesto (at) gmail (dot) c0m

Re: HP67 doesn't turn on without battery pack?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 6 Nov 2009, 1:53 p.m.,*
in response to message #1 by Gabriele Zaverio

Hi, Gabriele;

in most HP calculators, the battery pack acts like a voltage reference for the power supply, so it is not recommended to power the calculator circuits without it. Anyway, if you did not succeed to make the HP67 to work with only the main charger but it works fine with a 4.5Vcc source directly, chances are you have either a bad main charger or a problem with the charger circuit inside the calculator.

Can you test the main charger to see if there is measurable voltage output? The value you should obtain is printed on it, in the same face you have the input AC connectors.

Success!

Luiz (Brazil)

Re: HP67 doesn't turn on without battery pack?

*Message #3 Posted by **Gabriele Zaverio** on 6 Nov 2009, 3:18 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Thank you for your answer!

I measure the voltage at the battery contacts inside the HP67; with the calculator OFF, I have about 5.5

Volt, and when I turn on the calculator, I have about 6.5-7 Volt. Very weird! :)

Re: HP67 doesn't turn on without battery pack?

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 6 Nov 2009, 3:49 p.m.,*
in response to message #3 by Gabriele Zaverio

Hi, Gabriele;

that´s the reason you should not use the charger without the batteries, the voltage raises to a value that is far superior than the regulated value the circuits need to work. This happens because there is no voltage reference from the batteries, and the current source increases its output voltage to a peak level if no current circulates in the circuit load (in this case, the batteries being charged). I was interested on knowing the output value of the charger without connecting it to the calculator to see if it was working. Based on your measurements, I believe it is working, but I would ask you again to measure its voltage output without charge. Remember that it has a low voltage AC output, not DC. Next you should have a way to regulate the voltage in the battery compartment, and a single ZENER DIODE IS NOT SUITABLE for the job. I am not even sure if you can momentarily test the charger with the calculator by using a zener diode (4V7), we should wait for some extra information from other, more experienced guys who have already repaired HP67 calculators. I do not have one my own, just have repaired one some years ago, and the problem was in the card reader (adjustments and gummy wheel replacement).

Success!

Luiz (Brazil)

Re: HP67 doesn't turn on without battery pack?

*Message #5 Posted by **Steve Perkins** on 6 Nov 2009, 7:57 p.m.,*
in response to message #1 by Gabriele Zaverio

You should NEVER hook up your HP-67 to the power supply without a battery pack inside. It gives too much voltage (or current?) to the card reader circuit and can cause significant damage.

I'm not sure how to test the transformer without doing so, but please don't plug it in to the calculator without a battery pack.

There are good sources of aftermarket batteries at that auction site. Start there.

Re: HP67 doesn't turn on without battery pack?

*Message #6 Posted by **Gabriele Zaverio** on 7 Nov 2009, 5:09 a.m.,*
in response to message #5 by Steve Perkins

Thank you all, I will rebuild a fresh battery pack using 3 Ni-MH 1.5V batteries, they fit perfectly inside the old battery pack shell. :)

Re: HP67 doesn't turn on without battery pack?

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 7 Nov 2009, 5:27 a.m.,*
in response to message #6 by Gabriele Zaverio

Hi, Gabriele;

the NiMH batteries are usually rated 1.2Vcc instead of 1.5Vcc and the regular pack for this model is actually three NiCad cells (because of the charger characteristics), with a working voltage closer to 3.6 Vcc, which is the best choice. I built a pack from a cell phone rechargeable pack for my HP55, which uses the same type of the HP67. Their internal power circuits are very different, though.

Cheers.

Luiz (Brazil)

Re: HP67 doesn't turn on without battery pack?

*Message #8 Posted by **Michael de Estrada** on 7 Nov 2009, 9:40 a.m.,*
in response to message #1 by Gabriele Zaverio

I have read this thread and there are some confusing and I think incorrect assertions being made, so I'd like to try and clarify my own understandings:

1) The AC adapter/charger is a dual circuit combination adapter and battery charger that outputs DC on both circuits, not AC. The no load output of a properly functioning unit is approximately 17 Vdc on the battery charger side and 5 Vdc on the adapter side. You can check this by placing the unit in a live AC outlet, the negative (-) probe of your voltmeter in the center pole (-) of the plug and the positive (+) in the outer poles. The outer pole marked + should be ~17 Vdc and the unmarked pole should be ~5 Vdc. If any of these outputs are nil or significantly different values, then there is a problem with the AC adapter/charger. Many times the problem is in the cord and not the unit itself.

2) When the AC adapter/charger is plugged into the calculator, it depresses the bridge contact in the receptacle which opens the circuit from the battery to the main calculator circuitry (ICs, display, keyboard), such that the battery will no longer provide power to the calculator and is no longer a part of the circuit. At this point the calculator is receiving its power exclusively from the AC adapter (5 Vdc) circuit, and if the adapter is faulty or not plugged into a live wall outlet, the calculator will not work. This does not apply to the card reader, however, since it's on a separate circuit that is receiving power from both the battery and the charger side (17 Vdc) of the external power unit. So, it is quite safe to operate the basic calculator from the AC adapter/charger with the battery removed, provided you do not attempt to operate the card reader.

3) If the AC adapter/charger checks out OK, then you could have left a wire disconnected or reconnected incorrectly when you re-assembled the calculator. The HP-67 has some internal wires that are not soldered, but are plugged into receptacles and can easily come loose during disassembly.

I hope this helps and I have not mis-stated anything here.

Michael

Re: HP67 doesn't turn on without battery pack?

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 7 Nov 2009, 10:09 a.m.,*
in response to message #8 by Michael de Estrada

Hi, Michael;

I have no HP67, but I have an HP55. I failed to consult the related documentation prior to answer the initial post because I was affraid the HP67 was dammaged if used without batteries. I also do not know if the HP55 can be used without batteries because it has a separated DC, regulated line, and the manual does not mention such possibility.

Now for the question: do both the HP67 and the HP55 share the same charging circuitry? If so, I was

wrong considering the H67 was closer to the HP97 than to the HP55.

Thanks.

Luiz (Brazil)

Edited: 7 Nov 2009, 10:12 a.m.

Re: HP67 doesn't turn on without battery pack?

*Message #10 Posted by **Gabriele Zaverio** on 7 Nov 2009, 10:43 a.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

I checked my HP charger: with the ground on the center pin, the Voltage measured to the other poles is ... 0 V !!!

And measuring between the external poles I have about 8Vcc.

Very weird! :(

I mounted new batteries into the HP67, it works very well :D

Now I think I have to fix my charger. A nice surprise: I don't need to "crack open" the charger, there are 4 easy screws! It opens very well. Very simple circuit!

Also, under the charger I can read an interesting notice. Here's what is written:

---------- (there's a switch to select 110/220V) INPUT - 86 to 127V - 48-66 Hertz INPUT - 172 to 254V - 5VA

82010A BATTERY CHARGER AC ADAPTOR MADE IN SINGAPORE BY HEWLETT - PACKARD

USE WITH HP CALCULATORS ONLY

OUTPUT: 50mA 4.2V 4V 150mA

I will make and publish some detailed pictures of this charger very soon.

ps: checked with my tester, the center cable is interrupted. :)

Edited: 7 Nov 2009, 10:51 a.m.

Re: HP67 doesn't turn on without battery pack?

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 7 Nov 2009, 11:01 a.m.,*
in response to message #10 by Gabriele Zaverio

Hi, Gabriele;

Data you wrote about your charger is:

```
----------
(there's a switch to select 110/220V)
INPUT - 86 to 127V - 48-66 Hertz
INPUT - 172 to 254V - 5VA
```

```
82010A BATTERY CHARGER AC ADAPTOR
MADE IN SINGAPORE BY
HEWLETT - PACKARD

USE WITH HP CALCULATORS ONLY

OUTPUT:
50mA 4.2V
4V 150mA

---------------------------------------
```

Right? The one I have for my HP55 is the HP82002A, it is not the same as yours. Anyway, finding a faulty (interrupted) cable is the very beginning... If you consider that the faulty cable is the common, that that´s OK to measure 0Volts with the other poles. And the 8Vcc you measure between poles is closer to what you could have, it seems not to be OK. The HP82002A connected to a 220Vac outlet, without any load in the output, measures 5.2Vcc (regulated) and 15.2Vcc (unregulated) related to the central pole, and ~10Vcc (9.98Vcc) between poles, which is the difference between them.

Cheers.

Luiz (Brazil)

Edited: 7 Nov 2009, 3:17 p.m.

Re: HP67 doesn't turn on without battery pack?

*Message #12 Posted by **Michael de Estrada** on 7 Nov 2009, 5:28 p.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Hi Luis,

I have copied the following information from the MoHPC:

> Quote:
>
> Classics (HP-35, 45, 55, 65, 67, 80) Battery HP 82001B, Chargers HP 00035-60008, HP 03502A, HP 82001A/B, HP 82002A/B/C, HP 82010A (120/240 VAC), HP 82022A(240 VAC), HP 82011A (240 VAC)
>
> Topcat (HP-91, 92, 95C, 97, 97S) Battery HP 82033A, Chargers HP 82040A, HP 82059A/B/C/D, (HP 82032, 82066B, 82068B 240 VAC only)

As you can see the HP-67 and HP-55 use the same type of external power unit, as I have described. Since the HP-55 does not have card reader circuitry, it is safe to operate it off the external adapter without there being a battery inside. However, as stated by Randy, damaged is possible to the card reader circuitry, even if it is not operating.

The HP-97 uses a totally different power unit, which outputs ~12 Vac no load on a single circuit (it is rated 8 Vac, 3W). This is a similar situation to Spices and Woodstocks, where power signal rectification and regulation occurs inside the calculator and which require that a good battery be present when operating the calculator. Basically, this type of power unit should be used as a battery charger only, and should not be considered an external adapter for operating the calculator in lieu of

batteries. In fact the Owner's Handbook for the HP-97 states that "Even though you are using the adapter/charger, the batteries must remain in the calculator whenever the calculator is used - Note: Attempting to operate the HP-97 from the ac line with the battery pack removed may result in wrong or improper displays."

Michael

Classic safety clairification

*Message #13 Posted by **Randy** on 7 Nov 2009, 1:26 p.m.,*
in response to message #8 by Michael de Estrada

1) Yes, a bad cord is very common followed by a bad 400uf filter cap.

2) It is *NOT* safe to operate a 65 or 67 from the AC adapter without a good battery in place. The battery is the only load on the constant current supply such that without the battery, you have 16 volts open circuit exactly as mentioned. But, there is a danger to the card reader sense amplifier/motor controller - as it is connected directly to the battery terminal and therefore sees that 16 volt source when there is no battery in place.

The original IC, 1826-0158 was used in the 65 and was susceptible to over-voltage damage. The part was redesigned as the 1826-0322 which appeared in the 67,97 and 41 readers. While it was supposedly better able to withstand the over-voltage stress, I wouldn't tempt fate.

Thanks to Tony Duell for explaining this quite clearly several years ago as it isn't obvious without seeing the schematics.

3) Not all 67's have the wire sockets, early units where soldered.

The 82002 Classic charger was well documented by Tony, details are available here

Re: Classic safety clairification

*Message #14 Posted by **Gabriele Zaverio** on 8 Nov 2009, 11:40 a.m.,*
in response to message #13 by Randy

Thank you everybody!

Now I'm using my HP-67 with three fresh AA batteries :) It's working very well. I will search now for an user manual :)

p.s. Does someone know a way to build magnetic strip cards, maybe reusing old telephone magnetic cards?

Re: Classic safety clairification

*Message #15 Posted by **Marcus von Cube, Germany** on 8 Nov 2009, 12:01 p.m.,*
in response to message #14 by Gabriele Zaverio

I don't know how to built yor own magnetic cards but since the 67 uses the same type of cards as the 41, you can find them on the famous action site.

Re: Classic safety clairification

*Message #16 Posted by **Steve Perkins** on 9 Nov 2009, 12:07 p.m.,*
in response to message #13 by Randy

Thanks for those more complete answers.

I wanted to post the warning as soon as I could, and I wasn't aware of all the specifics.

We appreciate the work you (Randy, Tony and others) do to keep us well informed about these technical questions.

Re: Classic safety clairification

*Message #17 Posted by **geoff quickfall** on 10 Nov 2009, 3:21 p.m.,*
in response to message #16 by Steve Perkins

Randy et. al. can correct me on this, but I would hesitate using 3 new alkaline batteries in a NiCd designed machine.

The 67 is up to 35 years old as are the voltage regulating circuits. I don't know if it makes a difference but 3 alkalines new at 1.6 each equals 4.8 volts whereas 3 NiCd at 1.22 volts each equals 3.66 volts.

Does this impact on the circuitry, which granted, probably has a fudge factor built in.

It would seem to me to be a better idea to purchase 3 NiCd and charge them externally then to place 3 alkalines in their place.

Also, I hope you don't intend to use the charger while the 3 alkalines are in place!

Cheers, Geoff

P.S. the 67 is a Woodstock electronically in a classic case. However the charging side does not suffer the same catastrophic failure when the battery pack is bad or not in place as the 20 series does (HP-21...) As you found out, it would not run the card reader but does run the calculator for reasons explained above.

Re: Classic safety clairification

*Message #18 Posted by **Marcus von Cube, Germany** on 10 Nov 2009, 4:16 p.m.,*
in response to message #17 by geoff quickfall

Geoff, the adapter outputs 5v dc directly to the circuits. So 4.5 to 4.8V from a pack of alcalines shouldn't be a problem.

Re: Classic safety clairification

*Message #19 Posted by **geoff quickfall** on 10 Nov 2009, 4:23 p.m.,*
in response to message #18 by Marcus von Cube, Germany

Thanks Marcus,

I also restore vintage watches and one of the types I have repaired are the old tuning fork watches (ACCUTRONS) by Bulova.

The original movements (214) were designed for mercury 1.33 volts and when replaced by the 1.55 Silver oxides the tuning fork can run at higher frequency which is not controllable by the fast slow mechanism.

Different system I know, but still the voltage is critical.

Cheers, Geoff

Re: Classic safety clairification

*Message #20 Posted by **Marcus von Cube, Germany** on 10 Nov 2009, 4:39 p.m.,*
in response to message #19 by geoff quickfall

Geoff, I agree. But the 67 is actually run at the higher voltage by the wall wart. So I think it's no problem.

Re: Classic safety clairification

*Message #21 Posted by **Michael Meyer** on 10 Nov 2009, 6:02 p.m.,*
in response to message #20 by Marcus von Cube, Germany

I don't know how scientific this is, but I know this debate has been going on for at least 8 years on the Forum, especially when it comes to AA Lithium batteries, which can run at even a bit higher voltage than the alkalines.

Nobody here has ever reported a failure that they thought was due to using primary cells in these calculators (that I know of-- PLEASE correct me if I'm wrong).

My guess is that time causes more circuit failures than battery voltage... in fact, the components that seem to fail the most (other than chips getting fried by bad charging circuits) are capacitors, which I believe work better over time when "excercised". I'd still rather have cells with (so far) little or no potential to leak than worry about the much rarer risk of over-voltage.

That's just my opinion on this matter, but it's one based on lots of years of experience with these wonderful antiques.

Re: Classic safety clairification

*Message #22 Posted by **Michael de Estrada** on 10 Nov 2009, 7:03 p.m.,*
in response to message #21 by Michael Meyer

Some time back I performed a overvoltage test on one of my many HP-45s to see what effect extended operation at 150% of its rated operating voltage (3.75 Vdc) might have on its circuitry. So, I hooked it up to my test bench regulated DC power supply, cranked it up to 5.6 Vdc, turned the calc ON, and left it running with -8888888888.-88 in the display for 7 days. The result of this particular test was that there were no observed failures. Now, I realize that this one sample test does not prove that operation at this level might not increase the chance of failure, however, it suggests to me that there is a significant margin of safety in the design, and that HP would not use an external adapter that outputs over 5 Vdc (no load) if that value was close to the safe limit for any components. Note that the 3.75 Vdc value is actually the minimum voltage at which the calculator will operate properly, and that a charged NiCad battery pack will exhibit a no load voltage well above that value.

Plugger challenge

*Message #1 Posted by **BruceH** on 5 Nov 2009, 5:54 p.m.*

Here's a challenge for all those that have identified themselves as pluggers...

At a recent HPCC meeting in London, Hugh Steers came up with two common calculations that are simpler to perform on a sliderule than on a modern calculator. Before I reveal them, what can you come up with?

Re: Plugger challenge

*Message #2 Posted by **Steve Keeley** on 5 Nov 2009, 8:17 p.m.,*
in response to message #1 by BruceH

"Simpler" would depend on the calculator, but I find it easier to do R -> P and P -> R calculations on a slide rule than on most calculators.

Re: Plugger challenge

*Message #3 Posted by **Palmer O. Hanson, Jr.** on 5 Nov 2009, 9:08 p.m.,*
in response to message #2 by Steve Keeley

Try a number raised to the 2/3 power. Set the cursor on the number on the K scale and read the result on the A scale. And, of course, do the opposite to raise a number to the 3/2 power.

A slide rule such as the K&E Log Log Duplex Decitrig that I used in college has additional scales folded at pi. So to multiply a number by pi simply set the cursor at the number on the D scale and read the result on the DF scale. Do the opposite to divide by pi.

On some of the simpler Mannheims which do not have an ST scale the S scale works with the A and B scales, e.g., a Sterling Precision. Align ends of the scales on the slide with the ends of the scales on the frame. To find the square root of the sine of an angle set the cursor on the angle and read the result on the D scale. And, of course, to find the 3/2 power of the sine of an angle ...

I can go on and on, but I'll stop there for now.

Edited: 5 Nov 2009, 9:38 p.m.

Re: Plugger challenge

*Message #4 Posted by **Walter B** on 6 Nov 2009, 12:35 a.m.,*
in response to message #3 by Palmer O. Hanson, Jr.

Starting at the grass roots, any set of proportions is easily and completely read on a slide rule, while it takes you repeated calculations with a calculator.

Re: Plugger challenge

*Message #5 Posted by **geoff quickfall** on 6 Nov 2009, 12:56 a.m.,*
in response to message #4 by Walter B

Walter scooped me!

My fuel flow versus time is a simple ratio. Once set on the C and D scale (or folded scales) all you do is move the cursor.

Same with money exchange rates. Set the rate and move the cursor only for each subsequent conversion.

It's just that easy.

Cheers, Geoff

Off to Sydney, Australia from Vancouver, British Columbia, Canada. Flight plan time 15 hours airborne non stop. Exchange rate is 85 cents Aussie to 1 Canadian. All set on my 1965 Breitling E6B slide rule watch!

8-)

Re: Plugger challenge

*Message #7 Posted by **BruceH** on 9 Nov 2009, 6:36 p.m.,*
in response to message #1 by BruceH

Thanks for the answers - some interesting ones there. As for Hugh's, one you got, the other is more debatable as to whether the calc is easier or not...

Here are Hugh's suggestions:

1. comparators. if you want to figure out which washing powder is the best value and perform quantity/price * other-quantity, you only need to see if the slider moves greater or less than the start point and not the exact value.

2. figuring out the bill in Indian restaurants. usually there is a prime number of diners and it's dark.assuming you're not carrying a LED calculator, it's difficult to read the screen in the dark. also, slide rules are good for rounding up to include the tip - you just go to the next significant mark after the divide. furthermore, the 1/x scale is good for this calculation also and a pocket rule is plenty accurate which fits neatly in a jacket pocket.

blowin' shite oop

*Message #1 Posted by **db (martinez, ca.)** on 4 Nov 2009, 11:56 p.m.*

Our own dave j is featured on boingboing.net tonight. Go to BANG and scroll down to the offending entry.
My only question is: how do the ausies end up being the only ones left alive in all those after the nuclear war stories?
Ya think they'd blow themselves up. With style, of course!

Re: blowin' shite oop

> We used to plug components into the mains and switch on at school ;-)

How crude! You can blow up almost any component with the mains. It's much more elegant to blow stuff up using low voltage :->

If I knew the video would have been this popular I would have put a bit more effort into it! I was just testing my new camcorder. Perhaps a second installment is in order...

Wish I had a second cam set up that showed the thing shoot 50ft into the air with a big trail behind it!

I still have no idea what BoingBoing is!, I take it it's a big deal or sorts?

Dave.

Dave; It's a blog on steroids, more of a news site, with several +/- full time staffers. One of them is Cory Dockorow, the writer who also puts up each of his published books on Creative Commons for free download. They have a lot of overlap with the internet civil liberties group "Electronic Frontier Foundation". The banner says it's about Tech Gadgets Science Entertainment Biz Art+Design Culture Action News Weird Offworld. I think your stuff fits into several of those categories. - db

low voltage is fun

*Message #6 Posted by **Frank Boehm (Germany)** on 5 Nov 2009, 11:44 a.m.,*
in response to message #4 by DaveJ

My 0-30V PSU was good for a lot of fun "back then". - creating a lightning arc between 2 graphite tips of a pencil (this is great, you should try it) - use a graphite tip on a selenoid rectifier (I certainly wouldn't try that at home now <g>) and aluminium foil - blowing up various stuff 8)

So is high voltage.....

*Message #7 Posted by **Michael Meyer** on 6 Nov 2009, 8:10 p.m.,*
in response to message #6 by Frank Boehm (Germany)

I also have had great fun with my 18,000 volt neon sign transformer. Makes great Jacob's Ladders, just like the movies. In high school, I once taped off one terminal and connected the other side to a wire around my ankle. I could then roll pencils, scatter paper, and do other "telekinetic" tricks without touching with my fingers.

Unfortunately, as you know, you don't have to actually touch the other terminal to complete the circuit. I was reminded of that once at home when I accidentally reached too close to the other terminal, which was uninsulated at the time. It "reached out" to touch me and I yelled out.... I still have a lightning patterned scar on my arm.... I don't think I'll try that again.

Let us not forget that the famous photo of Nikola Tesla underneath "lightning" from his coil as he reads nonchalantly is actually a double exposure...

http://en.wikipedia.org/wiki/File:Tesla_colorado_adjusted.jpg

And, yes, I had seen the photo and knew this fact prior to finding it on the Wikipedia entry for Nikola Tesla.

O.T. Are you a plugger?

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 4 Nov 2009, 9:54 p.m.*

The "Pluggers" cartoon in yesterday's issue of the Asheville Citizen-Times shows a youngster holding a slide rule and asking his grandfather "So, grandpa... What is this? Some kind of ancient game?" The caption for the cartoon is "You're a plugger if you know not only what a slide rule is, but how to use it."

How many pluggers in this forum?

Re: O.T. Are you a plugger?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 4 Nov 2009, 11:40 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Hi, Palmer;

I must confess that I red a slide-rule manual and followed some examples with the little thing in my hands some years ago. I cannot remember the brand, but I was able to perform some extra calculations and compare with the results I obtained with an HP41. Just got tired of that too fast... Also, the owner allowed me to stay with it for one evening, but I returned it back to him a couple of hours later. If that makes me a plugger, so be it... But I must confess I would not like to USE it regularly.

Cheers.

Luiz (Brazil)

in response to message #9 by Richard Reed

I used a sliderule at Purdue University in the late 1960's. I still credit my ability to do quick back of the envelope calculations to my early slide rule use.

What I really remember is taking mid-term and final exams, balancing a plywood lapboard on my lap, and trying to keep track of the test papers, erasers, pencils, and holding and using the sliderule at the same time. What great fun :)

Bill

*Message #13 Posted by **Andrés C. Rodríguez (Argentina)** on 5 Nov 2009, 10:22 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

I used some of them, not very frequently, many years ago (from 1970 to 1976), all before I had my HP25. I stil have one just to display it as a souvenir.

Re: O.T. Are you a plugger?

*Message #14 Posted by **Walter B** on 5 Nov 2009, 4:40 p.m.,*
in response to message #13 by Andrés C. Rodríguez (Argentina)

Almost the same story: I learned slide ruling at school still and used one until 1975 when I scraped a lot of money together to buy a TI SR50 to get rid of doing sums of squares manually in physics lab classes. I still have this old wooden slide rule and a few more I collected recently, topped by 2 Aristo 969.

Re: O.T. Are you a plugger?

*Message #15 Posted by **paolo** on 5 Nov 2009, 5:29 p.m.,*
in response to message #14 by Walter B

by chance, it happened me to use a slide rule just today in the lab as I hadn't my calculator with me. That rule (circular type) is on a shelf just for these "emergencies".

So I think I'm definitely a "plugger" (a word I didn't know up to now).

regards

Paolo

in response to message #14 by Walter B

Ditto,

With the exception that in 1972 we learned how to calculate using Log Tables (5 digits), the next year we learned how to use a Slide ruler, a Sun Hemi if I remember well, it still is somewhere in the attic.

And than in 1974 I bought the Ti SR-50 for indeed a lot of money (an HP was unaffordable …)

Marcus, you must be one of the little ones. I was in the class of 73 :-)

Re: O.T. Are you a plugger?

*Message #19 Posted by **geoff quickfall** on 5 Nov 2009, 12:33 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Yep,

Post 1461 and 1460. Used them both for first year Statistics at University. The next year they allowed the HP 25 in the exam but ramped it to 20 questions up from 4 to accomodate the faster ability of the 25 including the Sigma functions.

Still have the 1461 in the cockpit for setting up time fuel ratio which is faster then punching the calculator. Once set you simply move the cursor for the diminishing fuel and read off the time.

Still have the Jeppessen circular CR4 in the cockpit for point ot point navigation as well as other simple conversions which are built into the scales.

Yes, these conversions and navigation abilities all have their corresponding HP41C/42S routines but it is still faster to line up the scales for a direct read versus punching the numbers to the appropriate prompts from the machines.

Cheers, Geoff

Re: O.T. Are you a plugger?

*Message #20 Posted by **Don Shepherd** on 5 Nov 2009, 12:56 p.m.,*
in response to message #19 by geoff quickfall

Hey Geoff, maybe you should teach slide rule usage to other pilots so they will have something meaningful to do in the cockpit and won't get distracted by their laptop computers and miss Minneapolis!

Don

Re: O.T. Are you a plugger?

*Message #21 Posted by **Geoff Quickfall** on 5 Nov 2009, 1:26 p.m.,*
in response to message #20 by Don Shepherd

Hello Don,

There is almost no excuse in the cockpit for distractions other then aircraft systems falilures.

Another exception is fatigue, which in itself is deadly, but has a set of standards and procedures designed to allow a rest period in the cockpit while the other pilot is alert.

These procedures include; aircraft system alerts, ATC radio calls, Emergency frequency monitoring, on board computer alerts from ATC or company via data links and CRT displays, Flight attendant calls (especially when close to destination ETA).

All in all, whether a slide rule, company aircraft manual, rest period or computer, SOMEONE should always be flying the aircraft!

Now I won't prejudge, as all the info is not out, except for the confession of the pilot. I can say that the swiss cheese model of management completely failed. At my company, that would mean 8 layers of built in electronic, ATC, Company, Flight attendant monitoring and Pilot duties vis-a-vis operating procedures, failed, were omitted or are not present at their company.

The terminolgy in the cockpit is PNF or PF which until last month, ironically (prior to the MSP incident) was changed to PF and PM.

```
Was:

1  PNF   pilot not flying
2  PF    pilot flying

changed to:

3  PM    pilot monitoring
4  PF    pilot flying
```

Cheers, Geoff

p.s. I will wait until the NTSB report in 8 months before commenting fully as all the info is not in yet. What happened to the datalinks, aircraft chimes, flight attendant monitoring and etc. designed to preclude the trouble two pilots can get into when they are distracted?

Edited: 5 Nov 2009, 1:32 p.m.

Re: O.T. Are you a plugger?

*Message #22 Posted by **Don Shepherd** on 5 Nov 2009, 2:02 p.m.,*
in response to message #21 by Geoff Quickfall

Thanks, Geoff.

Yes, I will also wait for the NTSB report and not second-guess what happened.

Situation awareness in the cockpit. I am reminded of that Eastern Airlines flight from about 20 or 30 years ago, it seems, where the flight crew was distracted by a landing gear light that indicated

the gear was not down, as I recall. The crew was so obsessed with trouble-shooting that problem that they forgot to fly the plane, which crashed into the Everglades. So I would have thought that situation awareness would be top priority for every crew these days. And I am sure it is, but we are all human beings.

Don

Re: O.T. Are you a plugger?

*Message #23 Posted by **Sean Connor** on 5 Nov 2009, 1:26 p.m.,*
in response to message #20 by Don Shepherd

Yup a Plugger am I

We were the last year in school to be taught how to use one. After the year finished we were able to take our slide rules home to keep.

I still have mine.

The rich guys bought their own . The biggest show offs as I remember had a telescopic version.

I have long since thrown out my log/trig tables !

Re: O.T. Are you a plugger?

*Message #24 Posted by **Steve Perkins** on 5 Nov 2009, 5:35 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

I am a plugger.

I had a slide rule in high school, and learned to use log/trig tables too.

I got my HP-25 my senior year. I still kept a slide rule handy in case the batteries failed all through college.

I've even recently collected a few of the nicer ones.

I still know how to use the basic functions, but not as well as I did. For instance they're very handy for comparing prices of different sized boxes at the grocery store. And you never have to worry about punching digits in wrong on a keyboard. Keeping track of the decimal point was a valuable skill I'm still grateful to have.

Re: O.T. Are you a plugger?

*Message #25 Posted by **John Garza** on 5 Nov 2009, 7:32 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

I was fortunate in high school; I bought a used HP-67 from a fellow PPC member (and worked all summer to pay for it!)

But I have since acquired several slide rules and learned how to use them. I even have one framed hanging over my PC. The inscription reads:

"In case of computer failure - break glass."

-J

Re: O.T. Are you a plugger?

*Message #26 Posted by **Steve Keeley** on 5 Nov 2009, 8:08 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

I learned to use a slide rule back in my junior year of HS back in 1970. It was a cheap Sterling I bought at the local stationary store.

By the time I entered college as an engineering student (after serving in the Navy) in 1977, scientific calculators were pretty cheap; a TI-30 could be had for under $20.

About a year ago I was practicing some engineering problems as a refresher using my HP-50g and wondered if I was too dependent on the calculator, so I started hunting around for slide rules and wound up with a small collection. (I use the Aristo 970 and Pickett N3T the most.) I worked my way through the excellent K&E manual that came with the Log-log Decitrig and was amazed at how much you could do with a good slide rule. It was also worthwhile learning how to keep track of the decimal point.

I still like to solve problems with the slide rule and then check with the calculator and see how close I came.

HP 9810A - current value?

*Message #1 Posted by **DavidShenk** on 4 Nov 2009, 3:29 p.m.*

I may have an opportunity to buy a 9810A and can't seem to find a recent value. The two prices listed here are $185 and $500. They must not come up that often on TAS. I haven't seen a photo of it yet, but assuming it's in good condition, what would a fair offer be? Shipping these things around can't be cheap either!

Dave

Re: HP 9810A - current value?

*Message #2 Posted by **Eric v d Wateren** on 4 Nov 2009, 5:07 p.m.,*
in response to message #1 by DavidShenk

I paid about 260 Euros (plus 40 Euro shipping from Germany) for a very nice looking 9810 last year. It was in working condition electronically, but the printer roller was completely disintegrated and had turned into a black sticky 'tar' that had to be patiently removed from the machine's inside.

The printer roller, as well as the card reader rollers, needed to be replaced and now the machine works like a dream (thanks to Tony Duell's unique expertise and help!).

If you search on the web you should be able to find a few good articles related to repair for this type of machines.

Good luck with your purchase, they do indeed not come up very often.

Re: HP 9810A - current value?

*Message #3 Posted by **DavidShenk** on 4 Nov 2009, 7:08 p.m.,*
in response to message #2 by Eric v d Wateren

Thank you for that. Looking back in the archives here, it looks like they can have quite a bit of trouble and are not easy to troubleshoot. They look more like a computer than a calculator inside. Of course, you don't hear about the ones that work fine.

Dave

*Message #7 Posted by **Mike Morrow** on 6 Nov 2009, 3:07 p.m.,*
in response to message #4 by marais

I bought an HP-9820A, the next step up, ten years ago for $10.

Of course, it doesn't work. But it was worth the $10 just to disassemble and inspect. The 9820A that I used in 1972 at Georgia Tech I was never allowed (for understandable reasons) to take apart!

Edited: 6 Nov 2009, 3:08 p.m.

Re: HP 9810A - current value?

*Message #8 Posted by **marais** on 8 Nov 2009, 4:22 a.m.,*
in response to message #7 by Mike Morrow

That's a fine machine. You should give it a try! They're intimidating at first, but after all not that complicated, if you have the appropriate documentation. And there are many experts here on the forum. The machine shares many parts with the 9810; I have a complete memory cage as spare parts. If I had a 9820/30, I knew what I'd do over the christmas holiday.

Re: HP 9810A - current value?

*Message #9 Posted by **Tony Duell** on 8 Nov 2009, 5:48 a.m.,*
in response to message #8 by marais

I've repaired the 9810, 9820 (very similar machines, actually) and 9830 (same processor boards). I am happy to help anyone else do the same...

The main difficulty in faultfinding is that they're bit-serial machines, and almost all the signals are (or at least should be) changing all the time as bits are clocked into the shift registers. A logic analyser or storage 'scope is very useful for serious debugging, but it is often possible to manage without one.

Re: HP 9810A - current value?

*Message #10 Posted by **marais** on 8 Nov 2009, 10:42 a.m.,*
in response to message #9 by Tony Duell

Tony, since you know the entire family of machines: Given the similarity of the 9810 and the 9820, how far would one get with boardswapping between an operational 9810 and a defective 9820?

Andreas

Re: HP 9810A - current value?

*Message #12 Posted by **Tony Duell** on 9 Nov 2009, 8:44 a.m.,*
in response to message #11 by Eric Smith

With me you'll get nowhere!. I do not, and never have, approved of board-swapping as a way of finding faults. It's about the only thing I'll refuse to help you do.

The 98x0 series are well-made machines and deserve to be repaired properly! If you want to do that, I'll talk you through it.

Re: HP 9810A - current value?

*Message #13 Posted by **Tony Duell** on 13 Nov 2009, 9:34 a.m.,*
in response to message #10 by marais

A few thoughts...

Firstly, the sections that are different between the 9810 and 9820 are :

The memory box (the aluminium box at the left side of the machine) and all the boards in it

The display PCB

The keyboard and encoder PCB

The I/O backplane (the 9820 supports DMA IIRC, the 9810 does not)

The other sections are the same (processor, PSU, printer, card reader/controller, main backplane).

The machine will run with the I/O backplane removed and the keyboard disconnected (it plugs in on an edge connector under the front of the printer). So while I don't approve of board swapping, I will say that if you pull the I/O backplane and disconnect the keyboard, you could fit the 'wrong' memory box and display to either machine.

My diagnostic methods go roughly like this :

If I don't think the machine has been powered up recently, I remove all the boards

apart from the 3 PSU ones. I disconnect the keyboard from the main backplane, but leave the power swich cable connected. I remove the printer and memory box (in case that's not covered by 'all the boards' :-)). I then power up and check the PSU voltages. There are 6 of them (+5V, +12V, -12V, +24V, +19V, +16V). All but the first have labelled testpoints on the PSU PCBs. For the +5V, I know where to find it on the main backplane (and will tell you too :-)).

Then I fit just the CPU clock PCB (09810-66512). I check the 8MHz master clock and the 2 main CPU clocks (bitclock and muclk). If they're wrong, I find out why.

Then I fit the other 3 CPU boards, the memory box, and the display. If it was working correctly, the machine would run like this and give the right power-on display. Most of the time, if it's faulty, the display remains blank. The first thing I check is the dispstb line on the display connector. It should be pulsing if the CPU is trying to drive the display. It nearly always isn't (pointing to a problem in the CPU or memory areas) but I'd feel a right idiot if I spent time tracing the microcode only for the fault to be in the display driver.

At this point I use the fact that it's a bit-serial machine and that all signals should be changing. I quickly look at the M and T register outputs on the memory box test connector. All bits should be changing. If only the top <n> are, it points to a likely problem with that register. So I look into that.

At this point, alas, it's time to grab the logic analyser and the microcode listings and see what the CPU is doing. You can pick up the microcode program counter on the test connector on the CPU control PCB (09810-66513). I generally find one of 3 things now :

1) The microcode is going through a crazy sequence of states, pointing to a problem with the microcode program counter and/or ROMs. This is rare

2) The microcode seems to be going round the fetch-execute cycle. Maybe a problem in the memory box, or a the data path. Time to look at that

3) The microcode is stuck, often in the I/O loop. So I look as to why.

Electronically-good machines with mechanical problems are easy to fix in theory, but harder in practice (you really need a good workshop including a lathe to do card reader or printer repairs). There are some photos in my flickr account (tony_duell) showing both main mechanical repairs.

Electronic faults are harder to track down (but I assure you it's always possible) but fixing them is much easier. What you want to take on is up to you!

CEO of Royal Bank of Scotland uses an HP

*Message #1 Posted by **Nigel Bamber** on 4 Nov 2009, 8:35 a.m.*

In yesterday's Lomdon Evening Standard , there was a picture of Stephen Hester at his desk at RBS on which there was a HP voyager calculator - no doubt a HP12C.

Nigel

Question about how HP Math pacs calculate Bessel Functions!

*Message #1 Posted by **Namir** on 3 Nov 2009, 4:00 p.m.*

Hello All,

If you look in your HP-65 and HP-67 Math Pac manuals and the HP-41 High Level Math solution book, you may come across programs that calculate the Jn(x) and In(x) Bessel functions. These programs use recursive algorithms that calculate series of a specified number of terms m. The documentation calculates m using an interesting formula:

m = 2 * INT[(6 + max(n,z) + 9z/(z + 2))/2]

Where n is the order of the Bessel function and z = 3x/2.

My question, can anyone find the reference for HP's algorithms to calculate the Jn(x) and In(x) Bessel functions using the above equation?? The HP documentation mentions the "Handbook of Mathematical Functions" by Abramowitz et al. as a reference. I looked in that book and and the closest thing I found was at the bottom of page 385 (under the heading Numerical Methods). The handbook discusses informally the algorithm HP used but does not mention m and how it is calculated. Did I miss something? Or is the equation for m something HP came up with?

I guess you can say that this is a math challenge, with a new twist!

Namir

*Message #2 Posted by **Frank Rottgardt** on 3 Nov 2009, 5:08 p.m.,*
in response to message #1 by Namir

I don´t know which edition of Abramowitz you have excess to. This source cites the 1972 edition which would fit the HP-67 timewise.

MathWorld

Abramowitz, M. and Stegun, I. A. (Eds.). "Spherical Bessel Functions." §10.1 in Handbook of Mathematical Functions with Formulas, Graphs, and Mathematical Tables, 9th printing. New York: Dover, pp. 437-442, 1972.

Re: Question about how HP Math pacs calculate Bessel Functions!

*Message #3 Posted by **Namir** on 3 Nov 2009, 6:51 p.m.,*
in response to message #2 by Frank Rottgardt

I also have the blue-soft cover version. On page 385 (Bessel functions of integer orders) the book discusses

in general terms basically the same algorithm that HP uses, except there is no mention for of m and the equation to calculate it. The discussion does mention the use of recursive iteration to calculate non-normalized Bessel function values, and then briefly hints at how to normalize them.

The HP documentation is much clearer. I was able to implement the algorithm in Excel VBA in two versions: using arrays and without arrays. Both yield accurate results.

Namir

Re: Question about how HP Math pacs calculate Bessel Functions!

*Message #4 Posted by **Ángel Martin** on 4 Nov 2009, 1:43 a.m.,*
in response to message #3 by Namir

There's programs in the SandMath-5 module to calculate Jn, In, Kn, and Yn for both integer and non-integer indexes, and any real number. I used the usual approach given the relatively fast convergenge of the series.

Cheers, ÁM

*Message #5 Posted by **Namir** on 4 Nov 2009, 6:29 a.m.,*
in response to message #4 by Ángel Martin

Angel,

Your SandMath ROM looks **VERY** nice!!!

You calculate the Bessel functions Jn(x), In(x), Kn(x), and Yn(x) in your SandMath ROM. Do you base your calculations for ALL FOUR Bessel functions on an algorithm that is a similar one that HP uses? If yes, how do you calculate Kn(x) and Yn(x)? Sorry for being nosy.

Cheers,

Namir

Re: Question about how HP Math pacs calculate Bessel Functions!

*Message #6 Posted by **Ángel Martin** on 5 Nov 2009, 12:25 a.m.,*
in response to message #5 by Namir

Hi Namir,

No complex stuff: it's basically just about summing terms until there's no significant contribution to the sum value. The process is sped-up by using a couple of MCODE functions involved in the function term calculation (like obviously GAMMA for non-integer orders, HARMN for the harmonic number, X=YR? for rounded comparisons, CHSYX, etc.), and a couple of re-arranging tricks of the series syntax to optimize the efficiency. It still takes its time, but this is a non-issue if you use V41's TURBO mode of course - it feels instantaneous response.

I considered an ALL-MCODE implementation but so far had no time to implemented, maybe some day...

I'm on the road for a couple of weeks but can send you more details when I'm back if you give me an email address to send it to.

Best, ÁM.

HP-41 Bar Code Printing

*Message #1 Posted by **Gerry Schultz** on 3 Nov 2009, 2:29 p.m.*

To All:

This all started when I was looking into whether or not I wanted to buy an HP-41 Plotter ROM from that unmentionable site. That got me interested in figuring out how to print HP-41 bar codes. After doing some googling (I love the "site:www.hpmuseum.org" option), there is a lot of old information on the subject. I am specifically interested in using either my PC's HP printer or a ThinkJet on the HP-IL loop. (Side thought, is fan-fold paper still available? Right now I'm feeding individual sheets through mine.) I found Gene's pages on bar code printing to a ThinkJet as well as Christoph's pages on printing bar code using EMU41.

This brings me to the SKWIDBC module for the 41 which I also ran across. It appears to be the perfect solution but it's designed specifically to drive the ThinkJet or LaserJet printers. The plus version only talks to the LaserJet Plus or the LaserJet Series II, according to the manual. Also, there is a warning in the manual that bar code generated with this module might not be able to be read by the 1E version of the Wand, but is fully compatible with with the 1F version.

So, my questions are: Does the SKWIDBC module work properly with EMU41 using the host PC's HP 990Cxi inkjet printer connected to a parallel port? How big a problem is SKWIDBC bar code compatibility between the 1E and 1F Wands? After 5 years, are there any easier, cleaner or better solutions to printing 41 bar codes under windows, or any other OS than has been discussed in the archives?

All comments and feedback is appreciated. This little detour into 41 bar code printing has been keeping my busy for the last two days, time permitting.

Thank you for your time,

Gerry

Re: HP-41 Bar Code Printing

*Message #2 Posted by **Allen** on 3 Nov 2009, 7:45 p.m.,*
in response to message #1 by Gerry Schultz

The Modules and PLOTTER ROM are one way to go. There are at least two other alternatives than the HP41 modules.

If you already have a HP-IL ISA card or PIL box, you can export to EMU41, then from EMU-> Text file -> then use 41uc.exe

Not sure if that will do exactly what you seek?

Re: HP-41 Bar Code Printing

*Message #3 Posted by **Gerry Schultz** on 4 Nov 2009, 3:44 p.m.,*
in response to message #2 by Allen

Thank you for your response, Allen. I do have EMU41, and an HP-IL ISA card. My PIL Box I/F doesn't allow EMU41 on my Laptop to talk directly to external HP-IL devices. J-F tells me he's working on a new version of EMU41. I can use the PIL Box to migrate files between my 41C and EMU41 using HDRIVE1 as he presently recommends.

I've never used EMU41 to generate a text file so I'm not sure how to do that. I assume you would use the DOSLINK device to send data to the emu41out.dat file; but what would you do then, open that file using Notepad to print it out to my system printer? This is where I get vague as I don't know specifically how to implement this workflow.

My interest is to backup my old 41C program cards to 3.5" floppies (I have 9114B drives) as well as back them up to paper as bar code. That's why when I was reading about SKWIDBC and saw the restrictions, I wondered if there were anyone who had experience with this software. I have looked at the 41uc.exe page on this website and to be honest, it's a bit overwhelming. I need to understand the workflow of getting from a program stored on an EMU41 HDRIVE to printout on either the local PC printer or one on the HP-IL loop. Even though I have hardware, I still have a lot to learn on how to use it.

Anyway, that's what I was thinking. Any more feedback or comments are appreciated.

Thanks,

Gerry

Re: HP-41 Bar Code Printing

*Message #4 Posted by **Egan Ford** on 4 Nov 2009, 5:13 p.m.,*
in response to message #3 by Gerry Schultz

If your program is in EMU41, then try this:

1. Edit EMU41.INI, and change HDRIVE1 to HDRIVE1 progname.lif, this specifies that you want to use progname.lif as your virtual floppy drive (the default is HDRIVE1.DAT).
2. In your EMU41 directory type >progname.lif, this creates a blank disk.
3. Start up EMU41
4. Type XEQ NEWM 001, this formats the blank disk with a single record. (NOTE: You may want to ; out HDRIVE2 in your .INI file so that you do not accidentally hose HDRIVE2.DAT).
5. Type ALPHA PROGNAME ALPHA, then XEQ WRTP. That should copy your program to the virtual floppy drive and thus to progname.lif
6. Exit EMU41
7. Type: hp41uc /l=progname.lif /r=progname.raw
8. Type: hp41uc /r=progname.raw /s=progname.ps PROGNAME
9. Use any freely available PS to PDF converter.

Now you have a PDF of your barcode that you can distribute or print on any printer with any PDF viewer. Example multipage barcode PDF: http://sense.net/~egan/41cx/cpi.pdf

I made an easy to follow step-by-step movie for you here: http://sense.net/~egan/emu41barcode.avi

If your program is on your 41CX, then:

1. In your ILPER directory type >progname.lif
2. Connect up your PIL-Box and 41CX.
3. Start up ILPER, and set it to use progname.lif as your HDRIVE.
4. Type XEQ NEWM 001

5. Type ALPHA PROGNAME ALPHA, then XEQ WRTP
6. Exit ILPER
7. Do 7-9 from above.

Sorry, no movie.

I should mention that if you want to do multiple files and save time then make the argument to NEWM equal to the number of files or greater. Then ALPHA PROGNAME ALPHA WRTP PROGNAME for each program. Then change:

```
hp41uc /l=progname.lif /r=progname.raw
```

to:

```
hp41uc /l=allprogs.lif /r=progname.raw PROGNAME
```

The later command will search the LIF image for PROGNAME and save it as progname.raw. Do that for each program.

Lastly use hp41uc to convert all your .raw programs to .bin and .txt. The .txts can be used as listing. The .bins can be loaded into V41 or your shiny new iPhone rendering your 41CX useless. Send your useless 41CX to me. :-)

Edited: 4 Nov 2009, 5:34 p.m.

Re: HP-41 Bar Code Printing

*Message #5 Posted by **Gerry Schultz** on 4 Nov 2009, 9:15 p.m.,*
in response to message #4 by Egan Ford

Egan:

Thanks for the step by step. I had been playing with HDRIVE2 in EMU71 to bring LIF files that I had downloaded from the internet into EMU71 and see what I could do with them. It's also teaching me about using BASIC commands as I just got the full version of EMU71 from J-F just a few days ago. I bought a real HP-71B a few months ago but I've done nothing with it to work on understanding HP-IL, EMU41, etc.

I was also going to try some LIF files from the internet for EMU41 and see how that worked this weekend, time permitting. So, using WRTP with HDRIVE1, I'm converting a native HP-41C program file to a LIF filetype. THAT'S AMAZING!! I didn't know you could do that. File conversion in an emulator, what a concept! But thinking about it, it does make sense. Thanks for sharing that. I get the feeling that I'm just seeing the tip of the iceberg when it comes to what these EMU41/71 emulators can do. What other file formats does EMU41 support when writing to HDRIVE1? If I specified a RAW or Postscript (PS) filetype, would EMU41 or 71 support that as well? What about PDF or is that too much?

I have been re-reading the 41uc user file and it appears that the bar code generation happens when you convert from RAW to PCL or PS so I doubt EMU41 supports that. Something for J-F to add given how busy he is right now? The poor man, I'm sure he must roll his eyes at all my suggestions.

Anyway, this is very exciting. I'll have to give that a try this weekend. Thanks again, Egan for explaining that. EMU41's docs only hint at this and I didn't pick it up. I wonder what else am I missing?

Thanks again, Gerry

Re: HP-41 Bar Code Printing

*Message #6 Posted by **Egan Ford** on 5 Nov 2009, 1:43 a.m.,*
in response to message #5 by Gerry Schultz

> Quote:
>
> [quote] What other file formats does EMU41 support when writing to HDRIVE1?

None--only LIF. It does not matter what filename or extension you use with HDRIVE1 or HDRIVE2 the format of the file will be LIF. i.e. HDRIVE1.DAT, FOO.BAR, BACKUP.LIF--all LIF. LIF is not a program format like BIN, DAT, RAW, or TXT (hp41uc supported types). LIF is more like an archive (a zip file without compression). You can have multiple files of various types in a LIF image. LIF images are simply dumps of tapes or disks. HDRIVE1 and HDRIVE2 in both EMU41/EMU71 are simulating 9114B drives. With the right tools you can create LIFs from diskettes and vv.

> Quote:
>
> I have been re-reading the 41uc user file and it appears that the bar code generation happens when you convert from RAW to PCL or PS

As outlined above you need RAW to convert to PS. It shouldn't take more than a few minutes to backup each EMU41 program to a single LIF image. From there you can write a dos batch program to take a program name as an argument and run all the hp41uc commands for you.

> Read IL2000 Interface System manual Page IX.46 : Easy and fast Barcode print directly from EMU41 with help of the Skwid BC-Rom...

Thanks. IMHO, its a bit limiting and requires a Laser Jet. I find the above method I outlined a bit more complex, but I also end up with a PDF--something easy to share and print on any printer.

If I get time I'll try to find a PCL -> PDF converter and see if I can use that with DOSLINK.

Re: HP-41 Bar Code Printing with EMU41

*Message #9 Posted by **Egan Ford** on 6 Nov 2009, 11:26 a.m.,*
in response to message #7 by Christoph Klug

SKWIDBC.MOD just locks up EMU41. I tried various .INI setups. Same results. I guess SKWIDBC.MOD really wants a Laser Jet to be there.

MLDL2000 update

*Message #1 Posted by **Meindert Kuipers** on 3 Nov 2009, 12:32 p.m.*

It has been a long time since my last update about the MLDL2000. It does not mean that I have not been busy, but unfortunately not with the MLDL2000. There has been some progres however:

Most important, the hardware design is done, expect for one small item, and I have done some trial layouts

Unfortunately the layout trials did not go very well. Due to the increased complexity I cannot manage to make a reliable design that fits in a cardreader. Added to that is the issue how to access the SD (micro) card in the cardreader, for which I could not find a good solution. Therefore the new MLDL2000 will be based on on a single PCB, that has to be mounted in an external housing. The good news is that the costs will be considerably lower. I will try to finalize the layout in the next month or so, if my spare time allows. More news to follow

I have been updating the specs of the MLDL2000V2, and should be able to publish a first draft within a few weeks

Work has been done on the software side as well. A new M2kM will be published with a completely overhauled disassembler, that allows for configurable disassembly listings. This will also take a few more weeks.

Finally I have upgraded my old PC and bought a new one. Of course it had to be an HP, this time with Windows 7. It runs really nice, and even the MLDL2000 runs good on it, but remember to download the latest FTDI drivers. No changes appear to be needed.

Also I am considering to make a version of M2kM for Linux. If you are interested in this let me know. I need to port the software (written in Delphi) to Lazarus, and I have no idea how much effort that might be. If nobody wnats this, then I will not do this of course.

Your feedback is appreciated,

Meindert

Re: MLDL2000 update

*Message #2 Posted by **Ángel Martin** on 5 Nov 2009, 12:15 a.m.,*
in response to message #1 by Meindert Kuipers

Hey Meindert, thanks for the update news. I personally don't think an external box represents any issues, well worth the admission price to have SD card support. Great news to hear you're improving the SW as well, can't wait to have a look at the new features. Let me know if you need beta testers :)

Best, ÁM

Opening a Woodstock external charger?

*Message #1 Posted by **John Garza** on 2 Nov 2009, 5:23 p.m.*

Does anyone have experience opening the woodstock series external charger (sometimes called a "reserve power pack")?

The thing is built into an attractive mini-woodstock case. But there are no screws on it (I checked under the rubber feet). I'd hate to pry it apart by force and crack the plastic.

-John

I'd like to know as well. >>

*Message #2 Posted by **tim m.** on 2 Nov 2009, 5:29 p.m.,*
in response to message #1 by John Garza

I have a classic series charger (03502A) that is sealed with no screws. I'd like to open it so that I may repair the strain relief and check the electronics. The constant-voltage supply reads 6.7 V no load; this seems a bit high, although my 35 chargers and functions fine off of the supply.

-Tim

Re: I'd like to know as well. >>

*Message #3 Posted by **Randy** on 2 Nov 2009, 5:55 p.m.,*
in response to message #2 by tim m.

The sealed, smaller chargers were ultrasonically welded as well. The circuity is totally different than the 82001 and the higher voltage is normal. Trying to open one will usually result in breakage... since the weld lines are not exposed.

Thanks! >>

*Message #4 Posted by **tim m.** on 2 Nov 2009, 6:37 p.m.,*
in response to message #3 by Randy

I didn't realize that the circuitry was different. Am I correct in assuming that these sealed chargers were supplanted by the more common four-screw classic chargers?

It's also good to know that the higher voltage is correct. I'll see to repairing the strain relief from the outside.

Re: I'd like to know as well. >>

*Message #5 Posted by **Charles Oxford** on 2 Nov 2009, 7:41 p.m.,*
in response to message #2 by tim m.

how do you check output voltage?

Re: I'd like to know as well. >>

*Message #6 Posted by **tim m.** on 2 Nov 2009, 7:53 p.m.,*
in response to message #5 by Charles Oxford

With the charger plug facing you, I measured between the center (common) and rightmost contacts. For a good picture, scroll about halfway down this page: http://www.jacques-laporte.org/HP35%20power%20unit.htm.

As for my HP-35 charger, some of the sealed plastic case is chipped away at the charger's strain relief. I used epoxy to fill in the missing parts. I also sliced a plastic strain relief off of an old in-line phono plug, cut it open, wrapped it around the charger cable where it emerges from the case, and secured it in place with more epoxy. This should reinforce the rather wimpy OEM strain relief.

Edited: 2 Nov 2009, 7:57 p.m.

Charlie

Re: Opening a Woodstock external charger?

*Message #8 Posted by **Randy** on 2 Nov 2009, 5:52 p.m.,*
in response to message #1 by John Garza

Like most HP calculator assemblies, it was ultrasonically welded. You're right, it will most likely crack if you attempt to part the pieces.

Nothing inside but a diode, resistor and LED. *Very* hi-tech ;^)

Re: Opening a Woodstock external charger?

*Message #9 Posted by **John Garza** on 3 Nov 2009, 1:28 a.m.,*
in response to message #1 by John Garza

Just to clarify...

I'm NOT talking about the AC adapter that plugs into the wall.

This is basically a box to hold the batteries. You then plug the AC adapter into this box instead of the calculator. It looks like a 2/3 size woodstock case complete with rubber feet, "hewlett packard" metal strip, and an LED to indicate charging. It serves the same function as the more common classic series little black hinge-top "reserve power packs".

Not sure I made that clear enough in my original post.

I've been using alkalines for years in my woodstocks. Now I feel the urge to switch to rechargables. I'm well aware of the hazards of in-machine battery charging, so I thought this little jewel would do the trick. It certainly looks better than anything I could construct. Only problem is I think the diode is blown. When I

connect my AC sdapter to it, the battery charging contacts show a little over 10 volts AC! I've never actually tried to use it until now. It's just been sitting in my "accessories box" with all the spare AC adapters, armored security cradles, field cases, etc. that I never really use.

-John (3665)

Re: Opening a Woodstock external charger?

*Message #10 Posted by **Katie Wasserman** on 3 Nov 2009, 1:59 a.m.,*
in response to message #9 by John Garza

I happen to have a few of these and one was badly corroded and in need of repair. It had also been previously opened as there was a chip in the front. The two pieces of the shell are held together by what appears by glue around the boarder of the center rectangle. Here's a picture:

I think that it might be possible to break the glue bond without damaging the case, but it's not going to be easy.

The circuit is just a diode in series with what seems to be an 11 ohm 2 Watt resistor for charging and an LED in series with a 22 ohm resistor to indicate that current is flowing into the battery.

-Katie

ME33S Advanced uses of logarithmic functions

Log and antilog functions

Before calculators like the ME33S became easily available, logarithms were commonly used to simply multiplication. They are still used in many subjects, to represent large numbers, as the results of integration, and even in number theory.

The ME33S has four functions for calculations with logarithms.

These are the “common” logarithm of “x”, $, its inverse, !, the “natural” logarithm of “x”, & and its inverse, #. Common logarithms are also called “log to base 10” and the common logarithm of a number “x” is written LOG10 x or just LOG x Natural logarithms are also called “log to base e” and the natural logarithm of a number “x” is written LOGe x or LN x

Logarithms can be calculated to other bases, for example the log to base two of x is written LOG2 x

Some problems need the logarithm of a number to a base n, other than 10 or e. On the ME33S these can be calculated using one of the formulae

LOGn x = LOG10 x ÷ LOG10 n LNn x = LNe x ÷ LNe n ! and # are also called “antilogarithms” or “antilogs”. # is also called the “exponential” function or “exp”. Apart from being the inverses of the log functions, they have their own uses. ! is very useful for entering powers of 10, especially in programs where the } key can not be used to enter a power that has been calculated. # is used in calculations where exponential growth is involved. 1# is a quick way to type the value of e. The) function can be seen as the base “n” antilog function. If 10x is the inverse of log10 x and ex is the inverse of loge x, then yx is the inverse of logy x.

Practice using log and antilog functions

Example 1: Find the common logarithm of 2. Solution: In RPN mode type 2¹$

Figure 1

In algebraic mode type 2¹$Ï MEcalculators - 2 - ME33S Advanced uses of logarithmic functions - Version 1.0 MEcalculators ME33S Advanced uses of logarithmic functions

Figure 2

Answer: The common logarithm of 2 is very nearly 0.3010.

Example 2: A rare species of tree has a trunk whose cross-section changes as 1/x with the height x. (Obviously this breaks down at ground level and at the tree top.) The cross section for any such tree is given by A/x, where A is the cross-section calculated at 1 meter above the ground. What is the volume of the trunk between 1 meter and 2 meters above ground? Solution: The volume is obtained by integrating the cross-section along the length, so it is given by

the integral:

Figure 3

It is possible to evaluate this integral using the ME33S integration function, but it is much quicker to note that the indefinite integral of 1/x is LN x. The result is therefore V = A (LN2 – LN1) Since LN 1 is 0, this simplifies to V=A LN2 In RPN or algebraic mode type 2&. In algebraic mode follow this with Ï No one is likely to measure tree heights to an accuracy of more than three significant digits, so set the ME33S to display the answer with just 3 digits after the decimal point, by pressing Þ13

Figure 4

Answer: Figure 4 shows that the log to base e of 2 is close to 0.693, so the volume is 0.693A cubic meters.

Example 3: What is the log to base 3 of 5? Confirm the result using the) function. Solution: Using the equations given above, the log to base 3 of 5 can be calculated as (log10 5)/(log10 3). In RPN mode, press: 5¹$3¹$¯ In algebraic mode, press: 5¹$¯3¹$Ï MEcalculators - 3 - ME33S Advanced uses of logarithmic functions - Version 1.0 MEcalculators *12* 33S Advanced uses of logarithmic functions

Figure 5

That this is correct can be confirmed if the following keys are pressed.

In RPN mode: 3w) In algebraic mode: 3)¹ÍÏ

Figure 6

Answer: The log to base 3 of 5 is 1.465 within the current accuracy setting of the calculator, as shown by Figure 5. Calculating 3 to this power gives 5.000 which confirms that the correct value for the log had been obtained. Example 4: An activity of 200 is measured for a standard of Cr51 (with a half-life of 667.20 hours). How much time will have passed when the activity measured in the sample is 170? The formula for half-life computations is shown in Figure 7.

Figure 7

Solution: Rearrange the equation to solve for t, as in Figure 8.

Figure 8 Now calculate t. In RPN mode: 667Ë2Ï170Ï200¯&¸Ë5&¯ In algebraic mode: 667Ë2¸º y170¯200º|&¯Ë5&Ï

Figure 9

Answer: 156.4352 hours. Figure 9 shows the result in RPN mode. Note: When you have finished this example, press Þ4 to return the display to Standard display mode.

Note: Please ignore the above information, in case it has been informed or circulated.

in response to message #1 by Naseer Norris

Looking at the not really matching characterset, I presume that this article has been copied from the Net or some text book. Could you point us to the source of your information, please?

Re: HP 33S Advanced uses of logarithmic functions

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 2 Nov 2009, 3:23 a.m.,*
in response to message #1 by Naseer Norris

Hi, Nasser;

It seems to me that part of the information you posted was copied and pasted from this document, available at the HP Calculators homepage. I thought you would like to know about this, maybe you are not aware of it. The actual HP33S page has many other papers about other subjects. Hope you find them useful as well.

Cheers.

Luiz (Brazil)

Re: HP 33S Advanced uses of logarithmic functions

*Message #4 Posted by **Naseer Norris** on 2 Nov 2009, 11:38 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Thank you for pointing out.

I knew that this topic is already posted on HP homepage and I have copied it. Perhaps, as mentioned in the **NOTE**.

I gust wanted to give a little start in this forum.

Reminder : Please ignore it.

Thanks

Edited: 2 Nov 2009, 11:44 p.m.

So...

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 3 Nov 2009, 2:35 a.m.,*
in response to message #4 by Naseer Norris

... I think all others would like to know more about you. You see, your 'first appearance' was quite unusual, and I believe most 'old timers' agree with me. As a bare comparison, if this is an automotive-address museum you were introducing yourself by showing us the best way to change tires... by using data from a well known document with no regards mentioning the source. Can you understand why did you toke us by surprise?

Now I´d invite you to tell us about which calculators you use, program, etc... I began contributing here in 2001, and people are totally friendly. But as Namir mentioned, we are not babes in the woods. At least not the most of us... 8^)

Welcome!

Luiz (Brazil)

Edited: 3 Nov 2009, 3:57 a.m.

One other point:

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 3 Nov 2009, 8:24 a.m.,*
in response to message #4 by Naseer Norris

Naseer, you wrote above:

> Quote:
>
> I knew that this topic is already posted on HP homepage and I have copied it.

But then you answered Michael Meyers with:

> Quote:
>
> Please ignore it, if publicly available.

I do not want to go ahead discussing what seems to be already pointed out, but still, would you like to comment on that?

Luiz (Brazil)

Edited: 3 Nov 2009, 8:25 a.m.

HP 33S Advanced Use: the rest is here...

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 2 Nov 2009, 4:40 a.m.,*
in response to message #1 by Naseer Norris

Hi, Nasser;

I see that the rest of the information you posted seems to be copied and pasted from this other document, available at the same HP Calculators homepage I pointed previously.

Cheers.

I second your opinion Jeff. This thread is mega-useless!!!!

Namir

Re: HP 33S Advanced uses of logarithmic functions

*Message #10 Posted by **Michael Andersson** on 3 Nov 2009, 9:00 a.m.,*
in response to message #9 by Namir

There are people on this forum who more and more often comment on posts that they are useless or that the subject has already been discussed and should not be brought up again. I think such comments should be kept away from here since they add very little and may scare people of from the forum, stopping them from posting again. This does not mean that constructive critisism isn't sometimes in place, but that's something else.

There are often subjects here that do not interest me, but I have a simple solution to that - I don't read them. I hope this forum is not a place for a few elite HP-users, but rather a place where also beginners are welcome.

Re: Welcome to the Museum Forum

*Message #18 Posted by **bill platt** on 3 Nov 2009, 8:08 a.m.,*
in response to message #17 by Naseer Norris

Hi Naseer,

The real point is that you could've done something like posting, say, "I found this on the hp website (link) and thought it rather curious, specifically (citation etc)."

By simply posting a copy, with no text of *your own*, it looks like clutter. It is clutter. There is no point to it.

Please see it from other people's perspective--that no, most people do not understand you.

PIL-Box meet DOSBox

*Message #1 Posted by **Egan Ford** on 1 Nov 2009, 3:35 p.m.*

A new feature of the latest EMU41 (http://www.jeffcalc.hp41.eu/emu41) is support for the PIL-Box (http://www.jeffcalc.hp41.eu/hpil). This allows a modern Windows-based PC to access HP-IL devices in the same manor an ancient DOS-based PC accesses HP-IL devices via the HP-IL ISA adapter.

This is great--if you run Windows. Fortunately, many of us do not run Windows, and fortunately there are DOS alternatives for non-Windows platforms. DOSBox (http://www.dosbox.com) happens to be one of them. DOSBox is available for just about any platform (I use it on my Mac). Because DOSBox emulates DOS and the x86 instruction set it will be slower (but still much faster than necessary) than Windows/DOS or Linux/DOSEMU. However, the upside is that if you have a Power Mac or a low power portable ARM-based Linux machine, then you are still in luck. DOSBox like Windows/DOS and Linux/DOSEMU also utilizes a shared file system directory making it easy to use your native OS environment to setup and edit files.

Getting EMU41/DOSBox to talk to the PIL-Box is fairly straightforward. I'll be using my Mac as an example.

1. Install DOSBox from the URL above.

2. Define a directory for all your DOS needs. I will be using /Users/egan/dosbox.

3. Install EMU41 into your dosbox directory. E.g. /Users/egan/dosbox/EMU41.

4. Install BNU 1.70 (http://www.pcmicro.com/bnu) into your dosbox directory. E.g. /Users/egan/dosbox/BNU.

5. Edit your DOSBox Preferences. Read the DOSBox documentation to find the preferences file. E.g. on my OS/X machine I edit: /Users/egan/Library/Preferences/DOSBox\ 0.73\ Preferences (NOTE: the backslash space is because I edit files from the command line).

   Make the following edits:

   In the serial section:

   ```
   [serial]
   serial1=directserial realport:cu.usbserial-FTE03NXR
   serial2=disabled
   serial3=disabled
   serial4=disabled
   ```

   Where realport is the name of the PIL-Box. It will differ from platform to platform, the example above is for OS/X (NOTE: /dev/ is omitted).

   In the autoexec section:

   ```
   [autoexec]
   mount c: /Users/egan/dosbox
   c:
   cd bnu
   bnu
   cd ..
   ```

Save and exit your editor.

6. Edit EMU41.INI and add in the [DEVICES] section XIL COM1:. Follow the EMU41 documentation for more details on how to use the PIL-Box with EMU41.

7. Run DOSBox.

8. Start up EMU41:

```
cd emu41
emu41
```

That's it. Enjoy. Now when will see EMU71 with PIL-Box support?

Re: PIL-Box meet DOSBox

*Message #2 Posted by **J-F Garnier** on 8 Nov 2009, 4:02 p.m.,*
in response to message #1 by Egan Ford

Interesting that Emu41 works better with the PIL-Box in an DOS emulation environment than in Windows!

I just released an updated Emu41 version (2.48) with improved native support of the PIL-box. What I did basically is to increase the communication timeout values to take into account the very slow response time of serial communications in a DOS box inside Windows. On my dual-core system with Win2k, it works reasonably well, but on a small Centrino-based, XP tablet PC machine it is quite slow.

Still, the recommended solution for file exchange between Emu41 and HP-41 with the PIL-Box is to use the ILPer software.

J-F

> Interesting that Emu41 works better with the PIL-Box in an DOS emulation environment than in Windows!

For some reason with Windows/PIL-Box, EMU41 (2.47) intermittently does not see anything on the loop until I power on/off something on the loop. I did not have this problem with DOSBox/EMU41--works every time.

Re: PIL-Box meet DOSBox

*Message #4 Posted by **Gerry Schultz** on 10 Nov 2009, 1:06 p.m.,*
in response to message #2 by J-F Garnier

Jean-Francois:

Quick note, I downloaded EMU41 version 2.48 last night to my 5 year old laptop and tried it with my PIL Box and 9114B disk drive. Works great!

Thanks for the update. Gerry

Wow! Why? Of all the modern options why the 71B?

> Quote:
>
> I've computer with RS232 interface. I lost many useful programs and need type it again. Somebody can help me found easy way how to save/load my programs to/from PC. I don't know with software and what a commands I've to use. With respect,

IIRC, here is the general idea:

1. Install EMU71 (free version, http://www.jeffcalc.hp41.eu/emu71/index.html). Get all your programs running in there (you can cut/paste them in or use DOSLINK, read the EMU71 docs).
2. Make this cable: http://www.jeffcalc.hp41.eu/emu71/files/serialcable.pdf. Run the little 71B program at the end of the doc on your 71B. Then connect the IL-RS232 device to your PC.
3. Configure EMU71 to use the serial port the IL-RS232 is connected to.
4. From EMU71 type COPY PROGRAM TO SERIAL1:
5. From 71B type COPY :HP82164A TO PROGRAM

The above may or may not work, I think I have done it once. I have not had to rely on this method because I have an ISA HP-IL adapter in an old PC for this type of work. However, that recently changed with the introduction of the PIL-Box (USB to HP-IL, http://www.jeffcalc.hp41.eu/hpil/index.html).

Quote:

Their newer offerings are not better than the old

Well said, I'm on the same track here.

Nevertheless it's quite interesting finding this to be the choice for today's students - if not for anything, consider how unknown the old systems are - or at least I thought so.

Re: Need help with HP82164A HP-IL/RS232 Interface

Hola, Ángel; ¿que tal?

Quote:

(...)consider how unknown the old systems are (...)

If the old systems are actually unknown at a certain extent (and I agree with that), what can we say about the new ones, with billion times more system and virtual memory than the old ones? Who'd dare explaining, or even understanding, a source code generated by a sub-code from a builder after some newbie (wannabe?) 'explains' the system what he believes he wants the system to do in a dozen lines? The idea scares me!

Cheers.

Luiz (Brazil)

You and I are biased having *been there, done that*. I'd like to know *why* a 20-something (assumed) student independently determined that the 71B in 2009 best fit his needs.

> Quote:
>
> My 71 with its modules, extra 160KB of RAM, many LEX files from the user groups, and better manuals is worth far more to me than my 50g.

The 50g AUR is actually quiet good and searchable. The size of the user contributed code for the 50g from hpcalc.org and other sources easily eclipses the 71B. The 50g has modern I/O options. And there is a very good 71B emulator for the 50g.

I am not trying to say the 50g is better or to argue that the 71B is not best for you, but someone making a comparison in 2009 would most likely select the 50g.

> Quote:
>
> AFAIK, there are precisely zero modern handheld options that can act as a lab instrumentation controller.

I know nothing of this space, but I'd wager that the percentage of people that care about such things rounds to zero. Simply because if a larger percentage cared then the market would (should) meet demand.

So I've sensed, at least from this forum; but it makes me wonder why anyone would want a ton of speed and memory if they can't get a ton of data into it quickly to operate on, by reading it over an interface from instrumentation, and can't do anything useful with the voluminous results except maybe view a little of it in a small built-in screen. So what gives?

> We have a lot of matrix and others calculations. I wrote many programs in basic what help me very much.

Do you have the math ROM for the 71? It has all the matrix operations in assembly language so it's much, much faster than anything you'll write in BASIC.

The 71's display can do graphics but only 8 dots tall. I wrote Forth utilities for it to display two lines of 33 or 44 tiny characters per line. The graphics capabilities of modern calculators are of almost no value to me though.

Re: Need help with HP82164A HP-IL/RS232 Interface

*Message #11 Posted by **Egan Ford** on 3 Nov 2009, 11:54 a.m.,*
in response to message #8 by Ilyas B.

> Quote:
>
> Could you advice another terminal program?

I did not have a lot of time, but this worked for me.

Create the following programs:

T2S:

```
10 REMOTE @ OUTPUT :HP82164A ;"LI5;C0" @ LOCAL
20 ON ERROR GOTO 120
30 DESTROY ALL
40 DIM A$[100]
50 INPUT "FILENAME:";F$
60 TRANSFORM F$ INTO TEXT TMPFILE
70 ASSIGN #1 TO TMPFILE
80 READ #1;A$
90 DISP A$
100 OUTPUT :HP82164A ;A$
110 GOTO 80
120 OUTPUT :HP82164A ;"EOF"
130 PURGE TMPFILE
140 END
```

S2T:

```
10 REMOTE @ OUTPUT :HP82164A ;"LI5;C0;SL2" @ LOCAL
20 DESTROY ALL
30 DIM A$[100]
40 INPUT "FILENAME:";F$
50 PURGE F$
60 CREATE TEXT F$
70 ASSIGN #1 TO F$
80 ENTER :HP82164A ;A$
90 IF A$="EOF" THEN CLEAR :HP82164A @ GOTO 130
100 DISP A$
110 PRINT #1;A$
120 GOTO 80
130 ASSIGN #1 TO * @ TRANSFORM F$ INTO BASIC
140 END
```

Connect the 82164 to your PC with a standard null modem cable, do not use the custom cable (did not work for me).

Launch Hyperterminal, setup with 9600 BPS, 8N1, Hardware Flow, and terminate lines with LF (Hint: Properties/Settings/ASCII Setup/Send line ends with line feeds).

To backup a BASIC program run T2S, from HT just cut and paste the output into notepad.

To restore a BASIC program run S2T, from notepad cut and pasted into HT. NOTE: Your input must end with the line EOF<cr>. If not, just type EOF<cr> in HT.

There is a minor issue I did not have time to resolve, so after each transfer power off your 71B, press

reset on the 82164, power 71B back on.

Good luck.

P.S. Sell your 82164 and get a PIL-Box (USB to HP-IL). It will be easier.

DeSoldering SMD Components easily!!! - Chipquik

*Message #1 Posted by **Thomas Chrapkiewicz** on 31 Oct 2009, 10:49 p.m.*

I have not yet tried this stuff, but the videos show it makes removing even 4-sided SMD components very easy!!!

It's a low temperature - high heat retentivity solder that stays liquified while you can heat up all four sides of smd component to then slide it off!!!

http://www.chipquikinc.com/index.htm

R, TomC

in response to message #1 by Thomas Chrapkiewicz

I think that stuff would be a "must have" if you need to save the components you remove. So far, I've only been upgrading the 42s so it is cheaper for me to just bend up one pin at a time to remove it. I'm just tossing the 8K chip I take out anyway.

Dave

HP-15c/12c for google android?

*Message #1 Posted by **palmheads** on 31 Oct 2009, 7:43 p.m.*

With the various iphone emulators for the classic Voyager calcs like the 12c & 15c, does anyone know if a google android port is being done by anyone?

It could be an opportunity, as the Android Market (which is becoming huge) only has a few RPN calcs, including an excellent HP48 (Droid48) based upon the linux port x48.

With the google android touch screen, would make a perfect platform for more hp calcs like the 15c!

cheers Daryn

That sounds promising!!!

Was forced to drag out my old Palm Tungsten T3 the other day, which has Free42, Power48 & KK-12c on it.

cheers Daryn

I could not figure out where or how to download "droid48". (And I'm not exactly new to these internets toobs). Can anyone give me a direct link to a binary/package/zip??

Great to also read in this thread another version is coming soon. Hopefully in full 854x480 glory (motorola droid).

Edit: I did check the Android Market. I browsed each category ("featured", "top paid", "top free") and used the search function, but nada...

I think its actually called "Droid48".

I actually found it by just searching for "rpn" in the Android Market.

cheers Daryn

OT:Cronus 3-S

*Message #1 Posted by **Saile (Brazil)** on 31 Oct 2009, 3:26 p.m.*

Does exist other models?
A site that I can obtain more information?
Was this the only chronometer model using LED?
Would I like to have more models in my collection anybody could help?

Thank's

My Collection has Reached the Century Mark

*Message #1 Posted by **Michael de Estrada** on 31 Oct 2009, 2:52 p.m.*

My calculator collection has reached the century mark, and it has done so in a very special way. First, the calculator is not a Hewlett-Packard, however, it uses RPN. The manufacturer is the company "fate" in Argentina, and the calculator is a microcifra 10, based on the same National Semiconductor ROM used in the Novus 4510. Details can be seen on Dennis Belillo's site:

microcifra 10

But this is not just the story of an unusual calculator marking a significant milestone in my collection, but also the special way I came to acquire it. Most of the calculators in my collection that I have acquired recently were obtained via TAS, often from sellers that were totally ignorant and unappreciative of these unique machines, and just looking to make a quick buck. I found this calculator on the Argentinian online site "mercado libre", which translates to "free market", and is similar to TAS. Since I am fluent in Spanish, I set up a user account on mercado libre, and found the microcifra 10, however, the seller would not ship outside Argentina (most of them won't). At this point Juan Demin, who is a member of this forum and lives in Argentina, offered to visit the seller, examine the calculator, send multiple photos, purchase it, bring it with him on a business trip to the USA, and then mail it to me. At no point was there any mention of money, although I hope he allows me to thank him in some material way for this. To me that makes this whole experience totally memorable and special. So, I'd like to publically thank Juan Demin and all the other fine human beings on this forum who have helped me and others in this and many other ways. Were it not for Dennis Belillo, I would remain totally ignorant of the existence of non-HP RPN calculators. Were it not for Luis Vieira, Randy et al, I would not know how to repair a Spice. The list goes on endlessly. People showing kindness and consideration to others without any consideration of monetary profit. Life is good.

Does the machine really have two way keys? Does it depend on whether you press the key on the top or bottom edge? Or did I miss a shift key?

Re: My Collection has Reached the Century Mark

*Message #3 Posted by **Bruce Bergman** on 31 Oct 2009, 6:28 p.m.,*
in response to message #2 by Marcus von Cube, Germany

It's the little blue key. 2nd row down, 2nd key over.

What does the "V" key? 2nd key in top row ...

TIA for enlightenment

Re: My Collection has Reached the Century Mark

in response to message #4 by Walter B

"V" stands for the Spanish word "Visor", which literally means viewer, but actually means display. The calculator has a power saving feature, which activates after 25 seconds of inactivity, and replaces the contents of the display with periods that consume less power. In order to turn the display back on without disturbing its contents the "V" button is pressed. If any other button is pressed, then that function will be performed, and the previous contents of the X register shown in the display will be modified.

Hi, Michael;

thank you very much for your kind words and, why not to say, your pleasant experience here.

> Quote:

Believe you me, I know some people who do not believe this. Some guys can only measure what you do for the money you ask or are paid for. I prefer believing people.

A few days ago I bought this babe at 'Mercado Livre' (Brazilian version of Argentinian´s 'Mercado Libre'):

The seller mentioned that it is not working and I do not have it in hands yet, but I'm already searching for information. I know at least one of the MoHPC contributors has one of these, I'm just waiting for it to get here to inspect it and go ahead with the 'restoration' process.

Cheers and congratulations for your nice new 'fella'.

Luiz (Brazil)

Hi Luiz,

This is pretty clearly a re-branded Commodore N60, I had no idea that Commodore did that with this machine. Here's the manual if you need it.

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 31 Oct 2009, 6:01 p.m.,*
in response to message #7 by Katie Wasserman

Hello, Katie;

thank you very much! I almost wrote your name as the possible owner (I suspected so), but I was afraid of relating it wrongly.

Thanks again. As soon as it get to my hands I'll post again with either good or bad news...

Cheers.

Luiz (Brazil)

I brought two different C= calculators back to life. Both just had bad capacitors. If yours isn't working, I'd try to replace them first.

Good luck!
