I'm actually working on a mode game rom that will be about 4k but cover only one game (maybe two). I love the idea of a games rom, especially in mode. Id be happy to participate in typing or scanning or something (within reason) but even more I'd be interested in writing a mode game. I thought about risk once but the problem is the map. But writing the computer ai as opponents would be much fun to do...

Cheers

Peter

Re: Archaeology attack: Rubik's Cube on the 41

*Message #5 Posted by **Håkan Thörngren** on 25 May 2010, 3:44 a.m.,*
in response to message #3 by Ángel Martin

Where can it be found? Is this the one that used precompiled GTOs without labels and were sold on magnetic cards back in the old days?

> Quote:
>
> Not to forget the ever-elusive Chess CH-136, which cannot get compiled and thus remains impossible to write to ROM!

Re: Archaeology attack: Rubik's Cube on the 41

*Message #6 Posted by **Håkan Thörngren** on 25 May 2010, 11:59 a.m.,*
in response to message #5 by Håkan Thörngren

I found the Chess game.

Re: Archaeology attack: Rubik's Cube on the 41

*Message #7 Posted by **Ángel Martin** on 25 May 2010, 1:39 p.m.,*
in response to message #6 by Håkan Thörngren

Hej Håkan,

Yes, it's available at TOS... can't specify link or the message will be "preempted"

Do you have any suggestions as to how to upload it on a ROM? The problem is of course the initial PACKing - which deletes all the pre-compiled jump distances.

Re: Archaeology attack: Rubik's Cube on the 41

*Message #8 Posted by **Håkan Thörngren** on 25 May 2010, 3:10 p.m.,*
in response to message #7 by Ángel Martin

Yes, I found it at TOS.

It should not be a big issue to upload it to a ROM, but it will take a while as I only put a couple of hours per week into this. I was already working a bit on RPN code handling for other reasons, so I went ahead and started making a RAW reader as well.

in response to message #3 by Ángel Martin

Hi,

Could we get Mcode a target backend of a C compiler (or has this already been done). i'm thinking LLVM?

that might be interesting.

Re: Archaeology attack: Rubik's Cube on the 41

*Message #10 Posted by **PeterP** on 25 May 2010, 11:03 a.m.,*
in response to message #9 by hugh steers

Hugh, do you mean to write a compiler from C to MCODE, preferably in MCODE?

Cheers

Peter

Re: Archaeology attack: Rubik's Cube on the 41

*Message #11 Posted by **hugh steers** on 25 May 2010, 12:01 p.m.,*
in response to message #10 by PeterP

it wouldnt need to be in mcode, only emit it. then you'd simply compile the compiler into mcode :-)

Re: Archaeology attack: Rubik's Cube on the 41

*Message #12 Posted by **PeterP** on 25 May 2010, 1:48 p.m.,*
in response to message #11 by hugh steers

I guess I'm confused. If it has to be for the 41 then we can only write it in focal or mcode (or, theoretically in forth...). So if the Compiler is supposed to take a c file as Input and produce mcode as output it could not compile itself. Or are you talking about an offline compiler that takes c code and converts it to mcode in which case the compiler would have to be written in c to be compilable to mcode to run on the 41. So what kind of compiler are u suggesting? Sorry to be slow...

Cheers

Peter

corrected spelling from iPhone in wrong language mode...

Re: Archaeology attack: Rubik's Cube on the 41

*Message #13 Posted by **hugh steers** on 25 May 2010, 3:33 p.m.,*
in response to message #12 by PeterP

i was thinking it would be interesting to have a way to generate mcode from C. if we had a compiler (eg on the PC) that took C and generated mcode then, if that compiler itself was written in C, it could compile itself into mcode. That would give a C->mcode compiler in mcode and therefore one that could (theoretically) run on the 41 itself.

I say theoretically, because in practice it would require significant processor power and memory to actually perform a compilation on the 41c. Nevertheless, it might work for expanded 41 emulators, modern systems based around the 41.

Personally, i'd be happy with a cross compiler running on the PC generating mcode. I wouldn't want to attempt to write a self-hostable C compiler. An interesting idea would be to write a mcode backend for the LLVM project, which is basically a compiler with interchangeable back end code generators and front end syntax. it would involve writing a translator for LLVM IR (intermediate representation) to mcode.

is there an mcode reference anywhere?

Re: Archaeology attack: Rubik's Cube on the 41

*Message #14 Posted by **PeterP** on 25 May 2010, 3:38 p.m.,*
in response to message #13 by hugh steers

gotcha, thanks for the explanation!

w/ reg to MCODE, best reference is Ken Emery's book 'An Introduction to MCODE' on the DVD's here and on TOS. A very succinct yet complete reference are the last pages of the HEPAX manual, VOl 2, also on the DVD or on TOS.

Will have to check out LLVM, never heard of it (also never written any C-code...)

Cheers

Peter

Re: Archaeology attack: Rubik's Cube on the 41

*Message #15 Posted by **Geir Isene** on 25 May 2010, 3:57 p.m.,*
in response to message #14 by PeterP

And then there is the SDK41 over at TOS - invaluable.

Re: Archaeology attack: Rubik's Cube on the 41

*Message #16 Posted by **hugh steers** on 25 May 2010, 5:38 p.m.,*
in response to message #15 by Geir Isene

thanks.

i've just read some of these. the problem is that mcode makes effective use of its weird addressing modes (ie referencing part of its own registers). none of the compiler kits or libraries are, in any way, able to cope with this idea. instead, they are geared up more for modern offerings with limited addressing modes but diverse instruction types.

it would be an interesting project to build a mode "helper" which was able to generate mcode routines for expressions and also a few flow control primitives. this would be a bit like a "mini language" on top of mcode that had a more structured feel and easier to write.

maybe it's already been done?

Re: Archaeology attack: Rubik's Cube on the 41

*Message #17 Posted by **Ángel Martin** on 26 May 2010, 2:02 a.m.,*
in response to message #16 by hugh steers

Interesting to see how a Rubik's cube thread can inspire such deep reflexions on C-compilers :)

I'm no expert but the intrinsic differences between C and a low-low-level language (such as 41C mcode) aren't easy to reconcile - perhaps not need for it either.

Cheers, 'AM

HP-21 Rides again

*Message #1 Posted by **Namir** on 24 May 2010, 11:46 a.m.*

I was having dinner with Pascal (a frequent contributor to this forum) in Interlaken, Switzerland last night (families included). When the time came to split the bill, we needed a calculator. His daughter was playing a game on my iPad. I borrowed it for a second, ran the HP-21 simulator, and gave it to Pascal. He smiled and did the calculations. Who said such machines are dead? Maybe just reincarnated!

Namir

Re: HP-21 Rides again

*Message #2 Posted by **Michael Meyer** on 24 May 2010, 12:14 p.m.,*
in response to message #1 by Namir

I used the one on my desk frequently, but, alas, it is now placed on the shelf. I recently upgraded to an HP-25.

Re: HP-21 Rides again

*Message #3 Posted by **Namir** on 24 May 2010, 3:44 p.m.,*
in response to message #2 by Michael Meyer

No luck running HP-21s and HP-25s using AA Alkaline batteries. They all end up frying some chip. So an HP-21 emulator for the iPad is splendid.

I also play with the Java-based HP-25 in this web site.

Namir

Re: HP-21 Rides again

*Message #4 Posted by **Michael Meyer** on 24 May 2010, 6:38 p.m.,*
in response to message #3 by Namir

Really- That's terrible. I've never had a problem with alkalines or lithium cells (though 2 of my 3 19C's wouldn't power on after sitting awhile with lithium cells).

Do you think the chips were already close to failure? What do they show now?

Re: HP-21 Rides again

*Message #5 Posted by **Namir** on 25 May 2010, 3:04 a.m.,*
in response to message #4 by Michael Meyer

Some HP-25 machines came showing signs of trouble and died. Some HP-25 came ok and then also died. The last HP-21 I got was working very well with alkaline batteries. I may have forgotten to turn it off one day and that's when trouble struck. I will not power up anymore.

I stopped buying HP-25s because of the trouble I had. I was more sure of the 21. Not anymore. Now I only have the iPad emulator.

Namir

Edited: 25 May 2010, 3:05 a.m.

Re: HP-21 Rides again

*Message #6 Posted by **Thomas Okken** on 26 May 2010, 5:55 a.m.,*
in response to message #5 by Namir

I use NiMH batteries in my HP-25 -- no trouble so far, although I should probably mention that I don't use it often, it spends most of its time in a drawer.
Still, I always wonder why people would put alkaline batteries in calculators that were designed for NiCd batteries that deliver a significantly lower voltage. Applying 3V to a device that was designed for 2.5V seems like asking for trouble.

removing alluminium bezel (was restoring an HP11C)

*Message #1 Posted by **Alberto Fenini** on 24 May 2010, 6:54 a.m.*

ciao a tutti,
I had finally the chance to take few pics and upload them

The keyboard bezel has already been restored to my best effort,with a very thin brush and opaque black enamel
(I always forget to take picture before...)
The logo will be restored using the same technique, since I have tried with some silver markers but these are way too opaque, so I'll go for some chrmoe enamel.
However, I have tried to brush with some sandpaper the aluminuim bezel, with little improvement, which is why I'd like to remove it and brush it much better.
Has anyone done it ?
As always, thank you very much for help, take care and have a nice day,
Alberto

Re: removing alluminium bezel (was restoring an HP11C)

*Message #2 Posted by **Ron G.** on 24 May 2010, 1:37 p.m.,*
in response to message #1 by Alberto Fenini

I have removed a bezel using dental floss slipped under the edge, and worked carefully across the length of the bezel. You have to be careful with the grounding springs, but if you know where they are, you can avoid damaging them.

Re: removing alluminium bezel (was restoring an HP11C)

*Message #3 Posted by **Alberto Fenini** on 24 May 2010, 4:21 p.m.,*
in response to message #2 by Ron G.

Thank you very much for your message
You mean the two springs that can be removed unscrewing the backplate, right ?
I could remove them first, and then using the dental floss remove the bezel...
I'll give it a try, and let everybody know
thanks for help, Alberto

Martin Gardner dies at age 95

*Message #1 Posted by **Don Shepherd** on 24 May 2010, 5:36 a.m.*

His obituary.

Another one of the great ones passes. He revealed the fascinating side of mathematics to generations of readers through his books, articles, and Scientific American columns. He will be missed. Who will take his place? The guy who writes the comic strip Foxtrot has a mathematical leaning, but I doubt that a worthy successor to Mr. Gardner is likely, unfortunately.

In honor of his passing, I propose an easy challenge for a programmable calculator. Identify the only number(s) such that the sum of the digits times the product of the digits equals the original number.

And, no, 95 is not one of them: (9+5) * (9*5) =/= 95.

Re: Martin Gardner dies at age 95

*Message #2 Posted by **Paul Dale** on 24 May 2010, 7:38 a.m.,*
in response to message #1 by Don Shepherd

0 and 1 both satisfy the conditions and I didn't even need a program.

Add the restriction that there be two or more digits in the number.

- Pauli

> Add the restriction that there be two or more digits in the number.

Agreed.

Re: Martin Gardner dies at age 95

*Message #7 Posted by **Don Shepherd** on 24 May 2010, 8:59 a.m.,*
in response to message #1 by Don Shepherd

Now, let me turn this into a REAL challenge. Implement this on the 17bii+ using the solver.

Re: Martin Gardner dies at age 95

*Message #8 Posted by **Martin Pinckney** on 24 May 2010, 7:37 p.m.,*
in response to message #1 by Don Shepherd

O.K., here's the numbers. Somebody write a program to find them.

1 digit: 0,1

2 digit: 22 [answer: 4]

3 digit: Any combination of 123, 321, etc. [answer: 6]

4 digit: Any combination of 4211 (must have two 1's) [answer: 8]

5 digit: Any combination of 52111 (must have three 1's) [answer: 10]

6 digit: Any combination of 621111 (must have four 1's) [answer: 12]

And so on.

Any other combinations work?

Re: Martin Gardner dies at age 95

*Message #9 Posted by **Don Shepherd** on 24 May 2010, 9:22 p.m.,*
in response to message #8 by Martin Pinckney

Martin, those numbers don't satisfy the criteria: sum of digits (n) * product of digits(n) = n. For example, sod(22) * pod(22) = 4 * 4 = 16, not 22.

The only numbers that work are 0 and 1 and 135 and 144. I've tried testing numbers up to several million and found no others.

Don

Re: Martin Gardner dies at age 95

*Message #10 Posted by **Martin Pinckney** on 25 May 2010, 2:28 p.m.,*
in response to message #9 by Don Shepherd

I guess I misunderstood the criteria. I understood sum of digits = product of digits.

Re: Martin Gardner dies at age 95

*Message #11 Posted by **Don Shepherd** on 25 May 2010, 5:35 p.m.,*
in response to message #10 by Martin Pinckney

Yes, I see. That's a different problem, of course.

I guess no one wants to try to do this on a 17bii using the solver. I was hoping to point out a way of exiting a loop early in the solver, which the manual says you cannot do.

But you can.

:)

Re: Martin Gardner dies at age 95

*Message #12 Posted by **Martin Pinckney** on 26 May 2010, 10:47 a.m.,*
in response to message #11 by Don Shepherd

Well, I don't have a 17bii or +, but I do have a 17b and a 27s, so I would like to know the trick you mentioned. Probably others would also, although I get the impression the most members here are more interested in traditional keystroke programming than the Solver.

Re: Martin Gardner dies at age 95

*Message #13 Posted by **Don Shepherd** on 26 May 2010, 1:07 p.m.,*
in response to message #12 by Martin Pinckney

Martin, I wrote this little article 3 years ago for HCC2007. It describes the trick.

Re: Martin Gardner dies at age 95

*Message #14 Posted by **Antonio Maschio (Italy)** on 26 May 2010, 4:38 a.m.,*
in response to message #1 by Don Shepherd

Well, it's a very sad day. Martin Gardner was very popular even here in Italy.

Ciao.

HP prototypes

*Message #1 Posted by **Keith Midson** on 23 May 2010, 11:12 p.m.*

Hi all, I have seen some "proto" units listed on that auction site recently. Two in particular have been stamped with "PROTO UNIT NOT FOR SALE" on the back.
Did HP ever do this? Is this someone having a bit of a joke, or did HP actually mark some of their prototype units with this type of identifying mark? I know the Xpanders had a sticker on the back "Non Commercial Prototype" (I have one). The etched "Proto Unit" markings look a little dodgy to me.
Cheers, Keith

Re: HP prototypes

*Message #2 Posted by **Paul Dale** on 24 May 2010, 2:48 a.m.,*
in response to message #1 by Keith Midson

I've got a box somewhere with some prototypes from a never realised ACO product. From memory, there isn't anything identifying on the devices. The box has HP as the sender I believe.

- Pauli

Re: HP prototypes

*Message #3 Posted by **Allen** on 24 May 2010, 6:29 p.m.,*
in response to message #1 by Keith Midson

Keith, I have seen a number of Pioneers Units directly from Corvallis Employees that were heat-marked "DONATION UNIT NOT FOR RESALE" but I do not recall ever seeing "PROTO" markings like you describe.

I have seen this

*Message #4 Posted by **Frank Boehm (Germany)** on 25 May 2010, 9:24 a.m.,*
in response to message #1 by Keith Midson

I think on a 95LX and a 48SX. This has been molten into the plastic.

Help request for someone with a real HEPAX

*Message #1 Posted by **Eric Smith** on 23 May 2010, 10:13 p.m.*

I've recently been informed of a potential problem with HEPAX simulation, which occurs on simulators by multiple authors. Unfortunately I cannot find my HEPAX module at the moment to verify how it behaves. If anyone with a real HEPAX (not e.g. Diego's NoVRAM or NoV64) has a spare few minutes to try something for me, I'd be most appreciative. Just contact me by email.

Thanks! Eric

Re: Help request for someone with a real HEPAX

*Message #2 Posted by **JMBaillard** on 24 May 2010, 10:23 a.m.,*
in response to message #1 by Eric Smith

Hi Eric,

I do have an HEPAX module
so, if I can help...

Regards,
Jean-Marc.

Re: Help request for someone with a real HEPAX

*Message #3 Posted by **Eric Smith** on 25 May 2010, 2:50 a.m.,*
in response to message #2 by JMBaillard

Thanks Jean-Marc, but others here on the forum have now done the test I needed. The NoV-64 and HEPAX work as expected, but V41, Nonpareil, and i41cx+ have a bank-switching issue.

I've ordered a NoV-64, and once I get that I can collect logic analyzer traces for comparison to the simulators.

Re: Help request for someone with a real HEPAX

*Message #4 Posted by **Håkan Thörngren** on 25 May 2010, 3:47 a.m.,*
in response to message #3 by Eric Smith

I am curious on what the issue is?

Re: Help request for someone with a real HEPAX

*Message #5 Posted by **Meindert Kuipers** on 25 May 2010, 5:16 a.m.,*
in response to message #4 by Håkan Thörngren

I am interested as well to find out about this issue. I can do some tests with HEPAX in the

MLDL2000, and get accurate traces. This is not the real HEPAX however, but a copy in Flash ROM with its own bankswitching mecahnism.

Meindert

Re: Help request for someone with a real HEPAX

*Message #6 Posted by **Ángel Martin** on 25 May 2010, 8:37 a.m.,*
in response to message #5 by Meindert Kuipers

I'll leave Eric to elaborate as he sees appropriate but it's related to some instances where the operation fails to switch back to bank1.

I tested the real HEPAX, the NoVoRAM and the MLDL2k and all of them manage to work as expected.

I however remember being able to trip up the HEPAX itself but don't know the sequence anymore. - In fact, that's how I managed to look at bank3, taking advantage of a failed switch back. Surely involves calling XF or HEPAX...

Re: Help request for someone with a real HEPAX

*Message #7 Posted by **Diego Diaz** on 25 May 2010, 7:10 p.m.,*
in response to message #6 by Ángel Martin

Hi all,

There are a couple of things that makes bankswitching (BS) a not-so-easy feature to be implemented, neither physical nor emulated.

First is the fact that *every* BS module (or its emulated counterpart) *must* be able to interpret the ENBANK instructions, modify their internal memory addressing accordingly *and* keep track of it. This must be done independently inside every BS module.

Second, every non-BS module (including OS mainframe) *must* be accessible no matter which bank is active in the BS module where the "call" (JC/JNC) comes from.

The mess may come from any combination of these two sources:

Example 1: A BS module is running on bank n (n>1) then it jumps to an address in a non-BS page. If emulator does not have *all* non-BS pages visible from *all* banks you'll get a weird behaviour... (more likely a crash).

Example 2: Emulator includes ENBANK handling... (this is needed if it emulates CX) but just one bank pointer (instead of one for every BS module). Then it switches accordingly to the "last" ENBANK instruction, but it will switch "every" BS module... again a source for weird behaviour, since a BS module with 4 banks could be accidentally swiched back to bank n (say 2) when it is supposed to be in bank k (say 3).

To my mind the bug reported by Eric is about this second example. I faced this very same problem when developing the NoV-AdvH modules emulation, which handles two BS modules (HEPAX & Advantage) with the same code.

Software emulators will need one BANK pointer for OS (CX) + one for HEPAX + one for Advantage... IR... etc...

Don't know how MLDL handle BS but, since it's a physical device as NoV's, they don't need to care about the OS pointer (calculator itself handles it) that's why HEPAX works as expected on both. However, this is the reason why you cannot (yet) run Advantage into NoV-64: a second BS pointer is needed.

Rule of thumb:

BS modules: must have a dedicated BANK pointer for each BS page.

non-BS module: must be visible from every posible BANK (1-4)

I've also implemented a safety rule into NoV's: BANK is always set back to 1 just before STAND-BY.

Hope this helps.

Diego.

Edited: 25 May 2010, 7:39 p.m.

Re: Help request for someone with a real HEPAX

*Message #8 Posted by **Meindert Kuipers** on 26 May 2010, 1:46 p.m.,*
in response to message #7 by Diego Diaz

Thanks for this explanation Diego.

Most modules implement bankswitching in a pair of banks (one module port), and that is how the MLDL2000 does it, every pair of banks has its own register to remember the state. ANd I realize that this is a source of possible conflict, if 2 BS modules are used in the same (virtual) module slot.

The W&W RAMBOX (and also the 41CY) can switch pages in a different way, but I have forgotten how exactly.

It is important to return to bank 1 on STANDBY, I forgot this in the first MLDL implementations, and both HEPAX and Avantage ROMs will not work in that case.

Still it would be nice if Eric could explain the suspected bug in some detail ...

Meindert

Re: Help request for someone with a real HEPAX

*Message #9 Posted by **Diego Diaz** on 26 May 2010, 4:44 p.m.,*
in response to message #8 by Meindert Kuipers

Hi Meindert,

> Quote:
>
> The W&W RAMBOX (and also the 41CY) can switch pages in a different way, but I have forgotten how exactly.

For obvious reasons I have this information really "fresh" in my mind.

However, I don't think the term "Bankswitching" is fully appropriate. Although it also makes use of the same pseudo-instructions (H'100, H'140 & H'180) it's more a question of available OP codes than real Bankswitch. If I'm allowed to name it I'll choose "RAM swapping".

The process was first (and accurately) described by J-F Garnier in this thread.

Again, implementing this on emulated or physical devices is somehow cumbersome. IMHO this this one is a bit easier for the SW guys, than for the HW ones.

Best from Madrid.

Diego.

Re: Help request for someone with a real HEPAX

*Message #10 Posted by **Eric Smith** on 26 May 2010, 5:33 p.m.,*
in response to message #8 by Meindert Kuipers

Antonio Lagana tracked down the HEPAX issue to the Nonpareil code failing to select bank 1 when going into sleep states (either light or deep sleep). Neither he nor I ever noticed any issue with the Advantage ROM without that.

The specific symptom was that in PROGRAM mode, when entering the XP or HEPAX functions, bank 3 would remain selected. This results in the HEPAX functions not being available, and the bogus FAT of bank 3 showing in CATALOG 2.

I suspect, but have not verified, that doing this on an HP-41 with both a HEPAX and HP-IL Development module, and with flag 44 set (possibly by executing the "ON" function of the HP-IL Development module), would result in the same behavior.

Flag 44 prevents the 41 from going into deep sleep, but with the HP-IL Development module installed, it also will not go into light sleep.

Re: Help request for someone with a real HEPAX

*Message #11 Posted by **Håkan Thörngren** on 26 May 2010, 4:01 p.m.,*
in response to message #7 by Diego Diaz

Diego, thank you for the in depth explanation!

I had the bug in my not released emulator as well, I just corrected it.

It makes perfect sense, the ROM will just react to bank switch instructions when fetched from the same unit. Otherwise it would need to contain bus decode logic to spot bank switch instructions, which would complicate the design.

Re: Help request for someone with a real HEPAX

*Message #12 Posted by **Diego Diaz** on 26 May 2010, 4:50 p.m.,*
in response to message #11 by Håkan Thörngren

You're welcome Håkan.

I'm glad to know this info has been useful.

Look forward to seeing your emulation released.

Best.

Diego.

Unfortunately I spotted it close to the end, but thought it would make an interesting "look at" before it's removed.

in response to message #1 by Bart (UK)

HI;

The link still works, though!

I would like to see the electronic circuit. I thought about many current and voltage dividers, series and parallel arrangements and current and voltage sources, but I wonder how did the designers put these all together and made it work with the few components seen in the last picture. One question: could not identify what are those components in the bottom of the equipment (left side of the last picture): valve tubes? Electrolytic capacitors? Anything else?

"Fascinating!" (no quoting this time...)

Cheers.

Luiz (Brazil)

in response to message #4 by Vieira, Luiz C. (Brazil)

Seems to me (with very little electronics knowledge) that addition/subtraction are achieved by simply adding and subtracting resistances. Not sure how multiplication/division work, but something similar.

This simple construct would cause negative results to peg the needle to the left; hence the negative number switch, which would switch polarities.

The scale factor switch likewise has an obvious function, but the implied range of results is so limited, that one wonders why so much trouble for math problems that can be worked out on paper or mentally pretty easily.

Re: Interesting analogue calculator on that other site

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 23 May 2010, 10:58 p.m.,*
in response to message #5 by Martin Pinckney

Indeed!

But I took it into a different perspective.

Human neural network deals with numbers in such a relatively easy way. At least for most of us - humans in general- this is true. Building machines that implement such capability is another story. Since Babbage proposed the differential machine and others came with electromechanical and electronic implementations, we now deal computers in such a relatively easy way as well.

But only a few of humans actually know how to implement such capabilities in these machines.

I myself can follow some internal electronic structures from digital arithmetic IC´s, but I cannot build a complete electronic adding machine in my brain... not yet, at least. I know much of the pieces, I know how to connect some of them, but I need to go further prior to 'see' it all working as a whole. I am an Electrical Engineer, electronic knowledge has been a personal achievement.

I think that knowing how these small analogue calculators work may give some perspective...

Cheers.

> ...One question: could not identify what are those components in the bottom of the equipment (left side of the last picture): valve tubes? Electrolytic capacitors? Anything else?...

I'd vote for capacitors. They are wired in series with a red wire coming off the top and a green wire on the bottom. I was going to say some kind of odd-ball battery, but then I noticed the four 9v batteries directly to their right, so I wouldn't think there would be two kinds of batteries in it.

I'm guessing it was a student project of some kind (science fair, electronics class, etc.) based on the hand-made dial scale and some of the, err, "expedient" construction (e.g. soldering directly to the 9v batteries).

I remember using old analog computers in school to perform simulations that needed multiplication, division, integration and differentiation. Not sure why they were still in use; perhaps they were supposed to give us a better feel for the problems we were simulating on them (usually mechanical problems like the famous "damped mass on a spring" headache) than the digital simulations.

Cheers, Bob

Re: Interesting analogue calculator on that other site

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 23 May 2010, 11:53 p.m.,*
in response to message #8 by BobVA

Hi;

I captured the picture with [PrintScreen] and turned it 'upside up' so I could see the actual boxes of the 9V batteries (shame on me... the top connectors looked like valve tubes' 'heads' to me...) and the other blue boxes with two connectors in their top. Somehow (the picture does not help that much...) they seem to be a 'complementary' set of four batteries, as if the power supply is +/- 36Vcc with a common (neutral) terminal. One of the poles would come from the set of small 9Vcc batteries while the other pole is provided by the four blue batteries. Chances are that the active circuitry (voltage/current sources?) are fed through the blue set.

I really would like to see the schematics...

Cheers.

Luiz (Brazil)

I wish I had one of those

*Message #10 Posted by **Frank Boehm (Germany)** on 25 May 2010, 10:42 a.m.,*
in response to message #1 by Bart (UK)

I have been fascinated by those "analogue computers" for so long. But didn't dare to buy one due to the "another item piling up"-fear.
I think I spotted at least three TO-cans (transistors). So by the components I would place it around mid to late 60s, when transistors became affordable. Earlier DIY-experiments would have used way cheaper valves.

Re: I wish I had one of those

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 25 May 2010, 12:39 p.m.,*
in response to message #10 by Frank Boehm (Germany)

Hi, Frank;

have you also noticed the PCB´s layout? It´s been used a 'proto' type PCB, with pre-drilled holes in parallel cooper tracks, so I considered it could be an earlier experiment. Also, along with the TO-type transistors, it seems that some SOT-type units have been used (or else they are just small elect-caps). I also

noticed some CR25 resistors in some of the rotating switches.

There we go, acting as A. C. Doyle´s restless character...

Cheers.

Luiz (Brazil)

Re: Interesting analogue calculator on that other site

*Message #12 Posted by **Maximilian Hohmann** on 25 May 2010, 6:14 p.m.,*
in response to message #1 by Bart (UK)

Hello!

This must have been a project of an electronics magazine of the early seventies (maybe ETI (Electronics Today International), Elektuur/Elektor or Funkschau which were popular in Europe then?). I remember it from a classmate, whose father was a physicist by profession who loved to tinker with electronics in his free time. One day my classmate brought this "computer" to school, much to the amazement of our teacher! (By coincidence we will have our 30-year class reunion next weekend, but this "boy" is not on the list of attendees, so I can't ask...)

I think it uses opamps (you can see them in metal casings on the small curcuit boards) for multiplication and division, at least one set of batteries are needed for their symmetrical supply voltage of +/-15V.

Regards, Max

Complex Matrix Determinant on the 15C

*Message #1 Posted by **Andrew H.** on 22 May 2010, 11:19 p.m.*

Comrades,

Does anyone know of a program for the 15C that calculates the determinant of a 3 × 3 matrix with complex elements?

Andrew

Re: Complex Matrix Determinant on the 15C

>
> Andrew

That's a good question. I'm sure you're aware that the HP-15C can calculate the inverse of a 3 x 3 complex-valued matrix *in place* using built-in utilities that transform such a matrix into a real-valued 6 x 6 matrix, along with the LU decomposition. It can also calculate the determinant of real-valued matrices up to 8 x 8, using the LU decomposition. However, the determinant of a complex-valued matrix is something different.

I've thought about it before. Although I have no such program, I believe that it might be feasible within the resource limitations of the HP-15C:

1. Store the complex matrix as a 3 x 6 real matrix in the standard "Complex" form, with alternating real and imaginary values.
2. Compute the complex-valued determinant of a 2 x 2 complex submatrix in rows 2 and 3, recalling each element using indices on the stack with the "RCL g" function (or conventionally), then assembling and multiplying the complex-valued elements when ready.
3. Multiply this determinant by its corresponding complex-valued element in row 1, and store to two registers.
4. Do the same for the other two submatrices (except the last sub-result need not be stored).
5. Combine the three sub-results.

You'll need 18 registers for the complex matrix, 5 registers for Complex mode, at least 4 registers to store two or more complex-valued sub-results, plus space for the program. The "Simpler" method may require 22-23 registers in total, as "RCL A (user mode)" is a two-byte instruction.

Example (if I've got it right) for steps 2 and 3:

```
METHODICAL:                    SIMPLER:
instruct.  req'd stk depth     instruct.  req'd stk depth
2                1             2                1

Re: Complex Matrix Determinant on the 15C

*Message #3 Posted by **Andrew H.** on 23 May 2010, 2:51 a.m.,*
in response to message #2 by Karl Schneider

Karl,

Ausgezeichnet! Thank you.

I thought that it might be possible to do this using the 15C's in-built matrix functions (other than matrix addition, subtraction, and multiplication) in just a few steps, but it seems that this isn't feasible.

Andrew

Re: Complex Matrix Determinant on the 15C

*Message #4 Posted by **Karl Schneider** on 23 May 2010, 5:47 p.m.,*
in response to message #3 by Andrew H.

Andrew --

This enticed me to investigate in more detail a few things I've wondered about.

As I had suspected, if a complex-valued matrix is singular (determinant of 0 + i0), the HP-15C will also compute a value of virtually zero for the real-valued transformation matrix ('Py,x' followed by MATRIX 2). As an example, for the following singular matrix

```
[ 1+i3  2+i4 ]
[ 2+i6  4+i8 ]
```

the HP-15C calculates -2.053600001E-18 as the determinant (more about this later), while the HP-42S computes exactly 0 + i0.

Thus, if you are simply wondering if a complex-valued matrix is invertible, the HP-15C can tell you that.

For the nonsingular matrix

```
[ 1+i5  2+i4 ]
[ 2+i6  4+i8 ]
```

the HP-42S calculates -16 + i8 (exactly) as the determinant, while the HP-15C calculates 319.9999999 as the determinant of the transformation matrix. Note that 320 is the *squared magnitude* of the complex-valued determinant. I doubt that this is coincidental.

It seems that the HP-15C can give you the magnitude of a complex-valued determinant. I'm open to suggestions how that piece of information, along with the computed inverse matrix, could be employed using linear algebra to obtain the actual determinant.

Now, why does the HP-15C seem unable to compute exact integer values for the determinants of integer-valued matrices?

ANSWER: The HP-15C does not calculate determinants directly. Instead, it first computes a 'unitized' LU decomposition of the matrix that can be stored in the same space. The determinant of that is simply the product of the main-diagonal elements of the U matrix (those of the L matrix are all unity), with a

sign change for an odd number of necessary row transpositions.

The LU decomposition is part of the process for matrix inversion (allows in-place inversion), and speeds up solution of linear equations.

So, why is LU decomposition performed unnecessarily for determinants, when direct computation is faster and more accurate? Couldn't LU be computed when inversion or linear solutions are subsequently requested?

ANSWER: This was probably a consequence of limited ROM space for the functionality to be implemented. Additional machine code -- similar to what I devised above, but more extensive -- would have been needed for direct computation of determinants. Instead, the existing LU-decomposition code was utilized. Having LU already computed also provides a 'head start' on subsequent inversion or linear-solution calculations.

However, the unintuitive LU decomposition as part of the HP-15C's determinant calculation is indeed a potential "gotcha" to the user. The user may be chagrined to see his calculation of a determinant -- merely a scalar-valued output -- overwrite a needed matrix with an LU matrix. Or, if insufficient free memory exists to store the LU decomposition to the RESULT matrix, the operation will fail with a cryptic message "Error 10". No additional space is needed if the identifier of the RESULT matrix is designated as that of the original matrix, which can be approximately recovered by twice inverting the LU matrix.

Re: Complex Matrix Determinant on the 15C

*Message #5 Posted by **Andrew H.** on 25 May 2010, 7:32 p.m.,*
in response to message #4 by Karl Schneider

Karl,

A bit of research has uncovered a formula that might be useful:

det(A) = [tr^3(A) – 3tr(A)tr(A^2) + 2tr(A^3)]/6

which is derived from Newton's identities (http://en.wikipedia.org/wiki/Determinant).

The real part of the trace of a 6 × 6 partitioned matrix is just a(1,1) + a(1,2) + a(1,3) and the imaginary part is just a(4,1) + a(4,2) + a(4,3).

I agree with your observation that the product of the diagonal elements of the LU decomposition is the square of the absolute value of the determinant. This suggests that it might be possible to calculate the determinant from the diagonal elements of the LU decomposition using Newton's identities. However, this is probably not viable on the 15C as there might be row permutations during the calculation of the LU decomposition.

Andrew

Andrew --

A novel approach, but there's not enough space on the HP-15C for it, using built-in functionality. A 3 x 3 complex-valued matrix **A** has 9 complex-valued elements to represent as 18 real-valued elements -- each requiring a free register, of which no more than 64 are available. To calculate **A^2**, the first **A** is doubled to 36 elements by MATRIX 2, while the second **A** still has 18. The product **A^2** must be stored separately, requiring 18 more. That's 72 registers, and we still need to store a program to extract the traces, perform the multiplications, and combine the results.

in response to message #1 by Andrew H.

I have never had a 15C so I don't know its capabilities relative to the 33s and 35s so I don't know if this will help or not. I did write Third Order Complex Liinear Equation Solvers for those two machines which use Cramer's Rule so there are determinant solutions buried in both. You can find them as Articles 722 and 887.

Commodore PR 100

*Message #1 Posted by **Nigel Bamber** on 21 May 2010, 4:48 p.m.*

The references in another topic mentioning the Commodore SR7919 and Commodore PR100 - which were my first two calculators and it got my memory banks working.

I knew the PR100 inside out, one undocumented feature relates to the 9M function which would apply the same arithmetic function to each of it's ten memories - yes ten not nine memories, eg 15 M+ 9M would add 15 to each of the ten memories.

The PR100 also had an X <> M function. This would exchange the number on the screen or the X register with one of the ten memories chosen by the user.

The undocumented feature was that if you combined X <> M with the 9M function it would move the number on the screen (X register) into the contents of memory 0 , memory 0 into memory 1 , memory 1 into memory 2 etc until memory 8 moved into memory 9 and memory 9's contents were displayed onto the Screen.

Oh the memories .....

Nigel

HP-41 2*X-MEM emulation for NoV-64 & Clonix-D

*Message #1 Posted by **Diego Diaz** on 21 May 2010, 6:09 a.m.*

Hi all,

Another emulation for the NoV-64 users. This one can also be of interest to the Clonix-D users.

The title says it all, this new code turns your NoV-64 or Clonix-D into a Double Extended Memory module.

Needless to say that non-volatile RAM contents inside the NoV-64 is preserved and the user will get every page back, as they were before programming the 2*X-MEM emulation, as soon as the NoV-64-H (HEPAX) emulation is reprogrammed.

As with the latest files I've build, this is also experimental. Since I'm away from home, and have only got one 41CX with me; I cannot guarantee that this emulation will work in the whole range of HP-41 speeds or hardware. It won't run on 2x speeded up 41's.

The XM-NoV64.HEX file can be dowloaded as usual from here.

Comments and questions are welcome.

Enjoy your toys! :-))

Diego.

Re: HP-41 2*X-MEM emulation for NoV-64 & Clonix-D

*Message #2 Posted by **PeterP** on 21 May 2010, 11:39 a.m.,*
in response to message #1 by Diego Diaz

Wow, now this is cool!

So, we can have a 41cx with hepax, say sandmath, sandbox and a page for mcoding, plus 2x xm in one NoV64? Does this emulation allow the full range of synthetic manipulation of the program counter to eg run programs in xm, direct memory access to change file types, names, etc?

That would be awesome!

Cheers

Peter

Re: HP-41 2*X-MEM emulation for NoV-64 & Clonix-D

*Message #3 Posted by **Diego Diaz** on 21 May 2010, 3:02 p.m.,*
in response to message #2 by PeterP

Hi Peter...

I hate to cool your mood down... :-(but... this is "just" a 2*X-MEM emulation. You can have all what you mention and even HP-41CY emulation... but (sorry) not simultaneously.

So, when programmed with the referred XM-NoV64.HEX file, your NoV-64 or Clonix-D will become a double Extended Memory module and therefore it won't keep HEPAX emulation. I'll will keep HEPAX RAM contents as stated above.

In fact, both fuctions are incompatible within NoV-64 (or any other microcontroller based arquitecture...) at current clock rates (12 MIPS)

The requirements for the module to handle the 5 intructions set that X-MEM modules respond to (just the same as any other 41 D/S RAM chip) are certainly very tight; at a given point, the "gap" for HP-41 clock sinchronization is <200nS (in theory)... ;-)

To this extent, I've not tested it using Synthetics but assuming that the M-code instructions issued by Synthetics commands must be the same; the emulation should work as expected.

I've just tested it with some elemental file creation and data recovery. CAT 4 shows 600 registers when plugged (X-MEM empty), and a modified version of "AM" & "MA" M-code routines from "Emery's" book.

The module also implements the "gaps" into X-MEM (thus the 600 reg total). I may try to "close these gaps" and see if the X-FUNCS recognize the 34 "extra" registers... I think M-code will be able to gain access to them, but maybe not if they're filtered within the 41's OS Mainframe. Will let you know in the next few days.

Nontheless, and as in the case of the 41CY (W&W RAMbox 64 II) emulation posted a few days ago, this is sort of a "toy" more than a tool. I have plenty of spare time here, and the "minimal resources" to mess around with my little projects; so the .HEX emulation files I'm publishing these days are the combined result of all these... and the "resident question": What if...?

Best from the Caribbean Sea.

Diego.

Re: HP-41 2*X-MEM emulation for NoV-64 & Clonix-D

*Message #4 Posted by **PeterP** on 21 May 2010, 3:31 p.m.,*
in response to message #3 by Diego Diaz

Diego,

Thanks for the clarification. 200ns, wow, that's tight indeed! You're amazing...

I would suggest not to 'plug' the gap as the OS from the CX uses functions like 'NXTB' (or something like it) to get to the next byte or next register in the X/M files and for that it checks where you are currently and then calculates the next absolute address incl of all gaps etc. So while it might be interesting to have these gaps plugged one literally would have to write seperate routines to access them as none of the normal X/F routines could access them. So I'm not sure it makes much sense.

As you are in toy&tinker mode: Given the immense power and utility of the NoV64 it is a bit of pearls

in front of swines to use it as an XM (despite the engineering feat of making it possible), especially as one can get 2 XM for quite reasonable sums and then double them up into one module to occupy still only one slot. Unless of course there is a way to have a cheap NoV-XM version built for a similar price as 2 X/M but with say 4 x 2x XM contents that can be switched/selected by use off a code word. That would be of interest to some users (especially as there are a couple of 'save HP-41 State to X/M' programs out there. So one could save a whole set of programs and data to X/M, switch to a new set in the NoV-XM and voila, has a new fresh set of XM available. Now that would offer some playground...

Cheers

Peter

Cheers

Peter

Re: HP-41 2*X-MEM emulation for NoV-64 & Clonix-D

*Message #5 Posted by **Diego Diaz** on 21 May 2010, 4:34 p.m.,*
in response to message #4 by PeterP

Hi,

Though "wasting" a full NoV-64 potential to have "just" 2*X-MEM is undoubtly like "killing flies with a gun"... some users may still not have X-MEM module(s), or haven't dare to take them apart to build a double module. This file offers the possiblity to fiddle with X-MEM at zero cost (assumming the user already have a NoV-64 or Clonix-D)

And a Clonix-D is about the same price as 2 X-MEM and offers quite a wider range of possibilities... without the risk of damaging them in the "doubling" process... :-)

Regarding the gaps, you're absolutely right. I was testing this a minute ago, and found that this addresses are in use by some display routines. If the gaps are allowed in X-MEM you get weird display (missing or changed characters)

On the Nx 2*X-MEM modules propossal, I'm affraid that no such thing is feasible with current hardware. Note that X-MEM is build-up using internal microcontroller RAM since non volatile RAM is serially accessed thru I2C interface at 1MHz clock rate. Scrunching a few numbers soon reveals that building a 7 bytes registers structure is not possible with such speed constrains.

Does a 'Save/Get HP-41 staus to/from HEPAX RAM' exists/be possible? I think of this as a more interesting one... :-)

Cheers from the "now heavily rainy" Dominican Republic.

Diego.

Re: HP-41 2*X-MEM emulation for NoV-64 & Clonix-D

*Message #6 Posted by **PeterP** on 21 May 2010, 4:55 p.m.,*
in response to message #5 by Diego Diaz

yes, save/get hp-41 status to QRAM (such as HEPAX-RAM) exists. I think for example the Profiset-OS has such a function.

Cheers

Peter

HP-34C Excitement

*Message #1 Posted by **Mark Henderson** on 20 May 2010, 8:03 p.m.*

I recently picked up an HP-34C from TAS, believed unworking. I wanted at least one Spice in my HP collection (I like the Classics the most, any LED HP next, then the HP-41C, and recently enjoying a bargain HP-50G). When I received the 34C it was in overall good condition, but with a lot of tape residue on back. Battery contacts and bay in very good condition. Keyboard EXCELLENT - I had read the 34C keyboards could be really good, this one is like the best Classics, no rattle. Some white wear marks (?) around power switch, but otherwise clean. I was VERY doubtful that it would work, but I popped in a couple of alkalines and a paper clip to connect the cells, and I nearly fell off my seat when it powered up and worked PERFECTLY!! I am overjoyed! Everything seems to work wonderfully, and I'm really liking this little machine - based on combination of features (LEDS!, Continuous Memory, lots of keyboard functions, compact) I think it might become one of my favorites! Who knew??!! I'm going to give it a good cleaning, a battery pack and put it to daily use!

Congrats! (was: HP-34C Excitement)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 20 May 2010, 10:26 p.m.,*
in response to message #1 by Mark Henderson

Hi, Mark;

I got my HP34C some years ago, and I use it whenever I have the chance to. Today I bought a 'spare box', an HP34C that seems to be a good spare parts supplier. It cost me R$88 (about US$45,00 I guess) and it is not in good shape. Now I think I can keep the first one, in very good condition, for as long as I can.

Good machines, these HP34C´s.

Congratulations!

Luiz (Brazil)

Re: Congrats! (was: HP-34C Excitement)

*Message #3 Posted by **Bruce Bergman** on 20 May 2010, 11:12 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Yup, the 34c was one of the better models made. Always worked great for me, even up to today.

It is/was one of my favorite machines in that generation.

(I started with 25->25c->34c->19c...)

thanks,

bruce

Re: HP-34C Excitement

*Message #4 Posted by **Jeff Kearns** on 21 May 2010, 12:44 p.m.,*
in response to message #1 by Mark Henderson

Will you enjoy yours as much as Norm did his? KeR blIPPTY blippITY BLIP BLIP. I am envious!

Of my two Spices, the 32E and 33E, the 32E is my favourite and is a much more practical scientific/statistical analysis tool. The lack of continuous memory in the 33E makes it my least preferred calculator.

Norm's Memories of Cheerleaders

Re: HP-34C Excitement

*Message #5 Posted by **Michael Meyer** on 21 May 2010, 1:52 p.m.,*
in response to message #4 by Jeff Kearns

As a scientist, I'm not convinced that using an HP-34C is better than sex, at least generally. But it is my opinion, with a reasonable degree of medical certainty (important legal phrasing), that people who experience the joy of using a 34C also experience greater pleasure in many other activities as well. This, of course, would be best confirmed with industry sponsored, prospective, randomized trials. Perhaps a grant proposal to HP might be in order, but now that the 34C is no longer marketed, they probably wouldn't be interested. Too bad... it would be a great advertising campaign.

"New study proves that using an HP-34C improves your sex life..."

Norm is a poet

*Message #6 Posted by **db (martinez, ca.)** on 21 May 2010, 10:59 p.m.,*
in response to message #5 by Michael Meyer

Mike;

Freud might have believed Norm was saying that a 34c is better than the expandable version of the HP-48. If so; what would he have believed he has just learned about you? Never mind. Freud would have used AOS. Now Jung; he would have been an RPL man.

Me; i like my 34c, it's red LEDs, and solve function - but it has no interface port. -db

Tunnel Effect

*Message #7 Posted by **Michael Meyer** on 22 May 2010, 12:29 a.m.,*
in response to message #6 by db (martinez, ca.)

Don't CMOS circuits operate gates using a "Tunnel Effect"? Freud would like that!

Re: HP-34C Excitement

*Message #8 Posted by **Mark Henderson** on 21 May 2010, 2:38 p.m.,*
in response to message #4 by Jeff Kearns

Ha! I'm not sure I'll enjoy it THAT much, but it's close! I've had a whole day with it now, and I do like it a lot. Wrote some simple programs, love the "A" and "B" keys!

Two questions for the experts:

1. The wear around the ON/OFF key shows WHITE, which is unlike any other HP calc I've cleaned up? Doesn't look like it will clean off, more like this is exposing light color underneath? Any ideas if this is fixable? It's the only wear showing, happily.

2. Once in a while (like 1/20) I get an "Error 9" when I do a STO-ENTER self test (the rest of the time I get all the -888888s). This will persist until I turn the calc off, when turn on it will pass self test again. Program and register contents don't seem to be affected? Any ideas?

Cheers, 34C lovers!

Re: HP-34C Excitement

*Message #9 Posted by **Michael Meyer** on 21 May 2010, 4:24 p.m.,*
in response to message #8 by Mark Henderson

I know that with the Woodstocks, trying to clean the plastic with alcohol can cause whitish areas. I've had great luck with "Armor-All" vinyl conditioner. Rub a cloth lightly saturated with the stuff on the whitish areas. It might take a bit of time, but it should fix it. Then use a dry cloth to remove most of the Armor-All and buff it up. You can apply this lightly to clean the entire calculator. It's been discussed here previously. I've never seen it do any harm, even years after the application. I use it to polish up every calculator I restore.

Re: HP-34C Excitement

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 21 May 2010, 4:33 p.m.,*
in response to message #8 by Mark Henderson

Hi, Mark;

about the first question, I have an HP33E 'carcass' that has the white 'back' around the ON/OFF switch as well. I believe the keyboard faceplate is of some sort of white plastic (acetate?), it is not made of aluminum, as we see in other calculators.

The 'Error 9' tells me that your unit is one of the 'solderless' type, i.e., the IC´s are not soldered in a 'regular' PCB, instead they are 'sandwiched' pressed over a flexible PCB. Hence, some (or one) of the chips may be with a bad contact. Chances are that you may have a soldered unit with cold (broken) soldering, but I´d bet the first possibility.

I´m not an expert, and I actually love the HP calculators, but I still prefer a good female company, and, if all´s well, good s*x... 8^D

Cheers.

Luiz (Brazil)

HHC2010?

*Message #1 Posted by **Bill Zimmerly** on 20 May 2010, 1:32 p.m.*

I notice from this page (http://holyjoe.net/hhc2009/changes.htm) that last year's conference page went "live" on April 21st. Does anyone have news on this year's?

Sign me - anxious and excited. ;)

- Bill

Re: HHC2010?

*Message #2 Posted by **BobVA** on 20 May 2010, 5:54 p.m.,*
in response to message #1 by Bill Zimmerly

See Gene Wright's note in this thread:

HHC 2009: Guessing

Re: HHC2010?

*Message #3 Posted by **Gene Wright** on 20 May 2010, 6:00 p.m.,*
in response to message #2 by BobVA

Sorry, an infinite loop was set up.

Answers:

1) No confirmed location. Las Vegas is turning out to be more expensive that going to Fort Collins AND renting a car. Hotel rates AND conference room rental fees would mean more $$ spent compared to last year even if most everyone rents a car. Has the committee quite perplexed.

2) No agenda yet either.

Re: HHC2010?

*Message #4 Posted by **Bill Zimmerly** on 20 May 2010, 6:07 p.m.,*
in response to message #3 by Gene Wright

Thanks for the reply. If we can't get Vegas ... perhaps Chicago? :)

Re: HHC2010?

*Message #5 Posted by **Bill Zimmerly** on 20 May 2010, 6:08 p.m.,*
in response to message #4 by Bill Zimmerly

Of course, Fort Collins again would be great too.

Re: HHC2010?

*Message #6 Posted by **Katie Wasserman** on 20 May 2010, 11:55 p.m.,*
in response to message #4 by Bill Zimmerly

How about somewhere on the east coast for a change, maybe near Philadelphia, I think there are a number of HP fans in the area. It would make it easier for Europeans to get to as well.

-Katie

Re: HHC2010?

*Message #7 Posted by **Gene Wright** on 21 May 2010, 8:49 a.m.,*
in response to message #6 by Katie Wasserman

East coast would be nice.

However, a conference really takes someone local who can give a LOT of their time to pull it off. If we said "Atlanta!" we really can't do it unless someone IN Atlanta is willing to do legwork for months and give up a lot of the week of the conference to get it going.

Takes a lot more work than most people think.

AND, it takes more work if the conference is being held at a hotel. HP facilities remove a lot of headaches in addition to costs.

One of the largest attended conferences recently was held in San Jose. Why? Perhaps just the make up of the local population - high techies everywhere.

Might not be so here in Country Music TN. :-)

Re: HHC2010?

*Message #8 Posted by **Bill Zimmerly** on 21 May 2010, 12:47 p.m.,*
in response to message #7 by Gene Wright

Gene, I've never attempted to organize a conference before, but what other kind of "legwork for months" is required?

I called a few local Hotels (Festus, Missouri) and gave them the basic parameters: 20 to 50 people, mid-to-late October, 3 days, 2 nights, conference room to support from 20 to 50 people - and the prices ranged from $52.99 to $72.99 per room.

Beyond that, what other things is the local coordinator responsible for?

Re: HHC2010?

*Message #9 Posted by **Bruce Bergman** on 21 May 2010, 10:25 p.m.,*
in response to message #7 by Gene Wright

Gene, I think one of the other draws for San Jose is that it reasonably convenient for a LOT of people, the prices are low (it's not San Francisco), including flights and there is some "history" in that region. All of those help to make that a popular destination.

I would, by the way, easily welcome another San Jose meeting.

thanks,

Bruce

San Diego.

I personally guarantee it's cheaper. ;-)

Re: HHC2010?

*Message #14 Posted by **Richard J. Nelson** on 21 May 2010, 2:21 p.m.,*
in response to message #13 by Bruce Bergman

Conference Considerations 1. Hotel close to Airport - no rental car. 2. Meeting Room close to (in) hotel - saves time 3. Room nights at hotel (guaranteed)can save Meeting room costs 4. Meeting room (good size) Saturday 7:30am-10:00pm,Sunday 8:30 am - 6:00 pm. 5. Meals reasonable and very close (saves time) 3 & 5 may work together to make a package deal towards Meeting room costs. 6. We have HP's limited support and using their facilities saves about the $1,500 -$2,000 Meeting room cost. Anyone who wants to get quotes at a hotel near an International airport could help. I hope to check out Vegas next week for first hand details, but that is a two+ day trip which must be done M-F.

We hope to have a decision ASAP.

X < > Y, Richard

How about the nitty gritty details for the meeting room, like seating arrangements so everyone has table space, adequate electricity to plug things in, computer projector and screen, blackboards/whiteboards or easels with markers, tables, tables and more tables, possibly making and putting up signs, making sure the group has the rooms at least until midnight each day, getting security to guarantee that nothing "walks away" while the group leaves for the night in between the two conference days, having some sort of public-address system, podium, etc. If there isn't adequate restaurant facilities nearby, you might have to figure out how to get people to places to eat lunch. If something had to be printed at the last minute, you might need to locate a printing facility nearby. If somebody needed a last-minute piece of equipment (cable, USB stick, whatever), you might want to know the location the nearest Best Buy, Staples or Fry's or whatever. It is amazing what can come up when you least expect it.

Jake

*Message #21 Posted by **BobVA** on 23 May 2010, 9:52 a.m.,*
in response to message #1 by Bill Zimmerly

In case it's of any use, some Vegas observations from my experience...

- Broad selection of hotel/conference facilities within walking distance of each other. That would allow people to select hotel rates according to their taste, assuming the conference facilities weren't bundled with a minimum room commitment.

- Lots of other things to do without needing a car, so a less-HP-interested SO might come along.

- Cost of the airfare could amortized (ok, rationalized!) over both HHC and a small vacation.

- No shortage of airline connections (including some direct flights from Asia and England)

- Equally inconvenient for almost everybody :-)

Bob

changing the language in an HP18C

*Message #1 Posted by **Alberto Fenini** on 20 May 2010, 12:58 p.m.*

Dear All,
to my surprise (it's the first I ever have) I have discovered that
not only the documentation could be localized
but the calculator itself ...
In other words, I have received today an HP18C from a German guy,
the manual is in german (that I knew) but also the menus on the calc are in german ...
Is there any way to have them in english ????

thx for help, Alberto

Re: changing the language in an HP18C

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 20 May 2010, 1:39 p.m.,*
in response to message #1 by Alberto Fenini

Hi;

the HP19B (and the 17BII+ and newer HP17BII units) allows changing the language through the [MODES] menu, [INTL] softmenu. I am not sure about the HP18C, but it´s worth trying...

Hope this helps.

Cheers.

in response to message #2 by Vieira, Luiz C. (Brazil)

ciao Luiz,
thank you very much for your reply, how do I access the "mode " menu ? I only see keys for the financial, caluclator, sum, time, solve and math menu ...

I can't believe the language setting is hardcoded in the machine .....

take care Alberto

restoring an HP11C

*Message #1 Posted by **Alberto Fenini** on 20 May 2010, 6:20 a.m.*

ciao a tutti,

I'm in the process of restoring an HP11C just received.
The general conditions are fair, I'll post some pics later today.

However, the keyboard layout need some work, as some of the black background between the keys is ruined.

I was thinking to remove the keyboard faceplate, rather then opening the unit.

I have inserted a thin knife and it looks to me that is not much different from removing a classic back label.

Now to the most experts people the question is : Has everyone ever done it before ?
Do you have any idea of which kind of glue is keeping the faceplate attached to the unit ?

Thanks for help, and take care, Alberto

HP 41 Family Service Manuals

*Message #1 Posted by **Gerry Schultz** on 19 May 2010, 3:49 p.m.*

I was just on that unmentionable website reviewing HP Calculator items and I ran into someone in Germany selling CD disks with scans of an HP-41 Service Manual, HP82161A Cassette Drive Service Manual and an HP82162A Printer Service Manual. I reviewed my copy of the HP Museum DVDs, version 7, and could not find them on my disks.

Am I missing something or are these documents missing from the DVDs? I'm thinking that these documents are important to this site and if they're not available any other way, should I purchase and donate the scans to be included in the next issue of the HP Museum's DVDs?

Gerry

Correction: I did find the 41C CV CX Service Manual and the 41C Service Manual on the DVDs (I must be blind!) but not the cassette deck or printer service manuals.

Edited: 19 May 2010, 5:46 p.m.

Re: HP 41 Family Service Manuals

*Message #2 Posted by **DavidShenk** on 20 May 2010, 1:09 a.m.,*
in response to message #1 by Gerry Schultz

The Cassette Drive service manual can be found here.

Dave

I'm not the seller

*Message #3 Posted by **Frank Boehm (Germany)** on 20 May 2010, 9:33 a.m.,*
in response to message #1 by Gerry Schultz

so I couldn't care less - but donating the scans might be a legal grey area. I'm pretty certain that the seller has no rights whatsoever on the HP manuals, so he is very likely breaking copyright laws when commercially offering the scans. This doesn't make the copy of the copy legal... Best way would be to find an original manual and donate the scan (to my knowlegde, HP tolerates the scans on the museum DVDs). Just my 2 cents.

Re: HP 41 Family Service Manuals

*Message #4 Posted by **PeterP** on 20 May 2010, 9:57 a.m.,*
in response to message #1 by Gerry Schultz

don't. I got them and we can figure it out with Dave.

HHC 2009: Guessing

*Message #1 Posted by **Etienne Victoria** on 19 May 2010, 3:48 p.m.*

Hi all,

Browsing the HHC 2009 attendees list, I was looking at the presentation topics.

Wild guess just for fun: Cyrille would present a woodwork model of the next Hp RPL calculator as shown by the title "Return to RPL".

Just a wild guess of course, I have no information from or link to HP.

Let us know your thoughts :-)

Etienne

Re: HHC 2009: Guessing

Early calculators that could do x! for x > 69 ?

*Message #1 Posted by **Gene Wright** on 19 May 2010, 1:51 p.m.*

Always remembered 69 as the highest integer for which one could compute x! on machines with a two digit exponent.

However, I recently came across a calculator from 1976 that would compute the value for x > 69 up to a higher value.

Before I reveal that particular machine :-) does anyone else know the "first" machine that could do this?

What early (meaning red LED displays) could give a usable / correct result for 70 ! ?

Re: Early calculators that could do x! for x > 69 ?

*Message #2 Posted by **Thomas Radtke** on 19 May 2010, 1:59 p.m.,*
in response to message #1 by Gene Wright

The C= PR100 can (sort of) do that. It shows 1.2 * 10^00 and an overflow indicator.

Re: Early calculators that could do x! for x > 69 ?

*Message #3 Posted by **Gene Wright** on 19 May 2010, 2:08 p.m.,*
in response to message #2 by Thomas Radtke

So if you put in 90 and then computed the factorial, what would you see?

Could you get the actual result with a "mental" adjustment?

Re: Early calculators that could do x! for x > 69 ?

*Message #4 Posted by **Thomas Radtke** on 19 May 2010, 2:17 p.m.,*
in response to message #3 by Gene Wright

It shows 1.49 * 10^38.

Well, I certainly cannot adjust that mentally. Others likely can ;-).

Re: Early calculators that could do x! for x > 69 ?

*Message #5 Posted by **Gene Wright** on 19 May 2010, 2:32 p.m.,*
in response to message #4 by Thomas Radtke

Ah, ok, that's what I was hoping to find.

Some early machines did the calculation but since they could not show 3 digits of an exponent, they showed the mantissa and the last 2 digits of the exponent.

The Corvus 500 can do up to 120 ! and shows the result in a flashing display to indicate you have to add a 1 to the displayed exponent.

Seems like this one did it too.

So, which model was first to do this feat?

Re: Early calculators that could do x! for x > 69 ?

*Message #6 Posted by **Gerson W. Barbosa** on 19 May 2010, 4:06 p.m.,*
in response to message #5 by Gene Wright

Privileg SR54NC (1975)?

Well, according to this ad, the answer should be Corvus 500. Quoting from the ad:

"**FOR THE FIRST TIME** you can raise the number 10 to 199th power or calculate Factorial (x!) of up to 120. Unbelievable!"

Edited: 19 May 2010, 4:42 p.m.

Re: Early calculators that could do x! for x > 69 ?

*Message #7 Posted by **Michael de Estrada** on 19 May 2010, 5:24 p.m.,*
in response to message #6 by Gerson W. Barbosa

I just checked this on my Corvus 500, and indeed it works. I read through the manual, and while it makes no mention of the range for x!, it does state that the exponent range is +199 through -200. Once you get the flashing display, you must press CLx before proceeding with further operations, and remember the implicit "1" in front of the 2-digit exponent. Since this is not stored internally, many operations will yield incorrect answers. For example 120! = 6.69^198 will yield 6.69^98, and taking the SQRT will then yield 2.59^49, which is incorrect.

Re: Early calculators that could do x! for x > 69 ?

*Message #8 Posted by **Katie Wasserman** on 19 May 2010, 11:53 p.m.,*
in response to message #5 by Gene Wright

The Omron 12SR and the APF Mark 90 do this too.

The Bowmar MX-140 doesn't have factorial but it does allow exponential overflow.

-Katie

Re: Early calculators that could do x! for x > 69 ?

*Message #9 Posted by **Andrés C. Rodríguez (Argentina)** on 20 May 2010, 7:21 a.m.,*
in response to message #8 by Katie Wasserman

The Texas Instruments SR-10 and SR-11 managed exponential overflow . The SR-11 had a "K" switch, for constant multiply and division. It was possible to use it as an event counter: Set 10 as the constant, hit the " X " key for constant multiply, and then press the "Equal" key once for each event to be counted; the exponent field will show the count and will work well after 99 (of course, it's up to you to tell, say, 129 from 229).

I remember myself using it for events in the range of 160 per minute without any problem. That was before I got my HP-25...

The SR-10 and SR-11 only had square root, inverse (1/x) and EE (enter exponent) as "slide rule" functions, they were not really scientific models as the HP-35/45 or the TI SR-50 of the time.

Re: Early calculators that could do x! for x > 69 ?

*Message #10 Posted by **Michael de Estrada** on 20 May 2010, 9:52 a.m.,*
in response to message #8 by Katie Wasserman

Katie,

Did you mean the APF Mark 55? It uses the same Mostek ROM as the Omron 12SR and Corvus 500. I suspect that the Privileg SR54, Sanyo CZ2901 and GE CE93 will do x! for x>69 as well.

Michael

> Did you mean the APF Mark 55?

No, the Mark 90. It's nearly identical to the Commodore PR100.

Re: Early calculators that could do x! for x > 69 ?

*Message #12 Posted by **Bart (UK)** on 20 May 2010, 4:58 p.m.,*
in response to message #8 by Katie Wasserman

Commodore SR7919 also does not have factorial, but allows overflow of exponent too.

Re: Early calculators that could do x! for x > 69 ?

*Message #13 Posted by **Bart (UK)** on 26 May 2010, 5:34 p.m.,*
in response to message #12 by Bart (UK)

OK, so this got me thinking, how to do a factorial using this "feature" on the SR7919. Just doing simple 1*2*3... doesn't help much of course and only gets to 70 and is error-prone (I think human error increases as the tediousness of repetition increases).

So, in my search, Wikipedea was my friend and on their factorial page I found the following approximation by Srinivasa Ramanujan:

LN(n!) = n*LN(n) - n + (LN(n(1+4n(1+2n))))/6 + (LN(pi))/2

So all I have to do is calculate the right hand side (let's call it RHS) , and do e^x, except that the SR7919 doesn't do exponent overflow for the e^x function. The most complex function it does so for is x^2. Now I can see those cogs in your minds already at work

and before you have finished reading this sentence, worked out that SQR(n!)=e^(RHS/2)
then do x^2 and -voila!- I have n! up to n=120. Some results:

n	SR7919	HP-20S
70	1.1978 E00	1.1978572 E100
99	9.3327 E55	9.3326215 E155
120	6.6894 E98	6.6895029 E198

These are just a few sample points and accuracy may differ more at other points.

My next "challenge" - to find the least number of keystrokes to do this :).

(And why a 20S for comparing? It happened to be laying on the table and is capable of E499)

Edit: I used the 20S built-in n! function, whose accuracy I don't know either. It only accepts integers, so is not a Gamma aprroximation though.

Edited: 26 May 2010, 5:57 p.m.

Re: Early calculators that could do x! for x > 69 ?

*Message #14 Posted by **BruceH** on 19 May 2010, 9:28 p.m.,*
in response to message #1 by Gene Wright

Ah, that brings back memories. When I first got my HP-28C, I showed it to a work colleague and the first thing he did was type in 69! and time it against his Casio. It was satisfyingly faster and he was duly impressed.

Then I showed him the symbolic arithmetic. :-)

Re: Early calculators that could do x! for x > 69 ?

*Message #15 Posted by **Dimitri Simitas** on 19 May 2010, 10:36 p.m.,*
in response to message #1 by Gene Wright

Well, the HP-35S can do 253, no more.

Not sure how to get the HP-41 to do it if it can.

Dimitri

Re: Early calculators that could do x! for x > 69 ?

in response to message #15 by Dimitri Simitas

> Quote:
>
> Well, the HP-35S can do 253, no more.

Same for 27s, 32sii. Interestingly, the 27s gives the answer almost instantly, the 32sii shows a 'calculating' message for about 2 seconds. Probably due to RAM differences?

Re: Early calculators that could do x! for x > 69 ?

*Message #17 Posted by **Bart (UK)** on 20 May 2010, 4:59 p.m.,*
in response to message #16 by Martin Pinckney

And 20S with about 2s "running" message.

Re: Early calculators that could do x! for x > 69 ?

*Message #18 Posted by **Gerson W. Barbosa** on 20 May 2010, 5:15 p.m.,*
in response to message #16 by Martin Pinckney

> Quote:
>
> Probably due to RAM differences?

Most likely the 27S uses the function approximation even for integers, instead of doing hundreds of multiplications. Try both 253! and 253.000000001! on the 32SII and see which is faster.

Re: Early calculators that could do x! for x > 69 ?

*Message #19 Posted by **Martin Pinckney** on 20 May 2010, 6:25 p.m.,*
in response to message #18 by Gerson W. Barbosa

> Quote:
>

The latter is much faster on the 32sii. Almost instantaneous.

The 27s gives "non integer" error, which, I dare say, is the correct answer.

[edited to correct spelling]

Edited: 20 May 2010, 8:08 p.m. after one or more responses were posted

Re: Early calculators that could do x! for x > 69 ?

*Message #20 Posted by **Gerson W. Barbosa** on 20 May 2010, 6:40 p.m.,*
in response to message #19 by Martin Pinckney

> Quote:
>
> The 27s gives "non integer" error, which, I dare say, is the correct answer.

This means the 27s has no gamma function. Therefore my guess about its factorial function being faster was wrong. Perhaps someone else can give us a valid explanation.

Re: Early calculators that could do x! for x > 69 ?

*Message #21 Posted by **Gene Wright** on 20 May 2010, 5:59 p.m.,*
in response to message #15 by Dimitri Simitas

Ah, but the 35s, 20s, etc are not "early" calculators with red LED displays.

:-)

Re: Early calculators that could do x! for x > 69 ?

*Message #22 Posted by **Dimitri Simitas** on 20 May 2010, 6:23 p.m.,*
in response to message #21 by Gene Wright

I know but I never used a "!" function on a calculator before so I turned to my HP41 and 35S to see if they had it. So thought I'd post it.

Ray

Re: Early calculators that could do x! for x > 69 ?

*Message #24 Posted by **Frido Bohn** on 20 May 2010, 3:10 a.m.,*
in response to message #1 by Gene Wright

Well, I would say every calculator can do as long as it has the ability to handle logarithms.

Instead of multiplying the integer, do a sum over the logarithms of the integers - et voilá, you should be able to generate a (logarithmic) result of say 9.999999999^99. Raise this to the power of 10, so you get the integer 10^(9.999999999^99) as the result.
Now the question: the result of which factorial is that?
And which - of course handheld - calculator is able to give the output?

And don't tell me that's cheating. That's applied mathematics ;-)
Cheers

P.S.: To see what I suggest, try this little FOCAL app:
Simply put the number to be factorized in the x-register and start the program.
As an example, for 100 the output will be a count-down first and 9.3326E157 which corresponds to 9.3326 10^157.

```
01 LBL "LOGFACT"
02 0
03 X<>Y
04 LBL 01
05 LOG
06 ST+ Y
07 RDN
08 LASTX
09 VIEW X
10 DSE X
11 GTO 01
12 RDN
13 INT
14 LASTX
15 FRC
16 10^X
17 CLA
18 ARCL X
```

```
19 >"E"
20 FIX 00
21 CF 29
22 ARCL Y
23 AVIEW
24 SF 29
25 FIX 04
26 END
```

Note: at Line 19 >"E" shall denote the alpha-append sign (ASN in ALPHA-mode) followed by E (without quotation marks).

Edited: 20 May 2010, 9:47 a.m.

Re: Early calculators that could do x! for x > 69 ?

*Message #25 Posted by **Gerson W. Barbosa** on 20 May 2010, 5:02 p.m.,*
in response to message #24 by Frido Bohn

> Quote:
>
> As an example, for 100 the output will be a count-down first and 9.3326E157 which corresponds to 9.3326 10^157.

Which is correct, of course!

If we are curious about all other digits and want the HP-41 to compute them, we can use R. Farrando's program and get

```
                    FACTORIAL OF 100

                      0093326215
                      4439441526
                      8169923885
                      6266700490
                      7159682643
                      8162146859
                      2963895217
                      5999932299
                      1560894146
                      3976156518
                      2862536979
                      2082722375
                      8251185210
                      9168640000
                      0000000000
                      0000000000
```

This should take several minutes on the HP-41 (It took about 7 minutes on the HP-42S). See last message in the thread below.

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=108035

Regards,

Gerson.

Thanks, again!

*Message #1 Posted by **J Grim** on 18 May 2010, 8:28 p.m.*

I just wanted to post a public thank you to Michael Meyer for reviving my 25C. This is the second one he has fixed for me. The first was a 25 (no C). Both units were non-functional when I bought them and so far Michael is 2 for 2 in breathing new life into them. Both of them were apparently suffering from corrosion to one degree or another. The 25 was in better shape than the 25C. He and I have emailed each other back and forth throughout the process and I will post his comments on the 25C here if he gives me permission. Thanks again, Michael.

J Grim

Re: Thanks, again!

in response to message #1 by J Grim

Sure...it's O.K. to post. Many people in this community have helped me over the last ten years, and I'm just paying it forward.

Happy Programming, Michael

Re: Thanks, again!

*Message #3 Posted by **J Grim** on 19 May 2010, 12:46 a.m.,*
in response to message #2 by Michael Meyer

Here is the part of the email Michael sent to me telling me the good news that my 25C lived:

"Well, I have an interesting story for you. There was a good deal of corrosion on the 25C's circuit board, even some on the keyboard traces. I removed some from the board with the dremel brush and put De-oxy solution on it. I reassembled it, resigned to it being non-programmable. The memory chip didn't look to have anything physically wrong with it. I modified and cleaned the battery pack. Then I sat down to write you an e-mail.

While playing with the calculator, trying to program it... suddenly it started showing random keystrokes in program memory. O.K.... that was weird. Then, I could clear out memory and it seemed to take a few keystrokes! O.K.... then, it started working! I didn't want to push my luck with the board as the 25C's are so sensitive, so I didn't want to disassemble it again. But, then it started to malfunction again. So, I decided to take the chance and took it apart and re-soldered the memory chip and the ROM chip.

OMG... you have a fully programmable, fully functional 25C. Here's my conjecture: The Deoxy solution had some time to improve conduction somewhere just enough to make it work intermittently enough to alert me to it's possible survival.

I plan to play with it a little more while I clean the front with the usual Armor-all scrub. Looks as if I'm 2 for 2 for bringing these to life. Good feeling for a doctor."

Thanks, again!

> A good story. Hopefully, it helps other people to fix those dead calculators that are out there on the "parts piles"

HP 50g newbie question

*Message #1 Posted by **Bob Patton** on 18 May 2010, 8:10 p.m.*

How can I force a computed integer added to a string to not have a decimal point after the integer in the resulting string? This was never a problem for me with the 48G.

Re: HP 50g newbie question

*Message #2 Posted by **Gerson W. Barbosa** on 18 May 2010, 8:37 p.m.,*
in response to message #1 by Bob Patton

Clear flag -105:

```
-105 CF
```

(Exact mode on)

Alternetively press [MODE] [FLAGS] and [UP ARROW] until '105 Approx. mode on' is highlighted then uncheck it.

Edited: 18 May 2010, 8:41 p.m.

Re: HP 50g newbie question

*Message #3 Posted by **Bob Patton** on 19 May 2010, 9:02 a.m.,*
in response to message #2 by Gerson W. Barbosa

Thanks for the quick reply, but flag 105 is off (Exact mode on). The problem seems to be that the whole number value I have is still a real number, type 0, and not a real integer, type 28. Is there a way to convert type 0 to type 28? I do have the AUR if anyone can refer me to any clue in that.

Re: HP 50g newbie question

*Message #4 Posted by **Tim Wessman** on 19 May 2010, 9:51 a.m.,*
in response to message #3 by Bob Patton

R->I (real to integer, -> is the arrow character on RS-0)

Type it, find it in the CAT, or go into COVERT (LS-6) then REWRITE.

Need advice on HP-41C Accessory

*Message #1 Posted by **Jeff Kearns** on 18 May 2010, 7:08 p.m.*

This may be an inappropriate question and/or the timing may be such that the advice I get will be too late. If inappropriate, as it concerns the unmentionable auction site, I apologize in advance. Nonetheless, I need some quick advice concerning an item - a HP-41 Card Reader - for which I have just been outbid and the aution ends in a little over an hour (May 18, 201020:30:18 EDT).

I own a HP-41C with a number of Pacs, including Advantage, Math/Stat, Machine Design. I also have the Quad memory module. Nothing else... I would love to get external programs into the unit and therefore need either a wand or a card reader. I have no cards to be read mind you... These are presumably the HP-67 cards, and I don't even know how to acquire a good quality set.

Should I let this item go (current bid is around $80) and just concentrate on getting a wand, or should I bid some more - and how much?

Jeff Kearns

Re: Need advice on HP-41C Accessory

*Message #2 Posted by **Allen** on 18 May 2010, 7:26 p.m.,*
in response to message #1 by Jeff Kearns

The card reader is my least preferred method of getting programs to the HP41. Best/easiest options are: (not factoring cost, rarity, or others opinions)

```
1) Pil-BOX with HP-ILper connection and HP-IL module
2) The ISA HP-IL interface board with HP-IL module (via EMU-41)
3) Clonix/NovRAM/Nov32
4) Zengrange ZEPROMS
5) Wand
6) Hardware Mass Storage Device (Tape or Disk)
7) Card Reader
```

The card reader is cheapest, and requires the least hardware, but is the most maintenance. IMHO Full market value for a tested, working card reader has been in the $150 range for some time. Non-working or gummy-wheel needed still run from $50 to $100 depending on severity of repairs needed. I have no specific comments about any particular active auction, and I am not the seller of the card reader in question.

These are easy to find, they usually sell in sets of 20 units. Just search for "blank cards 41c". Better if the card holder and the red cleaning card are included.

> Quote:

Be sure it's been repaired recently. Mine cost $150 or so about three years go. I'm very pleased with it, even though I rarely use the card reader. I think the card reader is more useful for your purpose than the wand.

Gerson.

Re: Need advice on HP-41C Accessory

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 18 May 2010, 9:11 p.m.,*
in response to message #1 by Jeff Kearns

Hi;

I second Gerson´s words, I own two card readers myself and also two MLDL2000, one NoVRAM, one NoV32 and a 9114B disk drive. IN terms of storage, I prefer the MLDL2000 with the PC connection so I can emulate HEPAX RAM pages and save them with all of its contents (REG files, ALPHA files, programs, ROM images and so)in the PC. The disk drive comes right after and, based on these options, the card reader comes in third place. I remember, back in the 80's, when I could not even dream of having access to such devices and I was able to buy two card readers, one NIB and a used unit. They were the only means I had to store any retrievable data and I was completely satisfied with the fact I could have them. Have them both till today, both running with O-rings instead of the original silicon tracking wheel.

Cheers.

Luiz (Brazil)

Re: Need advice on HP-41C Accessory

*Message #5 Posted by **geoff quickfall** on 18 May 2010, 10:21 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

For me, when the 41CX is in my flight bag my card reader always accompanies it due to its size.

I have a 21 card WALL set which will reboot the calc if required and a set of synthetic Extended memory files for transferring the data files into the extended mem section.

I have at home a wand, combined with an HP dot matrix printer for bar codes, the 9114B disc drive and the cassette mass storage. My preference for reloading at home is the cassette drive then the disc drive followed by the card reader and lastly the wand.

In the calc is a Clonix with PPC Rom, CCD, Navigation with a blinky for the infrared printer and for some regression techniques a stat module and a double x mem module. And of course of suite of self written programs that are aviation specific such as altitude temperature corrections, breaks schedules, Great circle data and great circle coord programs as well as others.

I actually have 5 of the card readers working with new silicon tubing pinch rollers and restored dampening couples.

I concur with Allen in that the fixed working examples go for about 150. Again, for sheer portability the card reader beats them all.

Cheers, Geoff

*Message #6 Posted by **DavidShenk** on 18 May 2010, 10:45 p.m.,*
in response to message #1 by Jeff Kearns

Hi Jeff,

Well, you've got a lot of opinions. If you decide to get a card reader and are moderately handy taking things apart, you might want to find one listed as not working and fix it yourself. You'll save some money and gain some knowledge about your equipment. I have one that worked when I got it, but just recently fixed the reader on an HP 67. For me it still has a lot of "WOW!" factor and I enjoy using it as much for the novelty.

The PIL-Box mentioned above, if you don't know, allows you to connect your 41 to your PC via USB. They are not made by HP but a private party. I just ordered one, so I can't wait until it comes. There are hundreds of programs that can be downloaded from the internet and directly transferred into the 41 using it. You also need the HP-IL module, so this route costs $175-200 USD all together, but really opens up a huge library of software. And I think USB will be around for a while still.

Dave

O.T. RAM uce in XP OS

*Message #1 Posted by **designnut** on 18 May 2010, 1:14 p.m.*

I have installed 2GB of RAM in XP and tried every tweak I could find but it won't use more than about 500 MB of RAM. I even read once that XP can't use more than 500MB. Can anyone steer me to information to improve the situation? Sam

Re: O.T. RAM uce in XP OS

*Message #2 Posted by **Alejandro Paz (germany)** on 18 May 2010, 2:01 p.m.,*
in response to message #1 by designnut

It will use as much as it is available for the different applications... the rest is used as disk cache. The problem would be if it reports that only 512 MB are visible... but if it says 2GB then it is all ok.

Re: O.T. RAM uce in XP OS

*Message #3 Posted by **Quan** on 18 May 2010, 3:16 p.m.,*
in response to message #1 by designnut

If XP only sees 500MB, then there maybe a compatibility problem.

You can use crucial.com to check how much RAM your PC can handle, if you know the make/model or motherboard.

Just a thought.

Re: O.T. RAM uce in XP OS

*Message #4 Posted by **John Cadick** on 18 May 2010, 7:12 p.m.,*
in response to message #3 by Quan

XP is capable of handling up to 3GB of ram.

John

*Message #5 Posted by **J Grim** on 18 May 2010, 11:56 p.m.,*
in response to message #1 by designnut

The 32-bit version caps out at 3 GB. The 64-bit version theoretically 128 GB, if I remember correctly. Have you looked at the system setup (BIOS settings) and saved them? Or it could be that you are using incompatible memory. Another poster suggested checking compatibility at crucial.com. I have done this many times and it works very well. I have only had one system that wasn't in their database. They also have a system scan tool available. I have never tried it though. I have made numerous purchases there and have not had any trouble.

I would try the BIOS settings first. For me it's usually something simple like that. Good luck!

Re: O.T. RAM uce in XP OS

*Message #6 Posted by **Norris** on 20 May 2010, 1:15 p.m.,*
in response to message #5 by J Grim

HP offers a discussion of memory usage by Windows XP. Note that the vast majority of XP users have the 32-bit version (not the 64-bit version). Basically:

- In theory, 32-bit WinXP supports up to 4 GB of RAM
- In practice, the amount of available RAM is always less than 4 GB
- Typically, available RAM is between 3.0 and 3.4 GB, so it can in fact exceed 3 GB
- Your graphics card can have a particular impact on available RAM
- As an example, I have a 32-bit WinXP system with 4 GB installed, of which 3.25 GB are available

Stephen Hawking's voice. Would he want it back?

*Message #1 Posted by **Michael Meyer** on 18 May 2010, 12:10 p.m.*

I bought a Panasonic Compuvoice talking calculator from TOS for 5 USD. The seller had posted a You Tube video of it, and it sounded just like Stephen Hawking's voice, which I found somewhat amusing. I've been showing it off as, "Stephen Hawking's calculator". Then, I happened to watch the middle of an interview on You Tube where he was asked about his voice. He said that it was an older speech synthesizer from 1986 (the calculator is 1981-1984) and that he has come to identify with it as his own voice, so he's never changed it. He says the hardware is old, fragile, and not easily replaceable. I wonder if he'd have any use for the circuits in the calculator?

Re: Stephen Hawking's voice. Would he want it back?

*Message #2 Posted by **Katie Wasserman** on 18 May 2010, 12:59 p.m.,*
in response to message #1 by Michael Meyer

I'll bet that he's glad that his voice isn't the same as that used in the TSI Speech+ calculator from 1976. This came with an audio tape of a person reading the manual interspersed with examples of the calculator talking. If you're really bored put this on your ipod for a fun listen: TSI Speech+ Tape.

> Are there any recordings of Hawking prior to the voice synthesizer?

Hawking briefly appeared in one of the episodes of Carl Sagan's Cosmos (1980) and already he was losing the ability to speak. He basically "mumbled" quietly to an assistant, who repeated what he said to a classroom of people.

I wonder if he possibly is the only person in recorded history to survive ALS for this many decades....

Jake

Re: Stephen Hawking's voice. Would he want it back?

*Message #7 Posted by **Thomas Okken** on 19 May 2010, 5:38 a.m.,*
in response to message #1 by Michael Meyer

I always thought that Hawking's speech synthesizer sounds just like the original MacinTalk, but according to Wikipedia, he used to use a DECTalk DTC01 and has recently switched to NeoSpeech VoiceText. Wiki also mentions that Hawking's appearances on *Family Guy* were voiced by MacinTalk, I presume the current OS X incarnation, not the classic 1984 version. (I read somewhere else that Hawking's appearances on *The Simpsons* were voiced by Mr. Hawking himself.

GRADs in use?

*Message #1 Posted by **Tim Wessman** on 17 May 2010, 9:07 p.m.*

I remember in a discussion a while back someone asked why it seemed why many newer HP calcs didn't include grads as an option in the calculators. I kept meaning to ask (mainly because it is something I've been wondering now since I twas but a wee lad) in what fields/applications are grads still commonly used? I personally never encountered them anywhere other than as a setting on a 48g series calc.

I've always been wondering. . .

in response to message #1 by Tim Wessman

Tim,

Not just the 48 series. The 20s, 32sii, and 42s all have this setting, and I am sure there are a lot more.

I don't for sure know the answer to your question, but I believe grads were used by the U.S. military at one time; don't know if still. My father was Army artillery in WWII, and he told me they used grads for aiming instead of degrees.

Perhaps today it's all automated...

I know US military maps like most maps in this world today use Mils. Which are in turn used for artillery strikes today.

However if you want confusion about the matter. One circle has 6,283 mils. The US use 6,400 divisions instead. The Russians use 6,000 mil divisions. The French use 6,280 mils, the Swiss use 6,300 mils.

Actually, the U.S. did not "pick" the units system we have, we inherited it from the British. Although our units are not all identical to their Imperial counterparts, they have their origins there. In fact, these *were* the worldwide standard for a long time, since the British Empire was worldwide.

The metric system was developed by the French under Louis XVI, but not formally adopted until after the French Revolution. Just as the English and French have competed in many things for centuries, the two systems were in competition for years. It was another 100 years before the Metre Convention tried to standardize the metric system. The Système International was not established

until 1960. The U.S. adopted SI in 1988 as the "preferred" system for commerce, but conversion is strictly voluntary from a Federal standpoint. Some states have attempted mandatory conversion for highway construction, with mixed success. Of course, metric units have been used in science and the military in the U.S. for over a century.

Sorry, I could not resist.

It is not a bad method, consider that most of Europe today uses 6,400 Mils per revolution due to NATO.

A target ranged using 6,400 mils is only off by 2%. At 500 yards a 2 yard target is measured as 509 yards with American mils verses the proper 500 yards with the "natural". But if that target was a mere 2inches taller then it was assumed to be, then your target is really at 514 yards, measured with the American mils as being 523 yards away.

A slight variation of the target changes the measurement more then the relative error in range finding. Assuming good well known measurement values at the range, its under 2% the error caused by American mils.

Wikipedia Article on History of GRADS

I first encountered this angular measurement unit in the 70's on my TI-30. What a crappy machine but I loved it... Looks like GRADS are an invention of the French Revolution and are used in some European countries for Surveying. Some militaries use it for Artillery calculations.

Ironically, I have a book called "Surveying: Theory and Practice" that makes no mention of it. Probably because it's a Yankee book. The HP-45, and 55 have it. So does the HP-32E but not my HP-21. It seems to be on every scientific calculator produced by HP post-Spice (unless I am gravely mistaken).

I just bought an TI SR-56 from a second-hand dealer (forgive me ;-). This machine even has a separate switch beside the ON/OFF switch to change from GRAD to DEG! Whereas radians is accessible over the keyboard with a shifted key. For whatever reason, TI must have conceded a high priority to this unit in the mid 70s.

Cheers Frido

in response to message #1 by Tim Wessman

Grads are commonly used in France for surveying and mapping. As Grad is related to metric and decimal systems, it is a very practical unit :

Right angle = 100 grads

1 grad of latitude = 100 km

You don't have to bother with minutes and seconds, it's all decimal :

decigrad = 0.1 grad, centigrad = 0.01 grad, etc...

Grad is also named Gon in some countries.

*Message #18 Posted by **db (martinez, ca.)** on 18 May 2010, 1:07 a.m.,*
in response to message #1 by Tim Wessman

when i was traveling i talked with surveyors from all over latin america, from europe and north africa, who had worked in saudi and antarctica. i had the same question and no one used grads.

i read once that the 360 deg circle / 90 deg quadrants are standard because of both nautical tradition, and that they can be divided up into so many kinds of even fractions before one needs to resort to minutes and seconds.

along with that; i can see why the compass rose is first divided into quadrants: toward and away from magnetic north, and toward sunrise or sunset. then you have half, third, ninth quadrants and half, quarter, eighth, third, sixth, twelfth, twenty-fourth, thirty-sixth, and even smaller fractions of the circle.

all those would have been useful until Precision Survey Solutions and hp50G came along.

Re: GRADs in use?

in response to message #18 by db (martinez, ca.)

We used grads for navigation up north in areas of magnetic anomalies.

Had to convert the headings back and forth based on the map and the use of a system called Omega nav.

Also shot the stars out the window of the 737 when flying in true.

Cheers, Geoff

So Geoff:

*Message #20 Posted by **db (martinez, ca.)** on 25 May 2010, 8:32 p.m.,*
in response to message #19 by geoff quickfall

Speaking of goofy measurements; what are those 1:506880 scale maps of Canada all about, When you tell me that i'll have a clue how the 1:253440 scale from other places got chosen.

BTW: How's the book coming along?

Re: So Geoff:

*Message #21 Posted by **Norris** on 26 May 2010, 6:16 p.m.,*
in response to message #20 by db (martinez, ca.)

1:506880 represents a map scale where 1 inch = 8 miles
8 mi x 5280 ft/mile x 12 in/ft = 506,880 inches

1:253440 represents a map scale where 1 inch = 4 miles
4 mi x 5280 ft/mile x 12 in/ft = 253,440 inches

In either case, the scale makes it easy to read distances off the map in miles, by using a conventional ruler marked with 1/2, 1/4, 1/8, and 1/16 inch gradations

Edited: 26 May 2010, 6:18 p.m.

Re: So Geoff:

*Message #22 Posted by **db (martinez, ca.)** on 27 May 2010, 2:10 a.m.,*
in response to message #21 by Norris

Thanks Norris. I'd rhetorically ask why i didn't notice that but someone might answer me.

That's a great idea for a country that has a lot of inch rulers floating around. We can easily do the same sort of thing here if an architect draws in 1/4, 1/2, 1/8 etc scale. So of course they use 3/8, 3/16 & 3/4 scale just to mess with us.

Re: So Geoff:

*Message #23 Posted by **Norris** on 28 May 2010, 1:15 p.m.,*
in response to message #22 by db (martinez, ca.)

The traditional use of 1:24000 scale in 7.5-minute US topographic quadrangles also assumes the use of traditional inch rulers. With this scale, 1 inch = 2000 feet, and you can readily measure distances in feet using the traditional 1/2 inch, 1/4 inch, etc. gradations.

The 15-minute quads were traditionally mapped at 1:62500, which is very close to 1:63360, or 1 inch = 1 mile. For practical purposes, you could measure distances in miles on a 1:62500 map with a traditional inch ruler. The exact 1:63360 scale has been widely used for topographic mapping in Alaska.

You know; i've used 15 minute maps a lot and must have known that, but i've always thought of it as one mile = the last joint of my index finger.

Re: So Geoff:

*Message #25 Posted by **geoff quickfall** on 1 June 2010, 10:57 p.m.,*
in response to message #20 by db (martinez, ca.)

Hello DB

just saw your posting today! I am on course for a new aircraft and it is taking my time plus I had to write a 13 page article for the next HP Solve magazine at Richards Nelsons request.

That plus my car restoration and book have meant an absence from the forum.

I used many maps, we called them sectional 8 to 1 and 4 to 1 (eight and four mile to one inch). Lots of detail on the 4 to 1 and Norris has hit the nail on the proverbial imperial head!

The book is comming along, infact almost done, although everyone here keeps posting new stuff which may or may not get included. Oh well gives me something to add to a next printing.

Got to get back to the books!

Cheers, Geoff

Re: GRADs in use?

*Message #26 Posted by **Reth** on 18 May 2010, 4:23 a.m.,*
in response to message #1 by Tim Wessman

Grads or Gon are used across whole Europe except from the former USSR and England. I for one would never buy a HP calculator not having grads back then when HP calcs were main calc tool. Grads, being decimal are a lot easier to use thus logical and modern units. Same applies to metric - imperial units comparison. Strangely enough in Australia we use DMS for angles and metres for lengths. As they do in Russia. Long story short: today HP mighth abandon grads, no one will notice as no one uses calculators for real work in surveying. If you wanna find out if grads are dead or not, go check ALL modern surveying instruments made all over the world and if you find even one, let me know. I've noticed that "the world" for many is the USA. Well it's not.

> Quote:

Pretty much my experience too. The "G" setting was always something I had to skip past when changing angle mode or converting angles on my scientifics.

Then again I have never done artillery work or surveying. I've played a bit with navigation, but that was in degrees, and in electronic engineering work it is almost always in radians.

Grads are very much in use. They have been standard in surveying in most of Europe for about 100 years, in France for more than 200 years! Degrees mostly in astronomy and navigation.

Re: GRADs in use?

in response to message #28 by John Mosand

I am a bit surprised with some of the responses to GRADS.

From a practical point of view the GRAD system is far superior to any other syetem. 100 degrees to a right angle, then decimal degrees. A complete decimal system, very simple to use.

When you write a surveying program using the degree syetem, the most common bug is to forget either to decimalize the degrees or do the reverse process.

Years ago I taught surveying to builders. They had access to simple scientific calculators. One of the hardest parts of the course was to teach them conversion of degrees minutes and seconds into decimal degrees and the reverse. This is when I realised how backward our system was.

I come from a generation who were taught the imperial system at school and were used to strange units. The modern generation brought up on the decimal system find it difficult when using say miles, chains, feet and inches.

In Australia we had the option of changing to GRADS when we changed to the metric system, unfortunately the old surveyors who made the decision at the time could see no good reson for doing so. There are a heep of builders out there who could tell them that they made the wrong decision.

The problem is not forgeting to do this, but having to do it, which would take up precious memory space in low-memory calculators (not a concern anymore). The first version of this program was written for a land surveyor friend on his 4KB RAM CASIO PB-700 (which was later upgraded to amazing 16KB!). A GRAD mode was available (ANGLE 2), but I think no one uses GRADS here.

*Message #32 Posted by **Andrés C. Rodríguez (Argentina)** on 18 May 2010, 10:33 a.m.,*
in response to message #1 by Tim Wessman

If you need to model a bouncing ball (or body), moving in a (0,0 - 100,100) box, and bouncing at the edges, the sequence

```
GRAD
COS
ACOS
SIN
ASIN
```

is very handy to manage boundaries and so obtain the proper coordinates for the next position.

Best regards,

HP35s Stopping a program, help!

*Message #1 Posted by **Pablo P (Spain)** on 17 May 2010, 9:40 a.m.*

I was developing a program to calculate preferred values of resistors. After typing the program I executed it as normal. The problem is that it has entered in a loop and I cannot stop it even pressing R/S.

I have a lot of programs in this calculator and I do not want to lose them doing a reset. ¿Any suggestions?

Re: HP35s Stopping a program, help!

*Message #2 Posted by **Bart (UK)** on 17 May 2010, 10:16 a.m.,*
in response to message #1 by Pablo P (Spain)

Unfortunately you may have to do a reset or pull the battries. In any event it is very likely to lead to "MEMORY CLEAR".

See the HP-35S bug list, number 16.

I have had this happen to me and now make sure I have typed copies of all my programs. It will still take many hours to re-enter them though.

Edited: 17 May 2010, 10:33 a.m.

From the thread quoted by Gerson:

> Quote:
>
> The danger posed by the above, which is what happened to me, is that, if this aberrant behaviour occurs whilst test-running a program for debugging, and an error in the program code causes the processor to enter an endless loop, then you are completely stuffed. Nothing but nothing will interrupt it, short of paper-clip-resetting in the hole at the back, and this wipes all of the work, in all programs. Memory cleared.

This has been my experience. Sorry for the bad news.

Re: HP35s Stopping a program, help!

*Message #5 Posted by **Maarten Ambaum (Reading, UK)** on 17 May 2010, 12:05 p.m.,*

Same here; thankfully this happened before I had too many programs in memory. I did lose a substantial equation list which was more annoying to me.

Surely this must be one of the most serious 35s bugs....

Re: HP35s Stopping a program, help!

*Message #6 Posted by **Pablo P (Spain)** on 17 May 2010, 8:03 p.m.,*
in response to message #1 by Pablo P (Spain)

"Bug number 16: Some programs cannot be interrupted."

Oh! Surprise! Now, I know this horrible bug. I had to reset the calculator and consequently I lost all my programs. I have a hard copy of them (except last programs) but due to the lack of I/O I have to type them again and so I will lose a lot of time.

The next time I will check all my programs before executing them but anyway I think that this bug makes this calculator very untrustworthy. This is unacceptable in a modern calculator. Do you agree?

If anyone is interested my hp35s is a recent model with CNA 850.....

Lack of I/O is another gripe for many users, but HP probably did this to make it acceptable for use in certain exams.

I spent several days re-typing in my programs (total ~15k).

> Quote:
>
> This is unacceptable in a modern calculator.

Yes, this bug list has been out for almost 3 years now, although some issues were added more recently. However, if HP had bothered to implement a fix say a year ago (when most issues including this one were known), it probably would be in the current units on sale. Even if they did not offer an update/exchange, I think that many would be willing to purchase a fixed unit.

*Message #14 Posted by **bill platt** on 18 May 2010, 11:26 a.m.,*
in response to message #1 by Pablo P (Spain)

I just thought of something stupid.

Better to have two 35s machines. You would test and debug programs on one machine--and then you can save that program on the other machine.

Or you just buy another machine every time you come up with another big program that might crash...seems to get expensive.....

If I were a rich man, Ya ha deedle deedle, bubba bubba deedle deedle dum.

Hehe, it is not a bad idea but it is cheaper to carefully review you program before running it...

Re: HP35s Stopping a program, help!

*Message #16 Posted by **bill platt** on 18 May 2010, 12:18 p.m.,*
in response to message #15 by Pablo P (Spain)

Hi Pablo,

You are probably a much better programmer than I ever was. When it comes to debugging, whether it is on an RPN classic, or Pascal, back in university, I always find out that I missed something...until I actually run it, I don't know for sure...this always seems to get me when there is logical branching. (The "do while true" versus "repeat..until" comes to mind...)

How about zero 35s machines? There are other calculator vendors out there.

I never thought I'd see the day when I would recommend TI to anyone, but here it is. This bug is appalling. The worst thing an information device can do is lose data. In a machine that can't be backed up, the fault is unforgivable.

I don't blame the developer for the bug - bugs happen. I do question the QA that allowed this bug to slip through, but again, that's not unexpected. I blame HP for allowing that flaw to remain in current production models. I realize that HP's budget for the calculator business is thin. It must also be the case that this bug bites infrequently, or they never would have neglected it this long. But allowing such a fatal flaw to stay on a production machine over multiple years is a travesty. It shows the futility of trying to produce a quality calculator at HP, as Sam Kim tried to do. It saddens me because the 35s seemed to incorporate a lot of the values this community championed for years. But this bug gives the lie to all that. Data integrity is the first hurdle a machine must surmount in the race to quality. Unfortunately, HP stumbled out of the gate on that one.

Regards,
Howard

Needed - a little help with my HP-19BII

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 15 May 2010, 9:40 p.m.*

Earlier this year I purchased a 19BII which came with a manual and I decided to try to use it in algebraic mode. Of course, what I soon found is that the algebraic mode isn't algebraic at all but operates in what I have always called adding machine arithmetic; i.e, without the old "my dear aunt Sally" precedence. I knew that machines developed for the business community have often been mechanized that way for some reason. Page 120 of the Fifth Edition of Wlodek's book explains that by saying that the HP business models "... all work without precedence, assuming that business users do not bother with fancy ideas like this.", i.e., with precedence. Most of the TI business models also operate without algebraic precedence where the exception that I am most familiar with is the old MBA.

But then I discovered that the sequence

5 + 3 y^x 2 =

yielded 64, not the value of 14 that I expected. That occurs because the y^x function causes the 5 + 3 to be executed. So I ask, "Why do they do it that way?"

Re: Needed - a little help with my HP-19BII

*Message #2 Posted by **Martin Pinckney** on 15 May 2010, 9:53 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

>
> So I ask, "Why do they do it that way?"

We've had some discussions about this in the past. I maintain that the idea expressed above, that algebraic precedence is somehow a "fancy idea", is nonsense. Do business users not go to high school? This is just basic math! In other words, the calculator models that work like this are just giving incorrect results, IMO.

I agree!!!! (N.T.)

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 15 May 2010, 9:54 p.m.,*

in response to message #2 by Martin Pinckney

> Quote:
>
> ... the calculator models that work like this are just giving incorrect results, IMO.

That is not at all true! All the user has to do is to understand how his machine works, whichis also true of RPN and Algebraic.

But I admit that I may not have framed my question appropriately. It is generally understood that many of the machines targetted for business users are mechanized without precedence since that is how the old mechanical desktops worked and many business users are comfortable with that. What surprised me was that the y^x function operates at the same level as the four arithmetic operators and I wondered why.

Re: Needed - a little help with my HP-19BII

*Message #5 Posted by **Martin Pinckney** on 16 May 2010, 9:49 p.m.,*
in response to message #4 by Palmer O. Hanson, Jr.

> Quote:

> All the user has to do is to understand how his machine works, which is also true of RPN and Algebraic.

Of course I understand this. I did not mean to say the machine is malfunctioning, but I still say it is giving wrong answers! Luiz stated what I believe about this very well, with his test example. I still maintain that algebraic precedence is a universal standard that applies to business math the same as other disciplines.

Re: Needed - a little help with my HP-19BII

*Message #6 Posted by **Palmer O. Hanson, Jr.** on 16 May 2010, 10:02 p.m.,*
in response to message #5 by Martin Pinckney

> Quote:
>
> I still maintain that algebraic precedence is a universal standard that applies to business math the same as other disciplines.

Algebraic precedence does apply to to business math the same as other disciplines when it comes to writing equations on paper. But it doesn't apply to the way many business people expect calculators to work. The proof of my statement is the "algebraic" methodology -- really adding machine arithmetic -- which is used whereever "algebraic" is offered as an option in business calculators manufactured by HP.

Re: Needed - a little help with my HP-19BII

*Message #7 Posted by **Martin Pinckney** on 16 May 2010, 10:37 p.m.,*
in response to message #6 by Palmer O. Hanson, Jr.

I guess we will just not agree on this. I do understand your point:

> Quote:
>
> Algebraic precedence does apply to to business math the same as other disciplines

> when it comes to writing equations on paper. But it doesn't apply to the way many business people expect calculators to work.

To this I respond with a paraphrase of your own question: So I ask, "Why do businessmen expect it that way?" Your answer seems to be that it's because adding machines used to work that way. So we are going to perpetuate incorrect math operations forever, just because early machines were too simple mechanically to do it correctly?

Re: Needed - a little help with my HP-19BII

*Message #8 Posted by **bill platt** on 17 May 2010, 2:42 a.m.,*
in response to message #7 by Martin Pinckney

Yep. Another example: the cheap "4 function" calculators all have a weird chain arithmetic system built-in. And they too have no parenthesis. Try essentially any of them, and they have the weird chain arithmetic. So it isn't merely business ones that are screwy.

I'm sure we can find other examples of unneeded "backwards compatibility" in other (perhaps non-computing) products...I just can't think of any...

Re: Needed - a little help with my HP-19BII

*Message #9 Posted by **Palmer O. Hanson, Jr.** on 17 May 2010, 4:12 a.m.,*
in response to message #7 by Martin Pinckney

> Quote:
>
> So we are going to perpetuate incorrect math operations forever, just because early machines were too simple mechanically to do it correctly?

Yes. We will continue to see "algebraic" without precedence in business machines as long as the gods at HP and TI and whereever else continue to believe, whether it's actually true or not, that business users aren't comfortable with precedence. That's business.

Re: Needed - a little help with my HP-19BII

*Message #10 Posted by **David Hayden** on 16 May 2010, 8:16 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

It sounds to me like they're just being consistent. If the calculator doesn't honor precedence rules then it should do so consistently. I assume that if you enter 5+3*2 you get 16.

It's probably a hold over from the old (REALLY old) mechanical adding machines where there was no precedence. Business people got used to it and stuck. One could also argue that it's an easier to remember rule, I suppose.

Re: Needed - a little help with my HP-19BII

*Message #11 Posted by **Bart (UK)** on 16 May 2010, 12:16 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Nowadays HP call it "chain calculation" mode I think. I actually have a business friend that WANTS it to work that way. His words "If I want to sell a pack of 10 units and a pack of 5 units at £5 per unit, I want to do 10+5*5= and get 75, not 35". This may be more linked to habit as until recently he had a '70s Sanyo without

"operator precedence".

Moral of the story: use RPN - no such confusion :)

Edited: 16 May 2010, 12:18 p.m.

in response to message #12 by Thomas Radtke

> Quote:
>
> Try "1 Enter 2 Enter +" on a 32S and on a 20b in RPN mode. Confused? ;-).

Yes, I am. Can someone explain why they work this way? "1 Enter 2 +" gives the expected answer, but "1 Enter 2 Enter +" does not. At least I would expect the operator to act on the last two stack entries, but instead it acts on the last stack entry twice!

Re: Needed - a little help with my HP-19BII

*Message #14 Posted by **Don Shepherd** on 17 May 2010, 1:25 p.m.,*
in response to message #13 by Martin Pinckney

Yes, the 20b (and 30b, BTW) work this way. The 20b/30b are hybrid RPL/RPN, and this behavior is RPL-ish, I am told. If you ever plan to write programs for the 30b (assuming you can actually buy the 30b one day; it was released in January but has not been available for purchase for months now), you need to be aware of this non-RPN behavior.

Re: Needed - a little help with my HP-19BII

*Message #15 Posted by **Thomas Radtke** on 17 May 2010, 1:42 p.m.,*
in response to message #13 by Martin Pinckney

Very simple: As Don said, the 20b acts partially like a RPL calculator which has an extra register for entering numbers where earlier RPN calculators don't, so you had to enter numbers directly into the x register.

I bet, if memory wouldn't have been an issue in terms of cost in the early 70th, the 35 would have become an algebraic or RPL calculator.

Edited: 17 May 2010, 1:44 p.m.

Re: Needed - a little help with my HP-19BII

*Message #16 Posted by **Martin Pinckney** on 17 May 2010, 3:50 p.m.,*
in response to message #15 by Thomas Radtke

No, you've got it backwards. (Unless I am missing something). My 32sii gives 4 as a result to this simple problem; my 48sx give 3, the expected answer.

RPN or RPL ?

*Message #17 Posted by **Gene Wright** on 17 May 2010, 4:33 p.m.,*
in response to message #16 by Martin Pinckney

The question hinges on whether you think in RPL or RPN.

RPL requires an ENTER to terminate a command line input.

So, 1 ENTER 2 ENTER + gives 3 since the ENTER only terminates the command line and does not specifically DUP the stack. Note: the RPL machines do an implied ENTER before an arithmetic operator so that if you actually type 1 ENTER 2 + you still get 3.

On **pure** RPN machines, ENTER terminates DIGIT entry AND pushes the stack.

So 1 ENTER 2 ENTER + gives 4 on those machines.

Issue with the 20b / 30b is that they are a hybrid.

A command line approach has been placed upon the old 4-level RPN stack.

ENTER after a number entry does NOT push the number into stack level 2 aka Y.

So, you now have 3 options.

Original RPN

Original RPL

The RPN / RPL hybrid.

Re: RPN or RPL ?

*Message #18 Posted by **Martin Pinckney** on 17 May 2010, 4:48 p.m.,*
in response to message #17 by Gene Wright

Gene, thanks for the explanation. I think I actually understand it, mostly.

Only one piece of information I lack: the result from 20b/30b. Knowing this should help me understand the difference in how the hybrids function.

Re: RPN or RPL ?

*Message #19 Posted by **Gene Wright** on 17 May 2010, 5:52 p.m.,*
in response to message #18 by Martin Pinckney

The 20b / 30b works more like the RPL.

1 ENTER 2 ENTER + returns 3, not 4 as on "pure" RPN machines.

1 ENTER 2 + returns 3.

Re: RPN or RPL ?

*Message #20 Posted by **Martin Pinckney** on 17 May 2010, 6:45 p.m.,*
in response to message #19 by Gene Wright

Well, then, as an RPN "outsider" (or better to say an ALG user), I have to conclude that I like the RPL and hybrid designs better than RPN. Just makes more sense to me.

BTW, I think what you call "pure" RPN isn't pure at all, at least not pure postfix. STO, RCL, and XEQ come to mind. Just as traditional ALG isn't pure infix. RPL, on the other hand, is pure postfix (48 series), or pure infix (38G), at least as far as I can tell.

>
> Well, then, as an RPN "outsider" (or better to say an ALG user), I have to conclude that I like the RPL and hybrid designs better than RPN. Just makes more sense to me.

I started using HPs with the 28S, which is RPL. It also has the advantage of an "unlimited" stack (as memory allows), thus no "dropping off the top" of arguments.

Re: Needed - a little help with my HP-19BII

in response to message #16 by Martin Pinckney

What you expect is a result of what you know ;-). If you know RPN, you expect 4. 1 ist entered to x, "Enter" shifts it up to y (and y to z and so on), but keeping x (it's not a rotation). "2" is entered, overwriting 1. Same procedure after the second Enter, so in the end, both x and y registers contain 2, z contains 1. That's how RPN always worked and a result of x being used as entry register. On RPL machines, entries are written to a temporary register unless Enter is pressed. Now, if you press e.g. a binary operator before finishing an entry, the content of this temp register is copied to whatever the stack pointer points at. In contrast to RPN, RPL uses a clutch to show some convenience. It absolutely needs an Enter after each entry, and does it itself when the user refuses to do so.

RPN is very straightforward.

Can't argue with the first statement above. I did not "cut my teeth" on RPN, as most of you have, nor do I use it very often.

Regarding the second statement, though, my thinking is evolving. When I first started using my 48sx, I found it very confusing to use. The more I use it, the more consistent I find its construct to be, albeit in some respects not particularly intuitive.

*Message #24 Posted by **Bart (UK)** on 17 May 2010, 6:58 p.m.,*
in response to message #12 by Thomas Radtke

Ah, yes, I forgot about the RPN/RPL difference. Interesting that the 20b has RPL behaviour. I started my "HP life" with the 28S, thus RPL. I had to get used to "stack lift" when I purchased the 35s :)

Soooo....

Math may be an exact science (in which case I think ALL of us here, and in every math class on earth,

would give the answer 14 to Palmer's expression), but making calculators is clearly not!

Re: Soooo....

Here is a quotation from TI's old *The Great International Math On Keys Book* published back in 1976:

> Quote:
>
> Mathematics is a science which is persnickety about some things. One of them is it never permits two different answers to the same series of computations. Because of this requirement -- one solution for any computation -- mathematicians have established a set of accepted (and universal) rules when mixed operations are in one calculation. For example, the problem
>
> 3 + 10 - 2 x 14 / 7 = ?
>
> has only one answer! (Know what it is? It's 9.)
>
> ... Not all calculators will do this. ...

We all know the HP position on the use of RPN, namely that it's use avoids confusion.

If HP and TI and Casio as well take such strong positions on the right way to do things then the obvious question is "Why are they making calculators which use adding machine arithmetic?"

The answer is simple. Mathematics may be an exact science, but making and selling calculators is a BUSINESS.

While I am on the subject a recent thread told me that the latest version of the HP-12C (the C++ is it?) has an algebraic option. Can anyone tell me if the algebraic option uses algebraic precedence or does it use adding machine arithmetic.

Palmer

Palmer, I don't think it's the 12c+, but the 12c Platinum, and 12c Platinum 25th Anniversary Edition, that have the algebraic mode. That said, although I did own one for a short time, I cannot remember how the ALG mode worked.

Seeing Bill Platt's post, I went to Finseth's site. He states:

> Quote:
>
> Algebraic mode has no precedence. It also has no parentheses.

While the original Platinum (all silver) did not have parentheses, the latest version (Silver and black) and the 25th Anniversary Edition, do have them.

Allow me (again), please?

*Message #30 Posted by **Vieira, Luiz C. (Brazil)** on 17 May 2010, 12:02 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Hi, all.

Back in the 80´s, when I started dealing with computers, it took me a willing to know about the history of these tricky machines. I was just an electrical engineer student, and at that time, under military government (final years), Brazilian educational system was 'shacked' by new paradigms and engineers were not exactly encouraged to go beyond their own Cartesian thoughts. I failed to do so and went ahead studying whatever I could.

I clearly remember searching for computers' design timeline and reading about Blaise Pascal and his contributions in the field. Something in particular called my attention and I quote Wikipedia by helping me with the historical fact:

> Quote:
>
> In 1642, in an effort to ease his father's endless, exhausting calculations, and recalculations, of taxes owed and paid, Pascal, not yet nineteen, constructed a mechanical calculator capable of addition and subtraction, called Pascal's calculator or the Pascaline.

In an effort of helping his father with taxes figures and calculations, Pascal constructed a mechanical addition/subtraction calculator. If I remember it well, I red that the Pascaline was the first desktop calculator ever, and it was designed and built for... financial calculations!

Cannot say anything about Pascaline precedence because it provided only addition and subtraction, but if the above mentioned facts are correct, businessmen may actually care less for precedence for their first calculator did not provide it.

What do we know...

Luiz (Brazil... and still without answers)

Re: Needed - a little help with my HP-19BII

*Message #31 Posted by **Steve Perkins** on 18 May 2010, 12:36 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Historically, a reason that traditional RPN worked as stated was apparently to allow simple squaring or doubling of a value in the X register.

```
3 ENTER *
   or
3 ENTER +  (less keystrokes than 3 ENTER 2 *)
```

The HP-35 and HP-80 didn't even provide an X^2 key!

The paradigm survived in subsequent RPN machines. Pressing ENTER pushed the stack, but left a temporary copy of the X register still in X for convenience (and because something had to be there).

If the user started entering digits, the temporary value was overwritten. If they executed an operation it was utilized.

Where can I find vintage Sharp and Casio calcs in Tokyo?

*Message #1 Posted by **Egan Ford** on 15 May 2010, 9:33 p.m.*

Any hints? Any electronic swap meets or flea markets? Akihabara is already on the agenda, but my past experience with Akihabara is that it is a mega Fry's. I.e. new stuff, no vintage. Perhaps I was looking in the wrong places.

Thanks.

P.S. looking specifically for Z1GR, AI1000, and PC-G850V. Cheap of course. I wouldn't mind spotting any HP's as well or an MK-90.

in response to message #1 by Egan Ford

Try to get a Z-1GRA or FX-890P, because these pockets have a much better LCD contrast compared to the Z-1 or Z-1GR.

Probably you can find a PC-G850VS at Akihabara. It's the successor of the PC-G850V with flash ROM instead of mask ROM.

If you cannot find an AI-1000, there is an excellent emulator available here: AI-1000/PB-2000C Emulator

They're only available used, and are generally fantastically expensive (typically anywhere from $150 to $600 and beyond). I spent over a year trying to find one (after passing on a NIB example located in the States and offered on eBay for a BuyItNow price of $199) and it was tough going. I located MIB examples from India for $1300 and good examples with the FA-6 interface for $60 (but could never get the seller to correspond with me). Finally bought one from France for $275 (shipping included).

Before I found my examle, I'd steeled myself to go through a broker and buy via Yahoo! Japan Auctions. Purchase price would have been cheaper, I proabably could have gotten a more "mint" example, but after adding all the fees, I think it would have been about the same price or more and would have taken a very long time as well, as the supply seemed to dry up around the New Year. Last fall there were three or four a week on offer. I've seen perhaps three in the past five months.

Here's a link to a few NIB examples based in the US: http://www.a2zitems.com/ The seller also sells on eBay (though nothing at the moment). Last one he sold went for $336. Last one was offered at a reserve of $199/BuyItNow price of $350, but it didn't sell: http://cgi.ebay.com/Vintage-Calculator-Casio-FX-603P-Box-RARE-/140406312631?cmd=ViewItem&pt=Calculators&hash=item20b0de4eb7

Re: Where can I find vintage Sharp and Casio calcs in Tokyo?

*Message #14 Posted by **Philippe Lasnier** on 17 May 2010, 8:55 a.m.,*
in response to message #1 by Egan Ford

Hi Egan,

I think Akihabara is still to place to go, but I would head for the back streets where myriads of small shops deal in the second-hand market. Sofmap is a company that aggregated a lot of the independant shops that used to be there, so don't be surprised if you find a Sofmap shop next to...another, different, Sofmap shop.

I was there in January, getting Sharp Zaurus PDAs.

One major problem though is finding what you're looking for. I've heard that each small shop specialises somewhat, so finding the one e.g. that has pre-1990 Casios, might be difficult, especially if your Japanese is not fluent. Maybe web searches next to your favourite translator (if my case, my wife) would help.

Happy hunting!

Philippe

Re: Where can I find vintage Sharp and Casio calcs in Tokyo?

*Message #15 Posted by **Lyuka** on 17 May 2010, 4:31 p.m.,*
in response to message #1 by Egan Ford

PC-G850V is made and sold for educational institution, therefore it's not possible to buy it in the shop in Akihabara.
You might be able to find PC-G850V/VS at Takezen K.K. in Ryogoku Tokyo. (Ryogoku is the second station in Soubu Line from Akihabara)

Address: Takezen Bldg. 1F. 1-4-6 Ryogoku Sumida-Ku, Tokyo 130-0026 JAPAN
Phone: +81 3-3631-1054
Email: takezen (at) mud (dot) biglobe (dot) ne (do) jp

Good luck!

Re: Where can I find vintage Sharp and Casio calcs in Tokyo?

*Message #16 Posted by **Egan Ford** on 28 May 2010, 2:48 a.m.,*
in response to message #1 by Egan Ford

Thanks for all your suggestions. I just returned from Tokyo, empty-handed--from a calc point of view. But it was still fun looking.

Notes:

Akihabara really has not changed since the last time I was there 6 years ago (the Halal carts were new, but no match for NYC's 53rd and 6th Halal Cart :-). It does not matter what you are looking for, but you will tire from looking at the same old things that others also sell. Finding the 'right stuff' is a test of endurance or connections, e.g. in 2004 I was looking for a good price on a C-860 (Zaurus) and only got a good price because a local friend and colleague helped me out. BTW, I still have all my Zaurus calc emulator ports available here: http://sense.net/zc/.

That all said, I didn't leave Akihabara (Akiba) totally empty-handed. Vintage computer and video games are still a hobby too and I did find a great vintage video game shop not far from the train station. The prices were equal to or less than eBay.

Lyuka, thanks for the tip, but I only made it to Ryogoku for Sumo. This two week trip was my kids high school graduation present. Her agenda was packed and we didn't have time to go back to Ryogoku.

Lastly, I've come to the reoccurring realization that I have too many interests. I think for the short and long term that I'll just stick to HP calcs, the Apple II, and vintage coin-ops (video games). After family and work of course.

Thanks again.

HP 97 card reader clutch shaft repair

*Message #1 Posted by **Ed Sowell** on 15 May 2010, 5:09 p.m.*

The first time I reassembled my clutch (using the silicone sealant repair method) I seated the worm shaft firmly against the end of the motor shaft. When I mounted it in the frame I noticed the tip of the worm clutch only barely engages its pivot hole in the frame. I have dissambled it, planning on pushing the work shaft not quite as far onto the motor shaft, making it engage the pivot hole by perhaps 0.025" more.

However, I'm now thinking maybe this is not necessary. I've noticed that there is about 0.010-0.015" endplay in the motor shaft, and since the motor turns counter-clockwise and the worm has a Right Hand thread the shaft assembly will be driven forward, pushing the tip deeper into the pivot hole.

Any thoughts on this?

Ed

Re: HP 97 card reader clutch shaft repair

*Message #2 Posted by **geoff quickfall** on 15 May 2010, 5:36 p.m.,*
in response to message #1 by Ed Sowell

I have never done the repair this way as I favour the insulation method.

Remember that there is a ball bearing at the tip end of the worm gear. This will cause end shake if it is missing, it is tiny!

Some questions:

How do you centre the shaft with the silicon method. The wobble of an off centred system would cause a lot of vibration. After all this is a dampening couple and not a clutch.

I take it you have not swapped parts from another calculator system as for example, the HP 42 card reader assembly (looks identical) is not the same length as the HP 65 system:

```
HP-65           drive roller axle:      8.32mm
HP-41C          drive roller axle:      8.23mm
HP-65           worm gear length:       14.43mm
HP-41C          worm gear length:       14.36mm
```

As far as end shake goes, all my systems have been very close to a tight fit and the bearing acts as it should. That is there has been no endshake. Having said that, other then vibration I don't see a problem with some other than noise.

Cheers, Geoff

Quote:

> I have never done the repair this way as I favour the insulation method.

I pursued the insulation method for a while but abandoned it because I couldn't find a suitable piece of insulation. It seems to me that a size that gives a good fit on the motor will be too tight on the worm shaft. Also, I wanted to fit the aluminum sleeve over it, but that would leave a very thin wall over the worm shaft.

> Quote:
>
> Remember that there is a ball bearing at the tip end of the worm gear. This will cause end shake if it is missing, it is tiny!

I've noticed that. On mine it seems to be peened in on the opposite side of the frame so did not fall out.

> Quote:
>
> How do you centre the shaft with the silicon method. The wobble of an off centred system would cause a lot of vibration. After all this is a dampening couple and not a clutch.

When I did it the first time I followed advice given in previous posts by others: let it harded a few minutes then push it around a bit till it looks OK. All this is done with the motor vertical with the shaft up.

This time I am going to try to put the motor/worm shaft assembly into the frame after the silicone has hardened a bit. I think this will allow better centering, at least for the worm shaft, since it will be in its pivot hole at one end and on the motor shaft at the other. The only thing that can be off center is the sleeve, and that can be minimized by pushing it around a bit with a small screwdriver to get the gap between the sleeve in the frame hole even all around. Also, I will be able to get a better axial fit.

At this point I am very encouraged by the silicone method. It is really not very difficult. My desktop bench vice makes it a lot easier. For example, the frame can be held in any position you want while fiddling with the motor and worm gear. Also, I squeeze the silicone directly into the sleeve using the smallest possible cut on the silicone nozzle. Not messy at all that way.

> Quote:
>
> I take it you have not swapped parts from another calculator system as for example, the HP 42 card reader assembly (looks identical) is not the same length as the HP 65 system:

Nope. So far, I've found everything I've lost. Even that tiny nylon washer! (BTW, what's it for?)

> Quote:
>
> As far as end shake goes, all my systems have been very close to a tight fit and the bearing acts as it should. That is there has been no endshake. Having said that, other then vibration I don't see a problem with some other than noise.

So maybe the bearings in my motor are worn out?

Thanks for your help. I'm in no hurry with this project so it may be a while, but I'll report back with lots of photos when I'm finished.

Ed

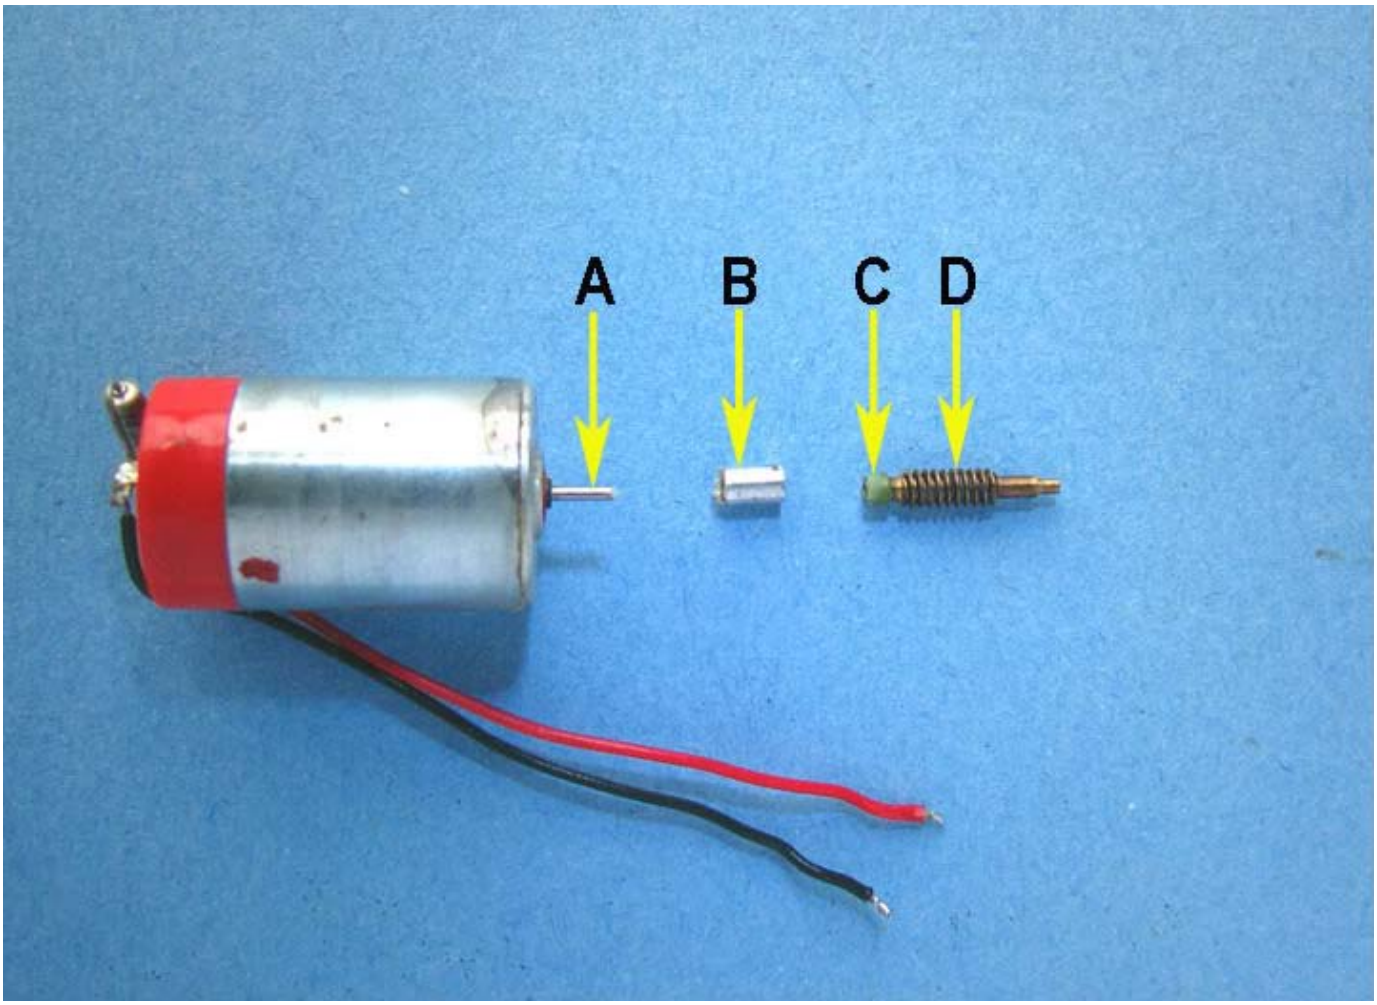
Hello Ed

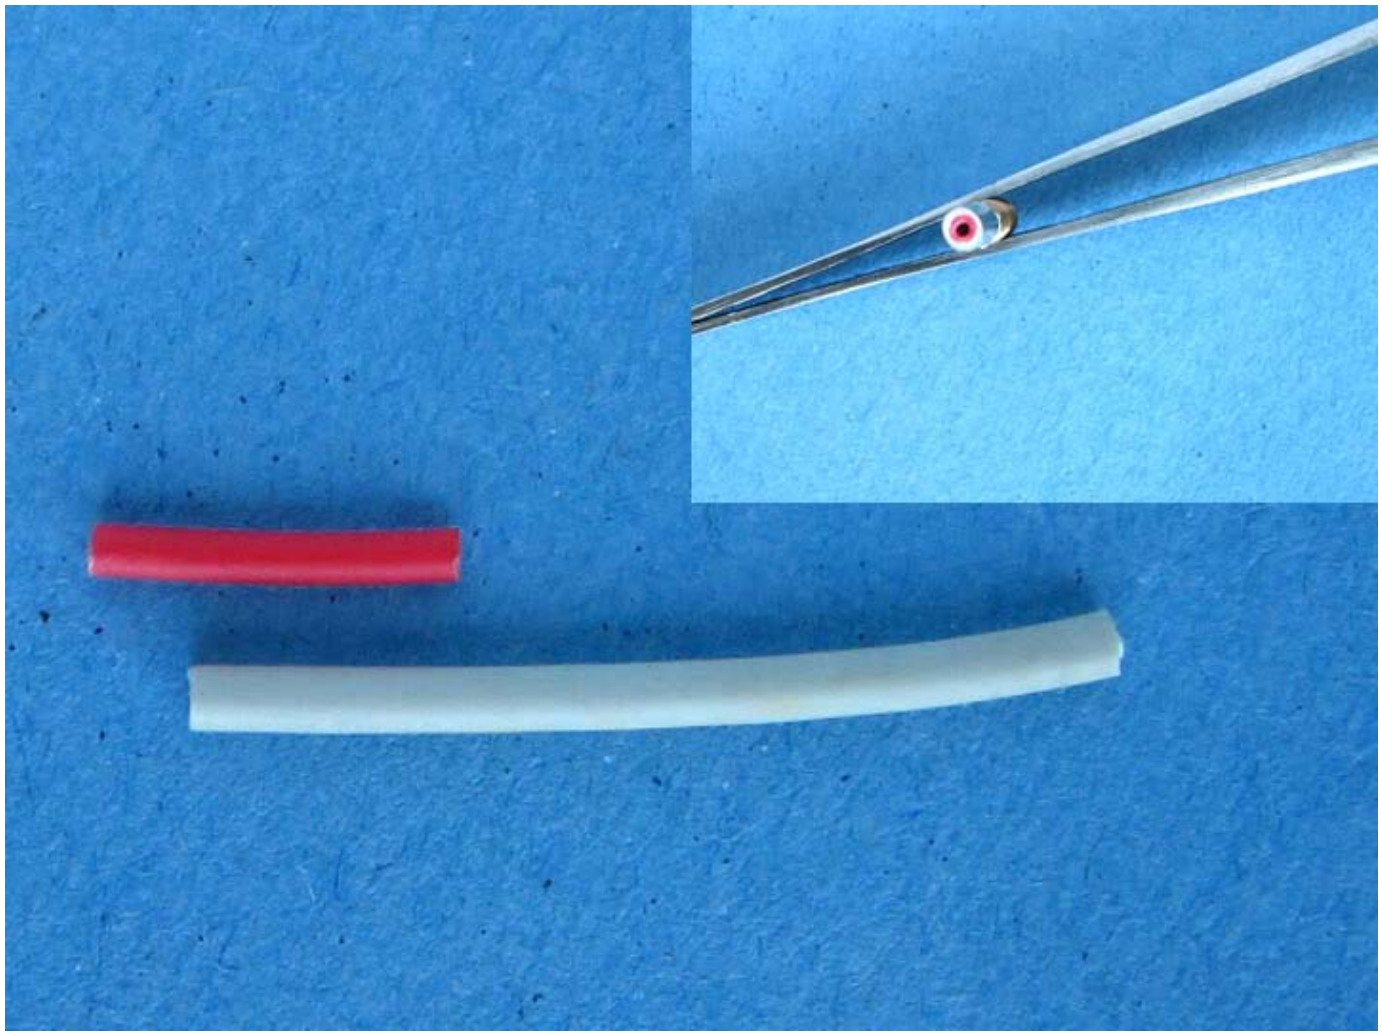
> Quote:
>
> I pursued the insulation method for a while but abandoned it because I couldn't find a suitable piece of insulation. It seems to me that a size that gives a good fit on the motor will be too tight on the worm shaft. Also, I wanted to fit the aluminum sleeve over it, but that would leave a very thin wall over the worm shaft.

Thats why I use the double insulation method:

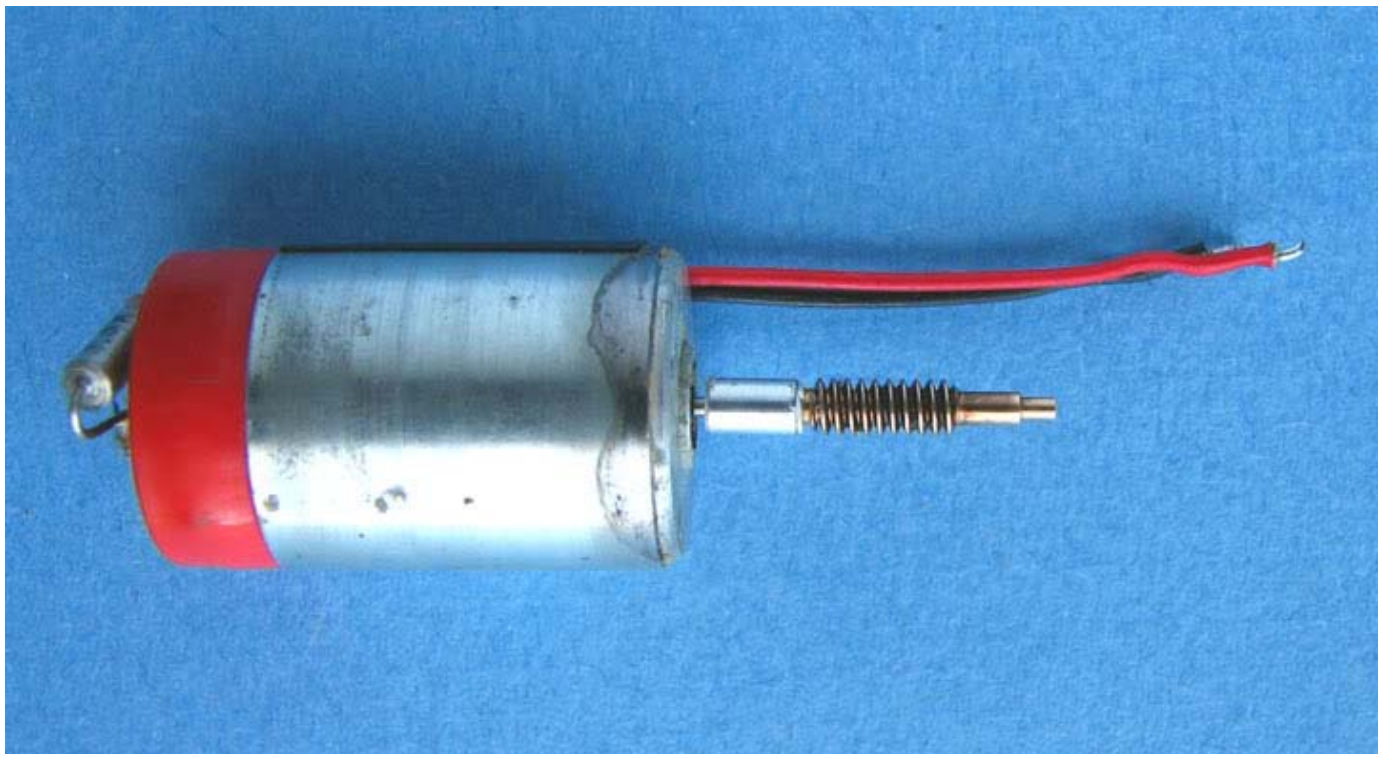
Diassemble:



Fabricate new couple with two insulations; narrow and wider inner diameters:



Reassemble:



Quote:

> I've noticed that. On mine it seems to be peened in on the opposite side of the frame so did not fall out.

Some are and some are not, probably due to some plastic frame deterioration. I have had them fall out and resorted to epoxing them back.

> Quote:
>
> So maybe the bearings in my motor are worn out?

Could be, how much end shake when you pull and push on the axle. They can be pushed to hard in their internal mounts, for example, when trying to fit a to tight new couple and sleeve into place.

Cheers, Geoff

> Could be, how much end shake when you pull and push on the axle. They can be pushed to hard in their internal mounts, for example, when trying to fit a to tight new couple and sleeve into place.

When I gently pull the shaft out as far as it will go and holding feeler gauges up next to it I judge it to be 0.010" endplay.

I'm going to try to make the worm shaft extend far enough so as to give about 0.030" pivot engagement when the motor shaft endplay is taken out towards the motor. Thus when the motor is on it will engage 0.040".

Re: HP 97 card reader clutch shaft repair

*Message #6 Posted by **Ed Sowell** on 18 May 2010, 1:03 p.m.,*
in response to message #4 by geoff quickfall

I believe I've seen your photos before. My problem was I couldn't find a wire with insulation like your white piece. It seems that its ID would have to be nice tight fit over the worm shaft, while at the same time it would have to be not so small that it wouldn't slip over the red one. In addition, the OD would have to slip into teh aluminum sleeve. I spent a lot of time looking over the wire selection at a local, well stocked electronics store with no luck. That's when I began looking at the silicone approach, although your insulation method looks easier.

Ed

Electronic design - 1978 - calculators article

*Message #1 Posted by **Didier Lachieze** on 15 May 2010, 10:09 a.m.*

Hello, I'm looking for an article about programmable scientific calculators including HP 67/87 as well as TI 58/59 and others, published in 1978 in Electronic design, Volume 26, Issues 1-7. I'm sorry I don't have much details about it. If someone can found this article and scan it for me that would be great!

on the trail of the 12c+

*Message #1 Posted by **hugh steers** on 15 May 2010, 7:47 a.m.*

Hi,

I want one of the new ARM based 12c+ models. Amazon have a reasonable price. does anyone know if they're shipping the new one by now (in UK).

thanks, -- hugh.

Re: on the trail of the 12c+

*Message #2 Posted by **Gerardo Rincon** on 15 May 2010, 6:22 p.m.,*
in response to message #1 by hugh steers

How can one knows it is an HP 12C+? vs. just a 12C?

Are they being labeled as 12c+?

Re: on the trail of the 12c+

in response to message #2 by Gerardo Rincon

> Quote:
>
> Are they being labeled as 12c+?

No, the package looks the same. You can tell from the width of the battery door (visible from the shrinkwrap). The old 12c has a small battery door (about one inch) and the new 12c+ has a much wider door (about 2.5 inches).

Re: on the trail of the 12c+

*Message #4 Posted by **Joe Burwell** on 16 May 2010, 8:14 a.m.,*
in response to message #3 by Don Shepherd

Yes they have started to use new packaging. The mostly black package that you see on other new HP models instead of the mostly white package. I have found them in both packages at Office Max stores.

Based on the serial number, models made this year are in the new package. The models they were making in 2008 (and 2009 I would guess) are in the old package.

Joe

*Message #5 Posted by **tony (nz)** on 17 May 2010, 8:20 p.m.,*
in response to message #4 by Joe Burwell

That's very interesting! I wonder if the 2010 12c+ has the new firmware to make the keycodes stay visible when single-stepping a program? That's all I really miss, the speed of the new one is amazing - going back to the slow one I notice the pauses.

in response to message #5 by tony (nz)

I suspect it would be hard to tell if a given unit has this fix. I would think that Cyrille would send the .bin file to anyone who had a unit without the fix. Of course, that person would need the special cable too.

42s upgrade

*Message #1 Posted by **Paul Dale** on 15 May 2010, 2:46 a.m.*

Just did a RAM upgrade on my 42s and a clock speed double. Now it doesn't work :-(

It worked for a time but the '5' key produced '5' CHS and the '6' key produced '6' EEX. The multiplication key did a CLx. A bit more fiddling and now nothing works :-(

I don't know if I cooked the RAM or not. I've check continuity everywhere and nothing seems out of place. Will see if I know anyone who'll replace the RAM properly.

Pauli

Re: 42s upgrade

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 15 May 2010, 5:23 a.m.,*
in response to message #1 by Paul Dale

Hi, Paul;

have you checked the RAM chip for, say, compatibility and power consumption? I remember finding specs about some C-MOS 32K-RAM IC's that were not exactly low-power. All I remember (after upgrading some HP42S, cannot recall the actual figures) is that any 32K-RAM from HP48S/48G would work fine.

Success!

Luiz (Brazil)

Re: 42s upgrade

*Message #3 Posted by **Paul Dale** on 15 May 2010, 6:02 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

I ordered the part number from digikey mentioned on this site a while back so I sure hope it is correct.

I think I've either shorted from tracks or burnt out the RAM chip. I'm not great at soldering and don't have access to magnification any more :-(

My plan now it to remove the RAM and replace it with a spare chip and try to get someone who knows how to solder surface mount parts to do it.

- Pauli

in response to message #3 by Paul Dale

> Quote:
>
> I think I've either shorted from tracks or burnt out the RAM chip

You guessed it the first time, you've shorted some traces. The four keys you mention share data and address lines, when there is leakage between then, you get the behavior you saw.

If the board does not have the green solder mask, that is it is all gold plate showing, look not just in the ram area for shorts as it is very easy to have a small bit of solder anywhere shorting something!

Re: 42s upgrade

*Message #5 Posted by **Paul Dale** on 15 May 2010, 8:25 a.m.,*
in response to message #4 by Randy

Thanks for the info. It has the gold tracks.

I figured I'd either shorted something or not got a good solder connection somewhere. My subsequent attempts to fix the problem have only made things worse -- now nothing works :-(

Will do a thorough check over tomorrow in good light.

- Pauli

Re: 42s upgrade

*Message #6 Posted by **DavidShenk** on 15 May 2010, 11:30 a.m.,*
in response to message #5 by Paul Dale

Pauli,

I would also make sure you have a fresh set of batteries. When you increase the speed, the battery voltage can't drop down as low as a normal speed calcs before it won't work. I believe that will occur before the batt warning would normally come on.

If you've completely given up, I would be willing to work on it no charge. I have upgraded 12-15 of these without problem. Just contact me off list.

Dave

Re: 42s upgrade

*Message #7 Posted by **geoff quickfall** on 15 May 2010, 5:28 p.m.,*
in response to message #6 by DavidShenk

Having sucessfully done 7 of these I have experienced similar start up glitches. These were all fixed with a return to the chip and a thorough inspection.

Do you have a continuity tester. Try testing each contact point and the respective leg of the chip for continuity. This can be due to a bad solder joint.

I have corrected the problems in all cases by applying solder flux to each leg and re-heating

the connection just confirm good contact. Then cleaning the residue with contact cleaner.

Also, to clear any previous problem that carries over in continuous memory, short out the battery +ve and -ve contacts and hold the on button down (without the batteries) after your fix and before turning the machine on.

Cheers, Geoff

Re: 42s upgrade

*Message #8 Posted by **Paul Dale** on 15 May 2010, 6:51 p.m.,*
in response to message #7 by geoff quickfall

That for the suggestions.

I have continuity tested all pins to their test points and no adjacent pins are shorted.

I haven't tried new batteries but will.

Re: 42s upgrade

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 15 May 2010, 7:12 p.m.,*
in response to message #8 by Paul Dale

Hi, Paul;

before going ahead with soldering, consider doing that WITHOUT batteries in place AND providing the batteries contacts are shorted with each other. I am sure this should be well known, but if batteries are in place no soldering should be performed because the chance of shorting active lines in the circuit (RAM chips must be powered if its contents are supposed to be retained, right?) and causing damage are big enough not doing so. Also, if the batteries terminals are shorted, remaining capacitor charge should be neglected and ESD would be avoided as well.

And before using a fresh new set of batteries, remember that their current capacity is the highest expected, so if you still believe that you may have shorted terminals, try with regularly discharged batteries first so they will not drive much current if a short circuit still exists. The worst scenario of using partially discharged batteries would be dimmed LCD characters and low battery indication, meaning that the calculator is probably working fine. If so, then go with the fresh batteries.

Last but not least, if nothing goes right, repeat the mantra: 'FIXTHATCALC'... 'FIXTHATCALC'... These HP42 beasts are stronger than they seem to be.

Success!

Re: 42s upgrade

*Message #10 Posted by **Paul Dale** on 15 May 2010, 9:38 p.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

I've done almost everything with the batteries out -- I did a few continuity tests with them in by accident which produced weird results.

I didn't know to short the battery contacts while soldering but will in the future.

The batterys are a bit flat -- dropping back to the slower crystal and the low battery indicator comes on.

- Pauli

Re: 42s upgrade

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 15 May 2010, 10:02 p.m.,*
in response to message #10 by Paul Dale

> Quote:
>
> I did a few continuity tests with them in by accident which produced weird results.

Actually, any continuity tester yields a small current in the circuit to be tested, so in terms of the calculator circuits, the test leads act as an extra current source. This would disrupt calculator operation, at least.

In terms of the tester circuit itself, continuity test applies to circuits without any signal, voltage or current source. So, the calculator batteries probably added a small amount of current that led to the abnormal, weird results you mentioned.

Still hoping for the successful recover of you HP42S!

Cheers.

Wait... I can use the 32k memory chip from my inoperable 48sx to upgrade my 42s??? This would be fantastic news!

Re: 42s upgrade

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 25 May 2010, 9:07 a.m.,*
in response to message #12 by Hugh Evans

Been there, done that...

With the HP48G RAM chip it works fine, though! The IC identifier in one HP48G I have in hands right now is

```
SONY
CXK58257AM-70L (70L - 70nS -speed-, L - low power C-MOS)
352G14VS       (series manufacturing data, perhaps?)
```

If your HP48SX is inoperative, should consider the chance that the RAM CHIP itself is not good, though.

Believe you me, I have also used three RAM chips I found in a multimedia sound board for PC, all of them with the 70L (maybe 60L) suffix. At least one of the two HP42S I still have with me uses one of these RAM chips. If you need I can find their identifiers.

Success!

Re: 42s upgrade

*Message #14 Posted by **Paul Dale** on 15 May 2010, 9:34 p.m.,*
in response to message #1 by Paul Dale

Another session triple checking both sides of the PCB, looking for solder bridges and resoldering pins. I also dropped back to a 32.768kHz crystal. Different symptoms this time but seemingly positive.

Pressing ON shows nothing in the display, but then pressing shift lights that annunciator. I can navigate the menus (the up/down arrows appear) and I can execute BEEPs and TONEs from the programming menu. The busy annunicator lights while beep is sounding.

So, it seems I've got some annunicators but no dot matrix display. Anyone have any ideas here?

- Pauli

Re: 42s upgrade

*Message #15 Posted by **Paul Dale** on 15 May 2010, 11:07 p.m.,*

Re: 42s upgrade

*Message #16 Posted by **Diego Diaz** on 16 May 2010, 2:17 a.m.,*
in response to message #15 by Paul Dale

Hi Paul,

> Quote:
>
> Another session triple checking *both* sides of the PCB...

According to this message, you've taken apart the display. Which in the end, may lead to all and every sympthom you've previously described.

Realigning the LCD with the PCB is somehow tricky as the stainless steel frame has gaps wide enough around LCD bezel for the screen to loose its alignment with the PCB's contact area.

Placing some isolating spacers (1mm wide aprox.) at every LCD side may help centering it. Tha bad news is that you 'll have to remove the frame once again (be gentle with the steel "twisted anchors" they're prone to break).

Hope this helps.

Cheers.

Re: 42s upgrade

*Message #17 Posted by **Paul Dale** on 16 May 2010, 3:16 a.m.,*
in response to message #16 by Diego Diaz

Yeah, I too the PCB off the keyboard/display unit. Thought I'd been careful but obviously not careful enough. Will disassemble again and see what I can do... :-(

- Pauli

Re: 42s upgrade

*Message #18 Posted by **Paul Dale** on 16 May 2010, 3:39 a.m.,*
in response to message #16 by Diego Diaz

That's it!!!! I've now got a working 32kb 42-s :-) Still only normal speed but I can live with that.

The screen is very dim but that is most likely the batteries. Being Sunday meant I didn't get out to replace them -- tomorrow I should be able to.

I couldn't noticeably move either the stainless steel surround or the LCD inside this using reasonable force, however I was able to very very slightly reposition the PCB in the slots.

Thanks to everyone for their very generous and very rapid assistance.

- Pauli

in response to message #20 by Vieira, Luiz C. (Brazil)

> Quote:
>
> These little beasts seem to feel a lot happier with this additional 24K RAM.

In what way? I have used my several HP42S units for almost 17 years. It is my favorite small HP calculator by far.

But I've never once been close to using more than about one-third of the 8K RAM. My fourth-order Runge-Kutta numerical solver (written for my HP-41C 30 years ago) for systems of simultaneous first-order differential equations barely uses up 1K of program space.

The 8K RAM of the HP42S is a tremendous advance over the 0.5K RAM of the predecessor HP-15C, but what is the practical value of an additional 24K in the HP42S, coupled with the degraded structural integrity of the result? The HP42S doesn't have the speed and I/O capability to make anything other than novelty use of increased memory, as far as my limited HP42S experience indicates.

If one is "upgrading" for the technical challenge or as a hobby project, rather than for any practical outcome, that's a totally different matter. But...I wonder how many perfectly good HP42S units have NOT survived this non-trivial operation.

Re: 42s upgrade

*Message #22 Posted by **Vieira, Luiz C. (Brazil)** on 16 May 2010, 1:40 p.m.,*
in response to message #21 by Mike Morrow

Hi, Mike;

I can tell by my own experience when I was testing statistics samples from many different areas and I offered to help colleagues to compute their own when I was in my master degree´s studies (about six years ago). I had my HP42S and for each sample I created a separated matrix so I ended up storing more than 20 samples with many elements each. I remember the calculator was filled with a lot of programs and we used it for a whole weekend. When I realized, we had already used more than 14KBytes amongst matrices and programs. It is less than half of the available 32K, but I'd need at least two HP42S to accomplish the task for me and the guys at the same time.

I was only worried about two things: could not save the job elsewhere outside the calculator and could not risk replacing the batteries as well... Scary, at least.

For the sake of the successful 'transplantation', I remember successfully upgrading at least 6 HP42S, not a single 'burn-out'.

Cheers.

Luiz (Brazil)

Edited: 16 May 2010, 1:43 p.m.

Re: 42s upgrade

*Message #23 Posted by **geoff quickfall** on 16 May 2010, 2:38 p.m.,*
in response to message #22 by Vieira, Luiz C. (Brazil)

I had a suite of programs developed for my university days. At the time the newest pc on the market and in our lab was an IBM 8086 with 2 stacked 5MB hardrives, amber Amdek screen, two floppies and 1 mb of ram, 640 for the progams.

Needless to say my HP 41C with quad memory, extended memory, printer, plotter, and stat module was my preferred machine. It was full even using synthetics.

Now I use the 42S in the cockpit with dedicated programs aircraft specific. I regressed the charts to quadratics and created software to print the answers with my infrared printer (saves time). I also have a suite of navigation, temperature as well as a large CONVERT program with 20 common conversion routines used in aviation for various countries including a meter to feet conversion routine based on ICAO (aviation) conversion. They round but the Chinese and the Russians round to meters differently! I quickly consumed the 8K.

I have configured the 42S as a PDA also with phone numbers and text search (labels) as well as door codes. These alpha progams use up memory also.

At the moment with a 32K memory chip I am running at 19K available. Sure wish it could communicate with the home computer.

So I guess it is a hobby but put to good use and a needed change. Now I wonder why HP allowed the architecture for 32K but only included 7K. I was told that it would be too expensive at 32K back in the 80's.

Cheers, Geoff

1972 HP-35 With Bug

*Message #1 Posted by **aj04062** on 14 May 2010, 10:40 p.m.*

I just got one of these of eBay. The battery was dead and the owner did not claim that it worked. I immediately tried a rebuilt battery I have and it did not work. However, when plugged in with the wall charger, it does.

I presume the two outside contacts on the charger plug socket must make contact when running on batteries. This contact is a little corroded. Is it safe to jump these to determine for sure that this bad connection isnt the fault?

I do not think I want to break into this calculator to look at the contacts beneath the battery tray as the label is in pretty good shape.

Thoughts on easy fixes?

Re: 1972 HP-35 With Bug

*Message #2 Posted by **Ignazio Cara (Italy)** on 15 May 2010, 2:57 a.m.,*
in response to message #1 by aj04062

Hello, congrats for your new calculator, and yes, is safe to connect the two extreme pin to verify if the calculator works with the battery pack inserted. But if you want replace or clean the original jump, you must open the body removing, even partially, the rear label. HTH

*Message #3 Posted by **Garth Wilson** on 14 May 2010, 3:13 p.m.,*
in response to message #1 by Norman Dziedzic

It sounds like it's not really a valid CVT if you have to have a motor of variable speed and torque on the second input shaft.

I read an article from decades ago (1950's, IIRC) on what people expected for the future of bicycles. One of the things was that they would have CVTs. What the writers did not anticipate was that we would get close to that with much lower weight, better efficiency, better durability, etc. by having so many gears so closely spaced. (They're out to 11 cogs in the back, and you can see how close the spacing is if the number of teeth goes 12-13-14-15-16-17-18-19-20-21-23. There are two to three chainrings in the front to select the range. Shifting is practically instantaneous too, unlike 30 years ago and back.

Edited: 14 May 2010, 3:16 p.m.

Re: OT: Continuously Variable Gear Transmission

*Message #4 Posted by **bill platt** on 14 May 2010, 3:36 p.m.,*
in response to message #3 by Garth Wilson

Actually we had closer ranges in the 60s than today. (Nobody shifts front and rear simultaneously for a specific fine tuning of ratio, except in very rare circumstances--too complicated and slow). This is because the old freewheels had a smallest cog of 14t and now we have 11 tooth cogs. The change in ratio from a 44-11 to a 44-12 is much bigger than the change from a 56-14 to a 56-15.

But the amazing thing is that some people can actually use a 53-11. Nobody road raced with a 67-14!

Edited: 14 May 2010, 3:37 p.m.

Re: OT: Continuously Variable Gear Transmission

*Message #5 Posted by **Garth Wilson** on 14 May 2010, 4:21 p.m.,*
in response to message #4 by bill platt

You're referring to half-stepping (optionally plus granny), which I did use for years. The most even spacing comes from a 42-47 front and 13-16-20-25-31 rear, with each step being almost 12% above the last. I ran calculator programs on gobs of combinations looking for the perfect distribution of gears in those years. Actually the calculator programs came after having done the same thing with a slide rule and plotting the results on logarithmic number lines (which are easily made by putting the slide rule's slide down on the paper if you didn't have log paper). All of the step sizes in the 12-23 11-speed cassette are smaller though, and without shifting chainrings. In the 70's, we could choose exact numbers of teeth. Today, shifting, especially of chainrings, has been made quicker and more foolproof by, among other things, the addition of ramps and pins on the larger ring(s) which not only catch the chain to help it up, but are also located such that when the chain comes up, the rollers are already positioned perfectly to go between the teeth instead of onto the points (or other in-between orientations). However this requires that the rings be paired for each other, something you can't do if someone can order any random combination of sizes. I partly lament the fact that the old way is mostly gone; but in most ways the new does prove to be better.

Edited: 14 May 2010, 4:23 p.m.

Re: OT: Continuously Variable Gear Transmission

*Message #6 Posted by **bill platt** on 14 May 2010, 7:28 p.m.,*
in response to message #5 by Garth Wilson

Wow, I haven't talked about this in years! Half-step versus "alpine" and some other gearing ideas. I also made extensive calculations as a kid--by hand (except for my trusty hp) with "sawtooth" diagrams to show the shift sequence.

But in racing, all those ideas went out the window by the time I was racing in the 80s--and it was simply "straight block" . There was one race, in Hagerstown, in the rain, as a junior, when I rand a 15-17-19-21-24 but every other race I have ever done has been in a straight block at least for the 4 smallest cogs.

It is interesting to see old racing bikes from the 60s with close spaced front chainrings--49/52 even! And in the back, a 14-16-18-21-24.

By the way, I have a Huret jubilee, two Suntour Superbe pro, a SunTour Cyclone, and both a Nuovo and a Super Record rear derailleurs. The newest campagnolo carbon units are still heavier than the old cyclone and jubilee--though they sure do shift better.

Re: OT: Continuously Variable Gear Transmission

*Message #7 Posted by **Garth Wilson** on 14 May 2010, 9:11 p.m.,*
in response to message #6 by bill platt

I still have a Regina 14-15-16-17-18 freewheel in a box. Your 15-17-19-21-24 is part of an

almost modern 12-27: 12-13-14-15-17-19-21-24-27. The 10-speed version adds the 16.

I still have all my old papers from having calculated lots of setups by hand.

> The newest campagnolo carbon units are still heavier than the old cyclone and jubilee--though they sure do shift better.

Speaking of better shifting, the latest SRAM 10 speed cassettes have both asymmetrical and missing teeth in specific locations to aid in moving the chain off the gear faster. As first glance, they look like they've seen 20K miles and should be in the scrap bin, not on the wheel.

Re: OT: Continuously Variable Gear Transmission

in response to message #3 by Garth Wilson

I think the CVT story started in the Netherlands by DAF cars.
The variomatic transmission in these cars had a gear for every speed.

See also: Link to DAF Museum early CVT construction.

The mechanism was based on a 'belt-pull' torque powertrain.
Evolving development resulted in a 'steel-belt-push' torque powertrain called CVT.
DAF cars reduced its portfolio to trucks but the transmission technology survived in VDT, later integrated in Bosch.
See Bosch CVT for the details

Maybe we should support Steve Durnin with some perfect HPxx programs for simulation and calculation .....

I can speak from experience - having had a 1999 Honda Civic with their version of the CVT. It's a little bit of a strange experience since you don't get the sensation of the gear changes as you accelerate. I think Honda used a steel belt CVT. I put over 230,000 miles on it and only got rid of it when the air conditioning failed & I didn't feel like spending a lot of money to fix it.

A lot of people had problems with the early demise of the Honda CVT transmission. Mine went at 98,500 miles but I had an extended warranty that put a new one in for only $25 out of pocket.

Turns out that you needed to use only Honda CVT transmission fluid and - this is the key item - change the fluid often. After the first transmission, I started changing the transmission fuild with every other oil change - and no more problems.

It was a great car and got 35-60 MPG in combination city/open road.

Just to make this HP related, thank goodness I used the HP calculsator to calculate the extended warranty plan.

Bill

in response to message #9 by Raymund Heuvel

I think CVT predate this by quite a bit. The earliest version I know about was by George Constantinescu who was quite an amazing inventor. See here for a discussion and description of his torque converter.

Mechanical CVT are available commercially e.g. zero-max.

*Message #13 Posted by **Garth Wilson** on 17 May 2010, 1:52 p.m.,*
in response to message #12 by Klaus

Interesting. I hadn't seen that one before. It looks like it's not continuously variable though. The positions are indexed, apparently so the teeth don't hit on the wrong parts of the belt. As for their comment on the belt lasting five times as long as a chain, I use an unconventional dry lube method with paraffin and graphite that makes the chain last at least 20,000 miles of hard use (a lot of climbing).

HP 12c as a basic scientific calc for the RPN newbie?

*Message #1 Posted by **nick lidakis** on 13 May 2010, 4:14 p.m.*

Currently, I can't find anything that is RPN and fits in a shirt pocket. I can't afford anything that's up on eBay in terms of an 11c or 15c. My 48G is sometimes too big to carry along for the basic chemistry calculations that I do. The HP 35s is a tad large as well, especially when stored in its bulky case.

As a new RPN user, I was wondering why I should not consider using a HP 12c as a basic, pocket, RPN calculator. Looking at a photo (http://www.sistemaeducacionalmoderno.com.br/Imagens/gif%20projeto/Hp12c.jpg) I do see that there are no trig functions, but there are log, ln, and square root functions.

So, any real reason *not* to pick one up used for basic scientific use? Are there any gotchas, considering it's setup as a financial calc.

P.S. In my cursory search on the internet, I read that in 2009 a prototype 15c+ was demoed at some conference. That would be really nice.

*Message #2 Posted by **Gene Wright** on 13 May 2010, 4:38 p.m.,*
in response to message #1 by nick lidakis

If you want a scientific RPN calculator that fits into your pocket, I would suggest considering the new HP 30b model. It may fit what you are looking for.

Why?

Trig functions and inverses Hyperbolic trig and inverses 5 probability distributions Programmable with 10 separate program "files" Ability to customize the keyboard with functions or programs

Good reasons to consider the 30b as a scientific RPN over the 12c.

The model you quoted can't be found on HP's (home or small business) website. Amazon doesn't have it either, though they do list the similar(?) 20b. No matter, because...

...I should have mentioned that I *really* do like the landscape (wide screen?)form factor of the 12c.

Thanks for the info.

One wonders why.

I've used Voyager-series calculators for more than 25 years. They are more than a little awkward to actually use as a "handheld" calculator, which is an unfortunate characteristic for a handheld calculator to have. It's a layout that has no advantage over the traditional layout, and some disadvantages, as evidenced by the fact that HP hasn't repeated the mistake in any other calculator that they've introduced since the Voyagers.

I suspect the only real appeal is that the layout is "different" and "cute".

I had a chance to tinker with a 12c today at the local Staples. I remembered --after reading your post-- that my natural instinct was to _not_ hold the calc in one hand while typing with the other.

Rather, I placed the 12c flat on a desk and slightly closer to my right hand. Now that I think about it, I can't recall of anyone at school actually holding a calc in one hand while using; 'tis always flat on some work surface.

Also, in comparison to my vertically longish 48G, I found that it was quite a bit easier (for the calculations I am doing now, i.e., non-graphing) for my fingers to travel across the 12c in its smallish horizontal landscape than it was to "climb" the the longer and larger 48G. I also preferred the position of the large enter key.

Again, I'm a total RPN newbie, so...

I frequently hold my 41cx in my left hand and press the keys with my left thumb, freeing up my right hand to keep a place in a book or on a drawing, etc.. It may sound precarious but I've never come close to dropping it doing this. Maybe I could always set the calc on something (desk, workbench, etc.) if I kept things neater and had room.

A "mistake"? I strongly, strongly disagree. To me, the Voyagers are not awkward but divine. I hold the calculator in both hands and press buttons with my thumbs. It feels perfectly natural, and I have the keystrokes so ingrained into my muscle memory that I can perform most operations perfectly with my eyes closed.

If the layout was really so empirically awkward (and a "mistake"), I don't think this calculator (especially the 12c) would have earned its critical success and its enduring reputation of being one of HP's most successful products.

You are right. I think Mike is confusing personal preference with evidence for bad design. One wonders why he used a "mistake" for 25 years ...

I think a 12c would work fine, however there are a couple of points to consider. My line of work is mechanical design. I bounce back and forth between various RPN calcs (50g, 11c, etc.). I purchased a 12c and took it for a spin at work for awhile. Here are the points I think should be considered aside from the ones you mentioned:

1) Compared to say, an 11c, I found running a program that is not the first stored program to be a bit cumbersome. For example, if said program begins on line 7, you must issue a GTO command in order to queue it up before running it. On an 11c, you can bind the program to a user defined hotkey.

2) The 11c and I presume the 15c are able to lock into USER mode which eliminates the need to press the f shift key prior to running a "hotkey" program or variable. I find this handy in most of the calculations I do at work. Unfortunately, the 12c does not have this capability. Of course, a workaround using the STO and RCL functions might overcome this issue. I personally like locking into USER mode for "one stop shopping".

All that said, I have found it to be more than adequate for simple calculations and a small "cheat sheet" taped to the front bezel for the GTO inputs for my programs doesn't hurt either. ;-)

*Message #17 Posted by **marais** on 14 May 2010, 2:59 p.m.,*
in response to message #16 by nick lidakis

I disagree. I got a 12C (several, in fact), and find them excellent for the application domain they were conceived for, but for the engineering stuff, it's just not the right machine. The trigonometry has been mentioned, but there's more. I need the complex arithmetic, unit conversions are convenient, I like to have base-n calculations - and for convenience, the ability to access programs directly.

If you need a scientific calculator, get the 35S (a very capable machine in my opinion, with the looks of the classic calcs), or save for an 11C or 15C. Or better yet, get the 12C now, and the 11C later.

in response to message #17 by marais

Agree with your assertions about scientific functions lacking in a 12c. Also with Gene's suggestion of a 30b. But Nick has already stated: 1) he prefers the landscape format, and 2) the 35s is too big.

So Nick, I say look for a bargain on an 11c, or start emailing HP to bring out the 15c+.

I agree with your points. However, the the original posting stated that the 35S was too big and the 11C or 15C are too expensive. I think that the 12C would be a fine solution in the short term. That being said, I think saving for a 11 or 15 is the best idea long term. Unless of course, HP re-releases the 11 or 15. Let's keep our collective fingers crossed. :-)

It's not like having them built in, but you can key in a trig functions program on the regular 12C or the 12C+, like Valentin Abillo's HP-12C Tried & Tricky Trigonometrics.
http://membres.multimania.fr/albillo/calc/pdf/DatafileVA003.pdf

This might be an option for the 12C Platinum.

Hi,

The reason is that the normal 12C has 99 lines of programming available and the 12C platinum has 399. So the second link just fits into the 12C platinum.

Considering the small price difference I see on the internet for the 12C and 12C plat (in the UK anyway) it may be wise to invest in a platinum if going for the 12C.

Bart

Hello Bart,

> Quote:
>
> ...the 12C platinum has 399. So the second link just fits into the 12C platinum.

Actually, the program requires "only" 276 steps. Lines 277 through 376 are optional and lines 377 through 399 were used to illustrate a point (rounding results according to HP classic rounding method so that the "Calculator Forensic" result matched the scientific Voyagers).

There is another option for the 12C Platinum: Tony Hutchins has published "Circular Functions on the HP-12C and 12cp" (DATAFILE V25N5P20 September/October 2006). It's about 220 steps long and relies on Taylor's Series and range reduction. (I haven't seen the listing as I don't have that issue).

http://www.hpcc.org/datafile/datafilev25.html#V25N6

Regards,

Gerson.

Did you know that you have to register/create an account with Apple to use an iPod Touch even if you plan on installing nothing but free applications? Neither did I, which is why I returned it after the first day.

The household here is Linux only. My Linux/GPL philosophy doesn't mesh well with Mr. Job's proprietary Apple philosophy.

I did find something called Free 42c for my Nokia N800. Not the same as a true pocket calc with months/years of battery life and real plastic keys. I think it will come in handy for sometime, so it will stay installed.

No iPhones allowed in my class for exams either. Thank you for the suggestion, though.

in response to message #36 by nick lidakis

Hello from Puerto Rico

I like the form factor of the HP-12C and I use it regularly because of it's long battery life and lightness. These two things outweight it's ackward design. Also it's display is well formed and easy to see.

Regarding the iTunes I agree with you on the Apple Store as a matter of fact they force you to use a credit Visa when with my debit one I never had any problems anywhere.

I use Linux too because I find comfortable working with a command line interface when I worked as a computer operator for a HP3000 mini during the mid-80s. It is not as easy to use as was MPE (HP3000 operating system) but for me it is OK.

Edited: 14 May 2010, 3:16 a.m.

Just wondering (a bit O.T....)

in response to message #1 by nick lidakis

Hi, Nick;

I see that you used a particular link to show a picture of the HP12C that actually points to a Brazilian kinda 'e-learning' system I was not aware of myself. Just for curiosity: was it a random choice or you actually have some interest on foreign courses?

About trigonometric with the HP12C: this is also an option. Although having some natural limitations related to the method, it fits well in the HP12C. And the suggestion of using an HP12C Platinum (avoid the first series...) relates to its 4-times larger programming memory, the ability of handling up to 80 cash-flow entries against the 21 available with the basic HP12C, and the Algebraic-RPN choice.

Cheers.

Luiz (Brazil... coincidence, ahn?)

Re: Just wondering (a bit O.T....)

*Message #39 Posted by **nick lidakis** on 15 May 2010, 10:26 p.m.,*
in response to message #38 by Vieira, Luiz C. (Brazil)

It was a random picture. I'm in New York City. I have recently made several trips to Manhattan's thrift stores in search of RPN treasure. One young lady told me that when old calculators do come in they usually toss them in the trash instead of putting them up for sale. :/

Regarding the trig functions, thank you much.

You all have been very kind and helpful. I'll keep you all updated.

*Message #40 Posted by **nick lidakis** on 20 May 2010, 12:57 p.m.,*
in response to message #39 by nick lidakis

I'm in the club!

I bypassed eBay and used a website that lets you search Craigslist on a national scale. I found a seller in Houston, TX that was offering a moderately used 15c (could not find a cheaper 11c) for $100 for calc and case only. A new 12c would have cost ~90 USD at the Staples.

It arrived today, and it looks better than I thought. Passes keyboard and display tests. Keys have such a nice feel to them. Labels on keys are a very bright white, and keys faceplate is perfect. There is a slight bulge/dent on the metal to the left of the display. Serial no. is 2533a31668. No major scratches, nor any engravings.

Congratulations!

*Message #41 Posted by **Vieira, Luiz C. (Brazil)** on 20 May 2010, 1:52 p.m.,*
in response to message #40 by nick lidakis

And welcome, of course!

The HP15C is a remarkable calculator. Now that you have yours, I'd strongly suggest entirely reading the HP15C Owner´s Manual AND, right after it, the HP15C Advanced Functions Handbook. Needless to say, the Advanced Functions Handbook is a 'must read' once you have red the Owner´s Manual.

A little tip: Part II of the HP11C Owner´s Manual and Problem Solving Guide also has many interesting material related to programming that are not covered in the HP15C Owner´s Manual, even though completely applicable to both calculators.

Success!

Luiz (Brazil)

HP-41CY emulation for NoV-64.

*Message #1 Posted by **Diego Diaz** on 13 May 2010, 9:37 a.m.*

Hi all...

First, beg your pardon because the title is not accurate enough.

There are some differences between both devices which are detailed below. But for many of you who (like me) have never had the opportunity to "play" with the real thing... and hardly will according to its price and rarity. :-(

What CY does and NoV-64 does not:

- Run in turbo mode.

[- Disable the RAM page when a ROM module is plugged on its same address. System modules are allowed of course (PRINTER, IR-PTR, HP-IL, TIMER, EXT-MEM)] This has been solved thanks to the hints by J-F and Winfried. The dowload link is updated.

What a NoV-64 does and CY does not:

- Preserves its OS, no matter how hard the crash, since it's stored in ROM.

- Preserves ist RAM contents without aditional power.

Of course, it handles the well known commands: PG<>, PG01 & PG10; as well as the intitialization/test via [MEMORY LOST].

In short, this is more a toy than a tool.. but I've found it funny to build and hope you also enjoy playing with it.

The download link is here.

As usual, comments and suggestions are welcome... A copy of the original English manual will be *really* welcome. :-) and... decription of the process to detect which ROM's are plugged in will be enormously welcome!! ;-))

So far I've only got some clues (and could be completely wrong) about how 41CY gets acquainted of the ROM's. Seems like if it intercepts mainframe's "ROMCHECK" process, performing its own... then returning the control to 41 OS. At this point it behaves like a "peripheral" (H'010) and handles a couple of registers and NUT processor flags 10 & 12 (status register)... long way ahead.

Best wishes.

Diego.

in response to message #1 by Diego Diaz

Hola Diego,

I see you're deepening and widening the knowledge on almost everything related to the Coconut world ;)

Well, I'm of course not an expert on the 41CY - don't have one, nor do I think I want it either (I'm saving for my NoVo-64 :), besides, give me a HEPAX anytime...) but - I happen to have an english manual for the RAMBOX - will that help? It does not have any techy stuff, just the basic functioning of the system, but maybe ...

Let me know.

*Message #3 Posted by **J-F Garnier** on 13 May 2010, 12:07 p.m.,*
in response to message #1 by Diego Diaz

Hi Diego,

I'm not be 100% sure, but I don't think the RAMBox OS does something special about pages already taken by ROM modules. I think the RAMBox just drives the ISA line in a weak way, so an external ROM can overdrive it.

The RAMBox OS uses the special ENROM1/ENROM2/ENROM3 opcodes to manage the page selection PG01, PG10 and PG<>. AFAIK, no other special opcodes and peripheral commands are used. I successfully emulated the RAMBox in Emu41 in this way.

It's great to have a hardware replacement for the RAMBox!

J-F

I don't know if this is correct, but it ist just the way I did it with the MBK-ProfiSet. There was a resistor in line with the ISA line and a switch (named "Priority Switch") paralell to the resistor. By this way you get a signal which ist weaker or stronger than the signal from the ROM module and you can switch between RAM and module.

The ProfiSET-OS simply reads the last word from each 4K page (the checksum), inverts the bits, writes this value and reads again. If the result changes it is a RAM page, if not it is a ROM page or a ROM page with a weaker RAM behind. It doesn't matter if the checksum is overwritten in RAM as it will not be valid most of the time and it can be calculated new if needed. The check was done with all pages each time the

OS tried to access a page. By this way it was possible to give each RAM page a sequential number called "block".

Someone who has got a RAMBox should verify it. Put a ROM module in one port which has also RAM addressed to it and overwrite one word with a mcode WROM (do not use the RAMBox OS for this). After this remove the module and read the word. If it has changed like it was written, the RAMBox uses just the weak ISA signal.

Re: HP-41CY emulation for NoV-64... (shadow RAM fixed)

*Message #5 Posted by **Diego Diaz** on 13 May 2010, 4:59 p.m.,*
in response to message #4 by Winfried Maschke

Hi Ángel, J-F, Winfried,

Thanks a lot for your responses, I've gone a SW "variation" (I cannot modify existing NoV-64 HW adding a serial resistor) of the propossed weak-ISA way, and it seems to work... ;-) (please consider this "extremely experimental" if your're about to test).

The new code is here for download. (Updated)

I'm certainly neither a CY expert... nor a fan of it. Fully agree with you about HEPAX, Ángel.

HEPAX puts 16K of "efficiency" into 4K of unused space, while CY "wastes" 8K of its own RAM space (it should more properly be called 56K RAM-Box) to allocate a "duplicated" block of a "memory pull-pusher" overvalued OS. No direct RAM access/editor, no dissasembler... in short, not enough revenue for the money.

However, its ability to put its RAM in the shadow if another module is plugged-in is of my main interest. Thats why I've come to that point in the end, not because a particular interest in the CY itself: I need/want "just" this feature for a future project... and was decided to "stole" it... :-)

Ángel, I've found both, 32K RAM-Box manual, as well as the German manual for the "41CY/64K RAM Box II" in TOS. If you have the English version of the later, I'd certainly appreciate your contribution.

J-F, the "weak ISA" is a feasible method, I find it "extremely" tricky though... Those guys at W&W were very serious and well founded in the 41 OS... However, as I've read not long ago in this very forum: "If you eliminate the impossible, whatever remains must be the truth"... (think I must trim the tip of my ears again).

Nonetheless, tricky use of pure HW interface (ISO level #1) is not uncommon. The "RS-232" PIC programmer is a very good example of it and as stated above, it solved the issue so far.

In the meantime, may some of you offer an (M-code) expert point of view on what CY does when it comes to I/O interrupt (polling point H'8FF8) pure couriousity by my side I must admit.

This is the code:

```
8FF8 330  GO 8FDE (-1A)
.
.
8FDE 130  LDI
8FDF 010  010
8FE0 270  SEL RAM    (DESELECTS RAM 010)

Re: HP-41CY emulation for NoV-64... (shadow RAM fixed)

*Message #6 Posted by **Håkan Thörngren** on 18 May 2010, 5:16 a.m.,*
in response to message #5 by Diego Diaz

Since no one answers I take a confused bite on this...

Peripheral 010 is the halfnut LCD extension peripheral. I have not much information of what it does, and I do not know what WRIT 15 means to it. Then it deselects peripherals and selects low ram.

The flags relelated to RPN program is checked to see if the RPN program pointer is in rom (flag 10), then the private flag (12). If both are set it tests if the RPN program pointer is in the same 4K module as the poll code. If it is, then it sets the private flag, which it already tested that it was set?? Makes not sense to me, I probably misunderstand something.

Re: HP-41CY emulation for NoV-64... (shadow RAM fixed)

*Message #7 Posted by **Diego Diaz** on 18 May 2010, 9:36 a.m.,*
in response to message #6 by Håkan Thörngren

Hi Håkan,

And thanks for taking the "chalenge"... Same conclusion than mine then: I found not much sense on this either.

But you've pointed out one thing that I didn't know: "Peripheral 010 is the Halfnut LCD extension".

BTW, are there listings of "Peripheral addresses" and "Peripheral Interrupt flags"?

Seems that they're the most poorly documented and "obscure" aspects of the 41 system.

Best wishes.

Diego.

Re: HP-41CY emulation for NoV-64... (shadow RAM fixed)

*Message #8 Posted by **Ángel Martin** on 18 May 2010, 9:54 a.m.,*
in response to message #7 by Diego Diaz

"WRIT 15(e)" is the disassembler's (vain) attempt to decode the display writing instruction "SLSABC" - as per Ken Emery's book, see pages 109 and following.

In case it helps - probably not.

Cheers, Ángel

Re: HP-41CY emulation for NoV-64... (shadow RAM fixed)

*Message #9 Posted by **Diego Diaz** on 18 May 2010, 5:41 p.m.,*
in response to message #8 by Ángel Martin

Hi Ángel,

Thanks for the tip, I've re-read "M-Code for Beginners", however, I think that the SLSABC... (and the rest of WRIT's and READ's for the display) are referred to the "standard display" peripheral H'0FD.

Peripheral H'010 (sort of halfnut extended display functions), acording to Emery's

(p.116), allows six (WRIT's/READ's) instructions, two of'em for the contrast adjustment, the only mention to any of the remaining four is just for "WRIT (e)"

Quote:

"... will crash the display, simultaneously lighting all the segments... The only way to recover from this particular crash is to remove the batteries..."

Still can't understand the basics of M-code... but this routine really sounds strange to my ears... regardles the "language"... ;-)

Cheers.

Diego.

Re: Halfnut display instruction??

*Message #10 Posted by **Meindert Kuipers** on 18 May 2010, 12:05 p.m.,*
in response to message #7 by Diego Diaz

I have looked into this a bit. I have checked the HEPAX code for changing the contrast of the display, and indeed it used peripheral 010 (works only for the halfnut display), see below (HEPAX bank 3):

```
            A105 043 054 052  .FNAME      "CTRAST"                    ; 043
054 052 041 053 0D4
CTRAST      A106 130 002      LDI         002
            A108 106          A=C         S&X
            A109 0F8          READ        ( 3)X
            A10A 306          ?A<C        S&X
            A10B 033          JNC  +06    LB_A111       A111
LB_A10C     A10C 3B5 08C 3B7  GOSUB       LB_AFB7       AFB7          ; ?NC
XQ 23ED, address in 4th Quad
            A10F 02D 028      ?NC XQ      0A0B
LB_A111     A111 10E          A=C         ALL
            A112 3B5 08C 397  GOSUB       LB_AF97       AF97          ; ?NC
XQ 23ED, address in 4th Quad
            A115 33C          RCR         1
            A116 2E6          ?C#0        S&X
            A117 3AF          JC   -0B    LB_A10C       A10C
            A118 130 010      LDI         010
            A11A 270          RAMSLCT
            A11B 3F0          PRPHSLCT
            A11C 2FC          RCR         13
            A11D 168          WRIT        ( 5)M
            A11E 3B5 08C 3B7  GOSUB       LB_AFB7       AFB7          ; ?NC
XQ 23ED, address in 4th Quad
```

The I/O service routine is supposedly called when the HP41 enters standby mode, so it may be part of a key-entry routine. The READ 12 is a eal read from status register b, and it tests for the nybble of the RPN PC indicating the position within a register, when in ROM it is the current ROM number. What I find a bit strange is that the routine tries to do something when a private RPN program executes from this ROM, but the RAMBOX ROM has no user code programs in its catalog.

My biggest question is now whan the instruction to the NUT special display does here ....

Meindert

Re: HP-41CY emulation for NoV-64... (shadow RAM fixed)

*Message #11 Posted by **J-F Garnier** on 18 May 2010, 2:12 p.m.,*
in response to message #7 by Diego Diaz

WRIT 15 writes to the control nibble of the internal timer in the halfnut display chip.

Except for the Hepax contrast function, I didn't know any ROM using this peripheral code 10! I was unable to find any use of this select code 10 in the CX ROM, not even in the CX service ROM (I set a breakpoint in Emu41 on read/write when SEL PERF = 10, and got nothing).

The registers related to the halfnut display PERIPH 10 are described in the CHHU V2N4 issue (July 85) p.10.

J-F

Re: HP-41CY emulation for NoV-64... (shadow RAM fixed)

*Message #12 Posted by **Diego Diaz** on 18 May 2010, 6:39 p.m.,*
in response to message #11 by J-F Garnier

Hi all,

And thanks again for your time. To keep on feeding my curiousity I'll go for the CHHU issue.

However, the point here is that I was wrong when assuming that the "I/O interrupt" call in RAMBOX 64 was related to the fact that 41CY's can sense physical modules... Which saved me a lot of time diving in the wrong direction.

Thanks a lot for that... :-))

Best wishes.

Diego.

Re: HP-41CY emulation for NoV-64... (shadow RAM fixed)

*Message #13 Posted by **Håkan Thörngren** on 19 May 2010, 2:48 a.m.,*
in response to message #7 by Diego Diaz

I am not aware of any complete in-depth compilation of all peripheral addresses and flag use. They are not too hard to find by looking at listings and fragments of information you can find in various places.

For the timer and HP-IL there are in depth documentation available. I have an old article about the card reader, but nothing that I can recall about the Wand and virtually nothing about the 010 halfnut lcd. The situation gets a little bit worse when it comes to how devices implement read and write instructions. That is at least the "mainstream" devices. Then there may be some non-HPIL special devices like the CMT multimeter, I do not know anything about these.

Then there are lots of other things to "worry" about, like XROM numbers, buffer numbers, file types (extended memory, mass storage, card reader, wand)...

But overall, we are actually very blessed with the wealth of information available.

Re: HP-41CY emulation for NoV-64.

*Message #14 Posted by **Eric Smith** on 15 May 2010, 5:15 p.m.,*
in response to message #4 by Winfried Maschke

I would have expect that to work on earlier HPs, but I'm surprised that it works on the 41.

In all of the HPs, the CPU drives the bus lines (ISA and DATA, or equivalent) low during one of the clock phases, which is called precharge. In most of the HPs, the driver in the ROMs and peripherals can only drive the bus lines high, not low. This is known as an "open source driver". [1]

With that arrangement, if you had a ROM that was trying to output a zero (by doing nothing), and a secondary device with a deliberately weak driver trying to output a one, you would see the one. The ROM would not override the weak driver.

On the other hand, the high-side driver in the ROM is very weak already, so if you didn't want the secondary device driving a weak zero to override the ROM driving a one, the secondary device's low-side driver would have to be *extremely* weak. Probably best to omit it entirely, and have the secondary device use an open source driver also.

While the Nut processor still did bus precharge, based on what you're saying apparently the ROMs, RAMs, and peripheral chips used with it no longer used an open source driver.

Eric

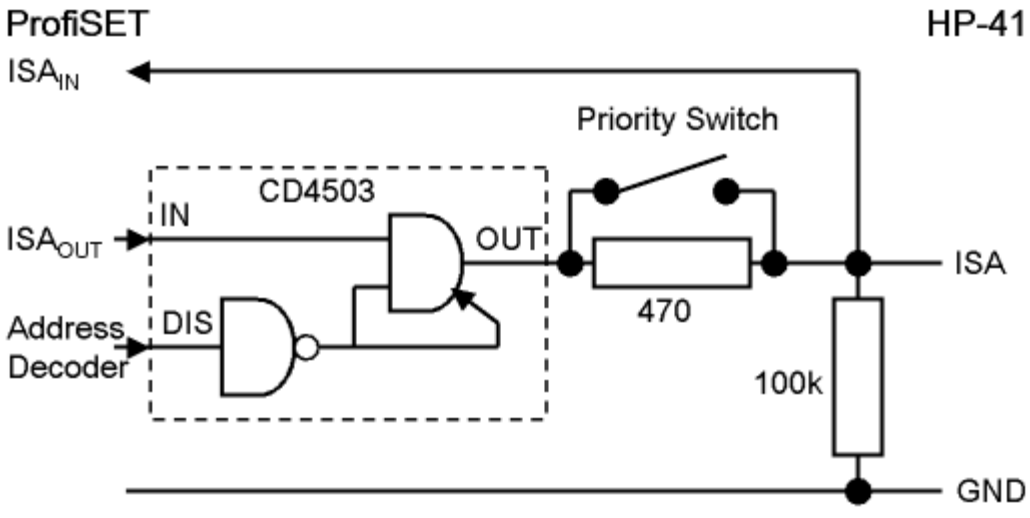
[1] similar to the better known "open drain driver", with "source" referring to the source terminal of a FET, and having nothing to do with "open source software".

Re: HP-41CY emulation for NoV-64.

*Message #15 Posted by **Winfried Maschke** on 15 May 2010, 8:18 p.m.,*
in response to message #14 by Eric Smith

Yes, the HP-41 ROMs have open source drivers.

This is the part of the circuit from the ProfiSET for driving the ISA line:



The CD4503 is a (hex) non-inverting 3-STATE buffer with high output current sink and source capability. It has 3-STATE outputs and a disable input.

In line with the output of the 4503 I used a 470 ohm resistor. Between ISA and GND there is a 100k resistor used as pull down inside the connector to the HP-41 port.

With the "Priority-Switch" turned on the signal is stronger than the signal from modules and it is weaker with the switch turned off and the 470 ohm resistor in line with ISA.

This works with ROM modules from HP, but will not work with all third party peripherals.

The MBK EPROM boxes had no switch and always the weak signal on ISA. I used a CD4066 instead of the CD4503. It worked with several hundreds of devices.

Dead Calculator

*Message #1 Posted by **Peter Geiser** on 13 May 2010, 5:49 a.m.*

Hi all

While preparing a few calculators from my collection to sell at auctions, I had a strange phenomenon this morning:

When I turned on an old HP 38C it first worked as usual, displaying all the numbers. Suddenly, the display started flickering and died. Upon removing the batteries I found they had started a very slight leaking, which I could clean immediately without any problem and no remaining stains.
I then placed new batteries in the calculator, but so far it did not work again. I know that the batteries work, since I tried them on another HP 38C which works perfectly.

Any ideas what exactly happens when batteries go dead? Is there an excess current that kills the electronics? Or is it just a matter of broken contacts?

My goal is of course to get the calculator to work again.

Thank you for any suggestions.
Best regards
Peter

Re: Dead Calculator

*Message #2 Posted by **Katie Wasserman** on 13 May 2010, 9:48 a.m.,*
in response to message #1 by Peter Geiser

The calculator will only draw so much current regardless of the state of the batteries. Excess voltage could kill it but that doens't happen when batteries leak. Almost certainly the issue is that you have corroded contacts that were just barely hanging together. The act of removing the batteries caused enough force to break the contact.

-Katie

Re: Dead Calculator

*Message #3 Posted by **Peter Geiser** on 14 May 2010, 2:56 p.m.,*
in response to message #2 by Katie Wasserman

Hi Katie

Thank you for your answer.

I tried to polish the contacts, but to no avail. I guess the calculators are really dead, so I'll sell them as defective.

So I probably just need to be more careful with the rest of my calculators.

Best regards
Peter

HP 20B Prediction weirdness?

*Message #1 Posted by **Joao S Veiga (Brazil)** on 12 May 2010, 9:02 p.m.*

Hello,

Can owners of the HP20b confirm this, or at least explain to me where I am wrong - I know I am, because I know HP is not!

1 - Turn off HP20b

2 - Press&Hold [N]+[Amort], press [ON/CE] (this will reset the calc to defaults, not necessary, but to make sure we are starting from scratch)

3 - [fn],[Mode], set to RPN

4 - [ON/CE]

5 - [fn],[Data]

6 - enter the following data:

X(1) = 0

Y(1) = 1

X(2) = 1

Y(2) = 2

X(3) = 2

Y(3) = 4

X(4) = 3

Y(4) = 8

(in other words, Y = 2^X)

7 - [fn],[Stats]

8 - on "2 Vars", scroll down to "Predictions"

9 - [INPUT]

10 - [INPUT] until b*a^X

11 - scroll to check that a = 2 and b = 1 (correct)

12 - scroll to "Pred X", enter "3", [INPUT]

13 - scroll to "Pred Y", [=] (returns 8, good)

14 - now scroll back to "Pred X", [=] (returns 2.81, what the heck?)

2.81 is the predicted X for Y=7. If you go back and forth predicting X and Y, Y goes down in steps of "1"

Same happens with the b*e^(aX).

Linear data (resulting from a a*X+b) works fine (you can go back and forth from predicting X and Y, and the values stay put).

After testing with data that correlates to each of the prediction functions, it looks to me that:

b*a^X : weird

b*e^(aX) : weird

a*X+b : ok

a/X+b : weird

b*X^a : weird

a*ln(X)+b : ok

Where am I messing up? I hope I am, because I have no JTAG cable to update the calc firmware...

Best regards,

Joao S Veiga

This seems to work ok in the very latest version of the firmware, dated 4/5/2010. I'm not sure when the fix was implemented.

in response to message #2 by Katie Wasserman

Ouch.

How do I know the version of the firmware in my 20b? I purchased it just last week from Amazon (but 4/5/2010 is pretty recent, can't blame Amazon...).

Also, is there a release notes for firmware (so I at least know what else is wrong in mine?)

Thanks!

Joao

Press ON+PMT, then down arrow until you see "SW Version" scrolling on the display.

> Quote:
>
> I purchased it just last week from Amazon (but 4/5/2010 is pretty recent, can't blame Amazon...).

I have no idea of what firmware versions are out there. The HP people here, Cyrille and Tim should know.

> Quote:
>
> Also, is there a release notes for firmware (so I at least know what else is wrong in mine?)

As far as I know, this is not available from HP. However I really think that it should be posted on their website. Not necessarily a list of all firmware changes but at least a list of known, important bugs and how to get a replacement calculator if these bugs affect you. This will go a long way towards inspiring confidence in their new calculators and maybe get HP past having to produce the 12C forever.

*Message #7 Posted by **Joao S Veiga (Brazil)** on 13 May 2010, 6:27 p.m.,*
in response to message #4 by Katie Wasserman

Thank you Katie!

Mine is 8/01/2008 :-(

Agree with you, without at least a list of corrected bugs, how can I trust that this is the ONLY bug on my firmware version?

I bought it out of stubbornness, as I was forbidden to use my 49g in a course, but refused to surrender to the 30-year old 12c recommendation.

Got it last week on a trip to the USA (30b is nowhere to be found), and I guess I'm stuck with it, as it is not sold in Brazil, so the local HP shop will probably not replace it nor update it for me.

Cyrille's documentation in the Development kit sounds like I can flash the firmware with a RS232 cable (a JTAG cable costs 3x the price of the calculator). Even then, the "HP20b original ROM.bin" which comes with the Development kit is dated 10/19/2009, so it may still have the bug.

A 28s went to college with me in the late 80's, a 49g is my working companion since the 90's. I could never expect a MUCH simpler HP calculator could get into stores with such an obvious problem. I mean, I found it after sporadically tinkering with it for just a couple of days! It shouldn't have taken one man-hour to test ALL of the 20b features (same cannot be said for the 28s or 49g). Heck, I'd gladly do it for free for HP; just send me calculators, one of each, DDP.

So much for being stubborn. Maybe I can slap the 20b front face on my 49g and get away with it in the course.

Any suggestions are welcome...

Thanks,

Joao

in response to message #7 by Joao S Veiga (Brazil)

Joao wrote: "It shouldn't have taken one man-hour to test ALL of the 20b features"

Gene: Actually, testing something is much more complicated than most people realize. One man-hour MIGHT be long enough to make sure the SIN function works properly for all arguments between 0 and 0.000001 radians. Well, perhaps not *all* arguments.

Well, you say, if SIN works for 0 and 0.1, it should work for 0.05. I seem to recall a problem with 2.02 on a previous calculator.

It is difficult. Each potential line of code can affect some other line of code.

Wlodek's book says that the 2.02 problem was with the e^x function on the early HP-35's where it could be seen by entering in order 2.02 ln e^x and seeing 2 not 2.02 .

I agree with you on the difficulty of finding all the bugs. In my olden days working in inertial navigation we had a rule which said that in any software of any substantial complexity there is always one more bug to be found.

Re: HP 20B Prediction weirdness?

*Message #10 Posted by **Bart (UK)** on 14 May 2010, 8:50 a.m.,*
in response to message #8 by Gene Wright

I agree with you in some way Gene in that it is impossible to test all combinations due to the complexities of the software.

However, HP IS letting us down:
1) By not publishing errata sheets - for instance why is it that a Museum member has to keep a comprehensive list of 35s problems? This is a major problem - users rely on these calculators for important calculations daily and they should know what the problems are.
2) I do question how serious HP management take testing and funding for it. Again using the 35s as example, there are some glaring bugs that should have been tested - for instance the program length and checksum, this never works but is a feature that should have been tested as a standard part of a test plan. Do test palns actually exist in HP?

And by the way, those simpler tests as per your example should be easily tested in this current age by automated means.

Anyway, just my 2p worth. And despite my moanings I still love my HPs.

Re: HP 20B Prediction weirdness?

*Message #11 Posted by **Tim Wessman** on 14 May 2010, 9:27 a.m.,*
in response to message #10 by Bart (UK)

Now please don't anyone take this out of context. I am just going to put on my "if I were a businessman hat" and ask a few questions that I would imagine someone in charge of setting a policy might ask.

This has nothing to do with HP policy, nor any internal discussions I've ever heard. I suspect this type of issue has come up with many varieties of products before though, both inside and out of HP. If it was just software you could send out a fix. Since there is hardware involved, everything is more difficult.

1. Does publishing a list of defects gain me more ($) than not doing so? (<-- that is the golden business question, when in doubt - follow the money!)

2. If I publish known defects, does that simply increase the number of people aware of problems that would have otherwise not known there were problems? I have deemed this to be a very minor issue that affects only a tiny percentage of users.

3. If I publish known issues, does that make me legally liable if I choose not to fix it due to time or cost?

4. If I publish known issues, does it cause the general customer who is not affected by the problem call my support center and ask for a replacement even though they aren't affected at all, simply because they now have the perception of a "bad product"?

There are probably more quesitons, but those were the ones that popped into my head while writing them down.

Of course, everything changes with a product if a failure means someone could die or is seriously injuered. Then from a business standpoint, you want to do everything possible. **NOT** from the "it is the right thing to do" standpoint, but rather the "Oh crap! We will lose so much money if we are sued over this". Again, follow the money.

Now think of this imaginary scenario. Let's say that HP suddenly became aware of 10 serious issues in the 12c. These issues were there from the beginning, and are definitely giving "bad" results. However, they are very obscure and nobody has found these issues since the very beginning and reported them. Are these serious issues that should be published? Would it be better to publish this info and possibly risk a core, longstanding product regarded so highly in the industry? It has been highly regarded for over 25 years. Should a business risk changing that, even thought nothing about the product has changed?

My personal view has, and always will be that transparency is best. However, I do recognize that there are some valid concerns those in charge of this type of thing have to weigh and evaluate.

TW

*Message #15 Posted by **Katie Wasserman** on 14 May 2010, 11:32 a.m.,*
in response to message #11 by Tim Wessman

Tim,

When I read your 4 point checklist I couldn't help thinking that the executives at Toyota went through the same thought process and decided to keep quiet. There might be a lesson for HP and many other big companies with previously sterling reputations in this.

The old HP did the "right thing" with the optional HP-35 recall and that helped make them the greatest calculator producer ever. It could happen again!

Since this is a hardware (and software) issue, and we all know we can't flash our buggy HP 35s, and since there IS a published list of known issues, is HP going to fix the software/hardware issues and produce more HP 35s? Or is that product dead?

I read the "bugs" article Gene referred to, and I know HP will not replace our HP35s,

but I would be glad to buy another one if they fix all/most of the bugs on the hpmuseum bug list.

*Message #17 Posted by **Bart (UK)** on 17 May 2010, 11:26 a.m.,*
in response to message #11 by Tim Wessman

Hi Tim,

Apart from the ""broken pencil" trust in HP" references, in response to your points:

> Quote:
>
> 1. Does publishing a list of defects gain me more ($) than not doing so? (<-- that is the golden business question, when in doubt - follow the money!)

It is the difference between an honest and dishonest company - or at least the perception. Particularly important if the products are being sold at higher prices because of "their legendary quality". Part of a good quality policy is the publishing of known non-conformances to the specifications. I work in aerospace, I support the use of ICs from a particular manufacturer because they publish errata sheets. Then we know how to deal with or avoid the bugs!

> Quote:
>
> 2. If I publish known defects, does that simply increase the number of people aware of problems that would have otherwise not known there were problems? I have deemed this to be a very minor issue that affects only a tiny percentage of users.

The Pentium FDIV bug comes to mind.

> Quote:
>
> 3. If I publish known issues, does that make me legally liable if I choose not to fix it due to time or cost?

It does not change the fact that you are liable, but it can change the judgement made against you (both the company and individual*) if you are found to be deliberately concealing a known major issue by not publishing anything.
*Note: in some countries only companies and not it's individuals can be held liable - just hope you're in the right one.

> Quote:
>
> 4. If I publish known issues, does it cause the general customer who is not affected by the problem call my support center and ask for a replacement even though they aren't affected at all, simply because they

> now have the perception of a "bad product"?

Of course, but your conscience would be clear.

> Quote:
>
> Of course, everything changes with a product if a failure means someone could die or is seriously injuered.

Major economical damage counts too, as you say throughout your response "it's about the money".

> Quote:
>
> Then from a business standpoint, you want to do everything possible. **NOT** from the "it is the right thing to do" standpoint, but rather the "Oh crap! We will lose so much money if we are sued over this". Again, follow the money.

Businesses have closed down because of this. It is better to loose some money by being honest than loose everything by being caught out.

This is why a good test regime is important (coming back to original concerns of this tread), to minimise this business impact of flaws by catching the worst ones before the product goes out.

All of my responses are things that people instinctively know to be right, but have buried deep in their minds for the sake of money.

Regards,
-B

edit:

> Quote:
>
> I am just going to put on my "if I were a businessman hat"...

That's what Morton Thiokol engineers did.

Of course you are just putting out calculating devices and sitting behind disclaimers "we are not liable for consequential damage", or it's use for safety critical applications etc.
However, I need SOMETHING to do my calculations with when evaluating risk etc. I currently use at least 2 calculators from different manufacturers and a PC to cross check. If I loose confidence in one manufacturer, I'll not hesitate to move to another.

Re: HP 20B Prediction weirdness?

*Message #18 Posted by **Joao S Veiga (Brazil)** on 14 May 2010, 9:17 a.m.,*
in response to message #8 by Gene Wright

Gene: Actually, testing something is much more complicated than most people realize.

Joao: Yeah, so let's drop even the simple tests, since doing it all is more complicated than most people realize.

Testing ALL possible arguments and sequences for ALL features of a calculator is such a ludicrous idea that I do not consider it possible - not even with automated testing.

Take for example all possible argument values, quantities and permutations for the Cash Flow functionality. Even automated testing would take forever (in the actual meaning of forever).

However, testing if the Cash Flow works at all takes less than a minute.

The problem I found is not a case of specific arguments to a function not working, but a big part of a feature not working correctly, for ANY argument.

So, to be pedantic, I rephrase "test ALL of the 20b features" to "test ALL of the 20b features with one set of arguments to rule out obvious bugs, as some people might not realize that testing everything with all possible combinations/permutations of arguments is not feasible in the real world". Is that Ok now?

Thanks,

Joao

in response to message #7 by Joao S Veiga (Brazil)

Just wondering...Not really suggesting anything yet, but thought I'd poll the audience...

Would you (or others) find it a worthwhile service if you could send someone your 20b or 30b and for a fee, that someone would reflash it with the most recent version (or a specific version, if requested) and mail it back to you? Figure the price would be about $10, inclusive of the return shipping.

What do you think?

I know that I wish I could always have the most recent ROM version from my HP calcs, but given the equipment and know-how needed, that's not always an option. But if I could send it somewhere and get it back, all pretty and up to date, I think I'd be willing to fork out a few bucks for that. Anyone else?

thanks,

Bruce

Re: HP 20B Prediction weirdness?

*Message #20 Posted by **Joao S Veiga (Brazil)** on 14 May 2010, 9:25 a.m.,*
in response to message #19 by Bruce Bergman

In the 20b Dev Kit documentation, Cyrille sounds like it is possible to reprogram the calc with a serial cable (without the expensive JTAG cable).

I emailed him for details (as instructed in the documentation), and also asked if it would be possible to get the latest binary ROM image, as the one in the Dev Kit is dated 2009, thus older than Katie's.

I'll post any progress here.

The HP service centers should do this (reflash, or even replace, buggy firmware calcs), but I don't think the Brazilian centers would do anything about this, as this model is not sold here.

If I manage to do this, I'll gladly do it for free for fellow 20b owners, but they would have to live in Brazil, as exporting/importing them would cost more than a new one :-/

Best regards,

Joao

Hi, João;

good to 'see' someone else from our tropical country out here!

I am in the verge of buying an HP20B from local 'representatives', if you know what I mean, but I was even more interested on the HP30B. But this little beast always seems to be hidden somewhere else...

Instead of contacting Cyrille and ask him for documentation (I am sure he´d not complain, though), would it be OK for you to send me what you get? I´m an electrical engineer myself and I like to handle test leads, soldering irons, PC-aided measuring devices and related software, so I´d not bother you with the completion of the task. In any way we could always trade information, as it happens here very often, then we share with the guys, as you mentioned. If you agree with, please:

linux_lcv (at) yahoo [ponto] com -dot- br

If you like electronic devices' pictures, please:

Pictures of the assembling of my MLDL2000 I really like the HP41 series...

Looking forward for your contact.

Cheers and thank you.

Luiz (Brasil, né?)

in response to message #1 by Don Shepherd

People use the devices/tools in different ways. We (US/UK/Europe/etc) are a capitalist society, and consumerism is nothing new. I don't see our governments outlawing "smart phones" and other connected devices.

Personally, I enjoy these things. Technically, they hold the same excitement for me that my HP-25C had when I was in school. I like the easy access to information and email. Yes, I see the potential to get lost in it, but that's up to the individual.

What I see going on, more than technology -- but certainly related to it, is the crumbling of the integrity of our news outlets. They're all adopting what used to be tabloid tactics. Teasers, voyeurism, sensationalism, minimal focus on local news... They don't ask themselves, "Is this what people need to know?" And of course there's

way to much time devoted to so-called "news programming", because the production costs are so low.

At least on my iPad I can easily access BBC news and other outlets that I prefer for certain types of news. Anyone can put anything out there now. Each of us gets to select what we want to consume. Maybe the vetting of information sources should be taught in school.

Re: are we becoming zombie-people?

*Message #5 Posted by **Don Shepherd** on 13 May 2010, 3:55 p.m.,*
in response to message #4 by Manatee

You make some very good points.

I know that every generation tends to complain about the next generation. The old "I walked five miles to school every day, why can't you?" syndrome. But then the next generation seems to do OK too.

But this massive use of and dependence upon personal electronic devices does tend to make us focus more on ourselves, at the expense of interacting with other human beings. I do worry about what effect that will have in the long run.

Regarding news sources, I tend to agree with you; it has become cutesy and seeks out our lowest common denominator, which in math is good but in humans is generally not so good. When I grew up, watching the evening news with Walter Cronkite (you just knew you could trust him) and reading the daily newspapers were just an accepted way of life; that is what educated people did. I don't think the new generation does that, and I'm sure there are reasons for it.

I personally think that we need a renewed emphasis on "thinking" in our world. We HP calculator programming fanatics tend to do that anyhow, seeking out new and better algorithms. I'd like to see a lust for "thinking" among the next generation instead of a preoccupation with and reliance upon all things i-whatever.

But I know that's not likely to happen.

After Walter retired, he wrote and spoke out, and we all learned soon enough that he had very strong political views. But very much to his credit, he did not let those views color his reporting the news all those years. At least it didn't seem so. Couldn't say the same for David and Chet. After Dan Rather took over... well, we know what happened there.

But if it took discernment to filter the reporting back then, wow, with all the wacko blogs and such that so many young people get their information from now... makes me shudder.

My opinions, of course.

Hi from Puerto Rico

One of the things internet has is that is more easy than ever to get news or information more fitted to a certain world view than ever before and this tend to isolate people more. This could be a strength or a handicap.

It is complicated by the fact that people read less and less and is more less educated specially when their world is based on having things to bring them a status to impress their peers.

But with technology something is gained and something is lost and one must compensate to used it properly. I participate in places like Facebook that allows me to met people from anywhere in the world and get my message through. At least I can have the possibility of bringing out a better view by sharing my thoughts.

I used Facebook daily as a conglomerate of tools that give me news (I post any diary or publication of my liking so I can read it there) cultural, social interests and able to share my opinion on any relevant issues.

Sometimes I know things the traditional media lacks or do not report. As a matter of fact some of my interests are omitted or not known because some information sells better than others or simply those reporters are not as educated enough to be helpful. Or someone is interested only to fill what is missing with worthless material.

I learn a lot by reading a blog thread on any issue or problem the world is having.

One must be ahead to be present in the position to allows us to have a voice in a world that is fast changing. Politicians have failed us so we must be in charge of things once in a while.

Is my opinion though

ARM Assembler Help Requested...

*Message #1 Posted by **Bill Zimmerly** on 12 May 2010, 4:31 p.m.*

I copied the listing from this post...

Re: confused about ARM

...and made the modification to Claudio Lapilli's code suggested by Cyrille de Brébisson.

The problem is, every time I put it on the stack and execute the ASM command, it aborts with "asm Error: Invalid File".

(Note: it ends with <CR><CR>@ as it should AND it fails like this whether I use either of the ASM or asm commands.)

Does anyone see anything wrong with the listing?

Re: ARM Assembler Help Requested...

*Message #2 Posted by **BruceH** on 13 May 2010, 7:06 a.m.,*
in response to message #1 by Bill Zimmerly

I think it should end <nl>@ not <cr>

Re: ARM Assembler Help Requested...

Hi Bruce!

Either way, the code I meant was produced on the HP-50G with the Right-Shift-Period key combination. ;)

*Message #4 Posted by **cyrille de Brébisson** on 13 May 2010, 8:17 a.m.,*
in response to message #1 by Bill Zimmerly

hello,

can you post the exact string that you are trying to compile?

cyrille

Re: ARM Assembler Help Requested...

*Message #5 Posted by **Bill Zimmerly** on 13 May 2010, 2:20 p.m.,*
in response to message #4 by cyrille de Brébisson

Hi Cyrille!

Here is the exact string:

```
"CODE

% SMALL ARM LAUNCHER
SAVE

GOSUB SKIPCODE
% INSERT ARM CODE HERE
!ARM
% TEST CODE - RETURN ONLY
MOV PC,LR
!ASM
*SKIPCODE
A=PC
A=A-4.A
C=RSTK
ACEX.A
D0=C % END OF BLOCK
C=C-A.A % NIBBLES TO COPY
D1=(2) 0 % ALIGN
MOVEUP
CD1EX
ARMSAT
LOADRPL
ENDCODE

@"
```

(Everything between the double-quote marks.)

Also, Cyrille, do you know of any ARM code more advanced than the simple examples presented in the AUR Manual? I would really like to know how to do I/O with the keyboard, display, and serial port with ARM code - but haven't been able to find anything at all on this.

- Bill

Re: ARM Assembler Help Requested...

*Message #6 Posted by **Han** on 13 May 2010, 10:12 p.m.,*
in response to message #5 by Bill Zimmerly

CODE ... ENDCODE is a SysRPL object. Perhaps you need to incude:

```
!NO CODE
!RPL
```

Either include that at the top of your source code, or make sure to have flag -92 set (so that MASD assumes SysRPL mode). The other possibility is to remove 'CODE' and 'ENDCODE'

Han

Hi Han!

Per your instructions, I did each of those steps and still got the same error each time. :(It's very puzzling...

Re: ARM Assembler Help Requested...

*Message #8 Posted by **BruceH** on 14 May 2010, 8:31 a.m.,*
in response to message #5 by Bill Zimmerly

Hi Bill,

This code that you have posted works just fine for me provided flag -92 is set. If not then it gives the invalid file error that you have been seeing.

In case there is something else, my flags are: { # 205010FF0h # 0h # 801000000A000000h # 0h }

Version HP50-C Revision #2,08

Re: ARM Assembler Help Requested...

*Message #9 Posted by **Bill Zimmerly** on 14 May 2010, 2:04 p.m.,*
in response to message #8 by BruceH

BruceH and Han,

It works now when I set flag -92. Thanks for your help!

(Han - I don't know why it didn't work before when I was doing what you said to do, but I re-entered the program, set flag -92 and it assembled to a "Code" object. Possibly a character I didn't see?)

Anyway - it works and I'm grateful for everyone's help. :)

Sincerely, - Bill

Hi David!

Since my goal is to port my ARM zForth system to the HP50G, I prefer to stick to ARM assembler exclusively. But I do agree with what you wrote about HPGCC - it's fast and quite useful! ;)

- Bill

Re: ARM Assembler Help Requested...

*Message #10 Posted by **David Hayden** on 14 May 2010, 9:35 a.m.,*
in response to message #5 by Bill Zimmerly

Bill,

Rather than coding in ARM assembly, consider coding in C with HPGCC instead. This will compile into native ARM code and it's really fast. Libraries let you access the keyboard and display, though I'm not sure about the serial port.

Re: ARM Assembler Help Requested...

I don't know why I missed this before, but the HPGCC source modules have a lot of good stuff to study in there. Cool!

Jazz 50G

*Message #1 Posted by **Han** on 12 May 2010, 12:07 p.m.*

For those who prefer HP mnemonics and miss having Jazz, I have ported most of Jazz's functionality over to the ARM machines. The initial release can be downloaded at this link:

Jazz 50g v1.0

Have fun coding!

Re: Jazz 50G

*Message #2 Posted by **Martin Pinckney** on 12 May 2010, 11:32 p.m.,*
in response to message #1 by Han

Han, I was not familiar with Jazz, so my curiosity was piqued. I gather that it is a 48 program that compiles System RPL into ML, right? So my question to you or anyone else, does the version on hpcalc.org run on a 48sx? Does it work with User RPL (which is supposed to be a subset of System RPL)?

Re: Jazz 50G

So my question to you or anyone else, does the version on hpcalc.org run on a 48sx? Does it work with User RPL (which is supposed to be a subset of System RPL)?

It compiles System RPL source code (written in the form of a "string") as well as machine code (using HP mnemonics). Personally, I have always preferred HP mnemonics (more readable, easier to add comments) so I never got into MASD (the built-in compiler for the HP50G). Hence the port.

Jazz is also capable of editing User RPL programs, but you should probably use TED to do your editing (as opposed to ED, both of which are part of Jazz). Other features include disassembler, System RPL debugger, and machine code debugger.

The one on hpcalc.org (under the HP48 section) does indeed run on the HP48SX (as well as the HP48GX). It also runs on the HP48G+ or any HP48 with upgraded RAM.

Re: Jazz 50G

Sir Clive Sinclair - OT

*Message #1 Posted by **Nigel Bamber** on 12 May 2010, 2:58 a.m.*

Taken from a recent article from the Telegraph in the UK , following Sir Clive's recent marriage in Vegas to his second wife, who herself has an intetesting background!

You will see he doesnt have a mobile phone and carries a slide rule with him.

" And the young, Surrey-born Sir Clive put his mind to an awful lot of different things. At 14, he designed a one-man submarine; by the age of 17, he was editing Practical Wireless magazine and selling earpieces to shops. Was he a nerd? “I’m not sure the word existed then, but I suppose I was: I got bullied a lot at school.” In 1961, after designing a pocket transistor radio, he set up Sinclair Radionics. The slimline pocket calculator followed in 1972, then the Spectrum computers. By the time he sold those off to Amstrad in 1986, Sir Clive was a millionaire.

Though not obsessed by technology (he doesn’t use a mobile phone, BlackBerry, computer or a car and has, since 1972, carried a slide rule in his pocket which he ironically deems “a lot handier than a calculator”), Sir Clive brightens at the mention of his current projects. In the corner of the room a stack of his new folding A-bikes are leaning against the sofa (“They’re half the weight of any other folding pedal bike in the world,” he says). And in his laboratory in east London, the Summer C5 (“the same concept as the old C5 with a completely new, improved design”) is being constructed. His great dream is to invent a “vertical take-off personal flying machine” to enable people to travel by air from one part of a city to another – and he claims to know how this can be done (“It will be entirely by GPS so you would just dial in where you want to go and take off”)."

Nigel

Re: Sir Clive Sinclair - OT

*Message #2 Posted by **hugh steers** on 12 May 2010, 8:40 a.m.,*
in response to message #1 by Nigel Bamber

I actually think a personal VTOL vehicle is very possible; however, im not saying I think Sir Clive will be necessarily the one to deliver it.

As I see it, it would be an autogyro, but with the blades underneath, surrounded by a skirt that prevents it hitting anything. As you know, autogyro flight works like a moving airplane wing and *not* like a helicopter (which simply forces air downwards). Thus the air flows upwards under the vehicle and out through vents on the sides. This means it does not cause massive air disruption below it and furthermore, no tail rotor is needed to correct rotational torque.

Experimental such vehicles go back to WWII. I understand the main problems were stability and control. Presumably today this could be solved by a calculator program :-)

The market for such a machine would be the elite rich – there are plenty of people who could afford one for the purposes of getting to destinations in crowded cities (like London).

I have concluded the main obstacle with this project is actually not the technology, but regulations. Presumably to fly it, you would need a pilots’ license (maybe a chopper license). There would have to instead

be a special "low altitude" consumer flight license governing a new layer of airspace below all current flight paths, but high enough above buildings. Although, I cant see this happening in the near future.

Who knows what the technology will have advanced to by the time the regulators have got themselves organised. This will give the technology time to mature with improvements from in-use experience.

in response to message #3 by Bart (UK)

> Quote:
>
> ... by the time the regulators have got themselves organized.

I don't think there will be an end to this wait :-)

I think people have a hard enough time not running into each other in the essentially 2 dimensional space of roadways. I can't imagine ever trusting my life to other people in a 3 dimensional travel space; whether they are flying around me or designing the software to "automatically" guide me to my destination...

I suppose horse riders said something to this effect about automobiles at the beginning of the last century so perhaps I'm a Luddite but it's how I feel right now.

in response to message #2 by hugh steers

> Quote:
>
> ... helicopter (which simply forces air downwards).

To be picky, I do not think this is completely correct. I believe the rotor blades are airfoils, so lift is achieved partly through pressure differential (like an airplane wing), and partly through forcing the air downward (like a fan).

Re: Sir Clive Sinclair - OT

Although, I cant see this happening in the near future.

In the U.S., "ultralight" airplanes are practically unregulated, and presumably this concept might apply to the personal VTOL devices as well.

Until they become numerous, then watch the regulations start. Eventually the ultralights will become regulated.

*Message #7 Posted by **hpnut** on 12 May 2010, 12:38 p.m.,*
in response to message #1 by Nigel Bamber

IIRC, sir Clive's calculators (or some of them) were RPN machines.

Re: Sir Clive Sinclair - OT

*Message #8 Posted by **Namir** on 12 May 2010, 4:07 p.m.,*
in response to message #7 by hpnut

He had one 3-stack calculator that was very basic. I don't think Dave Hewlett or Bill Packard ever lost sleep over Sinclair's RPN calculator.

Re: Sir Clive Sinclair - OT

*Message #9 Posted by **Steve Simpkin** on 12 May 2010, 4:26 p.m.,*
in response to message #8 by Namir

Don't forget the Sinclair Scientific Wrist Calculator! Although not RPN it could have given the HP-01 a run for its money...
OK, reality check. No it could not have.
I built one of these miserable little things (which was not easy!) and although it did work, it was not practical. The six mercury cells that powered it did not last long and cost a fortune (for me at the time) to replace. It also did not have a watch function, only a calculator.
An interesting product for the time but it did not lead to the discontinuation of the HP-01.

> Johnny

Organizer 1.1 (Org11) and Scribe make a great combination for turning your calculator into a decent PDA.

(Org11 needs Scribe for some PIM functionality.)

Re: HP-49G as PIM

*Message #3 Posted by **Johnny Bjoern Rasmussen** on 17 May 2010, 6:58 a.m.,*
in response to message #2 by Bill Zimmerly

Thanks Bill. It was just what I was looking for.
I wonder if there still is any developement going on...

Re: HP-49G as PIM

*Message #4 Posted by **P.Hart** on 21 May 2010, 4:38 p.m.,*
in response to message #2 by Bill Zimmerly

Thanks also from me. I have been considering alternatives to HP LX machines. Scribe and Org11 will be very useful. Both applications have been installed and are functioning well in my 49g (n.b. not the earlier 49G) and my 50g. BTW, I tried to communicate with the two developers when initially I had difficulty (my fault entirely) setting up in the 50g but sadly no answer, so if there is development going on it seems to be inaccessible. The Lost Tribes of RadioShack: Tinkerers Search for New Spiritual Home

Re: OT:RadioShack

*Message #2 Posted by **Garth Wilson** on 11 May 2010, 3:47 p.m.,*
in response to message #1 by Egan Ford

I wish I had kept copies of the Radio Shack catalogs from my growing-up years; maybe not all of them, but at least every third year. Same goes for Lafayette, Burstein-Applebee, and maybe others. At least I kept a few Heathkit catalogs. When we moved to this city 35 years ago, there were a dozen electronics stores within ten miles, and most were not chain stores. In fact, several were surplus electronics stores. It was wonderful to me, a kid whose hobby was electronics and who was always making things. I was into amateur radio too. Today, almost no one remembers what a "radio shack" (with lower-case "r" and "s") is.

Edited: 11 May 2010, 3:47 p.m.

Re: OT:RadioShack

*Message #3 Posted by **Michael Meyer** on 11 May 2010, 7:44 p.m.,*
in response to message #2 by Garth Wilson

My first computer was a Heathkit 386. I think the boards were already made, but you had to put together all of the case parts, switches, bays, etc. Then it became Heath-Zenith, if I remember correctly.

Re: OT:RadioShack

*Message #4 Posted by **Steve Simpkin** on 11 May 2010, 7:55 p.m.,*
in response to message #2 by Garth Wilson

Oh Man! The memories.... My Radio Shack catalog collection went back to 1974. Most of them were thrown out over the years but fortunately with the Internet, we don't have to miss them. The following site has almost every page of every Radio Shack catalog from 1939 to 2005!
http://www.radioshackcatalogs.com/
I also must have built almost every P-Box electronics kit they ever made. Here is a list of all of them as well
http://my.core.com/~sparktron/pbox.html

Growing up sucks.....

I kept catalogs religiously when growing up!
I had every Tandy (Radio Shack in Australia) yearly catalog, special catalogs (like computers), and every monthly flyer.

In an act of madness I finally ditched them all about 7 years ago in a big cleanup :-(

Dave.

Re: OT:RadioShack

*Message #7 Posted by **tim m.** on 11 May 2010, 10:06 p.m.,*
in response to message #2 by Garth Wilson

Ah yes, the catalogs. My formative years were spent collecting them along with the battery-of-the-month club cards. Today's Radio Shack is a faint shadow of what it once was, with all their electronic components relegated to four sets of drawers in the back of the store.

-Tim

OT: Casio fx-603P

*Message #1 Posted by **Jean-Michel** on 11 May 2010, 1:42 p.m.*

Hi all,

yes, I know, it's not exactly the right place to say it, but since they were very powerfull high-end calculators back in the 80's-90's, I thought some of you would perhaps be interested in knowing that there are two (2) CASIO fx-603p (yes, 603, not 602) on sale on eB**. Unfortunately, prices are as crazy as these calculators are rare... As an happy owner of a venerable and still functionning fx-602p, I would have been very pleased to discover how improved it may have been with its successor, but I will keep on satisfying myself by watching photos and reading datasheets of it...

Kind regards.

Re: OT: Casio fx-603P

*Message #2 Posted by **Johnny Bjoern Rasmussen** on 11 May 2010, 2:27 p.m.,*
in response to message #1 by Jean-Michel

I formerly owned a FX-602P. It was a great little wonder no doubt about that.

Johnny

Re: OT: Casio fx-603P

*Message #3 Posted by **marais** on 11 May 2010, 6:03 p.m.,*
in response to message #2 by Johnny Bjoern Rasmussen

I got myself an FX602P in 1981 and still keep it as one of my favourite calculators (got myself a spare, to be honest). I did not know about the 603 until a few years ago, I saw one in Prague in a supermarket and was stupid enough not to buy one. I immediately recognized the 602 heritage, and I thought, wow, they are releasing a new model, let's buy one for $3 less once they show up in France. Bummer! From what I read, the 603 was not a huge success. It was sold in Japan for a while, and part of the stock went to eastern europe. I wish I bought the model I saw in Prague, but for new, the 602 (and my HP calcs) must do the job.

Re: OT: Casio fx-603P

*Message #4 Posted by **hugh steers** on 11 May 2010, 7:09 p.m.,*
in response to message #3 by marais

i saw some of these some time ago on ebay (somewhat cheaper too), but i dont really want one. it looks, to me, a lot later built. Japan market only? Also, plastic case etc.

The 602p and 502p are cracking machines tho'

Re: OT: Casio fx-603P

*Message #5 Posted by **Michael Plant** on 11 May 2010, 8:12 p.m.,*
in response to message #4 by hugh steers

The 603p is actually metal, not plastic. I like it a lot. I also have two 602p's. Hard to say which I prefer, but from a strict "in the hand, user experience" perspective I'd have to say the advantage goes to the 602p. It's considerably smaller and lighter. However, the 2 line display of the 603 and the additional functionality is nice... I definitely prefer its looks, overall.

Re: OT: Casio fx-603P

*Message #6 Posted by **hugh steers** on 12 May 2010, 8:17 a.m.,*
in response to message #5 by Michael Plant

wow. maybe i should have got one when they were cheaper. i was judging by the pictures.

*Message #7 Posted by **Paul Dale** on 12 May 2010, 3:31 a.m.,*
in response to message #1 by Jean-Michel

When my first HP (a 34c) died I replaced it with a 602p. Had a lot of fun programming that one (and cramming lots into its miserly 512 bytes). It served me well for close to a decade before it went bad too. Finally replaced by a HP-28s which was also a lot of fun.

I wouldn't mind getting a 603p...

Re: A brief history of programming languages

*Message #4 Posted by **Namir** on 11 May 2010, 9:32 a.m.,*
in response to message #1 by db (martinez, ca.)

In the mod 80s I was able to GOTO the office of Kemeny & Kurtz in Lebanon, NH. They had launched True BASIC which was a modern version of their old BASIC-- supported structured programming and the use of library modules. I met with professor Kurtz several times, but only once with the late professor Kemeny. I remember asking him "I read in your company's bio that you worked for Einstein, How was he?" Kemeny replied that Einstein was incredible even in his seventies. Kemeny was working for Einstein to solve partial differential equations. After a year of trying hard, Kemeny went back to Einstein and told him the task was too difficult. Of course, Kemeny went on to be the Dean of Dartmouth College--no small task!

in response to message #4 by Namir

That's great that you actually met them, Namir. These two gentlemen were indeed pioneers of computer programming. They were among the first to really make programming accessible to the average person, in their case, non-engineering college students. All of us today are indebted to them for what they achieved.

*Message #6 Posted by **Bill (Smithville, NJ)** on 11 May 2010, 2:41 p.m.,*
in response to message #4 by Namir

I remember John Kemeny more for being the chairman of the Presidential Commission on the Three Mile Island nuclear accident. If I remember correctly, he said his home Apple II computer had many times the computing power as did the computers used to control Three Mile Island Nuclear Power Station. Someone had given me a copy of the draft report before it came out. He did a fantastic job chairing the commission.

Bill

in response to message #1 by db (martinez, ca.)

1957 - John Backus and IBM create FORTRAN. There's nothing funny about IBM or FORTRAN. It is a syntax error to write FORTRAN while not wearing a blue tie.

Now that is funny!

Dimitri

Replace HP-67 head

*Message #1 Posted by **kubla** on 10 May 2010, 2:11 p.m.*

I purchased an HP-67 off ebay. When I received it, the card reader wasn't working. After repairing the drive wheel, it worked mechanically, but generated an error message when reading or writing cards. I replaced the capacitors that are known to cause reader problems. It still gave error messages. I measured the head continuity; one side read open, so the head was bad. I removed the head and sent it to JRF Magnetic Sciences. John didn't have an exact match, so he sent me the best match he had. I installed the head and the calculator is now working perfectly. I have attached before and after pictures. I apologize for the poor workmanship, but I had to use leftovers from my parts bins, so I didn't even have the correct wiring: wrong colours and low-temp insulation. I may order the correct wiring and redo everything to clean up the workmanship, but I'm so happy to have it working, I may put that off for a while.

Re: Replace HP-67 head

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 10 May 2010, 2:38 p.m.,*
in response to message #1 by kubla

Hi;

Congratulations! Great job, indeed. Matching wires and soldering after-work is easier than what you've done already.

The worst of all should be the gap alignment, but it seems you've done it well. Based on the 'after' picture you ´d have no chance to correct it if misaligned, so I'd like to ask if you used any optical device other than magnifiers to check the gap alignment.

Cheers.

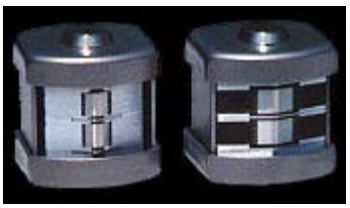
Luiz (Brazil)

Re: Replace HP-67 head

*Message #3 Posted by **kubla** on 10 May 2010, 3:11 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

I assumed the head gap was perpendicular to the long axis of the head face and eyeballed with a straight edge to put the head face in line with the grooves in the mounting plate. The OEM head looks a little like

the one on the left in the following pic; the new head looks a little like the one on the right, so long-axis alignment was easier on the new head.



Of course, if the gap and head face weren't right, I would have been hooped. If I had to do it again, I'd use a jeweler's loupe to eyeball the gap and head face.

I shimmed the head into place using small pieces of aluminum MIG wire, flattened to the correct thickness for a light interference fit. Using a small machinist square, I aligned the head face with the top of the groves in the mounting plate. That provides enough clearance so the card just clears the head. Two of the little white balls then squish the card against the head as the card is pulled through. I tacked the head with dabs of epoxy applied to the original mounting holes in the plate. I then epoxied the rear of the head to hold the shims and head in place. If I did it over, I'd probably just tack the head so I could adjust it if I had to. Once tacked, I'd also snip off the tops of the shims so they don't interfere with the rear case.

Re: Replace HP-67 head

*Message #4 Posted by **Joel Setton (France)** on 10 May 2010, 3:26 p.m.,*
in response to message #3 by kubla

Looks like you did a super job with the new head, I'm impressed!

Of course the real alignment test would be to try exchanging magnetic cards with another HP-65. Interchange compatibility is the "acid test" for both head-gap alignment and card speed.

Joel Setton

Re: Replace HP-67 head

*Message #5 Posted by **kubla** on 10 May 2010, 3:29 p.m.,*
in response to message #4 by Joel Setton (France)

I did that with my other HP-67 and HP-41. The fixed 67 can read cards written by the other 67, the other 67 can read cards written by the fixed 67, and the HP-41 can read cards written by either 67. I wish I had some preprogrammed cards to see how it works with them.

Great! The project does qualify as a complete success. Once again, congratulations!!!

Re: Replace HP-67 head

*Message #7 Posted by **Katie Wasserman** on 10 May 2010, 4:40 p.m.,*

in response to message #5 by kubla

I don't recall reading about any other head replacements on the HP-67/97 before, that's great to know that compatible parts exist! Was the problem an open coil? I had that problem on an HP-9810 calculator but a fellow collector had a spare so I was able to successfully replace that with an original (used) part.

Thanks for posting your repair story and congratulations.

-Katie

Re: Replace HP-67 head

HP10 problem when printing

*Message #1 Posted by **Ignacio Sánchez** on 10 May 2010, 12:43 p.m.*

Dear all,

sorry in advance if you think HP10 is not suitable for this Forum ;-D The thing is that I have a Hp10, ant it works fine except for two aspects, when printing: 1-the paper moves out but it is not "fixed". It can be moved slightly with the hand. 2- Last, and most important: when printing "0", it is shown very big, so, i.e. when 0.00 is printed it covers nearly totally the paper width. This do not happens with the rest of figures (1,2,3, etc.), only when a "0" appears.

I would appreciate your help in order to solve the problem,

Regards

Re: HP10 problem when printing

*Message #2 Posted by **Katie Wasserman** on 10 May 2010, 4:35 p.m.,*
in response to message #1 by Ignacio Sánchez

Ignacio,

You found the right place to ask your question!

The HP-19c and the HP-10 have the same printer mechanism. One of our HP repair experts, a regular contributor to this forum, has a very nice writeup on repairing this printer. This should be very helpful in fixing your paper feed problem.

You should also make sure that you have a good quality battery pack installed, that's it's fully charged and making good contact with the circuit board contacts. All these factors can cause the print to stretch out as you describe.

-Katie

NUT processor NOP's (beginner's question)

*Message #1 Posted by **Diego Diaz** on 9 May 2010, 1:42 p.m.*

Hi all,

There are some words (mainly in the class 0) that NUT processor considers as NOP's.

Some of them have been used for different purposes, the most well known being ENBANK (H'100, H'140, H'180, H'1C0) and WROM (H'040).

Another two are used by HEPAX module: ROMBLK (H'030) and WPTOG (H'1F0).

Willian Doug Wilder's M-code table shows WREG0 to WREG7 (H'200, H'240, H'280, H'2C0, H'300, H'340, H'380 & H'3C0). Although I have been unable to find further references to their usage.

Still three words remain apparently unused: H'080, H'0C0 & H'2B0.

So my question is: Are they *really* unused? and, therefore, can any of them be used to extend the functionality of a new born module?

Your comments will be much appreciated.

Best wishes.

Diego.

Re: NUT processor NOP's (beginner's question)

*Message #2 Posted by **Meindert Kuipers** on 9 May 2010, 2:57 p.m.,*
in response to message #1 by Diego Diaz

Hi Diego,

Funny coincidence, I just returned from a short vacation to the Canaries (Lanzarote)!

I actually compiled a complete table of NUT instructions recently after I discovered some issues in my M2kM disassembler. Your observations are fully correct, I recall that there is some explanation in the HEPAX manual about WREG0 to WREG7. Also CLASS 0, command D (13) seems to be unused, these include instructions $034 to $3F4 if I am correct.

Meindert

Re: NUT processor NOP's (beginner's question)

*Message #3 Posted by **Diego Diaz** on 9 May 2010, 3:31 p.m.,*
in response to message #2 by Meindert Kuipers

Hi Meindert,

Good to read from you... and hope you've enjoyed your Canarian vacations; Lanzarote is certainly one of my favourite islands, unique landscapes and awsome volcanic forms there. Not to mention the beaches (Puerto del Carmen and Papagayo to say some)

Back to the NUT question, I know that there are some other NOP's in the NUT instructions "map". These in the class 0 (H'xx0) are of my interest because they're easy to decode.

Thanks for the hint regarding the HEPAX manual. I've checked it but I probably passed over the WREG info. Will read it again more carefully... :-)

Best wishes from Quisqueya (AKA Dominican Republic)

Diego

Re: NUT processor NOP's (beginner's question)

*Message #4 Posted by **Angel Martin** on 9 May 2010, 4:33 p.m.,*
in response to message #3 by Diego Diaz

Hi Guys, I'm definitely a software person but here's some comment.

Not sure if they're different but I'm thinking of the instructions in the i41CX MATH module - all of them ignored by the NUT CPU and thus used as triggers for the native iPOD code.

I could dig them out if you need to know - or you probably already have?

Cheers, AM

Re: NUT processor NOP's (beginner's question)

*Message #5 Posted by **Diego Diaz** on 9 May 2010, 5:56 p.m.,*
in response to message #4 by Angel Martin

Hi Ángel,

Hope you're doing well.

I'm not aware of the i41CX intrincacies... just asking for the "real thing" behaviour as I want to build some extra features intended to avoid conflicts between physical ROM packs and the RAM pages. Quite in the way the W&W RAMbox64 (inside 41CY) does.

I assume that the CY uses some sort of internal mapping to detect whether or not a physical module is using any page in the range of its RAM (#8 to #F); and disabling such RAM page to avoid conflicts.

Regrettably I'm not one of the fortunate CY owners... :-(but the process itself might not be that difficult if I'm allowed to use a pseudo-NOP for mapping purposes on start-up.

However, if someone knows the details about W&W internal process it will also help a lot!

Best wishes.

Diego.

Edited: 9 May 2010, 5:58 p.m.

Re: NUT processor NOP's (beginner's question)

*Message #6 Posted by **Meindert Kuipers** on 10 May 2010, 12:41 p.m.,*
in response to message #4 by Angel Martin

I had already checked this out. i41CX+ uses the §3F4 instruction for all its functions to trigger the advanced math. The ROM images for I41CX support just contain the function names with the $3F4 instruction followed by a RTN. The rest of the ROM is just NOP's.

In the new MLDL2000 version I use memory mapped I/O, special functions are triggered by a read or write of a reserved location (I use x800 to x80F) in a special type of ROM image. This is pretty generic and can be used for both reads and writes.

I tried to search for info on the 41CY instructions (for speed change), but could not find any yet, maybe Christoph Klug can help us out here, he is specialized in the CX!

Meindert

HP9820A

*Message #1 Posted by **Dave Rand** on 9 May 2010, 10:07 a.m.*

Well, count me as another idiot.

My friend and I were just handed a HP 9820A, unknown condition.

As usual, the card reader is unhappy, printer unknown, and no display. We took it to bits, and washed everything down. Came out looking great (Magic Eraser worked wonders on the external case).

Power supplies, as usual, are rock-solid and happy.

We _briefly_ got a valid display (0: END |-), after one power one, but never again.

Clocks are fine, cleaned up some corrosion in a couple of edge connectors. It obviously _wants_ to live.

So, we will be working on this over the next few months. Thank you to all of you on this forum that have shared your experiences bringing up your gear - it will help. I'll share what we find along the way.

Re: HP9820A

*Message #2 Posted by **Thomas Falk** on 9 May 2010, 12:47 p.m.,*
in response to message #1 by Dave Rand

I wish you success! If you had it working once, it should be not to hard, but it may be ;-)

I have finished repairing a HP 9810A just two weeks ago. The 9810 uses the same mico processor. Feel free to ask if you think it may help.

Best regards,

Thomas

Surveying Pacs for HP-48

*Message #1 Posted by **Jeff Kearns** on 8 May 2010, 11:03 a.m.*

Can anyone tell me the basic differences (mainly overall capability, quality, etc) between the TDS-COGO48 Surveying Plug-in card and the D'ZIGN Surveying Pac Card (Version 2.0) for HP 48GX?

They sell these cards for such high prices on TAS. I have an opportunity to get a COGO card + overlay/manual with a Mint 48GX thrown in for good measure for a mere song.

Jeff Kearns

Re: Surveying Pacs for HP-48

*Message #2 Posted by **Martin Pinckney** on 8 May 2010, 11:41 a.m.,*
in response to message #1 by Jeff Kearns

No, I can't. But you might try googling for articles in the surveying trade magazines, such as "Professional Surveyor", "P.O.B.", etc.

Here's a link to an article on the TDS card.

My impression is that TDS and SMI had the majority of the market in those days. I have TDS, but no others.

Re: Surveying Pacs for HP-48

*Message #3 Posted by **db (martinez, ca.)** on 8 May 2010, 2:00 p.m.,*
in response to message #1 by Jeff Kearns

One thing to think about is: do you get to decide which to use or will you have to use what present and future employers will want. It seems that areas have a defacto standard. TDS is the standard here but i prefer the D'zign.

The D'zign will hold more points per given ram card size and it uses, not wastes, the resident memory. It's slope staking routine is the best on the market for the 48 series. I don't know if the Card version of D'zign you are talking about will hook up to the instrument you will be using or not. This is also something to think about with any iteration of TDS. They could not look into the future and anticipate newer guns.

Another thing to think about is support. Nowadays, the new TDS just can't be bothered talking to people who have already bought their product. With D'zign; you can call up and Phylis will talk you through any problem. On an SX, anything below ver 3.2 of TDS will have bugs and on a GX, get ver 4.12 or above.

As Forest Gump said: "that's all i know about that".

HP-71B FRAM Extension

*Message #1 Posted by **Hans Brueggemann** on 8 May 2010, 2:43 a.m.*

all,
"inspired" by raymund's current thread on the HP-71B bus simulation, i thought it might be in order to leak some information on my two current HP71-B ram extension projects. (obviously, i am not the only one in this forum living curiosity with a logic analyzer..)
1) so far, i managed to successfully link a cypress 256 kByte SRAM to the bus, giving a total of 128 kByte usable RAM (because in the current development stage, only 1 nibble per byte is used). the whole thing easily fits into a front port module.
2) next step is to use a 512kByte FRAM instead of the SRAM and pack it into a card reader housing. the completed memory module will feature 16 user-configurable ID-registers, each defining a 32kByte block of the FRAM as either RAM or write-protected RAM(ROM). i am currently working on the logics for a nybble-to-byte merger (and byte-to-nibble splitter) in order to make the complete 256kB (512kB) available.
the hardware is realized with an actel igloo FPGA and is still in a very early stage, but the design looks promising and might be useful to link any 8-bit parallel device to the 4-bit HP-bus. -->feature requests are welcome!

best regards,
hans

Re: HP-71B FRAM Extension

*Message #3 Posted by **Klaus** on 10 May 2010, 2:42 a.m.,*
in response to message #2 by Paul Dale

Very nice. I am definitely interested!

Re: HP-71B FRAM Extension

*Message #4 Posted by **Alejandro Paz (Germany)** on 8 May 2010, 5:46 a.m.,*
in response to message #1 by Hans Brueggemann

One of the important points to have in mind is power consumption. I haven't worked with the Igloo series but with the Spartan from Xilinx. They are many things... except low power. In my design I used a LM1117-3.3 without realizing the huge quiescent current it has... there are better alternatives :). I decided on a uC-powered design... let's see how it works.

Re: HP-71B FRAM Extension

*Message #5 Posted by **Chris Foley** on 8 May 2010, 5:48 a.m.,*
in response to message #1 by Hans Brueggemann

Very good news Hans.

Looking forward to hearing more news from this work.

Congrats!

*Message #3 Posted by **Manatee** on 7 May 2010, 8:36 p.m.,*
in response to message #1 by Wilhelm Taylor

Interesting. I'd been looking for one, and I don't recall seeing that one.

Re: How did this happen?

*Message #4 Posted by **Haskell** on 7 May 2010, 8:38 p.m.,*
in response to message #1 by Wilhelm Taylor

Maybe because the guy has zero feedback... but even then for $14.50 shipping + $0.99 bid, it would have been worth the risk.

Re: How did this happen?

*Message #5 Posted by **Paul Dale** on 7 May 2010, 9:11 p.m.,*
in response to message #4 by Haskell

Also only ships to the US so most of the world wouldn't have seen it.

- Pauli

Re: How did this happen?

*Message #6 Posted by **gene wright** on 7 May 2010, 10:06 p.m.,*
in response to message #5 by Paul Dale

It might have been ended shortly after being listed by the seller.

That way no one would have seen it.

Does anyone see a start time? I see when it ended, but where is the start time?

Re: How did this happen?

*Message #7 Posted by **Michael Meyer** on 7 May 2010, 10:57 p.m.,*
in response to message #6 by gene wright

I seem to recall that there was a reserve price on the calculator. Maybe no one wanted to see how high the reserve was....

Re: How did this happen?

*Message #8 Posted by **Michael de Estrada** on 8 May 2010, 12:08 a.m.,*
in response to message #7 by Michael Meyer

I refuse to bid on reserve auctions.

Re: How did this happen?

*Message #9 Posted by **Martin Pinckney** on 8 May 2010, 10:53 a.m.,*
in response to message #8 by Michael de Estrada

Curious as to why. If you set up a snipe bid with the max bid you want to pay, it doesn't matter whether there's a reserve or not.

Reserve auctions can be very useful to the seller, when combined with a BIN price. If you do not have a reserve, then someone can place a bid right after you list the auction, thereby eliminating the BIN option. So using a reserve keeps your auction visible to the greatest number of potential buyers for a longer period of time.

Knowing how it aids me as a seller, I am not put off as a buyer.

Re: How did this happen?

*Message #10 Posted by **Massimo Gnerucci (Italy)** on 8 May 2010, 11:58 a.m.,*
in response to message #9 by Martin Pinckney

And why don't you simply start your auction at your reserve price?

Greetings,
Massimo

Re: How did this happen?

*Message #11 Posted by **Juergen Keller** on 8 May 2010, 1:08 p.m.,*
in response to message #10 by Massimo Gnerucci (Italy)

It's more expensive ...

Re: How did this happen?

*Message #12 Posted by **Martin Pinckney** on 8 May 2010, 2:08 p.m.,*
in response to message #11 by Juergen Keller

Yes, it is. But there is another reason. Having studied eB** auctions a long time, I have concluded that there is are certain strange psychological forces at work. Whereas Michael refuses to bid on a reserve price auctions, I have concluded that many potential bidders will avoid an auction that starts with a "high" opening bid, *even if that opening bid is somewhat less than the item is probably worth.*

There are a few more such strange psychologies surrounding eB**.

Re: How did this happen?

*Message #13 Posted by **Massimo Gnerucci (Italy)** on 8 May 2010, 2:50 p.m.,*
in response to message #12 by Martin Pinckney

Ok, it's more expensive, but only if it goes unsold. Or am I totally wrong?
What is the object of the game? You want to sell it, right?
You start at the usual .99$ and let us bid up until we reach the magical plateau... When we find it you have to pay the same eBay fees. Right?
If you won't let it go under a certain amount why not only put a BIN price and wait for your customer?

I, for one, avoid bidding on reserve auctions (unless the item is a really peculiar one) since they could also be used to poll the interest about the item for sale and forge a following auction based on the result collected before.

Not that this could impact my chances since I always snipe...

I understand that hoping for a battle among newcomers to ride up the bids, being sure to not let the item go unless a reserve is reached and also putting in a BIN if someone wants it at once is covering all bases but...

However I concur that strange psychologies are at work when we visit TAS ;)

Greetings,
Massimo

Re: How did this happen?

in response to message #13 by Massimo Gnerucci (Italy)

> Quote:
>
> If you won't let it go under a certain amount why not only put a BIN price and wait for your customer?

As Martin already explained: the BIN offer disappears as soon there is the first bid. With a reserve price the BIN offer is available as long as the reserve price is not reached.

BIN as per not an auction: this is the price I want for my item...

Re: How did this happen?

*Message #16 Posted by **Juergen Keller** on 9 May 2010, 11:56 a.m.,*
in response to message #15 by Massimo Gnerucci (Italy)

It is perfectly legal to say: this is my BIN price, go for it if you want this item badly, for all the others this is my reserve price, I won't let it go for less. And there is a span in between for those who just want to try their luck. I don't see any problem with this. eBay is NOT just an auction platform, there are many many shops on eBay which sell their stuff at fixed prices. If you want a cheap HP calculator go to your local flea market; perhaps you are lucky. Otherwise you have to arrange with the normal economic system. Remember that you do not have to buy on eBay if you don't want to, and you do not have to bid on reserve price auctions. eBay is a company that has to make profit and make their share holders happy. So they have to provide different selling strategies for their members. I don't like every eBay feature, too, but there is no perfect company or service, probably because the LCD between all human beings is so small ;-)

Re: How did this happen?

*Message #17 Posted by **Massimo Gnerucci (Italy)** on 9 May 2010, 12:41 p.m.,*
in response to message #16 by Juergen Keller

This went far away the original scope of the post.
I don't have anything against eBay rules and go with them when I have the mood to. This was about reserve auctions, not eBay economics and shareholders.
I have nothing more to add about auctions preferences and liking; I only hope I made my point of view clear.

Greetings,
Massimo

HP-41 Programs

*Message #1 Posted by **JMBaillard** on 7 May 2010, 5:11 p.m.*

Hi All,

If you want to take a look at
http://hp41programs.yolasite.com you'll see the programs that I wrote for the HP-41

Though the display is not fantastic,
the listings may be useful - at least I hope so...

Best Regards,
Jean-Marc.

Re: HP-41 Programs

*Message #7 Posted by **Namir** on 7 May 2010, 8:40 p.m.,*
in response to message #1 by JMBaillard

Very nice! I have posted a few HP41 and HP67 programs on my web site, but they are a few. My reason is that I doubted many will actually use them!

Namir

Re: HP-41 Programs

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 7 May 2010, 9:26 p.m.,*
in response to message #7 by Namir

Hi, Namir;

I have seen your web site sometime ago (do not recall the e-address; could you point me there again, please?), and it has only interesting material. Congrats!

I also have some programs written for the HP41 that have never seen the sunlight, and I've always wondered if it is worth sharing. You know what? This is actually a way to show what can be done with it and what have we done with it. Some people may use the programs just for the fun, but hey! Once they were written for a purpose, this is what lasts.

Believe me, I'm typing and testing each one of the programs I wrote, and I'll post them as soon as I have the chance to build the pages. When I see that you guys are sharing your own gems, I feel even more confident showing the codes I wrote.

Let´s keep the HP41 spirit alive!

Cheers.

Luiz (Brazil)

in response to message #8 by Vieira, Luiz C. (Brazil)

By all means Luiz, go ahead and share those programs with the rest of 41-die-harder community :)

What's about this machine that refuses to die despite all logic and common sense??

Re: HP-41 Programs

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 11 May 2010, 6:13 a.m.,*
in response to message #9 by angel martin

Hi, Ángel;

I´ll do that, for sure. There are a few programs of mine that have no equivalent amongst the programs shared here and in other places I've checked so far, and I think they may become part of the HP41´s legacy.

About the HP41 refusal to die, I would like to quote a very well known Vulcan saying:

> Quote:
>
> If you eliminate the impossible, whatever remains must be the truth!

Thus, logic and common sense must be wrong in this case...

Live long and prosper!

Luiz (Brazil)

I will add my voice to the chorus and also say, "WOW!"

Re: HP-41 Programs

*Message #18 Posted by **Gerson W. Barbosa** on 8 May 2010, 11:27 a.m.,*
in response to message #1 by JMBaillard

A real treasure trove!

I had seen some of your programs before at MoHPC HP-41C Software Library and enjoyed them. Since you have suggested Warren Furlow's V41, I guess you have some RAW files for use with the emulator. It would be nice if they were also available.

Best regards,

Gerson.

Re: HP-41 Programs

*Message #19 Posted by **Martin Pinckney** on 8 May 2010, 11:34 a.m.,*
in response to message #1 by JMBaillard

Ditto!

Now a question for you. Have you started a list of which ones will port to the 42s? (Or at least which ones will not).

Thanks.

.RAW Files for these HP41 Programs??

*Message #20 Posted by **Namir** on 8 May 2010, 11:48 a.m.,*
in response to message #1 by JMBaillard

Jean-Marc,

Can you post .raw files for these programs. Will help loading them on 41 and 42 emulators.

Thanks!

Namir

Edited: 8 May 2010, 11:48 a.m.

Re: .RAW Files for these HP41 Programs??

*Message #21 Posted by **Angel Martin** on 9 May 2010, 3:56 a.m.,*
in response to message #20 by Namir

Typing the code into V41 is time consuming and prone to errors - so I'm not assuming JM will do that across the board - it's thousands of code lines!

Perhaps we should all do our favorites and send them to him in RAW format - that'll share the load.

Best, AM

Re: .RAW Files for these HP41 Programs??

*Message #22 Posted by **Massimo Gnerucci (Italy)** on 9 May 2010, 4:24 a.m.,*

in response to message #21 by Angel Martin

Why not using HP41UC.EXE/WIN41UC.EXE on the listings?

Greetings,
Massimo

Re: .RAW Files for these HP41 Programs??

*Message #23 Posted by **Namir** on 9 May 2010, 7:39 a.m.,*
in response to message #22 by Massimo Gnerucci (Italy)

That's an idea that slipped my mind!

Thanks,

Namir

Re: .RAW Files for these HP41 Programs??

*Message #24 Posted by **Ángel Martin** on 10 May 2010, 6:53 a.m.,*
in response to message #22 by Massimo Gnerucci (Italy)

Hi Massimo,

I must be doing something wrong but I can't figure out how to convert ascii text files into RAW using win41uc.exe.

Any advise will be appreciated.

Cheers, ÁM

Re: .RAW Files for these HP41 Programs??

*Message #25 Posted by **Massimo Gnerucci (Italy)** on 10 May 2010, 8:27 a.m.,*
in response to message #24 by Ángel Martin

WIN41UC wants basic runtime libraries and HP41UC available.

I had HP41UC complain about being used in a (Win7) 64bit environment, suggesting to try in 32bit.*

I was able to succesfully convert the continued fractions program inside a WinXP 32 bit virtual machine by this command line: HP41UC.EXE /t=infile.txt /r=outfile.raw /n

Greetings,
Massimo

* 64-bit Windows does not support running 16-bit Windows-based applications.

Just a reminder to all HP-50G owners...

Egan Ford's Article on 41C to 50G Migration

A great place to store and play with these programs!

Re: HP-41 Programs

*Message #28 Posted by **HrastProgrammer** on 11 May 2010, 1:11 p.m.,*
in response to message #27 by Bill Zimmerly

> Quote:
>
> Egan Ford's Article on 41C to 50G Migration

Wow, it must be a looooooong time since the last time I have been here, because I didn't know about this article until today. And even much longer time since I finished my work on HP-41E ...

Anyway, with a 2-year delay, congratulations to Egan for making such a comprehensive and useful article!

Just one small correction ... If you store some of those code objects (containing various HP-41E variants) to a variable in the main RAM, you won't get MEMORY LOST after you exit the emulator with ON&F and run it again, no matter if RAM saving has been enabled or not. This is because the whole RAM has been preserved inside the emulator body. You can even copy such code objects from one calculator to another and emulator RAM will be preserved.

Of course, if you store it to a SD card on HP-50G, then you'll get MEMORY LOST each time, because the emulator has to be temporarily copied from SD to main RAM for execution. So, in this case, RAM saving has to be enabled, otherwise you will loose all your work, as stated in the article.

Best regards.
HrastProgrammer

For the HP-41 M-coders out there: NoV-64 update... (you'll love it!) ;-)

*Message #1 Posted by **Diego Diaz** on 7 May 2010, 12:52 p.m.*

Hi all,

I've been taking a long rest by Caribbean Sea shore. Sun, beaches, palms, good rum, better company... ok, ok, I'll stop.

Back to the point, relaxing is great for the brain, so I've taken a nice portion of time to build a new code for the NoV-64.

Geir Isene has offered an unvaluable help suffering a big bunch of crashes while beta-testing. Want to make public my gratitude for his efforts.

This update includes several new fuctionalities which I hope may be appreciated not only for the M-coders, but for the average user as well.

In abstract (but please, please, please... read the manual!):

- Handles 32K RAM in-a-row, allowing page copy between different RAM blocks.

- Allows RAM to ROM page copying.

- The ROM page copied from RAM is now fully operative.

- Allows the ROM page copied from RAM to be extracted to a .ROM file in you PC.

- Keeps RAM page protection status regardles the page your RAM is allocated.

You can download it from here.

Please note that it will still must be considered "preliminary", therefore, it is advisable to save your current "NoV-64-H.asm" file in a safe place. The rest of the files in the update are new so no conflict with any other.

Please feel free to mail me back with your comments, questions, suggestions, etc.

Best from Dom. Republic.

Diego.

Edited: 7 May 2010, 3:51 p.m.

Re: For the HP-41 M-coders out there: NoV-64 update... (you'll love it!) ;-)

*Message #2 Posted by **Geir Isene** on 7 May 2010, 4:30 p.m.,*
in response to message #1 by Diego Diaz

I'll return the compliment by saying this is an excellent upgrade to the NoV-64. It's a very complete product.

An invaluable add-on for the modern HP-41 user.

Thanks Diego.

Re: For the HP-41 M-coders out there: NoV-64 update... (you'll love it!) ;-)

*Message #3 Posted by **Diego Diaz** on 9 May 2010, 3:43 p.m.,*
in response to message #2 by Geir Isene

It's ok, I look forward to taking those beers with you... ;-))

In the meantime, I've been considering the possibility of adding yet another feature to NoV-64.

I think that once the RAM image has been saved into a PC file, the requirement of re-programming the whole module to recover page #F is a waste of time. Users more likely have their favourite ROM images loaded into NoV-64 ROM, so there's no need to go through the configuration process again wasting about 2minutes.

So I'm now preparing a small code that will allow page #F (last page on ROM Block 2) to be erasable directly from the control word. Namely, by writting H'3FF in it.

The erasing process will take about 0.16seconds so it won't cause noticeable overhead, and page #F will again be available for RAM dumping.

I hope I'll have the final release by the next week.

Best wishes.

Diego.

Re: For the HP-41 M-coders out there: NoV-64 update... (you'll love it!) ;-)

*Message #4 Posted by **Geir Isene** on 9 May 2010, 3:51 p.m.,*
in response to message #3 by Diego Diaz

Nice addition - as I usually have pages #E and #F free for physical plug-in modules.

Re: For the HP-41 M-coders out there: NoV-64 update... (you'll love it!) ;-)

*Message #5 Posted by **Diego Diaz** on 10 May 2010, 11:01 a.m.,*
in response to message #1 by Diego Diaz

Hi all,

A report regarding a NoV-64 (ver. 08r) issue was received yesterday. Thanks a lot to Frido for pointing this out.

In short CX + NoV-64(08r) + HP-IL cannot operate unless HP-IL PRINTER switch is set to DISABLE.

As I'm preparing the mods to allow page #F erasing on-the-fly; I'll include the required code to fix the bug reported by Frido in the next (definitive? :-) release.

Best regards.

Diego.

Re: New issue of HP Solve Newsletter posted...with some changes ... new editor is Richard Nelson

*Message #3 Posted by **Frido Bohn** on 10 May 2010, 4:20 a.m.,*
in response to message #1 by Gene Wright

Finally, the grandmaster of editors endeavours a new episode of HP-calculator related writing!
In his late phase, he appears to follow in the steps of Henry Horn, who took care of the HP Key Notes in the late 70s and early 80s.

I hope he will be able to accomplish his philosophy of user-involving publishing he ever wanted to. In contrast to the 80s where internet was a highly sophisticated project for a very minority, nowadays Richard will have a lot more opportunities to spread his ideas. Indeed, these are very welcome in an era where we have the technology to share information in a pace never seen before. However, likewise as with the internet in the 80s, there is a lot of work to do in terms of the quality of contents.

Hopefully, Richard will find the adequate balance between user-proximity and commerce in the HP-environment. He has a lot to contribute, and I am very curious about his role as the **Editor** in this newsletter.
I wish him the best of luck in his new position!

Frido Bohn

Mini HP meeting

*Message #1 Posted by **Art Litka** on 7 May 2010, 12:09 p.m.*

Since I will be in the Bay area (from Fla), db has suggested a mini HP calc enthusiasts meeting in Martinez, CA during the the weekend of May 15-16, 2010. Please see his reply to my original post farther down in the Forum. Anyone out there interested in an informal calc and wine get together that weekend?

Re: Mini HP meeting

*Message #2 Posted by **db (martinez, ca.)** on 7 May 2010, 12:28 p.m.,*
in response to message #1 by Art Litka

Hey Art; If it works for you and anyone else who might want to show, let's aim for Saturday the 15th if possible. I can make it the 16th if need be though, and if you're still interested in doing the flea market in Oakland on Sunday morning, i'm all over that. As the guest; you get to buy any HPs we find, unless it's a 95c. All bets are off in that case.

Re: Mini HP meeting

*Message #3 Posted by **Art Litka** on 9 May 2010, 10:48 a.m.,*
in response to message #2 by db (martinez, ca.)

Saturday it is! You'll get two Arts for the price of one since my wife's brother in law will drive us out there and later to Bethel Island. He is a building dept. official and former contractor who is into rehabbing houses, CAD and wine! It should be fun even if he does not (yet) have the old HP calc bug. Hopefully you can round up a few others out there as well. We'll coordinate further via phone soon.

Re: Mini HP meeting

*Message #4 Posted by **Johnny Bjoern Rasmussen** on 10 May 2010, 6:56 a.m.,*
in response to message #1 by Art Litka

Hi Art
I can only recomend a meeting now and then. I held one last saturday and it was a great success.
If you want to you can view some photos at my blog.

Good luck

Best regards
Johnny, Denmark

I'm thinking to sell my Red-DOT!!

*Message #1 Posted by **Ignazio Cara (Italy)** on 7 May 2010, 5:01 a.m.*

Hi dear friends, can you see any reasons to justify this ? Thanks for your opinion.

Ignazio

Re: I'm thinking to sell my Red-DOT!!

*Message #2 Posted by **aj04062** on 7 May 2010, 6:31 a.m.,*
in response to message #1 by Ignazio Cara (Italy)

Nope, that's insane.

Is the "red dot" the raised bump on the 5?

Re: I'm thinking to sell my Red-DOT!!

*Message #3 Posted by **bill platt** on 7 May 2010, 7:58 a.m.,*
in response to message #2 by aj04062

No, the red dot is a little indicator to the right of the on off slider. This particular 35s at auction is not a red dot.

Re: I'm thinking to sell my Red-DOT!!

*Message #4 Posted by **Manatee** on 7 May 2010, 8:31 a.m.,*
in response to message #1 by Ignazio Cara (Italy)

Well, a painting that Pablo Picasso did in one day just sold for $106 million. Do you have any of those lying around?

I recently got a 35 for about 1/10 of the one in the link, but it's not nearly as pretty. It works, though.

Re: I'm thinking to sell my Red-DOT!!

*Message #5 Posted by **Michael de Estrada** on 7 May 2010, 9:11 a.m.,*
in response to message #1 by Ignazio Cara (Italy)

Hi Ignazio,

If you sell yours then I'll just have to sell mine for even more! lol

Although I agree that the price in this case is rather high, perhaps it's not totally ridiculous, since it happens to be a late version 2 that still has "the bug", and these are becoming fairly difficult to find. Also, I'm not sure but the auction is on the Italian TAS and caters to a market that may be more tolerant of high prices. About a month ago an HP-70 on the US TAS sold for nearly $1000 USD, and it was not even perfect. That was a

worldwide auction, and the winning bidder was probably european. A short time later a nearly identical HP-70 sold to a US bidder for about half as much. Anyway, this is not the first time that TAS auctions have gone crazy, nor will it be the last. At least we're not trying collect rare art.

Michael

Not in the U.S. I recently had two Spice power transformers, and could only get 20-something U$D for them.

I'm rich I have two boxes full of them! :-)

Re: I'm thinking to sell my Red-DOT!!

*Message #9 Posted by **Ignazio Cara (Italy)** on 7 May 2010, 12:21 p.m.,*
in response to message #5 by Michael de Estrada

Hi Michael, when I wrote my post the seller had not inserted yet the note about the bug. But it's my opinion that the price is too high, I have purchased my Red-Dot for less money. BYW, the auction is on TAS USA! (# 120564849077)

Regards

Ignazio

Re: I'm thinking to sell my Red-DOT!!

*Message #10 Posted by **Michael de Estrada** on 7 May 2010, 3:01 p.m.,*
in response to message #9 by Ignazio Cara (Italy)

Hi Ignazio,

Yes, I see now that it is indeed TAS USA and the item location is also in the USA. It would be interesting to know if the high bidder is also in the USA. The bid history suggests that it is a US bidder (all items in English). I agree that the price is high, already over $600 USD and of course that is really the second highest bid minus $10, so the actual max bid is higher. The auction is almost over, so maybe this will end up being the winning price.

Edit: Bidding has ended and winning price remained at $605.

Regards,

Michael

15C short battery life

*Message #1 Posted by **paul spiro** on 6 May 2010, 4:34 p.m.*

I recently replaced the batteries in my trusty 15C for maybe only the 3rd or 4th time since new. When I picked it up a couple days later it was dead. Another new set of LR44's went dead after about 3 hours of occasional use. I never noticed it getting hot or any other abnormality.

I've searched here and elsewhere but this doesn't seem to be a common problem. Any comments, suggestions?

I love my long-term companion and see it's irreplaceable except on the collector's market. And my 41CV just recently took a dive too...

Re: 15C short battery life

*Message #2 Posted by **Steve Simpkin** on 8 May 2010, 2:15 p.m.,*
in response to message #1 by paul spiro

No one has responded so far so I will give it a shot. My first suggestion is to buy a new set of batteries from a different source, just in case of a bad batch. I this doesn't help, I would perform a full memory clear using the ON and - keys as described on page 64 of the Owner's Manual. You could also run the self test routines (page 263) to see if they turn up anything. If nothing else helps, you might have a leaky tantalum memory capacitor. This is the large blue capacitor (near the battery supply wires) shown on the left side of the following picture. http://www.hpmuseum.org/10cmbb.jpg Obviously replacing this is a last resort. Good luck.

Re: 15C short battery life

*Message #3 Posted by **paul spiro** on 10 May 2010, 8:42 p.m.,*
in response to message #2 by Steve Simpkin

thanks for the response, Steve. The 2 sets of batteries were different brands from different stores and tested fine before installation. The cont memory was already cleared from sitting w/o batteries for a few days but I threw batteries back in and ran the ON/- and ON/x tests anyway.

however... the ON/x test showed that the bottom 2 vertical elements of the penultimate right-hand digit were missing. A little experimentation revealed that unless those final 2 digits were displayed all seems fine. As soon as I display the last digit or two the display noticably dims. I'm thinking my problem is not the power capacitor but an internal short in the LCD display.

I'm going to try running the calc w/o those last 2 digits and see if that solves my battery drain. I don't suppose parts are still available? (I was hoping it was just the cap...)

CST, SEL, MAR operations (OT ?, maybe)

*Message #1 Posted by **Alberto Fenini** on 6 May 2010, 1:39 p.m.*

Dear all, am I wrong or there are no early models from HP that offer these three funtions directly off the keyboard ? Thank you very much for help, alberto

Re: CST, SEL, MAR operations (OT ?, maybe)

*Message #2 Posted by **Gene Wright** on 6 May 2010, 2:18 p.m.,*
in response to message #1 by Alberto Fenini

No, you are correct.

The earliest models containing these functions were the HP 10B, HP 17B, and HP 14B ... or the HP 18c, which ever of these came first.

Probably because the relationship between these functions is essentially a fairly easy division of (X - Y) / (T - Z) or such.

:-)

Re: CST, SEL, MAR operations (OT ?, maybe)

*Message #3 Posted by **Alberto Fenini** on 6 May 2010, 3:19 p.m.,*
in response to message #2 by Gene Wright

Too bad ... you mean a loyal HP collector has to go for a TI Business Analyst to get those functions ? :))

Re: CST, SEL, MAR operations (OT ?, maybe)

*Message #4 Posted by **Gene Wright** on 6 May 2010, 3:38 p.m.,*
in response to message #3 by Alberto Fenini

I think they were considered too "elementary" to put on the business models at the time.

More important to have bond or amortization or linear regression than computing margin from:

(Sales Price - Cost) / Sales Price

which is awfully elementary. :-)

Edited: 6 May 2010, 5:09 p.m.

Re: CST, SEL, MAR operations (OT ?, maybe)

*Message #5 Posted by **Jake Schwartz** on 6 May 2010, 3:45 p.m.,*
in response to message #3 by Alberto Fenini

When you say "early" models, did you mean models introduced early in the HP-calculator history? I believe that is how Gene interpreted and answered it....naming units which have long been discontinued. By "early", did you actually mean current "low-end"?

Jake

Re: CST, SEL, MAR operations (OT ?, maybe)

*Message #6 Posted by **Alberto Fenini** on 6 May 2010, 5:57 p.m.,*
in response to message #5 by Jake Schwartz

Well, by early I meant the classic family, the woodstock or the spice, or even the voyagers.
I'd like to use one of these for my everyday work, and since I started collecting then, I haven't been able to find those functionalities.
The TL function on the HP80 is good, but I also would like to have those.
I know, I can also write few lines of code and workaround the problem, but I would have preferred something more direct
I was just wondering if I had missing something on these lovely toys.
take care and thx for the replies.

Suggestion for the Next HP-50G ROM...

*Message #1 Posted by **Bill Zimmerly** on 6 May 2010, 6:35 a.m.*

Since the HP technicians (Tim, Cyrille, et al.) follow this forum, I thought I would take advantage of it and make a simple suggested modification to the AMORT menu that would hopefully be incorporated into a future ROM version:

The AMORT menu currently consists of:

F1 - EDIT

F5 - B->PV

F6 - AMOR

I suggest adding two new functions that would *greatly* improve the functionality of AMORT:

F3 - PREV

F4 - NEXT

Whereas "F3" would decrement the "Payments" value, and then recalc and relist the form.

"F4" would increment the "Payments" value, and then recalc and relist the form.

Thus, someone wanting to "watch" the changes in an easy "one-click" month* by month way can do so without having to click the "up" key, entering the new "Payment" number, and then clicking AMOR for every new iteration.

--- (* - I assume that "Month" is the normal default payment period for mortgages for the purpose of this posting.)

Re: Suggestion for the Next HP-50G ROM...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 6 May 2010, 12:56 p.m.,*
in response to message #1 by Bill Zimmerly

Hi, Bill;

never thought of it this way. In fact, the HP12C has the [n] key always present, so it is easy to do what you want.

If I may, I´d try

```
[  N+  ] [  N-  ]
   F3       F4
```

instead. I think these would be more suggestive.

In any way, what about a custom AMORT menu?

Cheers.

Luiz (Brazil)

Re: Suggestion for the Next HP-50G ROM...

*Message #3 Posted by **Bill Zimmerly** on 6 May 2010, 4:38 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Thanks Luiz! Another useful button (F2) might be to dump a year or so of AMORT data to a matrix that can be loaded into the matrix editor so the perspective home buyer can see it in a "spreadsheet" format on the HP-50G as well.

HP71B - Bus

*Message #1 Posted by **Raymund Heuvel** on 5 May 2010, 8:03 a.m.*

Is there any experience with HP-71B Bus measurement with a Logic Analyzer? Screen dumps?

Thx

Raymund

Re: HP71B - Bus

*Message #2 Posted by **Alejandro Paz (Germany)** on 7 May 2010, 3:19 a.m.,*
in response to message #1 by Raymund Heuvel

I know it is not what you asked for, but what do you want them for ? I made some measurements with a LA of the HP-71B bus for a RAM expansion board I made last year, but it seems, now that I look for them, that the files are gone :(. The BUS is described in the hardware manual for the HP-71B (it is in the museum's CD collection). I can make the measurements again, it is not a problem. If you plan on some hardware I'd recommend you use level shifters (like the 1T45 from TI) because the voltage swings from 0 to 6V outside the commonly-used-today CMOS chips. (Unless you use the 4xxx series, of course).

Re: HP71B - Bus

*Message #3 Posted by **Raymund Heuvel** on 7 May 2010, 9:56 a.m.,*
in response to message #2 by Alejandro Paz (Germany)

Hi Alejandro

I have created a "Software" HP-71 Bus and as a feature I think about a "Logic Analyzer" function presenting the HP-71 Bus signals.

So no Hardware.

Does the Bus description in the IDS match the reality?

Thanx and BR

Raymund

Re: HP71B - Bus

*Message #4 Posted by **Alejandro Paz (Germany)** on 7 May 2010, 10:22 a.m.,*
in response to message #3 by Raymund Heuvel

Yes it does. I can post a trace image if you (still) want it. What is your program for ? Are you writing an emulator ? (No problem if you do not want (yet) to tell).

Re: HP71B - Bus

*Message #5 Posted by **Hans Brueggemann** on 7 May 2010, 2:19 p.m.,*
in response to message #3 by Raymund Heuvel

hi raymund,
i am currently working on a RAM extension, too. i did some investigations on the HP-bus and it works very well according to the hardware IDS, chapter 2.1., 2.2, 2.3. i did not test 2.4. yet.
chapter 2.3.data transfer implies that single nibble transfers are possible, but i was never able to catch one in real life. maybe, someone (you?) can shed some light on as to whether there *are* single nibble data transfers, or always bytewise data transfers on the bus.
best regards,
hans

Hello Hans,

some PC addresses of ROM 2CDCC where the OS doing single nibble transfers. Behind the opcode I added the content of the data register at this time. All captures are made during the BASIC command line waiting.

```
0070A   C=DAT0  1       D0=#2F6E3
0EF86   C=DAT0  P       D0=#2E1FD
0EF90   C=DAT0  P       D0=#2E1FD
014CF   DAT0=C  1       D0=#2F81F
0150D   C=DAT0  S       D0=#2F81F
01B71   DAT0=C  1       D0=#2E3FF
```

Cheers

Christoph

Re: HP71B - Bus

*Message #7 Posted by **Hans Brueggemann** on 10 May 2010, 1:20 p.m.,*
in response to message #6 by Christoph Giesselink

christoph,
the reason why i was asking is as follows: *if* it would have been a simple bytewise "affair" it would have been easy to collect two nibbles from the bus in a single 8 bit latch and then write the data in one step into a bytewide RAM. however, if there is a nibble-wide piece of data to be stored in RAM, then one has to a) read 1 byte from RAM into latch, b)modify contents of latch with previously read nibble, c)write back byte in latch into RAM.
thus, the "1 nibble scenario" requires more process-cycles than the "always 1 byte scenario".

schade eigentlich. aber danke fuer die info!
best regards,

hans

Re: HP71B - Bus

*Message #8 Posted by **Christoph Giesselink** on 10 May 2010, 2:47 p.m.,*
in response to message #7 by Hans Brueggemann

Hans,

there's a more worse scenario: writing a byte to an odd Saturn address!

When you have a look onto the Yorke chip signals inside the HP48GX you always see two read cycles when you write a byte to an odd address in RAM.

Life is hard. ;-)

Cheers

Christoph

Replacing HP35s batteries

*Message #1 Posted by **Dave Shaffer (Arizona)** on 4 May 2010, 1:45 p.m.*

My '35s batteries are low (low battery indicator on, but it will turn on and do a calculation or two and then turn off).

I scrounged around and found only 1 fresh CR2032 in the house.

Does it make sense to put in just one new battery until I can get another, or will I just kill it prematurely? i.e. is it charging up the old, worn out one? Or, should I take out the old one?

I tried taking out the old battery, and the calculator seems to run OK with just a single battery installed, at least for simple arithmetic, and I don't use it that much.

I know we have discussed the battery arrangement in the 35S before, and have bemoaned the fact that they are not all that well isolated from each other.

> ...but the item was *sold* without proper title and that makes it a bit different...under California law...

It was lost into public domain, Apple was called about it and claimed it was not theirs. Therefor it became property of the founder, and the founder did his legal requirement of reporting it found with AppleCare. Corporate Apple asked for it back, they were told they can have it back. Then and only then was the guy arrested. Gizmo is going after this in court now as it is well documented on their side

that they did not break any laws.

Dimitri

>
> [Blah Blah Blah Address]
>
> Happy to have you pick this thing up. Was burning a hole in our pockets. Just so you know, we didn't know this was stolen [as they might have claimed. meaning, real and truly from Apple. It was found, and to be of unproven origin] when we bought it. Now that we definitely know it's not some knockoff, and it really is Apple's, I'm happy to see it returned to its rightful owner.
>
> P.S. I hope you take it easy on the kid who lost it. I don't think he loves anything more than Apple.

And yet police were still called in by Apple.

Whether or not its defined as a stolen good after the people at AppleCare said its not a iPhone to the person who found it counts as reporting it is a court issue but it seems to me he did try to get it back to its owner. Better then giving it to the bartender or bar maid that is for sure.

But I am pretty sure it will go to Gizmo being in the right as they already showed before the raid they do not intend to keep the lost property.

Dimitri

I don't think the police raid was about a stolen phone, whether returned or not. After all, the REACT team participated in the raid. It was about suspected computer crime.

> I don't think the police raid was about a stolen phone, whether returned or not. After all, the REACT team participated in the raid. It was about suspected computer crime.

Suspected computer crimes? The REACT team raided his home for the stolen phone as the official reason. Apple is on the teams steering committee. This is not the first time the REACT team was used to the benefit of its steering industrial committee. Unless of course the REACT team suddenly becomes responsible for finding every stolen sell phone in California. Perhaps then Apple really didn't have anything to do with it. But REACT's track record shows otherwise.

I just think this is over the top. Apple got its phone back after a employee lost it in a bar without Gizmo asking for a reward and police were still called in. If you or I lost our HP-41 and someone had purchased it and then when we said it was ours gave us it back. Do you think the Police would have done anything?

Dimitri

Re: Ex HP Calculator PR Guy on Corporate Leaks and Apple

*Message #11 Posted by **Manatee** on 5 May 2010, 7:50 p.m.,*
in response to message #1 by Howard Owen

I've been an Apple fan since the dawn of OS X. I like the products, and I used to like the aura. Over the course of my fandom, though, I've seen the rebel outsider turn into the establishment. Not that the products aren't great, but their carefully-crafted marketing image doesn't work on me anymore.

In the case of this nabbed prototype, I'm not sure where the pieces fall legally, but I applaud the finder (who knew what he'd found) and Gawker Media (despite knowingly paying for properly they knew had a very interested owner somewhere) for making the device public. It's become a big game to "out" Apple's tightly-held secrets, and this time the outsiders (the *real* outsiders) prevailed. When Steve shows the new device, with the usual Keynote presentation, everyone will know the story and the details, and there will be a little uneasiness in the room.

Oh, and this all comes on top of Apple's "iAd" product, where advertisers pay them big money to embed ads inside their applications. That's the end of any semblance of Apple's radical, crunchy affectation. Now they're

just like all the other big players.

But anyway, I'm looking forward to the arrival of my HP-16C tomorrow. I'll have to put the iPad aside for a while.

*Message #12 Posted by **Israel Otero** on 5 May 2010, 9:15 p.m.,*
in response to message #11 by Manatee

Hello from Puerto Rico That is why I embrace technologies that allow people to have the best tools to their needs and not to be controlled by any business PR leader. As a fan of HP calculator myself, I use my HP-50g nearly daily, because as I have an engineer oriented mind that made love the freedom and power that comes from that platform. I admired HP during the 80s to be a company that put quality and seriousness of purpose above monetary gain. I have an iPhone and a Mac OS X computer. I have each of those because each one have it's merits. But mainly as something to be experienced and comprehended to be aware on the hardware industry is going but too restrictive to be of my liking. Those worked admirably and are masterpieces of design by a mentality that puts money to their pockets first and customer's second. Last year I got on the Ubuntu Linux bandwagon because it brings that freedom, stability and power that I love from my HP-50g with minimal investment on my behalf. The reason is that Ubuntu is becoming fairy easy to install and is based on the best known legacy operating system like UNIX that brought all of these like the Internet, Networking, Apple and Open Source.

IBM 5100 book

*Message #1 Posted by **Don Shepherd** on 3 May 2010, 7:21 p.m.*

The recent forum discussion of the IBM 5100 made me look in the book that, I believe, was the "bible" for the 5100: "The IBM 5100 Portable Computer" by Harry Katzan, Jr. I found something interesting on page 71 of this book:

> Quote:
>
> Nothing that is done from the keyboard can physically damage the 5100 Portable Computer. The worst thing that can happen from "indiscriminate button pushing" is that the user may alter a program or data in main storage.

Now, main storage went away when the power was turned off, so it appears that "button pushing" could only affect main storage, not any hardware or program libraries (which, I believe, resided on mag tapes), or the storage containing the operating system and BASIC and APL languages.

Interesting concept in 1977.

Re: IBM 5100 book

*Message #2 Posted by **Steve Leibson** on 3 May 2010, 7:59 p.m.,*
in response to message #1 by Don Shepherd

The 5100 stored the OS and language in ROM, as did all HP desktop calculators from HP's Calculator Products Division in Loveland, Colorado starting with the HP 9810A, which was introduced in 1971. (The HP 9100 also used a ROM for code, but the ROM was a 16-layer pc board.) The reason for this "innovation" in code storage was cost. Masked ROM was much, much cheaper than RAM in the 1970s. Even today, DRAM is 4x more expensive per bit than Flash EPROM. The downside back in "the olden days" is that the released code had better be bug free, because you couldn't download new ROM contents. First, the Masked ROM wasn't changeable. Bits were permanently set at manufacturing time. Second, the whole idea of "download" at the then-current maximum speed of 300 bits/sec (as in 0.3 kbits/sec or 0.0003 Mbits/sec) over an acoustic coupler was laughable. Not only was it slow, but the code required to support the download would have occupied too much ROM.

Steve, that raises an interesting question. My Apple][+ had a ROM that, I believe, contained the OS and Integer BASIC and Applesoft BASIC. I think my Mac 128k was built the same way, OS in ROM.

What's the current standard for PC's? I gather that most, if not all, of Windows is on disk and loaded as

needed into RAM. Is there any ROM on modern PC's?

Re: IBM 5100 book

*Message #4 Posted by **Mark Storkamp** on 3 May 2010, 11:28 p.m.,*
in response to message #3 by Don Shepherd

There are typically 3 programs in ROM on a PC. The BIOS (Basic Input Output System) consisting of POST (Power On Self Test) that finishes by reading the first sector of the drive selected in Setup into a fixed location in memory and transferring execution into that routine, as well as routines for accessing the keyboard, HDD, floppy, serial port, clock &c. Secondly there's the Video BIOS for doing basic character and low resolution graphics to the terminal. Finally there is Setup, which is used to configure the hardware. There may, on some systems, be a bit more, but the OS is always (on modern PCs, of course someone will post the exception) loaded either from storage or through a network connection.

Little correction

*Message #6 Posted by **Frank Boehm (Germany)** on 4 May 2010, 4:16 a.m.,*
in response to message #4 by Mark Storkamp

First: more and more manufacturers tend to put a trimmed-down LINUX into the BIOS, so the PC can be used as an "instant-on" multimedia player.
Second: the ROM usually contains a flashing utility nowadays; some "heavy irons" even come with built-in diagnosis tools (that's software way beyond POST and boostrap)
Third: as pointed out, software in ROM better had to be bug free - which rarely happens. While the BIOS resides in an updatable FLASH chip, the CPU itself carries a lot of code in ROM as well - which cannot be altered. So they opted for a clever solution: the CPU itself has a boot code which looks for microcode updates, these are put into the BIOS or OS.

*Message #7 Posted by **Egan Ford** on 4 May 2010, 9:39 a.m.,*
in response to message #3 by Don Shepherd

Both my Apple][+ and Mac 512K required a boot diskette (DOS 3.3 or System x.y) and that was the 'OS'. OS in both cases being the code that allowed a user to interface with the computer to create and manage content. I'd wager that 90+% of the code in the 'OS' called ROM routines.

in response to message #9 by Egan Ford

Saving and load programs to/from cassette tapes was brutal in retrospect, but at the time I was thrilled to have a computer I could write programs on at all, at home! I loved that Apple. And it would boot in, I don't know, maybe 5 seconds from power on to prompt. Compare that with my current Windows XP which lately I just turn it on and go away for awhile while it does all of its startup things, and I come back in 10 minutes when I can get some real work done without waiting. Now THAT's brutal!

Well, Don, a slight exaggeration. My Windows 7 shows about 46,000 files in the Windows directory (I still haven't gotten used to 'folder'). This includes a lot of unused stuff and files added by the programs I have installed. The original PC-DOS had only a few required files.

Anyway, your point is well taken about the complexity and opaqueness to even the technophiles. At this point I stop, before lapsing into yet another exposition on How Much Technology Do We Really Need?

Re: IBM 5100 book

*Message #18 Posted by **Don Shepherd** on 5 May 2010, 11:49 a.m.,*
in response to message #17 by Martin Pinckney

Yeah, my Windows directory contains just over 36,000 files. My PC is about 7 years old, running XP. It would be interesting to see a graph of

the number of files in the Windows directory by age of computer. Or maybe size of registry vs. age of computer.

My first major use of DOS was 3.3, and it fit on a single 5.25" low-density (360K?) floppy disc, and booted faster than modern computers with huge OSes on hard disc.

It's an under-appreciated fact that the ROMs have a lot to do with why the IBM PC was cloned and the Mac was not. As a result, IBM quickly lost all control of the machine that they created and Apple did (and does) keep an tight grip of their hardware.

After the PC came out, several companies reverse-engineered the ROMs in a clean-room environment. This is perfectly legal. And since IBM allowed Microsoft to sell the OS to other manufacturers, it quickly became possible to create an IBM clone.

In contrast, the Mac ROMs were much larger (4MB around 1990 as I recall), so a good chunk of the OS ran from ROM. It wasn't practical to reverse engineer that much code so no one did, at least not

successfully.

The][+ came with Applesoft BASIC in ROM. But you could load a copy of Integer BASIC into RAM and have both resident at the same time. (You could do that with the original Apple][as well, but there it was Applesoft in RAM.) The new ROMS were missing some features that the old Integer BASIC ROMS provided. But I know I used the mini-assembler on my Apple //e, so there was some way to get the feature back. I don't recall if it was included in the Integer BASIC disk image or not.

I suppose technically it's not the keyboard, but I do know of a case where a 5100 was physically damaged by using a switch on the outside of the box.

I belonged to an Explorer Post which did the scorekeeping for the local Klondike Derby. That's where groups of Boy Scouts pull sledges through the snow and do Scout-types of things. Being sponsored by IBM, we had a couple of 5100s. We also had a stone-and-log cabin with fireplaces blazing at both ends, instead of tents like everyone else. We endured quite a bit of ribbing for being softies.

One morning, to demonstate our operation to the bigwigs, we fired up one of the 5100s before the cabin had warmed up. Sizzle! Pop! Sparks flying!

After destroying $14000 worth of computer gear, we didn't hear any more complaints about our being coddled in our cabin.

Reverse engineering the 12C+

*Message #1 Posted by **Scott Newell** on 3 May 2010, 2:13 a.m.*

I mapped out the display and keypad today, which was enough to get the 20B hex 4 banger project ported and running. No power management at all, yet.

I'm still fiddling with the LCD settings, but so far, so good.

My biggest failure was the debug UART--I simply couldn't get it to transmit. Ended up turning the CPU clock rate way up and bit-banging a 9600 baud output, which allowed me to decipher the display and keypad. (Probably something dumb that I forgot to configure, but it doesn't really matter now.)

Now for the tough parts...

Re: Reverse engineering the 12C+

*Message #2 Posted by **BruceH** on 3 May 2010, 9:01 a.m.,*
in response to message #1 by Scott Newell

According to the wiki there is an SDK that contains a simple 4-banger as an example. Does this not already have the keyboard mapped out?

Re: Reverse engineering the 12C+

*Message #3 Posted by **Scott Newell** on 3 May 2010, 10:02 a.m.,*
in response to message #2 by BruceH

I don't have a 12C+ SDK, and it looks like I (probably?) won't need one. I enjoy figuring out the hardware.

What is wrong with this HP-19C

*Message #1 Posted by **Michael de Estrada** on 2 May 2010, 11:04 p.m.*

I spied this HP-19C on TAS. It's obviously got a problem, but I wonder what. Bad ACT? Anyway, here it is:

HP-19C on TAS

Re: What is wrong with this HP-19C

*Message #2 Posted by **Michael Meyer** on 2 May 2010, 11:32 p.m.,*
in response to message #1 by Michael de Estrada

Probably. The 19C is essentially a Woodstock. Powering it up without a good battery could result in burning out the ACT and other components, such as the continuous memory chips and even the ROM chips. This would result in the flashing display.

Re: What is wrong with this HP-19C

*Message #3 Posted by **Michael de Estrada** on 2 May 2010, 11:44 p.m.,*
in response to message #2 by Michael Meyer

Yeah, so sad. These are so rare anyway, and then to see that most of them are fried is truly a shame. Fortunately, I have one that works perfectly, but am always worried about charging the batteries inside the calculator.

Re: What is wrong with this HP-19C

*Message #4 Posted by **Michael Meyer** on 3 May 2010, 1:41 p.m.,*
in response to message #3 by Michael de Estrada

BTW, occasionally these will power up O.K. when a regular battery is put in place if it hasn't been burned out yet. That's why I'll bid some for it, but I won't go too high... it's not worth it if it's only going to be a parts machine. But, I had to mention... there's a chance it COULD still work.

MBK-04 EPROM Box

*Message #1 Posted by **Juergen Keller** on 2 May 2010, 5:06 p.m.*

A while ago I've got an MBK-04 EPROM Box for the HP-41. The name implies that it can provide 4K ROM (1 page). As the box is nearly as large as the HP-41 this seems not be not very much. Does anybody have documentation about this EPROM box?

There are 3 EPROMs installed, from two different manufacturer, one is a TMS2764JL45. I guess such EPROMs can still be bought somewhere. Does anybody know a good source?

To burn my own ROMs I would need a suitable EPROM programmer. Hmm, don't know much about such devices. Can anybody advise me?

Any help highly appreciated!

Thank you, Juergen

About EPROM programmer

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 2 May 2010, 7:06 p.m.,*
in response to message #1 by Juergen Keller

Halo, Juergen;

I bought a very good programmer some months ago and I am completely satisfied. I was searching for some schematics or related information so I could build my own, but I found all I need and a bunch more with Elnec´s BeeProg+. If you want to go ahead programming other devices, I think this has one of the best cost/benefit ratio.

About the MBK-04 EPROM box: I do not know it, have never see. Any chance that you could post some pictures? Are you aware of any e-place I could find pictures as well?

Thanks and success!

Luiz (Brazil)

Re: About EPROM programmer

*Message #3 Posted by **PeterP** on 2 May 2010, 7:11 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

I don't know for sure - maybe Diego can pitch in - but I think the programmer we use for his PICs could also be used for EPROMS and is significantly cheaper. I once searched for EMPROmmers as well and I think I found one that has the EPROMS the HP-41 boxes use listed as 'can be programmed' and was btw 50-100 usd. Maybe a google with the EPROM type and EPROM programmer can lead you to similar results... Sorry, I don't have the exact info handy right now, I'm on the road...

Cheers

Peter PS: I do have the MBK box alas without any memory, but when I get home I will check on how many pages it covers.

Re: About EPROM programmer

*Message #4 Posted by **Diego Diaz** on 5 May 2010, 8:59 p.m.,*
in response to message #3 by PeterP

Hi all,

Peter, the bad news are that USB PIC programmer used for Clonix and NoV's is just for PIC microcontrollers which programming procedure is way different from EPROM's.

There are plenty of EPROM (and many other devices) programmers available, and even the cheapest will make a good job for a hobbist purposes.

Googling (or "eBuy-ing") for "EPROM programmer" will show a nice bunch of'em.

My advice: get one with USB interface. :-)

Oh, please don't forget you'll also need an UV eraser if you're about to play with EPROM's.

Cheers from the Caribbean.

Diego.

Re: MBK-04 EPROM Box

*Message #5 Posted by **Winfried Maschke** on 2 May 2010, 7:12 p.m.,*
in response to message #1 by Juergen Keller

I should be the best source for information about it as you will still find my name on the PCB ;)

It is labled MBK 04 because it was the 4th PCB layout made by me for MBK. It can be used with EPROM-Sets from 4K to 32K. There are some informations about the setup and the EPROM-Sets on my website http://maschke.de/hp41/ under MBK-32 EPROM-Box, which was the real name of the box.

The EPROM-Sets are split into 2 upper and 8 lower bits like it was standard at that time.

More questions?

Small Sunday Afternoon Mini-Challenge

*Message #1 Posted by **Gerson W. Barbosa** on 2 May 2010, 4:22 p.m.*

Let's define a factorial-like function, and for lack of a better name let's denote it x?:

```
x? = 1 * 1.5 * 2 * 2.5 * 3 * 3.5 * ... * (n - 0.5) * n
```

Thus,

```
  2? = 1 * 1.5 * 2 = 3

3.5? = 1 * 1.5 * 2 * 2.5 * 3 * 3.5 = 78.75
```

Write a small program to compute this function on your HP calculator of choice. Smallest programs win (least size in bytes or number of steps) for each calculator. RPN programs should not destroy register X. So far I have a 9-step program for the 12C and most scientific RPN calculators (LBL and RTN and final GTO 00 don't count) and a 16.5-byte program for the 32SII, but I hope you can improve this. Searching through the internet for reference is allowed and encouraged.

The function can be generalized for real arguments other than those ending in 0.5. So,

```
3.333333? = 51.0575911879

(2 * pi)? = 668840.999380    (bold digits not correct)
```

(the HP-12C program will not handle these).

Gerson.

Re: Small Sunday Afternoon Mini-Challenge

*Message #2 Posted by **Patrice** on 2 May 2010, 7:20 p.m.,*
in response to message #1 by Gerson W. Barbosa

Hi all,

Here is my quick and dirty answer.

My little analyse gives:

```
x? = 1 * 1.5 * 2 * 2.5 * 3 * 3.5 * ... * (x - 0.5) * x
```

transforms to

```
x? = 1 * 2/2 * 3/2 * 4/2 * 5/2 * 6/2 * 7/2 * ... * (2x - 1)/2 * 2x/2
x? = 2 * 2x! / 2^2x
```

and the program on my 41C gives:

```
01 LBL A
```

```
02 2
03 *
04 FACT
05 2
06 LASTX
07 Y^X
08 /
09 2
10 *
11 RTN
```

Without the GAMMA function, generalizing the program is not very easy.

Patrice

Re: Small Sunday Afternoon Mini-Challenge

*Message #4 Posted by **PeterP** on 2 May 2010, 7:48 p.m.,*
in response to message #2 by Patrice

I think you can actually save 2 steps hence beating Gerson's 9 step program. However I was not sure what he meant by 'the x register should stay undisturbed' (which this version does not do and I was not able to find an elegant way of preserving the stack without burning up 2 or more steps which would then be the same 9 steps or worse that Gerson had already...)

```
00 LBL A
01  St+ X
02  FACT
03  2
04  LASTX
05  Y^X
06  /
07  St+ X
08 END
```

Re: Small Sunday Afternoon Mini-Challenge

*Message #5 Posted by **Gerson W. Barbosa** on 2 May 2010, 10:41 p.m.,*
in response to message #4 by PeterP

> Quote:
>
> However I was not sure what he meant by 'the x register should stay undisturbed'

I just wanted to preserve at least the X register so that chained calculations could be done more easily, for instance, in order to obtain

```
2.2? * 3.3? = 198.171558303
```

I do on my 33s

```
2.2 XEQ Y 3.3 XEQ Y *
```

I am glad you and others were able to find a solution so soon. I didn't think of using the HP-41. I think an even smaller program is possible on it, but I'll leave that for you.

Interestingly on the 33s my 9-step solution is 69 bytes long while the 51-byte one is 11 steps long, but that has to do with the number of bytes required by numeric constants.

Regards,

Gerson.

Edited to correct a typo

Re: Small Sunday Afternoon Mini-Challenge

*Message #6 Posted by **Paul Dale** on 2 May 2010, 11:37 p.m.,*
in response to message #4 by PeterP

The 20b scintific load out can do this in one step less and one stack level less:

```
001: LBL B
002:  STO+ X
003:  x!
004:  LASTx
005:  2^x
006:  /
007:  STO+ X
008: RTN
```

Unfortunately, I don't see how to do any better.

- Pauli

Re: Small Sunday Afternoon Mini-Challenge

in response to message #2 by Patrice

Hello Patrice and all,

Congratulations to all of you. Now let's wait and see if one step or two can be saved (keep the X register).

Quote:

> Quote:
>
> Without the GAMMA function, generalizing the program is not very easy.

You're right. The HP-42s has GAMMA and other scientific HP calculators have Gamma(x+1), that is, x! or PI(x), which I prefer. On the 15C just replace FACT with x! and you're done (see Hugh's program). By the way, those who like pi might like the following triple pi expression:-)

```
18*PI(PI(pi)) = 132850.000038
```

Regards,

Gerson

Re: Small Sunday Afternoon Mini-Challenge

*Message #8 Posted by **Angel Martin** on 3 May 2010, 12:45 a.m.,*
in response to message #7 by Gerson W. Barbosa

There's a Gamma function available on the SandMath-5 Module for the 41 platform.

Cheers, AM.

Re: Small Sunday Afternoon Mini-Challenge

*Message #9 Posted by **Gerson W. Barbosa** on 3 May 2010, 7:14 p.m.,*
in response to message #8 by Angel Martin

¡Hola Ángel!

Then this should work like it does on the 42s:

```
01 LBL "?"
02 STO+ ST X
03 1
04 +
05 GAMMA
06 2
07 STO- ST L
08 LASTX
09 Y^X
10 /
11 RTN
```

Regards,

Gerson.

Edited to save one step: STO+ ST X instead of 2 * :-)

Edited: 3 May 2010, 7:23 p.m.

Re: Small Sunday Afternoon Mini-Challenge

*Message #10 Posted by **Ángel Martin** on 5 May 2010, 10:59 a.m.,*
in response to message #9 by Gerson W. Barbosa

It works like a charm :)

Best, ÁM

Re: Small Sunday Afternoon Mini-Challenge

*Message #11 Posted by **hugh steers** on 2 May 2010, 7:32 p.m.,*
in response to message #1 by Gerson W. Barbosa

ok. 15C

```
LBL A
2
*
STO 0
x!
2
RCL 0
1
-
Y^X
/
RTN
```

that's 10 without the bumpers.

also, using this (might help others)

```
function moo(n)
   return math.factorial(2*n)/math.pow(2,2*n-1)
end
```

i get

```

*Message #13 Posted by **Namir** on 3 May 2010, 10:33 a.m.,*
in response to message #1 by Gerson W. Barbosa

Gerson,

Does the function you are proposing in the challenge have any interesting properties? Does it solve any particular kind of equations?

Maybe we can call it the Shift Factorial function, defined as:

SFact(X, s) = 1 * (1 + s) * (1 + 2d) * (1 + 3d) * ... * (1 + n*s) * X

Where s is the shift factor and x > (1 + n*s) for some integer value of n.

In the case the shift factor s = 0.5, we have the function you defined.

SFact(X,0.5) = 1 * 1.5 * 2 * 2.5 * 3 * 3.5 * ... * X

In the case s = 0.25

SFact(X,0.25) = 1 * 1.25 * 1.50 * 1.75 * 2 * 2.25 * 2.5 * ... * X

The smaller s the larger SFact is for the same value X.

Of course if s > 1, say 2 we have:

SFact(X,2) = 1 * 3 * 5 * 7 * ... * X

And when s = 1, the SFact function is equivalent to the factorial function.

Namir

> Quote:
>
> Does the function you are proposing in the challenge have any interesting properties?

I think its properties are similar to those of x!. For instance,

```
(1/2)! = 1/2*sqrt(pi)              (1/4)? = sqrt(pi/2)

                                   (3/4)? = 3/4*sqrt(pi/2)

(3/2)! = 3/4*sqrt(pi)              (5/4)? = 15/16*sqrt(pi/2)

                                   (7/4)? = 105/64*sqrt(pi/2)

(5/2)! = 15/8*sqrt(pi)             (9/4)? = 945/256*sqrt(pi/2)

                                  (11/4)? = 10395/1024*sqrt(pi/2)

(7/2)! = 105/16*sqrt(pi)
```

```
 and so on ...

1, 3, 15, 105, 945, ... are double factorial numbers (OEIS A001147)
```

> Quote:
>
> Does it solve any particular kind of equations?

None that I am aware of.

Regards,

Gerson.

```
   (5/8)¡ = 5/4*sqrt(pi/4)
   (7/8)¡ = 35/32*sqrt(pi/4)
   (9/8)¡ = 315/256*sqrt(pi/4)
  (11/8)¡ = 3465/2048*sqrt(pi/4)
  (13/8)¡ = 45045/16384*sqrt(pi/4)

a)   (15/8)¡ = ?
b)  How is ¡ defined?
```

Anyone?

Edited: 6 May 2010, 11:38 a.m.

Re: Small Sunday Afternoon Mini-Challenge

*Message #16 Posted by **Paul Dale** on 6 May 2010, 9:45 p.m.,*
in response to message #15 by Gerson W. Barbosa

Since nobody has commented yet, I'll do part a:

```
  (15/8)¡ = 675675/131072*sqrt(pi/4)
```

Assuming I am correct, the fraction portion on the right is multiplied by the fraction on the left we're going to.

i.e. (n/8)¡ = n/8 . ((n-2)/8)¡

Unfortunately, part b is eluding me. I'm not in a very thinking mood at the moment but I should have been able to make more progress than I have :-(I suspect the double factorial function x!! is involved but haven't figured out how yet.

Re: Small Sunday Afternoon Mini-Challenge

*Message #17 Posted by **Gerson W. Barbosa** on 8 May 2010, 11:02 a.m.,*
in response to message #16 by Paul Dale

Hi Paul,

You have noticed

```
16384 * 13/8 * 3465/2048 = 45045

131072 * 15/8 * 45045/16384 = 675675

So the next term will be

1048576 * 17/8 * 675675/131072 = 11486475
```

which of course is correct. Hadn't seen it.

I've found a way to express this sequence in terms of the Gamma Function:

```
a(n)=(2^(2+n)*Gamma(n+5/2))/(3*sqrt(pi))
```

Thus

```
a(6)=(2^(2+6)*Gamma(6+5/2))/(3*sqrt(pi)) = 675675

a(7)=(2^(2+7)*Gamma(7+5/2))/(3*sqrt(pi)) = 11486475
```

However, your insight is right: this can be expressed in terms of the double factorial function and the equivalent expression is more elegant and simple.

Part b is more a guessing game rather than a thinking game. If

1 * 2 * 3 * 4 * 5 * 6 ... * n produces special values at 1.5, 2.5, 3.5, 4.5 ... all involving sqrt(pi)

and

1 * 1.5 * 2 * 2.5 * 3 * 3.5 * ... * n produces special values at 1.25, 1.75, 2.25, 3.75, ... all of them involving sqrt(pi/2)

then you can guess what function will produce special values involving sqrt(pi/4) at 1.125, 1,375, 1,625, 1,875, 2,125 ...

Gerson.

*Message #18 Posted by **David Hayden** on 3 May 2010, 4:17 p.m.,*
in response to message #1 by Gerson W. Barbosa

I believe that the solutions presented will all overflow on some inputs, even when the final result can be represented within the precision of the calculator. This is because the solutions compute a large numerator and then divide by a large denominator.

Can you come up with a solution that will always give an answer if the actual answer can be represented within the precision of the calculator? How accurate is your answer? How much time does it take to compute?

Dave

Re: Small Sunday Afternoon Mini-Challenge

*Message #19 Posted by **Namir** on 3 May 2010, 4:59 p.m.,*
in response to message #18 by David Hayden

Maybe we should switch to the logarithm form of the function, thus end up adding logarithms instead of multiplying numbers. This way the sum does not overflow as quickly as the product of numbers.

Re: Small Sunday Afternoon Mini-Challenge

*Message #20 Posted by **Paul Dale** on 3 May 2010, 5:05 p.m.,*
in response to message #18 by David Hayden

For the 20b scientific firmware:

```
001: LBL B
002:  STO+ X
003:  1
004:  x<>y
005:  +
006:  LNGAMMA
007:  LASTx
008:  2
009:  -
010:  2
011:  LN
012:  *
013:  -
014:  e^x
015: RTN
```

Not as short or neat but handles a larger range of positive inputs.

- Pauli

in response to message #18 by David Hayden

> Quote:
>
> Can you come up with a solution that will always give an answer if the actual answer can be represented within the precision of the calculator?

By definition x? = 1 × 1.5 × … (x-1) × (x-.5) × x

Patrice shows that x? = 2 × (2x)! / 2^{2x}

But this formula is, as you just state it, a ration of two large values and may not produce a correct answer even if actual result is within the precision of the calculator.

But Patrice give the correct recurrent formula : x? = 1 × 2 / 2 × 3 / 2 × 4 / 2 × 5 / 2 × 6 / 2 × 7 / 2 × ... × (2x - 1) / 2 * (2x) / 2

The trick is to divide by 2 after each multiplication from 2x down to 1.

This is my attempt for a RPN code (for HP97)

```
000
001     21 11   *LBL A
002        02     2
003       -35     ×
```

```
004     35 46    STO I
005  16 25 46  f DSZ I
006     21 09   *LBL 9
007        02     2
008       -24     /
009     36 46    RCl I
010       -35     ×
011  16 25 46  f DSZ I
012     22 09    GTO 9
013        51    RTN
```

I was able to obtained result up to 41? Without any overflow error. This is not so bad, when considering that 70! Is already out of scope (> 9.999999E+99).

OT - PC's: a tool in search of a need

*Message #1 Posted by **David Hayden** on 2 May 2010, 8:02 a.m.*

Reading the thread about the IBM 5100 made me recall the early days of the PC. The commercial showed a real estate agent and a farmer doing calculations - in BASIC. These were the days before spread-sheets had been invented.

Basically, these machines where tools in search of a use as I recall. Am I right, or just imagining things?

To me, the biggest example is the home PC. From the beginning, it seemed that the PC makers were trying to get computers into the home, but they just couldn't seem to sell them. Those pesky users kept putting them on their desks at work instead.

As I recall, it was the CD-ROM and "multimedia PCs" that finally cracked the home - mostly because parents bought them for their children. Having a word processor and computerized encyclopedia gave the kids an advantage at school.

Circling back to calculators, someone pointed out recently that their old HP calculator (it may have been a 67) was as useful today as it was when he bought it. I think that's quite true. An HP 41 from 1980 is a lot more useful today than a dual-floppy IBM PC with PC-DOS 1.0.

Dave

*Message #3 Posted by **Don Shepherd** on 2 May 2010, 9:27 a.m.,*
in response to message #2 by Paul Dale

One of the early proposed "uses" of PC's in the home was "you can store your menus on them." Remember that? Lame.

Games were certainly one of the reasons that computers in the home became more prevalent; Internet was another huge reason. But games seem to haved jumped to dedicated gaming platforms these days. Remember all the Egghead software stores of the 80's and 90's? I haven't seen one in years, but I used to buy interesting computer-based games there. I think Flight Simulator 2004 was the last game I bought for my PC, and I still enjoy it.

Steve Jobs was in the news last week for criticizing Adobe and its Flash, saying it was made for the PC era, and with the advent of the iPhone, iPod, and now iPad, apps like Flash need to be updated to support touch screen and mobile computing.

Is he right? Have we passed into a new era of computing, defined by wireless touchscreen technology and apps you must download from hosts like iTunes instead of writing your own applications on your device? I was interested in the iPad until I learned that you really can't "roll your own" software, like you can on the PC.

Will the PC, as we know it, become a relic like the HP-65? I think the answer is yes, but I think the business need for the PC will be around for years to come. I can't see businesses doing their payroll on an iPad.

A co-worker (another engineer) was extremely interested in the iPad for the same reason: he though you'd be able to "roll your own" software, but his interest in it evaporated when he found out you can't.

in response to message #4 by Garth Wilson

> Quote:

> I hate touch screens!

I haven't used them enough to have an opinion, for or against. On a calculator like the TI-NSpire, I think a touch screen would be preferable to the current navigation buttons. But to do the type of detailed things you would want to do on the NSpire, I think a stylus would be necessary.

I spent this past week training to be a census enumerator, and during the next few weeks we will visit homes that did not return their mailed census questionnaire. The Census Bureau originally planned to use handheld computers, manufactured by HTC and marketed by Harris in the US, for this operation. But, because they couldn't get the software ready and tested in time, we will be using paper forms, like all previous census's (we did use the handheld computers a year ago to record the location of every housing unit in the country, to create the mailing files, and they worked pretty well for that operation). Anyhow, the gal I sat next to during training had an iPhone. She showed me how you use its touchscreen to do things like run apps or zoom in/out or expand/contract the screen. I noticed the calculator app and opened it. It was a basic 4 function calc, but it seemed to have a lot of significant digits. If you tilt the device sideways, it turns into a scientific calculator. The touchscreen worked OK for that app.

It was interesting to use the iPhone for a few minutes, but I'm not going to run out and buy one. I'm sure she pays a lot more per month for phone and wireless Internet than I do for my basic cell phone (about $30), and I just don't need Internet access except on my desktop computer at home. But the younger generation is obviously enamored with these devices and is willing to pay the monthly fees associated with them.

Your co-worker needs to do a bit of research. Where do you think all the iPhone/iPad apps come from? Apple? No.

If you want to RYO iPad apps you just need to download the free SDK, you must have a Mac to use the SDK, and if you want to publish the app for yourself or others then you need to pay $99/year.

So you *can* RYO software, but at a cost.

That all said, you can write very interesting HTML5/JavaScript apps for the built-in browser at no cost (except your time and possibly sanity). Gmail is a great example of this. It is actually better than the on-board email app.

*Message #7 Posted by **Don Shepherd** on 2 May 2010, 1:58 p.m.,*
in response to message #6 by Egan Ford

Egan, I'd say the co-worker did the research (as did I) and he probably wasn't interested in

paying for a separate Mac computer to develop on or paying $99 per year to be able to run his own apps!

To develop and run your own apps on the PC, you have to do neither of these two costly things.

Re: OT - PC's: a tool in search of a need

*Message #8 Posted by **Egan Ford** on 2 May 2010, 2:03 p.m.,*
in response to message #7 by Don Shepherd

I understand that, but that is not what was stated. It was simply "can't".

BTW, the $99/year is only to publish. In principle, if you make no changes to your app, then you do not need to pay again. In practice, the OS changes so frequently, that you may need to recompile or change your app.

If you jailbreak your device you can develop at no cost and there is no restrictions. There is an alternative tool-chain. I do not have the exact details, but its only a Google search away.

BTW, by year-end there will be alternatives. The appeal with Apple products is the size of the audience. If you want to make a buck writing apps you are going to have to pay the Apple tax.

Apparently you can't do it on itself like you can a 41 or a PC. You have to have another computer, one he doesn't have and doesn't want to buy.

No, not for me. I couldn't care less how many iPads Apple sells. My interest is developing something for myself to use and play with on this new and appealing platform, not something I want to sell to the world. I've done this on virtually every small computer I have ever used, from the Apple][to the Mac 128k to the Mac SE to the Mac PowerBook, and finally to the PC.

Apple obviously is not addressing this particular type of user, probably because there aren't that many of us and they can make millions with their iTunes app store. More power to them, but I choose not to be a participant.

> > Apple obviously is not addressing this particular type of user, probably because there aren't that many of us and they can make millions with their iTunes app store. More power to them, but I choose not to be a participant.

What Apple is doing is not unique. I can think of very few embedded devices that were designed to be programmed on-board. I cannot think of a single hand-held device, sans a calculator, that was designed to be programmed and not just used. I cannot think of a single mass market mobile phone, gaming device, MP3 player, wristwatch, or PDA that has the ability to be programmed on-board. I know some exist, but they never really penetrated the mass market (e.g. Linux-based Zaurus).

As for cross-development, I think Apple is taking a cue from Nintendo, Sony, and other mobile platforms where you pay to develop and publish and it is controlled. If you think Apple is bad, read up on the Gameboy and PSP. Apple's model has made them a lot of coin that others (MS and Palm) envy. Others will follow.

That all said, you are 100% correct. Apple is not interested in the hobbyist market. There will be a number of Andriod-based tablets soon. I think you'll find them to your liking. To each their own.

BTW, I am not defending Apple, just stating the facts. I have an iPad, and have no interested in creating apps for it. I purchased it as a replacement for paper media. The form-factor and battery life make it the perfect travel companion for me to catch up on my reading and Tivo'd videos. I spend ~80 hours a month in public transportation (writing this from the airport) and a notebook is just too cumbersome for digesting media. The lack of a stylus is my only beef. I cannot create content in an appealing way without a stylus. I'll be dumping the iPad for the first decent tablet with both touch and stylus input.

IMHO, current touch-based devices are most useful for communications and consuming content (web, games, video, music, apps, etc...), i.e. limited purpose. General purpose systems (for now) will still rein for creating content, especially for limited purpose devices. I would not consider the iPad suitable for writing a novel, a web page, or for writing a program.

IMHO, computers (i.e. anything with an OS) have moved beyond their primary purpose of increasing productivity to consuming content (reduction in productivity :-). As I look around my home at everything with an OS (embedded systems too), I'd have to say the majority are used for communications or to consume some type of content.

Today there are more and more consumers of information and computers to facility that consumption, so your speculation that this may define *computing* in the future may be correct. But, I think it will more accurately define communications and media.

Egan, this is very well put. In my business, engineering design, we still use computers for creating (productivity), instead of consumption (as you said, the opposite of productivity). It almost seems that the off-the-shelf computers more and more come with features that interfere with productivity rather than enhance it.

Only if your a follower of "The hippy nation" ie Apple. Otherwise for 550$ you can get a Archos 9 with Windows 7, enjoy Flash, multitasking, USB and other useful features that the iPad lacks.

Currently typing this on the Archos 9, had one for a few months now. I am waiting for other devices that are similar to come out. There should be a flood of them in the next year.

> To me, the biggest example is the home PC. From the beginning, it seemed that the PC makers were trying to get computers into the home, but they just couldn't seem to sell them. Those pesky users kept putting them on their desks at work instead.

My first computer was an Apple][+ that I obtained in 1985 at age 17. I had a *need*. I wanted to program, and access to my school's computer labs was limited. Many starting with the Altair had the same *need*.

However, I'll agree that programming was not the targeted need by late 70's and early 80's commercials (or today's commercials). My parents and many of my friends parents had computers primarily for personal finance and word processing. Or at least that was the *need*. I think my father logged more time playing flight simulations. My mother did use the computer for word processing (work (legal) related) as did I for papers. That was another *need*--a powerful typewriter replacement.

IMHO, many just wanted to explore the possibilities of having a computer, as you put it, "a tool in search of a need".

Apple sold about 5-6 million Apple IIs. Commodore sold about 30 millions C64s. The only thing I'd ever seen a C64 user do is play games. IMHO, it was games that was the ultimate *need*. The use of PC's for gaming contributed to the *Video Game Crash of 1983*. There is no doubt that it was games that got more computers into people homes. It's applications that sell computers, not the HW. The platforms with fewer games failed.

*Message #19 Posted by **Thomas Okken** on 2 May 2010, 1:59 p.m.,*
in response to message #1 by David Hayden

PCs were never tools in search of a need. By the time IBM introduced the first PCs, people had been using Intel 8080-based machines running CP/M, and of course Apple IIs, for years, and there was a lot of productivity software for them -- the big names I remember were WordStar, dBASE, and VisiCalc (word processor, flat-file database, and spreadsheet, respectively). The Apple II was also fast becoming a popular gaming platform, in addition to having some decent productivity software available for it -- VisiCalc was originally written for the Apple II.

The problem with the pre-PC machines was that they all used 8-bit CPUs with 64 kilobytes of address space, and by the late '70s, that was becoming a problem as software became more and more sophisticated, and people needed to be able to work with documents that didn't fit in RAM all at once. Some machines used bank switching to get past the 64 kilobyte limit, but that makes life pretty miserable for software developers. A larger address space was what was really needed.

The IBM PC was eagerly anticipated; the market was ready for a mainstream 16-bit machine. Many considered the PC a disappointment when it arrived, because other, superior CPU architectures existed, but the 8086 architecture had the advantage of assembly language source code compatibility with the 8080, so software vendors could port their CP/M products over to DOS relatively easily. This was a big, probably decisive factor in the rapid market acceptance of the PC.

For hobbyists the early PCs weren't much fun, because they lacked sound, color, graphics, and were much more expensive than the 8-bit machines... But in offices, they started popping up like mushrooms. IIRC, in Europe, the PC overtook the very popular Commodore machines (the 3000, 4000, and 8000 series) in terms of market share in about a year.

Hi Thomas,

That recollection with respect to the "mushrooming" of 8086 machines matches my memories. Up to around 83 or 84, the Commodore 64, the "trash-80" and the Apple II were the ones to have. By 86 or so as I remember, the 16-bit machines were proliferating. The first Macintosh was cute, but it wasn't the workhorse until a bit later. By 1990, my university had upgraded to a 286 lab that was far and away larger than the Mac lab that had been put in in '88. The Macs had some good features, but the GUI aspect just wasn't a *productivity* enhancer yet...

I will say that one of my college hall-mates got one of the big (and I mean big!) new macs in 1990. He had "MooseProofs" or something that would talk, and he had a flight sim on it. I think that was the beginning of a very strong rally for Mac, which it ultimately lost when Windows was perfected. By 1995, the engineering and science users of the Mac were finding themselves out of luck and had to switch to PCs either because their employers (hospitals, universities) were no longer supporting MAcs, or because they needed software that wouldn't run on MAcs...

Looking back, I guess we should see the changes in the past 10 years as poitively glacial. I can happily work with year 2000 software for almost everything--even engineering software. Some of the 3D tools have gotten much better, but the 2D tools haven't really improved since 97 or 98. Word processors are worse now. And heck, you can load programs from 1995 with no trouble! Compare that to the changes from 1983 to 1988 and it is bewildering...

Of course my memories as to dates might be fuzzy here and there...

My recollection/belief is that after the IBM PC came out, the biggest market share was non-technical corporate (i.e., not home) users. And the whole mentality of "no one every got fired for buying IBM" was still in full force. The Mac, for all it's superiority, was seen as a cute toy for geeks. Few business people wanted one.

Processor speeds haven't improved much in 10 years, but disk capacities have continued to grow. The trend now is towards putting more CPUs (cores) in the box, and it will be exciting to see the raw horsepower start to increase again. I've heard that Intel is already testing a 48 core CPU.

Not all applications can benefit from more cores, but many others can. My point is that interesting times lie ahead.

Another big improvement over the past 10 years has been graphical power. Considering that pretty much every desktop has a high powered 3D engine on the graphics card, it's a wonder why we the desktop is still such a static 2D beast.

Non-technical/corporate users are exactly the market that the IBM PC was designed for. Hobbyists and home users didn't start to warm up to the PC until a few years later, when clone makers started driving prices down.
The Mac didn't gain traction early on because (1) it didn't run the productivity applications that were driving IBM PC sales, and (2) because the lack of clone makers kept Mac prices high while PC clones got cheaper and cheaper.

> Quote:
>

In the small- to medium-size business segment, buying IBM computers in the pre-PC days *would* have gotten you fired, for the same reason that it's a bad idea to buy an 18-wheeler for pizza delivery. Even if that 18-wheeler is a Peterbilt.

One very forgotten thing about IBM's PC is that IBM gave the technical specifications manual out for a fee, which allowed clone makers easy reverse engineering of the system as it was well documented. I know I maybe wrong, but I think IBM at its core never wanted the PC market.

Although IBM sued people who outright copied their BIOS. They had the data, from schematics to the actual BIOS code out there. Only reason I could see them doing this is to standardize the computer market and eliminate the multiple standards. Which would make their lives easier to support their corporate customers and interfacing instead of dozens of half documented standards, only worry about the one they created.

In the next few days I'll post on my website the documents as I have them on PDF.

Dimitri

I think the idea behind documenting the hardware was primarily to help third parties create add-in hardware, and profit a bit from selling the specs... The idea was probably inspired by the success of the Apple II, which owed a lot to third-party plug-in cards. (*) Unfortunately for IBM, a lot of plug-in board makers decided not to bother with paying the fee and reverse-engineered the ISA bus instead, and IBM ended up losing control of ISA. When IBM released the PS/2, they tried to regain control by making the MicroChannel

specification depend on a patented chip set that you had to buy from them, but by then it was too late; the industry standardized on EISA and PCI instead and IBM was officially demoted from leader to just another player.
The PC market was certainly a bit of a culture shock for IBM -- officially endorsing third-party hardware instead of trying to keep everything closed and proprietary was new territory for them!

Cool! Looking forward to it. :-)

- Thomas

(*) Apple, of course, managed to shut clone makers out of the Apple II market because it was impossible to create a 100% compatible clone without the Apple II ROMs. Perhaps IBM envisioned keeping the PC market to themselves in a similar manner, but because the PC's BIOS ROM was much simpler and had cleaner APIs, it was possible to simply re-create from scratch, duplicating its functionality while sidestepping IBM's copyright.

I don't think so. I remember reading back in the 80's that it was deliberate corporate policy to make the PC "open" architecture. I think what happened to IBM was they never anticipated two things: how low competition would drive the price, and how the IBM "name" would lose it's draw in the face of so many seemingly excellent alternatives in the marketplace.

I say "seemingly", because my experience has been that "IBM quality" was real; you could fire up most any XT or AT today if the magnetic media hadn't failed. Problem was, of course, that the technology changed so fast the longevity of IBM components became moot.

http://www.northerndtool.com

Check out the computer section. Once you see the PDF's you'll see what I mean about IBM not caring and probably wanting clone makers.

IBM gave the BIOS code in those documents, no need to recreate it, hence the lawsuits and Compact doing their 2 stage development of their own patent infringement free BIOS.

Exactly the same point I was making, Dimitri, though not as as clearly. I do remember those Technical Reference manuals, which basically told third party developers or competitors all thy needed to know to design "PC Compatible". I had a TRM for the PCjr.

I haven't read those documents yet, but I'm having a hard time parsing the sentence above.

"IBM gave the BIOS code in those documents, no need to recreate it" -- so are you saying that clone makers could just use IBM's BIOS code? But then you say "hence the lawsuits and Compact [sic -- did you mean Compaq?] doing their 2 stage development of their own patent infringement free BIOS" -- so clone makers apparently *did* need to re-engineer the BIOS? I can't figure out what point you're trying to make here.

I still have the blue cloth-bound 3-ring "IBM Personal Computer Hardware Reference Library - Technical Reference" in its slipcase on my bookshelf. Complete circuit diagrams for the PC, MDA and CGA cards, etc. - even the Epson MX-80 printer they rebadged - and yes, it has the BIOS source in it. The essential point is that, having published the source code in paper form, legally there was no doubt that it was copyright - something that was contentious with regard to program code at that time (I remember being an expert witness in a software copyright case a year or two later, and it was hell trying to explain this stuff to the barristers involved).

So, companies wishing to create a BIOS had to have two teams of coders. One would use the IBM BIOS to write a specification for an abstract BIOS: must have a routine at address such-and-such which takes these parameters in these registers and returns a result in this register, etc. . .

The second team had to have **no** IBM or IBM-compatible PC experience at all and be able to stand up in court and swear to such - they were called "virgins". They were passed the spec through a "Chinese wall" and set to work coding, whereupon the first team tested the results and refined their spec, then sent code back for rework. The result was a BIOS that was IBM-compatible but written by programmers who had never seen the IBM BIOS, and hence could not be a breach of copyright.

Best,

--- Les

Hmmm... So IBM published the BIOS source code, but not the BIOS API specification? I never understood what the deal was with this "clean room development", but if you're forced to read the code in order to re-implement the API, I can see that you might have to work that way.
It makes me wonder, though. Has anyone ever actually been convicted of software copyright infringement based on the fact that they were familiar with the original work, but *without* any evidence of plagiarism (i.e. no suspicious similarities at the source code level)?
The question is not entirely academic; I'm wondering about things like Free42

which re-creates something that I *am* familiar with, so I'm definitely not a "virgin" in the sense of your post. I could argue that I have never studied the HP-42S ROM, although I obviously did look at it long enough to extract the two screen fonts from it (*) -- but my gut feeling is that it the onus should be on the prosecution to prove that I copied their work, not on me to prove that I didn't, much less that I *couldn't* have. (Clearly, I am not a lawyer, I have never even set foot inside a courtroom.)

(*) It is my understanding that low-resolution bitmapped fonts are not protected by copyright, but that's another one of those things that's probably not as clear as it should be, and dependent on which jurisdiction you're in, etc.

Biggest problem with the PC BIOS as I understand it is that there are only so many ways to do the same functions in assembly, and that even people without any knowledge of the original code, but as good programmers will end up with similar code.

If any lines or block of lines are the same which would make sense, seeing as there are only so many ways to cut a sandwich. And US copyright "May not be reproduced in whole or in part" could still land them in legal trouble with IBM.

So by distancing the formation of the code like they did was a attempt to protect themselves as they did their due diligence to create legal code.

Thomas, The point I am getting, particularly after reading Les' post, is that the publishing of the BIOS code did two things: it invited third party software and peripheral makers to jump in to the PC marketplace, and it meant that clone makers HAD to be extremely diligent in documenting their reverse-engineering work, or face lawsuits.

Re: IBM PC Technical Manual.

*Message #34 Posted by **Dimitri Simitas** on 6 May 2010, 10:09 a.m.,*
in response to message #29 by Thomas Okken

> Quote:

Les covered it well. The reason the IBM BIOS was easy to reproduce is because the BIOS code was written on paper.

Many of the first clone makers simply copied the BIOS code and found themselves in hot water from IBM's legal team.

Compaq, and others at the same time developed clean room BIOS software where they have one team document every command entered and outputted in the IBM BIOS but without copying any of the code. And a second team develops the code to give the right input and output commands.

Today however companies specialize in BIOS writing. Phoenix is probably by far the oldest of such companies that also used a clean room method to develop a IBM BIOS. Which they turned around in 1984 and sold to any clone maker that wanted it.

PS Compaq, not Compact, sorry I spell words phonetically at times.

*Message #35 Posted by **Steve Leibson** on 7 May 2010, 10:02 a.m.,*
in response to message #34 by Dimitri Simitas

Dimitri's recollection of the early PC BIOS situation most closely matches my own. IBM's PC team surprisingly published the technical details of the PC's hardware design and BIOS firmware in the technical manual. (That's the only cloth, slipcased manual I've kept from those early days.) Early PC copiers simply replicated the BIOS byte by byte and ended up in lawsuits with IBM as a result, prompting other copiers to develop the cleanroom approach. It's easy to prove copying in court when the BIOS ROMs match byte by byte. I do not recall the cleanroom approach to software/firmware replication ever being done before; There was no high-volume ROM product worth copying before the PC BIOS. However, most PC development history tends to repeat minicomputer development history, which also tends to repeat mainframe development history. Something about IBM, Amdahl, and Fujitsu sticks in my head but I really didn't follow the big-iron stuff as closely as PC stuff.

At first, the PC cloners did their own cleanroom development and there were elaborate descriptions of the lengths the cloners went to when trying to produce "clean" BIOS code, but there was an immediate and obvious product niche quickly filled by startup companies such as Phoenix (as Dimitri writes) and Award. Once the productized PC BIOSes were on the market for purchase by PC makers, the cloners bought these BIOS ROMs to get lower-

cost access to both the code and the liability protection.

*Message #4 Posted by **Monte Dalrymple** on 2 May 2010, 10:36 a.m.,*
in response to message #3 by Angel Martin

A prescient question... This is the week I plan to program the FPGA and CPLD, connect the first prototype to a donor calc and apply power. I have had the boards since before the first of the year, but have been otherwise occupied.

The Flash memory is programmed with the OS and new code to manage the expanded memory. I went through the OS and tagged the sections that need to always run at 1x, so that's ready to go (but the max speed is 50x, not 100x).

The "expanded functions", written in mcode, allow users to "virtually" plug and unplug ROM images from the ports exactly like it would be done physically, which was always my goal.

I hope to have a finished calc in time for HHC, even though I may or may not be able to actually attend.

Thanks for asking. I wasn't sure that anyone was still interested in the project. Had I been working on this full-time it would ahve been done five years ago. Oh well.

*Message #2 Posted by **Allen** on 1 May 2010, 9:20 p.m.,*
in response to message #1 by Jeff Davis

jeff, Greetings! Quick question, are you:

```
1) trying to get files from your HP41 onto EMU41 on a computer?
2) looking to type something up on the computer (EMU-41) and send it to the HP41?
```

If so, can you provide an example of the code you would like to transfer and/or a listing of hardware you have available to accomplish this?

IMHO, even with a full set of hardware including the zengrange, No VRAM, HHP eprom, CMT eprom, EMU41/ILPER/Serial Converter/Pil-BOX and such. The fastest/easiest way to transfer moderately short programs from computer to 41c calculator is the User-Code barcode generator by Leo Duran

It only requires a computer, printer, and wand.

There are many other methods, of course.

Re: ILPer/Emu41/Transferring Files

*Message #3 Posted by **Jeff Davis** on 2 May 2010, 9:17 a.m.,*
in response to message #2 by Allen

These files are in either .raw or .dat format. I have the HP-41CX hooked up to the PILBox/ILPer what I need to do is to transfer the program from the computer to Hdrive1 than I can send it to the calculator. What is the method using EMU41 to save the file to the hdrive1? Or can this even be done?

in response to message #3 by Jeff Davis

Hi,

For the .raw format, I propose this procedure using the HP41UC utility of Leo Duran and the PIL-Box. Assume the program prm41.raw has to be loaded into the HP41:

```
- Install HP41UC and ILPer in the same folder than Emu41,
- convert the raw file to the emu41in.dat file using the HP41 "INP/OUTP" format:
  hp41uc /r=prm41.raw  /d=emu41in.dat
```

```
- in Emu41:
  GTO ..
  "DOSLINK"
  FINDID   ; this returns 3 in the default emu41.ini config
  SELECT
  CLRDEV
  INP
now, save the program to HDRIVE1 disc image file
  "PRM41"
  WRTP
- on the HP41 linked to the PIL-Box, with ILPer running and targetting the same
hdrive1.dat disc image file:
  GTO ..
  "PRM41"
  READP
```

Re: ILPer/Emu41/Transferring Files

*Message #5 Posted by **Jeff Davis** on 3 May 2010, 5:57 p.m.,*
in response to message #4 by J-F Garnier

Thanks to all who responded. I have succesfully completed the transfer. Thanks JF for describing the sequence. Worked as you had written it.

Edited: 3 May 2010, 5:57 p.m.

Re: ILPer/Emu41/Transferring Files

*Message #6 Posted by **Egan Ford** on 2 May 2010, 1:10 p.m.,*
in response to message #3 by Jeff Davis

Another way to do this without EMU41 would be to use HP41UC to convert the .RAW and .DAT to .LIF. You can only do one program at a time, i.e. 3 programs, 3 .LIF, e.g.:

```
RAW:

hp41uc /r=blah.raw /l=blah.lif blah

DAT:

hp41uc /d=blah.dat /l=blah.lif blah
```

The 1st argument is the input file (/r= or /d=), the 2nd is the output file, the 3rd (optional) is the name of the program in the LIF directory, if not specified it will equal the name of the input file sans the extension. I like to play it safe and specify the LIF directory name.

Next start-up ILPer, and point to the first .LIF as the HD image.

Connect the 41, execute "DIR" and you should see your program. Put that program name in the ALPHA register and then execute "READP". Change ILPer HD image to the second .LIF file and repeat.

The least rare vintage HP

*Message #1 Posted by **Michael de Estrada** on 1 May 2010, 10:08 a.m.*

OK. So we're always talking about the rarest vintage HP's. You know, those that sell for astronomical prices or don't even ever appear on TAS. But what about the ones that are so common that you might even expect to find them on the shelves at Walmart. The ones that keep appearing by the dozens on TAS and keep selling for lower prices. The ones that you collect, not by one or two or three, but by the dozen. Anyways, what prompted me to write this is that I just bought my tenth HP-45 for the lowest price ever, and ironically I wasn't even interested in the calculator itself. Nope, I mainly wanted the hard case, because it had a good latch and I can use it with an HP-55 or HP-65. Hard cases in good condition are, pardon the pun, "hard" to find. They are usually grouped with a much more costly HP-55 or HP-65, and often have broken latches. Anyway, I really didn't care about the condition of the calculator, but as it turned out, it was in perfect working condition with no corrosion in the battery compartment and just some slight missing silver trim above the keyboard. It also came with a clean ownner's manual and leather soft case. I paid $51 for all this, whereas in the past I'd paid more for the calculator alone. So, is the HP-45 the most ubiquitous of vintage HP calculators, or do any of you have another model HP that is more so? Which model is the most common in your collection? The most I have of any other model is three.

Michael

*Message #2 Posted by **Kees van der Sanden** on 1 May 2010, 11:16 a.m.,*
in response to message #1 by Michael de Estrada

The most common model in my collection is the HP 32SII. I have 8 of them. This calculator was the first HP calculator I owned. I liked it so much, I collected some spare ones. Still my favorite.

Kees

45

*Message #3 Posted by **Maximilian Hohmann** on 1 May 2010, 11:24 a.m.,*
in response to message #1 by Michael de Estrada

Hello!

Same here: The HP-45. Like you, I bought the last one for the hard case alone, but it is in decent shape and fully working and came complete with manual and charger. All together for 15 Euros, if I remember correctly.

But I made a mistake when cleaning the hard case, which was covered in thick, greasy dust: I completely immersed it in hot soap water for some time. Now, several months later, there is still water sloshing around inside, because the breathing holes are in a position that will not allow for the water inside to drain completely...

Regrards, Max

Re: The least rare vintage HP

*Message #4 Posted by **Juergen Keller** on 1 May 2010, 3:56 p.m.,*
in response to message #1 by Michael de Estrada

From my experience, 45s are really quite common, but I had also many HP-25 (not the C model) and HP-21. On the Swiss auction sites (small market, not very representative) I most often see 48(G/GX), 32S(II), HP-41CV, 11C, and 20S (yuk, non-RPN). I do not mention the 12C because it is still in production. Are there any statistics (by model) how many calculators are ever produced?

Edited: 1 May 2010, 3:57 p.m.

Re: The least rare vintage HP

*Message #5 Posted by **Michael de Estrada** on 1 May 2010, 6:24 p.m.,*
in response to message #4 by Juergen Keller

Now when you say HP-25 and HP-21, what percentage of those are in working condition? With the HP-45s, for me it's been 100%. At most, I've had to open mine up to clean the keyboard and slider switch contacts. I've never had one with fried electronics. OTOH, my experience with Woodstocks is that less than 50% are operational, and many are way beyond my ability to repair them. You mentioned Voyagers, but except for the HP-12c, all of the ones I've seen here in the USA sell for way over $200. I think the HP-45 was a real workhorse calculator that many companies and government agencies bought in bulk for their employees, and many were repeatedly refurbished, since the basic calculator was so durable.

Re: The least rare vintage HP

*Message #6 Posted by **Juergen Keller** on 1 May 2010, 6:39 p.m.,*
in response to message #5 by Michael de Estrada

Regarding the HP-21/25: my estimation is that around 1/3 was none working or had severe damage (broken keys, etc.); many of them had slightly corroded battery contacts. Regarding the HP-45: most of them worked fine but some had none working keys. Regarding the (scientific) Voyagers: you are right, although there are many around they get high prices; is it the form factor, or the long battery life, or because they look so nice?

Anyway, the HP-45 is indeed a reliable calculator, it has no obvious weakness as some other Series have. The only problem is that the Classic AC adaptors get a bit rare ...

Re: The least rare vintage HP

*Message #7 Posted by **Keith Midson** on 2 May 2010, 1:53 a.m.,*
in response to message #1 by Michael de Estrada

For me I have 7 x HP28S, along with 2 x 28C (as well as the financial 18C, 19B, & 19Bii equivalents). As with some of the others, the main reason is that this was my first HP.
I also have 5 x 12C's, all different variants ...
I also seem to keep ending up with more of the original 35. I have 4 of these (people seem to like donating these to me!).
I think the most common HP available has to be the 12C simply because it's been around for so long - also has to be one of the cheapest.
Cheers, Keith

HP 30b - Thanks Gene and Katie

*Message #1 Posted by **Joe Burwell** on 1 May 2010, 8:59 a.m.*

Thank you both. I used your information on how to program the HP 30b to do a % change calculation and it is great. Now I am starting to like my 30b as much as my 12c. Also, I realized that I could use the switch key to redo some of my other programs to reduce the number of key strokes. Much of the material on this site is way above me so it was nice you both took the time to write out the program instead of just saying you can write a program to do this. After all that is how I learned about the switch key, something I did not know.

Re: HP 30b - Thanks Gene and Katie

*Message #2 Posted by **Gerardo Rincon** on 1 May 2010, 11:17 a.m.,*
in response to message #1 by Joe Burwell

I agree - Gene and Katie - Thank you for taking the time to post this program. I do think not having a 1 button option for % change in the HP 30B was a miss. In my opinion, the one thing the HP 12C still has over the 30B (same as the 15C has over the 35S) is the size.

Edited: 1 May 2010, 11:22 a.m.

Re: HP 30b - Thanks Gene and Katie

*Message #3 Posted by **Allen** on 1 May 2010, 5:27 p.m.,*
in response to message #1 by Joe Burwell

I agree thanks to gene and Katie- they're both world-class experts on the Hp 30b!

But Re the programming advantage I must suggest there IS a 1-button "% change" key on all RPN models: it's the divide key.

Re: HP 30b - Thanks Gene and Katie

*Message #4 Posted by **Joe Burwell** on 1 May 2010, 5:35 p.m.,*
in response to message #3 by Allen

Good Point about the RPN and the divide key.

Re: HP 30b - Thanks Gene and Katie

*Message #5 Posted by **Joe Burwell** on 1 May 2010, 5:39 p.m.,*
in response to message #3 by Allen

Well really, I guess you could do that on any calculator, RPN or not.

HP 12C+

*Message #1 Posted by **Joe Burwell** on 1 May 2010, 8:48 a.m.*

I have notice that the new 12c+ is out in the new HP packaging. The black rather than white package. I have found these calculators at Office Max stores. Also, it might be easier to find them in college towns as I would expect those store locations to have a higher turnover of financial calculators.

HP41C nuts - how tight ?

*Message #1 Posted by **John Robinson** on 1 May 2010, 12:29 a.m.*

Hi all, just wanting to know how tight to tighten the two nuts in an early 41c, i.e. number of turns. I don't want to over tighten and strip the thread on the screw posts.

Thanks John

Re: HP41C nuts - how tight ?

*Message #2 Posted by **db (martinez, ca.)** on 1 May 2010, 1:18 a.m.,*
in response to message #1 by John Robinson

someone must know a best way but here's what i know:
the threads are fairly steep so when the case pulls together, that's about it.
start by spinning the screw backwards and when it falls/drops at the end of the threads; start spinning it the right way; that'll start it in the old threads
if the threads are in good shape and you haven't crossed them; it will screw easily till you get all the way in and then get tight all of a sudden.
you can use a screw driver with a small handle or grip the shaft only, so you don't easily over-torque it
if you find a funky screw; do the other three first to practice getting the range.
one should be able to screw those things in and out a hundred times carefully, or not quite once if you reef on it so it's good you are thinking ahead.
i've never seen one stripped but i've seen several split - you probably knew that.
i've never broke one, so neither will you.
and last but not least: lefty loosey, rightsy tightsy. but you knew that one too.

Re: HP41C nuts - how tight ?

*Message #3 Posted by **John Robinson** on 3 May 2010, 7:18 a.m.,*
in response to message #2 by db (martinez, ca.)

Hi DB,

Thanks for the response. I'm actually not concerned about the four case screws, but the two nuts (approx 1/4" thread) inside the early 41c units that is used to hold the CPU board to the keyboard, hence applying pressure to the connectors between the two boards.

Any suggestions in these ?

Thanks John

Re: HP41C nuts - how tight ?

*Message #4 Posted by **geoff quickfall** on 3 May 2010, 11:14 a.m.,*
in response to message #3 by John Robinson

Very difficult to get this right.

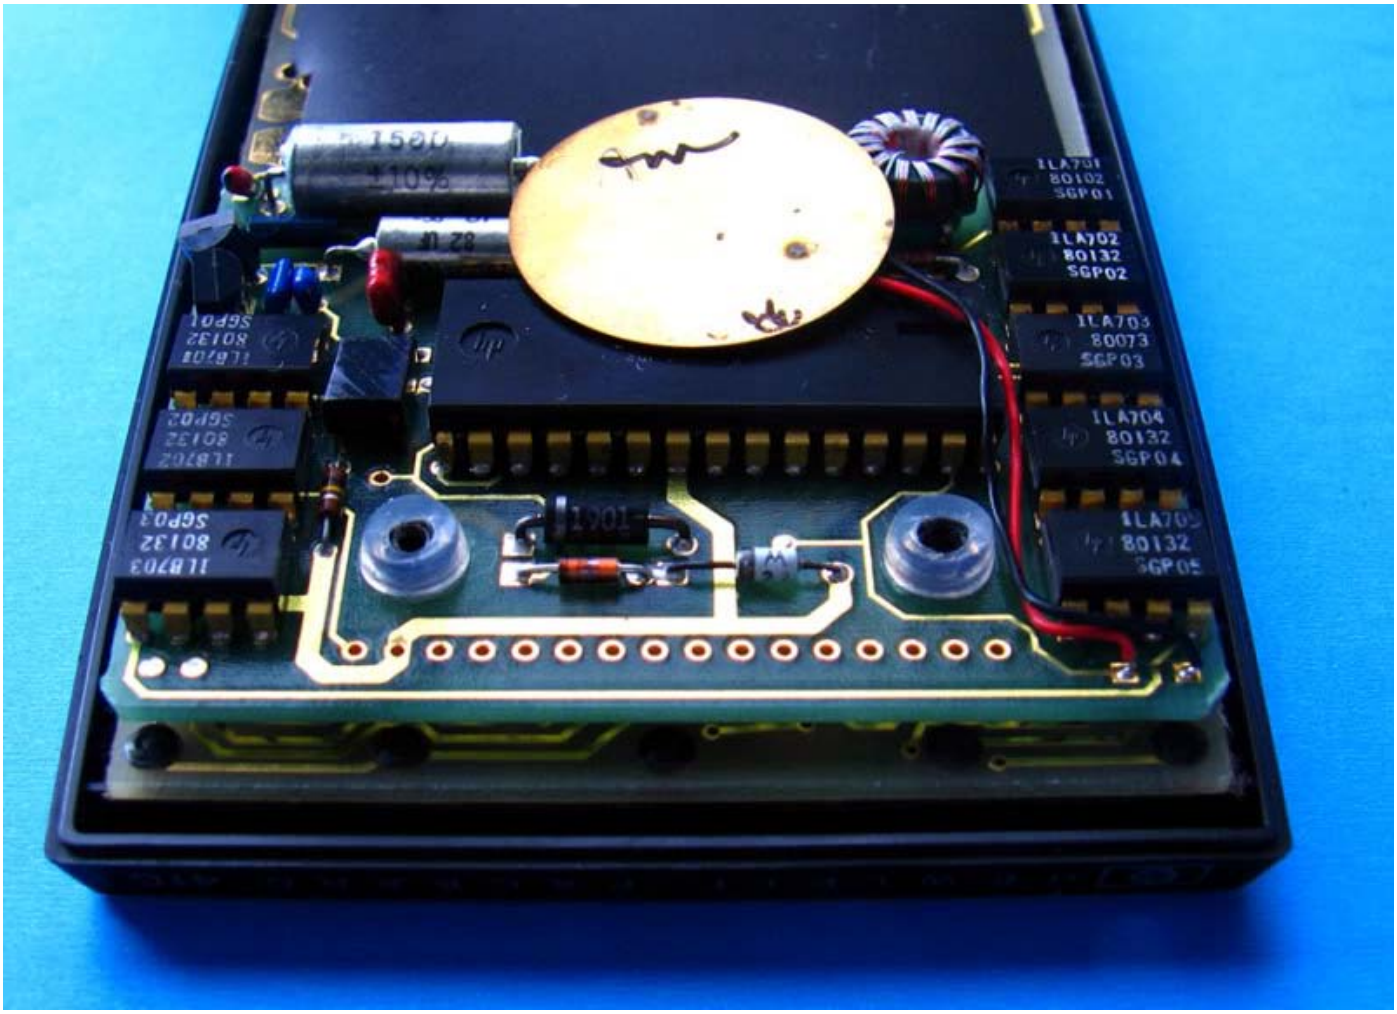
The pca posts were not tapped in the first place. The nut was simply added and it self tapped! If it doesn't line up then you will cross thread and poof, no more lock down.

The best you can do is try but only until just tight. Close it up and test the unit. Tighten some more if it did not power up due to a bad connection. Repeat.

If, according to the manual, the nuts do not tighten then switch to a smaller diameter nut. Not a very helpful suggestion. If smaller nuts are not available then take some vinyl tubing of the same type everyone uses for the pinch roller in the card readers. Cut a section slightly shorter then the amount of post that sticks out the PCA when it is in place (with the nuts removed). Place the tube over the post when the PCA is in place. Replace the back and screw together the case. This may take a few attempts to get the tube length correct. So cut it long, then shave off some. You are trying to make a pressure fit that relies on the bottom case posts without over stressing the case posts themselves.

What you have created is a pressure fit that relys on the bottom case screws to press against the vinyl tubes which then press down on the PCA (what the nuts used to do) and complete the connection.

It should look similar to this:



Hope this helps.

Geoff

p.s. In repair attempts on two of these types I have resorted to the above repair. I am either clumsy or this really was a bad design not conducive to more then one or two removals. Thus necessitating the newer design about one year later.

Edited: 3 May 2010, 11:15 a.m.

Re: HP41C nuts - how tight ?

*Message #5 Posted by **John Robinson** on 4 May 2010, 3:51 a.m.,*
in response to message #4 by geoff quickfall

Thanks Geoff for the suggestion. I presume I can try a CV case back as well to apply the pressure, to at least test that everything else is ok. The only caveat is thickness of the logic boards.

I am aware that the thickness of the 41 logic boards varied over the production run, do you have guidance on when the

thickness changed. My understanding is, later fullnuts CXs (and maybe CVs) had thinner logic boards, hence the use of the thin nylon washers in some models.

Thanks John

Re: HP41C nuts - how tight ?

*Message #6 Posted by **geoff quickfall** on 4 May 2010, 10:56 a.m.,*
in response to message #5 by John Robinson

Hi John,

Don't have the specs on the thickness but I will measure some up as I have 6 different boards.

The advantage of the tubing is that it keeps the original halves together, will never strip again and retains the original serial number.

I have to check, but if memory serves, it was that the later boards with out the hex nuts did not fit the HP 41C case back. I may be mistaken though.

Cheers, Geoff

HP-19C issue

*Message #1 Posted by **Giovanni Jimenez** on 30 Apr 2010, 11:03 p.m.*

What could e the reason for this behavior on a HP-19C ?

"...When it is plugged in and turned on, the numbers continue to flash/scroll as if it is calculating a formula. All of the characters light up..."

thanks !

Re: HP-19C issue

*Message #2 Posted by **Michael Meyer** on 1 May 2010, 8:29 p.m.,*
in response to message #1 by Giovanni Jimenez

Hard to say for sure, but my bet is that there's a "fried" ACT chip. Or soon to be fried, if you plug it in without a good working battery. The 19C is essentially a Woodstock and prone to the same damage if plugged in without a good battery with good contact. Try powering it with battery or a power supply connected the to battery contacts only.

Repair of Woodstock keyboard register problems

*Message #1 Posted by **Kees van der Sanden** on 30 Apr 2010, 3:41 a.m.*

I had two Woodstock models with keyboard register problems.

An HP21 that would not register the 4 and registed the 5 as a 7. This calculator showed some traces of battery leakage. The PCB through holes of the 4 and 5 key are just above the battery contacts, so residues of the battery leakage inside the key domes could be the root cause.

With a needle I dripped some vinegar into the holes of the 4 and 5 keys. Pressed the keys a few times and suck away the viginer with the same needle. I repeated this a few times. I continued this process with some water, to wash away the vinegar and ended with IPA. Let it dry for a day and the keyboard registers fine now.

An HP22 with a bad 4 key, that could not even be pressed, has been fixed in the same way.

I'm almost certain you will find this kind of watch there 8)

Re: You might want to check this site

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 29 Apr 2010, 5:46 a.m.,*
in response to message #4 by Frank Boehm (Germany)

Halo, Frank; und danke schöen!

I got almost that close, because I have seen some of the watches shown in the page you pointed me to. Matter of fact, the collection shown there has more choices than I found in other pages, thanks!

Despite of the actual segmentation it uses, it seems to me that this one has the closest functionality to the one I posted about.

You know, my first motivation to find more info about this watch was the picture of a conceptual watch I saw in one old issue of the Elektor magazine. The watch could be seen in a tech exposition held in German. It uses no numbers, just bars, and the system demands a bit of 'on-time' computing prior to conclude what time is the watch showing.

This one, in the picture I posted, needs no computing, just direct reading, but surely the ones coming from Korea, China and Japan are twisting the concept of checking the time in a wristwatch.

And did you see? They already have a two-page museum! Wow! The no-longer-being-built watches are as futuristic as the ones still being sold.

Cheers.

Luiz (Brazil)

HP purchases Palm, Inc.

*Message #1 Posted by **Seth Morabito** on 28 Apr 2010, 4:52 p.m.*

Word has just come out that HP has purchased Palm, Inc. for $1.2 Billion.

PC Magazine announcement of the purchase is here.

Of course I have no idea how (or even if) this will impact calculator development, but I thought it worthy of a little note here. I think that Palm's WebOS is an interesting platform in its own right.

Re: HP purchases Palm, Inc.

*Message #2 Posted by **BobVA** on 28 Apr 2010, 5:02 p.m.,*
in response to message #1 by Seth Morabito

Conversely perhaps we'll see the HP-15C emulator ported to WebOS (puh-leeze!)

Bob

Re: HP purchases Palm, Inc.

*Message #3 Posted by **hugh steers** on 28 Apr 2010, 5:29 p.m.,*
in response to message #2 by BobVA

WebOS was all java iirc, that's when i knew it wasn't really going to work. not that im against java, it's just that it closes out everything else. for example your C/C++ calculator codebase.

it's a shame, because some of palm's old products were really very innovative for their time.

Re: HP purchases Palm, Inc.

*Message #4 Posted by **Pal G.** on 28 Apr 2010, 7:00 p.m.,*
in response to message #3 by hugh steers

Hugh,

Android applications are written in the Java programming language. And I have an HP48GX emulator running on my Droid.

http://developer.android.com/guide/topics/fundamentals.html

http://www.androidzoom.com/android_applications/productivity/droid48_wex.html

This doesn't mean I understand why HP would buy Palm.

Re: HP purchases Palm, Inc.

*Message #5 Posted by **hugh steers** on 28 Apr 2010, 7:18 p.m.,*
in response to message #4 by Pal G.

not all of them. you can write native code apps now in android. what you need is this choice. for example, you might want to use a native code library that you've already developed and build a java front end. if _everything_ has to be in java, you cant do that.

google have made their java fast through their own dalvik virtual machine. they needed to change the way some of the java compiled code works. for example, making method dispatch more efficient. so dalvik java binaries are not the same as regular .class files. also it's a register based architecture not stack based.

so what im saying is that google have spent effort to make java good enough for their mobile system, but webOS didnt have this and it didnt have a native code option either.

is droid48, in fact, a native app? it's based on the X48 source code which is in C.

??

Same with BeOS, which HP now presumably owns. But that's kinda 10 years too late.

WebOS is actually all JavaScript/HTML. Unlike the iPhone, you can access all the hardware (eg GPS) from JavaScript and can have installable JavaScript applications.

There is also a native SDK, but i'm not sure if it has been publicly released yet.

Re: HP purchases Palm, Inc.

*Message #8 Posted by **Bruce Bergman** on 28 Apr 2010, 10:05 p.m.,*
in response to message #7 by Jonathan Purvis (New Zealand)

HTML, Javascript and CSS actually. That's the base platform tools for the WebOS development system.

That being said, there is a native option (can't remember the code name right now) that many of the game developers are using (GameLoft, for example). These games are on par, or better than, those that are out for the iPhone.

BTW, lest you be smitten otherwise, Objective-C is a PIA to deal with. ;-)

Thanks,

Bruce

iPhone OS 3.0 allows the browser to access HW, e.g.:
http://www.thecssninja.com/javascript/geolocation-iphone.

And you can install browser-based apps. E.g. Gmail.

Well, sorta. I remember seeing one of those in Paris in 1976; it particularly stuck in my memory because it was running BASIC, but all the BASIC keywords were in French (IMPRIMÉ instead of PRINT, for example). I couldn't do much with it. ;)

But optionally, it could run APL programs and could have up to 64KB of RAM (with the APL interpreter entirely in ROM), making it pretty good for scientific work, as long as you don't mind reading code from right

to left. ;)

A bit more capable than the 67, or even the 41 of a few years later.

Hi Les; Question: How many times more effective, or frugal with program memory is RPN compared with that implementation of BASIC - in your opinion? Combined with that, would a 41cx with a couple of good ROMs, 2.2 in main and 6k in extended come close to equaling a 64k IBM? Does the ease of programming on the fly add enough to that to bring it up to that? If not then how about a 41 on a 32k RAMBOX, which was available back then?

I know how much you prefer RPN, so i'm just trying to give you a way to get on the side of the Angels here ;-) -db

The IBM had a full size keyboard and a reasonable screen. Add the sturdy tape drive and you get a professional machine. Compared to that, a 41C is a geek machine.

You are kidding?

*Message #7 Posted by **db (martinez, ca.)** on 30 Apr 2010, 11:31 p.m.,*

While the IBM 5100 wasn't used for docking maneuvers on the Apollo-Soyuz mission like the 67's less capable predecessor the hp65, i'm sure it was a fine machine. Those "geeky" space shuttle astronauts just bought 41s with their own money and got hp to teach them how to program so they could play *Moon Rocket Lander* during their orbital off hours too. The programs for ground antenna acquisition, emergency re-entry, landing calculations and the like were just a cover-up. I'm sure the 5100 series could have done all that anyway. That ad

should have mentioned it's more impressive abilities, instead of concentrating on helping a clueless real estate agent decide when to do landscaping and telling a farmer what to feed to cows. Forget about all those "toy"-like uses for the 41 like NATO artillery targeting, nuclear & Cardiac/Pulmonary medicine, Optometry, the Math/Stat pac, the high level math and engineering solutions books, the blue water navigation pac, the USAF rom for loading cargo planes. I mean, really; the IBM 5100 was used by Insurance Companies! Wowie!

I found this on a 5100 site:
Time Travelers Need IBM 5100 Computers! From 2000-2001, John Titor claimed to be a time traveler sent form 2036 to 1975 to fetch an IBM 5100 in order to solve problems with legacy software in 2036 (before Unix systems fail in 2038). He stopped in 2000 to warn us of a civil war that would start in the US in 2005 and culminate in World War III in 2015. He claimed that there was some special hidden feature in the 5100. **No toy here.**

While wandering around the upper Amazon in the late '90s with my cx and transit doing boundary surveys, i often wished for the "full size keyboard and a reasonable screen" of a "professional machine" like an IBM 5100 series, a generator to power it, a tent to put them in, along with 6 porters to carry it all.

Touché!

I don't know the details of their BASIC implementation, db, so I can't comment confidently. However, it was fairly common for BASIC interpreters to tokenize all the keywords of a program, so that they might take only one or two bytes. As a result, the difference might not be all that great.

And of course, APL is an extremely terse language in which arrays and matrices are first-class types (take a look at http://en.wikipedia.org/wiki/APL_%28programming_language%29 for some examples).

> Quote:
>
> I know how much you prefer RPN, so i'm just trying to give you a way to get on the side of the Angels here ;-)

Oh, yeah - you'd have to pry my 41's from my cold dead hands. Having said all the above, I wouldn't trade a 41 for a 5100, especially these days - the 41's have undoubtedly aged a lot better!

(But if I had the time, it would be fun to do some tinkering with a modern APL implementation).

Best,

Les; The BASIC i learned in '81 at Western Nevada Community College's school of Casino and Cat-House Management may have been a math deprived one. I know there are more complete implementations of it, but i always think of the little BASIC i know and compare (un)accordingly. I remember having to teach the computer how to convert minutes and seconds to decimal degrees, step by step - and thinking that my new 11c was twice the computer.
APL is a language that goes way beyond what i have ever needed to do. And being both high level and math oriented, it looks more compact than even RPN. Going to anything else after that must have felt like swimming in concrete.

I have several 41s, and except for my favorite, I would gladly trade one of them for a 5110. Not only would it advance an ambition to own one of every machine I ever worked on personally*, if I became strapped for cash to feed my calculator habit, I could sell the 5110 and buy something in the neighborhood of 81 complete 41C systems. (Going by Mike Morrow's estimate below, and figuring around $1000.00 per 41C[V|x] + nice peripherals.)

Regards,
Howard

* The major barrier to achieving my ambition is that darned Star array processor attached to a VAX 11/780 at the UCSB Physics department.

Ah, see, I only have two 41's left - I'm a user, not a collector, so I wouldn't surrender a large chunk of my tools for a machine I wouldn't have that much use for.

And if I'd kept every machine I'd owned - let alone every one I've worked on, going back to the Elliot/ICL 1901 - I'd have a museum.

Best,

I worked on an IBM 5150 in my first computer job in 1983. It was a relic by then. I believe it was a model that had been delivered with APL as the user programming language, because the keyboard had the APL special symbols on shifted keys. But the machine had been converted to use an extremely primitive form of BASIC. The machine was as small as pictured in the referenced ad, but sat on top an enormous dual 8 inch floppy drive unit that was large enough to raise the machine to a comfortable height for typing. The small computer consulting firm I was working at had several customers that used the 5150 with a custom payroll application developed by the company. Later, I graduated to using the Convergent Technologies machines. These had a very early form of networking, and ran Microsoft BASIC. I sure appreciated the advance control structures, like WHILE/WEND, in that dialect. :)

One should check out some details of the IBM 5100 before making that type of inaccurate off-the-cuff statement. See this IBM 5100 article .

I own the HP-67 and HP-41, and they weren't even in the same ballpark in terms of capability. But the cost, back in late 1975, was 24 kg in mass and up to $20,000 ($81,000 in 2010).

Re: old computer comercial

*Message #20 Posted by **Garth Wilson** on 29 Apr 2010, 11:04 p.m.,*
in response to message #19 by Mike Morrow

Unless it was better than the 5150 which came later, the 41 was much, much more efficient at quickly getting programs going to control lab equipment at take data, using the HPIL & Ext I/O modules and the 82169A HPIL-to-HPIB interface converter. I found that out when I worked at a microwave semiconductor manufacturer.

Re: old computer comercial

*Message #21 Posted by **Don Shepherd** on 30 Apr 2010, 12:01 a.m.,*
in response to message #19 by Mike Morrow

I agree, Mike, you really can't compare a programmable calculator like the 41 or 67 with, essentially, a minicomputer like the 5100. The 5100 was revolutionary; it really was the first "personal" computer in a day where computer = IBM 360. I've still got the brochure IBM sent me when the 5100 came out; it was like they shrunk the 360 to fit on your desk.

Mini HP Calc (and wine?) meet

*Message #22 Posted by **Art Litka** on 4 May 2010, 10:53 p.m.,*
in response to message #1 by db (martinez, ca.)

Since I will be visiting theBay area for about 10 days from Fla, db has suggested that we have a mini HP fest in or near Martinez CA on the weekend of May 15-16. It might be a good chance for some of us rpn geeks to meet, share stories and "wine" about HP's current state of calculator affairs. Anyone interested?

Edited: 4 May 2010, 10:55 p.m.

Re: Mini HP Calc (and wine?) meet

*Message #23 Posted by **db (martinez, ca.)** on 5 May 2010, 12:12 a.m.,*
in response to message #22 by Art Litka

Obviously; i'm interested since art and me will be meeting up here in river city. I'll have the "alternate universe RPN museum" unpacked, for anyone that wants to fondle a Russian, Argentine, German, Japanese, or whatever calculator with a sensible operating system. (Art: there's a couple of new ones you haven't seen yet). Art and me will be "wine tasting" like the other times. You might try to get him to talk astronomy while he's on vacation, good luck there. Other possible diversions can be:
The John Muir Home is here and worth a pilgrimage if you climb or study nature.
The Viano Winery is a mile from here for yet more wine tasting. As Clem said: "It's the Grapes".
If the Sons of Italy are finished restoring it: Joe DiMaggio's Chriscraft speedboat may be back on display. It's a siren call to fans of both baseball and places that Marlyn Monroe placed her lovely fundament.
I plan on checking out Art's 48-with-a-41-card, and i might try a glass of wine.

Transport from and to BART is already in the cards. All we need to know is which day: 15th or 16th. I don't know who all here is close anymore- Ted moved south, lost track of the folks in Davis. Eric, Howard, show up if you want.

HP 30b numeric integration program

*Message #1 Posted by **Gene Wright** on 28 Apr 2010, 11:04 a.m.*

Here is a numeric integration program for the HP 30b. This is a translation of the HP-25 Program Library entry # L19 from 65 Notes V4N2P32 originally by Bandes, Davidson, and Derrick.

Usage:

At LBL 99, key in the function to be integrated. When LBL 99 is executed, the value of the X to be evaluated is in the X register (display) at entry to LBL 99. If you need it again to evaluate the function, it is stored in memory 3. Memories 6 and up are available as well.

At the PRGM location in which this program is stored (at the proper entry in the HP 30b program catalog), Key lower limit, press =, key upper limit, press =. Then press = again to start the program.

This program uses Simpson's rule with a default value of 200 for the number of increments.

The program is VERY fast. To solve the integral of e^x from 0 to 1 using 200 as the number of increments takes less than 2 seconds if this program is program 0 in the HP 30b.

The integral of e^x from 0 to 1 is solved to be 1.71828182849. Value of e minus 1 is 1.71828182846, an error of 3 in the last position.

The integral of SIN(PI*X) from 0 to 1 is solved in about 5-6 seconds with 500 as the number of increments with a solved value of 0.636619772363.

Register usage:

```
Memory 0 = number of increments, default is 200. Must be an even value.
Memory 1 = lower limit of integration
Memory 2 = upper limit of integration
Memory 3 = value of x being evaluated
Memory 4 = a positive or negative 1, depending on the loop.
Memory 5 = value of integrated function (sum)
```

Version shown here uses 92 bytes with a checksum of 016.

Improvements can be made to this code. The labels chosen correspond to the line numbers of the GTO statements in the original HP 25 program. Suggestions for improvements:

1) I used LBL 99 for the function to make the function occur at the end of the listing. This could be put into the code right after LBL 06, saving bytes and speeding up execution.

2) Lines 33-35 are to make the stack mimic what was in the HP 25 program. I have not found an easier way to do this, but it is clumsy as is.

3) Lines 36-40 and 48-51 are there to accomplish the following: memory 4 is initialized to zero. The first time through the loop, this should have negative 1 placed into it. Thereafter, the sign of the contents of memory 4 should be switched from negative to positive to negative, etc., each time through the loop. I freely admit this is again clumsy, but it does work.

4) Use something other than Simpsons, especially since it will fail if an endpoint is undefined. Integrating LN(X) from 0 to 1 fails, of course. :-)

Re: HP 30b numeric integration program

*Message #2 Posted by **Gene Wright** on 30 Apr 2010, 3:51 p.m.,*
in response to message #1 by Gene Wright

While the overly sensitive might take a lack of replies to a post like this personally, I'm not (overly) sensitive. :-)

I did some additional comparisons of this integration program with the examples given in John Kennedy's HP 34C review from the PPC Journal V6N5P19-20. He gives 6 examples as shown below:

INTEGRAL	34C INTEGRATE FUNCTION VALUES DISPLAY AND TIMING INFORMATION			EXACT 10-DIGIT VALUE	16-POINT GAUSSIAN QUADRATURE
$\int_0^{10} 5x^2 \cdot dx$	DSP 2 1,666.666428 40 seconds f(x) used 31 times	DSP 4 1,666.666667 42 seconds f(x) used 31 times	DSP 9 1,666.666667 79 seconds f(x) used 63 times	1,666.666667	1,666.666667 28 seconds f(x) used 16 times
$\int_1^9 \sqrt{2x + 7} \cdot dx$	DSP 2 32.66690936 13 seconds f(x) used 7 times	DSP 4 32.66667861 25 seconds f(x) used 15 times	DSP 9 32.66666667 91 seconds f(x) used 63 times	32.66666667	32.66666667 31 seconds f(x) used 16 times
$\int_0^{\pi} \cos(x) \cdot dx$	DSP^2 -2.571285543 15 seconds^{E-10} f(x) used 7 times	DSP 4 -2.571285543 15 seconds^{E-10} f(x) used 7 times	DSP 9 -2.571285543 15 seconds^{E-10} f(x) used 7 times	0.000000000	-6.425214698 E-10 38 seconds f(x) used 16 times
$\int_0^1 \frac{4}{1 + x^2} dx$	DSP 2 3.14105343 13 seconds f(x) used 7 times	DSP 4 3.141592712 49 seconds f(x) used 31 times	DSP 9 3.141592654 185 seconds f(x) used 127 times	3.141592654	3.141592654 33 seconds f(x) used 16 times
$\int_0^5 x^3 \cdot e^{-x} \cdot dx$	DSP 2 4.409433596 33 seconds f(x) used 15 times	DSP 4 4.409845363 65 seconds f(x) used 31 times	DSP 9 4.409844509 249 seconds f(x) used 127 times	4.409844509 ?	4.409844510 41 seconds f(x) used 16 times
$\int_0^{\pi/2} \sin^4(x) \cdot \cos^2(x) dx$	DSP 2 0.09817646211 54 seconds f(x) used 15 times	DSP 4 0.09817646211 54 seconds f(x) used 15 times	DSP 9 0.09817477042 432 seconds f(x) used 127 times	0.09817477043 ?	0.09817477044 64 seconds f(x) used 16 times

Using the above program with 500 intervals, the following results are obtained.

Note that if the number of intervals are reduced to 50, the results still appear to be accurate to about 8-10 decimal places and the run times are 1-2 seconds!

1. Result of 1666.6666666633 in about 4 seconds.

2. Result of 32.6666666659 in about 5 seconds

3. Result of -5.4365x10^(-10) in about 4 seconds

4. Result of 3.14159265355 in about 5 seconds

5. Result of 4.40984450786 in about 5 seconds

6. Result of 0.0981747704617 in about 6 seconds.

Perhaps when more of you have an HP 30b, this will generate a bit more excitement? :-)

Me: Ditto.

#2 HP 30b numeric integration program

*Message #5 Posted by **Gene Wright** on 30 Apr 2010, 4:38 p.m.,*
in response to message #2 by Gene Wright

This is another numeric integration program for the HP 30b. It is a translation of the HP 41 program found in V7N8P10-11 of the PPC Journal. It uses an iterative 3-point Gaussian Quadrature.

And, as you will notice, I am not smart enough to write my own ORIGINAL integration program. I'm having to translate the work of others. :-)

As typed below with LBL 98 containing the SIN function, it is 86 bytes with a checksum of 221. As written, it is very fast. It solves the example problems from the PPC ROM routine IG with varying levels of accuracy, generally 4-8 decimal places - no doubt due to the 3 point nature of this approach compared to a 16-point approach. :-) But, compared to the simpson's approach, it will evaluate integrals where the endpoints are undefined.

Key in your function to integrate at LBL 98. The value of X is in the X register. If you need it more than once, save it into memories 0, 1, or 2. Register usage is 6 - lower limit, 7 - upper limit, 8 - number of iterations, 9 - sums (scratch), 5 - offset (scratch), 4 - midpoints (scratch), 3- dx (scratch)

** Why do these things? Well, here is a BUSINESS calculator with RPN that can be programmed to do all sorts of non-business things...and it is fast. **

Re: HP 30b numeric integration program

*Message #6 Posted by **Gerson W. Barbosa** on 30 Apr 2010, 9:48 p.m.,*
in response to message #2 by Gene Wright

Thanks for posting the programs. Would you please time the one below? The exact twelve-digit result is 0.03648997398, or 2 + Psi(1/2). (On the 50g Psi is accessible through white left shift MTH NXT SPECI).

```
/1
⌠
⌡ (sqrt(x)/(x-1) - 1/ln(x))dx
/0
```

> Quote:

Perhaps I should get myself one.

Re: HP 30b numeric integration program

*Message #7 Posted by **Gene Wright** on 30 Apr 2010, 10:10 p.m.,*
in response to message #6 by Gerson W. Barbosa

The simpson's version won't run, of course, since it tries to evaluate LN(0).

The 3-point iterative quadrature program with 50 iterations returns 0.0364973556 in about 1-2 seconds. It's very fast.

Increasing the iterations to 500 takes about 12 seconds, returning 0.0364906580, which is surprisingly good (IMO).

Hey, it IS only a 3-point method. :-)

The code I used for LBL 98 was stack-oriented saving a register. These were my steps:

```
LBL 98
LN
ANS
SWAP
1/X
SWAP
SQRT
ANS
1
-
/
SWAP
-
RTN
```

> Quote:
>
> The simpson's version won't run, of course, since it tries to evaluate LN(0).

Changing the integration bounds to 1e-38 and 0.9999999 shouldn't affect the 12-digit result, but even Simpson 3/8 with 19500 intervals performs badly on this one:

```
Program Simpson_3_8;
var a, b, h, s1, s2, x: real;
                     n: integer;

function f(x: real): real;
begin
  f:=Sqrt(x)/(x-1)-1/Ln(x)
end;

begin
  ClrScr;
  Write('A, B, N: ');
  ReadLn(a, b, n);
  n:=3*n;
  h:=(b-a)/n;
  s1:=0;
  s2:=0;
  x:=a+h;
  repeat
    s1:=s1+f(x+2*h);
    s2:=s2+f(x)+f(x+h);
    x:=x+3*h
  until x>a+(n-3)*h;
  s2:=s2+f(x)+f(x+h);
  WriteLn(3*h/8*(f(a)+f(b)+2*s1+3*s2))
end.

------------------------------

A, B, N: 1e-38 0.9999999 6500
  3.6498295709E-02
```

Anyway, this is a tough integral for numerical methods:

Integration speeds: JK's HP 34C review

*Message #9 Posted by **Karl Schneider** on 4 May 2010, 1:50 a.m.,*
in response to message #2 by Gene Wright

> Quote:
>
> *(Gene Wright)* did some additional comparisons of this integration program with the examples given in *(an)* HP-34C review from the PPC Journal V6N5P19-20.

Gene --

Thanks for presenting the table. The author's review of the HP-34C was favorable, yet he chose six integrals that, in a sense, made the HP-34C's INTEG capability 'look bad' by comparison to 16-point Gaussian quadrature. The GQ results, the author points out, were at least as accurate and were obtained in less time. Furthermore, they were produced by an RPN routine programmed on the HP-34C -- not a built-in microcoded function. He speculates that the GQ approach "may not have been used by HP because of internal storage requirements."

Maybe so, but I notice that all the examples utilized very well-behaved integrands over narrow intervals, for which even simple methods will tend to produce good results. HP's objective in this inaugural effort was robustness and practicality -- to provide sufficiently-accurate real-world results in science and engineering without the user's having to specify the number of evaluations, or avoid endpoints for which the function was undefined, or risk wrong answers due to an inadequate sampling rate for a periodic function.

I do note that the GQ program uses all 21 storage registers and consumes 40 lines of programming. The user's program defining the integrand must not employ any register, because no unused ones are available. It also cannot exceed 30 lines, lest register R19 ('.9') be *automatically* deallocated, rendering the GQ program inoperative. (Score a point for the successor HP-15C and its *manual* memory allocation.)

The exact value for the fifth integral is 6 - 236*e^(-5) = 4.40984450821.

The exact value for the sixth integral is 3*pi/96 = 0.0981747704247.

The HP-34C GQ result and timing for the "Kahan integral" in the paper linked by Gerson:

```
f(x) = sqrt(x)/(x-1) - 1/ln(x)
0 <= x <= 1
```

At each endpoint, f(x) is undefined but does approach zero, as shown by limit analysis. From x = 0.000, f(x) rises quickly to a 'smooth' local maximum of 0.117680329841 at x = 0.00473796324935, then gradually and monotonically declines to a local minimum of ...
-0.117680329841 at x = 211.061155894 (which is 1 / 0.00473796324935), as this function has the property f(1/x) = -f(x) for all x (where defined).

The derivative:

$$df/dx = \frac{1}{x(\ln x)^2} - \frac{(x+1)}{2\sqrt{x}(x-1)^2}$$

The exact value of the integral is (2 - ln 4 - gamma), where gamma is the Euler-Mascheroni Constant of 0.577215664901532...

```
FIX 5            FIX 6           'Exact'        Gaussian

0.03661813695  0.03649023200  0.036489973980   0.0364900935
19 seconds      268 seconds                      45 seconds
```

The 16-point GQ outperforms the built-in Romberg method in this instance, too. Over this short interval of [0, 1], the 16 points seem to provide adequate coverage for high accuracy, and it does not evaluate at endpoints -- a definite 'plus' in this instance.

The highly-accurate GQ result might have been 'dumb luck', as no evaluation point (node) fell between zero and 0.004738.

I do wonder about its performance over large intervals with erratic integrands, but the Gauss - Kronrod method (used by the TI-82 and likely its successors) handles that situation by comparing the difference between estimations and taking more evaluations as necessary, much as HP's modified Romberg method does.

I may add a section to my HP Articles Archive contribution (#556), with a deeper analysis of this integral and computational methods.

Gerson said above:

> Quote:

> ... but even Simpson 3/8 with 19500 intervals performs badly on this one:
>
> 3.6498295709E-02
>
> Anyway, this is a tough integral for numerical methods:

In reasonable amounts of time with endpoints of 1E-8 and 1 - 1E-8, the Casio fx-115MS obtains 0.0365 using Simpson's Rule at 512 points, but the successor fx-115ES obtains 0.03648997346 using Gauss-Kronrod (and, I might add, a perfect answer of 0.03648997398 using 1E-10 and 1 - 1E-10 as the endpoints). Then, after a period of inactivity, they shut themselves off and forgot the integrals I'd entered...

Gene said below:

> Quote:

> Karl, what I'd rather do is make sure you get an HP 30b soon to try your hand at programming it for things like this.

Nah, I'd rather not program things that should be built into a calculator, even though the HP-30b is a business model. Besides, the HP-34C LED 'light show' should be played from time to time...

*Message #10 Posted by **Gene Wright** on 4 May 2010, 10:11 a.m.,*
in response to message #9 by Karl Schneider

Karl, what I'd rather do is make sure you get an HP 30b soon to try your hand at programming it for things like this.

In the meantime, I'd be glad to try the routines I've translated for some integrals if you care to suggest some examples.

Or... if you know of an RPN program to do integration that doesn't do lots of X<> IND Z or DSE Y type of stuff, I could try translating that. The 30b stack behavior is slightly different than the HP 41 style "RPN" since it has some RPL tendencies, so sometimes complicated stack-using programs are a pain to translate.

Re: Integration speeds: JK's HP 34C review

*Message #11 Posted by **Gerson W. Barbosa** on 10 May 2010, 4:54 p.m.,*
in response to message #9 by Karl Schneider

Hello Karl,

Thanks for taking the time to do all these analyses and comparisons among different integrating methods.

> Quote:
>
> The 16-point GQ outperforms the built-in Romberg method in this instance, too. Over this short interval of [0, 1], the 16 points seem to provide adequate coverage for high accuracy, and it does not evaluate at endpoints -- a definite 'plus' in this instance.

I had seen JK's program before but I never bothered keying it into the 34C. I will try it later on my double-speed 15C.

Regards,

Gerson.

12c firmware

*Message #1 Posted by **Paul Dale** on 28 Apr 2010, 8:47 a.m.*

Has anyone with the new 12c attempted to download firmware from the 10c, 11c or 16c onto it?

I.e. find where the original 12c ROM lives in the image and replace that with a ROM image for one of the others.

The 15c is less likely to work since the ROM is twice the size.

- Pauli

Re: 12c firmware

*Message #2 Posted by **Scott Newell** on 28 Apr 2010, 9:04 a.m.,*
in response to message #1 by Paul Dale

Interesting...how would you do it?

As I understand the 12C+ (not having found one yet), there is no JTAG port, so no way to pull the existing firmware out as we did with the 20B. Booting into the AT91SAM7L128 serial bootloader will erase the firmware from the calc.

Once you have the firmware, you'd still need to find the 10C, 11C, or 16C image. Last time I checked, they'd been removed from the nonpareil distribution. (Which leads me to think that it might still be a fun project, yet not something that could be publicly distributed without upsetting someone...)

That's all correct.

It's also possible that there are some patches to the original 12c firmware to handle certain timing issues -- I'm just speculating on this based on some comments Cyrille made here in the past.

However it's still a neat calculator to re-purpose even if you have to start nearly from scratch. It's in the perfect format with a highly readable display and great keys not to mention a very fast processor.

Don't be too sure. I've got a bad habit of starting projects and losing interest or never finishing them. After all, it's been what, 2+ years since I did any 20B hacking?

I think I've got a line on a 12C+. Should know by the weekend.

I thought the rom of the 12c was really big--to handle all the financials. You say the 15c rom was bigger? Is this a fact, or speculation?

Re: 12c firmware

*Message #11 Posted by **Katie Wasserman** on 28 Apr 2010, 11:20 a.m.,*
in response to message #10 by bill platt

The 11c, 12c and 16c all have the same ROM size (about 55,000 bytes) while the 15C's ROM is twice as big. ROM in the ARM chip that HP is currently using (AT91SAM7L128) is 128K and given that you'd need the emulator in there too it would be hard to fit without some sort of compression. There's a similar 256K chip (AT91SAM7S256) but it has a higher current draw and would have to run a a lower speed and have a shorter battery life in the off state.

From what I remember of the ROM files in the old nonpareil distribution, that's not correct. I think they are much smaller.

Maybe Eric Smith will chime in.

Re: 12c firmware

*Message #14 Posted by **Monte Dalrymple** on 28 Apr 2010, 1:15 p.m.,*
in response to message #13 by Scott Newell

The 10c, 11c, 12c and 16c used 6144 (0x1800) 10-bit words of ROM.

The 15c used 12288 (0x3000) 10-bit words of ROM.

RISC might be fast but it sucks big-time for code density.

The nonpareil ROM images are 55k but are text in a not even remotely compacted format: 4 digits of address, a colon, three digits of code and a new line. i.e. 9 characters per ten bits. Looks like about 6150 lines of real code there.

Anyway, the reason I thought the 15c firmware would be harder isn't due to it fitting or not, there should be plenty of flash space free. Rather, it would be due to there not being space to just dump it into the firmware in place.

We need to get a flash dump somehow to experiment :-)

Yes indeed, I stand corrected.

I count 14,336 10-bit words in the 15C emulator image, but some of this might be more than in the original ROM.

*Message #7 Posted by **bill platt** on 29 Apr 2010, 12:28 p.m.,*
in response to message #6 by Tim Wessman

Actually that makes me think of something. I was around ten when the HP 67 came out. Boy was that thing a marvel. Not that I had a lot of chances to use one, but I did get the chance to play moon lander on it--and that experience was never forgotten. It was cool high technology the latest and greatest.

Fast forward to today. My own kids think these old calculators are sort of neat, but they are totally enamored (well, I wouldn't say unthinkingly so) of the ipod and smart cell phones.

When they are 40, are they going to look back at the iphone the way I look back to the HP 67?

Re: HP Calculator Colors

*Message #8 Posted by **Dimitri Simitas** on 29 Apr 2010, 2:32 p.m.,*
in response to message #7 by bill platt

No because they will remember them as junk. The HP67 had a use, was relatively new technology, and still works making the dream to own one again possible for you. Most people I know who bought iPods when they first came out already have replacements because they broke down.

Dimitri

Re: HP Calculator Colors

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 2 May 2010, 7:32 p.m.,*
in response to message #8 by Dimitri Simitas

I second Dimitri´s thoughts.

Some years ago I wondered about the same subject, including whatever we have today. I am not a collector in the sense I would not have an item just to complete a

collection. I just try to keep working units with features I need or want.

I also have some cassette decks and recorders, most of them are Philips from the 70´s up to mid 80´s. Those were built to last, and almost all of them are serviceable with components available nowadays. I also happen to have some equipments from other origins, mostly Japanese, but they are not serviceable as well because some components are no longer available. In fact, with a few exceptions, most of the European sound equipment form that time are still serviceable and most of their electronics can be found today. And for me they are kind of working technology register, far better then reading about them in books or wondering about them in service manuals.

What can we tell about the new equipments? They are built to trash, not to last. Once their lifetime expires, kiss them good bye. We all know the HP41 and its internal user (RAM) memory. The HP41CV offers 2240 bytes (2237 if we consider the permanent .END. cannot be used) for program and register storage, and so too many things were created with that we can´t tell. Today many users happen to stuff 64 GByte pendrives with MP3- and JPG- and MPG- files, leaving no space for serious business. This kind of data is also volatile, meaning that in a couple of years -if that further- these MP3, MPG and JPG files will no longer be of interest. And the device itself will be too 'small' to store the silliness these users will want to store in then.

The iPods surely became small, 'resourceless' and 'old', and I'd not count on people telling 'how good they were back then'.

Cheers.

Luiz (Brazil)

in response to message #7 by bill platt

I doubt it will be the same for the iPhone. The whole concept of having a powerful hand-held device just isn't new any more. Sure, the iPhone has some great capabilities, but it doesn't feel as "new and special" as the early calcs.

I do wonder, though, what device _will_ have that cachet to today's teens in the future, the way calculators appeal to me. Maybe hand-held game machines.

Btw, crazy as it may sound, I've hung on to each version of the iPhone as I buy the new ones. I have no love for them, though, because all the delight comes from the software. I'd get a greater rush holding a dead HP-67 in my hand and tapping on the clicky buttons.

Re: HP Calculator Colors

in response to message #10 by Manatee

I'm not so sure the same thing won't repeat itself.

My son, who is just 20, already wishes he had held onto his first iPod. Will probably buy one for him so he always has it.

Sure...when he is 60, the idea of 20GB of storage on an iPod will seem ridiculously small, but I think there will be many who remember their youth this way.

The original iPod is certainly iconic. I've kept my original 5GB (mechanical click wheel, Fire-wire only) from 2001, along with all the packaging. I've kept several others, too.

Maybe it's because of the hard lesson learned from letting go of my dead HP-25C, about 30 years ago. I still haven't managed to replace it. Shouldn't be hard, though... A dead what would be as good as what I had.

in response to message #7 by bill platt

I'm not sure that the iPhone will have the same nostalgia value as the HP 67 because it isn't such a huge leap in technology. I think the relatively big advances that occurred over the past 10 years that kids will be nostalgic about are:

- the iPod
- the cell phone
- the Nintendo Wii

I look forward to one day telling my grandchildren about the bizzare old days when telephones were permanently plugged into the wall and had to use a thing called a typewriter to write papers.

"But grandpa, how did people call you when you went to work?"
"There was a separate phone at work. But get this: it had a different number. So you had to tell people both numbers and they'd call whichever one they thought you might be at"
"Well that's just DUMB grandpa!"

in response to message #13 by David Hayden

There will be some problems with the iPhoe in the (not so distant) future:

The battery is toast and irreplaceable.

iTunes will have ceased to exist, no way to put anything on the device.

The cellular networks will have emerged in a way that the iPhone will be useless, even if it would still be in good shape.

A classic HP calculator will still be useful.

The battery in an iPhone is replaceable just like rechargeable battery packs for classic HP calculators. It's a module, maybe with wires soldered (in the 1st generation) to the motherboard. Whoopee.

There are kits and 3rd party service providers today if you need a battery replacement.

As for the rest... Well, the iPod Touch is an iPhone without cell service and people find it useful. Furthermore people have "jail broke" them both to put non-Apple software on them without using iTunes and for their own purposes.

I'm not saying that an iPhone/iPod will have the market in 30-40 years that old HP calcs had at that age, but it seems disingenuous to claim that an old iPhone will be significantly more useless than an old HP calculator. Maybe you could run free42 on your old iPhone...

I was given a mint HP 67 with several software packs, manuals, etc. that the owner considered useless. I purchased a 41cx in very good condition that the owner considered useless. Both had been sitting unused for years.

I'm sure many people will feel the same as those owners did when thinking about a 30 year old iPhone, and I am equally sure that some people will find that phone desirable and maybe even useful.

> My own kids think these old calculators are sort of neat, but they are totally

> enamored (well, I wouldn't say unthinkingly so) of the ipod and smart cell phones.
> When they are 40, are they going to look back at the iphone the way I look back to the HP 67?

I was fortunate enough to get a Sinclair Scientific when I was 11 years old, and an HP-25 about two years later. I wrote my first computer programs (in BASIC) on a friend's dad's Commodore PET, and, with a little help from my dad, on the local university's mainframe (in ALGOL-60, good times!). By the time I got to college, I was programming the Commodore 64 and the first generation Macintosh.

From that first scientific calculator to the Commodore 64 was all just one cool adventure. Don't get me wrong, it's not like I didn't have a life outside of this -- I loved spending time with friends, being outdoors, etc., just as much then as I do now. But that newfangled digital technology was just, well, really really *new*.

By the time I started programming on the Macintosh in the mid- to late '80s, the novelty was starting to wear off. I was learning GUI APIs, learning how to write "real" applications, i.e. the kind of stuff that people want to use because it helps them with their jobs, as opposed to the stuff that people run just because it's cool.

I have no regrets about making that transition; the "boring", "just useful" stuff, it pays my bills with plenty left to spare...
But the fun and excitement of those early years, that's gone. I haven't felt excited about digital technology since more than 20 years ago. Sure, stuff like the iPhone is neat, but in the end, it's just more of the same. Things keep getting smaller and faster and just generally better and easier to use... but the sense of something truly *new*... That's gone.

It seems to me that the young 'uns (as in, anyone born in the late '70s or later) never had the chance of experiencing that sense of excitement to begin with... and so they'll never have the kind of nostalgia that I sense on this forum and other places that celebrate the technology from the early days.

Repairing a HP41 Printer?

*Message #1 Posted by **Dimitri Simitas** on 27 Apr 2010, 2:41 p.m.*

I finally am running my printer, but the paper doesn't advance enough and it prints ontop of the old. If I click Paper Advance 3 times it will print underneath, clicking 4 times gives alittle more space. Using original HP paper that came in the package with the printer still in its original 6 roll HP box.

Does not matter if I am plugged in or just running on batteries, as it does the same thing.

Any ideas?

Thank you.

Dimitri

Re: Repairing a HP41 Printer?

*Message #2 Posted by **Michael de Estrada** on 27 Apr 2010, 2:50 p.m.,*
in response to message #1 by Dimitri Simitas

Paper advance rollers are probably flat spotted. Sometimes you can work them back into round, but usually they have to rebuilt.

Re: Repairing a HP41 Printer?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 27 Apr 2010, 2:57 p.m.,*
in response to message #1 by Dimitri Simitas

Hi;

there are two small springs, in both left and right tips of the cog that pulls the paper, that control the pressure made over the printed paper. Are they in place? Also the rubber-like (kind of a polymer) rings in the same cog may be either contaminated (dirty) or wear. Should check it.

I also have a printer that does not pull the paper because the rubber belt that connects the motor pulley to the cog mentioned above is loose and it slips.

Cheers.

Luiz (Brazil)

Re: Repairing a HP41 Printer?

*Message #4 Posted by **David Hayden** on 27 Apr 2010, 10:21 p.m.,*
in response to message #1 by Dimitri Simitas

I think Geoff Quickfall's calculator repair book will cover this. I have a busted printer for the 41 also, as well

as a card reader with gummy rollers. I'm planning to get Geoff's book when he's done and trying to repair them myself.

HP 25 Woodstock

*Message #1 Posted by **timw** on 27 Apr 2010, 9:48 a.m.*

Hi, I am wondering what the general consensus is regarding the fragility of the HP 25. Does the HP 25 survive an over voltage condition as seen when the charger is used without a battery pack ?

I believe the HP 25 uses PMOS technology which is less sensitive to overvoltage than CMOS or NMOS - is this true ?

I have looked through the archives and found plenty of cases where a HP 29C (and to a lesser extent the HP 25C) is destroyed by the charger over voltage when the battery is not making good contact or is not fitted. Most authors point to the CMOS ROMS as being destroyed, rendering the calculator useless.

I do not recall seeing any examples of a HP 25 or 21 being destroyed in this manner.

What is your experience with the 25/25C/29C ?

Regards, tjw.

Re: HP 25 Woodstock

*Message #2 Posted by **Jim Horn** on 27 Apr 2010, 11:45 a.m.,*
in response to message #1 by timw

My HP-25 (non-C) is dead, perhaps for that reason. The charger has been lost for many years but replacing the NiCd batteries with regular AA (alkaline) cells doesn't turn it on. Right now it's in storage so I can't debug it.

My first calculator - wish it still works!

Re: HP 25 Woodstock

*Message #3 Posted by **Kees van der Sanden** on 27 Apr 2010, 1:16 p.m.,*
in response to message #1 by timw

From a technical point of view I don't see a reason why PMOS is less sensitive to overvoltage than CMOS or NMOS. The main reason for damage due to overvoltage is gate oxide breakdown. This breakdown depends on the oxide thickness and the quality of this oxide. The thinkness of this gate oxide is decreasing by each technology generation. This is a reason why the supply voltage of modern chips is also decreasing. It could be that the CMOS chips used in the C models were made in a new and less mature CMOS process compared to the standard PMOS technology in that time.

Re: Some progress (HP 85B)
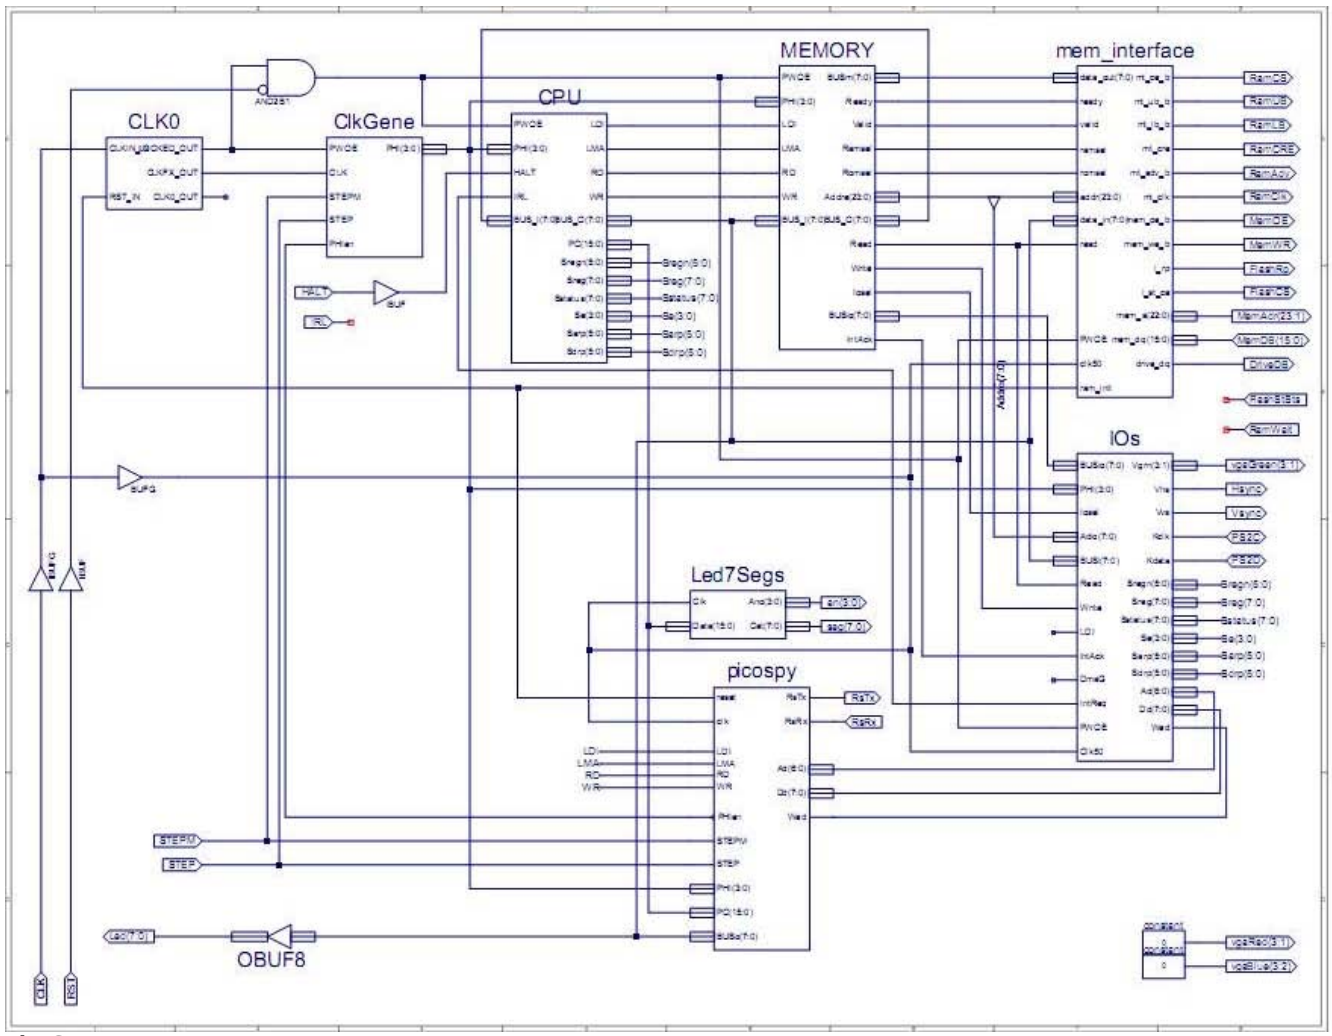
*Message #3 Posted by **Juergen Keller** on 1 May 2010, 4:11 p.m.,*
in response to message #1 by Olivier De Smet

Are there any technical background information?

Re: Some progress (HP 85B)
*Message #4 Posted by **Olivier De Smet** on 2 May 2010, 3:01 a.m.,*
in response to message #3 by Juergen Keller

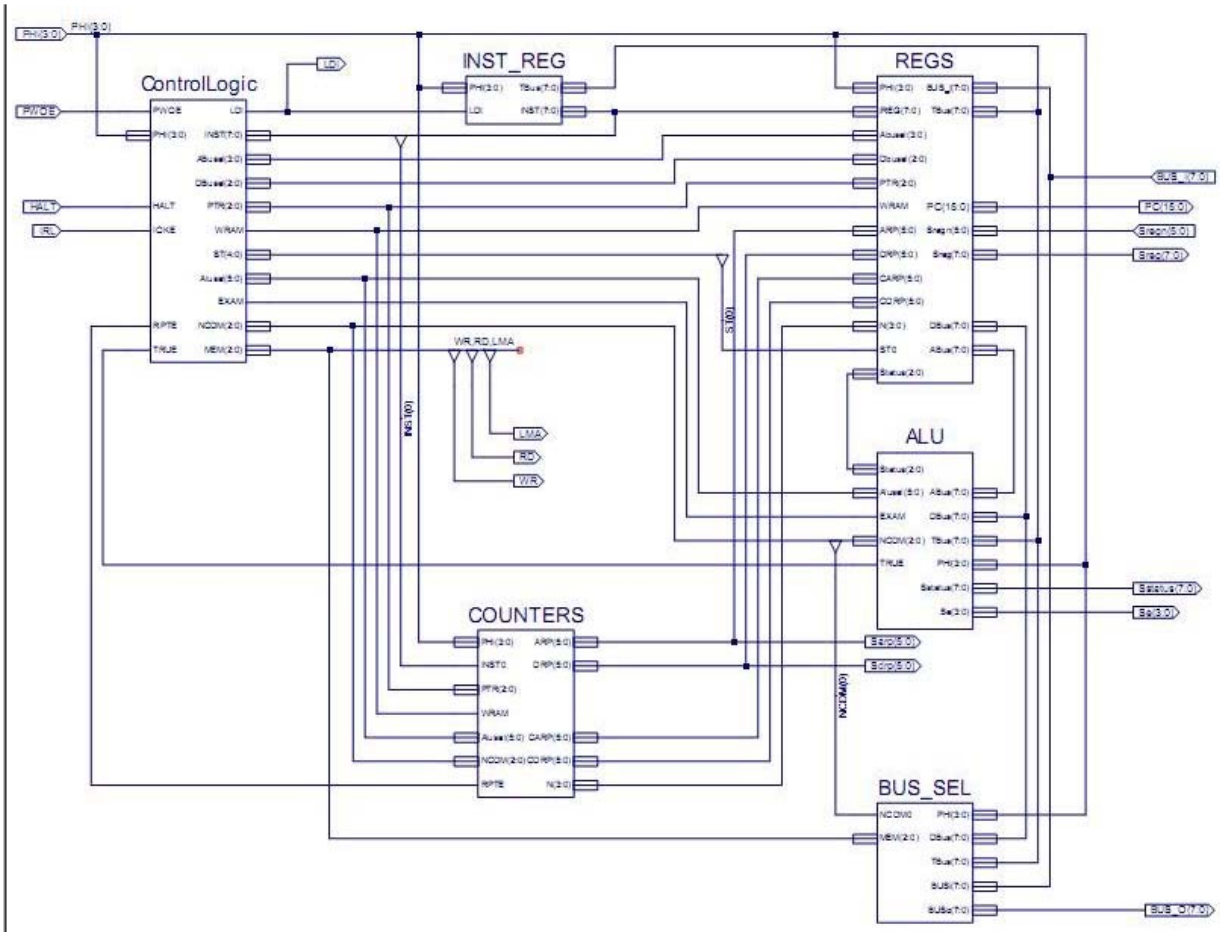
My main source is the patent # 4424563 for the description of the CPU. For the system I used the Assembler manual and other HP publications.

The global structure



MEMORY
mem_interface
CPU
CLK0
ClkGene
IOs
Led7Segs
picospy
OBUF8
BUFG
HALT
IRL
STEPM
STEP
CLK
RST

The CPU



I used fig. 1 of the patent to structure the fpga project :

- schematics to structure the system
- some verilog for ALU and Control Logic

For the global system I added a picoblaze controler to 'hypervise' the system with the serial link of the board:

- step CPU
- trace until PC
- ...

But now I think I have some timing problem with the Strataflash on the Nexys2 board. Sometimes the CPU can't 'read' the rom ...

25 and/or 25c Repair

*Message #1 Posted by **J Grim** on 26 Apr 2010, 11:22 p.m.*

I recently acquired a couple of 25's (actually, a 25 and a 25c). Both had what appeared to be replacement batteries and the the battery pack holder modified to accommodate the new batteries. A wall charger was included with these. Neither unit would power on, so I assume the batteries are shot. I did not plug them in for fear of frying them. In the 25, I tried a fully charged, fairly new set of NiMH batteries and still no power.

At this point, I suspect the previous owner may have tried plugging them in via the wall charger and perhaps they are already fried. Does anyone have experience diagnosing these or any suggestions as far as who I could send them to for repair/diagnosis? It would be sweet if these were more than just "display" models (attractive as they may be). :-)

Thanks,

J Grim

Re: 25 and/or 25c Repair

*Message #2 Posted by **Michael de Estrada** on 27 Apr 2010, 12:14 a.m.,*
in response to message #1 by J Grim

I would suggest contacting fixthatcalc

Unfortunately, if those calculators, codenamed Woodstock, are connected to the AC adapter w/o a good NiCad battery pack installed, serious damage usually occurs to the electronic components.

Re: 25 and/or 25c Repair

*Message #3 Posted by **JGrim** on 27 Apr 2010, 9:02 a.m.,*
in response to message #2 by Michael de Estrada

Thank you. I had read that that might be the case. I don't know if the previous owner did plug them in or not, but I am afraid that he did. Oh well, if they are not repairable, at least they are nice to look at and I did not spend that much to get them.

Thanks again,

J Grim

Re: 25 and/or 25c Repair

*Message #4 Posted by **Michael Meyer** on 27 Apr 2010, 12:11 p.m.,*
in response to message #3 by JGrim

Hi J!

Don't give up yet. You've got nothing to lose by opening them up and seeing if corrosion is the problem. Have you tried connecting an external power supply to the battery contacts?? (Not a supplied charger, but 3V directly?) Usually, when these are powered incorrectly and the ACT chip goes, there should still be some kind of display... random or flashing LED's. If there's nothing in the display, other (maybe fixable) problems could exist.

If you're not familiar with fixing these, have someone else take a look. I don't have the experience that Randy and Tony and others have, but I'm not too shabby, and I'd be happy to take a look at them for free. Don't know how close we are... you list Iowa, and I'm in Omaha. All I can promise is that they won't be returned working less well than they are now <grin>.

The HP-25 was truly my first love; I get great satisfaction in making them intact again.

Re: 25 and/or 25c Repair

*Message #5 Posted by **J Grim** on 27 Apr 2010, 1:32 p.m.,*
in response to message #4 by Michael Meyer

Hey, thanks for the offer. It would be great to find out just what the problem is. I am not experienced/familiar with the testing or repair of these things. I did take it apart and there appears to be no PCB corrosion. However, there looks to be some minor (I hope) battery terminal corrosion. One of the old batteries that was in it had a very slight leak. I have not supplied any power to it except for putting in fairly new, charged batteries.

Please send me an email to my forum address with your mailing address and I will send you one of the units to examine. Unfortunately, Omaha is a longer drive than I want to make for this.

Thanks again,

J Grim

in response to message #7 by J Grim

The HP-25 is generally much easier to fix than the 25C, BTW.

Michael

Re: 25 and/or 25c Repair

*Message #9 Posted by **J Grim** on 29 Apr 2010, 11:01 p.m.,*
in response to message #8 by Michael Meyer

Michael, I sent you an email, but just in case you don't check it, I am sending my 25 to you at your office on Friday via USPS. You should have it early next week.

Thank you,

J Grim

Ah... Great News!!!

*Message #10 Posted by **Michael Meyer** on 3 May 2010, 9:30 p.m.,*
in response to message #9 by J Grim

The HP-25 you sent is, indeed, a pretty specimen. There was corrosion on both contacts, but the circuit board is remarkably and unusually clean. The keyboard is perfect. The display is the older type with squarer numbers and a "regular" decimal point, which I prefer.

Some cleaning with a dremel brush and re-soldering of the contacts, and your machine is alive-- running well and programming. (Sometimes the RAM is shot and they won't program). I polished it up and removed some tape residue, and it looks great.

I've put lithium cells in, and I, personally, would recommend never using the wall charger.

Another beautiful HP-25 is alive. I will contact you by e-mail. Now... let's see if we can get that 25C to work!

Re: Ah... Great News!!!

*Message #11 Posted by **J Grim** on 4 May 2010, 12:14 a.m.,*
in response to message #10 by Michael Meyer

That's great! Thank you so much! I can't wait to get it back and put it to use.

Thanks again,

J Grim

*Message #3 Posted by **Jeff Kearns** on 26 Apr 2010, 8:28 p.m.,*
in response to message #2 by Paul Dale

That one came to mind for me too! My HP21 has a 'roughed-up' cover.

Re: Spare Part Needs - Spice Series Battery Cover - More

*Message #4 Posted by **aj04062** on 26 Apr 2010, 8:35 p.m.,*
in response to message #3 by Jeff Kearns

I currently do not own a Woodstock series. Anyone have a battery holder in rough shape? Can be broken in two or missing pieces, as long as I can tell what was there I can reproduce it.

Edited: 26 Apr 2010, 8:36 p.m.

Re: Spare Part Needs - Spice Series Battery Cover - More

*Message #5 Posted by **db (martinez, ca.)** on 27 Apr 2010, 2:17 a.m.,*
in response to message #4 by aj04062

adam;
the woodie series battery box is kind of complicated and will need to be done in at least two parts. i have one you can scan. contact me through the forum system and i can send it to you.

a note on the spice series door: make sure the one you pattern yours after is a good fit for several units. some are tweaked and sit funny; latching, but just barely and having one edge or another standing proud of the bottom face of the calculator.

Classic series charging plug. :)

*Message #6 Posted by **tim m.** on 26 Apr 2010, 8:45 p.m.,*
in response to message #1 by aj04062

:)

Re: Classic series charging plug. :)

*Message #7 Posted by **aj04062** on 26 Apr 2010, 8:55 p.m.,*
in response to message #6 by tim m.

I hear ya Tim! I started this, but the little contact I got from Amphenol would need to get bent over or trimmed off if we wanted the calculator to still sit flush.

I stopped to see if I could find another type. I just got some samples of push contacts for an application at work (gold plated too). They are for only a .062 diameter, but if they had a bigger vs it should fit great.

I'll update you soon.

Hard to spend too much time on this as spring has sprung here in Maine and you need to take advantage while the weather is good. Winters are too long!

Re: Classic series charging plug. :)

*Message #8 Posted by **tim m.** on 26 Apr 2010, 10:03 p.m.,*

in response to message #7 by aj04062

Thanks for this update.

Ah yes, as a native New Englander I remember the nice weather. Being in northeastern Ohio, one doesn't see much of the sun. Vitamin D deficiency is actually chronic up here (no joke).

HP-12C+ source in the US?

*Message #1 Posted by **Scott Newell** on 26 Apr 2010, 7:55 p.m.*

I've been on another round of the local office supply stores, and I've yet to find a 12C+. (The ones I saw this weekend were in the white packaging, and I couldn't seem to get a good viewing angle and spy the battery door.) Is there a known online source in the US for the 12C+?

I've upgraded to a new computer, and I'm starting to feel the need for some more calculator firmware hacking...

Thanks!

in response to message #2 by bill platt

I checked Staples and Office Depot Saturday. No 20B, 30B, 35S, or 50G, and the 12C units brought out from the stockroom were not obviously the new ones.

in response to message #3 by Scott Newell

Is there a Fry's near you? If not, you might call one of their stores and ask, they're pretty savvy about these things. My 12C+ came from there via a very generous person who frequents this forum.

Question about HP-50Gs and Battery Life...

*Message #1 Posted by **Bill Zimmerly** on 26 Apr 2010, 3:10 p.m.*

I've owned my HP-50G since 2006 and use it almost every day. I believe I've had to change batteries in it three or four times over those years and I think that this means that the device is outstanding in power management.

Yet, I've read (mostly in the Amazon reviews of the device) that for some owners, the calculator eats batteries very quickly.

Curiosity drives my question - was there an HP-acknowledged problem with some of the HP-50Gs?

Re: Question about HP-50Gs and Battery Life...

*Message #2 Posted by **Bart (UK)** on 27 Apr 2010, 4:43 a.m.,*
in response to message #1 by Bill Zimmerly

I find that the batteries drain quickly when doing a lot of graphing (particularly if high pixel density is chosen) or long integrations etc.

I think that the "problem" is that the ARM processor clock is increased when the calculator executes routines and reduced when not doing much. The processor uses a lot of current at high clock frequencies. This is more "the nature of the beast" than a problem.

Re: Question about HP-50Gs and Battery Life...

*Message #3 Posted by **Bill Zimmerly** on 27 Apr 2010, 3:23 p.m.,*
in response to message #2 by Bart (UK)

Thanks Bart!

in response to message #3 by Bill Zimmerly

For some discussions, see these threads on comp.sys.hp48:

HP graphing calculator power consumption

Some numbers on Battery Life

There seems to have been a problem in a few cases, see here:

New HP 50G owner, experiencing problems

Re: Question about HP-50Gs and Battery Life...

*Message #5 Posted by **Crawl** on 28 Apr 2010, 8:12 a.m.,*
in response to message #1 by Bill Zimmerly

I'm sure another issue is that the calculator is easy to accidentally turn on even when it's in its case (say, while in a book bag).

If it only ever sat on a desk, presumably that would be much less of a problem.

TI-83 Plus IS> and DS< program commands

*Message #1 Posted by **Don Shepherd** on 25 Apr 2010, 10:49 p.m.*

I've never used these two commands since the FOR command sort of makes them unnecessary. They seem to operate exactly like HP RPN ISG and DSE, but the manual states that "they are not looping instructions." Why would it say that? Why else would you use these? Why are they even included in a non-RPN calculator?

Re: TI-83 Plus IS> and DS< program commands

Because they aren't? (And I'm not trying to be snarky.) In the strictest technical sense, ISG and DSE are conditional skip instructions, which are great for implementing loops, and indeed that is their primary purpose -- but the skipped instruction doesn't have to be a GTO.

> Quote:
>
> Why else would you use these? Why are they even included in a non-RPN calculator?

I vaguely remember using ISG/DSE for purposes other than looping in some programs I wrote a very long time ago. I'll try to dig up an example, but don't hold your breath. (It's all written down on paper... somewhere.)

Re: TI-83 Plus IS> and DS< program commands

*Message #3 Posted by **Don Shepherd** on 26 Apr 2010, 6:56 a.m.,*
in response to message #2 by Ivan Nejgebauer

> Quote:
>
> using ISG/DSE for purposes other than looping

Yes, they are sometimes used in RPN just to increment or decrement a variable without looping, to save a byte or two, or avoid using the X register, but this seems rather dumb in a non-RPN calculator.

Non-typical usage of ISG

*Message #4 Posted by **Andrés C. Rodríguez (Argentina)** on 26 Apr 2010, 8:17 a.m.,*
in response to message #2 by Ivan Nejgebauer

In the discussion about this program, http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv018.cgi?read=128554 , the usage of ISG as a mere "increment register" instruction is mentioned. While I used this technique, further analysis by Jeff O. showed it was not the best choice.

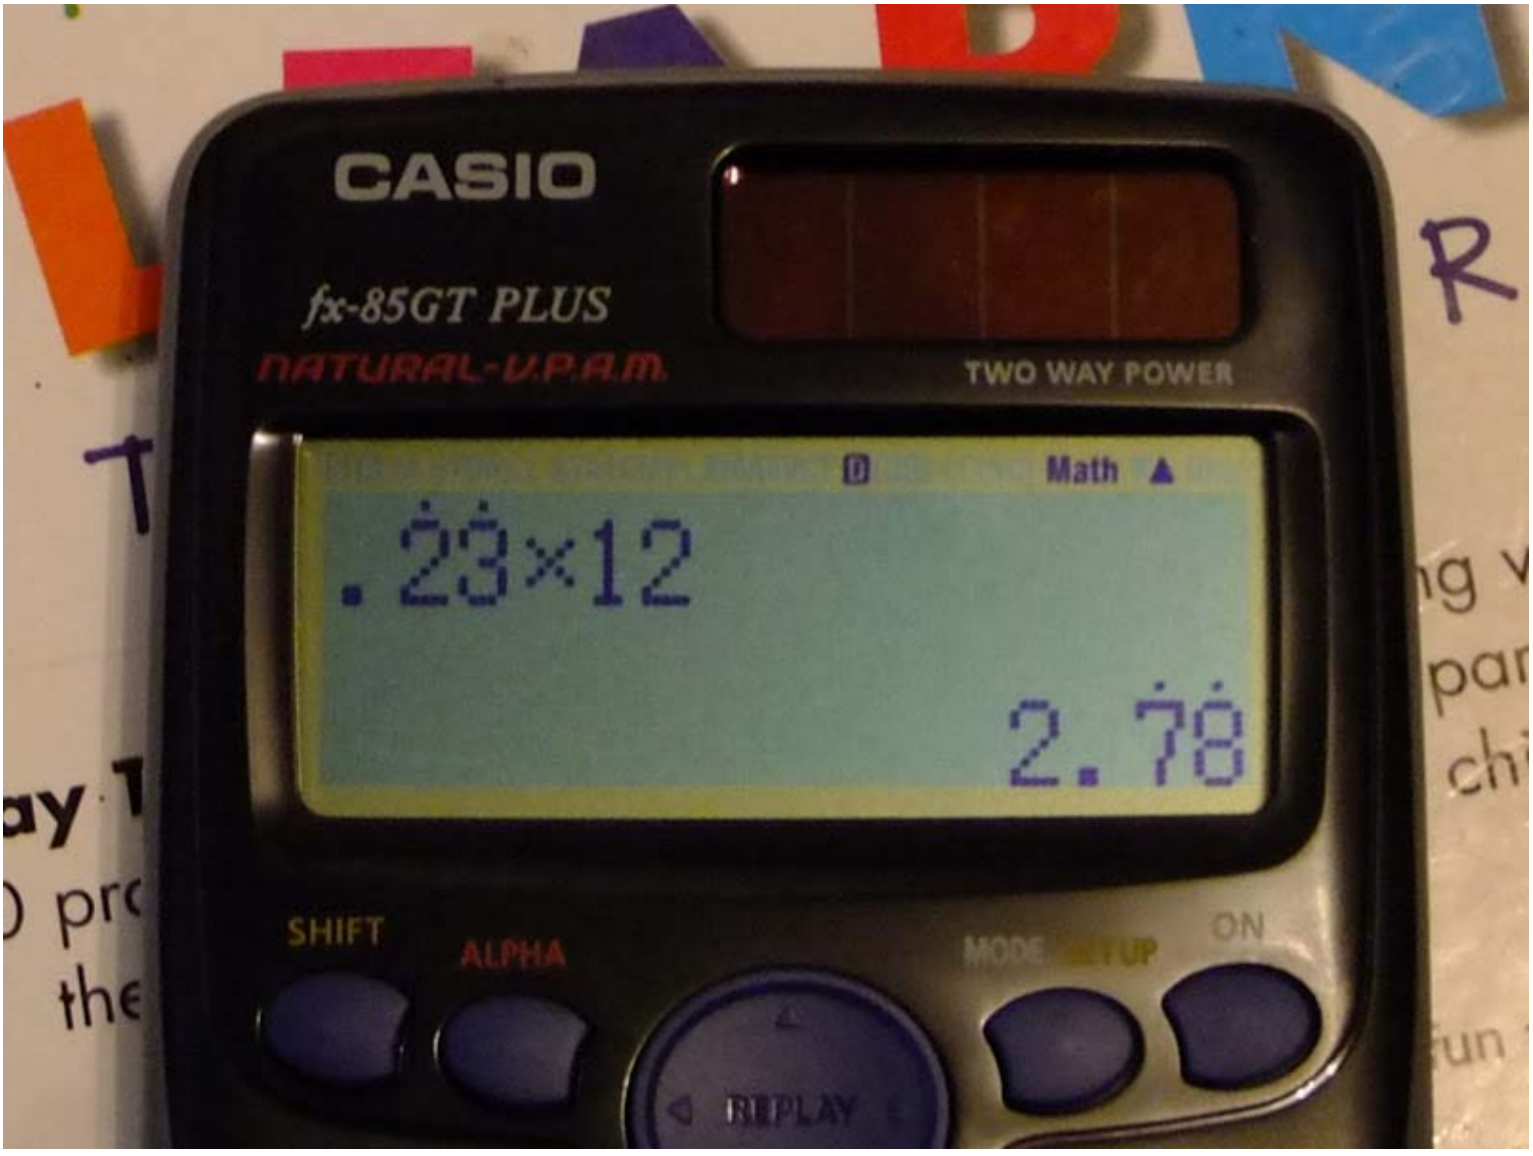
OT: recurring decimals!

*Message #1 Posted by **Nigel J Dowrick** on 25 Apr 2010, 4:51 p.m.*

Casio have recently updated some of their basic scientific calculators: the FX-83 ES and FX-85 ES have become the FX-83/5 GT Plus. Amongst other features, the new models allow the entry of recurring decimals, and will display results in this format as well!



I'm not sure if this is really of any practical use, but it is fun to play with! Does anyone know if this has been done before on a calculator?

Nigel

Re: OT: recurring decimals!

*Message #2 Posted by **Javier Goizueta** on 27 Apr 2010, 11:19 a.m.,*
in response to message #1 by Nigel J Dowrick

I don't think this has ever been used in a calculator, but I wrote a library (for the Ruby programming language) that handles recurring decimals:

- Source code: http://github.com/jgoizueta/nio
- Documentation: http://nio.rubyforge.org/

(look for "Repeating Numerals" in the documentation)

Re: OT: recurring decimals!

*Message #3 Posted by **Paul Dale** on 27 Apr 2010, 6:21 p.m.,*
in response to message #1 by Nigel J Dowrick

Although exact rational arithmetic could be useful, I can't think of much use for these.

Still, it demonstrates that there is still innovation in the calculator industry.

- Pauli

Re: OT: recurring decimals!

*Message #4 Posted by **Thomas Okken** on 28 Apr 2010, 9:09 p.m.,*
in response to message #1 by Nigel J Dowrick

I doubt that it's of much practical use, but it is fun to think about.
Repeating fractions are like

$a . b_1...b_n \underline{c_1...c_m}$

in other words

$a + (b + c / (10^m - 1)) / 10^n$

(e.g., 1 / 12 = 0.08$\underline{3}$, so a = 0, b = 8, c = 3, n = 2, and m = 1)

which is clearly a rational number.
It's not a very efficient way to represent rational numbers; the repeating-fraction representation of a rational number p / q can have up to q - 1 repeating digits.

What I find interesting here is that this means that for any integer q, there must be a number $10^r - 1$, where $r < q$, that is divisible by q.
I think I'm starting to understand why some people find number theory interesting. :-)

> It's not a very efficient way to represent rational numbers; the repeating-fraction representation of a rational number p / q can have up to q - 1 repeating digits.

From some work I did on this in college....

All 'q' that have q-1 repeating digits (i.e., the maximum number of digits in the repetitions) are prime numbers -- call these maximal primes. (Of course, not all prime numbers have the maximal number of digits.)

Here's the interesting thing I found and I'm sure is well know somewhere out there.... but it wasn't to me in 1974 when I figured this out for a math class project and later proved it.

If you look at the digits in one repetition of a maximal prime you'll find that it's a perfectly flat distribution. For example: 1/181 is a repeating with 180 digits in the repetition. Each digit 0 though 9 occurs exactly 18 times in this sequence. Furthermore each double digit 00 to 99 occurs exactly 1 or 2 times. This is true for all number bases, naturally. In other words, the frequency of each number within one repetition is as close to the average as possible.

After I conjectured this I wrote one of my first computer programs to prove this to be the case for numbers up to 1 million. Then I came up with a simple proof. I researched it some and couldn't find any prior reference to it, but never tried to published this. (I was just a freshman in college who would have listened.)

Anyway, it made for a fun computer program to write if nothing else. This is easily doable on almost any HP calculator with indirect storage registers, BTW. This might make a good little programming challenge!

-Katie

Re: OT: recurring decimals! -- > Programming Challenge?

*Message #6 Posted by **Thomas Okken** on 30 Apr 2010, 9:20 p.m.,*
in response to message #5 by Katie Wasserman

If q is a maximal prime, all the possible remainders 1...q-1 will occur during the long division, each exactly once per cycle, and so the digits generated for base b are floor(b/q), floor(2*b/q), ..., floor((q-1)*b/q), which trivially leads to a perfectly flat distribution of the digits 0...b-1.

The double-digit phenomenon seems a little trickier to explain. Maybe analyze the problem in terms of base b^2 instead of base b? Hmmm...

UPDATE: Generalized from base 10 to base b.

Edited: 1 May 2010, 12:50 a.m.

Re: OT: recurring decimals! -- > Programming Challenge?

*Message #7 Posted by **Thomas Okken** on 1 May 2010, 12:22 a.m.,*
in response to message #5 by Katie Wasserman

What makes a prime number q a maximal prime?
One way q can fail to be a maximal prime is when it divides the base. For example, 5 is a maximal prime in base 2, because $1/5 = 0.\underline{0011}_2$, but in base 10, 1/5 isn't even a repeating fraction.

What about 11 in base 10? $1/11 = 0.\underline{09}$, only 2 repeating digits... why not 10?

Any prime q that does not divide the base b is guaranteed to divide some number b^n-1, where n <= q. This must be true because long division is basically a state machine whose only state is the most recent remainder, which must be less than q (because p mod q < q, always) and greater than 0 (because otherwise the fraction wouldn't repeat), so the repeating part of the fraction is at most q-1 digits long. Discarding any non-repeating part, any fraction with r repeating digits can be represented as a rational number whose denominator is b^r-1, so q must divide b^r-1.

My conjecture: a prime number q is a maximal prime in base b if and only if it does not divide b, and does not divide any b^n-1, where n < q.
In base 10, the number 11 fails this test because it divides the number 99, which is b^2-1, and 2 < 11.

Re: OT: recurring decimals! -- > Programming Challenge?

*Message #8 Posted by **Thomas Okken** on 1 May 2010, 2:34 a.m.,*
in response to message #7 by Thomas Okken

It seems that for bases b, where b is a square, there are no maximal primes.
Try this program:

```
#include <stdio.h>

int main(int argc, char *argv[]) {
    int a, b, bsq, base, d, r;
    if (argc < 2 || sscanf(argv[1], "%d", &base) != 1) {
        fprintf(stderr, "Usage: %s base\n", argv[0]);
        return 1;
    }
    a = 1;
    while (1) {
        next_a:
        a += 2;
        b = 1;
        bsq = 1;
        while (1) {
            b += 2;
            bsq += (b - 1) << 2;
            if (a < bsq)
                break;
            if (a % b == 0)
                goto next_a;
        }
        r = 1;
        d = 0;
        while (1) {
            d++;
            r = r * base % a;
            if (r == 0)
                goto next_a;
            if (r == 1) {
                if (d == a - 1)
                    printf("%d\n", a);
                goto next_a;
            }
        }
    }
    return 0;
}
```

Save it as maxprimes.c, compile it, and run it like

```
./maxprimes <base>
```

Re: OT: recurring decimals! -- > Programming Challenge?

*Message #9 Posted by **Katie Wasserman** on 1 May 2010, 10:14 a.m.,*
in response to message #8 by Thomas Okken

I haven't run your code yet, but that's an interesting find. I don't have an intuitive enough sense of number theory to see why that should be.

As to the matter of number distribution in the repeating series of a maximal price. It's not just single and double digit numbers that have a flat distribution it's all numbers. So if you had a repeating decimal with a period of 10,000 digits all 1 digit numbers would occur 1000 times, all 2 digit numbers would occur 100 times, all 3 digit numbers would occur 10 times. and 4 digit numbers would occur once. I agree that the proof isn't interesting, but this characteristic is, I think.

-Katie

Re: OT: recurring decimals! -- > Programming Challenge?

*Message #10 Posted by **Thomas Okken** on 1 May 2010, 4:13 p.m.,*
in response to message #9 by Katie Wasserman

Regarding the nonexistence of maximal primes in square bases, I think I found a proof.
Say q is a maximal prime in base c^2. The base-c^2 representation of 1/q has q-1 repeating digits, by definition of what it means to be a maximal prime. The equivalent representation in base c would appear to have 2q-2 repeating digits, which would be impossible. However, we need to rule out the possibility that the base-c representation actually has fewer than 2q-2 repeating digits; for example, $1/5 = 0.\underline{1463}_8 = 0.\underline{0011}_2$; if a number can be a maximal prime in base c^3 *and* c, why would the same thing not also be possible in base c^2 *and* c?
Let's say you have a repeating fraction with r repeating digits in base c. If you convert this to base c^n, the repeating part in the new base can be at most n times shorter, if n divides r. If you call that the best case, the worst case is that gcd(r,n)=1, in which case the base-c^n representation has exactly as many repeating digits as the base-c representation. The base-c^n representation will never have *more* repeating digits than the base-c representation, because n repetitions of the base-c repeating section (with length r) will always fit exactly in r base-c^n digits.
Returning to the base-c^2 vs. base-c case, what this means is that for any repeating fraction that has r repeating digits in base c^2, the base-c representation must have a repeating section that is either 2r or r digits long. For 1/q, with q being a maximal prime in base c^2, the length in base c^2 of the repeating section is q-1; in base c, the length of the repeating section would then have to be either 2q-2 or q-1. The former is impossible because 1/q can never have more than q-1 repeating digits in *any* base, and the latter is also impossible, because q-1 is even, so the repeating section in base c^2 would be (q-1)/2 digits long, contradicting the claim that q is a maximal prime in base c^2.
Hence, no number q can be a maximal prime in base c^2, Q.E.D.

Note that I'm making the important assumption that primes are always odd. Of course the number 2 is the one exception to that rule, and 2 is, in fact, a maximal prime in *any* odd base, including square bases. :-)

Proving the flat distribution of groups of 2 or more digits is a harder nut to crack. I think one should start by looking at the remainders that generate one specific next digit, e.g. 1...(q-1)/b will generate 0, and then look at the distribution of the subsequent remainders 1%q...(q-1)/b%q. I think the idea is pretty straightforward but the devil is going to be in the details.

OT:iDisk For the Apple II

*Message #1 Posted by **Gerry Schultz** on 25 Apr 2010, 3:57 p.m.*

For those who follow other old computer hardware, here is a link to the iDisk for the Apple II. It's a card you plug into an old Apple II and load it with multiple disk images to run on the hardware. These images are stored on USB Thumbdrives and you can even add Bluetooth if you wish. It's still a work in progress and I found out about it from the latest Juiced.GS journal. Lots of fun and it's good to see products still being developed for the Apple II...

http://sites.google.com/site/idiskapple2/

Enjoy,

Gerry

Re: OT:iDisk For the Apple II

*Message #2 Posted by **Egan Ford** on 26 Apr 2010, 1:46 p.m.,*
in response to message #1 by Gerry Schultz

This and other HW/SW development for the Apple II* is frequently discussed on comp.sys.apple2 (did you know that there is an FPGA implementation of the original Apple?).

I am a huge fan of the Apple II series (sans the GS). The Apple II+ was my first computer. I have a //c at home. For the most part I've gone virtual, Virtual][to be specific. It is hands down the best][+, IIe emulator. Unfortunately, its only for OS/X. It emulates a number of HW options (clock, z80, sound, I/O, etc... cards, a printer, HDs, etc...). I only use my //c about once or twice a year to test my programs on the real thing, mostly for fun. I used ADTPro (freeware) to get all my orginal diskettes (including my very first) imaged so that I can run under emulation (to do this you need a real II* and a serial cable, and it goes both ways).

You just reminded me that I need to published my 41CX vs Apple II Pi shootout that Ron Knapp started 30 years ago (Ron threw the first stone :-).

Is there something going on out there? (or Getting Back to My Roots...)

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 25 Apr 2010, 2:56 p.m.*

Hi, all;

After having my newest HP50g being ‘eaten’ to its guts by one leaking battery from the four standard ones that came with the calculator while resting for about a month, I decided to buy a new one and actually grabbed it a few hours ago. Strangely the calculator’s blister was a bit thinner than the other ones and, after a first look, I noticed that the printed manual was replaced by a printed, 54-page 'Quick Start Guide', a black-and-white cover brochure (Mine is Edition 2, part # F2229-90201, no month-year stamp). What actually called my attention was a (very good) surprising change: when applicable, all examples from page #5 and ahead are illustrated with the calculator in RPN mode. Page #5 particularly has the following words under ‘Using RPN’:

> Quote:
>
> The HP50g comes from a history of calculators designed specifically for engineers an mathematicians. (...) Because the HP50g comes from a line of calculators that used RPN exclusively, the calculator is easier to use and functions most effectively in RPN mode.

Maybe some of you have not noticed that, but I could not help mentioning it here. Any chance that someone at HP H.Q. wants to get the company back to its roots? I mean, to give credit to whatever deserves? RPN was first use in calculators by HP, and it has been neglected since the new manuals for the new calculators with both systems (HP17BII/BII+, HP49G/50G, etc) only mentions RPN as 'the other operating mode', and almost all of the examples (if not all of them) in these manuals are performed by using the calculator in algebraic mode. And without no intention of turn the flames on again (even knowing it may happen...), I still believe that RPN as a calculating mode helps reasoning on and understanding the solution instead of trying to rely on the number in the display after pressing the [=] key...

Cheers.

in response to message #3 by David Hayden

Yup. I wrote it. After it was done and ready to go, I was informed we could add a few more pages. You can probably easily spot where it switches from me to a technical writer filling in a bit more info.

Everyone agrees that using the 50g in alg mode is kind of clunky, so I wanted to try and get people at least exposed. I don't care if they want to use algebraic, but hopefully they will see they can use algebraic in RPN and not lose the benefits. Also, I knew right away there was no possible way both modes could be covered, and since using algebraics in RPN is easy on an RPL machine, I figured I could stick it in that way. I think I even devoted a section to "Using Alegebraics in RPN" or something like that.

It was approached from the "there is far too much to teach here, so let's try to expose as many simple, cool things that make people appreciate the new calculator, and hopefully get over that initial hurdle in using it." By the end, I hope people can at least use it for basic calculations and equation solving without feeling too lost.

Some places are exteeeeeemly dense in information. I remember writing a few sentences in a row that introduce 2 or 3 things in each sentence. I hope people will actually sit down and go through it once or twice. I still discover things about the 50 I wish I'd know a few years ago every now and again. :-)

TW

PS - as I hope I will be able to write more of these in the future, feel free to send any comments (positive/negative) so I can hopefully continue to improve.

Tim,

Speaking of which, did you see the bug I found where FACTORS thinks that 9999999967^2 is prime? (In version 2.09 of the firmware.) I did a bit more checking and it seems that squares of primes that are 10 digits in length or larger are not factored correctly. (2^31 - 1)^2 is another example. However, in all cases ISPRIME? works correctly.

in response to message #1 by Vieira, Luiz C. (Brazil)

Hi, Luiz!!

This may be obvious for many of you, but it's news for me: Does the 50G has a RPN-mode (with a four-level stack, copy of "T" on drop, etc.), or it's just RPL like the 48G and siblings? A RPN (I mean, with a final "N") mode would be a very nice thing! On the other hand, for my old brain, RPL and algebraic are both an effort to work with.

Edited: 26 Apr 2010, 8:02 a.m.

*Message #16 Posted by **Katie Wasserman** on 26 Apr 2010, 8:38 a.m.,*
in response to message #15 by Andrés C. Rodríguez (Argentina)

I think that the old RPN is dead at HP. The 20b and 30b are advertised as 'RPN' calculators and indeed have a 4-level stack with t copied to z on drop, but they don't push x into y until you perform another entry. This means that you can't do something like "5 ENTER *" as a way to get 5 squared. This is how RPL works but is really the only change from the traditional RPN.

-Katie

Re: Is there something going on out there? (or Getting Back to My Roots...)

*Message #17 Posted by **Angel Martin** on 27 Apr 2010, 12:50 p.m.,*
in response to message #16 by Katie Wasserman

I re-learned (or remembered perhaps?) a few things about RPN while writing the 41Z module - all relative to that automated stack lift and no need for argument re-entry. It´s funny how we take all that for granted until you need to replicate the way it works on a complex memory buffer...

in response to message #15 by Andrés C. Rodríguez (Argentina)

Ola, Andrés; ¿como estás?

You are correct: the HP50G is actually an RPL-based calculator. And it has no RPN-like functionality, as it happens with the actual RPN-based models (HP35, HP41, HP42, HP19BII, etc.). Fact is that the HP50G 'Quick Reference Manual' mentions RPN as the main operating mode while previous literature mentions RPN as 'the other operating mode'. That is what called my attention.

I actually did not notice the RPN<->RPL 'reversal' reference, if I can say so...

Cheers! (long time no... read, Andrés!)

I think this distinction, apparently so obvious to most members here, might be lost on the general universe of calculator users, including myself.

In other words, the math logic used for entering problem is definitely RPN-like to me, at least as compared to algebraic logic ...

Re: Is there something going on out there? (or Getting Back to My Roots...)

*Message #20 Posted by **Vieira, Luiz C. (Brazil)** on 26 Apr 2010, 5:35 p.m.,*

in response to message #19 by Martin Pinckney

Hi,Martin;

as a matter of fact, I remember that some discussion arose when the meaning of RPL became the subject here, some long time ago. I must confess I am not aware of what does actually RPL stand for. At wikipedia we find:

> Quote:
>
> The RPL programming language (RPL meaning ROM-based procedural language following Hewlett-Packard or, alternatively, Reverse Polish LISP) is a handheld calculator system and application programming language used on Hewlett-Packard's engineering graphing RPN calculators of the HP-28, HP-48, HP-49 and HP-50 series, but it is also usable on non-RPN calculators, such as the HP-39 series.

Cheers.

Luiz

Re: Is there something going on out there? (or Getting Back to My Roots...)

*Message #21 Posted by **Martin Pinckney** on 26 Apr 2010, 6:01 p.m.,*
in response to message #20 by Vieira, Luiz C. (Brazil)

Luiz, as I see it, if the hallmark of RPN is postfix notation, then the RPL machines are the *most* RPN-like of all, since in them *everything* is postfix, even operations like setting the number of decimal spaces in FIX mode.

However, I take it that the definition of RPN being used by the RPN aficionados here is the type of operation used by the certain traditional HP machines, which is really a combination of prefix and postfix.

Re: Is there something going on out there? (or Getting Back to My Roots...)

*Message #22 Posted by **bill platt** on 26 Apr 2010, 9:17 p.m.,*
in response to message #21 by Martin Pinckney

Hi Martin.

I think you are correct.

But the infix part is very few commands, most notably STO - [reg], RCL + [reg], FIX [value], SF [n] and their relatives.

As I see it, there isn't any mathematical operation in "traditional" RPN other than the storage arithmetic.

Re: Is there something going on out there? (or Getting Back to My Roots...)

*Message #23 Posted by **Vieira, Luiz C. (Brazil)** on 26 Apr 2010, 9:51 p.m.,*
in response to message #21 by Martin Pinckney

Hi, Martin;

> Quote:
>
> *(about RPN)* the type of operation used by the certain traditional HP machines, which is really a combination of prefix and postfix.

I always applied the 'postfix notation' reference to the calculator core, I mean, math and arithmetic operations. If we consider algebraic notation, RPN is homogeneous in terms of math and arithmetic operations. In calculators operating with algebraic notation we have either postfixed (e.g.: 45 COS for COS(45), no need for [=] key) or infixed operation (e.g. 4 + 5 [=]) or, in some newer machines, prefixed operations (e.g.: [COS] 45 [=]; in these machines, COS(appears in the display when [COS] is pressed). Because algebric notation allows such distinctive keystroke sequences without loosing algebraic correspondence, chances are that RPN-based calculators have easier, simpler rules to be remembered.

All of the rest, namely structural operations like FIX, STO & RCL, program-addressed operations like LBL, GTO and GSB and others, are essentially prefixed in the early RPN models. With the HP67/97 the indexed -or indirect- addressing allowed prefixed operations to behave like postfixed operations.

But I guess all of this is mainly known, it is just a matter of putting things together. When the HP28C was introduced, two particular chapters in its Owner´s Manual deal with that: Notes for Algebraic Calculator Users and its counterpart for RPN, too. The softbound, thick HP48 Owner´s manual also brings a dedicated appendix: Comparing the HP 48 and HP 41. The PDF file in the link was created over scanned images of the original HP48 manual. Page #3 in this PDF (page #F6 in the original manual) has a very concise explanation about these differences.

Also, we must notice that Willian C. Wickes 'Insights' books are 'THE' source of information for these matters, if I may.

Well, I see I wrote too much, sorry! Chances are that users with the need of extra clarification may find in these texts some guidance. And I hope my writings will not get readers into confusion...

Cheers.

HP 9810A: It's alive

*Message #1 Posted by **Thomas Falk** on 25 Apr 2010, 9:30 a.m.*

Hello everybody,

I just want to share my joy over the successful reviving of a HP 9810A.

This device was in my cellar for several years and didn't work since I got it from its former owner. Some time ago I did a first try to repair. At this time I got some useful information from this forum. Unfortunately I had no success then.

At the begin of this year I found some time again. I set the goal to present this calculator on the European Vintage Computer Festival (VCFE), which will start at the first of May.

It took about two months of hard work. I found three defects in the machine: one dead ttl logic gate (74H30) and one dead transistor in the address drivers of the DRAM circuits. The third defect was hard to find: The calculator worked, but the display was wrong. After comparing the memory accesses with these listed by the HP9800 series emulator, I located the fault in one of the microcode ROMs. At least two addresses give the wrong data. One of them caused a wrong sequence in the microcode. It should be mentioned, that this circuit is an Intel 3301A, which is a mask programmable ROM. I never assumed that these could get defective, they should live almost forever.

I "repaired" this by decoding these addresses and correcting the output of the ROM by some external circuit. The solution does not really look pretty:

but it works! After the VCFE I will do some cleanup.

I would like to say Big Thanks to Tony Duell who gave me the first hints and especially to Dr. Andreas Bürger, who wrote the great emulator for the HP9800 series.

I found the most information in the patent US-3,859635, which can be found here. It contains the schematics of the circuits, the dumps of the microcode roms, some listing of the application code and lots of explanations to data stuctures and sequences. The HP 9810 is obviously one of the best documented calculators.

There is an repair manual from HP, which can be found on the museums DVDs. This manual is next to useless now, because it requires a complete set of circuit boards to find the defective one by swapping one by one.

The next step will be the connection of the plotter HP 9862A which I have too. For this I will have to rebuild the missing connection module.

Best regards,

Thomas Falk

Re: HP 9810A: It's alive

*Message #2 Posted by **Joel Setton (France)** on 25 Apr 2010, 9:57 a.m.,*
in response to message #1 by Thomas Falk

Thomas, congratulations for your success! After having done a similar "revival" project on a very sick 9815A, I can understand the pride and joy which comes when bringing an HP calculator back to life. And when it finally works, you have to tell the world about it. It's part of the experience!

Joel Setton

*Message #3 Posted by **Pierre Brial** on 25 Apr 2010, 10:48 a.m.,*
in response to message #1 by Thomas Falk

Impressive work Thomas. Congratulations. Hope to see some pictures of the beast in working order.

Re: HP 9810A: It's alive

*Message #4 Posted by **Thomas Falk** on 25 Apr 2010, 11:43 a.m.,*
in response to message #3 by Pierre Brial

Hi,

thanks for the gratulations.

Here are two pictures. The first shows the display after repairing the memory system. The numbers shown where displayed after pressing the Clear key and didn't change much after pressing other keys. Only the program display was right. On top you see the connections for the logic analyser at the microprocessor board and the memory block. The red/black wires are connections into the memory block to be able to measure on the working calculator.

The second picture shows the calculator after fixing the error in the ROM during the last checks before closing the cover. At the left is a logic analyser and the oscilloscope. Both are useful for different kinds of faults.

If you want to see the calculator live, you should come to Munich at the next weekend to the VCFE

Greetings,

Thomas

HP20b's 1-variable weighted function

*Message #1 Posted by **Ric Lombardo** on 25 Apr 2010, 6:34 a.m.*

Has anyone had a go at trying to implement the 1-variable weighted function that is part of the Statistical Suite available on the HP20b. Apart from a brief cursory mention in HP's official manual for this calculator there is no example or explanation of what this function does or how to implement it. I presume it helps one to determine the expected value of a random variable by inputting random variable outcomes into the X: register and their associated probabilities in the Y: register but I cannot seem to get any results. If anyone knows how this function operates I would appreciate some assistance or guidance.

Cheers and have a nice day,

Ric

Re: HP20b's 1-variable weighted function

*Message #2 Posted by **Walter B** on 25 Apr 2010, 6:47 a.m.,*
in response to message #1 by Ric Lombardo

AFAIK the 20b calculates a *weighted mean*. It does it the conventional way with the weights in y. I don't remember any "weighted function" but I don't have my calc at hand.

Re: HP20b's 1-variable weighted function

*Message #3 Posted by **Gene Wright** on 25 Apr 2010, 7:56 a.m.,*
in response to message #2 by Walter B

This is for the 30b, but take a look here:

30b frequency and weights

Re: HP20b's 1-variable weighted function

*Message #4 Posted by **Ric Lombardo** on 26 Apr 2010, 7:19 a.m.,*
in response to message #3 by Gene Wright

Thanks guys for your help. I see now that the trick is that the Y-values are entered as frequencies {F} and NOT as relative frequencies {Fi/Sum(Fi)} (or probabilities) which is what I thought I had to do. In essence then this is not very much different from the approach used with the HP 10B and HP10BII. By the way Gene I think that little Guide entitled: "The HP 20b Business Consultant" was really great and that in your next update you might want to slip in a line or two on the matter discussed here.

Thanks again for you time and assistance,

Ric

Re: HP20b's 1-variable weighted function

*Message #5 Posted by **Gene Wright** on 26 Apr 2010, 8:07 a.m.,*
in response to message #4 by Ric Lombardo

Oh, I did not write that. Tough to cover everything that is important in a small guide, however. :-)

Re: HP20b's 1-variable weighted function

*Message #6 Posted by **Ric Lombardo** on 30 Apr 2010, 10:50 a.m.,*
in response to message #5 by Gene Wright

Interestingly, even though the HP20b was designed to replace the simpler but very popular HP-10B and HP-10B2, the latter two calculators can provide a weighted mean irrespective of whether the weights are entered as frequencies or relative frequencies. Its a pity the HP-20B dispenses with this flexibility as it means one cannot compute the expected value E(X) of a random variable X in the conventional fashion.

Re: HP20b's 1-variable weighted function

*Message #7 Posted by **Gene Wright** on 30 Apr 2010, 11:09 a.m.,*
in response to message #6 by Ric Lombardo

True, but the frequency statistics have a much greater breadth to them than the basic "weighted average".

To get a weighted average is actually pretty easy and requires rethinking the input only slightly.

If you have a random variable with a 40% chance of 10 and a 60% chance of 5, you can of course input the weights as 40 and 60 in 1 Freq mode or even as 4 and 6 in 1 Freq mode and the Descriptive submenu reports the correct mean.

x49gp updated

*Message #1 Posted by **Egan Ford** on 24 Apr 2010, 7:54 p.m.*

The biggest change was an updated QEMU for x49gp that I finally got around to checking in. This also fixes a few problems building on 64-bit OSes.

There is a bug somewhere that I have yet to track down--on some systems the labels to not appear on the keys. The hack around this was to provide a hp50g.png file with the keys already printed. If any of you find the bug please let me know and I'll check it in.

Tested configs: Ubuntu 9.04/9.10 32/64 bits, CentOS 5.4 64-bit, Fedora 12 64-bit, OS/X 10.6.3 64-bit. OS/X 10.5.x should still work.

I'll try to get a Windows build done this summer. I may create an OS/X version using a native GTK so that macports is not required.

What is x49gp? x49gp is a 50g emulator that also emulates the ARM processor. It is the only emulator that can run HPGCC 2 and 3 binaries.

More info:

http://x49gp.svn.sourceforge.net/viewvc/x49gp/README.QUICKSTART

Numerous errors with announcement.

WAS: HP vs. TI on eBay auctions

*Message #1 Posted by **Joerg Woerner** on 24 Apr 2010, 2:08 p.m.*

Hi Michael, Maximilian et.al,

I guess the keyword "RPN" in the auction header was the trigger word. I just placed anouther bunch of calculators on TAS an played for the statistics with the auction header:

1) RPN CALCULATOR WEEK #9: Novus Mathematician aka 4515

2) CALCULATOR HISTORY: National Semiconductor 4650 - US

Both calculators are listed in the Vintage Calculators category and should get a similiar number of hits.

As additional proof of the "RPN" idea I use a third calculator:

3) ONE TIME WONDER: Ultra rare IJI MINI calculator - 1972

This one should draw MORE ATTENTION than all others ;-))

My HIT counters are public and I will report you the "WATCHED #" from eBay.

Have a great weekend and enjoy calculator hunting.

Cheers,

Joerg

Re: WAS: HP vs. TI on eBay auctions

*Message #2 Posted by **Paul Dale** on 24 Apr 2010, 6:27 p.m.,*
in response to message #1 by Joerg Woerner

By posting this before the auctions are over, you've biased the results.

- Pauli

Poll: HP-Forum and TAS

*Message #3 Posted by **Joerg Woerner** on 24 Apr 2010, 6:53 p.m.,*
in response to message #2 by Paul Dale

This would imply that most of the eBay bidders read this forum frequently.

Time for another poll:

How often do you (# per week)

(1) Read this HP FORUM?

(2) Search eBay.com for (RPN) calculators?

First entry:

Joerg Woerner:

(1) 2..3 times per week

(2) 3..4 times per week

Regards, Joerg

Re: Poll: HP-Forum and TAS

*Message #4 Posted by **Paul Dale** on 24 Apr 2010, 7:04 p.m.,*
in response to message #3 by Joerg Woerner

1/ lots 2/ never

But I did look at some of your auctions after you mentioned them.

- Pauli

Re: Poll: HP-Forum and TAS

*Message #5 Posted by **Egan Ford** on 24 Apr 2010, 7:59 p.m.,*
in response to message #4 by Paul Dale

1. Daily unless on vacation (no net access) or swamped with work.
2. I have eBay search for me, I then read the emails I get from eBay about once or twice a week. Next, I put into Auction Sniper anything that I'd be interested in and then forget about it. I usually lose (too cheap), but win about once every 3 months.

Re: Poll: HP-Forum and TAS

*Message #6 Posted by **Keith Midson** on 24 Apr 2010, 8:36 p.m.,*
in response to message #5 by Egan Ford

For me:
1. Every day.
2. Never. I only really search for "HP Calculator", or "Hewlett Calculator". I still suspect that it is HP, not just RPN that is the key (and the majority of HP's are RPN).
Keith

Re: Poll: HP-Forum and TAS

*Message #7 Posted by **Bruce Bergman** on 24 Apr 2010, 10:08 p.m.,*
in response to message #3 by Joerg Woerner

1 = Daily, or thereabouts 2 = Weekly, or thereabouts

Re: Poll: HP-Forum and TAS

*Message #8 Posted by **Etienne Victoria** on 24 Apr 2010, 10:11 p.m.,*
in response to message #3 by Joerg Woerner

Read this HP FORUM?

3# per week:

- more when topics are on calculator repairs,

- less when topics focus on the next Hp calculator release,

- near epsilon when discussion is on how many $$$$ were spent on auction xxx :-)

Search eBay.com for (RPN) calculators?

Permanently on Hp-80*, Hp-81 & Hp-970* (Okay, latter is not really a calculator...just the display)

Etienne

Hallo JÃ¶rg,

don't get me wrong but the ads section is somewhere else, isn't it?

Re: WAS: HP vs. TI on eBay auctions

*Message #20 Posted by **db (martinez, ca.)** on 29 Apr 2010, 11:34 p.m.,*
in response to message #18 by Joerg Woerner

Joerg; I looked at a couple of your finished auctions for non-hp RPN calcs. There's no way i can know how many total watchers there were at the end but i noticed that the algebraic programmable Novus financier went for only 36 gollies, while the RPN programmable Novus scientist netted you a big 66. They are the same make, age and condition with comparable capabilities and built inside the same body. The RPN sold for almost twice the price. Now i'm not saying that a thing's dollar value equals it's real value but you *were* saying that RPN doesn't command a premium price. All i can say in response is neener neener neener! PTPTPTPTPTPTPTPTPTPTPTPTPTPTPT!!!

Note to everyone else: Joerg and me have been having this argument for about 7 years. I concede that TI sells more calcers. He buys RPNs to play with but not use. We both like beer. Agreement may never get any deeper.

HP 82240B. Infra red printer for HP 42---HP 50g

*Message #1 Posted by **Stuart Sprott** on 24 Apr 2010, 7:31 a.m.*

I am just curious as to how many people still use the HP printer that works off the HP 42, HP 48, and HP 50g. I got my printer back in 1991 and it is still going strong.

I was told the other day that HP no longer make this printer.

Re: HP 82240B. Infra red printer for HP 42---HP 50g

*Message #2 Posted by **Etienne Victoria** on 24 Apr 2010, 9:06 a.m.,*
in response to message #1 by Stuart Sprott

Hello,

I still use this printer with my Hp-41Cx and 17BII+.

It is the most high tech gear I own.

At work, I prefer the Hp-81 (No thermal paper needed :-)

I have 3,

Two because I needed a back up and the third cause it was free.

Use it in cockpit with my 42S or 41CX depending on which one I take with me.

Cheers, Geoff

Hi;

I use both A and B models when in a hurry (and they are working fine, too), but I actually prefer capturing the IR output from the calculators with an HP48G. Then I upload the corresponding ASCII-related file to the PC and edit the final text as needed, with the aid of adding any extra text and using columns to add comments.

As long as I have the time to, of course...

Cheers.

Luiz (Brazil)

Re: HP 82240B. Infra red printer for HP 42---HP 50g

*Message #7 Posted by **Christoph Giesselink** on 25 Apr 2010, 5:52 p.m.,*
in response to message #1 by Stuart Sprott

I own several of them but I never used them. I also have some printer wreck in the cellar, most of them with a defective printer head.

One reason for this maybe also, that I use a real HP48SX and real HP32S only under some rare circumstances. Most times I have a HP calculator emulator somewhere around.

Since end of 80ies, beginning with the HP28S, I used different PC adapters to capture the IR output directly on the PC.

Nowadays I use this adapter only to capture ROM images. The last time in October last year to capture the AA ROM image of an international 17BII.

Cheers

Christoph

> Can you give me a lead as to where you can find the PC adapters.

The first one in 1990/1991 was a commercial DOS program from a German company called "PrintHP". Later I rebuild the hardware interface and then the signal decoder under DOS. "PrintHP" quit working with the early 486 processors (they were too fast). Last successful try of my own DOS development was on a Pentium III/850MHz under pure DOS.

For the last 10 or more years I use a selfmade Redeye->Serial converter with a microcontroller. I wrote the controller firmware, but the copyrights don't belong to me.

I don't know any commercial product (except the HP48) that can capture the data on a non printer device.

Cheers

Christoph

I am also interested. A month ago i started a more or less equal project. I build a red-eye receiver with a micro controller and it displays the received code on 24 small 5x7 dot matrix displays. It emulates the original ROMAN8 character set. It looks promissing but the software is not stable yet.

Excellent. If you need a tester, then please let me know.

Re: HP 82240B. Infra red printer for HP 42---HP 50g

*Message #13 Posted by **Christoph Giesselink** on 27 Apr 2010, 6:57 p.m.,*
in response to message #11 by Kees van der Sanden

Yes, I know this. The interrupt service routine capturing the data is quite tricky. The DOS and the microcontroller solution are written in pure assembler, so the code is quite unreadable. Both codes were made in the early 90ies and were massivly tested with corrupted codes made by a special transmitter.

I'm thinking about publishing a C source code under the GPL made for Emu42. In 2002 I tried to emulate the printer device, but because of limitations (timer2 inaccuracy) and speed problems (emulator has to slow down to get proper timing values) the code wasn't stable enough to publish. Nevertheless the code contain all design elements and error correction of the assembler code.

Christoph

The best RPN scientific calculator ever made is a Pioneer with IR output to the HP82240. That 22-year-old machine is called the HP42S. It can generate audible tones also. Useful.

Re: HP 82240B. Infra red printer for HP 42---HP 50g

*Message #20 Posted by **Kees van der Sanden** on 29 Apr 2010, 1:00 p.m.,*
in response to message #19 by Mike Morrow

Also the HP 27S has an infrared printer interface. Although it is not RPN it is a scientific calculator. All Pioneers with the Lewis processor (HP-17B, HP-17BII, HP-27S and the HP-42S) have this interface.

Re: HP 82240B. Infra red printer for HP 42---HP 50g

HP97 batteries?

*Message #1 Posted by **Keith Midson** on 24 Apr 2010, 3:20 a.m.*

Hi HP world, is there anyone out there making battery packs for the 97?
Or is there anyone who can recell them? They are big!
cheers, Keith

Edited: 24 Apr 2010, 3:21 a.m.

Re: HP97 batteries?

*Message #2 Posted by **Ignazio Cara (Italy)** on 24 Apr 2010, 5:39 a.m.,*
in response to message #1 by Keith Midson

Hello Keith, I will be very happy to help you with a recell service for your HP-97 battery pack. I live in Italy so you must evaluate the postal fees. I'm also selling rebuilded old HP-82033a battery pack with good 2200 mA NiCd akku. Let me know if you are interested.

Regards

Ignazio

Re: HP97 batteries?

*Message #3 Posted by **Karl-Ludwig Butte** on 25 Apr 2010, 6:23 a.m.,*
in response to message #2 by Ignazio Cara (Italy)

Hello Ignazio, I'm very happy to hear that you recell HP-97 battery packs. So maybe you can tell me how to open the plasticcase around the batteries without destroying the plastic case. I tried with a scalpelknife and a tiny rotating metal disc. The first method takes way too long and the second method results in clouds of molten and again solidificated plastic along the cut.

Every hint is very much appreciated - thank you very much in advance.

Regards

Karl

Re: HP97 batteries?

*Message #4 Posted by **Katie Wasserman** on 25 Apr 2010, 11:22 a.m.,*
in response to message #3 by Karl-Ludwig Butte

I've opened dozens of these battery packs as follows:

All you need is a heavy duty X-acto knife handle (#5) with a #19 blade.

Lightly cut through any labels that might be spanning the case halves.

Force the blade into all 4 corners between the case halves as far as you can. You need to use a lot of force so put the pack on a table and be careful to keep your hands clear of the blade in case the blade slips (or breaks, but this has never happened to me).

Find the corner that you were able to insert the blade the deepest into and re-insert the blade. Then twist the blade and the pack should split apart.

This procedure will slightly damage the corners of the pack but it will be hardly noticeable. About 20% of the packs won't open this way, in those cases you need to score into the ends of the packs as well. This is much harder to do, but always works if you spend enough time at it.

-Katie

Re: HP97 batteries?

*Message #7 Posted by **Joel Setton (France)** on 24 Apr 2010, 3:44 p.m.,*
in response to message #1 by Keith Midson

Hi Keith,

The cells in the HP-97 pack are a fairly standard size known in the industry as "Sub-C" (22 x 42mm), which you can get from many sources. You can also look them up on TAS!

Joel Setton

Re: HP97 batteries?

*Message #8 Posted by **Keith Midson** on 24 Apr 2010, 5:24 p.m.,*
in response to message #7 by Joel Setton (France)

Thanks Ignazio and Joel, I just bought a new pack from that auction site. I did look there before I posted the message and couldn't find them, but they are there. The batteries of my newly acquired 97 actually hold a some charge for a little while - not bad for batteries that are more than 30 years old! Cheers, Keith

Re: HP97 batteries?

*Message #9 Posted by **Michael de Estrada** on 24 Apr 2010, 5:34 p.m.,*
in response to message #8 by Keith Midson

I believe you bought them from Waterhosko (Mark Hoskins), who also makes replacement battery packs for HP Classic and Spice series calculators. He also sells O-rings for card reader drive wheel repair.

Re: HP97 batteries?

*Message #10 Posted by **Keith Midson** on 24 Apr 2010, 8:32 p.m.,*
in response to message #9 by Michael de Estrada

Yes that's right Michael. Have bought many batteries from him, but couldn't find 97 ones until this morning for some reason. The card reader also needs repair, along with the printer. This can be the next project. Funny I didn't actively seek this machine out, but now I have it I love it! Keen to restore it to its former glory. Cheers, Keith

Re: Faint HP-11 LCD

*Message #5 Posted by **cm41u** on 23 Apr 2010, 8:55 p.m.,*
in response to message #4 by aj04062

It looks like you're posting a link to a web page, not an image. You need the link to the actual image which is:
http://lh3.ggpht.com/_32YBZSrfeUs/S9HHuUqIMaI/AAAAAAAAAi0/vv7eRZy37Gk/Cal.jpg
which you can then imbed with the image command like this:

Re: Faint HP-11 LCD

*Message #6 Posted by **Gerson W. Barbosa** on 24 Apr 2010, 10:20 p.m.,*
in response to message #1 by aj04062

Same problem here, but in a lesser degree:

Lyuka has suggested in a former thread LCD contrast problems might be due to a faulty tantalum capacitor, among other things, but I haven't checked this out as I got used to the slightly low contrast on this one.

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv019.cgi?read=160283

Re: Faint HP-11 LCD

*Message #7 Posted by **Lyuka** on 25 Apr 2010, 11:16 a.m.,*
in response to message #6 by Gerson W. Barbosa

Hi, Gerson

The cause of the low contrast LCD of the 42s was found to be broken switching transistor for LCD bias generator in the chip.

for more information : A work-around for sticking-to-low-contrast LCD problem of the HP-42S

However this won't apply to the HP-11C's case.

Regards,
Lyuka

Re: Faint HP-11 LCD

*Message #8 Posted by **Gerson W. Barbosa** on 25 Apr 2010, 12:35 p.m.,*
in response to message #7 by Lyuka

Hello Lyuka,

That particular HP-15C (SN 2905B29505) was bought brand new in 1989 by a collector in São Paulo and kept unused for more thant fifteen years before he eventually sold it to me. About one year earlier, another collector in São Paulo was lucky enough to find a new-in-box HP-15C in a small store, forgotten in a upper shelf where it had been kept since 1989. He sent me some pictures of it, but I cannot find them anymore. Incidentally, his only complain was about the dim display. From these two samples I cannot infer whether this was due to the long time the calculators had been kept unusued or to a problem on those final run units. Do you have any idea?

Regards,

Gerson.

TI NSPIRE vs HP50

*Message #1 Posted by **fabrice** on 23 Apr 2010, 4:49 a.m.*

I have seen that Texas instrument sold a NEW ti nspire, actually i own an HP50 but i don't like it, the HP50 is built with bad 'plastic' and i hate the screen and the keyboard but i like the RPL. Th HP50 quality is less than HP48. The new n spire is built in very good quality, bigger screen with grayscale, arm processor . i HATE to say it but NOW i begin to prefer TI calculator. doas anyone know if HP is going to 'respond' to TI with a better calculator ? if no i stop to programm on HP and jump to TI.

since a long time i developp on HP calculator and i love it but the last good calculator is the HP48 after this model all are bad. hp49, hp49g+, hp50 i woul like to continue with HP but is they don't correct the quality i prefer to stop.

fabrice

Re: TI NSPIRE vs HP50

*Message #2 Posted by **Don Shepherd** on 23 Apr 2010, 6:02 a.m.,*
in response to message #1 by fabrice

Fabrice, if the main thing you like about the HP50 is programming in RPL, you will not be happy with the NSpire. It's programming language is BASIC, and it offers none of the advanced programming constructs of RPL. Indeed, before the latest OS release there was no way to input a value during program execution. It is not a "programmer's" calculator.

While the NSpire does have a large screen, it is very difficult to read it in normal room lighting situations; I keep a flashlight next to mine.

Most HP50 users seem to be very satisfied with the build quality, so I'm surprized that you find it lacking in that department.

Is it likely that HP will issue a calculator like the NSpire? No. The NSpire is really meant for students, and HP has no real presence in that market.

> While the NSpire does have a large screen, it is very difficult to read it in normal room lighting situations; I keep a flashlight next to mine.

I just picked up a Brand-new in packaging Ti-Nspire CAS (non-touchpad) at a local drugstore for $30 (They had a whole table full of them, with the non-CAS version going for $50. I wish I had bought one of those as well - they were gone the next day). I got it home and immediately updated to OS 2.0. Now, I

would say that the screen is, if anything, worse than people have reported on the internet. It's dire. Even having read the reports about its illegibility, I though initially that I had a bum unit! Contrast controls have no appreciable effect. It's still useable, but the screen takes some getting used to.

I also own an HP 50g and wouldn't call it inferior in any way to the Ti-Nspire. The Ti-Nspire's "advantage" is mind-numbing ease of use, which would make it useful in an education setting, I suppose.

Don't get me wrong - I like the Nspire (I collect calculators, of cousre I like it!) - but using the two side by side, they feel like very different animals to me and the HP yields nothing in terms of build quality.

Caveat: the foregoing is based on minimal real-world use of either calculator...

This isn't for lack of a product. I think the HP 39gs and 40gs are wonderful student calculators. Unfortunately, they seem to have very little market share.

in response to message #6 by Ron Ross

Thanks for putting this review together Ron. I enjoyed it very much.

Re: TI NSPIRE vs HP50

*Message #8 Posted by **Mike Morrow** on 23 Apr 2010, 11:00 p.m.,*
in response to message #6 by Ron Ross

Not to be too critical, but...

I would be led to think after reading it that the writer of this review works in TI marketing and sales.

I've owned a TI-89 HW1 for ten years, and recently purchased a TI-89 Titanium HW4 when Wal-Mart cleared these non-sellers for $72. There's still at least one left unsold at my local store after several weeks on clearance.

I'd long since ditched my first TI-89 dog, so I'd forgotten what a nasty oversized abomination the TI-89 series is. I believe that even $72 is overpriced for its limited and inconvenient capabilities.

It amazes me that any comparison with the HP50G can fail to acknowledge the great advantage of the HP50G SD card, the speed of the HP50G ARM, the superior legibility of the HP50G LCD, the HP50G's superior RT clock, the HP50G's superior keyboard, the TI-89's lack of sound capability, lack of printer capability, lack of external power connection, the TI-89's higher price (unless one can find a clearance), the TI-89's awkward clamshell design, etc., etc., etc.

In the review almost every machine that is NOT TI-made is essentially dismissed, and summary statements repeatedly suggest that a TI model is the only model that most are likely to find useful.

Me, I feel like my new TI-89 Titanium is a just a $72 paperweight, regardless of how baselessly glowing and effusive the review is.

in response to message #8 by Mike Morrow

One has to wonder about your judgment, Mike...like, you should have known better than to buy that thing...

Re: TI NSPIRE vs HP50

*Message #10 Posted by **John McCormick** on 24 Apr 2010, 1:55 a.m.,*
in response to message #8 by Mike Morrow

Stop by your local school or college of engineering. Find the freshmen. It's nearly guaranteed one of them will be toting around an HP 48...(or maybe better!) given to them by an uncle as they whine "I don't know how to use this thing. I wish I had a TI like everyone else." That's how I got mine.

Re: TI NSPIRE vs HP50

*Message #11 Posted by **Ron Ross** on 24 Apr 2010, 10:44 a.m.,*
in response to message #8 by Mike Morrow

Well, Mike, your criticism is duly noted and I most assuredly do not work for Ti. I cannot refute a single statement you have made. However, I can assure you that my review is sound and fair. If the Hp50G were to gain more market inertia where there were several knowledgeable users available to demonstrate how much better the Hp 50G is in comparison to the Ti-89, I would gladly recommend the Hp 50G over the Ti-89. Notice I did not state the Ti-89 is the superior calculator, I stated it is the calculator you should choose for the normal high end user that can't transition over to RPN (and most common calculator users can't or won't, same difference). I have tried to use many of the Hp 50G functions in algebraic mode and the calculator is simply not equal to the Ti-89 in algebraic mode.

If you can't read the screen of the Ti-89, Ti has the V-200 option available. EE and ME pro are kinda nice perks that Ti has made available for free on the Ti-89 family and aren't officially available to the normal Hp50G user either.

I could not in all honesty elaborate on those advantages to the normal user. That would mislead the normal (and not all that technically savvy) user to believe that the Hp 50G will solve his problems by the simple purchase of the calculator.

Let me address each of your superior features of the Hp 50G from a typical user's perspective:

Hp50G SD card, this is a great plus if you are aware of hpcalc.org, however, many typical users never download anything onto their calculators unless it is games or the teacher distributes something in class. If the Teacher does distribute something in class, IT WILL be for a Ti.

75 (or 200) MHz processor, My Ti-89 has never really been slow, especially in comparison to an Hp 48G. So Hp corrected their problem, but the Ti-89 never had complaints among the typical user for lack of speed.

Hp 50G LCD Another good point, but the standard user of the Ti-89 is probably 20 years younger than me, anyway and if not, can most likely afford to upgrade to the V200.

The Hp 50G clock, is a step backwards in comparison to the older clock in the Hp48G series and the newer Ti-89 now has a clock. The verdict is still not in on the Hp50G keyboard quality, although I am inclined to believe it is a great keyboard and its layout is far superior to the Ti-89.

I make two or three references to this shortcoming. However the quality of the Ti keyboard line is superb. Their line of keyboards do last. Hp's record over the last ten years doesn't compare.

Lack of sound, lack of printer, lack of power connections, none of these features are really important to the typical calculator user.

The slide on cover for the Ti-89 is probably the smarter choice of protection for Ti's intended market. The Hp48Gii uses the same type of slide on cover. Students do not take care of their equipment nearly as well as older professionals as a general rule.

I suggest you re-read some of my review. 9 out of 10 students should buy the Ti-89 for their studies, plain and simple. I have seen too many reviews where the typical student who buys the Hp 50G ends up abandoning it and buying a Ti. My review is meant to help that student avoid that mistake. As stated earlier, the inertia of the market ie limited number of Hp50G users available to consult is very limited and therefore if you buy an Hp50G, you cannot get personal help from any professor or fellow students (unless your professor is Harold Climber!!)

> Notice I did not state the Ti-89 is the superior calculator,

Your (valid) point about market inertia aside, while you may have stated the 50g is superior in some ways, you damned it with faint praise, in my opinion.

> Quote:
>
> I stated it is the calculator you should choose for the normal high end user that can't transition over to RPN (and most common calculator users can't or won't, same difference).

Doesn't this assume that high school and college students are lunkheads incapable of learning anything? (Oh.. wait..)

Seriously, motivation aside, younger folks are far more capable of absorbing new techniques and knowledge. If you use mobile text, how well do you do at it? (I get by, but with a good mobile keyboard.) If you use Facebook, how well did you make the transition to Twitter? Did you find the transition from Myspace to Facebook easy or hard? Most young folks made both of those transitions, and will undoubtedly move on to whatever comes next. What's more, *they still have and occasionally use the older accounts.* Old farts like me tend to stick with Facebook.

Apart from the relative merits of RPN vs Algebraic, I think the difficulty of learning both is exaggerated for most young folks of reasonable intelligence.

> Quote:
>
> If you can't read the screen of the Ti-89, Ti has the V-200 option available.

Granted, young eyes are going to have less difficulty with illegible displays than my older ones.

> Quote:
>
> EE and ME pro are kinda nice perks that Ti has made available for free on the Ti-89 family and aren't officially available to the normal Hp50G user either.

TI can certainly afford to throw in more extras, given the volumes at which they sell their machines. Of course, to some extent, they need to do that because the underlying implementations lack features.

> Quote:
>
> I could not in all honesty elaborate on those advantages to the normal user. That would mislead the normal (and not all that technically savvy) user to believe that the Hp 50G will solve his problems by the simple purchase of the calculator.

I take your point that TI's domination of the educational calculator market is a powerful argument for using their machines in high school, and to a lesser extent in college. But I think this statement ignores an important fact. People under 30 years of age use the Internet in ways many of us older folks simply don't get. I was talking to a lady friend in Facebook chat last night. We were both

listening to the same shoutcast stream - offshore radio - playing "old fart" music from the 50s, 60s and 70s. I was identifying tunes and artists from memory and doing pretty well at it. But she was cleaning my plow by using google on the lyrics. She was back to me with the identities of obscure songs in seconds. (I mean less than five, typically.) The point is not that googling such things is hard, it's that this was her first thought when confronted with a game like this. She's 30, and says her 10 year old daughter puts her to shame.

So I think your dismissal of hpcalc.org isn't warranted. Any young person with a tiny bit of interest in an HP calculator will have instant access to that site, and the rich resources available for the 50g. Of course, "tiny bit of interest" is a key phrase here.

> Quote:
>
> Hp50G SD card, this is a great plus if you are aware of hpcalc.org, however, many typical users never download anything onto their calculators unless it is games or the teacher distributes something in class. If the Teacher does distribute something in class, IT WILL be for a Ti.

See above as to hpcalc.org. You restate your main point that TI's market domination makes their machines a good choice for high school students. But I think your denigration of Internet resources here is just plain wrong.

> Quote:
>
> 75 (or 200) MHz processor, My Ti-89 has never really been slow, especially in comparison to an Hp 48G. So Hp corrected their problem, but the Ti-89 never had complaints among the typical user for lack of speed.

Straw man. You lead with a comparison between the 75Mhz processor of the 50g and that of the TI-89, then dismiss it on the basis of a comparison with the HP48. Then you basically say the TI-89 speed is good enough. Maybe, but you are jumping through hoops to avoid acknowledging a clear advantage for HP.

> Quote:
>
> Hp 50G LCD Another good point, but the standard user of the Ti-89 is probably 20 years younger than me, anyway and if not, can most likely afford to upgrade to the V200.

Check. As above, young eyes do better with crappy displays. And since today's kids will be unlikely to continue squinting at any calculator after they leave school, the concern about eye damage is probably misplaced. :)

> Quote:
>
> The Hp 50G clock, is a step backwards in comparison to the older clock in the Hp48G series and the newer Ti-89 now has a clock. The verdict is still not in on the Hp50G keyboard quality, although I am inclined to believe it is a great keyboard and its layout is far superior to the Ti-89.

It has also been shown to be more durable than the 49g+ abomination. Point taken under

advisement, but I think it's just here for rhetorical purposes. The 50g's keyboard *may* not last for 10 years, so we should make buying decisions on the assumption it *won't*. This denigrates the improved quality of HP's top of the line keyboards far more than is warranted, in my opinion.

> Quote:

OK, once again, your main point is valid. It's a hard pill for me to swallow that the far more powerful and elegant 50g or even the 39/40gs, are not appropriate choices for most high school students, but I think it's true. However dismissing resources for support that students will most definitely find, if they have an interest, is wrong.

*Message #13 Posted by **Crawl** on 24 Apr 2010, 12:37 p.m.,*
in response to message #12 by Howard Owen

But the HP50g isn't just DIFFERENT (like Facebook / Twitter), it actually is HARDER.

Adjusting to RPN for most things (eg, arithmetic) is probably not that difficult, I agree.

But there are still some things I don't know how to do off the top of my head, and I've used this calculator just about daily for years. For instance, if I wanted to enter a definite integral, I'd have to do it in the equation editor, because I can't remember the order of the arguments otherwise.

If you forget the order of arguments on the TI89, the catalog list shows them.

If the HP50's help library was more complete it could close this gap, but it's not.

The HP50 also has esoteric names for commands. Eg., DROITE for the equation of a line. Even if the help library was more complete, you might not know to look that up to begin with.

Also, some programming tasks (mainly, loop breaking) are easier with TI basic than RPL (though RPL is more powerful).

Honestly, I don't know if I could say which calculator is "better". If I had to recommend one to a generic "average" user, I guess I probably would recommend the TI89, due to ease of use. If someone was more of a calculator "nerd", I'd probably recommend they get both (which is what I did).

The HP ARM is emulating a Saturn Processor while the TI is, I believe, running native code. If for no other reason than this, a comparison of clock speeds isn't very meaningful. The only real way to compare the performance is to run some benchmarks on both machines.

That said, I think it **is** true that the HP is capable of much faster calculations, but you have to code in C or ARM assembly. A good example is my Sudoku Solver on hpcalc.org. It can solve any Sudoku puzzle with a single solution in about 0.1 seconds.

Re: TI NSPIRE vs HP50

*Message #15 Posted by **Howard Owen** on 25 Apr 2010, 1:26 p.m.,*
in response to message #14 by David Hayden

Point taken on clock speeds. That certainly accounts for perceptions that the calculators have comparable performance. But I still think comparing the TI-89 to the HP-48 isn't fair.

As to native code, I'm out of touch. How many apps out there actually use the capability?

Regards, Howard

This does not apply to Brazil. All my students have HP 49g or HP 50g, and I distribute programs for these calculators. On the other side, I rarely see a TI 89 in class.:)

*Message #17 Posted by **Crawl** on 24 Apr 2010, 12:13 p.m.,*
in response to message #8 by Mike Morrow

No, the TI89 really is a great calculator. I was very surprised since I don't like other TI calculators. But they did a good job with that one, making it both durable (I've dropped it several times with no ill effects) and giving it powerful software.

> Quote:
>
> I'd forgotten what a nasty oversized abomination the TI-89 series is.

It's about the same size as the HP50. With the case, the HP50 is much bigger. It is possible to put a TI89 in jeans pockets (if you don't mind the bulge), but an HP50 in case will not fit in pants pockets. I've had winter coats whose pockets the HP50 won't fit into.

> Quote:
>
> the HP50G's superior keyboard

I don't think that's true. I've never had a problem with the TI89 keyboard. By the way, even when the HP50 is in its case, it is prone to accidentally having its power button turned on. This can cause it to go through batteries like crazy. The TI89's hard case prevents this, and it also has a little ridge by the on button to make it less likely to be accidentally pressed.

(I got a third party calculator case, probably intended for TI calculators (though it fits the HP perfectly), for my HP50, to deal with the power button issue)

> Quote:
>
> the speed of the HP50G ARM

Maybe you're talking about writing C or assembly for the calculator. When it comes to using the calculators' own math software, I haven't found either calculator to consistently be faster than the other, for all operations.

> Quote:
>
> the superior legibility of the HP50G LCD

I think the differences here are insignificant.

> Quote:

> the TI-89's lack of sound capability

I think this is trivial for most people. I've heard it's possible to devise some sort of headphone connection to the calculator through one of the ports if you really need it, though.

> Quote:
>
> the HP50G's superior RT clock

Really? Right now my HP's clock is off by ten minutes. I can't say for a fact that that's because it lost time, or because I set it wrong to begin with.

> Quote:
>
> the TI-89's awkward clamshell design

Well, it does do a good job of protecting the calculator, and, as I said, it prevents the calculator from being turned on accidentally.

> Quote:
>
> the great advantage of the HP50G SD card

This is a true advantage of the HP. The HP does have some real advantages over the TI (and vice versa).

But even this isn't as huge an advantage as it could be. If a program needs to be installed as a library, it still needs to be copied to the calculator's own (much more limited) memory.

On the other hand, I will say that I still think the TI89 is probably the only TI calculator worth buying. Graphing calculators without a CAS (like the TI83 or 84) are pointless.

Re: TI NSPIRE vs HP50

*Message #18 Posted by **Don Shepherd** on 25 Apr 2010, 5:47 a.m.,*
in response to message #17 by Crawl

> Quote:
>
> Graphing calculators without a CAS (like the TI83 or 84) are pointless.

I would disagree. The TI-83 and 84 are wonderful calculators for graphing and studying equations or inequalities. As a math teacher, I use the 83's to help my students explore all kinds of things related to equations, like slope, y-intercept, parallel and perpendicular lines, intersection points, and so on. Recently I had my students determine the equation of a line using two points, then graph the equation and look at the table of x/y pairs to see that the original two points are in the table. That was useful.

Of all the graphing calculators I have used over the years, the 83 and 84 are easiest to use and have the features that are most useful. They don't need a CAS at all, although CAS is available on them through third parties.

Pre-built Windows version of NutStudio tools for HP-41 available

*Message #1 Posted by **Håkan Thörngren** on 22 Apr 2010, 3:00 p.m.*

A pre-built Windows version of my MCODE tools for HP-41 is now available at
http://code.google.com/p/nutstudio/downloads/list

The package contains an assembler and a linker that will allow you to create MCODE modules for the HP-41.

As before, documentation and pre-built versions for Mac OS X and Linux are also available.

Re: Pre-built Windows version of NutStudio tools for HP-41 available

Thanks. Makes me want to learn MCODE just to use it. Perhaps in a doc update you could have a 'hello world' example from editor, to compile, to link, to running in an emulator.

Yahoo! Finally got me a HP-70

*Message #1 Posted by **Michael de Estrada** on 21 Apr 2010, 2:31 p.m.*

Well, after wondering if I'd find a nice HP-70 to fill in the biggest hole in my collection, I finally found one in perfect working condition with only missing silver trim at the top of the keyboard to make it less than perfect cosmetically. I had recently passed on an auction that ended up selling for nearly a grand, and another one which had a missing battery cover (unique color to the HP-70) and had a reserve (I hate reserve auctions and don't bid on them). There was another auction in which the calculator had been butchered by soldering wires to the battery contacts, and I didn't even bother with that one.

So now, I feel that my collection is complete to the extent that it meets my desire to have all the HP LED models from the classics onwards. Well, not truly complete in that I lack an HP-81, although I do have an HP-46, and then there's the unreleased HP-95C....

Edited: 21 Apr 2010, 3:27 p.m. after one or more responses were posted

Re: Yahoo! Finally got me a HP-70

*Message #2 Posted by **Michael Meyer** on 21 Apr 2010, 3:09 p.m.,*
in response to message #1 by Michael de Estrada

Congratulations!!! I had mixed feelings about bidding for one. It's a key item missing in my collection, now that I have a working HP-10 and working (finally) HP-29C, but so expensive. And, it gives me something to strive for to actually complete the collection. I mean, now that you've got one, you need to start over and make sure you have a "spare"....!! You don't want to be "done" collecting, now, do you?

I did get a broken Panasonic 850 in the mail today. Battery pack worked, fuse was good, but no continuity in the switch. Easy fix. The vacuum tubes even have an 8th segment to complete the tail of the crossed "4". What a cool machine! Manual courtesy of Katie (Thanks!)

Congratulations on your 70!!

Things that are missing...

*Message #3 Posted by **Gene Wright** on 21 Apr 2010, 3:48 p.m.,*
in response to message #2 by Michael Meyer

So, what are the holes in your collections?

The holes in my collection are:

```
HP-10A
HP-35A red dot
HP-95c (ha!)
```

I have had an HP-10A and an HP-35A red dot, but I feel guilty not converting them to cash when I see the eyes of my family showing hunger. (kidding about the hunger, but not the guilt).

Otherwise, all the models are represented. I don't have all color combinations, for example, only the yellow/blue HP-32SII rather than the ugly teal/purple. I'm not THAT much of a collector nut. ;-)

And, yes, I know that the HP-70, HP-92 and HP-01 I have are worth a good penny...I just haven't felt quite that guilty yet.

Re: Things that are missing...

*Message #4 Posted by **Michael de Estrada** on 21 Apr 2010, 5:05 p.m.,*
in response to message #3 by Gene Wright

I guess that I should have clarified that I'm only interested in RPN calculators, so I also lack the HP-10 and HP-01, but have no intent on acquiring them. I do have an HP-35 Red Dot, which is a complete set with all original accessories as well as a complete HP-92. I know that there are a few MoHPC forumites who have the HP-81 and HP-95C, so I'll probably have to ingratiate myself with one of them if I ever hope to acquire those models.

Re: Things that are missing...

*Message #5 Posted by **Katie Wasserman** on 21 Apr 2010, 6:28 p.m.,*
in response to message #3 by Gene Wright

Gene,

Does that include the 94 d/e/f? Do you collect the larger machines like the 46, 81, 9805 and the really big stuff?

I'd rally like to find a 9805 and an affordable 01, but otherwise I think I'm fully collected as far as my HP calculators go.

-Katie

Re: Things that are missing...

*Message #6 Posted by **Gene Wright** on 21 Apr 2010, 9:44 p.m.,*
in response to message #5 by Katie Wasserman

Ah, no 94 models and not the 46/81 (although I have had one of both of those before).

Of the really big guys, I have a 9820 given to me when I helped someone sell an HP 9100.

Really, though, it needs to be a handheld to be on my list. . . and the 94's don't count to me. ;-)

So, the 3 listed are the only ones on my list I don't have. Not really looking hard. :-)

Re: Things that are missing...

*Message #7 Posted by **db (martinez, ca.)** on 22 Apr 2010, 12:29 a.m.,*
in response to message #5 by Katie Wasserman

Katie; Last time you mentioned it i think you only had one. Do *you* now have a pair royal of 94s? -db

And BTW: if anyone has a spare 70, 86 or 9100, wants a 94, and is going to the HHC-- lets talk.

Re: Things that are missing...

*Message #8 Posted by **Katie Wasserman** on 22 Apr 2010, 2:28 a.m.,*
in response to message #7 by db (martinez, ca.)

db-

> Quote:
>
> Do you now have a pair royal of 94s

Three-of a kind, the d, e and f.

I wrote a really, really bad sort-of-HP-35 simulator for them in BASIC just so that I could call them calculators and stick them in my collection.

Dave's footnote:

> Quote:
>
> (4) If you really want to impress your collecting friends, collect one each of the HP-94D, HP-94E, and HP-94F.

However, I think that this isn't so since most collectors don't consider these HP collectibles, much less calculators. They're just a weird artifact from the mid 1980's that got lumped with calculators because of their model number.

-Katie

in response to message #2 by Egan Ford

That sounds like a interesting project, keep us posted.

I am wondering what heads will turn if I use the printer at my college come September. Would be interesting as a social experiment.

Multiple business model RPN calculators and not many scientific ones?

*Message #1 Posted by **ravwalia** on 20 Apr 2010, 6:42 p.m.*

Hello All,

As the subject line, my impression is that there are quite a few new business rpn calculators you can buy, but the same is not true for engineering/scientific calculators.

Is there any particular reason for this?

Have we got to the point where there wont be any new scientific rpn calculators made and we'll either have to pick between the HP35s or the HP50g?

I know there was some speculation a while back that at somepoint the HP15c would be reissued but that seems like it was just wishful thinking or am I wrong?

Come on HP give us some new scientific non graphing calculators please.

Yes, marketing.
There must be a bigger market for financial calculators than scientific calculator, simple as that.

The only other reason would be if someone high up at HP had a financial calculator fetish.

> Quote:
>
> Have we got to the point where there wont be any new scientific rpn calculators made and we'll either have to pick between the HP35s or the HP50g?

It's a possibility.

The 35S and 50G were made to meet two very specific market segments.
It can be argued that no such (reasonable size) market exists for general use scientific calculators any more.

> Quote:

> I know there was some speculation a while back that at somepoint the HP15c would be reissued but that seems like it was just wishful thinking or am I wrong?

It's not wishful thinking.
If HP were to release a new scientific calculator, it makes extraordinary sense for it to be a re-issue of the 15C.

I've explained the reasons before. But basically because there is clearly very little market for such a thing, you have to come out with something novel. The 15C would be retro-novel, have much lower development risk and cost, and would have the best shot at getting decent sales. It also fits in with the HP retro paradigm.

Dave.

Perhaps we should have people following Cyrille and Tim, in case one of them accidentally drops a 15c prototype at the bar..

It was a global financial/business crisis, not an engineering/scientific one. So that sector may need proper tools more desperately. Just guessing ... d;-)

I find myself puzzled over the HP calculator division's direction. Then sometimes I wonder if they just stick a finger in the air to see which way the wind is blowing.

When I look at the 48/49/50 and 38/39/40 series, it looks like they decided to speed up and modernize the 48G and 38G models, so since TI has been so successful, they made the new HP's look like TI's. That didn't go over so well, so we got the 50g, which looks more like an HP, and seems to be doing well. So expect HP to leave well enough alone in that area.

Then the 33s got a "modern" look, which also got mixed reviews. I think the 35s had two reasons for it's development: 1) As a special commemorative model with a retro look to generate short-term sales, and 2) as test model to gauge the market for a more traditional HP-looking scientific. What did HP learn?

The rubber-key financials (10bii and 17bii+) didn't sell so well (witness Walmart dumping 10bii's at $2 each), so we got the new 10bii and silver 17bii+.

Now to the 20b and 30b. Not sure why HP brought these out, given the continued success of the 12c, and the acceptance of the newer 10bii and silver 17bii+. However, the fact that HP did bring them to market, IMO is the best news in a while, because they are completely new calcs, and because the architecture lends itself to the development of a whole line similar to the Pioneer concept.

We'll just have to wait and see.

*Message #6 Posted by **Bart (UK)** on 21 Apr 2010, 11:11 a.m.,*
in response to message #1 by ravwalia

Well, there's the 33s and 48Gii, but they are both quite closely related to their bigger siblings.

This possibly leaves space for a more basic (perhaps non-programmable) RPN and something in-between like the 41C*/42S.

There's always the danger of over-diversifying and ending up with too many models giving a higher production cost but not the required increase in sales.

Would a 15C be viable? On the one hand a risk that it will only sell to the nostalgics but offset by the possibility that much of the 12C hardware can be used. It should even be possible to keep the hardware exactly the same as the new 12C (apart from screen and key labels), even down to the ARM processor and run the original 15C code encapsulated in an emulation within the ARM like the new 12C. But does HP still have the source code of the 15C?, I heard rumor that a lot was lost with the closure of the old calculator dept.

Not a rumor, I think Tim actually stated this. But aren't there other ways to retrieve the code?

Surely HP would not need the original source, just the binary ROM dump? I heard that a new 15C prototype was displayed at one of the events?

Would a 15C be viable? Well IMO is would be by far the most viable option of any general market scientific calc. Why? it's simple, it's all about marketing leverage. A new standard scientific calc stands almost zero percent chance of getting any coverage what so ever, and Hp wouldn't dare spend a red cent marketing it. But a 15C would surely get tons of geek blog space because it's retro and it's cool. "Hey look, HP bought back the exact same model from the 80's - cool!". It would be like Nintendo bringing back the Game'n'Watch. All that potential free publicity for very little in terms production time and risk. Like I've been saying from day one, it's complete no-brainer.

Dave.

> Quote:
>
> There are quite a few new business rpn calculators you can buy, but the same is not true for engineering/scientific calculators.
>
> Is there any particular reason for this?

Yes. In the pre-PC world, engineers used scientific calculators because, after the slide rules died, that was the best option. The PC changed all that. And today, with iphones and their apps carried by every human under 30, there is no market for a scientific calculator. Even look on this forum at the discussions, by old geezers like us, of iphone calculator emulators. Anyone who thinks new engineers are going to buy engineering calculators is living in a dream world.

I recently visited my old university bookstore to see what calculator offerings it had. Only one brand, TI, was represented. TI-84's for the math people and whatever TI's current financial offering is, for the MBAs and business types. Not a HP in sight.

Yes, the 12c+ and the 15c share the same hardware platform, but does anyone really think HP will put resources into developing a new 15c if only 27 people will buy it? That's a no-brainer.

That's an interesting point, Michael, about the use of calculators on professional exams. ETS and others have always made huge amounts of money on professional paper-based exams. I wonder if, in the future,

we will see universitites switch to computer-based exams, where an on-screen calculator will be part of the test environment for certain tests, and scoring will be immediate instead of waiting 6 weeks for ETS to score the exams (and you have to pay $25 if you want to know your result before it is mailed to you).

I wouldn't be surprized to see something like this happen in the near future. I'll bet ETS is already figuring out how they can capitalize on it.

in response to message #11 by Don Shepherd

Dang! Hadn't thought of that! College Board exams are already available as computer based and as internet based tests, so it wouldn't be a big leap for them to supply the virtual calculator as well.

I've already known that to happen, see my posts in this thread (about 2/3 down, msg 12, 14 & 15).

Re: Multiple business model RPN calculators and not many scientific ones?

*Message #14 Posted by **Don Shepherd** on 21 Apr 2010, 10:00 p.m.,*
in response to message #13 by Bart (UK)

Yeah, I remember reading that now. Thanks Bart. It was six years ago that I took some paper tests from ETS in order to become a teacher. I wondered at the time why we didn't use the college's computers to do those tests, because we would have known the results immediately. If they haven't switched to this method yet, I expect they will eventually.

Which leads, again, to the question of the future of scientific calculators. Assuming that a large number of current scientific calculators are sold to support the test-taking activity, what happens when they are no longer required?

*Message #15 Posted by **Norris** on 22 Apr 2010, 9:03 p.m.,*
in response to message #14 by Don Shepherd

In the US, the largest single market for the HP-35S is probably among engineers and surveyors taking NCEES professional licensing exams. Only a few calculator models are approved for these exams, and the 35S is the most powerful. If you look up the 35S at amazon.com, you will see that the associated "Customers Who Bought This Item Also Bought" list is full of FE and PE exam study materials.

Anyway, NCEES is looking very seriously at Computer-Based Testing. There is a good chance that they will switch from the old pencil-and-paper model in the next 2-3 years. However, the

current plan is that examinees will bring in their own NCEES-approved calculators, so 35S sales would not be affected.

Details on pp. 6-7 at

Did you ever hit the nail on the head! Looking over the NCEES annual report, available here, about 25,000 engineers take the PE exam every year. Not to mention the 40,000 taking the FE exam, or the additional thousands taking surveyors exams. That's a lot of calculators each year, even if they are divided between HP, TI, and Casio.

Did you ever think about the simple fact that 95% of mankind lives outside of the USA?

<rant> Thus you may expect coarsely the same fraction of students (both kinds of ;)) and engineers in both parts of the world. So the market is in that large area you call "foreign countries" or "rest of the world" (while the rest of the world may well call the missing 5% "rest of the world"). <end of rant>

So, metaphorically, you hit the nail on the head but the wrong nail IMHO.

*Message #18 Posted by **Martin Pinckney** on 23 Apr 2010, 10:18 a.m.,*
in response to message #17 by Walter B

Wow, Walter, we seem to have hit a raw nerve rather than a nail!

Norris qualified his statement "In the U.S.", and I was responding to his comment. Speaking for myself, I was simply making the point that there is a huge market just from U.S. exam takers, let alone any other market. It was never my intention to slight the "rest of the world".

And DaveJ, who hails from "the rest of the world", seems to think that "the 35S was designed specifically to meet that market requirement".

We'll probably never know, but I would bet that 95% of 35s sales are to U.S. buyers. No?

Martin, maybe Dave and me are pointing to the same. HP may have designed the 35S for those 50,000 missing the fact their target market could have been 1,000,000 people in the world. So why focus on those 50,000 and HP's presumably good share there as long as HP has a very poor share of the 1,000,000 possible customers elsewhere having been within reach with another design? Simply look where the volume is. I may be wrong by a factor of 2 or 3.1415/2 but this does not kill the argument.

If HP knew the market for a scientific calc outside of that US exam market was an order of magnitude bigger then you can bet your bottom dollar we'd have either two scientific calcs, or a 35S which *wasn't* crippled to meet those exam requirements.

After all HP already had a good selling exam calc in the 33S, so it speaks volumes that their next (and only) general scientific calc was crippled to meet that exam market (i.e. no I/O etc).

So either HP are incredibly naive about the "rest of the world" market, or they they know something about the general market we don't. Or possibly they just wanted to shoot for a lower risk "sure thing"?

Dave.

What about cost and market saturation? That, to me, is the obvious reason HP didn't look to the "1. 06" outside. Look at the supersaturation of Casio FX 115 and 300 etc. And they cost $10/$15/$20 apiece.

So I am sure HP looked at the world market. What would give them the warm fuzzies about a large market for a calculator that costs 3 times what the most expensive Casio full-featured sciuentific costs?

Exactly. There is very little incentive to try IMO, and they already have a mass market scientifics in the SmartCalc 300 and 10S. Trying to do the same for just an RPN machine would likely be marketing suicide. That's why you need an angle or a gimmick. The retro 15C would be such a gimmick, and probably the only ace they have left up their marketing sleeve.

Dave.

With a rebranded "smart calc 300" or alike HP just sells a "me too" product not making a difference. But how about quality? And smart design? I admit these are old-fashioned criteria and features, so they will make a difference (and fit to the retro wave).

Ceterum censeo: HP, launch a 43S.

That's not surprising considering that the 35S was designed specifically to meet that market requirement. It is highly likely that no other market segment was given anything but cursory consideration during the design of the 35S. And they made it retro because they wanted to do something for the anniversary, so it tied in nicely.

Dave.

Martin, I've never seen HP publish it's calculator sales figures; it would be interesting to know how many 35s's have been sold.

As I recall, when HP built the original 35 they estimated only a few hundred would be sold, and the huge actual demand surprized them. But that was the first of a new breed. A re-issued 15c would probably only appeal to members of this forum, for example, a very limited segment.

It's much closer to the mark than your joke figure of 27 units.

Yes, they would sell 50K easily, bet the farm on it. That's with no advertising. Get the unit blogged to death on the geek sites and have a good price point and that number could easily go into 6 figures.

If you don't think those numbers are realistic then you haven't really thought about it.
Take Walmart for example, they sell HP calculators. They have almost 8000 stores. For HP to get 15C stock into all those stores they'd have to make at least 50,000 of them. Would they sell'em all?, sure they would eventually.
Not to mention all the other stores and online shops around the world that sell calculators to the nerdly masses.

A figure of 50,000 is nothing in this business!

> Quote:
>

Just how many HP35S units have you ever seen in Wal-Mart? Try zero! Do you really think that Wal-Mart would carry a "new" HP-15C? Just WHAT HP scientific calculator have you EVER seen in Wal-Mart except for the HP33S units that they could only sell though clearance a couple of years ago. The local Wal-Marts carry no HP calcs of any sort since clearing out the HP10BII for $5 a few months ago. Their experience with the HP33S and HP10BII can not have been very gratifying.

If they were foolish enough to carry some sort of HP-15C reincarnation, those that finally left the store would be just like the TI-89 (recently cleared at the local Wal-Mart for $72) and the Casio fx-9750GII (recently cleared at the local Wal-Mart for $23). There's no significant market for such an obsolete 29-year-old contraption, regardless of how much a very few have apparently deluded themselves thinking that there is.

The HP-15C is dead. RIP.

I'm not quite ready to eulogize the HP-15C. The hardware may be a thing of the past, but when HP made virtual calculators available from the Apple Store I think they acknowledged the value

and utility of the “obsolete 29 year old contraption.” This comes from a man who has a Soroban, Slide Rule, HP-35s, HP-50g, and of course a PC sitting on his desk. I don’t care how old something is, if it works and makes my life easier, I’ll keep it running as long as I can. Very respectfully, David

Put a modern version of a HP-41C infront of me with USB, SD card, and a multi-line display, I'll buy it in a heart beat. Does not even need to be able to program on the device if the programs are stored as text files named with the program name.

Since my own calculator project (ND&T-41) warped into a desktop unit (ND&T-91), after I'm done with it I will transfer what I like best of the bigger version to the small one. I hope to be able to get the desktop version work if not complete by September.

Biggest problem for HP today, atleast here in Canada you can get a graphing model from them for nearly the same retail price as the HP-35S. It in itself kills the market for scientific.

Dimitri

Thanks for the replies everyone.

I've read through them twice and there's some very thoughtful and insightful responses.

I would say on the 15C, my feeling is that we wont see it being reissued. I would love to be wrong, but I don't think so. With more and more alternatives coming out for the calculator users, such as apps for phones, ipad, Pc's, etc, HP may feel that there isn't the return on investment that a 15C reissue would provide. I would dearly like to be wrong on this and if they did issue I would probably have my name down for 3 and then buy additional ones

for presents. So I think that the reissue is going to be unlikely but I'll have my fingers and toes crossed.

I suppose in a way the scientific/engineering market is covered by the 35s and the 50g with only a completely non programmable rpn required to complete the line. Thing is though, I'm not sure if the people in the market for a basic calculator would justify bringing out another rpn calculator.

So my theory is that unless there is a HUGE grass roots campaign to get another scientific calculator we are going to be stuck with 35s and the 50g and maybe some slight tweaks to those.

Thoughts?

Re: Multiple business model RPN calculators and not many scientific ones?

*Message #36 Posted by **Martin Pinckney** on 22 Apr 2010, 3:05 p.m.,*
in response to message #35 by ravwalia

My bet is that the 15c will be released as a limited edition (limited time) "retro-novel" (DaveJ) device, not really intended as a serious competitor. AND an all-new scientific based on the 30b platform will eventually replace the 35s, which will take its place a special short-term commemorative model.

That's right, HP would have a hard time justifying just another general purpose basic RPN scientific calculator. So it would not surprise anyone (including me) if HP never do it. But if they *DO* do it the 15C is the only one that makes sense from a risk/marketing (and probably internal political) point of view.

In recent years HP have clearly aimed all of their calculators at very specific markets, and that's of course what you'd expect. The reason no general purpose RPN has been released is because there is no perceived market for it. And I'm sure most sensible people would agree that's most probable, considering the other big brands and the one-hung-low brands have that market sown up. And quite frankly the RPN factor does not sell.

HP's direction has been fairly clear on two fronts:
1) Niche market spaces and 2) retro looks

The 15C hits both areas, so it's probably easy to sell internally and the risk is fairly minimal.

A scientific version of one of the new business platforms OTOH would require more development with clearly little or no retro appeal. So it's a bit of a lame duck idea, and I doubt you'll ever see one.

But hey, internal politics and marketing often change on a dime, so anything's possible.

Dave.

Three reasons why you may be wrong. First, the very existence of the 20b and 30b says to me that HP wants to keep in the calculator game. After all, why not just keep selling 12c's and 17bii+'s instead of developing a completely new series?

Second, "little or no retro appeal" is the point! These calculators (20b & 30b) have been deliberately styled more like other 21st century electronic devices. They remind me somewhat of the styling of HP notebook computers. The 35s was specifically styled to have retro appeal, otherwise has capabilities very similar to the 33s. So why not a new scientific series with an updated look but without the "over the top" look of the 33s?

Third, does it not strike anyone that the deliberate "re-purposing" capabilities designed into these new calcs might serve HP as well?

Maybe it's just the way big companies work. They may in fact be just keeping the calculator division as a throwback to the old days. Who really knows? They certainly are not "serious" about calculators given the number we've heard of people working in the department.
For HP as a global entity, the calculator division rates literally a few words in the annual report as one part of a subdivision of a division, that's how insignificant it is to them in terms of sales.
And as with any product department it's standard practice to keep at least some form of token development team (current a team of two?), and of course products will eventually pop out the other end of that.

> scientific series with an updated look but without the "over the top" look of the 33s?

Because an ordinary scientific calc won't sell very well, the market is too flooded. The 33S was only released to meet the exam market. For a more general market modern styling is not a big enough differentiator, and as I said the market doesn't really care about RPN. Retro on the other hand could be a significant differentiator if they want to re-enter the general purpose scientific calc market.

> Quote:
>
> Third, does it not strike anyone that the deliberate "re-purposing" capabilities designed into these new calcs might serve HP as well?

It certainly will, it's a positive differentiator. But unfortunately one that is limited to a very small and niche market.

Dave.

35s Modification

*Message #1 Posted by **Hugh Evans** on 20 Apr 2010, 2:32 p.m.*

I recall some discussion in the past regarding modification of the 35s. Given the relative ease of disassembly, good keys, and an attractive form factor is anyone up for using the case and keys to make a new machine?

All I'm proposing here is a new LCD and PCB with perhaps a more capable processor, more memory and USB/some form of IO.

I think this should be kept as simple as possible and would estimate a very nice mod kit to accomplish this could easily run $50.

Anyone interested?

Re: 35s Modification

*Message #2 Posted by **PeterP** on 20 Apr 2010, 3:37 p.m.,*
in response to message #1 by Hugh Evans

I'd buy a mod kit for 50 bucks to add I/O

Re: 35s Modification

*Message #3 Posted by **Gene Wright** on 20 Apr 2010, 4:03 p.m.,*
in response to message #2 by PeterP

I'm in for $50.

*Message #6 Posted by **Walter B** on 20 Apr 2010, 5:12 p.m.,*
in response to message #1 by Hugh Evans

How about putting the same into a 30b? It's smaller and has a full row of keys below of the display, so soft keys are easily done with a reasonable LCD.

Just my 0.02 Euros.

Re: 35s Modification

*Message #7 Posted by **DaveJ** on 20 Apr 2010, 5:41 p.m.,*
in response to message #1 by Hugh Evans

It was Jeff.O who did some early work on this "Phoenix 35sx" project back in 2007 and posted photos, got sample LCDs, and even did a DXF of the required board size and holes etc

IIRC it wasn't trivial to disassemble and required drilling out a bunch of heat stakes. If so, that means reassembly of a new PCB would not be trivial either. So it looked pretty messy from a physical hardware point of view.

Dave.

Edited: 21 Apr 2010, 5:44 p.m. after one or more responses were posted

Looking at Jeff O.'s post linked by Reth, the assembly looks similar to the HP-50g which I have taken apart and the small screws are easily put back into the shaved-off stakes and hold very well.

Re: 35s Modification

*Message #9 Posted by **Hugh Evans** on 21 Apr 2010, 12:58 p.m.,*
in response to message #7 by DaveJ

From the pictures the process doesn't look that bad, certainly much easier than a pioneer for example. I'll pick up another 35s and a 30b to document the dissection and put together some CAD drawings. My suspicion is that replacement of the PCB and LCD will be reasonable enough to be worthwhile.

This obviously doesn't need to be too high-end. I think most people would be happy with something powerful enough to emulate saturn. Even 1MB of memory would be extreme in this application.... And a nice high contrast reflective LCD should complete the picture.

I'll post progress as soon as I can.

Re: 35s Modification

*Message #10 Posted by **Jeff O.** on 21 Apr 2010, 4:05 p.m.,*
in response to message #9 by Hugh Evans

Hugh,
I prepared some CAD drawings that I can send to you if they would be helpful. Front and back of the PCB, in dxf format.
Jeff

Re: 35s Modification

*Message #11 Posted by **Hugh Evans** on 22 Apr 2010, 10:27 p.m.,*
in response to message #10 by Jeff O.

Jeff, that would be fantastic. At the very least we can define design constraints from your work. From your experience with assembly/disassembly of the units does my drop-in replacement sound feasible with at least moderate skill?

Re: 35s Modification

*Message #12 Posted by **Jeff O.** on 23 Apr 2010, 8:24 a.m.,*
in response to message #11 by Hugh Evans

Hugh,
I think I have an e-mail address for you, I will look around and send you the files. If I can't find an e-address I will let you know.

It was not difficult to disassemble the 35s as documented in my post of a couple years ago. So I would say yes, your drop-in replacement certainly sounds feasible.

Good luck.

Jeff

in response to message #1 by Hugh Evans

On a related note, has anyone developed a schematic of the HP35s?

There appear two be two major integrated circuits under the epoxy 'blobs'. I assume these are the processor and a memory chip.

Please let me know if there are any details out there.

Regards, TomC

Re: 35s Modification

*Message #16 Posted by **Eric Smith** on 23 Apr 2010, 2:04 a.m.,*
in response to message #15 by Thomas Chrapkiewicz

I don't have a schematic, but what's under there is a GeneralPlus microcontroller (based on a 6502 core) with masked ROM, and a 32KB SRAM. Except as a one-off hack, it's not practical to try to reuse the PCB for anything, as it is much less expensive to make a replacement PCB.

Problem with HP 110+ / Portable Plus battery charging (+workaround)

*Message #1 Posted by **John AS (UK)** on 20 Apr 2010, 8:07 a.m.*

Hi,

I have a Portable Plus and have noticed the following problem with the way it charges the lead acid battery. Not sure if this is the same on other machines or just a fault with mine.

Problem occurred when the computer was left in a cupboard for several weeks and the battery voltage dropped very low, it would not then re-charge with the HP power unit, and the computer would not turn on.

Here's what I did to investigate & fix. I disconnected the battery from the computer, and it measured something like 2V (should be 6V or more). I then plugged the 8V AC power supply into the computer. The voltage across the computer leads for the battery measured 7.2V, and the computer would turn on. With the meter still connected to the computer I disconnected the power supply lead, the meter reading fell gradually to 0V. If the voltage fell below 10mV and I then connected the power supply, it would rise back to 7.2V again. If however I disconnected the supply, then when the voltage dropped to say 2V then reconnected the power supply, it would only go 2.3V and stay there. Obviously the computer would not turn on in this state.

So with a half-dead battery connected to the computer again, plugging in the power supply led to a charging voltage of only 2.3V so the computer would not turn on, and the battery did not get charged up.

I disconnected the battery and connected it to an external charger (I bought a trickle charger off eBay for 6V and 12V use, it was designed for motorbike batteries and cost about £8). Luckily the battery recovered and charged back up to 6V. I then reconnected the battery to the computer and it turned on, and when I connected the power supply the charge voltage is back to 7.2V.

The computer works fine and will work on battery power (I haven't tested it for many hours though!). The battery keeps enough charge to allow the computer to be turned off and put away for a day or so, but for long term storage I will remove the battery and recharge it from time to time.

HTH,
Regards,
John

Re: Problem with HP 110+ / Portable Plus battery charging (+workaround)

*Message #2 Posted by **J-F Garnier** on 20 Apr 2010, 4:56 p.m.,*
in response to message #1 by John AS (UK)

I made the same observation on my Portable+ and used the same workaround in case of deeply discharged battery, i.e. charging using an external power supply not the HP charger.

For long storage period, there is a jumper to disconnect the battery, no need to physically remove it.

J-F

Re: Problem with HP 110+ / Portable Plus battery charging (+workaround)

*Message #3 Posted by **John AS (UK)** on 21 Apr 2010, 1:32 p.m.,*
in response to message #2 by J-F Garnier

> Quote:
>
> For long storage period, there is a jumper to disconnect the battery, no need to physically remove it.

Yes you are right there is a jumper to disconnect the battery. In my case I want to keep the battery charged up and be able to check its voltage, as I have an external charger it is easier for me to remove it rather than rely on the computer + HP power supply.
Regards,
John

total solar eclipse Corvallis 2017 !

*Message #1 Posted by **hugh steers** on 19 Apr 2010, 7:03 p.m.*

ok, whilst messing with my astro code, i discovered there's a total solar eclipse that goes through Corvallis in 2017! specifically, 2017 August 21 about 10:10 local time.

as you know, total eclipses have a "central line" that moves across the globe. If you're on the line at the right time = total darkness! i had my program emit a google earth KML file. check this:
http://www.voidware.com/tmp/eclipse10-25.kml

just open google earth and load this KML file. what you will see a number of yellow lines across the globe. each one is a central line. if you zoom in, each line has little pushpins. click on these and it will tell you the date and time for the location.

some notes:

all the times are in GMT (ie no summer time correction too), for example the 2017 line hits Oregon at around 17:10 GMT (so -8 + 1 = 10:10 local time).

the line thickness is not to scale. when im feeling really keen i might add this to my program. depending on your zoom, you could be off the line and still see totality. in fact that's quite likely unless your zoom is way out!

where's the conference that year :-)

Re: total solar eclipse Corvallis 2017 !

*Message #2 Posted by **DavidShenk** on 19 Apr 2010, 7:58 p.m.,*
in response to message #1 by hugh steers

For those of you that may have a total solar eclipse on your "bucket list", you really should plan ahead to catch one. I am in the Southern California area and have found that this eclipse in 2017 is the closest one will come to me in my lifetime. Another one in 2020's in Texas and that is it, without extensive traveling.

I'll be taking the kids on a road trip in 2017 and we'll see the event of a lifetime. (I think my wife is less enthusiastic)

Dave

Re: total solar eclipse Corvallis 2017 !

*Message #3 Posted by **BruceH** on 19 Apr 2010, 9:26 p.m.,*
in response to message #2 by DavidShenk

I was lucky enough to be able to be in Balatonbognár in Hungary for a total eclipse in 1999. It was truly remarkable - and I fully understand why eclipse chasers rush around the globe seeking them out.

If at all possible you really should go. I suggest you try and avoid crowds - I was lucky to have total

silence - but the TV news coverage later that evening of the crowds at the popular venues showed a lot of shouting and whooping which would have spoilt it for me.

Re: total solar eclipse Corvallis 2017 !

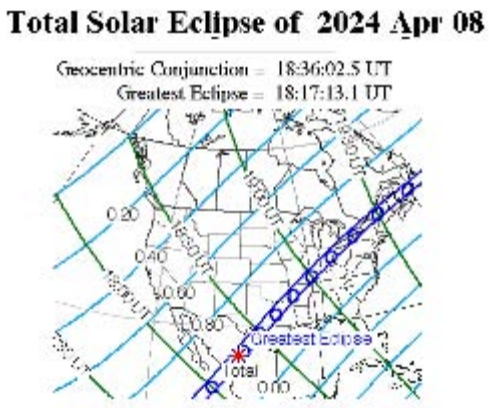
April 8, 2024:



I'm sure it will be cloudy that day where I am if I am in the path of totality.....

Re: total solar eclipse Corvallis 2017 !

*Message #6 Posted by **megarat** on 20 Apr 2010, 1:16 p.m.,*
in response to message #2 by DavidShenk

I completely agree with this. Additionally, as part of planning ahead, it is equally important to consider local weather conditions. You don't want clouds/rain to ruin your otherwise perfect plans, so your viewing should be someplace where they are minimized, if possible.

I've had the remarkable fortune of being able to see two solar eclipses w/o doing any deliberate travel to view them. In February 1979 (growing up in eastern Washington state) and on the summer solstice, 2001, in Lusaka, Zambia (being there for work at the time). One of my fondest memories ever is of that afternoon in Lusaka, especially the moment of totality, standing in the dusky darkness with a low, rusty African sunset 360 degrees around me. Absolutely beautiful.

I will certainly be in Oregon for 2017. It's too close for me to ignore it.

Re: total solar eclipse Corvallis 2017 !

The path (through the U.S., at least) can also be seen on Wikipedia. I noted it goes through Charleston, SC. Since I always go to Beaufort once during the summer, perhaps I will plan my trip for mid-August instead of the usual mid-July.

I saw a total solar twice before, but don't remember what years.

unable to plot UTPN

*Message #1 Posted by **stroran** on 19 Apr 2010, 11:57 a.m.*

Hi,

Plotting the function

<< -> X << 0 1 X LN UTPN >> >>

leads to an error message: "UTPN Error: Bad Argument Type". Any suggestions as to why this is happening?

When I store the function above in a variable V and enter it in the command line, it evaluates to a number just fine, e.g., V(1) EVAL leads to 0.5 as expected. But when I use V(X) as the function to be plotted it complains as described above.

This issue is related to having the function LN(X) as the argument to UTPN. Do I need an extra step to make sure LN(X) evaluates to whatever datatype UTPN takes?

Thank you very much for your time.

Re: unable to plot UTPN

*Message #2 Posted by **Tim Wessman** on 19 Apr 2010, 6:48 p.m.,*
in response to message #1 by stroran

If you are in approximate mode, then you should be fine. If not, add in a ->NUM right before the UTPN.

TW

Re: unable to plot UTPN

*Message #3 Posted by **stroran** on 20 Apr 2010, 5:00 a.m.,*
in response to message #2 by Tim Wessman

Thanks Tim.

Unfortunately, I can't still get it to plot even with ->NUM. The funny thing is that

<< -> X << 0 1 X COS ->NUM UTPN >> >> or << -> X << 0 1 X EXP ->NUM UTPN >> >>

plot as expected. However,

<< -> X << 0 1 X LN ->NUM UTPN >> >> or << -> X << 0 1 X LOG ->NUM UTPN >> >>

refuse to plot giving "UTPN Error: Bad Argument Type". Do log functions need to be treated differently? I have an HP50g.

Re: unable to plot UTPN

*Message #4 Posted by **Kiyoshi Akima** on 21 Apr 2010, 12:10 p.m.,*
in response to message #1 by stroran

What's your plot range? Can x be negative? Then ln(x) is complex, and UTPN doesn't like complex numbers.

HP-48SX Repair - Diode

*Message #1 Posted by **aj04062** on 19 Apr 2010, 9:32 a.m.*

I think I just did a stupid thing.

late last night I was trying to resurrect a 48SX that had/has a battery acid damaged keyboard.

I have a 3 cell batter holder to test the unit before putting the back on. I think I reversed the polarity of it and momentarily smelled overheating electronics before I pulled it. Prior to this, I did resuscitate the unit, but the LCD screen had lines (I hadn't tightened the clips).

Is it permanently dead? I've read doing this will fry the zener diode. Where is it? Can I replace it?

Re: HP-48SX Repair - Diode

*Message #2 Posted by **Han** on 21 Apr 2010, 2:03 p.m.,*
in response to message #1 by aj04062

The zener diode is right at the positive battery terminal (looks like a Y-shaped SMD).

As for the lines on the display, if it's missing lines then you simply did not tighten the twist-tabs tight enough. If on the other hand you see garbled pixels then it's because your screen is no longer in alignment with the LCD connectors on the PCB. Just realign the screen until it is as close to center as possible.

Re: HP-48SX Repair - Diode

*Message #3 Posted by **aj04062** on 21 Apr 2010, 5:23 p.m.,*
in response to message #2 by Han

Can you suggest a way to test the board/display funtioality seperately from the keyboard? The previous owner let the batteries leak onto the keyboard. I think this is the source of the problem, but I'd like to isolate it.

If it is the problem , then I need to try and fix the keys. Looks like a pain to pull that apart.

Re: HP-48SX Repair - Diode

*Message #4 Posted by **aj04062** on 21 Apr 2010, 5:26 p.m.,*
in response to message #2 by Han

HP 97 clutch repair methods compared

*Message #1 Posted by **Ed Sowell** on 18 Apr 2010, 3:23 p.m.*

I'm reading up on the clutch problem since my card reader was a bit noisy after replacing the drive wheel rubber.

Although a fair tug was needed to pull the clutch off the motor shaft when I first did it to check the condition of the clutch, I now find it comes off quite easily. So, the question is what to do about it.

There seem to be 4 methods in earlier posts, listed below. Clearly, for either of the first 2 to be considered the original clutch material must be in good condition and just slipping a bit, like mine.

1. Superglue between the motor shaft and the original clutch material. (various people have suggested this)

2. A small bit of cling-wrap between the motor shaft and the original clutch material. (Rafa, Spain)

3. Replacing the original clutch, aluminum sleeve and all, with a piece of insulation pulled off of a solid conductor electrical wire. (Bernd Schmeling)

4. Removing the original clutch material from the worm gear shaft and the aluminum sleeve and replacing it with ordinary household silicone adhesive. (described in detail by Johnny Nestor)

Method one is clearly the easiest, but it has been criticized for fears of serious damage under some circumstances if no slippage at all is allowed. Method 2 seems tedious and perhaps not durable. I worry about method 3 because the aluminum sleeve is omitted; if it's not needed I wonder why HP put it there. I like method 4 because I believe that's pretty much what HP did in the first place, i.e., molded the two shafts together with a rubbery material inside a metal sleeve to provide lateral rigidity. However, it sounds very messy and I wonder how hard it is to get perfect centering (or good enough).

So, with that background here's my question: If the clutch material should not be bonded to the motor shaft in method 1, why is it OK to do so in method 4? In both cases the bulk of the clutch material will provide the wanted vibration isolation.

Comments?

Re: HP 97 clutch repair methods compared

*Message #2 Posted by **Michael de Estrada** on 18 Apr 2010, 3:54 p.m.,*
in response to message #1 by Ed Sowell

First off, something I found out in the past is that it is not a "clutch", which implies that it should slip if there is a card jam (it should not), but that it is an elastomeric coupling that provides a certain degree of vibration dampening. As such, it should idealy be bonded permanently to both the worm gear and the motor shaft.

The method that I use is to use wire insulation that has on OD that permits the metal sleeve to fit over it to retain its shape and ensure a tight fit on the motor shaft. For good measure, I also place a tiny drop of Superglue on the motor shaft before sliding the coupling over it. Since I use only one piece of insulation, its ID is a tight fit on the motor shaft, and I bore it out on the worm gear end to permit it to fit.

That's what I think too.

If the original clutch material looks to be in pretty good condition, i.e., not at all gooey, wouldn't it do to simply put Superglue on the motor shaft?

Thanks.

Ed

That material may seem to be in good condition, but it will have deteriorated badly over time and should not be reused. In my experience, it does not become gooey, but rather it becomes dry and loses its elasticity, and it will just shear and crumble. I strongly advise against trying to reuse it.

*Message #5 Posted by **Ed Sowell** on 19 Apr 2010, 10:46 p.m.,*
in response to message #2 by Michael de Estrada

Michael, My measurements show that the motor shaft is 0.037". Solid wire gauge #19 is 0.036. From posts to the forum I've read that the ID of the sleeve is 3/32 = 0.094". I went to a major electronics store today hoping to find #19 with OD of something close to 0.094" and found nothing. Do you remember what you used?

I did find that SmallParts.com lists a Tygon micro bore PVC tubing with ID 0.030" OD 0.090" Have you tried that?

Ed

Re: HP 97 clutch repair methods compared

*Message #6 Posted by **Michael de Estrada** on 19 Apr 2010, 11:21 p.m.,*
in response to message #5 by Ed Sowell

Ed,

The wire insulation that I used is unmarked, but it has an OD of approximately 2.4mm (0.0945") and the ID of the stranded wire bundle is approximately 1.0mm (0.0394"). I used this particular wire simply because it was lying around and was the only wire I could find that would work. The Tygon tubing might be too tight a fit on the motor shaft; PVC is not very stretchy, but you might be able to hot bore it with a heated nail, which is the way I enlarge the bore on the worm gear side.

Michael

That's encouraging, Dan. I might as well give it a try since I can always clean it up and try something else if it doesn't work for me. How do you keep the silicone from getting all over the motor?

Ed

Re: HP 97 clutch repair methods compared

*Message #10 Posted by **Dan W** on 21 Apr 2010, 10:54 p.m.,*
in response to message #9 by Ed Sowell

After you fill in the little cylinder, wipe off the sides and the ends (and your fingers) of any excess. Set the worm gear in the cylinder then slide onto the motor and make sure the axle engages with the gear.

Some silicone will be pushed out of both ends but not as much as you'd think. I use a toothpick and a cotton swab to clean off any excess. If you push down on it and it seems too much is coming out the bottom, just raise it up a bit and wipe it off, then press down again. Center the cylinder. Then set it upright overnight.

It helps a lot to have a strong magnifier or loupe on your head, and lots of light. ;)

*Message #11 Posted by **Ed Sowell** on 3 May 2010, 12:28 p.m.,*
in response to message #10 by Dan W

After reparing the clutch using the silicone sealant fill method I find that the shaft is not quite long enough to fully engage in its hole in the frame. See: Shaft fit.

When I did the repair I made sure the motor shaft bottomed out on in the hole in the worm shaft, as suggested in Nestor's write-up. See:

Repaired clutch.

What am I missing?

Re: HP 97 clutch repair methods compared

*Message #12 Posted by **Dan W** on 6 May 2010, 10:31 p.m.,*
in response to message #11 by Ed Sowell

I dug through my notes and photos. I have never seen a case where it didn't engage the frame enough, though there is quite a bit of variability in just how far it goes into the hole.

When I press the worm gear on to the motor shaft there is always some air in the hole in the axle so that it rebounds some. I never try to work it down any further.

-- Dan

Rebuilding an HP 41 battery pack

*Message #1 Posted by **DavidShenk** on 18 Apr 2010, 11:39 a.m.*

I am in the process of rebuilding a 82120A battery pack for my 41CX with new NiCd cells. The problem I'm having is that the old cells leaked and damaged the metal contacts that mate with the calculator. They are both broken and I don't think they can be used again.

Does anyone have an ideas for a substitute for those metal contacts? My guess is they have to have some spring or flex in them so the battery pack can be removed, but maintain contact otherwise.

Dave

*Message #2 Posted by **aj04062** on 19 Apr 2010, 8:49 a.m.,*
in response to message #1 by DavidShenk

what about trying foam with a plate, like in all the 48 series?

Re: Rebuilding an HP 41 battery pack

*Message #3 Posted by **DavidShenk** on 19 Apr 2010, 11:15 a.m.,*
in response to message #2 by aj04062

That would work. I also thought of just using a small spring. I've been busy and haven't had a chance to try anything yet.

Dave

Re: Rebuilding an HP 41 battery pack

*Message #4 Posted by **Andreas Grund** on 20 Apr 2010, 2:56 a.m.,*
in response to message #3 by DavidShenk

David,

The battery pack is kept in place by the force of the 4 spiral springs inside the battery pack. For my better understanding, which contacts are coroded? The thin copper layer in the battery compartment? Or the springs in the battery holder?

In case you want to rebuild a battery case from scratch, this is very simple, based on 4 commercially available N size cell holders.

Andreas

Re: Rebuilding an HP 41 battery pack

*Message #5 Posted by **DavidShenk** on 20 Apr 2010, 11:55 p.m.,*
in response to message #4 by Andreas Grund

Hi Andreas,

The rechargeable battery pack that I'm trying to rebuild isn't constructed the same as the N cell pack. Part of the rechargeable pack is taken up by the charging circuit. The rest of the pack contains 4 small NiCd cells tab-welded together, then each side of the pack has a piece of spring steel that makes contact between the batteries and the copper in the calculator. It is this flex that replicates the springs in the normal N cell holder.

Of course, it is probably easier just to use N cells in the normal holder, but that's not the point!

Dave

Re: Rebuilding an HP 41 battery pack

*Message #6 Posted by **John Robinson** on 20 Apr 2010, 6:42 p.m.,*
in response to message #1 by DavidShenk

Hi David, I am in the same situation, and I thought about springs, but ruled them out, as I doubt they would stay in place. I am going to try some thin "spring steel" shaped pretty much to the same shape as the originals. I'll let you know how I go, if it works, I can send you some of the same steel - I have enough to build 100s of 82120 :-)

Cheers, John

Re: Rebuilding an HP 41 battery pack

*Message #7 Posted by **DavidShenk** on 20 Apr 2010, 11:46 p.m.,*
in response to message #6 by John Robinson

Thanks for the offer John. My thinking with the springs would be to solder them (if possible) right onto the ends of the batteries. I think that, you're right, they would move and cause problems otherwise.

Fabricating a duplicate part would be ideal. Let me know how it goes.

Dave

Re: Rebuilding an HP 41 battery pack

*Message #8 Posted by **John Robinson** on 22 Apr 2010, 5:45 a.m.,*

HP vs. TI on eBay auctions

*Message #1 Posted by **Joerg Woerner** on 18 Apr 2010, 10:37 a.m.*

Hi There,

After selling more than 1,000 Texas Instruments calculators on that auction site, I put four days ago some HP calcs for sale.

Guess what? For most of my TI's I could predict the number of watchers, with my HP's it is completely different!

Examples:

Texas Instruments ABLE (the rarest TI I ever auctioned): 54 watchers

Texas Instruments SR-60: 52 watcher

Texas Instruments SR-51 Mint-in-Box: 50 watcher

Most TI's have 3..20 watchers after 4 days on the site.

And now the HP's:

Hewlett Packard HP 55: 58 watchers after 4 days!!!

Hewlett Packard HP 35: 36 watchers...

Wow - I have to collect HP, too.

Have a great Sunday, Joerg

Re: HP vs. TI on eBay auctions

*Message #2 Posted by **db (martinez, ca.)** on 18 Apr 2010, 11:15 a.m.,*
in response to message #1 by Joerg Woerner

Joerg: You *did* collect HP calcs, but you're selling them off. What interests me are the prices the apf and national semiconductor have been bid up to so far. That is yet another proof of the superiority of RPN - it has no equal.

So it's not too late. You can still cancel your auctions and even buy the Corvus that someone is selling. Come to the Dark Side Joerg. It's postfixerific!

Re: HP vs. TI on eBay auctions

*Message #3 Posted by **Michael de Estrada** on 18 Apr 2010, 2:04 p.m.,*
in response to message #2 by db (martinez, ca.)

Dennis, you hit the nail on the head. The value of these calculators is not so much their branding as HP .vs. TI, but the fact that they are RPN. I bought a NIB complete NS 4615 similar to the one Joerg is selling for $13.45 + shipping. With about a day left in Joerg's auction, the price has already been bid up to $41, and the final winning bid will not doubt be higher. The notable difference between the auction I won and Joerg's is that my auction made no mention of RPN, whereas Joerg's has RPN featured prominently in the heading and throughout the description. Remember when Joerg sold the RPN module for a TI calculator; it sold for a freekin' fortune.

Re: HP vs. TI on eBay auctions

*Message #4 Posted by **Maximilian Hohmann** on 19 Apr 2010, 6:01 a.m.,*
in response to message #3 by Michael de Estrada

Good morning!

> Quote:
>
> ... but the fact that they are RPN.

Which makes me curious, if there is any statistics/estimate regarding the percentage (or rather parts per million...) of RPN calculators within the total calculator "population". Theoretically, RPN calculators should be more valuable than non-RPN calculators by that factor, if value is based on rarity as with other collectibles. That would immediately place a six to seven figure price tag on any RPN calculator, no matter who the manufacturer is :-)

Regards, max

Re: HP vs. TI on eBay auctions

*Message #5 Posted by **Michael de Estrada** on 19 Apr 2010, 11:31 a.m.,*
in response to message #4 by Maximilian Hohmann

Statistical analysis is only useful if it places proper boundary conditions on the model. Regardless of rarity, if the population of buyers that are willing or able to spend 6 to 7 figures on a collectable item is zero, then that particular item can never attain that price. Rather, I see the RPN attribute as an added factor to the relative value of the calculator, rather than an absolute determinant. Also, I see the population of calculator collectors for whom the RPN attribute is important to be very small relative to the total population of collectors. Some, such as Joerg, may even see it as a negative.

Update. The auction is over and the National Semiconductor 4615 that was advertised as "RPN" sold for $86, whereas I paid only $13.45 for mine, which was not described as "RPN". However, I am not suggesting that it is the only reason for the differing prices, since other factors such as a worldwide .vs. domestic sale and the fact that this seller (datamath-computer-museum) gets tremendous exposure when compared to the typical calculator seller. Still, I do contend that there are sufficient data points for other similar sales to conclude that there is a positive correlation between RPN and desirability/price. The same, of course, can also be said for Hewlett-Packard .vs. all others, and a non-HP brand RPN will probably never achieve some of the prices paid for the rarer HPs. Still, some vintage HPs such as the HP-45 are pretty much common as dirt, and can easily be found in good condition for under $100. The APF Mark 55, BTW, went for $128.50.

Re: HP vs. TI on eBay auctions

*Message #6 Posted by **Joerg Woerner** on 20 Apr 2010, 8:44 p.m.,*
in response to message #5 by Michael de Estrada

Thanks for the kudos...

FYI: I have for sure a nice stat about my auctions. 62% (!) of my calculators sold this year outside of the US. These nine RPN auctions ended up in: Germany (4), Switzerland (1), France (1), Italy (1), Israel (1) and United States (1).

"Domestic only" would kill half of the bids immediately.

I moved in 2006 from Germany to the US and still remember how disappointing every single "domestic only" auction was.

Regards, Joerg

Re: HP vs. TI on eBay auctions

*Message #7 Posted by **Michael de Estrada** on 23 Apr 2010, 2:40 p.m.,*
in response to message #5 by Michael de Estrada

Not to beat a dead horse, but just another example of the "HP" and "RPN" value factor. Today I received a totally mint Novus Mathematician PR 4515 in the mail, including the soft case and charger, all for $26 plus $5 shipping priority mail. It works perfectly, and the internal NiCad batteries still hold a charge. Again, this was a worldwide TAS auction which made no mention of RPN in the heading, although it was mentioned in the listing. It got only a total of 67 visits, many of them mine, and none of the other bidders appear to be international (non-US). Anyway, I now have 10 National Semiconductor/Novus RPN calculators in my collection, all in good working order, and most of the non-HP RPN chipsets are now represented in my collection.

Walter,

I have one HP 38E left and just started to play around with it. A lovelly machine - I really like it. Feels much better than even the SR-51, one of my favorites.

Cheers, Joreg

Re: HP vs. TI on eBay auctions

*Message #20 Posted by **Keith Midson** on 19 Apr 2010, 11:23 a.m.,*
in response to message #1 by Joerg Woerner

Similar thing happened to me, but from the HP side ... a colleague donates a mint 1975 TI-SR-51-ii to me, knowing that I collect HP's. Not sure if this was a statement, or him not fully understanding what I collect!
It's complete in the box, looks kinda nice, works well, has those red LED's that I love on my HP's ... but Joerg tells me that it's worth only about US$30 or so! Much less than an 'equivalent' HP.
HP's just have no equal ;)
Cheers, Keith

Re: HP vs. TI on eBay auctions

*Message #21 Posted by **Michael Meyer** on 19 Apr 2010, 12:12 p.m.,*
in response to message #20 by Keith Midson

Keith, the problem I've had with this "hobby" is that I can only afford to collect a limited number of HP's, even with the many duplicates I have.

At least with other brands, I can see them, feel them, use them, appreciate their diversity, all for mostly the cost of postage. I've bought many calculators from 1 cent to 5 dollars. Not great if all you collect is HP's, but enjoyable for me to expand the collection to "calculators" in general.

I've bought some industry-specific calculators that I've found interesting: Horse racing calculator, paper industry calculator, time clock calculator, etc., all for just a few dollars.

Still, there's my HP's, then there's all the rest.... but at least I can get, "all the rest" for the cost of one or two HP's....

Re: HP vs. TI on eBay auctions

*Message #22 Posted by **megarat** on 19 Apr 2010, 3:18 p.m.,*
in response to message #20 by Keith Midson

A similar thing happened to me as well. A friend found a pristine (albeit with corroded battery terminals) TI-59 at a yard sale, complete with several software libraries, and gave it to me as a gift.

I just haven't had the enthusiasm to fix it up, and the prices for these things on eBay haven't helped any. It has been sitting forlornly in a bottom desk drawer since.

Re: HP vs. TI on eBay auctions

*Message #23 Posted by **Michael Meyer** on 19 Apr 2010, 6:53 p.m.,*
in response to message #22 by megarat

Well, now, it's time to get the enthusiasm to fix it up!! The 59 was an incredible machine, and though others had a lot of bad luck with the keyboards, my 59 lasted through most of my senior year in high school and all four years of college. It still works perfectly today... somehow the card reader didn't even go bad! It had an alphanumeric printer, making it my "computer" until the HP-71 came out. I re-wrote every computer assignment, every physics and statistics equation... well, most everything. It printed calendars, banners; did everything but play music. (My 71B does that.)

Most every one of them does need the card reader fixed, but it still can be powered up and experienced without a working card reader. Go experience!

I got one on eBay a few months ago (my first) for $9. It was ugly BUT after a good cleaning it looks unused. Inspired by your story, I was emboldened to try the card reader (it came with the diagnostics card) and it worked!

I also got a TI-58c for $2 at a local thrift store, with a leather pouch and in beautiful shape. I rebuilt battery packs for it and the TI-59 and they are both now among my favourite calculators.

in response to message #24 by Michael Plant

Nice. I can't imagine investing the "brain power" to really learn to use the machine again, with all the op codes and such, especially for me, having "returned" to RPN. But when I did "stray", it was only for the 59. So it will always hold a special place in my heart. The only times I came close to filling up the machine's memory was with programs heavy on alphanumerics, which took up a lot of steps. BTW, if you can pick up a PC-100A or C printer, they make the greatest noise when they print, and they print quite fast, considering...

Somewhere in the PPC Journal...Richard Nelson said...

*Message #1 Posted by **Gene Wright** on 17 Apr 2010, 2:48 p.m.*

Ok, this has been driving me batty (or battier if you like) for a while.

I remember changing the way I type based upon a statement that Richard Nelson made in the PPC Journal.

He said that you should learn to type only ONE space after a period at the end of a sentence for several reasons: saving space, better flow of the text across the page, better results from a typographical perspective, etc. He asked the obvious question: How can I unlearn the double-space after a period? His answer: practice!

My problem is I cannot find where he said this. Unfortunately, I cannot remember if it was an editorial, an "ed. note" in response to a user letter in the feedback area of the journal...I can't even remember what YEAR it was in.

So, is there anyone out there having a sleepless night who enjoys reading through their back issues of the beloved PPC Journal who can help me find this?

Richard himself does not remember it. :-)

Help!

Re: Somewhere in the PPC Journal...Richard Nelson said...

*Message #2 Posted by **Don Shepherd** on 17 Apr 2010, 4:31 p.m.,*
in response to message #1 by Gene Wright

Gene, this could start world war 3.

I learned

1. 2 spaces after a period at the end of a sentence
2. 2 spaces after a colon
3. 1 space after a comma
4. 1 space after a semi-colon

I think the forum software reduces two spaces to one so, regarding typing posts here, it's a moot point. But I always use punctuation based upon what I learned in high school.

Re: Somewhere in the PPC Journal...Richard Nelson said...

*Message #3 Posted by **Gene Wright** on 17 Apr 2010, 4:50 p.m.,*
in response to message #2 by Don Shepherd

Oh, I learned it that way as well. I **changed** how I typed after reading Richard's statements in the PPC Journal. It appears many places suggest a single space after a period, such as:

http://webword.com/reports/period.html

"The only reason that two spaces were used after a period during the 'typewriter' age was because original typewriters had monospaced fonts -- the extra space was needed for the eye to pick up on the beginning of a new sentence. That need is negated w/proportional space type, hence [it is] the typographic standard."

But, I'm not interested in debating the standard.

I just want to find where Richard said it! :-)

That need is negated w/proportional space type, hence [it is] the typographic standard."

I'll bite. I do not agree at all. The original monospaced typewriters made it *easier* to see the end of a sentence because the periods were so big. I sometimes have to re-read things now because they didn't make sense, and it turns out that I ran things together because the second space was missing. There were typewriters that did do proportional spacing long before we had computers-- they were just more expensive. My mom used one when she was a secretary in the early 1970's. A lower-case "i" took two units of space as I recall, whereas a capital "M" took five units. If you backspaced to type over something with the white-out tape, you had to know how many units to go back. Still, two spaces between sentences was correct. I think what has happened now is that we have people writing software who are too young to have taken the standard two years of typing in high school.

Another one I've been seeing recently is only half a blank line between paragraphs in block style, intead of a whole blank line. Someone probably thought that typewriters had to do either single or double spacing, which is not true. We could go one and a half, but it makes it confusing to look at, especially if one paragraph ends near the right margin. Use an entire blank line.

I will also put in a pitch for a comma before the "and" in a sequence. For example, "we went out to eat with the Smiths, Mark and Kathy" has a different meaning from "We went out to eat with the Smiths, Mark, and Kathy." The first one incorrectly implies that the Smiths' names are Mark and Kathy, whereas the second one says we went out with Bob and Ann Smith, and also with Mark and Kathy whose last names were different and they were engaged to be married. The lack of the comma changes the meaning and makes the statement incorrecct.

There also needs to be a second period after an abreviation at the end of a sentence, so you have one for the abreviation and one to end the sentence. A single period is extra bad if there's only one space after the sentence and the next sentence starts with an acronym or with a proper noun (like someone's name) which would be capitalized regardless and you lose the separation between sentences.

in response to message #4 by Garth Wilson

I agree with Don and Garth - two spaces after the period at the end of the sentence.

I also agree 100% with Garth on putting the comma before the "and" in a list of three or more names or items.

Re: Somewhere in the PPC Journal...Richard Nelson said...

*Message #6 Posted by **Thomas Okken** on 17 Apr 2010, 8:48 p.m.,*
in response to message #4 by Garth Wilson

Totally agreed about the comma before the "and" -- the comma indicates a pause that is, in fact, there when people say things like "one, two, and three" out loud.

But this two spaces after a period thing makes me feel like I just wandered into a typographic Twilight Zone. I have seen old college textbooks -- the kind that was written by a professor using a typewriter strictly for circulation within the school -- and some followed this two-spaces convention. I found it visually jarring and almost as annoying as people who insist on some non-standard spelling.

I can't find a single book that has more space between sentences than between words, and that includes books that were typeset before the digital age. Why would you want that extra space anyway? Between the extra space that's already caused by the period, and the emphasis from the following capital letter, sentence boundaries stand out just fine already. Well, except in Windows browsers where the standard font has a one-pixel period that is almost invisible on today's high-resolution laptop screens, but that's another matter...

Re: Somewhere in the PPC Journal...Richard Nelson said...

*Message #7 Posted by **Don Shepherd** on 17 Apr 2010, 9:38 p.m.,*
in response to message #6 by Thomas Okken

> Quote:
>
> I can't find a single book that has more space between sentences than between words, and that includes books that were typeset before the digital age.

That's because most books use flush left AND RIGHT margins, at least in my bookcase. And the typesetting software obviously tries to put an equal amount of white space between all sentence elements.

> Quote:
>
> Why would you want that extra space anyway?

I want that extra space so that I don't have to guess where the sentence (and thought) ends. A sentence is a thought, or statement, and we should have a little extra space between sentences for the same reason we should have a blank line between paragraphs. It makes the text more understandable and readable. I'd say that was the original reason for two spaces after a sentence; I doubt it had anything to do with typewriters.

> Quote:

> Between the extra space that's already caused by the period, and the emphasis from the following capital letter, sentence boundaries stand out just fine already.

I don't agree. And a period takes up very little space, almost inconsequential. Especially in an early HP-33s calculator! :)

Leave it to Gene to start world war 3. And, in the end, people who want one space will do it that way, same with people who want two spaces, and we'll all manage to get by.

Re: Somewhere in the PPC Journal...Richard Nelson said...

*Message #8 Posted by **Thomas Okken** on 17 Apr 2010, 10:51 p.m.,*
in response to message #7 by Don Shepherd

Meh, one vs. two spaces isn't enough to start World War III. Just a few border incidents at worst. Windows vs. Mac, RPN vs. AOS, vi vs. EMACS, universal health insurance vs. not, those have way more potential. :-)

Re: Somewhere in the PPC Journal...Richard Nelson said...

*Message #9 Posted by **Paul Dale** on 17 Apr 2010, 5:37 p.m.,*
in response to message #2 by Don Shepherd

It possibly isn't so much the forum software at HTML which reduces multiple whitespace characters into a single space.

- Pauli

Re: Somewhere in the PPC Journal...Richard Nelson said...

*Message #10 Posted by **Thomas Okken** on 17 Apr 2010, 9:28 p.m.,*
in response to message #9 by Paul Dale

That is correct; the forum does actually preserve whitespace, but web browsers treat all runs of whitespace as equivalent to a single space; this behavior is actually required by the HTML specification.

```
If you really must use double spaces, your only option is to use
the [pre] and [/pre] tags, but that has the drawback of not allowing
the browser to flow the text so as to fill the available width.
Also, it's ugly. :-)
```

Since there is no way to search through the issues on the CD, it would only be a manual process. However, it still might be quicker than physically thumbing through the paper issues...

Jake

Yes, I have now gone through the PDF set for the years Richard was editor TWICE.

I was hoping either someone might remember (ha) or someone might go through a year looking for such a thing. You know, another set of eyes. :-)

Re: Somewhere in the PPC Journal...Richard Nelson said...

*Message #16 Posted by **Katie Wasserman** on 21 Apr 2010, 9:23 p.m.,*
in response to message #15 by Gene Wright

Gene,

If you have some OCR software (Adobe Acrobat works well) you can take the PDF's, OCR them and then do a search on the revised document. I've been OCRing many of the manuals on my website and I know that Dave did this for the many of the manuals on the latest HP Museum DVD.

Emu71 updated for the PIL-Box

*Message #1 Posted by **J-F Garnier** on 17 Apr 2010, 5:05 a.m.*

Hi, an update of my Emu71 emulator with support of the PIL-Box is now available on my site .

It was already possible to exchange program and data between Emu71 and a HP-71B by using the ILPer software and this is still the recommended method, but now Emu71 is also able to directly drive external HP-IL devices such as a HP3468 multimeter or a HP9114 drive.

J-F

Re: Emu71 updated for the PIL-Box

*Message #2 Posted by **ZOleg** on 18 Apr 2010, 7:52 p.m.,*
in response to message #1 by J-F Garnier

Thanks for new version!

Re: Emu71 updated for the PIL-Box

*Message #3 Posted by **Mike (Stgt)** on 19 Apr 2010, 4:03 a.m.,*
in response to message #1 by J-F Garnier

Merci beaucoup!

Mais... is it possible to link now your emu41 and emu71 to a "virtual" HP-IL? Or is it only possible using your PIL-Box? Which _is_ a must-have anyway I was told this WE.

Ciao.....Mike

Re: Emu71 updated for the PIL-Box

*Message #4 Posted by **Egan Ford** on 19 Apr 2010, 1:19 p.m.,*
in response to message #1 by J-F Garnier

Thanks!

Comments/question:

1. No problem working with OS/X, DOSBox, PILBox, 9114B. I just backed up my memory to physical disk.
2. 9600 BPS. Slow. But it works.
3. Does this indicate that there is no longer a commercial EMU71?

Thanks again for all your hard work.

Re: Emu71 updated for the PIL-Box

*Message #5 Posted by **J-F Garnier** on 19 Apr 2010, 2:56 p.m.,*
in response to message #4 by Egan Ford

Indeed there is no more a registered version. A side effect of providing PIL-Box support is that the ISA board is also supported in the free version.

To Mike: data can be easily be shared between Emu41 and Emu71 by using the same hdrive1 file, for instance.

J-F

Dumb question #1

*Message #6 Posted by **Gene Wright** on 19 Apr 2010, 3:46 p.m.,*
in response to message #5 by J-F Garnier

Ok, downloaded and launched the emu71.

Get messages that the rom files that I put in the .ini file are not found as it starts up.

The rom images are in the same folder as the emu71 file that I am running in a command prompt window in XP.

The emu71.ini file contains:

```
; emu71.ini        Emu71 initialisation file
;
[MODULES]
; 10 softwired modules max., plus 1 hardwired module
; main RAM in port 0 only
; port(1-5) type(ROM,RAM,HRD) size(Ko) file
0 RAM 32 ram00.bin
1 ROM 16 hpilrom.bin
2 ROM 32 JPCF.BIN
3 ROM 32 symb.bin
4 ROM 32 math.bin
5 RAM 32 iram50.bin
;
[DEVICES]
DISPLAY
HDRIVE1
HDRIVE2
DOSLINK
LPRTER1
```

So...dumb question...what mistake have I made? I renamed the ROMs to the shorter names and even tried caps vs. no caps.

Re: Dumb question #1

*Message #7 Posted by **Etienne Victoria** on 19 Apr 2010, 4:12 p.m.,*
in response to message #6 by Gene Wright

Gene,

IIRC, the math Rom is MATHROM.BIN and not math.bin.

Did you rename it "math.bin" on purpose ?

And in your config, depending on your JPC Rom version, you may want to check the filename too: for example JPCROMF.BIN for the F revision.

Best

Etienne

Edited: 19 Apr 2010, 4:14 p.m.

Re: Dumb question #1

*Message #8 Posted by **Etienne Victoria** on 19 Apr 2010, 4:21 p.m.,*
in response to message #6 by Gene Wright

Gene,

Sorry for not reading your post thoroughly enough.

You state quite clearly that you did rename your Rom filenames.

So I cannot help further.

The only thing I can say:

This new version works for me with the original filenames as found on the Roms repository hosted by Jean-François.

Hope you can fix your issue.

Etienne

Re: Dumb question #1

*Message #9 Posted by **J-F Garnier** on 19 Apr 2010, 4:21 p.m.,*
in response to message #6 by Gene Wright

Did you have the problem with the default ini file and ROM names?

Can you check that the "8.3" filenames are correct with a DIR /X at the command prompt?

I think someone already reported this, it was caused by a particular un-zip utility. Can you try to unzip with an other tool?

J-F

Re: Dumb question #1

*Message #10 Posted by **Gene Wright** on 19 Apr 2010, 4:31 p.m.,*
in response to message #9 by J-F Garnier

Aha. The DIR /X suggestion pointed out the problem. Been a long time for me away from DOS.

Issue was that in windows the file extension was not showing...so stupid OSX Mac guy that I was... I added .bin to the filename. So, the filename to DOS was Math.bin.bin.

Ha.

Loaded now. Thank you.

Re: Emu71 updated for the PIL-Box

*Message #11 Posted by **Mike (Stgt)** on 20 Apr 2010, 7:44 a.m.,*
in response to message #5 by J-F Garnier

Dacord, I did read your description. But I wanted to go a step further, for example put your emu41 with the 'Devil-ROM' in a IL to monitor the IL-commands. BTW, this is the only condition when the HP-41 is not the controler of the IL.

To be more precise: may I use the ILPer without PIBox (which I do not have yet), together with emu41 *and* one or more emu71? Or without emu41 and just one (or more) instances of emu71?

Ciao.....Mike

Re: Emu71 updated for the PIL-Box

*Message #12 Posted by **J-F Garnier** on 20 Apr 2010, 4:51 p.m.,*
in response to message #11 by Mike (Stgt)

ILPer is to be used only with the PIL-Box. An external HP-IL controller (41, 71, 75) can communicate with several instances of Emu41 and Emu71 by using a commun disc image file but no way to build a virtual HP-IL connection between Emu41 and Emu71.

J-F

Re: Emu71 updated for the PIL-Box

*Message #13 Posted by **Mike (Stgt)** on 21 Apr 2010, 5:43 a.m.,*
in response to message #12 by J-F Garnier

Merci!

My idea just was to have everything virtual.

Re: Emu71 updated for the PIL-Box

*Message #14 Posted by **Marcus von Cube, Germany** on 26 Apr 2010, 6:54 a.m.,*
in response to message #13 by Mike (Stgt)

There might be a way with software like com0com which provides virtual com ports that are linked together. If they are seen by Emu71 and/or Emu41 and can be used as a PILbox substitute, it might work.

Re: Emu71 updated for the PIL-Box

*Message #15 Posted by **Egan Ford** on 26 Apr 2010, 1:00 p.m.,*
in response to message #14 by Marcus von Cube, Germany

That may actually work. Unless, EMU41/EMU71 for the PIL-Box sends something to the PIL-Box that is unique to the PIL-Box (e.g. some type of reset) that must be acknowledged. I've use com0com to have different EMU48 sessions communicate. I also used it for this project: http://sense.net/~egan/virtual82240b/. Good stuff.

Re: Emu71 updated for the PIL-Box

*Message #16 Posted by **Mike (Stgt)** on 27 Apr 2010, 5:57 a.m.,*
in response to message #14 by Marcus von Cube, Germany

I thoght about this too but did not test it yet. IIRC Christoph Giesselink once mentioned it to link an emulated calculator running under Emu48 to the host. That I tried and failed as 'my' WinXP did not like com0com too much it seemed to me. I will give it an other try on Win7 Starter ...fun ...joke ...

Ciao.....Mike

15C Spotted on National Geographic Program

*Message #1 Posted by **Jeff O.** on 16 Apr 2010, 1:27 p.m.*

I'm surprised no one else has mentioned this yet, but since they haven't, I will.

On the National Geographic Channel program called "Known Universe" shown on April 15, they were explaining how the Kepler mission will allow the number of earth-sized plants in the Milky Way Galaxy to be determined. An amiable astronomer or other type of scientist (whose name I did not note) explained that the total number of such planets in the galaxy will be determined by considering the Kepler results to be a sample of the entire galaxy. He then compared this process to figuring out the number of blades of grass on the soccer field on which he was standing by counting the blades in a small square. He laid on the ground and counted the blades in a 2" x 2" square, then proceeded to use an HP-15C to calculate the total number on the field based on his sample area count. The calculator was shown only fleetingly for two short intervals, the badge was missing, and his hand blocked much of the keyboard, but I am pretty sure that that I saw "RESULT" above the EEX key.

I hope this scientist does not lose his 15C, or we might never know how many other earths are out there. Unless HP did something "out of this world" (get it?!) like re-release the 15C!

...

challenge

*Message #1 Posted by **Don Shepherd** on 15 Apr 2010, 7:05 p.m.*

OK, here is the challenge. 1741^9 is equal to the sum of 9 consecutive prime numbers. What are they?

Without using a computer or CAS calculator, please.

Re: challenge

*Message #2 Posted by **Paul Dale** on 15 Apr 2010, 7:18 p.m.,*
in response to message #1 by Don Shepherd

Youch they are big.

```
1741^9 = 146,956,547,386,947,872,723,891,185,261
```

So the numbers will be around:

```
16,328,505,265,216,430,302,654,576,140
```

There must be a short cut...

- Pauli

Re: challenge

*Message #7 Posted by **Egan Ford** on 15 Apr 2010, 11:58 p.m.,*
in response to message #6 by Paul Dale

Not to give too much away. But 5 are below and 4 above.

Re: challenge

*Message #8 Posted by **hugh steers** on 16 Apr 2010, 9:23 a.m.,*
in response to message #7 by Egan Ford

ok, let N = 1741^9. mod(N, 9) = 1, so write N = 9k + 1 with k = floor(N/9). and k is paul's number earlier. k is not prime.

now make a table P-k, where P prime greater than k and smaller than k, say 7 each way. i get:

```
P-k, P > k
151, 191, 193, 229, 343, 349, 391
P-k, P < k
-17, -49, -131, -253, -313
```

need to find a combination of the above that sum to 1, so that sum (P-k_i) = 9k + 1.

a quick scan shows first 4 of from the first list and first 5 of the second list do this. ie 151+191+193+229-17-49-131-313-253 = 1

so the desired numbers are k with each of these added.

163285052652164303026545762 91 163285052652164303026545763 31

163285052652164303026545763331632850526521643030265457636916328505265216430302654576123 163285052652164303026545760911632850526521643030265457600916328505265216430302654575887 163285052652164303026545758271

it was a bit lucky that the ones immediately up and down were the answers.

Now that the answer is exposed here is my WolframAlpha input:

```
Sum[NextPrime[1741^9/9,i],{i,1,4}]+Sum[NextPrime[1741^9/9,i],{i,-5,-1}]
```

Re: challenge

*Message #10 Posted by **hugh steers** on 16 Apr 2010, 12:51 p.m.,*
in response to message #9 by Egan Ford

presumably, there's no way to perform the search for the actual values in the summation. if they weren't so lucky to be centred around the mean, it would have been much harder to find them.

Although i used my calculator to perform the prime tests, i wonder if there's a short cut. for example, we have to find primes (1741^9)/9 + a, for relatively small `a'. it seems that all composite such numbers for small a have small divisors (note 1741 is prime). is this significant?

> Although i used my calculator to perform the prime tests

Which one, a 50g?

Don stated the challenge so as to not use a CAS calculator. This would require writing some 30-digit math routines and programing a probabilistic primality test routine using them. That is, unless there's some really clever short cut.

Re: challenge

*Message #12 Posted by **Bart (UK)** on 16 Apr 2010, 6:21 p.m.,*
in response to message #11 by Katie Wasserman

Displaying long numbers is one of Hugh's specialities. He has several bits of

software that do that, e.g. Scicalc, Exact and Reckon. Reckon on the fx-9860G/Gii (listed as non-CAS) displays the full 30 digits (Reckon on my 9860GII was the first thing I reached for when I read the challenge). It also has a factoring function and a prime number checking function, that can take these many digit numbers as arguments.

Re: challenge

*Message #13 Posted by **hugh steers** on 16 Apr 2010, 10:01 p.m.,*
in response to message #12 by Bart (UK)

I used my own of course :-)

I'm using Reckon on the 9860g. I haven't developed a CAS for it yet (although i do have some work in this direction). However, it does support big ints and has some factoring code.

you are correct, that the "prime" test method uses a probabilistic algorithm. to reject composites i use a strong pseudoprime test up to the Riemann limit = min(floor(2ln(n)^2), n-1) or 50 trials whichever is the smallest. 50 is an arbitrary number for confidence. hand waving theory says this gets 2^-50:1 of being wrong. i'd like to do more trials, but calculators are slow.

however, you can just punt the number to the "fac" method, which attempts factorisation (it's also short to type than "prime"). the fac method uses a series of approaches including prime testing. firstly, "fac" attempts trial division. for this i use my "division without division" method to find any factors up to 2^20. here's an article on this method i wrote a while back

http://www.voidware.com/hpcc/smallfactor.pdf. Actually this approach is suitable for factoring any number up to 12 digits in length in under 10 seconds, but not for larger numbers.

if the above fails to find a factor, the strong pseudo prime test is applied, either up to the Riemann limit or 50. if it thinks the number is prime, then the process stops. most often the method finds a "witness" for a composite, in which case prime testing quits and we move on.

if we get past the trial division and prime test, then we have a composite with a factor > 2^20. now we're in trouble! my old code used to use a bunch of methods including pollard rho, Fermat and shanks' square free method. since then ive implemented Lenstra's elliptic curve method (ECM) and, without a doubt, this method dominates all others. the other attempts are no longer attempted and "fac" moves right away to the ECM.

the ECM is the third best known factoring method. unfortunately the other two, the quadratic sieve, and (general) number field sieve cannot be implemented on calculators because they require a large amount of memory. the ECM requires hardly any and is a very beautiful method which has running time proportional to the smallest factor - a highly desirable property!

the theory and efficient implementation are covered in Crandall & Pomerance, "prime numbers", chapter 7, 2nd edition. the authors develop a number of important optimisations to the method. i have followed these in my implementation but i have not gone as far as the Montgomery arithmetic

(it's totally weird!)

if you want to try this out,

checkout http://www.voidware.com/reckon/ for the casio

or for the PC exe get, http://www.voidware.com/reckon/reckon.exe

try these

```
a=1741^9-1
a=a/9+151
prime(a)
or fac(a)

also try,
a=2^73-1
a=a/439
fac(a)

or even
fac(2^103-1)
```

Bart, thanks for the comments. FTI, i just uploaded a new reckon casio binary 1.15 no actual change except that i just noticed it was suddently taking a _lot_ longer to factor numbers. turned out it was the escape key test i put in recently (you can press "EXIT" whilst factoring to abort). this _really_ slowed it down, so i moved this test out of an inner loop and its fine now.

Re: challenge

*Message #14 Posted by **Katie Wasserman** on 17 Apr 2010, 1:22 a.m.,*
in response to message #13 by hugh steers

Hugh,

I just downloaded your new code, very nice and fast!

But I tired:

```
x=9999999967^2
fac(x)
```

and while prime(x) returned 0, fac(x) returned 99999999340000001089. I was expecting 9999999967. Is that wrong?

-Katie

Re: challenge

*Message #15 Posted by **hugh steers** on 17 Apr 2010, 8:44 a.m.,*
in response to message #14 by Katie Wasserman

Hi Katie,

You're not wrong. looks like it failed to factor this one. the number returned was the original number. However, i wondered why it failed on this, because this value is within its range. turns out that Lenstra's ECM doesnt work for exact powers! That will teach me to read the

small print :-)

so, i've added an extra test for the number being p^n. For example i tried x=1048583^3. This didn't factor before either (v1.15), but now it does.

I've uploaded v1.16 with these fixes both for the casio and reckon.exe (same links as before).

thanks - another bug squashed!

Re: challenge -- 50g bug (?)

*Message #16 Posted by **Katie Wasserman** on 17 Apr 2010, 12:22 p.m.,*
in response to message #15 by hugh steers

What a speedy bug fix!

Funny thing is, the 50G (ver 2.09) has a similar bug, I think. The 'factors' function thinks 9999999967^2 is prime and it takes its time to reach this conclusion.

I found a CAS for the ipod touch that's got most of the functionality of the CAS in the 50G and is really fast, PocketCAS pro ($5), it gets this problem right! Wolfram Alpha is now cheap, but you need to have wifi access for that.

-Katie

Re: challenge -- 50g bug (?)

*Message #17 Posted by **Glenn Shields** on 19 Apr 2010, 9:40 p.m.,*
in response to message #16 by Katie Wasserman

Thanks for that bug, it's interesting that ISITPRIME says 0. and PREVPRIME and NEXTPRIME give numbers 2 below and 24 above the number in question. After the 35s bug exposition and continued finding of new bugs, it's fun to poke at the "revered" 50g. :-)

in response to message #13 by hugh steers

Hugh, I just downloaded your latest Reckon to my slim. Great product! How did you find the primes > 1741^9/9? When I do this I get this:

```
x=1741^9/9
  1632.....140+1/9 response
np(x)
  1632.....140+1/9  same response??
I expected 1632....576291
```

Re: challenge

*Message #20 Posted by **hugh steers** on 17 Apr 2010, 11:41 a.m.,*
in response to message #19 by Don Shepherd

it wont touch the number if its not an integer.

try,

```
1741^9-1
ans/9
```

then

```
np(ans)
```

keep doing this for a list of the primes, then repeat with pp(n) for the previous primes.

Re: challenge

*Message #21 Posted by **Don Shepherd** on 17 Apr 2010, 4:33 p.m.,*
in response to message #20 by hugh steers

Thanks, Hugh, I'll try that.

They **must** lie around 1741^9/9. Nine numbers less than 1741^9/9 cannot sum to 1741^9. Likewise for over.

This leaves the either possibilities of 8 below & 1 over through to 1 below and 8 over. I.e. 16 primes in total. Moreover, the search can be trimmed once you start finding primes and discover they are near to 1741^9/9 both above and below.

Re: challenge

*Message #23 Posted by **C.Ret** on 16 Apr 2010, 4:28 p.m.,*
in response to message #1 by Don Shepherd

> Quote:
>
> Without using a computer or CAS calculator, please.

OK.

1741^9 is about 1.4696E29 on my HP28S. The nine consecutive primes numbers are around 1.6329E28.

I win the cahllenge ?

That's all the 12 digits precision of my advance scientifc calculator (not a CAS computer !) can tell to me.

OK. No I am not the winner !

Knowing that my HP28S needs nearly 21 min to test primality of 9999999967, I expected about 7 days to test a prim number around 1.6329E28. So seeking for these nine consecutive prim numbers will be about 3 months !

OK.

What's the trick to solve this challenge on any classic HP in a week-end ?

Re: challenge

> Quote:
>
> What's the trick to solve this challenge on any classic HP in a week-end ?

I don't know if it actually can be solved on a non-CAS calculator, but I know there is a lot of brain power among people who participate in this forum, so I'm hoping some genius among us will hit upon a way of approaching this particular problem that nobody has thought of before. Hey, if the NSpire CAS or the 50g can test primality for a big number in a few seconds then, theoretically, why can't the 30b? Maybe (probably) it will take re-purposing it, or the 12c for that matter. But can it be done? If it can, and somebody figures out how to do it, I think that will be noteworthy.

Hugh, didn't you repurpose the Casio 9860 to do some factoring with large integers? Can it do this problem?

As they said in "A Beautiful Mind," who among you will be the next Einstein?

Re: challenge

*Message #25 Posted by **hugh steers** on 17 Apr 2010, 8:57 a.m.,*
in response to message #24 by Don Shepherd

Hi Don,

yes, i did repurpose the casio and that's the machine i used to help me solve this problem. actually i had to manually search the neighbourhood for primes using the prime test.

Absolutely, the 30b could solve this problem with some repurposing. it's actually faster than the casio. a while back i tried to implement a couple of factoring programs on the hp30b in the user mode programming language. however, the problem is that, working with 12 digits you can only perform arithmetic on a 6 figure integer before it overflows the mantissa and you get the wrong answer. this is fine for trial division because you know there's a factor in 6 figures or it must be prime. However, i tried getting pollard rho working, but this requires arithmetic mod N and then you get overflow.

in the end i did write a home-brew multiprecison workaround, but it wasn't really going to solve the show. we just have to persuade HP to put some factoring code in the roms :-)

or implement our own (scientific) calculator on the hp30b - which im thinking of doing for fun :-)

Re: challenge

*Message #26 Posted by **Thomas Klemm** on 16 Apr 2010, 6:57 p.m.,*
in response to message #23 by C.Ret

The ALG48.LIB is about 50K. I'm afraid it won't fit into your HP-28s. However you need only a small set of functions out of it. So it might be possible to make them fit.

I doubt that a probabilistic primality test (e.g. Miller-Rabin) will take 21 minutes for 9999999967 even on a 28s.

Cheers
Thomas

Re: challenge

*Message #27 Posted by **Thomas Klemm** on 16 Apr 2010, 6:30 p.m.,*
in response to message #1 by Don Shepherd

Here's a program for an HP-48gx with the ALG-library installed:

```
\<< \-> n
  \<< n 9 ADIV @ a good starting point
    { }
    1 9
    START @ build a list of nine consecutive primes
      SWAP PRIM+
      DUP ROT
      +
    NEXT
    SWAP DROP
    DO @ try previous prime
      DUP TAIL
      SWAP DUP
      SIZE GET PRIM-
      + DUP
      \<< AADD \>> STREAM
    UNTIL
      n SWAP / B\->R
    END
    REVLIST
    1 \<< Z<->S \>>
    DOLIST
  \>>
\>>
```

Enter #1741d 9 APOW and run the program.

It takes some time (4'52") so you might want to test it with a smaller example 81^9 where a solution exists as well.

Is the HP-48gx considered a CAS calculator? However I'm just using some functions from a library. Would it be fun to write these for an HP-35s? I guess it would be rather slow.

Thanks for posting the challenge.

Best regards
Thomas

Thomas, thanks for the post.

> Quote:
>
> Is the HP-48gx considered a CAS calculator?

I don't know, I'm not familiar with the 48gx's capabilities. Was it advertised as CAS? Did the term "CAS" even exist back in those days? I don't know. I think that the 50g is considered CAS, and isn't it a successor to the 48 series?

Nevertheless, please show the outputs of your program to identify the 9 prime numbers that sum to 1741^9. I think we all will be interested.

"16328505265216430302654576331"
"16328505265216430302654576333"
"16328505265216430302654576369"
}
```

Re: challenge

*Message #30 Posted by **Csaba Tizedes (Hungary)** on 16 Apr 2010, 6:49 p.m.,*
in response to message #1 by Don Shepherd

Google said the sum of first n prime is approx: s(n)~=1/2*n^2*ln(n)

We need the n from this equation: s(n+9)-s(n)=1741^9

It seems to me like an approximation of derivative of s(n):

ds/dn = (s(n+9)-s(n))/9 == 1741^9/9, so let's make derivative of s: ds/dn = n*ln(n)+n/2 == 1741^9/9, this is equal: (2*ln(n)+1)*n = 2*1741^9/9, solve this equation we get the n~=2.662E27

I have no idea about the number of known primes today, but I think this n is too large to determine the exact n for summing that nine primes...

(SRY 4 MY BAD ENGLISH)

Re: challenge

*Message #31 Posted by **David Hayden** on 16 Apr 2010, 9:11 p.m.,*
in response to message #1 by Don Shepherd

Here's a generalized solution for the 50g. It uses integer arithmetic and NEXTPRIME/PREVPRIME, so I'm cheating as far as the original challenge is concerned. Finds K consecutive primes that sum to N. No error checking on N and K.

On my 50g this found the answer in 6 minutes 53 seconds.

```
@ Program to figure if a given integer N is
@ the sum of K consecutive primes
@ Input:
@ Level 2: N
@ Level 1: K

@ Output:
@ Level 1: { list of primes }  OR "NO ANSWER"

@ This works efficiently by realizing that the
@ K primes can't all be less than N/K, nor can
@ they all be greater.

« DUP2 IQUOT  N K pivot «
  @ Get K primes that are less than pivot
  {} pivot
  1 K START
    PREVPRIME
    DUP ROT + SWAP
  NEXT
  DROP

  @ You have a list of K primes on at level 1 now
  @ add them up and while the sum is less than N,
  @ remove the head (smallest) and add the next prime.
  WHILE
    DUP …LIST N <
  REPEAT
    DUP K GET @ Get last element
    NEXTPRIME
    SWAP TAIL SWAP +
  END

  @ Level 1 is now the answer or a list that's too large.
  IF DUP …LIST N ‹ THEN
    DROP "NO ANSWER"
  END
  »
»
```

Re: challenge

*Message #32 Posted by **Don Shepherd** on 17 Apr 2010, 2:01 a.m.,*

in response to message #31 by David Hayden

Thanks David.

I was going to ask Thomas Klemm if the 50g included the ALG library from the 48, but then your code shows that it is not necessary, I'm supposing here.

I appreciate this solution, and Thomas', for showing how this problem can be implemented using a very few lines of code. I've always appreciated that about RPL, but I've never actually taken the time to learn it myself. I love the simplicity of RPN, and the speed of RPN on the 30b.

I had hoped (and still hope, really) that the 30b and RPN might be able to solve this problem, but I imagine it will take repurposing, as Hugh has done with the Casio.

But maybe someone will surprize me!

Wacom makes such a device (http://www.wacom.com/cintiq/cintiq-21ux.php). However it is only for drawing.

I wish the iPad had a stylus in addition to touch. A stylus would allow for content creation. The best iPad art software still takes a professional 2x longer than pen and paper.

I carry a Moleskin notebook in my bag for taking notes. Nothing bests a pen for quick notes, drawings, etc...

I'll be looking at other tablets. Since my original need was content consumption the iPad fit perfectly. But now I want more. I want to create in a natural way. I think I'll have to wait less than 12 months for someone to create the perfect tablet.

OT: iPad (Was: Best HP-15C emulator for the iPod/iPad)

*Message #9 Posted by **Egan Ford** on 15 Apr 2010, 12:33 p.m.,*
in response to message #6 by PeterP

> Quote:

> iPad. Now - how is it?

It's a big iPod touch primarily suited for the consumption of visual media as apposed to audio media.

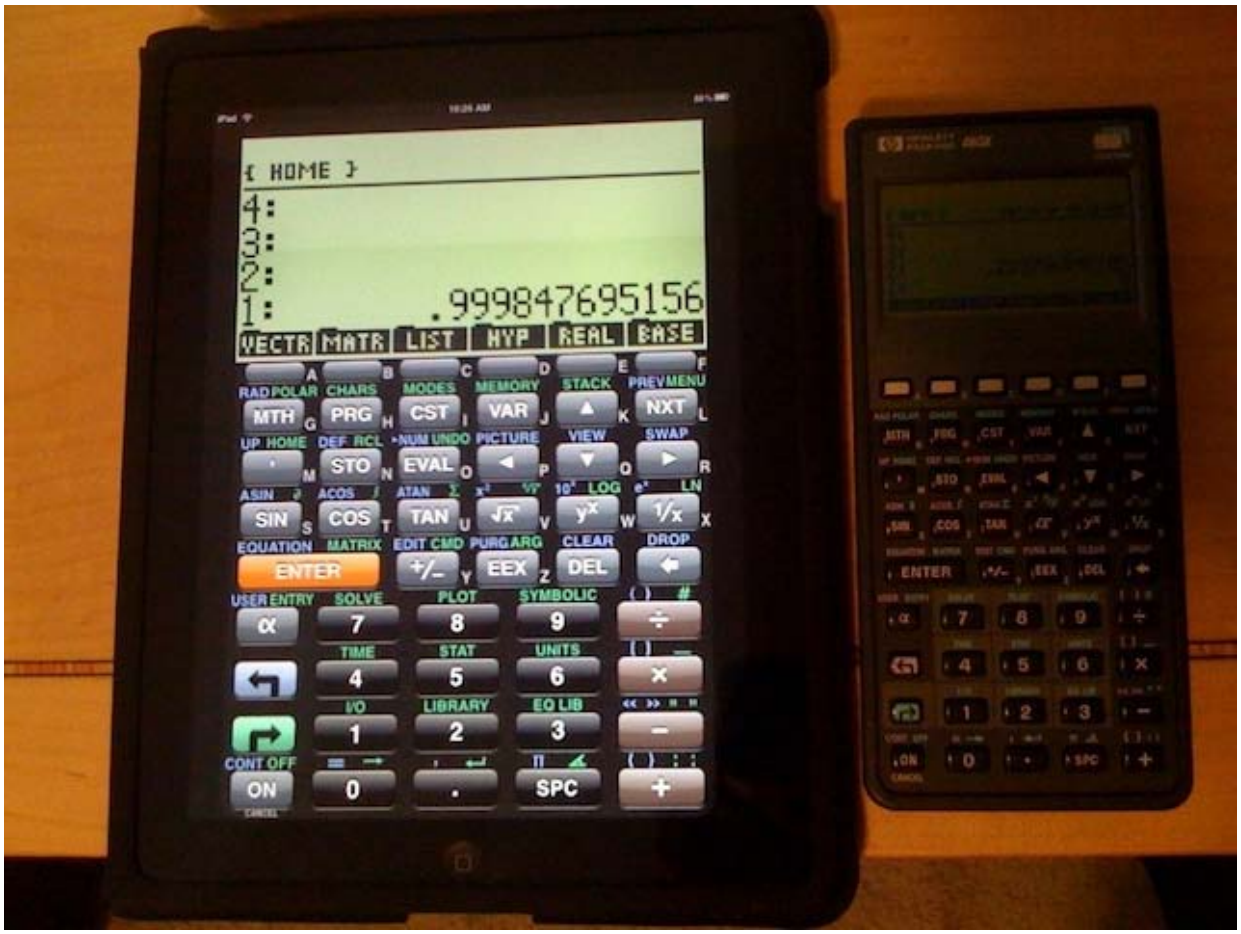
I spend about 80 hours a month in public transportation (mostly planes followed by taxis, trains, subways, and buses). Hauling around a lot of paper to read was getting me down. Last November I actually read a book on my iPhone mostly on NY subways and taxis. So, I proved to myself that I should probably invest in an eReader. Fortunately, the B&N Nook was late or hard to get, then Apple announced, and I waited, and I am very glad I did.

The battery life is incredible, the form-factor is great, the WiFi sucks (SW fix being worked on), the screen is beautiful. Touch typing is actually doable.

All of my publications except two are available in PDF, so I switched over MAA, ACM, and SciAM. Wired will be digital soon leaving only one journal that is paper. But its small and only quarterly.

I no longer use my iPhone for portable video. It was always too small and a drain on the battery.

As for calculator emulators. All the iPhone emulators work, but blown up. Its actually easier to just keep using the iPhone as my calculator. The only emulator I think that will make the most sense would be a 71B. I have the iPad beta of m48+. I need to create an iPad skin for it (no time). Tying up the entire screen just for a calculator seems a bit ridiculous. Hopefully in the future the iPhone OS will have some type of widget support--mini apps that run on top of other apps, but I doubt it.



So far I am happy with it and very happy to dump paper newpapers, magazines, and books.

sorry to hog this for one more iPad related question:

I do a lot of searching for academic papers and reading them or least skimming. However if it is

interesting I would want to save it. Is that possible? All the info I found so far online would indicate no.

Also, it would be awesome to be able to email or otherwise get to the iPad papers I have. Say I found a couple of interesting papers at work, email/copy/whatever to the iPad, leave the office and read on the road. How easily is that done? From info online it would appear to be possible but it is not clear to me, how easy this would be.

I think what will be the killer thing for the iPad (or any such device) to have text-books on it, especially science text books. Imagine that you could have your physics text-books on the iPad - instead of describing a pendulum, you can show a video etc. You could include multiple choice tests right into the text book etc. That would be cool!

Cheers

Peter

How do you read the papers? E.g. JSTOR will allow you to download any paper as PDF. There are multiple PDF readers for the iPad. I use Goodreader ($0.99US). I just drop all the PDFs I need into Dropbox.com, then Goodreader can pull from that.

If its Web based, then get iSaveWeb. I use that to get Web pages for reading offline. Its also an iPad app.

Easy. However, if you email them to yourself you must get your email while you still have WiFi. Unless you get the 3G + WiFi model (to be released).

Goodreader can read a lot of formats and has a built-in web server, you can always upload your stuff to yourself, or use dropbox like I do.

Some schools are considering the iPad for textbooks.

Quote:

.. I actually read a book on my iPhone mostly on NY subways and taxis ..

A couple of years ago I read all the original James Bond books written by Flemming on my Palm TX. After the initial "getting used to" I was reading every chance I got during the day.. especially during travel, as you've described.

Interestingly, I do not read for long periods of time on my laptop. Never have. Is the iPad somehow different? I do not believe many people read novels on laptops or LCD monitors. Perhaps it's the ergonomics or form factor that is important, not the display itself.

I think its more form-factor than screen. Most people I know sit in front of an LCD all day without complaint. And when they go home they sit in front of another LCD. :-)

I am not entirely sure what the difference is between emitted (LCD) and reflected (paper) light. IMHO, real books are still more pleasurable to look at than eBooks. Perhaps its the randomness of the reflected light, the texture of the paper, the crispness of the fonts.

As a frequent traveler it comes down to weight/benefit.

in response to message #15 by Egan Ford

If I may offer another random data point: I don't use e-readers and don't own an iPad, but the other day I started reading the Unix Haters Handbook, which I downloaded from somewhere in PDF format.

This is a 360-page book. I read the first 240 pages on my laptop, and the next day I read the rest on my iPod touch. I found the experience pretty decent on both machines, the main irritation being that you can't jump to a specific page on the iPod, and having to scroll all that way manually was annoying and took forever. There may be third-party PDF readers with a better user interface, but I haven't looked.

I can't see myself reading novels this way, though.

in response to message #19 by Namir

I just tested SCI-15C and RPN-15C on my iPad. On the iPhone 3G RPN-15C is a bit sluggish and not as snappy as SCI-15C with the keystroke processing. I suspect that RPN-15C was tested on the iPhone 3GS or other faster iPods. On the iPad they perform the same.

Calculator like HP10BII but scientific and RPN

*Message #1 Posted by **Gerardo Rincon** on 14 Apr 2010, 6:23 p.m.*

I really like the simplicity of the HP 10BII - it is great for work. I wish there was the option to use it in RPN mode (it already has an Input Key that maybe could have worked as an Enter Key as well). The keyboard feel of the 10BII is very nice as well.

It would also be great if there was a Scientific Calculator simple like the 10BII with some stats and RPN.

Re: Calculator like HP10BII but scientific and RPN

*Message #2 Posted by **Dave Johnson** on 14 Apr 2010, 6:59 p.m.,*
in response to message #1 by Gerardo Rincon

Hey..Please don't give HP ideas like this.....The HP10BII will not function for more than a few months (display stops functioning, keys get mushy and not responsive) I have experienced this with several... Try to 35S....

*Message #3 Posted by **Gene Wright** on 14 Apr 2010, 10:48 p.m.,*
in response to message #2 by Dave Johnson

Hey Dave.

Which version of the 10b2 are you referring to? The one done out of Australia or the new industrial design launched about a year and a half ago?

The earlier one really is / was a mess. The new industrial design has been rock solid for me. I've banged on it over and over again and never had any problems at all.

By contrast, the ACO version of the 10b2 was junk a week after I got one.

So... which have you had a problem with? If the new ID, then that's news to me! :-)

in response to message #4 by DaveJ

HP's calculator group was based in Melbourne for a few years. They closed down about 8 years ago from memory.

I was contracted to do a network bootloader for them for a never realised device running uClinux. I think I've still got the box of prototypes and development boards something.

Yes, I know that much, I actually applied for an advertised calculator design job there at one stage! They closed shop about 6 months later IIRC.

The 10BII is that old? (I'm not into financial calcs so haven't a clue)

Dave.

in response to message #3 by Gene Wright

The 10BII I had issues with was a few years ago and not the most recent one so I hope they have improved it but once I've been burned I don't recommend items!

Re: Calculator like HP10BII but scientific and RPN

*Message #9 Posted by **Gene Wright** on 15 Apr 2010, 7:47 a.m.,*
in response to message #8 by Dave Johnson

Ah, then you should try again.

The ACO version of the HP 10BII was a truly awful design. Think 49g with its rubber keys vs. what the 50g is today.... the 50g is MUCH much better and nothing like the rubber key monster.

You can find a current industrial design HP 10BII on ebay for $15 or less.

*Message #11 Posted by **Katie Wasserman** on 14 Apr 2010, 7:22 p.m.,*
in response to message #1 by Gerardo Rincon

The new 30b has nice "clicky" keys, great stats and RPN (and programmablility and trig functions). You can customize the keyboard to a limited extent and it's just slightly larger than the 10bii.

Most of the functions that you don't want are hidden in menus so if you ignore them you'll have a simple calculator.

in response to message #11 by Katie Wasserman

On simple thing I don't like about the 30B or 20B is that the % change is not available in a top key. It is buried in menus and take and bunch of key strokes just to do a % change. In general I really like the 30B. I hate the keyboard of the 20B. I like the "look" of the 20B

Re: Calculator like HP10BII but scientific and RPN

*Message #16 Posted by **Katie Wasserman** on 14 Apr 2010, 10:53 p.m.,*
in response to message #14 by Gerardo Rincon

%-change is really an interactive menu on the 30b. If you want the good old RPN way of doing it you need to write a little program and assign that program to the '%' key.

I do this (assuming you're in RPN mode)

Enter program mode by pressing SHIFT Keypad. Choose a program slot (0 is the default) and press INPUT. Then enter the following steps. (You'll need to press the up arrow to get to line 0.)

```
0  %       ; line zero is the (optional) key assignment location
1  ) Swap  ; this is just swap but shows the ')' too
2  -
3  ANS      ; same as LASTx in RPN mode
4  /
5  1
6  0
7  0
8  x
9  Stop     ; (This is SHIFT-HOLD RCL)
```

Press SHIFT Keypad again and you'll see: 10.126 (10 bytes used, checksum = 126)

Use the above program like you would %-change on most HP RPN calculators:

4 INPUT 5 %

and you'll see: 25

-Katie

Edited: 14 Apr 2010, 11:00 p.m.

Re: Calculator like HP10BII but scientific and RPN

*Message #17 Posted by **Gene Wright** on 14 Apr 2010, 10:58 p.m.,*
in response to message #14 by Gerardo Rincon

In RPN mode, you would enter both numbers and then execute the program that is assigned to the key you want to execute the % change function.

Suppose you want it to be shift-hold 1 --- you don't plan to use RAND very much. If you want to replace NPV, then press NPV when step 0 is showing and you would then start the program when you press the NPV key.

Program:

```
001 ) SWAP
002 -
003 shift ANS
```

```
004 /
005 1
006 0
007 0
008 x
009 STOP
```

now press down down up so that step 001 is showing.

press shift and hold it and press 1. SH1 shows up on line 0 of the program.

The program takes 10 bytes.

In run mode, key 30 = 25 = then shift hold 1. The answer of -16.67 is shown in the display. % change is 16.67% down.

Katie and Gene,

Thank you so much fo the explanation! It works!

One more question: will this program ever be earse (by itself) I know I can use the reset button and erase Program 0. If I have to replace the batteries, would it erase?

Edited: 15 Apr 2010, 8:18 a.m.

Re: Calculator like HP10BII but scientific and RPN

*Message #24 Posted by **Gene Wright** on 15 Apr 2010, 8:27 a.m.,*
in response to message #23 by Gerardo Rincon

Katie will probably have answered this before I click "I agree. Post Now" but here goes.

It should not erase if you replace the batteries one at a time. If you remove BOTH batteries before replacing either, then all bets are off.

You can learn a great deal about programming the HP 30b by going here:

HP 30b learning module material

The last 6 on the list include programming related material.

5.25 --> 3.5 Floppy Disk migration

*Message #1 Posted by **Giovanni Jimenez** on 14 Apr 2010, 4:42 p.m.*

I recently picked up some nice programs for the HP-85, but they are on 5 1/4" Floppy Diskettes.

Would someone in this forum, who owns the appropriate Disk Drives, be so kind to migrate these programs from the 5 1/4" to 3 1/2" floppies for me? Of course I would supply the 3 1/2" disks and shipping both ways.

thank you !

Re: 5.25 --> 3.5 Floppy Disk migration

*Message #2 Posted by **bill platt** on 14 Apr 2010, 8:30 p.m.,*
in response to message #1 by Giovanni Jimenez

I never had any 8088 programs last more than a year on 5-1/4" disks. They were always corrupt and unreadable.

Are these programs readable?

Re: 5.25 --> 3.5 Floppy Disk migration

*Message #3 Posted by **Dave Shaffer (Arizona)** on 14 Apr 2010, 11:38 p.m.,*
in response to message #2 by bill platt

Hi Bill and Giovanni,

I just resurrected my 20 (!) year old Pentium Pro (with overdrive, so it is running at 400 MHz!) and I can read 20 year old 5.25 floppies. It even runs Windows98.

I have invited Giovanni to send me his disks.

Re: 5.25 --> 3.5 Floppy Disk migration

*Message #4 Posted by **bill platt** on 15 Apr 2010, 12:10 a.m.,*
in response to message #3 by Dave Shaffer (Arizona)

Holy Cow!

I got rid of my P50 486 a few years back. I suppose I should have kept it. Not for the 5-1/4s though--for the still-working 100 MB hard drive and the Windows 3.1 for giggles!

Re: 5.25 --> 3.5 Floppy Disk migration

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 15 Apr 2010, 9:08 a.m.,*
in response to message #3 by Dave Shaffer (Arizona)

The formatting and filesystem are critical to read those floppies. For instance, I have one 5.25" hard-sectored, and I don't think I will ever be able to read the files it contains. Perhaps with a huge time budget it can be done, but such budget doesn't exist.

It the files were created on a PC or similar equipment (MS-DOS, FAT), you will be able to recover, but if they were created on a CP/M system (i.e.: Z-80 machines as just one example), things will be harder. Were your disks created on an HP-85 with an external floppy drive, perhaps connected to HP-IB (just guessing)?

Re: 5.25 --> 3.5 Floppy Disk migration

*Message #6 Posted by **Giovanni Jimenez** on 15 Apr 2010, 11:42 a.m.,*
in response to message #3 by Dave Shaffer (Arizona)

Thank you Dave!! I will send the floppies this w/end (after tax season:)

I don't know much about those programs, but I believe they are either original from HP or copied directly from original diskettes via HP-IB.

Thank you all,

Giovanni

OK - at any rate, it has been sitting around for a while.

Next challenge: to take the ORIGINAL IBM PC/AT (Circa 1982) out of its box and see if it still runs. I remember when I put in a speed-up option (from 6 to 8 MHz, IIRC) and upgraded the hard drive from 20 to 30 MB - what a feeling of power I had!! I still use the PC/AT keyboard everyday for whatever is my current PC.

17BII+ wobble

*Message #1 Posted by **Ryan** on 14 Apr 2010, 9:27 a.m.*

I recently took delivery of a new version 17BII+ (double-wide input key) and found that it wobbles slightly on my desk.

Is this a well-known defect or did I just get a dud? I bought it direct from HP and am wondering if others have had any experience of exchanging this calculator or others for the same reason.

It's frustrating that I have an el cheapo Casio desk calculator that sits perfectly flat on my desk and this HP that costs four times as much can't get it right!

Thanks in advance for your responses.

Re: 17BII+ wobble

*Message #2 Posted by **Katie Wasserman** on 14 Apr 2010, 10:40 a.m.,*
in response to message #1 by Ryan

I don't have a 17bii+ but I find that the 20b (and now 30b) rock back and forth too. This is a design defect where pressing keys on the outer column put force beyond the support feet.

-Katie

Re: 17BII+ wobble

*Message #3 Posted by **Frido Bohn** on 14 Apr 2010, 11:19 a.m.,*
in response to message #1 by Ryan

Hello Ryan,

perhaps your desk has a slight bumpiness to which the Casio perfectly fits by pure coincidence ;-)

My 41CV has suffered the same flaw since I bought it 1984. I solved the problem with adhesive tape. Another solution would be to try to pull outwards the disturbing rubber foot a little bit (I don't know whether the 17BII+ has) in order to restore the balance. This works with the HP48, but you must be careful not to lose the foot.

Best regards
Frido

My 41CV of 26 years also has this very annoying problem.

Re: 17BII+ wobble

*Message #6 Posted by **Ryan** on 14 Apr 2010, 11:45 a.m.,*
in response to message #1 by Ryan

Thank you, all.

It seems the rubber feet are perfectly molded into depressions in the bottom, so pulling it one direction or the other isn't possible. The outer column of keys also appear to be well within the supported area so the wobble seems to be from imbalanced rubber feet or a twisted case.

That said, my 12cp has the same problem and I ended up putting some tape on the bottom to keep it from rocking. The downside is that it lost its grip in that corner so now it tends to slide a bit!

I must be overthinking this. HP is sending crap out the door.

I had the same problem. To fix I just twisted the body to fit. Perfect now. Just give it a gentle twist.

Re: 17BII+ wobble

*Message #8 Posted by **Ryan** on 14 Apr 2010, 3:30 p.m.,*
in response to message #7 by Egan Ford

Who would've thunk!

I did as you advised. I gave the calc a slight twist and problem solved (for now).

I'm hoping this is a permanent solution--what with the bumps and scrapes in my bag I put my calcs through...

Thanks!

*Message #10 Posted by **Marcus von Cube, Germany** on 14 Apr 2010, 4:36 p.m.,*
in response to message #9 by Sancerre (Phoenix)

My 17bii+ wobbles very slightly. Twisting didn't cure it, I'll probably have to do it again.

Re: 17BII+ wobble

*Message #11 Posted by **Ryan** on 15 Apr 2010, 9:53 a.m.,*
in response to message #10 by Marcus von Cube, Germany

The wobble was back this morning. Argh!

I had to twist it again to correct the issue. It's clearly a temporary solution. Why, why does HP do this? !

HP-41 Flat top N cells

*Message #1 Posted by **Xavier A. (Brazil)** on 14 Apr 2010, 6:41 a.m.*

Hello HP fans,

I just bought a N (LR1) *flat top* cells set. Someone told me it would be possible to make contact in the HP-41, but he didn't explain how. Did anyone already try to use this cells? Thank you!

Edited: 14 Apr 2010, 6:42 a.m.

You have mail! Also...

Pure Horror

*Message #1 Posted by **Patrick Rendulic** on 13 Apr 2010, 1:45 p.m.*

This afternoon we had a meeting at our business. A colleague saw my HP41 in my shirt pocket and asked me whether mine still worked. I said yes. He then told me that his one no longer worked and that he threw it away 2 weeks ago ...

... together with some installed modules (time, x-functions, ...), card reader, ...

... ...

Re: Pure Horror

*Message #2 Posted by **Michael Meyer** on 13 Apr 2010, 1:51 p.m.,*
in response to message #1 by Patrick Rendulic

I know it can be called a compulsion... my desire to continue to collect and restore. I just restored a lowly SR-11. I prefer to call it, "saving it from the trashbin of history." I will continue to strive to save HP's and others from the "trashbin of history..."

Re: Pure Horror

*Message #3 Posted by **bill platt** on 13 Apr 2010, 2:58 p.m.,*
in response to message #1 by Patrick Rendulic

What's interesting is what you might call the "delta" of valuation. The inefficient market. Or whatever. The idea that two people who are quite closely associated end up with completely different gut senses about value. This happens all the time not just in calculators. It is the whole world of antiques that is like that at emergence.

I was originally more like your colleague: I figured I'd pick up an old one on ebay for cheap....boy was that an education!

Re: Pure Horror

*Message #4 Posted by **PeterP** on 13 Apr 2010, 3:09 p.m.,*
in response to message #3 by bill platt

Bill,

That's exactly how it started for me a few years back! I needed a simple desk calculator and remembered how much I had fawned over the 41C. I figured that it would be cheap and kinda cool to pick up that old calculator to have on my desk, in case I can find one that still works.

Today, irrecoverably infected with the HP virus, I know that this was by far my most expensive 'pick up something cheap' idea I ever had...

Cheers

Peter

... but it was worth every penny, it was (and still is) a lot of fun, and there are many other fools like me ;-)

Re: Pure Horror

*Message #6 Posted by **David Hayden** on 13 Apr 2010, 4:03 p.m.,*
in response to message #1 by Patrick Rendulic

I was almost like that. A few years ago I decided for fun to check the value of my HP 41CV and accessories on ebay. I was shocked. Today a bunch of accessories are in a drawer in the basement with a little note that says "these are actually valuable" in case I get hit by a bus.

The virus is spreading within me. I'm actively programming my 50g, 48gii's, and 39gs. At a flea market this weekend, I found myself looking for calculators. I found a TI 81 and took a long hard look at it before moving on.

flea market

*Message #7 Posted by **Frank Boehm (Germany)** on 14 Apr 2010, 8:02 a.m.,*
in response to message #6 by David Hayden

Good thing I started almost 20 years ago looking for calculators - it's pointless to visit a flea market now, too often not even a single one is to be found. 10 years back, I often returned home with several bags full of calculators - talk about dead technology 8)
(But then there are rare times, when some really cool stuff shows up. E.g. one guy had a prototype PCB for a calculator developed by VALVO, as well as box full of NORBITs, even prototypes. NORBIT Info)

My dad's first car (in the 50's) was a Model A Ford convertible. He was glad to get rid of it because the cloth top leaked and there was something loose in a headlight that made it go off and on. What he wouldn't give for that car today! Having said that though, I must add that my 41cx's value to me is still in its usefulness, not its important place in computing history.

in response to message #1 by Patrick Rendulic

You will never guess what happened yesterday.

I was at the dump and found an HP 41C with a time module and ....

Okay, just kidding.

But I did find an HP 25 sitting in a trash can at the operations office for the airline I worked for 15 years ago. I was picking up a flight plan for a trip from Winnipeg to Chicago when I threw out a piece of paper I needed. When I went to retrieve the paper from the waste paper basket there was a non functional HP 25 staring at me.

It was the first HP I ever restored, bad battery connector terminal due to corrosion. The calculator works perfectly still.

My gain, someones loss.

Cheers, Geoff

Re: Pure Horror

*Message #17 Posted by **Namir** on 14 Apr 2010, 11:29 a.m.,*
in response to message #16 by geoff quickfall

Jeff,

This happened a year before I signed up with eBay and discovered that the vintage HP machine market is alive and well!! I do believe that my HP41-CX calculator could have been repaired and the plug-in modules to be working.

I kick myself whenever I think about that incident.

BTW .. I met with Dave Shaffer here in Flagstaff (where I am spending some time with my son). We met at the Lowell Observatory where he was working on a telescope setup. We had the chance to hear from another staff member about SOFI -- the special telescope project that is flown in a custom Boeing 747. The telescope is flown high enough to avoid atmospheric interference. We told the staff member that we belong to a calculator online community, which also includes an Air Canada pilot who is very much into using and restoring vintage HP calculators. I thought you might be a good candidate to fly the SOFI telescope.

:-)

Namir

Now that would be fun, Science and flying, don't get that around here!

You sure are a world traveller, will you make HCC2010?

Of course it is 25 years for the HP 71B, don't know what the theme is but it would be a good follow up from the 41C in 2009.

Cheers, Geoff

Re: Pure Horror

*Message #19 Posted by **Dave Shaffer (Arizona)** on 14 Apr 2010, 1:29 p.m.,*
in response to message #17 by Namir

Namir is close: the mission he is referring to is SOFIA (stands for Stratospheric Observatory for Infrared Astronomy). See here for details.

Geoff may appreciate what else we learned: the telescope in SOFIA (which I think is around 2 meters in size) weighs so much, and is aft of the center of gravity, that they have to put ballast in the FRONT (nose) of the 747SP to keep it balanced. (Weight and balance are critical elements of flight planning!)

Re: Pure Horror

*Message #20 Posted by **Namir** on 14 Apr 2010, 4:52 p.m.,*
in response to message #19 by Dave Shaffer (Arizona)

Dave,

SOFIA it is .. I stand corrected. I should have remembered correctly, since it was my grandmother's name.

Nmair

Re: Pure Horror

*Message #21 Posted by **Marcus von Cube, Germany** on 15 Apr 2010, 4:27 a.m.,*

Note for NoV-64 users.

*Message #1 Posted by **Diego Diaz** on 13 Apr 2010, 10:31 a.m.*

Hi,

In the docs it's fairly clear that NoVRAM and NoV-32 can be configured in a Clonix-41 fashion. However, this seems not to be clear at all for the NoV-64. Of course they also can.

I should have properly pointed it out in the docs (my fault).

For those of you that may find this feature useful, just select "Clonix-D" in the configuration window and make sure you include the same ROM images in *both* "Flash ROM blocks" fields; plug your NoV-64 in the programmer and procced as usual.

Hope this helps.

Diego.

Re: Note for NoV-64 users.

*Message #2 Posted by **Frido Bohn** on 14 Apr 2010, 11:02 a.m.,*
in response to message #1 by Diego Diaz

Dear Diego,

does this mean that you can use the NoV-64 module as a Clonix-D by simply overwriting the pages occupied by HEPAX?

Best regards
Frido

Re: Note for NoV-64 users.

*Message #3 Posted by **Diego Diaz** on 14 Apr 2010, 6:14 p.m.,*
in response to message #2 by Frido Bohn

Well Frido, not "exactly". NoV-64 does not have the possibility of swapping its internal ROM banks as the Clonix-D does. So you can only have 6 pages (as in a standard Clonix). Thus the need to replicate the ROM images selection in *both* Flash ROM blocks.

Hope this helps.

Cheers.

Re: Note for NoV-64 users.

*Message #4 Posted by **Eric Smith** on 15 Apr 2010, 9:19 p.m.,*

in response to message #1 by Diego Diaz

I guess I'm not the only one that is somewhat confused about the differences between the Clonix, Novram, Nov-32, and Nov-64. It might be helpful to have a table comparing them.

Re: Note for NoV-64 users.

*Message #5 Posted by **Diego Diaz** on 16 Apr 2010, 2:34 a.m.,*
in response to message #4 by Eric Smith

Hi Eric,

You're more than probably right... as the "family" is growing up, its different members' features may lead to confusion.

Here you are an abstract:

Clonix-41: It's basically a ROM-box which can hold up to 6 pages (4K each) Intended to "clone" any ROM PAC module(s).

Clonix-D: Same features that Clonix-41 but double ROM size. Its ROM is divided in two blocks of 6 pages each. These blocks can be swapped by plugging the module into an even or odd port.

NoVRAM: A RAM-Box, mainly intended to clone "Adv HEPAX". It has 16K RAM and ROM to hold the four pages of the HEPAX module plus two extra ROM pages.

NoV-32: Same as NoVRAM but double RAM size. Its 32K RAM are organized in two blocks of 4 pages each which can be swapped by writting h'000 or h'001 into a control word placed at address H'4100.

NoV-64: Again HEPAX emulation with 4 blocks of 16K ram (thus the "64") and another two blocks of 16K ROM. Switching between the blocks can also be achieved by writing said control word.

Alternatively a new ROM (ICEBOX1H) written by Geir Isene, includes several commands in order to handle the ROM and RAM blocks of a NoV-64, allowing the user to switch between them from a FOCAL program.

NoV-32 is backward compatible with NoVRAM and Clonix-41, as NoVRAM is backwards compatible with Clonix-41.

NoV-64 is compatible with Clonix-D in terms of internal functionality, but it lacks the possibility of swapping its ROM blocks by changing the port. That's why it only shows 6 pages and they must be programmed in both banks.

Hope this clarifies a bit the differences.

Cheers.

Diego.

Pocket Professional Math-Pro

*Message #1 Posted by **Norman Dziedzic** on 12 Apr 2010, 1:35 p.m.*

I just acquired a 48GX with a card called the Pocket Professional Math-Pro. I don't know that much about anything 48 series.

Were they very popular? There was also a card in the box that mentioned a software called CalcWare PC Link for upload/download with the calculator. Is that still around?

Thanks,

Norm

Re: Pocket Professional Math-Pro

*Message #2 Posted by **Han** on 12 Apr 2010, 5:03 p.m.,*
in response to message #1 by Norman Dziedzic

The Math-Pro card probably is not as popular as many of the other software cards such as surveying cards or engineering cards. One of the reasons is that there were many really powerful math programs written for the 48 series that were free. Two that I personally still use are ALG48 and ERABLE. There is a bit of overlap between these two packages, but they are very nice.

The Calcware PC Link is no longer in production. I believe this was produced by Sparcom (who published the Pocket Professional series). It was basically the PC link with their own upload/download software.

Determining HP 48sx ROM version by SN?

*Message #1 Posted by **megarat** on 12 Apr 2010, 1:18 p.m.*

Hey all,

I've decided to get back into the RPL game by hunting down a 48sx. Ideally I would get one with firmware/ROM version J. (Unless you can recommend an earlier version instead, for a reason that isn't obvious to me.)

So: is there a way to determine the ROM version by the serial number? Most eBay sellers seem to balk at going through the steps of determining their ROM version, but don't have much issue with providing an SN.

(I suspect there is probably a very clear relationship between SN and ROM version, so I guess the second-order question is: has this relationship been properly mapped out? A survey of HP48 owners would be the obvious way to do this. (Although such a mapping would exclude units that have been factory-upgraded by HP, of course.))

Re: Determining HP 48sx ROM version by SN?

*Message #2 Posted by **Dave Britten** on 12 Apr 2010, 3:46 p.m.,*
in response to message #1 by megarat

I can't say how strong the correlation is, but here's my J ROM unit as a data point:

3310S04480

I've got another SX at home that's *not* rev. J that I can check later this evening.

The steps for checking the ROM revision in an SX are so simple that I'd be surprised if any decent seller wouldn't take the necessary 30 seconds for a potential buyer. All you do is press On+D, Backspace, Eval, which prints the ROM details plain as day. Then press ON+C to resume normal operation.

Re: Determining HP 48sx ROM version by SN?

*Message #3 Posted by **Allen** on 12 Apr 2010, 6:01 p.m.,*
in response to message #2 by Dave Britten

I have a 48s ROM Version J (not SX) SN 3311S00452, If you're interested, send me your address.

I'm with you on that ... I ask politely, ask early in the auction cycle, and even include the instructions, but so far, every single time I've asked, I've either received (a) no response (four out of six times), or (b) an unhelpful waffling akin to "all I can say is that it's made in [country] and passes the self-tests" (twice).

I generally take this as an indicator of someone I wouldn't want to do business with and keep looking.

Survey: what is the serial number and ROM version of your HP 48?

*Message #8 Posted by **megarat** on 12 Apr 2010, 6:48 p.m.,*

in response to message #2 by Dave Britten

I'll maintain a list of all responses here. If you (generically addressing the reader) can provide your SN, specific model, and ROM version, I'll keep adding to the list, at least for the near future.

(Last updated: 13 Apr 2010)

```
48sx ROM: A     2952A00211
48sx ROM: B     3013A01447
48sx ROM: C     3017A01085
48sx ROM: D     3021A00931
48sx ROM: D     3027A01190

in response to message #8 by megarat

Thanks everyone for your posts thus far. I've been updating the article here.

I'm not trying to be exclusive of the 48s series ... if you want to submit your G/GX/G+ information as well, feel free.

Regardless, I'm particularly interested in cases that help define the boundary conditions (e.g., where the versions change).

Here goes:

48G Ver.R S/N 3422S07894
48GX Ver.R S/N 3616S02571
48GX Ver.R S/N 3627S01702

Re: Determining HP 48sx ROM version by SN?

*Message #16 Posted by **Mike Morrow** on 16 Apr 2010, 9:53 p.m.,*
in response to message #2 by Dave Britten

My units:

HP48SX ROM Version E 1989 3117A00013
HP48GX ROM Version R 1993 3629S01544
HP48GX ROM Version R 1993 SG72400781

It's interesting that there are 3116S and 3117S listings here, even though my SX is definitely a 3117A. I guess there was some overlap of the American and the Singapore manufacturing process for the SX.

Edited: 16 Apr 2010, 10:05 p.m.

Low-bat indication continuously on

*Message #1 Posted by **Johannes Trepte** on 12 Apr 2010, 11:38 a.m.*

Hi, I have an HP-21 calculator which I had in use until a few years ago. There were never any defects, except for several replaced battery packs. Because it "ate" Ni-Cads, I used it with the mains adapter most of the time, which in turn damaged the batteries quickly.

My question: Even with new cells, the "low battery" indication (inverted decimal points) is always on. I would like to fix this, because I really like the part. Still perfect for every day work, no key bouncing at all ...

Has anyone experienced the same effect? Are there any schematics of the vintage HP calculators available, which could help to find the problem?

Re: Low-bat indication continuously on

*Message #2 Posted by **John Stark** on 12 Apr 2010, 2:44 p.m.,*
in response to message #1 by Johannes Trepte

Johannes:

For what its worth, had a similar experience with vintage HP.45.

Issue was solved by dissassembly of calculator and thorough cleaning of contacts on power switch.

Works like a champ now.

John Stark

PS: BE CAREFUL disasembling a Woodstock-class unit. You may want to review others' experience before proceeding.

Message output capability of HP35s?

*Message #1 Posted by **John H (UK)** on 12 Apr 2010, 9:54 a.m.*

Hi

I am looking at buying an HP35s to use for medical dose calculations. For this I need it to be able to output a 'message' as a text data label at the same time as a numerical output.

For instance:

'Dose per hour (mg) = 35' ....etc...

I will also need to do some pretty serious branching in respose to user choices (input as numbers; again displayed against various options) for instance:

'Choose MCG (1), MG (3) or ML (4) ?'

I know that the 50g can do this but it is quite bulky (we are not allowed white coats to keep out stuff in here in the UK).

Can the HP35s do this?

Thanks in advance.

Cheers

J

Re: Message output capability of HP35s?

*Message #2 Posted by **bill platt** on 12 Apr 2010, 10:26 a.m.,*
in response to message #1 by John H (UK)

The parsing of numerical values into a string will be the impossible part. But you should be able to do branching and messages.

'Dose per hour (mg) = 35'

would have to be something like:

```
Dose per hour (mg)= (press R/S)
35
```

But really, why not use something like the Iphone, or perhaps a 48G or 50G emulation on a handheld device?

If you wrote an Iphone app, you might get a big market for it. And it is small, and sexy, and all of that. And physicians love Macs and Iphones, so they already have one!

Re: Message output capability of HP35s?

*Message #3 Posted by **John H (UK)** on 12 Apr 2010, 12:24 p.m.,*
in response to message #2 by bill platt

Hi,

An interesting suggestion; I have an android (mainly for its full large pdf display apps; iphone couldnt do that at the time) with an HP48 emulator on it. But button pushing is tricky as it is sooo small.

How hard is it to write an native app for these smartphones? I had not really considered it. Is it much more fiddly than writing calc prog; it would seem so at first thought?

Any guidance?

Cheers

John

*Message #4 Posted by **bill platt** on 12 Apr 2010, 2:14 p.m.,*
in response to message #3 by John H (UK)

I don't know anything about the mechanics of writing apps for Iphone. But I do know that they are proliferating like wild-fire!

Thomas Okken, who posts here, wrote the veritable free42 for the Iphone...

Re: Message output capability of HP35s?

*Message #5 Posted by **Thomas Okken** on 12 Apr 2010, 10:22 p.m.,*
in response to message #4 by bill platt

I find writing native code for the iPhone to be pretty painful, I guess mainly because the APIs are so different from the Windows and Unix ones I'm used to. People familiar with Mac OS X have much less of a learning curve to deal with.
Writing native GUI apps is a lot of work on any platform I know, but it sounds like what John wants to do could also be done using HTML and JavaScript, and *that* wouldn't be much more involved than writing a calculator program.

Re: Message output capability of HP35s?

*Message #6 Posted by **bill platt** on 12 Apr 2010, 11:22 p.m.,*
in response to message #5 by Thomas Okken

Now that is an interesting idea! (Java Script or HTML on Iphone)

Thanks for weighing in.

*Message #7 Posted by **John H (UK)** on 12 Apr 2010, 12:27 p.m.,*
in response to message #2 by bill platt

Hi Again,

Actually the HP35s example that you use is actually quite acceptable; especially if the message and the input are on-screen at the same time, albeit on different lines of the display?

Hmm now thinking about a smartphone app though.

Cheers

John

Re: Message output capability of HP35s?

*Message #8 Posted by **bill platt** on 12 Apr 2010, 1:44 p.m.,*
in response to message #7 by John H (UK)

My physical 35S is lost at my son's school, so I cannot check the ability to keep the prompt in the Y register while the answer is in X. It should be possible, as long as you handle the stack appropriately. It might require "echo" of the prompt and recalling the answer to the stack from a register, rather than simply dumping the results of a calculation to the X register. All calculations use stack manipulation (except equations) and so that is that.

Also, read chapter 14 of the manual. You'll want to see how deep you have to nest. 20 is the limit for subroutines.

Edited: 12 Apr 2010, 1:56 p.m.

Re: Message output capability of HP35s?

*Message #9 Posted by **Dave Britten** on 12 Apr 2010, 4:01 p.m.,*
in response to message #7 by John H (UK)

The 35s is very limited in terms of what you can do with message output. You won't be able to generate a message that includes calculated data - static text only - and you can only display a single message at a time, so no two-line tricks. Plus there are many documented bugs in this model that can lead to incorrect figures or memory loss under certain circumstances. Not sure I would personally trust it with anything as mission-critical as dosage calculations!

The 42s, however, features quite capable string manipulation, but is rather costly. The alternative is to get an iPhone/iPod Touch, and buy 42s for it (about $10 US, I believe). It's got nice big buttons, runs many times faster than the real thing, and gives you about 90MB instead of 7KB.

Or you could go really old-school and get a cheap secondhand Psion Organiser II. :)

Re: Message output capability of HP35s?

*Message #10 Posted by **John H (UK)** on 12 Apr 2010, 4:50 p.m.,*
in response to message #9 by Dave Britten

Ah Ok.

The reason for going for a simple robust machine (like a 35s) is for that feeling of simplicity and reliability.

Most of the calcs that I am thinking about you sort of do in your head automatically but at times you might just need a reliable little electronic friend to tell you that you are right.

However if it is buggy then it defeats the object. Such a shame as I have a tendency for old-school things (like the idea of the robust feel of the 35s) and liked the idea of starting with a machine that feels solid but is actually in current production!

I have written a portion of the code for the old casio FX-7000GB (!) and it works well but it is already an old machine(and a bit big for the shirt pocket). I really don't like the plastic model-kit feel of current casios....

I have had a look at android app programming and it all looks a bit fancy. Not sure that I have the time to spend with all of the frilly stuff. I guess the iphone is somewhat similar.

Maybe a 42 emul is the way to go...?

I now wish I had an iphone.. hmm

I cannot thank you enough for the heads up regarding the HP35s bugs.

Cheers

J

> BTW the apps such as free42 run on hte Ipod Touch as well as on the Iphone.

Yup, that's how I run 'em. I used 42s to find the best price per pound for cat litter earlier today. I'm posting from my iPod right now, in fact! They'll probably run fine on the iPad too, if you want a gargantuan 42s.

Another thought: How complex are the formulae you're working with? The 17bii can be had relatively inexpensively, if its (admittedly fairly sophisticated) algebraic solver can cut it.

Re: Message output capability of HP35s?

*Message #13 Posted by **Pal G.** on 12 Apr 2010, 11:12 p.m.,*
in response to message #10 by John H (UK)

I searched for "medical" at Androidzoom.com and hundreds of programs came up..

Or, if you'd like to do the programming yourself and you don't care about a gui, have a look at "android scripting environment". Write programs on your machine or android device. Supports scripting languages such as Lua, Perl, Python, JRuby, etc..

Re: Message output capability of HP35s?

You shouldn't overlook the Casio FX-9860G Slim: programmable, with a C/C++ SDK available if Casio Basic is too basic, foldable (so it should fit in your pocket), and (in my opinion) well-made and not at all plasticky. At least, **I** like it!

Nigel

Psion Organizer II for WBC differentiation

*Message #15 Posted by **Nenad (Croatia)** on 13 Apr 2010, 2:52 a.m.,*
in response to message #9 by Dave Britten

> Quote:
>
> Or you could go really old-school and get a cheap secondhand Psion Organiser II. :)

Several years ago I wrote this program for Psion Organizer II for the blood testing laboratory in my wife's pediatric office. The program supports counting types of leucocytes if you want to count them by type directly under microscope manually.

We simply had the Psion Organizer II available, with practically no use for it when I wrote this program.

Now, if there is a doubt wrt results of "differential white cell count" (I am not sure about the correct medical expression, but you will certainly understand) obtained by the "blood counting machine", you can check WBC differential count manually by Psion. When the operator recognizes the leucocyte in a certain field she presses the appropriate button for this type. Psion beeps when you reach 100, but you can continue counting if you want.

Just to shed some light to an easy implementation of this obsolete but robust gadget. There is nothing smart in this program, but its use is practical.

Re: Message output capability of HP35s?

*Message #17 Posted by **John H (UK)** on 13 Apr 2010, 6:35 a.m.,*
in response to message #16 by tim m.

Thanks Guys..

It is a shame that I recently gave all my Psion stuff to my brother...Doh!

Have had a look at the Epocrates thing; looks interesting.

Not had look at the calcs section yet.

In many ways I wanted to do something myslef so I can have 100% confidence in it (and my understanding of it actually).

A scripting language may be the way to go. Should not be too tricky either. In that way it should be nicely cross platform...

Cheers again.

(and saves me 60USD on the price of a 35s!)

hp20b hacking: SW reset problem

*Message #1 Posted by **hugh steers** on 12 Apr 2010, 9:50 a.m.*

Hi,

so i finally got around to repurposing a 20b to play chess.

everything was going swimmingly, until i get about 3 moves in and then the unit software resets!

im using the hp20sdk (latest i think). at the start of main, it figures out the startup state and displays it (if you enable the lcd) and i get "SW Reset" when i press ON again.

so i get rid of everything i can find that does this. im disabling the watchdog (damn good idea!) and also various logic to deliberately perform "cpureset".

when i do this, instead of software reset, i get a power reset. when i press on i get "Power Up" and not "Normal Wakeup". this says to me that there is power down. could it be that my batteries are low and cant sustain the output. i notice ServiceBOD handles this, but it performs an Off which should correspond to normal wakeup (or does it?). Getting rid of ServiceBOD does not change anything either.

so im wondering if maybe the unit cant handle it. im running flat out at 36Mhz for say 5 seconds. unfortunately, i haven't got a new set of batteries to test.

are there any other sneaky timers, i might have missed that might do this? disabling the RTC 5 minute timer makes no difference either.

any ideas?

Re: hp20b hacking: SW reset problem

*Message #2 Posted by **Katie Wasserman** on 12 Apr 2010, 2:36 p.m.,*
in response to message #1 by hugh steers

I've seen similar problems with all the HP ARM-based calculators, the CR2032 cells can't deliver the needed current at high clock speeds for prolonged time. The BOD level doens't seem to matter much either. Always using new batteries and/or lowering the clock speed is really the only solution. The cells are in parallel with no blocking diodes which helps handle the peak current draw but stinks as far as battery life goes.

-Katie

Re: hp20b hacking: SW reset problem

*Message #3 Posted by **hugh steers** on 12 Apr 2010, 3:35 p.m.,*
in response to message #2 by Katie Wasserman

thanks. im going to try decreasing the cpu speed slightly.

WIP here, http://www.wiki4hp.com/doku.php?id=20b:hpvchess

i'll post an update, if i upload a binary that works :-)

Re: hp20b hacking: SW reset problem

*Message #4 Posted by **hugh steers** on 12 Apr 2010, 5:01 p.m.,*
in response to message #2 by Katie Wasserman

I have discovered that my batteries are knackered! i think it must be that i've drained them too much with this experiment.

reducing the CPU speed to 24MHz made no real difference in this case, and the original problem of power dropout happens now right away.

i found just one good battery in the back of a drawer and it seems to work, ie i dont get the drop outs, but one battery isnt going to work very well.

so what i dont know is how long before new batteries suffer this problem. it looks like the ServiceBOD code tries to handle power drop, but isnt doing a great job.

anyway, i compiled a new version and uploaded it on the wiki. this one identifies itself as version "1.0".

happy hacking!

If you are running at full speed, you can drain the batteries really quickly. I'd do development with power going in on your cable and that should solve a lot of the problem.

i would be interested to know the curve of cpu speed vs power drain and whether it is linear.

for example, the points 18, 24, 30, 36 (Mhz). I guess i could test this myself if not known.

If the curve is linear, then clearly the same amount of energy is used for a given calculation. however, if the higher speeds are progressively more power hungry, then there is a win to using a slower speed (unless too slow to be useful).

in response to message #7 by hugh steers

The CPU specifications from ATMEL has plenty of power details in section 35.3.2. The consumption looks worse than linear but only a little.

e.g. From table 35.10 at VDD=3V, 25 degrees:

```
 8MHz    5.37
16MHz   10.37
20MHz   12.13
24MHz   14.24
30MHz   19.55
36MHz   22.63
```

Not sure of the units in the second column but I'm sure it is explained in the PDF.

in response to message #8 by Paul Dale

Intersting. from this table, the best speed to power ratio is at 24Mhz.

This would be the speed to run at (from a consumption view), unless full-out performance is needed. Also, it would be sensible to back off as battery output drops.

Re: hp20b hacking: SW reset problem

*Message #10 Posted by **Paul Dale** on 13 Apr 2010, 7:05 a.m.,*
in response to message #9 by hugh steers

The units are mA.

Check out the document for lots more details. Google doc6257.pdf to find it.

There are lots of options for bits that can be powered down.

*Message #11 Posted by **Katie Wasserman** on 13 Apr 2010, 8:36 a.m.,*
in response to message #10 by Paul Dale

While the speed vs power consumption for the this chip might be close to linear the current draw vs cell capacity is very far from linear. They don't even spec these cells beyond 2ma current draw and even at that level the capacity is half of

nominal. At 20ma draw (10 ma per cell) you can probably expect on the order of a couple of hours (maybe less) of useful life from these cells.

CR2032 spec sheet

These ARM-based calculators really need to be powered from AAA cells or a rechargeable prismatic lithium cell. When running long programs on these calculators you really need to have a large supply of CR2032's handy. Fortunately you can buy the best quality ones in quantity for about $0.25 each.

Or you just run the calculator at a sensibly slower speed and live with the extra processing time.

I mean really, how many people run long programs on such a calc that warrants 30MHz processing speed?

Dave.

Just some of us here, playing with silly ways to factor 10 digit numbers.

I agree, lowering the clock speed is the way to go with this platform.

Correct, running at lower speed is better for consumption.

I've discussed this at length here before, and I've done a blog episode on the exact issue:

http://www.eevblog.com/2009/04/16/eevblog-4-low-power-calculator-design-and-fpgas/

The processor consumption is essentially linear with speed, as it is with most CMOS processors. But in the case of this design it is the battery series resistance that causes a non-linear issue that gets worse as the battery life drops. So it is IMO a poor design choice to operate the calc at 30MHz off CR2032 batteries. Cyrille eventually admitted this and said he would be more cautious of using that high a speed in subsequent designs. I don't believe he has, the newer calcs do the same thing I believe.

Dave.

The latest version of the SW only uses high speed when needed, and only for a short period, after that, it drops back to more manageable levels for the battery. since most calculation that will finish in any resonable time will finish before the speed drops, it seems to work well.

regards, cyrille

IIRC the processor is speced at nominally 0.5mA/MHz So for two paralleled CR2032 batteries at 240mAH @ 30MHz, ignoring losses like the series resistance and the low batt cutoff point. The best case battery life at full speed would be 480mA/15mA = 32hours. So realistically you'd be lucky to get say 24 hours.

Dave.

At 7.5mA per cell *continuous* you'd be lucky to get 15 hours.

> Quote:
>
> ignoring losses like the series resistance and the low batt cutoff point

That's exactly where the problem lies at high drain. The internal resistance causes loss of output voltage and very high drains could cause it to drop below the equipment drop-out voltage almost immediately.

Of course this does not mean that you've used up all the energy of the cell, you can still "use it up" by using the cells in low drain devices.

I used to see that exact thing happen on a HP-200LX with Duracell AA's when using an IBM 10 Volt PCMCIA flash memory card. With Duracell's, you would see the battery low message instantly whenever you turned on the 200LX. With Everyready batteries, that didn't occur. I remember someone telling me that was because of the initial high current drain the card caused and that Duracell's had a higher internal resistance than the Everyready's.

*Message #19 Posted by **cyrille de Brébisson** on 13 Apr 2010, 8:31 a.m.,*
in response to message #4 by hugh steers

Hello,

Did you try putting breakpoints on the abort and other FIQ handler in order to see if that was not what was causing your reset? you might be filling your stack for example. This would cause a reset...

You can run the CPU at 36MHZ on battery power for as long as the battery will last with no reset. When you put a normal 20b in Test System Mode, it does run at 36Mhz continuously.

At that speed, you get less than 24h of battery life however. This is why I always run the calculator on AA battery for testing...

The cpu speed vs power consumption is fairly linear in the 0.6mA/Mhz range. of course, the battery life is not linear as the internal battery resistance play a more and more preeminent role as the power drain increases.

Also, the actual mips is not linear as you have to put 1 wait state once you get over 15Mhz.... This can cause a slow down of the actual CPU instruction throughput. Depending on your program.

Cyrille

Re: hp20b hacking: SW reset problem

*Message #20 Posted by **hugh steers** on 13 Apr 2010, 11:08 a.m.,*
in response to message #19 by cyrille de Brébisson

I'll try those breakpoints later and report. At first, i suspected the stack, the usual suspect of random crashes :-) but i think that's ok. i've actually increased the default stack size to be sure.

since powering off a brand new cell, it is working fine (until i drain it that is!). so im still suspecting the power problem.

im wondering whether to get the ServiceBOD code to reduce the fast speed that is used when processing an operation (a move in this case!). it might be a good way to prevent power outage.

also, do you know what happens to the battery backed RAM when power drops below operation - does this get kept or is there no guarantee.

thanks,

Re: hp20b hacking: SW reset problem

*Message #21 Posted by **David Hayden** on 13 Apr 2010, 10:31 p.m.,*
in response to message #1 by hugh steers

I'm not familiar with the 20b, but when doing low-level programming, one cause of crashes can be writing to the wrong side of the stack pointer. Since an interrupt service routine can change the contents of the free memory that the stack grows into, you have to always allocate space on the stack before using it.

Basically, you have to pretend that memory on the "wrong side" of the stack pointer contains random bits that constantly change.

Dave

Re: hp20b hacking: SW reset problem

*Message #22 Posted by **hugh steers** on 14 Apr 2010, 8:08 a.m.,*
in response to message #21 by David Hayden

Hello,

I have found out the source of all my problems!

confession: my game variables were not located in battery backed ram.

turns out that many of them don't need to be because they are initialised each time, but a few are important. Like, er, the board state. However, it looks like you get away with this quite a lot. maybe the non-backed ram works for a while but is unreliable. this is likely between different units.

i have uploaded a new binary (V1.1) that has a, very small, opening book.
http://www.wiki4hp.com/doku.php?id=20b:hpvchess

It was the opening book that revealed the problem. i couldnt understand why the program worked fine on everything except the actual calculator (annoying huh). It would play the book and then make an illegal move. what was happening is that the `inBook' state was not being properly reset. This variable and others are now in the 2K backed ram, which handily gives me more space for other stuff :-)

The original power problem still persists. basically if your batteries cant cut it, you get a power outage and it powers down, losing all state.

HP-67 keyboard restoration

*Message #1 Posted by **Pierre Brial** on 12 Apr 2010, 6:27 a.m.*

Hello, A friend of mine, retired university teacher, make me a great gift : an HP-67 in very nice condition, with manual, pouch, some cards ... ! The calc in in working order, but the keyboard is unreliable : keys sometimes don't register despite the 'click', and sometimes they register twice. A bit disappointing given hp keyboards reputation (I have got an older HP-35 which doesn't have such flaw).

Did you already experienced this problem ? The procedure described in http://www.hpmuseum.org/howtohp/howtohp.htm recommend the use of sandpaper to clean the gold plating. But may be there is a softer way to do ?

Re: HP-67 keyboard restoration

*Message #2 Posted by **Jose Poyan** on 12 Apr 2010, 1:25 p.m.,*
in response to message #1 by Pierre Brial

Hi, I have exactly the same problem with the "0" key on my hp-67, samtimes it doesnt work, sometimes it marks twice. Besides the keys seem to be lower than they should, they are loose and rattle a lot, do you have this problem too? I wonder if it has something to do with the loose of contact. I didnt open mine yet, but it'll be interested to see what you find.

regards, jose

Re: HP-67 keyboard restoration

*Message #3 Posted by **Pierre Brial** on 12 Apr 2010, 11:03 p.m.,*
in response to message #2 by Jose Poyan

Hi Jose,

I don't have this rattling problem on the HP-67, but I did have it on an HP-45. There are metal strips under the plastic keys, which give to hp calcs keyboards their distinctive click. Theses strips were cracked, and even cut on some keys. So keys losed their firmness, and the electrical connection was lost on cutted ones. Il repaired the connections by soldering tin on the cracks, but I lose the elasticity of the keys.

Regards

Pierre

Re: HP-67 keyboard restoration

*Message #4 Posted by **Jose Poyan** on 14 Apr 2010, 4:13 p.m.,*
in response to message #3 by Pierre Brial

I see... Which strips were broken on your hp45? The bent strips or the contact strips on the pcb?

As I said I dind't open my hp67, but I can tell you about a repair I did on my HP34c last week.

I bought from ebay silver contact paint that comes in small 3 grams glass tubes, for £4. I used this paint to cover the metalic strips on the pcb. I used it too to paint the contact strip on the membrane that was broken for the key "1" (my version of hp34c uses a plastic membrane for the keyboard, with bubbles on the keys and metalic strips for contacts) This failed becouse the bubbles deform when pressed and the paint is not elastic.

Then I bought cupper tape, that are used in plants to avoid insect, and you can get from ebay for £3, and it's the same as the aluminium tape but cupper one. I cut a very small square. The glued side is not conductive, so I turned it over almost from the middle to make a doble conductive tape and I left a thin strip with glue. I put it under the membrane, and it worked. Most notable I didnt loose the elasticity of key "1", it feels exactly the same. Yes, I scratched a little with my screw driver on the pcb, but it didnt mind since I completed the scuffs with Silver paint which proved to be very conductive.

I suggest you to use Silver paint for the contacts. Please let me know if you find the bent strips bronken when you open your hp67.

regards, jose

PICS OF A HP-41C HALFNUT

*Message #1 Posted by **Philippe Pizzaferri** on 11 Apr 2010, 4:45 p.m.*

Hi,

I just want to share with you some pics of one HP-41C halfnut I just bought recently for 27 dollars. This unit is from the estate of an engineer in Oregon involved according to the seller in the early development of such devices.

It works perfectly after some repairs (Beeper and bottom shell were missing)

I have also pluged a quad module which has been recognized....

You know what, sometimes, I feel Lucky :)

Re: 9114B Battery Replacement?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 11 Apr 2010, 5:59 p.m.,*
in response to message #1 by Ángel Martin

Ola, Ángel; ¿como estás?

I once had to replace the battery that came with the HP9114B I have. At the time I tried finding a replacement, I found only a 1.3Ah battery against the 2.4Ah that came with the unit. Here you can see the pictures I took when testing the batteries (pictures were edited: cut and resized)

Considering that the smaller unit would provide shorter working periods, I tested it and it worked well. I actually avoided using it without the charger, as stated in the 9114B manual, so I thought that the worst case scenario would be the battery not providing enough peak current, like when the main driver motor started spinning the disk. I had no problems working with the 9114B with it for a while, and after the new replacement was delivered I replaced it. Have been using so far, for about two years.

Hope this helps a bit.

Luiz (Brazil)

A thousand dollars is still a large amount of money to me!

Re: OK - Who just paid $987 for an HP-70?

*Message #8 Posted by **Michael de Estrada** on 10 Apr 2010, 11:53 p.m.,*
in response to message #6 by Reth

Reth, I understand what you are saying. I paid $395 in 1972 for my HP-35 V2, which would be about $2000 today. That was 2 weeks takehome pay for me back then. You can easily find a very clean complete set today for under $500. Even the HP-70 which sold for $275 in 1975 would be nearly $1100 today. But all consumer electronics have come down dramatically in price since those days, so the sale price of these antiques is totally unrelated to their inflated original prices. I see the value of these calculators in terms of their uniqueness and the milestones that they represent and not in terms of their simple rarity. Other than the unique color scheme, there is nothing special to me in the HP-70. It was not the first to introduce some new technology; its only real claim to fame is that the run was short, so the supply is scarce. I am not one of those collectors who just must have a "complete" collection at any cost. You might have noticed that another HP-70 has shown up on TAS, and perhaps the floodgates will open as other people decide that now is the time to cash in their gold while the price is high.

Re: OK - Who just paid $987 for an HP-70?

*Message #9 Posted by **Reth** on 11 Apr 2010, 1:12 a.m.,*
in response to message #8 by Michael de Estrada

Michael, I get your point too. I wouldn't pay even a dollar for the HP-70, it does nothing for me. Apparently though it does for the guy who paid $987 and there is where difference lays. As time goes by people can afford more and pay big money for things based on sentimental value rather than anything else. Someone actually made this point here some time back - possible scenario - it was the first calc in the beginning of someone's successful career or something he/she couldn't afford back then...
Cheers

Re: OK - Who just paid $987 for an HP-70?

*Message #10 Posted by **Keith Midson** on 11 Apr 2010, 1:37 a.m.,*
in response to message #9 by Reth

I bid 4 times on this item, and was the runner up with $977. Guess I didn't quite want it as bad as the other person! Cheers, Keith

Hello!

> Quote:
>
> completion of a collection is a powerful urge.

Certainly. But then, a "complete collection" is an impossible thing to achieve. No matter what one collects. And once one accepts that as a fact, the urge or pressure to "complete" the collection is greatly relieved. To me, it does not matter much if I am one piece or two pieces or ten pieces short of the ideal "complete collection". Therefore, the value of an individual item does not change depending on the rest of my collection. Makes life easier (and

cheaper!) if you can see it that way :-)

Regards, max

True, a collection should never be considered "complete", but half the fun is growing and changing a collection as you go. I have more than 120 HP's (and about 50 Sharp pocket computers - sorry!), and I get a kick out of buying and selling stuff as my collection matures.
when I say "complete" a part of the collection, I mean that the HP-70 completes the 'Classic' series of my collection, where I have 3xHP35's, 2xHP45's, 1xHP55, 2xHP65's, 2xHP67's (including a prototype - ignoring the fact that the 67 isn't technically a Classic), and 1xHP80. Part of completing the collection is getting the boxes, manuals, cards, etc.
I'm sure I will keep going, but hey it's a lot of fun!
Cheers, Keith

Hello!

> Quote:
>
> ... but hey it's a lot of fun!

It certainly is. But for me, part of the fun comes from "finding" my calculators at bargain prices. I don't think that I paid $987 for all my 75 (+/- 1 or 2) Hp calculators together. And for me too, the HP-70 is the only classic still missing (and the 27 the only second-generation one). But paying as much for one calculator than for all the others together? Certainly not.

Regards, max

NB: I just received a Novus Mathematician PR in the mail, a very rare RPN programmable calculator (here in Europe at least, actually

the first one I ever saw advertised). The Batteries still hold their charge. With pouch and reference cards only 24 Euros. Much more fun than buying an HP-70 for 1000 Euros!

in response to message #16 by Maximilian Hohmann

That's a typical German attitude: It must be a bargain otherwise I'm not happy. That's why they got all these discounters like Aldi, Lidl, ... ;-)

Sorry, Maximillian, I couldn't resist, don't take me to seriously! I also got an NIB unused 11C for $40, and I still tell the story how I got it. On the other hand, I once bought an expensive calculator because I knew that such an opportunity would never return. I'm excited about both, the cheap and the expensive one.

*Message #18 Posted by **Keith Midson** on 12 Apr 2010, 3:35 p.m.,*
in response to message #17 by Juergen Keller

I'm with Juergen, I love getting a bargain as well as paying top dollar. Some of my bargains include a 45 for $5 (last week!), mint boxed 28S for $10 (not on TAS), and a dusty box of about 7 HP's for $50 that included a mint 11C, fair condition 28S, very good condition 19Bii, a good condition 20S, and a few others. I also picked up a 42S for $85 last year.
The most i've ever paid is US$900 for an HP.
I also enjoy selling stuff as well - cleaning up bargain finds, and selling off for others to enjoy.
Cheers, Keith

15C for $44

*Message #19 Posted by **Michael Meyer** on 12 Apr 2010, 5:23 p.m.,*
in response to message #18 by Keith Midson

I bought an HP-15C on the auction site for $44. Came last Friday. Scratched up bezel, and obliterated back label and no feet. But it works perfectly. I printed a replacement back on my laser printer (on plastic paper) from a MoHPC image (Thanks Dave!), glued it on, replaced the feet... and I have a pretty decent looking, "Kick Around" 15C. The one I have on display is much too clean to be throwing it in a briefcase, etc. Nice price for a very useable machine!!

Not attitude, but necessity, now that the Swiss have sold our bank account information to the tax office ;-)

But to rehabilitate my fellow countrymen: I must confess that I too have once paid a four-figure amount for a watch manufactured by HP (however immediately compensated by buying a very smart Omega watch on the bazar in Istanbul).

Greetings, Max

in response to message #9 by Reth

Reth, I second you. That's about what I mentioned in a previous thread. Why worry about prices other people pay (for whatever items, not only calcs) at all? The only reason I can figure out is that this lowers the chance that I can get one at a reasonable price. That's why I haven't got a Van Gogh: there are many other people willing to pay MUCH more than I. I have to accept this fact, period.

in response to message #23 by Dave Shaffer (Arizona)

Given all this discussion on who can afford what, and how much some people are prepared to pay for HP stuff, I'm interested to know what the highest known price is for an HP calculator (not counting the HP01 watch)? Is this humble HP70 in the running, or has there been anything higher?
Cheers, Keith

*Message #25 Posted by **bill platt** on 12 Apr 2010, 10:32 a.m.,*
in response to message #24 by Keith Midson

There were NIB 41CX coming from somewhere in England I think, about 4 years ago that fetched huge prices. I think they may have topped it, but not by much.

15C will go for $500 from time to time.

Re: OK - Who just paid $987 for an HP-70?

*Message #26 Posted by **Michael de Estrada** on 12 Apr 2010, 11:43 a.m.,*
in response to message #24 by Keith Midson

I seem to recall that several years back on TAS a Japanese buyer paid $995 for an HP-65 that was a complete working set in excellent condition. Although I have never paid close to that for my 4 HP-65's (I have since sold one), I find that somewhat justifiable in that the HP-65 represents a milestone in calculator history, being the first pocket calculator of any brand with a card reader. Also, many US auctions are not open to foreign bidders. The most I ever paid for an HP calculator was for my HP-35 Red Dot, and it was considerably less than $987. I must say, though, that I might be willing to pay that much for something truly rare and exceptional, such as an HP-95C, provided it was complete. But, like most of the rest of you, I will spend my life just watching HP-70's sell for high prices to people willing and able to pay. Oh, and going to museums to see Van Gogh's.

MLDL2000 V2 update

*Message #1 Posted by **Meindert Kuipers** on 10 Apr 2010, 12:57 p.m.*

I finally found some time during the Easter weekend to work on my breadboard version of the MLDL2000V2, and I now have the last bits of design figured out. I have worked out most of the schematics and have started working on the layout. I hope to be in a position to request quotes for the PCB and assembly within a few weeks, and may need to do some changes based on the input of the assembler. Anyone who is interested in obtaining the MLDL2000 should contact me, so I can have an idea of quantities, as that is important for the quote. Technical details will follow when I have the feedback from the assembler (this may influence the choice of some of the components).

Meindert

*Message #3 Posted by **Philippe Lasnier** on 12 Apr 2010, 9:00 a.m.,*
in response to message #1 by Meindert Kuipers

Hi Meindert,

I would be interested too, although this depends to a certain extent on the actual cost; are we talking roughly the same price as the previous one, 260€? What about an enclosure for it? You said this won't fit any more in a card read's enclosure. Will there be something else to fulfil to same function?

On an other note, and if you don't mind my mentioning it, your site gives out text for links using a dark blue colour. On your starry black background this is simply unreadable (I have to select the text so that the colours get inverted to be able to read them). Any chance you could change that?

Best,

Philippe

*Message #6 Posted by **Meindert Kuipers** on 13 Apr 2010, 12:59 p.m.,*
in response to message #1 by Meindert Kuipers

Just a few additional remarks: - price is unkown, this depends on quantity and the quote I get from the assembler and PCB supplier - there will be only one PCB, in a box. The exact size to be determined - the new unit will be in an external housing (fully assembled as an option) buyers will have to supply a module housing for the cable - memory capacity will probably be increased (depending on component cost an availability) - HP41 Analyzer will be fully integrated - SD card controller (fro micros SD card) is optional, this is an additional PCB, which is commercially available - power consumption will be much better (except when using the SD card controller) - integrated LED's, programmable with mcode

Meindert

Re: MLDL2000 V2 update

*Message #7 Posted by **Ángel Martin** on 13 Apr 2010, 2:02 p.m.,*
in response to message #6 by Meindert Kuipers

Hi Meindert,

I too would get one, sounds too good to pass on...

BTW I never thanked you for the updated Mk2 manager SW - it works like a champ for me. I've been using it lately to port old user code programs into roms - and the one-line-per-word option is just a godsend.

Keep up the good stuff!

HP 48gII displays division as a fraction

*Message #1 Posted by **Peter Klein** on 9 Apr 2010, 5:19 p.m.*

A colleague has a problem: His HP 48gII is displaying the results of division as a fraction. If we key in

2 Enter 5 /

The display reads

```
2
-
5
```

I'm an RPN guy, not RPL, and neither of us can figure out how to change this back so division displays as a real number with decimals. The calculator is in Fix 3 mode. Addition, multiplication and subtraction seem to work as expected.

Thanks

Edited: 9 Apr 2010, 5:49 p.m.

Re: HP 48gII displays division as a fraction

*Message #2 Posted by **Allen** on 9 Apr 2010, 6:01 p.m.,*
in response to message #1 by Peter Klein

he should read his manual.
http://h20000.www2.hp.com/bc/docs/support/SupportManual/c00043591/c00043591.pdf

Re: HP 48gII displays division as a fraction

*Message #3 Posted by **bill platt** on 9 Apr 2010, 6:03 p.m.,*
in response to message #1 by Peter Klein

Read the manual, look at the system flag settings, under MODE. Look at the CAS settings there. Sounds like it has to do with not being in approximate mode or something like that.

Re: HP 48gII displays division as a fraction

*Message #4 Posted by **David Hayden** on 10 Apr 2010, 9:39 a.m.,*
in response to message #1 by Peter Klein

He's in exact mode. If he wants it behave more "normally" he can switch to "approximate" mode by holding down the right shift key and pressing ENTER. Note that the small "=" indicator at the top will change to a squiggly equal sign to indicate approximate mode.

If he wants to stay in exact mode and just convert the value to a number, press right-shift then ENTER to execute the ->NUM function.

Tim wrote a very good new users guide to the 50g that should apply to the 48 gii also. I urge your friend to work through it.

Re: HP 48gII displays division as a fraction

*Message #5 Posted by **Tim Wessman** on 10 Apr 2010, 10:14 a.m.,*
in response to message #4 by David Hayden

It isn't perfect, but it was written from the approach of "lets teach you about the most common stumbling blocks, while introducing some of the really neat things this calculator does. By the time you go through it, you should be able to use it for day to day calculations without problems and at least have an idea where to go if things go wrong."

http://forums13.itrc.hp.com/service/forums/bizsupport/questionanswer.do?threadId=1414559

Click on the paperclip on the second post there. It was the first placeI could findit.

I'd download it and tell your friend to go through it. If I recall, it talks about real/approximate atleast 3 places. Don't you lovecomputers with broken keyboards. . . (using the wife'smachine that is full of food under the keys :-D)

TW

Re: HP 48gII displays division as a fraction

*Message #6 Posted by **Peter Klein** on 10 Apr 2010, 5:32 p.m.,*
in response to message #5 by Tim Wessman

Thanks, everyone. It was indeed exact vs. approximate mode. My friend is like many people who own a graphing calculator. He knows well the features he uses every day, but has forgotten the ones he doesn't.

The 48-50 series is complex enough that one errant keystroke can sometimes send you to the Land of Oz. I have a 48S, but only occasionally use it, mostly for unit conversions. Most of the time, I reach for my 32S or 32Sii.

HP97 box restore project (you may remember)

*Message #1 Posted by **Alberto Fenini** on 9 Apr 2010, 2:22 p.m.*

Hi everybody
someone of you may remember I was working on a restoration
project of an HP97 box, received in bad conditions.
After I while, since the restoration was too hard for the results
I was getting, I have purchased a flat bad scanner,
and scanning the good parts, I have rebuilt the box.

What you see (look at it compared to a mobile phone size)

is a *mock-up* one third of the original size
The idea is then print this out in original size (I have worked on the original size with the scanner) on a self adhesive film, and then put it on the original box.
Actually I have scanned several rare boxes, mostly for HP accessories, should anybody be interested in these, I'll be more than happy to share those **heavy** files with everyone.
As always, feedbacks are welcome !
Enjoy your weekend, Alberto

Re: HP97 box restore project (you may remember)

*Message #2 Posted by **Juergen Keller** on 9 Apr 2010, 3:24 p.m.,*
in response to message #1 by Alberto Fenini

Ciao Alberto,

you are a real enthusiast! The box looks quite nice. Such small mock-ups might also be interesting to show the box besides the calculator in a showcase.

Next, buy a 3D scanner, scan the cases of some HP calcs and create transparent replica cases so you can see the innards ;-)

Take care, Juergen

Re: HP97 box restore project (you may remember)

*Message #3 Posted by **Alberto Fenini** on 9 Apr 2010, 3:37 p.m.,*
in response to message #2 by Juergen Keller

ciao Jurgen,
well, actually I'm talking to some people in order to understand
I much would it cost a molded replica of a case ....
I'll keep you posted if I make any progress
I may have the printing on film done within the next two weeks,
is failry cheap, I have been talking to a company and the price
is about 35€ per each square meter of printing.
Since it is regardless of the number of objects you put on the surface, you can have ten or more mixed sizes boxes.
Then I'll post some photos of the results
Also, you can morph a 32E box into a more rare 34C box ...
take care my friend, Alberto

Re: HP97 box restore project (you may remember)

*Message #4 Posted by **Juergen Keller** on 9 Apr 2010, 3:44 p.m.,*

OT: Zero feedbackers

*Message #1 Posted by **DaveJ** on 9 Apr 2010, 3:07 a.m.*

I've got a HP calc for sale on you-know-where. Haven't sold one in a long time.

I've had two zero feedback bidders so far, both of which I have canceled because I think they are just scammers trying to up the market price. I know it's to my advantage as a seller, but I don't like it as it ruins it for everyone. And if they are the only bidder they almost certainly won't go through and buy it.

I sell lots of other stuff and never get zero bidders. So is this common when selling HP calcs?

Dave.

Re: OT: Zero feedbackers

Re: OT: Zero feedbackers

*Message #3 Posted by **Bart (UK)** on 9 Apr 2010, 4:07 a.m.,*
in response to message #1 by DaveJ

Hi Dave,

Two possibilities I can think of:
1) Some people (like myself) are put off by shipping costs from far away continents (although I seem to be in the minority if I go by what I read on the museum forum).
2) Sometimes several potential bidders wait to snipe in the last few seconds.(I was watching a Nixie tube calculator the other day and it went from 99p to £32 in the last 5 seconds).

It can be very unpredictable. As a previous reply said, put a link to it in the museum classifieds section.

OTOH we all had to start as zero feedbackers I suppose, and calculator collecting, particularly HP, seems to be a growing fad. You are right though that we do live in a world with scammers and caution should be applied.

I have no concerns about the number of bidders, I know the calculator will sell, I know all about sniping and how the system works. It's just that I found it interesting that I've had two zero feedback bidders on a HP calculator, and never on anything else (and I've sold hundreds of items). Something is definitely suss. But not terribly surprising I guess given all the things I hear about various HP dealers on the auction site.

Dave.

> But not terribly surprising I guess given all the things I hear about various HP dealers on the auction site.

Do you suppose that other HP calc sellers try to keep the prices high with a second (dummy) eBay account?

I think there are some categories of items (e.g., vintage calcs & computers, ...) for which eBay is the easiest way to get one. Perhaps this might be a reason why there are more zero-feedbackers on such items.

Yup, that was how I discovered eBay - decided I 'needed' a hp-41 to replace a Casio and remembering the mystique that surrounded hps (very expensive and RPN) when I was a kid at school in the 70s I made my first of many hp calculator purchases (35, 45, 67, 21, 25C, 34C, 41C, CV and CX, 10C, 12C, 15C, 16C, 48S and 48G and 71B). Thinking about it, I would have been quite a bit richer if my original zero-feedback bid had been cancelled!!

Have since found eBay to also be a good source of Innocenti Mini Cooper (Italian built version of the sixties British Mini Cooper) spares.

Perhaps. But I have contacted these people and they do not reply. Hence they are almost certainly fake accounts.

Dave.

in response to message #7 by DaveJ

Hi,

over the last year or so, I also had some bidders with zero to below-ten feedback points.
I also had slight doubts whether they were serious buyers and would actually pay.

However each of them was a serious buyer so far.

A few years ago, there were some unreliable bidders who did cost me time and nerves.
Then I decided to activate some restrictions for bidders, and actually no fake bidder showed up ever since:-)

Raymond

Re: OT: Zero feedbackers

*Message #9 Posted by **Juergen Keller** on 10 Apr 2010, 2:20 p.m.,*
in response to message #8 by Raymond Del Tondo

I had similar experiences/doubts. But when looking back I conclude that shipping is the biggest problem (especially when you ship worldwide). I had much more shipping related problems than problems with non-paying customers.

People on eBay are just a mirror image of the society; there are good guys and bad guys, but the bad guys are only a minor fraction, as in real life.

But back to DaveJ's suspicion: is it really that easy to have a normal account for selling and a second account to play whatever games you want to play?

Re: OT: Zero feedbackers

*Message #10 Posted by **Bill (Smithville, NJ)** on 12 Apr 2010, 6:48 a.m.,*
in response to message #1 by DaveJ

Hi Dave,

Ummmmm, Zero Feedback Bidders.

I seem to remember that I was once a Zero Feed Back Bidder as we all were at one time.

Question: How does a person get feedback if they are never allowed to bid? Chicken and the Egg.

I would suggest you contact them, see if they will give you references, such as web sites they mey have posted at, or even a phone number. When I sell on the HPMuseum web site, I always check the person out who is wanting to purchase what I have offered. I also check their shipping address to see if it matches their name (not always possible I know).

Of couse, the auction site is a different animal. I'd be wary if you only receive Zero Feedback bidders - any HP calculator should also receive some valid bidders with feedback. I miss the days where the bidders weren't hidden and I could check to see what else they had bid on.

Bill

HP-67 Battery Pack

*Message #1 Posted by **Robert Hollyer** on 9 Apr 2010, 12:55 a.m.*

Recently I decided to replace my Classic series NiCd battery packs with non-rechargeable batteries. Since I wanted to easily swap out the disposable batteries, I purchased AAA battery holders that use 3 cells. These battery holders are somewhat smaller than the classic series battery cavity opening, so I padded the extra space with closed cell foam. I then attached copper tape to the underside of the battery packs, and soldered the connections. The new holders work fine.

My question for the forum members is regarding the voltage tolerance of the Classic series. I chose to install Lithium batteries for the usual reasons, energy density, shelf life, etc, but I didn't give much advance thought to the overall battery pack voltage. However, as I was verifying the battery pack polarity, I noticed that the cumulative voltage displayed on my DMM was about 5.3V. This elevated voltage should have been an obvious consideration prior to building the battery packs. Now I am wondering if I should replace the 3 cell holders with 2 cell holders to drop the voltage down to the range of the original 3 cell NiCd packs, 3.6V.

I haven't looked at a Classic power supply circuit for awhile, so I can't recall if HP used a Zener reference to set the internal voltage levels. I am curious if the internal power supplies are regulated and if the over voltage due to the Lithium batteries is a concern? I should mention that my first test unit is an HP-67, with a rebuilt card reader.

Re: HP-67 Battery Pack

*Message #2 Posted by **John Robinson** on 9 Apr 2010, 10:41 p.m.,*
in response to message #1 by Robert Hollyer

Hi Robert,

I regularly run classic series from 3 x Alkaline AA batteries with no adverse affects. With all "classics", (and even though the 67 is not really a classic, I think it's still the same), the battery voltage goes only to a DC-DC converted inside the calc which generates the three separate voltages the calc needs. And yes, the internal DC-DC converter output voltages are voltage limited by a zener diode.

For more information, take a look at Jacques LaPorte page on DC-DC converters in HP classics

HTH

Cheers, John

HP-19C Paper

*Message #1 Posted by **Wingman54** on 8 Apr 2010, 4:17 p.m.*

Hi, still have an HP-19C thermal prinitng calculator that I STILL use on a daily basis at my current job. Trying to find a supply of the thermal paper and the Internet sites I've tried talk to me like I'm nuts. Maybe I am. Help..... anybody have any suggestions? Appreciate any/all help.

Re: HP-19C Paper

*Message #2 Posted by **DavidShenk** on 8 Apr 2010, 4:53 p.m.,*
in response to message #1 by Wingman54

If it takes the same size paper as the 82143A, I found it at Staples, but they probably have it at any office supply store. They actually have packages of thermal calculator paper.

Edit: I can't find a reference to paper width in the 19c manual, but length is only 22'. The shortest rolls they have at the office store are 85', so as long as the width is the same, you could "roll your own".

Dave

Re: HP-19C Paper

*Message #3 Posted by **Thomas Okken** on 8 Apr 2010, 5:50 p.m.,*
in response to message #1 by Wingman54

The HP-19C (and the HP-10) does **not** use the same size paper as the HP-82143A; it uses narrower paper and the paper holder also requires a smaller roll diameter.

The topic comes up every once in a while around here. There is some information in the forum archives, for example this thread looks like it might be helpful (the 19C is mentioned at the end), and so does this one. Google is your friend.

in response to message #1 by Wingman54

It looks like this place has a size that would fit:

http://www.paperrollsplus.com/thermal%20paper.htm

Dave

Re: HP-19C Paper

*Message #5 Posted by **Michael de Estrada** on 9 Apr 2010, 8:21 p.m.,*
in response to message #4 by DavidShenk

Well, I know the width is 1-1/2" and the only roll diameter listed is 2-1/2" which is way too big (should be about 1-1/2"), so you would have to discard much of the roll. I wish I could remember where I found mine, I think Katie gave me a source.

Re: HP-19C Paper

*Message #6 Posted by **DavidShenk** on 10 Apr 2010, 12:37 a.m.,*
in response to message #5 by Michael de Estrada

There is one on that page I believe would work without any modification:

15XS 1 7/16" x 1" 18 12 rolls/case $19.50

It's 1/16 smaller in width so I don't know if that would cause a problem, but it also has only 18' on the roll, so it looks like the diameter would be OK.

Dave

Re: HP-19C Paper

*Message #7 Posted by **Michael de Estrada** on 10 Apr 2010, 9:38 a.m.,*
in response to message #6 by DavidShenk

Actually, it won't work. I know, because I've tried it. It's the same stuff as Radio Shack Cat. No. 65-708, and that mere 1/16" difference in width is sufficient for it not to engage the feed rollers properly and not fill the guide slot. The paper feeds unevenly and gets crooked as it advances.

Re: HP-19C Paper

*Message #8 Posted by **Bruce Bergman** on 9 Apr 2010, 12:20 a.m.,*
in response to message #1 by Wingman54

Just buy the stuff from Staples. I do that for all of my printers, including the 19c and the 97. It's actually pretty cheap. Just make sure the width isn't too much and then you're set.

If you can't find the exact stuff, let me know and I'll go to my local Staples and track it down.

thanks,

Bruce

Re: HP-19C Paper

*Message #9 Posted by **Wingman54** on 12 Apr 2010, 11:49 a.m.,*
in response to message #1 by Wingman54

Thank you all for your great suggestions. I think I'm going to go with the 38mm variety that I found at Thermal Paper Warehouse. It's quite long and I'll just have to roll my own on the rolls that I kept.

Re: HP-19C Paper

*Message #10 Posted by **Wingman54** on 13 Apr 2010, 9:43 p.m.,*
in response to message #1 by Wingman54

And here's the link for the paper for anyone else's benefit:

http://www.transactsupplies.com/store/38mm-x-40ft-Thermal-Taxi-Cab-Meter-Rolls-p-18904.html

It's a 38MM X 40 FT Cab Meter Roll that SHOULD work just fine. I'll re-post if it doesn't work.

Re: HP-19C Paper

*Message #11 Posted by **Wingman54** on 19 Apr 2010, 7:05 a.m.,*
in response to message #10 by Wingman54

The 38mm paper roll discussed above WORKS LIKE A CHARM!!!!!!! Got a quan of 100 rolls for like $30 (enough for my lifetime!) Perfect width and it's darker than the royal blue of the original paper from H-P. You will have to strip off the first 3-4 feet though as the roll's a little too fat to fit down into the paper well and close the top door. Still gives you 36 feet which is better than the original 22 feet.

More work in progress

*Message #1 Posted by **Eric Smith** on 8 Apr 2010, 4:23 p.m.*

Added three more photos.

Richard Ottosen replaced the keyboard and display kludge I hand-wired last month with a DIY-RPN 3 circuit board with only the keyboard, LCD, and LCD power supply stuffed, and wired to a header for a ribbon cable to the EFM32 development kit. There's a mostly 41-like laminated photo paper overlay attached by tape to the keys. This is a huge improvement for development use.

I've made some improvements to the software, mostly to the keyboard scan/debounce, LCD driver, and power management. The LCD contrast can now be adjusted. There's still a lot of work to be done on the software infrastructure, and I should be able to further reduce the power consumption in the light sleep and deep sleep states.

The calculator software has been coming along slowly, though I should be able to make fairly rapid progress now that the infrastructure code has reached the point of being fairly useful.

Edited: 8 Apr 2010, 4:25 p.m.

in response to message #2 by Brian Walsh

Looks cool.

so what's the EFM32 SDK like? is it stable or new with bits missing. have they supplied useful libraries or is it all writing to the metal :-)

also, which CPU variant are you using - or is this still an option?

good luck!

Re: More work in progress

*Message #4 Posted by **Eric Smith** on 9 Apr 2010, 12:27 a.m.,*
in response to message #3 by hugh steers

The supplied libraries are fairly minimal. I'm programming the bare metal, which is generally what I want. I'm currently using the IAR Kickstart package, which can be downloaded at no charge, but only

supports executables up to 32KB. IAR does provide a standard C library, but I'm not using much of it. I use printf() for debugging, but it's huge, so I won't use it in the real calculator. I'll most likely be switching the GCC anyhow.

The EVM without the segmented LCD driver uses the EFM32G290F128, which has 128KB of flash and 16KB of RAM. It's in a BGA package, which we don't want to deal with, so when we lay out a PCB it will be for the EFM32G280F128, which is in a 100 TQFP. It has the same memory as the 290 but slightly fewer GPIO pins.

It is expected that there will be new parts with larger memory announced later this year, some of which might be pin-compatible with some of the current parts, which would provide a convenient upgrade path.

Ram card

*Message #1 Posted by **John Mosand** on 8 Apr 2010, 6:44 a.m.*

I have a 128K ram card (82215A). When inserting it in my 48SX, I get "Invalid Card Data". At the same time, the "Low Battery" indication comes on. I have put a new battery in the card. No difference. When I remove the card, everything seems normal. What can be the matter?

Re: Ram card

*Message #2 Posted by **Raymond Del Tondo** on 8 Apr 2010, 7:32 a.m.,*
in response to message #1 by John Mosand

On the SX, an easy way to "format" a RAM card is to temporarily merge it with main RAM, then unmerge (free) it again.

So if you have the card in port 1, first perform **1 MERGE** ,
and after a few seconds **{} 1 FREE** . The brackets to the left are an empty list.

HTH

Re: Ram card

*Message #3 Posted by **Ron G.** on 12 Apr 2010, 1:21 p.m.,*
in response to message #1 by John Mosand

"Invalid Card Data" is the expected response, until you have data on the card. It does not indicate a bad card or other problem.

Got that? [off topic]

*Message #1 Posted by **Paul Dale** on 8 Apr 2010, 2:09 a.m.*

Completely off topic but fun nonetheless...

(Be sure to read the explanation below before loading the video.)

Got That?

Several years ago, Rockwell International decided to get into the heavy duty transmission business. They were getting ready to tape a first introduction video, and, as a warm up, the professional narrator began what has become a legend within the trucking industry. This man should have won an Emmy for his stellar performance. Now remember this is strictly off the cuff, nothing is written down. It became the biggest talk in the industry, but had nothing to do with the new product which they were introducing.

http://home.comcast.net/~steveham21/turbo.mpg

Re: Got that? [off topic]

*Message #2 Posted by **Eric Smith** on 8 Apr 2010, 2:54 a.m.,*
in response to message #1 by Paul Dale

I don't believe it was off the cuff, given how much similarity there is to the better-known turboencabulator paper.

Re: Got that? [off topic]

*Message #3 Posted by **Howard Owen** on 8 Apr 2010, 5:07 a.m.,*
in response to message #1 by Paul Dale

There are tons of these on YouTube. This one features the same comic, with a longer script. It's not as tight as the one you posted, so I'm guessing it's an earlier offering. But it has some hilarious little throwaways that didn't make the cut, like the mention of the Peruvian Institute of Scatological Science.

This one is still under the Rockwell Logo, but features a different comic. To my taste, he's not as funny as the other guy. The script sounds very similar to the one you posted.

This video features the same actor, looking quite a bit older. He's joined by two other comics. This is hands down the funniest of the videos I watched, though it didn't seem promising up front. There is lots of new material.

Then, we have this video, that comes from Sun Microsystems. It has a new actor (a Sun manager no doubt) who really really sucks. The script has a few minor tweaks, but is essentially the same. The differences that stand out are that the product name has been changed to the "Heisenberg Compensator," and that the shtick is illustrated with Sun hardware video amd animations.

Hard to tell from the video, but this guy may be claiming he came up with the turboencabulator routine. Either

that, or the comment up front is part of the gag. Either way, this presentation at a GE retiree luncheon from 2008 is funny to me because it's geekier. It's also a good example of why most engineers shouldn't quit their day jobs for stand up :)

The ending is hilarious. I wonder who makes the light bulb?

(Response referred to below was mine. I rolled it into this posting.)

HP45 Original Price

*Message #1 Posted by **Bon** on 8 Apr 2010, 12:06 a.m.*

I purchased an HP45 just after they were released. I had to travel to an HP business office to do this. I picked up and paid for the calculator and wrote a check for something like $750.00!! Several weeks later, and out of the blue, I received a refund check from HP. They sent me the difference between what I paid and the $395 "final" retail price. I was quite surprised as I didn't have any idea that they were going to do this! I was a student of electrical engineering at the time. Money was precious but I absolutely needed the edge that the HP45 offered as I didn't know how to use a slide rule at all. Whew! That sure was a lot of money in the early 70's!

Re: HP45 Original Price

*Message #2 Posted by **Michael de Estrada** on 8 Apr 2010, 12:20 a.m.,*
in response to message #1 by Bon

Well, I had to pay $395 for my HP35 in 1972, before they dropped the price to $295 in 1973.

Re: HP45 Original Price

*Message #3 Posted by **Mike Morrow** on 8 Apr 2010, 12:31 a.m.,*
in response to message #1 by Bon

Funny.

I have never known of ANY engineering student before the mid-1970s who was NOT very comfortable with the slide rule. Anyone otherwise would have chosen the wrong profession.

I was an EE undergrad from 1970 to 1974. I was very interested in the HP product line beginning with the HP-35 in 1972, followed by the HP-45 in 1973. I never saw an HP-45 discounted, yet I never saw a price greater than $395 ($2000 in 2010!) for it. I never saw a price for any HP handheld (HP-35, 45, 80) that exceeded $395 until the HP-65 appeared at $800 in 1974.

My interest in HP at that time was academic...the HPs were an extraordinarily expensive way to do the calculations that could be performed by a $35 slide rule. That's all that any engineering student needed at that time, at least at Georgia Tech. Professors did NOT allow electronic calculators on tests, so slide rule expertise was mandatory, no matter how much money a very few students had to spend on unnecessary trinkets like an HP.

Edited: 8 Apr 2010, 12:33 a.m.

Re: HP45 Original Price

*Message #4 Posted by **bill platt** on 8 Apr 2010, 1:06 a.m.,*
in response to message #3 by Mike Morrow

That's an interesting anecdote. When did GT change policy and allow electronics?

Re: HP45 Original Price

*Message #5 Posted by **Mike Morrow** on 8 Apr 2010, 10:20 a.m.,*
in response to message #4 by bill platt

Kindly observe that my comment states that calculators (if that is what you mean by the ambiguous term "electronics") were NOT allowed on any *test* that I knew about at Georgia Tech, more than 35 years ago. Logically then, I can not answer your charcteristically dismissive question about when calculators became acceptable for tests at GT. I graduated before that era.

Are we clear?

Now, to other things. Here's some more price equivalents, then vs. now, with inflation data from US BLS Inflation Calculator:

As a student I could only afford, barely, a Bomar 901 four-function calculator ($130 in 1972, $675 in 2010). I bought the new TI scientific SR-50 ($150 in 1974, $660 in 2010) after I graduated and was working in the US Navy nuclear program.

I still have these units, working. Those were fun times, watching the competition between HP and TI. TI one-up'd the HP-35 in 1974 with the SR-50, the HP-45 in 1975 with the SR-51A, the HP-65 in 1975 with the SR-52, and the HP-55 in 1976 with the SR-56. The technology and capability of the HP-67 ($450 in 1977, $1610 in 2010) was very soundly trumped by the TI-59 ($300 in 1977, $1075 in 2010) in most respects except the extemely important one of reliability. For that reason alone, I ultimately selected the HP-67 and -97 for use in several military (submarine) applications, reserving the TI-59 for "hobby" use.

So you never traveled at that time. I remember a price of 1200 DM (well, 1199 DM ;)) for an HP-45 in late 1973, when I first saw an ad sheet for it at my university. Looking at the prices of HP calcs today, that trade policy didn't change :(

in response to message #3 by Mike Morrow

I was not your traditional engineering student of the 70's. Sadly, I was clueless in high school and avoided any and all science and math. It was only later that I realized my calling. I entered the College of Engineering for a degree in electrical engineering without sufficient preparation and without ***any*** knowledge of the slide rule. I really, really had to scramble! I needed every advantage I could get and the HP45 was such an advantage!! I died when my batteries died. In large part I owe my success to my HP45 calculator - seriously! I still practice electrical engineering and have the title of Director of Research of which I'm very proud. I still use RPN HP calculators to this day. Regards!

Some time ago I found references about a "sub-compact" car (new, not used) costing around U$S 2000 in the USA around 1970 (i.e.: Ford Pinto). I would like to hear from you if that was true and, if is so possible to say that, at the time of it's introduction, an HP-65 costed about a third of the price of such a car.

BTW: My USA electronics magazines from 1974-1975 costed in the range of 0.50 or 0.75 U$S per issue; today prices for current, similar items are 10x those prices... (regretably, in my own country, inflation has been about 1E10 between 1970 and 1990).

Yes, this is quite accurate. I purchased a new California-emissions (higher cost) 1974 Opel Manta (Adam Opel AG) for $2800. Any way that one looks at it, HP calculators were very very expensive 35 years ago.

If one did not insist on a new car, it was possible to buy a reasonably servicable used car for the price of a new HP-45 (not 65) in 1973. I mentioned that possibility in a "Memories" post I made on this site in the late 1990s: HP-45 vs. Used Car.

Whilst we are making things clear, in your memory you say:

> Quote:
>
> I am most attached to the HP42S, the best **pre**-RPL calculator ever made.

Which should read **non**-RPL, as the HP28C preceded it by more than a year.

The 28C was my first calculator, which I purchased in my second year of university for around ZAR1000, and comparing that to the annual cost of studies of ZAR3500 IIRC, it was a lot of money. I was driving in a used car purchased for ZAR600.

TI Selling new TI NSpire Touchpad

*Message #1 Posted by **Namir** on 7 Apr 2010, 9:14 p.m.*

Hi All,

I just got an email from TI announcing that they are starting to take orders for the new TI Spire CAC/non-CAS Touchpad. I went a head and placed an order for the calculator and for the accompanying software.

Namir

Re: TI Selling new TI NSpire Touchpad

*Message #4 Posted by **Eddie W. Shore** on 10 Apr 2010, 2:47 a.m.,*
in response to message #3 by Namir

The touchpad arrived. I find it easier to type notes on the Touchpad version rather than the clickpad - despite the alpha keys are smaller on the Touchpad version.

In addition, any public library objects must be saved in the MyLib folder, Problem 1. Otherwise refreshing the libraries won't pick up the objects for the catalogue (I consider this a bug)

in response to message #1 by Namir

Hi,

do you know if there's an SDK for the new nspire? i had a quick look on the ti site and didnt find anything. i saw the 89/92 sdk, but nothing for the nspire?

thanks.

Re: TI Selling new TI NSpire Touchpad

*Message #9 Posted by **Don Shepherd** on 10 Apr 2010, 11:48 a.m.,*
in response to message #8 by hugh steers

Hugh, I don't know if that is possible on the NSpire. It doesn't support "apps" in the traditional TI-83/84 sense, only the applications it comes with (calculator, graphs, etc.). People have written custom .tns libraries (conics, linear algebra, and number theory), but those can be done on any NSpire. I read that someone developed something to let you run C code on the NSpire, but it seems to require a much earlier NSpire operating system, so I doubt that is very viable.

TI NSpire Touchpad now available in UK (was Re: TI Selling new TI NSpire Touchpad)

*Message #10 Posted by **Bart (UK)** on 20 Apr 2010, 6:20 p.m.,*
in response to message #1 by Namir

All this talk, the nice pics on this forum... "resistance is futile", my non-CAS Nspire Touchpad arrived today and I have spent most of my evening playing with it :).

I ordered it from a supplier with "educational supplies" in their title, so my wife (a teacher) who answered the door when it was delivered, was very curious and all around me until I opened it, and then replied somewhat in disgust "oh, another one of *those*". To quote a tagline I've seen on other collector forums "my biggest fear is that when I die, my wife will sell it all for what I told her it cost".

HP 82104A card reader, fork-shaped brass tongues, REPAIR PROBLEM

*Message #1 Posted by **Markus Sanke** on 7 Apr 2010, 5:03 p.m.*

Hello HP-calc-communuity,

I hope the collected experience of this outstanding forum can give me some information to solve a serious problem:

I recently repaired the "gummi wheel issue" of my HP 82104A card reader, using the "O-ring method" described in several documents here. That worked very fine, the movement of the magnetic card through the slit is now smooth and regular.

BUT: While opening and disassembling the card reader's case the two fork-shaped brass tongues and their respective small(in fact very small!) plastic counterparts FELL OUT. I afterwards found out that the uppermost (i.e. far from display) tongue serves as a simple SWITCH to turn the motor on and off while inserting and propulsing the card through the reader. But what purpose is the second, lower (i.e. nearer to the display) tongue? What movement must this part perform while a card is read, and when? The small plastic counterpart of this tongue is different from the other one, it is even smaller, smoother and has no distinct "nose" or cam. I don't get this tongue to bend and move upward while a card is read in the reader, in no stage of the process... The other tongue bends up very well when a card is inserted and always closes the (funny construction...) electric traces on the printed circuit covering the whole installation, and it opens again when the work is done. BUT the other strip seems to have nearly no effect. It does NOT move up in any stage of the card movement process. This is why I always get a "MALFUNCTION"-message. I think the signal from the second circuit is responsible for this error.

I hope I could describe my problem precise enough for You to know what my issue is. So I can only beg You to PLEASE help me with any information You can give me! What can I do, what must I observe, what method of repairing and testing do You propose? If You need more information I could of course publish some photos with additional text showing the parts I mean.

Thank You very much in advance for any support and best wishes from Bamberg, Germany!

Markus Sanke

Re: HP 82104A card reader, fork-shaped brass tongues, REPAIR PROBLEM

*Message #2 Posted by **Ignazio Cara (Italy)** on 8 Apr 2010, 4:44 a.m.,*
in response to message #1 by Markus Sanke

Hello Markus, the second tongue enables the magnetic head to read/write the card. If this circuit is not closed by the contact of the tongue with the upper contact, you will always have an error message. It's somewhat strange and unusual that the two contacts and two cams have gone amiss. After this maybe you have made an error in reassembling the contact and one cam. If you can, post some image of the actual assembly so we could see if there is any error in the reassembly.

Regards

Ignazio

Ignazio

Re: HP 82104A card reader, fork-shaped brass tongues, REPAIR PROBLEM

*Message #6 Posted by **Diego Diaz** on 8 Apr 2010, 11:57 p.m.,*
in response to message #3 by Markus Sanke

Hi Markus,

I've taken a look at your pictures and think I may shed some light with your Card Reader issue.

First, to answer your question regarding the glass tipped part in the circuit: it is a phototransistor, it's used by the Write Protect detection circuit. Therefore it has nothing to do with the reading trouble.

The shape of the actuators (the plastic balancing pieces) is indeed diferent as they should. The smaller one is for the head activation circuit. While the larger is for the motor driver circuit. They both look good in your pictures.

The contact blades ("tongues") don't look that good though... the faulty one shows a slight bending which, in my opinion, may prevent it to work properly. Both blades are identical, so you can swap them to test if the actuators are working.

Should this was the case, my advice at this point is that you try to gently unbend it in order to turn it back to the shape of the working one. You may be able to to this just with your finger tips.

Hope this helps.

Best wishes from the Caribbean Sea.

Diego.

Re: HP 82104A card reader, fork-shaped brass tongues, REPAIR PROBLEM

*Message #8 Posted by **Markus Sanke** on 9 Apr 2010, 6:32 a.m.,*
in response to message #7 by Ignazio Cara (Italy)

Hello to You all (wow, around the whole globe, as I see...)!

Thank You Ignazio, Diego and Ed for Your answers; I'm happy to hear that my parts are at least not too damaged.

Two short informations would help me to finally solve my problem:

#1 While moving through the slit, what is the exact time-scheme the two contact blades should operate ("up" and "down" in relation to time or card-way). I description or diagram would help!

#2 Could You describe the correct form of the blades? Must they be absolutely flat except for the two side-parts bending upward? Or do they have a kind of "pre-bending"?

I will try the changing of the two blades again, but I probably already did it without any improvement. I have the impression that the small actuator for the defective blade is not moved/rotated enough by the card. Maybe this is also due to a wrong pressure or distance of the two module halves?

Thanks again! Maybe one of You finds time to answer again! (I am very impressed of the kind helpfulness in this forum!!!!)

Best wishes

Markus

Re: HP 82104A card reader, fork-shaped brass tongues, REPAIR PROBLEM

*Message #9 Posted by **Diego Diaz** on 9 Apr 2010, 10:53 a.m.,*
in response to message #8 by Markus Sanke

Hi Markus, Ignazio, all...

(Ignazio, thanks for asking, I'm fine and hope you're also doing well. Currently in the Dominican Republic taking some weeks of rest... well, more or less... ;-)

To your questions Markus:

The first actuator to operate is the (so called) motor driver. In fact this is properly a Card Insertion detect switch by means of which the internal circuit is waked up and, if necessary, the 41 CPU will also be waked up. It is the CPU that in the end instructs the Card Reader circuit to turn the motor on.

Once the card is running through its path, the head actuator should make contact at the point in which the card reaches the head tip.

Here is an image of how the contact blade should look like. Is it obviously not to scale, and drawn from my head so please take it with a grain of salt... :-)

The long blade should be *very slightly* (less than pictured) bent upwards. Just enough to settle in place with very little pressure on its ends. This bending should look convexe along the blade. In your pictures a small concave bending shows up just beneath the actuator hinge and I think this must be corrected.

Note that this is not the "factory" shape, but I found it easier to produce that small banding than get it back to full straight when a repair is needed.

The actuator could in fact has gone so badly worn out that it can no longer tilt enough to activate the switch. This looks quite improbable to me though. So let's try the easier and if it doesn't fix the trouble will look further.

Hope you can get your Card Reader back to work soon.

Cheers.

Re: HP 82104A card reader, fork-shaped brass tongues, REPAIR PROBLEM

*Message #12 Posted by **Markus Sanke** on 11 Apr 2010, 8:25 a.m.,*
in response to message #10 by Ignazio Cara (Italy)

Thank You again Ignazio and Diego! I spent another two nights in attempting to repair my reader with Your friendly help. The effect was as follows:

I now got the two switch contacts into the shape of Diego's drawing and Ignazio's photo. They both had to be reshaped, using slight pressure of the fingers and finally with the help of tweezers.

Now the situation is this: When the upper board, bearing the brass contacts and their actuators, is isolated (i.e. NOT mounted onto the lower half of the slit assembly), BOTH contacts now move upward when touched by a slightly moving finger. Only the sligtest pressure is sufficient. The movement of the contact blades is satisfactory, the center part moves upward for more then 1 mm.

BUT if I re-assemble both halves of the mechanism, again only the first switch works. Te second one (that with the smaller actuator) is kind of blocked or disabled, no real movement occurs when a card moves along the actuator.

I experimented with different distances of the two halves, by screwing up and down the screws. Last night I got the card reader working for about one hour, demonstrating that principially everything is still all right (Writing and re-reading a program over two magnetic cards). But after a few tests the "Malfunction"-message appeared again, now mixed with "Card Error"- and "Checksum Error"-messages.

I think the problem now lyes more in the way of re-assembling the two halves. The distance of both parts seems to be a crucial issue. If too tight, the motor stops when a card is inserted. If too wide, no regular movement occurs and the above error messages appear.

May be one of You could again check my description and offer me some helpful ideas! If photos are neeed, I can again publish some!

Best wishes to all of You

Markus

Re: HP 82104A card reader, fork-shaped brass tongues, REPAIR PROBLEM

*Message #14 Posted by **Diego Diaz** on 12 Apr 2010, 6:02 p.m.,*
in response to message #12 by Markus Sanke

I agree. At this point some pics, similar to the one posted by Ignazio, from your two contact blades will help a lot.

It is quite unlike that the spacing between the PCB and the reader's plastic block require any adjustment at all.

Cheers.

Re: HP 82104A card reader, fork-shaped brass tongues, REPAIR PROBLEM

*Message #15 Posted by **Markus Sanke** on 15 Apr 2010, 12:52 p.m.,*
in response to message #12 by Markus Sanke

Hello again,

I made a short video showing the upper half of the assembly with the two contact blades. When I slightly glide on the lower side with a finger(simulating a magnetic card), the first contact blade always moves up for a good amount. The second one often, but not always moves the same way. The axis-part of the second blade is very loose, sometimes allowing to "jump" up and down (see video, from 0:36 on).

Link to Video

If I reassemble the two halves, only the first contact works; the second one does not move up and close the switch.

I don't believe that the form of the two brass stripes is responsible for the error. If I change them, again contact #1 is good, #2 is bad. I show You the actual form of the two blades in detail in this photo; I treid to form them as near as possible to the photo You posted here a few days ago:

Link to Photo

I am short before giving up because I don't know what else can be done to repair the card reader... This is especially frustrating because I know that "principially" the machine works, which I could see a few days ago - but only for an hour or so.

Any hints and helping suggestions are VERY welcome!

Best wishes

Markus

Re: HP 82104A card reader, fork-shaped brass tongues, REPAIR PROBLEM

*Message #16 Posted by **Diego Diaz** on 16 Apr 2010, 2:58 a.m.,*
in response to message #15 by Markus Sanke

Hi again Markus,

I'm affraid I have to disagree, the shape of the blades IS the cause of the malfunction. This is clear after watching at your last picture.

Just in case you have not the tools or the experience to straighen them back to the suggested shape, and before you thru away a "basically" operative Card Reader. You may want to ask for service.

I would happily do it for you, but I'm currently far from home and will still be away for several weeks.

My advice is to give it another try and do your best in order to remove any irregularities in the blades, mainly these small concave bending curves that appear in your picture.

Best from the Carribean Sea and don't give up! :-)

Diego.

HP 67/97 card reader: O-rings vs. vinyl tubing

*Message #1 Posted by **Ed Sowell** on 7 Apr 2010, 3:11 p.m.*

As I mentioned in an earlier post, O-rings work fine for me except for the noise. To hear it click here.. In trying to figure out what causes the buzzing I took it apart again. I notice that the tiny pinch roller works against the drive roller right in the middle, over the gap between the O-rings. To see this click here.. It's clear that there is no support in the middle and edges of the pinch roller are doing all the work. Moreover, the O-ring OD measures about 6.47 mm as opposed to the 6.15 mm that is mentioned by Bernd Schmeling. Perhaps the noise is due to flexing of the card under the stress?

I'm going to try the vinyl tubing approach and see how it works.

Comments appreciated

Edited: 7 Apr 2010, 3:17 p.m.

Re: HP 67/97 card reader: O-rings vs. vinyl tubing

*Message #2 Posted by **Michael de Estrada** on 7 Apr 2010, 4:16 p.m.,*
in response to message #1 by Ed Sowell

The O-rings that I use only measure about 6.05mm uninstalled. Although they will expand somewhat once installed on the wheel, I can't imagine them expanding to the extent that you mention. I have used O-rings on 6 different card readers of all types (65/67/97/82104A), and never experienced any noise problems. Also, that noise may not be related to the card feed, but to the motor/coupling/gears.

Re: HP 67/97 card reader: O-rings vs. vinyl tubing

*Message #3 Posted by **Ed Sowell** on 7 Apr 2010, 4:51 p.m.,*
in response to message #2 by Michael de Estrada

Thanks, Michael.

You must have different O-rings than I do. The ones I have measure 0.250" (6.35mm) unmounted. Also, you can see in the photo that when mounted they are larger than the diameter of the shoulder which measures 0.242" (6.15mm). Where did you get your O-rings?

I don't think it's the clutch. I pulled the worm gear and clutch off the motor shaft and looked it over. The rubber in the clutch did not appear to have deteriorated; it was plyable but tough and required some force to push it back on. And the card reads in smartly as oppposed to the jerky motion I've read happens when the cluth is failing. In any event, I don't see how it could make the "ZZZZZ" sound I'm hearing. Were you able to hear it?

Perhaps the noise could be from the meshing of the worm and spur gears. In fact, with the O-rings being oversized as mine appear to be they no doubt press the gears together tighter than they should be.

By the way, when you reinstall the eccentric shaft how do you know when it's properly in place? IOW, do

you just push really hard or do you look at the gap between the head and the reader frame?

thanks for your interest.

Ed

Re: HP 67/97 card reader: O-rings vs. vinyl tubing

*Message #4 Posted by **Michael de Estrada** on 7 Apr 2010, 7:23 p.m.,*
in response to message #3 by Ed Sowell

Hi Ed,

I got my last set of O-rings from Mark Hoskins (Waterhosko) on TAS. He's the guy who makes replacement battery packs for Classic and Spice series calculators.

O-rings

The installed O-rings per your photo look much larger than mine, which extend less beyond the shoulder. Also, on my HP97 card reader, my O-rings barely clear the card reader frame, and I'm pretty certain yours would not, so maybe yours are rubbing, but I don't know if that would create a buzzing noise.

Yes I heard the noise and if the pressure from the oversized O-rings was sufficient to cause some slippage of the motor shaft inside the coupling (clutch), the end of the motor shaft could be rubbing against the worm gear. Or, like you said, maybe gear noise.

When I install the eccentric shaft, I use a flat blade screwdriver in the slot, and push and turn until it stops. There will be a small gap of ~1mm remaining between the shaft shoulder and the reader frame.

Hope this helps.

Regards,

Michael

Re: HP 67/97 card reader: O-rings vs. vinyl tubing

*Message #6 Posted by **Gerry Schultz** on 7 Apr 2010, 7:26 p.m.,*
in response to message #3 by Ed Sowell

Does the motor still make this noise when it's not connected to the drive roller? If you turn on the motor with no load, does it still make that ZZZZ sound? When I listened to the noisy motor sound you

posted, I immediately thought it sounded like a bearing. So, does the motor still make the same noise if the motor shaft is unloaded?

Re: HP 67/97 card reader: O-rings vs. vinyl tubing

*Message #7 Posted by **Katie Wasserman** on 7 Apr 2010, 9:30 p.m.,*
in response to message #6 by Gerry Schultz

See this post from quite a while ago. In it I mention tubing from Small Parts that works perfectly and has held up well for 10 years in many card readers that I've repaired.

-Katie

Re: HP 67/97 card reader: O-rings vs. vinyl tubing

*Message #8 Posted by **Michael de Estrada** on 8 Apr 2010, 12:36 a.m.,*
in response to message #7 by Katie Wasserman

I've thought about the tubing method, but so far O-rings have worked well for me. Of course, I've only been doing this for about 3 years, so I don't yet know how well they will stand up long term. Right now I'm just starting to try some serious repairs on printers.

Re: HP 67/97 card reader: O-rings vs. vinyl tubing

*Message #9 Posted by **Ed Sowell** on 8 Apr 2010, 11:50 a.m.,*
in response to message #8 by Michael de Estrada

Good luck with the printer, Michael. I've recently finished refurbishing mine, so if I can be of help let me know.

Ed

48SX Soft Menu Key Problem

*Message #1 Posted by **J Grim** on 6 Apr 2010, 9:36 a.m.*

Greetings all,

I have a 48SX that I received on trade from a colleague. It works fine except that the soft menu keys must be pushed very hard in order to register. I think there must be a problem such as gunk under the keys, etc. Does anyone have advice regarding maintenance of these keys or the keyboard in general? Of course, I am hesitant to disassemble it without consulting with someone who may have done this before.

Thank you,

J Grim

Re: 48SX Soft Menu Key Problem

*Message #2 Posted by **Han** on 6 Apr 2010, 11:46 a.m.,*
in response to message #1 by J Grim

If you press down on the bezel area between the bottom of the screen and the soft menu keys, does it make the menu keys register more easily?

If so, check out my repair guide from way back.

Re: 48SX Soft Menu Key Problem

*Message #3 Posted by **J Grim** on 6 Apr 2010, 12:49 p.m.,*
in response to message #2 by Han

Thank you for the response. My 48 does behave in the manner you describe. When I push down on the bezel, the keys respond much better. I will probably try the repair myself. Thank you again.

41C - Curve Fitting Revisited

*Message #1 Posted by **Ángel Martin** on 6 Apr 2010, 8:34 a.m.*

I'm compiling some curve fitting programs into a dedicated module, and was wondering if there's any RAW file (or other loadable format) for William Kolb's work.

I've finally succeeded porting the AECROM program & MCODE function -quite a fast implementation on the NUT world - so I thought it'd be nice to complement it with the other Classic reference work on the same subject...

Best Easter wishes, ÁM

Re: 41C - Curve Fitting Revisited

*Message #2 Posted by **Geir Isene** on 6 Apr 2010, 1:49 p.m.,*
in response to message #1 by Ángel Martin

This is of great interest to me.

I have pretty much given up on the AECrom due to strange conflicts with other roms I use (not label or XROM conflicts, but some weird buffer issues locking up the calc). So, I took Kolb's book and added some needed features like Momentums, Skewness, Kurtosis and basic statistics. I then produced the following FOCAL program:

STAT v. 0.2

Re: 41C - Curve Fitting Revisited

*Message #3 Posted by **Ángel Martin** on 7 Apr 2010, 2:39 a.m.,*
in response to message #2 by Geir Isene

Quite a long one! :) Thanks Geir, I'd say I should send you the transplanted CURVE and CRVF functions and you try them out.

The AECROM uses the "available" bits in the c(13) register and that conflicts with other custom ROMS, like the CCD - which uses it for the WSIZE among other things. This may explain your troubles...

So, you'll have mail...

Re: 41C - Curve Fitting Revisited

*Message #4 Posted by **Geir Isene** on 7 Apr 2010, 11:52 a.m.,*
in response to message #3 by Ángel Martin

Thanks for the explanation regarding the conflicting use of the c-register. It clears up this issue for me. I prefer the CCD over the AECrom - although I really needed the curve-fit program, hence the long FOCAL program. Having it as part of a non-conflicting MCODE module would be the best.

The FOCAL program covers several needs:

1. Curve fitting with a large range of curves 2. Basic statistics 3. Advanced statistics such as Momentums/Skewness/Kurtosis 4. The ability to use a data set from XM and analyze it through #1-#3 above (both single and paired data points).

If we could produce a new STAT module that covers the above needs and others (ANOVA etc.) - with saved data sets (XM, cards or mass storage) I would be in heaven.

Edited: 7 Apr 2010, 12:19 p.m.

Re: 41C - Curve Fitting Revisited

*Message #5 Posted by **Ángel Martin** on 7 Apr 2010, 1:40 p.m.,*
in response to message #4 by Geir Isene

That kind of statistical heaven you dream of :) sure will require a reliable method to transfer the program to the rom - typing it is out of the question!

The AECROM funcions work FAST (again, for Coconut standards) but don't offer the advanced stuff you added. I like the XM option, very neat!

cheers

Re: 41C - Curve Fitting Revisited

*Message #6 Posted by **PeterP** on 8 Apr 2010, 10:57 a.m.,*
in response to message #5 by Ángel Martin

Angel,

Assuming Geir has the Focal program installed on one of his 41s, maybe he could be enticed to export it to his NoVram via one of the available OS (I think Hepax would do that as well). One could then export the module from the NoVram to a PC at which point it would be available in electronic form.

There is a little article I wrote which shows how one can mix and match MCODE and Focal programs in a module. That way we could mesh his program with your AEC extraction (BTW - that's just awesome, Angel!)

Cheers

Peter

HP-10 Adding Machine

*Message #1 Posted by **aj04062** on 5 Apr 2010, 9:40 p.m.*

Hi Forum,

I just picked up an hp-10 from my uncle who worked for HP. It is in need of some restoration as it is quite dirty, needs new batteries and doesn't seen to be working right.

My question is: I know some calcs are recommended to be run with batteries. Is this one of the designs? I plugged it in and the printer head initializes and the led's flicker back and forth.

Any thoughts?

Re: HP-10 Adding Machine

*Message #2 Posted by **Katie Wasserman** on 5 Apr 2010, 11:22 p.m.,*
in response to message #1 by aj04062

You must have batteries in this machine to run this calc. It's not hard to open the battery pack and replace the 4 nicad cells with new ones. You will see exactly the results that you are getting if you run this without good batteries in it.

-Katie

Re: HP-10 Adding Machine

*Message #3 Posted by **aj04062** on 5 Apr 2010, 11:41 p.m.,*
in response to message #2 by Katie Wasserman

yup, that's the ticket. New batteries and it is alive again. Thanks for the confirmation.

Now to cleaning.

I saw some insane prices quoted on this thing on this website. Is that still true? Is it that rare to warant > $500?

I can't sell it as my uncle gave it to me, but....

Re: HP-10 Adding Machine

*Message #4 Posted by **Katie Wasserman** on 5 Apr 2010, 11:55 p.m.,*
in response to message #3 by aj04062

It's pretty rare and might fetch around $400-$500 if it's in very good condition. OTOH, it's not RPN and some of the people on this forum wouldn't' even consider a non-RPN calculator even if HP made it when they were in their prime.

Take a really close look (using a magnifying glass) at the decimal points in the LED display on your HP-10. More likely then not you'll find a surprise.

-Katie

Re: HP-10 Adding Machine

*Message #5 Posted by **Alberto Fenini** on 6 Apr 2010, 6:10 p.m.,*
in response to message #4 by Katie Wasserman

Boys, that's intriguing ... what should exactly be revealed ? Cheers Alberto

Re: HP-10 Adding Machine

*Message #6 Posted by **Michael Meyer** on 6 Apr 2010, 7:19 p.m.,*
in response to message #5 by Alberto Fenini

Only one of the coolest features of any LED calculator in history. Though there are some displays in the HP-10's and 19C's without this, most have it. I have a couple of displays without it, but they're in my parts box. My working machines are spiritually correct. (Though I wonder, Katie: rarities are often worth more, but this is such an outstanding feature of the machine that I suspect the more common display is still the more important....)

Re: HP-10 Adding Machine

*Message #7 Posted by **Bruce Bergman** on 6 Apr 2010, 8:29 p.m.,*
in response to message #6 by Michael Meyer

I once postulated that it must be the most valuable dot in all of HP calculator history!

in response to message #11 by Katie Wasserman

Huh, doesn't appear to have the HP on any of the decimal points.

Where does that place this one?

Adam

Re: HP-10 Adding Machine

*Message #13 Posted by **Katie Wasserman** on 7 Apr 2010, 1:28 a.m.,*
in response to message #12 by aj04062

Are you sure you don't have it? You really do need to have a pretty strong (10x or more magnifying glass to see the "hp" logo. If you have it it would be on all the decimal points.

I think we took an informal survey of sorts here and came to the conclusion that about 1/4 of all the hp-19c and hp-10 calculators have displays without the decimal points. I don't recall if there's a correlation to serial numbers.

-Katie

Re: HP-10 Adding Machine

*Message #14 Posted by **Alberto Fenini** on 7 Apr 2010, 4:59 a.m.,*

*Message #20 Posted by **aj04062** on 7 Apr 2010, 8:04 p.m.,*
in response to message #19 by Keith Midson

Ok, so should I presume this later ('78) calculator doens't have the logo, but is just as rare/valuable as one with the logo?

Is it more valuable?

Re: HP-10 Adding Machine

*Message #21 Posted by **Keith Midson** on 7 Apr 2010, 10:03 p.m.,*
in response to message #20 by aj04062

That's a difficult one to answer - for me personally, I have no real interest in the HP-10, except now for the dot - but you can get the HP-dot in the 19C, so I would rather go for that one over the HP-10.
So It really depends on who is looking for an HP-10 at the time, and whether they are after a 'dot' or a 'no-dot' to complete their collection and how much they are prepared to spend. The HP-10 is a rare beast, so I would imagine that it would be valuable with or without the dot.
Cheers, Keith

Re: HP-10 Adding Machine

*Message #22 Posted by **aj04062** on 8 Apr 2010, 11:47 a.m.,*
in response to message #21 by Keith Midson

Agreed, as these things can always fluctuate wildly based on "who wants it"

I just sold one of 3 HP-55's I had for $170 to a guy in New Zealand. I had listed it with a reserve a few weeks before and didn't get $80 for it. Needless to say, I was happy to get almost $100 more by relisting it.

Me peronsally would rather have the logo. That seems unique.

I tried like hell with my 10X jewlers glass and couldn't see a thing. I've got to get

a higher magnifier to see if it is really there.

Test card for HP 97

*Message #1 Posted by **Ed Sowell** on 5 Apr 2010, 3:09 p.m.*

I'm trying to get my card reader to work after installing the O-rings on the drive wheel. The card pulls all the way through so I think the switchs are making good contact with the PCB, but I keep getting Error.

I am testing it with the only card I have with something on it, but it's one that came with the machine and I really have no idea of what's actually on it. Is it possible that the card contents can cause Error even if it reads correctly?

I think what I need is a good test card. Where can I get one?

Thanks.

Re: Test card for HP 97 SUCCESS!

*Message #2 Posted by **Ed Sowell** on 5 Apr 2010, 4:51 p.m.,*
in response to message #1 by Ed Sowell

It finally dawned on me to enter a simple program from the User's Manual and record it. It works!

So my refurbished card reader now writes and reads. Much to my pleasant surprise, it is not at all sensitive to adjustment of the eccentric shaft. I've moved it in about 45 degree increments one way and the other and never get an Error. Only difference seems to be a minor difference in sound.

As suggested in Mike Davis' write-up I've had it it set up with the reader hanging off it's ribbon cable on the bottom side of the board throughout this testing. I'll now reassemble it properly and declare the project a success. I may put the photos I've been taking in an album and post it.

Re: Test card for HP 97 SUCCESS!

*Message #3 Posted by **Michael Meyer** on 5 Apr 2010, 6:29 p.m.,*
in response to message #2 by Ed Sowell

Careful, Ed. It can be addictive. Now you may want to repair a second machine, just to admire its incredible power and beauty. (Gold button contacts! Big LED's!) That can lead to another..... well, never mind. Congratulations!!!

Re: Test card for HP 97 SUCCESS!

*Message #4 Posted by **Ed Sowell** on 5 Apr 2010, 6:46 p.m.,*

Re: Test card for HP 97 Noise

*Message #8 Posted by **Ed Sowell** on 6 Apr 2010, 2:00 p.m.,*
in response to message #2 by Ed Sowell

Although the reader reads & writes fine I think it's a bit noisy. However,I don't know how noisy is too noisy, never having heard a 97 reading a card before.

Here's a movie with sound so you can hear it. It's about 1.7MB. Be sure your sound is on and truned up in Windows Media Player or whatever you use.

My card reader in action.

Comments appreciated.

If it's too noisy, how can I quiet it down?

Ed

Re: Test card for HP 97 Noise

*Message #9 Posted by **Katie Wasserman** on 6 Apr 2010, 2:36 p.m.,*
in response to message #8 by Ed Sowell

Sounds kind of noisy to me. Try putting a tiny bit of good quality grease on the worm gear, that should quiet it down. Small tubes of good quality grease can be found at most bicycle shops (although they've gotten pretty exotic and expensive these days). Lubriplate works well on this.

-Katie

Edited: 6 Apr 2010, 2:36 p.m.

Re: Test card for HP 97 Noise

*Message #10 Posted by **Ed Sowell** on 6 Apr 2010, 3:13 p.m.,*

in response to message #9 by Katie Wasserman

Thanks, Katie. I already put a couple drops of 3-in-one on the worm, but I'll try some grease. I happen to have a tube of Finish Line, which is a premium synthetic I got at a bicycle shop for another project.

Re: Test card for HP 97 Noise

*Message #11 Posted by **Mike T.** on 6 Apr 2010, 5:15 p.m.,*
in response to message #8 by Ed Sowell

That does sound a little loud.

I don't remeber the uneven edge to the tone (it was almost 20 years ago that I last used an HP97) but I'm sure it was more of a hummmm than a zZzZzZzZ...

(Really hope that makes sense!)

Mike T.

Re: Test card for HP 97 Noise

*Message #12 Posted by **Ed Sowell** on 6 Apr 2010, 6:21 p.m.,*
in response to message #11 by Mike T.

I agree it sounds kind of buzzy. Trying to imagine what would produce the sound. I'm a little worried that the O-rings may be a little large, although they were offered on eBay for this purpose. At one point I measured the motor current with a 1.5 volt battery source and could not get it down to the specified 180 +/- 20 mA.

Also, I'm pretty certain the tip of the eccentric shaft is properly seated since I first put it in with out the gear to see how it fit. I was very careful with the side guide springs too.

Ed

Re: Test card for HP 97 Noise

*Message #13 Posted by **Hans Brueggemann** on 7 Apr 2010, 5:26 p.m.,*
in response to message #8 by Ed Sowell

ed, your card reader is not only extremely noisy, but also makes a totally "wrong" noise. if everything is working o.k., the card reader is just purring (well, sort of..).
take it apart again and check for proper alignment of worm shaft and toothwheel.
best regards,
hans

Re: Test card for HP 97 Noise

*Message #14 Posted by **Gerry Schultz** on 7 Apr 2010, 7:51 p.m.,*
in response to message #13 by Hans Brueggemann

I just wanted to mention something about interchange. Since Ed doesn't have someone else to exchange cards with to test his card reader he can only use self-recorded cards.

But, if he (or anyone) does exchange cards with other users then checking for interchange is important. I would think that it's not just track alignment but also the card's speed through the reader

so the bpi (bits per inch) is similar to the specification. How tight is that?

It's just something I wondered about while reading this thread. I wonder if anyone still has any HP alignment cards (or if they are needed) to confirm interchange?

Gerry

Re: Test card for HP 97 Noise

*Message #15 Posted by **Ed Sowell** on 8 Apr 2010, 12:40 p.m.,*
in response to message #14 by Gerry Schultz

Interesting point. I would be willing to send a card that I have written to someone to test, and perhaps someone would do the same for me.

Re: Test card for HP 97 Noise

*Message #16 Posted by **Ed Sowell** on 8 Apr 2010, 12:45 p.m.,*
in response to message #13 by Hans Brueggemann

Thanks, Hans. The alignement looks OK to me, but then I don't know how it could not be. There doesn't seem to be any way to adjust anything in that regard. I mean, the motor seems to register into place, the opposite end of the worm gear registers into an indent in the frame, and the spur gear floats with very little extra side space. What am I missing?

Re: Test card for HP 97 Noise

*Message #17 Posted by **Ignazio Cara (Italy)** on 9 Apr 2010, 3:22 a.m.,*
in response to message #16 by Ed Sowell

Hello Ed, I've saw your short movie. It's my opinion that your reader is too much noisy, and that you must pull the card when it's out of the reader. You have used o-rings too much wide! BTW, have you checked the test-point on the card-reader PCA with a continuity tester? There are three test-point marked M (motor switch), F (Write protect swith) and H (head switch) on the upper left side of the PCA, that you must check with the ground signal (to the left of the three test-point) to test the switches are working properly. Let me know.

Re: Test card for HP 97 Noise

*Message #18 Posted by **Ed Sowell** on 10 Apr 2010, 11:26 a.m.,*

That is true. How did you know that?

> Quote:
>
> You have used o-rings too much wide!

Hadn't thought about the width, but do believe they are too large in diameter. How would

width cause the noise? There is clerance enough so it's not rubbing on the sides, at least before it is assembled. Does the pinch roller force the O-rings apart? I put a drop of super glue between them.

> Quote:
>
> BTW, have you checked the test-point on the card-reader PCA with a continuity tester? There are three test-point marked M (motor switch), F (Write protect swith) and H (head switch) on the upper left side of the PCA, that you must check with the ground signal (to the left of the three test-point) to test the switches are working properly.

Just when the card is all the way in. I guess I could insert the ccard a little at a time to better test the arms individuallt. BTW, have you nocied that one of the arms doesn't do anything at all, since its pad on the PCB is not connected to anything!

Ed

> That is true. How did you know that?

I saw it from the last frames of your short-movie.

> Quote:
>
> Hadn't thought about the width, but do believe they are too large in diameter. How would width cause the noise? .....

My mistake, it's not the width of the o-ring but the diameter. I have always purchased the o-ring from 'waterhosko'. The better. For eliminate the noisy you should take apart the motor and apply lubricant to the tip and sides of the worm-gear. You must lubricate the thrust bearing hole too. Use moly-disulfide lubricant.

> Quote:
>
> Just when the card is all the way in. I guess I could insert the ccard a little at a time to better test the arms individuallt...

Yes, you must insert the card a little at a time to better test the arms: first the Motor switch, after the 'F' for the write protect switch and last for the 'H' magnetic head. If the switches are all ok and again you have an error message when you try to read a card, another thing you could to test are the resistance of the two head's circuits, that should be executed with an ohmeter connected first to the wires red and yellow, and last to the wires blue and orange. You should read about the same value, from 45 to 55 Ohms for

the two couples. If you read a value infinite for one of the two circuites, you have a problem on the magnetic head. Of course, you must detach the wires from the reader's PCB to properly execute this test. And yes, one of the arm of the switches assembly is not operative. I hope that my contribute might help you to make progress with your card-reader. Let me know if you make progress and I apologize for my very bad english. Take care

Ignazio

Re: Test card for HP 97 Noise

*Message #20 Posted by **Ed Sowell** on 11 Apr 2010, 7:19 p.m.,*
in response to message #19 by Ignazio Cara (Italy)

Thanks, Ignazio.

I got some model airplane fuel tubing today since it is available locally for about US$1.50 per foot. Right away I see the challenge with this approach is getting a very square cut, especially at the end that goes against the shoulder. If that end is the least bit off-square the tube will deform when it is pressed against the shoulder, setting the circumference of the roller askew and probably creating uneven pressure on the card.

Regarding the motor stopping before the card has ejected completely, is this a sign that one of the switch contacts is not working?

Ed

I did a Google on moly-disulfide lubricant and find that it comes in oil, grease, or dry form. Which do you use?

Ed

New MCODE tools available for the HP-41

*Message #1 Posted by **Håkan Thörngren** on 5 Apr 2010, 2:35 a.m.*

I am happy to announce the release of NutStudio Tools for the HP-41. This first release consists of an assembler and a linker for easy creation of MCODE based modules.

Pre-built binaries are available for both Mac OS X i386, Mac OS X PowerPC and Linux i686. You can find them and documentation at http://code.google.com/p/nutstudio/downloads/list

Edited: 5 Apr 2010, 2:36 a.m.

Why this strange Haskell?
Why not use normal C/C++?

Re: New MCODE tools available for the HP-41

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 5 Apr 2010, 11:17 p.m.,*
in response to message #3 by ZOleg

Hi, ZOleg;

I´m not the very person to explain Haskell, but I know that it was taught in many Telecommunications courses as a language suitable to high-level, object oriented coding. I also had the chance to look at the source of many applications, and after knowing what where those applications for, I wondered about where else to use it. Seems I have found...

Sorry, cannot go any further.

Cheers.

Luiz (Brazil)

*Message #2 Posted by **Don Shepherd** on 4 Apr 2010, 10:06 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Luiz, speaking of the 12c, examine a 12c+ repurposed to do hex arithmetic. No, that's not a Photoshopped 16c, it's a real 12c+ with ARM processor and here is the code (modified from code originally supplied by Cyrille and further modified by Katie) that did it.

OK, now you have my attention...

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 4 Apr 2010, 11:02 p.m.,*
in response to message #2 by Don Shepherd

Hi, Don;

thanks for this information! I was not aware of that... So, as it happens with the HP30B, the new HP12C+ is 'repurposable' thanks to the ARM structure... Should the HP30B procedures be followed the same way with HP12C+ as well or is there a particular set of instructions/procedures to repurpose an HP12C+? Any links? Forgive me if this is well known by all of you, guys... I was just 'not here' for these days. Sorry!

Wow! Hewlett-Packard is now doing some strange things...

Thanks again.

Luiz (Brazil)

in response to message #3 by Vieira, Luiz C. (Brazil)

The same procedure is used to repurpose a 12c or a 20/30b. You just need to know the differences with regards to the screens, but they are treated very similar.

TW

Re: OK, now you have my attention...

*Message #5 Posted by **Don Shepherd** on 5 Apr 2010, 1:00 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Luiz, anyone wanting to re-purpose a 12c+, 20b, or 30b is going to need several things in addition to the calculator itself:

1. A special cable with one end that plugs into the standard old serial port of your PC and the other end that plugs into the connector in the battery compartment of the 12c+ and 30b (not sure about 20b, I don't have one of those). This is used to download firmware to the calculator. Cyrille is the only source for this, AFAIK. Some have tried using this cable with a USB adapter instead of a standard serial port, with varying degrees of success. Fortunately my PC is old enough that it has a real serial port, and this cable has worked fine for me.
2. Samba software for performing the actual firmware download to the calc, available from Atmel.
3. A folder from Cyrille with support files for the specific calc.
4. An SDK for developing the C++ code on your PC. HP recommends the one from a company called IAR. I had nothing but trouble getting that to work and finally got so discouraged that I uninstalled the whole thing from my PC.
5. An unlimited amount of patience and perserverance!

Re: My Calculator Collection

*Message #5 Posted by **Marcus von Cube, Germany** on 5 Apr 2010, 11:41 a.m.,*
in response to message #1 by Gerardo Rincon

A suggestion:

You use the full scale pictures for you index page and scale them down by width and height tags. This loads very slowly and the browser is not very good at down scaling to high quality. You should create separate thumbnail images and put a link behind them which either loads a full res picture or redirects to the appropriate page.

Interesting Blog Post (Sci Am, Sept 77)

*Message #1 Posted by **Les Bell** on 3 Apr 2010, 10:13 p.m.*

I often check out the Modern Mechanix blog (http://blog.modernmechanix.com/) for its cool reprints of scientific/technical (and social) articles from the last century. A recent entry (http://blog.modernmechanix.com/2010/03/30/ti-micro-electronics/) concerned TI Microelectronics - basically an advertorial or advertising insert in the September 1977 issue of Scientific American. The content describes TI's 9900 series 16-bit microprocessors, and although the insert cover shows various related products, there's also a TI-59 on there - but I didn't think it was based on a 9900 processor; was it?

Anyway, there's several other articles from that particular issue on the same site: http://blog.modernmechanix.com/issue/?magname=ScientificAmerican&magdate=9-1977. The articles mostly related to various early hobby computers, including one on the HP-01. Enjoy!

Best,

--- Les

Re: Interesting Blog Post (Sci Am, Sept 77)

*Message #2 Posted by **Eric Smith** on 4 Apr 2010, 12:19 a.m.,*
in response to message #1 by Les Bell

You are correct that the TMS9900 16-bit microprocessor was not used in the TI-59 calculator, nor in any other TI calculator. The TI-58, TI-58C, TI-59, and SR-60A all used the TMC0501E four-bit processor, specifically design for use in calculators. It is unclear as to what if any, functional differences this had from the TMC0501 processor used in the earlier SR-50, SR-51, SR-52, SR-56, and SR-60 calculators.

The TM 990/189 "University Module" (microprocessor evaluation board) used a TMS9900 microprocessor, and used a top case of a TI-59 as a display and keyboard, but it was definitely not a calculator.

First impressions of new TI-NSpire CAS

*Message #1 Posted by **Don Shepherd** on 2 Apr 2010, 11:50 p.m.*

This isn't an in-depth review, just some first impressions after playing with it for a few days.

Calculator

keyboard

back of keyboard

The display is comparable to the original NSpire display. It is still hard to see without a strong bright external light source. A backlight, like on the Casio fx-9860g Slim, would be a most welcome addition.

The touchpad does make navigating easier, but it is tedious to move the cursor with the touchpad. A real touchscreen would be another welcome addition.

The home screen concept is better than the original NSpire. It encourages experimentation and makes documents easier to find.

The removeable keyboard (on the CAS model) is something new, although the TI-84 keyboard apparently will not work with the CAS model. That's unfortunate.

There are two new instructions in the BASIC-like programming language; Request to input a number and RequestStr to input a string. Both are very welcome. There is also a Text instruction to output a text box.

The NSpire is primarily a tool for students. It has many features that allow for experimentation; for example, to see how the formula of an equation changes in real-time as you change the shape of the curve. Some kids will learn from that.

It is not an engineers calculator. It is rather big and heavy and the trig functions are accessible via a menu rather than dedicated keys.

All in all, a worthy calculator for experimentation and number theory work.

*Message #2 Posted by **Namir** on 3 Apr 2010, 7:02 a.m.,*
in response to message #1 by Don Shepherd

Where can you purchase one? Did you get a pre-sale unit because you are on a special list with TI?

Also where did you get the info on the additional programming commands? I was looking at the programming commands of the older TI Nspire and it had no input commands that prompt the user to enter values--only input is the arguments that you give the program or function!!

Namir

Re: First impressions of new TI-NSpire CAS

*Message #3 Posted by **Don Shepherd** on 3 Apr 2010, 8:09 a.m.,*
in response to message #2 by Namir

Page 34 of the release notes talks about the new programming instructions.

I have seen the new units advertised in a couple of places online, I'd Google it. I was able to swap my old NSpire CAS for the new one because I'm a teacher, and they let teachers do that.

Re: First impressions of new TI-NSpire CAS

*Message #4 Posted by **Namir** on 3 Apr 2010, 8:59 a.m.,*
in response to message #3 by Don Shepherd

Thanks Don! I plan to buy one when TI starts selling it. I have the TI Nspire from 2008, but did not have time to tinker with it. I plan to do more with the new version.

Namir

Re: First impressions of new TI-NSpire CAS

*Message #5 Posted by **Don Shepherd** on 3 Apr 2010, 9:48 a.m.,*
in response to message #4 by Namir

I think the new NSpire is definitely an improvement over the old one, but not a revolutionary improvement. A revolutionary improvement would have been a display that you could actually read in low (or normal, really) light conditions, and a real touch-screen with stylus. Although the screen has a very good degree of resolution, you just can't read it easily most of the time, and that really takes away from the usability of the device, in my opinion. You can choose the font size among three settings, but even when you choose large font, it doesn't help much. And the new touchpad does make navigating between pages or items on a page easier, but a real touchscreen and stylus would be so much better.

From my perspective, the major improvements in the new version are a new keyboard layout with the alpha keys relocated (I was always hitting those green alpha keys when I didn't want to) and, of course, the programming instructions for getting user input during the execution of a program. When I saw that the original NSpire did not have any programming input commands, I wrote TI and told them that you might as well not even offer a programming language if you are going to have that restriction; looks like they finally listened.

By the way, the alpha keys on the new unit have a distinctive "click", a la HP, so you know when it registers. That's good.

Re: First impressions of new TI-NSpire CAS

*Message #6 Posted by **Namir** on 3 Apr 2010, 10:50 a.m.,*
in response to message #5 by Don Shepherd

The display problem you mentioned reminds me of the same problem with the Casio ClassPad. I ended up using the emulator for that calculator more than the calculator itself. The revised version of the ClassPad had a better LCD display.

I am glad that you wrote TI about the lack of program execution input commands.

I remember in July 2008 I was in a big grocery store in the south of France looking for a Casio Graphics calculator with an SD card port. My son Joey said "Dad! You'd better look at this!" as he pointed to the new TI Nspire CAS and non-CAS versions. I picked two CAS units and he demanded one (as he was an avid TI-89 user). I figured that would be OK as I will go back in \a few days to the same grocery store and buy a second Nspire CAS for me. I was very surprised to see the store remove the CAS version units!!! I ended up buying the second TI Nsire CAS from the US.

Namir

Hey, maybe HP online sales hired the guy from that store!!

:)

Re: First impressions of new TI-NSpire CAS

*Message #8 Posted by **Namir** on 3 Apr 2010, 7:27 p.m.,*
in response to message #7 by Don Shepherd

I think they were removed because French schools (like most in the world) did not want students to have the CAS features that would make them bypass the need to learn more basic algebra and calculus.

Namir

Re: First impressions of new TI-NSpire CAS

*Message #9 Posted by **Jean-Michel** on 4 Apr 2010, 4:02 a.m.,*
in response to message #8 by Namir

Bonjour Namir,

in fact, I guess you are not correct assuming that the TI Nspire CAS was removed from stores shelves due to its CAS features. Things are nit ruled the same way in France than in the US on this topic. Evidence of this is that this calculator has always been, and still is, available. I think it is more a concern with this particular store you mentionned in your post rather than a complete removal of this calc from shelves. Another evidence of this is the CASIO Graph 100+ (at least named like this in France) which also has CAS features. I checked this morning, and found only the first version of Nspire on sale.

Bonnes fêtes de Paques !

JM.

Re: First impressions of new TI-NSpire CAS

*Message #10 Posted by **Namir** on 4 Apr 2010, 4:51 p.m.,*
in response to message #9 by Jean-Michel

In addition to the Carrefour grocery store, I did see only the non-CAS version at the nearby FNAC store, and I assumed it's the same reason. Sounds like it's the choice of these stores.

In any case, I stand corrected.

Have a Happy Easter!! You guys are also off tomorrow!!!

Namir

Re: First impressions of new TI-NSpire CAS

*Message #11 Posted by **Marcus von Cube, Germany** on 5 Apr 2010, 10:55 a.m.,*
in response to message #6 by Namir

You know that the new OS loads fine in an older unit? So you get the new commands without shelling out money.

An improvement, but not by much. Those are some TINY buttons!!

Re: First impressions of new TI-NSpire CAS

*Message #13 Posted by **Don Shepherd** on 3 Apr 2010, 5:54 p.m.,*
in response to message #12 by Han

True, they are tiny, and I wouldn't want to use them to type a letter or write a report, but they do have a distinctive key-click, and my initial experience using them is that I don't press the wrong key when I use them, so they work for me.

What I'd really like is a more readable display.

keys to Woodstock security cradle?

*Message #1 Posted by **megarat** on 2 Apr 2010, 11:17 p.m.*

Hey all,

I had a fortuitous find today at a university surplus sale: a box containing five HP-27 calculators, including many carrying cases, adapters, etc. Everything seems to be in great shape thus far, although I haven't yet gotten around to any practical testing.

One strange caveat is that the calculators are all locked in the (optional) (HP-manufactured) "security cradle". (See this archived brochure for more info.) Does anyone know the details of the lock for these things? I.e., are they all keyed the same? (And if so, is it possible to get the keys?)

I'm pretty handy with drilling locks, but I'd like to preserve these if possible, in case anyone out there might be interested in them.

Edited: 2 Apr 2010, 11:17 p.m.

Re: keys to Woodstock security cradle?

*Message #2 Posted by **megarat** on 3 Apr 2010, 1:33 a.m.,*
in response to message #1 by megarat

I found the answer to my own question. In the one-page installation manual for the cradle, it says, "The factory cannot supply additional keys. We recommend you have duplicates made."

Re: keys to Woodstock security cradle?

*Message #3 Posted by **Dave Britten** on 3 Apr 2010, 9:21 a.m.,*
in response to message #1 by megarat

Are they wafer tumbler locks? Those are usually relatively easy to pick with the right household tools (I've used straightened hair pins and very small knitting needles in a pinch).

Once you've opened them, you could potentially replace/rekey the locks, or impression some keys if you really know what you're doing. (I definitely don't!)

Re: keys to Woodstock security cradle?

*Message #4 Posted by **megarat** on 3 Apr 2010, 11:39 a.m.,*
in response to message #3 by Dave Britten

My knowledge of lock taxonomy is pretty limited, but I believe they are. It looks like a small cam lock, and resembles the lock for the "ignition key" on an SGI Onyx I picked up from Boeing Surplus a few years ago ... no key was included with that, but it matched the key for a friend's screen door perfectly. I'm under the impression that these types of locks don't have a large "key space", so I may just luck out by trying a few things.

If not, I'm going to solicit a friend with a lock-pick set before breaking out the drill. Also, as part of the kit, there is an open, empty cradle, so I can remove the lock and see how available they are. It would be nice if I can drill them open and replace the lock, and still have them be perfectly reusable.

Edited: 3 Apr 2010, 11:42 a.m.

Indeed, although that's probably my last option, given that I expect them to charge at least US$50 for the service.

in response to message #6 by megarat

i've had call to need a lock picked and re-keyed a couple of times by a locksmith here in river city. he charged me $15 to pick and re-key a lock i brought to him but he charges $70 to go and do the same song and dance with the sheriff on an eviction. moral: call ahead, describe the problem, tell him that there are a few of them, and that you will deliver and pick up. you might get a big discount because he doesn't have to charge for "windshield time" and that the second will be easier than the first & the third will.....

Re: keys to Woodstock security cradle?

in response to message #7 by db (martinez, ca.)

This is good advice. If you do some checking, I'd bet you can find a locksmith that will be very reasonable. I believe locks of that type are easy to pick and re-key. Just don't assume the first quote you get is the best or that the others will be the same. That's been my experience at least.

Anyway, since you got these calculators at such a bargain (assumed), isn't it worth a little money to get them off the cradle without damage?

Re: keys to Woodstock security cradle?

> Quote:
>
> Anyway, since you got these calculators at such a bargain (assumed), isn't it worth a little money to get them off the cradle without damage?

I don't know why, but it was such a good deal that I'm a little bit embarrassed to report on it. The box contained:

-- 5 HP-27 calculators, each with mains adapter and locked in security cradle; quick tests show three of them seeming to work fine, two seeming to be twitchy.

-- One extra empty/open cradle.

-- (Of the six cradles, only three have security cables.)

-- 8 apparently unused faux-leather cases.

-- One HP-27 User Manual, one manual addendum, two catalogues of calculator accessories, and two "manuals" (one-page pamphlet, really) for the security cradles.

The complete kit was US$5. (One dollar per calculator.) What made it especially tickling was that I went to the sale on a time-killing lark; I was not, in any way, on the lookout for anything exciting.

Re: the effort of preserving the cradles. This begs the question, will anybody be interested in these? I'm happy to preserve them if there is likely to be interest, but if these are off the radar for most people/collectors, it would be easier, faster and more economical for me to just drill them.

So let me know: is anyone here interested in these cradles? If so, I'd be happy to preserve them and send them to you for the price of shipping. Note that they're not pristine; they're in good condition, but they bear some institutional markings in indelible ink. (Among them, on two of the cradles, some cheeky scoundrel wrote "TI" on the top.) Oh, and as alluded to earlier, three of the six are missing cables.

two things:
1) i'd be interested in a cradle. email me whenever. i could fabricate a cable at the marine supply place here in martinez. if i can swedge together climbing equipment; i can do the same for a calc cradle.
2)forgive me for both telling you something that you may already know, and quoting myself, but i'm not sure how your 27s are set up and not sure how familiar you are with the woodstock class of HPs. that flicker scares me. here goes:
IMHO it is dangerous to charge the batteries INSIDE your model of hp calculator. A high percentage of them are dead because the batteries weren't making good contact, maybe because of slight corrosion or dust, and the irreplaceable ROMs got fried with too much DC. Let this be known as the too much cheesecake too soon syndrome. I avoid the problem by charging the batts outside of the calculator or running slightly used AA alkaline 1.5v cells in place of the 1.25v rechargeables.
sorry if this is old news or something taken care of by hp in your units but care is warranted in any old hp and especially one as rare as the 27.

> sorry if this is old news or something taken care of by hp in your units but care is warranted in any old hp and especially one as rare as the 27.

Thanks for the information ... I hope I didn't do anything negligent, but fear that I might have. Being locked in the cradles, the calculators are currently unavailable to inspection. (For instance, I don't even know if, cosmetically, they have any institutional markings. All I can see is the keyboard and the LED, refracted through the plastic visor of the cradle.)

I had read that Woodstocks should be powered on only with batteries in place, and I felt confident that that was the case with all of them (being still in their cradles with adapters attached), but hadn't considered the possibility of connection problems.

I'll proceed much more cautiously from hereon out.

EDIT: Reading now from the MoHPC's batteries page, I can see, clearly, the warning, "Most models can be damaged if run from the charger without good batteries installed". I missed that the first time, having skipped straight down to the Woodstock section. Rats, I hope I didn't fry those two calculators, that would break my heart.

Re: keys to Woodstock security cradle?

*Message #13 Posted by **Alberto Fenini** on 4 Apr 2010, 5:07 a.m.,*
in response to message #12 by megarat

Hello everybody, Happy Easter to everyone !!!
That was my experience with a Woodstock cradle.
Mine was keyless and with the red panel broken.
Luckily the HP25 that came with was out of the cradle, but neverthless I wanted to restore the cradle too.
A quick research showed that in Italy, or in Milano where I live was impossible to find a replica for the key
The lock was then drilled

Since I was not into that job, I had it done from a small hardware shop.
At the poin the cradle could be opened and revealed the locking mechanism

The lock was replaced with a cheap and very common lock for condos mailboxes,

and the locking "arm" was installed on it. The guy at the shop told me that it required little work but nothing dramatic, work and new lock costed 20 €
Then I have found this company on internet Plexishop and found out that for 2€ eahc, they can cut custom size red plexiglas.

I also purchased some of their plexiglas polish and I can say the it was very useful for bringing back to good conditions some of my units displays.It only should be noted that the spare display was not polished on both sides, so I had to do it by myself, but was a easy task.
The glass was cutted (metric system) 3 mm thick, 63 mm length and 13 mm high. From thre inside is a little loose, but from the outside looks very nice.
I found it a good glue to be Item number: 120510277353, which I also have used to restore plastic cracks or to meld together restored battery packs shields
I hope these information can be of help to you or to anybody in this forum, I'm not affiliated with any of these vendors, I just wanted to give a practical hint.
Should you have some cradle for sale, please let me know, I'm interested in buying those, or event a non working HP27 unit
Again,Happy Easter Everybody

in response to message #13 by Alberto Fenini

Hi,

I don't understand how and why this lock is used. What is it locking? Can someone send pictures of the complete HP-27?

Re: keys to Woodstock security cradle?

*Message #15 Posted by **Martin Pinckney** on 4 Apr 2010, 5:57 p.m.,*
in response to message #14 by Sören Nilsson

Sören, if you follow the link in the original post on this thread, you will see the whole kit. The lock secures the calculator to the security cradle, which in turn can be secured to a desk by the steel cable you see coiled up in the photo of the whole kit. Much like the laptop computer cables that nobody uses.

HP 65 Repair Effort

*Message #1 Posted by **ClausB** on 2 Apr 2010, 4:05 p.m.*

I recently got a broken 65 off eBay. On power up it displays all 1s for a second and then goes blank. It has been repaired before because the logic board ROMs have later dates (7437) than the serial label (1333A 08230) and the main IC has a sticker dated '78. Also the card reader is clean and its wheel has new o-rings. Would anyone here happen to know the history of this unit?

I printed the logic board layout from the May '74 HP Journal article and checked the power supply output with a DC voltmeter. I get these readings:

Nominal _ Actual
3.75 _____ 3.8 (batt)
6 _____ 6.2
7.5_____ 7.7
-12 _____ -12.2

These seem OK, no?

I also measured 2.9 DC volts at phi1 and 3.4 at phi2. Sound reasonable?

I guess the next step is to scope some signals. Any other ideas?

Edit: Can that serial number be right? I thought the 65 came out in '74.

Edited: 2 Apr 2010, 5:59 p.m.

Re: HP 65 Repair Effort

*Message #2 Posted by **Eric Smith** on 2 Apr 2010, 11:30 p.m.,*
in response to message #1 by ClausB

DC voltages OK. To really tell whether the clock is OK, you'd have to look at it on an oscilliscope. The main signals to look at are:

signal	test point	hybrid pin	ROM pin	
Phi1	6	38	12	
Phi2	5	39	10	
SYNC	1	32	7	sync, pulse active 10 of 56 cycles
IA	3	8	15	instruction address, CPU -> ROM
IS	2	33	6	instruction, ROM -> CPU
RCD	10	34	n/a	reset cathode driver, every 15 words
WS	9	30	14	word select, which digits are affected by instruction
DATA	8	35	n/a	56-bit data word

Pin information is from my own personal notes, but I think it matches Tony's schematics.

Math Software that supports BCD?

*Message #1 Posted by **Tim Wessman** on 1 Apr 2010, 3:42 p.m.*

Hello,

Is anyone aware of a mathematical suite that has an option to use BCD math instead of binary? (not something like the IBM BCD library, but more like matlab)

TW

Edited: 1 Apr 2010, 3:44 p.m.

Re: Math Software that supports BCD?

*Message #2 Posted by **Norman Dziedzic** on 1 Apr 2010, 6:01 p.m.,*
in response to message #1 by Tim Wessman

I don't know of any packages outside of the industrial software we use to program machine controllers but you have piqued my curiosity as to why you would want such a thing?

Re: Math Software that supports BCD?

*Message #3 Posted by **Tim Wessman** on 1 Apr 2010, 7:54 p.m.,*
in response to message #2 by Norman Dziedzic

Basically, for doing comparison against other sources when developing new math routines. For example, the FMRR calculation made for the 30b was very difficult to find things to compare against (granted, that is a specialized financial thing, but I've been hoping to find something for general usage for a while now). When you are implementing something new, and you have a slight difference in the last digit or two with what you are comparing against, is it difference in the algorithm? In the encoding? Do you have a bug? And so on. . .

Ideally, something that can be programmed/scripted allows good testing coverage.

TW

Re: Math Software that supports BCD?

*Message #4 Posted by **hugh steers** on 1 Apr 2010, 8:46 p.m.,*
in response to message #3 by Tim Wessman

what you should do is use a multiprecision library (not necessarily in BCD) and make it work to 50 digits or so. then have it convert to strings and use those to compare your results. ie validate the resultant decimalised strings.

Suppose you want to verify a 12 figure answer, from the high precision library result first add ANS*5e-13 for 12 figure rounding, then convert to a string, then just keep the first 12 figures and compare.

Re: Math Software that supports BCD?

*Message #5 Posted by **Tim Wessman** on 1 Apr 2010, 9:16 p.m.,*
in response to message #4 by hugh steers

Well, yes. There are definitely plenty of ways to do this. I was thinking it would be quite cool to be able to essentially "simulate" 12 digit, 15, 6 or whatever nicely. :-)

> Quote:
>
> Ideally, something that can be programmed/scripted allows good testing coverage.

What you're actually looking at is "validation", a subset of a complete test plan/program.

Things to beware of:
-Using a single alternative comparison does not prove anything.
- If using more than one alternative source, how independent are they (be aware of: if they are using the same language, compiler, algorithms [e.g. both used snippets of the same publicly available -possibly erroneous- code], or similar coding logic, etc).

Hi Namir,

> Quote:
>
> Turbo Pascal ... those were the days!!!

What do you mean - I still use Turbo Pascal on a daily basis. Nothing works better for me for one-off utilities - data filter programs, etc. I do a lot of data collection, sometimes as often as every 6 seconds or so, and these generate very large files very quickly. So I use a Turbo Pascal Program to read the data and then output only the data I need at any particular time. Also useful for combining data into more usable subsets - such as hourly, daily or monthly.

Of course my new home computer is running 64 bit Windows 7 - which won't directly run my 16 bit programs. But Dosbox & virtual Machine work fine on it.

Bill

Then you might be interested in FreePascal. This is a modern Pascal compiler with excellent compatibility with TP 7.0. A native Win64 version can be found at: www.freepascal.org/

Herbert

Re: Math Software that supports BCD?

*Message #15 Posted by **Bill (Smithville, NJ)** on 6 Apr 2010, 7:06 a.m.,*
in response to message #14 by Herbert Crepaz (UK)

Herbert,

Thanks for the link to Free Pascal. I just downloaded it and the supporting documentation. I'll give it a try this weekend.

Thinking of Turbo Pascal 7.0, I remember when we upgraded to it at work, we paid "$45 Freight" instead of "shipping" charges due to the large amount of documentation that came with it. Man, those were the days - when computer programs came with full printed documentation.

Bill

in response to message #15 by Bill (Smithville, NJ)

Bill,

You might also consider trying Delphi. It's a Pascal language with fabulous windows support.

Re: Math Software that supports BCD?

*Message #17 Posted by **Bill (Smithville, NJ)** on 7 Apr 2010, 6:53 a.m.,*
in response to message #16 by David Hayden

David,

Thanks for tip on Delphi. I don't really need or want "windows" support. A line oriented in/out batch file works great, and when assiged to the windows scheduler, can occur at a convient time each day. It's part of an automated data logging procedure. I usually create an excel spreadsheet that can directly load the resulting data files for any further viewing/manipulation.

I loaded Free Pascal last night and it's perfect for my application.

Bill

*Message #6 Posted by **Pal G.** on 1 Apr 2010, 1:37 a.m.,*
in response to message #3 by Namir

HP is such a ginormous company, I imagine their web megalopolis (can't really call it a 'site') is being organized and maintained by bots. Humans probably don't go near it! Since the bot algorithms are unsupervised and self-learning they often get it wrong, but sometimes get it right. If you swing by at just the right time, in between garbage collection and a new release of marketing bots from the nursery, you might actually find something you want..

..or not. I'd try Office Max.

Tim, this is the sort of complaint that you can push up the management chain and really get results. If you tell management "someone is TRYING to give HP money and the website won't let them" then you'll get results. :)

HP 65 Service Manual

*Message #1 Posted by **ClausB** on 31 Mar 2010, 1:57 p.m.*

Is a service manual available anywhere for the 65?

I read in one of the forum archives that someone made a schematic of the 65, but I can't find that post again. Can anyone help?

Thanks!

Re: HP 65 Service Manual

*Message #2 Posted by **John Robinson** on 31 Mar 2010, 11:04 p.m.,*
in response to message #1 by ClausB

Hi Claus,

Complete schematics as drawn by Tony Duell can be found on the PPC CD/DVDs - contact Jake Schwartz for those. See PPC DVD

Also, I have redrawn the DC-DC converted schematic using a CAD tool, and you can find that at : 65 DC DC converter

Cheers, John

Re: HP 65 Service Manual

*Message #3 Posted by **Eric Smith** on 1 Apr 2010, 2:12 a.m.,*
in response to message #2 by John Robinson

Are you sure they're on Jake's PPC disks? I thought Tony's schematics were only on the HPCC Schematics CD.

Re: HP 65 Service Manual

*Message #4 Posted by **ClausB** on 1 Apr 2010, 6:48 a.m.,*
in response to message #2 by John Robinson

I saw your schematics and posts on Jacque's site - very nice. I await your next "best practices" post.

I got the PPC DVD yesterday and could not find the schematic. Is it in the UK PPC section?

Re: HP 65 Service Manual

*Message #5 Posted by **John Robinson** on 1 Apr 2010, 7:39 a.m.,*
in response to message #4 by ClausB

I could be (probably are) wrong about which CDs. I'll have to dig them out over the weekend and let you know, unless someone else has a definative answer before I get back to you.

Cheers, John

Re: HP 65 Service Manual

*Message #6 Posted by **Etienne Victoria** on 1 Apr 2010, 1:01 p.m.,*
in response to message #2 by John Robinson

Hi Claus, John, all,

I have ordered Tony Duell's schematics CD from the HPCC user club:

HERE.

(Your contact is Dave Colver)

and wholeheartedly recommend this purchase.

Tony's extensive work has helped me in almost ever repair I have done those past years.

Thanks to the Hacker in Residence.

Etienne

Re: HP 65 Service Manual

*Message #7 Posted by **Jake Schwartz** on 1 Apr 2010, 4:04 p.m.,*
in response to message #6 by Etienne Victoria

Right you are....Tony's handiwork is not on my disk(s), just the one available from HPCC.

Jake

Re: HP 65 Service Manual

*Message #8 Posted by **ClausB** on 1 Apr 2010, 6:51 p.m.,*
in response to message #7 by Jake Schwartz

OK, so I've bought the PPC DVD and the Museum DVDs and I still don't have what I need. Was there ever an HP Service Manual? Has it ever been scanned and posted? Seems hard to believe if the answers are no.

Edit: Sorry for the tone. I just got frustrated. Thanks to you all for helping.

Edited: 1 Apr 2010, 7:53 p.m.

Re: HP 65 Service Manual

*Message #9 Posted by **Eric Smith** on 1 Apr 2010, 10:08 p.m.,*
in response to message #8 by ClausB

There almost certainly was an actual HP service manual for the HP-65, but service manuals for

APD and Corvallis Division products were never supposed to be available to customers. (There was a screwup somewhere that led to the HP-75 service manual being orderable.)

The other service manuals that are in the wild were leaked. It's possible that a few more might turn up in the future, but don't hold your breath. As far as I've been able to find out, talking to both current and former HP employees, it is very likely that HP themselves no longer have the service manuals nor any other technical documents relating to old calculators.

What exactly are you trying to find out, anyhow?

Edited: 1 Apr 2010, 10:09 p.m.

Re: HP 65 Service Manual

*Message #10 Posted by **ClausB** on 2 Apr 2010, 8:00 a.m.,*
in response to message #9 by Eric Smith

I'm surprised, given the devotion of HP owners, that one has not survived. Maybe service manuals were rare because the calculators never broke!

Well I have a broken one and I want to fix it. I found some good info from John and Jacques about the power supply and I suppose that's the best place to start. I just thought I would collect all the info available before starting the repair. Once I start, there will be many more questions posted, I expect.

Re: HP 65 Service Manual

*Message #11 Posted by **Eric Smith** on 2 Apr 2010, 12:02 p.m.,*
in response to message #10 by ClausB

They're rare because HP did a very good job of keeping them from getting into the hands of customers. Other than the HP-75, most of the service manuals that have been found and scanned were leaked many years after the discontinuance of the model. However, that became nearly impossible for the old models after calculator responsibility was transferred from Corvallis to Singapore, because everything that wasn't relevant to then-current models was destroyed.

HP-85 cover all yellow

*Message #1 Posted by **Johnny Bjoern Rasmussen** on 31 Mar 2010, 6:18 a.m.*

Hi folks
My HP-85 has a very yellow cover.
Can I do anything to brighten it up a little (not by painting, thank you)
I'm shure that I have read about this earlier here...

Cheers!
Johnny

Hard to get pregnant when you're counting lines of code, or calculating how many numbers of the form x^6 have a 4 and 6 digit but no 5. :)

This is a variation on Pauli's exclusion principle where wife and calculator can not exist in the same hand due to different energy levels and spin.

in response to message #1 by Bart (UK)

> Quote:
>
> Someone was really deperate for a 32S?

Don't think so. I suspect you don't collect Pioneers... as it is not your average 32S. Not just in condition but in form as well. I would guess-ta-mate it is one in a thousand.

Re: What's the auction world coming to? A 32S sells for more than a 16C

*Message #4 Posted by **DavidShenk** on 30 Mar 2010, 7:03 p.m.,*
in response to message #1 by Bart (UK)

It looks like it beats the lowest known serial number by quite a bit, maybe that is why it went for so much?

Dave

Re: What's the auction world coming to? A 32S sells for more than a 16C

*Message #5 Posted by **Randy** on 30 Mar 2010, 9:32 p.m.,*
in response to message #4 by DavidShenk

Earliest 32S = 2809

Unit in question: 3013S

How does that beat the lowest number?

Re: What's the auction world coming to? A 32S sells for more than a 16C

*Message #6 Posted by **ron g.** on 31 Mar 2010, 2:47 a.m.,*

in response to message #1 by Bart (UK)

Obviously:

1. It has new batteries.
2. It's from Belgium, so the buyer get some non-US stamps to add to his collection.
3. The seller used a large font.

Could it be any simpler?

Edited: 31 Mar 2010, 2:47 a.m.

Re: ... A 32S sells for more than a 16C

*Message #7 Posted by **Karl Schneider** on 1 Apr 2010, 3:09 a.m.,*
in response to message #1 by Bart (UK)

Randy hinted at the salient point:

> Quote:
>
> ... it is not your average 32S. Not just in condition but in form as well. I would guess-ta-mate it is one in a thousand.

This one is a 1990 model, likely the only year of the HP-32S with the improved Pioneer-series display -- recessed, with anti-glare face, taller characters, and dust seal. The HP-32S in 1988-89 had the original 'flush' display, and HP-32SII replaced it in 1991.

I also paid around $200 a few years ago when I found a 1990 HP-32S in very good condition at auction.

You mean it wasn't the font? 8-)

Thanks for the information, Karl. I was not aware of the different 32S versions.

Re: ... A 32S sells for more than a 16C

*Message #9 Posted by **Bart (UK)** on 1 Apr 2010, 6:06 p.m.,*
in response to message #7 by Karl Schneider

Randy is right that I am not a collector of calculators. I just like to get interesting models.

However, this is my 32S, serial no. 3038Sxxxxx. Thus it falls exactly in that era you mention, but I got it on eBay last year for for less than 1/4 of the price.

Anyway, if i'd have had the money to spare, i would rather have purchased this HP67 and taken my wife for dinner with the change (after which she'd forgive my calculator extravagance).

Re: ... A 32S sells for more than a 16C

HP-01 stylus

*Message #1 Posted by **Alberto Fenini** on 30 Mar 2010, 5:23 p.m.*

Hope could be of help for someone, item 190385177515, (I'm not related in ANY way to seller) are advertised as Pulsar, but to me these are identical to the Garland stylus that came with the HP-01, available in both gold and steel, price seems good to me, if compared to average prices for this item.

Note for the forum moderator : if this message does not comply with the Terms of Use, please delete it immediately.

Re: HP-01 stylus

*Message #2 Posted by **geoff quickfall** on 31 Mar 2010, 2:53 p.m.,*
in response to message #1 by Alberto Fenini

Differences:

```
-Pulsar engraved on all Pulsar (Garland styluses).
-HP are not engraved.
-Pointer of a Pulsar Stylus differs from the HP-01 in that
  it is spring loaded and has a black soft tip.
```

You can always find a Garland Twin-o-matic at a tiny fraction of the cost in gold or silver. Then convert the correct end to a pointer by

```
-removing the ink cartridge
-removing the nib of the ball point ink cartridge
-cleaning the tube of the ink cartridge
-inserting a plastic rod into ink cartridge
-reinstalling the cartridge into the pen
```

I actually picked up 9 silver Garlands new old stock in their boxes for $20, no one bid on them! These are identical to the HP-01 stylus as they are not engraved. I have still have to convert them to the HP-01 stylus as described above.

Still it is a cheaper option then waiting for the HP-01 stylus to show up.

Cheers, Geoff

Idea for high-end scientific (but not graphing) HP

*Message #1 Posted by **bhtooefr** on 30 Mar 2010, 3:27 p.m.*

This calculator would slot in above the 35s, and would target the "I want a 48gII or 50g because I want the stack of an RPL calculator, and some of the nice features, but I don't care about most of the other features" demographic.

Go for styling like the SmartCalc 300s. Solar might even be doable, but it'll add to the vertical height of the device.

It seems that on RPN calcs, HP is going back towards their heritage. No reason to fight that at all. Use a 48-like layout, although a row or two of keys could probably be removed, due to the removal of graphing features and probably CAS features. Either that, or use the modern layout, but you could probably remove a row of keys there, too - the 35s, actually, looks like a winner, layout-wise, just add a row on top for the function keys.

To prevent it from cannibalizing sales of the 48gII and 50g, no PC connectivity, no expansion, and only a 4-line LCD - think 28-like.

Give it an ARM7 instead of the ARM9 - longer battery life, cheaper, and slower (helps prevent cannibalization of sales.) Some ARM7 microcontrollers may even have enough RAM and flash to avoid having to have anything outside of the MCU.

Now, price it where the 35s is right now, and either drop the 35s to near where the 33s is now (probably either replacing the 33s, or dropping its price,) or just replace the 35s.

Emphasis how flexible it is at handling unit conversions, varying datatypes, and such.

I think it might just sell.

Thoughts? Sorry, no image, lack of photoshopping skills, but I think it might just be possible to make a $60 RPL calc.

(Yes, I'm someone that owns a 50g because I wanted an RPL calc, and heard bad things about the 48gII, but I often end up using as not much more than an RPL 4-banger. I wouldn't even use all of the features of a 33s.)

Re: Idea for high-end scientific (but not graphing) HP

*Message #2 Posted by **Chuck** on 30 Mar 2010, 4:04 p.m.,*
in response to message #1 by bhtooefr

Any calculator today should have the ability to externally store programs or data. PC connectivity or an SD card slot, for me, would be a huge selling point.

CHUCK

Re: Idea for high-end scientific (but not graphing) HP

*Message #3 Posted by **Bart (UK)** on 30 Mar 2010, 5:00 p.m.,*
in response to message #1 by bhtooefr

An RPL calculator without the graphics (which most people do on computers anyway) would definitely have my support. I would want PC connectivity though, but a USB port would be enough. I use the SD on the 50G merely for convienience to transfer programs but I also have the non-SD fx-9860GII and find transferring data is simple enough and apart from the 64K RAM, it has 1.5MB Flash storage memory which I find adequate (but it would be easy and cheap enough to put more on a non-graphics RPL).

Re: Idea for high-end scientific (but not graphing) HP

*Message #4 Posted by **Marcus von Cube, Germany** on 30 Mar 2010, 5:40 p.m.,*
in response to message #3 by Bart (UK)

You would still need a dot matrix display to handle different fonts and show complex data types like lists, or complex numbers. So some simple graphing capabilities (comparable to the 28S) would still be possible. It shouldn't be advertised as such but the feature wouldn't hurt.

Re: Idea for high-end scientific (but not graphing) HP

*Message #5 Posted by **bhtooefr** on 30 Mar 2010, 6:12 p.m.,*
in response to message #4 by Marcus von Cube, Germany

And it'd probably be more work to REMOVE the graphing capabilities, and it would cripple it, compatibility wise. And, USB probably isn't a bad idea, although serial and IR probably won't be needed.

Then again, giving it graphing would have the problem that it would cannibalize 48gII sales. Of course, that's what the ARM7 and 4-line display are for...

By 4-line, BTW, I mean a 32 pixel tall LCD, like the 4-line display used on the 28 series.

Re: Idea for high-end scientific (but not graphing) HP

*Message #6 Posted by **Bart (UK)** on 31 Mar 2010, 5:15 a.m.,*
in response to message #5 by bhtooefr

> Quote:
>
> And it'd probably be more work to REMOVE the graphing capabilities

You are probably right as HP is into emulating the existing software on new platforms and the calculator division is too small to have resources for significantly altering code.

You mentioned the 28s and 300s, I had been thinking exactly that HP could put a 28s functionality in the 300s body, with an extra shift button (instead of the extra fold-open keyboard) - the keyboard I/O gets processed in the encapsulating software anyway I think.

So, just putting the 28s software on a 300s platform would not cannibalize the 48/50 sales much as it:
-has no ALG or CAS input
-No equation writer
-No clock/date/alarms
-only 2D graphs
-No financial applications
to name a few

Of course with enough memory, some of these could be programmed in, but as such it does not have them "out the box".

So, they can re-use old software currently "gathering dust" and use a case that is already in production (300s).

Re: Idea for high-end scientific (but not graphing) HP

in response to message #6 by Bart (UK)

I'd say that algebraic input is a must-have, if only to go after those that don't want RPN.

Keep in mind that, I'd think they'd want to stay as close to the codebase of their other calcs as possible, which means a cut-down version of the current firmware, MAYBE with some old 28S code mixed in.

Everything else, however, makes sense.

Not bad... I hope HP keeps coming out with new models. However, for me, I would be greatly satisfied with a non-programmble, small, RPN calculator along the size of the HP 6S or Casio fx-260... and preferably with an excellent keyboard. I think 5 storage registers would be sufficient.

It's my latest calc project called the uCalc, and has been much discussed many months back.

Credit card size, full graphic display, 3-axis tilt sensor, Micro SD card, 16 bit processor, touch panel keypad, standard CR coin batteries, and piezo buzzer.

That's the first prototype I built, but sadly I have not had time to work on it since then.

Dave.

*Message #15 Posted by **David Hayden** on 31 Mar 2010, 10:24 a.m.,*
in response to message #1 by bhtooefr

My hope is that their goal is to move to native ARM code. After converting the development tools and porting the RPL engine, they could look at past calculators that provided decent functionality and were written in mostly RPL. Use that as the basis for a new, very fast calculator. Then use sales from that to fund further development/porting of the rest of the calculator line.

I suspect that the 30bII is the first in just such a line of calculators.

By dropping the dot matrix display and going to a multi-line segmented display, I wonder if they could improve display contrast to be comparable to the 41C? I think that might be worthwhile.

I definitely agree with others that any calculator with more than 1K of memory should have an external PC connection of some sort these days. This lack of I/O is the major reason why I haven't bought a 35s.

Desktop RPL Bleat..

*Message #16 Posted by **John Stark** on 31 Mar 2010, 11:42 a.m.,*
in response to message #1 by bhtooefr

While on the subject of an intermediate step between 33/35 series and 50G series, how about an RPL "repackage" in a desktop size similar to OfficeCalc series.

Display could be dot-matrix or "41-style" segmented. A row or two of keys (unless clever use of "gold" or shift key) would have to be added to OfficeCalc form factor.

Still a nice unit for those of us who miss the 91/97 desktop series of yore.

My 0.02 anyway.

John Stark

John,

I've always dismissed the desktop calculators as obsolete because we have PCs, but maybe I'm being too hasty. What advantage do you see to a desktop calculator over a PC or laptop?

Re: Desktop RPL Bleat..

*Message #18 Posted by **bhtooefr** on 31 Mar 2010, 5:47 p.m.,*
in response to message #17 by David Hayden

I've seen people use desktop calculators for totalling stuff, even with a computer in front of them.

Sometimes the whole screen is taken up with whatever task they're doing, and they don't want to resize things.

So, there is a market, but from what I've seen, it's pretty much mostly 4-bangers. Then again, an RPN financialish 4-banger probably WOULD do well as a desktop calculator.

Re: Desktop RPL Bleat..

*Message #19 Posted by **Bart (UK)** on 1 Apr 2010, 5:17 a.m.,*
in response to message #18 by bhtooefr

I must say that I often have a calculator next to me when working on a computer as I've always found it easier to quickly tap on a physical calculator than to bring up an on-screen one and clicking the "buttons" with a mouse (anything more than basic four function is not available on the keyboard/numeric keypad).

Re: Desktop RPL Bleat..you're getting Warm...

*Message #20 Posted by **John Stark** on 1 Apr 2010, 11:15 a.m.,*
in response to message #18 by bhtooefr

Now there's an idea. Something 30-ish in a desktop format.

I would find desktop format with larger keys and display convenient even when using a computer for side calculations. Currently use either 35S or 45 (!) in this role.

Desktop keyboard and display easier on the eyes and fingers , too.

Re: Desktop RPL Bleat..you're getting Warm...

> What advantage do you see to a desktop calculator over a PC or laptop?

Readiness. Even more ready than a handheld. The bigger, the better.

Seriously, my 32SII is always the same. Same interface, same functions. No need to reinstall anything. Since '91 I had a lot of different computers, each with new software. There's not much to get used to that lasts as long as a calculator.

If I had the space, I'd use my 59 much more because it rests on its printer and can't be removed easily.

Re: Desktop RPL Bleat..Printer, Too.

Another idea for the HP.30DT++. (30 DeskTop Plus Plus)

Printer version at $ 20.00 or so more.

Have a fine holiday (both Passover and Easter). Thanks for your feedback.

John Stark.

Re: Desktop RPL Bleat..Printer, Too.

*Message #24 Posted by **Mark Henderson** on 2 Apr 2010, 6:20 p.m.,*
in response to message #23 by John Stark

I always have a real calculator on my desktop because it's always there, faster to operate. I was imagining my dream non-graphing calc and looks like this:

- Must have dedicated function keys (one row, with shifts) that can be assigned to programs (without affecting functions of other keys) - Keystroke programmable for fast automation of simple tasks - RPL, with multi-level stack display (yes, RPL and key-stroke programming) - SD card - USB - Write programs on PC in key stroke, RPL or C - Compact and tilted for desk use (Classics are perfect...)

Dave's uCalc misses a couple of these points but is probably the closest thing to likely come along any time soon?... I know a 48/49/50 match pretty well, but I find myself reaching for a Classic over my 48 most of the time for daily use....

Pi wrong?

*Message #1 Posted by **Bruce Bergman** on 30 Mar 2010, 1:31 p.m.*

So, I've been sitting here on hold with BofA for what must seem like hours, and I'm gazing at my HP calculator poster, looking at the various models. Very pretty. ;-)

As I glance at the HP-10bii model ("R2D2"), I see the value of Pi in the display. 3.1415926545.

Wait. 545? I always knew it as 3.1415926535.

My HP-97 says 3.141592654 (using DISP), so, okay, it rounded up.

My HP-30b says 3.14159265359 (gotta love the extra digit).

I don't have an HP-10bii handy, but that value in the display, on the poster, appears to be wrong. Was it just typed in or actually displayed wrong on that unit?

Inquiring (bored) minds want to know.

thanks, bruce

Re: Pi wrong?

*Message #2 Posted by **Katie Wasserman** on 30 Mar 2010, 1:40 p.m.,*
in response to message #1 by Bruce Bergman

The 10bii doens't have a pi key nor trig functions nor other obvious way to calculate pi so it almost certainly was typed in wrong.

-Katie

Re: Pi wrong?

*Message #3 Posted by **hpnut** on 30 Mar 2010, 3:04 p.m.,*
in response to message #2 by Katie Wasserman

IIRC pi=22/7

so any calculator ought to be able to display pi

Re: Pi wrong?

*Message #7 Posted by **Garth Wilson** on 30 Mar 2010, 5:49 p.m.,*
in response to message #3 by hpnut

```
22/7 is off by about +4.0E-4.
245/78 is off by about -1.8E-4 (not a whole lot better).
355/113 is off by about +8.5E-8.
65298/20785 is off by about -5.1E-8.
93343/29712 is off by about -9.9E-9.
```

For 16-bit scaled-integer work with 32-bit intermediate results, 355/113 is usually used as it is quite accurate and you have to go to much higher numbers, all the way to 62298/20785, to get any better, and even that doesn't bring much improvement.

HP 34C - which way round are the batterys fitted?

*Message #1 Posted by **Jon Duke** on 29 Mar 2010, 9:10 a.m.*

Hi, the message title says it all really. I'm seeing if I can get my father's old HP 34C working. The batteries were badly corroded and thinking that there would be marks telling me which way round to fit new ones, I pulled out the old ones, only to find that there are no marks that I can see on either the body of the calculator or the case.

I do also have the charger. Is there a max charge time and is it OK to run it while connected to the charger? Thanks for any help.

Re: HP 34C - which way round are the batterys fitted?

*Message #2 Posted by **Katie Wasserman** on 29 Mar 2010, 9:56 a.m.,*
in response to message #1 by Jon Duke

Look here

Charging time varies depending on which battery type you used as the replacement. Newer cells generally have higher capacity than older ones and require more charging time. It's always best to not overcharge as the heat from overcharging will reduce battery lifetime. Charging for 10-12 hours should be enough to fully charge most cells and not too long to damage them. It's ok to run the calculator while the batteries are charging but charging times will be longer.

Edited: 29 Mar 2010, 10:02 a.m.

Re: HP 34C - which way round are the batterys fitted?

*Message #3 Posted by **Jon Duke** on 29 Mar 2010, 10:39 a.m.,*
in response to message #2 by Katie Wasserman

Hi Katie. Thanks for your reply regarding charging the calculator. Would you know which way round the batteries go?

Re: HP 34C - which way round are the batterys fitted?

in response to message #3 by Jon Duke

Sorry Katie!!!! I only just spotted the picture! 10**6 thanks

Re: HP 34C - which way round are the batterys fitted?

*Message #5 Posted by **db (martinez, ca.)** on 29 Mar 2010, 11:42 a.m.,*
in response to message #1 by Jon Duke

Jon;
Here i am in the unnatural position of wanting to add something to Katie's post, the weird thing being that she

taught me over half of the little i know about charging batteries.
Here goes: IMHO it is dangerous to charge the batteries INSIDE your model of hp calculator. A high percentage of them are dead because the batteries weren't making good contact, maybe because of slight corrosion or dust, and the irreplaceable ROMs got fried with too much DC. This also happens to the Woodstocks. Let this be known as the *too much cheesecake too soon* syndrome.
I avoid the problem by charging the batts outside of the calculator or running slightly used AA alkaline 1.5v cells in place of the 1.25v rechargeables. The last is an easy solution if your calc has broken spring contacts like a couple of mine do.

QUESTION: Has anyone tried to coat the batt contacts with something like that conductive anti-oxidizing goop which is used on aluminum high voltage wiring?
db

Re: HP 34C - which way round are the batterys fitted?

*Message #6 Posted by **Jon Duke** on 29 Mar 2010, 12:04 p.m.,*
in response to message #5 by db (martinez, ca.)

Hi DB, thanks for your words. What you say sounds like a good safe approach. It's something I hadn't considered. Re things to stop corrosion, I favour silicone grease, what plumbers use to ease plastic plumbing pipes over O rings in connectors. Over here the phone companies dip wires in it before clamping them in roadside distribution boxes, so it ought to be good. It is very inert indeed. The only thing to watch out for is that it does not go down well in places where paint is being applied, like car bodyshops: it causes wet paint to roll back from any trace. HTH.

Re: HP 34C - which way round are the batterys fitted?

*Message #7 Posted by **Michael de Estrada** on 30 Mar 2010, 11:39 a.m.,*
in response to message #1 by Jon Duke

Jon,

Let me add to what has already been said. You may have noticed that the original battery pack uses AA flat top cells, which do not have the extended tip at the positive terminal. This makes the battery shorter, such that it compresses the battery contacts less. Using regular high-top cells can result in eventual breaking of the battery contacts due to over-compression, which bends the contacts past their yield point. I've also seen them break off from their mounting rivets. To this end, I always use flat top NiCad AA cells in all of my HP Spices, which I purchase from Batteries Plus for $2.50 each. You should be able to find them at any store that reubuilds battery packs.

Michael

Re: Looking for details on 82033A battery pack

*Message #3 Posted by **Ignazio Cara (Italy)** on 29 Mar 2010, 3:12 a.m.,*
in response to message #1 by Clark H Lewis

I don't know if it's possible check a battery pack without a preliminary complete charge in a reserve power pack, printer or calculator that is good. Maybe it's no possible. Afer a good charge for at least 8 hours or more, if the akku have a capacitance >= of the originals, you must remove the battery pack and connect a 5 ohm, 10%, 10W resistor across the battery contacts. After 45-60 minutes, remove the resostor and measure the DC voltage between the battery contacts. If the voltage is less than 4 Vdc, the battery pack is bad. If the voltage is at least 4 Vdc or more, the battery pack is good. Before to check the battery pack, is a good thing verify if the charger is functioning properly. You cam perform this procedure: measure the power outlet voltage (Vin) using an ac voltmeter. Plug the recharger into the outlet and measure the recharger ac output voltage (Vout) under no-load conditions using an ac voltmeter. Vout should be between 9.9 and 13.3 Vac at power voltage of 110 or 220 Vac. Vout should equal (Vin/110)x11.6 Vac +/- 1.7 V or (Vin/220)x11.6 Vac +/- 1.7 V. Vin is the AC voltage of the power outlet). If Vout is outside the allowable range, the recharger is bad. If Vout is inside the range, connect a 12-Ohm, 5%, 5W resistor across the recharger output contacts and measure the ac voltage across the load: if the voltage is between 5.3 and 7.3 Vac the recharger is good, otherwise it should be discarded.

Hope this my contribute could help you.

Take care

Ignazio

Very impressive, very nice, my iPhone is lusting after the new version!

Re: i41CX draws sine curve

*Message #3 Posted by **Garth Wilson** on 28 Mar 2010, 9:51 p.m.,*
in response to message #1 by Egan Ford

In my experience, the greater value of drawing the curves with the 41 as brought up in the original thread about using the pen plotter to draw the curve is in testing some kind of product, especially for the military when I worked in the engineering lab at a microwave power transistor manufacturer, and the paper goes into a report that is kept on file, immune to disc crashes and so on. (Of course today multiple back-ups on servers should remedy that problem.) I've seen it used for this kind of thing many times, never just to see what something would look like or get a cool graphic, but rather to keep a record of the test results of the product.

The Future of Graphing Calculators

*Message #1 Posted by **bill platt** on 28 Mar 2010, 10:30 a.m.*

Yesterday, after reconfiguring my widoze registry, I got my computer to communicate with my old HP 49G. Having crashed regularly while running ROM 1.18, I updated it to Rom 1.19-6 and it is more stable, and yet I still lost memory twice in one session!

I decided to go back to the "EQUATION WRITER" example in the HP 48G quick-start guide to see how much better the 49G (which is essentially MK + Erable +ALG48 or something). I intend to put MK back on one of my 48GX machines ,too, to see it, but haven't yet.

What I found, playing around with the native equation writer on the 48, as well as the 49G version, left me underwhelmed.

The 48G built-in equation writer is pretty much useless. While it is possible to type in the example, if you make one mistake, you are toast, there is no good way to edit it in the writer. And of course it is absurdly slow, if you "view" the equation. Maybe it was good in 1990, but today, with small laptops, why bother?

On the 49G, the speed is really impressive. And the editing paradigm (developed by the MetaKernel team) is hugely superior to the native 48G equation writer. So far so good.

But then we come to the actual use of such equations. If you have the 49G in its default settings, and you ask it to "EVAL" that nested set of square roots, you will crash the machine. If you ask to "NUM" it, it works fine. Change the CAS settings to approximate, and numeric, and you can EVAL without crashing. Of course EVAL always works just fine on the HP 48G natively, as there is no CAS.

This is a lot of words to set up for the real question:

Considering that the 50G is really just a 49G with new hardware, then even with the 50G, you are dealing with an old-fashioned little device.

With Wolfram Mathematica "home edition" (32bit) available at $295, what is the future of the graphing calculator?

irI am thinking of my own kids here: why waste their learning time and effort on stupid little toys, when they can spend that time on a tool worthy of the effort?

I don't know Mathematica--never used it. But I've looked over the website often enough and said again and again to myself, "that looks interesting--too bad it costs $2500." Now available for under $300, perhaps it is time to try it.

Any thoughts? any Mathematica users?

(Note that if I'd known this a few days ago, I wouldn't have advised the EE major from Spain to get a 50G in addition to his 35s!)

In my own work, the calculator has gone from the status of "indispensible programmalbe computing tool" to, "I'd rather use a spreadsheet for this."

> But then we come to the actual use of such equations. If you have the 49G in its default settings, and you ask it to "EVAL" that nested set of square roots, you will crash the machine. If you ask to "NUM" it, it works fine. Change the CAS settings to approximate, and numeric, and you can EVAL without crashing. Of course EVAL always works just fine on the HP 48G natively, as there is no CAS.

You may find this thread interesting or validating: http://groups.google.com/group/comp.sys.hp48/browse_frm/thread/a8ff441fed3d23ff#. IANS, the OP describes some of the pains of the CAS.

> Quote:
>
> With Wolfram Mathematica "home edition" (32bit) available at $295, what is the future of the graphing calculator?

IMHO, the graphing calculator's days are numbered. All it would take is for standardized tests to be computerized with all the necessary tools included as part of the testing system. By the time this happens every school will be a laptop school and they will train the students to use the tools necessary to pass the tests. I think TI sees this.

> Quote:
>
> irI am thinking of my own kids here: why waste their learning time and effort on stupid little toys, when they can spend that time on a tool worthy of the effort?

My kid graduated from high school in 2009. Owning and learning the TI 83+ was a requirement to pass tests. Some (internal) tests were written for the 83+ (AP Calc, AP Stats).

However, the 83+ does not do CAS. I tried to teach my kid to use Sage (open source Mathematica competitor). Sage is no harder or easier than Mathematica and both CASes produce the same results. Neither CAS was of much help since they produce answers and not the path taken to get there. They are great for checking work, but that's about it. Maple OTOH has a learning mode that will display how to solve problems step-by-step. IIRC, the 50g and TI-nspire have similar features.

IMHO, graphing calcs and Mathematica are both goal oriented tools to help the user be more productive solving some larger problem. I think they both fail as a tool for teaching, but they were never designed to replace teachers (or learning). I think they are both great tools for discovery (e.g. what if I change this to that, what happens?).

> Any thoughts? any Mathematica users?

I'd exhaust all the open source alternatives first before spending $300 on a tool that will get rarely get used. Sage is great and easy to setup. If you have a home server you can put it there and just have your kids point a web browser at it. Or you can use a number of congested Sage servers on-line. If you want pretty print (and who doesn't :-), then make sure you install the proper browser fonts.

My 15C and 48GX were great must have tools for school, but outside of school I never needed them. I love gadgets and my calculators are more toys than tools now. Do I *need* a 30b? No, but I have one, just to play with it. However, I think I've had the most fun with the 41/71 (HPIL) and the 50g (HPGCC).

My thoughts of the future. Tablets. An ARM exec claimed that there would be 50 different tablets by year-end. Something as easy to use as a graphing calculator but with the power of Mathematica would be a suitable app for a tablet. But is that just wishful thinking?

Re: The Future of Graphing Calculators

*Message #3 Posted by **Chuck** on 28 Mar 2010, 12:47 p.m.,*
in response to message #2 by Egan Ford

Mathematica does not fail as a teaching tool. I use Mathematica every day in class for demos, lecture notes, on the fly investigations, things that a calculator can never do.

I no longer allow graphing calculators on in-class exams, only a scientific calculator that can do two-variable statistics (preferably solar) . Our school also just purchased a 3-year site license for Mathematica which allows every student to have a copy at home for free, for as long as they are a student.

The great thing about the recent versions Mathematica is a command called Manipulate. With one command you can change a static graph such as y=2x^2+3x-7 into an interactive quadratic y= ax^2+bx+c with sliders for a, b, and c to investigate what these parameters do. I believe the Nspire can do something like this, but what a cumbersome ugly beast.

I've also created simple manipulates which generate a desired number of practice problems for multiplying polynomials, factoring, finding equations of lines given two points, etc. It generates the practice problems using a random seed, and then checking a box displays the answers immediately; great for quick practice or review in the classroom, at home, or for online students.

Also, Mathematica can display a slide show just like Powerpoint, except that they are live. An example: I used it in 4th quarter calculus for notes, theorems, and demos etc. When investigating line integrals through vector fields in class using Mathematica, a students asked "What if we change....". Make the change, or turn the example into a manipulate and explore.

I've also begun using Mathematica as a word processor to write all my notes, handouts, exams. I also import my grades from Excel to generate more sophisticated graphs and analysis that Excel pales at. I also import data collected using the TI- calculators and CBL's (this is one good use for the graphing calculator.) Students can produce much better graphs, documents, and professional looking work.

The students are also taking to it quite well, but there is a learning curve. The best thing is that they now are better able to figure out when to use Mathematica as a tool, i.e, when the scientific calculator and straight forward algebra isn't enough. No longer are they reaching for the blasted graphing calculator to add fractions, solve a quadratic with pre-programmed programs, square an integer smaller than 10, graph a function like y=2x+3 etc.

Bottom line, graphing calculators do have an educational value, but not nearly as huge as TI and others make it seem. I would be perfectly happy if graphing calculators completely disappeared; students use them far too often as an "answer machine" rather than a tool.

My two (fifty-two) cents worth.

Mathematica is good tool to work with. I am using Mathematica's tools as part of my graduate thesis work.

Personally, I prefer a graphing calculator because of its portability. You can't exactly take a laptop in every possible location (maybe with the notebooks getting smaller, this is getting close to reality). The additional plus of the calculator is that if I press the ON button, it's ready to go... I don't have to wait for a computer to start up.

I don't believe graphing calculators are going away any time soon(which is good news for calculator freaks like me LOL). Given that TI, HP (to an extent), and Casio, especially TI, have invested so much into the graphing calculator market the last decade. The nSpire has a potential of being a portable Mathematica/Matlab - it is on its way there.

However, I think graphing calculators are going to split into two directions: small, portable, and (hopefully) solar powered that deals with functions, maybe polar, parametric, and sequential graphing - and a small to medium sized amount of programming; and the nSpire/Classpad/"HP 51g" types where the CAS gets more sophisticated as well as the function set, input devices, and communication with computers.

I went through this exercise with a friend at work a few months ago. We basically concluded that a graphing

calculator has two uses: as a learning tool in school and as hand-held special-purpose computer. Both uses rely on its durability and "instant on" feature.

I think it will be interesting to see where the ipod, iPad, cell phones, netbooks and e-readers take us. Off hand, I'd guess that we're going to end up with something like an iphone in our pockets, and something like a kindle or netbook or iPad in our briefcases/pocketbooks.

Calculators seem to be used in surveying a lot, but I'm surprised that they aren't used for other fields as well. Industrial hand-held computers are very expensive compared to a calculator.

Finally, I have an interesting anecdote. I'm a computer programmer and for years I had no calculator at work. When I got back into HP calculators a couple of years ago, I bought a 48gII which I now keep at the office. I find myself using it a couple times a week now. It's usually faster to pull it out than it start Excel.

It's usually faster to pull it out than it start Excel.

I currently have 3 HPs on my desk in a stack (X:15C, Y:30b, Z:50g). I too find that I will at times reach for the top calc (15C) when I need to do a bit of fast arithmetic. The windows metaphor used on OS/X and other desktops is not well suited for running two apps at the same time. Yes it is possible, but first I have to launch the calculator, resize both windows for a side-by-side view, and then I have to cmd-tab to switch between applications. Sometimes just leaving the app open that needed the input without resizing and using a 2nd device is more convenient--too bad I cannot BT/WiFi send the calc result (there are iPhone apps for this, but none with RPN).

Now that all said I still use a CLI RPN calculator called 'calc' for most quick math, its just a habit, especially since I travel most of the time and do not have my stack of calcs. For longer calculations I usually use my iPhone in 42S or 41CX mode. But for the longest or if I just want to feel some buttons I reach for the top of the stack.

For me the advantage of a graphing calculator over an ordinary scientific is not graph plotting, but its bigger screen. It's nice to see lots of stack levels on an RPN machine, or several previous calculations and results on

an algebraic machine. Other applications (e.g., a numeric solver) also benefit from the bigger screen size.

With one exception, I rarely use these machines to draw graphs, and I would certainly never use the HP-50g to do algebra! I find its CAS too inconsistent to be easily remembered. I haven't used Mathematica since its early days; back then, I loved it. I'm sure it's still wonderful; it would certainly be nicer than the HP-50g, even for simple problems.

The one calculator I do use for graphs is my Casio FX-9860G Slim. I teach Physics to students aged 13-18: when I do an experiment, I like to type the results into its spreadsheet and then graph them. (My students are forced to plot graphs by hand, because that's what the exams require!) This calculator is so nice to use that unless I need a printed graph I don't bother with a "proper" computer. I think that machines smaller than laptops that can draw graphs still have a role to play.

Ditto for me, the bigger screen is what attracted me to the 48s in the first place, not graphs per se. However, it's the power of these machines that keeps me coming back, still struggling with the learning curve.

in response to message #8 by Nigel J Dowrick

I couldn't agree more: I bought a 50g because I wanted an infinite stack and access to a proper RPL language. In fact I came to this via postscript programming: there seem to be many similarities. I can recommend postscript programming to anyone interested in postfix/stack programming. It is very powerful, very easy to learn, and runs on your printer!

The graphing capabilities of the 50g are - let's be fair- really quite pathetic, when compared to a computer. I need access to high quality vector plots (postscript and pdf) so the graphing on the 50g is useless to me. If I want to explore a graph then I just use a plotting program on my laptop (mainly gnuplot - again a free package). Why bother with a slow, cumbersome, and low quality graphing environment?

It is a bit of an artificial market to rely on schools who demand graphing calculators for exams or their math classes. I would imagine that they also start to move to more user-friendly and realistic graphing environments on the computer.

So the graphing calculator market surely is a dead end. I'd rather have a nice, compact scientific (with an infinite stack preferably ...) That really offers something that computers, or even iPhones and the like, cannot replace.

I feel the same way. >>

In the education side, I have already seen computer based exams that do not allow any handheld device, but only the use of the software calculator on the computer. Depending on the sections of the exam it had a four-function or sceintific calculator. This precludes the need for examiners to check & approve calculators. They can provide exactly what they want you to use on the computer. I believe this is the future of calculators in the education sector.

In the private sector, I agree with what has been speculated elsewhere in this thread, iPhones or whatever with software calculators will be the handheld calculator of the future. Everything else we do on computers, with the ever advancing mathematical software packages becoming available within the price range of the average user. We'll even have them on our iPhones one day.

Just like books are going to be replaced with e-readers*, calculators will be replaced by software on computers & pocket devices. It may not happen as quickly as with other technologies (because so many of us are still used to whipping out a physical book or calculator), but I think that eventually it will.

* This electropnic book thing still irritates me at times, just this weekend I was looking at some functions on a graphics calc - with the PDF manual on a laptop. To the amusement of my family, as I'm always advocating the portability of calculators but have to carry around a device several times it's size to read the manual :(

Bart, can you elaborate on this? To me, it wouldn't make sense to disallow a hand-held calculator while allowing a laptop or computer because a student could sneak all sorts of cheat programs on a laptop. I suspect I'm missing something about the situation.

Hmmm, several people have said that they like the large display of the graphing calculators. So to us, are they really "input form calculators?" Would we be happy with a calculator with a large display of alphanumeric characters only? Imagine a calculator that used a segmented display like the 41, but the

display was twice as wide and had 7 or 8 rows. If the contrast was a good as the 41, I might prefer that over the dot matrix display of the 50g.

The computers were the learning centre's own desktops, i.e. they have total control on what's on them. The calculator was something like the windows standard calculator.

Hi,

Further to my post, here's an example:

numeracy test

If you select one of the *practice* tests, hit next until you're past the mental arithmetic questions (past the blue/grey to the green/gray screens), you'll see a "calculator" box, which brings up a 4-function calculator, which is all you're allowed to use. When you take the test you sit down in front of a computer that only allows the running of the test.

I think this is the way it will and should go as it is a reasonable way of controlling what calculator power is used and also to "level the playing field" where every exam taker has the same calculating power at hand.

Note: I am giving a bit of second hand info as I did not take these tests myself, my wife did as part of her converting her teaching qualification to QTS (UK Qualified Teacher Status) when we moved from SA to UK.

Re: The Future of Graphing Calculators

*Message #16 Posted by **Crawl** on 29 Mar 2010, 2:55 p.m.,*
in response to message #1 by bill platt

I guess I'll be the minority on this.

I think modern (ie., with CAS) graphing calculators are great. I use them just about every day. I only wish I had gotten them earlier.

An example:

Years ago when I took Jackson's Classical Electrodynamics, I did all the problems pretty much by hand. I had a scientific calculator, but what good did that do me? You had to derive equations, not just plug numbers into equations you already had.

I'd say it took me about 7 hours to do an average problem. I ended up using about 12 pages of paper (6 sheets front and back) for the algebraic manipulations, which were then reduced to about 4 for the polished version I turned in.

My weekends were dedicated to that class for about 9 months.

If I had a good graphing calculator then, I estimate I could have gotten my average time down to maybe 2 hours per problem. That's huge time savings. It by no means would have "done the work for me" -- you still have to figure out how to set up the problem and understand the physics. But all the tedious crap -- distribution when multiplying polynomials, finding determinants of 5x5 matrices (and symbolic matrices, so even an HP15c wouldn't help) -- is made much easier.

I think that's exactly what a calculator is for.

What about Mathematica or Maple?

I think the same arguments apply for using a graphing calculator vs those programs as apply for using a scientific calculator vs having to pull up your PC/laptop's built in calculator. More convenient. Easier to use (even an HP50g is MUCH more intuitive than Mathematica or Maple).

And those things reinforce each other. Since a calculator is portable, you will find yourself using it more often, in more situations. Since you use it more, you become more familiar with it and it becomes easier to use.

With you there. I often find myself sitting at a table with drawings spread out that I am doing some design and marking up the sheets for the drafter. Much more convenient to have a calculator (or two different ones) right at hand than to go back and forth to the computer. Even a laptop.

Re: The Future of Graphing Calculators

*Message #18 Posted by **Crawl** on 13 Apr 2010, 9:41 a.m.,*
in response to message #16 by Crawl

I guess I have a couple of other things to add.

First, since the Equation Editor was the thing that kicked this off:

I do not think the equation editor is intended to be used as a general purpose entry method. 90% of the time, good ol' RPN is what I'll use. What I'll use the equation editor for is symbolic work that involves

cutting and pasting.

For example, consider the Fresnel Equations. The numerator and the denominator is identical except for one sign change. So the easiest way to enter them is to enter the numerator, select all and copy, hit divide, paste in the numerator as the denominator, and then use the cursor to change the one sign.

This is an example of what the Equation Editor is for, in my opinion. It is probably more efficient than another other method. (At least it is both efficient and easy to understand)

I also don't think Mathematica has anything like an equation editor, nor RPN.

Another thing is that I think people tend to underestimate how powerful CAS calculators are, and over estimate the advantages Mathematica has over them.

When someone says something like, "I don't need a CAS because I'm not in school", I imagine they think a CAS calculator can do something like the integral of sin(x) -- something you can easily do in your head.

Of course it can do that, but they can do quite a bit more. They can definitely do things that, yes, you know how to do from school but would be far too tedious for you to ever want to do by hand, if you could avoid it. That was the point of some of the examples I gave earlier.

Much like, yes, if you went to school you could do, by hand, long division of two 8 digit numbers, but it would be rather tedious and is something that's better suited for a calculator.

I think these calculators are actually *astoundingly* powerful, certainly for something that can fit in your hand. I showed that the HP50 can solve the general quartic equation, which I think is a pretty impressive feat.

What advantage does Mathematica have over a calculator? Well, yes, it has a more powerful CAS, but not by as much as you might guess. It can evaluate integrals that require things like hypergeometric series or other special functions. For functions that have elementary solutions, the difference between them isn't that large. And there are expressions that Mathematica still can't simplify.

The main advantage, of course, is that it runs faster and has more memory. So, an HP50 could get you maybe 50 coefficients from this series, but eventually it will run out of memory.

That could even be fixed. It could be possible for a calculator emulator to use more memory than the calculator itself. You could write a program on a calculator, bug check it, test it, and then load it onto a computer and push it to the limit.

Something like that in the future of graphing calculators would be exciting.

And keep in mind that between RPL overhead and the saturn emulator, your 50g is running 10x-100x slower than the hardware could let it.

It's too bad that HP doesn't have the resources to bring RPL into the modern world. The software is still designed around the assumption that memory is extremely expensive. I'd love to see an ARM-based 32-bit RPL model that would (mostly) maintain source-code compatibility with existing RPL programs. I'd like to see the memory model changed so that you didn't have to copy the return stack all the time, or move objects in tempob when you did garbage collection, or rewrite UserOB whenever you modified a variable, or completely rewrite a list any time you changed a value in it. Changes like this could make the calculator 50x faster and allow 100x more memory with basically no change in hardware cost. But it requires development time and that means money :(.

Re: The Future of Graphing Calculators

*Message #21 Posted by **Han** on 29 Mar 2010, 5:20 p.m.,*
in response to message #1 by bill platt

I don't think calculators will ever go away. They will certainly become faster, and maybe be equipped with ever more powerful CAS, but never will they be replaced by any general purpose hand-held device.

When I think about why I even own a calculator, I realize that it's because a calculator has a dedicated design. It is all about quick-access to commands. With a graphing calculator, I can access most of my often-used commands with a few button presses. With a computer algebra system, I would have to TYPE in the command. Most hand-held devices are extremely poorly designed for typing (even with a qwerty keyboard -- ever try to type with the TI nSPIRE 2.0?) And anything with a comfortable keyboard made for typing would not be as portable as a calculator.

While today's calculators are very capable of high-level algebra, there will always be enough instances of us needing only a few quick calculations for which a sophisticated device will often-times be too cumbersome to even bother.

What Would a 30bII Look Like?

*Message #1 Posted by **Andrew H.** on 28 Mar 2010, 3:31 a.m.*

I've followed with interest the comments in this forum concerning the new 30b. (I don't yet have one.) The consensus appears to be that it is a very good calculator but with a few annoyances. For example:

1. Many functions are buried in menus rather than being visible on the keypad;
2. The STO key is not a primary key;
3. The shift key is not more centrally located (Gene Wright); and
4. 1/x and y^x are not primary keys (bink).

I envisage that a 30bII would address them all these. The question is how?

I'm interested to find out what others think a 30bII might look like. In contemplating this, consider it to be a refresh of the 30b rather than a complete redesign, so that its functionality remains essentially the same.

To get things started, I've taken a hypothetical keypad for the 20b from a previous post and adapted it for the 30b. I think I've addressed all the annoyances listed above by introducing a second shift key.

  SOLVE    GOTO     GOTOT    GOTOF    chi2
   RCL       4        5        6        *
   ANS       !       nCr      nPr    INV chi2

           CALL      LBL    RETURN      t
  <-         1        2        3        -
|Reset|    RND     RAND      pi      INV t

           MSG      STOP     DISP       n
 ON/CE      0         .        =        +
  OFF      IP       FP     (SHOW)    INV n
```

Notes

1. Menus are identified by vertical lines ||.
2. Option is just a different name for the Black S menu.

3. UP and DOWN represent the up and down arrows, which are now located at the top right of the keypad (cf. 35s and 50g).
4. INS and DEL and located next to INPUT because they are all used for entering data in lists.
5. STO and RCL are now located at the bottom left of the keypad (cf. TI BA II Plus).
6. !, nCr, and nPr are all based on factorials, so they are grouped together.
7. Back space and CE both delete, so they are grouped together at the bottom left of the keypad.
8. Pi is on the 3 key, where it belongs.
9. SHOW on the = key is not present on the 30b. It would reveal all the digits of the number in the X-register.
10. Almost all the keys of a standard 4-banger calculator (including STO and RCL but except for %) are found as primary keys in the bottom 5 rows. This could be common across all HP calculators.
11. The display of the 30b only has one secondary-function-active indicator, which would be displayed whenever either the gold (f) or the blue (g) keys was active.

Re: What Would a 30bII Look Like?

*Message #2 Posted by **Eddie W. Shore** on 28 Mar 2010, 1:21 p.m.,*
in response to message #1 by Andrew H.

Very nice keyboard, Andrew.

I like the fact that (1) you made STO a primary key, (2) kept the groups together, (3) put the distributions and pi on the keyboard. (I take it the trigs are now in the Math menu)

Re: What Would a 30bII Look Like?

*Message #3 Posted by **Andrew H.** on 29 Mar 2010, 6:15 p.m.,*
in response to message #2 by Eddie W. Shore

Eddie,

Correct. The trigs would replace the tests on the 7-8-9 row for the 20b.

Andrew

*Message #5 Posted by **Andrew H.** on 28 Mar 2010, 6:06 p.m.,*
in response to message #4 by Bruce Bergman

Bruce,

As soon as the design spec is finalized.

The layout above is just my two bits' worth. I'm very interested to find out the views of others. Is there anything about the 30b that annoys you? If so, how would you fix it?

Andrew

Re: What Would a 30bII Look Like?

*Message #6 Posted by **Don Shepherd** on 28 Mar 2010, 6:30 p.m.,*
in response to message #5 by Andrew H.

From a programming perspective, having R/S as a shifted key is a large annoyance.

Re: What Would a 30bII Look Like?

*Message #7 Posted by **Andrew H.** on 29 Mar 2010, 6:14 p.m.,*
in response to message #6 by Don Shepherd

Don,

You could try something like this:

```
  INS       |Stats| |Date|  |Math|   PRGM
INPUT         (       )      +/-     R/S
 DEL          Beg     End     ABS     EEX
```

However, this raises two issues.

1. The primary keys on the 20b and the 30b are the same. If R/S were a primary key on the 30b, it would have to be something else on the 20b (presumably EEX, which is why I have placed in on the same key as R/S above).
2. As a general principal, I think that HP should aim to have a common layout for the primary keys of the bottom 5 rows of all its calculators, just like all cars have the clutch on the left, the brake in the middle, and the accelerator on the right. (An exception to this would be replacing = with i for scientific calculators.) The layout above would conflict with this principal.

A possible alternative would be to change the f and g keys to a gold up-arrow and a blue down-arrow respectively. Normally, these would act as shift keys, but they would act as scroll keys when in lists. This would free up the rightmost keys of the top 2 rows, one of which could be used for the R/S key.

Andrew

Re: What Would a 30bII Look Like?

*Message #8 Posted by **Andrew H.** on 30 Mar 2010, 8:49 p.m.,*
in response to message #7 by Andrew H.

Don,

I think this addresses your annoyance, and everything just hangs together. However, it depends on the up- and down-keys doing double duty as shift keys: I'm not certain that this wouldn't create a conflict. (Cyrille or Tim might be able to advise.)

```
          xP/YR    |IRR|    |NPV|   |Bond| |Option|
 UP [f]     N      I/YR      PV       PMT      FV
          P/YR    |IConv| |BrkEv| |Amort| |Depr|
```

```
          PRGM     e^x     x^2   |Math|  |Stats|
DOWN [g]   R/S     y^x     1/x      %   (DELTA%)
           LOG      LN    sqrt   |%calc| |Date|

    |Memory|     |CshFl| |Data|    Beg    Binom
      INPUT         (       )      EEX     +/-
     |Mode|         INS     DEL     End     ABS

     ISG       ?<       ?=       ?>        F
     STO        7        8        9        /
     DSE       ?>=      ?!=      ?<=     INV F

    SOLVE     GOTO     GOTOT    GOTOF    chi2
     RCL        4        5        6        *
     ANS        !       nCr      nPr    INV chi2

              CALL      LBL    RETURN      t
     <-         1        2        3       -
   |Reset|     RND     RAND      pi      INV t

              MSG      STOP     DISP      n
    ON/CE      0         .        =       +
     OFF      IP        FP     (SHOW)    INV n
```

Notes

1. When in a list, INS and DEL would be invoked by just pressing the (or) keys respectively. (Pressing the down-arrow first would just roll the list down.)
2. I have added the Binom function and a DELTA% function (cf. 12C), which would make a useful addition.
3. Sqrt would take the place of R/S as a primary key on a 20bII.

Andrew

Note: Edited to correct an error and to add point 1 above.

*Message #10 Posted by **BruceH** on 28 Mar 2010, 7:01 p.m.,*

in response to message #5 by Andrew H.

Please remember to leave one key label in an obviously wrong position. That way HP can 'fix' it and then their legal people won't have to get all worried about the copyright situation.

;-)

Re: What Would a 30bII Look Like?

*Message #11 Posted by **Gene Wright** on 28 Mar 2010, 9:52 p.m.,*
in response to message #1 by Andrew H.

Thanks for the name plug, but that shift key comment is just something I remember from the PPC Journal. Why have longer finger travel than you need to have?

Looks good. . . as LONG as the (and) keys double as X<>Y and roll down, which aren't otherwise on the keyboard (?).

:-)

Re: What Would a 30bII Look Like?

*Message #12 Posted by **Andrew H.** on 29 Mar 2010, 6:18 p.m.,*
in response to message #11 by Gene Wright

Gene,

I don't for a minute advocate omitting x<>y and roll-down: this would be tantamount to heresy.

Andrew

New update for Clonix and NoV's users.

*Message #1 Posted by **Diego Diaz** on 27 Mar 2010, 9:34 p.m.*

Notes on the files for the Update270310 pack.

I've finally managed to achieve some of the pending tasks in order to build a few files that improve functionality for NoV's and fix a known bug of Clonix-D.

Here are some abstracts of the included files:

- CLR_RAM1.HEX & CLR_RAM2.HEX

These files improve the RAM erasing procedure on NoVRAM and NoV-32 modules respectively.

Burn the appropriate one into your module and plug it in your HP-41 (calculator must be OFF)

After some seconds (about 5sec. for NoVRAM and 10sec. for NoV-32) your calculator will power up automatically showing a message [CLR OK] indicating that the erasing process has been successfully completed; or [NO CLR] indicating that the process failed at some point.

Once your RAM is erased turn your HP-41 OFF, remove the module and reprogram it as usual.

In case you got the error message [NO CLR] turn your calc OFF remove and reinsert the module to repeat the process. Make sure that your calc is running on a fresh set of alkalines.

If the problem persist, please mail me in order to find what the cause could be.

Note that the contents of the Stack is preserved during this procedure.

- ADDRS08p.asm

This file will allow NoV-64 users to take full advantage of Geir Isene's ICEBOX1H.ROM by enabling on-the-fly RAM blocks switching. Please visit his page for details on this outstanding piece of M-code. Here.

- Clonix-D.asm

Fixes an issue reported by several users which found that the ROM blocks did not switch as they should after changing the module from an odd to an even port or vice-versa.

Install this Update by including these files (replacing old ones when necessary) into your working directory.

Hope this helps.

Best wishes from the Caribbean Sea.

Diego.

*Message #2 Posted by **Geir Isene** on 28 Mar 2010, 5:46 p.m.,*
in response to message #1 by Diego Diaz

Me = Happy :-)

What's the next on the roadmap?

I have my wish list:

1. Ability to see two blocks of RAM to copy RAM pages between blocks

2. RAM2ROM for NoV-64

3. RAM clear for the NoV-64

Re: New update for Clonix and NoV's users.

*Message #3 Posted by **Diego Diaz** on 29 Mar 2010, 1:39 p.m.,*
in response to message #2 by Geir Isene

Hi Geir,

Thanks for the feedback and support.

I must say that your wish #3 is already accomplished. Please check your working directory, you should find the file "CLR_RAM4.HEX" which will clear your NoV-64 RAM in about 22sec. showing [CLR OK] message afterwards. Let me know if you miss that file, and I'll mail it.

Regarding wishes #1 and #2, they're both in my to-do list. Along with the mods required for NoV-32 code to handle on-the-fly RAM chips swapping, as required for your ICEBOX1H.ROM (I didn't forget that one ;-))

Cheers from Dom. Republic.

Diego.

Re: New update for Clonix and NoV's users.

Does HP Advertise Their Calculators?

*Message #1 Posted by **Jake Schwartz** on 27 Mar 2010, 9:17 p.m.*

Hi,

It was suggested that a new topic be started on HP marketing calculators (or lack thereof). Back in the day, HP would do direct mailings when a new calc was introduced, offering 15-day trials and all sorts of neat stuff. Of course, that was then, but what kind of marketing is HP actually doing (if any) right now? We have this neat new 30b and I haven't seen any HP emails announcing it, any magazine ads, nothing. What did I miss? Is it appearing in ads in financial publications? How is the word getting out? It might mysteriously appear on a "peg" at a store such as Target, but is that going to mean anything? If anybody starts at www.hp.com, is it mentioned that a new calculator has appeared and that they should click on a link to see it? What does an HP calculator marketing person actually do? I can't wait to find out that my cynicism is unfounded :-)

Jake

Re: Does HP Advertise Their Calculators?

*Message #2 Posted by **Don Shepherd** on 27 Mar 2010, 9:38 p.m.,*
in response to message #1 by Jake Schwartz

Jake, the same can be asked of the 20b. I've never seen any advertising for it. It appeared on Amazon.com a few months after it was introduced, as I recall, but I've never seen it on a peg in any store. The only HP calcs I've seen on pegs in the last few years are 12c and platinum, 10bii, and 17bii+. Never a 35s, and I don't expect to see the 30b on a peg either. Maybe the marketing world has changed, or there is something going on that we don't know about, but I don't know how HP expects to sell these things if nobody knows about them.

...because HP abandoned the education market some years ago (management decision, and a poor one at that). TI took the ball and ran with it, and now HP would be playing catchup for YEARS to get back to where they were.

in response to message #8 by Norman Dziedzic

Norman, Do you know about the CHIP group? It's one of the longest running HP users clubs, originally started in 1976 as the Chicago chapter of PPC by Craig "Pinball Wizard" Pearce.

We meet twice a month (first and third Wednesdays) at Ace Metal Crafts in Franklin Park. Some of the guys go for dinner locally, then the informal meeting (if you want to call it that) usually gets rolling around 8 o'clock. The next meeting is Wednesday, April 7th. Once in a while calculators come up in the conversations.

Call Ron Johnson, 312-630-0100 weekdays, for a bit of info if you'd like. It would be fun to meet another HP enthusiast in the area.

Brian

in response to message #10 by Norman Dziedzic

A lot don't attend every meeting, but most show up every few meetings, especially when someone has something to talk about which interests them. Video and photography are of interest to some, and there's often something computer related some take an interest in. HP handhelds come up in conversation once in a while, not often enough from my perspective, but it's not what keeps the group together after 34 years. I'd say show up for a meeting or two and ask Ron to put you on the mailing list for meeting notices if you like. By all means you should meet Jack Stout, the guy who has been instrumental in arranging for the meeting location for so many years and is a best friend to everyone. Without Jack it wouldn't happen. I can't say enough good things about Jack. He is a Dutch uncle.

I've been checking the local Office Depot and Staples monthly since the 12C+ was released...still haven't seen one. They've got the 10B on the peg, but the 12C isn't on a peg, and there's no tag to pull, so it's a *huge* hassle to buy one, much less look at the battery door.

FWIW, I've never seen a 20B in either office supply store. And that one's been out how long?

Excellent topic, Jake.

The cynic in me says this lack of marketing effort speaks to the HP of today's investment in calculators.

Re: Does HP Advertise Their Calculators?

*Message #16 Posted by **DaveJ** on 28 Mar 2010, 1:06 a.m.,*
in response to message #1 by Jake Schwartz

I doubt there is such a thing as a "calculator marketing person" at HP.

I'm sure someone will correct me if I'm wrong, but the calculator division is part of the "Handheld Computing" group, which is a group within the much bigger "Personal Systems Group" division.

So it's highly unlikely they would have specific marketing people just for the tony calculator sub-group of the handheld computing group of the personal system group division! I wouldn't be surprised if there is only one marketing department for the whole overall division.

See the HP 2009 annual report for a breakdown of the groups and a good example of the almost irrelevance of the calculator division within HP as a whole.

It probably comes down to the usual manpower/budget thing, where the squeakiest wheel gets the oil.

Dave.

Come now, the 50g, 30b, and to a lesser extent the 20b have all gotten pretty good reviews here.

Re: Does HP Advertise Their Calculators?

*Message #19 Posted by **Don Shepherd** on 28 Mar 2010, 4:30 a.m.,*

in response to message #1 by Jake Schwartz

The golden age of HP scientific calculators occurred in the 1970's and 1980's. I imagine that the HP-48, and its predecessors, were a success because they were built well and did things that could otherwise only be done on minicomputers costing tens or hundreds of thousands of dollars. That all changed when the PC came along; the PC made the scientific calculator obsolete in the same way the HP-35 made the slide rule obsolete.

I would imagine that the only calculator HP currently sells in numbers high enough to justify a "calculator" division at all is the 12c, and they don't have to advertise it because it is the "gold standard" among financial types. But they've got to be careful to not change it too much because that group might look elsewhere if they couldn't trust it.

The HP calculator division consists of Cyrille and Tim, and probably a few other support people. The 12c probably subsidizes every other HP calculator currently produced. If the 12c ever loses favor (and sales) in its market, HP calculator division will cease to exist.

Well, not quite. Many here have demonstrated why calculators are still important. And while production of new slide rules is almost nil, Casio, Sharp, TI, and HP still make and sell a lot of calculators.

> Quote:
>
> I would imagine that the only calculator HP currently sells in numbers high enough to justify a "calculator" division at all is the 12c, and they don't have to advertise it because it is the "gold standard" among financial types.

Chicken or egg. Would the other calculators sell better *if* they were advertized?

> Quote:
>
> If the 12c ever loses favor (and sales) in its market, HP calculator division will cease to exist.

Well, I certainly hope not. Anyway, are sales figures published anywhere?

I believe you always need to advertise, in this case to two audiences: those that haven't got it to tell them what they're missing; and to those that have got it to remind them that they made the right choice (and thus keep them recommending the product).

E.g. Dyson is considered a top brand of vacuum cleaner in the UK, but they still advertise. It only takes a competitor to closely match the virtues of a leading product and a good advertising campaign to sway the buyers if they are not constantly reminded of the superior virtues of the top brand. (As HP may loose it to BWK). Anybody that thinks they "have it made" and are "indespensible" enough to stop advertising may just find themselves loosing everything.

*Message #22 Posted by **Karl-Ludwig Butte** on 28 Mar 2010, 7:06 a.m.,*
in response to message #1 by Jake Schwartz

Here's a feedback from Germany: I don't know of any advertisements for HP-calculators at all. Even worse, all marketing activities, like e.g. contests ("Design the next calculator" (or similar) I've heard of a couple of years back, were limited to the U.S. excluding the rest of the world. I heard of no special offers for teachers directly from HP (please someone proof me wrong) and some products, like e.g. the Streamsmart 400, isn't offered at all, even not by those onlineshops which usually have HP calulators. Brick & mortar stores may offer HP ink for the inkjet-printers but offer calculators only from TI, Casio, Sharp and nonames. Casio is doing a much better job in the respect of marketing: They are serving the schoolmarket with a website and offers special offers for teachers and have books, too.

I guess this threat won't come up with any good news, so I'd like to ask you all: Isn't there anything we could do to change this really bad situation ? I tried to start with an article about the calulation of RC-filters (it's for German speaking readers and please scroll down to the end of the article 'cause it's an addendum to an already existing article).

Best wishes

Karl

Re: Does HP Advertise Their Calculators?

*Message #23 Posted by **David Hayden** on 28 Mar 2010, 8:54 a.m.,*
in response to message #22 by Karl-Ludwig Butte

A few random comments....

The only advertising I see for *any* calculators is the store displays at office supply stores and the "on sale" items in their circulars around back-to-school time. These are usually for the TI-83.

Interesting point about the 12C. It would seem that both TI and HP are propelled by inertia in their respective markets. HP has the financial world locked up via word of mouth. TI has the education world locked up via the textbooks. It seems to me that only a serious marketing effort could unseat either one.

Middle school and high school (ages 12-18) are, by far, the biggest market for the scientific & graphing calculators. I suspect that very few people switch brands once they're used to what they have. So any marketing effort should be aimed at them.

What can we do? Maybe write companion material for some of the textbooks to explain how to use an HP calculator for each of the exercises that requires a calculator. Maybe one for the 39gs/40gs and one for the 48gII/50g.

Great topic.

in response to message #23 by David Hayden

Good points, David.

TI's presence in the education market is huge. They have a nation-wide network of support people who work with the schools and teachers to show how TI calculators can benefit teachers and students. And I'm sure they offer "deals" to school systems who buy their products. Walk into most middle or high school classrooms and you will see pouches hanging from the wall that hold 30 TI calculators. In middle school it is usually the TI-73 (or similar), and in high school the TI-83 plus. Regarding requiring students to buy calculators for math class, my experience is in middle schools and no middle school in which I have taught requires a student to buy a calculator; it may be different at the high school level, especially in advanced math classes.

Three years ago, when the TI-NSpire came out, TI sponsored 3-day training sessions around the country for educators to get familiar with the NSpire. I attended one in Hendersonville, Tennessee. I think it cost like $225 (which most school systems paid, but not mine!) but each attendee received a new NSpire (non CAS, but you could swap for a CAS unit later, which I did) plus an electronic screen that you could use to show the NSpire display on an overhead projector. I have rarely used that, or the NSpire, in class, but I do have about 4 or 5 TI-83's and 84's that I have used over the years with my students. This past year Texas Roadhouse donated 8 TI-83's to the school at which I currently teach.

So TI has a very large presence nationwide. And the textbook publishers have followed suit as well. I doubt that any textbook publisher would be interested in including HP calculator specific information in their textbooks since there aren't--and aren't likely to be--any HP calculators in the classrooms.

I imagine that when kids that have bought scientific or graphing calculators leave school, they pretty much leave the calculators behind. Bulky TI-83's aren't really necessary around the house, and their pockets are filled with i-devices!

in response to message #1 by Jake Schwartz

Regarding current marketing I have seen:

Being a land surveyor, the ONLY advertising I have seen for HP calculators is in surveying publications and surveying equipment supply vendors.

I think this is 100% driven by the National Council of Examiners for Engineers and Surveyors (NCEES) exams. The HP 33s and the HP 35s are the only calculators from HP permitted for use in the exams.

On that topic, I write and sell program books for surveyors for both the 33s and 35s. During some of my limited market research, I was trying to find any major outlet stores that carry those HP calculators, without success.

I just don't get it: I see the HP laptops, the HP printers, the ink, the peripherals, etc.. But why not throw a couple calculators on the shelves while your at it?

> But why not throw a couple calculators on the shelves while your at it?

Why? If HP is not pushing their own calculators, then you are asking a brick and mortar shop lose profits on inventory that may not move. It'd be great if Walmart carried every HP model. Then I'd just have to sit back and wait for Walmart to sell them for $10 (or $2 http://s946.photobucket.com/albums/ad309/martindupre/?action=view&current=DSC01972.jpg :-) as they try to recoup some loss on stock that never moved.

BTW, I do see HP calcs on selves at my local university book store. They sell just about every model. I imagine that university students represent the largest scientific calculator market for HP.

I think that is the point of this thread - why isn't HP pushing their calculators like they push computers and printer?

> Quote:
>
> It'd be great if Walmart carried every HP model. Then I'd just have to sit back and wait for Walmart to sell them for $10 (or $2)...

I sold every one of those $2 calculators I bought at Walmart for $15 each on eB**. Does that mean online sells and brick and mortar doesn't? Still, why doesn't HP even highlight their calculators in their own emails?

in response to message #1 by Jake Schwartz

Usually, in Los Angeles, the Fry's stores are the only stores that carry HP calculators beyond the 12c in Los Angeles, even though I got the 17bII+ Silver at an Office Depot this past January.

I agree that there is not enough advertising from the HP calculators department. There needs to be more of it: especially with the 50g and 30b/17bII+.

in response to message #1 by Jake Schwartz

Anyone who watches "March Madness" knows that H-P advertises, but I suspect that there are very few individuals outside of this forum who notice or even care that calculators aren't mentioned in the advertisements.

I suspect that many in this forum underestimate the length and depth of the TI commitment to the educational market and the amount of coordination with other educational activities that was involved. TI started a newsletter "It's About T.I.M.E." in 1989 where T.I.M.E. stands for Technology in Math Education. The October 1990 issue included the statement

> Quote:
>
> "Teaching Mathematics with Calculators: A National Workshop" is a joint project of the Mathematical Association of America (MAA) and the National Council of Teachers of Mathematics (NCTM). The project is funded by a $1.2 mllion grant from the National Science Foundation (NSF) and a contribution of $330,000 from Texas Instrumens.

The square root of ten revisited

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 26 Mar 2010, 10:41 p.m.*

In response to Gene Wright's "Happy Square Root of 10 day!" (16 March) I wrote:

> Quote:
>
> I am fairly sure that some slide rules were made with the CF scales folded at the square root of ten rather than at pi.

Stan Keeley and Martin Pinckney reported that the Hemmi 250 has the CF and DF scales folded at the square root of ten. I have a Hemmi 250 in my collection.

Page 38 of *SLIDE RULES - A Journey Through Three Centuries* by Dieter von Jezierski as translated by Rodger Shepherd states in part

> Quote:
>
> . Folded scales ... ... were seldom incorporated in slide rules until 70 years later [about 1887] ... ... when Tscherepaschinski [a Russian] arranged a pair of scales folded at 3.16 along the lower slide-stator interface. Eventually, folded scales became common, especially in American duplex slide rules, which had four slide-stator interfaces. Some early German models had scales that were folded at the square root of 10, but most folded scales were folded at the value of pi. ... ... In the case of merchants' slide rules, the folded scales were folded at 3.6, thereby permitting direct multiplication or division by 360 days when carrying out calculations involving interest.

The CF and DF scales on my K&E 4094 Merchant's Mannheim, K&E 4095 Merchant's Duplex, and K&E GP12 Business-Science slide rules all have the CF and DF scales folded at pi. In my collection only my A.W.Faber-Castell 67/22R Business slide rule does have the CF and DF scales folded at 3.6 .

I can't recall needing the square root of ten in any of my calculations. Is there a technology where the square root of ten apprears frequently in calculations?

Re: The square root of ten revisited

*Message #2 Posted by **BobVA** on 28 Mar 2010, 2:47 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

I've got a guess. The wikipedia article below says there are two uses for the CF and DF scales. Besides convenience for calculations involving pi, it also recommends use in lieu of the C/D scales when it isn't obvious which index on the latter to use in order to keep the results on scale. I hadn't heard of this trick, but it makes sense.

So, if the folded scale was originally devised to solve the "index ambiguity" problem, it would have been logical to fold the scale in the middle (10^0.5). Then perhaps some other clever person came along and noted that you could do the same thing by folding the scale at the nearly equivalent value of pi, with the bonus of

adding the pi computation features.

Just speculation, of course.

in response to message #1 by aj04062

Some big junque stores and seasonal rummage sales have a shelf or box of those plastic cases that cordless tools etc. come in. I was looking at used tools once and found an empty classic series plastic case for 50 cents. It's a great home for the 67 that John Lopez gave me after he retired. Because of the low probability of finding one; it's not worth a special trip but if you're there anyway...

On a similar note, is there a good way of reinforcing the plastic hinges? >>

*Message #4 Posted by **tim m.** on 28 Mar 2010, 1:45 p.m.,*
in response to message #1 by aj04062

The one for my '35 has some ominous cracks in it.

HP 32SII keyboard - dead column of keys fixed

*Message #1 Posted by **Jeff Johnson** on 26 Mar 2010, 12:38 p.m.*

Found archived forum message about fixing the HP 32SII keyboard where the right column of keys was flaky or dead. Of the two methods offered, I went the route of carefully cutting around the four posts in the battery compartment to separate posts from body with a very sharp, pointed Exacto knife blade. From there I departed from the method slightly. It is not necessary to loosen the four posts at the bottom. I just carefully kept the calc pried open from the top far enough to slide the jaws of a small set of needle-nose pliers in and twist the anchors to tighten them slightly. Problem solved. All keys work great now.

Re: HP 32SII keyboard - dead column of keys fixed

in response to message #1 by Jeff Johnson

Good job! I have volunteered to fix a 17B with the same exact problem, so I'm hoping mine goes this easy too.

Dave

Re: HP 32SII keyboard - dead column of keys fixed

*Message #3 Posted by **geoff quickfall** on 27 Mar 2010, 2:34 a.m.,*
in response to message #2 by DavidShenk

problem is, it isn't the twist tabs that are responsible. It is the foam pad used to push the keyboard flex PCB against the logic PCA.

This foam deteriorates with time and loses its resiliency.

Although the fix works for now the foam will need to be replaced.

Cheers, Geoff

Re: Mini Challenge from comp.sys.hp48

*Message #2 Posted by **J-F Garnier** on 26 Mar 2010, 1:42 p.m.,*
in response to message #1 by Egan Ford

Found it! Unique solution, at least up to 1E6.

Using Free42 (will not work on regular HP42):

```
00 { 60-Byte Prgm }
01>LBL "MC"
02 1
03 STO 00
04>LBL 01
05 RCL 00
06 ENTER
07 ×
08 ENTER
09 ×
10>LBL 02
11 RCL ST X
12 10
13 MOD
14 5
15 X>Y?
16 GTO 03
17 Rv
18 -
19 10
20 ÷
21 X#0?
22 GTO 02
23 "FOUND "
24 ARCL 00
25 AVIEW
26 STOP
27>LBL 03
```

```
28 RCL 00
29 1
30 +
31 STO 00
32 1E6
33 X>Y?
34 GTO 01
35 .END.
```

*Message #3 Posted by **Gerson W. Barbosa** on 26 Mar 2010, 4:51 p.m.,*
in response to message #2 by J-F Garnier

Since n^4 ends in 1 for n ending in 1, 3, 7 and 9 and final 5 appear to always introduce either 0 or 2 in the answer, you can do it in half the time by replacing the '1' in lines 02 and 29 with '2'.

Gerson.

Re: Mini Challenge from comp.sys.hp48

*Message #4 Posted by **Gerson W. Barbosa** on 26 Mar 2010, 5:27 p.m.,*
in response to message #2 by J-F Garnier

Is ENTER * faster than X^2?

Even numbers ending in 0 can be handled by inserting X=0? and GTO 03 between lines 13 and 14, but the improvement (if any) is hard to notice on Free42.

Gerson.

Re: Mini Challenge from comp.sys.hp48

*Message #5 Posted by **J-F Garnier** on 26 Mar 2010, 5:38 p.m.,*
in response to message #4 by Gerson W. Barbosa

You're right X^2 is just simpler...

Free42 on PC, especially the binary version, is fast enough to find the solution in less than one second, but the decimal version is needed to check all numbers up to 1e6 thanks to the 25-digit accuracy.

This is what I mostly appreciate with Free42: fast speed and enhanced accuracy versus the HP42S, and I like to be able to choose between speed (binary version) or accuracy (decimal version) depending on the problem.

If only there was a Free71...

J-F

Re: Mini Challenge from comp.sys.hp48

*Message #6 Posted by **Reth** on 26 Mar 2010, 9:57 p.m.,*
in response to message #4 by Gerson W. Barbosa

Also, why not:

```
1
STO+ 00
RCL 00
```

42S on Iphone solves it almost instantly.
Today I noticed 42S showing:

00 { 31-Line Prgm } rather than bytes, I guess it makes no difference using different methods of calculating x ^ 4 would change program running time.

Re: Mini Challenge from comp.sys.hp48

*Message #7 Posted by **Glenn Shields** on 27 Mar 2010, 11:27 a.m.,*
in response to message #2 by J-F Garnier

May I offer a program for the 50g as a "newb", not a fast, efficient or clever one, but as a service to others like me just new to RPL. I'm using the fact as given in the original post that the number can't end in 1,3,7 or 9, and the hint that it can be proven that 5 is excluded too. If this program wouldn't have found a solution in a reasonable time (and the real answer did end in 5), it could have been easily re-done to search for multiples of 5 (and more quickly). So this program churns through the even numbers in just under 20 minutes. Just store 0 in variable 'N' and then the answer is left there at the end. Again, pretty much a brute force program just to demonstrate some functions for my fellows wondering how one might begin to solve this challenge!

<< DO 2 'N' STO+ 'N^4' EVAL ->STR DUP SIZE -> s << 1 CF 1 s FOR i DUP HEAD SWAP TAIL SWAP OBJ-> IF 4 <= THEN 1 SF END NEXT DROP >> UNTIL 1 FC? END >>

Happy programming! Regards, Glenn

*Message #8 Posted by **Marcus von Cube, Germany** on 27 Mar 2010, 7:05 p.m.,*
in response to message #7 by Glenn Shields

You can of course exclude the even multiples of 5 but why the numbers simply ending in 5? I'd like to see a proof.

Re: Mini Challenge from comp.sys.hp48

*Message #9 Posted by **Glenn Shields** on 27 Mar 2010, 9:55 p.m.,*
in response to message #8 by Marcus von Cube, Germany

Looking at the beginnings of a proof for excluding 5, the "10a + b" term is suggested. If you multiply out (10a + b)^4 and simplify, and substitute b=5, you get the following arrangement: 10000a^4 + 10000a^3 + 25000a^2 + 5000a + 625. Notice if a = 1, you get 50625 (15^4). The "proof" comes in showing that the fourth- largest place is always 0. This is because the last two terms in the expansion have a 5 in the thousands place, and when a is even the two 5's become 0's in the sum, and the other terms all involve higher places. When a is odd, a^2 is also odd, and those two terms keep a 5 so then the two 5's add up to 0 again. Is this a formal proof? It seems to hold up. Anyway, a great challenge and it's what this forum is all about. Regards, Glenn

*Message #11 Posted by **C.Ret** on 27 Mar 2010, 7:45 p.m.,*
in response to message #7 by Glenn Shields

Hello.

This challenge triggers my curiosity. I am searching for a clever mathematical way of this interesting problem, but still clue less.

Meanwhile, my attempt of a quite "brute force" search program lead me to the following RPL program that I run on my HP-28S (it is so simple that it will run on all RPL from 28C to 50g):

```
« DO                  @ Do main loop
     2 +              @ looking only for even numbers
     DUP 1 DISP       @ Optional display current number – slows research
     DUP SQ SQ        @ Compute x^4
     ->STR            @ Convert to string
     0 48 52
     FOR c            @ 48 to 52 are ASCII code for "0" to "52"
        OVER c CHR
        POS           @ test if digit less than 5 present in "x^4"
        +             @ equivalent to OR
      NEXT
      SWAP DROP       @ remove "x^4" after tests
   UNTIL
      NOT             @ sum of POS is 0 if none of the digits were found
   END
»
'PRO1' STO
```

Usage: Enter starting number 0, the program simply stop leaving the answer in stack. Continue searching by simply re-running it, the previous value is kept in the stack.

As every one may have notice, it is really close to the one Glenn Shields post previously.

But, as same one may have notice, it is unable to search for number greater than 1000 !

Because of the 12 digit precision of HP-28S, the x^4 value is rounded and digits can't be tested to the missing unit position !

1000^4 = 1000000000000 which is 1.E+12

So I suggest that HP49/50g users use full precision arithmetic capabilities, and HP28/48 users binary number which may be efficient up to 65536 since largest binary of 64 bits is 2^64 which quadric root is 2^16.

```
« 64 STWS DEC         @ switch to decimal binary word full length
  DO
     #2d +            @ looking only for even binary numbers
     DUP 1 DISP       @ Optional display current number – slows research
     DUP
     DUP * DUP *      @ Compute x^4: SQ not available with binary numbers
     ->STR
     0 48 52
     FOR c            @ Search for 0 to 4 digit in "x^4"
        OVER c CHR
        POS +
      NEXT
      SWAP DROP       @
   UNTIL
      NOT             @ sum is 0 for any solution
   END
»
```

My HP-28S found the solution in 7 min (~6min without DUP 1 DISP). No other solution was found before reaching 65536 after a 2h30 run.

*Message #12 Posted by **Glenn Shields** on 27 Mar 2010, 9:04 p.m.,*
in response to message #11 by C.Ret

Wow, C.Ret, I tried your program on the 50g (but without the second DUP in the third line) and got an amazing 1:59 time. Then I removed the DUP 1 DISP and got an even more amazing 1:48 (but it was more fun with the display). This is the cleverness I was looking for, great use of POS, CHR and NOT, these just blitz the other tests and string manipulations. This type of programming was given in examples in the user guides but it's great to see them applied in other ways. Great!!

DUH!!!! Didn't that just prove that our number will always end in 0625? Now there are two nails for that coffin. Yup.

After a quick look at your formula I just decided to ignore the rest of your reasoning. Enough zeros in the factors to see the obvious. ;)

Okay, I know this is an HP calculator challenge, but I had to give it a try with Mathematica. Here's the code:

i = 2; While[Min[IntegerDigits[i^4]] < 5, i = i + 2]

It found the solution in 0.009491 seconds. Darn quick. I also let it run until i was about 26,000,000; no more solutions found.

CHUCK

Isn't this just a matter of probability? I think it is very unlikely new solutions are found as i increases although this is not impossible. For instance, let's investigate 5-digit fourth powers: We expect to find about eight of them, sqrt(sqrt(99999)) - sqrt(sqrt(10000)) = 7.78, of which only 40% will be candidates to a solution (the ones whose bases end in 2, 4, 6 and 8), that is, about three candidates (7.78 * 0.4 = 3.11). In fact, for this case, we have eight powers, 10^4 through 17^4, but only 12^4, 14^4 and 16^4 might be a solution. The probability of an individual digit is equal or greater than five is 0.5 and the probability a five-digit power is a solution is 0.5^5 = 1/32. So, the probability a solution is found among our three candidates is 3/32 or about one chance in eleven. Likewise, if we check all 14-digit fourth powers we'll find the chances are smaller: about one in seventeen. But we've been lucky this time, as we know.

```
((sqrt(sqrt(1e15)) - sqrt(sqrt(1e14)))*0.4)/(0.5^-14) = 16.64
```

Of course, if new properties concerning these powers are discovered, this result should be reconsidered and they might even lead to a different conclusion.

Gerson.

Definitely a probability problem. 26000000^4 has 30 digits in it. The probability that none are less than 5 is P(none are<5)=0.5^30 =9.3x10^-10, and it only gets worse from there. But again, it's not impossible, but highly unlikely. :)

*Message #18 Posted by **Gerson W. Barbosa** on 28 Mar 2010, 7:26 p.m.,*
in response to message #17 by Chuck

Considering there's a lot more squares of squares with 30 digits in them, the overall probability to find a solution in this group is 9.17e-3 or about 1/109 (if the distribution of the digits follows a random order, which is not exactly the case). But you're right, that's still a dim probability and it dwindles as we go further.

That would only be true if the digits were completely random and independent of the number being raised to the fourth power. However, any number ending in an odd digit has a probability of 1 for having at least one small digit when raised to the power of four.

It is certainly true that a RANDOM 30 digit number among all possible 30 digit numbers is unlikely to have no small digit.

Having a couple of hours free today I thought I give it a try with MCODE for the 41. Alas, we don't have enough digits precision (10) in the normal format and I'm too lazy right now to see if 13 digits would be enough (as noone has posted the actual solution number). The below MCODE program tests until X=316 before it crashes out without having found a solution. Is that correct? Maybe I get around to rewriting it for 13 digits but looking at the code, its not trivial and run time wise, this is going to be slow as well. But would be great to know how high the solution number is and if it can be found with 13 digit accuracy at all...

For those enjoying MCODE, here is the code: To speed up the expensive part - calculating x^4, I first calculate which power of 2 is smaller than x (and then smaller than x^2) as the NUT can do multiplication by 2 very quickly so that should speed up the power calculation. It also checks for the starting number not ending in 1,3,5,7,9,0. All of them seem obvious, although it took a little while for me to make sure 5 is correct as well.

Cheers,

Peter

Re: Mini Challenge - 45s MCODE

*Message #21 Posted by **PeterP** on 30 Mar 2010, 12:42 p.m.,*
in response to message #20 by PeterP

okay,I'm such a sucker for these things, it is pathetic. But so much fun...

Anyway, I could not rest but wanted to see if we can entice the 41 to also spit out an answer in non-geological times. The code below uses all 14 internal digits we have to represent numbers, better multiplication logic and takes advantage of the fact that we can exclude from the interim result x^2 all numbers that start with 1, 4, 5, 6 as they will yield a first number <5. On V41 and normal speed setting (which feels close to a 41cx or maybe a bit faster) it gives us the answer in about 45 seconds. If we remove the tests for X^2 it takes about 1minute. Not bad for the little guy...

Cheers

Peter

```
;=============================================================================================
; X43 - Find a number x who's 4th power has no digit less than 5
;
; Takes a starting number from x
; uses right justified format in C[S&X & M]
; only uses odd numbers (ending in ) 2,4,6,8 (as 0,1,3,5,7,9 are out).
; calcs x^2
; Exclude x^2 that start in 1,4,5,6
; calcs x^4
; Checks if any digits <5
; If no, outputs result to X-reg
; If yes, read x, increase by two, loop

in response to message #21 by PeterP

Nice! I've been so swamped I have been unable to work out any solution except for a small python script because I wanted to see the answer:

```
import re;

i=0;
while(1):
  i+=2;
  if not i % 10:
    next;
  if not re.search("[0-4]",str(i**4)):
    print i, i**4;
    break;
```

MCODE - Unit Conversion

*Message #1 Posted by **Ángel Martin** on 25 Mar 2010, 4:35 p.m.*

Good news for those interested in archeological achievements :)

I finally cracked the unit conversion functions implemented in the Thermal-1A module - a very nice implementation that I always regarded as a great example of the 41 system capabilities.

I've added the electrical units to the built-in ones, more for the sake of completion than for actual practical purposes - given that SI units are the only practical ones used in electricity.

I love its homogeneity checks, like Horse Power -> Ohm x Amp^2

Will post it at TOS shortly, but I just thought someone out there will be interested in a heads-up.

Best, ÁM

Re: MCODE - Unit Conversion

*Message #2 Posted by **Geir Isene** on 25 Mar 2010, 6:17 p.m.,*
in response to message #1 by Ángel Martin

Yeay!! Kudos.

Eagerly awaiting TOS upload.

Re: MCODE - Unit Conversion

*Message #3 Posted by **PeterP** on 26 Mar 2010, 12:14 a.m.,*
in response to message #1 by Ángel Martin

Awesome! Will you post it with comments? (pretty please, pretty please...)

Cheers

Peter

Re: MCODE - Unit Conversion

*Message #4 Posted by **Ángel Martin** on 26 Mar 2010, 2:36 a.m.,*
in response to message #1 by Ángel Martin

Here are the new units added:

A - AMP
CB - COULOMB
FAD - FARAD

GSS - GAUSS
HY - HENRY
MAX - MAXWELL
OED - OERSTED
O - OHM
V - VOLT
TS - TESLA
WB - WEBER

There's still room for some more - any wishes??

*Message #7 Posted by **Håkan Thörngren** on 26 Mar 2010, 7:58 a.m.,*
in response to message #1 by Ángel Martin

Cool! I have never tried the unit conversion feature before, though I know it exists in various modules.

This sparks my interest to take a look at it.

Re: MCODE - Unit Conversion

*Message #8 Posted by **Ángel Martin** on 26 Mar 2010, 3:21 p.m.,*
in response to message #7 by Håkan Thörngren

guys, there's enough units to fill a 32k rom with them :)

I meant to ask about "electrical" units - call it my tribute to my EE years, I still remember longing gor them when I was in college, so this is payback time in some regard.

But not to worry, you can add your own after you see how it works - just give me a couple of days to finish the "blueprints".

Here's the alphabetical list of new units I've added:

```
AMP
COULOMB
FARAD
FARADAY
GAUSS
HENRY

in response to message #8 by Ángel Martin

Did you really have to add KiloOHM, MilliHENRY, and PicoFARAD? I thought they already handled SI prefixes? (Or was that a feature that was added for the 28/48 unit conversions?)

Re: MCODE - Unit Conversion

*Message #10 Posted by **Ángel Martin** on 28 Mar 2010, 5:19 p.m.,*
in response to message #9 by Eric Smith

No support for multiple/submultiple chars in the implementation exists - so yes, they have to be added individually.

mH, pF, and kOhm are more typical than their |proper| SI counterparts and therefore the addition...

in response to message #1 by Ángel Martin

The fabulous HP Unit Management system was first presented by HP's Eric Vogel on 3/28/81 at the 1981 HP Handheld Conference in Rockville, Maryland. A full 32 pages of the conference proceedings consisted of Eric's material, presented as it first appeared in the HP41 Petroleum Fluids Pac. I remember the audience being amazed. Following the dinner after the one-day affair, Richard Nelson, Irv Weiner (the Providence, RI PPC chapter coordinator), Eric and I returned to the conference meeting room to chat and wound up staying there until 6:30AM the next morning. Fun times.

in response to message #11 by Jake Schwartz

oh my, did those proceedings survive the passing of time or are they lost forever??

it's not that I would have liked having them before, I've had a great time deciphering this rosetta stone - one of the best ones so far!

I'm curious to see if the assumptions I've made align with the original designer goals.- after all reverse-engineering code is always tricky.-

The main unknown was which code to give to the new primary magnitude (the electric current), as all dimensional checks will use it and should be uniquely characterized. I opted for a nice prime -unlucky for some- number and it seems to work quite well :)

And sure I agree, there's nothing short to fabulous in this implementation, still today!

They survive in the PPC CD#4 disk of conference proceedings from 1979-1999 along with all the Australian HP calc newsletters, but I just put up a copy of that proceedings (around 10 MB) here for viewing or downloading if anybody is interested. None of the pdf bookmarks in the left column will work except for the "contents" one, but Eric's material can be found from pages 13 to 44.

in response to message #11 by Jake Schwartz

I thought Petroleum Fluids ROM had the latest and greatest version, following after the Machine Design ROM and the Thermal Transport ROM. Do I have the history wrong?

Re: MCODE - Unit Conversion

*Message #17 Posted by **Eric Smith** on 27 Mar 2010, 9:05 p.m.,*

in response to message #1 by Ángel Martin

HP's most complete implementation of unit conversion for the 41 was in the Petroleum Fluids ROM.

It was extremely clever how they tracked the dimensionality. The general idea was to multiply and divide by prime numbers, so if length (m) was assigned 2, and time (s) was assigned 3, then m/s^2 would be 2/9. However, since multiplication and division are relatively expensive on the Nut processor, they added and subtracted logarithms instead, using a 10 bit field. It is possible to find inconsistent conversions that they won't detect, but it is extremely unlikely in practice.

Re: MCODE - Unit Conversion

*Message #18 Posted by **Ángel Martin** on 28 Mar 2010, 5:22 p.m.,*
in response to message #17 by Eric Smith

Yes, I figured that already. I have used 19 (13 Hex) for the Ampere and so far it seems to be uniquely differentiated in all the derived dimensions I've tried.

[OT] useful feedback search tool for the infamous auction web site

*Message #1 Posted by **Pascal** on 25 Mar 2010, 2:59 a.m.*

Hello, I came across a search engine that can display extensive feedback ratings and comments (even mutually withdrawn feedbacks) for the infamous auction site. It displays all neutral and negative feedbacks of a user collected over the years. It also reveals negative feedback that were removed from statistics when the auction site changed its feedback policy.

see www.toolhaus.org

Pascal.

Re: [OT] useful feedback search tool for the infamous auction web site

*Message #2 Posted by **DavidShenk** on 25 Mar 2010, 12:32 p.m.,*
in response to message #1 by Pascal

I'd like to see a site that keeps completed items longer than just a few weeks. This would be especially useful when researching items that don't sell often, maybe just a few a year.

HP 48GII keyboard

*Message #1 Posted by **Han** on 23 Mar 2010, 9:47 p.m.*

Are these any good? Did they use the same manufacturing technique for the HP 48GII as the HP 50G? I was thinking of waiting out for a cheap 48GII or even 39GS or 40GS to swap keypads with my current HP 49G+.

Re: HP 48GII keyboard

*Message #2 Posted by **David Hayden** on 24 Mar 2010, 1:10 p.m.,*
in response to message #1 by Han

I have a 50g, two 48gII's (the old version and the new one) and a 39gs. The keyboards seem identical to me but I must admit that I haven't done a careful side-by-side comparison.

Given the similarities of the calculators, I think it's a safe bet that the keyboards are all manufactured with the same process, and probably by the same machines.

HP.45 Keyboard - Dead Row

*Message #1 Posted by **John Stark** on 23 Mar 2010, 4:48 p.m.*

Recently purchased a nice HP.45 calculator on the Unmentionable Site.

The only issue is that no keys on the bottom row register when pressed.

Disassembled unit, and found no issue by visual inspection (broken trace etc.)

All LED segments light up OK.

It appears either the bottom row is not getting "strobed", or the return from that row has an issue (either electronic or mechanical).

Any ideas would be appreciated.

Thanks.

John Stark

Re: HP.45 Keyboard - Dead Row

*Message #2 Posted by **John Robinson** on 23 Mar 2010, 7:25 p.m.,*
in response to message #1 by John Stark

Hi John,

I am not familiar with the 45, but you should be able to find all the information you need to trace the correct line all the way back to the CPU chip. The following will help :

1. Tony Duells article Inside the HP45 gives some good background to the HP 45 internals.

2. The PPC DVD should have the circuit diagrams for the 45 (it has the circuit diagrams for the HP 65). You need to contact Jake Schwartz to purchase the DVD, see PPC DVD

I hope that helps.

Cheers, John

Significant variation in Woodstock keyboards?

*Message #1 Posted by **Michael Meyer** on 22 Mar 2010, 10:21 p.m.*

I received another "broken" HP-21 in the mail today. Fresh batteries and it works perfectly. This one is nice, with no corrosion whatsoever on the springs, contacts, circuit board. But I notice that the entire keyboard is really "soft"-- not just a few well-worn keys. I have other Woodstocks with almost ridiculously stiff and crisp keyboards... like some of my Spice series machines. And all my Woodstocks vary significantly in keyboard "stiffness"... and now that I've noticed this, I don't believe it has anything to do with how used the calculators were... you'd expect them to vary more within the same calculator, if that were the case.

What do you think accounts for this significant variation, one calculator to another... I have another HP-21 with very stiff keys!

Re: Significant variation in Woodstock keyboards?

*Message #2 Posted by **Walter B** on 23 Mar 2010, 1:29 a.m.,*
in response to message #1 by Michael Meyer

Woodstocks open easily. So, if you want to know, I'd suggest opening those two. Then check for significant differences.

Edited: 23 Mar 2010, 1:30 a.m.

Re: Significant variation in Woodstock keyboards?

*Message #3 Posted by **Michael Meyer** on 23 Mar 2010, 11:37 a.m.,*
in response to message #2 by Walter B

Of course, I've opened all of them... to repair, swap chips, clean, etc. First thing I did with the new one was to soak the keyboard all day in soapy water then a good rinse and dry. Looks and works great.

Visually, the keyboards look the same, regardless of their tension. Since they're heat staked, the only ones I've torn apart were corroded. I'd like to avoid taking 2 of them apart just to answer this question if someoneone else on the forum has some insight and more experience.

HP41 models and susceptibility for cracked posts

*Message #1 Posted by **Nigel Bamber** on 22 Mar 2010, 6:34 p.m.*

I was wondering whether some of the newer built models would have less susceptibility for posts cracking due to changes in design i.e. in the early models the logic board was a separate unit and connected by the zebra connector to the main PCB in the first HP41c units. But in the later CX and CV units they had one PCB Board with all IC hardwired to it , I believe, thus reducing connection difficulties relating to the separate logic board.

If so is it possible to tell which units only had one PCB board, eg maybe all Halfnut units ?

What are the views here ?

Thanks

Nigel

Re: HP41 models and susceptibility for cracked posts

*Message #2 Posted by **John Robinson** on 22 Mar 2010, 6:39 p.m.,*
in response to message #1 by Nigel Bamber

Hi Nigel, all 41 calcs are susceptible to screw post breakage, but as you point out, single board versions don't rely on case pressure to keep the contact between several boards. Hence single bpard calcs remain operational even if the screw posts are broken.

All half nuts are single boards, except for the CX models, which have an extra piggy back board, but it doesn't rely on case pressure for good contact between the main board and the piggy back board.

HTH

Cheers, John

Re: HP41 models and susceptibility for cracked posts

*Message #3 Posted by **Etienne Victoria** on 23 Mar 2010, 4:46 p.m.,*
in response to message #1 by Nigel Bamber

Moreover, even halfnut HP41 designs are subject to cracked posts. Even though the boards are not impacted on these models, the module connector sub-assembly is.

It is held tight to the main board by pressure and will fail if the upper screw posts are cracked.

Etienne

HP 97, OK I cracked the print head..

*Message #1 Posted by **Ed Sowell** on 21 Mar 2010, 10:33 p.m.*

Now what?

I read that this was a possibility so I was extremely careful... at least doing what I thought I needed to be careful about. The thing slipped nicely between the clamping bar, slid nicely under the platen, was not cocked or misaligned as nearly as I could see with my magnifying glass and flashlight, and yet "Snap" when I tightened.

What's the best shot at getting a replacement? A 82143A printer?

Assuming a replacement is available, what is the secret for reinstalling this thing?

Grrr!

Edited: 21 Mar 2010, 10:36 p.m.

Re: HP 97, OK I cracked the print head..

*Message #2 Posted by **Ignazio Cara (Italy)** on 22 Mar 2010, 3:14 a.m.,*
in response to message #1 by Ed Sowell

Hello Ed, unfortunately the thermal printer head of the 82143/82162 printers aren't compatible (80 ohm Vs 11 Ohm of Topcat printer series). You must search another Topcat printer if you want replace yours. Sorry for the bad news.

Regards

Ignazio

Re: HP 97, OK I cracked the print head..

*Message #3 Posted by **Ed Sowell** on 22 Mar 2010, 10:57 a.m.,*
in response to message #2 by Ignazio Cara (Italy)

Thanks, Ignazio. BTW, what is a "topcat" printer? I've seen the term used here but don't know what it means exactly. I assume it refers to the particular printer used in the 97 and probably others, but I don't know which others.

Do you know what I might have done wrong? I did look at the head with a magnifying glass before tightening and all look OK to me. IOW it was not cocked in the slot. I held the platen out of the way so I could push the head in till it registered against the opposite side of the carrier, leaving the top end flush with the carrier.

Ed

Re: HP 97, OK I cracked the print head..

*Message #4 Posted by **geoff quickfall** on 22 Mar 2010, 1:49 p.m.,*
in response to message #3 by Ed Sowell

Sorry to here that Ed.

The specs are different and the HP 91, 92, 97S and 97 are the "TopCat" family.

Cheers, Geoff

Re: HP 97, OK I cracked the print head..

*Message #5 Posted by **Ignazio Cara (Italy)** on 22 Mar 2010, 3:03 p.m.,*
in response to message #3 by Ed Sowell

Hello Ed, Geoff has just answered to your first question about the Topcat calculators. Regard the second question I must say that I haven't understood so well how do you have tried to assemble the print head. I prefer to assemble the paper feed cam with the carrier and the print head, not over tighten the two screws that hold the clamp, then install this assembly in the body of the printer. And after mounting the lead screw, the two rod and all the other parts, as the last thing reconnect the printer cable contacts to the PCA using a thin metal foil 24 mm wide. Let me know if my English is understandable and if you prefer some pics too.

Regards

Ignazio

Re: HP 97, OK I cracked the print head..

*Message #6 Posted by **Ed Sowell** on 22 Mar 2010, 5:55 p.m.,*
in response to message #5 by Ignazio Cara (Italy)

Thanks, Igzazio. I understand your explanation of your method... basically you're installing the head on the carrier before installing things into the housing. I reversed the disassembly procedure given by Tony Duell in his Sept 2005. This makes the print head installation on the carrier last, after everything else is in place. But, I don't see why that should make any difference as long as the head is properly positioned in the carrier.

Does anyone know exactly what typically causes the fracture? For example, is it:

a. Improper positioning in the slot it's supposed to register in on the carrier?

b. The head being pushed too far or not far enough into the carrier?

c. Simply overtightening?

d. The head interfering with the cam?

In other words, just saying "be careful" doesn't help if one doesn't know what to be careful about.

I haven't removed it yet, but I will now and see if there any clues.

Ed

Edited: 22 Mar 2010, 10:34 p.m.

Re: HP 97, OK I cracked the print head..

*Message #7 Posted by **Ed Sowell** on 23 Mar 2010, 7:33 p.m.,*
in response to message #6 by Ed Sowell

Looks like I might have cried wolf too soon. I took the head off the carrier and it's all in one piece and no cracks are evident with a magnifying glass. I won't know for sure till I get it all back together, of course.

I also removed the carrier from the slide rods etc. so I could see exactly what it means to have the head registered in the carrier. There is a lip on the carrier where the business end of the head goes. Obviously, the head must be within its channel and registered against this lip. I think I may have had it slightly up over the lip and the snap I heard while tightening it was when it managed to snap down where it belongs.

It would be nice if the head could be installed on the carrier before installing it on the lead screw and cam. However, there would be a problem getting the cam through the carrier. The only way that could be done would be to pull one of the rollers off, slip the shaft through the carrier, and then reassembly the cam assembly in situ, so to speak. Triky biz.

Another thing I noticed is it looks like there was some kind of thread locker on the screws that lock the head to the carrier. has anyone else noticed this? That would make it unnecessary tighten them so much.

Ed

Re: HP 97, OK I cracked the print head..

*Message #8 Posted by **Ignazio Cara (Italy)** on 24 Mar 2010, 3:32 a.m.,*
in response to message #7 by Ed Sowell

Ed, If you have a multimeter or a Ohm_meter (?), you can verify if the resistance between the ground and each other seven tracks is about 11 ohms, measured to the connector at the other end of the flat cable. If this is not true for one or more of the contact, your thermal head must be throwed away. You can assemble the carrier with the paper feed cam and close it with the print head and the clamp. The two screws must be installed with a drop of thread locker on the tip. You must remember to lubricate the rod and the lead screw after intslling them on the body of the printer.

Ciao

Ignazio

All are about 10.8 ohnm, so I guess I dodged the bullet! Since I have not removed the

cable from the connector I did these measurements at the PCB pins.

> Quote:
>
> You can assemble the carrier with the paper feed cam and close it with the print head and the clamp.

I figured that out after I wrote the last note. that's what I will most likely do. In retrospect, its the only way one can really see that the head is properly seated at the "business end," if you understand that term.

It also occurs to me that by removal of one roller from the cam shaft the during disassembly one could slip the carrier/head assembly off the cam so the rollers could be worked on without even disturbing the print head. have you tried that?

> Quote:
>
> The two screws must be installed with a drop of thread locker on the tip.

I'll use the kind that is less strong so it will be possible to remove them if needed.

> Quote:
>
> You must remember to lubricate the rod and the lead screw after intslling them on the body of the printer.

What would you recommend that I might be able to find? How about graphite powder sucn as used in locks?

Ed

Ed,

> Quote:
>
> All are about 10.8 ohnm, so I guess I dodged the bullet! Since I have not removed the cable from the connector I did these measurements at the PCB pins.

I prefer to measure the resistance on the flat cable disconnected from the PCB. The value of 10.8 Ohm is correct.

> Quote:
>

> properly seated at the "business end," if you understand that term.

I don't understood "business end", can you translate in other words? Thanks Look at this image, thermal printer assembled with carrier and paper feed cam.

and at this, after installing on the printer body:

> Quote:
>
> What would you recommend that I might be able to find? How about graphite powder sucn as used in locks?
>
> You must lubricate the lead screw and guide rods with lightweight machine oil (sewing machine) and a long nosed applicator. Apply one drop at each bushing, and one or two drops along the screw itself and each guide rod. Then turn the main gear a number of time to distribuite the lubricant.

Re: HP 97, OK I cracked the print head..

*Message #11 Posted by **Ed Sowell** on 24 Mar 2010, 8:02 p.m.,*
in response to message #10 by Ignazio Cara (Italy)

Thanks, Ignazio.

"Business end" of something is slang for the end that does the work. I was looking for an easy way to refer to the end of the print head that actually does the printing.

OK, that clears up the lubricant issue. I believe the exploded view of the printer in the Service Manual shows these points. I've seen posts recommending "plastic lube" for the plastic parts such as the cam, but I wouldn't know where to get such a product.

Re: HP 97, OK I cracked the print head..

*Message #12 Posted by **Ignazio Cara (Italy)** on 25 Mar 2010, 3:04 a.m.,*
in response to message #11 by Ed Sowell

Ed, thanks for your explanation about the " business end". Let me know how your work goes ahead with the printer.

Hawkeye Bendix: Remember this one ? (2/?) [Long + pictures, Sorry]

*Message #1 Posted by **Etienne Victoria** on 21 Mar 2010, 3:41 p.m.*

Hi all,

Back in July, I posted a couple of pictures of a Bendix-modified Hp-67:

Serial: 2004S02232

The first posting.

I purchased this calculator to get parts for a Hp-67 I'm restoring for a friend. I have his calculator since Eons and feel guilty not to be able to repair it faster :-(

Anyway, I opened it and thought I would share a few pictures.

I've tried to identify the pins and signals as requested by Katie but have been unsuccessful until now (I need time to delve in Tony Duell's schematics and in the mixed color wires from the connector.

Let's open it:

Card reader is pretty much the standard device:

From the MicroK connector, the yellow, blue, red and black wires are connected to the card reader through small white sockets. I cannot figure out where the brown lead goes.

The whole assembly is VERY tight and wires are short, therefore flipping over the card reader assembly does not seem a good solution. I maintained it slightly lifted with clamps.

The logic board is 00067-60003 with components from Korea and Malaysia.

For comparison purpose, this is a picture of another board with components from Malaysia:

Going to the keyboard sub-assembly and much to my surprise, the board is black and not translucent as is the one of all the other Hawkeye I have opened.

Some minor corrosion spots here --> cleaned up.

Maybe somebody has already encountered such a board.

The card reader has the standard "Goo all over the place" syndrom: cleaned up, restored and refit.

And yes I can hear the crowd :-) --> I prefer O-rings over tubing.

Restoring the card reader shows a black wheel axis. Beside I've put the white axis from another 67. However, I think black wheel axes are very common.

The funny thing is the small plastic 'pin' protuding from the axis, it is definitely not a manufacturing defect and seems to be there on purpose.

I hope it is visible on the pic:

Let's end this first sequence by a view of the display part:

When I have time to go back to the machine, I will focus on:

- trying to identify the signals as proposed by Katie,

- try to understand the behaviour of the LBLs calls.

I apologize for the long post and the somewhat blurred pictures but I took them in a quick sequence while cleaning/repairing.

As soon as I have more time, I'll post more info.

Spring has come.

Cheers to all from France!

Etienne

ciao Etienne,
then, in theory, any HP67 could be turned into a Bendix modified machine, or is there any IC modification ?
take care Alberto

Re: Hawkeye Bendix: Remember this one ? (2/?) [Long and big pictures, Sorry]

*Message #3 Posted by **Etienne Victoria** on 21 Mar 2010, 4:14 p.m.,*
in response to message #2 by Alberto Fenini

Ciao Alberto,

I have swapped the logic board with two others and the machine has the same behaviour.

I have not seen this logic board on my other 67s.

However, I still have to check if other components are different from mainstream 67s, for example the card reader.

Best

Etienne

Re: Hawkeye Bendix: Remember this one ? (2/?) [Long + pictures, Sorry]

*Message #4 Posted by **Eric Smith** on 21 Mar 2010, 6:32 p.m.,*
in response to message #1 by Etienne Victoria

If the wiring connects to the card reader, it seems likely that this is an interface to load programs and/or data from an external device.

Re: Hawkeye Bendix: Remember this one ? (2/?) [Long + pictures, Sorry]

*Message #5 Posted by **tim m.** on 22 Mar 2010, 10:20 p.m.,*
in response to message #4 by Eric Smith

That's a good guess. If one could get it apart a bit more, one could continuity test with a multimeter to see if the added leads are connected to anything in common with the magnetic head or its associated circuitry.

HP-67 not displaying decimal point

*Message #1 Posted by **Etienne Victoria** on 21 Mar 2010, 12:24 p.m.*

Hi all!

I'm restoring/repairing an HP-67 for a friend.

It took me a long time to find the proper parts and I have restored the card reader, the battery contacts, found a perfect keyboard with non-yellowish keys.

It now works fine except for one thing: the decimal point does not display.

That is all digits display perfectly, calculations, programming... are fine except the decimal point that should light and doesn't!!

Logic board is Ok.

I would like to repair it if possible instead of swapping the display subassembly because I use the Bendix Hp-67 as a base and it has a very complex internal wiring to a specific connector (I've posted pics here a couple of months ago)

Does anybody have a hint ?

Many thanks in advance!

Etienne

Re: HP-67 not displaying decimal point

in response to message #1 by Etienne Victoria

Hi all,

Me again.

I've solved the problem.

One of the Bendix connector wires had an unwanted connection to the display driver.

The decimal point is back !

Thanks

Next week-end, I'll try to post a couple of picture of the internals.

Etienne

You spoiled our party ;-)

Etienne,

by solving the problem by yourself, you've spoiled our party! We would have been so happy to help you locating the problem ... ;-)

I'm looking forward to your pictures!

Best Regards, Juergen

Re: You spoiled our party ;-)

*Message #4 Posted by **Etienne Victoria** on 21 Mar 2010, 3:23 p.m.,*
in response to message #3 by Juergen Keller

Hello Jürgen !

Don't worry, I still have problems with the Bendix-67 :-)

Mainly a weird behaviour during calls to LBLs A to E (programming them is Ok, calling them is not).

As I don't know if this is related to this particular customized calculator, I'll let it to rest for this week and try again in a couple of days.

It's been 8 hours and 2 sushi meals since I started the repair.

Even if it's not my first 67 repair, I proceed more cautiously with this one as I don't want to break the custom connectors all linked to the card reader.

Instead, I'll post the first pictures in a couple of minutes.

Cheers to all !

Etienne

OT: For Sale: Bill Hewlett's 1987 Chevy Suburban

*Message #1 Posted by **Steve Leibson** on 21 Mar 2010, 11:44 a.m.*

Just blogged this on my EDN blog:

There was an oddity inside of an oddity in today's San Jose Mercury News. First, there was a real classified section. The Sunday paper looked bulkier than usual, one of my bellwether signs of economic health here in Silicon Valley. I very, very rarely look at the classified section of the newspaper any more, but I did today. Still not sure why. However, in the auto classifieds, under "Customs and Classics," I spotted this ad:

"Chevy 1987 Suburban Custom Bill Hewlett's Deluxe 20. An all-original 1987 Chevy Suburban with only 28,000 miles! Previously owned by Bill Hewlett, founder of Hewlett-Packard. This truck is in excellent condition and has been garaged for 23 years. 208-721-8572."

A quick Google shows the same ad in a few online classifieds. Sometimes, the asking price is $30K. Other times, no price is listed. Area code 208 is in Idaho. Actually, it's all of Idaho although a little more Googling shows that this phone number is in Ketchum, Idaho. In fact, it seems to belong to a company called "Wood River Igloos."

Here's an unprecedented opportunity for those collectors of rare HP paraphernalia to own something possibly owned by Bill Hewlett. Sure, it's not his HP 35 calculator, but it's much, much bigger! I haven't called Ketchum to verify any of this information. I don't have room for a Suburban in one of my condo parking spots and it's not really my kind of vehicle anyway. However, I'll bet someone out there wants it. I wonder if it really was his and how it got to Idaho. Must be a good story there.

Just think - one of you guys (gal) with the huge HP collection could install shelves and take it on a tour as a traveling museum.

Maybe you can find some of Bill Hewlett's shirts at a garage sale somewhere...

Re: How Bill Hewlett's 1987 Chevy Suburban came to be in Ketchum, Id. (sheer fantasy).

*Message #3 Posted by **Hal Bitton in Boise** on 22 Mar 2010, 1:52 a.m.,*
in response to message #1 by Steve Leibson

So, Bill had driven up to visit the printer division headquarters at the beautiful HP campus here in Boise. He then continued on up to Ketchum/Sun Valley for some skiing (he was an avid outdoorsman, after all). An urgent situation developed, which required his immediate return to Palo Alto. The HP corporate jet was dispatched to the resort to pick him up, where he had to leave his Suburban with a friend. Bill never got around to retrieving the SUV.

Hey it makes a good story, and it could have happened that way. 8)
Hal.

Was the truck garaged in the now famous "Hp Garage" ?

if this is the case, how could this precious relic (The Holy Truck) be proposed to sale without it's original box (aka The Not less Holy Garage :-)

A true Hp collector should not accept this situation :-)

Okay...I'll go back to my Hp-67...

33s or 35s or casio fx-5800 for electronic engineering

*Message #1 Posted by **Pablo P (Spain)** on 21 Mar 2010, 4:59 a.m.*

Hi all. I am an electronic engineer (soon I hope) and I need a programmable (but not graphical) calculator. I have read about them and I think that I have those three options. Is 35s a bad product? is it true that 33s is faster than 35s but 35s is more powerful for programming? And what about fx-5800? It has the same amount of memory, 4 line display and a language similar to basic but, has it got some lacks? Also I hope that I could use the calculator in the future.

Thanks all.

in response to message #1 by Pablo P (Spain)

fx-5800p? what is this. can't find a lot about it out there, some sales in Germany only and a few on ebay from Korea.

does anyone know more about it. the screen looks nice. looks like it uses casios weird programming notation. i hope it's not too modal (the curse of casio). maybe i should get one and check it out?

*Message #5 Posted by **Pablo P (Spain)** on 21 Mar 2010, 12:25 p.m.,*
in response to message #2 by hugh steers

I compare fx-5800p and hp 35s because, If we do not copare them with discontinued products, they are the most advanced programmable (not graphical) calculators from casio and hp.

About the fx-5800

Page:

http://edu.casio.com/products/program/fx5800p/

Some specs:

http://www.casio-intl.com/calc/programmable/programmable_spec.pdf

Manual:

http://support.casio.com/pdf/004/fx-5800P_E.pdf

I am undecided. Hp 35s has RPN and its pretty complete, but fx-5800p is faster according to http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=700

And also 33s is faster than the others but I cannot do gto to a line number.

Calculator Speed Benchmark using the N-Queens Problem

4:17 HP-35S Keystroke / RPN

3:47 FX-5800P Formula / Array

2:11 HP-33S Keystroke / RPN

Edited: 21 Mar 2010, 12:26 p.m.

*Message #6 Posted by **Bruce Bergman** on 21 Mar 2010, 2:00 p.m.,*
in response to message #5 by Pablo P (Spain)

Strictly speaking, I believe the (current model) HP-50g to be the most advanced scientific and graphing calculator HP makes. You probably would be best to compare that one against the Casio.

Thanks,

Bruce

Re: 33s or 35s or casio fx-5800 for electronic engineering

*Message #7 Posted by **Mark Henderson** on 21 Mar 2010, 2:02 p.m.,*
in response to message #5 by Pablo P (Spain)

I would only consider RPN personally. I have both 33s and 35s and for day-to-day work the 35s is far preferred - better keyboard, layout, display contrast etc.

Re: 33s or 35s or casio fx-5800 for electronic engineering

*Message #8 Posted by **Bruce Bergman** on 21 Mar 2010, 2:06 p.m.,*
in response to message #5 by Pablo P (Spain)

Also, it would be fun to see the times using the 30b and the Casio FX-9860g slim (the best Casio in my estimation, and also arguably one of the fastest calculators made).

Anyone up for posting the speeds on the other two above?

Last year we had some discussion of this and Egan posted the speeds for the 71b and 41c. Results Here

Thanks,

Bruce

Re: 33s or 35s or casio fx-5800 for electronic engineering

*Message #9 Posted by **Bruce Bergman** on 21 Mar 2010, 2:12 p.m.,*
in response to message #8 by Bruce Bergman

Kind of answered my own question. ;-)

I found the master list from 2007 and it appears that the posting is updated by Xerxes regularly. He has times for both the FX-9860g at a blazing 17 SECONDS for N-queens, and the 30b at a shocking 11 SECONDS. Wow. :-)

This 30b is one fast calculator...

Edited: 21 Mar 2010, 2:16 p.m.

Re: 33s or 35s or casio fx-5800 for electronic engineering

*Message #10 Posted by **hugh steers** on 21 Mar 2010, 2:26 p.m.,*
in response to message #9 by Bruce Bergman

Hi,

yes, the 30b runs at a faster clock rate than the 9860g, base rates are 36Mhz (i think) and 14.7Mhz resp.

However, i've overclocked my 9860 by about 2x :-) There is a 4x option, but it's a bit unstable, but 2x is fine (just uses more power). In my reckon calculator for the 9860g, i temporarily engage the 2x for heavy-duty operations, like integer factorisation and graph plotting.

when i get around to putting a program language in it, i plan to let the user have control over the speed setting - could be very useful.

Re: 33s or 35s or casio fx-5800 for electronic engineering

*Message #11 Posted by **hugh steers** on 21 Mar 2010, 2:19 p.m.,*
in response to message #5 by Pablo P (Spain)

here is what i'd say at first glance;

firstly, i think your choice is either the 35s or the 5800p.

the casio will be faster and more accurate, integrate and solve are likely to be better (more modern algorithm, + brute force). the screen is bigger, which may be a big plus for matrices if you need them. However, i never had any problem with matrices on the single line 15c, so it's not a dealbreaker, and further it makes the unit physically larger.

casio have their weird programming language which isnt basic and rather odd, although i can see it being ok for small programs. alternatively the 35s is step programmable, which is pretty low level, but useable and also not great for large programs. also, you might have problems using all of the 35s program memory due to labels etc.

casio really missed a trick here not having a standard way to transfer programs to the PC (or am i wrong?) i see it comes with calc-to-calc transfer, but not calc-to-pc transfer. it might be worth seeing if there are some user community tools for calc-to-pc transfer. if this is possible, if it were me, i'd get the casio (im a big fan of cross development) and also it means you can load programs from others without having to type them in - this would be a huge plus!

complex number might work a bit more intuitively on the casio, but i suspect that the support for complex operations is limited to the 4 basic ops, sqrt, 1/x. for example Y^X is probably not supported for complex Y. however, the complex support on the 35s is also a bit lacking (compared to 15c, 48 etc).

however, the biggest overall factor is whether you like the way the machine works. some machines have a habit of being really annoying and some aren't. i cant say if the 5800p is or not. if it's like the 4800p, i think it's ok, but makers have a habit of making simple things complicated and annoying (for example if you press "Sqrt(" then 2, so you have to press ")" as well). if you get the 35s, then you really need to be using it in RPN, so that means you like RPN. If you hate RPN, i would advise the casio conversely if you are big on RPN, get the 35s.

lastly, i presume you don't want graphics for some reason, despite the fact that the 5800 has a large screen, so it's not a size constraint. otherwise there are more calculators to choose from.

Re: 33s or 35s or casio fx-5800 for electronic engineering

*Message #12 Posted by **marais** on 21 Mar 2010, 5:53 p.m.,*
in response to message #11 by hugh steers

As an EE, I'd say the biggest factor is how complex numbers are handled. I find both machines lack behind my 28C/S, or the 15C, for that matter. Otherwise I am quite fond of my 35S. The graphing capabilities are worthless for an engineer (since we have access to more powerful tools), but handy for students. I know my comment is not helpful, but had to give it anyway.

Re: 33s or 35s or casio fx-5800 for electronic engineering

*Message #13 Posted by **Michael Andersson** on 21 Mar 2010, 2:20 p.m.,*
in response to message #1 by Pablo P (Spain)

Owning one of each, here are my thoughts.

Of the three the fx-5800 has the most functions. It can do pretty much what the HP:s can and much more. The only thing I can thing of that the HP:s can that the fx-5800 cannot is to take the logarithm of a complex number. But for normal complex calculations the Casio is much easier to use. One problem with all the functions in the fx-5800 though is that many are burried quite deep in menus and requires many keystrokes to get to.

The calculator I enjoy using the most is the 33s. It's RPN, has most functions I need and has a nice feel to the keyboard. Compared to the 33s the 35s adds some nice functions. But I don't like the layout of the keyboard of the 35s and it constantly misses keystrokes if you type too fast. The feeling in the keyboard of the fx-5800 is not good, but at least it does not miss any key strokes.

Re: 33s or 35s or casio fx-5800 for electronic engineering

*Message #14 Posted by **Norman Dziedzic** on 21 Mar 2010, 5:46 p.m.,*
in response to message #1 by Pablo P (Spain)

I love my 35s. In fact it rekindled in me the love of hp calculators and started me collecting them.

I use it all the time as except when I need to work in hex or binary when I use a 32sii.

I really like the solver feature which I hadn't played with much on the 32sii although I have had it for years.

I have to wonder what problems people are doing on a daily basis that they are complaining about the speed of a hand held calculator. For serious stuff I would use MathCad or scilab or even Excel.

Re: 33s or 35s or casio fx-5800 for electronic engineering

*Message #15 Posted by **David Hayden** on 21 Mar 2010, 6:38 p.m.,*
in response to message #1 by Pablo P (Spain)

I can't speak to the casio, but if you want an HP calculator for engineering, I'd get the 50g, or the 48gII if money is a concern. You will find the CAS system extremely useful when you start getting to complicated equations. Also, you'll want the I/O capabilities so you can easily load programs onto the calculator. With the 35s or 33s, you have to key in the programs by hand, which can be very time consuming.

If you don't need RPN, you might look at the 40gs also.

I own both the 48gII and 50g. To me, the advantages of the 50g are (in order) the SD card, more memory, faster processor, larger display, carrying pouch vs slide-on plastic shell. The 48gII has one advantage over the 50g in my opinion: an easier-to-read keyboard.

A word of warning - if you decide to get the 48gII, be aware that HP made two versions that are quite different. The old version, which is available on ebay for very cheap, has 80k for memory, a serial point only, no equation library etc. The newer ones have serial and USB, 230k of memory, equation library and use 4 batteries. You can tell the difference on the blister pack by looking for the number of batteries and by carefully reading the package to see if it says it supports USB.

A good calculator can make a huge difference when taking tests and doing homework. If you get the right one, you'll use it for decades. I used my HP41CV for 25 years, but I got the card reader attachment very quickly after buying the calculator so I could enter programs easily. Trust me, you NEED I/O.

Dave

Re: 33s or 35s or casio fx-5800 for electronic engineering

*Message #16 Posted by **Pablo P (Spain)** on 21 Mar 2010, 9:10 p.m.,*
in response to message #1 by Pablo P (Spain)

I think that I will buy the hp 35s for these reasons:

- Casio fx-5800p seems good but it lacks rpn. Also I want to taste an hp calculator (I have always used casio

ones).

- I want a lightweight, not very big calculator.

- About 48gII and 50g: They have I/0 and that is very good. However I only need the calculator for a daily use and not for very complex things. I agree with Norman Dziedzic: If I want to do complex things I use Maple or Matlab.

- For my needs, I value simultaneous equation solving, operate with complex numbers, base conversions, and writing moderately complex programs. 35s has those features. 33s does not have built-in simultaneous equation solving (you have to program it and waste some labels) and although it is faster, it cannot gto program line. Also it lacks indirect variables (useful in complex programs).

I will go to bed now. Thanks and see you tommorrow.

Re: 33s or 35s or casio fx-5800 for electronic engineering

*Message #17 Posted by **Don Shepherd** on 21 Mar 2010, 9:17 p.m.,*
in response to message #16 by Pablo P (Spain)

Don't expect much from the 35s base conversions. 33s is much better for that.

Re: 33s or 35s or casio fx-5800 for electronic engineering

*Message #18 Posted by **Lutz Jacob** on 22 Mar 2010, 6:10 p.m.,*
in response to message #1 by Pablo P (Spain)

I would suggest going for a 33s and ignoring the 35s because of its collection of really stupid bugs (base conversions, unusable floating point display, ...). The 35s looks nice but that doesn't help if you can't see the result of a calculation or have to press lots of keys to do some simple calculations with hexadecimal or binary numbers. And if you have to do many calculations with complex numbers - which is very likely in any kind of electrical engineering - than you should go for a HP48, 49 or 50. The 33s and 35s are nearly useless in this area.

Re: 33s or 35s or casio fx-5800 for electronic engineering

*Message #19 Posted by **bill platt** on 22 Mar 2010, 7:25 p.m.,*
in response to message #1 by Pablo P (Spain)

In the present context, anything but a computer is essentially a toy, or useful assistance to ad-hoc manual computation.

To that end, the 35s, the Casio, the 33s, old HP RPN machines, are all a crippling disadvantage. I'd steer clear of them if you are young and want to get ahead.

Those of us who are older fondly remember the days when we got our first 11c or 15c, or a bit older, when we got our 34c, 41C, or before that our 55, 65, 67 etc. In those days, when a real programmable computer such as the HP83 cost over $2200, and the Apple and the TRS 80 model II did not yet exist, these programmable calculators were fantastic!

Today, even the programmables, such as our venerable 41C, 42S, 15C, or the newer, more crippled 35S, are avocational curiosities, not effective tools, where programming is concerned. Computation, yes, portability, yes, programming, no.

Don't get me wrong: I own a number of RPN machines including the new ones. I use the 27s frequently for its

solver. But I am "old" and therefore make use of legacy equipment because I already know it well and it works for me. But if there is a lot to do, I go to the computer.

Some other posts mention test-taking. This is really the crux of the matter. In your career, you are going to use a real computer to solve real programs. You will buy fantastic software for $1000 that can run circles around everything--circuit analysis, harmonic analysis, you name it. But for tests you need a calculator. To this end, find out what is *permissible* in your university. Find out what is permissible for your licensing examinations. It is likely that the 50G will be the only proper choice, if permitted. IT is *fully* programmable in RPL, SysRPL, Assembly language, and C! (If you like retro, buy a 48G series but you'll need cards and SpeedUI or Metakernel, and ALG48 or Erable for CAS--stuff I don't have expertise in).

In the US, we have to use the 33s or 35s for licensing tests as the 50G and all graphing calcs are banned. In the recent past, everybody used 48S and later 48G series on the tests. This dates all the way back to 1990!

35S has the disadvantages mentioned above: goofy quirky incomplete functional design for non base 10, and polar to rectangular. Trouble with trig close to 90 degrees. Some have problem with non registering keys. This also happens to some 33s. We are picky--we grew up on Voyagers, Spice, Classics, Woodstocks and Pioneers!

35S solver is better than 33s because of full editability of equations. 33S is way better in its layout for doing Base arithmetic, Polar to Rectangular and other stuff. Earlier ROM versions of the 33s had a bug in the Rectangular to Polar, as well as the Decimal Hours to H.MS maths! Only buy a newer one with the bigger decimal point. If you get an old one, you can write short, easy programs to do these functions correctly (I and a number of others here wrote programs that did this and you can find them and check them. At one point HP even made them a service release though I don't know it it is still up on their website).

I hope that helps.

Bill, if you hadn't posted this so late, so that not many will see it, you would have started another big debate.

Of course I disagree, because I consider writing Solver routines programming, and those are a boon to me

in my work. As far as keystroke programming, well, I hardly ever do it myself, so I can't disagree on the practicality, but I do disagree on the power available there.

I think perhaps what you are really saying is for the young engineer starting out, don't bother trying to learn programming calculators, because you will really use computers for almost everything...

Yep. And why waste effort with no I/O (42s, 27s 15c, 35s etc)? If it is ad-hoc, so what, but for real work, that's crazy.

...and that is the great thing about the 48 (including the 49 and 50): it has a lot available, and it has I/O, and it can be run as an emulator on the computer, and you can take the files back and forth from the real thing to the computer. Really it is the holy grail of calculators....even though I am a rank beginner on the 48, I see its merits!

Re: 33s or 35s or casio fx-5800 for electronic engineering

*Message #24 Posted by **Bruce Bergman** on 22 Mar 2010, 9:32 p.m.,*
in response to message #19 by bill platt

A lot of good points, but I too disagree. Maybe it's not such a help in electrical engineering, but I can tell you that in computer science -- as a software developer -- having a calculator handy can be a big help. It's a daily event.

When I have 20 windows open on my computer, and things are already slow enough, the last thing I want to do is open a copy of Free42 or other program and wait for it to launch.

In fact, on a day-to-day basis, I actually have an HP-97 sitting on my desk. I get a lot of laughs and smirks, but when I have a group sitting in my office working out some simple math problem, I'm at the answer far faster than anyone in my area. That, IMHO, is valuable.

Thanks,

Bruce

*Message #27 Posted by **MK-52** on 23 Mar 2010, 8:25 p.m.,*
in response to message #1 by Pablo P (Spain)

Hello. I am Japanese and I have a fx-5800p. Personally, I think that if you can buy TI or HP calculators, you should not buy 5800p. Because it has no CAS and complex operations is meaningless. 5800p can't calculate even i^i and (-1.6)^(1.5). Program language is only BASIC style language. This calculator need many key strokes. For example, if you calculate the factorial, you must type FUNCTION 1 5. ABS, Hyperbolic function and its inverse function are the same.

BTW, I don't speak English well. I apologize for my poor English.

Re: 33s or 35s or casio fx-5800 for electronic engineering

in response to message #27 by MK-52

Hi all again, finally I have bought the hp 35s. This is my first programmable rpn calc and my impression is good.

Be warned, I am a noob in calculators but this is my first review:

Good complex numbers support, you can covert between polar and rectangular coordinates (if you see them as complex numbers), high quality case and buttons, huge memory for a RPN Keystroke programmable calc, simultaneus equation solver (2*2 an 3*3), it is small and light which it is good for daily use...

On the other hand it has some known lacks, you can do all calculations and connversions between bases but you have to type many buttons. It has not got a function to calculate logarithms in a base other than 10. Also I do not like its logic capabilities: when I do the NOT of 1111b I expect 0000b but I get 11111111111111110000b (but probably I will not use this feature)...

Perhaps it is very soon to make a judgement but I like this calc.

*Message #31 Posted by **Gene Wright** on 24 Mar 2010, 3:31 p.m.,*
in response to message #30 by Pablo P (Spain)

1) The LN key computes logs to base e.

2) Binary word size is set to 36 bits. Can't change it.

in response to message #1 by Juergen Keller

It says you need the plotter module. The plotter module will probably make it easier, but you can do this without it. The plotter just uses HPGL (HP graphics language) which is plain text, so it's basically like you're printing the text data, and the plotter interprets it. "PU" (plain text characters) for example means "pen up." If you have the 82169A HPIL-to-HPIB (GPIB, or IEEE-488) interface converter, you can use the HPIB version of the plotter too, without needing the HPIL option. Alternately, if you have the HP82164A or FSI164A HPIL-to-RS232 interface converter, you could use the RS-232 version of the plotter without the HPIL option. There are lots of ways to skin a cat.

Re: HP-41 draws sine curve

*Message #5 Posted by **Juergen Keller** on 21 Mar 2010, 5:18 a.m.,*
in response to message #4 by Garth Wilson

Yes, I know that, but I wanted to keep the movie short; pointing out all options would have been too confusing.

Anyway, when plotting bar code - I suppose this was one of the main applications - the plotter module turns out _very_ handy. I also tried the HP-IB option with my 9872B plotter (this is a real beast). The only difference is that you have to SELECT the plotter manually (use MANIO, then enter the address of the plotter and SELECT). Finally, an unfullfilled dream is to drive a 7580B plotter with an HP-41 ;-)

Cheers, Juergen

*Message #15 Posted by **PeterP** on 24 Mar 2010, 10:07 a.m.,*
in response to message #1 by Juergen Keller

really cool. I'm still looking for the 7470A Opt 3 (got a 7475 with HP-IB though). Anyone has one or knows of one, pls let me know...

What is it that makes it so slow? I think if it were driven by a HP-71, it would be faster. But the program sounds pretty simple... IF one wanted to do this in MCODE, how could one speed it up?

Cheers

Peter

Re: HP-41 draws sine curve

*Message #16 Posted by **Egan Ford** on 24 Mar 2010, 10:25 a.m.,*
in response to message #15 by PeterP

> Quote:
>
> What is it that makes it so slow?

The 41. I've got the same plotter and have done the same plot. Yes it is slow. However using EMU41 or nonpareil in turbo mode with a PIL-Box or IL-ISA adapter is significantly faster.

Re: HP-41 draws sine curve

*Message #17 Posted by **PeterP** on 24 Mar 2010, 10:43 a.m.,*
in response to message #16 by Egan Ford

so MCODE would make it faster. Is it the PRPLOT program that is so slow or the sin calculation?

Cheers

Peter

Re: HP-41 draws sine curve

*Message #18 Posted by **Egan Ford** on 24 Mar 2010, 1:59 p.m.,*
in response to message #17 by PeterP

It could be PRPLOT, the 41, or the HP-IL adapter. Hard to tell without a PRPLOT replacement.

Re: HP-41 draws sine curve

*Message #19 Posted by **Garth Wilson** on 25 Mar 2010, 4:46 p.m.,*
in response to message #18 by Egan Ford

The 41 is not very quick at any of the major factors here: calculating the SIN, probably doing some division and multiplication to scale it to the drawing size and maybe addition or subtraction for the drawing's offset, putting the text commands out, converting the number result to text, and then operating the IL which it only does at about 150 bytes per second (compared to the 71's 5,000 bytes per second). When I used the 41 for controlling equipment and printing out long lines of test results, synthetic programming sped up some of the printing operations because I could do things like embed escape sequences in quoted text. The 41 might also be inputting status from the plotter before every command, although there apparently is no danger of overrunning the plotter's input buffer!

Edited: 20 Mar 2010, 4:44 p.m.

Re: Does this look familiar to any one?

*Message #2 Posted by **Marcus von Cube, Germany** on 20 Mar 2010, 5:03 p.m.,*
in response to message #1 by Gerardo Rincon

Yes, it does. It's a well known 12c work alike. Whether it uses code and patents from HP, I don't know.

Re: Does this look familiar to any one?

*Message #3 Posted by **Eric Smith** on 20 Mar 2010, 11:13 p.m.,*
in response to message #2 by Marcus von Cube, Germany

I'm not sure what patents you're referring to, but it is unlikely that it uses any of HP's code, as there are many differences in its behaviour compared to the 12C (and 12c Platinum).

Re: Does this look familiar to any one?

*Message #4 Posted by **Marcus von Cube, Germany** on 21 Mar 2010, 2:19 a.m.,*
in response to message #3 by Eric Smith

I wasn't thinking of any specific patent. From what you are telling, it's not a licensed copy, just a clone.

Re: Does this look familiar to any one?

*Message #5 Posted by **Walter B** on 21 Mar 2010, 2:27 a.m.,*
in response to message #2 by Marcus von Cube, Germany

AFAIK, after more than 25 years, any patents still applicable seem pretty unlikely.

New HP-41 Skin for the free HP-42S!!!

*Message #1 Posted by **Namir** on 20 Mar 2010, 10:51 a.m.*

I was checking the latest version of Thomas Okken's free HP-42s emulator. I also downloaded new skins that Thomas recently posted. Among them is a very cool HP-41C skin. It is awesome and makes the calculator a bit easier to use. There are "blue" and "gold: commands located on the keys. You invoke them by clicking the mouse on them! This saves having to go through the menu system to find and execute these commands.

Namir

What is the best financial calculator made by HP

*Message #1 Posted by **Jeff Kearns** on 20 Mar 2010, 10:34 a.m.*

My 'collection', and I hesitate still to refer to my dozen or so models as a collection, since I use them all, or try to, regularly, has consisted of scientific calculators. Lately, my career path has taken me into the Marketing and Sales world, but I still consider myself an engineer at heart. Anyway, I scored a truly pristine HP 19BII (with RPN) for $50CDN on Kijiji yesterday. I have neglected and avoided owning any of the financial calculators up until now since my main financial interests seldom went beyond the Time Value of Money, which is easily computed on a number of programmables, but am I ever impressed with this one! With its scientific feature set and HP Solve, it makes for a great multi-function calculator! Plus, it looks great on a desk.

How does it compare with other financial calculators made either by HP or others? I know it is far more powerful than the world-famous 12C, but I wanted to get your thoughts on this.

Jeff Kearns

Re: What is the best financial calculator made by HP

*Message #2 Posted by **Marcus von Cube, Germany** on 20 Mar 2010, 11:12 a.m.,*
in response to message #1 by Jeff Kearns

The 17bII (and its recent incarnations with the "+") comes closest. Same feature set except for the missing trig functions and the less then perfect alpha entry in the solver.

Re: What is the best financial calculator made by HP

*Message #3 Posted by **Bruce Bergman** on 20 Mar 2010, 2:44 p.m.,*
in response to message #1 by Jeff Kearns

HP-30b. It's the pinnacle of modern tech, with the most finance and stats functions available. Also programmable.

Of course, the 17bii+ have the HP Solver, which is also legendary.

thanks,

bruce

Re: What is the best financial calculator made by HP

*Message #4 Posted by **Dave Britten** on 20 Mar 2010, 2:48 p.m.,*
in response to message #1 by Jeff Kearns

The HP palmtops (95LX, 100LX, and 200LX) are all financial/business calculators at heart. The HP Calc application is essentially the 19BII with a huge screen, and there are also built in word processing and scheduling programs, and a great little customizable database. Plus you have Lotus 1-2-3, and full DOS 5.0 compatibility, and you get a lot more storage than 7KB!

Re: What is the best financial calculator made by HP

*Message #5 Posted by **Jeff Kearns** on 20 Mar 2010, 7:17 p.m.,*
in response to message #4 by Dave Britten

Aside from the palmtops (which I assume have it all...) do any other financial calcs have hyperbolic trig functionality (or trigonometric functionality period!)? The 17BII doesn't appear to, and forget about the 12C, 27, 38C etc...

You can hardly call the Palmtops calculators. I am really enjoying this (my first clamshell) fine machine, the HP 19BII. I put in a similar category to my trusty HP 32E, also a great machine with some interesting features that its elder brother the 34C doesn't have, but that are oh, so important - e.g. hyperbolic trig!

Jeff Kearns, in Ottawa

Re: What is the best financial calculator made by HP

*Message #6 Posted by **Tim Wessman** on 20 Mar 2010, 9:10 p.m.,*
in response to message #5 by Jeff Kearns

Both the 20b and 30b have trig and hyperbolic.

Arguably, they are the most powerful financials HP has ever made. Sure as mentioned with programability you can make up for it with some other models, but there is a strong argument for that statement.

TW

Re: What is the best financial calculator made by HP

*Message #7 Posted by **Eddie W. Shore** on 20 Mar 2010, 7:48 p.m.,*
in response to message #1 by Jeff Kearns

For the moment, I'm torn between the HP 30b and 17BII+ (Silver). Both are very fast and have a great amount of features.

The 30b has an extended funciton set, both in finance and scientific caclulator functions; but with 17bII+'s big memory, one can make up for it.

The 14B gets an honorable mention, only because it was made in the USA.

The 12C Platinum - the 25th Anniversary Edition - is my dad's favorite.

Edited: 20 Mar 2010, 7:55 p.m.

Re: What is the best financial calculator made by HP

*Message #8 Posted by **Eric Smith** on 20 Mar 2010, 11:21 p.m.,*
in response to message #1 by Jeff Kearns

If you want traditional RPN, the 19BII is the best. The 20b and 30b have RPN, but it's different in several ways from traditional RPN, which I find very irritating. That aside, the 30b is certainly one of the most powerful financial calculators.

Re: What is the best financial calculator made by HP

*Message #9 Posted by **Tim Wessman** on 20 Mar 2010, 11:27 p.m.,*
in response to message #8 by Eric Smith

Good point. I think it was Gene Wright that said "it is a 4 level RPL machine".

The differences are there, but coming from RPL machines personally it is the first "RPN" machine that doesn't annoy me to death. Every time I use one I constantly end up with duplicated items on the stack. :-D

TW

Re: What is the best financial calculator made by HP

*Message #10 Posted by **Eric Smith** on 21 Mar 2010, 6:35 p.m.,*
in response to message #9 by Tim Wessman

I could live with four-level RPL, though I don't think it's a particularly good idea, but I can't stand that pressing the backspace key doesn't act as CLx when there is a result in the display. I complained to Cyrille about that previously, and he claims that it's a useful feature, but I've never understood how it is useful.

Re: What is the best financial calculator made by HP

*Message #11 Posted by **Tim Wessman** on 21 Mar 2010, 10:21 p.m.,*
in response to message #10 by Eric Smith

Unless I am mistaked about what CLx does on old RPN machines, ON/CE does that operation on the 20/30. Is there a way to edit the number in your display on old machines?

TW

Re: What is the best financial calculator made by HP

*Message #12 Posted by **Eric Smith** on 22 Mar 2010, 3:54 a.m.,*
in response to message #11 by Tim Wessman

No, and I don't see why there should be a way to edit a result; that doesn't make any sense. On the 41C/CV/CX, 11C, 15C, 16C, AND on all RPL models (28/48/49/50), the backspace key allows editing of entry, but acts as clear X for results.

Edited: 22 Mar 2010, 3:55 a.m.

Re: What is the best financial calculator made by HP

*Message #13 Posted by **Tim Wessman** on 22 Mar 2010, 10:03 a.m.,*
in response to message #12 by Eric Smith

I find myself editing things all the time. Granted, it isn't a result but rather a miskeyed entry on the 20b. . . :-D

TW

Re: What is the best financial calculator made by HP

*Message #14 Posted by **Eric Smith** on 22 Mar 2010, 10:57 a.m.,*
in response to message #13 by Tim Wessman

I don't have any issue with editing entered numbers. I've never before seen a calculator that makes it easy to accidentally edit results, and IMNSHO the value of the feature is negative.

Re: What is the best financial calculator made by HP

*Message #15 Posted by **Nigel J Dowrick** on 22 Mar 2010, 1:40 p.m.,*
in response to message #14 by Eric Smith

There's a possible joke to be made about the particular needs of the accountancy profession here ...!

Re: What is the best financial calculator made by HP

*Message #16 Posted by **JDonley** on 20 Mar 2010, 11:43 p.m.,*
in response to message #8 by Eric Smith

Choosing between the 17B11 and the 19B11 is a horse race I won't bet on. I have 2 of each. If a person wants to carry one in his pocket, the 17B11 wins. If he (she) wants to do alot of solver problems, the 19B11 wins hands down (to me). However,it isn't pocket-able. These are just two different and wonderful creatures. Buy and enjoy them both!

Looking forward to getting my 30B with a good keypad (hopefully).

don

Re: What is the best financial calculator made by HP

*Message #17 Posted by **Jeff Kearns** on 22 Mar 2010, 11:29 a.m.,*
in response to message #16 by JDonley

The 19BII does fit nicely in a jacket pocket though. Jeff Kearns

Re: What is the best financial calculator made by HP

*Message #18 Posted by **Walter Lam** on 23 Mar 2010, 2:56 a.m.,*
in response to message #17 by Jeff Kearns

I prefer 17BII. It's a masterpiece except for the LCD Display.

17BII+ is also good financial calculator but I like the industrial design and keyboard feel of old 17BII more than 17BII+.

How to transform an HP-25 into an HP-25C ?

*Message #1 Posted by **Giovanni Jimenez** on 20 Mar 2010, 9:42 a.m.*

Is it possible to make a Continuous Memory calculator out of an HP-25 ?

Maybe with the right connections from the battery terminals?

Probably adding one of those button-cell 3V batteries to maintain the tiny current needed to keep the chips' memory ?

I am willing to risk my newly acquired HP-25 if someone tells me What / Where / How to make the connections.

Thanks...Giovanni

Re: How to transform an HP-25 into an HP-25C ?

*Message #2 Posted by **Hal Bitton in Boise** on 20 Mar 2010, 10:03 a.m.,*
in response to message #1 by Giovanni Jimenez

Hi Gionanni
The 25C was built with CMOS (complimentary metal oxide semiconductor) circuitry, which used MOSFET logic, which required very little current to operate. The 25 used TTL (transistor-transistor logic), which draws much more current. I'm afraid the only way to make your HP 25 non-volital is to leave it on all the time.
best regards, Hal

Re: How to transform an HP-25 into an HP-25C ?

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 20 Mar 2010, 12:49 p.m.,*
in response to message #2 by Hal Bitton in Boise

The HP-25 and similar calculators were built with PMOS technology, the HP-27 was made with NMOS. CMOS made their appearance in the HP-25C, followed by HP-29C and so. Not all the HP-25C was made with CMOS technology, only part of the RAM memory is CMOS. That's why only registers R0 thru R7, program steps and (if memory helps) X register are preserved with the calculator off. In the 29C, only part of the registers are non-volatile. The HP-41C is a full CMOS design.

TTL is based in bipolar transistors (as oposed to MOS), and its power requirements are much higher; also the density (devices per chip) was much lower than MOS. It is not a suitable technology for portable devices, in general terms.

Re: How to transform an HP-25 into an HP-25C ?

*Message #4 Posted by **Michael de Estrada** on 20 Mar 2010, 1:01 p.m.,*
in response to message #3 by Andrés C. Rodríguez (Argentina)

FYI - The stack X-register is not preserved in the HP-25C when the calculator is turned off, however, it is preserved in the HP-29C.

Re: How to transform an HP-25 into an HP-25C ?

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 20 Mar 2010, 5:52 p.m.,*
in response to message #4 by Michael de Estrada

If I recall correctly, the HP-25C saves R0-R7 (eight 56 bit registers), 49 program steps (seven 56 bit registers, or 7 x 7 x 1 Byte), and the LAST X register; all of them in a 16 register, 56 bit per register CMOS RAM chip. So the X register is not preserved, as you said.

In the HP-29C, there are 32 non-volatile registers (double than in the 25C). Not completely sure about this, but I think that 98 program steps are saved using 14 registers, 16 data registers are saved, and a backup copy of X is also saved (the "real" X is on the CPU). I think that LAST X is not preserved on the 29C, perhaps the remaining regsiters are used to save the program counter and pending return addresses for GSB instructions.

Re: How to transform an HP-25 into an HP-25C ?

*Message #6 Posted by **Michael de Estrada** on 20 Mar 2010, 6:14 p.m.,*
in response to message #5 by Andrés C. Rodríguez (Argentina)

Correct. Last X is preserved in the HP-25C but is not preserved in the HP-29C.

hp 30b keyboard issue

*Message #1 Posted by **Gerardo Rincon** on 19 Mar 2010, 11:33 p.m.*

I ordered an HP 30b directly from HP (Small Medium Business Dept.) When the calculator arrived, the #4 key in the keyboard was damaged (no click) it was depressed and it was hard to press to produce the #4 in the screen. I called HP (Small Med Bus dpt) and they were very nice about it and sent me a replacement. When the replacement arrived, same problem again but now with the "." (period) key. I called again and they are sending me another exchange.

Is this a coincidence to get two calculators with bad keyboard keys? Has any one else experience similar issues with 30b keyboards?

I have to say HP has been VERY nice about exchanging the units, great service. But I just rather have a 100% good calculator....

Re: hp 30b keyboard issue

*Message #2 Posted by **Bruce Bergman** on 20 Mar 2010, 2:22 a.m.,*
in response to message #1 by Gerardo Rincon

I have four of the 30b's, including two that came last week, and none of them have a keyboard problem. There were a couple issues with that very bottom row, but they were fixed.

I'd guess you probably just hit a bad spot. What were the serial numbers?

Thanks,

Bruce

Re: hp 30b keyboard issue

*Message #3 Posted by **Gerardo RIncon** on 20 Mar 2010, 8:21 a.m.,*
in response to message #2 by Bruce Bergman

YOu are probably correct - the serial numbers are similar... 4CY00300075 and 4CY00300024 .. they are 51 calculators from each other?

Re: hp 30b keyboard issue

*Message #4 Posted by **Joe Burwell** on 23 Mar 2010, 6:02 p.m.,*
in response to message #3 by Gerardo RIncon

I purchased two HP 30b calculators and have not had a problem. The serial number on one of them is 4CY00300074.

Re: hp 30b keyboard issue

*Message #5 Posted by **Gerardo Rincon** on 23 Mar 2010, 9:25 p.m.,*
in response to message #4 by Joe Burwell

Update: I just received replacement calculator from HP and is all good! All Keys work correctly. Serial # 4CY00300040. It may have been a random error.

Edited: 23 Mar 2010, 9:27 p.m.

Re: hp 30b keyboard issue

*Message #6 Posted by **Walter B** on 24 Mar 2010, 1:54 a.m.,*
in response to message #5 by Gerardo Rincon

Congratulations!

Nevertheless, pulling two random errors of one kind out of a production featuring a gross error probability of - let's guess - significantly less than 0.1% is very improbable, i.e. much less than 1ppm. So, your experience should make us wondering - especially those folks who know the production numbers.

Re: hp 30b keyboard issue

*Message #7 Posted by **Dave Shaffer (Arizona)** on 24 Mar 2010, 12:57 p.m.,*
in response to message #6 by Walter B

The real question should perhaps become: "is it really a random error?"

When you take most probablility and statistics courses, you spend the semester considering only proper statitical problems. However, when the probability gets too low, maybe it is time to think different thoughts. i.e. if you roll a dice (without looking too closely at it), and you get a 5 twenty time in a row, perhaps it is time to inspect the dice more closely!! You are more likely to have a loaded dice than to have actually rolled the same number 20 times at random.

Here, there may well have been a production glitch that comparably affected a bunch of machines.

Re: hp 30b keyboard issue

*Message #8 Posted by **Walter B** on 24 Mar 2010, 6:33 p.m.,*
in response to message #7 by Dave Shaffer (Arizona)

Hi Dave, that's exactly what I wanted to initiate :) Two random errors in a row are very improbable. We may only speculate about the true cause, however, since nobody but the people close to this production have all the information.

Re: hp 30b keyboard issue

*Message #9 Posted by **Tim Wessman** on 20 Mar 2010, 10:08 a.m.,*
in response to message #1 by Gerardo Rincon

Please send me an email. I'll probably be wanting those to look at. Apart from some very early issues due to really bad warping in the plastic while the process was getting set up (very normal), this would be the very first keyboard issue.

Curta calculator

*Message #1 Posted by **Bruce Bergman** on 19 Mar 2010, 9:38 p.m.*

A guy around town here is selling a Curta Type II calculator on craigslist.

Follow this link

The curious part is that he hasn't set a price. I'm assuming that this is going to go for a darn pretty penny, but I have no idea of a good price (not that I'm going to bid on it anyhow). Just a curiosity to me, but what do you think something like this is worth?

Thanks,

Bruce

Re: Curta calculator

*Message #2 Posted by **geoff quickfall** on 20 Mar 2010, 1:43 a.m.,*
in response to message #1 by Bruce Bergman

I have seen these, with canister and booklet go in mint condition for 1000 to 2000 depending on the day of the week.

Found mine in a junk store in Winnipeg for $60.00 but the first digit would not increase past 8 internally.

When you selected 9 as the first digit, internally the machine would select eight. Mentioned this and the fact that these cost 400 to fix at a minumum and the seller dropped the price.

Turns out there is a screw at the base of the machine that is a shade to long when tightened. A short filing (minute amount) of the working end of the machined screw and all was working perfectly!

Cheers, Geoff

Running executable on HP 95LX

*Message #1 Posted by **B Jong** on 19 Mar 2010, 11:06 a.m.*

Dear all,
In a nostalgic mood I dusted off my old HP 95LX with the intention to try to do some programming for it.
I looked around in this forum and found a lot of interesting information. Thank you for that!
In a thread from sept. 2007 "HP-95LX Programming" I read that it would be possible to create an executable with TurboPascal 5.5 that would run on the 95LX.
So I installed TP 5.5 and wrote a very simple "hello world" program with TurboPascal and copied the compiled exe file to the 95LX.
However when I run it, the screen goes blank and the device gets completely blocked.
Reading through the information on this forum and linked sites, I guess that it might have to do with the setting of the screen size. However I could not find how to do that properly for the 40x16 screen.
I would very much appriciate if anyone could help me out here. Could it indeed be the screen size setting and if so what should I do, or is it anything else?
Thanks.

Re: Running executable on HP 95LX

*Message #2 Posted by **Bill (Smithville, NJ)** on 19 Mar 2010, 11:53 a.m.,*
in response to message #1 by B Jong

A couple of quick things to check for:

Under Options/Compiler, make sure Numeric Processing is set to Emulation and not 8087/80287.

Also, make sure the box for 286 instructions is NOT checked.

Bill

Re: Running executable on HP 95LX

*Message #3 Posted by **B Jong** on 20 Mar 2010, 5:19 a.m.,*
in response to message #2 by Bill (Smithville, NJ)

Thank you for your reaction. The menu options are a bit different, but I got the drift. Unfortunately there is no difference. Any other suggestions?

Re: Running executable on HP 95LX

*Message #4 Posted by **Marcus von Cube, Germany** on 20 Mar 2010, 8:35 a.m.,*
in response to message #3 by B Jong

Does you program run on a DOS-PC?

What does it do? How do you access screen and keyboard?

Re: Running executable on HP 95LX

*Message #5 Posted by **B Jong** on 21 Mar 2010, 5:48 a.m.,*

in response to message #4 by Marcus von Cube, Germany

I found the solution. What I did is I copied the compiled file to the SRAM card on a PC with a PCMCIA slot, put it in the 95LX and tried to run it then. However apparently the file gets corupted in this proces. I now use the CPACK connection and all works fine.

Thank you all for your support.

HP 41C and CV boards with some piggy backing from the factory

*Message #1 Posted by **Geoff Quickfall** on 18 Mar 2010, 1:51 p.m.*

Further to my queries below, and thanks for all the help from everyone.

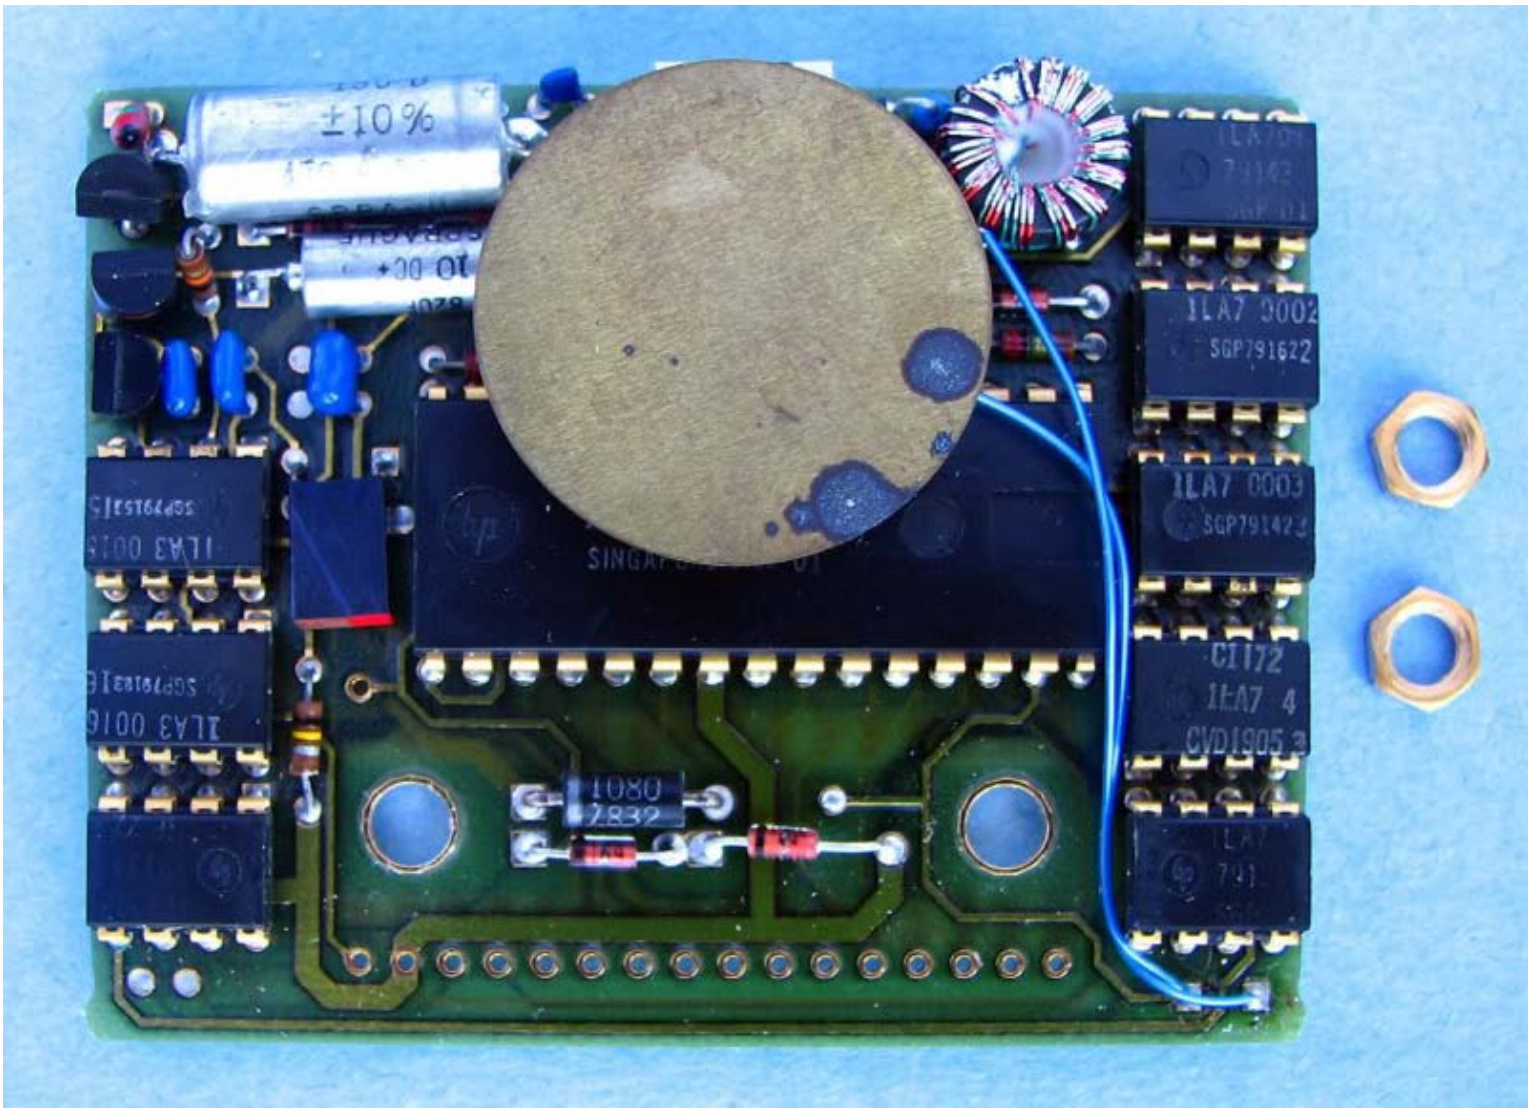
Just to let you know, I do have an orphan CV board which will donate the LCD panel (functioning of course) and the:

1LE7 0001 THROUGH 1LE7 0005

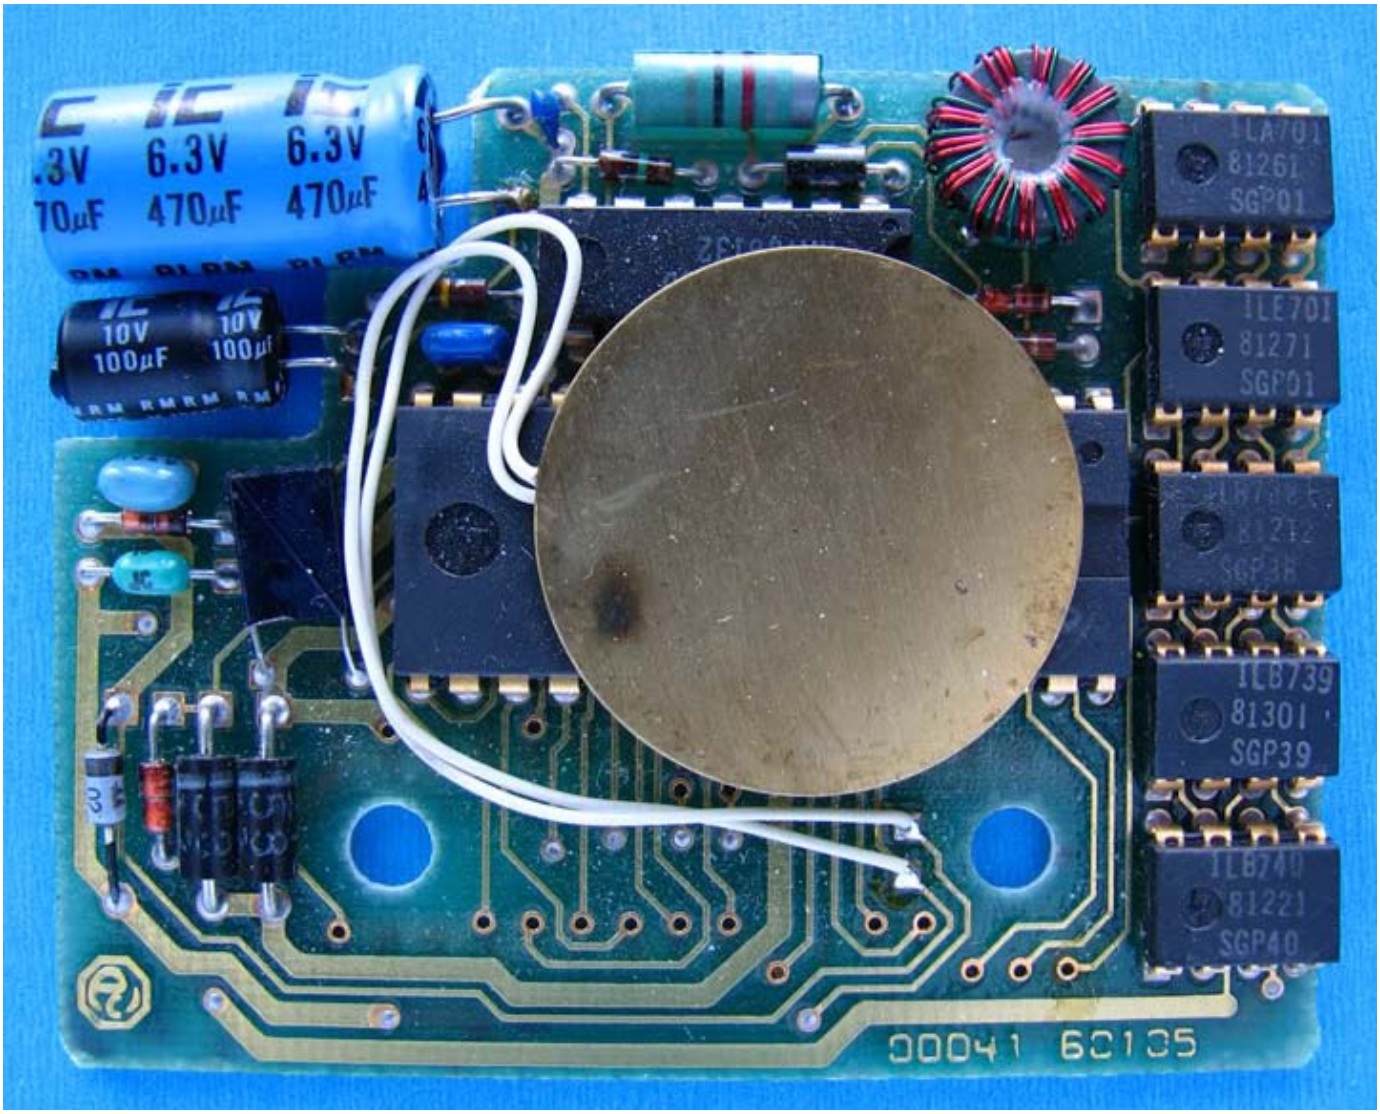
to a "with all bugs, tall keys, contact balls" 1979 HP 41C with a bad D/S. This will give it a CV memory while saving the bugs which is the intent.

Here are five pictures of two C pcas and three CV pcas:

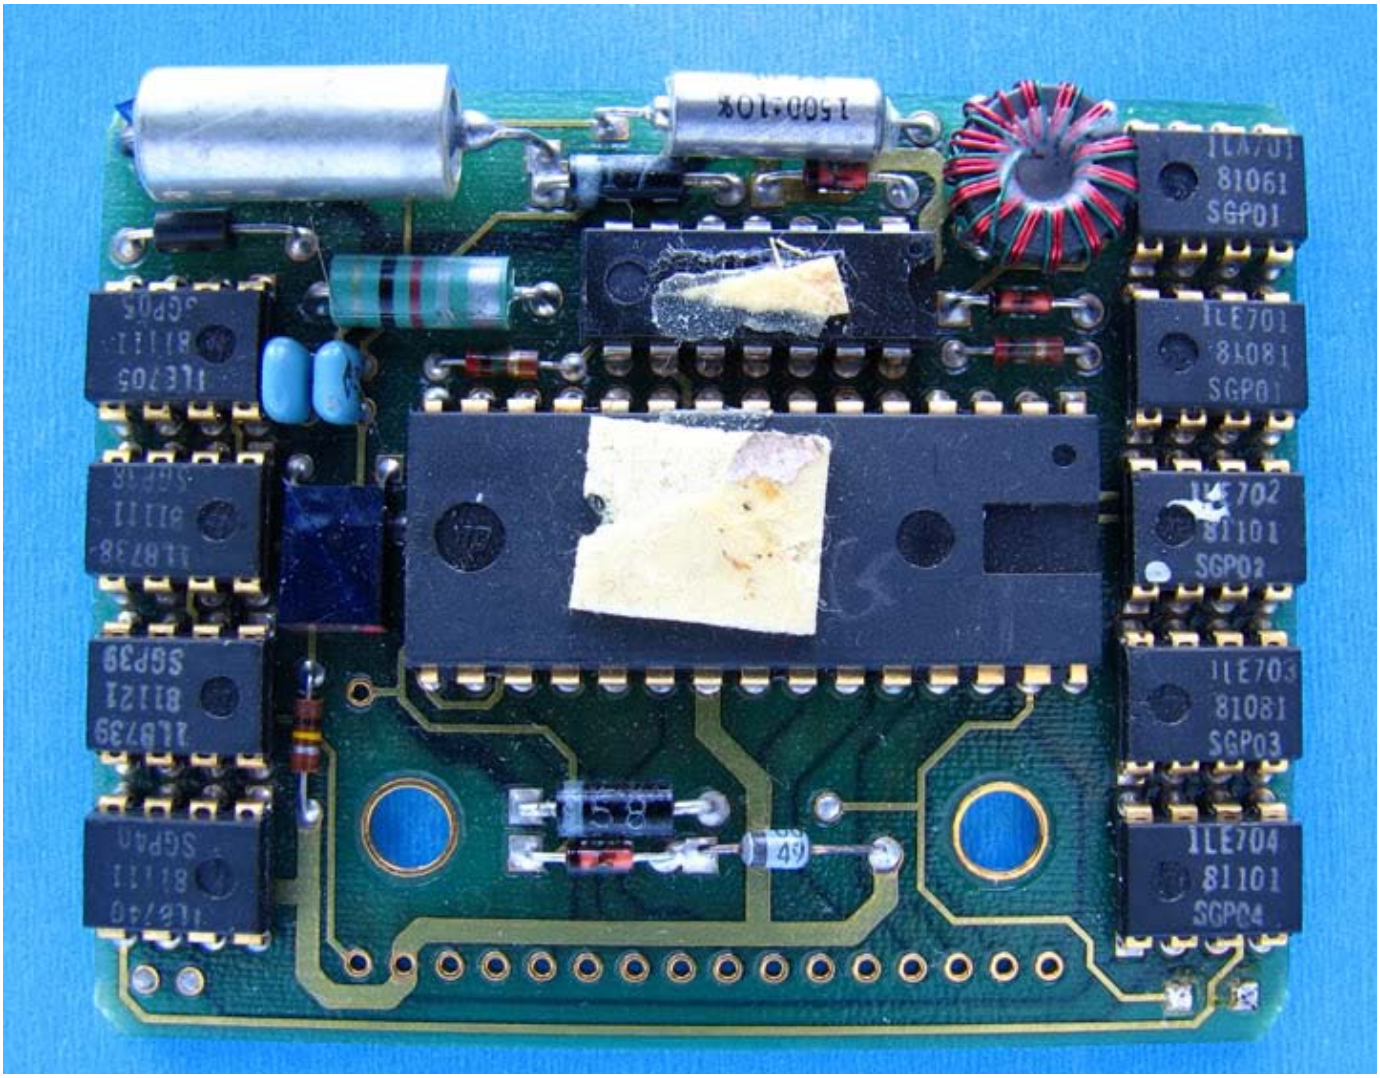
The "with all bugs, tall keys, contact balls" 1979 HP 41C with a bad D/S:



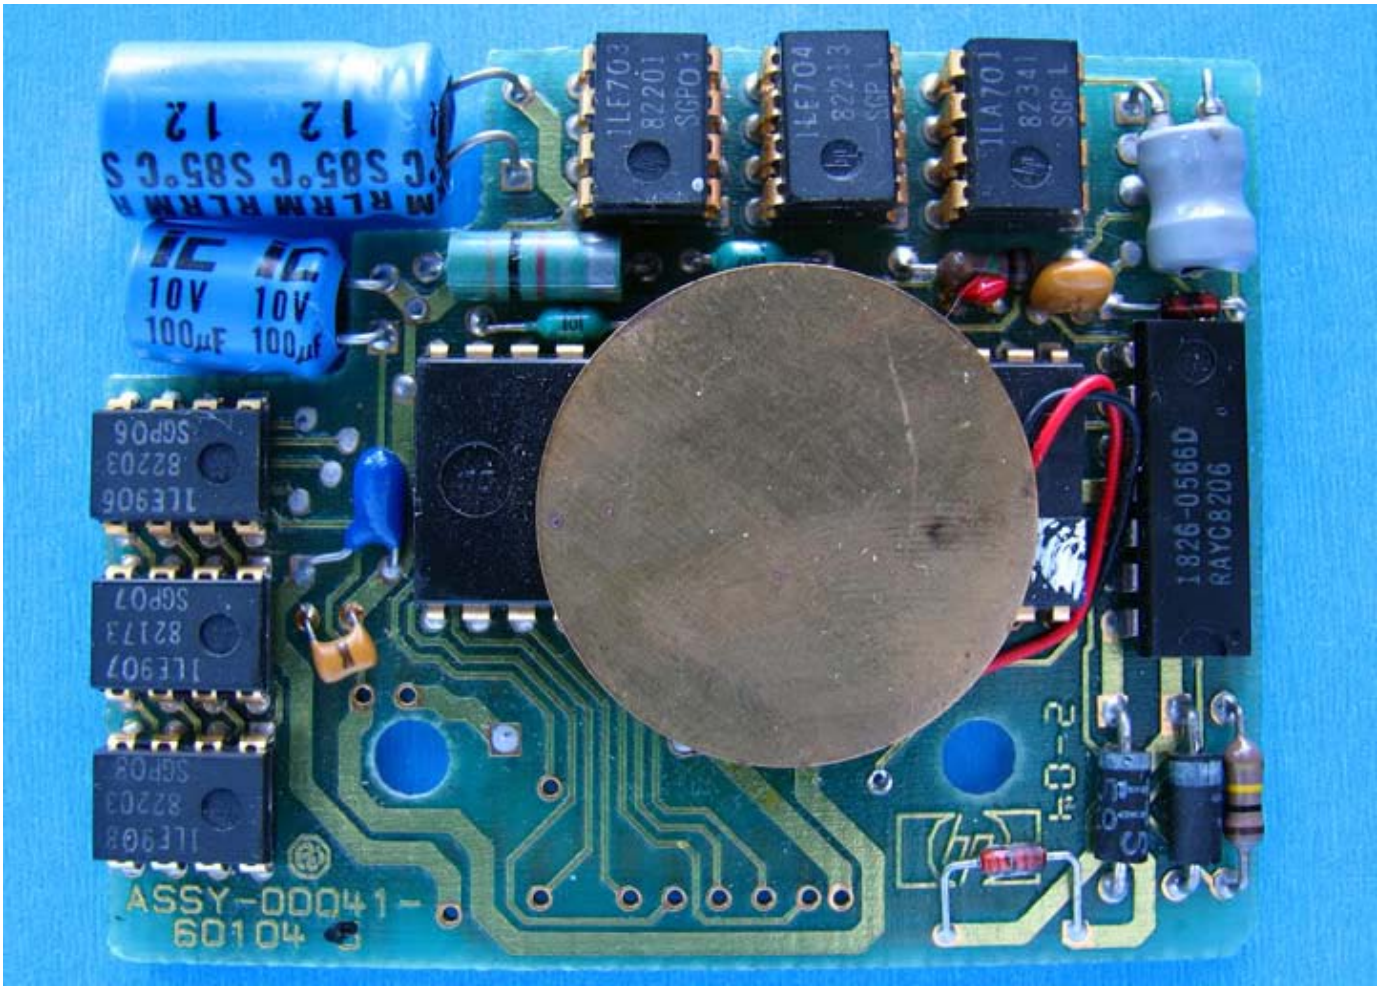
An HP 41C circa 1981:



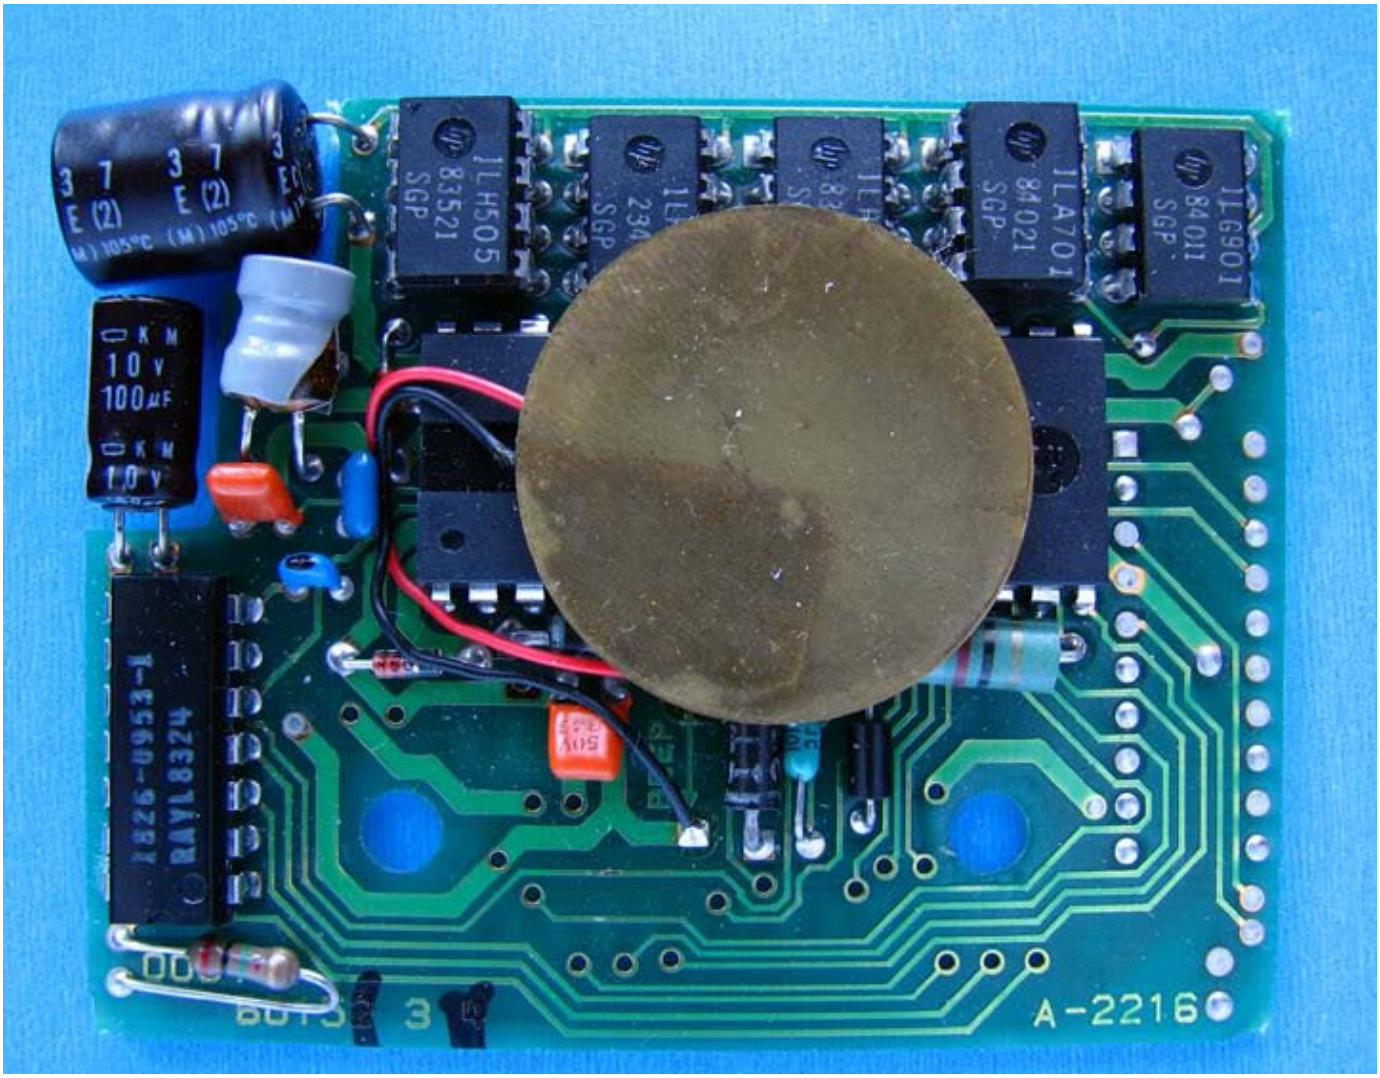
An HP 41CV circa 1981 no piggy backing:



A 1982 HP 41CV with all six D/S chips piggy backed located at the top:



A 1983 version with two piggy backed D/S chips:

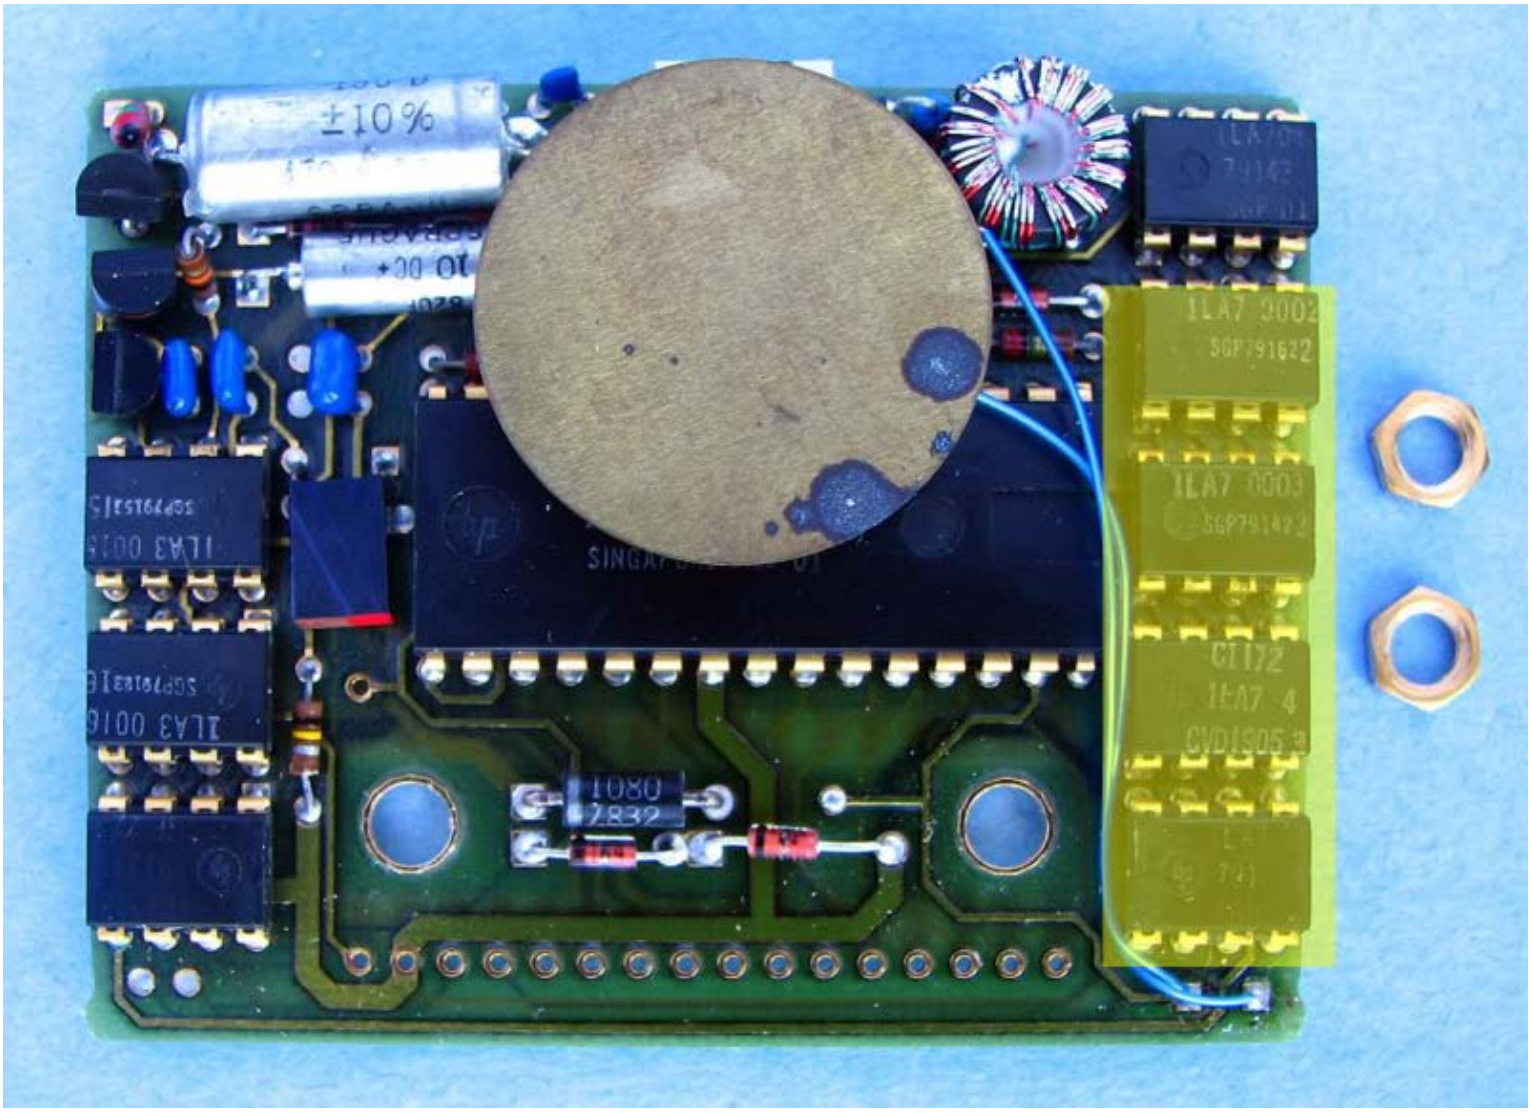


Now I know what piggy backing is (what a neophyte!)

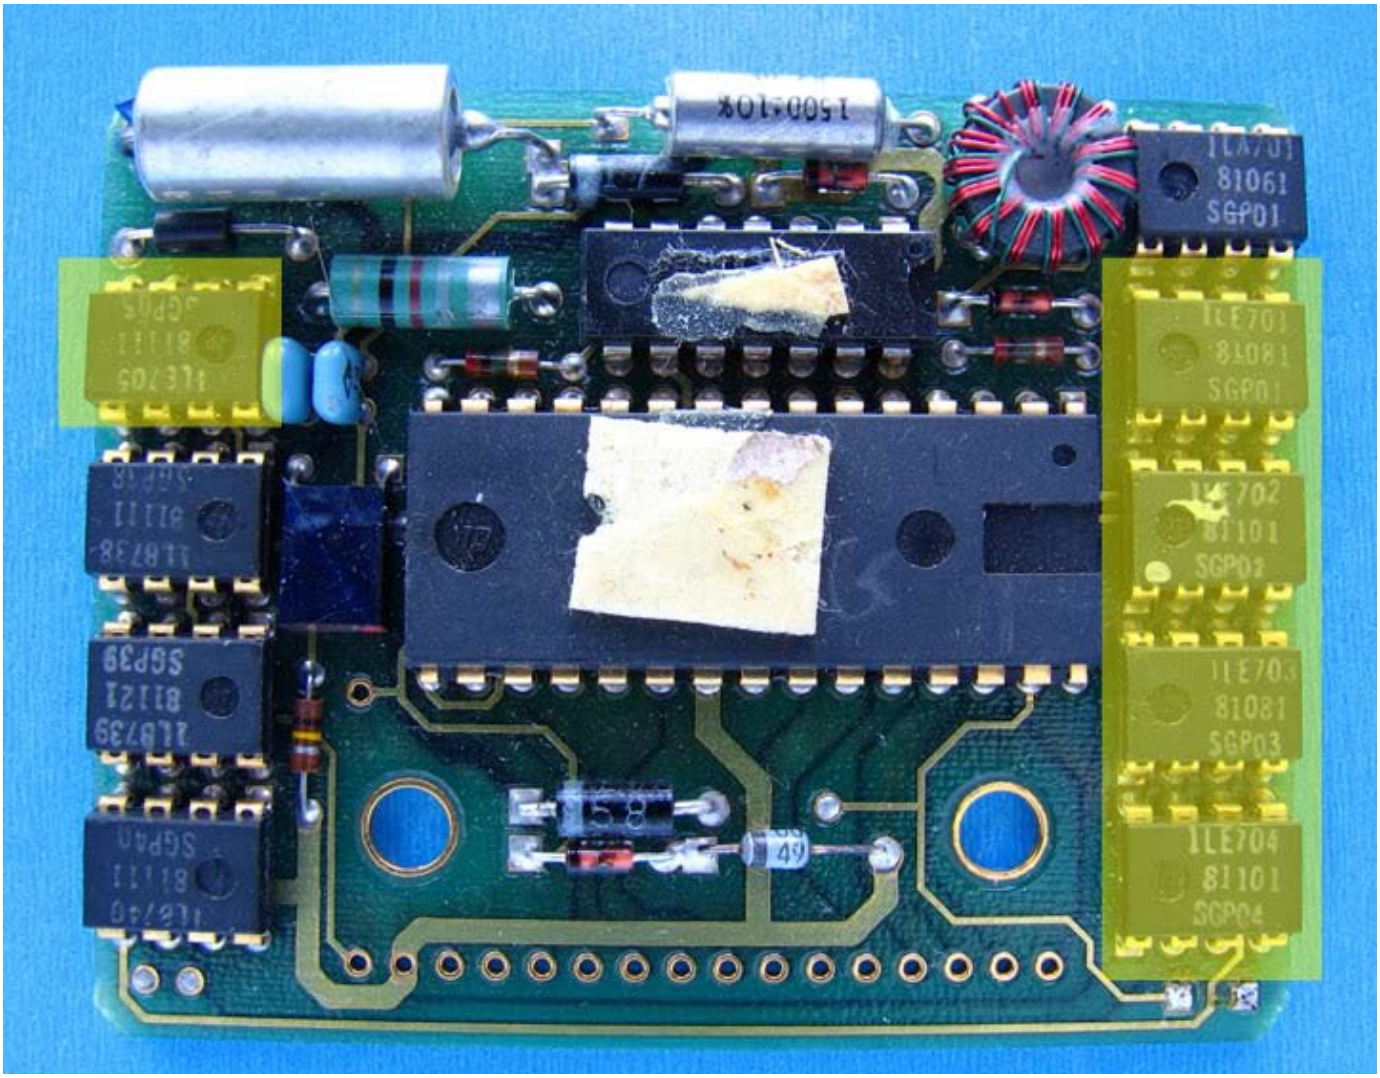
==========
==========

Here is the project:

remove the yellow highlighted D/S chips on this HP 41C:



remove the yellow highlighted D/S chips on this HP 41CV and install them on the HP 41C board above with one chip piggy backed near the top for case clearance (thanks Eric, Randy and Jim):



If you see any problems with this YELL as I won't be doing it today ;-)

Cheers, Geoff

Is peace of mind worth $150 ?

*Message #1 Posted by **Michael de Estrada** on 18 Mar 2010, 11:48 a.m.*

We've all heard the horror stories of Woodstocks being destroyed by the sketchy charging system. While it's questionable whether charging a good battery inside the calculator with the calculator turned off will result in eventual damage or failure, it is nerve-racking to contemplate ruining one of my good units given the near impossibility of replacement. As I've posted before, it seems to me that the Woodstock line is rapidly becoming the rarest of vintage calculators, since most have been ruined through neglect and misuse. I don't like to use disposable 1.5V AA alkaline batteries, due to the higher voltage, and only use 1.2V AA flat top NiCads. Since I weld a jumper between the two battery cells at the spring end to ensure good electrical continuity, charging the individual cells in an external charger is not an option. So I finally bit the bullet, and paid nearly $150 for a Woodstock external charger (powerpack), so that from now on a charger will never be attached to any of my Woodstocks. Am I being overly cautious and did I spend too much for my peace of mind?

Re: Is peace of mind worth $150 ?

*Message #2 Posted by **Håkan Thörngren** on 18 Mar 2010, 12:13 p.m.,*
in response to message #1 by Michael de Estrada

$150 is not much to pay for peace of mind. I would like to own a Woodstock also, as I have none.

I payed a hefty sum for a NOS HP-41CX to be used as a backup for the old (very nice condition) one I hardly dared to use. Then I could start to use it without worrying.

However, I soon started to think, what happens if it breaks? Then I only have the backup and would be afraid to use it. So I bit the bullet and bought a backup for the backup! Also a NOS HP-41CX for the same hefty sum.

Now I am not afraid that I will run out of HP-41 for the rest of my life. That is peace of mind for me and it was worth the hefty price tag (times two) that I paid!

Re: Is peace of mind worth $150 ?

*Message #3 Posted by **Ángel Martin** on 18 Mar 2010, 1:03 p.m.,*
in response to message #2 by Håkan Thörngren

I too have a triad of CX's... but more and more I use the virtual rendition (V41) and recently got myself an iPodTouch just because of i41CX - so the real machines are even better preserved ;)

Re: Is peace of mind worth $150 ?

*Message #4 Posted by **Alberto Fenini** on 18 Mar 2010, 12:19 p.m.,*
in response to message #1 by Michael de Estrada

Naaaa, I don't think you have spent too much, since I was the one bidding against you, I was ready to spend the same money... Congratulations ! BTW, I was just doing it because of the box, since I already have a working external charger for the woodstock... would you sell me just the box ? Take care Alberto

Re: Is peace of mind worth $150 ?

*Message #5 Posted by **Michael de Estrada** on 18 Mar 2010, 12:37 p.m.,*
in response to message #4 by Alberto Fenini

Alberto,

Check your email.

Regards, Michael

Re: Is peace of mind worth $150 ?

*Message #6 Posted by **Bill (Smithville, NJ)** on 18 Mar 2010, 1:06 p.m.,*
in response to message #1 by Michael de Estrada

Michael,

I ruined one HP-25 by charging in the unit. Then I spent about $150 to replace it with a HP-25C. With it I only use AA batteries, but would love to have an external charger for it. I gave the broken HP-25 to Randy so he could use the parts to save other woodstock. I almost wish I had hung onto it and turned it into an external charger.

My philosophy is "as long as the wife is okay" then I didn't spent too much ;)

Bill

Re: Is peace of mind worth $150 ?

*Message #7 Posted by **Michael de Estrada** on 18 Mar 2010, 1:23 p.m.,*
in response to message #6 by Bill (Smithville, NJ)

Actually, I've been using a duplicate HP-22 as a battery charger for my other Woodstocks, so at worst I was going to ruin that one. Still, I'd rather not ruin anything. All my Woodstocks are in perfect working condition, as well as excellent cosmetically, and I'd like to keep it that way.

Re: Is peace of mind worth $150 ?

*Message #8 Posted by **juan demin** on 24 Mar 2010, 9:43 p.m.,*
in response to message #7 by Michael de Estrada

I fully agree with you Michael... that's not a big sum of money to keep peace of mind... well done!!

Sick HP40G

*Message #1 Posted by **Nicholas Cole** on 18 Mar 2010, 3:08 a.m.*

I have a HP40G which is reluctant to turn on and off; if I use the solution suggested for sick HP42S, pressing on the keyboard just below the screen, it works, but I would like to open it up and substitute something for the foam which apparently doesn't fill its role and maintain a good contact.

The HP40G is a sort of clamshell design in 2 parts clipped or glued together, with no overlay for the keyboard, and no screws I can find anywhere. The solution must be to prise apart the two halves of the machine. I've tried, timidly, but I fear damage if I apply more force.

Has anybody done this, or have ideas on how to do it ? Any hidden claws, anything that slides ? Thanks in advance, Nicholas

Thoughts on HP 30b

*Message #1 Posted by **Eddie W. Shore** on 18 Mar 2010, 12:02 a.m.*

Having just got it from HP on 3/16:

* This is a nice, lightweight calculator. I so far do not have any keyboard issues. The keys feel better on the 30b than on the 20b.

* The calculator comes with a cover pouch, which I have to say it is better than the pouch for the 17bII+. I cannot accidently turn the 30b on while it is in its pouch. Plus the 30b contains declining depreciation w/crossover, inverse and quadratic regressions, and trigonmetric functions.

* Programming is similar to the HP 12c, with every number being literally being a step. For example, entering 12000 in a program takes five steps. The comparison mechanisms are nice too (test operators work similar to HP50g).

* While there are only 290 steps, one could fit some nice programs, after all most HP 12c owners have been working with only 99 steps since 1982.

* Like the 20b, the 30b is super fast.

* Ther learning manuals on HP's web site are well written. I only wish that they put more concrete examples in the getting started guide.

* The truly annoying thing about programming in the 30b is that if you have to access something in the Math menu, you will use a lot of steps to get there.

Sample Program: Blueprint for the Sum Function - RPN Mode M2 Sigma f(M0) M0 = M1

store values in M1 (beginning) and M2 (end) before excuting the program (4 in this example)

0

STO 3

EEX

*Message #2 Posted by **Tim Wessman** on 18 Mar 2010, 12:41 p.m.,*
in response to message #1 by Eddie W. Shore

Have you had a chance to try the solver yet?

TW

Re: Thoughts on HP 30b

*Message #3 Posted by **Eddie W. Shore** on 18 Mar 2010, 4:35 p.m.,*
in response to message #2 by Tim Wessman

Yes. The solver is like the Sovler on the 15c. The equation is entered as a program. Then Sovler is activated in calculator mode.

Re: Thoughts on HP 30b

*Message #4 Posted by **Gerardo Rincon** on 18 Mar 2010, 7:16 p.m.,*
in response to message #3 by Eddie W. Shore

The one thing I really don't like about the 20b and 30b is the number of steps it takes to execute some simple functions thru the MENU. For example a simple % change in the 12C (and most hp calcs) it takes 4 steps: type number, <ENTER>, second number, <%change> and you have the answer.

To do the same operation with the 20b and 30b it takes 5 key press to get to the <% change function> and then 8 additional steps to do the actual % change calculation ==> 5 + 8 = 13 steps. It is a very inneficient way to perfom this operation.

What used to be done in 4 stpes, it takes 13 steps now.... I know the benefit of the menus is to add more function capabilities, but a second color function (let's say an orange)would have provided more of the common functions without having to go through the complicated menus.

Re: Thoughts on HP 30b

*Message #5 Posted by **Tim Wessman** on 18 Mar 2010, 8:53 p.m.,*
in response to message #4 by Gerardo Rincon

And on the 17bII? (just wondering as I am not familiar at all with those units)

Unfortunately, the 20/30 do so much you couldn't fit it on the keyboard even if you tried. You'd end up with a lot of keys that would activate menus, but you'd still have menu operations.

TW

Edited: 18 Mar 2010, 9:00 p.m.

Re: Thoughts on HP 30b

*Message #6 Posted by **Sancerre (Phoenix)** on 18 Mar 2010, 10:34 p.m.,*
in response to message #5 by Tim Wessman

It is isolated as an example, but the 17Bii uses a menu (under Business) for % change. Once you go to the menu, you enter the before number, then the after number, and click on the soft menu for % change). Basically, it functions as though you had coded up a solver equation.

--Sancerre

Re: Thoughts on HP 30b

*Message #7 Posted by **Gene Wright** on 18 Mar 2010, 11:12 p.m.,*
in response to message #6 by Sancerre (Phoenix)

That's part of the design approach chosen. Has pros and cons.

Good news is that you can easily write a program that does the functions you use often and assign them to the keyboard so you don't spend time finding them in menus.

My 30b has several small programs loaded for the inverse trig functions. These are "assigned" to the shift-hold locations of the regular trig functions. Very nice.

I've also assigned the normal distribution and inverse normal distribution functions in a similar way.

If you keep in mind that the programming approach is **really** much more a macro ability than a programming environment, then the keystrokes in a program required to access functions in menus makes sense.

That said, some VERY good programs, some very good FAST programs can be written on this little machine.

And, financial functions never before found on a business calculator too, such as FMRR.

I think this may grow on you. I for one don't pick up my 12c nearly as often as I used to...and I've used that 12c for 25 years.

Re: Thoughts on HP 30b

*Message #8 Posted by **David Hayden** on 19 Mar 2010, 8:13 a.m.,*
in response to message #5 by Tim Wessman

Overlays overlays overlays. I really believe that this problem and all sorts of others could be avoided by providing a user-assignable keyboard and keyboard overlays. 99% of the "my favorite function is buried in the menus" complaints would go away.

I know that some (most? all??) of the calculators allow user-assignable keys already, but with no convenient way to tell what function has been assigned to a key, this extremely useful feature is effectively crippled, IMHO.

Dave

Re: Thoughts on HP 30b

*Message #9 Posted by **Don Shepherd** on 19 Mar 2010, 9:06 a.m.,*
in response to message #8 by David Hayden

It would have been nice if the 30b package contained an overlay that you could write on. The overlay that is included is very good, but it shows only the programming commands, which is necessary for program development, obviously, but not useful to the end-user. Perhaps someone will offer for sale a good quality overlay (like the enclosed one) that you can write on (or computer print on).

Re: Thoughts on HP 30b

*Message #10 Posted by **Egan Ford** on 19 Mar 2010, 11:02 a.m.,*
in response to message #8 by David Hayden

> Quote:
>
> but with no convenient way to tell what function has been assigned to a key, this extremely useful feature is effectively crippled, IMHO.

On the 41 you press and hold. The function will be displayed, and if you keep holding 'NULL' will be printed indicating no action taken. I think its a perfect solution and it works with user defined keys as well, i.e. it prints what you defined, not the base function of the key.

Re: Thoughts on HP 30b

*Message #11 Posted by **Bruce Bergman** on 19 Mar 2010, 11:26 a.m.,*
in response to message #8 by David Hayden

On the 30b, you can achieve this by creating up to 10 user-defined keys. Just create a program with the functionality you want (even as simple as just one keystroke) and then assign it to another key on the keyboard. Shifted or unshifted.

In the program catalog, you can also see which key it is assigned to, or review all user-assigned keys on the calculator.

thanks,

bruce

*Message #12 Posted by **Don Shepherd** on 19 Mar 2010, 12:45 p.m.,*
in response to message #11 by Bruce Bergman

Neither pressing and holding the key (a la 41) nor bringing up the program catalog, as Bruce suggested, is the ideal solution to this problem; both require work a user shouldn't have to do to run a custom program assigned to a key. Anyone who wants to use the 30b as a platform for users (or anyone, really) to run custom-coded solutions really needs a custom overlay.

I believe that HP should step up here and offer some such service. The 30b will never reach its fullest potential without this capability.

Of course, the "best" solution would be programmable keytops!

Re: Thoughts on HP 30b

*Message #13 Posted by **David Hayden** on 19 Mar 2010, 8:37 p.m.,*
in response to message #12 by Don Shepherd

I agree with Don that keys with programmable key top displays would be ideal, but I don't think the technology exists today, and if it does I have to believe that it isn't cost effective.

I agree with Egan that the 41's solution was wonderful and it's practical. Holding the key down showed you what function it performed. In addition, the calculator came with overlays that had the normal functions printed on them, along with a set of small stickers that could be placed on the overlay to indicate new functions. Some of the stickers had existing functions pre-printed on them and others were blank, so if you reassign existing functions or assign keys to execute new programs. You put the stickers on an overlay where the reassigned keys are, slap it on on the calculator and all the keys would be labeled. Indeed, this is how my calculator went through life for about 20 years.

I don't know how hard it would be to display the function of a key on a 50g, but it might not be trivial. At the very least, it means that a key's function isn't executed when the key is pressed, but when it is released.

But overlays seem pretty easy to me. All it requires is a small lip around the top of the keyboard and a spring latch to hold the overlay in place. It looks like the keyboards for many calcs in the current lineup are the same shape, so one size would fit all, so to speak.

There's an alternative that would work well with the existing calculators if someone has time on their hands to do it. Craft stores sell programmable paper cutters. One could probably be programmed to cut out an overlay. Now if the paper is really a big peel-off label with post-it adhesive, you've got an overlay that you can firmly attach to the calc. Add a word-processor template that lets you print the key labels on the sheet before you feed it into the cutter and you have your overlays.

Dave

Actually, on the 30b, you don't need any spring latch. The overlay for the programming commands, which is included with the calculator, is clear plastic with the Shift+hold programming functions listed in black type, and it just clings to the surface of the calculator very well. It is great because it does not peel off when you don't want it to, but you can remove it easily if you do want to do that.

I'd say the ideal solution is this exact type of overlay that can be printed on by your PC printer and it covers the entire keyboard (as opposed to only the top 4 rows). If HP would furnish that as an accessory, at a reasonable cost, that would make this calculator truly revolutionary.

Maybe this is a good time to ask a simple question about the 30b. Does the 30b have degree-minute-second math functions? On the 41/42, those would be HMS+, HMS-, HR, and HMS. I'm just trying to figure if I could reassign keys and make this a useful calculator for me.

No.

Re: Thoughts on HP 30b

*Message #18 Posted by **Bruce Bergman** on 19 Mar 2010, 9:31 p.m.,*
in response to message #16 by Forrest Switzer

No, but you could write four little programs to do that, and then assign each of those to a key. Then you have what you want!

Thanks,

Bruce

Re: Thoughts on HP 30b

*Message #19 Posted by **Forrest Switzer** on 20 Mar 2010, 2:30 a.m.,*
in response to message #18 by Bruce Bergman

I know. Just a matter of IP, addition, subtraction, and division and multiplication by 60. But, it seems that the only things of interest to me on the 30b calculator are the speed and trig functions. I have some backup 42's. It is just such a PITA if I have to re-enter those programs on the 42. I guess once every three or four years shouldn't be a concern. I have a a number of calcs at work, but when I really need to do something it is always the 42 that gets picked up. Contrary to popular belief, I think the display is perfect for what it does (annotations and numbers on two lines).

I'll wait until they come out with the 30s or 45s. None of the other recent calcs (since the 42) have been better for my needs.

thanks

in response to message #5 by Tim Wessman

My observations on the 30B are that whilst it adds a lot of great functions over the 12C, the 12C is still preferable as a daily calculator, mainly because its extra shifted functions make it faster to use.

Going through menus for regularly used functions is a huge disadvantage when the speed of a calculation is critical, as it is when used in a financial markets environment.

Disadvantages of 30B over 12C: - Lack of 12x and 12/ for time value functions, since these are often used. - Having y^x and 1/x as shifted functions is a problem as these are often used in rate calculations. - STO is a shifted function - again, this adds time to complex calculations.

Re: Thoughts on HP 30b

*Message #23 Posted by **Eddie W. Shore** on 20 Mar 2010, 8:11 p.m.,*
in response to message #22 by bink

All that is needed is to set 12 as P/Y, then SHIFT N acts as 12x. The interest key is for annual interest, not periodical interest.

Re: Thoughts on HP 30b

*Message #24 Posted by **Don Shepherd** on 20 Mar 2010, 8:20 p.m.,*
in response to message #22 by bink

To be fair, the 12* and 12/ aren't needed on the 30b because you can set p/yr to whatever you want. And I would think that financial people would not use y^x and 1/x and STO often enough that the shift on the 30b for these would be a problem.

I know most users of the 12c don't write and run programs, but from a programming perspective there is no comparison between the 12c and 30b, the 30b wins hands-down.

I have both, and I like both. But if I'm going to write a program (which is all I generally do with these), I'll do it on the 30b.

Re: Thoughts on HP 30b

*Message #25 Posted by **bink** on 21 Mar 2010, 6:20 a.m.,*
in response to message #24 by Don Shepherd

Don,

y^x and 1/x are used a lot in doing interest rate conversions. Similarly, STO is also used a lot for storing several constants (in different registers) and also intermediate results. Also, setting 12 as the number of periods (if I understand correctly) is something that would have to be changed frequently as you alternate between annual compounding and monthly compounding calculations.

Eddie,

Cashflow calculations can be done for different periods, such as monthly when calculating swap rates and valuations. The annual convention is arbitrary, and irrelevant for some calculations, so I think in terms of compounding periods rather than years or months.

An example of the 12C 12/ function use is when an NPV is being calculated and the rate is quoted as an annual equivalent on a monthly compounding basis. Having the 12/ function makes it easy to throw in 12 g i (4 keystrokes) instead of 12 ENTER 12/.

Bruce,

I know the 30B has a faster processor, and I will try it at some point, but I doubt that it will be faster than the 12C at everyday financial market calculations.

Compare the way the 12C and 30B are laid out - the 12C is really laid out in a more organized way. I don't think that serious financial number crunchers were consulted in the design of the 30B. Having the y^x and 1/x keys near the Time Value of Money section is very useful.

As a related aside, I had a conversation with someone at HP a few years ago and mentioned that a limitation of the 12C was that it needed a greater number of digits in the display, and gave the example of calculating swap values, but they seemed unaware of this application (which leads me to believe they didn't consult professional users). Maybe it is more accurate to say that HP DID consult professional users in designing the 12C, but this part of HP's organizational memory has been lost.

In addition to the TVM, the y^x, 1/x, STO and RCL keys are probably the most often used keys in doing everyday rate, cashflow and bond related calculations (i.e. bonds, swaps, futures).

I don't know of any common finance applications that rely on trig functions - I would have thought that that should have been relegated to a menu, rather than on the main keyboard.

FWIW, I have used the 12C for 20+ years (after using a 41C), and have tried various other HP models, but none so far beats the 12C for financial markets usage.

Tim or Katie can probably comment on the relative speed of calculations between the 30b and 12c, but I would also be interested in hearing that answer.

Remember, if you don't like the keyboard layout of the 30b, you can reassign up to 10 keys. This way you could move y^x, 1/x up where you want them, and you could even flip the behavior of STO and RCL (RCL being shifted, or put on another key, and STO being the default action of that key).

Each key has three possibilities: keypress, shift-keypress and shift-hold-keypress.

All that being said, if you're really that attached to the 12c, I would agree with Don that you probably won't like any other calculator for your daily use.

Thanks,

Bruce

Hello,

> Quote:
>
> y^x and 1/x are used a lot in doing interest rate conversions. Similarly, STO is also used a lot for storing several constants (in different registers) and also intermediate results.

But the 30b has an interest conversion function (IConv), so you don't real need ^ and inv. I agree that STO is important, unfortunately, we ran out of keys. RCL was put as primary because you normally do multiple RCL per STO.

> Quote:
>
> setting 12 as the number of periods is something that would change frequently as you alternate between annual compounding and monthly compounding calculations.

if you alternate between 1 period per year and 12 periods per year, yes, you will have to change it often. not that it is slow. 1 shift P/YR is only 3 keys...

> Quote:
>
> Cashflow calculations can be done for different periods,

cash flow calculations are done in the CF menu and it has it's own p/yr setting, so

this would not affect the p/yr used for TVM calculations. Basicaly, on the 30 (and every other modern finance calculator), Interest rates are ALWAYS on a yearly basis with a given compounding. Since these calculators do not overload keys by having them being used for various semi-related thing for various function, it means that you can have simultaneous TVM calculations with 12 p/yr and TVM calculations with p/yr=1 going on at the same time.

> Quote:
>
> I doubt that it will be faster than the 12C at everyday financial market calculations.

If you are a power user of the 12c, you are probably right. and the main reason is that the 12c has 1 function per key, threfore resulting in faster user input. However, if you are NOT a power user and do not remember exactly which registers the bond values have to be placed on an what arguments are needed for the BOND price function and what the result means, then the 30b is much better. Also, realize that the 30b has at least 2 to 3 times more functions than the 12c. So, a 30b with one function per key would require close to 80 additional keys compared with the 12c.

If you do cash flow calculations, you should realy have a look at the 30b as it makes working with cash flow a whole lot easier thanks to the nice CF editor.

> Quote:
>
> I don't know of any common finance applications that rely on trig functions - I would have thought that that should have been relegated to a menu, rather than on the main keyboard.

This is mostly done because finance student more often than none have to take some math and need the trig functions. This has beed a magor hurtle for the 10b and therefore had to be added proeminently on the 20/30b.

regards, cyrille

Re: Thoughts on HP 30b compared to the 12c...

*Message #29 Posted by **Gene Wright** on 22 Mar 2010, 12:52 p.m.,*
in response to message #25 by bink

Hi bink. I am a longtime user of the 12c as well as a former university instructor who taught business math to freshmen and sophomores for nearly 20 years. Let me comment on some of your observations.

1) y^x and 1/x. The only real way these could have been better positioned for what you want is to have made them primary keys on the 20/30b. However, the primary keys are already used/taken for other functions / menus, such as the IRR / NPV menus and the cash flow environment, etc. Given that they were going to be shifted functions on account of this, the finger travel distance is essentially the same where they are located on the 20b/30b and where they would have been had they been located near the top of the calculator.

2) P/YR vs. periodic compounding. This is essentially a wash, as I have become convinced over a number of years. On the 20b/30b (and it must be said, the 10b2, TI

BAII Plus, TI BAII Plus professional, the casio financials, the sharp financials and every other (?) financial calculator presently sold other than the 12c), you must type 12 shift P/YR or 1 shift P/YR or 4 shift P/YR when you want to change the payment frequency. This is **offset** by the requirement on the 12c to divide the nominal interest rate by the under of periods in order to enter a periodic interest rate. Having taught classrooms of students using BOTH types of machines for 20 years, there is no speed difference between the methods that I have ever been able to ascertain. It is a matter of taste and what you are accustomed to.

3) STO as a shifted function. While Tim and Cyrille are correct ... that you tend to store a number/value less often than you recall the value, I too would like to see a primary store key. In practicality, I don't see this as a make/break compromise.

4) Cash flow compounding periods. Given that the 20b/30b are MENU oriented calculators, this is affected by setting a #CF/yr value at the bottom of the cash flow environment. Set it once if you don't need to change it very often and you are good to go. If you need to change it all the time, this might be less convenient.

5) Speed. The new 12c+ is certainly about as fast as the 20b/30b at many financial calculations, certainly. The older 12c seems painfully slow now at some functions, however. Compared to the older 12c, the 30b can be 10-20 times faster. Calculations are simply instantaneous in almost all circumstances.

6) Interest rate conversions. These seem to be the primary reasons the location of the 1/x and y^x key placement seems to be very important to you. However, once you have used the interest rate conversion environment found in IConv, you will be slower at converting interest rates using 1/x and y^x.

7) Professional user involvement. Suffice it to say that there were professional users involved and feedback was very positive.

Bottom line (ha).

For someone used to the 12c, great... buy a brand new 12c+ that runs much faster and continue to enjoy the HP way.

However, the 20b/30b offers much that the 12c does not. You may have no use for these, but they are certainly wonderful to have available if you ever find a need for them.

Advantages of the 20b/30b over the 12c...

1) Customizable keyboard. Bring ANY function out from a menu and assign it to a primary, shifted, or shift-hold key position. Write a program to do any calculation you want, including 12 / and assign it to any key position...such as the shift I/YR position. Now you have the 12 / function from the 12c on the 30b. You can do this for 10 key positions if you wish.

2) Trigonometry, inverse trignometry, hyperbolic trigonometry and inverse hyperbolic trigonometry. Hey, not everyone needs these, but even a financial analyst might want to know how tall a telephone pole is given the length of its shadow and the angle to the sun.

3) Probability distributions. Normal distribution and inverse normal. Students t distribution and inverse. F Distribution and inverse. Chi-square distribution and

inverse. And depending on the rom revision, the binomial distribution. No substitute for having these built in when you might need them.

4) Much more advanced statistics. Built-in population standard deviation of X and Y. No more computing the mean and doing Sigma+ to fake this. Covariance. Nice financial computation built-in. Standard error of the X and Y means. Very handy for hypothesis testing or confidence intervals. Built-in permutation and combination calculations. SEVEN regression models including Best fit. Just no comparison here. If you don't use statistics, these don't mean much to you. Sure.

5) Increased financial functionality. 30b has MIRR built-in. !2c requires a program or a move to Excel. 30b has FMRR (financial management rate of return) as an alternative to MIRR. For NPV calculations, there is also Net FV, Net Uniform Series, Payback, discounted payback, and a total cash flow summation. The 12c does not directly offer ANY of that.

6) Bond calculations. The 30b offers two bond duration calculations. 20b/30b directly compute yield to call as well as yield to maturity.

7) Breakeven. 20b/30b have this built in. 12c does not.

8) Black Scholes Option pricing. Built in. 12c requires a wonderful program written by Tony Hutchins.

9) Programmability. The 12c can be programmed. Sure. The 30b has more program space and is MUCH faster. It also allows for up to 10 separate programs. Has subroutine abilities, text messaging abilities, etc. 12c looks old by comparison.

So...

Don't get me wrong. I was raised on the 12c. I still THINK like the 12c works. But, the 30b is well worth a look by anyone who has used a 12c. The VERY few changes required to use the 30b (which works like all other financial calculators in existence today) are well rewarded by a host of improvements and things you just cannot do with a 12c. Part of me is pained to write that sentence, but I believe it to be true.

My 2 cents...and that's a distinct present value.

*Message #31 Posted by **Gene Wright** on 22 Mar 2010, 6:04 p.m.,*
in response to message #30 by Sancerre (Phoenix)

Agree about the solver.

I was thinking of it with regard to programming, since you write a program to evaluate the function so that it is equal to zero.

But, you are correct. The ability to have a program that evaluates:

A - B / C + D*E = 0

and to easily store values into A, B, C, D or E and solve for the unknown is very nice.

The learning module on using the HP Solve in RPN mode contains an entire solver program that handles loans with odd days first periods. 2 odd days, 34 odd days, etc. You can even SOLVE for the odd days if you know the other pieces.

Rather difficult to do on the 12c, certainly with only one program...and especially since the 30b program is simply written as the formula set to equal zero. And, again, I say things like that about my old friend the 12c with a twinge of pain.

Gene

30b manuals online? (was Re: Thoughts on HP 30b compared to the 12c...)

*Message #32 Posted by **Bart (UK)** on 25 Mar 2010, 6:05 a.m.,*
in response to message #31 by Gene Wright

Is there a manual available? I can't seem to find any on the HP site. I know there are modules, but in this electronically connected age, manuals are usually available online and I like to look through them before deciding to buy (or not).

The 30b seems like a nice almost-do-everything calculator (financial with a good bit of maths & stats), I'm just dissapointed by the lack of programming space. Probably because initial information said it would have 32k. But I guesss they wanted more reasons to place it below the 17bii+. However, a bit more e.g. 4k would have been nice.

Re: 30b manuals online? (was Re: Thoughts on HP 30b compared to the 12c...)

*Message #33 Posted by **Don Shepherd** on 25 Mar 2010, 8:07 a.m.,*

The CPU has 2048 bytes of non-volatile RAM. The low level drivers don't use any of this (at least they don't on the 20b and I suspect they are identical in this respect).

So 1758 bytes are being used for other purposes (and probably a bit spare for bug fixing etc). I smell a lot of waste here :)

There is another 4096 bytes of volatile RAM which is powered down most of the time.

Yes, external storage could be added for additional cost.

I'd personally prefer some kind of SD or USB host capability. There is no reason user code couldn't be run from such.

Just to clarify, with "external" I meant "not part of the processor" but still on the PCB, not external to or removable from the calculator (although that would be nice). Maybe HP were afraid of the complaints again "what's the use use of having all that memory without ways to backup and restore it". They could see it coming: add memory, add I/O. Price, positioning (again I make my point - relative to the 17Bii+) all had their influence I suppose. (Like the 42s was a crippled upgrade to the 41, but I digress).

From what information I've gathered, it seems a very nice calculator for the price. (but I would have been happy with just that bit more memory*, even without I/O capability).

* But as any programmer will tell you "how much memory is enough? just that little bit more ;)

I don't know what is stored where, but there are a lot of financial variables that are kept by the continuous memory (think things like PV, N, etc and cash flows and statistics data and ...) all of which has to be stored too.

Re: 30b manuals online? (was Re: Thoughts on HP 30b compared to the 12c...)

*Message #39 Posted by **Tim Wessman** on 25 Mar 2010, 7:59 p.m.,*
in response to message #34 by Paul Dale

A lot of waste? There isn't a spare byte of space left in there. 290 bytes is all that is left for user program space.

You have to store all of the various menu items, saved data, settings and so on. Remember the calculator is essentially turned off all the time. It has to be able to retain all of those items in saved memory or they disappear when you release the key.

There are approximately 200, 12 digit+3exponent numbers that need to be maintained, plus space for the lower and upper lines of text. . .

> There are approximately 200, 12 digit+3exponent numbers that need to be maintained, plus space for the lower and upper lines of text. . .

Financial registers -- a complete waste ;-) For the sarcasm impaired both this and my original comment have a degree of jest present. Opps, that was sarcasm too: damn an infinite loop.

Given that the bulk of the non-volatile RAM is used for these numbers, how much space is left? 12 digits + 3 exponent digits + 2 sign bits can be packed into seven bytes without any difficulty: three digits per ten bits plus two sign bits is 52 bits leaving 4 unused bits. 200*7 = 1400, leaving 600 bytes for other stuff. System state and the lines of text (the lower line isn't really text but we will ignore that) will consume some of this but over half seems very high.

However, using 8 bytes per register and doing a dumb BCD encoding leaves about 400 bytes minus the 290 for programming and we're down to a size I can believe for the other overheads (although it still seems a bit on the high side). However this *is* wasting precious memory.

Memory is very short on this CPU and the CPU is very fast. Trading CPU cycles for memory is beneficial here: store the numbers space efficiently and convert them to/from an unpacked format for calculations.

Yeah, I know existing code, time to market, etc will stop this form being a possibility...

- Pauli

Re: 30b manuals online? (was Re: Thoughts on HP 30b compared to the 12c...)

*Message #41 Posted by **Marcus von Cube, Germany** on 26 Mar 2010, 4:16 a.m.,*
in response to message #40 by Paul Dale

Another idea would be t have a curtain between the numbers and program space which moves automatically. So you have probably less room for cashflow data if you have stored a bigger program but who cares?

Having lot of UP/DOWN steps in a program isn't very memory efficient either. Why not code each function as such? That would make reading programs easier, too.

Spending a lot of CPU cycles for routine tasks my drain the batteries faster.

*Message #42 Posted by **Katie Wasserman** on 26 Mar 2010, 10:45 a.m.,*
in response to message #41 by Marcus von Cube, Germany

I agree, the 30b should have dynamic memory allocation. The 290 steps are not "fully merged", so sequences like "STO + 2" take up 3 bytes of RAM. After writing a good number of programs for the 30b I've concluded that the program memory is effectively not much more than the 99 steps of the 12C. OTOH, having an array of 100 bytes that's always available is awfully nice even if the programs that use that array tend to be quite long.

-Katie

> Quote:
>
> A lot of waste? There isn't a spare byte of space left in there. 290 bytes is all that is left for user program space.

Although I completely understand the hardware and cost limitations here, it's still very unfortunate that in 2010, when memory costs something like 10 one-millions of a penny per byte, that a calculator has only 290 bytes of memory available for programming. I'd actually view this as a marketing snafu. A consumer who reads the specs carefully is likely to think "290 BYTES of memory? Didn't they have more than that on the HP 41C 30 years ago?" A consumer would wonder why HP didn't raise the cost by a penny and put in a hundred K of memory. Maybe another processor with more embedded NVRAM will come available.

Still, I'm very encouraged by the 30b, mostly because it seems to imply a push towards native ARM code!!

*Message #44 Posted by **Gene Wright** on 25 Mar 2010, 8:30 a.m.,*
in response to message #32 by Bart (UK)

Think of the 30b this way...

1) A nice, inexpensive "do everything" calculator. Well, almost everything.

2) Programmable enough for one or two big programs (prime factor, base conversion and lunar lander all fit at once) or use the program space to reassign up to 10 keyboard locations with frequently used functions.

3) Programming is more like a macro recording language than we've seen before. Keep that in mind and you won't get all worked up over UP and DOWN showing as program steps to access menu items.

4) An advanced financial model containing functions never before found on any financial calculator.

5) An advanced statistics calculator too.

I will be curious what the community at large think of it. I know Don and I like it. :-)

in response to message #44 by Gene Wright

I have received a copy of the manual. It certainly has some handy functions, including ones that the 35s hasn't got (apart from financial that is). I will try and plan some programs and see what I can can fit in once I get one (if and when it finally lands in the UK).

30b learning modules and example programs

*Message #46 Posted by **Gene Wright** on 25 Mar 2010, 7:48 p.m.,*
in response to message #45 by Bart (UK)

The 30b learning modules have quite a few programming examples in them too.

Examples

```
Example 1: Calculating digits of PI
Example 2: Finding prime factors of an integer
Example 3: Base conversions for bases 2-10
Example 4: Lunar lander game from the 1975 HP 25
Applications Program book
Example 5: Guess the secret number game
```

and here:

HP Solve examples

Example 5: Generalized odd-days loan solver program

All the 30b learning modules can be found here:

30b learning modules

in response to message #32 by Bart (UK)

I too would prefer more programming space, but -- honestly -- once you start playing around with it, you'd be surprised at just how much you can fit in there. And how much more effort you put into thinking them through and making them smaller. It's actually rewarding!

Give it some time. My bet is that as you write your first dozen programs, you'll find that there's more space than you imagined.

thanks,

Bruce

Re: Thoughts on HP 30b compared to the 12c...

*Message #48 Posted by **Joe Burwell** on 23 Mar 2010, 6:25 p.m.,*

in response to message #29 by Gene Wright

Enjoyed reading your comments on the calculators, I liked all the information. I am a Financial Planner and very much prefer the HP 12C but that was not always the case.

When I first started as a planner I would use a different financial calculator every day. I used the; Sharp EL-738, TI BA II, HP 10B, etc. Both older models purchased on e-bay and new models. I did not use the HP 12C as I purchased one but did not use it enough to see the advantages of RPN. Several years ago I tried it again. I learned the advantages of RPN and also loved the fact I could do most financial calculations with a lot fewer keystrokes. Now I love it and use it most of the time.

I do have a HP17bll+ which I have also put a few programs in but still prefer the HP 12C. I also purchased two HP 30b calculators and have input one program just for fun.

For a person who truly is using the calculator as a financial calculator, the key set up on the HP 12C is unbeatable. I have several of the newest model that will calculate the FV, for example, right away.

*Message #50 Posted by **Bruce Bergman** on 20 Mar 2010, 11:06 p.m.,*
in response to message #22 by bink

As both Eddie and Don have pointed out, I think you'll find that the 30b is much easier and faster to use than it first seems. You really should look at the keyboard and give it a shot.

Thanks,

Bruce

Re: Thoughts on HP 30b

*Message #51 Posted by **Jake Schwartz** on 26 Mar 2010, 1:19 p.m.,*
in response to message #50 by Bruce Bergman

Now that the machine is announced and shipping, I would *love* to see where the HP marketing folks have advertised this unit. How can the world learn about it? I receive a couple of emails from HP each week, advertising PC-related products and I have found none so far with any calculator items. Does HP advertise in print any more, even in financial pubs? If anybody knows of an ad for HP calcs *anywhere* in print or on line (but not HP's website), please let me know. And if they're not doing it, why not? It can't cost THAT much to sneak something into an HP-originated email about a calculator, could it? I know, corporate rules, blah blah blah, but you can't buy something you don't

know exists.

Re: Thoughts on HP 30b

*Message #52 Posted by **Martin Pinckney** on 27 Mar 2010, 7:35 p.m.,*
in response to message #51 by Jake Schwartz

Jake, you raise a VERY interesting point, which applies to the 35s, new faster 12c, etc. We have had many threads on here debating cost to add this or that feature, or cost to improve keyboard quality, or how $5, $10, or $20 added to the final price would affect sales numbers, what market is HP going after, etc. etc. ad infinitum.

But I do not remember any discussions on HP's marketing efforts! Come to think of it, neither do I recall seeing any HP calculator ads, even in their own emails. You have to dig into the website to find the calculators. What does this say about HP's investment in the calculator market?

This is an important topic, so since your post was No. 51, few are going to read it; I suggest you start a new thread with this topic.

4 PPC CDs Combined into Single DVD

*Message #1 Posted by **Jake Schwartz** on 17 Mar 2010, 10:03 p.m.*

Hi,

The four PPC CD disks, containing 4 decades of HP calculator materials from various user groups, have been combined into a single DVD disk for more ease of use. Everything remains in pdf format and once entered, the user may navigate anywhere in the material from within the Acrobat environment. The DVD also incorporates an updated PPC CD #3 with the British Handheld and Portable Computer Club's Datafile Issues extended to a 27th year to 2008.

For additional information on obtaining these, check Here.

Jake Schwartz

P.S. - See you at the HHC2010 conference on Sept 25-26th, location to be announced.

Re: 4 PPC CDs Combined into Single DVD

New Classic Battery Cover Latches For Sale

*Message #1 Posted by **aj04062** on 17 Mar 2010, 9:38 p.m.*

I am in the process of making new plastic latches for a classic series calculator.

These will be made via a rapid prototyping machine and made in a structural plastic. Drawback is the natural color is white. It can be painted to match various models.

I am posting this to gage interest in the forum as I am willing to make up more than the two I need. Price is TBD at this point as I have not finished them to determine total costs. I think they could be in the 30-40 range for a pair. Are people willing to pay this for new latches?

I can make 2 versions - 1 with cutout for rubber feet. Another made from solid plastic if your feet are missing.

I am also seeking to gage interest in the production of other like parts for other models. Drop me an email if you are interested.

Peace, Adam

Re: New Classic Battery Cover Latches For Sale

*Message #2 Posted by **John Robinson** on 18 Mar 2010, 7:48 p.m.,*
in response to message #1 by aj04062

Yes please Adam, I'd been keen for 8 - 10 assuming price will be a few $$$ each.

Cheers, John

Re: New Classic Battery Cover Latches For Sale

*Message #3 Posted by **aj04062** on 18 Mar 2010, 9:38 p.m.,*
in response to message #2 by John Robinson

is what I quoted "a few"? I am not looking to get rich here, but some of the processes that I am experimenting with are expensive, others are not quite so. One that could give me a black part without painting is much more expensive than the white version I would need to paint.

would you want to pay less for unpainted versions and you finish?

here is a link

*Message #10 Posted by **Gerardo Rincon** on 20 Mar 2010, 11:56 p.m.,*
in response to message #1 by aj04062

The hp third generation Hp 31E to hp 38E were notorious for losing the battery covers. Myself I have 34E without battery cover. I have been looking for one to show up in ebay for a long time but no luck..

Re: New Classic Battery Cover Latches For Sale

*Message #11 Posted by **aj04062** on 25 Mar 2010, 11:21 p.m.,*
in response to message #10 by Gerardo Rincon

Ok here's the deal.

I got these working tonight. I'd like to offer them for $15 a pair without paint + shipping. My first batch required a little sizing with an exacto knife and a nail file. I will tweak the CAD model so this is minimized in future builds. However, I beleive it is better to have too much material than too little so I will leave some material to be filed.

If you want a pair please send $16.50 to my Paypal account: adamjjones@adelphia.net

OR

See my posting on eBay. You can go there to see a picture.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=130377815175

I am open to making other plastic items for restorations, but I need good samples to copy.

in response to message #2 by Mark Henderson

Yeah, Eric. That's like telling half a joke... Come on...

Re: work in progress

*Message #4 Posted by **Eric Smith** on 17 Mar 2010, 7:18 p.m.,*
in response to message #3 by Johnny Bjoern Rasmussen

Obviously I'd like it to be some sort of calculator, but it isn't there yet. Right now it's just prototype hardware that doesn't do much more than scan the keyboard, display test messages on the LCD, and test energy consumption in various modes (running at various frequencies, sleeping at various frequencies with and without peripherals enabled, etc.

The processor is an Energy Micro "Gecko" microcontroller, which uses an ARM Cortex-M3 core. This has very low power consumption in both active and sleep modes. There are a few other microcontrollers that get lower uW/MHz, but they generally don't have nearly as much compute performance per clock cycle, so the Gecko might actually have the best power/performance ratio.

I wired this up to verify their power claims, and to determine whether a calculator using it could have a decent battery life on a pair of lithium coin cells. Now that I've answered those questions, I'll move on to the fun part.

Re: work in progress

*Message #5 Posted by **cyrille de Brébisson** on 18 Mar 2010, 9:34 a.m.,*
in response to message #4 by Eric Smith

Hello Eric,

Can you post your power consumption in Off mode, Idle mode (LCD on) and in running mode (indicating the frequency?)

thanks, cyrille

Re: work in progress

*Message #6 Posted by **Eric Smith** on 18 Mar 2010, 3:42 p.m.,*
in response to message #5 by cyrille de Brébisson

Hi Cyrille!

This is the EFM32G290F128, which has 128KB of flash and 16KB of RAM. All 16KB of RAM is preserved in sleep mode, though it is possible to turn portions of it off to save even more power. I haven't done that.

Off mode (32 kHz osc running, wakeup on timer or key press): 1.6 uA

The LCD I am using is just some random surplus character LCD module, so it doesn't make any sense for me to report power consumption with that. Without the LCD, idle mode is nearly the same as off mode, since the CPU isn't doing anything different other than scanning the whole keyboard rather than just the ON key. There is a version of this CPU with on-chip LCD controller for up to 160 segments, but I'm not using it, so I haven't measured its power consumption.

Running mode, internal RC oscillator, zero wait state flash:

```
1 MHz:  450 uA
7 MHz:  2.4 mA
11 MHz:  3.4 mA
14 MHz:  4.1 mA
```

Running mode, internal RC oscillator, one wait state flash:

```
21 MHz:  4.6 mA
28 MHz:  6.1 mA
```

Running mode, external crystal, one wait state flash:

```
32 MHz:  7.2 mA
```

What currents have you measured for your AT91SAM7L128-based calculators?

Thanks, Eric

Interesting. Looks like a 41 keyboard with a dual line display a la 42? Could this be a 41/42 hybrid?

I am not an electronics guy, so this is just a guess...

Re: work in progress

*Message #11 Posted by **Walter B** on 17 Mar 2010, 8:37 p.m.,*
in response to message #1 by Eric Smith

Looks very interesting. Seems to become something like a 48, taking the number of keys into account. Are you sure you're striving for a pocketable device? d;-)

Ceterum censeo: Launch a 43S.

Re: work in progress

*Message #12 Posted by **Eric Smith** on 18 Mar 2010, 12:37 a.m.,*
in response to message #11 by Walter B

I'm not likely to do anything like the 28, 38/39/40, or 48/49/50 families; implementing the software for those would take too long. (Though if someone else wants to write the software...) Like the earlier DIYRPN calculators Richard Ottosen and I have made, this prototype has enough keys to compare with the various pre-Saturn handheld calculators.

Re: work in progress

*Message #13 Posted by **Marcus von Cube, Germany** on 18 Mar 2010, 10:13 a.m.,*
in response to message #12 by Eric Smith

Could be a platform for Free42. Does the design care for I/O?

Re: work in progress

*Message #14 Posted by **Eric Smith** on 18 Mar 2010, 3:28 p.m.,*
in response to message #13 by Marcus von Cube, Germany

The only likely I/O is a serial port, and an SD or microSD card slot.

There's only 128KB of flash, not enough to fit Free42. I also didn't put enough keys for Free42, though that could be fixed easily. It's also really hard to find a suitable graphic LCD module for

Free42, that isn't physically too wide for a handheld calculator.

Re: work in progress

*Message #15 Posted by **Paul Dale** on 18 Mar 2010, 5:54 p.m.,*
in response to message #12 by Eric Smith

OpenRPN had a fairly complete RPL implementation which could be used. Otherwise, my 20b firmware would easily fit.

- Pauli

Re: work in progress

HHC2010 Schedule???

*Message #1 Posted by **Namir** on 17 Mar 2010, 5:03 p.m.*

Hi All,

Anyone knows about the location and date for the HHC2010?

Thanks,

Namir

Re: HHC2010 Schedule???

*Message #2 Posted by **Eric Smith** on 17 Mar 2010, 5:15 p.m.,*
in response to message #1 by Namir

I'm guessing mid-September in Fort Collins, Colorado, though there has been some consideration of other possibilities such as Boise, Idaho and Las Vegas, Nevada.

As far as I know, neither the date nor location are finalized, but mid-September is traditional.

Re: HHC2010 Schedule???

*Message #3 Posted by **Namir** on 17 Mar 2010, 5:35 p.m.,*
in response to message #2 by Eric Smith

Thanks Eric!

Re: HHC2010 Schedule???

*Message #4 Posted by **Geoff Quickfall** on 17 Mar 2010, 6:49 p.m.,*
in response to message #3 by Namir

HPCC Datafile V29 N1 says Sept 25th - 26th although that is probably tentative.

Las Vegas and then as a side trip the Star Trek show at the Hilton ;-)

Cheers, Geoff

p.s. see you there.

Re: HHC2010 Schedule???

*Message #5 Posted by **Dave Shaffer (Arizona)** on 17 Mar 2010, 9:11 p.m.,*
in response to message #4 by Geoff Quickfall

Unfortunately, the Star Trek show has been out of business for several years.

I'd root for Vegas, though: only a 250 mile drive and we used to live there (for 15 years - a somewhat surreal state of affairs!).

Re: HHC2010 Schedule???

*Message #6 Posted by **Eddie W. Shore** on 17 Mar 2010, 11:48 p.m.,*
in response to message #5 by Dave Shaffer (Arizona)

I'll vote for Vegas too. Hopefully the conference is a week or two earlier - then I could go before school starts in fall.

VIVA LAS VEGAS!

remember what happens there stays there!

*Message #7 Posted by **geoff quickfall** on 18 Mar 2010, 12:03 a.m.,*
in response to message #6 by Eddie W. Shore

to bad about the star trek thing!

Vegas would be great. They have, like, $49 flights from San Diego to Las Vegas all the time. It'd be great!

Vegas has my vote.

Thanks,

Bruce

I think that LV would be great for us East Coasters too. While it's still a long trip it's pretty cheap and the non-calculator things to do there makes for a good, very long weekend destination.

Also, I like the idea of holding the conference at a hotel with many food options, places to hang out, things to see, machines and people to lose money to and like-minded friends to meet and talk with. Frankly the idea of sitting in one room at HP for 2 days straight is a bit scary to me.

I think the argument to use an HP facility was to save a bit of coin. However, what is saved in conference fees ($20/day?) is quickly lost to rental cars. Corvallis is clearly the exception--a mecca for HP calc nerds.

I too cast my vote for a hotel in Vegas. There are many transportation options from the airport and within the city there is a monorail. Cars should not be necessary.

If you are looking for field trip ideas, then check out http://www.neonmuseum.org/. Not as high tech as last year, but suitable low tech for this type of conference.

It's not any worse than sitting in one room at some other conference facility for 2 days straight. In fact, it's better, since HP has provided snacks, beverages, and even meals when they've hosted it, while at hotels and such the snacks have usually been limited to what you can get from their vending machine.

In any case, the conferences are usually so interesting that rather than the two days seeming long, I'm surprised that they're over so quickly.

I'm OK with almost any location in North America. I think it would be nice to visit Chicago or Philadelphia again one of these years, if the folks there felt like hosting another conference.

There is no reason why HP cannot provide food, drink, etc... if in a hotel.

Re: HHC2010 Schedule???

*Message #13 Posted by **Eric Smith** on 19 Mar 2010, 12:54 a.m.,*
in response to message #12 by Egan Ford

If it's in a hotel, they generally have to contract with the hotel to provide it, which costs a lot more money than if HP can use their usual food service contractor. In the past at hotels they've sponsored a dinner, but if memory serves they usually haven't provided other snacks, beverages, meals, etc.

in response to message #8 by Bruce Bergman

Can you check how much extra ticket prices are during school/college holiday times? Several people who work in education are denied the opportunity to attend because of the timing. The traditional reason for the timing is that the costs are lower than in high season. It would be nice to know how much lower.

Re: HHC2010 Schedule???

*Message #16 Posted by **Dave Shaffer (Arizona)** on 19 Mar 2010, 12:50 a.m.,*
in response to message #15 by BruceH

It almost doesn't matter when you go to Vegas (except, unlike almost all other destinations, weekends can be the HIGH cost days!).

Also, unless you enjoy 110 F days, the summer is the low (cost - not temperature!) season in Vegas.

Re: HHC2010 Schedule???

*Message #17 Posted by **Brian Walsh** on 19 Mar 2010, 4:50 p.m.,*
in response to message #2 by Eric Smith

I for one would vote AGAINST Las Vegas. Not because of any cost issues but because the place has become so darned congested and walking distances are very long. It's NOTHING like it was 10 years ago, much less 27 years ago (1983 at the Marina). And like a lot of others, speaking for myself of course, gambling holds no interest for me. I'd also like to know what kind of weather there is in September, but I expect it's still quite hot.

Fort Collins was pretty nice, but I agree with Katie it was kind of weird being more or less sequestered at HP, and I only attended on Sunday. But I'd take Fort Collins over Las Vegas in a heartbeat, especially if there is more freedom to move around.

Is Boise out of the running?

Re: HHC2010 Schedule???

Please, not Vegas. I finally have a shot to attend this year, but Vegas falls outside the scope of "as long as the spouse is happy".

Re: HHC2010 Schedule???

*Message #19 Posted by **Dave Shaffer (Arizona)** on 29 Mar 2010, 12:02 p.m.,*
in response to message #18 by Alex L

What does it take to "keep the spouse happy"?

I lived in Vegas for 15 years, and can assure you that there is lots to do besides spend time in casinos. If outdoor activities are favored, there are parks and hiking within an easy day drive, and Zion National Park can be done in a long day. Hoover Dam is fascinating (take the "inside" tour). California sand dunes can be seen on a day trip, too.

What else? The Liberace Museum? The Atomic Bomb (!) museum? The neon sign museum (OK, that one's mostly nostalgic Las Vegas kitsch)?

in response to message #20 by Tim Wessman

All of the comments regarding HHC 2010 are great. The date is fixed, it is the last weekend in September. The location is open and several considerations are being discussed.

We haven't had a conference in Vegas for many years and this year is certainly a good time with all the new hotel rooms keeping the prices low. We have a local contact that can help with this.

The committee is the same as last year and we should be getting together to make a decision in the next few weeks. Keep the comments and ideas coming.

I liked Fort Collins too ... but wish I didn't get sick there right after the conference. (Probably the bug that Tim warned us about.)

I would like the conference anywhere that has a nearby Amtrak station as I love taking the train - especially to Chicago. ;)

Re: HHC2010 Schedule???

HP 41C data storage integrated circuit swapping: Maybe Eric could answer this ;-)

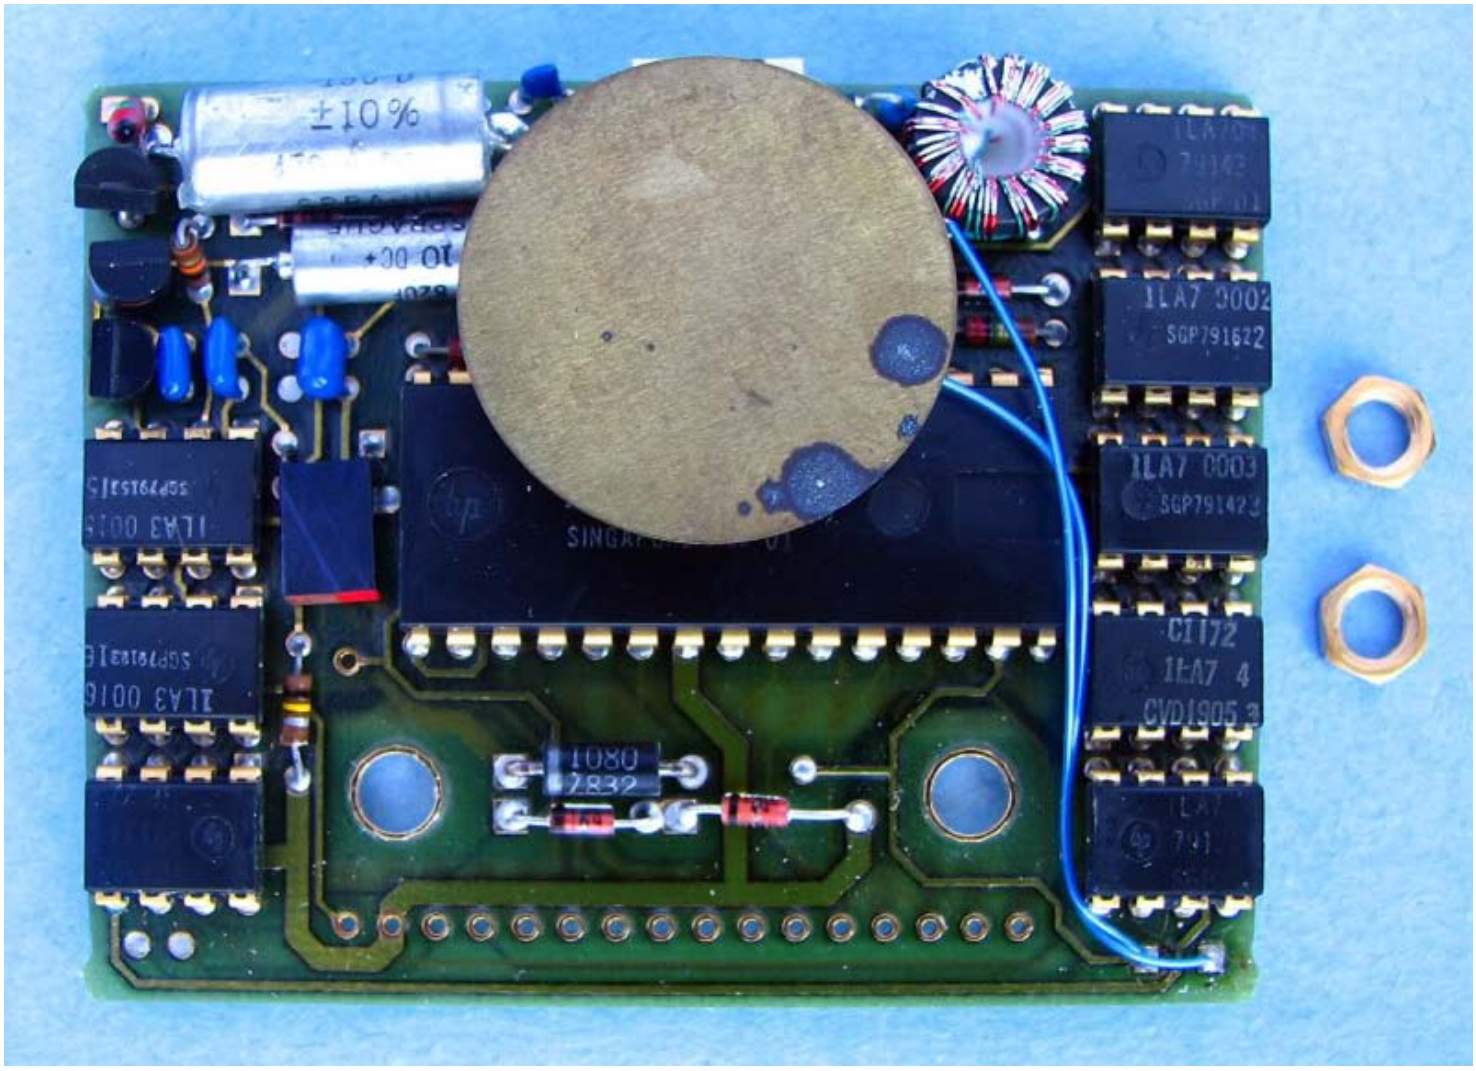
*Message #1 Posted by **Geoff Quickfall** on 17 Mar 2010, 3:44 a.m.*

Hello experts,

I posted this many months ago and cannot find it in the archives. I know Eric Smith had many good answers including swapping the memory with a 41CV. I just can't find the info so here is the question again

Here is a photo of an early HP 41C with all the bugs and also with a defunct D/S integrated circuit (RAM) (ser# 1931Axxxxx). It is the one at the bottom right labelled:

```
1LA705
```



When SIZE 000 is executed the program registers available equal 47 out of the required 63. All programs execute and the data registers used for STO when SIZE 047 is executed are accessable. This indicates that (my logic) the last D/S chip is unserviceable and must be replaced:

```
1LA705:
```

My quandry is that I have a newer HP 41C board (1981) with the following chips. They have the following codes from first to last:

```
1LA701,
1LE701,
1LB738,
ILB739,
1LB740 (this chip is in the same position as the chip on the
        early board)
```

My assumption is that the last chip; 1LB740 would be the one to use. My question is, is it swappable with 1LA705.

I also have a two CV's with similar blocks of 5 D/S chips:

```
1LA701
1LE701
1LE702
1LE703
1LE704  this chip is in the same position as the chip on the
        early board)

AND

1LG901
1LA701
1LH502
1LH503
1LH505  (this chip is in the same position as the chip on the
        early board)
```

My questions are as follows:

```
1.  is my assumption correct and the last D/S chip is the
    defunct chip on the photo above; chip 1LA705?
2.  Which chip in the 3 lists above are swappable;
    1LB740, 1LE704, 1LH505 or any of the others?
```

The reason for doing this, to keep the early with bugs board intact with its bugs. That precludes me just swapping out the board for a newer one which I have. That is I would like to use a donar chip from the three options above to replace the bad chip that I hopefully have identified correctly.

Thanks in advance, Geoff

Edited: 17 Mar 2010, 3:51 a.m.

Re: HP 41C data storage integrated circuit swapping: Maybe Eric could answer this ;-)

*Message #2 Posted by **Randy** on 17 Mar 2010, 11:25 a.m.,*
in response to message #1 by Geoff Quickfall

> Quote:
>
> My assumption is that the last chip; 1LB740 would be the one to use. My question is, is it swappable with 1LA705.

1LB738/39/40 are the roms so no, it is not swappable.

> Quote:
>
> My questions are as follows:
>
> 1. is my assumption correct and the last D/S chip is the defunct chip on the photo above; chip 1LA705? 2. Which chip in the 3 lists above are swappable; 1LB740, 1LE704, 1LH505 or any of the others?

1 - Not a valid assumption, you can only identify the faulty d/s with the service rom.

2 - AFAIK, none of the three can be interchanged.

Re: HP 41C data storage integrated circuit swapping: Maybe Eric could answer this ;-)

*Message #3 Posted by **Jim Horn** on 17 Mar 2010, 12:06 p.m.,*
in response to message #1 by Geoff Quickfall

If it helps, Geoff, when the '41CV came out a few of us who worked at HP Santa Rosa got the new CV RAMs directly from Corvallis and replaced the ones in our '41C machines, turning them into CVs but with all the first generation bugs. As I recall, the CV had one more RAM than the C did, so one was piggybacked onto the board to make it fit. One of the reasons for doing that was that in-house orders for the CV had something like a six month wait list whereas the ICs were available immediately.

Last time I used it it still worked fine but, like most of my things, it's in long term storage. Otherwise I'd pop it apart to verify the details including IC numbers.

Jim Horn - my 41C has 319 registers, power contacts in the battery access tunnel, etc.

Thanks Jim and Randy, further info

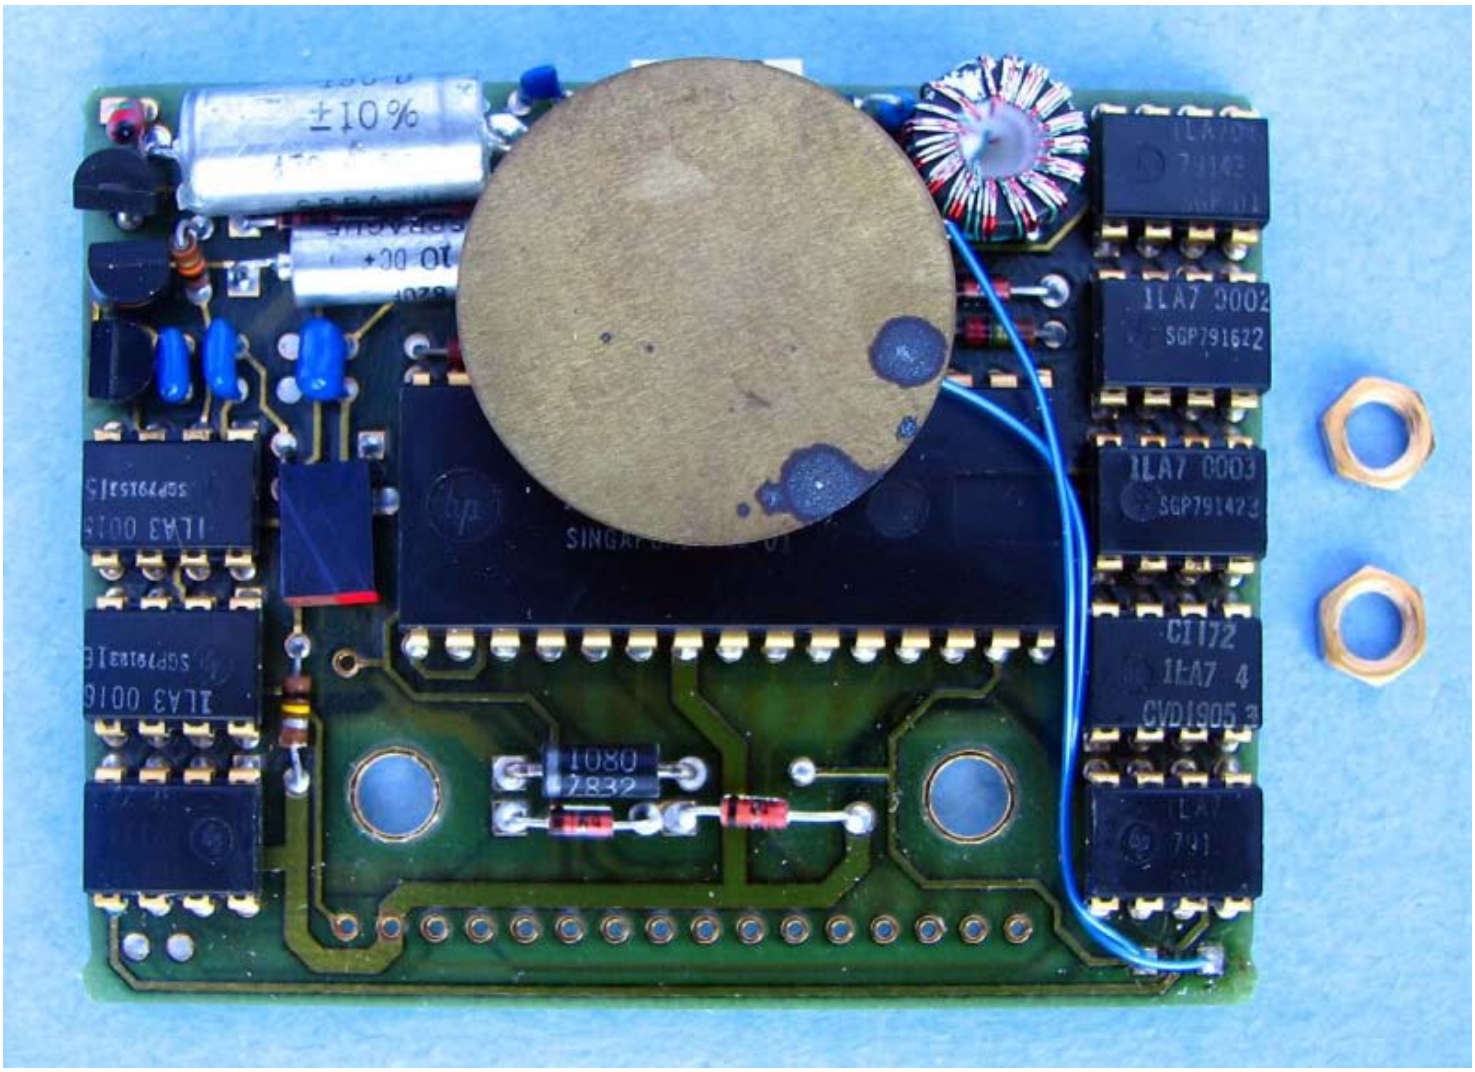
*Message #4 Posted by **geoff quickfall** on 17 Mar 2010, 2:20 p.m.,*
in response to message #1 by Geoff Quickfall

after running the diagnostic with the service module the calculator passes all tests except for the D/S which doesn't surprise me.

The failure message is:

```
D/S   1   BAD
```

If I am doing this correctly and according to the 41C service manual that would imply, refering to the photo, that 1LA7 002 (the second D/S chip on the top right) is bad.



The first chip 1LA701 would be used internally for the X,Y,Z,T LASTX and ALPHA which all work correctly.

Knowing that would the 1LE701 from the 1981 HP 41C be usuable as a replacement, it too is the D/S 1 chip?

Failing that, Jim, the HP 41CV conversion sounds interesting as I have the ability to swap out all the c chips for working cv chips. More info on that would be interesting, converting this to a tall keys with gold balls 41C also!

Cheers, Geoff

Re: Thanks Jim and Randy, further info

*Message #5 Posted by **Ignazio Cara (Italy)** on 17 Mar 2010, 3:19 p.m.,*
in response to message #4 by geoff quickfall

Hello friends, you can find all information you need at the following link , about all the HP-41C released (Initial, two transistor and final) with the tabs for the replaceables parts. I hope this could be a little help for Geoff and Randy.

Regards

Ignazio

Thanks Ignazio

*Message #6 Posted by **Geoff Quickfall** on 17 Mar 2010, 6:57 p.m.,*
in response to message #5 by Ignazio Cara (Italy)

I currently am using the HP 41C service manual but unfortunately only have access to the 41CV and 41CX diagnostics rom.

It looks like I will be swapping the four HP 41C D/S rams with four HP 41CV D/S rams as described by Jim Horn and Eric Smith.

This should give me an HP 41C "with all the bugs" in a tall keys 1979 case but with HP 41CV memory (319) registers.

Cheers, Geoff

*Message #10 Posted by **Eric Smith** on 17 Mar 2010, 5:13 p.m.,*
in response to message #4 by geoff quickfall

Which diagnostic ROM did you use? If it's reporting a bad D/S 1, it probably is a diag for a 41CV/CX.

With 48 registers working, I'd think that the 1LA7-0005 is the bad one. When the memory is sized, they start from address 0C0 and count upwards until they find a non-existent register. If a RAM in the middle fails, the good RAMs past it are not found. (They can still be accessed as data registers, though. However if the 41C D/S 1 (1LA7-0002) fails, it won't be able to find any registers, and won't be able to create the permanent ".END.". I'd expect the calculator to work very poorly if at all.

From memory, which might be mistaken, I believe the mapping is:

```
000-00F  D/S 0  1LA7-0001  status registers
```

```
010-03F  gap
040-07F  X FCN memory (41C/CV),  D/S 6 1LE7-0006 or 1LH5-0006 (41CX)
080-0BF  X FCN memory (41C/CV),  D/S 7 1LE7-0007 or 1LH5-0007 (41CX)
0C0-0CF  D/S 1  1LA7-0002 (41C) \
0D0-0DF  D/S 2  1LA7-0003 (41C)  \ D/S 1 1LE7-0001 or 1LH5-0001 (41CV/CX)
0E0-0EF  D/S 3  1LA7-0004 (41C)  /
0F0-0FF  D/S 4  1LA7-0005 (41C) /
100-13F  mem module 1 or quad mem (41C), D/S 2 1LE7-0002 or 1LH5-0002 (41CV/CX)
140-17F  mem module 2 or quad mem (41C), D/S 3 1LE7-0003 or 1LH5-0003 (41CV/CX)
180-1BF  mem module 3 or quad mem (41C), D/S 4 1LE7-0004 or 1LH5-0004 (41CV/CX)
1C0-1FF  mem module 4 or quad mem (41C), D/S 5 1LE7-0005 or 1LH5-0005 (41CV/CX)
200      gap
201-2EF  X MEM 1
2F0-300  gap
301-3EF  X MEM 2
3F0-3FF  gap
```

You could replace all four chips 1LA7-0002 through 1LA7-0005 with a single 1LE7-0001 or 1LH5-0001. You'd still have the equivalent memory of a 41C if you did that without adding 1LE7-0002 through 1LE7-0005 or 1LH5-0002 through 1LH5-0005.

Eric, YEAH!!

*Message #11 Posted by **geoff quickfall** on 17 Mar 2010, 6:35 p.m.,*
in response to message #10 by Eric Smith

From memory I remember you mentioning this. I was thinking also that if a bad memory chip was found the program registers would stop and not continue, which is not the case here.

You are correct, the diagnostic is the CV and CX version, I mistakenly thought it would diagnose the chips in order. But intuitively it did not seem correct that the first chip would be the bad one considering the calculator acts pefectly up to 46 registers in the program mode.

> Quote:
>
> You could replace all four chips 1LA7-0002 through 1LA7-0005 with a single 1LE7-0001 (do have a spare 1LE7-001) or 1LH5-0001 (don't have a spare 1LH5-001)

It would seem that this is the way to go as I have 3 spare working cv boards.

To clarify, I would remove 1LA7-002 through 1LA7-005 and replace with a single 1LE7-0001 at the 1LA7-002 position. Thus, obviously, leaving the other 3 successive chip solder points empty.

Sorry to be such a neophyte with this, if it was my calculator I wouldn't hesitate to experiment but trying to keep this buggy and with the correct memory registers is the intent.

Cheers, and thanks, Geoff

p.s. to get fancy and to increase the memory to a CV with the C bugs would the chip swap below result in the HP-41C with bugs having the same 319 registers as the CV the chips came from. I mention this as Jim Horns posting sounds as though this is possible:

```
ORIGINAL 41C      SWAP      ORIGINAL 41CV
   CHIPS                         CHIPS

1LA7-002          <-->          1LE701
1LA7-003          <-->          1LE702
1LA7-004          <-->          1LE703
1LA7-005          <-->          1LE704
```

I think Gene would like a 41C with all the bugs plus the memory of a CV in a tall keys case.

Wouldn't you Gene????????

Re: Eric, YEAH!!

*Message #12 Posted by **Eric Smith** on 17 Mar 2010, 7:21 p.m.,*
in response to message #11 by geoff quickfall

If you want the full CV memory, you'd have to put in all five of the 1LE7 chips from the CV, and keep the 1LA7-0001, so you'd have to piggyback one of them.

The RAMs have identical pinout and wiring, so it doesn't matter which physical location they're installed into.

Piggy backing

*Message #13 Posted by **Geoff Quickfall** on 17 Mar 2010, 7:29 p.m.,*
in response to message #12 by Eric Smith

Physically what does this entail. find a location for the extra chip and use jumper wires to the previous chip. Is there a crossover required such as in the double-x-memory mod.

Actually, is this explained in the archives or journal?

Thanks for you help.

Of course the easiest thing is to just remove the four and swap for the one.

Cheers, Geoff

Edited: 17 Mar 2010, 7:43 p.m.

Re: Piggy backing

*Message #14 Posted by **Eric Smith** on 17 Mar 2010, 8:06 p.m.,*
in response to message #13 by Geoff Quickfall

No crossovers, the pinout is identical and there is no chip select. Piggybacking is just soldering one chip onto the legs of another, avoiding use of jumper wires. HP did this themselves in the 41CX (fullnut only), in order to get two 12Kword ROMS and eight RAMs to fit in five 8-pin DIP footprints.

Re: Piggy backing

*Message #15 Posted by **Randy** on 17 Mar 2010, 8:13 p.m.,*
in response to message #14 by Eric Smith

Piggybacking was also done in CV's when using the common C/CV/CX PC board 5081-5564.

If you want to do it in the original 41C board, use only the top most position next to the toroidal transformer as any lower and the thickness will be too much for the case back to fit properly.

Re: Piggy backing, good suggestion and noted.

*Message #16 Posted by **Geoff Quickfall** on 17 Mar 2010, 9:00 p.m.,*
in response to message #15 by Randy

don't want to have to do any milling of the plastic thats for sure.

Thanks Randy,

Geoff

Re: Piggy backing

*Message #17 Posted by **Jim Horn** on 18 Mar 2010, 11:56 a.m.,*
in response to message #15 by Randy

Geoff, Eric and Randy hit the nail on the head. That's exactly how I did mine, including the piggybacking and which chips went where. Thanks, team!

By the way, piggybacking was not uncommon back then. Many of the first Amiga owners (model 1000) piggybacked two more sets of DRAMs on those in it, giving (with the optional 256k plug in) a total of 1M of RAM - a staggering amount back then. I remember having 24 active programs crowding the screen with memory to spare. Now my HP-50g has far more memory, CPU horsepower, etc. (as does my cell phone, my PDA, and so on). Moore's Law is our friend!

I won't even describe what we did to my HP-110 Portable...

Thanks Eric

*Message #18 Posted by **Geoff Quickfall** on 17 Mar 2010, 8:13 p.m.,*
in response to message #14 by Eric Smith

Well that is that then, might throw this in an appendix for the heck of it (if it works ;-)

Cheers, Geoff

p.s. can you send my your address via email. Then I can send you the HP-01 circuit board.

one final question ;-(

*Message #19 Posted by **geoff quickfall** on 18 Mar 2010, 12:21 a.m.,*
in response to message #14 by Eric Smith

the donar chip is labelled:

1LE701

is that equivalent to your:

1LE7-0001

==========

That would be all but as an extra I am going to take pictures of the 3 CV boards I have.

two of these have piggy backed D/S and one does not.

Re: one final question ;-(

*Message #20 Posted by **Eric Smith** on 18 Mar 2010, 5:18 p.m.,*
in response to message #19 by geoff quickfall

Yes. They usually leave off the first two zeros of the suffix printed on the 8-pin parts, but the official part number is still 1LE7-0001.

Further to an earlier posting, Method to the madness!

*Message #1 Posted by **Geoff Quickfall** on 16 Mar 2010, 1:14 p.m.*

Earlier this month the qestion was asked:

"is more valuable a 41cx broken calculator than a good one?"

As the person that purchased the HP-41CX I can let you in on the reasoning. The same seller was also auctioning the following HP-41C parts which I purchased for 122 USd:

```
1.  two HP-41CV boards
2.  two HP-41C boards
3.  one complete HP-41CV case
4.  one complete HP-41C case
5.  one half HP-41CV top with a 41CX bottom.
6.  one partly diassembled card reader (with all parts)
7.  various screws, zebra strips and misc.
```

Combine this with the HP-41CX not working auction for 98 USd. This calculator in fact was working but had an HP-41C bottom shell and HP-41CX top shell. Also the not working part was the connection between the module i/o block and the keyboard pca. Cleaned the contacts and it is now fully functional.

Also, I have Roger Hills original HP-41C with all the bugs and a bad LCD driver and Gene Wrights HP-41C with all the bugs and a bad ram chip.

After testing the parts auction I now am able to:

```
-  replace Genes Ram chip (which will be returned to the owner)
-  replace Rogers LCD panel (which will be returned to the owner)
-  repare and rebuild the card reader
-  repare and rebuild two HP-41CVs
-  repare and rebuild one HP-41C
-  swap out the wrong HP-41C shell on the CX with the correct
   bottom shell
```

so for approximately 200 USd I will have:

```
-  six functional HP-41xx's (two being returned as fixed to
   their owners.
-  a functional card reader.
-  some spare parts.
```

The moral is, sometimes auctions aren't all they appear!

Cheers, Geoff

OT, but where better to ask?

*Message #1 Posted by **P.Hart** on 16 Mar 2010, 11:45 a.m.*

Where better to ask what is the best replacement for the HP LX machines? Since the early 90's I have used a HP 100LX, a 200LX 1MB and a 200LX 2MB as personal organisers. The hinges on the first two broke and sadly the third is now going the same way. Any LX bought now would be very expensive or well on its way to a similar fate. Which currently available machine would people recommend as a replacement? The must-have LX features for me are the appointments, phone book, custom database, spreadsheet, note taker and filer applications and the ability to install other programs. Very grateful for any recommendations.

Re: OT, but where better to ask?

*Message #2 Posted by **Mark Henderson** on 16 Mar 2010, 12:26 p.m.,*
in response to message #1 by P.Hart

I replaced my LXs (95->100->200) with a Sharp Zaurus SL-C3200 - amazing little machine (full Linux, built in apps, color, keyboard, 6GB hard drive). There are others in the series that are very similar (SL-C3100, SL-C3000, SL-C860 etc.). All imports from Japan but available here and there, of course on E*ay etc. And you can run HP calc emulators on it! Recommended.

Re: OT, but where better to ask?

*Message #3 Posted by **Egan Ford** on 16 Mar 2010, 12:46 p.m.,*
in response to message #2 by Mark Henderson

I still have my SL-C860. It was my PDA from 2004 until 2008. Having a color VGA (640x480) Linux machine in my pocket was awesome. I could do so much on it. My HP calc ports can still be obtained from here: http://sense.net/zc/. Click on the x48, nonpareil, and free42 directories. I also ran EMU71 and EMU41 in Bochs. You could probably run an LX emulator in Bochs (my bochs build is also at the aforementioned URL).

Sadly I had to dump it as a PDA. It was a great pocket Linux machine, but a lousy PDA. Syncing was the top issue. I also got tired of hauling around two devices (Phone and PDA). In 2008 I got the iPhone.

My primary uses for my C860 was:

1. SSH and VNC access to customer machines.
2. Video and music.
3. PDA stuff.
4. HP Calcs.

The iPhone has all of that and many HP calcs too (e,g, 1*C, 41CX, 42S, 48*, 49G).

It was hard not having a keyboard at first, but I adapted.

Re: OT, but where better to ask?

*Message #4 Posted by **Dave Britten** on 16 Mar 2010, 12:42 p.m.,*
in response to message #1 by P.Hart

Here are a few possibilities I can think of at the moment.

Psion 5/5mx - Spreadsheet is pretty weak compared to Lotus 123, and the database application isn't as full-featured, but it's got all the basic functionality, plus a nice, big keyboard. You can sync with Outlook 2007, and even synchronize multiple computers to separate calendar or data/contact files (one of very few PDAs I've seen that can do this). Not as much Epoc software readily available as there is for DOS. The built-in programming language is kind of like QBasic, but notably lacking dynamic allocation without a lot of pointer tricks.

Later model HP Jornada (e.g. 700 series), or NEC Mobilepro - It's Windows CE, which you may or may not have strong feelings for/against. The later versions include Pocket Access, which is pretty stripped down, but still functional. Battery life will be lessened due to the backlight and color screen. Again, Pocket Excel is no Lotus 123.

Old HP OmniBook - You know, the old ones with the little fly-out plastic mouse. It's larger than a 200LX, but still pretty darn small for a laptop. The advantage here is the mountain of DOS/Win3.1/Win95 software you could load on the thing. I believe some (all?) of these included an HP Calc application that's much like the one on the 200LX.

HP OmniGo - Not as impressive as the 200LX, and not nearly as DOS compatible, but they can be found pretty cheaply at times. Runs GEOS, with a touch-screen, and the keys are a little bit bigger. It's been a while since I messed with mine, but I don't think the database application was as good as the 200LX. Compact Flash compatibility is limited, as I recall.

Re: OT, but where better to ask?

*Message #5 Posted by **Bill (Smithville, NJ)** on 16 Mar 2010, 1:12 p.m.,*
in response to message #4 by Dave Britten

If the 200LX really meets yours needs, then I don't think getting a replacement is really that expensive - just did a check on the bid site and many go for less than $200. Considering that many people pay that much for a new cell phone every year or so, it doesn't seem outrageous to pay that much for something that really does what you want it to do.

Many of the other options have already been mentioned. The Psion, Zarus, Wince machines will all fill the bill. The NEC Moblepro's are some of the best WINCE machines and can be had for very reasonable prices. Nice keyboard and there is a lot of old software that can be found on the net. One thing to remember on all the Wince machines, rechargeable batteries may be next to impossible to come by. Some of the machine did have an accessory to use standard penlight batteries (I think the Nec Mobile pro did).

While large (compared to the 200LX), the HP Omnibook series are fantastic computers and do have a fairly complete version of the HP-Calc and HP-Appt, plus you could load the 200LX connectivity software on it to fully emulate the 200LX.

The best one is the OB-430 which was the last one to still run directly off of penlight batteries. You can use standard Compact Flash cards for a C-Drive and still access two other CF cards as Drives A & B. While normally runs MSDOS and WIN 3.1, I've also have CF Cards loaded with older version of Linux and CPM/86. A really fun machine to play with.

But I still recommend just getting another HP-200LX.

Bill

Re: OT, but where better to ask?

*Message #6 Posted by **P.Hart** on 16 Mar 2010, 6:27 p.m.,*
in response to message #1 by P.Hart

Thanks everyone, just the superbly informative response I was hoping for. Now I must sort out the recommendations. Mention of Psion by Dave Britten prompts me to mention that I dug out my old Psion LZ64, not seen since it gave way to the LX100. It still works perfectly except that the data packs are unreadable. It's a bit too simple to replace an LX but at least there were no hinges to break.

Re: OT, but where better to ask?

*Message #7 Posted by **Dave Britten** on 16 Mar 2010, 6:41 p.m.,*
in response to message #6 by P.Hart

The Organiser II is a pretty cool machine. There's even a Y2K patch for the CM and XP models floating around. As a handheld calculator, I find it rather lousy, but for programming and expandability, I'd say it definitely gives the 41C a run for its money.

Speaking of durability, you should probably be aware that the Psion 5 is somewhat notorious for having the display ribbon cable fail over time. I don't have any first-hand experience with how long it takes to fail, but it's something you should know ahead of time, and not after!

Another machine I forgot to mention is the Fujitsu Poqet PC Plus. The hardware is similar to the 200LX, but the screen and keyboard are larger (you can likely touch-type), and it features a backlight and two PCMCIA slots. I believe it has DOS 5 in ROM. That's about all it has in ROM, though - no real PIM or office software to speak of. The major drawback is that it uses a proprietary NiCd battery.

Re: OT, but where better to ask?

*Message #8 Posted by **Marcus von Cube, Germany** on 16 Mar 2010, 6:45 p.m.,*
in response to message #6 by P.Hart

I'm still on the original Psion netBook, an EPOC machine, as my main organizer. Its WinCE successor netBook PRO never took over.

As a backup, I have a Psion 5mx, and my 200LX is still alive, too. I've written a program to export the LX contatcs database as a vCard stack which imports easily into the Psion Contacts app. If you're interested, just ask here.

HP-97 Card reader reassembly

*Message #1 Posted by **Ed Sowell** on 15 Mar 2010, 5:42 p.m.*

I've replaced the drive rollers, cleaned everything, and am now ready to reassmble. The problem I'm having is getting the side load springs in place.

To simplify description of the issue, I will refer to the read head assembly (motor, read head, etc) as the TOP and the frame (the part with the feet and ball recesses) as the BOTTOM.

When I took it apart the spings dutifully stayed in their recesses in the TOP as I lifted it off the BOTTOM. However, I now can't get them to stay in place as I attempt to set the TOP back onto the BOTTOM.

One would think that these springs should be set into the BOTTOM, along with the pinch roller and nylon balls so the TOP could be dropped into place without the springs falling out. However, the sping recesses in the BOTTOM are so large that they don't hold the springs in the position where they must be to mate with the smaller recesses in the TOP.

So, it's pretty clear that HP wants me to set the springs into the recesses in the TOP. However, they don't fit tight enough in the TOP recesses, so they fall out when I invert it to set the TOP onto the BOTTOM.

Sorry for being so wordy here, but I wanted to make myself clear.

TIA

Did We Miss The 20th Anniv. of the HP48SX?

*Message #1 Posted by **Jake Schwartz** on 15 Mar 2010, 4:34 p.m.*

Hi,

I think we may have missed acknowledging the 20th anniversary of the HP48SX on 6 March. Boy was that an exciting time. The U.S. HP calculator conference in 1990 was held in the Chicago area between June 1st and 3rd and Bill Wickes and Eric Vogel visited from Corvallis. It was a really fun weekend, extending to the CHIP group meeting on the following Wednesday. I remember that the intro of the 48 really legitimized RPL to the point where most of the locals in my area who held off getting the 28C or 28S finally jumped in with both feet, migrating from their HP41 systems. Bill's book, "HP41 HP48 Transitions" was a big help.

Jake Schwartz

Adjusting card reader eccentric screw

*Message #1 Posted by **Ed Sowell** on 15 Mar 2010, 12:32 p.m.*

I would like to try the adjustment method based on motor current draw as described in the Service manual. Since my calculator is in pieces can I disconnect the motor leads and use a 1.5v(?) battery in the test?

Re: Adjusting card reader eccentric screw

*Message #2 Posted by **Geoff Quickfall** on 16 Mar 2010, 1:11 p.m.,*
in response to message #1 by Ed Sowell

Thats how I do it and I have yet to have a problem.

Cheers, Geoff

Re: Adjusting card reader eccentric screw

*Message #3 Posted by **Ed Sowell** on 16 Mar 2010, 4:25 p.m.,*
in response to message #2 by Geoff Quickfall

Just to be sure, is the motor test voltage supposed to be 1.5 volts? I recall having seen that somewhere but now can't find it.

Re: Adjusting card reader eccentric screw

*Message #4 Posted by **Ed Sowell** on 17 Mar 2010, 4:29 p.m.,*
in response to message #1 by Ed Sowell

The spec says I should adjust the eccentric screw to get 180 +/- 20 mA while holding the card from going through. The lowest I can get is about 330 mA. When the motor is running freely w/o card it draws about 190-205 mA. This is while using a nominal 1.5 volt battery, which actually is about 1.4 volts, with a digital multimeter in series.

I am using O-rings bought from the eBay seller.

Is this typical?

HP-34C switch problem

*Message #1 Posted by **Giovanni Jimenez** on 15 Mar 2010, 11:48 a.m.*

My HP-34c turns on fine and works ok; however, when I move the right switch to "PRGM" mode, the calculator turns off.

If I then turn the ON swtich to OFF and back to ON, the 000- digits appear and seem to be working properly (i.e. I can enter a program).

Any idea why and how can this be fixed ? hopefully without opening the case.

I looked into this link but didnt find the answer:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=164451#164451

Thank you !

Re: HP-34C switch problem

*Message #3 Posted by **Ed Look** on 15 Mar 2010, 3:30 p.m.,*
in response to message #2 by Giovanni Jimenez

Giovanni, I still have my 34C, even if I have not turned it on in a few years now. The last days that it was still somewhat serviceable, I had a very similar problem.

I was more brave in those days, and I opened the 34C (I don't think nowadays I can do so without breaking the shell) and gave the switch contact strip a cleaning with a simple (but clean) pencil eraser, wiping off any dirt, probably rubbing of some of the oxides that may have built up over the years. After that, it worked much better, but only for about a year's time or less.

I tried this because even then, I called HP and they said they no longer had any of the switches on hand and these switches even then were no longer manufactured.

That was then. Now, I would recommend you try FixThatCalc.com or if one of the forum guys with experience with these Spice series HP calculators might want to see if they can do something for you.

Thank you Ed. I will contact fixthatcalc.com first.

giovanni

Re: HP-34C switch problem

*Message #5 Posted by **John Garza** on 15 Mar 2010, 5:31 p.m.,*
in response to message #2 by Giovanni Jimenez

DeOxit and DeOxit Gold work great for switches. I use the pen applicator with a slightly abrasive tip. Just scrub it on and it cleans an leaves a protective film.

Geodat, any info about the ic's and unit?

*Message #1 Posted by **Geoff Quickfall** on 15 Mar 2010, 2:26 a.m.*

Hi there,

This was sent to me for battery replacement. Two nicads which are toast.

It contains an HPIL module (at least it looks like one). When the unit is assembled and the HPIL is plugged into the HP 41C and simutaneously into the Geodat pca the following module titles are found in CAT 2:

```
printer 2e
mass st 1h
ctl fns
```

With the HPIL plugged into the HP 41C and not attached to the Geodat pca via the 16 pin plug nothing displays, in fact the calculator freezes.

I am assuming that the ROM modules reside in the EPROM (chip with the white paper label).

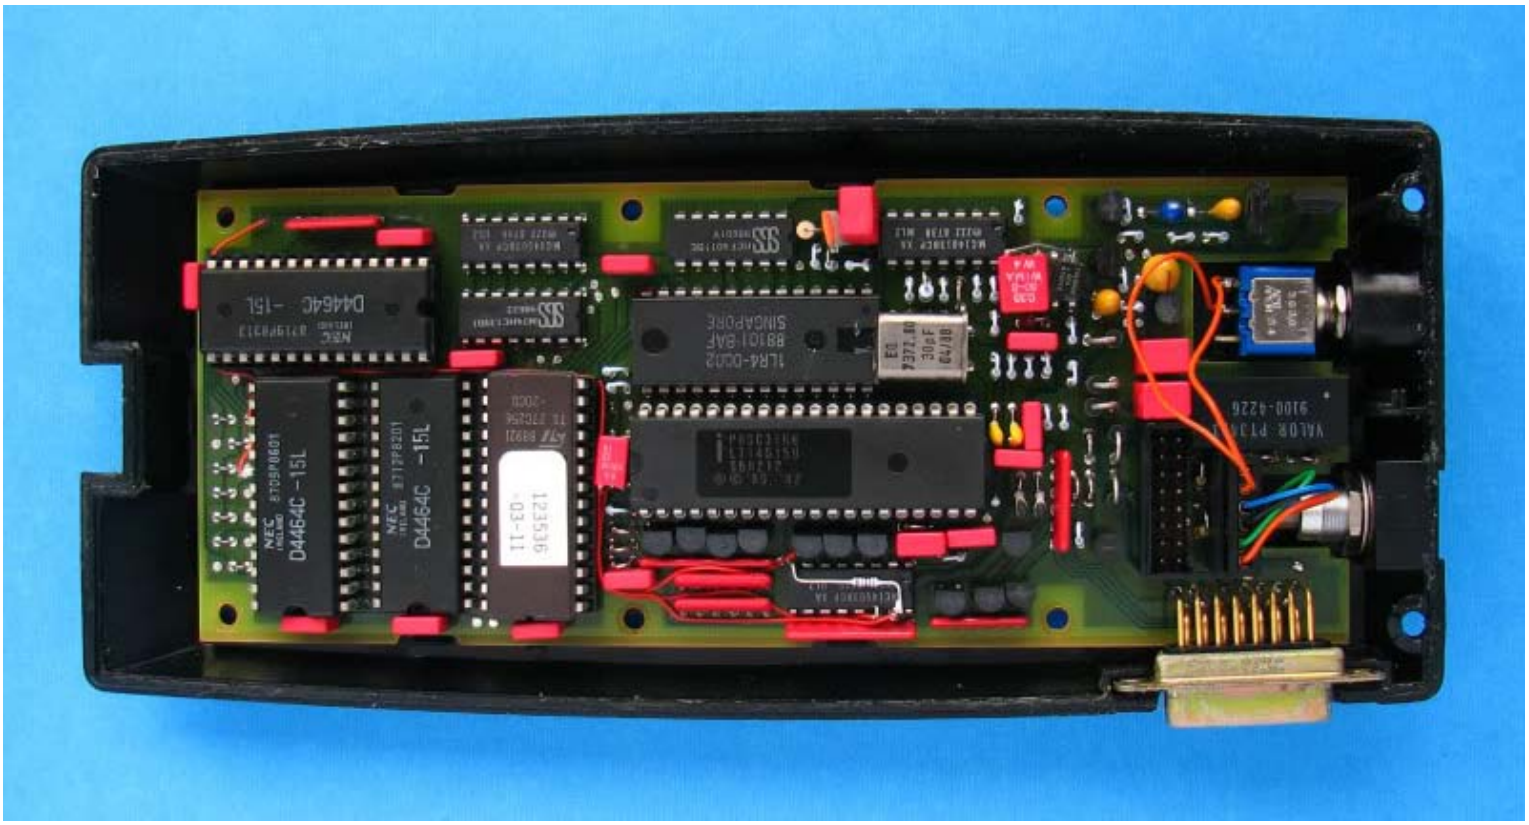
It will be an easy procedure to replace the batteries but I was wondering if anyone had any more info for this that I could supply the owner with and maybe include in the book.

check out the following pictures:

Top shell

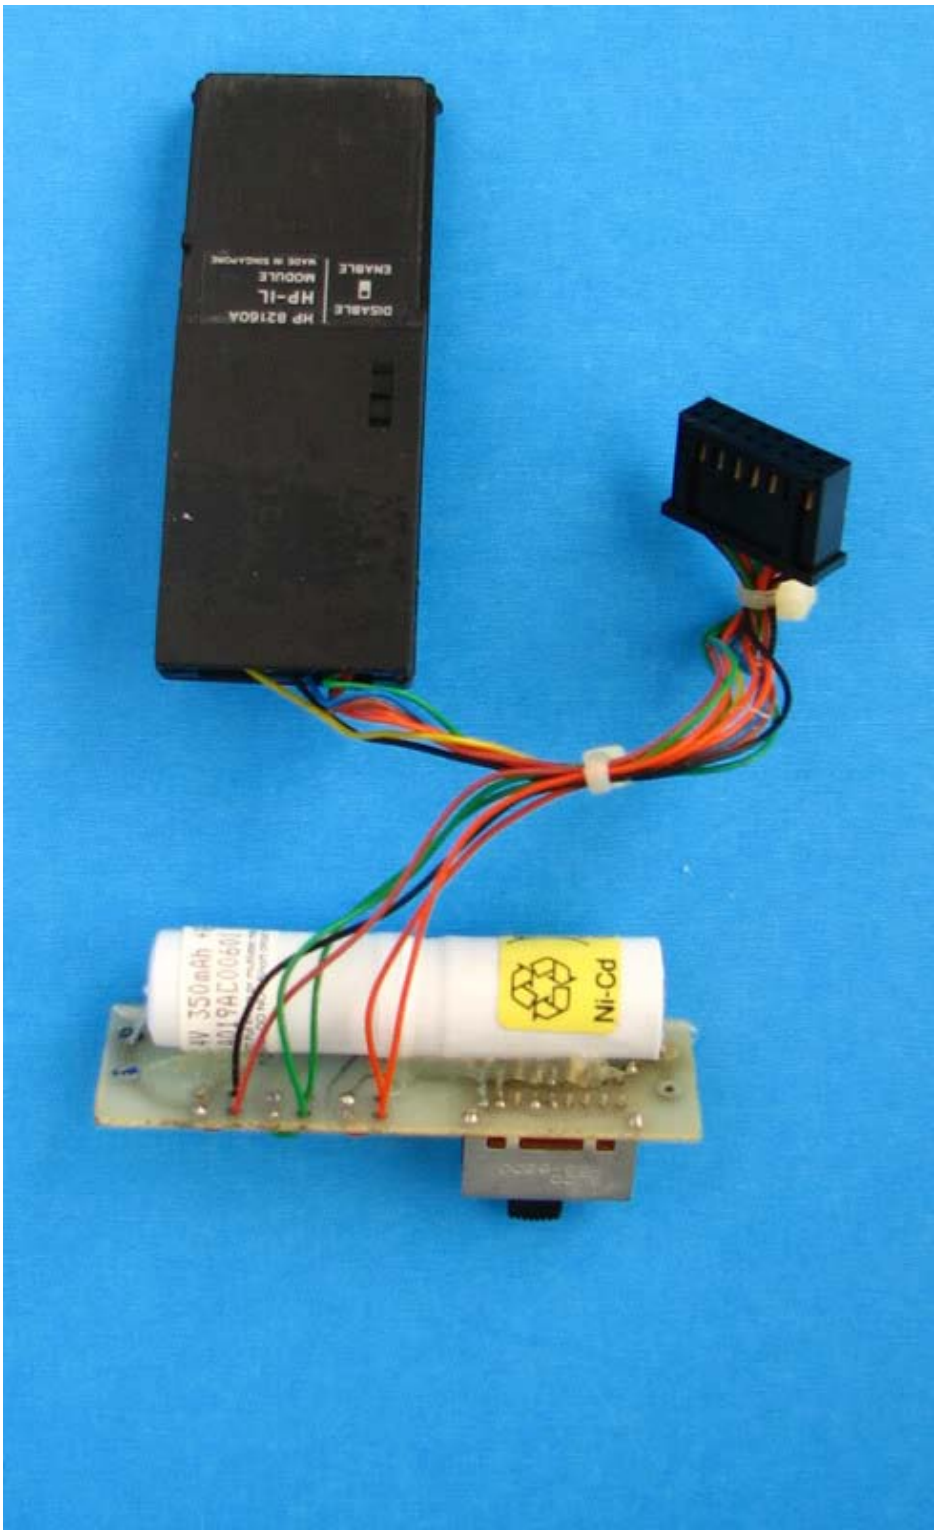
Top shell removed showing Geodat PCA and EPROM with white paper label:

Geodat, any info about the ic's and unit?



HPIL link and battery; two views:

Geodat, any info about the ic's and unit?



Cheers, Geoff

Re: Geodat, any info about the ic's and unit?

*Message #2 Posted by **Klaus** on 15 Mar 2010, 4:11 a.m.,*
in response to message #1 by Geoff Quickfall

Hi Geoff, I have the Geodat unit and a HP-41C module called "Geodat 126C". It is a takeover module that redefines nearly all the keys when the calculator boots. It only works with my HP-41CV, the HP-41CX gets a "memory lost" when this module is inserted into it.

Since the backside of the unit includes some reference to functions, I have assumed that the user can enter some user-defined functions which the Geodat then uses for calculations.

Btw, my Geodat unit has the "Printer enable" switch of the HP-IL module set to "disable".

Could it be that the calc freezes because the HP-IL loop is broken?

Kind regards, Klaus

Re: Geodat, any info about the ic's and unit?

*Message #3 Posted by **Stuart Sprott** on 15 Mar 2010, 7:05 a.m.,*
in response to message #2 by Klaus

Hi,

I am a Surveyor and just from memory I can recall that the Geodat was a data collector for the Geodimeter Theodolite. (I can't remember the model number.) This would have been in the early 1980s.

Esentially it would have captured data in the form of rectangular co-ordinates or polar co-ordinates straight from the Theodolite.

Some Surveyors used straight HP 41 calulators as data recorders and wrote their own software. They were never really a great success. There were troubles with the cable connection. For a Surveying instrument the cable connection has to be very robust in order to survive field conditions. Eary GPS units had the same problems with cables. Now days most connections are done by blue tooth.

I never used a Geodat, so I can't really comment on its reliability.

in response to message #3 by Stuart Sprott

By chance, I have some photos of my unit, I have uploaded them to: photobucket

Re: Geodat, any info about the ic's and unit?

*Message #5 Posted by **Eric Smith** on 15 Mar 2010, 10:33 a.m.,*
in response to message #1 by Geoff Quickfall

The 1LR4 is a replacement for the 1LB3 HP-IL chip. As far as I know, it is functionally identical to the 1LB3-0003.

The Intel part is a ROMless microcontroller. The EPROM is firmware for that, and the three NEC chips are CMOS static RAM for it.

The "takeover module" mentioned by Klaus must be mounted in the HP-IL module itself. Does the HP-IL module look like it has been cut open and glued back together?

Re: Geodat, any info about the ic's and unit?

*Message #6 Posted by **Klaus** on 15 Mar 2010, 12:45 p.m.,*
in response to message #5 by Eric Smith

Hi Eric, I posted the link to the pictures of my unit after you replied. It seems that my unit has the same hardware as the other unit, so it guess the other unit will require the takeover-module (which is in a standard HP-41C module housing), as well

Regarding the hardware, I found a reference in "the american surveyor" (the page says november, Copyright 2007, so this is likely to be the issue date) to the hardware, claiming that in 1981 the "Geodimeter 140 Series and GeoDat 126 Data Collector" were introduced. I found the page on the internet, it contains the history of Geotronics titled "A Company of Firsts".

*Message #4 Posted by **Nigel J Dowrick** on 15 Mar 2010, 9:15 a.m.,*
in response to message #3 by Han

What ruined it for me was an absolutely horrible keyboard that would repeatedly register multiple key presses. If the keyboard on your model is fine (later models were better, I believe) and the colour scheme appeals to you, then you've got a bargain! It's a very powerful machine.

Nigel

Re: Is the HP49G+ that bad?

*Message #5 Posted by **Jeff Kearns** on 15 Mar 2010, 11:00 a.m.,*
in response to message #4 by Nigel J Dowrick

Mine is, I believe, a later model. CNA41900***. Although I have noticed the odd double entry key press issue in the past, I find it acceptable - notwithstanding the colour scheme and ENTER key size and placement. I would go so far as to say that the 50G is the most disappointing incremental

improvement in calculator design ever. How does a new colour scheme (albeit a very nice one), a fourth battery, a quasi-RS232 serial port, and a slightly improved keyboard (over later models) warrant a whole new model number?

Here is an old post comparing the two units. There is no fundamental difference in my opinion, and a later model 49G+ (at a good price) is a good deal.

Re: Is the HP49G+ that bad?

*Message #7 Posted by **Ed Look** on 15 Mar 2010, 3:40 p.m.,*
in response to message #6 by Tim Wessman

I have a 49g+ that I had to have exchanged by HP. This one is nice and works well, no real glitches nor hiccups I can think of, off hand.

As to the 50g, I guess one could call it an incremental improvement, even over the non-improved early 49g+ version, but to me, the increase in speed coupled with the ability to use a larger SD card and faster at that, is a major thing. I... and I'm sure others too... do not like waiting too long for a calculator (or computer or microwave, or subway train) to do it's thing, whether it's a calculation or searching for a file.

Forget Pi day, I'm waiting for Avogrado's exponent day.

Probably not going to make it to Avogrado's mantissa day.

Re: Happy Pi Day

*Message #11 Posted by **BruceH** on 15 Mar 2010, 7:21 p.m.,*
in response to message #10 by Howard Owen

> Quote:
>
> Forget Pi day, I'm waiting for Avogrado's exponent day.

6x10^23 = 6/10/23 you mean?

Much sooner than that is the day next year in January (or October) when binary becomes as easy as 1,2,3: 01/10/11

Re: Happy Pi Day

*Message #12 Posted by **Michael Meyer** on 15 Mar 2010, 7:29 p.m.,*
in response to message #11 by BruceH

And, of course, the obvious: 3.1416 will be here soon. Won't see another one of those in my lifetime.

Re: Happy Pi Day

*Message #13 Posted by **tony (nz)** on 15 Mar 2010, 8:47 p.m.,*
in response to message #12 by Michael Meyer

3/14/16 is rounded pie day ;-)

I guess 6/28 could be 2Pi day.

Edited: 16 Mar 2010, 12:04 a.m.

Re: Happy Pi Day

*Message #14 Posted by **Howard Owen** on 15 Mar 2010, 9:55 p.m.,*
in response to message #11 by BruceH

6.022142 to six decimals. So I read that as 6.02.2142. Round to four decimals and I might have a chance :)

But that is Avogrado's **mantissa** day. The exponent day is 10/23, a little over 7 months away.

in response to message #2 by Vieira, Luiz C. (Brazil)

Thanks a bunch Luiz. Hmmm... It has the "Error 23 SELF TEST."-syndrome though. Did anyone ever find out what the problem was?

Re: Hurray: Just got an HP-85

*Message #4 Posted by **Namir** on 14 Mar 2010, 8:38 p.m.,*
in response to message #1 by Johnny Bjoern Rasmussen

Congratulations on your new acquisition!

The HP-85 was my very first PC. I got the matrix ROM and the Advanced Program ROM. I also had VisiCalc and the Regression Pac. When I wanted to buy an external disk drive for the machine I realized that the drive costs as much as an Apple][+. So I sold my H-85 and it's software and bought an HP-85. I still long for it though. When I got the Apple][+ I was disappointed that the Apple BASIC did not do matrices. You had to write matrix subroutines from the ground up!

Namir

I completely understand your elation. My HP-85 was delivered to the house in the spring of 1980....came from Educalc for $3250 (I think). It was my first computer and I remember how awed I was upon removing it from the packing box. No computer since has given me that same feeling. It is still in my garage in the humongous case I bought for it and should still be in perfect condition. Hope yours brings as much joy as mine has.

don

Shirt pocket plotter for HP41

*Message #1 Posted by **Wilhelm Taylor** on 14 Mar 2010, 4:35 p.m.*

At HP in Colorado Springs, 1981 or 1982, we had some visitors from Palo Alto who showed us a shirt pocket plotter. It looked like a case for eyeglasses which broke open in the middle. The two halves were connected by a telescoping flat bar at the bottom and another bar (for the pen) at the top and clicked into place with enough space between then to engage a piece of 8.5" wide paper. The engineers mentioned a new grit roller system which I had not heard of at the time. This mini plotter connected via HP-IL to an HP41. The plotter drew a space shuttle - a wire frame image many of you have seen.

We were told not to take pictures or even talk about the project until it got to market. I never saw or heard about the mini plotter again but did see the first of the grit-roller plotters come out in a much larger size - the 7470A.

Watching the little plotter was fascinating. When the paper was loaded, it moved in-and-out several times, rather slowly. Then a pencil stylus came out of one half of the pack and went back and forth while the paper moved up and down to create the line image.

I have mentioned this encounter to several people and nobody seems to remember it. Am I in the Twilight Zone? Can anyone confirm what I know I saw?

Re: Shirt pocket plotter for HP41

*Message #2 Posted by **Steve Leibson** on 14 Mar 2010, 10:44 p.m.,*
in response to message #1 by Wilhelm Taylor

I left HP in 1980. At least two or three years earlier, in Lovelend, Colorado, I attended a meeting where HP labs people demonstrated grit-wheel plotting. There were two projects at the time. I am pretty sure they were called SweetPea and SweetLips. SweetPea eventually became the HP 7470 plotter. I imagine the mini plotter you're describing was Sweet Lips. The paper went back and forth through the grit wheel/capstan pinch roller initially to impress tiny indentations in the paper, creating a unique sort of rack and pinion between the paper (rack) and the grit wheel (pinion). This was the essential innovation developed at HP labs and was the basis of the 7400 series HP plotters, which grew and grew. I don't think the mini plotter ever made it to market because ink-jet printers quickly took over.

Re: Shirt pocket plotter for HP41

*Message #3 Posted by **Wilhelm Taylor** on 15 Mar 2010, 10:41 a.m.,*
in response to message #2 by Steve Leibson

Thanks, Steve

The thing that intrigues me about this is having a plotter in you shirt pocket. Pure HP41 territory. I can just envision that prototype sitting in some box in a warehouse....

When'd you work at HP Loveland? I worked there pt while I went to CSU 1974-76. Continued in Colorado Springs after graduating until 82.

Re: Shirt pocket plotter for HP41

*Message #4 Posted by **Steve Leibson** on 15 Mar 2010, 11:44 a.m.,*
in response to message #3 by Wilhelm Taylor

Wilhelm,

I worked at HP in Northern Colorado (Loveland and Ft. Collins) from 1975-1980.

I admit, a shirt-pocket plotter would have been cool. These days, I'm trying not to carry so many things in my pocket. I think that a connection to wireless printers and plotters is much better.

Steve

i41CX+ gets another plus (CAS with editor) [micro review]

*Message #1 Posted by **Egan Ford** on 14 Mar 2010, 3:36 p.m.*

i41CX+ already has a lot of pluses, e.g.:

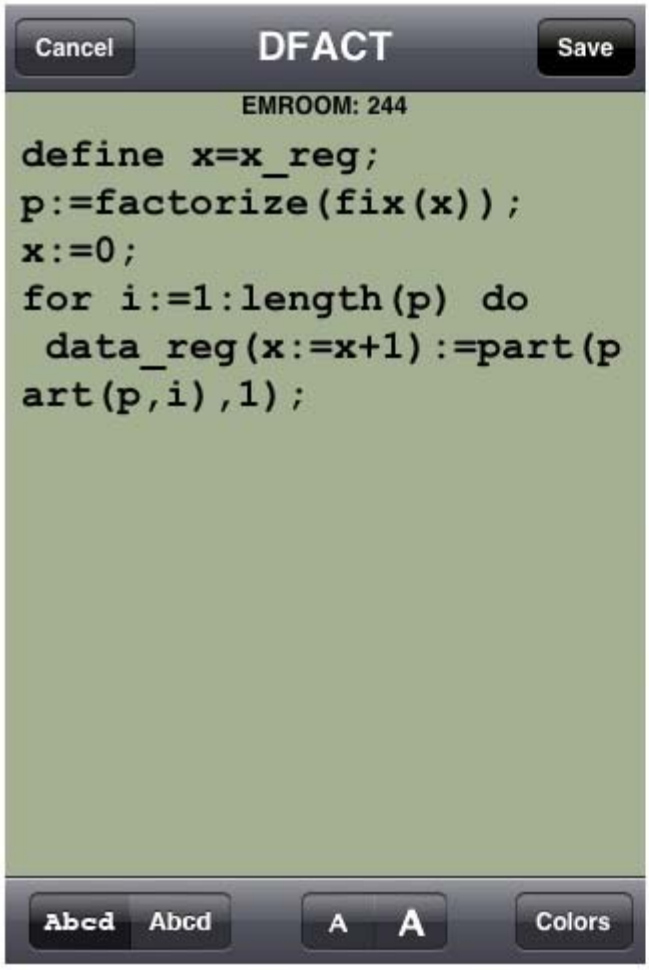
- Direct HW access (e.g. GPS, compass, accelerometer, etc...)
- Printer emulation
- Overlays and skins
- Module support including HEPAX
- Many ways to get data in and out
- ARM-based math module with advanced functions (e.g. LnGamma, LambertW, etc...)
- 5 field stack display

And soon, with the next release, CAS and a text editor.

I am currently beta testing the next release of i41CX+ and I thought I'd share with you some of the new CAS and editor features.

The Editor

There is a new command (I41CXED) that when executed will edit and/or create a text file as defined in the alpha register. The text file unless too large will be saved into XM. Any XM text file can be edited. If the file is too large then it will be saved (and can be retrieved) from XXM (extended extended memory :-). IOW, the iPhone main flash memory. AFAIK, only the I41CXED and CAS commands can actually access XXM files.



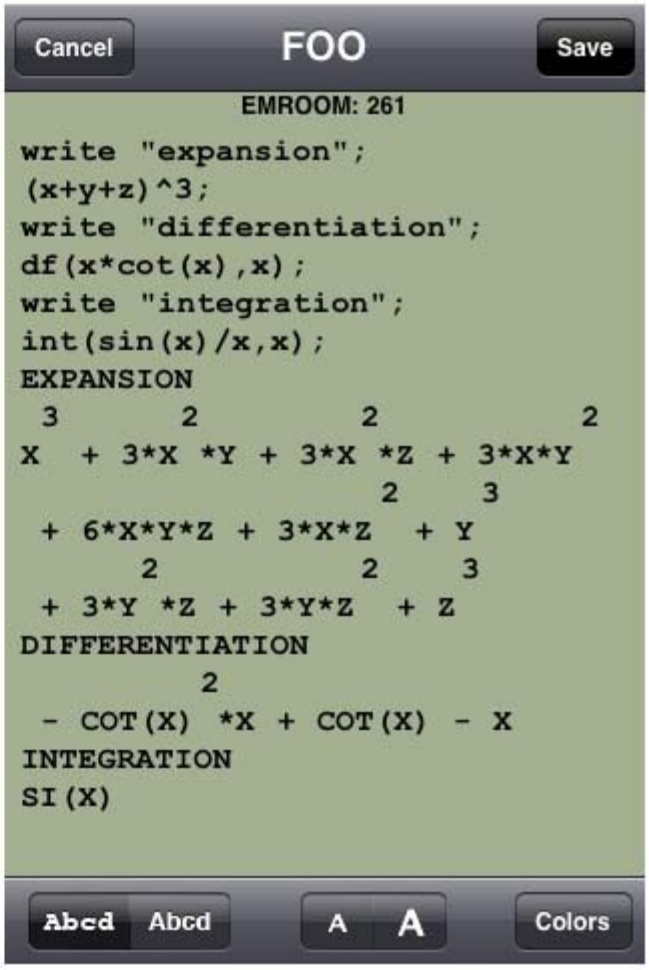
The editor supports two fonts (monospace and not monospace) with variable sizes and colors. The colors mimic the 41CX LCD, but you can toggle to black on white. Your last font, font size, and color are retained between sessions. Tapping the name of the file will drop down the keyboard.

The alternative would be to email (cut and paste) or download text files created elsewhere (also supported by i41CX+). Having the editor built-in is much nicer since the iPhone still does not allow the multitasking of 3rd party apps. I like it so much that Sigma+ is now I41CXED.

CAS

The CAS is based on REDUCE--"A portable general-purpose computer algebra system" (http://reduce-algebra.sourceforge.net/). The version of REDUCE used in i41CX+ is optimized for embedded systems (http://reduce-algebra.svn.sourceforge.net/viewvc/reduce-algebra/branches/asau-bsd-port/csl/embedded/). I use the embedded version on my MacBook to quickly prototype REDUCE programs for i41CX+. The documentation for both versions is the same and can be obtained from the first URL. (I have a PDF of the docs for any that are interested).

REDUCE is a worksheet style CAS environment similar to Mathematica, Sage, etc... Basically, you enter some expressions, statements, programs, etc... execute CAS and then view the output, e.g.:



Unless specified the output will be appended to the input. Most useful for a quick CAS session. Unlike Mathematica, Sage, and many others the input and output on the worksheet is not separated. Because of this a "re-CAS" would produce the same initial results, but then could produce a lot of errors as it parses the old output. The solution for this is to specify two files in the alpha register, e.g. FOO,BAR. Where FOO would be the input file and BAR the output file. When the editor is invoked it will stop parsing the alpha register when either a comma or end of line is encountered. If the output file does not exist then CAS will create it with the output of the input file. If the output file exists then the output will be appended. If the output file is not specified but a comma still terminates the line (e.g. FOO,), then the output is sent to /dev/null, IOW there will be no output. There is actually a use for no output when writing programs that directly manipulate the 41CX registers (more on this later).

Given all the CAS programs available for the iPhone, including HP 49g emulation in m48+, you may be asking yourself, "why?"

There are a few distinct advantages of having this CAS built into i41CX+:

1. You can write an RPN program to programmatically create a CAS input file, execute CAS, then parse the output. Large matrix operations perhaps?
2. You can write powerful CAS programs that can use any 41CX register as input and/or output.
3. Because it's CAS in a 41CX. :-)

CAS Program Examples

REDUCE programs are not much different that other structured programming languages (smells a bit like Pascal). What is unique with REDUCE for i41CX+ is that you can get and put data to any RPN register. The following table illustrates this relationship:

41CX	REDUCE
X,Y,Z,T,L	x_reg, y_reg, etc...
ALPHA	a_reg
R000-R*nnn*	data_reg(0)-data_reg(*nnn*)

Some of the following examples have been submitted for inclusion into the on-board i41CX+ examples.

FACTOR:

```
define x=x_reg;
p:=factorize(fix(x));
x:=0;
for i:=1:length(p) do <<
 q:=part(p,i);
 for j:=1:part(q,2) do
  data_reg(x:=x+1):=part(q,1);
>>;
```

FACTOR will store all the prime factors of an integer into the 41CX registers starting with R001 with the number of factors stored in X. The *fix* function converts any non-integer input to integer--input conditioning as apposed to proper error handling. If the number of registers required is not available the CAS system will exit with a DATA ERROR message. I am unsure if a flag is set on error.

FACTOR can be easily modified to only return distinct primes by replacing this block:

```
for i:=1:length(p) do <<
 q:=part(p,i);
 for j:=1:part(q,2) do
  data_reg(x:=x+1):=part(q,1);
>>;
```

with:

```
for i:=1:length(p) do
 data_reg(x:=x+1):=first part(p,i);
```

FACTOR relies on the CAS *factorize* function. *factorize* returns a list of pairs (lists), e.g. {{2,2},{5,2}}. The *part* function is one way to manipulate lists.

The *define* statement can be use to assign an alias. If you find your code using a lot of *_reg variables you can reduce your byte count by redefining some of the *_reg variables. This strategy was important with the early CAS betas, but now that XXM is supported it is less important.

REDUCE can use << >> or *begin end* to delimit blocks.

DIVIS:

```
define x=x_reg;
define r=data_reg;
r(0):=0;

procedure err(a); <<
 a_reg:=a;
 r(0):=-1;
 update_regs_and_quit();
>>;

if not fixp x then
 err """NOT INTEGER""";
if x<1 then err """X < 1""";

p:=factorize(x);
q:={1};
if x=1 then p:={};

while p neq {} do <<
 t:=first p;
 s:=first t;
```

```
 p:=rest p;
 l:=length q;

 for i:=1:second t do <<
  k:=s^i;
  for j:=1:l do
   q:=append(q,{part(q,j)*k});
 >>;
>>;

x:=length q;
if x>part(length(r),1)-1 then
 err """OUT OF REGS""";
for i:=1:x do r(i):=part(q,i);
```

DIVIS will return all the divisors of an integer into registers R001-R*number-of-divisors* with the number of divisors stored in X unless the initial X is not an integer or less than 1. In that case X is left on the stack and an error message returned to the ALPHA register. If the number of registers required is less than the number of divisors then DIVIS will exit with an error, however X will contain the number of divisors (and therefore the number of registers needed (remember to add one for R000)).

DIVIS does a better job of error handling than FACTOR. To do this I defined a procedure (err) to accept an encapsulated string as an argument that then stores that to the ALPHA register as well as stores a -1 to R000 (the default is R000=0). The last statement *update_regs_and_quit()* updates the registers then exits. If *quit* or *bye* had been used then none of the *_reg variables would have been returned to the 41CX environment.

Below is an RPN wrapper around DIVIS (also called DIVIS). R000 is used as a return code; 0 for OK, and -1 for error. If error, then AVIEW, otherwise print the divisors.

```
01♦LBL "DIVIS"
02 "DIVIS,"
03 CAS
04 RCL 00
05 X≠0?
06 GTO 01
07 RDN
08 ENTER↑
09 ENTER↑
10 1000
11 /
12 1
13 +
14 PRREGX
15 RDN
16 RTN
17♦LBL 01
18 AVIEW
19 RDN
20 .END.
```

Example output of 90 DIVIS:

```
 R01=   1.000000000
 R02=   2.000000000
 R03=   3.000000000
 R04=   6.000000000
 R05=   9.000000000
 R06=   18.00000000
 R07=   5.000000000
 R08=   10.00000000
 R09=   15.00000000
 R10=   30.00000000
 R11=   45.00000000
 R12=   90.00000000
```

If you have a 49/50 handy you will notice both output in the same order (I'll assume they use the same basic algorithm). To address the order issue I created a small *straight insertion* sort program.

SORT:

```
define r=data_reg;
for j:=2:x_reg do <<
 a:=r(j);
 k:=j-1;
 while k>0 and r(k)>a do <<
  r(k+1):=r(k);
  k:=k-1;
 >>;
 r(k+1):=a;
>>;
```

All that is needed is to call this sort in my DIVIS RPN program. Since the X register is left with the number of divisors and the sort program is expecting X to have the last register used for sorting then all that is needed is:

```
SORT,
CAS
```

New RPN DIVIS:

```
01*LBL "DIVIS"
02 "DIVIS,"
03 CAS
04 RCL 00
05 X≠0?
06 GTO 01
07 RDN
08 "SORT,"
09 CAS
10 ENTER↑
11 ENTER↑
12 1000
13 /
14 1
15 +
16 PRREGX
17 RDN
18 RTN
19*LBL 01
20 AVIEW
21 RDN
22 .END.
```

New output of 90 DIVIS:

```
R01=   1.000000000
R02=   2.000000000
R03=   3.000000000
R04=   5.000000000
R05=   6.000000000
R06=   9.000000000
R07=   10.00000000
R08=   15.00000000
R09=   18.00000000
R10=   30.00000000
R11=   45.00000000
R12=   90.00000000
```

Easy!

Summary

A 41CX with CAS? What's next? Graphics? :-)

I am not an expert with REDUCE. I have only quickly scanned the documentation. I cannot tell you if REDUCE is the most complete or best CAS for the iPhone. Without a complete survey its hard to say. However, I've tried just about every iPhone CAS. For programming, flexibility, and fun, this has to be my favorite (CAS is now assigned to Sigma-).

OT: TI-Nspire 2,0 arrived

*Message #1 Posted by **Joerg Woerner** on 13 Mar 2010, 9:15 p.m.*

Hi folks,

I received yesterday both a TI-Nspire 2.0 and TI-Nspire CAS 2.0 and played two hours or so with them.

Short answer: PERFECT CALCULATORS!!!

I found nothing to complain and look forward to spend $10 for the new Touchpad and upgrade my original TI-Nspire's. Unfortunately can the the original TI-Nspire CAS not be upgraded.

I tested all configurations with the different versions and keyboards and it look pretty impressive!

Even the new TI-Nspire with Touchpad emulates the TI-84...

Regards,

Joerg

Re: OT: TI-Nspire 2,0 arrived

*Message #2 Posted by **Don Shepherd** on 14 Mar 2010, 5:41 a.m.,*
in response to message #1 by Joerg Woerner

Looks great, Joerg.

> Quote:
>
> Unfortunately can the the original TI-Nspire CAS not be upgraded.

I'm not sure what you mean by this. I upgraded my original CAS unit to OS v2 and it works OK, just no touchpad, of course. I also upgraded my PC software, teacher CAS edition, to v2 and it works fine with the touchpad emulator.

One thing I noticed about the new programming commands, Text and Request, is that Text does let you split your text across several lines using char(13)&char(10), but Request does not. Perhaps TI will add that capability to Request in v2.1.

Re: OT: TI-Nspire 2,0 arrived

*Message #3 Posted by **Marcus von Cube, Germany** on 14 Mar 2010, 1:39 p.m.,*
in response to message #2 by Don Shepherd

Jörg seems to be referring to the simple keypad upgrade available for the non CAS version of the Nspire only. This is the $10 option he's mentioning in his post. The v2 OS is running on my older Nspire CAS with success, just with the original clickpad.

Jörg, how's the touchpad?

Re: OT: TI-Nspire 2,0 arrived

*Message #4 Posted by **Han** on 14 Mar 2010, 10:53 p.m.,*
in response to message #3 by Marcus von Cube, Germany

I don't speak for Jörg, but my personal experience with the touchpad is that it is much nicer than the clickpad, but it is still far from being as good as a touchpad found on today's laptops. When you press the MENU button, the pointer disappears. Touching the touchpad requires a few milliseconds for the pointer to reappear (i.e. moving your finger over the touchpad does not result in the immediate response of a moving cursor; there is a bit of a delay). I think I have become too used to the touchpad on my laptop, and am a bit more critical of the touchpad's sensitivity than perhaps your "normal" user.

Bottom line, however, it is worlds better than the clickpad.

*Message #8 Posted by **Nigel J Dowrick** on 15 Mar 2010, 9:54 a.m.,*
in response to message #1 by Joerg Woerner

They do look good. However, they still remain aimed clearly at "education", meaning schools. No differential equation graphing; still very few input and output facilities in programs (although the improvement is nice); no 3D graphing (perhaps because it isn't required in schools? I'm not sure about this). These machines are so powerful that it seems to me that they would make excellent engineering calculators or general-purpose data-collection devices. Are these latter two markets really so small that TI has chosen to ignore them?

I fear that the answer may be "yes". Will TI ever again produce a new calculator like the TI-89?

Nigel

Re: OT: TI-Nspire 2,0 arrived

*Message #9 Posted by **Timo** on 15 Mar 2010, 1:55 p.m.,*
in response to message #8 by Nigel J Dowrick

I've made the experience that functions like differential equation solver or 3D-ploting are rarely required for engineering purposes.

Personally I owned a TI Voyage 200 that I used for some time in university. When I started my first job I had it in a drawer in my office for quite a while but never used it. Everytime things like differential equations, 3D plotting or something smilar had to be tackled I used tools like Scilab ot Matlab.

Part of the reason for this is surely that these tasks were part of larger projects that needed to be documented in a traceable manner. That's something you can hardly do with a calculator unless you connect it to a printer.

So frankly, I do not see much use for such powerful calculator functions nowadays unless you need a really handy powerful unit for field use.

Re: OT: TI-Nspire 2,0 arrived

*Message #10 Posted by **Alain Mellan** on 16 Mar 2010, 1:26 a.m.,*
in response to message #8 by Nigel J Dowrick

Definitely meant for the education market, not for engineers: look at the size and position of the EE key!

*Message #11 Posted by **hugh steers** on 15 Mar 2010, 1:15 p.m.,*
in response to message #1 by Joerg Woerner

Nice pictures,

does anyone know if these are new improved hardware and if so what the specs are, or are the new models just variations?

thanks,

Re: OT: TI-Nspire 2,0 arrived

*Message #12 Posted by **Egan Ford** on 15 Mar 2010, 2:23 p.m.,*
in response to message #11 by hugh steers

Can it be re-purposed? C, C++?

Re: OT: TI-Nspire 2,0 arrived

*Message #13 Posted by **Don Shepherd** on 15 Mar 2010, 2:47 p.m.,*
in response to message #12 by Egan Ford

Egan, I did read somewhere about some hack that allows you to run C-developed apps on the NSpire, but I know TI would frown upon that since they guard their operating systems pretty closely. But it might be "possible".

Re: OT: TI-Nspire 2,0 arrived

*Message #14 Posted by **Joerg Woerner** on 15 Mar 2010, 11:04 p.m.,*
in response to message #11 by hugh steers

Difficult question!

The old SoC was labeled TI-NS2006 and the new one TI-NS2007 Magnum.

The old PCB had three memory chips, the new one misses the NOR-Flash. I suppose that it was integrated into the ASIC. Everything else looks identical.

Execution speed is identical, LC-display is identical.

I will post pictures of the PCB'son my website before the end of this week. Stay tuned.

Regards,

Joerg

Repair of HP 11C

*Message #1 Posted by **Don Steele** on 13 Mar 2010, 7:13 p.m.*

New Poster - I have an older 11C and the faceplate came off. I tried to re-attach with rubber cement which was a horrible plan. I have taken it completely apart and cleaned it up. I have read prior forum articles about using using hobby tire cement to hold down the keyboard pcb and using a soldering iron to remelt stake tops to attach the pcb. Other articles talk about using tire cement or gorilla glue for the faceplate. Opinions about what is best?

The foam connector between the keyboard pcb and the display/cpu came off. This has a black side and a red side. Which side goes next to the keyboard pcb? I think it is the black side.

Where can I get another spring? There was only one spring when I opened this up.

I appreciate your help. - Don

Re: Repair of HP 11C

*Message #2 Posted by **Michael Plant** on 14 Mar 2010, 1:45 a.m.,*
in response to message #1 by Don Steele

Gorilla glue expands, so be careful with that. I'd just use double sided tape, personally. However, I've never attempted this on a Voyager (I've never had the face plate off one), so I'm keen to hear other opinions.

Re: Repair of HP 11C

*Message #4 Posted by **Dave Shaffer (Arizona)** on 14 Mar 2010, 1:43 p.m.,*
in response to message #3 by geoff quickfall

> Quote:
>
> I used a thin coating of contact cement applied to both pieces, the bezel and the case.

A minor warning: contact cement gives you NO second chance at alignment - once the two pieces touch, you can not slide them around.

Re: Repair of HP 11C

*Message #5 Posted by **Geoff Quickfall** on 14 Mar 2010, 2:33 p.m.,*
in response to message #4 by Dave Shaffer (Arizona)

Dave is correct.

To minimize the need to realign I start with small points of application on the bezel with corresponding points on the case. There is no need to coat the entire bezel and case at all contact points.

Then, with the bezel at a 45' angle to the case (longitudinally) place the bezel on the case starting at one end. Line it up at this point then lower the opposite end confirming the line up, until the bezel is in place.

If after this it is out of alignment, a reaplication of heat on the bezel as described (and as the glue is new) will allow you to remove the bezel and reapply it -or- to remove the bezel, pick off the glue from the case and bezel and reapply it.

Cheers, Geoff

I have used this method for applying Classic labels, Voyager bezels, Pioneer keyboard overlays and have never had to remove them yet (perhaps just lucky)

In any case (pun intended) let us see the results.

Repaired 41C

*Message #1 Posted by **ClausB** on 13 Mar 2010, 8:09 a.m.*

I repaired my 41C's flex circuit which was damaged by corrosion. In testing, I found something odd. With no other modules in place, the Math Pac worked in port 1 but not in port 2. The display would come on but then no response to any key, including power. The repair is on the port 1/3 side of the flex circuit, not the port 2/4 side.

However, with a 4X RAM in port 1, the Math Pac works in port 2. I read that the ROM has to come after the RAM, but why would the ROM not work without the RAM?

(Edited: they're ports, not slots. D'oh!)

Edited: 13 Mar 2010, 11:08 p.m. after one or more responses were posted

Re: Repaired 41C

*Message #2 Posted by **Jeff Kearns** on 13 Mar 2010, 8:41 a.m.,*
in response to message #1 by ClausB

I believe you are simply not allowed to leave slot 1 empty. Although the instructions indicate that you can leave 'gaps' e.g. memory module in port 1 and application module in port 3 or 4 with port 2 empty etc., you may have to use port 1 first in either case.

Re: Repaired 41C

*Message #3 Posted by **Massimo Gnerucci (Italy)** on 13 Mar 2010, 8:58 a.m.,*
in response to message #2 by Jeff Kearns

The only requirement is to fill lower ports with RAM modules (if present). How could you use Card reader (and associated ROM) without additional RAM modules otherwise?
Since you mention corrosion check that you got rid of all of it

Greetings,
Massimo

Edited: 13 Mar 2010, 9:01 a.m.

Re: Repaired 41C

*Message #4 Posted by **ClausB** on 13 Mar 2010, 7:59 p.m.,*
in response to message #3 by Massimo Gnerucci (Italy)

The only corrosion I found on the PCB was a bit on the gold contacts to the flex circuit, easily cleaned off. The flex circuit itself was badly corroded. The negative battery terminal was destroyed so I cleaned it and covered it with a metal strip that reaches up to the PCB contact. It is a bit thick so I covered the adjacent contacts with aluminum foil strips to ensure contact.

It seems to work except for the oddity noted above, but perhaps that is normal?

Re: Repaired 41C

*Message #5 Posted by **Massimo Gnerucci (Italy)** on 14 Mar 2010, 7:40 a.m.,*
in response to message #4 by ClausB

May I suggest that you try to contact Diego Diaz (http://www.clonix41.org/Maintenance/IO_Block/IO_Block.htm) for a replacement, if available?

;)

Greetings,
Massimo

Edited: 14 Mar 2010, 7:40 a.m.

Re: Repaired 41C

*Message #6 Posted by **ClausB** on 15 Mar 2010, 6:14 p.m.,*
in response to message #5 by Massimo Gnerucci (Italy)

That new flex circuit looks very nice but I recently put in new batteries (Radio Shack, 2 for $0.99) and now the Math Pac works in port 2 with or without RAM in port 1. Yay! The old batteries measured about 1.25 V each unloaded and there was no Lo Batt indicator, but they were 15 years old. They had been stored outside the calculator, after the corrosion damage had occurred with the previous set.

HP41 faster after crash and reset?

*Message #1 Posted by **Timo** on 13 Mar 2010, 7:06 a.m.*

I've had the first unpleasant experience with my Fullnut HP-41CV yesterday. During a business trip I got it out of its pouch for some quick calculations only to discover that it had turned completely nuts over night.

It did not turn on correct, displayed only garbage, etc. All quick recovery actions failed. When I got home I was able to reset it by taking out the batteries, shorting the contacts for half an hour (combined with pressing the On-key for two minutes), then pressing Backspace-Enter-On a couple of times. That when I was able to turn it on as normal again, and after performing a master clear (Backspace-On) the episode was over.

However, when I had my programs wanded in again I had the impression, that the calculator is now a good bit faster than before. Is that only in my imagination or can this really be true?

Maybe discharging all the capacitances in the system cleared some memory garbage or else??

And BTW, how can such a crash happen in the first place? I mean, I didn't even touch the unit before it went nuts...

Re: HP41 faster after crash and reset?

*Message #2 Posted by **Håkan Thörngren** on 13 Mar 2010, 1:11 p.m.,*
in response to message #1 by Timo

Maybe you just went out of USER mode? That can make the calculator a lot more responsive.

HP-41s can get lost, crash and lose the memory. It is not common, but I think it happens a little bit more often than most other LCD HP calculators which tend to be very stable. (I have extremely little experience with LED calculators, so I will not judge them).

I do not know why, maybe it is due to the zebra strip in the early ones, in combination with temperature variations?

Re: HP41 faster after crash and reset?

*Message #3 Posted by **Timo** on 15 Mar 2010, 1:40 p.m.,*
in response to message #2 by Håkan Thörngren

Oh man, sorry for this late response, but I do not find lots of time for this forum at the moment...

I don't think its attributed to the USER-Mode since I exit this mode everytime I do not need it. I don't know, maybe I was just so happy to see my little friend back alive, that I thought it's also slightly faster now...

However, what I did find regarding possible causes of a crash is this PDF: See this...

It seems to be a letter from HP to a customer who sent his HP 41 to HP for repair. In this letter they mention that strong magnetic fields or electromagnetic discharges can cause such problems on a HP-41. I

did actually hear the high pitched noise that depressed keys can emit as mentioned in this document, though it was hardly discernable.

I don't know, maybe I had it stored to close to this age-old TV-Set in my hotel room... ;)

New ILPer version for the PIL-Box

*Message #1 Posted by **J-F Garnier** on 13 Mar 2010, 6:11 a.m.*

Hi,

Thanks to Christoph Giesselink, a new version of my ILPer software is now available.

Main change is that ILPer is now written in VC6 instead of VB2005, and no more requires the installation of the MS NET Framework.

This new version also provides several fixes and improvements: the ILPer window can be minimized and restored without problems, the COM port can be selected from a list of available ports, there is a “open file” buttom to select the disc image file, and finally the settings (COM port and speed, image file name) are saved.

I recommend using ILPer to transfer data/programs between HP41/71 and Emu41/71, even if Emu41 (and Emu71 very soon) provide native PIL-Box support. ILPer is faster and more robust.

J-F

Link to My HPIL page .

HP 30b Business Professional

*Message #1 Posted by **Gerardo Rincon** on 12 Mar 2010, 8:01 p.m.*

I just recevied confirmation of HP shipping my new HP 30b Business Professional! I can't wait to have it.

Re: HP 30b Business Professional

*Message #2 Posted by **Don Shepherd** on 12 Mar 2010, 9:03 p.m.,*
in response to message #1 by Gerardo Rincon

Then maybe you will want to look here for some training modules, including how to program it.

Adjusting HP-97 card reader

*Message #1 Posted by **Ed Sowell** on 12 Mar 2010, 4:18 p.m.*

In his great write-up on replacing the rubber drive wheel, Mike Davis says "Adjust slotted shaft until the card reads and writes properly."

What's being adjusted here? Perhaps the slotted shaft, which is the axle for the gear roller and gear, is slightly excentric so turning it moves the gear closer to or farther away from the worm on the motor shaft?

Re: Adjusting HP-97 card reader

*Message #2 Posted by **Michael de Estrada** on 12 Mar 2010, 5:07 p.m.,*
in response to message #1 by Ed Sowell

Yes, the shaft is eccentric, but what is being moved is the rubber wheel against the card to increase are decrease the pressure. Too much pressure and the motor will strain and the card will pull through too slowly. Too little pressure and the card may slip and not pull through smoothly. The service manual uses the current draw in the motor as the card is held back in the reader to determine the proper adjustment.

One HP-35 back to life

*Message #1 Posted by **Jean-Michel** on 12 Mar 2010, 4:02 p.m.*

Hello all!

I'm pleased to share with you, and especially with those who answered my question a few days ago about polarities of the HP-35, the fact that my recently acquired 35 is ALIVE. I plugged it to an adjustable current supply set to the required 3.75 V and the screen immediately showed the most beautifull "0" I've ever seen... I tested all the keys and none of them is out of use.

I now have to glue the right side of the bottom label and to refresh the silver strips just above the ON key and it will be ready to receive a new battery set.

Any hits of how to do it with current batteries?

I tried to do the same with the 25 I received from the same person, but it seems that corrosion damaged the circuitry. Surprisingly the two pcbs seems very clean. But I know that a killed electronic component may look totally normal.

If anyone of you has a better idea, he could make me even happier.

Kind regards. Jean-Michel

Cleaning the goo off card reader

*Message #1 Posted by **Ed Sowell** on 12 Mar 2010, 2:35 p.m.*

What's a good solvent for cleaning the gooey rubber off the HP 97 card reader parts? Acetone? DesolveIt?

Re: Cleaning the goo off card reader

*Message #2 Posted by **Ed Sowell** on 12 Mar 2010, 5:45 p.m.,*
in response to message #1 by Ed Sowell

I decided to try acetone. It disolves the goo just fine, but I'm worried it might attack the plastic parts too. So far, I've used it only on the steel shaft that carries the rubber roller.

If anybody has a better idea, let me know.

Re: Cleaning the goo off card reader

*Message #3 Posted by **geoff quickfall** on 12 Mar 2010, 6:59 p.m.,*
in response to message #2 by Ed Sowell

Alcohol or rubbing alcohol (anhydrous propynol, iso-propynol). I use 99% and you can find it at the drug store. Acetone hates plastic and if you get some on the pinch roller plastic you will ruin the teeth.

In fact alcohol will remove the goo from the card reader frame work and not affect any of the plastic. Use a stif natural bristle brush and clean the eccentric cam, pinch roller, framework.

Your next step is to decide on which type of pinch roller rubber substitute you will use, silicone tubing or o-rings.

Also, once the pinch roller is cleaned and the rubber replaced the next fault area is the dampening couple (incorrectly refered to as the motor clutch). It is the tiny aluminum sleeve connecting the motor shaft to the worm gear.

It is made of the same rubber and suffers the same degradation as the pinch roller. While you are at this point you might as well replace the rubber there also otherwise the rotational stress of the new pinchroller system will cause it to fail.

Cheers, Geoff

Good thing I asked! The Rubbing alcohol on the shelf is 70%. Will that do?

> Quote:

> Your next step is to decide on which type of pinch roller rubber substitute you will use, silicone tubing or o-rings.

I bought the O-rings from the eBay seller of same. Seemed easier than looking for a model airplane store or a medical supplier, the apparent sources of other suggested replacements.

So I have to remove the motor, pull the sleeve/worm gear off, and dig the goo out of that tiny aluminum tube? What is the replacement? [/quote]

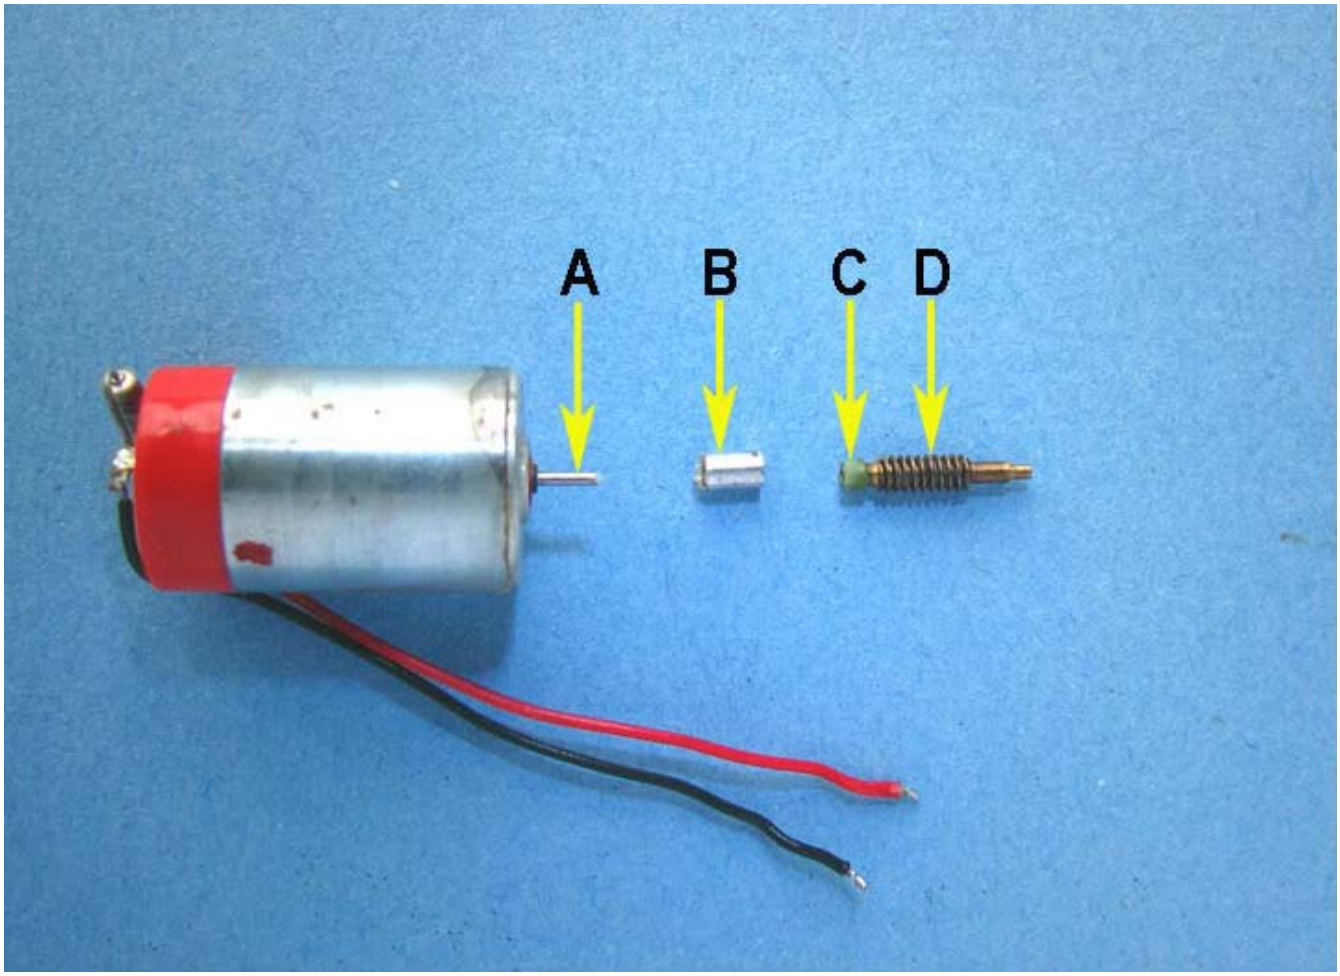
Thanks!

here you go

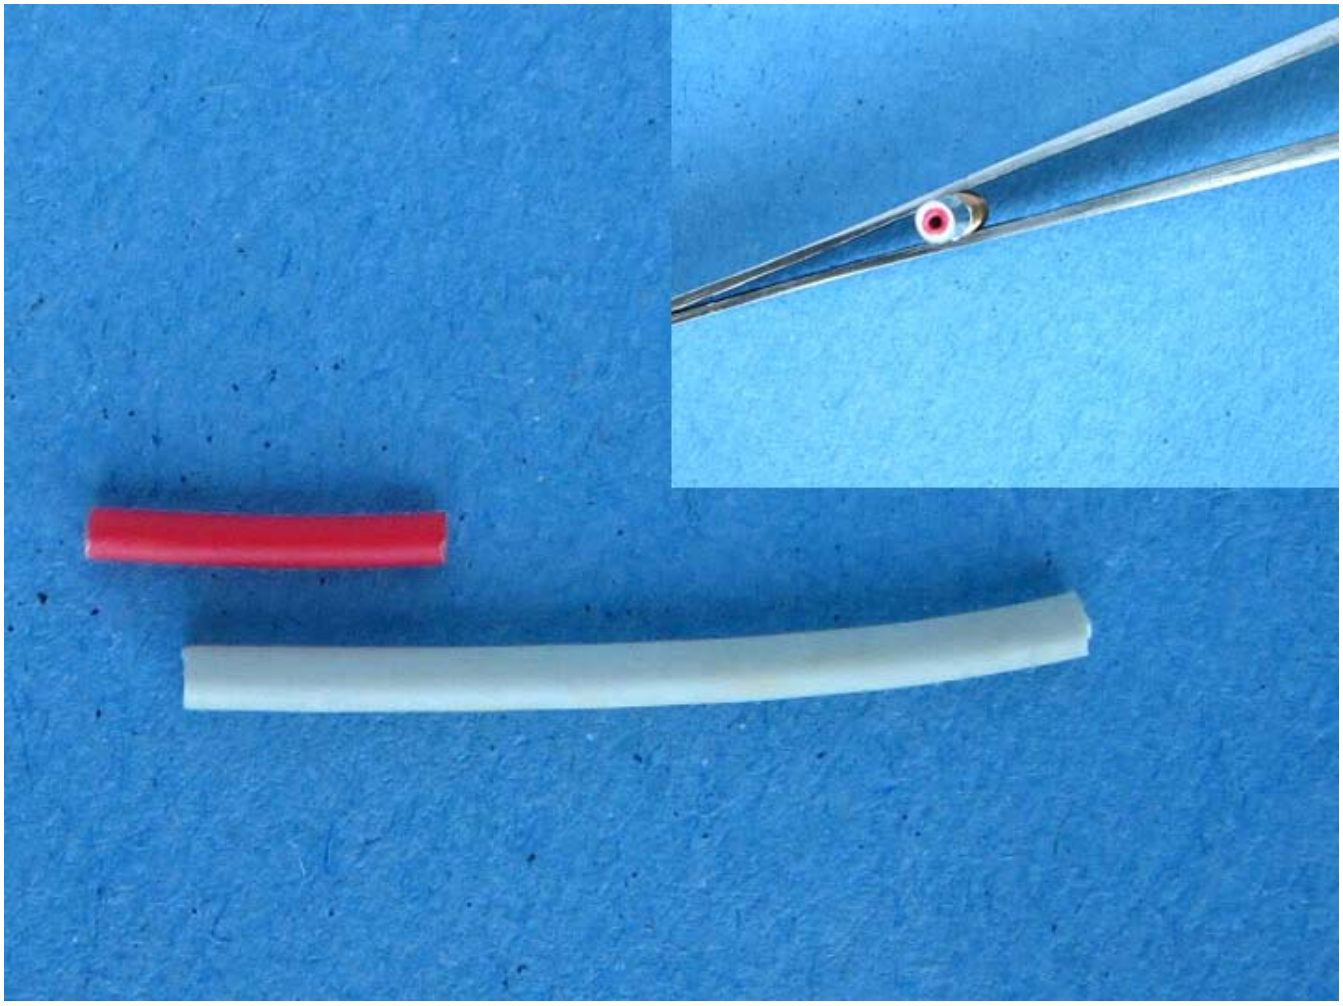
*Message #5 Posted by **geoff quickfall** on 12 Mar 2010, 11:23 p.m.,*
in response to message #4 by Ed Sowell

70% works fine, nice thing is that the alcohol will evaporate. I use it to clean the pcas and contact points. Good for the card reader head, similar to the cassette deck cleaners we used with cassettes.

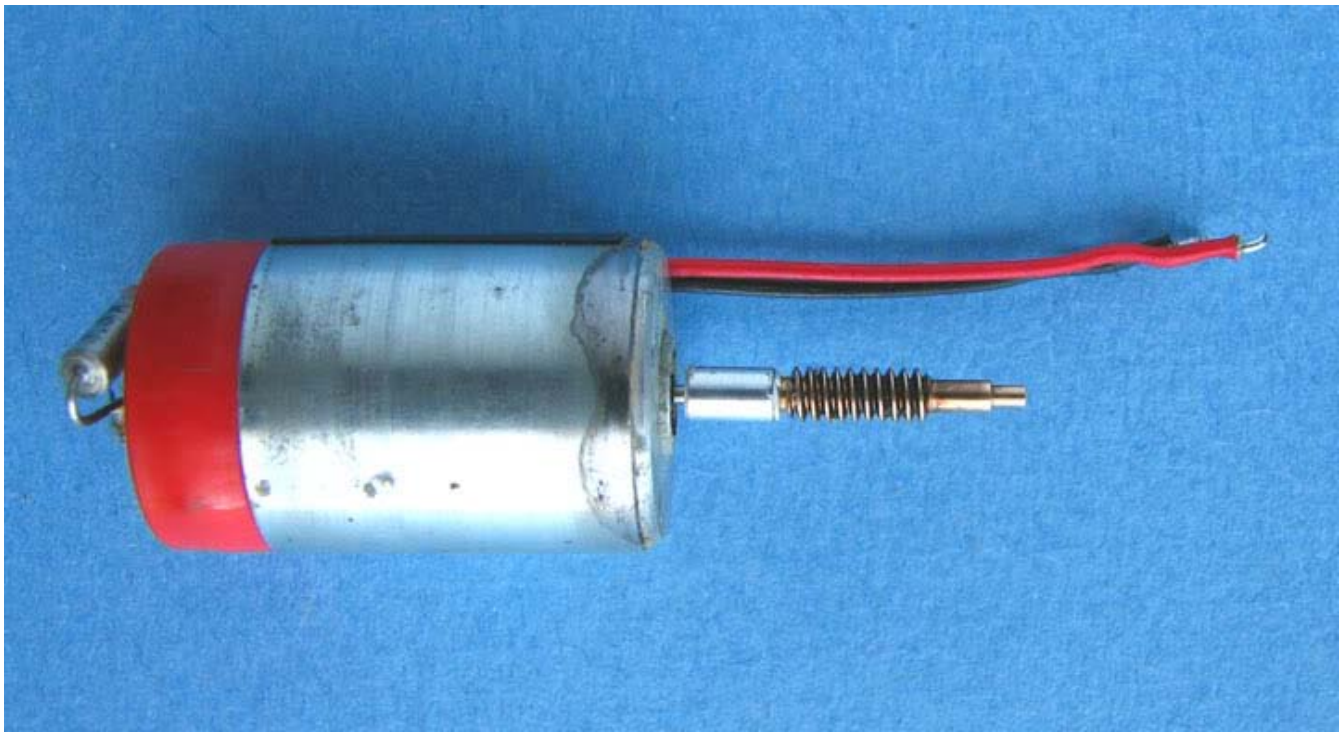
here are some photos of the dampening couple. I use two different diameter wire insulations to simulate the rubber of the original couple. remove the wires and insert the small diameter into the larger diameter. the smaller diameter will be shorter allowing the wide diameter to connect to the worm gear and the narrow diameter to connect to the spindle of the motor:



a: spindle
b: aluminum sleeve of couple
c: couple (deteriorated rubber)
d: worm gear



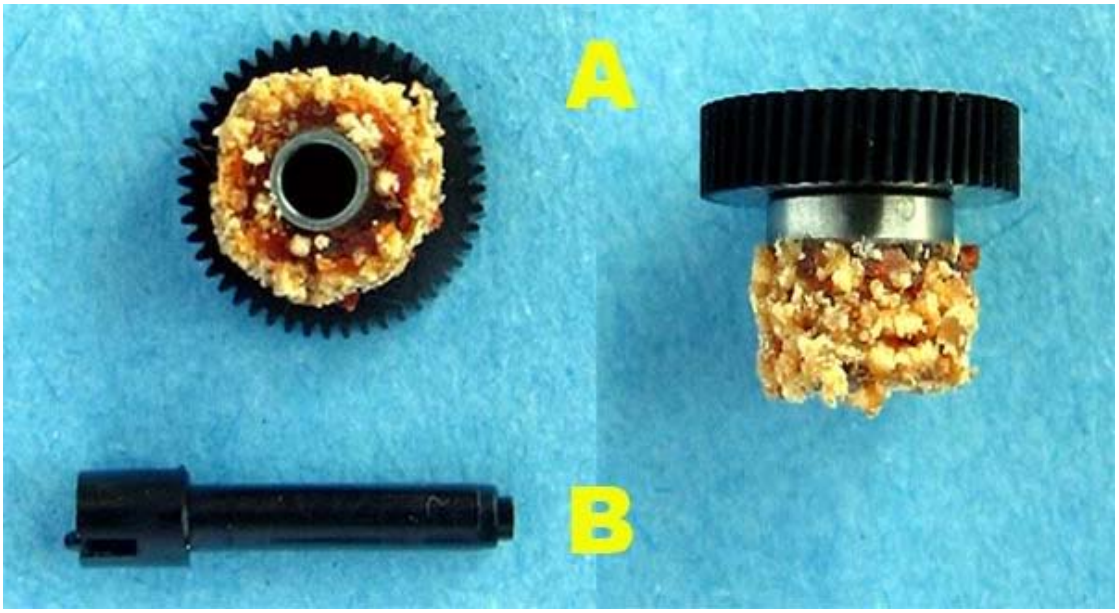
inset showing relationship of inner to outer insulation



assembled unit

I find this preserves the intent of the couple; to dampen the vibration between the motor and the worm gear.

I never tire of showing the following image of a deteriorated pinch roller from an HP-41C



cheers, Geoff

Re: here you go

*Message #6 Posted by **Ed Sowell** on 13 Mar 2010, 4:14 p.m.,*
in response to message #5 by geoff quickfall

Thanks, Goeff.

A couple more questions.

How do I tell if my dampening coupler needs to be fixed?

In the original part, was th pliable material bonded or glued to the sleeve and shaft? What I'm getting at is whether slipage is indended, or the action of a dampened spring?

Finally, do you recall the wire sizes?

Re: here you go

*Message #7 Posted by **Geoff Quickfall** on 13 Mar 2010, 5:15 p.m.,*
in response to message #6 by Ed Sowell

"How do I tell if my dampening coupler needs to be fixed?"

Because it is there ;-) Really because it is the same material as the pinch roller and age and you might as well repair it at the same time that you have it apart for the pinch roller. It saves flexing the solder joints and wires.

"In the original part, was th pliable material bonded or glued to the sleeve and shaft? What I'm getting at is whether slipage is indended, or the action of a dampened spring?"

It is compression and friction fit, no glue, that is why gluing or adding cyano acrylate as some suggest is not the best fix, although it works.

"Finally, do you recall the wire sizes?"

Not off hand and I am not at home to refer to my notes, but get the larger diameter with a slightly larger outer diameter then the aluminum sleeve and the narrow insulation should have an inner diameter smaller then the motor shaft for a friction fit. You nmight have to experiment.

Cheers, Geoff

Re: here you go

*Message #8 Posted by **Marcus von Cube, Germany** on 14 Mar 2010, 12:37 p.m.,*
in response to message #7 by Geoff Quickfall

Shrinking tube is another material suitable to fix the coupler.

Re: here you go

*Message #9 Posted by **Geoff Quickfall** on 15 Mar 2010, 2:14 a.m.,*
in response to message #8 by Marcus von Cube, Germany

Hello Marcus,

I have heard this before and was wondering if you have had first hand experience with it.

Do you remove the aluminum sleeve and just join the shaft and worm gear together with the heat shrink tube?

Or do you fit it then slide the aluminum tube over the repair. If so do you equalize the diameter of the tubing on the narrow part to equal the thickness of the tubing over the worm shaft.

Cheers, Geoff

Re: here you go

*Message #10 Posted by **Marcus von Cube, Germany** on 15 Mar 2010, 6:08 a.m.,*
in response to message #9 by Geoff Quickfall

I did it just once for my 41 card reader. I think its just the tube without the metal sleeve. You need tube with the right "shrinking factor" because the ends are of different diameter. When I find the time, I'll open the case and check again.

Re: here you go

*Message #11 Posted by **Ed Sowell** on 15 Mar 2010, 12:27 p.m.,*
in response to message #10 by Marcus von Cube, Germany

I don't see any mention of heat shrink in Geoff's method. Seems to be just ordinary insulation pulled off of solid wire.

Edited: 15 Mar 2010, 12:28 p.m.

Heat shrink

*Message #12 Posted by **Geoff Quickfall** on 15 Mar 2010, 3:06 p.m.,*
in response to message #11 by Ed Sowell

Never used the heat shrink method. I will check it out as an addendum to my HP 41C card reader chapter.

I have used the wire insulation method, but if the heat shrink works, and obviously it does, I will try it and document it.

Just recieved a box of HP 41cv cx and c boards shells and etc. Five in all and they all test even thought they have bad posts and shell washers. Looks like all five will be working when assembled and the shells repaired.

Also included was a card reader. All this for 122 USd:

```
2 HP 41C boards and one case(both boards test working)
3 HP 41CV boards and 3 cases (two boards test ok)
1 HP 41CX board and case (also tests ok)
1 HP 41 card reader disassembled in part (repairable)
```

Not a bad haul and as I stated, I will try the shrink wrap method on this card reader. The test will be to see how the hard shrink wrap dampens the vibration.

Cheers, Geoff

Reduce fraction on HP50G

*Message #1 Posted by **olivier scalbert** on 12 Mar 2010, 2:12 p.m.*

Hello,

When I derive and eval the following function: (x^3 -8)^(1/3), I get: x^2 * (x^3-8)^(1/3)/(x^3-8)

Is it possible to simplify the (x^3-8) in order to get: x^2 / (x^3-8)^(2/3)

Thanks very much,

Olivier

Re: Reduce fraction on HP50G

*Message #2 Posted by **Glenn Shields** on 12 Mar 2010, 9:20 p.m.,*
in response to message #1 by olivier scalbert

It can be "forced" by the following: enter the expression, use DERVX in the CALC menu, press down-arrow to enter eqn writer, press down-arrow, down-arrow, right-arrow, EVAL, enter (to leave the eqn writer), then EVAL once more. You should have : x^2 / (cube root of x^3-8)^2, close to but not the fractional power you want. I'm a new user and after going thru the AUR twice, nothing comes back to me in this regard. Any suggestions? ☺

HP 19B

*Message #1 Posted by **Keith Midson** on 11 Mar 2010, 9:07 p.m.*

Hi Hp world,
I have two 19Bii's in my collection - one with a traditional side battery cover, and the other with a rear battery cover.
I have never seen a 19B come up for auction anywhere. I am keen to get one to compete that part of my collection, but every listing on TAS seems to be a 'ii' model!
Were there not many made? Quickly replaced by the Bii model perhaps?
Thanks, Keith

Re: HP 19B

*Message #2 Posted by **JDonley** on 11 Mar 2010, 9:58 p.m.,*
in response to message #1 by Keith Midson

I have seen them in the past on E*** auction site. Don't know how long you have been looking, but I think if you are patient you will find one on that site.

don

Re: HP 19B

*Message #3 Posted by **Allen** on 11 Mar 2010, 11:12 p.m.,*
in response to message #1 by Keith Midson

Trouble with the unmentionable site is the naming confusion with the 19b series. The 19b was the "Business Consultant II" because it followed the 18c business consultant.

The 19bii was also "Business Consultant II".... I think it causes confusion among the sellers who simply list both as "19bii"

Edited: 11 Mar 2010, 11:14 p.m.

Re: HP 19B

*Message #4 Posted by **Keith Midson** on 12 Mar 2010, 3:47 a.m.,*
in response to message #3 by Allen

Perfect! Thanks Allen - that explains it! I had always looked at the "Business Consultant II" and thought that related to the 19BII ...
Just found one on that auction site.

Economical replacement for 42s

*Message #1 Posted by **fiveolddogs** on 11 Mar 2010, 5:43 p.m.*

During a recent move, I lost my trusty 42s. In looking to replace it, I notice two things. First, they are quite expensive to buy, apparently becoming collectible items while I was busy becoming middle-aged. And second, the current HP models are not nearly as cool as the old ones.

Now, I don't use 10% of the features the old 42s had. I use it for simple around-the-house and at-work calculations.

What I love about the 42s: the fantastic HP buttons RPN the stack the build quality

Given what I love about the 42s and that I don't need most of its special features or functions, what HP calc past or present can you folks recommend to me as a economical replacement?

Thanks!

Re: Economical replacement for 42s

*Message #2 Posted by **Martin Pinckney** on 11 Mar 2010, 6:01 p.m.,*
in response to message #1 by fiveolddogs

I think you would have to be more specific about what features of the 42s you used.

The quick answer is HP expects you to buy a 35s.

But if the feature set is adequate for your needs, then comments on this forum might suggest the new 30b has better build quality.

Re: Economical replacement for 42s

in response to message #1 by fiveolddogs

are emulators an option for you ? http://delicious.com/elegant.algorithm/calculator+emulator

Re: Economical replacement for 42s

*Message #4 Posted by **Michael Meyer** on 11 Mar 2010, 7:20 p.m.,*
in response to message #3 by Allen

For basic calculations, there's no better deal (IMHO)than a vintage HP-12C. You can buy one for $10 or less at that auction site, if you watch-- there's always a bunch of them being sold. HP keyboard, RPN, etc. But, personally, I wouldn't be able to sleep well at night without replacing the 42S. I'd pick up a 32S as a backup to that. But that's a collector's point of view..... P.S. Wait until you try an HP-25. You'll like that one, too..... it has LED's.

Re: Economical replacement for 42s

*Message #5 Posted by **Dave Britten** on 11 Mar 2010, 7:16 p.m.,*
in response to message #1 by fiveolddogs

The 17bii might be a good option if you don't need trig or other advanced scientific functions. They can be found much cheaper than the 42s. The 32s and 32sii are also quite nice if you don't mind spending a bit more. The 30b that was just released looks promising, but I haven't had a chance to try one yet. If a grapher isn't out of the question, the 48SX and 48G have been available at very reasonable prices lately (I'd lean toward the 48SX personally).

Re: Economical replacement for 42s

*Message #6 Posted by **Martin Pinckney** on 11 Mar 2010, 7:37 p.m.,*
in response to message #5 by Dave Britten

> Quote:
>
> The 17bii might be a good option if you don't need trig or other advanced scientific functions.

This is actually probably the best suggestion - it has the same form factor as the 42s, also a two-line display, and uses soft keys - RPN option - you'll feel right at home!

Re: Economical replacement for 42s

*Message #7 Posted by **Dave Britten** on 11 Mar 2010, 8:30 p.m.,*
in response to message #6 by Martin Pinckney

Plus it does list-based stats, rather than summation registers, which I much prefer. And you CAN get it to do trig if you're patient enough to (mis)use the solver to implement these functions. Check the articles forum for a few implementations.

Oh, and you can also use it as an alarm clock - the 42s doesn't do that! ;)

I find that it's a very underrated machine, if prices are any indication. (Ditto for the 20s.)

Trig on 17BII

*Message #8 Posted by **Martin Pinckney** on 11 Mar 2010, 10:01 p.m.,*
in response to message #7 by Dave Britten

> Quote:
>
> ... you CAN get it to do trig ... Check the articles forum for a few implementations.

I checked, and found four, I think, by Gerson Barbosa, W. B. Maguire II, and Michael Blankenship. Hope I didn't leave anyone out.

Anyone tried all and compared these methods?

Re: Trig on 17BII

*Message #9 Posted by **Nigel J Dowrick** on 12 Mar 2010, 5:55 a.m.,*
in response to message #8 by Martin Pinckney

I believe that there are several different calculators, all called 17Bii. The earliest looks just like the HP-42S; it's fine. After that came a multi-coloured model that looks great but apparently has very poor build quality (I don't have one myself). The current 17Bii is silvery-looking and solidly-built; I picked up a second-hand one cheap and (apart from the lack of trig functions) it's one of my favourite machines. I'm hoping that the new 30b has a similar build quality.

Nigel

Re: Trig on 17BII

*Message #10 Posted by **Don Shepherd** on 12 Mar 2010, 6:40 a.m.,*
in response to message #9 by Nigel J Dowrick

> Quote:
>
> I believe that there are several different calculators, all called 17Bii.

Well, first there was the 17b (algebraic), then the 17bii (added RPN). These looked alike and had a great solver. Then came the brown/gold rubbery case 17bii+, with a less-than-stellar, shall we say, solver. Then about 3 years ago came the 17bii+ silver/retro look, with a great build quality but the same less-than-stellar solver.

And, yes, the 30b has the same build quality as the current silver 17bii+.

Re: Trig on 17BII

*Message #11 Posted by **Martin Pinckney** on 12 Mar 2010, 8:49 a.m.,*
in response to message #10 by Don Shepherd

Many eB** sellers add to the confusion by not making any distinction between the various ii models in their auction titles. But as far as fiveolddogs is concerned, since he is trying to replace a 42s, IMO only the Pioneer 17bii will do. No +'s.

Re: Trig on 17BII

*Message #12 Posted by **Allen** on 12 Mar 2010, 4:50 p.m.,*
in response to message #10 by Don Shepherd

Ya, I agree, the 17bii is a good replacement for the 42s I find no trouble switching between the two. I also agree it's hard to know what you're buying these days. Most online retailers don't clearly say. In order: 17b (NOT RPN!), 17bii, 17bii+ (gold), 17bii+ (silver) (images copyright Enterhp.com, used with permission)

*Message #13 Posted by **Paul Dale** on 12 Mar 2010, 4:08 a.m.,*
in response to message #1 by fiveolddogs

If I ever get it finished, the replacement firmware (WP-34s) for the 20b (& 30b I suspect) will do most of what the 42s does (e.g. no matrix, less nice complex). Certainly closer than the 35s :)

Pauli

Re: Economical replacement for 42s

*Message #14 Posted by **Richard Reed** on 12 Mar 2010, 10:41 a.m.,*
in response to message #1 by fiveolddogs

I got quite lucky with a somewhat marred but perfectly operational 42s for $86. If that sort of price is reasonable for you, and you haven't lost patience with e***y (aka TAS), here's a description of mine:

Two dents, one significant in the bezel, but in the auction photo and in real life, no effect on the display, which starts to darken before achieving the contrast I like, but is fine, really. No discoloured pixels.

Slightly gritty looking keyboard face, but keys all firm and labels clear.

Self test is all pass.

Battery compartment is clean.

Case is from another calculator, maybe 32s.

I haven't tested the IR output yet.

I reason that I got that $86 price because the collectors weren't interested due to the cosmetic problems. I was willing to pay $200, and this was my fifth attempt to snipe at that price. Later I saw a prettier one with a failing display go for $235!

Fiveolddogs, have gotten enough recommendations yet? :-)

Re: Economical replacement for 42s

*Message #16 Posted by **fiveolddogs** on 15 Mar 2010, 11:14 a.m.,*
in response to message #15 by Martin Pinckney

Some great information here; I really appreciate it. That last post with the pics of the 17iib's really helped clarify a few things.

I kind of like the idea of grabbing an old 12c, but I don't know if I could handle having only one line of the stack visible at a time. I may get one of these as a backup anyway, just for kicks, if I can find one in that $10-$15 range.

Right now, I'm feeling inclined to skip eBay and go with a new calc. I have to say, it's disappointing there is not a more direct replacement for the 42s on the scientific side of things.

If I understand the recommendations here, a new silver 17bii+ has a solid build with a quality keyboard and will do RPN. If that is correct, I think that's the way I'll go.

Correct, but remember the silver 17bii+, like all 17b's, has a two-line display, but the lower line is dedicated to the soft key menus; so you still will only see one stack value at a time.

Just so you know.

>
> Just so you know.

Wait. Really? I just assumed those menus were only active in certain circumstances, allowing that line to display the stack most the time.

Okay, let's go back to the 35s. No one recommended this one for me, but it looks like it does 2 lines, RPN, and is a scientific calc. What is the argument against this one?

Re: Economical replacement for 42s

*Message #19 Posted by **Ron Ross** on 15 Mar 2010, 5:00 p.m.,*
in response to message #18 by fiveolddogs

You never qualified what you NEED in a calculator. If it is a similar form factor, feel and quality of the Hp 42s, the Hp 17Bii is you best physical replacement. Also has long variable names and an extremely easy solver to use. The stats functions are actually superior as its stats are list based.

If you need trig, two line display and programming, the Hp 35s is you your other solution. The programming accesses 32K of RAM but is limited to only single name variables and address numbers. In some ways, the Hp33s (aside from an ugly keyboard and no address lines) has a better keyboard with a better handling of Rect to Polar conversions and HEX,BIN,DEC conversions.

I have both, and while I like the look of the Hp35s better, I preferr to use the Hp33s. Better size and the R->P seals the deal for me. The Hp35s is nearly the physical size of a graphics calculator. It is not really a true pocket calculator.

Hp is just releasing an Hp 30B which you might also consider, but beforewarned, it has only a meager 130 keystroke steps. Not sure if you can segment these out to several programs or not. Looks to be a promising calculator, but is optimized for the business user first so that trig is buried under menus, still a better option than the Hp 17bii if you do need trig though.

Sadly, the only true replacement for an Hp42s is another Hp42s. There is not yet a superior or even close replacement. If I had to replace my Hp42s and didn't have my spare, I would then use an Hp48g over the present offerings.

Currently I am in a Graduate design course and I use an Hp50G and it is fast and has lots of bell and whistles, but I still like my Hp48g better and am seriously considering stepping down to the Hp 48g(ok, +) even though it is lots slower. I just like the keyboard and the number crunching layout BETTER! Knowing this I hesitate to tell you to upgrade to any newer Hp graphics. While they have improved their keyboards and their prices are actually less than their Ti counterparts, they still don't have that old Hp feel that an Hp 48g would probably give you.

And while an Hp 48g isn't a pocket calculator, if your Hp 42s sat on your desk, an Hp 48g would probably sit on your desk just as well.

> Quote:
>
> Hp is just releasing an Hp 30B which you might also consider, but beforewarned, it has only a meager 130 keystroke steps. Not sure if you can segment these out to several programs or not. Looks to be a promising calculator, but is optimized for the business user first so that trig is buried under menus, still a better option than the Hp 17bii if you do need trig though.

Hi Ron. On the 30b, the SIN, COS, and TAN functions are on the keyboard (shift key), but the other trig functions are under the Math menu, you are right. For keystroke programming, it actually has 290 bytes available, which isn't much, certainly, and many common functions take more than one byte, like STO 1 takes 2 bytes, and STO x 3 takes 3 bytes, so effectively it has the equivalent of about 130 keystrokes as we know them on the 12c, for example. Still, I agree, woefully too small. On the positive side, you can have up to 10 programs stored in those 290 bytes and each can be accessed from whatever key you want.

These are the most accurate words written on this subject. HP completely dropped the ball with the clownishly inadequate HP32SII, HP33S, and HP35S units. I'd rather have a $18 Casio fx-115ES than any of those.

The HP50G is the only current HP product that provides the capability of the HP42S, but it is RPL and is more than twice the size and weight. It is nonsense to suggest any financial calc as a replacement, as much as I like my HP17BII for what it does.

I have two HP42S 1993 ROM C models, one still new in box. Still, I jumped at the opportunity to buy a new condition HP42S 1989 ROM A model and manual for $120 at a ham radio flea market last week. (Minor gloat...sorry!)

Unfortunately, there's NEVER been a RPN calculator better than the 22-year-old HP42S design. If I couldn't have an HP42S, my HP50G comes closest, all things considered.

All true, but remember the OP stated:

> Quote:
>
> Now, I don't use 10% of the features the old 42s had. I use it for simple around-the-house and at-work calculations.
>
> Given what I love about the 42s and that I don't need most of its special features or functions, what HP calc past or present can you folks recommend to me as a economical replacement?

So that is why several recommended some of the financial calcs that they believe embody:

> Quote:
>
> What I love about the 42s: the fantastic HP buttons RPN the stack the build quality

And by the way, fiveolddogs, although I did not quite *recommend it,* for the record I did state right up front:

> Quote:
>
> The quick answer is HP expects you to buy a 35s.

After all, it is scientific, it has a two line display, and it does RPN.

> Okay, let's go back to the 35s. No one recommended this one for me, but it looks like it does 2 lines, RPN, and is a scientific calc. What is the argument against this one?

Okay, I will go out on a limb and recommend the 35s. I used a 42S for many years and extolled its virtues many times on this forum. I now use the 35s almost exclusively. It has a long list of bugs and/or operating "quirks", but they are easy to avoid or just plain don't come up in normal use. As the first calculator with a dedicated "i" key, I feel I must support it.

Just my two cents, your mileage may vary!

Best regards to all,

Jeff

Re: Economical replacement for 42s

*Message #24 Posted by **Bruce Bergman** on 16 Mar 2010, 12:28 a.m.,*
in response to message #23 by Jeff O.

The 35s was my most recent favorite "go to" calculator. It's got a sweet look to it, reminiscent of the calcs of yore, a great keyboard and some good programmability. It is lacking in other areas, though, like use of labels in programs, general useful program options and so on.

However, my new "go to" calculator is the HP-30b. Light years better than the 20b, but retains all of the good things. For example, it has a much improved keyboard (one of the best recently), a nice display, and the programmability is better, IMHO, than the 35s. This because you can display arbitrary strings, do complex conditionals, prompt for values, reassign programs to keys and so on.

I would highly recommend you give the 30b a chance. At $49, it's also cheaper than the 35s. I think you'll be impressed.

thanks!

Bruce

in response to message #24 by Bruce Bergman

The 30b is a nice calculator. A repurposed 30b would be awesome. However, in its standard financial calculator form, I do not consider it to be an acceptable replacement for a scientific calculator.

A 42S emulator (like 42S from Byron Foster or Free42 from Thomas Okken) running on an iPod Touch is my preferred option; now I have a 42S with me all the time (while my real 42S is safe at home). Not exactly "economical": you may need to justify the emulator platform with other uses as wi-fi client; music player, photo album, etc. There are many excellent emulators not only for iPod / iPhone but also for PDAs and PocketPCs / Windows Mobile devices. Granted, mechanical key feedback is absent.

The 17 BII Silver is a good option too, I have one and use it from time to time.The upcoming 30B may also deserve its place. On the other hand, I don't like the 33S (because of chevron keyboard and poor display) or the 35S (good looks, but bad display, quirky functions for BASE and R<>P among others, and some strange bugs).

HTH.

Gaussian Primes

*Message #1 Posted by **Gerry Schultz** on 11 Mar 2010, 5:00 p.m.*

I'm reading a book called "Stalking the Riemann Hypothesis" by Dan Rockmore. I've always been interested in prime numbers but I've always thought of them as positive integers. This book talks about complex prime numbers which I had never put together before in my head and I find it fascinating (I am not a geek, I am not a geek...). One of the interesting facts Dan Rockmore mentions is that in the complex plane, 2 is NOT a prime number (1+i)(1-i)=2.

The HP-15c, HP-42, and the RPL calculators can all handle complex numbers. Is it possible to write a program to calculate and display prime complex numbers? Could it use the same algorithms as is used to display integer primes? An example program is in William C Wicks' book "HP-48 Insights Part I" (Original edition) Section 12.11.2 on pages 359 and 360 or pages 397 through 399 in the GX version.

Since complex numbers are on a plane and not a line, a different way to display complex prime numbers is shown on page 113 of the book by using the Cartesian plane and marking 'Xs' where prime numbers are shown.

Anyway, to you Math Majors this might seem like a trivial subject but it's fascinating to me so if you have any comments to share I would appreciate it. I did search through the HP Museum about this topic but I didn't see anything specific about this jump out.

Thanks for your feedback, Gerry

Re: Gaussian Primes

*Message #2 Posted by **Egan Ford** on 11 Mar 2010, 6:26 p.m.,*
in response to message #1 by Gerry Schultz

> Quote:
>
> Is it possible to write a program to calculate and display prime complex numbers? Could it use the same algorithms as is used to display integer primes?

From Wikipedia:

A Gaussian integer a + bi is prime if and only if:

- one of a, b is zero and the other is a prime of the form 4n + 3 or its negative -(4n + 3) (where n >= 0)
- or both are nonzero and $a^2 + b^2$ is prime.

So, you should be able to modify your prime search program to test for (p-3)/4 is integer (got mod?, then p mod 4 = 3), if not, then since all primes not in the form 4n+3 are the sum of two squares, find the squares. Every odd prime number you find will fit the first or second case. So, all you are really doing is altering the output of any prime search program. In the first case you could report (0,p), (p,0), (-p,0), (0,-p) and in the second (a,b), (-a,b), (a,-b), (-a,-b).

Reporting all 4 for each case may be redundant. I'd just report to paper tape p or p:a,b, e.g.:

```
3           4n+3
5 :1,2      4n+1 (sum of squares)
7
11
13:2,3
17:1,4
19
etc...
```

P.S. If you like the Riemann Hypothesis mixed with a bit of history then read *Prime Obsession*.

Scientific American Magazine Article

*Message #1 Posted by **ClausB** on 11 Mar 2010, 12:17 p.m.*

I remember an issue in the mid-70's with an HP calculator keyboard close-up on the cover and some articles inside about how a calculator works, microcode, and digital electronics. I may be combining several issues in my memory. Can anyone specify the issue and maybe provide a link to the articles? My web search was fruitless. It seems only the newer and older issues have been digitized.

Latest crazy auction - HP-70 for $660

*Message #1 Posted by **Michael de Estrada** on 11 Mar 2010, 11:24 a.m.*

HP-70

Someone just paid $660 for an HP-70 with AC Adapter, but no box, manual or soft case. Also, the seller refers to it as "Mint", however, photos that he sent me show corrosion in the battery compartment and multiple scratches/grooves in the back label. I realize that this model is extremely rare, however, I can't justify paying this much for something in this condition. A genuine Red Dot, maybe.....

Re: Latest crazy auction - HP-70 for $660

*Message #2 Posted by **Michael Meyer** on 11 Mar 2010, 12:23 p.m.,*
in response to message #1 by Michael de Estrada

I was too busy this morning and didn't bid on this in time. Probably best-- that's a lot of money for me right now. Still, it's a major "hole" in my HP collection. I guess if it were ever "complete", I'd have something less to strive for.

Re: Latest crazy auction - HP-70 for $660

*Message #3 Posted by **Michael de Estrada** on 11 Mar 2010, 1:03 p.m.,*
in response to message #2 by Michael Meyer

The problem I have is that it is not truly complete, because I would still lack unique accessories such as the manual, which I've never seen for sale. My concept of collecting, especially with vintage HPs, is that the whole package set is just as important as the bare calculator. What good is an HP-65 without its hard case, leather soft case, spiral bound manual and QR guide, and Standard Pac. About the only part that can be sourced separately is the AC adapter. Also, patience is a virtue. After watching incomplete and imperfect HP-92's sell for $500 for years, I recently picked up a complete set with even the box in excellent condition for $303. Maybe that will never happen with the HP-70, but like you said if my collection were complete, then I'd have nothing to do anymore.

Re: Latest crazy auction - HP-70 for $660

*Message #4 Posted by **Keith Midson** on 11 Mar 2010, 3:00 p.m.,*
in response to message #1 by Michael de Estrada

Someone bought my HP Xpander for AUD$750 (about US$660) yesterday. Cheers, Keith

Re: Latest crazy auction - HP-70 for $660

*Message #5 Posted by **Michael de Estrada** on 11 Mar 2010, 3:26 p.m.,*
in response to message #4 by Keith Midson

Well, I can see that price as it is ultra rare, since it was never released, whereas the HP-70 did see several years of production. The Xpander is more in the class of the HP-95C, and I would definitely pay that much

for it.

Re: Latest crazy auction - HP-70 for $660

*Message #6 Posted by **Juergen Keller** on 11 Mar 2010, 4:26 p.m.,*
in response to message #1 by Michael de Estrada

Money rules the world ...

If you say you wouldn't pay that much that's your decision. But why do you say this auction is crazy? This implies that the winner is crazy, too. But I think it is the bidder's decision how much he wants to pay. These calcs are collectibles, and for collectibles the price range is always large. You cannot see into the bidder's mind; perhaps the HP-70 was his first calculator, and after 30 years he wants to have one again to fresh up all the good memories.

Well, we all are a little crazy because we are so addicted to these old calculators. At least, that's my wife's point of view ;-)

Cheers, Juergen

Re: Latest crazy auction - HP-70 for $660

*Message #8 Posted by **Keith Midson** on 11 Mar 2010, 7:31 p.m.,*
in response to message #7 by Martin Pinckney

I agree we must be crazy, but it's fun for whatever reason ;)

I just had a look at the HP70 lising - it was an early production of the HP70, so that adds to the collectability for some people. Also the 70 is seemingly hard to get hold of (I don't have one, but would like one one day!).
I have to wonder if the item was listed internationally on ebay (ie. they put a postage price for international shipping) then it might have attracted more buyers and sold for even more. Even though the seller said that they would post internationally, it didn't come up in searches from other ebay sites (Australia, UK, etc), so wasn't found.
Prices are a fickle thing - depends on who 'really' wants something at any one time, and how much they are prepared to pay for it. I have paid 'silly' prices for something that I 'had' to have, but I have a collection that means something to me and that's what matters. Sure it's similar for others. Cheers, Keith (and my wife thinks i'm mad too).

My wife and I have made a point of keeping a separate pool of money for each of us to spend as we please. My wife is into Indian art and I just spent my latest kilobuck on camera lenses. Anybody else here a victim of LBA (lens buying addiction; as, I guess, contrasted to CBA - calculator buying addiction). Mike - you could have a field day with this. Are these officially recognized afflictions!?!

Re: Latest crazy auction - HP-70 for $660

*Message #11 Posted by **Juergen Keller** on 12 Mar 2010, 2:37 a.m.,*
in response to message #9 by Michael Meyer

Well, spending 1000$ for something that keeps (or even raises) its value is like saving the money on your bank account. Hope this helps in discussions with your wife ;-)

The fine print: there are two problems. First, we are not sure if our calcs are really of the same value in ten or twenty years. Second, if we have a nice one it would break our heart to sell it. But as I said, this is the fine print, you can ommit it in discussions with your wife!

Cheers, Juergen

Re: Latest crazy auction - HP-70 for $660

*Message #12 Posted by **Michael Meyer** on 12 Mar 2010, 10:57 a.m.,*
in response to message #11 by Juergen Keller

LOL! I agree with both of you! And I do think, after discussing it on the Forum, that these machines will hold their value or increase. Now: is it an addiction? I've been known to call it that. I prefer "hobby" or "passion". Or maybe it's just that some addictions are healthier than others. I suppose if it were to start to interfere with my marriage, work, etc., I'd have to call it a disorder. So far I think my wife has been very understanding and supportive.

Re: Latest crazy auction - HP-70 for $660

*Message #13 Posted by **Bart (UK)** on 12 Mar 2010, 11:14 a.m.,*
in response to message #12 by Michael Meyer

> Quote:
>
> I suppose if it were to start to interfere with my marriage, work, etc.

Or get you into debt. It's fine to pay $1000 if you can afford it, but I can't. It's one of the reasons I don't have any HP LED calcs. I've decided to start saving a monthly amount, so maybe in a few month's time...

But as they say here in the UK with shares investments: "the price can go down as well as up"...
I might end up chasing an ever increasing goal.

I predict that truly mint rare or important models will hold their value as collectibles - but everything else will diminish after the generation that used these when they were new is gone.

Re: Latest crazy auction - HP-70 for $660

*Message #15 Posted by **Michael de Estrada** on 12 Mar 2010, 12:15 p.m.,*
in response to message #14 by Martin Pinckney

> Quote:

> I predict that truly mint rare or important models will hold their value as collectibles

I think that this is a crucial point. Models that represent milestones, such as the HP-35 Red Dot, HP-65 and HP-25C will always be valuable. Models like the HP-70 can only be valuable if they are mint and complete, which is not the case with the HP-70 that is the topic of this thread. Even through the HP-70 is a rarity, I don't see it's value being very high when it's condition is only average and it's missing crucial accessories such as the Owner's Manual. Having said this, I do not collect calculators as an investment or with the intention of selling them at a future date for a profit.

Re: Latest crazy auction - HP-70 for $660

*Message #16 Posted by **Bart (UK)** on 12 Mar 2010, 12:59 p.m.,*
in response to message #15 by Michael de Estrada

For many it is not just milestones that make a collectable, it also the amount in existance. The fewer there are, the more people are prepared to pay for not-so-good items. The items must have some fame. Older HP calculators in general have fame. Of course this is more important for those that collect for investment or want to have at least one of each of this famous brand.

> Quote:

> I do not collect calculators as an investment or with the intention of selling them at a future date for a profit.

I feel the same way. I'd like some HP LED calcs because I like them. I would not buy it for the thought of making money, similarly I would not buy a piece of art I find ugly just because it would be a good investment, it must be something I like to look at. I like to look at HP calculators (wow, look at that beauty - [hmmm that sounds geeky :)]) - and use them. If I buy an HP classic I'd like to play with it once in a while. Not just take it out the cabinet, put the battery in, type "3 enter 3 *" then remove the battery, wipe off the fingerprints and put it away. I would treat it with care, but still occasionally use it for an actual calculation requiring a scientific calulator. I like to experience it, not just look at it.

Re: Latest crazy auction - HP-70 for $660

*Message #17 Posted by **Juergen Keller** on 12 Mar 2010, 6:46 p.m.,*
in response to message #15 by Michael de Estrada

Michael,

my previous posts were a little provocative, but don't get me wrong; that's my nature. We all share the same passion, and even if we don't agree on everything, we all know that HP produced some really impressive milestones which will keep their value (at least their value as technical innovation).

But what I've learned in my time as collector is that the value of a certain model heavily depends on the individual experience, i.e., the first HP calculator you got in your hands has always a special value. My HP career started with a 41, and the Series 41 calculators are still my favorites. Probably, the reason is that the first HP calculator taught you an important lesson: there is an easier and more efficient way to solve computational problems!

The value of an item is an individual parameter. It depends on individual experience and on the money you have in your pockets.

Finally, one of my favorite citations: "The quality remains long after the price has been forgotten!" (Frederick Henry Royce, co-founder of Rolls Royce)

Best Regards, Juergen

HP 50G...the last graphing calc from HP?

*Message #1 Posted by **juan demin** on 11 Mar 2010, 7:24 a.m.*

I found specific state-of-the-art software developed for TI 89 calculator. When I asked if they were thinking of producing it also for HP calculators, the Technical Services Dept gave me a quick and sharp answer: “no, because HP will no longer produce scientific plotting calculators” Ups…!!! Is it true?

Re: HP 50G...the last graphing calc from HP?

*Message #2 Posted by **Eddie W. Shore** on 11 Mar 2010, 9:38 a.m.,*
in response to message #1 by juan demin

I sincerely hope not.

Re: HP 50G...the last graphing calc from HP?

*Message #3 Posted by **Marcelo Vanti (Brasil)** on 11 Mar 2010, 11:17 a.m.,*
in response to message #1 by juan demin

Hello,
I don't think so. The Titanium and HP 50 G are improvements of previous TI 89 and HP 49 graphic calculators.
One can read from TI internet page: Introducing TI's most powerful graphing calculator: The TI-89 Titanium ...Well, the TI 89 was released in 1998, the same with HP 49.

in response to message #1 by juan demin

I don't know how a call center person would know anything about what R&D is working on. They don't get any information until a product is about to be released. . .

I suspect there was a misunderstanding somewhere.

Residuals in HP41 BatteryCompartment

*Message #1 Posted by **Timo** on 11 Mar 2010, 3:47 a.m.*

Good morning everybody! (If you don't live in Central Europe replace the Good Morning Appropriately... ;))

Below is a link to a picture showing the battery compartment of a HP-41CX. The seller claims that the unit never suffered any battery leakage in its life. I tend to believe him, since the contacts are indeed shiny and new. However, I nevertheless wonder which effect could cause the whitish rediuals on the bottom of the compartment?

Does anybody on the form have a good explanation for this (dust, a reflexion...???)

And here is the link to the picture:

See here...

Thanks for your feedback in advance! Timo

Edited: 11 Mar 2010, 3:48 a.m.

looks like dust

Apollo Soyuz HP 65

*Message #1 Posted by **ClausB** on 10 Mar 2010, 11:04 p.m.*

Forgive me if this has been asked and answered. I don't know how to search the forum archive. Have the Apollo - Soyuz mission programs for the HP 65 been published anywhere on the 'net? Also, does anyone know the whereabouts of the actual flight calculator?

Re: Apollo Soyuz HP 65

*Message #2 Posted by **Juergen Keller** on 11 Mar 2010, 3:08 a.m.,*
in response to message #1 by ClausB

The web site HP calculators and space exploration contains a lot of information about HP calculators in space, and of course about the Apollo Soyuz mission. There was also a short article in the HP-65 Users' News (Vol 1, No 2), read it here: HP-65 in Space Rendez-Vous.

Re: Apollo Soyuz HP 65

*Message #3 Posted by **Don Shepherd** on 11 Mar 2010, 6:15 a.m.,*
in response to message #1 by ClausB

I've been trying to find those programs for years, without success. If you have any luck finding them, please post it here.

Re: Apollo Soyuz HP 65

Graphing Calculator Innovations

*Message #1 Posted by **Eddie W. Shore** on 10 Mar 2010, 10:51 p.m.*

(I'm not sure I have this 100% right, but here it goes):

First Graphing Calculator: Casio 7000G in 1985

First Foldable/Clamshell Calculator: HP 28S. There is one on the market today, Casio fx-9860 Slim.

First one with Natural Input: HP 48S

First one with a Stylus: Casio Classpad 300

First one with a Touchpad: TI nSpire Touchpad

First one with "documents": I want to say the HP 38G/39G; I think that was slightly before Casio came out with their e-activity.

First one with external backup: HP 48S

First one I ever owned: TI 81 back in 1991 - I was in high school. The first HP graphing calculator I owned was the HP 48G in 2000. The first Casio graphing calculator I owned was the fx-Algebra 2 (I think it was 2004).

Re: Graphing Calculator Innovations

*Message #2 Posted by **Frank Boehm (Germany)** on 11 Mar 2010, 1:57 a.m.,*
in response to message #1 by Eddie W. Shore

The 28C was released one year(?) before the 28S.
First one with external backup? You need to go *way* back - check out the CompuCorp 3xx series. Though a lot larger than the 48, I'd still call them a "pocket calculator".
If you consider them being too large, the 41 or Sharp PC-series from about the same time offer external backup as well.
The first calculator I owned was the fx-7000G (199 German Marks back then), soon to be replaced by a 28C (444 German Marks).

Re: Graphing Calculator Innovations

*Message #3 Posted by **C.Ret** on 11 Mar 2010, 3:16 a.m.,*
in response to message #2 by Frank Boehm (Germany)

Your are right on several points:

* HP28C was out nearly one year sooner than HP28S, but due to distribution and logistic facts, HP28S apears only a few months or weeks after the HP28C in many dealer shops ! (Especialy in Europe)

* Right in 1982 I own a SHARP PC-1211 with CE-121 Cassette Interface which I use for external backups

on audio tapes. Note that 28 years later, most of these backups are still available and functional.

Re: Graphing Calculator Innovations

*Message #4 Posted by **Palmer O. Hanson, Jr.** on 11 Mar 2010, 3:29 a.m.,*
in response to message #1 by Eddie W. Shore

You should add the first graphing calculator with a color display.

Re: Graphing Calculator Innovations

*Message #5 Posted by **Eddie W. Shore** on 11 Mar 2010, 9:21 a.m.,*
in response to message #4 by Palmer O. Hanson, Jr.

Thanks Palmer, I did forget:

Color Graphing: Casio 9850g Series (late 1990s, early 2000s)

In addition: the one with backlight (that I know of) Casio 9860g Series (GII, Slim)

First one with a Matrix/List Editor: HP 48S

First with 3D Graphing as a feature: TI-89 (?) I am truly not sure about this one.

Re: Graphing Calculator Innovations

*Message #6 Posted by **Marcus von Cube, Germany** on 11 Mar 2010, 11:53 a.m.,*
in response to message #5 by Eddie W. Shore

The TI 92 predates the 89. It runs the same software (at least in the "plus" version. Don't know about the plain 92's graphics capabilities.

You could add the first with full alpha keyboard (28C or TI-92? No: Sharp PC-1210 or Casio FX702P is more probable.)

Edited: 11 Mar 2010, 11:53 a.m.

Re: Graphing Calculator Innovations

*Message #7 Posted by **Xerxes** on 11 Mar 2010, 12:52 p.m.,*
in response to message #5 by Eddie W. Shore

The first color graphing calculator was the CFX-9800G from early 1990s.

I'am not sure, but probably the FX-7500G was the first foldable graphing calculator.

one more thing

*Message #8 Posted by **Frank Boehm (Germany)** on 11 Mar 2010, 4:07 a.m.,*
in response to message #1 by Eddie W. Shore

The first foldable/clamshell calculator dates *way* back too (how could I forget - I have a massive sterling silver encased one <g>):
http://www.vintagecalculators.com/html/facit_1106_sharp_el-805s.html#EL-8009
I'm unsure about the "Natural Input" - I'd say the (earlier) Casio BASIC-capable models offered the same feature. AFAIR you were able to enter something like "sqr(sin(45)+cos(45))="...

one more thing (2)

*Message #9 Posted by **Frank Boehm (Germany)** on 11 Mar 2010, 5:09 a.m.,*
in response to message #1 by Eddie W. Shore

How could I forget again (since I own both of them, maybe I'm getting old): the first stylus-based calculators are without doubt the Litton Royal II and III:
http://www.vintagecalculators.com/html/royal_digital_iii___iv.html

Re: one more thing (2)

*Message #10 Posted by **Eddie W. Shore** on 11 Mar 2010, 9:26 a.m.,*
in response to message #9 by Frank Boehm (Germany)

The Royal Digital III looks like a Price Is Right display. Four digits-display? Wow. They are neat looking calculators, thanks Frank.

what's so funny about "only" 4 digits?

*Message #11 Posted by **Frank Boehm (Germany)** on 11 Mar 2010, 2:26 p.m.,*
in response to message #10 by Eddie W. Shore

Try this one - with only 3 digits:
Sharp EL-120
I think this is about the oddest calculator ever inventend. Please note the special "+1" counter button (below the display).
Btw: they (oddly enough) even made an OEM version for Quelle, Germany (formerly the largest mail order in Europe, maybe worldwide).

The Sharp EL-120

*Message #12 Posted by **Palmer O. Hanson, Jr.** on 11 Mar 2010, 9:07 p.m.,*
in response to message #11 by Frank Boehm (Germany)

While the EL-120 displays three digits at a time it can calculate and display many more. For example, in the reference that you give when 123456789 is entered the user can see three digits at a time, i.e., 123 then 456 and then 789 where the actual displays are

+123,,

456 ,

789.

and the machine does more than in the discussion in the reference. For example, with the A M switch in the A (automatic) position the result of a calculation will be automatically sequenced through the display with a pause of about one second for each part of the answer.

The machine can actually calculate up to twelve digits, nine to the left of the decimal point and three to the right of the decimal point. For example, if you multiply 111111.1 times 1111.11 the machine will display

+123,,

456 ,

645.

.321

Comparason of Old Computers and Calculators ....

*Message #1 Posted by **Dimitri Simitas** on 10 Mar 2010, 10:16 p.m.*

Since I am working on my project I am looking at old systems and how they implemented some features. Anyways some notable historic items came up as I was reading.

Compared to the cost of the early computers, and the HP-65 and the HP-67. If I was even alive at that time, I think a HP-65/67 would have been a better choice then the computers on the market. It seems like a no-brainer, atleast to me, that HP had a winner even if it was more of a "calculator" then a computer. For 450$ for a programmable handheld with magnetic strip storage, verses lets say the Sol-20 in 1976 costing 745$, plus the monitor, plus $2295 for the 8" floppy drive! Ouch!

What do you guys think?

Dimitri

Re: Comparason of Old Computers and Calculators ....

*Message #2 Posted by **Palmer O. Hanson, Jr.** on 11 Mar 2010, 3:44 a.m.,*
in response to message #1 by Dimitri Simitas

I purchased my Radio Shack Model 100 in early 1983. It came with

BASIC language programming

14 digit calculations

Telephone interface

A full size keyboard so that I could touch type

A sound output which could be used to play music

A graphing capability loong before the fx-7000G

External backup on magnetic tape - see another current thread

After that I "played" with programmable clculators but for real work I used my Model 100.

> Palmer, do you still have it? Do you know Club100.org? A nice group of people, similar to this one.

I have two. I purchased the first one in the 32K version. I got the second one for a low price at a garage sale. I have a printer cable, a cassette recorder cable and bar cod reader.

I also have a Model 200 purchased at a garage sale for five dollars.

I am not familiar with Club100.org. I will have to check it out.

I have some nice little programs for the Model 100. One of them will play four Christmas carols while the display shows a fire burning in a fireplace.

Palmer, it's time to join the mailing list. Info is on the web site.

Re: Comparason of Old Computers and Calculators ....

*Message #6 Posted by **Håkan Thörngren** on 11 Mar 2010, 4:45 a.m.,*
in response to message #1 by Dimitri Simitas

I remember back around 1983, when I had a HP-41CV with card reader and a Commodore 64, first with tape, then floppy.

The computer was way more powerful, it was faster, had bigger display, capacity and it could even run Forth. However, the calculator was more portable and easier to have a bunch of useful programs in it. They were both very useful in their different ways.

Today the vintage calculator holds up very well, but I see no reason to run such vintage computer...

Re: Comparason of Old Computers and Calculators ....

Excellent observation!!!

"no reason" *is* the reason

*Message #8 Posted by **Frank Boehm (Germany)** on 12 Mar 2010, 2:53 p.m.,*
in response to message #6 by Håkan Thörngren

We all know that your USB keyboard probably has more RAM and more CPU power than an ALTAIR. Still it's good to know that there are people around, caring about this "way outdated" stuff - just for the fun of it. I don't see a huge difference between collecting old electronic stuff and, say, old books.

Re: Comparason of Old Computers and Calculators ....

*Message #9 Posted by **Jim Horn** on 11 Mar 2010, 12:06 p.m.,*
in response to message #1 by Dimitri Simitas

Well, back in 1975 - 1977 the computers available were hobby toys, not practical machines for most folks. The Altair 8800 had 256 bytes of RAM and no provision for any I/O of any sort (1975). The TRS-80, Apple][and Commodore PET didn't arrive until 1977 and they were generally 8k RAM (4k for the Apple), limited video (often upper case only) and I/O but priced high (the PET was $799 but hard to find; the Apple was well over $1000 with 4k). Printers started at about $1000 for Centronics and similar pin-feed monsters and went up - way up from there. Floppies weren't out yet and when they did arrive held 128k of data unless you went for the enormous 8 inch 1M drives at well over $1000 each.

The HP-65 was $795 in 1974. The HP-67 came out in 1976 (I had mine in August '76) for $395 as I recall. Not cheap on a second lieutenant's pay of $6700 per year but worth every penny. I seriously lusted after a computer - but bought the '67. And gave my HP-25 to my brother Joseph. "And now you know... the Rest of the Story."

The HP-65 Users Club (later to become PPC, etc.) published scores of pages each month of programs to analyze circuits, do math, etc. The HP-65 Users Library (via HP) had exotic code to do satellite orbit analysis, etc. The RAND Corporation published "Hand Calculator Programs for Military Officers" that derived orbital trajectories accounting for a non-spheroidal earth. Meanwhile, Byte, Creative Computing, Dr. Dobb's Journal (of Computer Calisthenics and Orthodontia - "Running Light Without Overbyte") and such were publishing 2k byte Tiny Basic interpreters, how to gut a cheap TI LED watch to add a real-time clock circuit and such.

Computers were lots of fun (and still are). Calculators were serious workhorses (and still are - though computers are too now). Both sets of user groups were priceless.

Gotta enjoy 'em both! And my eternal gratitude to Richard Nelson and the myriad wonderful folks who made all this so worthwhile!

Jim Horn (older^2 than dirt; PPC 1402 usw.)

Re: Comparason of Old Computers and Calculators ....

*Message #10 Posted by **John Garza** on 15 Mar 2010, 6:04 p.m.,*
in response to message #9 by Jim Horn

In the 70's, the first personal computers were as much hobbies as useful tools. They caught the trailing edge of DIYers, ham radio buffs, etc. Most of the fun of "using" them was building and constantly tinkering with them. Nowdays they are appliances, like toasters. But back then, if you didn't know a resistor from a capacitor, you were in for trouble. The true appliance machines didn't hit until the second wave (Apple II, Commodore PET, Tandy TRS-80); and were popular with the newbies who kept hearing tales of wonder from the Altair owners.

HP, on the other hand, did not market to hobbyists or the curious but less competent newbies. They sold well-built and well-designed machines for professionals.

So, IMHO, it's an unfair comparison - the traditional apples & oranges. Yes, they're both fruit, but that's about it.

-J (3665)

Re: Comparason of Old Computers and Calculators ....

*Message #11 Posted by **Martin Pinckney** on 11 Mar 2010, 12:12 p.m.,*
in response to message #1 by Dimitri Simitas

The early programmable calculators were ideal for the everyday routine engineering calculations that prevailed at the time (and still do, to a lesser extent). Most engineering calculations in the 70's and 80's were made with simplified mathematical models that had been developed before the advent of computers. The early personal computers gave no significant advantage for these calculations; spreadsheets are one exception.

As more and more powerful personal computers became available, more programs were developed that do a lot of number crunching, beyond the power of calculators. They remain useful for the simpler algorithms, however, because they are so handy.

"beyond" is the right wording

*Message #12 Posted by **Frank Boehm (Germany)** on 11 Mar 2010, 2:35 p.m.,*
in response to message #11 by Martin Pinckney

I ported both Mandelbaum and bifurcation diagram to the fx-7000. I think the classic "fractal image" took a bit more than 24h to complete (with lowest possible iterations). And remeber: it had only about 600 pixels to calculate (black and white). Raising the number of iterations easily depleted the batteries before completion.

fair Value on HP-35

*Message #1 Posted by **aj04062** on 10 Mar 2010, 9:48 p.m.*

Anyone have any thoughts on what a fair value on a std HP-35 would be with charger and case?

$100 a good deal. I know you can pay more.

Re: fair Value on HP-35

*Message #2 Posted by **tim m.** on 10 Mar 2010, 10:12 p.m.,*
in response to message #1 by aj04062

I paid roughly $120 for a '35 (early second version) in good working condition including all accessories (some well-used) as well as original sales receipts and other documentation from the original owner.

So, if the '35 on offer for you is in working condition, I think $100 would be a good deal--especially considering that the market may be a bit bullish lately from what I've been reading on the forum.

-Tim

OT: New Version of TI-Nspire

*Message #1 Posted by **Gerry Schultz** on 10 Mar 2010, 1:31 p.m.*

I just bought a TI-Nspire, but haven't received it yet. It's the first non-HP Scientific calculator I have ever bought. I have a lot of mixed feelings about it but I'm getting tired of waiting for HP to come out with a competing unit.

There was an earlier topic about a new Nspire coming out and in my research of the Nspire family, it now has four models; the TI-Nspire with Clickpad, the TI-Nspire CAS with Clickpad, the TI-Nspire with Touchpad, and the TI-Nspire CAS with Touchpad. The clickpad version is the original and the Touchpad is new but a little different and the screen is the same for all four units, 320 x 240 pixels, around 115 DPI and 16-level gray-scale with no touching the screen for input. The big hardware difference is the new keypad that separates alpha and numeric keys and owners of the original Nspire will be able to order the new keypads for $10. There is a major update to the OS to version 2.0 but I don't know if it's a big improvement or not.

I'm not sure if I'm going to like this unit, being so spoiled by HPs, but I've been curious about the Nspire ever since it came out. I almost bought one then but when I read the reviews, it turned me off so I waited, hoping HP would release a new generation unit to compete with the Nspire. Since HP has written off the school market and focuses on the Financial profession, I wonder if HP will ever release a new HP scientific to replace the 50g (that's NOT an update)?

I have had a 50g for several years and like it but it's basically a revamped 49g+ (which I also have), which is an update to the 49g (which I have), which is an update to the 48gx (I have several), which ...etc. After being at HHC 2009 and learning about just how small their calculator development division is and what they have to deal with, at present they can barely turn out one or two 'upgraded' calculators a year.

Sorry to be such a downer, but I am getting tired of reading and discussing HP's past successes. What is HP doing today to keep up with the scientific/engineering market? Are their products so good and ahead of the competition they can wait to come out with new products? Or are they just looking at where they can get the most bang for the buck? Where is the innovation and long-term view? That's what excited me about my first HP-45 and later sold it to buy to the HP-55 (which I still have). Something so unlike anything I had seen before that excited me just by looking at it and to hell with the price. When I saw it in the Base Exchange (I was in the Air Force at the time), I borrowed money from my girl friend to get enough cash to buy it. I didn't care who... opps, I mean what I had to sell to get it, I WANT IT, NOW! That's also how I felt about the HP-41 then and which I still collect and work on today. No wonder my wife thinks I'm crazy.

I also wanted an HP-97 back then but it was just too much money. I had to wait over 25 years and now I have two of them. I'm so glad to have them but I rarely use them. What's that all about?

Anyway, Feeling frustrated today,

Gerry

That's about owning something today that was built years ago to last decades, and has! I feel the same way about my HP-65 I got about 3 years ago; built like a tank and still works great after all those years. There is nothing like those flashing LEDs while your program is running. And there is something very satisfying about implementing an algorithm in a programming space that is limited to 100 lines and 9 registers.

HP's new 30b is primarily a financial calculator but it does have the trig functions, a keystroke programming capability (it could use a lot more program space, however), and a blazingly-fast ARM processor.

You will like the NSpire, I predict. As an educator who has had the CAS unit for the past 3 years, I can upgrade to the CAS TouchPad version for free. I sent my old unit off a couple of days ago and, hopefully, will receive the new one shortly. I had already downloaded the new OS2 onto my old unit to see how it worked, and I was satisfied with it. Here are the principal changes.

The home screen now includes something they call a "scratchpad" that lets you play around with calculations and graphs without worrying about saving them in documents (although you can if you change your mind). Personally, that's kind of nice, but I was always able to play around with calculations and graphs on the old unit without undue work.

I think the new OS will let you solve simultaneous equations and polynomial equations on the regular NSpire (non-CAS) unit, whereas you needed the CAS version to do that before. Since I had the CAS, that's not an advantage for me.

The touchpad looks interesting. It will make navigation between screens and windows and documents easier, I think, but a real touch-screen and stylus would have been a revolutionary improvement; maybe next time.

I'm anxious to see what the real screen looks like on the new units. One of my complaints during the last 3 years was that you really need a very strong light source to be able to see what's on the screen. I remember when I first got the old NSpire, in a TI training class in Nashville, they dimmed the room lights so we could see the overhead projector images, but dimming the lights made the NSpire screens almost invisible. A backlight would have worked wonders. Another poster said that the new screen really does look as good as the image in one of the other threads, and I hope so. You can choose between 3 font sizes, but even the largest is rather hard to read with my old eyes.

From the beginning, the NSpire was not a very good programming platform, which is one of my main interests. As originally issued, you could only code functions. They added programs almost immediately, but it was hard to edit them on the handheld unit itself. Then they gave you a program editor and user libraries, which were good improvements. But the biggest problem was, there was no INPUT command to get user input during the execution of the program. That crippled the BASIC-like language, in my estimation. I think what drove that was kids creating games and playing them in class when they are supposed to be doing interesting math things like studying box and whisker plots (I'm being facetious a bit, I hate box and whisker plots). But now there is the equivalent of the INPUT command (called Request) and a textbox command (called Text). Those do work, I've tried them out on my old unit.

The NSpire is really meant for students. I suspect that a real engineer will probably be disappointed in it, especially since the trig functions are accessible only via a menu. That's not a big deal to me, but I'm not an engineer.

When you get it, please post your reaction here. We'd all like to know how an engineer view it.

IMO it's partly corporate philosophy and partly just the realities of the present-day marketplace.

Certainly the corporate philosophy of HP has changed since the days of the Classics, or even the 48 series, for that matter. But everything electronic has such a short life-cycle these days because of constantly-changing technology. Why design something to last 25 years if it will only be used for, say, 5 years tops? At least I think that's the prevailing wisdom nowadays. We all lament it, but will any company have the courage (or stupidity, depending on how you look at it) to buck the tide? That is, produce a really quality scientific calculator, even if it's market life is short?

Re: OT: New Version of TI-Nspire

*Message #4 Posted by **Eddie W. Shore** on 10 Mar 2010, 10:34 p.m.,*
in response to message #1 by Gerry Schultz

Gerry,

After TI upgraded their NSpire software to Version 2 and having just acquired a Casio Classpad 330 (birthday calculator, LOL my birthday is 3/14), I am also itching to see if HP responds with a HP 51G. That would be so cool.

I have only upgrade the CAS; I will upgrade my blue "non-CAS" version tonight. Actually the way I found out about the new nSpire stuff was on this board, because I kind of forgot about it shortly after I purchased it.

Some thoughts on Version 2:

MAJOR improvement over Version 1. The scratchpad allows for everyday calculations and graphs. This is good for quick calculations or if you don't need to open an "official" document for calculations. Can't use programming commands (i.e. If, Then, etc..) on the scratchpad, but that's OK. Multiple commands, separated by a colon, are allowed though.

The home screen has improved as well and is a lot more organized.

The Graph and Geometry applications have been separated, which gives a better focus to each application.

The screen looks much better and crisp than it did in Version 1. To me the screen in Version 1 was always kind of blurry. The screen actually is readable now.

More programming commands in the input/output department: Request boxes, Output command (I have to look this command up), and Text Box (similar to HP 50G's message box). And the Disp command gets a nice upgrade being able to display more than one thing. In addition, you can display more than one line with Disp.

Some of the new commands are:

Derivative at Point "box": give the variable and number it returns the derivative form where you fill the remaining box with the function

Solve a system dialog box: same concept as the Derivative at Point; you give the variables and order and the TI Nsprie does the form; all that reamins to is to put in the equations.

On the Graph Applicaton: When something is graphed you can toggle the Table with Ctrl+T. Also graph analysis tools are now included (zeros, mins, maxes, etc)

The mouse movement is also better, more responsive. I have the "old" keyboard.

Version 2 makes the TI nSpire actually useable IMHO.

Eddie

To anyone with a TI nSpire - UDPATE to version 2! Highly recommend it.

Eddie, I haven't seen any documentation on a new "Output" command; let us know if you find it in there. The Disp command has been able to display more than one thing for some time, I think. Like Disp "the score is",s for example.

In my brief testing (before I sent my NSpire CAS clickpad back to TI to swap for a touchpad version), using crlf=char(13)&char(10) to get a new line, the Text command supports this structure (to get multiple lines in a dialog box in one command), but the Request command does not. I didn't test the RequestStr, but I imagine it doesn't either. Perhaps TI will fix this inconsistency.

You're right, Don, I didn't find the Output command now that I'm looking through the reference guide. Maybe Disp is the "Output" command given it has been enhanced.

I'll have check out the mulitline consistency.

Re: OT: New Version of TI-Nspire

*Message #7 Posted by **Han** on 10 Mar 2010, 11:13 p.m.,*
in response to message #1 by Gerry Schultz

I have been teaching with TI's, and HP's and I have found that the nSpire to be the worst calculator for in-class use. It is great for doing presentations, but it is horrible as a calculator due to the fact that everything is drop-down-menu driven.

The notion of a graphical menu works well only if you have an equally responsive input device such as a mouse. Even with the new touchpad feature (where they big, square, "arrow keys" region is like a touchpad on a laptop), navigating all those menus with an arrow is tedious.

What makes a calculator a viable piece of electronics today is the fact that its input method involves a dedicated keyboard. There is a reason why those fancy hand-held devices with huge RAM and CPU power and colored screens will never replace a calculator (even something as "cool" as an iPhone with the HP48 emulator) -- it's the fact that there are not enough dedicated keys!

When comparing the HP50, TI89, and nSpire, the menus are easiest to navigate in that order: HP50, TI89, nSpire. The TI89 has way too many items nested within a single menu --- the "MATH" menu. The built-in Fn menus do help a bit, but it is still cumbersome to navigate. The HP on the other hand has several "main" menus categorized by topic. I should mention that the menu system "devolved" from the HP48 to the HP50 (a few menus and key assignments could have made the HP50 a better machine). The nSpire is just a horrible in terms of getting to the correct function. While they nicely categorize the functions, it takes me a lot longer on the nSpire to get to the "limit" operator vs on an HP50. I do like the inspire, however, in that once you have selected something like "limit," you are then shown the limit operator as seen in textbook format, and you merely fill in the blanks. To move around input fields, you can use the tab key or the touchpad/arrows (tab is just faster than moving that pointer around).

One other benefit to using the menu system on the HP50 is that the menus themselves do not cover up the main screen. Imagine finding a function whose location you accidentally forgot. I can hunt around on the HP50 without losing track of what I am doing since I can see the main screen. That is not the case with the 89 or nSpire. The TI85 was a good calculator in this respect.

Input methods aside, the nSpire has an extremely powerful software set. I just wish it had 3D graphing capabilities (I was unable to find it on the latest release of the nSpire; but I have only played with it a few days)

in response to message #7 by Han

Good point, Han. The soft key menus are my favorite.

While we are on the subject: I don't understand why the trig functions (SIN/COS/TAN/ASIN/ACOS/ATAN) have to be grouped into one key and further more, why the

recirpocal, factorial (should be for all numbers in the complex plane IMHO), and rect/polar conversions aren't on the keyboard at all. Not a deal breaker but a minor thorne for me.

Re: OT: New Version of TI-Nspire

*Message #9 Posted by **Don Shepherd** on 11 Mar 2010, 9:12 a.m.,*
in response to message #8 by Eddie W. Shore

I beleive SIN, COS, and TAN were on the keys in the original NSpire clickpad, but TI moved them to a trig menu now, probably because they aren't as necessary for students every day as they would be for engineers.

Query re. HP 82973A HP-IL Interface card and 82161A Digital Cassette Drive

*Message #1 Posted by **John AS (UK)** on 10 Mar 2010, 8:00 a.m.*

Hi,

I'm currently reading the manual for the 82973A HP-IL Interface card (ISA bus card), it describes the HPIL.SYS driver as follows:

```
In CONFIG.SYS enter the line:

       DEVICE = HPIL.SYS

You can use HP-IL peripherals as you would other devices connected to your

 IBM PC computer. The following table lists the names that your IBM PC

 recognizes and their corresponding devices on the loop.

        Name                        Device
        ------------------------------------------------------------------
        HPILPRN                     The first printer on HP-IL.

        HPILPLT                     HP 7470A Graphics Plotter (option 003).

        Drives C to J (D to K)      Disc drives or HP 82161A Digital Cassette

                                    Drive. (Drives D to K for the IBM XT.)
```

I can understand that a 9114A/B disk drive would appear as a MSDOS drive letter, and the manual says these can either be formatted by an HP-110 or by usng the HPILFOR utility on a PC with the 82973A. But can you actually format a cassette tape as an MSDOS drive (ie with a FAT), either on an HP-110 or via the 82973A?

I thought from earlier forum posts that the 82161A only understood Filbert protocol, and the HP-110 only understood SS-80 protocol, so the two were incompatible (without any additional software!) I would also be surprised if HPIL.SYS provides support for the Filbert protocol.

Regards,
John

*Message #4 Posted by **Egan Ford** on 11 Mar 2010, 11:27 a.m.,*
in response to message #3 by John AS (UK)

I tried this AM. No luck.

With EMU71/EMU41/FreeDOS I can format, read, and write to both my 9114B and 82161A.

If I add DEVICE=HPIL.SYS to my CONFIG.SYS and reboot, then both drives fire up and are assigned drive letters. If I try to access the drive letter I get an error.

```
dir e:

Error reading from drive E: DOS area: unknown unit for driver
(A)bort, (I)gnore, (R)etry, (F)ail?
```

If I try to format I get:

```
hpilfor e: (or hpilfor e: /w)

(I hear the drive)

Press any key to begin formatting E:

Media Format Error.
```

Perhaps its FreeDOS or that I am running DOS under DOSEMU. I guess I need to try MS-DOS.

I was referring to copy of HP 82973 manual from a MoHPC CD3 from a few years ago (a .txt file). For the software I would refer you to 'the other HP museum'.

I guess HP found the error in the manual and removed it from later versions such as you have.

Thanks very much for trying,
Regards,
John

Thanks for the link. I've found the newer version of the HP 82973A manual you referred to:

ftp://hpmuseum.org/lif/hplink/manual.txt

so quite a few changes from the earlier version, no mention of the 82161A Digital Cassette Drive.

Nice too to find a description of the DOS INT 54 service:

ftp://hpmuseum.org/lif/hplink/int54h.doc

used to send/receive data over the 82973A.

Thanks again for your help,
Regards,
John

Why no relative pointer in RPL

*Message #1 Posted by **David Hayden** on 10 Mar 2010, 7:22 a.m.*

I noticed the other day that RPL has no simple way to evaluate an object via a relative address. What I mean is that there's no way to say "evaluate the object whose address is here +/- some offset." This ability is practically a requirement of creating position-independent code.

It's trivial to evaluate an object using an absolute address - just put the address in the run stream. But when a library wants to call a subroutine, it must do it via an XLIB object which finds the library, gets the command from the hash table and jumps there. This is complex and time consuming. The other ways are via a global identifier or a LAM. Since many HP39gs aplets aren't libraries, they have to resort to a jump table at the beginning of the program. Double yuck.

A solution to this seems simple to me. A "relative pointer" object consisting of a 5 nibble prolog and a 5 nibble relative offset. It's function would be to call the object pointed at by the offset.

I suspect there's a good reason why such a thing doesn't exist, but I can't think of it. Does anyone have any ideas?

Thanks, Dave

Re: Why no relative pointer in RPL

*Message #2 Posted by **C.Ret** on 10 Mar 2010, 11:25 a.m.,*
in response to message #1 by David Hayden

Hye,

There is several simple ways to evaluate an object in RPL via a relative address. I may missing same thing about the XLIB and LAM object you speak about.

As far as I understand indirect reference mechanisms, the following RPL codes are all indirect reference to object in the XLib list :

Suppose the following list of objects store in XLib { 10 20 30 [1 2 3] [[7 8 9][4 5 6][1 2 3]] "Any Text" « DUP PRG » (12,3) 12.3_feet #adress ...} 'XLib' STO

To evaluate the object at the relative adress n, simply GET it ! 'XLib' n GET EVAL

Ex. 'XLib' 5 GET EVAL or 'XLib(5)' EVAL returns "Any Text"

And, a more relative adress can be used using any supplementary Index :

Ex. { 3 5 2 4 6 7 6 3 9 } 'Index' STO then 'Xlib' 'Index' 2 GET GET returns "Any text"

Or several as need : Ex. [1 2 3 4 5 1 2 3 4 5] 'PostIndex' STO tehn 'XLib' 'Index' 'PostIndex' 7 GET GET GET returns "Any Text"

And so on...

So, it looks to be easy and simple to make relative, relative indexed, relative multi indexed references in RPL !

No extra "pointer" object is required as any list, array or matrix may be used as a pointer table.

I certainly missing samething there and I may mistaken which XLIB, LAM or prolog's nibble you speak about.

Can you please be a bit more explicit concerning the HP49g's aplets jump table ?

Re: Why no relative pointer in RPL

*Message #3 Posted by **David Hayden** on 10 Mar 2010, 1:43 p.m.,*
in response to message #2 by C.Ret

The methods you mention will work, but what I'm talking about is something lower level. Suppose you have a library like this:

```
xNAME CMD1
::
  %1
  myInc
  %2
  myInc
;

NULLNAME myInc
::
  %1
  %+
;
```

The calls from CMD1 to myInc get converted into XLIB objects (AKA DOROMP objects). These objects contain a 3 nibble library ID and a 3 nibble command number. XLIB's prolog has to find the library, find its link table, find the command's entry in the link table and only then does it know where "myInc" is located.

A "relative pointer" object would be 1 nibble smaller than an XLIB, it would reduce the size of a library (because the internal commands wouldn't need to be in the link table) and it would be faster.

This is low level stuff related to how programming languages are implemented. Sorry if I wasn't clear.

Thanks, Dave

Dave

Re: Why no relative pointer in RPL

*Message #4 Posted by **Han** on 11 Mar 2010, 12:52 a.m.,*
in response to message #3 by David Hayden

Is the GOTO command perhaps what you are looking for?

There are other ways to implement such a relative jump, but it requires embedding in a little bit of Saturn assembly code. The following code is untested (just what came to my head).

```
xNAME CMD1
::
  %1
  myInc
  %2
```

```
CODE
  GOSBVL =SAVPTR
  GOTO   _jumphere-(*)
ENDCODE
;

NULLNAME myInc
::
SKIP
CODE
_jumphere
  GOVLNG =GETPTRLOOP
ENDCODE
  %1 %+
;
```

Re: Why no relative pointer in AKA DOROMP objects

*Message #5 Posted by **C.Ret** on 11 Mar 2010, 2:55 a.m.,*
in response to message #4 by Han

Thanks for the explanations.

I now understand my mistake, all this have nothing with user RPL and it looks to me more related to internal code and machine assembly language than I have expected from the first post title.

As I have no HP49, nor HP50, I only interpret RPL as user RPL languages as available on HP28C/S calculator. And I have to admit I have no clue of what all this stuff is related to.

What you are describing here have nothing to do with classic RPL and it's look to be really system specific (I suspected you aren't actualy hacking all this code on true HP calculator, but on emulator or dedicated software environnment).

That's the cost of this technology, no more portability and sharable understanding or logic. This is exactly the travers denoncied by RPN users who like RPN's portability, no hardware specificity and a wide shared standard.

Sorry, for being incompetant in this stuff.

> Quote:
>
> What you are describing here have nothing to do with classic RPL and it's look to be really system specific (I suspected you aren't actualy hacking all this code on true HP calculator, but on emulator or dedicated software environnment).

Actually, it isn't system specific, it's generic system RPL and goes right back to Wickes's RPLMAN.DOC description of the language.

I received a wonderful explanation in a private email. I won't mention who in case he wants to remain anonymous. It isn't really practical currently because of the way the calculator does memory management. When you execute a command in a library that isn't in port 0, the calculator copies the command to temporary memory and executes it there. Since it copies the

command and not the whole library, a relative pointer wouldn't point to the right place.

Another casualty of an address space that's too small.

Battery pack for an HP-35

*Message #1 Posted by **Jean-Michel** on 9 Mar 2010, 4:12 p.m.*

Hello all,

believe me or not, but I was given these past days two old HPs for free.

One is an HP-25, serial number 1803B... in very good cosmetic condition, as well as the leather-like pouch, with very few and minor scratches. It seems to have been used very few, as the keys still have the famous "rotate-and-click" behavior. Unfortunately, it has been left for years with the battery pack inside, and I found a huge leakage when openning it. A good cleaning and fresh AA batteries did not bring it back to life. At least I now have a very nice paper weight...

The other I received just today is an HP-35, serial number 1302S..., in very good cosmetic condition too. Like the first one, it seems to have been unused the major part of its life, which is rather surprinsing when one knows the price of this calculator in '73! Since there is no battery pack in it and the battery terminals don't show major evidences of battery leakage, I keep a tiny hope it's still functional.

My question is the following: since there's no marking in the battery compartment nor on the battery cover showing the polarities of the battery terminals, could someone tell me what they are, so that I could test the calc? Same for the 3 plugs on the back side, near the battery door. In case of use, mine is like the third one starting from the left on this photo.

Any help much appreciated.

Kind regards.

Jean-Michel.

*Message #5 Posted by **Hal Bitton in Boise** on 10 Mar 2010, 1:34 a.m.,*
in response to message #1 by Jean-Michel

On the HP 25, I'm assuming that you have put the new AA's into the original battery case. If so, be sure you have good contact at the closed end of the case, where the cells are (supposed to be) jumpered together (the original cells had a soldered on strip connecting them at this end). Without that strip, that spring in the end of the case is the sole connection. Perhaps it's corroded through.
Best regards, Hal

Re: Battery pack for an HP-25

*Message #6 Posted by **geoff quickfall** on 10 Mar 2010, 2:08 a.m.,*
in response to message #5 by Hal Bitton in Boise

Hal suggestion is excellent, while there, sometimes the round soldered battery contacts of the logic pca are corroded.

I have a 29C sold as broken which appeared excellent. Never powered up and I could not find any corrosion damage. It turned out to be the negative battery contact on the logic PCA. This was a cold solder and the connection although appearing perfect was broken at the solder.

After remelting both of the logic pca contacts (they look like rivets) on the logic pca the calculator works and I haven't looked back since.

is more valuable a 41cx broken calculator than a good one?

*Message #1 Posted by **Gonzalo Fernandez (Spain)** on 9 Mar 2010, 2:25 p.m.*

See http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=280472811380 versus
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=280472808417 ($93 versus $81)

Re: is more valuable a 41cx broken calculator than a good one?

*Message #2 Posted by **Raymond Del Tondo** on 9 Mar 2010, 3:38 p.m.,*
in response to message #1 by Gonzalo Fernandez (Spain)

Part of the answer is given in the auction text:

> Quote:
>
> There is a name engraved in the calculator and battery case (an attempt to scratch them out has been made)

The broken one isn't more valuable than the working unit,
but who wants a calc which has the previous owner's name engraved?

Actually the broken unit is not a halfnut, so there's a great chance to get it repaired.

HTH

Re: is more valuable a 41cx broken calculator than a good one?

*Message #3 Posted by **John Robinson** on 9 Mar 2010, 6:47 p.m.,*
in response to message #2 by Raymond Del Tondo

However, the broken one has the wrong case :-) so that will detract from it's value.

Cheers, John

method to the madness??

*Message #4 Posted by **geoff quickfall** on 9 Mar 2010, 7:57 p.m.,*
in response to message #1 by Gonzalo Fernandez (Spain)

As the guy (me) who purchased the broken one you have a good point but:

- PARTS if possible and very probable for 5 others that need work... - Combined with the other auction:

parts auction

- Required for the book as I intend to disect a keyboard heat stake system the least destructive way possible then document the process.

also;

- Can't find broken ones around here unfortunately.

Cheers, Geoff

p.s. if it is a candidate for restoration it will look and act as though new, pristine even, and as stated it is a full sized board and not a "halfnut" later version.

Edited: 9 Mar 2010, 7:59 p.m.

16c case refurbishment

*Message #1 Posted by **Dan Eicher** on 9 Mar 2010, 1:29 p.m.*

Recently I picked up a 16C on ebay. The electronics, keys and display all work perfect. The case shows signs of a very hard life, the aluminum has rough scratches and the case is chipped and dinged.

Anyone have any advice for cleaning up the aluminum and plastic case?

Thanks, Dan

Reading and writing text files from/to LIF-files: Two new scripts

*Message #1 Posted by **Geir Isene** on 8 Mar 2010, 5:41 p.m.*

Ok, here goes - an itch that needed some scratching.

Whereas the following two scripts are not general purpose read/write from/to LIF-files, they do read an ascii file from a LIF-file and write an ascii file into a LIF-file. From the web site:

"lifasread " - a Ruby script to read an ascii file stored in a lif-formated file (used by the HP-41 as file format on mass storage mediums. Tested on Linux. Run the script with the -h (or --help) option to see how it is used.

"lifaswrite " - a Ruby script to write a text file to a lif-formated file (the reverse of "lifasread". Run the script with the -h (or --help) option to see how it is used.

Re: Reading and writing text files from/to LIF-files: Two new scripts

Classic USB power cable and replacement connectors

*Message #1 Posted by **Mark Henderson** on 8 Mar 2010, 3:55 p.m.*

An enterprising gentleman has developed an after-market Classic series DC power plug and a USB power cable - I purchased a USB cable from eB*y and it is wonderful! He also sells just the connector for retrofit in case your connector/cable is flakey. A little pricey, but not when compared to the alternative. Highly recommended.

Classic Power Cable

I saw those last week and found them intriguing. >>

*Message #2 Posted by **tim m.** on 9 Mar 2010, 12:41 a.m.,*
in response to message #1 by Mark Henderson

I could use a new plug as mine has its structural integrity provided by a lot of Loctite epoxy. ;)

What I'd really like to see is a faithful molded repro, in black plastic, of the original plug.

-Tim

Re: I saw those last week and found them intriguing. >>

*Message #3 Posted by **aj04062** on 14 Mar 2010, 3:44 p.m.,*
in response to message #2 by tim m.

hey Tim,

What would you pay for a new plug? I could model one in CAD and then "rapid prototyped" from a hard rubber. No mold required.

I need one for a restoration I am doing. If you might pay, maybe I'd got that route.

Adam

Re: I saw those last week and found them intriguing. >>

*Message #4 Posted by **Alberto Fenini** on 15 Mar 2010, 1:01 p.m.,*
in response to message #3 by aj04062

That would be interestating, do you think it could be done for the battery cover latches as well ? Take care Alberto

Re: I saw those last week and found them intriguing. >>

*Message #5 Posted by **aj04062** on 16 Mar 2010, 6:37 a.m.,*
in response to message #4 by Alberto Fenini

Perhaps. That would take a bit more modeling and trial and error, I think. I have a need too on a 55 that has acid eaten latches.

What model do you need them for?

Do you feel there is a bigger demand for these?

Re: I saw those last week and found them intriguing. >>
*Message #6 Posted by **Alberto Fenini** on 16 Mar 2010, 9:44 a.m.,*
in response to message #5 by aj04062

Well, I do think very is a huge demand, if price is attractive enough, since are very easy to break, 8 out of 10 battery covers will need a replacement.

The problem I can see is that there are different models and differente colours to be done, and this may increase the production price.

If you want, I can send you some sample pics, I can post them here, or I can send you an email, I can be reached at alberto_1964 at hotmail.com, let me know

take care Alberto

Re: I saw those last week and found them intriguing. >>
*Message #7 Posted by **aj04062** on 16 Mar 2010, 12:29 p.m.,*
in response to message #6 by Alberto Fenini

well, I modeled the part up and am getting the first piece today or tomorrow. I will need to match the color of my 55 (black should be much easier).

I only have a 55. Are all the classics the same except for color?

If succesful with this one, it shouldn't be hard to do the other models. I would need good samples to start from. Are you willing to let me borrow yours if it is different than the 55?

peace, Adam

Re: I saw those last week and found them intriguing. >>
*Message #8 Posted by **Alberto Fenini** on 16 Mar 2010, 1:21 p.m.,*

HP-35S : do the battery last that long?

*Message #1 Posted by **Jean-Michel** on 8 Mar 2010, 12:34 p.m.*

Hi folks,

My HP-35S I bought new in nov' 2007 and barely used since needed some fresh batteries to power on today! (Not a problem of contrast setting, I checked this).

My question: did you guys notice that the lifetime of the two CR2032 cells was that short in this calc?

Just as an information: my 26 years old CASIO fx-602P needs much less similar batteries. I don't remember when I bought some new, but it's much more than two years ago!

Any opinions appreciated.

Kind regards.
Jean-Michel

Re: HP-35S : do the battery last that long?

*Message #2 Posted by **Michael de Estrada** on 8 Mar 2010, 1:23 p.m.,*
in response to message #1 by Jean-Michel

Yes, that is normal for the HP-35s. I only get an average 18 months use out of a pair of batteries. The calculator drains power even when turned off to maintain the contents of memory. The HP-33s is even worse.

Re: HP-35S : do the battery last that long?

*Message #3 Posted by **Jean-Michel** on 8 Mar 2010, 5:22 p.m.,*
in response to message #2 by Michael de Estrada

Michael,

many thanks for your prompt answer. I'm rather sad to know that this calc of the 21st century needs that much power to maintain the memory whereas calcs over twenty years old don't...I was far from thinking of this. Is this what we call progress?

One last question (probably stupid, but who cares?) : would it drain the same power to maintain the content of the memory if this one would be totally empty (variables and prgm lines)? Since my wife uses it quite exclusively now without ever putting anything into memory, I could leave it empty if this would help to increase the lifetime of batteries, but I doubt! If one of you have an idea...

Kind regards. JM

Re: HP-35S : do the battery last that long?

*Message #4 Posted by **Michael de Estrada** on 8 Mar 2010, 5:53 p.m.,*

in response to message #3 by Jean-Michel

I am certainly no expert with electronics, however, I doubt that the power consumption of the non-volatile memory is in any way related to it's state. OTOH, when the calculator is performing a calculation or running a program, it will consume more power than when it is idle. I believe the reason that the power consumption of the HP-33s is greater than the HP-35s is because its CPU runs at a faster speed. Because the memory of the HP-35s is much larger than older vintage calculators, it probably requires more power to maintain its contents when the calculator is powered off. If you use this calculator only occasionally and don't need to maintain the contents of memory, you might consider simply removing the batteries during storage,since it is extremely easy to remove and install batteries in this model.

Re: HP-35S : do the battery last that long?

*Message #5 Posted by **Katie Wasserman** on 8 Mar 2010, 9:24 p.m.,*
in response to message #4 by Michael de Estrada

The 35S has a fairly high off-state current draw. I measured it on at around 10ua per cell. A typical CR2032 cell has a maximum rated capacity of around 220mah so you could expect about 2.5 years of battery life if you never use the calculator.

The amount of memory is insignificant to the off-state current draw for most calculators. What is stored in memory has zero effect on current draw in CMOS technology. What counts is:

1) circuit design -- cells in parallel with no blocking diodes is bad (the 12C+, 20b and 30b all have this problem).

2) silicon technology -- the leakage current on each gate. The Voyager series used chips that had near zero leakage current and the silver oxide button cells lasted for many, many years.

3) firmware design -- if the processor needs wake up often to scan the keyboard, update a RTC or do other maintenance functions, battery life is going to suffer.

-Katie

Re: HP-35S : do the battery last that long?

*Message #6 Posted by **Jean-Michel** on 9 Mar 2010, 3:50 p.m.,*
in response to message #5 by Katie Wasserman

identify old calculator?

*Message #1 Posted by **randy bozarth** on 8 Mar 2010, 11:29 a.m.*

I am trying to identify a calculator I used in the late 60's or very early 70's. Definitely before hand-held calculators. ....Hewlett-Packard? Approximately 14" x 14" x 24" high and rolled on casters. Keypad and digital readout was on top. Add, subtract, multiply, divide only. Stack memory. RPN?

Re: identify old calculator?

*Message #2 Posted by **Jean-Michel** on 8 Mar 2010, 12:41 p.m.,*
in response to message #1 by randy bozarth

Hi Randy

Give a try to this site :
http://www.calculatormuseum.nl/calc/start.htm
Perhaps is the calc you're looking for there...

Re: identify old calculator?

*Message #3 Posted by **Frank Boehm (Germany)** on 8 Mar 2010, 4:05 p.m.,*
in response to message #1 by randy bozarth

Most of the early electronic "monsters" had 2 casters on the back side - too heavy to carry around, you just had to lift the front a bit and were able to move the calculator somewhat back on your desk. Your description limits the number of possible calculators to around 100 or so... So a little drawing (position of keyboard, display, maybe outer casing, as these were often quite "strange") might help to narrow down to a handful of possibilities.

Re: identify old calculator?

*Message #4 Posted by **randy bozarth** on 8 Mar 2010, 10:52 p.m.,*
in response to message #3 by Frank Boehm (Germany)

Here is an image of what I remember. It didn't roll around on the desk but rolled on the floor. I apologize for the lack of details.

Edited: 8 Mar 2010, 10:54 p.m.

I'm clueless...

*Message #5 Posted by **Frank Boehm (Germany)** on 9 Mar 2010, 4:22 a.m.,*
in response to message #4 by randy bozarth

I haven't seen a floor-standing model yet. Are you sure it wasn't just mounted on a cabinet? The first

electronic calculators (Anita, IME, Canola, Sharp) were "desktop-sized".
One exception were WANG-calculators, those used a floor-standing electronics unit and several remote displays/keyboards (which is different from your image).
All larger calculators did use a vertical display, only about 1969, a somewhat more "horizontal" (like 45o angle) type was introduced for "portable" desktop calculators.
Example:Walther ETR 1

Re: identify old calculator?

*Message #6 Posted by **Bart (UK)** on 9 Mar 2010, 4:31 a.m.,*
in response to message #4 by randy bozarth

There was a prototype Friden that was similar, but the production model was "desktop" sized (Friden 130).

See here, the black & white sketches show the cabinet size prototype.

Re: identify old calculator?

*Message #7 Posted by **Martin Pinckney** on 8 Mar 2010, 4:24 p.m.,*
in response to message #1 by randy bozarth

Quote:

...Hewlett-Packard? ... Add, subtract, multiply, divide only.

Definitely not HP. From this site:

The HP 9100A was Hewlett-Packard's first calculator. In the mid to late 1960's electronic four function fixed point calculators were brand new and typically cost $1000-$2500. In 1968 HP introduced the HP 9100A featuring:

* Floating point math with a range of 10^-98 to 10^99 * Log (natural and base 10) * Antilog (natural) * Square root * Trigonometric (including hyperbolic) functions and inverses * Vector addition/subtraction * Polar/rectangular conversion * Misc. features like 1/x, PI etc. * A logic system that could handle complex expressions (RPN) * Programmability * A magnetic card reader/writer * Options such as a printer and a plotter

*Message #2 Posted by **J-F Garnier** on 12 Mar 2010, 2:41 p.m.,*
in response to message #1 by David Airey

The Applied Statistics I & II documentation appeared on The Other Site.

Actually, I submitted the french "Statistiques Appliquées I" to the MoHPC (is on the current DVD), and the

strange program line I reported some times ago is also present in the english version, see here .

This answers to the questions I asked at the time, it seems that the english version is a translation of the original french documentation, and programs are the unchanged french versions.

Last question : does someone own the french manual "Statistiques Appliquées II" ?

J-F

USB Logic Analyzer

*Message #1 Posted by **Thomas Chrapkiewicz** on 7 Mar 2010, 10:37 a.m.*

Hello:

Would anybody like to share their opinions / experiences with USB port Logic Analyzers such as these:

http://www.usbee.com/sx.html

http://www.saleae.com/logic/

Thanks, TomC

Re: USB Logic Analyzer

*Message #2 Posted by **Meindert Kuipers** on 7 Mar 2010, 11:28 a.m.,*
in response to message #1 by Thomas Chrapkiewicz

Thomas,

I have the LogicPort device and I am very happy with it: - http://www.pctestinstruments.com/

I have used this intensively for the MLDL2000 development. It is very flexible, and especially the large number of channels is something I really wanted. It may be a bit more expensive than the low-cost tools you are considering, I just needed the channels.

You might also look at: - http://www.tech-tools.com/dv_dv1.htm I have worked with this, also good, a bit more expensive - http://www.pic-tools.com/dbg_sigma.htm I do not have any experience with this

Meindert

*Message #3 Posted by **Bruce Bergman** on 7 Mar 2010, 12:56 p.m.,*
in response to message #1 by Thomas Chrapkiewicz

I hadn't seen the Saleae unit before, but it looks *really* nice. I'd be interested in hearing about either of these two units as well.

Thanks, Bruce

Re: USB Logic Analyzer

*Message #4 Posted by **Seth Morabito** on 7 Mar 2010, 3:56 p.m.,*
in response to message #1 by Thomas Chrapkiewicz

I own a Saleae Logic. For the price, it's a great product, I really love mine. The software is Windows-only at

the moment, but it's being rewritten from the ground up to be cross platform, which I certainly appreciate.

I have no experience with the USBee, but it also looks like a good product. It looks like it has more built-in protocol decoders in the software, but otherwise a very similar or identical feature set. I'd like to be able to compare the two side-by-side.

Re: USB Logic Analyzer

*Message #5 Posted by **cyrille de Brébisson** on 8 Mar 2010, 8:47 a.m.,*
in response to message #1 by Thomas Chrapkiewicz

Hello,

I have and use the Salee one and I love it. Go for it, worth every of the few penny it cost!

Re: USB Logic Analyzer

*Message #6 Posted by **Bruce Bergman** on 9 Mar 2010, 4:19 p.m.,*
in response to message #5 by cyrille de Brébisson

Interesting. I have known of the USBee SX for some time, but had never seen the Saleae unit before. After digging into the web for more information on both, I see the following differences:

```
Price:
  USBee SX = $139
  Saleae   = $149

Bling:
  USBee SX has additional CLK and TRG signal leads; signal generator
  Saleae comes with carrying case; leads detachable

Software:
  USBee SX has "Suite" version; many more config/trigger options
  Saleae is ultra nice; *MAY* have a Linux version in future

Blogs/comments:
  USBee SX:
    solid history
    software more feature rich and useful
    signal generator cool
    company seems solid and stable
  Saleae:
    after initial run, they "scaled back" resources due to economy
    promised Linux version now for over a year
    removable lead pod is awesome and useful
    leads are easier to attach (soft wires)
```

With all that in mind, I'm tempted to go with the USBee SX unit. Is there anyone else that can shed some light onto the pros and cons?

thanks, bruce

Re: USB Logic Analyzer

*Message #7 Posted by **Adrian Godwin** on 9 Mar 2010, 4:47 p.m.,*
in response to message #6 by Bruce Bergman

It's true the salae unit has promised linux / OSX support for a long while, but it's not vaporware : there is an alpha version which is extremely usable and easily available from the company. I won't give more details here but you won't have difficulty if you ask.

Build quality is what sold me on it - the usbee seems like the usual plastic box. Salae is a black-anodised pod with flex wires and real ez-hook grabbers.

The salae software was way ahead (with SDK for protocol analysers too) but while they worked on the cross-platform version usbee have pretty well caught up on a slick interface and are now offering protocol details for data transfer (you could possibly use something like the Sump analyzer software with it).

I think the usbee hardware is slightly more flexible (external clock and power for interfaces) but salae seem to 'get' user interfaces better. I suspect an HP lover would go for the salae and a TI lover for the usbee!

I don't know about company stability. Salae seem to have been quiet for such a long time that they're either about to produce something wonderful or announce they've sold up. Initial supply problems were solved some time back, I think.

*Message #8 Posted by **Adrian Godwin** on 9 Mar 2010, 4:54 p.m.,*
in response to message #7 by Adrian Godwin

Also see this one :

http://dangerousprototypes.com/2010/02/25/prototype-open-logic-sniffer-logic-analyzer-2/

Note that it's a completely different device from the others - it has a small amount of fast on-chip storage rather than an indefinite amount of pc-based storage. Better for fast data, worse for long, slower data. It's also completely open source, FPGA included.

I'm very happy with the Salae but will very likely buy one of these too. And I already own an HP16500.

HP50g SigmaDat

*Message #1 Posted by **Chris** on 7 Mar 2010, 10:18 a.m.*

I just got an HP50g. I have been playing around with it and trying (I stress "trying") to store data in the "sigmaDAT" variable for stats.

The manual suggests that when I enter data in the MATRW I should just then store it to sigmaDat (STO SDAT) as if there's a simple key sequence that will do that.

However I cannot (and again I stress cannot) find any way to store something to the SigmaDat register.

I see where sigmaDAT is when I go to run the stats application but no way to store something in it.

I could store it to any other memory register, but the good folks at HP clearly state I should be able to store it to the sigmaDat register as if there is such a thing.

How do I do this?

Re: HP50g SigmaDat

*Message #2 Posted by **Han** on 7 Mar 2010, 11:21 a.m.,*
in response to message #1 by Chris

If you are in the default algebraic mode, then: 1. create a matrix of values (or a vector, depending on what sort of stats you plan to do) and press ENTER. 2. press the STO> key and you should see ANS(1)> on the command line (the 1 may be a different value); finish typing into the command line the following keystrokes: right-shift, SIN, right-arrow, backspace, backspace, alpha, alpha, D, A, T, ENTER

If you are in RPN mode: 1. create your matrix/vector and place it onto the stack 2. type in the variable name with the tic marks: ', right-shift, SIN, right-arrow, backspace, backspace, alpha, alpha, D, A, T, ENTER, STO>

Re: HP50g SigmaDat

*Message #3 Posted by **BruceH** on 7 Mar 2010, 1:40 p.m.,*
in response to message #1 by Chris

sigmaDAT is the reserved variable. STOsigma (accessed from the CATalog) stores into it; RCLsigma recall it to the stack. Sigma+ and sigma- add and remove data points to and from your data set.

Re: HP50g SigmaDat

*Message #4 Posted by **Chris** on 10 Mar 2010, 2:32 p.m.,*
in response to message #3 by BruceH

Thanks! I was able to finally find it waaaay down the list on the CAT menu.

Amazingly inconvenient.

Another poster also noted to directly enter it from the STAT menu.

As much as I have loved HP calculators for the past 30 years I fear that the quality of the product itself is going downhill. I am sure the 50g is far more powerful than I will ever utilize but I equally fear that it is cheap construction and materials and there's no way it will be around 22 years later like my trusty 11C is.

Thanks for all the help on this!

Re: HP50g SigmaDat

*Message #5 Posted by **Dave Britten** on 7 Mar 2010, 3:49 p.m.,*
in response to message #1 by Chris

The original 48GX Stat menu is available on the 50g, but hidden for whatever reason. All the SigmaDAT operations are in the DATA submenu. To access it, use the following steps: 96 MENU

I would suggest making a small program out of that, and either adding it to your Custom menu, or to a User key binding (USER Right-Shift 5 being the obvious choice).

Better yet, just buy a 48SX or 48GX, which has a sane menu layout. ;)

Another related tip: You can, of course, store a matrix directly in SigmaDAT, but you can also store the name of another matrix variable into SigmaDAT. If it contains a name, then all stat operations will operate indirectly on that named variable. This makes it much easier to store and work with a few different sets of data in one directory. The matrix variable has to already exist, however, otherwise Sigma+ will simply create a new matrix and store it directly in SigmaDAT.

Re: HP50g SigmaDat

*Message #6 Posted by **Norris** on 7 Mar 2010, 11:10 p.m.,*
in response to message #1 by Chris

Here's another way to store something into SigmaDAT.

Go to the STAT menu with [right-shift] 5.

Pick the type of statistical analysis that you want. Let's say it's "1. Single-Variable Statistics". So you select that.

In the resulting form, the cursor will be in the first space in the upper left, which is "SigmaDAT".

If you've already stored your data in a matrix variable, press CHOOSE and select it. The matrix will be copied to SigmaDAT.

If you haven't entered your data yet, press EDIT to go to the Matrix Editor and enter your data. When you finish, the result will be stored in SigmaDAT.

Re: HP50g SigmaDat

*Message #7 Posted by **Hal Bitton in Boise** on 8 Mar 2010, 11:15 a.m.,*
in response to message #1 by Chris

If EDAT already exists, here is yet another, very simple way to store data into it (RPN mode)...

Put the matrix you want to store into EDAT on level 1 of the stack.

Call up the VAR menu and find the EDAT softkey by scrolling through the variables with NXT.

Press left shift (and release), then the EDAT softkey to store whatever is in level 1 into the EDAT variable. (This works with any variable).

You can of course review what's already in EDAT by simply pressing it's softkey. You can also use the stack to save/swap data sets into EDAT.
Best regards, Hal

Re: HP50g SigmaDat

*Message #8 Posted by **Dave Britten** on 8 Mar 2010, 1:17 p.m.,*
in response to message #7 by Hal Bitton in Boise

Yup, Left-Shift SigmaDAT is a convenient way to store new data, as long as the variable already exists (or you've added its name to a custom menu). If not, you have to use a different approach.

Also, if you're going to work with multiple data sets, I'd recommend using the technique I mentioned earlier, i.e. storing the names of other variables into SigmaDAT. This will safeguard against a stack-clearing mishap destroying any of your data, or user error while shuffling data between variables. Also, the CLSigma command will only delete SigmaDAT, and not the underlying matrix variable holding the actual data, offering another layer of protection.

As an example, I wrote some programs for recording drive times of different routes, where each route is stored in its own matrix variable. The program prompts for a route name with 3 TVARS TMENU ... INPUT, then converts the resulting input string to a name and stores it in SigmaDAT. Then the program uses either Sigma+, or stores the data point directly into a new matrix if the named variable doesn't exist yet. The analysis/plotting routines do pretty much the same thing, minus creating new matrices.

Incidentally, you can do this same indirection with CST for saving custom menus. For example, I keep my normal custom menu in CST.DEFAULT, then store 'CST.DEFAULT' in CST. From there, I create submenus by invoking other CST.whatever list variables with TMENU. Thus I don't have to worry about a program's injudicious use of MENU deleting my permanent custom menus.

The one other place I can think of where this works is EQ - you can store the name of an algebraic variable, or a list of such variables. (This works with both the standard solver and multiple-equation solver.)

These indirection features aren't particularly obvious on the 48GX and newer models - I don't think the manual mentions it - but the way the variable catalog system works on the 48SX makes it second nature.

An update on Carly

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 6 Mar 2010, 8:12 p.m.*

An article on politics in California on page 40 of the latest issue of *The Economist* states

> Quote:
>
> ... Carly Fiorina is running for the seat of Barbara Boxer, one of the most liberal members of Congress. Ms. Fiorina was once boss of HP, a printer- and computer-maker. She is trying to make voters overlook the fact that HP was worth much less when she left than when she came, not to mention that the board ousted her in 2005. Her grasp of governance matters is superficial: she recently seemed to think that California could declare bankruptcy. And her campaign and advertising have been bizarre.

Re: An update on Carly

*Message #2 Posted by **Seth Morabito** on 7 Mar 2010, 2:13 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Oh yes. As a California resident, I can confirm that it has been a fairly bizarre campaign. But don't take my word for it. Just Google "Demon Sheep".

"No, not crazy, but just like any other CEO, thinks they walk on water and can do no wrong. Being a man or woman has nothing to do with it. Just sheer ego. It goes with the job."

That's such a nice way of putting it Tom. I'll use that in the future. **My** standard rant has usually started out something like: "once someone has sucked their way to any position of authority they will use that power to prove that they are omniscient, omnipotent, transcendent, righteous..... to themselves" and it continues downhill from there. I'm as likely to vote Democrat as Republican, but never Carly, not after she turned "the company of engineers" into the company of loss-leader printers.

Carly's opponent, Tom Campbell, was interviewed on KGO radio today. They invited her too but according to her handlers: "Ms Fiorina doesn't do media".

Well... that's what it's become.

Re: An update on Carly

*Message #14 Posted by **John Garza** on 15 Mar 2010, 6:20 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Wasn't it on her watch that HP gave out employee SS numbers so people could impersonate them on the telephone? "Pretexting" I think was the euphemism used in the media. Or was it after her?

I think Tolkien had it right. The mere fact that someone desires power is enough to disqualify them. It points to psycological issues that could be greatly amplified by the addition of power.

Wild hack: Synchronize your HP-41 with your mobile phone calendar

*Message #1 Posted by **Geir Isene** on 6 Mar 2010, 12:31 p.m.*

From the fringe outback of sanity: You can now use your HP-41 as a true PDA and have it synchronized with your Google Calendar (and hence your mobile phone if it supports Google Calendar).

It's a wild hack consisting of the REM program (v.0.4) on your HP-41 and a Ruby script (remsync.rb) on your PC and requires a working HP-41<->EMU41 setup with PIL-box or such as the link.

From the REM web page (go to the page to get all the needed links):

With the help of a PC-side program, you can now even sync your HP-41 with Google Calendar and through that service keep your mobile phone calendar and HP-41 in sync! This requires you to have the PIL-Box or similar bidirectional communication with your PC and the EMU41 running on your PC (use Dosbox if you use Linux). Download the Ruby-script here.

Download the EMU41.INI (and edit it to suit your needs), the Dosbox config (edit the serial1 as needed - it is set for use with Ubuntu Linux 9.10) and the remsync config (Linux users should save remsync.conf as ".remsync.conf" while Windows users should save it as it is - without the period in front of the file name). For Linux users, read this post on how to get your HP-41 connected to EMU41 in Dosbox on your PC via the PIL-Box.

Before you can synchronize, you need to format the HDRIVE1 Lif-file: XEQ "NEWM" and press "001" to format the file rem.lif with only one file (the REMF). Then create the REMF file in the Lif-file: Enter "REMF" in Alpha, 126 in X and XEQ "CREATE". Finally create a file called "rem.lif" on your PC and make sure you edit the variable "Lif_file" (in ".remsync.conf") to point to "rem.lif". Note: for Windows users, edit remsync.rb so that you load the correct remsync.conf file (leave it somewhere and let the load command in remsync.rb point to where it is).

To synchronize, first ensure you have EMU41 running on your PC with your HP-41 connected (via the PIL-box or otherwise) and XEQ "REMSYNC" on your 41. The program will stop and display "RUN PC PRGM". You then run remsync.rb on your PC. When remsync.rb finishes, press R/S on your 41, and voilÃ¡ - you have sync'ed. You will now find that the next 25 or so appointments are the same in REM on your HP-41 and your Google Calendar. Only the start date/time and the titles are sync'ed to not eat all you Extended Memory on your 41. Try to keep the titles of your appointments short as you enter them in Google calendar (preferably 12 characters or less).

Useful? Probably not. Fun to make? You bet :-)

Thanks to Egan Ford and Tony Duell.

in response to message #1 by Joerg Woerner

If this is a prototype of the next version of the nSpire, it is unfortunate that they did not do much to improve the keyboard. The current nSpires have buttons that are way too tiny (letter keys) and cluttered (letter keys in between normal buttons). I see that they have not done much in terms of improving the key size for letters.

There is something just... "nice" about have those extra buttons for common functions like SIN, COS, TAN, etc...

in response to message #1 by Joerg Woerner

Hallo Jörg,

das Tastenfeld wirkt deutlich aufgeräumter als in der vorherigen Version. Die Alphatasten sehen erstmals brauchbar aus. Aber es hat immer noch zu viele Minitasten auf engem Raum. Vernünftige Größen und Abstände haben eigentlich nur die Ziffern und die Tasten darüber. Und es sieht wirklich aus wie ein Fluke.

Beste Grüße aus dem alten Europa (heute wieder eingeschneit)

Walter

(For our English-only readers: Keyboard looks tidier, but still crammed. And the device in total really looks like Fluke.)

Wow, all that German translates to 2 short English sentences ;).

PS Google Translate does quite a good job of German -> English (I think).

> Quote:
>
> And the device in total really looks like Fluke.

Perhaps meant to be as it's possibly aimed for purchase by schools only (re text under keypad) - to dissuade theft (who'd want to own something that looked like THAT. :))
Then again for those in T&M, it would fit in perfectly with the other test equipment. Maybe even pursuade the boss to pay for it - with datalogging devices of course.

Re: db: Double wide ENTER key spotted in the wild

*Message #7 Posted by **Nigel J Dowrick** on 6 Mar 2010, 6:02 a.m.,*
in response to message #6 by Bart (UK)

I'm guessing it's yellow because it's a school property model - these are often made yellow to make stealing them more difficult.

I think that the keyboard is an improvement: having the two sets of buttons in different places will at least make the main buttons easier to press without pressing the tiny ones.

The display looks to be a lot higher contrast than the present model, too.

I wonder if there are any plans to make this new model properly programmable?

Nigel

Well, this is an interesting development. If the display on this new unit really looks as sharp and clear as that pictured, with that degree of resolution, that would be great because the display on the original unit was really hard to discern; this is crystal clear.

But the bigger item of interest is the icons at the bottom of the screen, which lead me to believe that this is a touch screen, with a stylus maybe. That would be a huge improvement.

If it still has a BASIC-like programming language but with an added ability to enter data DURING program execution (which the original lacked, significantly), I'm getting one!

IMHO this picture is pure artwork only. Maybe it's based on a photograph, but nothing more.

> Quote:
>
> But the bigger item of interest is the icons at the bottom of the screen, which lead me to believe that this is a touch screen, with a stylus maybe. That would be a huge improvement.

Well, it says "TI-Nspire Touchpad", so let's assume this means something d;-)

in response to message #13 by Walter B

Well, this kind of explains what's new. You may be right about the screen being based on a picture, I don't know, the release notes don't say anything about a much more readable screen, so I assume that the resolution and clarity of the display is unchanged. If true, that is unfortunate.

There is no stylus or touchscreen, but the "touchpad" makes it somewhat easier to navigate on the screen; still, a stylus and real touchscreen would have been a huge improvement.

On the plus side, the programming language now includes a command to prompt for an input during program execution. This is good. But unless the screen is much more readable, I don't think I'll upgrade yet.

Tim; That Ranger in the picture isn't a bad unit, except that it's bigger and heavier than the 50g, saddled with a mistake generating touch screen and a proprietary battery pack, not programmed in RPL, and sold as the only platform for surveying software that "passes the gee wizz test but fails the so what test". It's got good keys though. Did you or John ever consider porting your 48-50 stuff onto the Ranger too?

in response to message #1 by Joerg Woerner

I actually got to play with one of these today. My sister got back from the T3 conference in Atlanta (TI's international conference).

Anyway, some cool things about this unit:

1) The keyboard is modular -- you can remove it and presumably in the future they will have several types of keyboards that change be interchanged with the one you see.

2) The "touch" aspect has to do with the "arrow" key (center top of photo). The big square button actually is like a mousepad/touchpad; you can also use the square as a set of big arrow keys too.

3) TI plans to have rechargeable battery packs for this unit.

4) The screen is in fact as crisp as you see in the photo.

5) Navigation is still a pain in the rear -- menu systems only work well when you have a REAL mouse (though the touchpad is a nice upgrade). However, imagine going through 4 levels of menus just to get to your basic commands...

6) I could see these things being used for data collection in the near future...

I'll try to post photos later this week. The model I played with was black and dark grey.

in response to message #17 by Han

This is what the new OS2 looks like on an older CAS unit. With a strong light shining directly on the screen, it's not too bad. But without a strong direct light, it's still hard to discern. I hope the screen characteristics of the new

touchpad unit, as you say, overcome this problem.

The biggie in OS2, from a programming point of view, is commands for getting user input while a program is running: "Text" displays a dialog box; "Request" lets the user enter a numeric value for a variable; and RequestStr gets string input. The NSpire programming language is now a real programming language. The dialog boxes, however, are pretty small and tough to read.

in response to message #19 by Don Shepherd

Information on the new nspire models and the enhancements in OS2 is now available on the TI website. It all looks very good - I shall be upgrading my old nspire (non-CAS) as soon as I can! It's nice to see new calculator hardware and software still being actively developed in an imaginative way, even if the results are not exactly what everyone would like! Good for TI! (ducks)

The HP 50G could have been given a large ENTER key

*Message #1 Posted by **Han** on 5 Mar 2010, 11:25 p.m.*

I recently purchased an HP50G (waiting for it to arrive). I know this topic has been beaten to death, and I am aware of some of the reasons for the ENTER key being placed where it is include:

- the need to be able to enter in letters and press the arrow keys simultaneously (K, P, Q, and R on the HP48 series were tied to the arrows keys); having a larger ENTER key meant losing one of the regular keys

- similarity to other graphic calculators (e.g. TI has its ENTER key in the same position)

While the second reason seems silly to me, I have to wonder why they made the keys on rows 4 through 6 slightly wider than the first 3 rows. The HP48 calculators only had "large" keys for the numbers, shifts, and four basic operations +, -, *, and /. The other keys were all smaller width. It seems to me that had rows 4 through 6 on the HP50 used keys with the same widths as rows 1 through 3, they could have fit 3 more buttons per row. Or this could translate to 2 more new keys and a large ENTER.

I wonder if the design was limited by the number of address lines connected to the CPU...

Re: The HP 50G could have been given a large ENTER key

*Message #2 Posted by **Hal Bitton in Boise** on 6 Mar 2010, 4:48 a.m.,*
in response to message #1 by Han

If HP would have put six proper keys in that space(as in the 48 series), instead of those 4 silly buttons, they could have had up to 18 keyboard functions in that same real estate that the 50G now has only 4. With my 48gx, I've never had a problem with the arrow keys also being alpha keys. Of much more significance to me is that the divide key is *NOT* also an alpha key on the 48, whereas it is on the 50G.

The large, centrally placed enter key was not only HP's trademark, it was part of a very well thought out keyboard scheme that dates back to the original HP35. It epitomized the superior design for which HP was known. It's size and placement make it easy to get to and hit with a thumb or finger of either hand. Why HP choose to abandon it with the 49g/50G is beyond me.
I still like my 50G very much, but it would be that much better with a proper "HP" keyboard layout.
Best regards, Hal

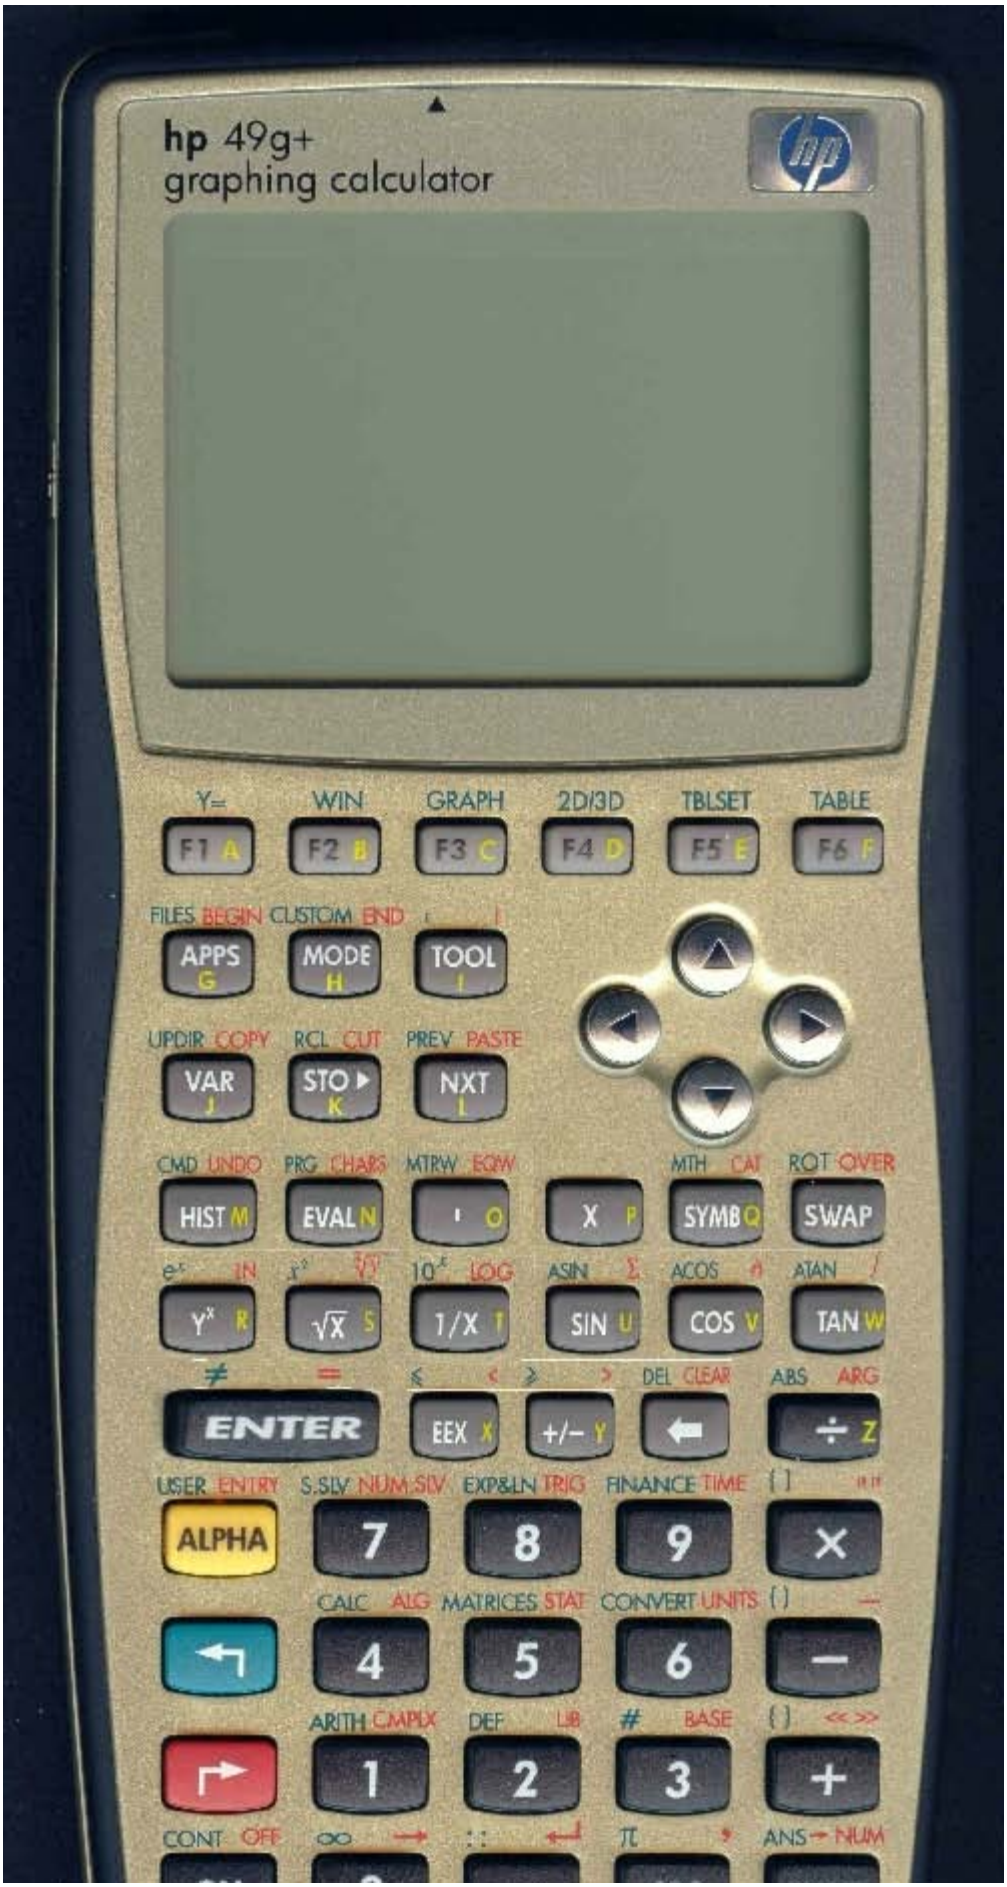
Re: The HP 50G could have been given a large ENTER key

*Message #3 Posted by **Jake Schwartz** on 6 Mar 2010, 2:24 p.m.,*
in response to message #2 by Hal Bitton in Boise

Hi,

Yes, this has been mentioned before. Just because the 49G in 1999 had the ENTER in the lower right corner didn't mean that it was a precedent which needed to be retained. It seemed that HP was getting the message when the 35S returned the ENTER to its original place from where it had been moved on the 33S. Back at HHC2004 in San Jose, I proposed this "hack" as an alternate key layout the HP49G+, with

ENTER keys in BOTH places a la Hydrix' Qonos:



Unfortunately, when the 50G appeared two years later, they were still not doing keyboard changes in the graphing line to please the HP "traditionalists".

HP-97 printer paper feed cam shaft

*Message #1 Posted by **Ed Sowell** on 5 Mar 2010, 7:52 p.m.*

How are the nylon(?) rollers attached to the shaft? for example, is the nylon roller bonded to the steel, or is it more like a tire that is glued on? Has anyone ever tried replacing them with something?

*Message #5 Posted by **Ed Sowell** on 8 Mar 2010, 4:48 p.m.,*
in response to message #4 by Ignazio Cara (Italy)

Hi Ignazio,

Couple questions.

First, are the "supports" embedded within the rubber? It looks like they are.

Second, how did you get the plastic parts that the rubber is molded to off the shaft? Looks like one would need a thin, strong slotted "collar" of some kind to slip behind the part, then press on the steel shaft using an arbor press.

I have found a person who can possibly mold new rubber on if I can get them off the shaft.

Ed

*Message #6 Posted by **Ignazio Cara (Italy)** on 9 Mar 2010, 4:36 a.m.,*
in response to message #5 by Ed Sowell

Hi Ed,

I hope I understood your questions. To the first, yes, the support is embedded on the rubber. Today evening, when at home, I will upload other more detailed images of the cilinder without the rubber, from diffrent view angle.

To the second question, it's very trivial to take apart the cilinder from the shaft. You must push the pin of the shaft against a strong surface, holding the cilinder tightly. I will show the way with a photo as well.

I hope to be helpful, for now. Take care

Ignazio

LogicDart help needed (probes)

*Message #1 Posted by **Hrvoje** on 5 Mar 2010, 5:32 p.m.*

Greetings from the Croatia! I have a HP LogicDart without probes. For many years I tried to buy it, and now that I finally succeeded, I can not find the probe or any information about how I can make them. Therefore, I believe that this is the right place to ask you nicely to someone give me any information obout the purchase or construction of probes for the Logic Dart. Manny thanks! Best regards

Edited: 6 Mar 2010, 7:02 p.m.

Re: LogicDart help needed (probes)

*Message #2 Posted by **BruceH** on 7 Mar 2010, 3:07 p.m.,*
in response to message #1 by Hrvoje

The bare Darts recently appearing on eBay were probably service replacements which is why they come without cases or probes.

Unfortunately the probes contain some electronics and HP never released a service manual explaining what went on. So, unfortunately, there is no easy way to replace them.

Re: LogicDart help needed (probes)

*Message #3 Posted by **Hrvoje** on 7 Mar 2010, 5:39 p.m.,*
in response to message #2 by BruceH

I am aware of what you wrote. Unfortunately, I realized it only when the LD came into my hand (after I bought it, of course, on e-Bay). My LD really looks like new (not even one scratch), and it seems to work perfectly (passed all tests that do not include the probes). Has a small sticker on the back that says: HP refurbished product. I really like this product, and I really need it in my work so I'm ready to do anything to make it complete (make or buy a probes). If anyone has any idea where to start, please tell me. Best regards, Hrvoje

Re: LogicDart help needed (probes)

*Message #4 Posted by **BruceH** on 8 Mar 2010, 7:24 p.m.,*
in response to message #3 by Hrvoje

You can't make the probes because no one knows how they work. You can't reverse engineer a probe because no one wants to ruin a working one. You can't reverse engineer what they do by looking inside the LogicDart because it has a couple of big custom chips. And you can't buy probes from a broken LogicDart because it's odds on that whatever zapped the Dart also zapped the probes.

FDIO - floppy drive utility

*Message #1 Posted by **John AS (UK)** on 5 Mar 2010, 3:13 p.m.*

Hi,

Found this site today:

http://www.hp9845.net/9845/projects/fdio/

FDIO is designed to read early HP floppy disk formats, to create and restore disk images under Windows.

Not tried it yet, looks like a useful tool.

Same person as HPDRIVE utility, so a good pedigree!

Regards,
John

Re: FDIO - floppy drive utility

*Message #2 Posted by **Egan Ford** on 8 Mar 2010, 4:05 p.m.,*
in response to message #1 by John AS (UK)

I wanted to give this a shot to see if this would work like Tony Duell's lifdump/lifimage for Linux, but the RAW FD driver does not support USB drives.

I only own notebooks and they all use USB floppy drives (if ever needed). The only exception is my 200MHz, 32MB, RH9 Linux/FreeDOS machine that I use with my HP-IL ISA adapter. I do not think XP will run on it.

Perhaps another can try to see if they can read a 9114B disk and convert it to a LIF image for use with EMU* (and vv.). I can do this with lifdump/lifimage on any of my Linux machines with floppy drives (however I have not tested a USB floppy drive).

A viable vintage data aquisition system?

*Message #1 Posted by **Timo** on 5 Mar 2010, 2:06 p.m.*

This is a question out of pure curiosity.

In my job I regularly work on electronic data aquisition systems and I'm always wondering how experimental data (in a laboratory for example) was aquired and processed in the "HP-41 era".

After some googling I wonder if the following "HP-only" system would have been a viable solution:

- an HP-41CV/CX

- a Agilent HP 3468A Digital Multimeter

- an HP 82160A HP-IL module to connect to the 3468A

- an HP 82162A printer

- another HP 82160A HP-IL module to connect to the printer.

Using this system you could read the voltage samples from a sensor, convert and process them, store them temporarily and finally print them. In case you have a 41CX or a C/CV with time module it could even be done time triggered. Some kind of mass storage device would come in handy as well...

As I said, it's really just to sattisfy my interest in engineering history. Maybe there are a few guys here on the forum who did actually work on such laboratory systems in the late seventies or early eighties. I'd really be interested to know whether a system like the one outlined aboe was actually ever used professionally in a laboratory.

Thanks for your feedback in advance and best regards, Timo

PS.: And before you ask: No I do not own all of this equipment! However, I'd lie if I said that it is not tempting to try and get all the components together... ;)

Edited: 5 Mar 2010, 2:08 p.m.

Re: A viable vintage data aquisition system?

*Message #2 Posted by **Garth Wilson** on 5 Mar 2010, 2:24 p.m.,*
in response to message #1 by Timo

My first automated test equipment (ATE) system contact with a 41 used the HP3421A data-acquisition unit with HPIL. It was like a DMM with relay cards also to do some controlling, not just taking data. The company got a loaner 3421A from HP to evaluate for buying. Most of the engineers in the engineering lab had their own HP-41's, and my friend used his on this and took 20 minutes of his lunch time to write the program and get it going.

It was an instant hit, being so much less expensive and easier to program than the other millions of dollars of

IEEE-488 equipment and controllers the company had. A requisition was put in for a set, but management wounldn't approve the 41, saying it was too easy for someone to put it in their pocket and walk off with it. Instead, they got an IBM PC with an IEEE-488 card, and three weeks after it came in, the two engineers responsible for setting it up were still trying to get the PC and IEEE-488 card to be friends.

A couple of years later, I was at another, much smaller company that was starting to need some ATE. I had my own 41cx by then (1986) and started using it with the HPIL-to-HPIB (IEEE-488) interface converter (HP82169A) to connect to equipment on the workbench to automate the repetitive jobs of taking certain readings through the DMM, and controlling signal generators, relay boxes, power supplies, and so on. In small but quick steps, the company got into a product line that required a lot of testing that was totally impractical to do by hand. Not realizing how quickly this situation was going to escalate, I set up automated testing, using my HP-41 as the controller. Especially back then in the late 80's, people would be absolutely stunned to see a large rack of instrumentation controlled by something that would fit in a pocket. It gradually got to where I didn't get to use my HP-41 much anymore. Production test operators were using it all day to test our product. In fact, the first two million dollars' worth were tested by this HP-41cx and a 20-page program.

Eventually we transfered the control of the production testing to a 68000-based HP series 9000 computer. Interestingly, it was not even twice as fast as the HP-41, because much of the time was spent giving filters time to settle and waiting for readings to come back from the equipment.

I still use the same 41cx every day, but it's pretty seldom that I use it to control anything on the workbench anymore. The 71 gets used more for that-- in fact, that's nearly the only thing I use the 71 for these days-- but that's still not much. My workbench control and data acquisition now is mostly handled by a home-made workbench computer about 5"x7"x2.5".

Re: A viable vintage data aquisition system?

*Message #3 Posted by **Timo** on 5 Mar 2010, 4:16 p.m.,*
in response to message #2 by Garth Wilson

THanks for your response Garth,

very interesting! I thought about the HP-41 only in terms of a device for laboratory level usage. But you are right I forgot about the HP-IL/HPIB converter which opens a much wider field of applications.

I'm reasonably familiar with GPIB since almost all of our test equipment offers a GPIB interface. As far as I know, HPIB and GPIB are very similar since GPIB is based on the HPIB. I'm not sure but would it be possible to control GPIB devices with the HP-IL/HPIB converter and a HP-41?

I'm just imagining a Keithley DMM being controlled by a pocket calculator which was produced about 20 years before the Keithley was even designed - and the looks of the colleagues...

Re: A viable vintage data aquisition system?

*Message #4 Posted by **Garth Wilson** on 5 Mar 2010, 4:40 p.m.,*
in response to message #3 by Timo

I have never found any differences between HPIB and GPIB. IEEE adopted HPIB as a standard and gave it the number IEEE-488. I used the 41 to control IEEE-488 instruments from HP, Wavetek, Cytec, and others, all at once. HPIL is basically a serial implementation of HPIB, and the interface converter was basically invisible to the 41. IOW, as far as the 41 was concerned, the instruments out on the IEEE-488 bus were really on HPIL, except that they weren't auto-addressed. My programs had to say "9 SELECT" for example to select the device at HPIB address 9.

To call it "viable" (your word) is a big understatement. In spite of the 41's lack of structured programming, I found it easier and quicker to devlop the programs on the 41 than I did later on the 68000-based HP-9000 computer running Rocky Mountain Basic 5.1. Remember I said my friend wrote that initial test set-up program in 20 minutes of his lunch. You couldn't do any better with a modern system with a drag-and-drop graphical test-writing interface.

I should mention that I have the Extended I/O module (built into my HPIL module so it doesn't take up an extra port). I also have the FSI164A which was virtually identical to the HP82164A HPIL-to-RS232 interface converter except that the FSI came with two RS-232 channels and optionally had up to 8, and could also be battery-powered. I wish I had gotten both of the HPIL-to-parallel interface converters when they were available. I can do it now through my home-made workbench computer by communicating with it through RS-232 and having it do that parallel part, but it's a "middleman." This is in fact how I use my parallel printer with the 41 and 71.

If you buy the new equipment, yes, it's very expensive. You can get used equipment very inexpensively on the auction site. It has its advantages, depending on what you want to do. Most of it you can also use stand-alone if you want to, without a computer to control it, unlike a lot of things made strictly for the PC, whether to go inside it or have proprietary driver software that only runs under certain operating systems within a narrow range of release times. The product life of industrial buses is much longer than that of the fast-moving PC market, and that longevity gives valuable stability.

For the last ATE I did at that last place of work however, we were supposedly going to need seven sets. In that case, the "rack-and-stack" IEEE-488 approach would have been cost-prohibitive, so we pursued a route that took more development time but the time could easily be amortized over the seven sets since the per-set hardware cost would be a lot less. The hardware platform we (or should I say *I*, since I did 90% of the work on it) chose was STD bus. "STD," by the way, stands for "simple to design," not "standard." STD is far less expensive than something like VME or VXI. I used a 19"-wide card cage and off-the-shelf power supplies and STD-bus cards for CPU, signal generators, and analog I/O, and designed custom boards too for

programmable filters, signal routing relay sets, programmable power supplies, programmable loads, and DMM front-end.

I had gotten my start in Forth on the HP-71 (which is not a very good Forth), but this project is where I really took off with Forth. I programmed the project in Forth and found that it made for very efficient use of programming time, leaving more time to debug hardware problems (which it also facilitated). During the development, relations turned sour with a couple of our foreign assembly plants, and I stopped with only two sets of the ATE. For only two, it might have been more cost-effective, at least when the development time was factored in, to go with the rack-and-stack IEEE-488 equipment. (Test fixtures had to be custom either way though.)

> I was wondering which one for a hobby programmer who does micro-controllers would you recommend for a modern HP-41 calculator?

Get a used HP3421A HPIL data-acquisition unit from the auction site, making sure it has the relay cards in it. You can use them to select inputs for the internal DMM and do some low-speed digital I/O with them too. This will take you a long way on a small budget. I recently got one, full, for $100 plus shipping. (That was the starting bid and no one else bid, IIRC.) I think both the user manual and the service manual are available in digital form on both this site and Warren Furlow's HP-41 site.

in response to message #2 by Garth Wilson

> Quote:
>
> My first automated test equipment (ATE) system contact with a 41 used the HP3421A data-acquisition unit with HPIL. It was like a DMM with relay cards also to do some controlling, not just taking data. The company got a loaner 3421A from HP to evaluate for buying. ... It was an instant hit, being so much less expensive and easier to program than the other millions of dollars of IEEE-488 equipment and controllers the company had.
>
> ...
>
> *(The company later)* got an IBM PC with an IEEE-488 card, and three weeks after it came in, the two engineers responsible for setting it up were still trying to get the PC and IEEE-488 card to be friends.

That story had certain things in common with my 'challenge' from 1993. Part of my task was to write a program for an HP3852A Data Acquisition Unit to receive measurements from a load cell. The other part as to write Visual Basic software for a PC to accept and process the data from the HP3852A.

After overcoming one hurdle by replacing the DOS-based GPIB card with one that supported Windows 3.1, we were able to send data to the PC in a 64-bit double-precision IEEE standard floating-point format that both devices supported. However, the data received appeared to be random noise. I thought at first that the problem might be incorrect parity.

It turned out to be "little-endian, big-endian": The Intel-based PC stored words in reversed byte order, while the Motorola-based(?) HP3852A stored words in their original representations. (Peter Norton's books termed this "backwords".)

Not seeing any option in the GPIB's data-transfer commands to account for this, I managed to handle it by writing a DLL routine in C language to perform the 'byte-swapping'. One minor misstep: I learned that a 'short int' is not necessarily one byte if a regular 'int' is two bytes. Execution of the byte-swapper using a pointer to a two-byte 'short int' was entertaining to watch on the PC, as waves of gibberish passed over the screen accompanied by frequent beeps, due to corruption of instructions. That cleared up after changing the swap variable to a 'char'.

Re: A viable vintage data aquisition system?

*Message #10 Posted by **Marcus von Cube, Germany** on 11 Mar 2010, 10:13 a.m.,*
in response to message #9 by Karl Schneider

Karl, this is why the IP protocol family defines a "network byte order" which is, btw, big endian. Writing networking software always has to deal with this. Many protocols and data formats use strings for numeric data to avoid these problems.

The C language specifies only that sizeof long >= sizeof int >= sizeof short int >= sizeof char. In most implementations, long is 4 bytes, int is 2 bytes on 16 bit compilers and 4 on 32 bit compilers, short int is 2 bytes and char is 1 byte. With the rise of unicode, 2 byte chars are possible but mostly a seperate data type (wchar) is defined.

Since Java runs on a virtual architecture, definitions are much more strict here (big endian, 8, 4, 2, 2 bytes for long, int, short and (unicode) char). To access a single byte a seperate data type byte exists.

Sick HP42S

*Message #1 Posted by **Chuck Galloway** on 4 Mar 2010, 10:55 p.m.*

Virtually all function keys on the right column (+, -, x, /) have stopped working. In addition, this evening powering-up became sporatic. Is there an easy fix for this?

Re: Sick HP42S

*Message #2 Posted by **tim m.** on 5 Mar 2010, 1:04 p.m.,*
in response to message #1 by Chuck Galloway

Sounds like a loose connection to the matrix keypad.

Re: Sick HP42S

*Message #3 Posted by **geoff quickfall** on 5 Mar 2010, 2:15 p.m.,*
in response to message #1 by Chuck Galloway

Press down just under the LCD panel above the top row of keys.

While pressing at this point depress the faulty keys. They should work. If so it is the physical connection between the keyboard pca and logic pca via the flex pcb. This means the foam pressure pad completing the connection is desintigrating and needs replacement.

Only way is to enter the calculator.

Got to go to work.

Cheers, Geoff

Re: Sick HP42S

*Message #4 Posted by **Chuck Galloway** on 6 Mar 2010, 12:34 a.m.,*
in response to message #3 by geoff quickfall

That did it Geoff. Thanks for the tip.

That old auction business of "disclosure"

*Message #1 Posted by **bill platt** on 5 Mar 2010, 10:09 a.m.*

You know all the humorous threads, like "Mint" equals "my kid spilled jelly on it this morning" and "runs great" means "dirtier than sack of %^%2" etc.

Here's my latest auction win. See if you think the description meets with the concept of "disclosure":

Description was:

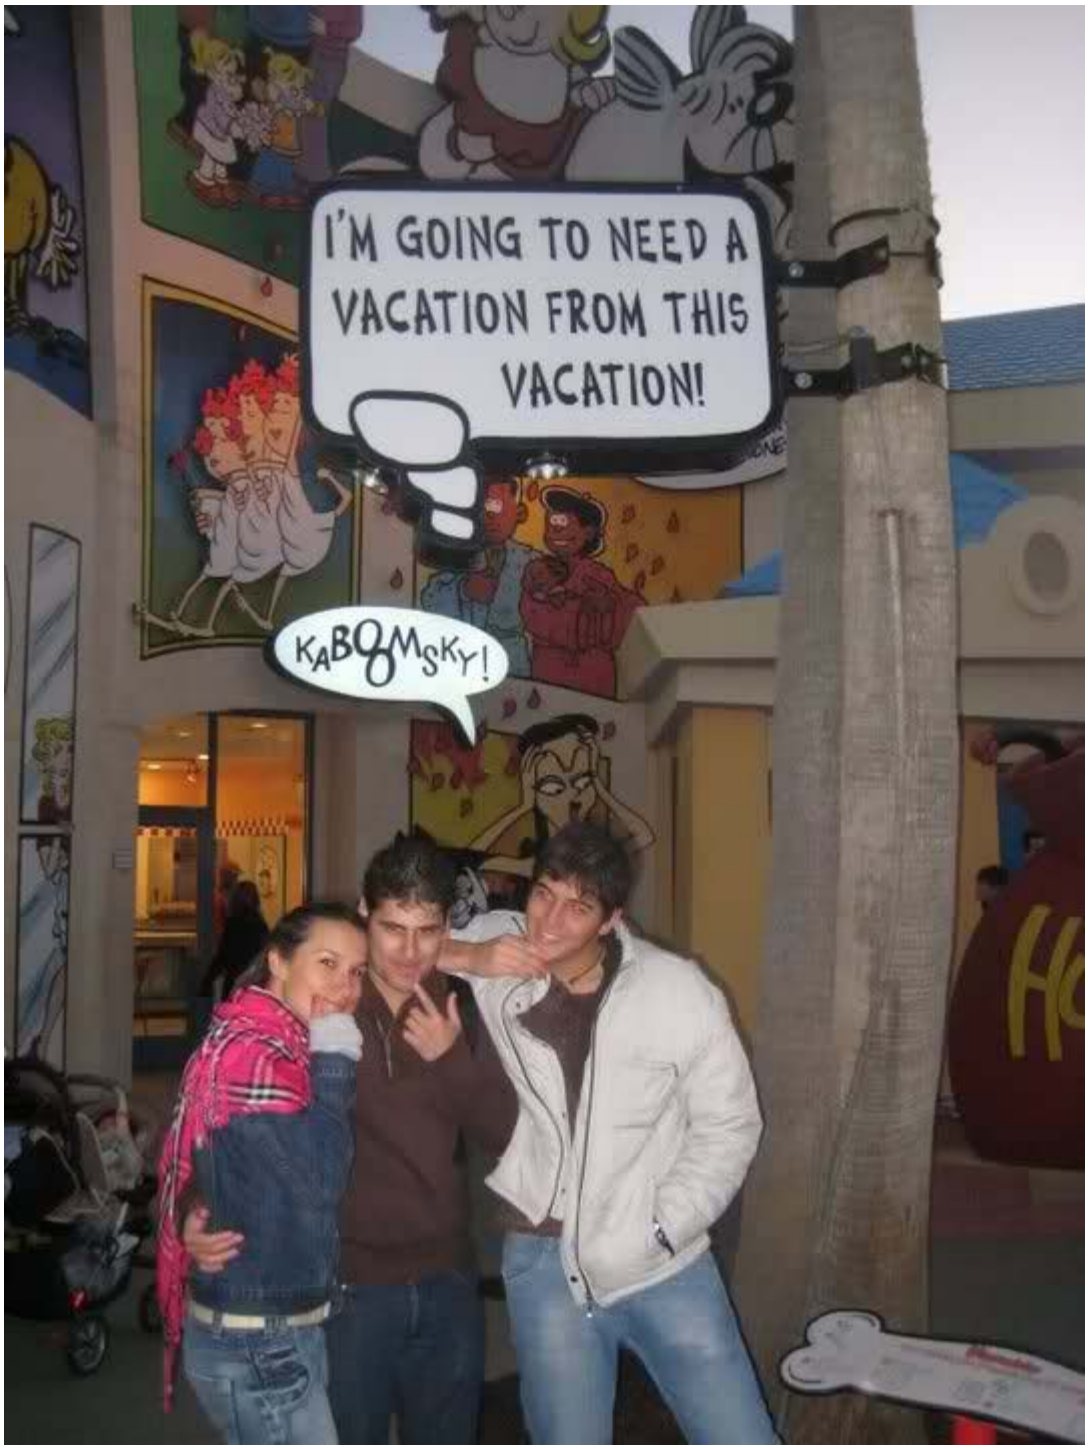
```
This is Vintage Hewlett Packard 27S Scientific Calculator. Used and
shows some wear but seems to be working just fine and still in good
usable condition. Comes with batteries.
You will receive actual item shown in the pictures, thank you.
```

And the picture was:

In reality, the bezel has both deep dents, as well as sharp dents that look like a mechanical pencil injury, and the screen has two deep mechanical pencil impalements.

And of course the batteries were completely dead. Voltage was at 1.0 per cell.

Here's a scan I made. Even this doesn't really show the extent of the dents.



Most of my online auction experiences have been good. But there have been a handful that are not good. Makes me skittish...

Re: That old auction business of "disclosure"

*Message #2 Posted by **Bruce Bergman** on 5 Mar 2010, 10:47 a.m.,*
in response to message #1 by bill platt

Leave the seller a negative rating, and bit.ly this page as evidence. It will at least make them think twice before advertising like that again...

I agree -- this kind of thing hurts, especially for those who are being above board on everything.

thanks, bruce

*Message #3 Posted by **Bart (UK)** on 5 Mar 2010, 10:54 a.m.,*
in response to message #1 by bill platt

Isn't there also something about not trusting fuzzy pictures?

That said, I have a near mint 48GX (I think it has only seen batteries in it to run self tests), sold from a less than perfect picture. Which probably helped me as I got it for a reasonable price.

Sometimes you're lucky - sometimes not :(.

Now for you to find a dead donor with a perfect case & faceplate.

The original picture shows it all.

*Message #4 Posted by **Frank Boehm (Germany)** on 5 Mar 2010, 11:11 a.m.,*
in response to message #1 by bill platt

At least that's what I think. Scratches are visible, and that dull area would have stopped me to bid more than a handful of $$$.
I don't think the seller cheated you with a "better than real" picture, and the definition of "some wear" differs a lot 8)
dead batteries sold as "good" are a no-no though, but personally I always hope that *no* batteries are included, as I would have to bring them to the hazardous waste collection point...

Re: That old auction business of "disclosure"

*Message #5 Posted by **DavidShenk** on 5 Mar 2010, 11:18 a.m.,*
in response to message #1 by bill platt

It looks like the initials scratched into the top have been blurred out of the auction photo.

My most obvious issue with an auction item was for a 42s and case. The case was shown in several photos and looked fine, however, when I received it, it had a big chunk torn out of one side. By sheer coincidence, all of the photos happen to be taken of the good side. I gave the seller a little email feedback, if you know what I mean. Not a huge deal, but that was deliberate.

Dave

*Message #6 Posted by **Walter B** on 6 Mar 2010, 3:22 a.m.,*
in response to message #1 by bill platt

I second most of the previous posts. After all, that's what eBay feedback is for. There are 3 alternatives you may click, not just one. And in the detailed feedback, there are even 5. Please use them. The seller may cry, but it's refecting your feelings.

Re: That old auction business of "disclosure"

*Message #7 Posted by **DaveJ** on 6 Mar 2010, 4:58 p.m.,*
in response to message #1 by bill platt

The reality of it is that the average consumer does not collect calculators and they do not fuss over the visual appearance to the extent that those on this forum would.

Therefore I believe the description is fairly accurate and adequate for the average buyer. Yes, they could have mentioned the engraving.

Sorry to say, but if you cared about the visual appearance that much, you should have asked for more hires photos. The photo they provided clearly shows some scratches and a big scuff mark on the top.

You paid your money and took your chances without asking questions. Buyer beware.

Dave.

MLDL2000 Disassembler to SDK - Help

*Message #1 Posted by **PeterP** on 4 Mar 2010, 10:28 p.m.*

Hi,

I was trying to test the disassembly functionality of the MLDL200) to SDK (using the version 1.51). While I got the disassembled text it did not appear to be at all in SDK format.

Has anyone successfully used the 1.51 version to disassemble a ROM into SDK41 format? If so, would be great to pass on some tips if possible,

Thanks!

Peter

HP owners actually use them?

*Message #1 Posted by **Dimitri Simitas** on 4 Mar 2010, 5:39 p.m.*

I got to ask, so far everything I bought seems to look like they were used once and stored. So did most HP users even use their items?

Just in jest, but I still wonder since most things from the 80s I own or have owned never looked as good as the HP-41 items I have purchased recently.

Dimitri

Re: HP owners actually use them?

*Message #2 Posted by **Mark Henderson** on 4 Mar 2010, 6:04 p.m.,*
in response to message #1 by Dimitri Simitas

I think it's a tribute to how well the older HP machines were made! In building my Classic collection (I now have at least one of each :-)) I definitely have calcs that were WELL used... But amazingly, even the saddest of them ends up being a reliable, smooth operating machine after only basic cleaning and repair. Amazing for 35+ year electronics! In fact, the best feeling keyboards are on my oldest and most worn calcs! I, for one, use my Classic, Woodstock and Nut HPs every day, rotating them based on whim, or occasionally based on what I'm doing!

Re: HP owners actually use them?

*Message #3 Posted by **Rainer Wiedemann (Germany)** on 4 Mar 2010, 6:51 p.m.,*
in response to message #1 by Dimitri Simitas

I second your observation. Most of the hp41 stuff I bought on TAS or elsewhere has been delivered in outstanding condition.

I bought my HP-41CV together with the card reader in 1982, when I was a student. Although sponsored by granny and my parents it was really expensive. So I always took good care of it in order to keep it in good shape. Now, after 28 years it still has almost no signs of use or wear and works like a charm.

IMO hp's quality is one reason to the good shape after so many years. Another reason: the effort to own one was a motivation to take good care of it. Devices, which were heavily mistreated, are very likely to have all died after such a long time. A similar effect can be observed on the marketplace of used cars, at least I can speak for Germany, where rolling junk vanishes over the time and only cars in collector's condition survive. So in the end devices in good optical condition may be the majority. But a nice appearance does not necessarily correlate to a good technical condition. Defects or aging of the electronic circuitry mostly elude the owner's care.

Re: HP owners actually use them?

*Message #4 Posted by **Walter B** on 5 Mar 2010, 2:02 a.m.,*
in response to message #3 by Rainer Wiedemann (Germany)

I second this fullheartedly. HP calcs were a real investment at that time! Paying many bucks for a quality tool. After all it turned out being a good one. But watch it, it takes a long time to build a reputation and an instant to destroy it.

IMHO, the nicer & less used it is, the more chance of corroded batteries (and subsequent internal circuitry damage).

Given the cost of 70s and 80s high-end portable electronics I expect that they were used and very well taken care of. It also helps that they were built to last.

I cannot image many that would purchase a $100-$400 calculator and not use it more than once. A good calculator was both a tool and an investment. All of my classmates engraved their names on their 15Cs. Not me--it was too pretty.

For 9 years my 15C was a constant companion only to be betrayed by my shinny new 48GX. The 15C still looking like the day it was purchased was thrown in a box with other stuff from the 80s. Later I lent it to my best friend, it came back like it had been to hell and back. It's on my desk now. The battery compartment cover still has a sticker with my name on it from 1984.

in response to message #1 by Dimitri Simitas

Hi!

> Quote:
>
> So did most HP users even use their items?

I would say: The newer they are, the less they were used. Not for the obvious reason (age), but because in the eighties people started using their desktop PCs for the real calculations and kept their calculator in the drawer. That's why so many HP-41s look new and unused from the outside, but have their battery terminals corroded away after they were completely forgotten eventually.

And for "field use" (schools, univerities, construction sites) HPs have always been too expensive/precious for most. Even students who could afford an HP calculator would normally leave it at home and take a cheap replacement to school/university every day. That's what I also did with my Ti59, and this cost only 1/3 of a comparable HP-67 or -41 of that era.

But from my collecting experience, early LED calculators, especially the HP-45 (being the first "affordable" HP calculator) really saw some heavy usage. I have some badly worn '45s - but because of their rugged construction, they all work till this day!

Regards, Max

Re: HP owners actually use them?

*Message #12 Posted by **bill platt** on 5 Mar 2010, 9:06 a.m.,*
in response to message #11 by Maximilian Hohmann

My son was observing this just yesterday. He dug out an HP45 from one of my boxes, and compared it to the new 35s. He recognized the style ideas, but was especially impressed with the old keys of the 45, and astounded that they were molded with "inlay" as he termed it. "And yes, it still works" brought special appreciation...

Re: HP owners actually use them?

*Message #13 Posted by **Han** on 5 Mar 2010, 11:36 a.m.,*
in response to message #1 by Dimitri Simitas

Well, I use most of them. I have a brand new, never opened HP48SX, HP48S, HP48G, HP48GX, and HP48G+. These I do not use, but keep around because I like owning a little bit of HP history (back when they still made awesome calculators). I am about to purchase an HP50G and if this one turns out to be a well-designed calc, I may buy another one just to keep for my collection.

The ones I do use include an HP20S (I use this to do simple calculations when I am at my desk), about 4 HP48GX's (two set up for programming with Jazz, two set up for ALG48 and Erable to do math -- a set for home and the other for work), and 3 HP48G's upgraded to 512KB RAM (these I keep around for fun and to run things like SpeedUI and Metakernel).

At one point, I owned every single Pioneer-series calculator, but then sold that collection since I never used them. (I collected them since they looked like the HP48 series). I do regret selling my HP42S and my HP32SII, though.

*Message #14 Posted by **bill platt** on 5 Mar 2010, 12:07 p.m.,*
in response to message #13 by Han

HI Han,

You can put metkernel on a 48G with a hard-wired 512 RAM upgrade?

How much RAM is left for user programs?

It is more stable than having MK installed using both ports? I found that I ended up with a few "memory lost" cases where I accidentally joggled the 128k card :-(

Any ideas where to get a 48 cable without spending $30?

Best regards,

Bill

Re: HP owners actually use them?

*Message #15 Posted by **Han** on 5 Mar 2010, 11:48 p.m.,*
in response to message #14 by bill platt

> Quote:
>
> HI Han,
>
> You can put metkernel on a 48G with a hard-wired 512 RAM upgrade?

Yes. The upgraded units have the memory split as follows: 128K for port 0 (i.e. user RAM), 128K for "card slot 1" (port 1), and 256K for "card slot 2" (ports 2 and 3). Thus when I install Metakernel, I install it to port 1. My upgrades uses 2 extra chips (74HC00 NAND gate and 74HC32 OR gate) that act as a bank switcher for the 512K RAM chip.

> Quote:

> How much RAM is left for user programs?

128K in port 0 and 256K in ports 2 and 3 (384K total).

> Quote:
>
> It is more stable than having MK installed using both ports? I found that I ended up with a few "memory lost" cases where I accidentally joggled the 128k card :-(

Well, MK should only be installed in port 1.

Perhaps I am not sure what you mean by using both ports. My guess is that you are referring to the case of using a 256KB or 512KB RAM card in card slot 1. In this case, putting a copy of MK on each 128KB "bank" (where a "bank" is equivalent to a port when used in card slot 2) ensures that the calculator always sees MK no matter which "bank" is used by card slot 1. This is one way to make a card larger than 128KB to appear to the HP as only 128KB (as all the banks look the same in terms of their contents).

Regarding stability, I use MK for non-essential stuff as even the latest revision (2.30) is somewhat buggy (especially when working with large matrices of integers). I prefer SpeedUI; but there are also many features in SpeedUI that I would rather not have (and which makes SpeedUI take up a lot of memory). The main one is the catalog of commands (just the list of commands is ~5KB) which I never use. Perhaps someday Raymond might make a "light" version consisting of only the 6-lvl stack with pretty-print and the improved editor (and maybe customizable fonts).

> Quote:
>
> Any ideas where to get a 48 cable without spending $30?

I suppose there is always the option of building your own =). But commercially, I have only seen them as low as $19.99 plus shipping (on eBay).

Re: HP owners actually use them?

*Message #16 Posted by **bill platt** on 7 Mar 2010, 8:58 a.m.,*
in response to message #15 by Han

Hi Han,

Thanks very much for the details.

Maybe my memory is slipping. Years ago, Raul Lion walked me through the Metakernel load. I remember using the 1MB card, merging the 128mb card, then "installing" metakernel from the 1MB card to the system...maybe that is totally faulty memory.

On the other hand, perhaps I should just give SpeedUI a try.

I have 2 48GX, two 128MB klotz cards (one with a broken switch but someone here suggested I just make a solder bridge so that it works as RAM) and one 1MB Klotz card.

I might as well use them for some good!

Re: HP owners actually use them?

*Message #17 Posted by **designnut** on 5 Mar 2010, 12:12 p.m.,*
in response to message #13 by Han

I have some HP calcs still in the package against the day I might need them. I have some intended for gifts. I have a 32SII at my hand as I type, used as needed. I used easy to remember and use formulas several times a day while working, no long retired at 81. I learned relations with RPN i would never have known with algebraic. RPN can give you multiple answers as you calculate that were useful to me while with algebraic you get one answer. In calculating resistive dividers I first got the total resistance, then the divider fraction, then the equivalent resistance from the divider. I could do things with resonant elements that were fast and surprising as I changed the book formulas to be handy on RPN with fewer data entries using the automatic repeating t register. It is surprising what you can squeeze out of the original HP35 if it is all you have. More remarkable still with programmable versions. I fitted curves that are still intractable as they don't use the tools right, but only conventionally. Sam

Come now, Sam, its OK to be an RPN afficianado, but this over-glorification of its virtues ...

With algebraic you can accomplish the same thing with how you structure your parentheses. Well, OK, that depends on which implementation of algebraic we're talking about. With the algebraic Pioneers, for instance, each time you close a parenthesis, you get an intermediate answer. With a 48 series, you would have to wait until you EVAL.

Re: HP owners actually use them?

*Message #19 Posted by **designnut** on 5 Mar 2010, 5:03 p.m.,*
in response to message #18 by Martin Pinckney

Martin, we don't need no stinking parenthesis! I stand by my premise that I learned relations with RPN I would never have seen with algebraic. I changed the book formulas to be handy with RPN. The book formulas are clumsy to use. I changed them for quick RPN calculations and I did discover relations I have never seen published. Probably because they didn't have an RPN calculator when the books were written. Sam

Re: HP owners actually use them?

I agree with Sam. Parentheses are a burden, one has to remember to open and close. RPN dispenses with () and = !

Re: HP owners actually use them?

*Message #21 Posted by **bill platt** on 5 Mar 2010, 8:20 p.m.,*
in response to message #20 by hpnut

Ironcically enough, if you have an HP *RPL* machine, you can put in an *algebraic* object and not have to keep track of parenthesis.

(Same is true on many other current designs including 35s).

What's worse--tracking parenthesis, or overfilling a 4 level stack and losing a calculation off the t-register? I think the latter is worse, as it can happen without realizing it. In parenthesis, if there is a limit to them, you will be told before the result!

Re: HP owners actually use them?

*Message #22 Posted by **Bart (UK)** on 6 Mar 2010, 6:05 a.m.,*
in response to message #21 by bill platt

> Quote:
>

I've had my days with parenthesis tracking, getting erroneous results. Having to re-do the calculation several times to get the correct result or at check that I get the same answer at least twice. Give me RPN any day. I find a 4-level stack quite adequate. And from the HP-45 onwards you had plenty of storage registers to store intermediate results in (Something many algebraic scientifics have lacked). I had so many mess-ups with parenthesis (yes, it tells you when you are wrong - but where in the line did I make the mistake? Oh, let's start AGAIN) that I used to analyse problems so that I could use the memory function or even took to writing down intermediate results. Perhaps that's why I took so easily to RPN when I got my first HP.

Re: HP owners actually use them?

*Message #23 Posted by **Martin Pinckney** on 6 Mar 2010, 7:53 p.m.,*
in response to message #20 by hpnut

Why do you have to "remember"? They appear on the screen; you can see them...

Re: HP owners actually use them?

*Message #24 Posted by **designnut** on 9 Mar 2010, 12:35 a.m.,*
in response to message #23 by Martin Pinckney

Martin, In chain calculations with RPN we can get answers that are later consumed in the next calculation. We can use store to save those intermediate results. In calculating a resistive divider I enter the lower resistor repeatedly to fill the stack, then the upper resistor and add; see the total resistance; divide see the fraction of the divider: multiply and subtract: see the equivalent output resistance. For RC corner frequency I use 2Pifrc=1: multiply the known values and invert for the unknown. For LC frequency resonance I removed the square root sign and use 2PiF2PiFLC=1 With 2PiF in the t register key either L or C, multiply twice and invert to see the other resonant element.

As an intermediate result when 2PiFL is shown it is the reactance of the elements at resonance. These are bread abd butter calculations for electronics. This method may be expanded to other common calculations with ingenuity and practice. I felt sad when neophyte engineers had to wr4ite programs to solve these basics. Sam

Can't argue that point, because that is your experience. I was arguing the other point you made, that with algebraic you only get one answer, no intermediate results. I stated that's not necessarily true, and I stand by that!

What a coincidence... I first got interested in a 48sx because it looked like a "stretched" Pioneer!

I look back to some time in the early 90s when I sa wa catalog of current offerings, and I wince at what I thought at that time: "Oh, yuck, they sell algebraics now," and "that big 48 looks terribly clunky."

Now I know better. I missed the opportunity to get in on the ground floor with the 27s, now one of my all-time favorites, and of course the 48 series is clunky, but oh-so- powerful and well-made, too. I daresay seems much better made than that 41 series. I've shied away from them ever after buying my first "great condition" one back in 2002 or so.

Who still uses them?

Well, I work in the Planning & Engineering Department of the world's busiest airport.

HP 11Cs and 15Cs are still fairly common on the desks of the engineering staff. We have one engineering consultant that still pulls out his 41CX. One of our oldest engineering staff members has an HP 45 on his desk, and it still works and he uses it every day. The battery pack is shot and he keeps it plugged in all the time, but the LEDs still glow!

There are at least two HP 50s at work in my office (one of them mine)

My desk sports an fully functional HP 97. I fire it up now and again for show or if I'm doing a calculation for which I want a paper trail.

However, my day-to-day go-to calculator is a new HP 35S. If I just need to crunch a few numbers it fits the bill fine. I used it just the other day to compute some coordinate system adjustments. There is still a place for a good RPN scientific calculator with basic functions available at the primary or secondary key level.

Sadly, my sense is that new engineering students get no introduction to calculator-level RPN. Most newly minted engineers (and we get our share of Ga. Tech grads) don't know anything about RPN-based calculators. I put it down to lack of choices and, of course, the rise of PC-based software tools to handle most of the basic calculations that engineers used to tackle with handheld calculators just a few years ago.

There is a clear generational dividing line. "Older" staff - say those over 45, will frequently be seen using HP calculators. Most of them old, beat up 10-series models. "Newer" staff, those that entered the job market after the desktop PC became the engineering tool of choice, more frequently grab any old algebraic calculator to punch numbers.

You know recently when I tried to do math with a Algebraic since I started to use RPN, seems that I have become pretty useless on them. Takes a couple tries to get it to work. And although I am young at 22 I see the calculator as the device who's job is to do math. The PC is for CAD/CAM and doing other work. And yes when working on something both are on my desk and used.

But it is nice to know the overall feeling of this thread. For a moment there I thought maybe the HP users bought them, got frustrated and then ran off to get a new Algebraic keeping the RPN in storage instead. Kidding of course.

I used an 11c/15c exclusively for 13 years, and a 32sii exclusively for another 7 or so.

Now I use an *algebraic* 20s most of the time, or the "algebraic" objects on a 48. But the 15c gets attention, too. It is in the same drawer.

I don't have any real problems switching back and forth. The more you switch, the easier it is:-) (It was harder to switch back and forth at first...)

In my very small company, I use Pioneers and a 48SX, and one of my drafters uses a 32SII. The other uses a Calculated Industries model. A staff engineer uses a 48GX. My professional surveyor still uses his 41CV. One field guy uses an old beat-up TI 30-something, the other a 48GX and 35s.

A former employee, professional surveyor, died recently. The last I heard, he had been still using his original HP 35!

I have a reasonably large collection of HP's, but I currently have on my desk a 28S that I use for more complex calculations where I need to see the stack, a 71B (which I have a couple of novel programs that I use for my business, although I don't 'need' to), and a 12C (a mint condition 1984 USA model, not a new China version) that I use for quick or financial calculations. I also carry around a 50G in my laptop bag, and often have a 42S or 32Sii in my jacket pocket.
I my previous job in a large engineering firm, there were many 15C's (another favourite of mine), 42S's, 48S's, 48G's, 11C's on desks everywhere. These calculators just never die!
Cheers, Keith

I started out with an HP35A a year after it came out - I worked at HP in Loveland, CO, at the time and got a 30% employee discount (i.e. 70% of $299!!!). Switched to HP41 when it came out (and was cheaper) and have used it since. I'm an opto-mechanical engineer and am conversant with all manner of CAD, spread sheets, MathCAD, etc... but was perturbed last week when my N-batteries died (at work) and I couldn't find any in this town (Boulder). So...purchased 12 batteries on-line.

I tried an HP48 once after my 41 was stolen but found it tedious, so traded the new 48 for a used 41 - I got the best of that deal.

There seems to be a very recent bull market...

*Message #1 Posted by **bill platt** on 4 Mar 2010, 11:45 a.m.*

The 15c is on the rise...again.

It used to be that the only ones that broke $200 had a manual and a box...now I see one that broke $360 without a manual or a box, and even has a worn slipcase.

Extraordinary!

And then there is the 49G. What had been sold for $20 to $30 spiked to $40 to $60 for about a week, and now seems to be deflating like a leaky balloon.

"Pricing" for antique calculators seems to be nothing if not reliably volatile. I noticed the same basic tendency 10 years ago, but now the prices are higher :-/

We should start a spoof radio show--like "Marketplace" on public radio. When we "do the numbers" we can really do them!

in response to message #1 by bill platt

My observations over the last three years is that prices drop (Less competition? More supply?) over the summer and xmas holidays.

Perhaps spring cleaning increases the number of items and disposable income is directed to summer activities.

Holiday shopping must have an impact. But it goes both ways. I spend nothing on calc purchases (need to get gifts for family), but then my wife may pay anything to get me a calc for xmas.

Direct. My wife, kid and myself for years have had nothing on our xmas lists, so we gave up on xmas and just did family trips. However my kid wanted xmas again, so we started up two seasons ago. Xmas tree, presents, etc... The problem still remains, nobody wants anything, but if you do not pick something, then you'll get stuff that you do not need or want. So we all have to have a list to hand out to the others.

Capricorn CPU microcode

*Message #1 Posted by **Olivier De Smet** on 4 Mar 2010, 8:33 a.m.*

I started to look more precisely to the Capricorn CPU with the HP patent # 4424563. With this patent I started to look at the microcode of the CPU, but it appears that the given microcode is not the final one. It can be seen with the LDM R4,=xxyy instruction. In a real HP85/86 this code jump to xxyy+1 address and with the microcode from the patent this jump to xxyy+3 or +4 (if DRP R4 code before).

Does anyone have more informations about that ?

Thanks in advance.

Olivier

Edited: 4 Mar 2010, 11:16 a.m.

Re: Capricorn CPU microcode

*Message #2 Posted by **Eric Smith** on 4 Mar 2010, 8:37 p.m.,*
in response to message #1 by Olivier De Smet

Interesting. The patent application was submitted at a late enough date that the PLA contents (microcode) should have been long since finalized. I haven't yet studied it in enough detail to confirm your finding, so perhaps you could explain in a bit more detail how the patent microcode gets to +3/+4 rather than +1.

Aside from finding someone who worked on it, the only way I know to determine the exact microcode in a production Capricorn chip would be to decap and photomicrograph the chip, and thereby extract the PLA pattern.

Re: Capricorn CPU microcode

*Message #3 Posted by **Olivier De Smet** on 5 Mar 2010, 3:52 a.m.,*
in response to message #2 by Eric Smith

Here is a link to an excel file with the microcode executed for each opcode:

http://sites.google.com/site/olivier2smet2/CL.xls

The first page is the PLA decoded with some comments.

The second is about the outputs of the control logic.

The third is the microcode for each opcode (the Byte and Multibyte opcode are grouped). This was done with a python script interpreting the PLA for each opcode.

The fourth is the opcodes in octal, the fifth in hexadecimal.

The comments are mainly in french, sorry.

It was used to make a simulation with tkGate software. Actually it's operational (based on the patent and some other documentations) but this bug is a serious one ...

To see the bug, look at 'Ajustement PC' : adjust the PC (R4-5), code done after the most opcodes (and particularly NOT done after ARP and DRP opcodes see 'ARP R#' witch jump back to state 16d (read a new opcode)).

It can be seen that after 'LDM D,=a' opcode the jump is made to state 7d (Adjust PC)

Adjust PC (state 7d for PCL:R4 and 17d for PCH:R5) is adding N register + 1 to PC. N is an internal register counting the bytes read from the last 'real' opcode, and in this case the =a loop (state 1, near excel line 148, is done 2 times and stopped due to RPTE input) increments N by 1 at each loop (NCDM column, INN output). If a DRP R4 opcode was just before the LDM, N was already incremented by one (state 25d excel line 41).

So the total adjustment is 3 or 4.

It is consistent with the tkGate simulation where the PLA is computed with a Verilog script to drive the rest of the CPU (done with the schemes from the patent).

Re: Capricorn CPU microcode

*Message #4 Posted by **Eric Smith** on 5 Mar 2010, 1:03 a.m.,*
in response to message #1 by Olivier De Smet

I was having trouble visualizing the flow of the microcode, so I used graphviz to plot a graph of the state machine: http://www.brouhaha.com/~eric/hpcalc/series80/capricorn-ucode-state.pdf

It only has the state numbers (in octal), without any annotations to explain the meanings of the states or transitions.

Re: Capricorn CPU microcode

*Message #5 Posted by **Olivier De Smet** on 5 Mar 2010, 6:22 a.m.,*
in response to message #4 by Eric Smith

Thanks for the graph, I found a mistake in the excel file given previously. After state 37O (31d) it's state 4O (4d), not 8O as I used ... I'll look at it more precisely.

It's only in the excel file not on the microcode I used, so not a real mistake.

Anyway, I just wired a small hack to the simulation (CLN when WRAM and CDRP==5 for those who might understand ;)) and it's enough to continue

Edited: 5 Mar 2010, 11:19 a.m.

Re: Capricorn CPU microcode

*Message #6 Posted by **John AS (UK)** on 10 Mar 2010, 2:59 a.m.,*
in response to message #5 by Olivier De Smet

Quote:

> Anyway, I just wired a small hack to the simulation (CLN when WRAM and CDRP==5 for those who might understand ;)) and it's enough to continue

Could this 'hack' exist already in the real HP-85, either as a few gates inside the Capricorn processor chip or as external logic?

Regards,
John

Re: Capricorn CPU microcode

*Message #7 Posted by **Olivier De Smet** on 10 Mar 2010, 3:50 a.m.,*
in response to message #6 by John AS (UK)

Yes it could be. It's a simple one only 10 gates or so and all the signals are already in the function block 'COUNTERS' (on patent fig 1)

Notes on installing EMU41P on Portable Plus

*Message #1 Posted by **John AS (UK)** on 4 Mar 2010, 3:19 a.m.*

Thanks to J-F Garnier for the EMU41P package:http://www.jeffcalc.hp41.eu/hpplus/index.html . Here are my notes on installation.

Setup:
HP Portable Plus (110+) with 1MB memory module, set to give 512KB user RAM and the remainder as EDSIK (drive A:)
82169A HPIB/HP-IL convertor (all switches to 0)
9122D floppy drive (supports SS-80)
Double sided / double density floppy disks (aka 720k)

1. Format a DOS floppy on the Portable Plus

format c: /y

The /y option uses 512 byte sectors. The resulting floppy can be used on PC under XP (and probably Linux too), appears to be 693kB rather than 720kB, due to having less tracks (77 rather than 80).
2. On PC create subdirectory \emu41 and copy in emu41p.exe and all the .bin files, renaming those to match the emu41.ini file (see below).
3. Create emu41.ini in Notepad, here is one I used:
[MODULES]
0 12 a:\emu41\rom41cx.bin
3 4 a:\emu41\cxfcn.bin
5 8 a:\emu41\cxtime.bin
6 4 a:\emu41\prter1e.bin
7 4 a:\emu41\hpil1h.bin
8 4 a:\emu41\xio1a.bin
9 4 a:\emu41\ccd_osx.bin
10 12 a:\emu41\adv41b.bin
[DEVICES]
DISPLAY
HPDRIVE1
; DOSLINK
; SERIAL1
XIL
4. On Portable Plus copy contents of floppy (C:) to EDISK (A:), into directory a:\emu41
5. Run EMU41p and enjoy!

I have had the Portable Plus for years, but only recently also have a 9114A. This works fine under EMU41P as a Filbert drive. I assume I could have created the DOS floppy above on the 9114A instead of the 9122D, but it was out on loan at the time.

Regards,

John

Kitchen timer on 17B/17BII/17BII+/19B/19BII/27S

*Message #1 Posted by **y.miyata** on 4 Mar 2010, 1:31 a.m.*

Does anyone know a way to set an appointment time from the Solver in 17BII ?

These calculators have appointment alarm function, thus can be used as a kitchen timer. If you wish to count 8 min for boiling spaghetti (or whatever you want to do),

1. You get the current time in the calculator.

2. Add 8 min to the current time to get the appointment time.

3. Set the appointment time for an alarm.

This could be done manually;

1. Select MAIN -> TIME menu.

2. Add 8 min to the current time in your brain to get the appointment time.

3. Select MAIN -> TIME -> APPT -> APTx (x=1 to 9), key-in the appointment time calculated by you to TIME

Letfs do it in a slightly sophisticated manner;

1. Keep a gTIMERh equation in Solver

TIMER: HMS(HRS(MIN/100)+HRS(CTIME))=ALARM

2. MAIN -> SOLVE -> select TIMER equation -> CALC, input 8 to MIN, calculate ALARM

3. Remaining the ALARM value in the x register (calculator line), set an appointment alarm by MAIN -> TIME -> APPT -> APTx (x=1 to 9) -> TIME

O.K., it works fine (please forget a possibility to start boiling spaghetti after 23:52 midnightc). Step 3 above can be done automatically if I can put the ALARM time within the Solver, probably knowing the internal variable name for the appointment settings. I would like to ask you if there is a way to set the calculated appointment time from the Solver?

I hope you understand what I wish to do and somebody here helps me.

New MLDL2000 Disassembler function

*Message #1 Posted by **PeterP** on 3 Mar 2010, 8:22 p.m.*

Hi,

I'm trying out the new MLDL200.exe from Meindert and the Disassembler function to SDK but I must be doing something wrong. I always get a 'Range Check' error. Here are the steps I do:

- Open MLDL2000.exe
- Open a ROM file from within the same directory as the MLDL2000.exe
- Click on Show Fat
- Click on Dissassemble

The result is always the same, independent of the ROM I use - it shows pass 1, 2, 3, 4 in the status line at the bottom and then 'Range Check' Error comes up.

Any hints?

Cheers

Peter

Re: New MLDL2000 Disassembler function

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 3 Mar 2010, 10:27 p.m.,*
in response to message #1 by PeterP

Hi, Peter;

I am using ML2K 1.51.0.39 and I did exactly what you did and I could see different ROM listings. Usually I suppress [List FAT], but I tried with some ROM files with and without [List FAT]: works OK both ways.

Have no 'Range Check' message (is it an error?) in any case, though.

What ML2K Manager version are you using?

Cheers.

Luiz (Brazil)

*Message #13 Posted by **Tom Mathes** on 5 Mar 2010, 11:06 a.m.,*
in response to message #1 by Don Shepherd

What does "rotate and click" keys in the description mean?

Re: 30b can be ordered

*Message #14 Posted by **Bruce Bergman** on 5 Mar 2010, 10:15 p.m.,*
in response to message #13 by Tom Mathes

In non-technical terms, it means the keyboard is light years better than the 20b. Maybe not as good as the classic calcs, but it's a solid, positive tactile feel. In addition, there are no problems with double-presses, missed keystrokes or anything of that sort.

Translation: buy it, you'll love it. :-)

bruce

Re: 30b can be ordered

*Message #15 Posted by **Thomas Radtke** on 6 Mar 2010, 7:52 a.m.,*
in response to message #13 by Tom Mathes

I guess the rotation of a key by a few degrees around the axis formed by the two hinges is meant with 'rotate'. I heard this term the first time with the 30b. 'click' might be the obvious.

Re: 30b can be ordered

*Message #16 Posted by **Walter B** on 6 Mar 2010, 8:31 a.m.,*
in response to message #13 by Tom Mathes

Nothing more than what HP's calculator keys used to do since the HP35 until the HP48GX inclusively. So, the wheel wasn't reinvented but relabeled - something US-American marketeers can do best d;-)

in response to message #16 by Walter B

Hi Walter!

Is it different for the 50g and 35s?

Thomas

Re: 30b can be ordered

*Message #18 Posted by **Tim Wessman** on 6 Mar 2010, 10:06 a.m.,*
in response to message #17 by Thomas Radtke

Not really. The domes are different between them slightly, but the underlying methodology is identical. This was a late printing and had a few issues so ignore those. Neither cyrille nor I have seen the shipping units.

For those wondering, all the text was tweaked from the 20b. Things were centered, aligned, enlarged (numbers, arrows, backspace) and spaced much better. Anything with CAPITAL spelling is a direct command (except where it wouldn't make sense - IRR vs Irr), lowercase signifies a menu. The fonts are Luz Sans and Gentium (as opposed to TNR on the 20 - blech).

TW

Re: 30b can be ordered

*Message #19 Posted by **Walter B** on 6 Mar 2010, 10:55 a.m.,*
in response to message #18 by Tim Wessman

FWIW, this one shot method is used since the Pioneers. Earlier models (Voyagers and before) had individual keys.

The 35S uses a similar approach. No idea about the 50G, however.

HP41 bugs - testing

*Message #1 Posted by **John Robinson** on 3 Mar 2010, 7:08 p.m.*

Hi All, are there comprehensive test steps written down somewhere to determine which bugs a 41c has ? If so, can someone point me to those please ?

Thanks John

Re: HP41 bugs - testing

*Message #2 Posted by **Namir** on 3 Mar 2010, 7:23 p.m.,*
in response to message #1 by John Robinson

You should have been there (when the HP-41C was launched in 1979)!!

Re: HP41 bugs - testing

*Message #3 Posted by **Allen** on 3 Mar 2010, 8:12 p.m.,*
in response to message #1 by John Robinson

A full list is in "Extend Your HP-41" available on the DVD Version 7

Main versions:

```
ROM   Date codes   Comments
DDE   1926-1940
FDE   1936-1952
FEE   1951-2034
GFF   2035-84??
HFF   84??-Present CV version
NFL   2329- Present current CX version
```

Re: HP41 bugs - testing

*Message #4 Posted by **PeterP** on 3 Mar 2010, 8:19 p.m.,*
in response to message #1 by John Robinson

John, if you scroll to to the bottom here you see the range of serial numbers which have specific bugs.

A simple test to see if you have most/all bugs is the following: 49, Sto 00, SF IND 00

If the Bat-indicator goes on you have bug 3 and hence most likely all other bugs as well.

Cheers

Peter

Edited: 3 Mar 2010, 11:48 p.m. after one or more responses were posted

Re: HP41 bugs - testing

*Message #5 Posted by **Gene Wright** on 3 Mar 2010, 10:01 p.m.,*
in response to message #4 by PeterP

For bug 1:

48 SIGMA+ LASTX ... if 48 is not displayed, it has bug 1.

For bug 2:

999 ENTER 3 STO IND Y.... if this works, it has bug 2.

For bug 3:

49 STO 00 SF IND 00...if the BAT indicator turns on, it has bug 3. Note: this is 49, not 59.

BUG 4 is bad results from SIN for small angles. Can't remember the arguments.

The information below is from http://www.finseth.com/hpdata/hp41c.php

```
#4: Early models compute the SIN of small angles incorrectly.

#5: CLP would only clear 1089 program lines.

#6: -67A/-97A prorams that contain combinations of number entry, EEX, and CHS do not
translate correctly.  Example:

        EEX     CHS     7       CHS     5

translates to

        E-7-5

instead of

        1E-7    -5

#7: The second nybble of the seventh byte of Alpha is copies along
with the first six bytes during an ASTO.

#8: Early machines do not decompile programs if they are turned off
during PRGM mode.

#9: Executing CAT 1 while in PRGM mode, then interrupting it with R/S causes step
labelling oddities.

#10: If flag 25 is set and MEAN or SDEV causes an overflow, some flags can be altered.

#11 (CW1): If a program at the end of CAT 1 is replaced or deleted, a return to that
program will return into the new program or off-program memory.

#12: On early models, the function LN(1+X) gives wrong answers for
values of X between -.9990234374 and -1.00.

#13: On early models, the operation (.1)^-43 gives an answer of
9.999999999E42 instead of 1E43.
```

HP41 Rechargeable Battery Pack - three pins ?

*Message #1 Posted by **John Robinson** on 3 Mar 2010, 6:36 p.m.*

Hi All,

I have just aqcuired a 41C with rechargeable battery pack, but it has three pins instead of the normal two pins for the charger. Does anyone know what the extra (middle) pin is for ?, and can I charge this with a normal 41c battery charger ?

Thanks John

Re: HP41 Rechargeable Battery Pack - three pins ?

*Message #2 Posted by **Allen** on 3 Mar 2010, 10:40 p.m.,*
in response to message #1 by John Robinson

I wonder if that middle pin was designed to be a 'ground' pin at one point.. The AC plug is conspicuously missing a 'case' ground.

Re: HP41 Rechargeable Battery Pack - three pins ?

*Message #3 Posted by **Chiu Yiu Wai** on 4 Mar 2010, 3:43 a.m.,*
in response to message #1 by John Robinson

I am not sure the answer, some senior told me before , the different between two and three pin battery was the three pin battery could be used the AC charger power to hp41 directly.It also need 3 pin AC charger. Similar to classic series 45,65,67,80.The two pin battery can not used the AC charger power directly,it just charged the battery only when it plugged the AC charger.

If it is not correct answer, every senior user please tell me the true of the different between these two battery.

Repairing a HP 82033 Battery Pack

*Message #1 Posted by **Dimitri Simitas** on 3 Mar 2010, 5:28 p.m.*

I bought a printer with a dead battery, since the rest of the HP stuff the seller was selling worked less the printer due to the battery I figured the 30$ printer was worth the risk. So reading over the DVDs I have not found any tech specs on the pack.

Anyone have any advice how to rebuild the battery pack?

Dimitri

Re: Repairing a HP 82033 Battery Pack

*Message #5 Posted by **Dave Shaffer (Arizona)** on 3 Mar 2010, 9:27 p.m.,*
in response to message #1 by Dimitri Simitas

Depending on where you live, another possible option is Batteries Plus. In general, you give them a battery pack, and they return the same thing with the latest in NiCd or MiMH batteries installed. I've had them work only on my electric razors, but they seem to do a good job.

Re: Repairing a HP 82033 Battery Pack

*Message #6 Posted by **Dimitri Simitas** on 4 Mar 2010, 1:37 p.m.,*
in response to message #5 by Dave Shaffer (Arizona)

There are no Battery Plus stores in Canada per the site.

Dimitri

Re: Repairing a HP 82033 Battery Pack

*Message #7 Posted by **Rainer Wiedemann (Germany)** on 4 Mar 2010, 7:14 p.m.,*
in response to message #1 by Dimitri Simitas

If you have at least decent soldering skills, you can fix it on your own. See this museum page. Also you might want to check the articles section of this site. A google search like "battery site:hpmuseum.org" will show you lots of the museum archive contents related to battery packs.

It's really simple, good luck!

Re: Repairing a HP 82033 Battery Pack

*Message #8 Posted by **Dimitri Simitas** on 6 Mar 2010, 2:11 a.m.,*
in response to message #7 by Rainer Wiedemann (Germany)

I saw that, but figured for 28$ getting it rebuilt is pretty cheap, especially if I mess up.

Somewhat OT, but not really. Screwy cursor behavior.

*Message #1 Posted by **Martin Pinckney** on 3 Mar 2010, 4:56 p.m.*

I find that,the cursor flies to somewhere else from where I want it sometimes, when I am typing in the Message box,

There it just happened again! (seriously). So I get garbled text. Does this happen to anyone else?

Re: Somewhat OT, but not really. Screwy cursor behavior.

*Message #2 Posted by **Walter B** on 3 Mar 2010, 5:00 p.m.,*
in response to message #1 by Martin Pinckney

Not observed here. Any problems with your mouse?

Re: Somewhat OT, but not really. Screwy cursor behavior.

*Message #3 Posted by **bill platt** on 3 Mar 2010, 5:35 p.m.,*
in response to message #1 by Martin Pinckney

That's a laser mouse artifact.

Either that, or you are tapping your foot to Aerosmith and it is joggling the mouse tail :-P

Edited: 3 Mar 2010, 5:36 p.m.

Re: Somewhat OT, but not really. Screwy cursor behavior.

*Message #4 Posted by **Norman Dziedzic** on 3 Mar 2010, 8:00 p.m.,*
in response to message #3 by bill platt

I once had a similar problem. I was at the in laws who did not have wireless and went into the room with the Internet connection to do some online stuff.

My cursor started acting weird and then flying all over the screen. Needless to say I was a bit freaked out.

I had forgotten that I bad left my wireless Bluetooth mouse in the other room and my father in law, wondering what it was, had picked it up and was moving it around. Little did he know I was in the other room thinking my laptop had become posessed by deamons.

Re: Somewhat OT, but not really. Screwy cursor behavior.

*Message #5 Posted by **Martin Pinckney** on 3 Mar 2010, 8:58 p.m.,*
in response to message #3 by bill platt

Bill, am I correct that your first response was serious?

It is a MS Compact Optical Mouse. It is a laser mouse? Is this a known problem with this type?

Re: Somewhat OT, but not really. Screwy cursor behavior.

*Message #6 Posted by **bill platt** on 3 Mar 2010, 9:45 p.m.,*
in response to message #5 by Martin Pinckney

Hi,

Believe or not, I was serious, but not based on any solid proof. Merely my own observations from experience. The past few office machines I've run had optical mice, and one had a wireless mouse, and the cursor would just "jump" to a corner inexplicably at times. It has never happened that way on my wired mice (like the one I have now at home). My current mouse is optical. But it has behaved better than some others.

I had a theory with the optical jump that it is caused by "confusion" due to surface texture. For instance they never work on white formica.

Edited: 3 Mar 2010, 9:47 p.m.

Re: Somewhat OT, but not really. Screwy cursor behavior.

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 3 Mar 2010, 10:38 p.m.,*
in response to message #1 by Martin Pinckney

Hi;

It happens to me only when typing with the laptop, but it is not only with the message box. I am not quite sure about that, but it seems that somehow the movement of my fingers and hands over the touchpad sometimes causes the text cursor to jump, along with the mouse cursor. If I am not paying enough attention, already written words and sentences are broken by others. I considered that the touchpad sensitivity could be adjusted, but in my laptop I found no way to adjust it.

It never happened when I am typing with my desktop.

Cheers.

Luiz (Brazil)

Edited: 3 Mar 2010, 10:40 p.m.

*Message #8 Posted by **bill platt** on 4 Mar 2010, 12:11 a.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Oh yes, there's another one. I don't have a laptop but have borrowed one from time to time. That touch-pad thing is a pain! I've had my typing "broken up" just as you say.

Re: Somewhat OT, but not really. Screwy cursor behavior.

*Message #9 Posted by **Dave Shaffer (Arizona)** on 4 Mar 2010, 12:08 p.m.,*
in response to message #8 by bill platt

Quote:

> That touch-pad thing is a pain! I've had my typing "broken up" just as you say.

That's happened to me, too. I think it happens because your palm(s) is/are resting on or near the touch pad. It is quite a pain to look up and discover you are typing somewhere at random in your document.

When I realize this, I lift my palms and keep going. Not a real comfortable position, but since I never type very much on any laptop, it's not too much of a problem. For real typing, I go to my trusty original IBM PC/AT keyboards - these rank in quality with anything else ever discussed here: I have several of them, they are approaching 30 years of age, are being used on their fifth or sixth computer, and except for a slightly flaky flip-up foot, they are perfectly functional.

Re: Somewhat OT, but not really. Screwy cursor behavior.

*Message #10 Posted by **bill platt** on 4 Mar 2010, 8:11 p.m.,*
in response to message #9 by Dave Shaffer (Arizona)

Hi Dave,

Was it you that pointed out to us that the old PC/AT keayboards have a brisk ebay market?

And btw WP is awesome!

Re: Somewhat OT, but not really. Screwy cursor behavior.

*Message #11 Posted by **Dave Shaffer (Arizona)** on 4 Mar 2010, 9:14 p.m.,*
in response to message #10 by bill platt

> Quote:

HP35s zip cover

*Message #1 Posted by **DurbanGuy** on 3 Mar 2010, 10:09 a.m.*

I used to have a HP35s, however sadly it was stolen of my desk at work.

I have since orderd and recieved a new one but i was shocked to find the new one arrived with a slip on cover. I work in the field all day and my zip cover on my old HP35s made it irrepaleable.

Does anyone know where i could order a new zipper case online?? i have searched and cant seem to find one anywhere.

Re: HP35s zip cover

*Message #2 Posted by **Bruce Bergman** on 3 Mar 2010, 11:14 a.m.,*
in response to message #1 by DurbanGuy

What? The 35s now comes with a different case? Arrgggh! That's one of the best things about that calc!

(sigh)

Re: HP35s zip cover

*Message #3 Posted by **Seth Morabito** on 3 Mar 2010, 12:07 p.m.,*
in response to message #1 by DurbanGuy

That sucks! I had no idea they came with a different case now.

Leave me a private message here and give me your address, I have an extra HP35s zip case that I'd be happy to send to you.

Re: HP35s zip cover

*Message #4 Posted by **Martin Pinckney** on 3 Mar 2010, 4:32 p.m.,*
in response to message #1 by DurbanGuy

Typical. First bring out a new product at a certain price. Then keep subtracting things from the package (printed manual, zip cover, what's next?), giving the illusion that the price is stable, while in reality the effective price is creeping up.

Re: HP35s zip cover

*Message #5 Posted by **Tim Wessman** on 3 Mar 2010, 6:49 p.m.,*
in response to message #4 by Martin Pinckney

What is and isn't included in the packages almost always is dictated by distributors and retailers for consumer products (shelf/shipping/peg space)

I think the case was a casualty of needing to make the packaging thinner.

TW

Re: HP35s zip cover

*Message #6 Posted by **Martin Pinckney** on 3 Mar 2010, 9:03 p.m.,*
in response to message #5 by Tim Wessman

> Quote:
>

Incredible. Once was a time when the manufacturer dictated to the distributor/retailer how the product was to be displayed/stocked/sold. Sam Walton changed all that.

Re: HP35s zip cover

*Message #7 Posted by **Maarten Ambaum (Reading, UK)** on 4 Mar 2010, 4:50 a.m.,*
in response to message #5 by Tim Wessman

Having said that, the 50g I recently bought from amazon.co.uk came with a thumping big crap MP3 player packaged. Hardly a space saving device.

I'd be interested to see what is in the 30b package when they start selling it in the UK. Perhaps that is an indication of things to come.

Re: HP35s zip cover

*Message #8 Posted by **Bart (UK)** on 4 Mar 2010, 5:33 a.m.,*
in response to message #5 by Tim Wessman

> Quote:
>
> I think the case was a casualty of needing to make the packaging thinner.

To cut costs on both the cover and packaging.

BTW, the webpage for the 35s now says "pouch", but the PDF still says "premium protective case". You may want to get them to update the PDF too.

Re: HP35s zip cover

*Message #9 Posted by **Bart (UK)** on 5 Mar 2010, 5:35 a.m.,*
in response to message #8 by Bart (UK)

> Quote:
>
> To cut costs on both the cover and packaging.

That said, it makes sense. I tried my 33s pouch with the 35s and it fits perfectly. Would fit the 17BII+ too I'd guess (looks much like the 35s shape - though I don't own one to compare). So it would make sense to produce one cover that fits many models.

Just think - those of us that have a zipper case can in 30 years time advertise on eBay (or whatever takes its place) "with original zip case - only sold with earlier models" (much like the "red dot" ?? :))

Re: HP35s zip cover

*Message #10 Posted by **bill platt** on 5 Mar 2010, 9:08 a.m.,*

in response to message #5 by Tim Wessman

> Quote:
>
> What is and isn't included in the packages almost always is dictated by distributors and retailers for consumer products (shelf/shipping/peg space) TW

Tim,

I hope that HP will consider (or already has considered) selling the case as an accessory. I actually think there might be a bunch of money to be made by selling soft cases, printed manuals, etc. as add-on accessories.

Re: HP35s zip cover

*Message #12 Posted by **Maarten Ambaum (Reading, UK)** on 4 Mar 2010, 4:46 a.m.,*
in response to message #1 by DurbanGuy

That is indeed infuriating - the quality cover was a great feature of the 35s.

So did they replace it with a sturdy leather cover of some quality (like the 50g)?

Re: HP35s zip cover

*Message #13 Posted by **Bart (UK)** on 4 Mar 2010, 5:28 a.m.,*
in response to message #12 by Maarten Ambaum (Reading, UK)

> Quote:

Sounds more like in the lines of the 33s slip case.

Re: HP35s zip cover

*Message #14 Posted by **Michael Plant** on 4 Mar 2010, 9:51 a.m.,*
in response to message #12 by Maarten Ambaum (Reading, UK)

I found a picture here:

http://thumbnail.image.rakuten.co.jp/s/?@0_mall/auc-july/cabinet/calculator/35s-10.jpg

Looks like the 33s case...

Re: HP35s zip cover

*Message #15 Posted by **DurbanGuy** on 4 Mar 2010, 10:23 a.m.,*
in response to message #14 by Michael Plant

Yip, its pretty much exactly the same as the 33s. I mailed HP but its over 24hrs now and i still dont have a response.

Re: HP35s zip cover

*Message #16 Posted by **Ed Look** on 4 Mar 2010, 5:29 p.m.,*
in response to message #15 by DurbanGuy

If it's the 33s case, it is pretty nice. The 33s case is sturdy enough to protect the calculator from short falls, reasonable protection from objects hitting the cased calculator.

The Pioneer cases, if like the ones with my 20S and 32SII, are awful; they are thin vinyl and really only keeps dirt and moisture off the calc and is no good for anything more massive than a spitball hitting the calculator.

Re: HP35s zip cover

*Message #17 Posted by **bill platt** on 5 Mar 2010, 9:08 a.m.,*
in response to message #16 by Ed Look

The 35s is very loose inside the 33s case...

Re: HP35s zip cover

*Message #18 Posted by **Bart (UK)** on 5 Mar 2010, 9:40 a.m.,*
in response to message #17 by bill platt

Interesting, mine fits quite nicely. I can hold it with the opening facing down, and it takes a bit of shaking before it starts to fall out.

Re: HP35s zip cover

*Message #19 Posted by **bill platt** on 5 Mar 2010, 10:12 a.m.,*
in response to message #18 by Bart (UK)

Maybe my 33s case has worn it. I used the 33s solidly for 1 year--as primary--to see if I could adapt (couldn't) and even the 33s is looser in it than it used to be.

Re: HP35s zip cover

*Message #20 Posted by **Ken Shaw** on 5 Mar 2010, 11:51 a.m.,*
in response to message #16 by Ed Look

Not all the Pioneer cases are thin vinyl. The later ones are similar to the Voyager cases (leatherette--maybe vinyl--with a padded interior) and they fit nicely.

Re: HP35s zip cover / 33s slip case

*Message #21 Posted by **Bart (UK)** on 11 Mar 2010, 9:51 a.m.,*
in response to message #16 by Ed Look

A pioneer itself is very loose in the 33s slip case. Together with its slip case it fits in nicely. The pioneer's case stays inside when the calculator is withdrawn. Offers protection for both the Pioneer and it's slip case.

However, I have not figured out yet where in the UK to order extra 33s cases (or whatever other calc they get sold with).

in response to message #14 by Michael Plant

After seeing the picture, I realize I have one of those cases I got for my Pioneers. They are actually quite nice. I would prefer it over the original 35s zip cover, but that's just my preference.

Re: HP35s zip cover

*Message #23 Posted by **Scott Newell** on 4 Mar 2010, 7:20 p.m.,*
in response to message #22 by Martin Pinckney

I think I'd prefer it over the zipper case too. Both zippers on one of my 35S cases have gone bad, rendering the case useless.

Re: HP35s zip cover

*Message #24 Posted by **Reth** on 5 Mar 2010, 2:39 a.m.,*
in response to message #23 by Scott Newell

Mine got bad too - the zip case is a piece of @#$%. Where could one buy the pouch?
Cheers

Re: HP35s zip cover

in response to message #24 by Reth

I am still trying to source one than i will have both. I suppose in a day or two i will adjust to the slip on one.

It really is amazing how a calculator can become so important in your life, when ever i have to try use someone else i am lost...

Re: HP35s zip cover

*Message #26 Posted by **bill platt** on 5 Mar 2010, 9:13 a.m.,*
in response to message #25 by DurbanGuy

The "HP way" was always starkly different from Casio or Sharp or even Ti in terms of keyboard layout, logic of arrangement of mathematical functions, input paradigms (not just the RPN aspect) that I generally don't trust all the "bells and whistles" on other machines---I am never sure I have figured them out correctly. Stuff like nCr, or fraction

input, or even more, memory...or the AOS/EOS variations....all can bite you rather badly when switching to non-HP.

But as long as I stick to the basics--just arithmetic--or take a little bit of time to test the "advanced" features in immediate need, then I can get along with the "other" machines OK in a pinch.

The converse is also true. Hand any HP to a Casio user and he's dumbfounded about the layout. But they all sway (about pioneers and older) "but these buttons are great!"

HP-41 / EMU41P emulator query

*Message #1 Posted by **John AS (UK)** on 3 Mar 2010, 5:55 a.m.*

Hi,

I have recently installed the free version of EMU41P (HP-41 emulator) on my HP Portable Plus (has 1MB RAM so should work fine).

I am having problems with ALPHA mode, I am seeing the following:

Key pressed -> Character displayed
A -> a
B -> b
C -> c
Q -> *
W -> *
N -> *
T -> *
H -> *

basically I can only enter lower case abcd, other characters give * (I did see some other special characters, can't remember what I pressed), I can't enter upper case A to Z. I think I have entered some sort of character mode, can anyone suggest how to return to normal? Backspace deletes the * characters as normal.

I can enter commands OK, eg

XEQ ALPHA CAT ALPHA

enters the CAT command.

Regards,
John

Re: HP-41 / EMU41P emulator query

*Message #2 Posted by **J-F Garnier** on 3 Mar 2010, 12:27 p.m.,*
in response to message #1 by John AS (UK)

Hi John,

There is no problem with Emu41p, very likely you loaded the CCD ROM (or the CCD-OSX). Just activate the USER mode to access the normal upper characters in ALPHA mode, see the CCD ROM manual. Or remove the CCD ROM from the emu41.ini file if you are not confortable with it.

J-F

Re: HP-41 / EMU41P emulator query

*Message #3 Posted by **Ángel Martin** on 3 Mar 2010, 1:52 p.m.,*
in response to message #2 by J-F Garnier

Exactly my thoughts. I wish the CCD designers had implemented the reversed arrangement for the lower-case characters (that is activated with USER is ON and not the other way around).

BTW, does anybody (besides Raymond :) have access to a original (read: commented) CCD source code listings?

Best, 'AM

Re: HP-41 / EMU41P emulator query

*Message #4 Posted by **John AS (UK)** on 4 Mar 2010, 2:59 a.m.,*
in response to message #2 by J-F Garnier

Many thanks for the replies, apologies for the basic question I am a HP-41 newbie. This was the first time I tried to use the CCD module, the answer was to press USER (F2 in EMUI41P) to switch User mode on - all working fine now.

I've had a look at the CCD manual, and it explained about the keypad mapping to allow direct entry of any character - very nice. A colleague also added that the HP-41 display cannot show any lower case apart from abcde, hence the ******!
Next (simple) question on the CCD module then - how please do I enter following commands:

CAT'0 - to list HP-IL devices
CAT'7 - to DIR of HP-IL module

I tried:

XEQ ALPHA CAT ALPHA 0 (or 7) but that just listed all the functions.

Regards,
John

Parametric and Polar functions on 50G

*Message #1 Posted by **Ben** on 2 Mar 2010, 9:36 p.m.*

Greetings everyone. I'm a new HP convert, I'm moving from a TI-84 to an HP 50G in anticipation for college. However, I still need to finish High School Calculus. On the TI-84 one could put a function in parametric or polar form and on the "calc" menu find the value, dy/dx, dr/d0, dx/dt, or dy/dt, at any point in the window? Is there a way to do this on 50G? Looking at a friends TI-89, I see they have this function, but this capability is only available with functions on the 50G. Help!

Re: Parametric and Polar functions on 50G

*Message #2 Posted by **Eddie W. Shore** on 3 Mar 2010, 12:57 a.m.,*
in response to message #1 by Ben

Not on the graph, I think you have do this from the home screen.

Re: Parametric and Polar functions on 50G

*Message #3 Posted by **John McCormick** on 3 Mar 2010, 2:18 p.m.,*
in response to message #1 by Ben

Hi Ben, I was a TI-82 user until a few years ago, so I know where you're coming from. What you describe on the TI 8x series is a real convenience, but that kind of specialization makes the your TI a much less flexible tool.

I use my 50g in RPN mode with soft menus. I store information in a directory structure similar to a personal computer. I have directories like MATH, PHYS, etc and each has subdirectories based on chapters and sections down to individual problems. This allows me to store the plot, equations, derivatives, matrices, and nearly anything else for any particular problem all together in one place. Yes, I can carry my homework around on my calculator. I use the Archive command to back it all up.

Ok, so what does all that have to do with your question? It puts the lack of a corresponding function on your HP 50g into perspective. On your HP, you can compute derivatives symbolically, store the result, and then recall the result to the stack and use the SUBST (substitute) function in the ALG menu to plug in a numerical value (or a list of numerical values!) on the stack or you can plot the derivative and look up values in the table. Use the variable EQ to store an expression to plot. You can also plug your own values into the independent variable on the table if you select "Build Your Own" in the TBLSET screen under Type. Note that you can even store the table you produce! So it's a different approach and it takes some practice, but it's much more profitable in the long run. Programming can make a lot of this happen with a few button presses.

Have fun and make sure you download the training aids at http://h20331.www2.hp.com/Hpsub/cache/383680-0-0-225-121.html

You should also check out the comp.sys.hp48 newsgroup where there is scads of information similar to what you're looking for.

N cell alkaline batteries, inexpensive

*Message #1 Posted by **Garth Wilson** on 1 Mar 2010, 10:55 p.m.*

I was looking in the Mouser catalog for batteries for something else (actually the smallest lead-acid ones I can find) and came across their Gold Peak alkaline N cells: $.65/ea in singles, $.59/ea in qty 100-499 Mouser stock number 573-910A. There's another N cell, Energizer, Mouser stock number 525-E90, for $1.42/ea, or $1.34/ea if you buy 10. Go to mouser.com and put the stock numbers in the search bar near the top. That's considerably less than I've paid at Radio Shack for my HP-41 batteries. I buy parts occasionally from Mouser, so I would wait until I'm ready to order other stuff.

Re: N cell alkaline batteries, inexpensive

How many 41's do you have? Shelf life is short for cheap Chinese cells. I have bought blister packs of the A76 size (Pioneers) and they go bad in the pack before I can use them all.

Re: N cell alkaline batteries, inexpensive

*Message #4 Posted by **Tom Mathes** on 2 Mar 2010, 5:25 p.m.,*
in response to message #1 by Garth Wilson

I've seen these batteries before in other flavors, like AA size. They came in some Fluke DMMs we have in the lab. They lasted about 1/2 as long as a Duracell/Energizer and leaked on us. I swore to never allow the Gold Peak brand back in our office.

I hope you have better luck that we had. After my experiences I only use Duracell or Energizer. Our lab gear is worth more than a few bucks spent on a battery that doesn't leak easily and if it does is warranted. Plus in the end nothing was saved cost wise since they didn't last as long. You could tell they would not last as long since the batteries weighed a whole lot less than well known brands. They must have had dramatically less active chemicals in them than the brand names.

Re: N cell alkaline batteries, inexpensive

*Message #5 Posted by **Garth Wilson** on 2 Mar 2010, 8:51 p.m.,*
in response to message #4 by Tom Mathes

So if they're a lot lighter and don't last nearly as long, maybe they're not really alkaline and they're just lying, as was the case with a small Chinese FM radio I made the mistake of buying. It says "stereo" right on it, but it's not. The left and right earphones get the same signal. They probably figured, "Who's going to prosecute us?" Anyway, the Energizer-brand batteries are still there for $1.42/ea, or $1.34/ea if you buy 10.

Anyway, the Energizer-brand batteries are still there for $1.42/ea, or $1.34/ea if you buy 10.

I don't think they were lying, it's just they did not put as much active chemicals in the cell and hence did not last long. I find that 'bargain' brand batteries often are not a bargain when you consider they wear out quicker. I've stuck with Duracell or Energizer, even though more expensive, since they last longest and price/time used works out to be the same. Plus if they leak and trash my device both companies are good about reimbursing you for replacement.

Re: N cell alkaline batteries, inexpensive

The fact that they weighed a lot less too however suggests a different type of battery. I've seen some very misleading labeling on Chinese batteries, but I don't remember if they just straight out said they were alkaline when they were zinc-chloride. I have had to tell our customers sometimes when they complained about battery life that "Heavy Duty" normally means zinc-chloride, not alkaline. The next step down below that of course is carbon-zinc.

Re: N cells and 13/44/76/357 cells

*Message #8 Posted by **Karl Schneider** on 3 Mar 2010, 1:56 a.m.,*
in response to message #1 by Garth Wilson

> Quote:

> and came across their Gold Peak alkaline N cells:

I once bought a pack of Gold Peak button cells (for Pioneer/Voyager) via eBay, after becoming chagrined with short life in my HP-17B and HP-27S calc's. I later learned in this Forum how to turn off the clock ("coma" mode -- turn off while also pressing upper-right and lower-right keys). Use of an emulator (such as Thomas Okken's Free42) can reduce usage of the IR printer on the HP-42S.

I had no problems with the cheap cells, but did not feel confident entrusting vintage electronics to them.

Energizer silver oxide US-made 13/44/76/357 cells can now be bought in convenient and more-economical three-packs -- just the ticket for for Pioneer and Voyager series models.

> Quote:
>
> That's considerably less than I've paid at Radio Shack for my HP-41 batteries.

The electronics/photo departments at stores like Target or Fred Meyer (US Northwest) also sell calculator cells. Probably not much cheaper than RS, though.

Just keep an eye on those cells, make sure they don't leak. Outside of that no harm in trying them. I'm also curious to see if you get the same life out of your '41 like you did from Duracell/Energizer.

When I had a 41c (broke in 1998 after being dropped one too many times), I never had to buy batteries for it. My father's best friend was a Duracell exec that worked in the plant making the N cells. He'd give me 12 packs whenever I'd visit my home town. The cells were typically a week old or less right off the production line. :-) I went 18 years with never having to buy a battery for that calc.

Why are Serial Ports so Annoying? 49G But sort of Off Topic

*Message #1 Posted by **bill platt** on 1 Mar 2010, 10:40 p.m.*

I have a 49G and it has ROM 1.18. After two years of relatively normal operation, only occasional crashes, it finally became unbearable.

So I finally decided to try to interface the 49G with the computer.

(I used to do this successfully with the 48GX but I lost *that* cable over two years ago. And the backup battery on the 1MB card went dead and I lost all the saved stuff. So what, wasn't important anyway and the good stuff was old and on the backup computer anyway...)

I read James Prange's (remember him? Where'd he go?) amazing write-up on getting a 49G+ ROM onto a 49G and I was pretty lost. Along the way, I read a number of people's comments on C.S. HP48 which indicated it is better to update to the "unsupported" ROM 1.19-something.

So I gave it a try. I downloaded ROMs and connectivity kit (the one with the little dog).

And then

Nothing.

Computer never sees the HP49.

Why is this stuff always so da^$%$$#$ annoying!

I'm more of a mechanical and electrical as in analog waves guy. I get Lost in Acronyms.

Is this why the MacIntosh is popular? Are there fewer Acronyms?

I don't have a Clue what to do.

Re: Why are Serial Ports so Annoying? 49G But sort of Off Topic

*Message #2 Posted by **Martin Pinckney** on 2 Mar 2010, 12:01 a.m.,*
in response to message #1 by bill platt

Bill,

I think you will need to supply more info, such as, are you using a real serial port on the computer, or a USB-serial adapter? What operating system? What file transfer software?

Re: Why are Serial Ports so Annoying? 49G But sort of Off Topic

*Message #3 Posted by **bill platt** on 2 Mar 2010, 10:42 a.m.,*
in response to message #2 by Martin Pinckney

Hi Martin,

Perhaps Raymond's approach is best....

But yes, it is a real serial port. Of course it is Windows XP pro. And the file transfer software is as I described: the one with the picture of the little happy dog...

I am *sure* the problem just must have to do with IRQ interrupt COM port crap. I haven't had to struggle with that stuff in over 10 years, but when I did deal with that, back in the Neanderthal 90s, it was EPIC.

Edited: 2 Mar 2010, 10:45 a.m.

Re: Why are Serial Ports so Annoying? 49G But sort of Off Topic

*Message #4 Posted by **Raymond Del Tondo** on 2 Mar 2010, 3:18 a.m.,*
in response to message #1 by bill platt

Seriously, it's only a 49g.

I have seen various on TAS for between $20 and $50,
a few weeks ago someone sold a NIB for 13 Euros!

So if you really want to fiddle with the FHB,
I'd suggest not to waste too much time with updating it,
but instead to simply get another;-)

HTH

Raymond

Re: Why are Serial Ports so Annoying? 49G But sort of Off Topic

*Message #6 Posted by **Ron Ross** on 2 Mar 2010, 11:50 a.m.,*
in response to message #4 by Raymond Del Tondo

I believe the correct acronym is FHBB.

As the 49G isn't that popular today, hence not as well documented as other calculators, FHBB is short for Frozen Hamster Butt Blue.

hp48, factorization

*Message #1 Posted by **Sok-khieng Chum Hun** on 1 Mar 2010, 9:51 p.m.*

Hi, I am studying electronic engineering and I would like to know why my hp 48gx cannot factorize this transfer function :

10^4*s^2/(s^4 + 100*sqrt(2)*s^3 + 2.01*10^4*s^2 + 10^8*sqrt(2)*s + 10^12)

I use both alg48 and erable and I don't know why it can't factorize

(sorry for my bad english :()

Thank you :)

Re: hp48, factorization

*Message #2 Posted by **hugh steers** on 2 Mar 2010, 2:36 p.m.,*
in response to message #1 by Sok-khieng Chum Hun

what should the answer be?

Re: hp48, factorization

*Message #3 Posted by **Rainer Wiedemann (Germany)** on 2 Mar 2010, 2:49 p.m.,*
in response to message #2 by hugh steers

According to Wolfram alpha, the denominator's roots are

s ~ -739.788 - 672.84i, s ~ -739.788 + 672.84i, s ~ 669.077 - 743.193i, s ~ 669.077 + 743.193i,

Maxima didn't factor/gfactor the polynomial, too, but its solve function found the roots. Unfortunately the exact result is too long to post here. Not one of the roots would fit inside a hp48 lcd.

Has anyone an hp50g at hands to countercheck this, too?

Edited: 2 Mar 2010, 3:14 p.m.

Re: hp48, factorization

*Message #4 Posted by **Sok-khieng Chum Hun** on 2 Mar 2010, 4:01 p.m.,*
in response to message #2 by hugh steers

Hi, when i factorize it with matlab, it returns :

10^4*s^2/((s^2 + 1480*s + 1e006) (s^2 - 1338*s + 1e006))

Thank you :)

Re: hp48, factorization

*Message #5 Posted by **Rainer Wiedemann (Germany)** on 2 Mar 2010, 5:19 p.m.,*
in response to message #4 by Sok-khieng Chum Hun

Multiplying the factors from your solution shows, that Matlab did not yield an exact solution, but an approximation:

```
(s^2 + 1480*s + 1e006)(s^2 - 1338*s + 1e006) = s^4+142*s^3+19760*s^2+142000000*s+1000000000000 != s^4 + 100*sqrt(2)*s^3 +
2.01*10^4*s^2 + 10^8*sqrt(2)*s + 10^12
```

Re: hp48, factorization

*Message #6 Posted by **Sok-khieng Chum Hun** on 2 Mar 2010, 6:31 p.m.,*
in response to message #5 by Rainer Wiedemann (Germany)

Hi, than I must conclude that alg48 or erable are not able to factorize because they both only factorize exact solution?

I didn't take the time to ask myself whether the zpk function in matlab gives the exact solution or an approximation O_o.

Thank you, I very appreciate your help :)

Re: hp48, factorization

*Message #7 Posted by **Rainer Wiedemann (Germany)** on 2 Mar 2010, 7:05 p.m.,*
in response to message #6 by Sok-khieng Chum Hun

No, I don't think so. It should at least have found a numerical solution.

I just dug out my hp50g and I also found batteries for it. So I tried your polynomial. The 50g does factoring much similar to your Matlab solution, it yields a numerical solution.

It finds:

```
(s^2 + 1473.5755*s + 1000000) * (s^2 - 1338.1541*s + 1000000)
```

I couldn't get it to perform further factoring, i. e. have it find the complex roots. That seems strange to me.

OK, I'm not an experienced hp50g user, coz I prefer my old 41, and do higher complexity stuff on a pc.

So I suppose it might be a RAM issue, AFAIK the 48gx has 128k, the 50g some more.

Probably Raymond reads this thread, he's a 48g(x) expert and he could know more about CAS and its limitations.

Edited: 2 Mar 2010, 7:53 p.m.

Re: hp48, factorization

*Message #8 Posted by **Marcus von Cube, Germany** on 3 Mar 2010, 9:34 a.m.,*
in response to message #7 by Rainer Wiedemann (Germany)

Derive isn't bad at it. For the denominator it returns

(s^2 + s·(10·sqrt(19849) + 50·sqrt(2)) + 1000000)·(s^2 + s·(50·sqrt(2) - 10·sqrt(19849)) + 1000000)

I pasted and entered the complete equation and used the menu to factor it.

Re: hp48, factorization

*Message #9 Posted by **Rainer Wiedemann (Germany)** on 3 Mar 2010, 4:15 p.m.,*
in response to message #8 by Marcus von Cube, Germany

Is Derive still maintained or (at least) available? I remember the early 80s, where it was en vogue due to its efficient implementation and low hardware requirements.

For the sake of completeness (and for trying out my brand new guest file account :-)) I'm posting the exact roots calculated by wxMaxima:

$$s=-\frac{5\sqrt{643232\sqrt{19849}-99245\,2^{13/2}}\,\%i}{2^{5/2}\,19849^{1/4}}-5\sqrt{19849}-25\sqrt{2}$$

$$s=\frac{5\sqrt{643232\sqrt{19849}-99245\,2^{13/2}}\,\%i}{2^{5/2}\,19849^{1/4}}-5\sqrt{19849}-25\sqrt{2}$$

$$s=-\frac{5\sqrt{643232\sqrt{19849}+99245\,2^{13/2}}\,\%i}{2^{5/2}\,19849^{1/4}}+5\sqrt{19849}-25\sqrt{2}$$

$$s=\frac{5\sqrt{643232\sqrt{19849}+99245\,2^{13/2}}\,\%i}{2^{5/2}\,19849^{1/4}}+5\sqrt{19849}-25\sqrt{2}$$

I still can't get my hp50g find these as a final result, but it works for 4th order equations with smaller coefficients ?!? What am I doing wrong? ?

Is Derive able to find these? If so, does it do by factoring commands, or do you have to solve for the zeroes of the original denominator polynomial (as wxMaxima does)?

Edit: %i = sqrt(-1) in Maxima notation

Edited: 3 Mar 2010, 4:19 p.m.

Re: hp48, factorization

*Message #10 Posted by **Marcus von Cube, Germany** on 4 Mar 2010, 12:01 p.m.,*
in response to message #9 by Rainer Wiedemann (Germany)

I think, Derive has been replaced by the Nspire PC software. It can't be ordered directly from TI.

Derive finds 4 solutions for denominator = 0:

```
                4           3          4  2     8          12
#10:   SOLVE(s  + 100·√2·s  + 2.01·10 ·s  + 10 ·√2·s + 10   = 0, s)

#11:   s = - 5·√19849 - 25·√2 - 5·i·√(20101 - 10·√39698) v s = - 5·√19849 - 25·√2 + 5·i·√(20101 - 10·√39698) v s =

         5·√19849 - 25·√2 - 5·i·√(10·√39698 + 20101) v s = 5·√19849 - 25·√2 + 5·i·√(10·√39698 + 20101)
```

I didn't double check my input.

Re: hp48, factorization

*Message #11 Posted by **Steve Keeley** on 3 Mar 2010, 10:47 p.m.,*
in response to message #1 by Sok-khieng Chum Hun

Try this on your 48:

Hit right shift - solve
choose "Solve poly..." enter the coefficients: 1, 141.4214, 2.01*10^4, 1.414214*10^8, 10^12
Then hit "solve"

You'll get an array containing the following:
(-739.7877, -672.8403)
(-739.7877, 672.8403)
(669.0770, 743.1930)
(669.0770, -743.1930)

Re: hp48, factorization

*Message #12 Posted by **Bart (UK)** on 4 Mar 2010, 5:40 a.m.,*
in response to message #11 by Steve Keeley

That's the denominator (as solved by several people from message 3 onwards), how would you include the numerator?

Also, as per the original request, how does one factorise it?

Edited: 4 Mar 2010, 5:55 a.m.

Re: hp48, factorization

*Message #13 Posted by **Steve Keeley** on 4 Mar 2010, 2:32 p.m.,*
in response to message #12 by Bart (UK)

"Also, as per the original request, how does one factorise it?"

On an out-of-the-box 48, you don't factorise it in one step. You'd have to write or find a program for it.

With a 50g the FACTOR function would give 10000*s*s/(s^2-1338.15*s+1000000)*(s^2+1479.58*s+1000000). Rainer and Sok-khieng Chum Hun found the same denominator; the numerator doesn't factor further.

In order to factor the denominator all the way to the complex roots you need to use the Poynomial solve the same as on the 48.

Once you have the complex roots on the 48, you can get the quadratic forms by subtracting each pair of roots from s, multiplying them, and executing EXPAND and COLLECT.

Edited: 4 Mar 2010, 8:20 p.m.

Re: hp48, factorization

*Message #14 Posted by **Hal Bitton in Boise** on 4 Mar 2010, 1:46 a.m.,*
in response to message #1 by Sok-khieng Chum Hun

I got the same results for the denominator as Rainer did on both my 48G and 50G (with the 50G in approx mode). On the 48G I used the polynomial solver app...I did have to do a bit of juggling to get the coefficients into the solver in numerical form as follows: I put each coefficient onto the stack starting with the high order in level 5, and ending with the constant in level 1, making sure not to enter them as algebraic objects (') so they would evaluate to real (approx) numbers. Then I entered 5 and executed ->ARRY, and ended up with the coefficient array in level 1. Then go to the solve poly app, and with the coefficient field selected, hit NEXT, and the CALC (softkey)...the array is waiting in level 1, so just hit OK to put the coefficients into the solver app. Then solve for the roots as normal. Hit SYMB softkey and return to the stack to see the roots in factor form. Works like a champ. I don't know why the 50G wouldn't factor it symbolically.
If it's any consolation, I tried symbolically factoring this on my Ti89 emulator, and it locked up..;0
Best regards, Hal

Re: hp48, factorization

*Message #15 Posted by **Rainer Wiedemann (Germany)** on 4 Mar 2010, 6:14 p.m.,*
in response to message #14 by Hal Bitton in Boise

So now I learned: in order to get the complex roots I must use the "solve poly" function. Factorization seems to be restricted to real results.

Meanwhile I tried Steve's and your procedures on both my hp50g and on m48, an hp48 emulator on iphone, and bingo - I got the expected results.

Like you Hal, I don't know, why the 50g is not able to factorize symbolically. At least this thread has worked up my appetite for taking a closer look at the hp50g. If only the keyboard wouldn't be that (over)crowded, that's why I preferred using a pc for symbolic math and a hp41 as a calculator up to now. IMHO hp should have considered a double keyboard design for the hp50g as implemented in the hp28C/S. I guess that would have improved acceptance of this machine also among old-school calculator users like me.

Re: hp48, factorization

*Message #16 Posted by **Hal Bitton in Boise** on 5 Mar 2010, 5:34 a.m.,*
in response to message #15 by Rainer Wiedemann (Germany)

> Quote:
>
> So now I learned: in order to get the complex roots I must use the "solve poly" function. Factorization seems to be restricted to real results.

Actually, I tried this again with my real 50G (I was using my emulator before), and this time when using the factor command, the calculator asked me if I wanted to switch to approx mode, to which I responded yes. The 50G then factored the denominator with the aforementioned approximate results. It also worked using the symbolic solve function as long as the calc was in approx mode. (In case you may not be aware of it, you can quickly toggle between exact and approx modes by holding down right shift, and pressing ENTER)
Best regards, Hal

HP-41: Read/Write XM file from a LIF-file?

*Message #1 Posted by **Geir Isene** on 1 Mar 2010, 6:38 a.m.*

What is the easiest way to both read & write an XM-file to a LIF file. I believe I could read the file via Tony Duell's lifget... but write?

Edit: Turns out even reading an XM file from a LIF-file is quite a task - first saving all of Extended Memory to a LIF-file via WRTXM (from Extended IL(+)) and then extracting the whole XM file via Lifutil's command "lifget -f 'lif-file' 'xm-file'" and then poking out the file within Extended Memory from that... tough.

Anyone got some magic up their sleeves?

I will pay you back with a severe geek-hack :-)

Edited: 1 Mar 2010, 3:38 p.m.

Re: HP-41: Perhaps easier: Read/Write a data file from a LIF-file?

*Message #2 Posted by **Geir Isene** on 2 Mar 2010, 3:51 p.m.,*
in response to message #1 by Geir Isene

Since no takers, I have an idea that might be easier: Read and write a 41 "data file" (registers saved by the HP-IL command WRTR) in a LIF-file.

Still don't know how to do this yet, but it should be somewhat easier to accomplish as the registers are fixed length.

Anyone?

Edited: 2 Mar 2010, 3:52 p.m.

Re: HP-41: Read/Write XM file from a LIF-file?

*Message #3 Posted by **Håkan Thörngren** on 3 Mar 2010, 9:02 a.m.,*
in response to message #1 by Geir Isene

Do you want to write individual files from extended memory to mass storage device and back to extended memory?

Are there no such functions available?

And this Extended IL+ module you mention, where can I find it? I assume it is not the Extended IO module, as that one does not have any WRTXM.

Re: HP-41: Read/Write XM file from a LIF-file?

*Message #4 Posted by **Ángel Martin** on 3 Mar 2010, 1:55 p.m.,*
in response to message #3 by Håkan Thörngren

The PANAME module has XM<->Tape (or disk) functions, but not sure about individual files.

As far as I know the other mentioned ROM must be the only one still being sold commercially by the author. A pity for the real enthusiasts...

Re: HP-41: Read/Write XM file from a LIF-file?

*Message #5 Posted by **Geir Isene** on 4 Mar 2010, 2:45 p.m.,*
in response to message #4 by Ángel Martin

The WRTXM is part of the original HP-IL Extended module by Sqwid (image over at TOS).

Edited: 4 Mar 2010, 2:45 p.m.

Re: HP-41: Read/Write XM file from a LIF-file?

*Message #6 Posted by **Egan Ford** on 3 Mar 2010, 4:12 p.m.,*
in response to message #1 by Geir Isene

So you want to create an XM file on your real 41, e.g. an ASCII file call "FOO" with the contents "HP41, LIVE FREE OR DIE\0xFF". Then you want to copy FOO to a LIF diskette via HP-IL/9114. Then you want to shuttle that floppy to your Linux box and run "lifget" to get FOO on your PC. Then you want to be able to read it from Linux? And then you want to do the reverse?

Re: HP-41: Read/Write XM file from a LIF-file?

*Message #7 Posted by **Geir Isene** on 4 Mar 2010, 2:44 p.m.,*
in response to message #6 by Egan Ford

Pretty much - except I want to use the PIL-Box except for the shuttle disk.

Re: HP-41, HP-71, HP-75, HP-IL or all of the above?

*Message #2 Posted by **DavidShenk** on 1 Mar 2010, 11:26 a.m.,*
in response to message #1 by Dan Grelinger

Maybe everyone on the forum should contact the seller asking where the other calcs are...

Re: HP-41, HP-71, HP-75, HP-IL or all of the above?

*Message #3 Posted by **Namir** on 1 Mar 2010, 12:42 p.m.,*
in response to message #2 by DavidShenk

I think the seller is trying to get the attention of the collectors for the other models who scan auctions by keywords in the title. I am not sure that this is acceptable with eBay (I may be way wrong) because it can be confusing and misleading.

Namir

Re: HP-41, HP-71, HP-75, HP-IL or all of the above?

*Message #4 Posted by **Dan Grelinger** on 1 Mar 2010, 1:19 p.m.,*
in response to message #3 by Namir

Yes, it violates two eBay policies. One, that a seller must describe the item that he is selling accurately. And two, that a seller may not use 'keyword spamming' in attempt to hijack searches for other items to his item.

If someone were to buy this item and not receive what was described in the title, they could make a lot of trouble for the seller since ebay would automatically find in the favor of the buyer for any dispute. "Item misrepresentation."

Re: HP-41, HP-71, HP-75, HP-IL or all of the above?

*Message #5 Posted by **Martin Pinckney** on 1 Mar 2010, 10:37 p.m.,*
in response to message #4 by Dan Grelinger

Smart sellers get around this rule by this kind of subterfuge:

"HP 71B calculator NOT 41C..." etc.

Accomplishes the same purpose without being technically inaccurate.

Re: HP-41, HP-71, HP-75, HP-IL or all of the above?

*Message #6 Posted by **Dan Grelinger** on 2 Mar 2010, 10:47 a.m.,*
in response to message #5 by Martin Pinckney

That works for the first requirement of using an accurate item description in the title. It still is considered keyword spamming by ebay.

Re: HP-41, HP-71, HP-75, HP-IL or all of the above?

*Message #7 Posted by **Dave Shaffer (Arizona)** on 1 Mar 2010, 12:43 p.m.,*
in response to message #2 by DavidShenk

or report it to ebay? I had a listing taken down for far less egregious reasons (I had the audacity to accept CASH!!)

Re: HP-41, HP-71, HP-75, HP-IL or all of the above?

*Message #8 Posted by **Michael Meyer** on 1 Mar 2010, 1:43 p.m.,*
in response to message #7 by Dave Shaffer (Arizona)

My brother wondered about this once. You can't buy stocks with cash. Yet U.S. money says right on the bills, "This note is legal tender for all debts, public and private."

Re: HP-41, HP-71, HP-75, HP-IL or all of the above?

*Message #9 Posted by **Eric Smith** on 1 Mar 2010, 3:08 p.m.,*
in response to message #8 by Michael Meyer

If they don't give you the stock, you don't have a debt to them. It's a different situation than if you eat at a restaurant then try to pay with cash; at that point they can't refuse to accept the cash.

Re: HP-41, HP-71, HP-75, HP-IL or all of the above?

*Message #10 Posted by **Michael Meyer** on 1 Mar 2010, 3:37 p.m.,*
in response to message #9 by Eric Smith

Good point....

Finally found a new 12C at Fry's; firmware version

*Message #1 Posted by **Eric Smith** on 28 Feb 2010, 10:22 p.m.*

Every time I go to a bay area Fry's I look for a new 12C, and every time it's been the non-ARM model until today. I finally found the ARM model at the Fry's in Campbell.

It has the 2008-06-28 firmware (checksum 00be). Has anyone seen different firmware provided on a retail-purchase 12C?

Re: Finally found a new 12C at Fry's; firmware version

*Message #2 Posted by **Eddie W. Shore** on 2 Mar 2010, 8:56 a.m.,*
in response to message #1 by Eric Smith

Is it the 12C that requires two RC2032 batteries instead of one?

Re: Finally found a new 12C at Fry's; firmware version

*Message #3 Posted by **Katie Wasserman** on 2 Mar 2010, 5:37 p.m.,*
in response to message #2 by Eddie W. Shore

Yes. It has a very wide battery door that you can see by looking into the packaging from the top.

-Katie

48GII Specifications?

*Message #1 Posted by **Thomas Chrapkiewicz** on 28 Feb 2010, 9:16 p.m.*

A while ago, a thread:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv019.cgi?read=149314#149314

Indicated that the 'latest' 48GII calculators had both Serial and USB connectivity and uses 4AAA cells. The HP website today does not show this.

Can some one explain? Was it the older 48GII devices that were like this?

Thank you, TomC

Re: 48GII Specifications?

*Message #2 Posted by **Tim Wessman** on 1 Mar 2010, 8:31 a.m.,*
in response to message #1 by Thomas Chrapkiewicz

No, someone just hasn't updated it. I will mention it to the correct person later today to get fixed. Thanks.

TW

The USB port is the same, but I don't know for certain about the serial port. I regularly plug both calculators into the same USB cable on my desk. The same connectivity software works with both calculators also.

Hi, Bill;

although I have no HP67 (I have an HP97 thatÂ´s been fully cooperative when I need it...), this one would be welcome. A couple of months ago I lost the chance to buy one for R$150,00 (less then US$100,00 if I am not wrong), but for a matter of minutes it was taken by someone else. Too bad, the one I almost bought seemed to be in good shape.

Cheers.

Luiz (Brazil)

Re: OK, Fess Up, Who's the lucky winner? :-)

*Message #3 Posted by **Michael de Estrada** on 28 Feb 2010, 11:35 p.m.,*
in response to message #1 by bill platt

Frankly, I don't think it's such a good price for a calculator with a questionable card reader, no photo of the battery compartment and no accessories other than the AC adapter. Perhaps I'm a little jaded, as I found the two HP-67s in my collection for less with more accessories, although I did need to overhaul both card readers. Mine work perfectly and are in excellent to mint condition. Looking at the stats of the winning bidder, I'm thinking European, possibly German.

Meanwhile, in another auction a very questionable (probably ruined) HP-29C went for $330, which reinforces my previous contention that clean Woodstocks are becoming the new gold standard.

Re: OK, Fess Up, Who's the lucky winner? :-)

*Message #5 Posted by **Namir** on 1 Mar 2010, 8:26 a.m.,*
in response to message #1 by bill platt

Somehow the HP-67s price are up. They were not that high when I was selling them (fully restored) last year! I bought 2 recently, one was fully restored, and paid a pretty penny for that one. To make myself feel a little better about the high price I have been writing HP-67 programs (and HP-41C versions of the same programs) and posting them on my web site. It's fun to see the limit of the HP-67 and the HP-41CX (of course with this 41 you have more memory, programming steps, and more sophisticated stack and indirection commands). Granted that the HP-67 and HP-41 programs have nowhere near the power, speed, and superior results' display of Excel.

old HP67/97 programs for satellite communications

*Message #1 Posted by **Don Shepherd** on 28 Feb 2010, 12:04 p.m.*

In a thread below, aj04062 found an old document which contains HP67/97 programs. I Google'd that and found the author of that document, Mr. Michael Durbin, who wrote it in March of 1978. It contains information on 18 programs having to do with antenna things, and it includes: descriptions, program card images, code, formulae used, and algorithms. I contacted Mr. Durbin and he found a copy of this old document he wrote 32 years ago and scanned it and sent it to me (I'm thinking this is the same document referred to by aj04062). I uploaded it to my server. It consists of two pdf files, part 1 and part 2.

Mr. Durbin says we may all see it and use it. His web site is here. He currently lives in Texas.

Dave, I don't know if this is on your DVD or not, but it looks like it should be. You can contact Mr. Durbin from his website.

Edited on 3/3/2010, removed the two links above, part 1 and part 2. See message #3 below for the one link to the document.

Edited: 3 Mar 2010, 12:41 p.m. after one or more responses were posted

hp 50g won't find 2-line intersect on graph

*Message #1 Posted by **Noah Magnuson** on 28 Feb 2010, 10:30 a.m.*

I have read the large manual and everything else I could find, but when I graph two equations, I can move the cursor near any of the intersections, and it will only jump to either the x or y axis when I hit Isect, even if the intersection is far away from the axes. Am I missing something? I have even tried tracing to the point nearest an intersection and still it jumps to an axis. From reading the manual, it seems like it should be pretty simple.

Thanks for any help.

Re: hp 50g won't find 2-line intersect on graph

*Message #2 Posted by **Eddie W. Shore** on 28 Feb 2010, 7:32 p.m.,*
in response to message #1 by Noah Magnuson

What functions did you have a problem with?

Re: hp 50g won't find 2-line intersect on graph

*Message #3 Posted by **Noah Magnuson** on 1 Mar 2010, 8:59 p.m.,*
in response to message #2 by Eddie W. Shore

This is the first time I really wanted to use this feature. It was y=4-x, y=x, and y=4-3x. Nothing fancy at all. It would only go to the [0,4] intersect no matter where the cursor was. I tried it on some other random equations to see if it would find them, with no luck. I can easily calculate the intersections myself, but it says that it will find them by putting the cursor near the point and pressing ISECT. Been doing some volume rotations around the axes, so it would be nice to find them that much quicker.

I just set it up again to do the same three, and it only will give me the [2,2] intersection no matter where I put the cursor. I feel like I am just using it wrong or missing something.

Thanks, Noah

Edited: 1 Mar 2010, 9:04 p.m.

Re: hp 50g won't find 2-line intersect on graph

*Message #4 Posted by **Eddie W. Shore** on 2 Mar 2010, 8:59 a.m.,*
in response to message #3 by Noah Magnuson

I get you are getting, Noah, the ISECT function is pointing to the same point no matter where the cursor is currently located.

Playing with the order of equations makes a difference where the HP50g decides to concentrate its "efforts". I think the ISECT works on only the first two equations listed and ignores everything else.

Eddie

Re: hp 50g won't find 2-line intersect on graph

*Message #5 Posted by **Noah Magnuson** on 2 Mar 2010, 10:52 a.m.,*
in response to message #4 by Eddie W. Shore

Thank you. That is what it seems. I have to say I am pretty disappointed with that particular command. I guess something could be programmed... ,but really, how hard is it to find an intersection point. :)

Thanks again for the insight,

Noah

Re: hp 50g won't find 2-line intersect on graph

*Message #6 Posted by **Steve Keeley** on 2 Mar 2010, 8:01 p.m.,*
in response to message #5 by Noah Magnuson

After finding the intersection of the first two curves, go to "Y=", select the first equation, hit "NXT", and then "move down" twice. You can now find the intersection of the next two equations.

*Message #1 Posted by **Matthias Wehrli** on 27 Feb 2010, 1:22 p.m.*

Who can solve this sudoku for me? Maybe someone is interested in programming a special solver ;)

http://www.hp-collection.org/Sudoku.png

The sudoku needs digits from 1 to 9 and operates with the relation symbols "< is less than" and "> is more than"

Yours Matthias

in response to message #2 by Eric Smith

Hi Eric

I do not know what you mean. you simply have to insert the digits 1 to 9so that every relation sysmbol is correct.

Matthias

Re: Off-Topic: Who can solve this?

*Message #4 Posted by **Eric Smith** on 27 Feb 2010, 7:02 p.m.,*
in response to message #3 by Matthias Wehrli

So there isn't a limitation as to how many of each digit are used in each row, column, etc.?

Re: Off-Topic: Who can solve this?

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 27 Feb 2010, 5:16 p.m.,*
in response to message #1 by Matthias Wehrli

Hi;

I felt dizzy twice: by looking at the drawing and by thinking of the the possibilities of starting over...

I particularly do not like games neither mind puzzles, but I like to understand their solutions. In some cases there is a rational line in finding one or another solution, in others is just a matter of being lucky enough choosing the starting direction.

I thought about starting with '5' (upper, leftmost digit in the top) because the set is symmetrical and '5' is right in the middle of it: 1,2,3,4,**5**,6,7,8,9 and the '>' and '<' alternate with each other in the first line. Then I thought: 'Too simple minded solution...' and tried to 'see' how would the numbers evolve in the picture. ThatÂ´s when I felt the second dizziness and gave up.

Success and thanks for bringing it up! And if someone finds a rational way to solve it by reasoning, please, let me know the solution. Otherwise, if it is just a matter of starting with the right numbers, then the chances to make it wrong are way bigger than to make it right, and in this case, the solution cannot be explained, only shown.

ThatÂ´s why I prefer trying to solve problems of the real world.

Luiz (Brazil)

Re: Off-Topic: Who can solve this?

*Message #6 Posted by **Paul Dale** on 27 Feb 2010, 11:46 p.m.,*
in response to message #1 by Matthias Wehrli

I don't know the limitations on the placements of the digits. I'd assume that each 3x3 square has the digits 1 through 9 as per a traditional sudoku. A sudoku is normally a 9x9 grid with each row and column also including the digits 1 through 9, clearly this isn't the case here. It kind of looks like four sudoku puzzles overlapped at the corners.

Despite that, it doesn't look too horrible. Every nine digit must have all neighbours less than (given the lack of equalities). Likewise every 1 digit must have all neighbours greater. These two rules ought to net a few digits in the grids. Then a lot of deductive logic follows...

If I get bored enough I might give it a go....

- Pauli

Re: Off-Topic: Who can solve this?

*Message #7 Posted by **Paul Dale** on 28 Feb 2010, 7:21 a.m.,*
in response to message #6 by Paul Dale

I got bored enough -- something about most of our office having been made redundant on Tuesday :-(

It is four sudoku puzzles with common corners. The key things here are each 3x3 square with semi-bold borders has the digits 1 through 9. Each row and column of the 9x9 bold squares has the digits 1 through 9.

Anyway, it is possible to progress. Start by considering '9'. Any square containing this must be greater than all adjacent squares. Search the grid for a 3x3 square which has one square greater than everything and no others. E.g. the middle square in the second from the bottom row or the bottom right corner on the lower puzzle. Fill these with '9'. Then some deduction will allow you to completely fill all nines.

Next, do the same thing for '1'. Find a 3x3 square with only one place less than all its neighbours. E.g. the

bottom right square in the lower puzzle. Fill these with '1'. Some more deduction will allow you to fill every '1' in the puzzle in.

Consider '8'. Any square that is less than a blank cannot hold an '8'. So we've got to locate squares that are greater than all their neighbours (excepting possibly a '9'). The same bottom right square is an example here too. Some more searching and deduction allows every '8' bar two to be placed.

Do the same things for '2'. Again all can be placed.

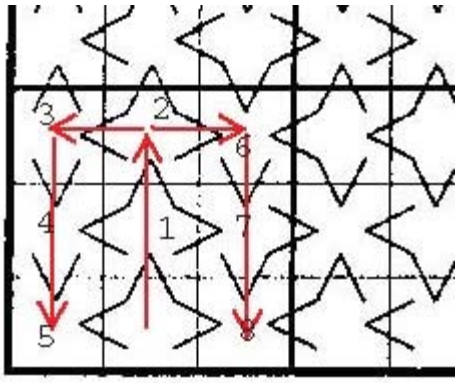
You should have the idea by now. Continue with the other numbers.

- Pauli

Re: Off-Topic: Who can solve this?

*Message #8 Posted by **Allen** on 28 Feb 2010, 10:01 a.m.,*
in response to message #7 by Paul Dale

I"m looking into a graphical method by which "line length" is used to find the topology of each grid. Starting with a "peak" you can move downhill, counting each line length only once, and so find some useful relations. This square shows the easiest one for "9". The numbers are counting steps, not the number that should be in the grid.



Re: Off-Topic: Who can solve this?

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 28 Feb 2010, 11:25 a.m.,*
in response to message #8 by Allen

Hi, allen;

this makes sense to me. First I thought the numbers you placed were the ones to fill the squares, then I saw they were the 'filling' sequence. If we start with 9, choosing were to place 6 and 5 (left-right or right-left) depends on the relations with the other 9-squares square, right? Would it be some Operational Research problem? Should G.A.M.S. be used to solve it?

Good luck to you all!

Luiz (Brazil)

Re: Off-Topic: Who can solve this?

*Message #10 Posted by **Eric Smith** on 28 Feb 2010, 9:37 p.m.,*
in response to message #1 by Matthias Wehrli

I'm working on a solver for it. I typed in a representation of the puzzle in plain text to work from, using A and V to represent the vertical inequalities, but it's tedious work and rather error-prone. Would anyone care to check my work? I think the easiest way would be for someone else to create the same thing, then we can diff them.

My text is:

```
             < > < > < > < >
            A V A V A A A V V
             > < > < < > > <

Re: Off-Topic: Who can solve this?

*Message #11 Posted by **Eric Smith** on 1 Mar 2010, 1:19 a.m.,*
in response to message #10 by Eric Smith

My solver reports that there are eight solutions to this puzzle, rather than a single unique solution. Here's the first solution it found:

```
             2 7 4 5 3 6 1 9 8
             3 1 5 4 8 9 6 2 7
             6 9 8 2 1 7 3 4 5
             4 2 1 6 9 5 7 8 3
             7 3 9 1 2 8 5 6 4
             5 8 6 7 4 3 9 1 2
3 1 6 2 4 8 9 5 7 8 6 2 4 3 1 5 6 2 7 8 9
```

```
9 2 7 5 6 1 8 4 3 9 7 1 2 5 6 8 9 7 3 1 4
8 5 4 9 3 7 1 6 2 3 5 4 8 7 9 3 4 1 5 2 6
7 4 1 6 2 5 3 8 9       6 8 5 1 2 3 9 4 7
2 3 9 7 8 4 5 1 6       7 9 2 4 5 6 1 3 8
5 6 8 3 1 9 7 2 4       3 1 4 7 8 9 2 6 5
6 7 5 8 9 2 4 3 1 9 6 8 5 2 7 6 1 4 8 9 3
4 8 3 1 7 6 2 9 5 3 7 4 1 6 8 9 3 5 4 7 2
1 9 2 4 5 3 6 7 8 5 1 2 9 4 3 2 7 8 6 5 1
            7 4 6 1 2 3 8 9 5
            3 8 9 4 5 6 2 7 1
            5 1 2 7 8 9 4 3 6
            9 5 3 8 4 7 6 1 2
            8 6 7 2 9 1 3 5 4
            1 2 4 6 3 5 7 8 9
```

combinations vs. permutations

*Message #12 Posted by **mike reed** on 3 Mar 2010, 10:07 a.m.,*
in response to message #11 by Eric Smith

Eric - I suspect your solver may be reporting combinations, not permutations... I don't think there is more than one unique solution to this puzzle, but with it's 90 degree rotations, the mirror solution, and its rotations - that gives you eight combinations. It was a fun puzzle to solve - took me about 45 minutes and a pencil. I did not use any calculating or computational devices.

Re: combinations vs. permutations

*Message #13 Posted by **Eric Smith** on 4 Mar 2010, 8:41 p.m.,*
in response to message #12 by mike reed

No, there aren't any rotations, etc., that satisfy the inequalities, because the inequalities are not arranged symmetrically around the puzzle. The eight solutions my solver found are very similar, differing mainly by a few values near the bottom of the puzzle.

I have not manually verified all eight solutions, so it is possible that my solver has a bug. I can send all eight to anyone that cares to try to verify them, or post them here if there is general interest.

Edited: 5 Mar 2010, 3:19 a.m. after one or more responses were posted

Re: combinations vs. permutations

*Message #14 Posted by **Eric Smith** on 5 Mar 2010, 3:19 a.m.,*
in response to message #13 by Eric Smith

The eight solutions are the possible combinations of three independent variations in different parts of the puzzle.

```
Solution 1:

 1:               2 7 4[5 3 6]1 9 8
 2:               3 1 5 4 8 9 6 2 7
 3:               6 9 8 2 1 7 3 4 5
 4:               4 2 1[6 9 5]7 8 3
 5:               7 3 9 1 2 8 5 6 4
 6:               5 8 6 7 4 3 9 1 2
 7: [3 1 6 2 4]8 9 5 7 8 6 2 4 3 1 5 6 2 7 8 9
 8:  9 2 7 5 6 1 8 4 3 9 7 1 2 5 6 8 9 7 3 1 4
 9:  8 5[4 9 3]7 1 6 2 3 5 4 8 7 9 3 4 1 5 2 6
10:  7 4 1 6 2 5 3 8 9       6 8 5 1 2 3 9 4 7
11:  2 3 9 7 8 4 5 1 6       7 9 2 4 5 6 1 3 8
12:  5 6 8 3 1 9 7 2 4       3 1 4 7 8 9 2 6 5
13:  6 7 5 8 9 2 4 3 1 9 6 8 5 2 7 6 1 4 8 9 3
```

```
14: [4 8 3]1 7 6 2 9 5 3 7 4 1 6 8 9 3 5 4 7 2
15:  1 9 2 4 5 3 6 7 8 5 1 2 9 4 3 2 7 8 6 5 1
16:               7 4 6 1 2 3 8 9 5
17:               3 8 9 4 5 6 2 7 1
18:               5 1 2 7 8 9 4 3 6
19:               9 5[3 8 4]7 6 1 2
20:               8 6 7 2 9 1 3 5 4
21:               1 2[4 6 3]5 7 8 9

Locations of possible alternates are marked above with
brackets.

Solution 2:  replace line 19 [3 8 4] with [4 8 3]
             replace line 21 [4 6 3] with [3 6 4]

Solution 3:  replace line 7 [3 1 6 2 4] with [4 1 6 2 3]
             replace line 9 [4 9 3] with [3 9 4]
             replace line 14 [4 8 3] with [3 8 4]

Solution 4:  replace line 1 [5 3 6] with [6 3 5]
             replace line 4 [6 9 5] with [5 9 6]

Solution 5:  apply the changes of both Solutions 2 and 3

Solution 6:  apply the changes of both Solutions 2 and 4

Solution 7:  apply the changes of both Solutions 3 and 4

Solution 8:  apply the changes of Solutions 2, 3, and 4
```

Problems with my 40G

*Message #1 Posted by **Tanya Poz** on 27 Feb 2010, 5:13 a.m.*

Please, I need advice!!!! My 40g calculator displays the 'invalid card data' message. It blinks and beeps and does not allow me to perform any actions on it. When I take batteries out and back in, it does all the same. The calculator does not react to any key. Does anyone knows what can be done? Thank you!

Re: Problems with my 40G

*Message #2 Posted by **Marcus von Cube, Germany** on 27 Feb 2010, 1:12 p.m.,*
in response to message #1 by Tanya Poz

From the manual:

Resetting the HP 39G/40G

If the calculator “locks up” and seems to be stuck, you must reset it. This is much like resetting a PC. It cancels certain operations, restores certain conditions, and clears temporary memory locations. However, it does not clear stored data (variables, aplet databases, programs) unless you use the procedure below, “To erase all memory and reset defaults”.

To reset using the keyboard

Press and hold the ON key and the third menu key simultaneously, then release them. If the calculator does not respond to the above key sequence, then:

1. Turn the calculator over and locate the small hole in the back of the calculator.

2. Insert the end of a straightened metal paper clip into the hole as far as it will go. Hold it there for 1 second, then remove it.

3. Press ON. If necessary, press ON and the first and last menu keys simultaneously.

To erase all memory and reset defaults

If the calculator does not respond to the above resetting procedures, you might need to restart it by erasing all of memory. You will lose everything you have stored. All factory-default settings are restored.

1. Press and hold the ON key, the first menu key, and the last menu key simultaneously.

2. Release all keys.

Note: To cancel this process, release only the top-row keys, then press the third menu key.

Re: Problems with my 40G

*Message #3 Posted by **Tanya Poz** on 27 Feb 2010, 5:23 p.m.,*

in response to message #2 by Marcus von Cube, Germany

Oh, Marcus, thank you so much!!! It really works now!!! Now I actually thought it was something more serious with it!!!

Power switch repair

*Message #1 Posted by **aj04062** on 27 Feb 2010, 12:04 p.m.*

I just picked up a HP-55 and the power switch is not making good contact at the detent or far right position.

Slide it back a bit and it works fine.

Is there any non-intrusive remedy for this?

Adam

Re: Power switch repair

*Message #2 Posted by **Michael de Estrada** on 27 Feb 2010, 12:31 p.m.,*
in response to message #1 by aj04062

AFAIK, there is no way to acomplish this without opening the calculator to clean the contacts. The only problem is that you must pull back the top of the large back label to access the two middle mounting screws, and it's quite tricky to do this without damaging the label in the process. If this is the only problem and the switch can be made to work properly, I wouldn't bother with it. The only time I open a classic calculator is if some of the key contacts require cleaning or to effect some other repair.

Here you go

*Message #3 Posted by **geoff quickfall** on 27 Feb 2010, 1:22 p.m.,*
in response to message #1 by aj04062

Unfortunately no non invasive way.

try this link:

HP 45 restoration

Michael is correct, the only way in is to remove the big label. Check out the link and scroll down also as I describe the way to remove the label and then flatten it to restore it to pristine shape.

Cheers, Geoff

Edited: 27 Feb 2010, 1:30 p.m.

Re: Here you go

*Message #4 Posted by **Nigel J Dowrick** on 27 Feb 2010, 3:24 p.m.,*
in response to message #3 by geoff quickfall

I'd like to add that I've followed Geoff's instructions for disassembling an HP-45 with great success. My repairs involved the power switch, keyboard cleaning, and resoldering a couple of broken tracks. The

calculator came apart beautifully and is back together once again, as good as new. Smoothing out the label and re-applying it was also successful.

I really enjoyed doing this - thanks, Geoff!

Nigel

Programmable ?

*Message #1 Posted by **Gilles Collas** on 27 Feb 2010, 6:52 a.m.*

Hi!

The following sequence of keys should be able to demonstrate the ability of a HP 41C to be programmed. It is the case on my 41 CVs, but not on the 41C, I would like to know what is going wrong here.

Keys ----> Display

ON+CLX ---> MEMORY LOST

PRGM ----> 00 REG 46

GTO .. ----> 00 REG 46

LBL alpha AAA alpha ----> 01 ASHF

SIN ---> ROM

R/S ---> ROM

PRGM --> 0.0000

PRGM ----> 01 ASHF

SST ----> PRIVATE

BST ----> PRIVATE

GTO .. ----> 00 REG 12

LBL alpha BBB alpha ----> 01 ASHF

COS ---> ROM

R/S ---> ROM

PRGM --> 0.0000

PRGM ----> 01 ASHF

SST ----> PRIVATE

BST ----> PRIVATE

GTO .. ----> 00 REG 12

And so on, I can't enter any program....

Any comments, gents (or ladies) ?

gilles

> My guess is that something is wrong with the built in ROM, try a service module and see what it says.

Sorry, but can you tell me what a service module is and how to operate?

Re: Programmable ?

*Message #4 Posted by **Håkan Thörngren** on 28 Feb 2010, 4:19 a.m.,*
in response to message #3 by Gilles Collas

The service module was not officially sold, but it can pop up on ebay.

An alternative way is to obtain the ROM image and download it to suitable reprogrammable module (hardware), such as an MLDL or a Clonix module.

Re: Programmable ?

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 27 Feb 2010, 9:01 a.m.,*
in response to message #1 by Gilles Collas

Hi;

I second HÃ¥kanÂ´s conclusion. One of the main interests I had when using MLDL2000 to emulate the HP41 system ROMÂ´s functionality was not only to locate the faulty ROM but also to test the remaining calculator if there is none to replace it.

In this case, the only way to repair would be taking a good ROM from a donator, though.

Success!

Luiz (Brazil)

Re: Programmable ?

*Message #6 Posted by **Marcus von Cube, Germany** on 27 Feb 2010, 1:02 p.m.,*

in response to message #5 by Vieira, Luiz C. (Brazil)

I was thinking of a faulty RAM. Can you check what happens if you store various numbers in a register?

HP-41: Nirvana Setup

*Message #1 Posted by **Geir Isene** on 27 Feb 2010, 3:51 a.m.*

With excellent help from Egan Ford, I have what I would now call a Nirvana Setup™.

Laptop: IBM Thinkpad, Linux (Ubuntu 9.10 Server), Dosbox 0.73, EMU41 v2.50 with the following modules (from EMU41.INI):

```
8   4 CCD_OSX.BIN
9   4 ICEBOX1H.bin
10  4 xio1a.bin
11  4 EXILplus.bin
12  4 Paname_L.bin
13  4 Paname_U.bin
14  4 m2k_rom.bin

HP-41CX (halfnut) with 2*XM module, NoV-64 and open port 4 for various modules and open port 3 for HP-IL or a self-built port-a-lite. The NoV-64 has the following setup (XROM# in parenthesis):

```
ROM:
   Bank1 (Regular):
      ICEBOX (16)
      CCD OS/X (20)
      (empty - cater for 8K modules)
      (empty - cater for 8K modules)
   Bank2 (HP-IL):
      Ext IO (23)
      XIL+ (27)
      (empty - cater for 8K modules)
      (empty - cater for 8K modules)
RAM:
   Bank0 (Time):
      (Hepax ram)
      (Hepax ram)
      (Hepax ram)
      (Hepax ram)
   Bank1 (Math):
      (Hepax ram)
      (Hepax ram)
      SandMath 6 L (2 or 8)
      SandMath 6 U (3 or 7)
   Bank2 (Astro/Phys):
      (Hepax ram)
      Astro I (31)
      Data Acq L (21)
      Data Acq U (31)
   Bank3 (MCODE):
      (Hepax ram)
      ICEBOX (4) - for further development on the 41
      David Assembler (2)
      Labels Rom (6)

Usual plugin roms for E/F
   Advantage (22,24)
   Paname (5,9)
   Navigation (14)
   Financial (4)
   Math/Stat (1,2)
   Games (10)
```

All RAM banks have block of HEPAX RAM to accommodate for full HP-41 Ram save/restore to have different

environments for each bank setup (one for math, one for Mcode development etc.) - programs in ram, key assignments, different flag setups etc. This is easily done with the ICEBOX functions SAVEN and GETN. The most used banks are accessed via the functions N100, N101 etc. assigned directly to keys.

And then the excellent PIL-Box to connect my 41 to the laptop. Works like a charm. Just wanted to share this.

Me = happy geek :-)

Edited: 27 Feb 2010, 4:00 a.m.

To quote an HP GURU; "ME WANT".

What a wonderful system, and what a fantastic update to the 41C system.

Cheers, Geoff

82059B/D

*Message #1 Posted by **Egan Ford** on 26 Feb 2010, 6:14 p.m.*

What is the difference between the B and D?

Thanks.

Re: 82059B/D

*Message #2 Posted by **Raymond Del Tondo** on 26 Feb 2010, 6:38 p.m.,*
in response to message #1 by Egan Ford

Should be a different localisation.

HTH

Raymond

Re: 82059B/D

*Message #3 Posted by **Eric Smith** on 27 Feb 2010, 4:45 p.m.,*
in response to message #2 by Raymond Del Tondo

No, the base (numeric) part number is different when the plug and/or voltage rating is different. The letter is a product revision. The 82059A wasn't suitable for later calculators. They added a slot in the plug and a keying piece in the socket to prevent the 82059A from being plugged into later calculators.

I'm not sure about the difference between the B and D; it's possible that it is just a manufacturing change with no significance to end users. Check the manual for a specific calculator to see which model is recommended; later revisions should work fine. In other words, if the manual calls for an 82059B, and 82059D will be fine, but the reverse may not be true.

Re: 82059B/D

*Message #4 Posted by **Allen** on 26 Feb 2010, 6:44 p.m.,*
in response to message #1 by Egan Ford

Electrically they seem identical. As far as markings go, the D-model has "Class 2 Transformer" in addition to all the language that appears on the B-Model. This suggests they were designed to meet a slightly different u.l. rating 891Z for the D model and 191J for the b model.

Re: 82059B/D

*Message #5 Posted by **Egan Ford** on 26 Feb 2010, 9:33 p.m.,*
in response to message #4 by Allen

Thanks. So, are they interchangeable?

Re: 82059B/D

*Message #6 Posted by **Allen** on 27 Feb 2010, 10:37 p.m.,*
in response to message #5 by Egan Ford

I think so, the manuals are not very heavy on what AC plugs are interchangeable.

Re: 82059B/D

*Message #7 Posted by **Egan Ford** on 28 Feb 2010, 2:10 p.m.,*
in response to message #6 by Allen

So I have noticed. Of all the devices I have only the 9114B and 41CX battery pack manuals specify what recharger to use (A, B, or C based on location). None mention D. The rest just refer to the AC adapter.

BTW I've only ever used a 'D' with my 9114Bs.

Thanks.

After my two fauxpas; re the HP41C below, here is the book

*Message #1 Posted by **Geoff Quickfall** on 26 Feb 2010, 5:06 p.m.*

so far.

I should never type without reference material. To clarify ;-) the HP41C card reader does indeed have fewer nylon balls then the HP 65, 67, and topcats, if you deem zero balls fewer! Also the cam is eccentric.

In any case these two facts were correctly stated in the 'book', if only I had referenced my chapter 8!!!

Still some chapters left to do, including the HP19C or 10 chapter. I still have to aquire some examples for restoration photos of these two as I have all the others required. In fact if anyone out there has a defunct 19C that requires repair I will do it for free (if possible) just to have an example for the book. Let me know if you have a donor that I can repair for documentation and then ship back to you!

Now to the posting, here are some shots of the book as it appears now.

Chapter One

About Restorations

To restore or repair? That is the question! With apologies to William Shakespeare, but I am sure he would agree if he had an HP-65! This is a restoration guide as it encompasses restoring, which includes of course, repairs. The difference between restoring and repairing is best portrayed by the following examples:

- The HP-41C series of calculators suffer from weak bottom shell screw washers, one fix would be to get metal washers and longer screws which protrude out the bottom shell. It works, it is repaired but it is not restored. A different fix would be to create the new washers and replace the broken ones permanently and invisibly.

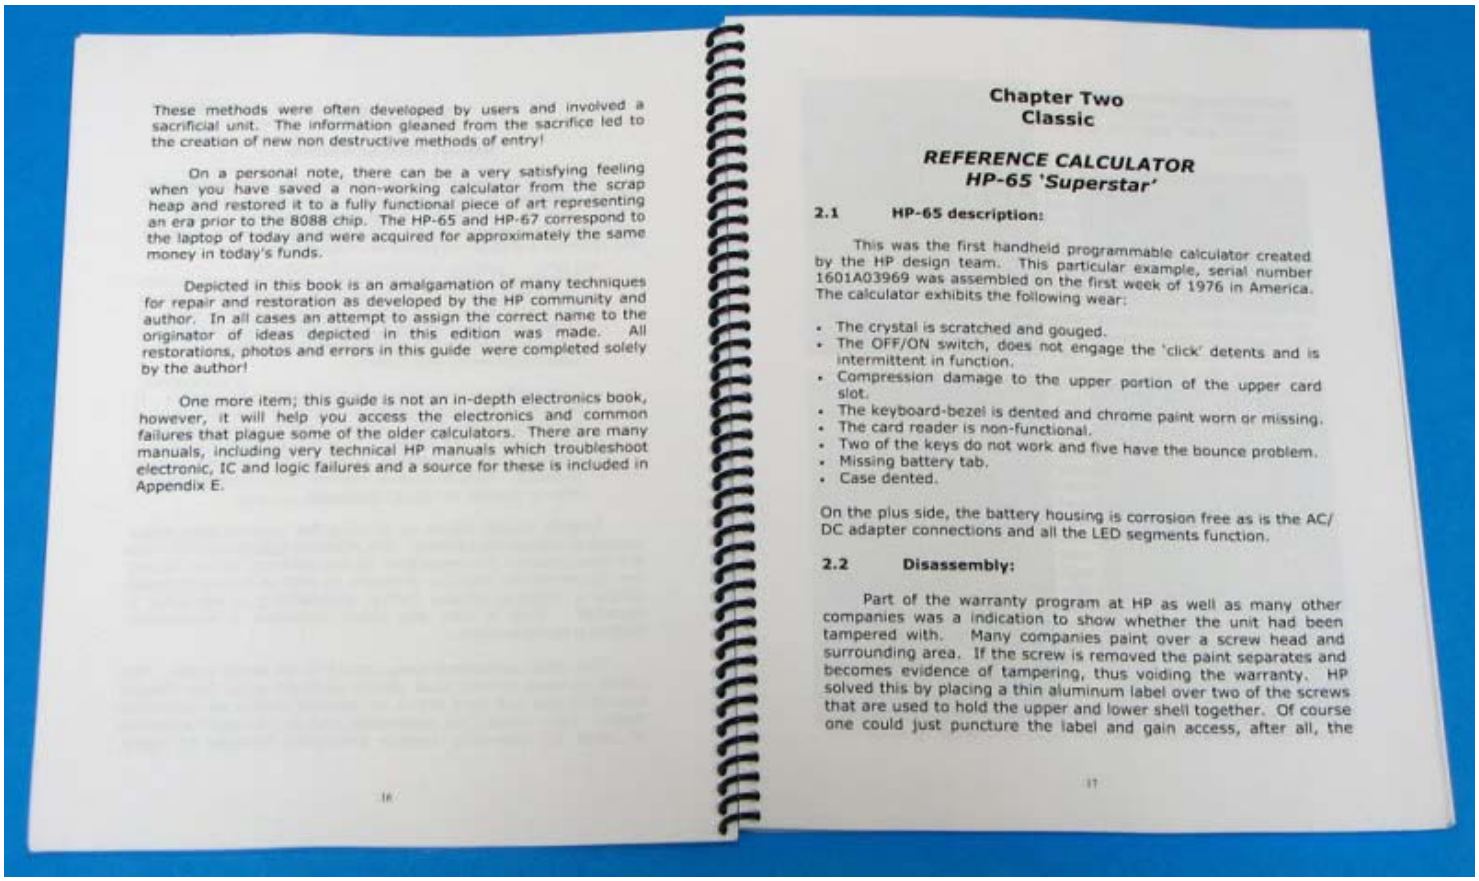
- Card readers experience degraded dampening couples. It is made of the same rubber as the drive roller and subject to similar disintegration. One method of repair is to apply super glue to the couple. This hardens the rubber and removes the dampening qualities the original rubber provided. There is another method, but you would have to refer to chapter two for that answer!

Another debate relates to cleaning the external shell of the calculator without disassembly. The following question arises; does this help preserve the calculator? On the contrary, foreign objects can be introduced into the keyboard as well as corrosive liquids during a cleaning process further exasperating a calculator in disrepair. That is why this guide advocates a disassembly approach to restorations..

The older calculators were meant to be taken apart. The newer versions contain heat staked *keyboard pcas*, and definite lack of screws and were not to be repaired outside an authorized dealer. Later models are problematic and do not lend themselves to repair or restoration without innovative methods for entry.

15

Page 16 refering to the HP 65 restoration:



These methods were often developed by users and involved a sacrificial unit. The information gleaned from the sacrifice led to the creation of new non destructive methods of entry!

On a personal note, there can be a very satisfying feeling when you have saved a non-working calculator from the scrap heap and restored it to a fully functional piece of art representing an era prior to the 8088 chip. The HP-65 and HP-67 correspond to the laptop of today and were acquired for approximately the same money in today's funds.

Depicted in this book is an amalgamation of many techniques for repair and restoration as developed by the HP community and author. In all cases an attempt to assign the correct name to the originator of ideas depicted in this edition was made. All restorations, photos and errors in this guide were completed solely by the author!

One more item; this guide is not an in-depth electronics book, however, it will help you access the electronics and common failures that plague some of the older calculators. There are many manuals, including very technical HP manuals which troubleshoot electronic, IC and logic failures and a source for these is included in Appendix E.

16

Chapter Two
Classic

REFERENCE CALCULATOR
HP-65 'Superstar'

2.1 HP-65 description:

This was the first handheld programmable calculator created by the HP design team. This particular example, serial number 1601A03969 was assembled on the first week of 1976 in America. The calculator exhibits the following wear:

- The crystal is scratched and gouged.
- The OFF/ON switch, does not engage the 'click' detents and is intermittent in function.
- Compression damage to the upper portion of the upper card slot.
- The keyboard-bezel is dented and chrome paint worn or missing.
- The card reader is non-functional.
- Two of the keys do not work and five have the bounce problem.
- Missing battery tab.
- Case dented.

On the plus side, the battery housing is corrosion free as is the AC/DC adapter connections and all the LED segments function.

2.2 Disassembly:

Part of the warranty program at HP as well as many other companies was a indication to show whether the unit had been tampered with. Many companies paint over a screw head and surrounding area. If the screw is removed the paint separates and becomes evidence of tampering, thus voiding the warranty. HP solved this by placing a thin aluminum label over two of the screws that are used to hold the upper and lower shell together. Of course one could just puncture the label and gain access, after all, the

17

Again the HP65 (Classic chapter) and some card reader tips:

keyboard pca and the *card reader pca*.

If corrosion is present, again in the form of powder, etc, then a mild solution of vinegar may be applied and gently brushed with a soft brush then rinsed with water followed by alcohol. Allow to dry thoroughly in the drying box!

Card reader assembly:

In **figure 2.9** we see the card reader assembly is composed of the following items:

- **A** Card reader motor.
- **B** Power wires from the card reader pca to the motor.
- **C** Dampening couple.
- **D** Eccentric cam.
- **E** Worm gear.
- **F** Card reader head.
- **G** "Gummy" driver roller.
- **H** Card reader logic pca.

Figure 2.9: card reader assembly.

Turning the assembly over, the card reader assembly screws are exposed as well as the card reader switch which senses the insertion and passing of the cards. The switch also detects clipped cards from non clipped versions. Remove the screws marked by the yellow arrows in **figure 2.10**.

Figure 2.10: screw locations.

Do not remove or loosen the screws marked by the red arrows, **figure 2.10.** Do not bend or catch the double edged prongs of the switch as they are set at the factory at a precise angle. As the card passes through it pushes on the tiny white balls, which in turn push the prongs into the circuit board completing a read or write circuit.

Figure 2.11: screw location at arrow.

Turn the *card reader assembly* over and you will see the last screw to remove. It is located by the upper corner of the card reader motor indicated by the yellow arrow in **figure 2.11.**

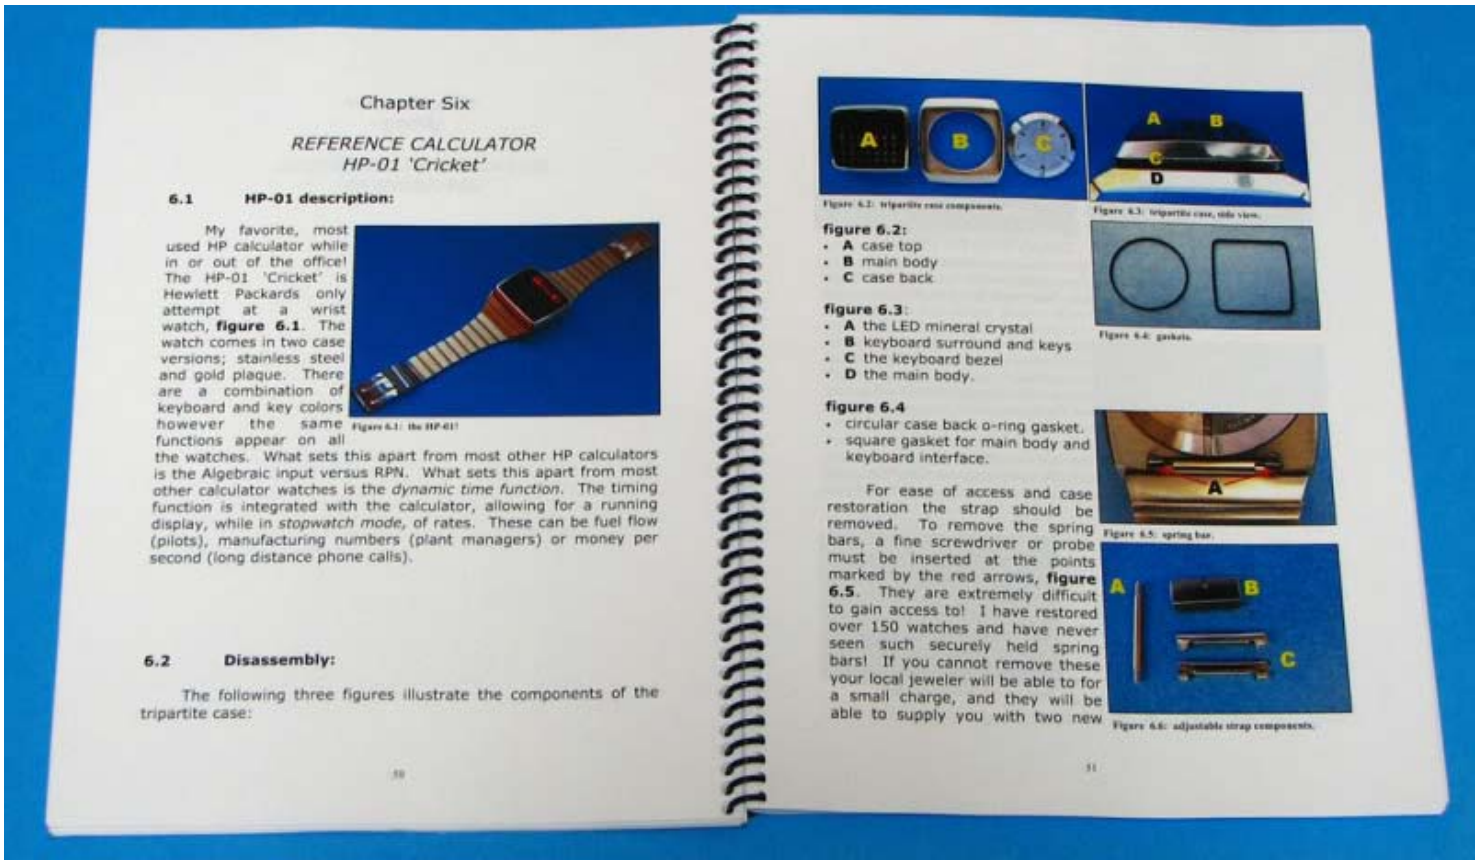
Figure 2.12: card reader components.

Place the entire assembly in a large clear bag. Remove the screw with caution and separate the two halves. The reason for placing the assembly in the bag and then removing the screw is now apparent. This way you will not lose the four small plastic balls, one small pinned white roller or the two bronze side springs that guide the card through the reader, **figure 2.12**.

Figure 2.13: card reader components.

With the *card reader assembly* apart, and referring to **figure 2.13,** gently pull the white slotted eccentric cam, **C**, out with a pair of pliers. Note that the entire *card reader assembly* frame has been removed in this example. In your restoration the card reader head would still be affixed to the frame preventing the complete removal as seen in **figure 2.13**. This was done for photographic purposes. The removal of the card reader head from the frame is not recommended as it is set at the factory.

Chapter 6, the HP 01 cricket:



Chapter Six

REFERENCE CALCULATOR
HP-01 'Cricket'

6.1 HP-01 description:

My favorite, most used HP calculator while in or out of the office! The HP-01 'Cricket' is Hewlett Packards only attempt at a wrist watch, **figure 6.1**. The watch comes in two case versions; stainless steel and gold plaque. There are a combination of keyboard and key colors however the same functions appear on all the watches. What sets this apart from most other HP calculators is the Algebraic input versus RPN. What sets this apart from most other calculator watches is the *dynamic time function*. The timing function is integrated with the calculator, allowing for a running display, while in *stopwatch mode*, of rates. These can be fuel flow (pilots), manufacturing numbers (plant managers) or money per second (long distance phone calls).

Figure 6.1: the HP-01!

6.2 Disassembly:

The following three figures illustrate the components of the tripartite case:

Figure 6.2: tripartite case components.

Figure 6.3: tripartite case, side view.

figure 6.2:
- **A** case top
- **B** main body
- **C** case back

Figure 6.4: gaskets.

figure 6.3:
- **A** the LED mineral crystal
- **B** keyboard surround and keys
- **C** the keyboard bezel
- **D** the main body.

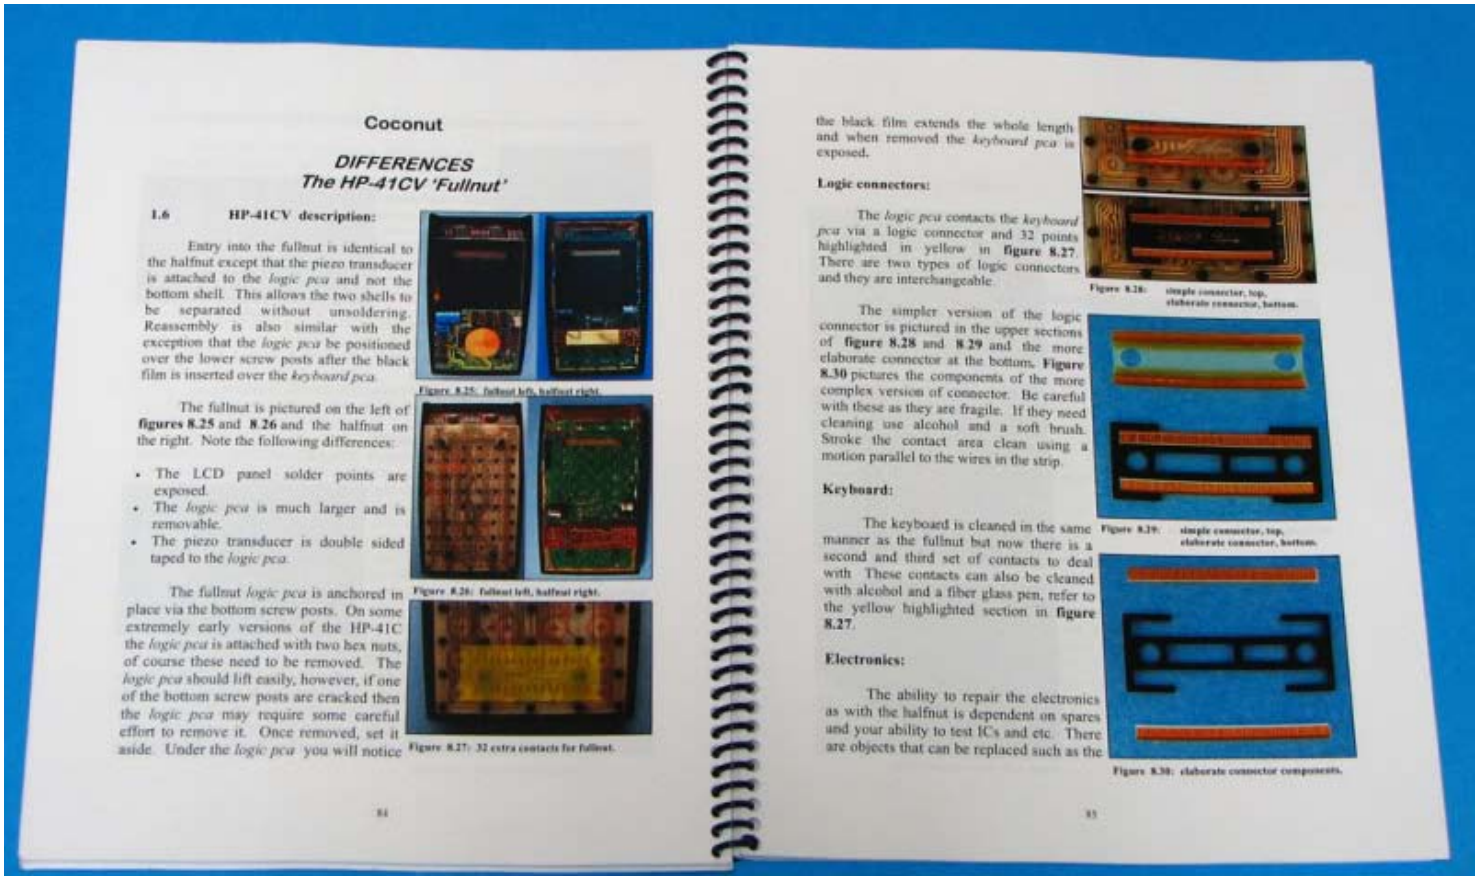
figure 6.4
- circular case back o-ring gasket.
- square gasket for main body and keyboard interface.

Figure 6.5: spring bar.

For ease of access and case restoration the strap should be removed. To remove the spring bars, a fine screwdriver or probe must be inserted at the points marked by the red arrows, **figure 6.5**. They are extremely difficult to gain access to! I have restored over 150 watches and have never seen such securely held spring bars! If you cannot remove these your local jeweler will be able to for a small charge, and they will be able to supply you with two new

Figure 6.6: adjustable strap components.

Second section of Chapter 8, the Fullnut:



Coconut

DIFFERENCES
The HP-41CV 'Fullnut'

1.6 HP-41CV description:

Entry into the fullnut is identical to the halfnut except that the piezo transducer is attached to the *logic pca* and not the bottom shell. This allows the two shells to be separated without unsoldering. Reassembly is also similar with the exception that the *logic pca* be positioned over the lower screw posts after the black film is inserted over the *keyboard pca*.

The fullnut is pictured on the left of **figures 8.25** and **8.26** and the halfnut on the right. Note the following differences:

- The LCD panel solder points are exposed.
- The *logic pca* is much larger and is removable.
- The piezo transducer is double sided taped to the *logic pca*.

The fullnut *logic pca* is anchored in place via the bottom screw posts. On some extremely early versions of the HP-41C the *logic pca* is attached with two hex nuts, of course these need to be removed. The *logic pca* should lift easily, however, if one of the bottom screw posts are cracked then the *logic pca* may require some careful effort to remove it. Once removed, set it aside. Under the *logic pca* you will notice

Figure 8.25: fullnut left, halfnut right.

Figure 8.26: fullnut left, halfnut right.

Figure 8.27: 32 extra contacts for fullnut.

the black film extends the whole length and when removed the *keyboard pca* is exposed.

Logic connectors:

The *logic pca* contacts the *keyboard pca* via a logic connector and 32 points highlighted in yellow in **figure 8.27**. There are two types of logic connectors and they are interchangeable.

Figure 8.28: simple connector, top, elaborate connector, bottom.

The simpler version of the logic connector is pictured in the upper sections of **figure 8.28** and **8.29** and the more elaborate connector at the bottom. **Figure 8.30** pictures the components of the more complex version of connector. Be careful with these as they are fragile. If they need cleaning use alcohol and a soft brush. Stroke the contact area clean using a motion parallel to the wires in the strip.

Figure 8.29: simple connector, top, elaborate connector, bottom.

Keyboard:

The keyboard is cleaned in the same manner as the fullnut but now there is a second and third set of contacts to deal with. These contacts can also be cleaned with alcohol and a fiber glass pen, refer to the yellow highlighted section in **figure 8.27**.

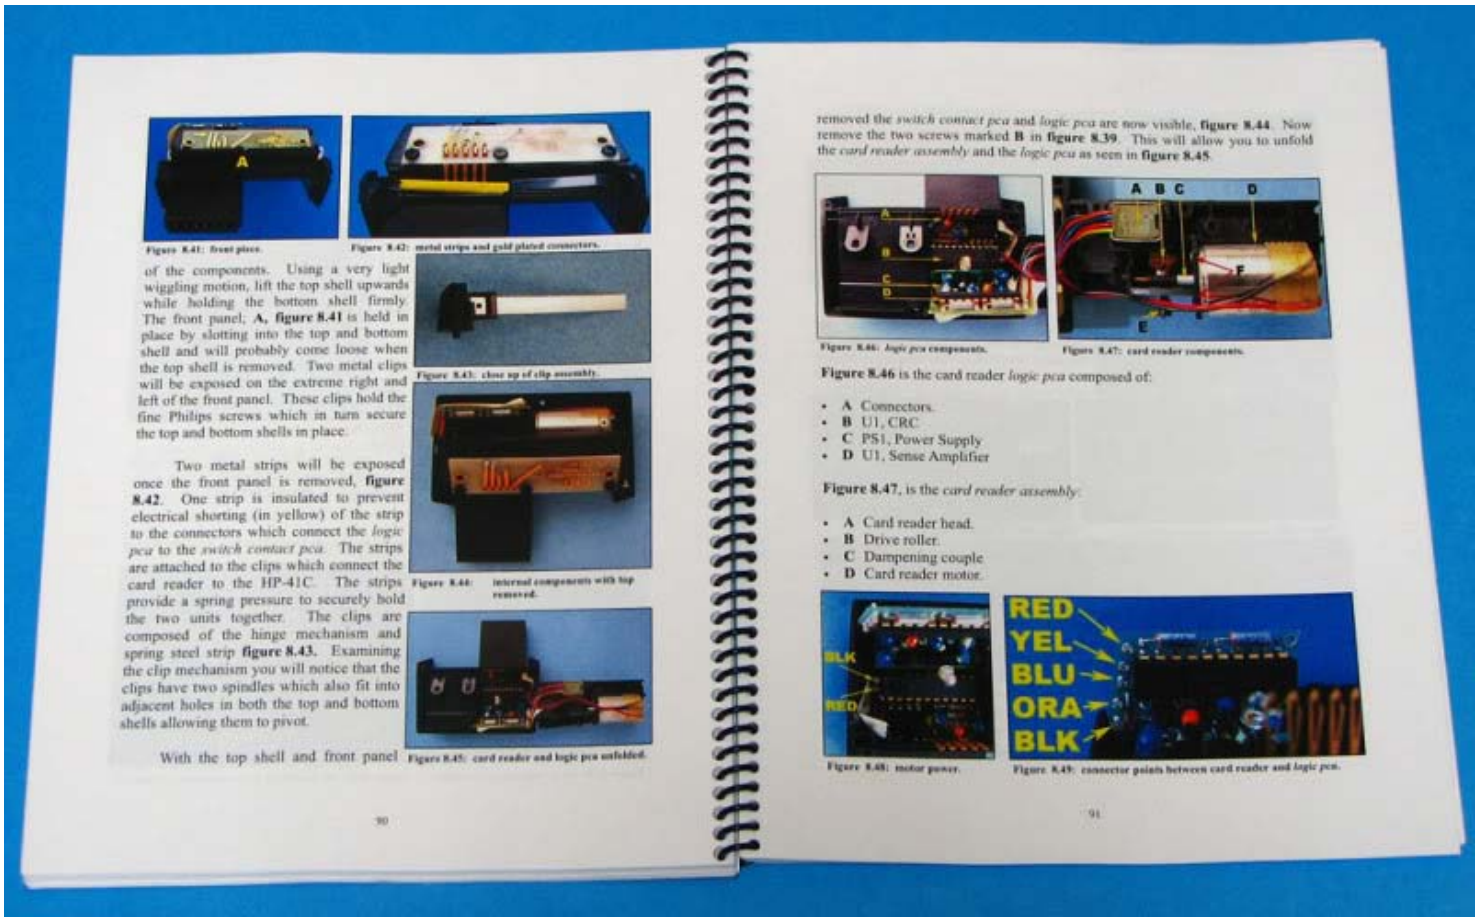
Electronics:

The ability to repair the electronics as with the halfnut is dependent on spares and your ability to test ICs and etc. There are objects that can be replaced such as the

Figure 8.30: elaborate connector components.

HP 41C the third section of Chapter 8, the card reader:

After my two fauxpas; re the HP41C below, here is the book



of the components. Using a very light wiggling motion, lift the top shell upwards while holding the bottom shell firmly. The front panel; **A, figure 8.41** is held in place by slotting into the top and bottom shell and will probably come loose when the top shell is removed. Two metal clips will be exposed on the extreme right and left of the front panel. These clips hold the fine Philips screws which in turn secure the top and bottom shells in place.

Two metal strips will be exposed once the front panel is removed, **figure 8.42**. One strip is insulated to prevent electrical shorting (in yellow) of the strip to the connectors which connect the *logic pca* to the *switch contact pca*. The strips are attached to the clips which connect the card reader to the HP-41C. The strips provide a spring pressure to securely hold the two units together. The clips are composed of the hinge mechanism and spring steel strip **figure 8.43.** Examining the clip mechanism you will notice that the clips have two spindles which also fit into adjacent holes in both the top and bottom shells allowing them to pivot.

With the top shell and front panel

removed the *switch contact pca* and *logic pca* are now visible, **figure 8.44**. Now remove the two screws marked **B** in **figure 8.39**. This will allow you to unfold the *card reader assembly* and the *logic pca* as seen in **figure 8.45**.

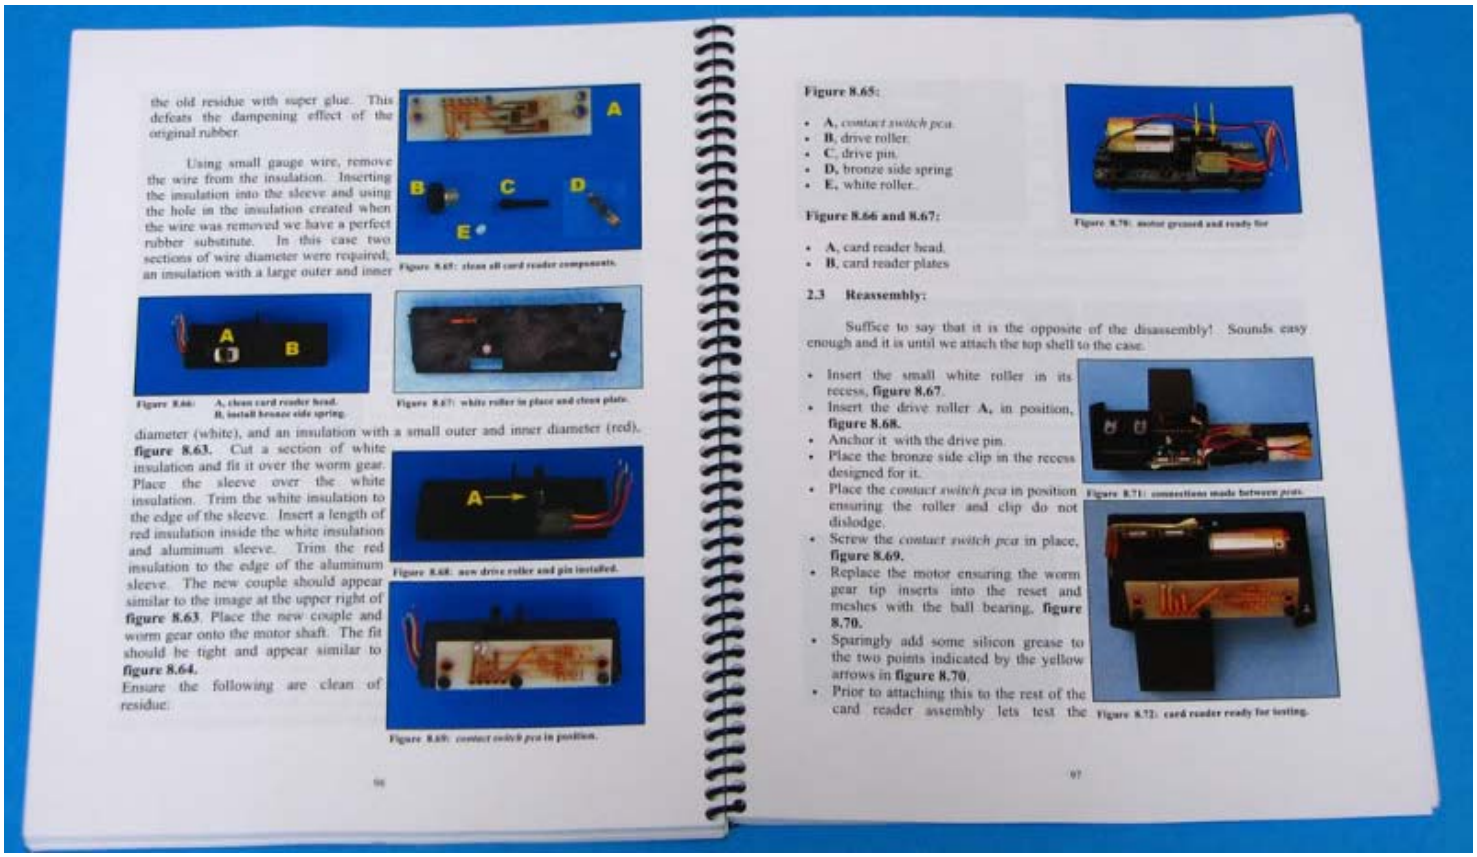
Figure 8.46 is the card reader *logic pca* composed of:

- **A** Connectors.
- **B** U1, CRC
- **C** PS1, Power Supply
- **D** U1, Sense Amplifier

Figure 8.47, is the *card reader assembly*:

- **A** Card reader head.
- **B** Drive roller.
- **C** Dampening couple
- **D** Card reader motor.

Stuff I should have refered to before typing responses on the HP41C card reader below!!



the old residue with super glue. This defeats the dampening effect of the original rubber.

Using small gauge wire, remove the wire from the insulation. Inserting the insulation into the sleeve and using the hole in the insulation created when the wire was removed we have a perfect rubber substitute. In this case two sections of wire diameter were required; an insulation with a large outer and inner diameter (white), and an insulation with a small outer and inner diameter (red), **figure 8.63**. Cut a section of white insulation and fit it over the worm gear. Place the sleeve over the white insulation. Trim the white insulation to the edge of the sleeve. Insert a length of red insulation inside the white insulation and aluminum sleeve. Trim the red insulation to the edge of the aluminum sleeve. The new couple should appear similar to the image at the upper right of **figure 8.63**. Place the new couple and worm gear onto the motor shaft. The fit should be tight and appear similar to **figure 8.64.**

Ensure the following are clean of residue:

Figure 8.65:

- **A**, *contact switch pca*.
- **B**, drive roller.
- **C**, drive pin.
- **D**, bronze side spring
- **E**, white roller.

Figure 8.66 and 8.67:

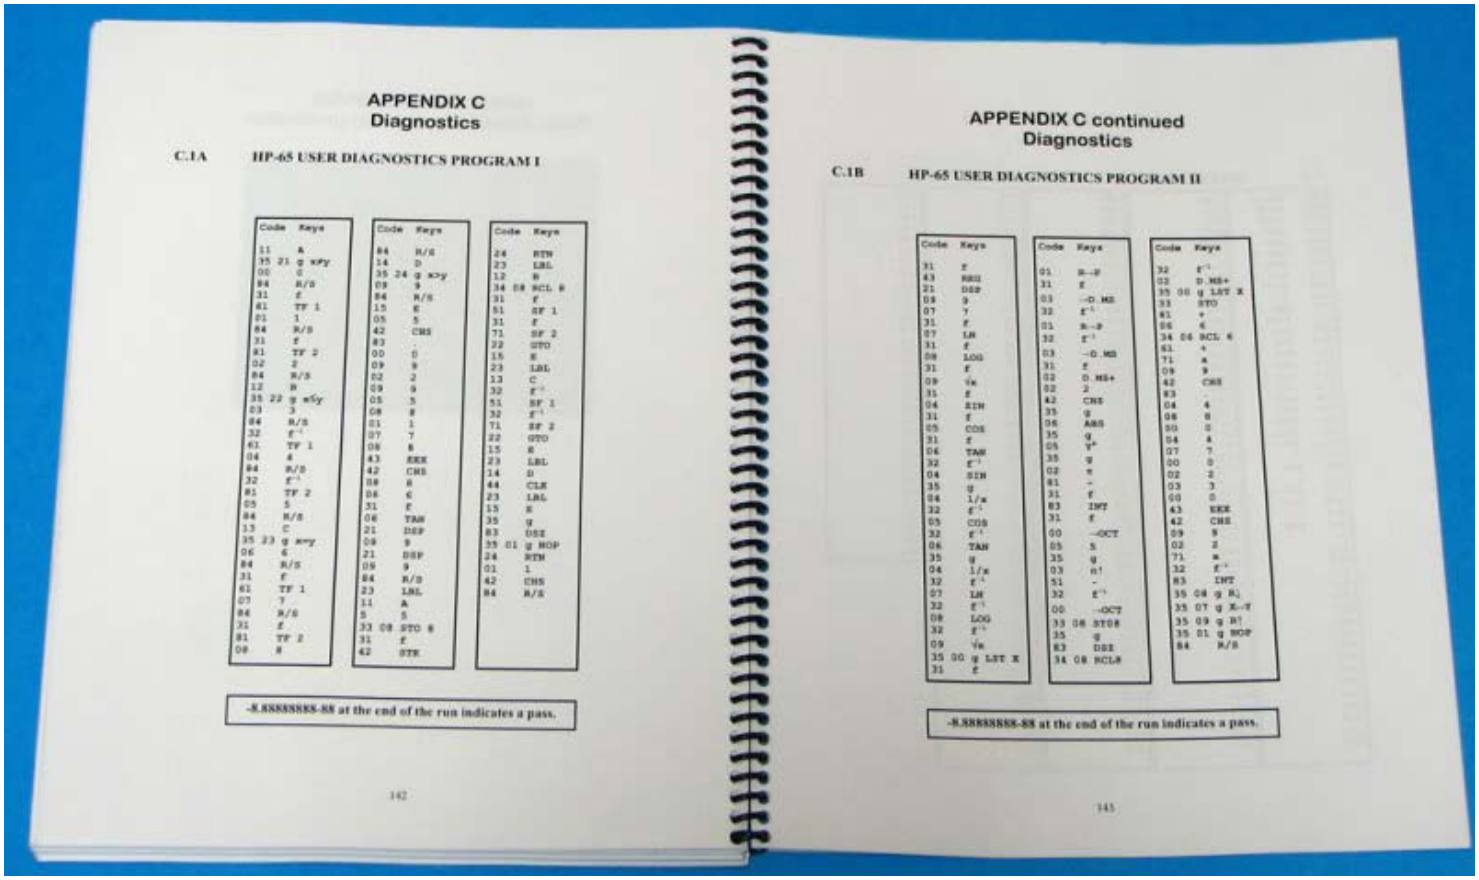
- **A**, card reader head.
- **B**, card reader plates

2.3 Reassembly:

Suffice to say that it is the opposite of the disassembly! Sounds easy enough and it is until we attach the top shell to the case.

- Insert the small white roller in its recess, **figure 8.67**.
- Insert the drive roller **A**, in position, **figure 8.68.**
- Anchor it with the drive pin.
- Place the bronze side clip in the recess designed for it.
- Place the *contact switch pca* in position ensuring the roller and clip do not dislodge.
- Screw the *contact switch pca* in place, **figure 8.69.**
- Replace the motor ensuring the worm gear tip inserts into the reset and meshes with the ball bearing, **figure 8.70.**
- Sparingly add some silicon grease to the two points indicated by the yellow arrows in **figure 8.70**.
- Prior to attaching this to the rest of the card reader assembly lets test the

One of the appendices, this one will include diagnostic programs documentation for those calculators that do not have built in diagnostics:



APPENDIX C

C.1A HP-65 USER DIAGNOSTICS PROGRAM I

-8.888888888-88 at the end of the run indicates a pass.

142

APPENDIX C continued
Diagnostics

C.1B HP-65 USER DIAGNOSTICS PROGRAM II

-8.888888888-88 at the end of the run indicates a pass.

143

I have selected a large clear Verdana font. All the figures are referenced in the text with large clear labels where required. The book as you can see is spiral bound, 11 inches by 8.5 with clear large figures with excellent resolution.

When done (HCC2010 or before) it will be aproximately 300 pages with over 400 illustrations. It will be peer reviewed also and will probably be completed with online publishing and some hard copies available through me. Have yet to pin all that down.

The current version illustrated here **(just to see how it would look and to see how the photos would print)** still requires 3 chapters to be completed and as a one off print at the local STAPLES it cost me $80 (200 pages bound in high res. colour laser). This will come down once I have established costs with a publisher.

Cheers, Geoff in rainy busy Olympic Vancouver.

in response to message #1 by Geoff Quickfall

Geoff, awesome, can't wait to get one, preferably signed by the author :-) BTW - I do have a 10c which could use some restoration if you are in need for an example there as well. The other thing should be on its way to you by tomorrow morning in either case.

Cheers

Peter

Re: After my two fauxpas; re the HP41C below, here is the book

*Message #3 Posted by **Geoff Quickfall** on 26 Feb 2010, 5:23 p.m.,*

in response to message #2 by PeterP

Peter,

thanks for the offer but I did a typo on the request, it is the printing HP10 or printing 19C that I require. In fact the 10C voyager is the subject of one section of the Voyager chapter.

If you have a printing 10 (STING Family) that would help!

I will keep an eye for the other thing in the mail.

Cheers, Geoff

Lucky you!

This looks fabulous, Geoff. Forgive me if I missed this in earlier threads, but will it include upgrades (e.g 42s memory), or just restoration and related repairs?

Re: After my two fauxpas; re the HP41C below, here is the book

*Message #6 Posted by **Geoff Quickfall** on 26 Feb 2010, 5:26 p.m.,*
in response to message #5 by Martin Pinckney

Absolutely,

I am trying to make it as comprehensive as possible. The HP 42S is the subject in the Pioneer section and includes the memory upgrade as well as mentioning the clock speed. There will also be a section on the Stretch Pioneer featuring an HP48SX.

See below about the pioneer chapter.

Cheers, Geoff

> Yes! Thanks! (Although I've never heard that term before, "stretch Pioneer", I like it. I once said the 48SX *looks like* a "Pioneer on steroids").

Re: After my two fauxpas; re the HP41C below, here is the book

*Message #8 Posted by **Geoff Quickfall** on 26 Feb 2010, 6:28 p.m.,*
in response to message #7 by Martin Pinckney

Also known as the Charlemagnes. I have been using the terminology for naming the families following "A Guide to HP Handheld Calculators and Computers" by W.A.C. Mier-Jerzejowicz.

Wlodek has been helping me with suggestions and examples to restore as well. All that will be mentioned in the book.

Of course, every one or two months and another repair comes to light. For example I had no idea about the radix jumper in the spice so of course I have to include the radix change with examples in the Spice chapter.

Other things come up such as 42S low contrast problem involving jumper switch and a different capacitor show up and have to be included. Of course this entails actually doing the upgrade and then modifying the chapter.

The problem is YOU people keep comming up with new clever ideas that have to be included!

Cheers, Geoff

*Message #10 Posted by **Thomas Radtke** on 26 Feb 2010, 5:34 p.m.,*
in response to message #1 by Geoff Quickfall

Great :-).

Small typesetting problem: Captions (first line of it) should be on the text body baseline. You did it in Word, right? ;^)

You will immediately see an improvement, when you try to adjust it, even by hand, if Word still doesn't support baseline snaps.

Re: After my two fauxpas; re the HP41C below, here is the book

*Message #11 Posted by **Geoff Quickfall** on 26 Feb 2010, 5:50 p.m.,*

in response to message #10 by Thomas Radtke

In Microsoft Publisher,

In fact these photos are slightly out of date as typos, typsetting and some other small glitches have been solved.

keep pointing them out thought, and I am sure the peer review team will not be merciful ;-)

Cheers, Geoff

*Message #12 Posted by **Thomas Radtke** on 26 Feb 2010, 5:58 p.m.,*
in response to message #11 by Geoff Quickfall

Ok, another thing: When defining a paragraph style, never allow for a page break right after the first or before the last line of a paragraph, so you never have just one line of it on a page.

You probably fixed that already.

Re: After my two fauxpas; re the HP41C below, here is the book

*Message #13 Posted by **Geoff Quickfall** on 26 Feb 2010, 6:12 p.m.,*
in response to message #12 by Thomas Radtke

Yep!

Keep going

;-)

Problem is when I move or change or resize a figure it ricochets down the chapter. Each chapter is it's own section in Publisher. this limits how much damage I can do when I change something at the beginning of the chapter.

New to this aspect. My thesis and journal articles follow a preset published set of rules. Apparently I can follow those! This ad-hoc approach has its own rewards though.

Once all the text is completed and the figures done positioned correctly I will go through the pages and clean up the stray sentences and etc...

Geoff

*Message #16 Posted by **Gerry Schultz** on 26 Feb 2010, 7:49 p.m.,*
in response to message #13 by Geoff Quickfall

Geoff:

You book looks fantastic! I'm looking forward to it as I have a couple of 41CX keyboards that need a little attention and I have two extended memory modules that I would like to merge together. I also just got an HP-55 that needs a little restoration as well as a second 71b whose battery terminals need some work.

It's great to see the section on rebuilding the 41 card reader. Do you intend to include other 41 peripherals in a second volume, perhaps later on? It could cover the 143/162 peripheral printers as well as the 161A tape drive and the 9114 A/B floppy drives. For instance, I have a 41 barcode wand in which the threaded ring the tip screws into has broken apart so the tip is hanging on by a small thread. It would be interesting to see how to fix that.

I will be purchasing a copy of your book when it's released. Thanks for doing this for all of us. We appreciate it.

Gerry

Yep!

*Message #17 Posted by **geoff quickfall** on 26 Feb 2010, 8:15 p.m.,*
in response to message #16 by Gerry Schultz

In fact I have section in the appendix for memory module combination "double x-memory". Restoring different battery packs.

The HP41 peripheral section could be a book on its own. So other than the card reader, calculators, memory upgrades, battery packs and a few other sections such as heat stake replacement/repairs, I think the peripherals will have to wait.

Take a look a Mathias site for the number of HP41 peripherals there are!!

I will be restoring a GEODAT 126 in the appendix which may help people get into other types.

Yep, THAT book would easily be 500 pages on its own!!

So far the logistics entails finding a representative of each family, some peripherals, memory upgrades and etc and then actually doing/documenting each repair.

Peripherals would be fun and I do have the following HP41 peripheral which could be included but I think the calculators will be the focus for HCC2010:

```
HPIL printer
HPIL plotter
Non HPIL printer
Infared printer
HPIL tape drive
HPIL floppy drive
LASER wand
6 card readers
```

As it is I have included and completed the following restorations and upgrades:

```
HP65 complete restoration
HP45 quartz crystal upgrade
HP55 quartz crystal replacement
```

Classic series LED block replacement as an example of unsoldering.

HP29C complete restoration
Woodstock battery modifications

HP97 complete restoration including card reader and printer

HP01 complete restoration including case, quartz crystal, trimming capacitor and possible an LED block swap

HP34C soldered complete restoration
HP spice unsoldered complete restoration

HP41CX complete restoration, with Diego Diazs battery pcb included
HP41CV complete restoration
HP41C early version complete restoration
Card reader with it's own section complete restoration
Double ex memory section

HP10C complete restoration including aluminum bezel swap
HP11C complete restoration including heat stake removal and remelting

71B early version complete restoration
71B later version complete restoration

HP18C complete restoration
HP28C complete restoration

HP42S complete restoration, memory upgrade, contrast enhancement
HP48SX complete restoration

Appendices:
battery pack reconditioning for CLASSIC/Topcat, Woodstock, Coconut

battery pack substitute for classics with bad contacts
battery pack repair for broken spice with bad ribbons

make your own drying box

make your own overlays

make your own rubber feet

Discussion on ESD protection while working on calcs

Diagnostic programmes

Glossary

references, citations and credits (including URLs with permission)

EYE CANDY photos of before and after (playboy section for calc nerds)

index

As you can see a lot of work and photography. I think peripherals not covered would indeed fit in a book on its own. Having said that, the title is HP Calculators (with some extras).

My wife is renovating the house, I am restoring my 1973 Celica from the ground up, work and the book so pretty busy here for the time being. Company just called and now off to Hong Kong tomorrow.

Work, work, work!!! Of course during my first 3 hour break I will work on the book on my laptop.

Cheers, all!

Re: After my two fauxpas; re the HP41C below, here is the book

*Message #18 Posted by **Garth Wilson** on 26 Feb 2010, 7:05 p.m.,*
in response to message #1 by Geoff Quickfall

Super! I want one when it's ready.

Since you can still edit it, a quick search-and-replace of "fullnut" replaced with "coconut" would be good. The original HP-41's were "coconuts." HP never had a "fullnut."

Re: After my two fauxpas; re the HP41C below, here is the book

*Message #19 Posted by **Geoff Quickfall** on 26 Feb 2010, 7:15 p.m.,*
in response to message #18 by Garth Wilson

Thanks Garth and actually corrected. I was using a general user term but have switched to HP terms whenever they exist in the latest version. This book was produce about 7 months ago to see how the graphics and text read and as such does contain errors. No doubt the final edition will also contain errors! I haven't submitted the final copy to the peer review group (I think it may compose of the HCC committee members, fingers crossed as they are busy people!).

Codenames such as the 'Coconut HP41C', 'Silverbird Hp41CV' and 'Honeynut HP41CX' are used in the book. The 41CX was the Honeynut and later came with a simplified electronics and was codenamed 'Halfnut' refering to the size of the PCA. In fact, according to Wlodeks book, it may have refered to the fact that the HP41 newest design was to include only two ports instead of four. The user group has developed the term 'fullnut' although it is not an HP codename to differentiate between the original versus halfnut electronics.

Cheers, Geoff

How I tackle a chapter for the book, with reference to..

*Message #20 Posted by **Geoff Quickfall** on 26 Feb 2010, 7:07 p.m.,*
in response to message #1 by Geoff Quickfall

Thomas Radkes observations on the typos and text position errors in the posting above ;-)

Firstly, choose a Reference calculator that exhibits most of the restoration points of interest and represents the majority of the family.

For example, in the Pioneer family all the calculators can be accessed the same way. Once inside the 42S lends itself to upgrading, both memory (jumper change and memory chip), clock speed (quartz crystal) and contrast (by swapping a capacitor and changing a jumper). That is, once inside to repair the standard problems, keyboard, zebra strip contact foam, keys and etc this example allows for upgrades.

Document each step by taking a raw series of photos with a macro lens, lighting and appropriate background. Pick the best photo and crop, label, align and size for correct use as a figure.

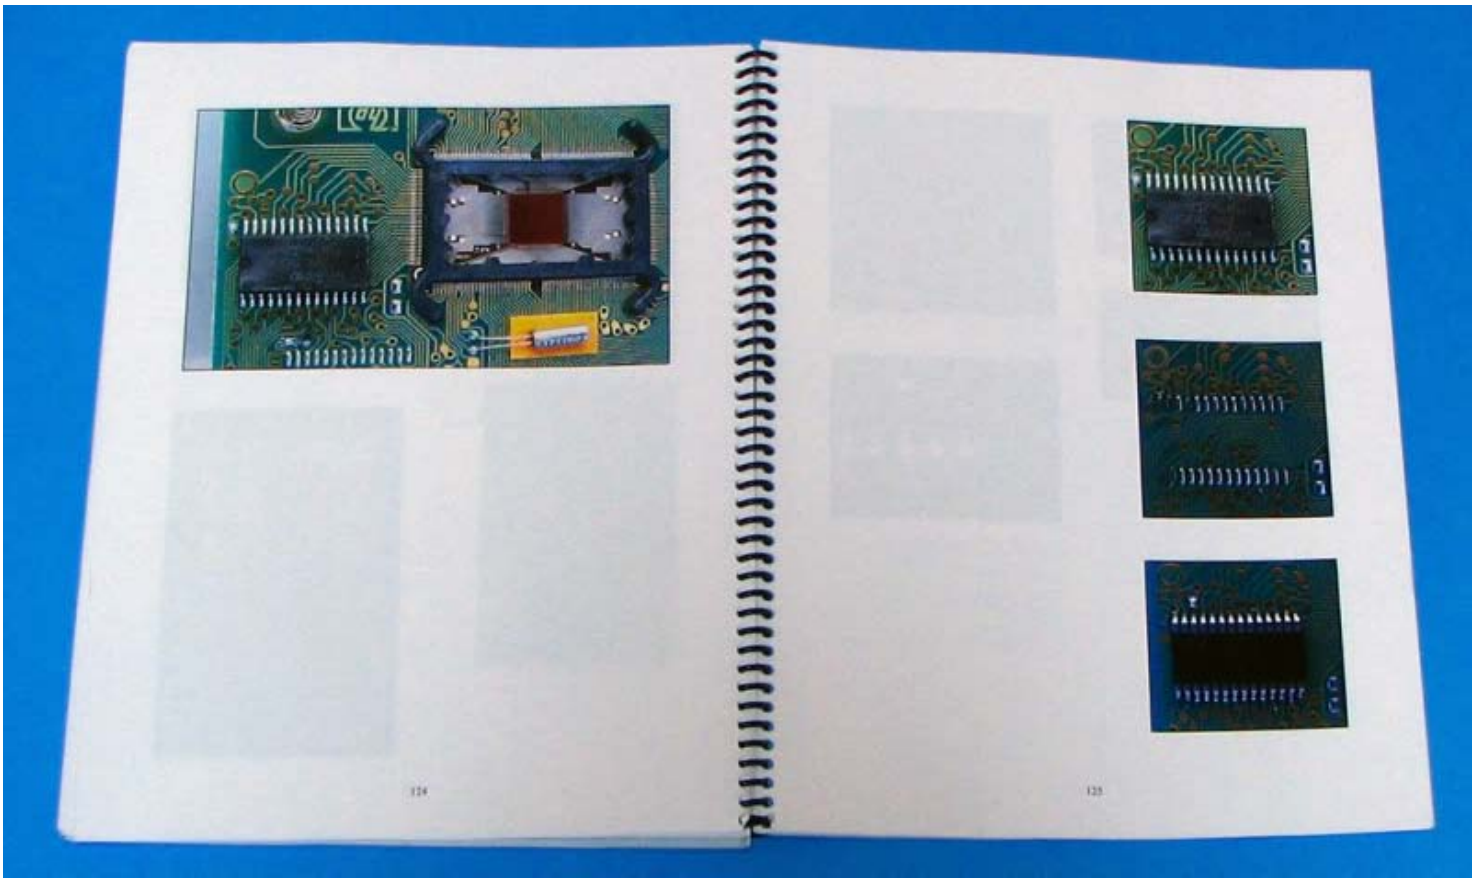
Place the figures in the appropriate order on the virtual book and then write the text around the sequence of figures.

Go back and take new pictures, insert them after cleaning them up and write more text. I try to over do the pictures as they are worth a thousand words.

Here are some shots of the Pioneer chapter with a reference calculator. Notice the reference calculator is the HP42S. The differences section of the Pioneer chapter includes the Stretch Pioneer (Charlemagne). I included the Stretch Pioneer in with the Pioneers as their construction is extremely similar.

The following pages show the figures cropped and sized but not yet labelled. The labelling will depend on the text.

After my two fauxpas; re the HP41C below, here is the book



After my two fauxpas; re the HP41C below, here is the book

This is the reference section and you can see some of the labels have been applied to the photos.

The next step is to write the text step by step referencing the figures. This of course changes the location of each figure with respect to the page number.

Once completed then correct any stray sentences and add or change some of the figures for better explanatory clarity.

Cheers, Geoff and it still raining!

I go I would like to thank everyone for their support, comments and ideas as well as emails.

On another note, I have a donor hp 19C that needs repair that I can use. Of course if anyone has an extra messed up one that they want to sell, I am always willing to purchase it.

Cheers, until next week, Geoff

A new thing to do in Hong Kong during my walks...

*Message #32 Posted by **geoff quickfall** on 1 Mar 2010, 12:29 a.m.,*
in response to message #31 by geoff quickfall

Hit the electronic stores in the back streets and look for the one with dusty boxes in the front window.

Can't photo the find here but I can describe it. It cost $20 Canadian dollars. A brand new in box (dusty) 38G still shrink wrapped complete with manual.

The box has a copyright of 1995 and the serial number of the calculator is 3539sxxxxxx.

Now to find the shop with the 23 HP42S in the back room still shrink wrapped. They might be here as this 38G is 1995 vintage. Now that would be fun to find.

Cheers, from foggy misty Hong Kong.

What a hockey game!!!! Even if the anouncers were speaking chinese, incredible hockey (Canada vs USA).

Geoff

Re: A new thing to do in Hong Kong during my walks...

*Message #33 Posted by **Martin Pinckney** on 1 Mar 2010, 10:27 a.m.,*
in response to message #32 by geoff quickfall

Even though I personally like the 38G, the market does not. A brand new old stock 38G is worth about what you paid for it.

Keep looking for the 42S cache.

in response to message #31 by geoff quickfall

I have a partially working HP 10 that I tried to restore. I cleaned the circuit boards, etc. and it still isn't working right... several numbers don't work (not the keyboard) and it won't print, etc. Let me know if you want to borrow it.

I spent a fortune on two of them, combining the best parts, so I do have a working one. Definitely the most I've ever spent on a model, but it was necessary....

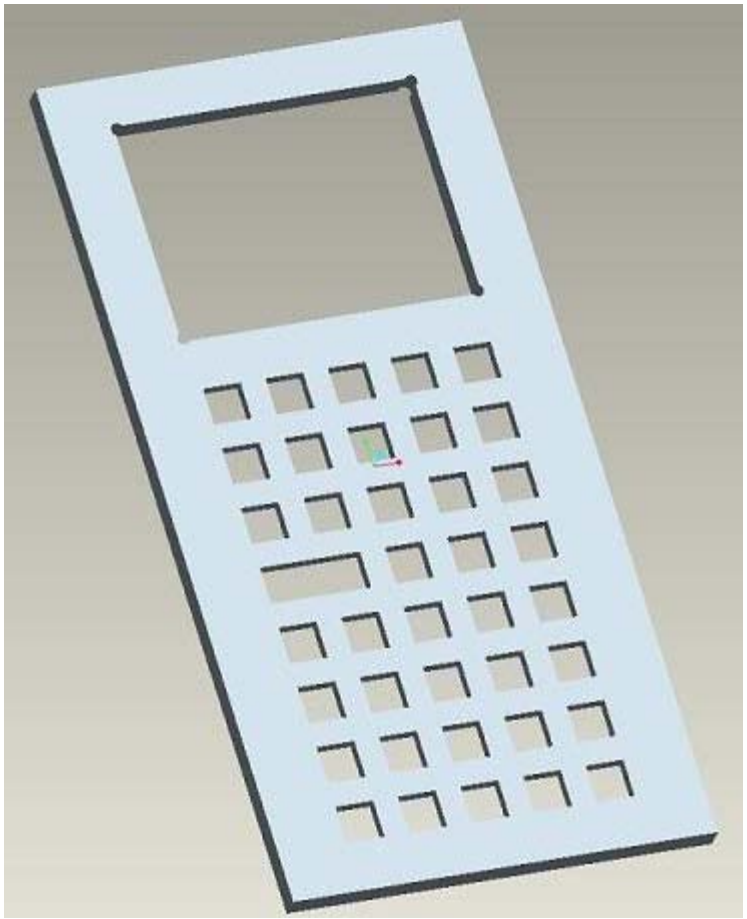
If you could....

*Message #1 Posted by **Dimitri Simitas** on 25 Feb 2010, 8:51 p.m.*

If you could layout this keyboard anyway you wished to for a RPN Graphing calculator, how would you?



Its 39 buttons in all.

Dimitri

Re: If you could....

*Message #2 Posted by **DaveJ** on 25 Feb 2010, 9:02 p.m.,*
in response to message #1 by Dimitri Simitas

I'd add another row of buttons for a start.

And possibly have the upper half buttons a smaller pitch to add another column as well.

Dave.

Re: If you could....

*Message #3 Posted by **db (martinez, ca.)** on 25 Feb 2010, 10:12 p.m.,*
in response to message #1 by Dimitri Simitas

Interesting question.
To get the kind of answers you want, we need to know
1)how many shift keys can there be
2)can functions be picked out by alpha, like the 41 series
3) if there will be a user keyboard option or if what we get is written in stone.

Two things i can say right now are that i really want you not to forget p<>r & r<>p and that putting programming functions on the primary (only?) keyboard of an alfa equiped calc (like the 41) is a waste of valuable prime real estate. Ex:All those X=whatever functions on the 41's shifted +,-,x,/ functions would have been better used as time arithmatic. We do more math than programming.

Re: If you could....

*Message #4 Posted by **Dimitri Simitas** on 25 Feb 2010, 10:27 p.m.,*
in response to message #3 by db (martinez, ca.)

Good point so my design considerations so far:

1) HP-41 compatible
a) Programs written in HP-41 format in a text document will run from SD card.
b) Programs will be accessible and used exactly like a HP-41.
c) Talk software interface for the HP-IL system and HP-41 printer.
2) No on board programming for now.
3) Built in HP Pac's in system for ease of use.
4) One shifted function per key.
5) Will have menu functions as to not need too many special keys.
6) RS-232 output and input available, built in command set with minimal additional added code in user programs (no advance programming needed) for robotic control etc
7) G-code interpreter with output connected to RS-232 for CNC hobby applications. G-code files on the SD card.
8) Graphing functions and equation solving routines built in.

Dimitri

Re: If you could....

*Message #5 Posted by **Monte Dalrymple** on 26 Feb 2010, 12:02 a.m.,*
in response to message #4 by Dimitri Simitas

Similar in some ways to my version... except I have no use for graphics. I haven't yet come up with a way to bring out the rs232 or SD interfaces, but that also isn't a priority at the moment.

Take a look at the appendicies in this document:
http://www.systemyde.com/pdf/newt.pdf

And here's a photo of the circuit board:

http://www.systemyde.com/hp41/photo_2.jpg

Re: If you could....

*Message #6 Posted by **Dimitri Simitas** on 26 Feb 2010, 8:16 a.m.,*
in response to message #5 by Monte Dalrymple

Looks interesting I will admit I'll be cheating alittle, internally it will be more like a old computer from the 80s then a single chip calculator.

I will be using the Atmel AVR series with 4 diffrent MCU in the system, the processor (the calculator & SD card + any built in flash), the graphic output chip, the HP-IL/RS-232/FDD chip, and one to interface the keyboard on their own chips connected with a TWI/I2C network internally.

Dimitri

Interestingly, in your layout the SIN, COS and TAN keys are in the same column while on almost all past or existing calculators they are on the same line ... the Sinclair Scientific being one of the exceptions.

in response to message #7 by Eddie W. Shore

Long but good, I was honestly going to skip Stat S+/S- (picture the Greek letter) mainly because I honestly don't know it, but will be on the later prototypes. Yah I am in college taking calculus courses but was never taught statistics.

You think basic high level programming would be good?

Really its going to be a interpreter on board, so I have been worried about it due to the available on board RAM already dealing with 30 floating point numbers (X, Y, Z, T, U and memory number Registers 1 to 25) plus doing math with them. Although it wouldn't be too bad since it will process actions in small steps anyways.

Dimitri

Programming is a favorite feature of mine since knowing even the basics of it - you can the calculator do almost anything. (and I really don't consider myself of having more than working knowledge)

in response to message #7 by Eddie W. Shore

Nice to see an independent layout. Some questions and comments:

- What's ROOT? Does SHIFT 9 calculate the x-th root of y, since SHIFT 8 seems to compute y^x?
- There's a mix of horizontal and vertical arrangements of related functions, e.g. SQRT and x^2 versus LN and e^x. For sake of consistency, either one would be prefered. Most people read from left to right d;-)
- The arrangement of arithmetic operators goes far back in history. Personally, I'd prefer the sequence + - x / going up with increasing complexity. Your mileage varies obviously d:-)
- I doubt trigs are used more frequently than a SQRT or LN / e^x. Apparently, you had to put SIN, COS, and TAN on primary since you feature a single SHIFT only.
- Nice and pretty complete menu system.
- Very nice programming set of functions. Assume you will display these structures using the big screen.
- 100.000 lines of code definitively require I/O. Thanks for taking this into account.
- Why is "=" on the keyboard? You don't propose an algebraic mode, do you?

Thanks for sharing your thoughts.

Walter

Re: If you could....

*Message #14 Posted by **Eddie W. Shore** on 28 Feb 2010, 3:59 p.m.,*
in response to message #13 by Walter B

Walter,

ROOT: The universal root function (y^(1/x)). I don't know how to type the radical sign in text.

Regarding the arrangement: sounds good going from right to left. I take it you are not a fan of the trig functions going downward. :) My first draft of fitting the functions onto the keyboard.

Arrangement of arithmetic operators: I was going for retro (HP 41C).

I would like to see LN and LOG as primary functions, though I was working with keyboard of 39 keys. I could rearrange the keys so that scientific functions are primary and menus are shifted.

Thank you about the menu system, I appreciate the compliment, Walter.

Currently I would have the I/O set in the APP menu (APP - F5).

Maybe the command set would be: SSD (to SD), RSD (from SD), SCPU (send to computer), RCPU (receive from computer), SCREEN (send screen shot) (Am I missing anything?)

No, this calculator does not have the algebriac mode. The "=" is for the Solver. Currently, I have the EQN work like the equation feature of the HP35s.

This keyboard is definately worth several revisions.

:)

HP-Emulator 64 bit program versions

*Message #1 Posted by **Christoph Giesselink** on 24 Feb 2010, 6:17 p.m.*

Hello, there was a thread from Mike about running Emu42 on Win7-64bit some weeks ago. Three years ago I began making my emulators x64 compatible. Last week Richard Garner tried a x64 bit version of Emu42 on his Win7 64bit PC. A new session emulating a HP-42S worked, but when loading a state file created with the Win32 version of Emu42 the x64 version freezed. I detected the reason for this behavior, which is a design problem of the original Emu48 emulator and was handed down to Emu28 and Emu42.

So you shouldn't create x64 versions base on the current published sources of Emu28, Emu42 and Emu48 by yourself.

Meanwhile I fixed the design problem in my beta versions of Emu28 v1.20, Emu42 v1.13 and Emu48 v1.50. This allowed me to make a benchmark test with Emu48. Several years ago I wrote UserRPL program splitting a real number into it's prime factors. Which a large prime number the program runs about 3 minutes depending on the PC hardware.

On my test computer with Win7-64bit Enterprise the x64 version of Emu48 was about 8% slower then the x86 version. Because Emu42 x64 takes no advantage from the larger address area, it makes IMHO no sense to publish the x64 versions.

Regards

Christoph

Christoph, just out of curiosity: Alignment problems? Data size differences (long, int?)

Re: HP-Emulator 64 bit program versions

*Message #3 Posted by **Christoph Giesselink** on 25 Feb 2010, 6:32 p.m.,*
in response to message #2 by Marcus von Cube, Germany

> Quote:
>
> Christoph, just out of curiosity: Alignment problems? Data size differences (long, int?)

A structure hold the internal state of the CPU, but also contain three memory pointers to the port memory. These pointer grow up from 4 bytes in the x86 to 8 bytes in the x64 version. It's also possible that these pointers moved too, to adjust them to an aligned address.

This "CPU structure" is part of the calculator state file, so the state file format differed from the x86 to the x64 version and caused the described problems.

Christoph

Re: HP-Emulator 64 bit program versions

*Message #4 Posted by **Paul Dale** on 25 Feb 2010, 4:20 p.m.,*
in response to message #1 by Christoph Giesselink

No surprise that the extra address space isn't of any use.

The wider registers could be useful -- the saturn is 64 bits internally (at least sort of). Making use of these will likely require extra effort and the benefits are unlikely to be huge. More so given the weirdness of the saturn's register fields etc.

- Pauli

Celestial Navigation softwarer for HP

*Message #1 Posted by **juan demin** on 24 Feb 2010, 4:58 p.m.*

Hi, I recently met with the "Sparcom Celestial Navigation Pac" for the HP 48. Does anybody know if there is a new version and/or new software to use with the HP 50G? Thanks

Re: Celestial Navigation softwarer for HP

*Message #2 Posted by **Martin Pinckney** on 24 Feb 2010, 9:50 p.m.,*
in response to message #1 by juan demin

Try this.

Re: Celestial Navigation softwarer for HP

*Message #3 Posted by **juan demin** on 25 Feb 2010, 9:09 a.m.,*
in response to message #2 by Martin Pinckney

Thanks Martin, this is the Sparcom's program developed for the HP 48 many years ago... it says that only the library is compatible with the HP 50.... Even though GPS slowed down or stopped celestial nav developments, there is a software called "StarPilot" that runs in the Texas Instruments calculators and is also sold together and preinstalled in the TI-89... I wonder where to find the equivalent for HP calcs….

Re: Celestial Navigation softwarer for HP

*Message #4 Posted by **Richard Reed** on 25 Feb 2010, 5:40 p.m.,*
in response to message #3 by juan demin

I'm also interested in the subject, but just Googled for a while and there doesn't seem to be anything new for 50g. The best seems to be the Sparcom upload to hpcalc.org mentioned above, but as you know that's 1993 (even though it was created for re-upload in 09). There's even another one there called Almanac by Thomas Metcalfe, but that's older (not the anonymous one).

BTW, don't get confused between Star-Pilot (StarPilotLLC.com) that you mentioned which is for several TI's, and "Star Pilot", an astronomy suite for PalmOS on a different web site.

HP11c - Swapping Internals Between Two

*Message #1 Posted by **DavidShenk** on 24 Feb 2010, 11:23 a.m.*

I have a working 11c that looks horrible on the outside. If I bought a nonworking 11c that looked good, how easy would it be to switch the "insides" so that I would have a nice looking, functional calculator built from the two?

Thanks, Dave

Re: HP11c - Swapping Internals Between Two

*Message #2 Posted by **geoff quickfall** on 24 Feb 2010, 1:26 p.m.,*
in response to message #1 by DavidShenk

Swapping internals with the heat staked keyboards is do-able. It requires that the keyboard heat stakes are decapitated and then somehow refixed to the new bezel by:

```
remelting
gluing
small screws
```

Check out this posting and see the restoration of the aluminum bezel on a 15C in place and the swapping of a dented aluminum bezel with a donor on a 10C:

bezel restorations on a 15C and 10C

Re: HP11c - Swapping Internals Between Two

*Message #3 Posted by **DavidShenk** on 24 Feb 2010, 2:05 p.m.,*
in response to message #2 by geoff quickfall

Hi Geoff,

Thanks for the info. I may attempt that. My bad 11c looks like it was stored in a corrosive environment at some point and the keyboard background is full of areas of peeling and flaking paint.

I am also interested in your book when it comes out.

Dave

Edited: 24 Feb 2010, 2:11 p.m.

Re: HP11c - Swapping Internals Between Two

*Message #4 Posted by **John Robinson** on 25 Feb 2010, 7:15 p.m.,*
in response to message #2 by geoff quickfall

I've done heatstake removal and restoration on several 41c units, by using a small flat screw driver to lift the top off the heat stake, such that you remove the surround only, i.e. it's donut shaped, and not shearing

off the whole top. Then to restore, I use a hot glue gun, squirt some glue, lick my finger, then press with my finger. The licking is to speed up the glue cooling, and prevent my finger getting burnt :-)

Cheers, John

Re: HP11c - Swapping Internals Between Two

*Message #5 Posted by **geoff quickfall** on 25 Feb 2010, 7:34 p.m.,*
in response to message #4 by John Robinson

Johns suggestion is excellent.

I have removed the heads of the heat stakes as he describes and then dry assembled the board back and it held remarkably well without and glue application. As of yet I have not glued the system back together but will.

Additionally, because the back plate is screwed together at four points a thin sheet of dense foam cut to cover the circuit board and placed between the board and the calculator back might also relieve the stress on the decapitated heat stakes.

Cheers, Geoff

Re: HP11c - Swapping Internals Between Two

*Message #6 Posted by **Walter B** on 26 Feb 2010, 1:53 a.m.,*
in response to message #5 by geoff quickfall

Hi Geoff,

any news from your book? ETD?

Walter

I used a different method

*Message #7 Posted by **Frank Boehm (Germany)** on 26 Feb 2010, 4:55 a.m.,*
in response to message #4 by John Robinson

I carefully removed the molten (donut-shaped) part and after fixing the calc used a soldering iron with a very pointy tip - it looked like new :)

*Message #1 Posted by **Alberto Fenini** on 24 Feb 2010, 9:23 a.m.*

ciao a tutti !

does anyone know what the original box for the HP70 was ? I have been looking on the site, but while is fairly easy to find pictures for the other classic models, I still haven't found a hint on what the original package for the 70 was.

Thanks for help, take care Alberto

Re: HP70 original box

*Message #2 Posted by **Matthias Wehrli** on 24 Feb 2010, 11:18 a.m.,*
in response to message #1 by Alberto Fenini

Hi

When I'm correct there was the same box as for the HP-35/45 - a white paperbox with only a print " HP 70A" on the side. I was told that these boxes where used for sending the calculators.

Re: HP70 original box

*Message #3 Posted by **Michael de Estrada** on 24 Feb 2010, 12:10 p.m.,*
in response to message #2 by Matthias Wehrli

I don't know what a HP-70 box would look like, but I do know that the HP-35 and HP-45 boxes were sized to match the hard plastic travel cases for those calculators. The boxes were heavy duty cardboard with a closure flap. The HP-70 did not have a travel case, so I would have expected the box to look more like those for later models like the Woodstocks, which had inserts for the charger and calculator soft case. The boxes for the HP-35 and HP-45 were meant to be discarded after shipment, since they had the hard cases for storage of the calculator and accessories. The box for the HP-70 would be retained, and I would expect it to be fancier.

One of my HP 70 calculators was obtained with its original box.

It is a plain cardboard box similar to those used for the HP35. But it also contains an insert with 2 cut outs; one for the calculator (in it's vinyl case) and the other for the A/C charger.

AFAIK, first generation HP calculators were not sold retail... everything was direct through HP's own sales channels. The Woodstock line was the first to appear in stores.

Card Reader motor - doesn't spin smoothly

*Message #1 Posted by **John Robinson** on 23 Feb 2010, 8:14 p.m.*

Hi all, I have two motors from HP41 card readers that don't spin smoothly, they're kinda "jerky" if that makes sense. Yet other card reader motors I have spin smoothly.

Does anyone know the cause of the jerkiness ?, and a cure ?? Or perhaps it's nto really a problem ? I am yet to test that.

Thanks John

Re: Card Reader motor - doesn't spin smoothly

*Message #2 Posted by **Michael Meyer** on 23 Feb 2010, 8:19 p.m.,*
in response to message #1 by John Robinson

Have they been rebuilt since they were new? All calculator card readers have rubber rollers that break down over time. Please check the "articles" section of the forum for more information and links to articles about repairs.

Re: Card Reader motor - doesn't spin smoothly

*Message #3 Posted by **Michael de Estrada** on 23 Feb 2010, 8:51 p.m.,*
in response to message #1 by John Robinson

Are you talking about the actual motor by itself, or the action of the card reader when pulling a card through? If the card reader action is jerky and/or noisy, it could be a slipping coupling (AKA clutch) between the motor shaft and worm gear. These couplings deteriorate and break down over time and need to be repaired.

Re: Card Reader motor - doesn't spin smoothly

*Message #4 Posted by **John Robinson** on 23 Feb 2010, 11:15 p.m.,*
in response to message #3 by Michael de Estrada

Thanks for the responses. I am referring to the motor itself, well the worm gear anyway, so I guess that means motor and clutch. I have already done the roller repair on this one, but it still throws up "Malfunction". I am pretty confident the roller repair is ok, as the other four card readers I did the same repair to all work fine :-)

Any clues ? Perhaps it's the clutch ??

Thanks John

Re: Card Reader motor - doesn't spin smoothly

*Message #5 Posted by **Michael de Estrada** on 23 Feb 2010, 11:58 p.m.,*
in response to message #4 by John Robinson

Yes, the coupling (clutch) is the probable culprit. I have repaired the coupling using some wire insulation. Geoff Quickfall may have this written up by now (it's his idea), but if not I can can pm you with more details.

Re: Card Reader motor - doesn't spin smoothly

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 24 Feb 2010, 12:11 a.m.,*
in response to message #4 by John Robinson

Hi;

I had some issues with the first card reader I repaired because after having the 'gummy wheel' replaced by two o-rings, the motor was somehow noisy and [MALFUNCTION] was shown in almost all card reading sessions. I inspected the gear

which gummy wheel I replaced and I noticed that the external portion of the axle (thicker than the rest of it) had a cut (for a screw driver?) and a small guiding mark. I removed the card reader from the calculator and inserted a card in the card slot till it touched the o-rings. Then I adjusted the axle by gently turning it (either clockwise or counterclockwise) with a screw driver till I felt the lower pressure possible over the card while gently trying to insert it. Then I tested it again, and the card passed faster with almost no extra noise, I could only hear the actual motor noise. Since then, I adjust the axles accordingly.

Hope this helps.

Luiz (Brazil)

Re: Card Reader motor - doesn't spin smoothly

*Message #7 Posted by **geoff quickfall** on 24 Feb 2010, 3:09 a.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Kind of busy right now but not enough to abandon the forum!

The dampening couple (motor shaft to worm gear):

Now we know why it is called a 'dampening couple' by HP! The couple to the worm gear is composed of an aluminum tube with the same type of rubber that the pinch roller has. Thus it suffers the same degradation over time that the roller does (bacterial infection has been suggested.

Hello Luiz, was the card reader you refer to from a 65, 67 or topcat (see below with reference to the HP41C series)?

The pinch roller axle (eccentric cam}:

In the HP 67, topcats and 65 the pinch roller axle shaft is assymetric allowing the pinch roller to raise or lower relative to the card reader horizontal axis. Luiz is correct that this may be a source of the noise or slipping of the card in the reader. The height of the pinch roller affects the card reading speed; slipping of the card inside the reader; again in my examples. It also raises, or put another way, changes the way the card presses against the card reader head. This to affects the ability of the card reader to read the card.

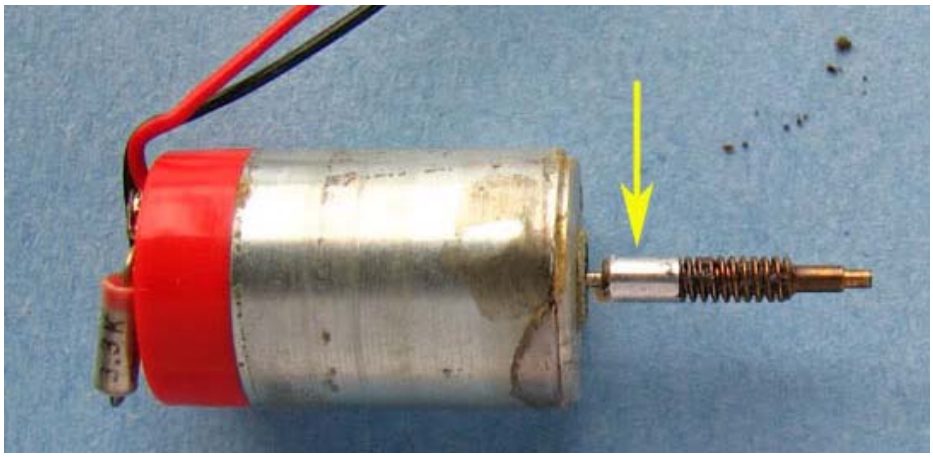
In the HP 41; at least the 15 I have restored to date, the axle is not assymetric (edtited: this is not correct as the axle is eccentric, Feb 25, 2010).

The motor itself may have very worn or corroded brushes causing the jerkiness. Have you powered the motors by a 1.5 volt battery outside of the housing, or at least while not attached to the card reader worm gear. Is it jerky.

Here is a sample of a fix Michael was refering to for the worm gear couple taken from my presentation at HCC2009 and will be found in my book. It refers to an HP 41C assembly. Notice the shaft of the pinch roller axle is not assymetric. Also, the HP41C series of card readers and the 65 (I have not compared them to a 67 or topcats) does not have interchangeable motor shaft/worm gears. They are of a different length and will not fit when the motor is placed back in the card reader assembly:

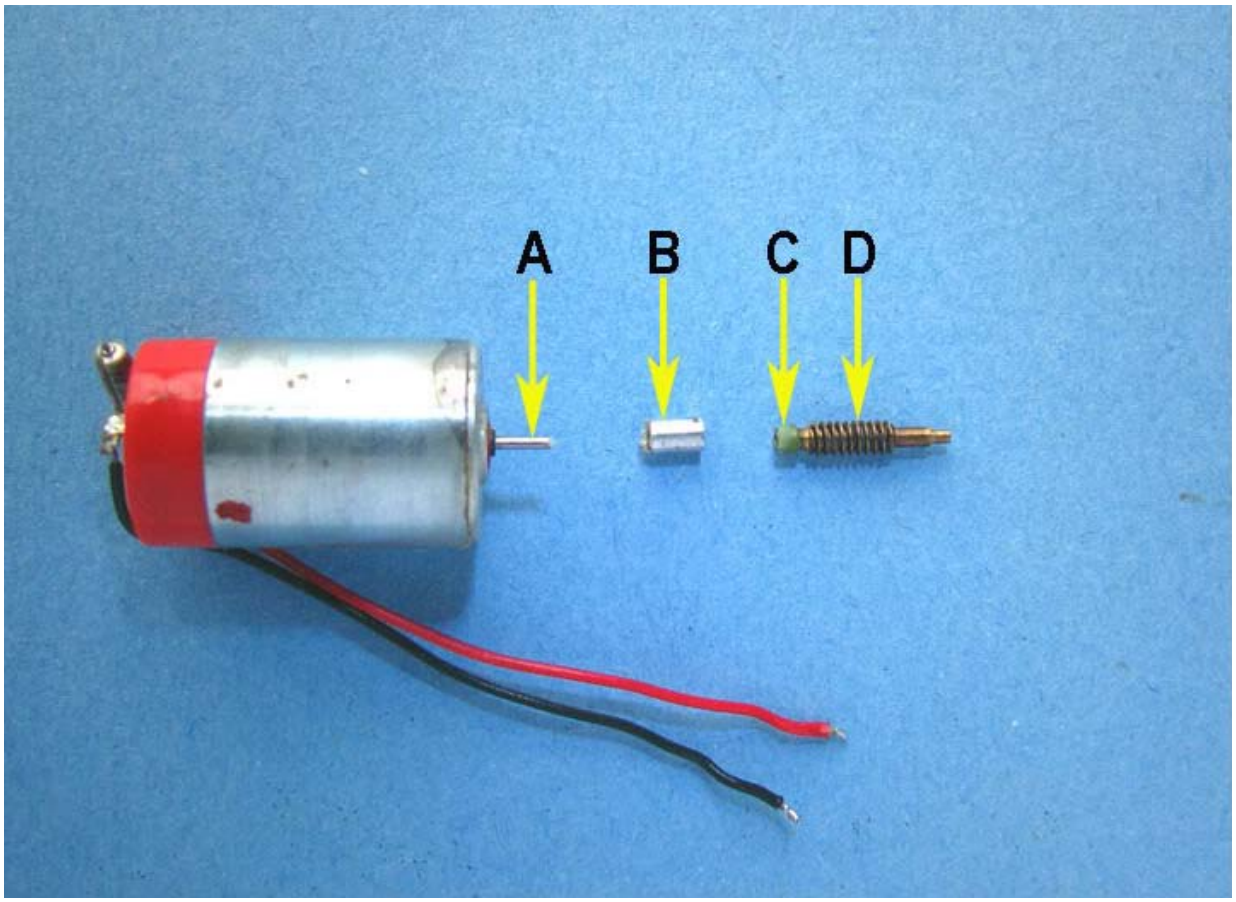
```
HP-65   drive roller axle:      8.32mm
HP-41C  drive roller axle:      8.23mm
HP-65   worm gear length:       14.43mm
HP-41C  worm gear length:       14.36mm
```

Original assembly removed with NOISY dampening couple:

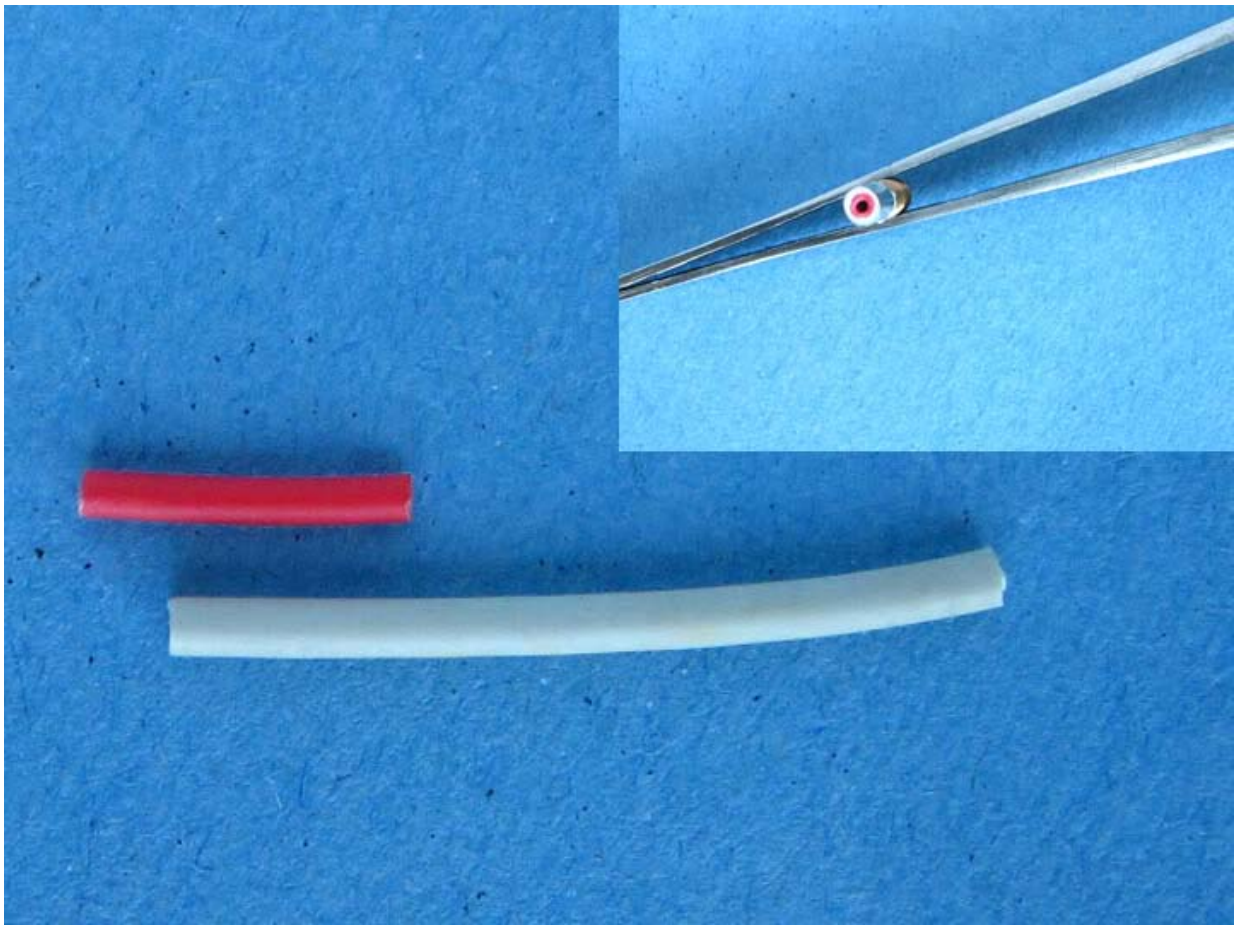


Couple components:

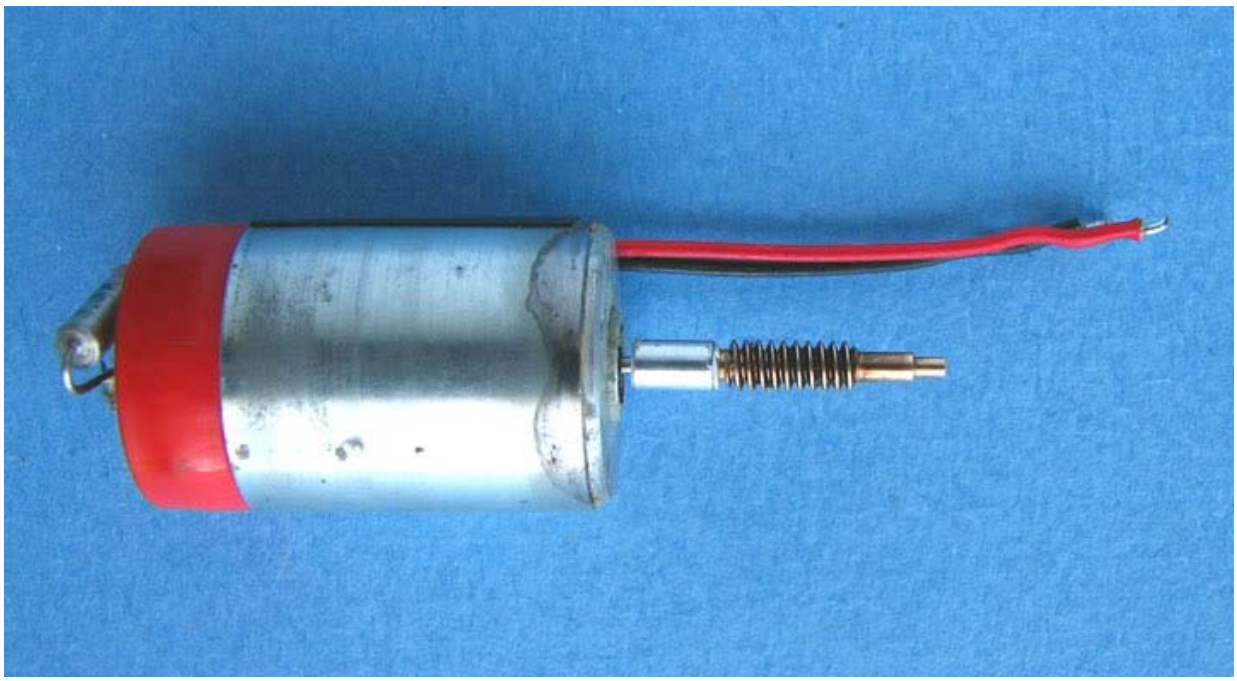
```
a. motor shaft
b. aluminum tube
c. part of the urethane rubber couple material
d. worm gear
```



Using wire insulation, two diameters, one inserted inside the other to accommodate the larger worm gear attachment diameter and the narrow motor shaft attachment.



Completed and assembled:



Interesting photos of the pinch roller from an HP41C assembly showing the bacterial infection in full force (H1N1 for the HP 41C):

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 24 Feb 2010, 7:58 a.m.,*
in response to message #7 by geoff quickfall

Hi, Geoff;

the first card reader I repaired was an E-version 82104A, the one that shows [CARD READER] header in CAT 2 instead of [CARD RDR vn], where vn is the version identifier. Now that you mention about the axle shaft (missing term in my previous post... Sorry!) of the 82106A not being asymmetrical, I feel confused... In fact, after repairing the first one I had the issues I mentioned, rotating the shaft allowed to correct it. Since then I repaired about four or five card readers and I used the same o-ring in all of them. Because of this, I rotated their axle shafts to match the same adjustment I found in the first one and they worked fine. Based on what you wrote, I see no explanation for the

correct operation of the first card reader since the axle shafts are symmetrical, and in the other ones I could have left the axle shaft in any position that it would not affect final operation.

Why did the guys left the alignment dot and the screw driver slot in the axle shaft if they have no purpose? Go figure...

Thanks for the very impressive photos and for your comprehensive descriptions. Very clarifying and totally useful. The solution of using wire insulator to fix the worm gear and the photos showing it are priceless! Thank you and Michael for that!

Best regards.

Luiz (Brazil)

Hi,

maybe you have special HP-41 card readers, but _every_ HP 82104A card reader I repaired so far (and it were many) does have an asymmetric pinch roller axle,
and adjusting this axle with a screw driver does have a very direct impact on the pressure between the gummy wheel and the small white counter-wheel.

The influence may not be obvious if you use O-rings as wheel replacements, but O-rings are no good solution at all, since even in the least-pressure position of the axle, they apply too much unbalanced pressure towards the counter-wheel,
and thus the mechanical force to the complete transport mechanism is higher than needed.
This in turn can lead to effects as stated by the OP, to more battery drain than needed, and to more wear than needed.

A much better solution than O-rings are silicon tubes, but suitable ones are hard to get.

HTH

Regards

Raymond

Re: Card Reader motor - doesn't spin smoothly, more thoughts.

*Message #11 Posted by **geoff quickfall** on 24 Feb 2010, 12:56 p.m.,*
in response to message #10 by Raymond Del Tondo

Luiz and Raymond, good to get corrections and thanks.

Darn,

Just printed out a response and lost the whole thing trying to save it.

The topcat manual refers to eccentric cams. I do not have an HP 41C repair manual so I cannot find the reference. My observation of the 41C reader is that my versions were not eccentric. It maybe that the eccentricity is much less visually then the classics. Also I have been fortunate with the 41C repairs as they have not needed to be rotated to allow the reader to work, maybe just luck.

The 65, 67 and topcats have needed rotating as per the manual.

I think I will have to tear down another, (sitting on the desk) and look again.

Thanks for the info, could it be that some later versions were not eccentric?

Cheers, Geoff

P.S. take a close look at the black cam in the photo. You can see the right hand tip that fits into the back end of the asssmebly is in the centre of the shaft, or visually, extremely close to centre. The slotted end also has the shaft protruding from the centre of its axis also. Compared to the classics this shaft section and tip are not visually eccentric. I will pull one out and check the measurments. It may be that the eccentricity of the cam is MUCH less but still required.

Also, does anyone have an HP41C card reader repair manual? The DVD set does not include one.

cheers, Geoff

The 82104A card reader service manual is available on TOS, there is a section dedicated to "Motor installation and adjustment" on page 3-5.

Card reader does have eccentric cam! OOPS

*Message #13 Posted by **geoff quickfall** on 25 Feb 2010, 11:46 a.m.,*
in response to message #12 by Didier Lachieze

Well, thanks everyone including Ignazio and Didier for pointing me to the correct reference in the manual.

There is an eccentric cam in the HP41C which it seemed everyone new about but me ;-).

I have modified the chapter to include the same procedures for aligning the cam to create the minimum current draw for the motor. This would be the correct position for the cam.

I have a white 67 cam and a black 41C cam in front of me now and the (in my defence ;-) level of eccentricity of the 41C cam is much lower then the 67 version.

Cheers, Geoff

Re: Card Reader motor - doesn't spin smoothly

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 24 Feb 2010, 3:07 p.m.,*
in response to message #10 by Raymond Del Tondo

Hi, Raymond;

I tried a silicon tube once and after cutting a piece of it and assembling it, I noticed that its thickness was not regular, leaving a visible 'lump' that pressed the card a bit more while pulling it and causing many reading problems. After that I restored all card readers I could with o-rings, and the three ones I own work fine with them. Is it possible that I am using o-rings with such dimensions they fit correctly in place? I never noticed any problems with my card readers after using o-rings.

Cheers.

Luiz (Brazil)

Re: Card Reader motor - doesn't spin smoothly

*Message #15 Posted by **John Robinson** on 24 Feb 2010, 6:37 p.m.,*
in response to message #14 by Vieira, Luiz C. (Brazil)

Hi All,

Thanks for all your responses, and thanks for the great pics Geoff.

To answer your question Geoff, it's jerky when not in the card reader. I pulled the motor out, but left the power wires connected to the card reader circuit board, then inserted a card in the slot to turn the motor on, so the jerkiness is present with the motor unloaded. If it is the brushes, are these motor serviceable at all ?, they look like a sealed unit to me.

Also, I too believe that pinch roller axle shaft is assymetric, and I too don't like the O-ring repair, I prefer silicon hosing. I "true" it up by putting it on the gear, then mounting that on a shaft then spin it up on a dremel, and essential lathe it with an emery stick (those things that women used to smooth their finger nails). Silicon hosing is much more pliable than the hard rubber of the O-rings. Using silicon, I am sure there is different pressure applied to the nylon pinch roller as the roller axle is rotated.

Out of my spare motors, I only have one that is not jerky, so I'll give that a shot.

Cheers, John

great answers

*Message #16 Posted by **geoff quickfall** on 24 Feb 2010, 7:29 p.m.,*
in response to message #15 by John Robinson

Obviously I will have to check some of 41C card readers!!!

Not a problem as I have two here that need new pinch rollers and both dated 1979 and 1980. I have yet to open the motor as all mine have worked smoothly. Other than cleaning the internal stator and brushes I don't know what or wear parts could be secured. I keep an eye out for absolutely recked machines for spares. And then swap the parts. That is how I found that the HP65 motor and worm gear will not work in an HP 41 C card reader due to the lenght of the assemblies.

Also, if you buy 'mil specification' fuel line hose, you will get the hole in the centre. I supplied everyone at the HCC2009 with 6 inches of this tubing and the hole is perfectly centred. No need for latheing.

I will dig up the roll (50 feet) and check the brand name. It seems this stuff is used by professional gas model airplane makers and military drones.

Cheers, Geoff

in response to message #16 by geoff quickfall

Hi Geoff,

That's interesting about the 65/41 card reader motor and roller gear not being interchangeable. Do you know if there is an level of "interoperability", i.e. between 65/67/97 and 41 ?. I am led to believe that the roller gears alone are interchangeable. Any more thoughts on that ? And what about the motors alone, i.e. without clutch and worm gear ??

Cheers, John

Re: great answers

*Message #18 Posted by **geoff quickfall** on 25 Feb 2010, 7:30 p.m.,*
in response to message #17 by John Robinson

The motor and shaft as well as the worm gear must be a specific length. I found this out the hard way by restoring a couple on a complete spare HP65 system. I then swapped out a bad 41C motor and worm gear for the HP65 system. I started to tighten the screws and noticed that the system was to long and forcing the screws would result in a jammed worm gear or the pressing out of the ball bearing at the tip of the worm gear.

Thats when I did the above measurements. Things in common appear to be the pinch roller, the nylon balls although the HP 41C has fewer and the nylon roller. The eccentric cams appear to be interchangeable but the HP41C eccentricity is much less then the classics (see above postings ;-)

I have to take apart the HP 67 to do a comparison and I am about to complete the topcat chapter at which time I will do more measurements. My inclination is that the Classic including the TopCat series will be the same but they will all differ from the HP 41C series. Of course there may be production differences between countries as HP shifted their manufacturing base.

Cheers, Geoff

Re: great answers

*Message #19 Posted by **Michael de Estrada** on 26 Feb 2010, 10:37 a.m.,*
in response to message #18 by geoff quickfall

> Quote:
>
> ...the nylon balls although the HP 41C has fewer...

Actually, the 82104A (HP-41C) card reader does not have any nylon balls, because it does not rely on them for the operation of the card sensor switches. Although I am not sure about this, I think it uses a reflected-light sensor. There is an LED inside the reader that I believe is used for this purpose. Perhaps Randy or someone else can correct/clarify/elaborate on this.

Re: great answers

*Message #20 Posted by **Randy** on 26 Feb 2010, 11:00 a.m.,*
in response to message #19 by Michael de Estrada

The I/R LED receiver and transmitter are the clipped card detector.

The motor run and card edge detector are done with the the two leaf spring switches.

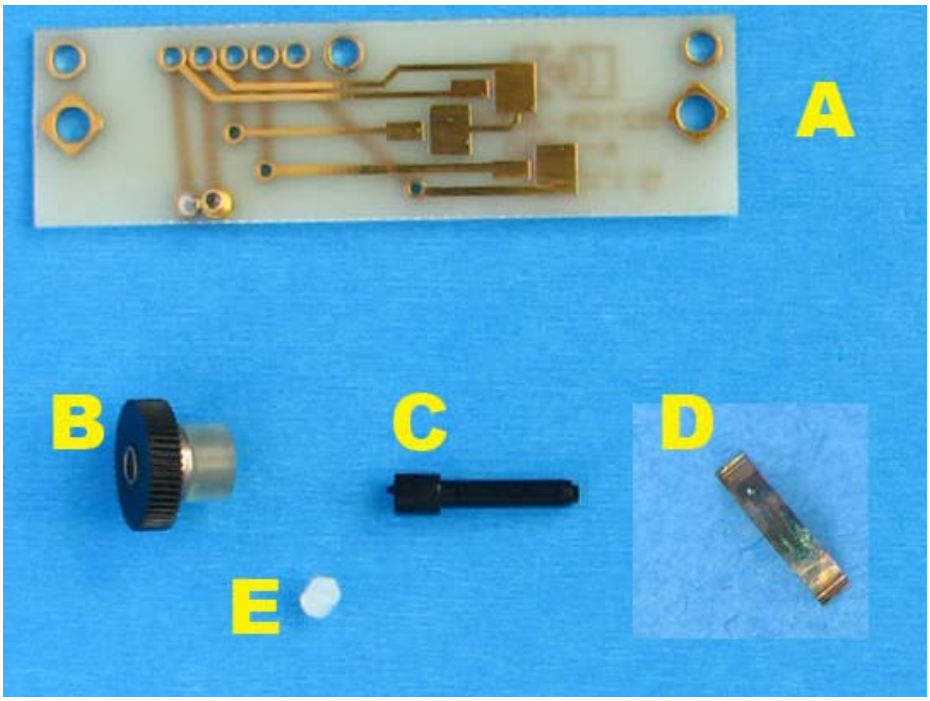
ARRRGGHHHH, I really should refer to my notes prior..

*Message #21 Posted by **geoff quickfall** on 26 Feb 2010, 1:43 p.m.,*
in response to message #19 by Michael de Estrada

to typing late at night from memory. And to boot this was part of the HCC2009 presentation (done correctly!)

Here I am writing a book, and then not refering to it! Not a very good advertisement. Here are some shots from chapter eight, the section dedicated to the HP 41C card reader!!!!

I really should think before I type:



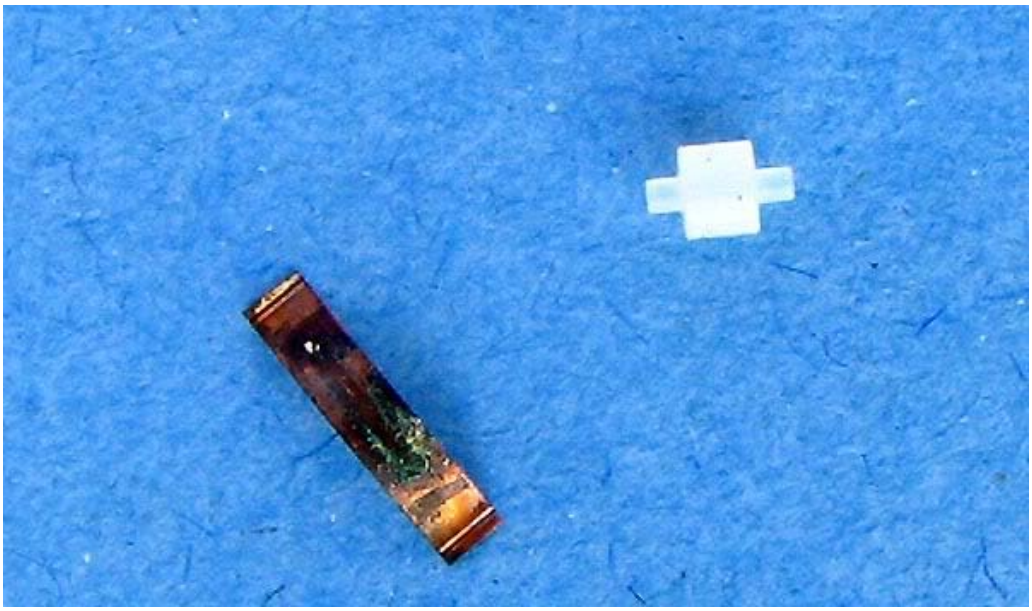
```
A:  CONTACT SWITCH pca
B:  DRIVE ROLLER
C:  ECCENTRIC CAM
D:  BRONZE SIDE SPRING (GUIDE)
E:  WHITE ROLLER (NYLON)
```

I will endeavour to reference the material before typing at night from memory. My wife has told me my memory is lacking sometimes!!!!

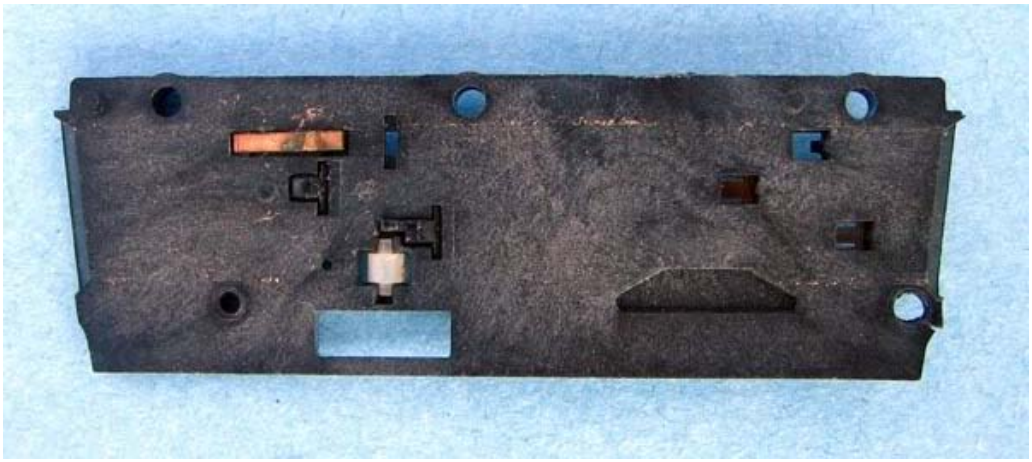
Signed, a slightly embarrassed Geoff

Some more shots:

NYLON ROLLER AND BRONZE SPRING both also found in the classic and topcats



Nylon roller in place (no nylon balls):



The leaf spring switches Randy is refering to:

in response to message #22 by Marcus von Cube, Germany

It's worth a shot Marcus, particularly if the motors can't be disassembled. Thanks for the suggestion.

Cheers, John

Card reader motor issues

*Message #24 Posted by **Randy** on 26 Feb 2010, 8:56 a.m.,*
in response to message #1 by John Robinson

Geoff is correct, the 65/67/topcat reader screws and housings are approximately 1 mm shorter than the 41 reader.

The motor itself, although they appear different in early models, are interchangeable between all readers.

With respect to jerky motion, before I suspect a bad motor, I'd look first at the coupler and then very carefully at all wiring and connections to same.

The 41 reader motors can be disassembled but getting the brushes back into place correctly involves careful study and sometimes just plain luck. The brush neutral position must also be set before gluing back together. The only real reason to open would be to lubricate but if you have the lead screw off, just set it on end and place a few drops of penetrating oil into the shaft area and allow to sit overnight. Repeat once then clean very well before re-attaching the screw.

HP-35 Bug: highest serial number?

*Message #1 Posted by **Mark Henderson** on 23 Feb 2010, 2:55 p.m.*

Any ideas what the highest serial number got to for the HP-35s with The Bug? Were they all 1143s or did some 1230s also get it?

Re: HP-35 Bug: highest serial number?

*Message #2 Posted by **Michael de Estrada** on 23 Feb 2010, 6:53 p.m.,*
in response to message #1 by Mark Henderson

I have a late version 2 (S/N inside battery compartment) 1249A08206 with "the bug".

Re: HP-35 Bug: highest serial number?

*Message #3 Posted by **Mark Henderson** on 23 Feb 2010, 7:34 p.m.,*
in response to message #2 by Michael de Estrada

Wow, that seems like a lot of units - we know the "week code" (1249 etc.") really wasn't the production week, but I guess the rest of the number couldn't be sequential, either? MoHPC and some other sources describe 20,000 - 25,000 original "buggy" units, but a quick look shows buggy units with S/Ns 1143Axxxxx, 1230A8xxxx, 1230A9xxxx, and your high numbered 1249A. Were the last 5 digits then really only recording a few thousand units? Interesting!?!

Re: HP-35 Bug: highest serial number?

*Message #4 Posted by **Matthias Wehrli** on 24 Feb 2010, 11:21 a.m.,*
in response to message #3 by Mark Henderson

Without any doubt on the unit of Michael de Estrada: It is very easy to exchange the mainboard of a non-bug unit with a bugy one or am I wrong?

Re: HP-35 Bug: highest serial number?

*Message #5 Posted by **Michael de Estrada** on 24 Feb 2010, 11:59 a.m.,*
in response to message #4 by Matthias Wehrli

That scenario seems a little far fetched to me. Certainly, I didn't do this and I don't believe the prior owner did either. The calculator showed no evidence of being opened (intact original back label) and the front of the calc has all version 2 indicators (bump on 5 key, front label w/o 35). Unlike a Red Dot, where a fake might have great value, I don't think there's much to be gained by deliberately creating a buggy version 2. I have seen strange inconsistencies in serial numbers on other calculators, so I wouldn't put too much stock on that factor in this case.

Curious question (OT): Green LEDs?

*Message #1 Posted by **Maximilian Hohmann** on 23 Feb 2010, 6:01 a.m.*

Hello!

Just a curious question: Many sellers advertise calculators with fluorescent displays as "green LED". I have seen several desktop calculators that really have green LED displays, but never a pocket calculator. So: was there ever an LED pocket calculator with a display colour other than red (like green or yellow)? Some Sinclairs have violet/purple filters over their red LEDs, but that dosen't count...

Regards, max

calculators: no

*Message #2 Posted by **Frank Boehm (Germany)** on 23 Feb 2010, 6:56 a.m.,*
in response to message #1 by Maximilian Hohmann

At least not to my knowledge. I think there were some hefty downsides (prohibitive expensive?), probably no driver ICs existed, requiring a transistor based driver (too large and too expensive).
There were one or two LED watches using green LEDs - extremely rare and sought after, because they were expensive back then :)

Re: calculators: no

*Message #3 Posted by **Thomas Radtke** on 23 Feb 2010, 8:52 a.m.,*
in response to message #2 by Frank Boehm (Germany)

Green LEDs were invented in the 1970th, so they were not available for the first pocket calculators. I might be wrong, but due to the smaller wavelength they probably consume more power. This, and the fact that at that time vfds were spreading, would have made it not really attractive for any company to switch from red to green displays.

Link of green LED watch

Green LED watch

Re: Curious question (OT): Green LEDs?

*Message #5 Posted by **Ron Ross** on 23 Feb 2010, 8:14 a.m.,*
in response to message #1 by Maximilian Hohmann

Yes, there were some green LED calculators. My first calculator was a Radio Shack 4 banger (Casio derivitive) and it came with green LEDs. It was a quality Casio calculator and used 2 AA batteries.

Re: Curious question (OT): Green LEDs?

*Message #6 Posted by **Thomas Radtke** on 23 Feb 2010, 8:53 a.m.,*
in response to message #5 by Ron Ross

Do you remember the exact identifier?

uh, *no*

*Message #7 Posted by **Frank Boehm (Germany)** on 23 Feb 2010, 8:59 a.m.,*
in response to message #5 by Ron Ross

Casio used LEDs for less than a handful calculators (I own 3 different, and I doubt there are more...) and moved as early as possible to VFDs (already in 1972 with the MINI!). So your Radio shack used (green) VFD...

I stand corrected.

*Message #8 Posted by **Ron Ross** on 23 Feb 2010, 10:06 a.m.,*
in response to message #7 by Frank Boehm (Germany)

I stand corrected. You are correct.

*Message #9 Posted by **Philippe Lasnier** on 23 Feb 2010, 8:23 a.m.,*
in response to message #1 by Maximilian Hohmann

I suppose that there were genuine green LED displays used in calculators, but most of the time the descriptions you refer to are given by ignorant people, or people who don't actually care that their description should be technically accurate..."LED means 'display' , right? and it's green-ish..."

On the same subject, how many time would you have seen plastic pouches and cases advertised as "leather"? It seems a lot of people don't know the meaning of the word...

Phew, it felt good to let that off my chest ;-)

Philippe

Re: Curious question (OT): Green LEDs?

*Message #10 Posted by **Eddie W. Shore** on 23 Feb 2010, 9:02 a.m.,*
in response to message #1 by Maximilian Hohmann

I had one with a green LED. I think it was a bluish TI adding machine. I think I was two years old ('78/'79) when I was playing with it however.

Re: Curious question (OT): Green LEDs?

*Message #11 Posted by **Bart (UK)** on 23 Feb 2010, 9:37 a.m.,*
in response to message #1 by Maximilian Hohmann

Hi Max!

I remember my dad bringing home a Sharp scientific calculator, the first one i'd seen (he had a 4-banger) - I was in primary school then. I was amazed that it had an exponent function. I always remember it having a green display and thought it was LED. Having searched the internet and from my memory, it was probably an EL-502 - which has a VFD display. So, I certainly can't recall any. I'll trust the great collectors on this forum on this topic - as if i'd doubt them in any case :-).

Bart

Re: Curious question (OT): Green LEDs?

*Message #12 Posted by **marais** on 23 Feb 2010, 9:51 a.m.,*
in response to message #11 by Bart (UK)

I am almost certain that what you recall as being green LEDs were all vacuum fluorescent displays. They were quite common in the late 70s, and still a sight to see, if you want my opinion.

Andreas

Re: Curious question (OT): Green LEDs?

*Message #13 Posted by **Thomas Klemm** on 23 Feb 2010, 11:34 a.m.,*
in response to message #1 by Maximilian Hohmann

There's an old thread: Green LED's?

Re: Curious question (OT): Green LEDs?

*Message #14 Posted by **Garth Wilson** on 23 Feb 2010, 3:11 p.m.,*
in response to message #1 by Maximilian Hohmann

I doubt it. For many years green was the least-efficient of the LED colors. Even when blue was super expensive, it still gave more brightness for the amount of current than green did.

I had a calculator (Cannon, I think) with a truly green (not bluish-green) vacuum-fluorescent display in high school. The display was quite attractive, but the calculator finished off a pair of AA alkaline batteries in about three hours-- maybe less.

Re: Curious question (OT): Green LEDs?

*Message #15 Posted by **Kiyoshi Akima** on 26 Feb 2010, 1:02 p.m.,*
in response to message #14 by Garth Wilson

Something's been tickling the back of my mind, and it finally came to the forefront this morning. No, I couldn't think of any calculators with green LEDs, but I've used cameras with green indicators in the viewfinder, and their manuals claim they're LEDs.

No, I haven't taken one apart to see whether they actually are LEDs, or whether they're some other color with a green filter.

non-scientific LED calculator worth more than HP35 red dot?

*Message #1 Posted by **Bart (UK)** on 23 Feb 2010, 4:49 a.m.*

Would anyone pay UKP1035.90 (~ USD1600.00) for this?: Realtronic red LED on eBay.

edit: from the Datamath museum info this is probably one of the "Far East Generic Design" types

Edited: 23 Feb 2010, 4:57 a.m.

Re: non-scientific LED calculator worth more than HP35 red dot?

*Message #2 Posted by **Maximilian Hohmann** on 23 Feb 2010, 5:19 a.m.,*
in response to message #1 by Bart (UK)

Hello!

Look at his other auctions, he obviously has set his calculator to engineering number format or something like that ;-)

Regards, Max

Re: non-scientific LED calculator worth more than HP35 red dot?

*Message #3 Posted by **Bart (UK)** on 23 Feb 2010, 5:39 a.m.,*
in response to message #2 by Maximilian Hohmann

Well, he couldn't have been using that one then as it doesn't even have have engineering format :-).

I think he's trying to get hits or a higher offer. It's been listed for about a year but previously at around 45 pounds IIRC. (Still not worth it, but he's not getting the message).

Re: non-scientific LED calculator worth more than HP35 red dot?

*Message #4 Posted by **Maximilian Hohmann** on 23 Feb 2010, 5:52 a.m.,*
in response to message #3 by Bart (UK)

Hi!

> Quote:
>
> I think he's trying to get hits or a higher offer.

Very strange. His Britney Spears CDs too have buy-it-now prices in excess of 1000 pounds. I always thougt the higher the starting price, the higher the eBay fees, even if the articles don't sell?

Re: non-scientific LED calculator worth more than HP35 red dot?

*Message #5 Posted by **Thomas Radtke** on 23 Feb 2010, 5:56 a.m.,*
in response to message #4 by Maximilian Hohmann

It's like a lottery. He pays that fees to get a low chance for a stupid buyer.

Re: non-scientific LED calculator worth more than HP35 red dot?

*Message #6 Posted by **Bart (UK)** on 23 Feb 2010, 6:04 a.m.,*
in response to message #5 by Thomas Radtke

I was thinking that maybe he is hoping for that one big sale.

Re: non-scientific LED calculator worth more than HP35 red dot?

*Message #7 Posted by **Eddie W. Shore** on 23 Feb 2010, 9:08 a.m.,*
in response to message #1 by Bart (UK)

I wouldn't do it.

HP-41CX Memory Registers

*Message #1 Posted by **Prabhu Bhooplapur** on 23 Feb 2010, 2:11 a.m.*

Hi,

My HP-41CX shows "00 REG 155" instead of the usual "00 REG 219". Memory reset does not help. Can this be repaired? Thanks for your ideas. Prabhu

Re: HP-41CX Memory Registers

*Message #2 Posted by **Garth Wilson** on 23 Feb 2010, 2:28 a.m.,*
in response to message #1 by Prabhu Bhooplapur

What does SIZE? give you?

Re: HP-41CX Memory Registers

*Message #3 Posted by **Prabhu Bhooplapur** on 23 Feb 2010, 2:32 a.m.,*
in response to message #2 by Garth Wilson

SIZE? gives me 36. Any suggestions?

Re: HP-41CX Memory Registers

*Message #4 Posted by **Håkan Thörngren** on 23 Feb 2010, 4:53 a.m.,*
in response to message #1 by Prabhu Bhooplapur

Do you have any module plugged in at the upper end? In that case, remove them. Is your HP-41 overclocked/speed up?

Starting with a <- ON sequence (MEMORY LOST). In that case the free program registers should be correct. I do not think the calculator actually test the integrity of the program registers. It checks the free program registers by counting zero registers until it sees something non-zero (or hit the limiting address 0C0). Incorrect memory not reading 0 after memory reset could give this symptom of too few program registers.

It does however check the integrity of data registers, and if you have a faulty memory, SIZE? may come up short.

Re: HP-41CX Memory Registers

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 23 Feb 2010, 5:43 a.m.,*
in response to message #1 by Prabhu Bhooplapur

HI;

just to add another question: is it a coconut or a halfnut? The coconut type may be repaired, as the memory chips are 'discrete', 8-pin DIP IC´s, but you need a 'donator' coconut because AFAIK, those memory chips are

not regularly sold. The halfnut units have a single hybrid chip under the LCD with all RAM/ROM and display driver circuitry (also called 'R2D2' in the Voyager structure) and are not serviceable.

To see the difference between both:

Success!

Luiz (Brazil)

Edited: 23 Feb 2010, 5:45 a.m.

Re: HP-41CX Memory Registers

*Message #6 Posted by **Prabhu Bhooplapur** on 23 Feb 2010, 7:27 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Thanks Garth, Hakan, and Luiz,

The 41CX under discussion is a full nut. I had a look at the printed circuit board. It has a row of 8pin DIP ICs as mentioned by Luiz and they are soldered one above the other (piggy-bac arrangement). Do you think it is possible to get these ICs? Then the question comes on how to identify which of these are faulty? Any ideas?

As Håkan mentions this appears to the case of faulty memory.

Prabhu

Re: HP-41CX Memory Registers

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 23 Feb 2010, 10:49 a.m.,*
in response to message #6 by Prabhu Bhooplapur

Hi;

the IC´s you want to search for are RAM IC´s, and these ones are in number of five (64 * 5 = 320). If you remove all of the 8-pin DIP IC´s you will see that five of them have the same prefix (usually ILE7xx) with the last digit being counted 1 to 5. They store 64 registers each, and the first one (lower numbered) relates to the HP41C basic memory. The other four relate to the Quad Memory Module, for instance.

If your HP41CX sees 192 registers (156 + 36, considering that the 3 bytes for the permanent .END. are counted as one less register), it means that the fourth RAM IC is faulty (ILE704). Interesting: I had two HP41CV´s in the same circumstance: the fourth RAM IC faulty.

If you want to confirm with a single test, provided that you have a single Memory Module, with the calculator OFF (could not miss mentioning that) insert it in port #3 and check if the memory count goes OK, then. If you do not have a single Memory Module, try this (I am not sure if this is the correct procedure, just have none of the faulty calculators at hand now):

- perform SIZE 191
- key in 256 (or any number from 256 to 319)

- try VIEW IND X

If I am not wrong, it will give no error message. But I cannot guaranty, OK? Consider that you have an HP41C with two modules, then you perform SIZE 191, then you insert a memory module in the fourth port. That´s what we achieve with the procedure above. So, the last 64 registers are available and there is a gap related to port #3.

Let us know how it goes.

Cheers.

Luiz (Brazil)

Re: HP-41CX Memory Registers

*Message #8 Posted by **Prabhu Bhooplapur** on 24 Feb 2010, 10:19 a.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I have a single memory module and tried that as suggested. No change in memory count.

I also tried the procedure you recommended without the memory module. The result is 'NONEXISTENT' display.

Any further suggestions?

Prabhu

Re: HP-41CX Memory Registers

*Message #9 Posted by **Michael de Estrada** on 24 Feb 2010, 10:47 a.m.,*
in response to message #8 by Prabhu Bhooplapur

What kind of memory module do you have installed? You should not use a 82106A or 82170A module in an HP-41CX. If that's what you have, remove it. A 82180A module is OK, but will not affect main memory.

Re: HP-41CX Memory Registers

*Message #10 Posted by **Prabhu Bhooplapur** on 24 Feb 2010, 9:53 p.m.,*
in response to message #9 by Michael de Estrada

Hi Michael, I had first tried, before your message, memory module 82106A. After seeing your message I also tried 82180A memory module. Still the memory count does does not increase. It still shows "00 REG 155" instead of "00 REG 219". Any other suggestions?
Prabhu

HP-41 CX at ebay - reasonable price?

*Message #1 Posted by **Timo** on 22 Feb 2010, 12:45 p.m.*

Hello all!

I've just discovered this HP-41 CX auction at ebay:

HP-41CX at ebay...

Would you regard this as a justified price for a HP-41 CX in this (promised) condition? I've checked earlier auctions of the seller and some CXs sold for even more, one for about 600$...

Since I've bought my (Fullnut) 41-CV I've started using it more and more (especially since I discovered HP41UC) and am thinking about buying a well preserved Halfnut 41-CX to have a spare.

My feeling tells me that's a bit high for a 41CX but I'm relatively new to this market, so I'd be interested in your opinion.

Cheers, Timo

Re: HP-41 CX at ebay - reasonable price?

*Message #2 Posted by **Marcus von Cube, Germany** on 22 Feb 2010, 1:46 p.m.,*
in response to message #1 by Timo

I wouldn't pay that much for a CX.

Re: HP-41 CX at ebay - reasonable price?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 22 Feb 2010, 2:04 p.m.,*
in response to message #2 by Marcus von Cube, Germany

... neither would I...

Re: HP-41 CX at ebay - reasonable price?

*Message #4 Posted by **Timo** on 22 Feb 2010, 3:22 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

All right, thanks for your quick feedback.

This atually confirms my thoughts...

HP-41 CX: just to add that...

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 22 Feb 2010, 3:49 p.m.,*
in response to message #4 by Timo

... as you are interested in aerospace, sports and motorbikes, I'd guess you at least intend to use the calculators somehow.

If you want computing power, you´d add an HP50G to your 'wishing list', and it would serve you pretty well. If you want actual computing devices as tools to help you reasoning about a problem in order to solve it, so you need any scientific calculator. The HP41 series fit fine in most design needs, since they are easy to use and have as much power as you can add to them, either by programming or by ready-to-use application modules. And there are new tools (toys?) available today, by both Diego Diaz and Meindert Kuipers. These guys offer the ultimate, up-to-date data storage facilities you´d surely need to plug in any of your HP41 calculator.

Just check these out:

The Clonix homepage
MLDL2000 homepage

These are worth spending some bux with. Hope it helps.

Cheers.

Luiz (Brazilien)

Edited: 22 Feb 2010, 3:51 p.m.

Re: HP-41 CX: just to add that...

*Message #6 Posted by **Timo** on 22 Feb 2010, 4:59 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Hi Luiz,

thanks for your response. You are right, I actually do use my HP-41. Although I have to confess that I'm not nearly old enough to have witnessed the times when it came out, I'm nevertheless absolutely fascinated by this little machine and its abilities.

I'm not only interested in aerospace, I work as an aeronautical engineer. We develop, document and certify all sorts of fligth experiments, so my main jobs are engineering computations and the 41 does a great job on these. Besides, the look of colleagues when you get it out during a discussion for a quick calculation is just priceless...

However, once things start to get too intense regarding the math required to solve a problem I usually switch over to tools like Scilab (mainly because the results are much easier to document). So a HP50 would indeed by nice, but I doubt that I would use it to its full capabilities. A HP-41 serves both, my computational needs as well as my nostalgic interest in engineering history (I even put out my fathers slide rule from time to time, just to remind myself how complex things were in his early active years...)

By the way, thanks for the links, they sure look interesting! I will study them soon.

Best regards from Germany, Timo

10BII Display Problems?

*Message #1 Posted by **JT** on 22 Feb 2010, 12:11 p.m.*

I just purchased a 10BII to add to my collection. It's the "middle" version (between the original 10B and the newest "retro" version). Was there a problem with the LCD display on this version? There seems to be a LOT of people on Amazon who reviewed this calculator around the time it was in production and complained about the display going bad after short time. What makes me wonder is that they also complained about the calculator accidently turning on while it was in their backpack etc., so they could have also inadvertently adjusted the display contrast without even knowing that feature existed on the 10BII. Just wondering if anyone could confirm whether or not there was a real QC problem with the LCD display on this version of the 10BII.

Edited: 22 Feb 2010, 12:11 p.m.

Re: 10BII Display Problems?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 22 Feb 2010, 2:10 p.m.,*
in response to message #1 by JT

Hi;

I have two HP10BII with a bad LCD. Some segments and some whole digits went off for good. I opened one of them and the zebra connector was broken. Piece of s..t, if you pardom my French, that zebra connector. Seems to be made to never bent, always broke. When I opened the second unit, I saw the same scenario.

I am about to ask my brother, who has a third HP10BII I bought him some years ago. Either it´s been thrown away and he never mentioned that or it is still working fine. I would not bet in the second option, though...

Cheers.

Sign of a new HP calculators prices inflation?

*Message #1 Posted by **Xavier A. (Brazil)** on 22 Feb 2010, 6:55 a.m.*

Hello,

for months now I'm seeking HP-80 financial calculator prices; this auction drives me a bit confused:
is that possible to spend such an amount of money in this (used & partially broken) calculator?

What is actually very strange is that the final bidder seems to have a big experience... new buyers (like me a few years ago) could have spent so much money, but this one?

Re: Sign of a new HP calculators prices inflation?

*Message #2 Posted by **Thomas Radtke** on 22 Feb 2010, 7:41 a.m.,*
in response to message #1 by Xavier A. (Brazil)

> Quote:
>
> is that possible to spend such an amount of money in this (used & partially broken) calculator?

It's quite complete, and the seller shows lots of good pictures.

You mean the broken case? Unfortunately, these hinges often break over the time. I've payed an insane price for a complete 35 set just to have a (mostly) good case, so, I wouldn't have placed a bid on that item. But others have a different focus.

Well, you need just two people wanting an item enough to get a strange final bit. It's much like a traffic jam, where just one car can cause a 20km stau (the slowest car is always the first one ;-).

Re: Sign of a new HP calculators prices inflation?

*Message #3 Posted by **Xavier A. (Brazil)** on 25 Feb 2010, 7:11 a.m.,*
in response to message #2 by Thomas Radtke

Thank you for your reply.

Another factor which we didn't mention is the fact that the seller decided a minimum price to be reached. For sure this parameter artificially pulls up the item's value.

Well, in this other example, it is obvious that also new buyers help prices growing. I am curious about this new sale, where pictures are excellent, the case perfect and the calculator aesthetically best as in the previous auction.

My opinion is that new buyers with new interests in HP products (like old financial calcs) are making the market ever more 'juicy' for sellers.

Re: Sign of a new HP calculators prices inflation?

*Message #4 Posted by **Gilles Collas** on 27 Feb 2010, 2:49 p.m.,*
in response to message #3 by Xavier A. (Brazil)

Also, can anyone explain this one : EB #290395201549

Re: Sign of a new HP calculators prices inflation?

*Message #5 Posted by **Marcus von Cube, Germany** on 27 Feb 2010, 4:16 p.m.,*
in response to message #4 by Gilles Collas

A working, clean machine with accessories and box. I'd like to have one. :)

Re: Sign of a new HP calculators prices inflation?

*Message #6 Posted by **Gilles Collas** on 28 Feb 2010, 9:44 a.m.,*
in response to message #5 by Marcus von Cube, Germany

Sure but the price is incredible to me..

Re: Sign of a new HP calculators prices inflation?

*Message #7 Posted by **Xavier A. (Brazil)** on 1 Mar 2010, 6:08 a.m.,*
in response to message #6 by Gilles Collas

With the box it is actually very rare, so it is very expensive :)

Re: Sign of a new HP calculators prices inflation?

*Message #8 Posted by **Alberto Fenini** on 1 Mar 2010, 10:35 a.m.,*
in response to message #6 by Gilles Collas

Yes it is ... I have been bidding on this item till 200 US$, then, since I have to add duties and shipping charges (I only use Priority International) I stopped. Just for everyone information, no later then one month ago, on the italian ebay direct sales site(called "ebay annunci") the same machine in WORKING conditions, with EU power supply and manuals (without box) was offered for 60 € .... take care all of you, Alberto

Re: Sign of a new HP calculators prices inflation?

*Message #9 Posted by **Michael de Estrada** on 1 Mar 2010, 10:57 a.m.,*
in response to message #6 by Gilles Collas

It's an HP-27, that's why. It's near impossible to find one in good working condition and complete. Woodstocks in general are very difficult to find in working condition, because they have been ruined by battery leakage and outgassing, and using the AC adapter with bad or no batteries. Of all the Woodstocks, the HP-27 is the rarest. I found one for about 1/3rd this price that was in good working condition but had some unfortunate engraving and markings on it. It has all accessories except the box.

Re: Sign of a new HP calculators prices inflation?

*Message #10 Posted by **Xavier A. (Brazil)** on 1 Mar 2010, 7:07 a.m.,*
in response to message #3 by Xavier A. (Brazil)

Well, the final price (US$ 242,50) of the auction I was speaking about seems to demonstrate a new interest of speculators or HP fans in HP-80 financial calculator (is there need to remember that this particular model never cause a big enthusiasm among HP fans?).

With recent new buyers on the market (as one can see for instance here or there), my opinion is that HP calcs prices will keep on growing next years. The question is now: until when?

Almost a Red-Dot. It seems only to lack the hole!

*Message #1 Posted by **Ignazio Cara (Italy)** on 21 Feb 2010, 1:41 p.m.*

I have got ah HP-35 from a american guy (SF, CA) and this seems to be a red-dot without the hole on the keyboard face plate. Ist serial number is 1143A4799 like you can see on the pictures. It have a battery pack with part code 03501A, the first type released by HP for this kind of calculator. Let me know how do you think about. Thanks a lot in advance.

Edited: 4 Mar 2010, 10:16 a.m. after one or more responses were posted

Re: Almost a Red-Dot. It seems only to lack the hole!

*Message #2 Posted by **Michael de Estrada** on 21 Feb 2010, 10:05 p.m.,*
in response to message #1 by Ignazio Cara (Italy)

It's an early Version 2. There are other differences between a Version 1 (Red Dot) and a Version 2. Early Version 2's shared a lot of similarities with the Red Dot, whereas later Version 2's were more similar to the Version 3, such as the serial numbers inside the battery compartment. Nonetheless, it's a nice find and looks to be in good condition.

Re: Almost a Red-Dot. It seems only to lack the hole!

*Message #3 Posted by **Ignazio Cara (Italy)** on 22 Feb 2010, 6:16 a.m.,*
in response to message #2 by Michael de Estrada

Many thanks for your appreciated contribute. This calculator is in very good working order, after an accurate restore from a very dirty and oxidized state. It hasn't the original ROM bug. I have just ask to the seller the story of this calculator , but He hasn't answered yet. If he does I will inform you. Regards

Ignazio

Re: Almost a Red-Dot. It seems only to lack the hole!

*Message #4 Posted by **Matthias Wehrli** on 22 Feb 2010, 7:04 a.m.,*
in response to message #3 by Ignazio Cara (Italy)

I guess it was a red Dot, but the upper faceplate was changed. As I can see there is a red dot on the power slider as well as there is the typical serial number plate of the Red Dot. Does it has a bug or not?

Re: Almost a Red-Dot. It seems only to lack the hole!

*Message #5 Posted by **Ignazio Cara (Italy)** on 22 Feb 2010, 7:11 a.m.,*
in response to message #4 by Matthias Wehrli

As you can read in my latest post, the calculator hasn't the ROM bugs, bu I agree with you about

the possibility that the keyboard face plate could be not so old. I'm awaiting for some information by the seller. Regards

Ignazio

my understanding:

*Message #6 Posted by **Frank Boehm (Germany)** on 22 Feb 2010, 7:51 a.m.,*
in response to message #1 by Ignazio Cara (Italy)

It's a factory refurbished red dot.
The serial# sticker is without doubt a red dot (and not V2) sticker, the serial number itself matches this.
When the "bug" was discovered, some/most users sent their machine to HP to have the ROM replaced (you can probably see some soldering remains from the manual rework on the PCB). Often "bad parts", like a damaged case part, were replaced for free. The original red dot faceplate was probably worn and has been replaced by a V2 part (as if the red dot hole was good for anything anyway <g>), after fixing it, the back label had to be replaced as well - with a V2 part (stating the "35").

Re: my understanding:

*Message #7 Posted by **Michael de Estrada** on 22 Feb 2010, 9:47 a.m.,*
in response to message #6 by Frank Boehm (Germany)

Maybe. Certainly the large rear label is not original and different from a Red Dot, but as you said would have been replaced if it had been refurbished by the factory. I am not so convinced by the serial number label, as there were a few Version 2's that had this style label (small numbers), and this serial number is higher than the earliest Version 2. Dr. Michael Eckstein has a database that has this information. You are correct that there is evidence of ROM replacement, and other evidence that the logic board itself is a Version 1 (Red Dot). Whether this was truly a Red Dot that has been factory refurbished or has been cobbled up from various pieces, some Red Dot and some not, is hard to tell, unless a factory work order or work makings can be found.

Re: my understanding:

*Message #8 Posted by **Ignazio Cara (Italy)** on 22 Feb 2010, 10:12 a.m.,*
in response to message #7 by Michael de Estrada

Thanks Michael, thanks Frank, I have deleted the image of the battery pack and insert a new image of the gold contact, I hope this could help us to discover the mistery. I think that only the Red-Dot had this kind ofcontact bridge. Is true or not? Frank, if you remember long time ago I purchased by you a RED-DOT s/n 1143A02874 and I are still the proud owner.

Ignazio

ser# label

*Message #9 Posted by **Frank Boehm (Germany)** on 22 Feb 2010, 10:32 a.m.,*
in response to message #7 by Michael de Estrada

The V2 and red dot ser# label differ, so it's actually impossible to falsify a V2 into a red dot. Probably a handful of people do know what to look for, but it's better not to tell ;)
I don't think the "earlier V2 number" is the full truth, probably another factory refurbished machine - it's not too hard to imagine they had the ability to reprint a ser# label...

Great discussion. I can add...>>

*Message #10 Posted by **tim m.** on 22 Feb 2010, 7:30 p.m.,*
in response to message #1 by Ignazio Cara (Italy)

...that my '35, #1143A31237, purchased from the original owner, is an early version 2 with bug that was refurbished by the owner. The back label states "HP-35" and one can see faint remnants of the old label. Plus, the original owner provided documentation indicating when the calculator was serviced for the "bug."

I'm judging that it is early v. 2 (without opening it) based on lack of red dot and S/N label style. It is conceivable that the faceplate was replaced, but the original owner had the machine serviced within a year or so of purchase, so I doubt this.

-Tim

Hardest part about doing taxes

*Message #1 Posted by **Michael Meyer** on 20 Feb 2010, 4:44 p.m.*

The hardest part about doing my taxes: which calculator do I use? Totalling deductions seems best done on an HP-97. But for routine calculations, do I use an HP-25? 19C? 32S? Maybe a business calculator? It's so confusing. The IRS website gives no guidance for this at all.

Re: Hardest part about doing taxes

*Message #2 Posted by **Sancerre (Phoenix)** on 20 Feb 2010, 4:58 p.m.,*
in response to message #1 by Michael Meyer

I had the same dilemma - ultimately I choose my 42S and leveraged the infra-red printing so that I had a ticket for each category.

Re: Hardest part about doing taxes

*Message #3 Posted by **Garth Wilson** on 20 Feb 2010, 6:11 p.m.,*
in response to message #1 by Michael Meyer

They've made it too complicated, so I haven't done my own in years. It takes me more than a whole day to prepare everything to take to the accountant.

Re: Hardest part about doing taxes

*Message #4 Posted by **Michael Meyer** on 20 Feb 2010, 7:08 p.m.,*
in response to message #3 by Garth Wilson

LOL! All I'm doing IS preparing everything to take to the accountant... and it does take all day!

Re: Hardest part about doing taxes

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 20 Feb 2010, 10:01 p.m.,*
in response to message #4 by Michael Meyer

Hi, Doc;

and Yep, we have the same problem here in Brazil. And I gave up computing our equivalent to the IRS about five/six years ago. Now I just press [R/S] in the accountant´s keyboard...

Cheer$.

Luiz (Brazil)

Re: Hardest part about doing taxes

*Message #8 Posted by **Nenad (Croatia)** on 2 Mar 2010, 3:37 a.m.,*
in response to message #7 by Peter A. Gebhardt

Though the tax calculation procedure here in Croatia is a bit complicated, each year in February I implement the same approach: I download the Excel spreadsheet from the site of Erste bank, fill the data in, print it out and save it into a zip file for the next year.

They at Erste Bank always prepare the actual sheet taking into account possible changes of regulations during the year and the printed spreadsheet looks exactly like the paper form that other people use and fill manually. I only have to sign it and to send it to the local office of Tax administration.

Next year, I copy/paste the most data from the previous year sheet.

Re: Hardest part about doing taxes

*Message #9 Posted by **Michael Meyer** on 2 Mar 2010, 1:46 p.m.,*
in response to message #8 by Nenad (Croatia)

There has to be a role for an HP calculator in this process somewhere. Maybe to double check the spreadsheet? I don't trust them computers.

Re: Hardest part about doing taxes

*Message #10 Posted by **Nenad (Croatia)** on 3 Mar 2010, 3:10 a.m.,*
in response to message #9 by Michael Meyer

Yes, it is essential to double check the output (spreadsheet figures) by my wife's HP12C (btw, dr Mike, she is your colleague, but a pediatrician).

From time to time it happens that the original form is stupid and requires you to enter the same figure (e.g. life insurance premium) into two different cells in the spreadsheet. Normally, the actual calculation can take only one of them into account. You do not know which one. It is the best

practice to go through the output manually (meaning with a HP calculator), to help you check the figures mentally.

The main advantage of the spreadsheet is the possibility of "what if". You replace one expense with a zero and see what happens.

However, the spreadsheet is useful as it produces the filled form you have only to print into pdf, and file both the xls and pdf versions together.

in response to message #1 by Michael Meyer

A 200LX, of course. Huge screen, Lotus 1-2-3, Pocket Quicken, a financial calculator that rivals even the 19BII in functionality...

Re: Hardest part about doing taxes

*Message #12 Posted by **Allen** on 20 Feb 2010, 7:47 p.m.,*
in response to message #1 by Michael Meyer

I used a 97 calculator for the first pass, then for the different sections, used a 17bii and 82240B printer- It's a little faster and has the TVM calculations at hand if needed. The 42s is also an excellent Idea- saw that above.

Lastly, I double checked the math on my HP 30b.

*Message #14 Posted by **Palmer O. Hanson, Jr.** on 20 Feb 2010, 8:44 p.m.,*
in response to message #1 by Michael Meyer

I have done my own taxes for sixty years. All that I have ever needed is a four-banger calculator, a pen, some scratch paper, the appropriate forms, the appropriate instructions, and the ability to read and follow the instructions. It really isn't that hard. I could probably do it using a chisel and stone tablet if I really had to.

Re: Hardest part about doing taxes

*Message #15 Posted by **Ed Look** on 20 Feb 2010, 10:03 p.m.,*
in response to message #1 by Michael Meyer

I wound up using my HP-48G+. I could have just as well used the 49g or 50g. The only reason for these and not a simple scientific or 4-banger is that it's nice to have a bunch of stack levels visible at the same time without having to store the figures in a variable or a register and then having to recall them. And, the 48, 49, and 50 series machines have an "infinite" stack.

Re: Hardest part about doing taxes

*Message #16 Posted by **Michael Meyer** on 20 Feb 2010, 10:52 p.m.,*
in response to message #1 by Michael Meyer

I love all the feedback... as you know, I wasn't being entirely serious. If I use all of my calculators, can I claim them all as deductions for business equipment? I should be able to claim them as dependents (They are my babies)!

Re: Hardest part about doing taxes

*Message #17 Posted by **Sancerre (Phoenix)** on 20 Feb 2010, 11:23 p.m.,*
in response to message #16 by Michael Meyer

I got your tongue and cheek tone; but I had to admit that my taxes were ever so bit delayed due to the dilemma of what calculator to use. In theory, the 17BII had to be the right choice, but I the elegance of the 42S won. The biggest decision was whether to sacrifice the full stack of the 48G.

So, yes I got your humor, but was nevertheless trapped in the same scenario....

Re: Hardest part about doing taxes

*Message #18 Posted by **designnut** on 20 Feb 2010, 11:30 p.m.,*
in response to message #17 by Sancerre (Phoenix)

Turbotax grabs your dats from previous years, can download from Scottrade or Citibank. Used it for years, no hassle. Sam

Re: Hardest part about doing taxes

*Message #19 Posted by **Katie Wasserman** on 21 Feb 2010, 10:15 a.m.,*
in response to message #1 by Michael Meyer

I need a calculator just to prepare my taxes to give to the accountant!

Which one to use is certainly a dilemma and it took years to figure out the best solution for me: a 17BII with 82240B printer.

hp 97 of year 1980

*Message #20 Posted by **dania** on 21 Feb 2010, 10:54 a.m.,*
in response to message #19 by Katie Wasserman

Dear, are an Italian citizen resident in Como (nearby Milan) and I have a HP 97 calculator purchased in 1980. For 2 years more to read cards; can't (do not enter into the slot). (The probable problem in your calculator is a damaged transport wheel inside the card reader). Everything works perfectly. I do not know where address repair not having any address where address. I tried shops in Palo Alto, but did not have a proper address. I ask you if you are able to provide me with an address where I can address and that it is serious.

Thank you in advance one awaiting your reply.

HP-41C with unusual serial number ?

*Message #1 Posted by **Marc Ferrer (France)** on 20 Feb 2010, 11:48 a.m.*

Hello,

Many years ago I got a used HP-41C (still working). Only recently, I realized that its serial number is unusual :

Instead of being stamped on the appropriate area, it's printed on a silver sticker which holds the number : 47067993. Under the sticker, no other marking.

I wonder if it's a refurbished machine, or maybe something more special...

In advance thank you all !

Cheers, Marc

Re: HP-41C with unusual serial number ?

*Message #2 Posted by **Iqbal** on 20 Feb 2010, 9:44 p.m.,*
in response to message #1 by Marc Ferrer (France)

Most likely the backpiece was changed.

Re: HP-41C with unusual serial number ?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 20 Feb 2010, 10:05 p.m.,*
in response to message #1 by Marc Ferrer (France)

HI;

I have one with the serial number printed a silver sticker glued in the black plastic sheet inside the battery compartment. The back case has no serial stamped on it.

Cheers.

Luiz (Brazil)

Edited: 20 Feb 2010, 10:05 p.m.

Re: HP-41C with unusual serial number ?

*Message #4 Posted by **Marc Ferrer (France)** on 21 Feb 2010, 4:42 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hello Iqbal and Luiz,

Thank you for your answers; that leads me to other questions :

Is there a relationship between these non-standard serial numbers and dates ? or more likely, in the case of a repairing process, is it just a record number used at HP servicing department ? (which would make dating more difficult if not impossible)

Thanks again for your help !

Marc

HP-41CV with HP82106A

*Message #1 Posted by **Dimitri Simitas** on 19 Feb 2010, 8:59 p.m.*

I got to ask I just recieved in the mail a HP82106A memory modual, and reading the HP Advance programming guide it mentions not using it on a HP-41CV, any reason for that?

Dimitri

Re: HP-41CV with HP82106A

*Message #2 Posted by **Eric Smith** on 19 Feb 2010, 9:32 p.m.,*
in response to message #1 by Dimitri Simitas

The HP-41CV and HP-41CX already contain the maximum amount of normal memory, so it is not possible to use the 82106A memory module or 82170A quad memory module with them. These modules should only be used in an HP-41C (no "V" or "X" suffix). Installing these modules in an HP-41CV or HP-41CX will not add usable memory, and may result in system crashes, higher battery drain, or other problems.

Similarly, the 82170A should never be used in combination with any 82106A modules.

Re: HP-41CV with HP82106A

*Message #3 Posted by **Michael de Estrada** on 19 Feb 2010, 9:37 p.m.,*
in response to message #1 by Dimitri Simitas

Adding a 82106A memory module or 82170A quad memory module to a HP-41CV or HP-41CX will not increase the memory in those models, because they already contain the maximum 319 addressable registers of internal memory. A HP-41C is the only model that can benefit, as its internal memory contains only 63 registers. A 82106A module will add 64 registers and a 82170A quad module will add 256 registers to an HP-41C. You can expand an HP-41C to 319 registers by adding 4 82106A modules or 1 82170A module. If you do install one of these modules in an HP-41CV or HP-41CX it will not function properly and the calculator will lock up if you attempt certain memory operations.

Edited: 19 Feb 2010, 9:38 p.m.

Re: HP-41CV with HP82106A

*Message #4 Posted by **Dimitri Simitas** on 19 Feb 2010, 9:46 p.m.,*
in response to message #1 by Dimitri Simitas

Thank you two for that, I have removed the module mind you still reading have not tried any memory functions with it thankfully. I guess it means I should have read up more. Mind you I ordered it before getting the calculator in the mail. Shame 33$ off ebay and not useful as a paper weight. Guess it will go into the parts box.

Dimitri

Re: HP-41CV with HP82106A

*Message #5 Posted by **Garth Wilson** on 19 Feb 2010, 10:37 p.m.,*
in response to message #4 by Dimitri Simitas

in response to message #4 by Dimitri Simitas

> Quote:
>
> I have removed the *(82160A memory module from an HP-41CV)* ... Shame 33$ off ebay and not useful as a paper weight. Guess it will go into the parts box.

I'd keep it in case you decide to acquire an HP-41C to complete an HP-41 collection: C, CV, CX. "Fullnut" models (1979-84/85) have nicer, more-legible displays, and the earliest models of these (e.g., C and CV from 1979-80) have shorter, but bolder, display segments.

The first-year HP-41C is of the steep-edged "tall keys" design carried forward from LED-display models that immediately preceded it. The later key design was better, but the original has some collector value...

Re: HP-41CV with HP82106A

*Message #8 Posted by **Dimitri Simitas** on 21 Feb 2010, 12:57 p.m.,*
in response to message #7 by Karl Schneider

Thank you for the reply. I do have somewhat of a similar goal but not to collect the calculators but accessories to use.

Double ended sword. I want to learn to use the HP-41 as well as I can but I also want to reverse the process as I am back in college and have a couple 4 month summers to get it done. Get a updated modern version of the HP-41 with SD cards for program storage and a HP-41 type slot to use original accessories with the HP-IL system. The memory expansion will not work in the slot, since there is the

SD slot will hold program files. As will a ROM chip inside will hold many application packs built in.

[OT] Future Calculator Nut?

*Message #1 Posted by **Tim Wessman** on 19 Feb 2010, 12:16 p.m.*

Probably not. . .

For those of you who know and have met my wife Katie (Wessman with no 'a' and no 'r') at the past few HHC conferences, she is feeling great and both are doing well.

Since I have access to more calculators now, this new little one gets an upgrade compared to his older sister. She had to chew on a quickcalc. He gets upgraded to a 10bII so he can start learning at an earlier age what a good keyboard (to a small extent) should feel like. I don't mind if it gets sucked on.

More info for those wanting at timandkatie.com.

TW

Edited: 19 Feb 2010, 12:18 p.m.

*Message #11 Posted by **David Hayden** on 20 Feb 2010, 9:18 p.m.,*
in response to message #1 by Tim Wessman

Congratulations to you and Katie!

This reminds me of a funny story. When my wife was pregnant in 1995, I wrote a very small and VERY simple program for the 100LX she had from work. It timed her contractions....

The trick was that had to be better than bullet-proof. It had to be better than idiot-proof. It had to be "expectant dad with wife in labor" proof!! Now that was a challenge.

I settled on 3 buttons: START STOP and SHOW. Press START when she started a contraction, press STOP when it ended and press SHOW to display a table of their duration and frequency. The code had to account for, say, pressing START, and then not being able press STOP because the missus was squeezing my hand and shouting at me... :)

I actually used the calculator during her brutal 45 hr labor.

The 100LX is in sight right now. Mother and child are upstairs watching a movie. :)

Dave

P.S. Tim, your children will not remember learning to use a mouse any more than you remember learning to use a door knob. They will have no memory of EVER hunting for keys on a keyboard. The very idea of not knowing which key is where will be completely alien to them.

Re: [OT] Future Calculator Nut?

HP-41CX beeps when turned on !!

*Message #1 Posted by **Giovanni Jimenez** on 19 Feb 2010, 9:04 a.m.*

I recently acquired an HP-41CX that looks in great shape; however, when inserted new batts and turned on, it just beeps (continuously), and doesn't respond to any key (incl ON key).

Any ideas ?

Re: HP-41CX beeps when turned on !!

Try to remove batteries, press and keep down "<-", tap "ON", then release "<-" procedure. Put batteries back and try to start it again.

If you still have a problem, try to get a diagnostic module and see if it can take control and tell you what is wrong.

Does it emit a high pitched noise or is it just a continuous beep?

Hi;

can you tell us if it is a coconut (fullnut) or a halfnut? Coconuts have the well known problems related to broken posts, and chances are that yours is suffering from this kind of trouble. To identify one for another:

Let us know about your findings, please.

And success!

Luiz (Brazil)

Followed Hakan's procedure and it stopped beeping (it was a high pitch beep). It doesn't turn on though.

It is the half-nut model.

What is the next step? and thanks !

Hi, Giovanni;

you may want to repeat Hakan´s procedure a couple of times again (as many as you need) and see if the calculator gets back to normal.

There is one straight procedure that is explained in the HP41 manual: leave the calculator without batteries for a couple of days (the C/CV may need about four to five days) in order to discharge all remaining electrical charges in all capacitors (it is known that the HP41 has two 'big' electrolytic capacitors). Because it uses low-power C-MOS technology IC´s as load, these capacitors take too long to get rid of remaining charge. The HP41C/CV (not the CX) may retain RAM contents for hours without batteries. The CX has the internal clock and extra RAM circuitry so discharging is faster.

There is also the electrostatic charge, different of the one found in capacitors due to regular operation. I had once to disassemble a coconut and 'resurrect' it after discharging the capacitors and leaving it over an aluminum foil, carefully pressed in the side without components so all terminals were shorted wit each other. After about an hour it was singing and dancing again.

Hope you succeed.

Hi, Luiz!

You've been gone for awhile from the forum lately. I hope all is well.

Hi, Doc;

main reason: classes have already begun and particularly in the university I teach at, many structural changes took place and, as you know, teachers are always the advanced front in the battle...

Appart of that, no problems. Should I have a 36-hour day, I´d use the extra 12 just for experimentation in my (humble) lab. Even in our 'carnival' week I took it for solving some issues.

Cheers and thanks for asking (in time: you have mail...)

Luiz (Brazil)

Website update

*Message #1 Posted by **Matthias Wehrli** on 19 Feb 2010, 7:23 a.m.*

Just made a small update of my website:

http://www.hp-collection.org

As I still have some time left: In that sort of information would you be interested on my website?

Hi Matthias

You have a great website! I appreciate the wealth of the information.

It would be nice to see more about all the special devices (e.g. prototypes) you have.

Keep up the good work!

Best regards
Peter

Lagrangian Interpolation for the HP-67 and HP-41C

*Message #1 Posted by **Namir** on 18 Feb 2010, 2:27 p.m.*

Hi All,

I posted PDF files that contain Lagrangian interpolation programs for the HP-67 and HP-41C on my web site.. The HP-41C programs come in two versions. The accompanying algorithm pseudo-code explains the difference. The second version performs some of the calculations needed once and stores the intermediate results. When you perform interpolation, the program performs the needed calculations that involve the interpolated value of x. Therefore, you save time when you perform multiple interpolation with the same set of observations.

Namir

Thanks Namir!

It was good to meet you at HHC 2009 and I look forward to HHC 2010.

- Bill

Same here. Any word on where and when HHC2010 will take place?

I haven't seen anything on it, but I'm sure that Richard, Joe, et al are working on it. ;)

HP200LX Connectivity Pack under Windows 7

*Message #1 Posted by **Mike (Stgt)** on 18 Feb 2010, 6:11 a.m.*

Just tried to run the HP200LX Connectivity Pack under Win7 Starter - and failed. Do I realy need QEmu, DosBox, VMware Player, or similar?

Ciao.....Mike

32 or 64 bit Windows? did you try compatibility mode (all the way back to Win95...)?

Greetings,
Massimo

No, I did only try to start it this morning in a hurry between a cup of tea and a shower before work. Did a "EasyTransfer" tonite from my worn-out WinXP-MSI Wind to an AAO-D250 under this funny Win7-Starter. 32 bit of cause. No chance neither for XP compatibility mode neither for the latest Virtual PC.
