The Museum of HP Calculators

The Museum of HP Calculators displays and describes Hewlett-Packard calculators introduced from 1968 to 1986 plus a few interesting later models. There are also sections on calculating machines and slide rules as well as sections for buying and selling HP calculators, an HP timeline, collecting information and a software library.

The Main Exhibit Hall

Before HP Calculators (1614-1968)

- The HP Garage - The Birthplace of Silicon Valley
- Calculating Machines, Slide Rules, etc.

The First HP Calculators (1968)

- HP 9100A&B Programmable RPN Calculators with *no digital ICs*

High End Desktop Series (1971)

- HP 9810A Second Generation RPN Calculator
- HP 9820A Full Algebraic Desktop
- HP 9830A Desktop Calculator with BASIC
- HP 9805A Algebraic Statistics Desktop
- HP 9815A/S Third Generation RPN Desktop
- HP 9825A First HPL Calculator

The Classics (1972)

- HP-35 The First Slide Rule Pocket Calculator
- HP-80 The First Business Calculator
- HP-45 Slide Rule++
- HP-65 The First Programmable Handheld
- HP-70 Inexpensive Business Calculator
- HP-55 Scientific/Programmable with Quartz Timer

Classic Printing Desktop Calculators (1973)

Message Index Display Configuration

Use the form below to search for messages which include certain keywords or which were posted at a particular time or by a particular individual, and/or to select the manner in which you wish the messages in the index to be displayed.

Display messages [Grouped into threads, indented]

When a message is selected in the index, if "Individually" is selected, a page containing only that message, a thread overview, and navigation features is displayed. When "Grouped into threads" is selected, all messages in the thread are displayed on a single web page. "Grouped into threads, indented" uses indentation to show the thread structure. "Grouped into threads, flush left" omits the indention and is mainly intended for small devices such as PDAs.

List only those messages:

- (•) Posted within the last [Several Eons]

(Options above this line are "sticky" if your browser accepts cookies. Options below are for the next view of the index only.)

- ( ) Posted between [Jan] [2013] and [Dec] [2013]

List:

- (•) All messages within the specified date range
- ( ) Only messages containing [Any] of the following keywords:

[ ]

- ( ) Only messages posted by:

F1011A AC/DCAdapter

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 16 Jan 2011, 10:18 p.m.*

This weekend I purchased a HP F1011A AC/DC Adapter in a an original carton from a thrift store for a dollar. A manual was not included. It seemed to me that there should have been an accompanying printer at the store but no such luck.

Re: F1011A AC/DCAdapter

*Message #2 Posted by **Martin Pinckney** on 16 Jan 2011, 11:57 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

The devices seem to give out long before the power supplies. I have a box of thirty or so power supplies for everything from cordless phones to HP printers. Hard to throw them away, tried unsuccessfully to sell them on eB** several years ago - maybe I should donate them to your thrift store.

Re: F1011A AC/DCAdapter

*Message #3 Posted by **Allen** on 17 Jan 2011, 6:35 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

The F1011A are compatible with and quite good replacements for the HUGE BRICK 82241A power supply- both the weight and size are less than half the former.

The lost formula

*Message #1 Posted by **designnut** on 16 Jan 2011, 11:49 a.m.*

I thought the knowledge that this ccould be done migtht inspire someone to find it again. The formula for the resisttance of negative temperature coeffient thermistors. is agonizingly ccomplex and works in a limited range. When I bought my HP65 I was working with thermistors and tried to match the resistance temperature curve by trying various things. I used only 3 constants for the particular one I was trying to match. The part I recall is adding a large number (~1200) to the temperature in C and taking ln. I used one constant to fit the resistance of that particular size device. It was dirt simple and truly accurate over the full range. I looked in my books for marginal references to what I had done and found none. I thought the knowledge that itt had been done might stimulate others to find it. sam

in response to message #4 by John B. Smitherman

On reading something everyone impress it on the matrix of "what they know". There can be nothing new under the sun, everything that can be learned has always been learned. You miss a lot of information that way. The impact of what I wrote is that there is a simple accurate method not disclosed by usual methods. Read the message with an open mind, your brains won't fall out. Sam

in response to message #5 by designnut

Sam,

things which have been (very) tedious in the past may be far easier nowadays and become even easier in the future, caused by new insight or just compilations of older insights. This process goes on and on. As a famous scientist once said: "We are standing on the shoulders of giants."

HTH, Walter

a challenge related to the 15 puzzle

*Message #1 Posted by **Don Shepherd** on 15 Jan 2011, 7:29 p.m.*

I'm sure most of us have seen the famous 15 puzzle, the little square plastic (usually) 4 by 4 puzzle with the 15 sliding pieces, and the goal is to get the pieces in the correct order. Most versions of the puzzle have interlocking pieces which cannot be removed from the puzzle board, but some versions allow you to remove the pieces and place them back randomly and try to solve the puzzle. However, if the pieces are removeable it turns out that there is a 50/50 chance that the puzzle will be unsolveable, depending upon the mathematics behind the order of the pieces.

The challenge: write a calculator program to determine whether the puzzle is solveable or unsolveable based upon a specific starting arrangement of pieces.

Here are two links that may help (there are many more):

Wikipedia

Wolfram Mathworld

Essentially, the puzzle is solveable if the row number (1-4) of the empty cell plus the number of "inversions" is even. An inversion occurs when a piece to the "right" of a piece has a lesser value. For example, for the arrangement of six pieces:

```
5, 8, 3, 2, 12, 10
```

there are 6 inversions: 2 numbers to the right of 5 are less than 5; 2 numbers to the right of 8 are less than 8; 1 number to the right of 3 is less than 3; 0 numbers to the right of 2 are less than 2; 1 number to the right of 12 is less than 12; 2+2+1+0+1 = 6.

This is a fairly simple problem to implement using BASIC. Using RPN and indirect addressing it is, of course, more complex, but I've written a HP-32sii program for it that works.

I'd like to see some RPL solutions to this problem because I have a feeling that a 4 or 5-liner may do the trick.

Re: a challenge related to the 15 puzzle

*Message #2 Posted by **Glenn Shields** on 16 Jan 2011, 12:42 a.m.,*
in response to message #1 by Don Shepherd

Hi Don, I thought this might be more fun on the 35s, with the indirect registers, but then thought about the "GET" function, and I was too lazy to look back in the manual for the details of "GETI", hence I produced a very "brute force", multi-line program to get the job done.
I just let "0" be the empty space, and then accounted for all the inversions it would cause depending on its "POS", then subtracted that out. Also, I would have liked to use local variables, but in a "RPN" manner used the variables C, E and P then purged them.
Just put the puzzle as a 4x4 matrix in the stack, and hit 'FIFTN': (sorry I don't know how to make paragraphs in this forum)

<<0 'C' STO 1 15 FOR j j GET LASTARG DROP SWAP 'E' STO j 1 + 16 FOR n n GET LASTARG DROP SWAP E IF < THEN 1 'C' STO+ END NEXT NEXT OBJ-> OBJ-> DROP * ->LIST 0 POS DUP 1 - 'C' STO- 'P' STO IF P 4 <= THEN 1 ELSE IF P 8 <= THEN 0 ELSE IF P 12 <= THEN 1 ELSE 0 END END END C IF 2 MOD NOT THEN "SOLVABLE" SWAP DROP ELSE "NOT SOLVABLE" SWAP DROP END {C E P} PURGE >>

Re: a challenge related to the 15 puzzle

*Message #3 Posted by **Glenn Shields** on 16 Jan 2011, 1:32 a.m.,*
in response to message #2 by Glenn Shields

Don, I am so sorry, I didn't beta-test this program (called 'FIFTN'), but to get it to work it needs the matrix stored in a variable called 'PUZZL' which will be saved at the end. Also forgot to add the row test result to C (duh!) So one more try:

<<DUP 'PUZZL' STO 0 'C' STO 1 15 FOR j j GET LASTARG DROP SWAP 'E' STO j 1 + 16 FOR n n GET LASTARG DROP SWAP E IF < THEN 1 'C' STO+ END NEXT NEXT PUZZL OBJ-> OBJ-> DROP * ->LIST 0 POS DUP 1 - 'C' STO- 'P' STO IF P 4 <= THEN 1 ELSE IF P 8 <= THEN 0 ELSE IF P 12 <= THEN 1 ELSE 0 END END END C + IF 2 MOD NOT THEN "SOLVABLE" SWAP DROP ELSE "NOT SOLVABLE" SWAP DROP END {C E P} PURGE >>

Regards, Glenn

Re: a challenge related to the 15 puzzle

*Message #4 Posted by **Allen** on 16 Jan 2011, 1:40 a.m.,*
in response to message #1 by Don Shepherd

Don, here's my listing partially optimized at 87.5 Bytes

```
Input: 16 element list (left to right top to bottom of the 15 square, using 0 for the
space)
Output: 0 if the list is unsolvable otherwise 1

« 0 SWAP REVLIST                          ' start a 0 counter
-7 7 FOR N                                ' -> loop over the list
  DUP HEAD DUP2 < SUMLIST - ROT +         ' | Subtract from N the number of entries < N
  SWAP TAIL NEXT                          ' | set up list for next loop
EVAL +  2 MOD »                           ' add box 1, check for parity
```

Edited: 16 Jan 2011, 2:49 a.m.

Re: a challenge related to the 15 puzzle

*Message #5 Posted by **Glenn Shields** on 16 Jan 2011, 2:58 a.m.,*
in response to message #4 by Allen

Allen, where is the test for the position of the blank? And you output a 1 if solvable, but isn't odd parity a sign of unsolvability? Didn't know about the list comparison capability, that's great, but your program says that these two lists are solvable, but are they? {1 8 9 0 2 7 10 15 3 6 11 14 4 5 12 13} and {1 2 3 4 8 7 6 5 9 10 11 12 0 15 14 13} cheers, Glenn

Re: a challenge related to the 15 puzzle

*Message #6 Posted by **Allen** on 16 Jan 2011, 3:44 a.m.,*
in response to message #5 by Glenn Shields

If you wish to impose the GRID parity for the invariant, add the top two lines to the above program (Total 134.5 Bytes)

```
 « DUP 0 POS                              ' (ADDED) Check for space
1 - DUP #4d / SWAP #1d * XOR B->R         ' (ADDED) Impose GRID Parity
SWAP REVLIST                              ' start counter using the GRID parity above
-7 7 FOR N                                ' -> loop over the list
  DUP HEAD DUP2 < SUMLIST - ROT +         ' | Subtract from N the number of entries < N
  SWAP TAIL NEXT                          ' | set up list for next loop
EVAL +  2 MOD »                           ' add box 1, check for parity
```

Edited: 16 Jan 2011, 3:52 a.m.

Re: a challenge related to the 15 puzzle

*Message #7 Posted by **Don Shepherd** on 16 Jan 2011, 5:35 a.m.,*
in response to message #5 by Glenn Shields

Thanks Allen and Glenn.

Glenn, the way to format code listings on the forum is to precede the code with [pre] and put [/pre] after the code. Then your code listing will look great.

The two sequences you listed are, according to my program, not solvable, with inversion counts 37 and 13 respectively (this count includes the row number of the empty cell). I'll double-check that with another program I have running on the Casio 9860g slim.

Don

Re: a challenge related to the 15 puzzle

*Message #8 Posted by **Allen** on 16 Jan 2011, 8:54 a.m.,*
in response to message #7 by Don Shepherd

Here are some test outputs I get with the two programs

```
#P - Parity program (earlier version)
#G - Grid parity program (later version)
#GS - Glen version program
0= "NOT SOLVABLE"
1= Can be Solved
```

Input	#P	#G	#GS**
{1 8 9 0 2 7 10 15 3 6 11 14 4 5 12 13}	1	0	0
{1 2 3 4 8 7 6 5 9 10 11 12 0 15 14 13}	1	1	0
{1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 0}	1	1	1
{1 2 3 4 5 6 7 8 9 10 11 12 13 15 14 0}	0	0	0
{13 9 2 3 14 0 4 15 10 11 1 7 12 5 6 8}	0	1	0
{13 10 11 6 5 7 4 8 1 12 14 9 3 15 2 0}	0	0	0

```
** NOTE: I use a <<EVAL {4 4} ->ARRAY >> to convert list to square matrix before
running 'FIFTN'.
```

Re: a challenge related to the 15 puzzle

*Message #9 Posted by **Don Shepherd** on 16 Jan 2011, 10:23 a.m.,*
in response to message #8 by Allen

Thanks Allen. Here is what I get when I run your six configurations (in order, inversions includes the row number [1-4] of empty cell):

```
not solvable, 37 inversions
not solvable, 13 inversions
solvable, 4 inversions
not solvable, 5 inversions
not solvable, 57 inversions
not solvable, 63 inversions
```

The best way to test these results is with a real 15 puzzle with removeable tiles. I ordered one a couple of days ago, it should arrive on Tuesday and I'll check these out.

thanks, Don

Re: a challenge related to the 15 puzzle

*Message #10 Posted by **George Litauszky** on 16 Jan 2011, 9:34 a.m.,*
in response to message #1 by Don Shepherd

Hi Don, this is a 50g solution.
Input: A list with the numbers, replace the hole with 0.
I use local variables because I just learning the stack programming. I use the STREAM command to come along the lists only. I tested it with Glenn's and Allen's lists (thanks) and it seems the program is correct.

```
\<< 0. 0. 0.  \-> lst he res pos
\<< lst 0. POS 4. /
    DUP IP SWAP FP
    IF THEN
     1. + 'pos' STO
    ELSE
     'pos' STO
    END
    1. 15. FOR n
     lst
     HEAD DUP 'he' STO
     IF THEN
      lst
      \<< DUP
        IF he < AND 0. > THEN
         1. 'res' STO+
        END \>>
      STREAM DROP
     END
     lst TAIL 'lst' STO
    NEXT
    res pos + 2 MOD
    IF THEN \"Not solvable\"
    ELSE \"Solvable\" END
\>>
\>>
```

Note:
To launch a difficulter chat in english with me: With your own personal risk only, please. :-)

George

Re: a challenge related to the 15 puzzle

*Message #11 Posted by **Glenn Shields** on 16 Jan 2011, 2:00 p.m.,*
in response to message #10 by George Litauszky

Hello George, thank you for your program, it has very interesting use of stream (to skip 0.) and the use of IP/FP to check the row that 0. is in (I couldn't think of how to do that). Fast and efficient. And thanks to Allen for his tabulation of the results, there is much to be learned from all. Don, I'm sure we'll hear more from this challenge (look at the last one!!) Cheers, Glenn

Re: a challenge related to the 15 puzzle

*Message #12 Posted by **Allen** on 16 Jan 2011, 4:16 p.m.,*
in response to message #11 by Glenn Shields

Ahh... after some sleep, I found a bug in the Parity checker for the GRID, now the fixed the program agrees with Glen and Don's findings. Some interesting byte saving tricks I'd forgotten about. In any case noted below,

Here are some test outputs I get with the two programs

```
                    Input                        #P   #G  #GS**  #AT3  #DS
-------------------------------------------------------------------------
{1 8 9 0 2 7 10 15 3 6 11 14 4 5 12 13}    1     0     0    0    0
{1 2 3 4 8 7 6 5 9 10 11 12 0 15 14 13}    1     1     0    0    0
{1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 0}    1     1     1    1    1
{1 2 3 4 5 6 7 8 9 10 11 12 13 15 14 0}    0     0     0    0    0
{13 9 2 3 14 0 4 15 10 11 1 7 12 5 6 8}    0     1     0    0    0
{13 10 11 6 5 7 4 8 1 12 14 9 3 15 2 0}    0     0     0    0    0

** NOTE: I use a <<EVAL {4 4} ->ARRAY >> to convert list to square matrix before
running 'FIFTN'.

#P - Parity program (earlier version)
#G - Grid parity program (later version)
#GS - Glen version program
#AT3 - 3rd version with corrected GRID Parity (see below)
#DS1 - Don's solution

0= "NOT SOLVABLE"
1= "CAN BE SOLVED"
```

The final version which includes both parity checks for the Grid alignment of the space and the number of inversions necessary to permute the puzzle. (Total 104 Bytes on the stack, checksum #16245d)

```
« DUP 0 POS 1 - R->B DUP SR SR XOR B->R       ' (bug fixed) check for space GRID
Parity and start the loop with it on the stack
                                              ' Grid Parity can be calculated by
XOR(Y>>2,Y) where Y is the 0 position - 1 using SR saves bytes over #4d
SWAP REVLIST                                  ' Reverse the list to use HEAD and
TAIL to grab the end
-7 7 FOR N                                    ' Loop Uses -7 to 7 to save 8 bytes
compared to 1 to 15
   DUP HEAD DUP2 < SUMLIST - ROT + SWAP TAIL  'Add the shifts and trim list
NEXT                                          ' Loop
EVAL + 2 MOD »                                ' Add the last element
```

At first glance, it may seem that I'm being sloppy with the calculations, but although the numbers coming out of the loop are all off by 1, they are PREDICTABLY off by 1 (which over a 15-step loop is off by exactly 15). When dealing with parity, it's not necessary to have the right sum, only the right sum MOD2. Accordingly, the math behind the scenes is something like this:

```
                    Input                   DON  GRID  INV  PARITY
-----------------------------------------------------------------
{1 8 9 0 2 7 10 15 3 6 11 14 4 5 12 13}  37 O  03 + 39  O+O=E
{1 2 3 4 8 7 6 5 9 10 11 12 0 15 14 13}  13 O  15 + 21  O+O=E
{1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 0}  04 E  12 + 15  E+O=O
{1 2 3 4 5 6 7 8 9 10 11 12 13 15 14 0}  05 O  12 + 16  E+E=E
```

```
{13 9 2 3 14 0 4 15 10 11 1 7 12 5 6 8}  57 O  04 + 60  E+E=E
{13 10 11 6 5 7 4 8 1 12 14 9 3 15 2 0}  63 O  12 + 74  E+E=E
```

Re: a challenge related to the 15 puzzle

*Message #13 Posted by **Don Shepherd** on 16 Jan 2011, 3:35 p.m.,*
in response to message #1 by Don Shepherd

Here is the program I wrote for the HP-32sii. It is not terribly fast; it takes around 40 seconds to return VALID or INVALID. One thing I learned from writing it is how to store multiple numbers in a register and then retrieve them one at a time. I didn't want to use 16 out of 27 registers just to hold the tile values, so the method I chose used only 4 registers for the 16 values. Thanks to Katie for advising me on that.

```
Program for HP-32sii to check an initial arrangement of number tiles
for the 15 puzzle to see if that configuration is solvable or not.

Prior to running, enter the initial arrangement (with 00 representing the
empty position) into registers A-D with 4 2-digit numbers per register, as follows:

A = 11051407
B = 15020904
C = 06000113
D = 10031208

(this arrangement is solvable, by the way, with 60 inversions)

Then XEQ A.  If the arrangement is solvable, the program will display
VALID, otherwise INVALID.  Press R/S to see the inversion count.

Register usage:
A-D - preset with initial arrangement of tiles
E   - count of number of inversions
F   - loop counter
G   - loop counter
H&I - values of current cells in loops F and G
X   - temp use in routine X

Subroutines:
M   - returns value of cell character x (1-4) row (i)
X   - returns value of cell pointed to in loops F and G

Code:

lbl a      entry point
1.004      begin loop to find row with empty cell
sto i      i will point to register A, B, C, or D
lbl b      outer loop
1.004      begin loop to iterate through 4 numbers in A, B, C, and D
sto f      get value 1, 2, 3, or 4 in A, B, C, D
lbl c      inner loop
rcl f      get value 1, 2, 3, or 4
ip
xeq m      return the value of that cell
x=0        looking for the cell with 00, need that row number
goto d     found it
isg f      inner loop
goto c
isg i      outer loop
goto b
rtn        won't get here unless you goof and don't put 00 in a cell
lbl d      found the 00, use row number to initialize inversion counter
rcl i      row number containing empty cell
ip
sto e      inversion count starts with row# of empty cell
1.015      now start looping to count inversions
sto f      outer loop goes from 1 to 15
lbl e
```

```
rcl f
xeq x
x=0         if outer loop value is 0, iterate outer loop (no need to see
goto j      if inner loop values are less than 0 since it's impossible)
sto h       store outer loop current cell value in h
rcl f       now establish inner loop counter, g goes from f+1 to 16
ip
1.016
+
sto g       inner loop counter
lbl f
rcl g
xeq x
sto I       store inner loop current cell value in I
x=0         if I is 0, ignore this iteration
goto g
rcl h
x<y         if second cell is less than first cell, increment inversions
goto g
1
sto + e     inversion count incremented
lbl g
isg g       inner loop iterate
goto f
lbl j       go here if outer loop value was 0 so don't waste time
isg f       outer loop iterate
goto e
sf 10       to enable message in equation to appear
rcl e       inversion count
2
/           if even, valid else invalid
fp
x=0
goto h
INVALID
rcl e       and display inversion count before stopping
cf 10       clear flag 10
rtn         stop
lbl h
VALID
rcl e
cf 10
rtn         stop
lbl m       subroutine returns value of number in x (1,2,3, or 4) in var (i)
enter
enter       adjust input 1,2,3,4 to get to the correct
1           digit number since you need 2 digits, so 1 points to digit 1,
-           2 points to digit 3, 3 points to digit 5, and 4 points to digit 7
+
9
x<->y
-
rcl (i)     i must be set prior to entering routine m
x<->y       to point to vars A,B,C, or D
10^x
/
fp
100         so you get the 2-digit number, like 05 or 12
x
ip
rtn         returns with the appropriate value in x
lbl x       this subroutine converts numbers 1-16 in the main loops
ip          to the appropriate variable (i) (1,2,3,4) and index (1,2,3,4)
sto x       and then returns the value of that character
3
+
4
/
ip
sto i       so correct variable A,B,C,D will be referenced
rcl x
enter
enter
4
/
ip
4           this will give x mod 4, but if it is 0
x           it needs to be 4
-
x=0
4
```

```
xeq m      now that i and x mod 4 are set, call m to get the value
rtn
```

Re: a challenge related to the 15 puzzle

*Message #14 Posted by **Don Shepherd** on 16 Jan 2011, 8:22 p.m.,*
in response to message #13 by Don Shepherd

The same program on the 32s takes about 32 seconds, a bit faster than the 32sii, which I have observed before. On the 32s, however, I can't display INVALID or VALID since it does not have the algebraic equation solver, so I just show the number of inversions; if the number is even the arrangement is solvable.

I had a question about why the -7...7 loop is more memory efficient than going from 1 to 15. As it turns out, the 48G is not the only place one can use this trick. Several programmable calculators have an exploitable memory trick when it comes to byte conservation.

```
Calc   Memory Trick                                          Ref
-------------------------------------------------------------------
32S    integers 0..99 use 1.5 bytes instead of 9.5     UM, p. 874
32SII  integers 0..254 use 1.5 bytes instead of 9.5    UM, p. 12-22
48G    Built-in objects (int. -9..9, pi) use 2.5 bytes
       instead of 10.5                                 AUM, p. 3-41
48gii  same as 48g                                     AUM, p. 3-30
49G    same as 48g                                     AUM, p. 3-30
49G+   same as 48g                                     AUM, p. 3-30
50G    same as 48g                                     AUM, p. 3-30

UM= USERS MANUAL
AUM= Advanced Users Manual

in response to message #1 by Don Shepherd

Here is an interesting article from "The Mathematical Gazette" in 1926 that describes a rather unique way of determining whether a specific configuration is solvable. It assumes that the empty position is always the 16th position, so it won't work for every possible configuration (it seems to me). But it is interesting that somebody figured this out in 1926.

Update:9100A with no display

*Message #1 Posted by **Richard Wilder** on 15 Jan 2011, 7:25 p.m.*

Still no display... I've verified the KB as OK. Probing on the core data board I found that D3 is not pulsing. All other Dn's are pulsing at the respective sense amp output transistor collectors (labeled D(n) on the schematic.) The inhibit FF's (F20 - F25) are all toggling except F25 which is D3's inhibit. K25 is toggling but J25 is not. J25 is the OR of BAddrE' and SC4 and a couple other signals. BAddrE' and SC4 are both toggling but at any given time one is a logic 1 so J25 is stuck at 1 (0V). And now I'm hoplessly lost... ;^P

HP-67 advice needed

*Message #1 Posted by **Alberto Fenini** on 15 Jan 2011, 5:34 p.m.*

Dear All,
I'm restoring an HP67, which was in bad to very bad conditions.
Battery contacts missing, very dirty and with a lot of oxidation.
I've cleaned the keys, the faceplate, and put all the electronics
in some vinegar for few hours.
I have recovered a couple of new battery contacts from an HP97
power pack and I have put some pieces back together.

I'm using a working HP-67 for the troubleshooting.
If I install the working board in the cleaned keyboard this is what I get

Would you think of a bad soldered pin on the cathode or anode drivers or something more serious ??
Also, the back of the keyboard plate had some corrosion and has been partially recovered, now it looks now like :

Could this also be responsible for the bad display ??

If I put the cleaned board

into the working HP67 all I get is the low battery led turned on.
I'm planning to do some seriuso rework in this unit,
desoldering everything an polishing the pcb, unless you have
a better idea.

As always, thanks in advance for any suggestion given
take care, Alberto

in response to message #1 by Alberto Fenini

Sorry that I cannot offer any tips or help.

But I couldn't resist offering some admiration. That is one deep dive. I wish I had the skills and patience to do the same.

Re: HP-67 advice needed

*Message #3 Posted by **aj04062** on 15 Jan 2011, 10:43 p.m.,*
in response to message #1 by Alberto Fenini

Can you light all the LED modules? I had a 65 with a similar problem, but it was only one module that was bad.

I'd have to go back to the schematic on the module, but I'd suspect a bad module.

Re: HP-67 advice needed

*Message #4 Posted by **Randy** on 16 Jan 2011, 9:50 a.m.,*
in response to message #1 by Alberto Fenini

Use a better test value, key in 8888888888 EEX 88 CHS

If you cannot enter the test value, check for operation of the bottom 4 x 4 grid of keys on the keyboard: all numeric keys and the 4 basic math functions. Start troubleshooting any inoperative keys looking for open traces as the keyboard scan lines and display cathodes are multiplexed.

Don't forget this: HP-67 Internals

in response to message #1 by Alberto Fenini

What is that symbol on the lower left corner ?... mine has an HP symbol there (I think). That board sure looks terrible :(.

Re: HP-67 advice needed

*Message #6 Posted by **Alberto Fenini** on 16 Jan 2011, 5:26 p.m.,*
in response to message #1 by Alberto Fenini

ciao a tutti
first let me tell that I'm able to light all the segments, and all do look like the first three shown in the picture.
As far as for the display, I have desoldered both the drivers and soldered them back again, but it didn't change a bit
I'll try to do what Randy suggests, but as far as I could remember, keys were operating correctly.

I have stripped all the components from the PCB :

and with the help of a 600 sandpaper and water, carefully tried to bring some connectivity back

I have then resoldered all the components back.
Red circles show damaged traces and I will restore those connections with a very thin isolated wire later.
However, using it as it is, in the working unit I have, it behaves exactly like yesterday ...

I think I'm going to keep the case as spare parts .... :) but I'll do any test that you would suggest

take care and thanks again Alberto

Re: HP-67 advice needed

*Message #7 Posted by **Randy** on 16 Jan 2011, 8:09 p.m.,*
in response to message #6 by Alberto Fenini

We have a misunderstanding due to the terms you have used.

A classic display has 15 ***digits***. There are 3 LED packages of 5 digits each. Each digit has 7 ***segments*** plus the decimal point.

The original picture you posted has "0.00" displayed but each digit that is illuminated is missing segments c, e and f. If every digit illuminates but it is missing the same segments (c,e and f), the problem is open traces or bad transistors within the 1858-0050 IC on the keyboard assembly. It would be a simple matter to test each transistor with an ohmmeter using Tony's information on the 67 Internals article that I referenced in my previous post.

You may also find this of some help: http://www.classiccmp.org/calcmuseum/clasdisp.htm

hp-41C: Statistic pac overlay??

*Message #1 Posted by **Ignacio Sánchez** on 15 Jan 2011, 11:05 a.m.*

Hello everybody,

I have seen a HP-41CV statistics PAC module for sale. The question is if this module has, or not, keyboard overlays? The Math PAC i.e. has a pair of overlays, but I don't know about the Statistics one? Thank you!

Ignacio

programming HP35s in algebraic mode, please.

*Message #1 Posted by **Kip Hopkins** on 14 Jan 2011, 8:19 p.m.*

I have a carpentry trigonometric program written in algebraic mode. I got it to go in RPN, but programmed in the original algebraic, I only get "syntax error" as the result. HP35s should do both?

Re: programming HP35s in algebraic mode, please.

*Message #2 Posted by **Martin Pinckney** on 14 Jan 2011, 9:02 p.m.,*
in response to message #1 by Kip Hopkins

From the 35s manual:

> Quote:
>
> **Selecting a Mode**
>
> Programs created and saved in RPN mode should be edited and executed in RPN mode, and programs or steps created and saved in ALG mode should be edited and executed in ALG mode. If not, the result may be incorrect.

Re: programming HP35s in algebraic mode, please.

*Message #3 Posted by **Kip Hopkins** on 15 Jan 2011, 12:16 a.m.,*
in response to message #2 by Martin Pinckney

I tried to do all steps and execution in algebraic. I switch mode to algebraic....get it in programming mode. The program reads something like: Sto D, x,Rcl A, +,....etc...So, I hit Sto D and it shows a right arrow and the D, and so I hit enter and fill in the next line or command. RPN mode displayed "Sto D", not right arrow D, but there may be a different display language in algebraic. I followed the program in this carpentry book and it just displays "syntax error". I had translated the book's algebraic to RPN by some forum's help, years ago, and the program is fantastic. The calculator is supposed to do both and a calculator in my childish algebraic would be less thought on the job. Oh, and I did remember the Rtn. command.

Re: programming HP35s in algebraic mode, please.

*Message #4 Posted by **David Hayden** on 15 Jan 2011, 8:36 a.m.,*
in response to message #3 by Kip Hopkins

Kip,

Can your reduce the program to a small example that shows the problem that you're having? If we can see something specific, we can probably help.

Dave

Re: programming HP35s in algebraic mode, please.

*Message #5 Posted by **Dieter** on 15 Jan 2011, 9:18 a.m.,*
in response to message #3 by Kip Hopkins

I'm not sure if I got your point, and to me all this sounds much more complicated than it actually is, so maybe it's a good idea to simply recall some basics here:

1. The 35s can be used in RPN as well as in ALG mode. Just as manual operation in these modes is completely different, so is programming: Every program you write has to be written explicitely *either* for RPN-mode execution *or* for ALG-mode execution, and it also has to be entered in this mode. If you're changing modes frequently it's a good a idea to place a RPN resp. ALG command right at the beginning of your program to make sure it's executed correctly.

2. If you're familiar with RPN but all you got is a program written for ALG-mode, you do not have to rewrite the program. Simply insert an ALG command at the very beginning so that the program runs as intended, and put a RPN command right at the end to switch back to your preferred RPN mode.

3. In some cases programs can be written in a way that allows correct execution both in ALG and RPN mode. This can be done by using equations and/or storage/recall arithmetics. For instance like this (Pythagorean theorem):

```
Classic version        Using equations

LBL C                  LBL C
RCL A                  SQRT(A^2+B^2)>C   equation: ">C" is "STO C"
X^2                    VIEW C
STO C                  RTN
RCL B
X^2
RCL+C
SQRT
STO C
VIEW C
RTN
```

   The classic version *must be entered in RPN mode!* Otherwise STO-instructions will be recorded as equations with these solid right-arrows you already mentioned, leading to syntax errors! The equation-based solution can be entered and executed in both modes.

If all this still doesn't solve your problem please give a specific example so that we're able to help.

Dieter

*Message #6 Posted by **Kip Hopkins** on 15 Jan 2011, 5:41 p.m.,*
in response to message #5 by Dieter

Thank you for your responses. Don't go overboard for me....protect your time, if you need to. But I'm reading and will be trying. At the end of this I will put down the full programs and their intent. And printing what you've put down and bringing that to my kid's tutor has already gotten me there, undoubtedly. Dieter's post starting: " I'm not sure..." will probably be over my head, but let me address something. Point #1, On changing modes frequently, I may never go to RPN, again, if I can program and run algebraic and so explaining "RPN resp. ALG" may be time wasted. "resp." may mean respond as, but I don't find that as a button or key. Point#2: I think that my former small

successes in RPN had the display TOP as top of the list. I only will do this one "rake wall" program, so I'm not labeling my program. It sounds like I could leave my great RPN program in there and line one could be that ALG command, but what buttons to push. But...I shouldn't go down that road, huh? I think Dieter's point#1, and line starting "Every program..." is what I need to plod towards. And this guy can help me, I'm sure. I prefer this as a project with you guys, but I have 4 day blocks off the computer, so don't feel ignored. That "Classic version..and Using equations" almost looks like I could learn that with some quiet hours. Or that guy. Thanks. Program from "Carpentry Layout", Ken Todd, '88. I assume ALG. STO D, x, RCL A, +, RCL C, =, STO E, RCL D, x,RCL B, =, STO F The book leaves out RTN, but I assume it's needed. And this program needed Height Multipier in MEM A: 2/12=0.1666667, STO A. And the Rake Multiplier in MEM B: 2 squared + 12 squared=an answer, square root of, /12=1.0137938, STO B. And the height or length of the first stud...maybe 92.25, STO C. When out of program mode, put in the short point of the first stud, say 15.25", hit R/S for Run and you get the distance along the rake or hypotenuse. Hit RCL E and you get short point length of that stud. With a forum's help I think that I learned how to interpret that into RPN. It works for me, but I yearn for the ALG. So, it's: STO D, RCL A, x, RCL C, +, Enter, STO E, RCL D, RCL B, x, Enter, STO F, RTN. And remember that all is over my head and I just need to get the one program in ALG, or, heck, I can always just this last in RPN. Still a good day. Thanks for reading, if nothing else. Right now Carmel Valley is warmer than my house and so I have the doors wide open in January.

I prefer this as a project with you guys, but I have 4 day blocks off the computer, so don't feel ignored. That "Classic version..and Using equations" almost looks like I could learn that with some quiet hours. Or that guy. Thanks.

Program from "Carpentry Layout", Ken Todd, '88.

I assume ALG.

```
STO D,
X,
RCL A,
+,
RCL C,
=,
```

```
STO E,
RCL D,
x,
RCL B,
=,
STO F

The book leaves out RTN, but I assume it's needed.
```

And this program needed Height Multipier in MEM A: 2/12=0.1666667, STO A.

And the Rake Multiplier in MEM B: 2 squared + 12 squared=an answer, square root of, /12=1.0137938, STO B.

And the height or length of the first stud...maybe 92.25, STO C.

When out of program mode, put in the short point of the first stud, say 15.25", hit R/S for Run and you get the distance along the rake or hypotenuse. Hit RCL E and you get short point length of that stud.

With a forum's help I think that I learned how to interpret that into RPN. It works for me, but I yearn for the ALG.

So, it's:

```
STO D,
RCL A,
x,
RCL C,
+,
Enter,
STO E,
RCL D,
RCL B,
x,
Enter,
STO F,
RTN.
```

And remember that all is over my head and I just need to get the one program in ALG, or, heck, I can always just this last in RPN. Still a good day. Thanks for reading, if nothing else. Right now Carmel Valley is warmer than my house and so I have the doors wide open in January.

Re: programming HP35s in algebraic mode, please.

*Message #8 Posted by **Dieter** on 15 Jan 2011, 7:06 p.m.,*
in response to message #6 by Kip Hopkins

Since the original program is from '88 it obviously wasn't programmed on a 35s which appeared almost 20 years later. Many things are different today - for instance there is no "="-key to finish a calculation, ENTER is used instead. Anyway - without extensive explanations, simply try this:

- Press GTO . . to place the calculator at the top of program memory (GTO followed by 2x decimal point). Make sure ALG mode is on by pressing MODE 4.
- Switch the 35s to program mode (blue shift R/S) to see PRGM TOP
- Enter the following program (of course without the line numbers)

```
0001 LBL A   (blue shift key, XEQ key, A)
0002 STO D
0003 RCLx A  (Press RCL, multiply, A)
0004 RCL+ C
0005 STO E
```

```
0006 RCL D
0007 RCLx B
0008 STO F
0009 RTN     (yellow shift key, XEQ key)

Quit program mode.
```

- Test in ALG Mode:

```
2 / 12 ENTER  STO A ENTER  result is 0,1667, display shows LASTx>A
2 y^x 2 + 12 y^x 2 ENTER   display shows 2^2+12^2, result is 148
squareroot LASTx ENTER     "LASTx" is blue-shift ENTER,
                           result is 12.1655
/ 12 ENTER                 divide this by 12, result is 1.0138
STO B ENTER                display shows "LASTx>B"
92,25 STO C ENTER          display shows 92.25>C

Press GTO .. again - just to be sure.
```

- Enter 15,25 and press R/S (or XEQ A), get the result 15.4604
- Press RCL E ENTER and see that E is 94.7917

This program will work both in ALG mode as well as in RPN mode.

All this just scratches the surface of what your HP35s can do for you. You will have to read the manual and get more accustomed to it to use its full potential. Your carpentry program could be much more powerful and way easier to use. ;-)

Dieter

*Message #9 Posted by **Kip Hopkins** on 16 Jan 2011, 12:04 a.m.,*
in response to message #8 by Dieter

I can't write in columns. Not savvy. Sorry. I did:GTO decimal decimal.....MODE 4....blue shift R/S...and saw PRGM TOP. LBL A went well. That line 0002, though, is heading me down that old path. I did STO D and got that solid right arrow and a D and a blinking space that I can only kill with an ENTER. I can make it read like Dieter's, but only in RPN, which may be what Dieter meant. In that ALG MODE test, just below in Dieter's post, I put it into ALG and at that MEM B, I got the Syntax Error.

Re: programming HP35s in algebraic mode, please.

*Message #10 Posted by **Dieter** on 16 Jan 2011, 8:32 a.m.,*
in response to message #9 by Kip Hopkins

> Quote:
>
> I can't write in columns.

You can. For a new paragraph simply press Return twice. Or press the "newline" button below the edit window, this will insert a [nl]. If you want to look everything the way you entered (like the program listing above) use the "preformatted" button or enclose that section in [pre] ... [/pre] tags.

> Quote:

> I did:GTO decimal decimal.....MODE 4....blue shift R/S...and saw PRGM TOP. LBL A went well. That line 0002, though, is heading me down that old path. Right - my fault. Although the program can run both in ALG and RPN mode, it has to be entered in RPN mode, not in ALG. So press MODE 5 (not 4), then switch to program mode, enter the listing, quit program mode and switch back to ALG with MODE 4.

> Quote:
>
> In that ALG MODE test, just below in Dieter's post, I put it into ALG and at that MEM B, I got the Syntax Error.

What "MEM B"? There is no such key on the 35s. To store a number use the STO key, to recall a number use the RCL key. The "MEM" is something completely different, it shows the memory used for variables and programs.

Just try again, set MODE 5, enter the program, switch back to MODE 4 and everything should work as expected.

Dieter

Re: programming HP35s in algebraic mode, please.

*Message #11 Posted by **Kip Hopkins** on 16 Jan 2011, 6:28 p.m.,*
in response to message #10 by Dieter

Wow. I was reading Dieter's 2y,up arrow, x, 2 as the x2 button, but then I recouped after 45 mins. of Syntax Error and spied the y-thing button. It works.....It works! Thank you, Dieter. None of my TI-30xA had that....no, I see it. Just never really saw it. My next move will be to try to understand how all those STO E's...etc....really work. The Program. You got me as far as I'd intended to go, but I like your idea of spending time with that manual tome.
I just tried the newline thing and I'll spy back and see if it worked.

Return twice worked? I'm doubting that one.Preformat? Try.

```
REPLACE THIS TEXT WITH YOUR LISTING
```

line 1 line 2 ...doubt..not important. line 3...etc
Thank you guys, so much. Doubt I'm welcome back. All your bruised foreheads!

Printing quality on HP-97

*Message #1 Posted by **Christophe Dubreuil** on 14 Jan 2011, 8:18 a.m.*

I just repaired the magnetic card reader of my HP-97. It is now working !

But after re-assembling it, the print quality drop down : * Globally lighter. * A line is sometimes missing..

I looked after contacts and positionning but i don't see anything wrong.

Does anybody have any idear what i might have unvoluntarily modified ?

Thanks

Christophe Dubreuil

OT - Collecting: calculators, ... and what else?

*Message #1 Posted by **Nenad (Croatia)** on 14 Jan 2011, 4:34 a.m.*

Hi to all. After several months I am back here to this wonderful forum.

Meanwhile, I have developed an additional addiction except collecting of calculators: collecting invaluable engineering information such as international (ISO, EN, CEN) and national (BS, DIN, VDI, VDA) standards, just for my personal education. Actually, with a little effort, the majority of these standards can be found free on the Web.

My try to find out if this is an information (the availability of free standards on the Web) well known to everybody did not give any outcome. So, I ask you here: is it something commonly known?

Thinking that there are many engineers here who may be interested in this topic, I will be glad to share my experience here, but subject to the following:

If you find this post inappropriate in any aspect (discussing about something that can violate copyright), the currator is welcome to delete this thread immediatelly.

Re: OT - Collecting: calculators, ... and what else?

*Message #2 Posted by **Walter B** on 14 Jan 2011, 7:34 a.m.,*
in response to message #1 by Nenad (Croatia)

AFAIK, in Germany it's very limited fun looking for free standards of the kinds you mentioned. There is one large publisher and some smaller ones taking care of their income ... There may be other ways, though.

Re: OT - Collecting: calculators, ... and what else?

*Message #3 Posted by **Martin Pinckney** on 14 Jan 2011, 9:12 a.m.,*
in response to message #1 by Nenad (Croatia)

In the U.S., it is somewhat similar to what Walter said. Government agencies do distribute free (usually) their standards via the Web. In times past you had to pay for printed standards to cover the cost of printing, at least. The Internet has changed all that. Examples are Army Corps of Engineers, Naval Facilities Command, Federal Highway Administration, state transportation departments.

On the other hand, NGO's that promulgate standards are almost always provided for a fee. Examples are American National Standards Institute, American Concrete Institute, American Society for Testing Materials.

There are exceptions, such as Underwriters Laboratories, or trade groups supported by their members. Some of these provide some standards for free, charge for others.

Corrected one word. See Karl's post.

Assume you were talking about NIST here, I had a different understanding of the abbreviation "NGO" so far.

Re: OT - Collecting: calculators, ... and what else?

*Message #7 Posted by **Dave Shaffer (Arizona)** on 14 Jan 2011, 11:43 a.m.,*
in response to message #6 by Walter B

"NGO" = non-government organizations

Re: OT - Collecting: calculators, ... and what else?

*Message #8 Posted by **bill platt** on 14 Jan 2011, 1:45 p.m.,*
in response to message #6 by Walter B

NIST is the National Institute of Standards and Technology and is a federal agency "NIST is a non-regulatory federal agency within the U.S. Department of Commerce. NIST's mission is to promote U.S. innovation and industrial competitiveness by advancing measurement science, standards, and technology in ways that enhance economic security and improve our quality of life."

```
Examples of NGO would include but not be limited to:
SAE
ANSI
AISI
AISC
ASTM
etc
```

There are a lot of engineering requirements free in the CFR (code of federal regulations).

Then there are free standards at most of these:

```
BV
LR
DNV
GL
ABS
RINA
```

It's ironic - so much effort is expended to create standards and then they are almost shrouded in secrecy by not being made freely and widely available.

John

John, I think they are widely available, just not freely. Anyway, I believe it's about cost, not secrecy. After all, the only reason the government-promulgated standards are "free" is because our taxes already paid for developing them.

Re: OT - Collecting: calculators, ... and what else?

This is exactly the point, John. Experts delegated by companies/nations into Technical Committees and paid by their companies create standards in one or several years debate with a great effort and after that someone else (e.g. ISO Geneva) sells them worldwide through their webpage for a signifficant amount of money.

But there is another (easy!) approach, instead of giving a lot of money to someone who is the document owner, though did not create it ... Is it correct that I say something about it here? Would this information violate moHP policy? Are you, dear engineers, interested in reading standards you don't have available?

I know something I would tell, I would tell, I would tell, ...

Green LED HP 45?

*Message #1 Posted by **ClausB** on 13 Jan 2011, 10:33 p.m.*

Auction

Interesting story. Is it true?

Re: Green LED HP 45?

*Message #2 Posted by **Martin Pinckney** on 13 Jan 2011, 10:54 p.m.,*
in response to message #1 by ClausB

My guess is yes. Too much plausible detail to be made up. Unless a very sophisticated con artist. Anyway easily debunked if untrue.

This may end up being the "$9000 Red - err - Green Dot(s)."

Re: Green LED HP 45?

*Message #3 Posted by **db (martinez, ca.)** on 13 Jan 2011, 11:20 p.m.,*

> Bill Hewlett used it for a few months and gave it back to my Department Head, Dr. Paul Green. Bill's comment was "You have to go into the Men's room and turn off the light to be able to use it"

I've been in Bill's office, which along with Dave's is kept as they used them. Window walls - lots of light. I can see the problem. I didn't go into the (shared if i remember correctly) bathroom.

I hope the buyer submits a good photo to the Museum.

in response to message #1 by ClausB

regarding the current consumption (running for 20 minutes), technically is very true. early green LEDS were extremely inefficient compared to red, hence why red was almost universally used back then. now, today the matter is quite different.

i have a couple of moderately scruffy 31E units with defective displays (bubbles in the plastic lens - probably since new) that i'm considering doing a similar sort of operation to, except replacing the displays with much larger orange LED digits of 1/2" height.

rob :-)

You don't _know_ whether he has been asked or not;-)

Re: Green LED HP 45?

*Message #14 Posted by **Maximilian Hohmann** on 16 Jan 2011, 6:06 a.m.,*
in response to message #13 by Raymond Del Tondo

Good morning!

> Quote:
>
> You don't _know_ whether he has been asked or not;-)

And, what did he say?

Anyway, if the final price for this thing will go anywhere near to where we expect it to go, it will be cheaper to travel to the US and collect it in person than to pay the inevitable import tax into the European Union if it gets shipped by mail.

Cheers, Max

Re: Green LED HP 45?

*Message #15 Posted by **Keith Midson** on 16 Jan 2011, 5:27 p.m.,*
in response to message #10 by Walter B

When an item is listed for sale within its country of origin it won't come up in search results for other countries sites unless it is listed for shipping to other countries. You can enter the item ID

to get the item to come up so you can still view it, but you need to know that it's there. You can even bid (well I did on this item!!), but if it's not offered for sale within that country then it won't show up in that country's TAS site (in my case e*ay.com.au, also eb*y.co.uk, *bay.co.nz, etc) then it won't come up in a search result that's all. Nothing to do with censorship. Cheers, Keith

Edited: 16 Jan 2011, 5:28 p.m.

Re: Green LED HP 45?

*Message #16 Posted by **Walter B** on 17 Jan 2011, 2:19 a.m.,*
in response to message #15 by Keith Midson

Keith,

you can avoid this by searching on the local website(s) of TAS yourself. IMO the US-site is worthwhile browsing, a few others as well - <5 in total on this planet. BTW, did you see the ;) in my posting above?

HTH, Walter

in response to message #5 by Martin Pinckney

I suppose it might have some small historical interest, but in the end it is just another modified calculator. While the mods were not trivial, they are not rocket science either. I'll pass.

Re: Green LED HP 45?

*Message #19 Posted by **Katie Wasserman** on 14 Jan 2011, 8:35 p.m.,*
in response to message #18 by Donald Williams

> Quote:
>
> but in the end it is just another modified calculator

I don't see it that way at all, it's a prototype that never made it into production, I think that makes it quite valuable.

I think it would be more than difficult to mod an HP-45 to have a green display. Finding any displays, much less green ones, that fit and look right in the classic calculators would be extremely difficult. More likely impossible, if this didn't come from HP. At the time HP had an entire division producing similar displays but not this one. So this is both a prototype calculator and a prototype display.

Re: Green LED HP 45?

> I don't see it that way at all, it's a prototype that never made it into production, I think that makes it quite valuable.

If the story is true, to a *serious* collector, it's value must derive from both its uniqueness and its direct association to Bill Hewlett.

Re: Green LED HP 45?

*Message #21 Posted by **Donald Williams** on 15 Jan 2011, 12:30 a.m.,*
in response to message #20 by Martin Pinckney

I suppose I should reconsider my objection's. I think I might just start "dumpster diving" at the Apple headquarters in Cupertino. If I can salvage some of the failed prototype's that Steve Jobs has recently rejected, maybe the income from the auctions can support me in my old age.

Re: Green LED HP 45?

*Message #22 Posted by **Gerson W. Barbosa** on 14 Jan 2011, 8:20 p.m.,*
in response to message #5 by Martin Pinckney

Really not interested. Too green for my taste :-)

Re: Green LED HP 45?

*Message #23 Posted by **Alan Andrews** on 16 Jan 2011, 11:36 a.m.,*
in response to message #22 by Gerson W. Barbosa

Hi Everyone,

I am the guy selling the Green display HP-45. My normal profile on EBAY is for shipping only to the U.S. I got a request from a Calculator museum in Europe and changed my profile to allow international shipping. I tried to edit the listing to drop the "U.S. only" but editing is not allowed once the reserve has been exceeded. So yes, I will ship it internationally. I cannot explain about Australia.

My story is true. Sincerely, Alan

Edited: 16 Jan 2011, 1:36 p.m. after one or more responses were posted

Re: Green LED HP 45?

*Message #24 Posted by **Martin Pinckney** on 16 Jan 2011, 12:50 p.m.,*
in response to message #23 by Alan Andrews

Alan,

Thanks for chiming in. A remarkable story. Best of luck on the auction.

By the way, be sure to send photos to Dave Hicks before you ship it!

HP 17BII Dropped!

*Message #1 Posted by **Mike D** on 12 Jan 2011, 5:40 p.m.*

I have a 17BII that I dropped on a ceramic tile floor. Now the calculator works but the keys on the right side do not work. I have read some material in this forum on how to open the caluclator, but not how to repair the problem keys, if that is possible. Please point me in the right direct for information on how to repair the keys.

Sorry if this is redundant, but I did see anything in the archive posts. I was also reading about Geoff Quickfall's book on restoration, but didn't know where or how to buy it.

Thanks for the help,

Mike D

Re: HP 17BII Dropped!

*Message #2 Posted by **Martin Pinckney** on 12 Jan 2011, 8:36 p.m.,*
in response to message #1 by Mike D

Mike, I have not tried any repair, and there are many members of the forum you have, but since they are a little slow to respond, you might try this or even this.

Re: HP 17BII Dropped!

*Message #3 Posted by **Allen** on 12 Jan 2011, 10:07 p.m.,*
in response to message #1 by Mike D

They are relatively inexpensive and abundant on ebay, why spend time and money repairing? If it were a 42s it would be a different matter.

Have you tried pressing on the bezel while you press the keys?

Re: HP 17BII Dropped!

*Message #4 Posted by **Walter B** on 13 Jan 2011, 4:09 a.m.,*
in response to message #1 by Mike D

FYI, Geoff's book is not available yet.

Running an HP7475A plotter on the HP-IL Loop

*Message #1 Posted by **Richard L. Taylor** on 11 Jan 2011, 10:14 p.m.*

Hi; I am working on a computer project. It involves the Hewlett Packered HP41cx handheld computer. I would like to use my HP41CX to drive my HP7475A plotter that has an HP-IB interface. I have the following items:

```
1.  HP41CX
2.  HP 5061-5238 PLOTTER MODULE
3.  HP 82160A HP-IL I/O MODULE
4.  HP 82183A EXTENDED I/O MODULE
5.  HP 82169A HP-IL / HP-IB INTERFACE UNIT
6.  HP 9114B  3.5 INCH FLOPPY DRIVE
7.  HP 82161A DIGITAL CASSETTE DRIVE WITH MINI CASSETTES
8.  HP 82162A THERMAL PRINTER
9.  A NUMBER OF HP-IL CABLES
10. HP 7475A PLOTTER WITH AN HPIB INTERFACE
11. L-com CMP SERIES - IEEE - 488 GPIB CABLE TO CONNECT THE PLOTTER TO THE HP-IL / HP-IB
INTERFACE UNIT
```

The HP-IL loop works just fine with the floppy drive, cassette drive and the printer. I just can't get any response from the plotter. The plotter is on the end of the HP-IL loop

```
3.5 INCH FLOPPY DRIVE                    =  HP-IL address 1
DIGITAL CASSETTE DRIVE                 = HP-IL address 2
THERMAL PRINTER                           = HP-IL address 3
HP-IL / HP-IB INTERFACE UNIT      = (HP-IL ?) address 4 ---- Here I set the dip switches
PLOTTER                                                 = (HP-IL ?) address 5 ---- Here I set the
dip switches
```

I have tried every thing that I can think of to get the plotter to responed to the HPGL commands sent through the HP41cx and no luck. I tried Sending the HPGL commands with or with out an ESC character (ascii no. 27) with the HP-IL command OUTA. Can any one help me with this? I would be very greatful.

Re: Running an HP7475A plotter on the HP-IL Loop

*Message #2 Posted by **Garth Wilson** on 12 Jan 2011, 12:30 p.m.,*
in response to message #1 by Richard L. Taylor

I have done tons of I/O with the 41cx through multiple instruments on the other side of the 82169A HPIL-to-HPIB interface converter, although not in recent years, and not with the plotter. Can you post some 41cx code? Did you put it in MANIO and use SELECT to select the plotter's address? Does the plotter seem to respond to the IN (initialize) command? Do you have the plotter manual?

As I remember, setting the DIP switches on the 82169A is only necessary if the controller is on the HPIB side. I don't think I ever touched them for controlling it from the HPIL side. If the plotter is at address 5, its DIP switches will be set to 00101. The plotter can have any address above the 82169A's address though. It does not have to be 5. After you get onto HPIB, the addresses do not have to be consecutive.

This is a continuation of the topic on TOS --> forum --> HPIL --> "Using an HP7475 plotter that has an HPIB interface."

Re: Running an HP7475A plotter on the HP-IL Loop

*Message #3 Posted by **Tony Duell** on 13 Jan 2011, 4:46 a.m.,*
in response to message #1 by Richard L. Taylor

I think the problem may be the DIP switch settings on the HP82169 interface.

What you want to do is set the 82169 to 'translator' mode, not 'mailbox' mode. The latter is for use when you have a controller (such as a computer or calculator) on both the HPIL and HPIB sides.

The simplest configuration has the 82169 as the last device on the HPIL loop -- that is the 'output' connector of the 82169 goes back to the calculator. Then set the plotter (or other HPIB devices) address switches to a number higher than the number of HPIL devices (here, you need to set it to 5 or higher). And then simply address the plotter as that device from the HPIL side.

I've never tried a 7475 plotter, but I've had no problems runnign a 7440 Colorpro plotter this way, using the HP41 plotter ROM.

Re: Running an HP7475A plotter on the HP-IL Loop

*Message #4 Posted by **Richard L. Taylor** on 14 Jan 2011, 2:48 p.m.,*
in response to message #3 by Tony Duell

Tony, I wonder if my plotter problem is with the plotters handshake parodical. I have the plotters HP-IB manual. I don't understand the handshake parodical commands Also, I wonder if it has something to do with the HP41cx flag 53 the I/O flag. I can"t work on this project to much because of my health (chronic pain) in my shoulders.

Multimeter HP 3468A, CMOS RAM battery replacement

*Message #1 Posted by **Frido Bohn** on 11 Jan 2011, 3:09 a.m.*

Hello,

the multimeter (HP-3468A) has a 3V lithium battery to prevent the deletion of the CMOS RAM while turned off. This is crucial because otherwise the calibration data would be erased.
My point now, is to ask whether someone has ever replaced this battery while maintaining the calibration data. According to the service manual, the CMOS RAM gets its supply voltage from the grid while the machine is turned on. So it would be obvious to do some soldering and replace the battery when the multimeter is turned on.
Another idea would be to keep the old battery. Then, to connect the new battery in parallel, and eventually, to disconnect the old battery.
However, I am afraid to produce some shorts or whatsoever which could drain the contents of the RAM anyway, or even worse, damage some other part of the multimeter.

Does anyone have some ideas or comments on this?
Any help is appreciated.

Best regards
Frido

Re: Multimeter HP 3468A, CMOS RAM battery replacement

*Message #2 Posted by **Ren** on 11 Jan 2011, 9:06 p.m.,*
in response to message #1 by Frido Bohn

Although I have calibrated and repaired HP multimeters in the the past, I am unfamiliar with that model or any that contain a lithium battery.

You may have posted this in desperation, or were you unaware this forum is for HP calculators?

I suggest posting your question the to sci.electronics.repair newsgroup, or Google search

Sincerely,

Ren

dona nobis pacem

Re: Multimeter HP 3468A, CMOS RAM battery replacement

*Message #3 Posted by **Eric Smith** on 11 Jan 2011, 9:24 p.m.,*
in response to message #2 by Ren

The 3468A has an HP-IL interface, so it was commonly used with the HP-41, HP-71, and HP-75. (Meters with an HP-IB interface could be used, but required the 82169A IL/IB translator.)

The 3468A calibration is stored in battery backed RAM. If the battery dies, you lose the calibration. Unfortunately mine had a dead battery when I received it.

Re: Multimeter HP 3468A, CMOS RAM battery replacement

*Message #4 Posted by **Martin Pinckney** on 11 Jan 2011, 11:07 p.m.,*
in response to message #3 by Eric Smith

> Quote:
>
> The 3468A has an HP-IL interface, so it was commonly used with the HP-41, HP-71, and HP-75.

Does this then, allow an "in" for Frido to ask the question here?

I know nothing about this unit, but just on general principles, it would seem that soldering a new battery in parallel (with the unit off), then removing the old would be preferable to doing any modifications while the unit is turned on.

Re: Multimeter HP 3468A, CMOS RAM battery replacement

*Message #5 Posted by **Katie Wasserman** on 12 Jan 2011, 12:49 a.m.,*
in response to message #4 by Martin Pinckney

I know nothing about this meter either, but found the service manual here.

The schematic shows that the memory is powered by diode steering logic going to the +5V supply and the 3.6 volt battery. Either will power memory. There's also a .1uf capacitor at the junction so even with no battery and the +5 volt supply off, memory will be preserved for at least a short while.

If I were going to replace the 3.6 volt battery I'd: (1) disconnect it from the AC power; (2) hook up an external 3.6 volt power supply thru a third (temporary) diode to this junction point using some good micro-clips; (3) remove the old battery by just clipping the leads (it's faster than desoldering); (4) solder in the new battery to those cut leads.

The reason for using 3.6 volts and going thru a third diode is just in case the your external power supply quits or is shorted out, you'd still have the .1uf cap to hold memory for a bit.

Re: Multimeter HP 3468A, CMOS RAM battery replacement

*Message #6 Posted by **Frido Bohn** on 12 Jan 2011, 4:32 a.m.,*
in response to message #5 by Katie Wasserman

Thank you, Katie!

I believe that your suggestion is the most sophisticated way to resolve the problem.

I know that the item is somewhat OT as it was stated by Ren. However, as Eric remarked, the multimeter has an HP-IL interface and may be considered as a peripheral of those HP calculators which support that interface. Therefore, I thought that it was not too remote to believe that someone in this forum could give some advice. Indeed, I purchased a used HP-3468A because I was curious to use it with my HP-41.
It works fine currently, and a loop together with a IL-printer can be established which then

serves as a logger. The issue with the battery does not urge. I use to check the voltage yearly and I planned to replace the battery when the voltage drops.
As I am only a medic whith no in-depth knowledge about electrical engineering I just wanted to be prepared for the day X. Also, I do not have the equipment for a new calibration, and because of that an *in vivo* replacement of the battery seemed to be a good option.
Apologies if I may have caused discomfort.

Best regards
Frido

I haven't done any of that with HP machines. Back in the early 1980's I was very active with that sort of thing with the TI-57, TI-59 and TI-66.

When the TI-66 came out page F-3 of the manual stated "There are no HIR commands or other hidden features on the TI-66 that you may have accessed on the TI-58/58C/59 through illegal key sequences." The first issue of TI PPC Notes published after the release of the TI-66 included some results with illegal sequences.

*Message #9 Posted by **Crawl** on 11 Jan 2011, 6:48 a.m.,*
in response to message #8 by Palmer O. Hanson, Jr.

Okay, seriously, I did discover how to do some limited programming on some Casio models (115ms and es, I think), which is not documented in the manual.

It's very limited because there's no conditional branching, and looping isn't automatic. But I've gotten use out of it for summing series, or using Newton's method in two dimensions.

Re: Calculators as amusement

*Message #10 Posted by **Paul Gaster** on 11 Jan 2011, 8:57 a.m.,*
in response to message #9 by Crawl

I would be interested in hearing more about what can be done with the FX-115 models if you could share. What I would really like is to be able to somehow enter the TVM equation into the FX-115ES

and solve for a variable, like on the 33S or 35S.

Re: Calculators as amusement

*Message #11 Posted by **Crawl** on 11 Jan 2011, 12:25 p.m.,*
in response to message #10 by Paul Gaster

Boy, I don't know. If you had a specific problem in mind, I could see if the 115 could solve it.

But like I said, there's no branching, so you wouldn't be able to choose what variable to solve for from a single multi-purpose program. There's also no long term program storage, which would also defeat the purpose of something like that.

Then some of the variables could be solved for simply by using the calculator's built in solver, I think.

So, yeah, I think it really depends on what you specifically want to do.

Re: Calculators as amusement

*Message #12 Posted by **Ron Ross** on 11 Jan 2011, 8:08 p.m.,*
in response to message #10 by Paul Gaster

That should be easily possible as the FX115 has a solver with six variables. The downside is that this calculator loses this function the minute it is turned off. Therefore not a machine you want to enter complex work on.

Re: Calculators as amusement

*Message #13 Posted by **Paul Gaster** on 12 Jan 2011, 11:03 a.m.,*
in response to message #12 by Ron Ross

I was just thinking along the lines of the FE and PE test that I hear usually have some TVM questions. With a 33S or 35S you can input the TVM equation and be ready to go. I think I also read somewhere that the materials provided on test day have equations and TVM tables that can be used. I did pass the FE about 15 years ago, but I don't remember much and I am sure things have changed. So it seems you can use the tables, have a programmed HP, or use the solver in the FX-115ES. If you have an FX-115ES now I know you can use that solver, but maybe the TVM tables are faster.

Overall my mind just got off on a tangent. I really like the FX-115ES and would like to know more about it. The HP offerings first need some programming to even match the FX-115ES in features, but of course with programming and equation storage you can eventually do more with an HP. The FX-115ES is a great calculator though, especially considering the low cost.

OT: Canon Pocketronic rebuild advice

*Message #1 Posted by **Michael Meyer** on 9 Jan 2011, 8:48 p.m.*

I'm finally getting around to rebuilding a Pocketronic in beautiful condition. Fortunately, the batteries did not leak much. Unfortunately, I do not have a charger, and I don't like rebuilding with rechargeables anyway. I'd like to rebuild it with non-rechargeable lithium cells. There is an assortment of cells inside, including a double and triple cell (2.4v, 3.6v) I have some Duracell photo AA's that are 3v. Does anyone see a problem with me mixing 1.5v lithium cells with 3v cells? I only plan to keep it on long enough to show it off (if I can even get it to fire up), so I don't think I'll overheat the cells. Any advice?

Re: OT: Canon Pocketronic rebuild advice

*Message #2 Posted by **Palmer O. Hanson, Jr.** on 9 Jan 2011, 9:14 p.m.,*
in response to message #1 by Michael Meyer

Somewhere in my collection I have an inoperattive Pocketronic so I will be interested in any advice.

I have found the mint condition 20 ampere high speed battery charger which came with it including the carton. Not suprisingly it is a big beast for a battery charger -- about 2" x 2" x 5".

Re: OT: Canon Pocketronic rebuild advice

*Message #3 Posted by **Katie Wasserman** on 9 Jan 2011, 11:21 p.m.,*
in response to message #1 by Michael Meyer

Michael,

I have a couple of Pocketronics and a Monroe 10 (the same thing in a slightly different case). Like you, I've retrofitted virtually all my calculators to use Energizer lithium cells.

The Pocketronic uses two voltages : 7 x 2/3AA nicads (8.4 volts nominally) and 6 x AA nicads (7.2 volts nominally). The trick is to come up with battery holders for AAA size cells that can both fit in the provided spaces and can be wired in series to provide adequate voltages. I was able to do this using the following (I'm doing this from memory, so don't hold me to it):

```
1 2xAAA holder where the cells are front to back (not side by side)
2 1xAAA holders (side by side)
1 4xAAA holder (side by side)
1 3xAAA holder (side by side)
```

(Mouser sells these, the 2xAAA holder front to back is hard to find elsewhere.)

That's a total of 11 cells: 6 for the 8.4 volt nominal supply and 5 for the 7.2 volt nominal supply. There's only one way you can position these 5 battery holders in the Pocketronic cavities but there are several ways you could wire them up in series -- have fun with that!

Also, in case you loose track of the current wiring in the process of replacing the cells, it's this:

```
violet color wire is the common for both voltages
```

```
green color wire gets +7.2 volts
orange color wire get -8.4 volts
```

The craziest color scheme I've come across in a calculator but they are very consistent from unit to unit (I've rebuilt several of these over the years) even in the Monroe 10.

-Katie

Re: OT: Canon Pocketronic rebuild advice

*Message #4 Posted by **robert rozee** on 10 Jan 2011, 4:57 a.m.,*
in response to message #3 by Katie Wasserman

hi, any chance of a photo of the machine? if going for non-rechargeables for just demo purposes i'd consider using a pair of 9v batteries, with a few diodes in series with each to drop down the excess voltage. provided, of course, they would fit in the available space - or you can leave the two battery snaps hanging out a convenient hole.

but do also consider that ni-cads will peak at 1.5 volts each when fully charged, so you will likely be ok just using the 9 volts direct. non-rechargeables don't have nearly so high a peak when brand new.

i remember once re-wiring an electric excavating arm that was used for demo purposes at a place where i worked (a JV with caterpillar). it had a reach of about 1.5 metres, with some hefty motors running it. i amazed everyone by running it off two little tiny 9v batteries in series while carrying out testing... worked fine, though obviously drained the batteries extremely quickly.

cheers, rob :-)

*Message #5 Posted by **Katie Wasserman** on 10 Jan 2011, 3:43 p.m.,*
in response to message #4 by robert rozee

I'm away form my collection for some time, but I'll try to post a pic in a week or two. Two 9V batteries might not work, the print head and drive motor both draw a ton of current in very short pulses. AAA lithium cells are more than up to the task but I don't think that a 9V alkaline battery is.

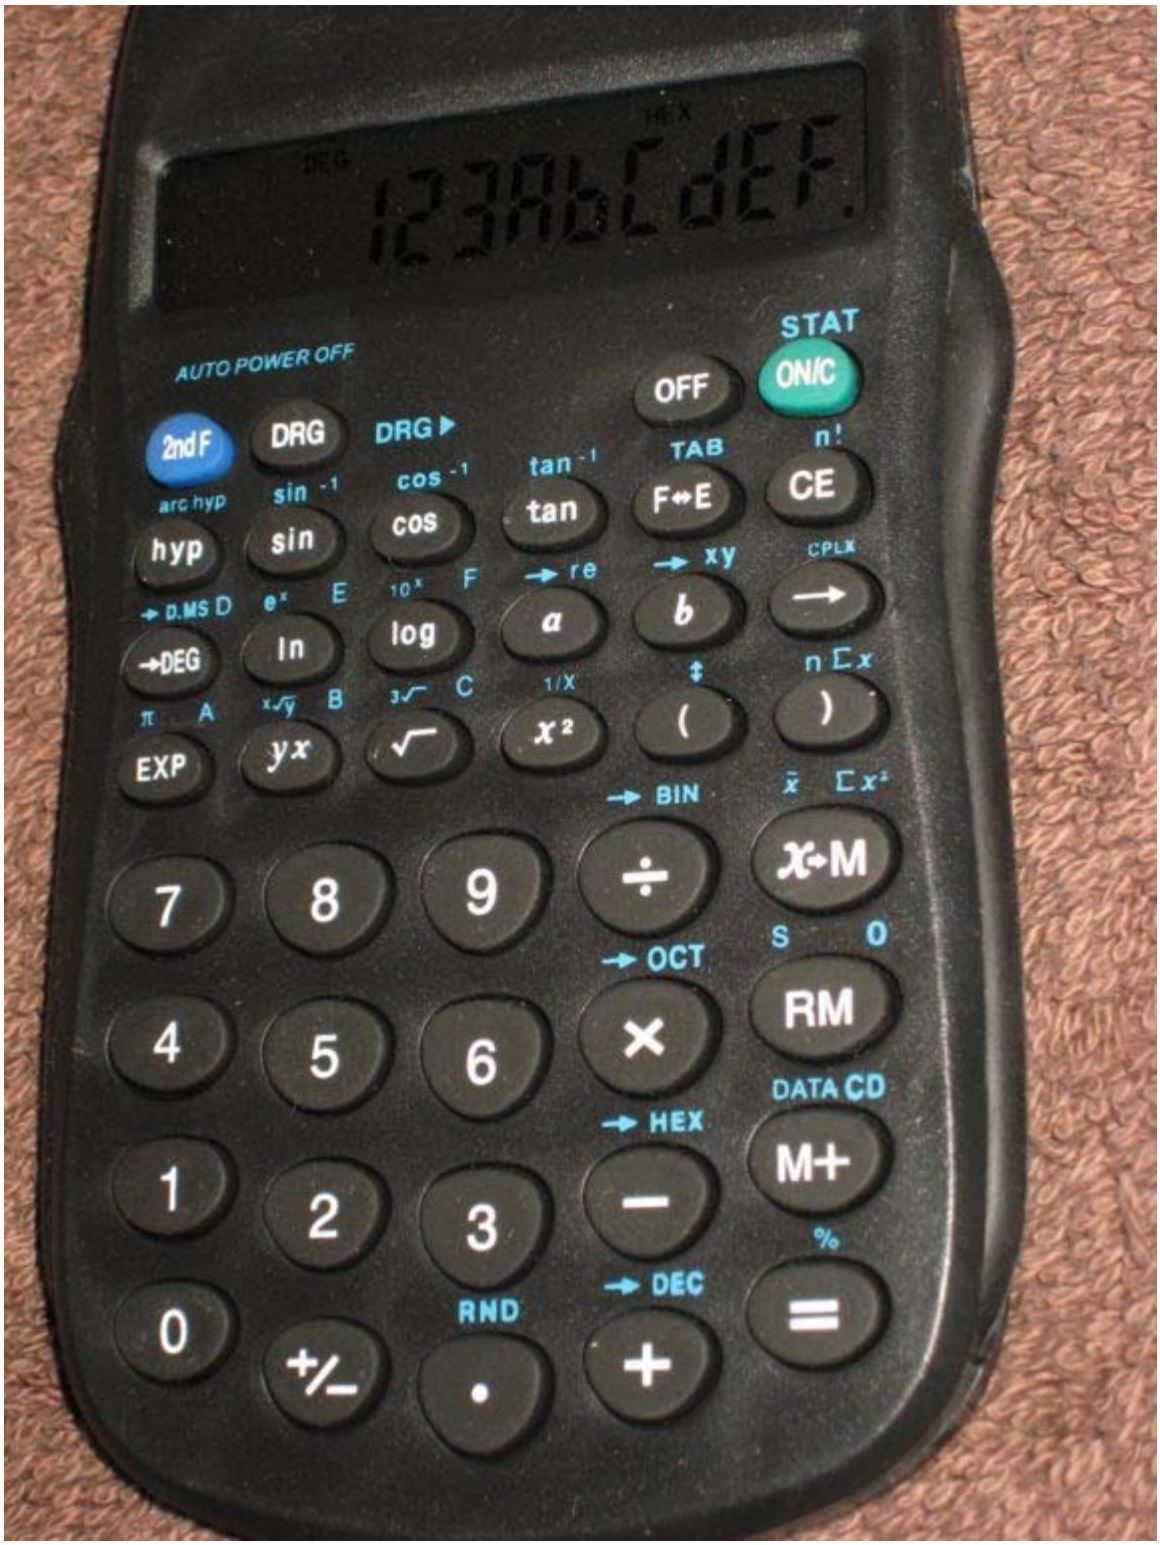
OT: Most sophisticated 99cent calculator

*Message #1 Posted by **Mike Ingle** on 9 Jan 2011, 1:36 a.m.*

The 99 cent store has sold 4-function calculators for a while. When I saw a "scientific" on the shelf I had to pick it up and look, and I got a real surprise:



Hex, octal and binary conversions. Ten digits. Parentheses. Complex numbers. Coordinate conversions. Deg.min.sec conversion. Single variable stats. For a buck? Really?

I bought one and tried it out. The functions all work, no missing display segments, and the keys all work and are quite usable for rubber keys.

The complex numbers appear to be just for four-function and coordinates, not for scientific functions. You press for example 2nd CPLX 1 a 2 b X 4 a 8 b = to do a complex multiply, then a and b to see the real and complex parts.

The hex mode is 40 bits (1-2 gives 10 Fs) so it understands two's complement. I was impressed and bought several

to give out to the coders at work.

Here's what the package looks like: Package photo

Here are scans of the two sides of the one-page manual (zoom to read): Side 1 Side 2

in response to message #10 by Walter B

I doubt if Ren is marketing products to the Chinese, but I could be wrong.

Reminds me of the '60s when we we actually could purchase Japanese-made electronics. We used to get a kick out of some of the grammar in the instruction books. At the time I remember thinking, they have an American distributor for their products, why can't they cough up a few bucks for a technical writer? But then we would not have had the enjoyment.

Of course this was for meaningful products, not a $1 calculator.

Re: OT: Most sophisticated 99cent calculator

*Message #12 Posted by **Walter B** on 11 Jan 2011, 11:59 a.m.,*

*Message #13 Posted by **Alejandro Paz (Germany)** on 11 Jan 2011, 12:36 p.m.,*
in response to message #11 by Martin Pinckney

Some years ago I bought a CD-ROM reader for a PC and the installation manual was translated to many languages, spanish among them. The spanish description of that small pin hole to extract the CD in the case the door does not open was described as "Emergency ejaculation". Sometimes "not even close synonyms" can bring you some problems ;-)

Re: OT: Most sophisticated 99cent calculator

*Message #14 Posted by **Mike Morrow** on 15 Jan 2011, 9:19 p.m.,*
in response to message #13 by Alejandro Paz (Germany)

I have a book describing WWII German submarine technical details. It is a translation from the original German into English. There are several paragraphs discussing generator "agitation". It didn't take but a few seconds to realize that the intended English term should have been "excitation" (the DC current flow in a generator rotor).

Such is always a possibility when the translator doesn't understand the details of the subject being translated.

So...what "99 cent store" is selling these scientific calculators for that price? All we have around this part of the US is "Dollar General".

Re: OT: Most sophisticated 99cent calculator

*Message #15 Posted by **Martin Pinckney** on 15 Jan 2011, 9:48 p.m.,*
in response to message #14 by Mike Morrow

I've seen several different brands of "dollar" stores. Most mean what most people would expect - that everything sells for $1 or less. But there is one brand where it means everything sells for a whole dollar amount, no cents!

Power management and deep sleep

*Message #1 Posted by **Tim Wessman** on 8 Jan 2011, 12:01 p.m.*

Hello,

I was thinking about power consumption and so on earlier this week and realized that I really don't have much knowledge on just what earlier calcs used to be so good at sipping power. Does anyone have any links or useful info on any of the techniques that were used? Custom chips helps a lot, but I know there was more than that.

For example, I just found out that the 41s had a deep sleep mode (yeah, I know. . . I'm a young'un). Is that similar to the 48 deep sleep? In what ways was it different? When was the deep sleep first introduced?

I know that was used to ship the thing in the box to make sure it would have batteries when you pulled it out, but are there any links or info anyone can point me to about how/when this was implemented?

Thanks!

TW

Re: Power management and deep sleep

*Message #2 Posted by **Katie Wasserman** on 8 Jan 2011, 12:36 p.m.,*
in response to message #1 by Tim Wessman

Tim,

I don't know about "deep sleep" modes, but if you're talking about the current HP ARM-based designs I believe that the only way to drop power consumption enough for really long-term storage is to power off the chip. In power-off mode the AT91SAM7L128 will consume 100na verses 3.5ua in the next lowest power mode (which I think you use now). Waking up form power-off mode can only be done using the FWUP pin which could be tied to the "ON" button on the calculator through a diode switch.

Alternatively, you could use a "hardware" solution by putting a small piece of Tyvek between the bottom of the battery and the contact on the calculator. Have a short tab stick out of the battery compartment telling the new owner to "pull this out" when ready to use the calculator. --- I just tried this on the 12C+ and it works quite well.

-Katie

*Message #4 Posted by **Andrés C. Rodríguez (Argentina)** on 8 Jan 2011, 2:29 p.m.,*
in response to message #3 by Tim Wessman

Just for the record, my HP-41C (1980) came with a small box (located under the calculator) with four "N" batteries; so no batteries came installed. I think my HP-42S (1990) came with the batteries already installed.

Re: Power management and deep sleep

*Message #5 Posted by **Garth Wilson** on 8 Jan 2011, 4:38 p.m.,*
in response to message #4 by Andrés C. Rodríguez (Argentina)

My 41cx's alkaline batteries would go about two years until I got the double extended memory module, and now they only go about six months. Obviously one of the memories is a bit leaky. CMOS circuits theoretically take absolutely no current at all however when they are not switching. Even in the mid-1980's I remember having a 10uF capacitor holding a SRAM's memory intact for 24 hours or more. So if the processor has a stop instruction, and it has an on-board clock oscillator so it can even shut that down, and then you can wake it up with an interrupt, it can sleep on virtually no power. The 41 can wake itself up with alarms, an in fact my 41cx is my only alarm clock (although it was more cool 20 years ago when I was using it to wake itself up and take data periodically, log it, and put itself back to sleep). I don't know how much current the timer module takes, but it's obviously peanuts, like a wrist watch.

Re: Power management and deep sleep

*Message #6 Posted by **Didier Lachieze** on 8 Jan 2011, 6:50 p.m.,*
in response to message #3 by Tim Wessman

Hi Tim, the HP-41 power management is described in details in the HP- Service Manual under Theory of Operation - System Operation.

In summary there are 3 different modes:

RUN: CPU is working and display is active
STANDBY: CPU clock is off - display is active
SLEEP: CPU clock is off - display is off

When you press a key the HP-41 goes in RUN mode, executes the associated code and goes back in STANDBY mode, after ~10mn without activity or if you press ON the HP-41 goes to SLEEP.

Re: Power management and deep sleep

in response to message #1 by Tim Wessman

I believe hunting for low power was with the HP-41, LCD and use of CMOS. The processor just shuts off, the power consumed is to hold the RAM which at least from the beginning was separate circuits.

I once had the batteries out of a HP-41C (no extra memories) for a week, then realized that I had not saved the program I wrote on it. I put the batteries back and the memory contents was intact!

The HP-10 series uses basically the same CPU, but running at half voltage and lower clock frequency.

There were no real time clock in the 10-series, the HP-41 introduced it later.

I am not so familiar with the Saturn that came after it, but remember that the HP-28S could hold memory for amazing periods of time by going into coma, dropping the clock update. I had one for years in a drawer with batteries going flat before I resurrected it by putting in new batteries and the memory was still there. The clock was off though. I ended up selling it and eventually got a HP-48GX. I believe there is some key sequence at least on HP-48 to put it into coma. This was to allow it to be shipped with batteries installed without affecting the batteries much.

The HP-41 shipped with batteries in a separate box. I do not remember whether the 10-series or the early Saturns shipped with installed or separate batteries.

in response to message #1 by Tim Wessman

Power Management on Saturn CPU based calculators

Normally whe distinguish between 4 modes, but most of the power consumpting units can be separately switched on or off.

1) Running Operation

The calculator is doing normal operation at nominal crystal speed, the CPU decodes opcodes, display is on, timers are on, 1ms keyboard scanning on and the Clarke/Yorke chip the card detection updating every 122uS.

2) Idle State

This is the state where the calculator is on and is waiting for input. In this case the Saturn CPU is powered down by the SHUTDN opcode, display is on, the timers are on, 1ms keyboard scanning is on and on the Clarke/Yorke chip the card detection updating every 122uS.

3) Light Sleep

This is the standard off mode. In this case the Saturn CPU is powered down by the SHUTDN opcode, display is off, the timers are on, 1ms keyboard scanning is off and on the Clarke/Yorke chip the card detection updating every 1mS.

4) Deep Sleep (aka Coma mode or storage mode)

In this case the Saturn CPU is powered down by the SHUTDN opcode, display is off, the timers are off, 1ms keyboard scanning is off and on the Clarke/Yorke chip the card detection is off.

```
Enter HP28S/HP48 Coma/Storage Mode
----------------------------------

High End Pioneers: <ON> <+> <SK6>

HP28S:             <ON> <ENTER> <<->

HP48SX/GX:         <ON> <SPC>
```

Beware that the HP28S has a bug in the hardware design around the Lewis chip, so the calculator is consuming more power in coma mode than in light sleep mode.

Here's an extract of

HP-67 battery questions

*Message #1 Posted by **Thomas Okken** on 7 Jan 2011, 8:37 p.m.*

Hi all,

I have an HP-67 that I bought on eBay a couple of years ago. All I have is the calculator, the soft case, and quick reference guide; I have no battery pack, no charger, nor any of the other things that came with the calculator originally.
The calculator has been sitting in a drawer ever since I bought it, but now, finally, I'm starting to feel the itch to bring this thing back to life and run some programs on it.
I figure I'll send it to Randy for some general good lovin' once he's ready to accept new jobs, but until then, I would at least like to see if the darn thing even still works.
I figure I can just take three AA batteries, and with some wire and some tape to hook them up to the terminals in the battery compartment, I'll be able to find out if the calculator is still a calculator, so to speak.
Before I do that, though, I think I should ask some of the more experienced people on this forum for advice, specifically: (1) is it OK to power an HP-67 with three NiMH or Alkaline batteries, given that those have a somewhat higher voltage than the NiCd batteries that the calculator was designed for, and (2) which of the terminals in the battery compartment is (+) and which is (-)?

Thank you -- and have a great weekend!

- Thomas

*Message #2 Posted by **db (martinez, ca.)** on 7 Jan 2011, 9:48 p.m.,*
in response to message #1 by Thomas Okken

Thomas; You probably know all this but:
-Yes, randy is da man, period. Good choice.
-This guy is the only source for after market chargers.
-Waterhosko has sold batteries for years on ebaby and just by word-of-mouth. His stuff works.
-The overlap between the 67 and woodstock series is well documented. Since i have gotten good service out of nimh cells in my 21/25/27/29 i would trust them in a 67. Besides; the specs are just about identical.
-Someone who knows more than me once posted that it would be safer to burn slightly-used alkaline cells (if you want to use throw-aways) in calcs that expect rechargeables, for obvious reasons. I've had good luck doing this but i don't know if i would have had bad luck not doing it. Like the lady said; "couldn't hoit"

in response to message #2 by db (martinez, ca.)

Hi db,

This is very useful information! I have an HP-25 that I use with batteries that I recharge outside the calculator, but with the HP-67, that seems like a much more awkward approach, because of how the battery pack is built and also because most battery chargers won't charge 3 batteries at a time... So it is good to know that it is still possible to get a battery pack that I can just leave inside the calculator, and get a charger that I can use to charge the batteries while they're inside the calculator.

Regarding the polarity of the battery pack, after googling a bit more diligently, I found this (at this site, where else? *facepalm*) so I can now go and find out if the calculator is still working, before doing anything else.

OT but leds are leds ...

*Message #1 Posted by **Alberto Fenini** on 7 Jan 2011, 5:22 p.m.*

ciao a tutti,
first of all forgive me if this is too much OT, if this is the case please delete this post.
I have purchased some Bulova parts, with the idea of putting them together and make at least one working N6 Computron out of these.
Unfortunately, it wasn't such an easy task, and the following photos will show what remains :

Well, the cases ARE working :), and so the modules, or at least one module.
What had suffered most from the manipulation are the LEDs,so the question is :
how difficult is to recover the missing segments, given that at least one of the two display was entirely working before I had a chance to work on it ??
Did anybody had a similar (bad) experience ??

Thanks for any help, take care Alberto

Re: OT but leds are leds ...

*Message #2 Posted by **Thomas Falk** on 7 Jan 2011, 6:08 p.m.,*
in response to message #1 by Alberto Fenini

Sorry to bring bad news ... but you may not have a chance to swap segments from one display to the other.

It can not be seen from the pictures if the segments are single chips or all segements of a digit are on one chip. In any case the chips are glued to a pad by conductive glue and bonded with wires which connect to another pad.

I assume that the bonding wires are broken, because they are not protected by anything. If you can't find a fully working display, your only chance is to use the one with the most working segments. If you are **very** lucky, you may bend the wire in such a way that it gets contact to the display. But this required a steady hand, patience and good eyes and it will probably not work for a long time.

You may look for a company which does chip bonding. If you find one, they may even be able to repair both displays.

Have you checked the displays? With a 3V voltage source and an 3.3k Resistor you should be able to test which segements are working.

Electronic watches are an very impressive technology but even more difficult to repair than calculators.

Greetings,

Thomas

Re: OT but leds are leds ...

*Message #3 Posted by **Alberto Fenini** on 7 Jan 2011, 6:17 p.m.,*
in response to message #2 by Thomas Falk

Ciao Thomas
the back of the display PCBs include the chip, which is covered by what seems back epoxy resin.
The display PCBs were connected to the main modules (hosting the trim and the quartz) by a small flat cable which broke off
I was able to swap the PCBs, they are from to identical watches, only the led layout is slightly different since one is newer.
The first unit I had received had a blank piece of plastic covering the ultrathin wires.
However, during the work, the plastic protection came off, and some segments, I should say most, went off.
I have read some posts, and posted as well, on the www.dwf.nu where I hope someone can sell me a working module.
Is bounding the thin wires really so tough ??? (I was kind of knew it was bad news...)
Thanks anyway, greetings from Italy

Ciao Alberto,

> Quote:
>
> Is bonding the thin wires really so tough ???

IIRC for wire bonding you need at least a professional tool. We did such work nearly 20 years ago, so my memory may fail, but bonding means micro-welding so it was definitively not for amateurs.

Cordialmente,
Walter

in response to message #1 by db (martinez, ca.)

Yeah, I've had one of those for about a month now, evaluating it as a teacher (one of the few benefits of being a teacher and a calculator nut). I have to return it next week, and I don't think I'll buy one now. It's essentially like the Casio 9860gii I think it is, except this one has a great color screen and the ability to create functions from points you identify on pictures of objects.

I don't think the Prizm will replace the TI-84's and NSpires that most high schools use now. But I have to admit, that screen is easy on the eyes!

I wouldn't be surprized if the next update to the TI NSpire includes a color screen like this one.

in response to message #6 by db (martinez, ca.)

Well, it is pretty new. When Casio announced it they said it would be available in January, but they apparently beat that estimate by a month or so. If HP would use this display for a new scientific grapher, that would be of GREAT interest to this group, I'm sure.

Well, depends IMHO. Personally, I won't show up in any meeting with such an oversized calc - and in my office I have a laptop at hand.

Ceterum censeo: HP, launch a 43S (with a reasonable LCD as discussed here ad nauseam)

HTH, Walter

in response to message #8 by Walter B

I would like you to comment on whether this type of calculator is just for 'prestige' only. I cannot program in RPL, there is a very steep learning curve. I have seen occasions where calculators are carried for prestige only and not used beyond simple calculations. Comment please. Sam

Re: enduring market for high end calculators-

*Message #10 Posted by **Walter B** on 9 Jan 2011, 1:15 p.m.,*
in response to message #9 by designnut

Sam,

such a graphic calculator may be most useful at university, if you study engineering, physics, chemistry or mathematics. Perhaps, if you're very well trained on it, you

may continue benefitting from it working in R&D. That's it IMHO. I cannot tell if such a graphic calc is really necessary at any of these locations, however, personally I doubt it. A reliable, compact, rugged pocket calc did and does the job in my studies and professional life - programmability is nice to have now for some repeated calculations, but I did use this feature a lot more some 30 years ago (though far inferior than the applications other forumers create here).

My personal 20m€ only, FWIW

Indeed, the real problem with RPL programming is the *height* of the required learning curve, not its slope, which depends upon the time taken for learning.

Speaking of which, a steep learning curve *achieved without excessive effort* is desirable, while a steep *required* learning curve can be daunting.

Here's my 'great' accomplishment in RPL programming, which worked on my first effort:

```
"<< IF A B < THEN A 360 + 'A' STO END >>"
```

-- Karl

I have an 28S and a 48S. I have made several attempts to do something original in RPL but have always given up in frustration. I have successfully modified two RPL programs written by others.

My first modification was to the iterative refinement program on page 69 of the HP-28S Reference Manual to provide two iteratioins rather than one. Not exactly a big whoop for that!

My second modification was to an analysis program by Rodger Rosenbaum to strip out a quadratic solver as a stand alone program. Has anyone heard from Rodger lately?

Re: enduring market for high end calculators-

*Message #16 Posted by **Martin Pinckney** on 10 Jan 2011, 8:21 a.m.,*
in response to message #9 by designnut

For once, I agree with you, Sam. I have not even attempted RPL. For me, learning the built-in (already programmed, if you will) functionality of the 48 series is daunting enough.

Re: enduring market for high end calculators-

*Message #17 Posted by **David Hayden** on 10 Jan 2011, 9:45 a.m.,*
in response to message #9 by designnut

I agree that programming in RPL is very difficult. RPN and post-fix operations (e.g. 1 'X' STO instead of 1 STO 'X') are great when evaluating expressions on the keyboard, but they are not easy to *read* in a program. We grow up reading in-fix operations so the switch is very hard.

Note that I'm talking about the usability and learning curve of RPL, not the functionality. RPL is extremely flexible and compact. That's great for programming

gurus who are writing applications, but for the average user, a simple-to-understand, simple-to-read language would be better.

BTW, this is one reason why I often recommend the 48gii. For most people who need a high-end calculator, this will do the trick and it's much cheaper than the 50g.

Dave

I suppose it is what one is used to? Somehow the mixed infix/postfix of both traditional RPN and traditional ALG machines just seems more natural.

For example, RPN machines usually had infix STO and RCL, as you point out. Similarly, ALG machines used to have postfix unary operations, such as 30 SIN and 40 1/X. This all flows naturally for me.

But the "pure" postfix or infix of the newer machines I don't like so much. 1 'X' STO and INV(40) just seem awkward. Really awkward are infix conversions like MILE(45).

Re: enduring market for high end calculators-

*Message #19 Posted by **Walter B** on 10 Jan 2011, 1:56 p.m.,*
in response to message #18 by Martin Pinckney

IMHO it depends on what you are acustomed to. While most people are taught parameters following function names like in *f(x)* or *f(x,y,...)*, far less think reverse and even less write reverse. So *SDEV(x,y,z,...)* looks natural, while anything like *x,y,z ... SDEV* looks awkward to the vast majority.

RPN requires us handling only one parameter per step the reverse way, e.g. 3 ENTER 17 / or 123 STO 7, which seems being achievable at least for the many enthusiastic users of this logic - and even becoming natural after some training (else we won't find as many missionaries of RPN).

RPL further proceeds in this "awkward" direction, and apparently goes beyond what most people are willing to accept.

These are no statements about the qualities of the methods mentioned, only observations.

in response to message #9 by designnut

I can program in RPL (in a basic/intermediate level) and do not understand RPN programming as in classic HP calculators (I'm not saying it's hard, I never tried to learn). But I admire people solving complicated problems in the old classics, it shows the real power of these machines. Many people (including myself) couldn't solve those problems even with the most modern computers available.

*Message #21 Posted by **Martin Pinckney** on 10 Jan 2011, 3:42 p.m.,*
in response to message #20 by Daniel Oliva

> Quote:
>
> I ... do not understand RPN programming as in classic HP calculators (I'm not saying it's hard, I never tried to learn).

Well, at it's most fundamental level, RPN programming is nothing more than just recording the keystrokes you would use while solving the problem from the keyboard. Not much to learn there. Of course it can get more complicated, with conditional branching and indirect addressing, etc. When you get to the 41 series, there's much more to learn.

Repairing HP82066B charger

*Message #1 Posted by **Timo** on 7 Jan 2011, 11:40 a.m.*

Dear forum members,

after helping me so well with my request regarding charging times of the HP41 battery pack here, I now came across a different problem when I tried to actually charge the pack.

It seems that the charger is broken down. Indications: - No reaction of the HP41 after inserting the "charged" pack, - charger does not warm up during charging and - I can not measure an output voltage when the charger is inserted into a power receptacle.

My question is: Has anybody ever repaired an HP82066B charger? For example, my first problem is to get past the casing whithout damaging it too much (I can not find any screws). Another idea would be to build a new charger on my own. As far as I know, all I have to do is provide the battery pack rectifier circuit with 3VA, 8VAC. Does anybody know where I can find a circuit diagram of the original charger that I could use to identify the required components?

Kind thanks for your help in advance!

Best regards, Timo

Edited: 7 Jan 2011, 11:41 a.m.

Re: Repairing HP82066B charger

*Message #2 Posted by **Dieter** on 7 Jan 2011, 2:48 p.m.,*
in response to message #1 by Timo

Hi again. :-)

> Quote:
>
> My question is: Has anybody ever repaired an HP82066B charger?

For my part: no, and I'd say: don't even think about it. The AC adapter (no, that's not a charger) cannot be opened without breaking it. I cannot be reassembled in a way that ensures safe operation.

> Quote:
>
> As far as I know, all I have to do is provide the battery pack rectifier circuit with 3VA, 8VAC.

The original 82066A provides something like 14 Volts AC while the battery pack is charged, and the charging current is something like 15 or maybe 20 mA. There's nothing even close to 3 Watts. Remember: the 82066A

also had to power other devices like the printer and its charging ciruit for its much bigger batteries.

In the meantime you know the electronics inside the 82120A battery pack. You immediately realize that the whole thing essentially runs on the 12 V provided by the 78L12 voltage regulator. This IC performs best with an input voltage a few Volts higher, e.g. 15 V. Taking into accout the four rectifier diodes and the 100 Microfarad capacitor, this means that the whole thing should be able to run from a simple AC-adapter with 12 V output - AC as well as DC. If a cheap AC-adapter without voltage regulation is used, its nominal output voltage can be as low as 9 Volts since the effective (!) voltage is significantly higher than the nominal value: the whole charging circuit requires only a few mA, way below the adapter's max. rating like, say, 300 or 500 mA. That's also the reason why the 82066A is rated at 8 Volts: it provides this voltage *if* it is connected to a 375 mA load. With just 20 mA load the output voltage is much higher.

However, I'm not an electronics expert. So beware and correct me if I'm wrong. ;-)

Dieter

Re: Repairing HP82066B charger

*Message #3 Posted by **Dieter** on 8 Jan 2011, 8:50 a.m.,*
in response to message #2 by Dieter

Two remarks:

> Quote:
>
> The original 82066A ...

Of course it's the 82066B. Sorry. ;-)

> Quote:
>
> ...this means that the whole thing should be able to run from a simple AC-adapter with 12 V output - AC as well as DC

With a usual AC adapter (i.e. constant (smoothed) direct current) a higher voltage like the mentioned 15 V is required. As Paul said, the minimum is 12 + 1,7 = 13,7 V, in this case plus the voltage drop caused by the rectifier diodes, leading to about 14,5 V altogether. 12 V AC (or *pulsating* DC) will result in about 1,4*(12 - 0,7) = 15,8 V which is fine.

Addendum: I just measured my two own 82066Bs. Connected to 230 VAC and *with no load*, both of them give the same output voltage of 11,5 Volts AC.

Dieter

Re: Repairing HP82066B charger

*Message #4 Posted by **Paul Berger (Canada)** on 7 Jan 2011, 4:55 p.m.,*
in response to message #1 by Timo

You say no output from the charger when it is connected to the battery pack, so I am guessing that you have checked and found that there is AC present at the end of the cord when it is not connected to the battery pack? If so looking in the schematic for the battery pack posted in the other thread one of my first suspects would be

100uF capacitor on the input side of the 78L12. Electrolytic capacitors are a common point of failure and can fail short, or partially short which may pull down the input voltage to the 78L12. According to one of my data books the drop out voltage for a 78L12 is 1.7V this means that the input voltage must be at least 1.7V greater than the output.

Re: Repairing HP82066B charger

*Message #5 Posted by **Timo** on 8 Jan 2011, 11:37 a.m.,*
in response to message #4 by Paul Berger (Canada)

Thanks for all the very helpful answers!

Paul: What I meant was that I checked the AC output at the cord when the adapter was pluged into a 230VAC receptacle. I did not measure any voltage there so I'd say it is dead.

I wouldn't consider myself someone with a very good background in electronics. I do know a bit more than basics though (at least I can recognize the hot end of the soldering iron when I see one, so to speak ;)).

So summing up your answers it seems, that building a "self-made" AC adapter for the battery pack sounds quite managable to me. I checked the datasheet of the 78L12 here and the recommended operating conditions are an input voltage of 8-20V. So a simple AC source with a voltage of approx. 15VAC as you recommend should work indeed. Maybe a fuse to limit the output voltage of this adapter in order to protect the battery pack circuit would come in handy as well...

However, I do have some colleagues at work which are really knowledgable when it comes to electronics, so I will try and show them the battery pack circuit diagram. Maybe they have some additonal inputs as well.

I'll give you some feedback once (and if) we've found a workable solution. In the meantime thank you very much again for your replies and best regards!

Timo

Re: Repairing HP82066B charger

*Message #6 Posted by **Dieter** on 8 Jan 2011, 12:47 p.m.,*
in response to message #5 by Timo

Well, the 78L12 may handle input voltages as low as 8 Volts, but in this case it won't provide the desired 12 V output of course... ;-)

Building a home-brew AC adapter may be fun, but on the other hand working solutions are cheap and readily available. In your case your local Conrad shop may be worth a visit: take a look at this 15 V AC adapter for instance - for less than 10 Euros you get stabilized 15 V DC. The maximum load (800 mA) even is way higher than required. For a few Euros more you'll get an adjustable solution for voltages between 9 and 24 V, again stabilized and with enough power to handle even higher loads, making it an universal solution for various other applications.

Simply connect one of these with the 82066B's cable, either directly or with a self-made adapter that connects the AC adapter's plug with the HP-cable.

Dieter

A few more alternatives:

Do you have any old PC power supplies lying around (if you have as many old PCs as I do, the price is right: zero!). They are wonderful sources of +/-12 VDC, +/-5 VDC, and maybe others (all nicely regulated, and in the case of +12 VDC, at currents up to 10s of amps). You usually have to short out the right pair of pins somewhere on the motherboard power supply plug to fool the power supply into thinking that its PC is turned ON. Check the web for pin outs (i.e. search "PC power supply pin connections" or something similar).

Are there stores in Europe similar to Goodwill in the US? These are places, usually connected with some sort of charity, that resell items that people bring in and give to the store just to get the stuff out of their house - and get a tax deduction. (Sort of like ebay - except you GIVE your stuff to them and they keep ALL the sales price.) The stores here have many of the little power supply "wall warts" that plug into the AC line and supply power for all of our modern gizmos (calculators, modems, telephones, etc.). They might sell for as much as $1 and they come in all varieties of AC or DC output voltage (read the label!) but are easily hacked by cutting off the power tip and replacing it with what you need or have.

Re: Repairing HP82066B charger

*Message #8 Posted by **Timo** on 8 Jan 2011, 4:22 p.m.,*
in response to message #6 by Dieter

My golly, that penny took a while to drop!

I was so pinned on an AC power supply that it wasn't before reading Dieters message with the Conrad-Links that it dawned on me. Of course the diode bridge in the rectifier doesn't care if you supply DC voltage to it, it's simply that one of the branches of the bridge isn't used at all... Oh dear!

Dieter, Dave thanks for your tips. I have indeed an old PC as well as an additional old PC power supply. However, I think I also have some old AC adapters lying around here that deliver the required 15VDC output. I thinks that's the solution I will go for. Nice and easy, all I have to do is replace the cord of the new AC adapter with that of the old HP-adapter. And above all, it's by far the safest way of dealing with the 230VAC connection that is required...

Many thanks for your continued support, I really appreciate your input!

Regards, Timo

HP-41cx battery connection

*Message #1 Posted by **Ignacio Sánchez** on 7 Jan 2011, 4:53 a.m.*

Hello everybody and happy New Year!

The thing is that I have purchased a HP41CX, in good condition except for the fact that one of the four the battery connections is broken. The question is if I could replace this four battery connection block for one coming from a HP41CV (if it helps both are fullnut models).

Thank you!!

Ignacio Sánchez (Valencia, Spain)

HP35 for $9K?

*Message #1 Posted by **Wilhelm Taylor** on 6 Jan 2011, 9:06 a.m.*

Anybody interested in this item: ebay item 280610917257

VINTAGE - WORKING - HP 35 - SCIENTIFIC CALCULATOR

Starting bid $9000. Yes, $9K! With dead battery.

And just to add insult: $150 shipping.

Re: HP35 for $9K?

*Message #2 Posted by **Don Shepherd** on 6 Jan 2011, 9:31 a.m.,*
in response to message #1 by Wilhelm Taylor

There is already a thread below discussing this auction.

in response to message #4 by Keith Midson

Mine came from Tasmania five or six years ago, close serial number. It cost me about 160 AUD, air shipping from the other side of the world included. It's a similar set, except that the latch in the travel case is missing (and the battery pack now does hold a charge). Investmentwise, beyond my wildest expectations :-)

Re: HP35 for $9K?

*Message #9 Posted by **Gerson W. Barbosa** on 7 Jan 2011, 10:00 a.m.,*
in response to message #8 by Keith Midson

Hello Keith,

I remember I was overbidden in another HP-35 auction. I contacted the seller and he said he was going to list another one the following week. I felt he was a trustworthy person and ended up buying it off-ebay. He sent me some nice high-resolution pictures, shot by a Cannon camera if I am not wrong, but I can't find them anymore. It arrived three weeks later to my address (Curitiba, Brazil) and surely over exceeded my expectations. Your first name sounds familiar, but I am not sure about the last one.

Cheers,

Gerson.

Charging times for HP-41 rebuilt battery pack

*Message #1 Posted by **Timo** on 6 Jan 2011, 7:56 a.m.*

Hi there, it's been quite a while since I last posted here on the Forum but only recently I came across a question regarding a rebuilt HP41 battery pack that I purchased. More precise, the question concers the charging time required to charge it to full capacity again.

The pack contains 4 150mAh KAN (NiMH) accumulators and I'd like to charge it using the standard HP charger. Now, the charger has the well known 3VA 8VAC output which translates in a current of 375mA. However, it's AC and it's converted to DC by the rectifier built into the pack. Since I do not know which type of rectifier is used in the pack I can't really figure out how much DC current is effectively used for charging the cells, therefore I can not judge how long I have to charge the pack.

Can anybody give me a helping hand in figuring out the charging time?

Thanks a lot in advance for your efforts and best regards, Timo

Re: Charging times for HP-41 rebuilt battery pack

*Message #2 Posted by **Dieter** on 6 Jan 2011, 2:10 p.m.,*
in response to message #1 by Timo

Timo, the rating of 3VA and 8 Volts is just a nominal value, and of course the charging current provided by the small PCB inside the battery pack is much, much lower. Just imagine the original 70 mAh batteries being charged with 375 mA... #-)

As far as I know (and also measured by a friend who rebuilt such a battery pack some time ago) the original charging circuit is set to a charging current of 15 mA, maybe a tiny bit higher. For a 150-mAh-battery this means that a completely empty battery pack requires a charging time of 150 * 1.2 / 15 = about 12 hours. Assuming the original PCB was not modified.

By the way - the schematics of the PCB inside the original HP battery pack can be found somewhere out there "on the net". For instance here. The Zener diode limits the voltage to not much more than 6 Volts when the 41 is powered from the AC-adapter. You can also see a small voltage regulator IC for 12 V output and 100 mA max. current. Another reason why "8 V at 375 mA" is far off. :-)

Dieter

Re: Charging times for HP-41 rebuilt battery pack

*Message #3 Posted by **Timo** on 7 Jan 2011, 11:31 a.m.,*
in response to message #2 by Dieter

Hi Dieter!

Well, thanks a lot for this detailed answer. Especially that circuit diagram explains a lot. I did not rebuild the pack myself. However, I can not remember that the guy who sold it to me mentioned modifications of

the charging circuit. This would have been dumb anyway since he sold me the original HP charger as well... ;)

Anyway, in the meantime it seems that I also have a problem with the charger. I have started another thread about this, maybe you can help me out with this one as well.

But thanks again for your help on this problem!

Best regards, Timo

a new challenge

*Message #1 Posted by **Don Shepherd** on 5 Jan 2011, 11:19 p.m.*

A new year deserves a new challenge!

Write a program on whatever calculator you like to answer the following question: Are there 4 consecutive 4-digit integers that are each evenly divisible by the sum of their digits? If so, list them (there MAY be more than one set, and I probably wouldn't pose this challenge if there were no sets).

For example, if 1001 is evenly divisible by 2 and 1002 is evenly divisible by 3 and 1003 is evenly divisible by 4 and 1004 is evenly divisible by 5, you've got a set. Of course, only one of those 4 conditions is true in this example, so 1001-1004 don't work.

So post your program and tell how long it took. This challenge has no practical value that I can think of other than it's just fun to develop the algorithm and get it to work, and that's reason enough for me.

64-       3    3
65-    44 0    STO 0
66-43,33 30    GTO 30
```

It finds three solutions in about 80 seconds on my current model (i.e. fast) 12c. I'll leave the solutions as an exercise for the reader :-) However, I've verified them as being correct. Only the smallest of the four values is displayed.

It would be easy to speed this up to about thirty seconds by changing line 01 and line 08 to 3. If you are only interested in a single solution, change the pause to GTO 00 and watch it speed up even more.

- Pauli

[edit: wrote largest instead of smallest]

in response to message #2 by Paul Dale

Good work Paul. I love the 12c, and especially the super-fast new one.

I solved this first on the 32sii, then on the 30b. I'll post the code in a day or so. The speed of the 30b revealed some 5-digit solutions that would have taken much too long on the 32sii (probably require a new set of batteries!).

Hint: one of the 4-digit solutions is an IBM mainframe! That can't be a coincidence.

Don

> I was hoping to find more than 4 consecutive numbers somewhere, have you found that yet?

In the range from 10 to 1E6, there're indeed only two 5-consecutive sets: starting at 131052 and 491424. There're 22 more, if you go to 1E7.

In the range from 10 to 1E8, I found only 9 6-consecutive sets. (First one at 10000095.) Two of which are actually 7-consecutive (10000095 and 41441423).

After 3 minutes I found one 9-consecutive set at 12432xxxx. The last digits have vanished. Maybe to give your hp 30b something to do. ;-)

Oliver

in response to message #8 by Oliver Unter Ecker

Wow, another niner'.

Amazing.

Re: a new challenge

*Message #10 Posted by **Oliver Unter Ecker** on 6 Jan 2011, 11:33 a.m.,*
in response to message #4 by Paul Dale

Paul,

I'm curious.

Would you care to post your "non-calculator" program and timings?

On my Mac using CalcPad, the MorphEngine implementation reported for ND1 finds the 7-digit solutions in 10.8s, and the 1383 solutions for 8-digit numbers in 120s.

Cheers.

[EDIT: For completeness: With the improved algorithm, the timings are 0.6s and 6.1s, respectively.]

Edited: 8 Jan 2011, 3:13 p.m. after one or more responses were posted

Re: a new challenge

*Message #11 Posted by **Paul Dale** on 6 Jan 2011, 6:56 p.m.,*
in response to message #10 by Oliver Unter Ecker

> Quote:
>
> Would you care to post your "non-calculator" program and timings?

Sure. The code is not in the least bit elegant and is trading copious amounts of memory for speed. It is in c++ for the bit vector library support.

Here is my initial version that does the problem as stated in essentially zero time on my old slow laptop:

```
#include <vector>
#include <stdio.h>

#define MAX 10000

int main() {
        std::vector<bool> v(MAX, false);
        for (int n = 1000; n<MAX; n++) {
                int d1 = n%10;
                int d2 = (n/10)%10;
                int d3 = (n/100)%10;
                int d4 = (n/1000)%10;
                int ds = d1+d2+d3+d4;
                if (n % ds == 0)
                        v[n] = true;
        }
        for (int n = 1003; n<MAX; n++)
                if (v[n-3] && v[n-2] && v[n-1] && v[n])
                        printf("%d : %d\n", n-3, n);
        return 0;
}
```

Here is a version that checks from 10,000,000 up to 100,000,000 in under 4 seconds on my rather old mac laptop:

```
#include <vector>
#include <stdio.h>

#define MAX 100000000

int main() {
        std::vector<bool> v(MAX, false);
        for (int n = 10000000; n<MAX; n++) {
                int d1 = n%10;
                int d2 = (n/10)%10;
                int d3 = (n/100)%10;
                int d4 = (n/1000)%10;
                int d5 = (n/10000)%10;
                int d6 = (n/100000)%10;
                int d7 = (n/1000000)%10;
                int d8 = (n/10000000)%10;
                int ds = d1+d2+d3+d4+d5+d6+d7+d8;
                if (n % ds == 0)
                        v[n] = true;
        }
```

```
        for (int n = 1006; n<MAX; n++)
                if (v[n-6] && v[n-5] && v[n-4] && v[n-3] && v[n-2] && v[n-1]
&& v[n])
                        printf("%d : %d\n", n-3, n);
        return 0;
}
```

The extension to search for the nine sequences should be obvious. That program takes about forty five seconds.

- Pauli

in response to message #11 by Paul Dale

Nice, Paul! Thanks. I was hoping for Mathematica (as I'd like to see how it's done there) but this, too, is clean, compact and easy to read.

Re: a new challenge

*Message #13 Posted by **Paul Dale** on 6 Jan 2011, 8:54 p.m.,*
in response to message #12 by Oliver Unter Ecker

Here is another version that much more closely mimics the 12c program above (counting up not down though):

```
#include <stdio.h>

int main() {
        unsigned int a, b, c, d, e, f, g, h, i;
        unsigned int n = 100000000;
        unsigned int count = 0;
        for (a=1; a<10; a++)
        for (b=0; b<10; b++)
        for (c=0; c<10; c++)
        for (d=0; d<10; d++)
        for (e=0; e<10; e++)
        for (f=0; f<10; f++)
        for (g=0; g<10; g++)
        for (h=0; h<10; h++)
        for (i=0; i<10; i++) {
                const unsigned int s = a+b+c+d+e+f+g+h+i;
                if (n % s == 0) {
                        count++;
                        if (count >= 9)
                                printf("%u - %u\n", n-count+1, n);
                } else
                        count = 0;
                n++;
        }
        return 0;
}
```

Seven seconds to find both 9 sequences.

- Pauli

Re: a new challenge

*Message #14 Posted by **Paul Dale** on 6 Jan 2011, 6:47 p.m.,*
in response to message #2 by Paul Dale

For reference my program does the full iteration from 9999 down to 1000. The timings I've given are for

the entire range.

Re: a new challenge

*Message #15 Posted by **Oliver Unter Ecker** on 6 Jan 2011, 11:24 a.m.,*
in response to message #1 by Don Shepherd

Here's an implementation and timings for ND1.

This function finds the next solution vector, given a starting number:

```
function (x) { // arg is starting number
  function crossSumOfDecDigits(x) {
      var v = String(x);
      var sum = 0;
      for (var i=v.length-1; i>=0; i--)
        sum += v[i] * 1.0;
      return sum;
  }

  function nextNCrossSumDivisibles(n, x) {
      var solutionVec = [];
      do {
        if (!(x % crossSumOfDecDigits(x)))
            solutionVec.push(x); // add candidate num to solution
        else
            solutionVec = []; // reset solution
        ++x;
     }
     while (solutionVec.length < n);

     return solutionVec;
  }

  return nextNCrossSumDivisibles(4, x);
}
```

Given the starting point 1E5, the first solution vector, [10307 10308 10309 10310], comes up after 5ms.
Given the starting point 1E6, the first solution vector, [1010022 1010023 1010024 1010025], comes up after 0.17s.

The following function uses the function above (named "crossSumDivisibles" in the same user folder) and returns a vector of solution vectors, given a search range, and reports timings:

```
function (start, end) {
  Bench.start();

  var solutions = [];
  for (var i=start; i<end; i++) {
    var solution = crossSumDivisibles(i);
    solutions.push(solution);
    i = solution[0];
  }
  solutions.pop(); // we're computing one solution too many; drop it

  Bench.elapsedMsg();

  return solutions;
}
```

The 3 solutions for 4-digit numbers, as per challenge, are found in 0.13s, but somehow, mysteriously, are kept secret.

The 7 solutions for 5-digit numbers are found in 1.3s.
The 39 solutions for 6-digit numbers are found in 14.2s.
The 234 solutions for 7-digit numbers are found in 149s.

That's on my iPhone 3GS.

RPL on ND1 would run significantly slower on this task. (But I shall try running it, if someone posts a UserRPL solution.)

Cheers.

Maybe you'll have to pay Steve Jobs a couple of million $ to unlock the secret!

Very nice work. It really shows the fundamental differences between the new breed of "app" calculators running on i-devices and Androids versus the traditional dedicated RPN calculators.

Thanks.

Don

Re: a new challenge

*Message #17 Posted by **Oliver Unter Ecker** on 7 Jan 2011, 8:57 p.m.,*
in response to message #15 by Oliver Unter Ecker

I was able to speed up this implementation by a factor 20, by
- maintaining a running count of the digit sum instead of deriving it from x
- no longer using an array to hold candidates

The new code is

```
function (x) {   // arg is starting number
    function digitSumOf(x) {
        var s = String(x);
        var sum = 0;
        for (var i=s.length-1; i>=0; i--)
            sum += s[i] * 1.0;
        return sum;
    }

    function nextNivenSequence(n, x) {
        var digitSum = digitSumOf(x);
        var sequenceLength = 0;
        do {
            if (!(x % digitSum))
                ++sequenceLength;
            else
                sequenceLength = 0;
```

```
            if (++x % 10)
                ++digitSum;
            else {
                if (x % 100)
                    digitSum -= 8;
                else if (x % 1000)
                    digitSum -= 17;
                else if (x % 10000)
                    digitSum -= 26;
                else
                    digitSum = digitSumOf(x);
            }
        }
        while (sequenceLength < n);

        return x-sequenceLength;
    }

    return nextNivenSequence(4, x);
}
```

The algorithm retains the ability to start the search from any given number, is not confined to a certain number of digits, and will look for an adjustable count of consecutive numbers.

New timings:

The 3 4-digit solutions: 8ms
The 234 7-digit solutions: 6.5s

Hello Don,

Interesting problem!

I was glad my first HP-33s program found the solution in less than five seconds... until I read Paul Dale's post and realized there were three sets of them. Not so nice, too many labels, not so optimized, anyway this second try finds the three sets in about 260 seconds (after 3 s, 132 s and 260 s, respectively).

Re: a new challenge

*Message #19 Posted by **George Litauszky** on 6 Jan 2011, 3:45 p.m.,*
in response to message #1 by Don Shepherd

It's a HP 50g solution but slow a bit. The 3 solutions: 52 sec, and the full loop from 1001 to 9999 is 3 min 50 sec.

```
\<< 0. {} 'CLST' STO
  1001. 9999.
  FOR M
   M
   DUP
   1000. /
   DUP IP SWAP FP
   1. 2. FOR N
    10. *
    DUP IP SWAP FP
   NEXT
   10. * + + + MOD
   IF NOT THEN
    1. + DUP
    IF 4. == THEN
     M 3. - 'CLST' STO+
     DUP  -
    END
   ELSE
     DUP  -
   END
  NEXT
  DROP CLST REVLIST
\>>
```

Re: a new challenge

*Message #20 Posted by **George Litauszky** on 7 Jan 2011, 12:41 p.m.,*

in response to message #19 by George Litauszky

A restructured 50g version. A bit faster. The solution: from 52 sec reduced to 44 sec and the full loop from 3' 50" to 3' 14".

```
\<<
  {} 'CLST' STO 0.
  1. 9. FOR A
   0. 9. FOR B
    0. 9. FOR C
     0. 9. FOR D
      A 1000. * B 100 *
      C 10 * D + + + DUP
      A B C D + + + MOD
      IF NOT THEN
       SWAP
       1. + DUP
       IF 4. == THEN
        SWAP 3. - 'CLST' STO+
        DUP -
       ELSE
        SWAP DROP
       END
      ELSE
       SWAP DROP DUP -
      END
     NEXT
    NEXT
   NEXT
  NEXT
  DROP CLST REVLIST
\>>
```

Re: a new challenge

*Message #21 Posted by **Oliver Unter Ecker** on 8 Jan 2011, 6:34 a.m.,*
in response to message #20 by George Litauszky

George: I bet if you find a way to write this without STO+, this'll run ~10 faster.

Re: a new challenge

*Message #22 Posted by **George Litauszky** on 8 Jan 2011, 8:24 a.m.,*
in response to message #21 by Oliver Unter Ecker

Thanks Oliver. But in this case this STO+ playing three times only till the program is running.

Re: a new challenge

*Message #23 Posted by **Oliver Unter Ecker** on 8 Jan 2011, 9:40 a.m.,*
in response to message #22 by George Litauszky

George,

Sorry about the bad lead! I didn't read your code properly and was just parsing it for slow instructions to explain the unexpected slow speed. (Surely a 50g must run this faster than a 12c!)

What about changing "B 100" to "B 100." and "C 10" to "C 10."?

Oliver

Edited: 8 Jan 2011, 9:43 a.m.

Re: a new challenge

*Message #24 Posted by **George Litauszky** on 8 Jan 2011, 11:45 a.m.,*
in response to message #23 by Oliver Unter Ecker

The "B 100 and C 10" it's a text mistake only, I'm sorry for it. My 50g is in Approx mode and the program ran with "B 100. C 10." values. The low speed related the level of my knowledge I think.

Re: a new challenge

*Message #25 Posted by **George Litauszky** on 9 Jan 2011, 5:57 a.m.,*
in response to message #24 by George Litauszky

This is my third HP 50g version. I just found an interesting topic on the HP48 forum about the local variables. With this method the three solutions was found in 31" and the full loop's time was 2' 15".

```
\<< 1000. 1. \-> up dn
\<< {} 'CLST' STO 0.
  1. 9. FOR A
   0. 9. FOR B
    0. 9. FOR C
     0. 9. FOR D
      1. up + 'up' STO
      1. dn + 'dn' STO
      up dn MOD
      IF NOT THEN
       1. + DUP
       IF 4. == THEN
        up 3. - 'CLST' STO+
        DUP -
       END
      ELSE
       DUP -
      END
     NEXT
     -9. dn + 'dn' STO
    NEXT
    -9. dn + 'dn' STO
   NEXT
   -9. dn + 'dn' STO
  NEXT
  DROP CLST REVLIST
\>>
\>>
```

Thanks Don for this challange. I'm waiting for the next one.

Re: a new challenge

*Message #27 Posted by **Gerson W. Barbosa** on 10 Jan 2011, 1:32 p.m.,*
in response to message #25 by George Litauszky

Programs that used only the stack used to be faster on the HP-48G/GX and the HP-

49G. Since the original Saturn microprocessor is emulated on the HP-49G+/50g, I don't think this applies to the HP-50g. The 50g program below is base on the Turbo Pascal code somewhere else in this thread and takes roughly one minute to find all three solutions, starting at 1000. On my HP-48GX it took about 150 seconds, that is, the 50g is only 2.5 times faster in this case.

Regards,

Gerson.

```
%%HP: T(3)A(D)F(,);
\<< 0, ROT CLLCD
  DO DUP DUP 0, OVER
    DO 10, / IP SWAP OVER + SWAP DUP
    UNTIL 10, <
    END DROP 9, * - MOD
    IF NOT
    THEN SWAP 1, + DUP
      IF 4, \>=
      THEN OVER 2, DISP 1, WAIT
      END SWAP
    ELSE NIP 0, SWAP
    END 1, + 3, PICK OVER
  UNTIL <
  END 3, DROPN
\>>

On the HP-48G/GX, replace NIP with SWAP DROP.

<< << 1000. 3035. DC >> TEVAL >>  -> s: 60.1381
```

Re: a new challenge

*Message #28 Posted by **George Litauszky** on 10 Jan 2011, 3:29 p.m.,*
in response to message #27 by Gerson W. Barbosa

Thanks for the nice program, Gerson. It takes one minute for me too. In this moment I don't know what is it doing but I will visit it's run with my debugger. :-) It seems my third version with the local variables is faster. If you modify it's middle section:

```
       IF 4. == THEN
        up 3. - 'CLST' STO+
        DUP -
        CLST SIZE IF 3. == THEN KILL END      <---- Here.
       END
```

In this case the program takes 31 seconds and the three solutions are in the list named CLST.

Re: a new challenge

*Message #29 Posted by **Gerson W. Barbosa** on 10 Jan 2011, 9:12 p.m.,*
in response to message #28 by George Litauszky

George,

At half a minute, it looks like you're reaching the limit of the HP-50g for the particular algorithm you've been using. Well done!

> Quote:

> In this moment I don't know what is it doing but I will visit it's run with my debugger. :-)

I haven't written any remarks, instead I am providing a Turbo Pascal program which has virtually the same structure, so it can be more easily followed. The bold-face text in the RPL listing is borrowed code from hpsolo I found at comp.sys.hp48 ("sum of digits" contest).

Gerson.

```
%%HP: T(3)A(D)F(,);
\<< 0, ROT CLLCD
  DO DUP DUP MANT 0,
    DO OVER IP + SWAP FP MANT SWAP
    UNTIL OVER NOT
    END + MOD
    IF NOT
    THEN SWAP 1, + DUP
      IF 4, \>=
      THEN OVER 2, DISP 1, WAIT
      END SWAP
    ELSE NIP 0, SWAP
    END 1, + 3, PICK OVER
  UNTIL <
  END 3, DROPN
\>>

<< << 1000. 3035. DC >> TEVAL >>  -> s: 55.3735
```

```
Program Niven;
var n1, n2, n: real;
      c, i, m: byte;
            k: char;
function Sod(x: Real): byte;
var s, t: real;
begin
  s:=0;
  t:=x;
  repeat
    t:=Int(t/10);
    s:=s+t
  until t<10;
  Sod:=Trunc(x-9*s)
end;
begin
  ClrScr;
  Write('n1, n2, m: ');
  ReadLn(n1, n2, m);
  WriteLn;
  n:=n1;
  c:=0;
  repeat
    if Frac(n/Sod(n)) = 0
      then
        begin
          c:=c+1;
          if c>=m then WriteLn (n-i+1:18:0)
        end
      else
        c:=0;
    n:=n+1;
  until n=n2
end.
```

Re: a new challenge

*Message #30 Posted by **George Litauszky** on 11 Jan 2011, 1:36 p.m.,*
in response to message #29 by Gerson W. Barbosa

Gerson,
Thanks for the lists. I visited the first one. It was a good occasion to learn the stack manipulation. On trial i change the older DUP DUP and 3.

PICK commands with the subsequent DUPDUP and PICK3 ones. The program's run time reduced with three hard seconds. :-)

Edited: 11 Jan 2011, 5:25 p.m.

Re: a new challenge

*Message #31 Posted by **Gerson W. Barbosa** on 11 Jan 2011, 11:11 p.m.,*
in response to message #30 by George Litauszky

A small improvement and a version for the HP-28S:

```
HP-50g:

%%HP: T(3)A(D)F(,);
\<< { } 0, 1000,
  DO DUP DUPDUP 10, / IP DUP 10, / IP DUP 10, / IP + + 9,
* - MOD
    IF NOT
    THEN SWAP 1, + DUP
      IF 4, \>=
      THEN UNROT + LASTARG NIP ROT
      END SWAP
    ELSE NIP 0, SWAP
    END 1, + DUP 10000,
  UNTIL >
  END DROP2
\>>

<< DC >> TEVAL   ->       {1017. 2025. 3033.}
                                  s: 171.2803

( 38.3768 seconds when up to 3033)

HP-28S:

\<< { } 0 1000
  DO DUP DUP DUP 10
/ IP DUP 10 / IP DUP
10 / IP + + 9 * -
MOD
    IF NOT
    THEN SWAP 1 +
DUP
      IF 4 \>=
      THEN OVER 4
ROLL + ROT ROT
      END SWAP
    ELSE SWAP DROP 0
SWAP
    END 1 + DUP 3033
  UNTIL >
  END DROP2
\>>

DC   ->    { 3033 2025 1017 }  (after 3.00 minutes)
```

Re: a new challenge

Gerson,

These lot of program lists are very interesting and instructive me. Thanks, George

Re: a new challenge

*Message #33 Posted by **Gerson W. Barbosa** on 12 Jan 2011, 2:26 p.m.,*
in response to message #32 by George Litauszky

Since positive multiples of 9, except 0, are Niven numbers, they can be skipped in the sum of digits routine. However, for 4-digit numbers it is faster to simply do the sum. This might be useful when testing larger numbers though. The contents THEN and the ELSE statements have been exchanged and the common SWAP instruction is now duely out of the structure. I hope there are no more obvious mistakes.

```
\<< { } 0. 1000.
  DO DUP DUPDUP 10. / IP DUP 10.
/ IP DUP 10. / IP + + 9. * - MOD
    IF
    THEN NIP 0.
    ELSE SWAP 1. + DUP
      IF 4. \>=
      THEN UNROT + LASTARG NIP
ROT
      END
    END SWAP 1. + DUP 3033.
  UNTIL >
  END DROP2
\>>

37.6573 sec

\<< { } 0. 1000,
  DO DUPDUP 9. MOD
    IF
    THEN
    DUPDUP 10. / IP DUP 10.
/ IP DUP 10. / IP + + 9. * - MOD
    ELSE DROP 0.
    END
    IF
    THEN NIP 0.
    ELSE SWAP 1. + DUP
      IF 4. \>=
      THEN UNROT + LASTARG NIP
ROT
      END
    END SWAP 1. + DUP 3033.
  UNTIL >
  END DROP2
\>>

38.5524 sec
```

No, the lists are correct. (37.8970 and 39.1434. Your HP is faster a bit. :-)
Gerson, in this case (4 digit numbers) maybe isn't the fastest way: Simple to count the numbers one by one? (Oliver's method for example.)

Re: a new challenge

*Message #35 Posted by **Gerson W. Barbosa** on 12 Jan 2011, 9:10 p.m.,*
in response to message #34 by George Litauszky

George,

I know that is not the best algorithm, I was just trying to optimize for speed the one I had already started. But you're right, there is no need to use a formula in this case. As we can see from the table, the sums of digits follow a quite predictable pattern. In the program below, the sum of digits is computed with that pattern in mind, but then again it is equivalent to a program that simply would sum the digits one by one in the innermost loop. So, no gain this time. The RPL program cycles from 1000 to 4000 and leaves the answers in the stack.

```
%%HP: T(3)A(D)F(.);
\<< 1000. 0. \-> n c
  \<< 0. 2.
    FOR i 0. 9.
      FOR j 0. 9.
        FOR k 1. 10.
          FOR l n i j k l + + + / FP
            IF
            THEN 0. 'c' STO
            ELSE 1. 'c' STO+ c 4. \>= { n }
IFT
            END 1. 'n' STO+
          NEXT
        NEXT
      NEXT
    NEXT
  \>>
\>>

<< DC >> TEVAL  ->          1017.
                            2025.
                            3033.
                      s:59.4524

------------------

  n   SOD(n)      n   SOD(n)      n  SOD(n)
```

```

*Message #36 Posted by **George Litauszky** on 13 Jan 2011, 1:35 p.m.,*
in response to message #35 by Gerson W. Barbosa

Quote:

> I was just trying to optimize for speed
> the one I had already started.

Gerson,
I visited your programs and I tried to modify the first one from these. It was a good idea from you: to restructure the IF-END part. I changed the DO UNTIL structure to a FOR NEXT one and use the loop variable to count the dividend and so the stack commands decreased a bit.

```
\<< { } 0.
  1000. 3033. FOR n
   n DUPDUP
   10. / IP DUP 10. / IP DUP
   10. / IP + + 9. * -
   MOD
   IF THEN
    DROP 0.
   ELSE
    1. + DUP
    IF 4. \>= THEN
     DROP n 3. - + 0.
    END
   END
  NEXT
  DROP
\>>

34.6757 sec
```

Edited: 13 Jan 2011, 1:44 p.m.

Re: a new challenge

*Message #37 Posted by **Gerson W. Barbosa** on 14 Jan 2011, 1:33 p.m.,*
in response to message #36 by George Litauszky

Great!

A couple of seconds less:

```
\<< { } 0. 1000. 3033.
  FOR n n DUPDUP MANT IP OVER .1
* IP DUP .1 * IP + + 9. * - MOD
    IF
    THEN DROP 0.
    ELSE 1. + DUP
      IF 4. \>=
      THEN DROP n 3. - + 0.
      END
    END
  NEXT DROP
\>>

 32.5687 sec (average of three runs)

145.1378 sec (the whole cycle)
```

Re: a new challenge

*Message #38 Posted by **Gerson W. Barbosa** on 14 Jan 2011, 5:31 p.m.,*

in response to message #37 by Gerson W. Barbosa

Another couple of seconds:

```
\<< { } 0. 1000. 3033.
  FOR n n DUP MANT DUP IP SWAP
FP MANT DUP IP SWAP FP MANT DUP
IP SWAP FP MANT + + + MOD
    IF
    THEN DROP 0.
    ELSE 1. + DUP
      IF 4. \>=
      THEN DROP n 3. - + 0.
      END
    END
  NEXT DROP
\>>

 30.6459 sec (average of three runs)

 141.292 sec (the whole cycle)
```

Re: a new challenge

>
> Another couple of seconds:

I understand: Isn't it your real goal, but however it was a nice solution from you.

George

Re: a new challenge

*Message #40 Posted by **Oliver Unter Ecker** on 11 Jan 2011, 2:32 p.m.,*
in response to message #25 by George Litauszky

Here's another RPL version:

```
\<< {} 0 \-> results len \<<
   27
   1000 9999 FOR x

     IF x 10 MOD THEN
       1 +
     ELSE
       IF x 100 MOD THEN 8 -
       ELSE IF x 1000 MOD THEN 17 -
```

```
            ELSE 26 -
            END
        END
      END

      DUP x SWAP
      IF MOD THEN
        0 'len' STO
      ELSE
        IF len 3 == THEN
          'results' x len - STO+
        ELSE
          'len' 1 STO+
        END
      END
    NEXT
    results
\>> \>>
```

This one allows you to adjust the range to search but the initial digit sum (maintained on stack) needs to be in sync. Also, if you want to search into 5 digits, you need to add a "x 10000 MOD" case.

Run-time:
25.8s Emu48-based calculator on iPhone
10.8s ND1 (v1.3) on iPhone
105.3s 50g (thanks, George, for reporting)

Here's the equivalent JavaScript program:

```
function () {
    var results = [], len = 0;
    var digitSum = 27;

    for (var x=1000; x<9999; x++) {
        if (x % 10)
            digitSum += 1;
        else {
            if (x % 100) digitSum -= 8;
            else if (x % 1000) digitSum -= 17;
            else if (x % 10000) digitSum -= 26;
        }

        if (x % digitSum)
            len = 0;
        else {
            if (len == 3)
                results.push(x-len);
            else
                len += 1;
        }
    }

    return results;
}
```

ND1 runs this one in 11ms. That is, 1000x faster than the RPL program. (2500x faster than Emulator on iPhone, ~200x faster than Emu48-emulated 49G on a Mac. ~10,000x faster than 50g!)

I'm working on technology that will transform ("code-morph") UserRPL into JavaScript for the obvious benefit.

George --

I'm quite sure that Katie's statement was "tongue-in-cheek" humor, not meant to be taken seriously.

I honestly didn't know about that fairly-new Wikipedia page you cited, and was surprised not to recognize any of the authors.

George,

Right. The 30b (also ARM) is faster still. Both surprising to me.

I'd love to see a SysRPL implementation...

Oliver

*Message #52 Posted by **Ronald Williams** on 9 Jan 2011, 9:29 p.m.,*
in response to message #19 by George Litauszky

```
I thought I would offer another solution for the hp-49g+ or the hp-50g using User RPL.
I was not concerned with speed but wanted to learn more about programing using lists
and this turned out to be a great learning tool for me.  I only evaluated the 4-digit
case.

I have generated 2 sets of times, one for the emulator and one for the calc.  The
emulator is running on a 32bit Linux laptop under Wine.  Times for full range for 4-
digit numbers is 43 min 34 sec.  A real battery eater!  For the emulator 2 min 57 sec.
The calc is in exact mode.

Listing

«
8996 { 1000 1001 1002 1003} {} {} {}

Re: a new challenge

*Message #53 Posted by **George Litauszky** on 10 Jan 2011, 2:43 a.m.,*
in response to message #52 by Ronald Williams

Ronald, try set the calculator to approx mode. Maybe your program will run faster I think.

Re: a new challenge

*Message #54 Posted by **Ronald Williams** on 10 Jan 2011, 4:07 a.m.,*
in response to message #53 by George Litauszky

George, Thanks for the advice. For some strange reason I can't figure out, when in approximate mode the time for the full set is 1 hr 1 min and 3 sec. Go figure! Again I'm not concerned with speed. I just had a thought that because most of the work is being done on integers that this may cause exact mode to be faster. I don't really know but maybe someone as knowledge with hp calculators as John Myers may have an answer.

Re: a new challenge

*Message #55 Posted by **George Litauszky** on 10 Jan 2011, 1:15 p.m.,*
in response to message #54 by Ronald Williams

I was imprecise I'm sorry. The goal is: Convert every numbers to floating point form in your program. From this: 100 to this: 100.

The easiest way is: First set the HP to Approx, then push your program list to the stack, call it to the edit line and press Enter to push it to the stack again. The floating point number is really faster, try it.

Re: a new challenge

*Message #56 Posted by **Ronald Williams** on 10 Jan 2011, 7:51 p.m.,*
in response to message #55 by George Litauszky

George, Your suggestion proved to be correct. By changing most integers to reals the time

for the full 4-digit range is now 12 min 42 sec. I use reals and approximate mode in the future if I am concerned with speed. Thank you.

Re: a new challenge

*Message #57 Posted by **Ronald Williams** on 10 Jan 2011, 7:21 a.m.,*
in response to message #52 by Ronald Williams

I noticed that the \-> in the second line did not come through. Very important for defining local variables. Sorry I did not catch it before I posted.

Re: a new challenge

*Message #58 Posted by **Don Shepherd** on 6 Jan 2011, 9:04 p.m.,*
in response to message #1 by Don Shepherd

Many thanks to Paul, Oliver, Gerson, and George for posting your solutions to this problem. Very clever work.

I developed solutions for the HP-32sii, HP-30b, and the HP-12c+. Below I show the code for the 32sii and the 30b; the code for the 12c+ is just the same algorithm adjusted slightly for the 12c+ instruction set.

The three solution sets are: (1014, 1015, 1016, 1017), (2022, 2023, 2024, 2025) and (3030, 3031, 3032, 3033).

The 32sii took 9.5 minutes to find the third solution. The 30b took 18 seconds, and the 12c+ took 48 seconds.

Among 4-digit numbers, the highest number of consecutive numbers is 4 (the three solutions shown above). When you open it up to larger numbers, there are some examples of 9 consecutive numbers that meet the criteria. I find that amazing.

Here is the code for the 32sii and 30b:

```
For the 32sii, enter starting number to check then XEQ F

A = sum of digits accumulator
B = number being tested
C = number of consecutive numbers divisible by SOD

lbl F    entry point
clrvars  so A and C are initialized to 0
sto B    current number to test
lbl A    begin loop to get SOD
10
/
fp
sto+A    will x 10 later
lastx
ip
x=/=0
goto A   loop until all digits summed
rcl B
10
rcl*A    gives SOD
/        see if divisible by SOD
fp
x=/=0
goto B   number not divisible by SOD
1
sto+C    is divisible, count
4
rcl C
x<y      if fewer than 4, don't display
goto C
view B   the 4th consecutive number (or 5th or 6th...!) number
view C   the frequency (found at least 4 in a row)
lbl C    get ready to test a new number
```

```
0
sto A    SOD accumulator
1
sto+B    next number to test
rcl B    so it will be in x
goto A   try next number (program never ends until you R/S)
lbl B    this number was not divisible by SOD, so clear C
0
sto C
goto C
```

30b solution:

This is a direct translation of the 32sii program to the 30b.

Reg. 0 = 32sii reg. A
Reg. 1 = 32sii reg. B
Reg. 2 = 32sii reg. C

Label 00 = 32sii label A
Label 01 = 32sii label B
Label 02 = 32sii label C

Press Amort to run after keying in number to start with.

```
(0  Amort)
sto 1
0
sto 0
sto 2
swap
lbl 00
10
/
math up = (yes, all that for fp)
sto+0
ans
math up up = (ip)
0
swap
?=/=
gt 00
rcl 1
10
rcl*0
/
math up =
gt 01
1
sto+2
rcl 2
4
?<
gt 02
rcl 1
r/s
rcl 2
r/s
lbl 02
0
sto 0
1
sto+1
rcl 1
goto 00
lbl 01
0
sto 2
goto 02
```

I wasn't aware of them either. You were quite right about their ludic purpose. Thanks again.

Gerson.

in response to message #61 by Gerson W. Barbosa

Using Don's HP32Sii program on my HP42S, it took a dismal 59 minutes to find the third solution. I did realize how slow the old technology is.

Re: a new challenge

*Message #63 Posted by **Gerson W. Barbosa** on 7 Jan 2011, 4:43 p.m.,*
in response to message #62 by Dwight Sturrock

The following is a straightfoward conversion of Don's HP-32SII program to the HP-42S, except for the sum of digits algorithm. All three solutions to his original problem come up instantaneaously on Free42. If line 28 is changed to 5, it will take 4.6 s for the first 5-number sequence solution, starting with 10 (Free42 @ 1.86 GHz)

Still based upon Don's program (except for the sum of digits formula), the following does it in one-third of the time:

```
00 { 63-Byte Prgm }
01>LBL "DC"
02 STO 02

in response to message #59 by Gerson W. Barbosa

Yes, thanks for those links! Nice to read up on this after getting one's hands dirty.

I was only able to give Don a 14-digit number yesterday, because I tripped over an obvious pattern after finding the first 9-consecutive numbers:

```
  X{0}n2[0-8]
```

where

```
     X: special numbers { 1243242, 6216210, 21135114, 31081050, ... }
  {0}n: 0 to n "0" digits
 [0-8]: the digits "0" through "8", making the set

Example: 310810500000020, 310810500000021, 310810500000022, ...
```

That is, there're infinitely many 9-consecutive numbers following this pattern. (The Wikipedia page confirms this in general.)

All 9-consecutive Niven numbers I found are Nivenmorphic. (They also shared the same digit sum, 20.)

Anyone with a mathematical mind who cares to prove, or disprove, that this applies to all 9- (and higher?) consecutive Niven numbers?
The Wikipedia page is silent on that...

Nice finding! I think my HP notebook (T2350 @ 1.86GHz) would have to be at least 1,000 times faster to check all through the 1e14 to 1e15 range for these sequences in a day's time, using the TurboBCD program below. Perhaps I little less if I switched to C :-)

```
Program Niven;

var n1, n2, n: real;
      c, i, m: byte;
            k: char;

function Sod(x: Real): byte;

var s, t: real;

begin
  s:=0;
  t:=x;
  repeat
    t:=Int(t/10);
    s:=s+t
  until t<10;
  Sod:=Trunc(x-9*s)
end;

begin
  ClrScr;
  Write('n1, n2, m: ');
  ReadLn(n1, n2, m);
```

```
  WriteLn;
  n:=n1;
  c:=0;
  repeat
    if Frac(n/Sod(n)) = 0
      then
        begin
          c:=c+1;
          if c>=m then
            begin
              for i:=m downto 1 do
                WriteLn (n-i+1:18:0);
              repeat
                read(kbd,k)
              until not KeyPressed;
              WriteLn
            end;
        end
      else
        c:=0;
    n:=n+1;
  until n=n2
end.

----------------------------------------

n1, n2, m: 3.108105e14 3.108106e14 9

   310810500000020
   310810500000021
   310810500000022
   310810500000023
   310810500000024
   310810500000025
   310810500000026
   310810500000027
   310810500000028
```

```
Good old HP41C:

Somewhat different approach: No digit counting.
The divisor is increased and decreased in line with the increasing dividend. Correction
with -9 at each 10/100/1000 cycle.

I watched until solution 2 (202x .. 202y), then my battery died
So I did not test it to the end!

```
The same approach as my previous post but a solution in C.
Looks as a candidate for a recursive approach with a variabele amount of digits....

void func2()
{
    int Dividend = 999;
    int Divisor = 0;
    int Hit = 0;
    for(int i=0; i<=9; i++){
        for(int j=0; j<=9; j++){
            for(int k=0; k<=9; k++){
                for (int l=0; l<=9; l++) {
                    Dividend++;
                    Divisor++;
                    int r = Dividend%Divisor;
                    if(!r)
                    {
                        Hit ++;
                        if(Hit == 4)
                        {
                            printf("%d .. %d\n",Dividend-3,Dividend);
```

```
                            Hit--;
                        }
                    }
                    else
                    {
                        Hit = 0;
                    }
                }
                Divisor -= 9;
            }
            Divisor -= 9;
        }
        Divisor -= 9;
    }
}

???? shouldn't it be replaced with

for(int i=1; i<=9; i++){

?

it is a 10% optimizing

Patrice

Re: a new challenge

*Message #72 Posted by **Raymund Heuvel** on 8 Jan 2011, 12:44 p.m.,*
in response to message #71 by Patrice

Hello Patrice

Since we have 10 digits we need 10 steps from 0 up to and including 9. Therefore from 0 .. <=9. Variant: from 1 .. <=10 but this doesn't cover the digits - although it has the same functionality.

And .. I tried your proposal to ckeck if my considerations are OK (was not 100% sure). Result, starting with 1 doesn't lead to the solution (with the program as presented).

Thanks for the review comment, it forced me to think about my assumption!

BR. Ray

Hi Raymound,

add

printf("%d\n",Dividend);

at the end of your program, I think you will have a surprise!

Hmm, among the 3-digit numbers I find one instance of 4 consecutive integers that satisfy this. It includes a number that any computer scientist would recognize.

Re: a new challenge

*Message #77 Posted by **Glenn Shields** on 8 Jan 2011, 10:55 p.m.,*
in response to message #76 by Don Shepherd

Thanks, Don, for a new mini-challenge -- in trying to understand George's second 50g program, I tried modifying it to search the three-digit numbers, and it got the one solution you mentioned. Just eliminate the D loop and the other D, change "A 1000." etc. to "A 100. * B 10. * C" and eliminate one plus sign in each group of three, and also one NEXT. It took only 15 seconds to find it.

Re: a new challenge

*Message #78 Posted by **George Litauszky** on 9 Jan 2011, 3:20 a.m.,*
in response to message #77 by Glenn Shields

Glenn: Could you post here this modified program list please?

Re: a new challenge

*Message #79 Posted by **Glenn Shields** on 9 Jan 2011, 3:37 p.m.,*
in response to message #78 by George Litauszky

Ok George, now with your new program I am sure to lose some sleep! Here is your "trimmed down" program for 3-digit numbers: << {} 'CLST' STO 0. 1. 9. FOR A 0. 9. FOR B 0. 9. FOR C A 100. * B 10. * C + + DUP A B C + + MOD IF NOT THEN SWAP 1. + DUP IF 4. == THEN SWAP 3. - 'CLST' STO+ DUP - ELSE SWAP DROP END ELSE SWAP DROP DUP - END NEXT NEXT NEXT DROP CLST REVLIST >> Thanks for continuing this challenge! Cheers, Glenn

Re: a new challenge

*Message #80 Posted by **George Litauszky** on 9 Jan 2011, 4:58 p.m.,*
in response to message #79 by Glenn Shields

Thanks Glenn. It's a good challenge, not too easy to discontinue it. :-)

Re: a new challenge

*Message #81 Posted by **LMMT** on 11 Jan 2011, 11:22 a.m.,*
in response to message #76 by Don Shepherd

Hello, maybe I am writing a bit late but for those interested the link http://oeis.org/ offers you the chance to write some numbers and the page tries to find the sequence for them. If you write 1014, 2022, 3033 it finds the answer. Best wishes!

Re: a new challenge

*Message #82 Posted by **Don Shepherd** on 11 Jan 2011, 12:33 p.m.,*
in response to message #81 by LMMT

> Quote:
>
> 1014, 2022, 3033

That didn't work for me, so I tried 1014, 2022, and 3030, that worked. Very interesting site, thanks much.

Don

Re: a new challenge

*Message #83 Posted by **David Hayden** on 16 Jan 2011, 10:52 a.m.,*
in response to message #1 by Don Shepherd

Here is a solution to the challenge in User RPL that takes a completely different approach. On a 50g, it runs in 123 seconds. I haven't attempted any coding optimization - the time is due entirely to the algorithm - so I'm sure it can be improved.

Instead of checking each possible 4-digit number to see whether it's divisible by the sum of its digits, this program starts with a possible sum of digits for four consecutive numbers. It then checks the much smaller set of numbers that can be divided by this set.

For example, the sum of the digits in the first solution (beginning at 1014) are 6,7,8, and 9. It turns out that any set of numbers N, N+1, N+2, N+3 that are divisible by 6,7,8 and 9, must be of the form N = 6 + 504k where k is an integer. So for the sums {6 7 8 9} we only have to check every 504'th number.

The program is quite long and this will be a long explanation. I hope you'll find it interesting. I implemented the program is a directory for simplicity (and debugging!) and I'll refer to the various programs in the directory.

Throughout this explanation, I'll use N, N+1, N+2 and N+3 (or N0, N1, N2 and N3) to refer to the sequential 4-digit numbers, and I'll use s0, s1, s2 and s3 to refer to the sum of the digits in each of these numbers.

Enumerating the sums of digits

To begin, lets figure the possible values for the sum of the digits of four sequential numbers between 1000 and 9999. Clearly the smallest sum is 1 (for 1,000) and the largest sum is 36 (for 9999). So any sum must between 1 and 36.

For most sequences of N, the sum of their digits is also a sequence. E.G, for N = {1001, 1002, 1003, 1004 }, s = {2 3 4 5}. So one possible set of sums is:

```
{s s+1 s+2 s+3} for s= 1 through 33
```

Now consider N = {1207 1208 1209 1210}. The digit sums are s = {10 11 12 4}. In general, when the one's digit rolls over from 9 to 0, you lose 9 in the digit sum, but you gain 1 because the 10's digit increments. So another possible set of sums is:

```
{s s+1 s+2 s-6} for s=8 to 33
```

The roll-over from 9 to 0 could occur anywhere in the sequence, so other possibilities are:

```
(s s+1 s-7 s-6) for s=9 to 34
(s s-8 s-7 s-6) for s=10 to 35
```

The numbers in N can also roll over from 99 to 00 or 999 to 000, these give the possible sums:

```
{s s-17 s-16 s-15} for s=19 to 35
{s s+1 s-16 s-15} for s= 18 to 34
{s s+1 s+2 s-15 } for s= 17 to 33

{s s-26 s-25 s-24} for s=27 to 36
{s s+1 s-25 s-24} for s=26 to 35
{s s+1 s+2 s-24} for s=25 to 34
```

In my solution, all of these lists are calculated by the SUMS program. The result of SUMS is a list of lists where each sublist is 4 numbers that represent the sums of the digits of 4 consecutive numbers.

Restricting the start and end values

The challenge asks us to find a 4-digit number - one that's between 1000 and 9999, but if we start with a possible sum of the digits in N, we can use that information to restrict the upper and lower bounds of the search. For example, suppose we're considering the sums 10, 11, 12, and 13. The smallest 4-digit number whose digits add up to 10 is 1009 and the largest is 9001, so there's no point in checking numbers less than 1009 or larger than 9001.

The subprogram BIGandSMALL calculates the largest and smallest 4-digit numbers whose digits sum to each of the values between 1 and 36. It leaves the results on the stack in two arrays. The main program calls BIGandSMALL once and stores the results in global variables BIGGEST and SMALLEST. For example, BIGGEST[12] is the biggest 4 digit number whose digits sum to 12. Later when we check a particular set of sums, we use BIGGEST and SMALLEST to get the upper and lower bounds of the loop.

Mathematics

Suppose we're given a list {s0 s1 s2 s3} that is a solution for the sequence of numbers {N N+1 N+2 N+3}. That means that N is evenly divisible by s0, N+1 is evenly divisible by s1 etc. Mathmatically:

```
N   == 0 mod s0
N+1 == 0 mod s1
N+2 == 0 mod s2
N+3 == 0 mod s3

or equivalently:
N ==  0 mod s0
N == -1 mod s1
N == -2 mod s2
N == -3 mod s3
```

(I'm using "==" to mean "congruent to," which is usually indicated by a symbol with three horizontal lines).

What are the values of N that satisfy these equations? The first equation means that N = k0*s0 for any integer k0. Plugging that into the second equation gives k0*s0 = -1 mod s1. Can we simplify this into the form k0 = r mod s? The answer is yes.

Solving modulo equations - there's an app for that!

In a more general sense, how do you solve Ax == B mod C? This is done with the Linear Congruence Theorem. The procedure goes like this:

1. If (B / GCD(A,C)) not an integer,then there is no solution
2. Let D = GCD(A,C).
3. Find r and s such that rA + sC = D
4. The solution is x == (rB/D) mod (C/D)

How do you find r and s? It's built-in to the 50G! The IEGCD command does it for you.

Here is the function that solves a single modulo equation:

```
@ This solves an equation of the form ax = b mod n
@ Where "=" really means "is congruent to".
@ It returns r s such that x = r mod s, or
@ equivalently x = s*k + r
@ arguments are a b n (must be integers)
@ Results are r s 1. if there's a solution, or
@ 0. if no solution exists.
@ See http://en.wikipedia.org/wiki/Linear_congruence_theorem
```

```
@ and the IEGCD command for details.
  SLVMOD
  \<< \-> a b n \<<
      @ If GCD(a,n) doesn't divide b evenly then no solution
      IF b a n GCD / DUP IP \=/ THEN
        0.
      ELSE
        @ It's good!
        a n IEGCD DROP
        b * OVER /
        n ROT /
        1. @ Indicates success
      END
    \>>
  \>>
```

Solving simultaneous modulo equations

Let's return to the original problem. We want to find N such that it simultaneously solves:

```
N ==  0 mod s0
N == -1 mod s1
N == -2 mod s2
N == -3 mod s3
```

More generally, suppose we want to solve two simultaneous equations:

```
X == b mod a, and
X == r mod s
```

we do it as follows:

```
X = a*k0 + b          (for any integer k0)
a*k0 + b == r mod s   (substituting for X into the second equation
k0*a == (r-b) mod s   (subtract b)
```

We can use SLVMOD on this equation to find:

```
   k0 == u mod v, or equivalently
   k0 = k1*v + u for any integer k1
```

and substituting for k0 into the equation above:

```
X = a*(k1*v+u) + b
  = (a*v)k1 + (a*u + b)
X == (a*u+b) mod (a*v)
```

The program SSLVMOD solves these simultaneous modulo equations:

```
@ Given two equations:
@  x = r mod s, and
@  x = b0 mod a0
@ This program returns b1 and a1 such that
@  x = b1 mod a1
@ Arguments:  b0 a0 r s
@ results: b1 a1 1. (if there is a solution), or
@          0. if not
  SSLVMOD
  \<< \-> b a r s
    \<< a r b - s
      IF SLVMOD
      THEN a * SWAP a * b + SWAP 1.
      ELSE 0.
      END
    \>>
  \>>
```

Putting it all together

The somewhat poorly named **FACTS program** takes a list of possible sums of digits {s0 s1 s2 s3} and

computes a and b such that N == a mod b and

```
N ==  0 mod s0
N == -1 mod s1
N == -2 mod s2
N == -3 mod s3
```

Remember, this means that if {s0 s1 s2 s3) are a possible sum-of-digits, then the vales N == a mod b are the only possible numbers where N, N+1, N+2 and N+3 are evenly divisible by s0, s1, s2, and s3 respectively.

For example, given the list of possible sums-of-digits {4 5 6 7}, FACTS determines that N == 4 mod 420 are the only values that will work.

The **CHKSUM prorgam** takes a list of possible digit sums and checks for a solution to the challenge that matches that list. In other words, it checks to see if there is a sequence of four 4-digit numbers that are (1) evenly divisible by the numbers in the list, AND (2) whose sum of digits equals the values in the list.

CHKSUM uses FACTS to determine the possible values that satisfy the first criteria. Then it uses the BIGGEST and SMALLEST arrays arrays to look up the largest and smallest numbers that satisfy the sum-of-digits criteria. Finally, it uses a FOR loop to check each of the possible values to see if it matches the sum-of-digits criteria.

The **DIGITS program** takes an integer and computes the sum of its digits.

The **MAINP program** is the main entry point to the algorithm. It computes and stores the biggest and smallest 4-digit numbers for each possible sum. Then it calls SUMS to create the list of all possible sums of digits of sequences of 4-digit numbers. Finally, it uses DOLIST to call CHKSUM on each of these possible sums.

Conclusions

I think this is a good example of how you can squeeze performance out of a program by exploiting the properties of the problem that you're trying to solve. By starting with the potential sum of digits and then working forward to the possible 4-digit number (rather than the other way around), this program cuts down on the work needed:

1. Computing the biggest and smallest numbers with the given sum cuts the range of numbers that you need to check.
2. Computing the possible numbers that satisfy the divisibility test cuts the numbers down even more.

The program also demonstrates that it's worth stepping back from a problem and asking "is there a different approach that might work."

David, I'm speechless, and that doesn't happen that often. I'm going to print your post and read it carefully, I really like what you did here.

This thread will fade into archive oblivion one day, but your post cannot. This needs to be immediately available for all to see and benefit from. Please enter this post as an article.

This is truly great work and I look forward to reading it in detail, even though I'm not an RPL guy. You (and Allen) may force me to buy and learn the 50g!

Don

Re: a new challenge

*Message #85 Posted by **David Hayden** on 16 Jan 2011, 9:45 p.m.,*
in response to message #84 by Don Shepherd

Thanks Don. I really enjoyed this challenge.

To me, the best part of my solution came at the deepest part of the math when I needed to solve an equation in modulus math. I spent days trying to work out a solution by myself but when I finally turned to wikipedia to see how it's done, it turns out that the 50g has the critical function (IEGCD) built in!

I've posted the challenge and my solution as an article. I noted the dates of the original posts so any curious future readers can find the thread in the archives.

Dave

HP 65 & HP 67 Program Cards

*Message #1 Posted by **Clayton** on 5 Jan 2011, 4:48 a.m.*

Will the HP 67 read HP 65 magnetic cards without any user alterations being required? Thanks,

Re: HP 65 & HP 67 Program Cards

*Message #2 Posted by **Thomas Chrapkiewicz** on 5 Jan 2011, 2:48 p.m.,*
in response to message #1 by Clayton

The magnetic properties of both cards are compatible.

HP65 coded cards canNOT be read by an HP67. The program codes (ane perhaps the writing methods) are NOT compatible.

TomC

Re: HP 65 & HP 67 Program Cards

*Message #3 Posted by **Ignazio Cara (Italy)** on 6 Jan 2011, 5:12 a.m.,*
in response to message #1 by Clayton

No. In the '65 the instructions are coded on 6 bit, on the '67 on 8 bit.

The magnetic cards (phisically) are the same!

Take care.

Ignazio

OT: Canon X Mark I Premium Calculator

*Message #1 Posted by **Matt Kernal** on 4 Jan 2011, 2:53 p.m.*

This calculator caught my attention for one reason (OK, two reasons)..

1: Double Injection Keytops

http://www.usa.canon.com/cusa/consumer/products/calculators/premium_calculators/x_mark_i_black#Specifications

2: $9.95

http://www.amazon.com/Canon-Premium-Desktop-Calculator-3982B005/dp/B0035MCVA2

A quality four banger for a not-so-premium price .. who'd a thunk'it?

Re: OT: Canon X Mark I Premium Calculator

*Message #2 Posted by **Walter B** on 4 Jan 2011, 4:21 p.m.,*
in response to message #1 by Matt Kernal

Nicely packed, but alas: still only a 4-banger ...

Re: OT: Canon X Mark I Premium Calculator

*Message #3 Posted by **Karl Schneider** on 4 Jan 2011, 10:31 p.m.,*
in response to message #1 by Matt Kernal

Hello, Matt --

Long time no post!

> Quote:
>
> $9.95 ... A quality four banger for a not-so-premium price .. who'd a thunk'it?

Ah, but the original list price of $69.95 is exorbitant indeed. To me, a disqualifying attribute is the "skinny" numerals having a low width-to-height aspect ratio, making them hard to read. Is having 12 digits on a non-scientific calc worth the loss of legibility?

-- Karl

Re: OT: Canon X Mark I Premium Calculator

*Message #4 Posted by **Eric Smith** on 5 Jan 2011, 3:04 a.m.,*
in response to message #1 by Matt Kernal

It does suggest that if Canon can make a calculator with double-shot injection molded keys to sell for under $10, that HP ought to be able to do it for calculators that sell for $40 and up.

I've never believed the claims that double-shot injection molding was too expensive. It is obviously somewhat more expensive, but the added cost has to be well under $1 per calculator.

Re: OT: Canon X Mark I Premium Calculator

*Message #5 Posted by **Walter B** on 5 Jan 2011, 3:12 a.m.,*

Apparently the Canon was intended to sell at $69.95, not $10. This seems to be a close-out or something.

Re: OT: Canon X Mark I Premium Calculator

*Message #7 Posted by **Eric Smith** on 5 Jan 2011, 5:25 p.m.,*
in response to message #6 by Martin Pinckney

OK, then it is at least proof that double-shot injection molded keys can be used in calculators that sell for $70 and up. That price range includes the 17BII and the 38/39/40, and 48/49/50 families.

Re: OT: Canon X Mark I Premium Calculator

*Message #8 Posted by **Matt Kernal** on 7 Jan 2011, 11:45 a.m.,*
in response to message #7 by Eric Smith

You saw what I saw..

Premium calculator, double-injected keys, and low price (most likely due to low wages).

HP, if you're listening, I'd pay extra for 1970's/1980's calculator quality... Canon is proving this is possible in today's economy (even without the high price).

Re: OT: Canon X Mark I Premium Calculator

*Message #9 Posted by **Frido Bohn** on 5 Jan 2011, 4:20 a.m.,*

in response to message #1 by Matt Kernal

Hello Matt,

quite interesting product indeed.
What also attracts my attention is the statement on the Canon site:
"Display lens made from Canon Digital Cameras' Recycled Pre-consumer materials"

So, we are confronted with a by-product of the camera manufacturing branch of Canon.
Not to say, a product made of parts which formerly would have disappeared in the waste basket, and now contributes to the Green labeling of the company.
What kind of calculators would we have to expect as a by-product of, let's say, Rolls-Royce, Coca-Cola or Boeing?
Or even Hewlett Packard? :-))

Regards
Frido

P.S.: What in the heck is "Pre-consumer"? Is there a life form beneath of the consumer?

industrial waste

*Message #10 Posted by **Frank Boehm (Germany)** on 5 Jan 2011, 8:13 a.m.,*
in response to message #9 by Frido Bohn

I'd say this is industrial waste from the manufacturing process - not from a finished-and-returned-product, allowing for "sortenrein" (dang, my english fails on me today) recycling, aka "as good as new".

Re: OT: Canon X Mark I Premium Calculator

*Message #11 Posted by **Katie Wasserman** on 5 Jan 2011, 11:05 a.m.,*
in response to message #9 by Frido Bohn

How about a hyper-premium calculator from HP made from recalled and recycled HP-95C's? That would sell for a pretty penny I'll bet :)

in response to message #9 by Frido Bohn

What caught my attention was the "Grand Total" function (GT key). I've never heard of that. I had to read the manual to see how that works.

Re: OT: Canon X Mark I Premium Calculator

*Message #13 Posted by **Martin Pinckney** on 6 Jan 2011, 7:16 a.m.,*
in response to message #12 by Pal G.

This used to be fairly common with "adding machines" designed for business/retail. The GT key was accompanied by a ST (subtotal) key, thus allowing summing several subsets of numbers before reaching the "grand" total.

Strange HP41 battery pack

*Message #1 Posted by **Alberto Fenini** on 4 Jan 2011, 9:41 a.m.*

Happy New Year Everybody !!

Having some spare time at the begining of the year, I was sorting out
some items and I have found this :

Has anyone ever seen a battery pack with three pins ??
What is the third pin for ??
Take care and again, Happy 2011 !! Alberto

Re: Strange HP41 battery pack

*Message #2 Posted by **Raymond Del Tondo** on 4 Jan 2011, 10:36 a.m.,*
in response to message #1 by Alberto Fenini

Happy New Year to you, too:-)

Yes, I have seen batt packs with 3 pins. Some time ago there also was a related thread here in the forum.
And no, I don't know exactly what the central pin is used for, but it *might* have been planned for use with a similar AC adapter as on the classics.

Ray

Re: Strange HP41 battery pack

*Message #3 Posted by **Randy** on 4 Jan 2011, 11:45 a.m.,*
in response to message #2 by Raymond Del Tondo

It is the original design 82120A, later changed to a two pin design.

Think of the 3 pin circuit being the same as the classics, when you plug the charger in, the calculator runs from a separate 5 volt source from within the battery pack while the battery charges. Remove the charger and the calculator runs from battery. The switch is that copper color tab on the center pin of the pack in your photo.

They eliminated the switch in the later design as it could glitch and crash the 41 if it was on when the charger was removed. Any 3 pin packs I rebuild, I modify the circuitry to the later design. This is usually a must as with even minor corrosion, the crazy little flex circuit strip is destroyed beyond reuse. It's easier to toss the extra parts and modify to the later design.

Re: Strange HP41 battery pack

*Message #4 Posted by **Alberto Fenini** on 4 Jan 2011, 12:05 p.m.,*
in response to message #2 by Raymond Del Tondo

Thanks for the clarification,
does anyone know where I can find on TAS the necessary batteries for rebuilding this pack ?
take care Alberto

Thank You Tony Duell

*Message #1 Posted by **Namir** on 4 Jan 2011, 8:13 a.m.*

I have been recently looking at the HP-41C Software library. Most of the applications there were submitted by J-M Baillard and Tony Duell. The ones Tony submitted includes .raw files which can be quickly downloaded into the HP-41C emulator offered by TOS. The documentation for these programs are found on the HP museum DVD and/or TOS. This makes the process of running these programs a breeze since one needs not enter a single line of code! I want to thank Tony for his brilliant contribution that makes it so easy to run HP-41C (and also converted HP-67) programs in the HP-41C AND Tom Okken's HP-42S emulator.

Namir

*Message #7 Posted by **Paul Dale** on 6 Jan 2011, 7:01 p.m.,*
in response to message #6 by JMBaillard

Now to incorporate them into something like Ángel's complex stack support but for quaternions...

Unfortunately, I can't currently do M-code on my 41. I'll have to wait for the Newt to reach fruition...

- Pauli

Quaternions Stack

*Message #8 Posted by **Ángel Martin** on 7 Jan 2011, 2:59 a.m.,*
in response to message #7 by Paul Dale

> Quote:
>
> Now to incorporate them into something like Ángel's complex stack support but for quaternions...

While it'd be possible to extend the "complex stack" concept to Quaternions (just by doubling the buffer size and modifying the housekeeping routines) I'm not sure that the benefits would be that noticeable - at least to warrant the programming effort.

Think that inputing quaternions requires the four real stack levels, and that the calculator display is not suited to display the four components together - it barely fits the two complex real and imaginary parts.

Anyway this is just a first-gut thought, maybe Jean-Marc has some suggestions on how it could be handled.

And Pauli, you can always use an emulator to do your MCODE programming... so roll up your

sleeves and get to it! :)

Best, AM

> Anyway this is just a first-gut thought, maybe Jean-Marc has some suggestions on how it could be handled.

Just a thought. Complex support is a subset of quaternions so why not do both???

> Quote:
>
> And Pauli, you can always use an emulator to do your MCODE programming... so roll up your sleeves and get to it! :)

Yeah, I know about the emulators. I'd prefer to do it on the real device (which is what I take to work every day). Sadly, I've not bought anything M-code related yet, althought the Newt will be a must have.

BTW: I started assembly in the 1970's on an 8008 and am still doing it to this day on a variety of CPUs. I think I've suffered enough already :-)

- Pauli

Re: Quaternions Stack

*Message #12 Posted by **Walter B** on 8 Jan 2011, 3:35 a.m.,*
in response to message #11 by Paul Dale

Assembler programming a pdp 11/10 with tremendous 64**k**B memory, 2.5**M**B fixed HDD plus another 2.5MB mobile disk plus 1600bpi magtape. Using other pdp 11 and VAX computers as well as IBM mainframes of that time. No PCs yet. Those where the days ... ;)

Forgot mentioning said pdp 11/10 was then sufficient for fast (i.e. kHz then) online acquisition and analysis of nuclear physics data in accelerator experiments. And - for our younger forumers - that device in a rack 2m high, 0.6m wide and 0.8m deep was mobile computing at that time ;)

FWIW

Re: Quaternions Stack

*Message #13 Posted by **Ángel Martin** on 8 Jan 2011, 5:47 a.m.,*
in response to message #9 by Paul Dale

> Quote:
>
> > Just a thought. Complex support is a subset of quaternions so why not do both???

Well, it's not as simple as that. The complex buffer relies on the (real) stack levels Y&Z for synchronization before and after any complex function. That'd be completely different with quaternions of course. Add to that the fact that quaternion math isn't the same as complex (or real) math, and you'll have right there a couple of serious issues - or at least reasons why the complex buffer implementation isn't valid for quaternions without extensive mods.

Cheers, 'AM

Re: Thank You Tony Duell

*Message #14 Posted by **Namir** on 5 Jan 2011, 6:42 a.m.,*
in response to message #2 by Ángel Martin

I agree. Jean-Marc's work is amazing!! I have contemplated programming some numerical algorithms and said to myself that it would not fly on an HP-41C, only to discover that Jean-Marc has already implemented these algorithms on an HP41C.

Re: Thank You Tony Duell

*Message #15 Posted by **JMBaillard** on 6 Jan 2011, 5:05 p.m.,*
in response to message #14 by Namir

Many thanks to all !

With respect to quaternions,
the module is going to be created.

Is it really useful? I don't know.
May be some quaternionic special functions
are not built-in in Mathematica?
But we can do it with an HP-41 !

All the Best
Jean-Marc.

9100A with no display

*Message #1 Posted by **Richard Wilder** on 3 Jan 2011, 12:58 a.m.*

Hi Group! I recently got a 9100A into my lab for repair. Symptom is no display. So far I've verified all supply voltages, fuses are all OK, the register display lights come on but the error light doesn't come on with the RUN switch set, pressed STOP, STOP, 1, CHS, SQRT. The error lamp tests OK. I downloaded Tony Duell's incredible schematics for the A model and have tested the display board signals and all the FF outputs with the following results. At this point I don't know which FF's should be toggling. I've also tested all the main ROM and control ROM outputs and I can post those results if anybody thinks that might be usefull. For now here are the FF states. Any assistance troubleshooting this vintage machine would be greatly appreciated! ;^)

```
9100A
Symptom: No display
Fuses: OK
Register illumination lights: Light
-15V, 220V & 3500V all OK

RUN mode, press STOP,STOP,1,CHS,SQRT: No error light, lamp tests OK

On the Vertical amp board:
ZDHD and ZDRD signals are OK, ZDMV and ZDRV are no signal

On the Horizontal amp board:
ZDHL is ON, all of ZDRL, ZDSL, HDRR, ZDFO are no signal

ZACE (blanking) on the gating board is stuck high (0V) (crt trace blanked)

Checked FF's on the TP connectors:

(0 = -V, 1 = 0V, T = toggling)
LH FF    CKT      STATE
F1       ROMA8'   T
F2       ROMA7'   T

Re: 9100A with no display

*Message #2 Posted by **Eric Smith** on 3 Jan 2011, 2:56 a.m.,*
in response to message #1 by Richard Wilder

Hopefully Tony will offer more authoritative advice, but from your description I'd guess that the logic is working correctly and that the fault is in the display electronics. IIRC, that circuitry is covered in the official service manual.

Re: 9100A with no display

*Message #3 Posted by **Richard Wilder** on 3 Jan 2011, 2:46 p.m.,*
in response to message #2 by Eric Smith

Thanks Eric! ;^) I've rung out the display boards but problem is they're missing several of the signals as pointed out in the service manual. Also, the error sequence doesn't turn on the lamp so I'm concentrating on the logic now.

Re: 9100A with no display

*Message #4 Posted by **Tony Duell** on 3 Jan 2011, 5:01 a.m.,*
in response to message #1 by Richard Wilder

I would have said this is a logic (rather than display) fault. The fact you can't get an error light from sqrt(-1) suggests the logic is not doing the right thing. And many of the inputs to the display driver boards are not toggling.

On the other hand, most of the FFs are doing something. So, alas, it's not an obvious fault like the clock generator.

My schematics cover the -B model (since that's all I own :-)). the flip-flop boards are identical, the control logic/microcode board (far left) is similar (same schematic, different ROM programming), the other areas of logic are different. How different I do not know. A fault in almost any part of the logic (even the keyboard!) can kill the display, which makes life a little harder, particularly as I don't have the schematics.

I think what I would do next is to dismantle the machine totally and clean all the edge connectors. Test the diodes on the gating board (it doesn't take long with a DMM :-), they can all be tested in-circuit). Maybe check the transistors on the ROM PCB itself, they can fail, although normally a loss of a ROM drive line will kill the ROM outputs (and stop many of the FFs toggling).

The problem could be core memory related. Have you checked any signals in that area?

Re: 9100A with no display

*Message #5 Posted by **Richard Wilder** on 3 Jan 2011, 2:56 p.m.,*
in response to message #4 by Tony Duell

Thanks Tony! ;^) I've dis/re-assembled the thing but I haven't tested all the logic diodes yet. Today I'll test the KB & also see what's coming out of the core board. On one of your previous posts you mentioned that all of the ROMAn outputs should be toggling. Mine aren't all toggling - should I be concentrating on those FF inputs? (Or maybe the idle state is not necessarily branching all over the ROM...?)

Re: 9100A with no display

*Message #6 Posted by **Tony Duell** on 4 Jan 2011, 4:56 a.m.,*
in response to message #5 by Richard Wilder

Something struck me last night....

The display task is synchronised to the mains (power line) -- there's an AC feed from the secondary of the power transformer to a circuit in the logic assembly. I wonder if this is missing. On the -B, the circuitry is on the right hand 'sideboard', but I have no idea where it is on the -A.

May be worth looking at this, since much of the logic is working.

Re: 9100A with no display

*Message #7 Posted by **Richard Wilder** on 3 Jan 2011, 4:20 p.m.,*
in response to message #4 by Tony Duell

I noticed some wierd timing on some of the core ROM outputs. Here's the output from TBS:

And here's what I would consider a normal looking signal out of SC4:

That < 500ns glitch on TBS doesn't seem right.

Re: 9100A with no display

*Message #8 Posted by **Richard Wilder** on 4 Jan 2011, 2:03 a.m.,*
in response to message #4 by Tony Duell

I checked the KB today: All the strobes are changing with a key press as well as all of K0 - K5. I checked the ST output of the STOP transistor. It's normally -10V and goes to -15V when I press the STOP key. The STOP key generates strobe as well as a keycode on K0-K5. The -10V doesn't seem right - shouldn't it be close to 0V? I tried to follow the ST output from the KB connector on to the logic board but can't find it on any of the schematics. It becomes ISTP on the logic connector but I can't find it anywhere else. Any clues as to where this line goes?

Thanks! ;^)

Re: 9100A with no display

*Message #9 Posted by **Tony Duell** on 4 Jan 2011, 5:05 a.m.,*
in response to message #8 by Richard Wilder

ISTP certainly goes to the rear peripheral connector on the gating board. I am not sure if it goes

anywhere else...

Re: 9100A with no display

*Message #10 Posted by **Eric Smith** on 4 Jan 2011, 3:56 a.m.,*
in response to message #4 by Tony Duell

Apparently I misread it, as I thought he was claiming he did get an error indication. If not, then I agree that it is most likely a logic fault.

Re: 9100A with no display

*Message #11 Posted by **Richard Wilder** on 4 Jan 2011, 10:36 a.m.,*
in response to message #1 by Richard Wilder

Any comments on that glitchy looking TBS signal or the ISTP high level being at -10V instead of 0V?

Re: 9100A with no display

*Message #12 Posted by **Tony Duell** on 5 Jan 2011, 4:30 a.m.,*
in response to message #11 by Richard Wilder

If ISTP doesn't go anywhere other than the I/O connector (and it may well not), then there's no pull-up on that signal. I am not sure what you are measuring it with, but I'd not worry too much about the the odd voltage level. I will check the 9125A plotter schematics (the only peripheral I have) and see how it's used there.

Remember that the inputs to logic circuits on the 9100 are often current, not voltage, driven. This can make signals look odd.

For the TBS signal, remember, again, it's an open-collector signal. It's used (in the 9100B) on sheet 11 of the gating board schematic, were it's effectively ORed with TBA (via diode J1) and then used as an input to one of thr JA5 AND gates. Your glitch may well be the TBA signal.

Well coburlin has now listed a 35 with all the trimmings for a 'bargain' $489. Which to buy? Such a tough decision ...

Re: $9000 HP-35 on TAS

*Message #16 Posted by **Michael Meyer** on 5 Jan 2011, 3:47 p.m.,*
in response to message #15 by Keith Midson

Maybe it's a "public service" for sellers. The HP-35 I have in my office was about $30 a year or two ago. Now, suddenly, they seem to have jumped to $150 to $200!

I wonder: if I list a couple of TI-30's for thousands of dollars could I can then sell others for more than

$5.00.....?

It does seem like the "buy it now" prices have driven up the regular auctions' prices some. Or do I have that wrong?

Re: $9000 HP-35 on TAS

*Message #17 Posted by **Allen** on 5 Jan 2011, 5:28 p.m.,*
in response to message #16 by Michael Meyer

In nearly every time case I've seen longer than 15 days or so MAX(price.bidding) > MAX(price.buynow). Every year there are seasonal spikes around December, January, July, and March, dips in May, August, October- especially true for popular models.

You also see some echo sales when one model goes for more than expected, buyer thresholds go up while the max sale is still visible in TAS auction history- then people get their common sense back.

Re: $9000 HP-35 on TAS

*Message #18 Posted by **Keith Midson** on 5 Jan 2011, 9:59 p.m.,*
in response to message #17 by Allen

I agree that prices fluctuate seasonally as well as randomly (depending on when two or more collectors 'have' to have a particular model at the same time thus driving prices up), but I can't figure out what would motivate someone to think that anyone would pay $9,000 for something that they can get for around $200 if they wait a few weeks or so.
I have 4 x 35's, two complete with boxes and all paperwork - two of these were given to me, one cost $90 and the other cost $200 (April this year). The $200 looks like it was never used - I still remember thinking that I paid too much! I have three versions, including one with the famous bug. It's not like it's a 'rare' machine - important model in history yes, but plenty around to keep collectors happy. Maybe if it were a mint red dot it might be possible to ask in the thousands.
Be interesting to see what it gets relisted at after it finishes with no bids!
Cheers, Keith

No - I asked him! Aparently it's "worth a lot more than that. i saw a red dot, not in this good condition, sell for over $1,900 just sell 4 days ago". So apparently there is something very special about this one that makes it worth MUCH more than any other i've seen.

red dots? where?

*Message #21 Posted by **db (martinez, ca.)** on 6 Jan 2011, 1:33 a.m.,*

in response to message #20 by Keith Midson

thinkin that seller's got red dots all over his thorax like those space bees on the latest Futurama.

OT: 2011 and european trip

*Message #1 Posted by **Andrés C. Rodríguez (Argentina)** on 1 Jan 2011, 8:00 p.m.*

Hi all!, please have our best wishes for the new year!!

I will be in the south of Spain and in Berlin during the second part of January. If someone would like to suggest places to visit, give any advise, and/or just be in contact, please email me to:

a . rodriguez AT ieee . org

(of course, remove spaces and replace the "at" symbol)

Thanks in advance!!

Edited: 1 Jan 2011, 8:01 p.m.

*Message #2 Posted by **Frank Boehm (Germany)** on 2 Jan 2011, 2:42 p.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

I can only speak for Berlin: It's impossible to visit even a tiny bit of the most interesting sites, unless you have a couple of weeks to spend. January is not really a great time to vistit Berlin, I'd rather suggest May or June. What I found quite nice is a public bus, doing a city roundtrip. Not as good as a guided tour (if you have very limited time, that would be your best option), but you can exit the bus if you like, do your visit, take the next bus to continue your tour. I'd suggest to buy a good city guide way before your visit and pick the interesting sites. A couple of places are worth a visit: Brandenburger Tor, e.g. Other sites are "overhyped", like Checkpoint Charlie - seemed like a tourist ripoff to me :)
Unfortunately, Berlin is *huge*, so going from one site to another takes it's time. Btw. if you are staying for a couple of days, you really should be using bus/subway. It's usually much faster than going by car.

Re: OT: 2011 and european trip

*Message #5 Posted by **Walter B** on 3 Jan 2011, 1:06 p.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

For Berlin: May be freezing cold there. So besides enjoying public bus line 100 for a sightseeing tour (good value for little money) it depends on your interests: in addition to what previous posters mentioned there are some famous museums concentrated on the so-called "Museumsinsel" (Isla de Museos) where you can easily spend a day or more.

For Southern Spain: If you happen to touch down in Andalusia, don't miss Granada and Cordoba - worth a journey!

Edited: 3 Jan 2011, 1:08 p.m.

Re: OT: 2011 and european trip - Thank you all!!

*Message #6 Posted by **Andrés C. Rodríguez (Argentina)** on 3 Jan 2011, 1:22 p.m.,*
in response to message #5 by Walter B

Yes, I know January is not the best month for a Berlin trip, but our holidays must be in January (it's summer here, and the university where I teach works from February to December almost non-stop). So there are no options.

I'll take all suggestions into account. Thank you again.

I second that. The Alhambra at Granada is worth a visit to Spain all by itself; winter is not ideal because the gardens probably won't look like much, but the architecture is gorgeous all year round. :-)
Also visit Sevilla if you have a chance.

Re: OT: 2011 and european trip

*Message #8 Posted by **Iñigo Rodriguez** on 4 Jan 2011, 11:09 a.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

Excuse, I will write this post in Spanish. Hola Andrés: Si tu intención es visitar el sur de España, básicamente Andalucia. Tienes que visitar Sevilla, Cordoba y Granada si puedes. En Sevilla puedes ver todo el casco antiguo, barrio de Triana, La Giralda, la Torre del oro y disfrutar de sus bares y restaurantes. Esto último lo puedes hacer en cualquier lugar de España. En Cordoba tienes que visitar, además de la ciudad, la mezquita y la ciudadela. En Granada, además de la ciudad en sí, no te puedes ir sin ver la Alambra. Solo por esta visita

merece la pena el viaje. Habla con tu agencia de viajes y consulta el tema de las entradas para la Alambra, suelen estar muy solicitadas. En Granada también tienes una estación de esqui, Sierra Nevada, que es de las mejores de España. Recuerda que aquí estamos en invierno y aunque el sur es menos frio, tienes que venir preparado. Y recordarte que en Andalucia hay muy buen pescado y marisco. Si necesitas algo, no dudes en ponerte en contacto conmigo. Iñigo

The Fibonacci Triangle - HP-38/39/40 GROB Question

*Message #1 Posted by **Marcus von Cube, Germany** on 1 Jan 2011, 10:14 a.m.*

In this thread in the French MySilicium forum there are several programs to display the Fibonacci sequence as a binary image. The original idea is from this page: http://naivedesign.com/ND1/The_Fib_Triangle.html.

The by far fastest solution runs on a HP50g and uses binary arithmetic and a dynamically built GROB. The HP40gs uses very similar hardware but its programming model is so simplified that I came up with a program which is about 100 times slower than the user RPL program for the 50G. This is a little frustrating. The main problem is that I couldn't find a way to dynamically construct a GROB. I see two possible solutions:

1) There exists a library somewhere in the wild which provides dynamic string and GROB handling.

2) The program is translated to SysRPL. Can I program in SysRPL on the machine or what do I need?

Re: The Fibonacci Triangle - HP-38/39/40 GROB Question

*Message #2 Posted by **Han** on 1 Jan 2011, 11:06 p.m.,*
in response to message #1 by Marcus von Cube, Germany

> Quote:
>
> 2) The program is translated to SysRPL. Can I program in SysRPL on the machine or what do I need?

You can program in SysRPL on the machine by simply typing "256 ATTACH" and using the built-in compiler. You can also download Jazz 50G if you wish to do SysRPL debugging, among other things.

Re: The Fibonacci Triangle - HP-38/39/40 GROB Question

*Message #3 Posted by **Marcus von Cube, Germany** on 2 Jan 2011, 5:28 p.m.,*
in response to message #2 by Han

Han, I'm talking about the 39G (or 39gs/40gs), not the 50g. I don't think I can attach the library on these machines.

Re: The Fibonacci Triangle - HP-38/39/40 GROB Question

*Message #4 Posted by **Han** on 1 Jan 2011, 11:09 p.m.,*
in response to message #1 by Marcus von Cube, Germany

Also, it would be faster to draw directly onto the screen after each computation rather than manipulate everything via strings and GROBs.

Re: The Fibonacci Triangle - HP-38/39/40 GROB Question

*Message #5 Posted by **Marcus von Cube, Germany** on 2 Jan 2011, 5:34 p.m.,*
in response to message #4 by Han

This was my first attempt and it's slower than the GROB version.

Re: The Fibonacci Triangle - HP-38/39/40 GROB Question

*Message #6 Posted by **Tim Wessman** on 2 Jan 2011, 1:06 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Yes, you can program in sysRPL, but it is quite a pain and requires you to understand applet structure, and use a lot of not so nicely integrated tools to do so.

TW

Re: The Fibonacci Triangle - HP-38/39/40 GROB Question

*Message #7 Posted by **Marcus von Cube, Germany** on 2 Jan 2011, 5:33 p.m.,*
in response to message #6 by Tim Wessman

I understand that I can program FOR the machine in SysRPL but obviously not ON the machine.

BTW, is there a SYSEVAL call the does the equivalant of PVIEW to allow interactive scrolling of a GROB of arbitrary size?

Re: The Fibonacci Triangle - HP-38/39/40 GROB Question

*Message #8 Posted by **Oliver Unter Ecker** on 2 Jan 2011, 4:19 p.m.,*
in response to message #1 by Marcus von Cube, Germany

Hi Markus,

> Quote:
>
> The by far fastest solution runs on a HP50g and uses binary arithmetic and a dynamically built GROB.

Fastest, if you don't include the calculator that served as inspiration for this thread. For completeness, ND1, with a run-time of 0.3s for computation and 0.7s for computation and display, is quite a bit faster than the 50g at 170s for this task. :-)

The implementations are really impressive, though.

Oliver

Re: The Fibonacci Triangle - HP-38/39/40 GROB Question

in response to message #8 by Oliver Unter Ecker

Can you tell us more about ND1?

Re: The Fibonacci Triangle - HP-38/39/40 GROB Question

*Message #10 Posted by **Oliver Unter Ecker** on 2 Jan 2011, 6:41 p.m.,*

in response to message #9 by Marcus von Cube, Germany

Marcus,

Of course. ND1 is a new calculator in the spirit of the HP-28,-48,-49 lines. A vague mix of HP-28S and HP-50g, it supports RPL but its biggest strength and architectural feature is that it's built on JavaScript and HTML5, and that it's fully programmable and extensible. There's a lot of information on the "app-site" at http://naivedesign.com/ND1 Click on Specs to begin and also see the comparison to HP calcs on the specs page.

An intro to the project, and call for programmer participation, for HP pros is here http://groups.google.com/group/comp.sys.hp48/browse_thread/thread/2b377149669b7fb4# You may also want to check out http://groups.google.com/group/comp.sys.hp48/browse_thread/thread/5bd6e0b2e4691311#

Cheers.

Re-celling

*Message #1 Posted by **ClausB** on 31 Dec 2010, 1:54 p.m.*

Having replaced the AA NiCds in my HP-45, HP-33E, SR-52, SR-56, and TI-59, I thought I should try some more modern battery technologies. I put 2 AAA NiMHs in a BP7 for my TI-55, -57 and MBA. It works well with the stock TI charger. Then I put a 3.7 V Li Ion battery from a broken cell phone into a modified TI-58. It works well but I have not installed an internal charger.

Have any of you used other battery types to replace NiCds in your LED calculators?

Re: Re-celling

*Message #2 Posted by **designnut** on 1 Jan 2011, 10:26 a.m.,*
in response to message #1 by ClausB

I use Sanyo Eneloop AAA cells in 50G and bought some NiMh with welded tabs to replace nicads in a cell phone. The Sanyo cells have a very low self discharge rate, and have been recebtly improved. The voltages seem to match a nicad cell. I use the Sanyo cells in shavers, toothbrush, flashlights, radios. I used to keep 2 chargers busy replacing the self discharge loss, now I seldom use one. I use the AA cells in a holder to substitute for D cells and get good life. Sam

Re: Re-celling

*Message #3 Posted by **Dieter** on 1 Jan 2011, 11:57 a.m.,*
in response to message #1 by ClausB

> Quote:
>
> Have any of you used other battery types to replace NiCds in your LED calculators?

Yes, I use my good old 34C with two standard Sanyo Eneloop NiMHs. Since the regular HP battery pack uses two NiCds connected with welded tabs, the new solution has to provide some kind of connection as well. I simply use a short piece of metal, or even a piece of aluminium foil folded several times to give the required thickness, fitting snugly into the battery compartment.

Using NiMHs replacing NiCds usually causes no major problems - this was one of the key features pointed out by the battery manufacturers in the early nineties when NiMHs became available to the average consumer. As with NiCds, the standard charging method applies a constant current, charging the battery with a similar efficiency of roughly 80% (for lower charging rates). This means that, in many cases, old LED-calculators with their low-current unsophisticated (and uncontrolled) simple not-exaclty-constant-current chargers can be used for NiHMs as well. However, the same charging time still gives the same operating time. So a full charge of the new cells means that a capacity four times as high also requires four times the charging time. Or four times the charging current for the same time as before. That's one of the reasons why I usually charge my NiMHs in a decent external processor-controlled charger.

NiMHs with low (virtually nonexistent) self discharge are available from several manufacturers, e.g. from

Sanyo as "Eneloop" but also under different brand names. As far as I know these cells are not available with welded soldering tabs, at least not from Sanyo. The standard type has a capacity of 2000 mAh, giving 4x (!) the operation time of the original NiCds. Since there is virtually no self-discharge this kind of battery also is perfect for infrequently used devices. A set of four low-self-discharge NiMHs with a decent four-channel -dU processor-controlled charger can be had for less than 30 EUR/USD.

More information, including several brand names, can be found in this Wikipedia-article.

I took some low self-discharge button-top cells to a local battery shop ("Batteries Plus" for USA readers) and had them spot weld and shrink wrap a couple of packs for me for about USD 10 each. Resulting packs are a bit taller than flat-tops with solder tab, but may work for some applications.

Re: Happy New Year

*Message #13 Posted by **Dieter** on 1 Jan 2011, 12:14 p.m.,*
in response to message #12 by Walter B

Well, the one or other RPN-user might prefer to write this as...

```
2011 ENTER 125 RMDR  =>  11 = B
2011 ENTER 125 INT/  =>  16 = G
```

I love all those numeric functions that make things more elegant, more precise or just shorter. :-)

However, in this case the final solution of course is writing "2011" as a base-2011-number: a simple "10". B-)

Dieter

30b Learning Modules PDF?

*Message #1 Posted by **Norman Dziedzic** on 30 Dec 2010, 6:19 p.m.*

Got a 30b under the tree for me !!!

Does anyone know if the learning modules are available as pdf files like they are for the 35s? It would be great if they have them all zipped together for single download.

Thanks

Re: 30b Learning Modules PDF?

*Message #2 Posted by **Mark Harman** on 30 Dec 2010, 6:47 p.m.,*
in response to message #1 by Norman Dziedzic

Here you go:

Manual:

30b Full Manual PDF

Learning modules:

30b Learning Modules (zip file)

I love the 30b. I've had mine since August and think it is a terrific calculator. If you have any questions about it, feel free to ask me.

Regards,

Mark

*Message #4 Posted by **Mark Harman** on 30 Dec 2010, 9:45 p.m.,*

in response to message #3 by Norman Dziedzic

Strangely enough, the PDF versions of the learning modules aren't on HP's site - yet they are HP-produced PDFs. These are on the hpcalc.org commerce site. The ones on the HP site, as Gene mentioned, are XML versions. I'm thinking that hpcalc.org likely got a hold of them when Tim Wessman posted a temporary link to them and then they loaded them on their own server.

Regards,

Mark

in response to message #1 by Norman Dziedzic

Norman,

Be sure to find and attach the clear plastic keyboard overlay for the programming commands. I think it's in the back of the quick start guide. It's easy to miss it and throw it away with the packaging.

The 30b is a lot of fun. I really like the split display (dot matrix on top, 7-segment down below). They keyboard has a nice feel and it's really fast.

Re: 30b Learning Modules PDF?

*Message #7 Posted by **Mike Morrow** on 1 Jan 2011, 2:09 p.m.,*
in response to message #6 by David Hayden

> Quote:
>
> Be sure to find and attach the clear plastic keyboard overlay for the programming commands.

Also, be sure to NEVER rub the print on the overlay. The ink has been applied to the exposed surface of the overlay. It rubs away very very easily, beginning with the initial act of applying the overlay sheet to the keyboard. One would have thought a little better attention to detail would have been warranted.

The functions on the overlay are accessed from the keyboard by pressing and holding the blue shift key while depressing the desired function. The same technique is required to program an UP or DOWN function. Otherwise, pushing those keys scrolls through the program.

> Quote:
>
> The 30b is a lot of fun....The keyboard has a nice feel and it's really fast.

The HP 30b itself is an amazing device. It's the fastest handheld anyone has ever produced.

Here is a HP 30b version of the well-known Savage Benchmark.

In Prgm 0:
1 STO 0
2 0
3 Input
4 Lbl 00
5 1
6 +
7 sqrt
8 x^2
9 LN
10 e^x
11 Math
12 Input
13 UP
14 TAN
15 DSE 0
16 Gto 00
17 Stop
(Checksum 22.085)

Set the HP 30b for RPN, RADIANS, and FIX 11. Then execute:
2500
Input
Prgm 0
=

The result is 2499.99946106 (perfect would be 2500). Execution time (from a stopwatch) is 6.5 seconds! That is the same numerical result from the HP 50g, which takes 65 seconds to do the same.

The HP 30b is ten times faster than the HP 50g! (At least for this application.)

HP 65 programmable

*Message #1 Posted by **designnut** on 30 Dec 2010, 6:15 p.m.*

My dad showed me the method of successive trials to solve intractable problems. When I had my HP65 I found I could enter the variables in storage and do a repeatted solution without effort. I was working with negatice temperature coefficient thermistors and had tabulated resistances but no formula. I tried until I found that adding a large number to the temperature and take the Ln I could match the slope of the resistance temperature curve over the complete range. I could refine the precision by repeated trials. To date this has not been discovered, but an extremely compleex method is used and they are not going to change. I thought I could match other graphs I used in electrical engineering and by trial and error matched many of them. I was interested in retirement and matched income tax in my renge, and made varied assumptions of inflation, return on investments, raises and solved them year by year. I found all you needed was to make more money than you spent and you could pay your way. I did not depend on SS or retirement benefits, I thought them unworkable schemes. So I'm good at 82 and will leave an income for my niece to sustain her.

Re: HP 65 programmable

*Message #2 Posted by **Eric Smith** on 31 Dec 2010, 2:27 a.m.,*
in response to message #1 by designnut

There were programs for most HP programmables to do curve fitting, including logarithmic curves. It sounds like that was what you were doing manually.

As far as I can see, if you don't make more money than you spend, there isn't any retirement plan that will work.

Re: HP 65 programmable

*Message #3 Posted by **designnut** on 31 Dec 2010, 12:17 p.m.,*
in response to message #2 by Eric Smith

If simple regression analysis would do it, they would not be using a complex solution (from the factory). What I was illustrating was that the ease of repeated trials can enlarge the range of problems you can undertake. "Go where no man has gone before." Sam a chum said If sidney darlington can have a coupound transistor namedafter him, we should be able to name a compound FET after you. Har Har.

HP 35 ... top row buttons

*Message #1 Posted by **Jeff Kearns** on 30 Dec 2010, 3:30 p.m.*

Hi everyone,

I recently purchased on TAS a complete, fine looking 4th version HP 35 s/n 1346A 46XXX. I never fully appreciated, until having examined one, the fine design and construction of this pioneering electronic slide rule (especially the battery door design with sliding clasps/pads). The only cosmetic deficiency is some wearing off of the silver paint above the OFF/ON switch. It is a very nice addition to my collection and will be used as well!

It works well except for the top row of keys which need to be pressed quite forcefully to register. I knew this when I purchased it so no surprises there. The 'on' switch is a little touch and go also, and the x^y and LOG keys are the hardest to get to work consistently. The e^x works the best of the lot (top row only). I believe all of the above issues are related. Seems to be a case of poor contact and shouldn't be a difficult repair job - once I figure out exactly how to do it.

I am not an expert HP calculator electronics tinkerer, having only taken apart a Spice model successfully using the fine explanation at Spice Repair to add some foam to increase pressure on the circuit card. If Geoff Quickfall's book will be out soon, hopefully he can put me on his list of buyers....

In the meantime, can anyone (Geoff??) recommend a repair method for this beauty? I do not want to cause any damage to it! It is my 15th HP RPN model and I guess I will have to start maintaining them on my own at some point.

Thanks! ----- Jeff Kearns

What's special about this one?

*Message #1 Posted by **Keith Midson** on 30 Dec 2010, 2:48 p.m.*

I've been watching this for a few days now: TAS item 320635175981. Does anyone one know what is so special about this HP65 that would make someone bid over US$1,300!! I know it has a lot of extras, and I don't recall seeing a box for a 65 (usually the 65 comes with the plastic hard case - at least that's what i've got).
Happy new year everyone!
Cheers, Keith

Re: What's special about this one?

My theory is not that the economy is picking up so much as most other places to park one's money are just terrible. Banks are paying near zero percent and returns on real estate are worse. Collectibles of all kinds benefit from this lack of good investment vehicles.

Re: What's special about this one?

*Message #8 Posted by **Eric Smith** on 31 Dec 2010, 2:34 a.m.,*
in response to message #7 by Katie Wasserman

> Quote:
>

Yet another instance of the "Greater Fool" theory.

Generally collectibles are a terrible investment, because it is impossible to predict **which** collectibles will actually gain significant value. Most don't even match the rate of inflation.

There are routinely news stories about people that discover that they have some incredibly valuable collectible, but that's a six-sigma event. The only way it's going to happen to you is if you have a time machine.

Re: What's special about this one?

*Message #9 Posted by **Martin Pinckney** on 31 Dec 2010, 9:36 a.m.,*
in response to message #8 by Eric Smith

> Quote:

> Generally collectibles are a terrible investment, because it is impossible to predict **which** collectibles will actually gain significant value. Most don't even match the rate of inflation.

Generally, perhaps so, especially if by "collectibles" you mean the artificially-created ones manufactured for "Greater Fools." But there are fields of collecting that consistently see gains over long time periods. Rare or mint specimens of cameras, for instance. Or guns of almost any type, but especially certain iconic models. Rare coins.

Knowledge is the key. Nevertheless, ultimately there is no way to predict, as you state. But apparently the same is true for any investment vehicle, with the possible exception of physical gold.

Re: What's special about this one?

*Message #10 Posted by **Thomas Okken** on 1 Jan 2011, 3:33 a.m.,*
in response to message #9 by Martin Pinckney

> Quote:
>
> Knowledge is the key.

If anything, **prescience** is the key. I'd call it luck, personally.

You tend to hear much more about people who "just knew" that something was a good investment and made a bundle; you don't hear so much about those who tried to play that game and lost. There's a reporting bias going on there.

The things that have tended to appreciate substantially in my lifetime have included things like art, vintage cars, and some kinds of vintage technical equipment (e.g. some cameras). These are things that aren't worth much in practical terms; they just fetch a lot of money because there are collectors who are able and willing to throw a lot of money at them. It's whatever's fashionable. If that really were predictable, there would be a lot more antiques dealers in the Fortune 500 -- as it is, all we have there is eBay. :-D

>
> Generally collectibles are a terrible investment, because it is impossible to predict which collectibles will actually gain significant value. Most don't even match the rate of inflation.

Perhaps a somewhat-harsh assessment, there.

I suspect that most people who buy collectibles with some of their discretionary income, during times when conventional equity investments seem not very promising, are choosing to indulge some "wants" rather than to invest more heavily in 'serious' things.

As far as collectibles that appreciate or at least hold their value: Never underestimate the allure of things that remind affluent people of their youth, especially things that were expensive and unobtained back in the day. Rarity and condition are also important for determining price, as always.

Now then, to pay US$1000 or more for a "Red Dot" HP-35 seems quite absurd to me. Yes, it's the original edition, and it might have a computational bug, but I never have quite understood its particular desirability. The last (fourth) edition is the best one, anyway...

-- Karl

*Message #13 Posted by **Eric Smith** on 31 Dec 2010, 11:04 p.m.,*
in response to message #12 by Karl Schneider

Oh, I understand collecting for personal interest or sentimental reasons. That's almost totally unrelated to collecting as investment.

Re: The HP-35 and collectibles as investments

*Message #14 Posted by **Karl Schneider** on 1 Jan 2011, 4:45 p.m.,*
in response to message #13 by Eric Smith

> Quote:
>
> Oh, I understand collecting for personal interest or sentimental reasons.
> That's almost totally unrelated to collecting as investment.

Yes, of course. I believe that Katie's statement observed that people tend to redirect some discretionary income to collectibles (and maybe consumer goods, as well), when saving and investing don't appear to offer much return. These expenditures would be made *in lieu of* investing, not necessarily as *alternative* investments.

You and Thomas Okken (above) are absolutely right that to make money investing in collectibles is difficult to achieve systematically. The value of any collectible invariably derives from characteristics other than sheer practicality.

Also, the collectible must be in excellent condition in order to fetch a high price. Anyone who purchases something new, with the expectation that it will be highly valuable in the future, must be prepared to wait a very long time (usually decades) to reap his reward. Moreover, the item must be maintained in pristine condition all that time. Far better to pick up an excellent used one cheap when it is passé, then restore it if necessary.

-- Karl

Help solving equation
*Message #1 Posted by **Geir Isene** on 29 Dec 2010, 10:16 a.m.*

It would be great if someone here could help me symbolically solve the following equation - it is part of an upcoming program to calculate the "processability" of a business area (i.e. if it is a sound business decision to create a process for a certain area of business). To be able to solve the bigger equation, I need help solving this one:

Solve for x:

(a^x)/x = b

Re: Help solving equation
*Message #2 Posted by **dietmar13** on 29 Dec 2010, 10:25 a.m.,*
in response to message #1 by Geir Isene

wolfram alpha is always your friend...

http://www.wolframalpha.com/input/?i=%28a^x%29%2Fx+%3D+b+solve+for+x

Re: Help solving equation
*Message #3 Posted by **Geir Isene** on 29 Dec 2010, 10:30 a.m.,*
in response to message #2 by dietmar13

Wow. Excellent. Wolfram is a better resource after this.

Re: Help solving equation
*Message #4 Posted by **Geir Isene** on 29 Dec 2010, 12:48 p.m.,*
in response to message #2 by dietmar13

Looking into this further, I am unsure of how I would go about resolving the following in an HP-41 program:

How do I handle the Lambert W-Function in a program?

in response to message #4 by Geir Isene

> Quote:
> I am unsure of how I would go about resolving the following in an HP-41 program

If you really **need** to... :-)
try with HP-41Z module by Ángel.

Greetings,
Massimo

Edited: 29 Dec 2010, 1:22 p.m.

Re: Help solving equation
*Message #6 Posted by **Geir Isene** on 29 Dec 2010, 1:34 p.m.,*
in response to message #5 by Massimo Gnerucci (Italy)

OK, but how?

Re: Help solving equation
*Message #7 Posted by **PeterP** on 29 Dec 2010, 2:37 p.m.,*
in response to message #6 by Geir Isene

This gives a good explanation as well as the numerical evaluation at the bottom

as well as here in Wolfram Alpha

[link:http://www.google.com/url?sa=t&source=web&cd=2&ved=0CCUQFjAB&url=http%3A%2%2Fciteseerx.ist.psu.edu%2Fviewdoc%2Fdownload%3Fdoi%3D10.1.1.86.9305%26rep%3Drep1%26type%3Dpdf&rct=j&q=how%20to%20calculate%20the%20lambert%20W%20function&ei=8o0bTcrBIoLGlQfxh6jJCw&usg=AFQjCNGzCdFCPN-BNVvFeSmeqBIbaY59AA&sig2=-qIe1lZhmayysqt745QTmg&cad=rja]and here if you *really* want to know a whole lot about the W (as well as a last chapter on numerical evaluation)[/link]

Cheers

Peter

Edited: 29 Dec 2010, 2:43 p.m.

Re: Help solving equation
*Message #8 Posted by **Geir Isene** on 29 Dec 2010, 3:17 p.m.,*
in response to message #7 by PeterP

I am looking for a simpler, more basic approximation - see further down on the "math challenge"; An approximation of the original function to make the symbolic solve easier without it becoming recursive and such.

Re: Help solving equation
*Message #9 Posted by **Thomas Klemm** on 29 Dec 2010, 3:23 p.m.,*

in response to message #6 by Geir Isene

Here's the Lambert W function:

```
 01 LBL "W"
 02 STO M
 03 0
 04 STO N
 05 LBL 00
 06 RCL N
 07 ENTER
 08 ENTER
 09 E^X
 10 *
 11 LASTX
 12 1
 13 R^
 14 +
 15 *
 16 LASTX
 17 1/X
 18 1
 19 +
 20 2
 21 /
 22 R^
 23 RCL M
 24 -
 25 ENTER
 26 RDN
 27 *
 28 -
 29 /
 30 ST- N
 31 ABS
 32 RND
 33 X#0?
 34 GTO 00
 35 RCL N
 36 END
```

Here's how to use it:

a ENTER b

```
X<>Y
LN
CHS
STO 00
X<>Y
/
XEQ "W"
RCL 00
/
```

I'm using:

$$x = \frac{W(\frac{-\log a}{b})}{-\log a}$$

HTH
Thomas

Re: Help solving equation
*Message #10 Posted by **Geir Isene** on 29 Dec 2010, 3:52 p.m.,*
in response to message #9 by Thomas Klemm

It sure does :)

Re: Help solving equation
*Message #11 Posted by **Gerson W. Barbosa** on 29 Dec 2010, 6:25 p.m.,*
in response to message #9 by Thomas Klemm

Alternatively, if you have the Advantage Module:

```
 01 LBL 'W
 02 STO 01
 03 CLx
 04 ENTER
 05 10^x
 06 'L
 07 SOLVE
 08 RTN

 01 LBL 'L
 02 e^x
 03 *
 04 RCL 01
 05 -
 06 RTN

Example, using your procedure:

2 ENTER 32

x<>y
LN
CHS
STO 00
x<>y
/
XEQ "W"
RCL 00
/                     -->   0.031949779

2 x<>y y^x LASTx /    -->   31.99999999
```

Another solution is x = 8, but this requires the other real branch of Lambert W.

Regards,

Gerson.

Re: Help solving equation
*Message #12 Posted by **Gerson W. Barbosa** on 31 Dec 2010, 12:29 a.m.,*
in response to message #11 by Gerson W. Barbosa

The following program can be used to compute the second real solution:

```
 01 LBL 'WM

Re: Help solving equation
*Message #13 Posted by **Geir Isene** on 1 Jan 2011, 8:18 a.m.,*
in response to message #12 by Gerson W. Barbosa

As this should not fade away to oblivion as programs buried deep into an HP Forum thread, I decided to put the two solutions to the W Lambert fuction into one program here:

http://www.isene.com/isene.cgi?hp-41_WL

Re: Help solving equation
*Message #14 Posted by **Gerson W. Barbosa** on 1 Jan 2011, 11:41 a.m.,*
in response to message #13 by Geir Isene

The program for the second real branch of Lambert's W function above (W_p or W_{-1})is based on this formula, found quite by chance when playing with the RPN stack:

$W_{-1}(-1/x) = -(...x*\ln(x*\ln(x*\ln(x*\ln(x))))...)/x$

This is not a fast method, especially for arguments close to -1/e, it was originally meant for the HP-12C+:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv019.cgi?read=159032

$W_{-1}(-0.367) = -1.070791879$ (about 5 seconds on the HP-12C+ and 2 min 20 sec on the HP-41CX). Actual 10-digit result: -1.070791887.

A faster method for the second branch should be appreciated.

The steps 05 through 07 in the previous program made sense only for manual calculations. This shorter version is better:

```
 01 LBL 'WM
 02 CHS
 03 1/x
 04 STO 01
 05 LBL 00
 06 STO 02
 07 LN
 08 RCL 01
 09 *
 10 RCL 02
 11 x<>y
 12 -
 13 x=0?
 14 GTO 01
 15 LASTx
 16 GTO 00
 17 LBL 01
 18 LASTx
 19 RCL 01
 20 /
 21 CHS
 22 END
```

*Message #15 Posted by **Geir Isene** on 1 Jan 2011, 12:00 p.m.,*
in response to message #14 by Gerson W. Barbosa

Check out the updated program listing

Re: Help solving equation
*Message #16 Posted by **Gerson W. Barbosa** on 1 Jan 2011, 12:28 p.m.,*
in response to message #15 by Geir Isene

You've been quick! My editing involved checking my result upon Egan's Ford LAMBERTW program for the HP-50g and other minor changes. No changes to the listing have been made. Now, sorry for the dumb question: how to enter STO M, N, on the HP-41? Thanks!

Re: Help solving equation
*Message #17 Posted by **Thomas Klemm** on 1 Jan 2011, 12:52 p.m.,*
in response to message #16 by Gerson W. Barbosa

> Quote:
>
> how to enter STO M, N, on the HP-41?

- Plug in the CCD module.
- cf. HP-41C Synthetic Programming
- Just use register 00 and 01 instead of M and N.

Cheers
Thomas

Re: Help solving equation
*Message #18 Posted by **Gerson W. Barbosa** on 1 Jan 2011, 2:42 p.m.,*
in response to message #17 by Thomas Klemm

> Quote:
>
> - Just use register 00 and 01 instead of M and N.

I'll stick to that :-)

Thanks,

Gerson.

Re: Help solving equation
*Message #19 Posted by **Geir Isene** on 1 Jan 2011, 2:55 p.m.,*
in response to message #18 by Gerson W. Barbosa

Just as well.

Using registers N and M (part of the Alpha register) saves using standard registers that are often used by other programs.

Re: Help solving equation

>
> A faster method for the second branch should be appreciated.

A much faster program, using the Solver:

```
 01 LBL 'WW
 02 CHS
 03 STO 01
 04 1/X
 05 LN
 06 ENTER
 07 LN
 08 +
 09 ENTER
 10 ENTER
 11 .5
 12 +
 13 'LL
 14 SOLVE
 15 CHS
 16 END

 01 LBL 'LL
 02 e^x
 03 /
 04 RCL 01
 05 -
 06 RTN

-.367 XEQ WW    -->    -1.070791885    (12 seconds). Actual 10-digit result: -1.070791887.
```

*Message #21 Posted by **Ángel Martín** on 4 Jan 2011, 2:41 a.m.,*
in response to message #20 by Gerson W. Barbosa

WL0 and WL1 are available in the SandMath module. MCODE implementation, not using SOLVE (but internal iteration routine instead).

Re: Help solving equation
*Message #22 Posted by **Geir Isene** on 4 Jan 2011, 4:34 a.m.,*
in response to message #21 by Ángel Martín

Ah, thanks for that.

The Sandmath includes just about everything. Should have checked that listing of course.

Re: Help solving equation
*Message #23 Posted by **Gerson W. Barbosa** on 4 Jan 2011, 2:12 p.m.,*
in response to message #21 by Ángel Martín

Hola Ángel,

I'm sure the SandMath module tackles these and other special functions hands down. I'll try it in an emulator, if this is possible. I was never an HP-41 user, mine is used only occasionally.

Cheers,

Gerson.

Re: Help solving equation
*Message #24 Posted by **Ángel Martin** on 5 Jan 2011, 1:03 p.m.,*
in response to message #23 by Gerson W. Barbosa

Gerson you can use V41 from TOS - it works like a charm.

Cheers, AM

Re: Help solving equation
*Message #25 Posted by **Ángel Martin** on 29 Dec 2010, 2:40 p.m.,*
in response to message #4 by Geir Isene

There´s a WL0 (and WL1 as well) MCODE function in the sandmath, so I´d suggest you use it to program your own expression and then use the Advantage´s SOLVE upon it.

Have you considered taking exponentials on each side of the equation?

Cheers, ÁM

Math Challenge (was: Help solving equation)
*Message #26 Posted by **Geir Isene** on 29 Dec 2010, 2:44 p.m.,*
in response to message #1 by Geir Isene

To elaborate on the task at hand;

I am looking to see if a business area would benefit from a formalized process.

A task has the total cost (C) after N repetitions of c*N (where "c" is the cost of doing the task once). If N = n*y (where "n" is the number of times a task is done per year, and "y" is the number of years), we get the total cost of a task done over a certain number of years (or fraction(s) of years):

C = nyc (pun not intended) [#1]

If introducing a standardized process for the task gives an efficiency ratio of "E" (a number hopefully between 0 and 1), after the process is introduced we get:

C = nycE [#2]

But establishing a process has an initial cost of "I". To recuperate the cost, we get:

nyc - nycE > IR^y [#3]

where "R" is the needed return on investment: R = (1 + r/100) where "r" is the percentage needed as annual return on the investment. In some instances the initial cost is recuperated after a certain time, in other cases, the initial cost is never recuperated and a formalized process is not warranted.

If the task is repeated often and the cost of introducing a process is not too costly, it would be a sound business decision to formalize a process for the task - as is the case with an assembly belt production line. Other more unpredictable and emergent tasks are very seldom repeated and the initial cost is never recuperated.

The challenge is to solve equation #3 for y. Actually it would be good to create a program that would solve for any variable given the other variables in the equation (as in the Ohms Law program discussion recently).

I could settle for approximations instead of wild and complex equations as the real world cases are approximations in any case.

Take this as a math challenge :)

Any suggestions?

Re: Math Challenge (was: Help solving equation)
*Message #27 Posted by **PeterP** on 29 Dec 2010, 2:50 p.m.,*
in response to message #26 by Geir Isene

why dont you just use solve to find the value 'y' for which the left side equals the right side? You can use any number of available 'solve' programs, but probably the MCODE one in AdvantageMod should be just fine. You can even get fancy and use the FOCAL to MCODE program from a module (forgot its name right now) if speed is an issue. That way no fancy math is needed and that's what I probably would do as the required accuracy is probably pretty low and hence convergence would be very fast.

Cheers

Peter

Re: Math Challenge (was: Help solving equation)
*Message #28 Posted by **Geir Isene** on 29 Dec 2010, 2:54 p.m.,*
in response to message #27 by PeterP

I would like a direct approach with a symbolic solving of the equation and not to rely on a brute force SOLVE approach.

Edited: 29 Dec 2010, 2:54 p.m.

Re: Math Challenge (was: Help solving equation)
*Message #29 Posted by **PeterP** on 29 Dec 2010, 2:56 p.m.,*
in response to message #28 by Geir Isene

then wolfram has given you already the symbolic solution of your equation and you can go ahead and program it via one of the numerical procedures mentioned to evaluate W for a particular x. My guess is that this will require a longer and slower Focal program (but I can see the greater appeal in programing the symbolic solution 100%)

Cheers

Peter

Re: Math Challenge (was: Help solving equation)
*Message #30 Posted by **Geir Isene** on 29 Dec 2010, 3:06 p.m.,*
in response to message #29 by PeterP

Right, but I can't get my wits around how to treat the W function in a program - and so I am looking for approximations and creative genius to simplify the (to me) daunting Wolfram answer.

Re: Math Challenge (was: Help solving equation)
*Message #31 Posted by **Thomas Klemm** on 29 Dec 2010, 3:51 p.m.,*
in response to message #30 by Geir Isene

Try to transform the equation so that you can apply the Lambert W function:

$$\frac{a^x}{x} = b$$

$$a^{-x} \cdot x = \frac{1}{b}$$

$$e^{-x \log a} \cdot x = \frac{1}{b}$$

$$e^{-x \log a} \cdot (-x \log a) = \frac{-\log a}{b}$$

Substitution: $u = -x \log a$

$$e^u \cdot u = \frac{-\log a}{b}$$

$$u = W(\frac{-\log a}{b})$$

$$x = \frac{W(\frac{-\log a}{b})}{-\log a}$$

No Wolfram Alpha required. QED.

Best regards
Thomas

Re: Help solving equation
*Message #32 Posted by **Chuck** on 29 Dec 2010, 6:20 p.m.,*
in response to message #1 by Geir Isene

The Lambert-W function can't be written in terms of elementary functions, but may be approximated with a recipe of elementary functions depending on the domain for x you have in mind and the maximum allowable error. Any idea what the domain and error desired is?

CHUCK

Re: Help solving equation
*Message #33 Posted by **Geir Isene** on 29 Dec 2010, 7:14 p.m.,*
in response to message #32 by Chuck

Well, in the equation #3 above, clarified is:

(nc(1-E))/I > (R^y)/y [4]

then from my original equation;

"a" is R

"b" is (nc(1-E))/I

A value for y here would have to lie in the area 0-7 for a sound business decision to be made.

Re: Help solving equation
*Message #34 Posted by **Thomas Klemm** on 30 Dec 2010, 3:47 a.m.,*
in response to message #33 by Geir Isene

I assume *r > 0*, thus *a > 1*.

The function

$$\frac{a^x}{x}$$

has a minimum at:

$$(\frac{1}{\log a}, e \cdot \log a)$$

I suggest you have a look at the graph.

To get real, positive solutions for

$$\frac{a^x}{x} = b$$

b has to be bigger than that:

$$b \geq e \cdot \log a$$

$$nc(1-E) \geq Ie \cdot \log a \approx Ie \cdot \frac{r}{100}$$

In this case you will always get two solutions. The bad thing is, that you will lose in the long term: the exponential function outperforms any polynomial.

So you might want to rethink your model. Why is it that you don't get any interest for what you gain thanks to the more efficient standardized process? At least you could use that to pay back the initial cost.

Cheers
Thomas

Edited: 30 Dec 2010, 10:01 a.m.

Re: Help solving equation
*Message #35 Posted by **Geir Isene** on 30 Dec 2010, 11:54 a.m.,*
in response to message #34 by Thomas Klemm

> Quote:
>
> Why is it that you don't get any interest for what you gain thanks to the more efficient standardized process? At least you could use that to pay back the initial cost.

Now that is a good point. One should of course accumulate interest on the gain per year after the implemented process...

Firstly:

The cost gain per year equals nc - ncE, and that should gain interest:

(n*c - n*c*E)*R

times number of years:

(n*c - n*c*E)*R*y > I*R^y

And then:

n*c*(1-E)*R/I > (R^y)/y

I substitute E = (1-f/100) to make the input in a program more intuitive as "f" would be the percentage of efficiency given by the process. I also substitute R = (1 + r/100) where "r" is the percentage needed as annual return on the investment for a more intuitive use. And to keep with only lower case and to make the initial cost easier to read, I substitute the letter "I" with "i". We get:

ncf(1+r/100)/100i > (1+r/100)^y/y [or: ncf(1+r/100)/100i > (1+r/100)^y/(1+r/100)y]

Seems correct?

Then it is a matter of applying the Lambert W function to this and we get the result...

Re: Help solving equation
*Message #36 Posted by **Geir Isene** on 30 Dec 2010, 2:53 p.m.,*
in response to message #35 by Geir Isene

Oops, not correct.

The compounded interest for the cost saving of the implemented process would actually be:

We need to divide every element by two as one would only get half the gain of each year as the process gets repeated throughout the year.

Now, to solve the resulting equation for the value "y" gets to be hell IMO - and beyond my current skills set. Can we simplify/approximate/make a shortcut somewhere?

Any takers?

Re: Help solving equation
*Message #37 Posted by **PeterP** on 30 Dec 2010, 4:27 p.m.,*
in response to message #36 by Geir Isene

at the risk of sounding like a broken record - what is so bad about using solve for such real life problems problems? Its fast, short and lets you change and adapt the code to fit the actual problem of your client quickly and easily. Given that you are interested in a real-life answer I simply don't see the benefit in writing an analytical solution that will for sure require some special function for which you need to write a numerical approximation etc etc but that's just me...

Cheers

Peter

Re: Help solving equation
*Message #38 Posted by **Geir Isene** on 30 Dec 2010, 4:35 p.m.,*
in response to message #37 by PeterP

I am starting to lean toward your solution... :-/

I would like to write a self-contained program, though.

Re: Help solving equation
*Message #39 Posted by **Marcus von Cube, Germany** on 31 Dec 2010, 3:21 a.m.,*
in response to message #38 by Geir Isene

Looking at the graph, the function seems to be well behaved so writing the solver (e. g. Newton) yourself should not be the problem. You can even use the analytical derivative instead of an approximation in the algorithm because the function to be solved is known in advance.

Processability (Was: Help solving equation)
*Message #40 Posted by **Geir Isene** on 31 Dec 2010, 8:53 a.m.,*
in response to message #1 by Geir Isene

After excellent input here and some pondering and tweaking, I have come to this formula for the processability of a business area (whether an area warrants the formalization of a process):

- p = initial cost of implementing a process
- i = interest rate (return) needed for a sound business decision (as a percentage)
- t = number of time periods (the time period corresponds to "i"; usually yearly)
- n = number of times a task is done per time period (i.e. the number of times a process would get run per time period)
- c = cost of doin the task without a formalized process in place
- f = efficiency benefit from executing the task as a formalized process (as a percentage indicating how much one would benefit from the formalized process)

As long as one can estimate the initial cost (p) and the process efficiency (f), set the time period - usually yearly, the maximum payback time (t), set the required return (i) and estimate the number of times the process would be repeated per time period [per year] (n), the job of calculating whether the area would yield a profit

from introducing a process is pretty straight forward. But if one would attempt to solve for e.g. "t", this gets tough.

How would I go about using SOLVE to solve this equation for "t"?

BTW: A short explanation of the elements in the equation: The first part is the initial cost with the compounded interest for the period evaluated. The second part is the economic gain from an implemented process - the gain comes from each repetition of the process and that gain gets compounded interest as well. The total cost of the implementation minus the total gain for the process should be negative to indicate a profit durin the time period one evaluates for.

Edited: 31 Dec 2010, 11:55 a.m. after one or more responses were posted

Re: Processability (Was: Help solving equation)
*Message #41 Posted by **Walter B** on 31 Dec 2010, 9:41 a.m.,*
in response to message #40 by Geir Isene

First, I'd throw away the unnecessary stuff:

$$p\,(1+i)^t - \sum_{j=1}^{nt-1} cf\,\left(1+\frac{i}{n}\right)^j < 0$$

by expressing i and f in real numbers. Then I'd turn back to your question:

> Quote:
>
> How would I go about using SOLVE to solve this equation for "t"?

Well, I have to admit I don't know how *you* would go about that ... d;->

Re: Processability (Was: Help solving equation)
*Message #42 Posted by **Geir Isene** on 31 Dec 2010, 11:44 a.m.,*
in response to message #41 by Walter B

:)

Well, those elements are unnecessary. But... It's a matter of using the numbers most familiar to a business person ("i" and "f" being percentages and all).

Re: Processability (Was: Help solving equation)
*Message #43 Posted by **Marcus von Cube, Germany** on 31 Dec 2010, 12:41 p.m.,*
in response to message #40 by Geir Isene

If you'd expect to be t a non integer, I must admit I don't have a solution but with t being a (hopefully small) positive integer you can just compute the part left of the "-" by repetitive multiplication and the sum by repetitive addition until the condition is met. You'll do n additions per multiplication.

If you want the result to be exact to the level of single instances of the process, just stop the summation as soon as the condition is met even if j is below n*t. j is then the total number of process executions for the break even.

Re: Processability (Was: Help solving equation)
*Message #44 Posted by **Thomas Klemm** on 2 Jan 2011, 12:23 p.m.,*
in response to message #40 by Geir Isene

Though I'm not familiar with your business process I guess the interest of the economic gain is payed at the end of the time period and not when the task is done. So in fact you have a variant of an ordinary "time value of money" (TVM) problem with the following payment at the end of the period (year):

$$PMT = \sum_{j=0}^{n-1} cf(1+j\frac{i}{n}) = cf(n+\frac{n(n-1)}{2}\frac{i}{n}) = cf(n+\frac{n-1}{2}i)$$

The interest rate *i* in this formula is already divided by 100 as suggested by Walter.

The present value *PV* corresponds to your initial cost of implementing a process while the future value *FV = 0* (break-even). Most solvers (e.g. HP-12C, HP-48GX, ...) use *n* for the number of time periods. So take care because you use this variable for the number of tasks (and that's also the meaning in my formula above). It might be better to use another variable instead.

It appears that the Advantage module contains a TVM-solver adapted from Finance Pac. So you can use either of these.

Best regards
Thomas

Re: Processability (Was: Help solving equation)
*Message #45 Posted by **Geir Isene** on 3 Jan 2011, 1:02 p.m.,*
in response to message #40 by Geir Isene

Thanks for the input, guys - it's highly appreciated. I have now concluded with the following formula:

- p = initial cost of implementing a process
- i = interest rate (return) needed for a sound business decision (as a percentage)
- n = number of time periods (the time period corresponds to "i"; usually yearly)
- r = number of repetitions of the task per time period (i.e. the number of times a process would get run per time period)
- m = maintenance cost of having the process in place per time period (knowledge management cost, training cost)
- c = cost of doing the task without a formalized process in place
- f = efficiency benefit from executing the task as a formalized process (as a percentage indicating how much one would benefit from the formalized process)

With this, we now have a complete formula to identify whether it is an economically sound decision to formalize a process in a business area.

Re: Processability (Was: Help solving equation)
*Message #46 Posted by **Walter B** on 3 Jan 2011, 1:13 p.m.,*
in response to message #45 by Geir Isene

Watch out, this formula won't work with values entered as percenteages. Use real values instead.

I know. I took your advice :)

Re: Processability (Was: Help solving equation)
*Message #48 Posted by **Thomas Klemm** on 3 Jan 2011, 2:44 p.m.,*
in response to message #45 by Geir Isene

Still I think the 3rd term in your equation is wrong.

Taking the additional maintenance cost into account I get:

$$PMT = cf(r + \frac{r-1}{2}i) - m$$

From your formula I assumed *m* is paid at the end of the time period.

Then I used this formula for TVM calculations:

$$\frac{PMT}{i}\left(1 - (1+i)^{-n}\right) + FV(1+i)^{-n} + PV = 0$$

This may be simplified since *FV = 0*:

$$\frac{PMT}{i}(1 - (1+i)^{-n}) + PV = 0$$

In your case *PV* and *PMT* have different signs:

$$PV = -p$$

That's what I end up with:

$$p = \frac{cf(r + \frac{r-1}{2}i) - m}{i}(1 - (1+i)^{-n})$$

Now all you have to do is solve this equation for *n*. You're lucky! This can be done symbolically.

Best regards
Thomas

Edited: 3 Jan 2011, 2:53 p.m.

Re: Processability (Was: Help solving equation)
*Message #49 Posted by **Geir Isene** on 3 Jan 2011, 3:51 p.m.,*
in response to message #48 by Thomas Klemm

The reason I think the third term is correct is that for every time the process is run, one gets the profit "cf", but from then on and out until r*n, one will accrue interest on that one profit. The first profit will result in a total profit of cf(1+i/r)^(nr-1), the next process run will result in a profit with accrued interest of one less, i.e. cf(1+i/r)^(nr-2), all the way until the last process run which will accrue only cf as profit (which means that my third term is actually a tad wrong as it should be summed from j=0 [not j=1] until (nr-1). All those profits with accrued interests are summed up for a total of the process gain over the time periods n.

I have updated the formula above to correct the error found.

Re: Processability (Was: Help solving equation)
*Message #50 Posted by **Thomas Klemm** on 3 Jan 2011, 5:49 p.m.,*
in response to message #49 by Geir Isene

It all depends on when the interest is paid: if it's at the end of the process I agree with you. But that's not how the banks I know handle it: the interest is usually paid at the end of the year. The interest is proportional to the time and of course the interest rate. The annual temporal ratio of the first process is *(r-1)/r* while the last process (still of the first year) doesn't get any interest. Assuming the process is run monthly then *r = 12* and the first process gets interest for 11 months and the last process gets none. If you sum all this up you get the annual payment *PMT*. Only from now on you get compound interest every year. It's up to you to decide whether to subtract the maintenance *m* once at the end of the year (as I did) or monthly. In the latter case the formula will slightly change.

You might also ignore this consideration altogether and use *PMT = cfr - m* instead if you're just interested in a rough approximation of *n*. As long as *i << 1* and *n* is not too big it should still be quiet accuarate.

I hope I could clarify my objection.

Kind regards
Thomas

Bonus question:
What happens with your 3rd expression when *r* gets bigger and bigger but still the annual cost *cr* is constant?

Re: Processability (Was: Help solving equation)
*Message #51 Posted by **Geir Isene** on 4 Jan 2011, 1:30 a.m.,*
in response to message #50 by Thomas Klemm

Yes, you did clarify your objection.

However, from a business viewpoint, you get compounded interest for every process gain as the alternative is not to put the money in the bank (as very few businesses do for investment). The alternative is to invest the money otherwise in the business that would get (also) immediate return/profit.

Do you agree that the formula is correct given that interest is calculated from every process repetition?

> You might also ignore this consideration altogether and use *PMT = cfr - m* instead if you're just interested in a rough approximation of *n*.

$$n = -\frac{\log(1 + \frac{ip}{m - cfr})}{\log(1 + i)}$$

Of course you want to use **LN1+X** to calculate that with your HP-41. This should also be a good initial value for a solver of your equation.

Cheers
Thomas

Rethinking this, I believe you are right - it would be the usual business optimism that interests are accrued after each gain (that would be the maximum of the gain, but not a realistic one). So, unless you have something to add to your formula above, I think we can conclude that your equation is the final answer for this chapter.

The next chapter would be to add Risk Management to the equation; We simply RCS to cf to obtain the gain from each process run, where R is the risk of the task going wrong (real number), C is the cost when/if it goes wrong and S is the security offered by the process (a real number between 0 and 1, where 0.1 indicates a 10% security added by the process). Thus, given that a task has 0.001 chance of failure and the corresponding average cost of such failure is 10000, the added risk cost per task is then 10. If a process would help the security of the process by 10%, the added value of doing the task via a formalized process is then 0.001*10000*0.1 = 1.

I use capital letters for RCS as it indicates a more "virtual" gain through Risk Management.

*Message #57 Posted by **Thomas Klemm** on 4 Jan 2011, 7:49 a.m.,*
in response to message #53 by Geir Isene

What's the meaning of $^2 (or NOK^2) when you multiply cost c with cost C?

Re: Processability (Was: Help solving equation)
*Message #58 Posted by **Geir Isene** on 4 Jan 2011, 7:59 a.m.,*
in response to message #57 by Thomas Klemm

Sorry, changed it to addition, not multiplication - there is an economic gain from efficiency of the process and there is a "virtual" economic gain from the process minimizing failure of the task. Added, not multiplied. Thus, one could justify implementing a process purely from a security perspective or an efficiency perspective or both.

Re: Processability (Was: Help solving equation)
*Message #59 Posted by **Thomas Klemm** on 4 Jan 2011, 2:23 a.m.,*
in response to message #45 by Geir Isene

Still you can use:

$$\sum_{k=0}^{n-1} m(1+i)^k = m\frac{(1+i)^n - 1}{i}$$

$$\sum_{j=0}^{nr-1} cf(1+\frac{i}{r})^j = cfr\frac{(1+\frac{i}{r})^{nr} - 1}{i}$$

Re: Processability (Was: Help solving equation)
*Message #60 Posted by **Geir Isene** on 4 Jan 2011, 3:18 a.m.,*
in response to message #59 by Thomas Klemm

True. And nice.

But how do you account for p(1+i)^n?

I mean, one would get compounded interest over n periods for the initial investment if one would rather invest that cost into something else.

So, there is hope for next year. Thank you both!

After watching this video, I expected to find one under mine last Saturday, but it was not there. I thought the culprit was the nasty Frenchie in this other youtube video :-)

Our resources are very limited. Nevertheless, user interface and software are ready to be tested on the original HP 30b hardware. That's the status as Jake presented it in the video and that's it - nothing more than kind words came from HHC conference participants and community members so far ...

Hey folks, SW is ready, who will compile it and put it in the real thing?

HP-41 Ohms Law Program

*Message #1 Posted by **Jeff Davis** on 24 Dec 2010, 7:38 p.m.*

I have been writing a program to calculate the Ohm's Law Circle. Below is the program. There are three calculations possible for each category based on which two inputs are non zero when the program runs. I am very interested in any feedback as well as program improvements to make the program run smoother and faster.

Please let me know your thoughts.

Thanks, Jeff

Re: HP-41 Ohms Law Program

*Message #2 Posted by **designnut** on 25 Dec 2010, 12:02 a.m.,*
in response to message #1 by Jeff Davis

I wrote a simple program to enter the x value into the stack to fill the t repeating register, it can be used to clear the stack if X is zero, or to enter E into the t repeating register. Keying a resistor and dividing gives I, multiplying then gives EI=W. keying I and dividing gives R. This seemed sufficient for me. Sam

Re: HP-41 Ohms Law Program

*Message #3 Posted by **Namir** on 25 Dec 2010, 4:12 a.m.,*
in response to message #1 by Jeff Davis

I suggest that you design your program using the following labels for the input of values and the calculations of results:

```
label A --> Input P
label B --> Input E
label C --> Input I
label D --> Input R
label E --> Quit
label a --> Calculate P
label b --> Calculate E
```

```
label c --> Calculate I
label d --> Calculate R
label "OL" --> display "P E I R Q" menu above the keys A, B, C, D, and E
```

The program displays the "P E I R Q" menu before each set of calculations. You then proceed to enter any three values and calculate the fourth one. After you view the result, you press the R/S key and have the program jump back to the label "OL" to display the "P E I R Q". Pressing E tells the program to display a termination message like "DONE" or "BYE".

If you want a widespread use and understanding please remember the common letter for voltage is U.

Re: HP-41 Ohms Law Program

*Message #5 Posted by **Garth Wilson** on 27 Dec 2010, 2:19 a.m.,*
in response to message #4 by Walter B

As someone who has been in electronics engineering in the U.S. for the last 25 years, I have never heard of using "U" for "voltage." Karl's link below seems to explain why: it's mostly only in use in Europe. I would not say it's in "widespread use" here.

Edited: 27 Dec 2010, 3:19 a.m.

Re: HP-41 Ohms Law Program

*Message #6 Posted by **Karl Schneider** on 27 Dec 2010, 2:28 a.m.,*

Here's the post containing the link that Garth referred to:

> Quote:
>
> If you want a widespread use and understanding please remember the common letter for voltage is U.

I've wondered about this, having seen "U" utilized to denote 'voltage' (potential difference) in German and Scandinavian documents. "V" and "E" (electromotive force) are favored in North America, but I have not thought this to be ideal.

- "V" leads to circularities:

  What does it signify? 'Voltage'.
  How is that measured? Volts.
  How is the unit "volt" abbreviated? V.

- "E" can also denote the electric field (normally as a vector), or energy.

However, it also seems that use of "V" for denoting potential difference is not unique to North America. I found a short discussion from five years ago to be reasonable:

http://boards.straightdope.com/sdmb/archive/index.php/t-338522.html

I tried to verify it expediently by reviewing Wikipedia pages in a number of languages that concerned 'potential difference'. However, not having ready access to textbooks from around the world, I couldn't say if the explanation given in the discussion is entirely correct. Perhaps knowledgeable Forum'ers in Britain, Australia, Spain, Italy, France, Netherlands, and Brazil might like to chime in...

One of my textbooks (HAYT Jr, William H. & KEMMERLY, Jack E. *Análise de Circuitos em Engenharia*) uses *v* for voltage (and *i* for current). Thus, Ohm's Law is stated as

v = Ri

Also, this notation avoids ambiguity in expressions like *v* = 6 *V*. All my other engineering textbooks use uppercase *V* indistinctly for both voltage and the SI unit, however. Here, some high-school Physics textbooks use *U* for voltage.

Gerson (Brazil).

Re: HP-41 Ohms Law Program

*Message #8 Posted by **Bart (UK)** on 27 Dec 2010, 12:06 p.m.,*
in response to message #7 by Gerson W. Barbosa

Certainly my experience in both South Africa and the UK is V for voltage.

Lowercase *v* & *i* are usually used for instantaneous values (e.g. in AC analysis).

> The latter claims US-Americans use another letter than the international community - as usual ;)

As former editor of various international editions of an electronics magazine (in the UK, Canada and Australia) I've **never** seen U as a symbol for voltage. It's always been V or equally commonly E (for *electromotive force*, I believe).

One might more properly claim that some parts of Europe use a different letter from the international community - as usual ;)

Best,

--- Les

Re: HP-41 Ohms Law Program

*Message #11 Posted by **Karl Schneider** on 28 Dec 2010, 12:51 a.m.,*
in response to message #9 by Walter B

From the "off-Forum" discussion of 2005 I linked, along with my limited personal experience, I took it as a given that potential difference or 'voltage' was denoted by "U" in the Germanic, Scandinavian, and eastern European countries. It also now seems clear that "V" remains the favored term in British-influenced countries (UK, USA, Canada, Australia, South Africa). But what about the prominent western and Mediterranean countries of Europe (France, Spain, Italy, and Portugal)?

A closer examination of pertinent Wikipedia pages in Romance languages suggests that "U" denotes electric potential *difference*, while "V" denotes electric potential, even though both have the same unit (volt).

At least three of the pages criticized the term 'voltage' in favor of 'tension' -- for the good reason of eliminating circularity of terminology, but 'tension' itself can also mean the physical, weight-bearing load that stresses an overhead electrical line.

Portugese:

> Quote:
>
> ...voltagem *está tecnicamente incorrecto, ... A maioria dos engenheiros eletricistas repudiam o uso do termo* voltagem...

My interpretation: "...'voltage' is technically incorrect .. A majority of electrical engineers repudiate the use of the term 'voltage'..."

French:

> Quote:
>
> *Elle est souvent nommée* voltage *par le grand public, mais ce terme n'est pas utilisé professionnellement car il s'agit d'un anglicisme.*

My interpretation: "It is often popularly called 'voltage', but the term is not used professionally (as an) anglicism."

Italian:

> Quote:
>
> *Sempre nell'ambito elettrico, tale differenza di potenziale è anche chiamata comunemente* tensione *o, più raramente (ed impropriamente),* voltaggio.

(Help?) "... potential difference...'tension', (or the rarer) and improper 'voltage'."

> > *Sempre nell'ambito elettrico, tale differenza di potenziale è anche chiamata comunemente* tensione *o, più raramente (ed impropriamente),* voltaggio.
>
> (Help?) "... potential difference...'tension', (or the rarer) and improper 'voltage'."

Interpretation Aid: "Always in the electrical area, this difference of potential is also commonly called 'tension' or, more rarely (and improperly), 'voltage'."
Watch out: This is not a "potential difference" = ambiguity of the English language. Please note there's an obvious difference between adjectives and adverbs, too :-/

Addendum 1:

> Quote:
>
> But what about the prominent western and Mediterranean countries of Europe (France, Spain, Italy, and Portugal)?

I hate to repeat, but as stated in my post you responded to, at least French and Portuguese use U. French even inform you (just for the case case you didn't know before) this U is the "standardized symbol" for electrical tension - please check the site of IEC - regards to Les ;)

Addendum 2:

> Quote:
>
> As former editor of various international editions of an electronics magazine (in the UK, Canada and Australia) ...

Please don't confuse "international" with "English speaking country" or "former British colony".

Re: HP-41 Ohm's Law Program

*Message #13 Posted by **Les Bell** on 28 Dec 2010, 7:07 p.m.,*
in response to message #12 by Walter B

As a member of the IEEE, I have to defer to my ancient copy of the "Electronic Engineer's Handbook", Donald G. Fink (ed), McGraw-Hill, 1975. Para 1.27 states:

> Quote:
>
> **Electrostatic Potential and Potential Difference.**
> [...] While it is not possible to specify uniquely the *absolute potential* of any point in an electric field, the *difference in potential* between two points in the field can be determined when the manner in which the electric field strength varies between the points is known.
>
> [...]
>
> The potential difference between two points *a* and *b* in an electric field of strength *E* is, then

> V_{ab} = . . .

I've omitted the rest of the equation - I wish the web and email spoke LaTeX, but it doesn't. ;) And for the rest of this 2.8"-thick (oops: 71mm-thick) book, so it goes - consistently using V to represent voltages (which we all know are potential differences). The word "tension" doesn't appear in the index, and disappeared from electrical English usage around the same time as vacuum tubes.

Now, to business:

> Quote:
>
> French even inform you (just for the case case you didn't know before) this U is the "standardized symbol" for electrical tension - please check the site of IEC - regards to Les ;)

Ah, yes - but if you look one line higher(http://www.iec.ch/zone/si/si_elecmag.htm#si_epo), you'll see:

Electric potential, V

Since you can't measure an absolute potential, there is no unit for it, and the SI unit, the volt, must represent a potential difference. So V and U are the same thing by different names, and the IEC should stick to what it's good at: setting standards for power supply connectors. ;)

> Quote:
>
> Please don't confuse "international" with "English speaking country" or "former British colony".

We had French and (it's been so long I can't remember) either Dutch or German editions as well - and in my occasional communications with them I can't recall "U" being used. I certainly never received any requests to explain our use of "V", but I would certainly have been puzzled if I had seen "U = IR" in the copies of their editions that I occasionally browsed.

My advice is, in any calculator program which has to represent voltage and which you hope will be used internationally, stay away from "U". We all know what "V" is, even if we resent its imperialistic connotations. And for proof that "U" is confusing, just read this thread and those linked from it.

Of course, the prudent programmer will probably wish to determine the Mandarin/Chinese/Japanese character for voltage, since it will probably ultimately trump "V", "E" and "U". But since it probably isn't on the keyboard of the HP-41 (and since they probably use "V" anyway ;)) I'd say you're safe for the time being. And besides, Alessandro Volta deserves the credit.

With tongue planted firmly in cheek,

--- Les

You're right! That's exactly what the authors say in the first chapter of the book (Definitions and Units). It's been quite a long time since I last read it, but I do remember my HP-28S was particularly useful then :-)

Re: HP-41 Ohms Law Program

*Message #22 Posted by **Dieter** on 25 Dec 2010, 8:42 a.m.,*
in response to message #1 by Jeff Davis

Hehe... for decades this kind of calculation has been a classic for any programmable calculator: a set of variables, connected by a set of equations - enter some of them and determine the rest.

For this kind of program I prefer the same approach other HPs use for their TVM calculations: Every variable is assigned to a certain key. Enter the known values in any order, then have the program determine the others, again in any order you like.

I usually did it this way:

- Every variable uses its dedicated key. The self-assigning alpha-labels may be used. In this case for instance

- [A] = voltage (Volts)
- [B] = resistance (Ohms)
- [C] = current (Amperes)
- [D] = power (Watts)
- [E] = Initialisation

- Pressing a key *either* enters this value *or* starts its calculation. This is usually done by checking Flag 22 (data entry). Or the program may check whether the input is zero (start calculation) or not (data entry).

- The program knows which variables have been entered and therefore which others will have to be calculated in which way. This can be done with a simple trick: think of the four variables as bits in a four-digit binary number. So 1001 means that the first and the fourth variable have been entered, and 0110 means the second and third one are known. Each time a variable is entered, the program sets its corresponding bit by adding the respective decimal value, adding up to a unique "variable code":

- Add 1 when U (voltage) is entered
- Add 2 when R (resistance) is entered
- Add 4 when I (current) is entered
- Add 8 when P (power) is entered

In this case (Ohm's law) always two values are known and the two others can be calculated. So we end up with six possible cases, resulting in six different variable codes: 3, 5, 6, 9, 10 and 12.

The rest is easy: a simple indirect jump to label 03, 05, 06, 09, 10 or 12 where the two remaining values are evaluated and stored. For instance, at label 06 the values for R and I are known, so the missing voltage is determined by U = R*I and the unknown power is P = U*I.

I think most of us who are familiar with the HP41 will be able to write such a program whithout major effort. My solution works as described above, for example with U = 24 V and R = 470 Ohms:

Initialize

```
XEQ "OHM"
```

Enter values U and R:

```
24  XEQ A
470 XEQ B
```

Now any key A, B, C or D can be pressed to get the corresponding value:

```
XEQ C   =>  I=0,051
XEQ D   =>  P=1,226
```

All other values can be recalled as well:

```
XEQ A   =>  U=24,000
XEQ B   =>  R=470,000
```

I do not include the listing - I think it's trivial.

Not to me it isn't!

What an elegant solution. If you have it can you share it ?

Thanks

Nigel

Re: HP-41 Ohms Law Program

*Message #24 Posted by **Thomas Klemm** on 27 Dec 2010, 6:13 a.m.,*
in response to message #23 by Nigel Bamber

cf. Ohm's Law for the HP-41C/CV/CX

If you don't have a card reader you can replace the following command with **CLΣ** (clear sigma) and set **ΣREG 21**:

```
112 7CLREG
```

Switch to **USER** mode and use the following key-mapping:

- [A] = Initialisation
- [B] = P (power)
- [C] = I (current)
- [D] = U (voltage)
- [E] = R (resistance)

Initialize

```
XEQ A
```

Enter values U and R:

```
24  XEQ D
470 XEQ E
```

Now any key B, C, D or E can be pressed to get the corresponding value:

```
XEQ C   =>  I=0.051
XEQ B   =>  P=1.226
```

All other values can be recalled as well:

```
XEQ D   =>  U=24.000
XEQ E   =>  R=470.000
```

The program doesn't use Dieter's method but instead calculates the value if it is 0. Feel free to modify it to your needs.

Cheers
Thomas

Re: HP-41 Ohms Law Program

*Message #25 Posted by **Dieter** on 27 Dec 2010, 4:13 p.m.,*
in response to message #23 by Nigel Bamber

I used this method about twenty years ago for a triangle calculation program: three sides and three angles are six variables, three of which are given by the user. That's eighteen possible combinations, and here the mentioned method starts making sense.

In this much simpler four-variable-case it gets even more elegant with another method I'm experimenting with at the moment: The 41 has these nice four flag indicators for flags 1 to 4. So the user can see how many and which values were entered. Using four flags instead of four binary digits (1, 2, 4 and 8) also has another advantage: Enter two values, determine the other two by simply pressing the respective key, then change one of the values (or enter a third one), or even remove one, and see how the other values change correspondingly.

Example: Enter U = 24 V and R = 470 Ohms to get I = 0,051 A and P = 1,226 W. Then change P to 1 Watt and see that R now is 576 Ohms. So far so good.
Now change R to 560 Ohms, try to determine I and get an error message since the now three given values U, R and P do not match.
Remove U and recalculate it, giving U = 23,664 V and I = 0,042 A.

I'm working on it. :-)

Dieter

I guess this is how Sam would solve these problems:

> Quote:
>
> Example: Enter U = 24 V and R = 470 Ohms to get I = 0,051 A and P = 1,226 W.

```
24   ENTER   ENTER   ENTER          24.000
470   /                             0.051
*                                   1.226
```

> Quote:
>
> Then change P to 1 Watt and see that R now is 576 Ohms. So far so good.

```
CLx   1   /   *                   576.000
```

> Quote:
>
> Now change R to 560 Ohms (...) Remove U and recalculate it, giving U = 23,664 V and I = 0,042 A.

```
1   ENTER   ENTER   ENTER            1.000
560   *   SQRT                     23.664
/                                   0.042
```

---

cf. EE calculations, some not obvious

Ohm's law

This may seem simple, but can be used as a rapid verification of dissipation and the voltage and current relation. Remember the little circles of voltage E divided by the IR product.

Key in the voltage repeatedly, and divide by either I or R to see the other value, as in E=IR.

The power in a resistor can be found by keying in the resistor and dividing to get I, then multiplying to get EI. It can be used to solve W=EI, by keying in power repeatedly, and dividing to get either E or I.

Sam, it's a pity your article is hard to read. I think it's a treasure unfortunately well hidden. Above you may find a suggestion to improve its legibility. Add some examples if possible and maybe some explanations or pictures as well.

Best regards
Thomas

For a technoclutz like me, does this HP-41 listing work with an HP-48G?

@Walter, As I've previously noted you and I pronounce (some?) letters of the alphabet differently, U = voltage? Maybe your "u"'s sound like my my "v"'s or vice-versa "woltage", wice-wersa (typed purely in jest, no offense intended)

Ren

Re: Ohm's law drifting off topic

*Message #29 Posted by **Walter B** on 27 Dec 2010, 12:25 p.m.,*
in response to message #28 by Ren

Hi Ren,

dona nobis pacem ;) FYI, AFAIK the letter U employed for voltage has no relation with any pronounciation. It's just a letter commonly used for this physical entity like I is common for the current, L for inductivities etc. And as Karl mentioned, a capital V would be ambiguous, as well as a capital E is since it's employed for the electrical field strength.

Referring to the point you brought up: I dunno where you come from nor live, though the probability for being US-American is pretty elevated in this forum. Since I am definitely no native English speaker I will certainly make some pronounciation errors (among others), though following some decades of experience people in "English" speaking countries understand me quite well (allowing me leading some projects there) - far better than most "English" speakers are understood here (if they bother learning a second language at all).

Since you know "languages" is one of my hobbies, you know there's no offense intended. BTW, is your forum name in any way connected to the Chinese word for man?

Re: Ohm's law

*Message #30 Posted by **Ren** on 28 Dec 2010, 9:20 p.m.,*
in response to message #29 by Walter B

@Walter B.,

I am in Southeastern Minnesota, USA, while I'm not fluent in any other language than English, I have had limited learning experience in Spanish, Arabic, and Chinese Mandarin, which brings me to your question on my name.

I was named after a friend of my dad's, he died in a rodeo while I was very young, so I'm not sure if I ever met him, and never asked him where our name came from. It has been suggested it came from (Saint) Irenaeus.

One of my Mandarin teachers in giving me a Chinese name used the word "kindness" (also pronounced "ren")

With an HP-48G I'd recommend to use the built-in equation library:

2: Electricity
2: Ohm's Law and Power

Or you could install the HP-41E MicroCode Emulator and use the listing.

Cheers
Thomas

Ouch, Sam!

Though a CE, not an EE, I have written solver routines for similarly simple relations, like the Rational Formula (Q=CiA). For me , its not the difficulty of the problem, its the convenience when doing repetitious calculations that makes these programs useful, particularly when you have the variable names displayed in front of you.

Re: Ohm's law

*Message #34 Posted by **Jeff Davis** on 27 Dec 2010, 6:13 p.m.,*
in response to message #32 by designnut

Thanks to all who have responded. I am not an EE but I do like to program on the HP-41. Since I was currently in a project to calculate a few items I thought it would be fun to write a program. I know it is trivial but fun none the less.

*Message #35 Posted by **Ren** on 28 Dec 2010, 9:43 p.m.,*
in response to message #32 by designnut

@Sam

Touche'!

In my defense, I was thinking about the "harder to memorize" (for me) equations of Ohm's Law. (Please forgive my lack of HP calculator notation in these examples)

i.e.

Square root(Power divided by Resistance) equals Inductance

or

E (or U, or V) equals Square root (Power times Resistance)

or

E(squared) divided by R equals P

While many subscribers to this forum could probably derive the above examples in their head (knowing that P=IxE and P=I(squared)R, it took me several minutes to work the last one out on paper!

What I suggest to calculator users for frequently encountered problem is to think about kepstroke procedures rather tthan formulas. There is a kinesthetic sense that can work for you in rapid solutions. Formulas are handed down from generation to generation with no reference to current circumstances. Since the calulator is in everyday use, you must revise your formulas to be useful in the calculator. I solved one resistive divider until I knew all the answers. I played with the soluion and a solution that was usually awkward appeared. I retraced my steps. found the solution easy and tested it for other cases and found it accuate. It is a keystroke solution which has no equivalent in published equations. Here it is: for a resistive divider enter the lower resistor repeatedly to fill the t regtister. Key the upper resistor and add, see the total resistrance, divide and see the divider voltage fraction. Multiply and sutracct and the Thevenin soue resistance of thee divider appears. steps, add, divide, multiply, sutions. so take the book formuas and turn them into procedures useful to you on the keyboard. To be ccontinus. sam

Re: Ohm's law

*Message #37 Posted by **designnut** on 29 Dec 2010, 1:23 p.m.,*
in response to message #36 by designnut

Sorry, my writing kept disappearing on me. The steps are Add, divide, multiply, subtract and the equivalent output resistance appears. when doing RC frwequency corners tthe formulas were R=Xc=1/2(Pi)FC. I changed thatt to 2(Pi)FRC=1, simply multiply the known factors together and invert to find the missing value. Again you can run 2Pi up the stack so it is available repeatedly.

Well, I think I understand this, although I [did not] completely follow your examples.

> Quote:
>
> Formulas are handed down from generation to generation with no reference to current circumstances.

Not sure what you mean by this. The formulas we have been discussing are expressions of physical laws that don't change. I see no reason that relations published in textbooks should be revised for particular calculator styles. They are sometimes rewritten in calculator manuals, though.

> Quote:
>
> Since the calculator is in everyday use, you must revise your formulas to be useful in the calculator.

Perhaps yes, for RPN calculators. No doubt when you started out with the early HP's, this made sense. And still may for some people. But the original RPN HP's were developed when memory resources (RAM and ROM) were very expensive. Now there are lots of choices in calculator styles, many of which allow easy evaluation of the formulas in the original form, which makes more sense to some people. This is why we have choices in calculators.

Edited to correct meaning.

Re: Ohm's law

*Message #40 Posted by **designnut** on 30 Dec 2010, 5:43 p.m.,*
in response to message #39 by Martin Pinckney

Martin, I have discovered relations that have not been shown in formulas. They were exposed by the handy number manipulation of the calculator. I suggest it is the difference between the academic approach (everything has been learned that can be learned) and the engineering approach where it is possible to discover something new and incorporate in the lessons. Not only are the formulas copied in content bu in form, however awkward it may be. Yet nothing new is added. Have we learned nothing in the years? I found formulas have not adapted to modern usage and are totally outmoded. I gave the example R=Xc=11/2(Pi)FC. How much handier is 2(Pi)FRC=1. The old form is still in use, copied from book to book. The resonance formula is always F=1/[2(Pi) (LC)]^1/2. I squared it and moved all tthe terms to the left as [2(Pi)]^2LC=1. Then I used the repeeating T register to store 2(Pi)F and solved by muiplying twice to square the term. I adapted the forrmula for rapid use with RPN. If you never use RPN you will not benefit from the change. I've read you use algebraic so you must use archaic formulas and do not benefit from modern methods.

Re: Ohm's law

*Message #41 Posted by **Martin Pinckney** on 30 Dec 2010, 8:57 p.m.,*
in response to message #40 by designnut

Sam,

I acknowledge that you have developed shortcuts that work well with RPN calculators that served you well in your career.

However, to describe these as "modern methods" seems curious to me. I remind you that the early HP calcs were originally designed with RPN because of the limitations of technology at the time. The "change" that occurred in calculator design has gone the *other* way, first to algebraic, then to textbook entry/display. I for one have benefited from this change.

I am not against RPN. I have and use several HP RPN calcs. I am only against presenting RPN as if it were this magical superior system that only the few know how good it is.

Re: Ohm's law

*Message #42 Posted by **designnut** on 30 Dec 2010, 10:53 p.m.,*
in response to message #41 by Martin Pinckney

Martin, we don't need no stinkiin parentheses. I did find relations I have not seen addressed in books, I think if they were known they would be addressed. I discovered them only because of the handy number manipulation available with RPN. I believe they have not been shown because they have not been discovered. Possibly my investigation has been more exhaustive than formerly. While the solution of formulas for any variable is available in calculators, first you muct call the formula and enter each known element and then solve. I find it more adroit to key the data in RPN and get direct solutions. I founnd RPN handy when one realized that a change of units was needed in mid-solution, handy with step by step solution. Also it enables one to sense when one is making a mistake, and mentally follow the calculation and back out an error and revover. I found using the repeating t register in solutions a key to speed and versatility. Sam

Chip design folks that need lotsa *usable* RAM without thrashing are not pleased with this issue on Win boxes. It's been an issue back to NT/2K days, (unsure of the severity levels across the platforms).

There was a company that produced IDE "hard disks" that were really RAM drives. System performance improved markedly; similar results occurred with RAM drive software. It was more valuable to add RAM to a RAM drive than it was to add RAM to the system pool beyond around 512MB.

-Bill

*Message #4 Posted by **Raymond Del Tondo** on 26 Dec 2010, 7:26 a.m.,*
in response to message #3 by bill wiese

Nowadays you can simply use a real RAM drive, located in main memory. If your PC has 4GB or more RAM, at least the Gavotte can create a PAE RAM disk automatically (if chipset/BIOS allow)
Then you can set your temp directories to there, which will lead to a big performance gain in many cases.
Consider unpacking a 100MB zip file. Normally it will be unpacked to the current temp dir on the HD, and then copied to the destination. The 1. step, unpacking, will be _much_ faster if you use a RAM disk, and even the copy operation will be faster.
And your web browser will react faster, too, if the cache resides in RAM.

Ray

Re: O.T. XP won't use all RAM

*Message #5 Posted by **Richard Garner** on 24 Dec 2010, 4:22 p.m.,*
in response to message #1 by designnut

A Pagefile is a location setup on your hard drive that Windows uses as temp storage of open programs and data so it can be easly swaped out when the OS needs more RAM for other programs. When you change the amount of disk space that is used you need to click on the SET button to get Windows to accept the change. Windows will then tell you, you must restart the computer for the new settings to take effect. I think most systems default to 2GB but generally recommend 5GB as the minimum. I use allot of CAD and GIS software so I have my minimum at 10GB and maximum at 16GB.

Re: O.T. XP won't use all RAM

*Message #6 Posted by **designnut** on 24 Dec 2010, 11:16 p.m.,*
in response to message #5 by Richard Garner

The program I use to look at all memory use shows me that the sum of memory used would easily fit in 2GB RAM. It slows down all processes when it shuffles data onto disk when it need not. It may be that a BIOS revision is a key. That would obviate having to work with XP. Thanks, sam

*Message #7 Posted by **Pascal** on 26 Dec 2010, 2:44 a.m.,*
in response to message #6 by designnut

Have you tried disabling paging file completely ?

Re: O.T. XP won't use all RAM

*Message #8 Posted by **designnut** on 27 Dec 2010, 2:23 p.m.,*
in response to message #7 by Pascal

I have chosen "no page file" and restarted. It notifies me my pagefile is too low and resets it. It is simply reverting to the days when 512M was a lot of RAM. I'll see if an updated BIOS is available. Thanks, sam

OT: Is his a real Red Dot? :-), Again

*Message #1 Posted by **XYZT** on 23 Dec 2010, 7:05 p.m.*

I could never imagine that a calculator that Sharp had the sale value.
I have one and I see no feature that makes it stand out from other calculators.

WORLDS RAREST PROGRAMABLE CALCULATOR

Message #5 Posted by Palmer O. Hanson, Jr. on 17 Dec 2010, 10:43 p.m.
in response to message #1 by XYZT

"I have a PC-1201 in mint condition.
It is a nice little device.
I struggled with programming it because I didn't have a manual but I eventually figured it out.
I paid three dollars for it back in 2005.
Perhaps I should hold it and wait for even more appreciation.
The bid of $607 does seema little high but I don't have any real insight as to the rarity o the PC-1201 or how many collectors are interested. I do have a HP-41CV in very good condition with manual, carrying case and carton that I purchased in 1998 for two dollars.
I also have a mint condition HP-41CX with manual, carrying case, and carton that I purchased in 1999 for five dollars.
How does the appreciation of those devices compare with that of the PC-1201? "

Good explanation for the green display and this one?

Sharp Scientific Calculater EL 5103 S

*Message #2 Posted by **Chuck** on 24 Dec 2010, 1:04 a.m.,*
in response to message #1 by XYZT

Well, some of my favorite calculators in my collection ARE Sharps. For some reason the sharp-edged metal accents of the Sharps are enticing, sometimes more-so than the brown plastic HP's that most here go ape over. And, the Sharps aren't all that bad of a calculator. Last week I acquired a Sharp 5500III Computer. Nice little machine for about 1/10 the price of any HP (okay, not any, but most.) Not sure if I'd go to the $200 plateau on one, but still I find them interesting.

Firmware update for new HP-12C+

*Message #1 Posted by **Ernst Fueloep** on 23 Dec 2010, 7:35 a.m.*

Hi,

In this thread (HP12C - SST in RUN-Mode doesn't work correctly the latest firmware for the HP-12C+ is mentioned as 2009-11-19.

Now, my HP-12C+ has firmware version 2009-07-02.

Is it possible to update the firmware using a PC? I have the serial cable (many thanks to Tim Wessman). Is it possible to download the latest firmware from somewhere?

The above thread says something about Cyrille may be able to help? How can I contact this person?

Thanks.

Best Regards, Ernst

Re: Firmware update for new HP-12C+

*Message #2 Posted by **Katie Wasserman** on 23 Dec 2010, 10:24 a.m.,*
in response to message #1 by Ernst Fueloep

It's not available for download as far as I know, but Tim should be able to send it to you, especially since he sent you the cable. It's sort of a necessary component, if it's not included with the cable and you're playing with re-purposing you would have lost the 12C functionality.

RIP 46

*Message #1 Posted by **Keith Midson** on 22 Dec 2010, 12:03 a.m.*

A sad day - my "built like a tank" HP46 suddenly decided to pour out grey smoke out the back and make a horrible bang noise before switching itself off forevermore ...
So I guess I will need to get a new calculator now. It will be hard to find something that has the same presence in its case!
Cheers, Keith

Re: RIP 46

*Message #2 Posted by **bill platt** on 22 Dec 2010, 12:19 a.m.,*
in response to message #1 by Keith Midson

Oh NOOOO!

And that is the first time I even remember anyone mentioning the 46! Had to look it up!

Re: RIP 46

*Message #3 Posted by **Katie Wasserman** on 22 Dec 2010, 12:23 a.m.,*
in response to message #1 by Keith Midson

A common problem on the HP-46 is the large electrolytic capacitors in the power supply failing. A loud bang with smoke could very well be an indication of this. Such a failure would likely have also blown the fuse. Open it up for inspection, a blown up capacitor will be obvious. They are easy to replace if you're at all handy with a soldering iron.

Re: RIP 46

*Message #4 Posted by **Keith Midson** on 22 Dec 2010, 1:17 a.m.,*
in response to message #3 by Katie Wasserman

Yes the fuse self destructed quite spectacularly as well. My 7 year old son was devastated! Good to know about the capacitor - I assumed that it had died for good. I will have a look and report what I find.
Cheers, Keith

Re: RIP 46

*Message #5 Posted by **Tony Duell** on 22 Dec 2010, 3:54 a.m.,*
in response to message #4 by Keith Midson

You can get schematics from the Australian Museum site.

I would start by taking off the top and bottom covers and then look for obviously burnt or damaged componets. Yes, some faults do leave a visible trail!. But remember that the burnt part may have been damaged by a fault elsewhere.

Continue by unplugging the transformer secondary edge connector from the back of the logic PCB. Replace the fuse with one of the correct rating and apply mains. If the fuse blows, then you have shorted turns in the mains transformer :-(. If the fuse holds, check the secondary winding voltages.

Then check the PSU components on the logic PCB. Others have mentioned the smoothing capacitors (the value is not too critical, if you can't find a 5000uF, don't worry, a 4700uF is fine). Also check the rectifier diodes (I've had problems with these in other machines) and the pass transistors.

Re: RIP 46

*Message #6 Posted by **bill platt** on 22 Dec 2010, 8:41 a.m.,*
in response to message #3 by Katie Wasserman

Hi Katie,

Remember how Valentin felt strongly that in some period of time, all these wonderful old devices would die? Was he speaking of the simple dead bug pieces like electrolytic caps or was he thinking about something else?

As our machines age, I wonder if it is possible to come up with a "safe pre-test" protocol for checking the machine's capabilities before actually powering up?

Re: RIP 46

*Message #7 Posted by **Mark Storkamp** on 22 Dec 2010, 9:19 a.m.,*
in response to message #6 by bill platt

This is all making me wonder about the possible modes of failure. I know switches are prone to metal fatigue, rubber can deteriorate, capacitors can dry up, and tin whiskers can sprout in chips.

What are the other possibilities? Can P and N regions migrate? Does the O in MOS break down? How long do LCDs last? How many years until 37% of the units have died of natural causes? I suspect the newer models have a shorter life span for a number of reasons.

Re: RIP 46

*Message #8 Posted by **John B. Smitherman** on 22 Dec 2010, 10:34 a.m.,*
in response to message #7 by Mark Storkamp

The newer models have fewer parts which should help with their overall longevity.

John

Re: RIP 46

> The newer models have fewer parts which should help with their overall longevity.

But the dies are smaller and more tightly packed, so slight manufacturing tolerances are going to have a greater impact. They typically run at a lower voltage so less variation over time will

put them out of spec. Of course, this is all conjecture.

On the other hand, they also (in my case) tend to just sit collecting dust while the older ones get used far more often.

Re: RIP 46

*Message #10 Posted by **Katie Wasserman** on 22 Dec 2010, 11:51 a.m.,*
in response to message #7 by Mark Storkamp

HP's experiment with NMOS in the HP-27 proved that early NMOS devices fail sooner than PMOS devices of the same era. That's why there are so few working HP-27's around and yet most of the other Woodstocks still work.

> Quote:
>
> and tin whiskers can sprout in chips

... and now they can sprout on every soldered connection since RoHS went into effect. Actually I think the jury is still out on this, but there is great concern from what I've read about this possibility.

> Quote:
>
> "safe pre-test" protocol

As Tony suggests, you could discounted the power supply from the logic and check that first. This would at least limit the damage to just the power supply, which is usually easy to repair. This works on large desktop machines where the power supply is almost always easily separable from the logic. On pocket calculators of unknown condition I power them from a external power supply with current limiting. This allows me to ramp up the current slowly to limit the chances of burning something out. This is a bit tricky to do since the calculator won't usually turn on until you give it enough current, but with practice you learn what's too much and want's about right.

How to identify 12C 25th Anniversary Edition

*Message #1 Posted by **Frank Gifford** on 21 Dec 2010, 12:13 a.m.*

I have a an HP 12C Platinum which I am trying to confirm the type. I was told that it is the Anniversary Edition but HP tech support states that all anniversary editions have the marking on the front and back for it where this unit only has the "Platinum" mark on the left of the display. Not sure if serial is any help but it is CNA00204899 which is on a sticker on the back of the unit. There is also what appears to be a model number next to the HP logo in the back as RMN HSTNJ-KN11 right above Made in China. It uses 2 x CR2032 3V coin size batteries. So, my question, is this just the plain Platinum model or is it the 25th Anniversary Edition. Thanks.

Re: How to identify 12C 25th Anniversary Edition

*Message #2 Posted by **Raymond Del Tondo** on 21 Dec 2010, 7:34 a.m.,*
in response to message #1 by Frank Gifford

The Anniversray edition says "Anniversary Edition" on the front and on the back, uses one single coin cell, and has a black keyboard overlay. It was made from 2006 on.

HTH

Re: How to identify 12C 25th Anniversary Edition

*Message #3 Posted by **Allen** on 22 Dec 2010, 7:54 p.m.,*
in response to message #2 by Raymond Del Tondo

AFIK there are several editions of the 12C /12C platinum in order of creation:

```
Major Versions of standard 12c
1) Original 3-cell design 1981*-2001?
2) 1 cell design similar to first 12c Platinum 2001-2009
3) 2 cell "12c+" design 2009/2010 and later

Major Versions of Platinum Calculator
4) "12C Platinum Financial Calculator" with Silver background/1 cell 2003*-2008?
5) "HP 12C Platinum 25th anniversary" - Black background/1 cell) 2006*
6) "HP 12c Platinum Financial Calculator"- black background/2 cell- 2009-2010 and later

Other 12c Versions:
7) "HP 12c Prestige" - Brazil only (1 Cell) 2003*
```

*Source- HHC 2007 Calendar

I've owned all except (7), by far I prefer the 2-cell models because of the faster speed and better quality. In contrast, the 1-cell versions are slow and poorly made.

Gerardo --

This was covered a few years ago, but I didn't bookmark the discussion.

"Y^X" is indeed more consistent with other operations such as division and subtraction, which perform Y/X and Y-X, respectively.

Unlike the HP-45, the HP-35 lacked a "10^X" key. "X^Y" saved a keystroke over "Y^X" when finding common antilogarithms of a computed value on the HP-35:

```
(value) 10 X^Y
```

This is mentioned on the Museum page for the HP-35.

Also, "x raised to the y", like "y over x", may have been considered to be more visually intuitive from the stack representation.

Classic (and other) Keyboard Layout Musings

*Message #1 Posted by **Mark Henderson** on 20 Dec 2010, 5:49 p.m.*

As I admire my HP Classic and LED collection I'm a little surprised at the apparent lack of consistency and standardization in the keyboard layouts and standardization?

There seems to have been little effort made to keep layouts similar from model to model (e.g. grouping the stack manip keys in the same way?), colors vary widely and in some cases it's really hard to see the logic in the colors, the HP-67 has the shifted functions BELOW the keys vs. above for all others (yes, I realize the top row of soft keys mandated this, but it is really confusing as you switch between models!).

Anyone know how this might have come about? Just not an attempt to standardize? Different teams developing different products? Not that it really matters, perhaps except to those of us who switch models daily!

Re: Classic (and other) Keyboard Layout Musings

*Message #2 Posted by **Thomas Okken** on 20 Dec 2010, 9:49 p.m.,*
in response to message #1 by Mark Henderson

> Quote:
>

>
> There seems to have been little effort made to keep layouts similar from model to model

It seems to me that HP did, in fact, try to standardize at least the most heavily used part of the keyboard. The Classics and Woodstocks all have the exact same layout for the number, period, arithmetic, and ENTER keys. The CHS key is just to the right of ENTER on all of those models except the HP-80, and the EEX and R/S keys, on those models that have them, are always in the same positions, as is the CLX key on all except the HP-70.

Regarding the position of the shifted functions on the HP-67, I think you answered your own question. :-)

As far as the color scheme is concerned -- I'd love to hear someone from HP who was actually part of the design process weigh in on this, but having no such insights myself, I'll just state for the record that I think they all look great, and even (especially!) the oddball HP-70 looks like it is perfectly at home in the early '70s when it was created. :-D

> Quote:
>
> but it is really confusing as you switch between models!

Ah, but see, back then, nobody ever did that. Even the HP-25, which had one of the best price/performance ratios of the HP LED calculators, cost today's equivalent of about $800 back then. People didn't buy several

calculators; they bought the one that hit the sweet spot between what they wanted and what they could afford, and that was it -- then they'd stick with that one calculator for years and years.

Re: Classic (and other) Keyboard Layout Musings

*Message #3 Posted by **bill platt** on 20 Dec 2010, 10:49 p.m.,*
in response to message #2 by Thomas Okken

1982 to 1995: one calculator. 2003 to 2010: innumerable calculators. Something happened in 2003 or so.

Re: Classic (and other) Keyboard Layout Musings

*Message #4 Posted by **Walter B** on 21 Dec 2010, 4:53 a.m.,*
in response to message #3 by bill platt

Started earlier: 1977 - 2002 one calculator at a time, just purchased new ones for replacement. 2003 - today: as Bill so I can confirm the observation 2003 must have been special.

Re: Classic (and other) Keyboard Layout Musings

*Message #5 Posted by **Mike Morrow** on 21 Dec 2010, 9:33 a.m.,*
in response to message #2 by Thomas Okken

I bought my first calculator in 1972. Not an HP-35 (which had a 2010 equivalent price of $2100), but a four-function Bomar 901B for $130 (2010 equivalent of $680). It supported my real "calculator", a Dietzgen N1725L slide rule ($35 in 1969, 2010 equivalent of $210, still the finest slide rule ever made).

By 1978, I owned a SR-50, SR-51A, SR-56, TI-58, TI-59, HP-67, and HP-21, and had traded the TI-58 for a used HP-35 Red Dot (that DOT had no special significance to me at the time...I just wanted the early machine that I had so admired a few years earlier).

So, I had a better than average collection of calculators more than a third of a century ago, even when compared to my fellow electrical engineers.

But Thomas is correct...even among engineers there were very few who had more than two calculators back then, and generally only one of the two would have been a high-dollar HP machine or a more modestly-priced TI. (All HPs were really high-dollar then.)

Re: Classic (and other) Keyboard Layout Musings

I disagree:

1. Layouts were pretty standardized in each product line up to and including the Pioneers. Thereafter there were no real product lines anymore.
2. The logic in the colours was pretty obvious up to and including the HP-48SX. This topic was discussed here some years ago and also covered in a talk on one HHC, IIRC, but I didn't bookmark that. The

colours chosen for the HP-48G etc. had no technical reason but were only fashionable at that time. Recently, HP returned to better contrast again.

3. On keyboards before the HP-80, labels of shifted functions were generally located above the primary functions. See also typewriter keyboards where the shift key is actually an arrow up. So by mere tradition shifting meant "shifting up" and that was copied. OTOH you stated one reason for all shifted labels below the keys of the HP-67 already. The HP-21 and - recently - the 17bii+, 20b, and 30b show another: it allows the cleanest keyboards. This requires, however, slanted keys which were not featured anymore after the Voyagers until the 35s. I see no reason why you shouldn't have the labels of all the shifted functions below the keys - it would even make keyboards a bit tidier.
4. As Thomas explained above, swapping calculators was no custom when calculators were tools.

HTH,

Walter

"Layouts were pretty standardized in each product line up to and including the Pioneers. Thereafter there were no real product lines anymore. "

That would be the 2003 thing.

Ok, Bill, so I misunderstood your statement above ...

Re: Classic (and other) Keyboard Layout Musings

*Message #9 Posted by **bill platt** on 21 Dec 2010, 11:12 a.m.,*
in response to message #8 by Walter B

I think 2003 is when HP canceled the whole calculator enterprise. Or was it 2002? Somewhere around then. That's when I suddenly found myself looking for backup machines and that led to becoming a collector...

*Message #10 Posted by **Michael Meyer** on 21 Dec 2010, 6:21 p.m.,*
in response to message #9 by bill platt

My collecting:

1. First thing I looked up on eBay. Not sure why.

2. Soon after, went to the Smithsonian for my 40th birthday, 10 years ago. Saw their calculator collection. I wanted it. And got it...and more.

Re: Classic (and other) Keyboard Layout Musings

What did/does the Smithsonian have in its calculator collection??

Re: Classic (and other) Keyboard Layout Musings

*Message #13 Posted by **Mark Henderson** on 21 Dec 2010, 5:02 p.m.,*
in response to message #6 by Walter B

Well, perhaps I'm more of a nit-picker, but a few examples of what I see is:

Layout inconsistencies (mainly thinking about stack manip keys that are common and hence likely to be standardized?):

HP-45 and HP-55 - above the ENTER line, very little consistency!? (All models) - LASTx wanders around all over the place!

Colors:

HP-55 - very few consistencies or real obvious patterns compared to others?

Maybe it's the odd-ball HP-55 that's throwing me??!

Re: Classic (and other) Keyboard Layout Musings

in response to message #1 by Mark Henderson

> Quote:
>
> As I admire my HP Classic and LED collection I'm a little surprised at the apparent lack of consistency and standardization in the keyboard layouts and standardization?

I am sure the same can be said about any emerging technology. E.g. automobiles. I would suspect as features increase and feedback is received coupled with economic restrictions and other give and take that what you are seeing is evolution.

*Message #15 Posted by **Karl Schneider** on 21 Dec 2010, 6:58 p.m.,*
in response to message #1 by Mark Henderson

Mark --

(Honest, I drafted this and posted it later, not having seen Egan's post.)

Others have already elaborated, but I believe that it was mainly a matter of evolutionary improvement of the

products.

The original production HP-35 -- particularly the earliest models -- still looks to me like a prototype, with buttons too small and poor color contrast. Feedback from users and critical analysis from the engineers surely led to the quick improvements in design.

*Message #16 Posted by **Mark Henderson** on 21 Dec 2010, 7:25 p.m.,*
in response to message #15 by Karl Schneider

Yeah, I guess evolution does explain it. Hard for me to swallow since the HP-35 was perfect :-) Well, of course it wasn't, but it is a true icon. Lately the one I've been really enjoying is my 19C, very nice machine. But could I choose just one? I doubt it (that's why I need to collect them ALL!!).

The original HP-35 was a shot in the dark - nobody knew whether it would succeed or not. To me, it looks exactly like this: taking the established colors and key sizes of other HP products of that time, double shot moulding for the most basic keys only, blank keys for all other, cheap printing on the keyplate. HP-35V4 did show how it could have looked from the very beginning ... but of course the engineers tried to keep risk low at launch.

Just my 20 m€, of course

Re: Classic (and other) Keyboard Layout Musings

*Message #18 Posted by **Palmer O. Hanson, Jr.** on 27 Dec 2010, 8:57 p.m.,*
in response to message #1 by Mark Henderson

I am quite sure that what follows was discussed in an earlier thread in this forum but I haven't been able to find it,

Starting with with the HP-35 and continuiing through the Classic series, the Woodstock series, the Spice series and ending with the HP-41 the arithmetic keys were at the left side of the calculator and arranged in the order - + x / reading from the top. Starting with the the Voyagers and for nearly all subsequent models the arithmetic keys were moved to the right side of the calculator and arranged in the order / x - + reading from the top. The curious aspect of all of this is that the move resulted in an arrangement which mimicked that which had been used by TI and Sharp for many years.

The exceptions that I know of are the HP-6S, HP-8s, and HP-10s where the arithmetic keys are at the lower

right and placed in a 2x2 array where x / are above + -. This arrangement is similar to that used in many but not all Casio machines.

These were not HP machines. They merely have HP badges.

When HP did the voyagers, I do wonder if someone at HP thought that it would help to get Ti converts, if they re-arranged the keys to match.

M2kM Software manual updated

*Message #1 Posted by **Meindert Kuipers** on 20 Dec 2010, 1:32 p.m.*

While travelling I have been updating the manual for the M2kM software (now updated to version 1.70). Those with and MLDL2000 will know what is is. It may be found at my website.

If you do not have an MLDL2000, this software may be of use because of the HP41 disassembler (can now disassemble for SDK41, for easy re-assembly) and the manipulation of MOD files.

HHC MMC Programming challenge inC code

*Message #1 Posted by **David Hayden** on 20 Dec 2010, 12:02 a.m.*

The programming challenge at HHC MMX was to write a UserRPL program to sort a list of integers with the odd numbers appearing first and the even numbers appearing second. Entries were scored based on the run-time multiplied by the program size.

Just for fun, I wrote a solution in C code. Although this was clearly an invalid entry for the contest, I wanted to see if the huge increase in size would be offset by the increase in speed.

The UserRPL programs can be found here.

Here are the results. The input lists L10, L100 and L1000 are my own lists of 10, 100, and 1000 random integers. Note that these are not the input lists used by Joe Horn to judge the contest. Size is in bytes and runtime in seconds. Program names are as given in the link above, except that "dh2.c" is my C code implementation.

```
                        PROGRAM
         BVB      PRGM2    PRGM3    PRGM4    PRGM5    dh2.c
size     98.5     90       99       90       141      16433

Run Time:
L10      0.27     0.42     0.40     1.15     0.90     0.05
L100     2.11     5.55     5.58     7.70     9.93     0.09
L1000    40.25    452.00   211.67   114.90   152.30   0.30

Score (run time * size)
L10      26.1     38.1     40.0     103.6    127.4    828.2
L100     208.2    499.3    552.7    693.1    1400.5   1465.8
L1000    3964.5   40680.0  20955.2  10341.1  21474.3  4865.8
```

The C code is more than 100 times bigger than the biggest User RPL solution. For a 10-item list, it runs about 5 to 18 times faster, resulting in a "bytes times seconds" score far worse than any of the other programs. But when the list is 1000 items, it runs more than 100 times faster than the fastest User RPL program, which is itself almost three times faster than the next fastest entry. At 1,000 items, the C code's overall score is a close second place to the Bill Butler's winning program.

Note that with a 50G, it's easy to store the C program on an SD card and access it with a small stub program that just recalls and evaluates it.

Here is the C code:

```
#include <hpgcc49.h>
#include "hpobjects.h"

// Callback function for quicksort. Sort by odd/even then by size
int
cmp(const void *p1, const void *p2)
{
    long long ll1, ll2;
    int mod1, mod2;

    ll1 = *(long long*)p1;
```

```
    ll2 = *(long long*)p2;

    mod1 = ll1 % 2;
    mod2 = ll2 % 2;

    if (mod1 &&  !mod2) {
        // ll1 odd, ll2 even
        return -1;
    } else if (!mod1 && mod2) {
        return 1;
    }

    // both are odd or both are even
    if (ll1 < ll2) return -1;
    if (ll1 > ll2) return 1;
    return 0;
}

int main()
{
    SatAddr oldList, newList;
    SatAddr listOb, iter;
    int size, i, j;
    SatAddr *arr;
    long long *llArray;

    sys_slowOff();
    if (!STACKdepth()) {
        return 0;
    }
    oldList = STACKpop();
    if (!isLIST(oldList)) {
        STACKpush(oldList);
        return 0;
    }

    size = LISTsize(oldList);
    arr = calloc(size, sizeof(SatAddr));
    llArray = calloc(size, sizeof(long long *));

    // Get the objects from the list
    i = 0;
    for (listOb = LISTfirstOb(oldList, &iter);
         listOb;
         listOb = LISTnextOb(&iter)) {

        if (isZINT(listOb)) {
            ZINTdecodell(listOb, &llArray[i++]);
        }
    }

    qsort(llArray, i, sizeof(long long), cmp);

    for (j=0; j < i; ++j) {
        arr[j] = ZINTencodell(llArray[j], 0);
    }
    newList = LISTencodeN(i, arr, 0);
    STACKpush(newList);
    free(llArray);
    free(arr);
    sys_slowOn();
    return 0;
}
```

Re: HHC MMC Programming challenge inC code

*Message #2 Posted by **Oliver Unter Ecker** on 24 Dec 2010, 7:15 p.m.,*
in response to message #1 by David Hayden

David,

Thanks for the interesting read.
It inspired me to find out how ND1 (http://naivedesign/ND1) would do on this challenge.

Here's my would-be entry:

```
f(v)=v.sort(function(a,b){return(a&1&&!(b&1))?-1:(!(a&1)&&b&1?1:a-b)})
```

71 bytes.
This code is MorphEngine's "natural math" syntax for maximum compaction.

Easier to read (but slightly larger; and we're sweating bytes here…), it would be written like this:

```
function(v) {
  return v.sort(function(a, b) { return (a%2 && !(b%2)) ? -1 : (!(a%2) && b%2 ? 1 : a-b);
});
}
```

Run-time for a 1000-element vector is 0.035s on my iPhone 3GS. B*T score would be ~2.5 (71*0.035).

Run-time for the original 64-element vector from the competition is 0.002s. Score: 0.142
(That's almost a factor 1000 higher than the UserRPL winner.)

Run-time for a 100,000-element vector (generated in a little over a second) is 5.9s.

The integer vector is created either through this RPL program

```
\<< \-> n \<< [] 1 n START RAND 2E12 * RND 1E12 - + NEXT \>> \>>
```

or, for higher speed, this equivalent JavaScript program

```
function (n) {
  var v = [];
  for (var i=0; i<n; i++)
    v.push(Math.floor(Math.random()*2e12)-1e12);
  return v;
}
```

Note, that iPhone and 50g use the same CPU architecture (ARM9), but the iPhone is clocked ~10x faster.
Interesting, though, that this advantage is not (at least partially) lost by the interpreter vs. compiled difference.

Re: HHC MMC Programming challenge inC code

*Message #3 Posted by **David Hayden** on 25 Dec 2010, 6:34 a.m.,*
in response to message #2 by Oliver Unter Ecker

> Quote:
>
> Interesting, though, that this advantage is not (at least partially) lost by the interpreter vs. compiled difference.

It's probably using just-in-time compilation. Basically the interpreter compiles blocks of code as it encounters them and caches the results. The next time it encounters that block of code, it can execute the compiled block. This usually results in interpreted code running nearly as fast as compiled code. That's why java applications usually run pretty quickly.

Re: HHC MMC Programming challenge inC code

*Message #4 Posted by **Oliver Unter Ecker** on 26 Dec 2010, 7:18 a.m.,*
in response to message #3 by David Hayden

David,

You're probably right. SquirrelFish Extreme (Nitro) is the JavaScript engine in Safari and, yes, it's JIT'ed. I don't know if Mobile Safari uses the same engine (the older JavaScriptCore engine had no JIT compiler).
I can tell you that in many instances JavaScript code does perform quite a bit slower than C code, as one might expect. I'm working on a bridge that allows me to use C code (specifically, vectorized code) from JavaScript for greater speed.

Re: HHC MMC Programming challenge inC code

*Message #5 Posted by **Glenn Shields** on 26 Dec 2010, 9:46 a.m.,*
in response to message #1 by David Hayden

Hello all, I'm still trying to figure out what is happening in the winning RPL program in the link. They are all amazing, but what is STREAM doing with the stack? It's mysterious, because going step by step leaves a list with the size on top. Debug seems impossible with this parallel list processing. Any help? cheers, Glenn

Re: HHC MMC Programming challenge inC code

*Message #6 Posted by **Thomas Klemm** on 26 Dec 2010, 12:09 p.m.,*
in response to message #5 by Glenn Shields

> Quote:
>
> Debug seems impossible with this parallel list processing

Try adding a **HALT** in the code object which is **STREAM**ed:

```
\<< I\->R SORT DUP SIZE 3. ROT +
  \<< HALT
      DUP R\->I SWAP 2. MOD { OVER ROLLD } { UNROT 1. + } IFTE
  \>> STREAM DROP \->LIST
\>>
```

Now you can **SST** into that code section as well. The top of the stack keeps track of where the odd numbers are inserted. With each even number inserted this pointer is incremented.

HTH
Thomas

PS: Just tested this on a HP-48 emulator, but I assume this is similar on the HP-50.

Re: HHC MMC Programming challenge inC code

*Message #7 Posted by **Glenn Shields** on 28 Dec 2010, 11:24 a.m.,*

in response to message #6 by Thomas Klemm

Thank you Thomas, that did it - I could follow the ifte process, and the use of that counter to let higher odd numbers "hop over" the accumulated even numbers in the stack. Amazing what these RPL experts can do with the tools available. Regards, Glenn

Re: HHC MMC Programming challenge inC code

*Message #8 Posted by **Thomas Klemm** on 28 Dec 2010, 12:03 p.m.,*
in response to message #7 by Glenn Shields

You might want to compare the programs in message #5 and #6 of this previous Programming Challenge.
STREAM (or fold or reduce in other programming languages) is a powerful tool though some consider it harmful.

Cheers
Thomas

*Message #30 Posted by **Randy** on 21 Dec 2010, 1:32 p.m.,*
in response to message #28 by Randy

Remove one bushing but not the other? That's not consistent.

So where are you hiding the two 22uf capacitors on the card reader pcb? C1 and C2 - the caps in series with the head windings. Are they under the Christmas Tree?

Re: A little Christmas game
*Message #31 Posted by **Ignazio Cara (Italy)** on 21 Dec 2010, 3:22 p.m.,*
in response to message #30 by Randy

Hi Randy,

Game over!

You are right, the three caps (2*22uF + 1*6,8uF) are missing from the card reader PCB!

You are the winner... but you have won... only a Bravo!

Merry Christmas to everybody and many thanks for your participation and sympathy.

HP-67 Emulator for the iPad???

*Message #1 Posted by **Namir** on 19 Dec 2010, 9:27 a.m.*

Hi All,

Any developer out there working on or thinking of writing an HP-67 emulator for the iPad?? I recently got the emulator combo pack for the HP-35, 45, 80, and 55. I downloaded an upgrade last night that added some missing features and made the keys glow when you touch them.

Re: HP-67 Emulator for the iPad???

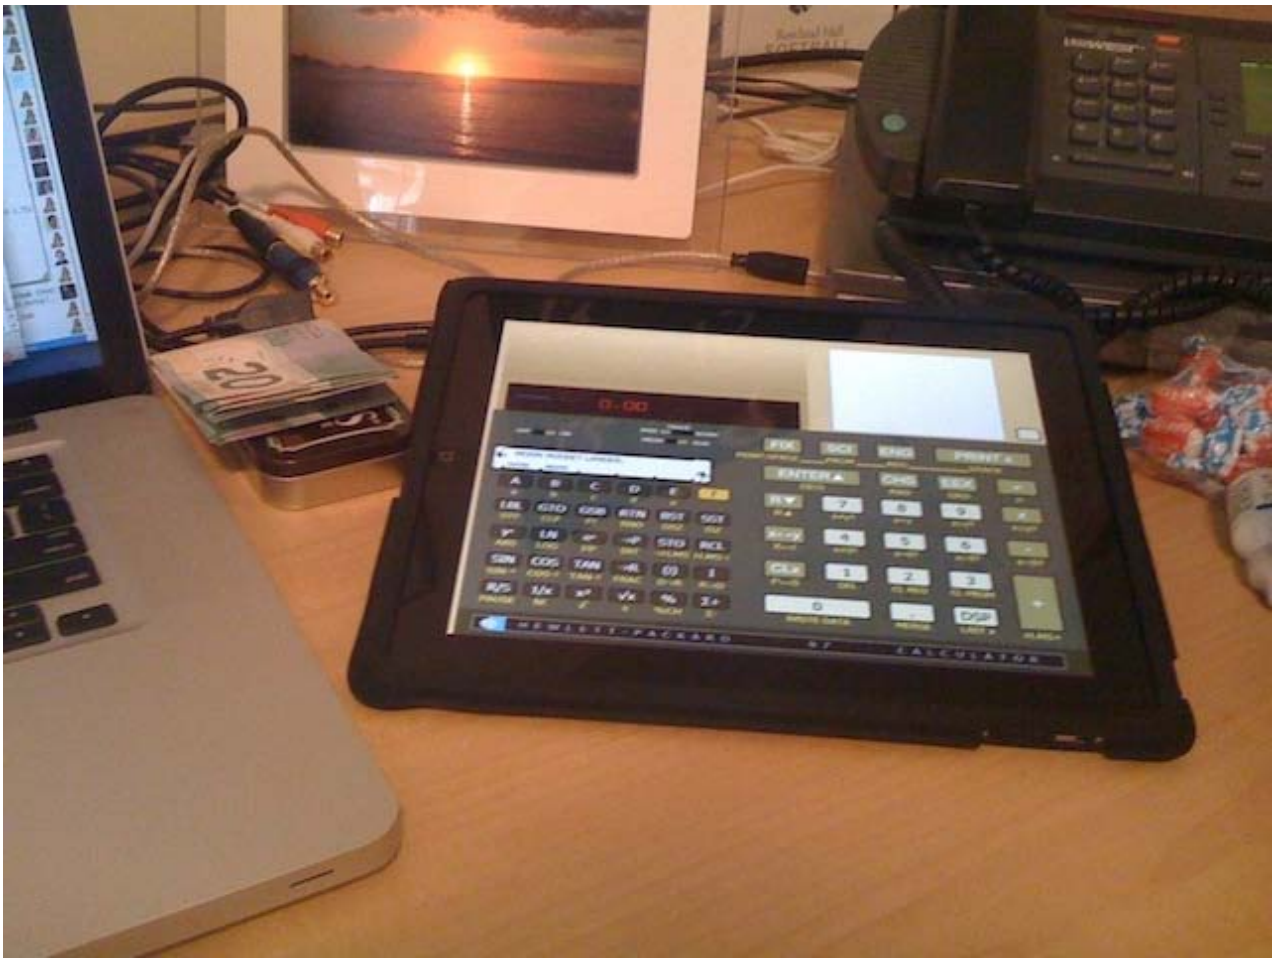
*Message #6 Posted by **Egan Ford** on 19 Dec 2010, 4:43 p.m.,*
in response to message #5 by Namir

Thanks. Found it. This is from the same developer that has the cheaper Voyagers. Based on the models offered, and that random numbers on the emulated 15C are the same as a real 15C, then I'll assume that this is yet another Nonpareil-based iPhone app using Eric's ROM dumps. So, until Eric gives us a 67, those basing their Apps on Nonpareil will have to wait. BTW, a 97 would be awesome on the iPad (see below).

$15 is a bit steep and they are not universal apps, just iPhone for now. No screen shots on iTunes does not inspire confidence.



Edited: 19 Dec 2010, 4:46 p.m.

Re: HP-67 Emulator for the iPad???

*Message #7 Posted by **Bruce Bergman** on 19 Dec 2010, 1:41 p.m.,*
in response to message #1 by Namir

But this is actually an iPhone app. How does it look on the iPad? So far I'm not impressed with some of the appearances once they show up in the phone emulator on the iPad...

thanks, bruce

Re: HP-67 Emulator for the iPad???

*Message #8 Posted by **Namir** on 19 Dec 2010, 1:44 p.m.,*
in response to message #7 by Bruce Bergman

The upgraded version adds more features. The HP-55 linear regression does not work, for example. You can now program the HP-55. i have not thoroughly tested the emulator for all the four calculators.

Namir

Re: HP-67 Emulator for the iPad???

*Message #9 Posted by **Jean-Michel** on 19 Dec 2010, 3:44 p.m.,*
in response to message #8 by Namir

Hello Namir!

How is it possible you already bought this (expensive!) application AND also downloaded and upgrade when the date of publishing mentionned in the AppStore (at least from France) is just... today (dec. 19th, 2010)?! Just curious. That being said, wouldn't it be that expensive (11,99€), nice app though. Thanks for sharing.

Kind regards.

JM.

Re: HP-67 Emulator for the iPad???

*Message #10 Posted by **Namir** on 19 Dec 2010, 9:34 p.m.,*
in response to message #9 by Jean-Michel

Maybe it was under another name or they reset the release date? Anyway, I am not the only one who bought an early version (See post by Vladan).

As Vladan mentions, the emulators still need work, but it's nice to be heading that way!

So I still hope for HP-67, HP-25C, and HP29C emulators.

Namir

Edited: 19 Dec 2010, 10:23 p.m.

Re: HP-67 Emulator for the iPad???

*Message #11 Posted by **Vladan Dugaric** on 19 Dec 2010, 6:17 p.m.,*
in response to message #8 by Namir

I also bought it a few days ago when HP-55 programming was still broken. The unit conversions did not work in that version either.

Now programming works (as Namir noticed), but there are still some things broken or missing. The degF <-> degC conversion works for some values but not for others (for example, 50 ->C correctly gives 10 and 10 ->F correctly gives 50, but 0 ->C gives 82.22222222 which is wrong (and Nonpareil 55 on which this one is supposedly based gives a correct answer of -17.777778). The R<->P conversion is not yet in the iPhone emulator, even the key label only reads <->.

The previous version had SCI above the second and thr fourth key in the second row, and it did not

work. Now that has been fixed and it works.

There is one annoying problem in the iPhone emulator though (and I hope the author fixes it) - the key target areas are small, likely just the key picture areas. This makes them easy to miss if the finger is not precisely centered over the key. There should not be any dead space between the keys, so that keys would register always. In this (and the previous) version, there are a lot of misses when typing.

The keyboard is also a bit slow, so typing fast enough will result in a lot of missed keystrokes. Needless to say, the Windows version of Nonpareil does not suffer from this problem. To be fair, the problem on the iPhone version might be due to small key target areas and might not exist in reality (I cannot reproduce it always).

The timer mode of the original HP-55 and its Nonpareil emulation is missing in the iPhone version too.

I haven't tested more features. Hopefully, they are just bugs in the implementation of the original Nonpareil code (the way program executes with the flashing display suggests it might be the case).

Re: HP-67 Emulator for the iPad???

*Message #12 Posted by **BobVA** on 19 Dec 2010, 11:17 p.m.,*
in response to message #11 by Vladan Dugaric

I just bought the 19 DEC update. No operating problems at all, since it doesn't run :-(

Immediately crashes when I start it on my iPod Touch with 3.x OS. No links to any support site or feedback mechanisms other than posting a review, either. The developers website is just an ad page with no contact info. Hope he's checking in here. Looks like a nice app, but it clearly needs better testing.

Bob

Re: HP-67 Emulator for the iPad???

*Message #13 Posted by **Vladan Dugaric** on 20 Dec 2010, 12:31 p.m.,*
in response to message #12 by BobVA

Both my iPod Touch 2G and iPhone 3GS are running iOS 4.2.1. I haven't tested this app on iOS 3 since it came out long after I upgraded both of my devices to 4.x.

The app runs fine on both.

If you don't have a solid reason to stay with 3.x, I suggest that you upgrade the iPod Touch to 4.2.1. The performance issues of 4.0 to 4.1 are gone in 4.2.1.

Vladan

Edited: 20 Dec 2010, 12:33 p.m.

Excellent! Thanks very much for that - it was precisely the reason I was holding back. I'll give the upgrade a shot and see what happens.

Regards, Bob

Update: Installed 4.2.1 and the emulator now works fine.

Casio Prizm screenshot

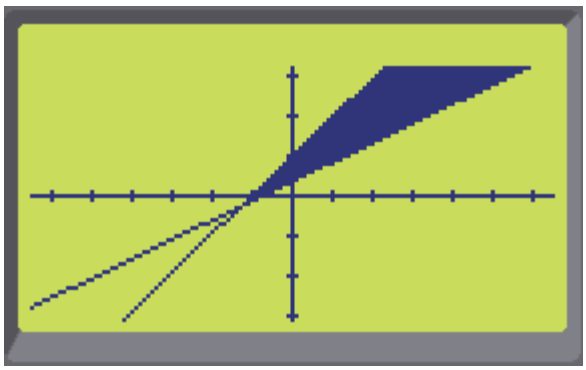
*Message #1 Posted by **Don Shepherd** on 18 Dec 2010, 10:27 p.m.*

Here is a screenshot from the Casio Prizm, showing the graph of two inequalities, y>=x+1 and y<2x+3. The dark shaded area is the solution to both inequalities. The actual screen looks somewhat crisper than the screenshot.

Re: Casio Prizm screenshot

*Message #2 Posted by **Thomas Klemm** on 19 Dec 2010, 2:33 p.m.,*
in response to message #1 by Don Shepherd

What an improvement compared to what we can do with an HP-48G:



Since I'm not that familiar with plotting I had to consult the manual. You need two different plot-types: **TRUTH** and **CONS**. As suggested in the manual I created two variables:

INEQ

```
'Y\>=X+1 AND Y<2*X+3'
```

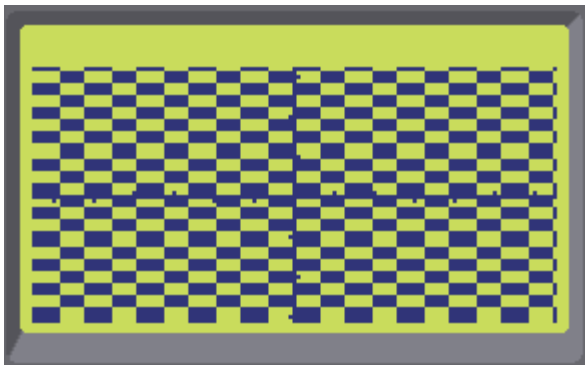
EQNS

```
{ 'Y=X+1' 'Y=2*X+3' }
```

Now you can choose one or the other for **EQ**. Don't **ERASE** the graph after drawing the first plot.

Currently I'm reading the fun of programming. There's a chapter dealing with images (7 Functional images). So I wondered whether I could do that with my HP-48 as well. Here we go:

Checker



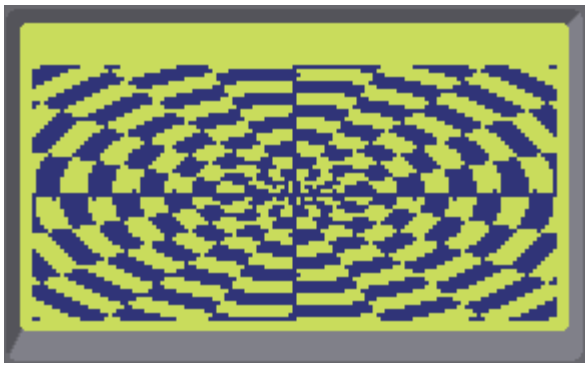
checker

```
\<<
  FLOOR SWAP
  FLOOR +
  2 MOD
  NOT
\>>
```

EQ

```
\<< Y X checker \>>
```

Polar Checker



Make sure you have your calculator in RAD-mode.

toPolar

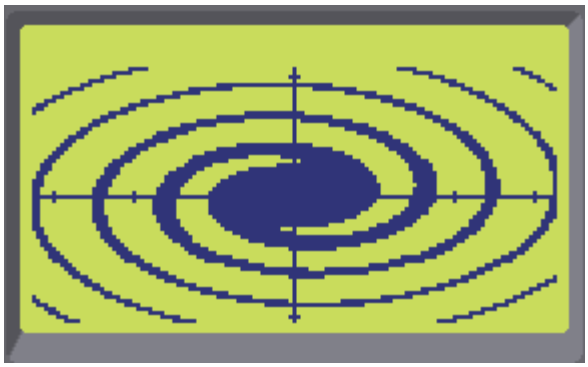
```
\<<
  R\->C DUP
  ABS SWAP ARG
\>>
```

n = 10

EQ

```
\<<
  Y X
  toPolar
  \pi /
  n *
  checker
\>>
```

Swirl Vertical Strip



vstrip

```
\<< ABS .5 \<= \>>
```

fromPolar

```
\<<
  \-> r \Gh
  \<<
    \Gh SIN r *
    \Gh COS r *
  \>>
\>>
```

r = 1

EQ

```
\<<
  Y X toPolar
  OVER
  2 * \pi *
  r / +
  fromPolar
  vstrip
\>>
```

Now this turns out to be **very** slow. Moreover I received an "Insufficent Memory" error and had to plot the image in several runs. Not exactly what you want.

Still I hope these examples might be inspiring.

Best regards
Thomas

*Message #4 Posted by **Egan Ford** on 19 Dec 2010, 1:07 p.m.,*
in response to message #1 by db (martinez, ca.)

I am unimpressed. It's a PC in a funky case running a C64 emulator. It is neither a good PC or a good C64. You can get a real C64 cheaper.

There are some great recreations of 8-bit systems out there that use as-close-to-the-original parts as possible (e.g. http://www.brielcomputers.com/wordpress/?cat=4) or emulate in FPGA (http://www.c64upgra.de/c-one/). I find the FPGA-based solutions interesting because of the low power requirements vs. emulation in a PC.

Re: everything old is new again

*Message #5 Posted by **Thomas Okken** on 20 Dec 2010, 10:17 p.m.,*
in response to message #4 by Egan Ford

> Quote:
>
> You can get a real C64 cheaper.

...and you'll get your money's worth!

I got fed up with the Commodore 64 when my fourth one died. Don't get me wrong, I'm a big fan of the C64, but the hardware was always a bit iffy, and the chips that were the most likely to die were also the ones that were the hardest to replace.

Once I had transferred all my C64 games to my PC, and had a decent C64 emulator to play them all on, I got rid of my C64 hardware, and never looked back. I still play C64 games every once in a while, using CCS64 on my PC and Power64 on my Mac. The only thing I do miss sometimes is my Competition Pro joystick.

My uncle was fond of machine language programming. He got on this obsession with increasing the machine's level of precision by doing some sort of clever business in machine or assembler or something (you can tell that I am not an expert at low level code). One day, he got that 64 really cooking--really. It wouldn't power down, got in some sort of loop that exceeded the duty cycle. It started to smoke and he unplugged it.

I can't remember whether he served it for breakfast or lunch.

HP-41CX Extended Memory

*Message #1 Posted by **Jeff Davis** on 18 Dec 2010, 8:19 p.m.*

I was wondering since the extended memory modules do get rather expensive and are rarely found any more, is there any way to take an old Math pac, for instance as I have one that does not work, and remove the chip and then put together an Double Extended memory module. What chip was originally used? Is there a schematic for the Module anywhere?

Re: HP-41CX Extended Memory

*Message #2 Posted by **Eric Smith** on 19 Dec 2010, 8:24 p.m.,*
in response to message #1 by Jeff Davis

The extended memory module uses four custom HP chips directly bonded to the PCB and encapsulated in epoxy. There is no commercially available memory chip that will work in an HP-41.

in response to message #1 by XYZT

I hate to nag, but could you not use [pre] tags around your text? I makes it hard to read, especially on small screens.
I'm guessing that you're doing it in order to be able to force line breaks where you want them, but you can do that using [nl].
(To get a paragraph break, use an empty line.)

in response to message #1 by XYZT

> Quote:
>
> I could never imagine that a calculator that Sharp had the sale value. I have one and I see no feature that makes it stand out from other calculators.

I have a PC-1201 in mint condition. It is a nice little device. I struggled with programming it because I didn't have a manual but I eventually figured it out. I paid three dollars for it back in 2005. Perhaps I should hold it and wait for even more appreciation.

The bid of $607 does seema little high but I don't have any real insight as to the rarity o the PC-1201 or how many collectors are interested. I do have a HP-41CV in very good condition with manual, carrying case and carton that I purchased in 1998 for two dollars. I also have a mint condition HP-41CX with manual, carrying case, and carton that I purchased in 1999 for five dollars. How does the appreciation of those devices compare

with that of the PC-1201?

Program not working with V2.15 for HP50G

*Message #1 Posted by **Iqbal** on 16 Dec 2010, 2:30 p.m.*

Only now realised that my subdivision program stops with the following error : "Bad argument type" while running. The program fouls up with a black and blue 50G using the 2.15 firmware. However, with 2.08 version, it works flawlessly. All flags are the same on both calculators. Any ideas what could cause that?

Re: Program not working with V2.15 for HP50G

*Message #2 Posted by **Namir** on 16 Dec 2010, 4:13 p.m.,*
in response to message #1 by Iqbal

Dear Iqbal,

Can you share the listing for the subdivision program? This might give someone on this web site an insight as to what is wrong. In general (and I really mean in a very general sense) memory-related problems can do this type of errors ... and they drive you nuts!

Namir

Re: Program not working with V2.15 for HP50G

*Message #3 Posted by **Tim Wessman** on 16 Dec 2010, 10:47 p.m.,*

Blue HP 50G

*Message #1 Posted by **Iqbal** on 15 Dec 2010, 2:33 p.m.*

Just got myself one of those blue toys. It's very blue. It's pretty different from the older days calculators like the 41CX and 42S, but everyone who saw it, liked it. The keys also feel softer. One of my students who has a black 50G also noticed the softer key feel. The battery cover is loose, so I changed it with a black cover, which fits pretty snug. Maybe just coincidence. I got it from Spain, obviously, since it is only available there. It's a nice variation from the black, for those who want change. One thing I am concerned about is because of the lighter blue the body is in, it may tend to get 'dirty' easier. The black ones would probably hide these flaws, but the blue would show it up. Just my observations.

Edited: 15 Dec 2010, 2:34 p.m.

Re: Blue HP 50G

*Message #2 Posted by **Tim Wessman** on 15 Dec 2010, 5:41 p.m.,*
in response to message #1 by Iqbal

It is definitely very blue. :-)

I haven't seen the final working model, but it does look much better in hand than in any picture. If you just go by that then you will be very worried. Granted, blue will not float everyone's boat, but I do think you hit the nail nicely regarding a selection for those that want it.

That does seem very strange that the keys feel that different. . .

Is his a real Red Dot?

*Message #1 Posted by **Mark Henderson** on 15 Dec 2010, 1:46 p.m.*

TAS Listing

To me it seems like it might be a counterfeit? But the bidders are running it up....

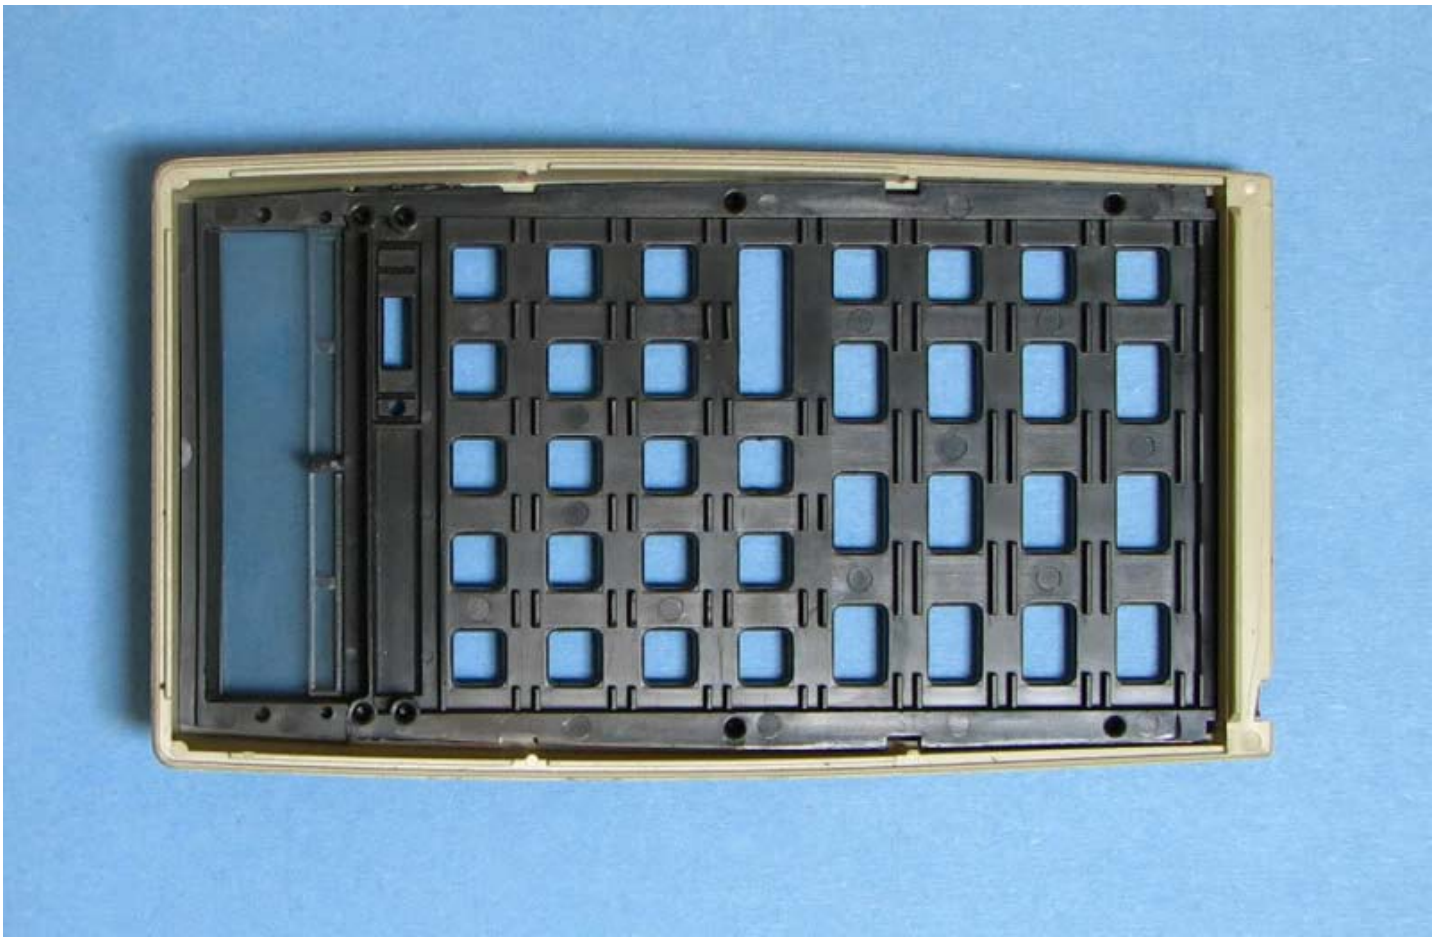
I am very curious why you think this is a counterfeit.

Re: Is his a real Red Dot?

*Message #3 Posted by **Geoff Quickfall** on 15 Dec 2010, 2:29 p.m.,*
in response to message #2 by bill platt

From what I can see, with a cursory visit to google "red dot HP 35" and my prototype 'brown' red-dot case (see images):

```
1.  red dot hole correctly placed inside and out plus
    it appears to be the correct diameter.
2.  serial number falls in the correct range ~< 4000
3.  correct silk screened bezel
```



Also look at this old thread:

red dot talk from 2000

The upshot is, by looking at the inside back where the hole should line up with the frame work. I have seen a fake where the hole is WAY to big and not centred on the switch opening or on the reverse, inside the rigid molded supports.

Would be nice to see the label at the bottom end of the calculator. It should read only "HEWLETT PACKARD" without the 35 added. This is not always a perfect check either, as it was HP's policy to update the label if the original was faded or damaged with a new one in stock on a warranteed repair. They didn't care what was applied as long as it was correct to the calculator. Hence a number of HP 25's running around with HP 25C labels; HP 41 Cs with labels mixed with CV and CX. Got this from an HP repair centre employee.

Cheer, Geoff

Re: Looks like

*Message #8 Posted by **Mark Henderson** on 17 Dec 2010, 10:14 a.m.,*
in response to message #7 by Matthias Wehrli

One of the reasons I raised the question was that the description on the listing doesn't say Red Dot, only "..hole..". Strange that someone who apparently knows the value of the "hole" wouldn't know that the description that would get the most attention (and bidding) would be "red dot". Hmmm.

Re: Looks like

*Message #9 Posted by **Walter B** on 17 Dec 2010, 10:23 a.m.,*
in response to message #8 by Mark Henderson

Hmmmh, I can't see anything red shining through said hole - so why should the seller claim a red dot where there's none to be seen? Do those dots wear off?

red dot

*Message #10 Posted by **Frank Boehm (Germany)** on 17 Dec 2010, 11:30 a.m.,*
in response to message #9 by Walter B

I think they are just stickered on the switch. So they might wear (Matthias might have mre infos) - might be dirt covered, too, since the calculator doesn't look that great. Btw. the V2s sometimes still have the red dot switch, but the red dot is left black. And of course there is no hole to notice this :)

Re: Looks like

*Message #11 Posted by **Martin Pinckney** on 17 Dec 2010, 1:46 p.m.,*
in response to message #8 by Mark Henderson

I think the answer is the seller wasn't aware of the "red dot" moniker. It seems to me he got his description off of Nigel Tout's website, which emphasizes the hole rather than the dot. In fact Nigel calls it a "spot."

Does anyone know what the opening bid was? Perhaps the seller is surprised by how much he landed.

Emulators from HP

*Message #1 Posted by **Mike (Stgt)** on 15 Dec 2010, 8:37 a.m.*

Once again about this subject. I wanted to get such an emulator as HP offers for PC and other platforms. But the purchasing dept. try to urge me taking a real HP35S as they can not find a supplier that deliveres the emulator in Germany. Poor Germany.

IMHO this must not be true so it can't be true: who delivers the emulated HP35S as offered by HP to a legal entity located in Germany?

Ciao.....Mike

Would anyone try to explain why HP chooses to sell the emulator to educators only? Why don't they want to make more money by selling it to virtually everyone who wants one?

Do they fear non-educators would make a torrent from it? Maybe so and they would lose some money. But by not selling at all they lose all the money. I frankly don't get it?!?!?

Re: Emulators from HP

*Message #8 Posted by **Don Shepherd** on 15 Dec 2010, 9:49 a.m.,*
in response to message #7 by George Bailey (Bedford Falls)

George, at least a couple of years ago some of the HP emulators were available to everyone, or at least everyone willing to spend about $20 or so. I bought the 12c emulator, and I think there was a 15c emulator as well, for sale by HP to anyone.

Don

*Message #18 Posted by **robert rozee** on 16 Dec 2010, 7:47 a.m.,*
in response to message #17 by Mike (Stgt)

am in new zealand, and just tried the link:
http://h20331.www2.hp.com/hpsub/us/en/calculators/Calculator_Software.html

takes me to a page with several emulators, the hp35s one then goes off to an outfit called 'digital river inc' where credit card details can be entered. the price can be displayed in a number of currencies, including swiss francs, swedish kronas, pounds sterling and euros.

it seems you can buy this software from anywhere, without restriction. the ONLY problem you may face is if you want to specify an address for physical delivery of media. if you aren't buying the physical media option, you could even enter a false address in the country of your choice.

quite simply, it appears the HP sales folks supplied you with false information. just enter your (or your company's) credit details and download the emulator.

cheers, rob :-)

praise for the 32sii

*Message #1 Posted by **Don Shepherd** on 13 Dec 2010, 8:07 p.m.*

OK, I know some folks don't like it, but I do, having recently acquired a couple of them. Why I like it:

1. It has the perfect function set, for me anyhow.
2. It has a crystal clear, large display.
3. The keyboard has that classic HP quality, and the key legends are very easy to read.
4. Most functions are not hidden in menus (although the 32s uncluttered keyboard is desirable also).
5. It uses named (A-Z) registers rather than numbered, which improves program usefulness.
6. The INPUT and VIEW commands are great, rather than relying upon the user to remember what to put on the stack when running programs.
7. It has decent programming space, especially integers between 1 and 254 requiring only 1.5 bytes.
8. Navigating program lines shows actual commands, rather than keycodes.
9. It allows programming indirect access to the 6 stats registers.
10. It has relatively fast ISG/DSE looping commands (compared to the slow ones on the 33s).
11. The algebraic equation solver is a pleasure to use.

Nits:

1. It requires two keys to navigate to each line of code, which requires you to look at the keyboard each time.
2. It would have been nice if the L.R. menu (linear regression) didn't kick you out of the L.R. menu when you view the slope (m) and y-intercept (b). The backspace key can be used in some menus to not kick you out, but not L.R.
3. It would have been nice if the designers had not placed the i variable between the regular registers A-Z (1-26) and the 6 stats registers (28-33), so you could have had a continuous block of 33 indirect-access registers.
4. It would have been nice to support infrared printing, like the 17bii.

Having used the calculator for only a few months, I can see why it is highly valued.

Re: praise for the 32sii

*Message #2 Posted by **Karl Schneider** on 13 Dec 2010, 8:55 p.m.,*
in response to message #1 by Don Shepherd

Don --

Nice summary about the HP-32SII; it's my primary calculator.

Some comments about a few items:

> Quote:
>
> It has decent programming space, especially integers between 1 and 254 requiring only 1.5 bytes.

384 bytes (and 390 bytes for the HP-32S) total for programming and data is "decent", albeit less than the 469 bytes offered by the HP-15C. However, even though the HP-32S/SII programming paradigm is good enough to use for permanent-residence programs and equations, its user RAM is insufficient to retain them all while still being able to use SOLVE and INTEG. I wish that these two models had the 2 kB RAM of the original HP-28C, even if the 33 registers A-Z, i, and Stat were permanent.

> Quote:
>
> The algebraic equation solver is a pleasure to use.

It's the one from the HP-22S. One annoyance is the lack of insert/delete editing within the equation, as opposed to the end of it. That was remedied on the HP-35s.

> Quote:
>
> It would have been nice if the L.R. menu (linear regression) didn't kick you out of the L.R. menu when you view the slope (m) and y-intercept (b). The backspace key can be used in some menus to not kick you out, but not L.R.

I don't quite understand. Each menu on the HP-32SII's one-line display is only one level deep, and will exit upon execution so that the full function name and result can be displayed. The regression variables m, b, and r are calculated separately.

> Quote:
>
> It would have been nice if the designers had not placed the i variable between the regular registers A-Z (1-26) and the 6 stats registers (28-33), so you could have had a continuous block of 33 indirect-access registers.

Indirect access to the six stat registers and the indirect register (i) was added to the HP-32SII; it was not present on the HP-32S. Any register can be "cleared" by setting its value to zero; the six stat registers can be cleared *en masse* by a single command (Clear Sigma). I suppose there's no reason why the indirect register could not have been the last one (33rd).

> Quote:
>
> It would have been nice to support infrared printing, like the 17bii.

Only the high-end Pioneers (HP-42S, HP-17B/BII, and HP-27S) got that feature, along with a full-matrix display and a faster processor. Also, the printing commands are too numerous and lengthy to be shown clearly on a lesser display.

The HP-32S/SII and HP-14B were mid-grade models.

For a list of most of the other differences between the HP-32S and HP-32SII, please see this archived post:

HP-32S vs. HP-32SII differences

Re: praise for the 32sii

*Message #3 Posted by **Don Shepherd** on 13 Dec 2010, 10:10 p.m.,*
in response to message #2 by Karl Schneider

Thanks Karl, great comments and I agree with them all. And thanks for that link to the post with the differences between the 32s and 32sii, I've come to really like both of them recently.

Here's what I meant about the L.R. menu. I've spent a lot of time recently using it to prepare problems for my 8th grade students who are studying linear equations. I enter the ordered pairs for two points in the stats registers, then I want to determine the slope and y-intercept of the line that includes those two points. I press L.R. and then m and it displays the slope. What I'd like to do at that point is press the backspace key and have it bring up the L.R. menu

again so I can press b and see the y-intercept, but that won't work. Backspace just clears the display, it doesn't take you back to within the L.R. menu so I could press b. I must press L.R. again and then b to find the y-intercept.

Compare that to the MEM (memory) menu. You press MEM and you see buttons for VAR and PGM. If you press VAR (and you actually have some variables defined), you will see the variables and you can then press backspace and end up back in the MEM menu, so you could then press PGM immediately if you wanted to, without having to bring up the MEM menu again. That's the behavior I'd like to see in the L.R. menu too, it would just make it a tad easier to get slope and y-intercepts. But it's just a nit.

When I see how the 32sii (and 32s) were designed to just work so well, I am amazed at the professionalism of its designers back in the 1980's I guess. In another post I (with Gerson's help) recently tracked down Roy Martin, one of the principal designers of the HP92 I think it was, and I wrote him a letter with some questions and he responded with a letter to me. That was so great. Some of those old guys are still around, and if any of them read this forum I hope they know how much we admire what they did decades ago.

Don

HP-32S/SII: MEM vs. L.R. menus

*Message #4 Posted by **Karl Schneider** on 14 Dec 2010, 2:06 a.m.,*
in response to message #3 by Don Shepherd

> Quote:

That's the behavior I'd like to see in the L.R. menu too, it would just make it a tad easier to get slope and y-intercepts.

I just can't agree with you there, Don.

MEM is a *non-programmable command* that brings up a menu to allow individual variables or program sections to be interactively deleted, via the VAR or PGM lists.

"L.R.", however, brings up a menu of five *programmable functions*, each of which calculates and returns a value to the x-register. If the execution of one of these functions did not exit the menu, the function would not work the same way as any other programmable function accessed via menu.

Keystroking for repeated regression analyses can be reduced by using a display program:

```
Detailed:                 Austere:

LBL L                     LBL L
m      (via L.R. menu)    m
STO M                     R/S
b      (via L.R. menu)    b
STO B                     R/S
r      (via L.R. menu)    r
STO R                     RTN
VIEW M
VIEW B
VIEW R
RTN
```

*Message #6 Posted by **bill platt** on 14 Dec 2010, 2:08 p.m.,*
in response to message #5 by Don Shepherd

The programming paradigm of the 32sii is IDEAL for ad-hoc programs of just this sort. You MUST use the programming memory for that purpose! Elaborate, long programs have no place on a machine with no I/O, no back-up, and tedious interface, by modern standards.

It is one thing to play with these machines in the mind set of 1978. It is another to think of their utility today, for which I think you will agree, the 32sii, and indeed, even Mike Morrow's sacred cow 42s, is a shabby, less than practical or useful tool for any significant programming.

Put it another way: In 1982 when I got my 11c, there was no reliable portable programming of the sort today. You had Sharps, HP, Timex Sinclair, Commodore Vic 16, Atari. Only the Sharps and HP were portable. The 11c/15c and their progeny, the 32s/42s, were never designed for power-programming: the 41C (and later 28S, heir to the 55/65/67) was intended for that purpose.

Trying to justify one's use of these non-I/O machines for serious programming, rather than ad-hoc, would be akin to showing one's blinders to cost/benefit, or trying to justify the unjustifiable. (Not you, but just a point.)

This was even obvious to me in 1982. The longer programs, so beautifully written in the spiral-bound manual seemed, to me, an awful lot of overhead for something that could not be backed up or loaded later. I knew of the 67 and the 41 then--I had used a 67 once--and so I stayed away from heavy duty programming but relished the ad-hoc simple but extremely useful programs one could construct on the fly.

In the mid-70s when there was NO Timex, or Atari or anything, then trying to squeeze a long program into a non I/O machine had real benefit. But by the early 80s that was no longer the case.

Re: HP-32S/SII: MEM vs. L.R. menus

*Message #7 Posted by **Don Shepherd** on 14 Dec 2010, 7:53 p.m.,*
in response to message #6 by bill platt

I don't disagree with you, Bill. Nobody's going to write a payroll program for the 12c (I don't think you could quite do that in 99 lines of program space anyhow).

Gene always said that, for the 30b, the programming capability can best be used to bring commonly-used functions within menus to the keyboard, for quick execution. I would agree.

I've used programs I developed on calculators for simple utilities (like base conversion), games (like hi-lo guess), number theory things (like prime factorization), or just the challenge of implementing the solution to a puzzle or riddle on something like a 12c with its limited programming space. To do that successfully is just eminently satisfying, even though it may have no practical value.

Serious programming work requires a PC or a mainframe.

Re: praise for the 32sii

*Message #9 Posted by **Don Shepherd** on 14 Dec 2010, 12:54 p.m.,*
in response to message #8 by Thomas Klemm

Thomas, I had to enter the L.R. menu twice if I wanted to see both slope and y-intercept, and my point was that it would have been nice to not have to do that. That would have required the backspace key to take you back into the L.R. menu after choosing m or b and viewing them, but it doesn't work that way. Karl pointed out that a simple program will do the trick, and I will probably use that if I find myself needing to find m and b repeatedly.

I don't know if the 42s has similar behavior, I've never owned or used one.

This is certainly not a deal-breaker, however. It's still a great calculator.

Don

in response to message #9 by Don Shepherd

> Quote:
>
> I don't know if the 42s has similar behavior, I've never owned or used one.

Just checked the behavior of the HP-32SII and it's NOT the same as that of the HP-42S: When you know you will use e.g. the PROB-functions a lot you can select that menu twice. Then you won't exit the menu after choosing a function. Instead you have to use the EXIT-key explicitly. From your description I thought you were looking for something like that. I think that this is quiet clever: when you use a function only once you don't want to be forced to use the EXIT-key as well but when you use a group of functions often you don't have to select that menu every time.

You could download Free42 to get an idea how it works. And I agree: both are great calculators.

Best regards
Thomas

*Message #12 Posted by **Mike Morrow** on 14 Dec 2010, 12:18 a.m.,*
in response to message #1 by Don Shepherd

Major problems:

(1) It has absolutely unspeakably horrible complex number support, just like the later HP33S and HP35S abominations. It seems to have established HP's paradigm for complex number support on small scientific calculators, very unfortunately. That is a huge disappointment from a scientific calculator that appeared four years after the HP42S and ten years after the HP-15C set the standard for natural complex number handling.
(2) It has an extremely small amount of RAM for a calculator from the mid-1990s...less than the HP-15C of ten years earlier.

One positive: It seems to be about 35 percent faster than the HP42S for problems that it can handle.

I've kept that HP32SII mistake...it's like new today, from lack of use. But I acquired a few HP42S units as soon as possible after the HP32SII disappointment. (Excellent machines in daily use 18 years after they were made.)

in response to message #12 by Mike Morrow

The 42s, offering a convenient subset of the huge 41c system, is well suited to RPN users who want to write their own programs on a pocketable platform. It's deeper than a typical calculator.

The 32sii, on the other hand, fills the role of a traditional calculator, a go-to device for quick calculations with its functions mostly all on the keyboard, but with the capability to go a little deeper with either short programs or solver equations.

So, complex number support aside, the 32sii fills its niche nicely, as many have testified. It ain't a 42s, but not meant to be one.

*Message #14 Posted by **Don Shepherd** on 14 Dec 2010, 12:59 p.m.,*
in response to message #12 by Mike Morrow

Mike, I never use complex numbers, so that is not important to me.

Yes, more memory would be nice, but we can say that (and I think you have) about the 30b too.

I've never had the urge to get a 42s. I know (or have read) it is similar to the 41, but I've never had the urge to get one of those either.

I'd be glad to take that pesky 32sii off your hands for a reasonable price.

:)

Don

I agree about the 33s, but don't think the 35s should be included in the "abominable" group. In my opinion, the 35s implemented a major leap forward regarding complex number support: the inclusion of an "i" key. With a few tweaks it could have been darn near perfect, but even as-is, the 35s does a better job than the 32sii or 33s in handling and calculating with complex numbers.

Mike, can you elaborate on this? What do you like about the 15C that isn't in the 32sii and 35s? What would be your ideal complex number support?

I'm not disagreeing with you, I'm just curious to know what you (and others) think is the right way to handle complex numbers.

One thing I like about the 35s that isn't available on the 15C is the ability to store complex numbers in a register.

Thanks, Dave

Not trying to speak for Mike, but he as already said (many times) - 42s.

This 32sii is great/horrible debate has occurred more times than I can count. It seems to be a perennial topic to liven up the Forum when it gets a little dull. Thanks, Don.

The ability to calculate asin(2). Once you're in complex mode everything just works as expected.

The HP-32SII doesn't claim full support of complex numbers. You may call it clumsy but it may be usefull.

On the 35s a complex data type is supported but it's restricted to certain functions. And that's something I can hardly understamd after having seen what was possible before with the HP-15C or HP-42S.

> Quote:
>

Thomas --

The historical explanation is that the complex-number functions offered by the HP-32S, HP-32SII, HP-33s, and HP-35s seem to have been based upon the set of keystroke programs on the HP-41 Math Pac of 1980 (and on the Advantage Pac of 1985). What was present on the HP-41 Math Pac is present in microcoded form on the latter-day models; and what wasn't, isn't.

The 42s is an abysmal failure as a serious programming device, as it has no I/O.

Perhaps it is the Holy Grail of RPN calculators--but it is certainly *not* the holy grail--not even close--of *programmable* calculators (that would have to go to the 41C of course).

For persons in need of the following:

Complex number calculations, Matrix handling, nested numerical integration and other calculations,

then the 42s is the obvious choice of non-or-limited programmable *calculator*.

For those who need none of those in a *calculator* (that same person may be doing those tasks on a computer) then the 32sii is in fact Superior to the 42s.

And a small subset of historically RPN users actually find the 27s to be the best machine of all--for the 32s utility level. If only I had bought one back when they were new!

Even the $1 walmart job has I/O. Or you're ignoring the HP42S keyboard, display, tone, and IR printer I/O devices. :-)

I've used several HP42S units for the past 15 years, including one that goes where I go daily. Even in the early days when I was experimenting with the debugging/system memory display/execution feature that's provided by the HP42S, I have yet to corrupt memory or cause a memory loss on any HP42S.

It would be great if a modern version of the HP42S had a bigger display, much more RAM, a real-time clock/calendar, financial functions, and a micro-SD card. But I don't think that writing to the SD card would be practical in a device powered by button- or coin-sized primary batteries. I suppose that I could live with a thicker design that used N-cells, as long as the battery compartment was better designed than that of the unfortunate HP-28C/S.

> Quote:
>
> Perhaps it is the Holy Grail of RPN calculators--but it is certainly *not* the holy grail--not even close--of *programmable* calculators (that would have to go to the 41C of course).

I've owned several HP-41C models since it first appeared. I still have a HP-41CX with mag card reader and IR print modules that I bought new in 1984. It's a nice machine, in a third-of-a-century-old-technology sort of way. But for RPN programming, the HP42S is far better human factored for accessing functions, it is much much faster, it presents results with several orders of magnitude better precision and accuracy, its built-in firmware supports many functions that the HP-41C could only be programmed to do slowly and less accurately (including numerical integration, a numerical solver, a complete spectrum of complex number handling and matrix functions), it has IR printer output and a two-line "real" alphanumeric display, it comes with several times more RAM than the HP-41C could ever support, it's smaller, and it's much much more battery frugal.

OTOH, the HP-41CX has the best keyboard feel of any calculator I've ever used. The industrial design isn't bad (better than the Pioneers), except that HP decided to eliminate the classic black/blue HP logo found on earlier models. I won't be getting rid of my HP-41CX in my lifetime, but for actual RPN programming, years ago I converted my HP-41C stuff to run on the HP42S and if I write anything new, it goes on the HP42S.

With respect to the ultimate programmer's calculator (that exists today), I believe that honor clearly and unambiguously falls to the HP50G. This includes TI, Casio, and all other HP competition. The superiority of the hardware of the HP50G by itself (including the SD card and the display clarity) is enough to cause wonder about how, say, the latest TI-89 Titanium Hardware Version 4 would be more attractive to any knowledgeable person. (Now, if only the HP50G had the speed of the HP30b, which is about ten times faster.)

Re: praise for the 32sii

*Message #22 Posted by **bill platt** on 15 Dec 2010, 1:49 p.m.,*
in response to message #21 by Mike Morrow

Although I don't have a 50G, I think I agree with you for the current ultimate. I have 48GX and that is pretty darn close.

I didn't know the 30b was *that* fast. Holy smokes!

I knock on wood for you and your 42s data. I've corrupted data in lots of machines, including voyagers...and a 27S which is of course the 42S predecessor in development (at least by dates on Finseth's hpdatabase).

One interesting development is that if you can accept the "virtualness" of emulators and simulators, the 42s and all the other pioneers can be run on a PC now--or in the 42s case on an iphone/ipodtouche--and in that case, you do actually have back-up!

(But like you, I cannot get past the need to feel the keys under my fingers...)

*Message #24 Posted by **Geoff Quickfall** on 15 Dec 2010, 2:36 p.m.,*
in response to message #1 by Don Shepherd

I like it, but I don't require matrix or complex numbers in my line of work.

I REALLY like it because of the cluttered colourful keyboard ;-) It has a wow factor that the menu calcs do not have. I mean, look at the HP 67 with THREE, count them, THREE function keys.

Yep, the 32Sii is the prettiest, most colorful of the Pioneers and therefore, esthetically my favourite Pioneer. My most useful pioneer is the 42S but that is because it takes up less room and is less prone to ESD then my all time favourite; the 41CX.

*Message #28 Posted by **bill platt** on 15 Dec 2010, 10:57 p.m.,*
in response to message #27 by John B. Smitherman

Voyagers, with landscape, moved to the right and followed the standard Ti arrangement. Then Pioneers continued that. All the previous machines had the HP arrangement with arithmetic on the left.

Re: praise for the 32sii

*Message #29 Posted by **Mike Morrow** on 16 Dec 2010, 12:21 a.m.,*
in response to message #27 by John B. Smitherman

I think that having the +-*/ keys on the right side is actually better from an ergonomic standpoint, if like most one is right handed.

Although putting the ENTER key above the +-*/ keys wasn't possible with the (IMHO terrible) landscape layout of the Voyager experiment, all subsequent models could easily have placed the enter key on the right side too, above the re-located +-*/ keys just like the calculator dieties intended.

It is a horrible ergonomic layout for efficient number entry to have the ENTER key located on the side opposite the +-*/ keys.

At least the HP49G+/HP50G have all these keys on the right (and correct) side, it would be an improvement to place the ENTER key ABOVE the +-*/ keys, instead of below them. And make it wider too!

Yes, the "Link" feature can be utilized to hide a URL if desired, although it can be somewhat of a hassle.

Copying and pasting an unhidden URL into the same window or a new tab is not too difficult.

It IS indeed a hassle for the reader to get to the URL. You must know that. It's a mind-numbingly simple process for one who makes a post to properly reference a URL that can be reached with one click.

Many will not bother finding an improperly posted URL. If one wishes to maximize the probability that someone will look at the URL that one references, then one must use the method that the list provides. Otherwise one says in effect that it's not very important to see, or "I'm too lazy to do the job correctly".

I NEVER look at URLs that are not *properly* included in a posting. I know I'm not alone.

Re: Ebay: Comedy or Tragedy?

*Message #7 Posted by **Bart (UK)** on 13 Dec 2010, 6:50 p.m.,*
in response to message #6 by Mike Morrow

Well I, on the other hand, PREFER to have the whole URL displayed when referencing an eBay item. eBay.com is blocked at my work, but for example eBay.de isn't. So I can take just the item number and search for it. In a hidden "one click" link as above, I now first have to "copy link location" and paste into Notepad, then select the item number to paste into a search box.

HP 41c . don't touch if you don't know

*Message #1 Posted by **aurelio** on 12 Dec 2010, 5:34 p.m.*

Hello and greetings from Italy! happy to be back on this board! I opened today a 41c fullnut calculator which I bought used on e-bay quite an year ago; it has a little problem in displayng the second and third characther from the left of the display: any segment not displayed properly, and changing while pressing on it; at the beginning I tryed to forget this problem and delay the fix of it. Yesterday unfortunately I opened the calculator, thinking to find a bad solder joint between the keyboard printed circuit board and the display board or simply with the purpose of trying to clean the contacts (the battery ones were very clean, I wanted to do something. Well, to replace the black paper cover I disconnected the CPU board form the keyboard.....after that the calculator doesn't work at all!! At the beginning I had a lightly bad working calculator and now the display doesn't show anything more I thought that maybe the CPU board was not touching properly the keyboard printed circuit. there is a connector that never I saw before (two white soft plastic or rubber stripes), I tryed to clean it with alchool (the display at that time was still showing something, when moving the claculator:segments letters and numbers). then I thought to fix it with a small amount of superglue around the bottom screw holes, just to hold the two printed boards in touch, but as I told you The display doesn't still show anything

Anybody who can help me to fix this problem, or, at least to make a diagnostics? PS Luiz, Alberto have you experience with this kind of calculator?

Re: HP 41c . don't touch if you don't know

*Message #2 Posted by **John Robinson** on 12 Dec 2010, 6:08 p.m.,*
in response to message #1 by aurelio

This is probably due to the CPU board not making good contact with the keyboard PCB board. From what you describe the connector strips are the elastomeric kind, which as far as I know were not originally used in the 41c model, but used in later CV and CX models. There is another type of connector which looks like a whole bunch of fine wires wrapped around a kind of flexible clear small plastic sausage, and both sides are joined together by thin clear plastic with two holes for the screw posts. So I'd day those strips have been replaced.

Does your 41c use two nuts on the screw posts to hold the pressure on the connectors ? It is hard to get the pressure correct with the screws, and sometime it might be worth replacing with a short length of soft plastic tubing.

Are all the screw posts in good condition, both top and bottom ones ? If the top screw posts are cracked or broken, this can affect the pressure required for the connection of the flexible PCB which carries power to the keyboard PCB.

Do you have any photos to share ?

Cheers, John

*Message #6 Posted by **Geoff quickfall** on 13 Dec 2010, 6:18 p.m.,*
in response to message #5 by aurelio

It looks like you have at least two cracked posts from your pictures.

The one on the right:

The bottom two posts keep the pcb to keyboard connector compressed and attached. You can clean the zebra strips with alcohol and a lint free cloth. Also clean the contacts on the keyboard pca side and the logic pca side.

top right:

The top two posts connect the Module and power supply to the keyboard pca. The connection should also be cleaned on the keyboard pca and the logic pca.

Repair the posts as indicated in my previous posting, take a look at the link.

ALL these posts must be intact with threads for the calculator to maintain the contacts.

Cheers, Geoff

Re: HP 41c . don't touch if you don't know

*Message #7 Posted by **aurelio** on 13 Dec 2010, 6:57 p.m.,*
in response to message #6 by Geoff quickfall

Thank-you Geoff for your help I'll read carefully your istructions to fix the cracked posts,

I must find silicon tubes (for the card reader I used in the past o-rings, but I think that silicon tube is better, so that I have to find it anyway) and I have to find a plastic piece to shave; I have not any old memory module cover, so that I must find something working in place of that. As I can understand the tube clamps the post and shavings flake mixed with glue rebuild it!!!

So the connector is the mitic zebra one??

thanks again

Edited: 13 Dec 2010, 6:59 p.m.

Re: HP 41c . don't touch if you don't know

*Message #8 Posted by **geoff quickfall** on 13 Dec 2010, 7:28 p.m.,*
in response to message #7 by aurelio

any type of tubing or orings as long as they have a smaller inner diameter then the outer diameter of the post

any hard plastic, scrap from an old calculator or radio or any rigid plastic leftovers.

One of the connectors is the zebra one. The other resides in the module of the loosely attached to the case back. It is the part that contains the battery module contacts and the rom module plugs. You will notice that the contact that meets the keyboard pca is supported by a foam or silicon strip. the silicon strips are good, the foam strip decomposes with time. So fix all the posts and allow to dry at least 24 hours.

Clean the contacts on the module, keyboard pca and the zebra strips. Blow out the dust. Attach both halves of the calculator with the screws, (do not overtighten). If it works don't worry about the foam insert in the module.

let us know how it works and we can take it from there!

Cheers, Geoff

in response to message #9 by aurelio

Looks good so far, did you manage to introduced shaved plastic to the posts.

The glue (sparce amount) is to repair the crack and the shavings introduce new plastic into the tube to replace the plastic removed as the screw stripped the threads.

Make sure you let it dry completely as it looks like there is a liberal amount of glue in each post.

When dry. Just barely screw in a screw with the silicon tubing in place. Then, with a soldering iron (takes a few seconds for the soldering iron to warm the screw), warm the screw. Do not heat the screw so it melts the post, but just enough to soften your glue/heat shaving mixture. Then while the screw is hot, and applying slight downward pressure as you turn it. Screw it into the post about half the length of the screw. Let everything cool, then remove the screw. It will now be set for use with the case back.

So:

```
1 clamp the post with the tubing
2 add glue and shavings.
3 with tubing in place,
  a gently warm the screw (not hot).
  b place the warm crew tip in the post and screw it half way.
  c this has the effect of tapping (adding threads) the post.
4 let cool.
5 remove screw.
6 let assembly sit and cure completely.
7 remove silicon. (if it sticks, use a razor blade to remove it.
```

It is essential that the post be completely cured before you tighten the screws. To tighten the screws:

```
1 place the screw in position.
2 reverse the screw direction (unscrew) until you feel the screw
  seat in the threads.
3 screw in the tightening direction.
4 screw until it just stops and maybe 1/8th of a turn more.
```

Cheers, Geoff

... fortunately lots of good advice from the proffesionals here :)

Re: HP 41c . don't touch if you don't know

*Message #12 Posted by **Alberto Fenini** on 14 Dec 2010, 4:47 p.m.,*
in response to message #1 by aurelio

ciao Aurelio
welcome back
If the Alberto you mentioned was me, here I'm.
Personally I don't like too much the 41 serie, even if I own
the C (fullnut), CV (halfnut), CX (halfnut) and Blanknut.
reason is, when it comes to repair, it's always trouble ....
I have been helped from a very skilled italian collector (Ignazio thanks thanks thanks)
and I have did something myself as well.
When I have had the zebra connector problem, this is what I did :

I usually take a lot of pride in restoring in a nice way, but in the case of the zebra connector .... well, this way works 100%, Geoff forgive me for I have done ...

I also have had a battery connector to restore, and this is what I have done, once again is not "cool" but it works :

http://www.hpmuseum.org/guest/Fenini/p122a.jpg

I think you have had the best suggestion from one of the most skilled in among the forum, Geoff is relly a master for all of us, but in case is should not work out, well, this is a good option too.

If you mess up with the display, well, you should talk to Ignazio.

ciao a tutti, BTW, what part of Italy are you from ? I'm from Milano

*Message #14 Posted by **aurelio** on 15 Dec 2010, 3:50 p.m.,*
in response to message #12 by Alberto Fenini

Ciao Alberto, hello Geoff and thank you both for the help! Yes, Alberto, you are the one I meant in the opening post, I thank you and Luiz again, for the help in fixing a 34C problem. Actually that calculator is stolen in a drawer, waiting for my care but I think to give it soon a new life (!). Actually I prefer older LED calculators to the coconuts, but I love my 41, expecially the 41 (CX) that works very well (halfnut). My first one was a 25c in 1977, still it works very well altough not properly in mint condition (school time was harder than 1000 surveies!!!) Today in the bottom of my briefcase lies a 49+g one, it's really smart and powerful, but compared with its honorable and older grandmas' it looks like a children toy!

Back to the case: I'll try first to apply the Geoff method, then I will consider your advice too "iron solder adventure. Actually I'm not a master in soldering art so that I hope to solve fixing the posts. I live in Savona, if you plane a journey to the sea, give me a call!

Today I bought silicon tubing and liquid cement (the last time I used it was in the assemblyng of an aircraft 30 years ago !) I'm going to start the job!!

Cheers

in response to message #15 by aurelio

Good evening (afternoon overseas)! This first inning was very bad and unsuccesfully, 'cause the rebuild of the two left posts (boottom and top)falided!! maybe lack of flakes (not enough I mean)maybe I did not press them properly inside the hole, really I don't know, so that I've just tryed the second chance, now drying!!

Re: HP 41c . don't touch if you don't know

*Message #17 Posted by **geoff quickfall** on 17 Dec 2010, 3:28 p.m.,*
in response to message #16 by aurelio

Make sure you let the post completely dry.

The tubing seals the and clamps the posts but also does not allow the curing to ocurr quickly. That plus the amount of glue you are appear to be using may prolong the curing process. As the exposed surface of the glue dries it seals the undried glue. This extends the curing process.

Give it sufficient time, maybe two days (48hrs). If you are like me I must have it fixed prior to the repair ;-)

So be patient.

This system fails if the glue and shavings have not bonded correctly to the inside of the post.

Cheers, Geoff

*Message #20 Posted by **Randy** on 24 Dec 2010, 8:51 a.m.,*
in response to message #19 by aurelio

The problem is most likely the pink elastomeric connectors.

They where replaced with the continuous round gold contacts as they proved to be a common failure point. HP always discarded and replaced with the improved part during service. I've seen many a 41 with them that worked until the logic board was removed and re-inserted.

Re: HP 41c . don't touch if you don't know

*Message #21 Posted by **sylvandb** on 25 Dec 2010, 10:49 a.m.,*
in response to message #19 by aurelio

The newly cracked post looks like the glue is not melting the plastic. The added plastic and the post and the remaining glue all seem to be staying separate.

The glue should be a plastic solvent based glue that welds by dissolving the plastic, not a cyanoacrylate and not a two-part resin and hardener (known as epoxy or

perhaps araldite).

However, if you have used a cyanoacrylate glue, the solvent glue will not work very well on the old glue covered pieces and a two-part might be necessary. It is tricky to use as there is not much surface area to glue on the old posts. I have better luck with the slow cure types (hours not minutes) and the more liquid instead of paste or putty types. I usually buy the "J-B Weld" brand. It cures hard enough that it can be drilled, filed, etc.

sdb

*Message #22 Posted by **aurelio** on 26 Dec 2010, 4:23 a.m.,*
in response to message #21 by sylvandb

Hi Sylvan, I used a "Revell" brand liquid cement, that actually is "a plastic solvent based glue that welds by dissolving the plastic". I checked on the web and found "J-B Weld" brand products, but I've not seen any liquid cement or plastic model cement, only two components epossydic glue or other kinds for motors or marine pourposes.....

Last time I left the post drying at least 72 hrs!

First Impression of the New Caso Fx-CG10

*Message #1 Posted by **Namir** on 12 Dec 2010, 1:44 p.m.*

Hi All,

Two weeks ago, I received the new Casio Fc-CG10 color graphics calculator. This machine enhances on previous models, the Casio fx-9860G and the Casio fx-9860GII. The main enhancement, as the brief model name may hint at, is the addition of colors. This new features allows you to plot graphs in colors and even list data by varying the color of each list of columnar data.

Like its predecessors, the CG10 uses an menu of icons and each icon leads to a multilevel set of menus. The Exit button serves to go up one level and you get used using the Exit key very quickly.

The calculator supports lists and matrices. You can have up to 26 numbered lists (1 to 26). Also you can store up to six sets of lists internally. The CG10 supports up to 26 matrices, named A to Z.

From programming aspect, the CG10 supports programs only. You can have a program call another as a subroutine. There are no parameters. The single-letter variables, 26 lists, and 26 matrices are accessible to all programs. So the programming model kind of resembles programming in GW-BASIC minus the line numbers. The CG10 supports For-Next loops, While loops, Do-While loops, IF-ELSE-THEN constructs, GOTO and labels, and also the ISZ and DSZ statements. The ISZ and DSZ statements will skip the next statement if the targeted counter (a variable) is zero. In addition to numeric variables, the CG10 programming commands also support a descent set of string operations.

I wrote a few programs to solve for the root of an equation, calculate the square root using Newton's method, and perform multiple linear regression. Emulating functions by calling subroutines was basically programming with a global-only scope of data. You have to choose your variables carefully. The CG10 supports user prompt input and display output statements. The regression program exercised common matrix operations line transpose, invert, and multiply. As I worked with that program I realized it was easier to separately enter the matrices using the matrix editor and then run the program (especially for the sake of debugging and learning how to navigate with the CG10 commands). As I dug into the list of CG10 commands I was able to edit the regression program and make it run smoother and make it easier to use.

The CG10 aalso supports spreadsheets that accepts numeric input or use formulas to calculate the contents of a cell.

The Csaio Fx-CG10 calculator comes with a CD. You can load the Screen Receiver program. When you plug in the USB cable into the calculator and PC, you get a menu giving you options for how to proceed. I used the USB option to have the laptop view the Casio as a drive. This allows me to browse through the different folders and see the various data, graphics, and program files. You can backup these files into your PC. I was able to copy a CSV (Comma-Separated Values) file from the PC into the CG10 and then read that file as a set of list and also as a single matrix. This means that you can start with data in Excel, save the data as a CSV file, and then read it into the Casio. Using the lists you can then perform single or double variable statistics and regression (you can do linear and polynomial regression, sinusoidal, and other types of regressions).

If you choose the screen receiver option while connected to the PC and while running the Screen Receiver software on the PC, then the PC will echo the screen that appears on the CG10. You can then capture screen to your heart's

contents. The software does other things, but I only focused on screen capture in my brief overview of the CG10.

Overall the Casio FX-CG10 is a nice machine with nice computing power. The programming features are OK--not too bad and not spectacular. The ability to connect to a PC and swap data is nice (and is also supported by programmable commands!).

in response to message #3 by Namir

One thing that isn't clear to me from the manual is whether you can put your own pictures onto it, or whether you are stuck with pictures that Casio supply. The picture format is something like .g3p, which I haven't come across elsewhere. Do you yet know whether adding your own pictures is possible?

Nigel

*Message #5 Posted by **Marcus von Cube, Germany** on 12 Dec 2010, 2:33 p.m.,*
in response to message #1 by Namir

I haven't seen the machine yet but what you explain about the Casio programming language resembles very much the legacy of the earlier models.

What Casio always messes up between generations of graphics calculators is communication. It's neither reliable nor comfortable nor compatible. The Classpad can't read fx-9860G files and cannot be connected directly to it despite the presence of a three pin port on both machines. The first generation machines (CFX-9800G for example) can only talk to the PC via the unreliable 16 bit program FA-121. No way to communicate between a CFX-9800G and its successor CFX-9850G. Why? Import of first generation *.cas files in the newer comm software works but is one way and well hidden. Neither can an Algebra FX 2.0 communicate with a fx-9680G because of a different baudrate. *FA-124, the PC software, regularly fails in saving data from the Algebra FX 2.0 calculator. {EDIT: FA-124 didn't like my combination Casio RS232*

cable-prolific USB adaptor. A pure USB cable (by Yellow Computing, Germany) works better.} As said before, a total mess.

What you explain about the new CG10 seems to follow the same rules. You're even left without a comfortable way to edit programs on the PC. Can a fx-CG10 talk to a fx-9860 or a Classpad? I doubt it.

Marcus

*Message #6 Posted by **Namir** on 12 Dec 2010, 3:46 p.m.,*
in response to message #5 by Marcus von Cube, Germany

I don't get the impression from the documentation and the connection interface that you can communicate between the CG10 and any other different model. The machine came with a cable that looks like you can connect two CG10 machines.

According to the documentation, you **can** edit a program on your PC, but you have to follow closely the conversion table listed that shows how math symbols, special symbols, and Greek letters translate into plain text. It seems to me that typing a program on the machine is the easier choice.

Re: First Impression of the New Caso Fx-CG10

*Message #7 Posted by **Marcus von Cube, Germany** on 12 Dec 2010, 4:00 p.m.,*
in response to message #6 by Namir

So they implemented the escape syntax used in their transfer software on the calculator platform instead. Thats a possible way to go but a specialized editor makes life easier. It might be possible to implement such a software in Java to make it platform independent. Unicode should provide the symbols needed but you need the right fonts installed.

Where did you get your sample from and at what price?

Re: First Impression of the New Caso Fx-CG10

*Message #8 Posted by **Katie Wasserman** on 12 Dec 2010, 5:21 p.m.,*
in response to message #6 by Namir

Namir,

I read the manual on the fx-CG10 and saw that the functions are almost identical to the fx9860g family with the addition of color, a better PC-based editor, built-in metric conversions and a few other things. What they don't mention in the manual is anything about speed. Is it any faster than say the fx-9860gii in native mode?

Re: First Impression of the New Caso Fx-CG10

*Message #9 Posted by **Namir** on 12 Dec 2010, 7:40 p.m.,*
in response to message #8 by Katie Wasserman

Katie,

I got an fx-9860gii SD version but I have not opened yet to compare it with the CG10.

I am not surprised that the CG10's programming commands are a somewhat modest superset of the fx-9860gii.

Re: First Impression of the New Caso Fx-CG10

*Message #10 Posted by **Marcus von Cube, Germany** on 13 Dec 2010, 7:39 a.m.,*
in response to message #9 by Namir

Speed comparison can be done by playing around with the dynamic graph feature. All pictures are precomputed before the animation starts. This takes considerable time. OTAH, this is very much dependent on the screen resolution. The 2nd generation calcs have a screen of 128x64 pixels (127x63 are used by the graphics.) What does the CG10 provide?

Edit: I've just stumbled across the manual. Screen resolution is roughly 9x the 128x64 of the older models (3x in each direction). But user memory is just the same 64KB as its predecessors if I understand the comparison sheet correctly. Here is the info: http://edu.casio.com/products/cg_series/fxcg10_20/. The calc has a 3pin port which is compatible with the older calculators (fx-7400G+ onwards).

Some comments:

> Quote:
>
> Speed comparison can be done by playing around with the dynamic graph feature.

I guess so, but I'm more interested in the speed of programs. A simple FOR-NEXT loop would likely be a good enough comparison since they apparently made minimal changes to the programing language.

The manual states that you can use the built in images or download additional content from the Casio website, it makes no mention of being able to import your own image (g3p, g3b) files. I'll guess that someone will figure out the format of those sooner or later and it will become possible to download your own images.

The manual provides a detailed description of what data/programs can be transferred back and forth between the CG-10/20 and earlier models which include the 9860 series, 9850, 9750 and 7400.

Screen resolution is indeed much greater on the CG-10 than previous models. You can now plot points in a 187 x 379 area (almost 1/4 VGA). However, you're still limited to 7 lines of 21 characters of text, very disturbing.

*Message #19 Posted by **Don Shepherd** on 15 Dec 2010, 8:32 a.m.,*
in response to message #18 by Marcus von Cube, Germany

Yeah, this is what I used. It is a slight modification from the example program shown in the Prizm (and 9860g slim) manual:

```
ClrText
"Input Number"?-->A
2-->B:1-->C
Do
While Frac (A/B)=0
B trianglesymbol
A/B-->A
WhileEnd
B+C-->B:2-->C
LpWhile BxB<=A
If A =/= 1:Then A trianglesymbol
IfEnd
"END"

where --> is the right-arrow "assign to" symbol
and trianglesymbol is Casio's funky output symbol
```

in response to message #15 by Don Shepherd

Hi Don,

on my OS 2.0 fx-9860G Slim I get 9 seconds, not six. Do you still have the older OS on your machine? I'll have to test on my other Casios when I'm back from holidays.

Re: First Impression of the New Casio Fx-CG10

*Message #21 Posted by **Donald Williams** on 17 Dec 2010, 11:55 a.m.,*
in response to message #20 by Marcus von Cube, Germany

It is certainly true that VER 2.0 is much slower than VER 1.0, but I cannot determine exactly why that is so. This upgrade added a lot of features, see here

I can only imagine that the large difference in the speed of operations is somehow related to complex number support. Pure speculation on my part though.

Re: First Impression of the New Casio Fx-CG10

*Message #22 Posted by **Don Shepherd** on 17 Dec 2010, 12:07 p.m.,*
in response to message #20 by Marcus von Cube, Germany

Yeah, I'm still running OS 1 on my slim. Katie said that OS 2 is slower, I guess that explains the time difference.

Sometimes older is better (or at least faster!).

Don

If you have a program you developed on the calculator and you want to edit it on the PC, you must first SAVE AS a .txt file on the calculator. That's easy. Then, when you connect to the PC via the USB cable, the contents of the calculator memory shows up just like on a USB drive, and you don't need any special software installed on your PC to do this; that's nice. You can use Notepad to edit the .txt file. And, yes, you must be careful to use the right character combinations for the special symbols in your program, such as "Disps" for the funky triangle output symbol, and "(CR)" for a carriage return, and "->" for the assignment arrow. That will take some getting used to, but if you do it enough you will remember them. Then, when you terminate the USB connection, the updated .txt file is written back to the calculator memory and the program is automatically updated from the .txt file. It's somewhat labor intensive, but it does work.

Overall, this is much better than the Casio FA-124 software from before, which I never could figure out, frankly. But it is much more work than updating TI-BASIC programs on a PC for the TI-8x series, where the special characters are handled in a much better way and you can check syntax on the PC prior to downloading to the TI calc. Let's hope Casio develops something better in the future for those who want to write programs for this calc.

To answer my own question:

> Quote:
>
> Can a fx-CG10 talk to a fx-9860 or a Classpad? I doubt it.

Yes it can without any hazzle. This time I'm a bit impressed. ;) With the 3 pin cable, you can link the Prizm to a fx-9860G (OS 2.0) and move back and forth programs, graph data (even dyna graph data from the CG10 to the 9860, the precomputed images are discarded but the setup is preserved.)

Next thing I have to try is connecting the Prizm through FA-124. USB will not work, but probably my 3 pin USB cable will.

Here is a sample animation I wrote for the fx-9860G. The code here was transferred to the Prizm, converted to TXT format (SAVE-AS) and then transferred to the PC:

```
'ProgramMode:RUN
ClrGraph
ViewWindow (-)5,5,1,(-)6,4.1,1
Y=Type
"1/X*(1-_cos _A)*(.5-(A>2_pi_))+(X_^2_-4)(1+_cos _A)*(.5-(A>_pi_)*(A<3_pi_))"->GraphY7
D SelOn 7
"_(-)_1/X*(1-_cos _A)*(.5-(A>2_pi_))-(X_^2_-4)(1+_cos _A)*(.5-(A>_pi_)*(A<3_pi_))"-
>GraphY8
D SelOn 8
D Var A
0->D Start
2pi->D End
pi/4->D pitch
DrawDyna
```

Since the functions are stored as strings, tokens like 'cos' are escaped: '_cos _'. This is only done in strings, not in normal code.

Re: First Impression of the New Caso Fx-CG10

*Message #25 Posted by **Don Shepherd** on 27 Dec 2010, 12:09 p.m.,*

> Next thing I have to try is connecting the Prizm through FA-124. USB will not work, but probably my 3 pin USB cable will.

Marcus, I could never understand that FA-124 thing with my fxCG9860g slim, but I could easily connect the Prizm to my PC with the supplied USB cable. The Prizm essentially shows up as a disk drive, and after connecting you can edit any of your programs (you have to save them on the calc first using "save as" which saves them as an invisible .txt file). When you click the icon at the bottom right (on the PC) to "disconnect USB device", it automatically updates calculator memory and compiles any .txt program into the real program.

I also found that, on the calc, when you "reset main memory", it does not delete the .txt program files, because the next time you connect to the PC the .txt files are still there in the PROGRAMS folder, which is rather convenient. If you really want to get rid of the .txt files on the calc you would have to

remove them from the PROGRAMS folder after connecting to the PC, then they will be gone from the calc as well once you disconnect the USB connection.

I find this USB connection, which does not require any Casio software on your PC, to be great. As I said, I gave up on that FA-124 thing, just too confusing.

I haven't decided yet if I will buy a Prizm (I have one for 30 days through the teacher loaner program). That color screen is very nice!

Don

*Message #26 Posted by **Marcus von Cube, Germany** on 27 Dec 2010, 4:12 p.m.,*
in response to message #25 by Don Shepherd

The USB connection works flawlessly with my Mac. That's a real advantage over the Win only implementations "of old". I used the "save as" feature to present the little program in my previous post. One time, I'll probably write a comfortable editor for the internal files of type g3m that show up on the connected device.

What made me smile is the ability to connect the Prizm to the older devices. I've yet to test with some older implementations like the fx-7400+ or the CFG-9850G. Transferring files back from the Prizm to the fx-9860G is also on my to do list. They probably did it right this time. :)

ILXA ROM for HP-41

*Message #1 Posted by **Jeff Davis** on 12 Dec 2010, 12:25 p.m.*

Does anyone have any documentation for the ILXA ROM? Please let me know.

Thanks, Jeff

Re: ILXA ROM for HP-41

*Message #2 Posted by **Raymond Del Tondo** on 12 Dec 2010, 3:25 p.m.,*
in response to message #1 by Jeff Davis

Yes, I may have some info about that ROM, since I compiled it;-)

The base was the Extended IL, enriched with some functions of the Extended I/O ,
and two custom functions for XMem <-> IL mass storage forth and back transfer.

However I strongly suggest getting and using the Extended IL+ ROM (CK1C) published by Christoph Klug, which is basd on the ILXA, and which contains nearly the same base IL functions, but some more functions covering a wider range of topics.

Raymond

*Message #10 Posted by **Ángel Martin** on 13 Dec 2010, 1:42 a.m.,*
in response to message #2 by Raymond Del Tondo

Is the ROM image available somewhere (TOS?) or is this the "last commercially sold item" perhaps?

Re: ILXA ROM for HP-41

*Message #11 Posted by **Raymond Del Tondo** on 13 Dec 2010, 4:30 a.m.,*
in response to message #10 by Ángel Martin

I uploaded the ILXA to TOS a few years ago.
The Ext IL+ however, is distributed by Christoph as part of his valuable book (IL 2000 Interface System / I/O board), which every serious HP-41 fan should have.
The book is sold commercially, not the ROM, which is a giveaway accompanying the book, and the

book is worth every cent.

in response to message #11 by Raymond Del Tondo

I bought the IL2000 book some years back and the ROM was not included at that point. Maybe it has changed.

Re: EXT-IL-PLUS ROM for HP-41

*Message #13 Posted by **Christoph Klug** on 14 Dec 2010, 1:38 p.m.,*
in response to message #11 by Raymond Del Tondo

Dear HP-41 enthusiasts,

nice to detect your interest about the EXT-IL-PLUS ROM. As Raymond describes correctly - this ROM is a free of cost giveaway for my two books printed in one voluminous book = "HP-41 Input Output Board" & "IL2000 Interface System".

This reference book for today HP-41 enthusiasts describes mass storage-, data logger-, measurement-, interface- and control- applications beside working with different RAM-Box solutions and ROM Image Files.

The details and software example routines about the EXT-IL-PLUS ROM you find in an own chapter: This ROM includes features from the well known EXT-IL-ROM plus additional Autostart&DUP features, plus advanced functions for working with RAM Box solutions, and some more missing functions...

In Germany you get the book by ebay or from your local book shop. For interested readers in the whole world I offer a special transfer solution to their home address.

With best regards - Christoph Klug

HMS+, HMS-, HMS, HR: LEX files

*Message #1 Posted by **geoff quickfall** on 12 Dec 2010, 2:04 a.m.*

Playing with my 71B and have written a few programs for it. I am however looking for an augment in the form of a lex command. After searching I found a 2003 thread:

2003 thread link

In it the following lex program is listed;

hmslexp.lex_____(hms+, hms-, hms, hr) or HMSLEX2

A few questions,

```
a) anyone familiar with it?

b) anyone have a text copy of it they can send to me (I have the
   makelex installed)?

c) does one actually invoke the functions with a descrete command
   in the program listing similar to:

   i  HMS(H1,H2)  take a decimal time in H1 and convert it to a
      sexidecimal time in H2.
   ii HR(H1,H2)   take the sexidecimal time in H1 and convert it
      to a decimal time in H2
```

Cheers, Geoff

Edited: 12 Dec 2010, 2:07 a.m.

Re: HMS+, HMS-, HMS, HR: LEX files

*Message #2 Posted by **HrastProgrammer** on 12 Dec 2010, 3:01 a.m.,*
in response to message #1 by geoff quickfall

You can find those LEX files in CHHU archives:

ftp://ftp.hpmuseum.org/hpswap/

HMSLEXP is in CHHU05.GZ ...

Thanks, and the next question is...

*Message #3 Posted by **Geoff Quickfall** on 12 Dec 2010, 3:52 p.m.,*
in response to message #2 by HrastProgrammer

I would like to see the actual file in print, allowing me to input it manually.

OR

How does one without UNIX (using Windows XP) open up a .lif and view it. Does it require an 71B emulator? If so, and being extremely lazy on a Sunday afternoon, does anyone have a step by step method? ?

right now I am using sub routines HMS and HR which I call and convert the sexidecimal to decimal and back again. This is cumbersome and an addition of lex commands would make programming easier.

If anyone actually has the numeric display file available that would be appreciated other wise another day learning another emulator. When will it ever stop

d:-0

so today off to J-Fs site to learn about EMU71! I see another reason to get my pil-box up and running. Looks like my free time is now not so free.

Still, if anyone has a printed copy of the lex file it would get my programing running today!!??

*Message #3 Posted by **Jean-Michel** on 13 Dec 2010, 5:36 p.m.,*
in response to message #1 by Egan Ford

Hello Egan,

Thank you very much for sharing this. Very much appreciated.

I am very sad to know that Spaces Shuttles I have seen taking off since the very beginning when I was adolescent will soon stop to do, and more to say, without being replaced by any transportation system having a similar fascinating power.

I think that a major chapter of space exploration has ended. We are loosing all what made us dream: Concorde, Space Shuttles, ... and in another way, fascinating RPN calculators as the 41C was.

This is just my own opinion, and I would be pleased to have yours (You, Egan, and some other nostalgic people)

Kind regards.

JML

*Message #4 Posted by **Dan W** on 13 Dec 2010, 9:21 p.m.,*
in response to message #1 by Egan Ford

Spent 10 years of my life on that program. It has to come to an end of course as all things do, but the really sad part is there isn't any replacement coming soon, and the sadder part is no one seems to care anymore about such adventure.

At any rate, I can say my HP-42S played a crucial role in designing one of the Shuttle ascent/abort guidance algorithms.

November 2010 Issue of HP Solve is out!!!

*Message #1 Posted by **Namir** on 10 Dec 2010, 3:08 p.m.*

Hi All,

The wait is over! HP has posted online the November 2010 issue of HP Solve. I was happy to see my article on the PROOT function for the HP-50G appear!!! Hopefully future articles will bring you more on the subject.

Enjoy!!!

Namir

Re: November 2010 Issue of HP Solve is out!!!

*Message #2 Posted by **Geoff Quickfall** on 10 Dec 2010, 8:29 p.m.,*
in response to message #1 by Namir

Good work to Richard for creating and editing the journal. Many, many thanks!

Namir,

Got to get out my advanced calculus and math dictionary and then purchase a 50g and then try to understand. But really, good article.

And the next time I see Mark, I can put two and two together! By the way Mark, when does 50 calculators not equal a collection? Also thanks again to Jake for more HP input from a veteran.

Cheers and Merry Christmas

Re: November 2010 Issue of HP Solve is out!!!

*Message #3 Posted by **Namir** on 11 Dec 2010, 8:49 a.m.,*
in response to message #2 by Geoff Quickfall

This article, and subsequent ones in the HP Solve newsletter, came as a fruit of studying the various algorithms AND approaches for solving the roots of polynomials. The duplication (or multiplicity) of roots is the worst enemy of many algorithms. The best approach to handle duplicate roots (and you can have several ones too, to make things worse) is to reduce the original polynomial to a simpler form where the duplicate roots are removed. Once you do this then you are pretty much set.

Calculating the roots of polynomials fall into two approaches: sequential and parallel (i.e. simultaneous). The latter work well because you avoid the deflation of polynomial required by the sequential methods (which typically causes round-off errors). The enemy of methods that calculate roots simultaneously is duplicate roots!!

Regarding duplicate roots, I have not seem many polynomials in real-life applications that have (a high number of) duplicate roots. So when solving polynomials in engineering and scientific applications, you

should be fine with using most root-seeking algorithms.

Namir

in response to message #1 by Namir

Link to list of HP Solve newsletters

The "November 2010" issue is a 5+ MB, 46-page PDF.

Regarding "The PROOT Gem":

> Quote:
>
> *The advent of the HP-48GX/G+/G family of calculators introduced a new function PROOT that replaced the Solver when dealing with polynomials.*

It should be mentioned that the PROOT function debuted ten years earlier on the HP-71B Math Pac, not on the HP-48G series. However, HP-71B's and their accessories are in very limited supply nowadays.

-- Karl

Edited: 11 Dec 2010, 6:50 p.m.

Lucky for us who have them :)

Re: LINK: HP Solve newsletter

*Message #11 Posted by **Namir** on 12 Dec 2010, 1:41 a.m.,*
in response to message #9 by Karl Schneider

There is going to be an upcoming article about the PROOT in the HP71B. It was limited to real-coefficient polynomials. You can use the EMU71 to test the Math ROM PROOT function because the emulator also supports the Math ROW software (available in a link from the emu71 web site)

So stay tuned!

Namir

Edited: 12 Dec 2010, 8:27 a.m. after one or more responses were posted

HP-71B Math Pac: PROOT and other limitations

*Message #12 Posted by **Karl Schneider** on 12 Dec 2010, 7:27 a.m.,*
in response to message #11 by Namir

> Quote:

> .. PROOT in the HP71B .. was limited to real-coefficient polynomials ..

The HP-71B Math Pac routines for the Saturn microprocessor were an initial effort whose complex-number support hadn't reached full development. A more curious limitation is that the inverse functions of trigonometrics and hyperbolics -- ASIN, ACOS, ATAN, ASINH, ACOSH, and ATANH -- did not include complex numbers in their domains or ranges.

Trigonometrics and their inverses were built into the HP-71B for real-valued numbers only. Hyperbolics with domain and range both real and complex, as well as extension of trigonometrics to the complex domain and range, were added by the HP-71B Math Pac. In this way, its functionality went somewhat beyond the keystroke routines of the HP-41 Math ROM, which did not offer complex-number support for the hyperbolic functions.

Didn't the HP-48S series have PROOT in some form -- either the HP-71B Math Pac version or the HP-48G version?

-- Karl

Edited: 12 Dec 2010, 7:54 a.m.

Re: HP-71B Math Pac: PROOT and other limitations

My HP48SX, ROM version E, does not have a PROOT function. I suspect no HP48S did.

Re: HP-71B Math Pac: PROOT and other limitations

*Message #14 Posted by **Didier Lachieze** on 13 Dec 2010, 12:49 a.m.,*
in response to message #13 by Mike Morrow

The HP-71B PROOT function was made available as an HP 48S/SX object by Bill Wickes in 1992:

"The HP 48 object listed below in ->ASC form is a high-performance polynomial root finder. Those of you who remember the HP 71B Math Pac will recognize this as the same as the PROOT command from that Pac; it is in fact the same assembly-language code, given an RPL front end to operate in the HP 48."

Polynomial Rootfinder repost - comp.sys.hp48
PROOT on hpcalc.org

Re: HP-71B Math Pac: PROOT and other limitations

*Message #15 Posted by **Namir** on 13 Dec 2010, 9:59 a.m.,*
in response to message #14 by Didier Lachieze

I see Wickes offered the PROOT object as a software object and not built-in as is the case with the HP-48G/G+/GX/GII/GII+ and the HP-50G.

HP 15C

*Message #1 Posted by **Robert Love** on 9 Dec 2010, 2:21 p.m.*

On 24 Nov I dumped a glass of orange juice on my HP 15C calculator.

I contacted the HP Calculator Care Forum asking for the address of a service center that can repair any damage since the address in the owners manual (Corvallis, OR) no longer worked.

As is typical of all HP customer care these days, I have heard nothing in reply.

I rinsed the calculator off immediately with water and dried the keyboard as best I could. No liquid entered the battery compartment.

Questions: 1. How much damage did I likely do? 2. Will the barrier under the keypad remain in tact? 3. Where can I send the calculator for service and cleaning?

Thanks for any help.

Robert love

Re: HP 15C

*Message #2 Posted by **bill platt** on 9 Dec 2010, 2:45 p.m.,*
in response to message #1 by Robert Love

1. I hope you took the batteries out and kept them out.

2. If you look in the archives--or maybe even in the articles--you can see discussions of cleaning. One surprising idea is to immerse the whole machine--without the batteries--in clean warm water and soak thoroughly. Then, you dry thoroughly for a week, with some forced warm air. Apparently, electronics get washed all the time in the factory.

You might find these discussions posted by by Randy.

Re: HP 15C

*Message #3 Posted by **Michel Beaulieu** on 9 Dec 2010, 3:28 p.m.,*
in response to message #2 by bill platt

As Bill wrote, you should completely immerse the calculator in warm soaky water for some time and then rince with distillated water. But you hsould open the back cover before for easier drying and cleaning. I ofen soak old tube radio board before woorking on it. It is very important to let the electronic dry near a source of heat (not to hot)for several days. If you have an air compressor you could also remove the excess of water around keys spacing on the keyboard. Pay attention not to be to close as you can damage the keys with too much air pressure. i always clean my PC keyboard this way after soaking them. Good luck!

Re: HP 15C

*Message #4 Posted by **Michael Meyer** on 9 Dec 2010, 5:41 p.m.,*
in response to message #3 by Michel Beaulieu

I dry all of my electronics on a floor air register. If you have a forced air heating or cooling system and can leave it turned with the fan on, it creates the perfect environment to dry this stuff out from minutes to days (for your 15C).

Re: HP 15C

*Message #5 Posted by **Katie Wasserman** on 9 Dec 2010, 9:02 p.m.,*
in response to message #4 by Michael Meyer

> Quote:

> I dry all of my electronics on a floor air register.

You have a routine for drying off electronics? Are you really accident prone or just living in a really wet climate? :)

-Katie

p.s. It's a good tip, I've done this too, but just once!

Re: HP 15C

*Message #6 Posted by **Michael Meyer** on 9 Dec 2010, 9:26 p.m.,*
in response to message #5 by Katie Wasserman

I try to disassemble and clean and reassemble every HP I restore. It makes sure everything is clean and as free of corrosives as possible...and I can't stand dirty keyboards and dirty buttons. Most parts end up in the sink for a good scrubbing, then a good drying before reassembly. I use a big food strainer and make sure the drain has one as well... I don't want to lose any buttons!

It's a bit compulsive, but the end result is beautiful HP's! (I don't do this to Voyagers or Pioneers, of course.)

Re: HP 15C

*Message #7 Posted by **db (martinez, ca.)** on 10 Dec 2010, 11:51 a.m.,*

So; is OCD in the restoration of old hp calculators *not* a disease? This would be good news for me.

Re: HP 15C

*Message #8 Posted by **Michael Meyer** on 10 Dec 2010, 1:20 p.m.,*
in response to message #7 by db (martinez, ca.)

Well... then I have good news! For OCD to be considered a disease, it has to be intrusive and has to disrupt your life. Being compulsive about doing a single activity right doesn't QUITE meet the definition. Now, if I spent all day worrying that I hadn't done it quite right; intrusive thoughts that I had somehow not cleaned that HP-45 well enough... then that would count.

Re: HP 15C

*Message #9 Posted by **uhmgawa** on 9 Dec 2010, 7:18 p.m.,*
in response to message #1 by Robert Love

Quote:

On 24 Nov I dumped a glass of orange juice on my HP 15C calculator.

We've all had days like that.

Quote:

I rinsed the calculator off immediately with water and dried the keyboard as best I could. No liquid entered the battery compartment.

The battery compartment is the least concern of the incident. It is easily cleaned and even dried OJ is unlikely to cause conduction issues although it will make somewhat of a mess.

Quote:

Questions: 1. How much damage did I likely do?

Likely little to none, qualified with the points below.

Quote:

2. Will the barrier under the keypad remain in tact?

The rubber sheet under the keyboard is a dust shield. The adhesive film bonding the snap domes during manufacture is more/less a liquid barrier. However both are perforated via the enclosure pcb mount heat stakes, which although set under heat/pressure, really don't create a liquid tight seal. Also neither rubber sheet nor adhesive film fully wrap the keyboard so it is possible for liquid seep through.

An easier way for liquid to enter the switch matrix is through the pcb bottom as each dome has a large through via which serves in part as a dome vent. This invites contamination into the exact location where it can do the most damage and is most difficult to remove. This is one reason I'd strongly caution against wholesale dunking a voyager in water in an attempt to flush it out. The inside of the case can accumulate a fair collection of fine dust which can be carried into the dome vent vias by the flush attempt. If it really needed to be flushed I'd remove the enclosure bottom, vacuum off the pcb, flush cautiously while keeping anything from entering the vent vias, and vacuum off the excess flush solution before allowing to air dry. Dust will still be sitting on the upper rubber membrane so it is still possible to dislodge this into unwanted areas.

Quote:

3. Where can I send the calculator for service and cleaning?

The right way to clean this also the most involved as the heat stake heads must be cut and pcb removed. If contamination has entered under the domes, the adhesive film must be removed such that domes and pcb lands can be cleaned. The downside is you'll need to replace the adhesive film and recast the heat stake heads. If digging down this far I'd label the snap dome strips before pulling them out of their known configuration. Doing so you can swap/rotate them to wear level the domes. IOW swap the domes corresponding to the original enter, +, -, x, ON, etc.. keys with those of lower usage keys.

After you've given it the warm soapy water treatment, you might consider rinsing or submerging it in rubbing alcohol. The alcohol evaporates much faster than water.

WARNING: I haven't actually tried this. If anyone knows that this is bad idea, please correct me.

Dave

leaving the display submerged in alcohol overnight can fog the surface of the clear outer protective lens. little droplets of it in tight places will not air-dry very quickly. alcohol is a great cleaner but it should not be the last thing to rinse with.

That's a good point. There is no seal between the LCD glass polarizer and the outer protective window. Anything seeping in between is likely to usher in loose debris and at least leave a watermark. I suppose one can always try and see what happens. But worse case is you'll need to cut the abs heat stakes and remove the pcb to gain cleaning access for anything after the 23xx s/n voyagers.

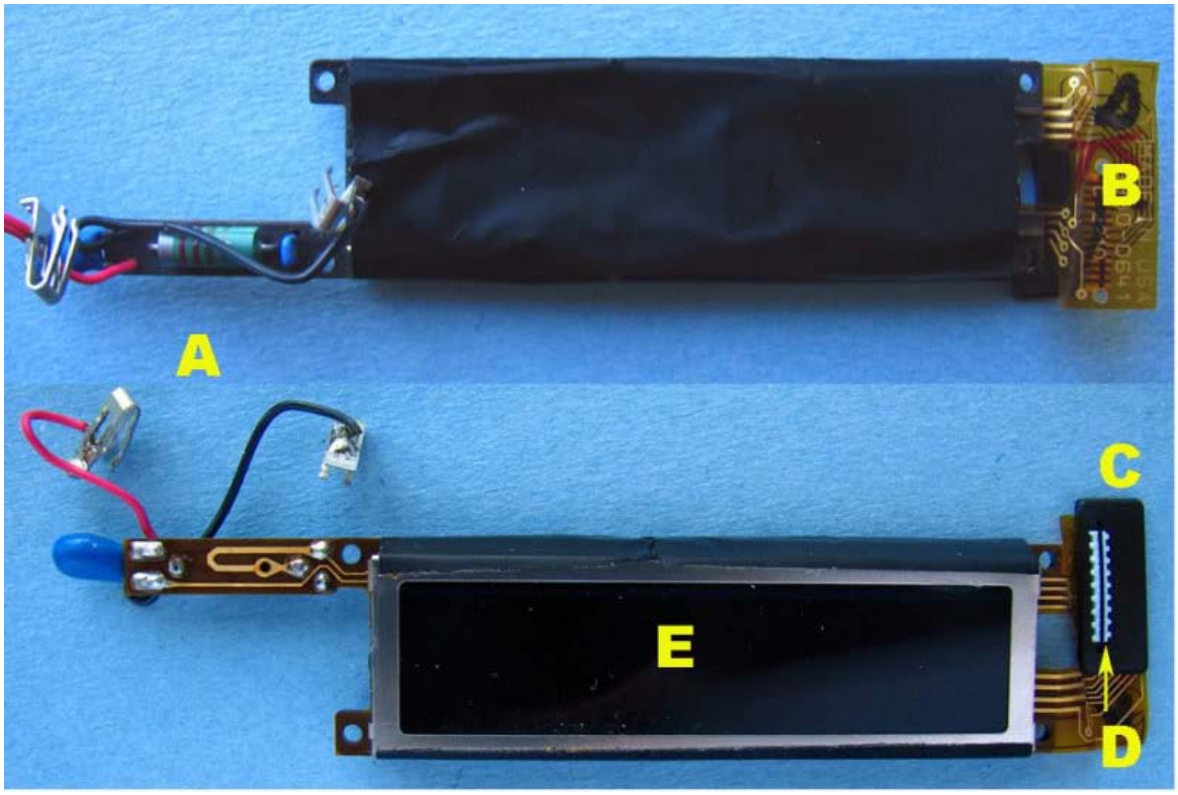
Okay, good advice from all,

The sugars from the OJ will change the resistance on all contacts and especially at minute solder points such as the ICs. Because OJ is water and fruit sugar, water is a good solvent. If some oil or oil based product was spilt then a mild solvent would be required.

Washing is good, HOWEVER, if the LCD panel is clear of any debris or OJ AND it is not the older removable type then immerse the HP 15C in a bowl of water with the LCD panel above the level of the water.

an example of the removable older display.



Remove the back and the batteries.

open up the antistatic wrap (if present),

Start with luke warm water with a drop of liquid detergent and suspend the calculator LCD above the level of the water. Allow to soak for a few minutes. You could agitate the calc while keeping the LCD clear of the liquid.

Next rinse the calculator by immersing the calc in a bowl of water only. Again agitate the calculator while keeping the LCD display clear of the water.

At this point you can rinse with 90% denatured alcohol or rubbing alcohol. This will speed up the drying in the next step but it is not necessary. Again, do not introduce any liquid, be it alcohol, OJ or water to the LCD as it will leave watermarks.

Shake the excess water from the calculator or use a can of air or a photography lens blower:

The drying process. Got a hair dryer with a cold air setting?
Then take a shoe box, cut a hole in one end and at the top.
Insert the dryer into the lower hole as seen in the pictures below.

drying box open:

drying box closed:

Under no circustances should the hair dryer be set for heat. I did that and shocked myself when the HP15C LCD was pure black. After cooling it went clear and suffered no permanent damage (PURELY LUCKY).

Be patient with the drying process. Re-assemble the calc and tell us how it went.

Geoff

Unless contamination actually entered under the snap domes and the goal was to flush it out, I'd be quite leery about allowing a solution to seep into the dome matrix in any scenario. While one could plug the vias temporarily with a dab of hot glue, the dome matrix itself isn't sealed against a prospective submersion into liquid.

Re: HP 15C
*Message #17 Posted by **geoff quickfall** on 11 Dec 2010, 1:49 a.m.,*
in response to message #16 by uhmgawa

I agree, if the contamination was strictly located on the keyboard side of the snap domes and had not seeped into the domes

I am assuming the worst case scenario; that the orange juice (how much for how long) has seeped in.

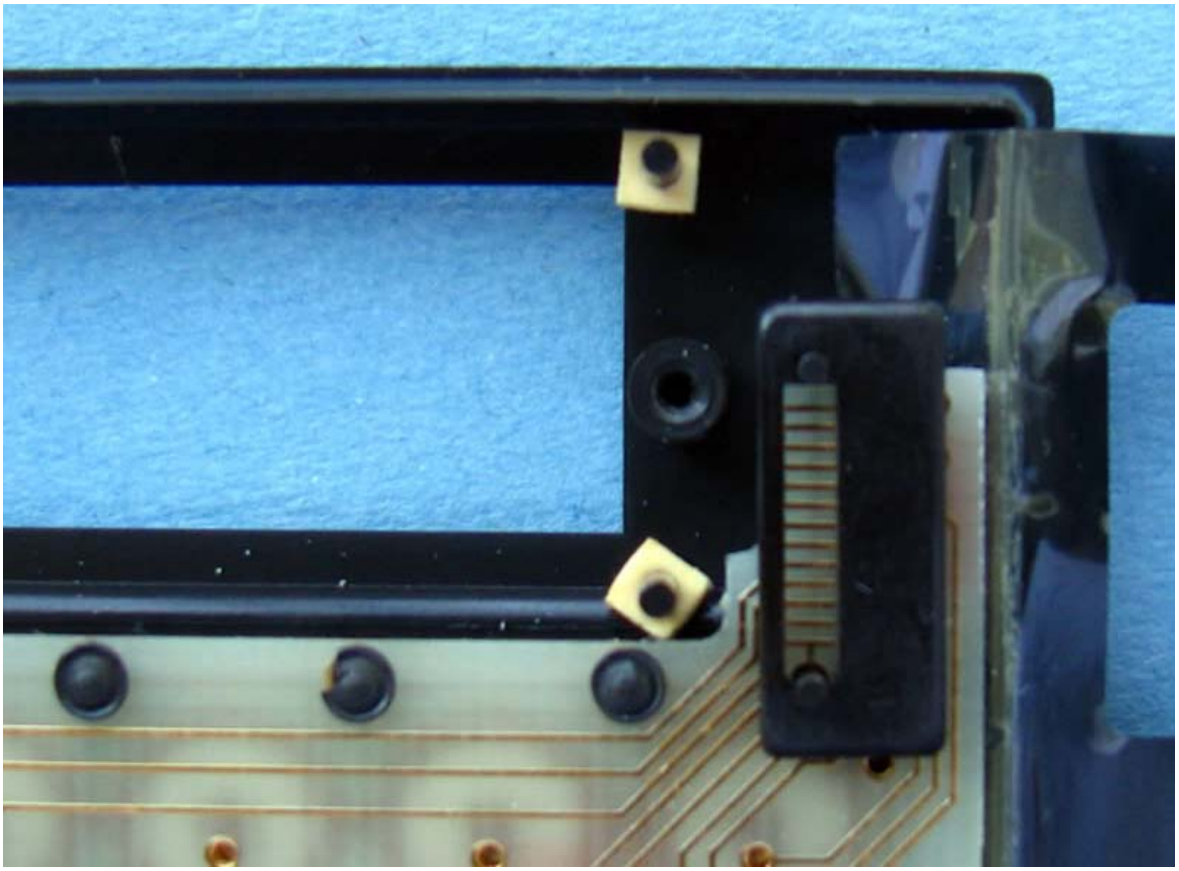
Fortunately there are holes under each dome accessable from the back, or exposed side of the pcb once the back is removed. I have acutally introduced contact cleaner into these holes and also use these holes to blow out the contaminant, contact cleaner, water or other liquid. Interestingly (from experience), the mere fact that I can blow the liquid out of the snap dome without damaging the dome would imply that the dome is not sealed completely. I do this by placing the plastic straw that comes with a can of air over the hole in the back of the snap dome (see the lower three holes in the accompanying picture). This allows liquid contamination in, and conversly, the ability to blow the contaminant out.

I have used this process on about 20 voyagers and all have benefited. Of course this is a last resort before excising the heat stakes

and committing major surgery and due to major contamination.

A mild wash to the face plate under a tap while keeping the LCD display free of the flow of water usually suffices. This has worked for me on minor spills but usually if the calculator buttons are not responding it can be a combination of contaminated ICs as well as the snap domes.

You can just see three of the holes in the pcb back sid at the bottom of this picture.



Cheers, Geoff

Not necessarily. Blowing over the vent hole will reduce static air pressure there so the dome will "breath out" (think of good old velocity measuring devices in airplanes, Mr. Prandtl et al.) so debris may be transported out as well. Stopping the air flow will let the dome "breath in" again - but now only clean air since the debris is blown away already. Repeating this procedure will clean the volume under the dome to some extent. To some extent only, since the static vacuum generated is only an English vacuum, no real physical vacuum - just lower pressure. Hope this is understandable despite the obstacles of a n...l language.

*Message #19 Posted by **Geoff quickfall** on 12 Dec 2010, 1:06 p.m.,*
in response to message #18 by Walter B

Ah, the venturi affect.

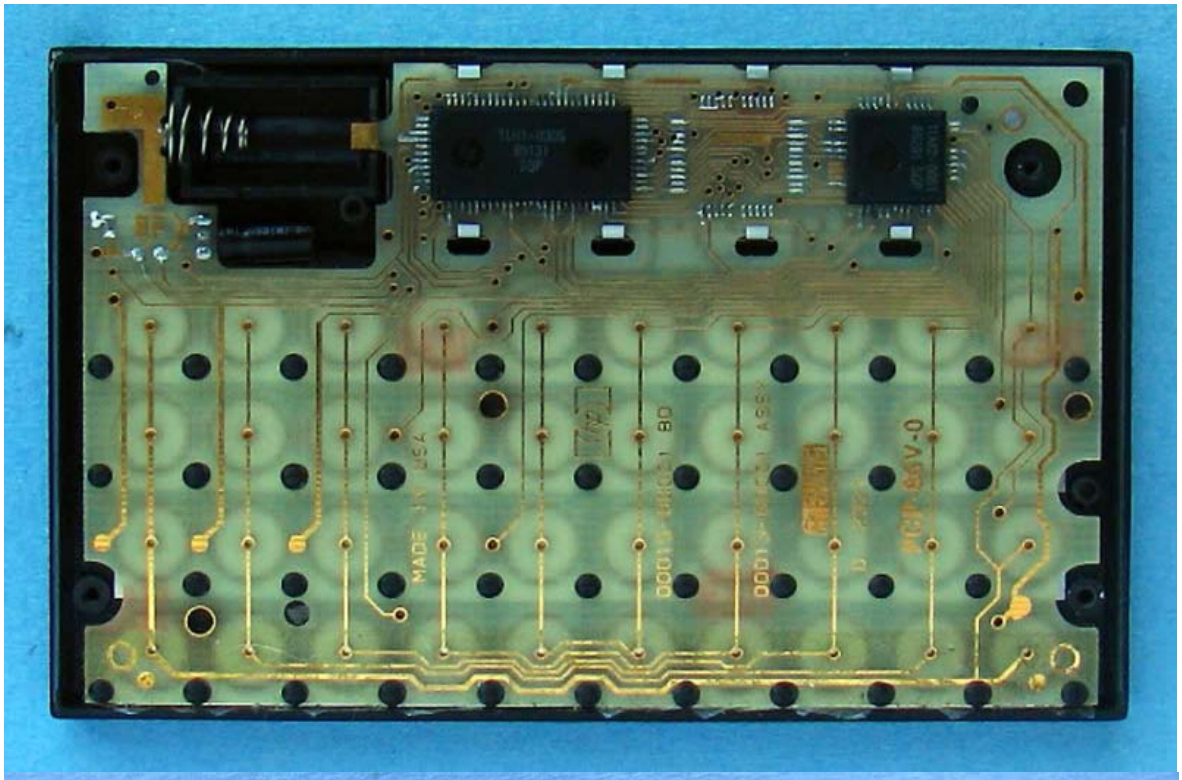
Could be, but when the extended nozzle of the can of air was applied directly to the hole I could swear the liquid migrated out of the snap dome via its edges.

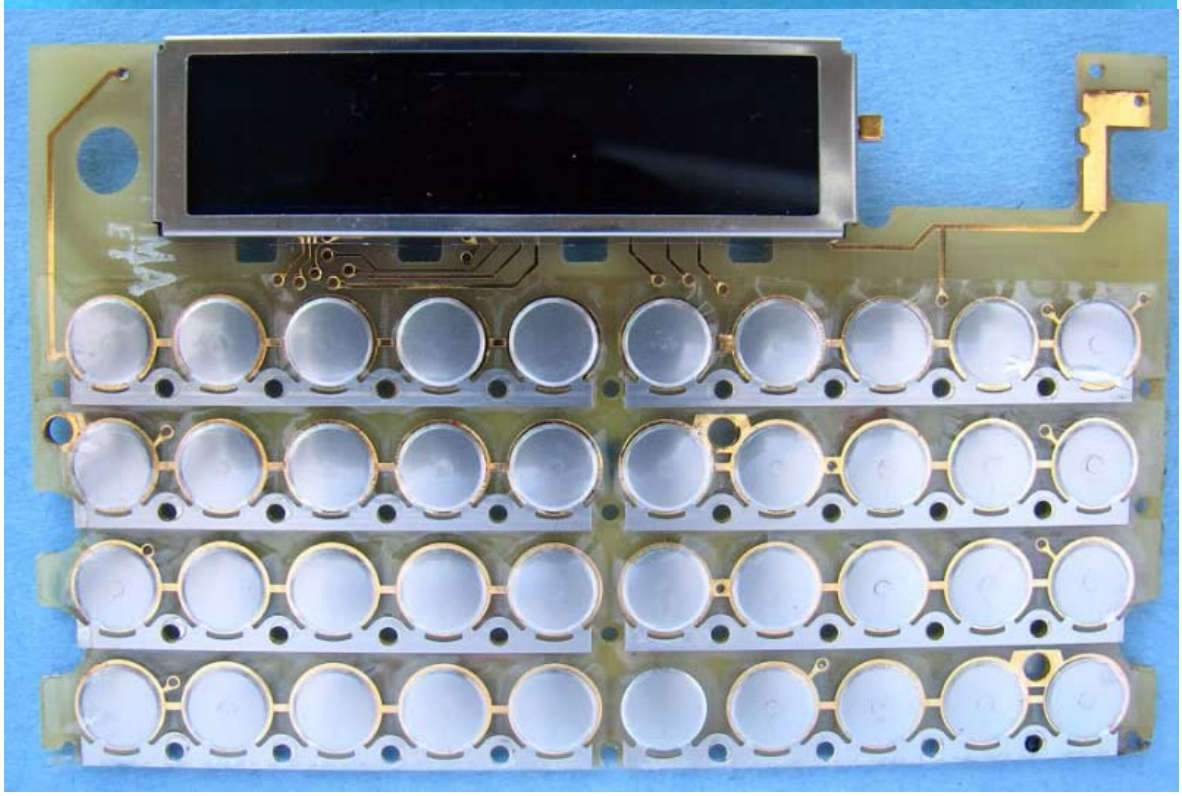
Could be mistaken though! In any case, once dried after the wash and rinse cycle the bouncy keys and non-functional keys were resurrected.

Again, I would say this procedure is a last case manuever to save a calc from death by OJ.

Cheers, Geoff

one should always check ones notes, two images of a pcb
*Message #20 Posted by **Geoff Quickfall** on 12 Dec 2010, 1:41 p.m.,*
in response to message #19 by Geoff quickfall





In the first image, at the extreme bottom of the photo you will see the main obstacle (other then sealed snap domes) for drying the PCB of theis 1989 15C. You can just make out the edge of a polyethelene (?) sheet which is placed over the snap domes and sealed around the edges of the PCB.

Looking at the second image you can see the sheet in place and sealed. This prevents the OJ or ... from actually contacting

the domes depending on its integrity. Therefore a quick rinse of the keys under a tap (LCD kept clear) would suffice on a superficial spill.

When soaking the keyboard this membrane contains the liquid you are using as a solvent (water, soapy water, alcohol). When I had to treat a non functional keyboard I actually had to trim the membrane at the bottom of image one to allow the trapped water to escape from the snap dome side of the PCB. By trimming the edge of the membrane I was able to blow and shake the water to the bottom edge of the PCB and blot it up. This was discovered by trial and effort. Initially after soaking the keyboard I could not release the water from the lower snap domes and they remained squishy (technical term). That was because the liquid had collected at the bottom of the PCB and was sealed in the snap domes by the membrane.

From the above experience I deduced that the snap domes were not sealed all they way around the edge and that the liquid was trapped at the bottom of the PCB by the membrane. Opening the membrane at the position indicated allowed the collected moisture to be released.

The only way to access this membrane is to remove the heat stakes as was done for the lower image.

So the caveat is:

do not soak unless absolutely necessary and once done, the membrane will seal the moisture in place unless it is punctured. OF course this has the negative effect of unsealing the membrane allowing liquid contaminants to penetrate from the keyboard side. So don't spill OJ after this surgery is done!

So there are two impediments to draining and drying, the snap dome design and the membrane barrier.

Cheers, Geoff

From my observation of the housing I didn't see any seat molded into the base of each heat stake which could have created a seal against the rubber dust shield. With 42 heat stakes perforating the polyester film I sort of expected some attempt to reseal the surface.

A related quirk I've found on some voyagers I suspected had worn out domes is the actuator prong of the corresponding key bottom had punctured the rubber film. This caused the key to bear on a much greater area of the dome than intended resulting in the sloppy tactile response. Ironically it seems more of a hassle to repair/replace the rubber shield than replace a single dome.

I'd hazard you'd need to submerge the entire housing to introduce enough contamination into the dome vias in the pcb bottom. Which is sort of why I cringe at the thought of wholesale submerging the calc in any fluid. I'm concerned enough with having a voyager routinely sit open on the bench pcb bottom up, allowing dust to accumulate in the large vent vias, that I cover the board when I'm not working with it.

But I don't mean to exaggerate the problem. It is straightforward enough to free the pcb of the heat stakes for cleaning or repair. The more disagreeable part is getting the adhesive film off the board and domes without creating a major mess. I've tried most everything including heptane, acetone, naphtha, etc.. and I haven't yet found a solvent which would soften the adhesive such that it integrally releases from the pcb and dome strips. All of the above create a mess so I just hit it with carb cleaner afterwards and mop up the resulting goo with paper towels. I usually snap off the display to avoid any ill effects of the above solvents on the polarizer adhesive and zebra strips. But I suppose you could create a jig/barrier to allow leaving the display in place.

> Quote:

> Fortunately there are holes under each dome accessable from the back, or exposed side of the pcb once the back is removed.

Those are the dome vent vias. They're about 42mils and are sized to relieve dome pressure when actuated, otherwise the tactile response is impacted particularly for round domes.

HP-41C Time Module: Calendar Routines

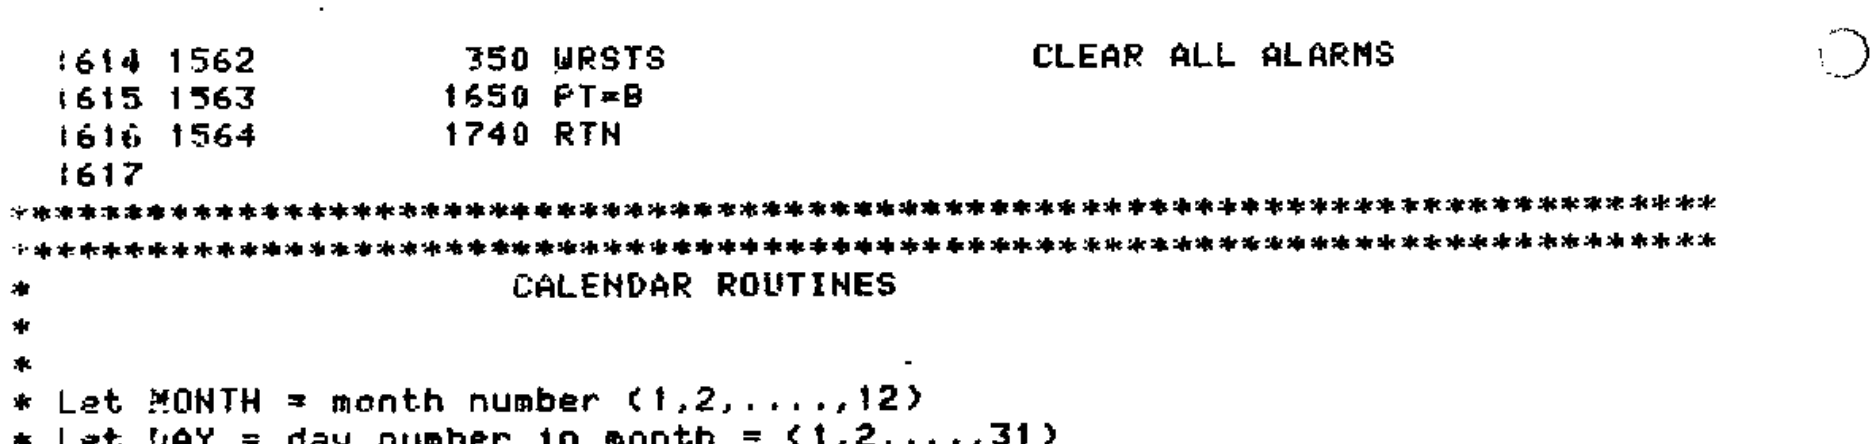
*Message #1 Posted by **Thomas Klemm** on 9 Dec 2010, 1:58 p.m.*

In this thread I've noted:

> Quote:
>
> I haven't analyzed the whole program yet but this algorithm is used:
>
> ```
> if m <= 2:
>    m = m + 12
>    y = y - 1
>
> jd = int(365.25*y)
>    - int(y/100)
>    + int(y/400)
>    + int(30.6001*(m+1))
>    + d
>    - 478164
> ```

In the meantime I had a look at the "Time Module VASM Listing 1C" on TOS. Here's a page of useful comments I found there. Probably I should have better started with that.

Regards
Thomas



```
* Let DAY = day number in month  (1,2,...,31)
* Let YEAR = year number = (1582,1583,...,4320)
* Let DAY# = day number since October 15, 1582    [Oct 15, 1582 = day 0]
*
* Now define the following conditionally depending on the value of MONTH:
*     If MONTH < 3 then let M = MONTH + 13  and let Y = YEAR - 1.
*     If MONTH >= 3  then let M = MONTH + 1  and let Y = YEAR.
*
* Also define the following functions:
*     SUM3(Y) = int(Y * 365.25) - int(Y/100) + int(Y/400)
*     M306(M) = int(M * 30.6001)
*
*
* Mapping DATE to DAY#
*     DAY#(MONTH,DAY,YEAR) = SUM3(Y) + M306(M) + DAY - 578164
*
*
* Mapping DAY# to DATE :
*     Calculate the value of Y0 as follows:
*        Y0 = int( [(DAY# + 578164) - 121.5] / 365.2425)
*        This is an approximation of the correct year.
*     Now calculate M0 as follows:
*        M0 = int( [(DAY# + 578164) - SUM3(Y0)] / 30.6001)
*     If this M0 is less than 4 then Y0 was one too high
*        therefore let Y0 = Y0 - 1 and recalculate M0 using the new Y0.
*     Once M0 >= 4, the values of MONTH, DAY, and YEAR are:
*           DAY = [(DAY# + 578164) - SUM3(Y0)] - M306(M0)
*           If M0 >= 14 then MONTH = M0 - 13 and  YEAR = Y0 + 1
*           If M0 < 14  then MONTH = M0 - 1  and  YEAR = Y0
*************************************************************************
*************************************************************************
* C-YMDD = C REGISTER INPUT -- YEAR,MONTH,DAY TO DAY#     1-23-81  RSW
*

About squaring a number on my HP...

*Message #1 Posted by **Michel Beaulieu** on 9 Dec 2010, 12:58 p.m.*

When squaring 2.25 i got 5.052499998 on my HP calculator. I know it is normal for a calculator to loose accuracy after "a lot" of calculation (Forensics) steps, but just squaring a number is only one step; why it is not 5.0625 ?

Thanks!

Re: About squaring a number on my HP...

*Message #2 Posted by **Martin Pinckney** on 9 Dec 2010, 1:44 p.m.,*
in response to message #1 by Michel Beaulieu

Don't see how this is possible, unless your 2.25 was really 2.247776679 and your mode was set to FIX 2, but then the square would not be displayed to 9 decimals.

Which HP model?

Re: About squaring a number on my HP...

*Message #3 Posted by **Mark Harman** on 9 Dec 2010, 3:20 p.m.,*
in response to message #1 by Michel Beaulieu

This is a strange result. I, too, am curious about what model you're using. On the three HP calculators I own I get 5.0625.

*Message #7 Posted by **Michel Beaulieu** on 9 Dec 2010, 3:45 p.m.,*
in response to message #1 by Michel Beaulieu

Their is no model number on it.

It's a calculator that was given to me by my father some months ago. The only indication i can see is Hewlett Packard - 500mW on the back near feets I guess that their was a sticker on the back probably with model number and serial but only glue is still present...

I usually have a HP-41C for RPN but my batteries are dead so i pick up this one. I also have a business HP, but these two gives good answers on squaring.

A sticker on one of my HP-35 calcs tells at this position something about 500**MV**. Seems not everyone being able to print and attach a sticker is knowledgeable about units (and maybe that was one reason for discarding such stickers on the Spices ;) or those special stickers are simply a fake?) ... for sake of fairness, all other stickers in my collection are correct.

... like a *Sepplhut*, or order a *Jagertee, Einspänner, Almdudler* (these last three are beverages since you were looking for a trinket, if you know what I mean)

> Quote:
>
> ...and I like the alphorn. Now you've got me wondering if the alphorn shares a border with Suisse, or if it is on t'other side of *(??)* Oesterreich.

AFAIK the *Alphorn* lives in *d'r düütsche Schwiiz* (the German speaking part of Switzerland) only and is not endemic *bei d'r armi östriichische Verwandtschaft* (with the poor Austrian relatives) nor anywhere else.

> Quote:
>
> As for the extra sylylable in alp(en)horn, I guess I just like the sound of it better that way!:-P Like Old Times versus Olden Times.

Works different in German: If we want some text looking really old fashioned, we put some "y" and "th" where an "i" or "t" is found now, like e.g. *Nothschrey* instead of *Notschrei* - but that won't work schematically. And we'll use a Gothic font, of course.

Re: About squaring a number on my HP...

*Message #19 Posted by **Thomas Klemm** on 9 Dec 2010, 4:53 p.m.,*
in response to message #7 by Michel Beaulieu

It could be an HP-35. At least that would match the following:

- squaring 2.25 you get 5.062499998
- there is no model number on it
- 500mW on the back near feets

Does it have a x^y key? How do you calculate the result? What is the answer for:

```
2.25
ENTER
x
```

As Geoff explained above logarithm and exponential function are internally used by x^y (or y^x on later models). That's why you don't get an exact result.

Best regards
Thomas

*Message #20 Posted by **Martin Pinckney** on 9 Dec 2010, 5:23 p.m.,*
in response to message #19 by Thomas Klemm

OK, you got it. I did not have a 35, only an emulator, which gives the exact result.

Re: About squaring a number on my HP...

*Message #21 Posted by **Michael Meyer** on 9 Dec 2010, 5:47 p.m.,*
in response to message #20 by Martin Pinckney

My 35 here at work gives 5.062499998. Square root returns 2.25.

Re: About squaring a number on my HP...

*Message #22 Posted by **Michel Beaulieu** on 9 Dec 2010, 6:03 p.m.,*
in response to message #1 by Michel Beaulieu

I saw the picture on this wonderful museum and it is an HP-35 that my father gaves me. Probably the algorythm in programming the first scientific calculator was not accurate for exponentiation and log calculation.

Thanks!

Re: About squaring a number on my HP...

*Message #23 Posted by **Thomas Okken** on 9 Dec 2010, 6:36 p.m.,*
in response to message #22 by Michel Beaulieu

If I remember correctly, the first HP calculators that calculated Y^X accurately for integer X were the HP-19C/29C and HP-67/97. The earlier models calculate Y^X as exp(X*log(Y)) for all cases, while the later ones use an iterative squaring/multiplication algorithm when X is an integer. The new algorithm is not complicated, but the earlier calculators didn't have enough ROM space for such niceties.

UPDATE: The iterative algorithm is like this:

```
float pow(float y, int x) {
    if (x == 0)
        return 1;
    if (x < 0) {
        x = -x;
        y = 1 / y;
    }
    float r = 1;
    while (true) {
        if ((x & 1) != 0)
            r *= y;
        x >>= 1;
        if (x == 0)
            return r;
        y *= y;
    }
}
```

I seem to remember reading about this in an HP Journal issue, but I don't remember which one.

Re: About squaring a number on my HP...

*Message #24 Posted by **bill platt** on 9 Dec 2010, 7:00 p.m.,*
in response to message #23 by Thomas Okken

On a 32sii, if you do e^(2*ln(2.25) and then show the mantissa, or fix 11, you see 5.062 499 999 99

If you set fix 10 (that's dot 0), of course it shows 5.062500... Of course y^x has the newer algorithm and so it comes out exact even with showing the mantissa.

*Message #25 Posted by **Thomas Okken** on 9 Dec 2010, 7:23 p.m.,*
in response to message #24 by bill platt

I just tried this on the HP-25: **2 ENTER 2 y^x** returns 3.999999999, and **2 ENTER 3 y^x** returns 8.000000002... exactly the same results as you get when you calculate **2 ln 2 × e^x** and **2 ln 3 × e^x**, respectively.

Oh, and **2.25 ENTER 2 y^x** returns 5.062499998.

Re: About squaring a number on my HP...

*Message #26 Posted by **Martin Pinckney** on 9 Dec 2010, 10:15 p.m.,*
in response to message #25 by Thomas Okken

Well, does any HP give this result with an X^2 key? Or does this only happen with the Y^x (or X^y) key?

The point being it could have helped narrow down the cause if Michel had stated he raised 2.25 to the power of 2 instead of squared 2.25.

Re: About squaring a number on my HP...

*Message #27 Posted by **Thomas Okken** on 9 Dec 2010, 10:22 p.m.,*
in response to message #26 by Martin Pinckney

I don't think any HP gives inaccurate results with the x^2 key, but the HP-35 doesn't have one. :-)

> Quote:
>
> Probably the algorythm in programming the first scientific calculator was not accurate for exponentiation and log calculation.

It is not a matter of accuracy. The HP-35 log and exp algorithms are accurate enough, it just happens the result of exp(2*ln(2.25)) would be exact only if the computations were carried out with infinite digits. Free42 Decimal, for instance, returns 5.062499999999999999999412 internally, which is of course rounded to 5.0625 when the display is set to ALL.

Gerson.

in response to message #29 by Gerson W. Barbosa

It's been a long, long time ago but back in the early days of hand-held calculators didn't we all understand that if we wanted to accurately square a number we should simply multiply the number by itself (e.g., Enter followed by x) rather than use the y^x function?

Hi Gerson!

This is a bit OT -- but which release of Free42 are you using?
AFAIK all 1.4.66 versions get 2.25^2 exactly right, regardless of whether you use Decimal or Binary, and regardless of whether you calculate 2.25^2 using ENTER *, X^2, Y^X, LN 2 * E^X, or LOG 2 * 10^X.
What you describe, an error of almost 600 ULP for a simple calculation involving transcendentals, should not happen with any Decimal version >= 1.4.52, and with no Binary version since 1.0.
(The < 1.4.52 Decimal versions evaluated transcendentals to less than full accuracy, guaranteeing at least 20 digits accuracy but not the full 25 digits that all other functions produce... But since 1.4.52 they use one or two additional terms in the Taylor series, and should be accurate to 1 ULP now.)

RPN and students

*Message #1 Posted by **Michel Beaulieu** on 9 Dec 2010, 12:51 p.m.*

I want to show the effectiveness of RPN to my student compare to their TI graphing calculator. Do you have an exemple of a simple arithmetic calculation but with lot of steps and () that i can compete with them?

Thanks

Re: RPN and students

*Message #2 Posted by **Sok-khieng Chum Hun** on 9 Dec 2010, 1:41 p.m.,*
in response to message #1 by Michel Beaulieu

sqrt(5*((((0.2*(350/661.5)^2 + 1)^3.5 - 1)*(1 - 6.875*10^-6*25500)^-5.2656 + 1)^0.286 - 1)) = .8357...

Re: RPN and students

*Message #3 Posted by **Martin Pinckney** on 9 Dec 2010, 2:08 p.m.,*
in response to message #2 by Sok-khieng Chum Hun

This is not a good example, IMO, if you are trying to show the advantage of RPN over ALG. True, the number of keystrokes is less. But the complexity of the expression perhaps tilts the advantage toward ALG?

To quote this site, under **Learning RPN**,

"You can *easily* evaluate more complicated expressions than the one shown above. Just start with the innermost set of parentheses and work outwards as you would to solve the expression with a pencil and paper". [Emphasis added]

For a simple mind like mine, it's too easy to get lost in evaluating such an expression in RPN.

With ALG, I can just start at the left and go to the right. Of course, I have to type it correctly.

Re: RPN and students

*Message #4 Posted by **Chuck** on 9 Dec 2010, 7:42 p.m.,*
in response to message #1 by Michel Beaulieu

The one I use is:

Solve 300=2.45 e^(.025x) +35for x.

Using RPN you can solve it without writing anything down (just perform the inverse operations):

```
300 ENTER
35 -
2.45 /
ln
```

```
.025 /
```

On an algebraic input calculator, you almost have to solve it on paper first (or do some mental gymnastics) in order to see exactly how to type it in:

ln((300-35)/2.45)/.025 = which just looks atrocious.

CHUCK

If the user of a TI-83+ wants to solve by generating the equation for x he does NOT have to derive the equation by using pencil and paper and then enter the derived equation into his machine. Rather, he uses the display as a scratchpad and uses the cursor keys and the insert function to generate the derived equation in the following manner

Place (300-35)/2.45 in the display

Realize he has to insert the ln function at the front. Slew to the left margin, press 2nd INS, press ln and see ln (inserted at the front of the equation.

Slew to the end of the entered equation and press) / .025 and see the derived equation in the display as

ln((300-350/2.45)/.025

and press ENTER to solve. It seem to me that the solution for x isn't atrocious. It is just what it is.

The user of the TI-83+ does NOT have to solve by entering the equation in that manner. Rather, he can solve the problem as follows::

300 - 35 ENTER

/ 2.45 ENTER

LN 2nd ANS ENTER

/ .025 ENTER

which yields the same intermediate displays as would be received with a typical RPN machine. The same sequence will work on any of the TI graphic machines. A similar sequence will work in algebraic mode on the HP-35s.

Re: RPN and students

*Message #6 Posted by **Martin Pinckney** on 15 Dec 2010, 10:58 a.m.,*
in response to message #5 by Palmer O. Hanson, Jr.

I agree, Palmer, there is nothing "atrocious" to me about just keying in the expression the same way you read the problem statement in any published source.

I do see that RPN has some advantages with some types of math problem solving, but I don't think I'll ever understand this seemingly fanatical devotion to it.

Re: RPN and students

*Message #7 Posted by **bill platt** on 15 Dec 2010, 2:04 p.m.,*
in response to message #6 by Martin Pinckney

I think part of it stems from a feeling of remaining connected with the process of solving--of doing the maths rather than letting the machine do it. The formula entry approach is like "the chimp can go to space" whereas RPN is like Mr. Jaeger in the X-15 and the NF-104.

Re: RPN and students

*Message #8 Posted by **Garth Wilson** on 15 Dec 2010, 3:05 p.m.,*
in response to message #6 by Martin Pinckney

> Quote:
>
> there is nothing "atrocious" to me about just keying in the expression the same way you read the problem statement in any published source.

I would reiterate however that that is **not** the way most engineering calculations in real life go. The steps are more commonly figured out in your head as you take a number, do something to it, (see the result), do something else to it, etc., which seldom happens in left-to-right order. (That's not to say it can't be done this way in ALG-- it's just not quite as slick.) If it's already figured out for you (or you've figured it out yourself before), it's probably already in a program waiting for inputs.

> Quote:
>
> I do see that RPN has some advantages with some types of math problem-solving, but I don't think I'll ever understand this seemingly fanatical devotion to it.

I could have gone either way (RPN or ALG), until I started using my 41cx in the late 1980's for equipment control and data acquisition and suddenly RPN came out way ahead. In computer programming languages, once I got into Forth (which is RPN), I never wanted to use an algebraic

language again with its piles of parentheses and punctuation.

Devotion to their mechanization isn't unique to rpners. Back in the 1980's I was the editor of a newsletter for TI machines. We were a least as dismissive of RPN as the rpners are of algebraic. One source of humor was the nomenclature "reverse Polish". It was suggested that an idea like that could only have originated in that old children's book *Inside Outside Upside Down*.

Re: RPN and students

*Message #10 Posted by **Thomas Okken** on 9 Dec 2010, 8:16 p.m.,*
in response to message #1 by Michel Beaulieu

Whatever you do, make sure you just show your students how RPN *can* be easier to work with, but don't try to convince them that RPN is the best system no-matter-what.

http://www.woz.org/letters/general/57.html
See the last "Comment from E-mail" on that page, and Steve Wozniak's response.

Note: I have been an RPN user for nearly 35 years now, and I wouldn't have it any other way -- but I'm not going to try to proselytize. (Same thing with my use of **vi**.) If I hear anyone complain about the tools they're using, *then* I may start to talk, but I'm not going to Preach The Word! :-)

Re: RPN and students

*Message #11 Posted by **David Hayden** on 9 Dec 2010, 9:50 p.m.,*
in response to message #10 by Thomas Okken

How about the quadratic equation? It should be familiar to them.

To me, the key advantage is that you can evaluate an expression that appears in a textbook. If it's already written out on one line with the appropriate parentheses then ALG will be easier, but in textbook form, where the divisors and radicals and subscripts and superscripts all imply orders of operation, RPN reall shines.

For bonus points, show how easy it is to save the intermediate sqrt(b^2 -4ac) in RPN so you can evaluate the second root easily.

Dave

That is interesting. And true. It really took the "textbook entry" approach before the "algebraic" entry became universally possible for any published equation. Interesting too that the 48G really didn't have a useable textbook sort of entry system until the Metakernel/Erable/ALG48 developments--the original equation editor is really really horrible.

However, many equations worked just fine even with that old infix arithmetic with postfix functions "algebraic" that was used in the Ti SR series, as described by Steve Wozniak.

41CX-X, say what?

*Message #1 Posted by **Ángel Martin** on 9 Dec 2010, 9:14 a.m.*

Well, extended-expanded in a modest way if you consider adding ONE more function worthwhile.

As it turns out there was room in the FAT for one more entry, and plenty of room in page 3 for some additional code (no need to resort to the bank-switched page). So... you can imagine how tempting such a situation is.

Here's the question: If you had a choice, which one would be the single one and only function to incorporate to the CX function set?

In fact there could be up to three, assuming we'd use the section headers to call the remaining two. Sort of "easter eggs", as it's done on some power-user modules (like the CCD).

Possibly having to do with extended memory management (CLEM, RENMFL, RETYPFL...) or would you go other way?

Let's have a poll!

Edited: 9 Dec 2010, 9:15 a.m.

Re: 41CX-X, say what?

CXISA = Read ROM word (address in X) and push it on the stack

Re: 41CX-X, say what?

*Message #3 Posted by **Angel Martin** on 9 Dec 2010, 2:17 p.m.,*
in response to message #2 by HrastProgrammer

interesting choice, I can tell you're a heavy-duty programmer! :)

Re: 41CX-X, say what?

*Message #4 Posted by **HrastProgrammer** on 10 Dec 2010, 9:17 a.m.,*
in response to message #3 by Angel Martin

Otherwise, I agree that some kind of random number generator function would be useful.

Re: 41CX-X, say what?

*Message #5 Posted by **Geir Isene** on 9 Dec 2010, 10:15 a.m.,*
in response to message #1 by Ángel Martin

One would of course have to have a function to call the header easteregg functions as well.

Re: 41CX-X, say what?

*Message #6 Posted by **Ángel Martin** on 9 Dec 2010, 2:16 p.m.,*
in response to message #5 by Geir Isene

Yes of course. We could think about adding XROM as the "official" entry, or rely on having the OS/X or CCD around.

Re: 41CX-X, say what?

*Message #7 Posted by **Geir Isene** on 9 Dec 2010, 5:49 p.m.,*
in response to message #6 by Ángel Martin

I say *self contained* - all the way. SO, XROM is in.

Re: 41CX-X, say what?

*Message #8 Posted by **Håkan Thörngren** on 9 Dec 2010, 11:09 a.m.,*
in response to message #1 by Ángel Martin

What are you up to now? Replacing the 41cx ROM?

If I were in charge when the 41CX ROM was made, I would have added a random number generator.

Since done is done, today I would probably use the space for extended prompting, but that would not take any FAT entry.. :)

Or rather, I think I would leave it alone, done is done, just put the extensions in a separate plug-in module instead.

Re: 41CX-X, say what?

*Message #9 Posted by **Ángel Martin** on 9 Dec 2010, 2:21 p.m.,*
in response to message #8 by Håkan Thörngren

Not after replacing the CX ROM but to extend it (a little bit at least). I like the RNG idea, and would like to suggest using the one you published in PPCCJ way back then.

It uses the time module to produce a credible seed, and is buffer-based and everything, so it's a nice all-round exercise.

But let's see which other inputs we get..

Re: 41CX-X, say what?

*Message #10 Posted by **Geir Isene** on 9 Dec 2010, 5:50 p.m.,*
in response to message #9 by Ángel Martin

I second that.

Re: 41CX-X, say what?

*Message #11 Posted by **db (martinez, ca.)** on 9 Dec 2010, 11:38 a.m.,*
in response to message #1 by Ángel Martin

I think the most glaring omission from the extended function set was the ability to easily store and recall DATA files between mass storage and extended memory. The TDS survey ROM has this function using TDC and THP and it simply makes the whole module useful. Otherwise, one is limited to having one 300 point file, period - or changing file type from data to ascii and back in order to move them.

I never understood why HP would not have given the ability to archive data files from a platform that was being used as a data collector. It stores and retrieves program and ascii files between ex mem and mass storage media. It's as if HP expected users to be using their 41 for word processing but not math.

Anyway; that's my vote.

Re: 41CX-X, say what?

*Message #12 Posted by **Ángel Martin** on 9 Dec 2010, 2:23 p.m.,*
in response to message #11 by db (martinez, ca.)

I sort of agree with you but remember that we're emulator-based, so the HP-IL is not a very useful device... afraid to say.

This is fun, sort of the most-wanted drill all over again.

Re: 41CX-X, say what?

*Message #13 Posted by **Geir Isene** on 9 Dec 2010, 5:51 p.m.,*
in response to message #12 by Ángel Martin

No, no, we're not necessarily emulator-based... I'm not. I'm all for The Real Thing, HP-IL and all.

Re: 41CX-X, say what?

*Message #14 Posted by **Ángel Martin** on 12 Dec 2010, 12:27 p.m.,*
in response to message #11 by db (martinez, ca.)

In retrospect it's true that they gave a lot of emphasis to the ASCII files, way over the data files if one is to judge by the number of functions (with the EDitor being the clearest example). Perhaps too much considering the obvious limitations in the platform for text editing...

at any rate, looks like the poll is over, and the winner is...

Re: 41CX-X, say what?

*Message #15 Posted by **Namir** on 9 Dec 2010, 12:53 p.m.,*
in response to message #1 by Ángel Martin

You asked for three functions, so here is my pick:

1. Random number generator.

2. Write all/range of memory registers to a data file on the PC.

3. Read a data file on the PC into memory to replace all or some of the memory registers.

Namir

Re: 41CX-X, say what?

*Message #16 Posted by **PeterP** on 9 Dec 2010, 3:20 p.m.,*
in response to message #15 by Namir

I think the answer changes tremendously with the reference frame:

For a physical HP-41 back in the day when modules where expensive (or a physical HP-41 today with no clonix) I would have to vote for peekb/pokeb and code/decode. These are very powerful functions that are time-consuming to replicate in pure Focal and they have massive re-use. RAND is useful once in a while for games and the like but it is easily replicated by FOCAL and doesnt really expand what one can do with the HP41. Assuming there is enough space in page 3 for more stuff, one would have to consider allowing sto/rcl/x<> to the system registers a,b,c,d,etc which does not require a FAT entry.

In an emulator world I would vote for saving/retrieving XM to/from a QROM page and/or save/load a user program to a QROM page to free up memory. If there is only 1 FAT entry, a SAVEALL command to save/exchange the complete RAM and XM to 1 (or 2 with full XM) QRAM pages would allow to have a couple of configurations always at hand in ones simulator (say a data collection configuration, a games configuration and a programming configuration)

Basically an additional function should be hard to replicate with already existing functions and combine well with existing functions to create new possible uses.

Cheers

Peter

HPIL, HPGL

*Message #1 Posted by **Mike (Stgt)** on 8 Dec 2010, 10:20 a.m.*

Two subjects (bad habit, I know).

i) I was told that somebody managed to add HPIL to HP-41 on Nonpareil. Who may point me in the right direction where to find something about it.

ii) I googled for a freeware HPGL viewer w/o luck. Yes, graphic viewer like IrfanView or XnView would do, alas (AFAIK) they both read a file from disk - I look a SW that could take a stream as input. Or what trickles through virtual HPIL <G>. Every hint is appreciated.

Ciao.....Mike

Generating Permutations

*Message #1 Posted by **Norman Dziedzic** on 8 Dec 2010, 1:36 a.m.*

I have been trying to figure out how to generate permutations of the elements in a list in user RPL w/ my 48gii. I know I can write a brute force generator but it seems there should be some elegant way to do this with P2C and/or C2P and perhaps DOLIST or DOSUB but I'm getting nowhere understanding the cycle notation stuff.

Am I whistling in the wind here or is there a way?

My simple test case is to generate all the permutations of the elements in the list {1 2 3 4}.

Thanks, Norm

Intesting Auction Site Practice!!!! Read and Learn

*Message #1 Posted by **Namir** on 7 Dec 2010, 9:52 p.m.*

Hi All TAS Bidders,

I bought an HP48GX with accessories from TAS. The seller emailed me asking if I would buy for $15 more a cable for the calculator that he did not include in the auction. I wrote back saying no thank you since I already had several such cables. Next thing I know I get a message from PayPal saying the seller has refunded me my money. I wrote the seller asking why and he said he wanted to re-list the item to include the cable!

I called the auction site by phone and complained about this kind of practice!! They said since I was issued a refund, they could not do anything!!!

So here is a new rule that will fly by TAS!! YOU DON'T LIKE THE SELLING PRICE, THEN REFUND THE MONEY AND RELIST IT. IF YOU CAN LIVE WITH JUST A NEGATIVE FEEDBACK THEN YOU ARE FINE!!!

Namir

PS: TAS knows that I am sharing this message with you all!!

Edited: 7 Dec 2010, 11:10 p.m. after one or more responses were posted

According to the above, the seller violated the spirit of an auction and should be sanctioned. But ebay largely being an unpoliced mudpit, the reprimand once again falls into the hands of the alienated buyer. Your one club is the red doughnut negative feedback -- use it with full force. The seller may dispute your feedback but you still have one more follow up after that. The issue is effectively closed for comment after your second feedback submission.

FWIW I've seem sellers cancel an auction before the final 12 hour period because bids were running low and the seller didn't list with (or want to pay for) a reserve. In that case no opportunity exists for would-be buyer feedback as the auction never concluded.

Re: Intesting Auction Site Practice!!!! Read and Learn

*Message #4 Posted by **Namir** on 8 Dec 2010, 4:34 a.m.,*
in response to message #3 by uhmgawa

It was a Buy-It-Now auction, which I promptly responded to. I was able to leave a negative feedback, but could not open a case (due to the full refund). As far as TAS is concerned, that's all I can do since the seller refunded me my purchase. My feeling is that the seller felt he sold the items for a low amount.

How should I clean my hp-15c

*Message #1 Posted by **JJDietrich** on 7 Dec 2010, 9:18 p.m.*

Is it ok to use rubbing alcohol with q-tips? Something else?

Re: How should I clean my hp-15c

*Message #2 Posted by **bill platt** on 7 Dec 2010, 9:38 p.m.,*
in response to message #1 by JJDietrich

Rubbing Alcohol is safe for faceplate. I can't remember about the screen. Start with water in q-tip.

Absolutely No Ketones.

Re: How should I clean my hp-15c

*Message #3 Posted by **Randy** on 8 Dec 2010, 9:49 a.m.,*
in response to message #1 by JJDietrich

I would not use cotton swabs. Might create polished areas and more importantly, they wouldn't touch the gunk around the keys.

My mix is 70/30 isopropyl/di water. Very soft bristle toothbrush. Spray lightly, brush lightly, mop up, canned air dry off. Repeat if needed. The key is not to saturate with liquid, light spray only and repeat when needed. It's like spray painting, two light coats are better than one heavy.

Disclaimer: do not use isopropyl on Classics, it will lift the clear coat.

Re: How should I clean my hp-15c

*Message #4 Posted by **Martin Pinckney** on 8 Dec 2010, 11:05 a.m.,*
in response to message #3 by Randy

Randy, I'm curious. Is isopropyl better than "denatured" (Ethyl/methyl mix, usually) for some technical reason? Or is it the lower cost that makes it attractive?

Replacement for HP-35S

*Message #1 Posted by **Jean-Michel** on 5 Dec 2010, 3:09 p.m.*

Hello folks,

I consider now to replace the HP-35S of my wife and which will soon cost me more in new batteries than the calculator itself by another less battery-consuming calculator. Since my wife started to feel comfortable with RPN, I want to buy her another HP. Does the 20B suffer from the same "disease"? It looks nice but since I am fed up with buying fresh batteries every now and then, I prefer to ask for opinions first.

Thanks for your help.

Kind regards. Jean-Michel.

P.S.: my wife does not bother with fingerprints on glossy surfaces ;-)

*Message #2 Posted by **bill platt** on 5 Dec 2010, 3:55 p.m.,*
in response to message #1 by Jean-Michel

33s. It might use less. Anyone know?

Used 32sii. Common as dirt. Can be had for $50 if you are patient.

Re: Replacement for HP-35S

*Message #3 Posted by **Karl Schneider** on 5 Dec 2010, 4:25 p.m.,*
in response to message #2 by bill platt

> Quote:
>
> 33s. It might use less *(battery power)*. Anyone know?

I suspect that the HP-33s actually uses more power and discharges its cells faster than the HP-35s. The 33s runs faster, and uses the same two Type 2032 cells in parallel. I've noted that battery replcement is more frequent than expected, even during non-use.

Only the old-school HP-41, Voyager-series, and Pioneer-series models had astounding battery life. Those of that group that kept "wall time" -- HP-41CX, HP-41 Time Module, HP-27S, HP-17B/BII -- will have much shorter battery life due to the running of that clock, even while the calc is turned off.

I've observed the 35s discharges significantly faster than the 33s sitting idly on a shelf. Statistical basis is one of each only, so watch it - but far more sound than suspecting d;-)

Re: Replacement for HP-35S

*Message #5 Posted by **Dieter** on 5 Dec 2010, 4:21 p.m.,*
in response to message #1 by Jean-Michel

Batteries for your 35s will soon cost you more than the calculator itself? I don't think that the 35s uses much battery power. The first set that came with the calculator lasted for at least one year, with daily use and lots of programming with the new toy. The second set was able to power the 35s for 1 1/2 years until the battery announciator came on - again with daily use.

How often do you have to change the batteries in your 35s?

Dieter

*Message #7 Posted by **Pal G.** on 5 Dec 2010, 8:26 p.m.,*
in response to message #1 by Jean-Michel

I would buy two or three HP 12Cs if I were you. Someone once said he keeps one by each phone in the house (presumably when folks had land-lines and a phone in almost every room).

You can get 'em cheap and the batteries last forever. However, they don't have scientific functions she may need. In that case, iPod Touch would be a nice gift this time of year ;)

Edited: 5 Dec 2010, 8:26 p.m.

Re: Replacement for HP-35S

*Message #8 Posted by **John B. Smitherman** on 5 Dec 2010, 11:27 p.m.,*
in response to message #1 by Jean-Michel

Hi Jean-Michel. You may have a defective unit if it is using batteries excessively. If it is still under warranty

you should consider contacting HP for a replacement.

Good luck and regards,

John

*Message #9 Posted by **Paul Dale** on 6 Dec 2010, 3:35 a.m.,*
in response to message #1 by Jean-Michel

Search eBay for CR2032 batteries. Many to be had for next to nothing. If the link works: eBay link.

Be careful, many of these have high postage to compensate for the trivial cost of the batteries.

Re: Replacement for HP-35S

*Message #10 Posted by **Thomas Chrapkiewicz** on 6 Dec 2010, 7:37 a.m.,*
in response to message #9 by Paul Dale

I've also (surprisingly) been impressed by the relatively low cost of name brand CR2032 cells on commercial sites (such as Digikey) if one purchases quantities of 50 or more.

TomC

Re: Replacement for HP-35S

*Message #11 Posted by **David Hayden** on 6 Dec 2010, 12:42 p.m.,*
in response to message #1 by Jean-Michel

I agree with Bruce, if you're considering a 20b, get a 30b instead. The keyboard on the 20b is really bad (keys sort of squish instead of clicking) and the 30b is programmable.

For functions that aren't on the keyboard, the 30b's menu system is time consuming. You choose the menu and then you have to scroll down through the options to find the function that you want. It's easy to use for sure and ideal for functions that you don't use often, but if your wife frequently uses functions that are on the menu's it can be time consuming. On the other hand, it's pretty easy to assign functions to less frequently keys.

One alternative to consider is the older version of the 48gii. These can be had new on ebay for less than $60.

Dave

Battery cells: CR2032 and "button" style

*Message #13 Posted by **Karl Schneider** on 8 Dec 2010, 2:11 a.m.,*
in response to message #12 by designnut

> Quote:
>
> found I could buy 20 *(CR2032?)* cells for the price of 2 retail at auction, so I now stock them. Sam

I once bought a package of cheap imported 13/44/76/357 button cells on eBay, due to the number of Voyager- and Pioneer-series models I have, and the short life of the cells in the models having an operating built-in 'wall clock'.

The cells tended to lose energy with or without use, and I noticed that one of them in my HP-10C started to form crystalline deposits from a leak.

Out they went. 3-packs of quality silver iodide Energizers can now be bought for under US$7. There is no reason to risk expensive collector electronics to shoddy battery cells.

Perhaps cheap CR2032 cells in an HP-33s or HP-35s is worth the risk...

Office Depot is now selling the above for $3.99 per 3-pack. Incredibly, still made in the USA.

Re: UPDATE: Battery cells: 357 "button" style

*Message #16 Posted by **Alex L** on 9 Dec 2010, 3:07 p.m.,*
in response to message #15 by Martin Pinckney

I've purchased 357, 2016, 2025, and 2032 button & coin cells from SwatchBattery.com. Got the Energizers - $10.71/10-pack, except the 2032s which are $8.91/10-pack.

Name brands, shipped quickly. My personal experience only. YMMV.

Re: UPDATE: Battery cells: 357 "button" style

*Message #17 Posted by **Mark Harman** on 9 Dec 2010, 4:50 p.m.,*
in response to message #16 by Alex L

Even though they don't have anywhere near the same selection, BestByte does have better prices than SwatchBattery.com. You can get the Energizer 357 for 84 cents a piece and for greater quantities they charge less. For example, an order of 10 batteries would be $8.10 (81 cents a piece).

Additionally they have the Panasonic CR2032 for 39 cents a piece. The HP 30b ships with Panasonic OEM batteries. The only differences are the writing on the battery and the nominal capacity (higher for non-OEM). The OEM and non-OEM are made in Indonesia and are high quality batteries.

They also ship very quickly.

Regards,

Mark

Re: UPDATE: Battery cells: 357 "button" style

HP15C LCD dust - any way to remove?

*Message #1 Posted by **JJDietrich** on 5 Dec 2010, 10:39 a.m.*

I just bought an HP-15C, serial number 2313A05258. There is a small black speck of who-knows-what on the display and it looks like it's trapped between the outer display and the actual inner LCD display. Is there any way to remove this?

I removed the back, and that's as far as I had the guts to go, so I just put it back together. I suppose I can live with it, but it's annoying! Thanks!

-Jason

Re: HP15C LCD dust - any way to remove?

*Message #3 Posted by **JJDietrich** on 5 Dec 2010, 6:33 p.m.,*
in response to message #2 by BobVA

Thanks! After some fiddling around, I got it, and fixed another little problem I didn't know existed. FYI here's what I did:

1. unscrewed and removed the back panel

2. peeled back the 2 overlapping protective film pieces (slowly, tried not to rip the adhesive tape. Wasn't 100% successful but close)

3. used tweezers to gently pull up the battery terminal clips

4. there were 3 little square bumper type things sitting on little plastic posts on each corner of the LCD area, so I used tweezers to carefully remove them and set them aside - this is the problem I found that I wasn't aware of - there was a 4th bumper sitting loose, which had caused the gap to form originally between the LCD and the plastic screen allowing the original gunk to end up there. Clearly these bumpers are used to gently press the LCD screen against the outer plastic window once you reassemble since the back panel has extensions which fit right over those bumpers - sort of a female version of the post. The LCD circuit board is attached via a flexible piece on the right side, and is not directly/rigidly attached to the rest of the electronics - this is what allowed me to easily accomplish the next step:

4. with the LCD basically free (although still attached at the right side), I gently pulled up the left side, letting a little gap form between the LCD and the outer screen. then I picked the whole thing up, rotated it

backwards, let gravity hold the gap, and reached in with the tweezers and gently touched the gunk which came right out

5. reassembled

Good as new! (well, as new as a 25 year old calculator can be). As I mentioned, those 4 little square bumpers are now back around the LCD, so now there is a nice tight "seal" between the LCD and the outer window.

Hrast BASIC-4X Discussion

*Message #1 Posted by **HrastProgrammer** on 5 Dec 2010, 5:52 a.m.*

As asked by J-F, I am creating this thread about the BASIC interpreter for HP-48/49 I am currently working on. We can discuss specifications (after I'll have them fixed), ask questions, provide benchmarks etc.

> Quote:
>
> *doesn't allow identifier after NEXT (so, NEXT always closes the inner FOR and FOR/NEXT crossing isn't possible).*
>
> So how do you exit a for loop early????
>
> - Pauli

I must admit that I don't understand your question. How does variable after NEXT help you to exit a FOR loop early?

For example, we have the following program:

```
10 FOR I=1 TO 10
20 DISP I
30 NEXT I
40 DISP "I am out!"
```

How does NEXT I enable a premature exit, compared to NEXT only?

Couldn't you write I=10: GOTO 30 to exit the loop, no matter of NEXT vs. NEXT I?

```
10 FOR I=1 TO 10
15 IF I=6 THEN I=10: GOTO 30
20 DISP I
30 NEXT
40 DISP "I am out!"
```

Of course, BASIC-4X, being a highly structured language, provides EXIT and EXIT FOR statements for such purpose:

```
FOR I=1 TO 10
  IF I=6 THEN EXIT
  DISP I
NEXT
DISP "I am out!"
```

Re: Hrast BASIC-4X Discussion

*Message #2 Posted by **Namir** on 5 Dec 2010, 2:14 p.m.,*
in response to message #1 by HrastProgrammer

Hrast,

Anyway you can setup a PayPal account so that we can purchase the various software you are selling? Sending money through Western Union has a bad taste because of all the scams on the *other auction* site!!

Namir

PS: Your music shows that you are also talented in that area as well as programming.

Re: Hrast BASIC-4X Discussion

*Message #3 Posted by **Howard Owen** on 5 Dec 2010, 6:07 p.m.,*
in response to message #2 by Namir

I second this. My bank goes a little insane every time I send money via Western Union.

Re: Hrast BASIC-4X Discussion

*Message #4 Posted by **HrastProgrammer** on 6 Dec 2010, 1:18 a.m.,*
in response to message #2 by Namir

> Quote:
>
> PS: Your music shows that you are also talented in that area as well as programming.

Thanks Namir! The problem is to find time to do all this, because of other "trivial" activities like work etc. Time is my biggest enemy :-(

In regard to PayPal/Western Union ... When I started with emulators, there wasn't even a sign of PayPal here and last time I checked it still wasn't possible to receive money via PayPal. Perhaps things changed recently, I will check it again.

Re: Hrast BASIC-4X Discussion

*Message #5 Posted by **Eric Smith** on 5 Dec 2010, 9:23 p.m.,*
in response to message #1 by HrastProgrammer

NEXT with a variable name is used for exiting an inner loop:

```
10 FOR I=5 TO 1000 STEP 2
20 FOR J=3 TO SQR(I) STEP 2
30 IF I/J = INT(I/J) THEN 60
40 NEXT
50 PRINT I;
60 NEXT I
```

You might well be able to do this better with your fancy structured BASIC, but this is how it was traditionally done.

Re: Hrast BASIC-4X Discussion

*Message #6 Posted by **Paul Dale** on 6 Dec 2010, 1:19 a.m.,*
in response to message #5 by Eric Smith

Eric got it first go. Being able to exit an inner loop (or two) is useful.

Many Basics pre-evaluate the loop bounds so setting the control variable to the end value didn't always work. It seems this isn't the case with yours though.

- Pauli

Re: hp-15c: From my museum to yours..

*Message #1 Posted by **uhmgawa** on 4 Dec 2010, 11:45 p.m.*

Just encountered this latest arrival:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=190476167188

although it seems to have endured more "road rash" than other recent specimens.

Incidentally I've noticed a trend in 15c auctions where for whatever reason jpegs are apparently being captured while at sea. At least I'd assume so given the apparent difficulty of obtaining an image parallel to the horizon.

HP-97 keyboard sudden failure

*Message #1 Posted by **BobVA** on 4 Dec 2010, 8:01 p.m.*

Hi: The numeric/arithmetic keys (i.e. the right part of the keyboard) have suddenly stopped working on my HP-97. I opened the case and separated then reseated the gold finger contacts between the keyboard and the logic board, hoping to get lucky, but alas... Appears similar to this problem.

Anyone seen this before or have any pointers? It's pretty difficult to trouble shoot this due to all the disassembly/reassembly required, so I'm hoping for something to narrow down the problem.

No easy explanation for the failure. Worked last month when I balanced my checkbook, took it off the shelf and turned it on this month and no numeric keys. No drops, spills, etc.

Regards, Bob

NoVRAM / HEPAX MCODE Question

*Message #1 Posted by **Jeff Davis** on 4 Dec 2010, 7:04 p.m.*

Is there any specific procedure to allocate one of the HEPAX RAM pages as a ROM image? I would like to build a ROM image using the HEXEDIT program. If the HEPAX resides in 8-B pages would "B" be the page to allocate? Or is this even possible? I am assuming you could break the link in order to isolate this 4k block. Please let me know.

Re: NoVRAM / HEPAX MCODE Question

*Message #2 Posted by **Geir Isene** on 5 Dec 2010, 6:28 a.m.,*
in response to message #1 by Jeff Davis

Take a look at the ram2rom feature (files in the Clonix package)

Re: NoVRAM / HEPAX MCODE Question

*Message #3 Posted by **Frido Bohn** on 6 Dec 2010, 5:01 a.m.,*
in response to message #1 by Jeff Davis

Hi Jeff,

It is possible to allocate HEPAX memory for other purposes, such as for ROM-creation.
Basically, you have to change the word at address xFF3 to 300h using HEXEDIT, were x denotes one of the pages 8–B. Then, addresses xFE7 and xFE8 have to be 000h. A detailed description can be found in the HEPAX manual Vol. 1, p. 63.
A neat example how to program a user-developed ROM can be found in the HEPAX manual Vol. 2, p. 153.

What Geir described above is the way how to copy the programmed ROM into Page F via ram2rom into the Nov64 system where Page F usually must be flashed, I believe. Thus, it would be the next step after you did your ROM programming.

Best regards
Frido

RPN for Kids and Poor Guys

*Message #1 Posted by **Joerg Woerner** on 4 Dec 2010, 5:42 p.m.*

The famous HP-35 was neither the calculator for kids nor the choice of poor guys.

And now look at these two RPN calculators introduced in 1975:

The Unitrex 90SC assembled in Hong Kong and not really a high-quality product.

The WhizKid Edition of the National Semiconductor Model 600 obviously named with kids in mind.

Well, times changed!

Have a great weekend,

Joerg

Re: RPN for Kids and Poor Guys

*Message #2 Posted by **Walter B** on 4 Dec 2010, 7:00 p.m.,*
in response to message #1 by Joerg Woerner

The Whiz Kid does it even without an ENTER key - must be either witchcraft or a bit too poor ;)

(Well, I know you can start with a cleared calculator and use + to terminate the first number entry. If that little wizard comes to a point where it needs a single parenthesis, however, the end is near ... ;)

Re: RPN for Kids and Poor Guys- What Memories!

*Message #3 Posted by **John Stark** on 5 Dec 2010, 12:03 p.m.,*
in response to message #1 by Joerg Woerner

The Unitrex 90SC was my FIRST "Scientific" calculator, long before I could afford any of the HP line.

Considered it a vast upgrade from my K& E Slide Rule in 1976.

I have stuck with RPN in one form or another ever since.

My technical and economic migration took me through:

- National Semiconductor Mathemetician

- HP.25 (PROGRAMMABLE !)

- HP.29C (RETAINS PROGRAM IN MEMORY!)

- HP.35 (Traded HP.25 for it; liked classy case design)

- HP.67 (UNIVAC on a Stick and IN YOUR POCKET! - Still have that beast)

And a small but growing collection of Classics today.

Thanks so much for the memory refresh.

Sure is amazing how things have changed today.

Cheers to all..

John Stark

OT: Can you identify this calculator?

*Message #1 Posted by **Joerg Woerner** on 4 Dec 2010, 2:44 p.m.*

Short question:

What was the purpose of this calculator? Just found it in a larger lot and struggle to come up with the reason behind the two metal hooks...

Any help appreciated. There is no manufacturer stated on the product or the PCB, but it was manufactured in Korea around 1976.

Have a great weekend and happy calculator hunting...

Regards,

Joerg

*Message #2 Posted by **Dave Shaffer (Arizona)** on 4 Dec 2010, 2:48 p.m.,*
in response to message #1 by Joerg Woerner

Do those rings snap out? If so, I'll bet those rings were to hold a day-by-day calendar. You flip over the pages as each day goes by.

Re: OT: Can you identify this calculator?

*Message #3 Posted by **Joerg Woerner** on 4 Dec 2010, 2:59 p.m.,*
in response to message #2 by Dave Shaffer (Arizona)

Dave,

They are removeable - but not really easy. They are rather thick and you have to press them together by 5 mm to release them.

Thanks and Regards,

Joerg

82143A printer roller replacement

*Message #1 Posted by **James Grenert** on 4 Dec 2010, 12:57 p.m.*

Hello. Has anyone replaced the paper advance rollers in the 82143A printer? Mine have flat spots and are generally not as sticky as they should be. Thanks! -J. P.

Re: 82143A printer roller replacement

*Message #2 Posted by **Ignazio Cara (Italy)** on 4 Dec 2010, 2:38 p.m.,*
in response to message #1 by James Grenert

Hello, I have exchanged the original rollers with a couple of o-ring and made other modify to the plastic supports. You can see the final product of this kind of work in the following pictures:

Of course, you must take apart the printer head assembly but it's a worth time job.

I can send you a complete paper feed cam with my modify if you send me your damaged part. Let me know if you are interested.

Regards

Ignazio

Re: 82143A printer roller replacement

*Message #3 Posted by **James Grenert** on 4 Dec 2010, 3:12 p.m.,*
in response to message #2 by Ignazio Cara (Italy)

Wow, nice work! I don't have a 82143A service manual in the DVD set. Is it easy to open up and disassemble? I have pretty good mechanical skills (repaired a gummy wheel on my card reader).

Thanks for your help and kind offer!

Re: 82143A printer roller replacement

*Message #4 Posted by **Ignazio Cara (Italy)** on 5 Dec 2010, 2:50 p.m.,*
in response to message #3 by James Grenert

Hi James, I have the service manual but it's not usefull for this kind of job; it show only a exploded view of the printer assembly. If you need this image, tomorrow morning I can send you the file. Let me know a mail address.

Regards

Ignazio

How to clean a 20B ?

*Message #1 Posted by **Karl-Ludwig Butte** on 4 Dec 2010, 10:08 a.m.*

Dear all,

yesterday my new 20B arrived and its design is awsome. Only one problem: after inserting batteries and testing some of the function there are some fingerprints on the high gloss surface. I tried to wipe them off with a microfibre cloth but couldn't remove them completely.

Has anyone an idea how to clean it without doing any harm to the high gloss surface ?

Any hint will be very much appreciated - thank you very much in advance.

Regards

Karl

HP-12c, November 25, 4046, answer

*Message #1 Posted by **Don Shepherd** on 3 Dec 2010, 7:35 p.m.*

In this thread, I asked the question why does the 12c calendar function have an end date of November 25, 4046. I noted that the number of days between the beginning date of October 15, 1582 and the ending date is exactly 899,999, and I wondered why the specified ending date was chosen by the 12c designers. Thomas Klemm thought it might have something to do with the fact that there is uncertaintly whether the year 4000 will be considered a leap year, so perhaps the designers ended the date range at that point because of that. Gerson Barbosa found a 1977 Hewlett-Packard Journal article by Roy Martin, one of the designers of the HP-92 financial calculator, who stated that the ending date was determined by internal register limitations. Thomas Klemm did some analysis of the actual 12c code and did not see the need for this limitation.

Gerson Barbosa found the current address of Roy Martin and I wrote him a letter asking for clarification on this issue. I received his very nice reply today in the mail. It turns out that Thomas Klemm was correct. Mr. Martin stated that they realized that calendar adjustments needed but not yet decided could cause actual calendar dates to deviate from the calculated results in the year 4000 timeframe, hence the choice of the 900,000 limit on the calendar function on the HP-92 financial calculator (and subsequent HP-12c).

Per Mr. Martin: The claim (in the HP Journal article) that the date was determined by internal register limitations and not any special knowledge of the future was tongue in cheek.

To make a long story short, the designers of the HP-92 limited the calendar days function to around the year 4000 (as opposed to year 9999, for example) because they couldn't know if it would one day be considered a leap year, as Thomas Klemm had proposed.

It is great that at least one vintage HP calculator designer is still around to answer such questions.

Re: HP-12c, November 25, 4046, answer

*Message #2 Posted by **David Hayden** on 4 Dec 2010, 1:22 a.m.,*
in response to message #1 by Don Shepherd

Hmm. This get me thinking. It's my understanding that the source code for some of the older models has been lost. I wonder if we could track down some of the old developers and see if they have copies of the source in their records.

Dave

Re: HP-12c, November 25, 4046, answer

*Message #3 Posted by **Thomas Klemm** on 4 Dec 2010, 8:46 a.m.,*
in response to message #1 by Don Shepherd

Hi Don
It is also great that you could find Mr. Martin and clarify the issue. Many thanks for letting us know.

Best regards

Thomas

PS: It shows we have to take care when reading HP Journal articles. It may well be they wanted to trick us.

Muito bom dia, Luiz,

good to read you again :) BTW I've got some expansions and suggestions for your HPDotMatrix1 font - so if you got some spare time to look over it, please tell me. If not, I won't bother you with that.

Cumprimentos,

Walter

Re: Jean-Michel Lecointre (and news about me...)

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 3 Dec 2010, 6:10 p.m.,*
in response to message #6 by Walter B

Hallo, Walter; wie geht's?

Yes, please! Let me know what you have in mind...

As you may have noticed, the TTF files were mostly created in the mid 90's (it´s been long since...) At that time I used a very simple font manager that allowed me to fill all gaps, in fact it allowed me to insert characters were CorelDRAW! didn't. I actually created the fonts in Corel than I used this other software to rearrange some characters into prohibited positions (codes). I should master it back for I am not sure I still remember how to use it...

In time: I thought all characters at DotMatrix 1 were filled... are there any placeholders to be filled? I remember I wanted to add some characters, like the checkmark (kinda 'V', if you know what I mean) but I found no free code. Well, I'm talking about Windows 95/98/ME font coding, I remember seeing new placeholders in some fonts at Windows XP. Would that be the case? If so, I think I'll need another font manager...

Let me know, OK?

Cheers.

Luiz (Brazil)

Benefits from programming in vintage HP machines

*Message #1 Posted by **Namir** on 2 Dec 2010, 2:36 p.m.*

Hi All,

Now that my collection of vintage HP calculator (as well as graphing HP, TI, and Casio machines) is growing again, I feel compelled to program.play with them to justify their presence. Of course using these old limited machines is no match with today's PCs (even the smallest ones). Yet I feel that working with the limited vintage machine challenges us to program in a lean way. The temptation today is to justify "wasteful" programming, such as extra arrays that store duplicate data that we justify for whatever reasons. And that's just the tip of the iceberg.

Do you feel that programming vintage HP, TI, Casio, Sharp, and other machines is a total, partial, nostalgic waste of time, or a nice reminder and exercise in lean programming?

Namir

Re: Benefits from programming in vintage HP machines

*Message #2 Posted by **Kiyoshi Akima** on 2 Dec 2010, 5:46 p.m.,*
in response to message #1 by Namir

> Quote:
>
> Do you feel that programming vintage HP, TI, Casio, Sharp, and other machines is a total, partial, nostalgic waste of time, or a nice reminder and exercise in lean programming?

Yes. :-)

I enjoy programming the vintage machines, but I also enjoy programming newer machines (and computers, for that matter). But if I need to get something done, I'll use the computer (or at least a 50g).

My first calculator had 49 steps of programming memory, and I thought it was wonderful. I also remember when a big computer had 64K of memory and we managed to get real work done on them. Now as back then, I enjoy the challenge of fitting programs into limited memory.

Anyone else?

Re: Benefits from programming in vintage HP machines

*Message #3 Posted by **David Hayden** on 2 Dec 2010, 5:59 p.m.,*
in response to message #1 by Namir

The calculator imposes three (or more) constraints. Your code most be small, your data must be small, and your algorithms must be fast. All three provide intellectual challenges that can help you to think creatively so in that sense they're all useful traits. But lets compare them to "programming in the real world."

Small code doesn't matter very much any more, unless you're dealing with embedded systems or other small devices (like calculators!). Or maybe I'm just showing my own bias - I program for a large distributed system.

Small data can be important if there is a lot of it.

Fast code is definitely important. A bad algorithm can eat up all the CPU power available today, tomorrow, and for thousands of years to come.

Dave

Re: Benefits from programming in vintage HP machines

*Message #4 Posted by **Michael Meyer** on 2 Dec 2010, 6:46 p.m.,*
in response to message #1 by Namir

I wondered this when I first started collecting. Why would anyone waste their time on old calculators? Well... why would anyone waste their time building furniture with hand tools rather than power tools? Why would anyone waste their time restoring old furniture? Why would anyone want to restore and drive an old car or an old airplane? Why restore mechanical watches or clocks? Why would anyone stick with an older spouse? (Better not go there...)

In addition to the already mentioned benefits, it's simply a love and a passion for some of us-- me, anyway. I know that even college-age programmers get a kick out of learning to use older equipment. And it does also help teach the value of concise and elegant solutions. And I still feel a bit strange to think about the thousands of years of scientists, up to and including Einstein, who would have given anything for a "lowly" HP-35...

Re: Benefits from programming in vintage HP machines

*Message #5 Posted by **Jerry Raia** on 4 Dec 2010, 12:08 a.m.,*
in response to message #4 by Michael Meyer

Ditto :)

Re: Benefits from programming in vintage HP machines

*Message #6 Posted by **Allen** on 2 Dec 2010, 7:46 p.m.,*
in response to message #1 by Namir

I think it's tremendously useful.. Just a few months ago I had to write a program to calculate averages and standard deviations. Rather than using a 200 element array and computing the stdev and average separately like the rest of the class, I just used a three element array and accumulated n,x,x^2 then at the very end calculated the stdev and avg. The idea was inspired by the way my first 32sii calculator could average 2 numbers or 50,000 using the same RAM. i ♥ calculator programming.

Another example, Polynomial multiplication and Discrete Time convolution. Through programming, I realized these are the exact same processes. In that case I arrived at the same answer with different approaches, and learned a math lesson besides.

The skill of writing a 22-byte program is indispensable, and missing from modern computer science.

Re: Benefits from programming in vintage HP machines

*Message #7 Posted by **Martin Pinckney** on 2 Dec 2010, 10:25 p.m.,*
in response to message #1 by Namir

While I don't have any "vintage" HP's (my earliest are Pioneers), the programs I write for them (I include Solver routines) are practical working tools in my profession, civil engineering. Not an academic exercise. No one disputes computers are more powerful. But having the convenience of a handheld on the desk/conf. room table for quick problem solving - can't be beat.

Loaded question, Namir! ;^)

Seriously, a handheld calc is the wrong tool for a big job (see David Hayden's criteria above), but I still prefer to program a vintage HP for straightforward tasks instead of struggling with MS Excel on an PC.

If you want to experience the speed or slowness of an algorithm, then implement it on a programmable calculator or even pocket BASIC machine.

Qunestion about extending the HP-71B BASIC

*Message #1 Posted by **Namir** on 2 Dec 2010, 2:30 p.m.*

As I return to dabble in HP71B BASIC programming I am faced with the limitations on variables' names. The JPC ROM (especially using the EMU71 emulator) offers more structured program flow for the 71B BASIC. These improvements are a welcome sign. Of course the 71B BASIC supports GOTOs and GOSUBs that support named labels, which is a much welcome improvement over line numbers.

My question to 71B extension gurus is "Is there anyway to extend the 71B BASIC to support reasonably long variable names?"

Namir

Re: Question about extending the HP-71B BASIC

*Message #2 Posted by **HrastProgrammer** on 3 Dec 2010, 2:37 a.m.,*
in response to message #1 by Namir

"Is there anyway to extend the 71B BASIC to support reasonably long variable names?"

I tried to extend 71B BASIC with longer variable names when developing my HP-71X emulator for HP-48/49, but eventually I gave up. It seems that HP programmers were totally obsessed with packing a variable name into 3 nibbles, so they forgot about the existence (and usefulness) of longer names. This makes the implementation of longer names almost impossible without a big BASIC ROM rewrite, which wasn't worth a trouble to me, because it would probably break a lot of other things.

The above is one thing that irritates me so much about 71B and I really cannot understand how they couldn't provide a proper variable naming after they provide a lot of other extensions and overcomplicated 71B ROM to a Space Shuttle levels. OK, the speed etc., but they could leave this 3-nibble format for short names and implement longer names that will be slower and will consume more memory, but will be there if you need them.

The other thing that irritates me is the lack of proper integer numbers. Yes, 71B has INTEGER variables but those are just for saving some memory because they, in fact, contain truncated real numbers and the calculator (computer) is dealing internally with real numbers only. Because of those REAL=>"INTEGER" conversion, working with INTEGER variables can actually be slower to some extent than working with REAL variables, what a joke. For some reasons unknown to me, HP insists on that REAL/SHORT/INTEGER variable representation on all BASICs ranging from HP-85 (probably even from HP-9830/9845) via HP-75C to HP-71B.

These are just two reasons that motivated me to start developing my own BASIC (Hrast BASIC-4X) for HP-48/49 series a few months ago ;-)

Re: Question about extending the HP-71B BASIC

*Message #3 Posted by **Namir** on 3 Dec 2010, 3:43 a.m.,*
in response to message #2 by HrastProgrammer

Thank you for your insight an detailed explanation. I was hoping that someone can add an extension to complement the more structured program flow control done by the JPC ROM. If I am not wrong the TI-74 BASIC supports names longer than one or two letters, and I am almost certain that some Sharp and Casio pocket computers also do that.

Namir

Re: Question about extending the HP-71B BASIC

*Message #4 Posted by **HrastProgrammer** on 3 Dec 2010, 4:16 a.m.,*
in response to message #3 by Namir

Yes, TI-74 has variable names of up to 15 characters and Sharp PC-E500 has names of up to 40 characters (not sure 100% => should check manual). Lower Sharps (PC-14xx, etc.) have only 1- or 2-character names but, at least, you can have 2-letter names compared to HP-71B, HP-75C and HP-85 (EDIT: and perhaps some other members of HP-8x family) where only letter+number names are supported.

in response to message #4 by HrastProgrammer

Just for sake of truth, the HP86/87 basic has long variable name up to 31 chars with case distinguished.

Olivier

Re: Question about extending the HP-71B BASIC

*Message #6 Posted by **Namir** on 3 Dec 2010, 12:05 p.m.,*
in response to message #4 by HrastProgrammer

I am thinking about writing a Windows-based pre-processor utility that takes a pseudo-HP-71B program with long variable names and generates HP-71B code. The choice I have for this kind of utility is either have a user-defined list of name-translation table or the name translation is done entirely by the utility. The latter can more elaborate since the program has to derive the shorter variable names based on the long ones, device a scheme to deal with overflow in variable names (e.g using up A, A1, ..., A9, A0).

Using a user-defined allows the user to control the mapping of long variable names into short ones, so that he/she can edit/correct the translated program with more ease.

Re: Question about extending the HP-71B BASIC

*Message #7 Posted by **Marcus von Cube, Germany** on 3 Dec 2010, 3:51 p.m.,*
in response to message #6 by Namir

An automatic approach would simply map the first variable to A, the second to B, the 27th to

A1, and so forth. If you start writing your programs on the PC you should stick to it.

Use EMU71 for testing.

Re: Question about extending the HP-71B BASIC

*Message #8 Posted by **Namir** on 4 Dec 2010, 8:44 a.m.,*
in response to message #7 by Marcus von Cube, Germany

That's one approach, the other one is to take the first letter of the long variable name and append a digit, starting with 0 and going up.

I have implemented an Visual Basic utility that is an HP71B program pre-processor that adds line numbers, converts pseudo-labels into line numbers, and replace variables with long names with shorter one. The approach I am using is to let the program extract the list of long-name variables and give the user an option of manually naming them or let the program name them using the above scheme. Once the program uses <letter>0 through <letter>9 it stops translating and yields a blank name to let the user choose a name. The program avoids renaming long-name variables to single-letter variables (A, B, C, ... Z) as these may be used in the source code.

*Message #10 Posted by **J-F Garnier** on 4 Dec 2010, 5:10 a.m.,*
in response to message #2 by HrastProgrammer

Hi Hrast,

I second your opinion about the variable naming scheme on the HP-71B, this is definitevly the major weakness of the otherwise excellent HP-71B Basic implementation. As mentionned by Olivier, the HP-85 had the same limitation, that was overcomed in the HP-86/87, together with much larger program space.

The main practical use of INTEGER/SHORT variable types was for memory saving when using large numeric arrays. Independently of the INTEGER type, the HP-85 and HP-75C (but not the HP-71B!) had a fast integer processing using a clever implementation, see Speed comparison

These are just two reasons that motivated me to start developing my own BASIC (Hrast BASIC-4X) for HP-48/49 series a few months ago ;-)

Great! Let us know more soon, a target specification would be very interesting to discuss :-)

Hi J-F,

Thank you (and Olivier) for clarifying this because I was under impression that HP-86/87 used the same BASIC as HP-85.

> Quote:
>
> Great! Let us know more soon, a target specification would be very interesting to discuss :-)

I don't have the exact specifications yet because this is work in progress and I am experimenting with a lot of things in order to choose optimal solution (in terms of speed and memory consumption). Currently I mainly have goals that I would like to achieve in the final product. I can present those goals in a separate thread if the community is interested in this subject ...

But, despite of the specifications, I can asure you that:

(1) It won't be an ordinary BASIC and in many ways it looks and behaves more like Pascal than BASIC.

(2) It will be fast, and I mean real *fast*.

(3) It will have many fancy and useful things ;-)

I executed your tests from the above link and here are the results:

REAL version (looking almost like your program):

```
10:REM
20:T=TIME
30:X=1
40:FOR I=X TO 1000: NEXT
50:DISP TIME-T
```

Time: 0.943 seconds

In regard to real numbers, Hrast BASIC-4X works internally with 15-digit mantisa/5-digit exponent, all the time. Native REAL variable type is REAL15, but it supports REAL12, as well, and automatically converts REAL15 to REAL12 when storing to REAL12 variable. It also rounds 15-digit mantissa to 12 digits when executing comparision operations.

INTEGER version (looking almost like your program):

```
10:REM
20:T=TIME
```

```
30:X=%1
40:FOR I=X TO 1000: NEXT
50:DISP TIME-T
```

Time: 0.254 seconds

Integer range is -524288..524287.

Native REAL version:

```
REM
T=TIME
X=1
FOR I=X TO 1000 NEXT
DISP TIME-T
```

Time: 0.898 seconds

Native INTEGER version:

```
REM
T=TIME
X=%1
FOR I=X TO 1000 NEXT
DISP TIME-T
```

Time: 0.208 seconds

You can also write it in more packed form:

```
T=TIME:X=1 FOR I=X TO 1000 NEXT DISP TIME-T
```

Timing is the same because FOR/NEXT is inside the same line in all versions. Notice that it doesn't need line numbers or statement separators (except before assignment if you don't use LET) and doesn't allow identifier after NEXT (so, NEXT always closes the inner FOR and FOR/NEXT crossing isn't possible).

All tests were executed on HP-48GX running Hrast BASIC-4X initial "1st step" working prototype ...

> My question to 71B extension gurus is "Is there anyway to extend the 71B BASIC to support reasonably long variable names?"

Once I got my very full-featured text editor going (which used a ton of LEX file material from the Paris user's group), I have written my more complex HP-71 BASIC programs in text. One of the text editor's features uses TRANSFORM to turn it into BASIC, but it also replaces long variable names with the HP-71 kind before the transformation, and additionally adds the line numbers and takes out blank lines and so on. This allows making the program very readable while you're working on it. You can use indentation for conditions, loops, etc., vertical alignment, and other things that make it easier to visually factor. I use a particular character to concatenate lines so even though the HP-71 requires certain things to be kept all on the same line, I can put them on separate lines. I have an extra 160K of RAM, so memory space is not a problem.

*Message #8 Posted by **Keith Midson** on 2 Dec 2010, 6:36 p.m.,*
in response to message #7 by Massimo Gnerucci (Italy)

I think I remember seeing one of these on TAS a few years ago - my bid was far too low from memory! Don't suppose you want to sell it to me Massimo? ;)
My prototype seems to be a very early one - there are a few differences from the final design. The battery compartment is very different (batteries slot into the end of the calculator, rather than on the bottom), layout of keys are different, overall size is also slightly smaller. Unfortunately it doesn't work (maybe it never did?).
Cheers, Keith

The HP17B and 27S were both introduced on 4 January 1988, in conjunction with the Winter Consumer Electronics Show that year in Las Vegas. The next "batch" was the 22S and 32S on 1 June 1988 at the Summer CES in Chicago, followed by the 42S and 14B on 31 October 1988; the 20S, 21S and 10B on 3 January 1989; the 17BII on 6 January 1990 and 32SII on 1 March 1991.

Which calcs have click-and-rotate keys?

*Message #1 Posted by **Jim Yohe** on 1 Dec 2010, 2:30 p.m.*

Which models of calculators have click-and-rotate keys? I can't seem to find that even on the HP website but I could be using the wrong search term "click-and-rotate".

Re: Which calcs have click-and-rotate keys?

*Message #2 Posted by **Tim Wessman** on 1 Dec 2010, 3:27 p.m.,*
in response to message #1 by Jim Yohe

Everything except the cheapest products. Anything ~30$ or higher (with the exception of the 20b) has hinged keys.

TW

Re: Which calcs have click-and-rotate keys?

*Message #3 Posted by **Jim Yohe** on 1 Dec 2010, 10:56 p.m.,*
in response to message #2 by Tim Wessman

I wonder why I've seen customer comments regarding the 17BII+ having bad keys if it too has the click-and-rotate style keys.

Re: Which calcs have click-and-rotate keys?

*Message #4 Posted by **Tim Wessman** on 2 Dec 2010, 1:36 a.m.,*
in response to message #3 by Jim Yohe

Because ya'll are super picky. ;-)

The real issue boils down to this - a keyboard produced now for a fraction of the cost of one from many years ago won't be as good as an original that cost 3-4 times the price. (this is ignoring potential software problems which are a whole different game)

We try to make them good and it drives *us* (the R&D people) nuts when there are keyboard problems, but unfortunately I am not king of the world. If 99.9% of the customers are happy, marketing and business people are as well.

That .01% is the most vocal though. . .

The fact that the definition of a good keyboard is a subjective thing doesn't help either. I've heard people who think the 48g had a great keyboard, and others who think it is crap. Throw in incositent manufacturing due to everyone trying to save cost, and there is plenty of potential for some units to be perfect, while others aren't.

Key features and picky people

*Message #5 Posted by **Walter B** on 2 Dec 2010, 4:02 a.m.,*
in response to message #4 by Tim Wessman

IMHO keys were - and to some extent still are - one of the "key" features putting HP ahead of the crowd since 1972. The opposite is true as well: if HP would become unable to deliver "good keys" then all calculator manufacturers are equal in this feature, and other points will determine the buyer's choice.

So, again IMHO, **a "good key" basicly is one giving you an unambiguous tactile feedback when that key is pressed and registered.** Nothing more.

Consequence: If you get this tactile feedback, you can rely on the keystroke being registered. BTW, this works fine with all the vintage HP pocket calcs I've experienced so far. Additionally, most of their keyboards were also designed well in respect of function grouping and key locations, but that's another topic and is changed easily - after all, it's only a match table connecting keys and functions. The basic key hardware and registering firmware has to work reliably in any case. After all, a calculator shall be a professional tool.

Corrolary: If you happen to observe a single keystroke being not registered though the tactile feedback was given, you're extremely alarmed since this shakes the basis of your trust in your calculator! So if people would observe this on a true HP calc and talk about it, I won't call them picky but concerned.

As mentioned above, this topic was discussed earlier in this forum already several times, but that's what it all boils down to IMHO.

Ceterum censeo: HP, launch a 43S (with a good keyboard, of course :)

Walter

Edited: 2 Dec 2010, 5:48 a.m.

Walter, I would respectively add one thing **more.** The keyboard should **last!** That's what brought me to HP to begin with - I had two too many TI keyboards fail.

Re: Key features and picky people

*Message #7 Posted by **Walter B** on 3 Dec 2010, 1:50 p.m.,*

in response to message #6 by Martin Pinckney

Martin, you're right of course. OTOH my posting stated exactly this already, since a key will end being a good one as soon as said condition is true no more d;-)

If, however, you were talking about double-shot keys then you're right again: that's another important feature, though I'd rate that slightly lower than the one I stated.

Re: Key features and picky people

*Message #8 Posted by **David Hayden** on 4 Dec 2010, 1:37 a.m.,*
in response to message #5 by Walter B

Quote:

> So, again IMHO, **a "good key" basicly is one giving you an unambiguous tactile feedback when that key is pressed and registered.** Nothing more.

I don't think it's a requirement that you get tactile feedback. I get no such feedback from my computer keyboard but it doesn't bother me because the key always registers.

I would add a couple of other requirements:

- the key registers once when pressed once (i.e., de-bounce).
- the key registers twice when pressed twice (i.e., good de-bounce :))
- pressing a second key registers, even if the first one hasn't yet been released.
- The legend on the keys remains visible after heavy use

Re: Key features and picky people

*Message #9 Posted by **uhmgawa** on 4 Dec 2010, 5:00 p.m.,*
in response to message #8 by David Hayden

Quote:

> I don't think it's a requirement that you get tactile feedback. I get no such feedback from my computer keyboard but it doesn't bother me because the key always registers.

They are different use cases. The very limited travel of a calc keyboard switch benefits from sharp tactile feedback where a computer keyboard comparatively does not. IIRC the latter experiment with pronounced tactile feedback seemed to die off with the original XT keyboard.

Although strictly speaking the molded silicone domes in the garden variety PC keyboards do exhibit some tactile feedback when inverted. But it is nowhere as distinct as a metal dome.

Quote:

> I would add a couple of other requirements: [ul]
> - the key registers once when pressed once (i.e., de-bounce).

- the key registers twice when pressed twice (i.e., good de-bounce :))

TI seems (seemed?) to have an awful time figuring this out. Unsure if the debounce was attempted in HW or SW but the horrid result (at least for models I've owned) rendered the calc effectively useless.

Re: Which calcs have click-and-rotate keys?

*Message #10 Posted by **Karl Schneider** on 2 Dec 2010, 11:09 p.m.,*
in response to message #4 by Tim Wessman

> Quote:
>
> Because ya'll are super picky. ;-)

Well, count me as picky, too -- because I believe that the hinged design that allows the key to move only like a mechanical rocker, regardless of where it is pressed, is far superior to a design that allows the key to wobble as though it is connected to a ball-and-socket joint.

The "vintage" HP-49G's keys have acceptable tactile feedback and reliability, but slow the user down because they wobble when pressed off-center -- and not because they are made of rubber. I use several remote controls that cause me similar exasperation by failing to register key presses.

A mid-1980's TV remote I use, however, has plunger-style buttons that move only up and down -- and always work properly.

I also agree that the reliability and durability of the keyboard will determine the success and acceptance of the calculator.

A better photo and some history here: (Caution: Ad-laden page that is slow to download)

Ours was the four-button later model from the 1960's for black-and-white sets, similar to

this one for color TV's. In function at least, these didn't change much into the 1970's, until infrared remotes arrived later.

AFAIK most of those complaints were about the first 17BII+ (non-silver) (see Kieth Midson's post on "Evolution of the HP17B - prototype to current in pictures", the second last one was apparently the "bad" model), the latest one appears to be better. I believe it was similar with the 10BII (I have the latest model and so far it is OK).

Which calculator passes the first test?

*Message #1 Posted by **Tommy** on 1 Dec 2010, 2:15 p.m.*

First, (-) is the change sign key and (x^2) is the square key.
If you hit (-) 2 x (-) 2 = the answer is 4 on most calculators. But if you hit (-) 2 (x^2) = you probably end up with negative 4. As far as I know, the only non-HP calculator that gives the correct answer is this Sharp .
Do you know about any other non-HP, passing this test?
What about the algebraic HP10s and SmartCalc300s?
/Tommy

Re: Which calculator passes the first test?

*Message #2 Posted by **Jim Yohe** on 1 Dec 2010, 2:34 p.m.,*
in response to message #1 by Tommy

Are you suggesting that HP calculators handle that wrong or that they all do it correctly? My 32SII and 30B both return 4 not -4.

Re: Which calculator passes the first test?

*Message #3 Posted by **Mark Storkamp** on 1 Dec 2010, 2:56 p.m.,*
in response to message #1 by Tommy

I believe -2^2 is -4. Unless you mean $(-2)^2$, which is 4. It's not clear from what you wrote, what you expect the correct answer to be.

Re: Which calculator passes the first test?

*Message #4 Posted by **Tommy** on 1 Dec 2010, 4:22 p.m.,*
in response to message #3 by Mark Storkamp

All my HP:s gives the correct answer 4, but most calcs gives the wrong answer -4. My question is: What other calcs gives the right answer. Negative 2 squared is +4.
/Tommy

Re: Which calculator passes the first test?

*Message #5 Posted by **Tim Wessman** on 1 Dec 2010, 4:40 p.m.,*

Both wolfram alpha and google disagree. . .

Just saying. :-)

TW

Re: Which calculator passes the first test?

*Message #6 Posted by **Tommy** on 1 Dec 2010, 5:07 p.m.,*
in response to message #5 by Tim Wessman

Do you suggest that all HP are faulty? :-)
Of course, -2^2 is negative 4. But that is not the issue here. I want to know what calcs I can recommend to my students. They receive all kind of random answers when they use the (-) key on their calcs. The Sharp D.A.L is ok in this respect.
HP is out of the question here in Sweden. /Tommy

Re: Which calculator passes the first test?

*Message #7 Posted by **DeboT** on 2 Dec 2010, 6:14 a.m.,*
in response to message #5 by Tim Wessman

But when entering on Wolfram Alpha, you use the minus key. Is there an equivalent "change sign"? When using the "change sign" on a calculator, are you not making the negative a part of the characteristic of the number? When using the minus sign, it is equivalent to "0 - number", in which case "0 - number^2" indeed results in a negative answer. Thus the Wolfram Alpha answer is correct, as you are entering a minus, not a "change sign".

Re: Which calculator passes the first test?

*Message #8 Posted by **Kiyoshi Akima** on 1 Dec 2010, 4:58 p.m.,*
in response to message #4 by Tommy

My HP 35s gives "Syntax Error" when I press +/- 2 x^2 ENTER in ALG mode.

I can get either -4 or +4, depending on whether I calculate -SQ(2) or SQ(-2).

Re: Which calculator passes the first test?

*Message #9 Posted by **DeboT** on 2 Dec 2010, 6:16 a.m.,*
in response to message #8 by Kiyoshi Akima

Restricting the input to -SQ(2) or SQ(-2) seems a clever way to avoid the controversy :)

The 33s in ALG mode: 5, +/-, x^2, ENTER yields:
$(^{-}5)^2=$
25

and MINUS, 5, x^2, ENTER yields:
$0-5^2=$
-25

Exactly what I would expect ;)

> First, (-) is the change sign key and (x2) is the square key. If you hit (-) 2 x (-) 2 =

I am still not clear what you mean. Are you talking ALG or RPN calcs?

Since you include the = key, I might assume ALG. But I don't understand your notation. You stated that (-) represents the CHS or +/- key. But then in your example, the CHS key *precedes* the argument, while to my knowledge it always *follows* the argument, whether ALG or RPN model.

And does the "x" in your example represent the multiplication key, or the quantity x? I don't see the square appearing in your example.

Re: Which calculator passes the first test?

*Message #11 Posted by **Hal Bitton in Boise** on 1 Dec 2010, 5:28 p.m.,*
in response to message #4 by Tommy

4 is the correct answer only if the expression is (-2)^2. -2^2 is (correctly) seen by most calculators as "the negative of 2 squared", or even "negative 1 times 2 squared", which is -4, as exponentiation takes precedence over multiplication, and there no parenthesis to dictate otherwise. On my 50G in algebraic mode, -2^2 = -4 (correct), and (-2)^2 = 4 (also correct), and finally, SQ(-2) = 4 (correct). I must go now and quickly change my 50G back to RPN mode!! Best regards, Hal.

Re: Which calculator passes the first test?

*Message #12 Posted by **Walter B** on 1 Dec 2010, 5:56 p.m.,*
in response to message #4 by Tommy

The good old math standard precedence is "exponentiation > multiplication > addition" (in German: "hoch vor Punkt vor Strich" - we're more concise here :)), so -2^2 = -4 (if no parentheses are set) regardless of whether you see the unary minus as a multiplication by -1 or something like 0 - ...

(-2)^2 is a different cup of tea :)

Re: Which calculator passes the first test?

*Message #13 Posted by **bill platt** on 1 Dec 2010, 8:18 p.m.,*
in response to message #12 by Walter B

English is even more concise:

```
P E M D A S

Parenthesis
Exponentiation
Multiplication & Division
Addition & Subtraction
```

I looked at this very problem in detail a few years ago. For most calculators and calculator users, the problem originates with a misunderstanding of the way each machine works and especially what the CHS or +/- key does, as compared to the - key.

Some calculators parse a command line. Others operate and never parse. An RPN machine operates, an RPL machine parses. Some ALG or SemiALG machines parse some things but operate

with others. **Edit: note that RPL parses when using an Algebraic Object delimited by single quotations. It operates on stack items or a valid command line object**

The traditional "Alg" machine (which is better described as infix arithmetic with postfix functions) is an operator not a parser. DAL and SVPAM etc are parsers.

Then there are machines which have documented features which may be confusing. The 32sii equation list recognizes a "unary minus" with precedence over exponentiation, but it has a bug when it is in the initial position! See Craig Finseth's HPDatabase. The 33s and 35s eliminated this confusing unary minus feature and they are correctly documented.

Then there is the confusion of the fact that some machines have more than one mode, where one mode has a line interpreter but the other operates (e.g. 17bii, 27s, 32sii, 33s, 35s). Some machines will allow the +/- key to work as an operator only, while others allow it to function as a toggling character key. Some machines treat both the - and the +/- as the same thing, others as different things. And then some machines such as the 35s have a "high" minus sign when you push the +/- and a low one with the - even if there is no functional difference....

It is very confusing and totally MACHINE SPECIFIC. I haven't found any machines that are perfect except for the 48G series and descendants, and the pure RPN machines. I haven't looked at the latest Sharp/Casio/Ti so it may be the case that some of them are clearcut now.

In RPN, there is never an issue, as there is NO PRECEDENCE because there is only operation, not line interpretation/parsing.

[edit: small grammatical error and incorrect reference]

Thank you, Bill, for straighten this out for me! So my question remains: are there any other clear cut non-RPN calcs out there? /Tommy

Re: Which calculator passes the first test?

*Message #15 Posted by **bill platt** on 2 Dec 2010, 7:26 a.m.,*
in response to message #14 by Tommy

Sure. The 20s is very clear cut. I expect that the old 21s and 22s were also clear.

I can't speak to the non-hp because I don't have any modern ones in front of me at the moment.

I find the 27s clear enough, even though it has two modes.

The biggest problem is a lack of care in the use of the tools. When was the last time you saw a student follow RTFM41?

In ALG mode I get a SYNTAX ERROR when using the minus-key:

```
-2
```

On the other hand I get the expected result with the +/- key:

```
¯2
```

So to me there **is** a functional difference.

> Quote:
>
> In RPN, there is never an issue, as there is NO PRECEDENCE because there is only operation, not line interpretation/parsing.

This is not quiet true as entering a number changes the behaviour of the CHS key. Just think of what happens after the EEX key. There's a peculiar behavior in the HP-35: when the key following the CHS is a number key the negative sign is considered part of this number. So the following example will give 3 instead of -3 what probably most of us would expext:

```
5
ENTER
CHS
2
+
```

In addition to that the stack doesn't contain 5 in the Y-register. So you could enter negative numbers as you read them. However I think it was a wise decision to change that in later models.

Re: Which calculator passes the first test?

*Message #17 Posted by **bill platt** on 2 Dec 2010, 8:55 a.m.,*
in response to message #16 by Thomas Klemm

Hi Thomas, Thanks for the reply. I don't have an original HP 35--maybe it is a good thing as that would confuse me! (I am a voyager and forward guy).

I think I am mixing up the 32sii 33s and 35s wrt the high minus. Indeed the 35s is a completely different animal than even the 33s in how it handles entry and interpretation. As I remember, when in ALG mode, it is a parsing machine, whereas the 33s is an operation machine but with the added feature of a history reporting line that shows how it all comes together. (all three are of course parsers within the equation list mode). Later I'll pull the 33s out and have a look. Unfortunately one of my kids lost the 35s so I can't have a look at it!

Re: Which calculator passes the first test?

*Message #18 Posted by **Walter B** on 2 Dec 2010, 9:36 a.m.,*
in response to message #16 by Thomas Klemm

I can confirm this "feature" of the original 35. So I looked what happened to it:

1. HP-35: 5 ENTER CHS 2 + results in 3.
2. HP-45: 5 ENTER CHS 2 + results in 7. So does 55, 65, 80, 21, 22.
3. HP-91: 5 ENTER CHS 2 + results in -3. And so it stays until the 42S. And the "new" calcs including the RPL-machines keep it this way.

Interesting :)

Edited to add some Woodstocks and the HP-91 as first HP calculating the way we are expecting it today. Anybody having some more Woodstocks at hand for checking?

It seems the stack isn't lifted after CHS thus -5 is overwritten by the following 2. I consider that a bug: the negative sign shouldn't be silently ignored. Was this already known before?

5 ENTER CHS 2 + results in 7

*Message #24 Posted by **Walter B** on 3 Dec 2010, 1:42 p.m.,*
in response to message #23 by Thomas Klemm

> Quote:

> It seems the stack isn't lifted after CHS thus -5 is overwritten by the following 2.

That's my guess, too. Still I don't have any information about the history of this "feature" (see my previous post) beyond the fact that it was dropped apparently early in 1976. Anyone of the old experts knowing something about the circumstances?

Re: 5 ENTER CHS 2 + results in 7

*Message #25 Posted by **Thomas Okken** on 3 Dec 2010, 1:58 p.m.,*
in response to message #24 by Walter B

It is a bug. I remember reading about this ages and ages ago, and I thought I remembered seeing this behavior on the HP-25 as well. As luck would have it, I'm working from home at the moment, so I could get my HP-25 out of its drawer, and I confirmed, 5 ENTER CHS 2 + returns 7, both from the keyboard and in a program.

Re: 5 ENTER CHS 2 + results in 7

*Message #26 Posted by **Walter B** on 3 Dec 2010, 4:25 p.m.,*
in response to message #25 by Thomas Okken

Thanks, Thomas. Your result fits well in the line since the HP-25 was made before the HP-22 according to the museum. Does anybody have a working HP-27 for checking?

Re: 5 ENTER CHS 2 + results in 7

*Message #27 Posted by **Thomas Okken** on 3 Dec 2010, 6:31 p.m.,*
in response to message #26 by Walter B

You're welcome! For what it's worth, my HP-25 has a serial number that starts with 1605, i.e. made in February 1976.

Re: 5 ENTER CHS 2 + results in 7

*Message #28 Posted by **Walter B** on 5 Dec 2010, 11:34 a.m.,*
in response to message #27 by Thomas Okken

OK, I have the results of some more models now. So the updated table looks like this:

1. HP-35 until and including V4: 5 ENTER CHS 2 + results in 3. So this looks like a prefix CHS being perfectly legal in numeric input of the mantissa. Checked by CLR CHS 5 ENTER CHS 2 + resulting in -7, q.e.d. In exponents, BTW, pre- and postfix CHS are allowed until today.

2. HP-45: 5 ENTER CHS 2 + results in 7. So does 55, 65, 80, 21, 22, 25, 27, 25C. But 5 ENTER CHS + returns 0 as expected. Seems CHS is executed in any case but is undone if a *first digit* follows:

```
    display on a 25C or a 32E (see below):
CLX              0.0      0.0
CHS             -0.0      0.0
1                1.       1.
CHS             -1.      -1.
2               -12.     -12.
CHS              12.      12.
3                123.     123.
ENTER            123.0    123.0
CHS             -123.0   -123.0
4                4.       4.
+                127.0   -119.0
```

   Please note CHS does not terminate the input sequence in either case. So the last CHS on the 25C belongs to the input of 4 and is thus undone when 4 is entered!

3. HP-91: 5 ENTER CHS 2 + results in -3. So CHS is now recognized as an operation as soon as an input is completed (e.g. by ENTER) - thus it operates on 5 in X, turning it to -5, and 2 is added to this as we expect it. CHS will not work after CLX, it needs at least 1 digit put in but may be used arbitrary times during numeric input of one number as before. - The same result is returned by the 67, the Spices, Voyagers, and Pioneers. And also the "new" calcs including the RPL-machines keep it this way.

For sake of completeness: Has anybody access to a working 29C and/or 19C? Could you please check it and report the results?

I don't remember having read anything about this change of concepts here for some years - so let me ask: is this known for longer already?

TIA for enlightenment(s).

I don't agree with you here: instead I assume that -123 is overwritten by 4 since CHS doesn't enable the stack lift.

The CHS has two different modes of operation: either as part of the input of a number or to change the sign of the X-register. In the HP-35 it isn't clear which mode to use until **after** the next key-stroke. So first it changes the sign of X. But if the next key is a number, this change of X is reverted and instead the negative sign is considered part of the number. It is clear that CHS can't enable the stack lift. Otherwise the following two sequences leave a different number of elements on the stack:

```
5 ENTER CHS 2 +
Y: 5
X: 3

5 ENTER 2 +
X: 7
```

So I think this magic handling of the CHS was removed, but enabling the stack lift wasn't added.

In addition to your tests I suggest the following variants:

1. make sure the stack lift is enabled, e. g. by performing an operation like +
2. use RCL instead of entering a number after CHS

Store 2 in the register (2 STO) and make sure the stack is empty:

	5 + CHS RCL +	5 ENTER CHS RCL +	5 + CHS 2 +	5 ENTER CHS 2 +
HP-35:	-3	7	3	3
HP-45:	-3	7	-3	7
HP-25:	-3	-3	-3	7
HP-91:	-3	-3	-3	-3

I have verified these results only with online emulators of the HP-35/45/25. The results for the HP-91 are just my expectations.

Best regards
Thomas

Added the results for the HP-25.

From Walter's original statement:

> Quote:
>
> 1. HP-35: 5 ENTER CHS 2 + results in 3.
> 2. HP-45: 5 ENTER CHS 2 + results in 7. So does 55, 65, 80, 21, 22.
> 3. HP-91: 5 ENTER CHS 2 + results in -3. And so it stays until the 42S. And the "new" calcs including the RPL-machines keep it this way.

From Thomas' post:

> Quote:
>
> The CHS has two different *(modes of operation)*: either as part of the input of a number or to change the sign of the X-register.

Yes, that's the crux of the matter. I believe that HP, in those early years, was still working out the important nuances of the CHS function. Its implementations on the HP-35 and HP-45 were flawed, in that user input could sometimes get completely changed during data entry.

Characteristics of proper CHS functionality in RPN:

- When CHS is utilized to input a negative number, prior entry of at least one digit or the radix point should be required. Saturn-processor calculators (not the handheld computers, such as the HP-71B) will accept 0 or the radix point as that initial entry; prior models will not.

- Upon using CHS to negate a final result left in the x-register by ENTER or other means, stack lift should always be (re-)enabled.

The HP-91 and *most* subsequent models implemented CHS correctly. A few early models on the HP-45's software-development track retained its flawed CHS functionality. Also, a subtle bug got slipped into many (but not all) Spice-series and Voyager-series models:

HP-15C bug -- CHS and Stack Lift

-- Karl

Clarified several statements, based in part on new information.

Re: 5 ENTER CHS 2 + results in 7

*Message #31 Posted by **Walter B** on 5 Dec 2010, 7:12 p.m.,*
in response to message #30 by Karl Schneider

> Quote:
>
> The HP-91 and subsequent models implemented CHS correctly

Not quite. The timeline is as follows according to HPDATAbase:

```
1975        1976
1977
09 10 11 12 01 02 03 04 05 06 07 08 09 10 11 12
01 02 03 04 05 06 07

22 .. .. .. .. .. .. .. 27 .. 25C (all these
return 7)
                  91 .. .. .. 67 .. .. .. .. ..
.. .. .. .. .. .. 29C etc. return -3
```

So there was some overlap. Seems it took HP significantly more than 4 months to implement the new CHS-handling in new Woodstock models, though it was "only software".

The correct answer to **what**? $-2^2=-4$, and $(-2)^2=4$. This is the convention that's universally used in mathematics textbooks, and yet you seem to imply that $-2^2=-4$ is "wrong". Given that you've also indicated that you actually **teach** this stuff, that makes me think that you really, really need to do your homework, before looking for calculators whose behavior matches your mis-informed idea of mathematical notation.

BTW, as Hugh mentioned, this was discussed on this forum not too long ago. See here.

If you really want to teach your students well, teach them how the notation works **as it is used in textbooks**, and, if this actually comes up in your course, **also** mention how certain calculators and programming languages differ from the textbook standard.

> I believe -2^2 is -4. Unless you mean $(-2)^2$, which is 4. It's not clear from what you wrote, what you expect the correct answer to be.

I disagree, if I have -2 on the display, and square it, it is to be interpreted as (-2)^2, if I wanted -(2^2), I would enter 2^2, then (+/-). The negative is part of the number (I am talking about having used the change sign, not minus), I did not enter "0 - 2^2", in which case the 2 is separate of the minus. What calculator when squaring a real number only squares the fractional part?, or when given a proper fraction only squares the fractional part?

By the way, now that your calculator has -4 as the answer for -2^2, press the ^2 again and see what you get. -16?, NO most will give 16 as they will do ANS^2 - so now it does see the negative as part of the number. A bit inconsistent I'd say.

Further Edit:
As far as I recall all my LED/VFD scientific calculators give + when squaring a negative number. Somewhere along the line when DAL, VPAM etc. calculators came out someone thought it "good" to let a negative number (entered with change sign) be the same as "0 - the number" and thus squaring it results in a negative answer. Now many people in the world are justifying this?

in response to message #43 by Tommy

> Quote:
>
> But the intresting part is that you can not rely on the results.

Why? You just have to know what you're doing. As Bill explained above, there are different ways calculators handle such problems. A major advantage of RP**N** is it acts in a very consistent way: number first, operation second - no need to care for precedences etc.

So 17 +/- x^2 will always result in 289. OTOH 17 x^2 +/- equals -289. The world can be so simple ;)

Exception (on my 42S): 17 +/- E +/- 2 will result in 0,17 as well as 17 +/- E 2 +/- while the second input is more in line with RPN principles.

Side track: Remember STO12 being an operation in RP**N**, so 17 +/- STO12 will store -17 in register 12. IMHO one disadvantage of RP**L** is they got these things mixed up so you have to enter 17 +/- ENTER 12 STO to reach the same (if numeric registers were allowed). End of side track.

Re: Which calculator passes the first test?

*Message #45 Posted by **bill platt** on 2 Dec 2010, 7:31 a.m.,*
in response to message #41 by Tommy

Note my discussion of Operation versus Parse. Answer^2 is an operation on the answer.

Re: Which calculator passes the first test?

*Message #46 Posted by **DeboT** on 2 Dec 2010, 8:46 a.m.,*
in response to message #45 by bill platt

My point is exactly that a negative number created with a "change sign" should be operated on in it's entirety and not parsed.

Re: Which calculator passes the first test?

*Message #47 Posted by **bill platt** on 2 Dec 2010, 8:52 a.m.,*
in response to message #46 by DeboT

Yes, but this is of course machine specific. If the function of the +/- key is for entry of characters into the line, then it will be line interepreted. See for instance the 48G

Re: Which calculator passes the first test?

*Message #48 Posted by **bill platt** on 2 Dec 2010, 7:36 a.m.,*
in response to message #40 by DeboT

> Quote:
>
> I disagree, if I have -2 on the display, and square it, it is to be interpreted as (-2)^2

Note my discussion of line interpreter/parser versus operation. If you have -2 on the display and you operate on it, of course you get +4. That is what an RPN machine will do, or an older "algebraic" because even the latter is postfix and operation-based (is the same as RPN). Newer machines line-line interpret *expressions* rather than operate on numerical entities. However, the "answer" function operates on the answer.

This is always, first and foremost, a problem of not following RTFM41 rather than a machine defect or bug. However I do have opinions regarding good versus bad design, but even the "bad" designs work correctly if one bothers to learn how they work.

I would rather say that "bad" designs work as the designer *intended*, but not necessarily *correctly*. Of course *correct* being a bit subjective in the current topic :).

in response to message #40 by DeboT

HA! Even Microsoft agrees with ME :P
Try on Windows calculator:
2, +/-, x^2 = ; the answer is +4
now try
-, 2, x^2 = the answer is -4

well, for whatever credit one can take from microsoft *grin*

in response to message #1 by Tommy

this discussion came up a while back. it turns out that the operator precedence of unary minus is different for different manufacturers. we even found differences amongst different casio models.

the problem is compounded when you allow two minus buttons, ie regular operator minus and (-).

Re: Which calculator passes the first test?

*Message #54 Posted by **Crawl** on 1 Dec 2010, 11:10 p.m.,*
in response to message #1 by Tommy

If you have a calculator, you should know how it works, so you can make it give you the answer you think it should. That's the only issue here.

Let's put this a different way. Sin30 (in degrees) is 0.5.

But do you have a calculator that lets you enter 30 Sin, you might get 0.5.

But what's 30 Sin? That's 30 times the Sin of nothing! It's meaningless!

That seems kind of like what you're saying.

Re: Which calculator passes the first test?

*Message #55 Posted by **bill platt** on 2 Dec 2010, 7:43 a.m.,*
in response to message #54 by Crawl

That's right. GIGO. 30 SIN is postfix. sin(30) is line interpreted. sin 30 = is used in an infix machine, for instance, the old SHARP EL 5020. Of course the manuals don't necessarily bother to explain the inner workings, especially the cheap Non-HP designed machines with little fold out manuals. Even HP manuals won't always discuss the parse versus operation aspect--but note that until recently, no calculator parsed expressions! By recently, I mean early 90s or late 80s. I am showing my age :-D

Re: Which calculator passes the first test?

*Message #56 Posted by **Marcus von Cube, Germany** on 2 Dec 2010, 9:28 a.m.,*
in response to message #1 by Tommy

Manufacturers seem to disagree about the interpretation of (-)2^2 even within their own product range:

Sharp: None of my algebraic Sharp calculators returns +4. I do have the EL-9200/9300/9600 and an EL-5120. Are you sure, the EL-520WBBK does?

Casio: None of my algebraic Casio calculators returns 4. I tried with a BASIC computer (PC-1262), some newer algebraics, and various graphics machines (old and recent).

The Canon F-300P returns +4. Likewise the TI Galaxy 67, while all the TI graphics calculators, including the CAS machines, and also the TI-34 multiview return -4.

Now to HP: The 30s and the 9g both return -4. Same for the 38G. The RPL machines lack the postfix ^2 operator as has already been mentioned. -2^2 returns -4.

Return -4 seems to be the rule, +4 the exception.

Re: Which calculator passes the first test?

*Message #57 Posted by **Walter B** on 2 Dec 2010, 10:17 a.m.,*
in response to message #56 by Marcus von Cube, Germany

Sorry, I disagree about the RPL-machines. You'll find x^2 on e.g. the HP-48SX easily (gold shifted square root). And it behaves mathematically correct, i.e. 2 +/- x^2 equals 4.

Re: Which calculator passes the first test?

*Message #58 Posted by **bill platt** on 2 Dec 2010, 3:02 p.m.,*
in response to message #57 by Walter B

I should have elaborated. When you do that, using the stack, it is an operation on the -2, which is in the command line.

If you do this:

'-2^2' ENTER EVAL

Then it is parsed.

Re: Which calculator passes the first test?

*Message #59 Posted by **Tommy** on 2 Dec 2010, 1:50 p.m.,*
in response to message #56 by Marcus von Cube, Germany

Danke! This is what my question is all about
I am not sure about the EL-520WBBK, but the EL-506WBBK does return +4. Both are D.A.L. (Direct Algebraic Logic).
This one also returns +4: Karce KC-156
Sorry about all confusion I created. Hopefully HP returns with a cheap scientific RPN calculator in the future. /Tommy

Re: Which calculator passes the first test?

*Message #60 Posted by **Kiyoshi Akima** on 2 Dec 2010, 12:56 p.m.,*
in response to message #1 by Tommy

Tommy, why are you expecting RPN and non-RPN machines to give the same result for the same sequence of keystrokes?

(-) 2 x^2 in algebraic is calculating the same result as 2 x^2 (-) in RPN. (-) 2 x^2 in RPN is ((-) 2) x^2 in algebraic. I'll leave it to you to count the keystrokes and make any decisions about efficiency.

*Message #61 Posted by **bill platt** on 3 Dec 2010, 11:58 a.m.,*
in response to message #1 by Tommy

Hi Tommy,

Re-reading your question in light of all the commentary, please read the following.

The algebraic expression -2^2 is equal to -4. This is a fact of uniform notation. If you think this is incorrect, then that would be a problem. However, what I think is leading you to believing that calculators are giving incorrect answers is that you are used to the older style of machines, where you *operate* on what is displayed. In this case, the problem you are actually trying to figure out is the following:

```
(-2)^2
```

An older machine such as a 1970s Ti SR70 or an HP 20s, or a 27s or an HP 33s set in ALG, or any RPN machine will work identically:

This type of machine OPERATES on the x-register. A currently available HP is used in the example below:

```
expression:   (-2)^2
keystrokes                display
33s ALG mode

2                         2_

.....................................

+/-                       -2_
.....................................
                          (-)2^2
x^2                       4
.....................................

[note how cool this machine is in ALG mode. It uses the
old-style post-fix functions operating on numeric line
entries, but it displays the proper complete algebraic
notation in the upper line. Pretty damn cool!]
```

If you are using a more "modern" machine with a "textbook" type of interface, you will have to type in the expression correctly according to standard notation. (note however that there is variation from machine to machine even here--some allow implicit multiplication, some don't follow standard rules exactly etc [ex: equation list of 32sii which has a unary minus].

An example of a properly functioning PARSED LINE INTERPRETER is found in the currently available HP

33s Equation List:

```
(                              (
- {or +/-}                    (-
2                              ( 2_
)                              (-2)_
y^x                            (-2)^_
2                              (-2)^ 2_
ENTER                          (-2)^2
ENTER                           4

--or---

x^2                            SQ(_
+/- {or -}                     SQ(-_
2                              SQ(- 2_
ENTER                          SQ(-2
ENTER                          4
```

[note that you don't have to close the parenthesis here because the line interpreter will implicitly close it. Some machines would error at this. Every machine is different and you have to Read the F$#$#$#@ manual :-)]

I hope this helps you.

Best regards,

Bill ENTER

Re: Which calculator passes the first test?

*Message #62 Posted by **Bart (UK)** on 3 Dec 2010, 4:35 p.m.,*
in response to message #61 by bill platt

> Quote:
>
> Every machine is different and you have to Read the F$#$#$#@ manual :-)

Indeed. The Sharp EL-W506 Writeview manual states:

Priority Levels in Calculation

1. Fractions
2. Angle prefix, Engineering prefixes
3. **Functions preceded by argument (e.g. x^{-1}, x^2, n!, etc)**
4. y^x, $\sqrt[x]{\ }$
5. Implied multiplication of a memory value (2Y, etc.)
6. **Functions followed by their argument (sin, cos, (-), etc.)**

.
.
.

Note: (-) = change sign.

So one can see that as the x^2 is defined as taking precedence over (-), thus entering: (-), 2, x^2 will be evaluated as 2^2=4, (-), = -4.

Whether we like it or not, it does what the manufacturer intended and specified.

*Message #64 Posted by **Tommy** on 3 Dec 2010, 7:44 p.m.,*
in response to message #61 by bill platt

Hi Bill,
Thanks for this thorough examination. But this is all about HP calcs.
I know, you must not quote yourself, but I do quote my message #1:
“Do you know about any other non-HP, passing this test?”
I am familiar with RPN and with HP calcs. My favorite is 15C, which I use on daily basis. People round me are using, in my opinion, not-so-good TI/Casio/Sharp calculators.
Since I know that nobody actually reads the manual, besides perhaps members of this forum, I was looking for a decent, fairly cheap, algebraic calculator. And by decent, I mean reliable, consistent and predictable. The 35s would be ok, but it is a little bit too expensive (for the students).
Yes, you are correct. I want to operate on the number visible on the screen. If I see a negative number on the screen and the x^2 key is hit, I expect a positive number. Always! Not only when the number is an answer to a calculation, but also when the number is entered as (-)2. (on most non-HP calcs the change-sign-key is hit before the number).
A calculator should be an aid in performing calculations. But if you need to RTFM to be sure about what happens, then the calculator is an obstacle. I would never enter a negative number in this way, but the students rely so heavily on their calcs so they do. The advice is: If you want to stay in control, always use parenthesis!
I was quite chocked when I realized how the x^2 key worked. When I showed the phenomenon to my colleagues, no one was aware of it. Were you?
So I began some testing. A negative number multiplied by a negative number, always gave a positive number. A negative number squared, always gave a negative number (on non-HP calcs). This is very inconsistent IMO. Negative numbers are treated correctly except when used in co-occurrence with the x^2 key. The symbol on the screen is sometimes different from a normal minus sign. The behavior is erroneous! Compare the following two examples:
2+-2^2=-2 that is 2 plus minus 2^2 correct
2+(-)2^2=-2 that is 2 plus negative 2 ^2 incorrect
Every time I had an opportunity to test a new calculator, I performed this “first test”. After a while I found the Sharp D.A.L. If there is one decent calculator, there might be several. That’s the reason for this topic.
Today I noticed that my Android RealCalc behaves correctly in both RPN and ALG mode. Besides that, no decent (non-RPN) calc have come to my knowledge.
HP20s: not on the market any longer.
HP30b: inconsistent answers in this topic.
HP10s and HP SmartCalc 300s: no answer

Canon F-300P and TI Galaxy 67: too obscure I guess
Hopefully, this long letter clarifies my statements. I felt a need to do so since I got some comments in bold. And yes, I do know about precedence. I am also familiar with the concepts of subtraction, change sign and negative numbers. Further more, I recognize a crappy calculator when I see one.
Cheers /Tommy

Re: Which calculator passes the first test?

*Message #65 Posted by **bill platt** on 3 Dec 2010, 9:01 p.m.,*
in response to message #64 by Tommy

Hi Tommy:

"The 35s would be ok, but it is a little bit too expensive (for the students)"

I have to laugh at this. I guess it is priorities. IF you have to spend as little as it costs for one Hamburger and fries, then, yes, I guess $45 bucks or so is too much. Same kid thinks nothing of blowing $10 a week on iTunes.

And people don't read the manuals because they are LAZY. I read my 11c manual cover to cover when I got it in 1982, and so did my brother even though it wasn't his. IT was fun to know how it worked.

I think the 33s is a better choice than the 35s actually. It is more user friendly and has much better handling of rectangular to polar, and base arithmetic. And it is, as I showed, a postfix function/infix arithmetic and *operates* on the displayed number. The 35S does NOT do this the same way. The 35S is an infix machine (except for factorial.)

You should download the manuals for the 33s and the 35s. Look at page C-1 in each one. I lost my 35s so I can't test it, but there is a "unary minus" ahead of multiplication on the 35S. I just don't remember how it works.

All told, the 35s and 33s are totally different approaches in their Algebraic modes (as distinct from their equation modes, which are essentially identical (see p 6-13 through 6-15 of each manual. They have a unary minus ahead of multiplication, but this is to handle the issue such as -a X -b, which is I believe what is also the unary minus treatment in the 35s ALG mode). [The 32sii equation list had the unary minus given precedence over taking powers, which was the real problem there. Both the 33s and 35s have rectified this by moving the unary minus down.]

Fortunately, I haven't much experience with current non-HP machines. I have 15 or 20 year old Sharps and a TI so that won't help you....

Re: Which calculator passes the first test?

*Message #66 Posted by **Tommy** on 4 Dec 2010, 4:14 a.m.,*
in response to message #65 by bill platt

I totally agree with you. I enjoy reading the manuals.
But in the case of money, the 35s and 33 are in range of what a TI graphical calc costs. And you can not compete with TI there. I need a cheaper one. I am using Excel and GeoGebra. But TI is 99% mandatory in Sweden. All textbooks have “how to do this and that on your TI”. Sorry to say, HP has lost the battle, but I still fight for good calculators.
Back to the main issue:
(-)2^2=-2 that is negative 2 ^2 incorrect

(-)2= ^2= 2 that is negative 2 = Ans ^2 correct
The only difference is an extra =. In this case the = is an “almost equal sign” You cannot argue about an “equal sign”, or can you? ;-)

Best regards
/Tommy

Equal pricing

*Message #67 Posted by **Walter B** on 4 Dec 2010, 6:36 a.m.,*
in response to message #66 by Tommy

> Quote:
>
> You cannot argue about an “equal sign”, or can you?

On calculators beyond trivial calculations, "equal" means always "almost equal" within the tolerance (or accuracy) of the calculator. Your example, however, counts to the mathematically trivial applications, so I agree "almost equal" being not necessary there.

Our American friends tend to forget sometimes the price policy of HP in the countries beyond God's own. I hate to repeat this, but e.g. a new 35S sells for 50 € (Euro) in Germany at least - look here for Hewlett Packard and enjoy your location since 50 € "almost equal" 66 US$ today :(

Re: Equal pricing

*Message #68 Posted by **bill platt** on 4 Dec 2010, 9:38 a.m.,*
in response to message #67 by Walter B

and don't forget the eurotaxes.

I wonder if there is a cost of doing business aspect to european pricing nowadays. All items that we can buy here, and there, are more in eurozone. All. but this was not the case in the past. My father bought a couple pairs of binoculars, a camera, and a Rolex in Germany in the 60s for significantly less. In 98, I found that the dollar being strong, made the Mark really inexpensive. Chocolate bars were only 60% of what I paid here. But now, it hardly matters what the currency does--the Eruo pricing is always high, or higher...

Re: Equal pricing

*Message #69 Posted by **gene wright** on 4 Dec 2010, 11:03 a.m.,*
in response to message #68 by bill platt

In most cases, MSRPs in Euro are the numerical value of the MSRP in USD$$.

At the current exchange rate, yes, that means Europeans pay more.

That is an almost universal practice among retailers, who really tend to influence the MSRP, more than manufacturers.

Re: Which calculator passes the first test?

*Message #70 Posted by **Bill Platt** on 4 Dec 2010, 9:49 a.m.,*
in response to message #66 by Tommy

Hi Tommy,

Your notation has me flummoxed. I thought I understood what you meant, but now I'm not so sure.

The TI "maths cookbook" approach is also dominant here.

That gets to another subject.

Nobody can write cursive, and the teachers don't care. "Just use the computer, they say. Nobody can spell, and teachers don't care. "Just use spell-check" they say. Nobody can do arithmetic, and the teachers don't care. "Just use a calculator" they say. What's next? Nobody can think critically, "just google it."

And the parents? I guess there must be an unspoken consensus among parents that this trend is good.

And yet, Sweden is outperforming the US rather dramatically in Maths education. Only Massachusetts and Minnesota outrank Sweden. Evidently the calculators are only a minor issue...

Re: Which calculator passes the first test?

>
> And the parents? I guess there must be an unspoken consensus among parents that this trend is good.

In principle, human beings are curious and lazy. Scientists tell 20% of the energy consumption of an average (wo)man is consumed by (her) his brain. People tend to become overweigh - emmh, horizontally challenged in modern societies. Now, let's add 1+1+1 and guess the result ... ;)

OTOH, already Sokrates complained about the youth in Athenai, calling them incapable and good-for-nothing some 2300 years ago - and their successors discovered America ;)

Re: Which calculator passes the first test?

*Message #72 Posted by **bill platt** on 4 Dec 2010, 2:02 p.m.,*
in response to message #71 by Walter B

"OTOH, already Sokrates complained about the youth in Athenai, calling them incapable and good-for-nothing some 2300 years ago - and their successors discovered America ;)
"

Hahaha so true. Then again, somewhere along there, the Greeks lost to the Romans etc...

What I find striking about the bible isn't the religious stuff, but the parables, the warnings of what can and does happen when decadence prevails. Never mind the god and hell stuff--the fact is that ancient cities perished because the youth were led astray...

In the US, it is immigrants who keep us honest. They often show us the way when we lead ourselves astray. They show us that we shouldn't take our great society for granted--that freedom, liberty and justice do matter...

Re: Which calculator passes the first test?

*Message #73 Posted by **Chris Randle (UK)** on 6 Dec 2010, 7:23 a.m.,*
in response to message #66 by Tommy

> Quote:
>
> But in the case of money, the 35s and 33 are in range of what a TI graphical calc costs. And you can not compete with TI there. I need a cheaper one.

Is the HP 10s a possibility? Calculators don't come much cheaper than that, and I don't just mean the price ;-)

There's no RPN option. The algebraic *parsing* of

```
- 2 ^ 2 =
```

returns

```
-4
```

and

```
- 2 =
Ans ^ 2 =
```

returns

```
4
```

I've read all the posts and I'm still not 100% clear on whether or not this passes "the test", but I contend that its answers are correct, bearing in mind all that Bill Platt wrote about the critical difference between parsing an algebraic input string and the immediate operation of RPN on a stack.

Re: Which calculator passes the first test?

*Message #74 Posted by **Kiyoshi Akima** on 6 Dec 2010, 12:49 p.m.,*

So, by your reasoning, you would expect an algebraic calculator to give the result 9 for the key sequence 1 + 2 x^2 = since the x^2 is to operate on the "1+2" in the display?

Re: Which calculator passes the first test?

*Message #75 Posted by **DeboT** on 7 Dec 2010, 5:02 a.m.,*
in response to message #74 by Kiyoshi Akima

I think that's exactly what Tommy's not saying (am I right Tommy?), but rather that which I stated previously. To quote myself:

> Quote:
>
> I disagree, if I have -2 on the display, and square it, it is to be interpreted as (-2)^2, if I wanted -(2^2), I would enter 2^2, then (+/-). The negative is part of the number (I am talking about having used the change sign, not minus), I did not enter "0 - 2^2", in which case the 2 is separate of the minus.

And the 33s is a perfect example of this:

> Quote:
>
> The 33s in ALG mode: 5, +/-, x^2, ENTER yields:
> $(\,^{-}5)^2=$
> 25
>
> and MINUS, 5, x^2, ENTER yields:
> $0-5^2=$
> -25

Thus the answer to your key sequence would be the normally expected 5.

When Tommy mentions "the number on the display" I think he is indeed talking about a number, not an equation - his examples illustrate this. (Tommy - please correct me if I am wrong).

That is exactly what happens when one uses the type of algebraic mnechanized in business machiines such as the HP-10B, HP-17BII and HP-19BII. It is NOT what happens with the algebraic mechanizations in the HP-10s, HP-33s or HP-35s.

*Message #1 Posted by **Marcelo Vanti (Brasil)** on 30 Nov 2010, 10:44 a.m.*

Hello,
I have been using the thermal paper HP 82175A with my calculator printers HP 97, 82143 and 82240. Recently I did see in a KEY NOTES issue (June 1982) that " Using the new black thermal paper (HP 82175A) in your HP-91/92/97 will cause premature printhead wear ".
Did its true? Have somebody experimented some trouble like that before?

Re: hp 82175A thermal paper

*Message #2 Posted by **Juergen Keller** on 30 Nov 2010, 3:00 p.m.,*
in response to message #1 by Marcelo Vanti (Brasil)

Do you use your HP-97/printers daily? If not I suppose it's not a problem. I use cheap replacement paper as you'll find in most office shops, no problems encountered, but I must confess I only use the HP-97 occasionally. Probably there are some power users out there, or someone who has some experiences to share from the good old days?

HP-41 MCODE wiki: Mainframe entry points

*Message #1 Posted by **Geir Isene** on 30 Nov 2010, 7:27 a.m.*

So, I have added all the mainframe entry points from a list I got from Peter some time ago. They have been added as links to empty pages so that the documentation for each are placed on separate pages.

Those who care to pitch in can now click on a link on the page containing mainframe entry points, and in the popup choose "blank page", click "create page" and add the documentation for that entry point on the new page.

Re: HP-41 MCODE wiki: Mainframe entry points

*Message #2 Posted by **Geir Isene** on 30 Nov 2010, 8:00 p.m.,*
in response to message #1 by Geir Isene

It would be great if someone with an MCODE black belt could document just one mainframe entry so that a mere mortal like myself could try some other entry points along the same line.

Re: The HP71B Program That Caused Some Tech Queries

*Message #2 Posted by **Christoph Giesselink** on 30 Nov 2010, 12:14 p.m.,*
in response to message #1 by Namir

Hi Namir,

I tried to type in your code on Emu71. I can't run your code at the moment. I recognized two problems.

1) program input problems

440 IF ABS(D1(I)) > T0 THEN C0 - 1

is an invalid line. I think you mean

440 IF ABS(D1(I)) > T0 THEN C0 = 1

2) runtime problems

Line

260 R(I)=(1,0)

fail at runtime -> variable I is out of scope (I=-1)

To all:

Does anybody know a method or tool to convert such a text listing into LIF or DAT format that it can be read by ILPer or by Emu71?

Christoph

Re: The HP71B Program That Caused Some Tech Queries

*Message #3 Posted by **J-F Garnier** on 30 Nov 2010, 2:39 p.m.,*
in response to message #2 by Christoph Giesselink

Does anybody know a method or tool to convert such a text listing into LIF or DAT format that it can be read by ILPer or by Emu71?

With Emu71/DOS, a convenient method to import such small programs like this is the 'cut&paste' method (In the Command window, you have to select the paste command, ctrl-v will not work).

Re: The HP71B Program That Caused Some Tech Queries

*Message #4 Posted by **Namir** on 1 Dec 2010, 11:44 p.m.,*
in response to message #3 by J-F Garnier

Thanks for the tip Jean-Francois!! Makes program input to the EMU71 much much easier!

Re: The HP71B Program That Caused Some Tech Queries

*Message #5 Posted by **Namir** on 30 Nov 2010, 2:46 p.m.,*
in response to message #2 by Christoph Giesselink

Thanks! I corrected the listing accordingly. If you are running the program under EMU71 you can remove the PAUSE in line 510, to let the program display all of the results in one swoop.

(Trivia?) Display setting

*Message #1 Posted by **Kiyoshi Akima** on 29 Nov 2010, 5:32 p.m.*

Name an HP-manufactured RPN calculator that, when set to FIX 2 display mode (and with any fraction mode turned off), does NOT display 0.01 when displaying the result of 70 1/x.

Re: (Trivia?) Display setting

*Message #2 Posted by **David Hayden** on 29 Nov 2010, 6:07 p.m.,*
in response to message #1 by Kiyoshi Akima

My 30b in RPN mode with FIX 2 displays 0.014. Looks like it displays 2 significant digits. Enter 0.000033 and that's what it displays.

On pages 2 and 3, the 30b manual says that the FIX=N value is "the number of digits displayed to the right of the decimal point."

The 20b displays 0.01.

Dave

Re: (Trivia?) Display setting

*Message #3 Posted by **Kiyoshi Akima** on 29 Nov 2010, 6:33 p.m.,*
in response to message #2 by David Hayden

Correct. I ran across this earlier today when I wanted exactly five digits to the right of the decimal point and couldn't get them.

I'm trying hard to like the 30b. It's small, fast, and then something like this pops up...

Re: (Trivia?) Display setting

*Message #4 Posted by **Karl Schneider** on 29 Nov 2010, 10:46 p.m.,*
in response to message #2 by David Hayden

> Quote:

> My 30b in RPN mode with FIX 2 displays *(1/70) as* 0.014. Looks like it displays 2 significant digits. Enter 0.000033 and that's what it displays.
>
> On pages 2 and 3, the 30b manual says that the FIX=N value is "the number of digits displayed to the right of the decimal point."
>
> The 20b displays 0.01.

While the HP-30b does not seem to meet its specification, neither the HP-20b nor HP-30b handle this as did the "old school" HP's for FIX *n*:

The scientific models would revert to scientific notation (SCI *n*) if the number was too small for FIX *n* to show any significant digits. The business models, however, would keep increasing the number of decimal digits (FIX *n+1*) until one significant digit could be displayed, then use SCI *n* only if necessary.

FIX display on business vs. scientific

These display formats seem to have been tailored to the likely users of the respective models.

Any program flow control commands for the CompuCorp?

Re: Look what I found d8-) Namir!

*Message #9 Posted by **Geoff quickfall** on 29 Nov 2010, 9:11 p.m.,*
in response to message #8 by Namir

Nope!

I use the start/stop at a logic choice. For example the great circle heading program requires a test for a -ve value which determines the east or south direction (360 +). When the program pauses it displays a +ve or -ve value for the sine of the heading. If negative pressing start/stop calculates the reciprocal value of the heading and displays that.

You will notice prgm 1&2 switch. Each program is 49 lines and switching to the other allows a program to continue.

Interestingly, if you input the values in the stack at the correct points while programming the display shows your progress!

Cheers

here are two programs, one resides at position 1 and the other at 2 using the switch. You can see that if the sine is negative then the last routine in program two will switch the heading for you. See the explanation in program two contained by the ***

I was restoring an HP55 and I'm working on a 65 card reader,
seriously, any way to connect the two ??
I'd love the timing capability of the 55 with the ability to
store programs and read them off the cards.
The architecture of the two (55 and 65) is similar enough to make it
worth a try ??

Suggestions,as always are all welcome, Alberto

Re: Read what I thought ...

*Message #19 Posted by **geoff quickfall** on 30 Nov 2010, 4:44 p.m.,*
in response to message #18 by Alberto Fenini

In which way, add a timing circuit to the HP-65? Problem is, though it has a timing circuit for program execution it does not have code to interpret the timing function for display purposes such as the HP 45 (hidden) or the HP 55.

You can always time your loops with pauses introduced on the 65 then come up with a correction factor if you want to use it as a crude timing device. But I do not see any way of introducing the quartz crystal into the system to have a timing display, unless you write a program to display at each blink now that the crystal is in place.

You would have to identify the circuit used for the timing, see this posting on the HP 45:

HP 45 conversion to quartz

HP museum article

cheers

Re: Read what I thought ...

*Message #20 Posted by **Alberto Fenini** on 30 Nov 2010, 5:31 p.m.,*
in response to message #19 by geoff quickfall

Actually I was thinking at the viceversa ... adding a card reader to an HP55
May be I'm wrong, but it shouldn't be impossible
the back case will be taken from an HP65, but if the connections are all available it could be done.
All the card reader electronic is on the card reader pcb
to the main board only a couple of voltages and the ReadA, ReadB, WriteA, WriteB signas get connected
I know it's kind of meaningless, but it's worth a try,
only I don't have the schematics for the HP65 and 55 to check whether these points may be available on both boards.
At the end of the day, the card reader reads from the card and writes to the memory.
Since programming techniques are very different from 65 to 55, I can accept the limit that only "55 mode" programs will be written and read back by this "hybrid" unit, but in theory it should work.
I don't know, but it's kind of fascinating to me (just to me ??)
Take care Alberto

uCalc Video

*Message #1 Posted by **DaveJ** on 28 Nov 2010, 8:55 p.m.*

For those interested in the uCalc project:

http://www.youtube.com/watch?v=fk8GCKO5mw4

No it hasn't progressed any since the last update.
Please don't ask when it will be available, the answer is a shoulder shrug!

Dave.

Re: uCalc Video

*Message #2 Posted by **Martin Pinckney** on 28 Nov 2010, 9:24 p.m.,*
in response to message #1 by DaveJ

Those "interested" will want to ask the verboten questions. Therefore, the video is for the uninitiated.

Re: uCalc Video

*Message #3 Posted by **Egan Ford** on 29 Nov 2010, 1:36 a.m.,*
in response to message #1 by DaveJ

Awesome. Now I want one again. BTW, how do you get the batteries out? Perhaps a seesaw inside so that if I push a battery in deeper the other comes out. This way you'll always have a battery in.

Re: uCalc Video

*Message #4 Posted by **Walter B** on 29 Nov 2010, 2:45 a.m.,*
in response to message #1 by DaveJ

Very very nice! Hope it will be available soon. I will never, however, put this precious in my *back* pocket - simply don't like the sound of cracking material d8-)

Re: uCalc Video

*Message #5 Posted by **David Hayden** on 29 Nov 2010, 8:07 a.m.,*
in response to message #1 by DaveJ

Very cool Dave, thanks for the sharing. Makes me want one too :)

Will the battery slot have a cover of some sort? Without one I can picture it getting filled with lint and stuff pretty easily.

Also, how tough is the paint on the PCBs? After some time in a wallet, it might start to wear off, possibly exposing the electrical traces underneath.

Re: uCalc Video

*Message #6 Posted by **Alejandro Paz (Germany)** on 29 Nov 2010, 1:30 p.m.,*

OK, I won't ask even though you (once again) mercilessly taunt us.

However, I will ask if the project might be complete were it not for the "silicon bug" you mentioned in the above video and described more fully in a previous blog, or is there more to it than that?

Re: uCalc Video

Nothing to do with the silicon bug, that simply caused a me a few hours of grief. I simply lost enthusiasm for the project at some point, or more correctly, got more enthused about other projects at the time.

Dave.

HP-IL 71B to 71B via HPIL

*Message #1 Posted by **Geoff Quickfall** on 28 Nov 2010, 7:31 p.m.*

Okay,

started to play with my 71B which has 25 programs loaded into main and backed up to the protected memory.

OOPS lost everything, and now a blank HP 71B. Installed new batteries and checked it out and it is fine. So, I have another HP 71B with the programs on board. What I would like to do is connect both via HP-IL (both contain the modules and I have the cables). Then transfer the programs from the backup 71B to the memory lost 71B.

I do not have the HP-IL manual for the 71B but do have the 41C HP-IL manual. Of course I cannot get those commands to work so without digging and digging:

How or what are the commands to transfer from one HP71B to another both connected to the HP-IL modules in each?

Cheers, Geoff

Re: HP-IL 71B to 71B via HPIL

*Message #2 Posted by **John Pierce** on 28 Nov 2010, 7:51 p.m.,*
in response to message #1 by Geoff Quickfall

HI Geoff, the following has worked well for me.

10 DIM F$[100] 20 RESTOREIO 30 RESET HPIL 40 CONTROL ON 50 REMOTE 60 OUTPUT :HP71 ;"RESTOREIO" 70 INPUT " FILE? ";F$ 80 IF F$="" THEN OUTPUT :HP71 ;"OFFIO" @ OFF IO @ STOP 90 OUTPUT :HP71 ;"COPY :LOOP" 100 COPY F$ TO :HP71 110 GOTO 70 120 END

Cheers John Pierce

Re: HP-IL 71B to 71B via HPIL (Thanks John)

*Message #3 Posted by **geoff quickfall** on 28 Nov 2010, 8:34 p.m.,*
in response to message #2 by John Pierce

PERFECT!

All done, now to back up on my 9114B and tape drive!

Many thanks, Geoff

Re: HP-IL 71B to 71B via HPIL (Thanks John)

*Message #4 Posted by **Namir** on 28 Nov 2010, 10:20 p.m.,*
in response to message #3 by geoff quickfall

That's why I love the EMU71 software. I can create as many versions I want, allowing me to work on multiple projects AND spin-off projects, all while having access to the MATH rom and the versatile JPC-ROM in EVERY SINGLE project. That is so cool in my book. Thank you J-F for this piece of art!

So far, the limitations that I see in the HP-71N is the variable names' scheme. Any ROM or LEX files that can expand the names of variables to more meaningful names?

Namir

Re: HP-IL 71B to 71B via HPIL (Thanks John)

*Message #5 Posted by **geoff quickfall** on 29 Nov 2010, 2:13 p.m.,*
in response to message #4 by Namir

Not being the math genius you are I find that my use for my handhelds is mostly for work.

I have a suite of programs in all HP languages and I use them as I rotate my machines in and out of the cockpit.

That and the definite lack of a computer at work (sterile cockpit and all) combined with my desire to hold the item in my hand relegates me to what I can use.

The 71B was sitting on the shelf with its mate for over a year and I thought it was time to take it with me and that is when I discovered the battery problem which led to a memory lost problem which led to my ineptitude when copy programs from the protected memory back to the main memory. A subsequent freeze up and obviously the wrong reset (init 1) should have resulted in a machine with all my programs still protected and only the loss of the main memory.

That and the fact that my card reader is definitly U/S; found and identified by the 71B but not reading anything caused me to try to transfer the programs in the back up 71B over. The trials and tribulations of the real versus the virtual world ;-)

Any one out there with a working card reader for sale ;-(

Cheers, Geoff

*Message #6 Posted by **Marcus von Cube, Germany** on 30 Nov 2010, 11:35 a.m.,*
in response to message #2 by John Pierce

Your program looks better this way: ;)

```
10 DIM F$[100]
20 RESTORE IO
```

```
30 RESET HPIL
40 CONTROL ON
50 REMOTE
60 OUTPUT :HP71 ;"RESTOREIO"
70 INPUT " FILE? ";F$
80 IF F$="" THEN OUTPUT :HP71 ;"OFFIO" @ OFF IO @ STOP
90 OUTPUT :HP71 ;"COPY :LOOP"
100 COPY F$ TO :HP71
110 GOTO 70
120 END
```

Marcus

BTW, what are the steps on the second machine?

Re: HP-IL 71B to 71B via HPIL

*Message #7 Posted by **John Pierce** on 30 Nov 2010, 3:34 p.m.,*
in response to message #6 by Marcus von Cube, Germany

I agree about the format. When it was typed in it looked like your format. I didn't preview it before posting and somehow the cr/lf were lost. It has happened to me before. How did you get your text in?

When it comes to running the program hook up both HP-71s using the HP-IL cables, turn both HP-71s on and RUN the program. It goes to the "remote" HP-71 and prepares and controls it.

Sorry about the form of the text.

John Pierce

Re: HP-IL 71B to 71B via HPIL

*Message #8 Posted by **Marcus von Cube, Germany** on 1 Dec 2010, 2:19 p.m.,*
in response to message #7 by John Pierce

To get your listing in the right form, just use the button labeled <preformatted> at the bottom of the text entry window.

When I connect two 71bs, isn't it necessary to disable the controller function on one of them with CONTROL OFF ?

Re: HP-IL 71B to 71B via HPIL

*Message #9 Posted by **geoff quickfall** on 1 Dec 2010, 3:49 p.m.,*
in response to message #8 by Marcus von Cube, Germany

Hello Marcus,

I didn't use 'control off' and the controller 71B perfectly downloaded the back up programs to the reciever 71B.

Cheers, Geoff

Re: HP-IL 71B to 71B via HPIL

*Message #10 Posted by **John Pierce** on 1 Dec 2010, 4:06 p.m.,*
in response to message #8 by Marcus von Cube, Germany

Thanks for the tip on the "Preformatted" button. Only one device in the loop can be the Controller. I did not study the HP-IL IDS but assume when the initiating HP-71B issues the command "Control ON" the other loop devices are prevented from being the Controller. Maybe I just got lucky.

Re: HP-IL 71B to 71B via HPIL

*Message #11 Posted by **Egan Ford** on 30 Nov 2010, 3:56 p.m.,*
in response to message #6 by Marcus von Cube, Germany

This can be automated a bit or made simpiler by using:

```
CAT$(I,":MAIN")
```

E.g.:

```
I=1
F$=CAT$(I,":MAIN")[1,8]
```

will store the first filename in F$. Increment 'I' to get the rest. If F$ = "", then you are at then end. With this minor change you can either just blindly copy or prompt with Y/N. E.g.:

```
12 I=0
70 REM INPUT " FILE? ";F$
72 I=I+1
74 F$=CAT$(I,":MAIN")[1,8]
```

Change :MAIN to :HP71 to restore.

Just my $0.02 US.

Re: HP-IL 71B to 71B via HPIL

*Message #12 Posted by **Michael Meyer** on 1 Dec 2010, 6:55 p.m.,*
in response to message #11 by Egan Ford

That's how I do this, essentially. If I have a "blank" HP-71B, I can connect it to a disk drive, manually copy the "copy" program, then completely restore the rest by running the program. It's come in handy, and allows more than one machine to easily have the same configuration....

HP-41 MCODE: Compilation of routines for custom modules?

*Message #1 Posted by **Geir Isene** on 28 Nov 2010, 5:03 p.m.*

Looking at all the modules Angel is creating and with Peter's work, Raymond, Hakan and others, a wild idea struck me:

How about a program or even a web service where you could pick from hundreds if not thousands of MCODE and FOCAL routines to create your own ROM on the fly?

The program would load the routines as MCODE, string them out within the 4K space, bild the FAT, assign the wanted XROM number and spit out your own custom ROM.

Just an idea.

HP-41 MCODE: System calls - a cataloged/priotitized list?

*Message #1 Posted by **Geir Isene** on 28 Nov 2010, 12:30 p.m.*

Does anyone have a cataloged/prioritized list of the most useful HP-41 MCODE system calls - like a QRG of sorts? I have seen bits and pieces around, but nothing like a complete list. Did I miss it? Pointers, anyone?

Re: HP-41 MCODE: System calls - a cataloged/priotitized list?

*Message #2 Posted by **PeterP** on 28 Nov 2010, 4:02 p.m.,*
in response to message #1 by Geir Isene

I never had found a truly comprehensive one but for example Ken Emerys book has useful routines and there were a few PPC articles IIRC that had lists. I basically started collecting somewhere in handwritten notes good entry points.

One person who can provide probably a quite comprehensive and very insightful list of useful entry points is Angel Martin. Unless some of the gurus from ERAMCO, MBK and W&W have kept a list of entry points they used in writing their OS's and can still find it. Either one would be awesome to have...

Re: HP-41 MCODE: System calls - a cataloged/priotitized list?

*Message #3 Posted by **Geir Isene** on 28 Nov 2010, 4:50 p.m.,*
in response to message #2 by PeterP

And I find myself plowing through the MCODE book, Angel's listings, articles, the VASM listings etc. looking for the right entry points. Shouldn't we start a wiki or something and collect and catalog them? If someone has some sort of a starting point with their own list.

Re: HP-41 MCODE: System calls - a cataloged/priotitized list?

*Message #4 Posted by **Raymond Del Tondo** on 28 Nov 2010, 5:04 p.m.,*
in response to message #3 by Geir Isene

IIRC there were sorted and maybe priorized entry point lists in the PPC journals;-)

*Message #8 Posted by **Ángel Martin** on 29 Nov 2010, 10:15 a.m.,*
in response to message #6 by Raymond Del Tondo

Aren't you following a false vector here? What good is to have all the entry point names and locations if you don't have the documentation for them?

Here's what I did: disassemble the CX OS using the MLDL2k manager, transfer the text result into Excel, then trace the entry points identified by this process matching them back with the VASM ducuments, then provide an hyperlink to go back-and-forth as required. I use Excel but the same could be done with other vehicle (pdf, for instance).

This "project" is not complete. I finalized ROM0, and ROM2, still working on ROM1. More difficult is the stuff in ROM3 and ROM5 (both banks), as they're not documented in the older VASMs - and neither in MLDL2k manager.

I think this could be the core for an open, Wipi-like, community effort to complete them and add more information as we go...

Just a though.

PS. Look at the LABELS ROM documentation for what you're after...

Re: HP-41 MCODE: System calls - a cataloged/priotitized list?

*Message #9 Posted by **Geir Isene** on 29 Nov 2010, 10:48 a.m.,*
in response to message #8 by Ángel Martin

I agree - as I wasn't only looking for the entry points, but rather the entry points with a short and to-the-point explanation of each. Would be nice to have this as a searchable wiki that anyone could add information to... The "HP-41 MCODE wiki" or some such. Your project would be the perfect jump start, really.

I could simply erect a wiki at Wikia and we're off. What do you say?

Re: HP-41 MCODE: System calls - a cataloged/priotitized list?

*Message #10 Posted by **Meindert Kuipers** on 29 Nov 2010, 11:01 a.m.,*
in response to message #8 by Ángel Martin

Great work Angel. I did the same some time back, and (mainly manually) added the many labels to the SYSTEMLABELS.TXT file that comes with the MLDL2000 manager. The base of the list was actually a listing created with the LABELS.ROM, and the sources of V41. In my opinion the label list that comes with M2kM is now pretty complete, available and free ;)

In general the VASM listing provide sufficient documentation for most of the entries, and the OCR'd listings that Peter Platzer created allow easy navigation between labels.

BTW the LABELS ROM just provide a list of the labels with the addresses, which is also in my SYSTEMLABELS.TXT file.

Meindert

Re: HP-41 MCODE: System calls - a cataloged/priotitized list?

*Message #11 Posted by **Ángel Martin** on 29 Nov 2010, 11:57 a.m.,*
in response to message #10 by Meindert Kuipers

Yes to all of that Meindert, many thanks for your work with the MLDL2k manager :)

I for one find the VASM listings uncomfortable being in Octal and all that. Peter did a superb job with the pdf scan but somehow my adobe keeps missing what I'm looking for every time,- and it's very time consuming too.

BTW, Do you know if there are lables for the CX versions? Everything comes as criptic "LB_XYZ" and reconciling that with the X-Functions code is a near impossible job.

Cheers, ÁM

Re: HP-41 MCODE: System calls - a cataloged/priotitized list?

*Message #12 Posted by **Meindert Kuipers** on 29 Nov 2010, 1:52 p.m.,*
in response to message #11 by Ángel Martin

I do not have any CX labels, only what is publicly available already. I do not understand your remark about X-Functions, I do have the labels of the X-Functions module (not the CX unfortunately).

BTW the new M2kM disassembler has some improvements, maybe that helps you a bit

Meindert

Re: HP-41 MCODE: System calls - a cataloged/priotitized list?

*Message #13 Posted by **Håkan Thörngren** on 29 Nov 2010, 1:58 p.m.,*
in response to message #11 by Ángel Martin

The mainframe VASM listing I have is in hex. I have seen scans of the mainframe VASM, and they are indeed in octal, like the plug-in listings I have.

The octal listings are a real pain. The only (smaller) pain with the hex one is that it divides everything in 1K blocks and restart the address counter from 0000 in

each one.

Re: HP-41 MCODE: System calls - a cataloged/priotitized list?

*Message #14 Posted by **Angel Martin** on 28 Nov 2010, 5:18 p.m.,*
in response to message #4 by Raymond Del Tondo

An excellent source for all conceivable entry points is the document posted @ TOS, under the LABELS ROM manual

I've been using an EXCEL sheet with the COMPLETE CX-OS MCODE (ROMS 0 to 5), where every call is hyperlinked to the corresponding entry point. It's very handy (was key for me to understand the 13-chr math routined for instance) - but still not a fully-documented source, suffice it to say.

The MCODE wiki

*Message #15 Posted by **Geir Isene** on 29 Nov 2010, 1:59 p.m.,*
in response to message #1 by Geir Isene

Here goes - the HP-41 MCODE wiki:

http://mcode.wikia.com/

Anyone is now free to add any and all MCODE information on this wiki.

It would be cool if this could build up as a collaborative effort to document HP-41 MCODE; Entry points, nice routines, modules, tips & tricks etc.

Re: The MCODE wiki

*Message #16 Posted by **Meindert Kuipers** on 29 Nov 2010, 2:51 p.m.,*
in response to message #15 by Geir Isene

That was fast! Great idea,

Meindert

Re: The MCODE wiki

*Message #17 Posted by **Angel Martin** on 29 Nov 2010, 3:08 p.m.,*
in response to message #16 by Meindert Kuipers

Yes, a nice project. How do I add an adobe document? I just finished the 13-digit documentation and would be a good one to innagurate it with.

Re: The MCODE wiki

*Message #18 Posted by **Geir Isene** on 29 Nov 2010, 3:18 p.m.,*
in response to message #17 by Angel Martin

It is best to create a new page and copy the text into the page directly. That way it is fully searchable.

Pure text and images like in Wikipedia works the very best :)

13: Unlucky number for some...

*Message #1 Posted by **Angel Martin** on 28 Nov 2010, 12:05 p.m.*

Greetings fellow SW archaeologists :)

I few days ago I started to look into the 41 OS code (ROM_1) to better understand the 13-character math routines. It's been a great journey of discovery, which has finally been fruitful.

Once I understood their design and utilization I set forth to "update" every possible system call within the SandMath and the 41Z, ttaking advantage of the "extended precision" routines. Not a totally trivial thing, as it's all ridden with potential goofs if you aren't extra-careful (and even if you are!)

The good news is the work is done - Yep, they make a (small) difference, so that the final results are correct to the 10th decimal digit - I love it when GAMMA(7) is exactly 720, pure integers all the way up to the range of the 41 :)

The added bonus is that the code is shorter - it's now clear to me that the math routines within the OS where designed to be all 13-char. There are auxiliary ones that make the data handling easier, and in general they require a reduced number of steps. ADDONE, SUBONE, STSCR, RCSCR...etc. Even PI/2 and LNC10 ar all in 13-char fashion, quite some piece or work indeed.

Oh, they also are NOT slower than the 10-char counterparts - just because there are no 10-char counterparts! They are the same routines, just using the "truncated form" in the data input. Clever as it can get, an awesome design to overcome the limitations of yore.

So be in the lookout for the updated modules posted in a couple of days at a TOS near you :)

Best, "AM

Edited: 28 Nov 2010, 1:27 p.m.

Re: 13: Unlucky number for some...

*Message #2 Posted by **Håkan Thörngren** on 28 Nov 2010, 3:41 p.m.,*
in response to message #1 by Angel Martin

Cool!

Would it be possible to document your findings now that you understand it and have it fresh in your mind? It could be of help to others...

Anyway, great work!

Re: 13: Unlucky number for some...

*Message #3 Posted by **Angel Martin** on 28 Nov 2010, 5:07 p.m.,*
in response to message #2 by Håkan Thörngren

Yes, I shall prepare a short article for the forum and a pdf for download @ TOS... it's a bunch of routines, so a few pages will be required.

Re: 13: Unlucky number for some...

*Message #4 Posted by **Johnny Bjoern Rasmussen** on 29 Nov 2010, 5:10 a.m.,*
in response to message #3 by Angel Martin

Perhaps that is why there was never a HP-13 ;-D

Re: 13: Unlucky number for some...

*Message #5 Posted by **Angel Martin** on 29 Nov 2010, 4:22 p.m.,*
in response to message #2 by Håkan Thörngren

The mini-paper is done and submitted to TOS. I tried Geir's Wiki but got lost in the process, afraid I'll need some practice with the new tool. Let me know if you'd like the sneak peek and I'll email you the pdf doc.

Re: 13: Unlucky number for some...

*Message #6 Posted by **Geir Isene** on 29 Nov 2010, 4:56 p.m.,*
in response to message #5 by Angel Martin

sorry...

... but, let's get through the learning curve.

What you need to do is take pure text and paste it into the page after clicking "edit".

I really want to see this wiki capture knowledge.

Free42 for Android, first alpha

*Message #1 Posted by **Thomas Okken** on 27 Nov 2010, 8:10 p.m.*

Hi all,

I've been working on the Free42 Android port for a few weeks now, and it's at the stage where it is actually usable. There is still a lot of functionality missing (program import/export and printer emulation are the big ones), so I'm still in the early alpha stages. The missing functionality will take another 2-4 weeks, at which point I'll start calling it a beta, and then I'll spend another 2-4 weeks fixing bugs and polishing the app to get it ready for general release.
If you're not interested in testing an early alpha, I totally understand; that's up to you. :-)
If you just want to keep an eye on my progress, take a look at http://thomasokken.com/free42/android.html every now and then.
If you are feeling adventurous, please try my alpha release and let me know what you think. The HP-42S emulation should work right now on any Android phone with a 320x480 screen and OS version 1.5 or later. You can't download it from Android Market yet, so if your phone does not allow side-loading, you won't be able to use the alpha, unfortunately.

Looking forward to hearing from you!
Thank you, and best regards,

- Thomas

Re: Free42 for Android, first alpha

*Message #2 Posted by **Allen** on 27 Nov 2010, 9:30 p.m.,*
in response to message #1 by Thomas Okken

Thomas- What a great November surprise! I've installed the alpha release using the eoeAppInstaller application in the Droid Market. It runs the basic checks very nicely! I will report any bugs found at your email address.

I'm impressed so far with the speed and performance on OS1.6!

Re: Free42 for Android, first alpha

in response to message #2 by Allen

> Quote:
>
> I've installed the alpha release using the eoeAppInstaller application in the Droid Market.

I tried installing it on an AT&T HTC Aria using eoeAppInstaller, but that didn't work. It gave me an error message telling me to go to Settings -> Applications and allow unknown sources, but that option wasn't there. Not surprising, since I knew that this phone does not allow sideloading, but apparently eoeAppInstaller doesn't let you get past that restriction, either.

I did manage to install the app in the end, using the adb tool from the Android SDK. That wasn't exactly painless, either; I had to download and install "HTC Sync" just to get the Android USB driver (for Windows), and that package also installed some other junk that I don't think I want. And just finding HTC Sync on the HTC web site was a bit of a trek, too.

Writing up installation instructions for non-Market-users will be a ton of fun, I can already tell...

> Quote:
>
> I'm impressed so far with the speed and performance on OS1.6!

Thanks! I'm pretty pleased with it on the Aria, too. I was worried at first because it felt a bit slow on the emulator (both on my Mac and my PC), but, then again, the Free42 core is native code, which runs on an emulated ARM CPU in the emulator, and that slows things down a lot. On the real device, it looks like a dead heat between the Aria and the iPod touch 4 so far, which is pretty good, considering that the Android app has a Java UI and lots of JNI calls between the UI and the core. While I do try to keep the overhead to a minimum, it's nice to hear that that's actually working out.

- Thomas

Edited: 29 Nov 2010, 11:55 p.m.

Re: Free42 for Android, first alpha

*Message #4 Posted by **Bill (Smithville, NJ)** on 30 Nov 2010, 7:10 a.m.,*
in response to message #3 by Thomas Okken

In case anyone is interested, it's fairly easy to install on a Droid X. Just copy the APK file to the SD card, go to Settings/Applications and Select "Unknown Sources" to allow for installation of non-Market applications. Use "Files" to go to the APK file and select it to install it. Be sure to go back and deselect "Unknown Sources". No need for any special application installer.

Free42 works great. I've already made use of it at an office meeting yesterday.

Thanks,

Bill

Re: Free42 for Android, first alpha

*Message #5 Posted by **Pal G.** on 27 Nov 2010, 11:12 p.m.,*
in response to message #1 by Thomas Okken

Perfect so far! Thank you for letting us alpha test. I will report if I have problems.

Looking forward to high resolution skins, or at least full screen UI.

Motorola Droid (WVGA 854x480); Android 2.2 FRG22D.

Thanks again.

Re: Free42 for Android, first alpha

*Message #6 Posted by **Geir Isene** on 28 Nov 2010, 7:49 a.m.,*
in response to message #1 by Thomas Okken

This is good news.

I installed Free42.

Then I uninstalled Realcalc.

Thanks.

Re: Free42 for Android, first alpha

*Message #7 Posted by **Hubert Weikert** on 28 Nov 2010, 11:22 a.m.,*
in response to message #1 by Thomas Okken

Thank you very much!

Works on T-Mobile G1 with Android 1.6.

Works also on the Booq Verne tablet, with Android 1.5. This has a bigger screen (800x600). The calc remains at the designed size.

On both devices the application terminates when the devices is turned from landscape to portrait and vice versa (no visible forced close). Also on both, one has to start the application sometimes twice, as the first start returns nothing.

Hubert

I haven't tried dealing with landscape mode yet -- I should probably just disable that until I'm ready to to deal with it. Crashing is certainly not desirable behavior. :-)

I just installed the app on a borrowed AT&T HTC Aria, and I have to start it twice quite often, too. I don't know what's going on there yet, but I'll have to look into it. I've noticed this failure to launch even in the simulator, but it doesn't happen very often there. On the real phone, it happens a lot. Clearly something that needs to be looked into! (UPDATE: Actually, it happens all the time in the simulator, or more precisely, every second time. It just doesn't seem to happen while running under debugger control. Looks like I have some old-fashioned printf debugging to do!) (UPDATE 2: Maybe I'm just not dealing with the Android app life cycle correctly, and the app appears to die on startup when the OS tries to revive an instance that wasn't shut down cleanly.)

I'll put both items on my to-do list. Thank you for the feedback!

- Thomas

Re: Free42 for Android, first alpha

*Message #9 Posted by **ncrook(UK)** on 30 Nov 2010, 5:39 p.m.,*
in response to message #7 by Hubert Weikert

Works fine on Samsung Galaxy S, Android 2.2

(Installation is simple: allow unknown sources. Browse to web site, select the .apk file. Once downloaded, go to downloads and long-touch the .apk then select "complete with package installer".)

Thomas: if you use something like http://qrcode.kaywa.com/ you can generate a QR-code of the URL of the .apk file and embed it on your web page. Then, android users (running "Barcode Scanner") can just point their phones at the QR-code on their computer screens, scan the image and download (like a really lazy form of networking)

great work, thanks

Neal.

> On both devices the application terminates when the devices is turned from landscape to portrait and vice versa (no visible forced close). Also on both, one has to start the application sometimes twice, as the first start returns nothing.

I get the impression that in both scenarios -- the app exiting when the device switches to landscape mode, and the app failing to launch -- the app isn't actually exiting, it's merely hidden. The next time you try to launch after either scenario, the app slides into view, rather than popping up, which makes it look like it was running already. Also, I don't see anything in the logs to indicate app death.

As long as you make a point of leaving the app using the "home" button, rather than using the "back" button or the OFF function, the app comes up at the first attempt every time (or until the OS decides to unload it by itself, of course).

I clearly have some figuring out to do as to how Android manages app state; presumably there are some messages from the OS that Free42 needs to handle that it currently doesn't.

To fix the landscape problem, for now I've just set a flag that prevents landscape mode altogether. I want to support landscape mode eventually, but this will at least prevent the annoying pop-down until then. (The new version is on my web site now.)

Re: Free42 for Android, first alpha

*Message #11 Posted by **Bill (Smithville, NJ)** on 28 Nov 2010, 1:15 p.m.,*
in response to message #1 by Thomas Okken

Thomas,

Fantastic - early Chrismas Present.

I tried downloading it, but got a zip file in lieu of a APK file. The link points to Free42Android.apk but when I click on it I get the file Free42Android.zip.

Am I doing something wrong?

Can't wait to try it out.

Thanks,

Bill

Re: Free42 for Android, first alpha

*Message #12 Posted by **Thomas Okken** on 28 Nov 2010, 4:24 p.m.,*
in response to message #11 by Bill (Smithville, NJ)

That sounds like Internet Explorer being a smartass. It looks at the file contents, sees a zip file, and decides that it should have a zip extension. You can just rename it back to Free42Android.apk (apk files really are zip files).

Re: Free42 for Android, first alpha

*Message #13 Posted by **Bill (Smithville, NJ)** on 28 Nov 2010, 5:54 p.m.,*
in response to message #12 by Thomas Okken

Thomas,

You're right - stupid Internet Exploder.

Renamed it, set the Droid X to allow it to be installed, and it is now working great.

Now I can uninstall the other calculators (may keep the Droid48, even though I don't use it much).

Thanks for all your hard work. Can hardly wait for the finished product.

Bill

Q: using (micro-)SD card for program import/export etc.

*Message #14 Posted by **Thomas Okken** on 29 Nov 2010, 9:55 p.m.,*
in response to message #1 by Thomas Okken

The one big thing I haven't figured out yet is what would be the best way to support getting *.raw program files into and out of Free42 on Android. So here's a question to you all: in your experience, do all Android phones have (micro-)SD card slots that can be used to transfer files onto and off the device?

If they do, then my job will be pretty easy, but if they don't, the next question is: do Android phones that do *not* have a card slot offer some other way of copying files between the phone and a computer via USB, by allowing the phone to be mounted as an external USB disk drive or some similar means?

I can support import/export etc. even if the answer is "no" on both counts, by using the approach I used in the iPhone version (built-in web server), but it would be nice if I didn't have to do that, since it is a bit of a pain to

support that properly. Even the iPhone version is far from complete in that area.

- Thomas

Re: Q: using (micro-)SD card for program import/export etc.

*Message #15 Posted by **Bill (Smithville, NJ)** on 30 Nov 2010, 7:05 a.m.,*
in response to message #14 by Thomas Okken

Thomas,

I don't know if all of the Android phones have a SD card or not, but I think most do. I strongly recommend just storing the raw and any other files in a directory on the SD card. Much much easier to have all my files with me rather than pointing to a web site, etc. That's one reason I never made much use of the HP calculators on the Ipod Touch.

With the various models and operating system versions for the Android, you may need to select a subset and develope for that subset, rather than try for a home run on all of the various models.

Thanks,

Bill

Re: Q: using (micro-)SD card for program import/export etc.

*Message #16 Posted by **Thomas Okken** on 30 Nov 2010, 8:15 p.m.,*
in response to message #15 by Bill (Smithville, NJ)

Hi Bill,

I will definitely implement SD card support -- it's by far the easiest option to implement, and, I think, also by far the easiest and most intuitive to use.

Having said that, I don't want to exclude models that don't provide an easy way to copy files onto and off the device, either, and those can be supported using the embedded web server code from the iPhone version. But if I can support all models using just option A, so much the better!

(Even the embedded web server is nothing compared to the lengths I went to to support SD-card-less Palm devices. I don't think I want to do *that* again. :-))

- Thomas

Re: Q: using (micro-)SD card for program import/export etc.

*Message #17 Posted by **Bill (Smithville, NJ)** on 1 Dec 2010, 7:14 a.m.,*
in response to message #16 by Thomas Okken

Hi Thomas,

Another posbility is to email the files as attachments and then just save them to either the sd card or the internal memory (is it possible to save to internal memory if no sd card is present?).

That's the way I just installed the latest build - download it, email it, save and then install. Quicker than using the cable which I don't usually have with me.

Bill

So the guy has a set of the museum CD's and he wants to sell them. I don't see anything in the clause that says he can't.

Or am I missing something?

Nothing to see here....

*Message #3 Posted by **Allen** on 27 Nov 2010, 6:52 p.m.,*
in response to message #2 by Don Shepherd

Don, I agree.. they do not appear to be the upgrade versions of the CD and as such bear no obligation to sell them together with the original source. I see nothing interesting about Walter's claim at all.

Re: Nothing to see here....

*Message #4 Posted by **Walter B** on 28 Nov 2010, 2:54 a.m.,*
in response to message #3 by Allen

Ok, I admit I overreacted when seeing this offer since it came with many more, massively overpriced objects of the same seller congesting TAS in short intervals. Nothing against claiming any price you want, but seeing the same stuff again and again with identical skyrocket starting bids is really annoying.

Usually waiting for "free weekends", now it seems the season drives him. So it will cost him some money at least. The more often I see this the more I turn against free lunches at TAS. [/rant]

Edit: FYI, starting bid was 49,99 Euros yesterday, it is lowered now.

No no, it's "free weekend" again. I got the announcement from eBay sometimes last week. Otherwise he wouldn't offer the same 300 items again and again and again. What's really missing in eBay is the "ignore user" function that some forums offer.

Re: Caveat emptor :(

*Message #6 Posted by **Allen** on 27 Nov 2010, 6:50 p.m.,*
in response to message #1 by Walter B

Price variations are a common practice among capitalist economies. Even this weekend I walked into Best Buy Store and found Adobe Premiere/Photoshop Elements 9 listed for $149, when I can buy them together on the Adobe.com website for $95 and Amazon Black Friday deals for $90 or $105 any other time of year. Shall I boycot Best Buy?

Important MLDL2000 update

*Message #1 Posted by **Meindert Kuipers** on 27 Nov 2010, 10:34 a.m.*

For all MLDL2000 users I have just published an important update. The update will unleash the full SRAM capacitty of your unit for 64 images to 127 or 255 (depending on the version you own). For this to work you need to update both software (M2kM application) and the CPLD firmware. Please go to my website for the download. Please follow the instructions in the README.TXT file carefully.

This will be the last update before the MLDL200 V2. Work is now well underway to communicate with the MBED module, and all seems to work fine.

Meindert

PS: thanks to Peter for beta testing

Re: Important MLDL2000 update

*Message #2 Posted by **Angel Martin** on 28 Nov 2010, 12:09 p.m.,*
in response to message #1 by Meindert Kuipers

This sounds quite exciting - I'll perfrom the update later today, hope I don't goof it up - these things can be tricky...

Question about programming the HP-71B

*Message #1 Posted by **Namir** on 26 Nov 2010, 9:00 p.m.*

Hi All,

I am using an HP-71B with a MATH Pac module. This module supports the COMPLEX type. How can I declare a SUB subroutine to have a parameter with the COMPLEX type?

Thanks!

Namir

Re: Question about programming the HP-71B

*Message #2 Posted by **Jerry Raia** on 26 Nov 2010, 9:27 p.m.,*
in response to message #1 by Namir

Here is one way:

Main Program

```
10 COMPLEX A ! declare type
20 A=-5
30 CALL TESTSUB(A) ! call and pass the variable
```

Sub Program

```
10 SUB TESTSUB(A)  ! sub program with variable passed
20 DISP SQRT(A)  ! take the sqrt of the negative number
```

you should get (0,2.2360679775)

Edited: 26 Nov 2010, 9:29 p.m.

```

Maybe the above info helps?

Re: Question about programming the HP-71B

*Message #7 Posted by **Katie Wasserman** on 27 Nov 2010, 4:10 p.m.,*
in response to message #3 by Namir

On a real 71b with Math ROM I can confirm that the answer is (0,2.236...).

Re: Question about programming the HP-71B

*Message #8 Posted by **Namir** on 27 Nov 2010, 4:23 p.m.,*
in response to message #7 by Katie Wasserman

Sounds like an emulator bug, given the INI configuration I am using. The good news is that the

polynomial-root program I wrote (which heavily uses complex math and complex variables and arrays) works just fine!!

Edited: 27 Nov 2010, 4:24 p.m.

Re: Question about programming the HP-71B

*Message #9 Posted by **Karl Schneider** on 27 Nov 2010, 4:33 p.m.,*
in response to message #7 by Katie Wasserman

> Quote:
>
> On a real 71b with Math ROM I can confirm that the answer is (0,2.236...).

I'll second Katie. I got the answer (0,2.2360679775) by modifying Jerry's program as follows and hitting "RUN" to execute:

```
10 COMPLEX A
20 A=(-5,0)
30 CALL TESTSUB(A)
40 SUB TESTSUB(A)
50 DISP SQRT(A)
```

ADDENDUM: The following program also works. It proves passage of the complex-valued variable, undeclared in the subroutine.

```
10 COMPLEX A
20 A=(-5,0)
30 CALL TESTSUB(A)
35 END
40 SUB TESTSUB(B)
50 DISP SQRT(B)
```

Re: Question about programming the HP-71B

*Message #14 Posted by **Namir** on 27 Nov 2010, 4:19 p.m.,*
in response to message #2 by Jerry Raia

My main goal was to write SUB routines that have parameters that are complex arrays and variables. The good news is that the approach you suggest WORKS!! It seems that with the MATH module, the HP-71B does not require a special syntax for COMPLEX parameters. When the arguments passed to the SUB routines are complex, the routine treats them as COMPLEX within its scope.

I was trying to implement the Aberth–Ehrlich method that simultaneously solves for all the roots (real and complex) of polynomials. The good news is that the implementation works!

Namir

NOAA tour at HCC2010 (video) just added two more!

*Message #1 Posted by **Geoff Quickfall** on 26 Nov 2010, 2:39 p.m.*

Hello All!

For those that weren't there (HCC2010) one of the highlights, aside for HCC2010 was the NOAA tour.

Although the tour included many aspects of NOAA one the more interesting aspects was the theatre with the Globe inside it. Picture a round room with a white sphere suspended from the ceiling. The sphere is 68 inches in diameter and is projected upon by series of computer controlled projectors.

Below are a series of videos I took of the various subjects projected onto the sphere. This gave a real three dimensional effect which you could walk around. The human controller could also spin the image, rotate it, move it forward and backward in time.

Enjoy, you will have audio also. I took these videos using a Canon Powershot S3IS without any lighting or tripod. Also the microphone is closer to me then the speaker so bear with it please!

Iceland volcanic plume

Global earthquake occurence

Earth real time geosynchronous orbit

Artic Ice and climate change (september values)

Venus and Jupiter

More videos to follow but the upload to photobucket is slow and there is 1.5 gigs to be sent and I have to use the computer today!

IO

all flights globally

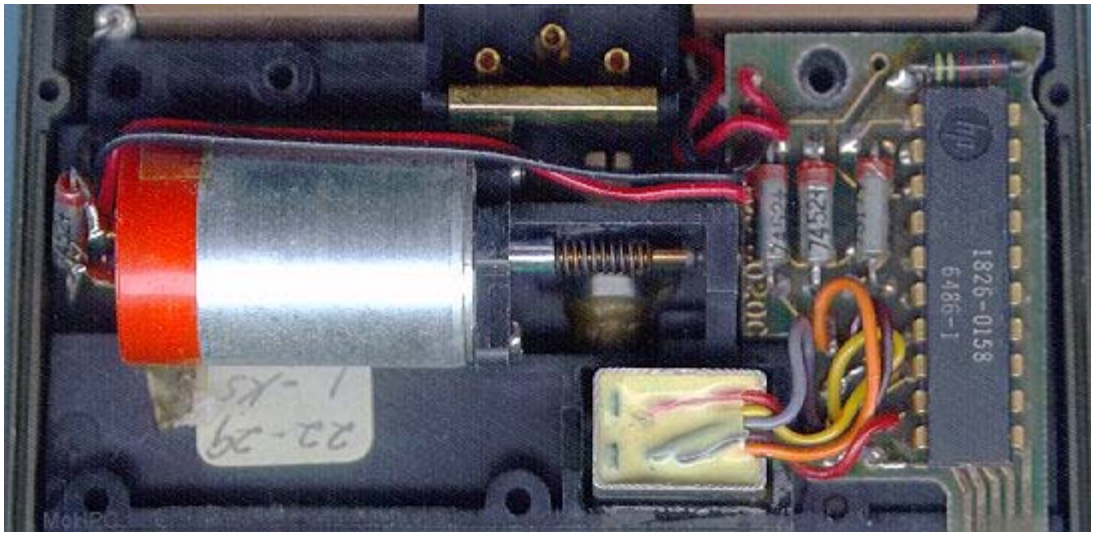
Restoring a card reader from an HP65

*Message #1 Posted by **Alberto Fenini** on 26 Nov 2010, 5:08 a.m.*

ciao a tutti,

I'm about to restore a card reader from an HP65,
does anyone know what the capacity of the capacitors is ?



Thanks for help, Alberto

Re: Restoring a card reader from an HP65

*Message #2 Posted by **aj04062** on 26 Nov 2010, 1:50 p.m.,*
in response to message #1 by Alberto Fenini

I measured them on a unit I restored as I thought they might be bad.

From left to right on your picture: 20.9 micro farad 20.9 " " 15.9 " "

Don't know what the design values are, but the card reader works.

Deteriorating pouch (case)

*Message #1 Posted by **Ernst Fueloep** on 25 Nov 2010, 4:06 p.m.*

Hi,

I have two cases for Spice calculators and one for my HP-41CV. All three have the problem that the inner black synthetic material is deteriorating in a way that it crumbles into tiny black crumbs. The HP-41CV I removed from the pouch had these crumbs all over the keyboard. I used a vacuum cleaner to get rid of them.

Is this a normal process of such a pouch?

Is there anything I can do to fix it? All I can think of is to throw them away.

Any ideas?

Thanks.

Regards, Ernst

Edited: 25 Nov 2010, 4:06 p.m.

Re: Deteriorating pouch (case)

*Message #2 Posted by **Jerry Raia** on 25 Nov 2010, 4:19 p.m.,*
in response to message #1 by Ernst Fueloep

The same thing happened to my 71B case but not my 41CV case (which is older). Both were stored in the same environment. Those crumbs also stuck to the quick ref guides I had in the 71 case. They cleaned off with a damp paper towel thankfully.

I can't bring myself to throw out the case but I don't use it anymore.

Edited: 25 Nov 2010, 4:20 p.m.

Re: Deteriorating pouch (case)

*Message #3 Posted by **Karl Schneider** on 25 Nov 2010, 4:40 p.m.,*
in response to message #2 by Jerry Raia

It's a common problem. You can put the HP-71B inside a plastic bag inside the crumbly case.

Re: Deteriorating pouch (case)

*Message #4 Posted by **Juergen Keller** on 25 Nov 2010, 4:46 p.m.,*
in response to message #1 by Ernst Fueloep

Don't throw them away. I (or more exactly, my wife) put it into the washing machine; use a gentle washing program (30/40°). This worked well for many HP-41 cases.

There seem to be different HP-41 cases, some of them show this deterioration, others not.

Hope it helps, Juergen

Re: Deteriorating pouch (case)

*Message #5 Posted by **Gerson W. Barbosa** on 25 Nov 2010, 4:49 p.m.,*
in response to message #1 by Ernst Fueloep

My HP-71B case had the same problem (sticky and greasy black particles). I turned it inside out and drowned it a bucket with water, powder-soap and a fabric whitener (Vanish 0_2). I waited about thirty minutes then washed it and rinsed it a couple of times. After dried up, it felt like new. I still don't know what did the trick (the whitener, the soap or both).

Hope this helps,

Gerson.

Re: Deteriorating pouch (case)

*Message #6 Posted by **Ernst Fueloep** on 26 Nov 2010, 9:49 a.m.,*
in response to message #5 by Gerson W. Barbosa

After washing is it possible that the problem occurs again some months/years later?

I guess I have to find out.

Regards, Ernst

in response to message #9 by Jerry Raia

Great! I will wash mine too.

Regards, Ernst

Re: Deteriorating pouch (case)

*Message #11 Posted by **Martin Pinckney** on 25 Nov 2010, 9:23 p.m.,*
in response to message #1 by Ernst Fueloep

I don't have any older HP's with the style of case you refer to, but I assume this is a foam rubber lining that is deteriorating.

This seems to be a common problem with foam on old equipment. I have had this happen with many camera-related cases from the 1970's and 80's. Not only foam, but the leatherette cases seem to get to a certain age, and then crack and crumble, or turn gooey, like the infamous card reader rollers.

I have often wondered if this is environment-related or just age.

Interestingly, just recently the headliner in my (Dodge) truck began to droop. I found there was a thin foam pad above the fabric, and it was crumbling. Now the truck is only six years old.

When I took it to the auto trim shop, the guy indicated it was a common problem. He said the factory foam "has oil in it," but his replacement material does not.

Re: Deteriorating pouch (case)

*Message #12 Posted by **geoff quickfall** on 26 Nov 2010, 2:18 a.m.,*
in response to message #11 by Martin Pinckney

Yep, same problem in my 74 5spd Celica (my high school car purchased in 76) head liner. New closed cell foam has been applied and it looks as original.

Ditto on the pouches also. I hand wash mine in the kitchen sink with mild liquid dish detergent and they turn out fine. At worst the foam disappears. At least they are still good for storage!

Cheers, Geoff

*Message #17 Posted by **Michael Meyer** on 29 Nov 2010, 1:40 p.m.,*
in response to message #16 by Walter B

I've had good luck turning them inside out and washing them in the laundry, then letting them air dry. I've tried washing in the sink, but it doesn't seem to get all of the particles out nearly as well. The cases end up in surprisingly good shape after a good cycle through the wash!

HP-41: Buffers (creation & managing)

*Message #1 Posted by **Geir Isene** on 25 Nov 2010, 12:33 p.m.*

I haven't used buffers before, and decided to see if they could be useful for some of my projects. The ICEBOX ROM inherited several buffer functions from the TOOLBOX ROM; SHOWB, FINDB, BLNG?, MAKEB, BUF>R, R>BUF (the last two seems to be from the David Assembler ROM).

I try to create a buffer and fill it with data from registers, but somehow I just can't get it to work properly, and so I ask the gurus of this forum for some assistance.

I can't seem to get the buffer header right in register 00 to make it save the data properly. All it does is create a new buffer that shows up with a question mark in front of the ID#... and it keeps on creating more such odd buffers with the same ID# and with the "?" in front (like "?11").

Could someone write a baby-step howto on creating a buffer with let's say ID #11 and save the contents of 5 registers to it?

Re: HP-41: Buffers (creation & managing)

*Message #2 Posted by **Geir Isene** on 25 Nov 2010, 3:32 p.m.,*
in response to message #1 by Geir Isene

Specifically, there is an issue with the header as described in the David Assembler manual. It gives the format of the buffer header:

```
Bit:          | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05| |04 | 03 | 02 | 01 | 00 |
Content : | ID | ID |   SIZE  |  buffer data ----------------------------------------->|
```

Why the two IDs? And, is there anything in particular that needs to be in the "Buffer data" area of the header?

Re: HP-41: Buffers (creation & managing)

*Message #3 Posted by **Raymond Del Tondo** on 25 Nov 2010, 3:51 p.m.,*
in response to message #2 by Geir Isene

> Quote:
>
> Why the two IDs? And, is there anything in particular that needs to be in the "Buffer data" area of the header?

IIRC one of the two IDs will be cleared by the system at turn-on, which means the buffer is marked as deleted. To retain the buffer, a suitable startup code in your ROM sets the buffer ID again.

Re: HP-41: Buffers (creation & managing)

*Message #4 Posted by **Geir Isene** on 25 Nov 2010, 4:13 p.m.,*
in response to message #3 by Raymond Del Tondo

Right, but why two IDs?

Being home with a fever does have it's advantages. I did some more keying on my 41 and now understand that a buffer is properly created via the function R>BUF as long as the first ID number remains "1". So here is how I did it:

```
Loaded in Alpha: "15080000000000"
XEQ "HEX>NNN"
STO 00
XEQ "R>BUF"
```

And via CLRG, BUF>R, I verified that the buffer was saved with the content of registers 01-07 when the R>BUF was called. So: Problem solved.

But I still don't know why the first ID number has to be "1" and why SHOWB returns a "#" and the ID number of the first buffer and "?" and ID number on the subsequent buffers...

Buffers are within reach now, though :)

Re: HP-41: Buffers (creation & managing)

*Message #5 Posted by **Angel Martin** on 26 Nov 2010, 1:12 a.m.,*
in response to message #4 by Geir Isene

Buffers are tricky and treacherous, as you have already noticed. It's a combination of their inherent nature, plus some OS bugs (or idiosyncracies). Here's what I've learned (the hard way BTW, many hours of trial and error efforts):

1. Header register, located at the bottom in memory. Holds the buffer id and the buffer size info. Anything else is available for your usage - like I use it to store the POLAR/RECT flag in the 41Z.

2. Footer register, located at the top in memory. It must be non-zero, or the OS will ignore the buffer when resizing, packing, or creating another buffer (like XZYALM does, or even worse, when you try to access your own buffer).

3. The funcions R>BUF and BUF>R from the DavidAssembler are somehow limited in that they always use registers 00 and following to store the buffer contents. I don't know if they also include the "footer".

I wrote functions ZB>RG and RG>ZB to prompt for the storage register number - they are in the BUFFER rom, companion to the 41Z. Be aware that they expect buffer id#=8 and only handle 12 registers, the size of the complex stack buffer.

Also notice that the header register should not be RCL'd or STO'd again, because of the normalization.

4. I don't know why the BLIST function shows "#" sometimes and "?" some other times. Worse yet, sometimes it returns the "NO BUFFERS" message even when I know for a fact that there are (Complex stack, etc). I didn't study the function, which I believe was written by David Yerka.

Hope this helps, I've sent you in a separate mail the Buffer appendix from the 41Z manual, where it lists the buffer creation and handling routines.

Cheers, 'AM

Edited: 26 Nov 2010, 1:32 a.m.

PGTRAIL? + a NoV COMPANION

*Message #6 Posted by **Geir Isene** on 26 Nov 2010, 3:09 a.m.,*
in response to message #5 by Angel Martin

No mail... did you send it to g@isene.com?

Now, the only thing missing in the manual is an explanation for the PGTRAIL function. I have no idea what that does. When I try it, it only returns an "N" in Alpha, nothing else.

Also, did you get my e-mail regarding the possible NoV COMPANION module?

Re: PGTRAIL? + a NoV COMPANION

*Message #7 Posted by **Angel Martin** on 26 Nov 2010, 7:51 a.m.,*
in response to message #6 by Geir Isene

If memory serves I think PGTRAIL is al older implementation for OSREV. It's supposed to give you the ROM Page revision number (actually a letter) when you enter the page number as input (eg. 0,2,3). Does that jive?

Note: I tried it and it works as advertized. In fact it gives you the complete ROM id# string, which can be up to 4 chrs length (when you use it on the ROMS plugged on ports 1-4)

I'll reply to your email tonight :)

Edited: 26 Nov 2010, 7:53 a.m.

Re: PGTRAIL? + a NoV COMPANION

*Message #8 Posted by **Geir Isene** on 26 Nov 2010, 8:29 a.m.,*
in response to message #7 by Angel Martin

Thanks :)

And: Yoohoo! The ICEBOX manual is now complete!

Re: PGTRAIL? + a NoV COMPANION

*Message #9 Posted by **Geir Isene** on 26 Nov 2010, 11:23 a.m.,*
in response to message #7 by Angel Martin

BTW; Me getting an "N" upon executing "PGTRAIL" is because X contained "0" and Page zero yields an "N". The pages on my 41CX OS:

```
0 -> "N"
1 -> "F"
2 -> "L"
3 -> "EF2D" (Extended Functions v. 2D)
4 -> "@@@@" (PGTRAIL yields this 4*#64 when it can't find anything)
5 -> "TM2C" (Time module v. 2C)
6 -> "H11D" (HEPAX v. 1D)
```

Re: HP-41: Buffers (creation & managing)

*Message #10 Posted by **Angel Martin** on 26 Nov 2010, 1:27 a.m.,*
in response to message #4 by Geir Isene

Geir, I don't think the top char must be a "1". The Complex Stack buffer has "8" as such, but it's related to the behavior Raymond described above:

"The 41 (some early versions of the OS at least) may set the top digit (PT=13) to zero when it's turned on./ The OS then polls each of the ROMS to allow them to put the top digit back. After each ROM has had its go, the OS deletes any buffers that are not claimed (top digit remaining zero)".

That's why the buffer searching routines should use digit 12 instead, in case they're used during the power-up sequence and the OS had wiped the top digit already.

Have a look at the ZBHEAD, ZBVIEW and ZBLIST functions in the BUFFER rom. but make sure it's placed next to the 41Z or else it'll create havok (they use routines within the 41Z module, as a way to diagnose it).

Cheers, 'AM

Edited: 26 Nov 2010, 1:41 a.m.

Re: HP-41: Buffers (creation & managing)

*Message #11 Posted by **HrastProgrammer** on 26 Nov 2010, 1:27 a.m.,*
in response to message #4 by Geir Isene

Right, but why two IDs?

I don't recall everything about buffers but IIRC there is only one ID in the form that enables a particular ROM to recover its buffer on startup. Let's say your ROM requires buffer with the ID 44. HP-41C will set this ID to 40 on startup (n0 buffers are marked as deleted), so your ROM should search for ID 40 and change it to 44 in order to recover the buffer.

Temporary buffers have 0n IDs, so they can be automatically deleted on startup (such IDs will be changed to 00 without a chance to recover).

Forum Opinion Sought on Early HP-65

*Message #1 Posted by **aj04062** on 25 Nov 2010, 10:44 a.m.*

I just picked this calculator up and am seeking some opinions. Keyboard operates pretty well. Card reader does not work. Rear label is in very good shape, no scratches at all. All LEDs work

Question is: **Would you open this unit up to repair the card reader?** I looked at the forum's oldest s/n list and this matches the earliest date code. I don't know if makes it any more unique than any other 65.

Also, do you think the original owner made the nametag below the LEDs or is this an HP/aftermarket piece? It fits the space very well.

Re: Forum Opinion Sought on Early HP-65

*Message #2 Posted by **Thomas Chrapkiewicz** on 25 Nov 2010, 11:21 a.m.,*
in response to message #1 by aj04062

Hello:

The nameplate is home-made.

I still have my 65 that I purchased in 74/75. I'll have to check the sn.

Certainly, if you want a fully operational machine, fix the card reader. There are many helpful members here with experience and advice.

in response to message #5 by Geoff Quickfall

Geoff,

I thought about you when I was watching a TV documentary (here in Sydney) about an Boeing 767 Air Canada flight in 1983 that lost both engines (due to error in fuel calculations) and how it's pilots where able to glide it to an airport near Winipeg. Part of the error was that the 767 used (a new) metric calculations for the fuel weight in kilograms. The technicians fueling it, who where used to "pounds", filled it with under half of the required fuel. Making matters worse is the loss of power to the flight panel which had (then) new CRT screens to provide readouts. The pilots landed but it was not easy and there were several complications. All passengers made it without serious injuries.

Namir

*Message #9 Posted by **Wanderley Navarro** on 25 Nov 2010, 8:01 p.m.,*
in response to message #1 by aj04062

If your only concern is the back label, maybe an alternative is to purchase one from Mr.Beng

Re: Forum Opinion Sought on Early HP-65

*Message #10 Posted by **aj04062** on 25 Nov 2010, 9:01 p.m.,*
in response to message #9 by Wanderley Navarro

yes,

I have one for another 65 I have repaired. After I did this I read about the major controversy using these within the forum community. I was less concerned ripping into this one as it had MAJOR battery leakage damage and wouldn't operate at all.

I suppose the fact remains that NO untouched 65 remains today without being opened up and its reader repaired.

Re: Forum Opinion Sought on Early HP-65

*Message #11 Posted by **geoff quickfall** on 26 Nov 2010, 2:14 a.m.,*
in response to message #10 by aj04062

I think the point could be that if done correctly, the label can be reused and not appear as though it was removed. The calculator can be restored to almost pristine looking condition

Cheers,

Geoff

p.s. I did fly the "gimli glider" including its second to last flight. The Wikpedia entry does a good job describing the incident. Of course every incident creates new procedures!

p.p.s. The book is about four months from completion, for those that are interested.

THE book

Thanks for the information. Now the stopwatch is started for a calibration run - how long last four Canadian months? ;)

Re: THE book

*Message #13 Posted by **geoff quickfall** on 26 Nov 2010, 3:08 a.m.,*
in response to message #12 by Walter B

Walter!!!

Yep, the book has been four months to completion for the last 8 months but other things got in the way.

The "other things" are completed or on hold so full speed ahead on the 4 remaining chapters.

CST (canadian standard time) is USUALLY equivalent to USAST (USA standard time).

d;-)

Re: THE book

*Message #14 Posted by **Walter B** on 26 Nov 2010, 3:38 a.m.,*
in response to message #13 by geoff quickfall

Geoff,

watch it! Even in the same country, time warps may be observed - even in a single company. By experience I know some departments where clocks run with considerably different speed. As a matter of facts observed, a deceleration factor of approximately Pi is found frequently, sometimes even Pi^2 d;-)

Re: THE book --- Yay!

*Message #15 Posted by **gene wright** on 26 Nov 2010, 8:08 p.m.,*
in response to message #13 by geoff quickfall

Heheh... maybe a couple of other projects get bumped up too?

lol. Just messing with you old buddy.

Re: THE book --- Yay! actually YES!!

*Message #16 Posted by **geoff quickfall** on 27 Nov 2010, 2:45 p.m.,*
in response to message #15 by gene wright

Wink!

All remaining projects are part of the book including yours!!

p.s. did you fix your HP 01 strap, if not I have the top half in stainless without the defective part.

let me know.

Geoff

David Yerka? & updated ICEBOX user manual

*Message #1 Posted by **Geir Isene** on 25 Nov 2010, 9:15 a.m.*

Trying to get hold of David Yerka, but when I send him an e-mail I get back that the mail box is full.

David, if you read this, please send me an e-mail: g@isene.com

David helped with documentation on the buffer functions in ICEBOX, and I have now finally gotten around to include this in an updated manual.

Re: David Yerka? & updated ICEBOX user manual

*Message #2 Posted by **Angel Martin** on 26 Nov 2010, 1:36 a.m.,*
in response to message #1 by Geir Isene

Hi Geir, I was perusing your updated ICEBOX manual, and I noticed your buffer table still doesn't list the Complex Stack buffer, id#=8 :)

Edited: 26 Nov 2010, 1:36 a.m.

Re: David Yerka? & updated ICEBOX user manual

*Message #3 Posted by **Geir Isene** on 26 Nov 2010, 3:01 a.m.,*
in response to message #2 by Angel Martin

Fixed ;)

And updated the manual some more to reflect new knowledge from the buffer thread above.

HP-41: Sail boat parameter program

*Message #1 Posted by **Geir Isene** on 24 Nov 2010, 1:37 p.m.*

I decided to make a complimentary program to the Bobby Shenk yacht module (progress is being made in translating this - both module and manual to English).

The program "BOAT" will prompt for sail boat parameters and output a set of sail boat characteristics.

I also decided to reorganize the UC-41 page where you will the BOAT program, the Ultimate Alarm Clock, STAT & DATA, the ICEBOX ROM and all the other stuff that helps my HP-41 increase its value.

Telesensory Systems - any connection to HP?
*Message #1 Posted by **Maximilian Hohmann** on 24 Nov 2010, 1:19 p.m.*

Good evening!

Recently, I was able to fish this thing out of the bay:

According to a website that google found for me, it is the first talking pocket calculator, a "Speech+" model from Telesensory Systems in Palo Alto, Ca. Inside, it has two large circuit boards full of bad evil chips from Texas Instruments, but the housing looks very HP like: The same kind of plastic, dark brown colour and texture of some HP models.

And even more HP like is the pouch of unusual size 21x15cm or 8x6in: Same colour, same material and it even has the inner pocket of many HP pouches (used here to hold an earplug):

So I'm wondering if this manufacturer was related to HP in any way? Google and Wikipedia couldn't help, but maybe someone on this forum knows more?

Regards, Max

Edited: 24 Nov 2010, 1:24 p.m.

Wow! No, this calculator wouldn't have survived a bath in seawater, although it is very solidly built, but certainly not watertight. It was indeed eBay.

It has some interesting peculiarities: The keyboard layout is "upside down" for a calculaor (rather like a telephone) and the +/- key is labelled */- and it also speaks "multiply minus" when the key is pressed. Also the memory keys work differently from most other calculators that i've seen.

Re: Telesensory Systems - any connection to HP?

*Message #4 Posted by **Katie Wasserman** on 24 Nov 2010, 5:45 p.m.,*
in response to message #3 by Maximilian Hohmann

There's no connection to HP as far as I know. I love this calculator just the same, it's a lot of fun to play with and I've got the audio version of the manual on my site if anyone is interested in hearing how it talks (listen to the examples).

-Katie

Re: Telesensory Systems - any connection to HP?

*Message #5 Posted by **Maximilian Hohmann** on 26 Nov 2010, 3:30 a.m.,*
in response to message #4 by Katie Wasserman

Hello!

> Quote:
>
> ... it's a lot of fun to play with and I've got the audio version of the manual ...

Thanks for the link, mine came without the tape, maybe because I have the german version, and they didn't make a tape for that. If you are interested, I can try and record the speech output in german for your site. I have also got the german manual. Interestingly, it says "klar" for "clear" which is a very unusual term in german for that operation. All my other talking calculators (later models with LCD) say "loeschen" as one would expect. Maybe the speech EPROM was just not big enough for the longer word...

Once again, I was amazed that no fellow collector showed any interest in this item (in fact, I was the only bidder). They easily spend in excess of 100 Euros/Dollars for commonplace calculators like HP-41s. But a german version of a 1976 red led talking calculator must come close to a red dot HP-35 in terms of rarity?

Regards, max

Re: Telesensory Systems - any connection to HP?

*Message #6 Posted by **Katie Wasserman** on 26 Nov 2010, 10:11 a.m.,*
in response to message #5 by Maximilian Hohmann

Max,

I bought a couple of these TSI calculators on TAS and think I paid about $10 for each, I was also surprised at the lack of other bidders. HP calculators are obviously the most "collectible" as are a handful of other brands like Wang and MITS, but the vast number of brands are completely ignored except for certain models (like the Canon Pocketronic). Like many other collecting hobbies, prices are not based primarily on rarity, rather desire for certain brands/models comes first. I don't know if you have a television show like "Antiques Roadshow" in Germany but it makes this fact very apparent.

Sure, if you want to record some of the examples on the audio tape from your German language version of the TSI I'd love to post them on my site.

-Katie

Re: Telesensory Systems - any connection to HP?

*Message #7 Posted by **Martin Pinckney** on 24 Nov 2010, 11:07 p.m.,*
in response to message #3 by Maximilian Hohmann

> Quote:

> It has some interesting peculiarities: The keyboard layout is "upside down" for a calculator (rather like a telephone).

The audio manual that Katie supplied states that this key orientation (like a phone) is an ease-of-use feature.

It also claims the speech feature helps confirm keypress registers. (Think 35s keypress issues).

The audio examples are fun to listen to. Harks back to the very earliest, crude speech synthesis ("computer voice").

Thanks for sharing.

Re: Telesensory Systems - any connection to HP?

*Message #8 Posted by **Thomas Klemm** on 26 Nov 2010, 4:52 a.m.,*
in response to message #1 by Maximilian Hohmann

A blind coworker once showed me how he uses the calculator on his iPhone: with one finger he seeks the right button and confirms this by tapping with a second finger. Since VoiceOver is part of the operating system, he can use the same method with any application. For him, the iPhone has the best user interface for a long time. And it doesn't even have keys you could feel. Devices that are manufactured specifically for the blind are usually bulky and very expensive. Imagine the iPhone if it had been developed specifically for the blind.

Something similar happened with the advent of the fitness craze. Since there were now many foods without sugar, diabetics suddenly had a larger selection. Diet Coke certainly wasn't put out for this target group.

Maybe a little off-topic but this just came to my mind, when I saw the picture of this calculator.

Best regards
Thomas

HP Solve Newsletter?

*Message #1 Posted by **Norman Dziedzic** on 22 Nov 2010, 1:06 p.m.*

Anyone know if there will be another HP Solve Newsletter?

Re: HP Solve Newsletter?

*Message #2 Posted by **Walter B** on 22 Nov 2010, 3:13 p.m.,*
in response to message #1 by Norman Dziedzic

Why not?

Re: HP Solve Newsletter?

*Message #3 Posted by **Norman Dziedzic** on 22 Nov 2010, 4:03 p.m.,*
in response to message #2 by Walter B

It seems like they were coming out every 2 months and now nothing for Oct and it is almost December. . Unless I'm looking in the wrong place?

Re: HP Solve Newsletter?

*Message #4 Posted by **gene wright** on 22 Nov 2010, 4:56 p.m.,*
in response to message #3 by Norman Dziedzic

Patience, paddy-wan.

Re: HP Solve Newsletter?

*Message #5 Posted by **Norman Dziedzic** on 22 Nov 2010, 5:03 p.m.,*
in response to message #4 by gene wright

Patience I have, master Wright. Always in motion is the future.

Re: HP Solve Newsletter?

*Message #6 Posted by **Walter B** on 22 Nov 2010, 5:06 p.m.,*
in response to message #3 by Norman Dziedzic

They still claim it being a bimonthly newsletter. We all know, however, HP's website being not always - hmmh - true nowadays :-/

Re: HP Solve Newsletter?

*Message #7 Posted by **Namir** on 22 Nov 2010, 5:12 p.m.,*
in response to message #1 by Norman Dziedzic

I am equally anxious to see the next HP Solve newsletter since I sent Richard Nelson (the editor) a couple of articles that should appear in the next issue and/or the one after that. So just hang in there friend. Be patient.

Namir

Re: HP Solve Newsletter?

*Message #8 Posted by **David Hayden** on 22 Nov 2010, 8:57 p.m.,*
in response to message #1 by Norman Dziedzic

I'm looking forward to it also. And while we're talking HP Solve, let me thank Richard for taking on this task. I'm sure it's a lot of work and somehow I suspect that he's getting paid less than, say, JK Rowling....

Thanks Rickard.

Re: HP Solve Newsletter?

*Message #9 Posted by **Norman Dziedzic** on 22 Nov 2010, 9:24 p.m.,*
in response to message #8 by David Hayden

I want to make it clear I wasn't tryin to sling dirt on Richard. Wonderful job!

I think we're all in the not making as much as J.K. Club these days. Kids loved the HP7 Part 1 movie last night. I thought it was pretty good as well.

Re: HP Solve Newsletter?

*Message #10 Posted by **Namir** on 22 Nov 2010, 10:33 p.m.,*
in response to message #9 by Norman Dziedzic

Richard edits and prepares the newsletter files and sends them to HP who publish the material on the HP web site. My guess is that HP personel (being few) who post the files are behind schedule.

Namir

Re: HP Solve Newsletter?

*Message #11 Posted by **Richard J. Nelson** on 23 Nov 2010, 6:50 p.m.,*
in response to message #10 by Namir

Yes, it is HP that is holding up the current issue. A new "topic" was suggested and the legal beagles had to decide how to handle it. You all know that the legal types are not known for their speediness.

X < > Y,

Richard

Re: HP Solve Newsletter?

*Message #12 Posted by **Walter B** on 24 Nov 2010, 12:58 a.m.,*
in response to message #11 by Richard J. Nelson

Maybe it helps suing HP for falsely advertising a bimonthly newsletter ;)

Re: HP Solve Newsletter?

*Message #13 Posted by **Eddie W. Shore** on 24 Nov 2010, 8:15 a.m.,*
in response to message #12 by Walter B

LOL. I have not seen one in a while.

Re: HP Solve Newsletter?

*Message #14 Posted by **Norman Dziedzic** on 8 Dec 2010, 1:06 p.m.,*
in response to message #1 by Norman Dziedzic

November is out at http://www.hp.com/calculators

Thanks Richard!

Re: HP Solve Newsletter?

*Message #15 Posted by **Jim Yohe** on 8 Dec 2010, 2:54 p.m.,*
in response to message #14 by Norman Dziedzic

Well, HP, it's about time! ;-)

Surface soldered chips (HP71B)

*Message #1 Posted by **Alberto Fenini** on 22 Nov 2010, 11:03 a.m.*

Dear all,

I need to desolder a couple of surface mounted chips
from an HP71B board (actually the display drivers) since I would like
to swap these with those from another unit.

Does anybody has ever done something like this without burning the board itself ??

Thanks for help, Alberto

Re: Surface soldered chips (HP71B)

*Message #2 Posted by **Alejandro Paz (Germany)** on 22 Nov 2010, 12:02 p.m.,*
in response to message #1 by Alberto Fenini

There are several methods depending on the tools you have, the people you know and the utility of the chips you are about to desolder. This info is provided "as-is" without any explicit or implicit warranty or fitness, use at your own risk :).

To not burn the board and other components you need to have some experience or know someone who does :), read below, please.

If you are comfortable using a soldering iron and/or a hot air desoldering station, then it may be for you. If you don't, there are people who may help, maybe a cell-phone repair shop or similar. Someone you know may be of help.

If you _do not_ need the chips you are about to desolder, the easiest is to cut (with a sharp-blade knife like a swiss-army one) the leads and then with the soldering iron and small pliers you remove the leads carefully.

If you have the equipement but you are unsure, there are videos in youtube on how to rework with SMD parts, watch them and then practice with an old motherboard and so on before you touch the 71B.

Have fun, Ale

Re: Surface soldered chips (HP71B)

*Message #3 Posted by **Alberto Fenini** on 22 Nov 2010, 2:49 p.m.,*
in response to message #2 by Alejandro Paz (Germany)

Thank you very much Alejandro,
first of all I do need the chips, I want to try some swaps, but I do not know if that is the problem, so I may need to resolder everything.
I have a traditional desoldering station, for old chips, and I did some tests, but without results.
I do have a bosch air gun, with selectable temp, and from what I have read around, 270 ° C should do the

work.
I'll do some tests and will return to the fourm
if anybody has done it before, I will appreciate any suggestion
thanks again Alberto

Re: Surface soldered chips (HP71B)

*Message #4 Posted by **Garth Wilson** on 22 Nov 2010, 2:51 p.m.,*
in response to message #1 by Alberto Fenini

Use Chip Quik

http://www.chipquikinc.com/index.htm

They have a video demo on their website too. Chip Quik dramatically reduces the melting temperature of the solder so it stays liquid long enough to get all the way around the IC with the soldering iron and remove the IC before any of that solder hardens again.

Re: Surface soldered chips (HP71B)

*Message #5 Posted by **Bill (Smithville, NJ)** on 22 Nov 2010, 5:40 p.m.,*
in response to message #4 by Garth Wilson

As a Amateur Radio person, I've been following the SDR (Software Defined Radio) kits which ave surface mounted devices. There's a lot of articles and videos where Ham's have used fairly standard tools for putting their kits together. There are a lot of videos on You Tube which show some of these techniques.

While I do have an SDR kit, I haven't yet tried to assemble it - probaby will be a winter project.

Not sure if these soldering techniques will work with what you have planned for the 71B, but might be worth a look.

Good Luck.

Bill

HP 20S recurring key identification

*Message #1 Posted by **Andrew** on 22 Nov 2010, 12:49 a.m.*

Just wondering how to enter a recurring number without hitting the last digit several times. Thanks.

Re: HP 20S recurring key identification

*Message #2 Posted by **Karl Schneider** on 22 Nov 2010, 1:17 a.m.,*
in response to message #1 by Andrew

> Quote:
>
> Just wondering how to enter a recurring number without hitting the last digit several times.

???

Did you mean the HP-20S, and not the HP-20b, correct?

Also, by "recurring number", did you mean a constant value used for repeated calculations, or a repeating-sequence fractional part of a number?

I don't see a constant-operand key or capability on the HP-20S or in its manual.

-- KS

Edited: 22 Nov 2010, 9:51 p.m.

Re: HP 20S recurring key identification

*Message #3 Posted by **Nigel J Dowrick** on 22 Nov 2010, 11:30 a.m.,*
in response to message #1 by Andrew

I've never come across a recurring decimal facility on any calculator, except for a couple of new Casio models (e.g., FX-83 GT Plus). I'm sure that no HP model has this facility. Does anyone know differently?

Re: HP 20S recurring key identification

*Message #4 Posted by **Tommy** on 22 Nov 2010, 1:29 p.m.,*
in response to message #3 by Nigel J Dowrick

If it is a repeating fractional part of a number, you may enter it as a fraction. Suppose x=0.2977777... 10x = 2.977777... 9x = 2.68 x=2.68/9 This is "a recurring number without hitting the last digit several times" /Tommy

Re: HP 20S recurring key identification

*Message #5 Posted by **Katie Wasserman** on 22 Nov 2010, 1:53 p.m.,*

in response to message #3 by Nigel J Dowrick

I have a Bohn Omnitrex 8 desktop calculator. Its extremely simple logic using DTL chips doens't implement any sort of decimal point. The way it does division is to simply show a "running quotient", meaning that it only stores the remainder and the divisor and just keeps going. Because of this it allows infinitely long quotients and therefore, in some sense, recurring decimals.

For example if you divide 1 by 7 and keep hitting the "=" key you'll see: 142857142857..... If you give it something with a larger period like 1 divided by 181 you'll see: 005524861878..... and it will keep going for 180 digits then repeat.

It's pretty neat, very primitive and the only calculator that I've ever come across that does this.

-Katie

Edited: 22 Nov 2010, 1:53 p.m.

Re: HP 20S recurring key identification

*Message #6 Posted by **Walter B** on 22 Nov 2010, 3:19 p.m.,*
in response to message #5 by Katie Wasserman

That's really nice logic - never heard of any calculator like this before. Thanks for pointing to that.

HP-41: Backup and restore of complete HEPAX RAM across the whole NoVRAM, NoV-32 & NoV-64 modules

*Message #1 Posted by **Geir Isene** on 21 Nov 2010, 2:52 p.m.*

I've been itching to do this one; An easy complete backup and restore of my NoV-64.

From the ICEBOX page:

With the programs "SAVENOV" and "GETNOV", you can now very easily save and retreive all the HEPAX ram in a NoVRAM, NoV-32 or NoV-64 module.

The scenario: You are a blissful owner of a NoVRAM, NoV-32 or NoV-64 module by Diego Diaz. You have loaded into the module's ROM the companion module (the ICEBOX) and the excellent CCD OS/X (or another rom with the SAVEROM and GETROM functions). You want an easy way to back up the entire HEPAX RAM to a mass storage device. Manually, this is a tedious task, especially with the NoV-64, having 4 blocks of HEPAX RAM with 4 pages of 4K HEPAX RAM each.

With the SAVENOV/GETNOV program in ordinary HP-41 RAM, simply XEQ "SAVENOV" and it will prompt for the type of module you wish to back up (1 for the NoVRAM, 2 for the NoV-32 and 3 for the NoV-64). Upon you pressing the right number and the R/S key, it commences with backing up the whole RAM of the module with files named "N0-8", "N0-9", "N0-10", "N0-11", "N1-8", "N1-9"... "N3-11" and shows "NOV SAVED". The same with retrieving the whole RAM of the module: Prompting for the right module type, copying each page into it's proper place and ending with "NOV RESTORED" in the display. Simple.

Re: HP-41: Backup and restore... the renaissance of the cassette drive

*Message #2 Posted by **Geir Isene** on 21 Nov 2010, 4:53 p.m.,*
in response to message #1 by Geir Isene

BTW: With this program my old cassette drive is back into production. Despite having a well functioning PIL-Box/Emu41 setup, it's still a tad easier to hook up the cassette drive and XEQ "SAVENOV" and have my NoV-64 backed up to a cassette.

Reversi reconstituted

*Message #1 Posted by **David Hayden** on 20 Nov 2010, 8:59 a.m.*

In a fit of OCR'ing, I have converted my copy of Vanlentin Albillo's HP-41C Othello program "Reversi" from the User's Library into a Word document. I also have the .RAW file, making it easy to load on an emulator. What I've created is a real Word document, relatively short (2MB) and it looks great when printed because it isn't a scan (except for the printer examples).

I would love to post this, but I'd like Valentin's permission first. Does anyone know how to get in contact with him?

Thanks, Dave

Re: Reversi reconstituted

*Message #2 Posted by **Fernando del Rey** on 21 Nov 2010, 5:01 p.m.,*
in response to message #1 by David Hayden

I'll send a message to Valentin regarding this post. I'll try to get him to answer.

Regards, Fernando

Re: Reversi reconstituted

*Message #3 Posted by **Angel Martin** on 22 Nov 2010, 2:02 a.m.,*
in response to message #1 by David Hayden

You should know that Reversi (as well as Checkers, and MiniChess) are available in the "ALBILLOS" section of the FunStuff module, posted at TOS.

The programs still run like a charm, specially on i41CX where you can see the printout on the screen :)

Best, 'AM

Re: Reversi reconstituted

*Message #4 Posted by **Fernando del Rey** on 22 Nov 2010, 2:44 p.m.,*
in response to message #1 by David Hayden

David,

I have contacted Valentin by e-mail. I sent him an exact copy of your message and he answered that he gives explicit persimssion to your request. He is totally OK with it.

I don't think Valentin will post an awswer here, so you have to take my word.

Regards, Fernando

Re: Reversi reconstituted

*Message #5 Posted by **David Hayden** on 22 Nov 2010, 9:17 p.m.,*
in response to message #4 by Fernando del Rey

Thanks Fernando! I have uploaded the word doc, the .raw file and the PDF to the incoming directory on this site. I'll email the curator so he knows what it is. Hopefully this will show up in the library in the not-to-distant future.

I have fond memories of Reversi. It was one of the first programs I ordered from the User's Library. I'd played the Othello board game and was anxious to see how good the program was. When I played my first game, the calculator beat me. Incredulous, I played another game... and it beat me again.... At this point I went straight to the listing to figure out how he did it.

Updated DATA management (STAT & DATA)

*Message #1 Posted by **Geir Isene** on 20 Nov 2010, 2:11 p.m.*

After wrapping my mind around what amounted to one of the hardest programming tasks I've had on the 41, I now proudly present the updated "DATA" program, version 0.6.

It has new features and combined with the FILEMAN program, you have a complete file and data management system, and with the STAT program, a full blown statistical analysis tool.

Go to the DATA and FILE page.

Re: Updated DATA management (STAT & DATA)

*Message #2 Posted by **Angel Martin** on 21 Nov 2010, 2:19 a.m.,*
in response to message #1 by Geir Isene

Greetings Geir, I can't access the FILEMAN page - can you pls. check the link?

Re: Updated DATA management (STAT & DATA)

*Message #3 Posted by **Geir Isene** on 21 Nov 2010, 12:42 p.m.,*
in response to message #2 by Angel Martin

It's right here: http://www.isene.com/isene.cgi?hp-41_FILEMAN

...and fixed the link from the STAT page. Thanks for notifying.

Edit: Fixed the double "http" in the link

Edited: 21 Nov 2010, 2:44 p.m. after one or more responses were posted

Re: Updated DATA management (STAT & DATA)

*Message #4 Posted by **Angel Martin** on 21 Nov 2010, 1:12 p.m.,*
in response to message #3 by Geir Isene

Sorry Geir but still that new link doesn't work for me.

Still a small error...

*Message #5 Posted by **Karl Schneider** on 21 Nov 2010, 2:35 p.m.,*
in response to message #3 by Geir Isene

There's an extra "http//" in the link...

http://http//www.isene.com/isene.cgi?hp-41_FILEMAN

Re: Still a small error...

*Message #6 Posted by **Angel Martin** on 21 Nov 2010, 2:43 p.m.,*
in response to message #5 by Karl Schneider

That explains it. I accessed it from the main web site, but it's surprising to see yet quite a few other calls to more global labels not included in the FILEMAN program...

Geir, Help!

Re: Still a small error...

*Message #7 Posted by **Geir Isene** on 21 Nov 2010, 2:46 p.m.,*
in response to message #6 by Angel Martin

Angel: As it says on the page: "These programs requires the LIBXM and LIBHPX libraries."

Fixed the double "http" in the link above.

Re: Still a small error...

*Message #8 Posted by **Angel Martin** on 21 Nov 2010, 3:08 p.m.,*
in response to message #7 by Geir Isene

> Quote:
>
> "These programs requires the LIBXM and LIBHPX libraries."

hmmm... would you mind reminding me/us where to get those?

Re: Still a small error...: Solved :)

*Message #9 Posted by **Geir Isene** on 21 Nov 2010, 3:39 p.m.,*
in response to message #8 by Angel Martin

...they are appropriately linked from the FILEMAN page (or the main UC-41 page). And they are here:

LIBXM & LIBHPX page

Re: Still a small error...: Solved :)

*Message #10 Posted by **Angel Martin** on 21 Nov 2010, 4:13 p.m.,*
in response to message #9 by Geir Isene

Mystery solved :)

Have you never thought about compiling an ICEBOX -page-II with all these libraries and handy routines? Would be a fitting addition to the module, I think.

Re: Still a small error...: Solved :)

*Message #11 Posted by **Geir Isene** on 21 Nov 2010, 4:18 p.m.,*
in response to message #10 by Angel Martin

That is a very good idea. Let's see, we have the following tools that would fit

nicely as the ICEBOX FOCAL Companion module:

LIBXM

LIBHPX

FILEMAN

FILE

SAVENOV/GETNOV

... I should cough up a few more useful programs to fill the 4K. Let me think about it for a day or two.

HP-41C/LCD Display Problems

*Message #1 Posted by **Kevin Kitts** on 18 Nov 2010, 6:50 p.m.*

Hi All, I bought an old HP-41C calculator recently from the auction site that was listed as "for parts" since its LCD does not display a few segments. The serial number is 2046A03570. Not 100% positive but I think it is the old "fullnet" kind of HP41. It seems to have boxier keys and the square LCD style.

I bought this because it was cheap and I wanted the Time Module and a couple of other modules that came with it. I don't actually need the calculator. However, other than the few missing LCD segments (just parts of the first couple of numbers) it seems to be in remarkably good shape. All the keys feel good.

Is there any way to repair the LCD? I don't want to put a lot of money into it - so it would have to be a do it yourself repair...

Thanks.

Re: HP-41C/LCD Display Problems

*Message #2 Posted by **M. Joury** on 18 Nov 2010, 7:27 p.m.,*
in response to message #1 by Kevin Kitts

Hi,

I have no information on repairs, but I can tell you that the earlier 41C models had "boxier" more upright keys. This was changed in later 41C's and all CV's and CX's. So you have one of the earlier calcs. I had one of these in college and then traded it in for a CV. Back then I could not afford more than one calculator. Years later I went on a special hunt for that particular model and was lucky enough to get one in excellent working condition.

Good luck getting yours fixed.

Cheers!

Re: HP-41C/LCD Display Problems

*Message #3 Posted by **Raymond Del Tondo** on 19 Nov 2010, 3:57 a.m.,*
in response to message #1 by Kevin Kitts

Hi,

sometimes it helps checking and resoldering the joints between the LCD tray and the kbd pcb,
but in most cases it's easier and less time consuming just to replace the whole LCD unit.
Special care has to be taken about the solder lands on the LCD tray side, since these are VERY sensible against mechanical and thermal stress,
and tend to lift off, sometimes also pulling the trace to the controller, which renders the LCD to an unrepairable state.

For this reason I strongly suggest to desolder the kbd pcb side only.

Most of the non-halfnut LCD trays are interchangeable, but on the early HP-41C units there's a chance to find a tray which back side looks somewhat different (square controller covers instead of round blobs). AFAIK those should be replaced by the same type.

*Message #4 Posted by **robert rozee** on 19 Nov 2010, 6:26 a.m.,*
in response to message #1 by Kevin Kitts

as a general repair of LCD issues (not HP specific) where a flexible 'printed' cable is bonded to glass or a PCB: if you suspect the cable has lifted from the glass/PCB, try for a strategically places SMALL piece of foam rubber to lightly press the cable in contact when the casing is assembled. the current flow is next to zero, so only a light pressure is necessary to restore function. i've fixed quite a few issues with LCDs in the past using this method - calculators, pagers, etc, and it can last surprisingly well... certainly a number of years.

cheers, rob :-)

Re: HP-41C/LCD Display Problems

Sometimes it is possible to reseal the conductive cable with caution. The conductive adhesive used to mechanically and electrically bond the tape to the lcd glass ITO contacts is either a thermoset or thermoplastic adhesive impregnated with microscopic (10~40 micron) metal plated polymer balls. This anisotropic film laminates the carbon ink cable to the glass under heat and pressure. If the adhesive gives up the ghost over time it might be worth a try to reheat the junction cautiously, say with a thumb tack head heated by a low heat soldering pencil. Keep moving it around while applying pressure to reseat the junction. Remove heat while maintaining pressure and movement. Starting off with a conservative heat is a good idea as overheating the carbon ink cable can melt the cable polyester film backer.

FWIW: Only HP calculators made after 2003 use this technology, beginning with the with the HP10Bii.

Re: HP-41C/LCD Display Problems

*Message #7 Posted by **Randy** on 19 Nov 2010, 4:44 p.m.,*
in response to message #1 by Kevin Kitts

Quote:

Is there any way to repair the LCD? I don't want to put a lot of money into it - so it would have to be a do it yourself repair...

Missing segments in a fullnut display is caused by one or more of the following three things:

1. Defective LCD
2. Defective Display Driver
3. Bad interconnects between 1 & 2 (elastomeric zebras)

It is one of the more difficult problems in a 41 to repair and you risk LCD damage if done incorrectly. If cleaning the interconnects does not resolve the problem, you'll need another LCD and driver to troubleshoot.

If the calculator had signs of battery leakage, I would lean towards an interconnect problem on early 41's, especially if it has the round gold connectors. Those typically need to be replaced.

If the interconnects are white or pink, it is most likely a bad driver.

Edited: 19 Nov 2010, 4:50 p.m.

Re: HP-41C/LCD Display Problems

*Message #8 Posted by **Kevin Kitts** on 19 Nov 2010, 6:03 p.m.,*
in response to message #7 by Randy

Hi Randy, I've checked the contacts and they look great.

BTW, I've used your company before for a repair and might do so again for this repair if it is something you could fix. I see from your web site that you are swamped with repairs and not taking any new orders at the moment - so I'll check back in a few weeks/months.

Best Regards,

Kevin

Re: HP-41C/LCD Display Problems

*Message #9 Posted by **robert rozee** on 20 Nov 2010, 1:26 a.m.,*
in response to message #7 by Randy

"elastomeric zebras": is there a chance these have shrunk over time? this is the bane of many Fluke multimeters. have you tried GENTLY pressing back on the LCD to try and compress the gap that the zebra strips fill? in the past i've fixed these sorts of problems by shaving down surrounding supports to shrink a gap, as well as 'massaging' the zebra strips to stretch them a fraction in the required direction. on SOME Fluke meters the PCB has a thick solder tinning over all exposed pads, and it is possible to simply build up

the pads with more solder.

can someone perchance provide a link to a photo?

cheers, rob :-)

*Message #10 Posted by **Alejandro Paz (Germany)** on 23 Nov 2010, 3:15 p.m.,*
in response to message #9 by robert rozee

Not only Fluke multimeters. Years ago the used to plage the HP48SX... mine lost 3 lines that way...

HP-48SX LCD Display Problems

*Message #11 Posted by **Randy** on 24 Nov 2010, 9:45 p.m.,*
in response to message #10 by Alejandro Paz (Germany)

Had nothing to do with the zebra connectors, it was due to a layout problem of the internal LCD traces... by Epson.

The root problem still exists today in all 48S/G series LCD's but the occurrence is extremely low. The condition is when all top row annunciators are on without excitation. Same root failure, difference symptom.

Re: HP-48SX LCD Display Problems

*Message #12 Posted by **Alejandro Paz (Germany)** on 25 Nov 2010, 12:34 p.m.,*
in response to message #11 by Randy

It has to do with the elastomers, if you press it a bit more (LCD against the board) the lines show up again, at least in mine and a few others I saw at the time ('91, '92).

Re: HP-48SX LCD Display Problems

*Message #13 Posted by **Randy** on 26 Nov 2010, 12:53 p.m.,*
in response to message #12 by Alejandro Paz (Germany)

> Quote:
>
> if you press it a bit more (LCD against the board) the lines show up again

Yes, that may be true but in the case of an early production 48SX (serial begins with 30) that is missing three vertical columns on the far left side of the screen, the root problem isn't the connectors, it's a design flaw of the LCD.

OT - Tower of Hanoi

*Message #1 Posted by **Chuck** on 18 Nov 2010, 4:47 p.m.*

Somewhere down the message list here was a conversation about the TofH game. I had my Intermediate Algebra students discover the pattern; calculate the number of moves for 70 disks; and the time it would take to solve it making 1-trillion moves per second (a long time).

It got me thinking (but not too much yet), what if the rules were the same, but at any step you could move 2 disks. But why stop there? How many moves will it take to solve using "m" disks if you can move at most "n" at any time? Hmmmm.

I should probably do a search on this before pressing send, but it's more fun to ponder it awhile.

Re: OT - Tower of Hanoi

*Message #2 Posted by **Allen** on 18 Nov 2010, 5:16 p.m.,*
in response to message #1 by Chuck

The first few chapters of Knuth's Concrete Mathematics explores pretty much any variation of ToH that you might like.

Without much thought, being able to move two disks of a 70-disk stack seems like it would play much like a 35 disk stack without much change in complexity.

Re: OT - Tower of Hanoi

*Message #3 Posted by **Crawl** on 18 Nov 2010, 5:23 p.m.,*
in response to message #2 by Allen

Almost simultaneous posts!

The way I thought the new rule worked was that you just can move two pieces per turn, hence you halve the number of moves.

I think the way you thought of it was that any two stacked pieces can be moved at once as a single piece, which acts like halving the number of pieces.

Re: OT - Tower of Hanoi

*Message #4 Posted by **Crawl** on 18 Nov 2010, 5:19 p.m.,*
in response to message #1 by Chuck

Can you explain why allowing 2 disks to be moved in one step would have any effect other than halving the number of steps total?

Re: OT - Tower of Hanoi

*Message #5 Posted by **Patrice** on 18 Nov 2010, 8:19 p.m.,*
in response to message #1 by Chuck

Hi,

My first guess (a 2 seconds thinking) is that:

a ToH of 30 disk with a move of 2 disks at the time is the same as a ToH of 15 disks.

a ToH of 30 disk with a move of 3 disks at the time is the same as a ToH of 10 disks.

Patrice

Getting younger people involved - HHC Scholarship?

*Message #1 Posted by **David Hayden** on 18 Nov 2010, 3:32 p.m.*

One thing that bothered me while attending HHC this year was the lack of younger people in the group. While everyone there was the picture of health and vigor, it would be nice to get some younger people involved in the community.

Here's one idea: provide an "HHC scholarship" to a college (or graduate) student. The idea is to raise enough money that we could pay for the travel and lodging costs for a student to attend HHC. This would probably cost $500-$1,000.

Even better would be to pay the way for a high school student, but now we're talking about a minor, which means they'd need to be accompanied by a parent, which nearly doubles the cost.

Do you think something like this would work? Would enough people be willing to donate money to pay for it? Is there some other way to encourage the next generation of RPN enthusiasts?

Dave

*Message #9 Posted by **Namir** on 19 Nov 2010, 11:01 a.m.,*
in response to message #2 by Allen

The HHC meetings can perhaps bee seen as the meeting of the old wizards who had been involved in perfecting the art of computing with calculators. Attendants come to give homage to another era--the pre-PC era--when programmable calculators were special.

Last month I was in Vienna and (re)visited Freud's apartment on Berggasse street. I sat in one of the rooms looking at the pictures on the wall. Some of these pictures included ones for many small-size far and middle Eastern gods and goddesses (I have actually seen Freud's collection in the house he lived in until his death, in London a few years ago). I came to a realization that our calculators where perhaps small-size statues to the gods and goddesses of the digital world!! The buttons and display represented the way we "speak" to these deities and how the reply back!

41 MCODE Question

*Message #1 Posted by **Ángel Martin** on 18 Nov 2010, 9:25 a.m.*

Hi MCODE addicts out there... here's a question for you.

Q: How to call ANUM on the CX as a subroutine (from within another MCODE function), and still get it to return to the calling point?

ANUM has XROM A6:42, so I tried both [XEQAX] and [RAK70] mainframe routines. This method works with the X-Functions module (on a CV) but but it appears that the bank-switching code in the CX stops it from returning.

Here's the first snippet:

```
130     LDI S&X         build ANUM's fnc id#
342     CON:
0A6     C<>A S&X
130     LDI S&X
300     CON:            XROM 25,02 = A6:42
206     C=C+A S&X       ANUM
01C     PT= 3           complete the fnc. "code"
290     LD@PT- A        (not needed for GTRMAD)
029     ?NC XQ          Execute function!
01C      ->070A         [RAK70]
```

and here's the second:

```
130     LDI S&X          build ANUM's fnc id#
342     CON:
0A6     C<>A S&X
130     LDI S&X
300     CON:            XROM 25,02 = A6:42
206     C=C+A S&X       ANUM
001     ?NC XQ
020     ->0800          [GTRMAD]
381     ?NC XQ
008     ->02E0          [ERRNE]
2ED     ?NC XQ          Execute it
0BC     ->2FBB          [XEQAX]
```

It responds as if the return stack fills over, or maybe the CX-ANUM code ends with a call to [NFRU] (or equivalent).

Any ideas?

Cheers. ÁM

yes indeed, I was :-)

Re: 41 MCODE Question

*Message #6 Posted by **Angel Martin** on 19 Nov 2010, 3:04 p.m.,*
in response to message #3 by Mike (Stgt)

Guys this is frustrating:- I've never used M41 so I'm not up to speed with it, but regardless: I supect there's just the dreadful call to NFRNU (or equivalent) throwing away any chance to return to the calling point... a shame because the way it is I have to copy the ANUM code into the 41Z, about 140 "bytes" - quite some taxing deed.

I'm also stuck with - shame on me, even the simplest routine!- BLINK1. It's supposed to always work but alas, it doesn't - and I dunno why/when not. Never mind that I'm using it within nested loops of partial key sequence calls, it's still demoralizing :(

Ok, the updated 41Z is posted at TOS - take it for a spin if you'd like - a nice week-end treat :)

Best, 'AM

angel, I will try to take a look this weekend but I think your suspicion could be correct. It really is a

dreadful end to many a useful routine...

Cheers

Peter

Re: 41 MCODE Question

*Message #8 Posted by **HrastProgrammer** on 20 Nov 2010, 4:28 a.m.,*
in response to message #6 by Angel Martin

Ángel,

I think you can use the Windows version of my HP-41E emulator for this purpose because it has a very powerful debugger and tracer, which are also very simple to use.

First, download the latest version here http://www.hrastprogrammer.com/hp41e/hp41epc.zip and unpack it into some directory ... You should use this version because it has some capabilities not present in the old version floating around.

Let's say you want to trace BCDBIN routine at 02E3 hex ... Edit HP41E.INI file and add the following section:

```
[Tracer]
Activate=$02E3
Deactivate=
Powoff=0
```

You should close HP-41E prior to this otherwise it will rewrite INI file on exit. The above means "start tracer at $02E3 and deactivate it on the first POWOFF instruction". You can also deactivate it on a specific address if you specify Deactivate=$ADDR ... $ means hexadecimal.

Then start HP-41E, type 12 RCL IND X and you'll have HP41E.LOG file in the same directory. It looks like that:

```
02E3 27E C=C-1 S DAdd=003 PfAd=00 Base=16
  A=000000000690F3 B=00000000000020 C=01200000000001 Stack=0024 004E 00F0 122E
  M=01200000000001 N=01200000000003 Cy=0 P=1 Q=D G=90 FO=00 ST=00100011110011
02E4 27E C=C-1 S DAdd=003 PfAd=00 Base=16
  A=000000000690F3 B=00000000000020 C=F1200000000001 Stack=0024 004E 00F0 122E
  M=01200000000001 N=01200000000003 Cy=1 P=1 Q=D G=90 FO=00 ST=00100011110011
02E5 389 GOLC =ERRAD 14E2 DAdd=003 PfAd=00 Base=16
  A=000000000690F3 B=00000000000020 C=E1200000000001 Stack=0024 004E 00F0 122E
  M=01200000000001 N=01200000000003 Cy=0 P=1 Q=D G=90 FO=00 ST=00100011110011
02E7 106 A=C X DAdd=003 PfAd=00 Base=16
  A=000000000690F3 B=00000000000020 C=E1200000000001 Stack=0024 004E 00F0 122E
  M=01200000000001 N=01200000000003 Cy=0 P=1 Q=D G=90 FO=00 ST=00100011110011
...
```

You can also debug the code directly. Edit HP41E.INI and add the following:

```
[Debugger]
Activate=$02E3
```

Then start HP-41E, type 12 RCL IND X and the debugger will be automatically activated on the address $02E3. You can then SST the machine code from this point onwards.

Of course, debugger and tracer can be used simultaneously, tracer can be activated/deactivated from the debugger, etc. The debugger can be also be activated on-demand if you double-click on that overlay "latch" inside the emulator.

I hope this can be of some help to you ...

Best regards.
HrastProgrammer

Re: 41 MCODE Question

*Message #9 Posted by **Angel Martin** on 21 Nov 2010, 9:14 a.m.,*
in response to message #8 by HrastProgrammer

Many thanks Hrast, appreciate the tip. It's a very powerful implementation - I wasn't aware of it but sure enough I'll add it to my bag of tricks from now on.

I guess I have a humongous trace file to study now :-0 Regardless, does the trace mode mean what I think it does? Can a MCODE routine be executed using the SST key, one line at a time? ??

W.r.t. the ANUM code I've given up = I\m leaving the copied code within the 41Z anyway, so be it.

Cheers, 'AM

in response to message #9 by Angel Martin

> Quote:
>
> Regardless, does the trace mode mean what I think it does? Can a MCODE routine be executed using the SST key, one line at a time???

That's what a debugger is for and yes, among the other things, you can single-step machine code one instruction at the time, look at the contents of all registers (stack, memory, ...), even change their values to see what happens, animate the execution etc. See this:

Tracer is a different thing - it writes the complete machine code execution path to a text file. You can then load this file into a text editor and analyze it, do searches etc. HP-41E doesn't have the ability to set breakpoints for debugger/tracer inside the emulator (most likely because I didn't find a need to do this), but you can set them from the INI file, as described in my previous post.

I used HP-41E debugger+tracer capabilities hundreds of times while developing my HP-41E/X emulators for HP-48GX/49G/... And that's the main reason why I developed it - to have a good test/debug/simulation platform for hunting bugs and test various enhanced features I implemented in HP-41E/X ...

in response to message #10 by HrastProgrammer

Awesome! I wish I had known about this before, well I guess it's never too late.

One question: in your CX ROM things seem to be different from the "real" one, or at least from V41's NUTCX module. For instance, ANUM's code is not the same in both... would that be true?

Re: 41 MCODE Question

*Message #12 Posted by **HrastProgrammer** on 22 Nov 2010, 2:08 a.m.,*
in response to message #11 by Angel Martin

> Quote:
>
> One question: in your CX ROM things seem to be different from the "real" one, or at least from V41's NUTCX module.

They are the same (mainframe ROM version NFL, XFUNCS 2D, TIME 2C).

> Quote:
>
> For instance, ANUM's code is not the same in both... would that be true?

Hmmm, both look the same to me:

```
31C2 08D          CON 08D M
31C3 015          CON 015 U
31C4 00E          CON 00E N
31C5 001          CON 001 A
31C6 279          GSUBNC L319E 319E
31C7 0C4          *
31C8 20C          ?ST=1 2
31C9 360          RTNC
31CA 00B          GONC L31CB +01 31CB
31CB 180 L31CB    ENROM1
31CC 211          GOLNC 5884
31CD 162          *
```

Edited: 22 Nov 2010, 8:16 a.m. after one or more responses were posted

Re: 41 MCODE Question

*Message #13 Posted by **HrastProgrammer** on 22 Nov 2010, 8:19 a.m.,*
in response to message #12 by HrastProgrammer

I think the difference you see is because I am calculating relative jumps from the address after the instruction so, for example, you see GONC L31CB +00 instead of GONC L31CB +01. Now changed in this public version ...

*Message #14 Posted by **Ángel Martin** on 22 Nov 2010, 8:43 a.m.,*
in response to message #12 by HrastProgrammer

You're of course correct, sorry I got confused. So the ROM files have the same format as those used by V41 (and Clonix, MLDL, etc...) then it should be possible to add any of them to the 41E configuration INI file, right?

PS.- I went and checked after I first posted this (also read the README file, which I should have to begin with). Indeed it all works as expected - another great tool so useful for development!

Thanks.

To some extent ... HP-41E is very old piece of software (most of it was developed in 1998), so it supports only two formats: packed (four 10-bit instructions are stored in 5 bytes, module size must be a multiple of 5K) and unpacked (each 10-bit instruction occupies 2 bytes, module size must be a multiple of 8K). MOD files are not supported.

Hi Meindert, I didn't know there was a tracing facility in MLDL2k - I guess I need to RTFM :)

Whereabouts are the settings/options for it?

Cheers, 'AM

Re: 41 MCODE Question

*Message #18 Posted by **Meindert Kuipers** on 21 Nov 2010, 11:06 a.m.,*
in response to message #17 by Angel Martin

Angel,

Tracing will be included in the new MLDL2000 (code name MLDL3000 ;). I actually have a working tracer, but the software is a bit of a hack and requires seperate hardware, there is no need to RTFM as is is not in the FM at all ;) I was referring to V41, the PC emulator from TOS. With the menu you may choose Options, and then select Trace Dump to generate

a trace file, with Console you can really single step through code. There is also an option for breakpoints but I have never used it, so there lies a challenge for you ...

Meindert

Re: 41 MCODE Question

*Message #19 Posted by **Angel Martin** on 21 Nov 2010, 1:08 p.m.,*
in response to message #18 by Meindert Kuipers

Sorry Meindert, I misread your post - saw your name and automatically assumed it was about MLDL2k instead of V41... my bad (you gotta love this vernacular american-english expression, BTW). I wonder how would it be in german, "mein schlecht" perhaps?? :)

BTW the issue with the [BLINK1] routine is solved. This was supposed to be a trivial thing but for whatever reason it got very complicated. As it turns out, the routine [BLINK1] doesn't work most of the times when called from within a partial key sequence "loop". It took me quite a long time (and lots of frustration) to understand that DSPOFF simply does not work when used inside of the [NEXTn] code, ergo neither did [BLINK1]- surely my fault, it's probably well-documented somewhere I have no access to - but anyway I finally solved the issue just by calling [BLINK1] TWICE - that sort of does the trick in every circumstance... go figure.

Cheers, "AM

in response to message #3 by Gerson W. Barbosa

I too would be curious is there is more detailed information on the (previously)mentioned calculators such as:

Detailed thickness(es) - that is, for instance, the HP35s is 'wedge' shaped in that the display end is thicker than the keyboard bottom end (by about 0.8cm).

Also, location(s) of the keys - this in particular would be helpful in positioning a machine based - keypressing mechanism. I may optically scan in the machines and measure this.

Regards, TomC

Brain dead, need help with program

*Message #1 Posted by **briggleman** on 15 Nov 2010, 5:40 p.m.*

OK, how do I enter 1E2 in a program for the HP42s. Now, why do I say brain dead, because at step 25 in a program I did this entry and no problem, now at step 155 I cannot remember how I did it.

Too much drinking, brain cells destroyed.

Please help

Re: Brain dead, need help with program

*Message #2 Posted by **Steve Perkins** on 15 Nov 2010, 7:27 p.m.,*
in response to message #1 by briggleman

I'm not sure where your difficulty lies, but here goes:

Use the 'E' key next to the +/- key to enter an exponent (power of 10), which would be the same as the 'EEX' key on an HP-41C for example.

To enter 1E2 you don't even need to enter the 1 if you don't want, just hit 'E' '2'.

Hope that helped.

Re: Brain dead, need help with program

*Message #3 Posted by **briggleman** on 15 Nov 2010, 8:11 p.m.,*
in response to message #2 by Steve Perkins

Remind me, DO NOT DRINK AND PROGRAM, not a good thing.

Besides all that, thank you very much.

After 20 years I let the batteries die on my beloved HP42s. Yes, I did have printouts of all the programs I wrote for it back when they were HP41 codes. I then translated and modified the programs for the HP42s to take advantage of its menu system and in Sept. of 2002 got the bright Idea that I should print them out if I ever lost them. Thank God for hindsight.

and it is really strange after realizing you wrote this stuff 30 plus years ago and now look at it and its all a wonder to you. I feel old.

in response to message #6 by Allen

> Quote:
>
> why not just type 100?

Sorry, that was too easy. You have to remember I am old school when it comes to programing a calculator..... every byte or bit of memory is valuable. So 1E2 uses less memory than 100. No, it was the point of the matter that I figure out how to get 1E2 back into the program. I was determined. Now feeling very stupid as to not seeing the E key right in front of me!!! I mean.... I search the func. menu 10 times looking for that function and did not see it. Its like, have I forgotten that much since my twenties..... evidently so.

It's like cell phones... I no longer remember phone numbers, they are all programed in. I became so reliant on my old programs, I forgot how I wrote them, the formulas involved... Wow.

Now I really like "DO NOT DRINK AND DERIVE" thats a hoot. Thanks guys and gals. Much appreciated putting up with me on this.

Statistical analysis galore

*Message #1 Posted by **Geir Isene** on 15 Nov 2010, 5:49 p.m.*

Ok, the roll never stopped. I finally caught up with my HP-41 back-log.

A few months ago I posted a rather mammoth STAT-program. It is mainly the excellent program from William Kolb, but with added basic statistics, momentums, kurtosis and skewness of data and with a proper user interface via menus.

Some, very understandably, asked for documentation of the STAT program (reading through the 1122 program steps to figure it out was hard enough for me tonight). I finally got around to documenting it just now.

The brother of the STAT program is a program called DATA. It simplifies working with data sets on the 41. With DATA you can create single (one value) data sets or double (X and Y) data sets, save it to XM, retrieve it from XM, add more data points, save it back to XM, work with fixed size data sets (e.g. or 12-months rolling data sets), remove data points, print the data sets as a graph on a printer and more.

Along with the file management system posted earlier, you will have the mother of all data set and analysis programs on you HP-41.

Here is the STAT and DATA programs .

Testing for bugs and enhancements are very welcome.

Hi Geir,

just tried to compile DATA into my RAMBOX.
There, an error report came up with "NO Lbl 10", and indeed, if you look at your program there is no correspondend label for the GTO 10 directive in Line 158.
A bug?

Re: Statistical analysis galore

*Message #4 Posted by **Geir Isene** on 17 Nov 2010, 6:23 a.m.,*
in response to message #3 by Frido Bohn

:) Yes. A bug.

Somehow, parts of the program caught the infamous bit-rot. It's gone, and I am well in the process of reconstructing that part of the program (the LBL e: Printing of data set).

Seeing what parts are left under LBL e leads me to conclude that I was not on the right track in the first place and so I have almost written a whole new routine for this. It is now one of the most challenging programming tasks I have had on my 41 (including the challenges I have had with MCODE).

I will release the new version (0.4) soon. Perhaps later today.

Bit rot

What is bit rot?

Re: Bit rot

*Message #6 Posted by **Martin Pinckney** on 17 Nov 2010, 9:36 p.m.,*
in response to message #5 by Palmer O. Hanson, Jr.

From Wikipedia article:

"A program may run correctly for years with no problem, then malfunction for no apparent reason. Programmers[who?] often jokingly attribute the failure to bit rot".

Re: Bit rot

*Message #7 Posted by **David Hayden** on 18 Nov 2010, 12:14 a.m.,*
in response to message #6 by Martin Pinckney

I worked on a project once where we found the cause of many of "bit rot" errors. A more accurate description of the problem is "working by accident."

It turns out that programs often contain a bug, but because of some other property of the program or the running environment, the bug never manifests. A simple example is an uninitialized variable: the program allocates space for a variable, but doesn't initialize its value to something meaningful before using it. This is a bug. But if the location of that variable gets written by some OTHER part of the program just before the variable is allocated, then the code may work because the value turns out to be legal.

So the code works, but not because it was designed to work that way. It works by an accident of fate. The bug is never detected because the software works.

Fast forward 10 years and now there's an Operating System update, or a faster processor causes the program to execute slightly differently, or more memory does the same. The point is, *something* happens that causes the memory to be initialized differently from before. Now the program breaks, for seemingly no reason.

It's a wonder that this stuff works at all :)

Dave

Bit rot in the brain...

*Message #8 Posted by **Michael Meyer** on 18 Nov 2010, 10:09 a.m.,*
in response to message #7 by David Hayden

Extremely interesting to me as a psychiatrist. I think the brain may be a victim of these kind of errors as well. As one memory gets "reorganized", others get "overwritten".... I know that I'll be using this term, now, in reference to neurophysiology. (Or at least to my own errors!)

Re: Bit rot in the brain...

*Message #9 Posted by **Martin Pinckney** on 18 Nov 2010, 10:59 a.m.,*
in response to message #8 by Michael Meyer

Perhaps this is the reason a husband and wife (who have shared many of the same experiences for years) will remember certain details differently, and each be equally sure their recollection is the correct one.

Re: Bit rot

*Message #10 Posted by **Palmer O. Hanson, Jr.** on 19 Nov 2010, 9:51 p.m.,*
in response to message #7 by David Hayden

Future of HP-IL with PIL-Box and TCP/IP?

*Message #1 Posted by **Christoph Giesselink** on 15 Nov 2010, 2:16 p.m.*

In summer / fall 2009 Jean-Francois Garnier began to distribute his PIL-Box as solution for communication between real HP-IL devices like the HP-41C or HP-71B and virtual peripheral like printer and mass storage running on the PC. Therefore Jean-Francois published the Windows program ILPer, a virtual printer and mass storage solution with integrated IL frame scope. ILPer is communicating directly with the PIL-Box over a virtual COM port. The PIL-Box itself can operate as controller or as device, in case of ILPer as device.

With the current ILPer v1.35.3 solution it's not possible to create a virtual loop on the PC, the virtual loop is only inside of ILPer. First I thought about creating a virtual loop between applications inside a PC with "named pipes", later I made tests with TCP/IP and UDP. Finally, for some reasons, I decided to use TCP/IP IPv4 as transport protocol for a virtual IL implementation on a PC.

So the first program I wrote, was ILPilbox.exe. ILPilbox is a bridge between the real HP-IL world connected over a PIL-Box and the virtual IL using TCP/IP. On the next step I expanded ILPer with the TCP/IP virtual IL feature. Now I was able to create a virtual loop with two or more ILPer instances inside. Finally I created ILScope.exe, a separate IL frame scope, which can be included anywhere in the TCP/IP virtual IL. All programs are written for Win2k or later.

I made a demo side at http://hp.giesselink.com/ILPer/ILPer.htm showing an instance of ILPilbox, two instances of ILPer and one instance of ILScope showing the data back to the real HP-IL in one virtual loop. ILPilbox was connected with the PIL-Box and on the HP-IL side of the PIL-Box was a HP-41C as controller.

I'm looking for a few beta testers for this software. For testing you **must** have a PIL-Box. It would be interesting if someone has more than one PIL-Box, in this case one PIL-Box can operate as device (the one with the controller on the HP-IL side) and the other as controller with devices (or a closed loop) on it. I have only one PIL-Box so I'm not able to check this condition. If you're interested into testing, drop an eMail over my MoHPC account. Please explain for what do you use the current combination of the PIL-Box and other software. This will help me to decide if you fit into the beta test group or not.

Regards

Christoph

Re: Future of HP-IL with PIL-Box and TCP/IP?

*Message #2 Posted by **Mike (Stgt)** on 16 Nov 2010, 5:23 a.m.,*
in response to message #1 by Christoph Giesselink

For me this announcement is a little dream-come-true: the virtualisation of the HPIL-loop. And by using TCPIP as "virtual machine communication facility" it is _not_ restricted to run on one PC only.

Thank you very much Christoph!

But, what emulated controler do we have currently? Emu41? Nonpareil? V41 in future?? My NutEm in some decades?

Ciao.....Mike

HP-41 File management system

*Message #1 Posted by **Geir Isene** on 15 Nov 2010, 1:42 p.m.*

I was a roll and finally got around to publish also my file management programs - programs that I use regularly and find very useful:

The FILEMAN and FILE programs are found here.

Re: HP-41 File management system

*Message #2 Posted by **Jeff Davis** on 21 Nov 2010, 11:25 a.m.,*
in response to message #1 by Geir Isene

In the listing for the "LIBXM" file you have two entries NNN>HEX and aNRCL. Are these two MCODE routines possibly from SQUID MCODE book?

Re: HP-41 File management system

*Message #3 Posted by **Angel Martin** on 21 Nov 2010, 1:11 p.m.,*
in response to message #2 by Jeff Davis

Only Geir can confirm but sure enough they look like those functions from the Skwid book (and also present in the SandBox and TOOLBOX rom, and possibly also in Geir's own ICEBOX).

Re: HP-41 File management system

*Message #4 Posted by **Jeff Davis** on 21 Nov 2010, 1:26 p.m.,*
in response to message #3 by Angel Martin

Located in the ICEBOX rom.

Re: HP-41 File management system

*Message #5 Posted by **Geir Isene** on 21 Nov 2010, 2:57 p.m.,*
in response to message #4 by Jeff Davis

Yes. I asked the forum a while back for the best way of showing the current XM file and found the best way to be included in either the full CCD ROM (but it requires 2 pages and contains less useful matrix functions - so I opt for the much better CCD OS/X) or the ICEBOX rom. Only the function XMFILE? requires the ICEBOX.

Also, the call to XMFILE? can safely be removed from the FILEMAN and FILE programs as these are only included for the added convenience of showing the user what file is currently handled at the start of the FILEMAN or FILE programs.

Bobby Schenk Yacht Module; Answer from Bobby himself

*Message #1 Posted by **Geir Isene** on 15 Nov 2010, 12:57 p.m.*

I mailed Bobby and he answered;

Apparently there is no English manual.

Anyone care to translate the mains of it? If I knew German, I would do it myself and then publish it, but unfortunately I took four years of French in school instead (and was left with only one rude French sentence that I never got to use :(

Re: Bobby Schenk Yacht Module; Answer from Bobby himself

*Message #2 Posted by **Walter B** on 15 Nov 2010, 3:07 p.m.,*
in response to message #1 by Geir Isene

After I participated considerably in hijacking your last thread in this matter, I think it's adequate offering you some translation work. Hope it won't be tenths of pages though ;)

Re: Bobby Schenk Yacht Module; Answer from Bobby himself

*Message #3 Posted by **Geir Isene** on 15 Nov 2010, 5:20 p.m.,*
in response to message #2 by Walter B

Although it was one hell of a good hijack, I'll take you up on the offer. Send me an e-mail to g@isene.com, and I will send you a copy of the manual for translation. Just translate what you believe is important in order for me to actually use the module.

And: Thank you very much.

Now let the hijacking begin :)

Re: Bobby Schenk Yacht Module; Answer from Bobby himself

I can translate reasonably well from Gullah to English, but not necessarily vice versa.

Re: Bobby Schenk Yacht Module; Answer from Bobby himself

*Message #8 Posted by **Mike (Stgt)** on 16 Nov 2010, 4:57 a.m.,*
in response to message #1 by Geir Isene

Do not use the HP-41 Bobby Schenk Yacht Module for serious tasks. The navigator who once sold me this module told me that it has errors (beim Koppeln). Also I was never able to find the error I would like to warn you before something goes wrong.

IMHO the modue is a nice toy. It is quite useful to do some theory at home. But in practice in rogh conditions I put the HP-41 back to a secure place and used traditional technique (Karte und Besteck): map, ruler etc.

The module is protected. After removing the protection I had the impression that the programming was done in an other language and then migrated to the HP-41 as the code is not optimized for it.

My 0.02$ Ciao.....Mike

Re: Bobby Schenk Yacht Module; Answer from Bobby himself

*Message #9 Posted by **Geir Isene** on 16 Nov 2010, 5:27 a.m.,*
in response to message #8 by Mike (Stgt)

I will ask Bobby about this.

Re: Bobby Schenk Yacht Module; Answer from Bobby himself

*Message #10 Posted by **Geir Isene** on 16 Nov 2010, 6:13 a.m.,*
in response to message #9 by Geir Isene

Bobby is darn quick.

He says the module was indeed programmed in FOCAL by him, it sold in a few thousands and never was any bug reported. He also sailed with this module from Tahiti round Cape Horn and then to the med (with only one stop) and relied 100% daily on this module.

I'd say that's pretty serious undertaking.

Re: Bobby Schenk Yacht Module; Answer from Bobby himself

*Message #11 Posted by **Mike (Stgt)** on 16 Nov 2010, 12:10 p.m.,*
in response to message #10 by Geir Isene

Primo: As I sayed, I was told about a bug from the seller who was navigator on a cargo vessel. Alas I was never able to figure out the error in dead reckon. So my warning is somewhat vague.

2nd Primo: If Bobby did the programming in FOCAL on his own - well - he probably programmed it in an other language before, for a Sharp, or in BASIC. But before I get a legal dispute with a judge: this is just my impression. <VBG>

Ciao.....Mike

Re: Bobby Schenk Yacht Module; Answer from Bobby himself

*Message #12 Posted by **Geir Isene** on 16 Nov 2010, 2:48 p.m.,*
in response to message #11 by Mike (Stgt)

I am not going to attempt to beat Bobby's sailing feat. If the module was good enough for his sailing and he used it as his primary tool for that long trip, I would also trust it. And, if there is no verifiable bug, it may well have been a misunderstanding on your sellers part instead.

Re: Bobby Schenk Yacht Module; Answer from Bobby himself

*Message #13 Posted by **Walter B** on 16 Nov 2010, 3:11 p.m.,*
in response to message #12 by Geir Isene

On page 67 of the German manual, users finding an error in said module are requested to report it to the editor. So there's some probability that errors - if existing - were reported. OTOH, if nothing was ever reported, then probably no error was found - Bobby should know.

Re: Bobby Schenk Yacht Module; Answer from Bobby himself

Cell types for Pioneers

*Message #1 Posted by **Martin Pinckney** on 15 Nov 2010, 12:49 p.m.*

I know this topic has been covered on this Forum in years past, but I thought it might be useful to see if there are any newer perspectives.

I have several Pioneers in regular use, so I have to feed them fairly often. Does anyone have any data (as opposed to opinion) on the practical cost comparison (that is, in use) of silver vs. alkaline?

It looks like silver costs about 2.3X alkaline.

I mainly use 17b, 20s, 22s, 27s, 32sii. Occasionally 21s or 42s. Most get turned on and used for a few minutes at a time several times a day, except the 20s which stays in my truck and gets used for a few seconds perhaps once a week. The rest of the time it just bakes (SW Florida). And the 42s which mostly sits in the drawer (until I start programming it). About half the time I turn them off, about half the time they turn themselves off with the timer.

Curious, I checked various manuals I have. The 27s manual refers to either mercury(!) or alkaline. 32sii and 21s manual say use any brand of LR44 (alkaline). 42s manual is silent on cell type.

So the question is, even though I know silver lasts longer, are they cheaper in net cost, or alkaline?

Re: Cell types for Pioneers

*Message #2 Posted by **Dieter** on 16 Nov 2010, 8:34 a.m.,*
in response to message #1 by Martin Pinckney

I assume we're talking about a certain battery size with the dimensions 11,6 x 5,4 mm that, for example, is knows as

- LR44, A76, 357, A13, ... as an alkaline cell
- SR44, S76, V76PX, ... in its silver oxide version.

Mercury cells are no longer available. Both in the US and in Europe they have been banned for environmental reasons. Technically, there were great (constant voltage, very high capacity per volume unit).

A look at the manufacturers' technical specs shows the two main differences between alkaline and silver oxide batteries: capacity and voltage. On average, a LR/SR44-sized "silver cell" has roughly 50% more capacity ("more than 100 mAh" compared to "more than 150 mAh") and a higher average voltage that also drops very slowly.

> Quote:
>

>
> It looks like silver costs about 2.3X alkaline.

> (...)
>
> So the question is, even though I know silver lasts longer, are they cheaper in net cost, or alkaline?

Well... since there is an extremely wide price range, all you can say is that both (!) battery types may cost "some cents" as well as "some EUR/USD". For instance, over here in Europe we have those "One-Euro-Shops" where you can get (almost) everything they carry for one Euro. Including battery sets with ten or more different coin cells, three or five of which are usually LR44s. Of course I wouldn't expect the same battery life as a quality cell from a major brand, bought in an electronics or photo store for, say, 3 or 5 EUR/USD, but I don't think the question whether to choose an alkaline or a silver oxide cell can be boiled down to a factor 2,3. :-)

For my part, I almost exclusively use higher capacity cells, so in this case I would choose the silver oxide version. They last significantly longer and I don't think a few more cents really make a difference.

Dieter

I tried using g test 1 (x>0) but the program still does not work. Cheers Jim

Re: 15c calculator

*Message #5 Posted by **Walter B** on 15 Nov 2010, 3:29 a.m.,*
in response to message #4 by jim mac

Jim,

I'd suggest you show a listing of your program here and tell us what "does not work". Else try single-stepping through your program and check the values on the stack. AFAIK calculators aren't mean, so the problem sits in front of them usually ;)

Re: 15c calculator

*Message #6 Posted by **bill platt** on 15 Nov 2010, 10:01 a.m.,*
in response to message #4 by jim mac

Hi Jim, I now see that you tried this. Perhaps you are accidentally in complex mode? Check your initial conditions. Also check your memory allocation. The 15c memory can be allocated specifically. You

may have inadvertently over-allocated memory to program lines or vice versa...

Re: 15c calculator (test x > 0?)

*Message #7 Posted by **Karl Schneider** on 15 Nov 2010, 11:15 a.m.,*
in response to message #4 by jim mac

Jim --

g TEST 1 on the HP-15C indeed provides the "x > 0 ?" conditional test listed directly on the HP-11C.

The four conditional tests of equality and inequality on the HP-15C utilize both parts of a complex number, so they might act unexpectedly in complex mode (g SF 8). However, "x > 0?" is not one of those tests.

If difficulties persist, I'd echo Walter's suggestions for you to post the troublesome code and be more specific about "does not work".

-- KS

Edited: 17 Nov 2010, 12:49 a.m.

Re: 15c calculator

*Message #8 Posted by **bill platt** on 15 Nov 2010, 9:53 a.m.,*
in response to message #1 by jim mac

Jim,

The 15c has additional tests compared to the 11c. Unlike the 11c however, only two of the tests are directly labeled and keyed. The other ten are called using sequence g TEST n. Below is a comparison table:

```
11C has 8 tests, all in the 10th column of keys:
x<=y
x<0

x>y
x>0

x not y
x not 0

x=y
x=0
```

For the 15c, look on the back of the calculator and you will see a table thus:

```
   ERROR            TEST        MATRIX
0 | y/0, LN 0...| x not 0 |    0 DIM
1 | ----         | x > 0   |  ------
2 | ------       | x < 0   |
```

etc.

So to get "X > 0" you key in g TEST n which is g followed by the minus key, followed by the number 1.

I hope that helps,

Bill

HP 15C emulator for Ipod touch

*Message #1 Posted by **Jeff Fontaine (Canada)** on 13 Nov 2010, 9:20 p.m.*

Hello,

I maybe didn't search correctly, but I didn't find posts about HP 15C emulator. I would like to find a good one for my ipod, or a good rpn calculator for this device.

I found two, the one from HP (http://itunes.apple.com/app/hp-15c-scientific-calculator/id318956846?mt=8) and another one by Thomas Fors (http://itunes.apple.com/us/app/sci-15c-scientific-calculator/id291967860?mt=8). Does someone knows which one is the best ? Or another one which would be better ?

I also found a RPN calculator (http://itunes.apple.com/us/app/active-rpn-calculator/id317847341?mt=8) which seems to be pretty interesting. Any opinion about this one.

Thanks in advance

Jeff

Edited: 13 Nov 2010, 9:30 p.m.

Re: HP 15C emulator for Ipod touch

*Message #2 Posted by **Jean-Michel** on 14 Nov 2010, 9:16 a.m.,*
in response to message #1 by Jeff Fontaine (Canada)

Hi Jeff,

I have no opinion on HP-15C emulators for iPod touch since I only have free emulators, except i41CX which was the first one I bought, because of my personal interest for the 41, and also because at the time I bought it there were not much emulators available. Anyway, let me suggest you to consider m48, which is probably the best emulator of the 48. Two others are available, but less interesting to my opinion (GraphiX48 and i48).

Free 42 is also a "must have", more to say knowing that it is also free.

PCalc Lite is also nice, with both algebraic and RPN mode.

Concerning Active RPN you are talking about, I only have the free version, Access RPN. This app is very nice, especially because it is well adapted for the tiny screen of the iPod, when one does not need much scientific functions.

Except if you really need and want an HP-15C emulator you may find some interesting emulators among those I listed.

I should also add i41 CAS, which is a free version of i41CX, but with CAS capabilities.

Hope this helps.

Kind regards from France.

Jean-Michel.

Re: HP 15C emulator for Ipod touch

*Message #3 Posted by **robert rozee** on 14 Nov 2010, 10:57 a.m.,*
in response to message #2 by Jean-Michel

not for the ipod, but a sort-of HP-15c emulator none-the-less, is this here one:
http://sourceforge.net/projects/hp15c/

written in delphi (object pascal), non-programmable, and supporting a few extra features. a single fix of one compile error, and it compiles with delphi 5. should be port-able to platforms other than windows using lazarus/fpc, so an android version is not out of the question.

cheers, rob :-)

Re: HP 15C emulator for Ipod touch

*Message #4 Posted by **Egan Ford** on 14 Nov 2010, 10:48 a.m.,*
in response to message #1 by Jeff Fontaine (Canada)

I've tested the following:

1. SCI-15C, Tom Fors (based on nonpareil (Eric Smith)
2. ClassicRPN (they rolled up 11C, 12C, 15C, 16C into a single package)
3. RPN-15C, same as #2, but just the 15C.
4. Calc 15C (now gone from store), however Calc 16Cx and 11Cx are still there.

Of the 15Cs I've tested #1 provides the best user experience because of its simplicity, keyboard accuracy, redesigned rear view, and the big button feature. It also supports all the 15C self-tests and diags, even on-. works. It is a bit pricy, but since Eric gets some coin from that, I don't mind. My only criticism is that the colors (f/g) do not match a real 15C--The blue is a bit light and the yellow a bit dark--probably due to a delta in the designers monitor and the phone display. The key click volume also does not match the iPhone key click volume (it's too loud). When I need a 15C I use this one.

#2 has a lot of nice features. 4 level stack output. Horizontal and vertical displays. User definable colors and button sizes. All the Voyagers under a single icon. You can even move the stack from calc to calc (e.g. 15C to 12C). Macros. Issues: key lag and accuracy, annoying key click sound (also too loud, 41CX has a user definable volume for the key click--nice), for some reason settings are not being saved. Cheap, 4 calcs for < #1. I only use this for my 12C and 16C needs, but now that I have folders I may dump this for Tom's/Eric's 12C/16C.

#3 is just #2 with 15C only. Same issues IIRC.

#4 is like #1 but for $0.99. The rear view is poor. I do not recall why I deleted it (odd issues IIRC). 16Cx is not bad, but I do not like the display.

If you want a very solid, authentic 15C experience with a great rear reference, fast and accurate buttons, then get #1.

If you want a superset of the 15C then get 42s ($9.99) or Free42 (free), (please avoid RPN Calc 42s). I prefer 42s because is has a number of features making it really a 42S+ (e.g. larger stack display). Free42 is more in the spirit of Tom's/Eric's 15C--it's as close to a 42S as possible.

42s is my default everyday calculator, it loads fast, has nice complex math support (vs. 15C), the extra stack lines are great and can be expanded beyond 4 with 3 or 6 visible with just a swipe. The portrait view makes for simple one-handed computations.

Lastly, I must mention i41CX+ ($24.99). Of all the calcs listed above it's the only one that supports iOS multitasking (rapid switching to be accurate) besting 42s in load times. i41CX+ may become my default quick answer calc. The i41CX+ feature set it stunning. Not only does it emulate a loaded 41CX, but it also support all the modules including HEPAX and has great overlay support. It also has a printer, iOS cut/paste, email support, etc... See their website for all the details.

One more thing...

Not what you asked for, but if you are interested in 48/49 emulation then checkout m48+. Since it is based on EMU48 and not x48 like all the others you get a lot of the EMU48 features. And since there is a 15C emulator for the 48/49 that works in EMU48 then you could do that too. I do not recommend that, but I just needed a tie-in with your original request. :-)

NOTE: i41CX+ and m48+ are universal apps that look awesome on the iPad. The rest run in 2x mode--who doesn't want a giant 15C? :-)

REQUEST: Tom/Eric any chance for iOS 4 updates for fast task switch and perhaps a volume control for the key click? A Voyagers app with all 4 would be nice too--make it universal so that on the iPad I see all 4 on the screen at the same time with all functional of course so that when my 16C is busy computing ToH I can use the 12C to see if I am getting a good deal on my refi. :-)

Re: HP 15C emulator for Ipod touch

*Message #5 Posted by **Mark Hardman** on 14 Nov 2010, 12:00 p.m.,*
in response to message #4 by Egan Ford

Egan, thank you for the excellent comparison. My Windows Mobile HTC phone recently died and my employer has replaced it with an iPhone. So Jeff's original question was well timed for me as well.

I was considering purchasing the ClassicRPN app. But now that I know that Eric Smith is getting compensation from the sale of SCI-15C, I'll spend the extra money for the full SCI-11C, FIN-12C, SCI-15C and PRG-16C suite.

Considering that Tom and Eric have already leveraged the work in Nonpareil for these four apps, it is a pity that the other Classic, Woodstock and Spice emulations are not also available. I would drop $19.99 immediately for a HP-34C app.

*Message #6 Posted by **Jeff Fontaine (Canada)** on 15 Nov 2010, 9:00 p.m.,*
in response to message #1 by Jeff Fontaine (Canada)

Hi Guys,

Thanks a lot for your help and advice. I installed Free42 and m48 to test them, which seems to be very good. I just have a problem with the48 : it is nearly impossible to change the volume in the settings.

The i41 CAS is no more available, it was just for a limited time.

I was interested in a 15C emulator because it id the one I use, or use again since this summer. My very first one died 10 years ago and I bought a 48, but never really liked it as much as the 15C, or even the 67 I still have.

Once again thanks a lot

Jeff

Calculator Sacrilege..

*Message #1 Posted by **uhmgawa** on 13 Nov 2010, 3:30 p.m.*

Man. I though I'd received some punishable offences from EEEBay curators. But this casualty leaves my stories far behind on the voyager agony scale:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=280589007986

I can't imagine exactly what type of misfortune a 15c could meet to render it in that condition.

My real question is HOW the 15c logo can not only be still present on the device but arguably in better shape than the entire balance of the exterior. Well assuming it is the original, which I'm inclined to as it doesn't appear that fella was the recipient of abundant love throughout its life.

Edited: 13 Nov 2010, 3:43 p.m.

Re: Calculator Sacrilege..

*Message #2 Posted by **Frank Boehm (Germany)** on 13 Nov 2010, 3:53 p.m.,*
in response to message #1 by uhmgawa

This is a typical victim of the well-known killer H20. Increased humidity will lead to corrosion of the aluminium parts (front / back). The logo is made out of chrome-plated plastic, so it will not suffer from humidity.

Re: Calculator Sacrilege..

*Message #3 Posted by **uhmgawa** on 13 Nov 2010, 5:54 p.m.,*
in response to message #2 by Frank Boehm (Germany)

Sorry, I should have been clearer. This was somewhat tongue-in-cheek.

> Quote:
>
> This is a typical victim of the well-known killer H20.

I suspected water may have been a catalyst, but the corrosion due primarily to some type of salt attack. Not that I'd dispute it being possible. But I've never seen wear of that degree due to water/humidity alone.

> Quote:
>
> The logo is made out of chrome-plated plastic..

Voyager logos tend to be early cosmetic casualties, and given the ABS case mechanical wear, the logo condition struck me as a tad unusual.

> Even in that condition it went for $79. Proof positive of the high regard the 15C commands.

In general I believe the price vs. condition curve for a 15c to be quite nonlinear yet somewhat predictable at the low end. It seems really beat 15c units auction at an incomprehensible price relative to their condition, I'd hazard because bidders think they've found a repairable bargain, however the bidding escalates carrying them away.

Although no reflection intended to the unit/buyer here as this wasn't an auction.

Robotic Programming for 35s?

*Message #1 Posted by **David Hayden** on 13 Nov 2010, 7:56 a.m.*

So I have this cute little 35s with lots of memory and no I/O. It occurred to me that something like a Lego Mindstorm could be programmed to press the keys on the calculator. Add something to parse a program listing and you have a robot that will enter your code.

Another possibility might be an old X-Y plotter, modified with a soft tip instead of a pen, and with a holder for the calculator.

Has anyone done this?

Dave

Re: Robotic Programming for 35s?

*Message #2 Posted by **Katie Wasserman** on 13 Nov 2010, 11:11 a.m.,*
in response to message #1 by David Hayden

We discuss this here every once in a long while, here's one thread (start reading about half-way down). David Smith mentions that he made one once, but I don't remember anyone saying that they have or know of such a machine recently -- creating one would be a fun project!

-Katie

Edited: 13 Nov 2010, 11:15 a.m.

Re: Robotic Programming for 35s?

*Message #3 Posted by **Don Shepherd** on 13 Nov 2010, 2:03 p.m.,*
in response to message #2 by Katie Wasserman

Katie, trying to do something like this for program entry on the 30b would probably be impossible because of the "shift + hold" functions. You would, I suppose, need two actuators to depress two keys at the same time.

Re: Robotic Programming for 35s?

Good point. Or at bare minimum a dedicated solenoid for keys involved in simultaneous-down sequences. This even impacts the use of an analog multiplexer as it will be necessary to select more than one column/row in such scenarios.

Anyway the input mechanism is fairly straightforward. Getting output from the multiplexed voltage levels of an lcd will be much more interesting.

Re: Robotic Programming for 35s?

*Message #5 Posted by **Bill (Smithville, NJ)** on 13 Nov 2010, 3:44 p.m.,*
in response to message #2 by Katie Wasserman

And another link where I had pondered doing this for a HP-42s.

Robot Programming HP-42S??

I never got very far with it, but still interested if anyone can pull it off.

Bill

Re: Robotic Programming for 35s?

*Message #6 Posted by **Thomas Chrapkiewicz** on 13 Nov 2010, 11:16 a.m.,*
in response to message #1 by David Hayden

Hello David:

[You and I must have some type of Extra-Sensory Connection. (Good hearing from you - again - enjoyed your talk in Sept.)]

I have both Lego Mindstorms systems and a number of xy plotters 'laying around' and I've been considering exactly this for a number of I/O deficient calculators (35s, 42s, 15c, etc).

Here are the current issues as I see it: [in no particular order)

1. As the pen plotters would have to move the calculator (in the y direction), the mass of the calculator may be a problem. However, as I have velocity and acceleration control with the 7550 plotter, this may not be an issue.

2. The linear 'throw' of the PenDown for the plotter may not be sufficient. Force could also be an issue - but the actuator for the calculator will require a bit more thought.

3. Mechanical modifications of the plotter to accept the thickness of the calculator(s).

4. I/O limitations of the Mindstorms (I use the older RCX as opposed to the newer NXT systems) to sense actual position.

This is not (yet) at the 'top of my list', but it is a most interesting prospect.

>
> Has anyone done this?

I am envious of your free time. :)

Yet for as entertaining as a mechanical/robotic version may be I'd probably resort to a pair of analog multiplexers, one of each sitting on the row and column scan matrix, commons tied together. Yea grafting this into the calc isn't great. But it is more reliable and would eliminate otherwise undetectable contact bounce.

Unsure of the key matrix topology of the 35s but I'd hazard it isn't over 8 lines wide for either row or column. Never bothered to poke at it as the 35s is pretty much a black box without any reasonable means to probe its firmware outside of a nitric acid bath. AFAICT HP isn't sharing any useful details either.

While not the same effect as an x/y articulating probe, I'd consider a solenoid matrix if you're intent on a mechanical approach. The actuation force of the the 35s keys is ~150gm which should be workable with cast off surplus solenoids. To deal with interfacing the likely large solenoid body size to a relative tighter key pitch, flexible plastic rods could be used aimed at the key locations via a perforated alignment plate. Setup of the solenoid drive in a matrix similar to the key scan topology will minimize circuitry.

In any case please share any pictures with the class!

in response to message #8 by uhmgawa

> Quote:
>
> I am envious of your free time. :)

For what it's worth, there may be real money to be made here. For example, this software for sale is $100 for the software alone and $300 for the software preloaded on a 35s. Subtract $56 for the cost of the

calculator and they're charging $144 to key in the program.

Re: Robotic Programming for 35s?

*Message #10 Posted by **Thomas Chrapkiewicz** on 13 Nov 2010, 4:10 p.m.,*
in response to message #1 by David Hayden

...with a bit more thought:

I would like to use somewhat commonly available hardware-i.e a plotter or Lego Mindstorms.

1. My pen plotter idea is out (for now) as moving the calculator around,AND transferring the mechanical movement of the pen dropping is very difficult (for me). The plotters that are commonly available (HP7550, 7475) are not true table top plotters, but move the paper within pinch rollers (in the y direction).

2. The Lego RCX does have three motor outputs (X, Y and Pen) and three inputs - certainly sufficient for this task.

I will pursue #2 for now - as time allows!!!

Of course, we will still have the mechanical problems: 1. Aligning each particular machine (35s, 42s, 15c etc) will require unique 'tooling' to hold the calculator properly - both in X / Y and vertical distance.

2. Key pressure - I believe that the appropriate type of damping material along with limiting the vertical 'drop' of the pen will take care of this.

3. Certainly feedback will be an issue, as the robot will not have vision to ensure that the correct key was hit.

4. Of course, multiple/simultaneous keystrokes will not be possible - although perhaps the user could work in synchrony with the contolling software for the (potentially) few keysteps that would require this.

Why the resistance to make a true pocket Sci RPN calc

*Message #1 Posted by **Gerardo Rincon** on 12 Nov 2010, 9:54 p.m.*

I'm yet to understand why is it that HP has not built a true pocket scientific RPN calculator like the HP-15 was? HP scientific calculators are huge. The newer HP 35s calc is pretty big. A single line screen, pocket size, RPN/Alg would be a great addition to the HP line of calculators.

I also dislike calculator with menus in which I had to click multiple key strokes to get to a simple percent change or find mathematical functions. Direct key strokes are wonderful - one or two color shift keys can accomodate a lot of direct functions.

Programming capabilities are nice but not necessarily required.

Re: Why the resistance to make a true pocket Sci RPN calc

My schoolage son just commented today how strange it is that there are no machines on the market today as powerful and small as the 15c.

Maybe there is hope.

Then again, look at who his father is...

Re: Why the resistance to make a true pocket Sci RPN calc

*Message #3 Posted by **Martin Pinckney** on 12 Nov 2010, 10:21 p.m.,*
in response to message #2 by bill platt

As far as why HP hasn't built a new 15c-type calculator, corporate decisions these days seem to be made by idiotic marketing concepts instead of common sense.

As far as menu- vs. keyboard-driven interface, that's more of a personal preference. But I agree the functionality of keyboard-driven is simpler, even if the keyboard is more cluttered.

Re: Why the resistance to make a true pocket Sci RPN calc

in response to message #3 by Martin Pinckney

> Quote:
>
> corporate decisions these days seem to be made by idiotic marketing concepts instead of common sense.

Common sense depends on the community you're in. Nowadays, the community seems to be dominated

by marketeers and similar folks with only $,$$$,$$$ in their eyes, at least where HP is located. Sad, but fact.

Re: Why the resistance to make a true pocket Sci RPN calc

*Message #5 Posted by **robert rozee** on 13 Nov 2010, 3:50 a.m.,*
in response to message #4 by Walter B

quite simply, because the goal is no longer to produce able engineers with useful tools, but instead to produce consumers that will buy disposable products of minimum acceptable quality.

the 15c was a quality product that would last a lifetime. the person who could master it would attain a level of skill that would see them do well in their profession. but HP (and many other previously 'quality' companies) discovered that this was not the way to maximize shareholder revenue.

instead we provide students with tools that are designed to become obsolete, to break, and whose purpose is as limited as the market will withstand.

it is not just an HP problem, it is becoming almost impossible to buy ANY quality scientific calculator that is not geared exclusively to to what has become a dumbed-down educational system. today's calculators are not designed as general purpose problem solving tools, but as "answering machines" where the student can type in (verbatim) a limited range of questions, and have the machine magically produce an answer that student can write into exam paper and teacher can with little effort assign a grade to.

but we are all happy about this, as it maximises shareholder revenue - revenue with which we can all buy pink plastic flamingos and fruit-flavoured vodka mixers.

You get to the point :))

Re: Why the resistance to make a true pocket Sci RPN calc

*Message #7 Posted by **Patrick Rendulic** on 13 Nov 2010, 5:02 a.m.,*
in response to message #1 by Gerardo Rincon

I teach physics to teenagers. Each year it gets harder to convince them to buy a "decent" calculator. The problem is that they don't see a need to buy one because they all have their iphones. Obviously they are not allowed to use them. But they are getting more and more reluctant.

That's the current problem.

plastic glue

*Message #1 Posted by **aj04062** on 12 Nov 2010, 7:34 p.m.*

Anyone have a suggested glue/epoxy to repair a 200LX case?

Re: plastic glue

*Message #2 Posted by **Katie Wasserman** on 12 Nov 2010, 9:11 p.m.,*
in response to message #1 by aj04062

Hinge cracking issues?

The HP95/100/200LX case is a really difficult plastic to repair, I've tried several glues/epoxies none of which I'd recommend.

However, the recognized expert in this area is Daniel Hertrich and he describes using a 2-part plastic filler material, read about it here. I suspect that this is material is similar to Plas-T-Pair, but I've had little success using this.

HP 12c+ and HP 50g - initial impressions

*Message #1 Posted by **Jose Gonzalez Divasson** on 11 Nov 2010, 4:59 p.m.*

After a long relation with HP products (from a HP 33c in 1979 to 12c, 15c, 17bII, 19 bII, 41cv&x, 42S, 48G&GX, 71b, 85A + diverse printers, plotters, peripherals, oscilloscopes and multimeters), I was quite scared by the posts here about current HP quality and design.

I received last week a brand new HP12+ and an HP 50g from Eric (the only way to make sure it is the ARM-based model)

Some comments:

The HP12c+ quality:

-looks as good as the originals (I have an early USA 12c and a more recent Malaysian one),

-keyboard feels much better (time may be a factor - all my 4 voyagers have worse "click" than the new one). I would go as far as to say it betters my 41's and 48's in keying pleasure. Let's see how the painted keys age.

-Speed in a different world - IRRs and AMORTs are immediate!

-The yellowish tone of the screen is just different - not necessarily worse.

The HP 50G:

-Fast!

-Much better screen than 48GX - in all ways.

-Keyboard...lagging behind. Not bad, but if you're used to old models... In the next redesign, please use the slanted keys and mechanism of the 12c+: you still know to do it! (and put the double sized ENTER where it belongs)

-The exact mode for normal calculations is fun to use - and object manipulation much better than on the 48's. In general, I feel the 50G is a much better tool for most things. I have done in a week things that took me ages (or ever!) with the 48GX.

I have left my 48GX on my house desk. After using the 50g for 5 working days, when I took the 48g I felt it clunky as a brick (I apologize for the blasphemy) and slow as a snail. I guess that I will either use the 50g or the 41cx with nothing in between (for desk use: I always take either the 15c or 42s in my jacket pocket.

So, as a conclusion: kudos to the calculator team. HP still rules!

I suppose that's subjective. The legacy voyagers used a full round snap dome which has a softer action (broader threshold). The arm7 12c uses a 4 leg snap dome which gives the more pronounced inflection. Personally I prefer the older full circle snap dome. The 4 legged domes are popular as they allow a single side PCB layout for the keyboard matrix and tend to be more prevalent particularly in cost constrained designs.

If you measure the actuation force of both units however you'll find they are about the same at ~150gm.

> Quote:
>
> -Speed in a different world - IRRs and AMORTs are immediate!

Can't argue there. The 3.72Khz basic cycle time of the voyager NUTs wasn't exactly blazing. And even a pokey 1Mhz uP can best it performing emulation.

> Quote:
>
> -The yellowish tone of the screen is just different - not necessarily worse.

I'm not decided on this yet. I think the contrast is less compared to that driven via a 1LQ9 NUT which AFAICT is rendering the lcd at the same multiplex ratio. I suspect the hue of the polarizer is causing this but it may be due to other factors.

So ~1.5N in real force units ;) (150**g** is a mass, 150**gm** is something nonsensical, as people express it here)

Re: HP 12c+ and HP 50g - initial impressions

*Message #4 Posted by **uhmgawa** on 12 Nov 2010, 8:16 a.m.,*
in response to message #3 by Walter B

> Quote:

Indeed. However that argument may be more productive to pursue with switch/dome vendors most always specifying actuation forces in units of grams. I'd hazard it is more universally understood by their target market which apparently is also subject to the same gravitational force.

Re: HP 12c+ and HP 50g - initial impressions

*Message #5 Posted by **Walter B** on 12 Nov 2010, 9:56 a.m.,*
in response to message #4 by uhmgawa

So 150**g** may be reasonable. But don't you invent new units - the world has got enough.

Re: HP 12c+ and HP 50g - initial impressions

*Message #6 Posted by **bill platt** on 12 Nov 2010, 11:03 a.m.,*
in response to message #5 by Walter B

Walter,

Most good engineering predated SI.

There is such a thing as "gram-force"

There are metric units and systems that are not SI. There is the old MKS, and the cgs systems.

If you do engineering, you should be familiar with tonne-force, kgf, etc.

Somehow, scores of European engineers have managed to use the kgf and tonne force units for decades without getting confused. Everyone knows what the meaning of "150 gram weight" is.

*Message #9 Posted by **Gerson W. Barbosa** on 12 Nov 2010, 11:21 a.m.,*
in response to message #5 by Walter B

Walter,

From M-W 11th Edition College Dictionary:

gm *abbr* gram

sec *abbr* **1** secant **2** second

We know **g** and **s** are the correct SI abbreviations, however **gm** and **sec** are quite acceptable in non-technical writings.

Regards,

Gerson.

Your information is correct. This looked a bit exaggerated to me, so I decided to check. I had to stack up eight R$ 0.25 and eight R$ 0.50 coins on the EEX key in my 12C+ before it actuated. That's 119.7 grams (8*7.55 g + 6*6.80 g + 2*9.25 g - two 50 cents coins are dated 1998 and therefore heavier according to my reference). I should have repeated the experiment for some other keys and taken the average weight, but I am not that rigorous. Too many coins, I should have tried stronger currencies, like Euro or Dollar, but I have none :-)

Lost in translation

*Message #20 Posted by **Martin Pinckney** on 12 Nov 2010, 2:16 p.m.,*
in response to message #17 by Gerson W. Barbosa

Can't quite visualize how the Styrofoam is used. It seems to me you require a mechanism to apply the weight directly to the one key, and not surrounding keys.

BTW, Styrofoam is probably despicable to some environmentalists, but mostly negligible to engineers. [:-)

Re: Lost in translation

*Message #21 Posted by **Gerson W. Barbosa** on 12 Nov 2010, 2:24 p.m.,*
in response to message #20 by Martin Pinckney

I meant a square piece of a lightweight material, the size of key under test, thick enough so the stack of coins don't touch the surrounding keys after key actuation.

```
      ----------
     '----------'
     '----------'
     '----------' <- coins
     '----------'
     '----------'
        |    |    <-- styrofoam or other lightweight material
 ----    ----    ----
|    | |    | |    |  <-- keys
```

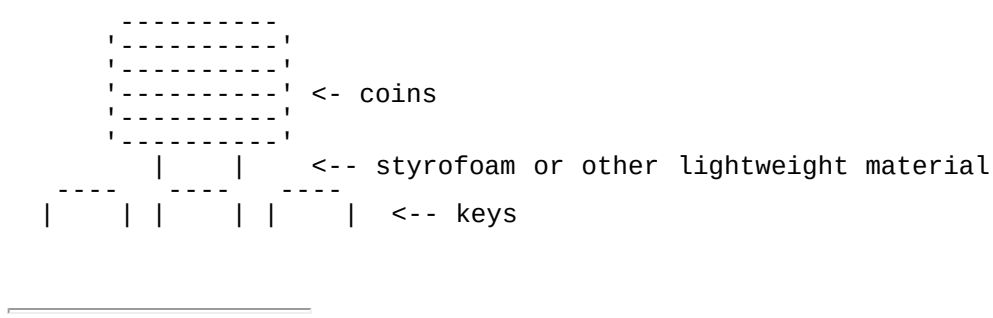
key actuation.



Just toss the calc on a $5 digital jewelry scale and let it zero out the body weight. Slowly depress the key of interest and observe the force measured by the "newton strain gauge sensor" at the dome inversion point. Empirically I've found up to a +33% variation (eg: 200gm) within the same key matrix. IME the absolute inversion force is less tangible to a user than the snap inversion width which is why the legged domes of the same inversion force have a noticeably different tactile feel.

Note this information is really only useful in the context of searching for equivalent replacement snap domes despite the unexpected entertainment value discovered here.

Thanks! When translating the usual Portuguese expression "massa desprezível" ("masa despreciable" in Spanish, I think) to English I first thought of "despisable mass", which would be equally wrong. I might have chosen "negectable mass", but I see now "negligible mass" is the correct English expression.

Quoting Paulo Rónai, perhaps the best Brazilian translator ever, who incidentally was born in Hungary:

"There was a time I was a technical translator ... That new job convinced me that there were at least fifty French languages, forty-nine of which had nothing to do neither with Racine, nor with Victor Hugo, nor with Anatole France. The same happened with my mother language itself (Hungarian)."

Regards,

Gerson.

Re: Lost in translation

*Message #27 Posted by **Martin Pinckney** on 14 Nov 2010, 7:57 p.m.,*
in response to message #26 by Gerson W. Barbosa

Gerson,

Even just using Google Translate (knowing nothing of Portuguese) I could see how you would make that error. Curious, I consulted English etymological dictionaries. These indicate that "despicable" comes from the Latin meaning "to look down on", as I expected. I can only surmise that the Latin phrase "to look down on" went into English meaning something contemptible, whereas in Portuguese the equivalent word more literally means something so small that you must "look down" to see it.

No?

Re: Lost in translation

*Message #28 Posted by **Gerson W. Barbosa** on 15 Nov 2010, 7:06 a.m.,*
in response to message #27 by Martin Pinckney

Both the Portuguese verb **desprezar** and the English verb **to despise** come from the latin verb *despicere* (*de* + *specere*) meaning "to look from above", that is, "to look down on" (to consider others to be at a lower level). It is possible the word had already lost its literal meaning in Classical Latin because **specere** (to look at) was already an archaic verb then. As of the adjectives, **despicabable** comes directly from *despicabilis* while **despisable** is the adjective form of **to despise**, thus the latter has a milder meaning than the former. These correspond to Iberian Portuguese **desprezível** and **desprezável**, respectively, while here in Brazil the former has prevailed for both meanings.

Re: Lost in translation

*Message #29 Posted by **Marcus von Cube, Germany** on 19 Nov 2010, 3:40 a.m.,*
in response to message #28 by Gerson W. Barbosa

The German word "despektierlich" has exactly the meaning you describe: looking down, lacking respect.

Re: Lost in translation

*Message #30 Posted by **Gerson W. Barbosa** on 19 Nov 2010, 5:57 a.m.,*
in response to message #29 by Marcus von Cube, Germany

Interesting! The german word appears to have the same latin root. So does "Spiegel", compare with Latin "Speculum", Portuguese "Espelho" and Spanish "Espejo" (mirror).

I know no German, but my 14-year old daughter has been attending optional German classes twice a week since August. She's always studied in a Lutheran School (because the education level is excellent and because it's only two blocks away from home). She's complained why I didn't send her to those German classes since the beginning so she would be speaking German by now. I replied "I didn't know you wanted to learn such a complicated and nonsensical language" :-) Obviously, I am kidding about "nonsensical" (but not about complicated).

Regards,

Gerson.

Re: Lost in translation

*Message #31 Posted by **Martin Pinckney** on 19 Nov 2010, 11:05 a.m.,*
in response to message #30 by Gerson W. Barbosa

Don't get Walter started again! [:-)

But really, with all due respect to Twain, isn't English at least as "nonsensical" as High German? Some examples:

"Slow up" and "slow down" mean exactly the same thing.

If something "frosts you" or "burns you up", it's the same.

Ditto for flammable and inflammable.

There are many, many more expressions like this.

More formally, many conjugations are inconsistent:

show-showed-shown - OK

blow-blowed-blown - No!

sing-sang-sung - Good.

bring-brang-brung - Nein!

Literally hundreds like these.

Then there's the pronunciation rules that have as many exceptions as there are rules. The letters that are silent in one word, but pronounced in another.

And so on - but I haven't the time.

In Portuguese, "sim" means "yes" and "não" means "no, not". However,

"pois sim!" -> an emphatic no

"pois não!" -> a helpful yes

> Quote:
>
> show-showed-shown - OK
>
> blow-blowed-blown - No!

flow-flowed-flown ok, however.

No problem with these triplets. I will not mention the Portuguese counterparts so no one is discouraged to give it a try :-)

Back to the English language, consider the following phase, in which every occurence of "ough" sounds differently:

*Molten snow fallen from the b**ough** flowed thr**ough** the tr**ough**, th**ough**. "That's en**ough**", I th**ough**t.*

Gerson.

That's fun in real life German: Ask somebody something using a negative expression, like:

"Das hast du nicht gemacht?!" (literally: "You didn't do that?!")

and you'll receive most times "Nein!" (though it's not done) where "Ja!" would have been true ;) since double negations are positive.

Fun - strange - but not nonsensical :)

Martin --

There are, of course, many examples of strong verbs with inconsistent conjugations, in English and other languages. This one, though, reminded me of a hit tune ("Play Me") in which the singer/songwriter took liberties with grammar in only one instance in order to make a rhyme:

Song she sang to me
Song she brang to me
Words that rang in me
Rhyme that sprang from me

-- KS

35s printed User's Guide

*Message #1 Posted by **David Hayden** on 10 Nov 2010, 11:15 a.m.*

I just called HP support to get my free printed User's Guide for the 35s. It was a very pleasant experience. Mike took my serial number and address and said I'd have it in 5-10 business days. Not surprisingly, he also asked where I bought it, how long ago, and would I give him my phone number and email address. Requesting this sort of marketing info seems to be standard practice among companies these days, and I give it (or not) depending on how I feel about the company. Naturally I gave HP all the info they requested :).

Nice job, HP.

Huh. This struck me odd as I had called weeks ago to order a manual and I was told they were gone with little hope of ever again being available. Just called again and apparently they had an unexpected shipment arrive yesterday, and since I was already in the queue, my manual is already shipping today. I could get used to customer service like this.

in response to message #2 by uhmgawa

With a plethora of small batch publishing houses available on the internet, I don't understand how they could say they were not likely to be getting more. If they needed more, and if they had promised them to their customers, then it's pretty poor service to not see to it that they are available. Unexpected shipment? I used to do purchasing at a small company. There is no such thing. Vendors don't just surprise you with product on your dock.

in response to message #3 by Mark Storkamp

Did you ever work at a large company? Hand A following process B doesn't always mean Hand C using process D that was set up by Hand E four hands ago. . .

Just a thought.

in response to message #4 by Tim Wessman

Regardless of company size, and which Hands are using or setting up which processes, based on Mark's comments one of HP's processes is broken or the Hands are not following their processes.

Someone should be slapped. By a senior Hand.

I didn't intend to suggest they were a surprise to corporate HP. Rather they were an unexpected arrival to the customer service individual who took my call. In my earlier conversation I was told the gratis 35s manual program had run its course of a few years and was apparently being discontinued.

I suppose if you're really in a bind and can't get a printed manual from HP, sending the PDF they do provide to one of the one-off internet book printers might be an option.

I've used Staples in the past with great success. Most recently I printed a manual at home on 8.5 x 11 inch paper, 2 images per side. I had staples cut the paper in half, put a spiral binding on it, and add a clear vinyl cover to the front and a black vinyl cover to the back. Poof! Instant manual. Since I printed it myself, I think the total cost was at Staples was only about $10.

hpcalc.org also has a few manuals available for very reasonable prices.

Interesting. I picked up an inexpensive comb binder punch for under $100 on EEEbay which does a better job than I'd expected on general reference materials. But a spiral bound half-letter sized footprint is far better for the reference manuals discussed here. How square was the resulting stack? I suppose what I'm asking is whether they just made a single cut in half or were able to square the deck afterwards.

> Quote:
>
> hpcalc.org also has a few manuals available for very reasonable prices.

I found someone selling HP calc manual reprints for $35 each in half-letter size with a spiral binding. I couldn't help be curious where the image data originated..

Note in particular that most of the HP manuals that come on CD's now are half-letter sized. You can confirm this by looking at the document properties of the PDF file.

> Quote:
>
> How square was the resulting stack? I suppose what I'm asking is whether they just made a single cut in half or were able to square the deck afterwards.

They just did a single cut, but that's all I asked them to do. They charge by the cut, so I could have asked to have it squared up if I wanted to pay a little more.

Looking closely at the manual, I can tell that it was cut, but not because the overall length is

off. Rather, the length is off on one end only, so I think the paper wasn't quite squared when it went into the cutter.

*Message #11 Posted by **M. Joury** on 10 Nov 2010, 3:24 p.m.,*
in response to message #1 by David Hayden

I had the same experience as uhmgawa some time back. No manuals and maybe I could obtain them from a third party.

Re: 35s printed User's Guide

*Message #12 Posted by **Dave** on 11 Nov 2010, 10:25 p.m.,*
in response to message #11 by M. Joury

Doesn't the 35s come with a printed user's guide? For some reason I have one and don't remember ever having to call and order it.

Re: 35s printed User's Guide

*Message #13 Posted by **M. Joury** on 12 Nov 2010, 12:49 a.m.,*
in response to message #12 by Dave

It used to. However it does not any longer. I got a couple with the guide included but ordered another recently and the user's guide was not included. Also, the the zippered case has been replaced by one of a different design. I have not actually opened the package yet but it is clearly not the zippered case and the new design appears to be a cheaper offering (I know that some hated the zippered cases but I personally liked them). As far as manuals go the same appears to be true of all recent HP calcs. They have replaced the user's guide with a CD.

Re: 35s printed User's Guide

*Message #14 Posted by **Kiyoshi Akima** on 15 Nov 2010, 2:09 p.m.,*
in response to message #1 by David Hayden

I bought my 35s at the end of October. I called HP about a week and a half ago to ask for the printed manual. The agent told me that the program had ended, but took my address and other data in case they got more manuals.

This morning there was a box on my doorstep containing the manual. Kudos to HP customer support.

Now, if I could get a printed manual for my 30b... :-)

Re: 35s printed User's Guide

*Message #15 Posted by **Jim Yohe** on 15 Nov 2010, 8:48 p.m.,*
in response to message #14 by Kiyoshi Akima

Oh YES for the 30b, plus all the "Learning_Modules". :-)

Re: 35s printed User's Guide

*Message #16 Posted by **Mark Harman** on 16 Nov 2010, 11:46 a.m.,*
in response to message #15 by Jim Yohe

Or, you can get a Kindle and read them using the Kindle's PDF reader. It is like looking at actual paper without all the "book weight."

Regards,

Mark

Re: 35s printed User's Guide

*Message #17 Posted by **Jim Yohe** on 16 Nov 2010, 12:48 p.m.,*
in response to message #16 by Mark Harman

If only talking about the 30b manual and its learning modules, have you ever tried to make out what some of the "key" symbols are? Thank goodness for my 27 inch monitor and the ability to enlarge those PDF pages. :-P

Re: 35s printed User's Guide

*Message #18 Posted by **David Hayden** on 17 Nov 2010, 6:55 p.m.,*
in response to message #1 by David Hayden

The printed User's Guide arrived today via UPS. Yippee!

I think my collection is complete...

*Message #1 Posted by **Mark Henderson** on 9 Nov 2010, 9:24 p.m.*

My passion is for LED models, been working on my collection, which stands as follows today (all are working and in good condition, with a few "extras" for parts etc.). I don't think I have any others I want? Am I missing any obvious examples?!?!

HP35 (with bug) HP80 HP45 HP70 HP55 HP65 (currently 2 with repaired card readers)

HP25 HP25C (needs ACT chip) HP19C HP67 (with repaired card reader)

HP34C HP38C

HP41C

HP33S HP35S HP50g

Re: I think my collection is complete...

*Message #2 Posted by **Michael Meyer** on 9 Nov 2010, 10:26 p.m.,*
in response to message #1 by Mark Henderson

Not a pocket machine, but the HP-97 is a beautiful example of engineering. I think you'd enjoy it.

Re: I think my collection is complete...

*Message #3 Posted by **Donald Williams** on 9 Nov 2010, 10:47 p.m.,*
in response to message #1 by Mark Henderson

Congratulations on your quest. You certainly have collected the main ingredients of a quality collection. If your intention was to collect "all" the LED models, my list (if I have everything correct) has a total of 28.

HP 97 HP 92 HP 91 HP 81 HP 80 HP 70 HP 67 HP 65 HP 55 HP 46 HP 45 HP 38 E HP 38 C HP 37 E HP 35 HP 34 C HP 33 C HP 33 E HP 32 E HP 31 E HP 29 C HP 27 HP 25 HP 25 C HP 22 HP 21 HP 19 C HP 10

Since you plainly exhibit the irrational behavior of the ordinary HP collector, I am sure you will not stop now.

I still need the HP 70 and HP 81.

Re: I think my collection is complete...

*Message #4 Posted by **Mark Henderson** on 10 Nov 2010, 5:32 p.m.,*
in response to message #3 by Donald Williams

Ok so you've convinced me I need to continue!

Re: I think my collection is complete...

*Message #5 Posted by **Steven Ellis** on 13 Nov 2010, 2:13 p.m.,*
in response to message #3 by Donald Williams

Heh, strange coincidence: the HP81 is one of the only two LED models that I own, and one of the only two that you *don't* own.

Re: I think my collection is complete...

*Message #6 Posted by **Donald Williams** on 13 Nov 2010, 5:47 p.m.,*
in response to message #5 by Steven Ellis

This situation cannot be allowed to continue. We need to trade.

Re: I think my collection is complete...

*Message #7 Posted by **Karl Schneider** on 9 Nov 2010, 11:50 p.m.,*
in response to message #1 by Mark Henderson

Mark --

Although you stated that your 'passion' was for LED models, you have one LCD model (HP-41C) from the LED era, as well as a few modern examples.

Your LED collection is missing the rare and pricey HP-27.

The HP-41CX, HP-15C, HP-16C, HP-42S, HP-27S, and HP-17BII are among the most desirable LCD models from the 1980's. The HP-41CX is the epitome of the HP-41 series, and has some functionality that cannot be added to an HP-41C/CV. The HP-16C is unique among HP models.

For LED models, I have only an HP-35 (no bug) and an HP-34C.

Re: I think my collection is complete...

*Message #8 Posted by **Mark Henderson** on 10 Nov 2010, 5:35 p.m.,*
in response to message #7 by Karl Schneider

My first calc was a Sinclair Scientific (!), then HP-25 and then HP-41C - so that is why it's in my collection! If I have to do some REAL work the 41C is probably my first choice...! I'm quite interested in the HP27, but honestly I've fallen in love with the C versinos of LED calcs and that is preventing me from falling in love with the 27! Well, that and the massive prices they command!!!

Re: I think my collection is complete...

*Message #9 Posted by **Matthias Wehrli** on 10 Nov 2010, 12:26 a.m.,*
in response to message #1 by Mark Henderson

I think you miss the HP-91, HP-92, HP-97, HP-97S..... and certainly the HP-95C... good luck!

Re: I think my collection is complete...

*Message #10 Posted by **Mark Henderson** on 10 Nov 2010, 5:36 p.m.,*
in response to message #9 by Matthias Wehrli

I've come very close to getting a 97, but I fear my office mates would tease me too much (you see, I use all of my collection daily at work (on rotation, of course! Today it's the 19C :-)))

Re: I think my collection is complete...

*Message #11 Posted by **Ed Sowell** on 11 Nov 2010, 10:36 p.m.,*
in response to message #10 by Mark Henderson

If you're afraid of leaving a paper trail that curious eyes might drift across seeing all your coding errors, just don't turn Trace on :-)

Re: I think my collection is complete...

*Message #12 Posted by **Mark Henderson** on 12 Nov 2010, 1:03 a.m.,*
in response to message #11 by Ed Sowell

Just knowing the decimal point on the 19C has that tiny HP logo on it makes it a favorite!

Re: I think my collection is complete...

*Message #13 Posted by **Walter B** on 10 Nov 2010, 1:18 a.m.,*
in response to message #1 by Mark Henderson

If you collect LED pocket models, you miss some Woodstocks (21, 22, 27, 29C) and some Spices (31, 32, 33, 33C, 37) still. At least I don't see a reasonable line excluding these from your collection ;)

Good luck in hunting!

Re: I think my collection is complete...

*Message #14 Posted by **Mark Henderson** on 10 Nov 2010, 5:38 p.m.,*
in response to message #13 by Walter B

You make a good point!!? See my thoughts on 27, above. 21 and 22 just haven't gotten to me yet? I have a good 21 emulator on my iPhone, perhaps that's enough?? A 33C would fill my LED+C desires, but the lower 3x range don't really excite me enough...

Re: I think my collection is complete...

12c date range

*Message #1 Posted by **Don Shepherd** on 9 Nov 2010, 1:52 p.m.*

The valid range of dates on a 12c is Oct 15, 1582 to Nov 25, 4046. I understand why the beginning of the range is what it is, but why is the end Nov 25, 4046? That's exactly 899,999 days, which leads me to believe that the date range had some limitation based upon memory size, but does anyone have an insight into this?

Edited: 9 Nov 2010, 1:52 p.m.

Re: 12c date range

*Message #2 Posted by **Thomas Klemm** on 9 Nov 2010, 3:17 p.m.,*
in response to message #1 by Don Shepherd

> Quote:
>
> No computer has been programmed for correct dates after 28 Feb. 4000 A.D. because there is no consensus on whether that year will be a leap-year. The HP-12C financial calculator thinks it will, and recognizes dates from 15 Oct. 1582 until Sun. 25 Nov. 4046 ; will the world end then?

cf. DAYDATE: Computing Days between Dates

Most of us know the author: Prof. W. Kahan

Re: 12c date range

*Message #3 Posted by **David Hayden** on 9 Nov 2010, 5:23 p.m.,*
in response to message #2 by Thomas Klemm

Here's a fascinating bit of trivia that I learned recently: a year is NOT measured as one revolution of the earth around the sun. Technically, one year is the time from spring equinox to spring equinox (or was it solstice to solstice?). In this way, the seasons remain constant relative to the calendar, even as the earth precesses in it's orbit.

So in several thousand years when Orion is visible during warm summer nights, the calendar will say it's July, not January.

Dave

It looks like Dr. Kahan wondered about that 4046 date too!

Re: 12c date range

*Message #6 Posted by **Katie Wasserman** on 9 Nov 2010, 7:53 p.m.,*
in response to message #5 by Don Shepherd

Interesting, but this doens't address Don's question. Why limit date calculations to 899,999 days? I took a guess that this is just about what would fit in one-half of a register and that perhaps the other half was needed for some financial calculation function.

-Katie

Re: 12c date range

*Message #7 Posted by **Thomas Klemm** on 9 Nov 2010, 9:35 p.m.,*
in response to message #6 by Katie Wasserman

It's not clear now whether 4000 will be a leap year or not. This makes 2/28/4000 the last possible date we know for sure. Therefore the limit should be 882'928 instead of 900'000 but the latter number is cheaper to enter. Just my guess however. Looking at the code might clarify that matter.

Re: 12c date range

*Message #8 Posted by **Gerson W. Barbosa** on 10 Nov 2010, 5:34 a.m.,*
in response to message #7 by Thomas Klemm

According to the HP-12C, 4000 will be a leap year:

```
1.014 1.014001 DeltaDYS  ->  366
```

Re: 12c date range

*Message #9 Posted by **Katie Wasserman** on 10 Nov 2010, 9:32 a.m.,*

in response to message #8 by Gerson W. Barbosa

The leap year or not question for 4000 is moot. It will be stardate 1677158 thru 1677163 on what we now call 2/28/4000 thru 2/29/4000.

Re: 12c date range

*Message #10 Posted by **Jeff O.** on 10 Nov 2010, 3:50 p.m.,*
in response to message #9 by Katie Wasserman

Hmmm....
I question the "accuracy" of the calculator at the link you provided. The earliest stardate from Star Trek TOS is 1312.4 and the latest is 5943.7, which would be April 24, 2324 through December 11, 2328 as calculated by your reference. I thought the original series occurred in the mid-23rd century, with Star Trek TNG in the 24th century. According to a well-known on-line resource whose accuracy is the subject of debate, the various series occurred in the following Gregorian time periods:

TOS: mid to late 23rd century
TNG: 2364–2370
DS9: 2369–2375
Voyager: 2371–2378
Enterprise: ~2150s

Of course the problem is that the “stardate” system was not a rigorously defined system.

But in any case, Live Long and Prosper!

...

> Looking at the code might clarify that matter.

I agree. Does anyone have access to it?

This is not earth-shaking, of course, just a matter of curiousity. I saw the upper limit in the 12c manual years ago and always wondered where they came up with that particular date. Like Katie said, it probably has something to do with a limitation on the available RAM or ROM on the 12c.

in response to message #13 by Fred Lusk

Aha! So you are still lurking on this Forum, but still have not ported *Feet-Inches-Fractions Calculator* to the 42s? [:-)

Actually, I found the exchange between you and Kelley back in Oct. 2005, wherein you described the changes necessary to get the program to run on the 42s, but I have not had time myself to try this.

Don,

I didn't even know the HP-12C had this limitation. You've been geeky enough to discover there are exactly 899,999 days between both dates. A google search for **calendar + "900000 days"** eventually hit Roy Martin's article.

It appears Katie's guess about only one half of one internal register being used to hold the numbers of days is correct.

Well, the HP-12C might have been used within all Star Trek series time frames. Anyway, they'd better take along a 17B-II, just in case.

Regards,

Gerson.

Re: 12c date range

*Message #17 Posted by **Don Shepherd** on 11 Nov 2010, 9:35 a.m.,*
in response to message #16 by Gerson W. Barbosa

Thanks Gerson.

Yeah, the 17bii can track all the way to Dec 31, 9999 (as does the 30b), so that should cover all the Star Trek missions!

Hmm, the year 9999 raises an interesting question. Will they have a "Y10K" problem then, when all the existing computer systems allow only 4 digits for the year? OTOH, I'm sure computers as we know them won't exist by that time.

:)

Don

I'm not sure about Windows, but Unix is moving toward time_t being 64 bits wide; assuming all the versions that use a 32-bit time_t have been phased out by 2038, we'll be fine for another 100 trillion years. We may need another fix sometime before the heat death of the universe, though...
Then again, all the databases that store years as 4-digit numbers *will* cause Y10K problems. :-)

AFAI have read recently (e.g. in Scientific American), the universe will eventually rather freeze out due to its accelerated expansion. A pulsing universe, though an idea I'd prefer for several reasons ;) , seems to be pretty unlikely based on the knowledge we have right now.

FWIW

Heat or Freeze? I go with Frost :-)

```
Fire and Ice
                  by Robert Frost

Some say the world will end in fire;
Some say in ice.
From what I've tasted of desire
I hold with those who favor fire.
But if it had to perish twice,
I think I know enough of hate
To say that for destruction ice
Is also great
And would suffice.
```

in response to message #19 by Walter B

"Heat death" refers to entropy reaching a maximum; because the universe is expanding it is entirely possible that it will be very cold when that happens.

We're way OT here, but having spent 1999 working on zillions of needed program changes for many wall street systems, I have to take exception to this. While the Y2K boundary issue that many feared never materialized this was because of the early and active recognition of the issue and the huge amount of work that went into fixing it.

I have to agree with Katie. I spent many hours in 1998 and 1999 testing, assessing, fixing, upgrading and replacing software. Most of the work was on vital systems but some was cosmetic. This made the changeover a non-event.

John

Re: 12c date range

Yay, a populist slogan! It's a guaranteed win on the campaign trail: either there was an actual problem that was fixed thanks to timely action, but now nobody will ever know; or there wasn't a problem, and all the time and effort that was spent on it was a waste.
I could mention that I spent a lot of time in 1999 helping to identify, fix, and test Y2K-related issues for a major U.S. telecom, but, you'd probably just call me a liar. Or were you actually trying to make a point? And if so, what?

Re: 12c date range

*Message #27 Posted by **bill platt** on 12 Nov 2010, 12:12 a.m.,*
in response to message #23 by Martin Pinckney

The "hoax" part was the idea, cultivated all across the "media," that it would be an unfixable Armageddon like disaster. This is how they interpret engineering problems for the masses. The media treats political problems and engineering problems exactly the same, while pretending to actually know something about the weather...

But the consequences were dire, would it were that the work Katie described went undone.

Re: 12c date range

*Message #28 Posted by **Don Shepherd** on 12 Nov 2010, 2:46 a.m.,*
in response to message #23 by Martin Pinckney

I concur with Katie and John and Thomas. I worked for Computer Sciences Corporation in the late 1990's on a special Y2K team charged with identifying and fixing potential problems in client's code systems. We even developed specialized software that looked at source code and tried to identify problems automatically. And we found (and fixed) plenty of problems. Later (1998), I worked for a smaller firm that did the same thing, mostly for clients in the health care field. You'd be surprized how many automated and embedded systems there are in a large hospital. Most of those systems were OK and required no change, but many did.

Interestingly, probably the most critical system we examined was US air traffic control within the FAA. I don't recall any critical problems within that system, mostly because air traffic control is largely not dependent upon dates.

January 1, 2000 passed uneventfully, largely because of all the work done beforehand. But had that work not occurred, there would have been many problems.

Re: 12c date range

*Message #29 Posted by **Martin Pinckney** on 12 Nov 2010, 10:27 a.m.,*
in response to message #23 by Martin Pinckney

OK, what I meant was, all the media and cult hoopla about how the world as we know it was going to end because of this "bug."

Yes, there were programming problems that had to be fixed, and thanks to Katie et al for doing so. But the idea was bandied about that somehow, because computer programs only had two digit dates, when January 1, 2000 arrived, the computers would "think" it was 1900, and all of us were not born yet, so somehow all our bank accounts would suddenly vanish. And the electric power system would fail because the power grid had not been invented in 1900... etc. etc.

All nonsense.

There were many books written, websites started, a whole survivalist culture developed around a bogus notion. And it was kept up right up until the last, in spite of the reprogramming that was done. That was the hoax.

Re: 12c date range

*Message #30 Posted by **Don Shepherd** on 12 Nov 2010, 5:41 p.m.,*
in response to message #29 by Martin Pinckney

Martin, I personally don't remember all of the media hoopla and world-ending predictions that you describe. That may have happened, but anyone familiar with computers and programming (most of the members of this forum, for example) would have known that this was just a relatively simple problem that needed to be assessed and fixed, and that's exactly what happened. I sure didn't stay up until midnight on 12/31/1999 to see if the earth would vanish at precisely midnight!

While Y2K did provide a unique way for old COBOL and FORTRAN programmers to cash in, it was, by it's nature, a very time-sensitive endeavor, because there was NO Y2K work to be done after the event. The consulting company I worked for at that time went out of business in December 1999, and I became a teacher!

*Message #32 Posted by **Don Shepherd** on 13 Nov 2010, 7:35 a.m.,*
in response to message #31 by Martin Pinckney

Good links Martin, thanks. I learned a new acronym: TEOTWAWKI.

It's interesting to speculate about what would have happened around 1/1/2000 if nothing at all had been done in advance. Of course, the world would not have ended. Computer programs would not necessarily have aborted, but many would have generated incorrect values, which would have resulted in incorrect data in electronic files, financial statements being wrong, scheduling systems being wrong, reports being wrong, and so forth, none of which would have been critical but all of which would have had to be fixed. So Y2K resulted in the problems being fixed beforehand, rather than dealt with at the time of error occurrance.

It's too bad none of us will be around in the year 10,000 although, as I said, computers as we know them today won't be around then. It's interesting to imagine what will.

*Message #33 Posted by **Thomas Klemm** on 17 Nov 2010, 12:01 a.m.,*
in response to message #11 by Don Shepherd

Quote:

Does anyone have access to it?

If you build nonpareil with the option has_debugger_gui=1 you will get an additional tab labeled "Debug". One of the choices in the menu is "Trace". If enabled you get 3 lines for each executed machine instruction:

```
 03462: 0456 a=a+b   w
cycle 17711  P=7 q=8 carry=0  stat=...3.........
 a=01200000000000 b=01200000000000 c=03060009999999
```

I haven't analyzed the whole program yet but this algorithm is used:

```
if m <= 2:
   m = m + 12
   y = y - 1

jd = int(365.25*y)
   - int(y/100)
   + int(y/400)
   + int(30.6001*(m+1))
   + d
   - 478164
```

This maps 15-10-1582 to 100000 and 25-11-4046 to 999999.

For both limits I compared the trace-output with that of the date just one day beyond the limit to find the point where they diverge:

```
14-10-1582                                                  15-10-1582

1582 * 365.25 = 577825.5              577825                1582 *
365.25 = 577825.5               577825
1582 -> 15                          -     15                1582 -> 15
-     15
                                      577810
577810
15.82 / 4 = 3.955                     +      3                15.82 / 4 =
3.955                     +      3
                                      577813
577813
11 * 30.6001 = 336.6011              +    336                11 * 30.6001
= 336.6011              +    336
                                      578149
578149
14                                    +     14                15
+     15
                                      578163
578164
                                     - 478164
- 478164
                                       99999
100000

cycle  4161  P=c q=8 carry=0  stat=...3.........              cycle  4968
P=c q=8 carry=0  stat=...3.........
 a=00999990000000 b=05781630000000 c=05781630000005
a=01000000000000 b=05781640000000 c=05781640000005
 03363: 1502 ? a<>0  p                                       03363: 1502
? a<>0  p
cycle  4162  P=c q=8 carry=0  stat=...3.........              cycle  4969
P=c q=8 carry=1  stat=...3.........
```

Here P=c which means it points to nibble 12 (i.e. the 2nd from left).

Still I don't understand why the lower limit 100000 was chosen. Using 0 instead leads to negative numbers for dates earlier than 15-10-1582. This sets the carry-bit and is easy to detect.

```
25-11-4046                                                  26-11-4046
```

```
4046 * 365.25 = 14778015.5            1477801                      4046 *
365.25 = 14778015.5            1477801
4046 -> 40                           -      40                     4046 -> 40
-      40
                                       1477761
1477761
40.46 / 4 = 10.115                   +      10                     40.46 / 4 =
10.115                   +      10
                                       1477771
1477771
12 * 30.6001 = 367.2012              +     367                     12 * 30.6001
= 367.2012             +     367
                                       1478138
1478138
25                                   +      25                     26
+      26
                                       1478163
1478164
                                     -  478164
-  478164
                                        999999
1000000

cycle 18292  P=c q=8 carry=0  stat=...3.........              cycle  4145
P=c q=8 carry=0  stat=...3.........
 a=01478163000005 b=14781630000000 c=09999990000000
a=01478164000005 b=14781640000000 c=10000000000000
 03325: 1376 ? c<>0  s                                        03325: 1376
? c<>0  s
cycle 18293  P=c q=8 carry=0  stat=...3.........              cycle  4146
P=c q=8 carry=1  stat=...3.........
```

Here the sign of register c is checked and thus a date outside the range will be detected.

> Quote:
>
> The second date is determined by internal register limitations

There's enough space. All the numbers could be shifted one place to the right. I don't see the limitation.

Cheers
Thomas

I found this old thread: 30.6001, 25 year old hack?

The same constant is used in the HP-12c so it might as well be that some old code was reused. From the HP-92 which is described in the acrticle of the Hewlett-Packard Journal or even from the HP-80 where space was much more limited.

in response to message #35 by Thomas Klemm

Somewhat disturbingly the the formula given in the appendix of the 12C manual is different from what you've uncovered. Perhaps they give the same result but why present a formula that's not actually used and claim that it is?

Re: 12c date range

*Message #37 Posted by **Thomas Klemm** on 18 Nov 2010, 3:26 a.m.,*
in response to message #36 by Katie Wasserman

What is the formula given in the manual?

A typical trace of the execution of DATE consists of about 29k lines. I didn't read that line by line. Instead I was looking for some patterns, numbers mostly, and followed them while they are processed. There are situations when you realize now you're in a loop as in a multiplication or a division and you want to fast forward. Instead of scrolling down I calculated the expected result and searched for the next occurrence. So the intemediate results I've given in the previous post are like links to points of interest in the trace. Between them sometimes things happen I don't really understand. So it may well be that something slipped through. After all it's my interpretation of what's going on. The formula isn't written there as in a high level language.

I was surprised to find 30.6001. That's why I googled it. I hoped to find a formula to calculate the Julian day number. It's funny that the first hit brought me back to this forum.

Best regards
Thomas

I can't answer the original question, but just to add another data point: The HP-41 Time Module handles dates from October 15, 1582, until September 10, 4320 -- 999,999 days later. I've wondered about that limit, too... It's obviously not a problem, but why they chose a limit well below what the calculator *could* handle, I would be interested to know. :-)

Re: 12c date range - 17bII+

*Message #41 Posted by **Marcus von Cube, Germany** on 12 Nov 2010, 4:34 p.m.,*
in response to message #40 by Thomas Okken

The same holds for my 17bII+. I can enter 10.151582 in DATE1, 999,999 in DAYS and I get 9.104320 as DATE2. Increasing DAYS by 1 results in an error calculating DATE2.

Edit: I must have made a mistake. I can't go below October 10, 1582 but easily up to December 31, 9999

Edited: 12 Nov 2010, 4:42 p.m.

Re: 12c date range - 17bII+

*Message #42 Posted by **bill platt** on 12 Nov 2010, 4:43 p.m.,*
in response to message #41 by Marcus von Cube, Germany

I just added 1e6 days to the Julian start date in my 27s and it worked. Sept 11, 4320. And this is 890s technology.

It will take 2E6 and calc 8/8/7058

5e6 is invalid.

I wonder why the 17bii+ is less than its predecessor the 27s? (problem solved. 17bii+ covers more. Entry error).

OK that makes sense--that the 17bii+ has more range.

Windows site registry cleaner

*Message #1 Posted by **designnut** on 9 Nov 2010, 1:48 p.m.*

This si a true microsoft windows site. http://onecare.live.com/site/en-us/article/registry_cleaner_why.htm Suggested use; click full scan, select customize, leave only registry cleaner checked, lett it run. It creates a restore point before changing your registry. Just let it run, Sam

What's Windows?

Can it be run on my 41CX?

Re: Windows site registry cleaner

+1. So is Linux. (I work in a Windowsless office.) The last time my 41cx crashed was over 20 years ago, and that was my fault from synthetic programming mistakes.

Re: Windows site registry cleaner

*Message #7 Posted by **bill platt** on 10 Nov 2010, 3:32 p.m.,*
in response to message #6 by Garth Wilson

I wish I could be "windowless" but alas, I have to use many programs which are not developed for non-windows: ProSurf, Solidworks, Abaqus (maybe they have a unix version, not sure about Linux releases), GHS (old one is dos), Rhino (soon to be Macompatible), AutoCad, Alibre, SJ MEPLA, and I would like a good free FEM system...right now looking over Calculix in windows but maybe it is unix/linux supported by somebody...

It would be nice to rid myself of Windows, and yet some stuff is good, albeit in some cases only available in XP: Paint Photo Editor Movie Maker (works but so would many alternatives) Notepad (so what, dos editor was just as good, that is simple) I am sure all of these are more than replicated...I would be interested in a photo editor replacement. Office 2003 and later and Windows 7 crippled their usefulness by purposely replacing photo editor with a POS viewer hoping you'd buy the M$ bloatware Photo something PRO.

If only there were a way to get all these specialty expensive programs to run on non-windows....but companies that develop software won't waste time on platforms that are minuscule in market penetration.

> I would be interested in a photo editor replacement.

I use Gimp. When Adobe was bragging about some cool things coming in CS5, our son checked it in Gimp, and found Gimp had had the same thing for years, the ability to remove a road from a desert scene or litter from the lawn in a park for example, and heal

the area so you couldn't tell it wasn't authentic. Gimp, like most Linux software, is free too.

> Quote:
>

The only stuff I haven't found available for Linux is some of the company-specific stuff like Microchip's assembler-- so I'm still using their DOS one, making a few minor tweaks for newer parts that weren't available when they had the DOS software. I have not done entire new families like the DSPICs though.

41Z - Just got POLARized...

*Message #1 Posted by **Ángel Martin** on 9 Nov 2010, 9:55 a.m.*

Greetings to all. You are no doubt holding your breath in expectation of the new developments on the 41_MCODE world... yes?

So the good news is the new release of the 41Z Module, with POLAR-mode capability: displaying and data input directly using POLAR notation.

Two new functions (aptly named POLAR and RECT) switch the 41Z mode back and forth. Complex number data entry (using the natural notation function, "^IM/AG") and displaying is done automagically according to the setting, but always stored in rectangular form.

This ensures compatibility with all FOCAL programs and speeds up the calculations - there's no need to convert the stored data upon mode switching, but only to display it appropriately when recalled.

The complex mode setting uses an internal "flag" in the complex buffer header register. It is permanent (until changed by the user), so it survives OFF-ON power cycles. The header has two more data registers to store the POLAR values of the currently-shown number - typically in XY, but can also be in a "complex storage register" if using the functions ZRCL or ZVIEW.

Should be posted at TOS in a few days, as always let me know if you have "urgent needs" :-)

Cheers, ÁM

Great! Can't wait to see this in Monte's 41CL !

*Message #2 Posted by **gene wright** on 9 Nov 2010, 11:26 a.m.,*

*Message #5 Posted by **Monte Dalrymple** on 9 Nov 2010, 7:24 p.m.,*
in response to message #4 by Gene wright

Indeed. I just got the IR Printer module (which I think is the most complex plug-in) working. So all there is left to check is the HP-IL module before I pull the trigger on the PC board fabrication.

Monte

Re: 41Z - Just got POLARized...

*Message #6 Posted by **Angel Martin** on 10 Nov 2010, 1:54 a.m.,*
in response to message #3 by Monte Dalrymple

Monte, I'm doing the final testing - so assuming I can resits the temptation to keep adding new frills to it (that's what happens when tester and developer are the same person) it should be coming your way in a couple of days.

The main improvement left is trying to spped it up a little (I know, use the 41L instead...) But the nicer the code the better performance!

Re: 41Z - Just got POLARized...

*Message #7 Posted by **Karl Schneider** on 10 Nov 2010, 11:40 p.m.,*

> Two new functions (aptly named POLAR and RECT) switch the 41Z mode back and forth. Complex number data entry (using the natural notation function, "^IM/AG") and displaying is done automagically according to the setting, but always stored in rectangular form.

Good enhancement -- sounds much like the capability of the HP-42S.

Storage in rectangular (cartesian) form is the right choice: It is unique (no angular mode); all complex-valued operations are defined (if sometimes less straightforward).

And the "automagically"-executed display sounds even more enticing!

:-D

Edited: 10 Nov 2010, 11:43 p.m.

Re: 41Z - Just got POLARized...

*Message #8 Posted by **Ángel Martin** on 11 Nov 2010, 2:00 a.m.,*
in response to message #7 by Karl Schneider

Hi Karl,

Yes it´s pretty much the same as the 42 model, with a few differences:

- It also has ZRCL _ _, ZSTO_ _, and Z<>_ _ , with complex suffixes
- It has many more functions than the 42, like inverse trig and hyp
- Data entry using "^IM/AG" is almost identical to the 35s implementation. You enter the real part (or the module), press "^IM/AG", and the display shows either "^IM J_" or "^AG <|_" depending on the mode setting. Then write the imaginary part (or the argument)using the digits, CHS, EEX and radix keys (not a simple feat but reasonably error-proofed) and press either R/S or ENTER^ to terminate the entry.
- It's of course slower than either the 42 or the 35S, call it a "venerable speed" if you wish - but it's very responsive, remember it's all MCODE

Cheers, AM

Re: 41Z - Just got POLARized...

*Message #9 Posted by **Angel Martin** on 11 Nov 2010, 3:03 a.m.,*
in response to message #8 by Ángel Martin

Not to forget a few other unique functions (meaning not on the 42 or -chuckle- the 35s), such us:

- Gamma, Digamma, LogGamma, Lambert with complex arguments, and
- Bessel J,I,K,Y for complex orders and arguments.
- Nth. degree polynomial roots - w/ complex coefficients

all mixing and matching dedicated MCODE functions and FOCAL drivers.

And a few other tricks as well.

Cheers

Edited: 11 Nov 2010, 3:04 a.m.

HP-25C ACT Chip?

*Message #1 Posted by **Mark Henderson** on 8 Nov 2010, 5:33 p.m.*

I have a very clean HP-25C that I'd like to add to my collection, but it is displaying "all 00000000000" which from what I read here is an ACT chip problem. I understand I can switch this with an ACT from another non-27 member of the Woodstock family. Does anyone have a working ACT chip I could buy or trade for? I have a fair selection of HP LED calcs to pick/plunder from. I'd really like to get this little guy back to working condition!

Cheers

How to use a formula in a post

*Message #1 Posted by **Thomas Klemm** on 8 Nov 2010, 4:22 p.m.*

cf. How to use a formula in a post

A LaTeX-tag would be cool:

```
[latex]e^{i\pi}+1=0[/latex]
```

This would be displayed as:

$$e^{i\pi} + 1 = 0$$

Best regards
Thomas

Re: How to use a formula in a post

*Message #2 Posted by **Norman Dziedzic** on 8 Nov 2010, 5:24 p.m.,*
in response to message #1 by Thomas Klemm

Wow, brings back memories. I used to know TeX by heart and a good amount of LaTeX as well. I was in college when it first came out. This one lady at the computer center was just gaga over it.

Another consideration may be MathML. I thought it was dead but it looks like they just updated it...

Perl is a unix routine. How do I run that on my wodoze machine?

Re: How to use a formula in a post

*Message #4 Posted by **Thomas Klemm** on 8 Nov 2010, 6:05 p.m.,*
in response to message #3 by bill platt

> Quote:
>
> How do I run that on my wodoze machine?

You may install strawberryperl or activeperl. Use a file for the formula instead of the here-document:

```
perl -MURI::Escape -ne 'chomp; printf "[img:http://latex.codecogs.com/png.latex?
%s]\n\n", uri_escape $_' formula.txt
```

There might be other utilities to uri-escape.

HTH
Thomas

I can't test that right now, but the following should work. Create a file "uri-escape.pl" with your favorite text-editor and enter the following lines:

```
use URI::Escape;
while (<>) {
    chomp;
    printf "[img:http://latex.codecogs.com/png.latex?%s]\n\n", uri_escape $_;
}
```

Create a 2nd file "formula.txt". It may contain several formulas each on a separate line:

```
e^{i\pi}+1=0
```

Now run in a command prompt:

```
perl uri-escape.pl formula.txt
```

Re: How to use a formula in a post

*Message #5 Posted by **Egan Ford** on 9 Nov 2010, 10:17 a.m.,*
in response to message #1 by Thomas Klemm

If you are too lazy to upload images you can use aamath for "a-text":

```
$ echo "e^(i*pi)+1=0" | aamath

 i ||
e     + 1 = 0

$ echo "sum([n-1;r],r = 0 .. min(n-1,4))" | aamath

min(n - 1, 4)
    =====
    \          / n - 1 \
     >         |       |
    /          \   r   /
    =====
    r = 0
```

Duplicate Submission! error

*Message #1 Posted by **Ernst Fueloep** on 8 Nov 2010, 10:34 a.m.*

Hi,

I have now tried several times to post a message to the HP-33C thread I have started. But I always get this message:

> Quote:
>
> Duplicate Submission!
>
> This error usually means that you have pressed the "Post Message" button more than once for the same message. If that is the case, please return to the message index (and reload it if necessary) to confirm that your message was, in fact, posted!
>
> The message could also mean that you "previewed" your post, but then went back to the main input form and tried to submit it from there without making any changes. If that is the case, simply go back, make a minor change, and resubmit it!

I have previously edited my first post and changed the word witout to without. Maybe that is the reason why this is happening? I changed it back to witout but I still am unable to post to this thread.

A bug in the forum SW?

Regards, Ernst

Re: Duplicate Submission! error

*Message #2 Posted by **Ernst Fueloep** on 8 Nov 2010, 10:39 a.m.,*
in response to message #1 by Ernst Fueloep

After I started this new thread I tried again to post my message to the previous HP-33C thread and this time it was successful.

Whatever happened is a total mystery for me.

HP-33C dead after connecting Charger witout batteries

*Message #1 Posted by **Ernst Fueloep** on 8 Nov 2010, 6:11 a.m.*

Hi,

I guess I have killed my HP-33C. I made the mistake connecting it to the AC Charger (82090B) without a inserted battery pack.

Now it doesn't display anything. I have inserted a battery pack but it is still death.

Have I killed it? Is there any hope in repairing it?

Any ideas welcome.

Thanks.

Regards, Ernst

Edited: 8 Nov 2010, 10:27 a.m. after one or more responses were posted

Re: HP-33C dead after connecting Charger witout batteries

*Message #2 Posted by **Walter B** on 8 Nov 2010, 6:49 a.m.,*
in response to message #1 by Ernst Fueloep

According to what I've read in this forum in the past years, the majority of accumulator-driven CMOS calcs ("HP-xxC") die this way. Yes, I've done it too :(- once. AFAIK there's no way to resurrect such a victim except another HP-xxC of the same kind :(But ask Randy of FixThatCalc - he knows for sure.

Sorry, that's all. It doesn't really help, I know.

Re: HP-33C dead after connecting Charger witout batteries

*Message #3 Posted by **Namir** on 8 Nov 2010, 7:39 a.m.,*
in response to message #1 by Ernst Fueloep

Yes you killed your HP-33C ... and what comes next is the HP Museum PoPo (new American slang for Police) show up at your door steps for an arrest. Budy ... you are in big trouble!

:-)

Edited: 8 Nov 2010, 7:40 a.m.

Re: HP-33C dead after connecting Charger witout batteries

*Message #4 Posted by **Joel Setton (France)** on 8 Nov 2010, 7:57 a.m.,*

in response to message #1 by Ernst Fueloep

There's a possibility that the overvoltage has destroyed the power supply module (which is built from discrete parts and can be repaired), and not fried the ICs. Have you tried swapping the power module with one from another calculator?

IHTH!

Joel Setton

Re: HP-33C dead after connecting Charger witout batteries

*Message #5 Posted by **Ernst Fueloep** on 8 Nov 2010, 8:10 a.m.,*
in response to message #4 by Joel Setton (France)

No I don't have another HP-33C to exchange parts with. I may get one in a few days. But the previous owner told me this HP-33C doesn't power up too. It may be affected with the same problem. Although the previous owner said he doesn't know why it doesn't react when it is powered on.

I know I shouldn't have done this extremely stupid mistake.

Regards, Ernst

decimal point

*Message #1 Posted by **budlor** on 6 Nov 2010, 1:21 p.m.*

how do I set the decimal point so that all my calculations are set to 2 places following the decimal? What I'm looking for is the answer to be like this 0.00. I had this setting but I just changed the batteries and I can't remember how to set it. I can't find my manual. Thank you

Re: decimal point

*Message #2 Posted by **Jim Yohe** on 6 Nov 2010, 1:41 p.m.,*
in response to message #1 by budlor

I think that would depend on the model of calculator you're using.

For my 32SII: DISP FX 2 (note: no other keys necessary to end sequence)

For my 30B: MODE 2 INPUT ON/CE (note: INPUT necessary to establish number of digits and ON/CE to exit MODE)

Re: decimal point

*Message #3 Posted by **Martin Pinckney** on 7 Nov 2010, 11:14 p.m.,*
in response to message #1 by budlor

1. On many smaller HP's it would be MODES (or DISP) FIX 2.

2. Except with some FIX is a shifted key, so you don't have to press MODES or DISP first.

3. On many RPL graphing calcs it would be true postfix notation: MODE 2 FIX.

4. Unless it's an algebraic graphing calc, then it might be MODES enter 2 on FIX line then ENTER.

Re: decimal point

*Message #4 Posted by **Jim Yohe** on 7 Nov 2010, 11:42 p.m.,*
in response to message #1 by budlor

It would have been simpler if you would have said which model of calculator you had since we are just "guessing" without knowing which steps you need to take to fix your two decimal places. ;-)

ANS vs LAST-X

*Message #1 Posted by **Jim Yohe** on 6 Nov 2010, 1:13 p.m.*

Sorry for the question but where did the ANS come from? I had to read the forums before I found a reference that the ANS key on my HP 30B is the same as the LAST-X key is on my HP 32SII.

While I'm on it, it appears that the ← key is doing double duty as the SHOW key does on the 32SII except that it's not a momentary view of all the digits like SHOW.

I suppose with further use (I'm had the 30B less than 24 hours) I'll see other changes to what use to be familiar to me. (Besides ENTER changing to INPUT) ;-)

Re: ANS vs LAST-X

*Message #2 Posted by **Mark Harman** on 6 Nov 2010, 2:34 p.m.,*
in response to message #1 by Jim Yohe

Jim,

ANS is that way to satisfy Algebraic and Chain mode users who are familiar with having an ANS key. ANS is familiar to TI users and it is the same as the LAST function on older scientific HP algebraic models. The majority of people who use this calculator will likely not use RPN. Quite a shame actually, as I converted from a Chain/Algebraic TI to this fine machine and now that I have learned RPN, I don't think I could ever use anything else.

Unfortunately, I am not sure what the &#8592 key is. I am guessing it is the backspace key. You hit it once to show full viewable precision of the result and you can hit it again as much as you want to truncate the result. I think this offers much better functionality than what SHOW does, which, as you mentioned, is momentary. Just hit the ON/CE key to get out of it - you won't lose your displayed number. If you want to keep the result, hit INPUT.

Regards,

Mark

Edited: 6 Nov 2010, 2:34 p.m.

Re: ANS vs LAST-X

*Message #3 Posted by **Jim Yohe** on 6 Nov 2010, 2:49 p.m.,*
in response to message #2 by Mark Harman

Oh sorry. I thought when I pasted the backspace key (from MS Word) that it would show up as the left facing arrow and obviously didn't. lol

Thanks for the background. I've been a long time since I owned a TI calculator and didn't remember having ANS so couldn't directly relate to it (obviously).

HP 30B Keyboard Overlay ... really?

*Message #1 Posted by **Jim Yohe** on 6 Nov 2010, 12:20 a.m.*

In Gene Wright's article, "The HP 30b Business Professional", published in the HP_Solve_Issue_18_April_2010.pdf, he states, "To help the user who wants to write programs more easily remember the command locations, a clear, thin, sticky overlay is provided which lays over the top four rows of keys.".

I just purchased my own HP 30B and didn't find an overlay. I wonder when these overlays were available. Hmmm.

in response to message #4 by Mark Harman

Found it. Had to retrace my steps (fell out next to a chair). Also, I downloaded the full User Guide and learning modules earlier. Had a look at all of them before deciding to make the purchase. Thanks.

Re: HP 30B Keyboard Overlay ... really?

*Message #6 Posted by **Mark Harman** on 6 Nov 2010, 1:36 a.m.,*
in response to message #5 by Jim Yohe

As a word of warning, there are some errors in the learning modules. I can't recall where they are at, though. However, you should get the main idea of what you need to do from them.

I think you will come to find, as I have, that the 30b is quite an amazing calculator. I have come to really appreciate is its high level of functionality as well as its blazing fast speed.

Regards,

Mark

Re: HP 30B Keyboard Overlay ... really?

*Message #7 Posted by **Kiyoshi Akima** on 6 Nov 2010, 2:13 a.m.,*
in response to message #6 by Mark Harman

I've found one problem that, while technically not an error in the learning guides, I consider an error in the calculator itself.

If you've set the display to FIX -1 mode, RCL MODE will return that as 13. However, when you want to set it this way, STO MODE requires it to be 12. If you set it to 13, the calculator rejects it and leaves the display mode unchanged. This means that if you do a RCL MODE, save the 12-digit number somewhere, change the settings, then do a STO MODE with the saved value, you won't necessary get the original display mode restored.

As I said, this is not an error in the guides, since they and the manual do give the values as 12 and 13. But who the heck designed it so that recalled value can't be used to restore things?

Re: HP 30B Keyboard Overlay ... really?

*Message #8 Posted by **Katie Wasserman** on 6 Nov 2010, 10:05 p.m.,*
in response to message #7 by Kiyoshi Akima

I agree that this is not consistent behavior that makes it difficult to save the state of the mode flags in a program then restore them when the program finishes.

However in defense of the 30b, I think that the ability to recall and save the state of the decimal places, entry mode and other settings in a single register is a very nice feature to have on a low-end programmable calculator.

-Katie

Re: HP 30B Keyboard Overlay ... really?

*Message #9 Posted by **DeboT** on 10 Nov 2010, 10:32 a.m.,*
in response to message #7 by Kiyoshi Akima

I also have a problem with the FIX mode. When set to -1 it will display all the zeros for numbers >=1E12, i.e. 1.0000000000 ^{12}. It does not do this for numbers <=1E-12. Would you consider this a bug?

Re: HP 30B Keyboard Overlay ... really?

*Message #10 Posted by **Katie Wasserman** on 10 Nov 2010, 11:41 a.m.,*
in response to message #9 by DeboT

FIX -1 mode is not the same as the ALL mode in previous HP calculators, although it acts like that when not in scientific notation mode. When the 30b switches to scientific notation to show 1E12, for example, it shows as many decimal paces as requested and FIX -1 means whatever fits on the display.

It's hard to call this a bug based on past HP calculator expectations especially since the manual says:

> Quote:
>
> If you specify –1, the calculator displays numbers with the most appropriate number of digits after the decimal point

"Appropriate" being in the eyes of the firmware developer not necessarily the user.

-Katie

Re: HP 30B FIX -1

*Message #11 Posted by **DeboT** on 10 Nov 2010, 1:17 p.m.,*
in response to message #10 by Katie Wasserman

But for negative exponents it does not display those zeros. So there's inconsistency at the very least. Anyway, it's not a problem as such, just "doesn't look nice".

Re: HP 30B Keyboard Overlay ... really?

*Message #12 Posted by **gene wright** on 6 Nov 2010, 7:09 p.m.,*
in response to message #6 by Mark Harman

Yes, there are 2 (I think) errors in one of the learning modules that slipped through.

Not sure what it would take to get the PDF files replaced, however.

Re: HP 30B Keyboard Overlay ... really?

*Message #13 Posted by **Kiyoshi Akima** on 6 Nov 2010, 8:30 p.m.,*
in response to message #12 by gene wright

Is there a bug list for the 30b? I have a contribution.

RCL arithmetic doesn't work properly for the Cashflow registers. You can put an instruction like RCL+ Cashflow into a program, but when executed (either in a program or from the keyboard) simply performs a RCL Cashflow without doing the arithmetic.

Re: HP 30B Keyboard Overlay ... really?

*Message #14 Posted by **Jim Yohe** on 6 Nov 2010, 9:19 p.m.,*
in response to message #13 by Kiyoshi Akima

You've already pointed out a couple. Where would a bug list be kept at?

Re: HP 30B Keyboard Overlay ... really?

*Message #15 Posted by **Katie Wasserman** on 6 Nov 2010, 9:57 p.m.,*
in response to message #13 by Kiyoshi Akima

I don't think this is a bug, sto/rcl arithmetic is not suppose to work on the indirect (i.e., cash flow and data) registers. The manual doens't say that it does, it only mentions sto/rcl arithmetic in conjunction with memories 0 - 9.

There are some other key sequences that you can put into a program that don't have any effect. This is an 'artifact' of the macro recording mode of programming and the way STO/RCL try to merge keystrokes for display purposes. I'm not sure that this is a bug either, just undocumented behavior.

-Katie

>
> -Katie

Undocumented behavior is always a sticky area when it comes to deciding if something is a bug or not. I understand that the STO/RCL arithmetic isn't supported with the cashflow registers, but it really should reject the command rather than silently doing something else.

I think it's a bug because it's something that a user is reasonably likely to try. It's better to give them an error than to silently give them some related but unexpected functionality.

Dave

*Message #17 Posted by **Don Shepherd** on 9 Nov 2010, 12:32 p.m.,*
in response to message #16 by David Hayden

I agree with Dave. If program mode accepts these as seemingly valid commands, as it does, then that is wrong. Bug.

Re: HP 30B Keyboard Overlay ... really?

*Message #18 Posted by **Jim Yohe** on 7 Nov 2010, 11:40 p.m.,*
in response to message #12 by gene wright

Hey Gene, I'm not sure if I found the two errors you are referring to in this one learning module or of there is another one that I haven't run across yet but in the "HP30b 33Trigonometry.pdf" file Example 4 has compound problems.

The solution is flawed in two ways. In this example the author creates an input to the arcsine (ASIN) function that falls outside of its domain and so therefore fails. The user is instructed to divide 6 by 3 which results in 2 and to take the arcsine of this number. The valid domains for arcsine (ASIN) is (-1,+1), arccosine (ACOS) is (-1,+1), and arctangent (ATAN) is (-infinity,+infinity) so 2 clearly falls outside of ASIN's domain of (-1,+1).

Now to identify the real problems:

1) You are given only dimensions for the (opposite and adjacent) sides of this right triangle not the (opposite and hypotenuse) sides which is required by the arcsine function. The only function that will work with these two sides is arctangent;

2) If you are to use this function and the angle is from the ladder to the wall (up where the ladder contacts the wall), then you need to divide 3 by 6 not the original 6 by 3.

Therefore the solution is:

Angle = ATAN(opposite/adjacent) = ATAN(3/6) = ATAN(0.5) = 26.56 degrees

Re: HP 30B Keyboard Overlay ... really?

*Message #19 Posted by **Jim Yohe** on 7 Nov 2010, 11:52 p.m.,*
in response to message #18 by Jim Yohe

Funny ... I just realized there are two Example 4's in that one PDF file. A minor error but that makes three.

Re: HP 30B Keyboard Overlay ... really?

*Message #20 Posted by **Jim Yohe** on 9 Nov 2010, 7:17 a.m.,*
in response to message #18 by Jim Yohe

I'm such a fool and will eat crow by admitting that part 1 of my argument is patently false. The problem originally posed that the length of 6 meters was of the ladder, the hypotenuse, not my incorrect reading as being the height from the floor to the where the ladder contacts the wall.

Therefore we still use the arcsine function but it must be of the opposite side divided by the hypotenuse:

Angle = ASIN(opposite/hypotenuse) = ASIN (3/6) = ASIN (0.5) = 30 degrees

OT - Age restricted audience - 50+: KIM-1 / SDK-85

*Message #1 Posted by **Joerg Woerner** on 5 Nov 2010, 5:27 p.m.*

I guess you have to be born before 1960 to remember the KIM-1, SDK-85, SC/MP etc single-board computers.

I just repaired a very odd device from the 1977 timeframe with an unknown CPU. Most of the devices on the board are marked with "WE ***". The 4 RAM's are AMD AM9131BDC devices, the ROM is a "WE IV77" and the CPU (40 pins) is a "WE 179 212C" marked device. Peripherals are from the Intel family, e.g. the 8255 chip.

Other, small DIP-16 chips are marked "WE 177" and "WE 178".

The keyboard has a label "MACTUTOR" and I was able to step through a few instructions of the (random) RAM content. It is obviously a 8-bit CPU and has instruction length of 1, 2 or 3 bytes.

Any ideas????

Thanks for your help.

Regards,

Joerg

Maybe Weitek (now Rockwell) made the chips? cannot seem to connect with ChipDocs at the moment, and UIowa just has WEITEK as the logo.

in response to message #7 by Joerg Woerner

Joerg,

My 'fate' with this started with SDK80 from Intel, with a 8080, somewhere in 1976. Having only a serial TTY interface (8251), I repurposed an old portable TV-set into a CRT, with a keyboard build with single switches. The CRT digital electronics was build around a NS character ROM and a Siemens TV timing circuit (S187). A Lorenz Lo15 mechanical typewriter served his duties as a hardcopy printer. The most fun was to handcode all the routines necessary for ASCII <--> Baudot conversion, and to see them working. This set up

was also used for some RTTY experiments, without the noisy typewriter.

I was also surprised to see that the MAC-8 development was driven by the suitability of this CPU for the C programming language. Had to write plenty of code in PL/M 80 and PLZ, C was not yet available at this time for the 8085 and Z80 CPUs.

Hubert

in response to message #11 by uhmgawa

I always enjoy the recent tear-downs of various gadgets, e.g. the iPhone, reading "company xyz managed to stack an ARM9, a SDRAM and even a Flash memory in a so-and-so housing".

Well, more than 30 years ago (in 1979) the engineering school I attended purchased a bunch of the latest personal computers, the CBM 3032 series. Okay, just one CBM 3032 for the teachers, the students worked with the CBM 3016's.

One day, after school, I opened the hoods of both the 3032 (32k RAM) and 3016 (16k RAM) and recognized immediately: The fully loaded Commodore had two rows of 16k*1 dynamic RAM installed, the 3016 featured only one row and ONE ROW of neatly alligned 10 mm holes, drilled carefully into the PCB at the original places of the optional RAM's!

After studying both the layout and datasheets, I asked the other day my teacher, if I could borrow the CBM 3016 over a weekend for an "important project". He agreed and I piggy-backed a set of MK4116 chips carefully one-to-one except the RAS and CAS pins, that I hand-wired to the left-overs of the traces ;-))

Wow - you should have seen his face after booting the CBM 3016 the following Monday to make sure the CBM is still working and he read the 32k RAM-Test message.

FYI: I earned a few hundered Deutsch Marks by updating all the CBM 3016's of this school and even another school.

OOPS: And later, collecting TI calculators, I learned that TI invented piggy-backing already in 1975 with the SR-51. That's about the fuzz of stacked silicon ;-))

Regards, Joerg

Sounds about right for a Commodore "we sell computers to the masses not the classes" maneuver.

> Quote:

My favorite recollection of dip piggybacking was the case of the old CD4016 analog gates. This initial version had a rather high "on" resistance but could be reduced by trivially paralleling devices. To this end, a cohort once soldered several together nested vertically totem pole style. He also cut the head off a screw and cemented it onto the topmost package. The fun then was to wait for someone to spot this and inspect the bottom of the PCB to see if there was a nut on the other side.

Suggestion for improved physical design

*Message #1 Posted by **David Hayden** on 5 Nov 2010, 10:13 a.m.*

I have a suggestion for a small change in the physical design of HP's calculators. Many of the new models come with a pouch to hold the calc. It's open at one end. The 48gii, 30b and 35s have these.

On my 30b and 35s, the pouch is fairly tight and it's hard to grip the calculator to pull it out. I expect that the pouches will loosen with time, but meanwhile, I usually have to work a finger into the opening at the bottom of the pouch to push the calculator out a little before I can extract it.

An easy change to fix this would be to put something on the sides of the calculator near the display that would prevent your fingers from slipping when you grab it in the case. For example, a set of small vertical ridges, or a slight finger-sized indentation would probably do the trick quite nicely.

Dave

Re: Suggestion for improved physical design

*Message #2 Posted by **Crawl** on 5 Nov 2010, 2:21 p.m.,*
in response to message #1 by David Hayden

The 35s used to have a zipper pouch. It was really good (maybe one of the best things about the calculator!) If the decision for how these things go is based on quality, they probably should just go back to that. But maybe it raised the price or something.

If I wasn't going to put a calculator in it, the zippered pouch seems like a nice amenity. Unfortunately extracting the 35s from it is a little too clunky as evidenced by my tendency to reach for another calc when I need a quick answer. Even more so if you succumb to strapping the 35s under the provided elastic bands. Not quite sure how those straps found their way on the drawing board -- unless the first demo to management of that clumsy case resulted in the contents sustaining a concussion with the floor.

With a thoughtfully designed slipcase the calc is already situated ready for use in the intended hand when it clears the case.

Re: Suggestion for improved physical design

*Message #4 Posted by **Crawl** on 5 Nov 2010, 5:35 p.m.,*
in response to message #3 by uhmgawa

I use one strap, the one that goes under the display. That holds it in place without obstructing usage. You could even keep the pouch unzipped then for quick usage, and the strap will still keep the calculator secure.

I think the reason for having two straps isn't to use both simultaneously, but to use one or the other, maybe depending on whether you're right or left handed.

I have had calculators fall out of slip cases. I don't like them.

My 35s case has a sticker inside showing exactly that. Works great.

Unfortunately, a second sticker showing how to repair the zipper is missing. From what I've read in this forum and my own experience, they all will fail after some usage. On my sample, both zippers were 'unhooked' at about the same time after approx. 50, erm, zips. Still try figuring out how to replace them.

A solution for housing the HP-41

There is a seller haunting EEEbay with voyager cases which paradoxically are far too big for a voyager's footprint. They work out better for a 35s from a less-bulk perspective compared to the original zipper case and are less clumsy to extract their contents.

IMHO the 35s case isn't fundamentally a bad design if storage protection is the primary goal. And to be fair it does need to fit the "who-again-has-pockets-this-size?" 35s. Frankly if a version existed ~2.5cm shorter and about 30% less height I'd probably pick up a few for voyager preservation.

> IMHO the 35s case isn't fundamentally a bad design if storage protection is the primary goal.

Sure, I agree with you on this. For circumstances involving protection/storage, or even portage in a briefcase, fieldwork, etc., that airform-esque case would have many advantages (assuming that size isn't an issue).

In my instance, however, the calculator was deskbound 99% of the time, and I only needed something to keep it protected from dust and wayward pens and drinking water, yet still have it be quick on the draw. That big clunky case was suboptimal in many ways, and I ultimately came to hate it. (Even after I got the 33s leather case, I got rid of the 35s anyway, since it couldn't live up to my 15c. (I know, an unfair comparison.))

Airform makes cases of a similar nature in all sizes, so given a few searches you might find one suitable for a Voyager.

*Message #10 Posted by **Mark Harman** on 6 Nov 2010, 1:20 a.m.,*
in response to message #1 by David Hayden

That is weird that you are having such a hard time removing your calc. I think the case has a snug fit, but the calculator has been easily removable for me. It looks like it was clearly designed to be removed by the top sides of the calculator while holding the bottom sides of the case. Maybe I lucked out in getting a slightly looser fitting case.

This much I can say: it sure is a heck of a lot better than the crappy case on my TI BA II Plus Professional.

Regards,

Mark

*Message #13 Posted by **designnut** on 6 Nov 2010, 12:38 p.m.,*
in response to message #12 by David Hayden

The 33s is a sensible calculator spoiled by someone who felt it should be "designed" so it has slanty keys and a rubber side grip. That leads to the klunkiest case HP ever allowed. Why can't they just allow perfection to continue. I liked my slip cases and at times had to stretch them by forcing the calculator in upside down (the top iss bigger). I dread losing my 32SII from whatever cause. It's the last of a dying breed. Sam

HP75C 82713A plug-in module simulator

*Message #1 Posted by **aj04062** on 4 Nov 2010, 8:53 p.m.*

I just picked up one of these and I suspect the internal battery is dead. Does this prevent it from working or? I am also seeking a manual (pdf) and other info on it. Does it require a magnetic card to run?

Edited: 4 Nov 2010, 8:54 p.m.

HP-35s current production line question

*Message #1 Posted by **Jaime Morales** on 4 Nov 2010, 2:39 p.m.*

I purchased an early production HP-35s, not long after they were introduced. I am curious if HP has addressed the somewhat highly reflective plastic LCD cover in current models? The glare has presented quite a problem in my present working environment. I just borrowed an HP-33s from a colleague and it seems to provide better viewing contrast (at all viewing angles) compared to my HP-35s.

Re: HP-35s current production line question

*Message #2 Posted by **David Hayden** on 5 Nov 2010, 6:49 a.m.,*
in response to message #1 by Jaime Morales

I have a pretty new 35s and unless I position it so a light is reflecting directly off the screen, I can read it just fine, much better than my 50g.

Have you adjusted the contrast? Hold down the ON key and the + and - keys to adjust it.

Dave

Re: HP-35s current production line question

*Message #3 Posted by **Tom Mathes** on 5 Nov 2010, 10:24 a.m.,*
in response to message #2 by David Hayden

Jaime means the plastic lens itself reflects so much it's difficult to see at nearly any angle and contrast isn't the issue. I have the same gripe with my 35s (also an early production run). The 35s has about the most reflective lens I've seen in any HP calc, definitely much worse than my 33s, 32SII, 41C or 48G.

*Message #4 Posted by **bill platt** on 5 Nov 2010, 12:13 p.m.,*
in response to message #1 by Jaime Morales

I bought an anti-reflective film for my new laptops. (New laptops are as useless as _____the screens are so reflective!)

This aftermarket film works GREAT!

NuShield DayVue is what I use, and it really does work outside. Without the film, I cannot use my laptops at all outside. They also make an indoor film, which I have not tried but it might work well for you. I called them and they were very helpful.

www.nushield.com

One does have to wonder why we need aftermarket products to able to use our equipment, but that's they way it is...like going to toys r us to buy baby carseats...

Actually, HP should license the technology and put it on all their calcs...

Matte films for GPS units, digicams, etc.. can be found where such are sold and are relatively cheap.

The only possible drawback is it will reduce contrast somewhat and the 35c matrix lcd doesn't have much of a budget surplus here at least to my eyes.

> Quote:
>
> Actually, HP should license the technology and put it on all their calcs...

It is fairly common for the top polarizer of an lcd to have some glare reduction. Unsure why that wasn't the case for the 35c. Although IIRC there is an outer window above the lcd in the 35c which is what needs this treatment. One could toss that and mount the adhesive matte film directly to the display.

Re: HP-35s current production line question

*Message #6 Posted by **bill platt** on 5 Nov 2010, 6:55 p.m.,*
in response to message #5 by uhmgawa

The film I bought is not a "matte film." In fact it is somewhat glossy--but anti-reflective. It is much much more effective than a matte film. It actually works in bright light, because it does not scatter, it cancels reflections.

Re: HP-35s current production line question

*Message #7 Posted by **Jaime Morales** on 17 Nov 2010, 12:43 p.m.,*
in response to message #1 by Jaime Morales

I went ahead and opened my HP-35s and removed the plastic window that is in front of the LCD. The glare was way too much for me and I'm willing to live with whatever risks are associated with the plastic cover being removed. However, it looks as though I could replace it with something less reflective (cut to size) if I wanted to, but I am happy with the present results.

The risk being scratching of the top polarizer. It certainly can be replaced but it is a bit of a pain to find a replacement and get it laminated to the glass without trapping dust in the lamination.

I'd just get an inexpensive camera/GPS screen anti-glare shield and cut a section sized to replace that gawd awful original window.

Re: HP-35s current production line question

*Message #9 Posted by **Jaime Morales** on 18 Nov 2010, 4:43 p.m.,*
in response to message #8 by uhmgawa

I agree, the plastic polarizing overlay is a bit fragile. I went ahead and put an anti-reflective overlay directly onto it. I used a spare sheet of AR film meant for an iPod and cut it to size. With the plastic LCD cover removed, it now looks great...NO GLARE and good contrast!!!

Re: HP-35s current production line question

Forgot to mention.. if you were to replace the upper polarizer, you could rotate it 90* to the achieve the inverse effect of white-text on a black-background. Just in case anyone may be into customization.

HP75C Display (was zebra connector)

*Message #1 Posted by **Alberto Fenini** on 3 Nov 2010, 5:29 p.m.*

Dear all,

the pics below are the front side, back side and the section of an HP75C LCD display.
Since I'd like to clean the zebra connector, I'm wondering if anyone else has ever done it before.
Any good idea on how to remove the black iron shield ??

Thanks in advance for any suggestion you may have,
Alberto

Re: HP75C zebra revealed

*Message #2 Posted by **Alberto Fenini** on 3 Nov 2010, 6:49 p.m.,*
in response to message #1 by Alberto Fenini

Zebra revealed !

By gently pushing the pcb, everything will slide out
I have cleaned the zebra and the pcb contacts with alcool
but it didn't get better.

However, it looks like one of the chip soldered on the back of the pcb was re-soldered ...
I'll try to swap the display unit with a LCD unit coming from a 75D which works fine and I'll post the results

Re: HP75C Bezel removed !

*Message #3 Posted by **Alberto Fenini** on 3 Nov 2010, 6:56 p.m.,*
in response to message #1 by Alberto Fenini

I'm posting this sequence, it may be of help to someone,

the 75C I'm trying to restore has also a ding close to the logo label
by using a blade and heating the surface I have removed the bezel
and discovered that it is a single piece including the keyboard layout

Tomorrow I'll polish the keys, and try to recover the ding.
If anyone has some ideas on how to smooth the ding, please leave your thoughts.

take care Alberto

Re: HP75C Display swap

*Message #4 Posted by **Alberto Fenini** on 6 Nov 2010, 9:44 a.m.,*
in response to message #3 by Alberto Fenini

Hello everyone,

for those of you interested in the project, hope to not bother too much the rest of the readers ...
I have opened the 75D and swapped the displays, which are fully compatible.
Well, it's not the disply the issue.
The display from the 75C works fine on the 75D and viceversa
the display known to work fne on the 75D has the same problem when installed in the 75C
What could it be the reason ??
Can the contrast be adjusted with a trimmer or a statement ??

thanks in advance and have a nice weekend !! Alberto

Re: HP75C Display (was zebra connector)

*Message #5 Posted by **geoff quickfall** on 4 Nov 2010, 12:44 p.m.,*
in response to message #1 by Alberto Fenini

Wonderful!!!

I have been away on a trip to Bejing and for some reason the government screeners on the wifi network at the hotel have blocked HPMuseum and my outgoing email accounts! This happens from time to time.

First, remove the glue residue from the keyboard and the faceplate backing. Some type of citrus based adhesive remover and cotton rag should work. Then wash the faceplate in warm soapy water.

Place the faceplate between to thick sheets of clear vinyl, thicker then a freezer bag. I use clear to see the results.

With the faceplate sandwiched between the vinyl, the entire package placed on a VERY FLAT AND

SMOOTH SURFACE (sheet of glass) and the printing visible (obverse) take a large soup spoon and rub over the ding. Flip the face plate over and rub some more from the (reverse) side. Continue this until the ding is removed.

Now with the entire face plate reverse side up rub the whole face plate taking care not to damage the reverse angle. This will impart a slight convex shape to the faceplate with the cup highest in the centre and lowest at the corners with the obverse side facing up.

This allows the faceplate to be glued in place (contact cement) with the corners fitting perfectly. Take a look at the following HPSolve article (HP42s) which is very similar to your 75.

June 2010

The second half of the restoration article explains the faceplate removal and glueing procedure. Also refer to the HP65 restoration piece, specifically how I smoothed the label out on it. There is a figure refering to label placement and the vinyl used.

Good work on the LCD panel also!

Cheers, Geoff

Re: HP75C Display (was zebra connector)

*Message #6 Posted by **Alberto Fenini** on 4 Nov 2010, 5:32 p.m.,*
in response to message #5 by geoff quickfall

Geoff !!
I was counting on your experience in removing labels and
making them look like new, I'm happy you liked my work,
honestly, it didn't seem to me such a great job, but I was in a situation where
I could'nt go back anymore ... if you know what I mean...
I'll work as suggested on the ding, and I'll post the results as soon as possible.

As far as for the display I need to test the display I have on the 75D before I can make any further assumption.
However, it seems that some of the chips have been re-soldered
Still, I'm wondering if all the pieces put together will make again an HP75C ....
Thanks for your help, and take care

BTW, how is the book project going ??
BTW (OT) how about the engine exploded on the A380 from Quantas ???

Re: HP75C Bezel - ding removed (?)

*Message #7 Posted by **Alberto Fenini** on 5 Nov 2010, 7:24 p.m.,*
in response to message #6 by Alberto Fenini

Hello everyone,

I have removed the ding, following Geoff's tips.

What would you ?
Geoff, can it get any better than this ??
Thanks for any idea or suggestion

take care Alberto

Re: HP75C Restore Project - Final conclusion

*Message #8 Posted by **Alberto Fenini** on 6 Nov 2010, 4:29 p.m.,*
in response to message #7 by Alberto Fenini

Hello everyone
as promised I had tried the display swap with a working display from an HP75D.
I have then discovered that the display are both working !!
Then I have swapped the memory boards. Since the memory board also host
the resistor for the contrast and the temperature based voltage regulation for the LCD contrast,
I wanted to be sure that also these were properly working, and so it was.
Then, I have reworked the base board, desolderin all of the connection pins
between this and the memory board, but it din't get any better.
Based on the service manual, thanks to Tony Duell for the hint, I have learned that while the columns are driven from some ICs solderd on the display PCB,
the rows and few other signals are driven from a chip that is on the logic board.
In case of bad display the service manual suggest to check all the soldering points, which I have done.

Does anyone has ever replaced a chip like this ???
take care and thanks for any suggestion ....

Cutting A Circle In Three Equal Pieces - Solution

*Message #9 Posted by **Thomas Klemm** on 8 Nov 2010, 2:07 p.m.,*
in response to message #5 by geoff quickfall

> Quote:
>
> June 2010

In the same issue I found the solution of HP Solve Math Problem Challenge #1.

Is it only me who thinks that both solutions are unnecessarily complicated?

This is the drawing from the article:

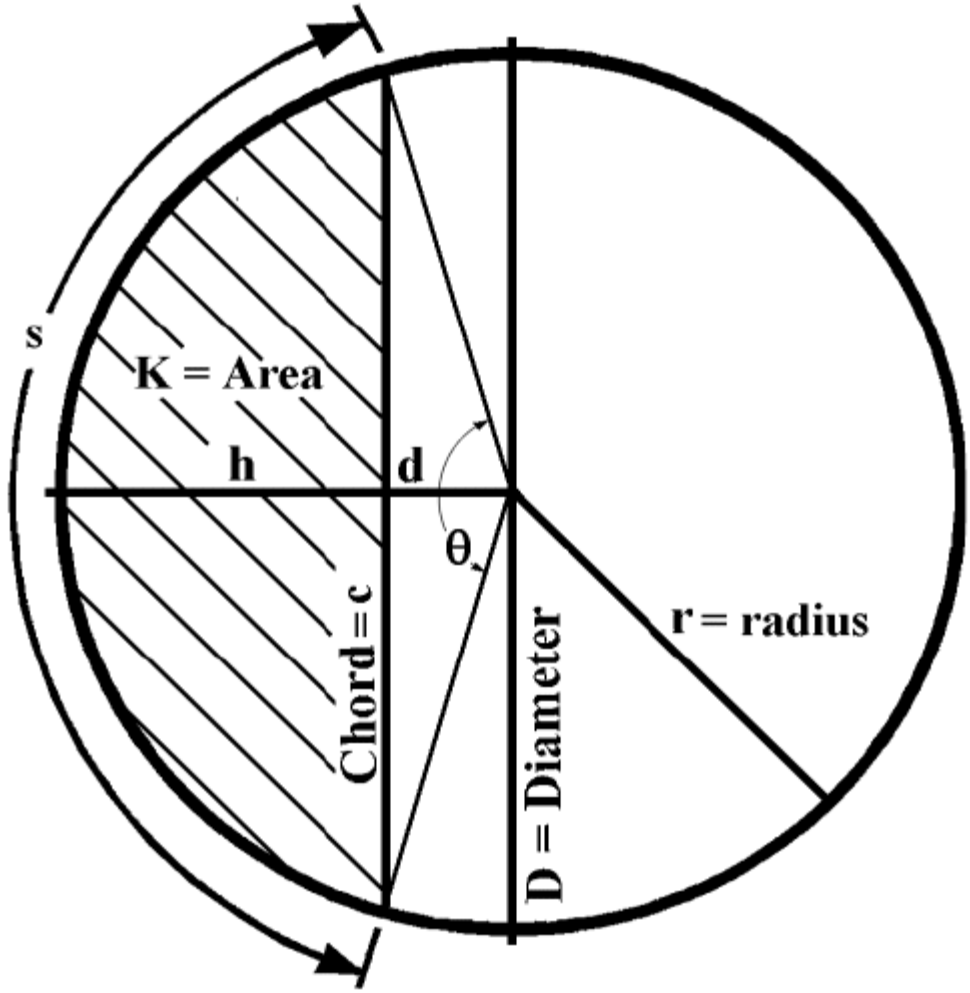

Fig. 1 – Segment of a Circle values identified.

> Quote:
>
> Let’s use a circle of unit diameter, D = 1.

Why not using a unit circle? It's much easier when r=1.

$2\alpha = \Theta$

Sector S

$$S = \frac{1}{2} \cdot s \cdot r = \frac{1}{2} \cdot 2\alpha \cdot 1 = \alpha$$

Triangle R

$$R = \frac{1}{2} \cdot c \cdot d = \frac{1}{2} \cdot 2sin(\alpha) \cdot cos(\alpha) = sin(\alpha) \cdot cos(\alpha)$$

Segment K

$$K = S - R = \alpha - sin(\alpha) \cdot cos(\alpha) = \frac{\pi}{3}$$

Now you can stop here and use the solver to find the solution or use the double-angle formula for sine:

$$2K = 2\alpha - 2sin(\alpha)cos(\alpha) = 2\alpha - sin(2\alpha) = \frac{2\pi}{3}$$

$$\Theta = \frac{2\pi}{3} + sin(\Theta)$$

Here we end up with a fixed point equation that can be solved by iteration.

First load the stack with:

```
2
PI
*
3
/
ENTER
ENTER
ENTER
```

Then repeat the following steps until you are satisfied with the accuracy of the result:

```
SIN
+
```

This will take some time but that could be a reason to deal with convergence acceleration.

Cheers
The wrong Thomas

PS: Alberto, I'd like to beg your pardon for hijacking this thread but the King said I mustn't beg.

*Message #10 Posted by **M. Joury** on 5 Nov 2010, 11:22 a.m.,*
in response to message #9 by David Hayden

I lived on the East Coast for years before moving to Texas and now I live in New Mexico. You can drive from Washington DC (don't blink when passing through Delaware and is it really large enough to be called a state?) to Albany via New York in much less time than it takes to drive across a single western state even with the higher speed limits (assuming of course that the New Jersey Turnpike, I95, etc. aren't parking lots--don't try this Thanksgiving day). You should visit the Texas Panhandle sometime and drive from Dallas to Albuquerque--nah, never mind, don't bother nothing to see other than the 64 oz. steak in Amarillo (I think). If you eat it all (plus the fixins') its free.

BTW, Dallas to Albuquerque is 647 miles and only 2 or 3 towns of any consequence in-between. DC to Albany via NY is 383... From the Oklahoma border to Laredo, TX is 496 miles.

Cheers.

I don't know American Geography, but I guess it's possible to travel from Phoenix to Oklahoma, making a pit-stop in Albuquerque, leaving before dawn and getting there before midnight :-)

in response to message #11 by Gerson W. Barbosa

1005 miles from Phoenix to Oklahoma City taking I17 to I40. So, yes, it can be done, but you're going to be awfully tired when you get there. A couple of years ago I drove from Albuquerque to Palm Springs, CA. Left at 1:00 PM and arrived there at 1:00 AM. 717 miles in 12 hours and I drove the whole way with only a couple of short stops. Don't know that I would have wanted to do another 300 miles.

Travel distances in the American SW

The trip in the hit song was even longer, but the destination could be anywhere in Oklahoma, not just OKC. Presumably, the origin was Los Angeles or San Diego. From a highway map, I get 373 miles from LA to Phoenix, 454 miles from there to Albuquerque, and 340 miles from there to the Oklahoma Panhandle. Total: 1167 miles (1878 km), which would be covered in the 22 hours from midnight to 10 PM at a constant mean average speed of 53 mi/h (85 km/h). *That's* homesickness!

Trivial, but "on topic": All three route-leg calculations (two segments each) can be totaled and retained using only a 4-level RPN stack prior to conversions. I'd never before checked how feasible this fictitious trip would have been.

*Message #17 Posted by **M. Joury** on 6 Nov 2010, 8:52 p.m.,*
in response to message #16 by Martin Pinckney

You are right of course. But for some reason, even though I have crossed Florida both E/W and N/S it seemed much shorter E/W. Don't ask me why, it must have been some time warp thing. Maybe that extra 50 miles was very painful. No, that wasn't it. Driving North my parents wanted to travel US 1. They really wanted to see the area. After a day or so of that I convinced them that we really needed to get on I95...

Re: Looking for availability of HP 30B near Austin TX

*Message #18 Posted by **Eric Rechlin** on 5 Nov 2010, 8:02 p.m.,*
in response to message #9 by David Hayden

I can drive west on I-10, maintaining the speed limit the whole time (70, 75, or 80 mph depending on where you are) and still be in Texas after 10 hours.

Re: Looking for availability of HP 30B near Austin TX

*Message #19 Posted by **M. Joury** on 6 Nov 2010, 8:59 p.m.,*
in response to message #18 by Eric Rechlin

Yes, but on I-10 you enter Texas over 200 miles to the west of where you would enter driving I-40. Even if the speed limit is 80 over that distance and you don't stop that is an additional 2.5 hours.

Towers of Hanoi in RPN

*Message #1 Posted by **Kiyoshi Akima** on 2 Nov 2010, 1:42 p.m.*

Has anyone written an RPN program for the Towers of Hanoi that's theoretically capable of handling the full 64-disk configuration? Or must I finish mine?

There's one for the 32S in the software library for up to six disks and V had a 16C program for up to thirty-some disks, but I haven't seen one that can theoretically handle 64.

It's all but trivial in RPL, but in RPN without local variables and without adequate inbuilt support for recursion... And, of course, I don't expect the batteries to last long enough, and I'm not going to check the full results...

Re: Towers of Hanoi in RPN

*Message #2 Posted by **Patrice** on 2 Nov 2010, 2:15 p.m.,*
in response to message #1 by Kiyoshi Akima

Hi, Can you post the program for the 16C or an URL to the program.

Knowing the 16C, I don't see why it could not be able to handle 64 discs (theoricaly :)).

The only problem I see is the lack of speed to achieve the full move. My only hope is to have an 12C+ re-purposing to a 16C on last hardware (just dreaming).

I suspect 30 disc is already out of reach for the 16C.

Patrice

Hi,

I found the program with google!

HP 16C article with Hanoi towers program

Re: Towers of Hanoi in RPN

*Message #4 Posted by **Egan Ford** on 2 Nov 2010, 6:37 p.m.,*
in response to message #1 by Kiyoshi Akima

I'll write one, but what must a ToH program do? Just count from 1 to 2^d - 1. The source peg is (count & (count - 1)) % 3 and the target is ((count | (count -1)) + 1) % 3.

Edited: 2 Nov 2010, 6:39 p.m.

> I'll write one, but what must a ToH program do?

Ok, based on the 16C example above, a ToH program should walk you through solving ToH.

Below is my version that will work for up to 64 discs on the 16C based on the equations I posted above.

Just GSB 0, then a 2 digit number will be displayed. The first number is the source rod and the second digit is the target rod. Press R/S to get the next set of numbers. This will solve any number of discs up to 64. Just keep pressing R/S until your problem is solved. For the case of 64, when the counter reaches 0, 0 will be displayed indicating that the 64 disc solution is solved.

Example output for 3 discs (2^3-1 moves):

```
13
12
32
13
21
23
13
```

Code:

```
001 - 43,22, 0  LBL 0
002 -    42  3  SET COMPL UNSGN
003 -       24  DEC
004 -        6  6
005 -        4  4
006 -    42 44  WSIZE
007 -        0  0
008 -    44  0  STO 0
009 - 43,22, 1  LBL 1
010 -    45  0  RCL 0
011 -        1  1
012 -       40  +
013 -    43 40  x=0
014 -    22  2  RTN
015 -    44  0  STO 0
016 -    45  0  RCL 0
017 -        1  1
018 -       30  -
019 -    42 20  AND
020 -        3  3
021 -    42  9  RMD
022 -        1  1
023 -       40  +
024 -        1  1
025 -        0  0
026 -       20  x
027 -    45  0  RCL 0
028 -    45  0  RCL 0
029 -        1  1
030 -       30  -
031 -    42 40  OR
032 -        1  1
033 -       40  +
034 -        3  3
035 -    42  9  RMD
036 -        1  1
037 -       40  +
038 -       40  +
```

```
039 -        31  R/S
040 -    22   1  GTO 1
```

in response to message #5 by Egan Ford

I believe there's a bug in this program, one that only shows when doing 64 disks. And no, I don't blame Egan for not running this case to its completion :-)

Halfway through, when it's finally time to move the biggest disk:

```
count              = 8000000000000000h
count-1            = 7FFFFFFFFFFFFFFFh
count or (count-1) = FFFFFFFFFFFFFFFFh
```

then (count or (count-1)+1) overflows. (2^64)mod 3 is 1 but the 16C, having lost the top bit, produces 0.

A partial fix is to replace the 1, + in lines 32-33 with 2, -. This will make it work correctly for the 64-disk case but the underflow screws up the 1-disk case.

Re: Towers of Hanoi in RPN

*Message #9 Posted by **Egan Ford** on 12 Nov 2010, 5:09 p.m.,*
in response to message #8 by Kiyoshi Akima

Here's a quick fix. I'll try to think of something better this weekend.

Replace:

((count | (count -1)) + 1) % 3

with:

((count | (count -1)) % 3 + 1) % 3

Where did you find this formula ?

Patrice

Re: Towers of Hanoi in RPN

*Message #11 Posted by **Thomas Okken** on 6 Nov 2010, 6:13 a.m.,*
in response to message #10 by Patrice

I remember looking at the Towers of Hanoi puzzle many years ago, when I discovered a non-recursive algorithm which I implemented on the HP-19C. I don't remember the details, but I do remember that it started when I discovered a simple pattern in the moves for each solution:

```
1 disc:  1-3
2 discs: 1-2 1-3 2-3
3 discs: 1-3 1-2 3-2 1-3 2-1 2-3 1-3
4 discs: 1-2 1-3 2-3 1-2 3-1 3-2 1-2 1-3 2-3 2-1 3-1 2-3 1-2 1-3 2-3
```

It becomes clearer when you change the destination peg from 3 to 2 for even numbers of discs:

```
1 disc:  1-3
2 discs: 1-3 1-2 3-2
3 discs: 1-3 1-2 3-2 1-3 2-1 2-3 1-3
4 discs: 1-3 1-2 3-2 1-3 2-1 2-3 1-3 1-2 3-2 3-1 2-1 3-2 1-3 1-2 3-2
```

For odd numbers of discs, you're always moving between pegs 1 and 3, then between 1 and 2, and then between 2 and 3, and then the pattern repeats. For even numbers of discs, the cycle is 1/2, 1/3, 2/3.

I don't remember how I derived the *direction* of each move, though. Of course this is easy to do by keeping track of the discs, but I distinctly remember discovering that that was not necessary. My algorithm must have been similar to Egan's formula, but I don't remember how I solved that last part. This is going to drive me nuts now. :-)

UPDATE:

This refreshed my memory. The key is to notice the pattern of *which disc* is moved. Numbering the discs starting with the smallest being 0, the pattern of disc moves is 0, 1, 0, 2, 0, 1, 0, 3, 0, 1, 0, 2, 0, 1, 0, 4,... In other words, you alternate between moving the smallest disc and some other one; discounting the moves of the smallest disc, you alternate between moving the second-smallest disc and some other one, etc. This much is easy to verify by looking at the recursive algorithm.

So at move n (starting from 1), you always move the disc m, where m is the lowest nonzero bit in the binary representation of n (with bit b being the one that represents 2^b).

Using the 1/3, 1/2, 2/3 pattern I mentioned at the beginning (for odd numbers of discs; for even numbers, use 1/2, 1/3, 2/3), this means that the smallest disc (and all even-numbered discs) must move like 1-3, 3-2, 2-1; the second smallest (and all odd-numbered discs) must move like 1-2, 2-3, 3-1, for odd numbers of discs; for even numbers of discs, just swap pegs 2 and 3.

So, at move n, you must move disc m = floor(log (n xor (n - 1))). How many times has disc m been

moved prior to move n? Answer: $p = \text{floor}((n - 1) / 2^{m + 1} + 1/2)$.

If the sum of the total number of discs and m is odd, you must move from peg $3 - (p + 2) \% 3$ to peg $3 - p \% 3$, and if the sum of the total number of discs and m is even, you must move from peg $p \% 3 + 1$ to peg $(p + 1) \% 3 + 1$.

This is still a bit ugly; we know how to get from the move number, n, to the number of the disc to be moved, m, and how to get from m to the number of times that that disc has been moved previously, p, but we can simplify that by combining those two functions: $m(n) = \text{floor}(\log_2(n \text{ xor } (n - 1)))$ and $p(m) = \text{floor}((n - 1) / 2^{m + 1} + 0.5)$, so $p(m(n)) = \text{floor}((n - 1) / 2^{1 + \text{floor}(\log_2(n \text{ xor } (n - 1)))} + 1/2) = \text{floor}((n - 1) / ((n \text{ xor } (n - 1)) + 1) + 1/2)$, and there you have a function that tells how many times the disc you have to move at move n has been moved previously; combining that with the formula that gives you the source and destination pegs for each disc given how many times it has been moved previously, plus the formula that tells you which disc m to move at any given move n, you have your 100% non-recursive algorithm.

Proving the 1/2-1/3-2/3 pattern and simplifying this mess to Egan's elegant formula is left as an exercise to the reader. :-)

There is also one in the software library for the 42S with graphical display of the disk moves:

Towers of Hanoi

Enjoy, Juergen

Re: Towers of Hanoi in RPN

*Message #14 Posted by **Kiyoshi Akima** on 3 Nov 2010, 10:30 a.m.,*
in response to message #13 by Juergen Keller

The 42S program apparently only handles up to 7 disks.

I'm putting on the finishing touches on a pair of 35s programs that will handle up to 64 disks each, using different algorithms. I also have a 27-step program for the 16C.

I hadn't seen Egan's formulae before. They sure make the thing easy, don't they?

Re: Towers of Hanoi in RPN

*Message #15 Posted by **Juergen Keller** on 3 Nov 2010, 1:26 p.m.,*
in response to message #14 by Kiyoshi Akima

The 7-disk limitation is only because of the limited 42S graphics capabilities. The algorithm itself - which is non-recursive - can handle more disks ...

Re: Towers of Hanoi in RPN

*Message #16 Posted by **Kiyoshi Akima** on 16 Nov 2010, 3:07 p.m.,*
in response to message #1 by Kiyoshi Akima

Since I started this thread, I suppose I have to contribute my code to it. Here are ten programs for the full 64-disk Towers of Hanoi puzzle including RPN programs for the 35s, 30b, 16C, and 15C. The 30b is by far the fastest of this lot.

Thanks. I've corrected that and fixed some other transcription errors in the 30b version.

Re: Towers of Hanoi in RPN

*Message #19 Posted by **Thomas Klemm** on 17 Nov 2010, 4:54 p.m.,*
in response to message #18 by Kiyoshi Akima

Unfortunately I have also trouble with iterative RPL program:

> Quote:

```
UNROT OR #2d - DUP #3d / #3d x
```

Here I assume a minus is missing at the end. I've also changed the #2d - to #1d + though I know what you possibly had in mind. But I prefer to have the first move displayed correctly in all cases than having the last one in the special case of n=64.

In the condition of the do-loop I simply use:

```
UNTIL
  DUP2 ==
END
```

Otherwise the program did not end.

There's a minor typo on page 7: 2^{34} mod 2 = 1

Probably you mean: 2^{34} mod 3 = 1. At least that would make sense in this context.

Cheers
Thomas

> How did you create the nice listings in LaTeX?

Very carefully. Below is an excerpt from the 30b version.

```
\noindent\begin{tabular}{|rl|rl|rl|rl|}
\hline
\textsf{  1}&\textsf{Input}              &\textsf{ 29}&\textsf{2}
&\textsf{ 57}&\textsf{EEX}               &\textsf{ 85}&\textsf{RCL Data}
\\
\textsf{  2}&\textsf{0}                  &\textsf{ 30}&\textsf{Call04}
&\textsf{ 58}&\textsf{2}                 &\textsf{ 86}&\textsf{EEX}
\\
...
\textsf{ 26}&\textsf{*}                  &\textsf{ 54}&\textsf{Math}
&\textsf{ 82}&\textsf{\underline{Lbl 03}} &\textsf{110}&\textsf{Up}
\\
\textsf{ 27}&\textsf{RCL Data}           &\textsf{ 55}&\textsf{Up}
&\textsf{ 83}&\textsf{Call04}            &\textsf{111}&\textsf{Input}
\\
\textsf{ 28}&\textsf{EEX}               &\textsf{ 56}&\textsf{Input}
&\textsf{ 84}&\textsf{+}                 &\textsf{112}&\textsf{RTN}
\\
\hline
&\multispan{6}\textsf{\hfil \ length/checksum = 142.056\hfil}&\\
\hline
\end{tabular}\label{prog.30b.r}
```

There are easier ways, and I have some scripts that handle numbering and columnating (is that a word?).

Thanks for making me feel old. And to make me even older, I can't remember writing for the PPCJ about the Towers of Hanoi. Eight Queens, yes. The Game of Life, yes. The Towers, no.

As for the 41 (and I presume, the 42), it's simple to translate the first (recursive) 35s program. Number the black triangles showing the destinations of branches. Type in the program and put in the labels where needed. Instead of variable I, use register R00 so that DSE I becomes DSE 00, RCL(I) becomes RCL IND 00, and so forth. Or use synthetics and use M or N. IP is INT and RMDR is MOD. I didn't include a 41 program because I don't have a working 41 and I didn't want to use an emulator (all of the programs were done on the actual hardware).

For a bare-bones 41 without additional memory, use the 15C program, using R33 for RAN#.

I still want to shoehorn the program into the 19C/29C. A 12C version would be fun, as well.

current draw from CR2032 coin cells

*Message #1 Posted by **Eric Smith** on 2 Nov 2010, 11:22 a.m.*

TI's applications engineers for Bluetooth low energy products studied capacity of CR2032 coin cells in pulsed operation at 15mA peak and 30 mA peak. CR2032 coin cells are usually rated for 15mA peak current. The best coin cells showed very little capacity degradation compared to constant current. This is reported on their blog and they've written a white paper.

Their measurements also showed how much variation in capacity there is between vendors, with Sony, Panasonic, and Maxell being the highest they measured, and GP and two no-name brands having only about 50% of the capacity of the better brands.

funny sidenote (history repeating)

*Message #2 Posted by **Frank Boehm (Germany)** on 2 Nov 2010, 12:22 p.m.,*
in response to message #1 by Eric Smith

I think Mr. Sinclair was first to use this pulsed power to save button cell battery life - sporting a TI Chipset - within the Sinclair Executive. TI said, it couldn't be done. Back then :)

I hope this means that you or someone else will create an RPN calculator with BT. I was actually looking for one yesterday. I would really like a 30b with a BT send function so that I can quickly send the results to my current open application on my desktop.

BT calcs exist and they double as numeric keypads, but none sport RPN.

Re: current draw from CR2032 coin cells

*Message #4 Posted by **Eric Smith** on 2 Nov 2010, 6:04 p.m.,*
in response to message #3 by Egan Ford

I really only brought this up because it had useful information about coin cell capacity, and not for anything about Bluetooth.

If you had an RPN calculator with Bluetooth support, what uses would you expect the Bluetooth to support?

Re: current draw from CR2032 coin cells

Two functions. One, act as a BT keypad for my Mac. Two, have a send button to send the results as keypad input to my Mac. They exist today, but without RPN.

Now, if a programmable RPN had BT, then it would be a crime to not allow backup and restore via BT.

The above would require two BT profiles. If a serial profile was added then programmable I/O becomes a possibility.

HP calculators feature on UK Import/Export Tax website

*Message #1 Posted by **DeboT** on 1 Nov 2010, 12:37 p.m.*

Whilst searching on info on import duties and VAT, I came across the following pages with pictures of HP calculators.

Although the logos have been removed from the pictures, the following page shows the unmistakable blue HP-49G:
Excise and VAT in international trade

and this one looks like the HP-20S:
Understand your tax obligations when importing or exporting

Re: HP calculators feature on UK Import/Export Tax website

*Message #2 Posted by **Martin Pinckney** on 1 Nov 2010, 1:34 p.m.,*
in response to message #1 by DeboT

Not a 20s, since that model has both blue and orange shifts, and the tiny picture you references has only blue.

22s has only blue, but has the flat bezel around the display; the tiny picture seems to have a deep bezel.

So perhaps a Photoshop amalgam?

Re: HP calculators feature on UK Import/Export Tax website

*Message #3 Posted by **DeboT** on 1 Nov 2010, 2:00 p.m.,*
in response to message #2 by Martin Pinckney

Looking closer, it almost seems like a 10B, but with the orange shift key & labels made blue. The two blue-only shift key pioneers (AFAIK the 22S & 27S) have an up-down key above the shift, doesn't seem so on this one. Also the 10B is the only one with something small above the "." key. Very difficult to say with such a small pic. The only thing I'm reasonably sure of is that it's a pioneer :-)

Re: HP calculators feature on UK Import/Export Tax website

*Message #4 Posted by **Keith Midson** on 1 Nov 2010, 3:23 p.m.,*
in response to message #3 by DeboT

It could be a 10B with green keys - I have one of these.
Cheers, Keith

Looks like the closest match to me. This green shift 10B is raising some questions in my mind, like was it released around the time of the green/purple 48G? Also in which countries was it released?

Re: HP calculators feature on UK Import/Export Tax website

*Message #10 Posted by **Stuart Sprott** on 2 Nov 2010, 8:22 a.m.,*
in response to message #9 by DeboT

The very first HP 49G calculators were the colour shown. I have still got one and it still works. I found it extremly slow and the keys were very stiff. The main reason why it still goes is that it was hardly ever used. I managed to find a HP 48 that still worked and went back to that.

My main calculator now is a HP 50g.

Re: HP calculators feature on UK Import/Export Tax website

*Message #11 Posted by **BruceH** on 3 Nov 2010, 9:29 p.m.,*
in response to message #10 by Stuart Sprott

It is the HP49G - it was very distinctive, the color earning the nickname "frozen hamster butt blue".

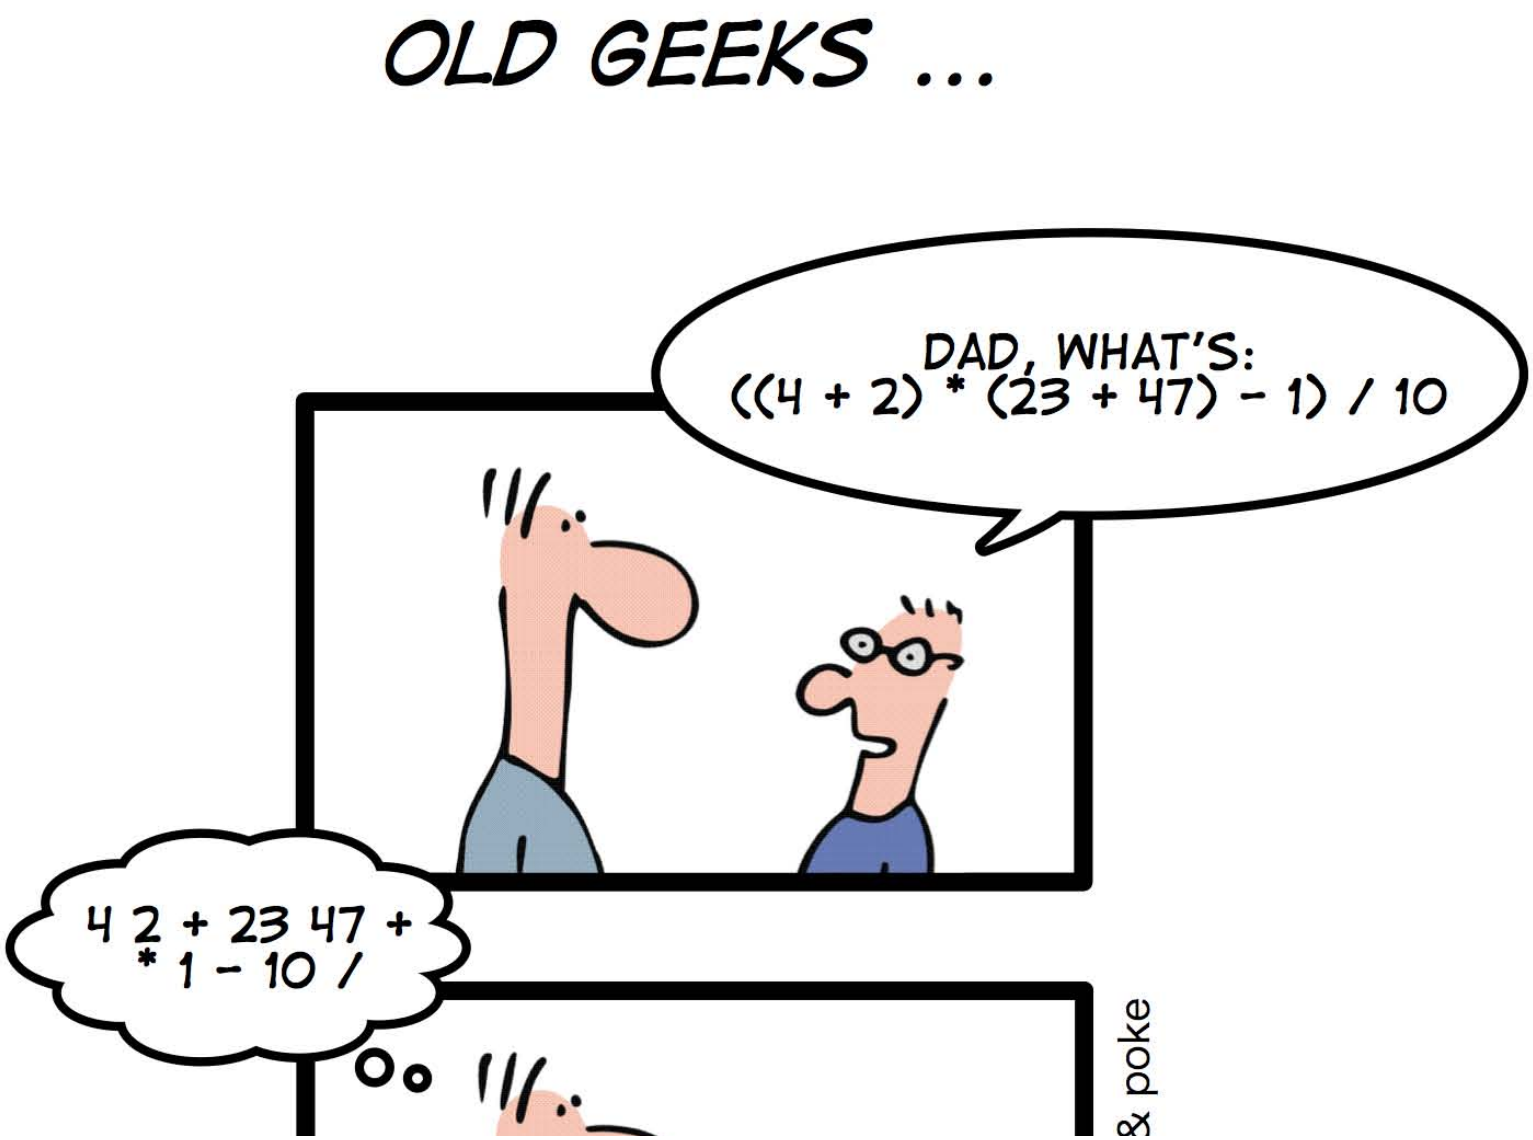
Old geeks miss their HPs

*Message #1 Posted by **Juergen Keller** on 1 Nov 2010, 3:47 a.m.*

Recently I found the site Geek and Poke and their comics are sooo funny! Yesterday the topic was RPN HP calcs:



You see, the answer is not always 42 ;-)

I can also recommend the first Geek&Poke book they provide on the web site. I'm not affiliated in any way with this web site but you know: a laugh a day keeps the doctor away ...

Enjoy,

Juergen

Maybe he means because it isn't 42?

Re: Old geeks miss their HPs
*Message #9 Posted by **Palmer O. Hanson, Jr.** on 4 Nov 2010, 9:53 p.m.,*
in response to message #1 by Juergen Keller

Manuals and books for RPN calculators typically contend that one of the advantages of RPN is that users can solve problems on their calculators in a manner similar to the way they would solve them with pencil and paper. For example,

Page 29 of the *HP-41C Owner's Handbook and Programming Guide* says about RPN that "You can calculate in the same manner you do with pencil and paper. ..."

Page 327 of the *HP 19BII Financial Calculator Owner's Manual* says "You can calculate in the same order as you would with pencil and paper -- that is, from the innermost parentheses outward."

Pages 38 and 39 of the Fifth Edition of Wlodek's *A Guide to HP Handheld Calculators and Computers* say the same thing but in much more detail.

That all may be true, but do RPNers REALLY solve elementary problems such as the one proposed here in their head using RPN as suggested in the cartoon or do they simply do it in algebraic?

Re: Old geeks miss their HPs
*Message #10 Posted by **Dave Shaffer (Arizona)** on 4 Nov 2010, 10:28 p.m.,*
in response to message #9 by Palmer O. Hanson, Jr.

I kind of suspect it would be a hybrid: if I was parsing the problem to understand and envision it, I would probably be thinking in an algebraic sense. If I had to evaluate it with my (RPN!) calc, then RPN it would be.

Re: Old geeks miss their HPs

*Message #11 Posted by **Juergen Keller** on 5 Nov 2010, 3:02 a.m.,*
in response to message #9 by Palmer O. Hanson, Jr.

If the expression is not trivial and there are parenthesis I start at the inner expression and go on to the outside. The only problem is that my brain has a very limited stack ;-) so I have to write down intermediate results. Anyway, it's the RPN way, and it's the natural way of computing such expressions mentally. My brain calculator does not provide parenthesis.

HP28S - made in Indonesia?

*Message #1 Posted by **Keith Midson** on 1 Nov 2010, 1:43 a.m.*

Hi HP world. I recently purchased a 28S from TAS - the 28S is one of my favourites as it's the one I went through University with. I have a few in my collection (USA, Singapore and the 100th anniversary edition). This particular 28S caught my eye as being made in Indonesia in 1997 - serial code: ID73800361. From the MoHP site, the 28S was made between 1988 and 1992. So one made in 1997 would be quite strange.
I have a few theories:
1. It has been repaired using a 19Bii back case, or
2. it was a rogue batch made in Indonesia that not many people know about.
3. I've read the date code incorrectly and it was made in 1987.
It is in excellent condition, although some sort of high quality repair appears to have been done around the battery door frame (on upper side), although this might just be normal wear.
Anyone got any ideas? Cheers, Keith

Re: HP28S - made in Indonesia?

*Message #2 Posted by **Jeff O.** on 1 Nov 2010, 8:06 a.m.,*
in response to message #1 by Keith Midson

My guess would be that it was made as stock for the out-of-warranty exchange service that HP used to offer. I believe their policy was to offer the service, which allowed you to send in your broken unit plus a flat fee and recieve a new unit, for five years after a model was discontinued.

*Message #4 Posted by **Mike Morrow** on 31 Oct 2010, 6:01 p.m.,*
in response to message #1 by Johnny Bjoern Rasmussen

Not much information here. The HP42S is said to be from 1988, yet the back of the calculator says 1987. So which anniversary is it...the 22nd or 23rd?

Regardless, knowledgeable people acknowledge the HP42S as the finest RPN calculator ever made...22 years after introduction. What a shame that HP no longer has capability to produce a machine that comes close to what was available almost a quarter century ago. The HP32SII, HP33S, and HP35S are execrable.

RPL is powerful, but RPN is straight-forward, non-tricky, intuitive, and a system that people can use without great study. It's a pity that freshman computer science types held sway with RPL, causing HP's loss of use for the things for which people still use calculators.

The HP50G is orders of magnitude a better machine than the TI-89 Titanium (HW 4). It's a really great product. But it has lost to the TI junk because of RPL's idiotic difficulty of use. At the very least, the successor to the HP50G should provide for programming in either RPL or RPN.

But, I digress. The HP42S represents much better times. Happy anniversary, HP42S and the long gone talent of the HP folks who created you!

Re: Happy anniversary to HP-42S and HP-14B

*Message #5 Posted by **Martin Pinckney** on 31 Oct 2010, 6:17 p.m.,*
in response to message #4 by Mike Morrow

The back of all Pioneers say "Copyright Hewlett Packard Company 1987", regardless of when the model was introduced or the particular calculator was made.

OK, they don't spell out copyright, they have the little copyright symbol.

This must be the year HP developed some common code for the series, or something like that.

Re: Happy anniversary to HP-42S and HP-14B

*Message #6 Posted by **Mike Morrow** on 31 Oct 2010, 6:45 p.m.,*
in response to message #5 by Martin Pinckney

That's true.

The copyright (C/R) dates shown during the self-tests vary. For example:

HP42S____ROM A___2934Sxxxxx__C/R date is 1988.
HP42S____ROM C___3328Sxxxxx__C/R date is 1988.
HP17BII___ROM B___ID710xxxxx__C/R date is 1987.
HP32SII_____ID718xxxxx__C/R date is 1987, 1990.

RPL was developed by Bill Wickes' - a person less like a 'freshman computer science type' I can't imagine.

Also Bill was intimately acquainted with RPN on the HP41: I'm sure he didn't cast aside RPN lightly.

I'll agree with that last point. <flame suit:on>RPN is okay-ish for short programs of up to 10 or15 lines but anything much more than that and it becomes impossible to debug. ;-)

Since you still wear it, you may take it off now ;) I agree with that point, too. Let the users decide. We took the same approach offering a choice of 4 and 8 stack levels in the 34S.

Ceterum censeo: HP, launch a 43S!

Walter

*Message #10 Posted by **Mike Morrow** on 4 Nov 2010, 2:02 a.m.,*
in response to message #8 by BruceH

I actually don't have a problem with RPL. I bought an HP 28C 23 years ago, and found it to be very powerful, but NOT easy to use.

I find it much harder to use RPL for those short programs to which you refer. But I've written RPN programs several hundred lines in length and IMHO it is much easier to follow an RPN program than a RPL program.

BTW, I also really respect Bill Wickes.

Question: Why own a 14b when you have a 17b?

Answer: Because some day, my eyes will be weaker, and the bigger screen fonts will be a blessing.

Same reason to own a 22s when you also have a 27s.

Faceplate separation repair

*Message #1 Posted by **Jim Yohe** on 30 Oct 2010, 3:46 p.m.*

For a long time now my 32SII metal faceplate has been separating away from the plastic body ... right up near the top by the display.

Is there a particular glue (I assume) and method I should use to correct this? Also, I should "try" get something back in there and pull away the lint and stuff from behind it first. How might I do that? Seems a cotton swab would be too large.

Sorry if this has been covered before but I didn't have any luck with my search terms for a similar post and solution.

Re: Faceplate separation repair

*Message #2 Posted by **geoff quickfall** on 30 Oct 2010, 8:18 p.m.,*
in response to message #1 by Jim Yohe

check out HPSolve, June 2010:

June 2010

The second half of the restoration article explains the faceplate removal and glueing procedure.

I suggest you remove the faceplate, depending on how much has separated, as that way you can put a reverse curve on it so that it glues back to the case with the corners down. If the raised edges are not to great then a fine paint brush and contact cement will work. Make sure to press the glue joint for a few minutes to ensure it does not raise.

Cheers, Geoff

Re: Faceplate separation repair

*Message #3 Posted by **Jim Yohe** on 30 Oct 2010, 9:18 p.m.,*
in response to message #2 by geoff quickfall

Thank you for your input on this Geoff. I'm downloading the newsletter now and will look at it.

...

Perhaps I should just try using a fine paint brush to clean out the dust, then contact cement applied with the toothpicks first to see if I can get it to stay down. It's not raised any further back than to the bottom of the LCD display.

Edited: 30 Oct 2010, 10:25 p.m.

HP 9865a cassette tape drive

*Message #1 Posted by **Keith Lueck** on 29 Oct 2010, 11:38 p.m.*

Hi -

I recently acquired a 9865a tape drive to go with my 9810a calculator. After a bit of fiddling around, I've gotten it to work. Does anyone have service info. or schematics for this beast? The only thing I was able to find was the interface schematics drawn by Tony Duell...

Also, does anyone have a manual (or pdf) for the 11265a cassette i/f ROM for the 9810a? All I have is a stapled set of yellowing Xerox copies. If no one has a clean copy, I suppose I will scan these and transfer them to pdf format, and upload them to this site or the .net site...

Cheers!

Re: HP 9865a cassette tape drive

*Message #2 Posted by **Tony Duell** on 31 Oct 2010, 5:28 a.m.,*
in response to message #1 by Keith Lueck

Yes, unfortunately I only have the interface, not the complete drive. And I suspect shipping a drive, even if one was for sale, would be out of the question for me.

I suspect (based on the part numbers) that the HP9830 internal tape drive uses some of the same PCBs as the 9865. Now the tape drive is one of the few bits of the 9830 that is field-repaired to component level. You can get full schematics of the 9830, and the 9830 service manual from the same place that you got the 9865 interface diagram.

I suspect that with that information it won't be hard to figure out the rest of the drive unit.

Re: HP 9865a cassette tape drive

*Message #3 Posted by **Keith Lueck** on 1 Nov 2010, 11:20 a.m.,*
in response to message #2 by Tony Duell

Hi Tony - Thanks very much for this info.! and also your other schematics - they've helped me maintain my 9810a and 9866 printer as well!

Plans to build Babbage's Analytical Engine

*Message #1 Posted by **Thomas Fänge** on 29 Oct 2010, 6:11 p.m.*

Hi all!

This might seems a bit OT, but it really sounds interesting, at least for me!

Please check out Plan28 for the plans to actually build the ideas of Charles Babbage, who had the idea of a "steam engine driven calculator/computer", dating back to 1837! This was the machine that Lady Ada started to write "programs" for, and she will for ever be remembered by the programming language Ada. But she never got the opportunity to "execute" them on a working machine ...

The Difference Engine has previously been build and proven, but never the Analytical Engine, and this might be an oppertunity to see it happen.

I have already made my pledge ... :)

Best regards!

Re: Plans to build Babbage's Analytical Engine

*Message #2 Posted by **Ed Sowell** on 31 Oct 2010, 10:23 p.m.,*
in response to message #1 by Thomas Fänge

The closest I ever got to anything like that was programming the Mechanical Differential Analyzer at UCLA in 1960-61. Huge thing, about 6-7 feet wide and 40 feet long. Multiply was by gear ratio, add-substract were geared differentials, integration by a little wheel rolling on a larger disk. Not all that similar to Babbage's analytical engine, but it stimulated memories. We solved dif eqs with it.

Ed

HP75C Restoration (zebra connector ??)

*Message #1 Posted by **Alberto Fenini** on 29 Oct 2010, 4:22 p.m.*

Dear All,
I have received this HP75C today, I knew it had some
cosmetic problems (see the ding in pic1)

and some display problems. As it can be seen in pics 2 and 3
all the pixels are there, but can only be seen at 30 degree angle.

I had opened the unit, and I was wondering if the LCD problem could be due to a bad zebra connection on the lcd dispaly
since I had some similar problems with the HP41s.
I also wanted to remove the aluminium bezel, in order to restore it
but it looks like it is a single piece with the lettering
bezel of the keyboard.

what the lcd people say ? is it worth a try ?

Last (stupid) question, what is the correct battery pack to be
used with ?? I was thinking about a classic one, but there is a third
connector that wouldn't not be powered ...

Thanks for help, and have a nice weekend !!
Alberto

Re: HP75C Restoration (zebra connector ??)

*Message #2 Posted by **Maximilian Hohmann** on 29 Oct 2010, 4:30 p.m.,*
in response to message #1 by Alberto Fenini

Hello Alberto,

I'm afraid I know nothing about the zebra connector (haven't opened a 75 so far) but the batteries are indeed the same ones as for the classics! I have asked that same question here a couple of years ago, therefore I know :-)

Saluti, max

Re: HP75C Restoration (zebra connector ??)

*Message #3 Posted by **Tony Duell** on 31 Oct 2010, 5:33 a.m.,*
in response to message #1 by Alberto Fenini

IIRC the LCD module comes out from the back, you don't have to remove the bezel or any heat stakes to get it out. There will be a zebra strip between the LCD glass and the driver PCB, it probably is worth cleaning the contacts.

I have the HP75C service manual, I can see what it says. Although I think the LCD is replaced as a complete module in this machine.

And yes, the battery pack is certainly the same as the one for classics. The extra contact was for a never-sold battery I think.

Re: HP75C Restoration (zebra connector ??)

*Message #4 Posted by **Alberto Fenini** on 31 Oct 2010, 7:17 a.m.,*
in response to message #3 by Tony Duell

ciao Tony,
thank you very much for your reply.

I know the display comes away from the back,
the reason I want to remove the bezel is only for restoring it
to the original aspect, I would like to remove the ding.
Is it glued or what ? Is it a single piece with the keyboard faceplate ?

As far as for the display, I have seen that all the components
are "slided" into a metallic shield (I will post pics in a couple of days)
how can I separate all the components in order to clean the zebra contacts ?

BTW, do you know where can I get a copy of the service manual ?
take care Alberto

Re: HP75C Restoration (zebra connector ??)

*Message #5 Posted by **Tony Duell** on 1 Nov 2010, 5:21 a.m.,*
in response to message #4 by Alberto Fenini

You can get the service manual from the Australian HP museum site. I am not sure I should post the URL here...

Alas it doesn't describe how to dismantle the LCD module. If you can't work it out, I'll take my own 75C apart and have a look.

Again the service manual doesn't describe how to remove the bezel (you are supposed to replace the complete top case/keyboard assembly). I am sure it is glued in place (HP bezels normally are), and it may well be one piece with the keyboard faceplate.

Re: HP75C Restoration (zebra connector ??)

*Message #6 Posted by **Alberto Fenini** on 1 Nov 2010, 6:47 a.m.,*
in response to message #5 by Tony Duell

Thank you very much, I have found it.

I have a working HP75D, I could take the display from there
and see if installed in the 75C is working properly.
Then it could be worth trying to clean the zebra contacts of the non working one
Are the two displays swappable ??
Thanks again and take care, Alberto

Looking for schematics

*Message #1 Posted by **Monte Dalrymple** on 29 Oct 2010, 3:02 p.m.*

Does anyone have schematics for the 82143A and/or 82153A? Yes, I know about the HPCC CDROM, but I really only need one or both of these...

Thanks, Monte

Re: Looking for schematics

*Message #2 Posted by **Tony Duell** on 31 Oct 2010, 5:30 a.m.,*
in response to message #1 by Monte Dalrymple

I've paid a lot more than the cost of the HPCC CD-ROM for just _one_ schematic in the past... And profits from the sales of that disk support one of the few HP calculator clubs still going.

However, I can see the point if you only want one diagram (particulalry as the 82153 diagram is only one sheet...)

Have you tried contacting Dave Colver (who produces the CD-ROMs). He might be prepared to send you just those 2 diagrams.

Re: Looking for schematics

*Message #3 Posted by **Monte Dalrymple** on 31 Oct 2010, 11:41 a.m.,*
in response to message #2 by Tony Duell

Ignazio Cara was kind enough (thank you Ignazio!) to send me scans of the service manuals for these two devices, so I'm good.

Calculator Related Math/Science Fair Project

*Message #1 Posted by **Tim Wessman** on 29 Oct 2010, 2:41 p.m.*

Hello,

The manger of the calculator group came to me today asking for some help/suggestions on something, and I think this is something that may be of some interest here. I know for sure I could definitely use some help.

Basically, his 8th grade daughter wants to do a project examining calculator precision and accuracy with various types of calculations. They are looking at both finance and scientific type calculations and trying to figure out how to test and compare this between different models. In addition, how this can help determine possible methods used to perform the calculations internally.

I know there have been a lot of discussions here in the past on calculator forensics, but I am not as familiar with them as I'd like.

Basically, I am hoping I can get some suggestions on:

1. Which forensics will be most interesting?
2. Which units should would be most interesting?
3. How and what would be good tests for financial calculations that would be interesting?
4. Any relevant links that could be helpful.
5. Any information or suggestions on how a project like this could be exciting and engaging for an 8th grade (~13yrs old students) advanced science/math class

I was planning to pass this post along to them for review, so feel free to post here and discuss. Thanks in advance.

TW

Re: Calculator Related Math/Science Fair Project

*Message #2 Posted by **David Hayden** on 30 Oct 2010, 6:35 p.m.,*
in response to message #1 by Tim Wessman

I think it was Joe Horn who posted a very simple way to tell if a calculator is doing binary or decimal arithmetic, and to get an idea of the precision. Enter 1/3 into the calculator. Then subtract the most significant digits. Repeat the process. If it's doing decimal, the digits will go to zero in some "sane" way. If binary then it will start to look strange.

For an 8th grader, the project could be "how to calculators calculate." It could talk about the fact that they use base 10 instead of base 2 like computers, and the fact that they use scientific notation. She could talk a little about BCD arithmetic and maybe the fact that calculators can REALLY only do addition, subtraction and maybe multiplication. All the other operations are done with these and clever algorithms. She might talk about one of those algorithms, like the square root, or 1/x and the fact that calculators divide by multiplying by 1/x (I

assume that's the way it's done).

Dave

Hi,

a very good introduction to errors in numerical calculations can be found in

Peter Henrici

Essentials of Numerical Analysis (with Pocket Calculator Demonstrations), 1982

You will get the book second hand for a few dollars at abebook.com. The book comes with many calculator demonstration, using HP 33 or 34, covering rounding errors, error propagation, the lot.

E.g. solving x^2-1634 x+2=0 teaches something about cancellation. That would be accessible for an 8th grader.

On the web: http://www.thimet.de/CalcCollection/Calc-Precision.html#CalcPrecision has a test suite for numerical experiments.

Hugh Steer has some nice tests at http://www.voidware.com/index.php?option=com_wrapper&Itemid=26

200lx question

*Message #1 Posted by **Bill Smith** on 28 Oct 2010, 1:53 p.m.*

My daily use calculator at the office was, until a week ago a 100lx. Unfortunately, the right hinge broke clean through, and I have been forced to press my 200lx into daily service. Some time in the far distant past, I found a trick to render the 200lx Appointment Book app quiet, so that it doesn't startup the first time it is switched on each day. Does anybody know the trick? I can't find it in the manual or online, but I'm sure I used it for years without the AB app starting.

Any ideas for the 100lx will be considered.

Thanks in advance for any responses...

PIL-IO board

*Message #1 Posted by **J-F Garnier** on 27 Oct 2010, 2:34 p.m.*

Based on the same technology than the PIL-Box (actually using the same PCB), I just released the PIL-IO board combining a mini HP-IL/GPIO (4 logic-level I/Os) and a simple UART-type HP-IL/serial (not RS232!) interface. It is a way to experiment and start controlling the world with HP-IL at low risk and minimum cost.

More details on my HP-IL page

J-F

Edited: 27 Oct 2010, 2:40 p.m.

*Message #4 Posted by **Christoph Klug** on 1 Nov 2010, 2:41 p.m.,*
in response to message #3 by J-F Garnier

Dear Jean-Francois,

nice to hear from your real world interfacing project. As you know I really like this activities, I call it "Connect HP-41 & HP-IL to future" and Wlodek would call it "Extend your HP41"

For more details about real world interfacing with HP-41 handheld computer I recommend my two books "HP41 Input Output Board" and "IL2000 Interface System".

Hope to see more hardware applications from you , based on your PIL box design...

Best regards - Christoph Klug

Re: PIL-IO board

*Message #5 Posted by **J-F Garnier** on 3 Nov 2010, 5:01 p.m.,*
in response to message #4 by Christoph Klug

Dear Christoph,

Thanks for your kind words. For sure my project does not compete with your great IL2000 Interface System, it's just a simple way to experiment. It was actually requested by a HP-41 user who wanted a few I/Os to drive a relay or sense a button. I added the serial interface because it's a convenient way to communicate with an external uC for more complex applications.

I also recommend your book, it's a great source of information on many HP-IL hardware and applications!

*Message #5 Posted by **PeterP** on 27 Oct 2010, 6:28 p.m.,*
in response to message #4 by Angel Martin

this is hilarious! When he comes to the point of long german words, here is one my father once told is the longest he saw once

Donaudampschiffahrtsgesellschaftskapitanskajuetentuer. (the door at the cabin of the captain of the company of the steam boats on the Danube, quite simple actually...)

Or something to that extent. The first part of the word is actually the legal name of a company (Donaudampfschiffahrtsgesellschaft). And, that word carries another of those exceptions as it should have 3

'f' in the middle (Schiff has 2 f's and when paired with Schiff-Fahrt, a quite normal word, you would have 3 f's). However, there are only 3 f's if they are between a vowel and consonant, as in 'Sauerstoffflasche' (oxygen tank) and as far as I know that makes german the only language with tripple letters in a word...

Not sure if the paper her read it in wanted to make a joke or he read it in some 'Amtsblatt' (goverment memo). It was quite amusing nevertheless.

It's amazing how consistently Twain delivers, even after so many years. He stands apart.

I vividly remember, working at Boeing on the NATO/European version of AWACS (that 707/KC-135 with the radar mushroom on top). I heard one of the German contractor-engineers in Seattle on the phone with his counterpart somewhere in Germany, working over a translation of the maintenance documentation. They were talking over certain difficult phrases found therein, and *constructing words on the spot* to adequately convey (we can only hope) the original American/English intent. What a marvelous language it must be -- especially for an engineer!

Re: English manual for the Bobby Schenk Yacht module, anyone?

*Message #12 Posted by **Thomas Okken** on 4 Nov 2010, 12:19 a.m.,*
in response to message #5 by PeterP

The longest German word I ever heard was Reichseisenbahngleisenknotenpunkthinundhersteller. (Obviously a joke word!) Any German speakers here familiar with that one? :-)

Re: English manual for the Bobby Schenk Yacht module, anyone?

*Message #13 Posted by **Walter B** on 4 Nov 2010, 1:34 a.m.,*
in response to message #12 by Thomas Okken

Very nice but never seen before. Just a minor correction: it should read Reichseisenbahngleisknotenpunkthinundhersteller.

IMO the longest German words really used (not meant to be joke words) are found in laws. BundesausbildungsfÃ¶rderungsgesetz (Federal law for the promotion of studies) is one of them, BaumaschinenmeisterprÃ¼fungsverornung ((approximately:) regulations for the approbation of persons being competent in construction vehicles) another one. Presumably caused by the fact lawyers and attorneys must use a very elaborated code.

Pure Mark Twain.

Essay on German language by Twain

*Message #15 Posted by **Karl Schneider** on 28 Oct 2010, 11:35 p.m.,*
in response to message #4 by Angel Martin

Ángel --

Thank you for the link to a work by Twain.

The complex grammatical rules of "High German" (and other dialects, I'm sure) have changed little if any since the late 19th Century. Verbs at the end of sentences, separable verbs, nonsensical noun genders, adjective endings that add little if any meaning -- it's all still there.

I would hope that internationalism and modernity has helped to discourage convoluted sentences, and long compound words where concise international words are available.

I've heard that Russian has seven grammatical cases, and that English was more complicated until intermixing of peoples (Norman invasion of 1066?) resulted in simplification.

(emphases added)

I hate to tell you, but IMHO these three sentences are a textbook example for the attidude which made the US of A the friend of all peoples (and the British Empire before etc.). FYI, a Chinese may use almost all of your statements for judging the "English dialects". China has its colonies as well, but that's another story.

Did you mean the same US of A whose "attitude" helped free Europe of German domination... twice?

Re: Essay on German language by Twain

*Message #19 Posted by **Walter B** on 29 Oct 2010, 1:38 p.m.,*
in response to message #18 by Martin Pinckney

Thanks for asking. The people of this US of A did have my greatest respect - though I was far from being born then. Seems to me, however, the world has changed a bit in 65 years as it did before and keeps doing. So e.g. some statements of Mark Twain may have been appropriate or just marketable in 1895 - like many other old texts and opinions looking strange today at least. Of course you are free to consider my remark about a specific other posting or drop it d:-)

Hmm? I meant only objectively-verifiable assessments of the German language, not some "more enlightened than others" pronouncement. Everything Samuel Clemens (Twain) wrote in 1880 rings just as true today.

> Quote:
>
> FYI, a Chinese may use almost all of your statements for judging the "English dialects".

I would not concur with that:

Modern English makes do just fine without article genders or adjective endings. Verbs -- none of which is a separable word -- tend to be close to their subject nouns, with perhaps a prepositional phrase or adverb slipped in between. Both subject noun and verb usually appear near the front of well-written sentences.

Moreover, common nouns need not be capitalized, and pluralization is usually accomplished by adding an "s" (but plenty of exceptions to that).

A traditional typing exercise in English that uses every letter of its 26-letter alphabet at least once is the following:

```
"The quick brown fox jumped over the lazy dogs."
```

Let's write that in simplified German, using English-like grammatical rules:

```
"Das rasch braun fuchs sprung über das faul hunde."
```

Na, ist das nicht ebenso verständlich als richtige deutsch? *(Now, isn't that just as understandable as proper German?")*

:-D

I'd also believe that modernity, with its far-reaching instant media, has eliminated most true dialects of both English and German. Sure, differences in manner of speech, pronunciation, spelling, slang, and certain nouns exist between different regions and countries with a common tongue. However, I'd say that commonality within both languages is the rule, not the exception.

The faster pace of modern life tends to reward a direct, get-to-the-point approach to writing, instead of the obfuscation seen in Clemens' examples from novels of the era.

I will certainly concede this: The 'adaptability' of the English language has rendered any rules of spelling and pronunciation rather unreliable.

You obviously didn't get my point. You as a foreigner did disqualify another language. You could have done the same with French or Spanish or ... and I would have stood up as well. You simply will not make friends in other countries with this attitude.

> Quote:
>
> > Quote:
> >
> > FYI, a Chinese may use almost all of your statements for judging the "English dialects".
>
> I would not concur with that ...

Modern Chinese makes (do??) just fine without articles at all, without conjugating verbs nor declining other words, etc. So, applying your measures, Chinese is THE language - don't you stop with English half way :-D

> Quote:
>
> A traditional typing exercise in English that uses every letter of its 26-letter alphabet at least once is the following:
>
> ```

Almost. Besides some little errors - if you want to give advise in other languages, please be correct at least there.

It's a wide spread error assuming schematic translation will do. Besides leading to really hilarious results this will miss a lot of subtext a good translator will "feel" and transmit. And don't forget some redundancy may be beneficial for understanding - one reason why grammatically more primitive languages tend to become unefficient is a lack of redundancy, so a single typo may switch the whole meaning of a sentence or prevent it being understood correctly at all. BTW, even the web can't translate the word "prouncement" you used above - please enlighten us.

On topic again: That's one of the benefits of math symbols: everyone has to learn them - no unfair advantages by birth - no discussions about different ways expressing the same facts -

forced precision etc. And it may have some reasons that some of the greatest mathematical thoughts were thought and recorded in (what you call) complex languages like French or Latin. Please think about it.

Re: OT: Essay on German language by Twain

*Message #23 Posted by **Karl Schneider** on 30 Oct 2010, 5:14 p.m.,*
in response to message #22 by Walter B

> Quote:
>
> You obviously didn't get my point.

And you don't seem to be getting mine, which was simply that the idiosyncrasies of the German language that Twain discussed at length in that 19th century essay are still present today. If this constitutes an "attitude" on my part...

> Quote:
>
> You as a foreigner did disqualify another language.

I did no such thing. And from further along in the thread:

> Quote:
>
> Well, Mark Twain: As far as I read, he judged a foreign language from his view as a foreigner. Any foreigner will always find strange stuff in any other language and may tell jokes about it.

Why would the reasonably-informed views of a "foreigner" or non-native speaker -- myself, Twain, or anyone else -- be invalid?

> Quote:
>
> Modern Chinese makes (do??) just fine without articles at all, without conjugating verbs nor declining other words,

To "make do" is a colloquial expression in English meaning loosely "to function or operate without". It sounds awkward, I admit.

A meaningful comparison of an alphabet-based language to a character-based language, though, is very difficult to make.

> Quote:
>
> Almost. Besides some little errors - if you want to give advise *(advice)* in other languages, please be correct at least there.

Should "sprung" be replaced by "sprang", and "in richtige deutsch" be replaced by "in richtigem Deutsche"? If these are still not right, please make them so. Also, please write the "quick brown fox" sentence in proper German, just for comparison.

> Quote:
>
> BTW, even the web can't translate the word "prouncement" you used above - please enlighten us.

I meant to type "pronouncement", but missed an entire syllable. Sorry for the typo -- one of several I have corrected.

> Quote:
>
> And it may have some reasons that some of the greatest mathematical thoughts were thought and recorded in (what you call) complex languages like French or Latin. Please think about it.

I never used the word "complex", nor did I mention French or Latin. However, there may be some truth to the concept that the mastery and usage of advanced and/or intricate languages helps to develop analytical reasoning.

Fundamentally, though, the 'major' languages based on the Roman alphabet are similar, although there are at least several major categories of them.

Re: OT: Essay on German language by Twain

*Message #24 Posted by **Angel Martin** on 31 Oct 2010, 3:04 a.m.,*
in response to message #23 by Karl Schneider

I suspected this thread might cause some roughing of feathers, that's a shame but of course not surprising. After all there's a very strong link between language and culture, making very difficult to involved parties (i.e. native speakers) to objectively discuss the goodness and shortcomings of their own tongue.

Interestingly enough in some cultures more acutely so than others, like I've never experienced resentment from a Finnish or Hungarian person when critiquing their (may I say complex?) languages. It's something they have assumed and don't mind at all what the foreigner's perspective is. Not out of arrogance, but of pragmatism. Furthermore, they don't make it as a sign of differenciation between "us" and "them".

I agree with Karl that comparing Chinese to any alphabet-based language is not a fair trade. Too different starting points. And wouldn't you think that people think in different ways, or express their thoughts differently depending on the language-tool they use?

I also agree with his comment that the idiosyncracies described by Mark Twain continue very much alive and present in today's German.

The point again was a humoristic approach to the situation, driven with intelligence and wit. Taking it as a foreing attack wasn't in his agenda, that's a sure thing.

But of course all this is written by a person (me) for whom both English and German are foreing tonges - so maybe that alone disqualifies me :-)

Cheers, 'AM

Re: OT: Essay on German language by Twain

*Message #25 Posted by **Walter B** on 31 Oct 2010, 3:13 a.m.,*
in response to message #24 by Angel Martin

Holá Ángel,

of course everybody may call any arbitrary language complex. But that's far from calling it nonsensical, isn't it? And that's the attitude I was criticizing, nothing more.

Walter

Addendum:

> Quote:
>
> Taking it as a foreing attack wasn't in his agenda, that's a sure thing.

I can only see what is written. If anybody steps into a catholic cathedral wearing shorts, his or her "intentions" (or lack of sensibility) aren't the point either.

BTW, why did you post the same text twice?

> The **complex** grammatical rules of "High German" (...) have changed little if any since the late 19th Century. Verbs at the end of sentences, separable verbs, **nonsensical noun genders, adjective endings that add little if any meaning** -- it's all **still** there.

An eulogy reads different :)

> Quote:
>
> Why would the reasonably-informed views of a "foreigner" or non-native speaker -- myself, Twain, or anyone else -- be invalid?

These views may be simply based on ignorance, though the viewers think being "reasonably-informed". E.g. most Roman languages decline adjectives. English does not. Which way makes more sense? If you don't understand that doesn't mean it being nonsensical ...

This is far from true, only camouflagued by the lack of precision of the language you used. The Roman alphabet is employed for many languages which didn't know this alphabet for the greatest part of their history.

*Message #27 Posted by **Karl Schneider** on 31 Oct 2010, 5:10 p.m.,*
in response to message #26 by Walter B

Walter --

For the indisputable record, I stated "complex grammatical rules" and "nonsensical noun genders", which were my terms for *aspects* of language that were discussed at length in the old essay. I never stated "complex language" or "nonsensical language", and I never 'invalidated' anything. Rhetorically speaking, what would define a "complex language" or make one invalid?

You continue to state that you were only criticizing "attitudes" -- mine, that of certain countries, (and perhaps Mr. Clemens', by implication). I don't consider it 'bad attitude' to point out that certain substantiated observations stated humorously 130 years ago remain valid today -- even if your feathers got ruffled in the process. If anything, *you* invalidated Mr. Clemens' opinions, which I essentially echoed, by labeling us dismissively as mere "foreigners" lacking the requisite expertise for the topic.

I would consider several statements in your last post to be fine examples of clever rhetorical 'spin' by implication. I won't spend time to refute them.

It seems that this could go on *ad infinitum* if you had your wishes, but it's off-topic, anyway. Enough already.

in response to message #22 by Walter B

I suspected this thread might cause some ruffling of feathers, that's a shame but of course not surprising. After all there's a very strong link between language and culture, making very difficult to involved parties (i.e. native speakers) to objectively discuss the goodness and shortcomings of their own tongue.

Interestingly enough sin ome cultures more acutely so than others, like I've never experienced resentment from a Finnish or Hungarian person when critiquing their (may I say complex?) languages. It's something they have assumed and don't mind at all what the foreigner's perspective is. Not out of arrogance, but of pragmatism. Furthermore, they don't make it as a sign of differenciation between "us" and "them".

I agree with Karl that comparing Chinese to any alphabet-based language is not a fair trade. Too different starting points. And wouldn't you think that people think in different ways, or express their thoughts differently depending on the language-tool they use?

I also agree with his comment that the idiosyncracies described by Mark Twain continue very much alive and present in today's German.

The point again was a humoristic approach to the situation, driven with intelligence and wit. Taking it as a foreing attack wasn't in his agenda, that's a sure thing.

But of course all this is written by a person (me) for whom both English and German are foreing tonges - so maybe that alone disqualifies me :-)

Cheers, 'AM

Being a great author, Mark Twain's words and humor were in many ways typical for his time and background - your objectivity and sensibility may be typical for yours ... Since even you admit your comments were "not witty", don't you want to focus on topics you're an undisputed expert?

Thomas --

Of course, that is a *near-pangram* (as ö, ü, and ß are omitted), not a translation. The link that Gerson provided includes some in other languages that are hilarious.

Both sentences are examples of filler text common in typography. You'd do a lousy job translating them verbatim. In most cases at least. It's a similar problem with puns. Usually the joke is lost when translated literally. A good translator at least tries to take that into account.

Sometimes we have to exagerate a little to make our points. I should have said *one of the possible* instead of *the correct* translation. I assumed you'll notice I wasn't *that* serious with my statement.

It's funny, I read your plural version and thought, "wait a minute, that's right but not quite what I remember" and so I said it out loud and realized from the rhyme-feel what I had remembered it as. Then, I pulled a calligraphy book off the shelf and sure enough, there it was. I think it is fun that it works both ways.

As for language, I just showed the remarkable range of flexibility and register range of English...some of which breaks rules based on Latin (synthetic) which were arbitrarily placed upon English (analytic) some time in the 18th century.

> I've heard that Russian has seven grammatical cases, and that English was more complicated until intermixing of peoples (Norman invasion of 1066?) resulted in simplification.

From the Oxford Companion to the English Language entry on Old English, pg 724:

```
Declension of definite article se: (singular only)
-----------------------------------------------------
```

```
                  Masculine     Feminine     Neuter
-----------------------------------------------------------
Nominative          se:           se:o         þæt
Accusative          þone          þa:          þæt
Genitive            þæs           þæ:re        þæs
Dative              þæ:m          þæ:re        þæ:m
Instrumental        þy:           þæ:re        þy:
-----------------------------------------------------------
(colons used in place of macros)
```

I think Mark Twain would have agreed the equivalent German declension table looked somewhat less complicated.

I liked Mark Twain's novel *A Connecticut Yankee in King Arthur's Court* when I read it 1978. A weak point in the story is the impossibility of mutual understanding between Hank Morgan and Arthur's courtesans as described, but I was not aware of this then.

> Quote:
>
> The complex grammatical rules of "High German" (and other dialects, I'm sure) have changed little if any since the late 19th Century. Verbs at the end of sentences, separable verbs, nonsensical noun genders, adjective endings that add little if any meaning -- it's all still there.
>
> I would hope that internationalism and modernity has helped to discourage convoluted sentences, and long compound words where concise international words are available.

Speaking from my own experience -- I was born and raised in the Netherlands, but most of my relatives are German, and I grew up bilingual and always spoke German with my parents, grandparents, aunts, uncles, and cousins -- the complicated grammar of German is used almost exclusively in writing and when making speeches; that is, when communication is one-way.

In **conversation**, people tend to use a much simpler subset of the grammar. The weird noun genders are still there even in conversational German, but those aren't a problem because you learn them at the same time you learn any noun; i.e. you don't learn "Mädchen", you learn "das Mädchen", and the fact that it might be a bit odd that the word for "girl" has neuter gender never bothers anyone until they start to think about (or rather, over-think) these things.

Maybe German will lose some of its complexity some day, but I'd say that it already has. The use of the more sophisticated grammar in print makes sense, because a writer can spend the time to arrange his sentences for maximum clarity, and it is in that kind of usage that the highly synthetic grammar really shines. If, on the other hand, you just want to exchange thoughts with a person face to face, you're going to skip the genitives and conjunctives etc. and just use simpler constructs (and a few more words) instead -- like English- and Dutch-speakers do all the time.

I wouldn't use the trickier parts of German grammars myself when speaking, and I'd be very cautious using them in writing, but I have no problem whatsoever understanding them while reading, and in fact I like them in that context -- I think that kind of language is very elegant, expressive, and concise.

Thank you for your thoughtful commentary, Thomas -- written in absolutely impeccable English, I might add.

Thank you also for providing, as a native speaker, a proper-German translation of my version of the well-known English sentence:

```
"Der schnelle, braune Fuchs sprang über die faulen Hunde."
```

It certainly 'checks out', upon consulting with my language reference.

This may be an opportune time to point out that the regular contributors here who speak other native languages write English that is very good to excellent. It is a refreshing change from the shockingly-horrid anonymously-posted garbage found in the "reader comment" sections of on-line newspapers and magazines in the US.

Don't worry, you're at least not alone. This is also true for German reader comments and forums.

But wait, this is maybe even more reason to worry??!? :(

An example from English: Simplicity and its pitfalls

*Message #52 Posted by **Karl Schneider** on 3 Nov 2010, 12:53 a.m.,*
in response to message #15 by Karl Schneider

Now that voluminous commentary has been posted in response to a comment about complexities of grammar and noun gender in a particular language, here is an example of the other side of the coin -- namely, ambiguity caused by inexact writing of (comparatively-simple) English.

The San Francisco Giants won the championship of American baseball -- please see recent thread titled, "Long Live RPN... and Go Giants! (somewhat off topic)". One story about it closed with the following awkward-sounding sentence:

```
"Baseball's best play in San Francisco."
```

"Play" can be a noun or a verb, and neither is capitalized. If a noun, the sentence is incomplete. *(Which play? And what about it?)*

Also, "Baseball's" can be possessive or a contraction of "Baseball is". If the latter, a minor change will make a meaningful sentence:

```
"Baseball is best played in San Francisco."
```

However, those who brave the powerful and chilly Bay Area sea breezes during summer afternoons and evenings might disagree with such a statement.

Here's what was meant -- and what the author ought to have written:

```
"The best in baseball play in San Francisco."
```

Or, more precisely:

```
"The best team in baseball plays in San Francisco."
```

Makes most sense to me in this context. But who knows what the author wanted to express in this particular language if (s)he can't write?

> Quote:
>
> However, those who brave the powerful and chilly Bay Area sea breezes during summer afternoons and evenings might disagree with such a statement.

Why? Isn't this another cup of tea?

As mentioned by different posters previously, language prima facie is a tool for transmitting information. This holds for written language in particular. If, however, the information content may be distorted by ambiguities, smallest errors in writing, sloppy proofreading, or by an author erroneously picking the wrong word and then denying responsibility for his choice, exhausting discussions may come up about his intentions or the "real" meaning of his text. This might either fall back on the author himself or point to said particular tool became a bit too ... hmmmh ... lean?

*Message #57 Posted by **Walter B** on 28 Oct 2010, 4:25 a.m.,*
in response to message #55 by Martin Pinckney

Almost :)

Schenk ist ein Segelabenteurer und Autor. Sein Yachtmodul ist ein Navigationsmodul für den HP-41.

And referring to the Donaudampf... : This is a very old joke. Generally, such composite words are perfectly ok in German, but nobody would ever drive it so far. Anyway, it avoids repeating "of the" several times, which is quite annoying in my eyes.

For long words you may also look to Suomi (Finland), where they attach postpositions instead of using prepositions. For example, rautatieasemaan and rautatieasemasta meaning "to the train station" and "from the train station", respectively IIRC. May be the proper language for RPN aficionados ;)

Well, Mark Twain: As far as I read, he judged a foreign language from his view as a foreigner. Any foreigner will always find strange stuff in any other language and may tell jokes about it. E.g. they told us about the Englishman in France wanting to buy tickets for the train two to two to Toulouse. In Mark Twain's times such jokes were pretty common, nowadays this kind looks just primitive. Nevertheless I enjoy his books about Tom Sawyer & Co.

About the triple "f": When I went to school, "Schiffahrt" was spelled the way mentioned above avoiding a triple "f". But in a feeble attempt to ease spelling and cut exceptions our ministers of education decided you may write "Schifffahrt" now. FWIW. They decided a lot of real nonsense in this attempt as well, making quite obvious they don't know much about grammar, but that's another story.

In general, there seems to be a long term trend going to grammatically simpler languages: compare the ancient global languages Greek and Latin with English and Chinese nowadays. But that's just my personal view again d:-)

Best regards, Walter

Chauvinisms (and poetry) apart, language should be a tool to communicate amongst people and express your own mind in the most-effective and descriptive manner, regardless of which one is your native tonge.

Some languages are better equipped than others due to the cultural influence, customs, openness, its evolution, etc. Archaic constructions or rigid rules normally difficult things, even for native speakers having trouble to achieve a lucid mind with the hindrance of a sub-optimal tool.

Language molds the mind, and maybe the other way around as well. May each one chooses the best-suiting une.

Way back in my college days, I was in one of those private study rooms in the library. I had gone there to practice pronouncing Chaucer's Middle English. (Yes, that was something we did--to try to understand the language better. How we know how to pronounce it is a whole story unto itself).

There was a window looking out, and a guy coming by out in the hall waved and popped his head in and said, "you are practicing German, I can tell."

And I hadn't even studied Deutsch yet--only French at that point.

Re: German orthography (spelling) reform

*Message #63 Posted by **Angel Martin** on 31 Oct 2010, 2:58 a.m.,*
in response to message #62 by Karl Schneider

> Quote:
>
> The reformed orthography became obligatory in schools and in public administration. However, there was a campaign against the reform and in the resulting public debate the Federal Constitutional Court of Germany was called upon to delineate the extent of reform. In its decision of July 14, 1998,[1] the court stated that because there was no law governing orthography, outside the schools people could spell as they liked, including the use of traditional spelling. In the wake of this decision there have been complaints and fear of the rise of Beliebigkeitsschreibung (arbitrary spelling).[citation needed] For example, confusion caused by the use of both the traditional spelling Kongreßstraße and the newly correct Kongressstraße could lead to the completely inconsistent spelling Kongreßstrasse.

Apparently reforming the language is a touchy subject internally - to the point of involving the constitutional tribunal to rule on it. It's not clear then that the reform brought any additional clarity, leaving the situation worse that it was (because it was bad before, wasn't it?)

Re: German orthography (spelling) reform

> It's not clear then that the reform brought any additional clarity, leaving the situation worse that it was (because it was bad before, wasn't it?)

As usual, the situation was a bit more complex. IIRC it all began with an international study called PISA. In this test, German students (not students ;)) didn't perform as well as we expected. So our "education mandarins" became excited. After some discussions they eventually stated German spelling being too difficult for average students (honestly, no joke! Can you imagine any French person of importance would ever say this about French?!). So they started said "reform". And they did it the German way, i.e. very exhaustive, but in this case unfortunately not at all systematic (or they were unable to see the systems). It's always dangerous when uneducated people get busy. So besides some minor simplifications we have a big mess now - and teachers are forced to teach it :((though in real life some of the worst cases are already turning back again.

Why does this sound like math and science education in the U.S., particularly the big cities?

Re: German orthography (spelling) reform

*Message #67 Posted by **George Bailey (Bedford Falls)** on 2 Nov 2010, 4:50 a.m.,*
in response to message #64 by Walter B

1) The nice thing about this reform is that no private person can be forced to use a specific orthography or grammar. We can all write just the way we want. And even if a judge would write his rulings in his own orthography or grammar or even as a poem, it would still be a legal ruling.

2) The average German does not use future tense or subjunctive while speaking. For example, the future tense is usually formed by using the present tense and indicating a time in the future: Tomorrow I go to school. Out of the many possible past tenses, only one is used in the average spoken language.

3) Noun genders in German are actually nonsensical. They are totally arbitrary and don't add any more meaning to the sentence apart from only a few words that have different meaning when used with a different gender: die See (ocean), der See (lake); das Schild (sign post), der Schild (shield).

4) Language is just a tool. How wonderful to have one with many levels of complexity, being able to use the appropriate level of complexity when it is needed: a simple one for every day use, a concise one for legal issues, a complex and redundant one for poems. How poor would we be had we only the simplest one.

As an aside: as far as I know (having read it somewhere) Mark Twain was very fond of the German language and the German culture. His text is a satire written with great humor, knowledge and love.

Have a look: >>>CLICK<<<

Re: German orthography (spelling) reform

*Message #68 Posted by **Walter B** on 2 Nov 2010, 8:03 a.m.,*
in response to message #67 by George Bailey (Bedford Falls)

Thanks for that link. This text is consistent with all I've written here about Mark Twain without actually knowing it then already.

After all, I'd still strongly suggest using the attribute "strange" instead of "nonsensical" for features you don't understand in other cultures, languages, habits etc. as long as people of the respective culture are listening. Else it would be easy finding a real lot of nonsensical points as well in what's going on where US citizens are involved, not only linguistically. OTOH in some strange corners of this world you may suffer severe personal damage when publicly calling the local way "nonsensical" - and it seems you won't even know why if you were not warned before. So take care d8-)

Martin, I want to reach peace instead. "Nonsensical noun genders", however, can't be left standing for the reasons explained at length - but you didn't write that d:-)

Re: German orthography (spelling) reform

*Message #72 Posted by **bill platt** on 2 Nov 2010, 12:39 p.m.,*
in response to message #71 by Walter B

Well, it is nonsensical. But so are French, Italian, Spanish noun genders. English ain't got 'em, that's all.

And like Thomas said, you simply make sure to learn the words with their attached articles. Of course this is easier said than done...if you are an English speaker, you tend to discount articles, and so after 3 years as a kid,

not paying attention to this, you find yourself with a pretty big vocabulary of unattached nouns...fenêtre, segel, porte, fenster, etc etc etc. Sometimes you are lucky and the correct article simply sounds right (from having heard or said it a few times) so la fenêtre, la porte, das fenster...

Used to. Have noun genders, that is. Whether nonsensical or not, is debatable. In any event they have been phased out, it seems to me.

Waitress, actress, seamstress, etc. all gone. Fireman and policeman became firefighter and police officer. PC: I still use the old forms out of protest, mainly.

We kept some adopted forms, such as masseur and masseuse, I suppose so people can declare their preference without being so obvious about it.

But when was the last time you heard someone distinguish between alumnus and alumna?

*Message #74 Posted by **bill platt** on 2 Nov 2010, 1:41 p.m.,*
in response to message #73 by Martin Pinckney

Hi Martin,

Your examples are Sensical genders, not nonsensical (as in door, window etc). They are being obsoleted because of the insistence of some that the vowel in the suffix "man" is a stressed vowel and therefore carries the meaning "male." One way to continue your protest while having some linguistic fun is to point out that the vowel is in fact a schwa unstressed and that it is not explicitly meaning "male" anyway. Just a thought...even if indefensible. (I hate the new term "drafter." As in, "hey, I need a drafter to draft these rafters by tomorrow." The word sounds more like it should mean someone who makes annoying air movements for a living. "Hey, it's awfully drafty in here. Somebody, please take that fan away from the drafter; I'm getting goosebumps.")

Political correctness in American language

*Message #75 Posted by **Walter B** on 2 Nov 2010, 4:32 p.m.,*
in response to message #74 by bill platt

The funniest story I heard about that development you describe

was some female students wanted to rename "history" in "herstory". It brings all the necessary ingredients together: absolutely no idea (about etymology in this case), but unlimited good will and belief in being on the right way.

And if by chance anybody would dare interfering, bad luck for him, we just want his best ;)

Re: Political correctness in American language

*Message #76 Posted by **megarat** on 6 Nov 2010, 10:51 p.m.,*
in response to message #75 by Walter B

FYI, the etymology of "history" is rich and gender-agnostic. That it also ended up as a portmanteau of "his story" is a cute coincidence.

(The existence of similar words in other contemporary languages (e.g., the French "histoire") is a good clue of this.)

"History" has a full page in the OED (2nd ed.) and you can find a more succinct description of its etymology here:

http://www.etymonline.com/index.php?term=history

What it's all about

*Message #81 Posted by **Walter B** on 2 Nov 2010, 5:21 p.m.,*
in response to message #79 by bill platt

Maybe it was too difficult so far, so I'll try to make it crystal-clear: "Nonsensical" reads like "nonsense". IMHO no outsider (or foreigner, stranger, French: étranger, Italian: straniero, German: Ausländer, Chin.: wai4 ren2) may deliver this judgment about another language or culture, by mere respect. We and you may find such things "strange", but in no way "nonsensical".

For those who have no respect for other (even older) cultures: you may just as well behave for reasons of politeness. It may help *you* to survive (please see above).

Reminder: We are not talking about science here, where truth may be found by debating.

Re: What it's all about

*Message #82 Posted by **Martin Pinckney** on 2 Nov 2010, 7:40 p.m.,*
in response to message #81 by Walter B

Well, what do you know: below it the exact text of a message I wrote today, in response to one of Bill Platt's, but then decided not to post. But since I turn out to be at least half right, I now post it:

"Speaking of misunderstandings, it occurs to me that perhaps Walter took 'nonsensical' to mean something along the lines of 'I don't understand it, so I therefore think it is nonsense,' rather than 'seemingly illogical or incongruent,' which was probably closer to Karl's intent.

But why am I speculating on either Walter's understanding or Karl's intent? Probably dangerous territory."

What do you call this: A real difference in language/cultural understanding results in a disagreement over a perceived affront about language/culture. Irony? Self-fulfilling something-or-other?

Re: What it's all about

*Message #83 Posted by **bill platt** on 2 Nov 2010, 7:56 p.m.,*
in response to message #82 by Martin Pinckney

nonsensical: seemingly illogical or incongruent is certainly my meaning. Perhaps it would have been more precise to have said inconsistent, or incongruent.

American Heritage Dictionary:

nonsense (nŏn'sĕns', -səns) n. 1. Something that does not make or have sense; especially, behavior or language that is meaningless or absurd. .... --nonsensical adj.

Re: What it's all about

*Message #84 Posted by **Walter B** on 2 Nov 2010, 10:51 p.m.,*

Your dictionary tells exactly the point (emphasis added by me). Please read this (written 3 days ago). What's so difficult to understand?? By people living in a society where you must call a fat man horizontally challenged not to hurt his feelings??? (Poor old Mark Twain: all his Mississippi tales have to be rewritten for improper speech.) Looks like political correctness had to be invented as guideline for people who lost the sense for collateral damages ... :(

Re: What it's all about

*Message #85 Posted by **DeboT** on 3 Nov 2010, 5:53 a.m.,*
in response to message #83 by bill platt

To that definition I think one should should add: **to the beholder/observer**, e.g. even RPN is nonsensical to some.

I must say, all these observations provide an interesting thread - without an answer to the OP after 80 posts, poor Geir ;-)

Re: What it's all about

*Message #86 Posted by **George Bailey (Bedford Falls)** on 3 Nov 2010, 5:43 a.m.,*
in response to message #81 by Walter B

Nonsense or nonsensical - whatever! I think we have understood by now that it meant 'linguistically and semantically without meaning' not 'Germans are suckers'. ;)

Now: Can someone try to explain, what exactly is the sense of noun genders in any language? Does a sentence with them convey any more information than the same sentence without them or with the "wrong" noun genders?

Apart from sounding strange at first glance, where is the informational difference between these three sentences, if there is one:

a) 'Der Mann geht in die Küche und kocht die Suppe'

b) 'Die Mann geht in das Küche und kocht den Suppe'

c) 'Mann geht in Küche und kocht Suppe'

I concede, the last one can have a slightly different meaning. For example 'kocht die Suppe' could mean a specific soup, whereas 'kocht Suppe' would mean no specific soup, just soup. But a) and b) have no different meaning, only that b) is orthographically/grammatically wrong by current standards.

- added redundancy
- There are nouns in German that are distinguished by gender: *der* Schild (buckler) vs. *das* Schild (plate). Others aren't and still have different meanings: das Schloss (castle or lock). So no general rule here.
- In Arabic language male and female *you* are distinguished. Who could be possibly interested to know whether you're talking to a lady or a man on the phone? Well wait, that grammar stuff must be much older than the invention of the telephone.

Just what came to my mind. Sorry, but I'm not an expert in these matters.

If you think noun genders are weird, take a look at Navajo grammar, where things like softness/hardness, roundedness/angularness, hairiness/smoothness, etc., are encoded as part of nouns. That language is so bizarre that the U.S. used Navajo speakers as "code talkers" during W.W. II. :-)

Or to take an example from the Indo-European family, which is what most of us on this forum are familiar with: what I remember from my high school Ancient Greek is that that language lets you express things like "I would have been going to walk" using a single word, by attaching all sorts of prefixes and suffixes to the verb stem.

It looks like, in the long run, this kind of elaborate grammar is losing out to simpler grammars where there is a substantially reduced number of cases and tenses, and where the subtleties are expressed using a small set of auxiliary verbs and prepositions... but to answer your question, the fact that some features of the original, highly synthetic Indo-European languages stubbornly refuse to disappear is, in my estimation at least, because of something you mentioned yourself, namely, that abolishing some features altogether (like gender in German) would simply "sound weird". Never underestimate the power of peer pressure to resist anything that's different, even if it would be an improvement in the long run.

(For comparison, consider trying to get the U.S. to abandon the old Imperial units and switch to SI... The fact that such attempts (yes, they have happened!) have failed to gain traction isn't so much due to U.S. backwardness; rather, the U.S. was in fact one of the earliest adopters of nationwide standards for units of measurement, and by the time the rest of the world started to adopt the French system, the incentive to adopt new standards in the U.S. had already largely disappeared. Sure, SI would be an improvement, but the weirdness factor will prevent it from happening in the foreseeable future.)

I'm guessing -- nobody really knows anyway -- that way back in the pre-historic past, some people simply decided that there was a need to express things like gender, and they decreed that this be part of a word, rather than indicated by

a separate word. This was a sub-optimal choice, obviously, but in the small communities of pre-modern humans, peer pressure would have been much more intense than it is in the large nation-states of today, and so change would have been very difficult. Again, I'm just guessing here, but I find it interesting that the most complicated languages in use in Europe today are Icelandic and Basque, both of which are spoken by small groups. The larger a language is, the more easily it mutates.

Well, not actually because it is bizarre, but because no Japanese could be expected to be familiar with it.

Noun genders, Najavo

*Message #90 Posted by **Karl Schneider** on 4 Nov 2010, 12:37 a.m.,*
in response to message #88 by Thomas Okken

Thomas --

That's another insightful 'short essay.' Yes, "Never underestimate the power of peer pressure to resist anything that's different, even if it would be an improvement in the long run." is a keen observation that explains why many things -- standards, customs, institutions -- remain entrenched, even when better alternatives are available.

Sheer inertia plays a role, too, when to change an established institution or design would be a major investment or undertaking. Would the incremental benefit justify the cost?

Martin is right about the use of Navajo. Japan had foreign-exchange students in the US and elsewhere, and could be expected to translate most any European language. Not so the indigenous languages of the US.

-- KS

Re: What it's all about

*Message #91 Posted by **George Bailey (Bedford Falls)** on 4 Nov 2010, 4:06 a.m.,*
in response to message #88 by Thomas Okken

Both Thomas's,

Thanks for your interesting answers, which were very enlightening but did not answer my question. I don't think the gender-noun-feature is any weirder as any other language feature. The language just came up with it and that's it.

But coming from 'nonsensical', I really am interested if someone has an idea if noun genders really do transport more information than just the bare noun.

I used the 'der Schild/das Schild' example myself above and I don't think it's a valid case of transporting more information by means of noun genders. Both words are just different words that sound alike. The diffenrentiation between them could be made adding letters or changing them or calling 'das Schild' from now on 'Glumpf'.

For example: Does 'das Haus' convey any more useful (!) information than 'die Haus', 'der Haus' or 'Haus'?

Re: What it's all about

*Message #92 Posted by **Walter B** on 4 Nov 2010, 1:06 p.m.,*
in response to message #91 by George Bailey (Bedford Falls)

Those "gendered" words come from a time long, long ago, but from our galaxy. You find them e.g. in ancient Greek: "hó ánthrOpos" (with O pronounced as a long closed o, the Omega), "hä gynä", "tó cháos", corresponding to "der Mensch", "die Frau", "das Chaos" in German or "the man", "the woman", "the chaos" in English. For man and woman so-called "natural gender" rules, but why is "to chaos" neuter in all these languages? And why is "hä lÓpä", i.e. "the coat", female in Greek, male in German and neuter in English? I can't tell you. Most of these genders do not carry a meaning IMO today. This doesn't mean, however, they are distributed stochastically or nonsensically. There are rules: e.g. all diminuitives are neuter in German - e.g. "die Frau" -> "das Frauchen" = "the little woman". This for example is the reason for "das Mädchen" = "the girl" = "the little young woman".

The articles, in any case, are important for differentiating e.g. "das Mädchen" and "die Mädchen" ("the girls") and "der Mädchen" ("of the girls"). Confused? Well, we have more: "dem Mädchen" ("to the girl"), "den Mädchen" ("to the girls") and "des Mädchens" ("of the girl"). But it's really easy - already 3-year-old toddlers know it.

Summing up: IF you are interested in a language, THEN you should deal with it before claiming anything being "nonsensical". HTH although I have my doubts :-/

Edited to correct some English errors.

Re: What it's all about

*Message #93 Posted by **Thomas Okken** on 4 Nov 2010, 11:39 p.m.,*
in response to message #91 by George Bailey (Bedford Falls)

> Quote:
>
> Thanks for your interesting answers, which were very enlightening but did not answer my question.

Well, we'll keep trying, then. :-)

My guess (and that's all it is!) is that sometime in pre-historic times, when language was much more primitive than it is today, people started feeling the need to qualify nouns. For example, if you're herding cattle, the difference between male and female cattle is important. If you're foraging for fruit, the difference between unripe and ripe is important. And so on.

Now, when you have to design a way to express certain attributes of physical objects, and you already have words that reference those objects (i.e., nouns), what are you going to do? You could modify the existing nouns in a way that expresses those attributes, like the Latin pattern of adding **-us** to anything male and **-a** to anything female, or you could define a new word that expresses the gender property (i.e., an adjective), and say that word just before or just after the noun in question, whenever the attribute in question is important.

From where we are now, it seems obvious that the approach of using separate words to express

attributes (adjectives) is better, but if you try to put yourself in the position of someone for whom the very notion of expressing such properties is totally new, the choice may not be very obvious at all. Inventing the words "male" and "female" would be a big leap for people who speak a language that doesn't have adjectives yet; if you do have them, adding gender to the set of adjectives is a lot easier. Maybe Navajo is weird simply because they were late inventing adjectives?

I think that the choice of making gender an intrinsic part of a noun was a bad one (and the Navajo pattern of making aspects like softness, sharpness, hairiness, etc. part of a word was even worse) but once such a choice is made, it's not easy to go back and revisit it.

The worst aspects of Indo-European seem to have eroded almost completely by now. In English and Dutch, for example, cases have disappeared almost completely (only the Nominative remains, plus the Genitive for proper nouns, plus a small handful of special cases), and the tense system for verbs has been reduced almost completely to present imperfect and past imperfect (everything else being constructed using a few auxiliary verbs plus infinitives and participles).

Gender in Germain remains, I think, mostly because dropping it would sound weird, and because it still serves a purpose in establishing cases (ich setze mich auf die Bank vs. ich sitze auf der Bank).

In short -- cases, genders, etc.: bad idea, using separate words to convey that information is much more efficient. Why were those bad choices made in the first place? Because people make bad choices sometimes (to err is human) and also because it isn't always obvious which choices are best initially (short-term benefits are often at odds with long-term ones). Why do bad choices persist even after it becomes obvious that another choice would have been better? Peer pressure, inertia, and because many of them aren't really all that bad. The really bad features of Indo-European have mostly disappeared already; the questionable ones survive because they're not really all that problematic anyway, and because reversing them would feel weird.

I second that!

But to prevent this very funny thread from ending soon, I have to spin it a little further again: I understand why a shepherd needs to differentiate between male and female, young and old. The thing is, real professionals don't do this by noun genders but with proper words: Lamm = younger than 1 year; Hammel = male, castrated, older than 1 year; Schaf = female, > 1 year; Bock = male, not castrated, > 1 year. The respective words exist for other animals as well.

An then, while I would want to know if my two sheep can produce offspring together, why would I bother if my table (der Tisch, male) and my lamp (die Lampe, female) have different genders? ;) Sadly, they will never be able to produce a table lamp together...

Re: What it's all about

*Message #97 Posted by **bill platt** on 4 Nov 2010, 7:26 a.m.,*
in response to message #88 by Thomas Okken

Hi Thomas,

Great stuff, and nicely written :-)

The business about small groups having their language change more slowly is a well-identified linguistic dynamic. I remember learning about it way back when--language "freezing" was the term I think. Examples given were given for English in London progressing and changing faster than Northumbria, and of Sea Island in the US being an 18th century time warp.

But when trying to apply the same rule to the set of Latin derivatives, it gets messy because the "center" kept changing, therefore Spanish, Italian and French all progressed a lot along the way. But there might yet be some identifiable features under this rule.

Another set of rules which I find utterly fascinating are Grimm's law and the even more fascinating related one Werner's law. This it the set of rules that sets the Germanic languages apart from the Latin ones and relates HunDred to CenTum for instance.

One final change moment that remains a mystery as far as I know, it the "Great Vowel Shift" in English, which occurred some time between Chaucer circa 1400, and Shakespeare circa 1550. This is what gives English all the dipthongs and "long" vowels distinct from the more consistent ones on the continent.

If I hadn't needed to make a living, I might have been a linguist. It is fascinating! (Maybe I am just not very good at it).

> The changes were arguably ill-advised.

Maybe, but maybe not. One of the changes I actually like is how the **ß** is replaced by **ss** at the end of closed syllables, e.g. Schuß became Schuss (reflecting the fact that the **u** is short) while Gruß remained Gruß (reflecting the fact that the **u** is long). Arguably this could have been carried even further, by changing the **ß** to **s** in the latter case; the **s** at the end of a syllable is always sharp anyway, so there is no need to use a special letter. (But that wouldn't fly because it would look weird.)

Then again, there is the issue of Maß, which is pronounced with a long **a** in most of Germany, but with a short **a** in Bavaria, so for most of Germany, the old spelling of **Maß** makes sense, while in Bavaria, **Mass** would be more appropriate under the new rules.

Every spelling reform causes its problems, but that doesn't necessarily mean that they shouldn't happen at all. I mean, I like the fact that the spelling of European languages is at least somewhat phonetic in general, and the fact that the letters of the Latin alphabet still have more or less uniform phonetic values, even across languages (English being the main exception due to its Great Vowel Shift), 2000 years after that alphabet was adopted across the continent. That uniformity is due to repeated spelling reforms that restored the correspondence between the spoken language and the written one. I mean, good luck trying to get people to change the way they *speak* to match the way their grandparents *wrote*. I think it's pretty neat how the Latin word **homo**, which survives as French **homme**, Spanish **hombre**, and Italian **uomo**, while obviously having changed a lot, is still spelled phonetically. If we had maintained Latin spelling religiously, we would have the advantage of uniform spelling across the continent, but we would have lost the advantage of phonetic spelling.

When spelling reforms happen, they can be jarring, but the bad reforms simply tend to get rejected, while the sensible reforms tend to survive. I've seen evidence of this in Dutch spelling reforms where redundant double vowels and -sch endings were replaced with single vowels and -s respectively, e.g. "het groote bosch" became "het grote bos", and apart from my Dutch grandfather, I have never heard anyone complain about *that* change... while the proposal to change -isch endings to -ies, which would make perfect sense phonetically, hasn't gained traction. And yet, I wouldn't be surprised if even that change were to happen eventually.

Almost. French is another major exception IMHO - think of eau, eaux etc.

>
> Almost. French is another major exception IMHO - think of eau, eaux etc.

There is certainly a big disconnect between French spelling and French pronunciation, but that disconnect is mostly because of all the letters that are silent. To a first approximation, you can pronounce French pretty well using a simple set of rules by just dropping the final consonants from most words and making the final vowels sound nasal. The phonetic values of Latin letters in French is pretty predictable; figuring out what to pronounce and what not to is a bit trickier. And, of course, the reverse process is completely impossible!

*Message #106 Posted by **Walter B** on 5 Nov 2010, 2:46 a.m.,*
in response to message #105 by Thomas Okken

Thomas,

thanks for your response. I should have explained my point better. Think of "tombeau" - the last "o" is pronounced like the one in "Hugo". Who knows by hearing such an "o" in an arbitrary word how to spell it in French? Or take "paire" and "père" ...

So IMHO French is far from featuring phonetic spelling. Same with modern Greek. Better examples are southern Romanic languages, or Germanic east of Rotterdam, or Slavic AFAIK.

FYI, the Bavarian (and Austrian) Maß with short a is female (die Maß) and exclusively used for Bavarian beer: eine Maß Bier = a jar of 1 l beer, enough for many people. The general German Maß is neuter (das Maß), has another meaning and is used in Bavaria, too.

This was a big mistake. Actually, the 'beta' is a sz ligatur indicating a sharp s. Over the time, in some instances the smooth s became a sharp s in the actual pronunciation but the simple s remained in written language. *That* should have been addressed.

You'd use:

Dasz Schlosz sitzt an der Tu"r.

instead of

Das Schloss sitzt an der Tu"r.

See what I mean? Both s are pronounced identically but are written differently.

Edit:

'Das' - sharp s / 'Schloss' - sharp s / 'sitzt' - smooth s

Re: German orthography (spelling) reform

*Message #109 Posted by **Walter B** on 6 Nov 2010, 12:12 p.m.,*
in response to message #108 by Thomas Radtke

Quote:

You'd use:

Dasz Schlosz sitzt an der Tu"r.

Depends on your way to speak. I think the writing

Das Schlosz sitzt so an der Tür, dasz man es gut erreicht.

is perfectly phonetic. Since our mandarins want me writing

Das Schloss sitzt so an der Tür, dass man es gut erreicht.

instead I can live with that as well. Both sz and ss define a sharp s. I didn't see a necessity to change the spelling though. As mentioned above already, however, I didn't see a need for this "reform" at all.

Quote:

[...] I didn't see a need for this "reform" at all.

Same here.

But when you enter into reforming the language to help students, you should ensure that in the end people can write as they speak (in high German - you have to agree on smoething, right?).

OTOH - often I recognize Bab..., erm, Bavarians the way the misspell words where they use the sharp s instead of the correct smooth s ;-p.

Sunrise and Sunset

*Message #1 Posted by **Thomas Klemm** on 26 Oct 2010, 6:52 p.m.*

At the horticultural exhibition Grün 80 I discovered this precision sundial punctual to the minute and still remember exactly how much I was impressed watching the time go by. It is still there if you ever happen to be in the vicinity.

Years later, I attended a lecture by Christian Blatter: "Von den Keplerschen Gesetzen zu einer minutengenauen Sonnenuhr" (From Kepler's laws to an exact sundial). I'm sorry that the paper is only available in German but here's a similar paper in English: "Another design for sundials", Norbert Hungerbühler. Though I knew about the equation of time and Kepler's law I wasn't aware of the interconnection until then.

Now that we can calculate the position of the sun for any date of the year I thought we could go one step further and calculate sunrise and sunset. However I was quiet disappointed by the result because it was very inaccurate compared to what I got for instance from http://www.sunrisesunset.com. It took me some time to understand why: It all depends on how you define sunrise and sunset. The usual value of the altitude of the center of the solar disc is about -0.83° while I assumed this to be zero. This may lead to an aberration of several minutes. On the other hand you're always late for the sunset if the upper edge just disappears.

The program is probably not the most precise. There are others around that do much better. My goal was to understand what's going on.

Best regards
Thomas

Formulae

From the paper I mentioned above the formula on page 158 was used in combination with the ansatz: psi(t) = t + d(t).

$$\psi(t) = t + 2 \sin t\, K + \frac{5}{4} \sin(2t)\, K^2$$

To make the calculation a bit easier I used the double-angle formula:

$$\sin(2t) = 2 \sin(t) \cos(t)$$

This leads to:

$$\psi(t) = t + K \sin t \left(2 + \frac{5}{2} K \cos t\right)$$

Both values *K cos t* and *K sin t* can be calculated in one step.

The expression in formula (6) on page 161 for mju(t) is stupendous. However it's far easier to use a suitable combination of polar/rectangular coordinate transformation. Don't tell me now you miss something on your HP-35s.

Constants:

- `K = 0.016722  numerical orbital eccentricity of the earth`

- E = 23.45 obliquity of the ecliptic
- P = 78.5 perihelion (relating to vernal equinox)
- U = 8:30'30" longitude (Zurich)
- V = 47:24'36" latitude (Zurich)

auxiliary quantity:

$$L^2 = \frac{1 + K}{1 - K}$$

Initialization:

(all angles must be stored in RAD)

in response to message #5 by Karl Schneider

Hi Karl

Maybe you're right. But I wouldn't recommend this program to actually calculate sunrise and sunset. Why would someone do that at all? It is indeed written in the newspaper every day.

I probably would not have posted this at all, unless Geir Isene recently would have drawn my attention to the module ASTRO 2010 by Jean-Marc Baillard. So I suppose there are a few of you who are interested in the topic as well.

There is an artist, I know. She noticed a spot of sunlight on the floor of the barn of her grandmother. Every day at the same time, she drew its outline on a large sheet of paper. With different colors. What led to an image over the time. But it's not about whether that's art. It's about perception. What happens when we do something every day at the same time? Why does this give a figure eight, symbol of infinity?

Or the days after the winter solstice. Why are the days getting longer again but still the sunrise happens later and later?

```

 4.01               X:      8.2743   Y:      16.4919
 5.01               X:      8.2736   Y:      16.5021
 6.01               X:      8.2727   Y:      16.5125
 7.01               X:      8.2714   Y:      16.5231
 8.01               X:      8.2659   Y:      16.5339
 9.01               X:      8.2640   Y:      16.5449
10.01               X:      8.2619   Y:      16.5600
```

And then the question of why I wrote a program for a thirty year old calculator and didn't simply key in the formula into Mathematica? Most probably because for me it is still the best way to understand these things.

Kind regards
Thomas

I don't have a need to use a calculator to compute sunrise and sunset. But a newspaper is simply not adequate so my computer does that calculation for me every day. My computer needs to know when to

expect the sunrise and sunset so it can perform tasks relative to those events. It is much easier for it to calculate sunrise and sunset than to fetch a newspaper and read it.

For example, at 0645 my computer starts to gradually bring up a light in my bedroom, but only if the sun is not yet up. Then it turns off the light about 30minutes after sunrise.

Let me add a few things:

- Should you be more interested in the equation of time just remove the call to subroutine **D** in the main program. The result is in RAD and may be transformed to hours using subroutine **E**.
- The subroutine **F** isn't really needed. It may be used to check the approximation used in subroutine **B**. These two programs are (not exactly) inverse to each other.
- I organized the program into smaller modules that can be used and tested independently. However the program can be unfolded to save some space.
- In the listing below I've added the status of the stack for each step to ease reading the program.
- Initially the program was written for the HP-11C but I preferred using letters for the registers. That's why I have selected the HP-32SII. However it's straightforward to transform that program to the HP-41 or HP-15C.

Cheers
Thomas

in response to message #10 by Thomas Klemm

For those who may be interested, here you can find my "Sun Tracker" program, for the 40G and the 49G. The 49G version also runs on the 50G.

http://www.physique.lu/hpcalculators/sunposition/sunposition.htm

I also hava an 48G version which is not online. If people are interested I will check whether I have more actual versions on my calculators (I think so). I haven't updated the code for some time.

Yes, please post the code here. I'd be interested.

Many thanks in advance
Thomas

Re: "Sun Tracker" on HP-49G and HP-48G

*Message #13 Posted by **Karl Schneider** on 28 Oct 2010, 11:24 p.m.,*
in response to message #11 by Patrick Rendulic

Patrick --

That looks like a good opportunity for me to try I/O on the HP-49G and actually use it for something...

And also my HP-48G, if and when the code is available.

Re: "Sun Tracker" on HP-49G and HP-48G

*Message #14 Posted by **Patrick Rendulic** on 29 Oct 2010, 4:26 a.m.,*
in response to message #13 by Karl Schneider

Hello Thomas, Hello Karl.

Give me some time. I will update the code within the weekend and will let you know here.

Re: "Sun Tracker" on HP-49G and HP-48G

*Message #15 Posted by **Patrick Rendulic** on 29 Oct 2010, 5:25 a.m.,*
in response to message #13 by Karl Schneider

I did it immediately, here you can find the actual versions:

http://www.physique.lu/hpcalculators/sunposition/sunposition.htm

In this version the errors during midnight sun and polar night are gone. If you use Urania then you will see that the program uses the same variables for latitude, longitude and time zone. There is one "minor bug" left. The times for sunrise and sunset are only calculated once when you start the program. So if you let the program run for more than a day, they will not be accurate because they will not be updated. But who will do that?

Pay attention that you now have to start the program with the "SUNT" command (for sun tracker).

The 49G versions also runs on the 50G. The 2 last lines of the screen will remain blank. I also added the version for the HP48G series, but did not have the time to check it on my 48G (fuzzy file transfer ...), but it worked fine on the emulator. Just let me know if there is a problem.

The programs are written in system RPL.

Re: Sunrise and Sunset

*Message #17 Posted by **Ángel Martin** on 29 Oct 2010, 2:55 a.m.,*
in response to message #10 by Thomas Klemm

Thomas, if you agree this seems a good one to add to the -ASTRO U/I module, which still has plenty of available space. I can add the alpha prompts to make it more intuitive - or you'd like to?

Any other contribution? Geir?

Re: Sunrise and Sunset

*Message #18 Posted by **Thomas Klemm** on 29 Oct 2010, 3:50 p.m.,*
in response to message #17 by Ángel Martin

Hi Ángel
Feel free to do whatever you like with the program. I agree that the UI is rather sparse.

Just be warned: the program uses currently the following formula to calculate the hour angle:

$$\cos \omega_o = -\tan(\phi) \times \tan(\delta)$$

This correction to that equation is used by Patrick's "Sun Tracker":

$$\cos(\omega_o) = \frac{\sin(a) - \sin(\phi) \times \sin(\delta)}{\cos(\phi) \times \cos(\delta)}$$

with the altitude (a) of the center of the solar disc set to -0.833°.

However I doubt that this alone explains the deviation.

Best regards
Thomas

in response to message #8 by Egan Ford

Hi,

you could have something like Loderunner with less effort on your iP. On hpcalc.org , there are some Loderunner implementations for the HP-48, which will also work on the m48(+) for the iP.

Just for the curiosity, the 1st Loderunner imp. in the search result list is called "Android"...so you could tell your friends that you run Android on your iP;-)

Time Travel?

*Message #1 Posted by **Bruce Bergman** on 26 Oct 2010, 1:48 p.m.*

Okay, so I was pretty skeptical when I read this. As much as I love Science Fiction and have a particular fascination for time travel, I just don't believe it's possible (too many issues/conflicts). But this is just too weird; it kinda freaked me out. Watch the video at the bottom, especially when they slow it down. Make your own conclusion. Does she have a calculator in her pocket too? ;-)

Time Traveler using cell phone?

thanks,

Bruce

Re: Time Travel ? : it can be cured :-)

*Message #2 Posted by **Etienne Victoria** on 26 Oct 2010, 2:11 p.m.,*
in response to message #1 by Bruce Bergman

Diagnosed by my brother in law: Otitis media in the left ear.

The symptoms basically differ from the ones observed on people suffering from Phonus Portabilis, let alone the Calculator RePeNsis syndrom.

HP-65 makes All-TIME 100 Gadgets list.

*Message #1 Posted by **Alex L** on 25 Oct 2010, 3:24 p.m.*

HP-65 on All-TIME 100 Gadgets list.

Re: HP-65 makes All-TIME 100 Gadgets list.

*Message #2 Posted by **Walter B** on 25 Oct 2010, 4:23 p.m.,*
in response to message #1 by Alex L

Hmmh, zero votes? The TI SR10 got a lot more ...

Re: HP-65 makes All-TIME 100 Gadgets list.

*Message #3 Posted by **db (martinez, ca.)** on 25 Oct 2010, 9:42 p.m.,*
in response to message #2 by Walter B

The SR-10 has 61 votes by the last count.

wait.

Doesn't Joerg Woerner have 60 employees?

Re: HP-65 makes All-TIME 100 Gadgets list.

*Message #4 Posted by **Joerg Woerner** on 26 Oct 2010, 4:16 p.m.,*
in response to message #3 by db (martinez, ca.)

Dennis,

I have far less employees and all but one are in their 20s! They use their TI-89's and probably don't know about the SR-10.

One guy is in his 40s, he uses a HP 15C. Couldn't convince him to switch to a TI-30X Pro and retire his HP 15C (aka me selling it on e**y).

Cheers, Joerg

Re: HP-65 makes All-TIME 100 Gadgets list.

*Message #5 Posted by **DeboT** on 28 Oct 2010, 5:22 a.m.,*
in response to message #2 by Walter B

Of the SR-10 they say

> Quote:

> the SR-10 was the first handheld calculator capable of computing square roots and other basic slide-rule functions

I thought that honour went to the HP-35?

Re: HP-65 makes All-TIME 100 Gadgets list.

*Message #6 Posted by **Walter B** on 28 Oct 2010, 5:51 a.m.,*
in response to message #5 by DeboT

The HP-35 was the first to compute trigonometric and exponential functions.

Re: HP-65 makes All-TIME 100 Gadgets list.

*Message #7 Posted by **DeboT** on 28 Oct 2010, 12:24 p.m.,*
in response to message #6 by Walter B

Hmmm, I'm not quite sure what you're trying to say, the HP-35 can do everything the SR-10 can do and more. Are you saying that if calculator B can do a subset of calculator A functions, then by stating "**basic functions**" it is a "*first*"? IMHO the HP-35 falls in the "handheld" category and is "capable of computing square roots and other basic slide-rule functions". I personally think that the fact that it can do more is irrelevant, it still remains "the first handheld calculator capable of computing square roots and other basic slide-rule functions". (Finseth states July 1972 as HP-35 release and Datamath states November 1972 as SR-10 release).

Re: HP-65 makes All-TIME 100 Gadgets list.

*Message #8 Posted by **Walter B** on 28 Oct 2010, 1:27 p.m.,*
in response to message #7 by DeboT

You're right of course. I simply wasn't aware of the late release date of the SR-10 due to its antique look. So the text here in that gadget list is definitively wrong. Thanks for the information.

Re: HP-65 makes All-TIME 100 Gadgets list.

*Message #9 Posted by **Mark Harman** on 28 Oct 2010, 11:59 p.m.,*
in response to message #2 by Walter B

This is stupid. The worst part is that you can't even vote for the HP-65 since the vote function is "inconveniently" not working on its page. That is why there are zero votes. Also, that really sucks about the misinformation on the SR-10.

Mark

Re: HP-65 makes All-TIME 100 Gadgets list.

*Message #10 Posted by **bill platt** on 25 Oct 2010, 11:59 p.m.,*
in response to message #1 by Alex L

That list is so lame. Looks like it was written by someone who is A: enamored with electronics and B: born yesterday. Sorry, but half the stuff on that list sucked when they were new, and are totally forgotten. Real stuff is left out. Leatherman is included, by not the swiss army knife?

And the cameras? Where the hell is the Brownie? Too much digital $%#$$# in the list, in every category.

Most of those things I never bought, because they were clumsy emergent tech or dumb fads. Examples: electric toothbrush, pedometer, Apple Newton, electric razor (I had one and hated it. always cut your face up and left a rash). Sony Mavica. What a waste. Film was better and still is often better today! Bluetooth headset. What a stupid annoying Borg contraption that encourages a combination of public insanity and anti-social behavior.

Belong on the list: Handi talkie, pager, space pen, credit card (though technically not a gadget!, zippo, velcro, (where the hell is the zipper and the button then! Heck, where's the front-closure bra?) dirt devil, smoke detector, pacemaker, hearing aid, scratch the dirt devil--it ain't that great and I haven't bothered to go buy one.

Edited: 26 Oct 2010, 12:08 a.m.

*Message #13 Posted by **Thomas Radtke** on 26 Oct 2010, 7:09 a.m.,*
in response to message #12 by bill platt

... and there are two Kodak cameras but no AIBO. Funny.

Re: HP-65 makes All-TIME 100 Gadgets list.

*Message #14 Posted by **Martin Pinckney** on 26 Oct 2010, 9:19 a.m.,*
in response to message #13 by Thomas Radtke

Agree with the inclusion of Nikon F, even though it certainly wasn't a "first", it was the arguably the most influential of its type. The Kodak Instamatic certainly belongs on the list as the first of a whole new breed of "easy to use" cameras.

Glaringly missing is the original Leica, which started the whole 35mm thing, which continues to this day.

What the heck is AIBO?

Re: HP-65 makes All-TIME 100 Gadgets list.

*Message #15 Posted by **Walter B** on 26 Oct 2010, 11:22 a.m.,*
in response to message #14 by Martin Pinckney

FYI, Aibo is a robo-dog (not doc! ;) made in Japan some years ago.

There are a number of very arbitrary selections (e.g. no Nokia phone but lots of Motorola), of course, and several important gadgets missing completely like the transistor radio, the HP-35, LCD, the HP-41C, the MTB, Shimano's bicycle gearings, ...

Re: HP-65 makes All-TIME 100 Gadgets list.

How about the microwave oven? My kid would probably starve to death without it. :-)

The first mass market electric refrigerator? Where's that?

Re: HP-65 makes All-TIME 100 Gadgets list.

*Message #17 Posted by **Martin Pinckney** on 26 Oct 2010, 1:18 p.m.,*
in response to message #16 by Egan Ford

> Quote:
>
> How about the microwave oven?

Serious omission.

> Quote:
>
> The first mass market electric refrigerator? Where's that?

You are right. I thought the date might exclude it, so I checked, While refrigerators were produced in tiny quantities prior, the Frigidaire came out in 1923, GE in 1927. The GE is probably the first truly mass-produced one. I have a 1935 ball-top model. I used it up until 1975, at which time it still worked. Been in storage since.

Come to think of it, it's been in storage almost as long as it was in use! I wonder if it still works now...

Re: HP-65 makes All-TIME 100 Gadgets list.

*Message #18 Posted by **Mike Morrow** on 26 Oct 2010, 10:31 p.m.,*
in response to message #15 by Walter B

But it DOES in fact include the transistor radio. The list contains the Regency TR-1, the first commercial transistor AM radio from 1954 ($50 in 1954, equivalent to about $400 today). It used four transistors, and TI was part developer.

The list is odd. One item on it is the Motorola HT-220 VHF-FM handie-talkie that was found everywhere 35 years ago. There's a short but surprisingly accurate reference to the US Army's WWII SCR-300 walkie-talkie and SCR-536 handie-talkie.

Re: HP-65 makes All-TIME 100 Gadgets list.

Per WiccanPedia (as you once referred to it, Bill):

> Quote:
>
> The first spring-loaded mouse trap was invented by William C. Hooker of Abingdon Illinois, who received US patent 528671 for his design in 1894.[1][2] James Henry Atkinson, a British inventor who in 1897 invented a prototype called the "Little Nipper", probably had seen the Hooker trap in the shops or in advertisements and used it as the basis of his model.[3]

Re: HP-65 makes All-TIME 100 Gadgets list.

*Message #25 Posted by **db (martinez, ca.)** on 26 Oct 2010, 1:29 a.m.,*
in response to message #10 by bill platt

right on bill; And how about the p-38 can opener or the electric guitar? You can do rock n roll on an acoustic, but you can't have feedback. Gore Tex is no more generic than his credit card, and more likely to save your life. He included lithium-ion camera batteries but not the the Kodachrome film that captured the most iconic images from nearly the entire period the list refers to.

Mainly, i didn't like it that i don't even recognize about half of the useless gadgets on his list. One of us was on a different planet.

One thing that does belong there is the LED, especially Norm's RRRREEEEEDDDD ones.

Re: HP-65 makes All-TIME 100 Gadgets list.

*Message #26 Posted by **bill platt** on 26 Oct 2010, 1:24 p.m.,*
in response to message #25 by db (martinez, ca.)

...yes! I suppose they are--even if only parenthetically--part of the HP-65

Re: HP-65 makes All-TIME 100 Gadgets list.

*Message #27 Posted by **bill platt** on 26 Oct 2010, 1:31 p.m.,*
in response to message #25 by db (martinez, ca.)

Definitely electric guitar. Although the first might pre-date 1923 depending on how you measure it. Lloyd Loar built an electric viola while at Gibson...

Re: HP-65 makes All-TIME 100 Gadgets list.

*Message #28 Posted by **Mark Harman** on 26 Oct 2010, 9:48 p.m.,*
in response to message #27 by bill platt

The first electric guitar ever invented was the Rickenbacker A-22 "Frying Pan," in 1930. It was marketed, produced, and sold from 1932 to 1939.

Regards,

Mark

The title of the article is intended as a pun, capitalizing **TIME**, (referring to the magazine), but perhaps misleading some, while the subtitle clearly states *"the 100 greatest and most influential gadgets from 1923 to the present"*.

Re: HP-65 makes All-TIME 100 Gadgets list.

*Message #31 Posted by **Palmer O. Hanson, Jr.** on 26 Oct 2010, 10:38 p.m.,*
in response to message #1 by Alex L

As I was reading the list I thought that there were far too many electronic widgets on the list; however, then I saw that my beloved Model 100 was listed and I reconsidered!

Some that aren't on the list but should be in my estimation are

1. The chainsaw, and in particular the gasoline powered chainsaw, which were invented in the mid 1920s, just in time to fit in the list. The devices changed the way logging and woodcutting for firewood were done.

2. The endoscope because its use found cancer in my ascending and transverse colon before it had spread beyond the colon and saved my life.

3. The electric typewriter and in particular the IBM Selectric.

4. The variable speed windshield wiper and washer.

Edited: 26 Oct 2010, 10:42 p.m.

I'm proud to see our product on the list, the Flip video camcorder.

Nice to be in good company :)

When I was a kid (already a calculator nut in grade school - I'd play with the HPs & TIs on the display stands in dept store, got an APF scientific in 6th grade, TI30 in 7th, TI58 in 8th and HP41C as senior in HS), I figured I might end up designing calculators - a grade schooler didn't really know how Moore's law would progress and that many such devices would be sold for pocket change today.

Still I ended up doing a 'pocketable' electronic product so I didn't land too far off my goal :)

in response to message #1 by Alex L

Not sure if these would crack the top 100, but it was fun to be reminded of them:

Heathkit assemble it yourself TV: Sure TVs around for years before, but I'll bet most people didn't have the courage to spend that kind of money for something they couldn't guarantee would work when completed. BTW, if it were considered a gadget, the Sears build it yourself house from their catalog would fall in this same category.

Franklin REX: Maybe an "ahead of its time" candidate instead. To have all that power--similar to a Palm Pilot--in the PCMCIA form factor, was great. I used mine everyday until they couldn't run on newer operationing systems.

And, why is TiVo on the list but not the original consumer videocassette recorder instead? That's what really changed consumer behavior--timeshifting of TV watching. TiVo is just the digital implementation of the same idea.

HP10C enulation

*Message #1 Posted by **PeterP** on 25 Oct 2010, 1:19 p.m.*

not sure but I think in the past there was a thread here about the need for the Voyager HP10C to get some info for an emulator of it. I just went through some stuff over the weekend and it turns out I have 3 of them so whoever was looking for a 10c with regards to the emulation, please contact me, I'd be happy to lend one of the units or something.

Cheers

Peter

RLM Tools has an HP-10C emulator (along with emulators for the 11C, 12C, and 15C).

Check here.

Namir

I believe that isn't an emulator running original voyager nut code but rather a functional rewrite. Pretty close simulation compared to others I've seen though.

HP-41CX

*Message #1 Posted by **Captainsimos** on 25 Oct 2010, 10:06 a.m.*

I am new here so please be patient. I purchased a HP-41CX that doesn't work. The battery terminals are corroded and that is probably the problem. I also have a 82059D charger that is suppose to be for this unit, but I can't figure out where it plugs in. There is an opening on the right side, but no prongs. Am I missing something. Thanks for any help and a great site.

Re: HP-41CX

*Message #2 Posted by **David Hayden** on 25 Oct 2010, 10:15 a.m.,*
in response to message #1 by Captainsimos

There was a rechargable battery pack available. The prongs for the pack lined up with the hole that you see. Without the rechargable pack, you'll need to clear the contacts and get some N sized batteries.

Re: HP-41CX

*Message #3 Posted by **Captainsimos** on 25 Oct 2010, 10:31 a.m.,*
in response to message #2 by David Hayden

Thanks for the information. I tried cleaning the contacts and installing new batteries, but nothing.

Re: HP-41CX

*Message #4 Posted by **db (martinez, ca.)** on 25 Oct 2010, 11:24 a.m.,*
in response to message #3 by Captainsimos

Three free things to try:
Make sure that you have the batteries facing correctly.
Try squeezing the front and back of the case together in various places while pushing the on switch. Having two left thumbs helps here.
Some switches prefer to be stroked while riding a bit toward the screen or away from it. Don't use a lot of force doing this, just try a few differing motions.

If those don't work, clean your contacts again and see if you have any places where you see missing copper so it is just bare plastic. There are metallic paints available at places like radio shack. This will be a tiny can with a tinier brush of metal fines (mine is nickel) that you can apply to the areas of your battery contacts that have flaked off. If this fixes it, remember that this is only a temporary fix and you will need to repaint it each time you change batteries. The corrosion could have also gone up where you can't see it and have destroyed the fine traces higher in the ribbon. A man in the Canary Islands has made replacement batt contact/ROM contact assemblies. You can buy one of these and it is an easy job to put one in, but that comes later.

There are about 15 or so more things to try, but with your unit's problems you might start with these.

Re: HP-41CX

*Message #5 Posted by **Håkan Thörngren** on 25 Oct 2010, 2:58 p.m.,*
in response to message #2 by David Hayden

Make sure to get 1.5V N size batteries, not 12V which will fry your HP-41.

Re: HP-41CX

*Message #6 Posted by **Martin Pinckney** on 25 Oct 2010, 4:15 p.m.,*
in response to message #5 by Håkan Thörngren

All N's are 1.5v. It is the 12v A23 to avoid, which is almost the same dimensions.

Re: HP-41CX

*Message #7 Posted by **Garth Wilson** on 25 Oct 2010, 1:59 p.m.,*
in response to message #1 by Captainsimos

fixthatcalc.com seems to have an outstanding reputation for fixing these.

I wouldn't worry about rechargeable batteries unless you're making heavy use of the optical wand or the card reader. Without those, a set of alkaline batteries will last a couple of years.

HP-35 chip images and schematics

*Message #1 Posted by **Peter Monta** on 24 Oct 2010, 7:44 p.m.*

After seeing the nice work from the Visual 6502 people (http://visual6502.org/) and the 4004 project (http://www.4004.com/), I thought it would be interesting to do something similar for the HP-35 chips. While emulators at the instruction-set level work fine, simulating the original implementation at the transistor level has a number of advantages:

- makes no assumptions about the microarchitecture---guaranteed to be bit-exact to the hardware

- can be used for cross-testing against other emulators and against the hardware

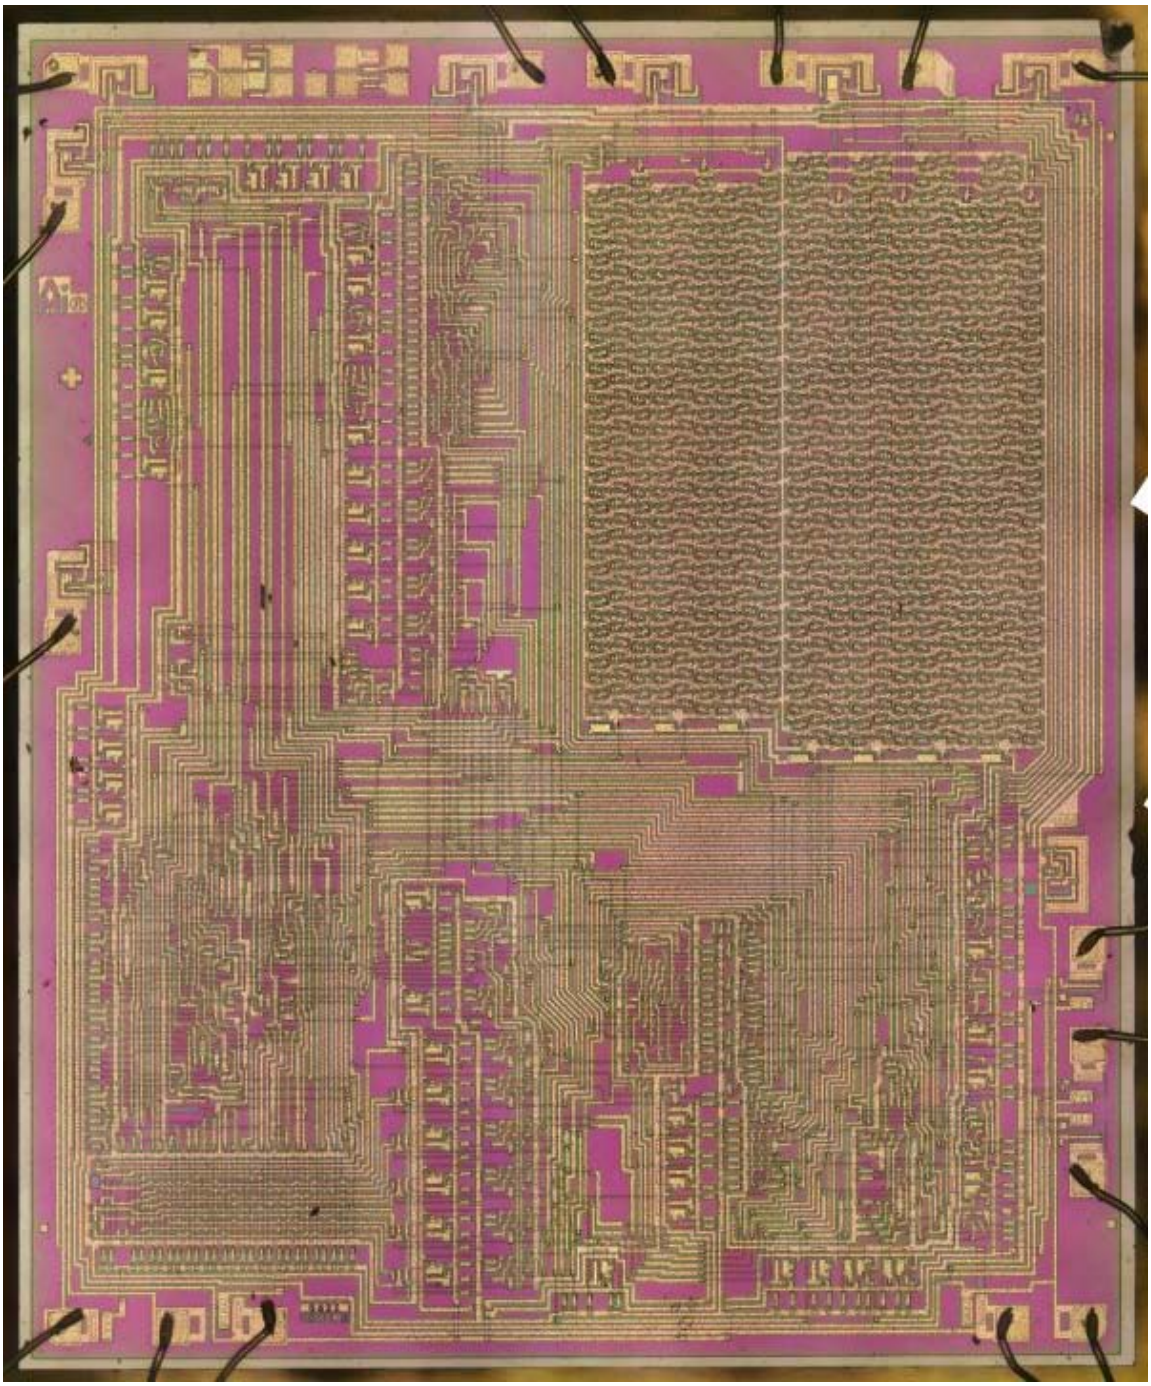
- provides complete, unambiguous documentation of the original implementation

- the derived masks can be used to make new chips

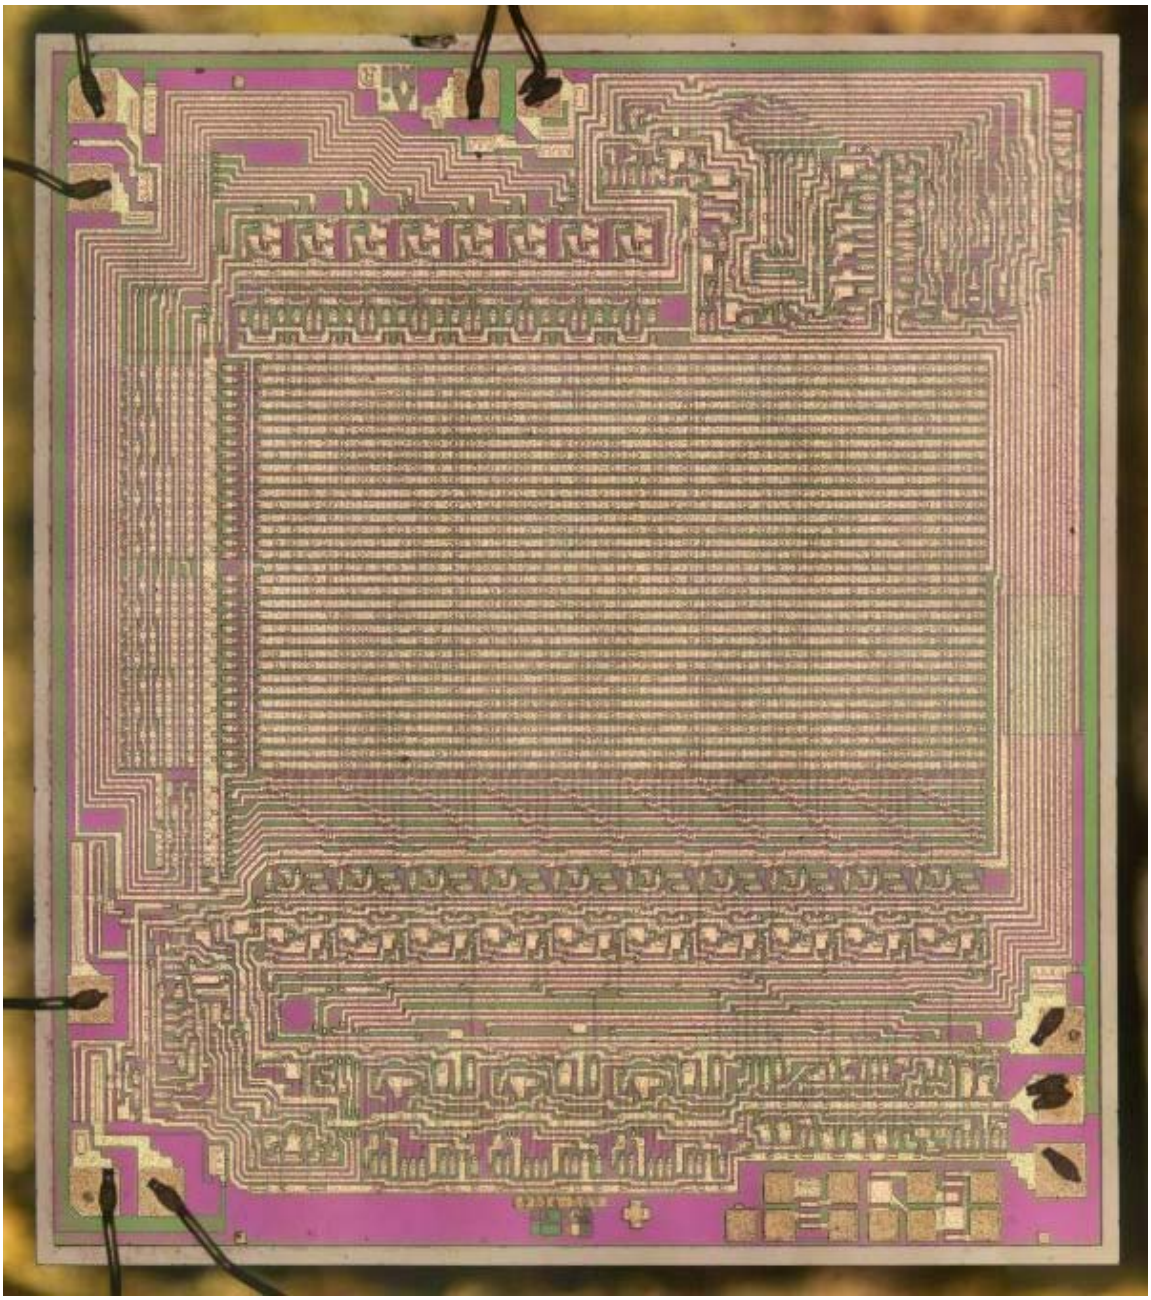
- the circuits can be automatically translated to switch-level HDL and run on FPGAs

So far I've got images of two chips (the A&R chip and one of the ROMs) and a schematic of one stage of the ROM address shift register. This is only a tiny part of the required work, but I thought I'd at least get the images out there so that anyone else who's interested can extract transistor netlists for other parts of the chips. Thumbnails of the chip images, an annotated closeup of the shift-register circuit, and the corresponding schematic are shown below.

A&R chip (AMI 1820-0848):

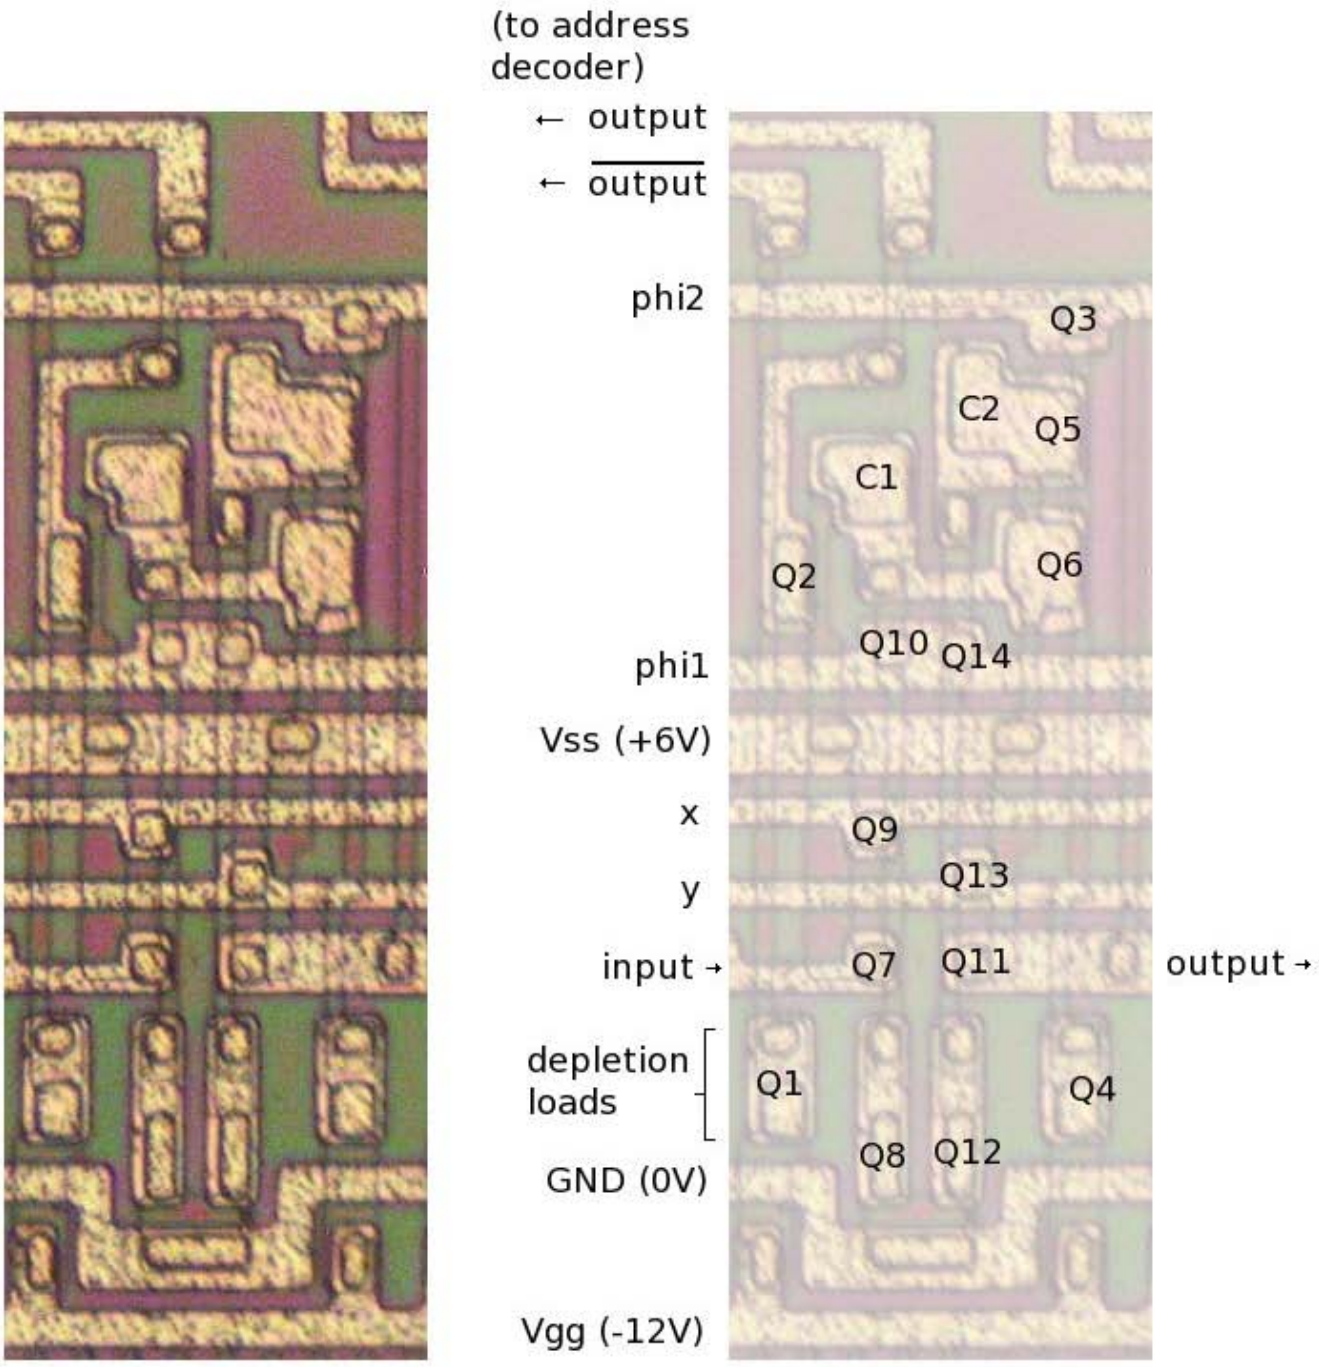


ROM chip (AMI 1818-0006):

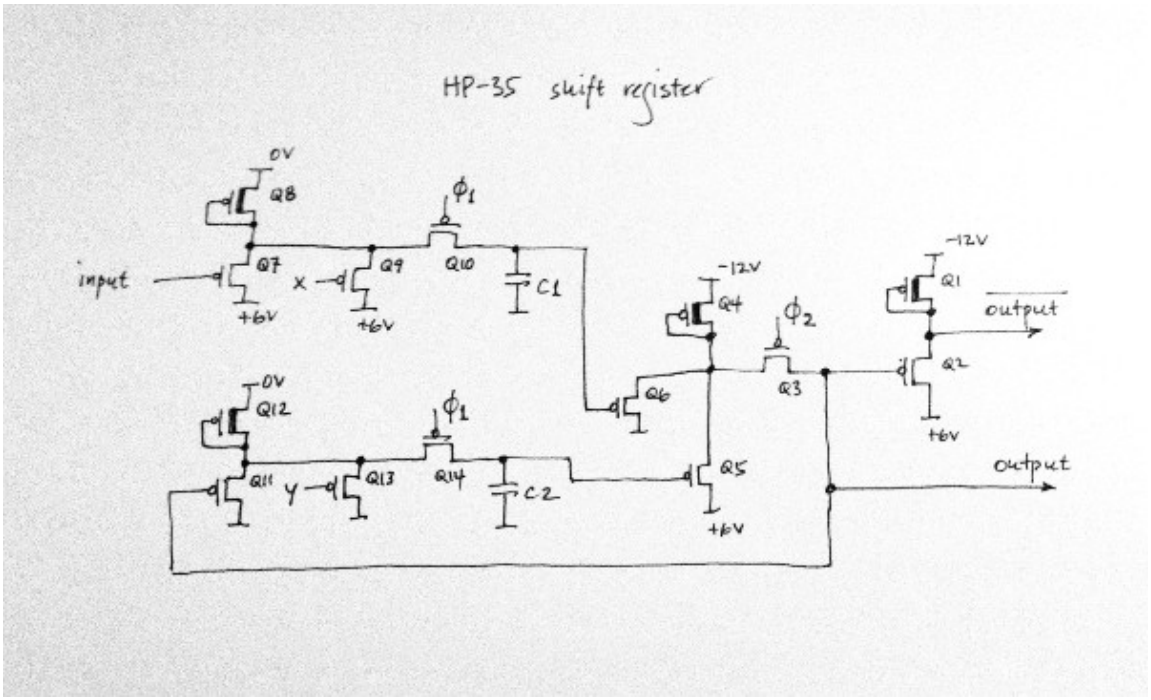


ROM shift register closeup:

HP-35 ROM address shift register



Schematic of the chip fragment above:



The full, high-resolution images can be found here:

http://pmonta.com/calculators/hp-35/chips/

My uplink is a DSL line, so it may be slow.

For the imaging workflow, very modest equipment was used (which was part of the fun): a $160 beginner's microscope with a generic 10x achromat objective, a hacked-up epi illuminator, an afocally-coupled Canon point-and-shoot camera running the free CHDK firmware, and hugin for image processing.

The images have some places where the focus is less than perfect. I hope to fix that in future by taking a focus series at each subimage ("focus stacking") before assembling the panorama.

Re: HP-35 chip images and schematics

*Message #4 Posted by **Ed Spittles** on 6 Nov 2010, 5:48 p.m.,*
in response to message #1 by Peter Monta

Hi Peter, everyone,

nice pictures! It might be worth trying to capture the layout using the degate software: http://www.degate.org/status.html - it's actively developed so you may well want to work with the author.

As you may know, Greg James deprocessed the 6502 for visual6502 and photographed the substrate separately. So it was probably easier for him to extract the buried contacts and identify the depletion implants than it will be for you. But your pictures look very clear to me so I think you have a good chance. Although it's PMOS not NMOS, the circuit style looks comparable.

In the event, I believe automatic vectorisation wasn't up to the task for the 6502.

Let me know if you need any help with the simulator: I've become moderately familiar with the javascript - it's not big or complex, just needs some data to describe the chip. It's MIT-licensed and it's on github.

(I became involved with visual6502 at a late stage, but am spending a lot of time on it, mostly tweaking the interface, and of course studying the chip.)

(My connection with HP calculators is limited to being very impressed by an HP-16c I had briefly at work many years ago. Also had a quick play with a 15c around the same time. And at one time a colleague had a 28 which I admired from afar.)

Cheers Ed

Re: HP-35 chip images and schematics

*Message #5 Posted by **Peter Monta** on 7 Nov 2010, 10:39 p.m.,*
in response to message #4 by Ed Spittles

Yes, I've had a look at degate. It seems like a good solution for standard-cell chips, but unfortunately there doesn't seem to be a way to extract low-level things like transistors (but I could have missed this, since I ran it for only a few minutes to get the general feel). Degate looks very good for wiring though.

So instead I've been rolling my own small tools starting from raster images. Gimp, the image editor, is convenient for editing multilayer rasters (Photoshop would probably be fine too). The original chip photo serves as background, and then I sketch in the metal, diffusion, gate, contact, etc. layers by hand as semi-opaque regions with the image underneath as a reference. Once each layer bitmap is exported to a separate file (using a Gimp script), an extractor tool extracts a netlist, then crunches on the netlist to extract transistors, gates, latches, and finally exports a Verilog netlist.

I considered using a layout editor like Magic to help with extraction, but it was just too tough to teach it about silicon-gate PMOS and deal with the geometry file-format issues.

> Quote:
>
> So it was probably easier for him to extract the buried contacts and identify the depletion implants than it will be for you.

Yes, correctly inferring all the layers from just one image is a problem. I'd prefer not to etch or mechanically delayer the chip if at all possible, and while the unetched images seem like they have a full view of everything for this technology, there are some small areas where ambiguity is possible. The layout is quite idiosyncratic in places, too: isolated areas of metal, gates with no diffusion, etc. Some areas are visibly hacked up to remove design-rule violations. Clearly a hand-drawn design.

The HP-35 ROM I'm using as a test case is silicon-gate PMOS with depletion loads. You mention identifying depletion implants: I can't see any way to do this for this chip except by context (looking for transistors with gate connected to source). There is no sign of an implant mask under the microscope, even with a 100x high-dry objective I recently got on eBay. Fortunately there are no buried contacts, since there is no poly, but even so it's sometimes tough to distinguish a contact from a gate.

Automatic vectorization is a worthy goal, but the high image quality needed for reliability is beyond my setup, I think, especially with the uncertainty and curve-balls of full custom.

> Quote:
>
> Although it's PMOS not NMOS, the circuit style looks comparable.

Fortunately the circuit style is conservative: two-phase latches and NOR gates only. (So far.)

> Quote:
>
> Let me know if you need any help with the simulator

The visual simulators are cool, but I think I'll stick with verilog for the moment. Since I'm extracting gates and latches I can live with iverilog, but if there were structures that required switch-level simulation I'd have to look at something like IRSIM or another (commercial?) Verilog simulator: iverilog, which is otherwise very good, doesn't support trireg, so the two-phase latches don't work. The latches on this chip are always phi1-inverter-phi2, so I export that whole chunk as a Verilog flip-flop.

I'll certainly keep an eye on visual6502 and the 4004 people---are there any other projects of this general type? It would be nice to have a forum for tools and data; maybe visual6502 will turn into that sort of resource, though last I checked they haven't released their low-level data yet. The existing Web resources on reverse engineering are mostly devoted to failure analysis, understandably enough, and not to recovering and running entire designs of historical interest in totally obsolete IC processes. (Step 3: profit!)

Cheers, Peter

Re: HP-35 chip images and schematics

*Message #6 Posted by **Ed Spittles** on 8 Nov 2010, 9:29 a.m.,*
in response to message #5 by Peter Monta

Hi Peter I'm not aware of active reverse-engineering forums but I'm sure there are small groups here and there.

I hadn't noticed the simple nature of this process: no poly, no self-aligned gates. Only metal and diffusion for connectivity. Wow. For anyone not familiar, there's a process cross-section on this page: http://www.david-brenner.net/2009/12/a-year-of-projects/ (see also http://www.google.co.uk/images?q=RIT+Metal+Gate+PMOS+process)

I've now tried degate, and indeed it seems to be aimed at capturing inter-cell connectivity, and only some abstraction of the cells themselves. For the 6502, a lot of the logic is free-form with not a cell in sight. I'm not sure if it's worth capturing the wiring if for some extra effort one could capture the geometry (and then

extract the wiring.) The effort might be double, but that would be OK.

In passing, although visual6502 is on the face of it a visual simulator, note that there's a more conventional textual mode on a sub-page, and also that the simulation is switch-level and handles bidirectional pass gates, shared busses, and charge storage. I suppose IRSIM does too, but I'm not sure about verilog.

I think visual6502 will release more data and tools in due course.

As for the difficulty of getting accurate extracted data, Greg's approach was to simulate what he had as he progressed: if the simulation works that's a positive sign (although not a proof.)

Cheers Ed

Contribution: User interface for the ASTRO2010 module

*Message #1 Posted by **Geir Isene** on 23 Oct 2010, 2:29 p.m.*

Celebrating the really great ASTRO 2010 module by Jean-Marc Baillard, I decided to group the most useful programs for an amateur astronomer and create the easiest possible user interface; A program I simply called "ASTRO"

While the ASTRO2010 module is a stroke of genius, it is lacking a simple user interface. Without my ASTRO user interface program you would have to rely on the user manual or have an elephant's memory. This ASTRO program delivers to the user a menu driven easy-to-use interface bringing the top amateur astronomy programs into one complete program.

ASTRO also fixes one bug or discrepancy in the ASTRO2010 module; the "MST" program does not accept a Date in the YYYY.MMDD format as indicated by the manual, but rather in the usual DD.MMYYYY or MM.DDYYYY format (depending on the setting you use). With the ASTRO interface, your usual date format is used throughout.

More at the ASTRO page on my website.

While this is a birthday present from me to me, I hope it also helps someone else out there.

Re: Contribution: User interface for the ASTRO2010 module

*Message #2 Posted by **JMBaillard** on 23 Oct 2010, 5:36 p.m.,*
in response to message #1 by Geir Isene

Hello Geir

Thank you for you interest for the ASTRO2010 module.
Your "ASTRO" program makes it much more user-friendly.
However, I've just tested again "MST"
and it works well with a date yyyy.mmdd in Y-register
and the time hh.mnss in X-register.

Best wishes
Jean-Marc.

Re: Contribution: User interface for the ASTRO2010 module

*Message #3 Posted by **Geir Isene** on 23 Oct 2010, 6:04 p.m.,*
in response to message #2 by JMBaillard

Ah, sorry for that one - I had another MST residing in HEPAX memory. Will correct.

Edited: 23 Oct 2010, 6:13 p.m.

Re: Contribution: User interface for the ASTRO2010 module

*Message #4 Posted by **Geir Isene** on 23 Oct 2010, 6:25 p.m.,*
in response to message #3 by Geir Isene

Corrected - both on the ASTRO page and in the program listing.

Any testing and reporting back on the results would be highly appreciated.

Re: Contribution: User interface for the ASTRO2010 module

*Message #5 Posted by **Angel Martin** on 24 Oct 2010, 4:32 a.m.,*
in response to message #4 by Geir Isene

Perhaps the most convenient thing to do would be adding Geir's add-on to a new 4k page, to be used with the "original" .

Makes sense?

Re: Contribution: User interface for the ASTRO2010 module

*Message #6 Posted by **Geir Isene** on 24 Oct 2010, 6:59 a.m.,*
in response to message #5 by Angel Martin

Sure. But there is a lot to filling up to do to get a full 4K. Any suggestions?

I know Arne Helme has a nice Field-of-View program that is valuable when switching between various oculars. Arne, could you post your program here for inclusion?

Re: Contribution: User interface for the ASTRO2010 module

*Message #7 Posted by **Angel Martin** on 25 Oct 2010, 2:36 a.m.,*
in response to message #6 by Geir Isene

Not a bad idea. If you send me RAW files it'll be a breeze to compile the page in ROM format.

PS. Your U/I program is already done, will send you the ROM via email

Edited: 25 Oct 2010, 8:14 a.m.

Re: Contribution: User interface for the ASTRO2010 module

*Message #8 Posted by **Karl Schneider** on 23 Oct 2010, 5:46 p.m.,*
in response to message #1 by Geir Isene

Geir --

This looks to be a worthy effort on your part. Of course, the ASTRO2010 ROM is needed. I'm unsure of the ROM's by you, Jean-Marc Baillard, Angel Martin, Diego Diaz, and others at "TOS" are available as plug-ins.

I hope that you noticed my post from yesterday, including a complete and slightly-improved source listing of your enhanced version of Tom Sherman's navigation program.

-- KS

Re: Contribution: User interface for the ASTRO2010 module

*Message #9 Posted by **Geir Isene** on 23 Oct 2010, 6:13 p.m.,*
in response to message #8 by Karl Schneider

The modules are for use with NoVs or the MLDL or the original HEPAX or EPROMS...

Re: Contribution: User interface for the ASTRO2010 module

*Message #10 Posted by **Ángel Martin** on 25 Oct 2010, 10:21 a.m.,*
in response to message #8 by Karl Schneider

I have just compiled a ROM file with this ASTRO U/I add-on, also including the SKY progtram as per the other thread. Anyone interested in testing it drop me a line w/ the email address.

Re: Contribution: User interface for the ASTRO2010 module

*Message #11 Posted by **Karl Schneider** on 25 Oct 2010, 11:57 p.m.,*
in response to message #10 by Ángel Martin

Ángel --

(I finally learned how to enter your name properly, using the HP Forum edit screen: +0193 while holding down "Alt", just as in TextPad.)

A microcoded version of "SKY" sounds useful -- provided that the Nav Pac routines, which do most of the work, are handled similarly. It would be nice not to have to wait several minutes for answers.

Unfortunately, I lack the setup to test your product.

-- KS

Re: Contribution: User interface for the ASTRO2010 module

*Message #12 Posted by **Ángel Martin** on 26 Oct 2010, 1:37 a.m.,*
in response to message #11 by Karl Schneider

Greetings Karl,

I appreciate your writing of the tilde character Á, sorry it was that involved (nothing like having a sample around for a copy-paste action :-)

It's not an MCODE version but the same SKY program what is in the new module, in user code glory (or FOCAL). The required setup is reduced to a windows-based PC capable of running V41, nothing more.

The execution speed goes much faster than a real MCODE program using the turbo mode of V41, pressing the TAB key - nothings beats that speed.

Cheers, ÁM

HP 35s. FIX affects precision

*Message #1 Posted by **Pablo P (Spain)** on 22 Oct 2010, 4:03 p.m.*

Hi all, by accident I have found that FIX mode affects the precision in some calculations.

FIX mode is used to control the number of decimal digits used in the display of numbers. Only to display them. But consider the next:

Insert this function in the equation list: EXP(-SQ(U)/2)/SQRT(2*pi)

Set FIX to 3 and integrate the function between -5 and 2.88 You will get 0.997993696055

Set FIX to 5 and integrate the function between -5 and 2.88. You will get 0.99801133646

Similar results, but not identical. Should this be added to the infamous bug list? I don`t know if I am missing something...

Re: HP 35s. FIX affects precision

*Message #2 Posted by **Bart (UK)** on 22 Oct 2010, 4:42 p.m.,*
in response to message #1 by Pablo P (Spain)

Hi Pablo,

This is not actually a bug, but a feature. For more difficult or long integrations, you can specify a lower number of significant digits which will increase the speed of the integration at the cost of accuracy. See page 8-6 of the manual for more information.

Cheers,
Bart

Thanks Bart, I missed this feature. The manual explains it perfectly.

Re: HP 35s. FIX affects precision

*Message #4 Posted by **Dieter** on 22 Oct 2010, 5:11 p.m.,*
in response to message #1 by Pablo P (Spain)

No, this is not a bug but a (quite useful) feature of the HP35s an other calculators with the HP Integrate. It was already implemented in the good old 34C, the first model with this function.

The idea behind this: you set the desired accuracy (by setting the display format) and the calculator provides a result based on that setting. This way you can choose between better precision and faster execution. In Fix 3 the 35s assumes the function it's integrating is given with three valid decimals. In Sci 5 it assumes six *significant* digits. So, settings like "Fix 9" or even "ALL" will provide a very accurate result, but the 35s may be busy for a few minutes, while Fix 4 returns a result with adequate accuracy within reasonable time.

Of course, all this is documented in the handbook (page 8-2). You will also find a (quite conservative) estimate for the uncertainty of the result in the Y-register.

Dieter

Dieter --

Very good explanation. I'd add that FIX/SCI/ENG as integration-accuracy settings on the HP-35s, HP-33s, and HP-48/49/50 series don't have the same meaning as those on the HP-34C through the HP-32SII. An archived thread:

HP-33S estimated error of integration

A thorough explanation:

HP SOLVE/INTEG on all RPN-based models

Short Quadratic Solver (HP-42S)

*Message #1 Posted by **Gerson W. Barbosa** on 21 Oct 2010, 10:20 a.m.*

Here is a 42S-specific quadratic solver. It is 28-byte long, uses only the stack and preserves the original stack register X. I have also a 27-byte version, but it requires one extra step.

```
QUADRATIC SOLVER - HP-42S

                                X                          Y                 Z          T
L
00 { 28-Byte Prgm }
01 LBL "Q"                      c                          b                 a          T
L
02 RCL/ ST Z                   c/a                         b                 a          T
c
03 X<> ST Z                     a                          b                c/a         T
c
04 ST0+ ST X                   2a                          b                c/a         T
c
05 /                          b/(2a)                      c/a                T          T
2a
06 +/-                       -b/(2a)                      c/a                T          T
2a
07 STO ST Z                  -b/(2a)                      c/a             -b/(2a)       T
2a
08 x^2                     b^2/(4a^2)                     c/a             -b/(2a)       T
-b/(2a)
09 X<>Y                        c/a                    b^2/(4a^2)          -b/(2a)       T
-b/(2a)
10 -                        b^2/(4a^2)-c/a               -b/(2a)             T          T
c/a
11 SQRT                 sqrt(b^2/(4a^2)-c/a)            -b/(2a)             T          T
b^2/(4a^2)-c/a
12 STO ST L             sqrt(b^2/(4a^2)-c/a)            -b/(2a)             T          T
sqrt(b^2/(4a^2)-c/a)
13 X<>Y                      -b/(2a)                sqrt(b^2/(4a^2)-c/a)    T          T
sqrt(b^2/(4a^2)-c/a)
14 STO+ ST Y                 -b/(2a)             -b/(2a)+sqrt(b^2/(4a^2)-c/a)  T          T
sqrt(b^2/(4a^2)-c/a)
15 RCL- ST L       -b/(2a)-sqrt(b^2/(4a^2)-c/a) -b/(2a)+sqrt(b^2/(4a^2)-c/a)  T          T
-b/(2a)
16 END
```

Examples:

1) Given $x^2 - 5x + 6 = 0$, compute $123456*x_1$ and $123456*x_2$

```
                    123456 ENTER 1 ENTER 5 +/- ENTER 6 XEQ Q ->  Y: 3          ; x2 = 3
                                                                 X: 2          ; x1 = 2
                                                          Rv * ->  X: 370,368   ; 123456*x2
                                                          Rv * ->  X: 246,912   ; 123456*x1
```

2) $3x^2 - 12x + 87 = 0$

```
                                3 ENTER 12 +/- ENTER 87 XEQ Q ->  Y: 2 i5        ; x2 = 2 + 5i
                                                                  X: 2 -i5       ; x1 = 2 - 5i

2) x^2 - (4 + 6i)x + (-5 + 10i) = 0

   1 ENTER 4 ENTER 6 COMPLEX +/- 5 +/- ENTER 10 COMPLEX XEQ Q ->  Y: 3 i4        ; x2 = 3 + 4i
                                                                  X: 1 i2        ; x1 = 1 + 2i
```

Re: Short Quadratic Solver (HP-42S)

*Message #2 Posted by **Gerson W. Barbosa** on 21 Oct 2010, 2:49 p.m.,*
in response to message #1 by Gerson W. Barbosa

Slightly different, but still 28-byte and 16-step long:

```
QUADRATIC SOLVER - HP-42S

00 { 28-Byte Prgm }
01 LBL "Q"
02 RCL/ ST Z
03 X<> ST Z
04 /
05 2
06 /
07 STO ST Z
08 x^2
09 X<>Y
10 -
11 SQRT
12 RCL- ST Y
13 X<>Y
14 RCL+ ST L
15 +/-
16 END
```

Re: Short Quadratic Solver (HP-42S)

*Message #3 Posted by **Gerson W. Barbosa** on 21 Oct 2010, 3:24 p.m.,*
in response to message #2 by Gerson W. Barbosa

One step shorter:

```
00 { 28-Byte Prgm }
01 LBL "Q"
02 RCL/ ST Z
03 X<> ST Z
04 /
05 -2
06 /
07 STO ST Z
08 x^2
09 X<>Y
10 -
11 SQRT
12 RCL+ ST Y
13 X<>Y
14 RCL- ST L
15 END
```

Re: Short Quadratic Solver (HP-42S)

*Message #4 Posted by **Werner** on 22 Oct 2010, 8:53 a.m.,*
in response to message #3 by Gerson W. Barbosa

From my archives ;-) One byte shorter, more accurate for cases where b^2 is large compared to 4*a*c,

and compatible with the 41C:

```
 x := -b/(2*a);
 y := c/a ;
 d := SQRT(x^2 - y);

 r1 := x + sign(x)*d;
 r2 := y/r1;
```

```
00 { 27-Byte Prgm }     X       Y       Z       T
01*LBL "Q"              c       b       a
02 X<> ST Z             a       b       c
03 STO/ ST Z            a       b       c/a
04 STO+ ST X            2*a     b       c/a
05 +/-                  -2*a    b       c/a
06 /                    x       y
07 ENTER                x       x       y
08 X^2                  x^2     x       y
09 RCL ST Z             y       x^2     x       y
10 -                    x^2-y   x       y       y
11 SQRT                 d       x       y       y
12 RCL ST Y             x       d       x       y
13 SIGN                 +/-1    d       x       y
14 *                    +/-d    x       y
15 +                    r1      y       y       y
16 STO ST Z
17 /
18 END
```

Re: Short Quadratic Solver (HP-42S)

*Message #5 Posted by **Gerson W. Barbosa** on 22 Oct 2010, 11:50 a.m.,*
in response to message #4 by Werner

Hello Werner,

> Quote:
>
> One byte shorter, more accurate for cases where b^2 is large compared to 4*a*c, and compatible with the 41C

These are valuable features. Michael Harwood's program in the Software Library (Fast Quadratic Formula for the HP-41C) is 16-step long (when the prompt is removed) and would require 25 bytes on the 42S, but it may not be as accurate as yours. I have been trying to preserve the stack register X. Without this constraint, I suspect a 42S-specific program might break the 15-step length barrier.

Regards,

Gerson.

Re: Short Quadratic Solver (HP-42S)

*Message #6 Posted by **Csaba Tizedes (Hungary)** on 24 Oct 2010, 6:08 p.m.,*
in response to message #5 by Gerson W. Barbosa

Maybe the HP's SOLVE algorithm is accurate?

Here is my solution (from my memories...) - not shortest, uses variables, but not uses the classical quadratic formula. The 32SII (low-end) version:

```
--- The firs root:
```

```
I01 LBL I
I02 CF 0
I03 FN=Q
I04 SOLVE X
I05 GTO X
I06 SF 0
I07 RTN

7 steps / CK=368D / 10.5 byte

--- The second:

X01 LBL X
X02 STOP
X03 RCL B
X04 RCL div A
X05 +
X06 +/-
X07 RTN

7 steps / CK=0339 / 10.5 byte

--- The quadratic equation:

Q01 LBL Q
Q02 RCL X
Q03 RCL mul A
Q04 RCL add B
Q05 RCL mul X
Q06 RCL add C
Q07 RTN

7 steps / CK=8AAE / 10.5 byte

'add', 'sub', 'mul' and 'div' means 'add', 'substact', 'multiple' and 'divide'
in this order.
```

Solve for real roots of an 'a*x^2+b*x+c=0' equation: a STO A, b STO B, c STO C then XEQ I. If FLAG 0 set this equation has no real roots (location of extremum on display). If FLAG 0 not set, the first real root appear on LCD, then press R/S, then the second root will be on the display.

Enjoy!

Re: Short Quadratic Solver (HP-42S)

*Message #7 Posted by **Gerson W. Barbosa** on 25 Oct 2010, 3:23 p.m.,*
in response to message #6 by Csaba Tizedes (Hungary)

Hello Csaba,

> Quote:
>
> Maybe the HP's SOLVE algorithm is accurate?

It's quite accurate, as we know.

The idea is getting the shortest possible HP-42S quadratic solver. By short I mean less number of steps (I know on the 42S less bytes would be more appropriate, but I guess less

steps means faster execution - to be sure, I would have to check out a table of T-states per instruction, but I don't have any).

Anyway, you approach using the SOLVER is interesting, thanks for posting it. When I tested it on the 33s I added the lines below to make it even easier to use, but then I noticed you had done that already here :-)

```
...
I0002 INPUT A
I0002 INPUT B
I0003 INPUT C
...
```

I expected the equivalent 42S version to handle complex cases, but it didn't. Perhaps I just didn't implement it right...

Best regards,

Gerson.

Re: Short Quadratic Solver (HP-42S)

*Message #8 Posted by **Gerson W. Barbosa** on 23 Oct 2010, 12:49 p.m.,*
in response to message #4 by Werner

Werner, that's the 27-byte version I had mentioned. It is one step shorter and will solve all my three examples as stated. Neither HP-41 compatible nor accurate enough for the case you handle though. Doing it using only HP-41 instructions would be quite challenging.

```
QUADRATIC SOLVER - HP-42S

00 { 27-Byte Prgm }
01 LBL "Q"
02 RCL/ ST Z
03 Rv
04 X<>Y
05 STO+ ST X
06 /
07 +/-
08 ENTER
09 X^2
10 RCL- ST T
11 SQRT
12 X<>Y
13 ENTER
14 X<> ST Z
15 STO+ ST Z
16 -
17 END
```

Regards,

Gerson.

Re: Short Quadratic Solver (HP-42S)

*Message #9 Posted by **Werner** on 26 Oct 2010, 4:05 a.m.,*
in response to message #4 by Werner

Strange how you can always improve upon an old program when you look at it again:

```
00 { 25-Byte Prgm }     X       Y       Z       T
01*LBL"Q"               c       b       a
```

```
02 X<> Z                a       b       c
03 ST/ Z                a       b       y
04 ENTER                a       a       b       y
05 +                    2*a     b       c/a     c/a
06 CHS
07 /                    x       y       y       y
08 ENTER
09 X^2                  x^2     x       y       y
10 RUP
11 -
12 SQRT                 d       x       y       y
13 RCL Y
14 SIGN
15 *
16 +
17 ST/ Y
18 END
```

To be sure, it exhibits the same pro's and con's as the previous:

```
+ 41C compatible
+ avoids cancellation
- no complex support (doesn't work for complex roots, nor for complex arguments)
- doesn't work for a=0 or b,c=0
```

*Message #12 Posted by **Ángel Martin** on 22 Oct 2010, 6:16 a.m.,*
in response to message #11 by Paul Dale

Does it also work with complex numbers? I guess so, since the 42 can hold them in the normal stack?

Reminds me those contests for the shortest implementation of a given program, and I'd have to say the following takes the prize:

01 QROOT

(see SandMath module - of course that's cheating, as the MCODE listing is longer than that :)

Hello Ángel,

> Quote:
>
> Does it also work with complex numbers? I guess so, since the 42 can hold them in the normal stack?

Yes, as in examples #2 and #3 above.

I've been using this formula:

$$x_{1/2} = -\frac{b}{2a} \pm \sqrt{\frac{b^2}{4a^2} - \frac{c}{a}}$$

(Presented by Allen in this thread (Message #2).

The HP-15C handle complex numbers also, as you know:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=114345

Regards,

Gerson.

Re: Short Quadratic Solver (HP-42S)

*Message #16 Posted by **Ángel Martin** on 22 Oct 2010, 8:23 a.m.,*
in response to message #15 by Gerson W. Barbosa

Since the 41 lacks the "native" ability to handle complex numbers on its stack, I added the following short routine to the 41Z to solve the quadratic roots in such case:

```
1   LBL "ZQRT"
2   ZENTER^
3   ZR^
```

```
4   Z/
5   LASTZ
6   ZR^
7   Z<>W
8   Z/
9   ZHALF
10  ZNEG
11  ZENTER^
12  ZENTER^
13  Z^2
14  ZR^
15  Z-
16  ZSQRT
17  ZENTER^
18  ZNEG
19  ZR^
20  Z+
21  ZRDN
22  Z+
23  ZRUP
24  END
```

just 24 steps (or Z-steps, rather). It takes the three coefs in complex stack leves 1,2,3, leaving both solutions on complex stack levels 1 and 2.

Cheers, ÁM

Accuracy-wise, Werner's code is better though. For instance, for a = 1E-13, b = -2 and c = 1 it returns the correct 12-digit results, that is 2E13 and 0.5. Mine returns 2E13 and 0. Unless, of course, you want to preserve at least the stack register X.

Gerson.

Re: Short Quadratic Solver (HP-42S)

*Message #20 Posted by **Paul Dale** on 22 Oct 2010, 8:00 p.m.,*
in response to message #19 by Gerson W. Barbosa

Werner's code fails for b=c=0 BTW.

Easy enough to detect and return the correct answer for but that means more steps.

- Pauli

Re: Short Quadratic Solver (HP-42S)

*Message #21 Posted by **Gerson W. Barbosa** on 22 Oct 2010, 9:06 p.m.,*
in response to message #20 by Paul Dale

It also fails for example #3, I noticed that soon after I wrote. I had checked only the second example. But this can be fixed. By the way, I never needed to solve a quadratic equation with complex coefficients before. I simply expanded (x-(1+2i))*(x-(3+4i)) and there it was.

Regards,

Gerson.

Re: Short Quadratic Solver (HP-42S)

*Message #23 Posted by **Walter B** on 23 Oct 2010, 5:33 a.m.,*
in response to message #18 by Paul Dale

Input of a, b, c as z, y, x and output of possibly complex x1 and x2 in x, y, z, and t ? Do we need more reasons for an 8 level stack? ;)

Re: Short Quadratic Solver (HP-42S)

*Message #24 Posted by **Thomas Chrapkiewicz** on 22 Oct 2010, 9:59 a.m.,*
in response to message #1 by Gerson W. Barbosa

Very nice!

You are to be highly commended for the high level of documentation of the process!! This is all too often negelected, both in calculator and computer algorithms.

TomC

Re: Short Quadratic Solver (HP-42S)

*Message #25 Posted by **Gerson W. Barbosa** on 22 Oct 2010, 6:01 p.m.,*
in response to message #24 by Thomas Chrapkiewicz

Thanks! However the documentation is still incomplete. The formulas used in the first version are, as we have seen,

```
'x1=-b/(2*a)+sqrt((b/(2*a))^2-c/a)'

'x2=-b/(2*a)-sqrt((b/(2*a))^2-c/a)'
```

which is the quadratic formula for

```
'x^2-b/a*x+c/a=0'
```

In the second and third versions, an attempt has been made to carry this one step further, by making the inputs coefficients a, b and c equal to 1, b/a and c/a, respectively. This requires additional steps, but the

formulas become somewhat simpler:

```
'x1=b/2+sqrt((b/2)^2-c'

'x2=b/2-sqrt((b/2)^2-c'
```

Regards,

Gerson.

Re: Short Quadratic Solver (HP-42S)

*Message #26 Posted by **Chuck** on 22 Oct 2010, 8:29 p.m.,*
in response to message #25 by Gerson W. Barbosa

Gerson, I had done this many many years ago for, I think, my HP-11c, but I believe mine was slightly different. (Actually, looking again, it's the same.)

Start with the usual ax^2 + bx + c = 0. Then define:

m = -b/(2a) and n = c/a

The solutions become

x1 = m + sqrt(m^2 - n)

x2 = m - sqrt(m^2 - n)

I can't remember if I used the stack or storage registers. Usually the upfront calculations of m and n are trivial, and allows for a very compact program, and no fractions in the final calculations.

For something like: 3x^2+5x-8=0 I'd key -5/6 run LBL A, -8/3, press R/S and get the solutions. I forget the actual program length, but it was quite small. I'll have to dig out the 11C and try it again.

CHUCK

Re: Short Quadratic Solver (HP-42S)

*Message #27 Posted by **Gerson W. Barbosa** on 22 Oct 2010, 10:00 p.m.,*
in response to message #26 by Chuck

Chuck,

This appears quite suitable for hand calculations also, as the formula is easier to use and remember. My 14-year old daughter has been studying quadratic equations and application problems in school, but so far she's been taught the traditional method only.

Regards,

Gerson.

Re: Short Quadratic Solver (HP-42S)

*Message #28 Posted by **Angel Martin** on 23 Oct 2010, 2:29 a.m.,*
in response to message #27 by Gerson W. Barbosa

The "classic" formula is still taught in high schools (also on my kids' case), perhaps on the grounds of being easier to memorize (?) - yet the other one is much more suitable for programming. That's the one I used in the MCODE listing, it saves time and storage space.

Cheers

Re: Short Quadratic Solver (HP-42S)

*Message #29 Posted by **Thomas Klemm** on 23 Oct 2010, 2:11 a.m.,*
in response to message #1 by Gerson W. Barbosa

This program returns only one of the possible solutions of the equation $x^2 + px + q = 0$. The quadratic solver hidden in ACOSH is used:

```
00 { 17-Byte Prgm }
01>LBL "Q"
02 SQRT
03 ÷
04 LASTX
05 X<>Y
06 -2
07 ÷
08 ACOSH
09 E^X
10 ×
11 END
```

With a minor change (-2 -> 2 CHS) it may be used with the HP-15C as well. However it won't work with the HP-35s due to its lack of proper support of complex functions.

Usage:

```
1) x^2 - 5x + 6 = 0
   5 +/- ENTER 6 XEQ Q -> X: 3

2) x^2 - 4x + 29 = 0
   4 +/- ENTER 29 XEQ Q -> X: 2 i5

3) x^2 - (4 + 6i)x + (-5 + 10i) = 0
   4 ENTER 6 COMPLEX +/- 5 +/- ENTER 10 COMPLEX XEQ Q -> X: 3 i4
```

Since neither addition nor subtraction is used there's no loss of significance due to cancellation.

Best regards
Thomas

PS: Finding the other solution is left as an exercise.

Re: Short Quadratic Solver (HP-42S)

*Message #30 Posted by **Angel Martin** on 23 Oct 2010, 2:32 a.m.,*
in response to message #29 by Thomas Klemm

Very nice idea - now we're shortening the program listing although at the expense of using other functions - a valid rule in the "brevity contest" :-)

What about using P-R instead of ACOSH for the 41?

Re: Short Quadratic Solver (HP-42S)

*Message #31 Posted by **Thomas Klemm** on 23 Oct 2010, 3:00 a.m.,*
in response to message #30 by Angel Martin

This could only be used when q <= 0. But even then you'd have to calculate the square root of -q previously to use R-P. So I'm afraid we won't gain anything. Only now I see you mentioned P-R, not R-P. What did you have in mind?

Edited: 23 Oct 2010, 11:02 a.m.

Re: Short Quadratic Solver (HP-42S)

*Message #32 Posted by **Thomas Klemm** on 23 Oct 2010, 4:00 a.m.,*
in response to message #30 by Angel Martin

Okay the following works only for certain values of p and q:

$0 < 4q < p^2$

```
00 { 20-Byte Prgm }
01>LBL "Q"
02 SQRT
03 ÷
04 LASTX
05 X<>Y
06 -2
07 X<>Y
08 ÷
09 ASIN
10 2
11 ÷
12 TAN
13 ÷
14 END
```

$0 < -4q < p^2$

```
00 { 21-Byte Prgm }
01>LBL "Q"
02 +/-
03 SQRT
04 ÷
05 LASTX
06 X<>Y
07 -2
08 X<>Y
09 ÷
10 ATAN
11 2
12 ÷
13 TAN
14 ÷
15 END
```

So all we have to do is combine these two programs into one.

BTW: I used here the following formulas:

$$\sin(2x) = \frac{2}{\cot(x) + \tan(x)}$$

$$\tan(2x) = \frac{2}{\cot(x) - \tan(x)}$$

Cheers
Thomas

Re: Short Quadratic Solver (HP-42S)

*Message #33 Posted by **Gerson W. Barbosa** on 23 Oct 2010, 6:21 a.m.,*
in response to message #29 by Thomas Klemm

Hi Thomas,

> Quote:
>
> PS: Finding the other solution is left as an exercise.

Still unoptimized, as I'm in a hurry:

```
00 { 25-Byte Prgm }
01>LBL "Q"
02 X<>Y
03 STO Z
04 X<>Y
05 SQRT
06 ÷
07 LASTX
08 X<>Y
09 -2
10 ÷
11 ACOSH
12 E^X
13 ×
14 ENTER
15 R^
16 +
17 +/-
18 END
```

Regards,

Gerson.

Re: Short Quadratic Solver (HP-42S)

*Message #34 Posted by **Thomas Klemm** on 23 Oct 2010, 7:41 a.m.,*
in response to message #33 by Gerson W. Barbosa

A little bit shorter:

```
00 { 21-Byte Prgm }
01>LBL "Q"
02 STO ST Z
03 SQRT
04 ÷
05 LASTX
06 X<>Y
07 -2
08 ÷
09 ACOSH
10 E^X
11 ×
12 ÷
13 LASTX
14 END
```

However I had something else in my mind.

Edited: 23 Oct 2010, 7:51 a.m.

Re: Short Quadratic Solver (HP-42S)

*Message #35 Posted by **Gerson W. Barbosa** on 23 Oct 2010, 9:21 a.m.,*
in response to message #34 by Thomas Klemm

You're right! $x_2 = q/x_1$, for $x_1 <> 0$, is shorter than $x_2 = -(x_1+p)$. This can be made shorter, I think.

Thanks for presenting your interesting insight.

Regards,

Gerson.

```
00 { 31-Byte Prgm }
01>LBL "Q"
02 RCL/ ST Z
03 X<> ST Z
04 /
05 X<>Y
06 STO ST Z
07 SQRT
08 ÷
09 -2
10 ÷
11 ACOSH
12 E^X
13 RCL ST Y
14 SQRT
15 ×
16 X<>Y
17 RCL/ ST Y
18 END
```

It does work for my three examples:

1) Given $x^2 - 5x + 6 = 0$, compute $123456*x_1$ and $123456*x_2$

```
                     123456 ENTER 1 ENTER 5 +/- ENTER 6 XEQ Q ->  Y:
2.99999999999      ; x2 = 3
                                                                  X:
2.00000000001      ; x1 = 2
                                                        Rv * ->   X:
370,367.999999     ; 123456*x2
                                                        Rv * ->   X:
246,912.000001     ; 123456*x1
```

2) $3x^2 - 12x + 87 = 0$

```
                                  3 ENTER 12 +/- ENTER 87 XEQ Q ->  Y: 2.00E0
i5.00E0     ; x2 = 2 + 5i
                                                                  X:
2.00000000001 -i5  ; x1 = 2 - 5i
```

3) $x^2 - (4 + 6i)x + (-5 + 10i) = 0$

```
   1 ENTER 4 ENTER 6 COMPLEX +/- 5 +/- ENTER 10 COMPLEX XEQ Q ->  Y: 3
i3.99999999999   ; x2 = 3 + 4i
                                                                  X: 1.00E0
i2.00E0     ; x1 = 1 + 2i
```

It will work for a=1E-13, b=-2 and c=1 also:

```
1.99999999996E13
0.50000000001
```

Best way implement an RPN stack?

*Message #1 Posted by **Håkan Thörngren** on 20 Oct 2010, 10:31 a.m.*

How would you implement an RPN stack today?

I can see a couple of scenarios:

1. The classic 4 level stack with "last X" register, duplicate T on drop, and stack lift disable flag.
2. As (1), but with more elements on the stack, in that case, how many?
3. Using a traditional stack pointer and using Forth stack semantics with DUP, ROT, SWAP and ROLL.

I never felt the 4 level stack was a big problem when I used the HP-41 back in the eigthies. After getting used to an HP-48 I feel a little bit more constrained by it these days.

What do you prefer?

Re: Best way implement an RPN stack?

*Message #2 Posted by **bill platt** on 20 Oct 2010, 10:53 a.m.,*
in response to message #1 by Håkan Thörngren

The problem with being a collector and having piles of calculators around is that we can pick what is best for what we are doing.

I prefer the traditional 4-level for anything that takes advantage of the repeating t-register.

I prefer the unlimited stack for anything where it is nice to have a running record of results or inputs.

One RPN computer application I used to have (but lost on a format and reload) had a selecteble 4 or 8 level repeating t-register stack. (XYZPQRST)

Re: Best way implement an RPN stack?

*Message #3 Posted by **Mark Storkamp** on 20 Oct 2010, 11:26 a.m.,*
in response to message #1 by Håkan Thörngren

I prefer a stack like on the 41, where you are entering directly into the X register. Typing a number and pressing ENTER^ pushes it up into Y, not like the 20b (and i believe the 35s) where typing a number and pressing ENTER^ puts it into X, and a second ENTER^ is needed to put it into Y.

However, I think two new registers could be added: D and F. D would hold the depth of the stack, and F would fill the entire stack with a singe value. Typing 35 STO F would fill all levels of the stack with 35, making it easier to use repeating T values with any depth stack.

Re: Best way implement an RPN stack?

*Message #4 Posted by **bill platt** on 20 Oct 2010, 11:29 a.m.,*
in response to message #3 by Mark Storkamp

The 35s is normal RPN, not RPL. It functions exactly the same as the 41, 65, 67, 10c series etc

Re: Best way implement an RPN stack?

*Message #5 Posted by **Walter B** on 20 Oct 2010, 1:00 p.m.,*
in response to message #3 by Mark Storkamp

The 34s (AKA 30b repurposing project) features a selectable stack size of either 4 or 8 levels with top level repetition. And it includes a FILL command copying x into all stack levels at once. There is a bit reserved for stack depth indication.

Edit: Forgot mentioning that complex FILL will copy the complex number x+iy into the respective levels, of course. Gracias à Angel for reminding me d;-)

Re: Best way implement an RPN stack?

*Message #7 Posted by **Martin Pinckney** on 20 Oct 2010, 1:07 p.m.,*
in response to message #1 by Håkan Thörngren

Never really got into RPN. Having used a 38g for a while, and now that I am teaching myself 48sx, I prefer the unlimited stack.

Re: Best way implement an RPN stack?

*Message #8 Posted by **Angel Martin** on 20 Oct 2010, 1:56 p.m.,*
in response to message #1 by Håkan Thörngren

Call me a tradicionalist but I side with the 4-level stack choice. To me it's just enough, and I've got so used to the T-replication that I won't consider doing without it.

Although you can say that T-replication is just a palliative to the awckward RPN-style programming, and that a (more advanced) RPL machine won't need it. That's probably a true statement.

When I wrote the 41Z I had to mimic all the real stack functionallity for the complex stack (buffer-based). That's when I really got to admire its design, I'm afraid it's for good in my case.

Cheers, 'AM

in response to message #10 by M. Joury

> Quote:
>
> I am in the process of implementing a RPN environment for the HP 39gs...

The questions naturally present themselves:

1. How can you do this? 2. Why would you do this? (i.e., why not get a 48gii, 49g+, or 50g)

Re: Best way implement an RPN stack?

*Message #12 Posted by **M. Joury** on 20 Oct 2010, 6:55 p.m.,*
in response to message #11 by Martin Pinckney

1. It is relatively easy. There are examples out there that do this only a little too slow to be useful. I already have a HPBasic implementation that is sufficiently responsive to be usable but I have stopped further development on it and am rewriting it all in Sys RPL.

2. Because I can and I enjoy the challenge. I own all three of the calculators you mentioned in addition to nearly every scientific/graphing calc HP has ever produced. For daily use I generally employ a HP48S/X or G/X as I prefer their keyboards to that of the 49g+, etc.

The HPBasic implementation so far handles basic 4 banger arithmetic, full 4 position stack manipulation including T replication (X<>Y, RollUp, RollDown, LastX, currently stack store / recall are not available), basic trig and log functions (no hyperbolics yet--would be easy to add), 30 storage registers, mode settings for std, fix, sci, and eng. Angle mode settings (DEG, RAD, GRAD) would be easy to add as would any other 1 or 2 variable functions (such as hyperbolics). The current HPBasic implementation is around 9K (source) and 19K after the first run.

For the sRPL implementation I plan on providing all the above plus hyperbolics, combinations, permutations, etc. (basically any scientific functions that the 39gs is capable of), 100 storage registers with full store arithmetic (this is already working) and in the future I might also implement rcl arithmetic.

-mj

Re: Best way implement an RPN stack?

*Message #13 Posted by **Martin Pinckney** on 20 Oct 2010, 7:36 p.m.,*
in response to message #12 by M. Joury

I am frequently amazed at the level of nuts & bolts expertise shown on this forum. I just struggle to learn how to *use* my 48sx. And here people are writing ML programs, debugging calculator internals with oscilloscopes, writing new firmware for repurposing, etc., etc.

Makes my head spin.

I feel exactly the same way. I'd love to know more about these wonderful little beasts, but scarcely know where to start ...

This forum is simultaneously inspiring and intimidating. :)

Re: Best way implement an RPN stack?

*Message #15 Posted by **Don Shepherd** on 27 Oct 2010, 12:00 p.m.,*
in response to message #14 by Glenn Becker

Glenn, don't be intimidated by things you see here. I bought a 16c around 1981 or 83, but I never learned how to program it. I was a mainframe programmer in those days and I couldn't see the point of programming a "calculator." But about 10 years ago I got a simple 12c, with a minimal set of programming statements, and I learned what it means to program in RPN, and I've been fascinated with it ever since. And you would be surprized what you can do with a program size limitation of 99 bytes!

So if you're interested in simple RPN programming, get a 12c and have at it. Today's ARM-based 12c runs about a million times faster than the 12c of 10 years ago (I'm exaggerating somewhat).

Don

Wow! Great news to hear. The 39gs is the only HP model I use with any regularity any more. My eye sight is no longer what it once was, and the keyboard of the 39gs is extremely legible compared to other HP calculators. While I have adapted to the loss of RPN I would adopt it again if it became available for the 39. If you need a beta tester or have any other needs let me know. I could become quite avid about your project. Good luck.

Re: Best way implement an RPN stack?

*Message #17 Posted by **M. Joury** on 20 Oct 2010, 7:07 p.m.,*
in response to message #16 by Donald Williams

Thanks! I agree about the legibility of the HP39gs keyboard. It is definitely better than that of the 48gII and in my opinion easier to read for my tired old eyes than the 50g.

I do have a working version of the HPBasic implementation as noted in an earlier post. Unfortunately I have not bothered to document anything (either code or use) yet and the code is a little messy as I wrote it (rewrote it) for speed rather than legibility or easy maintenance. However, other than the rather convoluted keyboard handling for the numeric input, stack lift enable/disable etc. it is pretty straight forward. Adding additional functionality would be easy so if someone was interested in adding hyperbolics or giving me some feedback on the keyboard layout I have chosen I would be happy to share what I currently have. I can also share some of the ideas that I have for the sRPL version I am working on now. Just send me an email offline. Be forewarned, however, that there is a good chance that bugs still exist in the stack handling code.

One thing that I would really like to implement and have not yet thought of a clean way to accomplish it would be a fully reassignable keyboard. It should be doable by putting the keycodes in some form of table and providing a way to edit or update the table (could use a list for this) but I fear that performance would suffer too badly to maintain usability so that idea is on hold for the moment.

*Message #18 Posted by **Matt Kernal** on 20 Oct 2010, 8:49 p.m.,*
in response to message #17 by M. Joury

Hi M.,

How similar/different is your 39GS RPN implementation to Manfred Pfeiffer's "RPN Add-On" (HPBasic) program (found at hpcalc.org).

I have it loaded on my 40GS and like it a lot, except for the speed, or lack thereof. :-) Sounds like you've addressed that issue in your implementation.

Thanks,

Matt

p.s. I feel the 40GS' color-scheme is just about right.

Re: Best way implement an RPN stack?

*Message #19 Posted by **M. Joury** on 21 Oct 2010, 12:39 a.m.,*
in response to message #18 by Matt Kernal

Hi Matt,

Very similar. In fact I got his program and decided I wanted a little more speed which led me to my own project. His is a very good implementation and if it were not for the speed issue I

would probably have not started my own effort. I have to admit, that for the HPBasic version, I borrowed the display GROB from his code and edited it rather than dealing with writing it from scratch. The GROB for the sRPL version required a near-complete rewrite.

At this point his is somewhat more complete as I have stopped development to tackle the Sys RPL version. Currently the only reason I use my version instead of his is the speed. My code is able to keep up with keyboard input as fast as I can enter it--single digit repeated at top speed--whereas his will lag in that and many normal usage scenarios.

The only benefit (other than speed) that my HPBasic version offers is the ability to backspace (delete and correct) numbers and 30 registers vs. 10. In general I am of the opinion that more registers are pretty useless in a non-programmable implementation since there is a limit as to how many one can keep track of. To aid somewhat in this I handle the registers in the same manner as the Voyager series. Single numeric digit for the first "bank", period followed by numeric digit for the second "bank", and comma followed by numeric digit for the third "bank". This will be replaced in the Sys RPL version by 100 numbered registers used exactly as in the HP41. In fact, in general, the user interface of the sRPL version will be patterned after the HP41 with, for example, keyboard access to the FIX, SCI, and ENG functions (these along with the storage sub-system are already coded) rather than menus.

I have lots of ideas for the sRPL version that may or may not pan out, but a working RPN implementation with support for all the math functions of the HP39gs seems to be relatively straight forward (once one deals with the numeric entry and stack lift issues).

Cheers,

-mj

> I feel the 40GS' color-scheme is just about right

I am glad you like it. I have a 40GS also, but I don't use it because of the color-scheme. I know I belong to a minority group of the forum members, but I have to point out a fact that many of you will face eventually.

I can use almost any calculator from any manufacturer in "ideal" lighting conditions. The trouble is that calculators are generally used as a portable device often in less than ideal locations. legibility can really suffer at times when the lighting gets poor.

My eye lenses has no focus problems at all, I have just reached an age where the rods and cones are dying in the back of the retina. I just need more photons on the retina. If everyone is lucky enough to survive to middle age they will probably arrive at a similar point.

I blame calculator industry for a really poor design effort in respect to legibility. I believe that early in the game, manufacturers were infatuated with the device display and chose a dark body design that accented the display iformation. I think this bad choice has persisted in spite of the disadvantages.

Does anyone remember using slide rules. Did anyone ever see a slide rule with a dark body and rainbow colored indexes. I didn't. Slide rules were almost universally light colored bodies with black index marks. I think they did that because that is the best method to accommodate the human eye. I still have no difficulty reading my 45 year old slide rule.

Calculators seem to generally ignore this principle and people like me suffer the consequences. Calculators could be improved by using a very light body for the keyboard background that will reflect the greatest number of photons to the surrounding legends and to the users eye's.

Most of you are probably not affected - yet, but I suspect some day you will be singing this same chorus.

Just my 2 cents worth on that particular subject

in response to message #20 by Donald Williams

Donald, great points. I love the 12c, but those blue letters on a black key frequently require a magnifying glass and/or flashlight for me to discern them. And on my 65, the blue letters on the white numeric keys are OK, but the conditionals on the black keys always require a magnifying glass.

Re: Best way implement an RPN stack?

*Message #22 Posted by **Donald Williams** on 21 Oct 2010, 10:50 a.m.,*
in response to message #21 by Don Shepherd

I discovered this phenomena quite by accident. When I first purchased my HP 41 CV back back in the 80's it came with a light cream colored keyboard overlay, which I installed immediately, and never removed. Many years later I acquired another everyday 41cx and my original 41cv "prized possession" went into the display case.

The new 41cx replacement did not come with that same overlay, and I soon noticed my difficulty with deciphering the keyboard legends. The overlay (I only have one) is now my most essential 41 series peripheral.

I think if you could somehow create a white overlay for your 12C machine you would probably not have to use the magnifier and light solution. Just the small increase of reflected light around the keyboard area is usually all you need to create better legibility.

I see the same silly situation on too many web sites: the web site creator thinks it "arty" "cool" or whatever to use a dark background with (often too-small!) white/light-colored type against the background. I find these very difficult to read.

in response to message #1 by Håkan Thörngren

Hakan;
There was a five level stack on this calculator. The mind reels at the mere thought of keeping track of Bill's & Walter's eight level stacks.
To answer your scenario #2; i'd say that 4 levels have always been enough for me. It was even possible to write an inverse routine for two pairs of coordinates loaded into the stack (without using any storage registers). However; the amount of rolls and X<>Ys meant that it didn't really save any space. Didn't run any faster either. So the classic 4, or the Heathkit 5 would get my vote. - db

> The mind reels at the mere thought of keeping track of Bill's & Walter's eight level stacks.

1. Basic purpose of such an eight level stack is providing 4 levels for complex numbers. Hope this helps your mind ;)
2. As long as you work in real domain, you may limit the stack to traditional 4 levels. HTH
3. FYI, MathUPro on my PDA features a 16 level stack. Do they want me keeping track of every item there? No - they want me to know I can push my numbers on it and calculate without worries for stack overflow. I fully agree you will hardly ever need more than 4 levels - let's assume in 99% of all calculations - but do you want to watch your calc since it does something strange with 1% probability? I don't. But that's my personal view and another reason for implementing a selectable stack depth. HTH
4. As long as it keeps reeling, can you use it for generating energy? ;) ;)

Re: Best way implement an RPN stack?

*Message #27 Posted by **db (martinez, ca.)** on 22 Oct 2010, 3:39 p.m.,*
in response to message #26 by Walter B

Walter;

I have no problem keeping track of 4 levels,. 5 would be ok too, but for 8 i would need to have an 8 level display - easy on a computer or 48's screen but...

I see that using a larger stack would pay dividends for the 1% of users doing deep, original, complex work, so being switchable takes care of all of us.

The mind reels slower each year. Have recently changed from generator to alternator to compensate. I hope the 30b project is going well. - d

I don't think there's a best. Four with repeating T is good, adding LastX and LastY to that simplifies lots of things. (Complex, of course, four-space could be nice for physics but I've never seen it proposed.)

What I always wanted in a calculator was the ability to DUP PUSH SWAP and DROP the entire stack (which would include the entire flag register and LastX and LastY, to at least twenty or more stacks) with another command to MERGE the current and past stacks, for a function return, moving the values about.

More exotic was the machine with sixteen registers, r0..rf, where each register was actually the top of a stack. The stacks were maintained in memory using a big LRU cache, and you could do things like push(r0) <-- pop(r1) + r2 (the result was pushed onto r0, r1 popped after the add, r2 was only read.) (Yes, I designed compilers, not hardware.)

Re: Best way implement an RPN stack?

*Message #30 Posted by **Karl Schneider** on 21 Oct 2010, 1:16 a.m.,*
in response to message #1 by Håkan Thörngren

Quote:

How would you implement an RPN stack today?

I can see a couple of scenarios:

1. The classic 4 level stack with "last X" register, duplicate T on drop, and stack lift disable flag.

2. As (1), but with more elements on the stack, in that case, how many?
3. Using a traditional stack pointer and using Forth stack semantics with DUP, ROT, SWAP and ROLL.

I've favored a settable-depth stack of between 4 and 9 elements (set by, e.g., "STKD 7") in the classic RPN operating paradigm. Minimum and default depth would be 4, because less than that is not useful, and 4 ensures compatibility with traditional RPN programs.

4 stack elements is usually enough, though, if the user is thinking ahead and mentally keeping track of pending operations. Too many more than that is difficult to keep straight.

*Message #32 Posted by **Crawl** on 21 Oct 2010, 10:52 a.m.,*
in response to message #1 by Håkan Thörngren

I'm sure that a 4-level stack is sufficient for "number crunching" work, but after I was exposed to symbolic calculators, there's no going back for me.

Ironically, even though RPN was developed so numerical expressions that used parentheses and order of operations could be evaluated on a simple computer without need for an algebraic parser or memory to store lots of pending operations, I think it works *even better* for symbolic calculations.

And for that sort of application, an unlimited stack becomes necessary.

Re: Best way implement an RPN stack?

in response to message #32 by Crawl

Agreed. And thanks again Crawl for showing me how to "build" an algebraic object, one step at a time, using RPN arithmetic. Its a beautiful thing.

I later came across this method in *An Easy Course in Using the HP 48sx*, and perhaps its also in the HP manuals, but I first learned about this from one of your posts.

Re: Best way implement an RPN stack?

*Message #34 Posted by **Håkan Thörngren** on 21 Oct 2010, 1:59 p.m.,*
in response to message #1 by Håkan Thörngren

Thanks a lot for all the comments!

It seems like there is a lot in favor for the 4 level stack.

My first feeling was towards an larger Forth like stack, but I now feel a 4 level stack is way to go when doing keyboard calculations.

A longer stack has its virtues, but a larger display is almost a must in that case.

Re: Best way implement an RPN stack?

*Message #39 Posted by **Thomas Klemm** on 22 Oct 2010, 5:30 p.m.,*
in response to message #1 by Håkan Thörngren

While I like both [1] and [3] and can't decide which I prefer I detest the mix of both as we have in the HP 20b:

- No stack lift after INPUT

- +/- changes ANS (aka LASTX)

Probably I wouldn't like the HP 30b neither.

Thinking about option [2] I wonder whether I'd like a 2nd parallel stack (similar to how you can "abuse" the return stack in Forth). You could push (>R) intermediate results that are somehow in the way and pop (R>) them later again when needed. I guess I'd prefer that to having an 8-level stack.

Best regards
Thomas

Thanks - I found it with the emulator in parallel. Nice feature with bouncing keys d;-)

Though it's not my kind of calculator OS, it sports some nice ideas. Still exploring ...

Edit: Some comments in random order:

1. I can't set the radix mark to the regular comma. What to do?
2. The result of 2^3^2 and the like depends on the display mode set :((What did they think there?! IMHO, the "Math Print" mode is damn wrong in its result :((
3. They allow implicit multiplication like 4(2+3)3=60 :) But who told them it's smart to key in 4(5)(6) for 4*5*6 ? Seven keystrokes instead of five! You find many examples of this kind in the manual :(Is this the latest result of math education in the USA?
4. It sports two nice math functions sum(and prod(.
5. One submenu of math is called math again :-/
6. Angles given in radians are tagged by an "r" in the exponent. I'd have liked a less ambiguous tag.
7. Input of DMS data is tedious. And P<>R is real fun for RPN people ;)
8. The so called "Coulomb constant" equals 1/(4*pi*eps0) . FWIW

Well, I don't understand the current fascination with curves. (OK, just to preempt the wisecracks, you *know* what kind of curves I mean).

The modern TI's are all curved on the sides & bottom. HP copied the look on the 48gii, 49, 39 series, etc.

But you know the old saw about beauty in the eye...

To my eye, beautiful is a Pioneer or 48sx. I'm a square guy.

At least it doesn't have lavender keys like the 39gs I saw in the store yesterday.

radiused corners...

As we discussed earlier, these are after all, "personal opinions" :-)

I must admit that I did wonder if you were going mention the lower rounded corners of the Pioneers when I posted, so thank you for coming through with flying colors! Indeed, the radii on those corners must be tighter (rounder) than the radius of the slightly curved arc of the 41's bowed sides.

Now, as I lovingly view my beautiful, 100% square (in every dimension save for the LCD bezel's corners) HP-12C...

Factorials and the 35s

*Message #1 Posted by **Dieter** on 19 Oct 2010, 4:12 p.m.*

One thing I like about the 35s (and my first HP, the 34C) is the combined factorial and Gamma-function. One might think that a few multiplications to get 50! or 100! will be executed in almost no time while on the other hand evaluating a Gamma-function may take some time. So I was quite astonished when I noticed this:

- 100! and 101! take about one second. However, 100.5! (i.e. Gamma(101.5)) is returned about twice as fast in just half a second.
- 150! takes roughly 1.5 seconds - but 200! appears almost instantly.

So the 35s obviously uses at least three different algorithms. If n! is evaluated directly by 1*2*3*...*n I wonder why it takes almost two seconds in 35s machine language to do 150 multiplications. A similar RPN-program finishes in six seconds. I would have expected the internal function to run at least 10x as fast as my hand-written code.

However, the more interesting part is the obvious switch between two different algorithms that seems to take place near x=158 since 158! is slow while 159! is much faster.

The 35s seems to use a different method for factorials and the Gamma-function - which sounds quite obvious. The Gamma-algorithms seems to be somewhat faster. Which leads to the question why the 35s doesn't use this faster method for factorials as well.

Maybe someone out there can shed some light on all this. Or at least we can speculate a bit about what's going on here. :-)

Dieter

I'm going to guess that there are actually two algorithms, one that multiplies integers and one that computes gamma. It uses the first algo for non-negative integers less than 159 and the second for all other numbers.

The slow processing speed may be due to the fact that it's doing BCD arithmetic, but I'm just speculating there. I don't know the details of the processor, but it does seem rather slow.

Continuing my speculation, when using the gamma function, they might convert the BCD number to binary and then compute gamma using binary arithmetic, which is usually much faster. When done, the would convert the result back. This might explain why gamma is pretty fast.

Dave

Re: Factorials and the 35s

*Message #3 Posted by **Marcus von Cube, Germany** on 21 Oct 2010, 5:30 p.m.,*
in response to message #2 by David Hayden

It's always a good idea to consult Viktor T. Toth's page about Gamma. The approximations are shorter then the repetitive multiplications but they are "only" approximations. It makes sense to use Gamma(x+1) instead of x! if the result has more nonzero leading digits than the maximum mantissa length of the calculator because above that the result can no longer be a non integer and thus approximation errors become less of a problem. I don't know why the 35s starts using Gamma instead of multiplication as late as 159!. 17! would be a better margin.

HP71 zebra connector

*Message #1 Posted by **Alberto Fenini** on 19 Oct 2010, 4:02 p.m.*

Dear All,

I had posted few days ago a couple of pics of an HP71b I'm working on.
It was basically missing the zebra connector.
Following your suggestions and the pics found on Etienne's web site
I have done my best to replace it.

These are the left and the right side of the HP71b with the new connections.
To my surprise, the number of connectors available on the left side is **16**while on the right side we have **17**points.
To me it looks that the first and second soldering points on the right board
are actually the same connection, neverless the question is :
how the heck should I connect letf with right ???
Needless to say, I have attached the power supply but the units is still dead (well, it could be due to a million reasons anyway ....)
As always, any suggestion is VERY welcome !!!
Take care and thanks in advance, Alberto

Re: HP71 zebra connector

*Message #2 Posted by **Bart (UK)** on 19 Oct 2010, 5:00 p.m.,*
in response to message #1 by Alberto Fenini

Hi,

Sorry, couldn't help noticing. There are 17 connection points on both sides. You have missed the 4th one from the top in the top picture, and second one from the bottom in the bottom picture (which indeed seem to be connected).

Good luck, hope you get it working.

Re: HP71 zebra connector

*Message #3 Posted by **Alberto Fenini** on 19 Oct 2010, 5:09 p.m.,*
in response to message #2 by Bart (UK)

Hi, and thanks for noticing it,
I knew about the 2nd from the bottom, I did it on purpose
since I thought it was connected with the adjacent

let me try agin and I'll post the results
thanks again ! Alberto

HP 15-C has odd flashing display

*Message #1 Posted by **dougo51** on 19 Oct 2010, 10:57 a.m.*

Inserted new batteries. Calc only comes on after holding the "on" key for about 5 secs. Display comes up as follows and is flashing. Note that 3 characters look like incomplete zeroes but obviously I can only post them here as complete characters. Note my use of "space" between characters:

"083spacespace0d,088space," Again, all zeroes are partial as if lcd is failing but it was working fine.

While flashing, if I hit other keys, calculator goes off.

Any help to get this old dog (bought in 1985) working again is much appreciated.

Re: HP 15-C has odd flashing display

*Message #2 Posted by **Eric Smith** on 19 Oct 2010, 1:10 p.m.,*
in response to message #1 by dougo51

Try holding the y^x key down then pressing the ON key. This forces a hardware reset, but doesn't change the content of memory. The content of the display should change, but not necessarily to anything sensible given what you've described.

Then turn it off. With it off, try holding down the minus key while pressing the ON key. That should clear the memory, resulting in a display of "Pr Error".

If that doesn't work, remove the batteries, leave them out for a few days, and try again.

I've never seen a 15C behaving as badly as you describe, so it's possible that it has a hardware fault.

Re: HP 15-C has odd flashing display

*Message #3 Posted by **uhmgawa** on 19 Oct 2010, 11:47 p.m.,*
in response to message #2 by Eric Smith

> Quote:
>
> I've never seen a 15C behaving as badly as you describe, so it's possible that it has a hardware fault.

I've seen some similar weird behavior trying to come out of power down recently with a pre 28xx s/n 12c in which I was probing around. It required removal of the batteries and short of the electrolytic cap to sort itself out. Not that the OP was doing the same, but it seems either the NUT or R2D2 can get into a locked up state, perhaps more conventionally via non fatal ESD.

Re: HP 15-C has odd flashing display

*Message #4 Posted by **dougo51** on 20 Oct 2010, 3:28 p.m.,*
in response to message #2 by Eric Smith

Thank you for your help and suggestions. Unfortunately, it had no impact. Flashing characters remain exactly the same regardless of what I do including the y^x suggestion. Also, batteries were out for a few days until I got around to replacing them so I doubt that suggestion will work but will try. I had followed ops manual instruction to short battery terminals briefly, but that had no effect either. Someone asked aboout s/n. It is: 2840A87206 with USA printed to left of s/n. How about using a previous cure all before power up/down became so popular--several blows with a hammer?

Re: HP 15-C has odd flashing display

> Someone asked aboout s/n. It is: 2840A87206 with USA printed to left of s/n.

That's the package reduced vintage with the former memory-use only r2d2 integrated in the cpu. I don't have one here but I'd speculate the external ISA bus still carries all activity. You could scope it to see if the cpu is executing bus cycles coming out of sleep. It should fall back into sleep (after a few seconds IIRC) where bus activity is quiesced, notably the bus clocks are idled.

The R2D2 has AFAICT a separate RC oscillator which clocks the display drive scan. So if you are seeing random junk on the display it could be the cpu hasn't set the display registers to a known state coming out of sleep/power-up and it is just rendering random power up data.

I'd still take a look at the LC oscillator and verify that is stable. Other issues I've noticed is a stuck key on the same row as the on key can cause startup problems (f/g/sto/rcl). Although in that case the firmware bails on power-up and shouldn't cause the failure you've described.

Don't discount physical damage in terms of an open lqfp package to pcb trace. I've seen some marginal reflow solder jobs on voyagers that I'd never expect to be associated with the name HP. So it could be an intermittent (or a contamination short).

> Quote:
>
> How about using a previous cure all before power up/down became so popular--several blows with a hammer?

Resist the temptation. If all attempts at resurrection fail someone will still buy it from you on EEEbay for a price which will leave you with an incredible story to tell.

If you're still having issues and are up for some investigation I'd scope the LC oscillator tank. If the clock isn't restarting reliably when the NUT tries to come out of power down it could lead to such anomalies.

What might the serial number of this unit be?

*Message #4 Posted by **PeterP** on 19 Oct 2010, 10:30 a.m.,*
in response to message #3 by Raymond Del Tondo

Thanks guys, at least Im not the only one that has not seen a box with the same graphical layout as the others...

Cheers

Peter

Re: 12c packaging

*Message #5 Posted by **Alberto Fenini** on 19 Oct 2010, 5:07 p.m.,*
in response to message #4 by PeterP

ciao Peter,
indeed it has existed, and to my knowledge at least in two different versions.

The one with bigger purple boxes is an earlier version identical to the other voyager boxes in appearance and size.
The second one is a later version, still same look, but different size, some small details are different as well.
The oldest, belong to a 12C S/N 2421A29479, and it makes sense,
since I also have the invoice, dated 9-6-85
The later one has a 12C SN/ 2702A02326, but in this case if I remember well,
box and calc are coming from two different sellers, and it was just a completetion of the set.
take care Alberto

Re: 12c packaging

*Message #6 Posted by **PeterP** on 20 Oct 2010, 12:42 a.m.,*
in response to message #5 by Alberto Fenini

Grazie mille Alberto! Allora, seems there is always one more thing to hunt down... And I was so happy when I got a HP10c with box etc... Now I have to get a 12c box of the same design...

Thanks again for your kind pictures and explanations

Cheers

Peter

Re: 12c packaging

*Message #7 Posted by **Alberto Fenini** on 20 Oct 2010, 7:59 a.m.,*
in response to message #6 by PeterP

You are very welcome !
The packaging of these items is as fascinating as the items themselves.
For instance, the Spice serie had a different package for the American and the European markets.
The USA version is square sized, while the European version has the same look but is rectangular.
If anyone is interested, it will be a pleasure to post more pics.
Take care Alberto

Navigation Module

*Message #1 Posted by **Jeff Kearns** on 17 Oct 2010, 6:06 p.m.*

HP 41C with Nav - Time and X Modules

Why was I the only bidder on this auction? Not only does the unit come with the Nav, x-functions, and time modules but it has the QUAD memory module too, with all manuals! I have always wanted a navigation module and thought this was a good buy considering that one sold recently for $125.

Considering the high prices for recent sales of the 15C (I got one in excellent shape at a garage sale last year for $5), am I missing something?

Jeff

Re: Navigation Module

*Message #2 Posted by **Raymond Del Tondo** on 17 Oct 2010, 6:40 p.m.,*
in response to message #1 by Jeff Kearns

Congrats, very nice item for a low price:-)

Why you were the only bidder: Maybe because the seller did not look at his watch when starting the auction. At 13:30 many people may just have gotten tired from eating;-)

HTH

Re: Navigation Module

*Message #3 Posted by **Jeff Kearns** on 17 Oct 2010, 6:45 p.m.,*
in response to message #2 by Raymond Del Tondo

Thanks! I thought so. One constraint may have been the US only shipping policy of this seller that would certainly limit the bidder pool significantly. I live in Canada but used a friend's address in the US for shipping.

I look forward to having a spare 41C too!

Regards,

Jeff Kearns

Re: Navigation Module (w/enhanced HP-41C)

*Message #4 Posted by **Karl Schneider** on 17 Oct 2010, 10:06 p.m.,*
in response to message #1 by Jeff Kearns

Jeff --

Congratulations on purchasing a great bargain for a collector! Looks to be a non-tallkeys HP-41C, like mine from 1980. A few years ago, I probably would have competed in the auction, but I have all the main pieces of the full ensemble shown.

Your new HP-41C with Quad Memory, Time Module, and Navigation Pac is able to run Tom Sherman's 1985 celestial locator application program for navigation, which I have loaded on my HP-41's. Given the local lat/lon and the UTC time and date, it will identify the position in the sky of the sun, moon, Venus, Mars, Jupiter, Saturn, and a broad selection of stars useful for navigation -- in short, all the celestial objects supported by the Nav Pac.

Each calculation takes several minutes, but it's never wrong...

The X-Functions module provides some backup storage and other useful functions, but you might want X-memory modules as well.

Re: Navigation Module (w/enhanced HP-41C)

*Message #5 Posted by **Jeff Kearns** on 17 Oct 2010, 10:37 p.m.,*
in response to message #4 by Karl Schneider

Karl,

Thanks for your post! I actually work for a company that makes ECDIS (Electronic Chart Display and Information Systems) products for warships and submarines, although my background in the navy was primarily in marine engineering. I have always had an interest in navigation and astronomy and have played around with the Nav Pac on my Palm-based P41CX. It should be an interesting exercise to run Tom Sherman's 1985 celestial locator application program for navigation - when I find it!!!

So far, I found reference to it in an old post here, in which you participated: Tom Sherman's Celestial Locator Post

If I cannot find it on my own, I will be in touch.

Regards,

Jeff

Tom Sherman's celestial locator for HP-41

*Message #6 Posted by **Karl Schneider** on 18 Oct 2010, 2:42 a.m.,*
in response to message #5 by Jeff Kearns

Jeff --

Geir Isene modified the program to provide a quicker, more compact user interface. I then inserted a single valuable instruction.

I possess the full hardcopy documentation from Tom with source listing, but I use Geir's version.

Geir's version includes the following instruction sequence in two places:

```
FS? 31
```

```
XEQ "DMD"
```

Flag 31 is a system flag that indicates the date format, but I don't seem to have the program "DMD". I suspect that it is Geir's own program for processing the date or its format.

Geir's program fits on three HP-41 magnetic cards (Tom's original fits on two).

-- KS

Re: Tom Sherman's celestial locator for HP-41

*Message #7 Posted by **Geir Isene** on 18 Oct 2010, 7:45 a.m.,*
in response to message #6 by Karl Schneider

Right, the DMD...

What it does is just to convert the date formats - between DD.MMYYYY and MM.DDYYYY (either way), like this:

```
LBL "DMD"
ENTER
INT
X<>Y
FRC
100
*
ENTER
INT
X<>Y
100
/
+
X<>Y
100
/
+
END
```

Edited: 18 Oct 2010, 7:46 a.m.

Re: Tom Sherman's celestial locator for HP-41

*Message #8 Posted by **Thomas Klemm** on 18 Oct 2010, 10:19 a.m.,*
in response to message #7 by Geir Isene

```
 01 LBL "DMD"
 02 INT
 03 LASTX
 04 FRC
 05 100
 06 *
 07 INT
 08 X<>Y
 09 LASTX
 10 FRC
 11 +
 12 100
 13 /
 14 +
 15 END
```

Saves a few bytes.

Best regards
Thomas

Re: Tom Sherman's celestial locator for HP-41

*Message #9 Posted by **Geir Isene** on 18 Oct 2010, 12:33 p.m.,*
in response to message #8 by Thomas Klemm

Excellent.

*Message #10 Posted by **Geir Isene** on 19 Oct 2010, 6:25 a.m.,*
in response to message #9 by Geir Isene

LASTX is perhaps the least used instruction in my programs. I should get used to it.

Geir Isene's improved version of celestial locator program

*Message #11 Posted by **Karl Schneider** on 21 Oct 2010, 3:41 a.m.,*
in response to message #5 by Jeff Kearns

Jeff --

You had found one of the threads regarding Tom Sherman's HP-41 celestial locator program, but there was another thread in 2006 in which Tom contributed and Geir posted his improved version of the program:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=91858#91858

I will copy and paste Geir's version below, together with the "DMD" program he omitted in 2006 (as recently refined by Thomas Klemm), and also including one worthwhile instruction added by me (003 DEG, to ensure that the degree angular mode is set for calculations).

The "DMD" program allows the user to maintain European-style date mode (dd.mmyyyy), which is initiated by running the Time Module command "DMY" (which sets Flag 31). The Nav Pac subroutine "FA" requires that the input date be formatted US-style (mm.ddyyyy), as documented on page 41 of the Nav Pac manual.

As a side note, years outside the range 1900-1999 are displayed on the HP-41 using four digits. The full dates look nicer in European format on the HP-41's 12-character display.

For guidance in usage, please see Geir's description of the features of his program, in the thread of 2006. I'll also note that entry of an arbitrary date and time is of the form <date> ENTER <time>, occupying two stack levels. In the source code listing, "|-" is the unprintable 'append' character shift-K in ALPHA mode.

The complete, improved program:

```
001 *LBL "SKY"          051  "LO"                101  GTO 02           151  DATE
002  LBL e              052  XROM "DSPLO"        102  LBL a            152  FS? 31
003  DEG                053  "|-?"               103  "VENUS"          153  XEQ
"DMD"
004  CF 01              054  PROMPT              104  AVIEW            154  STO 30
005  CF 02              055  XROM "*HR"          105  6                155  TIME
006  SF 00              056  STO 08              106  LBL 06           156  LBL 12
007  CLK24              057  LBL E               107  XEQ 01           157  RCL 54
008  "DT+TM=<NOW>"      058  "S,V O,M *,J ,SA"   108  .017             158  HMS-
009  CF 22              059  PROMPT              109  +                159  FS? 03

Karl,

Thanks. I expect to receive the Nav module in the next couple of days - it arrived at my surrogate US destination intact on Thursday. I look forward to trying out these programs and am pleased that, with the DMD program, I can maintain European/Canadian date formats.

Best regards,

Jeff Kearns

I have compiled a ROM file with this program and the ASTRO module U/I add-on, also written by Geir. A MOD file will be posted at TOS in a few days, but it'd good to have some testers before

that. Do I hear any volunteers?

Cheers, ÁM

*Message #14 Posted by **Jeff Kearns** on 3 Nov 2010, 4:53 p.m.,*
in response to message #11 by Karl Schneider

Karl,

Thanks again for the complete improved program! I have been playing around with the Navigation, Time, and X-Functions modules in what is now a spare 41C. I also picked up a used copy of volumes 1 and 2 of the Admiralty Manual of Navigation - an excellent resource for the theory and practical application of celestial navigation and dead reckoning techniques.

As an aside, I remember reading once in a novel (of all places) that the term "dead reckoning" is a morphed or bastardized version of the original abbreviation of deduced reckoning; "ded. reckoning".

I will try out the program soon and report back!

Jeff

in response to message #14 by Jeff Kearns

Jeff --

Enjoy using the program, which always gives correct results as far as my unmeasured 'eyeball estimation' tells me.

I expect that you've already entered it manually -- I do not have the means of electronic transmission by HP-41, other than the 'electro-physical' method of using magnetic cards.

(So *that's* where "dead reckoning" came from!)

voyager R2D2 documents?

*Message #1 Posted by **uhmgawa** on 17 Oct 2010, 3:32 a.m.*

While experimenting with older voyagers I've been wondering if after 30 years something approximating an R2D2 data sheet may have surfaced somewhere. The evidence thus far tells me no, however it seems no harm in asking.

I'm aware of the brief data sheets for the individual hp-41c rom, ram, and display devices. And while useful to an extent, they obviously fall short of being an R2D2 reference.

Off-forum replies as well much appreciated.

Thanks!

Re: voyager R2D2 documents?

*Message #2 Posted by **Eric Smith** on 18 Oct 2010, 3:51 p.m.,*
in response to message #1 by uhmgawa

I had to reverse-engineer how the R2D2 works because I couldn't get any datasheet.

It's not a very complicated device.

Understood. But I figured it was worth asking on the remote chance some HP retiree happened on one in the attic. I'm still finding MOS Technology (who?) data sheets in mine.

> Quote:
>
> It's not a very complicated device.

From that required by the firmware programming model I'd agree. But this can easily gloss over subtle

quirks, register access behavior, etc.. Driving the ISA bus directly via other than a NUT processor was my intention. A few weeks ago I cobbled together an ISA bus sniffer to capture rom images among other interesting data. Fairly trivial given the extremely slow bus speed even with modest bus data interpretation during acquisition. But it would still be useful to have electrical and timing specs for the device, even minimally so similar to the 41c ancient scrolls.

hp-15c: From my museum to yours..

*Message #1 Posted by **uhmgawa** on 17 Oct 2010, 12:05 a.m.*

I'm trying to puzzle what someone actually does with a near pristine calculator which has obviously been sitting in a desk drawer for the past 30 years. Well, other than put in their own desk drawer for the next 30.

Not that I can't appreciate the rarity here of a specimen which appears never to have been touched by a human. But I'd be more than a little nervous about actually *using it* as a calculator lest I unwittingly inflict the first $100 nick.

I witnessed this auction gone wild about a week ago:

http://cgi.ebay.com/Hewlett-Packard-HP-15C-Scientific-Calculator-/200526940627?pt=Calculators&hash=item2eb05649d3

And earlier today a near repeat of the above lunacy:

http://cgi.ebay.com/EARLY-HEWLETT-PACKARD-HP-15C-HP-15C-CALCULATOR-/300479956436?pt=Calculators&hash=item45f60045d4

I thought I was certifiably nuts to have paid ~$100 for what amounts to a $20~$30 manufacturing BoM cost comprising my 15cs. I guess when I'm ready to retire I can sell them along with my museum quality 16c, complete with original cardboard box and nerd-gotta-have-it antistatic pink foam sleeve.

That's why I like emulators .... sure no physical contact with the actual buttons ... but think of all the advantages:

```
1. No worry about battery.
2. All keys work ok ALL the time!
3. No LCD problems.
5. Emulator always looks pristine!
4. Some emulators allow you to save and load programs. Yeah for that!!! Try that with a
real15C.
5. Travels with you without adding weight or suffering transportation damage.
6. Usage does not decrease value!
7. Other advantages that have escaped me!
```

:-)

looks like the insanity of days gone by have returned - 12 or so years back i remember selling a near-pristine hp-15c along with both manuals (also near perfect) and it's box on ebay for close to us$500.

should i be taking better care of the hp-16c i have sitting here? again, close to perfect apart from an only-just perceivable shallow ding in the aluminium above the display (only visible in the right light). is one of the 'cheap' ones with repainted 15c keys. cost my nz$20 on trademe, a local internet auction site.

btw, does anyone have a good solution for a missing 11c badge? got that calculator a few years back for nz$30, a little scruffy and sans that rather vital id mark - the seller didn't know it was an hp, he thought it was broke!

cheers, rob :-)

> btw, does anyone have a good solution for a missing 11c badge?

I instigated this discussion relative to a logo-less 15c:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv019.cgi?read=172067#172067

Since then I've managed to acquire another logo-less 15c so I really need to do something. That something is likely going to be laminating a thin sheet of tempered aluminum to a black ABS base and engraving out the logo relief. The smallest detail of an original logo requires about a 0.2mm cut width at a depth of about the same 0.2mm. I found some CNC bits on EEEbay with a 0.1mm tip and a 20* taper which will do the job.

That will likely outlast the rest of the calculator. The only thing throttling the effort is not having yet produced the numeric artwork. I just wish I could fix this "free time" deficit problem.

> Quote:
>
> got that calculator a few years back for nz$30, a little scruffy and sans that rather vital id mark - the seller didn't know it was an hp, he thought it was broke!

That's right, its obviously is broken. Can't even get the 4-banger numeric operations to work the same as every other calculator on the planet. I hope more sellers like this emerge.

To be fair, some are downright entertaining. This unraveled late last week. Looked ok at first but then scanning through the pictures I noticed all the case screws were missing. And then the case back comes off:

http://cgi.ebay.com/HP15C-USED-1-OWNER-REAL-VINTAGE-/260675292289?pt=Calculators&hash=item3cb1754c81

I'd have to admit the diatribe explanation on the auction page was interesting. I asked the whereabouts of the ESD bonding springs and didn't get an answer that at least I understood. Somewhere around getting a shipping quote in excess of US$70 I sort of lost interest..

Playing the devil's advocate here..

> Quote:
>
> 1. No worry about battery.

There are few computation devices which have a battery life surpassing an original voyager.

> Quote:
>
> 2. All keys work ok ALL the time!

The original 9mm voyager tact dome switches have an estimated 5M cycle life. For an emulator a touch screen may or may not exceed this for service life cycle expectation of a single physical location but it is also shared usage. More importantly the dedicated physical tact switch matrix is a fundamental UI attraction of a voyager.

> Quote:
>
> 3. No LCD problems.

You wont find a better proposition on the LCD contrast vs. power consumption scale that a reflective monochrome display (particularly the earlier voyagers which have a lower voltage multiplex ratio). It is also about as simple as possible in terms of physical construction.

> Quote:
>
> 5. Emulator always looks pristine!

Pristine simulation?

> Quote:
>
> 4. Some emulators allow you to save and load programs. Yeah for that!!! Try that with a real15C.

You got me there.

> Quote:
>
> 5. Travels with you without adding weight or suffering transportation damage. 6. Usage does not decrease value!

The emulation host can suffer physical damage and once the host is toast, the value of the emulator goes to zero unless you're planning on purchase of another host.

Don't get me wrong, I think code emulators are fine tools. But they aren't the equivalent user experience of a physical voyager which is exactly what fosters the price insanity witnessed above.

Ironically I doubt we'll ever see HP introduce encore voyagers in a maneuver analogous to the 35s. Also limited availability of the original voyagers is what props up their prices to lunacy. Unsure how much of a commercial success the 35s turned out to be but as a user I wasn't really impressed with that execution.

Re: hp-15c: From my museum to yours..

*Message #8 Posted by **Martin Pinckney** on 17 Oct 2010, 9:18 p.m.,*
in response to message #2 by Namir

To me the only value of an emulator is to debug programs before entering them in. A hand-held is a hand-held. A computer is a computer. I sit at my desk with a set of drawings rolled out and my calculator on top of the drawing or nearby. There is also a scale or two nearby, and a pencil and a red pen. Sometimes (gasp!) even a compass.

And I can't imagine buying a calculator to sit in a case, untouched.

But that's just me. To each his own.

P.S. Yes, of course I use the computer. A lot more than the calculators. But for different functions.

*Message #9 Posted by **David** on 17 Oct 2010, 10:53 a.m.,*

in response to message #1 by uhmgawa

sweet jesus. 777 is the highest I've seen. I've seen some in 600's this summer. and for a unit without a box/manuals, at that.

Last week I was trying to buy a non-functional 15C for parts. It went for > $200, and it was clearly labeled in the title as non-functional.

It does seem to wax and wane, though. Also this summer I missed the opportunity to get a 15C for < $100. It was beat to hell but did work.

'measuring worth' seems to think that $135 in 1981 dollars is equivalent to $319 in 2010 dollars. So that's only about 2.6% annual appreciation over the past 29 years. Frankly I'm just happy that folks still love them, and that they are obtainable.

*Message #10 Posted by **Michael Meyer** on 17 Oct 2010, 5:13 p.m.,*
in response to message #9 by David

I was able to buy a working 15C a few months ago for $40 USD. It was pretty beat up and had a scratched up back label. I printed a new label from plastic paper on my laser printer and added 4 new rubber feet and it's perfect as a travel machine!

Re: hp-15c: From my museum to yours..

*Message #11 Posted by **Keith Midson** on 17 Oct 2010, 8:52 p.m.,*
in response to message #1 by uhmgawa

It all comes down to how badly someone wants something at any one time. I was the second highest bidder in the first auction (I am still in shock that US$767 didn't win it for me!), and won the second auction.
For me it's about getting a mint condition early model 15C back in my collection (which consists of about 100 HP's and a few Sharps). I recently sold me 'not-so-mint' 15C to make room for a new one. The collection just wasn't complete without a 15C.
Unfortunately for me other people also wanted 15C's badly at the same time, which seemed to push the price up!!
I am actually working on an on-line 'museum' at the moment so that others can enjoy the collection as well. Trying to make it a little different to others already out there.
Cheers, Keith (Australia)

Wow! I bought one about 10 years ago, brand new in the box with all manuals for around $150. $777 is, well, wild (at least more than I would be willing to pay)! I was just looking at mine today (before seeing this post) and wondering if I would ever actually use it. I have a couple very good 15c's that I use from time to time but the new one remains untouched (or at least unused).

was: A little programming chalenge: My solution, the principle

*Message #1 Posted by **Patrice** on 16 Oct 2010, 8:25 p.m.*

Hi all,

Contrary to what I expected, I did not present my solution at HHC 2010 because the schedule was too tight. Instead, I presented it after the conference in short comity.

As said previously, one sub-problem is to know how many cells can be filled for the current shape.

Said otherwise, the whole thing is about having a tool that tells you that you can't reach the maximum as soon as possible, in order to abort useless search as soon as possible.

My solution is to build a table which answers the 2 problems. When the table is filled, it tells the maximum number of cells that can be filled for the current shape.

I build the table cell by cell, starting by the last cell and going backward, so the part of the table already built is useful to build itself for the previous cell. And the process is repeated until the table is full.

I build the table by asking a question: while adding 1 more cell, can I find a filling order which allow 1 more cell filled?

Do you need more details?

Is it efficient? Yes it is! A square of 9*9 is filled in less than a second (actually it is closer to 0.1 second)

Patrice

Re: was: A little programming chalenge: My solution, the principle

in response to message #1 by Patrice

Hi Patrice,

Yes, more details please. I have tried to fill in the details based on what you've said and it seems to me to be more complicated than you imply. I'm probably missing something. Perhaps if you give an example.

Thanks, Dave

;;24;53;24;53;24;53
;;24;54;25;53;24;54
;;24;55;25;54;24;55
;;24;56;25;55;24;56
;;25;56;25;56;25;56
```

It contains 4 pairs of columns, each pair is the data for a serie in a graphic, the type of graphic is cloud of points, choose the sub type with line between points.

The principle of the graphic is to move up every time you fill a cell, and move left every time a cell is empty.

The max curve: shows the ending point of a filling depending on how many cells are filled.

The top curve: each point shows how many filled cells can be fitted in the beginning of the shape. It is not possible to preform better than the max curve without breaking the rules. Each point says for the x fist cells, you can fill y cells without breaking the rules.

The bot curve: is the top curve rotated a half turn.

The real curve: is the only path leading to the only filling with the maximum score.

All the trick is the bot curve, for every point, it says: in the last x cells, you can fill y cells to the maximum. if ever your current path goes right to this curve, you will never be able to reach the maximum, you can abort the search and backtrack.

How does it work ? simple! when you begin the fill the shape or a part, you perform better than the bot curve, just count the difference between your path and the curve, if negative, you are on the right of the bot curve.

```
Every time you check a cell in the shape, you look at the corresponding cell in your
table.
if you can fill the cell and the table says true, the path and curve are parallel.
if you can not fill the cell and the table says false, the path and curve are parallel.
if you can fill the cell and the table says false, you gain 1 spare filled cell.
if you can not fill the cell and the table says true, you loose 1 spare filled cell.
as long as the number of spare cells in not negative, you can continue the search.
```

The main search program is a binary tree explorer deep first, the alternatives are a cell filled or empty. what is not standard is the code to keep track of the spare cells.

Whishing this helps

For more details, just tell which part is not clear.

Patrice

Was: advice needed to visit USA

*Message #1 Posted by **Patrice** on 16 Oct 2010, 10:55 a.m.*

Hi all,

My holidays travel to USA is over. :(

Thanks again guys for the advices, and a special thanks to Dave which have even came to the meteor crater and guided me for the visit.

```
My travel was 11100 km with a rent a car:
landing in Montreal
Niagara falls
Cedar Point Amusement park (roller costers) near Cleveland
Route 66 (just following)
Meteor Crater (Flagstaf Arizona)
Arches NP
Fort Collins Colorado (HHC 2010)
NIST Boulder Colorado
Grand Tetton NP
Yellowstone NP
Mont Rushmore
and back to Montreal
```

My chart :

#1 Meteor Crater: Knowing it is big and seeing the pictures is something, seeing it is something else. Amazing !

#2 Grand Canyon: from a previous travel

#3 Niagara Falls

#4 Yellowstone NP

#5 the park with sequoias (previous travel)

The weather was magnificent, just little rain, but otherwise nice sunny days.

Crossing America by car is long, is tiresome, but it is a very good way to see that America is huge, it is way better than crossing by plane.

Patrice

4-space anyone?

*Message #1 Posted by **John Mosand** on 16 Oct 2010, 9:46 a.m.*

I initiated the "0" and the "inf." threads. Wow, the "inf." finally halted at 100 responses!

There was one thing that never came up. Some mathematicians went into "special analysis" with this particular view: the entity "d" or "iota", d = 0.000...001. In other words infinitesimally small. And 0.999... + d = 1. Now, if someone insists that d = 0, well it would still be OK, since one could say that 0.999... + 0 = 1. Or?

I know one retired mathematician who doesn't disagree with 0.999... = 1, but he says that 0.999... + d = 1 is more correct, since it eliminates certain doubts that some have about it.

Anyway, since I first read "Flatland" many years ago, I've been fascinated with the concept of 4-space. I'm quite familiar with the tesseract, a similar figure for a tetraeder, etc. I have been wondering about a 4-space sphere. Can it be two spheres which coincide? Anybody know? I've been searching Wikipedia for an answer.

Or this: WE ALREADY KNOW ABOUT THE .999 --> 1 THING (and 0/0 etc)

Re: 4-space anyone?

*Message #4 Posted by **Diego Diaz** on 16 Oct 2010, 12:58 p.m.,*
in response to message #1 by John Mosand

May it be that I'm too naive (mathematically speaking) but I've always found 0.99999...=1, so whatever (different from 0) you add to 0.99999... will make it also different from 1.

1/9 = 0.1111111....

n·1/9 = 0.nnnnn.....

9·1/9 = 0.99999.... = 9/9 = 1

Without any advanced math background, and just by commom sense, concepts like infinity, zero, i (sqrt(-1)), d (infinitesimal), and the like, are certainly unvaluable tools which allow mankind to deal with several aspects of the physical universe and its behaviour. However it is my opinion that many such abstract concepts haven't got a realworld counterpart.

Mathematics are the most powerful tool set to help us in understandig that real world by showing us a "simplified" sight. The same way a tomography can halp us to "see" the internals of our bodies.

Likewise a tomography "is not" a body, a mathematical model "is not" the real world.

Universe is what "really" exists... (regardless we are or not aware of any -or most- of its existance). Math is a rational artifact (built by us humans) in an attempt to make some parts of the universe to fit into the little (I really mean *little*) amount of "intelligence" inside our brains.

As stated above, may I'm just too naive... :-)

Cheers.

Nobody knows, at least no human body, since we lack a sense for the fourth dimension like flatlanders lack a sense for the third. It certainly cannot, however, be "two spheres which coincide" since these are 3D bodies definitively.

Re: 4-space anyone?

*Message #7 Posted by **John Mosand** on 17 Oct 2010, 6:57 a.m.,*

I'm not so sure about the last argument. A tesseract is a 3D representation (projection) of a 4D cube. Yet it consists of eight 3D cubes.

Re: 4-space anyone?

*Message #8 Posted by **Walter B** on 17 Oct 2010, 9:01 a.m.,*
in response to message #7 by John Mosand

Looks like the good old game of incomplete induction. We used to play this some 40 years ago in school (honestly, it wasn't what the teacher wanted to tell us in that class then ;)

Anyway, eventually you find that a 4D analogon of a tetraeder shall have 5 vertices, 10 edges, and 5 tetraedric "face volumes" around its 4D "hypervolume". And a 4D analogon of a cube (call it like you want) shall have 16 vertices and 8 cubic "face volumes" around its 4D "hypervolume". I won't dare to guess a hypersphere - too little vertices and edges ;)

FWIW

Edited for correct wording (would have been easier in my mother tongue).

You can build up a cube of 6 squares but you can't build up a sphere of circles in an analogous way. However you can use parallel circles of lattitude to build a sphere. This works also for the cube: lots of parallel squares make up the cube. Now extrapolate this idea to the 4th dimension.

Best regards
Thomas

> I've been searching Wikipedia for an answer.

Here's a picture of a 3-sphere in 3-space: n-sphere

IMHO it's rather confusing though. What helped me is the following approach from 3D to 4D: Consider a cube and its dual the octahedron. Now project the grid of the octahedron to the enclosing 2-sphere. You get 3 meridians. Chose one axis and rotate the meridian into the 3rd dimension: you get the 2-sphere.

Now do the same with the tesseract (4-cube) and the 4-octahedron (4-cross polytope). Search WolframAlpha if you need a picture of these. If you replace the squares (or rather parallelograms) by circles (or rather ellipses) you get a nice picture. Choose one of these 2-spheres and rotate it into the 4th dimension. (The 2-sphere you choose defines 3 dimensions. Choose one of them as the axis of rotation. Now choose one of the others and move this to the 4th axis.)

A picture would certainly help but unfortunately currently I don't have any. Still hope this helps.

Best regards

Thomas

> I read about the repurposing project for the HP12c and was wondering if anyone has updates?

I'd rummaged around there about a year or so ago with interest to see that move forward. I'm curious what may have throttled the effort?

Posted by Katie Wasserman on 5 June 2010, 12:31 a.m.:

> Quote:
>
> The 20b SDK won't work on the 12C+, only the CPU is the same the peripherals are all different, but there is an SDK of sorts (sample program actually) for the 12C+

I thought the 12c+ was designed around an AT91SAM7L128 (maybe ~L64) COB, is that correct? If true there isn't much in the way of 12c+ specific peripherals aside from the keyboard matrix and the LCD controller on ports A and B. Shouldn't be too difficult to puzzle out the interconnect. The key matrix can be mapped with a scan of port C, the LCD with a scan of A & B. I have a disembodied 12c+ LCD glass which I'd be willing to map out to help the effort.

Or am I missing some subtle design caveat here for the 12c+?

Posted by Katie Wasserman on 5 June 2010, 12:38 a.m.:

> Quote:
>
> Pogo pins are pretty easy to find maybe even in 2 x 3 arrangements. But unless you can create some sort of locking plug it's going to be hard to hold the connector in place while programming.

Unfortunately the 12c+ 2x3 contact grid is on 2mm centers. At least last time I rummaged for metric pitch pogos I didn't get anywhere as most are 100mil pitch which even if disassembled didn't look conducive to relocating on a 2mm pitch. I just saw MillMax has 50mil pitch pogos which could be made to work. But I'd only do so if I really needed a stand-alone connector which could lock to the keys molded in the housing. Even then you'd have a rather awkward package if you were planing on using the keyboard.

I'd probably just build a horizontal fixture and use stainless steel spring wire bent into a long "L" shape as contacts. That will give enough contact tension to make a reliable connection and the calculator would be able to sit at a low profile.

Posted by Scott Newell on 5 June 2010, 1:40 a.m.:

> Quote:
>
> If I was to build a fixture or cable from scratch, I'd seriously consider using the PC's serial port handshake lines to control the erase and reset pins... If only you could hit the on key through the cable, the whole programming process could be automated.

Is there anything needed to program flash besides communicating with the SAM-BA via the DBGU port? From my scan of the AT91SAM7L manual it appears the rom provides all needed functionality.

I have a bunch of AT91SAM7L128 samples lying around which I was planning to use. But if a 12c+ doesn't have a functionally modified AT91SAM7 use of that package is faster (and cheaper) than creating a throw away board layout.

Thanks!

You're correct. The 12C+ has the same AT91SAM7L128 processor as the 20b/30b. There's no need to map out the keyboard nor LCD as Cyrille can supply code that does this -- it's like the SDK for the 20b with a sample 4-banger, integer calculator in c/c++.

Nothing except for serial port level translation.

> Quote:
>

I'm not sure who else is experimenting with this. I was able to get some simple stuff working but haven't found the time to develop the code I envisioned for this platform. Also the 30b was released that gave me a fast-running scientific programmable with re-assignable keys, one of the tings I was planning for a modified 12c+.

Any idea where the serial number sequence started corresponding to the 12C/arm7 ? I have a CNAxxxxyyyy arm7 here and thought the CNA s/n prefix may be a reliable indicator but I've also seen single CR2030 cell 12Cs with a CNA s/n prefix. So I'm at a loss.

This is what I was getting at:

http://www.third-harmonic.com/projects/voyager/12c/arm7-connector.pdf

It looks far more complex than it actually is, since I wanted to document the dimensions accurately.

Armed with the SS wire, some scrap ABS, and minimal tooling this could be hand built in an hour or two. The goal is to bring out the contact tails to a more accommodating pitch (eg: 2mm or 100mil) and continue on with a standard connector.

Interestingly enough a hybrid approach is possible utilizing the existing battery cover. Unfortunately this is frustrated to some extent due to the cover seating via sliding. One would need to unload the pins beforehand and release them once the cover is seated to play correctly. Certainly possible though consuming a battery

cover isn't my first choice.

NB: the 12C connector pinout signal definitions were taken from the 20B schematic and some rudimentary probing of an actual 12c/arm7. I couldn't find a 12c/arm7 schematic and was making a leap of faith HP didn't have cause to reinvent the connector pinout. If a 12C/ARM7 schematic does exist I'd appreciate a pointer.

Thanks.

HP-41 Time Module question

*Message #1 Posted by **Monte Dalrymple** on 14 Oct 2010, 6:25 p.m.*

Okay, my head is starting to hurt from all the banging against the wall... Can anyone explain how the "Shift-On" function works to display the time continuously? The code seems to sail right through the "POWOFF" instruction without stopping, and I don't know why. Thanks, Monte

Re: HP-41 Time Module question

*Message #2 Posted by **Namir** on 14 Oct 2010, 7:31 p.m.,*
in response to message #1 by Monte Dalrymple

Execute the CLOCK command to display the time continuously!

Namir

> Quote:
>
> Can anyone explain how the "Shift-On" function works to display the time continuously?

You first press and release SHIFT (the solid yellowish key), "SHIFT" should be displayed on the LCD, then you press and release the ON key. Now your 41CX should display the time.

Unsure if this works with Time Module in 41C or CV (I do not have one to test).

Re: HP-41 Time Module question

*Message #4 Posted by **Jim Horn** on 14 Oct 2010, 7:55 p.m.,*
in response to message #1 by Monte Dalrymple

I believe Monte is trying to figure out how the HP-41 works internally, not how to invoke the clock display.

Re: HP-41 Time Module question

*Message #5 Posted by **Monte Dalrymple** on 14 Oct 2010, 8:06 p.m.,*
in response to message #4 by Jim Horn

Correct. I can't figure out why the machine doesn't stop with the POWOFF instruction, but continues on to display the time. There must be something I'm missing.

Re: HP-41 Time Module question

*Message #6 Posted by **PeterP** on 15 Oct 2010, 12:19 a.m.,*
in response to message #5 by Monte Dalrymple

I have not checked the mode but i think there is a polling point called before the execution which could check for the key code Inc of shift key and divert the processor to a different point. For that i would look at the code in the last few addresses of the time module (the bespoke polling points)

I wish i had the time to check it out, it sounds like an interesting thing ti hunt down...

Cheers

Peter

Re: HP-41 Time Module question

*Message #7 Posted by **Monte Dalrymple** on 15 Oct 2010, 12:27 a.m.,*
in response to message #6 by PeterP

Peter,

Thanks, but the polling points are tested while the processor is running. The CPU executes POWOFF to go into light sleep after processing. I couldn't figure out how it started right back up. But after reading the spec for the timer chip (duh... rookie mistake) I figured out that the timer chip drives the ISA bus High, which is one of the wake-up conditions. Sorry for wasting everyone's time.

Monte

Re: HP-41 Time Module question

*Message #8 Posted by **Raymond Del Tondo** on 15 Oct 2010, 12:25 a.m.,*
in response to message #5 by Monte Dalrymple

Just follow the TurnOff interrupt vector in the TIME module ROM;-)

I haven't disassembled it, but there is a big chance that this vector is used, and that the code behind starts the clock display routine if the SHIFT key flag was set...

How does one add a third-party program to Droid48?

*Message #1 Posted by **Michael Frick (California)** on 14 Oct 2010, 1:31 p.m.*

I have used HP calculators ever since college. Now that I have found Droid48 I have one less piece of gear to carry around. One question though -- how can I transfer programs into Droid48. Since it uses the HP48 ROM, I assume it is expecting serial communications.

Has anyone succeeded in transferring programs into Droid48?

Thanks for the help,

Mike

Re: How does one add a third-party program to Droid48?

*Message #2 Posted by **Allen** on 14 Oct 2010, 7:19 p.m.,*
in response to message #1 by Michael Frick (California)

```
1. Connect your phone to the PC
2. Copy the file to your phone.. I recommend the directory ".48"
3. Start Droid48
4. Press MENU   -> Put program on stack
5. Repeat as necessary.
```

Re: How does one add a third-party program to Droid48?

*Message #3 Posted by **Michael Frick (California)** on 15 Oct 2010, 9:44 a.m.,*
in response to message #2 by Allen

Many thanks. That definitely increases the usefulness of the program.

Mike

*Message #4 Posted by **Allen** on 14 Oct 2010, 7:32 p.m.,*
in response to message #1 by Michael Frick (California)

Actually, with 8 Gb of storage, you could put all of HPCALC.ORG on your phone and install what you want.. I just tried part of it with PTOE.LIB, JAVA20, and ICE.ENT.

HP71, ins't something missing ?

*Message #1 Posted by **Alberto Fenini** on 14 Oct 2010, 1:25 p.m.*

Dear all,
I have received this HP71 which I knew was for spare only
so I'm not complaining because it doesn't work.

However, I have just opened it, and based on the service manual
I was expecting to find a flex cable joining the two halves.

A closer look :

The flex is obviously missing, and looks like it was soldered
What do you suggest ?
Does anyone has an actual photo of how it should look ?

Thanks everybody in advance !
Take care Alberto

Re: HP71, ins't something missing ?

*Message #2 Posted by **Gerson W. Barbosa** on 14 Oct 2010, 3:06 p.m.,*
in response to message #1 by Alberto Fenini

Ciao Alberto,

I think Etienne Victoria can answer this better than me:

http://etienne.victoria.free.fr/Titan_zebra/

Gerson.

Re: HP71, ins't something missing ?

*Message #3 Posted by **Martin Pinckney** on 14 Oct 2010, 9:25 p.m.,*
in response to message #2 by Gerson W. Barbosa

Why not take a section of ribbon cable such as PC's used for the IDE or floppy drives, cut a short section 17 conductors wide, separate the wires slightly at each end, then solder this similar to how Etienne did. I little neater, perhaps.

Re: HP71, ins't something missing ?

*Message #4 Posted by **Etienne Victoria** on 15 Oct 2010, 1:27 a.m.,*
in response to message #3 by Martin Pinckney

Hello all,

I agree, it would be much neater.

However, for this particular Hp-71B, I wanted to be able to route the wires separately inside the case.

Also, a folded 17 conductors-wide section would have had an excessive overall thickness IMHO.

Etienne

Re: HP71, ins't something missing ?

*Message #5 Posted by **Adrian Godwin** on 16 Oct 2010, 8:10 a.m.,*
in response to message #4 by Etienne Victoria

I have replaced the flex connector in an HP71 using a bunch of wire-wrap wire in a similar way to Etienne. If the wire is kept together with a few small ties (also wire-wrap wire) it can be very tidy.

Conductive Epoxy

*Message #1 Posted by **Kevin Kitts** on 14 Oct 2010, 10:28 a.m.*

I found a couple of old posts from 2000 on using conductive epoxy to repair old HP 41 calculator battery contacts. I have a 41cv from around 1981 that had a single (the leftmost) battery contact with corrosion and operation became intermittent and then finally failed. I applied some of the recommended conductive epoxy and now it seems to work perfectly. I am just wondering if either of the two original authors that discussed this are still around - and if the fixes they made in 2000 are still working after 10 years. In other words - what is the longevity of these kinds of repairs.

Thanks All!

Here are the old posts:

HP-41C battery contact fix Message #1 Posted by Erik Wahlin on 2 Dec 2000, 5:07 p.m.

I just discovered a relatively easy way of fixing the HP-41C series calculator battery contacts. These are the gold or other gold color metal plated contacts on the battery contact block. Battery corrosion and mechanical wear from the batteries tend to ruin these contacts. You can apply a conductive epoxy to the damaged areas and this seems to work. I don't know yet if this type of epoxy oxidizes in time which would cause it to fail later. The epoxy I used is made by Circuit Works (part # CW2400). It is available through Allied electronics and is not cheap at about $18 for the two tube set (7 grams). The tubes have Chemtronics (www.chemtronics.com) printed on them.(http://www.chemtronics.com/catalog/catalog.cgi?action=list_products&category=7) This product is normally used for circuit board trace repair. Please use at your own risk. Has anyone else out there ever used this type epoxy for battery contact repairs?

Re: HP-41C battery contact fix Message #2 Posted by Katie on 3 Dec 2000, 1:28 a.m., in response to message #1 by Erik Wahlin

Hi Erik,

Good idea! I've used the same stuff for several difficult to repair electrical contacts (e.g., attaching leads to solar cells and fixing rear window defroster contacts), but never for a contact that's likely to see some wear and tear. However, the stuff does seem to last for many years and does not break down easily, not even in outdoor applications. I'll bet that it holds up fine.

-Katie

Re: Conductive Epoxy

*Message #2 Posted by **Katie Wasserman** on 14 Oct 2010, 11:30 a.m.,*
in response to message #1 by Kevin Kitts

It held up for a few years in my 41 but eventually failed because of the flexing -- I need to come up with a longer-term alternative. On rigid PCB's it seems to last forever and the repairs I've made years ago are all still good.

I've been concerned about this on legacy voyager units given the unusual length of time a set of batteries can reliably live in one of these.

The primary point of failure is the seal of the LR44 cell in contact with the negative power terminal. Leakage from this seal is quite close to this gold plated PCB finger and seems to be the first location for corrosion to begin. One possibility for a permanent restoration of this terminal would be wrapping it in thin copper foil and tack soldering it to the remaining terminal plate conductor. If that is corroded beyond resoldering the foil wrap can be epoxyed to the PCB and electrically connected to the fair sized negative via in the PCB just south of the finger contact. A quick solder tinning is better than the leaving the exposed copper to oxidize.

Corrosion of the positive spring terminal seems less likely as the LR44 cells have no case seal at that end. But even here you could find/make another terminal as the original contact spring is only compression mounted between the cell well wall and the positive PCB stub. It can be compressed with tweezers and lifted right out.

Prevention is probably a far better route considering the number of years batteries can be living in a voyager. I keep meaning to pull the cell stacks out and wrap them in a layer of thin poly tape, leaving about 2cm overage at each end of resulting cylinder. Fold it over against the positive-most terminal only. Fill the remaining end's overage with a few drops of hot wax from a candle and heat the shebang with a hairdryer to seal the tape and set the wax layer (open wax end pointing up). Put the masterpiece in the voyager and forget about it for 10-20 years or sooner in the rare event you actually deplete the battery before then.

Re: Conductive Epoxy

*Message #4 Posted by **Katie Wasserman** on 14 Oct 2010, 7:57 p.m.,*
in response to message #3 by uhmgawa

LR44 cells are alkaline and I would not recommend them in a Voyager for the potential leakage problem you cite but more because of the much higher self discharge rate that they have compared to the 357 cells. 357 (also SR44SW) cells are silver oxide which have almost zero self discharge, almost never leak and if they do seem to have a less corrosive chemistry.

Re: Conductive Epoxy

I tend to have an abundance of LR44s on hand to feed digital calipers where the instrument current consumption overshadows the self discharge rate of either version. But certainly silver oxide chemistry cells do have a flatter discharge curve. Unfortunately they're quite a bit more rare and somehow 16x the cost of alkaline counterparts. Still given the voyager's power consumption that by itself isn't a compelling argument.

HP specifies voyagers for either LR or SR cell usage derating LR service life relative to SR at 25..50%, where that range corresponds to static memory backup..active system execution. Somewhere in between is the state of powered-on-idle where the cpu and R2D2s are essentially unclocked sans the separate low frequency LCD refresh clock. This is probably more representative of average "on" usage but I don't know if that's what HP was characterizing vs. continuous instruction execution.

I've had an SR44 eat a negative spring-style contact in an early voyager so I'm not too trusting of either chemistry though empirically I'd say alkaline cells have in general done worse to my electronic devices but they're also far more prevalent. Yet given the fragility of the Au plated PCB contact finger I don't think one could be faulted for using a supplemental measure to contain cell leakage.

HP-300s cannot do nCr for many allowable values

*Message #1 Posted by **DeboT** on 14 Oct 2010, 7:36 a.m.*

The HP-300s cannot do nCr for many allowable values

E.g. 200C55 = 7.718340811E49 gives an error on the 300s. Similarly on the Casio fx-85GT plus, and Sharp EL-W506.

It seems to me that these new line of calculators all share the same code.

Fortunately for the EL-W506, I have a workaround as it has the SUM capability:

nCr = 10^(SUM(x=A downto A-B+1, logX) - SUM(X=1 to B, logX)),

or as per 506 display:

```
   / A-B+1                B          \
  (   SUM   (logX, -1) - SUM (logX) )
   \ X=A                 X=1        /
10
```

where A = n and B = the lesser of r or n-r.

This can then be stored in a formula memory for future use.

This formula was adapted from Eamonn's "Updated HP-25 C(n,r) program", message 17 in this thread.

Unfortunately HP seems to have only purchased a sub-set of these functions for the 300s and does not contain the SUM function.
.

Edited to fix a small typo

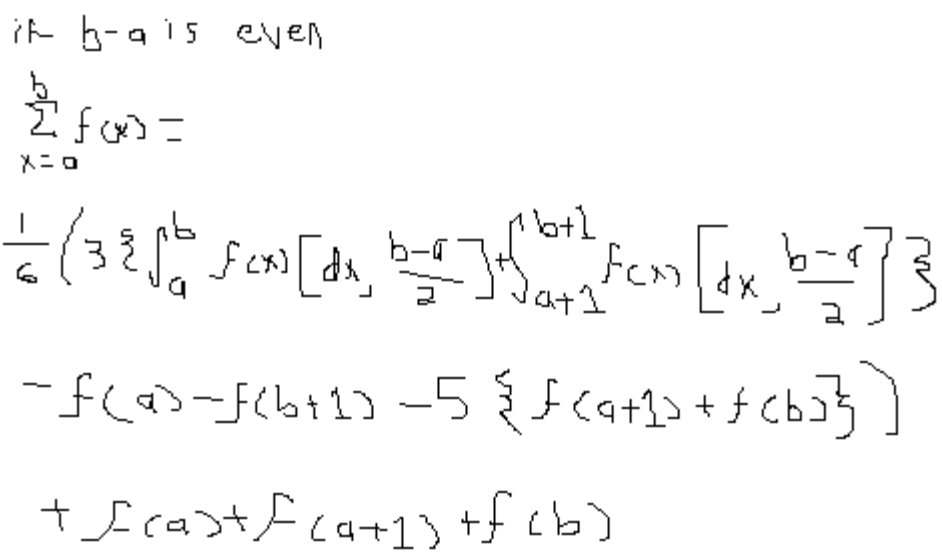
in response to message #1 by DeboT

> Quote:
>
> Fortunately for the EL-W506, I have a workaround as it has the SUM capability:

Huh? If you're talking about this calculator, I'm pretty sure it does not have the sum capability. Maybe this one does, though.

But the 506w does use Simpson's rule for evaluating integrals, so it can be manipulated into performing sums:



The funny (b-a)/2 argument in the integrals is the third argument you give the integrator, the one that indicates how many applications of Simpson's rule are to be used.

Obviously that's a pretty complicated formula, but if b-a is large enough it can save some time as compared to entering the sums manually.

Re: HP-300s cannot do nCr for many allowable values

*Message #3 Posted by **DeboT** on 14 Oct 2010, 9:38 a.m.,*
in response to message #2 by Crawl

Hi Crawl,

I'm talking about this calculator, note that the W is before the 506. A small difference in model no., but quite a different calculator :)

May be there's a difference in model no.'s for US and EU release, the EL-W516B being the US equivalent of EL-W506?

Re: HP-300s cannot do nCr for many allowable values

*Message #4 Posted by **gene wright** on 14 Oct 2010, 10:27 a.m.,*
in response to message #3 by DeboT

Define "allowable" values. If the nCr or nPr functions are done using the x! function, allowable values will not include the 200.

Re: HP-300s cannot do nCr for many allowable values

*Message #5 Posted by **DeboT** on 14 Oct 2010, 10:40 a.m.,*
in response to message #4 by gene wright

Hi Gene,

For "allowable" values I mean what the manual states:
0<n<=1E10; 0<r<n; 1<=answer<1E100

Just because the definition of combinatorial includes factorials, it doesn't mean the implemented algorithm should be limited to that.

Try it on an HP-11C for instance. As long as the answer <1E100 I have not found a (n,r) that it can't find an answer for.

Also the 300s happily calculates 200C40 :-).

Re: HP-300s cannot do nCr for many allowable values

*Message #6 Posted by **gene wright** on 14 Oct 2010, 11:20 a.m.,*
in response to message #5 by DeboT

Good. that's why I asked the question. I know some calculators use algorithms that do not use the x! but that some from long ago did.

Definitely an "oops" given the stated allowed values in the documentation.

Re: HP-300s cannot do nCr for many allowable values

*Message #7 Posted by **DeboT** on 14 Oct 2010, 10:45 a.m.,*
in response to message #2 by Crawl

Hi Crawl,

Nice idea for that calc. As the EL-W506 seems to implement the same integration technique, I'm going to go away and look at implementing your formula. Don't hold your breath, this may take me a while - I'm no maths guru :-).

Edited after implementing Crawl's formula on the EL-W506

OK, that works!!

For the first sum in my formula, I used a=A-B+1 and b=A in yours
For the second sum in my formula, I used a=1 and b=B in yours

I saved the first and second parts of the formula in separate memories as I get a "buffer full" error when trying to put the whole lot on one line.
Store each result in a memory (e.g. C and D) and take 10^(C-D). A few steps, but do-able.

Reverse engineering integration, cool!

Edited: 14 Oct 2010, 12:02 p.m.

*Message #9 Posted by **David Hayden** on 14 Oct 2010, 6:04 p.m.,*
in response to message #1 by DeboT

If you're going to iterate, then you can do it with multiplication and division in such a way that you never get a fractional result. So this may be faster and/or more accurate.

I'll demonstrate with an example. Consider 9C4 = (6*7*8*9)/(2*3*4) If you compute this as 6*7/2*8/3*9/4 then the intermediate results are guaranteed to be integers. To see this consider:

```
6*7/2     = 7C2
*8/3      = 8C3
*9/4      = 9C4
```

So after each division, you've computed a different nCr which is guaranteed to be an integer.

In (untested) pseudo-C-code, it looks like this:

```
comb(n,r)
{
  if (r > n-r) r = n-r;   // get the smaller of r and n-r
  result = n-c+1;
  f = result+1;           // the next factor
  for (d = 2 to r) {
    result = result * f;
    result = result / d;  // do the * and / in the right order!
    ++f;
  }
  return result;
}
```

The first 2 lines in the "for" loop could be combined into result = result * f / d, but I split them apart to stress that the multiply must come first.

Dave

Re: HP-300s cannot do nCr for many allowable values

*Message #10 Posted by **DeboT** on 15 Oct 2010, 5:50 a.m.,*
in response to message #9 by David Hayden

Hi Dave,

Yes, I have often implenemted similar product iterative routines in BASIC on old Sharp programmables (PC-1251 etc.). However the EL-W506 does not have programming nor does it have a PRODUCT function, the only iterative function is the SUM function (and integrate function as pointed out by Crawl), thus I had to devise a way to use that. The accuracy of the results have been satisfactory so far.
e.g.

Inputs	EL-W506 using Formula	Wolfram Alpha
90C7	7471735560	7471375560
101C6	1267339920	1267339920
70C8	9440350920	9440350920
425C23	5.987299533E37	5.98729953282171664909981 68... × 10^37
200C55	7.718340811E49	7.71834081143095795959768 89... × 10^49
335C167	3.044358792E99	3.04435879314697921045998279... × 10^99

Unfortunately I wanted to use combinatorials in another SUM function, but as I cannot use a SUM within a SUM, and I can't find a way of using a stored formula within another formula (on the EL-W506), so I'm

back to programmable calculators :(.

Edit:
Dave Hayden said

> Quote:
>
> So after each division, you've computed a different nCr which is guaranteed to be an integer.

The Sum function of course will always use the integer of any of its arguments (e.g. Sum X, X=1 to 5.8 will still produce 15), this may one the reasons for the reasonably good accuracy demonstrated above.

>
> Also the 300s happily calculates 200C40 :-).

I got exactly the same results for the 'cheapo' (< $20 each) Casio fx-115MS and fx-115ES, and the Sharp EL-520R: C(200,44) = 3.97106E44 was returned; C(200,45) = 1.37664E45 was not -- "Error" instead. It seems as though the same algorithms are being used.

This misperformance ought not to happen, but then again, consider the typical customer and retail price of most modern calculators.

Absolutely, if the inputs to a function are within the pertinent domain of the calculator, and the output of the function is within its range, the answer correct to its supported number of significant digits should be returned. That's all there is to it.

The two valid inputs to statistical combination C(n,r) are *non-negative* integers, so they must be identifiable as such. For a 10-digit calculator, 999,999,999 (1E10 - 1) would be the upper limit of input, and 9.999999999E99 would be the maximum output.

So, I would state:

0 <= n < 1E10; 0 <= r <= n; 1 <= answer < 1E100

A smart algorithm for combination or permutation, after validating both inputs, will achieve the following:

- Limit the magnitude of the intermediate results during calculation to prevent unnecessary overflow
- Calculate the result with the minimum number of operations
- Identify a true overflow condition as quickly as possible
- Minimize roundoff error

An approach was suggested in this thread:

nCr program - MCODE

David Hayden stated:

>
> So after each division, you've computed a different nCr which is guaranteed to be an integer.

It is true that each intermediate result calculated in this manner is guaranteed to be an integer. Another way to view it is as follows: When the first two consecutive-integer numerands are multiplied together, one of them must be even; when the third numerand is multiplied, one of the first three must be divisible by three, and so forth.

However, I doubt that there is any value to integer-valued intermediate results unless (faster) integer arithmetic is performed. Also, multiplying before dividing will eventually cause an overflow for some computations.

To prevent overflow at intermediate points, each term -- consisting of a quotient of two integers -- should be calculated prior to multiplying. The magnitude of the quotient terms should monotonically decrease, but always remain above unity, so the final result need not be obtained by 'scaling down' the running product.

Extended-precision floating-point calculations throughout may eliminate most roundoff error. Then, as a final step, the result could be rounded to the nearest integer -- if it is within the calculator's displayable range of integers.

-- KS

Since P(200, 44) = 1.0556E99 and P(200, 45) = 1.6468E101 I assume the following formula is used:

```
C(n, r) = P(n, r)/r!
```

Best regards
Thomas

BTW: Using the HP 35s I get an OVERFLOW for P(422, 200) but still the correct result for C(422, 200) = 2.3720E125. This shows it can be done correctly.

Thomas (and Marcus von Cube) --

Yes, that would seem to be the basis of the 'misperformance' of these and other models. The implementation on the Casios is not purely "C(n,r) = P(n,r)/r!", as they correctly (and quickly) calculate C(71,70) = 71, despite that both P(71,70) and 70! exceed 1E100. They will solve up to C(120,70) = 1.83617E34, but not C(121,70) = 4.35641E34.

The Sharp fails to calculate C(71,70), giving an "Error 2" message, so it probably *does* use "C(n,r) = P(n,r)/r!" directly.

This example underscores the differences in product development and marketing between quality calculators and some modern ones. If algortihmic shortcomings such as this one had appeared in the costly HP models of yesteryear, professional engineers and scientists would have complained. Flaws were actually quite rare, because HP had invested the effort and financial commitment (paying many highly-skilled people) to implement robustness in their legacy products.

Young students are less likely to need to tackle 'extreme' or difficult mathematical problems, won't care if the calc comes up short, and for $15, how much can be expected, anyway?

On language: "misperform" may not appear in your dictionary, but apparently several modern unabridged versions include it. "Misperform" and "misperfomance" sound unawkward and would not

mean the same as "malfunction" or "misoperate".

Interesting! Probably C(120, 50) and C(121, 51) are calculated instead: as P(120, 50) = 5.5846E98 and P(121, 51) = 6.7573E100 which leads to an OVERFLOW.

Re: Implemented methods for caclulating nCr

*Message #15 Posted by **Marcus von Cube, Germany** on 17 Oct 2010, 4:45 p.m.,*
in response to message #14 by Thomas Klemm

I found a hint in the fx-5800P manual (page E-130):

Function : Input Range
nPr : 0<=n<1E100, 0<=r<=n (n, r are integers), 1<=n!/(n-r)!<1E100
nCr : 0<=n<1E100, 0<=r<=n (n, r are integers), 1<=n!/r!<1E100 or 1<=n!/(n-r)!<1E100

So it works according to specifications.

Re: Implemented methods for caclulating nCr

*Message #16 Posted by **DeboT** on 18 Oct 2010, 7:10 a.m.,*
in response to message #15 by Marcus von Cube, Germany

Interesting, the Sharp EL-W506 manual states for nCr : n!/(n-r)!<1E100

However, the 300s manual states for nCr : 1<=n!/(r!(n-r)!)<1E100. As this is the definition of combinatorials, I interpreted this to be equivalent to "answer".

The not-so-cheap EL-9900 only states "0 <= r <= n <= 69" for both nPr and nCr. Considering it's supposed to be competing in the market with other graphics calculators, it's a bit of a let down. It is fully programmable though, but as I call the routine from another iterative program, execution times escalate quickly.

Re: [MORE] HP-300s cannot do nCr for many allowable values

*Message #17 Posted by **Paul Dale** on 17 Oct 2010, 5:37 a.m.,*
in response to message #11 by Karl Schneider

My 34s firmware calculates both permutations and combinations using the LnGamma function so overflow really isn't a concern until the final exponential step. Thus all these cases work fine :-)

In fact, the firmware handles the extension of both of these functions to the complex plane. And yes,

special care is taken to ensure that integer arguments produce an integer result.

- Pauli

Re: [MORE] HP-300s cannot do nCr for many allowable values

*Message #18 Posted by **Marcus von Cube, Germany** on 17 Oct 2010, 1:12 p.m.,*
in response to message #11 by Karl Schneider

Karl, the not so cheap Casio fx-5800P fails in the same way. Thomas assumption that C(n,r) = P(n,r)/r! seems to be correct for all modern Casios.

Edit: This seems to be common to many "Casioish" calculators like the older Casio fx991s and the new "Rex Dual Power" calculator sold at Aldi Süd in Germany recently.

Edit2: I tried it with the HP9G and 30s: They do not fail on C(200,45). The Casio CFX-985G fails while the fx-9860G slim does not fail. Casio seems to have corrected it at least for part of their offerings.

Edit3: All the Casio BASIC pockets (with the respective functionality) fail on NCR(200,45) but can compute NCR(200,44)

Re: HP-300s cannot do nCr for many allowable values

*Message #19 Posted by **Crawl** on 18 Oct 2010, 11:52 a.m.,*
in response to message #1 by DeboT

Another way of approaching this would be to use Sterling's approximation,

ln n! ~ n ln n - n + 1/2 ln (2 pi n)

This, however, only gets you

7.73 x 10^49

So you get the correct order of magnitude, and 2 correct digits, but the rest are wrong.

You might be able to try more terms in the expansion, but I imagine few want to memorize more terms.

A better readable version of the above:

Here is the 12c Version for nCr.

```
Store n in R1 and r in R2
Registers used:
R3 = sum of the left term
R4 = sum of the right term
R5= b. (r or n-r whichever is smaller)
R6= a-b+1
R7 = counter

Program:
1.   1
2.  STO 7
3.  0
4. STO 3
5. STO 5
6. RCL 1
7. RCL 2
8. -
9. RCL 2
10.   x<=y
11.  GTO 13
12. GTO 15
13. RCL 2
14. GTO 18
15. RCL 1
16. RCL 2
17.  -
18. STO 5
19. CHS
20. RCL 1
21. +
22. 1
23. +
24. STO 6
25. RCL 6
26. LN
27. 1
28. 0
29. LN
30. /
31. STO+ 3
32. 1
33. RCL 6
34. +
35. STO 6
36. RCL 1
37. RCL 6
38. x<=y
39. GTO 25
40. RCL 7
41. LN
42. 1
43. 0
44. LN
45. /
46. STO+ 4
47. 1
48. RCL 7
49. +
50. STO 7
51. RCL 5
52. RCL 7

hp-collection.org?

*Message #1 Posted by **Howard Owen** on 13 Oct 2010, 6:41 p.m.*

Google Chrome throws up a malware site warning when I try to visit hp-collection.org. Anyone know what's up with that?

Regards,
Howard

Re: hp-collection.org?

*Message #2 Posted by **Raymond Del Tondo** on 13 Oct 2010, 6:55 p.m.,*
in response to message #1 by Howard Owen

A while ago there was a related thread, either here or in comp.sys.hp48. One poster found out that there seems to be an invisible bitmap which refers to a bad web page somewhere else. Obviously the problem is still there.

Raymond

Re: hp-collection.org?

*Message #3 Posted by **Marcus von Cube, Germany** on 14 Oct 2010, 2:38 a.m.,*
in response to message #2 by Raymond Del Tondo

I checked the page (Ctrl-U in Firefox) when the issue came up first here in the forum soem weeks ago. I couldn't find anything bad, neither in the page nor in the CSS referenced. The page is obviously in some online malware list and needs to be removed from there.

I think, Matthias is aware of the problem.

in response to message #4 by Matthias Wehrli

Matthais, I clicked the Google Chrome message diagnostic and this is what was reported:

http://safebrowsing.clients.google.com/safebrowsing/diagnostic?site=http://hp-collection.org/&client=googlechrome&hl=en-US

Safe Browsing Diagnostic page for hp-collection.org

What is the current listing status for hp-collection.org? Site is listed as suspicious - visiting this web site may harm your computer.

What happened when Google visited this site? Of the 1 pages we tested on the site over the past 90 days, 1 page(s) resulted in malicious software being downloaded and installed without user consent. The last time Google visited this site was on 2010-10-04, and the last time suspicious content was found on this site was on 2010-10-04. Malicious software is hosted on 1 domain(s), including pipa-buzz.ru/.

This site was hosted on 1 network(s) including AS31424 (NEXELLENT).

Has this site acted as an intermediary resulting in further distribution of malware? Over the past 90 days, hp-collection.org did not appear to function as an intermediary for the infection of any sites.

Has this site hosted malware? No, this site has not hosted malicious software over the past 90 days.

How did this happen? In some cases, third parties can add malicious code to legitimate sites, which would cause us to show the warning message.

Next steps: Return to the previous page. If you are the owner of this web site, you can request a review of your site using Google Webmaster Tools. More information about the review process is available in Google's Webmaster Help Center.

HP-45S ? Is there a new model ?

*Message #1 Posted by **Karl-Ludwig Butte** on 13 Oct 2010, 3:54 p.m.*

Dear All,

while searching for pictures of the HP-40G I stumbled over this website where I found a picture of a HP-45S. It looks similar to an HP-35S but the cursor keys are in a different place and the LCD is larger showing all 4 stack registers. You can klick on the image to enlarge it. Beneath the image is a reference to "hpmuseum.org" but this link points to the same page.

Does anyone knows anything about an HP-45S ?

Best regards

Karl

That's because the pictured one was just one I had lying around. That's why it has a 1984 serial number, which I certainly wouldn't be selling now. :)

Yes, they are the new one, but I have very limited inventory because it's such a poor seller (I typically sell one every 6 months).

I have updated the description to make it clear that it is the new one.

```

The program computes the arithmetic-geometric mean (AGM) of two positive real numbers. Due to rounding errors, there is some uncertainty in the last significant digit of the results. No optmization has been tried, so there is still room for improvement.

Examples:

```
1) AGM(3,4)

   3 ENTER 4 XEQ A -> 3.48202767633   (The last digit should be 6)
```

```
2) AGM(12345,6789)

   12345 ENTER 6789 XEQ A -> 9359.76103251 (The last digit should be 0)

3) sqrt(2*pi*sqrt(2*pi)/AGM(1,sqrt(2))) = Gamma(1/4)

   2 pi * sqrt LASTx * 2 sqrt 1 XEQ A / sqrt -> 3.62560990822

                                4 1/x 1 - x! -> 3.62560990822
```

Gerson.

Hello Lyuka,

I think there is a variation here:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=101118

(Message #11)

I'd like to do it in BASIC, on the HP-71B perhaps. I have implemented a kind of fixed-point arbitrary precision multiplication but the square root algorithm is still missing.

Regards,

Gerson.

Re: algorithm for the square root

*Message #4 Posted by **Lyuka** on 13 Oct 2010, 8:05 p.m.,*
in response to message #3 by Gerson W. Barbosa

Hello Gerson,

How about these algorithm for the square root?

Quote:

Some sqrt(A) algorithm for 1 <= A <= 10, written in C-style.

```
/* Copyright (c) Takayuki HOSODA. All rights reserved.      */
/* sqrt2(a) , 2rd order convergence, Newton-Raphson method */
define sqrt2(a, epsilon) {
    local x;

    x = 0.8244 + 0.26072 * a;    /* 1st order Chebyshev approximation,
|err| <7.9% (1<=a<=10) */
    while(abs(1 - a / (x * x)) > epsilon)
        x = (x + a / x) * (1/2);
    return(x);
}

/* sqrt3(a) , 3rd order convergence, Pade approximation */
define sqrt3(a, epsilon) {
    local x, s;

    x = 0.8244 + 0.26072 * a;    /* 1st order Chebyshev approximation,
|err| <7.9% (1<=a<=10) */
    s = x * x;
    while(abs(1 - a / s) > epsilon) {
        x = x * (s + 3 * a) / (3 * s + a);
        s = x * x;
    }
    return(x);
}

/* 1/sqrt(a) , 4th order convergence, taylor series, no division */
define sqrtinv4(a, epsilon) {
    local x, h;
```

```
    x = 1.0711 + a*(-0.17802 + a*0.0105597);     /* 2nd order Chebyshev
approximation, |err| <=9.7% (1<a<10) */
    while(abs(h = 1 - a * x * x) > epsilon)
        x *= 1 + h * (8 + h * (6 + h * 5)) * (1/16);
    return(x);
}
```

Example: intermediate value and error

```
sqrt2(2, 1e-100)

in response to message #4 by Lyuka

The functions need the following if statements to properly deal with a being 0:

```
if (a==0) return 0;
```

Otherwise, the functions look very cool!

Namir

*Message #6 Posted by **Lyuka** on 14 Oct 2010, 7:56 a.m.,*
in response to message #5 by Namir

Hello Namir,

Thank you for your comment.

These functions are being optimized for use of decimal operation.
Therefore it assumes that the input 'A' is normalized within the range of 1 to 10, otherwise it will not function properly.

Regards,
Lyuka

*Message #7 Posted by **David Hayden** on 14 Oct 2010, 6:51 a.m.,*
in response to message #4 by Lyuka

If anyone converts these to working C code, you'll need to change "(1/2)" to "(1./2)" and also "(1/16)" to "(1./16)" (or do something similar to ensure floating point division).

Without the change, the compiler will use integer division and create an integer result for both of these expressions. As a result, they will both be zero.

By adding the decimal point, you convert one argument to a floating point double, which causes the other argument, the divide operation, and the result to be floating point.

Dave

Re: AGM (HP-33S & HP-15C)

*Message #10 Posted by **Namir** on 13 Oct 2010, 4:43 a.m.,*
in response to message #1 by Gerson W. Barbosa

Here is the AGM version for the HP-41C:

```
LBL "AGM"
LBL A
"Y^X?"
PROMPT
LBL B
RCL Y
X<>Y
```

```
ST+ Z
*
0.5
ST* Z
Y^X
STO T
X<>Y
ST- T
RCL T
ABS
1E-10
CF 00
X<Y?
SF 00
RDN
RDN
FS? 00
GTO B
RTN
```

The program does not store any values in memory registers. Press A (in User mode) to get a prompt for the arguments. If you want to skip this prompt, enter the two values in the stack and then press B (in User mode). The program iterates and then displays the AGM in the X stack register. Notice that the tolerance for the solution is hard coded in the listing as 1E-10. I initially used 1E-11, but discovered that for some numbers, the iteration does not end, so I switched the tolerance value to 1E-10.

Hello Namir,

> Quote:
>
> Notice that the tolerance for the solution is hard coded in the listing as 1E-10. I initially used 1E-11, but discovered that for some numbers, the iteration does not end, so I switched the tolerance value to 1E-10.

That's exactly what I was just testing. If you try AGM(4,5), you'll find the tolerance value has to be changed to 1E-08. Likewise for my second example, it will have to be changed to 1E-05. Finally, AGM(1E40,7E40) will loop forever unless the tolerance is switched to 1E32. But then the accuracy will be lowered in many cases. That's why I check the difference of the decimal logarithms of two consecutive means as a stop criterion. Perhaps there is a faster way, but that's the only one that has occurred to me. If you decide to change your program, I would suggest saving at least the stack register X to allow for easy one-level chained calculations.

Regards,

Gerson.

How about using %ch to determine when to bail?

```
01 LBL "AGM"
```

```
02 CF 00
03 LBL A
04 "Y^X?"
05 PROMPT
06 LBL B
07 RCL Y
08 X<>Y
09 ST+ Z
10 *
11 .5
12 ST* Z
13 Y^X
14 %CH
15 LASTX
16 X<>Y
17 ABS
18 1 E-7
19 X<Y?
20 SF 00
21 RDN
22 RDN
23 FS?C 00
24 GTO B
25 END
```

```
Hi,

here is another version for the HP-41

01 LBL "AGM"
02 ENTER^
03 LBL 01
04 CLX
05 RCL Z
06 RCL Y
07 +
08 2
09 /
10 RCL Y
11 SQRT
12 R^
13 SQRT
14 *
15 R^
16 X#Y?
17 GTO 01
18 END      ( 30 bytes )

Though the tolerance is zero,
```

```
it seems there is no infinite loop.

Regards,
Jean-Marc.
```

Re: AGM (HP-33S & HP-15C)

in response to message #16 by JMBaillard

Hi Jean-Marc,

Works great! The flying goose never makes to the end of its short path and most of the times it will stop only a bit past halfway the display.

Regards,

Gerson.

Re: AGM (HP-33S & HP-15C)

*Message #18 Posted by **Paul Dale** on 14 Oct 2010, 3:56 a.m.,*
in response to message #16 by JMBaillard

A one step shortening and one less square root per cycle:

```
01 LBL "AGM"
02 ENTER^
03 LBL 00
04 CLX
05 RCL Z
06 RCL Y
07 +
08 2
09 /
10 RCL Y
11 R^
12 *
13 SQRT
14 R^
15 X#Y?
16 GTO 00
17 END
```

- Pauli

*Message #19 Posted by **Namir** on 14 Oct 2010, 6:21 p.m.,*
in response to message #18 by Paul Dale

Very good of you Jean-Marc and Pauli. You did away with the tolerance issue and gave us a fast 41C implementation.

Namir

Re: AGM (HP-33S & HP-15C)

*Message #20 Posted by **Gerson W. Barbosa** on 14 Oct 2010, 7:55 p.m.,*
in response to message #19 by Namir

Agreed!

```
    HP-33S                    HP-15C

A0001  LBL A          001-42,21,11  f LBL A
A0002  ENTER          002-       36    ENTER
A0003   Rv            003-       33     Rv
A0004  x<>y           004-       34    x<>y
A0004   +             005-       40     +
A0006  LASTx          006-    43 36  g LST x
A0007   R^            007-    43 33  g  R^
A0008   *             008-       20     *
AOO09  SQRTx          009-       11    SQRTx
A0010  x<>y           010-       34    x<>y
A0011   2             011-        2     2
A0012   /             012-       10     /
A0013  x>y?           013-43,30,  7  g TEST 7
A0014  GTO A          014-    22 11    GTO A
A0015  RTN            015-    43 32  g RTN
```

These are my short 33s and 15C versions. The difference to my first draft is only the test, x>y instead of x#y, which sometimes would cause endless loops. I wrongly assumed a tolerance factor might be a better solution. Anyway, I think this has been a good exercise ...

Still under test: AGM(7,8) loops forever on the HP-33s (but not on the 15C). Will test on the 42S.

Regards,

Gerson.

Doesn't work on the HP-42S either, for (7,8); does work on Free42 Decimal, however. Perhaps an accuracy issue. The intermediate means increase towards the theoretical result so that after a few iterations two successive means should be the same. In most cases the one in register X gets slightly greater than the one in register Y (when they not converge to the same result), but in the (7,8) example this never happens.

*Message #24 Posted by **Werner** on 18 Oct 2010, 5:44 a.m.,*
in response to message #23 by Werner

More accurate, at the expense of only 2 bytes:

```
00 { 28-Byte Prgm }
01*LBL "AGM"
02 ENTER
03*LBL 02
04 ENTER
05 +
06 RDN
07 STO T
08 STO- Z
09 *
10 SQRT
11 X<>Y
12 2
13 /
14 RUP
15 STO+ Y
16 X#Y?
17 GTO 02
18 END
```

Re: AGM (HP-33S & HP-15C)

*Message #25 Posted by **Gerson W. Barbosa** on 18 Oct 2010, 6:43 p.m.,*
in response to message #24 by Werner

Hello Werner,

This will run on the HP-42S only. The test in step 21 is made between successive arithmetic means, which are computed as a + (b - a)/2, as in your program. The original stack register X is preserved, but surely not a good idea trying to use only the stack. It would be much better to use a memory register instead, that's what they are meant for :-)

Regards,

Gerson.

```
HP-42S

in response to message #26 by Werner

Hello Werner,

You can calculate the example #3 as stated if you store the stack register X in a memory register and recall it when AGM is done:

```
00 { 38-Byte Prgm }
01*LBL "AGM"
02 X<> ST Z          (or RCL ST Z)
03 STO 00
04 RDN
05 ENTER
06 ENTER
07*LBL 02
08 +
09 RDN
10 STO* ST Z
11 +
12 2
13 /
14 X<>Y
15 SQRT
16 RCL ST Y
17 %CH
18 1E-9
19 X<Y?
20 GTO 02
21 RUP
22 RCL 00
23 X<>Y
24 END
```

Regards,

Gerson.

P.S.: One step and one byte shorter:

```
00 { 37-Byte Prgm }
01*LBL "AGM"
02 X<> ST Z
03 STO 00
04 RDN
05 ENTER
06 ENTER
07*LBL 02
08 +
09 RDN
10 STO* ST Z
11 +
12 2
13 /
14 X<>Y
15 SQRT
```

```
16 RCL ST Y
17 %CH
18 1E-9
19 X<Y?
20 GTO 02
21 RCL 00
22 LASTX
23 END
```

Re: AGM (HP-33S & HP-15C)

*Message #28 Posted by **C.Ret** on 14 Oct 2010, 11:49 a.m.,*
in response to message #27 by Gerson W. Barbosa

Dear all RPN's enthusiasts !

I have to tell you that I am into studying your RPN programs with great interest. With great pleasure, I am playing to decrypt all this RPN codes and I am trying to understand how they differ or match from one HP model to another.

Behind all this line numbers, labels, tests, stack movements, I come to the surprising conclusion that they all scrub to converge to the expected result by recurrence, such as Imay have done it on an RPL calculator:

```
« -> a g
   'IFTE( eps<a-g,
          AGM((a+g)/2,SQRT(a*g)),
          a)'
»
'AGM' STO
```

Where eps=1E-9 or whatever the available/expected precision.

OR, with RPL not so far from RPN stack manipulation :

```
« DO DUP2 + 2 / ROT ROT * SQRT UNTIL DUP2 - eps <= END »
```

Re: AGM (HP-33S & HP-15C)

*Message #29 Posted by **Gerson W. Barbosa** on 15 Oct 2010, 11:14 a.m.,*
in response to message #28 by C.Ret

Hello,

I haven't been able to test your recursive version. Your second program will not leave the loop for a=1e7 and b=1e13, unless eps is greater than 10. By using %CH instead of subtraction, as per Mark Storkamp's suggestion, a fixed tolerance value will be enough:

```
«
  DO DUP2 * SQRT ROT ROT
+ 2 /
  UNTIL DUP2 %CH
.000000001 <
  END NIP
»
```

The following, which is a direct translation of my short versions, will loop forever in some cases, like 4 and 5. I haven't found non-working examples on the 15C, however.

```
«
  DO DUP2 * SQRT ROT ROT
+ 2 / DUP2
  UNTIL >=
  END NIP
»
```

Regards,

Gerson.

Re: AGM (HP-33S & HP-15C)

*Message #30 Posted by **Gerson W. Barbosa** on 16 Oct 2010, 12:56 a.m.,*
in response to message #27 by Gerson W. Barbosa

Here is another attempt on the HP-42S, using ontly the stack and preserving register X, no tolerance factor. However occasionally the consecutive means will not converge to the same value as they should, perhaps due to the extra arithmetic in lines 15 and 16. I will test it on the HP-41 later.

```
00 { 34-Byte Prgm }
01*LBL "AGM"
02 R^
03*LBL 00
04 Rv
05 STO ST T
06 X<>Y
07 +
08 LASTX
09 R^
10 *
11 LASTX
12 Rv
13 *
14 LASTX
15 STO+ ST X
16 STO/ ST Y
17 CLX
18 LASTX
19 SQRT
20 R^
21 X#Y?
22 GTO 00
23 R^
24 24<>Y
25 END

Example:

   sqrt(2*pi*sqrt(2*pi)/AGM(1,sqrt(2))) = Gamma(1/4)

   2 pi * SQRT LASTx * 2 sqrt 1 XEQ AGM / SQRT -> 3.62560990822

                                        4 1/x GAM -> 3.62560990822
```

Re: AGM (HP-33S & HP-15C)

*Message #31 Posted by **Gerson W. Barbosa** on 16 Oct 2010, 4:41 p.m.,*
in response to message #30 by Gerson W. Barbosa

So far no problem on the HP-41, but I would have to check more examples. In these HP-42S and HP-41 versions the comparison is made between two consecutive AGMs, as is Jean-Marc Baillard's method, not between the arithmetic and geometric means. However, his program computes geometric means as sqrt(a)*sqrt(b), instead of sqrt(a*b), any special reason?

```
01*LBL'AGM
02 R^
03*LBL 00
04 RDN
05 STO T
06 X<>Y
07 +
08 LASTX
09 R^
10 *
11 LASTX
12 RDN
13 *
14 LASTX
15 STO+ X
16 STO/ Y
17 CLX
18 LASTX
19 SQRT
20 R^
21 X#Y?
22 GTO 00
23 R^
24 X<>Y
25 END

Examples:

1) AGM(3,4)
   3 ENTER 4 XEQ AGM -> 3.4820277

2) AGM(12345,6789)
   12345 ENTER 6789 XEQ AGM -> 9359.761031 (The last digit should be 3)

3) 2 pi * SQRT LASTx * 2 sqrt 1 XEQ AGM / SQRT -> 3.625609909 (The last digit
should be 8)

4) AGM(1E07,1E13)

   EEX 7 ENTER XEQ AGM -> 1.033295938E12 (Ok; on my shorter HP-15C version, which
uses a different method, this example doesn't exit the loop).
```

Re: AGM (HP-33S & HP-15C)

*Message #32 Posted by **JMBaillard** on 16 Oct 2010, 5:13 p.m.,*
in response to message #31 by Gerson W. Barbosa

Hi Gerson,

In fact, I first used sqrt(a.b)
but in order to avoid an overflow if a.b > 9.999999999 E99
I finaly replaced sqrt(a.b) by sqrt(a).sqrt(b)

Best Regards,
Jean-Marc.

Re: AGM (HP-33S & HP-15C)

*Message #33 Posted by **Lyuka** on 16 Oct 2010, 6:18 p.m.,*
in response to message #32 by JMBaillard

Hi Jean-Marc,

And also in order to avoid an overflow if a + b > 9.999999999 E99 (a + b) / 2 would better be replaced by

a < b ? a + (b - a) / 2 : b + (a - b) / 2;

Regards,
Lyuka

Re: AGM (HP-33S & HP-15C)

*Message #34 Posted by **Thomas Klemm** on 16 Oct 2010, 6:23 p.m.,*
in response to message #32 by JMBaillard

As the AGM is linear in its parameter (i.e. AGM(ka, kb) = k AGM(a, b)) I don't consider that a big issue. We could be happy to just calculate AGM(1, x) with 0 <= x <= 1 (assuming only real values).

Cheers
Thomas

Re: AGM (HP-33S & HP-15C)

*Message #35 Posted by **Gerson W. Barbosa** on 16 Oct 2010, 7:31 p.m.,*
in response to message #32 by JMBaillard

Thank you, Jean-Marc! I should have imagined it :-)

Best regards,

Gerson.

Re: AGM (HP-33S & HP-15C)

*Message #36 Posted by **JMBaillard** on 17 Oct 2010, 7:23 p.m.,*
in response to message #35 by Gerson W. Barbosa

Hi Gerson,

As Lyuka suggests it, (a+b)/2 may also overflow.
But practically, taking sqrt(a.b) and (a+b)/2
will work almost always.
So, Pauli's listing is better.

Best Regards,
Jean-Marc.

Re: AGM (HP-33S & HP-15C)

*Message #37 Posted by **Gerson W. Barbosa** on 18 Oct 2010, 5:30 p.m.,*
in response to message #30 by Gerson W. Barbosa

By inserting a X<>Y instruction between lines 19 and 20 the program gets more stable on the real 42S:

```
.
.
.
20 X<>Y
21 R^
22 X#Y?
23 GTO 00
24 R^
25 X<>Y
26 END
```

Re: AGM (HP-33S & HP-15C)

*Message #38 Posted by **Marcus von Cube, Germany** on 14 Oct 2010, 5:31 p.m.,*
in response to message #1 by Gerson W. Barbosa

It's easy to implement AGM on the HP-38/39/40 series with the sequence applet.

In symb view:

```
U1(1)=A
U1(2)=(A+B)/2
U1(N)=(U1(N-1)+U2(N-1))/2
U2(1)=B
U2(2)=SQR(A*B)
U2(N)=SQR(U1(N-1)*U2(N-1))
```

On the home screen store the start values in A and B and then you can see the values in num view or plot the sequences in plot view. The graphics resolution isn't very good so you have to fiddle with the zoom options to see something. In num view, the number of digits is limited to 7. I don't know of a way to change that(*) but you can enter U1(6) or the like on the home screen to see a certain value.

At least it works.

(*) Just found out that you can move the cursor around and see the values on the bottom of the screen.

was: A little programming chalenge

*Message #1 Posted by **Patrice** on 11 Oct 2010, 9:04 p.m.*

Hi all,

Just landed back in France.

Egan how far did you get ?

Contrary to what I expected, I did not talk about this challenge during HHC 2010 but after in small comity at the hotel.

The schedule was too tight. :(

I have to put things together before posting my answer.

Off topic: by the way, thanks to you all guys for the advices on my holidays travel across USA.

Patrice

HP-15C Software

*Message #1 Posted by **Gerry Schultz** on 11 Oct 2010, 5:30 p.m.*

To All:

Quick question: Does anyone know of a repository that has collected HP-15C software written over the years? I got an old 15C recently and I couldn't find anything about software on either this website or the internet. If I'm missing something and it's as plain as the nose on my face, then sorry to have bugged everyone and please point me in the right direction.

Thanks for the help, Gerry

Re: HP-15C Software

*Message #2 Posted by **Karl Schneider** on 11 Oct 2010, 8:37 p.m.,*
in response to message #1 by Gerry Schultz

Hello, Gerry --

There is a meager assortment of Software Library programs for the HP-15C at the Forum's main page:

- http://www.hpmuseum.org/software/software.htm

I have intended to add several of my own programs that might be practical:

- HP-15C Library of complex-number utilities
- HP-15C program to compute 3x3 complex matrix determinant

Valentin Albillo's clever program, found halfway through the following thread, solves a numerical puzzle posed by me:

- A modest arithmetical challenge

Several reasons may explain the apparent dearth of user-submitted programs for the HP-15C, despite its ample programming capabilities:

1. Useful advanced mathematical functions, such as numerical integration, rootfinding, linear algebra, and complex-domain calculations, are already built in -- no need to write routines for them.

2. The 7-segment display offers very limited alphanumeric capability without clear prompting for input or identification of results. Instructions are represented by displayed keycodes. This does not facilitate permanent-residence programs that remain understandable over time.

3. No electronic I/O for saving or loading programs is available.

-- KS

Re: HP-15C Software

*Message #5 Posted by **Geoff Quickfall** on 13 Oct 2010, 2:51 a.m.,*
in response to message #4 by Martin Pinckney

Well it would seem that there are 15C programs out there.

Of course any of the programs for simple RPN machines with keycode programming would work.

Take a look at the following calcs and search for their programs:

```
HP 34C
HP 25
HP 11 and 10
HP 65
HP 67
```

Granted there are built in function differences but these can be converted easily to the 15C requirement.

I use the 15C in my shirt pocket for a suite of aviation related programs and it always gets looks from the other crew.

Also, if you were at HCC2010 I had one of the 15C's flashing in the display, with the use of NNN:

"Hello PPC"

I got the description of the program, synthetics and NNN's from Eric Smiths site in which he cites Allen F Tennants, "Synthetics on the HP 15C"

Synthetics on the HP 15C

Cheers, Geoff

HP-48gII ROM...

*Message #1 Posted by **M. Joury** on 11 Oct 2010, 3:52 p.m.*

Hi,

I have a question about the 48gII ROM that I know can be answered by people on this forum. I recently purchased a new unit (4 battery version) that is at revision level 2.08. I have searched the web for information on the current ROM revision and it is implied (though not actually stated) that the 49g+/50g ROM Revision 2.15 is compatible with the 48gII. Is this actually true?

Thanks!

Re: HP-48gII ROM...

*Message #2 Posted by **Tim Wessman** on 11 Oct 2010, 4:35 p.m.,*
in response to message #1 by M. Joury

No. It is not compatible.

*Message #8 Posted by **Mark Edmonds** on 11 Oct 2010, 12:20 p.m.,*
in response to message #7 by Namir

I thought it would go for about 1500GBP or 2385USD at current rates. Never expected in my wildest dreams what the final price would be - and the same person bought the plotter for a pretty large sum too.

My views on the 9100B I've said enough - I'd love one, it is my holy grail - but at that sort of money and if it sets the tone for any future auctions, I'm stuffed!

In the UK, we have charity shops and such but the chances of such a beast turning up in one are almost nill and I think there is also some over-safe rule concerning electrical goods and testing which means they might get refused and end up in a skip. Terrible thought!

Re: 9100 B on TAS goes for $5600.00

*Message #9 Posted by **Adrian Godwin** on 13 Oct 2010, 6:47 a.m.,*
in response to message #8 by Mark Edmonds

Well, I've got the plotter and a 9815 to drive it. Don't think I'd get that kind of money for it in the UK though.

Anniversary Editions

*Message #1 Posted by **Webunit** on 10 Oct 2010, 8:22 p.m.*

It's not clear to me from the museum pages whether the anniversary editions for both the 32S and 14B were available to the general public or just to employees and shareholders. The wording for the 32S suggests that it was but the wording for the 14B is not as clear -- only the employee price is given. Were these editions available in stores?

Re: Anniversary Editions

*Message #2 Posted by **Don Shepherd** on 11 Oct 2010, 9:04 a.m.,*
in response to message #1 by Webunit

Me too. I think the 32S 50th is more likely to be appreciated by scientific professionals so they've gotten snapped up and help onto. The 14B 50th calculators are more "liquid". Wlodek wrote this in the early days of ebay, when the dynamics were quite different and there were fewer HP calculator collectors.

I agree, I only got a 14B 50th for a resonable price at ebay, so the "normal" one is still missing in my collection.

Same with the 32S at ebay, I bought a normal one in used condition with German manual for 40 EUR some years ago. About one or two years later I got a 32S 50th in excellent condition with German manual and 50th edition box for 50 EUR. I bought both calculators somewhere around 2005 and later, so in a time where the Pioneers, especially the 32SII went out of production and from the dealers stock.

I really miss the times (< 2003) where you got a 32SII in good condition for ~35 EUR or below. :)

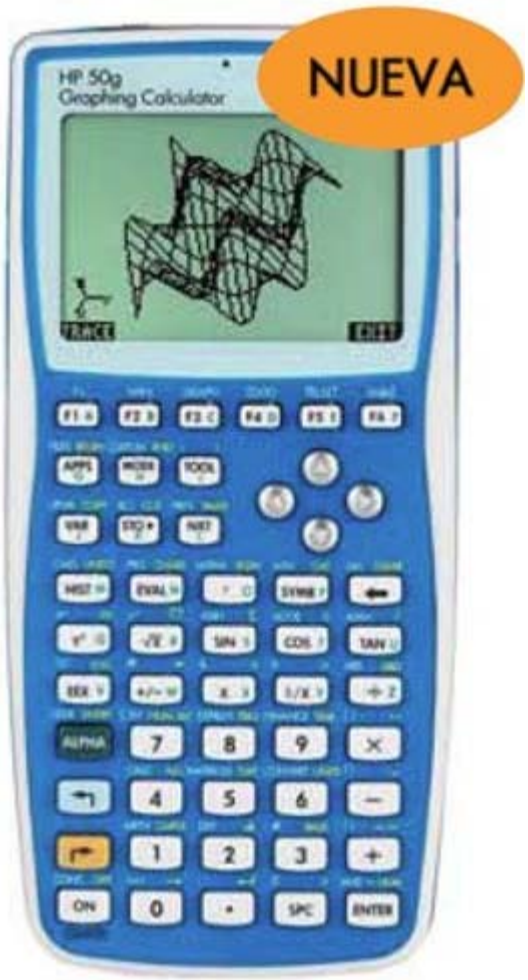
New model HP 50g Blue

*Message #1 Posted by **Pablo P (Spain)** on 10 Oct 2010, 12:27 p.m.*

I have found this file. It is from an official HP dealer in Spain:

http://ictiberia.com/datosftp/calculadoras/imf_1-ListaPrecios_sept2010.pdf



Re: New model HP 50g Blue

*Message #2 Posted by **Namir** on 10 Oct 2010, 1:20 p.m.,*
in response to message #1 by Pablo P (Spain)

That would be a cool color to have!!

Tim!!! Can you bounce of a few blue 50G my way!!

:-)

Namir

PS: My request reminds me of an Iraqi proverb "It is costly yet the demand is so cheap!"

I don't get it. A SciCalc for Teletubbies or Smurfs?

Perhaps the marketing department heard about "color" calculators and wanted to get into the action.

Old wine, new bottle.

Looks to me HP is doing a "If we can't beat them, we'll join them". I can walk into my local Wal-Mart and buy a TI 84 in any color I want, blue, green, yellow, red, purple, orange, pink, silver, white or black.

Re: New model HP 50g Blue

*Message #5 Posted by **Egan Ford** on 10 Oct 2010, 1:53 p.m.,*
in response to message #4 by Richard Garner

I wonder how TI knows how many of each color to make. It probably does not matter. The TI tech is so old that they probably make 90% profit on each unit and can take a loss on unpopular colors.

I am also curious as to 'why' make colors. My kid never got a choice throughout middle and upper school. It was always, "you must have this flavor of TI". Perhaps all the popular kids have a certain color and if you do not have that color then you are a loser, so you have to secretly 'lose' it and then get your parents to get you a new one. Of course the popular color then changes and the circle starts over again. Brilliant and evil. :-)

Perhaps the 50g not only needs to come in a rainbow of colors, but in patterns too, with rock-star, athlete, and Bill Nye the Science Guy endorsements.

HP's been there, done that: 39g, 49g, etc.

*Message #7 Posted by **Tim Wessman** on 10 Oct 2010, 2:11 p.m.,*
in response to message #1 by Pablo P (Spain)

This was in response to a specific request by retailers for a different color option. The color option also needed to be a bright and colorful one per request (zing and pop on the shelf. . . :-( ). The old model is still there and is not being replaced, but the blue is an *option* in this one region.

More than anything, it is an experiment to see if there is need/desire to do multiple color options for units later on in the life cycle. It has nothing to do with "not being able to beat them", but rather the fact that retailers want (demand?) constant refresh on products even if they are identical. It helps them move more units.

This represents nothing like a shift in strategy, a new future direction for colors or anything like that. If you don't like or want the blue, good! Neither do I, and the good black is still available.

However, there may be some who do want a brighter option and the color is the driving factor in choosing to buy it. It also makes the channel happy, and when you get right down to it *they* not the end user is the direct customer for what we, or almost any other product manufacturer sells.

TW

P.S. I would buy a Bill Nye calculator. He is one awesome dude! :-)

You should. Careful choice of a colours determines readability, discrimination of different sets of labels, etc., i.e. usability. That said, a dark background colour seems a good choice since 1972 at least.

Re: New model HP 50g Blue

*Message #10 Posted by **gene wright** on 10 Oct 2010, 5:49 p.m.,*
in response to message #9 by Walter B

I have no doubt that HP considers color choices these days. The colors probably look fine and, since they are not doing away with the original scheme, no big deal.

More units sold is a good thing.

Point taken - I prefer the original colour scheme because it is legible. My initial post was a bit of a knee jerk reaction...

Re: New model HP 50g Blue

*Message #12 Posted by **Steve Leibson** on 10 Oct 2010, 6:19 p.m.,*
in response to message #8 by Michael Plant

Reminds me of something Motorola said several years ago: "If we'd known how popular and how profitable alternative case styles would be for our cell phones, we would have gone into the plastics business."

Engineers don't care what color their caluclator is. 99% of the public shopping at Target or Office Depot or Staples thinks "That's a nice color. I'll buy the blue one."

Re: New model HP 50g Blue

*Message #13 Posted by **Bruce Bergman** on 10 Oct 2010, 6:31 p.m.,*
in response to message #12 by Steve Leibson

Steve, that's so true. I offered to buy my niece a TI-84 (needed for class, and HP wasn't "cool" enough for her) but she was lukewarm about it. When I found the version with the replaceable faceplates and one was purple, then it was "okay! I want that one!". So color does make a difference to kids these days.

Thanks,

Bruce

Color does make a difference to me. The incredibly poor color schemes of the Pioneers, the HP 48SX, the HP 48GX, and others are horribly incompetent and very poorly human-factored designs that seem to have been dedicated to selecting very worst low-contrast, miniscule, "left-coast artsy", ugly color schemes and key labeling in place of the excellent practical designs of earlier HP calculators. HP engineering really dropped the ball if it did not care about the colors that incompetent industrial design and marketing clowns established for the Pioneers and later.

This new blue HP 50G follows that same path of low-contrast illegibility. One hopes there's enough common sense even in Europe to sink this horror, and to do so promptly.

Years ago, when I was much younger, low-contrast illegibility was not a problem. Today it is a factor I can no longer ignore. IMHO HP only got this right once. I can always use my 39GS without trying to find my glasses. The white keyboard background is perfect for contrasting the key legends. So I really consider color important and I would prefer a white keyboard background. The Casio 9860G slim also has a light gray background. The 39GS and the 9860G are the only 2 calculators I am able to easily use anymore.

It certainly does if you're a business and people WANT different colors. The original Model A (T?) came only in black, but that was only long enough that people wanted other colors.

Serving the customer, regardless of whim, is definitely acceptable.

(IMHO)

Thanks,

Bruce

in response to message #18 by Walter B

Yes, the SX has a color schema with relative high contrast, so there should not be any problem. The left-shifted keylegends on the GX are not too good, but at least the layout is more consequent and logical than on the SX.

Maybe the initial 49g (aka FHB) was meant, with blue and dark red legends on a metallic blue surface, or the initial 12c platinum with alu kbd overlay, which has light yellow shifted legends printed on it. The person(s) who chose _those_ unergonomic color combinations should instantly get fired.

And since we're at it: The shiny surface incl. display cover on the disappointing 30b is not very ergonomic, too. However children seem to like shiny surfaces and colorful devices;-)

> Quote:
>
> The incredibly poor color schemes of the Pioneers, the HP 48SX, ... are horribly incompetent ... "left-coast artsy", ... in place of the excellent practical designs of earlier HP calculators.

And the curious thing about that statement? The schemes/designs were fundamentally *the same*: White, yellow and blue (in that order) function legends on a dark background (black or dark brown) were used on the HP-48S/SX as well as all Pioneer series except the HP-22S, HP-27S, and later HP-32SII -- just like their immediate non-RPL predecessors HP-41, HP-71B, and Voyager series. (Silver letters for alpha input were used on the HP-32S/SII.)

Yes, the HP-28C, the HP-48G, and later HP-32SII used different color schemes including 'designer colors'. The HP-22S and HP-27S omitted very-legible yellow, but followed the scheme otherwise.

Mike, I agree with you that the "white, yellow and blue on a dark background" scheme was ideal and should have been retained. However, your continual repeating of the same opinionated misinformation is a disservice.

HP-34C appearance and usage

*Message #32 Posted by **Karl Schneider** on 15 Oct 2010, 2:22 a.m.,*
in response to message #27 by John B. Smitherman

John --

Absolutely -- the HP-34C had great looks, as well as a superb 3-color manual and groundbreaking capabilities. Aside from several design flaws that degraded reliability, it was also kind of a chore to use. With only 30 keys and two slide switches, three shift keys were necessary to cover all of its functions.

- Every math function except basic artithmetic required use of a shift key.
- The black-shift function labels were hard to see on the side of the 'tall keys' similar to those of the HP-67 and the early HP-41.
- Only two NiCd cells served a power-hungry LED display, with no auto-shutoff.
- The slide switches (ON/OFF; PRGM/RUN) needed occasional lubrication, which required disassembly.
- No annunciators were provided for angular mode, or for anything else other than battery charge.
- No entry-correcting backarrow was provided.

GSB, GTO, and labels A and B were unshifted. Perhaps it was believed that the typical user would be a programmin' demon...

All of these problems were addressed in the HP-11C, and the HP-15C subsequently eclipsed both. It goes to show how H-P's engineers of that era were thinking "how can this be done better" wherever possible.

Re: HP-34C appearance and usage

*Message #33 Posted by **John B. Smitherman** on 15 Oct 2010, 9:26 a.m.,*
in response to message #32 by Karl Schneider

The labeling was very legible. The placement of the Enter key on the left with -, +, x, and / directly below suited me.

Being able to use it to program saved many trips to the computer center at school.

Yes, the shift keys are needed quite a bit. I've had no mechanical problems with mine and still use it

with 2 AA batteries.

Regards,

John

*Message #2 Posted by **Martin Pinckney** on 9 Oct 2010, 11:28 p.m.,*
in response to message #1 by Hugh Evans

OK, I give up, what's the connection?

According to Finseth's site, the 42s was introduced 10/31/88 (U.S. style date). That will be 22 years ago.

Now we could have celebrated the introduction of the 22s on 6/1/10. If anyone cared.

Re: 10/10/10 Happy 42 day!

Emulator CPU usage

*Message #1 Posted by **Martin Pinckney** on 9 Oct 2010, 10:02 p.m.*

I've noticed that when the 41c emulator by Harassed Programmer is active, the CPU usage meter on my laptop stays over 50%. By comparison, with the Emu48 by Christoph GieBelink it may be only around 5%.

Has anyone else observed such behavior? Why such heavy demands from such a small program?

I have an HP TC4400 running Windows 7 Professional.

Re: Emulator CPU usage

LOL^2 ... "Harassed" (= "To irritate or torment persistently")

I should probably don't bother to answer but anyway ... My HP-41E for Windows is very old program and some parts of it could be coded much better, going to sleep while waiting for a key, for example. But I used it only as a test/development platform for my emulators running on HP-48GX/49G, so I didn't bother to fix it.

Use V41 by Warren Furlow, it is much better. As far as I can remember, link to his site should not be posted here, but you can Google for it ...

Best regards.
Harassed Programmer

Production Dates HP41CX Fullnut vs. Halfnut

*Message #1 Posted by **Frido Bohn** on 9 Oct 2010, 11:39 a.m.*

Hi!

I'm just wondering when the production of the HP41CX Halfnut started. I just got a Halfnut as far as I can determine without opening by its rounded display for which the contrast can be changed. The back looks for me like of a HP41C/CV where the ALPHA keyboard is shown (the "true" 41CX shows the display of the Edit menu). The serial number shows 2339S41xxx, and for my taste 1983 was just the introduction of the Fullnut. Concluding, I suspect that the calculator was "refurbished" with a back of a 41C/CV.

Has somebody a clue about this finding? Could that engine I have be an original despite of that back?

Kind regards

Re: Production Dates HP41CX Fullnut vs. Halfnut

*Message #2 Posted by **Mike Morrow** on 9 Oct 2010, 10:34 p.m.,*
in response to message #1 by Frido Bohn

I don't know what you mean when you write: "the ALPHA keyboard is shown (the "true" 41CX shows the display of the Edit menu)".

That is an incorrect assertion.

I have the HP-41CX that I bought new in early 1984 (2403Sxxxxx). Its back shows the keyboard ALPHA assignments. Mine is very definitely a "true" HP-41CX.

I believe you have a machine that started out as an HP-41CX fullnut, then was subsequently HP-repaired with halfnut internals.

Re: Production Dates HP41CX Coconut vs. Halfnut

*Message #3 Posted by **Garth Wilson** on 10 Oct 2010, 12:55 a.m.,*
in response to message #1 by Frido Bohn

According to and article entitled "HALFNUT -- AN INTERNALLY IMPROVED HP-41C,CV,CX" by Richard Nelson and Jeremy Smith in the CHHU Chronicle V2N4 (Jul/Aug '85):

"Halfnut is a code name given to the engineering effort of redesigning the HP-41C, HP-41CV, and HP-41CX to improve its manufacturability and reliability. The code name is a hold over from another engineering project started in the summer of 1983 to investigate a product similar to the HP-41, but only have half the number of ports. Since the four-port HP-41 was code named "Coconut," it was natural to call a two-port version "Halfnut." There are stories around that say Halfnut got its name from a goal to reduce the IC count by half, or to cut the manufacturing cost by half, etc.. I don't know how the older product variation project turned into a manufacturing-improvement project, but certain secrets of HP's internal operation are never known."

It says coconuts could get replaced with halfnuts in the repair service, but HP did not make any halfnut announcements.

So again, work on it started sometime after the project that started in the summer of '83 got changed, and they got it to market in '85 and stopped selling coconuts at that time. There never was a "fullnut."

*Message #4 Posted by **Frido Bohn** on 10 Oct 2010, 5:30 a.m.,*
in response to message #1 by Frido Bohn

Mike,

I'm sorry about the somewhat imprecise description of the 41CX's back.
What I refer to as "Edit label" is printed in white with most remarkable changes on the row where the shift key is.
There shows "|-, INSERT, GTO, REC" as shifted assignments of the "K, L, M, SST" keys.
In contrast, on the 41C/CV the print color was orange with "APPEND, ASTO, ARCL, BST" on the shifted keys of the shift-key row.

Gart,

you are correct, the designation "Fullnut" never was an official designation of the early HP41CX.
According to a list "All of HP's Calculators – In "reversed time" Order" by "Richard J. Nelson, Jake Schwartz, & Wlodekz Mier-Jedrezjowicz" which (re-)appeared in the HP Calculators Newsletter of Aug 2010 (HP Solve #20 Page 23-24)
the designation of the HP41CX was "Honeynut" and of the HP41C was "Coconut".
The designation "Fullnut" was a logical deduction; if there was a "Halfnut" there should be also a "Fullnut".
And it appears to be a pretty solution to make the destinction between both versions of the HP41CX.

The explanation that an HP41 was replaced by the customer service with a new model seems to be plausible.
However, I wonder whether only the top has been changed in such a procedure leaving the back as it was before,
so the customer would have a repaired calculator with the serial number of the machine he sent to HP.

By the way, the weight of both calculators (without batteries) differ with about 12% more for the Fullnut:
Fullnut: 149g (5.256 ounces)
Halfnut: 133g (4.691 ounces)

Re: Production Dates HP41CX Fullnut vs. Halfnut

*Message #5 Posted by **Mike Morrow** on 10 Oct 2010, 10:36 a.m.,*
in response to message #4 by Frido Bohn

My apologies, Frido, for my ignorance of that distinction between the various backside labels of the HP-41 series. I've owned a HP-41C since 1980, and a HP-41CX since 1984, yet I never took notice of that difference before. Thanks for your precise explanation!

With respect to the desciptive labels "fullnut" versus "halfnut", I believe that many (myself included) use the terms exactly as you describe...not as a reference to a particular HP project designation, but only as

CLEARLY descriptive and unambiguous terms for the two major versions of HP-41 internal configuration.

So, there is an element of mystery to the HP-41CX that you have. The cited serial number could apply to a very early HP-41CX. Is it possible that these came from HP with the earlier HP-41C/CV backside label? Someone here who owns a HP-41CX with an even earlier serial number could answer that question.

I am always impressed by the natural curiosity that HP Museum members have, particularly with respect to the lineage of specific calculators. While not nearly as adroit at understanding the varieties of HP-41CXs, this thread caused me to look more closely at one I recently acquired from TAS.

The front label clearly shows "41CX." The display however, does not have the easily identifiable rounded corners of a CX, but rather the full, sharp cornered display of the earlier models (as an aside, I like this better anyway). Catalog 1 shows 219 registers, as I would expect on a default setting of a CX. The back label has the white label "INSERT, GTO,..." descriptions above the L and M keys as the shift functions. Yet the serial number is "251454nnnn" seemingly indicating a much newer model or production run.

While a bit confused by this all, I am simply happy to have a 41 again!

*Message #3 Posted by **M. Joury** on 8 Oct 2010, 10:57 a.m.,*
in response to message #2 by hpnut

If it supports the same development environment as the fx-9860gII that can be fixed. I looked at the Casio site and there is not a whole lot of information available on it. Just that it has a (very) high resolution color screen, what the memory limits are, and the battery life. Nothing more that I can find.

*Message #6 Posted by **Nigel J Dowrick** on 8 Oct 2010, 11:00 a.m.,*
in response to message #1 by Tim Wessman

Judging from the icons in the display the built-in software looks similar to the current 9850/60 series. The display resolution is good, but the power consumption is 0.6W - will students put up with a calculator likely to go flat in an exam?

Still, all credit to Casio for continuing to produce new models, even if this one is aimed squarely at the educational market. It looks nicer than the NSpire machines ...

Nigel

Re: [OT] New Casio Grapher

in response to message #6 by Nigel J Dowrick

I am not sure about Casio's battery test scenarios but the battery life on alkalines appears to be 3 times that of the 50g which, according to spec, has a battery life of around 50 hours typical use.

Re: [OT] New Casio Grapher

*Message #8 Posted by **Katie Wasserman** on 8 Oct 2010, 11:30 a.m.,*
in response to message #6 by Nigel J Dowrick

> Quote:
>
> but the power consumption is 0.6W

This appears to be the peak power consumption. They have a very detailed spec on battery life under different scenarios in the other link posted. Like most color, back-lite, LCD screens devices the brightness level is the main determinate of battery life. However at the lowest setting (most of the time) they claim 250 hours from 4xAAA alkaline cells. That works out to roughly .025W power consumption.

For comparison, the fx-9860g slim says .3W power consumption on the back label but I measure a peak power of only .2W (with back light on and running a program loop). The back light itself draws about .03 watts. I think this new machine will be just fine power-wise. I use my fx-9860g slim quite a lot often with the back light on and don't find myself changing batteries often at all.

-Katie

Casio Prizm fxCG10 looks great @ US$130

*Message #13 Posted by **db (martinez, ca.)** on 8 Oct 2010, 8:07 p.m.,*
in response to message #12 by Martin Pinckney

Martin; It worked for me when i posted, but not right now either. It's the formula for a symmetric parabolic curve. The algorithm for a non-symmetrical vertical curve would be a little more complicated but i wouldn't mind. Like most surveyors; i'm just so grateful to have any curve.... The link is: http://img2.moonbuggy.org/imgstore/civil-engineering-reference-wallpaper.jpg

Re: [OT] New Casio Grapher

*Message #14 Posted by **Martin Pinckney** on 9 Oct 2010, 6:26 a.m.,*
in response to message #13 by db (martinez, ca.)

Not to be argumentative, but the curves appear more circular than parabolic to me. I am a hands-on kind of engineer, but for some types of problems, I am restricted to visual observations only. So yes, the new Casio might prove valuable in this case.

Ceterum censeo: Walter, compile a 34s!

:-)

Re: [OT] New Casio Grapher

*Message #19 Posted by **Walter B** on 8 Oct 2010, 12:18 p.m.,*
in response to message #18 by gene wright

LOL

Gene, I'm sorry I can't do this since having neither Linux nor a Mac. And though having done quite a lot of SW earlier, I did my last real SW project some 20 years ago using Pascal at that time. That's the reason why I took the documentation job in the 34S project d;-)

So this compilation is gladly left for other people. How are your results so far?

Re: [OT] New Casio Grapher

*Message #20 Posted by **Tim Wessman** on 8 Oct 2010, 12:05 p.m.,*
in response to message #16 by Martin Pinckney

Not dismissed at not feasible (although not on any saturn code based machine - it took 6 months to make the 49g+ use the top of the screen for most things and that was the most *simple* task), but rather there is a big tradeoff with both power and cost.

TW

Re: [OT] New Casio Grapher

*Message #21 Posted by **Pablo P (Spain)** on 8 Oct 2010, 12:39 p.m.,*

Re: [OT] New Casio Grapher

*Message #22 Posted by **Hal Bitton in Boise** on 8 Oct 2010, 1:27 p.m.,*
in response to message #1 by Tim Wessman

Great display for sure...very eye catching, very flashy. But I notice the numerical range is only 9.9x10^99 to 9.9X10^-99. Do you suppose it has infinite numerical precision for integers, etc. Is there a decent CAS behind all that flash?

Re: [OT] New Casio Grapher

*Message #23 Posted by **Tim Wessman** on 8 Oct 2010, 1:31 p.m.,*
in response to message #22 by Hal Bitton in Boise

Nope.

From what I can tell, it is essentially the same SW in a 9860 with a bit more bling.

TW

Re: [OT] New Casio Grapher

*Message #24 Posted by **Ron Ross** on 8 Oct 2010, 2:32 p.m.,*
in response to message #23 by Tim Wessman

Along with the huge variable count of 28 variables ie single letter variables with theta and gamma or some such combination.

Truthfully, I feel that Hp SHOULD release an Hp 43s. A high end pocket calculator with I/O. Use the ROM of the Hp 50G, but gut the graphics (or include a VGA or DVI port as discussed later). Give it an okay LCD with 2-4 levels (with softkeys, just like the Hp 42s or 48G). Such a system would be able to use the huge library of existing 48G type programs if rewritten for the smaller screen.

Such a pocket calculator would be a great pocket companion for the technical field engineer. I/O could and should include an SD slot, usb slot and a small VGA or DVI type port so that graphics can be used by those that feel a need to have this capability. I feel it is a nice to have feature, but I have never used the graphics on my own Hp48g (but that could be because the Hp48G is notoriously slow to graph). Now, as a professional, I would never bother to use the graphics of a lowly calculator as I could use my PC to generate a better graph that could be printed out for reference too.

And Hp can't afford to go cheap on the keyboard. It has to be at the same standard or quality of the Voyagers or Pioneers.

Edited: 8 Oct 2010, 2:51 p.m.

It looks a bit too large for a shirt pocket... even Mr. Hewlett's one.

Re: [OT] New Casio Grapher

*Message #27 Posted by **Chuck** on 8 Oct 2010, 8:09 p.m.,*
in response to message #26 by Andrés C. Rodríguez (Argentina)

Ah, big for now, yes. But a clamshell version like my FX-9860g Slim would be most desirable.

And seriously, even though I've used HP's since 1980 and probably have over 35 HP's I've completely come to the conclusion that HP will NEVER come out with a fantastically (not just good or passable) quality calculator. The 35s was about 20% there, the 30b is about 25% there, as are the 49's, and 50's. They are now all button adorned dust collectors up in my garage.

Man will never walk Mars; dinosaurs will never walk Earth again; and HP will never create a quality scientific calculator. Things go extinct every now and then. Sad, but true. HP, I'm afraid, is losing the race, unfortunately.

Re: [OT] New Casio Grapher

*Message #28 Posted by **Csaba Tizedes (Hungary)** on 10 Oct 2010, 8:28 a.m.,*
in response to message #1 by Tim Wessman

Variable names: A...Z -> !FAIL! Dashed triangles, double arrows and other hieroglyphs in program lists -> !FAIL! Many info in handbook, no problems from real life -> !FAIL! No camera -> !FAIL! No strings (just 20 I-dunno-whats-this-really) -> !FAIL! Very impressive soap box without brain -> !FAIL! When I will pass all my exams this unit will be useless in professional life -> !FAIL! No SDK -> !FAIL! No C, C#, Python, Java -> !FAIL! No MP3 -> !FAIL! No DivX support -> !FAIL! No GSM/3G support -> !FAIL! No WiFi -> !FAIL! No GPS -> !FAIL!

I hope this was a test product from CASIO.

If the next will be...

same as clever as HP15C and 42S and 48SX AND will be friendly for students like as TI89 AND small as SonyEricsson Xperia X10 Mini AND looks like CASIO fx-CG10 (haha)

...thats will be the perfect calc.

Some missing things:

- able to fit parabolic equation with zero (or any given) slope in one given point - able to fit a function on a subset of measured data (simple check the given interval on the graph (xmin...xmax)) - able to make photographs and use it to measuring - and so on...

Re: [OT] New Casio Grapher

*Message #29 Posted by **Katie Wasserman** on 10 Oct 2010, 10:08 a.m.,*
in response to message #28 by Csaba Tizedes (Hungary)

While I agree with you about the variable limitations and weird programming language, I think for what it is (based on the 9860g) it's quite a nice calculator. No MP3 player, GPS or ice crusher but it's not claiming to be a do everything device. I do think that a simple camera would be perfect in this given what it's main selling point is. On the other hand... it does have an SDK (again, based on the 9860g), a pretty nice one that lets you create your own applications that can share variables with the built-in ones.

> I do think that a simple camera would be perfect in this given what it's main selling point is.

It would make stealing tests easier. :-)

I'm assuming the Casio displays your pic, and you place an 'X', then the next 'X', and so and and then you say, "find a curve". Interesting, perhaps someday I can have an augmented reality app for portable devices that would show the mathematics of the real world in real-time.

http://edu.casio.com/products/cg_series/data/fxcg10_20_E.pdf

Here is the thread: http://www.silicium.org/forum/viewtopic.php?f=46&t=27385&start=0

Re: [OT] New Casio Grapher

*Message #32 Posted by **Katie Wasserman** on 11 Oct 2010, 5:59 a.m.,*
in response to message #31 by Marcus von Cube, Germany

Marcus,

Thanks for that link. After a quick read of the manual I find this new machine somewhat disappointing. Casio just:

```
- added commands to deal with the color display
- a geometry application
- an image/plotting application (the advertised feature)
- metric conversions are now a built in application
- more statistics functions (and in their own application)
- better support to editing programs on a PC and transferring them to the calculator
```

Otherwise it's an fx-9860g II. While that's pretty much what I expected I was hopping for more programming improvements.

in response to message #32 by Katie Wasserman

Katie, have you figured out why the fx-CG10 is the North American version, and the CG20 is everywhere else? Also why the CG10 lasts 140 hours on battery versus 85 with the CG20? Doesn't seem like the specs lend to this disparity.

CHUCK

Re: [OT] New Casio Grapher

*Message #39 Posted by **Katie Wasserman** on 13 Oct 2010, 12:27 a.m.,*
in response to message #38 by Chuck

I think that the battery life spec is simply confusing to read and the both models have either 140 hours or 85 hours of battery life depending on usage patterns.

Casio notes that the CG10 is for the North American market while the CG20 is for the rest of the world. Significantly they also note that the eActivity screen shots and others saved on a CG20 can not be read on a CG20 but the reverse is not true and that Casio supplied images file can be read by either version. Other than that the manual mentions no differences between the two models. The distinction seems like it might be some sort of copyright infringement avoidance issue -- it makes no logical sense to me.

Re: [OT] New Casio Grapher

*Message #40 Posted by **Chuck** on 13 Oct 2010, 1:31 a.m.,*
in response to message #39 by Katie Wasserman

The battery discrepancy sounds plausible: same for both, but dependent on the type of battery being used. I'm surprised it's not the other way around since there has already been an awesome Casio CG10 sold here about 30 years ago. :) Course maybe it wasn't available in the states.

Casio CG10

Re: [OT] New Casio Grapher

*Message #41 Posted by **Jimi** on 13 Oct 2010, 4:22 p.m.,*
in response to message #1 by Tim Wessman

Very nice looking. I'd be interested in playing with one for sure.

My big thing on the current crop of calculators is readability, and ALL of the current batch of graphers is pretty poor. Shitty contrast, no backlight. My 48 is better than most, since at least the font size is larger. The TI89 is horrible for me unless in bright light conditions. The problem with the lighting, is that almost every class I'm in now is using projectors for lecture, and all dim the lights to some level. While writing isn't a problem, doing anything on the calculator is.

About battery life. If you're going in for your PE exam, SAT, whatever, you'd be smart to throw a new set of batteries in there. Just saying. The extra few dollars is trivial to the consequences.

41C Memory Module 82106A Check / Test

*Message #1 Posted by **AlbertTocarLoseggs** on 7 Oct 2010, 4:38 p.m.*

Hi again fellows,

I´d like to check / test an HP-82106A Memory Module for failure. Does exist a program, embedded function or standard procedure available and useful? I suspect a malfunctioning behavior, unfortunately. Many thanks!

BTW, the Card Reader / Writer was successfully repaired and it works great after almost 26 years of inactivity. HP quality is amazing! The gummy wheel was replaced by a medical silicone tubing: it fits and works perfect! "Gracias" a lot Karl-Ludwig Butte.

Albert

in response to message #1 by AlbertTocarLoseggs

If I am not mistaken, the service module can test the memory module. You will need either the real module (not common), or have an image of it loaded in some ROM emulation device.

The memory module loads itself in upper memory and becomes data memory by default, you can resize if you want to. I do not remember how many registers you should have (each module adds 64 registers), but if you find out, you can always write an RPN program put various numbers in it and see that they are recalled properly. Unfortunately, it is not easy to test with arbitrary bit patterns this way.

*Message #3 Posted by **Diego Diaz** on 9 Oct 2010, 3:21 p.m.,*
in response to message #1 by AlbertTocarLoseggs

Hi,

If you're handy with a solder iron, I'll gladly send you the internal circuit of the 82106A module so you can replace the defective one.

Let me know if you're interested.

Best regards.

Diego.

Batteries for 9114A/B

*Message #1 Posted by **M. Joury** on 7 Oct 2010, 4:09 p.m.*

If anyone is looking for a replacement battery for the HP-9114A/B HP-IL disk drive this appears to be a good solution. I picked up three of them recently and they are a drop in replacement at a higher (claimed) capacity rating than the original.

http://www.atbatt.com/sealed-lead-acid-batteries/b/panasonic/m/lc-r062r4pu.asp

The usual disclaimers apply -- I am not affiliated in any way... etc, etc.

Function Tree for HP48/et al.

*Message #1 Posted by **Thomas Chrapkiewicz** on 7 Oct 2010, 2:23 p.m.*

Hello:

In my frustration in finding my way through the (different) menu structure of the HP49/50 (relative to the HP48), it has occured to me - has anyone drawn up a function tree diagram for the HP48? [That is - showing the tree/branches below the MTH menu, the PRG menu, etc...]

I've searched the HP documents, the web, hpcalc, hpmuseum, Donnelly and Wickes texts and have found nothing.

Regards, TomC

in response to message #1 by Thomas Chrapkiewicz

Hello,

the HP 48G/GX Pocket Guide by Chris Coffin & Thomas Dick, published 1996 by Grapevine Publications, ISBN 0-931011-45-0 , offers what you want, and much more.
Looks similar to the 49g pocket guide (no wonder, AFAIK it was made by the same people;-)

Maybe one of the online HP dealers still has a copy.

HTH

Need help evaluating results of implicit differentiation.

*Message #1 Posted by **Hal Bitton in Boise** on 7 Oct 2010, 9:40 a.m.*

Hi everybody,
After I do implicit differentiation on my 50G, and solve for d1y(x), I have my result, which is d1y(x) = expression in terms of x and y(x). So far so good. Now I want to plug constants in for x and y(x) and evaluate my derivative at a point. This is where I'm having trouble. I can't store a constant in the variable y(x), because that is apparently not a valid variable name. I tried using the define command to create a user function setting y(x) equal to a constant ..IE y(y(x))=3 , but that did not seem to work. Is there any way to tell the calc that y(x) is equal to 3 when evaluating the results of my implicit differentiation?
Thanks, and best regards, Hal

Re: Need help evaluating results of implicit differentiation.

*Message #2 Posted by **Crawl** on 7 Oct 2010, 12:23 p.m.,*
in response to message #1 by Hal Bitton in Boise

It seems like the easiest thing to do would be to go into Equation Editor, select Y(X) with the cursor, and replace it with 3.

However, I can imagine situations where that wouldn't work (if there are a lot of Y(X)'s in the result and it would be tedious to replace them all by hand, or if you wanted to automate it with a program).

So here's another way. When you have your expression, enter 'Y(X)' on the stack. Hit DERVX so you have d1Y(X) on the stack (or just enter 'd1Y(X)' to begin with). Then enter some other variable that you're not using, like Z. Then =, SUBST.

Now you can enter 'Y(X)', 3, =, SUBST, and it'll substitute in, leaving the derivative alone (otherwise, it thinks you're saying Y(x) is the constant 3, so its derivative is 0).

You just have to solve for Z now rather than d1Y(X). Or if you really want it back the other way, 'Z=d1Y(X)' SUBST at the end also works.

Re: Need help evaluating results of implicit differentiation.

*Message #3 Posted by **Crawl** on 7 Oct 2010, 12:43 p.m.,*
in response to message #2 by Crawl

Actually, if you've already solved for d1Y(X)=f(X,Y(X)), and you just want to evaluate the right side, you could just take the right side of the equation and do the 'Y(X)=3' SUBST step.

(You can take the right side of an equation with OBJ->, DROP, DROP, SWAP, DROP)

I was thinking about a more general situation, in which you either haven't solved for d1Y(X) yet, or for which it might be impossible to solve for it (except numerically)

Re: Need help evaluating results of implicit differentiation.

*Message #4 Posted by **Hal Bitton in Boise** on 8 Oct 2010, 1:17 p.m.,*
in response to message #3 by Crawl

Thanks very much. The SUBST command was exactly the function I was looking for. It works perfectly. Best regards, Hal

Dead HP 200LX

*Message #1 Posted by **Chuck** on 6 Oct 2010, 7:52 p.m.*

So, reading the thread below about the 200LX and memory cards I decided to look at what compact flash card I had in my 200LX; removed it, looked at it; replaced it; turned it on and it locked up at the C: prompt.

None of the keys were functional. Took out and replaced a battery, and a horizontal line appeared in the middle of my screen. Now, nothing.....

Did my 200LX just cease to exist anymore? Sad day if it did.

CHUCK

OT: Men and Volts book

*Message #1 Posted by **Pavneet Arora** on 6 Oct 2010, 2:08 p.m.*

During HHC 2010, John Cadick and Jeff Bronfeld regaled us with stories of some great people at General Electric during its early years, Charles Proteus Steinmetz chief among them.

John also mentioned the book ``Men and Volts", which I have discovered is part of the American Libraries collection and is available in several formats at:

http://www.archive.org/details/menandvoltsstory00hammrich

For those who, like me, are enamored with the history of technologies and the personalities who shape it might be interested in giving this a look.

Thanks John!

Best wishes.

OT: HP200LX Mass Storage

*Message #1 Posted by **Gerry Schultz** on 6 Oct 2010, 1:47 p.m.*

Hello All:

From a previous posting, I recently remembered that I had won a 1 MB HP200LX PDA at HHC2009. I've got a CR2032 backup battery in it now and, so far, it works great. I have an old PCMCIA 5-in-1 card reader that fits into the slot on the side and I put a 64 MB SD card in it. In the Setup application, it reports the card battery is okay (as far as I know the card reader has no battery in it.) From the Filer, under options, when I try to format the card, it requests that I want to format A and I say yes, it prompts for a new disk (I am assuming it's in DOS), press enter and it reports Format not supported on drive A:, Format terminated.

I believe the problem is the PCMCIA card I'm using with an SD card is not compatible with the 200LX. I have some Compact Flash memory but that doesn't fit the slot in the side. I have no manuals but I did find one on-line but it doesn't talk much about what kind of memory the 200LX requires that I could find.

So, my questions are, what hardware do I need to have a valid A drive, what is the largest size the 200LX will support, and I would like to be able to move the A drive memory card over to a PC to move files on and off the 200LX as Katie suggested previously so what's the best media type to use? Compact Flash? Using a PC application and a serial cable appears to be a real pain.

Thank you for your suggestions. Gerry

Re: OT: HP200LX Mass Storage

*Message #2 Posted by **Gerson W. Barbosa** on 6 Oct 2010, 2:46 p.m.,*
in response to message #1 by Gerry Schultz

Hello,

I use a CF Type II to PCMCIA adapter and a 256MB SanDisk CF card (model SDCFB, copyright 2000) in mine. You can find a comprehensive table of compatible cards here:

http://www.hermocom.com/en/knowledgebase/hplx/storagecards

Gerson.

Edited: 6 Oct 2010, 2:53 p.m.

Re: OT: HP200LX Mass Storage

*Message #3 Posted by **Chris Randle (UK)** on 6 Oct 2010, 4:36 p.m.,*
in response to message #1 by Gerry Schultz

Try running the HP200's fdisk100 command on the card before you do the format.

Re: OT: HP200LX Mass Storage

*Message #4 Posted by **Bill (Smithville, NJ)** on 6 Oct 2010, 6:55 p.m.,*
in response to message #1 by Gerry Schultz

Gerry,

I think the problem is that you are using a 5 in one pcmcia card adapter. If that adapter was plugged into a standard windows pc, you would have up to 5 additional drives. The HP-200lx doesn't know waht to do with multiple drives the card shows.

My 200lx has always worked with a single card adapter - CF to PCMCIA,and Memory Stick to PCMCIA. Not sure if I've ever seen a SD to PCMCIA adapter. I suggest you get CF to PCMCIA, they work great.

Bill

Re: OT: HP200LX Mass Storage

*Message #5 Posted by **Gerry Schultz** on 6 Oct 2010, 7:48 p.m.,*
in response to message #4 by Bill (Smithville, NJ)

Oh crap, your probably right Bill, I hadn't thought of that. Gerson's link to hermocom.com was what I needed to find what CF cards are compatible with the 200LX, thanks Gerson. I've purchased some CF memory cards and CF to PC Cards type 1 adapters via that other site. It was pretty cheap. I hope they will arrive before my wife and I go on vacation.

Chris, I had read about fdisk100 this morning but I'll have to research how it works. I'm not sure how it's different from a regular fdisk command. Thanks for the suggestion.

Gerry

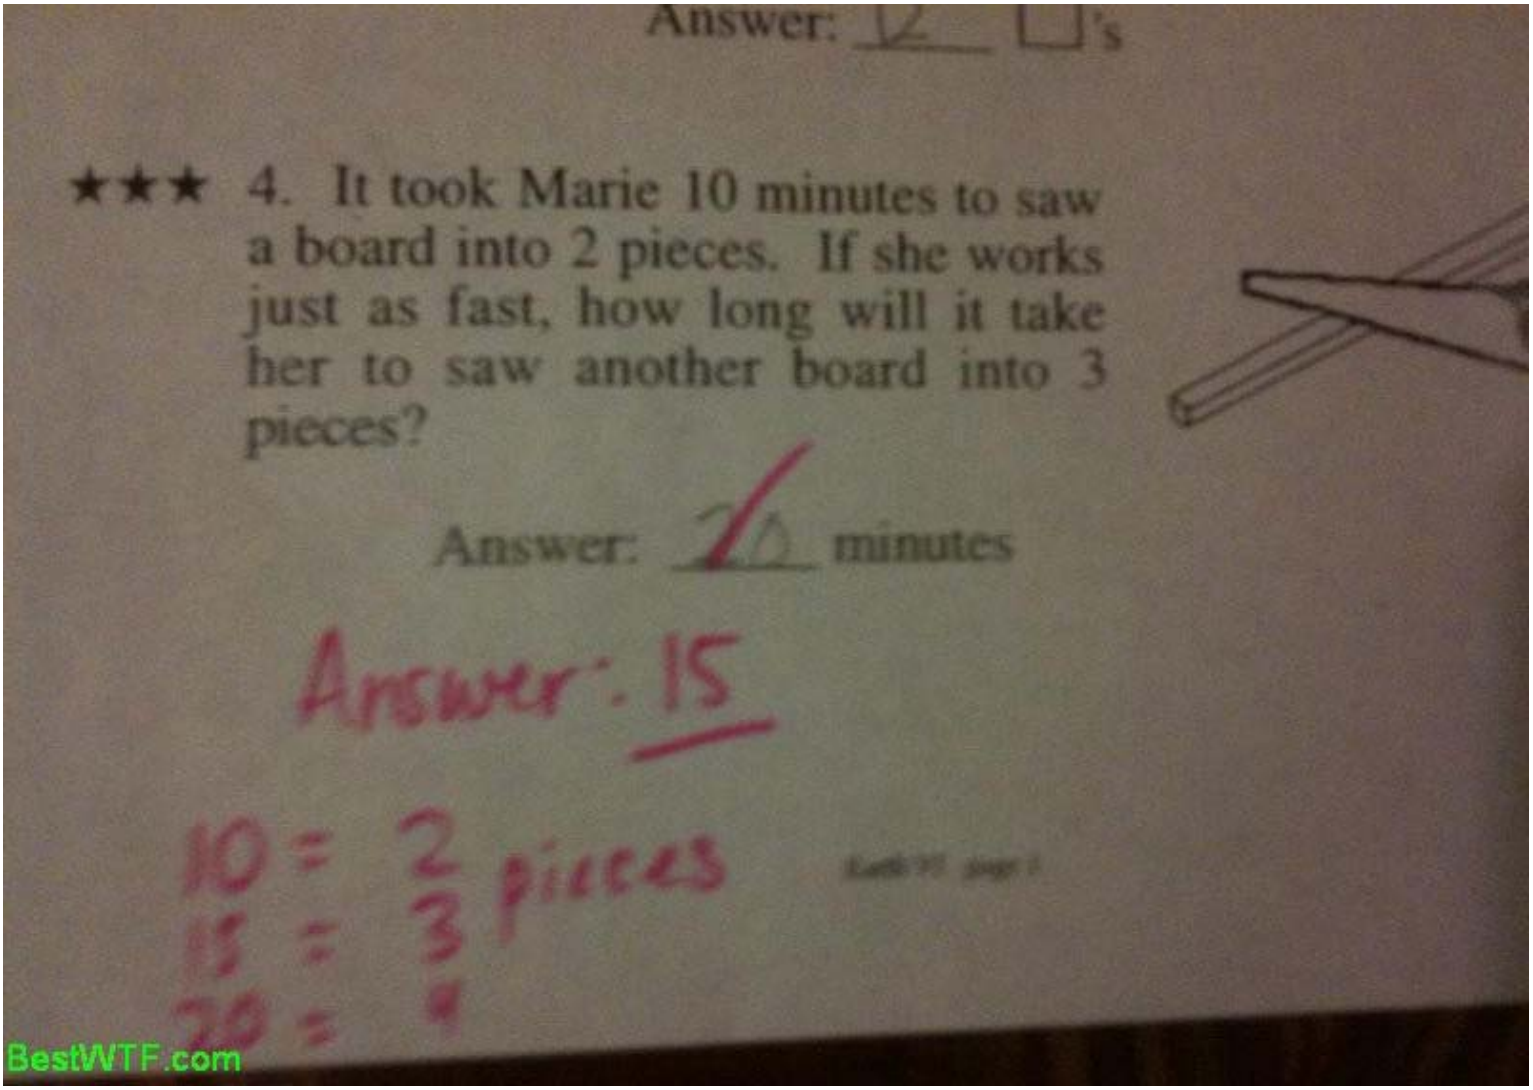
So leaving the board in one piece takes 5 minutes?

*Message #1 Posted by **Egan Ford** on 5 Oct 2010, 5:24 p.m.*



Re: So leaving the board in one piece takes 5 minutes?

*Message #2 Posted by **Geir Isene** on 5 Oct 2010, 5:59 p.m.,*
in response to message #1 by Egan Ford

hehe - and making it disappear takes zero minutes.

Re: So leaving the board in one piece takes 5 minutes?

*Message #3 Posted by **Diego Diaz** on 5 Oct 2010, 11:34 p.m.,*
in response to message #2 by Geir Isene

Hi there,

The real problem is that (many) teachers are no longer able to define a problem in such way that "one" only possible answer is correct.

Since no mention to the size and/or shape of the pieces (nor the original board) has been done, the problem has as many valid answers as one could imagine. Even the one propossed by the teacher!! and of course the one given by the alumn... and whatever Marie was able to saw... :-)

No need for the pieces to be of the same size or shape has been declared in the problem text... so: imagine a square board. Saw it into two identical rectangles. (10 min)

Saw one of these rectangles into two squares (5 min)

15 minutes in total, 3 pieces...

Saw the other rectangle into two more squares (5 min)

20 minutes in total, 4 pieces... sure you've got the idea...

Any amount of pieces can be achieved in any amout of time. In fact, the 10 minutes reference in the problem definition is basically useless since Marie could decide to start sawing a tiny corner... and then another one... or this corner into two pieces... or... whatever.

The more obvious is the one proposed by the alumn, three identical pieces from an original rectangle board require two cuts (20 min)

Agreed, this teacher should have the license revoked.

Cheers from the Caribbean Sea.

Diego.

Re: So leaving the board in one piece takes 5 minutes?

*Message #4 Posted by **Walter B** on 6 Oct 2010, 1:13 a.m.,*
in response to message #1 by Egan Ford

With the picture given the alumn... is definitively "more correct" than the teacher d:-) though I didn't know such a "Kantholz" is called a "board". Consistency is a hard job ... d;-)

Re: So leaving the board in one piece takes 5 minutes?

*Message #5 Posted by **Diego Diaz** on 6 Oct 2010, 2:18 a.m.,*
in response to message #4 by Walter B

Wow, I didn't even notice that drawing on the right!

But certainly this drawing does not show a "board"... may be a "lath".

With this new and valuable info another doubt arises:

Is Marie the right person to run this exercise? (I mean the sawing one)

10 minutes to saw a thin lath!! oh! C'mon!!

;-))

Charging 'classics' from a USB port

*Message #1 Posted by **Katie Wasserman** on 5 Oct 2010, 11:12 a.m.*

I'm not promoting this e**y item at all, 170502089219, just curious if anyone here has tried it. It seems like a good idea even if a bit expensive.

-Katie

Re: Charging 'classics' from a USB port - Careful,Careful....

*Message #2 Posted by **John Stark** on 5 Oct 2010, 11:18 a.m.,*
in response to message #1 by Katie Wasserman

Dear Katie:

I am no electrical engineer, but the calibrated eyeball tells me that there may be excessive current pulled from the USB port resulting in damage to the former, and, if regulated by the adaptor, insufficient current to charge the calculator timely.

My $0.02.

John Stark

Re: Charging 'classics' from a USB port - Careful,Careful....

*Message #3 Posted by **Katie Wasserman** on 5 Oct 2010, 11:41 a.m.,*
in response to message #2 by John Stark

John,

I see no reason why this cable shouldn't work well from an electrical point of view. USB ports are rated at minimum of 500ma, so unless there's something wrong with the calculator any USB port should be able to power it with a lot of current to spare. Most external USB hard drives require a lot more current than a classic calculator does when powering just the LEDs (a card reader will raise the current draw significantly).

I'm most curious about the calculator-side plug. It's looks pretty flaky to me on the closeup picture on the web page that the seller links to.

-Katie

Re: Charging 'classics' from a USB port - Careful,Careful....

*Message #4 Posted by **John Stark** on 5 Oct 2010, 12:15 p.m.,*
in response to message #3 by Katie Wasserman

Dear Katie:

Thanks for the clarification. Did not know of max current rating of USB ports.

John

Re: Charging 'classics' from a USB port - Careful,Careful....

*Message #5 Posted by **PeterP** on 5 Oct 2010, 12:47 p.m.,*
in response to message #3 by Katie Wasserman

Could one build a USB to Calc that works for HP-41 and HP-71 as well? I know the 41 needs 6v but could that gap be bridged savely? the main reason I am asking is that it would provide for a simple way to savely power a bunch of calcs that have volatile RAM-Boxes which need constant current but doing it with Batteries exposes the calc to leaking battery risk...

Thanks for any tips!

Cheers

Peter

Re: Charging 'classics' from a USB port - Careful,Careful....

*Message #6 Posted by **Paul Berger (Canada)** on 5 Oct 2010, 3:06 p.m.,*
in response to message #5 by PeterP

The HP-41 will run at 5V I have a CV that I am using with a homemade ROM box and it runs off of the 5V from the ROM box fed to the calculator on pin 1 of a I/O port.

The HP-71 would be a different story, I just went and tried it and if I connect +5V to the battery terminals (mind the polarity) a base 71 with HP-IL powers on and functions normally.

The adapter input on the 71 is designed for the 8V AC adapter that is also used by some peripherals, however since there is no transformer in the circuit it should work off of DC as well, but you will have the voltage drop of two diodes in the internal bridge rectifier, plus the transistor used to regulate the voltage from the adapter input. I thought that this would drop the drop the 5V input to he point where the 71 would not power on however much to my surprise it did turn on, but the low battery indicator was on and it did not function correctly, the orange f key would come up as 'CAT'.

Edited: 5 Oct 2010, 3:09 p.m.

> I know the 41 needs 6v but could that gap be bridged savely?

The 41-series doesn't need 6 Volts. That's just the nominal (!) voltage of four alkaline batteries. In

real life their voltage may be something like 6.5 V (new out of the box) or 5 V (after some time of use) and finally it's 4 V and below when they're essentially depleted.
HP's dedicated rechargeable battery pack 82120A uses four NiCds that provide 5 V on average and once again 4 V when they can be considered empty. So, if the 41 really required 6 V it would work neither with alkalines (except brand new ones) nor with HP's own NiCd-pack.
BTW, the 41 knows its limits: the battery announciator BAT comes on right at the point when the voltage drops below 4 Volts. That's why I'm also thinking about powering a 41 directly from an USB port. Its 5 V looks just fine here - same as HP's NiCd pack or an average set of alkalines.
Since many cell phones use Mini-USB connectors for their chargers this might be a possible option for a new connector in the calculator case. :-)

in response to message #7 by Dieter

good points, forgot about the 1.2V NiCads. And I love the mini-usb port idea, it would fit just nicely into the side port of the hp41... Maybe I give it a try.

Cheers

Peter

*Message #10 Posted by **Etienne Victoria** on 5 Oct 2010, 3:27 p.m.,*
in response to message #1 by Katie Wasserman

Katie,

I have bought one of these from David a couple of months ago.

My Hp-80 with Ni-Mh has been connected to it ever since.

When in my office, I use the Hp-81 and keep the 80 connected to the USB port through this adaptor.

Excellent slow charging ability. Ni-Mh don't heat up during the charging process. Robust prong design.

Bottom line: perfectly satisfied with this adaptor and will buy a couple of others.

I have NOT tried it with my HP-65s (I use Eneloops in these calculators).

Usual disclaimer applies: "I have no business relationship with this seller nor interest in promoting his products...etc...

...and David is a very kind person IMHO.

Etienne

Repairing HP-67 display

*Message #1 Posted by **Xavier A. (Brazil)** on 5 Oct 2010, 7:21 a.m.*

Hello HP fans,

I recently acquired a HP-67 calculator in very good cosmetic condition. Unfortunately the upper left LED segments all over the display don't lit.

I would like to know if:

1) I could change the display only;

2) I could buy another 'Classic' machine (hp-35, 80, 45, 55) for parts in order to rebuild this function.

Regards

Re: Parsing Object Oriented Expressions with RPN

*Message #3 Posted by **David Hayden** on 5 Oct 2010, 6:18 a.m.,*
in response to message #1 by Howard Owen

For what it's worth, this is basically how an algebraic calculator evaluates an expression that you type. So in a way, even TI's are RPN at heart :).

HP calculators do the same thing when they parse a symbolic expression because symbolics are stored in postfix notation.

Re: Parsing Object Oriented Expressions with RPN

*Message #4 Posted by **Thomas Klemm** on 5 Oct 2010, 12:57 p.m.,*
in response to message #3 by David Hayden

> Quote:
>
> symbolics are stored in postfix notation.

That's why you can't enter something like '(A+B)'. It is stored as 'A B +' and displayed as 'A+B'.

BTW: There's a programm ->RPN in the directory 'EXAMPLE/PRGS' you get when executing the command TEACH. It transforms an algebraic expression to its equivalent RPN-representation.

Thomas

Re: Parsing Object Oriented Expressions with RPN

*Message #5 Posted by **Namir** on 6 Oct 2010, 2:03 a.m.,*
in response to message #1 by Howard Owen

Several years ago I wrote an expression parser that converts an algebraic expression (with variables and

functions) into an array of RPN tokens. This approach allows the re-evaluation of the expression multiple times without having to re-parse each time. It was a fun project in VB .Net.

The program's GUI would list the parsed RPN expression.

I/O vs. Input only

*Message #1 Posted by **David Hayden** on 4 Oct 2010, 6:48 a.m.*

It's my understanding that various exam requirements affect calculator design and that exam administrators are more concerned with what you can bring OUT of an exam than with what you can bring INTO it. In other words, they're worried that you will record the test answers and sell them.

So the other day, I started thinking about a calculator that had I/O (lets say USB) but you could only transfer data INTO the calculator. For me, this would be acceptable. My main use for I/O on my 50g is to transfer programs into the calculator. I do most of my development on a PC with an emulator. Any programs I develop directly on the calculator are small enough that I can copy them onto the PC by hand.

Obviously there are drawbacks, but think of something like the 35s. With 32k of memory, it can hold large programs, but keying them in by hand is a real chore. Would you buy a machine like this with Input, but no Output? Do you use the output capabilities of a calculator? How?

Dave

No output?!?

*Message #2 Posted by **Frank Boehm (Germany)** on 4 Oct 2010, 8:37 a.m.,*
in response to message #1 by David Hayden

My first two ideas:
- print
- use calculator for data collecting (and export to computer)
- backup your programs/data (ever ran out of backup battery power?)

OK, three ideas, and there are certainly more. No way I would ever accept such a crippled calculator. (Not that I would need one, but still...)

Re: No output?!?

*Message #3 Posted by **David Hayden** on 4 Oct 2010, 9:25 a.m.,*
in response to message #2 by Frank Boehm (Germany)

> Quote:
>
> - backup your programs/data (ever ran out of backup battery power?)

I agree that it's important to have backup copies of your programs, but if you do the development on a PC, then the backup is there. Of course this assumes that you do the development on a PC.

Data is another story of course.

My point is that a calculator with input only would still be acceptable on a test and it would be much better

than a calculator with no I/O at all.

My own experience

*Message #4 Posted by **Frank Boehm (Germany)** on 4 Oct 2010, 10:48 a.m.,*
in response to message #3 by David Hayden

It's pretty helpful to have diagrams and formulas pre-programmed - trust me ;)
I'm not sure which test you are targeting, but in school and at university, the range of topics is limited (at least here in Germany), so you could gain lots of time by not having to program your calc during the test. So the best solution would be not to allow programmable calculators.

Re: My own experience

*Message #5 Posted by **Martin Pinckney** on 4 Oct 2010, 2:13 p.m.,*
in response to message #4 by Frank Boehm (Germany)

Typically the tests HP (and others) are targeting are the National Council of Examiners for Engineering and Surveying licensing tests in the U.S., where only specific calculator models are allowed (all with no I/O).

Apparently the exam preparers do not want to be continually coming up with new questions, so they are right particular about guarding the content of the exams.

Believe it or not, there have been actual cases where someone was paid to sign up for the exam, for the express purpose of trying to steal exam questions.

Re: My own experience

*Message #6 Posted by **Walter B** on 4 Oct 2010, 3:28 p.m.,*
in response to message #5 by Martin Pinckney

It has been discussed here several times: this way of dealing with scientific calculators focussed on one country only ignores 95% of the world.

Maybe it's possible to have a full "international" version with I/O and OTOH a crippled with a waterproof orange housing for the "home market"? Based on the price policy experienced in 3 decades I'm very confident the market will tell pretty fast where the profit is.

Re: My own experience

*Message #7 Posted by **Martin Pinckney** on 4 Oct 2010, 5:03 p.m.,*
in response to message #6 by Walter B

Yes, I also suggested different versions of the same calculator - the the I/O version would have universal appeal - but some way to prevent faking the I/O version as the exam version would be necessary - such as your suggestion of a different color case.

Re: No output?!?

*Message #8 Posted by **Maximilian Hohmann** on 4 Oct 2010, 9:41 a.m.,*
in response to message #2 by Frank Boehm (Germany)

Hello!

> Quote:

> - print

Is printing from a pocket calculator really required by anybody these days? I can't remember seeing a calculator printout for at least twenty years...

But I still like the idea of Ti, where you can send your "printouts" to a PC via the "Ti connect" software and include them in documents/reports if required. Of course, this feature still requires the calulator to output data in some way.

Greetings, max

Re: No output?!?

>
> Yes, I think this is a good idea. HP could even make two identical calculator models, one with I/O, the other I only, and give them different model numbers so the test proctors could easily distinguish... no, that would not work, since someone could just change out the top covers.

Re: I/O vs. Input only

*Message #11 Posted by **M. Joury** on 4 Oct 2010, 11:46 a.m.,*
in response to message #1 by David Hayden

Does not work for me. While I do develop on a computer (with those calculators that support this) I will often tweak a program and play around with changes on the calculator. Not being able to get those changes (sometimes significant) back to the computer would be a deal breaker for me.

Re: I/O vs. Input only

*Message #12 Posted by **Han** on 4 Oct 2010, 2:16 p.m.,*
in response to message #1 by David Hayden

Seems to me that I/O isn't really the issue here. Instead, it appears that what you are looking for is a calculator with all of what you need already pre-programmed. But then... this is merely a calculator designed with the specific goal of being used (for example) the professional exams. And such calculators would be severely crippled to someone who needs a "normal" calculator. And even those who do will likely move on to something else once they are done with their exams.

If you think of the problem in this way, I think you will find yourself more willing to agree that no such company would make such a calculator.

Re: I/O vs. Input only

> Quote:
>
> ... it appears that what you are looking for is a calculator with all of what you need already pre-programmed... I think you will find yourself more willing to agree that no such company would make such a calculator.

No, but third party suppliers will take a 35s and do the work for you.

See this, or this.

Re: I/O vs. Input only

*Message #14 Posted by **Crawl** on 4 Oct 2010, 2:47 p.m.,*
in response to message #1 by David Hayden

I do the opposite. I prefer writing programs on a calculator. Why? For all the reasons I normally prefer a calculator -- I can do it anywhere, it's easier to enter stuff (you have a real physical keyboard, etc.)

But if I have a complicated program, I might, after writing it on a calculator, transfer it to a computer and run it on an emulator, to get the speed advantage.

So personally I wouldn't be too interested in this.

Re: I/O vs. Input only

*Message #15 Posted by **Egan Ford** on 4 Oct 2010, 3:45 p.m.,*
in response to message #1 by David Hayden

> Quote:
>
> It's my understanding that various exam requirements affect calculator design ...

I think the exam boards need to wake up. If someone wants to cheat they will find a way. Want to steal a test, install a small camera in any calculator, should be easy. Or go low tech and have your buddy pull the fire alarm.

The real solution would be to put the test on a computer and the computer would have all the tools that you need. Microsoft did this nearly 20 years ago for MS certification. It seems trivial to adopt.

> Quote:
>
> So the other day, I started thinking about a calculator that had I/O (lets say USB) but you could only transfer data INTO the calculator.

I would need both. I prefer computer -> calculator and do that with my 71, 41. For my 48/50 I find RPL faster on the calculator, mostly because I do not know how to program it from vi. Clearly for C its compute -> calc.

But I do not want I/O just for backup/restore and program load. I also want programmable I/O. That is where the fun is (e.g. turning my 41 into a TV remote). I wish HPGCC had libraries for the serial, USB, and IR ports.

Re: I/O vs. Input only

*Message #16 Posted by **Iqbal** on 4 Oct 2010, 3:58 p.m.,*
in response to message #15 by Egan Ford

I have two 35S and I just have them put away. It's too frustrating in this day and age to type in so much lines of programs. I am sure, a mini sd card reader could be somehow integrated into the 35S. It is a nice calculator, but when your programs go down, it's frustrating. In fact, I loved my 42S more than any other calc. , but my love soon went out the window, when three times in two weeks, I saw those dreaded words "memory loss".

Re: I/O vs. Input only

*Message #17 Posted by **Egan Ford** on 4 Oct 2010, 4:49 p.m.,*
in response to message #16 by Iqbal

I agree with you at a min any programmable device should have some way to backup/restore. I've also put my 35s away and my 42S that looks mint has an issue when I apply pressure to one of the corners and it loses memory. Also the contrast is an issue. That all said I cannot seem to keep my 30b off my desk. I really want to hate it, but can't. I think its because I don't expect to program on it, and it's smaller than the 35s, and its missing the shiny metal cover so it looks like a geek tool. And, it is a great calculator. It's not quite a scientific calculator, but it has enough math functions to meet all my general needs. They should have called it the 30bs. :-)

RealCalc: a very nice RPN calc for Android

*Message #1 Posted by **LucaPCP** on 4 Oct 2010, 3:50 a.m.*

I have recently installed RealCalc on my Android phone, and I must say, I am really impressed. Aside from the lack of tactile feedback, this is one of the best RPN calculators. It is more in the style of the 32SII: more functions on the keys, compared to the 42s. The unit conversions, and the use of numbers in other bases, are very well implemented and very easy to use. The number of stack levels visible is configurable (I keep it on 2).

At work, not daring to leave my 32SII on the table (in an open cubicle area), I use a 33s, but I have to say, RealCalc is better implemented, except for the lack of tactile feedback (the phone can be set to vibrate when a key is pressed, but it's not quite the same). If you are looking for an excellent RPN calculator to have always with you, give it a try!

Luca

PS: I have no affiliation with the developers of RealCalc. I am simply an enthusiast of HP RPN calculators who is very glad to have found a very well implemented RPN calc for Android -- especially given the mixed quality of the 35s (and in part, the 33s).

Re: RealCalc: a very nice RPN calc for Android

A company that hires kleptomaniacs? Or just a large company where you don't know (trust) everyone?

I guess I am spoiled, having worked for a small company most of my career. But I did have my prized "jeweled" stainless protractor (from my Dad) sprout wings many years ago...

Re: RealCalc: a very nice RPN calc for Android

*Message #3 Posted by **LucaPCP** on 4 Oct 2010, 6:24 p.m.,*
in response to message #2 by Martin Pinckney

I actually work in a very good company, but once your floor is wide open, has hundreds of people, incuding contractors for cleaning, for helping people relocate, for this, and for that... Yes, I once had the luxury of working in an office with a door. That is now gone! And I treasure my HPs too much to leave them in the open like that. I am sure they would be fine, but I don't want to experiment. So I was very glad to see RealCalc: at least now I always have with me a very good RPN calculator -- if a virtual one.

Re: RealCalc: a very nice RPN calc for Android

*Message #4 Posted by **Lincoln R.** on 10 Oct 2010, 12:41 a.m.,*
in response to message #3 by LucaPCP

I'm a college student, and occasionally calculator theft is a problem here, but the thieves don't seem terribly interested in RPN calculators.

I first started using RPN after my TI-89 was stolen (I left it in a classroom and when I came back 10 minutes later it was gone). Since then, I've left my 48g in several places for long periods of time (In a computer lab for about 6 hours, in my coat in the student center, on lab desks, and nobody's walked off with it yet. Although I've never observed anyone else here using an HP, I might be the only person on campus who knows RPN and the thieves think it's broken :-P

Scan quality of "Manuals on CD/DVD"

*Message #1 Posted by **uhmgawa** on 3 Oct 2010, 12:15 p.m.*

I was hoping someone here might be able to shed some light as I haven't received a reply from the curator thus far.

I was wondering what the resolution of the digitized manuals contained on this DVD may be, specifically for the voyager 1xC series? I have most of the collection in the form of paper manuals but I keep wanting electronic versions. I find the existing scans circulating about (for example the 15c owner's manual and advance functions) fall short being coarse resolution and monochrome. I was toying with scanning my copies but if the DVD versions have already addressed this, that option would be far simpler.

Thanks!

Re: Scan quality of "Manuals on CD/DVD"

*Message #2 Posted by **Namir** on 3 Oct 2010, 4:57 p.m.,*
in response to message #1 by uhmgawa

I encourage you to scan your own manuals and share then with us. Like they say "You want a job done right, do it yourself". If you feel the quality of the existing scanned documents is lacking, take a leadership role and scan your manuals.

Peace out!

Namir

Edited: 3 Oct 2010, 5:00 p.m.

Yea wow, whatever.

Anyway I was referring to the hp15c.org manuals scans which are barely passable and not exactly archival

quality. I'm not looking for another project but I'd consider doing so if a reasonable alternative doesn't exist.

One logistical issue (unless I'm missing a clue) is HP appears to still hold a copyright on the manuals. So I'm not sure I'd want to entertain your proposal above unless I had some sort of nod from HP which I estimate would take between 1 and 2 forevers to materialize. I'm all for community effort and sharing burden but I really don't need love letters from HP lawyers either.

Re: Scan quality of "Manuals on CD/DVD"

*Message #4 Posted by **Namir** on 4 Oct 2010, 2:19 p.m.,*
in response to message #3 by uhmgawa

You are right about the copyright. The museum has a special permission from HP.

"searchable" as in they have been OCR'ed? Am I missing something here -- do representative sample pages exist for the DVD manuals to answer common questions like this?

Re: Scan quality of "Manuals on CD/DVD"

*Message #7 Posted by **Egan Ford** on 4 Oct 2010, 1:44 p.m.,*
in response to message #6 by uhmgawa

Yes they are OCR'd.

in response to message #7 by Egan Ford

I'm impressed with the quality of the OCR on the manuals. It is really nice to be able to search so easily through them.

Honestly, I do have trouble keeping up with my email sometimes but I have answered several emails from you including this one. Since they're not getting through, here's a quote from the scanning details section:

> Quote:
>
> Most applications pacs and User's Libraries were scanned at 300 dpi B&W (1 bit). Most Owner's Handbooks were scanned at 300 dpi 1 bit B&W or 200 dpi 4 bit gray scale. The latter gives similar text quality to 300 dpi B&W while also keeping complex color usage readable.
>
> Manuals marked "Color" are generally made at 300 dpi. These scans were mostly made after 2006 to take advantage of today's larger media. Most of these scans were made at the museum with great care. After scanning, most pages were individually rotated, cropped, had major dust specs removed by hand, etc. This post-processing took much longer than the actual scanning. Many manuals were unbound to get the best scans.

The documents are OCR'd for searching but with the image is displayed so that any OCR errors don't damage the document.

By the way, it's not a common question. I don't remember anyone else asking it within the last couple of years at least. This compares to 5 emails in an average day asking how much someone should sell something for on ebay.

HP65 which magnetic cards ?

*Message #1 Posted by **Alberto Fenini** on 3 Oct 2010, 8:24 a.m.*

Dear All,
I have different sets of blank cards

can be both used with HP65 ?
thanks in advance, take care Alberto

Re: HP65 which magnetic cards ?

*Message #2 Posted by **Dieter** on 3 Oct 2010, 9:30 a.m.,*
in response to message #1 by Alberto Fenini

All cards for the HP65, 67/97 and 41 have the same size (something like 71,1 x 11,3 mm - maybe someone has the offical specs), and AFAIK any of these can be used in any calculator.

Looking at the picture I see one card with the classic HP65-layout and another one that looks like a card for the HP67/97/41, just with only one clippable corner instead of two. So there are also no marks and arrows indicating side A and B. To me this looks like a late HP65-card with the newer design that afterwards (and/or at the same time) was also used for the dedicated HP67/97/41 cards (that fit the HP65 as well). I'm sure someone here will have an exact answer. :-)

Dieter

Re: HP65 which magnetic cards ?

*Message #3 Posted by **Thomas Chrapkiewicz** on 3 Oct 2010, 9:53 a.m.,*
in response to message #2 by Dieter

Yes; as mentioned both are usable in the HP65.

When the HP65 was first released, your top card was the only card available. These cards were double-sided, although HP did not publicized this fact.

As the HP67/97 was released, the double sided cards were released, and us HP65 users were made (formally) aware of the double-sided property. Then these same cards were usable with the HP41 series. I believe the 67/97/41 used higher density recording methods, but the magnetic properties of the cards were identical.

There are some nuggets of this information in the HP65 notes with these details. If anyone is interested I will try to find those. TomC

HP65 two different Standard Pacs ?

*Message #1 Posted by **Alberto Fenini** on 3 Oct 2010, 7:54 a.m.*

Hello everybody
I was sorting out things and I came across the following :
I have three different standard pac manuals and cards sets for HP65
the two with "JUNE 1974" printed on the front cover and "00065-90207 Rev 6/74" printed on the back cover
have the first card program named STD-01B DAY OF THE WEEK
the third manual with nothing printed on the fron cover and "00065-90207" printed on the back cover
have the first card named STD-01A PERSONAL INVESTMENT"
The cards sets goes accordingly.
Has anyone ever noticed the same or just me ??

Take care and have a nice weekend Alberto

Viewing card record tracks

*Message #1 Posted by **Ed Sowell** on 2 Oct 2010, 3:04 p.m.*

The HP 97 Service Manual test procedure for the card reader calls for using MagnaSee to check the record track lengths. MagnaSee is hard to find or no longer available, and other magnetic developers are $35-$45 for 2 ounces. Iron filings as used in school magnetic experiments costs about $5 for a lifetime supply. This shows how it works:

Click here for photo

It's not good enough to read the individual line patterns, but the length is easy to see.

Now, I have to figure out why the tracks are so short when compared to the diagram in the Service Manual.

Comments/suggestions welcome.

HP30b in Japan

*Message #1 Posted by **Andreas Grund** on 2 Oct 2010, 5:14 a.m.*

Finally, the HP30b arrived in Japan in retail shops. I got one today in Tokyo's Akihabara electronic district for Yen 5900, which is equivalent to approx. 70$ or 52Euro. It is packed in the typical blister with four short manuals in English, Japanese, Chinese and Korean, however, only one key layout sticker is inluded. The content of the quick start manual (all dated July 2009) is so basic, they better had not distributed.

The calculator does not fit well into my hand with its sharp upper rims, may be, I am spoiled from the daily use of my Pioneers. They keyboard is worlds apart from the former HP quality - the "4" key does not deliver a click, but an entry, the "5" returns a click, but only an entry if you press very hard ..... I return this calculator tomorrow.

Andreas

HP 97 Card not fully ejected

*Message #1 Posted by **Ed Sowell** on 1 Oct 2010, 5:44 p.m.*

After refurbishing the "clutch" and traction wheel it works well except the card is not fully ejected after reading. Does this problem mean that I have a speed issue?

By doing continuity tests while pushing the card slowly into the reader (with power off) I can verify that the motor switch, head switch, and write-protect switches work. I have yet to go through the process of changing R1.

TIA

Ed

Re: HP 97 Card not fully ejected

*Message #2 Posted by **Ed Sowell** on 1 Oct 2010, 7:54 p.m.,*
in response to message #1 by Ed Sowell

I just tried to see the length of the recorded strips on the back of a card using iron filings, the product used in school science labs. The particles are too large to work well, but I can see what I think is the recorded length. If so, they look too short. Maybe all the data gets read and the motor shuts off before the card is ejected?

BTW, since there are no values given for Lmin and Lmax in the SM I am assuming that the printed image of the back of the stip is to scale and one is supposed to just lay the card beside it. Is that right?

Ed

Re: HP 97 Card not fully ejected

*Message #3 Posted by **Randy** on 1 Oct 2010, 9:14 p.m.,*
in response to message #1 by Ed Sowell

> Quote:
>
> it works well except the card is not fully ejected after reading

Define "fully". If it can be pulled out with your fingers, it worked.

> Quote:
>
> Maybe all the data gets read and the motor shuts off before the card is ejected?

No, it doesn't work that way. Everything is controlled by the leaf switches.

> Quote:

I have yet to go through the process of changing R1.

Don't go there, shouldn't be needed. Unless of course you changed the motor.

The most important missing data: Does it read the card correctly and the motor stops with the end of the card out the back of the case? That's a correct read cycle. What does your 97 do?

Edited: 1 Oct 2010, 9:17 p.m.

Re: HP 97 Card not fully ejected

*Message #4 Posted by **Ed Sowell** on 1 Oct 2010, 11:05 p.m.,*
in response to message #3 by Randy

Thanks, Randy.

It does read the simple area of a circle program correctly, but does have to be tugged out. Others have told me the tug is abnormal. Also, the I wrote the program to this card after the repairs to the reader, so I wonder about the validity of the test. Another member of the forum is kindly sending me a card created with his reader which doesn't have the "tug it out" symptom.

Ed

Re: HP 97 Card not fully ejected

*Message #5 Posted by **Randy** on 2 Oct 2010, 7:21 a.m.,*
in response to message #4 by Ed Sowell

"Tug" it out? That's normal. It should be require very little force to remove. Are you expecting the card to be fully ejected out of the reader and calculator body?

Re: HP 97 Card not fully ejected

*Message #6 Posted by **Ed Sowell** on 2 Oct 2010, 11:44 a.m.,*
in response to message #5 by Randy

I don't expect it to be completely ejected out of the reader, but the trailing end should no longer be under the traction wheel. It's not.

Re: HP 97 Card not fully ejected

*Message #7 Posted by **Ed Sowell** on 2 Oct 2010, 3:10 p.m.,*
in response to message #6 by Ed Sowell

This shows the record tracks on a Data 2 card created with my reader. Much too short compared to the SM diagram.

Hey Ed,

I presume the video of my card reader convinced you that it wasn't working correctly.

Video

Edited: 3 Oct 2010, 10:55 p.m.

Re: HP 97 Card not fully ejected

*Message #9 Posted by **Ed Sowell** on 4 Oct 2010, 2:49 p.m.,*
in response to message #8 by aj04062

No, but from what you have shown I can't tell if you have to tug it out. By tug I mean to pull hard, with easily felt resistance. I believe the resistance I feel is due to the trailing edge of the card being still in the grips of the traction and pinch wheels.

Actaually, the problem was called to my attention when I posted a video of me doing the same thing, but pulling the card out after the read. Here it is again:

Video of my reader from last April.

I had posted it to get comments on the noise level I had at the time. Ignazio responded as follows:

> Quote:
>
> Hello Ed, I've saw your short movie. It's my opinion that your reader is too much noisy, and that you must pull the card when it's out of the reader. You have used o-rings too much wide! BTW, have you checked the test-point on the card-reader PCA with a continuity tester? There are three test-point marked M (motor switch), F (Write protect swith) and H (head switch) on the upper left side of the PCA, that you must check with the ground signal (to the left of the three test-point) to test the switches are working properly. Let me know.

Now that I've repaired the clutch and switched to the fuel tubing traction wheel repair the noise probelm is gone, but the incomplete ejection is still with me.

Thanks for you interest. It helps to get feedback!

Ed

Re: HP 97 Card not fully ejected

*Message #10 Posted by **Ignazio Cara (Italy)** on 4 Oct 2010, 3:35 p.m.,*
in response to message #9 by Ed Sowell

Hi Ed, It's my opinion that you have too much pressure of the drive roller on the magnetic card's surface, due a not correct position of the eccentric cam. This issue could be the reason of your difficult to pull the card from the rear of the calculator after a r/w session. Try to rotate this cam until the force needed to insert the card into the reader is not so high. Let me know if my opinion is helpfull.

Regards and ... never give up

Ignazio

Re: HP 97 Card not fully ejected

*Message #11 Posted by **Ed Sowell** on 4 Oct 2010, 3:57 p.m.,*
in response to message #10 by Ignazio Cara (Italy)

Good to hear from you Ignazio!

I have been thinkg that too, and have been trying to adjust it. I am measuring current per the Service Manual but cannot find any position of the eccentric shaft that gets it down to 180mA. About 300 is as low as I can get it. The manual also indicates the eccentric shaft may have to be replaced, but that might be hard to source!

Today I noticed that the wheel I made from fuel tubing is slipping on the shaft. I'll try a drop of superglue.

Give up? Me?

Thanks for your intertest.

Ed

Re: HP 97 Card not fully ejected

Bad eccentric? Not likely.

Remove the eccentric and the gear and run @ 3 vdc. If the motor current is greater than 25 ma, the motor is binding due to an off center coupler and is the cause of the higher than normal current. If motor current is okay, it could be:

1. Tubing is too large in OD
2. Gear and/or eccentric have goo on/in them from the old wheel

Re: HP 97 Card not fully ejected

*Message #13 Posted by **Ed Sowell** on 5 Oct 2010, 6:09 p.m.,*
in response to message #12 by Randy

Thanks, Randy.

The adjustments I've done seem to have speeded up the motor a bit since the track length is a little longer now and it doesn't take quite as much of a pull. But I will take it apart again and do the test you suggest.

I have to rule out the goo possibility as I have cleaned everything carefully. The OD is possibly the problem. I first tried O-rings purchased on eBay but they were of larger OD than the fuel tubing I now have installed. Might have to once again review the Archives on this issue.

Ed

Re: HP 97 Card not fully ejected

*Message #14 Posted by **Ed Sowell** on 6 Oct 2010, 8:02 p.m.,*
in response to message #13 by Ed Sowell

> Quote:
>
> I have to rule out the goo possibility as I have cleaned everything carefully.

Well, it looks like I was too sure of my goo removal talents. I found a tiny lump in one of the the cavities where the pinch wheel axle rides.

> Quote:
>
> The OD is possibly the problem.

Using a precision caliper, I have measured the OD of my fuel hose traction wheel while installed on the gear. It measures 0.244". That makes it almost exactly the diameter the shoulder on the gear that is fits up against. IOW, if the tubing OD was any smaller it would be below the shoulder.

So, my current theory is the tiny bit of goo was keeping the pinch roller from turning. That would make the motor work alot harder, possibly causing my symptoms.

More on this after I do the no-load current test and put it back together. I'll also put a little superglue on the gear shaft before slipping the new traction wheel on.

Ed

Re: HP 97 Card not fully ejected

*Message #15 Posted by **Ed Sowell** on 5 Oct 2010, 5:58 p.m.,*
in response to message #8 by aj04062

Got the Data 2 card. Thanks!

It reads great on my machine, even though the data track lengths are different from the card written by reader (in it's current state of adjustment). See how they compare below:

Comparing track lengths.

Yours is shown at the top. Comparing it to the diagram in Sec 4-35 of the SM, it looks like yours is about LMin, whereas mine is significantly shorter. Yet, mine now seems to read fine too, after fussing with adjustment of the eccentric shaft. Mine takes a little more of a tug to get out after the read, but not as bad as it was.

So for those who have wondered, cards written on readers of widely differing adjustments seem to be read OK on both.

Ed

Re: HP 97 Card not fully ejected

*Message #16 Posted by **aj04062** on 5 Oct 2010, 10:02 p.m.,*
in response to message #15 by Ed Sowell

Interesting Ed,

Mine takes a very minimal tugging to pull out.

I've rebuilt this card reader using some urethane orings. They are of a lower durometer than the std Buna (black) orings you get. I figured urethane is known for its high friction coefficient, so I'd give it a try. One thing I had to do though is super glue them to the shaft as they would slip on the gear. It did take some tinkering on the eceentric cam to get it running well.

I bought 100 of these crazy things for $5. If anyone wants to try a few, let me know.

Re: HP 97 Card not fully ejected

*Message #17 Posted by **Ed Sowell** on 5 Oct 2010, 10:34 p.m.,*
in response to message #16 by aj04062

As I mentioned, I saw slippage with the fuel tubing also. I had been doing the SM procedure of holding the card to get the extreme current reading and shortly afterwards just let it pass on through. It pulled through nicely for a bit then slowed down, then stopped. Since I have the calculator apart I was able to flip the reader over and see what was happening... worm gear sailing merrily along, gear turning, "traction wheel" still! Wouldn't have believed it possible.

Yes, I'd like a few (4 would do) of the urethane O-rings.

Ed

> PS: I really don't understand why it is frowned upon to mention Ebay here - seems a bit childish to me that there appears to be this unwritten rule "thou shalt not mention Ebay"!

I take it that eB** is considered a necessary evil but self-respecting professionals like us would prefer not to admit we would actually *use* such a rip-off site.

Edited: 1 Oct 2010, 1:52 p.m.

Re: HP9100B available on TAS

*Message #4 Posted by **Mark Storkamp** on 1 Oct 2010, 2:13 p.m.,*
in response to message #2 by Mark Edmonds

There's nothing like finding an auction that's passing under the radar, with a poor description or misspelling in the title, and getting in a low bid. Then someone posts a link to it since they, themselves aren't interested, and what once was going to be a good deal is suddenly bid way up. That's why, in some other groups I follow, linking to auctions is frowned upon.

Re: HP9100B available on TAS

*Message #5 Posted by **Han** on 1 Oct 2010, 3:05 p.m.,*
in response to message #4 by Mark Storkamp

On that note, perhaps noting that the shipping cost is a "mere" $85.00 USD (currently 10% of the max bid) may slow down the bids.

Re: HP9100B available on TAS

*Message #6 Posted by **Richard Wilder** on 6 Oct 2010, 2:12 p.m.,*
in response to message #5 by Han

$85 is the max for shipping. From the description: "If shipping turns out to be cheaper, a refund will be issued."

Re: HP9100B available on TAS

*Message #7 Posted by **M. Joury** on 1 Oct 2010, 8:50 p.m.,*
in response to message #2 by Mark Edmonds

I thought that the rule was not so much not to mention TAS but, rather, not to post opinions on individual auction and the sellers without disclosing your own account name. Or something like that (I actually read the site rules on this at one point).

Here they are:

Additional Terms of Use for Discussions About Ebay and Other Auction Sites

This is not meant to be a forum about ebay or other auction/sales sites though they will naturally come up at times. If you refer to any specific auction(s), sellers(s), or user(s) of any auction/sales site, then you must include your ID at that auction/sales site. This puts you on equal footing with the person you're talking about. Your auction/sales site ID may be confirmed by other forum users by sending a message via the auction/sales site. If that message isn't responded to in the affirmative, then your messages and/or account may be deleted. If you do not have an ID at the auction/sales site, or want to keep your identity secret, then please don't ask questions about specific auctions or sales on that site at this forum. If you have questions about a specific item, it is usually best to ask the seller for clarification. Also, please limit auction/sales threads to items of broad interest to HP calculator users.

I feel a little bit like I am a character in the Harry Potter series and we are talking about "He Who Shall Not Be Named"...

Edited: 1 Oct 2010, 9:02 p.m.

Re: HP9100B available on TAS

*Message #8 Posted by **Juergen Keller** on 2 Oct 2010, 4:20 a.m.,*
in response to message #7 by M. Joury

There were some lengthy (and sometimes not so nice) eBay discussions in the past; therefore it's only natural that some rules had to be established. This is THE forum for (HP) calculator users and collectors, with a very polite and cooperative spirit, and we all benefit from it, so it's in our own interest to accept some common-sense regulations.

Wishing you all many stimulating discussions in the future,
Juergen

Yea I'll bet it is. Probably along with the secret to eternal youth. But is this seriously the only method for performing a global archive search?

Re: Global search of archives..

*Message #4 Posted by **Michael Meyer** on 30 Sept 2010, 6:42 p.m.,*
in response to message #3 by uhmgawa

Try this:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=74734

Re: Global search of archives..

Thanks for the pointer.

An external site search indeed works but it is a bit roundabout and it picks up index pages as well as actual threads. Not a huge issue, but the omission of a conventional site search function seems rather curious.

Although I think I miss a thread activity e-mail notification mechanism more. I'll stop complaining now.

It probably works the same with all or most search engines. I never use Google myself. I've been using startpage.com , and it works the same there.

Challenge: Are costs for air travel & hotel higher/lower/the same before/after September 15th

*Message #1 Posted by **gene wright** on 30 Sept 2010, 8:58 a.m.*

One of the reasons why HHC typically occurs near the end of September is because when it was first held 30 or so years ago, it was believed that air travel and hotel costs went down significantly after the end of the "summer season", considered to end September 15th.

Is this still true?

Do costs for air travel and hotel stays go down once you pass September 15th? They may have in the past, but do they still do so?

If not, then perhaps HHC 2011 and beyond might be held in early / late August instead of the end of September.

But, the committee needs data! Help! :-)

Re: Challenge: Are costs for air travel & hotel higher/lower/the same before/after September 15th

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 30 Sept 2010, 10:17 a.m.,*
in response to message #1 by gene wright

In general, travel costs from my country to the USA are higher between July 1 and August 20. I would like to attend some future HHC (I was there in 2007), so I would recommend a date outside that range. Dec-Jan-Feb have also higher fares, as we have our summer holidays in these months.

Re: Challenge: Are costs for air travel & hotel higher/lower/the same before/after September 15th

*Message #3 Posted by **Thomas Chrapkiewicz** on 30 Sept 2010, 10:25 a.m.,*
in response to message #1 by gene wright

It is apparent to me that based on the email/mail promotion traffic (at least from Southwest and Northwest/Delta) that air travel costs do drop significantly after Sept15.

in response to message #1 by gene wright

I'm still waiting for this "challenge" to turn in to a programming challenge. :-)

Re: Challenge: Are costs for air travel & hotel higher/lower/the same before/after September 15th

*Message #7 Posted by **BruceH** on 5 Oct 2010, 8:53 p.m.,*
in response to message #1 by gene wright

Here's a screen capture from http://history.airfares.com showing AA fares (compared with the lowest available) purchased 14 days in advance for New York to Nashville over the last 12 months.

It seems that there is no peak or off-peak period: the fares fluctuate wildly as the prices are set automatically by yield management software.

Re: Challenge: Are costs for air travel & hotel higher/lower/the same before/after September 15th

Looks to me more like one-dimensional Brownian motion simulation software.

Re: Challenge: Are costs for air travel & hotel higher/lower/the same before/after September 15th

*Message #9 Posted by **gene wright** on 6 Oct 2010, 7:30 a.m.,*
in response to message #7 by BruceH

Ok, so there does not appear to be any airfare seasonal cost difference. Hotel room charges are the remaining piece.

Thanks so far all.

P.S. Again, one of the primary reasons given for having HHC 2010 in late September is the change of seasons and a resulting decrease in costs for airfare and hotel bills. I wondered if that was leftover from the

late 1970s and whether it was true today or not.

Re: Challenge: Are costs for air travel & hotel higher/lower/the same before/after September 15th

Message #10 Posted by ***Patrick Rendulic*** *on 7 Oct 2010, 9:43 a.m.,*
in response to message #9 by gene wright

As long as the conference takes place in late September, I will not be able to attend it. Where I live, school starts on the 15th of September. And being a teacher I cannot take a week off after the summer holidays.

Maybe it would be an idea to introduce a shift, eg. a conference every 13 months. Just my idea.

Infinity

*Message #1 Posted by **John Mosand** on 29 Sept 2010, 10:54 a.m.*

The '0-topic' turned out quite interesting. Now I'd like to have your views on 'infinity'. What is your concept of it? Is it a 'place', some kind of 'value', or just '...as n increases without bounds'? (I have my own view :-) Just recently I saw the following: n/inf. = 0, which leads to n = 0 * inf. (Maybe one should treat 'inf.' like 0: don't divide by it!)

Re: Infinity

*Message #2 Posted by **Jeff O.** on 29 Sept 2010, 11:12 a.m.,*
in response to message #1 by John Mosand

Not sure if this is what you are after, but I would recommend a book called "Everything and More - A Compact History of Infinity*" by David Foster Wallace. Deals mostly with the work of Georg Cantor. I read the book, but don't claim to have fully understood it.

* - The actual book title uses the symbol for infinity which I am unable to reproduce here.

Re: Infinity

*Message #3 Posted by **John Mosand** on 29 Sept 2010, 12:29 p.m.,*
in response to message #2 by Jeff O.

Books on this subject isn't my problem. (I can also recommend Peter Rozsa's 'Playing with Infinity'.) I just wanted to hear your views. There are some who disagree with Cantor, for instance. Oh yes, I can use the 'sleepy eight', but it doesn't come out right on some computers...

Re: Infinity

*Message #4 Posted by **Jeff O.** on 29 Sept 2010, 3:46 p.m.,*
in response to message #3 by John Mosand

OK, just making sure.

I'll leave the discussion to those who are qualified.

I was going to try using "oo" for the 'sleepy eight' symbol, but that didn't look very good.

Re: Infinity

*Message #6 Posted by **Don Shepherd** on 29 Sept 2010, 11:16 a.m.,*
in response to message #1 by John Mosand

Well, to my simple mind infinity is a concept; the concept that numbers (or series) go on forever, without end. It's certainly not like a "number" that can be the object of an arithmetic operation.

Middle school kids know what infinity is: numbers go on forever.

Re: Infinity

*Message #7 Posted by **Walter B** on 29 Sept 2010, 11:26 a.m.,*
in response to message #1 by John Mosand

> Quote:
>
> Just recently I saw the following: n/inf. = 0, which leads to n = 0 * inf. (Maybe one should treat 'inf.' like 0: don't divide by it!)

Heh, heh, you must still know what you are allowed to do: e.g. claiming x = y and "proving" it by multiplying both sides with 0 isn't a legal method either d:-) Be careful with 0 as well as with +/- inf. IIRC and if no mathematician is listening, we have divided by infinity quite frequently in limit problems (?= Grenzübergänge). As said above ...

Re: Infinity

*Message #8 Posted by **C.Ret** on 29 Sept 2010, 12:16 p.m.,*
in response to message #7 by Walter B

Right, Inf as 0 is not allowed in most algebra manipulation. Furthermore, le product '0 x inf' is 'undefined'.

The only arithmetic allowed with any non zero number are : n + inf = +inf , n - inf = -inf and n * inf = inf

And any expression like inf/inf, 0*inf, inf-inf, etc have no meaning in algebra and therefore are 'undefinited' such as any 0/0 ou n/0 notation.

In the other hand, "dividing by infinite" is quite a current operation in analysis of convergence, divergence and limits of function and series.

In this case : lim(1/x) = 0 when x --> inf has a meaning.

Such as lim(1/x) = +inf when x --> O+ and lim(1/x)=-inf when x --> 0- lim(x^x) = 1 when x --> 0 lim(x*sin(1/x))=1 when x --> +inf etc.

Please note that n / inf = 0 is true for any (real) number different of ±inf.

Re: Infinity

*Message #9 Posted by **Mark Storkamp** on 29 Sept 2010, 12:01 p.m.,*
in response to message #1 by John Mosand

My concept of infinity is based upon a single book I read a number of years ago, and those concepts may have been completely bogus or outdated by now. But...

You need to be specific about which infinity you are talking about, since there an infinite number of them. The smallest infinity is the set of rational numbers. Due to a limited character set I'll call that I0. Then there is the infinity of irrational numbers, I1. Greater than that is the number of curves in a plane, I2, &c. I0+I0 = I0, I0*I0 = I0, I0/I0 = I0, I0-I0 = I0, I0^I0 = I1.

A quick check on Wikipedia shows I'm not too far off base: Cardinality_of_the_continuum

Re: Infinity

*Message #10 Posted by **Ron Ross** on 29 Sept 2010, 1:08 p.m.,*
in response to message #9 by Mark Storkamp

"The smallest infinity is the set of rational numbers."

Nonsense, the number of primes is also infinite and certainly smaller than the number of rational numbers. Probably some ratio of Big O over Ln O or some such algebraic manipulation, but it is smaller.

Someone wiser may argue otherwise.

Re: Infinity

*Message #11 Posted by **Kiyoshi Akima** on 29 Sept 2010, 2:07 p.m.,*
in response to message #10 by Ron Ross

It's possible to find a one-to-one mapping between the set of prime numbers and the set of positive integers (first prime, second prime, etc.). There's a one-to-one mapping between the positive integers and the integers. There's a one-to-one mapping between the integers and the rational numbers. Hence there's a one-to-one mapping between the prime numbers and the rational numbers, and the two sets are of the same size.

Re: Infinity

*Message #12 Posted by **Ron Ross** on 29 Sept 2010, 4:13 p.m.,*
in response to message #11 by Kiyoshi Akima

I have heard this arguement before and readily accept it for any multiple and most countable infinities. However, Prime numbers are so sparse in comparison to natural numbers that this arguement is very hard to accept. As you progress into the larger primes, they tend to become very scarce and hence my own feeling that their infinite number must be less than the infinity of the natural numbers.

Re: Infinity

*Message #13 Posted by **Mark Storkamp** on 29 Sept 2010, 4:22 p.m.,*
in response to message #12 by Ron Ross

Fortunately, infinity is so mind numbingly huge that scarcity hardly seems to count for much. As long as there's a proof (and there is) that there is always a larger prime number than the last one you found, there's a one-to-one mapping with rational numbers.

What I have a hard time getting my head around is the sudden change when you get to irrational numbers. The idea that you are at infinity to-the-power-of infinity since the numbers extend both in growing magnitude, as well as a complete infinity between any two numbers.

Curves on a plane I have only the most feeble grasp of.

Re: Infinity

*Message #14 Posted by **Ron Ross** on 29 Sept 2010, 4:48 p.m.,*
in response to message #13 by Mark Storkamp

While primes are countable, they are barely so as there are spaces where there are billions (and even larger digits of numbers) of natural numbers in between MOST primes. That is why I am skeptical of the infinity of natural numbers being = the infinity of primes.

If you were to graph or show a density graph, the primes would be like grass in the desert.

Re: Infinity

*Message #15 Posted by **Kiyoshi Akima** on 29 Sept 2010, 6:03 p.m.,*
in response to message #14 by Ron Ross

Think about it going the other way.

Among the rational numbers, integers are so sparse that they almost vanish. Yet there are as many integers as there are rational numbers.

Once you've removed all the non-integers from the rational numbers, removing the composite numbers from the remainder is barely a trim.

Re: Infinity

*Message #16 Posted by **bill platt** on 29 Sept 2010, 8:47 p.m.,*
in response to message #15 by Kiyoshi Akima

The 'paradox' of infinity is that ratios become meaningless

Re: Infinity

*Message #17 Posted by **Ron Ross** on 29 Sept 2010, 9:53 p.m.,*
in response to message #15 by Kiyoshi Akima

Very good analogy, yet I would argue, integers are evenly spaced ie I know when the next one will appear. That isn't true for primes. The next prime may be a million, a billion, or a trillion digits away. There is no definite regular pattern on when I can expect the next one.

I guess that I may have issues with the proof of countability. I don't fully grasp (as I don't readily agree with) the idea that if I can count both of them, that makes them equal.

It takes me forever to count to one, if I count ratios, yet, that infinity is = to the infinity of integers, a much sparser set. I still say the sets are not equal, yet the countability therom says they are the same.

Re: Infinity

*Message #18 Posted by **bill platt** on 30 Sept 2010, 12:37 a.m.,*
in response to message #17 by Ron Ross

Hi Ron,

You are running up against the 'paradox' and extrapolating the observable 'morphology' of numbers in finite numberspace. But the extrapolation is not valid. Infinite numberspace is sort of like accepting Quantum Electro Dynamics: it is not in your physical experience...

Re: Infinity

*Message #19 Posted by **KC** on 30 Sept 2010, 1:11 a.m.,*
in response to message #17 by Ron Ross

For infinity you have to think "out of the box". The simplest analogy I am sure everyone knows is that a 1 to 1 correspondence holds for natural numbers and even numbers, and therefore their sizes are equal, yet every logical person would think that the size of natural numbers is twice that of even numbers. The point is: when we think of this, we are trapped into the idea that infinity has a boundary, and no matter where you place the boundary, this "twice as big" holds true. Only have you begun to realize that infinity has no boundary can you get out of the box.

KC

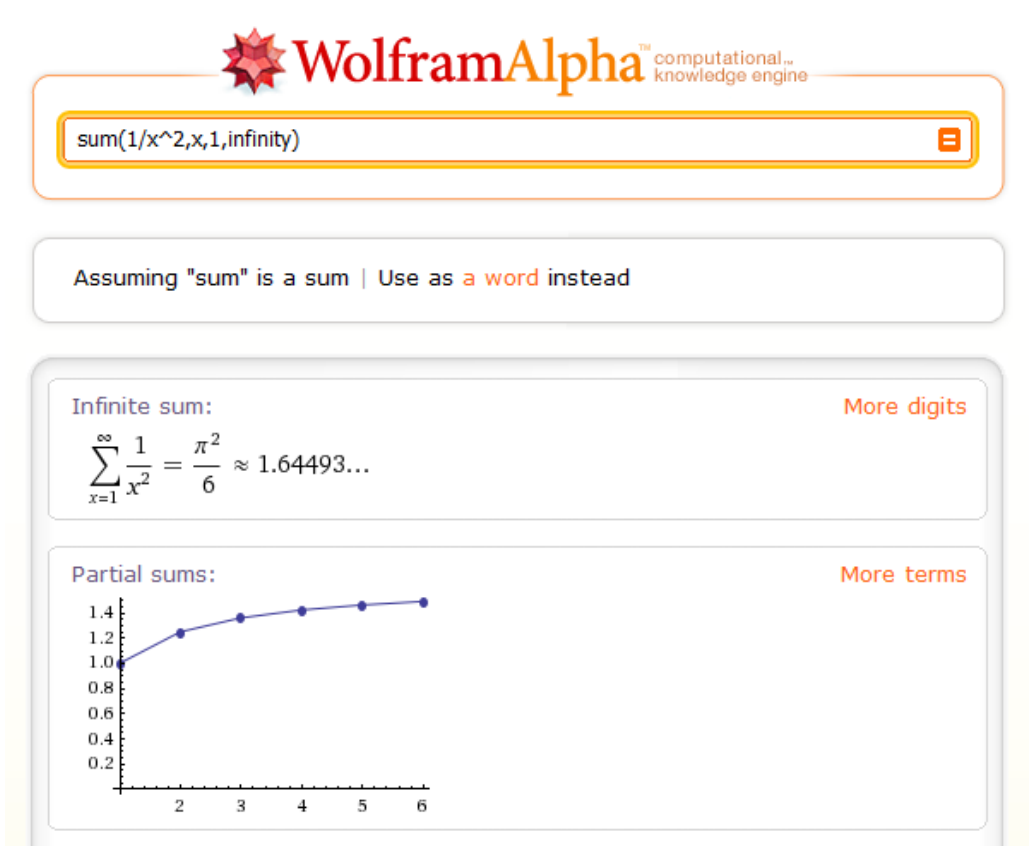
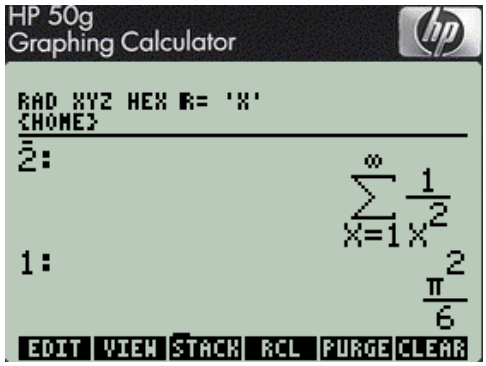
*Message #24 Posted by **Crawl** on 1 Oct 2010, 11:41 p.m.,*
in response to message #23 by Norman Dziedzic

This made it work.



Of course, it's better to do it with a calculator.



Re: Infinity

*Message #25 Posted by **Crawl** on 1 Oct 2010, 8:19 p.m.,*
in response to message #22 by bill platt

There are a lot of reasons.

By the integral test, the integral of 1/x^2, from 1 to infinity, is [-1/x], which equals 1. That is, it converges, so the integer sum must, too.

Also by comparison with the sum of the reciprocal triangle numbers. 1, 1+2, 1+2+3, etc. The triangle numbers are n(n+1)/2, which increases like n^2, so if one sum converges, so does the other.

2/(n(n+1)) = 2/n -2/(n+1)

This means

1/1 + 1/3 + 1/6 + 1/10 +...

=

2/1 - 2/2 + 2/2 - 2/3 + 2/3 - 2/4 + 2/4 - 2/5 + ...

This sum telescopes to

2/1 - 2/(n+1)

As n tends to infinity, the sum tends to 2.

In fact, the reciprocal squares are LESS than the reciprocal triangle numbers, so this proves that their sum must be less than 2.

Finally, Euler found the sum of reciprocal squares exactly. The sum is pi^2/6. The Hp50g has this result build in, btw. It's called the Basel problem if you'd like to know more. And, in fact, it was along this similar line of investigation that led Euler to prove that the sum of the reciprocal primes is infinite.

Edited: 1 Oct 2010, 8:23 p.m.

Re: Infinity

*Message #26 Posted by **bill platt** on 3 Oct 2010, 3:40 p.m.,*
in response to message #25 by Crawl

I misunderstood you. I thought you were saying that the sum of squares, not the sum of (inverse squares) was finite.

But nice explanation anyway!

Best regards,

Bill

Re: Infinity

*Message #27 Posted by **Crawl** on 3 Oct 2010, 5:09 p.m.,*
in response to message #26 by bill platt

Actually, Euler had argued about that, too! Example, you could argue that the sum of the powers of 2 is -1. He thought that if you took positive numbers until you "went past" infinity, you could end up back at negative numbers.

That sort of playing fast and loose with infinity is what led later mathematicians to try to treat the concept more rigorously.

In the case of the sum of the squares (not their reciprocals), you could use the analytic continuation of the Zeta function, at -2. In that case, the sum would merely be zero.

Re: Infinity

*Message #28 Posted by **Norman Dziedzic** on 29 Sept 2010, 1:33 p.m.,*
in response to message #1 by John Mosand

One of the neatest descriptions of infinity I have heard for the lay person came in a radio program covering teaching kids and how there are many different ways to learn and understand a topic. *(The following is my interpretation of the program I heard many years ago and hopefully conveys the essence of what I heard but, for sure, does not have the same details as the original story)*

Part of the story described a teacher asking her class to tell her what infinity was and to describe it. She was going for the standard answers that include some form or idea of forever or unbounded when one kid tells her that infinity is like a box of rice. She steered the child back toward her answer told him that while there are a lot of grains of rice in the box the number certainly isn't infinite and if we wanted to, we could certainly count them all.

After class the radio interviewer asks the child about his answer and finds out that the specific box the child was thinking of has a picture on it of a person holding that same box of rice; and, of course, the picture of the box had a picture of a person holding a box

of rice, etc. etc. This kid probably understood infinity better than any of his peers but because it wasn't what was expected in the context, it was not acknowledged as correct.

Re: Infinity

> Quote:
>
> One of the neatest descriptions of infinity...

My favorite allows the user/student to actually *see* infinity.

Take any object (say a box of rice or a grain) and drop it. For the object reach the ground it must first travel half the distance. After traveling half the distance, it must half the remaining distance before reaching the ground, and so on an infinite number of times. The object only reaches the ground after an infinite number of half steps.

Re: Infinity

*Message #33 Posted by **Geir Isene** on 29 Sept 2010, 1:33 p.m.,*
in response to message #1 by John Mosand

My view on this in exploration-mode at this time. Good timing for the question, then :)

Infinity may just be a theoretical/mathematical construct with no basis in reality - if the universe is discrete in energy, space and time and it does not have infinite length in any dimension...

Re: Infinity

*Message #34 Posted by **Ed Sowell** on 29 Sept 2010, 1:59 p.m.,*
in response to message #1 by John Mosand

I have read two books on infinity recently. One is Naming Infinity: A True Story of Religious Mysticism & Mathematical Creativity By Loren Graham, science historian & Jean-Michel Kantor, French mathematician. Very interesting book. A brief excerpt from a review:

"There was a “crisis” in mathematics near the end of the 19th century. The problem was an old one, how to deal with infinity, since once it is considered many paradoxes develop. The crisis was when it became clear than if infinity could not be defined rationally then many other mathematical objects, i.e., sets, could not be defined. This brought the entire structure of mathematics itself into question."

The other is The Infinities by John Banville. It is not at all mathematical, but is one of the best books I've ever read, with every sentence carefully crafted to be beautiful. I couldn't do it justice here in a few words, but there is a review of it in the 2/24/2010 LA Times.

I'm gonna go way off base here:

I'm not convinced that irrational numbers exist.

Someone who wanted to dispute that might say, "Oh, well, you must not understand the proof that the squareroot of 2 is irrational. Because it is very well established that that number is irrational, and therefore that irrational numbers exist."

But that's not true. There is a proof that there is no rational number that, when squared, gives 2. That does NOT prove that the squareroot of 2 is irrational. A third possibility is that there is NO number that equals the squareroot of 2 (if only rational numbers exist).

Of course, there are numbers that, when squared, are approximately 2. And they can get better and better as they get more decimal digits. As far as that is concerned, we might as well say the squareroot of 2 exists. Also, we can treat it formally -- eg., (x-sqrt(2))(x+sqrt(2))= x^2-2, whether or not sqrt(2) is a "number" or a symbol or whatever.

So, okay, we can ACT like irrational numbers exist. But do they really?

I saw a mathematician who worked on some sort of computer math (using a computer to find proofs, I think) who argued that irrational numbers don't exist from a completely different point of view: It could be possible to make some "ultimate computer" for this universe, by using every single particle in the universe to make it. This computer can only work with so many finite digits. It might be enormous, but there is a limit. Maybe you can calculate 5 trillion digits of pi, maybe you can calculate a trillion trillion digits of pi, but you might not be able to calculate a trillion trillion trillion trillion digits.

(Yes, there are formulas to calculate digits of pi without calculating preceding digits. But this ultimate computer presumably has a memory limit, so to calculate more digits would require dropping others. So even if you could calculate the trillion trillion trillion trillion trillionth + 1 digit, you might not be able to hold all those digits *simultaneously*)

If you can't know all those digits at once, is it meaningful that they "exist" in some philosophical sense?

You can actually use those infinite cardinal numbers in proofs. It's possible to show the cardinality of rational numbers is less than the cardinality of real numbers, hence irrational numbers exist. Or that the cardinality of algebraic numbers is less than the cardinality of real numbers, hence transcendental numbers exist.

Well, this isn't a way out of the above paradoxes. It just links the concept of infinite cardinal numbers to the concept of irrational numbers. We can ACT like infinite cardinal numbers exist, just like we can ACT like irrational numbers can exist. And if you think that one exists, you probably should think that the other exists, too. But infinite cardinal numbers are probably even less intuitive than irrational numbers, so I don't think looking at this issue from the former perspective have any persuasive power for the latter perspective.

in response to message #38 by Martin Pinckney

I don't think human beings can comprehend infinite, and possible even finite existance. Let's say that the universe is finite. It ends. To our minds, something must exist beyhond that sudden end. If it's a wall, something is on the other side of the wall. There can't be just "nothing", because that nothing has to exist. The nothing is something. To me this is perhaps harder to understand than an infinite universe that never ends. But, still, how can it go on forever? (Simple concepts, avoiding curves in space-time) Numbers don't end: they're not finite. There can be a finite number on an infinite background, but they don't really "end".

As a psychiatrist, we have similar problems with our own existance. When people commit suicide, they generally are trying to "escape" what is perceived as an inescapable situation of unhappiness or suffering. But because they don't escapte "to" something, or in that sense, "from" something, they end up simply not existing, which goes against the initial intent. They don't preserve any sense of "they". Humans have a difficult time with the concept of mortality... I would argue that it is the hardest thing we have to deal with in our lives, our own mortality, but I believe worse than that, the mortality of the people around us. I believe, and this is supported by verses in the Judeo-Christian Bible, that if people didn't die, we'd have no religions anyway. The central and primary purpose of religion is to try to cope with mortality.

Long-winded way to say that if we understood these concepts mathematically, we might even provide religion some answers they've been looking for (those whose religions allow them to look.)

fascinating wanderings this thread is taking - so glad about that, makes me feel there's still a certain hope - even if small - to get to understand things, even those so elusive as these.

Sometimes we're trapped in our own definitions, too rigid to allow a simple understanding. It's ok to be rigurous as long as you know when that's not required. Infinity (and non-existence) are perhaps two of those, notwithstanding their mathematical treatment.

in response to message #39 by Michael Meyer

Michael,

This is getting "infinitely" off topic but....

I almost completely agree with what you said about the the basis for religion except that I think that the need for religion is more fundamentally weaved into human brain structure. I'd say (and I'm not the only one) that it's a lot like music, which serves no obvious purpose (some may argue with this) except that virtually all cultures embrace some form of it and most individuals enjoy at least some of it. Without death I think that humans would still have religion, but it wouldn't be taken so seriously -- it might be even more like music.

Georg Cantor's work on infinite sets was indeed threatening to religious leaders at the time. They no doubt saw that understanding infinity took away some of the need for what they preached. Maybe if everyone in the world studied his work and later theories (like Gödel's) we'd have less intense religions, fewer wars, a more sustainable human population on the planet and probably a lot of smart people too!

-Katie

This is only true if you ignore the concept of revelation, both experiential and historical, which actually form the primary bases for both Judaism and Christianity.

*Message #43 Posted by **Ken Shaw** on 30 Sept 2010, 10:23 a.m.,*
in response to message #37 by Crawl

But what if natural numbers don't exist either?

Show me two identical objects and I'll argue that they are distinct. In that case, what is the meaning of any natural number? It's just an abstraction we make up in order to validate the abstract process of counting.

So the argument of the "existence" or not of numbers, rational or otherwise, seems to me to be semantic.

Re: Infinity

*Message #44 Posted by **Crawl** on 1 Oct 2010, 10:33 a.m.,*
in response to message #43 by Ken Shaw

Maybe I do believe in irrational numbers. I was thinking, the proof that the square root of 2 cannot be rational isn't enough,

because...

> Quote:
>
> Of the three ways in which men think that they acquire knowledge of things—authority, reasoning, and experience—only the last is effective and able to bring peace to the intellect. -Roger Bacon

Now I guess I'm not believing in "rigor".

But can you test that the square root of 2 is irrational, experimentally? Yes -- by checking that the decimal digits don't repeat.

Someone is bound to chime in here, You can NOT test that they NEVER repeat. Yeah, so what? You can test for thirty, a hundred, a million places.

If someone proved pi was irrational, but we calculated it out as

3.14159266666666666666666666....

with 6's out to a billion places and more, I think we should be quite skeptical of the proof, no matter how well reasoned and rigorous it seems. (unless someone was able to then prove why it should be so nearly rational -- example, sum 7 here agrees with pi to over 400 places, but there is a good reason for that (the sum is related to an approximation to the error function integral)

>
> So the argument of the "existence" or not of numbers, rational or otherwise, seems to me to be semantic.

I'm not so sure what to say to this! It's a mind bender. But natural numbers sure seem to exist, don't they? They do to me, anyway. They don't even seem to be abstract. Like, if I think of 2, I'm not necessarily thinking of 2 apples or two rocks or any other set of things.

But maybe it's just because I've used them for so long that I'm used to that conceptual model.

It does occur to me that, supposedly, all electrons (for example) are literally indistinguishable. If they are not, that could have actual physical consequences, in terms of particle statistics

On the other hand, 4-year-old children don't learn to count by counting electrons.

Re: Infinity

*Message #46 Posted by **Ken Shaw** on 4 Oct 2010, 11:34 a.m.,*
in response to message #45 by Crawl

Subatomic particles may be indistinguishable, which destroys my argument, but I don't know if that can be proven beyond doubt. So much of this "knowledge" depends on mathematics, which is an abstraction. The real world, as others have mentioned, doesn't conform well to math (ie, the apparent quantum nature of space, and even of time, another concept which may not really exist), although these theories are also derived mathematically.

Ok, my head is hurting now.

Re: Infinity

*Message #47 Posted by **Walter B** on 4 Oct 2010, 12:51 p.m.,*
in response to message #46 by Ken Shaw

Subatomic particles, e.g. electrons, *are* indistinguishable. This fact has a lot of nice observable consequences going pretty far in particle physics, and can be explained best by mathematical (here: quantum mechanical) models. Nature as a whole conforms rather well to mathematics, being no wonder, since mathematics was developed to describe nature ("máthema" = ancient Greek for "science, learning", so "mathemátikos" = "concerning science, scientific"; "phýsis" = ancient Greek for "nature", "physikós" = natural).

The honourable members of this forum, being technical people in their majority, focus on the shortcomings this model has in particular applications. This is quite reasonable (= "logikós") and will drive further progress in modeling.

But it's nothing new: As for each and every model you have to know and consider its limitations. So far, however, this model describes the laws of nature pretty well over 40 orders of magnitude. So I would keep it until somebody shows me something better d8-)

Edited for error correction.

Re: Infinity

*Message #48 Posted by **Marcus von Cube, Germany** on 1 Oct 2010, 3:28 a.m.,*
in response to message #37 by Crawl

Crawl, I disagree. You're comparing a mathematical concept (that of continuity) with the real world. In the real world, continuity doesn't exist. Each and everything can be broken down to smaller entities only a finite number of times until you get to a smallest entity which cannot be divided any further.* So the real world is finite in every respect.

Writing down an irrational number with decimal digits is nothing more then a rational approximation. We can write down the number that, when squared, gives 2, only in a formal way, e.g. as sqrt(2). Or the ratio between the diameter and circumsphere of a perfect circle as PI. In the real world, there is no such thing as a perfect circle.

* This might not be true for Time, but that's a totally different story.

Historically we have discovered:

Particles visible to the naked eye
Particles visible under a microscope
Molecules
Atoms
Protons, neutrons, and electrons
Various sub-atomic particles
Other hypothetical particles have been postulated

So how can we be so sure the discoveries won't go on and on?

Re: Infinity

*Message #50 Posted by **Marcus von Cube, Germany** on 1 Oct 2010, 10:48 a.m.,*
in response to message #49 by Martin Pinckney

We know, that there is a smallest distance, the Plank Distance. And even if we find our way down the particle path, we will always end up in rational space because a given particle is divided into a finite number of subparticles. Energy can't be divided, either, to arbitrary levels, it's all discrete and not continuous.

Re: Infinity

*Message #51 Posted by **Crawl** on 1 Oct 2010, 10:49 a.m.,*
in response to message #48 by Marcus von Cube, Germany

I'm obviously playing Devil's Advocate here, so there's no need to try to prove me wrong. But I think you're misunderstanding my argument. (there are two arguments anyway)

The argument at no point compares the square root of 2 or pi to anything in the real world -- the length of a line drawn with a pencil, or an interval of time measured with a stop watch. It only has to do with calculating the digits. Calculating the digits is independent of any real world application.

And there are many ways of calculating those digits. Bracketing the solution of x^2=2, starting with 0 and 2 as the initial end points. Using the binomial expansion, 1+1/2-1/8+1/16-5/128+.... Taking the log with the series 1-1/2+1/3-..., dividing by 2, and exponentiating with e^x=1+x+2^2/2+.... There is a digit by digit method that is similar to long division.

There are probably many, many more. It turns out that ALL of those calculations will give the exact digits, now matter how far you go. How do we know that they do?

There are two ways to know: You can actually do the calculation yourself, and see that the digits are all the same.

Or you can have faith that since they represent the same real thing, they must be equal in all ways. Can you imagine if they did NOT give the same result? I'm not saying that I seriously think something like that could ever happen, I'm just asking that you try to imagine it.

However, at some point, you cannot calculate more digits. At that point, all that's left is faith.

I do have faith, at least in logic. ;)

The point is that a human brain cannot "begreifen"* an abstract concept without resorting to some real world analogy. It's astonishing how far mankind has got with such a limited resource. ;)

* German for "understand". Means "put your hands on" something as Walter has already pointed out.

> Seriously, why does it have to be "experienced" to be understood??

It's a question of what you mean with "understand". As a mathematician, I've learned to just follow the rules of logic and apply them to some proven theorems and/or axioms to get to a new level of information. An entity like infinity or zero is just an object with given properties to which a set of rules applies. No need to have a "higher" understanding of its concept. If you ask a math guy "Where is infinity" he'll ask you back "How is 'where?' defined?".

On the other hand, math has its origins in the real world (astronomy, geography, physics). So its not a surprise that we try to apply mathematical concepts to the real world. This must fail for some of them, as infinity or continuity.

You are confusing two concepts (1) does the sqrt(2) EXIST and (2) can it be CALCULATED. If you accept that the real numbers are continuous then the regular proof that sqrt(2) is irrational will show that the number exists. You're argument is essentially "irrational numbers can't be computed, therefore they do not exist."

So it comes down to whether we are dealing with reality or the abstract model of mathematics - "faith" as you put it.

Dave

Re: Infinity

*Message #56 Posted by **Crawl** on 3 Oct 2010, 4:48 p.m.,*
in response to message #55 by David Hayden

It depends on what you mean by continuous. For any two rational numbers, an infinite number of rational numbers exist between them. That's true whether or not irrational numbers exist*.

Now, maybe what you're talking about are Dedekind cuts. If irrational numbers don't exist, it is possible to divide the real number line into two pieces such that the both the upper and lower piece are both open on both ends. I'm not sure why that should be something we can't accept (I believe the common assumption, that it is always possible to have one set be closed, is accepted merely as an axiom, not something that can be proved). Dedekind cuts were intended, I think, to give some grounding to irrational numbers (and without necessarily relying on a sequence of infinite (rational) operations), which were presumed to exist. If we don't presume they exist, we don't need to accept it.

*-And if we're thinking about the ultimate computer issue, maybe real numbers are not continuous. A real ultimate computer could handle who knows how many digits, but to make things easy let's say it can only handle 4. So there's 1.414 and 1.415, but nothing in between. Then 1.414^2=1.999, and 1.415^2=2.002, and there literally is no number between them that could possibly be the square root of 2.000 (or, for that matter, of 2.001).

Also, I'm not necessarily confusing those concepts. There have been historically people who have argued that something does not exist if it cannot be constructed. It is a minority view, granted, but I don't think it's something that can be said to have actually been disproved.

Re: Infinity

*Message #58 Posted by **Eric Smith** on 5 Oct 2010, 1:43 a.m.,*
in response to message #57 by Crawl

But the square root of two can be constructed very easily. Draw two line segments of unit length that are perpendicular and share an endpoint. Now draw a third line segment connecting the other endpoints of the first two. The length of this third line segment is exactly the square root of two.

Measuring it exactly is another matter.

Re: Infinity

*Message #59 Posted by **Crawl** on 5 Oct 2010, 9:28 a.m.,*
in response to message #58 by Eric Smith

I said before I was kind of playing Devil's Advocate and just wanted to see how far this argument can be taken. But it can be taken some interesting places.

Even if I concede that irrational numbers exist, do I have to concede that non-Computable numbers exist? I don't think I have to. And that relates back to the original topic of the thread. The only thing that makes real numbers have the cardinality of the continuum is noncomputable numbers. Even computable transcendental numbers have cardinality aleph-null. So it seems that it is possible to reject noncomputable numbers and the theory of transfinite numbers, since they are interrelated like that.

Re: Infinity

*Message #60 Posted by **Eric Smith** on 5 Oct 2010, 1:52 a.m.,*
in response to message #37 by Crawl

If you can't know all those digits at once, is it meaningful that they "exist" in some philosophical sense?

Of course they "exist" in a mathematical sense. Even if you can't compute all of them and store them in memory all at once, you can, on demand, compute any digit of it that you like. If I ask you today to compute the 10^100th digit of pi, and then ask you to do the same thing again at some arbitrary point in the future, you will get the same result, assuming that you don't make a mistake in the calculation. There is a single, unique value for pi. If that value didn't "exist", you wouldn't be able to reproduce it on demand.

If you're going to argue that pi or sqrt(2) don't exist, why shouldn't the same argument apply to 1/7? The fact that a place-value expansion of a rational number falls into a repeating sequence doesn't make it any more or less reproducible than pi or sqrt(2).

Re: Infinity

*Message #61 Posted by **Crawl** on 7 Oct 2010, 2:59 p.m.,*
in response to message #60 by Eric Smith

I don't agree that the rational decimal expansion case is equivalent to the irrational case. It takes very few bytes of data to

store all the decimal digits of 1/9. A rule like

Nth decimal digit of 1/9 = 1

suffices.

If you were skeptical that that worked, you could use long division (which does not require storing previous digits) and calculate each digit, even past the limit of digits your computer can store, and verify them. Even though you dropped early digits to calculate more, you can still use the general rule to get them.

The only way to store all the decimal digits of pi is to *actually* store them, so when you run out of space, you can't check more. If your computer's limit is 100^100 digits, and you want to calculate the 100^100+1, maybe you can by dropping the first digit. But since the only way you know the digits to pi is by storing them, now that you dropped the first digit, until you recalculate it, no one in the entire universe knows that pi~3.

(Remember, this is the ULTIMATE computer. You can't write pi~3 on a scrap of paper, because the material of that paper would have been better utilized in the computer. Likewise, a human can't just memorize it -- at best, the digits a human can remember would count towards the limit of the computer)

Re: Infinity

> Quote:
>
> The only way to store all the decimal digits of pi is to *actually* store them,

I strongly disagree. A program that can produce the n'th digit of pi on demand is externally indistinguishable from a program that produces the n'th digit from storage. It's just a form of data compression; from an information-theoretic point of view there is no difference between compressing pi into a short algorithm or compressing your shopping list into a self-extracting ZIP file, except that your shopping list is presumably of finite length. This also means that the actual information content of pi is very small.

Re: Infinity

*Message #63 Posted by **Crawl** on 8 Oct 2010, 7:10 a.m.,*
in response to message #62 by Eric Smith

Okay, if it is trivial to produce the 100^100+1 digit of pi on demand, then what is it?

I happen to know that the 100^100+1 digit of 1/9 is 1.

@Crawl:

> Quote:
>
> Okay, if it is trivial to produce the 100^100+1 digit of pi on demand, then what is it?

If I got it right then Eric didn't claim this being trivial, but more compact than storing all the digits of pi. OTOH you need *very* few bytes for storing 1/9 as decimal number. Way back they taught us to use a "period bar" for such numbers, e.g. "zero point period one" for 0.111...

Re: Infinity

*Message #66 Posted by **Crawl** on 8 Oct 2010, 12:19 p.m.,*

Re: Infinity

*Message #70 Posted by **Eric Smith** on 8 Oct 2010, 3:43 p.m.,*
in response to message #63 by Crawl

I didn't say it could be done quickly. In terms of information theory, though, it is equivalent, and thus pi has only very slightly more information content than 1/9.

We're straying from my point, which was that one can't credibly claim that irrational numbers don't exist just because one can't write down an exact decimal expansion of one on a finite piece of paper, or store that decimal expansion in a finite amount of computer memory.

Re: Infinity

*Message #71 Posted by **Kiyoshi Akima** on 8 Oct 2010, 4:08 p.m.,*

For sure. It's equal to 1E200+1 ... d:-)

Re: Infinity

*Message #73 Posted by **DeboT** on 11 Oct 2010, 11:44 a.m.,*
in response to message #37 by Crawl

Do numbers exist? Are they tangible, are they reality? Are they real? They represent a count of tangible (real) objects, but are they real in themselves?

Similarly words only represent real objects. The word "tree" is not real, but the tree itself is.

The word "infinity" is not real, but infinity itself is.

Have we been so conditioned by a world focussed on finite things, that it's become difficult for us to fathom infinity? Because we are so used to things having a beginning and end, we find it difficult to imagine an infinite space. We want to start measuring here and end measuring it there. That's why we have difficulty understanding an infinite being -God- who declared his infiniteness by the words that say an infinite amount: "I AM".

If only we grew up with infinity as a natural part of life, we might understand it more, & be more comfortable with it.

Re: Infinity

*Message #74 Posted by **Xavier A. (Brazil)** on 16 Oct 2010, 12:19 p.m.,*
in response to message #73 by DeboT

Your word reaches the duality language/consciousness.

Is human being's spirit able to make concepts without any language?

In my humble opinion, there is no way to do so.

Then, infinity exists in language, and thereafter/therefore in our minds. But the fact 'reality' is over our ability for us to reach it, totally.

Infinity is perhaps, so, the word used to mask our inability.

Agree.

Re: Infinity

*Message #76 Posted by **George Bailey (Bedford Falls)** on 30 Sept 2010, 8:13 a.m.,*
in response to message #1 by John Mosand

My concept of 'infinity' is the same as the one I have of 'time' before the big bang or 'space' outside the universe: none! I think it is impossible for human brains (or any brains for that matter) to understand either.

Religion is a means to explain things people don't understand (yet), death being only one of them. I favor finding a scientific explanation, go on searching for a scientific explanation, while simply accepting it's not yet found or coming to terms with the fact that an explanation can not be given, as it is the case with 'infinity', 'time' before the big bang, 'space' outside the universe or the 'meaning of life'

Re: Infinity

*Message #77 Posted by **Walter B** on 30 Sept 2010, 8:53 a.m.,*
in response to message #76 by George Bailey (Bedford Falls)

Mathematics and physics are full of mind-boggling models being hard to understand for our simple brains. In German, one word translating "understanding" is "begreifen" - meaning you can *touch it with your hands*. So, ideas or concepts like infinity (or QED or curved space or dimensions > 3 etc.) are non-understandable per definition. This may save us some fruitless discussions - so far I don't know another language providing a similar term, but that's most probably due to my 1/inf knowledge, sorry folks ;)

Death is another topic: you can "understand" it easily in the sense explained above, but a large fraction of mankind refuses to accept it as the final limit of a person. Must have a psycho-logical (i.e. not logical, irrational) reason.

Back to topic: Of all simple models for the idea of infinity, I like the one based on two parallel mirrors best - it's pricipally the same as the rice box, BTW. The one with the falling object is just cheating people "knowing" the concept of infinity already - the same is well known as the race of Achilles vs. a turtle ;)

Language (specially literal ones like the German example you provide) is the biggest hindrance to understading infinity. Abstraction is required, therefore math!

> Quote:
>
> Of all simple models for the idea of infinity, I like the one based on two parallel mirrors best

I always liked playing with parallel mirrors and looking into them, but it's only a good model in theory with ideal mirrors. In reality you always look in the mirrors under a certain angle so that the tunnel of reflections curves away from you - you're not able to actually 'see' infinity which is inevitably behind the curve. The image you see also turns gradually darker, thereby obstructing your view on infinity in a second way.

> Quote:
>
> Abstraction is required, therefore math!

The mathematical definition and abstraction of infinity is something entirely different from 'having a concept of' or 'understanding' infinity - it's the exact opposite! Being able to define something and work with it doesn't mean anyone understands it.

Things they are a'changing ;) even reality does ;))
You may either drill a keyhole in the center of one mirror or place a little webcam there. Enjoy!

Won't work! The webcam can see its own reflection but there it stops because the webcam's sensor or lens does not reflect the reflected image back.

If you argue one could put a semipermeable mirror in front of the cam the reflected image gets darker and darker and fades away very soon. Again, in theory this would go on and on, in reality you can not see infinity.

OK, I solemnly withdraw the webcam, though not completely convinced because I thought of some wide angle lens there. Anyway, how about the first suggestion?

> OK, I solemnly withdraw the webcam, though not completely convinced because I thought of some wide angle lens there. Anyway, how about the first suggestion?

Are you trying to have fun with me? For being reflected on its own path, the light beam has to be perpendicular to the mirror. It's not a question of a wide lens, the reflection will always have to happen exactly in the middle at the position where the eye, the sensor or whatever is, in order to stay on this path to infinity. In reality, the eye/sensor will therefor inevitably break the infinite reflection path. The barber shop mirror game only works because you look from slightly off center, you always see a tunnel that curves away from the ideal straight line.

*Message #84 Posted by **Donald Williams** on 2 Oct 2010, 11:27 p.m.,*
in response to message #83 by George Bailey (Bedford Falls)

See Douglas Hofstadter's book "I am a Strange Loop" chapter 5 "On video feedback". He describes the phenomenon he observed when he used a video camera taking a picture of the television it was connected to. In other words the video is a closed feedback loop. Focusing on the center of the television screen is not very interesting. When the camera is focused more towards the frame (his television had a metal strip along the edge) of the television he was able to create both finite and infinite "corridors". The angle of the video camera was critical when the image shifted from finite to infinite.

It sounds quite interesting but I have not tried it myself yet.

> Quote:
>
> It sounds quite interesting but I have not tried it myself yet.

I used to teach video back in the days of B&W cameras and monitors and Panasonic Portapacks. And I used to show my students video feedback as one of the first things, it was a lot of fun.

Also, back in the day, I came up with a way to do this all inside of a computer, no camera needed: Write a bit of very fast code that takes an area of memory and displays that on a monitor bit-by-bit or character-by character treating memory in the same arrangement as the screen, say 25x80 characters. Now write some more code that allows you to change the starting location of this mapping so that you can sort of "walk around" in memory and see where you're walking on the screen. Walk into the area being mapped and you've essentially got video feedback. It's looks and acts just like the real thing.

I wrote this for several early PC's. You had to write this in machine language because the goal was to get this all done within the time between screen refreshes. That usually limited the amount of memory you could map so you couldn't use the whole monitor but that was just as well, as this was just a window into memory anyway.

Very clever implementation of the same concept. I haven't done machine code in the last 20 years,so it would be quite a challenge for me personally, but it will go on my never ending to-do list.

Re: Infinity

*Message #87 Posted by **Dave Shaffer (Arizona)** on 3 Oct 2010, 3:33 p.m.,*

in response to message #84 by Donald Williams

If you try this (it is trivial - just connect your video cam to your TV set and aim the camera at the TV screen - relatively straight on), after you watch the first "zoom" to infinity (that's the impression I get), ROTATE the camera (one part-turn twist) - you will then see a spiral to infinity. Keep rotating, playing with the amount of rotation - it's almost addictive.

Re: Infinity

*Message #88 Posted by **George Bailey (Bedford Falls)** on 4 Oct 2010, 2:31 a.m.,*
in response to message #84 by Donald Williams

The video loop overcomes the problem of the non-reflecting eye in the center, a straight tunnel to infinity is possible with this. Also could one adjust the amplification of the looped signal for it not to get darker and darker with every step. But a third problem keeps us from actually seeing infinity: after every loop, the image has to be at least one pixel smaller than the one before or the effect would actually not be visible. And those one-pixel-steps are finite on a real world monitor. Again, this tunnel of reflections is a nice way in theory, but fails in reality to make 'infinity' visible.

True, but that is how it starts. IMHO, the study of anything complex starts with learning what it *does* and not what it *is*. Eventually after *doing* you may (if you are lucky) achieve an understanding (or what it *is*). Next, you write it down, and win some type of prize.

Working with it or winning a prize for it is not what I mean by 'having a concept of' or 'understanding'. As you say 'if you are lucky' you achieve an understanding. But we're not always lucky. There are many things in life that we use but don't (yet) understand or are unable to explain. The human brain, besides infinity, is one of these... ;)

All this infinity discussion reminds me of a hops induced discussion we had one day after classes at the university.

We were trying to figure out if Einstein's hair was always so messed up because he was driving in his convertible at the speed of light so he could turn on his headlights and see if he saw them when we pondered this: increasing velocity means we are moving through more space in less time. We postulated that if we were moving at a velocity of positive infinity, we would be moving through all space in no time and there would be nowhere left to go so, ergo, we must be standing still. < i did warn you %^) >

Thinking back, I don't ever recall wondering about the velocity of minus infinity???

Re: Infinity

*Message #101 Posted by **Norman Dziedzic** on 19 Oct 2010, 1:59 a.m.,*
in response to message #100 by DeboT

All right, I do have something to add.

Today my 11 year old is talking about zero and says that it is in the middle of the numbers because there are an infinite numbers above and below it.

Then he thinks a little and postulates that every number is in the middle of the set of numbers because there are always infinite numbers above and below every number. (At this point I'm beaming proud rays that he can even think about stuff like this <VBG>)

I don't have an answer (don't think there really is one) but I thought it was yet another interesting ponderance on the topic.

Re: Infinity

*Message #102 Posted by **Glenn Shields** on 19 Oct 2010, 11:42 a.m.,*

30b repurposing Status

*Message #1 Posted by **Thomas Chrapkiewicz** on 29 Sept 2010, 9:01 a.m.*

Hello:

At the HHC2010, the HP30b repurposing was mentioned -

What is the status of this effort? My interest is in the 34s repurposing as my concern is in a scientific version.

(I've searched the 20b wiki and could not find any information.)

Thanks and Regards, TomC

Re: 30b repurposing Status

*Message #2 Posted by **gene wright** on 29 Sept 2010, 10:08 a.m.,*
in response to message #1 by Thomas Chrapkiewicz

FWIW, Tim Wessman at HP did not think it would be that difficult to get the code onto a machine.

So, Walter? What's the status? What do you need to load the code onto a 30b and try it out?

Re: 30b repurposing Status

*Message #3 Posted by **Walter B** on 29 Sept 2010, 10:32 a.m.,*
in response to message #1 by Thomas Chrapkiewicz

> Quote:
>

Jake Schwartz gave a presentation at HHC2010 since neither Paul nor me have the $$$$ for a short transpacific or transatlantic trip just for a two-days meeting. The answer to your question is given in said presentation. If Jake didn't distribute it at the meeting (I have no idea), please drop me a mail and I'll send it to you.

> Quote:
>
> I've searched the 20b wiki and could not find any information.

As expected - I didn't write anything in that wiki. And since documentation is my task in our two-person design team I'm pretty sure Paul didn't as well.

HTH (else please explain your wishes once more since then I was unable to understand them)

Walter

Re: 30b repurposing Status

*Message #4 Posted by **gene wright** on 29 Sept 2010, 10:42 a.m.,*
in response to message #3 by Walter B

Walter, the presentation was given, but the HP people present did not understand what the exact hold up is / was for you to try the code on the actual unit.

Perhaps if you laid out a specific short list of 1. I need X. 2. I don't know how to do Y. etc. then someone can get that specific stuff available to you and testing on a unit can begin.

HP was willing to help, but after the presentation, they weren't sure exactly what you needed.

Just ask and be specific. :-)

It was well received. We all just want to help push it to the next level!

Gene,

thanks for your explanation and the offer. We'll sit down and compose a little list of bare necessities :) to get this homegrown thing up and running.

Re: 30b repurposing Status

*Message #6 Posted by **Thomas Chrapkiewicz** on 1 Oct 2010, 9:45 a.m.,*
in response to message #5 by Walter B

Hello Walter:

The links to the source and the documentation are 'dead'.

http://hpwiki.fatcity.com/lib/exe/fetch.php?media=20b:sci34s.tgz
http://hpwiki.fatcity.com/lib/exe/fetch.php?media=20b:enter_20b_1_1.pdf

The binary would also be helpful (if available).

Are these still available?

Thank you, TomC

Re: 30b repurposing Status

*Message #7 Posted by **Walter B** on 1 Oct 2010, 10:30 a.m.,*
in response to message #6 by Thomas Chrapkiewicz

Thomas,

just checked the addresses you mentioned and their roots. IMHO that wiki may be interesting, but doesn't look very active to me. Another enthousiastic attempt fading out d:(As I did mention in a previous post already, I did never publish anything in that wiki - what was published there was the first edition of Pauli's and my 34s documentation (v1.1 of Dec. 2008 to be precise), meant as an appetizer IIRC.

This is outdated for long, so I'm quite happy that link is dead. FYI, Jake's presentation was based on v1.11. If you want that documentation, some 2MB pdf, please drop me a message stating your e-mail address. Please note, however, this is a moving project - we are writing v1.12.

Regarding the SW, even I myself don't have the recent version. And it seems to be foggy over the Indian Ocean, so that continent down under is cut off. A soon as I get my collaborator to read my messages, I'll return with more as promised above.

Hope this answers your questions. Else continue asking ...

Re: 30b repurposing Status

*Message #8 Posted by **gene wright** on 1 Oct 2010, 10:36 a.m.,*
in response to message #7 by Walter B

Hey Walter.

Regarding the SW...

Do you have an edition that runs in emulation? Anything we can actually play with to help with testing?

Perhaps we could find someone outside HP who has the compiler who might be able to compile the code?

I wonder...Does the licensing agreement to the compiler say you cannot compile code for a friend? I understand why HP would not want to do that (really) but a compiler is a compiler...of course, I haven't read the byzantine licensing agreement, so ...

Basic question: is there an executable in any form we can play with?

Re: 30b repurposing Status

*Message #9 Posted by **Eric Rechlin** on 1 Oct 2010, 11:42 a.m.,*
in response to message #8 by gene wright

I think the concern with the compiler is that Tim most likely has a clause in his employment agreement that says that anything created with HP-owned equipment becomes HP property. Therefore he presumably can't do personal stuff on his work machine without risking loss of intellectual property.

If someone else has a license to the compiler they should be able to help. HP-GCC is the only compiler I have ever dealt with that has such Draconian restrictions on what you compile.

Re: 30b repurposing Status

*Message #10 Posted by **gene wright** on 1 Oct 2010, 12:12 p.m.,*
in response to message #9 by Eric Rechlin

Agreed, which is why I said I understood the objection. :-)

But, I bet we can find someone, somewhere, for whom that is not a concern. All we need is someone who has the compiler who can take a couple of minutes to do it.

Re: 30b repurposing Status

*Message #11 Posted by **Bruce Bergman** on 6 Oct 2010, 11:40 p.m.,*
in response to message #7 by Walter B

It's not active, but that's because I am just too busy these days to update it. I would LOVE some help from those here in the forums, but I think others are busy too.

I would appreciate any input as to what priority I should put on certain things on the wiki. For example, if I only had a couple of hours per week, would it be best to focus on just putting up .BIN files? Or do people need technical details? Or ??

I really do want to keep it current and active, but I'm just swamped.

thanks,

Bruce

Re: 30b repurposing Status

*Message #12 Posted by **Katie Wasserman** on 29 Sept 2010, 10:58 a.m.,*
in response to message #4 by gene wright

One impediment that I can think of is.....

IIRC the code for this project would occupy more than 32K of ROM. The free IAR Kickstart system only allows you to compile code up to 32K. So you'd need to have a full version of the IAR Embedded Workbench for ARM (which allows up to 256K of code) to compile this and that costs $3,400 for a single user license. That's a pretty big commitment.

Re: 30b repurposing Status

*Message #13 Posted by **gene wright** on 29 Sept 2010, 11:06 a.m.,*

Hmm... wonder if we have any friends who could take the source code **and compile** it for us? ;-)

Re: 30b repurposing Status

*Message #14 Posted by **Tim Wessman** on 29 Sept 2010, 11:14 a.m.,*
in response to message #13 by gene wright

Nope. I would not use an HP licensed program to do work for a non-HP entity/purpose - myself included. I could possibly give it an attempt to see if it fits, but could not distribute that.

However, a very good thing people could do to help would be to get a different toolchain that builds for ARM and that chip in something like GCC. Any ARM compiler should be able to do the job. HP just went with the one that was recommended by the manufacturer and for which they provided a pre-built project.

Code Sourcery provides ARM cross compilers based on GCC. They provide a few versions depending on the target OS. Perhaps one of them might work? (Not sure what binary API the calc needs...) The Lite edition is free:

Lite Downloads

(It can be hosted on Linux or Windows. They also sell and support "Pro" and "Personal" editions.)

Re: 30b repurposing Status

*Message #17 Posted by **Eric Smith** on 7 Oct 2010, 1:10 p.m.,*
in response to message #16 by sylvandb

I've used the CodeSourcery toolchain (arm-none-eabi) for other projects, and it works pretty well. It is the GNU toolchain (GCC, Binutils, etc.), but with many improvements for the ARM. CodeSourcery sends their updates to the FSF, but it takes a long time for them to make it into the official GCC releases.

In the past I've often been told that GCC doesn't have ARM code generation as good as other compilers, but I don't know whether that is still the case, as I haven't attempted to compare it to other compilers.

generation as good as other compilers, but I don't know whether that is still the case, as I haven't attempted to compare it to other compilers.

GCC-4 seems to have improved quite a bit on this front but I've nothing to compare it against not having used an alternative. That said, ARM is quite different from the "assumed" processor GCC is designed for.

Re: 30b repurposing Status

*Message #22 Posted by **Eric Smith** on 10 Oct 2010, 5:02 p.m.,*
in response to message #21 by Paul Dale

How does using a compiler available at no charge require any more porting than a $3400 compiler? I was under the impression that the $3400 needed for the compiler was a stumbling block, so surely a free compiler solves that problem and allows the project to make progress. Or am I missing something?

I'm not volunteering to do anything. Between school and trying to make a living, I've barely got any time to work on my own calculator project.

Re: 30b repurposing Status

*Message #23 Posted by **Thomas Chrapkiewicz** on 29 Sept 2010, 10:56 a.m.,*
in response to message #3 by Walter B

Well, at the risk of asking redundant questions (of both Walter and/or HP), I will request some specifics:

1. 34s Source Code.

2. 34s executable to be downloaded to the 30b.

3. Any other notes/docs to support 1 and 2 above.

4. 30b SDK (perhaps this is the same as the 20b SDK).

5. 12c SDK (I suspect this is not like the 20b/30b SDK due to LCD differences).

I understand that this stuff is in a very raw state and as such do not intend to nag any of the source(s).

Thanks, TomC

Thomas,

> Quote:
>
> 12c SDK (I suspect this is not like the 20b/30b SDK due to LCD differences).

I concur. Since we've tailored the output to fit the 20b/30b LCD, however, I doubt the SW will fit the 12C as is. And the 12C provides 39 keys, while the 20b/30b has 37 only arranged significantly different, so a minor redesign will become inevitable. Please understand we want to prove the design before we start a redesign d;-)

I'll return for the other points.

Re: 30b repurposing Status

*Message #25 Posted by **Tim Wessman** on 29 Sept 2010, 11:11 a.m.,*
in response to message #23 by Thomas Chrapkiewicz

There is currently only the 20b dev kit and there really isn't much of value you'd get out of the other units. The screen on the 20b is identical, so possibly a screen diagram and keyboard layout for the 12c is the only missing piece there.

in response to message #25 by Tim Wessman

Tim,

While it might not be an official SDK, I got a sort-of SDK for the 12C+ from Cyrille. It's got the all LCD and keyboard code and a simple 4-banger calculator.

in response to message #27 by Katie Wasserman

The 20B SDK should be very close, if you need to see schematics.

I reversed enough of the 12C+ to figure out the LCD and keys, but my planned projects on that one have stalled due to my poor time management.

Tools: I'm using GCC. The HP programming cable is nice if you plan on doing crash and burn debugging, but you could do without if you rig some pogos or just solder down some wires and dig up a TTL/232 level converter (or gut a cheap USB/serial adapter). With the 20B (and I assume the 30B) JTAG is an option as well. I've used a parallel port wiggler (cheap and slow) and a Luminary dev board (not as cheap, much faster) with OpenOCD. I found the free SAM-BA tools from Atmel ran *much* faster on XP than on windows 2k. A small power supply would allow you to run without worrying about coin cells. As with any embedded project, a 'scope is nice but certainly not required.

FTDI sells a USB/Serial cable that has TTL level. Nowerdays this is the best option, I think. I used it to link a Canon X-7 to my PC (see here: http://www.silicium.org/forum/viewtopic.php?f=46&t=22257&start=15 in French).

Re: 30b repurposing Status

*Message #32 Posted by **Paul Dale** on 2 Oct 2010, 3:34 a.m.,*
in response to message #1 by Thomas Chrapkiewicz

The current status is that the firmware compiles in a custom emulator for Linux and Mac terminal both using the curses library -- I'm happy to send this to folks who want to see it. Text based graphics, a weird QWERTY key mapping and some debug aids only. But fully functional. If the folks here want to have a play with the source, I can put something together fairly quickly. Earlier versions are available on the 20b re-purposing site but they are quite dated now.

I've compiled the full source code using HP-GCC for ARM on both a Mac and a Linux machine. We're still fairly comfortably within the 128kb flash space and we're just within the 2kb battery backed RAM limit -- sub 20 bytes free currently & program steps will be taken as required but I hope they aren't. We're well within the 4kb volatile RAM limit. In fact, there are a number of functions that aren't included in Walter's documentation that are ready to go: Reimann Zeta function for complex argument, digamma function, Jacobi's Elliptical functions, real bessel functions of first and second order (& almost complex versions of the same), cube and cube root, fused multiply add, x!!, !n, Easter & more. All depending on final space limits.

I started integrating HP's development environment into my source code but that failed, well at least I think it failed. Of course I was trying to merge their stuff into mine not the reverse which in hindsight was a mistake -- also losing my job at a work environment with all the facilities available to do the hardware port and debug hasn't helped.

I don't have IAR Embedded Workbench or even a windows machine to run it on and that would be the fastest way to progress the project by using HP's development environment. My code and theirs are structurally fairly similar -- both are reactive based on keystrokes being received -- mine is pure C, HP uses minimal C++ but on the whole there aren't a lot of differences (great minds or fools :-)

At the moment, my biggest limitation is free time to devote to the project -- I'm still on probation at my new job (GPS controlled tractor driving which is rather unrelated to my previous experience but fun nonetheless) which means I'm rather busy. I don't have a 30b but do have a 20b and programming cable which seems to be identical hardware-wise. If someone with access to the full version of IAR Embedded Workbench and the inclination to finish the port was interested, I'd be happy to assist and I don't think it would take very long to get a working result.

I've previously sent my code to Cyrille at HP in case they were interested in making a product of it -- they weren't. Regardless, we've made a number of major changes recently (larger stack, more lettered registers).

Finally, some random thoughts that aren't in the presentation.

* I've aimed for numerical accuracy over speed -- registers and stack are 16 digits BCD reals (including subnormals, infinities, NaNs, + & - zero all packed into 8 bytes). Internal calculations use 39 decimal digits almost exclusively. The calculator stress test "9 SIN COS TAN ATAN ACOS ASIN" returns the correct result for a correctly rounded 16 digit format. Quixotically, I'm aiming for correctly rounded results in the sixteenth digit -- yes I know this isn't really possible but I'd like to try.

* All program steps are fully merged (excepting the three character alphanumeric labels and the commands that call these which take two steps). 18555 different command codes currently -- mostly commands with arguments for various arguments and indirections.

* Every command that takes an argument can be executed indirectly (excepting LBL of course).

* Almost every function that takes a real argument has a complex equivalent. The exceptions are few: triadic commands and the error function.

* Matrix maths (e.g. JMB's) *could* be included via user programs in flash. Solve, integrate, sum and product are

implemented as user RPN code and the associated commands hook into these routines directly. To include matrix code, we'd have to lose something else I suspect.

* Integrate uses a 10/21 Gauss Kronrod quadrature and thus isn't adaptive. I'd like to replace it with something more robust eventually. Solve uses secant, bisection, quadratic interpolation and optionally a ridder's step (this last isn't used since it is larger and doesn't seem to help a lot). The solve code is used internally to provide the inverse statistical distributions.

What "make" command?

Doofus moment here.

In Terminal, once I have changed directories to the "sci" directory created, what next?

Make is not a recognized command.

doh!

Re: 30b repurposing Status

*Message #39 Posted by **Richard Gray** on 5 Oct 2010, 9:58 a.m.,*
in response to message #38 by gene wright

"make - GNU make utility to maintain groups of programs"

Try "man make" for a command description. make (small m) executes the commands in the Makefile of current directory.

Re: 30b repurposing Status

*Message #41 Posted by **gene wright** on 5 Oct 2010, 10:29 a.m.,*
in response to message #40 by Tim Wessman

Ah, if XCode is required in OSX, you must be registered as a developer.

"make" by itself in OSX without xcode is not a valid command.

Re: 30b repurposing Status

*Message #42 Posted by **Egan Ford** on 5 Oct 2010, 12:14 p.m.,*
in response to message #41 by gene wright

It costs nothing to register, just use your iTunes ID.

I can send you the build if you like, just verify that you have the following libs:

```
/usr/lib/libncurses.5.4.dylib (compatibility version 5.4.0,
current version 5.4.0)
/usr/lib/libSystem.B.dylib (compatibility version 1.0.0, current
version 125.2.0)
```

So, where is the manual? Tired of adding numbers, I'd like to write a program.

Re: 30b repurposing Status, emu34s screenshot!

*Message #47 Posted by **Egan Ford** on 5 Oct 2010, 4:52 p.m.,*
in response to message #46 by Walter B

Thanks. Below is my setup. I do have an issue with key assignments. E.g. A = STO. Is the keymaping for the emulator documented somewhere outside of the source?

Thanks.

Screenshot:

Re: 30b repurposing Status, emu34s screenshot!

*Message #48 Posted by **Walter B** on 5 Oct 2010, 4:59 p.m., in response to message #47 by Egan Ford*

Not sure I got your point, however: All shifted operations are printed *below* of the respective keys. So "A" in alpha mode

is entered by "pressing" Sum+.

Re: 30b repurposing Status, emu34s screenshot!

*Message #49 Posted by **Egan Ford** on 5 Oct 2010, 5:04 p.m.,*
in response to message #48 by Walter B

Since the emulator has to use a QWERTY keyboard, what is the mapping of the QWERTY keyboard to the virtual 34s keys? I would assume that if I press A on my Mac keyboard that I should get Sigma+ in the emulator, but I get STO.

Re: 30b repurposing Status, emu34s screenshot!

*Message #50 Posted by **Walter B** on 5 Oct 2010, 5:06 p.m.,*
in response to message #48 by Walter B

After checking some older mails I guess this is what you need:

```
Currently the program works in text mode using
the curses library. The keyboard is mapped thus:

q w e r t y top row of keys left to right
a s d f g h
z/x c v b n enter row of keys
u 7 8 9 /
j 5 6 7 *
m 1 2 3 -
spc 0 . , + bottom row of keys

There are also the extra characters 'Q' for
quit, 'F' to show lots of nice internal status
information and 'T' to trace programs being
executed.
```

This information was true in January. Please check.

HTH

Re: 30b repurposing Status, emu34s screenshot!

*Message #51 Posted by **Egan Ford** on 5 Oct 2010, 5:10 p.m.,*
in response to message #50 by Walter B

Perfect. Thanks.

Re: 30b repurposing Status, emu34s screenshot!

*Message #52 Posted by **Paul Dale** on 5 Oct 2010, 5:59 p.m.,*

in response to message #50 by Walter B

This information is still correct. See doc/layout for the key to keyboard mapping -- the function assignments have changed since I last updated that.

```
keyboard mapping
q  w  e  r  t  y
a  s  d  f  g  h
 z/x  c  v  b  n
  u   7  8  9  /
  j   5  6  7  *
  m   1  2  3  -
 spc  0  .  ,  +
```

Additionally, Q to quit, F for status flags etc & T to enter trace mode. The latter two aren't going to be much use to people apart from me, however F does display the entire stack badly formatted.

- Pauli

Re: 30b repurposing Status, emu34s screenshot!

*Message #53 Posted by **gene wright** on 5 Oct 2010, 5:07 p.m.,*
in response to message #48 by Walter B

Walter, he means the mapping to a computer keyboard, where pressing a invokes STO. It also appears that some of the characters in the keymap file are typed incorrectly. T is CMPLX but is labeled f in the file.

```
          CALCULATOR KEYBOARD LAYOUT
COMPUTER KEY MAP
        sig+     B     C     D   CMPLX   h
q  w  e  r  t  y
        STO      RCL   Rv    ->    f     g
a  s  d  f  g  h
        ENTER^         x<>y  CHS   EEX   <-
z/x   c  v  b  n
        XEQ       7     8     9     /
u   7  8  9  /
        BST       4     5     6     *
j   5  6  7  *
        SST       1     2     3     -
m   1  2  3  -
        ON/C      0     .     R/S   +
spc  0  .  ,  +

        If not defined in a program B == 1/x;
C == y^x  and D = PI
```

Re: 30b repurposing Status, emu34s screenshot!

Re: 30b repurposing Status, emu34s screenshot!

*Message #55 Posted by **Paul Dale** on 5 Oct 2010, 6:01 p.m.,*
in response to message #54 by Walter B

As I mentioned, the layout file is dated. We had a big rearrangement of the top couple of keyboard rows to better fit hex characters in & I never updated the layout since I don't use the file having learnt the positions of most of the keys already.

On the plus side, the three shift keys are now f, g & h on the QWERTY keyboard :-)

A pretty good month for collecting

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 28 Sept 2010, 11:06 p.m.*

During September I was able to add three vintage machines to my collection:

A Rockwell 24K with carrying case and instructions for a dollar.

A Unnisonic 811 with instructions, a registration card and a carton for a dollar. I now have an 811, 811-A, 811-C, 811-E and 811L-B. Was there an 811-B or an 811-D?

An HP-95LX with 1 MB RAM for $7.50 . Is there something unique that it can do that other HP machines can't do, and that I should become familiar with? Or, should I simply add it to my collection?

Palmer

Re: A pretty good month for collecting

*Message #2 Posted by **Katie Wasserman** on 29 Sept 2010, 12:39 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Palmer,

the HP95LX was the first of 3 really amazing HP machines. I think by far the best hand-held devices HP ever invented. All were basically IBM XT's running DOS using 2 AA batteries, a B&W display and some fantastic built-in software.

The 100LX improved greatly on the 95LX by expanding the screen to a full 25x80 characters and adding more/better built-in software. The 200LX improved on the 100LX by (optionally) adding more memory and still better built-in software.

I think that HP's big selling point with these was having Lotus 1-2-3 built in, but I think that the calculator software that HP wrote for these was just perfect. The solver on the 100LX/200LX (I'm not sure about the 95LX) was easily the best one ever. In addition you could link to 1-2-3 sheets to read/store data from within the solver and do some things not possible with any other solver in an HP calculator.

I still use my 15 year old HP200LX (double speed with 4M RAM) daily for calendar and phone book things as well as my calculator collection DB management tool. Not to mention the programming in various computer languages just to test out ideas and HP CALC for financial stuff and to see how far I can push the solver!

I totally agree. They are cranking out the same junk as every other company these days. Even the newer calculators don't have any sparkle to them.

Re: A pretty good month for collecting

*Message #5 Posted by **Pavneet Arora** on 29 Sept 2010, 5:47 a.m.,*
in response to message #2 by Katie Wasserman

I completely agree with Katie. I was fortunate to purchase the 95LX new and used it for a good long time. The one problem that I had that was maddening to me was that' at least on my version, bulk Kermit transfers didn't work and I had to backup my files individually. Having a visible stack was brilliant, and incidentally something I wrote to HP about during the Woodstock model era.

The OmniGo 100 running GeoWorks was a huge disappointment on the other hand.

Regards.

Re: A pretty good month for collecting

*Message #6 Posted by **Gerry Schultz** on 30 Sept 2010, 3:11 p.m.,*
in response to message #2 by Katie Wasserman

Katie:

Your posting reminded me that I have a 1 MB HP200LX that I got last year at HHC2009. I haven't done much with it since but where can I find an I/O cable (I can make one with the right 200LX connector), backup batteries (What type does it take? It's missing), and PC application software to transfer programs between the LX and a PC? I did find some manuals on that other site but they were pretty expensive.

It appears to work just fine on a couple of AAs, so I'm wondering what I can do with it now.

Thank you for any suggestions.

Gerry

Re: A pretty good month for collecting

*Message #7 Posted by **Thomas Chrapkiewicz** on 30 Sept 2010, 4:34 p.m.,*
in response to message #6 by Gerry Schultz

...I don't mean to interupt, but... . ....:

The backup battery is a CR2032. There should be a little plastic carrier in the side of the machine that it fits it.

The cable is very similar to (not NOT identical to)the HP49 cable. There is a 'Cable Table' around here somewhere that has the details.

It can run on NiCds or Alkalines. When running on NiCds, one can use an external 'wallwart' for charging. There is a setting to 'tell it' you are running on rechargable batteries.

Also, it IR emits HP SIR so a HP82240 printer should work - although I haven't figured out how to get it to work from QBASIC.

TomC

ps: I'm also a 'fan' of this fine machine!

Re: A pretty good month for collecting

*Message #8 Posted by **Katie Wasserman** on 1 Oct 2010, 2:11 a.m.,*
in response to message #7 by Thomas Chrapkiewicz

I think that the fastest way to transfer data between a PC and an HP95/100/200LX is to use a PC-CARD (aka PCMCIA). You can get them with 100+ MB for next to nothing on TAS and you can buy a PC-CARD reader (for next to nothing too) for you PC or laptop if you don't already have one.

Aside from being much faster than serial communications it's good to just keep one of these cards in your palmtop for greatly enhanced storage of programs and data, It looks to your palmtops that it has an like the A: when installed (by default, you could change that).

If you really want to go the serial route, you can still buy them new here and probably elsewhere on the web. The serial cable is needed for connection to a modem, for example, and you can even get an email client that works pretty well. It used to be possible to do some web surfing too, but I haven't tried that in years and I doubt that you'd get very far with it these days.

Finally it's possible to skip the serial connection but still connect to the internet by buying a PCMCIA modem card with an X-JACK built in. There was at least one 14.4K modem card that worked well on the 200LX, I don't think that there were any faster ones made that worked. IIRC they all draw more current than the 200LX can supply so you have to use an external modem for better speed.

devices HP ever invented.

So, I started playing around with it just a little bit. I ran the forensics algorithm and got 9.000000000029575 -- that's ten zeroes in there! That contrasts with the 8.9999999956625 (only eight nines in there) as listed in Sebastian's site for the HP-42, 48, 49, 50.

Palmer

Palmer, if HHC 2011 is in Nashville, maybe you can come?

*Message #10 Posted by **gene wright** on 29 Sept 2010, 7:40 a.m.,*

Mathematica code with C + HPGCC

*Message #1 Posted by **Sujith Abraham** on 28 Sept 2010, 10:30 p.m.*

If anyone here use HPGCC, can you tell, if we can use programs in Mathematica from C?

I guess it is too much to ask, I am just curious.

Re: Mathematica code with C + HPGCC

*Message #2 Posted by **David Hayden** on 28 Sept 2010, 10:33 p.m.,*
in response to message #1 by Sujith Abraham

Sujith,

I don't know if this is possible but I doubt it. We would have to port the Mathematica programs, along with Mathematica itself, to the calculator and then call the programs from within C code. I can't imagine that the calculator has enough memory for that.

Dave

Re: Mathematica code with C + HPGCC

*Message #3 Posted by **Ralf Fritzsch** on 29 Sept 2010, 7:25 a.m.,*
in response to message #1 by Sujith Abraham

> Quote:
>
> If anyone here use HPGCC, can you tell, if we can use programs in Mathematica from C?

At least the naming conventions are a bit different on both sides. A quick lookup involving the result of Integrate[1/(1 + x^3), x] and piping it through CForm in Mathematica showed, that Mathematica uses ArcTan, Sqrt, Log, and Power, whereas HPGCC prefers atan, sqrt, and log. Trying to compile Mathematica generated C-Code within HPGCC thus yields messages like

warning: implicit declaration of function 'ArcTan'
warning: implicit declaration of function 'Sqrt'
warning: implicit declaration of function 'Log'
warning: implicit declaration of function 'Power'

but nevertheless compiles something. But this is the opposite direction compared to your question :-(

Kind regards, Ralf.

HPGCC still active

*Message #4 Posted by **Sujith Abraham** on 1 Oct 2010, 11:01 a.m.,*

in response to message #3 by Ralf Fritzsch

I know this is asking for too much on a small device with such a limited resource. Anyway you can do a **lot** with C programming alone, and it makes it worthy.

What happened to HPGCC? Is it still under active development?

HP-65 card reader "saga"

*Message #1 Posted by **aj04062** on 28 Sept 2010, 8:57 p.m.*

I've been trying to source a fault on my 65 card reader.

I've checked the caps with an ESR Meter from a friend. Does anyone know what the calue of the CAP that connects Vbsw to Ground should be? This checked out at 15.9 micro F with a low resistance. The others checked out OK as well. I was doing a little research online and found some folks that claim they wouldn't trust an ESR meter on these and replace the CAPs anyways. Agree? Is there a series resistance anyone would recommend these caps be under?

Re: HP-65 card reader "saga"

*Message #2 Posted by **John Robinson** on 30 Sept 2010, 6:40 a.m.,*
in response to message #1 by aj04062

It should be 2.2uF according to Tony Duell's schematics. Have you tested it removed from the circuit board ? The Kemets capacitors are generally very reliable, but they can fail.

Vbat should be the same as Vbsw, if they are then the cap shouldn't be a problem.

Cheers, John

HP 97 data Card 2

*Message #1 Posted by **Ed Sowell** on 28 Sept 2010, 5:50 p.m.*

If you have an HP-97 with a properly workning card reader and would be willing to create and send a Data Card 2 to me I'd appreciate it. E-mail me what you think would be a fair payment the card, postage to So. California, and your time.

As you might know, Data Card 2 is used in testing and adjusting the card reader. Here's how to create it, as explained on page C-3 of the Service Manual:

```
0. Turn power on
1. Enter the data below into the indicated registers
2. Print the registers to confirm correct data
3. Press  Function key then W/ Data key
4. Feed side 1 into the card reader.
5. Clip the write-protect corners.

Register                              Number
0                          5.061779945+01
1                          0.000000000+00
2                          3.088997250+01
3                          -2.238303285+21
4                          4.301773670+27
5                          0.000000000+00
6                          0.000000000+00
7                          0.000000000+00
8                          0.000000000+00
9                          0.000000000+00
A                           -4.444444444-44
B                          -3.333333333-33
C                          -2.222222222-22
D                          -1.111111111-11
E                          8.000000000-77
I                          -3.000000000+00
```

Error HP 11C

*Message #1 Posted by **Hannes, Switzerland** on 28 Sept 2010, 12:17 p.m.*

Hello Guys,

I use a HP 11C for study since 2009 and Iam very happy with. It was bought in 1985 by my father on US holidays. Unfortunately I have a problem with it this days: It shows a blinking "3" on the display. All buttons and functions are disabled. I already tried to fix the problem with new batteries. Didnt work! Do you have a tipp for me to solve the problem? Is it an usual error?

Best Regards Hannes

Unfortunately that doesn't sound too healthy. Perhaps not very conclusive, but I'm curious if you can get it to do a self test ("x" down + "on" down/up + "x" up)? That will perform a rom checksum, ram scan, and bang on a raft of cpu instructions.

You might also try pulling the button batteries out and shorting the internal contacts to fully reset the unit.

Huh. So folks here just keep "polling" to determine whether anything new exists in a thread?

Re: Forum admin question..

*Message #4 Posted by **Michael Plant** on 28 Sept 2010, 10:36 p.m.,*
in response to message #3 by uhmgawa

I use the Daily View, which, provided I am logged in, alerts me to new messages and displays them in their thread context.

Works for me!

Re: Forum admin question..

*Message #5 Posted by **Michael Meyer** on 28 Sept 2010, 10:47 p.m.,*
in response to message #4 by Michael Plant

Yes... but it does keep us coming back daily. Or, in my case, several times per day. I should probably just make this my home page...

Re: Forum admin question..

*Message #6 Posted by **Michael Plant** on 29 Sept 2010, 12:18 a.m.,*
in response to message #5 by Michael Meyer

Yes - this is true. Though I rarely post here, I visit the Daily View page, at a guess, at least ten times a day and read most of the threads.

Re: Forum admin question..

*Message #7 Posted by **Katie Wasserman** on 29 Sept 2010, 12:20 a.m.,*
in response to message #3 by uhmgawa

This is an extremely active forum and if you don't get a response to your question/comment within the 2-day time span allowed for the "daily view" you probably never will. So, while you do need to check back, you just need to do so for a couple of days (unless the discussion really gets going of course). Often a thread will stay continuously active on the "daily view" for weeks because there are posts within two days of prior posts.

HHC2010

*Message #1 Posted by **John Cadick** on 27 Sept 2010, 9:04 p.m.*

HHC was just terrific this year. This was the first time that I have been able to go since 2007.

Several very good papers and enough good door prizes to send everybody back with lots of goodies.

To all that couldn't make it, you were missed.

To all that did make it, I was really great seeing you again. I look forward to 2011.

John

Re: HHC2010

*Message #2 Posted by **Namir** on 28 Sept 2010, 2:32 a.m.,*
in response to message #1 by John Cadick

John,

Glad you had fun at the HHC2010. I remember HHC 2007 in San Jose and the "event" during one of your talks, when your laptop displayed a eBay auction reminder (one which I was also bidding) which also appeared on the talk's projection. We both lost the auction, I remember but the whole conference attendees had a big laugh at what happened and many suggested that what happened would be an excellent eBay TV advertisement (if not the very best one for eBay). I think Jake video taped that "event" too, so it is in the HHC2007 video archive.

Sorry I missed the HHC2010, but the weather here in the south of France is fantastic!!!!

Cheers,

Namir

Edited: 28 Sept 2010, 3:16 a.m.

Re: HHC2010

*Message #3 Posted by **John Cadick** on 30 Sept 2010, 5:05 p.m.,*
in response to message #2 by Namir

That e-bay event was discussed with much laughter. I do not recall what the bid was for, but I'm sure that it was something that has improved the quality of my life.

You were missed and mentioned with fondness.

John

Gene,

Yes sir!!! Sign me up for HHC2011 in Nashville!! BTW, are there any country singers who love HP calculator as much (or even more) as country music???

:-)

Namir

Edited: 28 Sept 2010, 9:05 a.m.

Re: HHC2010

*Message #8 Posted by **Namir** on 28 Sept 2010, 9:07 a.m.,*
in response to message #6 by gene wright

Did Joerg Werner (the TI Datamath web curator) attend?

Re: HHC2010

*Message #9 Posted by **Walter B** on 28 Sept 2010, 9:52 a.m.,*
in response to message #8 by Namir

Jörg Wörner is on the list of registered attendees with a PoA of 100%. So I guess he was there.

Re: HHC2010 and HHC 2011 in Nashville?

*Message #10 Posted by **gene wright** on 28 Sept 2010, 11:04 a.m.,*
in response to message #8 by Namir

Yes, Joerg and his son were there for the Saturday morning.

Not sure about the country singers, but I am checking into having the conference here in 2011.

Hopefully, some individuals who live within driving distance of Nashville might be able to attend.

As for excursions, there are several possibilities.

The 1896 Tennessee Centennial Parthenon. As I tell my friends in Athens, our Parthenon isn't in ruins. :-)

President Andrew Jackson's home, the Hermitage:

The Grand Ole Opry:

and a few others.

Re: HHC2010 and HHC 2011 in Nashville?

*Message #11 Posted by **Namir** on 28 Sept 2010, 12:24 p.m.,*
in response to message #10 by gene wright

You are 9 hours by car from me. I used to drive through Nashville with my son on our way to Flagstaff, AZ, Nashville was our first stop. We stayed at a Holiday Inn (off I-40 east of the city) not too far from the airport.

Re: HHC2010 and HHC 2011 in Nashville?

in response to message #10 by gene wright

> Quote:
>
> Not sure about the country singers, but I am checking into having the conference here in 2011.

Gene,

Nashville sounds great - pun intended - for both location and music. Any danger of you costing-up for August as well as, presumably, September so that those tied to school holiday periods can have a chance of attending?

Re: HHC2010 and HHC 2011 in Nashville?

*Message #13 Posted by **gene wright** on 28 Sept 2010, 10:20 p.m.,*
in response to message #12 by BruceH

The reason for September is that at least in the past, travel costs and hotel costs were thought to be cheaper AFTER September 15 compared to before.

If someone can show the committee some analysis of airline fares, hotel costs before / after that date showing no difference, it would be open for discussion.

Please? :-)

Re: HHC2010 and HHC 2011 in Nashville?

*Message #14 Posted by **BruceH** on 30 Sept 2010, 6:38 p.m.,*
in response to message #13 by gene wright

The US Dept. of Transportation has average airfare statistics publicly available here. Unfortunately they are quarterly but the 3rd quarter falls mostly over the school holiday period so that might be good enough.

The stats are given as city-to-city average fare costs so just taking the first city pair out of the report (which is Austin, TX to Houston, TX) the average one-way fares for 2009 Q1, Q2, Q3 & Q4 were $120, $117, $121 and $123.

So I would suggest that the time of year makes precious little difference.

Thank you Gene and Thomas for your kind comments on my presentation. Personally, I thought I should have gotten an ad-hoc "most boring presentation award" based on the looks on people's faces. :) Since many attendees aren't C programmers, I don't blame them for being bored.

For those who weren't there, I'll explain Gene's comment about the programming contest. The contest rules said that entries would be scored by multiplying the number of bytes in the program by the runtime in seconds. As an experiment, I wrote two solutions, one in RPL and one in C code. Even though the C version was 100x larger (about 16k vs 139 bytes), it had a slightly better score on my test inputs because C runs so much faster than RPL.

Let me stress that the C code was strictly a curiosity. It was clearly not eligible based on the rules so the judges understandably didn't accept it.

Hopefully Joe will post the contest and the entries here. If he does, I'll post the C code and the timing results.

David

Don't confuse boredom with struggling to understand (at least in my case.) I was very interested, just not as knowledgeable about the subject as I would like.

Knew more about it after your talk than I did before. Good talk.

in response to message #21 by Pal G.

There really isn't much to elaborate on. The conference just enhanced my interest in the calculators and I don't own a 35s. I'd like to get one and tinker around with writing some programs for it, see how fast it is, etc.

The only thing that has prevented me from getting one until now is the lack of I/O capability, so all programs must be entered by hand. Maybe the 35s will be an excuse to get into cheap robotics - it would be fun to program a robot to program it. I've heard that someone has done this already.

David, programs on the 35s run a lot slower than the same programs on the 33s, fyi. If it's speed you want, the 30b will not disappoint you.

*Message #24 Posted by **Mike Morrow** on 28 Sept 2010, 10:39 p.m.,*
in response to message #23 by Don Shepherd

The HP 30b appears to be the fastest HP handheld ever. It performs a 2500-iteration version of the old Savage benchmark in 6.5 seconds. That's ten times faster than the HP 50G, and it produces exactly the same numerical result. It's a sturdy calculator with excellent ergonomics and mechanical characteristics...but not much program memory, though.

To return to subject...I think Nashville would be a great conference site, especially for us who are east of the Mississippi. Must there be an appropriate HP facility at at the city chosen for the conference?

Nope - we were simply taking advantage of the offers by HP between 2007 and 2010 to use their facilities, thus saving us easily between 1 and 2 thousand dollars that would have to be covered by the attendees. Based on 40 people, I am glad that we didn't have to charge each attendee an extra $50. to be there. (It is understood that in any case the conference fee would be very minor as compared to most of our transportation, hotel and food costs, but still...)

in response to message #1 by John Cadick

Yes, another wonderful conference and meet.

Some incredible math/algorithim discussions as well as interesting future ideas from HP! One of the benefits of attending ;-)

Ideas galore and it would seem, lots of feedback from HP. New venue for next year? Sure, but I will be there again!

The following require many thanks and kudos:

```
*  The Committed members of course
       Richard, Joe, Wlodek, Gene and Jake
*  HP of course;
       Tim, Laura and Jason
*  Special thanks to Mark Ringrose for organizing NOAA and
       NIST this year.
```

I will have some video links to the NOAA tour up some time today I hope. The globe projection room was incredible. The detail and 3d presentation that you could walk around was fascintating. I mangaged to get some good video clips of the following:

```
* plate tectonics spanning 600 million years
* north pole ice sheet fluctuations
* aircraft tracking on the globe
* IO, Jupiter and Mars scans
```

I will try to get them up today otherwise they may wait until I get back from my Tokyo trip Saturday.

Cheers and thanks to ALL for a great time and chat (listen ;-)

Geoff

Hmmm... If the pilot diverts the plane, it isn't hijacking, right?

Okay, here's the plan: we all travel to some airport next year - let's say Denver - and book a seat on one of Geoff's flights. Once we're in the air, he declares an emergency - a "software glitch in BCD rotator circuitry."

He diverts the plane to Tahiti for an emergency landing.

We hold the conference there and the airline flies us all back first class to compensate us for the diversion....

:) Dave

Kaprekar numbers

*Message #1 Posted by **Thomas Klemm** on 27 Sept 2010, 5:57 p.m.*

There was that mini-challenge I started concerning Kaprekar's constant (6164) which directed me to something completely different: The Kaprekar Numbers.

Now there's this function ***Inv**(a, b)* which I faintly remembered is related to calculating gcd(a, b). It took me some time until I got all the pieces together again and realized that 3D vectors could be used to calculate it. So I dug out my HP-35s and entered the following program:

```
0001 -
0002 LASTx
0003 RTN
```

Press RTN to make sure you're at the beginning. Let's assume you want to calculate Inv(369, 271), so put the following two arrays on the stack:

```
         [369, 1, 0]
         [271, 0, 1]
```

Whenever the leftmost number in the top array is bigger than the associated number in the bottom array, press R/S. Otherwise swap x and y.

```
R/S
         [98, 1, -1]
         [271, 0, 1]
x<>y
         [271, 0, 1]
         [98, 1, -1]
R/S
         [173, -1, 2]
         [98, 1, -1]
R/S
         [75, -2, 3]
         [98, 1, -1]
x<>y
         [98, 1, -1]
         [75, -2, 3]
R/S
         [23, 3, -4]
         [75, -2, 3]
x<>y
         [75, -2, 3]
         [23, 3, -4]
R/S
         [52, -5, 7]
         [23, 3, -4]
R/S
         [29, -8, 11]
         [23, 3, -4]
R/S
         [6, -11, 15]
         [23, 3, -4]
x<>y
         [23, 3, -4]
         [6, -11, 15]
R/S
         [17, 14, -19]
         [6, -11, 15]
R/S
         [11, 25, -34]
```

```
          [6, -11, 15]
R/S
          [5, 36, -49]
          [6, -11, 15]
x<>y
          [6, -11, 15]
          [5, 36, -49]
R/S
          [1, -47, 64]
          [5, 36, -49]
```

Finally we reached 1 = gcd(369, 271)!

Now you can represent 1 = -47 * 369 + 64 * 271

Thus Inv(271, 369) = 64 since 64 * 271 = 1 (mod 369) and Inv(369, 271) = -47 = 224 (mod 271) since -47 * 369 = 1 (mod 271).

As you can see the y and z component of the vectors keep track of the calculation.

However this algorithm gets more than tedious when the magnitude of both numbers differ as with 10^{10} and 7. What you can do is shift the smaller number to the left (i.e. multiplying with 10) until both magnitudes agree. And then shift it to the right again whenever it's too big to subtract.

Just wanted to note that the HP-35s has some useful features.

Cheers
Thomas

PS: Why would somebody want to calculate Inv(369, 271)?

Both 64 * 271 = 17344 and 224 * 369 = 82656 are Kaprekar numbers for n = 5 since:

17344^2 = 300814336; 3008 + 14336 = 17344

82656^2 = 6832014336; 68320 + 14336 = 82656

HP 35s case change?

*Message #1 Posted by **Morse** on 26 Sept 2010, 7:49 p.m.*

Hi everyone and thanks in advance;

I just bought a replacement HP35s at a ubiquitous US "big box" retailer and found that the case it came with is a rather cheap "slip" affair. Has there been a change? I prefer the zip cases and have considered picking up another spare HP35s - but want to ensure that I get the proper case. Fortunately I saved the case left over from the "expended in duty" calculator, so I swapped it out. The calculator appears authentic (comparing to my remaining spare).

Anyone know what is going on, and where I can pick up another spare HP35s with zipper case? 'Can't have enough spare RPN calcs....

Thanks again, Morse

Re: HP 35s case change?

*Message #2 Posted by **Chuck** on 26 Sept 2010, 8:02 p.m.,*
in response to message #1 by Morse

Both of my zip cases no longer zip rendering them useless, and they're very little used. (I no linger use either. I feel the calculator was a huge disappointment regardless of how many here extoll the the notion HP is "on the right track" with reproducing calculators.)

I would much rather have a (quality) slip case than a zippy one that fails after 50 uses.

*Message #4 Posted by **Chuck** on 27 Sept 2010, 10:51 p.m.,*
in response to message #3 by Thomas Klemm

Hi Thomas,

Thanks for the tip. I thought it was working, but it split again after about three inches. The killer for both zippers on each case are the corners; round the corners and she splits open. I'm not horribly upset because I was only going to repurpose the cases for pencil and pen pouches (since I don't use the 35s' anymore.)

CHUCK

Re: HP 35s case change?

*Message #5 Posted by **Raymond Del Tondo** on 27 Sept 2010, 12:28 a.m.,*
in response to message #1 by Morse

Hi,

there is an online seller where you can buy the 35s zipper cases w/o the calc. They look good, but unfortunately they seem to be of very poor quality. I did not use the calc, but both zippers of my 35s case are defective, and the batteries of the calc are empty. Not too good for an anniversary item.

OT: The protective case of the 12c anniversary edition also was a failure, but for different reasons. The 12c anniversary case is so bulky, ugly and impracticable that I doubt anyone is using it.

HTH

Raymond

> The protective case of the 12c anniversary edition also was a failure, but for different reasons.

Bulky it was, but it also used magnets, and I made the mistake one day of placing my HP-65 standard pac next to or on top of that case, and I lost all the standard pac programs. After that, I relegated that case to the closet.

And, yes, I realize that other cases (like the 17bii+) use magnets too.

Re: HP 35s case change?

*Message #7 Posted by **bill platt** on 27 Sept 2010, 12:13 p.m.,*
in response to message #6 by Don Shepherd

When you say you lost all your 65 std pac, is that forever, or can you rewrite from somewhere?

Re: HP 35s case change?

*Message #8 Posted by **Don Shepherd** on 27 Sept 2010, 12:22 p.m.,*
in response to message #7 by bill platt

I've got the manual, which has all the code in it, if I wanted to enter the code and write it to a new mag strip. Or maybe I could rewrite it on the existing mag strip, but I think they are notched as read-only so that might require some trick with scotch tape or something.

So, no, they are not lost forever, it was just a disappointment when I tried to read one that had previously worked and it wouldn't read, then I tried another with the same result, and I eventually figured out why they were all wiped out.

Magnet-laden cases and mag strips from the 70's are not a good combination!

Don

Re: HP 35s case change?

*Message #9 Posted by **Walter B** on 27 Sept 2010, 1:37 p.m.,*
in response to message #8 by Don Shepherd

Hi Don,

how about replacing the magnets by Velcro strips?

HTH

Re: HP 35s case change?

*Message #10 Posted by **Don Shepherd** on 27 Sept 2010, 2:08 p.m.,*
in response to message #9 by Walter B

That would probably work fine, but I'd have to cut into the case to remove the magnets and I'd rather not do that. I don't use the 12c Platinum 25th anniversary edition much since the fast 12c+ came out about a year ago; that's the one I play with these days. So mostly the platinum sits in its case in the closet.

Re: HP 35s case change?

*Message #11 Posted by **Jim Horn** on 28 Sept 2010, 2:26 p.m.,*
in response to message #6 by Don Shepherd

Don, you can write to protected cards easily with an "unprotect" card - take an old card that you aren't otherwise using and cut its bottom right corner off so its right side is at a 45 degree slope to the upper right corner. Then, if you gently put that into the exit port of the card reader (the left slot), you can write to a protected (cut corner) card. The protected card will push this one out of its way as it goes through, but this card's pointed corner will fill the gap of the protected card's cut corner, fooling the HP-65 (or HP-67 or HP-97).

My '67 and '97 card collection has had such a card in it since 1976. Useful tool!

Re: HP 35s case change?

*Message #12 Posted by **Don Shepherd** on 28 Sept 2010, 2:45 p.m.,*
in response to message #11 by Jim Horn

Thanks Jim, I didn't know about that trick.

Re: HP 35s case change?

*Message #13 Posted by **M. Joury** on 27 Sept 2010, 1:16 a.m.,*
in response to message #1 by Morse

I purchased a backup 35S recently and had left it in the package. After seeing your post I went and checked... Sure enough, it did not come with the zippered case. It also did not come with a manual. I realize that replacing manuals with CD's saves HP money, but I really like to be able to browse a manual away from my computer.

Re: HP 35s case change?

*Message #14 Posted by **Angel Martin** on 27 Sept 2010, 2:03 a.m.,*
in response to message #13 by M. Joury

here we go again: cost-cutting and corner-shaving on a product that could have been better to begin with. The pattern repeats itself.

And still there're those who believe a 41S will ever be done? I'm not holding my breath - and besides, the 41CL will be such a machine (or: the best replacement for a 41 is.. a faster 41!)

Re: HP 35s case change?

*Message #15 Posted by **Tim Wessman** on 27 Sept 2010, 9:36 a.m.,*
in response to message #14 by Angel Martin

Cost saving has very little to do with it.

The shape, size and most importantly *thickness* of a retail package is dictated almost exclusively by the stores which will say something like "to even be considered on my shelf you must have X number of units per Y sized box, and each must fit within W, H and be no more than T or I won't even consider giving you shelf space". It is the same for any retail item and will not change regardless how much you or I desire it.

TW

Bonjour M.,

> Quote:
>
> I had no idea that such things were dictated by the stores selling the product.

Tim was talking about real big shop chains in the USA, I assume, like Office Depot. We don't have too many of these stores in Europe, so the relations between manufacturer and store may be different here.

Re: HP 35s case change?

*Message #18 Posted by **M. Joury** on 27 Sept 2010, 11:35 a.m.,*
in response to message #17 by Walter B

Hi Walter,

Yes, I did realize that Tim was talking about the big stores that can dictate such things. I also realize (or I would have had I thought about it for any length of time--I was being a little provincial) from the fair amount of time I have spent in Europe over the years that Europe is a little different.

Cheers.

Re: HP 35s case change?

*Message #19 Posted by **Martin Pinckney** on 27 Sept 2010, 5:56 p.m.,*
in response to message #15 by Tim Wessman

So if I read this right, the HP 35s was first released only direct from HP, complete with the printed manual and zipper case. HP designed it this way, because it was the either the company policy to provide these accessories with the calculator as a matter of course, or because marketing determined that it would sell better as a professional tool if so supplied.

Then marketing decided the calculator needed to be in stores as well, and the chains insisted that the packaging be reduced to fit in their schemes. So HP complied.

But HP still sells them direct from their own website complete with the printed manual and zippered case, correct?

At least the "PDF version of all specs" on the HP website still says

> Quote:
>
> What's in the box - Calculator, batteries, user manual, premium protective case.

Re: HP 35s case change?

*Message #20 Posted by **M. Joury** on 27 Sept 2010, 6:26 p.m.,*
in response to message #19 by Martin Pinckney

Nope. I got mine directly from HP during their 15% off sale. No zippered case, no manual. I actually called to see if manuals were still available and was told that I could get them from a third party but that HP was not selling them.

Now I could always call back and hope that a different person gives me a different answer...

Actually that does not surprise me. I think it would probably be a headache to try to figure out what inventory goes where. Makes sense to just comply with the request of the big retailers. I just wish that the manuals were still available for purchase. I have several newer editions that did not come with manuals, including, as you noted, the HP50g. I seem to remember getting some sort of manual with my HP49g+ but I can't seem to find it.

in response to message #20 by M. Joury

> Quote:
>
> I think it would probably be a headache to try to figure out what inventory goes where.

Actually, it's not. I would assume HP has a sufficient number space of GTINs available, so nothing would stop them to offer a "premium" and a "cost-saving" model.
And "we only have limited shelf space" is less than half the truth. More space is easily available - you just have to pay for it. Considering the enormous size of a calculator, it's probably not a lot.
So this leads us to the whole truth: cost reduction and (more) profit. This is rather annoying, as this calc isn't quite a 1$-shop item, nor did the manufacturing costs for a zippered case explode beyond belief...

Yea, just got off the phone and apparently they stopped that deal recently. I'd requested my manual at the beginning of the year.

I wouldn't lose too much sleep over it. The rigid binding of the manual isn't exactly hp-friendly. I was planning to cut the binding off of it and spiral or comb bind it to lie flat in use. But it might not be too different just printing off and binding a copy scaled to a size you actually would want to lug around. Assuming you're inclined to lug around the 35s itself given it isn't quite a "pocket" footprint.

Re: HP 35s case change?

*Message #24 Posted by **Morse** on 27 Sept 2010, 2:58 a.m.,*
in response to message #13 by M. Joury

Thanks for the info - now I know to be on the lookout for zip cased models. Anyone know which retailer has which?

Sorry to read about the negative experiences with the zip cases from some out there. FWIW, my experiences with the zip case have been very positive. The zip case on my "daily use" HP35s has held up since they first came out, with the calculator in and out of the case more than once daily on average. It even withstood service as an "emergency mailer" from Japan one time, just wrapped in plain paper. Both zippered case and denshi jisho (electronic dictionary) made it back in one piece, and the case went right back into service on my everyday HP35s.

All the best, Morse

Re: HP 35s case change?

*Message #25 Posted by **Mark Storkamp** on 27 Sept 2010, 9:17 a.m.,*
in response to message #24 by Morse

I have to agree, the case is (was) the best thing about the 35s. The zipper works reliably every time I use it, which is more than I can say about the calculator inside the case. But I seem to recall an incidence where someone here reported the elastic in the case was sewn at the wrong location covering either their display or top row of keys. IOW typical hp hit or miss quality.

Hearing stuff like this is just painful. HP was one of the engineer's engineering companies in its day. I recall an ad run in a trade rag right around 1985 where a (IIRC) signal generator fell out of a airplane cargo area in flight, plummeting into a field. Somehow they managed to recover it and drug the remains into the lab. The case was toast but the instrument was still in calibration.

Closer to home I heard of a case where a calc user left the unit where it received a fatal dose of radiation. The user contacted HP wondering if service was even possible. HP offered to send him a new calc if he would return the nuked unit back to them for study. That is (sigh, was) an engineering company.

I find this to be a far greater shortcoming than the quality / type of case. The quality of the printed manuals used to be what set HP apart from the competition. Were it not for the excellent printed manuals that came with my HP 48SX, I'd still be fumbling around trying to figure out how to efficiently use my HP 50g.

>>>...Were it not for the excellent printed manuals that came with my HP 48SX, I'd still be fumbling around trying to figure out how to efficiently use my HP 50g...<<<

Agreed that the manual is important to fully utilize a programmable like the 48G, but for a simple scientific, I tend to wing it.

However, a first rate case is a must over here, since I carry the calculator at work and need to be able to hold/use it with one hand while writing on the board with the other. The zip case is perfect, since it offers good protection in the event of a drop, yet allows me to use the thing one-handed.

Everyday carry of the calculator pretty much sours the larger models for me, since they tend to damage my suit's pockets (too heavy). And I can't stand the odd placement of the tiny enter key on the 50G; what were they thinking?!

Argh! I just wish HP would get its act together and repurpose the 12C for scientific use. If they came out with a limited edition of 15C's I would stock up on the things, even if the keyboards aren't quite up to their old standard.

Vent over. All the best, Morse

At least they corrected that fundamental mistake of having the ENTER key in a key column different from the column with the / * - + keys. When HP shifted the / * - + keys to the right side while leaving the ENTER on the left side a couple of decades ago, it made key manipulation much more awkward and inefficient. It doesn't matter which side is chosen, but these five keys should *always* be in the same column.

I'd like to see a 50 percent wider HP 50G ENTER key, positioned *above* the / * - + keys. The additional key space which that would consume could be made up by arranging the arrow keys in the same manner as that of the HP 48GX (which would free two additional key locations of the HP 50G keyboard).

I find absolutely nothing good about the landscape keyboard layout for a machine that may be used as a handheld. It is very awkward to hold and use a Voyager calculator in one hand.

I would be very enthusiastic about a scientific in the new HP 30b configuration. It's a joy to use in one hand.

*Message #30 Posted by **M. Joury** on 29 Sept 2010, 11:47 a.m.,*
in response to message #29 by Mike Morrow

Just my feelings...

But the ENTER key should be on the left and the operation keys should line up with the numeric keypad not offset one key above the numeric keys as they are in the 50g.

I'll never understand why they moved the operator keys to the right side. Maybe it had something to do with the Voyager design? Am I right in saying that this was the first calculator with the operator keys on the right side? After that everything moved over. Maybe they did this for consistency among the different designs?

At any rate, I agree, the Enter key should be stacked above the operator keys. Give us back the layout of the 41C and the earlier calcs. And as pointed out, if extra keys are needed go back to the 48S/X 48G/X layout with the cursor keys. I liked it better anyway.

Cheers

The 41c and previous had Enter and operators on left. Voyagers went to operators on the right, Enter in the center. Pioneers, then 28c/s, 48 series kept operators on right, put Enter back on left. Ditto 35s, 20,30b. 49, 50 series put all on right. Confusing?

Re: HP 35s case change?

*Message #32 Posted by **M. Joury** on 29 Sept 2010, 6:34 p.m.,*
in response to message #31 by Martin Pinckney

Exactly. Just put everything back on the left where it belongs except for the Voyager series (right now limited to the 12C).

In a sense, if you think of just the numeric portion of the keyboard, everything since the Voyagers follows the Voyager layout--enter on left operator keys on right--of course the

Voyager enter is vertical and on the same level as the numeric keys but that is a side effect of the landscape layout. However, the Voyager is a completely different layout and, IMHO, does not have to match the vertical format calculators, or vice versa as appears to be the case.

Also, with the Voyager, the order of the operator keys all changed. It went from - + * / on all the models from the 35 to the 41C (as far as I can tell) to / * - + on all the later calcs. I have lots of fun switching between my 48SX and my 41C. Switching to the HP50 is even more "fun".

*Message #33 Posted by **Martin Pinckney** on 29 Sept 2010, 9:42 p.m.,*
in response to message #32 by M. Joury

Having the operator keys on the right always seemed natural to me, since I started with a TI 59, then went to Pioneers, 38g, 48sx in that order (though I still use the Pioneers).

I had not thought much about the position of the Enter key before now, and it certainly seems logical that it should be grouped with the operator keys. Nevertheless, I have been used to it on the left so long, that is not an issue for me.

Re: HP 35s case change?

*Message #34 Posted by **Mike Morrow** on 30 Sept 2010, 12:29 a.m.,*
in response to message #33 by Martin Pinckney

I also would favor these five keys being grouped on the right, with a wider ENTER key at the top. I think that works much better than the old classic HP all-on-the-left design, at least for right-handed individuals.

The Voyager and later models which split the ENTER or INPUT key from the arithmetic operator keys represent poor human factoring. That appraisal applies even to the new HP 30b. Putting the ENTER/INPUT key on the side opposite the / * - + keys is the very worst possible layout.

I suspect that the continuation of this unfortunate key arrangement for models which appeared after the Voyager series (whose awkward landscape layout forced the awkward separation) is simply some HP manager's unthinking and wholly arbitrary decision. While HP learned their lesson about the poor handling qualities of landscape layout, the obviously poor separated key column design still persists today in most HP models.

I guess, at least in part, it is what one is used to. I used the HP-41C and it's derivatives on an almost daily basis from 1980 through the early 90's before I began collecting some of the newer HP calculators. I have never found the "all-on-the-left" placement awkward and am not sure of the advantages for a right-handed person of all-on-the-right (I am right handed btw). I have to say that I even prefer the split arrangement with the double-wide enter key on the

left to the stacked all-on-the-right arrangement found in the 49/50. However, that said, if it has to be all-on-the-right, please, please, please put the enter key on top and make it double-wide.

I have followed this forum over the years but not very closely. I have to wonder how many times this discussion has come up. It seems to me that it could be one of those things that generates very strong opinions.

Well, I was "used to" that classsic configuration. I was a sophmore at Georgia Tech when the HP-35 was announced. I used the HP-35 and -45 that friends had, but I couldn't afford my own HP until a couple of years after graduation with a B.E.E. when I got an HP-67.

In spite of my accustomization to the old "all-on-left-side" keys, there was obviously never any justification for it, other than who ever specified it must have been left-handed (and very very evil :-)). Though I was used to the left side keys, I knew a right side placement was more sensible for most, who are right handed.

It's a pity that HP didn't establish the all-on-right-side convention, and worse, then continues to put the ENTER/INPUT keys on the opposite side of the / * - + keys on most models from the past three decades. That's just plain stupid. I think that HP dosen't give a damn. The correction of such fundamental errors would not cost a penny before a new calculator like the HP30b is produced.

I saw Eric Rechlin's (hpcalc.org) printed manuals at HHC2010 this weekend and won one as a door prize. They are really wonderful, laser printed on nice paper with heavy stock for the front and back

covers and high quality spiral bindings so they lay flat when open. If you need manuals, get them from him.

HP97 Card Reader adjustment

*Message #1 Posted by **Ed Sowell** on 26 Sept 2010, 7:40 p.m.*

Just getting back to this project after several months. I've now rebuilt the "clutch" using silicone adhesive and the traction wheel with fuel hose. It now reads a test program quietly, whereas before with original clutch and O-ring traction wheel it was noisy. Progress! But, the motor still turns off before card is fully ejected. No ERROR report, just stops prematurely so I have to tug it out.

The question is how to fix this. I've been looking at the test & adjustment procedure in the Service Manual which looks thorough but tedious. I'm willing to give it a go, but though I'd first ask if anyone here has used it with success. Or, is there a simpler way?

If I am to use the Sm test/adjust procedure I will need the test data cards. Since it writes OK I guess I could just create the one that is supposed to have data on it, but I'm wondering if it wouldn't be better to use a card created on a faultless card reader. Also, where does one get the magnetic powder referred to in the procedure?

TIA

Ed

HP-30b key assignment trick -- Sudoku helper revisited

*Message #1 Posted by **Katie Wasserman** on 26 Sept 2010, 5:04 p.m.*

I found a sort of tricky but useful way to temporarily reassign keys on the HP-30b. Normal key assignment is easy using program step 0, and all keys except a few critical ones (reset, ON/CE, INPUT,etc.) are reassignable, this includes the numeric keys. The 30b is a macro programmable machine in the sense that keys executed in a program act as if they were pressed on the keyboard. In particular there's no automatic ENTER for a numeric key, so a program can be used to enter a digit in the middle of a number, for example. Making use of the above two features along with a conditional that doesn't need to use the stack at all (DSE and ISG) allows for temporary reassignment of keys.

The following code demonstrates this for a program that was suggested in this thread

```
Mode:   RPN
Fix:    0

Shift-Hold 0 starts/resets Sudoku entry mode showing digits 1-9 available.
Pressing digits 1-9 will remove that digit from the display.
When all digits have been pressed 0 is shown and Sudoku mode ends
allowing normal calculator use.   Sudoku mode can also be ended by
storing 0 in register 0, this is possible since the 0 key is not redefined.

Registers used:

0 - indicates mode, if greater than 1 then Sudoku mode else calculator mode
6 - 10 ^ (number of digits in new digit string)
7 - new digit string
8 - old digit string
9 - user entered digit

Nice trick, but no more room for more programs. :(

Re: HP-30b key assignment trick -- Sudoku helper revisited

*Message #3 Posted by **Katie Wasserman** on 27 Sept 2010, 11:25 a.m.,*
in response to message #2 by Marcus von Cube, Germany

There's not a lot of room for program in this calculator at all. It's very close to the 12C in actual programming space because it's not space efficient in merging program steps.

However, in this case only about 50% of the total program space is used and you could add more programs to this code. Accessing them from arbitrarily reassigned keys wouldn't be possible but you could use the DSE/ISG mechanism as a means to branch to different programs by LBL. For example storing a 3 in register_0 could would indicate the program A should be run when Shift-0 was pressed, a 4 in register_0 would indicate program B, etc..

MLDL2000 update

*Message #1 Posted by **Meindert Kuipers** on 26 Sept 2010, 3:25 p.m.*

After having finished the design of the MLDL2000 and about to request quotes from assemblers I was pointed to the website www.mbed.org, and this is really a great product. I have made the decision to add it to the MLDL2000, instead of specialized SD card controller. The mbed controller will be able to support SD cards, and a lot more, including ethernet connectivity, serial ports and user application programming. It actually gives you a complete ARM Cortex to play with, complete with development tools, libraries and a user community online.
