in response to message #9 by Thomas Radtke

Hi, Thomas;

thanks for the tip 'in advance', I appreciate that. I'd guess they are electrolytic capacitors, right? Would that be easy to identify them (value, working voltage, polarity, etc.), if so? About the display, would it be cold-cathode?

Thanks again.

Luiz (Brazil)

AFAIK no, it's an ordinary vfd.

That is about as close to the scientific four-banger tossed around here a while back as I've ever seen and probably will ever see.

Lovely little machine,

- Pauli

Re: My Collection has Reached the Century Mark

*Message #13 Posted by **Andrés C. Rodríguez (Argentina)** on 1 Nov 2009, 7:14 p.m.,*
in response to message #1 by Michael de Estrada

Only to add that the "Fate" company is a local maufacturer of vehicle tires. The name is an acronym for "Fabrica Argentina de Telas Engomadas", which translates to "Argentine Manufacturing Company for Rubberized Fabrics". It was a local startup in the post-WW II era, and is still one of the major tire manufacturers here.

So, what has this to do with calculators? Well, around 1973, Fate started an "electronics division", targeting digital electronics products. The most important was the "CIFRA" computer, programmed in the "CIFRAL" language, and a calculator line. It sported some desktop printing machines (the kind which prints on a paper strip by means of a rotating cylinder and two-colored inked ribbon), the "minicifra", which was a smaller, LED-display based desktop model, and the "microcifra", which were the pocketable models already discussed here.

It's interesting to note that some of the electronics engineers who worked on these projects, later started many electronics iniciatives here. One of them became Secretary of Industry around the mid-1980 period, and promoted electronics manufacturing, albeit with a strong supervision of the national state; a plan that was not successful (in my personal opinion; I may be wrong, and I mean no offense for people with different views).

Other engineers from the Cifra project started their own companies; I had been in contact with some of them and, strangely enough, I bought an HP 91/92/97 carrying case from them around 1984, and also received from them my HP 41 Wand by the same time.

About the Cifra brand, I think some other company bought the rights to the brand and nowadays you can find

Cifra products in Buenos Aires, but with no local design nor content; most are just products from China, just rebadged as Cifra.

About selling overseas from here: while I don't know particular cases, in general it's very difficult and expensive, due to customs paperwork, money transfer issues, etc.. Some fear of goods never arriving to the intended destination may also be part of it.

Early HP-80 number keys and front label

*Message #1 Posted by **SteveC** on 31 Oct 2009, 10:30 a.m.*

I recently acquired an early HP-80 that has a raised nipple on the 5-key. The legends on the lower four rows of keys are also less bold than those on later models. The front HP label does not contain the '80' designation.

Does anyone know when the raised nipple and less-bold keys were discontinued? Also, when was the '80' designation added to the front label?

Thx for any info or leads.

Steve

Repainting silver trim on a 35?

*Message #1 Posted by **tim m.** on 30 Oct 2009, 8:24 p.m.*

Hello all. I just bought an HP-35 from the original owner, complete with a horde of documentation. The only real sign of wear on the calc is some missing silver trim near the power switch. I was thinking of touching it up with some paint, but am not sure where to get something with enough of a metallic reflective sheen. Has anyone looked into this before?

Thanks,

Tim

in response to message #1 by tim m.

Here's a good discussion on it:

link to HP forum thread

Re: Repainting silver trim on a 35?

*Message #3 Posted by **tim m.** on 31 Oct 2009, 2:38 p.m.,*
in response to message #2 by Dan W

Thanks for that; I should've used the search function to uncover that link. However, it seems that none of the brush-on or spray silver paints exactly replicate what was used on the originals.

-Tim

Re: Repainting silver trim on a 35?

*Message #4 Posted by **Geoff quickfall** on 31 Oct 2009, 2:43 p.m.,*
in response to message #3 by tim m.

Hello Tim,

Unfortunately, unless you vacuum plate them as originally done at the HP facilities you can't get that extremely shiny metal look.

The process is the same as used on car dashes.

People here have experimented with:

```
1  spray paint.
2  brushed paint.
3  silver gilt which requires sizing first.
4  1 and 2 with a coating of gloss clear coat (for plastic).
```

Cheers, Geoff

Cases for 38E/C

*Message #1 Posted by **Peabody** on 30 Oct 2009, 12:31 p.m.*

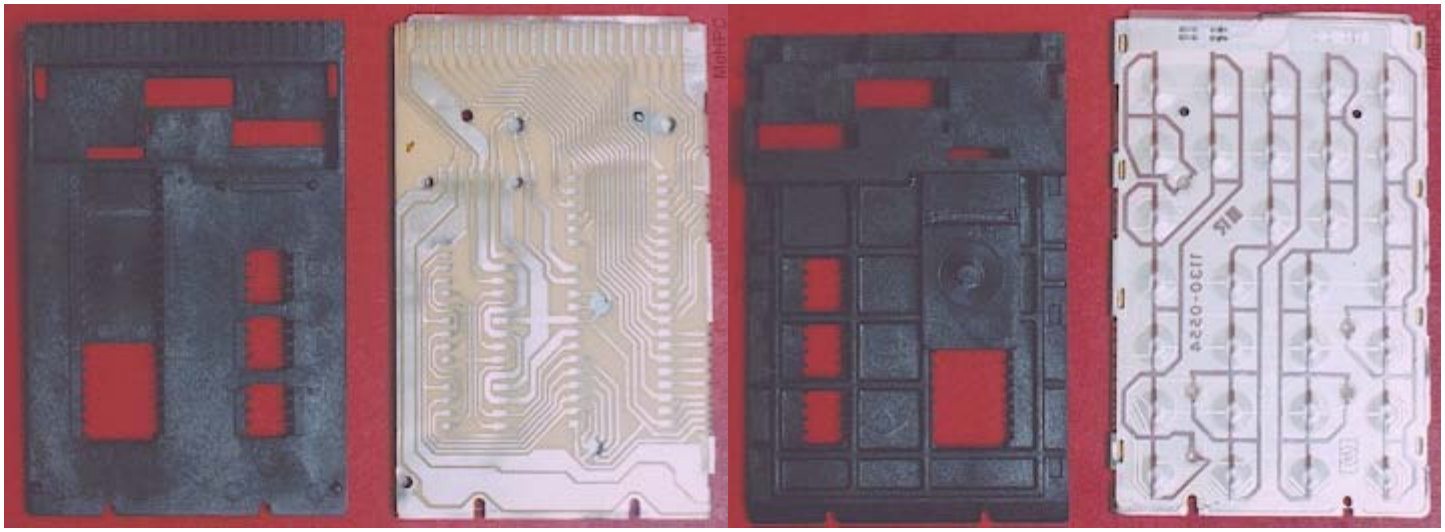
At some point I'm probably going to want to replace the case of my 38C - three of the six latch posts that hold the innards to the top case are broken. My 38C is one of the later versions where the ICs are soldered in. Did the case change when HP went to this new design, or could I use any 38C case (or even any 38E case) as a replacement?

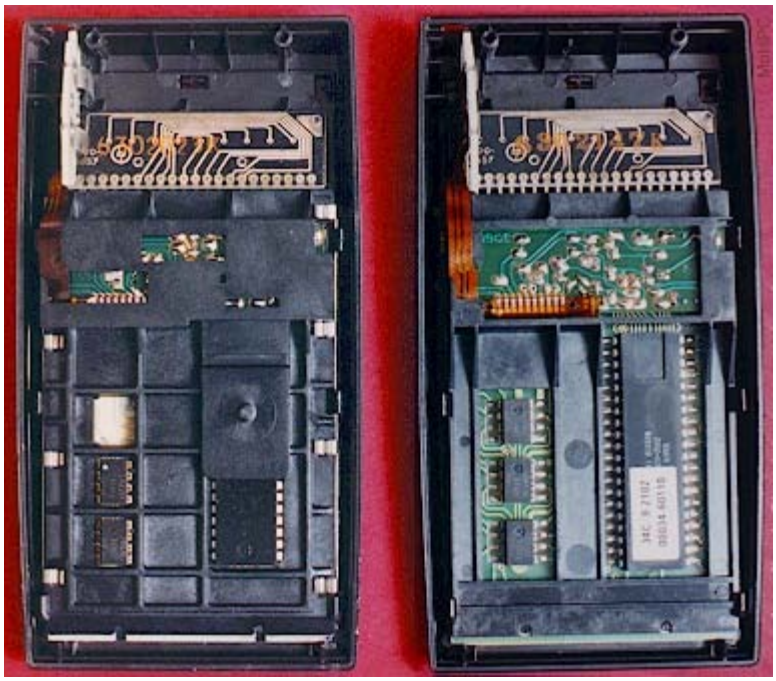
Re: Cases for 38E/C

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 30 Oct 2009, 12:55 p.m.,*
in response to message #1 by Peabody

Hi;

please, have a first look at this article and its pictures:





As you can see, there are two different cases because there are two different assemblies. One of them you already know, ant the other one is a solderless version: the IC´s, LED assembly and power supply unit are connected to each other through a flex circuit. As explained in the article above, their contacts are pressed with the flex circuit contacts through a metal plate locked by two clips in both left and right sides. This type of assembly is thicker than the one you have hence the posts being a bit taller. Their internals do not fit in each other cases.

I repaired an HP38E with two broken posts. First I used an acrylic solvent (must see the chemical composition) to set it in place. After fixed (one day drying out) I placed some acrylic in the outer part of the post, and that fixed it in place (one extra day for drying out). I'll add pics later, OK?

Success!

Luiz (Brazil)

Re: Cases for 38E/C

*Message #3 Posted by **Peabody** on 30 Oct 2009, 4:49 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Thanks very much, Luiz. Well that means I would have to find another soldered-version 38C to replace the case. Can I use the serial number to make that distinction?

I can't use your glue method bacause I don't have the broken pieces. They must have been broken long ago, and weren't there when I opened the case.

If the serial number won't tell me which model it is, is there a measurement I can make that would tell me without having to open the case? Thickness perhaps? When my calculator is resting on the desk, it is 1.25 inches (31.5 mm) tall at the highest point. Are the unsoldered versions thicker than that?

Peabody

Re: Cases for 38E/C

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 30 Oct 2009, 6:19 p.m.,*
in response to message #3 by Peabody

Hi;

externally they have no visible (nor measurable, AFAIK) difference. I cannot be sure if the serial numbers would be of any help, because refurbished calculators may have a new interior with the same, previous serial #. The best approaches I can offer you without opening the calculator are:

1 - weight - the solderless version without batteries weight (almost) the same as the soldered version WITH batteries; this is due to the metal plate the solderless version have;
2 - key course - the solderless version use flex circuit for the keyboard, and their keys almost level the keyboard faceplate when pressed (they go deeper inside); the soldered version needs almost half the angle to close their contacts.

Apart of that, the only way is to open the calculator. I have a spare Spice upper case with a very faded keyboard faceplate, but I am not sure if it is from a soldered or a solderless unit, and I also have to find it. I'd gladly send it to you, but you'd have to replace the keyboard faceplate. If I find it I´ll let you know.

Success!

Luiz (Brazil)

Re: Cases for 38E/C

*Message #5 Posted by **Peabody** on 30 Oct 2009, 6:35 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Thanks, but don't go to that trouble at this point. I may have found a dead one locally, and should know about that by next week.

Re: Cases for 38E/C: correction (please, read)

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 30 Oct 2009, 8:23 p.m.,*
in response to message #1 by Peabody

Hi;

I disassembled a solderless HP31E I have because it needs some work in the upper case (a small crack). So I decided to measure the difference between the posts in the upper case of a soldered HP38E that is already opened with the ones in the HP31E. I could not find any difference between them, the posts seem to have the same 'tallness'.

Interesting! I vividly recall building a soldered unit in a solderless case and noticing it was loose. Now I have no reason to keep that memory... What the h@#*!

Well, I apologize not checking it twice as I did now.

Cheers.

Luiz (Brazil)

Spice Ribbons

*Message #7 Posted by **Michael Meyer** on 1 Nov 2009, 9:26 p.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Hi Luiz! I sadly discovered today that several of the Spice's that I restored years ago no longer work. Batteries were fine (replaced with lithium cells). It was the %$#& ribbon cables. I guess that they continue to deteriorate if they have any corrosion on them. I fixed a 34C tonight, I have one 32E to go.

I hadn't though of restoration being an ongoing project!

Re: Spice Ribbons

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 2 Nov 2009, 12:49 a.m.,*
in response to message #7 by Michael Meyer

Hi, Doc.;

could I say 'Good news, afterall!? Well, your HP34C is back to life, and this is always good news, right?

I have observed that the HP41 has the same problem, i.e., once the batteries contacts show corrosion, cleaning and/or replacing only the contact tips will not always stop corrosion to go inside the flex circuits. I have two unusable contacts+I/O assembly. If we consider the thickness of the copper tracks and the amount of chemicals that have already been in contact with them plus the atmosphere elements (mainly oxygen), it seems to me an additional neutralizing component is needed after cleaning the leakage so it does not go ahead 'eating' the cooper. I achieved some acceptable results with sodium bicarbonate solution (I hope this is the English term for that). It is normally used to wash recently corroded PCB to neutralize the ferric perchlorate (I also hope this is the correct term...) so the final PCB is not slowly corroded by the remaining perchlorate. BTY, did you use a computer flat cable to restore the HP34C? I have an HP38E waiting for a transplant that will happen today, if time is not against me, and I'll use it. Luckily I'll replace only the three-track part of the ribbon, not the whole flex circuit.

Hope you succeed bringing the HP32E back to life. It is a fine statistics-addressed Spice.

Cheers.

Luiz (Brazil)

Re: Spice Ribbons

*Message #9 Posted by **Charles Oxford** on 2 Nov 2009, 2:16 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

"bicarbonate solution (I hope this is the English term for that)"

"sodium bicarbonate"

Here in America we call it baking soda. Is readily available in any grocery store and is useful for absorbing odors and neutralizing acids on car batteries, in swimming pools and many more uses including enhancing shampoo so as not to use as much.

Charlie - Phoenix USA

Re: Spice Ribbons

*Message #10 Posted by **Michael Meyer** on 2 Nov 2009, 1:54 p.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Thank you Luiz and Charles! I have repaired these by cutting the ribbon cable and super-gluing the remaining cable down and baring the copper with a grinding wheel. Then just two wires soldered to the remaining cable and then directly to the back of the battery terminals. (I haven't tried to retain rechargeability).

Can sodium bicarbonate solution be applied with a brush to the cable so the whole machine doesn't have to be disassembled when not needed?

The problem I see there is that the cable is "sandwiched" in plastic and the corrosion seems to find its way between the plastic layers....

Re: Spice Ribbons

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 2 Nov 2009, 2:26 p.m.,*
in response to message #10 by Michael Meyer

Hi, doc;

> Quote:
>
> (...) the corrosion seems to find its way between the plastic layers...

This is the main problem, as I see. I do not apply the sodium bicarbonate solution directly, I use it (in a 10% volumetric relation with the water, maybe less) to dip the corroded parts in it for a while, then I press them from time to time to allow the solution to reach the deepest possible. After that I wash the parts in current water, dry them out then I apply a thin coat of some micro oil, like WD40 or any other, with a small brush. This is to reduce contact with the atmosphere and to protect a little bit in case of leakage. The micro oil does not cause bad contact when the surfaces are well cleaned and pressed accordingly.

The HP41 demands some extra care because of the rubber foam used to press the battery+I/O assembly contacts. It should not be dipped in the sodium bicarbonate solution.

Success!

OT: I wish all companies listened and responded like this!

*Message #1 Posted by **DaveJ** on 29 Oct 2009, 4:48 p.m.*

Sorry for the OT stuff, but I know some here might be interested in this:

I recently reviewed the new Microchip PICkit3 compared to the old PICkit2 and pretty much hammered the people responsible on behalf of those who have found the PICkit3 upgrade rather lacking:
http://www.eevblog.com/2009/10/21/eevblog-39-pickit-3-programmerdebugger-review/

At it turns out, not surprisingly the video made it's way all around the Microchip offices, even to the desk of their CEO. As with any multi billion dollar corporation, I expected either deathly silence or a nasty letter from their lawyers.

But it turns out Microchip really do care about their products and customers, and really do listen, so they seriously took it as constructive criticism.

So not only was my blog well received at Microchip, I got a lengthy call from none other than the Microchip CEO Steve Sanghi, thanking me for the blog and raising the issues. He pointed out a few factual errors which was fair enough, but admitted they could have done the PICkit 3 better and most importantly are working to fix the issues and give customers what they expect.

They have even posted this hillarious video response in record time:
http://www.youtube.com/watch?v=3YUvlrVlNao

I am absolutely blown away by their honesty and responsiveness, and it starts from their CEO down. Two thumbs up to Steve Sanghi and the guys and gals at Microchip!

Goes to show the power of the video blog. I doubt the impact and response would have been the same from a simple text blog.

Dave.

Re: OT: I wish all companies listened and responded like this!

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 29 Oct 2009, 5:47 p.m.,*
in response to message #1 by DaveJ

Hi, Dave;

thanks for sharing these 'good news' with us. You see, less than one week ago I bought a BeeProg+ from a Brazilian distributor. It cost me some bux, but the little thing seemed to be the best local choice, and it came with a 3 year warranty. Based on reviews and technical articles I assumed I made the best choice, though.

I am more a hardware guy and I like to know that many companies still take care of their hardware-addressed products. Thanks for pointing this out.

Cheers.

Luiz (Brazil)

Have just seen the video... LOVED IT, MAN!

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 29 Oct 2009, 6:44 p.m.,*
in response to message #1 by DaveJ

Hi, Dave;

I simply LOVED the d*** h*** reference (PicIt 3) for the project managers against the engineers brilliant design (PicIt 2) with no resources. Believe me, that´s exactly what I tell my students every single day. A few days ago I saw a documentary about Apollo 11 and Gene Krantz mentions that at that time things were done because they could be done. Somehow, managers cut funds to finance whatsoever (wars, mostly) and he (Gene) also mentions that we need more mathematicians, scientists and engineers to create what is needed to support financial management.

Brilliant.

Cheers and congrats.

Luiz (Brazil)

*Message #5 Posted by **Bruce Bergman** on 30 Oct 2009, 1:29 a.m.,*
in response to message #1 by DaveJ

So, awesome for Microchip, and it IS good that they are listening and trying to address customer concerns. I truly appreciate that.

That being said, what did they say the would DO about this? I was one of the folks who bought the Pickit-3, to work with the uWatch, and it has been nothing but problem after problem. I finally just gave up out of frustration a month or two ago. I had been thinking of buying a Pickit-2, but with the $50 already spent on the -3, I wasn't all that keen on paying more.

So, what was their remedy, if any?

thanks! bruce

Re: OT: I wish all companies listened and responded like this!

*Message #6 Posted by **Garth Wilson** on 30 Oct 2009, 7:33 a.m.,*
in response to message #5 by Bruce Bergman

I've used the PIC16's for quite a few products we've brought to market because of the nice set of I/O, on-chip support, low cost, and the fact that they're in stock in so many versions at so many distributors. The

part I hate about the PIC microcontrollers is their decrepit microprocessor core which they apparently got from General Instrument eons ago.

I've used support.microchip.com at various times when there has been a deficiency in the documentation. The problem there is that they tend to glance through your description of your problem and, without making sure they know what they've read, they carelessly shoot out a generic answer that's hardly relevant, and then mark the web ticket "resolved," when it's not. Then when I try to follow it up and show them why it's not, they don't respond and you have to start another web ticket for the same thing and waste more time describing what went on earlier and where we need to pick up now.

Re: OT: I wish all companies listened and responded like this!

*Message #7 Posted by **DaveJ** on 30 Oct 2009, 5:30 p.m.,*
in response to message #6 by Garth Wilson

The part I hate about the PIC microcontrollers is their decrepit microprocessor core which they apparently got from General Instrument eons ago.

Then why not use the better PIC18 series, or even the PIC24 or PIC32 series?

The processor architecture is really only an issue if you program in assembler where you have to worry about that stuff. If you program in C then you hardly ever see or have to worry about that stuff.

Dave.

>
> So, what was their remedy, if any?

Their only stated claims are that they will re-release the external programmer software and make it and the firmware open source. Optimise the programming speed of the 16F parts, and look in to the LEDs (they took that very seriously!).

Plus improve the "out of box" experience for the user (i.e. better communication about changes from the PICkit2)

If you had or still have any other problem likes bugs and instability, then I don't know about that, they didn't mention it at all. I guess they'll they fix those things in time as the product matures. Of course you could argue it's been out for 6 months so should be fairly mature by now, or should have been from day 1 if they didn't change everything!

Dave.

Re: HP42s / HP35s Schematics

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 30 Oct 2009, 12:42 p.m.,*
in response to message #2 by Thomas Chrapkiewicz

Hi, Tom;

It is not a lack of interest, I´d guess it is more a lack of possibilities. I opening at least ten HP42S and saw some pictures of opened HP35S´, like this one (by Lyuka). The HP42S has both a controller and a RAM plus a few SMD components, and also provides room for another SMD chip (RAM/ROM?) right? Because

of the type of chip it uses, the HP42S is, somehow, 'serviceable'.

The HP35S has some more SMD´s and two chips under resin bubble (not directly identifiable) plus any LCD controller, if any, as we can see. I remember that the HP42S layout was easier to figure out by inspecting, but the HP35S seems to be somehow harder. Because the HP35S has not been what we could call a successful product (at least amongst us here), I see no reason to hack it and try something more than what it already has. On the other hand, the HP42S could only offer a way to add an I/O port, but some guys have been trying to do that for some time. It does not mean some more research is not desired... 8^)

I would go for the hP42S schematics, if I may. And if there is anything I can do for helping you, just let me know.

Cheers and thanks.

Luiz (Brazil)

in response to message #7 by Thomas Chrapkiewicz

Hi there,

Regrettably I have not a copy of the 42S schematics with me. However, if you're not in a big rush, I'll mail you the file as I get back home about Xmas.

Sorry for the bad news.

Regards from Dominican Republic.

Diego.

*Message #9 Posted by **Randy** on 4 Nov 2009, 6:00 p.m.,*
in response to message #8 by Diego Diaz

FWIW, there are 42S block diagrams in the patent application. They can be found on Eric's site. It doesn't take much to go from there to actual schematic. Once you have one, I really have no idea what you'd do with it... Let's see. One processor, one static ram, a voltage doubler, an IR LED, a capacitor and and LCD. Yep, that's a 42S.

I detailed the keyboard years ago...

Re: HP42s / HP35s Schematics

*Message #10 Posted by **Mike Morrow** on 4 Nov 2009, 7:14 p.m.,*
in response to message #9 by Randy

That would be a very interesting patent to read, but the patent page at Eric's site seems to have no entries for the HP42S. There's lots of HP32S (not 32SII) entries.

Re: HP42s / HP35s Schematics

*Message #11 Posted by **Charles Oxford** on 4 Nov 2009, 9:05 p.m.,*
in response to message #10 by Mike Morrow

Some of the patent docs appear useful to those who like to take calcs apart or to fix.

Re: HP42s / HP35s Schematics

*Message #12 Posted by **Randy** on 5 Nov 2009, 7:29 a.m.,*
in response to message #10 by Mike Morrow

The one I had in mind had no model listed. It applies to the original Pioneer keyboard design and the block diagram is of the 42S/17B format hardware.

in response to message #12 by Randy

Thanks, Randy! I just printed it out after seeing your citation.

I'm going to start looking through all the patents. Eric has assembled an impressive collection (Thanks, Eric).

Re: HP42s / HP35s Schematics

*Message #14 Posted by **Diego Diaz** on 7 Nov 2009, 12:14 p.m.,*
in response to message #13 by Mike Morrow

Hi all,

I've checked the patent .PDF and seems to have mayor differences with the actual schematic.

I'm speaking from my mind, but I do not remember any DATA line connected to the keyboard matrix and there are no resistors either.

On the other hand, Randy's diagram and description of the keyboard is (as usual) impecable. :-)

One of the relevant points regarding the 42 ans 17 schematic is that the extra ROM Data and Address wirings are not "alligned" with the ones on the RAM chip. So you can find, for example, that D1 in the RAM is connected to D2 in the ROM...

This is of the main importance if you're planning to write some Saturn code to place in such extra ROM.

I built the 42S-MLDL box in such way that the addresses and data are conveniently arranged to overcome that "disorder".

If there is a general interest in these issues I'll place the documents and pictures in a dedicated page at www.clonix41.org as I get back home.

Best wishes.

Diego.

Re: HP42s / HP35s Schematics

*Message #15 Posted by **Eric Smith** on 8 Nov 2009, 2:36 a.m.,*
in response to message #14 by Diego Diaz

Information in patents doesn't necessarily match the details of any given product. The "preferred embodiment" in a patent is a description of how the inventor (or patent attorney) thought the invention could best be recognized at the time the patent application was written.

The fact that some of the patents match actual products exactly, or

nearly exactly, might lead one to expect that, but it is the exception, not the rule.

The wiring of the data and address busses of static RAM chips are arbitrary. Unlike a masked ROM, there is no functional difference between any two data pins of a SRAM chip, or between any two address pins. This is true to a lesser extent of dynamic RAM as well. It is typically not true of flash memory due to the protocol used to control writing to the chip.

HP-42S partial schematic

*Message #16 Posted by **Lyuka** on 9 Nov 2009, 9:26 a.m.,*
in response to message #1 by Thomas Chrapkiewicz

Hi, there.

I drew an 'HP 42S partial schematic' just now. The original schematics have drawn previously while making some modification to my 42S.

HP 42S partial schematic

Note that some connectors are ignored and connections to the LCD are omitted. Though this is incomplete, I hope this helps you.

have fun!

Lyuka

P.S.
When you found a typo or an incorrect part in it, please inform me.

Re: HP-42S partial schematic

*Message #17 Posted by **Thomas Chrapkiewicz** on 9 Nov 2009, 9:15 p.m.,*
in response to message #16 by Lyuka

Hello Lyuka:

That is most helpful!

As I am considering interfacing to the keyboard, the information on your schematic is most useful to me.

However, as I recall, this circuit relies on specific resistance(s) between the column and row circuits.

Have you by any chance measured the resistance for each key in the keyboard?

Thank you, TomC

Re: HP-42S partial schematic

*Message #18 Posted by **Lyuka** on 9 Nov 2009, 11:35 p.m.,*
in response to message #17 by Thomas Chrapkiewicz

Hello TomC

The contact resistance of the key matrix had been measured to be 10k~12kOhm(11kOhm typ., Ta=25C)

Regards, Lyuka

Re: HP-42S partial schematic

*Message #19 Posted by **Diego Diaz** on 10 Nov 2009, 12:02 a.m.,*
in response to message #16 by Lyuka

Hi Lyuka, all...

Excelent job! (to say the least) :-)

One thing that calls my attention was the numbering order of the Saturn CPU pins. After looking at your pictures I realized that the plastic protective frame aroud it has a number "1" stamped in the location you choose to start numbering.

However a closer look to the PCB denotes the "PIN 1" indicator dot just in the corner between VSS and VDD (probably not visible in the pictures but I remember that since I removed said protective frame in the unit I took the schematic from... ;-)

Also some of the not-connected pins are tied together on the PCB... certainly this is irrelevant for technical use; just for the sake of accuracy.

Again my congrats for a nice and clean work.

Regarding the question on the keyboard contact resistance. This is just a design characteristic of the keyboard construction itself and not a functional requirement.

The Pioneer's KB is made of carbon traces, this causes some resistance to be present when a key is pressed; but a clean contact (0 Ohms) is also perfect for operation.

One of the most annoying troubles with heavily used Pionners is the referred CPU lock-up due to carbon dust between frequently used key contacts. Dissasembling, cleaning and reassembling the keyboard is, though possible, not trivial.

Hope this helps.

Best from the middle of the Atlantic Ocean.

Diego.

Re: HP-42S partial schematic

*Message #22 Posted by **Lyuka** on 10 Nov 2009, 1:12 a.m.,*
in response to message #19 by Diego Diaz

Hi Diago

IMHO the small dot mark on the PCB might be the orientation indicator for the automated parts mounter. Each parts which have polarity such as diode or solid tantalum capacitor, or specific pin allocation such as RAM, also have the dot mark nearby.

Regarding the key contact resistance, it should be not less than several Kilo Ohm, to avoid signal conflict, since each signal have multiple purpose such as address line to the RAM. Take a look on the patents page at Eric's site.

On the other hand, the contact resistance of the [ON] key-switch need to be less than several kilo Ohm by my experiment. The PWR-ON input of the processor seems to have some pull-down or require some power, and have threshold to activate the processor.

Regards, Lyuka

> Also some of the not-connected pins are tied together on the PCB... certainly this is irrelevant for technical use; just for the sake of accuracy.

Good design practice. Many a design has produced errors in high EMC environments due to pins left unconnected or floating ... even if the IC datasheet names them as N/C (no internal connection).

HP-42S/27S partial schematic

*Message #24 Posted by **Lyuka** on 14 Nov 2009, 10:01 a.m.,*

*Message #25 Posted by **Thomas Chrapkiewicz** on 14 Nov 2009, 12:32 p.m.,*
in response to message #24 by Lyuka

Lyuka:

Thank you for your fine work! It is most helpful.

What I am considering is bringing out the row and column signals to the outside world to implement program input to the 42s.

The empty socket pcb pattern makes a tempting access to the address lines to bring the keyboard signals to the outside. I do notice though, that K14(R0) does not seem to be connected to this socket pattern.

I wonder if anyone has tried anything like this before. (?)

Hi, TomC

> Quote:
>
> K14(R0) does not seem to be connected to this socket pattern.

However, there is a via hole near the processor.

Please notice that the wiring for the key switch are used as the address bus lines of the memory as well.
Additional wiring to the bus might cause some harm such as increased possibility of data error, or decreased EMI tolerance. Take care.

Cheers,
Lyuka

Re: HP-42S/27S partial schematic

*Message #29 Posted by **Thomas Chrapkiewicz** on 14 Nov 2009, 9:04 p.m.,*
in response to message #28 by Lyuka

Lyuka / Randy:

Thank you for your responses. I've followed all of the threads (I could find), and it appears that some were close to this, but did not ever complete it. I'm not yet totally confident that I can complete it either!

I am aware of the sensitivity of these lines; certainly keeping the switching matrix within the calculator package would be ideal.

R, TomC

Re: HP-42S/27S partial schematic

*Message #30 Posted by **Lyuka** on 15 Nov 2009, 12:20 a.m.,*
in response to message #29 by Thomas Chrapkiewicz

TomC

Then, if you really want to switch the key-switch matrix electrically, how about using two 8:1 analog multiplexers such as

ADG708, MAX4617 or MAX4638 to make cross-point switch matrix?
(A resistor of 10KOhm is needed between its common pin to common pin as the contact resistance.)

41 "Second Shift"

*Message #1 Posted by **Ángel Martin** on 29 Oct 2009, 3:14 a.m.*

I've come up with an idea for a "second shift" key on the 41. If you're like me, you rarely use the SIGMA+/- functions, so would appreciate using that key for something else instead (replace it with your most hated key if that's not the case).

Using the partial data entry routines it's relatively simple to make any key a launcher for other functions, as though they were assigned to the keys. Let's call it the RED shift key - blue is obviously taken by the Alpha keyboard). Its response is based on the pressed key codes, and it supports both shifted and unshifted selections (yellow shift).

Using other mainframe routines the behavior is identical to that of the native functions: the function name is read from the rom's FAT table and displayed while the key is depressed, and the NULL message is shown if maintained for the timeout time. A real charm, if you ask me.

On an emulator this scheme is easily completed by coloring the key and changing its face legend. I've got my 41V changed to that effect, and the legend is "Z" - as I use my red shift key to launch all the complex equivalent functions. Note that this only requires ONE key assignment, the function assigned to the RED key will do the selection work. Saves memory, your USER keyboard is free, and it's faster. You need to see it... will be added to the posted 41Z in a few days.

Now the finishing touches. I've been trying to use the "G" annunciator to flag this RED shift key usage. The idea is to have it come up while the key selection sequence is going on, and come off upon completion. Unfortunately so far I haven't managed - it's intimately linked to the RAD / GRAD selection, and it appears to have a life of its own despite my attempts to command its individual action.

In theory one can use WRITDATA with bit 9 set on C(S&X) - see Ken Emery's book - but that doesn't cut it. Not even the service ROM makes use of the "G" annunciator alone - I'm beginning to wonder whether it's possible at all?

Here's the routine I use to toggle its status - not working- , maybe you can spot the faulty bits: (the display is enabled when calling it)

> Quote:
>
> 178 READ 5(M)
> 23C RCR 2
> 3D8 C<>ST
> 30C ?FSET 1
> 01F JC +03
> 308 SETF 1
> 013 JNC +02
> 304 CLRF 1
> 3D8 C<>ST
> 37C RCR 12
> 2F0 WRIT DATA

3E0 RTN

Any ideas please?

Best, ÁM

Re: 41 "Second Shift"

*Message #2 Posted by **Eric Smith** on 29 Oct 2009, 7:40 a.m.,*
in response to message #1 by Ángel Martin

Turning the G annunciator on isn't a problem. There's just no way to prevent the mainframe ROM from updating it as soon as it gets control back. The "message" flag prevents an update of the character data and punctuation, but it doesn't prevent the annunciators from being updated.

Re: 41 "Second Shift"

*Message #3 Posted by **Ángel Martin** on 29 Oct 2009, 8:10 a.m.,*
in response to message #2 by Eric Smith

The mainframe roms make frequent use of the [ANN_14] routine to "refresh" the status of the annunciators, and I suspect that must also happen when the NEXT1 routine yields to go ligh sleep...

Yet routines like DSPTEST manage to light them all up at once, and they aren't overridden by the mainframe. That's the intriguing part, won't you think"?

Well, so be it. The RED shift works regardless of that little cosmetic detail, so it really doesn't matter much.

Edited: 29 Oct 2009, 8:11 a.m.

Re: 41 "Second Shift"

*Message #4 Posted by **Garth Wilson** on 29 Oct 2009, 2:08 p.m.,*
in response to message #3 by Ángel Martin

How about using two different pitches of very short chirp of the beeper to indicate the red shift going on and off. It's not ideal, but might help.

Re: 41 "Second Shift"

*Message #5 Posted by **Ángel Martin** on 30 Oct 2009, 2:29 a.m.,*
in response to message #4 by Garth Wilson

it's an idea, and can be controlled with user flag 26 of course. For visual feedback I use the text "CMP: Z_" on the display, so it's quite clear as well. It gets completed with the function name once the corresponding key is pressed.

For instance, pressing RED_Shift, SIN will display: "CPM: ZSIN"
and pressing RED_Shift, SHIFT, SIN shows "CMP: ZASIN".

Other interesting keystrokes, including hyperbolics, are:

RED_Shift, RED_Shift, TAN -> "CMP: HYP ZTANH"
RED_Shift, RED_Shift, SHIFT, TAN -> "CMP: HYP ZATANH"

RED_Shift, RCL -> "CMP: ZRCL _ _" (yes, prompting and with IND support)

Cheers,

Edited: 30 Oct 2009, 2:33 a.m.

Re: 41 "Second Shift"

*Message #6 Posted by **Garth Wilson** on 30 Oct 2009, 7:40 a.m.,*
in response to message #5 by Ángel Martin

It sounds excellent, since, if you get confused or change your mind and don't remember where you left it in the toggling after pressing RED_shift a few times, it still lets you know when you press the final key and hold it to see what the function will be, possibly long enough to get the "NULL" if it's not what you wanted.

Re: 41 "Second Shift"

*Message #7 Posted by **Eric Smith** on 30 Oct 2009, 7:21 a.m.,*
in response to message #3 by Ángel Martin

I'm not familiar with DSPTEST. Does it yield control back to the mainframe ROMs?

Re: 41 "Second Shift"

*Message #8 Posted by **Ángel Martin** on 30 Oct 2009, 1:36 p.m.,*
in response to message #7 by Eric Smith

No, it doesnt - that's how it achieves the feat, by going light sleep forced with POWOFF - and it also sets the msg flag right before doing so. So you were right, as usual. Many thanks for your insight.

The perfect HP for the kitchen?!

*Message #1 Posted by **Mark Edmonds** on 28 Oct 2009, 11:09 p.m.*

This might sound like a crazy question but there are plenty of reasons for keeping a calc handy in the kitchen, even better if you have a slightly scruffy spare model that wouldn't be hurt if damaged.

Things that wuold be needed:

Converting units both US and European (I recently came across a need for 2 8oz cups!!! What on earth is an 8oz cup??),

Converting cooking times for different microwave wattages,

Cooking timers,

Cooking notes,

and so on...

There probably isn't a perfect match but if any of you have found yourself taking an HP into the kitchen for something, which did you use?

I was initially thinking of a scruffy 17B I have but then it doesn't do units so any better ideas please?

Thanks,

Mark the amateur chef

Re: The perfect HP for the kitchen?!

*Message #2 Posted by **Chan Tran** on 28 Oct 2009, 11:23 p.m.,*
in response to message #1 by Mark Edmonds

For your purpose, the HP50G. It's easy to get, not too expensive, highly programmable, better suited to run program than the older calc like the 41. It's not too bad to accidentally flour, grease or dunk the 50g. Not as bad as if you dunk a 41 or 67 or 34c etc.... You can develop a suit of program that you think you would use in the kitchen and then basically when you use it you just run programs rather than doing calculations manually.

Re: The perfect HP for the kitchen?!

*Message #3 Posted by **David Hayden** on 29 Oct 2009, 12:11 p.m.,*
in response to message #2 by Chan Tran

If you want to save money and don't mind a slightly smaller display, consider a 48gii instead of a 50g. You can pick up the older version (less memory, serial port, but no USB) on ebay for $50.

Re: The perfect HP for the kitchen?!

*Message #4 Posted by **Charles Oxford** on 29 Oct 2009, 2:07 a.m.,*
in response to message #1 by Mark Edmonds

8oz=1cup 2 cups = 16oz = 1 pint 2 pint = 32oz =1quart, etc

Keep your calc clean and dry in a ziploc bag.

charlie

HP9835 system

*Message #1 Posted by **Bo in Lund (SE)** on 28 Oct 2009, 7:02 a.m.*

Hi! I have extensively of HP9835A manuals and info. The 9835 is not exactly a calculator, but it is listed here. I also have some standard pack software backed up on floppy. Would likely be possible to write new cassettes from the backup!

Re: HP9835 system

*Message #2 Posted by **Steve Leibson** on 1 Nov 2009, 9:59 p.m.,*
in response to message #1 by Bo in Lund (SE)

Bo, your HP 9835 came from HP in Colorado, where I used to work. The minicartridge drive likely has suffered "gummy capstan" aging, where the rubber on the capstan has turned to goo. In addition, any old tapes you have likely have died as the adhesion is lost between the mylar backing and the oxide coating that stores the magnetic bits. That said, you can get the drive revived if you want. Take a look here if you're interested.

Edited: 1 Nov 2009, 10:00 p.m.

Re: HP9835 system

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 2 Nov 2009, 8:54 a.m.,*
in response to message #2 by Steve Leibson

IIRC, those cartridges use a clever mechanism with a belt that works in contact with the external surface of each tape reel; I would check if such belts had not turned themselves into goo or something similar....

HP38C "6" key repair

*Message #1 Posted by **Peabody** on 27 Oct 2009, 11:39 p.m.*

I have a 38C Spice-series calculator, and have begun to have problems with the "6" key. Sometimes when I hit the key I get a 6, and sometimes I get nothing. The harder I hit the key, the more likely it is that I get a 6, but hitting it with the same force I use on all the other keys is kinda iffy. So I always have to be looking to make sure it took.

After much wailing and gnashing of teeth, I managed to get the back cover off in one piece, and took everything out and cleaned it. But I didn't disturb the actual key pad - you know, the back of the circuit board with the round metal domes that go click. It appeared to be sealed with a plastic sheet on top, and I was reluctant to disturb it.

Well, everything is back together, and I still have the 6 key problem. If I open it all up again and peel back the sealed plastic, am I going to find anything underneath that I can clean or fix and solve this problem? Or am I basically SOL? It does appear that the problem is under that metal dome over the 6 key, but I can't tell whether I would even be able to get under it to clean it.

What advice would the experts have on this? I would really rather use this than a 12C if I can get this one working again.

Thanks very much.

Re: HP38C "6" key repair

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 28 Oct 2009, 1:46 a.m.,*
in response to message #1 by Peabody

PLEASE NOTICE THAT THE TECHNIQUES DESCRIBED HERE DEMAND SKILL ON HANDLING THE EQUIPMENT MENTIONED AND ARE NOT GUARANTEED. FOLLOW THEM AT YOUR OWN RISK (looks like copyright warning...)

Hi;

Based on your description, I concluded that the IC´s are soldered in the PCB, right? I'm asking about this because there is a solderless series of spices, and the flex circuit used in these models allow contact cleaning.

If you look carefully at the component side, you´ll see that under each metal key cap there is a small, metalized hole. And we are lucky for the '6' key has an accessible hole, close to the memory IC's.

I succeeded many times (NOT ALL) carefully inserting a small amount of isopropyl alcohol through these holes with the aid of a thin brush in order to clean dirty, bad contacts. Use the thin brush soaked with a small amount of alcohol only to touch the hole in order to allow the alcohol to slide into the key cap. It should be done carefully not to spread it so it does not reach the sealing plastic you mentioned in the top of the keyboard. If you use an excessive amount, the alcohol may also dissolve the glue in the sealing plastic.

I usually insert some brush bristles (2 or 3 fair ones) through the small holes and gently move, rotate them inside of the key contact. Luckily the bristles will scrap the surface of the contact both in the key cap and the PCB surface. Please, make sure you choose bristles that would not leave small chunks inside the key contact (I

prefer using bristles from synthetic brushes). From time to time, with the bristles inside the key caps and steady (do not moving them), press and release the key cap a few times, then move the bristles, hold them steady, press the key cap again and so. This will enhance the efficiency of the cleaning process by forcing the dust to move out.

It is possible that the bad contact persists for a while,. but chances are that after rebuilding the calculator and using it for a while the '6' key becomes more and more reliable.

Please, understand the I added the warning in the beginning of the post for the sake of preserving your HP38C. I've done it many times already, and in some of them I did not get the best results.

Success!

Luiz (Brazil)

Re: HP38C "6" key repair

*Message #3 Posted by **Peabody** on 28 Oct 2009, 8:37 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Thanks very much for the suggestions.

Yes, I have the soldered version of the 38C. I didn't really study it carefully when it was opened up, but I would like to know more about how the metal domes work and are attached.

Does the dome just connect two contact points on the PC board, or is the dome itself one of the contacts? If the latter, then the dome must be soldered to the board in some way. Is it possible to remove (desolder?) the dome and replace it afer cleaning?

Of course removing the dome would require peeling back the plastic sealer. I assume that could be reattached in some way.

Thanks again, Luiz. Also, if I remember correctly I have you to thank for the dental floss. :-)

Peabody

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 28 Oct 2009, 9:16 a.m.,*
in response to message #3 by Peabody

HI;

thank you but credit for the dental floss is not mine, and I'm ashamed not remembering the name of the very well known contributor who posted about it some years ago... Shame on me!

I hope my explanations make sense for you.

I would not solder the domes (I called them 'caps'...) because when they are pressed down, they change shape and their edges move out a little bit. Soldering them would cause metal stress and future cracks in both metal and solder. And their edges touch the PCB in one of the contacts while their center, when pressed, touches the other part of it.

Earlier models had key contacts being soldered in the PCB or used some injected polymer (plastic)

domes with conductive dots inside of them and copper tracks printed on it, and they tend to break after some time. After the Spices we find the metal domes in the HP41 and Voyager series. The clamshells, Pioneers and the hP48 series brought back the injected polymer domes with a single conductive spot in the inner middle of them, so they actually close contacts in the keyboard flex circuit.

Cheers.

in response to message #4 by Vieira, Luiz C. (Brazil)

Yes, the dental floss idea was offered by Karl Schneider. Thanks Karl.

Well, Luiz, then what holds the metal caps in place? Are they just stuck to plastic sheet, and just resting against the circuit board contacts without being physically attached in some way?

If that's the case, it should be possible to lift up the plastic, with the cap attached to it, and clean underneath, then lay it back down again. Have you ever tried that?

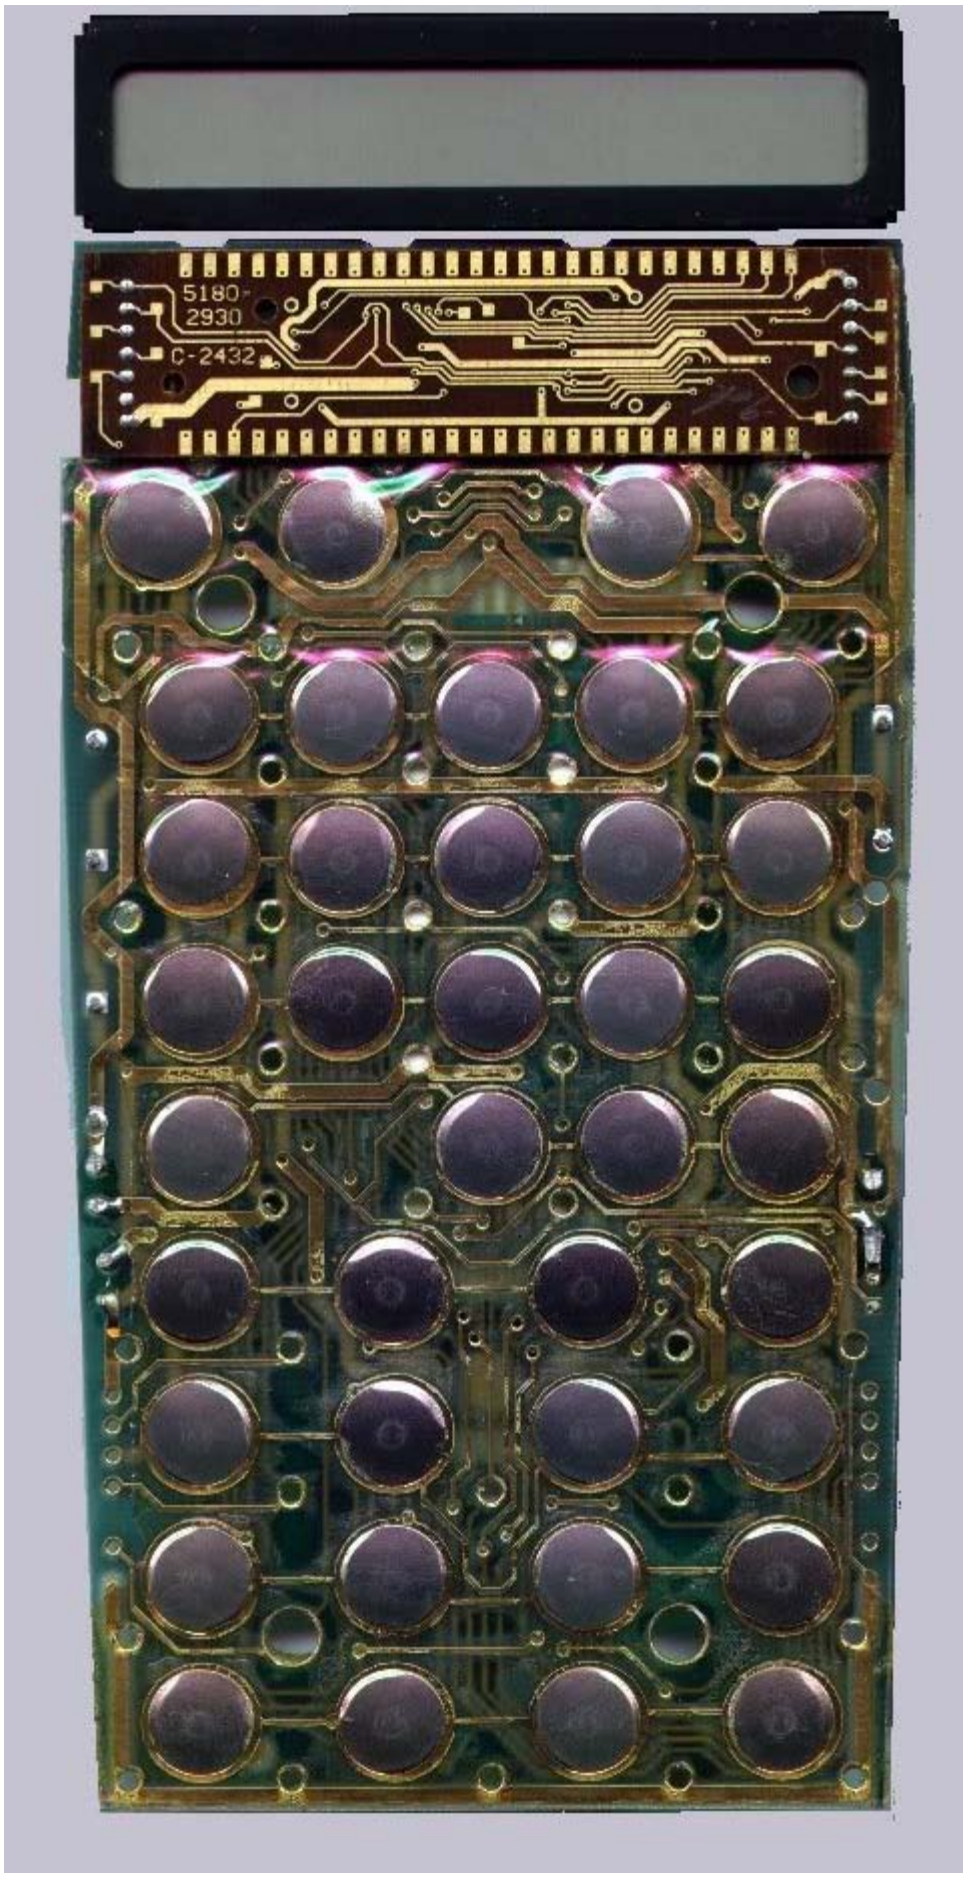
Re: HP38C "6" key repair

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 28 Oct 2009, 12:54 p.m.,*
in response to message #5 by Peabody

Hi;

> Quote:
>
> Are they just stuck to plastic sheet, and just resting against the circuit board contacts without being physically attached in some way?

AFAIK, it seems to be like this. I forgot to mention that Voyagers have the domes grouped in five units, forming half a row of contacts in the keyboard. This makes a more stable arrangement. In the HP41 (earlier than the Voyagers design) the domes are arranged in single units. Check the picture bellow (HP41 halfnut).



I have never tried to remove the protective plastic because of two reasons:

1 - centering the domes back in place - after 'pealing' the keyboard contact, chances are that the plastic never returns back to its original shape and position, and the key´s domes may slip away after some time

2- neutral atmosphere - surely the final assembly of the keyboard´s PCB, when the protective plastic is fixed in place, is performed in a neutral, dust-free environment. I am not quite sure about that, but by simply opening the plastic we will also allow more dust to get in and later we may face other keys with contact issues.

Please, understand that these are my own concerns. I do not like to think I'd find a solution for an emerged problem when I'm performing a technical task, I prefer to predict all possible scenarios (not possible, I know, I just go as far as I can). If you have a place where you could try opening the keyboard and removing the plastic with a confidence degree, I see no problem. You do not need sterilized environment, only dust free. And also you should find a way to make sure the dome will not slip out of the original place after settling it back.

Success!

Re: HP38C "6" key repair

*Message #7 Posted by **Peabody** on 28 Oct 2009, 6:01 p.m.,*
in response to message #1 by Peabody

I wanted to report the results of my key repair. I ended up just cutting and removing a rectangle of the plastic which covered just the bad key, cleaned the contacts, and replaced the cap and plastic. And it appears to work fine. For now. Time will tell. It looks like the plastic is just like the very thin clear shipping tape.

And I took pictures showing the rectangle and cap removed, and more details of the infamous Spice bottom latch. The pictures are posted here:

http://drop.io/HP38C_KeyRepair

On close inspection, it's clear that the "9" key had already been repaired in this way. That must have been done by HP long ago. The original calculator was sent back shortly after purchase because it didn't work right, and I assumed they had sent me a new one in its place. But apparently not.

I also found that three of the six latches that hold the board to the case had been broken,but not by me - the top two on one side, and the top one on the other side. It has been that way for 25 years, and I never noticed anything amiss. So it appears these latches are not critical, at least in the soldered version of this calculator. Of course it does put more pressure on the two screws that hold the case together because the bottom case now also has to keep the innards in place.

One other thing I did was to put a thin coat of Vaseline on the bottom latch parts in the hope they will come apart more easily next time. Hopefully it will not migrate. I used the dental floss method, but I hope in the future I can just side the bottom cover rearward with respect to the top cover.

Thanks again to Luiz for his help.

the future of programmable calculators?

*Message #1 Posted by **Herbert Crepaz (UK)** on 27 Oct 2009, 12:44 p.m.*

Lets have a look into the crystal ball and speculate a bit.
What will be the future of programmable handheld calculators?
From discussions in this forum it seems that many are quite happy with offerings from times gone by.
The recent trend to use emulators or simulators on pda's and smartphones will probably increase but they are not(yet) a substitute for dedicated calculators(reliability,cost,longetivety, power consumption..).
So will we see 600Mhz processors(current iphone standard) in high end HP calculators and how about oled displays or electronic paper type ones? Maybe also embedded virtual machines or micropower multicore cpus in graphing calculators.

your thoughts please!
Cheers,
Herbert

in response to message #1 by Herbert Crepaz (UK)

Hello Herbert,

We had this particular topic quite often already. Frankly, I don't really expect new arguments. If you don't mind, I'd recommend you check the archives first. Then feel free to return with the questions you think are not covered there sufficiently.

Ceterum censeo: HP, launch a 43S.

Walter

You got me wrong. Nothing against *new* ideas at all. Ruminating old stuff, however, isn't real fun to watch. Thus, my modest recommendation to look into the archives.

"Advantage to those who are able to read." German saying.

Re: the future of programmable calculators?

*Message #5 Posted by **David Hayden** on 27 Oct 2009, 5:35 p.m.,*
in response to message #1 by Herbert Crepaz (UK)

I looked through the archives going back to 2002 and didn't see much when searching for "future." I apologize if this has been covered earlier than that or under different topics.

I think there are (at least) two type of programmers that HP needs to think about: end users who are writing quick programs of a few lines, and more experienced programmers who are writing applications and such. End users need the development environment on the calculator, but for more serious code, I think you can offload all the development onto a PC.

In other words, I wouldn't put the development library in flash memory on the calculator. Let all complex development occur on PCs. Most of it probably occurs there now anyway.

Regarding speed, if I was HP, I'd be working hard to convert the 48/49/50 Saturn assembly code to native ARM and port the RPL to a 32 bit address, byte addressable environment (vs the 20 bit address, nibble addressable environment of the Saturn). This would give a huge speed boost over the TI's. As an aside, does anyone know how much of the ROMs are Saturn assembly code and how much is RPL?

Finally, I wish someone would create an RPL optimizer. I believe that most user RPL code could be greatly sped up by static analysis of the stack. For example, if you know that levels 1 and 2 of the stack contain real numbers and the next instruction is "+", then you can replace it with %+, thus avoiding lots of error checking. Really, I wish I had the time to do this myself.

Although not specifically related to programmable calculators, I think HP should offer some of the calculators in a different form factor. Nearly all of their calculators today are about 7"x3"x0.5". The 12C's form factor is quite popular and it fits your pocket. I personally liked by 29C because you could hold it in one hand and easily reach all the keys with your thumb, making for very handy one-handed operation.

Dave

Re: the future of programmable calculators?

*Message #6 Posted by **Chuck** on 27 Oct 2009, 9:49 p.m.,*
in response to message #1 by Herbert Crepaz (UK)

Personally, I've moved beyond calculators for programming; even though I have somewhere close to 30 HP's, 40 non-HP's, a multitude of other calculating paraphernalia, mechanical, "electronical", and programmable, I'm smitten with Mathematica. There is absolutely no comparison to the computing ability, graphical output, and programmability of Mathematica. I firmly believe I will never write another program for a calculator. Not that

I can't appreciate the extensive calculator programs I've written in the past, and won't appreciate programs written by others to come. It's just seems trivial program a calculator nowadays. HP may make a Turbo X 43g++ XJR HD calculator, and I'd be the first to buy one, but I can't say I'd spend more than an hour programming it. Ditto with the iPhone apps. Cute, (and I have 6 calculator apps) but.....

This could be why calculator manufacturers aren't overly hip on producing high-end expensive programmable machines. It's time to leave the past in the past, along with the manual typewriters without a "1" key (although I have 6 of those, as well.) Doesn't mean they need to make them again.

*Message #7 Posted by **Don Shepherd** on 27 Oct 2009, 10:45 p.m.,*
in response to message #6 by Chuck

Chuck, it takes all kinds to make the world go 'round. Just because you see no point in programmable calculators, there are people who enjoy writing programs on them. Personally, I like the challenge of developing algorithms for machines with limited resources, like the HP-65 and HP-12c. As I've said before, it's just fun. Of course these machines do not have anywhere near the capabilities that Mathematica has; that's the point.

I expect HP (and TI, Casio, Sharp, etc.) to continue to make programmable models for years to come. Time will tell.

*Message #8 Posted by **Alain Mellan** on 28 Oct 2009, 1:15 a.m.,*
in response to message #6 by Chuck

I still have my beloved 15C at home, a 41C, a 48G and a new 35S. I use them from time to time at home, but what I use the most at work is Free42 on the iPhone.

- An iPhone still has a smaller form factor than any of these calcs, and I always have it in my pocket.

- the portrait display is easier to use with one hand than, say SCI-15C's landscape mode

- I care more for an simple efficient RPN than the feel of the buttons

- When I need something involving programming, I use Python + numpy + matplotlib

For me, devices like iPhone are the future of handheld calcs, except maybe for exams where they will want non-programmable machines and no WiFi/3G :-)

Re: the future of programmable calculators?

*Message #10 Posted by **Thomas Radtke** on 28 Oct 2009, 6:54 a.m.,*
in response to message #1 by Herbert Crepaz (UK)

For a couple of years I have been working in a biolab. My 32SII did more or less trivial calculations for which

I wrote programs or used the equation solver. It wouldn't have been practical to use a computer. That's just a matter of space and speed. At that time there were no smartphones, but I think I wouldn't have brought an iPhone into that lab.

There is a target audience for small programmables. Unfortunately, this group is quite small and most members of it refuse to use any of them. I've seen colleagues typing their formulas into 4-bangers, over and over.

However, I'm happy to own a couple of programmables, sufficient to serve me for the rest of my life.

*Message #3 Posted by **Thomas Radtke** on 27 Oct 2009, 11:10 a.m.,*
in response to message #1 by Martin Pinckney

Walmart isn't exactly the right place to sell a business calculator, I conclude. Staples still sells the 10BII for $36,99?

Re: It's come to this . . .

*Message #4 Posted by **Bruce Bergman** on 27 Oct 2009, 11:13 a.m.,*
in response to message #1 by Martin Pinckney

Too bad it is not true. You could make a killing on eBay!

thanks, Bruce

Re: It's come to this . . .

*Message #5 Posted by **Martin Pinckney** on 27 Oct 2009, 2:47 p.m.,*
in response to message #4 by Bruce Bergman

Yes, it is true. I bought 33 at this price. And no, you can't make a killing on eB**. Just look at how many are offered there right now. I did sell enough on eB** to recover my costs. Then my wife asked for some to give to her students as rewards (she teaches high school).

Re: It's come to this . . .

*Message #6 Posted by **Mike Morrow** on 27 Oct 2009, 11:40 a.m.,*
in response to message #1 by Martin Pinckney

I was unable to open the photo site with the pictures (I'm temporarily on dial-up).

I posted a couple of months ago about HP10BII calcs being sold at various Walmarts, in the US South, at least, at cut rate prices. I bought one in Athens, AL, for $17, and another in Blytheville, AR, for $11. For the

money, they're quite nice.

I keep hoping for them to do likewise for the TI-89, which they sell for $160. One-third price is about all I'd pay for a TI.

Re: It's come to this . . .

*Message #7 Posted by **Martin Pinckney** on 27 Oct 2009, 2:50 p.m.,*
in response to message #6 by Mike Morrow

Mike, the sign over the 10bII's said $2.

Re: It's come to this . . .

*Message #8 Posted by **Mike Morrow** on 28 Oct 2009, 1:15 a.m.,*
in response to message #7 by Martin Pinckney

Now I feel silly thinking $11 was a great price! :-)

Re: It's come to this . . .

*Message #9 Posted by **George Bailey (Bedford Falls)** on 27 Oct 2009, 1:25 p.m.,*
in response to message #1 by Martin Pinckney

I particularly like the notion that it's sold as "Party Supply"!

Re: It's come to this . . .

*Message #10 Posted by **Reth** on 28 Oct 2009, 5:50 a.m.,*
in response to message #1 by Martin Pinckney

I wander when we'll see the HP35S and HP50 in similar situation. And wouldn't be surprised.

Re: It's come to this . . .

*Message #11 Posted by **DaveJ** on 28 Oct 2009, 7:01 a.m.,*
in response to message #1 by Martin Pinckney

I wonder how much Walmart actually paid for them?

Dave.

Re: It's come to this . . .

*Message #12 Posted by **Chan Tran** on 28 Oct 2009, 10:38 p.m.,*
in response to message #11 by DaveJ

That kind of thing happened at Walmart quite often. They put the price wrong but you won't get your calc for that price. I ran into that problem many times.

Re: It's come to this . . .

*Message #13 Posted by **Reth** on 29 Oct 2009, 1:42 a.m.,*
in response to message #12 by Chan Tran

Did you read the thread above? The guy GOT 33 of them at this price.

Re: It's come to this . . .

*Message #14 Posted by **Patrick Rendulic** on 30 Oct 2009, 10:47 a.m.,*
in response to message #1 by Martin Pinckney

Three years ago, I got ten 12C, those with the 3 button cells, for 20$ apiece. They were being sold out as the shop replaced them with Platinums ... .

I then asked 100$ per unit on ebay and they were gone quite rapidly ;).

A strange world.

hp 9815a/s program tapes

*Message #1 Posted by **frankabc** on 26 Oct 2009, 8:10 p.m.*

Hi, we're still trying to get our hp 9815a and 9815s going. The "s" is intermittent now. Sometimes the memory is 904 steps; other times it is the full 3720. But now we are wondering if the old program cassette tapes are still working.

Does anyone have a 100% known-to-be-working hp 9815a or 9815s? If so, would you be willing to run our DC 100 cassette tapes on your calculator? We need to learn whether anything is on these tapes. If there are still programs on the tapes, we would like to list the programs in hard copy via the printer, and we also want to make backup tapes. We have a roll of themal paper, and some new DC 100 tapes.

Thank you. Frank

Re: hp 9815a/s program tapes

*Message #2 Posted by **Joel Setton (France)** on 27 Oct 2009, 5:31 p.m.,*
in response to message #1 by frankabc

Hi Frank,

There seems to be limited interest for the 9815 in this forum, but I think it's a fascinating machine, almost in a class of its own because it runs on a commercial microprocessor.

I have a 9815s which is in great condition, although I have never been able to test or run its tape drive because I have not been able to find any suitable tapes. Of course I'll be glad to help if I can.

Joel Setton

*Message #3 Posted by **frankabc** on 27 Oct 2009, 9:10 p.m.,*
in response to message #2 by Joel Setton (France)

Joel, I was hoping that you would say yes. My email is franksimpson4@gmail.com, and I presently am living in Wisconsin, USA. Please let me know via my email how to reach you directly, so that we can make arrangements to run these program tapes on your machine. We might want to try programming some of our new tapes first on your machine with perhaps, 2 enter 2 +, to insure that your tape drive actually works. Is the tape drive spindle on your machine gummy? I also am wondering if a 9825 can read DC 100 tapes that have been pre-programmed on a 9815? We have all of the hp 9815a books, but some of our original tapes, such as the Utilities and Test tape, are missing. Thank you, Thank you!! Frank

What calc for my 7 years old son?

*Message #1 Posted by **Jose Gonzalez Divasson** on 26 Oct 2009, 6:03 p.m.*

He's just started to do additions, and he finds nice playing with numbers.

We all know RPN's better, but... would you have your son endure all you have endured? (unability to properly use other calculators, he cannot lend his to other lads, freak factor...)

And if so, which one? (I have gone from 33c to 17bII, 19bII, 41 (cv & cx), 42s, 48gx...where I am keeping all except the 33c - which broke 28 years ago...)

Re: What calc for my 7 years old son?

*Message #2 Posted by **Don Shepherd** on 26 Oct 2009, 6:19 p.m.,*
in response to message #1 by Jose Gonzalez Divasson

Jose, there is no better topic guarateed to raise a ruckus on this forum than this one!

For a kid just starting first or second grade (7 years old), as a teacher, I would recommend NO calculator. Let him learn the basics with pencil and paper and understand the principles behind the math first. By the time he hits middle school, if he knows these basics, and if he has supportive parents and good teachers, he will do just fine without a calculator at all. But there are good calculators to enhace the middle school math student's experience, such as the TI34 Multiview (or HP SmartCalc 300s). I teach middle school math, and after my students demonstrate that they can do the calculations with pencil and paper, I let them use a calculator. And they frequently discover insights they didn't know before by doing that, so I think it is valuable.

Don Shepherd

+1. It would be a big disservice to him to give him a calculator.

Re: What calc for my 7 years old son?

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 26 Oct 2009, 7:21 p.m.,*
in response to message #2 by Don Shepherd

Hi;

I am a teacher for more than 15 years, and although being a university teacher, I had some experiences with the equivalent to the US high school here in Brazil. We call it Medium or Secondary Teaching (9 years, now) because it is between the Fundamental Teaching (first 4 years) and the University. I also have a daughter that has not a single interest in math nor in calculators (I do that for both of us...).

Fact is that I second Don´s and Garth´s thoughts. Calculators should not be used to build math skills because they are actually the next step after the abstract math reasoning has already been built. I tell my students that math has many related areas, and calculating is just one of them that actually permeates almost all of the others. It is only a tool for the means of giving reason its magnitude. It is such that way that even a machine can do that. But most of all, understanding the meaning of the numbers is more important than getting to the numbers (calculators get to any numbers, we must be the ones to know what to do with them). When a calculator is a curiosity, people just press the buttons for the sake of the 'what...if's. When it becomes a tool, it will be used only when needed. Nobody messes up with tools, whichever they are.

Consider the following: allow your kid the access to a calculator when his reasoning looses track while he is crunching the numbers.

Cheers.

Luiz (Brazil)

Re: What calc for my 7 years old son?

*Message #5 Posted by **Lyuka** on 27 Oct 2009, 12:27 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Hi.

I basically agree with Luis, however, how about my son's case?

My four years old sun likes numbers, especially the series number of a car, a motorcycle or a train, for instance 2000GT or GSX-R1000.

On one day while he's playing with a toy-like HP10s, pressing '1' '0' '0' '0' and saying

"One, Ten, Hundred, Thousand!, Oh, thousand + thousand makes two thousand!'

he began to learn about what digit is, and what does '+' means. Then asked me

"Does adding '0' (by pressing '0' key) mean multiply by 10? Does 'multiply by 10' means 10 bunch of something? right?"

A calculator with arithmetic display, like HP10S, seems to help him to begin learning about number and simple math visually.

Regards, Lyuka

Re: What calc for my 7 years old son?

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 27 Oct 2009, 8:25 a.m.,*
in response to message #5 by Lyuka

Hi, Lyuka;

you see, based on your text, your sun was adding and multiplying by simply reasoning with zeroes (powers of ten, as we know already and he will know soon, as I see...). No mention to the '=' key so far... That is actually an abstract construction of reasoning for measurement and magnitude. I sincerely think that instead of using the '=' sign we should use the expression 'is equal to' as many times as needed until the kids use it implicitly, or ask for something to replace the expression. Then we show them how to write 'is equal to' with a signal, like the signals for add, multiply, etc. But I'd actually avoid it till they are studying variables and expressions. I remember once my younger brother asking me 'Why did the teacher write X=2, if X is not equal to 2? X is a letter, 2 is a number, how can they be equal?' The abstraction was missed, i.e., in a math expression X is not understood as a letter, it is a reference to an unknown quantity. It is a whole new set of meanings and a different use of known symbols. Abstraction is the key.

Cheers.

Re: What calc for my 7 years old son?

*Message #7 Posted by **DaveJ** on 26 Oct 2009, 7:59 p.m.,*
in response to message #1 by Jose Gonzalez Divasson

Apart from the "should he even have a calculator" debate, the answer is simple, RPN is just silly and archaic.

They learn and write "1 + 1 =" so a calculator should be expected to work the same way.

Forcing him to use a calculator that requires "1 ENTER 2 +" is just silly IMO. Show him RPN at a later date by all means, but don't start him off on it, there are more important things to be confronted with with and investigate at their age.

Flame away :-P

Dave.

Re: What calc for my 7 years old son?

*Message #8 Posted by **Don Shepherd** on 26 Oct 2009, 8:09 p.m.,*
in response to message #7 by DaveJ

Agree, Dave.

RPN might be a good topic in a graduate course in arithmetic entry systems in general, for those who might be interested in its capabilities, but apart from exceptional circumstances, I can't recommend its use in elementary or secondary education.

Re: What calc for my 7 years old son?

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 26 Oct 2009, 8:34 p.m.,*
in response to message #7 by DaveJ

Quote:

> Forcing him to use a calculator that requires "1 ENTER 2 +" is just silly IMO.

It is well known that Algebraic Notation and Reverse Polish Notation are, as their names say, notations, and not expressions. When one reads

```
1 + 2
```

and thinks of

```
3
```

it does not mean a sign of 'equal to' is demanded somehow, somewhere. And when one writes

```
  1
+ 2
---
  3
```

it does not mean a '=' is missing somewhere to finish the calculation. If we write '1 + 2' and say 'is equal to', then we do not need to add a '=' sign.

Considering RPN a silly notation is considering the closest notation to what one writes in a paper to perform a handwritten calculation silly, too. When we add, multiply, divide, compute a square root or whatever calculus that can be performed with paper and pencil, not one single time a '=' is needed. It can be used, mostly to indicate an answer, but it is not needed to perform calculations.

When we are writing down equations then it is another story, '=' is used to separate left and right sides of it. But we are talking about calculators, number crunching, not expression evaluation. RPN and Algebraic Notation live together in many new HP calculators, it is just a matter of what one wants to do.

And yes, Hewlett-Packard designers took advantage of the natural assembly language coding, which is closer to the actual calculations themselves, where adding A to B is expressed with the mnemonics

```
add A,B
```

and again, no '=' is demanded. Allowing A and B to be available and located prior to add them is the key for RPN operation, so [+] means

```
add Y,X.
```

Maybe my point is too focused, but I actually began reasoning and solving problems better after reasoning in RPN-fashion. I still do today, and this is due to RPN existence and a notation. I never dealt well with Algebraic Notation and I believe because it is not too close to the actual calculations, and my first calculator was a TI57 (1980, still with me). My second one, an HP41C (1982, still with me, too) actually helped me a lot more.

Cheers.

Luiz

About a year ago I was telling another engineer in our company about RPN when he asked. I told him algebraic tells you what you get, whereas RPN tells how you get there. He picked up and ran with that,

got an HP calc, and told me a few days ago that now he could never go back to algebraic, that his mind just doesn't think that way anymore. He's adicted to RPN.

Martin, I like RPN calculators because of their programmability. Keystroke programming is, in many ways, similar to assembler programming of the olden days. It is simple, has few rules and commands, executes pretty quickly on some of the current RPN calcs, and I enjoy the challenge of implementing an algorithm on a machine with a limited resource base, like the 12c. It's just fun!

Why some people like RPL amazes me. I like programming languages with 20 commands, not 2000.

In a few years, when he gets to algebra and starts learning about logarithms, get him a slide rule. Seriously. It's a great way to "see" how logs work.

With my kids, they didn't get a calculator until it was required for a particular class....about age 13 or so IIRC. However, starting about age 9, when they had finished their arithmetic homework, I would let them use one of my calculators to check their work. It was a reward for doing the pencil and paper excercise. All three kids learned enough RPN to work my calculators, but only my son (now 22) actually prefers RPN. His two older sisters don't have much use for calculators these days.

I was in 9th grade (age 14) when the HP-35 came out. My dad bought one immediately. At the same time, my geometry teacher had a simple 4-banger with an equals sign. I learned both at the same time and almost instantly found that RPN was more logical and easier to understand, as well as more flexible and forgiving.

Rather than a calculator, I'd play number games with him. At dinner, we'd play "High/Low" where one person thinks of a number and the others take turns guessing. After each guess, the person with the number would say whether their number is higher or lower than the guess. Pretty quickly the kids figure out how to divide the unknown space in two. Even if they divide it roughly, if gives them a good sense of numbers.

Also around the same age, I taught my daughter how to calculate a 20% tip (move the decimal place and then double the result). Any time we're out, she grabs the check and computes a tip to the penny.

Basically, at this stage, you just want to them to have a sense of how numbers and math work.

I bought the 33S at auction and give it to children. I thought they could have fun with it, never mind solving problems. Kids adapt readily, they have no fear of computers or calculators. I thought the 33S was a good RPN calculator with scientific functions for keyboard use. Further advanced was the formula solver and finally RPN programming which is less complex than the RPL. Sam

Re: What calc for my 7 years old son?

*Message #23 Posted by **designnut** on 27 Oct 2009, 1:33 a.m.,*
in response to message #22 by designnut

I forgot the fractional math capability of the 33S for kids that are faced with pages of fraction problems. I see little use for fractions but I think kids still have to endure it. I admit i played with my original 35S for amusement and discovered solutions I would never have found with algebraic logic. The 33S switches to algebraic if "Johnny" has to keep in step with the class full of TI and Casio.

uBASIC

*Message #1 Posted by **Thomas Chrapkiewicz** on 25 Oct 2009, 9:47 p.m.*

Many of you may be aware, but just in case:

uBASIC is a most interesting / capable 'dialect' of BASIC which supports precision up to 2600 digits, rational and complex datatypes, list handling capabilities...

It is an older DOS era program, runs quite quickly and consequently very small.

http://archives.math.utk.edu/software/msdos/number.theory/ubasic/.html

If uBasic sounds interesting to you, you may want to have a look at the old Tiny Basic

http://en.wikipedia.org/wiki/Li-Chen_Wang

which easily portable on almost any platform. I remember doing a 68k port myself back in the 90s.

marais

Re: uBASIC

*Message #4 Posted by **Patrice** on 26 Oct 2009, 9:10 p.m.,*
in response to message #3 by marais

What is perticular with UBasic is the native high precision numbers.

you can write a factorization program and provide an input in the form of 2^300-1 and expect to obtain the right factors.

You can display the factorial of 200 to the last digit.

and so on without having to deal with memory management.

>
> Start with a one in 'x' - all other registers zero.

The HP-33s in algebraic mode wins for ease from the keyboard with the following procedure:

With a one in "x' and zero in 'y' press + x<>y repeatedly and read the lower display after each + to see the sequence

1 1 2 3 5 8 13 and so on

and also notice that the sequence builds as a sum in the upper display as well but with a unwanted leading 1 + 0.

Edited: 25 Oct 2009, 9:36 p.m.

The HP12C Platinum follows it...

In Need of Calculator Advice

*Message #1 Posted by **Anders Peterson** on 24 Oct 2009, 4:18 p.m.*

My beloved 15c is well past its prime, and I feel it may be time to retire her from daily to occasional use. So I need to get another calculator. I have been investigating my options. While I would love to get another 15c, it is a very old calculator, and I don't want to risk picking one up that is not in very good shape. Unfortunately the ones in nice condition seem to sell for more than I can pay. I am currently considering the following options, and would really appreciate any advice.

Should I?

1) Try to pick up a used 32sii
I know and like this calculator. Though they sell high, I believe I could manage to acquire a decent one. I don't know anything about the original 32s, but it might also be an option.

2) Try to pick up a used 42s
I don't know this model as well, but it seems like a great machine. Also pretty pricey, but again, I believe I could get one with some patience.

3) Just get the 35s
No need to seek deals and auctions, and relatively cheap. I have read mixed reviews, some saying it is a return to real quality for HP, others saying the buttons are mushy and the design is poor. So I'm not sure what to think.

4) Something else
Is there any good option I am missing? There are a couple others I have been looking into. I discovered the 28s, for instance, when I found this great website, and it looks like a fantastic calculator. It also seems to sell for a good bit less than the 32sii and the 42s. However, the design bothers me, and seems less sturdy than other models and a bit too bulky.

Thank you in advance for any thoughts, experiences, or advice.

Re: In Need of Calculator Advice

*Message #2 Posted by **designnut** on 24 Oct 2009, 9:49 p.m.,*
in response to message #1 by Anders Peterson

I favor the 33s as being straightforward and affordable. If you can get by the clunky case and the strange keys it is a good value. First as a simple RPN scientific calc, then a good formula solver and then a RPN programmable with lots of space. You should be used to 26 storage registers. It is uncomplicated to use. Sam

Re: In Need of Calculator Advice

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 24 Oct 2009, 9:57 p.m.,*
in response to message #1 by Anders Peterson

Hi;

what resources you must have in the other calculator? Which ones you never needed to use in your HP15C? The 'evolution' in terms of available resources is the HP42S: all you need in the HP15C plus a lot more. And an extra challenge: find one for sale with an affordable price. Any other choice would either lead to a 48/49/50 series or to a calculator with less resources. Neither the HP33S nor the HP35S have matrix capabilities, and the amount of extra memory does not imply an improvement, instead an enhancement. I think that the HP32SII would suffice in terms of usage, but it still lacks matrices and complex number resources.

I´d go for an HP42S, but it surely depends on what you actually need from the replacement.

Cheers.

If you're having trouble with your 15c, I suspect, from all I've heard, that fixthatcalc.com can breathe at least another decade of life into it.

Re: In Need of Calculator Advice

*Message #5 Posted by **Michael de Estrada** on 24 Oct 2009, 11:01 p.m.,*
in response to message #1 by Anders Peterson

I think you'll get as many different opinions as you get responses. In my case, I've never replaced my HP-15c, but instead supplemented it with a series of RPL calculators (HP-28S, 48SX, 50g) for programming tasks, and retained the HP-15c for straight keyboard function work. The HP-32SII and HP-35s are no match for the HP-15c and the HP-42s, while it has all the great capabilities of the HP-15c and more, it has no communication capabilities to save data and programs on a PC or develop/edit programs in a PC and transfer them to the calculator. I just cannot comprehend having 7200 bytes of storage and no way to remote load or store programs and data. Of course, the HP-42s does have an IR printer port, but so do the RPL calculators. So, if it were my decision and I were making it today, I'd just keep using the HP-15c for non-programming tasks, and buy a HP-50g, which includes a USB port and cable for between $100 and $150. If you're afraid the HP-15c will wear out or break, don't. It will probably outlive you.

Re: In Need of Calculator Advice

*Message #6 Posted by **BobVA** on 24 Oct 2009, 11:28 p.m.,*
in response to message #1 by Anders Peterson

Not knowing exactly how you're using the 15c, this may or may not help, but:

- Keep scouring auction sites for a 15c or 11c daily driver. I've picked up a cosmetically rough 15c for $40 and a broken but repairable 11c for $35. You just have to be patient.

- If you've got an iPhone or iPod touch, there are some great 15c emulators. Also there are generic RPN calculator apps available for the old Palm platform (including Treo/Centro phones) and I believe for Windows Mobile as well.

- I like the 35S but, as noted in the posts above, it depends on how you're using the 15c as to whether it would be a good fit for your use. I switched out my 32SII for it. (Of course I just switched the 35S out for a

refurbished 55, but that's just me!)

Good luck! Bob

*Message #8 Posted by **Chan Tran** on 25 Oct 2009, 12:51 a.m.,*
in response to message #7 by Reth

Is there something wrong with you 15c? If there is something wrong with it then you should try to get another one in good condition. If there is nothing wrong with it but you simply want to retire it then get the 35s. It's not as good as the older calculator in many respect but it brings lots of new stuff too. It would be an interesting calculator to have, just for the change of pace. You may not like it very much but it's not expensive, brand new and easy to get.

The keys are quite good, the firmware is the problem. It's buggy. Another problem might be the glossy display.

If you like the 32SII, get one. I very much prefer it over the 35s due to its better display. Try to get a late Singapore model without the fraction bug. There's another bug with this calculator, but you will probably never find it.

Re: In Need of Calculator Advice

*Message #12 Posted by **bill platt** on 25 Oct 2009, 8:44 p.m.,*

If you use the "equation" feature of the 32sii you most certainly will find the bug, and it will drive you nuts! It messed me up a few times.

Correction [was: Re: In Need of Calculator Advice]

*Message #13 Posted by **Thomas Radtke** on 2 Nov 2009, 4:37 a.m.,*
in response to message #11 by Thomas Radtke

> Quote:
>
> The keys are quite good, the firmware is the problem.

I have to correct myself. The "arrow up" key on my 35s isn't recognised anymore despite its audible key click. I have to push it real hard. If I had some doubts about this calculator being completely unsuable for any professional task, this is history now.

Dear HP, you lost another customer.

Re: In Need of Calculator Advice

*Message #14 Posted by **Walter B** on 25 Oct 2009, 7:20 a.m.,*
in response to message #1 by Anders Peterson

My recommendations, to be executed top down: IF:

- your 15C is developing some defects, THEN contact Randy at FixThatCalc,
- your 15C displays an asterisk, THEN replace the batteries,
- ELSE continue using it.
- IF you like to see something more powerful, with a better programming interface (commands instead of keycodes), more space, better complex support, etc., THEN look out for a 42S. It may cost some money, but it's the best RPN calc you can get nowadays still, though 20 years old.
- IF you are afraid your 15C may get lost / stolen / destroyed THEN check what you really need and use every day: IF matrices and complex numbers are not in THEN buy a 35S, ELSE take even better care of your 15C. The 35S is a nice straightforward affordable calc, but you may be disappointed since you know a better tool already.

HTH,

Walter

Re: In Need of Calculator Advice

*Message #15 Posted by **Anders Peterson** on 25 Oct 2009, 10:43 a.m.,*
in response to message #14 by Walter B

Thank you everyone for your great input. What an awesome forum community you have here!

I have decided to put all my responses together to keep this thread from becoming a mess.

I suppose I should have provided more information on my calculator needs, but I did not want to make my post so long that no one would want to read it. I am a college student, and am also involved in biological research. Basic scientific functions, and ease of their use is a major factor for me. Statistical capabilities are also very important (this is also what I write programs for much of the time).

I don't think the 33s will work for me. It could be that the reviews I have read blasting the keyboard responsiveness of that model are incorrect, but in the end I want a calculator that I can really enjoy using, and though cost is a major consideration for me, the 33s is just so hideous that I have pretty much ruled it out.

Thanks for the tip about matrix support. I did not realize the 42s is the only one of those models that has matrices. They are not essential for me (I do have a TI grapher), but they are important, and that really bumps the 42s up on my list. Complex numbers are not as big of a deal for me.

I checked out the fixmycalc website, and they are not taking new repair orders due to overwhelming demand. That is not really an ideal option anyway. I would like to get my 15c fixed up at some point, but I need a calculator daily so I would have to get another one anyway if I send my 15c out. The truth is I could be overly paranoid about my 15c. It is functioning pretty well. The biggest issue is that the "f" (gold shift) key does not register about a third to a half of the times I hit it. There are a couple of more minor key issues, but nothing is completely broken. Furthermore, no matter what I get to replace it, I will definitely miss the "landscape" keyboard layout. I find it so much better than typical calculator layouts. That is actually the main reason I was interested in the 28s, but I'm not sure it would really be the same since it has the hinge. It seems like it would have to be laid on a surface to use.

I enjoy programming features, and consider them a necessity, but don't really require anything more than my 15c can do (though I expect I might come to enjoy additional capabilities). I really have no need for a grapher, and want something compact (I actually do like to stick my calculator in my shirt pocket from time to time).

As for hunting down a deal on a rough but functional 15c, that is basically what I already have (I should have been more clear about its condition in my original post). My issue is also that it is hard to tell if rough looking calculators are really going to be fully functional, and I can't really afford to take the risk and get a loser.

The 35s is looking like a good option, but the bugs mentioned by Thomas Radtke concern me. I will have to see if I can find any information about what functions are affected. The only other issue I have with the 35s is that it looks like it is a bit larger than the Pioneer models (and of course the fact that I now know it does not do matrices).

At this point, I am thinking my strategy will be as follows. I may be overreacting to small issues with my 15c, but I still think it's a good idea to get another calculator for a variety of reasons. It seems like the 42s might be the way to go if I can find a deal (I have downloaded a program called free42 to check out how it works, and the menu system would take some getting used to, but the 2 line display is nice, and it definitely seems to more than meet my needs). However, if I can't find a deal on a 42s, I may just pick up a 35s if I can find out whether those bugs will be an issue for me (obviously only if I find that they will not be). Once I have another solid calculator, I will be free to send my 15c into the shop if I feel it is

necessary. So I have all but ruled out the 32sii (it was my number one option coming in so this information has really helped me out).

Anyway, thank you to everyone, and please feel free to give me more feedback as I am still not certain what I will do.

Thanks,

Anders

>
> I don't think the 33s will work for me. It could be that the reviews I have read blasting the keyboard responsiveness of that model are incorrect, but in the end I want a calculator that I can really enjoy using, and though cost is a major consideration for me, the 33s is just so hideous that I have pretty much ruled it out.

I thought that this would be the case as well. However, having picked up an absolutely mint one on eBay for under $20, I have to say that in many ways I prefer it to my 35s. My main complaint is the legibility of the second and third key functions scripts - the purple and green are pretty washed out on the keyboard in most lighting conditions so that ALL text looks black. Other than that, I like it a lot.

YMMV

> So I have all but ruled out the 32sii (it was my number one option coming in so this information has really helped me out).

Personally, I wouldn't rule out the 32sII that quickly. It is arguably one of HP's finest in many respects - ease and speed of use, superb Pioneer form factor, construction and so on. The 35S doesn't do much more than the 32sII already does but the 35S is really a rather horrible affair in my book.

I know the 32sII doesn't do matrices or complex like the 15C but you've already said you don't need complex. I've never found matrices especially fun on any calc anyway but I don't use them much.

Unless there has been a surge on 32sII prices recently, I didn't think they go for much different than a new 35S and as a really well-balanced general purpose calc which is a lot of fun, the 32sII is a good solid buy. I really like it a lot and the older 32s is pretty good as well (but goes for higher prices).

So my advice would be - don't discount the 32sII totally as it has a lot to offer and even if you need more specialised functions in a different calc, having a 32sII for quickly bashing out calculations on a keyboard where everything is to hand is satisfying. I understand there is a speed-calculator competition somewhere and the calc of choice for people taking part is the 32sII because it is so quick and easy. That should tell you something about it, especially if you consider navigating your way round the maze of menus in a 42s (arrrggh!!!!).

in response to message #15 by Anders Peterson

A while ago I bought a new 35s as a light replacement for the 48SX and 48GII. But some of those bugs, especialy the display of floating point numbers and the handling of hexadecimal and binary, made it unusable in my job. So I went for a 33s and got a refurbished one from ebay at a very resonable price. No problems with the keyboard, and everything works as expected, so I'm very happy with it. I even got used to the Enter key in the lower right and meanwhile I find this a real improvement in usability.

Re: In Need of Calculator Advice

*Message #21 Posted by **John B. Smitherman** on 25 Oct 2009, 7:33 p.m.,*
in response to message #20 by Lutz Jacob

I agree. The Enter key should be grouped with the +,-,x,/. On the 34c the Enter key and +,-,x,/ are on the left side of the keypad but on the 32sii the Enter key is on the left and the +,-,x,/ are on the right. At some point these important functions were separated. I prefer to have them grouped together as on the 34c or the 33s and not like the 32sii and 35s.

Regards,

John

in response to message #20 by Lutz Jacob

Similar with me, only I went through 33s (found the 26 storage places a limitation), bought 35S (found some terrible problems like not showing the Exx portion!!, shifted STO, having to press XEQ A AND ENTER etc.). I also have a 50g which is fine but rather large for quite simple tasks I use it for. Now, my 35S is totally unused, 33S and 50g in use. Conclusion: 33S got extremely harsh response from tradition-loving users (what a keyboard layout! - in fact it's probably better than 35S keyboard layout), but it works much better than the (at first) praised 35S. Very good value for money.

I also find the 33s to have gotten a bad wrap. Sure, at first glance it looks a little funky and un-traditional, but it is a great little calculator nonetheless.

I have the 15C, 32sii, 42s, 35s, and several graphing calcs (11 different HP models in all). I strongly recommend, based on your intended use of the calculator, getting the 33s as your replacement calculator. You will be pleasantly surprised with its rather well thought-out keyboard. It truly is the evolution of the 32sii (just not as aesthetically pleasing).

in response to message #15 by Anders Peterson

```
Hi Anders,
Luckily I own both the 35S and 42S :-), so I may add some comments for comparison.

The 35S:
* no matrix capabilities but a built in solver for 2x2 and 3x3 linear equations and
a unique vector data type.
* Complex number support is only partially implemented (fully in the 42S) but still
quite usable.
* Linear regression and interpolation is available in the 35S. The automatic
selection of the best model among various nonlinear regression modes can be
programmed (built in in the 42S).
* a useful and timesaving equation mode; No need to write a program to use the
solver or numeric integration but only single letter variables! This makes things
quite confusing when you have lots of equations stored.
* a built in constants library and mode to calculate with fractions
```

```
* a superb carrying case
* some quirqs: bugs in trig functions for large arguments,shifted sto key, hex mode,
polar->rect, ...

The 42S
* state of the art pocket sized RPN calculator
* top notch build quality
* full matrix and complex number support
* clean keyboard layout, many functions hidden in menus
* multiletter alphanumeric variable names -> meaningfull names
* loads of programs available (HP41 compatible)

At the end, both are useful tools. The 42S is still at the top of the RPN model
range but you have to pay the price accordingly.

Ps.) For a pack of HP35S statistic programs have a look at Namir Shammas webpage.

You should consider supplementing your 15c use with a 12c. Depending on your needs for arithmetic (+,-,x,/), scientific functions, programming and portability the 12c could possibly be sufficient and extend the life of your 15c.

Good Luck!

John

in response to message #15 by Anders Peterson

Well, Anders, your experience is a perfect capture of what has bothered countless thousands of HP users for over a decade: Nothing exists in their lineup to properly pick up where the 15c left off. Nothing. Only the big graphing calcs, and they are big. They are not in the same league. They are sledgehammers where a pair of tweezers is desired. And that, is the reality.

*Message #28 Posted by **Nigel J Dowrick** on 26 Oct 2009, 4:54 a.m.,*
in response to message #15 by Anders Peterson

Have you considered a non-HP calculator? Given your need for statistical functions and your desire for something small, perhaps you should look at the Casio FX-9860G Slim. It supports matrices; it has a built-in spreadsheet useful for handling experimental data; it will draw graphs if you want it to. The number of built-in statistical functions is quite extraordinary. It's not RPN, but two (at least) RPN calculator programs are available to run on it. One of these (Reckon) has matrix support: you can find information about it on this forum.

I really like this calculator. It isn't drop-dead gorgeous like the HP-15C, but it's well-made, well-designed, and very usable. It is definitely worth thinking about!

in response to message #29 by Martin Pinckney

I agree!!! Burn the Heritic!!!

Sadly, I also agree with the Heritic, the Casio is a great choice. (But I didn't say it first AND I learn by example!!!) 8^)

Another good selection (IF you don't need trig) is the Hp17Bii. You can get the older Hp17Bii for NOT a lot of money and the newest one also looks pretty good.

While it doesn't have formal programming, its solver is capable of implementing Cramer's Rule for matrix solutions. The older one of renown quality has 7K of RAM available which is actually plenty since you have no I/O ability aside from an IR printer. The newer one has 32K of RAM and same I/O as earlier model.

But the main reason I suggest it, is that it is one of the best pocket calculators for Statistics available. It has list based stats with a strong function set in stats. And what it doesn't have can easily be remedied with its built in solver.

As anyone here with a 32K model Hp42s or newer Hp17Bii, THAT extra RAM is really useless, unless you have extreme persaverance. One MEMORY LOST on you LCD display will re-adjust your love of the 32K of ram you have installed. Yes, my Hp42s will never be short on memory and I actually have added ram to a few calculators (I like the pry and peel method as if it is done right, leaves NO idication of work). However, without anyway to save programs, any large amount of programming is LOST and that can be very annoying. That is the reason I switched over to a 48G model.

Re: In Need of Calculator Advice

*Message #31 Posted by **Nigel J Dowrick** on 26 Oct 2009, 10:44 a.m.,*
in response to message #30 by Ron Ross

Thank you for the relatively mild reactions to my heretical suggestion! I had expected to be hung, drawn, and quartered at the very least. Seriously, the FX-9860G is a nice machine for which Casio provides firmware updates and a SDK for writing C/C++ programs. The only modern machine which HP supports in a similar way is the HP-50g, a machine that I admire but find too unwieldy in every sense for regular use.

One further point in the Casio's favour is its USB port allowing programs and data to be easily backed up. It can also be linked to datalogging equipment, although I haven't tried this myself.

This calculator should be on the shortlist of anyone looking for a small but powerful scientific calculator. It is powerful and a lot of fun!

Nigel the Heretic (who does actually own and enjoy a lot of HP calculators too!)

*Message #32 Posted by **Bill Zimmerly** on 26 Oct 2009, 1:42 p.m.,*
in response to message #1 by Anders Peterson

I think the 50G is the very best, offering the most options for all calculating problems. Great display, great keyboard, great software, file manager, SD card backup, inexpensive, new, etc. How could you go wrong with that? I can only think of two ways that the 15C is better - battery life and portability.

Re: In Need of Calculator Advice

*Message #33 Posted by **Anders Peterson** on 7 Nov 2009, 3:24 p.m.,*
in response to message #1 by Anders Peterson

I just wanted to say thanks a bunch to everyone again. I got a lot out of this feedback, and ended up going with an option that I had not even been considering at first, the 33s.

I still find it somewhat lacking in appearance, and find the keyboard labeling somewhat crowded, and the unusual angles make a little more difficult to get used to. However, I really like this calculator, and its appearance does not bother me as much as I had thought it would. It serves my needs very well, and I saved a ton of money by getting it rather than an older model (I picked up a new 33s for $30!). Overall, I am very pleased with it.

IR link for HP 28s

*Message #1 Posted by **Frank Rottgardt** on 24 Oct 2009, 10:24 a.m.*

Found this on Hpcalc.org

HP Read 1.3

"DOS program which reads data sent by infrared pulses from an HP calculator (such as an HP-28S) to a Radio Shack GP1U52X Infrared Receiver"

How well does this program work with a 28s and can it be used to save programs on a PC? Have not yet had a closer look on this Radio Shack IR receiver and if it still is available. What PC-hardware is required to be able to run this type of receiver (drivers, adapters etc.)?

Is there anybody out there having tried this program together with an 28s?

Re: IR link for HP 28s

*Message #2 Posted by **sylvandb** on 24 Oct 2009, 1:06 p.m.,*
in response to message #1 by Frank Rottgardt

I don't recall anything special about the GP1U52X. It is a simple three-terminal (+5v, data, common) IR demodulator. I'm skeptical how well it would work with the 28s (was the 28s IR modulated or simple data burst?), but it sounds like it works sufficiently.

There are many modern equivalent IR demodulators and they probably would work about the same. However all of them are designed to work with consumer IR (remote control) and/or Serial Infrared (SIR) modulated signals, not necessarily the calculator IR.

The "DOS program" was the driver.

Hardware required is a power supply and a data input, both with the required voltage level (the old devices were all 5v, modern stuff is usually lower voltage).

The LIRC project has many plans for connecting IR demodulators to a serial port, using the handshaking outputs for power and data input and software to decode the binary pulses. However LIRC is intended for consumer IR (remote control) signals, not the calculator IR and not SIR.

Re: IR link for HP 28s

*Message #3 Posted by **Frank Rottgardt** on 25 Oct 2009, 9:59 a.m.,*
in response to message #2 by sylvandb

Thanks everybody for the technical input.

However, it seems to be easier to establish the link to the 28s with help of a 48GX I also own and software provided from Christoph G. To get the data later from the 48 to my laptop should not be a problem. However, I am not talking about a ROM image, rather User RPL programs I would like to "save" in digital form.

So I wonder in what format the 28s is sending data to the standard HP printers resp. 48 (plain ASCII code? ?)

I think there also exists a HP printer emulator that can be used together with EMU48? Maybe the raw data transfered from the HP28 to the 48 can be loaded into EMU48 and send to the printer emulator in order to make User-RPL "visible" again? In the end I only want to make a print out of my RPL programs which is much more comfortable that writing them down.

Re: IR link for HP 28s

*Message #4 Posted by **Eric Smith** on 24 Oct 2009, 5:12 p.m.,*
in response to message #1 by Frank Rottgardt

I've used it in the past with the 28 and 48. It worked fine on MS-DOS 6.22. I don't know if it will work properly under any version of Windows.

The GP1U52X had the advantage of being available from Radio Shack (is it still?), but an IR receiver/demodulator with a 32.768 kHz center frequency will work better than the 42 kHz of the Sharp GP1U52X.

The GP1U52X requires that its metal shield be grounded well, or it will not work well. The IR receivers from Vishay don't have this issue. You might try the Vishay TSOP4838, which is available from Mouser. It has a center frequency of 38 kHz, reasonably close to the calculator's 32.768 kHz. The TSOP4833 would be even better, with a 33 kHz center frequency, but Mouser does not stock it.

Re: IR link for HP 28s

*Message #5 Posted by **Eric Smith** on 24 Oct 2009, 5:52 p.m.,*
in response to message #4 by Eric Smith

Newark Electronics has the Vishay TSOP4833 in stock. The Newark web site incorrectly refers to it as an IR emitter, but the Vishay data sheet confirms that it is a receiver.

I've used the Vishay parts for other IR receive applications. I have not yet used one to receive from HP calculators, though I expect it should work quite well.

If you use the Vishay part rather than the Sharp, make sure you check the pinout and wire it correctly. Both parts have three pins, power, ground, and logic output, but they might not be in the same order.

Re: IR link for HP 28s

*Message #6 Posted by **Christoph Giesselink** on 25 Oct 2009, 6:04 p.m.,*
in response to message #5 by Eric Smith

Hello Eric,

from own tests the Vishay TSOP4833 isn't working in connection with the HP Redeye protocol. The earlier, but sold out, TSOP1833 does.

In every article you see that the TSOP4833 is the successor of the TSOP1833, but different TSOP4833 don't work where TSOP1833 work without problems.

Where's the difference in the data sheet?

After several hours I found a difference:

TSOP1833: Suitable burst length >=6 cycles/burst

TSOP4833: Suitable burst length >=10 cycles/burst

The HP-Redeye protocol defines 6-8 cylces (7 at the HP28 and HP42) for one IR burst and that seem too less for the TSOP4833.

Cheers

Christoph

Re: IR link for HP 28s

*Message #7 Posted by **Eric Smith** on 25 Oct 2009, 10:49 p.m.,*
in response to message #6 by Christoph Giesselink

Good detective work! I hadn't noticed the minimum burst spec. It's a shame that the new part won't work. It appears that they phased out all of the old parts that were specified for 5.0V +/- 10% operation, in favor of new parts that work over a wider supply range.

The Vishay web site lists some parts designed for "fast" IR protocols. Perhaps the TSOP4133 might work. The burst and gap specs seem similar to those of the old TSOP1833.

Re: IR link for HP 28s

*Message #8 Posted by **Christoph Giesselink** on 25 Oct 2009, 6:47 p.m.,*
in response to message #1 by Frank Rottgardt

Hello Frank,

using such receivers is quite a problem today. Solutions like HP Read need a native DOS operating system. At end of the 80'ies there where a commercial product called PrintHP sold in Germany. This product used a control line of the serial port for input. But a 486DX2 66 was too fast for this solution. I personally wrote a DOS receiver program for the PrintHP hardware in the early 90'ies (latest change in 1993) which worked also on faster PC's.

My latest try with my own written receiver was some years ago was on a P3/850MHz on MSDOS 6.2. It worked, but was very critical to get a proper result. With this program I captured all my UserRPL programs on the HP28S in 1993. After removing the checksum bits, the HP28S output is ASCII in Roman8 character set. About 10 year later I used the captured data to transfer them to an emulated HP28S. :)

My personal solution today for capturing data from the Redeye port is a self made hardware with a TSOP1833 receiver, a 8052 compatible MC decoding the data and sending them over RS232C to the PC.

Drop an email if you want to have a sample of a HP28S printer output.

Cheers

Christoph

MLDL2000, Clonix/NoVRAM/NoV32, PILBox ... Users/Owners? New stuff?

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 23 Oct 2009, 11:54 p.m.*

Hi, all;

I have two MLDL2000 (building the second one these days), one NoVRAM and one NoV32. I think these are some of the (if not THE) best devices available to the HP41, mostly because we can emulate almost every module available to it. Some 'weird breed', like the X-Functions, Time Module and any other with something more than ROM data, have not yet been cloned. But it seems to be a matter of time and dedicated people. So far, HEPAX with additional RAM are two major features these two marvelous hardware can emulate. Now we have the PILBox which bridges the HPIL to the rest of the USB world.

These 'guys' share the use of new technology to emulate ancient (30 Y.O.!) technology, and if we stop to think of what HP was doing at that time, we just reason about the fact that many of us still use this ancient technology with a bit of pleasant surprise when we find out that these old dogs still can learn new tricks. And I mean, for example, Ángel Martin having fun and amusing us all with a double ROM dedicated to complex arithmetic and stack manipulation. I stand amused!

Well, the best places to test Ángel are these new devices or the original ones who served as models (lucky you who has any...). So, which of us here are doing something more than storing ROM images in their MLDL2000 or Clonix/NovRAM/NoV32, etc? I have an idea but I must acquire additional background to start thinking of a feasible design.

And what about the existing ROM images? TOS has many, many of us know that some rare images exist somewhere, but are there anything new apart Ángel´s 'Complex with Stack ROM' (Sandmath 5, right?) I found two or three recent, new ROM´s at TOS, and also some listings to initialize HEPAX RAM, but I am not aware of any other sources nor news. Any new info about these, too?

I do not intend to start a deep thread, but I would actually like to be updated in relation to these subjects.

Thanks.

Cheers.

Luiz (Brazil)

Edited: 23 Oct 2009, 11:59 p.m.

Re: MLDL2000, Clonix/NoVRAM/NoV32, PILBox ... Users/Owners? New stuff?

*Message #2 Posted by **Ángel Martin** on 24 Oct 2009, 2:13 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi Luiz,

As you well say the new devices are instrumental (and the only real way) to put the new software to work on real 41's. I have sound copies of both the 41Z and the SandMath modules running on my MLDL2k and

NoV32, as well on the V41 PC emulator. I don't have an iPhone but I must admit having been tempted to get one just to run them on it as well :)

There are other new modules, with fantastic features and intriguing possibilities. Peter Platzer's Multi Precision Library is a good example, and Doug Wilder's DISASM and BLDROM roms are a must-have on every serious 41 user. And there are many others I'm not using or just forget about right now... even a TCPIC rom! (How about " Control your fridge over the internet with your 41" ?? :)

In fact this is perhaps the success of the 41 platform, being an open environment where people can extend and expand things as they need or just feel like. By releasing the VASM to the open public HP allowed this sustained loyalty to the system, and was the trigger to establish the 41 as something worthwhile using 30 years later... a remarkable move, bold and not exempt of risk those days.

Unfortunately that was also the end to the hope for "revival editions" of the 41. I've been reflecting on this lately, and have come to the conclusion that we'll never see a 45S machine similar to the 35S building on the 35. Besides, what's to be revived? Certainly not the HP-IL bus, which remains as one of the finest examples of clever and ingenious engineering from HP. Not the SW either, as the programming examples amply demonstrate. But the speed of a new CPU of course that'll be a superb gift, not to mention a more capable display... Beyond that, I'm not sure.

And this is letting aside all the other real-world considerations about what companies are like these days, compared to how things (the world, really) was 30 years ago. I don't mean to sound nostalgic (hey, I'm the one programming MCODE versions of NPR and NCR on the 41, remember?) but let's face it: HP is not a philantropic organization, and arguably they shouldn't be!

But (and this is the saddest part of all) even if they were, I very much doubt they could do it nowadays. I know this will sound foolish but I'm convinced they've lost the capability to reproduce something like the 41 system in all its splendor. I don't even believe there are archived copies of the source documents anywhere to be found anymore... let alone people left who could do anything with them. Of course you could run emulations over simulators over replicators over... you get my point, but would that be consider a feat? Let's face it: a quantum leap occurred from the 67 to the 41, but that's just impossible to replicate.

Enough said, of course just my own opinion and probably not valid to anyone else. Sorry it's kinda long - hope it strikes some good discussion as your message has already.

Best wishes, 'AM

in response to message #4 by Vieira, Luiz C. (Brazil)

Hello Luiz,

The home page for the project is at http://www.systemyde.com/hp41

You'll find the manual there... the last few pages of which have some more details about what's in the photo.

I'll start populating and debugging the board this week. I'm hoping the bring-up of the board goes smoothly, as I've just realized that it's going to be a pain to reprogram the flash memory if there's anything wrong with the cpu. We'll see.

I've had a magazine article about the project accepted, so I'll post a notice when that appears in print.

Thanks, Monte

How you know you're getting older...

*Message #1 Posted by **Michael Meyer** on 23 Oct 2009, 9:51 p.m.*

So, I was somehow the only bidder for a TI-59 with printer, multiple modules, lots of books, etc. ($5)

I haven't repaired a TI-59 card reader for awhile, so I did an internet search for advice.

I found an old posting on the HP Museum site describing how to do it. It wasn't until I read the posting that I realized that I had written it...almost 7 years ago.

You know you're getting older when you end up finding your own advice on the internet!

Re: How you know you're getting older...

Totally off-topic but still calculator related

*Message #1 Posted by **hecube** on 23 Oct 2009, 4:24 p.m.*

I just received a Sharp EL-5100.

What an incredible machine. Wow. It looks like a jewel. It looks and feels way better than anything on the market right now.

Re: Totally off-topic but still calculator related

*Message #2 Posted by **Eric Smith** on 23 Oct 2009, 6:33 p.m.,*
in response to message #1 by hecube

I bought a Sharp EL-5100 when they first came out. It's a nice calculator, but if I needed an algebraic calculator today, I'd much rather have something like the Casio fx-115ES (or fx-991ES).

Re: Totally off-topic but still calculator related

*Message #3 Posted by **Mark Edmonds** on 23 Oct 2009, 6:38 p.m.,*
in response to message #1 by hecube

Yes, it is an amazingly svelte and thin machine. It makes the Voyagers look like elephants! Did you get the 5100 or 5100S? The 5100 have the old style LCD which bleeds badly so most of those type are probably doomed to die with a black LCD. Sad fate for such a lovely calc.

Mark

David Shenk´s 'Soldering Upgrades in my 42s': any success?

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 23 Oct 2009, 12:46 p.m.*

Hi, David;

just to ask if you succeeded soldering the 32KRAM IC.

Best regards.

Luiz (Brazil)

Edited: 23 Oct 2009, 12:54 p.m.

Success!

*Message #2 Posted by **DavidShenk** on 24 Oct 2009, 12:21 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Luiz,

Yes! I just finished tonight and it works! Well, it didn't work initially. I had trouble getting the 42S to turn back on, then finally it said "memory reset" but then froze up. I took the batteries back out and found a few places that needed some touch up. I also went back over the jumper that is removed to make sure it wasn't making any contact. That seemed to do the trick and it is now working properly and reporting it's newly found memory.

I had ordered some new soldering tips as well as a fine solder wire, 0.020 inch. I ended up doing it your way and used the fine wire and the tip I was having trouble with. That method worked great for me. I also have a magnifying hood that is a must.

Thank you for all of the help and hand-holding. Thanks also to the others that had ideas. I am looking forward to doing some testing with the other soldering methods.

Dave

Re: Success! And good luck!

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 24 Oct 2009, 1:32 a.m.,*
in response to message #2 by DavidShenk

Hi, David;

I guess I speak in the name of all others when I say that the best 'reward' (if I can say so) is the success of all our friends and contributors, here. I feel sincerely happy for you as I felt the many times I succeeded bringing calculators back to life or after an upgrade. For these days I´m building my second MLDL2000, and it´s been actually fun. If you have not seen any of these yet, please, have a look at the official site and be my guest here (my MLDL2000 assembly) I added three new pics showing the internal connector with

some more details.

As you have any news or needs, please, let us know.

Cheers!

Luiz (Brazil)

Edited: 24 Oct 2009, 1:33 a.m.

Re: Success! And good luck!

*Message #4 Posted by **DavidShenk** on 25 Oct 2009, 12:00 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Luiz,

I appreciate the friendly atmosphere here. It is obvious that everyone is dedicated to their machines and getting the most out of them.

Thank you for the link to the MLDL2000. I hadn't seen any of that before. The next 2 calculators I really want to get are a 41CX and a 67. I have done some machine language programming in the past, so this might be a fun extension of my 41. I finished a program for the 42S a while back, but have been lazy and have not submitted it here yet.

Dave

Jumper and HP42S "Memory Clear" versus "Machine Reset"

*Message #5 Posted by **geoff quickfall** on 24 Oct 2009, 2:44 p.m.,*
in response to message #2 by DavidShenk

Yes, I just did my three and each one had a power up problem:

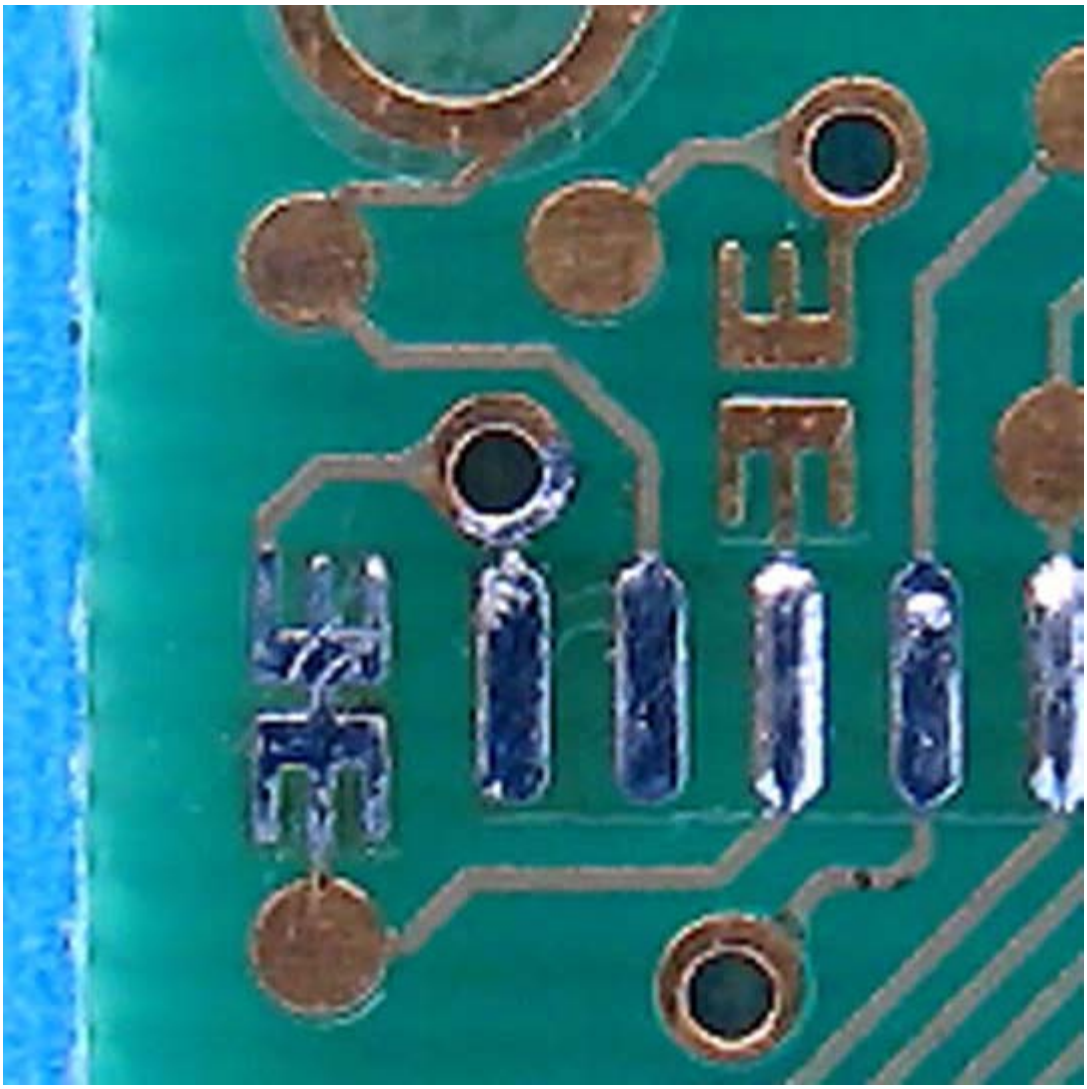
```
one machine said "memory clear" and froze.
Turned out to be a cold solder joint on the
just installed 32K chip.

the other two needed "time outs".
Both had the batteries removed and then the
battery contacts shorted.  This resulted in
"memory clear" followed by "machine reset".
```

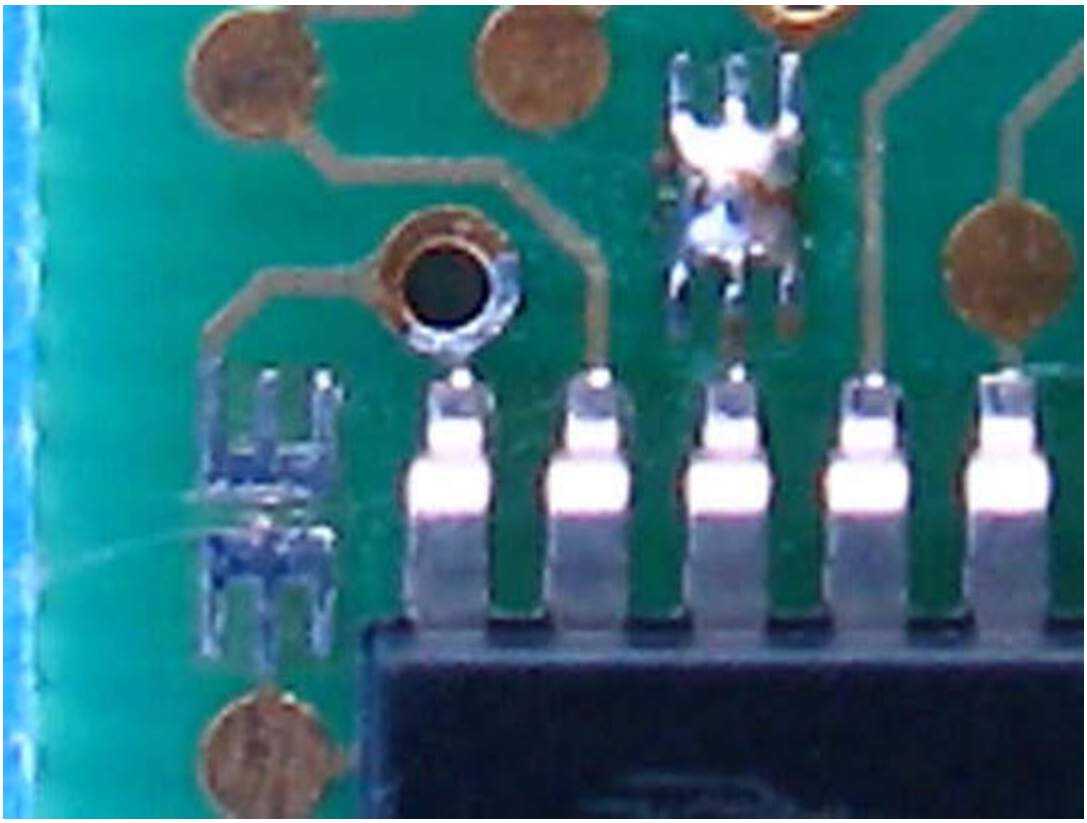
All three pass the diagnostics.

An interesting note about the jumper you remove. It actually did not need the solder to complete the circuit as there is a bridge trace joining the two sides. Contrast this with the jumper that you have to make. It has no bridge. So it is not enough to remove the solder but you have to physically remove the bridge trace.

The jumper with solder removed and the bridge trace apparent while the jumper to be soldered has no bridge trace:



New jumper soldered and the bridge trace physically removed from the old jumper:



Edited: 24 Oct 2009, 2:46 p.m.

Re: Jumper and HP42S "Memory Clear" versus "Machine Reset"

*Message #6 Posted by **DavidShenk** on 24 Oct 2009, 11:52 p.m.,*
in response to message #5 by geoff quickfall

Geoff,

I wasn't expecting the power up problem, but it looks like I'm not the only one. After I went back over everything to make sure it was soldered correctly, I did short the battery terminals as well. So I'm not exactly sure what corrected the problem, but at this point I don't care.

It's interesting that the jumper is permanently connected on the board like that. I wonder why they bother to blob solder on it during production since it's already connected.

I may do the crystal mod as well, but I didn't order any of those when I got the 32K chip. Apparently you can have both crystals in and switch between them. That seems like a very cool idea. I don't yet have a printer, but I would like to get one and would like the calculator to still work with it.

OT: Tutorials for R statistical language

*Message #1 Posted by **Namir** on 23 Oct 2009, 11:46 a.m.*

Hi All,

During the HHC2009 the subject of the open source statistical language R came up. I was surprised that a few attendees were as gong ho about R as I was.

I have posted several tutorials for R on my website (namirshammas[[[dot]]]com). Click on the bottom most link in the main page and you will see the R Master Page with the list of tutorials. All but one link will let you download pdf files.

One of the tutorial deals with automatic best linearized regression model selection for two variables and multiple variables. In the tutorial I mention that the concept of best-model search is inspired by vintage programmable HP calculators. If you tinker in R, I recommend that you check that one and of course the other tutorials too.

Namir

Edited: 23 Oct 2009, 4:11 p.m.

New Approximations for Inverse PDF

*Message #4 Posted by **Namir** on 24 Oct 2009, 12:37 a.m.,*
in response to message #1 by Namir

I also posted a short PDF file on my web site that has new approximations I was able to obtain for the inverse Normal, Student-t, Chi-square, and F probability distributions. You can find the pdf file when you click here to get to the New Algorithms page and then click on the related link.

The approximations for the inverse probability distributions are shorter than the legacy ones you find in the Handbook of Mathematical Functions and can easily be programmed on your calculators.

Namir

Re: New Approximations for Inverse PDF

*Message #5 Posted by **Paul Dale** on 24 Oct 2009, 1:04 a.m.,*
in response to message #4 by Namir

Thanks for this. Very interesting. No error estimate though :-(I only recently did the 20b scientific probability distributions and the inverses were a major pain. I ended up using the solver code and the cumulative distributions for all the hard cases. Since these functions are relatively well behaved, convergence seems to be fairly quick but I might look into your estimates as better starters...

- Pauli

Re: New Approximations for Inverse PDF

*Message #6 Posted by **Namir** on 24 Oct 2009, 8:55 a.m.,*
in response to message #5 by Paul Dale

I remember I was demanding on these equations. I would be very curious as to what your test comes up with.

Cheers,

Namir

Re: New Approximations for Inverse PDF

*Message #7 Posted by **Tim Wessman** on 24 Oct 2009, 11:20 p.m.,*
in response to message #6 by Namir

You don't happen to have any good, simple approximations for binomial and Poisson cumulative do you? I am aware of the incomplete beta method, which is actually the method used to calculate most of the stat distros and inverses in the 20b, but nothing that is really simple and quick for general usage. I've seen several that do a good job over specific ranges, but I haven't seen one the works decently over the whole range.

TW

Re: New Approximations for Inverse PDF

*Message #8 Posted by **Paul Dale** on 24 Oct 2009, 11:54 p.m.,*
in response to message #7 by Tim Wessman

For Binomial and Poisson you could also sum the individual probabilities directly.

However, I'd go with the regularised incomplete beta and gamma functions for most of the common probability distributions. There are relatively short and quickly converging iterative methods for both.

The inverses aren't so nice :-(

- Pauli

Re: New Approximations for Inverse PDF

*Message #9 Posted by **Tim Wessman** on 29 Oct 2009, 1:37 p.m.,*
in response to message #8 by Paul Dale

Yeah, summing directly works great until you start getting large Ns. Of course you can just use an approximated normal at that point. . .

How about a poll to liven things up (some more!)

*Message #1 Posted by **Martin Pinckney** on 23 Oct 2009, 9:52 a.m.*

The recent thread innocently started by Jonathan Eisch (Hecube, move over!) about Koss headphones and manufacturer responsiveness here has been so interesting, I propose a poll to see which general viewpoint about re-introduced 15c or improved 42s is shared by the most members on here, DaveJ's or Mike Morrow's.

Keep it simple. Just state "DaveJ", "Mike Morrow" or "none of the above" in your post.

I don't mean which calculator would be your preference, I mean who is more correct about the issues raised.

Not trying to inflame, I just think it would be fun. If either of the two of you object, let me know.

Anyone game?

Edited to add third choice.

Edited: 23 Oct 2009, 12:20 p.m. after one or more responses were posted

Re: How about a poll to liven things up (some more!)

*Message #2 Posted by **Michael Plant** on 23 Oct 2009, 10:35 a.m.,*
in response to message #1 by Martin Pinckney

Dave J.

Sadly, I'm with Dave J. on this one (I WANT to be with Michael Morrow, though!).

A point I haven't yet seen raised is that programmable calcs are virtually extinct in the NA market - how else to explain the Casio fx-5800p and Sharp EL5250 not being available here? I think this is due to TI's amazing marketing of their graphing calcs... Of course, this overlooks the fact that OUTSIDE NA non-graphing scientific programmables are still popular.

Re: How about a poll to liven things up (some more!)

*Message #3 Posted by **Egan Ford** on 23 Oct 2009, 12:05 p.m.,*
in response to message #1 by Martin Pinckney

> Quote:
>
> Keep it simple. Just state "DaveJ" or "Mike Morrow" in your post.

It's not that simple. You should add a 3rd option. None of the above. And there is my vote.

In January 2006 I was still using my 15C and 48GX. I used them as programmables for work, and not just simple calculators. While in a customer meeting (where no electronics could enter and then leave the building) I was forced to do calculations with pen and paper. I made a mental note to learn the abacus and find a $10

disposable RPN. I assumed that they existed--I was wrong.

I'd never visited HP's or any other calculator site until January 2006. I was shocked. RPN was clearly on the way out. And the 49g+ and 33s were abysmal and not $10.

Martin, if you had asked this 3 years ago I would have answered different, but after witnessing the evolution and convergence of many consumer electronics I feel different. The 41CX, 15C, and 48GX were all home runs in their own right. Each offered something critical and relevant and bleeding edge at the time. I'd like to see HP spend their resources on that next home run.

Re: How about a poll to liven things up (some more!)

*Message #4 Posted by **George Bailey (Bedford Falls)** on 24 Oct 2009, 1:38 a.m.,*
in response to message #3 by Egan Ford

Wow, would you care to elaborate on what kind of customer that was - without all readers being obligated to never leave this forum and the Internet afterwards? ;-) I don't want you to reveal anything secret here, just a hint on the reason behind this policy.

Edited: 24 Oct 2009, 1:40 a.m.

Re: How about a poll to liven things up (some more!)

*Message #5 Posted by **Bart (UK)** on 24 Oct 2009, 4:04 a.m.,*
in response to message #4 by George Bailey (Bedford Falls)

You have never experienced this? Lucky you.

My response to your question might be: ask no questions, hear no lies.

And don't assume it's government/military, many companies are edgy about their IP. Any electronic device is seen as possibly recording/collecting data. Just think what you could store on an 8GB micro-sd...

One of the most secure places I've been was the national control centre of an electricity transmission/distribution network.

Re: How about a poll to liven things up (some more!)

> Quote:
>
> Yep, that's the policy.

Meaning you can't take your watches in? Cellphones must obviously be banned. And guys with pacemakers or even hearing aids?

Re: Security and electronic devices

*Message #8 Posted by **Bart (UK)** on 25 Oct 2009, 9:35 a.m.,*
in response to message #7 by George Bailey (Bedford Falls)

I don't have a hearing aid or pacemaker and haven't worn a watch for 15 years, because I use my cellphone clock anyway.

I've had to hand in my car keys with remote though.

Re: How about a poll to liven things up (some more!)

*Message #9 Posted by **Egan Ford** on 25 Oct 2009, 11:49 p.m.,*
in response to message #7 by George Bailey (Bedford Falls)

> Quote:
>
> Meaning you can't take your watches in? Cellphones must obviously be banned. And guys with pacemakers or even hearing aids?

Watches, pacemakers, etc... are fine. Consumer electronics that have the ability to record are generally not allowed (computers, phones, camera, PDAs, etc...). A scientific calculator should not be an issue, but when judge, jury, and executioner is a security guard, why take the chance?

Re: How about a poll to liven things up (some more!)

*Message #10 Posted by **bill platt** on 25 Oct 2009, 10:50 a.m.,*
in response to message #3 by Egan Ford

Sounds like you need to find a new customer. Then again, if the pay is good...

Re: How about a poll to liven things up (some more!)

*Message #11 Posted by **Ken Shaw** on 23 Oct 2009, 12:12 p.m.,*
in response to message #1 by Martin Pinckney

Neither one, although if forced to choose, I would go with Dave J.

The problem with this question is that the 42S is a programmer's calculator. Too many important functions are buried in menus for it to be a successful daily-use calc. That may be why the 32SII was more successful.

OTOH, the 15C is reasonably okay for daily use since everything is there on the keyboard.

So, IMHO, those who prefer the 42S are systematically different in the way they use calculators, and the ongoing contest we see here between champions of one over the other is a question that can never be resolved. As somebody said in the earlier thread, it's comparing chalk and cheese.

Edited: 23 Oct 2009, 12:13 p.m.

Re: How about a poll to liven things up (some more!)

*Message #12 Posted by **Richard Reed** on 23 Oct 2009, 4:18 p.m.,*
in response to message #11 by Ken Shaw

I'm for Mike Morrow, and I think he was arguing for a next home run:

- shirt-pocket size,
- maximum utility (includes ergonomics) without programming,
- programming as a secondary option, but seriously implemented,
- could have a better display and some graphical (don't have to be big) educational features (on-board help?), although I think 42s is great for anyone with trigonometry,
- rudimentary I/O - although programming is secondary, the large basic feature set will always need customisation, and making this aspect more robust is just part of current practice.

Richard

Re: How about a poll to liven things up (some more!)

*Message #13 Posted by **Steve Perkins** on 23 Oct 2009, 4:19 p.m.,*
in response to message #1 by Martin Pinckney

None of the above.

Or rather both of the above.

DaveJ is probably right that HP is closer (easier path) to bringing a HP-15C+ to market, and so they should.

Hopefully they will find out this is economically viable and THEN proceed to bring out an HP-42S+ as well! It should also sell and be profitable for HP if done correctly. Maybe that's just wishfull thinking, but there you have it.

Re: How about a poll to liven things up (some more!)

*Message #14 Posted by **Thomas Radtke** on 24 Oct 2009, 5:15 a.m.,*
in response to message #13 by Steve Perkins

> Quote:

> DaveJ is probably right that HP is closer (easier path) to bringing a HP-15C+ to market, and so they should.

An emulated 15C ist more like a 15C-. After so many years of professional use without encountering a single bug, reliablility is a key feature of this calculator. A new 15C has to start from zero in this respect.

A completely new scientific programmable is even more of a problem. The 35s has shown that HP doesn't have the menpower to write such firmware anymore. They are not even able to debug it! Yep, here it is, the successor to one of the most popular RPN machines, the 32S*, and it carries severe bugs since 2007. Unbelieveable.

Re: How about a poll to liven things up (some more!)

*Message #15 Posted by **Eric Smith** on 24 Oct 2009, 5:34 p.m.,*
in response to message #14 by Thomas Radtke

This is why when HP needed to reengineer the 12C (not the Platinum), to use a new processor, I strongly encouraged them to do it by simulation. Any other method of doing it with their limited resources would have introduced a lot of new bugs, some of which would have been critical. As it turns out, the new 12C did introduce a few bugs, but none of them are critical or affect the numerical results of calculations.

If they introduce a new 15C, it will almost certainly be using the same simulation approach as they've used for the 12C.

Some people here in the forums have said that they won't buy a 15C unless it has a lot of new features compared to the original. HP could do that if they really wanted to, but they would have to engineer this hypothetical enhanced 15C from scratch.

Re: How about a poll to liven things up (some more!)

*Message #16 Posted by **Crawl** on 23 Oct 2009, 11:25 p.m.,*
in response to message #1 by Martin Pinckney

It seemed like they were arguing over matters of fact -- Which would sell more? Which would be easier to rerelease?

But as for my personal opinion, I think I'd rather see the 15C rereleased.

The 42S would fill a narrow, almost pointless niche. It would be more powerful than the 35s. But it would not be the most powerful HP calculator. That would still be the 50g. Over the 42S, the 50g has: A CAS, virtually unlimited storage space for variables and programs (with an SD card), easy connection to PC with USB... Heck, you can even power it with an AC adapter.

If I ever would be tempted to write an ambitious program for the 42S, I'd have to think, "Well, gee, will I just lose this someday, maybe when batteries die?"

On the other hand, for a basic number-cruncher, when the HP50g would be too much or not as convenient, it seems like the 15C would be a better choice. Like other people have said, to get at the 42s's functions, you have to go through menus, while the 15C is all on the keyboard. That's something I think is important for a number cruncher. (I kind of like "cluttered" keyboards -- even aesthetically. I like being able to just look at a calculator and tell how powerful it is.)

Re: How about a poll to liven things up (some more!)

*Message #17 Posted by **Reth** on 23 Oct 2009, 9:35 p.m.,*
in response to message #1 by Martin Pinckney

I see no contradicting views but guess work which one will make it to the market earlier if at all. I'd rather see both calculators on the market again soon. I'd buy both.

Re: How about a poll to liven things up (some more!)

> I don't mean which calculator would be your preference, I mean who is more correct about the issues raised.

Dave J! :->

We are mostly talking different things though. Mike is a 42S fanboy so wants to see the 42S reintroduced because it's the most powerful RPN calc ever made. Fair enough.

I'm arguing that the 42S is impractical to bring to market due to the development involved, and therefore the 15C is the only logical choice for HP with their limited resources, like it or not.

I guess the only point on which we are really arguing is over which would be most successful in the non-fanboy consumer market. On this point my argument is the lower price point, novel form factor, and more retro appeal of the 15C would trump the 42S in terms of number of units sold.

Actual margin and actual profit is harder to know, so I'm staying away from that one.

I deliberately did not mention functionality, because I think both have their silly old-style quirks that don't make them a good choice compared to modern machines. Good luck to HP if they try to sell a super-powerful programmable RPN machine with no way to save/store your programs, or a quirky limited 10 digit display scientific landscape calc.

Dave.

Re: How about a poll to liven things up (some more!)

*Message #19 Posted by **Bill Zimmerly** on 26 Oct 2009, 1:50 p.m.,*
in response to message #1 by Martin Pinckney

Why either one? I would like to see something with the form factor of a 15C, the programability of the 41C, and a megabyte or so of storage.

*Message #20 Posted by **DaveJ** on 26 Oct 2009, 8:08 p.m.,*
in response to message #19 by Bill Zimmerly

> Quote:
>
> Why either one?

Because, realistically, with HP's dwindling calculator resources, ROM simulated machines are quite a viable option in terms of time-to-market and development costs. Not to mention that HP have done market research in this areas and have started to release machines.

The 10C series platform exists in production with the new 12C, and the 42S platform exists in LCD and case design in 17BII+, all they need is a new hardware platform.

It's possible they may release both in due course.

Dave.

I think "electronic abacus" is correct.

I don't see how it's even "1 times faster" than a regular calculator, let alone 8x. (An abacus can certainly be faster than pencil & paper, but faster than the typical modern calculator?)

But I'd like to play with one.

Edited: 22 Oct 2009, 6:53 p.m.

in response to message #15 by Don Shepherd

Hi, Don;

> Quote:
>
> How many times would you need a key devoted to 9 zeroes, though?

Good question. In fact, I´d rather stay with the self-explained, intuitive [EEX]. You see, it seems to me people are loosing track of how to deal with numbers. When I see a calculator with a key to enter a number o zeroes and I associate it to the exponent of ten, I wonder 'Why didn´t they simply add a enter exponent key, instead?" I'm not afraid of changes neither to the new, I just want them to be better and with the aid of enhancing. If one does not understand numbers, [0x2] and [0x4] may easily be associated with 'add 2 zeroes' and 'add four zeroes'. I still prefer to understand 'times ten raised to 2' and 'times ten raised to four'. I must treasure the knowledge I had access to, and the ones who devoted their lives to conclude and share that knowledge with the rest of us. I understand [0x2] because I see it as 10^2, but I still see [EEX] with better, scientific eyes.

What about the HP22? It has no [EEX] neither a [10^{10}] key, but once you key in as many digits in the integer part as they fit in the display, the next number keys you press simply add 1 to exponent of ten that appears in the right of the display. That is ingenious!

Cheers.

Luiz (Brazil)

Edited: 22 Oct 2009, 10:21 p.m.

Why these keys are looking this way

IMHO the opposite is true: these people use number systems older than the scientific number scheme. As you can recognize easily, there are dedicated characters (and thus words) for 10, 100, 1000, and 10000. Then, it goes on with 10 x 10000, 100 x 10000, 1000 x 10000. 10000 x 10000 has a dedicated character (and word) again, etc. BTW, apparently correction works from left to right, starting with the most significant digit. Fascinating!

You find another such number system in India, with its Lakh (= E5) and Crore (= E7). It's a little less consistent, since it works the conventional way as we know it up to 1000, then transits to an older system based on the number 100.

And for Don's question: I think the E9-key is used frequently in setting up the national budget and losses on Wall Street, for example :(

Summing up, to me it seems this is a financial calculator. Personally, I prefer the scientific number system, but there are more businesspeople than scientists on this planet, like it or not.

New book on HP published by Chuck House

*Message #1 Posted by **Steve Leibson** on 22 Oct 2009, 10:20 a.m.*

Chuck House worked for HP for many years and eventually found his way to Intel management. Now he's a professor at Standord and he's a friend of mine. He's spent years writing a book about how and why HP became successful and that book has just been publixhed by the Stanford University Press. Here are summary reviews from Amazon.com:

"At last! The 'HP Way', that most famous of all corporate philosophies, has taken on an almost mythical status. But how did it really work? How did it make Hewlett-Packard the fastest growing, most admired, large company of the last half-century? Now, two important figures in HP's history, Chuck House and Raymond Price, have finally given us the whole story. The HP Phenomenon is the book we've been waiting for: the definitive treatise on how Bill and Dave ran their legendary company, day to day and year to year. It should be a core text for generations of young entrepreneurs and managers, a roadmap to building a great enterprise." —Michael S. Malone, author of Bill & Dave: How Hewlett and Packard Built the World's Greatest Company

"This is important history, compellingly told. House gives us a rare look into how Silicon Valley innovates, making this book a must-read for historian and entrepreneur alike." —Paul Saffo, Technology Forecaster

"This book is exceptional in its content, research, and strategic depth. The authors have lived the HP Culture, and the insights they bring to the super complex matter of product and business strategies in the late 1900s is amazing. The period of John Young had some of the most elusive decisions on computer operating systems one could ever imagine. They all become clear in this book." —John Minck, HP retired 1995 and author of Inside HP: A Narrative History of Hewlett-Packard from 1939-1990

The best price for the book is from Amason: http://www.amazon.com/HP-Phenomenon-Innovation-Business-Transformation/dp/0804752869/ref=sr_1_1?ie=UTF8&s=books&qid=1256220785&sr=8-1

41: All that HYPe about...

*Message #1 Posted by **Ángel Martin** on 22 Oct 2009, 8:22 a.m.*

Much has been written and discussed about keyboard layout and convenience of the different design choices for keystroke selection. In particular referred to the seldom-used hyperbolic functions (some more seldom than others, arguably).

Here's a simple, elegant and well-though out solution to the problem:

1. have a HYP "prefix" key that supports direct and inverse functions - like in the SANDMATH module
2. assign it to SHIFT-SHIFT - so it doesn't take any extra key and still maintains the global keyboard logic.

Examples:

SHIFT, SHIFT, SIN = SINH
SHIFT, SHIFT, SHIFT, SIN = ASINH

Did I hear too many shifts? You can't have it all - it's rather fast once you get the hung of it.

Tag. You're on :)

Re: 41: All that HYPe about...

*Message #2 Posted by **Mark Storkamp** on 22 Oct 2009, 10:00 a.m.,*
in response to message #1 by Ángel Martin

There would have to be very clear annunciators in the display to show what state you're in, particularly with the recent quality of keyboards.

Personally, I think it is too counter intuitive to be widely accepted.

How about having a second shift key that can be used independently or in combination with the primary shift key. e.g.:

```
Primary key [sin] is sin
[Shift 1] & [sin} is asin
[Shift 2] & [sin] is sinh
[Shift 1] & [Shift 2] & [sin] is asinh

or

Primary key [ln] is ln
[Shift 1] & [ln} is e^x
[Shift 2] & [ln] is log
[Shift 1] & [Shift 2] & [ln] is 10^x
```

Somewhat less intuitive would be grouping 1/x, sqrt, y^x and x^2 on a single key as well

HP had f^-1 on the 65 once. But it was dropped in later models. Maybe too challenging? Or a waste of key space? General shift keys are more versatile, since they may be used for inversions, but they don't have to be used for this. See e.g. the 34C.

Re: 41: All that HYPe about...

*Message #5 Posted by **Mark Storkamp** on 22 Oct 2009, 3:06 p.m.,*
in response to message #4 by Walter B

My first HP was a 34C and I was amazed at the number of functions it had. My second (and still favorite) was my 41C(x) (and one of the main reasons for getting an iPod). If you would take away the 'h' key on the 34C and use the combination of both 'f' and 'g' to enable the black characters on the bottom edge of the key (the 'h' functions), you would free up one more key, giving you 4 more functions available right on the keyboard.

Of course, pressing [user] and having an overlay magically appear (i41CX+) does nearly the same thing.

Re: 41: All that HYPe about...

*Message #6 Posted by **Walter B** on 22 Oct 2009, 3:10 p.m.,*
in response to message #5 by Mark Storkamp

Of course, some magic helps a lot in keyboard design. Pull out your wands! <;-)

in response to message #5 by Mark Storkamp

I found the HP34C very very powerful but never quite got to grips with the key layout - you can have too much of a good thing.

Interestingly you can accomodate all the HP34's functions with just two function keys using the same keyboard layout as the new HP20B

Re: 41: All that HYPe about...

Interesting, my first HP was a 34c in 1979/1980 and that died after a couple of years -- it was the solder less model and I attempted to *fix* it without really having a clue. Anyway, I just recently got a replacement for this and I find that I still have some finger memory for most of the functions. Amazing after all these years and different models in the meantime.

- Pauli

Indeed less intuitive but somehow related, that's true. The hyperbolics have the advantage of being "almost" the same as the circular trigonometry, and thus much simpler to remember.

I remember getting all over the THREE shift keys on the HP-67.. until the 41 came out and I marveled at the elegance of its design - to me still unparalelled (sorry, I'm definitely a 41 inconditional).

The 35S has a HYP prefix key, akin to the shift2 in your example.

Best, AM.

Not too many, but SHIFT, then SHIFT again simply turns it off;-)
Changing that standard behaviour doesn't seem to be the way to go IMHO.

> Quote:
>
> You can't have it all - it's rather fast once you get the hung of it.

Why not? There are other ways to get a HYP keyboard.
The easiest way is to use a HYP user keyboard.

However another approach could be SHIFThold.
If you manage to catch multiple key presses,
you could assign the HYP fcns to the SHIFThold level;-)

HTH

Raymond

Re: 41: All that HYPe about...

*Message #12 Posted by **Ángel Martin** on 23 Oct 2009, 6:31 a.m.,*
in response to message #11 by Raymond Del Tondo

Hi Raymond, long time no speak - hope you're doing well.

Actually SHIFT SHIFT works like a charm, the second one does not turn the first one off... assigning the function to the "10B" keycode does the trick.

Sure there's multiple ways to implement it and everybody has his preferred one :-) Using a HYP user keyboard is good as well but it conflicts with an existing User keyboard (not enough real state).

The SHIFT-Hold requires some operator skills, afraid it wouldn't pass the test of easiness for some :-O

Best, ÁM

Re: 41: All that HYPe about...

*Message #13 Posted by **Gerry Schultz** on 23 Oct 2009, 2:57 p.m.,*

HP 17BII+ BUG

*Message #1 Posted by **Nacho** on 22 Oct 2009, 3:47 a.m.*

Dears,

If Appointment selected for example APPT1 (entered DATE & TIME).

Then If an ERROR appears when calculating, eg ERROR: /0

Then Appointment is executed and ALARM Sounds.

This doesn't happen with a normal 17BII.

Regards.

Re: HP 17BII+ BUG

*Message #2 Posted by **Don Shepherd** on 22 Oct 2009, 7:34 a.m.,*
in response to message #1 by Nacho

I tried this on both my brown/gold + and the new gray + and did not see any problems. It did beep when I divided by 0, but I think that is normal and has nothing to do with appointments. What do you mean by "the appointment is executed?"

Re: HP 17BII+ BUG

*Message #3 Posted by **nacho** on 22 Oct 2009, 8:12 a.m.,*
in response to message #2 by Don Shepherd

Hello Don,

try that:

Go to Time menu.

Select APPT Menu.

Select for example APT1: then enter a date (must be the same day for example today 22 and an hour)

Then You will see SET:1

OK, go to main menu...no ERROR answer when 1 INPUT 0 / done...

Go to Math menu and Press PI key and then N! to create an error...

It will return N! N<0 or N NONINTEGER

Then press 1 or 2 or one number KEY... it will activate the appointment and alarm will sound...

Hope it is better explained

nacho

The solution to the quartic equation on the HP50g (long)

*Message #1 Posted by **Crawl** on 21 Oct 2009, 10:56 p.m.*

The HP50g has a nice CAS, but it cannot (automatically) symbolically solve cubic and quartic equations, though the solutions to those equations have been known for hundreds of years.

I recently got a 1GB SD card just for my calculator, and my (unrealistic) goal is to eventually fill it with calculator stuff. So, this seemed like a good project.

I learned a bit about the calculator on the way. In my first attempts, the quartic solution defeated the calculator -- it was just too long, it seemed.

But I figured out what the problem was. The calculator can deal with an *expression* that big -- it just has a hard time *evaluating* it. It seemed like the solution was to use stack commands. After all, if you have X on rows 1 and 2, and hit *, it displays X*X -- it does not simplify to X^2. That should make things easier on the CPU.

But I learned that *sometimes* the calculator does evaluate stack commands on symbolic input. I noticed this when I was just working on the simple quadratic equation. I noticed it returned

(-b-sqrt(b^2-4ca))/(2a)

even though I entered it b^2-4ac, with a and c in reverse order. So, every time you take a squareroot, the CAS tries to evaluate it. This was what was slowing the program down.

I tried several approaches. What finally worked was when I realized the calculator does not automatically evaluate after a substitution.

This is the solution to the quadratic equation. It is the shortest and easiest to see how I take squareroots. The other programs call it and assume it has name QUART3 (the 3 is just because I tried different versions before I got the squareroot to work)

%%HP: T(3)A(R)F(.); \<< ROT DUP ROT * 4 SWAP * ROT DUP 2 ^ ROT - '\v/SQUAREROOT' SWAP 'SQUAREROOT' SWAP = SUBST SWAP NEG SWAP - SWAP 2 SWAP * / \>>

I didn't want to just have the solution to the cubic and quartic equation -- I also wanted to show the method. But the programs don't really clearly demonstrate what the method is. So, I put the steps in row matrix form so they can be read. I was originally planning on having notes, but matrices can't have string entries. So, they might work more as a refresher if you once kind of knew how they were solved than a teacher. This is the method for solving cubics.

```
%%HP: T(3)A(R)F(.);
[[ 'A*X^3+B*X^2+C*X+D' ]
[ 'X=Y+T' ]
[ 'Y^3+(3*A*T+B)/A*Y^2+((3*(A*T^2)+2*(B*T)+C)/A*Y+(A*T^3+B*T^2+C*T+D)/A)' ]
[ 'T=-(B/(3*A))' ]
[ 'Y^3+P*Y+Q' ]
[ 'P=(3*A*C-B^2)/(3*A^2)' ]
[ 'Q=(27*A^2*D-9*(A*B*C)+2*B^3)/(27*A^3)' ]
[ 'Y=Z-M/Z' ]
[ '(Z^6-(3*M-P)*Z^4+Q*Z^3+M*(3*M-P)*Z^2-M^3)/Z^3' ]
[ 'M=P/3' ]
[ 'Z^6+Q*Z^3-P^3/27' ]]
```

And this program solves cubics. The quartic program assumes it has the name CUBIC.

%%HP: T(3)A(R)F(.); \<< 27 5 PICK 2 ^ * SWAP * 9 5 PICK * 4 PICK * 3 PICK * - 2 4 PICK 3 ^ * + 27 5 PICK 3 ^ * / 3 5 PICK * 3 PICK * 4 PICK 2 ^ - 3 6 PICK 2 ^ * / DUP UNROT 3 ^ 27 / NEG 1 UNROT QUAD3 3 INV ^ DUP UNROT 3 SWAP * / - 4 ROLLD DROP SWAP 3 SWAP * / - \>>

This is the method for solving quartics.

```
%%HP: T(3)A(R)F(.);
[[ 'A*X^4+B*X^3+C*X^2+D*X+E' ]
[ 'X=Y+T' ]
[
'Y^4+(4*A*T+B)/A*Y^3+(6*A*T^2+3*B*T+C)/A*Y^2+(4*A*T^3+3*B*T^2+2*C*T+D)/A*Y+(A*T^4+B*T^3+C*T^2+D*T+E)/A'
]
[ 'T=-(B/(4*A))' ]
[ 'Y^4+P*Y^2+Q*Y+R' ]
[ 'P=(8*A*C-3*B^2)/(8*A^2)' ]
[ 'Q=(8*A^2*D-4*A*B*C+B^3)/(8*A^3)' ]
[ 'R=(256*A^3*E-64*A^2*B*D+16*A*B^2*C-3*B^4)/(256*A^4)' ]
[ 'Y^4+P*Y^2+Q*Y+R=(Y^2+J*Y+K)*(Y^2+M*Y+N)' ]
[ 'J+M=0' ]
[ 'J=-M' ]
[ 'P=KM^2' ]
[ 'Q=M*(K-N)' ]
[ 'R=K*N' ]
[ 'K^2+N^2+2*K*N=(P+M^2)^2' ]
[ 'K^2+N^2-2*K*N=(Q/M)^2' ]
[ '4*K*N=(4*R=(P+M^2)^2-(Q/M)^2)' ]
[ 'M^6+2*P*M^4+(P^2-4*R)*M^2-Q^2=0' ]
[ 'N=(P+M^2-Q/M)/2' ]]
```

And this program does it

%%HP: T(3)A(R)F(.); \<< 8 6 PICK * 4 PICK * 3 6 PICK 2 ^ * - 8 7 PICK 2 ^ * / 8 7 PICK 2 ^ * 4 PICK * 4 8 PICK * 7 PICK * 6 PICK * - 6 PICK 3 ^ + 8 8 PICK 3 ^ * / 256 8 PICK 3 ^ * 4 PICK * 64 9 PICK 2 ^ * 8 PICK * 6 PICK * - 16 9 PICK * 8 PICK 2 ^ * 7 PICK * + 3 8 PICK 4 ^ * - 256 9 PICK 4 ^ * / 2 4 PICK * 4 PICK 2 ^ 4 4 PICK * - 4 PICK 2 ^ NEG 1 4 ROLLD CUBIC DUP '\v/SQUAREROOT' SWAP 'SQUAREROOT' SWAP = SUBST 5 PICK 3 PICK + 5 PICK 3 PICK / - 2 / 1 UNROT QUAD3 10 ROLLD 7 DROPN SWAP 4 SWAP * / - \>>

In all cases, it assumes the coefficient of the highest x power is entered first on the stack, and so on until the constant term is in level 1 of the stack. The programs work with both numeric or symbolic inputs. If you want a numeric result, however, you should be in approximate mode at the beginning. Otherwise, you might not be able to evaluate the result. The calculator has a quirk: It acts like it can't take cube roots of imaginary numbers.

If you're in numeric mode the whole time, though, it will do it.

I've noticed a few other quirks. Sometimes it doesn't simplify the cube root of zero. There are some cubic equation where you'd divide zero by the cube root of zero -- really, you should take a limit, and it would work. But the CAS evaluates zero divided by an unevaluated cube root of zero AS zero, even if a proper limit would give a different answer. In fact, this is specifically why I choose the sign of the squareroot in the quadratic solution the way I did. Otherwise, it leads to x^3+1=0 having solution ? (in exact mode) or 0.^(1/3) (in approx. mode). (The resolvent quadratic is x^2+x=0, and you want the -1 solution, not the 0 solution). There may be cases for which even the current solution might be numerically unstable, but I haven't checked everything.

Anyway, what happens if you try to solve the general quartic symbolically? You get this

%%HP: T(3)A(R)F(.); '(-\v/(XROOT(3,(-((-(27*((8*A^2*D-4*A*B*C+B^3)/(8*A^3))^2)-9*(2*((8*A*C-3*B^2)/(8*A^2)))*(((8*A*C-3*B^2)/(8*A^2))^2-4*((256*A^3*E-64*A^2*B*D+16*A*B^2*C-3*B^4)/(256*A^4)))+2*(2*((8*A*C-3*B^2)/(8*A^2)))^3)/27)-\v/(((-(27*((8*A^2*D-4*A*B*C+B^3)/(8*A^3))^2)-9*(2*((8*A*C-3*B^2)/(8*A^2)))*(((8*A*C-3*B^2)/(8*A^2))^2-4*((256*A^3*E-64*A^2*B*D+16*A*B^2*C-

It takes a couple of minutes to get that. I haven't timed it, but I believe it takes much less than 15 minutes (and on a real calculator, not an emulator). It seems the expression is too big to view in "pretty print". It displays fine as text, but when I select "graph", it just displays garbled nonsense.

It's still an impressively large expression for the calculator to handle.

Re: The solution to the quartic equation on the HP50g (long)

*Message #2 Posted by **Crawl** on 21 Oct 2009, 11:08 p.m.,*
in response to message #1 by Crawl

I see there is at least one mistake there

The quartic method matrix shows

P=KM^2

when it should be

P=K+N-M^2

It is correct on my calculator; an HTML formatting bug must have messed it up on the post. I'll have to check later if there are other errors.

Goodness, how EVER did you type that in? Who cares about the equation! I just want to know how long it took you to type that.

:-)

*Message #4 Posted by **Crawl** on 22 Oct 2009, 6:08 a.m.,*
in response to message #3 by Bruce Bergman

That's why I needed the calculator to do the solution -- I didn't want to type it in. After the calculator got the solution, I saved it as a variable, then transferred it to PC with the USB cable, then just copy pasted. So, it actually was fairly quick and easy.

It is always a good idea to give a minimum of documentation. Any reader of this forum may be interesting in such documentation and any educated people may have recognized the Cardan's method of resolution.

Fortunately, this is also the method I used to solve 3rd degree equation.

Despite Crawl's code, which is using a lot of obscure PICK command, my solution use local variables, which make it a bit more readable. But still, in my production the exhaustive list of intermediate equations is missing.

As Crawl's code, the EQU3 function takes equation the coefficients from the stack (the coefficient of the highest x power is entered first on the stack) and uses the EQU2 to solve the intermediate quadratic equation.

This code is originally for HP28C/S, assuming that LAST command is enable. But, it may be easily ported to any HP48/49 or 50, as it only simples RPL commands:

```
« -> a b c                              @  a.x2+b.x+c=0  where a<>0
     « b NEG 2 / a /                    @  term1: -b/2a
       b SQ 4 a c * * - SQRT 2 / a /    @  term2: SQRT(4ac-b^2)/2a
       -                                @    x2 : term1-term2
       LAST                             @  recover term1 and term2
       +                                @    x1 : term1+term2
»
'EQUA2' STO

Usage
3:          a      ---- EQUA2 ---->   2:            x2
2:          b                         1:            x1
1:          c
```

a,b,c coefficients of the quadratic equation (real, complex or symbolic) x1,x2 two roots of the equation (real, complex or symbolic).

Example: 4 1 CHS 1 CHS EQUA2 returns 2: –0.3904 and 1: 0.6404 (assuming 4 FIX display mode)

1 –2 1 EQUA2 returns 2: 1.0000 1: 1.0000 (double roots are simply repeated)

```
« -> a b c d                            @ a.x3 + b.x2 + c.x +d = 0
     «   c a / 3 / b SQ a SQ / 9 / -     @  p :  B/3–A^2/27      where B=c/a and A=b/a
         d a / b c * a / 3 / -
         2 b 3 ^ * a 3 ^ / 27 / +       @  q :  C-A.B/3+2A^3/27 where C=d/a
       -> p q
          «                             @ quadratic equation t^2+q.t-p^3=0
            1                           @  first  coefficient (t^2)
            q                           @  second coefficient (t^1)
            p 3 ^ NEG                   @  third  coefficient (t^0)
            EQUA2                       @  compute the two roots  u3 and v3
            3 INV ^                     @  extract v from v3
            SWAP
            3 INV ^                     @  extract u from u3
            b a / 3                     @  dx : B/3 for future usage (translation)
            -> v u dx
               « u v +                  @
                 DUP dx -               @   x1  : u+v – dx
                 SWAP –2 /              @  term1: -(u+v)/2
                 -3 SQRT 2 /u v - *     @  term2: i.SQRT(3).(u-v)/2
                 +                      @  x2+dx: term1+term2
                 LAST -                 @  x3+dx: term1-term2
                 dx – SWAP dx -
                »
          »
      »
»
'EQUA3' STO

Usage
4:          a
3:          b      ---- EQUA3 ---->   3:            x1
2:          c                         2:            x2
1:          d                         1:            x3
```

Exemple 1 –3 3 –1 EQUA3 returns 1.0000 (1.0000,0.0000) (1.0000,0.0000)

Most of the time x1 is expressed as a real,and, x2 & x3 are express as complex.

[/code]

Re: The solution to the quartic equation on the HP50g (long)

*Message #6 Posted by **Crawl** on 23 Oct 2009, 6:44 p.m.,*
in response to message #5 by C.Ret

Thanks for the interest in my program.

After I noticed that error in the quartic method, I decided to upload the files to an online directory. So those should all be error free. I also uploaded C. Ret's Equa2, Equa3, as well as Equa4, which is my quartic code, but which calls his quadratic and cubic routines rather than my own.

You should be able to upload either the text files or binary (.hp) files to a calculator. The advantage of the text files is you can read the source code; the advantage of the .hp files is they can be loaded directly into EMU48.

Yes, the PICK commands are difficult to read, but there was a good reason for it. The goal was to be able to even solve the general quartic, and in reasonable time. You can be lackadaisical with the quadratic, and even the cubic to some degree. But the quartic is MUCH harder.

Here are some timed tests (using a stopwatch).

For my programs... The general quartic: 3 minutes, 21 seconds. In my humble opinion, this is very fast for a pocket calculator.

The depressed quartic. That is, x^4+p.x^2+q.x+r=0.: 11 seconds. That's really fast! Plus, it can be viewed in pretty print through the equation editor.

The general cubic: Less than 2 seconds.

For C. Ret's programs.

The general cubic: About 23 seconds.

The depressed quartic with Equa4: Don't know. I let it run for over 15 minutes on a real calculator, in which time it didn't finish. I verified that it does work on EMU48, and pretty quickly (probably less than a minute).

The general quartic: Tried it on EMU48. Eventually got the message "INSUFFICIENT MEMORY"

I'm skeptical that the TI89's CAS can be used to solve the general quartic at all. This page has a quartic solver for the TI89, but it doesn't work sometimes even with numeric input (I think x^4-4.x^3+6.x^2-4.x+1=0 led to undefined). I ran it on VTI, which seems to be at least 10 times faster than a real TI89. For the general quartic, it ran for over an hour with no solution, and I believe it eventually caused the PC to crash.

Oh, but the TI89 has one thing that saved its honor during this challenge. I discovered another quirk with the HP50: When I tried making the substitution x=y+t into x^4+(b/a).x^3+...+(e/a), and then taking the taylor series, for some reason the HP50 just hung. It didn't finish in even 10 minutes. The TI89 does it almost instantly.

HOWEVER, if you have a=1, the HP50 also does it almost instantly. Maybe it gets caught up by worrying that a=0 or something?

Testing an HP82242 IR Module with a digital camera (or...)

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 21 Oct 2009, 6:37 p.m.*

Hi, all;

maybe this is yesterday´s news, but it´s worth mentioning.

I was wondering about how to test an HP82242 without either an HP82240A/B or an HP48/49 with INPRT running. I remembered that I saw someone testing an IR control through a cell phone with a camera, and I decided to do the same with the HP82242. Needless to say it worked OK, the flashing IR emission was captured and shown.

Hope this is of help. And if this has already been mentioned here, sorry and disregard the post...

Cheers.

Luiz (Brazil)

*Message #2 Posted by **Allen** on 21 Oct 2009, 9:22 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Good tip.

I use one of these Radio Shack Radio Shack 276-1099 IR Sensors for the working/not working test and the Service Module to check the ROM.

How do you do it Luiz?

Re: Testing an HP82242 IR Module with a digital camera (or...)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 22 Oct 2009, 9:42 p.m.,*
in response to message #3 by Chan Tran

Hi, Chan Tran.

I set 0 DELAY, put the IR module in TRACE, take a digital camera and turn it ON, execute CAT 2 in the HP41 and point the camera lens to the IR output, as if your camera is the IR printer (HP82242A/B). You´ll see the flashes of the IR LED in the display of the camera as if it is a white LED. You can use a cell phone with a camera, too; works the same. I also tested with a MP5 with a camera. You just need

to point the camera straight to the IR output.

This test only lets you know if the IR output is emitting anything, not if the data is valid. In this case, you´d need an HP82240A/B or something else to analyze the output data, right?

If you do not succeed let me know and I´ll try to capture it in a short movie.

Success!

Luiz (Brazil)

At least some companies listen (or check the auctions)

*Message #1 Posted by **Jonathan Eisch** on 21 Oct 2009, 2:30 p.m.*

I like listening to music throughout the day, and I've had my fair share of lousy headphones. I had a recommendation once that Koss makes some great sounding clip on earphones, the KSC-35. However, by that time, the KSC-35 had been discontinued and replaced by a futuristic looking KSC-75 (with the same speaker element). KSC-35s were going for over five times the original price on the auction site. I recently checked Koss' site, and saw that they had the KSC-35 back again, along side the -75. I clicked on the live chat and the person at customer service told me that they were back by popular demand, and were now made with higher quality materials for the target market. So, at least one company notices when a discontinued product is popular and selling for a premium and takes that as an opportunity to give the market exactly what it wants.

-Jonathan

in response to message #1 by Jonathan Eisch

Jonathon, not to dispute what you said about Koss (I had one of their headphones years ago, and it was great until the material that fit over your ear started disintegrating), if you are suggesting that HP should reissue the 15c or 42s or even the 41, consider the size of the market. In this age of ipods, iphones and what have you, the market for a quality headset is huge, probably in the millions. The market for a 15c reissue, I would guess, is pretty tiny, probably in the thousands. I think if HP really thought they could make some bucks, they'd do it in a minute. The bottom line drives most companies, HP included.

The bottom line drives most companies, HP included.

According to THIS website they can sell at least 53,870 of them. The changes required from the 12C are simply new key tops and badging and stick in the original 15C ROM, they have already done all the engineering. If they couldn't sell 100K of them then they would have to have seriously goofed it up, like chose the wrong price point or something.

I'll bet serious money Cryrille already has a prototype on his desk. I'm surprised it hasn't been released already, it's a complete no-brainer. Even marketing people know that niche retro products can sell very well.

And it actually makes sense from a marketing point of view given they have revived the retro look with the 35S and updated the 12C. The market almost expect this from HP now.

The 42S is massively harder to do, so forget that.

Dave.

Re: At least some companies listen (or check the auctions)

*Message #4 Posted by **Eric Smith** on 21 Oct 2009, 7:30 p.m.,*
in response to message #3 by DaveJ

A prototype of an ARM-based 15c was seen at a previous HHC conference. There is no question that HP has the technical expertise to produce a new 15c if they choose to do so.

From a business perspective, though, if they only expected to sell 50-100K units, it would be somewhat questionable as to whether it would make sense to introduce it as a product.

Perhaps, depends more on corporate attitude than economics. At the current 12C price point of $70, that's $3.5M to $7M in retail sales, not spectacular, but not bad either for a niche (struggling?) division of the company. If you couldn't crack a reasonable margin on 50-100K units then you probably shouldn't be in business. And if you are in the business, then STAY IN the business.

And considering that a good lot of the engineering has already been amortised on the 12C, the risk is fairly small and margins potentially wider.

And then there is the potential upside, if you market it right it could go through the roof. People love retro toys.

Dave.

Re: At least some companies listen (or check the auctions)
*Message #6 Posted by **Reth** on 21 Oct 2009, 7:48 p.m.,*
in response to message #3 by DaveJ

I'm not sure how accurate those statistics are today. 11,120 people buying 53,870 units? Sounds strange. I've signed that petition some years ago promising to buy at least 2. People change their minds though. If the suggested new edition of the 15C is identical to the original I won't buy it. A must-have things are I/O, mnemonics and more memory.
Cheers

Re: At least some companies listen (or check the auctions)
*Message #7 Posted by **Eric Smith** on 21 Oct 2009, 8:07 p.m.,*
in response to message #6 by Reth

There is no serious proposal for a 15c with your "must-have" enhancements. Doing that would require HP to completely reengineer the 15c from scratch, which is extremely unlikely. The plausible scenario is for HP to introduce a new 15c based on the new 12c platform. It would be functionally identical to the original 15C but significantly faster.

Re: At least some companies listen (or check the auctions)
*Message #8 Posted by **Reth** on 21 Oct 2009, 8:21 p.m.,*
in response to message #7 by Eric Smith

In this case they would sell 5,000 max - my guess. Needles to say, I'd withdraw my offer.

On a second thought I'll still buy a couple of those retro style machines - but that's me, ;)

in response to message #7 by Eric Smith

Making a version of the HP42S, perhaps a long-awaited HP42SII, would be the only winning strategy for re-issue of an older scientific calculator.

The HP-15C, as beloved as it has been, is a throw-back of more than a quarter century. The HP42S, OTOH, after 21 years is still the 2009 state-of-the-art in its RPN feature set and ease of use. But 2009 hardware could greatly enhance the speed, display, memory, and I/O that serve that outstanding feature set. (Let's choose a decent new color scheme too, something classic like that of the HP-15C.)

If by winning strategy, you mean greatest appeal as a functional RPN calculator for the working professional, then you are right.

But this misses the point, IMO. A re-issue of the 15c using the new 12c+ platform, by comparison has such trivial developmental costs (easy for me to say!), that it is more likely to happen first. So as an armchair (office chair?) expert, the 15c appears to be a sounder business decision, even if the market is smaller.

*Message #11 Posted by **Marcus von Cube, Germany** on 22 Oct 2009, 10:45 a.m.,*
in response to message #10 by Martin Pinckney

The question is: Why is the 12C so successful, despite of lacking all the bells and whistles of more modern constructs like the 20b or the 17bii+ ?

Because it hasn't changed for decades. It's a dependable tool!

This might work for a scientific calculator, too.

Re: At least some companies listen (or check the auctions)

*Message #12 Posted by **Mike Morrow** on 22 Oct 2009, 3:32 p.m.,*
in response to message #11 by Marcus von Cube, Germany

The HP42S would have been, I suspect, a continuous success had it continued to be marketed after 1995, especially if the rather weak HP32S/HP32SII RPN scientific had been dropped instead. Few of us, myself included, ever dreamed that the best RPN scientific calculator ever made would be discontinued without replacement by something equivalent or better. Very shortly after the discontinuance of the HP42S was announced, it sold out everywhere and became very hard to get. It has remained so. It isn't because of collector appeal...it's because it is such a masterpiece of really really useful RPN features.

I also don't understand why a modernized HP-15C would require significantly less effort than would a modernized HP42S. The firmware of each of the originals would need to be translated to the new hardware...it's not as if a ROM image of the HP-15C could easily be translated, but that of the HP42S could not.

Re: At least some companies listen (or check the auctions)

*Message #13 Posted by **Eric Smith** on 22 Oct 2009, 4:02 p.m.,*
in response to message #12 by Mike Morrow

Neither a modernized 15C nor a modernized 42S is easy. Either would need a large investment in new software development by HP. In the "good old days", HP had a fair number of software engineers to develop calculators. Today they have two engineers, who have many demands on their time. HP has to carefully decide what product development efforts are the most effective use of their available resources, including the time of those two engineers, and designing a modernized version of either the 15C or 42S is unlikely to make the cut, because neither is likely to be a huge hit. As much as we like the 42S, it is safe to assume that it was NOT selling nearly as well as the 32SII, or it wouldn't have been discontinued.

I don't have any special insight into what goes on inside HP; I'm just writing on the basis of how business and engineering resource allocation decisions are normally made.

The 15C is much easier because they already have the platform in place with the 12C. It's simply a matter of using the 15C ROM instead of the 12C ROM, and probably some housekeeping code. The software side would have to be an order of magnitude less complicated than a new 42S, of which they have no basic hardware platform to work from. i.e. no LCD driver, no keyboard driver etc. The 12C platform already has those drivers in place, as the LCD and keypad is the exactly same between the calcs.

The 42S would have been dropped for one reason, and one reason alone - it wasn't selling enough.
Remember, the fanboy and general purpose scientific markets are trivial, and HP know this, which why they market their calcs to target markets like education and finance.

If a new 15C or 42S comes out, it will because it's easy for them to do, has as little risk as possible, and can be marketed with retro appeal. The 15C is the only sensible choice here.

Dave.

> Isn't that what was in the Commodore Vic 20?

And the following:

1. Commodore C64
2. Commodore C128
3. Commodore C16, C116 and Plus/4
4. Commodore P500
5. Commodore 600/700 family of computers
6. Apple][family
7. Atari 8bit machines (e.g. 2600)
8. Oric Atmos
9. Nintendo Entertainment System (NES)
10. Supervision Game Console
11. Atari Lynx Console

The 6502 is a very capable processor. Last weekend I computed pi to 1000 digits in just a bit over 25 minutes on my Apple //c (6502 @ 1.023 MHz). I used cc65 (cc65.org) to compile my C program.

Now emulating a different platform is a different story and I'll guess that the 17BII+ is not running at 1 MHz (or is it?).

However if the 17BII+ was a 17BII clean room edition, then a 42S clean room ed. should also be possible. And, all the work is already done in Free42. Ah, but then there is that large company with many lawyers "Not Invented Here" attitude.

6502 cores in custom ICs for embedded control have exceeded 200MHz. (Dig that sub-50ns interrupt latency!) They have more instructions and addressing modes, have all the old NMOS 6502 bugs fixed, and several other benefits. My 5MHz 65c02 workbench computer does a 2,048-point complex FFT in fixed-point in 5 seconds-- in high-level Forth, not even assembly.

Re: At least some companies listen (or check the auctions)

*Message #21 Posted by **Eric Smith** on 24 Oct 2009, 5:39 p.m.,*
in response to message #20 by Garth Wilson

Sure, but these 6502-compatible cores don't achieve anywhere near the uA/MIPS power stinginess of low-power microcontollers, because people building ASICs generally don't have access to the extremely low power processes developed for those microcontrollers. And in general, a 6502 is going to have less than 1/10 of the equivalent MIPS of an ARM at the same clock frequency.

The 6502 core in the GeneralPlus (formerly SunPlus) microcontrollers being used in calculators only runs at a few MHz maximum, but is fairly low power.

Don't get me wrong, I actually like the 6502, and have written a huge amount of 6502 assembly language over the years, but it's NOT the best choice for an advanced calculator.

Re: At least some companies listen (or check the auctions)

And in general, a 6502 is going to have less than 1/10 of the equivalent MIPS of an ARM at the same clock frequency.

While it may not be the most suitable for a modern calculator (primarily because of its 16-bit data bus), it is nevertheless being sold at a rate of hundreds of millions of units per year today, mostly rather invisibly because it's going into custom ICs (ASICs) used in embedded control for products ranging from consumer to automotive to medical. Western Design Center, its owner, sells mostly IP licenses, not hardware. Of the little hardware they do sell however, their 65c02 takes a guaranteed maximum of 150µA per MHz at 1.8V for the core itself, and a guaranteed maximum of 500µA per MHz at 5V. 6502 MIPS is roughly 1/4 of the MHz speed, meaning the aforementioned 200MHz is worth about 50 MIPS. A PIC16, which I also have put in many products we've brought to market, would have to go about 400MHz to get comparable performance (regarding time to get a job done), if the PIC's poor instruction set doesn't keep it from doing the job altogether. I will estimate that a 65c02's performance gain over the 41, at comparable power, would be over two orders of magnitude. If I had to redesign the 41 and had to use a 65-family processor though, I would use the 65816 which is more powerful and even easier to program. In the Sieve benchmark, it performs approximately on par with the 68000, even though the 65816 is a much simpler processor.

Re: At least some companies listen (or check the auctions), and an MCODE challenge

*Message #23 Posted by **Egan Ford** on 24 Oct 2009, 5:01 p.m.,*
in response to message #19 by Gerson W. Barbosa

> Quote:
>
> Bob Bishop's Apple Pi (Integer BASIC) is about 100 times slower:
>
> http://bob-bishop.awardspace.com/ApplePi/index.html

I was cleaning my office a while back and stumble onto an article by Ron Knapp about how he bested an Apple II with a 41C when computing Pi to 1000 digits. I think the times were 40 hours vs 8.5 hours.

Being an Apple II fan that didn't sit right with me, so I decided to see for myself. I benchmarked both and also got 40 and 8.5 hours. Ron was right.

So, I decided I'd figure out what the Apple could do. I wrote 3 programs to compute Pi to 1000 digits--Forth, K&R C (Aztec), and ANSI C (cc65). The Forth and K&R C were available at the time of the Apple and the 41CX. The ANSI C compiler is very modern.

Times:

	Apple				HP
	INT	MAF	Aztec	cc65	41CX
Benchmark	BASIC	Forth	C 3.2	2.13	RPN
pi (atan)	~40 hr	24.93 min	36.33 min	25.23 min	~8.5 hr

Ron's HP time (1981) wasn't bested until 1985 when someone posted a USENET C program for the Apple. The author claimed 40 minutes, but I timed it at closer to 2 hours. I contacted the author to see if he could remember the exact compiler and system used, but he could not. Our algorithms were similar, but he computed with base 10 whereas I used base 2^{16}. My code needed much fewer operations. My guess is that he created a base 2^{16} version and benchmarked that, but posted an older base 10 version. He acknowledged that may be the case and said he'd search his backup tapes.

Not that it matters. 40 min or 1:52 hours. In any case Ron's HP was bested after a 4 year rein.

Challenge: Can a 41C MCODEr best the Apple II?

*Message #25 Posted by **Egan Ford** on 25 Oct 2009, 10:50 p.m.,*
in response to message #24 by Charles Oxford

I should have said, "6502 family". The 6502 has many permutations, e.g. the Atari 2600 used a slimmer 6507 that only had 8KB of addressable space.

I know it, look at my post with an hp17BII+ disassembled.

If you see my post you will see...changing overlay and keeping the keyboard, nothing about inside hardware is related in my post.

regards,

nacho

> Making a version of the HP42S, perhaps a long-awaited HP42SII, would be the only winning strategy for re-issue of an older scientific calculator.
>
> The HP-15C, as beloved as it has been, is a throw-back of more than a quarter century. The HP42S, OTOH, after 21 years is still the 2009 state-of-the-art in its RPN feature set and ease of use. But 2009 hardware could greatly enhance the speed, display, memory, and I/O that serve that outstanding feature set. (Let's choose a decent new color scheme too, something classic like that of the HP-15C.)

I think you are missing the point.
Either calculator will sell based mostly on it's retro appeal and perceived coolness, it's got little to do with its functionality.
The majority of buyers will NOT be HP fanboys.
It is quite possible (most likely IMO) that a retro 15C as-is would outsell the pants off a new super-duper 42S for a few reasons.

The first of which is the NRE which is extremely low for the 15C. The 42S would be a complete redesign from the group up using a new platform. This means the 42S would need a large development cost amortisation which would increase the price point and make it even less appealing to buyers. Not to mention hardware wise it's going to cost more than the 15C to begin with. It anything it would likely be based on the new 20B platform.

And a 42S would look like regular modern calcs, so it's not going to capture the imagination of retro geeks the same way a small landscape 15C with it's retro minimalistic 7 segment display would. You can bet your bottom dollar the 15C will make every geek blog on the planet, and that turns into serious sales if the price point is low enough. A new higher priced 42S would barely make a whimper outside of the HP fanboys.

And given that neither would find a niche educational market where you get big numbers, you have to market it based on other factors as I've mentioned. The 15C would be the most sensible choice in this respect.

Dave.

No it wouldn't. Not enough RAM on the CPU to emulate the 42s without adding an extra chip.

I'm not the one missing the point. The point is to sell calculators. The advantage that results from functionality is demonstrable. Any supposed advantage from "retro appeal" and "coolness" is in the realm of religion.

Calculators do not sell in any great numbers based upon any kind of retro appeal. I'd be curious to know what anchors that in your mind as the principal product characteristic that would dominate and dictate sales. If retro appeal is all that can be achieved in sales by some re-issue, I hope HP has sense enough to abort immediately.

Calculators sell in great numbers to a general audience based principally on price, functionality, and ease of use. The HP-15C fails the HP42S in the last two of those. I doubt that many of the people who for almost 15 years have paid high auction prices for the HP42S did so because of any retro or even any collector appeal. I suspect they do so because the HP42S is (somewhat unfortunately) **STILL** 2009 State-Of-The-Art in RPN calculator functionality. No other RPN calculator has been produced that can take its honored spot. Had there been such a later machine, it would currently be the most sought after, not the HP42S or the HP-15C. For functionality. Not for retro appeal.

> Quote:
>
> It is quite possible (most likely IMO) that a retro 15C as-is would outsell the pants off a new super-duper 42S for a few reasons.

That is MOST unlikely. The exact opposite will happen if an HP-15C is re-issued.

> Quote:
>
> The first of which is the NRE which is extremely low for the 15C. The 42S would be a complete redesign from the group up using a new platform.

It's my understanding that current HP-12C models are based on completely different processor hardware and firmware than were the units of the same vintage as the HP-15C. The original HP-15C firmware translation to the new hardware would be almost as much an effort, for very little return, as it would be to translate HP42S firmware to the new hardware, with potential for much greater return for the effort.

> Quote:
>
> And a 42S would look like regular modern calcs, so it's not going to capture the imagination of retro geeks the same way a small landscape 15C with it's retro minimalistic 7 segment display would. A new higher priced 42S would barely make a whimper outside of the HP fanboys.

I don't understand this obsession with some mythological and purely hypothetical mass retro geek appeal. It doubtless does NOT exist in enough quantity to make it worth even a week's development costs.

OTOH, the HP42S design appeals to those seeking the highest development of an RPN calculator for actual day-to-day use. I've used mine in work capacity almost daily for 12 years, and it's held up far better than the HP-15C that I used for eleven years before that. I suspect most HP42S users do likewise. I suspect these people far far outnumber any who would purchase a cryptic cyber-cipher like the HP-15C, were they given the choice.

> Quote:
>

Other factors yes, but not the *ONE* upon which you hang *ALL* your hopes. More reasonable would be the really radical approach of producing an instrument that provides a significant advance in capability over the proposed alternative, one that equals or advances what has been available, one that will see actual daily use in a work environment, by workers (not students, not retro geeks).

It's true that the current 12C (but not the 12c Platinum) is running on an ARM processor. However, it is running almost exactly the same firmware as the original 12C from 1981. The same could be done for the 15C, and in fact a prototype of that has been demonstrated at a previous HHC conference.

Is there some sort of emulator of the original hardware between the almost original firmware and the ARM processor? If so, wouldn't something similar be possible for a "new" HP42S-type of machine?

I'm frankly tired of HP taking the half-assed approach to scientific RPN calculators since the HP42S was discontinued 14 years ago. Everything in RPN-land since then has been extremely disappointing: The HP32SII, the HP33S, the HP35S...all these are fundamentally and substantially inferior to the functionality of the 1988 HP42S. The HP49G+ and HP50G are highly capable, but much larger and RPL-based. If HP continues down the path of mediocrity and issues its next RPN scientific calculator without features that one of their products carried more than 21 years ago, it would be evidence of lack of capability and commitment to produce useful and innovative products that were routine two decades ago. Very sad.

If HP-China burps out a pointless and unnecessary HP-15C clone, expect poor sales after the initial load of HP-15C freaks buy

one. I won't be a customer. "Landscape" calculators are testiments to eccentric style over logical functionality.

I'm sure Eric or others will correct me if any of this in inaccurate:

Yes, HP bought rights to use Eric's Nonpareil simulator/emulator software and ported it to their new ARM platform they use on the current production model 12C.

HP also reaffirmed(?) their right to the original 10 series (11C/12C/15C/16C) calc ROMs, that is why Eric is now not allowed to supply these ROM's with with Nonpareil software like he used to:

http://nonpareil.brouhaha.com/

Yes, in theory you can do the same with the 42S, but it requires more memory and screen resources than HP's current 20B/12C ARM hardware platform can provide. So that means HP have to develop not only the suitable hardware base, but also the emulator/driver base as well. This is a lot of work, good luck selling that internally when they have just spent their time and effort on the current ARM platform.

And then of course with ROM simulation you don't get any of the fanboy desired 42SII extras. Exact 42S functionality, take it or leave it.

Dave.

There is no 3rd party code in the 12c emulator. Eric was very helpful, but it is all cyrille's code.

As for the ROMs, it is much simpler than that. There is no copyright notice built into the ROM at all.

So are you saying that if I have the ROM dumps I can do whatever I like with them? Redistribute them? Create my own 12C and complete with HP?

You say *built into*. Given how sparse the space is I'd wager that there would be no space for a copyright and that copyright is implied. Or is it? Can HP give permission to someone to post the ROMs for public use like the 48GX and 48SX ROMs were published?

This is a very gray area.

Thanks.

As Tim said, the new 12C is NOT running my Nonpareil simulation code. I offered to license my code to HP under non-GPL terms, but they were not willing to do that unless I also ceased to make it available to others under the GPL.

Cyrille has done an excellent job on the simulation code he developed for the 12C (and which I assume is also used in HP's iPhone 12C app, etc.). His simulation code is much more focused on achieving maximum performance then mine was, although I've done some work on speeding up Nonpareil and shared some high-performance BCD arithmetic C

code with him. Cyrille hand-translated that code to very highly optimized ARM assembly language, and posted that here in the forum some time back.

But surely a re-issue of the 15C is better than HP bringing out nothing at all, or another fluoro colour $10 rebaged toy instead...?

The 15C was just as popular as the 42S in it's own way, so why any HP fan would boo-hoo over it's reintroduction is beyond me.

One could also argue that a re-issue of an all-mighty super-powerful programmable 42S you can't save or download programs into would be equally as silly...

Dave.

When comparing two products of the same type, yes. The 15C and 42S have always will be fairly different beasts.

> Quote:
>
> Calculators do not sell in any great numbers based upon any kind of retro appeal. I'd be curious to know what anchors that in your mind as the principal product characteristic that would dominate and dictate sales.

I'm not saying it's the principle appeal, but it's an additional appeal that will not be lost on modern forms of social marketing such as tech blogs.

> Quote:

Not so. The new 12C uses the original 12C ROM via an emulator, so all the real hard work has been done, HP recalled rights to the original 15C ROM for just this purpose. Just drop the 15C ROM into the current 12C emulator and you should be good to go.

Not so with the 42S where no current hardware/firmware platform exists to emulate that I am aware of.

As someone else said, a new 15C has already been demonstrated, so a 42S is nothing but pie in the sky. If HP are going to re-release either the 15C or 42S, smart money is on the 15C, by far.

> Quote:
>
> I don't understand this obsession with some mythological and purely hypothetical mass retro geek appeal. It doubtless does NOT exist in enough quantity to make it worth even a week's development costs.

Yet HP chose to push the retro angle when it marketed the 35S, and has also continued a retro angle with the 12C.

> Quote:
>
> OTOH, the HP42S design appeals to those seeking the highest development of an RPN calculator for actual day-to-day use.

Which is an audience bordering on almost ZERO in terms of the current market!

Do you really think Joe-Public gives a toss about having the most powerful RPN calculator ever made? Hint, it's down about the same level as your perceived level of retro appeal.

The 15C at least has a novel form factor compared to other scientific calcs currently on the market, which *might* give it an edge in marketability over the 42S in today's market. Especially when it's going to come in at a much lower price point.

The 42S has neither, all it has going for it is its (hidden) power.

But once again, we are not comparing apples to apples here, so the point is bit moot.

I'm not in marketing, but if I was I think I'd prefer the low price point limited functionality retro form factor 15C than the ordinary looking but powerful 42S at a higher price point.

Any marketing people here who want to share their views?

> Quote:
>
> I've used mine in work capacity almost daily for 12 years, and it's held up far better than the HP-15C that I used for eleven years before that. I suspect most HP42S users do likewise. The point is not about HP fanboys and what they want/like, it's about the general market and what will appeal to them more.

I wager the 15C will generate more market excitement than the 42S, at much lower development cost and risk to HP. Will that translate into good sales?, only time will tell.

> Quote:
>
> Other factors yes, but not the *ONE* upon which you hang *ALL* your hopes. It's all about what HP can actually bring to market with their limited resources.

A few almost certain facts are in order:
- A new 15C has already been demonstrated
- A new 15C requires comparatively little NRE
- A new 15C can leverage off existing 12C production to lower the cost (the hardware is identical to the current production 12C)
- A 15C will be easier to sell internally to management
- A new 42S requires much more development and NRE
- No current platform exists to emulate the 42S, it must be developed(?) - A new 42S will be at a more expensive price point
- A new 42S will be tougher to sell internally to management.

Based on that the odds of HP bringing a new 42S to market are pretty darn low. Sorry to all you 42S fanboys!

Dave.

Re: At least some companies listen (or check the auctions)
*Message #43 Posted by **Mike Morrow** on 24 Oct 2009, 9:03 a.m.,*
in response to message #39 by DaveJ

PART 1: Here are just a few other items.

Ease of Use - The HP42S is fully alphanumeric. It is far easier to program, edit, debug, and produce meaningful prompts and displays than it is on the HP-15C. A program step looks like a program step..."LBL B" instead of "42,21,12".

Accuracy/Precision of Results - The HP42S firmware/Saturn combination produces far better results than does the old HP-35 type of processor/firmware in the HP-15C. (I know the HP-15C is closer to the HP-34C, but still all pre-Saturn calculators harken back to 1971.)

I/O - Though limited, the HP42S swamps the HP-15C. It has IR printer output, and audible tone output. I find both to be great assets. (I only wish it had a clock with time/date function.)

Safety of Programs and Data - I've had a 370-step Runge-Kutta routine for solving systems of differential equations in my HP42S since I entered it in 1997 from a HP-41CX listing. I have carried and used the HP42S almost daily at a nuclear generating station where it must pass through high-performance security x-ray screening. In the entire time I've used the HP42S I have suffered no losses of any sort, no data corruption even with very routine x-ray exposure (not to mention the several battery changes and other routine threats like drops and other impacts).

PART 2: If HP re-issues an HP-15C clone would HP also re-issue the HP-15C manual set, spiral bound like the original? IMHO, the one area in which the HP-15C indisputably *still* sets the world standard is the quality of its basic user manual AND advanced user manual. It would be a shame to re-issue the calculator, then fail to provide its greatest asset.

PART 3: The following is for the next generation small pocket-sized successor, and not part of the HP-15C vs. HP42S re-issue argument.

a. Incorporate ALL the features now existing on thr HP42S, coded natively on the ARM processor for optimal run-time results (no emulation of firmware coding that was written decades ago for the Saturn processor). (I'd also like to see that on the successor to the HP50g, if there ever is one.)
b. Incorporate the features of the HP17Bii.
c. Add bigger, clearer display.
d. (Only if battery resources make it practical) Add micro-SD card I/O...maybe USB support could power the SD card write process when connected to a PC.

I don't disagree with any or your points.

But all that doesn't mean a new 42S would:

1) Sell as well as a 15C which would be at a lower price point

2) Be easy or cheap to bring to market

It's all about market/business/internal politics practicality, risk, development cost, and what HP can and are likely to actually do.

I'm sure we'd all like to see both released, plus Walters 43S etc, plus my much dreamed after true pocket calc or scientific calc watch etc. Out of all those, the 15C is the only likely winner.

Dave.

I for one would buy a HP-42S+ for approximately twice what I'd pay for a HP-15C+.

Of course, I'm probably in the fan-boy category.

I like the more flexible two line display with alpha capability and HP-41C compatibility of the HP-42S.

And my fond wish for either would be more memory, speed, and I/O possibilities.

All for a reasonable price, of course.

*Message #47 Posted by **Nico Tak** on 28 Oct 2009, 8:00 p.m.,*
in response to message #46 by DaveJ

Hallo,

I have some notes, and I wonder or it is useful for HP to write it down. This are no complains, just compare notes.

In 1987 i bought the HP27s, and in 1989 i bought the HP42s. That¡¦s 20 years ago, and for 20 years i am a unpaid salesman for HP calculators. But I have never seen a follow up for both calculators. I wonder, if you don¡¦t have a follow up, why don¡¦t you keep them in production? (too expensive?).

I bought the HP35s this year, in theory must be better than HP27S. I also know that I have to compare with today¡¦s calculator the finical calculator HP17II. But as far I can remember, the HP17 in that time, and probably still, is not so powerful as the HP27s.

For example, comparing HP27S with HP35s :

„« if you want to solve a formula you have to tell first witch variable you want to solve. Instead the menu bar, than you can solve all variable, and in any direction. „« if you write a program you can only store it as LBL A or LBL B not a real functional name. When you have 30kb memory, you must have a good memory by your self. „« You have to write all programs down each other. Not separate. If you press in the solving mode, (a equation) one time to much on R/S he start the next program.

Comparing HP42S with HP35s.

„« Much more functions then HP35s „« Better program labels, you can assign a word to each program. „« You can programming every lcd dot. „« Store and recall a alpha string „« Smaller and thinner than HP35s „« HP42S CLST? 3 operations, max 4 to clear somthing. HP35 CLST? 6 operation. max 7x button downs for clearing something.

Strong points HP35s.

„« RPN and algebraic „« Beautiful design and beautiful button shape. „« Fractions. „« Enough memory. „« Making a HP35s program is much easer, than programming the HP27S. „« Lucky HP, that they made the HP35s so beautiful ;-)

Of cause you can say why don¡¦t take the HP50g? I like the HP50g for the office, but it¡¦s to big to ware in you suite. And for students,.. the teachers don¡¦t accept a graphic calculator. In the time I went to university, there was no teacher that recognised my calculator as an programmable calculator..and still nobody recognised it today. That¡¦s a good, thing, everybody thinks that you can calculate very quick. And that¡¦s nice isn¡¦t is? Thank You!

Kind regards,

Nico Tak

Holland

The lucky owner of: HP27s HP35s HP42s HP48sx HP48gx HP50g„» (Enter button wrong place, isn¡¦t? ;-))

Once it's in production, I expect that the only reason they wouldn't be able to afford to *keep* it in production is if the production space is needed for a *more*-profitable model. If they don't have that, it's probably foolish to quit making the model they've already been making. HP has made some very foolish decisions though.

Sometimes, it's not just the space needed for a more profitable model. It's shareholder value business: What? The profit is below 10% while with product XYZ, produced far far away, we can get much more profit! Just lay off the much too expensive workers an ditch the whole division!

Even if the initial costs have been recouped, there are still ongoing manufacturing, marketing, distribution, support, personnel, etc... costs that require a minimum number of units sold to justify continuation.

You guys act as if there were no such thing as a niche market, or any viable companies in niche markets. If the market it tiny, those post-development costs are too. I myself have been in a niche-market electronics company since 1992 that has never grossed more than a few hundred thousand dollars a year and yet we've done most of our electronic assembly by hand in the U.S., our most complex product having nearly 1500 parts, which makes it far more complex productionwise than a calculator. If you look in the tiny ads in the back of hobby electronics magazines you'll find advertisements for products made by individuals in their garages, sometimes even moonlightling. One person or family does everything-- design, purchasing, assembling, advertising, shipping, technical support, sweeping, the works. A one-man company can still get a custom LCD made, custom keyboard, etc.. If I personally had what it takes to run a business, I'd like to make the calculator.

That's completely different. I thought we were talking about HP.

The setup for a manufacturing capacity of 1,000/year is different than 1,000,000/year. If you initially setup for 1,000,000/year and then reduced that to 1000/year with the same facility you would most likely be losing money.

Its moot anyway since HP outsources all consumer electronics. Like any other large consumer electronics company you send out a spec with an estimated quantity and then you get back a price. Smaller quantity, higher/unit price.

As for niche calculator market some recent examples of this would be the PIL-Box, NoVRAM/Clonix, uWatch, and MLDL2000. I paid 100 Euros for my PIL-Box that contains a single digit Euros of parts. But I am sure the cost just get started including custom circuit boards makes up the rest of the cost and I expect the volumes of all four to never get to a point where the cost will drop. And that's OK. I am fine with $100 Euros. Now I imagine that a calculator would be significantly more complicated with more upfront cost. However the volumes should also increase, but if we are talking about bringing back the 42S or something like it, I fear the volumes will be just the people on message board. Furthermore the price would have to be less than a used 42S on eBay.

Now I know that this changes everyday. Its possible to print your own circuit boards, there is an abundance of cheap LCDs, and even the cost to use automated 3D mills is getting cheaper. So who knows perhaps it is possible today to pull it off. But I'd defer to DaveJ and Eric Smith for the final word on that since they have actually done it.

I'll be your first customer. :-)

Re: At least some companies listen (or check the auctions)

*Message #54 Posted by **Nico Tak** on 29 Oct 2009, 9:06 p.m.,*
in response to message #53 by Egan Ford

Ok guys, I know you need a market to sell these things. But there is a market for a more complex calculator the HP50g too.. 1000 pages user's guide… (HP27s 256 pages. HP42S 350 pages)

But if you launce a new calculator like the HP35s.. - And there is no menu bar down the screen, a thing they developed 20 years ago…it sounds to me like Back to the future. - If you like to solve V= HxRxBxTxP and your calculator ask: What x to solve? Uh sorry,.. I forgot the names of the variables..

If you use a HP17II, HP27S or HP42S you can see the variables |V|H|R|B|T|P| down the menu bar. And enter them any direction, and solve them any direction. Much easer I guess.

A HP35S should be better than a HP27S isn't it? One of HP strongest points is the Solve menu bar.

HP invent it, use it!!

- HP35S program name you can only mark it with LBL A,B,C,D..Z. Do you think you can remember the program LBL K after three weeks?

Uak,.. I am boring,.. think positive… ebay. Kind regards,

Nico Tak

in response to message #54 by Nico Tak

Nico,

the 35s has a feature the 50g misses: Ease of use. Despite its memory, it is not intended to keep large programs or sets of equations. Instead, it hepls you to automate some calculations when you need it. And you don't have to mess with an alpha key, typing long variable names. The basic concepts of the 32S and all its successors are just brilliant, there's nothing to improve.

Thomas

in response to message #55 by Thomas Radtke

Hi Thomas,

Your right there is nothing to improve, I forgot the word “did”, HP did invent it, use it. I took up the 35S to see or I am wrong. But now two days later I still not convinced, that they make it very much easer. If it’s developed for easy use, why do you give the calculator so much memory? Use the memory for the menu bar,in the solve menu. Isn’t it? Programming is ok. Did you ever used a HP27S of HP42S? Because you must have the same problems, with the HP35S. And if you don’t have the same problems, you may be solved these problems. Please tell me your solutions..

Kind regards,

Nico

*Message #57 Posted by **Walter B** on 2 Nov 2009, 5:44 p.m.,*
in response to message #56 by Nico Tak

Hi Nico,

you're right: one of the most annoying features of the 35S (and the 20b, BTW) is the outdated display and the missing row of soft keys. Of recent calculator models, we have this row in the 17bII+ Silver, however, so HP seems to know it still ;) OTOH, the display of this calc has the same visible specs as the old 27S and 42S, so no progress in 20 years.

With a state-of-the-art display, a lot of opportunities open.

Ceterum censeo: HP, launch a 43S.

Walter

It's easily possible to pull it off, you just need to:
a) want to do it
b) have the time and some money to do it
c) do it reasonably well enough so people want it

My uWatch is an interesting example.
I've now discontinued the original Mk1 watch, not because it wasn't selling, but because I've lost interest in it. I still have 300+ people on the email waiting list, so I could probably sell another 50 or 100 at least at the current $99 price, that's practically guaranteed. And the profit is rather large now that the NRE has been absorbed. So I could be continuing to make money, but I just couldn't be bothered any more, it's just too much hassle.

Perhaps I need to outsource the hassle to someone!

Dave.

HP-12C mini-challenge (e^pi)

*Message #1 Posted by **Gerson W. Barbosa** on 21 Oct 2009, 8:32 a.m.*

Try to write a 10-step program on the HP-12C (final GTO 00 doesn't count) that displays, and *keeps displaying*, the so-called Gelfond's Constant, that is, $\mathbf{e}^{pi}$ = 23.14069264 (the value we get on all scientific Voyagers) or 23.14069263 (better 10-digit result).

Paul Dale has already two solutions based on his 9-step sequences for pi in a former thread, so the challenge will consist in finding as many 10-step sequences as possible. Besides Paul Dale's solutions below, there are at least **five** other 10-step solutions for 23.14069264 . Of course *one single* 9-step (or less) solution will supersede them all.

```
8 e^x 1 4 8 - 8 9 %T e^x

8 e^x 5 e^x INTG - 8 9 %T e^x
```

Gerson.

Re: HP-12C mini-challenge (e^pi)

*Message #7 Posted by **Steve Perkins** on 22 Oct 2009, 6:12 p.m.,*
in response to message #2 by Valentin Albillo

Trivially from Valentin's solution:

```
21382
ENTER
 924
  /
```

Re: HP-12C mini-challenge (e^pi)

*Message #8 Posted by **Gerson W. Barbosa** on 22 Oct 2009, 7:37 p.m.,*
in response to message #7 by Steve Perkins

I had missed that one, but it should count, so now we have **eight** 10-steps solutions. If we multiply e^{pi} by 14 we get 323.**969696**859, which is surprisingly close to $323\ ^{32}/_{33}$ (32.96969696...) or 10691/14, which divided by 14 is equivalent to Valentin's solution, 10691/462 (and your trivial solution, of course :-)

This rational approximation allows for solutions like

```
3 2 4 ENTER 3 3 1/x - 1 4 /
```

but it is not short enough for our purpose (but you can try one of your trivial solutions on this one ;-)

Edited: 22 Oct 2009, 7:55 p.m.

Re: HP-12C mini-challenge (e^pi)

*Message #9 Posted by **Steve Perkins** on 23 Oct 2009, 3:45 p.m.,*
in response to message #7 by Steve Perkins

Trivially from my solution from Valentin's solution:

```
21382
ENTER
 77
  /
 12/   (the single function under the "i" key)
```

Re: HP-12C mini-challenge (e^pi)

*Message #10 Posted by **Steve Perkins** on 23 Oct 2009, 3:51 p.m.,*
in response to message #7 by Steve Perkins

And another realization:

```
21382
 12/   (the single function under the "i" key)
 77
```

```
      /
```

Giving the solution in 9 steps.

Edited: I just realized that on the original HP-12C the "12/" function does NOT fix the resulting number on the stack (enable stack lift?) ready for the 77 above. So it doesn't work without the extra ENTER.

On my HP-12C platinum it DOES enable stack lift and works as I expected it to. Interesting. So just an unsatisfying solution that works for some models.

Edited: 23 Oct 2009, 3:58 p.m.

> I just realized that on the original HP-12C the "12/" function does NOT fix the resulting number on the stack (enable stack lift?) ready for the 77 above. So it doesn't work without the extra ENTER.

I had noticed this too but I didn't know it would work on the 12C Platinum because I don't have one. Looks like this is an old bug that has been corrected on the 12C Platinum. Both my 12C (CN04808261) and 12C+ (CNA 83816873) have the same behavior. Anyway, your 9-step solution is a record, albeit it works only on the Platinum. The solution in your previous post was on my list, so we have now **eight** 10-step solutions that work on any 12C plus **one** 9-step solution that works only on the 12C Platinum. The list is growing...

Gerson.

Edited to correct a typo

Hi Valentin,

> Quote:
>
> Related to your HP-12C mini-challenge, there's a way to get $\mathbf{e^{Pi}}$ in an HP-15C *without using neither* $\boldsymbol{e^x}$ *nor* ***Pi***, in just 6 steps.

Indeed:

```
  1
Re<>Im
ENTER
  yˣ
 1/x
```

x^2

If at least **pi** were allowed it would have been possible in 5 steps:

```
 pi
SINH
LSTx
COSH
 +
```

Regards,

Gerson.

Re: HP-12C mini-challenge (e^pi)

*Message #13 Posted by **Karl Schneider** on 22 Oct 2009, 9:52 p.m.,*
in response to message #1 by Gerson W. Barbosa

> Quote:
>
> ... Gelfond's Constant, that is, e^{pi} = 23.14069264 (the value we get on all scientific Voyagers) or 23.14069263 (better 10-digit result)

Ah, but this minor flaw need *not* be accepted. It is possible to honestly calculate Gelfond's Constant to full 10-digit accuracy on any scientific Voyager without resorting to elaborate multiprecision methods or unorthodox techniques. It is, um, "E-Z".

The problem, of course, is that pi is returned to only 10 digits, compromising the accuracy of the exponential calculation. Utilizing

```
sin (pi - x) = sin x ~= x (for very small x)

e^(x + y) = e^x * e^y
```

First, obtain several extra digits of pi that are correct after rounding, and incorporate them into the latter of two parts of the input argument for the exponential, which is then evaluated separately and recombined:

```
FIX 9
RAD
pi
1E-9
-
ENTER
SIN
x<>y
3.1
-
LASTx
e^x
R_down
+
e^x
R_up  (or three R_down on the HP-10C)
*

answer = 23.14069263
```

Subtracting 1E-9 yields the first 10 correct digits of pi, so that the two calculated digits are the correct rounded digits of pi. This subtraction is not absolutely necessary.

OK, I didn't say that it was *worth doing*, just that it was *possible*...

BTW, clicking your "Gelfond's Constant" link reveals a "Gelfond-Schneider Constant". I cannot truthfully claim any credit...

;-)

I fed its 12-digit value (*2.66514414268*) to my **IDENTIFY** program but it duly returned $\mathbf{2^{Sqrt(2)}}$ so no joy.

Best regards from V.

Re: HP-12C mini-challenge (e^pi) (Edited for correction)

*Message #15 Posted by **Gerson W. Barbosa** on 23 Oct 2009, 8:45 a.m.,*
in response to message #13 by Karl Schneider

Quote:

```
answer = 23.14069263
```

That's indeed the correct 10-digit answer, but how can we be so sure? The problem doesn't lie on your method, which is absolutely corret, but on the calculator itself as there is no warranty all ten significant digits returned by transcedental functions are always correct (even though most of times they are). We can try, for instance,

```
keystroke                  display
pi                       3.141592654
3                        3
/                        1.047197551
e^x                      2.8496539038   ; can we trust this final 8?
3                        3
y^x                      23.140692638   ; if not, how can we trust this final 3?
```

and still don't be sure of the result. However, your endeavoring to be accurate is quite appreciated.

Regards,

Gerson.

Correction:

I had forgotten to take into account the guard-digits. By redoing your procedure on a 12-digit calculator (to simulate the guard-digits when applied), I see we can take for granted your 10-digit answer is really exact:

```
RAD
pi                                                  3.141592654
1E-9                                                1E-9
-                                                   3.141592653
ENTER                                               3.141592653
SIN                                                 5.9E-10
x<>y                                                3.141592653
3.1                                                 3.1
-                                                   0.041592653
LASTx                                               3.1
e^x                                                 22.1979512814    ; e^3.1
                                                    22.19795128      ; rounded to 10
digits of the display
R_down                                              0.041592653
+                                                   0.04159265359
e^x                                                 1.04246974594    ; e^0.04159265359
                                                    1.042469746      ; rounded to 10
digits of the display
R_up  (or three R_down on the HP-10C)               22.19795128      ;
                                                    23.1406926326    ; 22.19795128 *
1.042469746
                                                    23.14069263      ; correct rounded 10-
digit answer
```

e^pi to 10 and 12 digits

*Message #16 Posted by **Karl Schneider** on 24 Oct 2009, 2:48 a.m.,*
in response to message #15 by Gerson W. Barbosa

Gerson --

Thanks for going through my calculation step-by-step, illustratively. I hadn't actually done so, but knew that the answer was correct, and believed that it was not a coincidence, because two extra digits of pi were utilized.

The point of it was really the basic mathematical formulae, significant digits, and a simple application thereof.

The method doesn't buy any extra accuracy for 12-digit inputs and three guard digits, because the 12-digit 'best' value of pi, 3.14159265359, is already quite close to the 15-digit 'best' value 3.14159265358979.

If the exact answer were not readily available (as in the not-so-old days), it could be reasonably inferred, without absolute certainty, by interpolation from adjacent 10-digit inputs that 23.14069263 is the closest 10-digit result for e^pi:

```
    pi            e^pi
3.141592653    23.14069262
3.141592654    23.14069264

3.14159265359  23.1406926328
```

Re: HP-12C mini-challenge (e^pi)

*Message #17 Posted by **Paul Dale** on 25 Oct 2009, 5:00 p.m.,*
in response to message #1 by Gerson W. Barbosa

Two possible nine step solutions for the 12cp:

```
4 x^2 7 . 7 y^x 6 * LN
8 x^2 5 . 3 y^x 3 * LN
```

Both unrelated to the existing solutions. Are these related to the *very different one* Gerson mentioned? Replacing the x^2 with ENTER * making them ten steps and suitable for the 12c of course.

- Pauli

> Are these related to the *very different one* Gerson mentioned?

You have found another different family that gives the best 10-digit answer and includes at least a couple of 9-step solutions that will work on ALL 12C versions.

Your solutions can be rewritten for two more 10-step solutions:

```
6 LN 16 LN 7.7 * +

3 LN 64 LN 5.3 * +
```

Gerson.

HP-12C mini-challenge (e^pi) - Solutions

*Message #19 Posted by **Gerson W. Barbosa** on 26 Oct 2009, 7:14 a.m.,*
in response to message #1 by Gerson W. Barbosa

Despite e^{pi} is not so appealing as **pi** and other more widely known mathematical constants this mini-challenge has elicited interesting and insightful responses. Thanks to all participants!

Here is a compilation of all available solutions so far:

10-step solutions

```
8 e^x 1 4 8 - 8 9 %T e^x          (Paul Dale)

8 e^x 5 e^x INTG - 8 9 %T e^x     (Paul Dale)

8 7 8 LN 1 6 * ENTER LN /      (Gerson W. Barbosa)

1 6 2 ENTER 6 6 1/x - 7 /
```

```
1 0 6 9 1 ENTER 4 6 2 /        (Valentin Albillo)

2 1 3 8 2 ENTER 9 2 4 /        (Steve Perkins)

2 1 3 8 2 ENTER 7 7 / 12/

6 5 ENTER 4 6 2 / 2 3 +

4 ENTER * 7 . 7 yx 6 * LN      (Paul Dale)

8 ENTER * 5 . 3 yx 3 * LN      (Paul Dale)
```

9-step solutions (12CP only)

```
2 1 3 8 2 12/ 7 7 /            (Steve Perkins)

4 x2 7 . 7 yx 6 * LN           (Paul Dale)

8 x2 5 . 3 yx 3 * LN           (Paul Dale)
```

Nice collection of solutions and a fun challenge.

I'd be a little surprised if there weren't quite a few more ten step solutions to this. Finding them is the difficult part. Still, nobody found the elusive nine step solution if such exists.

There are at least two more of them, actually just a rewriting of your own, see my reply to your post above.

> Quote:
>
> Still, nobody found the elusive nine step solution if such exists.

There are at least a couple of 9-step solutions that will work on the 12C as well, both based on yours.

Gerson.

Re: HP-12C mini-challenge (e^pi) - Solutions

*Message #22 Posted by **Paul Dale** on 26 Oct 2009, 8:00 p.m.,*
in response to message #21 by Gerson W. Barbosa

These two nine step solutions are an obvious continuation of my previous:

```
2 n! 2 9 . 8 y^x 12x LN
4 INTG 1 4 . 9 y^x 12x LN
```

I think these two are nicer:

```
2 LN 8 EXP INTG % EXP 12x LN
8 EXP INTG 2 LN % EXP 12x LN
```

- Pauli

Re: HP-12C mini-challenge (e^pi) - Solutions

*Message #23 Posted by **Gerson W. Barbosa** on 26 Oct 2009, 9:16 p.m.,*
in response to message #22 by Paul Dale

> Quote:
>
> ```
> 2 n! 2 9 . 8 y^x 12x LN
> 4 INTG 1 4 . 9 y^x 12x LN
> ```

Congratulations! Exactly what I had derived from yours, by solving LN(12*4^X)=EXP(PI) and LN(12*2^X)=EXP(PI) for X on the 33s:

```
4 ENTER 1 4 . 9 y^x 12* LN
2 ENTER 2 9 . 8 y^x 12* LN
```

Equivalent expressions could also have been found by hand, as in

$6*16^{7.7} = 6*16^{77/10} = 12*1/2*\text{xroot}(10,16^{77}) = 12*\text{xroot}(10,16^{77}/2^{10}) = 12*\text{xroot}(10,2^{308}/2^{10}) = 12*\text{xroot}(10,2^{298}) = 12*2^{29.8}$

but it was way easier with the SOLVER :-) LN(12*16^X)=EXP(PI) and LN(12*32^X)=EXP(PI) give two more 10-step solutions (plenty of them by now!).

> Quote:
>
> I think these two are nicer:
>
> ```
> 2 LN 8 EXP INTG % EXP 12x LN

Can anyone do likewise for pi^e = 22.459157718361...

My 15c gives 22.45915771 for this. Correctly rounded it should be 22.45915772.

So, what can people find for the 12c?

Currently, I've no better solution than the obvious type in the number. However, I'm sure someone can do better than 11 operations.

e^pi < > pi^e ? [Minor update]

*Message #28 Posted by **Karl Schneider** on 28 Oct 2009, 12:41 a.m.,*
in response to message #27 by Gerson W. Barbosa

A year or two ago, a Forum participant offered a small "challenge" of sorts for young math students: Knowing that pi and e were both near 3 in magnitude, and pi > e, how would one go about deducing whether e^pi or pi^e had the greater value, without actually calculating them?

Here's a straightforward approach I think most of us would follow:

```
  e^pi       ?         pi^e

ln (e^pi)    ?      ln (pi^e)

   pi        ?      e * ln (pi)

e * (pi/e)   ?      e * ln (pi)

Because to raise e to a given higher value requires a greater
multiplier than exponent, pi/e > ln (pi).

Applying this from the bottom upwards, we conclude that e^pi > pi^e.
```

12-digit answers:

e^pi = 23.1406926328
pi^e = 22.4591577184

e^pi is only about 3% greater than pi^e.

Similar, simpler numbers:

2^3 = 8
3^2 = 9

but

3^4 = 81
4^3 = 64

Paul Dale posted:

If anyone can present a reasonably-straightforward way to obtain this actual value of pi^e to ten digits

on a pre-Saturn HP, I'd like to see it, because I'm stumped...

On an HP-42S with both pi and e rounded to nine decimal digits (10 significant digits), pi^e = 22.4591577145, so it appears that the HP-15C's result is the best possible, given its limitations.

*Message #30 Posted by **Paul Dale** on 2 Nov 2009, 4:08 p.m.,*
in response to message #26 by Paul Dale

Here are two nine step solutions to the pi^e variation. Both give the correctly rounded result as required.

```
.0788 LN 25 +
25 EXP 7.88 % LN
```

Yes, they are essentially the same. The 12cp has at least three more variations on these two by utilising 5 x^2 instead of 25 and commutating the addition.

Nice one!

My 10-step solution was found with help a tiny 12c program. I started with n=500 and manually checked sqrt(n)/pi^e for interesting answers as n decreased by one unit. The Turbo Pascal code below tries to automate the process. I tried other functions but didn't find anything better. I quit!

Gerson.

```

Soldering Upgrades in my 42s

*Message #1 Posted by **DavidShenk** on 20 Oct 2009, 10:42 p.m.*

I finally bought a soldering station (Aoyue 937+) that seems to get good reviews but is inexpensive and has temperature control. The plan is to use it, among other things, to upgrade my 42s memory.

[Deeeeep Breath]

I took my beloved 42s apart the other day and didn't have that much trouble removing the 8K chip. The tip that comes with the iron is very pointy. Now my problem is the installation of the new chip. From some videos I've seen online, if the tip is too pointed, the solder won't be right at the end where you need it. This seems to be my issue. Of course, my poor 42s isn't working now in it's current state.

[Holding back tears]

Can anyone recommend a soldering tip or tips that they use for this type of work? Also, is a temp of 625F or so sound about right?

Any help in this area would be appreciated. Dave

Re: Soldering Upgrades in my 42s

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 20 Oct 2009, 11:19 p.m.,*
in response to message #1 by DavidShenk

Hi, David;

I have already upgraded about eight HP42S (three were my own, one was gifted) and I remember that after removing the 8KB RAM IC, soldering the 32KB RAM IC was relatively easy. I am sorry (I´m no native English speaker), but by pointy, do you mean the tip of the soldering iron is too thin or thick? Could you add a picture of it? If you had no trouble removing the 8KB RAM IC, I thought you'd have no trouble using the same soldering iron to set the new RAM in place.

And if you decided to stop and ask for help prior to go ahead, then you have chosen the best option (no need to worry about the HP42S without the RAM IC; just do not try powering it up now...).

I hope other guys have better directions, though.

Success!

Re: Soldering Upgrades in my 42s

*Message #3 Posted by **DavidShenk** on 20 Oct 2009, 11:38 p.m.,*

in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz, Yes, the tip seems to be too thin. Tapered too long, I guess. When I melt solder on the tip, the blob seems to move back a bit, away from the very tip. Touching the dry tip to the pin does nothing.

The tip shape is pointed like a pin or needle. I'm thinking that a chisel or beveled tip might work better.

Dave

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 20 Oct 2009, 11:59 p.m.,*
in response to message #3 by DavidShenk

Hi, David;

I am not if I understood this:

> Quote:
>
> When I melt solder on the tip, the blob seems to move back a bit, away from the very tip.

When I am soldering electronic components I do not use the soldering iron tip as a means to put solder in place. Instead I touch the surface to be soldered (component and PCB) with the tip of the solder stream (is that correct?) and then I touch both the solder and the surface to be soldered at the same time with the soldering iron tip. I had to acquire practice by soldering many simpler components (more than 25 years ago...) prior to make sure I was doing it correctly, and the smaller the surface, the faster we must be. SMD´s are the worst 'common cases'.

I have no videos nor pictures to show the way I solder, sorry! And pPlease, if this is not the case and you have prior experience with soldering, forgive me. Maybe I understood it wrongly.

Success!

Luiz (Brazil)

Re: Soldering Upgrades in my 42s

*Message #7 Posted by **DavidShenk** on 21 Oct 2009, 12:29 a.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Luiz,

I think that was my next question. In the videos I've seen soldering SMDs, they were doing the opposite of what you just described (here) . They put flux on the pins and a little solder on the iron, then touched the tip for just a second and the solder flows over and makes the connection. They were doing several at a time and it seems so easy!

I'll have to try it the way you described, but I need to get some fine solder wire first. I know this is how you solder more traditionally sized components, but I didn't realize you could use the same technique on SMDs.

I have only casual soldering experience and have never worked with anything so small, so any tips or critique is appreciated.

Dave

Re: Soldering Upgrades in my 42s

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 21 Oct 2009, 12:49 a.m.,*
in response to message #7 by DavidShenk

Hi, David;

at this very moment, I'm saving the video to see it later. Thanks.

You are correct with the appliance of the technique I mentioned to bigger components. As you also mentioned, if they are using soldering flux in the video, this means even faster soldering.

I did not see the video yet, so can you tell me if they applied the technique to a PCB with 'virgin' contacts, i.e., a PCB that had not yet been soldered? I have never soldered SMT components for the first time, instead I replaced many. So, there is always a thin coat of solder in both the component and the PCB. IN this case, I position the component and touch the tip of the soldering iron in two opposed terminals first (I.C.´s in this case). Then I solder the rest of them the way I mentioned. I use fine solder when dealing with SMD´s, but when the solder spreads to neighbor terminals, I use the 'solder trap' (cannot remember the name of the 'wire mash to remove solder' in English, sorry) to remove the excess of it.

I´ll see the video and post later, OK?

Cheers.

Luiz (Brazil)

Re: Soldering Upgrades in my 42s

*Message #9 Posted by **DavidShenk** on 21 Oct 2009, 1:02 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

I am curious to see what you think of the video. They did a very good job shooting it. I think in the examples they are using virgin boards and new components.

After I removed the 8K chip, I did go back over each pad and level the solder before placing the new chip on. Then I was able to solder down two corner pins, but that was about it.

I think the solder trap you're referring to is called desoldering braid or desoldering wick? I do have some and have already had to use it.

Dave

Re: Soldering Upgrades in my 42s

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 21 Oct 2009, 1:24 a.m.,*
in response to message #9 by DavidShenk

Hi, David;

the video is indeed vary good and has very important information. The way I usually solder SMT components is a mix of the techniques shown for the PLCC and the QFP. I actually use the residual solder that remains in the tip of the iron to allow the existing solder in the PCB and the components terminals to melt, and after some terminals are joined together I use a bit of solder to go ahead with the other terminals. I do not use some techniques shown in the video, like using a big amount of solder them removing the excess with this purpose, but in some previous industrial SMD soldering, the whole PCB with glued components were dipped into liquid, high temperature solder, so... what the heck do we know!

I agree with you, they are using new components and virgin boards, but the new boards seem to come with a coat of material in the soldering tags (terminals?) that I cannot identify. Maybe it has the same properties of the solder and helps soldering.

And yep, I was trying to mention the desoldering braid, or desoldering wick. Thanks.

I think the video gives enough guidance to a successful soldering. Can you find some old, not working PC board or daughter board, like slow modems or audio boards, that you could remove and re-solder SMD´s for the sake of 'skill enhancement'? Chances are that you´ll find your best, successful way of soldering. I'd bet that!

Success!

I do need to practice my technique on some scrap electronics before I work on my 42s again. Good idea! It appears that there are several different ways to do this, so I'll have to practice and see what works for me.

Thanks for all the help. Dave

Re: Soldering Upgrades in my 42s

*Message #12 Posted by **Eric Rechlin** on 21 Oct 2009, 1:40 a.m.,*
in response to message #9 by DavidShenk

Surface mount soldering is actually very easy. You do not need desoldering braid for cleanly soldering surface mount chips.

Just put flux on the board (something like Kester 186-25 is my favorite, but Kester 979 is good if you prefer no-clean flux), and position the chip.

Put a big blob of solder on the tip of your iron. Touch it to one corner of the chip. Now drag the tip of the iron (which presumably still has a blob of solder on it) across the pins on the opposite side of the chip. You'll solder them all at once, in a single stroke, and the flux will prevent the pins from sticking together.

Now use the remaining solder to do the other side of the chip, and re-stroke either side if there are any shorts.

You should be able to do a 10-20 pin chip in well under 30 seconds with this approach.

What kind of package are you trying to solder? I haven't tried any PQFPs, but I've done a few large SOICs onto SOIC-to-DIP adapters and found they were even easier than the video shows. I found that with a lot of flux, you can just go down the row of pins and flood the whole row with solder, making bridges everywhere with a large tip and large-diameter solder, then hold the board vertically and go down the row again, from top to bottom, and all the excess solder will

come off the board and stay on the iron. There will be the same amount of solder on each pin, and it will be smooth, and there will be no bridges. You don't need any solderwick. You do have to clean the flux off when you're done though.

Concerning the temperature: There's a lot of unnecessary worry about this. In my work in the mid-1980's I occasionally had to do thermal scanning of power transistors in operation. In the extreme situation, I saw transistors actually *operating* at many hundreds of degrees C (not F). Of course they wouldn't last very many hours doing this, but it did not destroy them. I like to use a very hot iron to solder, as this allows you to get the joint up to soldering temperature more quickly and be done before the inside of the part gets so hot. This is especially important with things like mechanical switches that have plastic parts. A hotter iron is *less* likely to melt the switch before you're done. I've seen our production people do more damage with expensive, low-temperature irons than with the 950-degree F uncontrolled ones.

Please keep in mind that Aoyue is not exactly a manufacturer of quality tools - this is what makes your soldering tip "crappy". A single tip from PACE, WELLER or ERSA already costs a good fraction of your whole soldering kit and actually is more high-techy than it seems. Be assured, the solder sticks to the tip on these ones ;) Maybe the tip could be replaced by a better (branded) one, that should help on your soldering project.

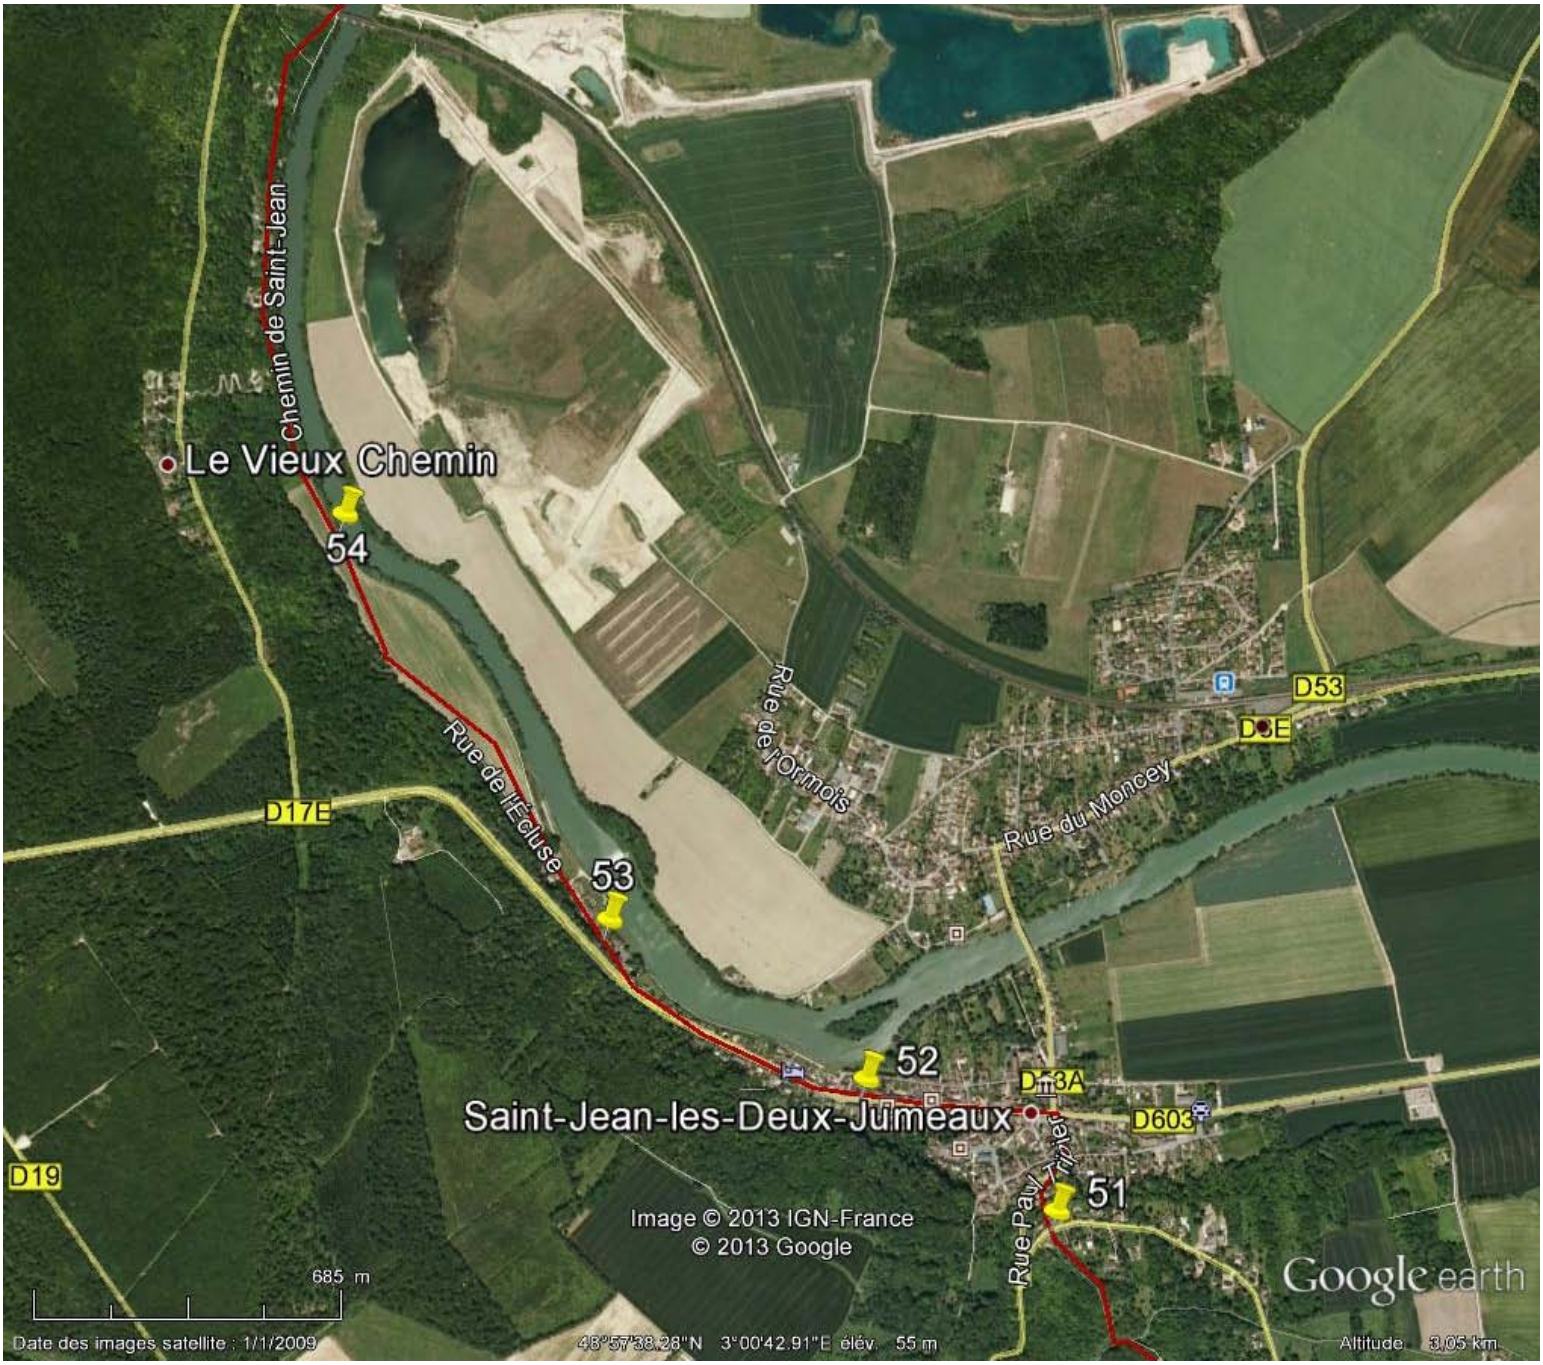
HP20b repurposing

*Message #1 Posted by **hugh steers** on 20 Oct 2009, 8:16 p.m.*

Extreme folly,

5254 ENTER gives,



ok, how do i make the wire, anyone?

Re: HP20b repurposing

*Message #2 Posted by **Tim Wessman** on 21 Oct 2009, 1:08 a.m.,*
in response to message #1 by hugh steers

Send 10 UPCs from the boxes, 5.95SH fee, a small chocolate cake and the deed to your house to cyrile's email address. Then ask nicely.

TW

Re: HP20b repurposing

*Message #3 Posted by **hugh steers** on 21 Oct 2009, 3:37 p.m.,*
in response to message #2 by Tim Wessman

hmm. there's a bit of a shortage of chocolate cakes around here. most of them are only chocolate flavoured cakes. the real ones are hard to come by.

i see that no one else has figured out the meaning of my original posting. anyway, i need to DL the proper dev tools to build a proper binary beforehand anyway. i think im good for the cut down version. my code is well under 32k.

are there any docs on how arrange the RAM sections so that i can put some vars in the 2K battery backed up memory and the rest in the volatile memory.

also, how do i beat the dog?

:-)

Re: HP20b repurposing

*Message #4 Posted by **Tim Wessman** on 21 Oct 2009, 11:23 p.m.,*
in response to message #3 by hugh steers

With a stick?

Cyrille will have to help with that stuff as he is familiar with it and I am not yet.

*Message #5 Posted by **Bruce Bergman** on 22 Oct 2009, 12:34 a.m.,*
in response to message #3 by hugh steers

I think if some of us understood what the HECK you were talking about, we could probably help. Certainly, I wish I could...both help and understand. But until someone explains it to me in more simple terms, for this simple mind, I'm afraid I'm not going to be much help.

That being said, I've created a wiki (http://www.wiki4hp.com) with the intent primarily to help folks develop on the 20b. If there are things that are missing, please let me know and I'll see what I can do to add them. If there is useful information for you there, then that would be even better.

thanks! bruce

Re: HP20b repurposing

*Message #6 Posted by **hugh steers** on 22 Oct 2009, 4:17 p.m.,*
in response to message #5 by Bruce Bergman

Hi Bruce,

Yes it's time for me to 'fess up.

I'm going to have a go at running chess on the 20b. 5254 is E2-E4 and the response is d7-d5 (4745). A bit silly i know.

I have a very small chess program which i wrote for the uWatch. it will easily fit into the 20b and Im hoping the 20b will be able to play quite well. firstly, the 4k of move stack will be quite good and also the 30Mhz arm will enable a quick response.

My next step is to build an actual hp20 binary, after that i'll have to hassle those with wires to let me have one - even if it means sending chocolate cakes!

when i get it working, i'll make the source code and binaries available.

Re: HP20b repurposing

*Message #7 Posted by **cyrille de Brebisson** on 22 Oct 2009, 9:28 a.m.,*
in response to message #3 by hugh steers

Hello,

I have updated the SDK, but it is not yet online... send me an email and I will send you the latest version which is a whole lot easier to work with.

to beat the dog, use the Watchdog() or the watchdog function (one is inlined, one is a function call).

if that is not defined in your version of the SDK, here is the code that I am using. It even answers 2 of your questions!:

#ifdef _ARM_ #include "board.h" TMyApplication *const MyApplication= (TMyApplication*)0x300000; // restart the watchdog inline void Watchdog() { AT91C_BASE_WDTC->WDTC_WDCR= 0xA5000001; } void watchdog(); // same function as above, but not inlined... #else extern TMyApplication MYAPPLICATION; TMyApplication *const MyApplication= &MYAPPLICATION; inline void Watchdog() { } #endif

do not forget to define MYAPPLICATION in the windows only part of the code somewhere...

the backup RAM is at address 300000. there is a way to create a section for the linker and then to tell the linker to place variables there, but I found it easier to create a structure (TMyApplication) that contains all the data that needs to be backed up and then to put that structure at 0x300000. It also makes is a whole lot easier to check that the structure is less than 2KB (sizeof)... as a matter of fact, in the test menu, the number under the copyright message is just that, the size of TMyApplication in order for me to check at each build if I did not mess up!

regards, cyrille

>-->-->-->--> HP17BII+ disassembled and...surprise (at least for me)

*Message #1 Posted by **Nacho** on 20 Oct 2009, 7:06 p.m.*

Dears,

I have opened my 17BII+ today, had no more time to fully disassemble it.

I don't know if someone has posted these pics before...

the construction hardware is not similar to a 35S but as you will see in the pics it is more "similar" to a Pioneer (42S, 17BII...)!

The LCD is the same of a 42S or a 17BII and connected via 2 zebra stripes. So...if you have a non working 42S and need a really better display than original one, 17BII+ LCD is simply perfect.

tomorrow will continue with the full disassemble.

to compare 35S and 17BII+

if Mr.Lyuka doesn't worry here is a pic of his 35S:

Regards

in response to message #1 by Nacho

Hi, Nacho

It's very interesting to know its LCD compatibility to the 42S. Thanks.

Regards, Lyuka

Re: >-->-->-->--> HP17BII+ disassembled and...surprise (at least for me)
*Message #3 Posted by **NACHO** on 25 Oct 2009, 8:51 p.m.,*
in response to message #2 by Lyuka

Hello Lyuka,

a shame , yesterday I did the swap from the 17BII+ LCD to the 42S HW and didn't work very well, the LCD's seem equal but the new one is has not the same length...

It gave the information at 90 degrees...

It said Memory Clear, but instead of giving that message horizontally it was vertically.

Regards

Fibonacci Sequence

*Message #1 Posted by **Mike T.** on 20 Oct 2009, 5:19 p.m.*

OK,

Following an interesting discussion earlier this evening I thought it might be fun to see just how few keystrokes you would need to calculate successive terms of the Fibonacci Sequence, preferably without using any storage registers...

I doubt it I have the best solution but thought the answer I came up with demonstrated really nicely why I like my old RPN calculator so much and that it would be interesting so see what other people came up with.

Start with a one in 'x' - all other registers zero.

Mike T.

Re: Fibonacci Sequence

*Message #2 Posted by **Ken Shaw** on 20 Oct 2009, 5:26 p.m.,*
in response to message #1 by Mike T.

I'm assuming this is a keystroke procedure only (not a program).

In that case, I think it's just

```
Enter
Enter
Roll Up
+
```

Then repeat, ad infinitum.

Edit: I failed to observe initially that there is no "roll up" key on most machines, including the 12C. I was surprised to realize that this also won't work on a 42S, where the keyboard up-arrow is actually BST. However, it does work on my daily calc, the 17BII, because the up-arrow key performs a RollUp. Unfortunately it is only a keystroke solution, not a program. Obviously this is not intended for RPL machines, as it depends on a revolving 4-level stack.

Edited: 21 Oct 2009, 10:23 a.m.

Re: Fibonacci Sequence

*Message #3 Posted by **Mike T.** on 21 Oct 2009, 6:01 p.m.,*
in response to message #2 by Ken Shaw

Very close in approach to my 'preferred' solution and it doesn't even rely on 'Last x', but since I was using an HP33C I couldn't use Roll Up...

Mike T.

Re: Fibonacci Sequence

*Message #4 Posted by **Paul Dale** on 20 Oct 2009, 5:31 p.m.,*
in response to message #1 by Mike T.

On an RPL machine (three command, ? keystroked):

```
SWAP OVER +
```

On a 42 (five keystrokes, two commands):

```
x<>y  RCL+ ST Y
```

Still thinking about other models....

In the 20b scientific firmware there is a generalised Fibonacci function :-)

One command:

```
RCL+ ST L
```

Edited: 20 Oct 2009, 5:51 p.m. after one or more responses were posted

Re: Fibonacci Sequence

*Message #6 Posted by **Paul Dale** on 20 Oct 2009, 5:49 p.m.,*
in response to message #5 by Byron Foster

Nice!

I'd come up with an alternating sequence of:

```
    STO+ ST Y
    STO+ ST X
```

But that isn't nearly as nice.

- Pauli

Re: Fibonacci Sequence

*Message #7 Posted by **Byron Foster** on 20 Oct 2009, 6:13 p.m.,*
in response to message #6 by Paul Dale

I recently worked on this so I could try and show off the new 7 line program display mode of the 42s/Free42 in iTunes. I came up with:

```
01 LBL "Fibonac"
02 1
03 STO ST L
04 LBL 00
05 STOP
06 RCL+ ST L
07 GTO 00
```

It's not perfect because it creates the sequence 1,2,3,... instead of 1,1,2,...

Re: Fibonacci Sequence

*Message #8 Posted by **Paul Dale** on 20 Oct 2009, 6:25 p.m.,*
in response to message #7 by Byron Foster

Try:

```
01 LBL "Fibonac"
02 0
03 STO ST L
04 1
05 LBL 00
06 STOP
07 RCL+ ST L
08 GTO 00
```

- Pauli

Re: Fibonacci Sequence

*Message #9 Posted by **Byron Foster** on 20 Oct 2009, 6:33 p.m.,*
in response to message #8 by Paul Dale

Yea, that's better, but I was trying to get it to fit in 7 lines.

Re: Fibonacci Sequence

*Message #10 Posted by **Paul Dale** on 20 Oct 2009, 6:35 p.m.,*
in response to message #9 by Byron Foster

Replace the "0 STO ST L" with CLSTK and you get to 7 steps :-)

- Pauli

Re: Fibonacci Sequence

*Message #11 Posted by **Byron Foster** on 20 Oct 2009, 8:50 p.m.,*
in response to message #10 by Paul Dale

How about:

```
0
E^X
LBL 00
STOP
RCL+ ST L
GTO 00
```

Initialization isn't pretty, but it's as non destructive as you can get, and it begins the sequence correctly.

Re: Fibonacci Sequence

*Message #12 Posted by **Crawl** on 24 Oct 2009, 12:18 a.m.,*
in response to message #4 by Paul Dale

Another 3 command RPL:

DUP ROT +

Fibonacci Sequence: where is Valentin Albillo?

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 20 Oct 2009, 6:17 p.m.,*
in response to message #1 by Mike T.

Hi, all;

Amongst many others, Valentim would be one of the guys to add some valuable comments to this thread...

Cheers.

Luiz (Brazil)

Edited: 20 Oct 2009, 6:34 p.m.

Re: Fibonacci Sequence

*Message #14 Posted by **Israel Otero** on 20 Oct 2009, 6:35 p.m.,*
in response to message #1 by Mike T.

Hi My program for the HP-41 of the Fibonacci sequence is:

```
01 0
02 1
03 LBL 00
04 X<>Y
05 ST+ Y
06 PSE
07 GTO 00
08 .END.
```

The advantages are that all terms are shown and is very efficient.

Edited: 20 Oct 2009, 7:26 p.m.

Re: Fibonacci Sequence

*Message #15 Posted by **Don Shepherd** on 20 Oct 2009, 7:18 p.m.,*
in response to message #1 by Mike T.

OK, a program on our old friend, the 12c, using no registers and 7 steps:

```
1
enter
+
pse
lastx
x<-->y
goto 03
```

Re: Fibonacci Sequence

*Message #16 Posted by **Allen** on 20 Oct 2009, 7:26 p.m.,*
in response to message #15 by Don Shepherd

Don- Nice work.. I love how you program the Finance Calcs!!!

Re: Fibonacci Sequence

*Message #17 Posted by **Gerson W. Barbosa** on 21 Oct 2009, 7:12 a.m.,*
in response to message #15 by Don Shepherd

Hi Don,

Too late for the show, anyway an alternative 12c program that produces 0,1,1,2,3,... if we don't mind clearing some registers:

```
01- CLEAR SIGMA
02- 1
03- x<>y
04- PSE
05- +
06- LST x
07- GTO 03
```

Regards,

Gerson.

Re: Fibonacci Sequence

*Message #18 Posted by **Mike T.** on 21 Oct 2009, 5:53 p.m.,*
in response to message #15 by Don Shepherd

Actually this exactly key sequence that I first came up with on my HP33C.

Each sucessive iteration takes just four steps/key strokes which I thought was quite efficent, but a little cumbersome to key in...

Mike T.

Re: Fibonacci Sequence

*Message #19 Posted by **Palmer O. Hanson, Jr.** on 20 Oct 2009, 8:49 p.m.,*
in response to message #1 by Mike T.

On a TI A.O.S. machine like the TI-59 start with 1 in the t register and 1 in the display. Then press x<>t + and see each successive term in the display after each + .

Re: Fibonacci Sequence

*Message #20 Posted by **Kiyoshi Akima** on 21 Oct 2009, 12:25 p.m.,*
in response to message #1 by Mike T.

```
LASTx
x<>y
+
```

That's four keystrokes on most RPN machines. On a line-addressed machine like the HP-25, the program becomes

```
01 LASTx
02 x<>y
03 +
04 PAUSE
05 GTO 01
```

Re: Fibonacci Sequence

*Message #21 Posted by **Mike T.** on 21 Oct 2009, 6:24 p.m.,*
in response to message #20 by Kiyoshi Akima

After thinking about it for a little bit on my HP33C I came up with

Enter, Enter, Rdn, Rdn, +

Admittedly not the absolutly the shortest number of keystrokes but it has a certain appeal...

Re: Fibonacci Sequence

*Message #22 Posted by **Michael Meyer** on 21 Oct 2009, 8:01 p.m.,*
in response to message #21 by Mike T.

I like it. Has a nice rhythm to it.

Giving credit where credit is due

*Message #23 Posted by **Palmer O. Hanson, Jr.** on 23 Oct 2009, 10:11 p.m.,*
in response to message #1 by Mike T.

In an earlier submission I gave a very short keyboard sequence for finding the series on an A.O.S. machine. The idea wasn't mine. I had seen it somewhere but couldn't locate it. Now I have found the original reference which is from V5N4/5P16 of TI PPC Notes:

> Quote:
>
> SHORTEST USEFUL ROUTINE - Samuel G. Allen sends me the shortest do-something-useful routine I have seen so far: 000: X<>T + PRT RST . With the t-register clear and 1 in the display, press RST R/S and it will print a listing of the Fibonacci numbers. ...

Re: Fibonacci Sequence

*Message #24 Posted by **Kiyoshi Akima** on 27 Oct 2009, 1:17 p.m.,*
in response to message #1 by Mike T.

If we can alter the initial stack conditions, it can be done in one step.

Set up the stack:

```
5
sqrt
1
+
2
/
ENTER
ENTER
FIX 0
5
sqrt
```

```
1/x
```

You'll need an additional ENTER if the FIX 0 doesn't enable stack lift.

After that, press * (multiply) to see 1. Press * again to see 1. Keep going to see 2, 3, 5, 8, 13, etc.

Re: Fibonacci Sequence

*Message #25 Posted by **Mike T.** on 4 Nov 2009, 5:08 p.m.,*
in response to message #24 by Kiyoshi Akima

Not sure that qualifies as the shortest but it is interesting and does show just how useful the stack can be...

Mike T.

Re: Fibonacci Sequence

*Message #26 Posted by **Michael Meyer** on 4 Nov 2009, 10:32 p.m.,*
in response to message #25 by Mike T.

Impressive. Most impressive. You may be an HP Jedi yet.

Re: Fibonacci Sequence

*Message #27 Posted by **Gerson W. Barbosa** on 7 Nov 2009, 6:33 a.m.,*
in response to message #25 by Mike T.

> Quote:
>
> ...it is interesting and does show just how useful the stack can be...

The stack is really useful: quite by accident (as almost everything I discover) I found it can be used to solve the equation

$$\frac{x}{\ln(x)} = k \ , \ k > e$$

Start by filling the stack with k then iterate 'ln *' until the answer on the display converges (somewhat slowly if k is close to ***e***) to the second real solution.

On my HP-45:

```
pi
e^x
ENTER
ENTER
ENTER
ln *    (16 times)

-> 1.084423455e02
```

As a comparison the HP-33s solver gives 108.442345473 (initial guess = 100). Can a non-programmable algebraic calculator do this? :-)

Gerson.

The answer is Yes!

*Message #28 Posted by **Palmer O. Hanson, Jr.** on 8 Nov 2009, 1:42 p.m.,*
in response to message #27 by Gerson W. Barbosa

Gerson:

You asked:

> Quote:
>
> Can a non-programmable algebraic calculator do this? :-)

The answer is yes. Try this on a TI-30:

pi INV ln STO

then do

ln x RCL =

After 16 iterations you will see 108.44235 in the display with 108.44234529 in the display register.

I suspect that this will work with any algebraic which has a memory. It works on my Sharp EL-501W where it yields 108.4423436 after twelve iterations.

Palmer

Edited: 8 Nov 2009, 1:51 p.m.

Re: The answer is Yes!

*Message #29 Posted by **Gerson W. Barbosa** on 8 Nov 2009, 2:17 p.m.,*
in response to message #28 by Palmer O. Hanson, Jr.

> Quote:

W&W RAMBOX 64K with DIP-Switches

*Message #1 Posted by **Christoph Giesselink** on 19 Oct 2009, 4:10 p.m.*

I recently saw a W&W RAMBOX II 64KB Version with three 8*DIP switches at bottom of the card reader housing. I was wondering about this, because the German RAMBOX II manual does not describe any DIP-Switches. These switches are for example described in the English manual of the W&W RAMBOX 32KB Version.

A HP41 specialist was quite surprised about the existence of such a W&W RAMBOX.

My question, has anybody seen a W&W RAMBOX II 64KB Version with DIP switches also?

From what I read so far, I assume that the W&W RAMBOX 32KB Version exists in two versions, one with dip switches, one without.

Can anybody confirm this?

So it seem that from the RAMBOX II also exist two hardware versions?

Cheers

Christoph

Re: W&W RAMBOX 64K with DIP-Switches

*Message #2 Posted by **Juergen Keller** on 19 Oct 2009, 5:32 p.m.,*
in response to message #1 by Christoph Giesselink

I can only confirm that there is a W&W RAMBOX 32KB _with_ dip switches as it is the only one I have.
Cheers,
Juergen

HP 42S sells for < $100 H**l freezes

*Message #1 Posted by **Michael de Estrada** on 19 Oct 2009, 11:12 a.m.*

I've been following TAS auctions for the HP 42S for a while, and seen the premium prices being paid, sometimes over $400, but lately it seems like the market has been getting soft for this model. Now, the unthinkable has happened. In a recent auction, a HP 42S sold for $89! Granted, it was lacking the manual, the soft case was for a HP 33s, it had a dent below the display and was a domestic (USA) only sale. Yet, it appeared to be in good working condition with no obvious wear and tear. So, has H**l finally frozen? Are other affordable out-of-production collectable models soon to follow? Stay tuned folks.

HP 42S Auction

Re: HP 42S sells for < $100 H**l freezes

*Message #2 Posted by **bill platt** on 19 Oct 2009, 11:41 a.m.,*
in response to message #1 by Michael de Estrada

Having watched these prices on and off since 1999, I'd say that up and down is the way it is....

Re: HP 42S sells for < $100 H**l freezes

*Message #3 Posted by **Egan Ford** on 19 Oct 2009, 11:57 a.m.,*
in response to message #1 by Michael de Estrada

My guess after 3 years of watching is that many have other priorities around summer and the Xmas holiday season (I know I do). Less competition may be driving down prices.

Re: HP 42S sells for < $100 H**l freezes

*Message #4 Posted by **Geoff Quickfall** on 19 Oct 2009, 1:04 p.m.,*
in response to message #1 by Michael de Estrada

Hello Michael!

Just a few points:

```
1.  It never ceases to amaze me to see a 'USA' only sale.  I know
    there are reasons for this; personal, export requirements,
    shipping problems and etc.  But if you want top dollar bid you
    have to open up the bidding to the REST of the world.

2.  The description was not the greatest:

    "Workhorse, used, 15
    years, small dent but does not affect the operation."

  How about:

    "Wow, works perfectly after all these years, no sticky or
    noisy keys.  One owner (me) and it was my main calculator!
    Moving on to a graphing machine for work so no longer
    required."

  Yeah, I know, sounds corny, but it does work!
```

```
3.  Some artwork when it comes to photography?
```

```
4.  one does not, a series make!  When I see 5 in a row go,
    working, for under 100 USd then I think the price is comming
    down.
```

The one pictured above went for 50 USd, granted it was not functional and the keyboard was a mess and the scratches and dents were very visible.

Just to see how strange the market is there is one listed with a "RESERVE NOT MET" and a leaky LCD panel. The bidding is at 100 USd at this moment. Now unless you have a spare panel kicking about, the ability to get in and swap it, it seems that the price is rather high and the reserve is not met yet.

Enough rambling, I chalk it up to Ebay and the collector mentallity!

Cheers, Geoff

Re: HP 42S sells for < $100 H**l freezes

*Message #5 Posted by **Michael de Estrada** on 19 Oct 2009, 8:51 p.m.,*
in response to message #4 by Geoff Quickfall

Hi Geoff,

I agree with points 2,3 and 4 but not necessarily point number 1. I have seen many USA only sales fetch top dollar, and more often than not the winning bidder in a worldwide auction will reside in the USA. To wit, recently a seller had 18 concurrent auctions for Woodstocks and Spices, and in 12 out of 18 cases, the buyer was a USA resident, myself being one of them. Furtheremore, the 2 highest winning bids of $418 and $385 were made by USA residents. The highest winning bid by a non-USA resident (France) was $215.40. So I don't think it is necessary for a seller that makes a good presentation to get a good price in a domestic only sale.

BTW, none of the winning bidders in these auctions was Canadian (4 France, 1 Luxembourg, 1 Australia).

Regards,

Michael

Small market = lower chance for a good price.

Big market = higher chance.

These chances will materialize observing large samples.

The observation of a larger fraction of winning US-bidders, if exceeding the expectations based on head count significantly, would show the US-bidders being more wealthy in average than the rest of the population.

Fairly trivial, isn't it?

*Message #7 Posted by **Bart (UK)** on 20 Oct 2009, 4:29 a.m.,*
in response to message #5 by Michael de Estrada

Hi Michael

Did you factor in the effect the non-winning non-US bidders had on pushing up the price?

Admittedly, I do not even bid on non-EU items as the shipping cost puts me off. Also I classify myself as a user, not a collector and have not paid over £100 for a used HP.

Re: HP 42S sells for < $100 H**l freezes

*Message #8 Posted by **Michael de Estrada** on 20 Oct 2009, 11:31 a.m.,*
in response to message #7 by Bart (UK)

Hi Bart,

You do bring up an interesting point. As you may know, the winning bid in a TAS auction is actually the

highest competing bid or next highest bid from the first loser plus an increment which is determined by the price range of the bid. The final winning bid price is either this amount of the actual highest bid, whichever is lower. The winner's actual bid is often much higher, especially if the winner places the bid within the last few seconds and does not have opportunity to rebid if it proves too low. So, I looked at the bid history of the 2 highest priced auctions, and found that in the case of the highest ($418), the first loser was a non-USA resident who bid $413, whereas in the next highest auction ($385), the first loser was a USA resident who bid $380. In the first case, the next lower bid was for a USA resident ($350). So, in the first case, participation by a non-USA resident increased the final price by $63, whereas in the second case participation by non-USA residents had no impact on the final winning price. So, I would agree that in balance, worldwide auctions will increase the odds of getting a higher price than domestic only auctions, but will not assure this with total certainty.

BTW, I had the same experience that you had in reverse. I won a Sinclair Scientific calculator in TAS UK auction, and had to pay over $20 in postage, only to have the idiot seller send it in a thin envelope and the calculator's foam box was severly damaged.

Regards,

Michael

Small samples statistics, but anyway ;)

Re: HP 42S sells for < $100. Statistically....

*Message #10 Posted by **Bart (UK)** on 21 Oct 2009, 5:42 a.m.,*
in response to message #9 by Walter B

Ah, good old statistics. Perhaps you should collect some data and post results here. Taking into account hitwords in the title and description (so we know how to flourish it up without being overwhelming :-)), effect of too low or high starting/reserve price, photos (no. claririty etc.), etc. etc. etc.

Which in the end would give us "on average you can expect". Then when you put yours on, ten others appear. So you could still be the outlier that's lucky to get a high price or the poor chap that gets 1 low bid.

I would have to agree the prices have been coming down on the 42s. during the first two weeks of October, 11 sold on eB**. Of these, the one you mentioned $89 was the lowest of the functional ones, $269 was the highest, and most were around $200.

Until recently, $250-$400 was more the norm.

I catch myself using iPhone emulators more often than the real tings lately. In the HP-42S case - 42s beats the real calculator hands down in any every respect except the keyboard feel; the HP-48GX has hard competition too, namely

m48 - with a bit of work it will be the winner. And all that in your pocket *all the time*. Unless HP comes with something really attractive like Walter's 43s I'm really over with spending any money on HP calc stuff.

A 35s costs, maybe, $50 these days (yes, I'm aware that calc has some issues). You probably spend over twice that EACH MONTH for an iPhone. I will never understand the appeal of emulators. The beauty of HP calculators is the hardware itself, and no emulator can emulate that. And once you buy it, you've got it and you don't have to keep buying it each month.

I will never own an iPhone and I get extreme pleasure out of my REAL HP-65!

Don, that expresses exactly the way I feel.

I greatly admire FREE42, but nothing beats real hardware. There's something special about using my real HP-67 that I've owned for 32 years, or even my real SR-51A that I owned before that, and think about the places in the world that they travelled with me and helped me perform my job aboard a nuclear submarine a third of a century ago.

The magic of these old machines is intimately bound to their physical hardware. Anyone who finds an emulator as satisfying as the original physical machine is likely one who did NOT use the machine at the time that it was originally marketed. He didn't have to budget to buy what was then state-of-the-art hardware (my HP-67 and accessories cost me more than a month's take home pay as a junior officer!). Things like that attach a lot of sentiment (cash value = 0). I really don't know why folks too young to have used these machines in their professional life at the time the machines were current would find them compelling today.

(iphones and blackberrys and dingleberries...just say NO!)

Thanks, Mike. We'll probably hear from the guys who did own and use the original calcs from years ago, and they like the emulators now too. I don't know, everyone's different of course; you like what you like and there's nothing wrong with that.

My first computer was an Apple][and I thought that was revolutionary since it made it possible for a regular person to afford a programmable computer (as opposed to the multi-million dollar IBM and Univac mainframes we used in our regular jobs). Then came the Macintosh in 1984. I remember attending a meeting where Steve Wozniak demonstrated the Mac 128k in January, 1984. I heard the ooohs and ahhhhs when he opened MacWord (I think it was) and demonstrated how to get your font to go bold; just select the text with

the mouse and choose bold from the menu, and there it is, bold on your screen, rather than put a ctrl+b in front of the text you want bold and another ctrl+b after it. That was WYSIWYG, and it was revolutionary in 1984. I went right from that meeting to my local Apple store and ordered my first (of several) Mac. Then, years later, I left Mac-dom and entered the PC world, largely due to the availability of software and more affordable prices of hardware.

I didn't own my 65 until about 2 or 3 years ago. I couldn't have afforded it in 1974, I was still in graduate school when it came out. But it was revolutionary too, in that it was the first programmable handheld calculator, I think. I enjoy it now because of its simple RPN implementation and the fact you can store your programs on magnetic cards, a feature many would love on some of the current line of HP calcs (like the 12c and 35s, for example).

It sure isn't anymore!

I am teaching a couple of sections of Intro Digital Photography at the local University this fall. When I was explaining the benefits of a single-lens-reflex camera, I used the term WYSIWIG, and all I got from the audience of 20-ish students in both classes was a blank look.

I had to explain to this crowd of iphone / windows / facebook / etc. users what WYSIWIG meant! They caught on quickly, but since they were all born after your Mac demonstration, I guess they assumed the world had *always* been WYSIWIG!!

Interesting thread.

I am someone who had an interest in programmable calculators and as a school boy could only afford a Commodore PR100 and then that was a stretch at the time. Never knew much about HP calculators and still wouldn't had it not been for an Itouch and coming across the I41CX+.

Whilst it can't emulate the fell of the real thing ,although it is the case that the creator has tried to emulate the original in every way possible, the reality is that the I41CX+ can actually do better in other ways :

1. You can upload/download programs 2. You have access to almost every module that was created for the HP41 and at no cost 3. You can use knewly created modules and/or updates eg IceBox or SandMath modules 4. You can easliy print programs onto A4 paper (not a till receipt) 5. YOu can try synthetic or machine code programming without fear of permanently locking your machine or having to to soft reset it , thus having to re-input your programs by hand again 6. Its more portable (smaller)

If you were to replicate all of that with original modules etc. then the cost would be north of $1,000. Even using Diego's Clonix/NovRam system it is going to cost you around $300 to $400.

Plus of course you can have other emulators on your machine !

I do understand the pleasure and tactile feel of the real thing, especially if you owned the original when you

were younger or still have it, but you shouldn't be so dismissive of the Itouch/Iphone emulators if you haven't tried them, as some of them ain't that bad and in many ways they are actually helping to maintain or even stimulate interest in the real thng !

What do you mean? iPhone is a phone and what I spend on a phone has nothing to do with the emulators. I also have iPod Touch running the same software.
I got HP-35S sn CNA72102367 couple of weeks after its release.
You got me wrong, it's not about money at all; I can't carry calculators on me all the time like I do with the phone. Then I use the emulators to do some calcs and not to enjoy their beauty. The latter applies to women in my case ;)

Cheers

A good emulator on a smartphone with a big display on a keyless face would be handy, and might approach the usability of the real thing. I have Thomas Okken's Free42, but use it only for program tests

that require substantial processing power and for program archival.

> Quote:

Questions about speeding up 48sx

*Message #1 Posted by **Martin Pinckney** on 18 Oct 2009, 8:51 p.m.*

I am looking for someone here with experience speeding up and/or changing the HP 48sx user interface.

I have found SpeedUI, Java, and Meta Kernel on http://www.hpcalc.org

The description for SpeedUI specifies "For the 48G series only".

The descriptions for both Java and Meta Kernel Full Version are silent on this, stating only for "HP 48".

I have read "A comprehensive review of the Meta Kernel ROM card", also on hpcalc.org, and it says that it works with the 48gx only. But this was a ROM card that is (presumably) no longer available. "Meta Kernel Full Version" is designed to be loaded onto a 128k RAM card, which I have.

Based on the descriptions, I am very interested in trying either Java or Meta Kernel on my 48sx.

Any thoughts? Thanks in advance.

Re: Questions about speeding up 48sx

*Message #2 Posted by **Nacho** on 19 Oct 2009, 4:15 a.m.,*
in response to message #1 by Martin Pinckney

Dear Martin,

I have seen in another post that you were trying to speed up your 48SX.

MK works only for 48G series.

remember that Port 0 of a 48SX only has 32KB and to download the MK you will need to 256kb Port 0 (128Kb) and Port 1 (memory card 128k)of a 48G.

So in a 48S series via that way it is no possible.

:(

Regards,

Nacho

Re: Questions about speeding up 48sx

*Message #3 Posted by **Martin Pinckney** on 19 Oct 2009, 7:31 a.m.,*
in response to message #2 by Nacho

Nacho,

Thanks for responding, although not the answer I was hoping for!

Are you saying that memory available for downloading is the issue? I have access to a 48gx for downloading and setting up the 128k RAM card; then could the card be transferred to and used in the sx? Thanks.

Re: Questions about speeding up 48sx

*Message #4 Posted by **Nacho** on 19 Oct 2009, 7:56 a.m.,*
in response to message #3 by Martin Pinckney

the correct answer is not memory problem but incompatibility.

Remember G and S series work the same way with USER RPL programs but ROM's differ a lot.

No chance.

Mr Raymond del Tondo perhaps can give more information about SpeedUI and 48S series.

Write him, he is the creator of SpeedUI.

Regards,

Nacho

Re: Questions about speeding up 48sx

*Message #5 Posted by **Martin Pinckney** on 19 Oct 2009, 1:55 p.m.,*
in response to message #4 by Nacho

Nacho,

Remember I was asking about Meta Kernel, not SpeedUI.

I thought your first answer was that there was not enough memory available in Port 0 for downloading, thus the reason for my further questions. Thanks.

So am am still wondering if anyone knows of similar software written for the sx.

Re: HP 41CX locked in program mode

*Message #6 Posted by **Raymond Del Tondo** on 19 Oct 2009, 5:44 p.m.,*
in response to message #5 by Martin Pinckney

On an SX, I'd suggest using JAVA, as it has a relatively small footprint, and works fine.

However I'd suggest upgrading to the HP-48GX,
since the GX is much better than the SX in almost all respects,
except maybe regarding the keyboard legend colors,
which are a matter of taste;-)

After downloading Java (I haven't installed it yet), I was indeed delighted to see that it does work on the SX.

Can you confirm, then, that Meta Kernel **will not** work on the SX platform? I still would prefer it, since it seems to have more features than Java.

> Quote:
>

Well, you hit on it. It's not only the color scheme, it's the inset logo instead of painted on, it's the molded key legends, it's the "Made In USA" on the back; in short, the overall impression of build quality.

My 1996 Singapore GX has moulded key legends and is every bit as solid and well constructed as my earlier SX.

I'd just forget the SX and go for a good GX. The GX is faster anyway, has more memory, has a much better display, features some powerful and very useful software enhancements and then to top it off, can run SpeedUI as well.

My SX lies idle which saddens me as it has special significance to me but the reason it is idle is simply that the GX is so much better. Get yourself a GX and I really don't think you will regret it one iota.

Mark

I confirm that the Meta Kernel don't work on a SX platform.

I agree with Mark that Singapore made HP48GX are good as USA made SX from the quality aspect. My latest Singapore made HP48GX from 1997 (with new serial number format) has still molded key legends.

My Indonesia made GX from 1999 has painted key legends. Also the key tactile feeling is quite worse. When the are older you may sometimes hear something which sounds like a releasing spring when you release a key on the calculator. You shouldn't buy an Indonesia one for every day usage. Most of all sold GX have ROM rev. R, all other calculators with a different ROM rev are IMHO only interesting for collectors.

I personally still use the SX but only in emulated form on Emu48. In this environment I have no speed problems at all.

Cheers

Christoph

Re: HP 48SX improved user interface options

*Message #10 Posted by **Martin Pinckney** on 22 Oct 2009, 7:49 a.m.,*
in response to message #9 by Christoph Giesselink

Thanks to all for your responses.

I actually have three well-worn Indonesia GX's that I "inherited" when I bought my engineering company from my former boss (well worn because they were used as data collectors). Interestingly, two of them have the **same** display as my SX - greenish background with blue foreground. The third has a slightly less green background with black foreground. Personally, I find the two types different, but contrary to what most posters say, I don't find either particularly better than the other.

All three have painted key legends.

To me the impression of build quality is more than just physical sturdiness, it is all of the other more subtle things I mentioned, as well. I guess my preference still goes to the SX, in spite of its limitations. Too bad about Meta Kernel. I will try Java and report back on my results.

HP42S upgrade and opening... pictures ;-)

*Message #1 Posted by **geoff quickfall** on 18 Oct 2009, 6:31 p.m.*

Just a short note.

It was brought up that opening a Pioneer by removing the keyboard overlay and then drilling the eight heat stakes may be risky or destructive. I thought I would post these results to let you be the judge.

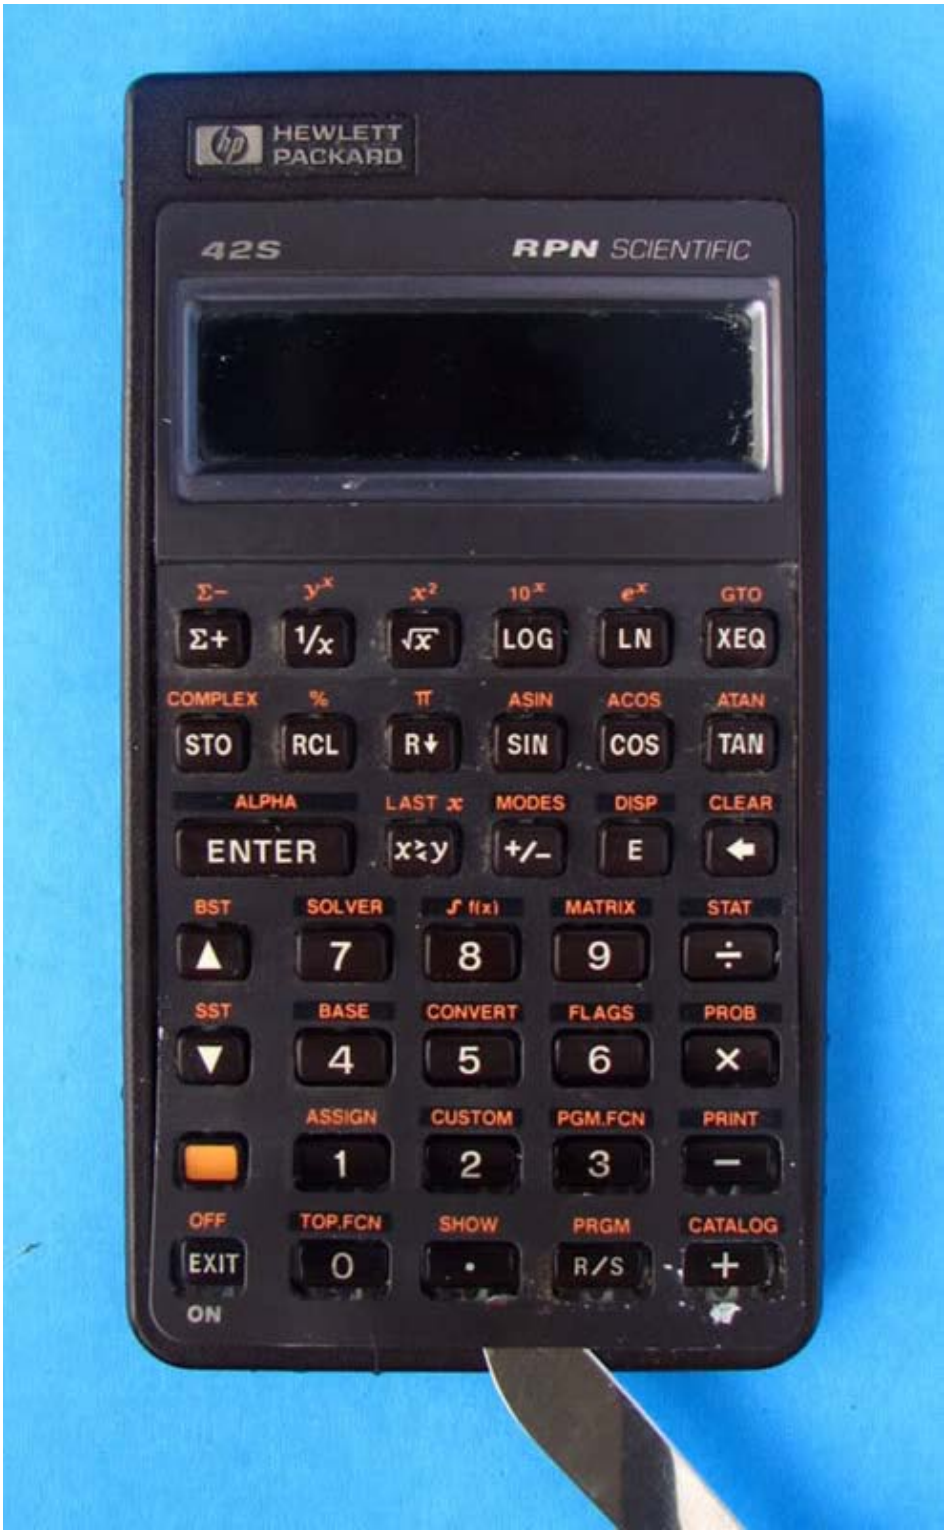
I tried the force full pry technique on a 48SX and was not happy with the results. Suffice to say it is working, looks good, but now has a wavy keyboard due to the forceful separation of the shells without predrilling.

Now when I say drill out the heat stakes I mean just enough to separate the shells and yet provide a snap back into position without the aid of glue.

Here are some shots of the procedure. I have completed 3 restorations and while inside the 42s I also upgraded the memory to 32K. Of course this will all be found in the book in greater detail 8-)

By the careful application of a little heat to the keyboard (warm but not hot to the touch), just enough to soften the glue you can pry the overlay off the calculator starting at the bottom as pictured. Note the flaked paint at the lower right hand corner.

'Calculator one' non-functional with corroded overlay:



While peeling the overlay back, do not bend it at such an angle that it creases.

'Calculator one' non-functional with corroded overlay. This calculator still needs the overlay touched up but has had the contact foam replaced, keyboard circuit cleaned and memory upgrade:

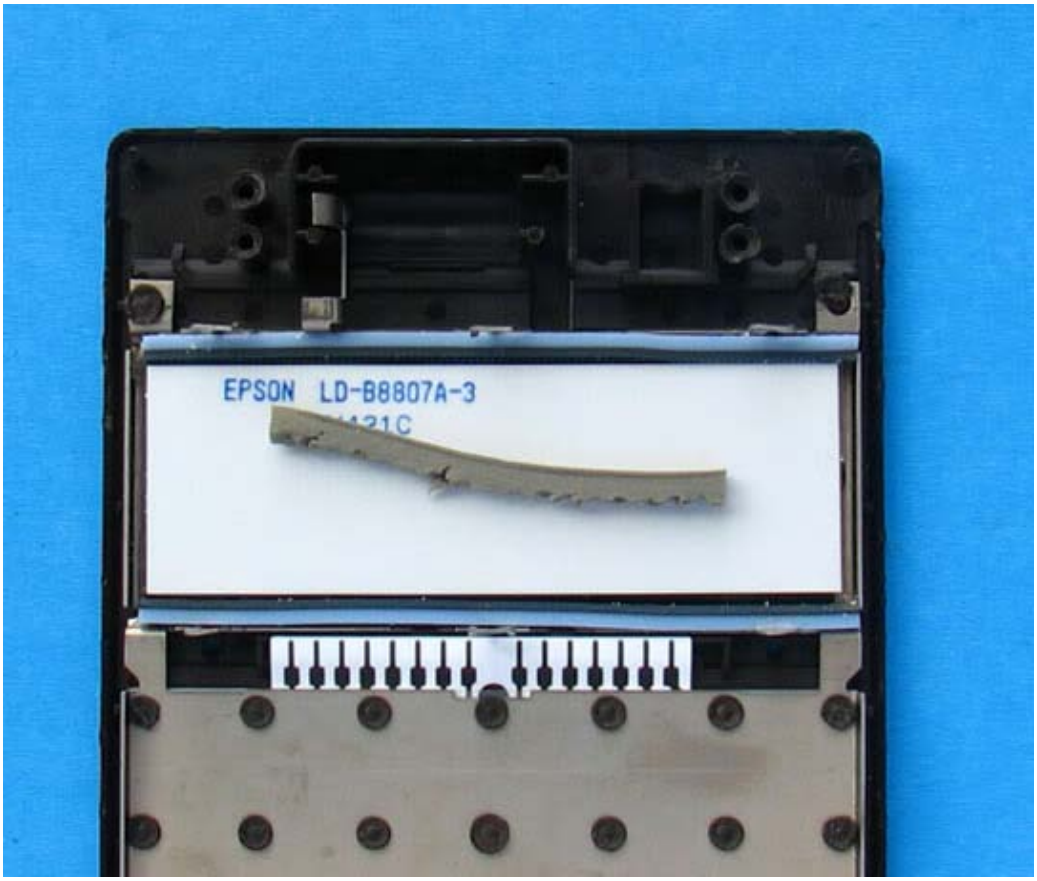
Here is a shot of two overlays looking at the back. The one on the left has had the adhesive removed. Once off, the overlay can be placed between two vinyl sheets on a flat surface. By rubbing a large spoon, bowl side touching the vinyl, the overlay can be flattened as seen below. Of course do not flatten the factory folds! The one on the right has not had the adhesive removed or been flattened yet.

The overlay pictured below had some corrosion on the bottom right corner which had caused flaking paint prior to it's

removal (see above). I am currently experimenting with paint but need an airbrush to correctly and invisibly apply it. At the moment the overlay is flat and crease free and could be placed back on the calculator with contact cement. Note the available memory!

'Calculator one' with corroded overlay:

The offending foam used for pressing the keyboard flex PCB into the logic PCA:

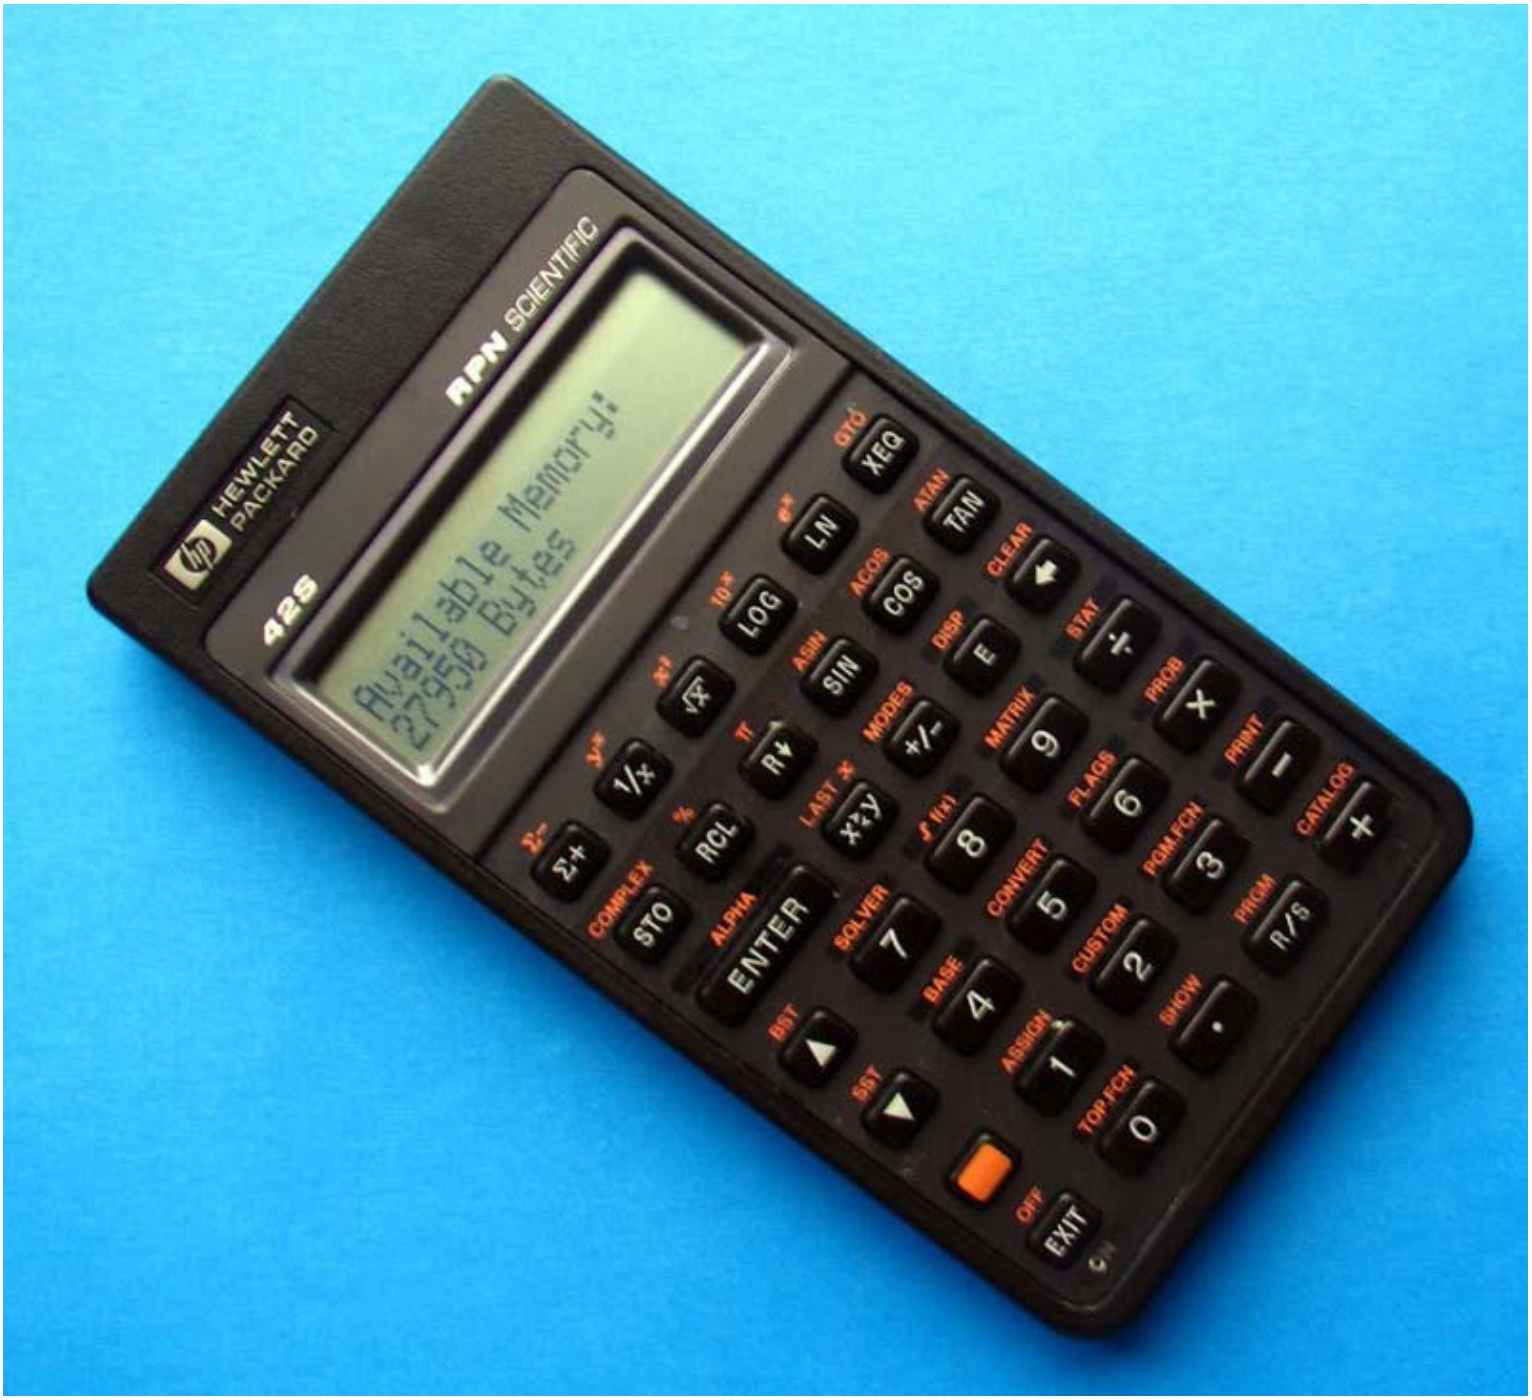


The heats stakes under the overlay prior to drilling:

The heats stakes under the overlay after drilling, you can see just how little needs to be shaved off the top of the heat stake:

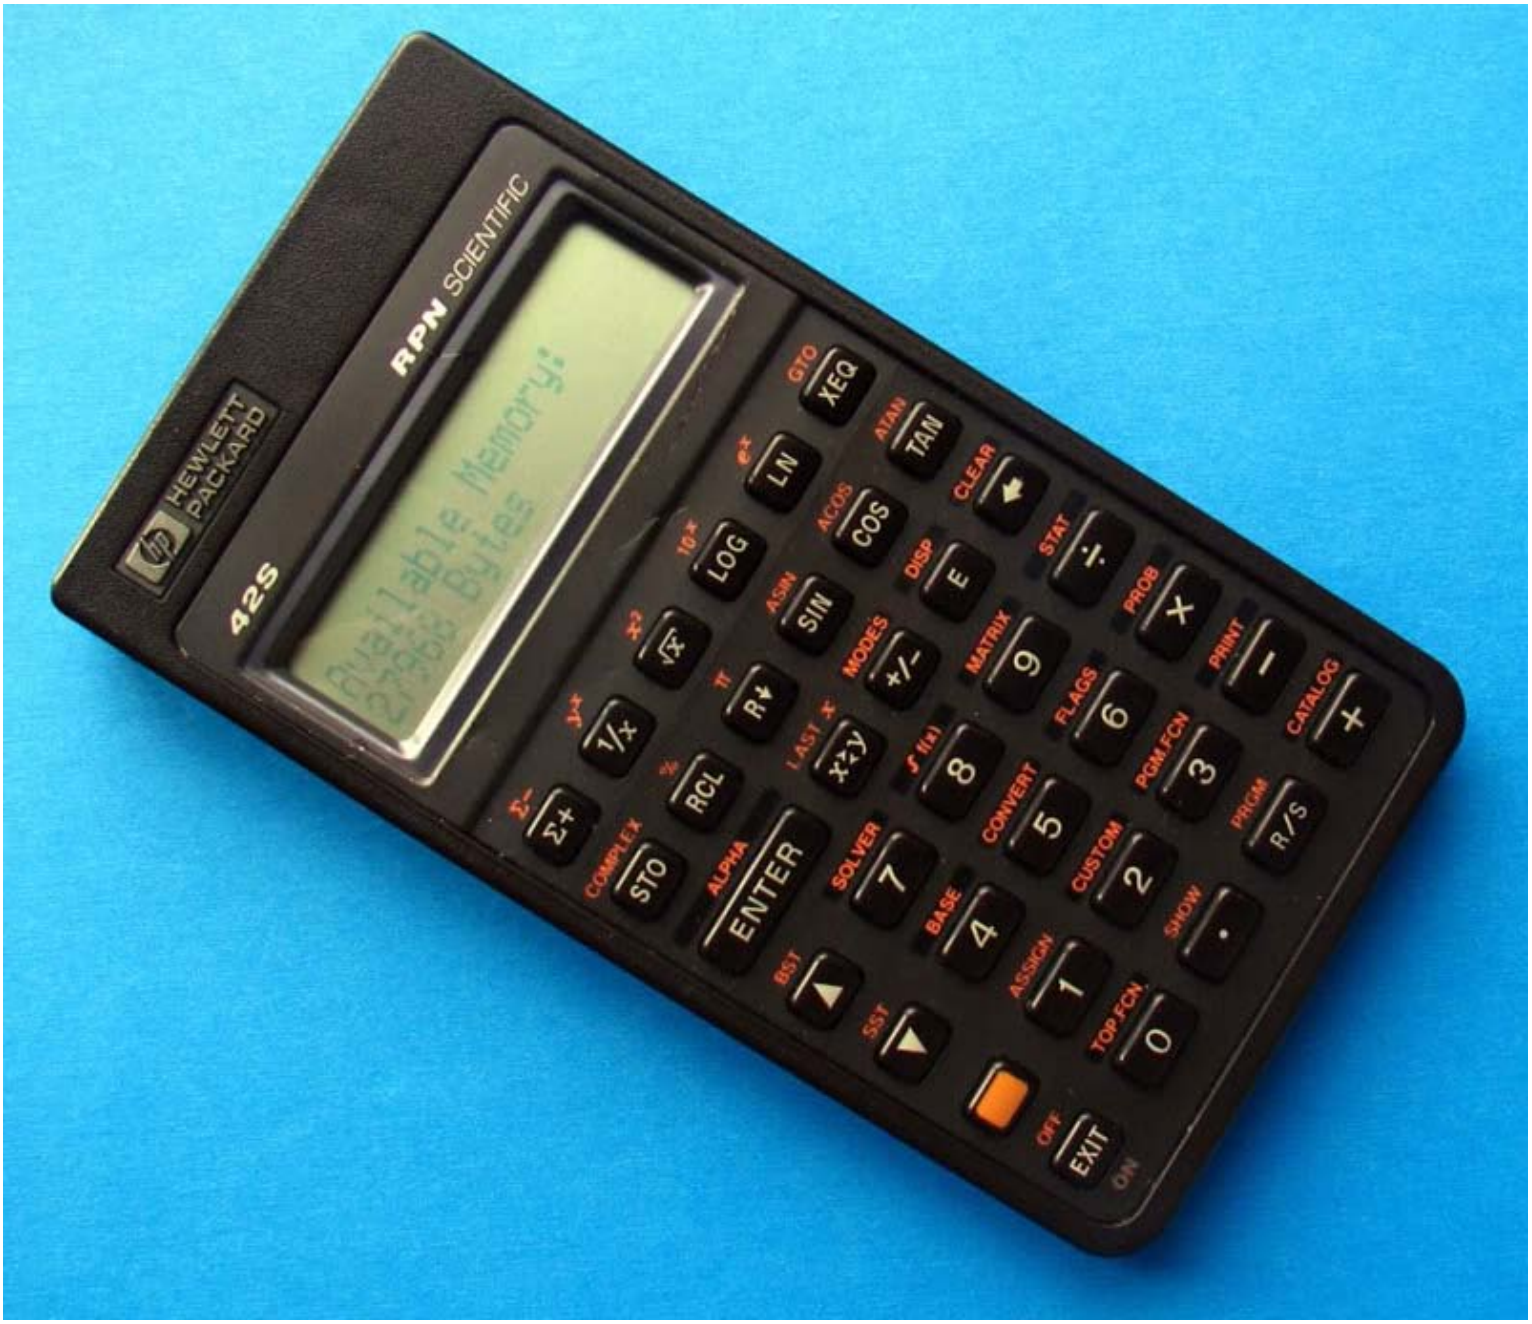
Of course what good is all this unless you have an after picture. This is one of the three. It had and almost perfect keyboard and I was reticent to open it up until I had experimented on the two non-functioning beat up versions.

Minty version with six small glue dots. This was used by a company in Britian that had overlays produced and then affixed to the keyboard overlay with six small dots of glue. I have removed as much of the glue that I can (mechanically) without harming the overlay. Both the next pictures show completed upgrades and restorations. The memory of 27,xxx reflects the available memory after the upgrade and my suite of progams have been loaded:



Here is a shot of a beat up version. The overlay was removed, keyboard cleaned as well as PCA and LCD panel and the offending degraded foam was removed which supplies the force to allow the keyboard flex PCB to contact logic PCA. The memory upgrade completed and then the whole thing bundled up. This overlay had dents and scratches. The spoon and vinyl method removed the dents and flattened the overlay after the adhesive was removed. The scratches were touched up with a combination of black and brown felt marks.

'Calculator two' non-functional with scratched and dented overlay. This calculator also had the overlay touched up, contact foam replaced, keyboard circuit cleaned and memory upgrade:



All three calculators snapped together with a healthy 'snap' yet allow me to open them if required. The overlays were affixed to the calculator with contact cement judiciously placed on the both surfaces.

I think they turned out alright and it is my opinion, having opened stretch and normal pioneers, that I prefer the keyboard overlay removal and heat stake drilling. If you try this experiment do it on a TOTALLY dead HP pioneer.

Cheers, Geoff

in response to message #2 by nacho

Hello Nacho,

Nice work. I will be trying the credit card method on an HP48SX with bad keyboard flex PCB and logic PCA contact. The foam again!

I will let you know how it works. I will also include the technique in the book as an alternative.

I can't read the RAM chip, did you upgrade the calculator RAM to 32K?

Also, did you remove the LCD for swapping purposes with one the worked?

Also, did you modify the stakes for re-assembly as I have found they do not go back into their holes easily, at least on the 4 I have done with the pry apart method. I had to shave the mushroom head shape (narrow it) before they would snap back into place.

Cheers, Geoff

Re: HP42S upgrade and opening... pictures ;-)

*Message #4 Posted by **nacho** on 19 Oct 2009, 4:06 a.m.,*
in response to message #3 by geoff quickfall

Hello Geoff!

I did not any upgrade to the 42S!

I removed the LCD because I cleaned all the Keyboard and Overlay intensely, they were plenty of dust!

I put the Keyboard in a recipient with distilled water and then with some neutral soap and a toothbrush I cleaned all the keyboard and overlay. A shame I did not the before pics.

To do a re-assembly I have always to shave the mushroom head shape, if not, it is impossible to assemble it well.

The calc was not very well treated, but now (the calc) is living a 2nd life.

Regards,

Nacho

FSl164A hp-il/RS232 Interface Power Supply

*Message #1 Posted by **Andy Delano** on 18 Oct 2009, 3:20 p.m.*

I am trying to determine the voltage/polarity for the FSl164A's DC power supply. The FSl164A was produced by Firmware Specialists and is very similar to the HP82164a.

Thanks, Andy

Re: FSl164A hp-il/RS232 Interface Power Supply

*Message #2 Posted by **Garth Wilson** on 18 Oct 2009, 3:54 p.m.,*
in response to message #1 by Andy Delano

9VDC, center positive.

The FSI164A was almost 100% instruction-compatible with the HP unit, but came with two RS-232 channels standard, and optionally up to 8, had deeper buffers, and also had a battery power option. I do believe FSI had told me there was a bug with even parity, but I never used the parity.

Re: FSl164A hp-il/RS232 Interface Power Supply

*Message #3 Posted by **Andy Delano** on 18 Oct 2009, 4:38 p.m.,*
in response to message #2 by Garth Wilson

Thanks! Does yours have the battery option? Mine does not but I was thinking it might be something I could add.

Edited: 18 Oct 2009, 4:52 p.m.

Re: FSl164A hp-il/RS232 Interface Power Supply

*Message #4 Posted by **Garth Wilson** on 18 Oct 2009, 7:27 p.m.,*
in response to message #3 by Andy Delano

I don't have the battery option, but since it has a DC input, it would be easy to have an external battery pack plugged in.

I think this was one of three different things with EPROMs in it that I refreshed recently and kept hex files on, since EPROMs don't hold their data indefinitely. I wanted to just read the EPROM into the programmer and then program it back before some of the contents were gone for good. I believe I also did it for my HP92198 80-column video interface and my 82169A HPIL-to-HPIB interface converter. I'd like to do it for the BIOS ROMS for my DOS PC too, but that's the PC the EPROM programmer works on.

Re: FSl164A hp-il/RS232 Interface Power Supply

*Message #5 Posted by **Klaus** on 19 Oct 2009, 2:30 a.m.,*

in response to message #4 by Garth Wilson

Hi Garth, you can hot-plug the BIOS-EPROMS, remove them after the PC has booted, and reprogram them.

restoring an HP-01 keyboard

*Message #1 Posted by **Alberto Fenini** on 18 Oct 2009, 8:02 a.m.*

dear all, i'm trying to get to near mint conditions my HP-01, which has some discoloration on the rigt side of the keyboard. It doesn't affect the keys or the functioning, but, I'd like to have it fixed. I've tried (with poor results) with a black CD marker softpen, does anyone of you has ever tried anything better than this ? Thx for help, Alberto

Re: restoring an HP-01 keyboard

*Message #2 Posted by **Rainer Wiedemann (Germany)** on 18 Oct 2009, 11:58 a.m.,*
in response to message #1 by Alberto Fenini

Ciao Alberto,

a couple of days ago I read **this** article. The author also describes the restoration of keys and keyboard. IMHO the procedure is very delicate and one can do a lot of damage. Another interesting thing about this article is, that the author has done a reproduction of the red watch crystal and is probably sharing (selling?) it.

I'll be glad if you would post a story of success with pics, when you're done. I'm still looking for an affordable one (which should be in a condition that still allows for refurbishing).

Good luck.

Regards,

Rainer

Re: restoring an HP-01 keyboard

*Message #3 Posted by **geoff quickfall** on 18 Oct 2009, 12:51 p.m.,*
in response to message #1 by Alberto Fenini

Hello Alberto,

A quick response, unfortunately the CD 'sharpie' marker are temporary at best.

I am hoping for an air brush system for Christmas (or I will just buy one). I saw a posting about building up the finish with an air brush. See the link Ranier posted as he beat me to this!

Again this should last longer then the airbrush but it has not got the durability of a paint that was baked on as the original is.

Sorry, no help here but if you have an air brush that might work better.

I have done eleven restorations to date for people on the HP-01 and even made my own crystals from armoured plexi glass. These do not have the Hewlett Packard label/name on them. I prefer the armored plexiglass as it can be polished at any time to remove scratches. The mineral glass can be polished with water

and diamond paste only when removed from the watch, even then it is a long involved process.

If your crystal does not have any major chips from the corner (pictures?) then after removing the movement the crystal can be removed and flipped over.

I will email you later and DO NOT start a dis-assembly UNLESS you know what you are doing!!!! Removing the battery holder can destroy the PCB if allowed to rotate.

Cheers, Geoff

*Message #4 Posted by **Alberto Fenini** on 18 Oct 2009, 4:47 p.m.,*
in response to message #3 by geoff quickfall

ciao a tutti !(hi everybody), and again thank you very much for you help.

Again, I'm not disassembling the watch, I admit I'd love it, but I have waited to much for it. I'm attaching an image, please considered I have already polished the bracelet (again thanks for help in shortening it) and changed batteries. As you will see it's in fair conditions, but, I'd like to fix the right side of the keyboard painting (that's the most annoying thing to me)

I have tried with the CD marker, but I don't like very much the result, if you look closely at the watch you can see an additional layer of painting. Any, and I mean any, suggestion will be appreciated. Take care, alberto

Re: restoring an HP-01 keyboard paint

*Message #6 Posted by **geoff quickfall** on 18 Oct 2009, 5:24 p.m.,*
in response to message #5 by Alberto Fenini

Nice watch and the keyboard doesn't look bad!

The airbrush technique is the only semi permanent way of repair that I have seen.

Your crystal is an excellent canditate for flipping up side down but of course the hewlett Packard would be missing.

It is amazing how much a good crystal changes the appearance of a watch.

Did you get the email I sent?

Cheers, Geoff

41 RCL MATH - 30 years later...

*Message #1 Posted by **Ángel Martin** on 18 Oct 2009, 6:51 a.m.*

Sunday News on the venerable 41 field, to somebody's surprise still happening these days...

After wrestling for a while with the NEXT1 and NEXT2 MCODE routines I've added a couple of ideas to the SandMath module, which you could call " funtion launchers".

The first one is HYP, a prefix-like function used to access the six hyperbolics functions on the module. It has a more logical keyboard layout, assigned to the SIGMA+ key it saves 5 key assignments, valuable to allocate other functions from the same rom to the keyboard. Hate it or love it, it works great and was great fun to programm.

The second one is RCL#, an extension to the native RCL function that allows the arithmetic functions to be invoked from the keyboard in a convenient manner. It mimics the STO user interface, so you can key in +,-,*,/ and also supports IND addressing. Try it out for size... It's also a launcher in that it'll transfer the execution to one of the module's RCL_Math four functions, or to the mainframe RCL.

Coming soon to a TOS near you...

Edited: 18 Oct 2009, 7:54 a.m.

Re: 41 RCL MATH - 30 years later...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 18 Oct 2009, 3:48 p.m.,*
in response to message #1 by Ángel Martin

Hola, Ángel; ¿que tal?

First of all, congratulations! Your HP41-addressed ROM´s are an actual inspiration to us, who like building our own stuff. Being more a 'hardware guy', I'm always tricked with SW development because I can not set hardware apart when seeing each code, so I cannot go ahead developing machine code without a good deal of knowledge about the hardware. Anyway, I´m not afraid of going ahead and trying my own HP41 ROM. I´ll get back with this subject later...

For now, one request/suggestion: wouldn't you be interested on writing down your own experience (like the one you started this thread with) and compose a collection of HP-41 ROM 'how to´s ? Either a complete text or a collection of directions, like the ones you have been posting here and some others you did not actually mentioned when facing and solving new problems. That would help a lot developing new code along with the many other literature. Something like an extended version of the notes you added in the module-s blueprints... c]8^) This way, anyone else creating their own ROM would contribute the same.

This is just an idea, a suggestion. What you have already done is gold, my friend.

Cheers.

Luiz (Brazil)

Re: 41 RCL MATH - 30 years later...

*Message #3 Posted by **Ángel Martin** on 19 Oct 2009, 3:53 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz, glad you're interested in these enhancements... not many people left these days, I actually wonder about my sanity sometimes :)

By all means go ahead and try your hand at your MCODE routines. It's kinda hard (not being a computer scientist but an old fashioned EE) but beware, it's very addictive.

I'm not sure there's much of generic procedures to write up, just common sense programming practices and lots of trial & error. VASM listings are a must (I discovered it the hard way, i.e. by not having them) and using a good environment is vital (I'm still behind on that, somehow got used to the "blueprints", call it hand-made if you wish).

There's a lot in those 12k called "mainframe ROMs", plus all the plug-ins and accesories. I just scratched the surface, nothing more than that - but lots of fun in the way. Will keep it up!

Best wishes.

Ignorant TAS Seller!

*Message #1 Posted by **Michael de Estrada** on 17 Oct 2009, 6:40 p.m.*

There is an auction for an HP-67 in which the seller states in part:

"I recently purchased the calculator at a local estate sale. I don't know a lot about the calculator but I'm sure there's someone out there who can appreciate its complexity.....The calculator does not have a battery or adaptor, so I haven't been able to see if/how it works. There is also a copper prong missing in the battery compartment. I don't know if the prongs are essential or if they're **just a cushion or spring for the battery**."

Also, in another place the magnetic cards are referred to as "labels". Well, I guess that is partially correct.

Oh well, maybe someone will pick it up cheaply for parts.

Re: Ignorant TAS Seller!

*Message #2 Posted by **Don Shepherd** on 17 Oct 2009, 9:49 p.m.,*
in response to message #1 by Michael de Estrada

Perhaps the seller does think that the copper prongs are springs to hold the battery in place. Having an HP-65, I can see where someone not familiar with these HP's might reasonably think that.

Re: Ignorant TAS Seller!

*Message #3 Posted by **Michael de Estrada** on 17 Oct 2009, 10:01 p.m.,*
in response to message #2 by Don Shepherd

Oh, come on Don. Even my 6 year old grandson knows that batteries need some sort of metal contacts to work, and those are the only metal items inside the battery compartment. Maybe this seller hasn't seen the battery compartment of an HP 65 before, but surely other electronic devices or maybe even changed the batteries in a flashlight. I think you are being too tolerant of just plain intellectual lethargy.

Edited: 17 Oct 2009, 10:02 p.m.

Re: Ignorant TAS Seller!

*Message #4 Posted by **Don Shepherd** on 18 Oct 2009, 12:44 a.m.,*
in response to message #3 by Michael de Estrada

If he has changed the batteries in a flashlight (and I think we can safely assume that anyone beyond the age of about 5 has probably done that), then he knows that sometimes springs are required to ensure a good contact. Most battery-powered devices that use commonly-sized batteries like C, D, AA, and so on, use springs of some sort. He might think that the copper prongs could be springs, I think. I'd give him the benefit of the doubt. He's obviously not knowledgeable about HP calcs.

Look, he said one of the copper prongs is missing. Anyone who would spend more than a few dollars for this calc is likely an HP collector or user who would know exactly what that means, so he's not

trying to hide anything, it seems to me.

I mean, I wouldn't put this guy in the class of the infamous coburlin who sells ratty-looking HP calcs for prices that are extremely inflated (assuming this auction is not BIN for $800). I just don't think this fellow is materially trying to misrepresent this calc, based on the information you provided here. I could be wrong, but since I'm not interested in buying this particular calc, it's a moot point to me.

Re: Ignorant TAS Seller!

*Message #5 Posted by **Michael de Estrada** on 18 Oct 2009, 2:48 p.m.,*
in response to message #4 by Don Shepherd

I wasn't trying to imply that the seller was attempting to mislead anyone, only that I am amazed that he could think that the "prongs" were merely some sort of spring or retention device and not needed for operation of the calculator. In the vast majority of cases, the springs inside the battery compartments of electronic devices, are essential because they are in fact the electrical contacts as well. Since there were no other metal items or wires inside the battery compartment, then one should assume that the broken "prong" was required. I definitely was not trying to put the seller in the same class as the infamous Mr. C.

Re: Ignorant TAS Seller!

*Message #6 Posted by **bill platt** on 18 Oct 2009, 2:15 p.m.,*

Connecting HP-110 to a 9122D floppy drive

*Message #1 Posted by **John AS (UK)** on 17 Oct 2009, 6:18 p.m.*

Hi,

I have the following set-up:

HP-110 laptop (HP-IL interface) HP 82169A HP-IL / HP-IB interface HP 9122D floppy drive (HP-IB interface / SS-80 protocol)

This set-up works fine and allowed me to format floppies and read-write them. I think the combination of the 82169A + 9122D works the same as the 9114A/B HP-IL floppy drive.

I've also tried the HP-110+ (Portable Plus) laptop and that worked fine too. I had no luck attempting to use an Amigo floppy drive (9121D).

The 82169A has a serial number starting 2512A, the 110+ plus manual states:

"Note: If you intend to use HP-IB disk drives, the HP-IL/HP-IB interface must have a serial number greater than 2406A00000. Otherwise it will cause a bad unit error message."

I've got a friend with an HP-41 and HP-IL interface, I'll report back if this can drive the 82169A + 9122D as well.

Regards, John

Re: Connecting HP-110 to a 9122D floppy drive

*Message #2 Posted by **Eric Smith** on 17 Oct 2009, 9:19 p.m.,*
in response to message #1 by John AS (UK)

The HP-IL module for the 41 doesn't speak either SS/80 or Amigo protocol; it only knows 82161A "Filbert" commands. The mass storage functions won't work any HP disk drives other than the 9114A/B, because those are the only ones that have the Filbert command set.

Re: Connecting HP-110 to a 9122D floppy drive

*Message #3 Posted by **John AS (UK)** on 18 Oct 2009, 3:46 p.m.,*
in response to message #2 by Eric Smith

> Quote:

Thanks Eric, yes I understand the 9114A understands Filbert and SS/80 protocols, I didn't know the HP-41 only supports Filbert.

Can you clarify please about the HP-71 or HP-75, does this also only understand Filbert for mass storage and no other protocol?

Can the HP-86 read files from a 82161A, perhaps via a BASIC program?

(note a similar topic has been discussed before: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=95690)

My friend has some files on 82161A cassettes, we were trying to work out how to transfer them to a PC with the hardware we have (eg no PIL-box).

Regards,
John

Edited: 19 Oct 2009, 11:47 a.m.

Re: Connecting HP-110 to a 9122D floppy drive

*Message #4 Posted by **Eric Smith** on 19 Oct 2009, 11:31 p.m.,*
in response to message #3 by John AS (UK)

The HP-71B (with HP-IL module) and HP-75C/D also only use the Filbert command set for mass storage.

I think you could write a program for the HP-86 with I/O ROM to read 82161A tapes. You just have to address the tape drive, send the appropriate DDT command to get it to read a sector, and read the 256 bytes of binary data that come back.

Re: Connecting HP-110 to a 9122D floppy drive

*Message #5 Posted by **John AS (UK)** on 20 Oct 2009, 3:49 a.m.,*
in response to message #4 by Eric Smith

I found another message in the Forum archive: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=105373 which includes the comment:

"Emu41 and Emu71 emulate the Filbert protocol used on the HP82161 and HP9114, that has nothing to do with CS80 or Amigo. The HP9114 also supports SS80, for use with the HP Portable Plus for instance and SS80 may also be used in the HP-71B Data Acq ROM to access DOS formatted disks."

Interesting! Has anyone got any further info on the HP-71B Data Acquisition Pac (HP 82479A), I couldn't find the manual on-line?

I found the article in the HP Journal

http://hp41.betapersei.com/files/HP%20Journal/HP%20Journal%201986%20Mar.pdf

based on this I doubt if does allow support of SS-80 disks, but would be nice to confirm.

Regards,
John

Silver line above on-off swiths Classics

*Message #1 Posted by **Ronald** on 17 Oct 2009, 11:32 a.m.*

Hi,

I stumbled yesterday in a watch magazine on some articles how to get some silverplating on plastic. You would have to apply some conductive silver paint/precoating first and after that put it in a bowl with some dissolved silver salts and a contra electrode and run some current trough it.

I have never seen any discussion on this method in the forum, any ideas if this would be worth a try. The set is around 40€ so no a huge loss, but if someone already knows this is not working, it saves some money for aquiring new HP toy.

Also I was wondering how did HP do it when it was originally manufacured. Was tho top selectively covered, sprayed with a conductive aerosol and then some silver ions in the air that were by some voltage difference deposited on the plastic, like powder coating?

Kind regards Ronald

Re: Silver line above on-off swiths Classics

*Message #2 Posted by **geoff quickfall** on 19 Oct 2009, 12:45 a.m.,*
in response to message #1 by Ronald

Hello Roland,

My first question: Is this for creating traces for electronics? If so I wonder how glossy or shiny the process would be and how permanent.

The original finish was vacumn plated as with car dashboard plastics.

It would be interesting to see a finished product.

Cheers, Geoff

Programming HP-42S

*Message #1 Posted by **Howard Jones** on 17 Oct 2009, 10:12 a.m.*

I am fairly new to programming HP calculators and I apologize if this question is basic. I am trying to programme the DPLOT programme on pp156-158 of the HP-42 Owner's Manual. I cannot find anywhere how I type in line 27 VARMENU IND "FCN" Thank you in advance

Re: Programming HP-42S

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 17 Oct 2009, 12:37 p.m.,*
in response to message #1 by Howard Jones

Hi, Howard;

every possible HP42S user has already been, at least once, fairly new to programming it too, so... welcome!

Now for the answer. Keep in mind that the IND (for Indexed, or indirect) is added only when the function (VARMENU, in this case) allows it to. And to add the IND after VARMENU, you should use the [.] key. Prior to go ahead, let´s call [SHIFT] key the prefix, golden key right above the [EXIT] key. Thus, considering that the calculator is already in PRGM mode and you can see step # 26 (whatever you have on it):

press [SHIFT][PRGM.FCN];
press [up-arrow];
press [VARM] menu key (actually [1/X]); you should see 27 VARMENU "_
press [.]; you should see 27 VARMENU IND _ _
press [ENTER] key to bring ALPHA menu back;
key in FCN;
pres [ENTER]

If all goes well, you should have your

```
27 VARMENU IND "FCN"
```

in the LCD by now. If not, let us know.

Cheers.

Luiz (Brazil)

Help with credits in the book, please.

*Message #1 Posted by **Geoff Quickfall** on 16 Oct 2009, 7:12 p.m.*

Hello all!

The book is comming along well, of course that is a subjective opinion since I have never written something this large for publication.

Just finished the Pioneer and Stretch Pioneer chapter which gives the following examples:

```
1.  HP 48SX with non functional display and keyboard
2.  HP 42S with non functional display, keyboard and the memory
    upgrade.
```

Here are some unlabled pictures of the 42S restoration and memory upgrade. All this thanks to Tony Duells' postings and emails. The book has many more figures, each referred to in the text and much more helpful then what is pictured below.

Removing the keyboard overlay for access to the four heat stakes.

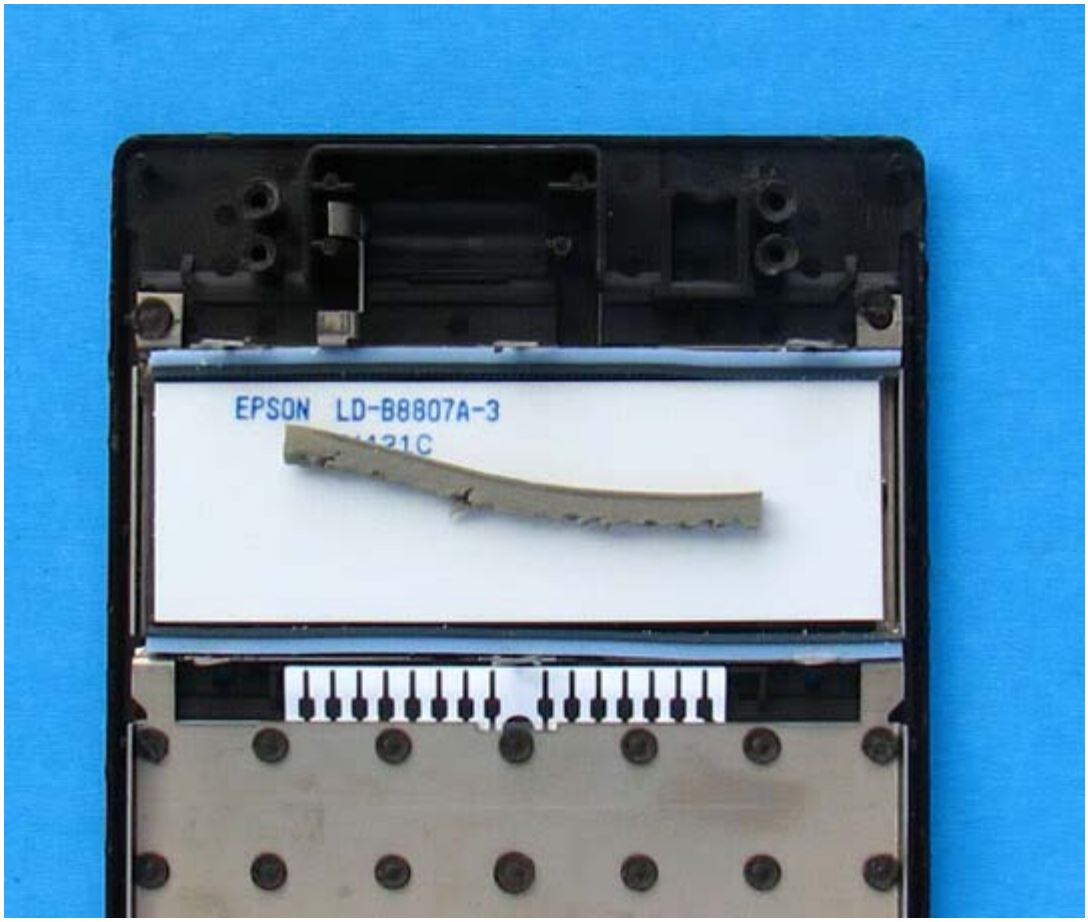
Two keyboard overlays, one with the adhesive and curved from removal, the other with the adhesive removed and reshaped by placing between two vinyl sheets and flattening with a spoon.

Help with credits in the book, please.

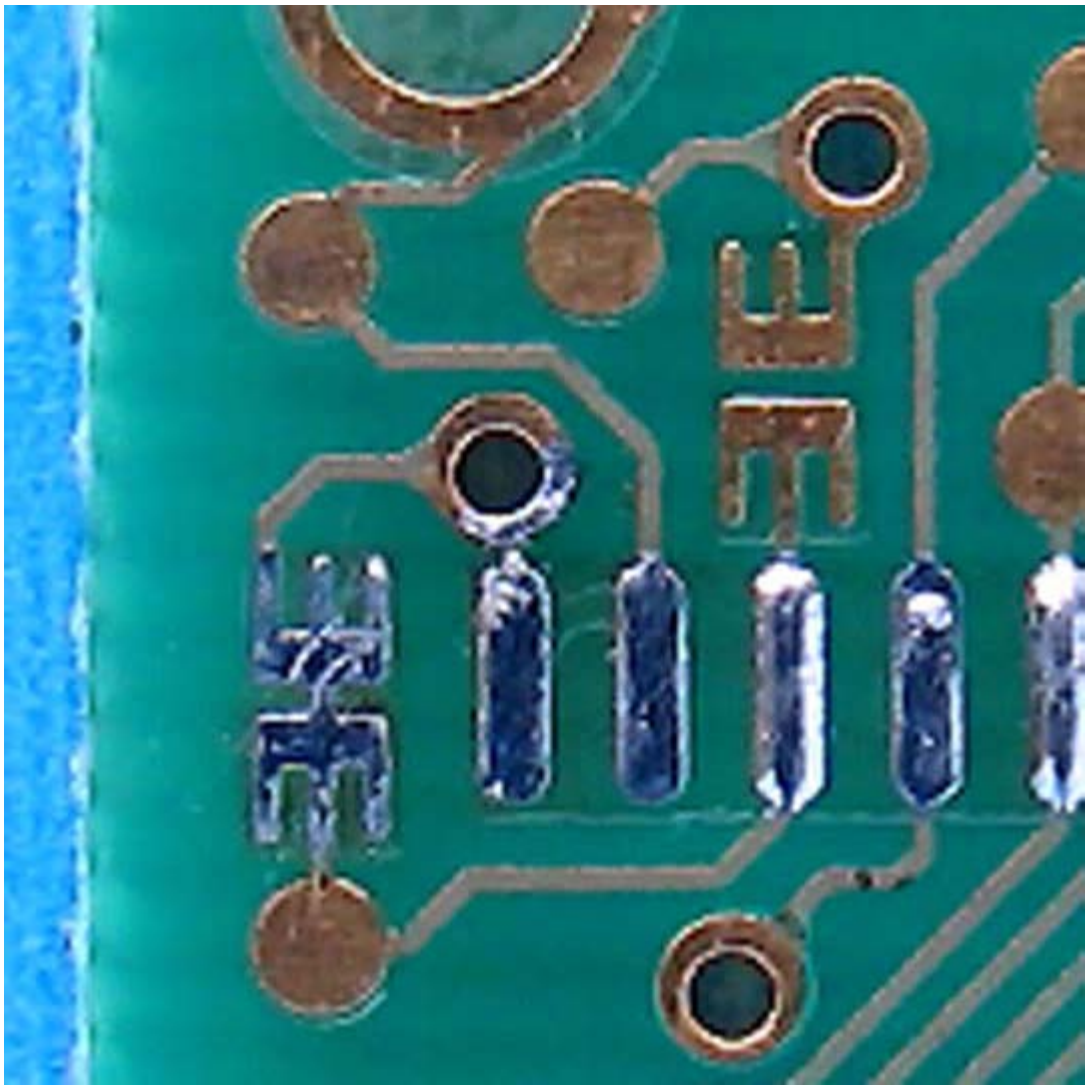
Close up of the heat stakes before drilling.

Close up of the heat stakes after drilling.

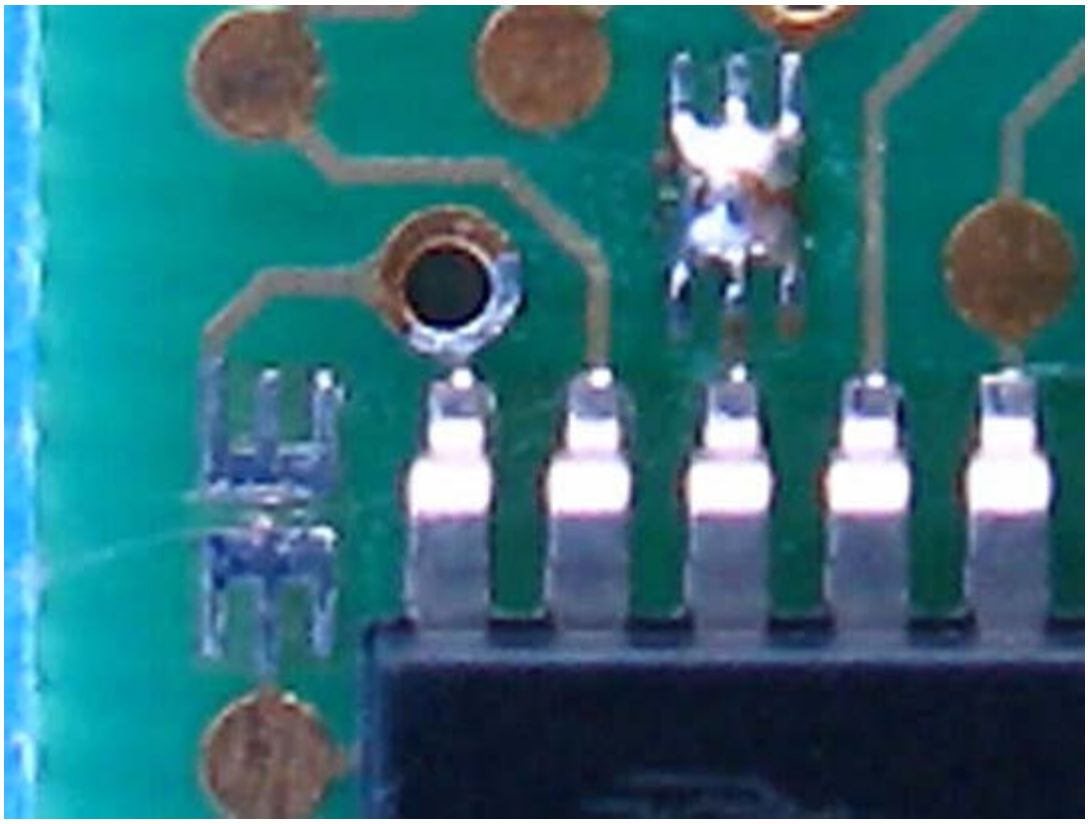
The deteriorated keyboard flex PCB foam insert. The major cause of the failed keyboards on the Pioneers and Stretch Pioneers.



Jumper desoldered showing the trace bridge left after the solder was removed



Close up of the jumper with the trace bridge removed and new jumper in place.



New memory accessable!

_____ ----------

Now for the reason and title of the post. There are THOUSANDS of postings in the archives ;-). Also articles and repair sections of the museum, let along googling the internet for repair techniques.

I certainly do not want to step on any feet when it comes to credit for techniques that have been developed. With that in mind I am compiling a list of peoples names that seem to be the originators of various techniques.

Some obvious names come to mind:

1. Katie Wasserman and the HP-97 topcat printer gear replacement
2. Tony Duell and the increase of RAM for the HP42s
   Tony also came up with a milled brass pinch roller for the 41C!

```
3.  Diego Diazs' flex PCB replacement for HP 41C I/O assembly.

But some are not so obvious:

3.  Vinyl tubing for pinch roller
4.  Dampening couple using wire insulation
5.  Jumper position in the Spice for decimal versus comma separator
6.  Foam insert replacements for Pioneers.
7.  Just saw Luizs' spice wire work around for broken flex PCB
8.  Using vinyl envelopes to smooth out labels that have been
    removed from the backs of the Classics and others.
9.  First occurrence of the quartz crystal application to the
    HP-45.
10. LED block replacements for removing ghosting.  Did this one
    after reading the forum and resurrected an HP-45 and HP-80.
```

The problem is the proper crediting of techniques. Of course a blanket THANK YOU would suffice but I rather be more personal.

For those of you wondering why the book is taking a while; it is going to be 300-400 pages with over 250 figures. It encompasses all the techniques that have been published (hopefully).

I am, however, documenting ALL the restorations in house and this takes time. For example, I need a Spike for photo purposes. I have one being lent to me but I have to get to London to pick it up (thanks Wlodek).

As you see above, I just finished upgrading 3 HP-42S to 32K. Two were non functional off Ebay and once I had documented the successful conversion I then upgraded my HP-42s that I use along with my HP-41C.

```
So does anyone know who originated the following:

1.  Vinyl tubing for pinch roller.
2.  Dampening couple using wire insulation.
3.  Jumper position in the Spice for decimal versus comma separator
4.  Foam insert replacements for Pioneers.
5.  Just saw Luizs' spice wire work around for broken flex PCB.
6.  Using vinyl envelopes to smooth out labels that have been
    removed from the backs of the Classics and others.
7.  First occurrence of the quartz crystal application to the
    HP-45.
8.  LED block replacements for removing ghosting.  Did this one
    after reading the forum and resurrected an HP-45 and HP-80.
```

Cheers, Geoff

Hello Geoff!

When you talk about opening a Pioneer series calc you mean drilling the 4 stakes?

I have opened several Pioneer and never in a so intrusive way.

I mean, drilling damages too much and removing an overlay is very dangerous (aesthetically).

Hope my opinion doesn't bother you.

REGARDS

Thanks for the input. My restorations are just that, restorations...

*Message #3 Posted by **Geoff Quickfall** on 16 Oct 2009, 7:47 p.m.,*
in response to message #2 by Nacho

I am not happy with just fixing the calculator but actually restoring it to the original factory look.

With that in mind, how do you open your Pioneers?

I have used two published techiques. The 'carefully pull apart and hope technique' and the 'careful removal of keyboard overlay' technique, then drill a miniscule amount of the stakes.

Both these techniques were successful, however, the pull apart version does distort the keyboard and mylar film and can cause several stressful moments as well as damage to the stakes and electronics if done incorrectly. It is also not as controllable as the keyboard overlay removal.

The careful application of heat to soften the adhesive and gentle pulling will remove the overlay without damaging it is the secret. The technique of removing the adhesive with adhesive remover and then flattening the overlay by rubbing it with a spoon while sandwiched between two sheets of vinyl has restored the overlay to perfect condition. It then is a simple process of gluing the overlay back into position.

All three 42S that I just did were using the keyboard overlay removal. Also, the stakes are drilled just enough to allow the shells to separate with some force but definitely less then the pry apart techniqe described. This allows the keyboard to be reapplied and the shells to snap back together. Also this allows continued access to the insides if done correctly. With the cautious application of drilling the shells will actually snap back together tightly.

I have successfully opened the Pioneer series and Stretch Pioneers series by removing the keyboard overlay (actually quite easy) without damaging them.

I have also opened them by carefully prying the heat stakes apart (much harder). I prefer the overlay technique described to me by Tony Duell.

After regluing the overlay back in place, all three calculators look perfect. The added bonus of having the overlay off is the ability to clean the keys of debris and the overlay. It also allows one to touch up the overlay with paint if required prior to replacing it.

Unless you have a third option (secret?) I recommend the removal of the overlay and the drilling of a very miniscule amount of the heat stakes versus the prying apart of the calculator with force. This is of course explained in the book as all techniques are included.

By the way I have restored six 48s and four 42s, a 32S and a 32SII and all look brand new.

Hope this explains the technique a little more, for a full explanation you will have to wait for the book.

Cheers, Geoff

*Message #4 Posted by **Nacho** on 16 Oct 2009, 8:07 p.m.,*
in response to message #3 by Geoff Quickfall

Hello Geoff,

Thanks for the explanation!

I have to say that I like very very much the way you restore the calcs, they look very nice and new.

I surely will buy the book.

I have opened several 48 series (mem upgrade) in my university years and repaired some and replacing original (blue LCD to black LCD) parts from 49 bad working units.

I'm not a perfectionist like you! but the way I open calcs has never damaged any calc.

the first time I opened a 48 I did the way you are telling here and I destroyed the overlay...

So I searched and found other ways.

It is true that the way of pulling creates more stress.

I open the calcs with 3 or 4 credit cards, these plastic cards don't damage the body of the card, and little by little it is possible to pull the stakes.

After that the calcs don't look opened.

And if the calcs in case of 48 series are singapore or USA versions (stronger than indonesia ones) I use a metal credit card.

in response to message #4 by Nacho

Thanks again!

You just cleared up a question I had as I remember reading about your credit card use for opening the case.

I actually tried this on a 48SX which needed a new foam insert. Unfortunately it took hours on my particular calculator (U.S.) and it was extremely tough. It was not the technique but the calculator I am sure!

In any case both methods are explained and your use of the credit card (hotel key?) is excellent. I was using peg wood for the same reason, so the calculator would not be damaged.

In any case, I still prefer the keyboard overlay method if done correctly, but thats me! And the minimalist drilling of the stakes.

Cheers, Geoff

*Message #6 Posted by **Katie Wasserman** on 16 Oct 2009, 9:26 p.m.,*
in response to message #5 by Geoff Quickfall

Geoff,

I think that giving specific credit is hard to do as many repair ideas were hashed out here over the years by many people with much back and forth dialog. I think a blanket credit to the Museum Forum members and especially Dave Hicks for facilitating all this would do nicely.

-Katie

Re: Thanks for the input. My restorations are just that, restorations...

*Message #7 Posted by **Geoff Quickfall** on 16 Oct 2009, 9:28 p.m.,*
in response to message #6 by Katie Wasserman

Thanks Katie,

I would tend to agree but as with cases such as the topcat printer the cudos are obvious ;-)

After all provenance for discoveries is an on going thing, just look at my field (Botany/Forestry) names of plants keep changing as an earlier paper is discovered describing a certain species.

So a blanket thankyou (already typed it out in the intro) should suffice. Any other ideas!!

Cheers, Geoff

in response to message #8 by Lyuka

Lyuka,

Thanks and yes, they are beautifully documented and photographed. However the dates of 2008 and 2007 were not the first occurences of these repairs.

Tony Duells description goes back to a Datafile more then 5 years back. I repaired many calculators prior to the postings above.

This is no way takes away the value of the postings done by Takayuki Hosoda but creates the question; Who created the idea?

As Katie stated, many of the repair and restoration techniques were a group effort over many years. I am

attempting to almagamate all the techniques into one book as they apply to each family (chapter).

Thanks again for the feedback.

Geoff

About Katie and the dot/comma selection in Spices

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 17 Oct 2009, 12:26 a.m.,*
in response to message #9 by Geoff Quickfall

Hi, Geoff;

first of all, congratulations on your writings. I am sure the book IS already a must-read.

Second, I remember that the first time I saw a reference at the MoHPC Forum about the jumper in the Spices´ power-supply board to select comma or dot as radix mark was in a post by Katie Wasserman. Later I took a picture myself and posted again, but this time it was a power-supply board with a different layout. I have both pictures stored in my computers. They are about eight years old... give it or take.

About any of my contributions you believe that may help in your book: crediting Dave Hicks and/or the MoHPC suffice, mostly because my contributions are here only for they found shelter.

Cheers.

Luiz (Brazil)

P.S. Thanks for your suggestions regarding Topcats´ battery pack... I appreciate 8^)

If I can add a further theory or info to this one please because I have not yet seen or heard about a Spice that breaks the theory.

I posted this before and was given a different explanation but logically, that explanation does not ring true to me.

I very strongly suspect that any Spice that has an asterisk next to the serial number is factory set to show a comma radix. Whilst this isn't a repair issue, if the theory is correct at least it lets you know what you are getting if you aren't able to confirm before hand.

My sample is small, slightly more than 10 calcs but none have broken the rule so far.

Anyway, just throwing that in whilst this aspects of the Spices is topical.

Mark

Dot/comma selection in Spices: Found the picture!

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 23 Oct 2009, 3:55 p.m.,*
in response to message #12 by Michael de Estrada

That was fast! Just sit in front of the computer, plugged the pendrive, opened the first suspicious directory and... there it is!

This image was captured with a flatbed scanner and shows the jumper for comma/dot selection in Spice series calculators. This is the power supply board of an HP38C, and chances are it is common to all other C-type Spices. This picture was (careless, sorry for the lack of focus...) taken a few minutes ago with a digital camera and shows the jumper for comma/dot selection in E-Spice series calculators. This is the power supply board of an HP38E, and maybe it is also common to all other E-type Spices.

Hope these help.

Luiz (Brazil)

Edited: 23 Oct 2009, 3:57 p.m.

Re: Dot/comma selection in Spices: Found the picture!

*Message #15 Posted by **Michael de Estrada** on 23 Oct 2009, 4:38 p.m.,*
in response to message #14 by Vieira, Luiz C. (Brazil)

Hi Luis,

I just cut the jumper, and it worked: Comma is now the radix, and period is now the thousands separator. I was pretty sure, since there is only one obvious jumper, but just wanted to be sure. Thanks.

BTW, I have tried to use an "E" suffix power board in a "C" suffix calc, and it does work, however, the contents of memory is lost when the ON/OFF switch is turned off, and you get a "pr error" display when it is turned back on. So I assume the "C" power board permits battery power to be fed to memory when the calc is switched off, but the "E" board does not.

Regards,

Michael

Programming with the 200LX

*Message #1 Posted by **R.J. Soto** on 16 Oct 2009, 2:42 p.m.*

I would really appreciate if you could share your experience programming the HP 200LX. What tools do you use?

I would be mostly interested in programming console applications in C (if possible the newest ANSI compliant version of C available.) But wouldn't be averse to programming in Pascal for example.

This would be something to do as a hobby while riding the bus and in spare moments. Something that I can have fun with and benefit from at the same time.

Re: Programming with the 200LX

*Message #2 Posted by **Thomas Chrapkiewicz** on 16 Oct 2009, 2:59 p.m.,*
in response to message #1 by R.J. Soto

I had tried various compilers from back in the day of the 200LX (Turbo Pascal 4.0, etc), but more regularily have used QBASIC and Derive.

TomC

>
> TomC

Thanks for your input, Tom. I remember finding information about Derive in the 200LX at some point. The kind of things that some people made to run in the 200LX is staggering. Like that windowing environment (is its name GEM?) that was a competitor to the very early versions of Windows.

Re: Programming with the 200LX

*Message #4 Posted by **BruceH** on 16 Oct 2009, 3:34 p.m.,*
in response to message #1 by R.J. Soto

Using an old version of Turbo C is the usual way - but this is K&R not ANSI.

Re: Programming with the 200LX

*Message #5 Posted by **Juergen Keller** on 16 Oct 2009, 3:46 p.m.,*
in response to message #4 by BruceH

Borland Turbo C 2.01 is provided by Borland free of charge (thanks, Borland). This is a good way to create DOS programs. I think you will need additional libraries to integrate your program into the 200LX system. Probably, you'll find some information here.

Good luck and happy programming, Juergen

Re: Programming with the 200LX

Happy day - Triple speed 15C - after 22 years

*Message #1 Posted by **Lyuka** on 16 Oct 2009, 2:35 p.m.*

Hello.

On a BBS, I've got an information that some old HP calculator will be sold at a radio parts shop in Akihabara Tokyo, last week. When I visit the shop, which is very next to the shop I bought 15C twenty two years ago, I found several old HP-15Cs between HP-35 and HP-65 (It still work!), and met a young man who had posted the information. After an hour of negotiation talk with the proprietor, I purchased an old HP 15C at reasonable price, and brought it back home.

Since I got a spare 15C, I made speed-up modification to it while doing cleaning and maintenance.

HP 15C - LC resonator replacement for triple speed 15C

It seems to work well until the battery voltage drops under 3.0V at triple speed, with double current drain of 2.5mA(at 4.7V, while running).

After all, I got 15C that is working at triple speed, and made the new young friend who is trying to use good-old-16C from now. It was a happy day.

Re: Happy day - Triple speed 15C - after 22 years

*Message #2 Posted by **hpnut** on 16 Oct 2009, 2:58 p.m.,*
in response to message #1 by Lyuka

Wow! you have a spare 15C to experiment with overclocking?

cool,very informative, thanks

Re: Happy day - Triple speed 15C - after 22 years

*Message #3 Posted by **Gerson W. Barbosa** on 16 Oct 2009, 4:00 p.m.,*
in response to message #1 by Lyuka

Nice work!

Three years ago I made a similar experiment:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=99306

I didn't use any inductor because battery consumption would increase, but perhaps I just didn't have proper ones. I found double speed to be most realiable. I don't have it anymore (traded it with a 16C and have received no complain so far :-) I did the same procedure on one of my three units (easily done as the SMD capacitor I had to replace was on the PCB visible side. It's ok after two and a half years of very moderate use,

except that the batteries went dead last week...

Regards,

Gerson.

I remembered it - Meta Kernel. Anyone have experience with this? Is it really faster than the native 48sx user interface? Once you load it onto a 128k card, and leave the card in, can you swap out cards in the other slot, without disturbing the Meta Kernel interface?

Re: - Triple speed 15C - question about 48sx

in response to message #5 by Martin Pinckney

> Quote:
>
> I understand SpeedUI only works on the gx.

I am not sure but that might be down to memory requirements rather than specific G features. You certainly wont fit it on an SX without a memory card and what I consider the basic configuration takes about 60K on my GX. Worth having though without any doubt.

Mark

Re: Triple speed 15C - after 22 years

*Message #10 Posted by **Karl Schneider** on 17 Oct 2009, 4:33 p.m.,*
in response to message #1 by Lyuka

Lyuka --

Nice work and photos!

I'd like to make a few comments:

1. Your modifications -- replacement of two capacitors and one inductor, plus addition of a parallel capacitor -- were more extensive than the simple parallel-inductor addition described in Ken Sumrall's writeup hosted by Eric Smith.

2. Was the purpose of lowering the oscillator capacitance values to achieve further increases in resonant frequency while maintaining an L/C ratio of the oscillator closer to its unmodified value? The better-matched L and C components would help to retain more energy-exchange capability and resulting magnitude of the oscillator voltage.

3. Was the bypass capacitor replaced with a higher-capacitance part in order to help compensate for the other changes?

4. Both of your HP-15C's are of the revised (1986-89) Voyager circuit design, with most or all of these parts atop the circuit board that allows easy replacement. The modifications you made appear not to be suited to the original (1981-85) circuit design:

5. Original-design Voyager units lack the same external connections for the bypass capacitor shown on the right side of the photos, as well as for the lower oscillator capacitor on the left side. Also, the oscillator capacitor is of a large "can" style residing in the cutaway of the circuit board, below the battery (shown on

your older 1986 calculator). The oscillator inductor is very difficult to access, residing below the circuit board.

6. Your photos did not include one of the unmodified older (1986) calculator. I assume that its oscillator capacitor was can-style like those of the original design. (I have a 1985 unit that has the cutaway as well as the same type 1LM2-0001 CPU).

I based a speedup of my 1985 original-circuit HP-15C on Ken Sumrall's approach. At first, I simply connected a 22-mH inductor in parallel, to give a 3.3x increase in speed. However, the calculator later malfunctioned at healthy battery voltage, so I removed the extra inductor, which restored proper operation. Next time, I will install a 33-mH part for a 2.75x increase in speed.

-- KS

Re: Triple speed 15C - after 22 years

*Message #11 Posted by **Lyuka** on 18 Oct 2009, 11:37 a.m.,*
in response to message #10 by Karl Schneider

Hi Karl,

Thank you for your comment. I'm sorry, but I forgot to add your 'successful HP-11C speed up' article to the reference.

I know that some* early model of the HP 15C has one aluminum electrolytic capacitor (which has poor characteristics) for bypassing. And later model has improved PCB design, and has one solid tantalum (which has good characteristics) bypass capacitor close to the CPU.

Though the solid tantalum capacitor has good characteristics, to increase the operating frequency up to 2.8MHz, it should better have one or two relatively high capacitance ceramic capacitor close to the CPU for mainly stability and EMI reason. (100uF/6V/MLCC that I used is over-quality and expensive, 47uF/10V/Ta with one 100nF/16V/MLCC in parallel may be enough.)

The series resistance of the inductor and L/C ratio are important for LC resonator. These parts should better be chosen to keep its maximum Q(quality factor) greater than several tens at oscillation frequency for stable oscillation.

regards, Lyuka

some* - some model uses dip solid tantalum (good characteristics)

Re: Triple speed 15C - after 22 years

*Message #12 Posted by **Gerson W. Barbosa** on 18 Oct 2009, 3:39 p.m.,*
in response to message #11 by Lyuka

Hi Lyuka,

Here is my current sped-up 15C, SN 2740B30986:

I only replaced the SMD capacitator that was soldered on the lower pads with the ceramic 27 pF capacitor you see. Considering the original 180 uH inductor, the speed-up factor I have is 2.5, not 2 as I thought (I will check this later). Have you measured the original current?

Regards,

Gerson.

*Message #13 Posted by **Lyuka** on 19 Oct 2009, 2:33 a.m.,*
in response to message #12 by Gerson W. Barbosa

Hi, Gerson

Yes, the original current have been measured as noted in the URL shown above.

> Quote:
>
> Power supply current (Ta=26¡ëC, Vbattery=4.72V(SR44¡ß3), fLC=884kHz(original), Agilent 34401A)
>
> Irun = 1.2mA, Iidle=7¦ÌA, Istandby<0.1¦ÌA

Your experience that 33pF gives exact x2 factor makes sense, since,

Factor_speedup = sqrt((180pF + C_inductor + C_line) / (33pF + C_inductor + C_line))

where
C_inductor is the parallel capacitance of the inductor, assumably 4pF from inductor's self resonant frequency.
C_line is the line capacitance, 12pF by your measurement.
Factor_speedup = sqrt((180 + 4 + 12) / (33 + 4 + 12)) = sqrt(196 / 49) = sqrt(4) = 2 (Great! :-)

Regards, Lyuka

Thanks for the nice documentation! I had tried to go beyond 2.5x before but did not succeed. Your choice of components to achieve maximum quality factor is interesting. I will try your mod later.

Regards,

Gerson.

Re: Triple speed 15C - after 22 years

*Message #15 Posted by **Lyuka** on 19 Oct 2009, 2:03 p.m.,*
in response to message #14 by Gerson W. Barbosa

Hi Gerson,

The bypassing capacitor is getting more important at higher frequencies.
At least one 100nF/MLCC should better be added in parallel with 22u/10V/Ta capacitor.

Regards, Lyuka

Quad-speed 15C (Experimental)

*Message #16 Posted by **Lyuka** on 22 Oct 2009, 8:57 p.m.,*
in response to message #12 by Gerson W. Barbosa

Hi, there.

I did further experimental speed-up modification on a 15C.

Experimental modification for quad-speed 15C

It seems that it's stable at 4X speed with fresh SR44 batteries, so far.

Regards,
Lyuka

Topcats, HP82143A and HP82161/82162 Battery Pack

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 16 Oct 2009, 2:31 a.m.*

Hi, all;

I am trying to 'make one out of two' HP82143A and both units have no battery terminals. I also have an HP97 with a broken battery terminal and another complete, working HP82143A. And one working battery pack... Nothing is perfect, though.

Having three units and a lack of battery terminals led me to search for a possible updated, readily available replacement. I found what seems to be a solution and, although it is not yet implemented, I´m adding pictures for your evaluation. (you may click on each image to enlarge it)

Now I´m reasoning about a way to connect the batteries with each other and fix them in place. I will use a two-pole connector like the ones used in wireless telephone batteries (maybe a pair of them to make sure enough current will be allowed to the circuit) instead of trying to rebuild original terminals.

I would like to hear from those interested on trying something like this that will not only allow the preservation of the original terminals but also will allow the safe use of the equipment with readily available components.

As soon as I have more news I´ll post.

Cheers.

Luiz (Brazil)

Re: Topcats, HP82143A and HP82161/82162 Battery Pack

*Message #2 Posted by **Bart (UK)** on 16 Oct 2009, 4:45 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Some electronics shops sell those recharcheable AA cells with tabs on the terminals. Perhaps that would help to connect them to each other?

Bart

Re: Topcats, HP82143A and HP82161/82162 Battery Pack

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 16 Oct 2009, 10:35 a.m.,*

in response to message #2 by Bart (UK)

Hi, Bart;

thanks for your suggestion. Unfortunately I did not find these ones around here... But surely would be faster to build the pack 8^)

Cheers.

Luiz (Brazil)

Re: Topcats, HP82143A and HP82161/82162 Battery Pack

*Message #4 Posted by **Bart (UK)** on 16 Oct 2009, 12:28 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

I would get tabbed ones, solder the tabs together & the connector's wires, then use heat shrink around the lot to make a pack.

Bart

*Message #5 Posted by **Garth Wilson** on 16 Oct 2009, 12:27 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

NiCad Lady (at the URL below) will rebuild the 82143A battery pack for $18. I've seen this company at an electronics swap meeet years ago and they seemed to do good work. I have no personal experience with them though.

http://www.nicdladyonline.com/rebuilding/photo-power.html

Re: Topcats, HP82143A and HP82161/82162 Battery Pack

*Message #6 Posted by **Egan Ford** on 16 Oct 2009, 12:59 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Is there a difference between NiCD and NiHM in an old HP rechargeable?

I'd like to try to do the same. Can someone in the US recommend a good source of the proper AA (NiCD or NiHM) with tabs? I found many Google hits, but I thought I'd ask.

Thanks.

Re: Topcats, HP82143A and HP82161/82162 Battery Pack

*Message #7 Posted by **Garth Wilson** on 16 Oct 2009, 1:25 p.m.,*
in response to message #6 by Egan Ford

If you want to keep using the same charger, it would probably be best to stay with NiCads.

Also, with all this talk of AA's, I would mention that I think my 82161A tape drive takes the same sub-C batteries, not C or AA. Sub-C rechargeable batteries made for battery pack assemblies should not be difficult to find.

Battery terminals in Classics and Topcats

*Message #8 Posted by **Geoff Quickfall** on 16 Oct 2009, 2:19 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Luiz, Hello!

Yes the rotted or fatigued battery terminals are a flaw in long term design.

I too am preparing a new system for the classics and the Topcats:

```
1  The classics are easy, purchase a standard 3 NiNH AA battery
   pack with the standard female phone plug.
2  Purchase the male plug
3  Open up the classic or topcat and remove the two prongs or
   whatever remains!
4  Mill a rectangular hole in the side of the battery housing in
   calculator.
5  Epoxy the male plug in place inside the milled receptacle.
6  attach the power wires to the male plug.
7  Insert the new battery pack (charged!).
8  Plug it in and voila, a new system for keeping the calculator
   running with available battery packs.
```

With the topcat the battery packs are not available. If you have an existing battery pack, diassemble it with a knife (carefully) as we want to keep the pack. Purchase the batteries and connect them, place them in the battery pack case and glue the halves together.

Now follow the above steps to modify the battery housing to accept the male battery plug. Secure the female plug and attach it to the correct poles in the battery pack and you are set to go.

This is acutally an appendix in my book for Calculators without the battery prongs due to corrosion or fatigue.

Like you, I have not yet documented the procedure but have all the bits here to complete the task.

Good luck, Geoff

Materials:

```
1  Male and female phone connector plugs (electronics shop).
2  4 (classic) NiMH AA batteries or 4 (topcat) C batteries.
3  Knife to open up the old battery packs (optional).
4  Tape or heat gun glue to secure the batteries to each other
   if not using the old battery packs.
5  tools to mill the receptacle for the male battery plug into
   the calculator battery hatch.
6  Of course; wire, solder, flux and solder iron!
```

HP95LX and IrDA / SIR Interfaces

*Message #1 Posted by **Thomas Radtke** on 15 Oct 2009, 5:09 p.m.*

Has anyone recently tried one of this IrDA interfaces offered at TAS (Germany) to connect 95LX and PC? I know the palmtop doesn't support all IrDA protocols, but in one "auction", SIR is explicitly mentioned.

USB IrDA

Re: HP95LX and IrDA / SIR Interfaces

*Message #4 Posted by **Christoph Giesselink** on 16 Oct 2009, 7:06 a.m.,*
in response to message #1 by Thomas Radtke

Hello Thomas,

I assume that this interface isn't working connecting a HP95LX with a PC.

I wrote an article about the possibilty of IR transfers to the HP48 several years ago. This article can be found at http://www.hpcalc.org/details.php?id=4856.

The IR interface inside the HP95LX is quite similar to the HP48 one.

Cheers

Christoph

Re: HP95LX and IrDA / SIR Interfaces

*Message #5 Posted by **Thomas Radtke** on 16 Oct 2009, 7:31 a.m.,*
in response to message #4 by Christoph Giesselink

Hi Christoph! Thanks for your article, which gave me some new insights on this issue. I was about trying a few interfaces but will probably stay away from it now. At least, until someone confirms a certain model to

work.

It's really sad that there's no such simple way to connect older HPs to the PC.

HP 48GX connection to Laptop

*Message #1 Posted by **Aubrey (South Africa)** on 15 Oct 2009, 9:53 a.m.*

I've got USB to serial converter (USB - RS232, PL - 2303 Driver for Windows XP, Prolific USB to Serial configured on COMM Port 8). I've installed all the relevant software and connected the 48GX to my laptop. When I try to establish the connection it gives me an error message: "ERROR (NO DEVICE DETECTED. CHECK THE CABLE CONNECTIONS AND THE CALCULATOR.)" Can you please help me to get my connection working?

Regards

Aubrey

Re: HP 48GX connection to Laptop

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 15 Oct 2009, 12:46 p.m.,*
in response to message #1 by Aubrey (South Africa)

Hi aubrey;

this has been discussed in this thread. If you have not red it yet, I think you might have a look at it and check the discussion. Maybe you´ll find some initial directions there.

Success!

Luiz (Brazil)

Re: HP 48GX connection to Laptop

*Message #3 Posted by **Richard Reed** on 15 Oct 2009, 1:07 p.m.,*
in response to message #1 by Aubrey (South Africa)

Hi Aubrey. I'm not the best at this, but I just did:

1. Plug the USB into the laptop and then load the driver dialog, either from the tray icon or Control Panel>System>Hardware tab>Device Manager>Ports.
2. Prolific seem to change the COM port used every time I plug in, so I always find which one (COM9 today) from the driver. I set the comm details _in the driver_ to 9600,8,N,1, no flow control.
3. As a test, load HyperTerminal and in File Properties set the COM port to the right one. Check Configure on COM9 (or whatever) to make sure the properties are the same as the driver - interestingly, mine worked with xon/xoff, which I think is HyperTerminal/Kermit for no _hardware_ flow control
4. Save that HyperTerminal config, just so it's easy to find and amend.
5. File>Open the new config file.
6. On 48GX, start Kermit from right-shift I/O... and set all the fields with the chooser, and pick any old object, ASCII.
7. Start Receive Kermit in HyperTerminal, picking the directory where - Kermit writes the filename as the object name.
8. Click Send in 48GX Kermit. You'll see a few packets go.

9. Check the ASCII object file in your laptop directory.

Post back your result. Richard

Re: HP 48GX connection to Laptop

*Message #4 Posted by **Aubrey (South Africa)** on 16 Oct 2009, 12:47 a.m.,*
in response to message #3 by Richard Reed

Good day Richard

Points no 1 an 2 I am happy with. Comm details 'in the driver' are set to 9600,8,N,1, no flow control.

Can you please explain points 3 and 4? How do I do the test, load the HyperTerminal?

Regards

Aubrey

Re: HP 48GX connection to Laptop

*Message #5 Posted by **Richard Reed** on 16 Oct 2009, 2:25 p.m.,*
in response to message #4 by Aubrey (South Africa)

HyperTerminal is in Accessories>Communication in the Windows Start Menu. When you start it you'll be able to see what I'm talking about.

My description of using HyperTerminal is for a test, before you get further involved copying directories, ports, etc. I don't mean to use HyperTerminal generally, as Conn4x is much better. It's free from HP.

Re: HP 48GX connection to Laptop

*Message #6 Posted by **Aubrey (South africa)** on 17 Oct 2009, 6:36 a.m.,*
in response to message #5 by Richard Reed

Hallo Richard

Thank you for the help and assistance. I eventually established a connection and could get info from my laptop to my 48GX.

Question? I am trying to save 'Text'. When I want to upload it to the 48GX, it gives me the following message: "... txt file and does not match the calculator. This may damage the calculator contents."

I've got the info I want to save in "Word". I then convert it to .txt format (because of the size) obviously this format is incorrect, because of the above message. What is the correct format to save the "Word" document to?

Regards

Aubrey

Spec of dust in a 16C LCD screen

*Message #1 Posted by **R.J. Soto** on 15 Oct 2009, 2:02 a.m.*

Hi,

I have a 16C which is in perfect condition except for having what looks like a small spec of dust inside the screen. Has anybody been in this same situation with a 16C or one of its sibling models, and found a way to solve it? I really don't want to take the calculator apart, because I remember doing a little bit of research, and it seems that these models were not assembled with disassembly in mind, and the calculator is kind of special (it belonged to someone who worked at Los Alamos in rocket propulsion if I remember correctly.)

Cheers,

Ruben

Edited: 15 Oct 2009, 2:03 a.m.

Re: Spec of dust in a 16C LCD screen

*Message #2 Posted by **Geoff Quickfall** on 15 Oct 2009, 2:40 a.m.,*
in response to message #1 by R.J. Soto

Buy a can of compressed air. Remove the feet and the four screws on the back. Remove the back. Be careful not to lose the two tiny springs used for ESD protection.

Blow the sides of the LCD panel from the inside. Do it until the dust leaves!

Short bursts of air not a prolonged burst as the air is cold when it decompresses and may cause condensation on the inside Clear LCD protection lens which when dry may leave evaporation marks.

If you have trouble getting the feet back on purchase some THIN double sided tape and cut to size. Reapply the feet.

Cheers, Geoff

Edited: 15 Oct 2009, 2:42 a.m.

Re: Spec of dust in a 16C LCD screen

*Message #3 Posted by **R.J. Soto** on 15 Oct 2009, 1:02 p.m.,*
in response to message #2 by Geoff Quickfall

Hi Geoff,

Thanks for your very detailed explanation. I had the notion that even removing the back of one of these calculators was a destructive process to some degree. I'm glad to know I was mistaken. I will first try Jimi's approach, and if that doesn't work, then I will do it your way. I'm sure either way it should work.

Out of curiosity, since you sound very confident about this procedure, I assume you have performed it before. Did you do it on a 16C, or in one of the other models?

Many thanks,

Ruben

Re: Spec of dust in a 16C LCD screen

*Message #4 Posted by **jimi** on 15 Oct 2009, 10:26 a.m.,*
in response to message #1 by R.J. Soto

I have had some luck in the past by charging up some fabric or paper with static electricity. You know, rub it on your pants or something. Anyway, then brushing the display, and it will sometimes "walk" the dust spec off the display. Certainly beats opening it up if you can get away with not.

Re: Spec of dust in a 16C LCD screen

*Message #5 Posted by **R.J. Soto** on 15 Oct 2009, 1:04 p.m.,*
in response to message #4 by jimi

Hi there,

Thank you for pointing this out, Jimi. Actually I had thought of this before, but I was a little leary of doing something like it just in case the static electricity is enough to damage the calculator (maybe I'm being too paranoid?) I think I might try your idea first, and then try Geoff's approach if necessary. First I need to make sure that by doing things your way I won't damage the calculator.

Cheers,

Ruben

A few more pictures: Spice series

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 14 Oct 2009, 10:55 p.m.*

Hi, all;

I added a few pictures here that may help those willing to repair their Spices. The first two pictures show data I collected while replacing the flex circuit for a cut of regular flat cable.

Cheers.

Luiz (Brazil)

Re: A few more pictures: Spice series

*Message #2 Posted by **Hal Bitton in Boise** on 15 Oct 2009, 1:19 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Very nicely done Luiz.
I did that same repair on my late model (soldered) 34C about a year ago, except I used 3 separate small gauge wires (stuff that I just had in my tool box). I was barely able to get the case closed after the repair (the wires could have been a little smaller). It worked out OK though.
The pictures you posted are excellent. I saved them so next time I can do it right!!
Thanks, and best regards, Hal

Relying on old technology

*Message #1 Posted by **Juan J** on 14 Oct 2009, 1:23 p.m.*

Hello,

Four years ago I bought an HP notebook and signed up for customer service, newsletters and related stuff.

The old gal still works, mainly at home, and is good enough for things like Ofice documents, Web surfing/e-mail, and "special" applications like Mathematica or Linux every now and then.

Las week I received a newsletter encouraging me to get rid of this so-called old technology:

» Replace your old technology now and save If you've been holding on to old PCs, you might not be aware of the hidden costs of operating and maintaining old equipment. Get the facts on how much money you can save with new HP technology.

I was surprised to receive this. My computer is old but still works. It will eventually give up the ghost, like all machines do.

Following this logic, I should have gotten rid of all my calculators. I remember HP including older models in a sort of insurance plan, and I also remember HP issuing notices of discontinuing lab/test equipment; the latter included details about the time during which consumables would still be available. Not anymore, I am afraid. And more than technology, costs are the driving factor here.

This notice kind of assumes I am one of those bean counters or one of those MBAs that led us to disaster, which thankfully I am not.

True, I can ditch the old girl and replace it, but what if she still serves me well and I want to keep her as long as she can be used?

Has anyone received such a message?

JuanJ

Edited: 14 Oct 2009, 1:26 p.m.

Re: Relying on old technology

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 14 Oct 2009, 1:48 p.m.,*
in response to message #1 by Juan J

Hola, Juan; ¿que tal?

I did not receive such a message, but I did not sign up for any stuff related to HP or any other company.

> Quote:

> And more than technology, costs are the driving factor here.

I'd go further and say that **profits are the driving factor**. For as long as you keep the old stuff running, you are no longer a buyer. I keep at least oe of each XT and 80286 Mother boards still working. They are boxed and at least one time a year I plug them into a power supply just to make sure they are still there. My house has no backyard, just a small construction in the back that I use for stocking and as a lab, so I can find a place to save these masterpieces from destruction. Who knows if 100 years from now someone finds them and decides they belong to a museum... or throw them away for good.

Back to calculators, most of my students actually never care about technology unless they can use it without the need of knowing how they work, like automobile drivers who have no idea what a piston, or a sealing joint are for. Fact is that regular drivers actually need no specific knowledge about their cars to drive them, while race pilots take the best of their race cars the more they know how their cars work. Hence they keep track of what engineers are doing to their cars. Here, where I am, we are missing true technology 'race pilots' and designers, while tech drivers are coming and coming...

I hope somewhere else the new guys change this route and go ahead trying to find something new to do with the old tech... As we do, somehow.

I'd dare wishing this does not happen to humans...

Cheers.

What a bunch of malarky. I still do some of my work on a old '486 PC and DOS, including PC board layout and embedded systems programming, just because it's so reliable. Even the same two hard discs have been in it, running non-stop for 10+ years. OTOH, the power supplies, CD-ROM drives, and 3.5" floppy-disc drives in my newer PCs have gone down right and left.

Re: Relying on old technology

*Message #4 Posted by **bill platt** on 14 Oct 2009, 3:18 p.m.,*
in response to message #3 by Garth Wilson

Yep. New hard drives etc are junk compared to old. I had my first unexpected failure--3 months old--recently, during a backup procedure. Since I didn't double double backup, I lost it all. I was moving rather than copying then throwing out files...

From now on I am even more fanatical than before. I have three hard drives of everything really critical!

in response to message #4 by bill platt

> Quote:
>
> From now on I am even more fanatical than before. I have three hard drives of everything really critical!

I have always been extra paranoid about my data for years. I used to make multiple tape backups of everything and store 1/2 off-site with the tape vertically.

Then I switched to burned CDs.

Now that HDs are so cheap I have a 16 disk RAID5 array at home. 2 of the 16 disks are hot spares that will automatically repair a failed disk. The probability of losing data is very remote.

However, I still believe in off-site. I have been using Backblaze on my and my kid's MacBooks. For my wife's Windows Laptop I may use Mozy, now I just do disk dups and a network backup manually. My kid and I also have extra HDs for Apples Time Machine backups. Time Machine is a real lifesaver because it backs up snapshots, so you can not only restore a backup, but you can get a certain backup in time. Most useful for user error.

Mosy and Backblaze are $5/month with unlimited usage. I got 200GBs on Backblaze--took 2 months to get it there. Once there only changes are saved, but only the last change, i.e. not like Time Machine. There is an online Time Machine as well, but charges per GB. Too expensive for me.

Unless all of North America gets hose or the unlikely possibility of losing my entire home with me in it and Backblaze being torched I think I am safe.

Were any listed?

Only things I can think of:

1. Software Support. May cost more to call a specialist.
2. Hardware Support. May need to use eBay to get parts, could be expensive.
3. Power efficiency. This is a real issue. FLOPS/Watts, bytes/Watts, etc... However, that assumes that your need for storage and speed increases over time. If your performance and storage needs are the same as they were 20 years ago, well then you are probably just as energy efficient with your old gear. But there are minor upgrades that are universal, e.g. replace CRT with LCD.

I've been using old computers and with some cheap upgrade (upgrade that were to expensive in their time) they work wonderful.

Re: Relying on old technology

*Message #8 Posted by **R.J. Soto** on 14 Oct 2009, 8:46 p.m.,*
in response to message #1 by Juan J

My main computer was until very recently a 5 or 6 year old Thinkpad X24, and it worked perfectly fine. It couldn't play HD video, but I didn't expected it to do that.

My philosophy about this is that there are three main things which drive the PC market: 1. Specialty applications which depend on sophisticated software and truly require top of the line machines (3D applications, video rendering and editing, music production, and such.) 2. Video reproduction (by this, I mean HD video reproduction on computers.) 3. By far the most important factor corresponds to sadly uninformed folks which probably only use their computer for email, office applications, and web surfing, and which rely on the "advice" of store sales people pushing new computers down their throats.

As far as I know, 5 years ago there existed applications to do pretty much anything at a professional level, and those applications ran on 5 year old technology. So use a 5 year old laptop with Adobe Photoshop 7, no need to use Adobe Photoshop CS4, because CS4 hasn't added any essential functionality (and by this I mean functionality which you definitely need to perform certain tasks.) It is perfectly possible to use "old" computers and yet be completely productive.

You missed by far the biggest driving force behind hardware development these days: games. Getting the highest frame rate on the largest monitor with the best graphics. Very big market.

Computers have been *fast enough* for most other tasks for more than a few years.

in response to message #11 by Paul Dale

HEHEHE. Congratulations then. I've been toying with the idea of building a miniature cabinet myself, either using a GP2X (Korean game console based on Linux) or one of the small MiniITX boards (is it Mini?) Can't beat good old Galaxian, Asteroids, etc.

Games nowaday are too realistic, and that strangely detracts from their charm. Old games were like a simple model of reality which you could immerse into. New games though are about as complex as reality itself.

If you haven't seen the movie "The King of Kong - A Fistful of Quarters" I wholeheartedly recommend it. One of its two main characters (not the evil one, but the good one) actually came to give an after-movie talk to my previous employer. Sadly, I missed it due to heavy workload.

Have you heard of the Multiple Arcade Machine Emulator (MAME)? It runs on a PC and emulates thousands of arcade games. Add a cabinet, the right buttons, joy sticks and track balls, plus a coin selector, and you have your own personal arcade.

I built one for my wife and it's a lot of fun even though we don't use it much any more.

Re: Relying on old technology

*Message #14 Posted by **Egan Ford** on 14 Oct 2009, 10:02 p.m.,*
in response to message #8 by R.J. Soto

I'd also add bad and bloated software. The answer to bad software slowing you down is always the same, get faster hardware. And if you upgrade that bad software, well then, it actually can be worse.

Three examples:

1. Many web sites require flash just to view. Flash requires newer browsers, that require more speed and RAM. Avoiding all flash sites was an option, but not any more. Its getting really bad out there.
2. Windows printer drivers. I do not know what changed in the last few years but it seem that there is a lot more overhead with ?? printer drivers. Its awful. I don't want my ink levels constantly monitored and sent to ?? so that I get prompted to buy ink. I have to kill the monitors frequently on my wife's

Windows box. If she had a newer dual-core machine, then the printer driver could hog one core and she could still work.
3. Background virus and spyware scanners are getting more and more CPU and memory intensive. I recently had to disable all automatic scanners on my XP VM after an upgrade because it was so slow to resume.

It's only going to get worse. Quad-core, 4 GB+, SSD machines will be the standard for software developers next year.

One of the only ways I have found to combat this trend of bloat is to use Linux. Not that there isn't bloat there, its just not as bad.

Re: Relying on old technology

*Message #15 Posted by **R.J. Soto** on 15 Oct 2009, 12:50 a.m.,*
in response to message #14 by Egan Ford

That's true, but there is even more to it than what you mention. It's not merely bad/bloated software, but higher level programming/execution environments. Back in the day every CPU cycle counted, so programmers really had a lot of low level work to do interfacing with the computer via machine language. Back then computer time was a very expensive commodity, so companies could afford to have programmers dedicated to the long and arduous task of programming them, just because computer-microseconds were more valuable than man-hours.

Now things are just different, and programmers are a more expensive commodity than computers. Companies can afford to save money by using high level programming platforms which afford a higher productivity rate, but which obviously produce less efficient code. It's the macroeconomics of the software business that drive this whole thing. Back 50 years ago if you had told a programmer that he would be able to program at the high level that programs are written today he would have probably had a seizure. Not to say that programming is less complex nowadays though, complexity used to grow horizontally, and now it is more of a vertical complexity (so to speak,) where you have a great variety of technologies interfacing with each other, computers communicating with each other through remote networks, and data flowing and being transformed everywhere.

I guess my point is not that the software companies are getting lazy, it's just that they are using the resources that they have the best way they can in order to advance at the fastest rate possible.

Of course, there are still guys like the SpinRite programmer (I forget his name) which do things the old way.

One of my favorites also. I still have the original manual & discs and it's loaded on my Omnibook 430 - a 386 notebook that runs on 4 penlight batteries!

Anothe great program is Turbo Pascal 3.0 - A 40K pascal compiler/editor that will generate COM programs. I still use it for quick & dirty one-off programs.

Bill

In the mid eighties I was a programmer for microcomputers used in manufacturing. The system was based on a Z80 compatible processor by Hitachi (HD64180, IIRC). The original hardware was developed from a TRS-80 clone. We did some impressive controller applications with this design, all within 64 KB address space! It was based on a realtime kernel that I wrote myself and a CP/M based Z80 C compiler (MI-C, a German development). I had to rewrite the libs as well but it worked. :)

Around 1980, we had a full fledged real time data acquisition and analysis system for nuclear spectroscopy on a pdp 11 featuring 2 hard disk drives (2.5MB each) and a magtape, all programmed in assembler by ourselves, and all well within 64kB. Just the OS was by DEC. Basis was a *small* mini computer, meaning just one 19" rack, some 2m high, and dammn heavy.

BTW, it's a pity DEC is not existing anymore -- they had really good stuff.

College: Dec VAX 11-780, and 11-750. Also in graduate school, University Library database was VAX...unless that was just the dumb terminal model. But we used a Unix system in graduate school, for the academic computing.

I liked finding open sessions at dumb terminals and writing quick code to "take over" the user account--only the appearance of it--when the person came back and logged on, a picture would pop up on the screen rather than merely the username "Login Successful" notice

I remember in 1990 0r so when the computer consultant told me, "come back to the computer room, I have something to show you." So I go back there, and all the "washing machine" memory was gone, the big racks with all the RED LEDS were gone, the air conditioned floor was not yet torn out but idled, and there on a desk, sitting on a desk, was a desktop cabinet with a keyboard and screen, taking up less space than the 286 machines out in the lab. "Say hello to the new 11-780," he said. "No way, that's it? Something of a let-down now, isn't it," I said. "And that's not all," he said, "all of the memory is on this," (shows me a DAT tape) "and a few more over here (empty shelves with three or four DAT cassettes)."

Ah, memories....

Thank you for sharing this information, it is very impressive! Although not strictly a pioneer of computer programming, your experience goes further back than most people that I know.

Back in the mid 80's my father got me the first computer I ever owned, an Amstrad CPC128 (I believe these machines were sold in Germany under the Schneider brand.) I'm bringing this up to give some context, and also to mention that the computer came with a version of CP/M. Later I learned that CP/M was the brain child of Gary Kildall,

who sadly passed away in the early 90's.

If you were developing microkernels in the mid 80's, you must have had exposure to computers much earlier than that, since that is an advanced task. How did you get started?

Re: Relying on old technology

*Message #29 Posted by **Marcus von Cube, Germany** on 16 Oct 2009, 1:47 p.m.,*
in response to message #28 by R.J. Soto

My first BASIC experience dates back to the age of 16 at the evening school of a friend on a Wang computer. Later at university in the early eighties, I bought my first "real" computer", the Video Genie - a TRS-80 clone. Z80 assembler became 2nd nature soon thereafter.

How do you learn C? Be young enough and buy the K&R book! I had to switch from NewDos to CP/M to run the compiler but it was worth it. My realtime kernel is the culmination of these experiences: a good mixture of Z80 assembler and C. Application development was in C, the kernel and some library functions were written in assembler.

*Message #30 Posted by **R.J. Soto** on 16 Oct 2009, 2:27 p.m.,*
in response to message #29 by Marcus von Cube, Germany

Thank you for sharing your experience with computers. Somehow it seems that back then (late 70s, up to the late 80s) was the golden age of the personal computer (I'm not talking about volume of sales, or even about the capability of the machines themselves, but about something else.) It sounds like back then it was more of a pioneering effort, and because the field was greener everything seemed possible (I'm just imagining this looking back in the past, as my experience with computers back then was limited for the most part to playing games on them and, at most, to writing simple Basic programs.)

I also hold the K&R book in good esteem. I still own the hardcopy version, which hasn't been on print in the U.S. for a few years now.

This is typical TI. I used to work for them, and they are a litigious bunch. They became like that in the late 80s when they sued several Japanese DRAM makers over patents. Ever since they'll sue at the drop of a hat; they're known in the semi biz as a quite sue-happy outfit.

Case in point: several of my co-workers and I left en masse (nine of us to be exact) to go work for a company they never considered a competitor. In any TI internal discussions/presentations, TI never ever even mentioned the company we left for as a competitor. Once we left, they sued us and our new employer (suddenly they were competitors, but none of us had employment nor non-compete contracts nor took any TI IP/property of any kind with us and could never prove it). The case was complete harassment and the court ruled as such. It didn't matter as TI has deep pockets and they caused us untold grief for a year.

TI acting like this is par for the course. Yhey love to bully anyone they think they can with lawsuits.

41CX Startup Program?

*Message #1 Posted by **Egan Ford** on 13 Oct 2009, 11:49 a.m.*

Is there a way in the 41 series (native or with a module) to have a program execute on start up?

The point would be the have the calculator always start up in a known state (e.g. flag settings).

Thanks.

Re: 41CX Startup Program?

*Message #2 Posted by **Etienne Victoria** on 13 Oct 2009, 12:07 p.m.,*
in response to message #1 by Egan Ford

Yep, native:

Automatic Execution Flag:
If flag 11 is set the HP-41C automatically begins executing the current program whenever the calculator is turned on.

Etienne

Edited: 13 Oct 2009, 12:08 p.m.

Re: 41CX Startup Program?

*Message #3 Posted by **Egan Ford** on 13 Oct 2009, 12:16 p.m.,*
in response to message #2 by Etienne Victoria

Thanks. But, what I am looking for would be a default program. Is that possible?

Re: 41CX Startup Program?

*Message #4 Posted by **Eric Smith** on 13 Oct 2009, 12:51 p.m.,*
in response to message #3 by Egan Ford

That's one of the functions of the Autostart/Mass Duplication ROM. The microcode function to support that was also in the HP SDK for use in custom ROMs.

Re: 41CX Startup Program?

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 13 Oct 2009, 1:29 p.m.,*
in response to message #4 by Eric Smith

Hi Eric, guys;

when I first read about the AutoStart & Duplication ROM I felt intrigued by such feature. Anyway,

some other ROM seem to take advantage over this feature, like the CCD ROM, AECROM and the FORTH ROM. By inspecting the FORTH ROM module listing, the last parameters after the main ROM space refer to such things as 'PAUSE interrupt' (#8FF4), action 'After each program line' (#8FF5) and so. All of them have a NOP code (that´s what we see in most ROM listings) except for the 'Awaken by pressing ON key' (#8FF9), which has a jump code for label 8FED (3A3: JNC -0C 8FED) in this FORTH ROM. Label 8FED is actually the last label in the listing and it seems to perform some sort of custom default setting. In fact, these three ROM modules actually reconfigure the HP41 standard keyboard in such a way the calculator performs custom tasks for regular keys when it is not in USER mode, and this should be done every time the calculator is turned ON (the calculator will never know if the module has been removed prior to be turned back on). I do not 'read' HP41 machine code without a table, so it would need further inspection. If the action to be performed when the calculators is 'Awaken by pressing ON key' can be defined by a user program, then we have a bunch of possibilities left...

Cheers.

Luiz (Brazil)

Re: 41CX Startup Program?

*Message #6 Posted by **Etienne Victoria** on 13 Oct 2009, 12:15 p.m.,*
in response to message #1 by Egan Ford

To complete my previous answer:

Upon turn on, the 41 will clear flag 11 before autoexecuting the program.

Therefore your autoexec program must set it again to ensure another autoexec at the next OFF/ON cycle.

HTH

Etienne

Re: 41CX Startup Program?

*Message #7 Posted by **Garth Wilson** on 13 Oct 2009, 5:23 p.m.,*
in response to message #6 by Etienne Victoria

Without using the modules, I have my sumation key (just under the ON key) assigned to a program that says SF 11, OFF. I never turn the 41 off by pressing ON, only by pressing the sumation key. The next instruction is where I want execution to pick up automatically every time I turn it on. That includes setting the constant-ON flag, then ENG 3, then seeing if an alarm is pending, and if so, display how long until it is due. Otherwise, it next checks to see if there's something in the DAYTIMR file it's supposed to remind me of, and if so, display that. Otherwise it goes on to display the time and date.

How do you sell your HP calculators?

*Message #1 Posted by **R.J. Soto** on 12 Oct 2009, 7:18 p.m.*

This question is mainly geared towards self-proclaimed collectors of these wonderful machines. I am faced with the prospect of having to sell a NIB Singapore 48GX, and the prospect of using eBay seems a little scary. I would rather this calculator ends up in the hands of a serious collector which will treasure it and take care of it, and I'm afraid it might end up in the hands of a college kid that doesn't know what he has.

One of the simple examples of why I cringe thinking about eBay is the fact that 48GX units with black LCD are promoted in auctions always as superior, without regards for other factors.

Besides the Classified Ads section in this very website, is there anywhere else that you guys use for this?

Re: How do you sell your HP calculators?

*Message #2 Posted by **Hal Bitton in Boise** on 12 Oct 2009, 8:33 p.m.,*
in response to message #1 by R.J. Soto

Hi R. J.
For such a prized machine as yours, the bidding on Ebay would quickly escalate beyond what a college kid would would want to pay, and into the realm of collectible value. I would think anyone who was willing to pay what I know it would go for would treat it with kid gloves.
As for myself, I have an "as new" 48GX black LCD that is the centerpiece of my collection. Nobody touches it but me, and then only after I've washed my hands and cleaned the entire surface where it will be used. So you see, I would give your 48GX the home it deserves :)
Best regards, Hal

Re: How do you sell your HP calculators?

*Message #3 Posted by **R.J. Soto** on 12 Oct 2009, 8:47 p.m.,*
in response to message #2 by Hal Bitton in Boise

Hi Hal,

Thanks for your answer. I suppose you are correct about the bidding process taking care of unqualified buyers by virtue of the price itself.

I completely understand your feelings about your 48GX, I treat mine with the same care, which sadly reaches the level of unabashed OCD ritual. :)

I really hate to part with it, but it must go. I'm still holding on to my NIB 42S and NIB 48SX. I know the 48SX is less valuable than the 48GX regarding market price, but it holds more personal value to me.

Regards,

Ruben

Re: How do you sell your HP calculators?

*Message #4 Posted by **Pal G.** on 13 Oct 2009, 7:19 p.m.,*
in response to message #3 by R.J. Soto

Why would an SX hold more personal value for you than a GX if they're both NIB? Cause you used an SX a couple times on your exams? ... only to switch to TI?

You just finished your exams 3 years ago but you have all these classic HPs NIB? Start school late?

In later threads, you are found whimsically adding and removing folks from your list of potential buyers.... I smell a troll. There, I said it.

PS - I am pleased to report I just bought a 48G (not + or X) for $34, incl. shipping, to replace my busted 49g+, that I actually used every day. People are paying way too much for 48GXs to put in glass boxes under warm lights and alarm systems.

Re: How do you sell your HP calculators?

*Message #5 Posted by **R.J. Soto** on 13 Oct 2009, 11:02 p.m.,*
in response to message #4 by Pal G.

You smell a troll? Listen, Pal. Get your nose checked. And while you are at it, take care of your mouth too, because you have a big one. Public forums can afford a sort of anonimity that tends to infuse courage in people that in real life would be quite meeker. I believe I have kept my discussion here so far civil, and I intend to continue doing that.

Why do you have to question why a 48SX holds more value to me personally than a 48GX? It is none of your business, but for the benefit of the other well intentioned folks in this forum, here are some of the reasons: - Manufactured in the U.S.A. If you think it is irrelevant, don't tell me about it, because I'm not interested. - When I was studying engineering 18 years ago, it was the calculator to have, and I used to covet one. - It is the original 48 design, and it looks better than the later models.

I started "collecting" HP calculators about 7 years ago. Why does this matter to you, anyway? And I don't consider myself a collector, because I have too few of them due to several reasons.

Edited: 13 Oct 2009, 11:02 p.m.

Re: How do you sell your HP calculators?

*Message #6 Posted by **bill platt** on 12 Oct 2009, 8:47 p.m.,*
in response to message #1 by R.J. Soto

The auction site which shall remain nameless seems to have the highest prices. Of course presentation is everything, as a search through "completed listings" will demonstrate. We "collectors" tend to be a bit more savvy about this which is good for us. Of course as collectors, we all hope for a badly presented listing--tends to reduce the price :-)

So list it as an HP47 GX Claculator please ;-)

HA, good one Bill. I'll list my Helewt Parckard 47GT Carculator soon, and I'll send you a PM so that you

can be the only bidder.

Seriously though, I understand about the presentation. I have taken quite a few pictures of the machine and its accompanying items, which I have already uploaded to a PhotoBucket album (if you are interested, the URL is listed in the Classified Ads secction.) I'm going to take a video of me running the tests also.

Another thing I hate about EvilBay is that you pay through the nose not just for the eBay fees, but for the PayPal fees (since eBay owns PayPal and PayPal has pretty much become a monopoly, you end up paying eBay twice.) I sometimes wonder with such a brilliant business model, how come their stock is not soaring.

Regards,

Ruben

HEHEHE. Ain't that the truth. Another thing that really irked me (this time about PayPal) is that they used to, up until a few weeks ago, discourage buyers from paying with a credit card, and instead favoured using direct bank transfers. Obviously, if you make a payment with your credit card and the transaction goes sour, you can issue a chargeback against PayPal, which then has to deal with the seller/provider. But if you make a payment via a direct transfer and the deal goes south, you are pretty much out of luck (despite what PayPal may tell you about buyer protection.) I was very surprised that they changed this practice of discouraging buyers to use credit cards, because it had been in place for as long as I can remember. Someone must have threatened a class order lawsuit or something, because otherwise it does not compute.

If you consider this forum here to be a playing ground for "self-proclaimed" collectors, and on the other hand you want to make sure your calculator finds it's way to a "serious collector", this is hardly the place to ask your question, isn't it?

If it was my calculator, I would sell it locally to some college kid, because then it will get a chance to be used as a tool for education and science. And this is what it was designed and built for.

Greetings, Max

That is an excellent point. What better tribute to our favorite calculators than to have them continue to be used for the purpose of making the world a better place, rather than sitting on a shelf in a personal shrine.

I'm sorry, but that is not an excellent point. It is a horrible point. At least in my opinion, for the reasons which I have already explained. These machines are more than tools, more than the sum of their parts and the technological abilities which they implement. So yes, they deserve to be kept in a shrine. Collecting is a free endeavour, and I reserve the right to sell my calculator to whomever I please (and as of now, you two have ceased to form a part of that select group of potential buyers.) No offense whatsoever, I just really like my calculator, and would like it to be kept in good shape for as long as possible.

This makes me believe you're just using these forums to find a potential buyer, knowing that the true collectors here will pay a premium for an excellent-condition machine.

If so, just be up front and say you want as much money for it as you can get. There's no reason to use the "high and mighty" road here because you're preaching to the choir. We all appreciate HP calculators, including those that are rare and in great condition. But you're either missing the point, or you're purposefully avoiding it. The guys above made an EXCELLENT suggestion -- find someone who will use it and let them have it at a discount. There's no reason to put these calculators on a shrine (at least, not until there's only one left in the world).

Don't use the forums to sell your product. Either use an auction site or the classifieds here. Be up front about what you want.

I suspect this will remove me from the pool of potential buyers too, and if so, then you've just proven my point.

Thanks, Bruce

Re: How do you sell your HP calculators?

*Message #18 Posted by **R.J. Soto** on 13 Oct 2009, 3:42 p.m.,*
in response to message #17 by Bruce Bergman

Hi Bruce,

You are partially right. I am of course interested in getting as much money for my calculator as possible. I even put an add in the Classified Ads section asking for offers, because I'm trying to determine how viable it would be to sell it directly through these forums. However, that is not the whole story. I truly wish to find a buyer for it that will take care of it. Call me crazy, but if someone with a sledgehammer offered me $1000 for the calculator with the purpose of smashing it in a commercial for Texas Instruments, I would not sell it. Life is not black and white. Most all human intentions are fraught with conflict and compromise. Yes, I want to get a good price for my calculator (who wouldn't?) But I also want to find a good home for it, and I'm horrified by the herd of beer-spilling ghouls that call themselves collectors which inhabit these forums (Don't be outraged, I'm just being humorous.)

You are still part of the select group of buyers, but you are pushing it...

IMHO, things that were designed to be used should be used. You'll extract more joy out of your collection by using it, than by knowing its just there.

How people choose to collect and what they do with that collection is their own business. Personally my stuff is all over the place (on desk, on shelves, on the floor). I try to take care of them, but I also use them frequently, so I never remove the batteries.

Stuff that I have no use for (e.g. LED calculators) I give away or put back in the community so that another can exact some joy from *using* it.

I have to agree with the OP that a modern university student would have little use for a 48GX. It'd be a frustrating experience (RPN only, hard to read display, slow). Most university students in the US today were raised on TI. My own kid (NYU freshmen) took her TI to school with her. She really likes her TI because she knows how to use it and it makes her successful. That said there will always be exceptions (I can think of one, a Theoretical Physics Ph.D student) that would truly appreciate and use legacy HP calculators in new and interesting ways.

My advice for the OP, if you are going to sell it, then sell it, why do you care what the buyer does with it? If you do care, then don't sell it.

I think I'll go visit Dave's "Museum of Amazing Used and Mostly Functioning Things".

You guys are missing the point. Let me just throw a couple of semi-random thoughts that might shed some light into my philosophy:

1: HP 48GX emulation has been perfected. Therefore, nothing would be lost if all HP 48GX calculators ceased to exist, given that their functionality can be preserved.

2: Since calculators like the HP 48GX were made to be used, aren't collectors that hoard a large number of such calculators doing a disservice to the human race? Wouldn't it be more in the spirit of the intent of such calculators to give them away to people that can use them? How many calculators can you use simultaneously, anyway? And, is there anything every single one of those calculators can do that no other calculator in the collection can do?

I'm just trying to be the devil's advocate and go against the prevailing tree-hugging mentality here.

*Message #25 Posted by **Bruce Bergman** on 13 Oct 2009, 4:48 p.m.,*
in response to message #24 by R.J. Soto

Okay, not that I want to give Ms. Soto any credibility here whatsoever, I think I have to give her credit -- just a little -- for this last post. It got me thinking. Maybe the issue here for me is that this is a 48 we're talking about.

I went back to some of the posts and inserted "HP-01" or "HP-10" or "HP-19c" in there, in place of "48" and found that when I did that, I had a bit of agreement with Ms. Soto. There is something to be said for those devices that are truly unique and more museum quality than day-to-day. For example, I could not fathom buying an HP-01 and then actually wearing it on a daily basis. One small mistake and the thing could be history. A scratch across the glass, or a button jammed in and it would detract from the whole thing. Same for my prized possession, my HP-19c (original owner) -- it's probably my most prized calc, and even though I do use it occasionally, it's not one I would want to give to a high-schooler.

In a like vein, I would have no problem giving a 32sii to a high schooler to use because -- although it is relatively valuable -- it is a powerhouse calc, and it would be used.

So, is this whole argument centered around the relative worth/value of the calculator? If so, where do we draw the line? I personally don't think a 48GX, even one with immaculate black text, is worth the hubbub that this is all about. To me it's in the same class as a 32sii or a 16c -- it's a great calc, and I'd have no problem seeing it used on a daily basis.

I still think I'd rather see it used.

thanks, bruce

*Message #27 Posted by **Jim Horn** on 14 Oct 2009, 6:37 p.m.,*
in response to message #25 by Bruce Bergman

Regarding "buying an HP-01 and wearing it on a daily basis" - I did for quite a while. But the $30 per year for the batteries back then ($100 / year now after inflation) to wear a 1/4 pound (115 gram?) watch which required you to press a button just to know the time got pretty old. Casio "Data Bank" calculator watches replaced it (the first was the oh-so-missed scientific model). With an LCD and 75% less weight and thinner, they are vastly more practical.

Still have my '01 though - if only to wear to HHCs when I can get to 'em. Still works fine, too. Not bad after having it for 30 years now...

Jim (still have the buckle button pusher - and a spare!) Horn

I have a number. That will be diminishing soon, as I lost my job, and at some point, extras will have to go. I will always keep a beater HP-15C around. Not worried about it dying. By the time that thing goes, we'll be able to get them implanted in our heads.

Still, except for a mint HP-16C, that I've kept tucked away, mostly because I have a pair of well used 16s in use, I use most all mine. To me, they only really hold value when I'm using them. I could often get by with software cals, and all too often end up just pulling up one for a quick calc, but I like using them too much to lock them away. I guess I'm not a very good collector. Just like them a lot.

in response to message #28 by Jimi

You actually make a good point. Maybe collectors who rarely turn on their machines don't really like the machines, but the idea of having them. What I really don't understand very well is how someone with a large number of different models can use all of them. It takes some time to know the intricacies of each model and to

become proficient with it. Unless you are going to use core functionality, but then what's the point of having so many different ones, if most of what you do with each one of them could be done with a single one? In other words, you might be using all of them, but you are not using them to their full potential. And isn't that what they were designed to do?

But the problem is that a calculator like the HP 48GX is used regularly, it will eventually fail just due to simple mechanical wear and tear. I'm just trying to postpone that fate by using it in a controlled environment and in a limited fashion, because to me it is more than a calculator.

*Message #33 Posted by **R.J. Soto** on 13 Oct 2009, 3:56 p.m.,*
in response to message #22 by Egan Ford

Yours is a very reasonable post, Egan. I can find no fault with it, yet at the same time I can't agree with it, because I'm a very unreasonable man. I do extract a lot of joy from simply looking at my calculator, holding it, and occasionally turning it on (just to reciprocate, and if you get this last joke you are as sick as I am.)

Unfortunately you are right about TI. I graduated in Mathematics 3 years ago, and my TI-89

served me well. Yet, I find it hard to feel sentimental about that machine. I even tried to take a 48SX to a couple of exams, but I wasn't able to use it as efficiently as the TI-89 for that purpose, so I ceased the experiment (my GPA was at stake.)

I don't claim to be reasonable or even rational. I'm not a hypocrite either, although perhaps I should have been more forward in my original post by saying I'm also interested in getting a good price for it (although I think that was implied.)

As much as I find reason and logic in your post, unfortunately I must cross you out of my pool of potential buyers. The idea of my 48GX laying on the floor gives me squalors.

Regards,

Ruben

I already have a 48GX, I do not need another. However if you *gave* it to me, then I assure you that it would not sit on my floor. Instead it'd sit in a padded box on its way to a student that I know would *use* it.

I've been taking a similar approach by foisting HP calculators on my kids. (How many 7th graders do you know swinging an HP-33s in class?) Of course, that regularly forces me back to the auction site that shall not be named when a kid succeeds in breaking or losing a calculator. ('My calculator won't turn on.' ... 'What did you do to it?' ... 'Nothing.' - another HP48G bites the dust :<)

Fortunately my wife is an engineer with a HP-11C in her purse, so I can get away with such behavior.

As a teacher and math tutor, I have given several calculators to my students over the years, if I thought they could benefit from them. I gave a 12c platinum to a seventh-grader who expressed interest in how programming on a calculator worked. I gave a TI-34 Multiview (excellent calculator for middle-school kids) to my entire 8th grade class last year as a graduation present (it was a very small school and the 8th grade consisted of only three girls).

And each year I take my HP-65 with its flashing LEDs to school, and the kids are always intrigued by that. Face it, kids are into electronics these days, and anything that gets them interested in math and its operations is a good thing.

This is my experience as well. In the sea of iPod Touches and iPhones, a calculator still resonates with teens, which actually runs contrary to my expectations. My HP-41CV and TI-59 are the biggest hits. The HP-42s is so discrete that it fails to impress. The 48GX doesn't excite as much interest as the 50g, presumably because mine is a well used example and the 50g looks "new".

Hi there,

I do not find any contradiction in my statement. Collecting is a voluntary activity which doesn't depend on talent or ability, but rather in the will and passion to collect something which is the object of your devotion. Therefore, a self-proclaimed collector is for all intents and purposes, a collector. In contrast, a self-proclaimed rocket scientist might be nothing more than a hack, due to lack of talent, knowledge, or ability. Basically, what I'm trying to tell you, is that I didn't mean "self-proclaimed collector" in any pejorative sense, but rather as a way to denote the self-conscious nature of a given activity (collecting HP calculators in this case.)

I also disagree with your second point. These calculators are a species near extinction, and a specimen of the kind I have stands a better chance of being preserved and admired by a collector. What you are saying is that I should sell this to a college kid so that the calculator can be used as a tool. I have to disagree with this for a couple of reasons: 1) At this point in time, there are machines which are far more capable tools, from the purely technological point of view, than a HP 48GX. As a matter of fact, you can probably run a perfect 48GX emulation using PDA hardware. 2) Most importantly, you are forgetting that a machine like the HP 48GX is much more than a simple tool. Some snobs (I'm saying this with tongue in cheek by the way) might even consider it a piece of artistic industrial design due to some of its qualities: Solid construction, materials, layout, etc. After all, we are in a museum, aren't we?

To make a crude analogy, what you are saying is that someone willing to part with a Hispano-Suiza with all original parts should sell it to someone who will drive it to the store and back just because that's what all cars were created for.

This is not nearly as true of 48GX as it is of 41C(V,X), and people have used those older models to death and then restored them for more _use_. PDA's don't quite fill the bill, as there is a constant battle

for appearance rather than ergonomics. A touch screen is quite difficult to one-hand. 48GX isn't great for one hand, so maybe, when surveyors (TDS is doomed ;-)) lecturers and students have all got 50g's...

I sort of understand collecting, but for me there is much more satisfaction using something I don't have to sling over my shoulder that was very carefully designed for my hand and brain.

Richard

Very reasonable post. Again, I can not agree though, because I'm not reasonable. I can envision a future, 200 years ago, when children won't be able to lay their eyes (multiple eyes, due to mutations caused by the great war of 2012) onto a mint 48GX. If this is not enough to give you nightmares, what is? OK, perhaps the idea of a braless Woopi Goldberg jumping rope with Rosie O'Donnell. But besides that, what is?

If I was in a real museum, I'd actually want to see a beat-up used HP48GX in the glass cabinet running a program. Rather than a shiny virginal one through its original bubble packaging without the batteries in lest they leak.
It gives it some character, history, and a sense of worth.

But that's just me...

Hey, why not?
I'm in a Youtube kinda mood today, so here is another one that is just so apt, err, I mean so choice, for you collectors...

http://www.youtube.com/watch?v=4MxPoxxt7n0

Dave.

100% agree!!!

That's what makes me think if I'm a collector or simply a user that likes to use great calcs instead of seeing them in a drawer.

Regards

DaveJ,

But you are missing the point of a museum. There is no shortage of beat up, dirty 48GX calculators full of character. Museums are for the excellent pieces.

That video brought a smile to my weathered convict-like mug. :)

No I'm not missing the point, because my viewpoint is different. That's what I'd prefer to see in a museum when it comes to technology like this.
Try going to the Computer History Museum some time. I don't believe there is a single item in the collection that hasn't been used and is beat-up in some way. You won't find any original boxes on display, that's for sure. I liked it.

Here is the calc section PHOTO 1 PHOTO 2

The only exception is the HP01, and that kinda makes sense because the box is designed for display. The other cals are in reasonable condition, but I like that they looked used, that's what I expected to see.

If pristine units in their original bubble packaging floats your boat, then that's fine too, just don't be surprised when others don't get so excited!

Dave.

in response to message #47 by DaveJ

I'm not surprised actually. I thought the feeling would be more prevalent, specially here. Maybe the term "Museum" should be changed to "Repository". I'm not arguing that my 48GX should be considered art, by the way. Even I can see the difference between a Picasso and a chunk of plastic with buttons on it.

Yes :-) This summer, I had the chance to go to the Duxford Flying Legends weekend (http://duxford.iwm.org.uk/) with a couple of colleagues. For two days in a row, we saw a stunning performance by dozens of aeroplanes, some of which were nearly 100 years old. Some of them one-of-a-kind specimens. Worth millions (of dollars/pounds/euros/whatever). But far too rare and precious to be left gathering dust in a museum. These things were built for flying, and the air is the place where they belong. If one of them gets damaged or destroyed in the process, then at least it has not "died" for nothing.

Today I had a day off and went flying with two students (I consider instructing as recreation, not work). We had the rare luck, to encounter the "Breitling Super Constellation" (http://www.superconstellation.org/) at the airfield where we practised instrument approaches. What a joy! What a pity and loss it would be to let this beauty rust away in some museum.

So when I say, that calculators should be used for calculating, I really mean it. Sometimes I feel guilty for not letting (most of) my 700+ calculators do what they are best at...

Greetings, Max

*Message #50 Posted by **R.J. Soto** on 13 Oct 2009, 4:32 p.m.,*
in response to message #49 by Maximilian Hohmann

Hello Maximilian,

I understand your point of view. But I think there is a limit to everything. You must be very conflicted about your 700+ calculator collection, because it radically goes against that theory. This leads me to believe that you at least partially understand some of my feelings.

How often do you use each one of your calculators? Wouldn't it be more in tune with your philosophy to donate all but 10 or 20 of them to people which would use them everyday in a practical context?

Do you have any duplicates? (I think this question answers itself.) If so, how can you justify that fact? Having more than one item which can exactly perform the same function does not make any

sense, at least according to your feelings that things should be used for that which they were intended. How does the superfluousness and waste inherent in owning two items of one kind fit with your theory, when you can only use one of them at a time?

The main thing that I disagree with is your attitude that you should use things "because that's what they were created for." Things are nothing but inanimate objects, and I think they should be used for that which their owner can derive the most pleasure from. If that is gazing at them, holding them, and occasionally using them, so be it. If that is using them without constraints or care, that's fine too. But there is no greater purpose to be fulfilled, no promise to be satisfied, in using a calculator for that which it was designed for. At least, not when it transcends the realm of utilitarian tools, and reaches the domain of industrial art. And perhaps the 48GX doesn't reach that level, but it is mightlily close.

Re: How do you sell your HP calculators?

*Message #52 Posted by **R.J. Soto** on 13 Oct 2009, 11:14 p.m.,*
in response to message #51 by Bart (UK)

How's it going, Bart.

I don't claim to be fully rational (and whoever does is a fool.) And yes, I see the contradiction in what I say. Let me see if I can rationalize some of it...

People get attached to things regardless of things themselves being inanimate objects. It happens all the time. Why is that? My guess is that things can sometimes be vehicles to spark remembrances of places in time, to evoke memories of times past. I'm not defending

this as rational behavior, but emotion in itself is the antithesis of reason (and I hope it stays that way, because otherwise we would all be a bunch of robots.)

Why would I care someone smashing my calculator? Because I like my calculator, it's as simple as that.

Cheers,

Ruben

Then why don't you keep it? Are you really *that* desperate for the cash?
With your sort of attachment it might be perhaps something you'll come to regret one day if you do sell it?

Dave.

Re: How do you sell your HP calculators?

*Message #54 Posted by **R.J. Soto** on 14 Oct 2009, 1:02 a.m.,*
in response to message #53 by DaveJ

It it were only that simple...

It's not as much about the cash as it is about my life in general. I have too much stuff and I need to get rid of some of it, because it has gotten to a point that it is ruling my life. I do tend to get obsessed as a matter of fact, and I have realized that I need to simplify. I am going to end up selling a bunch of stuff in eBay in the short run, and for the 48GX I wanted to figure out if there existed a different channel for collectors only that I may try. The first couple of very helpful responses I got made the point that I should just put it on eBay and let things sort themselves out. So that's what I'm going to do. I apologize if I created a stir with my views about how to deal with these calculators. It wasn't my intention to do that, it just happens to be the way I feel about it.

Cheers,

Ruben

> How often do you use each one of your calculators?

Not as often as I would like to!

> Quote:
>
> Wouldn't it be more in tune with your philosophy to donate all but 10 or 20 of them to people which would use them everyday in a practical context?

I have never suggested that you donate your calculator to anybody! But if you sell it, then (as others have pointed out already) I think it is the buyer alone who has to decide what's best for his newly acquired calculator.

And yes: It would be good if I could give away/sell most my calculators and keep only 20. My wife would love the idea! But as of now, I simply can't decide which ones to keep...

> Quote:
>
> Do you have any duplicates? (I think this question answers itself.)

Not so many, actually. Because I don't collect HP exclusively, but (in order of importance to me): Navigation calculators, exotic calculators of all sorts, programmable scientific with luminous display, scientific with luminous display, all others with luminous display, very smart calculators with LC display. As a matter of fact, I do not own a working HP-48GX, because it does not fit any of these categories...

> Quote:
>
> If so, how can you justify that fact? Having more than one item which can exactly perform the same function does not make any sense, at least according to your feelings that things should be used for that which they were intended. How does the superfluousness and waste inherent in owning two items of one kind fit with your theory, when you can only use one of them at a time?

I keep some duplicates for the purpose of trading or as spares for calculators that I actually use regularly. And especially the old ones really break if you continue using them.

> Quote:
>
> The main thing that I disagree with is your attitude that you should use things "because that's what they were created for."

I'm not all that strict about this point. But, as said before, if I had the choice to sell a calculator to either a collector or a user, than I would choose the latter. And be happy for "my" calculator!

Greetings, Max

Hello Max,

I think you have explained your feelings well enough. I hope my previous post didn't sound too hostile. Your collection sounds quite amazing. I used to have a Russian calculator with light tubes (I forget the name of the company, but it might have been Elektronika or something similar,) but I gave it away to a college friend from Russia whose father worked for Sun Microsystems.

How do you manage the storage and organization of your collection? That sounds like a great task in itself.

First: My collection is a very small and humble one. Some people who post on this forum (and some who don't) have 3000 or more...

As for the organisation, I have a little database with a short description and a photo of each calculator. And with storage, I must confess, I have a litte (or big, according to my wife) problem... I'm afraid, the day is coming close when I will have to focus on two or three specific classes of calculators and part with all the rest.

Greetings, Max

Yes but even Valentin (who takes impeccable care of his collection) made a very good point one day some years back when he asserted that all of these glorious HPs will one day stop working--even if you never touch them--as certain critical key components will decay and unlike an old National or Hallicrafters with dead-bug construction, you cannot bring one back phoenix-like.

So live a little--and use them claculaters! :-)

I understand what you say. Nothing lasts forever. Even the Universe is in a process of constant death. I just want to preserve some things for as long as possible.

Slightly out of topic, I hope you guys have looked into Faraday cages, because there is a world wide EM pulse attack at hand. It's just a question of time. And when that happens, bye bye calculator collection!

Also, I happen to admire my calculators when they are off as well (which happens to be most of the time.) Even without its innards a 48GX is a thing of beauty.

That's what I was told as a kid, to always keep the windows rolled up during a thunderstorm. As a matter of fact, I vividly remember seeing a demonstration of TV with a rat inside a model car submitted to some electrical discharge, which seemed to confirm that theory. So what you are saying is that the foundation on which I have based all my life is nothing but a lie?

I don't understand? This question is foreign to me. Sell.. my.. HP calculators???? Not gonna happen ;-)

I use a variety, about 8-10 different ones, here at work, and have a few more at home that the family uses for homework and account balancing.

But sell them? That's kind of funny!! (Half joking, half serious :-)

Matt

p.s. Call me old fashioned, but I recently bought an old Swingline stapler, just for the quality of it. Same thing about an old metronome. I just hate to see the race-to-bottom.. all the throw away stuff that isn't worth keeping. But that's just me.

p.p.s. I would however, easily consider selling some old TI's.

Staplers, huh? One of my most precious momentos is an Ace Scout Model 202 stapler given to me for my fifth birthday by my father 58 years ago. It was made in Chicago, Il by the Ace Fastener Co., and is built entirely of steel, except for the rubber feet. It uses these heavy duty buckle-proof undulated staples. Inside the box of staples is a small inspection card that states in part "If your Clipper or Scout does not function perfectly with these staples, send it to us with this card. This will assure only a minimum charge for putting the machine in working order."

And, yes, it still works perfectly.

Swingline staplers -- US manufacturing

*Message #73 Posted by **Karl Schneider** on 15 Oct 2009, 2:54 a.m.,*
in response to message #69 by Matt Kernal

Hi, Matt! --

> Quote:
>
> I recently bought an old Swingline stapler, just for the quality of it.

I bought one when starting college in 1981, paying around $20 for an all-metal, made in USA, Swingline Model 747. Pea-soup green, like the earth tones so in vogue back then. It's never given me a bit of trouble, and I still use it.

Just a few years ago, I bought a made-in-China Swingline 747 for about $11. It looked the same, but was not as solid, and some imprecise manufacturing made it jam frequently. I sent it to the metals-recycling bin.

Recently, I bought for about $20(?) a Swingline spring-loaded model (also made in China) that uses the same kind of staples, and is better-built than others of this type. So far, so good. The spring-loading is a clever innovation that gives more stapling power. The innards aren't accessible for safety reasons.

This is all very mundane, but what is significant are the familiar themes:

- How expensive, but durable, the original product was.
- The original, mass-produced low-tech product utilized domestic labor.
- Today's more-sophisticated product might still be lower-priced in inflation-adjusted dollars if it were domestically made, but is not -- with the US public generally unwilling to pay for high quality or for labor wages commensurate with their own.

I think it's important to differentiate between individual consumer products and business use products. Staplers are mostly used by businesses and considered office supplies, whereas small calculators are

generally purchased by private individuals. I think that businesses place more importance on durability and reliability, and are often willing to pay more for this. Individuals look more at cost and value, and are not so concerned with longevity, especially with rapidly evolving technological products. I personally get a kick out of playing with my ancient calculators and computers, but when it comes down to doing some serious work, I still use the newest ones.

> I think it's important to differentiate between individual consumer products and business use products. ... I think that businesses place more importance on durability and reliability, and are often willing to pay more for this.

It's a good point that businesses place more of a premium on quality, due to heavier use. Commercial-grade printers and appliances, for example, are certainly better-built and much more expensive.

Let's also remember that the purchaser for a large business is not spending his own money. Purchases made by someone for his small business may entail a tax deduction.

Still, the "devolution", or "race to the bottom" associated with outsourcing practically all US consumer-product manufacturing to cheap-labor countries is having serious consequences -- loss of family-wage jobs, loss of know-how and capability, dramatic increase in trade deficits.

That $20 I spent almost 30 years ago for a quality low-tech stapler and box of staples would be about $45 today. Who'd pay that much, when cheaper options abound? Hardly anyone...

Hi Ruben,

On behalf of all the members, welcome to the forum ;-)

Myself? I have been a member for only a few months, and had been reading it for quite some time before that. It's a fantastic place. As you found out, it's full of argumentative and opinionated people :-D

If you were in a room with them, you wouldn't hear the music for the din, and the police would probably knock on the door to ask to keep it down because they'd had complaints from the town next door.

But the wealth of knowledge is staggering; they are argumentative and opinionated, but passionate; they are also very helpful. Being so "green" myself (or "blue", depending on your custom), I feel a bit awkward putting myself forward like this; I feel it would be more up to long-time members like Maximilian, Egan, Michael, or

Luiz, to welcome you...but they were all busy arguing.

Who would have thought that asking a seemingly innocent question would spawn a thread that exploded in just a few days! Talk about baptism of fire. But I see that you held your end very well, parrying and thrusting; I am personally very impressed, although that would hardly count.

So again, welcome, and your HP-48GX looks very nice (I'm not in the running, I've got one like that already :)

Regards (to all),

Philippe

*Message #77 Posted by **R.J. Soto** on 15 Oct 2009, 8:57 p.m.,*
in response to message #76 by Philippe Lasnier

Hello Philippe,

Thank you very much for the warm welcome. I actually have no issue with arguments myself, as you have probably noticed. Regardless, I appreciate all the input received, and I have tried to put each of it in its proper context. Nothing like someone with a view completely different from your own to make you question your own actions. :)

Congratulations on your budding collection! Not everybody can perhaps even attempt to approach the gigantic collections of some of the folks here, but the important thing is not the magnitude of your collection, but your level of enjoyment (and after the discussions in this thread, I'm questioning whether I even am enjoying my meager collection enough to justify being the custodian of it.)

Out of curiosity, how did you get started with HP calculators? Like I said, I became immediately impressed after seeing several 48SX pieces in my old university days. Then, after going back to college to study Math, and despite the absolute dominance of Texas Instruments by then (I'm talking circa 2002,) at least in the U.S., it was only normal that my old interest in these machines would be rekindled.

Thanks again for your welcome!

Regards,

Ruben

*Message #78 Posted by **Philippe Lasnier** on 16 Oct 2009, 3:36 a.m.,*
in response to message #77 by R.J. Soto

In my case the story goes back to the (late 70's and) early 80's. At that time, while in high school (US meaning) in the scientific classes, I managed to acquire an HP-41C. I don't remember how exactly; I think it was second-hand. Before that, I had been using a TI-57. The TI was a great machine to learn on, and it taught me things that I've been using ever since; but the HP was a 'wow' moment. It was simply brilliant, and it got used extensively. At that time, TI and HP were at war, and the top calculators doing battle were the TI-59 and the HP-41. Frankly, I admired the TI-59 too, but the HP-41 was better ;-)

The accessories for the HP were too expensive, and I didn't have any, so when a few years later I needed something more practical, I sold the HP-41 and bought a Casio PB-700 with printer and

cassette storage. I always regretted selling the HP-41 (although I know it got to someone who put it to good use, like I had), but a cash-poor student has little choice. Don't get me wrong, the Casio was very good, and it got used nearly every day until the early 90's.

Forward many years, and I thought that I must have enough money now to buy an HP-41 again, this time with accessories - mostly for nostalgia; but I wondered if there were still any out there. Boy, was I surprised! So I got one, then two (you need a backup, right?), got the tape reader for it, then wondered what else from HP was worth looking for (I had seen HP-67s in my youth...). I spare you the details, but I turned into a collector without really realising it. I went through a magpie phase (I'm better now, thanks). It's not just HPs (I've got TIs, Casios, Sharps...), but HPs are the bulk of my collection.

In short, in my case it was nostalgia that made me look again for *the* machine of my youth, and it went on from there :-)

Philippe

Thanks for explaining your path to being a collector. Regarding Casio calculators, I seem to remember there was a Casio calculator which actually had a C compiler built in (or was it a Sharp calculator?) I thought this was quite surprising when I found out about it. You probably know (and possibly own) the calculator that I'm talking about.

>
> At that time, TI and HP were at war, and the top calculators doing battle were the TI-59 and the HP-41. Frankly, I admired the TI-59 too, but the HP-41 was better ;-)

The HP-67 was introduced in late 1976, and in response the TI-59 was introduced a few months later in May, 1977. I had both. Although the TI-59 is more technically innovative and has better performance than the HP-67, I went through several TI-59s by 1979 due to reliability problems. I never experienced any problems with my HP-67 until it had been in service more than four years, and the RPN programming was far more efficient than TI's AOS.

Thus, the numeric-only LED HP-67 was the true competitor to the numeric-only-except-for-printing LED TI-59. Introduced in 1979, the fully alphanumeric LCD HP-41C was in the "next generation." It is unfair to characterize the TI-59 as TI's competitor to the HP-41C.

Re: How do you sell your HP calculators?

*Message #81 Posted by **Philippe Lasnier** on 16 Oct 2009, 6:50 p.m.,*
in response to message #80 by Mike Morrow

Thanks for the precisions about the dates Mike. I need to put my statement in a narrower time-frame, and then it will be more accurate: I bought my HP-41C probably in late 1979 or early-to-mid 1980, in France. Going by the dates, the HP-41C would have been out (eclipsing the

HP-67), with the TI-59 being still alive and kicking (and no sign of any successor until the TI-66 in 1982). At that moment in time then, it is correct that the top calculators doing battle were the TI-59 and the HP-41 ;-)

I agree that the comparison was not fair though, so I stand corrected.

Ruben, I know the Casio you mean. Actually, there are many! But no, I don't own any, yet...I'm aiming for the PB-2000C and the FX-890P. Sharp had similar machines, but I haven't checked in detail.

Oops, we're getting off topic here...

Bonsoir,

Philippe

Pil Box ... works like a charm !

*Message #1 Posted by **Sean Connor** on 12 Oct 2009, 1:09 p.m.*

Had my Pil box for about three weeks now. Initially I had some problems with my (real) 71b locking up and lots of HPIL broken loop errors.

It was a problem with my Framework installation. I repaired it with the microsoft software and Voila ! It works like a charm.

Brilliant I'm chuffed to bits as we say over here.

Thanks to Jean-Francois for his efforts. It's worth every penny.

If this sounds like an advert I'll point out that I have no connection with Jean-Francois apart from buying a box from him LOL

Now HUNGRY for LIF images

Sean

*Message #2 Posted by **Marcus von Cube, Germany** on 13 Oct 2009, 12:18 p.m.,*
in response to message #1 by Sean Connor

My PILBox with HP-71b chokes. What kind of framework update did you do? I guess you're talking about .Net. I'll test with a different PC later.

Re: Pil Box ... works like a charm !

*Message #3 Posted by **Egan Ford** on 13 Oct 2009, 12:59 p.m.,*
in response to message #2 by Marcus von Cube, Germany

What does PRINT VER$ return? PIL-Box 1.2 or 1.3?

Thanks.

Re: Pil Box ... works like a charm !

*Message #4 Posted by **Sean Connor** on 13 Oct 2009, 1:48 p.m.,*
in response to message #3 by Egan Ford

Framework 2.0 Will check version of PIL box tomorrow (it's at work)

Marcus how does it 'choke' ? What are the symptoms ?

Sean

Edited: 13 Oct 2009, 1:53 p.m.

Re: Pil Box ... works like a charm !

*Message #5 Posted by **Marcus von Cube, Germany** on 13 Oct 2009, 3:54 p.m.,*
in response to message #4 by Sean Connor

I get "HPIL ERR: Message Error" and scrambled output in the display window.

My HPIL-1A seems to be the culprit, at least that's what JF told me. I might have to reflash my PIC to get it working.

Re: Pil Box ... works like a charm !

*Message #6 Posted by **Sean Connor** on 14 Oct 2009, 4:26 a.m.,*
in response to message #5 by Marcus von Cube, Germany

VER$ does not return the PIL Box version. I asssume its the latest firmware though as the box ifs from JF's latest batch.

My HPIL is ver 1A

My problem was also either broken loop errors or HPIL message errors.

I could see output in the scope window but nothing in the display area.

Sean

Re: Pil Box ... works like a charm !

*Message #7 Posted by **Marcus von Cube, Germany** on 14 Oct 2009, 11:52 a.m.,*
in response to message #6 by Sean Connor

Seems to be the same case as mine. JFG is working on the problem. I've a prommer so I can update the FW in my PILBox from images recieved by mail. Hopefully this will result in a new FW that works with 1A.

Re: Pil Box ... works like a charm !

*Message #8 Posted by **J-F Garnier** on 14 Oct 2009, 1:13 p.m.,*
in response to message #6 by Sean Connor

Hi Sean,

At least, the PILBox (firmware 1.3) works correctly with your 1A module. I have no problem as well with my 1A module.

It seems there are some differences between the 1A modules, unless Marcus's problem is due to something else. But for the moment, I still suspect the 1A module because the symptoms are very similar to what I (and others) observed with 1A modules and PILBox firmware 1.2.

J-F

Re: Pil Box ... works like a charm !

*Message #9 Posted by **Marcus von Cube, Germany** on 15 Oct 2009, 4:12 p.m.,*
in response to message #8 by J-F Garnier

JF, we can swap our 1A modules for further testing.

*Message #10 Posted by **ZOleg** on 15 Oct 2009, 6:56 p.m.,*
in response to message #8 by J-F Garnier

As I mentioned earlier in HP-IL 2009 thread there are problems with PILBox firmware 1.3 and HP-71B with HPIL version 1B.

Re: Pil Box ... works like a charm !

*Message #11 Posted by **Egan Ford** on 17 Oct 2009, 4:16 p.m.,*
in response to message #8 by J-F Garnier

> Quote:
>
> At least, the PILBox (firmware 1.3) works correctly with your 1A module. I have no problem as well with my 1A module.

I no longer have a problem with my 1A. I just reprogrammed the PIC today with 1.3 and tested with ILPer (Windows in a VM session), Linux and OS/X (hpil_test) without issue.

Re: Pil Box ... works like a charm !

*Message #12 Posted by **Marcus von Cube, Germany** on 17 Oct 2009, 4:34 p.m.,*
in response to message #11 by Egan Ford

My problem still persists, even with 1.3. It's probably my specific interface.

JFG has asked me to perform at test with another device in the loop. The only device I could provide was an old PC with Christoph's card and EMU41: It made the connection to ILPer work, but I have to recheck with a reversed setup (changing the position of the PC in the loop.)

Edit: I've just checked it: With the PC in the loop, PILBox works, without I get errors, no matter where in the loop the PC is.

Edited: 17 Oct 2009, 6:03 p.m.

Re: Pil Box ... works like a charm !

*Message #13 Posted by **Marcus von Cube, Germany** on 19 Oct 2009, 6:17 a.m.,*
in response to message #12 by Marcus von Cube, Germany

JFG has sent me a new incarnation of the firmware. This works better but mass storage access still produces errors. I'm positive that he will sort this out... :)

Re: Pil Box ... works like a charm !

*Message #14 Posted by **Marcus von Cube, Germany** on 25 Oct 2009, 4:44 p.m.,*

in response to message #13 by Marcus von Cube, Germany

JFG has created a fix for my HP-71b 1A HP-IL problem. The controller is simply too fast: It starts sending the next frame while it is still receiving the last package rearriving around the loop. This seems to have confused PILBox. Another device in the loop slows down communications enough to make PILBox happy.

The recent fix (1.3.3) introduces a special, jumper selectable, "no other device in the loop" mode that seems to take care of my 71b's behavior but might interfere with other devices in the loop. Since I don't have any other device, I'm happy with the solution.

Re: Pil Box ... works like a charm !

*Message #15 Posted by **Sean Connor** on 27 Oct 2009, 6:40 a.m.,*
in response to message #14 by Marcus von Cube, Germany

Hi Marcus,

Is this a firmware fix ? My PIL box has started to work intermitently with my 1A HPIL. It's really weired sometimes it will work for an hour and then on re-connecting fail for the rest of the day. I'm afraid I spoke too soon ! Maybe it's a temperature effect (clock drift ?) with the marginal timings.

Sean

Re: Pil Box ... works like a charm !

*Message #16 Posted by **Marcus von Cube, Germany** on 27 Oct 2009, 1:22 p.m.,*
in response to message #15 by Sean Connor

Sean, do you have any other HP-IL devices that you can put in the loop? If that fixes the problem, the new FW will help you. JFG can certainly send you the HEX file but you need a PIC programmer to install it on the chip.

Re: Pil Box ... works like a charm !

*Message #17 Posted by **Sean Connor** on 28 Oct 2009, 4:20 p.m.,*
in response to message #16 by Marcus von Cube, Germany

Hi Marcus

Yes I'll try to put my printer or 9114A in line tomorrow. I have a programmer so I may ask JFG for the new code.

Best Regards

Sean

Edited: 28 Oct 2009, 4:21 p.m.

in response to message #1 by Alberto Fenini

Buongiorno!

> Quote:
>
> Hello everybody, I know I have to buy the DVDs set but...

That won't help, because it is not described in the user manual anyway ;-)

OK, this is how it goes: First, you detach one side of the folding clamp to get easy access to the bracelet. For this purpose, you need to squeeze the end of the stainless steel part (where there are to layers of sheet metal), which you then can hook-out from the steel pin that goes across the bracelet cover. (You also need to to this when you want to change batteries.)

Now you see that the three or four links closest to the clamp have little slots on the inside. You take a needle (or a very, very small screwdriver) and gently push it into the slot of the link you want to remove. While you apply pressure, the links can be slided out sideways. Be very gentle, there is not much force required to do it. Do not proceed if you encounter any resistance, the locking mechanism of the links is very delicate. Try another link instead.

Saluti, Max

HP-01 help needed

*Message #1 Posted by **Alberto Fenini** on 9 Oct 2009, 6:43 p.m.*

Hello everybody, I need your help ! I have just received an HP-01 and I simply can't get it work. The item listed on ebay was pictured working, I have checked the batteris and are ok, what I'm I missing ? I just would be happy to see it showing date and time, any hint will be GREATLY appreciated, Alberto

HP-01 apart with pictures...

*Message #2 Posted by **Geoff Quickfall** on 9 Oct 2009, 10:46 p.m.,*
in response to message #1 by Alberto Fenini

Some basic points:

```
-  these watches are 30 years old.
-  they were beautifully engineered.
-  batteries leak or out gas.
-  the contacts on the battery holder (black plastic form) and
-  contacts on the (PCA)printed circuit assembly get dirty.
-  the contacts have a very narrow arc of contact.  That is the
   battery holder can shift in the case when the case back is put
   in place.
```

So without diassembly and with the back off the watch, remove the batteries noting the polarity of each. Clean the contacts on the PCA with a cotton swab and alcohol or contact cleaner. Allow to dry. Clean the contacts on the battery holder (do NOT attempt to remove it) just swab what you can. Replace the batteries observing the polarity marked on the PCA or with reference to the figures below. Once the batteries are in place press the reset button in figure 5.

Now let us know how it worked or email me personally.

Good luck, Geoff

A rolled gold plate watch (RGP)
-scratched crystal
-dirty keyboard
-marred case

Re: HP-01 apart with pictures...

*Message #3 Posted by **Alberto Fenini** on 10 Oct 2009, 6:58 a.m.,*
in response to message #2 by Geoff Quickfall

Dear Geoff, dear all, first of all thank you for the prompt response.

I did all of the things you suggested, (actually I didn't take apart the whole watch) but yet, the display remains black ...

Few things I don't know (forgive me if are obviuos to most of the readers and to you) :

a. should the watch work without the metal back cover mounted ? (this will make easier future tests

b. should it work, what should happen ? should display a default date and a running time ?

c. Now, about batteries, the watch comes from australia and the batteries inserted are Energizer 357/303, I have checked them with a voltmeter, and these provide a good 1.5 volt output. What do you suggest ?

Ebay Item was 260478798693, and to me, it really looked like it was working, could the shipping have ruined it ? It was very well packaged.

Again, thank you very much for help.

Re: HP-01 apart with pictures...

*Message #4 Posted by **Geoff Quickfall** on 10 Oct 2009, 10:47 a.m.,*
in response to message #3 by Alberto Fenini

a. should the watch work without the metal back cover mounted ? (this will make easier future tests)

Yes it will except for the piezo transducer (beeper) as that is built into the case back.

b. should it work, what should happen ? should display a default date and a running time ?

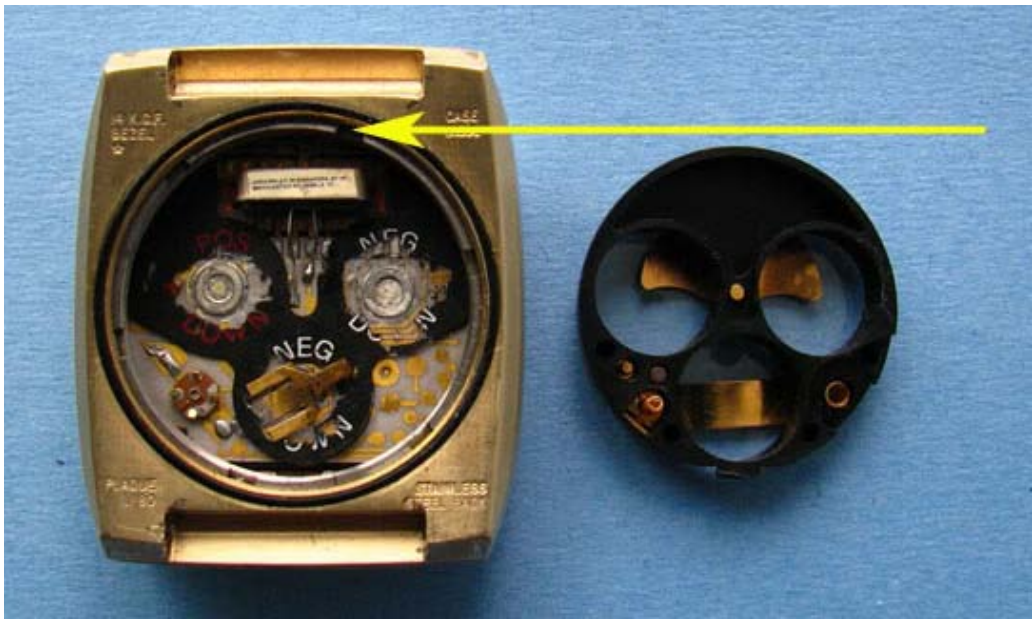
NO, you have to push the date button or time button. It MAY display a 0 followed by a decimal. If you press the reset button then you will get the 0. display

c. Now, about batteries, the watch comes from australia and the batteries inserted are Energizer 357/303, I have checked them with a voltmeter, and these provide a good 1.5 volt output. What do you suggest ?

The batteries are correct and show the correct voltage, HOWEVER, PURCHASE some new ones as a voltmeter does not test a battery with a draw on it. I have had bad batteries test close to 1.5 volts and not power the watch. These batteries when new on a volmeter should indicate 1.55 volts. The caveat here is to install new batteries prior to disassembly just in case!

Email me personally before you decide to disassemble the watch. When looking at the watch with it's face down and the case back off the sequence of battery placement should be:

```
upper left:    positive down   display battery
upper right:   negative down   display battery
lower centre:  negative down   memory battery  (also required for display to work but does
not power the display)
```



Ebay item 260478798693

He has the stopwatch function running. Have you tried pushing the upper right hand button marked S to see if that function works?

These watches are problematic when it comes to repair. Typically the batteries leak or out gas and corrode the PCA. A second failure point which can occur is the Quartz Crystal which can be replaced. The trimming capacitor can also be replaced. Contact breaks at both these points lead to a blank display.

Cheers, Geoff

HP50G related: is it just me or this is new?

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 9 Oct 2009, 3:23 p.m.*

Hi, everybody.

Some time ago I was lurking around the forum, just randomly reading the posts, and someone mentioned this stuff with the complaint that it was not HP49/50G addressed, only HP39/40G. A few weeks ago, I red this thread and decided to upgrade my HP49G (test driver) prior to upgrade the HP50G. It was a big surprise to see that the APPS menu offered, along with the equation library (12th. entry) and the periodic table (13th. entry), a StreamSmart menu (14th. entry). Was the StreamSmart menu available in previous O.S. versions for the HP49/50G or is this the first one?

Please, if this is yesterday news, let me know and forgive me...

Cheers.

Luiz (Brazil)

Edited: 9 Oct 2009, 3:34 p.m.

Re: HP50G related: is it just me or this is new?

*Message #2 Posted by **Tim Wessman** on 9 Oct 2009, 5:12 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

That is the first one. Is that a 49G you installed it on. . . or a g+? As far as I know it shouldn't boot on a 49G.

TW

Edited: 9 Oct 2009, 5:13 p.m.

(edited) HP50G related: is it just me or this is new?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 9 Oct 2009, 5:56 p.m.,*
in response to message #2 by Tim Wessman

Hi, Tim;

you are correct, it worked fine the HP49G+ and the HP50G. I did not test it in the HP49G (should not work, you are correct). I do not have a Stream Smart (yet...) to test it, but the OS ran smooth in both calculators.

In time: I added a 1GB SD card to the HP50G (long time ago) and tried to format it with the calculator OS. Did not succeed formatting the card with all available space, but after formatting through the computer (FAT32, 512K/cluster) the calculator saw the hole 1GB. I wonder if this new version allows formatting a card that big.

Cheers.

in response to message #4 by Paul Dale

I have no direct info, but I'd gues that person just glued in an FTDI USB/serial chip (or maybe one from Silabs/Cygnal)...

Bill Wiese San Jose CA

Re: HP20 and USB as showed at HHC

*Message #6 Posted by **Scott Newell** on 9 Oct 2009, 7:47 p.m.,*
in response to message #4 by Paul Dale

I was surprised to find that the 20B back cover is not transparent to IR.

Re: HP20 and USB as showed at HHC

*Message #7 Posted by **Eric Rechlin** on 9 Oct 2009, 7:20 p.m.,*
in response to message #1 by cyrille de Brebisson

I think Vern said it was a FT232 variant he bought pre-mounted to a board from SparkFun. The only problem was it was mounted on a 1/16" board instead of a 1/64" board, so it was too thick to close the case properly.

Re: HP20 and USB as showed at HHC

*Message #8 Posted by **Bruce Bergman** on 10 Oct 2009, 12:37 a.m.,*
in response to message #1 by cyrille de Brebisson

If we track him down, someone please let me know -- I'd really like to add that information to the HP-20b wiki. I think that would be a perfect add-on to the wiki (and the 20b!).

thanks, bruce

If one screw is missing, I'd probably lift up one of the feet and unscrew the one from there and move it to the battery compartment. I doubt the calculator will notice the one under the feet missing.

Or I'd take the screw to the largest nearby hardware store and try to match it with what they have. I matched a HP-97 screw very closely in the wood screws section.

Re: HP-35 screw dimension

*Message #3 Posted by **Michael de Estrada** on 8 Oct 2009, 10:49 p.m.,*
in response to message #1 by Andreas Grund

First, these are self-tapping screws and not machine screws. They tap the threads into the plastic posts in the case when they are first installed at the factory. I measured a few with a digital caliper, and they are approximately 7.2mm long and 2.2mm diameter. The thread pitch is very approximately 0.8mm, but I don't have a proper pitch gauge to measure this. The replacement screw may be bigger, in which case the original screw will no longer be a tight fit. I fixed this in one calc that had been previously opened by using a longer screw to make some new deeper threads.

Regards,

Michael

That is in fact the official repair technique right out of the HP service manuals.

in response to message #4 by Eric Smith

Thank you for the fast responses. First, I "reuse" the screws under the rubber feet for the more visible locations in the battery compartment and then I check for new screws of suitable size in the next hardware shop.

Andreas

Re: HP-35 screw dimension

*Message #6 Posted by **Randy** on 10 Oct 2009, 11:52 a.m.,*
in response to message #5 by Andreas Grund

HP did in fact use silver colored screws in early 35's so I would not assume it was an owner repair, more than likely it was original if the the pitch was the same as other screws inside the unit. FWIW, many 35's had a mix of both black oxide and silver colored screws.

I don't know what luck you'll have finding a metric substitute since the originals are a standard U.S. numbered screw size and further, they are of a unique self tapping design specifically for plastic and are sold under the trademarked name "Plastite".

Re: HP-35 screw dimension

*Message #7 Posted by **Andreas Grund** on 10 Oct 2009, 11:07 p.m.,*
in response to message #6 by Randy

Interesting to learn that screws of different colors were used even within the same calculator, I did not know that.

Meanwhile I got in a hardware shop silver color self tapping screws of 2.3x8mm, pitch 0.8, should be a suitable replacement.

greetings, Andreas

Need advice: 48SX battery leak repair

*Message #1 Posted by **Scott Newell** on 8 Oct 2009, 9:54 p.m.*

I caught it early (only the lower negative contact was affected), and cleaned the contact with Q-tips and vinegar, water, and alcohol. Looks pretty good, from what I can see. (Maybe a dot or two of green stuff on the backside of the contact--hard to say.)

However, the bottom row of keys are making a sorta wet squishy sound, so I'm concerned that I may have wicked the vinegar into the keypad. What's my best option for cleanup at this point? I'd really rather not open the case.

Dip the bottom inch of so in distilled water, then let it dry out for a week or so?

I wonder if Duracell will send me a coupon to make up for it.

Re: Need advice: 48SX battery leak repair

I am not quite sure about this, but I'd try it myself if the calculator is mine.

If you do that, please, let us know.

Success!

Luiz (Brazil)

in response to message #2 by Vieira, Luiz C. (Brazil)

Luiz, congrats on your country Brazil hosting the 2014 world cup. I sent a few calculators that had battery problems (exploding, leaking, corroded contacts etc) and Randy from fixthatcalc.com fixed them up as good as new. I know he is stacked up with work, but if you treasure your HP like myself, the wait shouldn't be a problem. Luiz, I know the distill water works for dirt and stuff, but I am not sure if it'll work for battery leaks.

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 12 Oct 2009, 11:27 p.m.,*

in response to message #3 by Iqbal

Hello, Iqbal; long time no talk...

Are you using SUBDIV yet? I was 'organizing and cleaning my attic' (my house has no attic, just a figure of speech...) and found many program listings, amongst them what seems to be SUBDIV´s last version. Good days, though...

Thanks for your mentioning the soccer (football?) world-series cup. I just hope our country, meaning people and government, makes to deserve it... There are many major problems to be fixed in Brazil prior to welcome tourists all over the world the way it must be done. Well, time will tell. I´m an optimist, just do not believe in miracles, I believe in people´s will and hard work. Miracles work well in the big screen, not that much in real life.

About the HP48 and the leakage: I considered that, at least, we'll have the alkaline leakage being diluted in distilled water, reducing its action for the moment. My advise (and this is something I'd do, actually) would be to remove the batteries and dip the bottom part of the calculator in distilled water till the water covers the battery compartment. Gently shake it and allow the water to pass through it, dissolving the alkaline solution. I'd repeat the process at least three times, with new amount of distilled water. THEN... I'd allow it to dry a little bit while setting the arrangements with Randy to send it to fixthatcalc d8^)

Once, I was given an HP48G that stopped working for good. I opened it and part of the internal metal frame was corroded by leakage (the owner had told me about that). The problem is that the leakage also corroded the carbon-based tracks of the flex keyboard circuit, hence the nonworking condition. I did not have conductive tape, but I decided to try to rebuild it with conductive ink, only to see what happened. I did not succeed putting it to work, though...

Not much of a help, but at least I cleared some points out. Thnaks, Iqbal; good reading from you.

Success!

Luiz (Brazil)

HP-IL 2009

*Message #1 Posted by **Egan Ford** on 8 Oct 2009, 3:43 p.m.*

I uploaded a PDF of my HHC 2009 PPT here: http://sense.net/~egan/HHC%202009%20HPIL.pdf.

Since it was a live demo much of this PDF may make little sense.

The big picture:

The PIL-Box with a laptop can be used to access physical HP-IL peripherals (HP 32 column video tested) from emulators (EMU41 and Nonpareil tested).

And

The PIL-Box with a laptop can be used by physical calculators (41CX, 71B, and EMU41 on PC with ISA card tested) to access emulated peripherals (ILPer simulating storage and printer tested and test_hpil simulating 32 column video and printer tested).

And

The two above mixed together. I.e. you can create a virtual HP-IL loop of physical and virtual devices.

An easier way to think of all of this is that an old PC with HP-IL ISA is equivalent to a modern PC with a PIL-Box.

Lastly, Windows, OS/X and Linux tested. My demo was done with Windows in VMware and OS/X.

The other big announcement was that for the first time ever there is an open source HP-IL implementation. ILPer (Windows VB), Nonpareil with HP-IL patches (C code), and test_hpil (C code) include the source.

In time Khanh-Dang may have a virtual PIL-Box completed. I.e. HP-IL to TCP (its mostly available today in the Nonpareil HP-IL patch). With this I should be able to create an HP-IL loop that spans the globe. NOTE: This is HP-IL encapsulated in IP, not IP encapsulated in HP-IL. The later is already done (NutIP).

How would you use HP-IL over TCP? Well let me give you an example. Say that I wrote a program for the 71B that you really wanted. I could email it to you or post it, then you'd have to find a way to get it into a LIF image so that you could use your PIL-Box to get to it via test_hpil or ILPer, or I could send you a LIF. Or... I could put it in a virtual storage device on a virtual loop and just send you the IP address. Then you connect to the PIL-Box, launch test_hpil with some option to extend your virtual loop to mine via TCP, then from the 71B you just read it from my virtual storage. (Howard Owen is drooling, I can see it from New York :-).

And, that is just the begining of many possible cool things to come.

Re: HP-IL 2009

*Message #2 Posted by **Geoff Quickfall** on 8 Oct 2009, 4:01 p.m.,*
in response to message #1 by Egan Ford

Thanks Egan,

Your explanation and talk at the HCC this year has convinced me of the need to update my 41C and 71B with a PIL-box.

The talk was wonderful as well as the demo. Most of the new peripherals for the HP-41 et.al. seem to be complex in usage but your demo disproved that!

Cheers, Geoff

And good to meet you also!

Re: HP-IL 2009

And we are talking 30YO technology...

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 8 Oct 2009, 5:15 p.m.,*
in response to message #1 by Egan Ford

Hi, Egan;

thanks for your very interesting information.

I contacted J. F. Garnier about three weeks ago in order to know how to buy a PIL-Box, but I had no answer from the second e-mail. I'll wait for a bit more and ask him again. It seems to me the PIL-Box is the best solution for connecting the HP41 to the new computers through USB ports.

In time: any chance that we have HPIL-cable clones? I guess that with available technology they are not that hard to be 'reversed-engineered'.

Cheers.

Luiz (Brazil)

Re: And we are talking 30YO technology...

I was thinking that myself. Would any know how hard it would be to create new cables and peripheral connectors?

Re: And we are talking 30YO technology...

*Message #6 Posted by **Eric Smith** on 8 Oct 2009, 11:54 p.m.,*
in response to message #5 by Egan Ford

It is unfortunate that the HP-IL specifications actually do NOT include proper mechanical drawings of the connectors. They have drawings, but the drawings are missing many important dimensions.

It would also be nice if we had specifications of the actual cable HP used. I haven't found any other cable quite like it.

Re: HP-IL 2009

*Message #7 Posted by **Martin Pinckney** on 9 Oct 2009, 7:47 a.m.,*
in response to message #1 by Egan Ford

Egan,

Even though:

1. I was not there

2. I don't have a 41

3. I have only the foggiest notion of what HP-IL is

4. I have no idea what Nonpareil, TCP, or most of the other jargon means

Still, I found your presentation enjoyable.

> 2. I don't have a 41

I didn't have one until 2007. It's never too late. :-)

> Quote:

> 3. I have only the foggiest notion of what HP-IL is

http://en.wikipedia.org/wiki/HP-IL is a good place to start. Think something like USB for calculators in the early 80s. IOW, its a network--a way to move data.

> Quote:
>
> 4. I have no idea what Nonpareil, TCP, or most of the other jargon means

Nonpareil is an open source *Swiss Army* HP calculator emulator. One of the models emulated is the 41.

TCP is short for TCP/IP.

> Quote:
>
> Still, I found your presentation enjoyable.

Excellent. Thanks.

Re: HP-IL 2009

*Message #9 Posted by **ZOleg** on 9 Oct 2009, 8:19 p.m.,*
in response to message #1 by Egan Ford

I recently received my PILBox and began to experiment.

In Windows XP x86:
1) HP-71B, HP-82161A and ILPer 1.3.1 works fine on normal and high speed.
2) HP-71B and Emu41 2.47 only work on normal speed, on high-speed Emu41 simply do not see any external device and HP-71B do not see Emu41 internal devices.
3) HP-82161A and Emu41 2.47 do not work together at all, when i try read directory or file from tape, recorder rewinds the tape, then just nothing happens - on recorder Busy lamp is flashing and Emu41 does not respond to any command until pressed F12. (Emu41 works in slow mode as specified in manual)

In Windows 7 Ultimate x64:
1) When i copy my files from HP-71B to HDRIVE1 on ILPer 1.3.1 at the end of the process of copying a message on 71B - HPIL ERR:Frames Altered. If repeat copy same file 2-3 times, then everything goes well (without any error). I tried with high-speed and norlmal-speed - same result, i tried small and big files - same result, i tried basic and lex files - same result.
2) If i use ILPer as DISPLAY or PRINTER device - all is in most cases normal, but sometimes by transmission characters disappear or garbage is transferred.

I dont have Linux to try modified Nonpareil, may be someone will tell me how to compile Nonpareil in Windows?

Edited: 9 Oct 2009, 8:35 p.m.

Re: HP-IL 2009

*Message #10 Posted by **Eric Smith** on 10 Oct 2009, 1:05 a.m.,*
in response to message #9 by ZOleg

There is currently no working way to compile Nonpareil for Windows. I hope to address that in early 2010.

The plan is to switch from GTK+ to Qt, as Qt has much better cross-platform support.

Re: HP-IL 2009

JFG stated to me that EMU42 2.47 will only function at 9600 baud (slow speed).

> Quote:
>
> 3) HP-82161A and Emu41 2.47 do not work together at all, when i try read directory or file from tape, recorder rewinds the tape, then just nothing happens - on recorder Busy lamp is flashing and Emu41 does not respond to any command until pressed F12. I have been able to reproduce this problem as well with EMU41. JFG did state that the EMU41 2.47 support of the was experimental. However, from Nonpareil with the PIL-Box patch it works as expected. NEWM, READP, WRTP, and DIR all behaved as expected.

> 2) If i use ILPer as DISPLAY or PRINTER device - all is in most cases normal, but sometimes by transmission characters disappear or garbage is transferred.

I suspect a bug in ILPer. I have issue #2 as well (did not test #1). JFG said that it may be a timing issue with the 1A version of the 71B HP-IL module. I have 1A and PIL-Box 1.2 and also have the dropped data. However with test_hpil on OS/X simulating a 32 col video and printer I was able to print out long 71B programs without missing characters. I'll try to add mass storage to test_hpil today and test for you.

I speculate that most of your issues are with software and not the PIL-Box.

> Quote:
>
> I dont have Linux to try modified Nonpareil, may be someone will tell me how to compile Nonpareil in Windows?

That may be a bit tricky. There are 3 versions of Nonpareil with HP-IL support. The first dated 7/14/09 has working simulated HP-IL support in Nonpareil with PIL-Box support that did not work. I was able to build that version for Windows under Cygwin. I'll try again and document it this time. It is not ideal, but it worked.

The 2nd is the work that Khanh-Dang did to fix the PIL-Box support. That has not been released, however I can zip/tar it up for you if you want to give Cygwin/X a crack with it.

The 3rd is test_hpil (still part of Nonpareil, but to be standalone in the future). test_hpil is hardcoded with a printer and a video display. It was done at the last minute for HHC 2009. I should be able to add mass storage.

The 2nd/3rd may be problematic for Windows since the way Linux/UNIX access serial devices is different that Windows, however if Cygwin/X exposes that as Linux-ish, then it should work. I'll try to give it a shot this weekend. I have a new XP SP3 machine I can try on.

Bottom line, my PIL-Box experiences with Nonpareil/test_hpil have been stellar and without issue. I believe the PIL-Box to be feature complete, but think the Windows software may need a bit of help. BTW, source is included with ILPer, so you can fix yourself. :-)

Hmmm... I have been trying to reproduce all my testing and document. I was able to do a long listing with my 71B last week before the conference, however I just tried again and I am getting the same dropped char result I got with ILPer. JFG is sending me PIL-Box 1.3 firmware for me to test with 1A on the 71B. Hopefully that will fix my problem. Still stumped however, it was working.

Re: HP-IL 2009

*Message #13 Posted by **Egan Ford** on 10 Oct 2009, 2:43 p.m.,*
in response to message #12 by Egan Ford

Update. It's more stable at 9600. I am unsure where the problem is. Could be the PIL-Box 1.2 or test_hpil. I am not going to bother with a mass storage simulation test with test_hpil until the printing from the 71B is resolved.

I have been unable to produce any problems with a physical 41CX. It may be that the 41CX is too slow. I'll test with EMU41 on a PC as a 41CX running at full speed.

Re: HP-IL 2009

*Message #14 Posted by **J-F Garnier** on 11 Oct 2009, 3:36 a.m.,*
in response to message #13 by Egan Ford

The timing problem Egan is mentionning is specific to the HP71B HPIL module version 1A. It will not happen with the HP41. Actually the timing difference that causes problem to the PILBox is due to the firmware of the embedded uC inside the HPIL module. I have no way to findout the firmware revision, but it seems it has changed at some point, more or less when the 1B revision was released.

I advise HP71's users to find a 1B module. Not only the PILBox will work better, but you will get rid of revision 1A bugs that can cause Memory Lost, see my web page.

J-F

Added note: this timing problem is solved, in principle, with PILBox firmware 1.3.

How to update PILBox firmware to 1.3 version?

Re: HP-IL 2009

*Message #16 Posted by **J-F Garnier** on 11 Oct 2009, 11:28 a.m.,*
in response to message #15 by ZOleg

You already have the latest firmware 1.3, Egan has not (not yet).

I can send replacement uC in case of firmware upgrade.

J-F

Re: HP-IL 2009

*Message #17 Posted by **ZOleg** on 11 Oct 2009, 7:33 p.m.,*
in response to message #16 by J-F Garnier

If my PILBox have 1.3 firmware and HP-71B have HP-IL module 1B version then the problem is something else. Perhaps ILPer does not work well in Windows 7 x64?

Re: HP-IL 2009

*Message #18 Posted by **Egan Ford** on 10 Oct 2009, 4:32 p.m.,*
in response to message #12 by Egan Ford

Another update. I used EMU71 w/ ISA card for HP-IL, then I connected that to my PIL-Box 1.2 and tested with hpil_test and ILPer. No dropped packets and I was able to fill up hdrive1.dat.

So, I suspect that JFG is right, there is a problem with 1A and hopefully PIL-Box 1.3 will fix it.

I got the patched Nonpareil to build in Windows, however you'll need Cygwin/X. It does work with the PIL-Box, however there are a few bugs that may make it unstable. I know how to get around one of them, but the other concerns me. For some reason ESC sequences are not making it to virtual or physical devices when testing 32 column video.

Until I (or Khanh-Dang) have time to fix it, I'd recommend avoiding it. But if you really want it let me know and I'll post it somewhere.

Re: HP-IL 2009

*Message #23 Posted by **Egan Ford** on 12 Oct 2009, 10:21 a.m.,*
in response to message #22 by ZOleg

Here you go. A few limitations:

1. If you see HP-IL traffic spewing on stdout nonstop, then press ON/ON. It's a bug only with Windows. The best way to avoid is to not use MEMLOST in your .nal file and then never power off the 41CX.

2. test_hpil is not built. My early attempts failed. I did not spend a lot of time on it. I'd prefer to wait for Khang-Dang's latest code.

3. For now it works much better in Linux and OS/X. If you really want test_hpil, better speed, and no problems, then I'd install Ubuntu 9.10 (avoid 9.04, there is an FTDI bug, or install 9.04 and then update the kernel yourself) in a virtual machine.

Build notes:

1. Install Cygwin/X

```
All Devel
All X11
Plus vim, atk-devel
```

2. Launch an Xterm (Important!).

3. Install scons

```
cd
wget http://prdownloads.sourceforge.net/scons/scons-1.2.0.tar.gz
tar zxvf scons-1.2.0.tar.gz
cd scons-1.2.0
python setup.py install
```

4. Build Nonpareil

```
cd
wget http://sense.net/~egan/nonpareil-0.79.cygwin_hack.tgz
tar zxvf nonpareil-0.79.cygwin_hack.tgz
cd nonpareil-0.79
scons -c
scons prefix=$HOME install
```

5. Sample $HOME/.nonpareil/41CX.nal:

```
#Don't use MEMLOST with Cygwin/PIL-Box hack.
#MEMLOST 100

#load code
#BIN IO.BIN

#load modules, HPIL first
MOD hpil.mod
HPIL hpil.conf

#Printer
#MOD 82143a.mod

#Modules
#MOD EXT-IO.MOD
#MOD CCD-OSX.MOD
```

6. Sample $HOME/.nonpareil/hpil.conf:

```
#HP82182A
#set printer_switch 1
#printer mode=manual

#HP82163
#video 32 zoomx=2 zoomy=2

#HP92198
#video 80 zoomx=1 zoomy=1

#HP9114B
#disc file=/home/egan/.nonpareil/disc.lif

#HP82161A
#tape file=/home/egan/.nonpareil/tape.lif

#New HP-IL devices
#serial tty=/dev/ttyp0
#tcp listen port=1111
#tcp host=127.0.0.1 port=1111

#PIL-Box
pilbox tty=/dev/ttyS2 init=con speed=115200
```

Speed can be 9600 or 115200 depending on how you jumpered your PIL-Box, tty=/dev/ttyS(COM port number - 1), e.g. COM1: = /dev/ttyS0, COM2: = /dev/ttyS1, COM3:

= /dev/ttyS2, etc...

Good luck.

*Message #3 Posted by **Bill (Smithville, NJ)** on 8 Oct 2009, 12:19 p.m.,*
in response to message #1 by Martin Pinckney

You gotta love the description:

"is a nice looking COPY of the Hewlett Packard H.P. 5952-2516 Vector Impedance Calculator in NEW condition"

So it's a NEW condition COPY. You would think the seller would at least use a little glue to put it together rather than staples.

Bill

I'm back! (...and HP stuff, of course...)

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 8 Oct 2009, 3:13 a.m.*

Hi, all;

First of anything else, thank you all very much for your so generous and kind 'Welcome'. Either from those of you who wrote it down here or from the ones who dropped me an e-mail, I really appreciate. Thanks.

I've seen some new names around here, but most of all the same sharing spirit remains. As you may have already read, I am getting back to the MoHPC Forum the way I've been since 2001 after about two years without serious contributions. Hence, I have about two years of unread posts I need to check prior to actually participate as an 'up-to-date' contributor. Please, let me know if I'm loosing track and mentioning facts that have already been discussed.

I asked Dave to allow me to introduce the book 'Voyagers in Brief', being announced for the new CD/DVD set, but I had no answer so far (he is surely busy, I understand). Anyway, because it has been already announced here (last one in the list), there is no secrecy about it. I began writing it in 2005 and, after many 'pit stop' occurrences, I finished it about a month ago. Please, I would like to invite you to have a sip of it here (forgive the format, the PDF converter did it so...).

This first edition misses the following subjects: amortization, bonds and depreciation for the HP12C; numerical integration and SOLVE for the HP15C; floating-point numbers in the HP16C. Actually, it misses a bit more info about matrices in the HP15C, too, and that's why I plan the 2nd. edition to be ready next year. I told Dave that I am not sure if this is the first book exclusively written for the MoHPC, and if so, I suggest inviting people to go ahead and do that! Please, let me know how do you like the 'sample'. The idea is to make it simple, readable and not crowded with examples, just a few ones. As soon as it is fully available, suggestions and corrections, as always, are welcome.

I have also mentioned that I have uploaded some pictures to photobucket. Please, be my guest at this other collection: hewpack_lcv

MLDL2000 pics
Some HP41 LCD modules.

From electron_br, I have these so far:

A hot glue gun I repaired... maybe the concept helps someone.
Two Brazilian designed amplifiers from the same factory. The only ones made by them.
A small regulated power supply that I built to my workbench. I still can do it right!

Some pictures are not yet sorted, others were not added descriptions nor titles. I will add images constantly, and I'll post about them.

There is more, but I think for now I wrote about too much.

Cheers!

Luiz (Brazil)

You are absolutly remarkable. I was looking for a photo of the front to see what voltages you have but no luck. Are you going to give more detailed info about how you made the pc board?

Charlie (Phoenix)

(edited) I'm back! (...and HP stuff, of course...)

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 8 Oct 2009, 10:28 a.m.,*
in response to message #2 by Charles Oxford

Hi, Charles;

thank you for your words, I appreciate! Of course, just let me find the PCB layout I have in the computer and I'll send you the file, no problem at all. I have it in CorelDRAW! (cdr) format, would that be good for you? Can you use it as it is or should I convert it to a suitable format? Just let me know.

The adjustments are in the range:

0 to 30 Volts (thanks to the negative voltage at -REF pin, the LM327 goes to zero-volt output)
0 to 1 Amp

I have no data about voltage regulation, though. It works pretty fine for me, and in low output voltages, say, 5Vcc, with 150 mAmps or more, the 2N3055 goes really hot (unregulated peak voltage at the 2N3055 collector is about 43VDC). Needless to say it needs fair thermal dissipation (I used the box for that, will add a picture of the external view).

Luiz (Brazil)

Is an HP-10 worth $700?

*Message #1 Posted by **Michael de Estrada** on 7 Oct 2009, 10:40 p.m.*

As a collector, I can understand that unique HP calcs can and should command a high price. But what about something like the HP-10, which is a totally mundane item that has been replicated by many other manufacturers. First, it is not RPN, just plain algebraic. Second, it is an ordinary 4 banger with just one memory register. I own a CASIO HR-10 that does everything the HP-10 can do, plus it has a neat calendar feature, that can print out a monthly calender for any year and month that you specify and is Y2K compliant! The CASIO cost me $30 in 1982, and still works perfectly today. Its quality is excellent and it's very solidly built. Yet, if I go to TAS, I see it being sold today for $30, whereas the asking price for an HP-10 is $695. According to MoHPC, an HP-10 has already sold for as much as $400. So I ask, is the mere fact that this is a rare antique item made by the old HP make it worth so much?

Re: Is an HP-10 worth $700?

*Message #3 Posted by **Patrick Rendulic** on 8 Oct 2009, 1:16 a.m.,*
in response to message #1 by Michael de Estrada

No, it is not worth so much.

The reason for such high prices is an "ebay-market" that went out of control. Sellors have noticed that some collectors may pay high prices. Now prices are generally high and most buyers seem to have accepted this state.

That's why I have stopped collecting.

Re: Is an HP-10 worth $700?

*Message #4 Posted by **Martin Pinckney** on 8 Oct 2009, 2:24 p.m.,*
in response to message #1 by Michael de Estrada

There is the old adage that something is worth the sum that both the buyer and seller agree on. So for this sale

we will have to wait and see ...

Even so, one can only establish a general value of a particular commodity based on a history of transactions. That is the beauty of eB**, because it gives a both a wider market exposure, and a larger number of comparative sales, than ever existed before it came into being.

Many here lament the way eB** has elevated the price of certain items, like the HP 10. However, don't forget that it has had the opposite effect on other items that sellers have flooded eB** with.

Re: Is an HP-10 worth $700?

*Message #5 Posted by **Richard Reed** on 8 Oct 2009, 4:11 p.m.,*
in response to message #4 by Martin Pinckney

The dynamic aspect of price is important. It's the main reason that value is so difficult to assign. Markets are only rarely if ever efficient at indicating value, and no one really knows when, only when the inefficiencies have swung in their favor to some degree.

The number of items like this is far to small to hope for market efficiency. I think this has allowed a few sellers to somewhat 'corner the market', such as it is. The existence of collectors may make their actions profitable for a time, but it's hard to say for how long or for which items. I have a use for a big memory card for my 48gx, but I may just buy a 50g for much less because sellers think the HP 1MB cards, and even inferior ones, are 'collectible', making a big deal out of "the original box" and so on. Down the road a bit I have my doubts.

Richard

Re: Is an HP-10 worth $700?

*Message #6 Posted by **Patrick Rendulic** on 9 Oct 2009, 4:57 a.m.,*
in response to message #5 by Richard Reed

Not finding an 1MB card with an acceptable price for my HP48 was the main reason why I finally switched to an HP50.

For less money I got a completely new calculator with more memory than I will ever need, with easy file transfers and with an updated system.

+- 10 years ago I bought a used 1 MB card for +- 100$. At that time I think that the price was more than reasonable because the HP48 was still in production. But nowadays?

Re: Is an HP-10 worth $700?

*Message #7 Posted by **Richard Reed** on 9 Oct 2009, 11:04 a.m.,*
in response to message #6 by Patrick Rendulic

Yes. I've become quite obsessive about this. I was able to see quite a lot of Oliver Klotz's eBay feedback and figure that he ran out of the cards he built in early 2007, and I think that would have been near his price for a big card. I also noticed that his card business really came to a halt over the previous year, so it's understandable that he quit.

BTW - I just ordered a 50g new for £113 -- and I know it goes for the same number of dollars, but with VAT/duty and shipping it comes out to the same thing!

Richard

Re: Is an HP-10 worth $700?

*Message #8 Posted by **Mike Morrow** on 8 Oct 2009, 5:13 p.m.,*
in response to message #1 by Michael de Estrada

I usually set, as the *upper* limit on the amount I'd possibly consider paying, the inflation-adjusted price of the calculator when it was introduced. This philosophy is based on the wish (sometimes) to be able to go back in time and buy the desired item new. Generally, I'd consider paying something near this only if the item were in like-new condition, with all accessories and documentation in likewise new condition.

For example, the most intriguing HP calculators to me are:

HP-29C - $195 in 1977 ($695 in 2009)
HP-34C - $150 in 1979 ($446 in 2009)
HP-15C - $135 in 1982 ($302 in 2009)
HP 42S - $120 in 1988 ($219 in 2009)

The HP-29C and HP-34C would be overpriced by this process, while the HP 42S would be a minor bargain.

The HP-10 was $175 in 1977, which was equivalent in buying power to $624 in 2009. By this process, $700 is not so far off after all. I personally wouldn't pay such an amount, if for no other reason than I considered the HP-10 to be a very boring machine when it first appeared, and I still do today, regardless of how rare it is.

Edited: 8 Oct 2009, 5:30 p.m.

Re: Is an HP-10 worth $700?

*Message #9 Posted by **Michael de Estrada** on 8 Oct 2009, 6:11 p.m.,*
in response to message #8 by Mike Morrow

I bought my HP-15C in 1982 for $108, and it still works perfectly today on only its third set of batteries. I still use it a lot and it is one of my favorite calcs.

I bought an HP-34C in 1979 for $123, and sold it to a co-worker when I bought the HP-15C. Two years ago, I bought another HP-34C complete with all accessories for $95, that was in good working condition but needed some case repair.

I just picked up an immaculate HP-29C that works perfectly for $385. It included only the soft zipper case and Quick Reference Card, which were also like new. Since I already have the HP-19C/HP-29C Owner's Handbook to go with my HP-19C, I basically have a complete set.

I have never owned an HP 42S, although I do have FREE42.

I have no interest in owning an HP-10, even for much less than its inflated value. Like you, I find it to be totally mundane.

> Quote:
>
> I have never owned an HP 42S, although I do have FREE42.

Ahhhh...you must correct that!

Many people (I'm one) consider the HP 42S to be the best RPN calculator ever made, even today 21 years after its introduction. It's not perfect, but perfection's peak can be seen from it.

Re: Is an HP-10 worth $700?

*Message #11 Posted by **Michael de Estrada** on 8 Oct 2009, 10:24 p.m.,*
in response to message #10 by Mike Morrow

I suppose it's all because of the path I took as opposed to others in my progression through HP calculators. I moved from the HP-34C and HP-15C straight to the RPL calcs, bypassing the HP-41. Since the HP-42S is HP-41 compatible, rather than RPL, I never saw any need to buy one. I've owned an HP-28C (1987), HP-28S (1988), HP-48SX (1990) and HP-50g (2009). I still have all of them, except the HP-28C (sold it), and the HP-28S is sidelined with a broken case at the battery door. Given the current feeding frenzy for the HP-42S on TAS, I've not seen fit to pay the prices currently being asked. Also, from the collection vantage point, my main interest is in older LED calcs like the HP-29C that I paid so much for. I would never pay that kind of money for an HP-42S or something like an HP-10C.

Re: Is an HP-10 worth $700?

*Message #12 Posted by **Mike Morrow** on 9 Oct 2009, 12:30 a.m.,*
in response to message #11 by Michael de Estrada

The trail of HP-29C to HP-34C to HP-15C to HP 42S was a logical progression through four generations in capability, sophistication, and decreased price for all-in-one-case (no expansion) RPN calculators, from 1977 to 1988. It would have been wonderful had this progression continued with two or three later generations between 1988 and 2009.

But such was not to be, and the HP 42S has remained the best-in-class for more than two decades. Its capabilities are yet so useful that most by far who pay those high eBay prices seem to be doing so not to acquire some collector's piece, but to have the best small RPN calculator that HP has ever made for actual work use.

I used an HP-15C as my day-to-day calc for ten years, so I didn't know I wanted/needed an HP 42S before they were discontinued in 1995. I was very fortunate in 1997 to find two new-in-box HP 42S units priced at $114 each still unsold after four years on the shelf at the University of Alabama at Huntsville bookstore. Although I had used the HP-35, -45, -67, -21, -41C, -41CX, -15C, 28C, 28S, 48SX, 48GX, and 32SII, I found the HP 42S to be simply stunning in its capability and ease of use. It has an excellent alphanumeric human interface, especially compared to the HP-15C that it replaced. It remains my favorite, though my HP 50g RPL machine has some very good points too. I usually take both with me to work, sometimes with the financial brother of the 42S, the 17BII.

The auction prices of the HP 42S seem to have moderated a bit with the recession. I think there are about five on ebay at any given time. I'd go after one if I didn't have my two. A calculator this good, this important, deserves to be part of any HP collection.

*Message #13 Posted by **Mike Morrow** on 9 Oct 2009, 3:31 p.m.,*
in response to message #12 by Mike Morrow

As if to illustrate my point about lowering auction prices on HP 42S units, here is an auction that finished a few hours ago for an HP 42S, an HP 82240B printer, and original spiral bound manuals. For $183! That's well below the inflation adjusted price of the HP 42S alone.

>
> I have no interest in owning an HP-10, even for much less than its inflated value. Like you, I find it to be totally mundane.

Interesting, how different people sharing the same hobby can be ;-)

I would have phrased those two sentences as follows:

"I have never owned an HP 42S and am even less interested in emulated calculators."

"I have no interest in owning an HP 42S, even for much less than its inflated value. Like no-one else here (?), I find it to be one of those dull 1980s mass produced grey LCD calculators that does not invoke the slightes desire in my fingertips to ever touch one of its keys, even less to navigate through one of its menus..."

And regarding the HP-10: It is one of the two most un-typical HP calculators and no collection will ever be complete without one. And it if you ever show your collection to a non-HP-enthusiast, it probably will be one of the three items immediately picked out by him (or her). Because it is so different. My personal price limit would be something like 200 Euros though. It really isn't worth more than that - even considering its rarity. And with patience, you can find it for that amount - even on the bad evil horrible auction site (at least I did).

Greetings, Max

A small correction: it actually has "adding machine" logic, which is a combination of RPN for addition/subtraction, and algebraic for multiplication/division.

Correction acknowledged, however, I still say this is nothing extraordinary or unique to HP; my $30 CASIO HR-10 printing calc works exactly the same way. In fact, I have a $1 "Big Display" calc I bought at Walmart for kitchen use that works this way and has memory arithmetic plus square root.

in response to message #16 by Michael de Estrada

Hola Michael…

A lot of Money for such a simple calculator, I agree… but let's see how it ends in a coulple of days...

The price of a piece of a collection, I think, is not so related to the quality of that piece. Once you've decided that it has to be part of your collection, the price is related to the how-difficult-is-to-find situation, compared with the rest. This involves also the other stuff supposed to arrive together (manual, case, etc).

I won't put the present value of the (those days) new price as a limit because an HP 65 could be as expensive as 3,500 USD nowadays, following this rule…

HP 42S Programming

*Message #1 Posted by **Howard Jones** on 7 Oct 2009, 9:35 p.m.*

I have put a simple little programme into my 42S

I want the result to be displayed as

New$KG= (the calculated value) All on the x line. It will not do that (my HP 41 does)

Relevant last lines are 13 x (This is the final multiplication to give the result I want) 14 CLA (If I don't do this every time I run the programme the statement in line 15 is added to each other multiple times. 15 (append sign like a plus with the left horizontal arm missing) "NEW$KG=" 16 AVIEW 17 END.

Re: HP 42S Programming

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 7 Oct 2009, 10:49 p.m.,*
in response to message #1 by Howard Jones

Hi, Howard;

in order to show the message you want, you should append the number you want to current ALPHA contents. If the number you want to add, referred to as (the calculated value), is in the X-register, you should use:

```
15 "NEW$KG="
16 ARCL X (appends X-register contents to ALPHA)
17 AVIEW
18 END
```

Please, let us know if it works.

You can eliminate the line #14 (CLA) if you do not append line 15 (text itself). If you simply key in a text instead of appending it (the addition sign without the left arm, as you described), the new text erases all previous ALPHA contents.

Cheers.

Luiz (Brazil)

Re: HP 42S Programming

*Message #3 Posted by **Howard Jones** on 8 Oct 2009, 2:04 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Luiz, That worked fine except that the "New$kg=(value) is on the y line and the (value) is on x line ie x:(value). Thank you, It is not perfect but a lot better than I could manage by myself. Howard.

Re: HP 42S Programming

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 8 Oct 2009, 11:21 a.m.,*
in response to message #3 by Howard Jones

Hi, Howard;

please, make sure you did not add a 'new line' character after the "New$kg=", because it would cause the ALPHA cursor to 'jump' to the next line. I tested the lines I posted previously with my HP42S and the complete ALPHA contents used only the first, top line of the display (commonly filled with the Y-register contents, as you mentioned). I filled the X-register with as many digits as possible.

You mentioned you could do that with the HP41, right? The HP42S is not much different, though. The ALPHA register holds more digits and the LCD allows more digits to be shown in one single line, but these are advantages. Also, the ARCL X should read ARCL ST X (Stack register X) in the HP42S to avoid confusion with a possible ARCL "X" (variable named "X"), instead. So, the lines would read:

```
14 CLA
15 "NEW$KG="
16 ARCL ST X
17 AVIEW
```

Please, make sure there is no $^{N}_{L}$ in the end of the ALPHA string in line #15 ("NEW$KG=$^{N}_{L}$")

Success!

HP-67 Battery Pack

*Message #1 Posted by **AlbertTocarLoseggs** on 7 Oct 2009, 6:00 p.m.*

Hi everybody, Can I use NI-HM Batteries (Panasonic HHR-P401 3.6V 1150 mAh) instead of the standard Ni-Cd pack? Does this option produce damages in the calculator? Thanks. ATE.

Re: HP-67 Battery Pack

*Message #2 Posted by **Geoff Quickfall** on 7 Oct 2009, 6:31 p.m.,*
in response to message #1 by AlbertTocarLoseggs

Absolutely, just a couple of points:

```
1   you will have to modify the connection as the unit you
    mention, the Panasonic HHR-P401 3.6V 1150 mAh has a standard
    home wireless telephone plug.

    The metal contacts found on the HP-67 match two metal strips on
    the original battery pack mount and the Panasonic does not have
    these.

2   A better option, if you want to purchase a unit, is to search on
    EBay for Classic Battery pack.  Check this link for the battery
    pack: ebay link
```

I am not affiliated with the seller but the price is lower and the added benefit of a correct contact not requiring modification.

As an aside I am doing a section on how to modify the classic case to accept the new style battery packs the telephones have. This modification is for the calculators that have been restored but have had severe damage done to the two spring metal contacts found inside the battery compartment. The mod is simply attaching the male receptacle in a milled portion of the battery compartment and then just plugging the battery into the receptacle as seen in modern wireless home phones.

Cheers, Geoff

P.S. the NiMH batteries will take twice as long as the NiCd batteries to charge while using a standard NiCd battery charger. If you use the HP-67 to charge the NiMH batteries be aware of this limitation.

I look forward to seeing your phone-pak mod. Sounds nice!

When I put NiMH in my 67, charge times were way more than "twice as long." (The original NiCd were only 450mAh, the smallest capacity AA NiMH I had on hand was some NexCells at IIRC, 1800mAh, maybe more.) A full charge now takes 2+ days before the batts start getting warm.

sdb

Two days sounds about right

*Message #4 Posted by **Randy** on 10 Oct 2009, 1:32 p.m.,*
in response to message #3 by sylvandb

The charge rate of the 82002 is approximately 55ma which puts it at .03/C for an 1800mah cell, a perfect trickle charge rate.

At that rate, 50 to 60 hours would be normal for a full charge but you might encounter problems should the cells ever discharge fully, the trickle rate most likely will not be enough to bring the pack back to life.

Because of the simplistic design and low current of the HP chargers, I avoid using Nimh in pack rebuilds since they seem to fail sooner, rather than later. Sanyo makes an 1100mah AA nicd so why switch chemistries if you don't have to?

PS: You'll find those eBay batteries are nicd's as well. Ask the seller why... :^)

Interesting. For 30+ years I have never had acceptable results with NiCd cells. Now I switch every pack I own to NiMH at the first failure and for many years I've been happy with that approach.

NiMH is a very robust chemistry if you avoid 1C or faster charging and the super high capacity cells. (The jury is still out on the low self-discharge variety, e.g. Sanyo eneloop.)

I'm even experimenting with switching out lead-acid (e.g. a UPS) and it seems to be working very well (but probably not cost effective). I'm watching for some surplus (read: cheap) flooded NiMH for my main UPS system. The cycle life and voltage curve should beat the flooded lead-acid, but since I don't care about energy density (volume or weight) the economics thus far have not worked.

Should I run into problems with a specific pack not charging (e.g. my 67 or the 25) I do have a generic NiMH fast charger which will charge anything from 2 to 12 cells in series (disconnected from any electronics and if I bypass any electronics in the pack). So far I've only used it when I did not have a charger for an application, or when I was in a hurry.

(It does up to 2amps into a pack with very good delta-V detection. Of course, delta-V into NiMH does not work very well below about C/5, but that's OK, at that rate my fingers safely detect the temperature rise in order to terminate charging.)

To add a data point... The same day I posted that, I used the 67 down to the point the display would blank and all would reset when trying to read a card (wouldn't even pull the card in). It would still do simple calculations, but that's it. Probably had no more than a few minutes left of that before it wouldn't do more than power up.

I plugged it in that evening (the 10th). Just unplugged it an hour or so ago (the 14th). The batteries had no detectable warmth this morning, but tonight they seemed just a bit above ambient (66 there now, but it varies +10/-2f or so over the past few days -- it's by a south facing wall near a poorly weatherstripped wooden door opening onto a large concrete patio).

After four days on charge, all's well for another three to six months (depending on how much I use it, with no use the charge is still usable after six months).

Off topic but still electronics...

*Message #1 Posted by **Geoff Quickfall** on 7 Oct 2009, 3:56 p.m.*

We all come to the forum for retrieving, posting or viewing information about HP calculators. The visits are for programming, wish lists, restorations and new additions be they peripherals or new calculators and etc.

What usually is not posted (but does show up) are 'off topics'. One of my recent focuses between HP restorations, the HP book, family and travel (work) are vintage radios between the mid 50's to the mid 60's although I do have some outliers.

The following are all between 1953 and 1963 and average 4.5 inches by 2.5 inches except for the toshiba and the zenith which are 5.5 aby 3.5.

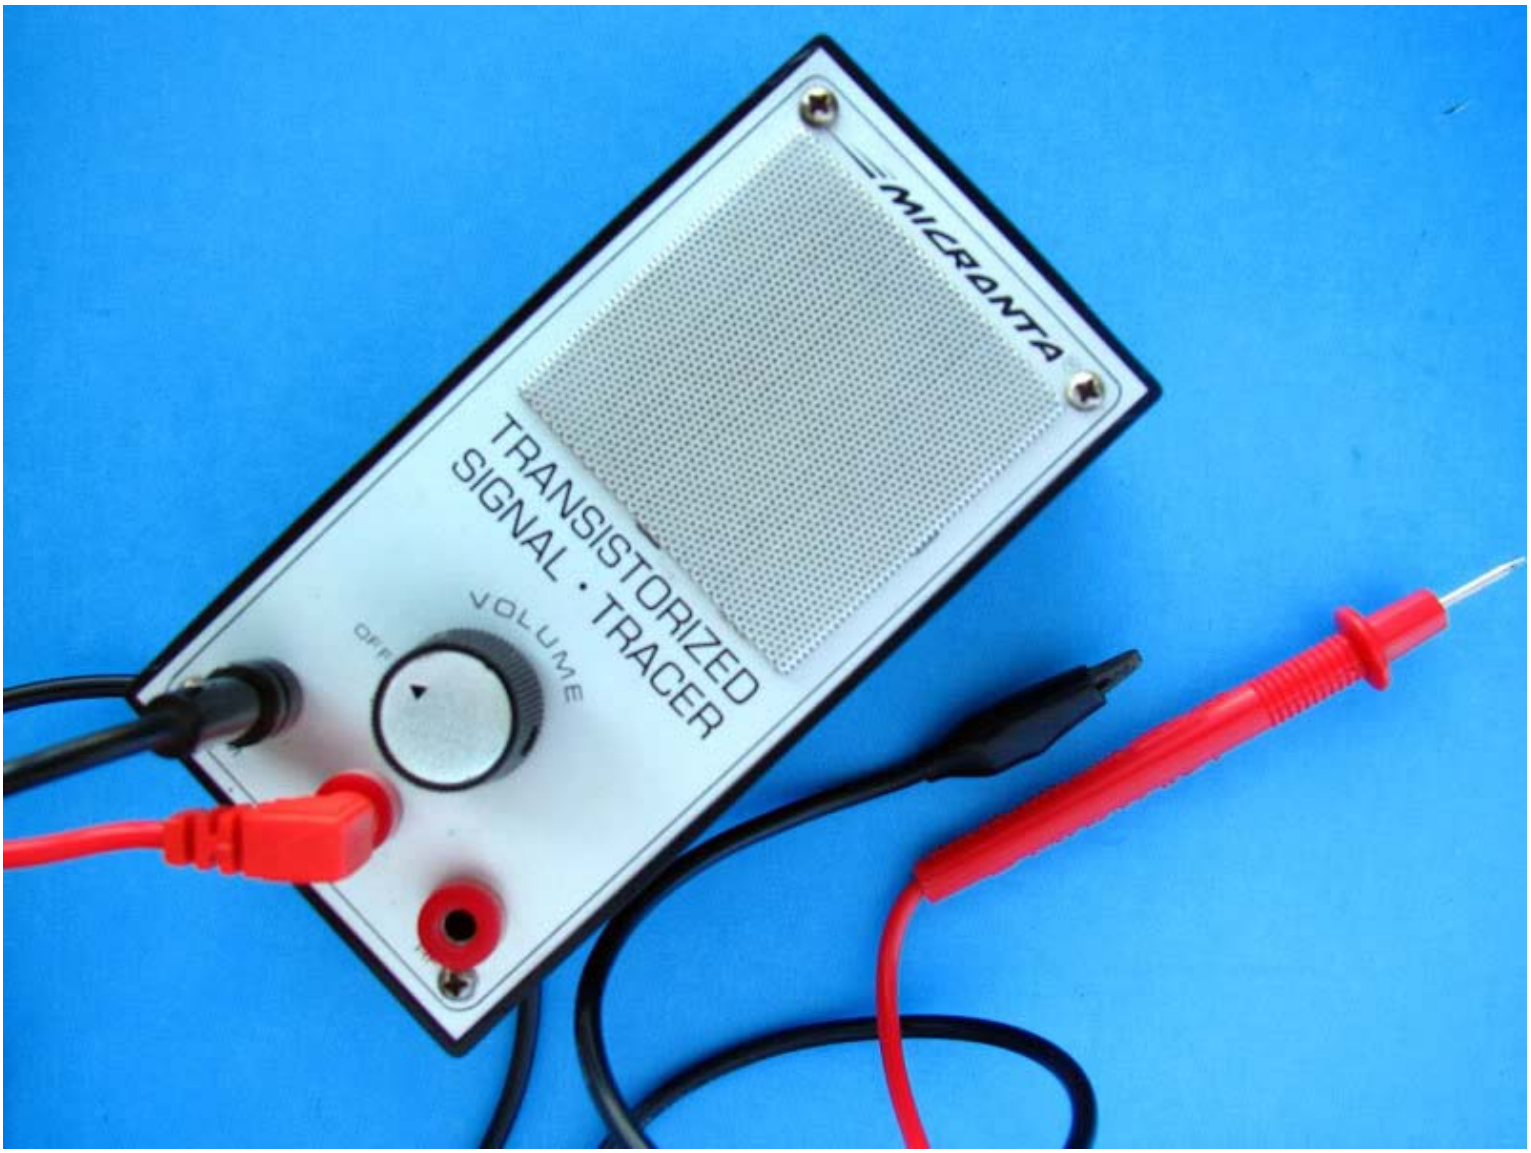
All you need to restore them is a signal tracer, electrolytic capacitors, maybe a resistor or transistor, although not much.

Tools are screw drivers, contact cleaner, plastic polish, crayons for the inlay numbers, gold wax for some of the names and of all things, a vial of WD-40. A drop of this on the volume control internal variable resistor will remove all traces of "scratch" when you use the volume control/on-off rotary switch.

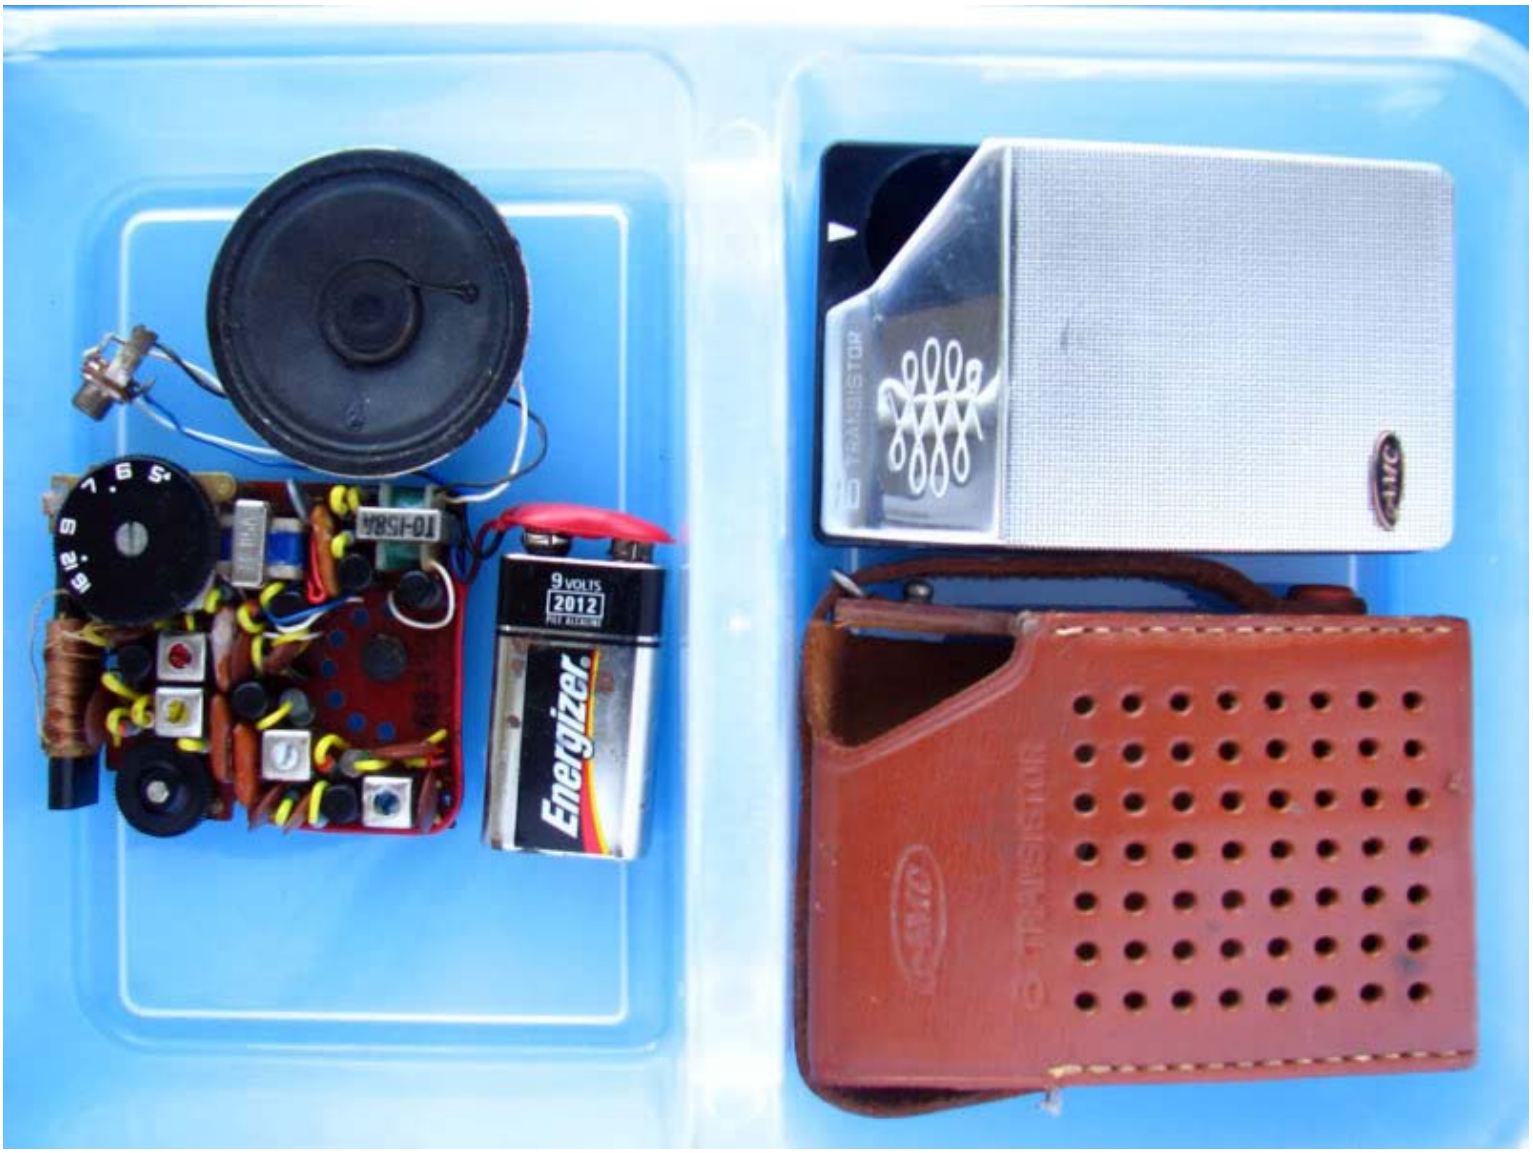
Enjoy the pictures and maybe post some OFF topic hobby pictures that you also do. I certainly learned at the HCC2009 that we all have many other hobbies aside from HP and work, lets get to see them!

Cheers, Geoff

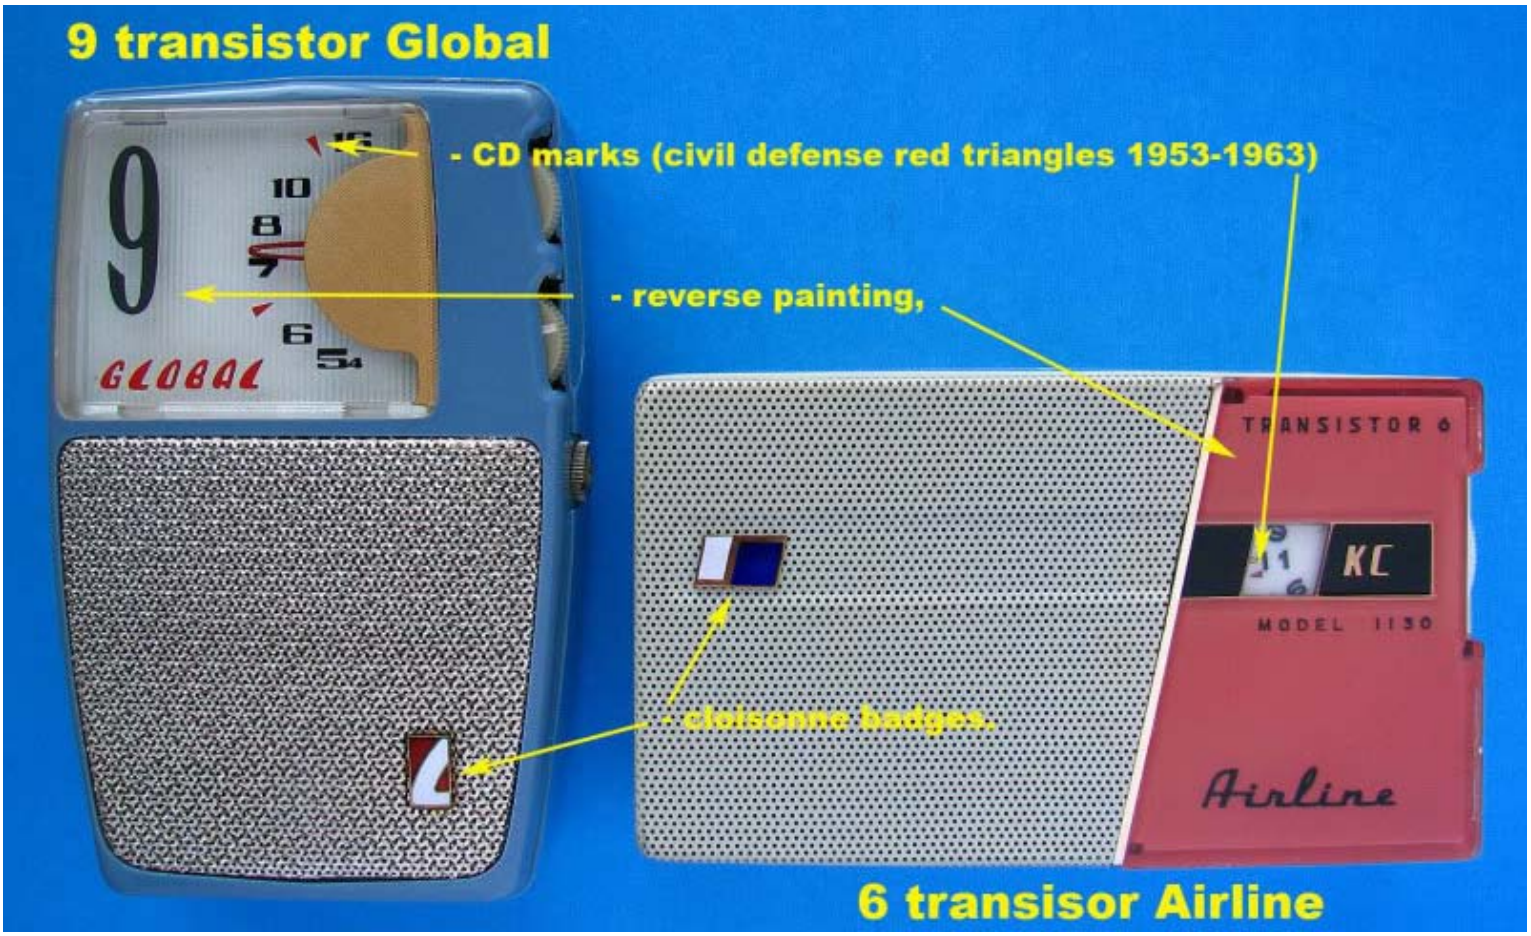
Shot of a signal tracer to trace which part of the circuit fails. This combined with an electrolytic capacitor around 20 micro farads on two clipped wires is used to dtermine which capacitors have failed. The capacitors dry up and are the MAJOR reason that these radios fail as indicated by no volume, weak reception or just static. All these radios failed due to capacitors and some due to cold solder and cracked resistors. None of these except the Global were working when the arrived.



A work in progress, the electronics are done but the case has chips and requires some epoxy work to make it look good.



What to look for if collecting transistor radios (IMHO):

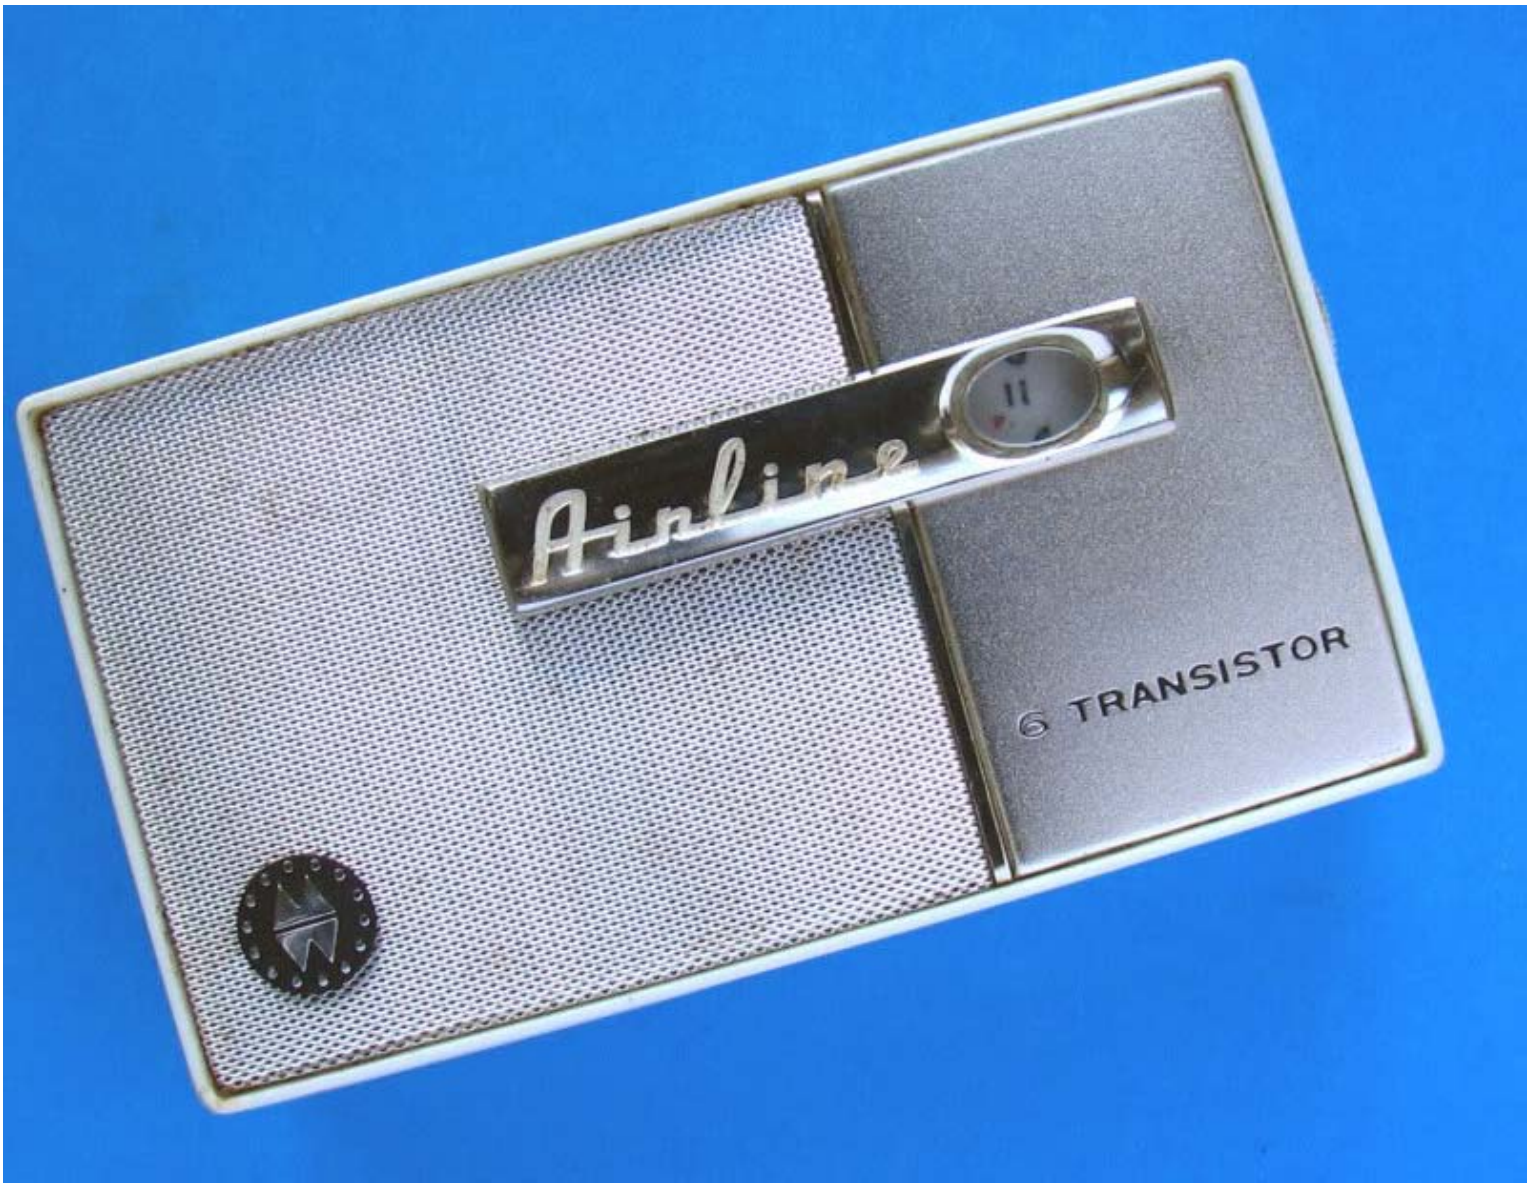


A before and after of an Omegas 6 transistor radio. Replaced two capacitors and restored the case on Tuesday.

The Zenith 500 D circa 1960 (or earlier):

Airline brand, colorful reverse painted and plain white with the same PCB inside.

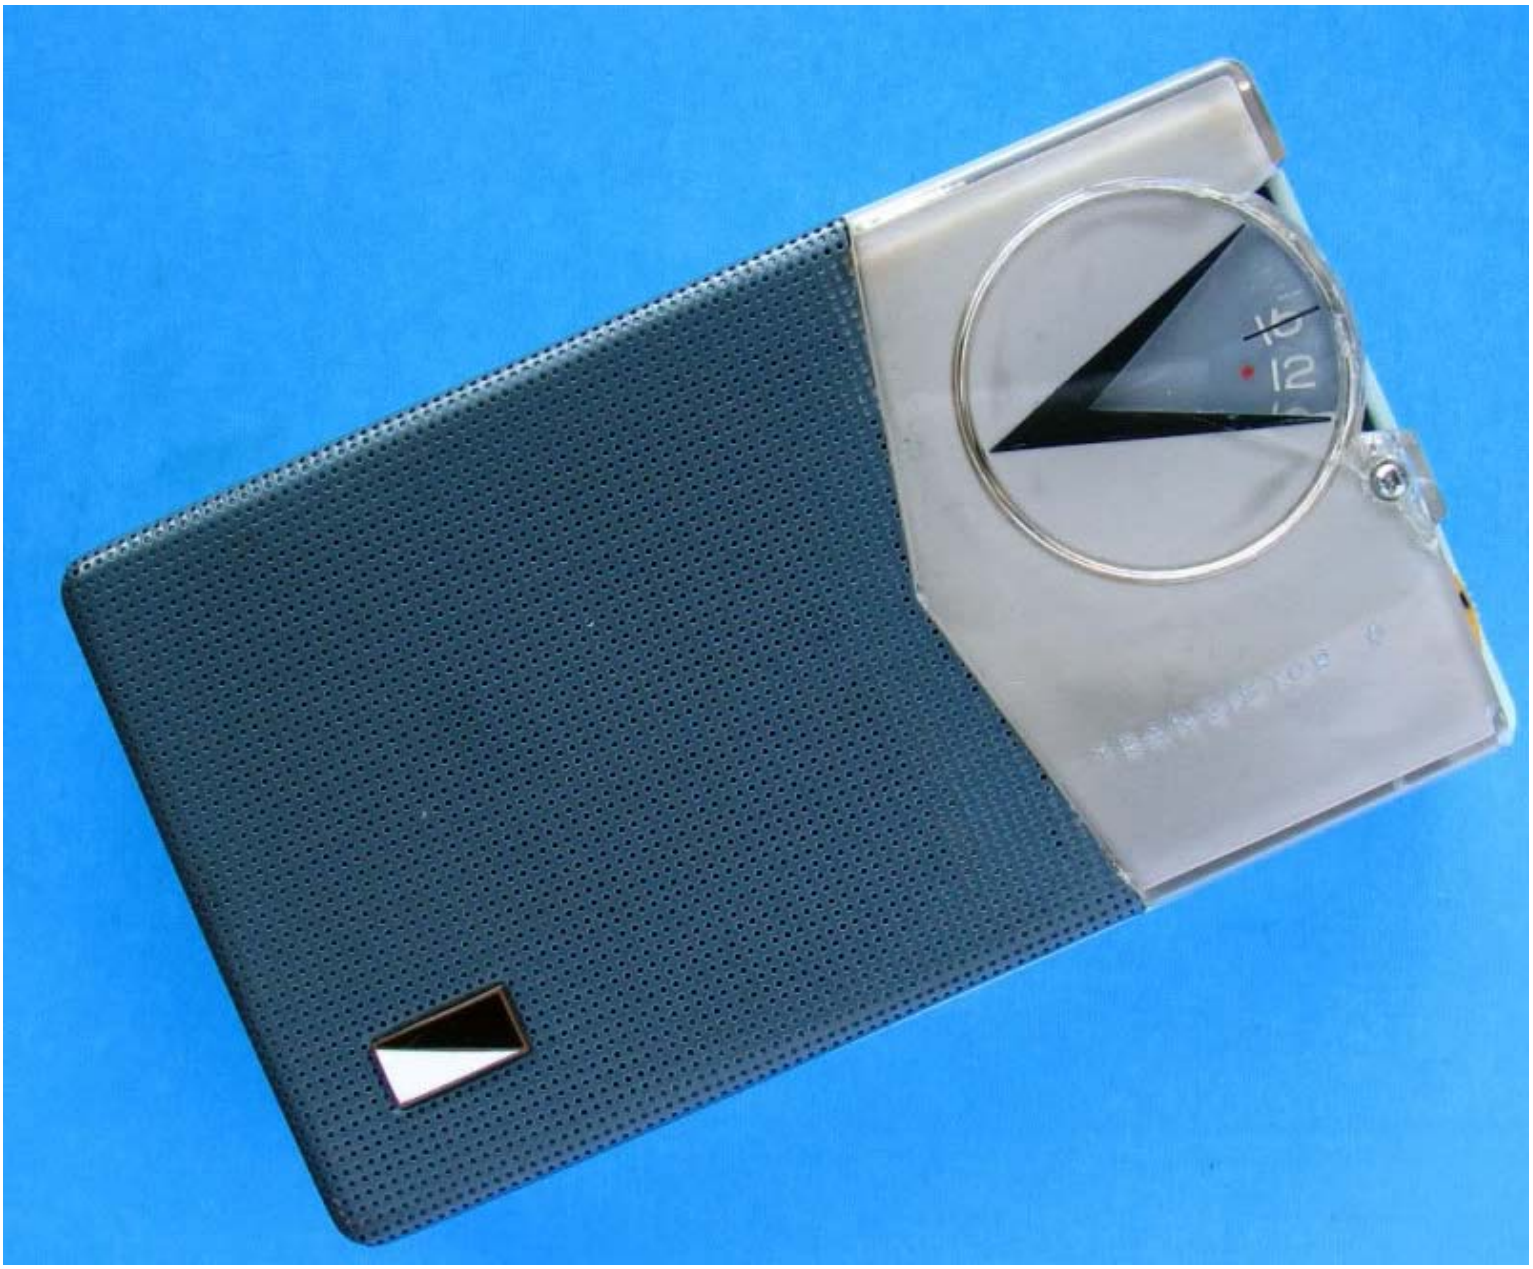
Off topic but still electronics...



A beautiful Viscount:

The Global 9 for nine transistor with its minty leather case and functional ear bud. The IPOD of its time and the reception is incredible! At night I get stations from Mexico as well as San Diego, not bad considering I am in Vancouver, Canada.

A no name with a Sony PCB:



My favourite as it is the one that hung from the rearview mirror of the 1958 Plymouth Station wagon we had in Germany when I was a child. Yes the car was four but the radio was from 1962. We had the car until 1968 and Dad still has his radio; and now I finally got one!

Hope you enjoyed the diversion from calculators, now back to the show.

Geoff

(edited to add picture) Off topic but still electronics...

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 7 Oct 2009, 5:38 p.m.,*
in response to message #1 by Geoff Quickfall

Hi, Geoff;

I have two major activities that I can tell them 'hobbies', although they have a lot more meaning than just fill the time.

One of them is almost like yours: I spend some time restoring cassette recorders to their work condition. I consider cassette recorders the perfect home-address technology that mixes analog and digital electronics with mechanics, a superb 'three technologies rendezvous'. From the very first Philips EL3300 till the uP controlled units, there is always something new to be observed. I'm filling my own photobucket with pictures, for now you can search electron_br and have a look (just a few pics, no specific organization so far).

The other 'hobby' is plastic modeling, but this one I need more time to show something. I like diorama, mostly about

unusual technology, and some German stuff goes ahead of their time. If you want to see something very interesting, search for BV141 and tell us about it... Just to give a glimpse.

It flew OK, but never went operational. Ten units built, only.

Cheers.

Luiz (Brazil)

Edited: 7 Oct 2009, 5:46 p.m.

Re: (edited to add picture) Off topic but still electronics...

*Message #4 Posted by **Geoff Quickfall** on 7 Oct 2009, 6:39 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Yes, the aero design of the 40's in Germany were spectacular from the ME267 to others including swept forward wings, double fuselage and etc.

The dioramas would be fun to see!

The tape recorders too!

Cheers, Geoff

Hi Luiz. I thought that this airplane looked familiar. It was featured recently in an article on asymmetry at link

Regards,

John

Re: (edited to add picture) Off topic but still electronics...

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 7 Oct 2009, 11:50 p.m.,*
in response to message #6 by John B. Smitherman

Hi, John;

thanks for your additional info.

I hope Dave (and other contributors) do not wish our heads to be cut off of our bodies, but since we are talking about off-topic, instead scientific subjects, let me go a little further.

I followed the proposed link and found this other one, with some other interesting stuff...

Also, the original article mentions that about thirty BV141 were produced. I read that no more than five units were built in a pre-production series and that thirteen were built after that, but only ten flew. Only original Luftwaffe papers would now tell us the actual truth, though...

And in order to avoid my HP soul to be condemned to the 'HP´less Hell of Sinners', what about using any of your HP calculator to compute the air flow and final engine torque in these asymmetrical beasts? Consider that in the BV141, the pilot pod balances the opposed torque at a certain engine RPM range. On the other hand, the pilot would need a 'crash course' on landing to avoid crash landings! (poor joke, I know...)

Cheers and thanks, again!

Woodstock feet replacements?

*Message #1 Posted by **Michael Meyer** on 7 Oct 2009, 11:37 a.m.*

Now that my Woodstocks are getting older, the feet are getting to the point that just "sanding" them isn't working... as with the drive wheels, they're turning into sticky goo.

I have had no problem finding the tan rubber in furniture feet, but cutting them into little Woodstock feet is turning out to be more difficult than I expected. They end up the wrong size, the wrong angles (the rubber deforms when pressed on with a knife), etc.

Any ideas on how to cut uniform replacements?

Re: Woodstock feet replacements?

*Message #2 Posted by **Rainer Wiedemann (Germany)** on 8 Oct 2009, 6:20 p.m.,*
in response to message #1 by Michael Meyer

It may be helpful keeping the rubber in a freezer overnight. It probably won't deform when you cut it due to its frozen state.

I never tried that on my own, the idea spontaneously came to my mind, so it might not work.

Good luck.

Re: Woodstock feet replacements?

*Message #3 Posted by **Michael Meyer** on 9 Oct 2009, 1:00 a.m.,*
in response to message #2 by Rainer Wiedemann (Germany)

Thanks. I knew somebody had to have SOME ideas. I thought of cutting razor blades to build a box die cutter, but I've never done something like this. The feet have to have depth and a taper unless they are glued towards the surface, but that would change the way you access the screws. I guess another approach would be to fill the openings with another material and just top them off with the rubber part. Still... a replacement piece would be best.

maybe a mold to fill with hot glue, topped by rubber?

Re: Woodstock feet replacements?

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 9 Oct 2009, 1:30 a.m.,*
in response to message #3 by Michael Meyer

Hi, Doc; are you OK?

I read your post and wondered about it since; no ideas so far. The specific format of the rubber feet actually helps cutting a spare from raw material (they are like small bricks). And the mold with hot glue seems valid: just wrap an existing feet with any aluminum foil (thicker than the one used in the

kitchen, which is as thin as a paper) and remove the feet from the top: your mold is ready. You could also try to carve the glue bar directly and then use a small amount of hot glue to set the sheet rubber feet (flat cut) in place. I would also suggest to cut the new rubber feet (sheet) a bit larger than the actual feet so its edges match the thickness of the small borders around them in the calculator case. Wish I had a picture or a Chinese to write down its description in a thousand words...

Success!

Luiz (Brazil)

Re: Woodstock feet replacements?

*Message #5 Posted by **Andreas Grund** on 9 Oct 2009, 1:58 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

The idea of Luiz how to build a simple mold is great, however, instead of hot glue I would prefer a 2K-silicon compound, which certainly can be blended with a filler and/or tan pigment to get the right hardness and surface. Such silicon compounds are usually available at modelling shops or dental supplies.

Andreas

compiled local variable

*Message #1 Posted by **DK2ZA** on 7 Oct 2009, 9:10 a.m.*

Hello all!

I would like to write a HP-50g program containing a compiled local variable.

Problem is: I do not know how to type that small left arrow which precedes the variable's name using the calculator's keyboard.

Help would be appreciated.

Greetings, Helmut

Re: compiled local variable

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 7 Oct 2009, 9:34 a.m.,*
in response to message #1 by DK2ZA

Hi;

when you are keying in your program, press [right-shift][EVAL] and all existing characters will be shown in the display (scroll it down and up, if needed). This is a way to key any character in. Choose it (cursor keys) and press [ECHO].

Cheers.

Luiz (Brazil)

Edited: 7 Oct 2009, 9:35 a.m.

Thank you very much!

Helmut

Re: compiled local variable

*Message #4 Posted by **Kiyoshi Akima** on 7 Oct 2009, 12:19 p.m.,*
in response to message #1 by DK2ZA

If you use it a lot, as I do, you might want to assign it as a one-character string to a user key.

Re: compiled local variable

*Message #5 Posted by **David Hayden** on 8 Oct 2009, 12:57 p.m.,*
in response to message #1 by DK2ZA

It's right-shift 0 (zero)

Re: compiled local variable

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 8 Oct 2009, 1:10 p.m.,*
in response to message #5 by David Hayden

Hi, David;

the right-arrow you get with the [right-shift][0] is not the same one you need for compiled local variables. The one that works here is the left-arrow, not available as a regular ALPHA character. Either you assign it to a key in the ALPHA keyboard (as Kiyoshi correctly suggested) or you use the CHARS menu.

I first read about compiled local variables (I do not remember reading about them in original HP manuals) at James Donnely´s "The HP48 Handbook" (2nd. Ed, p. 46). I consider this one a 'must read'. I also do not know if Willian Wickes tells about them in his "HP48 Insights", third volume (HP48G) because I did not read it (yet).

Hope this helps.

Cheers.

in response to message #8 by hecube

I'm not geeky enough to actually wear that watch, but it was amazing what Dave did with that project. I asked him once about the programming language of the watch, and he said it was basically a macro recorder, to let you record and then play back keystrokes, but no abilities to test or branch like a real programming language.

The HP-01 is interesting, but I can't see wearing that either. I do have one of the original Pulsar digital watches I got around 1972 or 73, and it still works after all these years. You adjust the hour and minutes with a little magnet concealed in the clasp. Cool.

Re: A great HP Watch (15C) replacement?

Accuracy by chance

*Message #1 Posted by **Javier Goizueta** on 7 Oct 2009, 4:19 a.m.*

Recently, while testing various implementations of arbitrary-precision decimal trigonometry, I came up with seemingly excellent results of the Savage test due to less than perfect trigonometry. By chance, error cancellation worked better with some imperfect implementations than it did with correctly rounded results.

This reminded me of the apparent accuracy of the HP-35s trigonometry (leaving apart its known bugs!) so I took a look at it.

The result of the forensic test for the HP-35s (a 12 digit calculator without hidden precision) is 8.99999986001 (1.56E-6 percent error) while the HP Saturn-based 12 digits calculators (HP-71B, 28*, 48*, 42s, etc.) give 8.99999864267 (1.51E-5 percent error.)

So, is the trigonometry of the 35s better than that of the venerable Saturn models?

The answer is no: in each step of the test the Saturn calcs give the best possible answer to within 12 digits, so no other 12-digit calculator (with no hidden precision) can possibly be better in this particular case.

The good result of the 35s occurs purely by chance.

When it comes to compute the ATAN, both calcs have the argument 1.74549998555E-2, which has accumulated some round-off error deviating from the perfect 1.74549998554886...E-2 result (computed with unlimited precision).

The ATAN of the 12-digits argument is 0.999996272743534 5... which is correctly rounded by Saturn calcs to 0.999996272744, while the 35s gives the not-so-correct 0.999996272743. But by chance some of the accumulated error has now cancelled and the final result is better; the unlimited precision result of ATAN(TAN(COS(SIN(9)))) is 0.999996272742885...). This tiny deviation fully explains the final result of the test.

Note that the forensics test is a great easy way of identifying families of calculators, and was never intended to measure accuracy.

In general, we should be aware of the randomnes in the results of tests that accumulate rounding error which makes them not a valid measure of accuracy in any particular case.

Take for example the Gruenberger test that I applied to the SmartCalc 300S in this thread If we compute it with perfectly rounded 14-digit arithmetic, the result is worse than using 13 digits. The best result with 25 digits is worse than the best result with 23 digits!

Well, after all, the Saturn models' accuracy remains unsurpassed! ... and the 35s trigonometry is not only buggy, but not-so-accurate as well.

You're right, but rather than microprocessors better algorithms have played an import role to achieve that accuracy. I think you are aware of this old thread, started by Rodger Rosenbaum, in which he quotes the philosophy behind math routines in HP calculators after the influence of Prof. Kahan:

"Each calculation is to return a result as though the calculation were done to infinite precision and the result properly rounded (round to even on most Saturn calcs) to an n-digit result."

The HP-33C and the HP-34C are the oldest calculator I have which achieve this goal. It appears newer HP calculators have abandoned this philosophy, so they will not give the expected forensic result. However at least the 12C Platinum has been programmed to replicate it:

```
1) asin(acos(atan(tan(cos(sin(9))))):
Keystrokes                Display
9                         9.
R/S                       0.156434465
g GTO 090 R/S             0.999996273
g GTO 100 R/S             0.017455000
g GTO 178 R/S             0.999996272
g GTO 157 R/S             0.156441660
g GTO 137 R/S             9.000417403
```

My long running and slowly progressing scientific 20b firmware fares well in this particular test:

```
9.000000000029361
```

Which, if you reference the old thread mentioned above, is correct for 16 digits :-)

- Pauli

>
> Which, if you reference the old thread mentioned above, is correct for 16 digits :-)

Way to go! That's exactly what I get on the 200LX:

```
1.564344650402309e-1
0.999996272742885
1.745499985548866e-2
0.999996272742885
1.56434465040737e-1
9.000000000029361
```

A 20b with your firmware should be fantastic. I only hope the keys are good enough.

Gerson.

Well, we try our very best. Though tactile response is given by the 20b as is.

> My long running and slowly progressing scientific 20b firmware...

Pauli,
Have you provided any/many details regarding your 20b scientific firmware project? I checked the archives, there was some discussion last Fall, and a couple of mentions in threads since then, but no details. So I went to the 20b repurposing web site, and found this page where you described your efforts to create a scientific calculator on the 20b:

> Quote:
>
> The calculator is based loosely on the HP-34c with some of the more modern functions added; it also has complex operations like the 32/35 series but over a much wider range of functions. Additionally, the device supports superset of the HP-16c integer mode functionality. It is programmable with 500 steps of program memory (every instruction taking but a single step) and 100 storage registers.

The above sounds pretty cool. That page was last updated on 2008/12/21. Unfortunately, the links on that page are broken, but with a little guessing I found them:

Source

Walter's documentation

Any updates on the above or other details regarding your project?

Re: Accuracy by chance

*Message #7 Posted by **Paul Dale** on 8 Oct 2009, 7:02 p.m.,*
in response to message #6 by Jeff O.

Those links are to a very old version of the project but most of the high level ideas haven't changed. There has been a bit of to and fro over the function set since this revision. Mostly new

functions added. There have also been a lot of bug fixes and space savings.

The software isn't currently running on the 20b hardware but I can compile it for the arm and there is still sufficient space (RAM and flash) left to do the hardware driving that will be required (some of this is done already but more is required). Does anyone know where to source a programming cable from? Any space left over after that will be dedicated to more functionality and bug fixes :-)

Highlights are still similar to what I wrote previously:

- 500 merged programming steps.
- 100 registers (+ stack X Y Z T L & I).
- HP-41 like programming model.
- Almost all operations support complex numbers done like the 35s.
- Logical and bit operations are a superset of the 16c. Bases supported are from 2 to 16 inclusive, arithmemtic modes are unsigned, ones complement, twos complement and sign and mantissa.
- Comprehensive suite of statistical operations.
- Time, date and calendar operations (using the internal RTC for current time and date).
- Fraction mode as per the 32sii with a maximum denominator of 9999.

Walter's documentation change list might be helpful (some of the special characters here will like get mangled):

1.2 4.1.09 Added ASRN, CBC?, CBS?, CCB, SCB, FLOAT, MIRROR, SLN, SRN, >BIN, >DEC, >HEX, >OCT, BETA, D>R, DATE, DDAYS, D.MY, M.DY, Y.MD, CEIL, FLOOR, DSZ, ISZ, D>R, R>D, EMGAM, GSB, LNBETA, LNGAMMA, MAX, MIN, NOP, REAL, RJ, W and WINV, ZETA, %+ and %-; renamed the top left keys B, C, and D, and bottom left EXIT.

1.3 17.1.09 Added AIP, ALENG, ARCL, AROT, ASHF, ASTO, ATOX, XTOA, AVIEW, CLA,PROMPT (all taken from 42S), CAPP, FC?C, FS?C, SGMNT, and the …# commands; renamed NBITS to BITS and STOWS to WSIZE; specified the bit commands closer; deleted the 4 carry bit operations.

1.4 10.2.09 Added CONST and a table of constants provided, D>J and J>D, LEAP?, %T, RCL and STO 􀁣 and 􀁤, and 2 forgotten statistics registers; deleted CHS, EMGAM, GSB, REAL and ZETA; purged and renamed the bit operations; renamed many commands.

1.5 5.3.09 Added RNDINT, CONV and its table, a memory table, the description of XEQ B, C, D to the operation index, and a and ge to the table of constants; put CLSTK on a key, moved CLΣ and FILL, changed the % and log labels on the keyboard, put CLALL in X.FCN; checked and cleaned alpha mode keyboard and added a temporary alpha keyboard; rearranged the alphabet to put Greek after Latin, symbols after Greek consistently; separated the input and non programmable commands; cleaned the addressing tables.

1.6 12.8.09 Added BASE, DAYS+, DROP, DROPY, E3OFF, E3ON, FC?F, FC?S, FIB, FS?F, FS?S, GCD, LCM, SETDAT, SETTIM, SET24, SINC, TIME, VERS, αDAY, αMONTH, αRC#; %Σ, as well as F-, t-, and χ2-distributions and their inverses; reassigned DATE, modified DENMAX, FLOAT, αROT, and αSHIFT; deleted BASE arithmetic, BIN, DEC, HEX, and OCT; updated the alpha keyboards; added flags in the memory table; included indirect addressing for comparisons; added a paragraph about the display; updated the table of indicators; corrected errors.

1.7 9.9.09 Added P.FCN and STAT catalogues, 4 more conversions, 3 more flags, Greek character access, CLFLAG, DECOMP, DENANY, DENFAC, DENFIX, Iβ, IΓ, αDATE, αRL, αRR, αSL, αSR, αTIME, 12h, 24h, fraction mode limits,

normal distribution and its inverse for arbitrary μ and σ, and Boolean operations working within FLOAT; deleted αROT and αSHIFT, the timer, and forced radians after inverse hyperbolics; renamed WINV to W –1, and beta and gamma commands to Greek; added tables of catalogue contents; modified label addressing; relabeled PRGM to P/R and PAUSE to PSE; swapped SHOW and PSE as well as Δ% and % on the keyboard; relabeled Q; corrected CEIL and FLOOR;

There have been a number of changes since the 1.7 documentation. Mostly extra statistic distributions -- currently, normal(0,1), normal(mean,var), chi^2, t, F, geometric, Weibull, binomial, poisson & exponential both cumulative distribution functions and their inverses.

The operations that aren't supported in complex mode are those that don't make sense, those that won't fit on the stack (regularized incomplete beta function), the integer mode only commands and a couple of other functions: error function and regularized incomplete gamma function - but not the normal gamma function. Complex stack and STO/RCL operations are supported, e.g. there is a complex lastX which restores L & I to the stack.

I can send the source to those interested I guess. I really should create a project on the web to host this.

- Pauli

in response to message #9 by Walter B

I guess your guest folder here is too full? To clear room in mine, I have gone back and subsituted smaller images for the originals. That way there is still an image in the archives and not the annoying:

Re: Accuracy by chance

*Message #11 Posted by **Walter B** on 9 Oct 2009, 9:31 a.m.,*
in response to message #10 by Jeff O.

AFAIK, nobody but Dave is allowed to upload files greater than 100kB on this site. This makes perfect sense, since at the golden age of our objects of worship, 64kB was what an entire data acquisition system for e.g. nuclear spectroscopy needed. So, sorry, no way to

upload 600kB here.

Waiting for a better offer,

Walter

Hi, Gerson --

> Quote:
>
> The HP-33C and the HP-34C are the oldest calculator I have which achieve this goal *(of returning a result correct to* n *significant digits, given input assumed to be accurate to* n *significant digits)*

Almost, but with at least one exception: Trigonometrics with small-magnitude results that reside within the guard digits. The HP-34C -- and every other subsequent scientific model (HP-41C/CV/CX, HP-10C, HP-11C, HP-15C) until the Saturn processor -- will return

```
sin (3.141592653 rad) = 5.9E-10, instead of 5.897932385E-10.
```

My explanation for this result is this excerpt from the following thread:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=123880#123880

HP calculators with pre-Saturn microprocessors (e.g., HP-15C) and many modern calculators from other manufacturers (e.g, TI-82) sometimes give only two significant digits for the sine and cosine calculations described. I suspect that they calculate out to their internal precision of three guard digits, round the answer to the second guard digit and "call it good", without recognizing that even more digits could be calculated due to the small magnitude of the result. Example:

```
       input    |guard|  extra
                \     /
sin 3.14159265358|000|
=   0.00000000000|979|323846264
                  |   |
```

On any Pioneer-series model and some descendants, you get 9.79323846264e-12 as the result. On some newer 12-digit non-HP's, you might get 9.8e-12 as the result.

> Quote:
>
> It appears newer HP calculators have abandoned this philosophy, so they will not give the expected forensic result.

I don't believe that the "philosophy was abandoned". However, the standard was certainly not met in some cases due to errors in porting ROM code to modern microprocessors, and the lack of rigorous testing that was done in the past. To my knowledge, all the identified transcedental-math errors of the HP-33s and HP-35s have been corrected -- except perhaps for the trig error discussed in the linked thread, which was corrected for the HP-20b.

As for giving highly-accurate forensic results, it's impossible without carrying many extra digits of precision in the calculations -- three is not enough.

Yes, *almost* is the word that was missing in my statement. Thanks for the correction! (an 's' was also missing :-)

> Quote:
>
> To my knowledge, all the identified transcedental-math errors of the HP-33s and HP-35s have been corrected -- except perhaps for the trig error discussed in the linked thread, which was corrected for the HP-20b.

I wish it had been corrected on the 33s also, even though it doesn't affect my calculations. Currently that is the replaceable HP calculator I use most. The '1' key on my second unit got broken after only two years of not so heavy use. The same had happened on my first one ('.' key).

Quote:

As for giving highly-accurate forensic results, it's impossible without carrying many extra digits of precision in the calculations -- three is not enough.

I assume by highly-accurate forensic results you mean results very close to 9. If such is the case three guard digits are really too little. But if each intermediate result is to be rounded to the number of digits of the display then three is enough - at least for the particular 9 degrees argument.

Regards,

Gerson.

HP41C issue: beeps, but the display does not work

*Message #1 Posted by **Nenad (Croatia)** on 7 Oct 2009, 3:34 a.m.*

Hi, everybody

My newly acquired HP41C arrived with the following problem: after putting a battery pack in and pressing ON, the display does not display anything, or something gibberish. Sometimes all the segments of the left half of display are seen, sometimes all the segments on the right, sometimes upper half, sometimes none, etc. After pressing any key, the display goes out, however a beeping sound (not a normal beep) is heard every three or four seconds.

The battery contacts are in perfect condition: clean, with no corrosion. All the screw posts seem to be intact (lower posts are reinforced by hexagonal nuts).

It also seems that all the keys have a perfect tactile feedback. The gibberish display can be cleared by any key, meaning that every key gives a contact.

What should I do next?

Another question: can I replace the HP41C PCB with the one from the HP41CV? I have an HP41CV with a PCB which works correctly, but the machine has another issues.

Thank you.

Re: HP41C issue: beeps, but the display does not work

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 7 Oct 2009, 8:17 a.m.,*
in response to message #1 by Nenad (Croatia)

HI, Nenad; greetings from this side of the ocean!

Your assumptions are correct: the mainboard of the 'coconut' series (I used to call the 'fullnut' as a counterpart for the 'halfnut', but it seems to me it is not the correct term, though) are interchangeable, and the display should work correctly. The behaviour you describe should be related to a bad contact between the main PCB and the rest of the calculator, and this should be because the small, double zebra contact (either with thin golden-plated strips or multi-contact conductive polymer) has not been pressed enough. If you have any modules connected to the calculator, you could also have other problems. Just as a brief test, press the calculator half cases against each other between the tow rubber feet in the botton, and see if it works. The zebra contacts are exactly there.

If you need more guidance or pictures, let us know.

Success!

Luiz (Brazil)

Re: HP41C issue: beeps, but the display does not work

*Message #3 Posted by **Nenad (Croatia)** on 7 Oct 2009, 2:39 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Your procedure did something very bad to my new/old HP41C. After disassembling the machine, cleaning the zebra strips, retightening the PCB nuts, putting the screws, as well as the battery pack back, the display showed something as:

MEMORY LOST

My machine lost its memory! I thought the memory was somewhere on the PCB. Nevertheless, I looked under the desk and there was no visible HP41C memory. Then the most interesting part comes: after I pressed <alpha> and a few keys afterwards, the LCD display says:

THANKS LUIZ

Finally, I decided not to exchange the HP41C PCB with the one of the HP41CV. Knowing that the HP41CV PCB is OK, this was a new information to me that this is also the case with the HP41C PCB.

Oh, that HP41CV. When I summarize what I have already done to it, it will certainly deserve my post under the topic "condemned to HP hell".

Ha Ha! 8-) good sense of humor...

"She"

*Message #6 Posted by **Nenad (Croatia)** on 9 Oct 2009, 3:29 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

"She" is reserved for my HP67! She was a real beauty back in 1980 when I finally got her attention (and still she is). She was always there with me, ready to help me through my university days, reports, exams, etc. with her bright red LED display and magnetic cards. I would have never completed studying of mechanical engineering without her smart support. Yes, I know that I should have talked to her, brought her flowers, written her poems, try to attract her in other ways, but unfortunately I did not have enough time later on as a young engineer-I had a lot of work to do, and (my confession) treated and exploited her as a working horse.

This is just to explain why I cannot use "she" to address my HP41C-it is only a common calculator.

;-)

*Message #8 Posted by **Michael Meyer** on 9 Oct 2009, 4:46 p.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Well... I used my TI-59 with printer in college to generate love poems for my random girlfriend... I mean, random poems.

Does that count?

Why not "she"? A few of us here, that will remain un-named (Luiz, you know who we are), call our calculators our "babies".

Just terms of endearment. I don't think that's too odd.

I finally pieced together a working 29C. A working circuit with a working keyboard. She's beautiful. She needs an HP-10 calculator to share a shelf with, now. Her Woodstock siblings and 19C big brother are getting old... they need a new companion...

Thanks, Doc!

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 9 Oct 2009, 5:23 p.m.,*
in response to message #8 by Michael Meyer

Hi, Doc; good old days, ahn?

You see, while reading Nenad´s post I actually 'traveled' that way, like a prelude for a TV commercial! That was wierd...

Anyway, I´m also guilty as charged... I still look at any of the Voyagers and think: 'What a beautiful design...'. Same with the HP71B (remember it? Still here, of course, and working fine...). I just did not know how bad that could be prior to consider that a way to get us rid of the 'HPless Hell of Sinners'.

'Nough said, though! The new guys may be wondering if this is the kind of stuff I actually used to post about in the past... I should have waited a bit more, right?

> Quote:
>

HP41C issue: be carefull with the zebra stripes

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 7 Oct 2009, 5:26 p.m.,*
in response to message #3 by Nenad (Croatia)

Hi, Nenad;

just to add that the golden plated zebra stripe is very fragile, and gentleness is demanded when cleaning it. I have what remains from a zebra stripe that simply dismantled in various parts, the zebra contacts themselves broke in a few small tubes. I was lucky enough to have a spare (polymer type) to replace it.

Cheers.

Luiz (Brazil)

Luiz,

What do you recommend to use to clean the gold zebra strip?

Thanks,

Steve Leibson

Re: HP41C issue: be carefull with the zebra stripes

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 9 Oct 2009, 12:11 a.m.,*
in response to message #11 by Steve Leibson

Hi, Steve;

I have already used isopropyl alcohol. From our good friend Wikipedia, we have:

> Quote:
>
> Isopropyl alcohol is cheaply available. Like acetone, it dissolves a wide range of nonpolar compounds. It is also relatively non-toxic and dries (evaporates) quickly. Thus it is used widely as a solvent and as a cleaning fluid, especially for dissolving lipophilic contaminants such as oil.

Because the conductors are golden plated, they will actually not oxidize, just get dirty or simply isolated because of lack of pressure. But I consider that the main problem actually is how to clean without dismantling the piece. I use regular, commercially available cotton swab moysted with isopropyl alcohol and carefully move it over the surface of the contacts the way I suggest in the drawing below (sorry if it is not better, I drew it right now...)

The image (hopefully) shows the polymer tube where the contacts are build. I use the swab like this to avoid the contacts to detach from the surface of its isolating base.

Hope this helps.

Success!

Luiz (Brazil)

HCC2009 and the NIST tour

*Message #1 Posted by **Geoff Quickfall** on 6 Oct 2009, 8:14 p.m.*

Hello all:

Had a great time at the HCC2009!

I thought I would share the NIST tour with you and thank Mark Ringrose for organizing the tour.

NIST link

actual link to the quantum lab info at NIST

The tour was composed of two parts; the Atomic clock lab and the Quantum computer lab. With that in mind the following are a series of pictures of the Quantum Computer research facility.

They include a series of pictures (powerpoint) on a research computer as part of a presentation. The slides were explained in greater detail by one of the researchers (the name escapes me but someone will supply it I am sure, it may have been Dietrich Leibfried). Once the slide show was completed we made our way around to the laser system (red and green) which are used to guide the ions into the ion traps.

Without further ado here are the slides and the laser plus ion trap sections photos:

WOW talk about your retro calculator HP 9100A

*Message #1 Posted by **Donald Williams** on 6 Oct 2009, 7:13 p.m.*

During my travels over the weekend, I stumbled across an HP 9100A. Forever the fool, I decided to buy the $50.00 boat anchor in an "unknown" condition. There was no available AC cord for a quick test. I just knew that the CRT would be dead after 40 years.

I broght it home and finally found the old style AC cord I had stashed away. After a quick visual, I switched it on with a silent prayer. A few pensive seconds later "viola" I was greeted with three green 0'S

0

0

0

I was stunned. These old devices are truly built like a tank, and they are a lasting tribute to the engineers and techs who designed and built them.

I was fortunate enough to get a great deal of the documentaion. The calculator was delivered in October of 1969 to a school district in California, and I acquired it in October of 2009. 40 years later it seems to be as good as the day it left the factory. I can imagine it lived a hard life among those students, but it never faultered in its mission.

In all my preliminary checks every operation seems to function. Unfortunately in came without the printer, but I did get the optical card reader accessory.

Now my problem. I have no media cards, so I cannot complete the checkout. No magnetic or card media came with the hardware.

Does anyone have any media to spare? I am not acually expecting to be successful with that plea. I know that "TAS" is a possibilty, but I finally broke that "bad habit" a few years ago, and that will be my absolute last resort.

I am always amazed at the number of bright and talented people who support this forum, and I thought perhaps someone had already blazed this trail before. Does anyone have any ideas about how to fabricate media cards for this device. This calculator "pre-dates" my desktop computing experience, I started out on an HP 9825. I have never even seen the type of media that I am searching for. With no samples or prior experience I don't know what I am trying to duplicate.

So if you have contributions, ideas, or suggestions I would really appreciate guidance.

BTW - product ID Z-000175 - no options stated

TIA

Don Williams

Re: WOW talk about your retro calculator HP 9100A

*Message #5 Posted by **paolo** on 10 Oct 2009, 6:32 a.m.,*
in response to message #1 by Donald Williams

Hi Donald,

I too stumbled on a HP9100A early this year, it was not working at first but the problem was just a couple of blown rectifying diodes in the power supply so I could fix it quite easily.

I wonder how many such units are still in working condition all around the world, may be forum could held a "census" about it ?

Also in my case I had the problem of missing magnetic cards so I tried to build some, at the end I made some working magnetic card for the HP9100A which I describe here below in case you would like to perform some test.

To start with I used the card dimensions, kindly told to me by a forum member (Etienne), to scale a printout of an actual card I found on the HP museum site. I then glued it to a cardboard to reach the given thickness. On the rear side I glued two strips of magnetic tape from a wrecked VCR cassette. Take care that the active side of the tape is that which faces outward w.r.t. the reels hubs, if you use the other side the support plastic film will prevent the head to get enough signal. The exact position of the strips I derived from measurements of the head position in the card reader. It took me four tentatives to get a working prototype, I realized that the main problem are:

a) to have the correct width for the card (I found it is 50.5 mm) to fit exactly between the rails of the reader, otherwise the card tilts on the right when driven out by the mechanism (which has a single rubber wheel on the left side) and alignement is lost with the data.

b) to be very careful in having the tape smoothly glued on the cardboard, any wrinkle causes poor performances. The trick seems to glue the tape with the card slightly concave (U-shaped) so that when allowed to relax it will "pull" the tape flat. A quality check is that the tape surface must be reflecting an incident lightbeam as it would be a mirror.

I tried the card many times, at first recording a sequence of numbers (which is useful to check if the process "skips" a data) and later saving and reloading simple programs.

After the first success with short (20-30 lines) programs I tried to load on the calculator the full "diagnostic program" which is 196 lines long (i.e. the whole RAM capacity) which was used by HP field engineers to test the overall functionality of these machines.

The prime result was that my HP9100A passes the test, which is the final prove that the HW is all working.

I did some other experiments to find a reliable enough procedure to reconstruct cards which works, the point seems just to be very precise with dimensions and tape gluing. On two of them I was able to load the full 196 steps sequence of the 9100A diagnostic program and the data were still retained one month later.

I have in the back of my mind the idea to write a "paper" about this topics to put in the related forum section but up to now I didn't fond the quiet times to prepare it, may be the renewed interest in HP9100 can trigger it.

Best Regards

Paolo

*Message #6 Posted by **Donald Williams** on 13 Oct 2009, 4:59 p.m.,*
in response to message #5 by paolo

Hi Paolo

I must apologize for my tardy response. Thanks for the information about fabricating a mag card. Some members have kindly offered to send me a sample, so hopefully I may have a specimen to copy soon.

Do you have a listing of the diagnotics program? I have just been randomly testing functions. It would be great to get a listing of the factory diagnostics. I have seen a missing digit on occasion. It must be intermittent. It would be helpful to loop the diagnotics for trouble shooting purposes.

Thanks Don W

in response to message #5 by paolo

Hi Donald,

you can find the listing in APPENDIX A of the HP Service Manual for models 9100A and 9100B H/P part 09100-90034.

you can download a copy of this document from the Australian site herebelow:

http://www.hpmuseum.net/collection_document.php

In this site there is lot of other good stuff, worths a visit.

Ciao

Paolo

LCD displays life expectancy

*Message #1 Posted by **hecube** on 6 Oct 2009, 8:13 a.m.*

For how much longer should we expect LCD displays of HP-41s to function properly?

Re: LCD displays life expectancy

*Message #2 Posted by **Garth Wilson** on 6 Oct 2009, 11:08 a.m.,*
in response to message #1 by hecube

Remembering documents from the mid-80's when the 41 was in its heyday, the biggest enemy to LCDs is not feeding them properly, giving them a net DC so they plate up on one side. Assuming HP designed their circuitry right, that's not a concern. The next enemy is heat and humidity, especially the combination; but Hantronix' website says the life expectancy of the LCD glass is 50,000 hours of use (almost 6 years of never being turned off), and I had a battery-powered LCD clock in the car for that many years and it didn't seem to deteriorate at all. (The mechanical clock had quit working so I stuck a $2 LCD clock from the drug store over it.) UV isn't good for them either, but I doubt that you leave your 41 in the sun. I have seen an LCD that was damaged by extreme heat or UV and the silver background had turned very dark blue IIRC. My own 41's LCD looks the same as it did new 23 years ago, with the bright silver background and really black segments. I really don't think you have anything to worry about. LEDs OTOH have a half life.

Failure is rare

*Message #3 Posted by **Frank Boehm (Germany)** on 6 Oct 2009, 11:38 a.m.,*
in response to message #1 by hecube

I have seen lots of failed "early" LCD displays:
- ca. 1972/1973 Rockwell LCD: almost 100% chance of being dead
- ca. 1973/1975 Sharp COS: 50% of being dead
- ca. 1976/1977 LCD (with or with yellow filter): 25% of being dead, sharply rising as of lately, still a 30 year life span
- later LCD: almost 0% being dead

This is of course only valid if you don't expose the display to intense sunlight or heat for longer period or physical damage.
There are several other parts of the calculator that will fail before the LCD.

LCD failure is rare

*Message #4 Posted by **Karl Schneider** on 6 Oct 2009, 11:27 p.m.,*
in response to message #3 by Frank Boehm (Germany)

> Quote:
>
> I have seen lots of failed "early" LCD displays:

- ca. 1976/1977 LCD (with or with yellow filter): 25% of being dead, sharply rising as of lately, still a 30 year life span
- later LCD: almost 0% being dead

This may explain why HP introduced an LED-display line (Spice series) in 1978, just before the upscale LCD HP-41C in 1979: They wanted to ensure that LCD technology was mature and reliable.

My much-cheaper Casio fx-3600P (bought in 1981) replaced an LED-display TI-30 from 1977. The Casio's LCD has had no problems, although I have used it very sparingly since I bought an HP-15C in 1983. That year, the still-available LED-display HP-34C with rechargeable battery looked retro by comparison (a "super TI-30"!), but I still gave it serious consideration.

*Message #6 Posted by **Egan Ford** on 6 Oct 2009, 11:52 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

How? I know I have read it somewhere, but since you brought it up please save me a few minutes of research.

Thanks.

BTW, I use my fullnut over my halfnut just for the contrast of the fullnut.

Re: Also, the halfnut units... (was: LCD displays life expectancy)

*Message #7 Posted by **PeterP** on 6 Oct 2009, 11:56 a.m.,*
in response to message #6 by Egan Ford

easiest is using the sandbox or the hepax, both of which have contrast and ct+/ct- (or similar commands. Do a CAT 2 and it will pop out immediately) to request, set, increase, decrease contrast.

HTH

Cheers

Peter

Re: Also, the halfnut units... (was: LCD displays life expectancy)

*Message #8 Posted by **Egan Ford** on 6 Oct 2009, 3:23 p.m.,*
in response to message #7 by PeterP

Thanks. It is persistent? What resets it (e.g. power on/off, battery swap, memory lost, etc...)?

Re: Also, the halfnut units... (was: LCD displays life expectancy)

*Message #9 Posted by **Garth Wilson** on 6 Oct 2009, 3:59 p.m.,*
in response to message #8 by Egan Ford

The so-called "contrast" setting is really a viewing-angle setting, otherwise we would just set it for max all the time. Sometimes it is appropriate to adjust it as battery voltage drops, in order to maintain the optimum viewing angle. It's more of an issue in low-duty-cycle LCDs though, mostly meaning graphics LCDs or large character-only LCDs. The 41's LCD hardly qualifies.

There never was a "fullnut" though. Before the "halfnut" was the "coconut"!

(edited) Also, the halfnut units... (was: LCD displays life expectancy)

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 6 Oct 2009, 4:52 p.m.,*
in response to message #8 by Egan Ford

Hi, Egan;

the contrast settings remains after being set, i.e., depends on calculator main hardware. It uses a four-bit range parameter (0 to 15), usually in the X-register. If you have HEPAX, try HEPAX function 005. Default contrast is 5 (0101) instead of expected 7 (0111)... Go figure!

And, yeap: contrast setting remains after MEMORY LOST, but I do not know how long does it take to restore to default after being without batteries... i.e., IF it restores.

Cheers.

Luiz

(After posting, I edited to add that HEPAX 005 actually uses X-register contents, and I left my HP41 without batteries after a MEMORY LOST for some more than 1 hour and the contrast restored to default, then.)

Edited: 6 Oct 2009, 8:59 p.m.

Re: LCD displays life expectancy

*Message #11 Posted by **Martin Pinckney** on 6 Oct 2009, 12:04 p.m.,*
in response to message #1 by hecube

Interesting question. Do they show signs of fading?

I recall reading that Nikon originally designed all their top-of-the-line professional cameras with removable meters, because they expected the electronics to give out before the mechanicals. This has proven true. Nikon F2 cameras were built to last forever, and they do, but the meters don't.

Nikon also at first resisted using LCD's, because of concerns about the life span. Finally, someone decided that changing market conditions made this a moot point, since any new camera model would be obsolete long before it gave out. This has also proven true, since the 1980's F3's (the first with LCD's) are still going strong

(for those who use them), but Nikon has since stopped making nearly all film cameras, and the digitals have only about, what, a 3-year model life span?

If you search on iTunes for a calculator called "Calc Zero" you'll find that it has a rating of:

Rated 12+ for the following: Infrequent/Mild Sexual Content or Nudity

I thought this was too funny that a calculator would be rated NC-17, so I mailed the developer about how this happened. Apparently some of his resource file names has the word boobs in them.. Apple review must have some kind of filter they perform on the submissions :)

Re: Profanity free iPhone calculator application

*Message #4 Posted by **Andrés C. Rodríguez (Argentina)** on 6 Oct 2009, 8:42 a.m.,*
in response to message #3 by Byron Foster

It may have had a SIN function, a blue square key, and other subtle traces of improper content. Physical

calculators were even worse, they used to have female connectors which may be near male plugs, and these obtained their power from transformers!

Connecting HP 48GX with PC via Conn4x....help!!!

*Message #1 Posted by **juan demin** on 5 Oct 2009, 10:32 a.m.*

I need some help with this first time connection...

I am trying to download the XModem (Manual-XRECV) following the steps: ' alpha X , left shift I/O , NXT , XRECV .... After some 20 seconds the calc displays: "XRECV Error: Transfer Failed"... And that's the end of the loop... I cannot connect the calc with the PC....

I am using a serial-USB adapter because my laptop does not have a serial port.. could be this a problem?

Any idea or hint? Thank you!!!

Re: Connecting HP 48GX with PC via Conn4x....help!!!

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 5 Oct 2009, 11:01 a.m.,*
in response to message #1 by juan demin

Hola, Juan; que tal?

If you are using an HP48GX, the only port available with its hardware is RS-232 compatible (PC_compatible serial) and, if I am not wrong, it is possible to use a serial-USB converter (that should not be the problem). But I am not 100% sure about this...

If you have the chance, try using another computer with a RS-232C compatible serial port just to make sure your HP48GX connects correctly.

(after editing) I forgot to ask: the keystroke sequence you mention, is it correct? I cannot check now, but it seems to me it has more keystrokes than usual (maybe it is because I´ve been using the HP50G more, lately)

Success!

Luiz (Brazil)

Edited: 5 Oct 2009, 12:52 p.m.

Re: Connecting HP 48GX with PC via Conn4x....help!!!

*Message #3 Posted by **Michael de Estrada** on 5 Oct 2009, 1:06 p.m.,*
in response to message #1 by juan demin

Hola Juan,

Something doesn't seem right here. If your HP 48GX recognizes the XRECV command, then you already have the XMODEM library installed on your calc, and shouldn't need to download it again. I too had problems with communication between my HP 48SX with XMODEM on it and my PC using Conn4x and a USB to RS232 converter. I did try some other communication programs with no luck. I assume that you made sure the

communication protocols were matched between the PC and calc (baud rate, parity etc.). I have an old DOS PC with a RS232 port and use Kermit to communicate with the calc.

Sorry I couldn't be more helpful.

Saludos, Michael

thank you Luiz and Michael... I cheked everything (that I know) and is still not connecting....

Re: Connecting HP 48GX with PC via Conn4x....help!!!

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 5 Oct 2009, 5:31 p.m.,*
in response to message #4 by juan demin

Hola, Juan;

I looked again at the keystroke sequence and, if I am not wrong:

- you define a variable named 'X' to hold data to be transferred from the computer to your HP48GX ([ALPHA] X); did you try [ALPHA][']X instead?
- then you open I/O ([left-shift] I/O);
- then you 'tell' the calculator to receive data ([XRECV]); it will be stored in variable named 'X', defined in first step, right?
- 20 seconds later you get transfer error message.

What message you have from the PC? What happens in the Conn4x window? The error message appears only in the calculator?

Just to let us track a little bit down.

Saludos, Luiz (Brazil)

Re: Connecting HP 48GX with PC via Conn4x....help!!!

*Message #6 Posted by **juan demin** on 6 Oct 2009, 12:43 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

That's correct Luiz, step by step.. I got no message in the pc, only in the calculator...It looks like they are not seeing each other...and no connection is stablished... Reading other mails and possible causes (thank you guys very much!!!!) I am still not clear about the problem... I have XP with SP2, this should not be a problem...

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 6 Oct 2009, 12:50 a.m.,*
in response to message #6 by juan demin

Hola, Juan;

Just another question: when you execute XRECV in the calculator, the computer should also 'be told' to send data. What operation are you performing in the Conn4x after (or before) executing XRECV in the calculator?

Cheers.

Luiz (Brazil)

in response to message #1 by juan demin

I guess you've recently upgraded Windows XP to SP3? After that serial to USB adapters no longer work even if you re-install windows and don't upgrade to SP3.

*Message #12 Posted by **Egan Ford** on 9 Oct 2009, 3:54 p.m.,*
in response to message #9 by Reth

I am using a Keyspan USB/Serial with XP/SP3 without issue. Perhaps if you uninstall and reinstall your drivers. One thing that I did do was to remove all the extra COM entries. I had 8 or so for many devices that I do not use like bluetooth. After I did that I was able to use two different USB/serial adapters as COM3 and COM4 without issue.

Re: Connecting HP 48GX with PC via Conn4x....help!!!

*Message #13 Posted by **Ed Look** on 5 Oct 2009, 10:31 p.m.,*
in response to message #1 by juan demin

I use a desktop, WinXP SP3. I could NEVER connect to it from my 48G or 48G+ using Conn4x.

I installed an older connectivity program, HP48Explorer. That seems to work just about all the time. I use a serial/USB converter, too.

I'm not sure what exactly is wrong with Conn4x as far as the 48G series machines, and what is exactly right with HP48Explorer, but the latter works.

Re: Connecting HP 48GX with PC via Conn4x....help!!!

*Message #14 Posted by **Reth** on 5 Oct 2009, 10:49 p.m.,*
in response to message #13 by Ed Look

I'm sure it's not Conn4x - before installing SP3 I connected my Leica instruments to USB ports through serial-USB adapter on 3 different computers. Once they got upgraded (automatically) to SP3 no one can't connect.

in response to message #15 by juan demin

Juan,

Did you try it?

Re: Connecting HP 48GX with PC via Conn4x....help!!!

*Message #17 Posted by **Dave Britten** on 6 Oct 2009, 8:46 a.m.,*
in response to message #13 by Ed Look

In my experience, Conn4x is extremely fussy when it comes to USB/serial adapters. I've never been able to get it to work that way, except for a very old build that's lacking quite a few features (ASCII transfer mode, for one).

Try sending a file to the 48 using HyperTerminal and XModem. Any file will do. I've never had issues getting that to work.

Re: Connecting HP 48GX with PC via Conn4x....help!!! Works just fine for me.

*Message #18 Posted by **Egan Ford** on 9 Oct 2009, 4:32 p.m.,*
in response to message #1 by juan demin

I just tried this without issue. Step-by-step:

1. Acquire Windows XP SP3 machine.
2. Acquire USB to Serial cable.
3. Plug USB to Serial cable into PC. Install driver if necessary (I had to).
4. Note the COM number, I was using COM3:
5. Install CONN4X.
6. Launch CONN4X.
7. Set "Connect Using" to your COM port (mine was COM3:)
8. Important. Set "Speed" to 9600 (it defaults to 115200).
9. On your 48GX Right Shift 1 (I/O), select Transfer..., make sure BAUD is 9600, PORT is Wire, ignore the rest, NXT, then F (OK).
10. From CONN4X select File/Download HP48 Server
11. Follow the instructions (I used 'XX' instead of 'X' because 'X' was already in use).
12. Watch it download and be amazed. :-)

My guess is that you did not do steps 7 and 8. If I omit them then I can reproduce your problem.

Edited: 9 Oct 2009, 4:45 p.m.

Re: Connecting HP 48GX with PC via Conn4x....help!!! Works just fine for me.

*Message #19 Posted by **juan demin** on 10 Oct 2009, 3:19 p.m.,*
in response to message #18 by Egan Ford

Thanks Egan for the detailed step by step explanation. I went thru it fut faild in the last minute, i think. There was a signal sying 0/3400 bytes transfered....wait... and then another one saying: connection error - please check your connections.... Meaning who knows what....

Re: Connecting HP 48GX with PC via Conn4x....help!!! Works just fine for me.

*Message #20 Posted by **Egan Ford** on 10 Oct 2009, 4:33 p.m.,*
in response to message #19 by juan demin

Try a different USB/Serial and check your HP48 cable and connections.

Spice question

*Message #1 Posted by **Paul Dale** on 5 Oct 2009, 3:40 a.m.*

Has anybody tried adding memory chips to the various spice range.

My 34c has all three spaces on the circuit board populated. My 32e has only two. I don't have any others in the range to compare but I'd be surprised if they all had all the memory spots populated.

Has anyone tried this? What happened?

- Pauli

Re: Spice question

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 5 Oct 2009, 6:46 a.m.,*
in response to message #1 by Paul Dale

Hi, Paul;

AFAIR, many discussions here in the (far) past led us to the fact that many spices of the same type have incompatible IC´s. I have two 38C, one of them with two IC´s and another with only one (in both cases, it is apart of the big processor). It seems that HP changed their internals the same way it did with the Voyagers, mainly the HP12C, over the years.

I am not sure if their memory can be extended... but, hey, what do we know? HP has hidden so many information (belong to them, right?) that nothing is for good.

Success!

Luiz (Brazil)

Re: Spice question

*Message #3 Posted by **Eric Smith** on 5 Oct 2009, 9:44 a.m.,*
in response to message #1 by Paul Dale

The memory chips in the 30 series are combined ROM/RAM chips. There aren't any that are suitable for just adding more RAM, and even if there were, the ROM code wouldn't recognize it.

Re: Spice question

*Message #4 Posted by **Paul Dale** on 5 Oct 2009, 7:48 p.m.,*
in response to message #3 by Eric Smith

Thanks, I suspected they contained RAM and ROM but wasn't sure :-(

9830A Repair

*Message #1 Posted by **Sebastian Kelz** on 4 Oct 2009, 3:50 p.m.*

Hello,

I hope someone around here can help me.

I recently aquired a HP 9830A. After checking the the power supply I decided to turn the unit on. But for some reasons the display stays black. So I guess one of the boards is defective.

When I turn the calculator on, 2 random characters flash up for a fraction of a second, so I guess the Display and its controller is working. I do have an osciloscope and a voltmeter. Can someone help me to get this thing going?

Thanks in advance,

Sebastian

Re: 9830A Repair

*Message #2 Posted by **Tony Duell** on 5 Oct 2009, 4:43 a.m.,*
in response to message #1 by Sebastian Kelz

The hp9800 series are bit-serial, which makes them 'interesting' to repair

You'll need the schematics, which are available from the Australian museum site. A logic analyser is very useful, but you can manage without one.

The display on the 9830 is partially scanned by the processor/firmware. So for the display to work, the processor, memory control, ROM, RAM and display all have to be working. Of course there are ways of tracking down the fault, but just about any problem in a 9830 causes a blank display

A little background info which will explain the 2 random characters you see at power-up. The CPU has a 16 bit I/O register. When talking to the display hardware, this register contains the 6 bit codes for 2 characters, and a 4 bit value saying where to put them. The character pattern generation is done in hardware. So at power-on you have a random pair of codes and location. There is a protection circuit that blanks the display if the processor isn't talking to it, hence these random characters disappear after a short time.

Re: 9830A Repair

*Message #3 Posted by **Sebastian Kelz** on 5 Oct 2009, 10:17 a.m.,*
in response to message #2 by Tony Duell

Hello, so thanks for this information. Does this mean that every board has to work? So even the complete cassette drive contoller? I really don't know how to get started on this system. I got 2 ram cards so I ruled these two out. I also sensed the 8 Mhz at the clock. But how do I find out wich components are working and wich are not? Do I have to check the boards by applying voltage and data signals to them outside the systeme, or is there a better solution?

Re: 9830A Repair

*Message #4 Posted by **Achim (Germany)** on 6 Oct 2009, 4:27 p.m.,*
in response to message #3 by Sebastian Kelz

Sebastian,

there are some function critical boards, e.g. the 4 CPU boards, on which a failure of nearly any IC leads to a complete calculator malfunction.

The easiest way to find out the defective board is to do board swapping with a known functional machine. The boards of the malfunctioning machine are plugged into the working one until a failure occurs. In the next step one has to isolate the defectice ICs my means of a logic comparator (HP5011) and/or a logic analyzer. Of course, for use with the logic comparator you would need a working sample of every TTL IC. This may become difficult since some of them are no longer produced and hard to find. Some defects can be found best by comparing the signals of the malfunctioning machine with those of a working one using the logic analyzer. Having a service manual handy is very helpfull.

Best regards, Achim

Re: 9830A Repair

*Message #5 Posted by **Tony Duell** on 9 Oct 2009, 8:17 a.m.,*
in response to message #3 by Sebastian Kelz

I don't normally post repair tips here any more due to the actions of one particular member, but I'll make an exception. If you contact me by e-mail, I can talk you through the entire machine.

Not all the boards have to be working, but most of them do :-(. And the ones that don't _have_ to work (like the cassette controller, expansion ROM backplane, etc) could fail in such a way that they prevent the machine from working.

The fact that you have 2 RAM boards (in the slots in front of the PSU) doesn't mean you don't have a RAM fault. The 2 boards are assigned fixed addresses (depending on which slot they're in) and there has to be RAM at some particular addresses for things like the system stack. So if that board has a problem, the machine won't work. Alas I am working from memory, and can't remember which slot has to contain a working RAM board.

So what I normally do is firstly remove all the 'unnecessary' boards. These are the 4 boards for the tape controller (Blue handles), the tape drive itself, the keyboard connector (in front of the display, but leave the mains cable to the on/off switch connected), the I/O backplane, the expansion ROM module backplane, and any internal expansion ROMS (but leave the black/red handled PCB that contains the last bit of BASIC in place).

Still no display? I then check the display strobe signal (see the scheamtics). It's almost always missing, but you'd feel a right idiot if you spent time debugging the processor section only to find the processor was sending data to the display and the fault was in the latter section.

Then there are several things to try. If you power up the CPU clock PCB (brown/red handles)on its own (either in the machine with all the other boards removed, or using a 5V bench supply), the BitClk and muClk signals will run. 16 bit clocks, then a muclock (microcode clock), and so on. Check this with a 'scope or logic analyser.

Since it's a bit serial machine, the M (memory address) and T (memory data) registers should have all bits changing. With the 'essential' boards back in the machine, check these with a 'scope or logic

analyser.

Then it gets harder. I connect a logic analyser to the microcode address lines on the CPU control PCB (brown/orange handles) and grab the microcode listings (ask me nicely by e-mail :-)). Then I see just what the CPU is doing and go from there.

Warning: GRiD cards ad for 48GX

*Message #1 Posted by **Richard Reed** on 3 Oct 2009, 2:46 p.m.*

On TAS, seller 'coburlin' is showing two 1MB cards labelled GRiD as "FOR HP 48GX". If I'm not mistaken, it was these Epson-built cards that did not have the HP changes for lower voltage levels, different from GRiD, at which 48GX is allowed to operate. It has been reported from several reliable sources that when calculator battery voltage in 48GX gets to a lower, still operable value, the GRiD cards clamp address and data inputs low while the calculator is still driving them, effectively shorting the calculator power supply.

The result has been reported variously as sudden low battery indication on new-ish batteries, loss of user memory, permanent calculator power supply damage, and "never saw any problem".

coburlin's prices are always too high for me anyway (no auction).

Please correct me if something about GRiD cards later changed to eliminate this problem.

Richard

Thanks Pascal.

The first day was a veyr very long day. We left HP's office at 9:30 pm!! When we got to the hotel we had a second wind and sat in the reception area and chatted some more!

Cheers,

Namir

Re: Live from HHC2009

*Message #7 Posted by **Don Shepherd** on 4 Oct 2009, 8:33 a.m.,*
in response to message #6 by Namir

Hmmm, sounds like no programming problem contest this year.

Re: Live from HHC2009

*Message #8 Posted by **BruceH** on 5 Oct 2009, 1:22 a.m.,*
in response to message #7 by Don Shepherd

There was one, won by Roger Hill. My effort was hopelessly outclassed (this is what comes of starting it at midnight the night before it was due in). Bill Butler set the challenge - I'll leave him to repost it here when he gets home.

Re: Live from HHC2009 (well, not quite live any more)

*Message #9 Posted by **Jeff O.** on 5 Oct 2009, 1:38 p.m.,*
in response to message #7 by Don Shepherd

It was specific to the 50G:

HHC 2009 Programming Challenge

Finding partial sums of rows of Pascal's Triangle

```
      1
     1 1
    1 2 1
   1 3 3 1
  1 4 6 4 1
    etc.
```

Write an HP50g program which takes a positive integer **n** of any size in level 2 and any integer **r** in level 1 and returns the sum of C(n,0) + C(n,1)+...+C(n,r) to level 1. The output should be 0 for **r**<0 and $2^{\mathbf{n}}$ for **r** >= **n**.

The program will be transferred from your HP50g to the judges' HP50g and will be tested (in exact mode) for a selection of values of **n** and **r** chosen by the judges. The fastest program wins.

The usual rules apply:

- The program must be in user code only

- The program must be self-contained

- The program must leave the stack unchanged except for replacing **n** and **r** with the result.

- Default flag settings are assumed, except that RPN mode must be set. Flag settings must be restored if changed.

- The judges' decision is final.

Re: Live from HHC2009 (well, not quite live any more)

*Message #10 Posted by **Don Shepherd** on 5 Oct 2009, 2:02 p.m.,*
in response to message #9 by Jeff O.

Thanks Jeff.

Re: Live from HHC2009 (well, not quite live any more)

*Message #11 Posted by **Allen** on 6 Oct 2009, 8:21 p.m.,*
in response to message #9 by Jeff O.

FWIW, I made a smaller binomial sum of products:

http://www.wolframalpha.com/input/?i=sum+%28-1^j%29*binomial%28+n%2Br-2j%2C+r-j%29*binomial%28n%2Br-3j%2Cr-2j%29%2C+j%3D0+to+r%2F2%2C+r%3D13%2C+n%3D8

to satisfy the programming contest.. there's some interesting limitations of it, but should work for all rows under row 30.

It steps through pascals triangle like a knight in a chess board:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14
0	1														
1	1	1													
2	1	2	1												
3	1	3	3	1											
4	1	4	6	4	1										
5	1	5	10	10	5	1									
6	1	6	15	20	15	6	1								
7	1	7	21	35	35	21	7	1							
8	1	8	28	56	70	56	28	8	1						
9	1	9	36	84	126	126	84	36	9	1

Hi Namir, guys;

congratulations, all of you. Good to know that you, people, are there.

I am not sure if this is common knowledge, but I would like to ask, please, as soon as any online information about the meeting is available, would you let us know? If any already, which links?

Thanks again.

Luiz (Brazil)

Thought experiment:: creating great hardware assuming software will follow

*Message #1 Posted by **Hugh Evans** on 3 Oct 2009, 1:43 a.m.*

Producing machines that exceed the quality of old HPs is relatively trivial but will require funding. Is this community interested in investing in the development of such a machine(s)?

I'm considering a stripped down version of my OpenRPN project involving only hardware and this is my target audience. My current theory is that if you build it the apps will come. Feel free to email me with concepts outside this post. Machines such as the 35s are nice, but I'm prepared to go way over the top in terms of design. Any interest? People willing to help make this happen?

Re: Thought experiment:: creating great hardware assuming software will follow

*Message #2 Posted by **Paul Dale** on 3 Oct 2009, 2:47 a.m.,*
in response to message #1 by Hugh Evans

I'd be interested. I don't know how much money I could contribute but I'm sure I could find some.

I agree that if the hardware exists, the software will likely follow. There are several good calculator software projects any of which would make a good starting place.

As for the OpenRPN project, the software development was fairly far along, so there wouldn't be a huge need to consider it hardware only :)

Re: Thought experiment:: creating great hardware assuming software will follow

*Message #3 Posted by **DaveJ** on 3 Oct 2009, 6:11 a.m.,*
in response to message #1 by Hugh Evans

Yes, if you build it they (the software developers) will come. The uWatch is a perfect example.

A calculator project is all about the hardware, so actual hardware = excitement. No hardware = no excitement.

No offense, but there was no OpenRPN hardware produced after how many years of development? (not even a single prototype of any aspect) How will this attempt be any different?

Also, please correct me if I'm wrong, you were somewhat adverse to producing "less than perfect" interim prototypes, which most people would consider essential for such a project. You wanted to shoot for the final product on the first attempt? Is this still the case?

Producing calculator hardware people will be happy with is far from relatively trivial.

Surely you have tons of stuff to show after all the previous OpenRPN development? If so, how about you show us some ideas so people can actually get excited and want to help out?

Dave.

*Message #4 Posted by **Bill Wiese** on 4 Oct 2009, 5:19 p.m.,*
in response to message #1 by Hugh Evans

OpenRPN (& other variant projects) were failures because:

1. It solved a problem not needing much solving. Creating decent calc FW isn't that hard these days with tons of decent low-power microcontrollers out there, or with iPhone, etc. platforms. Either 'Nut emulation or from-scratch code can be done with some reasonable facility.

2. The dream software served as occupational therapy for those folks not acknowledging it takes a ton of money & skills to get quality case, keyboard and consumer packaging to realize a worthwhile product one would want to use daily (as other than a "science project" on a perfboard.) And while I admire the uCalc (?) watch I certainly would not remove my Rolex to wear one (same said about Casio plastic watches). If a Calc watch were to ever be in production it would have to have some panache/quality a la HP01 (or even an upscaled Nat'l Semi sci calc watch from ages ago).

3. There's no need to duplicate/branch off a high-end RPL calc (HP48, 49g, etc.) Those calcs do what they do well, although the problems to which they're aimed often are burdened by data entry & speed, such that PC software is more appropriate to the task and setting.

3. I do crunch a few numbers daily and have no need for 48/49g, etc functionality. I think others agrree - the passion is for recovering the original elegance of the orig HP RPN calcs as they age and drop out of circulation. Those of us doing "powerful math" are not gonna subject ourselves to limited calc HW when we have laptops & PCs around with Matlab etc. There's a right tool for the job and a calculator can go back to being a calculator and not a 'protocomputer'.

4. Original keystroke programmability was a necessary compromise "back in the day"; later RPL programming alienated keystroke programmers who also worked with conventional languages.

5. Bringing back a quality RPN calculator with large ENTER key and reasonable HP layout should be goal. Programming language should be some form of BASIC. I note the HP71B BASIC as an excellent implementation and it could fit on an HP35S package. For years, there's no longer any need for the programming language to be coupled with the calculator's direct-entry mode.

6. The HP35S is a pretty good 1st cut at recovering a traditional RPN calculator. I don't care for the display too much and some key layouts are 'interesting choices'. And the programming model really doesn't make me sing.

7. Until proper case and keypad and funding work it's all a joke. And for quality keys some agreement on key legend & shifted key function labelling on top plate would need to be agreed upon. If this can't be done the project can't be started and it'll just be a buncha buttons on perfboard.

I agree, and it's my baby!
The original uWatch was simply a quick exercise in what could be done with off-the-shelf parts, so that's what it looked and felt like. It was actually done for a design contest (I didn't even place :-( )

The new uWatch Mk2 design is evolving slowly, so it should hopefully answer the criticisms of the first one. Namely:

1) A "real" case made out of anodised aluminium, so it should "feel" like a solid quality watch. Real integral watch band pin supports etc.

2) A graphical LCD display with a nice backlight.

3) Bigger more powerful processor. The programming community maxed the old one to death playing chess and all sorts of things!

4) Bigger spaced keys. In fact this one will use touch technology. The major problem is deciding exactly how to implement this. I originally crammed 24 buttons on the thing, even though I knew it probably would be unworkable in practice unless you have the worlds smallest fingers. My current thinking is to just go minimalist so the touch technology will actually work nicely for all. 16 or 18 keys max. Who cares if you have to hit shift for nearly everything, worked fine on my CFX-400 sci calc watch.
Don't like the key layout? Design your own PCB front panel.

5) USB and rechargable battery.

If I get off my butt and actually lay some money down to get the first prototype, it could be a decent product (I hope)...

Dave.

Sorry, Dave, a 'real' watch does not have an alum. case.
Good watches (which excludes most all Seiko, Citizen, Skagen, Pulsar, Casio, Swatch, etc) have at least 316 stainlees for case, and they also have (near-)scrtachproof sapphire crystals.

If you're gonna produce something attempting to be sellable, don't fight for the low-end. No margin for time & effort. Sell 'em for $500 - $1K, not $125 or less. Also, higher-end watch cases and bands are avaiable for custom watch builders from sources like [url]http://www.ofrei.com[/url]

> Quote:
>
> 1) A graphical LCD display with a nice backlight.

Please, don't overdo graphics. While graphix LCD might be required to do better-than-character-LCDs don't do graphics per se on the calc. Get RPN + memory/transcendentals and maybe some 12C PV/FV/PMT/i/n running and you're done.

Think something like Tritium capsule or other watch illumation like Indiglo.

For small volume production rape Timex or Casio calc watches.

> Quote:
>
> 3) Bigger more powerful processor. The programming community maxed the old one to death playing chess and all sorts of things!

Please O Please No! A low power 80c51 etc is fine - or even better a watch CPU. Find the BEST lowest-power CPU you can. Don't build a "computer". Battery life needs to be 1-2 years just like Casio calc watches.

Given touch sense (below) a Cypress or Atmel is likely best sol'n.

I agree. I also had the CFX20 wathc and CFX400. Capsense touch is the way to go and can work thru a watch crystal. A side button and timeout reversion should shift in/out of calc mode so capsense disabled and not burning power etc. Do not try use big LCD legends
for keypad, use printed logo. Capsense touch processing can solve 'fat finger' issue and can even do stroke recognition.

> Quote:

> 5) USB and rechargable battery.

Nobody wants a friggin' watch that has to recharge.
1+ yr battery life, or stay home.

If a stylish, $1000 stainless+sapphire QUALITY {too many nerds here who think Seiko=quality) watch that has an RPN calc with 1+ yr battery life hits the market, enough folks will buy, and money is made to recoup costs.

Frankly, Plan B is to work with Casio on a custom run to reprogram one of their touch calc watch variants and have it dropped in a quality case + sapphire face w/quality band.

Yes, I really meant aluminium as a minimum, not plastic. Stainless is a more expensive option, just gotta specify it. Easy.

Sapphire crystal is another expensive custom option. Anyone know where you can get such things custom machined?

I'm realistic enough to know that I perhaps don't quite have the skills on my own to design a watch worthy of a $1000 price tag. At that sort of price people expect fancy presentation cases, a really elegant case design, 5 year warranties etc. This tends to push the risk aspect (financial and time) into the stratosphere.

The uWatch was butt ugly, but it made a lot of people very happy. I can't begin to imagine what impact a slightly more refined version would have, one that looks like you could actually wear it every day. And I can do that with very little financial outlay or risk.

I know enough about various industries to know that price-point is an important factor. It can make or break your product.

I haven't overdone graphics. I've pretty much settled on a 128x32 display, much to the disdain of the community who wanted a 128x64

Backlight is integral white LED and is very nice. Not the lowest power solution, but backlights are not used often, and it's integral, so no development effort or risk.

Raping parts from other products is fraught with danger. If I sold a couple of hundred uWatch's, then I'd be crazy to think in design terms for anything less than 1000 Mk2's.

I've speced in an Atmel touch device. A low power micro is fine, but remember the other stuff takes power too, so it ain't just about the micro. The uWatch used a 64KB/8K 16 bit processor, and we ran into the limitations very quickly. No one is going to want to have to code in assembler... You can have your cake and eat it too here. A big processor can be clocked at 32KHz or shut down and draw adequately little power in time/date mode, but then has the grunt when and if you decide to use it. One can also argue a 32 bit processor is actually more efficient power-wise than an optimised low power 8 bit micro. There ain't much in it.

>
> ---

Actually, no. Cap sense creates the "big finger" problem. You can get higher density using tact keys because the finger can "feel" before pushing. Cap sense has to be spaced big enough to absolutely ensure it can be used by anyone. Although admittedly I have not experimented in this area yet, mainly going by what the informed are telling me. You think say reliable 6mm pitch keys with touch sense is possible? I'd love to see some foolproof implementation examples, please.

Unfortunately I'm being forced down the rechargable path.
The display takes around 100uA continuous, so even if I had a decent 500mAh capacity coin cell that's only around 200 days. And I have not factored in a DC-DC, touch sense, processor, occasional backlight use etc. Then the case design is more complex because you have to allow easy battery access. Yes, it can be done, but it means a custom LCD display and the entire project explodes into complexity from there. Complex development means more money, more time, more risk, and will ultimately never get done because I'll lose the enthusiasm. BTW, I'm already looking at around 1 month battery life for the rechargable.

Find me a suitable lower power LCD solution off-the-shelf and I'll happily consider giving you a year battery life. Really.

People who have not actually done in-depth investigation into designs like this can't really appreciate the countless trade-offs involved. I don't think I could even begin to list all the trade-offs I've encountered in this project. Not as many for pocket calc to be sure, but still, many gut-wrenching decisions need to be made. And I've said this before, this never works well by-committee or by-community. It need one smart person to do the legwork and make the big decisions for such a project.

That's why Hugh needs to simply make decisions, do the work and SHOW us something tangible. Then people will get excited and want to help out. It's a real shame nothing but software has come out of OpenRPN.

I believe OpenRPN never got off the ground because perfection was aimed for. I like being a tad more realistic with my projects. Perfection and gilding the lily is nice, but not needed for a successful product.

Dave.

Dave, please do what you are going to do the way you want to do it.

If it costs $1,000, I will buy exactly zero. My propensity to drop substantial money on toys maxes out well below that figure.

I always do! :->
I have 20+ years experience doing projects and kits like this for niche markets so I like to think I have at least some sense for it after all that time!

> Quote:
>
> If it costs $1,000, I will buy exactly zero. My propensity to drop substantial money on toys maxes out well below that figure.

So does mine.
You won't see me ever produce a $1000 niche hobby product, I know it would be a guaranteed loser.

The "magic figure" in the consumer market is $300, and the niche hobby market is substantially less than that.

Dave.

That will never work, you'll never ever get even close to majority agreement on such things. I think any design should be minimalist and have support for a drop-in face plate. This would not lock you into such critical design decisions at the start of the project.

You could also argue that you could do that with the hardware too. Use an FPGA perhaps so you can change the processor to anything you like.

I agree with what you say about big powerful calcs, I simply don't see the point. There are already plenty of calcs out there that fill this market. Think SMALL and really pocketable.

Aluminimum case to set the thing apart from a million other calcs on the market. because no matter how much money and effort you pour into the case and key design, it's still doomed to look like every other plastic chinese calc out there. Think different. Think about people who might want one (Geeks, Hackers, Makers, Steampunkers) simply because it looks cool.

Dave.

Screw the majority. Just do it right. Have an opinion that's based on ease of use/minimizing keystrokes.

You're either building a product or a science project.

> Quote:
>
> You could also argue that you could do that with the hardware too. Use an FPGA perhaps so you can change the processor to anything you like.

Baloney. Any reasonable calc for a watch can be done on a 4 bit CPU or even a bit-serial CPU.

FPGAs are not really designed for ultraportable ultralowpower and have lotsa pin/package baggage.

For a hand *calculator* and not a *watch*, yes. And laser-etched keytops and plates can be done in smaller-volume, with colored plastic filler filling in the keytop legends.

The HP 41 had a template overlay, and it was a good product, so I think it's doable if you want to.

Sorry, I'm not talking about the uWatch here, I'm talking Hugh's proposal.

Yes, FPGA's chew power and mostly big pin counts. But it could be novel for an open source powerful calc if you wanted to go that way.

I prefer hard silicon micros for stuff like this, but I like to be open minded too. (I design FPGA development tools for a living)

Dave.

You will need at least $4m and there is a 99.9% chance you won't get this money back. But don't take my word for it - go and find a venture capitalist for a second opinion.

You are generous with those odds at $4M!

Try $4K as an order of magnitude for a DIYer, $40K if you want it really schmick. Heck, give me a lousy $400K and I'll quit my job and go full time at it :->

I (and many others I'm sure) could quite easily produce a very usable calc for under $10K, provided I had help with the mechanical CAD stuff.

Even if I spent that sort of money on my MK2 uWatch (it won't even be close to that), it's practically a 100% certainty I'll get my money back on that investment. I think there is little risk in any sub $10K design that is done well. Over that and your odds start dropping fairly quickly I recon. I base that on a typical price-point and sales numbers of a project like my uWatch.

But like I've said in the past, I don't quite see the point in doing yet another pocket scientific calculator design. There are just too many other platforms out there. It would have to have some niche appeal that is not currently being met. e.g. a REALLY pocket size calc (no the Voyager is not what I call pocket size)

and/or some really funky all-metal design etc. Perhaps a retro LED calc even. Heck you'd probably sell a few hundred of those small non-programmable 4-banger type RPN designs doing the rounds a while back. Get it on ThinkGeek and you'll probably quadruple that number.

Dave.

This is not a "usable calc" but one which exceeds the rather excellent standards of the old HPs. That cannot be done cheaply nor can it be done at any of the prices you are proposing.

> This is not a "usable calc" but one which exceeds the rather excellent standards of the old HPs. That cannot be done cheaply nor can it be done at any of the prices you are proposing.

If you seriously think a skilled person cannot product an excellent quality product for a niche market for the figures I quoted then I'd guess you have a no experience at all in designing electronics products "mightnight engineer" style.

Remember several things:
No one is talking about starting up a company here, and it does not require more than a couple of experienced individuals to produce a world class product. You can even do it with one person if they have all the required skills.

And if you read Hugh's original post also:

> Quote:
>
> and this is my target audience

So it hardly has to a perfect gold plated world class product in a fancy silk lined box with a nice hydraulic closing lid.

Labor is FREE. This is a community/hobby project, people will not charge for their time.

There are no overheads or other expenses apart from prototype manufacturing costs.

There is nothing magical about the standard and quality of the old HP's, sorry to burst your bubble. In fact some of them were not all that great.

It's not rocket science to design a quality robust product like this. The electronics is trivial, don't even mention it. The case is not hard - make it metal and it will be more robust than anything HP has ever produced - ever. Chose a high quality brand LCD and it and the LED backlight will last as long as you want.

So what's left?

The only issue I see is with the quality/reliability of the keys, and this is not rocket science either. Top quality tact domes like Snaptron for example have rated lives of 5,000,000 actuation's. I've got a hole box of them on my desk, and they cost me nothing. Couple that with top quality gold plating on your board and a nicely designed keytop, mount and legend system and you are done. It'll take a few prototypes to iron out the issues and get the "feel" right, but it's far from hard. All it takes is for someone to DO IT.

Heck, even if I or others had to HIRE a professional contractor to design the case and keys, the project would still come in well under the $40K I mentioned, let alone the $400K I mentioned to do it as a full time job, or the silly blue-sky figure of $4M you mentioned.

Dave.

I suppose there are experts here. So, how much is it really for a rapid prototyping of Hugh's CAD drawings (case and keys), the PCB and a LCD?

> I suppose there are experts here. So, how much is it really for a rapid prototyping of Hugh's CAD drawings (case and keys), the PCB and a LCD?

The PCB will be around the $100-$150 mark + components.

The rapid prototyped case will depend on who does it. But emachineshop will do my fully custom uWatch2 case for around $200-$250 mark for 5 or 10 or so. Their prices are based on type and amount of material used + amount of machining. So figure maybe $500-$600 for the case + blank keys? (+ legend?) I believe there are people on this group with access to such machines as well. You have to use the emachineshop software though, but the advantage is you know exactly what it's going to cost up-front.

For the LCD you'd be crazy to go custom for such a project, plenty of suitable off-the-shelf solutions from the likes of Newhaven and CrystalFonz. A suitable LCD with nice backlight might be $20-$30

Dave.

I just got 100 multilayer (4-layer) SMT PC boards made, slightly smaller than what we'd need for a calculator, for about $800, *including* the NRE (non-recurring engineering) and all setup charges *and* bare-board automated testing.

At the last place I worked, we looked into getting a keyboard made with double-shot keys, and as I remember, the tool-up was something like $2-3K. That was 20 years ago, but I

think that would be greatest part of the cost. We've had lexan overlays made like the HP-41 has around the keys, and, although we didn't have to get the die made to make all cutouts for the keys, the NRE was under $2K.

We also looked into getting a custom LCD made for a product, and that was a couple grand too. We ended up using an off-the-shelf one for about $6/ea.

Yep, keys are the only major cost in the whole exercise really. You'd just have to budget for a few spins to get the physical interface right.

Dave.

I conclude that Hugh could have a prototype for about $1000, something to show and to study if it mechanically works. With some luck, it would already demonstrate a viable design. Considering time and effort that have been invested, I can't understand why there is still no prototype.

*Message #9 Posted by **Richard J. Nelson** on 12 Oct 2009, 7:19 p.m.,*
in response to message #1 by sjthomas

HHC 2009 was even more intense than previous HHCs. There were several additional speakers that are not yet shown on the HHC 2009 website. Most people are probably taking a few days just to recover from the around the clock discussions. An NIST tour was taken by 24 of the 47 attendees on Monday, and it was also super because it was very personally conducted for us - and very technical.

Several astounding topics were presented and these will be discussed in time (yes, there was a new machine, but that is almost "normal?"). We learned a great deal about how HP calculators are being made under the present business model and most of us were quite surprised at how ignorant we were.

It is a new HP Calculator World and this will be described by postings on the HHC website over the next few weeks. My thanks to all who participated. The hotel was super, and HP was a GREAT host.

HP 41CX locked in program mode

*Message #1 Posted by **Steve Leibson** on 2 Oct 2009, 7:37 p.m.*

I have a friend who gave me his mint-looking HP41CX. He couldn't get it to work any more. These handhelds aren't my specialty but I had a look. The batteries were badly drained. Some so low they measured 60 mV of reverse polarity. I got some new N cells, put them in, and the calculator came up with "memory lost." That solves that, I thought.

Not so, in seconds, the 41CX went into program mode and became unresponsive to most keys. The run/stop key produces a display with one "0" on the left and two zeroes on the right, for as long as I hold down the run/stop key. I've taken out the batteries, shorted the battery terminals, opened the calculator, shorted the electrolytics, put it together again, run the resent sequences, tapped it lightly to reseat anything loose, and rattled my beads.

For a brief moment, I could enter a short sequence (2 enter 2 x) and got the right answer (4) and then the 41CX popped back into program mode. I'm suspecting a short in the keyboard. Probably the PRGM key.

Any clues as to what's happening and what's to be done? I've seen nothing like this in the archived forum stuff, but it may be too far back.

Re: HP 41CX locked in program mode

*Message #2 Posted by **Randy** on 2 Oct 2009, 9:00 p.m.,*
in response to message #1 by Steve Leibson

> Quote:
>
> I'm suspecting a short in the keyboard. Probably the PRGM key

No, a stuck PRGM key would have the unit come up in program mode and show 00 REG 219.

Fullnut or halfnut?

Re: HP 41CX locked in program mode

*Message #3 Posted by **Raymond Del Tondo** on 2 Oct 2009, 9:02 p.m.,*
in response to message #1 by Steve Leibson

I don't know whether the reverse polarity did any damage to the hardware,
however the locked kbd could have it's cause in a bad contact,
either between the I/O connector and/or the CPU-to-kbd pcb connector.

Another typical error cause are broken screw posts.

Is it a halfnut model (rounded LCD frame)?

Re: HP 41CX locked in program mode

*Message #4 Posted by **Steve Leibson** on 2 Oct 2009, 9:20 p.m.,*
in response to message #3 by Raymond Del Tondo

Randy and Raymond, it's got a square LCD bezel.

Edited: 2 Oct 2009, 9:22 p.m.

Re: HP 41CX locked in program mode

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 2 Oct 2009, 10:16 p.m.,*
in response to message #4 by Steve Leibson

Hi, Steve;

now the next reasonable question should be: is it ACTUALLY a CX? If the LCD bezel has squared corners, then the unit is a fullnut and the mainboard is separated from the keyboard. Would it be possible to compare the mainboard with the pictures here and tell us which one compares OK with yours? The fullnut type may produce some unexpected behavior when the mainboard and the LCD driver do not establish good communication (bad contact with the contact strip under the mainboard)

Cheers.

Luiz (Brazil)

Cheers.

Luiz (Brazil)

Re: HP 41CX locked in program mode

*Message #8 Posted by **Randy** on 3 Oct 2009, 12:15 a.m.,*
in response to message #1 by Steve Leibson

Any crud/flux on the logic board around the rom area is from a sloppy repair can cause problems. So, remove

the processor and clean both sides well with isopropyl. Allow to dry for several hours.

Check the logic to keyboard connector for any corrosion. Clean with isopropyl if needed. If damage is severe, it will need to be replaced.

Reassemble and test. If the problem remains, it is most likely a bad rom. The only way to test further would be with the 5061-7221 service module.

200LX date format in filer - What determines it's format?

*Message #1 Posted by **Peter A. Gebhardt** on 2 Oct 2009, 3:18 p.m.*

I have two 200LX 2MB, ROM 1.02a (05/24/94) in front of me - both US International units (Brazil ... - ... USA). Both setups identical in Time & Int'l settings. Date & Time setup to "DD.MM.YY" and "HH:MM:SS" respectively.

DOS boot shows Date & Time in US format. Both D drives (200LX firmware) compare equal in file size & date stamps.

Now the question: Why does one unit (SG53 ...) display the date in filer as in above European format, BUT the other unit (SG70 ...) does display it in US format "MM-DD-YY"???

Best regards

Peter A. Gebhardt

Proposed Small Calculator

*Message #1 Posted by **Ron Kok** on 2 Oct 2009, 12:23 p.m.*

Here are the calculator designs that I want. Small. Simple. Versatile.

Features

• Algebraic or RPN • Undo • Fractions (a b/c) • Foot / Inch input (a' b") • Trigonometry • Logarithms • Degrees or radians • Deg : Min : Sec input • 13 memory registers • 6 programs (A-F) [Edited] • Mortgage calc's • Probability • Date math • Virtual tape display • Statistics • Solver • Complex numerals • Two-dimensional vector • Decimal, Binary, Octal, or Hexadecimal numerals • Fixed or significant digits

Edited: 3 Oct 2009, 1:44 p.m. after one or more responses were posted

Re: Proposed Small Calculator

*Message #2 Posted by **Martin Pinckney** on 2 Oct 2009, 2:07 p.m.,*
in response to message #1 by Ron Kok

Small, versatile. Maybe not so simple. (At least to get HP to build one).

I **especially** like *Foot/Inch input (a' b")* .

[Edited grammar]

Edited: 2 Oct 2009, 3:09 p.m.

Re: Proposed Small Calculator

*Message #3 Posted by **Ron Kok** on 2 Oct 2009, 7:47 p.m.,*
in response to message #2 by Martin Pinckney

The foot/inch input may not help in much of the world, but it is a big deal in the USA. I know of at least three companies that sell "construction" calculators. The people I know with one of those calculators all bought them just to get the inch/foot capability.

Re: Proposed Small Calculator

*Message #4 Posted by **bill platt** on 2 Oct 2009, 10:27 p.m.,*
in response to message #3 by Ron Kok

One of the first programs I ever wrote for my 11c wen I was a kid, was feet-inches-eighths to decimal feet and vice-versa. I think I've posted it here before, and someone even had some elegant refinements!

One of the neat things about making a pr0gram for F-I-E is that you can go finer than F-I-E merely by inputting or returning remainders. I allowed the Decimal Feet to FIE to give the decimal remainder of the eighths--which gives you 16ths etc so you don't even need a different program for F-I-S.

Of course nowadays this is almost exclusively the job of a spreadsheet--the Holy Grail of tabular repetitive calculations!

Edited: 2 Oct 2009, 10:28 p.m.

Where is it??

Re: Proposed Small Calculator

*Message #6 Posted by **db (martinez, ca.)** on 2 Oct 2009, 11:57 p.m.,*
in response to message #4 by bill platt

Bill;
That's a real useful program for construction layout here in the states, and from a kid too. Engineers and Surveyors use feet, tenths and hundredths. Architects and Tradespeople use feet, inches and fractions down to eighths. Like most old time layout guys i have every inch (1"=.08, 5"=.42) and the even fractions (6"=.50, 4"=.33) memorized, along with most of them just from repetition; there's only 96 eighths. Since a hundredth is so close to an eighth; one never has to add or subtract more than .04' to translate from decimal to Architectese. It goes quicker than using a calculator to do it in your head or from memory too.
Personally; i was too lazy to write my own program like you did at first. My PPC ROM would do my thinking for me - till rote memorization took over.

Re: Proposed Small Calculator

*Message #7 Posted by **bill platt** on 3 Oct 2009, 12:36 p.m.,*
in response to message #6 by db (martinez, ca.)

Hi db,

That is so true--about faster when memorized. I've gotten to know many (though not all) of those 96 eighths by heart: 0.0208333333 = 1/4" , .0625' = 3/4" etc. Some of this from typing in zoom scale 0.02083333xp into autocad to get a viewport to the right scale....

In the old days, when I used my program to go through a table of offsets, I would find that after a while, some of the patterns were memorized very quickly. like 7-7-4 is 7.625, 3-2-4 is

3.208333 etc.

And so in the end, the program was more a memorization aid than a program. Better for the brain that way anyway!

Edited: 3 Oct 2009, 12:38 p.m.

Re: Proposed Small Calculator

*Message #8 Posted by **DaveJ** on 2 Oct 2009, 6:26 p.m.,*
in response to message #1 by Ron Kok

I like the fraction display that doubles as an exponent display.

Don't forget R-P and P-R

No ENG display?

I'd have an unshifted X-Y key.

Dave.

Re: Proposed Small Calculator

*Message #9 Posted by **Ron Kok** on 2 Oct 2009, 7:45 p.m.,*
in response to message #8 by DaveJ

The [a b] key and the a«b key are meant to toggle between rectangular and polar modes.

I've always thought that an ENG mode misses the point. What I want is to be able to specify the number of significant digits. The calculator should display as many digits after the decimal as is necessary to display the number of digits specified by f Sig# __. That number of digits should be determined on the fly and will differ for every engineering or scientific calculation. Examples: 4.03 lb-ft (3 significant digits) or 48.4 lb-inches (again, 3 significant digits).

Re: Proposed Small Calculator

*Message #10 Posted by **Andrés C. Rodríguez (Argentina)** on 2 Oct 2009, 8:10 p.m.,*
in response to message #9 by Ron Kok

The "significant digits" seems like a nice option, but ENG is useful, at least in electronics, where you have "gigas", "megas", "kilos", "millis", "micros", "nanos", "picos" and so on, in units of daily usage.

And, by the way, allow for 3 simultaneous equations, and/or 3x3 matrices at least; don't settle for just 2 dimensional vectors.

For BIN, OCT and HEX, a WORD SIZE function is needed. And please, allow for comma and dot radix; thousands separators should be optional (as flags 28 and 29 in the HP 41C).

Best regards!!

Re: Proposed Small Calculator

*Message #11 Posted by **Ron Kok** on 3 Oct 2009, 10:07 a.m.,*
in response to message #10 by Andrés C. Rodríguez (Argentina)

The small calculator gets a decal on the back. On it goes some seldom-used mode changes. I thought they should be:

g Mode A -> Algebraic -><- RPN

g Mode C -> Comma -><- Dot

g Mode D -> M.D.Y -><- D.M.Y

g Mode E -> Record Macro (in POC 30 only)

g Mode 1 -> inch precision = 1/x

g Mode 2 -> Binary

g Mode 8 -> Octal

g Mode ^ -> Display Statistics

For bit bangers like you, I would be happy to add:

g Mode 3 -> Unsigned -><- 2's complement

g Mode 4 -> Word size = x

Matrices are intentionally excluded. It's a 31 key, one-line, no-menu calculator. I had to leave something out.

Edited: 3 Oct 2009, 10:31 a.m.

??

How do you want to access the necessary operations? And which do you want to offer?

BTW, keys A-F allow for 6 programs only (see your first post).

Re: Proposed Small Calculator

*Message #13 Posted by **Ron Kok** on 3 Oct 2009, 2:02 p.m.,*
in response to message #12 by Walter B

Thanks for catching the error regarding the number of programs. I've edited the original post.

The statistics function is an odd one, I agree. First, a bit of design philosohpy: I think calculators today serve best as a complement to computers, not an alternative to computers. That means, for me, simple one-line calculations get done on a calculator. More

complicated work gets done on a computer.

That philosophy drives some decisions on what to include Examples: (1) complex numbers are in, but 3x3 matrices are out. (2) Mortgage calcs are in but NPV is out.

I lost my nerve when it came to accumulated statistics. I really think that simple statistics should be done on a spreadsheet and complicated statistics should be done on SPSS or something similar. You can't check your work if do accumulated statistics on a calculator. So I don't want to give it much keyboard space.

So my, admittedly lame, statistics scheme is: (1) Use g [sigma] to enter a single datum. (2) Then type g MODE ^ to enter Statistic Retrieval mode (3) Then use the up and down arrows to retrieve mean, variance, etc.

Re: Proposed Small Calculator

*Message #14 Posted by **Walter B** on 4 Oct 2009, 9:14 a.m.,*
in response to message #13 by Ron Kok

> Quote:
>
> So my, admittedly lame, statistics scheme is: (1) Use g [sigma] to enter a single datum. (2) Then type g MODE ^ to enter Statistic Retrieval mode (3) Then use the up and down arrows to retrieve mean, variance, etc.

This falls far below the standard of any HP since the HP-45 in 1973. IMHO, the automatic calculation of basic statistics is one of the key features of a pocket calculator. By basic statistics I mean Sigma+, Sigma-, x-bar, s, and the necessary sums for linear regression and so-called forecasting.

At least the 4 functions named first should be readily accessible on the keyboard. Sigma+ should be primary.

I am an RPN old-timer and I agree with you, Martin. I really like the 27S--an "algebraic" and the 48GX ability to parse "algebraic" expressions.

How is the solver supposed to work?

I don't see any of the usual programming functions and the display doesn't seem suitable for formula entry.

Re: Proposed Small Calculator

*Message #24 Posted by **Ron Kok** on 3 Oct 2009, 10:16 a.m.,*
in response to message #23 by Paul Dale

To run a program, type gA, or gB, ... , gF. (When in HEX mode that gets you a hex numeral, so you have to type "g" twice to get the program when in HEX mode.)

Note that RPN users have no use for (or), so they get single-keystroke access to programs A and B.

To write a program, you have two options: 1. Simple programs can be recorded from the keyboard. To record program A, one would type g REC A, then keypress your program, then type g REC. 2. More complex programs can be written on a computer and input through a USB cable (sold separately).

The Solve key works the same way it does in the hp15C. Put a program into A, then type f SOLVE A.

*Message #25 Posted by **Walter B** on 3 Oct 2009, 4:24 a.m.,*
in response to message #1 by Ron Kok

Nice looking designs! I'd prefer the 31.

Some questions (asking's more efficient than speculating):

- What is a "virtual tape display"?
- Looks like you're suggesting a 7-segment display. If true then how are exponents handled in the small section reserved for them?
- Looks like fractions are confined to 2 digit denominators -- based on the assumption above.
- What is "odd" for and how shall it work?
- I see a yellow "Int" near to the decimal point -- what does it do? I don't see "Frac". Or shall it mean "Integrate"?

> What do you plan to offer behind "MODE"?

Some suggestions: I'd vote for ENG and a primary x<->y as others did before. + I won't waste a primary space for %.

Ceterum censeo: HP, launch a 43S.

Walter

Re: Proposed Small Calculator

*Message #26 Posted by **Ron Kok** on 3 Oct 2009, 10:26 a.m.,*
in response to message #25 by Walter B

A virtual tape display allows me to scroll back through the previous operations with the up arrow and down arrow keys. I personally would use it mostly when I'm paying monthly bills and I want to check my input.

If a seven segment display saves battery life, then I'm for it. Otherwise a good dot matrix display is better.

If an exponent runs more than 2 digits, the calculator can always revert to the old one-line style of exponent display. And you're right about the fractions. Of course, a dot-matrix display would solve those limitations.

The "Int" returns an integer result. With it, you can program your own "Frac" key or your own modulo.

The Modes are covered in a post above.

Regarding ENG and X-Y, perhaps you are right. Opinions vary, and I might come around to your way of thinking. But I'm committed to a small, 31 key calculator. That means something else gets displaced.

The "odd" key is for mortgage calculations. It is a reminder that memory register 0 holds a value for the number of odd days at the beginning of a mortgage term.

in response to message #1 by Ron Kok

> Quote:
>
> I've always thought that an ENG mode misses the point. What I want is to be able to specify the number of significant digits. The calculator should display as many digits after the decimal as is necessary to display the number of digits specified by f Sig# __. That number of digits should be determined on the fly and will differ for every engineering or scientific calculation. Examples: 4.03 lb-ft (3 significant digits) or 48.4 lb-inches (again, 3 significant digits).

SCI *n* and ENG *n* on HP models are identical, except that the value of the base-10 exponent in ENG is always

an integer multiple of three, while SCI produces a mantissa of magnitude greater than unity but less than ten. *n* is the user-defined number of significant digits to display.

What you may want is for the calculator to *determine* the valid number of significant digits in a calculation or chain of calculations. I am unaware of any calculator that does that. It seems possible, but a couple things are necessary:

- A means of activating and deactivating "significant digits" mode, so the calculator knows when to apply the process. (Maybe the "sig #" function would do that, but then a display annunciator would be needed.)

- A means of specifying an exact number without having to append zeroes. (It would be a nusiance in "significant digits" mode to see and utilize the full calculated value of 2*pi without having to enter '2.000000000000'.)

The calculator must track the number of significant digits of every result, imposing some extra overhead on the machine. Users, however, generally want it to provide the full-accuracy calculation, without analyzing results to determine what it signifies. In practice, if the operands don't have a decent number of significant figures (at least 4-5), the results often won't be very informative.

Programmability (or entry of equations) is essential for your concept, due to SOLVE. Your proposed 7-segment display doesn't allow for equations.

Why not provide numerical integration along with rootfinding -- a pioneering design objective of the HP-34C of 1979 incorporated into the HP-15C of 1982?

If, e.g., "REC A" essentially does PRGM, then LBL A -- I see no particular means of editing a program once it is entered. Also not provided are the more-advanced HP-15C capabilities such as multiple entry points (via LBL), GOTO, subroutines, looping, conditional tests, and flags.

The capability of editing is essential for useful programming. That of the HP-12C and HP-10C is barely usable, due to the lack of insert/delete editing. I have a 1981 Casio whose built-in Simpson's Rule integration requires programmability. It offers 38 steps amongst two programs; steps are executed as they are entered and recorded (yielding possible math errors); programs are not displayable or editable -- a program must be deleted and re-entered if an error is made.

What would the format of USB-uploaded programs be?

> Quote:
>
> Complex numerals

More than just the ability to enter and calculate with complex *numbers* is needed. They must be displayable, and the germane utility functions -- or a means of doing them -- must be provided.

> Quote:
>
> If a seven segment display saves battery life, then I'm for it. Otherwise a good dot matrix display is better.

Dot-matrix displays aren't battery hogs -- time clocks, I/O, and peripherals are. Thin batteries such as the CR2032 also don't seem to last, I assume due to less volume available for chemicals.

Since you seem either to have, or have seen, an HP-15C, why not review this discussion of its functional, organized keyboard layout, and -- better yet -- read the fine *Hewlett-Packard Journal* article from May 1983, available on CD or DVD ROM from the MoHPC?

Re: Proposed Small Calculator Significant Digits, Programming, Complex numbers)

*Message #29 Posted by **Ron Kok** on 3 Oct 2009, 5:48 p.m.,*
in response to message #28 by Karl Schneider

You are correct in that no calculator does significant digits the way I want. That doesn't make it right. Also, you don't have to type 2.0000000000. The result will be written to the number of digits previously specified by f Sig#__. So just type 2.

This keyboard does not allow you to edit a program, that's true. You have to start each program from scratch. Moreover, this keyboard does not provide for looping, conditionals, or indirection. It's actually a pretty rotten programming tool. So people will use this keyboard only to record trivially small programs. Complicated programs will need a computer and a USB cord.

I'm not trying to duplicate the functionality of the hp35. I think the high end RPN calculator market is served reasonably well. I'm trying to provide a design for the small RPN calculator. And I'm willing to make some trade offs to get that small size. I've got nothing against root finding and numerical integration, except that they will be used infrequently and probably more easily on www.wolframalpha.com. If a way can be found to include integration without increasing the number of keys, then I'll be for it. Otherwise not.

Re: Proposed Small Calculator Significant Digits, Programming, Complex numbers)

*Message #30 Posted by **Karl Schneider** on 3 Oct 2009, 9:54 p.m.,*

Then, maybe I'm confused. Specifying a number of significant digits to display is exactly what SCI is for. Many calculators -- not just HP's -- offer it.

> Quote:
>
> This keyboard does not allow you to edit a program, that's true. You have to start each program from scratch.

I and others would likely find this unacceptable. We can probably live without the other programming features, as spreadsheet programs with BASIC or other language support can tackle such tasks. (Back in the 1970's and early 1980's, however, the likely alternative to using a programmable calculator was to reserve time on a mainframe to run a Fortran program.)

> Quote:
>

I wouldn't count on a free website always being available and accessible to handle any computational problem one might have. This particular site is quite recent, anyway.

You can say that again. A programming language without looping, conditionals, and the ability to edit your program is not a programming language at all.

I'd say this calc is DOA if programming is important to you (and it is to me).

*Message #32 Posted by **Ron Kok** on 4 Oct 2009, 11:17 a.m.,*
in response to message #31 by Don Shepherd

Karl and Don don't like this calculator. That's fine. There is room in this world for more than one calculator model. You want the full set of functions and a robust programming interface on the keyboard. There are calculators like that being made. You're lucky.

A small RPN engineering calculator is not being made. Such a calculator would have value, even if it had no programming at all.

I hope now that we can part amicably, you to interest in a certain kind of calculator and me on a different path.

*Message #33 Posted by **Don Shepherd** on 4 Oct 2009, 1:50 p.m.,*
in response to message #32 by Ron Kok

Ron, it's not that I don't like the calculator you have designed. I love the Voyager design, something that fits easily in your shirt pocket. Ever since I began programming in the 70's I have dreamed of an ideal programmer's calculator that would fit in your shirt pocket. The 16c came close, but I want something with text input/output. I am also particularly interested in number theory, so my ideal calculator would have keys for prime factors, GCD, LCM, isprime(), and so on. No one makes a Voyager-sized calculator with those functions, and no one is likely to because the target market would be way too small to justify the expense of manufacturing and marketing such a product.

I thought that the 35s, imperfect though it may be, met the needs of most engineers, although it does not fit in the pocket easily.

I think the ultimate solution to what you want may be the Apple iPhone/iTouch system. I have neither, but I know people are developing software apps for them, including some pretty sophisticated emulations of past HP engineering calculators. Now, everyone has their own idea of what the ideal calculator should be, so what I think would be great would be a "calculator toolkit" to let you drag and drop the keys where you want them, with the legends and functions you want, and size the display with how you want it, and so on, and then be able to put that on the iPhone or iTouch platform. Then you would have what you want. Of course, someone would have to build the construction kit, and I'm sure that would not be trivial.

I don't know what direction HP is going in the future (I forfeited that right when I decided not to go to Ft. Collins this year). Maybe they are planning something close to what you describe, but I doubt it.

In any event, I do wish you luck in getting the calc you want. For me, I'm still happy with my 12c in my pocket and 99 lines of code (and unfriendly programming environment too!).

Don

in response to message #33 by Don Shepherd

The most cogent reply in this whole thread is the first one. You and Martin Pinckney both think it unlikely that anyone will build this calculator. You're both right.

I've come to agree with Karl about ENG and SCI displays. They should be in the mix. But a decent programming environment needs a lot of keys.

So does a interest in number theory mean that you need complex number input? (For Riemann type stuff?)

Comments like that make me realize just how well-off I was in those days. Honeywell had a computer network based in Minneapolis which was available anywhere if only one had a telephone line and a Silent 700 or equivalent terminal. It was S-L-O-W, but it had an extended BASIC with double precision mathematics, matrix manipulation commands, a substantial library of programs and, of course, printouts and plots on standard paper. There were terminals scattered throughout our facility. My big disappointment was that I couldn't convince my boss to let me have a terminal at my desk.

HP 49g+ unit conversion problem

*Message #1 Posted by **T.M. Baxter** on 2 Oct 2009, 11:38 a.m.*

Much to my dismay, several years ago I had to bid farewell to my 48SX calculator as it bit the dust - nothing would resurrect it. Some time later, I decided to purchase a new calculator and ended up buying the 49 g+, as the 48SX was not available (at least, not affordably at the time). Until today, the calculator was a paperweight but I decided today to use it to do some quick and easy unit conversions. Ha! As if! I must say, based on my experience with it when I first purchased it and my experience today, that I detest the HP 49g+. With the 48SX, unit conversion was so simple that even though my calculator broke years ago I still remember that it was an easy process.

Since the conversion wasn't intuitively obvious with this 49 g+, I looked online for assistance. I found some in archives from this site.

One method posted: 1: press right-shift than units. Press next and choose mass,F1. 2: press Kg,F1. The beep sounds and the box 'Error Too Few Arguments' appears on the screen. Just press on/cancel and the box disappears, leaving 1._kg on the stack. 3: press left-shift,then choose g from the menu,F2. Kg is now converted to grams

Here's another: 1 right shift minus to place an underline after the one, (press * on 48) right shift 6 to access the units menu f6 for speed units, (press e on 48) f6 again, to place knot after 1_, (press f on 48) ENTER left shift mpg to convert to mph

The problem is that when I press left shift I get NO menu. None. What the heck? With the 48SX, I was able to select the units I wanted converted from and then select (in the "menu" across the bottom of the screen) the units I wanted it converted TO without complicated keystrokes or voodoo.

Don't get me started on the online user's guide; it's a joke regarding what I need from it.

So here's the gist: I want to convert several data points from psi to MPa or vice versa. Let's say I want to convert 18,500 psi to MPa. It appears I'll have to convert to Pa and then just take it to MPa from there - no problem. It's getting from psi to Pa that is the problem.

So I start: 18500 right shift 6, 11, ok, 4, ok (yields 18500_psi in stack)

Now based on what I've read before, left (green) shift should give me a menu, right? **WRONG!**

So, how DO I convert from psi to Pa, short of pulling out my pad and pencil and books and do it manually? After all, that's why I bought the blasted calculator - to save some time and effort, not add to it!

Re: HP 49g+ unit conversion problem

*Message #2 Posted by **Tim Wessman** on 2 Oct 2009, 12:17 p.m.,*
in response to message #1 by T.M. Baxter

Turn on RPN mode if not already, turn off exact mode, turn off choose menus (system flag 117 if memory serves).

-117 CF (or it might be -117 SF, I don't have a unit in front of me)

There you go.

Re: HP 49g+ unit conversion problem

*Message #3 Posted by **Michael de Estrada** on 2 Oct 2009, 12:34 p.m.,*
in response to message #2 by Tim Wessman

FYI, the default is flag -117 cleared, which gives you pull-down menus. To get the soft menus on the top row keys, flag -117 must be set. At this point the HP 49g+ will behave just like the HP 48SX, which only had soft menus. That is how I have my HP 50g configured. This is documented in the AUM, however, you have to dig around to find it.

Thank you! This did help. Calculater was already set to RPN and exact; it was the boxes issue in my case. Thanks again!

Re: HP 49g+ unit conversion problem

*Message #6 Posted by **Mike Morrow** on 2 Oct 2009, 2:07 p.m.,*
in response to message #1 by T.M. Baxter

Almost any thing that the RPL(N)-only HP48SX/GX can do, the HP49g+/HP50g set for RPL(N) mode can do better and faster, using essentially the same technique. Finding something that is behaving starkly different between the these machines is usually a good sign that some significant optional setup differences exist (provided by the greater versatility of the HP49g+/HP50g), as has been pointed out already.

Some differences are really subtle, such as the possibility of significantly reduced execution speed of an HP49g+/HP50g program that unnecessarily uses binary integers (BINTS, integers displayed without a radix point). On the HP48-series, there's no significance to an integer displayed within a program with or without a radix point. On the HP49g+/HP50g, there definitely is.

Another feature that the HP48-series lacks is an exact versus approximate mode, and of course the algebraic mode option.

The HP50g became overall my favorite HP of the many that I've used since 1972, just edging out my beloved HP42S. I have owned an HP48SX for 18 years, and two GX units for 13. I disliked their slow speed, horrible LCD, misplaced ENTER key (should always be in line with the *, /, +, - keys), firmware that couldn't be revised, and low contrast micro-labeled keyboard. If you have a late HP49g+ with a decent keyboard, use it and you may develope a real appreciation for it.

Try using the User's Guide located on the CD or available for download from HP's website. It's a GREATLY expanded version of the User's Manual that comes with the calculator.

I recently broke down and printed a copy. Using the laser printer at work, I printed it 2-up and double sided for 4 pages per sheet of paper. Then I took it to Staples and had them put a spiral binding on it. Since their spiral bindings can only do about an inch of paper, I split it into chapters 1-12 and 13-end. I copied the title page and table of contents so I could put those in each volume. Total cost for binding and vinyl covers: $7.

Now, hopeless nerd that I am, I'm reading the manual for fun....

HP-25 Battery Pack

*Message #1 Posted by **Andreas Grund** on 2 Oct 2009, 7:04 a.m.*

It is well known that a HP-25 should not be connected to the AC charger without proper accu pack. Now, I built a new pack (the original one of my old (1976) HP-25 got lost...)with NiCds in a plastic case, which fits well into the battery compartment.

Question: Is there any risk, if I connect to the AC charger (calculator switched OFF) and the batteries loose contact while being charged?

Andreas

Re: HP-25 Battery Pack

*Message #2 Posted by **Maximilian Hohmann** on 2 Oct 2009, 7:18 a.m.,*
in response to message #1 by Andreas Grund

Hello!

> Quote:
>
> Question: Is there any risk, if I connect to the AC charger (calculator switched OFF) and the batteries loose contact while being charged?

Not as long as the switch is in the OFF position.

But it really is the best advice to place the charger in the most remote spot of your house and leave it there... Always charge the batteries outside the calculator. Since the original batteries only had 500mAh, your new NiMh last 5x as long with one charge and you will not have to charge them very often. If you use the original charger, it will take very very long to charge the larger batteries anyway.

Greetings, Max

Edited: 2 Oct 2009, 7:20 a.m.

Re: HP-25 Battery Pack

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 2 Oct 2009, 7:26 a.m.,*
in response to message #1 by Andreas Grund

Hi, Andreas;

I have the HP21 schematic diagram in hands, and it differs from the C (continuous memory) in many aspects. As you mentioned you have an HP25, not a 25C, I´d guess the power circuits may be closer to each other.

In the HP21, if the charger is connected and the ON/OFF switch is turned to OFF, there is only one diode and an 82 ohms resistor in series with the battery (half bridge rectifier, no capacitors); all of the remaining circuit is disconnected. Once you turn the calculator ON and the charger is connected, the 82 ohms resistor is

shorted and the calculator is fed thru the battery in parallel with the charger plus the rectifier. The power line capacitor, a 60uF/6V, is in the calculator circuit.

If the HP25 has something closer to it, I see no problem if there is bad contact with the batteries while charging. The problem is that the batteries act as a voltage reference (regulator) while the calculator is ON. So, my suggestion is: allow it to charge for, say, about ten hours. Check if the batteries and the calculator case close to them are getting warm (82 ohms resistor). If you are going to use the calculator, unplug the charger and do so.

In any way, this does not apply the same for the 25C series.

Hope it helps.

Success!

Luiz (Brazil)

Edited: 2 Oct 2009, 7:29 a.m.

Re: HP-25 Battery Pack

*Message #4 Posted by **Andreas Grund** on 3 Oct 2009, 6:49 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hi Max & Luiz,

Thanks for your thoughts and input. To be on the safe side - I don't want to ruin my old HP-25 which guided me safely through my chemical engineering studies three decades ago - I build now an external charger, using the original AC adapter together with a 82 Ohm resistor (should be 0.5W since quite some energy will be killed) and a diode (1N4001). So I charge the accu pack outside with the original adapter. Not convenient, but safe.

Regards,

Andreas

PS: By chance, since yesterday, I am owner of a HP-42s

> By chance, since yesterday, I am owner of a HP-42s

Congrats! I still have two working units, both upgraded to 32Kbytes RAM (I replaced them myself). One of them has one missing line and two missing rows in the LCD and many scratches in the keyboard faceplate, the other one is not mint, but looks great. Both work fine, though. I think the HP42S is the best choice for a stand alone calculator, mostly because I'm an electrical engineer and complex, matrices, integrals and SOLVE are our daily tools.

Cheers.

Luiz (Brazil)

Hi,

Another practical and simple solution : throw this junk wall charger in the garbage!

Put 2 lithium cells into the machine. It will last a long long time. I reloaded this unit more than a year ago. Cheers

Re: HP-25 Battery Pack

*Message #9 Posted by **Andreas Grund** on 10 Oct 2009, 11:13 p.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Meanwhile I decided not to use the original charger in combination with a self build battery pack. Instead, I put two Sanyo eneloop AA batteries into my self build pack and run the calculator. These eneloop AAs have 2000mA capacity, quite a lot compared with the original Nicads. I recharge them with an external NiMH charger.

Andreas

Re: HP-25 Battery Pack

*Message #10 Posted by **Andreas Grund** on 16 Oct 2009, 11:52 p.m.,*
in response to message #9 by Andreas Grund

Hi Luiz,

Cold you please confirm that the internal resistor is 82 Ohm, as you explained earlier? In previous postings 8.2 resp. 8.3 Ohm were mentioned. I m just building a simple external charger for Woodstock battery packs (original ones and self built ones) which uses the original AC charger as power source.

Andreas

HP-25 Battery Pack: I stand corrected!

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 17 Oct 2009, 12:14 a.m.,*
in response to message #10 by Andreas Grund

Hi, Andreas;

please, forgive me. You are correct: it is a 8.2-Ohm resistor instead of 82-ohm as I wrote.

I would edit the original post to avoid confusion and add a remark about your follow-up, but unfortunately it can no longer be edited.

Thanks a lot.

Luiz (Brazil)

in response to message #11 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Thanks for the immediate information/correction, so I visit now an electronics shop to get the correct resistor and certainly little later my external charger will be functional....

greetings,

Andreas

Re: HP-25 Battery Pack: power dissipation

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 17 Oct 2009, 12:54 a.m.,*
in response to message #12 by Andreas Grund

Hi, Andreas;

given the size of the resistor, the time the calculator was produced and the amount of heat one can sense, I'd go for a 1Watt dissipation power. 1Watt resistors we find today are the same size as the 1/8 watt at the time the HP25 was produced...

Success! And please, let us know how it goes with the charger 8^)

Luiz (Brazil)

(P.S. - I'm sorry for taking too long to answer your first question, I just red it a few minutes before answering...)

*Message #14 Posted by **Andreas Grund** on 17 Oct 2009, 4:45 a.m.,*
in response to message #13 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Among my electronic components I found a nice old 8.3 Ohm resistor with even 3W dissipation. Certainly oversized, it is like a small

ceramic brick and in the cold season I may abuse it as a heater..

The basic construction of the charger is already finished, I need to wait until the paint got dried and then I wire the unit.

How to post here some photos? What is best method - I do not have an image host.

greetings,

Andreas

in response to message #14 by Andreas Grund

Halo, Andreas;

you may ask Dave Hicks to create a directory so you may upload your photos as you log in (the directory usually has your name on it) and then use the links to address them. This way, as Dave has already mentioned, the photos will be preserved and the links will never be broken (permanent address).

You can also create an account at www.photobucket.com (faster and easier than you can imagine...). I´ve been using it for a while (Geoff also uses it) and it works fine. See here. Any of these pictures may be added directly, like this:

My first MLDL 2000...

If you need further info, let us know.

Success!

Luiz (Brazil)

Re: HP-25 Battery Pack: A simple external charger

*Message #16 Posted by **Andreas Grund** on 19 Oct 2009, 5:35 a.m.,*
in response to message #15 by Vieira, Luiz C. (Brazil)

The reasons are known why Woodstocks better should not be run with the AC Adaptor. Therefore I built a simple and low cost external charger, which uses as power source the existing AC Adaptor.

On a base plate of plywood 7.5x10.0x0.6cm I glued a box of wooden stripes (1.5x0.5cm) in exactly the dimensions of the battery compartment of an HP-25 (or any other Woodstock...)

In one end of this box I cut out an area of 1.5x0.8cm, which gives place to the retainer of the original battery pack and furthermore facilitates to remove the battery pack from the box. In the other end I drilled two 2.00mm holes in a distance of 14mm for the charging contacts. These contacts are M2x16mm screws.With nuts and washers the correct distance of 53.5mm can be easily

adjusted.

As connector to the AC Adaptor's plug two screws (M2x12mm) are used (head removed with cutting pliers). Drill two holes, diameter 2.0mm in a small wood stripe (glued on the base plate) and fix the screws with a 2k adhesive in the bores.

Now, the electrical part comes. Connect left connector in the box with the left connector to the charger with a 8.2 Ohm resistor (white body in the photo), soldering tags may be helpful and connect correspondently the two right connectors with a diode (I used a standard 1N4001). The "positive" end of the diode is marked with a silver or white ring, this needs to direct to the connector in the box.

The AC voltage is 9.0V, at the charging contacts (idle) it 4.2V DC.

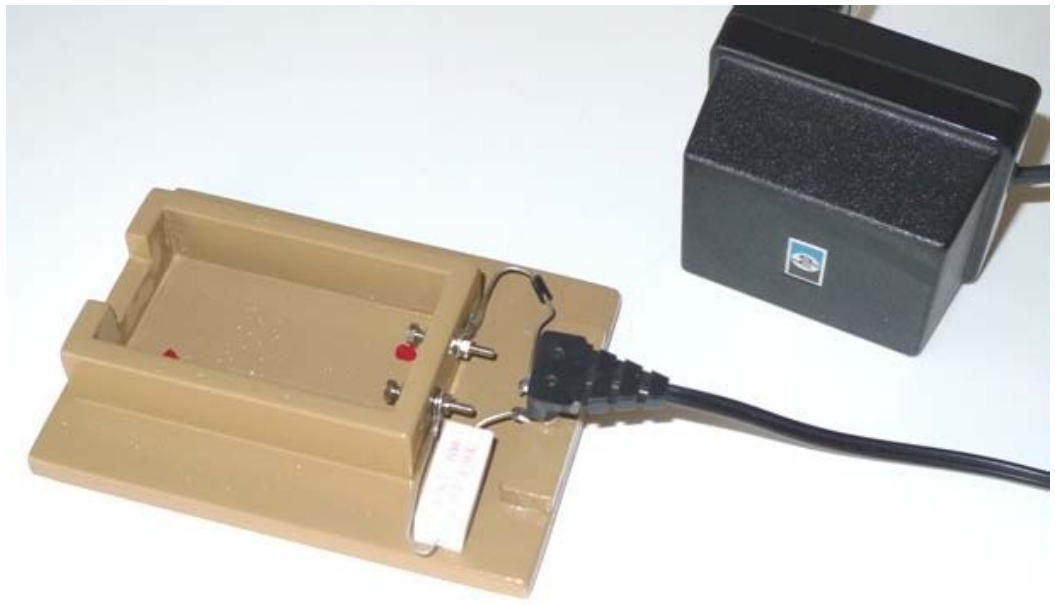
Finished - or continue with painting.

Materials: Plywood, wood stripes, 8.2 Ohm resistor (1W dissipation), diode 1N4001, soldering tags, 4 M2 screws with washers and nuts, wood glue, 2k adhesive, paint.

Tools: Jigsaw, sand paper, soldering iron, solder

Cost: approx. 1$

Time demand: 3hrs.



Greetings,

Andreas

HP-25 Battery Pack: Congrats!

*Message #17 Posted by **Vieira, Luiz C. (Brazil)** on 19 Oct 2009, 9:33 a.m.,*
in response to message #16 by Andreas Grund

Halo, Andreas;

first of all, thanks for your feedback. I see you found a 'guests place' at the museum so you could store your pictures. About the charger, I always believed (and still do) that the best solutions are the simpler ones, and most of all, one may need heavy brainy activity to come up with a working, simple solution. The pictures tell by themselves, it is beautifully done. And it works, what else do we need?

Thanks again, I´ll soon try my own based on your directions.

Cheers.

Luiz (Brazil)

Classic LED displays

*Message #1 Posted by **John Robinson** on 1 Oct 2009, 7:45 p.m.*

Hi, can anyone tell me what is the normal forward voltage and current for a segment in the classic LED displays ?

Thanks John

Re: Classic LED displays

*Message #2 Posted by **Joel Setton (France)** on 2 Oct 2009, 3:28 p.m.,*
in response to message #1 by John Robinson

Hello John,

The average current in a segment typically ranges from 1 to 3 mA. However, the Classic display is multiplexed, so the peak current is approximately 15 times this value. You'll find a detailed description of the Classic display multiplex mechanism in one of the HP-35 patents, available on Eric's website:
http://www.brouhaha.com/~eric/hpcalc/patents/3755697.pdf.

I hope this helps!

Joel Setton

Re: Classic LED displays

*Message #3 Posted by **John Robinson** on 2 Oct 2009, 8:55 p.m.,*
in response to message #2 by Joel Setton (France)

Thanks Joel, I'll check out the patent. I just wanted the information for constructing a tester for the classic displays. I won't be multi-plexing, just driving each segment with it's own current limiting resistor.

Cheers, John

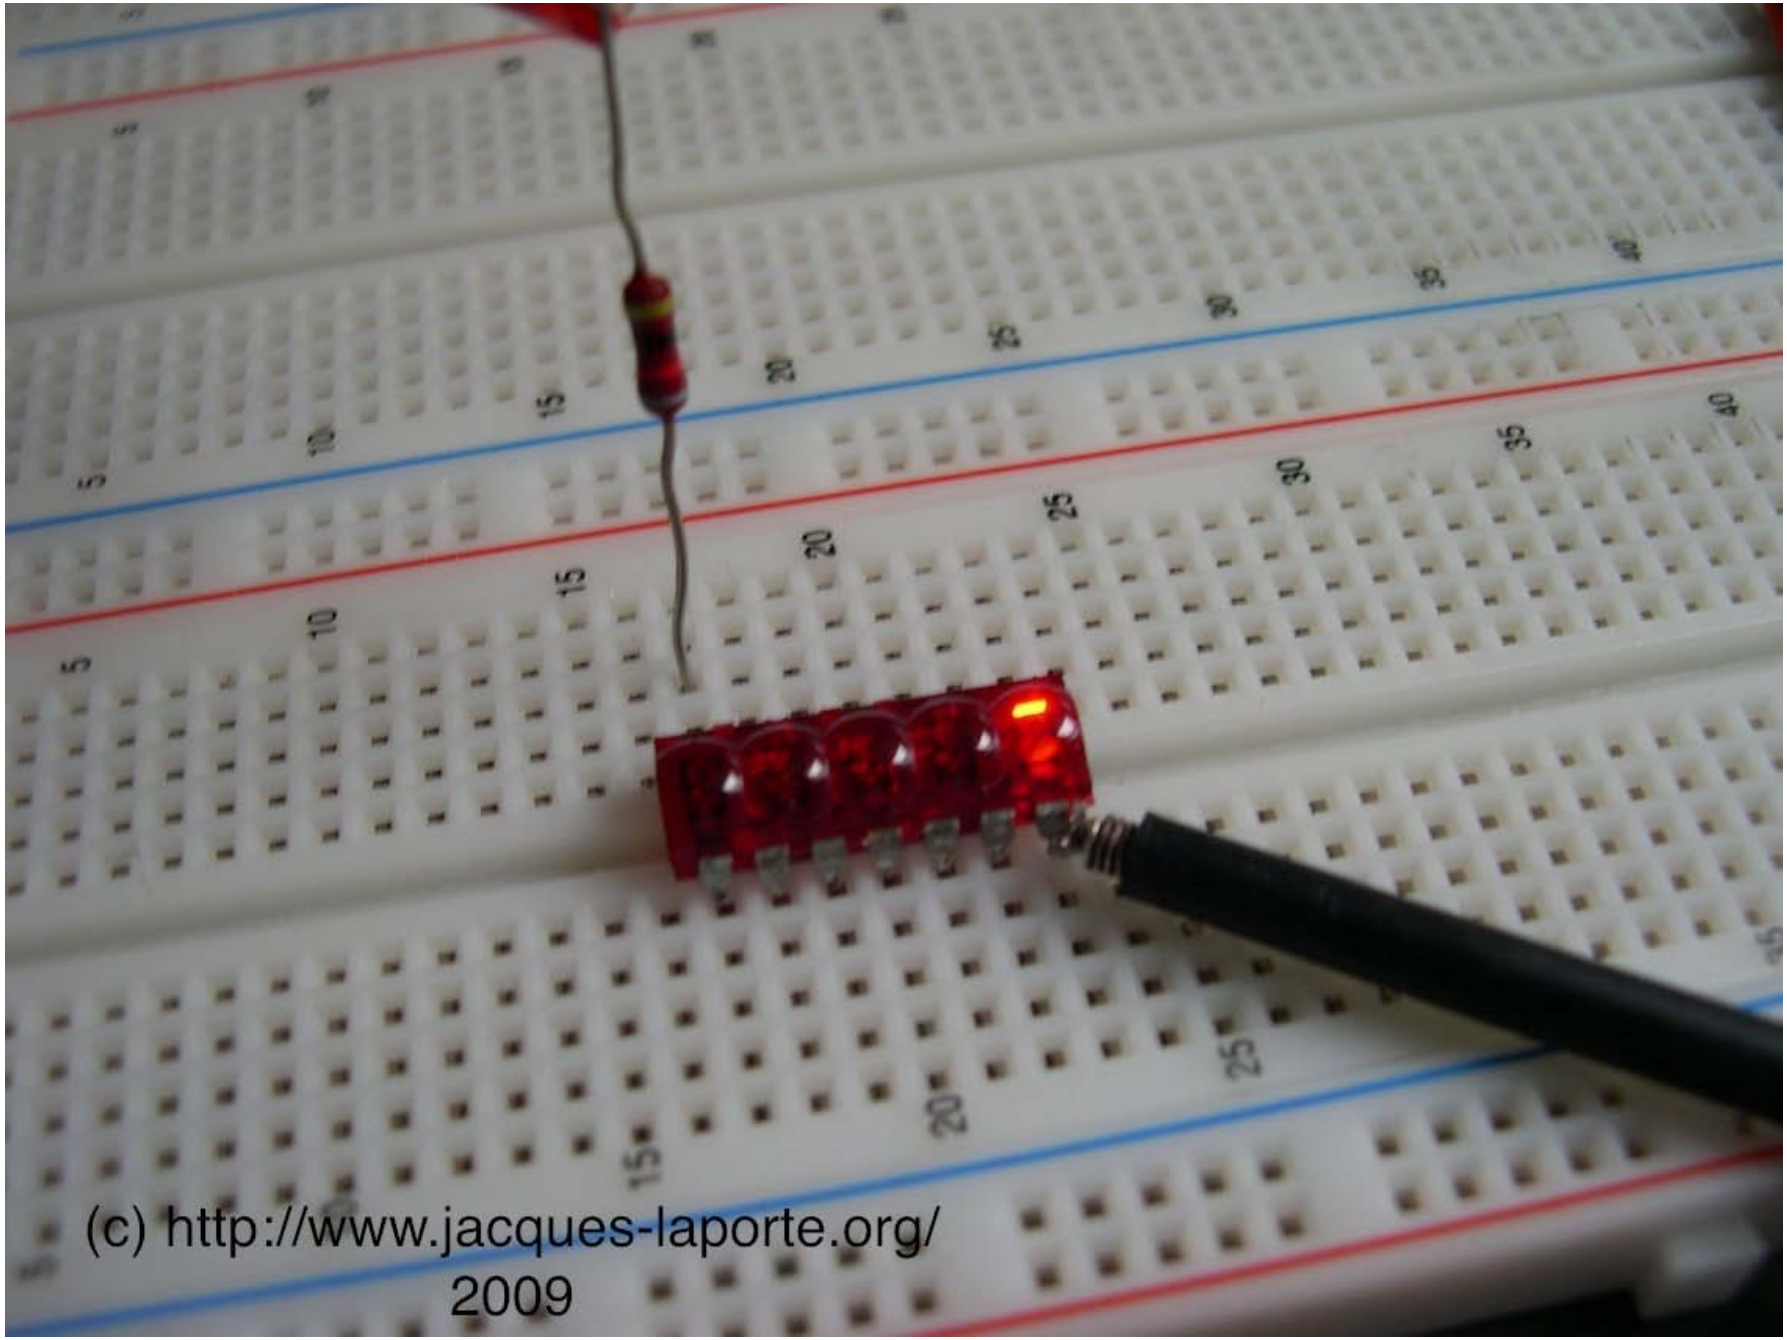
Re: Classic LED displays

*Message #4 Posted by **Jacques Laporte** on 5 Oct 2009, 7:07 a.m.,*
in response to message #3 by John Robinson

Good question John.

You put the 3.6 V DC '+' polarity on pin 14 of a Classic LED cluster (Anode a) through a 100 ohms resistor (here I took a 82 ohms handy) and the negative polarity on pin 7 (cathode 1) ; you light segment 'a' on digit 1. If you use a 300-400 ohms resistor the light will be dimmer. These LED voltage drop is 1.7V .

A cheap Classic Led tester!



See the Led Cluster pin out on my site here (to test other segments and other cathodes):

HP-35 Display system

Re: Classic LED displays

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 6 Oct 2009, 4:48 p.m.,*
in response to message #4 by Jacques Laporte

Red LEDs forward drop is 1.6 Volt (Plank's constant and the electron charge are related to such voltage drop and the wavelenght of the red light obtained; but that is another story), so you can select your resistor as per

R = [[VCC - 1.6 V]*1000] / I

where

R is the series resistor, in ohms

VCC is the power supply voltage, in volts

I is the desired current, in milliamperes

For VCC = 5 Volt, and I = 10 mA, a 330 Ohm resistor is adequate. Please check with the display spec sheet about a safe current value before starting your tests. Good luck!!

All this assumes a permanent condition, no multiplexing or pulsing of any kind.

Say with me: "Natural Complex Entry"

*Message #1 Posted by **Ángel Martin** on 30 Sept 2009, 8:11 a.m.*

I'm glad to report that finally the natural complex number entry is featured on the 41Z module!

This capability is implemented in the function "IMAGINE" - which until now was just a dummy place holder, but has become the heart of the matter now.

Assuming you have it assigned to the ENTER^ key, then the data entry sequence can't be more intuitive:

Re(z), ENTER^, Im(z), ENTER^

This will place the data in the XY registers appropriately, as well as lifting the complex stack automatically.

IMAGINE uses the "partial entry sequence" feature of the 41 OS - not for the faint of heart! Im(z) is entered by writing the digits and special characters into Alpha during the data entry process. The routine also updates the display at the same time to provide the feedback to the user.

During the process the keyboard is redefined, allowing only the following active keys:

- ENTER^ & R/S to terminate the entry
- numeric keypad
- back arrow to delete the previous entry
- comma for the decimal part
- EEX for the exponent field
- CHS for negative mantissa and exponent fields.

It supports both decimal choices for the radix, either comma or period as controlled by user flag 28. Features nice logic to control the sequence.

Once completed the information in the Alpha register is converted to numeric by using ANUM. Its built-in logic for it will resolve possible wrong typing, like repeated commas or EEX signs. Note that even on the new 35S there's the same issue, yielding 'Invalid Syntax' errors!

Arguably the wrong entries should be prevented during the process but that'll have to wait... let's say it's perfect and ready for users knowing their way around :)

Needless to say this doesn't replace the other methods to enter complex numbers, still available as until now. (Using ZREAL^, ZIMAG^, or ZENTER^)

Hope you enjoy it, will be posted at TOS in a couple of days I hope.

Best, ÁM

Assume you meant entering the number **Re(z)**, then calling **IMAGINE**, entering **Im(z)**, and finally calling **IMAGINE** again? If true, what is the functional difference between IMAGINE and traditional ENTER^ then? What did I miss?

TIA for enlightenment :)

Re: Say with me: "Natural Complex Entry"

*Message #3 Posted by **Ángel Martin** on 30 Sept 2009, 2:58 p.m.,*
in response to message #2 by Walter B

> Quote:
>
> Assume you meant entering the number Re(z), then calling IMAGINE, entering Im(z), and finally calling IMAGINE again? If true, what is the functional difference between IMAGINE and traditional ENTER^ then? What did I miss?

Well, for starters the sequence is in the natural order (as opposed to Im, ENTER, Re) which causes some trouble to some users. But the better aspect is the automated stack lift done by IMAGINE that saves a final ZENTER^ when using the alternative method.

You'll probably see this better if/when you try it by yourself, if you did.

Again, each user has his/her preferences - IMAGINE is important because goes beyond all other complex data entry implementations on the 41 done before.

Re: Say with me: "Natural Complex Entry"

*Message #4 Posted by **PeterP** on 30 Sept 2009, 6:02 p.m.,*
in response to message #3 by Ángel Martin

one word: awesome!

Re: Say with me: "Natural Complex Entry"

*Message #5 Posted by **Doug** on 2 Oct 2009, 8:27 a.m.,*
in response to message #1 by Ángel Martin

A'ngel, why do you insist upon a natural complex number entry? Just get over it and accept that the "i" portion must be entered first ! It's not that bad ! D

all this swicthing of regesters just confuses things. we need absolute certenty with 41c.

Edited: 2 Oct 2009, 8:43 a.m.

Re: Say with me: "Natural Complex Entry"

*Message #6 Posted by **Ángel Martin** on 2 Oct 2009, 8:57 a.m.,*
in response to message #5 by Doug

Howdy Doug, glad to hear from you - even if it's about sound criticism :)

Well, I realize the debate isn't over and will probably never be - it reminds me the RPN vs. AOL saga. The fact is there are two camps, and people take sides on whether it should be "natural" or "reversed" data entry - mostly a matter of personal choice depending on what we learned first or got used to doing.

To me they're both about the same, just a cosmetic aspect - but the natural data entry represented a challenge to implement (for me at least, using the partial key entry routines) so I wrote the IMAGINE function as a way to learn more about it. Now the 41Z has BOTH ways to do it, so everybody's happy, right?

IMAGINE has an advantage over the "reversed" method: it performs the complex level lift, so you save pressing ZENTER^. This is not always required, only for dual-argument functions or for stack chained calculations.

The following is a more detailed rationale - sorry if it's boring:-

If you've used the 41Z you'll have noticed that the 4-level complex stack is implemented using an I/O buffer. The actual XYZT stack is just a "scratch pad" used to prepare the complex numbers. Mapping of the XYZY regs is to the buffer's Level 1 and Level 2. The synchronization amongst buffer and stack is done at different points, (like before and after performing a function), but there isn't automatic stack lift upon pressing numeric keys.

Anyway, the Module is submitted at TOS (Revision 6Z shows when you switch OFF the calculator), so go ahead and take it for a spin and let me know what you think.

Cheers, ÁM

[resolved] HP49G+ doesn't turn on

*Message #1 Posted by **k.mart** on 29 Sept 2009, 12:36 p.m.*

Hello, (sorry for my bad english, I'm french..) so, i want to fix my HP49G+, when i turn it on, there are a flash on the screen and nothing happening. I opened it to check voltage and everything is ok. I think, it's a ROM problem. I searched information about an possible RS232 pins on motherboard,to reflash the ROM in the flash (SST39VF120) but I have not found informations about that. If you have an idea how I can repair my HP49G+, I'm ready to heard.

Edited: 6 Oct 2009, 1:55 p.m. after one or more responses were posted

Have you tried.. (Re: HP49G+ doesn't turn on)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 29 Sept 2009, 8:13 p.m.,*
in response to message #1 by k.mart

Hi;

the HP49 has a small hole in the back of it with a RESET inscription close to it. The idea is to reset the hardware (not intended to clear memory contents) in some circumstances. If you have not tried it yet, just gently insert the tip of a paper clip in the small hole till it reaches the mainboard (you will feel it canot go any further... No need to push it harder). At this point, a small metal plate is touching a contact in the mainboard, and you can keep it for about three seconds (HP recomendations). As you have already opened the calculator, you can easily locate it and even perform the reset directly. Maybe your HP49G will wake up and work fine after that.

Success!

Luiz (Brazil)

Re: Have you tried.. (Re: HP49G+ doesn't turn on)

*Message #3 Posted by **Pal G.** on 1 Oct 2009, 2:05 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Mine is bricked too. When I press the RESET button, with a small paperclip, I see a solid line that stretches across the screen, and sometimes an individual annunciator comes on (alpha, left-shift, etc) . Then, upon release of RESET, the LCD is dimly on, but does not respond to ON+plus or ON-minus. Reth's ON+C (release) CLEAR does not work either. I don't see Metakernal splash screen or anything anymore.

I've pulled all batteries for 24 hours. Nothing. I am using good batteries.

I was just programming some userrpl two days ago when it first locked up. I rebooted once or twice, but now it seems terminal.

Re: Have you tried.. (Re: HP49G+ doesn't turn on)

*Message #4 Posted by **Reth** on 1 Oct 2009, 7:01 p.m.,*
in response to message #3 by Pal G.

I got mine old HP49G+ "bricked" too for a couple of months; I even sent it to HP dealer in Melbourne, Australia - they could do nothing. It showed exactly what yours does. Joe Horn told me about the ON+C & BS (press and HOLD) trick. I had to try about 100 times before it worked. The HP49g+ and 50 are very quick (unlike the old HP49) and a lot harder and trickier to get this done, but it works. Probably the exact moment to hit the BS is important and one needs a bit of luck. Now I can do it in 2 out of 3 attempts ;).
I don't think you can really "brick" this calculator

PS I knew the problem with mine - I installed a 48 library and then "bricking" happened. Leaving all batteries out even for weeks does absolutely nothing - the flash memory port 2 doesn't get affected.

Edited: 1 Oct 2009, 7:07 p.m.

Another shot... (in the dark?)

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 1 Oct 2009, 11:08 p.m.,*
in response to message #4 by Reth

Hi, all;

a few days ago I updated the OS version for both HP50G I have. The primary steps to be taken are:

- press [+] and [-] keys and hold;
- proceed with regular RESET procedure: insert and remove metal tip into RESET hole in the back side of the calculator case;
- wait for about three second then release [+] and [-] keys;
- follow the OS updating instructions, etc.

The use of [-] and [+] keys was not known by me, and maybe it overrides regular start up sequence. Have you also tried it?

Success!

Luiz

Edited: 1 Oct 2009, 11:08 p.m.

Re: HP49G+ doesn't turn on

*Message #6 Posted by **Reth** on 30 Sept 2009, 12:32 a.m.,*
in response to message #1 by k.mart

You need to give more details about how it stopped turning on. Did you install any libraries?

Re: HP49G+ doesn't turn on

*Message #7 Posted by **k.mart** on 30 Sept 2009, 1:36 a.m.,*
in response to message #6 by Reth

I have already try insert a paper clip in reset hole but nothing happening (whith [+] [-] too).

For details, the first bug a few months back, and I suppose a librairy is concerning, but which .. maybe Openfire, tgv or hp49g library... I thought after few days whithout battery, it would restart but no.

Thanks you for your help.

Re: HP49G+ doesn't turn on

*Message #8 Posted by **Reth** on 30 Sept 2009, 10:18 p.m.,*
in response to message #7 by k.mart

If you have "bad" library try this:

> Quote:
>
> Holding BackSpace during Boot Sequence will put the calculator in safe mode. User library will be completely ignored...

That means reboot: press and hold down keys [ON]+[C] and immediately after they are released press and hold down backspace [<-] (below DEL and CLEAR). The above needs to be done very quickly so you may need to try a few times.
Hope this helps

Re: HP49G+ doesn't turn on

*Message #9 Posted by **k.mart** on 1 Oct 2009, 6:58 a.m.,*
in response to message #8 by Reth

I tryed to this sequence but I didn't have a success. One more thing, when I put the battery, my HP49g+ start with a flash screen and nothing, and I can't turn off (I observed the intensity because I can't know if it turn on or not..). Whith this, i can't turn on my calculator with [ON] key or [ON] + [C] , so I don't know if the i can enter in safe mode.

Re: HP49G+ doesn't turn on

*Message #10 Posted by **Bart (UK)** on 1 Oct 2009, 12:44 p.m.,*
in response to message #9 by k.mart

OK, this may be a bit of a long shot. I once had a PC that didn't start, but just beeped and flashed on the screen. It was because the air was too dry. I had to leave a humidifier in the room for a few hours before it would work. Is it very dry in your area recently? Try leaving the calculator in a room for a few hours with a humidifier or a little steam (not close to the calculator!) - but do not make condensation.

Re: HP49G+ doesn't turn on

*Message #11 Posted by **Ed Look** on 1 Oct 2009, 9:05 p.m.,*
in response to message #10 by Bart (UK)

This is the first I've heard of this!

One might think that the lack of moisture would not interfere with the operation of an electric (power on) circuit.

Re: HP49G+ doesn't turn on

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 1 Oct 2009, 11:29 p.m.,*
in response to message #11 by Ed Look

Hi, Ed;

I'd give credit to ESD (electrostatic discharge), which goes harder in dried environment. The particles of water combined with atmosphere suspended particles would be a path for partial electrostatic discharge. The so common atmospheric discharges (lightnings) are commonly seen when the relative air humidity increases, so the moisture may turn the atmosphere into a path for ESD instead of enhancing this condition. I was never told about lightnings in dried environment.

Any other thoughts?

Cheers.

Luiz (Brazil)

How can the weather over The United Kingdom have change to a so extreme point that the ambient air is too dry for a computer to operate ?

Which part of the country ? All the Great Britain, the Scotland's or the Wales have a solid reputation of rainy and foggy weather. Is this the end of an era?

Re: HP49G+ doesn't turn on

*Message #14 Posted by **Bart (UK)** on 2 Oct 2009, 4:51 a.m.,*
in response to message #13 by C.Ret

I lived in South Africa for 30 years, in the Highveld (Johannesburg area). It gets very dry there in the winter months, no rain for 4 or more months continuous. The humidity would be below 20% on my crude home barometer set. To get the PC working, it had to be above 40%. It was an i386 based machine.

I have never really investigated the possible mechanism of the problem, but considered that (as Luiz said) ESD is harder in dried environments, there may actually be a build-up of charges not conducted away as easily as in higher humidities.(Hence the ease at which one can get an ESD shock in dry climates - in electronic lab work grounding is a must!)

edit: as I said, it's a long shot because
a) I don't know if it gets that dry anywhere in France (where I believe k.mart is located)
b) no other electronic equipment I have owned before or since has been so severely affected this problem (most effects were due to a charged person touching the equipment, and a reboot sorted it)

Edited: 2 Oct 2009, 5:02 a.m.

Thank you very much!!

I try to put my calculator in my oven 5 minutes 100°C and it reboot! I will look the humidity and I will report to you.

You saved me, I have a math exam friday (matrix, trigonometry..)

Re: HP49G+ doesn't turn on

*Message #16 Posted by **Ed Look** on 6 Oct 2009, 5:46 p.m.,*
in response to message #15 by k.mart

Actually, putting any electronics in an oven at 100° C DOES NOT sound like a good idea!

Besides the electronics, what do you think will happen to the PLASTIC case??!!!

It will either melt or burn!

Re: HP49G+ doesn't turn on

*Message #17 Posted by **Bart (UK)** on 7 Oct 2009, 4:57 a.m.,*
in response to message #16 by Ed Look

I wouldn't worry too much about the electronics, at work we regularly test plastic encapsulated electronics on FR4 to 125°C (we use enhanced packages). Most commercial parts are rated at ~80°C normally because low thermal conductivity of junction-to-ambient requires this to limit junction temp to 125°C during operation. Unpowered, this wouldn't present a problem at 100°C.

What I **definitely would** worry about is the LCD, batteries (if installed) and the plastic case.

Re: HP49G+ doesn't turn on

*Message #18 Posted by **Bart (UK)** on 6 Oct 2009, 7:10 p.m.,*
in response to message #15 by k.mart

Be careful!!

I would not recommend anything higher than 40°C!!

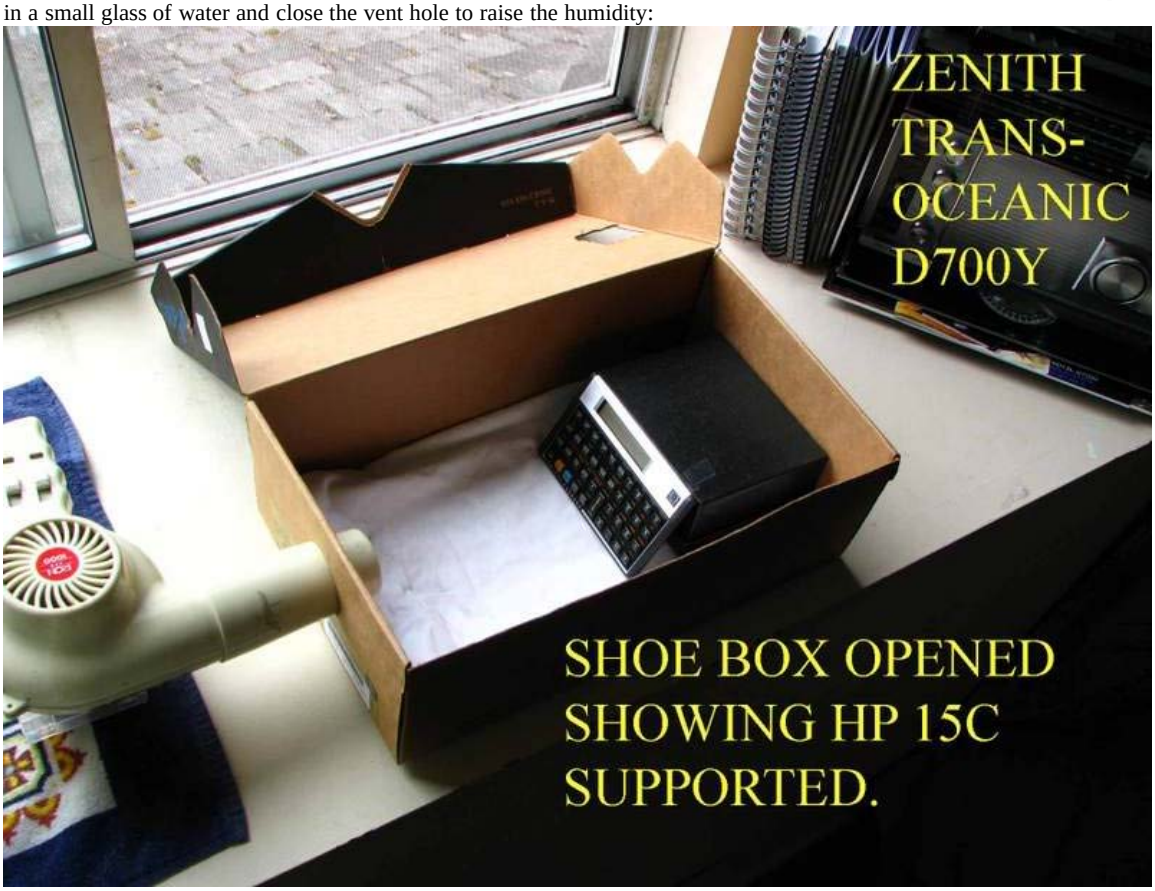
in response to message #19 by k.mart

> Quote:
>
> I didn't preheat the oven...

That probably saved it. A preheated oven could have damaged the LCD by thermal shock (stresses created due to uneven heating). The LCD would be my primary concern as you may be willing to put up with a warped/faded case, but when the LCD goes it's pretty much the end or an expensive repair (if HP sells such spares).

I would suggest using Geoff Quickfall's drying shoebox as an "environmental chamber". Use it as is to dry out, or just put in a small glass of water and close the vent hole to raise the humidity:



Thanks to Geoff for the photos.

Edit: Good to hear it is working again.

Edited: 7 Oct 2009, 7:24 a.m.

Re: HP49G+ doesn't turn on

*Message #21 Posted by **Ed Look** on 7 Oct 2009, 12:49 p.m.,*
in response to message #20 by Bart (UK)

You know, calcium sulfate (sulphate to some of you) is a commonly used drying agent. I believe that calcium chloride (perhaps a lot of us may use it to de-ice sidewalks in the winter) is also sometimes used for this purpose, of being a dessicant.

So, instead of a shoebox, perhaps a plastic box with a sealable lid, some of one of these salts on the bottom, and a small plate to put the calculator over it, and you have a pretty good drying environment.

Of course, don't open the lid more often than is necessary. And don't get any of that dust onto the calculator.

Re: HP49G+ doesn't turn on

I didn't know (and still wouldn't believe it if I didn't saw the pictures in Joerg's auction) that TI produced an RPN simulator module. Doing that, TI acknowledged that RPN is superior to AOS, otherwise there would not be any need of such a module. Really amazing!

Not so! All that they really acknowledged was that there were some hardheads out there in HP land, and they might make some sales with an RPN option. That is similar to what HP did when they offered an algebraic option with the HP-33s and HP-35s.

Re: Texas HP Module $$$$

*Message #7 Posted by **Juergen Keller** on 30 Sept 2009, 2:04 a.m.,*
in response to message #6 by Palmer O. Hanson, Jr.

You are probably right; I'm just too much a techie guy than a marketing guy. But from the winning bid on eBay I conclude that this module is rare, so TI didn't sell many of them. Perhaps they missed the point that an efficient method like RPN also needs a quality keyboard to really be useful.

- Juergen

in response to message #6 by Palmer O. Hanson, Jr.

> Quote:

> That is similar to what HP did when they offered an algebraic option with the HP-33s and HP-35s.

HP has done a much better job of producing algebraic logic calculators (including those that "swing both ways") than TI did for RPN with this module for the TI-59. AFAIK, it's TI's only attempt at any type of RPN capability.

I remember when these modules were announced. IIRC, the MIT Coop carried them, as well as a few other places in the Boston area. I never knew anyone who bought one. I had a HP-67 in addition to a TI-59.

A computer geek friend and I were intrigued by the TI Algebraic Operating System, since it seemed to have some characteristics of a line-by-line interpreter/compiler. Each "statement" would need internally to be parsed and converted to stack or register operations like RPN. It seemed to be a technically sophisticated way (like RPL) to make simple things complex.

Re: Texas HP Module $$$$ (and HP 9820)

*Message #11 Posted by **Andrés C. Rodríguez (Argentina)** on 30 Sept 2009, 7:42 a.m.,*
in response to message #10 by Mike Morrow

IIRC, the HP 9820 desktop calculator (there is information about it here at the MoHPC) accepts algebraic programs and formulas from the user. It even allows for implied multiplication, such as 2ab+3a. But, internally, it converts all to RPN, and stores the program in RPN syntax. When the user wants to read, edit or list a program, the RPN code is "decompiled" to show it in the algebraic way.

Re: Texas HP Module $$$$ (and HP 9820)

*Message #12 Posted by **Mike Morrow** on 30 Sept 2009, 4:13 p.m.,*
in response to message #11 by Andrés C. Rodríguez (Argentina)

Yes, it's true that the HP 9820 is algebraic. The HP 9820 was the first HP calculator I ever used. It was employed as a logic board controller in an early digital systems class at Georgia Tech in the early 1970s.

I have a complete but non-working HP 9820 that I bought for $10 a decade ago, just for nostalgia. It's impressively built.

Thus, HP has some long-time expertise with algebraic calculators. OTOH, TI has never made any RPN calculators (except this weak module).

Re: Texas HP Module $$$$ (and HP 9820)

*Message #13 Posted by **Don Shepherd** on 30 Sept 2009, 4:31 p.m.,*
in response to message #12 by Mike Morrow

> Quote:
>
> TI has never made any RPN calculators (except this weak module)

Mike, I doubt TI has any regrets about not entering the RPN market. I suspect they make more money from the TI-83 alone than HP makes from all their calculators.

Wrong in both counts.

First, this wasn't an *"RPN simulator"* in the sense I think you're assuming it to be, i.e., a module which would allow you to perform RPN operations from the keyboard and such, as if you were using an HP-25 or HP-67, say, to perform some casual calculations.

Nothing of the sort. What this TI module did was accept **an RPN program** written for the HP-67/97, which you would enter as the corresponding numeric keycodes (say 31 25 00 for "LABEL 0" or 35 64 for "ABS"), and it would then convert said RPN program to the equivalent TI-58/TI-59 program, which would then be output to the mandatory printer for you to key it in.

Thus, it never simulated or made available RPN keyboard operations, it just accepted an RPN program for the HP-67/97 and converted it to the equivalent algebraic program for the TI-58/59, for you to enter it and then run it in the TI machine.

The point was clear: using this module, a TI user would have access to the vast library of excellent RPN programs made available for the HP-67/97, thus greatly expanding the library software for their machines by also taking advantage of those quality programs written for the other side.

I don't see this as proof that *"TI acknowledged that RPN is superior to AOS"*, far from it. It actually was a very clever move by TI, even if the final results didn't meet the expectations.

Regards from V.

>
> Quite on the contrary, after reading the fanboy-like comment by the other poster I assumed that he didn't know how it worked and what it did or didn't do, at all.

Have a nice weekend and regards from V.

Re: Texas HP Module $$$$

*Message #17 Posted by **Juergen Keller** on 4 Oct 2009, 2:35 p.m.,*
in response to message #14 by Valentin Albillo

Thank you for clarification regarding the TI RPN module. I really thought it would simulate RPN input, because on the box it is advertised as 'RPN Simulator'. Making the huge HP program library available for TI-59 was really a good move and a comprehensible business decision. Anyway, one of my conclusions still hold: an efficient input method makes only sense together with a reliable keyboard. There are other RPN calculators (e.g., I have a Corvus 500), but I guess (I have no sales figures) they were not really successful because they lacked a quality keyboard.

Re: Texas HP Module $$$$

*Message #18 Posted by **db (martinez, ca.)** on 5 Oct 2009, 10:28 p.m.,*
in response to message #17 by Juergen Keller

Jurgen;

The nearly perfect hp keyboard isn't everything.
This had a near-hp quality keyboard and was sold just across the border from you. It has the advantage of **NOT** having one of the two worst battery/charging systems imaginable: those found in the woodstock and spice series.
On the other hand; i may be overly forgiving of keyboard failings because i kind of like the keyboard on *my* Corvus, or maybe mine is from a different production run. I just wish it had those double shot hp keys. - db

12C+

*Message #1 Posted by **Charles Oxford** on 28 Sept 2009, 11:48 p.m.*

I read somewhere (I think on hp site) that the 12c+ can't be repurposed to scientific calc. What then would be useful repurpose?

On friday I was in Fry's for batteries and printers so I checked the calcs on my way out. The last time I was there (maybe 2 months ago) they had 7 of the older 12c's. This time there were only 2. They don't seem to move very quickly. I asked an employee in the aisle about their stock but he didn't know.

I would be interested to hear about any repurposing done thus far.

Also, is the same equipment needed as for the uWatch?

Charlie

See HERE for info on the 12C repurposing.

Sorry, doesn't use the same micro as the uWatch, it uses an Atmel ARM processor with a serial interface (is the JTAG interface is accessible?). So you need either a suitable serial cable I believe HP sells?

Totally different development environment to the PIC too.

A scientific version would be easy in software, but the problem remains that of the keys have the finance legends on them.

It's surely just a matter of time before HP release the exact same machine with the original HP15C ROM and keys. I'm surprised it's taken this long already.

Dave.

Spice series issues

*Message #1 Posted by **Kevin Manley** on 28 Sept 2009, 7:51 p.m.*

Pardon my ignorance as I am sure this is old hat for most of you but I recently came into quite a few 1970s HP Calculators and am in the process of evaluating them for functionality. All seem fine for the most part except the Spice series, none of which power up. I have tried several power supplies and some do nothing while otheres just flash random numbers. Is it possibly because I have no batteries for these and am trying to turn them on with only the power supply connected? I got no battery packs for these and am also wondering where I should get them if available. I searched the trouble shooting on this web site and found no battery info pertaining to shis series.

Re: Spice series issues

*Message #2 Posted by **Paul Dale** on 28 Sept 2009, 8:13 p.m.,*
in response to message #1 by Kevin Manley

Spice + power supply + no battery = dead unit.

You've likely been destroying each as you test. Well those that aren't already dead and gone...

- Pauli

Re: Spice series issues

*Message #3 Posted by **Steve Simpkin** on 28 Sept 2009, 8:54 p.m.,*
in response to message #2 by Paul Dale

I wasn't aware that the Spice series had the same poorly designed battery charging circuitry as the Woodstock models. Damn! You know there should be a special place in Hell for the person or persons responsible for this charging circuit design. The upper managment personnel that approved the design should also join them.

Re: Spice series issues

*Message #4 Posted by **Paul Dale** on 28 Sept 2009, 9:19 p.m.,*
in response to message #3 by Steve Simpkin

Its possible I'm mistaken on this one but I do remember being warned to not run a spice without batteries.

- Pauli

Re: Spice series issues

*Message #5 Posted by **Michael de Estrada** on 28 Sept 2009, 9:30 p.m.,*
in response to message #4 by Paul Dale

All the Spice manuals (handbooks) have a note regarding ac operation: "Do not attempt to operate

the calculator from the ac line with the battery pack removed." Now, they do not specify what the consequences will be if this is done, but for sure the calculator will not function properly. Whether this can or will also result in irreversible damage to the calculator, I do not know, however, I think it is prudent not to find out.

Re: Spice series issues

*Message #6 Posted by **Michael de Estrada** on 28 Sept 2009, 8:16 p.m.,*
in response to message #1 by Kevin Manley

First off, you can't power these using the AC adapter, because it is a battery charger only, and the circuit requires that a good rechargeable battery be installed when you attach the adapter. The calculator can ONLY be powered by applying 2.5 Vdc to the two battery contacts inside the battery compartment. The polarity is (-) on top contact and (+) on bottom contact. You can do this by insertion of 2 AA cells with proper polarity and a jumper on the opposite site to connect them in series (be careful not to damage the contacts as you can deform or break them if they are compressed too much, since AA's are taller than the flat top cells used in a proper battery pack), or you can use a DC power supply if you have one. NiCd battery packs can be bought on eBay from Waterhosko (Mark Hoskins) for $9.50 including shipping.

Re: Spice series issues

*Message #7 Posted by **Howard Jones** on 28 Sept 2009, 8:19 p.m.,*
in response to message #6 by Michael de Estrada

I have found that the +ve terminals of the batteries can be hammered in (with care) to get them to fit.

Re: Spice series issues

*Message #8 Posted by **Howard Jones** on 28 Sept 2009, 8:23 p.m.,*
in response to message #7 by Howard Jones

Oops. I don't mean hammer them into the calculator. I mean hammer in as in standing the battery on the -ve end and gently hammer the +ve terminal in slightly. It only has to be hammered in about .5MM ie not much. Tap and then test and tap again if needed.

Re: Spice series issues

*Message #9 Posted by **Michael de Estrada** on 28 Sept 2009, 10:27 p.m.,*
in response to message #8 by Howard Jones

From what I can tell, a typical alkaline AA cell is 50.5mm tall, whereas a NiCd flat top AA is 48mm, so the difference is more like 2.5mm. Pushing the battery contacts an extra 0.5mm isn't going to hurt them, but an extra 2.5mm probably will. Even if you pound the positive tip all the way in, the cell will still be longer, because the body itself is also longer.

The battery contact design on the Spices is about as stupid as it gets, because they are almost guaranteed to break after a number of battery removals and insertions, unless the user is extremely careful and gentle. The contact has a very sharp bend, such that the material has already been taken past the elastic limit (yield point), and just a few stress reversals will break it off at that location. All HP had to do was form it with a gradual bend, and this failure would not occur. Also, the rivetted connection with the circuit board tends to get loose over time, resulting in a bad electrical connection. Even after HP fixed the solderless design issues, they still retained this faulty battery contact design, so finding a good Spice of any vintage remains a challenge.

Re: Spice series issues

*Message #10 Posted by **Kevin Manley** on 29 Sept 2009, 12:00 a.m.,*
in response to message #9 by Michael de Estrada

Wonderful....case closed. Thank you all for the very useful information.

One of the other units was a 97 that would only run once I removed the battery pack. So based on that I felt safe trying these without batteries.

I was able to rig a test with a couple double A's and in the name of research have discovered that preliminary testing seems to indicate many have survived my ignorant fiddling. Surprising considering the output of the "battery charger." One unit still shows only odd characters and I was unable to test two yet due to already broken battery tabs. One unit, a 38E, is completely dead but I have another 38E that seems to work fine so my assumption would be that it was done previous to my abuse. Based on that assumption I have a survival rate of 75%.

Thanks again to all for your helpful advice.

Kevin

MCODE Keith Numbers

*Message #1 Posted by **PeterP** on 28 Sept 2009, 1:19 p.m.*

I know this is very late, but I cant stand not-finished projects…

A few weeks back Don posted a Keith Number Challenge. It was obvious that a RPN solution for the 41 would be way to slow but I thought a MCODE solution should be acceptable time-wise. Unfortunately I got side-tracked in this other thing called 'normal life' and so the rudimentary code was never finished. Well, this weekend I stole a couple of hours to finish it (an unfinished project is really nagging me...)

Below you find an MCODE function called NXTK (Next Keith number) that finds the next Keith number > than the value in X. Original X is stored into L.

I must say that I was surprised how long it takes to get to the Keith numbers past 10^3. Even in MCODE and m41 simulation it takes a few minutes to get from 7909 to 31331, which is one of the larger gaps.

One useful piece of code for MCODERS might be MFFR – MCODE Find Free Regs. Sometimes one needs some scratch area and this routine finds the first free available RAM register in the buffer area. It also checks if there are enough free regs (you can request a certain number of free regs). To use it place the number of regs you need into B[S&X] and you get back in A[S&X] the absolute address off the first free reg which you then can use for your storage needs. If there are not enough free regs, the routine jumps out to [PACKE] (Packing, Try Again).

Pfhh, I'm happy this is finished now, I want to dig into 41Z from Angel!

Cheers

Peter

HP 34C

*Message #1 Posted by **Howard Jones** on 28 Sept 2009, 6:08 a.m.*

Can anybody help me with my HP 34C. It works fine except that sometimes when I switch it back on I get the message "Pr Error" and of course the all memory is lost. I feel it must be losing power. It does this even when it is on the charger. Thank you in advance.

Re: HP 34C

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 28 Sept 2009, 10:52 a.m.,*
in response to message #1 by Howard Jones

HI, Howard;

I had an HP38C with that kind of behavior. In that case, it was a bad power supply unit. I had it replaced and it worked fine since. Unfortunately I had no time to go ahead and find the actual cause: bad contact, faulty component, etc. All I can tell you is that I replaced it and the HP38C worked fine since.

There is also a possibility of your unit being a solderless one. In this case, a bad contact in the RAM terminals would be enough causing it to be erased due to power loss. Best chance would be opening it, disassembling and cleaning contacts. It would also be a good idea to check if the IC´s terminals can be a little bit bent against the flex circuit, so contacts would enhance.

Chances are that you could have a simple bad contact in the batteries, but since you have the same problem even when it is on the charger, I´d consider the power supply unit, instead.

Not too much of help, though...

Success!

Luiz (Brazil)

Re: HP 34C

*Message #6 Posted by **Michael de Estrada** on 28 Sept 2009, 10:54 a.m.,*
in response to message #1 by Howard Jones

There are several possibilities. First, are you using a B suffix charger? Use of an A suffix charger on a C suffix calculator can cause loss of "continuous memory". Second, the calculator gets its power from the battery, and not the charger. If the battery is discharged or bad, it won't properly power the calculator. Third, the battery contacts and/or connections may be bad. Fourth, the power circuitry board at the other end of the ribbon connector to the battery/charger contacts may have issues with it's circuitry that povides power to the "continuous memory" when the calculator is turned off. This circuitry is unique to the C suffix calculators, and an E suffix power board does not have this circuitry.

Re: HP 34C

*Message #7 Posted by **Dwight Sturrock** on 29 Sept 2009, 12:23 a.m.,*
in response to message #1 by Howard Jones

I lost the charger for my 34C many years ago (I bought it new in 1982). I still use the 34C with alkaline batteries. If I change the batteries in less than 10 seconds, the unit will maintain continuous memory. Based on this, temporary interruptions do not seem to affect the unit, and the original batteries or charger are not essential for regular operation.

Re: HP 34C

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 29 Sept 2009, 1:33 a.m.,*
in response to message #7 by Dwight Sturrock

Hi, Dwight;

you are correct. But consider that the power supply maintains the RAM I.C. continuously powered even when the calculator is turned off, so chances are that some capacitors directly connected to the DC lines take a little while to discharge prior to completely turn the RAM off (hence the 10 seconds to change the batteries). But if there is a bad contact in the circuit, mainly after the power supply, RAM contents may also be lost or become invalid too quickly if its DC line fails for a flash. It seems to be the case, here.

The main fact is that we are going ahead with the investigation, and this is what matters most. Any other thoughts?

Cheers.

Luiz (Brazil)

Mini review: m48, another 48GX for the iPhone

*Message #1 Posted by **Egan Ford** on 27 Sept 2009, 11:49 a.m.*

I just read about this on comp.sys.hp48. A new and much better 48GX for the iPhone was just released. This one is based on EMU48 (unlike i48 that is based on x48). The keyboard is dynamic (shifts/alpha change the keys) and A-F is merged in with the LCD. Looks like a Star Trek inspired setup. Quite usable. However the unshifed symbols are very hard to read. Something that could be improved. Right now I have to use shift to find things. If the 48GX was my daily calculator then I'd have it memorized.

Screen shots here: http://www.mksg.de/

Emulation performance is 4x faster (based on a single benchmark), whereas i48 was just a bit faster.

m48 is also more stable. i48 will crash if the clock is showing. i48 drops keys from time to time, but that may just be the accuracy of the user. m48 keyboard accuracy is much better. I have not missed a stroke.

Re: Mini review: m48, another 48GX for the iPhone

*Message #2 Posted by **Christoph Giesselink** on 27 Sept 2009, 5:44 p.m.,*
in response to message #1 by Egan Ford

Hi Egan,

it's quite unfair to compare the x48 emulator sources with one of the later Emu48 sources. :)

The lastest version of the x48 sources I have is 0.4.1e from 1999. Comparing to a 2004 copyrighted Emu48 version from me, x48 is as old as Methuselah in HP48 emulation technology. AFAIK x48 was never able to run the Metakernel because of it's MMU emulation limatations.

A Emu48 version copyright from 2004 smells like, that the base for m48 was the Mac OS Port from Pierre Tardy, which base on the original Emu48 IA32 v1.25 version (this implicate the chance of getting a HP49G version).

We should be glad that there are people out there, remembering the advantages of open source software, publishing there own versions of software to the public. I think, without the influence of Eddie C. Dost (x48) and Sebastien Carlier (Win48 / Emu48) emulators for Saturn based calculators wouldn't exist in the form like now.

Regards,

Christoph

Why? Both are 48GX emulators. I actually prefer x48 since it runs native on my Mac and Linux machines. However, if there were a current EMU48 port for UNIX/Linux, I'd use that because its faster and more capable.

Since m48 uses Emu48 (EMU48MS116 to be specific) as a base we can expect more features.

> Quote:
>
> The lastest version of the x48 sources I have is 0.4.1e from 1999.

0.6.1 is the latest version. It was published Aug 1 2009.

Despite the recent updates, it is still limited. All updates since 0.4.1e have been mostly bug fixes, no real feature enhancements. I still use 0.4.3.

Author told me EMU48MS116. Unsure why that version was selected.

Very grateful indeed for all contributors to open source emulators. Without them then I would not have i41CX+, 15C, 16C, 12C (nonpareil-based), or Free42, or x48/EMU48 on my iPhone. Thanks to Eddie I also have x49gp (50g ARM emulation) for my MacBook.

> Very grateful indeed for all contributors to open source emulators.

Me too. I think the first emu I came across was emu48 and I was totally flabbergasted that someone had managed to achieve such a remarkable program. And it isn't just the calculators. Almost every computer I've ever used exists in emulated form (not sure about the pdp-8/e though but nothing can replace the real front-end) as well as numerous arcade consoles that otherwise would have been consigned to the deep distant remnants of my memory.

No hyperbole or exageration here - the emu programmers deserve special recognition for one of the most significant contributions in modern computing history.

Mark

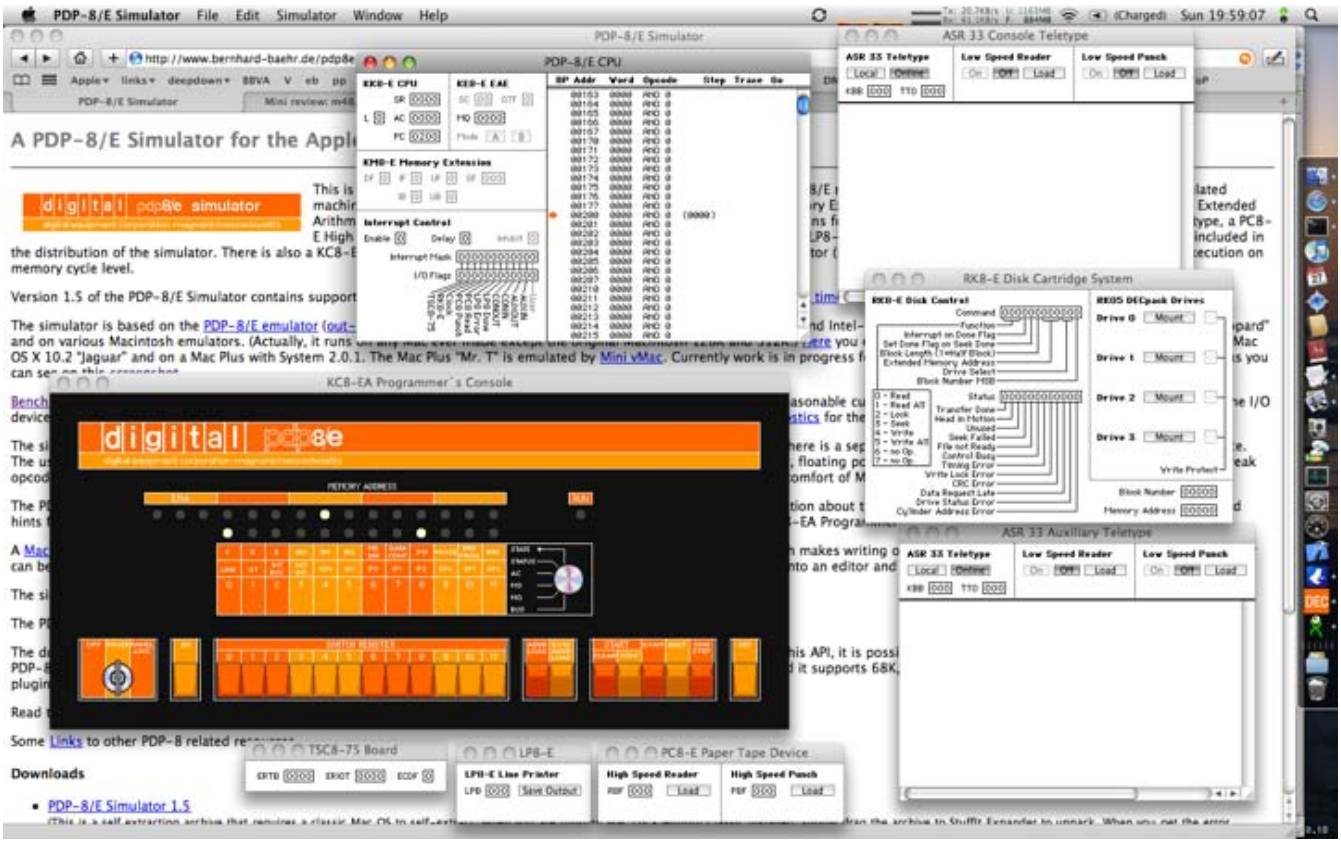
PDP-8/e has been done for Mac.

Author's homepage: A PDP-8/E Simulator for the Apple Macintosh

The screenshot on that site does not show the front end you mention, so I created a screenshot for you.



PDP8/e full size screenshot (1440x900).

Cheers.

Re: Mini review: m48, another 48GX for the iPhone

*Message #6 Posted by **Mark Edmonds** on 28 Sept 2009, 4:45 p.m.,*
in response to message #5 by Pal G.

Thanks Pal! That looks great :) Sadly, I don't have a Mac though but some searching has shown up some leads.

The 8/e was the first computer I ever used and with its front panel flashing away, teletypes clattering and paper tape spooling everywhere, it completely dominated the room, almost as if it was alive. I was very lucky to have such an evocative introduction to the world of computing!

Mark

*Message #7 Posted by **Reth** on 28 Sept 2009, 6:51 a.m.,*
in response to message #1 by Egan Ford

At first glance - the keyboard should be reworked completely, it's cluttered to the stage of being useless for obvious reasons. I'd get rid of all shifted labels and make them visible after LS and RS. It's a small price to pay - only one extra keystroke if the wrong shift key was hit.
Display font is not sharp enough.
Needless to say - program/data storage, IO, memory increase, printing etc. (the 42s is a good example) should be on the to-do list.
Pretty good start though.
Cheers

Or user definable. e.g. I'd prefer to see the shifted. However, I would like to see the Alpha labels removed, especially if the native QWERTY keyboard will be supported similar to i41CX+ and 42s.

> Quote:
>

The author has plans for most of this. The source should be posted soon. So, we can all lend a hand.

Re: Mini review: m48, another 48GX for the iPhone

*Message #9 Posted by **Byron Foster** on 28 Sept 2009, 4:08 p.m.,*
in response to message #8 by Egan Ford

I like the look of the keyboard, functionality aside. The blurry display is because the author is either creating an image with the display bitmap, or stretching the bitmap to fit the view, both give this kind of look. I went through this on the 42s, I found that drawing each pixel individually creates a better result, and also in many cases is faster. If source was available I would look at improving the display, already have the drawing routines.

What's the deal with the ROMs, does HP not care about their more contemporary ROMs being distributed like this anymore?

Re: Mini review: m48, another 48GX for the iPhone

Soon I'm told. It'd be nice to have your display code. BTW if you ON - or + you can cycle through different colors for the LCD. Plain white on black looks pretty good.

> Quote:
>
> What's the deal with the ROMs, does HP not care about their more contemporary ROMs being distributed like this anymore?

According to hpcalc.org, HP is allowing hpcalc.org to host the GX and SX ROMs. Unsure how this translate to others supplying the ROMs. Worse case i48 and m48 can just HTTP download the ROMs from hpcalc.org on initial startup.

All of this ROM business (nonpareil 12C, 15C, etc..., 41*, 48*, etc...) has always been a bit of a grey area to me. I suspect that there are no rights for redistribution. HP probably has the right to pursue any/all potential violators. I know that Atari, Nintendo, and other 70s/80s video game makers pursue those that illegally distribute their ROMs.

Memory increase is simple (although nearly pointless without I/O) It includes a 256k card in Port 1. To double your available RAM you just do the following: 1 press ENTER MERGE press ENTER

To see your RAM available before/after just type MEM and press Enter

OR port 1 could be used for Libraries. If only we could.

I have successfully replaced the "ram" file in i48 with one from Power48 (x48 on PalmOS) to get files on, but have been unsuccessful doing this with m48 using modified files from Emu48.

Of course this is only possible on a jailbroken device.

Sadly, i48 doesn't come with a port 1 card inserted, so I run out of RAM quickly.

Re: Mini review: m48, another 48GX for the iPhone

*Message #12 Posted by **deepdvd** on 9 Oct 2009, 6:06 p.m.,*
in response to message #11 by deepdvd

My brother found out how to get files into m48 (with a jailbroken device) 1) Make sure you have installed Emu48 on your PC (include CardCopy tool when installing) 2) Save whatever you want to transfer to m48 in port 1 3) Save the whatever.e48 state and CLOSE Emu48 4) Copy the "data" file from the m48 application /Documents directory to your PC (I put it in the Emu48 install folder for ease) 5) at the command line type "cardcopy whatever.e48 data" and you will get the following:

HP48 Port1 Import/Export Tool for Emu48 V2.1 Copy successful

6) Copy the "data" file from your PC back to the m48 /Documents directory and overwrite. (i-FunBox is great for this) 7) run m48 and move them into the main RAM or port 0 if desired 8) rinse and repeat...

Re: INFORM

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 27 Sept 2009, 7:11 p.m.,*
in response to message #3 by Jan Kromhout

Hi Jan, folks; (yeap, it´s me!)

I think you could try redefining the number of columns. Please, try this one (I am not sure, did not try in my HP50G):

"RECON" { { "WOQ" "" 0 } { "WZL" "" 0 } { "WZQ" "" 0 } { "EFCO2" "" 0 } { "WH2O" "" 0 } } {2} { 659.49820 6.29442 0.002705 94.0 1.80 } { }

The {2} argument means 2 columns with the input elements in each. It may work for the elements you want, I guess.

Cheers.

Luiz (Brazil)

(P.S. - hi, folks; I´ll be writing about my absence in a while, OK?)

Brief explanation...

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 27 Sept 2009, 7:37 p.m.,*
in response to message #5 by Michael Meyer

Hi, Doc; what´s up?

For the records: non-fatal heart condition due to repeating stressed activities. The ol´pump (I´m 48 Y.O., now) claimed for mercy with arrhythmic operation, and I had to slow down. No harm to the structure: muscles, "inner spaces", valves and blood flow were fine, just 'out of compass', followed by a little pain in the chest. Main fact is that I was pushing my limits up for about two, three years in order to show the bosses 'I could handle the pressure' (hence my absence...), but after that what was left of me was not that healthy anymore. Now I feel a lot better, working less (and having less $$$... nothing is absolutely beautiful, right?) but expecting to live longer.

Thanks for your warm 'welcome back', Doc... I appreciate!

Cheers.

Luiz (Brazil)

(folks: my old e-addresses no longer work; please, try linux_lcv@yahoo.com.br; I have some calculators with me that must be returned back to their owners...)

in response to message #10 by Jeff O.

Hi, Jeff;

just to tell you that in one of my 'silent readings' into the forum messages (a few, rare visits in the last three months), I read this thread and your comment was noticed.

Thank you very much!

Luiz (Brazil)

in response to message #6 by Vieira, Luiz C. (Brazil)

Hello Luiz,

It's good to have you back. I missed you insightful posts.

Take it easy. And don't overclock your main (and only) "ol' pump." Remember that there is no backup, and a spare is hard to come by.

Things that surely will condemn us to HP Hell

*Message #1 Posted by **Sean Connor** on 26 Sept 2009, 1:35 p.m.*

Been needing to get this off my chest for 15 years or so...

Back in 1992 or so I attended an auction in Bedford UK.There in a box lay two 71bs complete with a Zenwand each. I had (in those days) no idea what they were but hey, they looked interesting. I bought the pair for about £20. I'm an electronics engineer and hoarder so my life is full of cupboards containing old circuit boards computers etc etc.

I had them for about two years and played a bit with some basic programs. There was remember NO internet to speak of NO web and NO information.

I moved house in 1994 and ..... threw them into the bin !

My pennance. I now have a 41CX with math/stat, circuits, Advantage modules and HPIL

Also a '71b with tape drive HP914A drive RS232 module, math and text editor PIL box etc etc

Have I done enough to save my HP soul ?

What sins have you commited LOL

Sean

Re: Things that surely will condemn us to HP Hell

*Message #2 Posted by **Geoff Quickfall** on 26 Sept 2009, 1:55 p.m.,*
in response to message #1 by Sean Connor

Thats really bizarre!

In late 1994, due to a temporal rift, a pristine HP-71B with Zenwand showed up at my house, garage to be accurate, with a 20 pound note attached to it!

On a separate yellow stickey was the following:

```
"The answer is 42"
and
"This is for you"
```

Yes, you have paid your dues!!!!

At least I sold my HP-25 and put the funds to an HP-41C in 1982!

;-)

in response to message #1 by Sean Connor

> Quote:
>
> What sins have you commited LOL

In the late eighties or early nineties, at a flea market, I came upon a cardboard box full of old HP calculators, AC adapters and maybe some other stuff. At least two dozen calculators. They were all scientific LED models, probably HP-25, HP-33E and the like, but there's no way to be sure. All had "Property of [the power company]" stickers, and I guess they had been thrown out when the company bought newer LCD calculators.

The guy wanted 20$ for the lot. As I had just bought an HP 28s, I had no use for those old calculators, so I walked away...

*Message #5 Posted by **Mark Edmonds** on 27 Sept 2009, 2:34 p.m.,*
in response to message #4 by Paul Guertin

The only regret I have is that at some time in the past, hundreds and thousands of early HP desktop calcs got dumped in skips and probably ended up in landfills. If only I had known about them to go on salvage missions each time I saw a skip!

When you think about the rest of our computing heritage that has just been chucked out and lost, you can't help but ask yourself, why were we so stupid?

Mark

thinking that they would just keep getting better and better

I wish I had gotten the HPIL-to-parallel interface converters (there were at least a couple of them), and some other things, but I didn't feel that I could afford them at the time. I wish I had kept all the advertising literature from the early 80's, and I kind of wish I had kept all the boxes things came in. I do still have the 41's original box and the 82169A HPIL-to-HPIB interface converter box, and I have all the manuals.

For some reason when I started collecting I recognized that boxes, manuals and promotional literature were worth keeping. So, I have four working 41's (two 41C's, a 41CX and a 41CV) all with boxes and manuals, and with some of the promotional literature as well. I also have several dead calculators (the charger problems) with near mint condition boxes and manuals. I'm hoping to find working devices to match the boxes and manuals.

Another thing that will condemn this community to HP Hell is the apparent failure to appreciate what a great calc the 19Bii is. Although I will accept the clamshell formfactor is not ideal, what the calc offers functionally though is surely the most flexible and well specified all-rounder HP ever produced.

I am under the impression that the later models used button cells instead of the N cells so that got rid of the dreaded battery door problem as well.

A truly great calc that no one seems to like?

Mark

Actually late-run units kept all three N-type batteries, but the battery cover was modified and relocated to the back of the calculator. Surely a more clever design.

Gerson.

I spotted an HP-91 under a guy's sneaker at a hamfest. There was also an HP-97 in the pile as well. I bought both for $10 and parted out the 91 to get the 97 working. Then I binned the mortal remains of the 91. Oops!

At least I'm still balancing my checkbook with that 97.

Bob

It was about ten years ago, when I started to collect HP calculators, at a flea market. I saw a kind of little coloured HP calculator I didn't knew. At that time I thought it was a recent four banger made from HP, something of no interest to collect. I went away without even looking at the calc, thinking it was the kind of things we will find in quantities in flea markets ... Now, I'm not absolutely sure, but, the more I think about it, the more I'm convinced it was an Xpander.

Re: HHC 2009 only 1 week away...who is coming?

*Message #12 Posted by **Matt Kernal** on 2 Oct 2009, 11:26 a.m.,*
in response to message #10 by Karl Schneider

> Quote:
>
> as originally planned at HP's since-sold complex in Vancouver, Washington

A friend's wife who works for HP, said the Vancouver facility is being leased by HP for the time being. So other than ownership of the buiding(s), it *seems* the conference wouldn't have necessarily had to have been relocated to Ft. Collins, as it's "business as usual" in Vancouver.

My daughter's birthday is this weekend :-), so I won't be attending HHC2009 :-(. Hopefully next year, in Boise ID.

Matt

Re: HHC 2009 only 1 week away...who is coming?

*Message #13 Posted by **Reth** on 27 Sept 2009, 8:41 a.m.,*
in response to message #1 by Gene Wright

I'm really curious what drives one to attend this event under the circumstances in the last 10 years or so. The only reason I can see is nostalgia.

Re: HHC 2009 only 1 week away...who is coming?

*Message #14 Posted by **geoff quickfall** on 27 Sept 2009, 9:19 a.m.,*
in response to message #13 by Reth

Lots of reasons Reth

```
hope springs eternal
meeting old friends
meeting new friends
sharing ideas
programming and new initiatives in calculator design
```

It is about the old and the new, although I have used HP since 1975 I am new to the conferences. The names that attend I have known through HP programming and using for the last 34 years.

I finally get to put faces, traditions and thinking to all the names involved in design whether or not one accepts the reality of calculator design and marketing today.

In any case, attend one of the conferences and then make a comment about the reasons for attendance.

Cheers, Geoff

Re: HHC 2009 only 1 week away...who is coming?

*Message #16 Posted by **Tim Wessman** on 27 Sept 2009, 12:05 p.m.,*
in response to message #13 by Reth

The fact that everyone who goes, even unwillingly at first, ends up having a really fun time and enjoying themselves immensely might have something to do with it. People that don't even like calculators all that much have gone and had a blast. :-)

TW

Re: HHC 2009 only 1 week away...who is coming?

*Message #17 Posted by **BruceH** on 30 Sept 2009, 10:21 p.m.,*
in response to message #1 by Gene Wright

Nice prize list. You can add two more items from me:

- A standard 200LX, in full working order (but no batteries to preserve the insides)
- Four wax candles with an image of an HP-48SX on the sides originally produced by the Dutch club, STORC.

Those of a certain age from the UK reading this last point will automatically think of this. Perhaps they could be used as votive candles to help the HP team with their efforts to produce new calculators?

Hp 71b power fault

*Message #1 Posted by **Sean Connor** on 25 Sept 2009, 8:44 a.m.*

Hi all,

This is driving me NUTS. My 71b is fine on batteries but when powered from an AC adapter it keeps losing power and switching off. I thought that maybe it was a faulty wire from the AC to the recifier so I re-soldered these (The thin green and pink ones wound on the choke). It's STILL doing it. The behaviour can be aggrivated by wiggling the AC plug into the machine. What else could be loose ? Could it be that the actual pins are not being held tight enough by the adapter plug ?

I have no batteries inside themachine when I am doing this

Sean

PS I'm an electronics engineer so I don't mind swapping stuff out or soldering

Re: Hp 71b power fault

*Message #2 Posted by **Bart (UK)** on 25 Sept 2009, 11:46 a.m.,*
in response to message #1 by Sean Connor

Sean,

Have you checked to see if connection on the pins are good inside the unit? Also if the AC cord has been wrapped tightly, the strands inside it could be broken. Otherwise as you said it could be a loose fitting plug.

Bart

HP-97 diagnostics

*Message #1 Posted by **Bruce Bergman** on 24 Sept 2009, 8:59 p.m.*

So, I just picked up a nice condition HP-97 and have found only two issues with it. I wonder if anyone can point me at roughly what I need to consider as far as repairs.

1) Inserting a mag card. It doesn't grip well, although I hear the motor run. Upon ERROR, removing the card shows little patches of stickiness (technical term) on the bottom edge of the mag side. I presume something is gummed up inside.

2) The printer works well, but advancing the paper it "sounds" a bit like it's not cleanly (or perhaps confidently) advancing. No real issue here, but is there some preventative maintenance I can do to perhaps help the situation?

Thanks! bruce

Re: HP-97 diagnostics

*Message #2 Posted by **Michael de Estrada** on 24 Sept 2009, 9:11 p.m.,*
in response to message #1 by Bruce Bergman

1) Needs "gummy wheel" repair. Others on this forum can tell you how. Meanwhile, don't insert any more cards until this is fixed.

2) Could just need a good internal cleaning, or could be a bad printer advance gear. If the latter, I can tell you where to get a replacement.

Re: HP-97 diagnostics

*Message #3 Posted by **Geoff Quickfall** on 24 Sept 2009, 9:16 p.m.,*
in response to message #1 by Bruce Bergman

Hello Bruce, good find!

Three things to consider here:

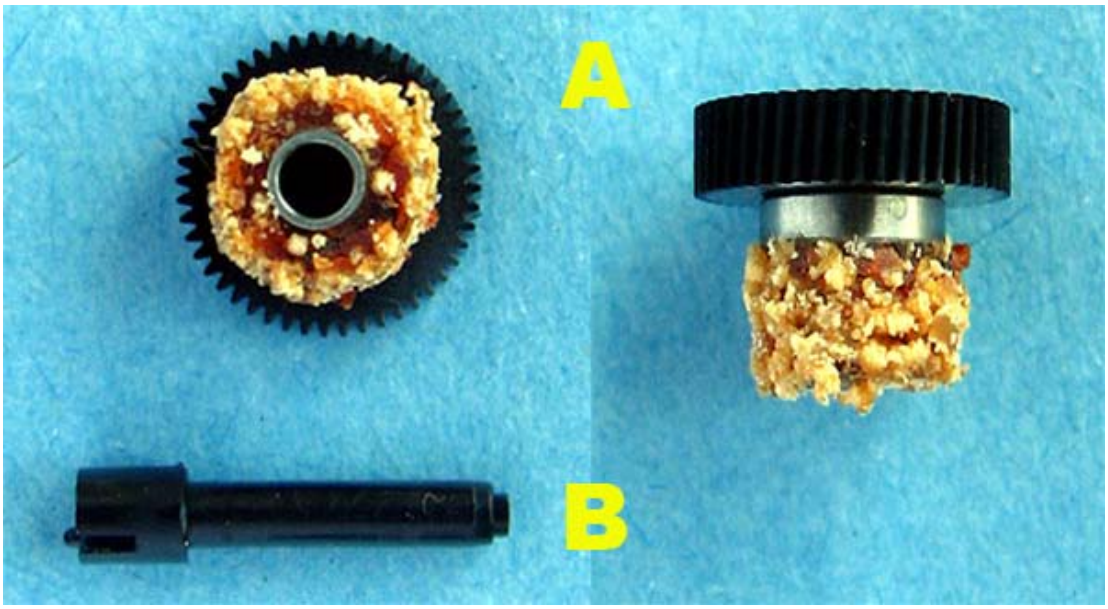
```
CARD READER:
a.  the drive roller rubber has deteriorated to a gummy
    residue and needs replacing.
b.  the dampening couple needs replacing as it is composed of the
    same rubber.

PRINTER:
c.  some printers have a carbon composite gear while some have
    a rubber gear composed again of the same rubber as in (a)
    and (b)above.
```

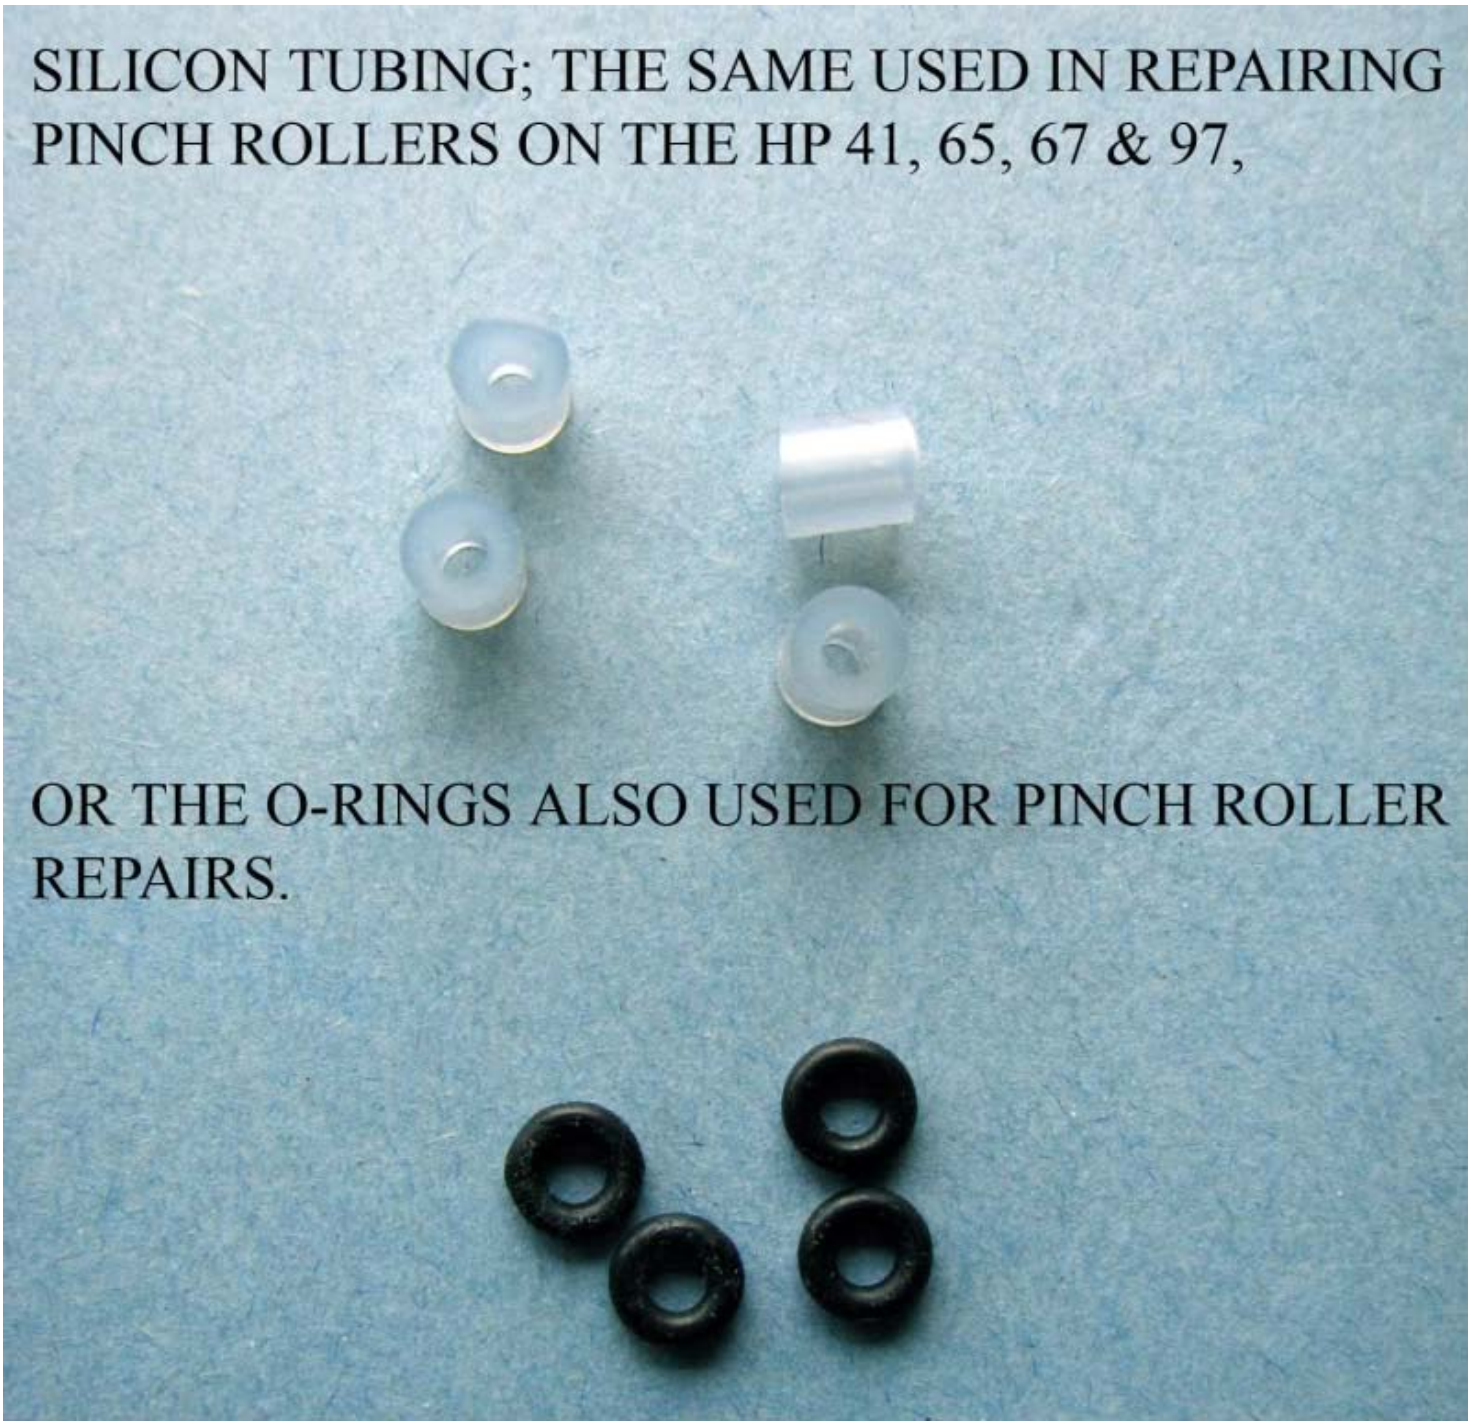
Check out the repair section of the MoHPC:

repair section

Example of a deteriorated drive roller, some talk about a bacterial infection of the natural rubber.



Example of repair types with tubing or o-rings:



Gratuitous photo of a 97 and 91 restored:

Cheers, Geoff

Re: HP-97 diagnostics

*Message #4 Posted by **Bruce Bergman** on 25 Sept 2009, 12:03 a.m.,*
in response to message #3 by Geoff Quickfall

Thanks guys! I figured the card reader was indeed the "gummy wheel" repair scenario, but just never encountered it as yet. Lucky I guess. I have ordered some parts for the repair from YouKnowWho here and will be tackling it when I get them.

Oh, and I didn't know the museum HAD a repair section! After all these years, there's new stuff to learn every day! ;-)

Thanks! bruce

Thanks! bruce

I don't know YouKnowWho, but the o-rings are very common 1/16 ID, 1/4 OD. You can find a couple at any hardware store for a buck or so.

I've repaired quite a few card readers and experimented with the o-rings and the tubing. I had more consistent success with the o-rings. They are manufactured to tight tolerances, whereas tubing is not manufactured to be perfectly round at all.

Re: HP-97 diagnostics

*Message #6 Posted by **Geoff Quickfall** on 25 Sept 2009, 1:00 a.m.,*
in response to message #5 by Dan W

Hi there again,

I prefer the tubing myself. It has greater surface area for tracking the card through the reader. I use MIL spec fuel line tubing which for some military reason has the hole in the exact centre. It is usually pink in colour.

Dan is correct though, the o-rings are consistent and easy to source.

Cheers, Geoff

Trivia: Which HP can't display its own programs?

*Message #1 Posted by **Mark Edmonds** on 24 Sept 2009, 3:47 p.m.*

I don't know if this machine is unique in this respect but one of HP's calcs can't display its own program code. So you type a program in and it is impossible to get the keystrokes back on the display. The only way to get the program details is to print it. An incredibly strange design decision which makes programming somewhat awkward and wasteful of paper.

Which calculator is it?

Mark

Re: Trivia: Which HP can't display its own programs?

*Message #2 Posted by **Katie Wasserman** on 24 Sept 2009, 3:54 p.m.,*
in response to message #1 by Mark Edmonds

The 9815, with it's shockingly loud printer.

Re: Trivia: Which HP can't display its own programs?

*Message #3 Posted by **Mark Edmonds** on 24 Sept 2009, 4:07 p.m.,*
in response to message #2 by Katie Wasserman

Well that didn't take long!!! Correct on both counts Katie!

I know the keyboard layout is not uniform for a simple grid reference but I really am surprised HP didn't find some way of using the display to show key numbers. It is a near-fatal flaw otherwise.

Mark

hp 9815a/s repair
*Message #1 Posted by **frankabc** on 24 Sept 2009, 1:50 p.m.*

I have corresponded 2 years ago concerning "hp 9815a repair". Last week we obtained an hp 9815s calculator via ebay. It is in better shape than our 9815a, but the 9815s does have some memory issues. Rather than displaying ~3800 programmable steps, it displays 904. Also the storage registers A->E and 003->009 work perfectly, but F->J, and 000, 001 and 002 already are filled with the number 2.02 x 10^33 when the unit is turned on. All other functions seem to work. Obviously some of the memory chips (hp 1818-0438) are faulty, but some chips are still active. Does anyone know which memory chips are responsible for which functions? Which memory chip holds storage registers A->J, which holds registers 000->009, and which hold the remaining 3800 programmable steps? We have Tony Duell's schematics for the hp 9815a (Australian HP Museum), but are not sure that these schematics cover the 9815s. Does anyone know which of the 8 memory chips does what?

And where do we find replacement 1818-0438 memory chips?

We also are seeking the Utility and Test tape cartridge for the 9815a/s, or a copy, or a print-out of the Utility and Test programs, so that we can make a test tape of our own. Apparently every 9815a/s came with a Utility and Test tape, so at least one 9815 owner must still have a Utility and Test tape cartridge that works - hopefully!!??!!

Thank you, most very kindly.

in response to message #1 by frankabc

I have a 9815a expanded to 9815s spec. The only difference between the two machines is surely the interface card and the extra ram card sitting middle top. So to reduce your machine to a 9815a, remove the extra ram card and then you've got a match for Tony's schematic. I would expect the base register location to be the same between both macine types anyway as the s just has more extended ram.

Don't know if that helps...

Mark

Copying the Utility and Test tape is something that I have been unable to do after many attempts, years ago. There's some sort of special copy protection that it makes use of.

> Can the Utility and Test tape program be printed out via list, or similar?

I'm afraid not. Most of the programs are hidden and are in machine language. They display and print patterns that are not possible to generate via user programming. I suppose that it wouldn't be impossible to hack the tape read/write code given that the 9815 used a 6800 microprocessor, but there must be an easier way to copy this tape.

Just curious, has anyone here ever figured out how to run their own 6800 code on the 9815A/S? I used to write in 6502 machine language for my PET computer way back when I didn't have an assembler and had most the op codes memorized. It might be run to try that (a few bytes of it) on a 9815.

Re: hp 9815a/s repair
*Message #6 Posted by **Mark Edmonds** on 27 Sept 2009, 2:15 p.m.,*
in response to message #5 by Katie Wasserman

Although it is a long while now, I used to be completely fluent in the 6800 (I detested the 6502!). Sadly, I know I have lost all my original opcode docs as I've been trying to find them for over 20 years but there must be docs on the net. If anyone can get a binary dump of these tapes, I wouldn't mind seeing what I can do with it given time. The results could be very interesting as they would show entry points and how to load and run your own 6800 code from tape.

One of the things that always picqued my interest in the 9815 was that it used a 6800 - it would be fun delving into this more even if we are a long way off doing this as of now.

Re: hp 9815a/s repair
*Message #7 Posted by **Joel Setton (France)** on 27 Sept 2009, 4:08 p.m.,*
in response to message #6 by Mark Edmonds

Hi Mark,

The starting point would be to get a binary dump of the ROMs, then disassembling the code shouldn't be too difficult since we have the partial listing in the patent. Any clues about how to read the binary without desoldering the ROM chips?

Re: hp 9815a/s repair
*Message #8 Posted by **Mark Edmonds** on 27 Sept 2009, 5:06 p.m.,*
in response to message #7 by Joel Setton (France)

Hi Joel,

No, wouldn't know how to do that.Back in those days, you tended to get branded as a software or hardware person and I was always software. I'm out of my depth here but all I can think of is a method of loading 6800 code via tape can be established, then a simple program to dump the entire 64K memory map. But seriously, I'm guessing a lot here.

Are the patent docs freely available on-line?

Mark

in response to message #1 by frankabc

The HP 9815's RAMs are most likely Intel 2111a parts. They're not the eight white chips that I think you're referring to. Those white ceramic parts are ROMs and contain the calculator's firmware. There are actually six RAMs on the motherboard. Each RAM is a 256x4-bit chip. They are black, have 18 pins, and most likely have a big, lower-case "i" for Intel stamped on them, although they may well have an HP part number instead of 2111a. I think they're up by themselves at the top of the motherboard between the tape drive and printer cutouts. It takes two of these chips to make one 8-bit byte and there are three banks on the motherboard. Sorry, I can't tell you which one is bad from your description. I did a quick search and you can still find these on eBay, but the chip is way obsolete. Some just sold on eBay: http://cgi.ebay.com.my/ws/eBayISAPI.dll?ViewItem&item=260454127351 for way cheap. You can also use AMD 9111a parts, I think.

*Message #12 Posted by **Steve Leibson** on 24 Sept 2009, 7:51 p.m.,*
in response to message #11 by Andrés C. Rodríguez (Argentina)

Intel 2101A parts are earlier devices. They have 22 pins instead of 18 and require multiple power supplies where the 2111A parts only require 5V. The HP 9815A was based on the Motorola 6800 microprocessor, which was the first commercial microprocessor to run on just 5V, hence the desire to use 5V RAMs as well: to simplify the HP 9815A's power supply.

Re: hp 9815a/s repair (Intel RAM)
*Message #13 Posted by **Eric Smith** on 24 Sept 2009, 11:49 p.m.,*
in response to message #12 by Steve Leibson

The 2101 is a 5V-only part. The reason it has more pins is that it has separate data inputs and outputs.

2101A

*Message #15 Posted by **Eric Smith** on 24 Sept 2009, 11:50 p.m.,*
in response to message #10 by Steve Leibson

Since the 9815S is newer and has more RAM, I'd expect it to use newer, higher-density RAM chips than the 9815A did. Possibly the 2114. But I don't have a 9815S handy to check.

Re: hp 9815a/s repair
*Message #16 Posted by **Steve Leibson** on 25 Sept 2009, 12:02 a.m.,*
in response to message #15 by Eric Smith

The additional RAM was added with a daughter card, I believe. Someone stated that in the archives earlier. Otherwise, there would have been two different motherboard designs, which there weren't. In addition, there would have to have been 2-Kbit SRAMs, which there weren't at the time. We designed those machines with the biggest commercially viable chips available at design time, and the IC generations were decidedly further apart in time than they are now. The HP 9825A started with 4-Kbit DRAMs and then graduated to 16-Kbit devices two to three years later in the HP 9825T. Note to all of you born in the 1980s or later: I'm sure this discussion of Kbit DRAMs is hilarious with the multi-Gbit SDRAM devices we have now, but the first commercially successful DRAM (from Intel) only appeared in 1971. It held all of 1 Kbit. Few people know that it was a bear to bring to production and it was only through the help of the friendly engineers of HP Loveland, who desperately needed the chips to make the HP 98x0 series of desktop calculators real that the chips made it to market in 1971.

Re: hp 9815a/s repair
*Message #17 Posted by **Eric Smith** on 25 Sept 2009, 1:43 a.m.,*
in response to message #16 by Steve Leibson

The 9815S was introduced four years later than the 9815A. The 2114 4-kbit SRAM (1Kx4) was certainly readily commercially available before the 9815S shipped.

I was of the impression that the 9815S used a different PWB than the 9815A, but I'll admit that it's been quite a while since I looked at the innards of either model, so it's quite possible that I'm mistaken about that.

Even if the 9815S used the same main PWB as the 9815A, it's still possible that it used a newer memory expansion board with denser RAM chips than the original optional memory expansion for the 9815A. In fact, I'd be extremely surprised if it *wasn't* a new board, because the 9815S had as standard *twice* as much memory as the 9815A could handle as an option. This means either a different memory board was used, or a different main board that could accept two memory boards.

Re: hp 9815a/s repair
*Message #18 Posted by **Joel Setton (France)** on 25 Sept 2009, 3:29 a.m.,*
in response to message #17 by Eric Smith

Folks,

The two CPU boards are different: The one in the 9815A uses the 2111 RAM chips (with a capacity of 256 x 4) and seven 2kx8 ROM chips; the board in the 9815S uses 2114 memory chips (each of which with a capacity of 1k x 4) and two 8Kx8 ROM chips. As seen in the 9815S I have, the CPU is not an upgraded 9815A, it is a redesigned board. The 9815S gets its larger memory from the "large-capacity" 2114s chips and not from an additional RAM expansion board.

I also believe that at some point in time, HP stopped making the old 9815A CPU board and used the newer 9815S boards to service defective 9815As. In the repair process, these calculators became "hybrids", with a 9815S CPU and its larger memory, but without the two explansion slots which are standard in the 9815S.

in response to message #16 by Steve Leibson

Steve, thank you for your comments. Yes, it is fun when we talk about bits and kilobits. I use to comment those facts to my engineering students at the university; for instance that all HP35 code fit in 768 x 10 bit words... some of them expect no less than megabytes even for the most simple task!

I still have (in working condition) my homebrew RCA 1802 board, with 256 bytes made from 2 5101 SRAM... I once "upgraded" it by adding a 2 kbyte CMOS SRAM, all battery-backed.

Re: hp 9815a/s repair
*Message #22 Posted by **Joel Setton (France)** on 25 Sept 2009, 3:37 a.m.,*
in response to message #1 by frankabc

Hi Frank,

The assignment of memory location addresses to the various storage registers in the 9815A (i.e. X/Y/Z/T in the stack, user program storage, etc...) is very well documented in the 9815A patent (US 4,089,059) which you can read from Eric Smith's website. This patent is a "must-read" for all those interested in the 9815A.

This should help you find the addresses of the defective RAM locations, which will point to a pair of RAM chips since RAM locations are 8-bit wide and each chips stores 4 bits.

I hope this helps, but please let me know if it doesn't!

Re: hp 9815a/s repair
*Message #23 Posted by **frankabc** on 26 Sept 2009, 4:53 a.m.,*
in response to message #22 by Joel Setton (France)

Thank you, thank you, for your many wonderful, helpful responses!!!

Since there seems to be some debate on the differences between the "a" and the "s" models, here is the scoop on the boards and memory chips for our hp 9815a and our hp 9815s, opened, side-by-side.

9815a - with both the 001 option (extended memory to 2008 programmable steps) and the 002 option (HP-1B interface).

```
Numbers on CPU Board:
     88809F
     REV B
     09815-66510
     4699
RAM chips on CPU: SIX 1818-0140 (these cross reference to Synertek SYP2112A-4).
RAM chips on 001 extended memory board: TWELVE 1818-0140.
All RAM chips are 16-pin with 8 pins per side.
Numbers on 001 option board:
     88809L
     REV A
     09815-66581
     525
     OS
ROM chips on CPU: SEVEN, white, 28-pin chips with 14 pins per side, with an open slot
 on the board for an 8th chip.
NOTE: The hp 1818-0140 RAM chips cross reference to 2112, NOT 2111.

9815s
Numbers on CPU Board:
```

```
     88809F
     REV C
     09815-66514
     3936
RAM chips on CPU: EIGHT 1818-0438 (these cross reference to TMS2114-45NL).
No provision on CPU board for attachment of 001 memory option board.
These RAM chips are 18-pin with 9 pins per side.
ROM chips on CPU: SEVEN, white, 28-pin chips with 14 pins per side, with an open slot
   on the board for an 8th chip.

Clarification of confusions on the forum:
1) The RAM chips on the 9815a cross reference to 2112, and the RAM chips on the
   9815s cross reference to 2114.  Although everyone is talking about 2111 chips, 2111's
   are not to be seen on either of our calculators.
2) Tony Duell mentions that the 9815a uses 7 ROM chips, but the 9815s uses a pair of
   ROM chips, http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=66265.
   Both our 9815a and our 9815s have 7 ROM chips.  Perhaps our 9815s is a transition model.
3) Our 9815s DEFINITELY has a redesigned CPU board compared to our 9815a (compare
   the serial numbers listed above).  Our "s" version has no provision for
   attachment of the "a" version's extended memory board.  In the region of the
   memory chips, the circuitry of the boards, and the layout of the chips, are quite
   different.  Plus the 9815s has eight 18-pin RAM chips on its CPU, while the 9815a
   has six 16-pin RAM chips on its CPU.
```

I'll let you know if/when we get either of these running at 100%, and how we solved it.

Frank

Re: hp 9815a/s repair

*Message #24 Posted by **Eric Smith** on 26 Sept 2009, 5:33 a.m.,*
in response to message #23 by frankabc

Thanks for posting all the details. If it's not too much trouble, could you check the part numbers of the ROMs in both units? If either one has part numbers other than 1818-2602 through 1818-2608, that would be very interesting to know.

You should be able to find some 2114 chips, but they've got a reputation for being unreliable, so pulls or even NOS parts aren't necessarily going to be good. If all else fails, you could kludge up something with newer RAMs such as the 6116. That was a 2K*8 CMOS static RAM originally introduced by Hitachi around 1980, but equivalent parts are still made to this day (unlike the 2114).

Thanks! Eric

Re: hp 9815a/s repair

*Message #25 Posted by **Joel Setton (France)** on 26 Sept 2009, 7:18 a.m.,*
in response to message #24 by Eric Smith

Hello Eric,

The ROMs on my 9815 are one 1818-1056A and one 1818-1057A. Each of these chips is 8K bytes, so that's a total of 16K bytes. However, the top 2K are disabled by the missing jumper which enables/disables the optional character set.

The CPU board part-number is 09815-69512 which is technically the same as a 09815-60512. The 69xxx prefix (as opposed to 60xxx) means the board was sold by HP as a service part.

Re: hp 9815a/s repair

*Message #26 Posted by **frankabc** on 26 Sept 2009, 3:31 p.m.,*
in response to message #25 by Joel Setton (France)

Dear Eric and Joel, Saturday, 9/26/2009

Here are the numbers of the white ROM IC's for our 9815a and our 9815s. As for the position of the chips, I am viewing the keyboard section inverted (i.e. upside down), and rotated so the white ROM chips are at the top. I then read left-to-right for the uppermost bank of four ROM chips, followed by, left-to-right, the lower bank of one empty slot, followed by three ROM chips.

hp 9815a
Upper bank:
G1818, 2605, 2693
H1818, 2602, 1363
D1818, 2603, 2696
B1818, 2604, 2801
Lower bank:
empty slot
B1818, 2608, 2668
D1818, 2607, 2783
E1818, 2606, 2455

hp 9815s
Upper bank:
H1818, 2605, 5640, SINGAPORE
H1818, 2602, 2581, SINGAPORE
D1818, 2603, 5454
B1818, 2604, 5174, SINGAPORE
Lower bank:
empty slot
B1818, 2608, 5633
D1818, 2607, 6149, SINGAPORE
E1818, 2606, 5915

General question: Why has 'most EVERYONE spoken of 2111 memory chips on the 9815a, whilst our 9815a has 2112's (hp 1818-0140)? Is our 9815a unique, or (heaven forbid!) are some recollections foggy?

Thank you, Eric, for the information on possible replacements for the unreliable 2114's, and thank you, Joel, for the patent reference for memory assignments for the RAM chips. Maybe we can order some replacement RAM's soon.

Endless details: Also Joel, when you refer to the two ROMs of your 9815, I assume that yours is an "s" version? So it is interesting that our 9815s has 7 white ROM chips, like our 9815a, while your 9815s has two ROM chips. Our "s" CPU board is REV C, 09815-66514, while you notice that your board is the service part 09815-69512.

Frank

2111a vs 2112a
*Message #27 Posted by **Steve Leibson** on 26 Sept 2009, 4:59 p.m.,*
in response to message #26 by frankabc

My incorrect reference to the 2111a was caused by the photo of the 9815 motherboard on this site. It shows 18-pin chips for RAMs. That led me to incorrectly state that the chips on your board were 2111a parts. Clearly, not correct. From now on, I'll leave it to the experts.

Re: hp 9815a/s repair
*Message #28 Posted by **Eric Smith** on 26 Sept 2009, 7:02 p.m.,*
in response to message #26 by frankabc

The 2112 (and AMD Am9112) are similar to the 2111 (and AMD Am9111), but have only a single chip select and no output disable pin. It's likely that they either used exactly the same die, or a die with only a metalization change. The 2112 was probably slightly less expensive due to the smaller package.

With regard to my previous suggestion of the 6116 as a possible replacement, you should be aware that it is not even *close* to being pin compatible. The 2114 is in an 18-pin DIP (0.3" row spacing), while the 6116 is most commonly found in a 24-pin DIP (0.6" row spacing). Were I in need of replacements for a lot of 2114 chips, I'd probably lay out a small PCB with a surface-mount SRAM like an ISSI IS61C256AL-12TLI (28-TSOP package) on one side, and two 9-pin surface-mount male headers on the other.

Hmmm... I wonder if enough people need 2114 replacements that I could sell some? I need a bunch myself.

On the other hand, Unicorn Electronics does have several 2114 variants in their catalog

2114 chips

Jameco (www.jameco.com), a mail-order company in the SF Bay area, sells 2114s for about $2 each. Just search on 2114.

Re: hp 9815a/s repair
*Message #30 Posted by **Joel Setton (France)** on 27 Sept 2009, 6:46 a.m.,*
in response to message #26 by frankabc

Hi Frank, Eric and all,

The ROM part-numbers in Frank's message show that his 9815A and 9815S have the same set of ROMs, so I think we can reverse-engineer the history of 9815x CPU boards:

- The 09815-66510, first generation used the seven-chip ROM set, 1818-2602 to 1818-2608. An additional 2K ROM chip can be added for optional characters. The RAM chips were six 2111s, and the CPU board has a connector for the RAM expansion board. RAM size is 768 bytes.

- The second-generation 09815-66514, uses the same 7-chip ROM set, but increases RAM size with eight 2114 chips to a capacity of 4K bytes. Since this is the maximum addressing capacity permitted by the firmware architecture, additional RAM cannot be used and the connector for the memory expansion accessory is deleted. This board is used to produce the first 9815S.

- The third generation is the 09815-60512, with keeps the same 4K of RAM in 2114 chips, but the seven+1 ROMs are replaced with two 8Kx8 chips, one 1818-1056A and one 1818-1057A.

The backward-compatibility of the newer boards, which can be used in all generation of 9815x calculators, resulted in HP using the newer boards to repair failed 9815As. This is what happened to mine, which was manufactured in 1977 as a 9815A, but was later fitted with a new board. Since the calculator had Option 001 (two expansion slots), this repair essentially turned it into a 9815S.

It would be interesting to know if the switch from the seven-ROM set (1818-2602 to 1818-2608) the two-ROM set (1818-1056 and 1818-1057) included any firmware changes, bug fixes etc... Is anyone aware of such changes?

Re: hp 9815a/s repair
*Message #31 Posted by **frankabc** on 28 Sept 2009, 12:27 a.m.,*
in response to message #30 by Joel Setton (France)

Maybe my one contribution to this whole exchange is to question, and hopefully put to rest, the notion that 2111 RAM chips were used in the 9815a. My 9815a here in my hands has 2112's - NOT 2111's. Apparently mine is not a one-off prototype. I am noticing that almost every mention in the forum of RAM in the 9815a, even by the expert Tony Duell back to circa 2004, says 2111. However, when I have looked up the 2111 at Jameco during these last few days, the 2111 has 18 pins. The 9815a here in my hands has 16 pins on each RAM chip. When I cross-reference the hp numbers of the 6 RAM chips on mine's CPU Board, and the 12 RAM chips of its 001 extended memory option board, every one of which is 16 pin, and every one of which is 1818-0140, I obtain SYP2112A-4. I have obtained this cross reference SYP2112A-4 at TWO different sites on the internet, by typing "hp 1818-0140" into google, as the girl on the telephone at hp did, and as she advised I should do, also.

Further, it was thoughtfully pointed out by Steve in Message #26 of this forum page, that there is a photograph of the entrails of an hp 9815a on the hp museum's internet site. I've gone to the hp museum's photograph. It really is of a 9815a, as its CPU board has the proper gold connectors for the 001 memory option. I unfortunately cannot decipher the code numbers on the chips of this photo; however by squinting and recounting several times, I find 16 pins on each RAM chip, 8 per side, not 18 pins/9 per side. I presume therefore that the RAM chips of the hp museum's 9815a are likewise 2112, not 2111.

Re: hp 9815a/s repair

Hello Joel, One more bit of curiosity. If your calculator really was initially a 9815a that later acquired an "s" board during servicing, I am wondering what its stickers read under the printer roll lid, at the back. Our 9815a has two stickers in this location that read, "option 001", and "option 002". While our 9815s has a single sticker here that reads, "9815 S". Might yours have all three stickers, perhaps?

I'm also noticing REV letters on the CPU boards. Our 9815a CPU board is REV B. Our 9815s CPU board is REV C. Both of these boards have seven ROM chips. Your CPU has dual ROM chips. Though it necessitates removing a few screws, etc., to open your case, so you may not want to risk a look, I also am wondering what REV letter your CPU board has. This letter might verify your reverse engineered theory, somewhat, by confirming that our REV C is an earlier "s" version, while your board is later.

Frank

*Message #34 Posted by **Joel Setton (France)** on 28 Sept 2009, 3:26 p.m.,*
in response to message #32 by frankabc

Hi Frank,

I had a look at the CPU board, it's an 09815-69512, A-2244 which means it's the first version of the 09815-6x512 copper (revision A) and the last engineering change to that board was made in the 44th week of 1982. Of course this is not the date of production, the most recent chips on the board have 1984 datecodes. The board has 4K memory in eight 2114 chips, and two 8Kx8 ROM chips.

The revision letters were incremented when a board went through a change which did not affect "fit, form and function", in other words when its feature set and compatibility with the outside world are unaffected by the change. When the feature set changes, for example when replacing the 2112 SRAMs with 2114s and removing the memory expansion connector, the new board is not an exact replacement for the old one, so it gets a new part-number and its revision letter is reset to A.

Comparing the revision letters of two different boards is probably not going to tell us a lot, because production of different types of boards may have overlapped during some time.

On the outside, my 9815 started life as an "A" and included the optional I/O backplane. It has just one sticker, "Option 002". Then it probably failed and got repaired with a new 09815-69512 CPU board, with 2114 RAMs and two 8Kx8 chips. This repair upgraded the machine to an exact 9815S.

Does this help?

One last word: when it comes to HP calculators, curiosity is not very far from passion!

Joel

Why is x^2 shifted?

*Message #1 Posted by **Frank Rottgardt** on 24 Sept 2009, 6:29 a.m.*

I often wonder why HP (and many other brands) choosed many times to make x^2 a shifted function? In most formulas I see you´ll find a lot more squared variables than square roots. As example only one simple formula used a million times each day around the globe c = SQRT(a^2+b^2). I love the 33s for having a dedicated x^2 key. Is there some deeper going logic behind having x^2 shifted?

Re: Why is x^2 shifted?

*Message #2 Posted by **Bart (UK)** on 24 Sept 2009, 6:48 a.m.,*
in response to message #1 by Frank Rottgardt

Interestingly, the 300s has X^2, x^3, x^n and SQRT as direct keytop functions.

in response to message #3 by DaveJ

actually I'd like to know your issues with the dedicated HYP key - being curious about pros/cons of such implementation.

I can see cases where accessing the hyperbolics would be convenient. It's just one key to launch 6 functions (or more).

I just implemented it on the 41Z. Point in case is the user keyboard is full with "regular" functions (non-user is the real-numbers 41, user is the COMPLEX 41). HYP saves six key assignments and also presnts a more logical arrangment.

Best, ÁM

grin
Yes, it's a simple matter of need. What percentage of typical sci calc users would use Hyperbolic trig functions on a regular basis?

My guess is it wouldn't even reach a single percent.

Infinitely more sensible to make HYP a shifted function.

Dave.

in response to message #1 by Frank Rottgardt

Don't forget the venerable HP-45, which was the first HP pocket calculator to feature the x^2 function. It has a dedicated x^2 key and the sqrt(x) function is shifted. I always have an HP-45 handy for routine calculating.

I agree that x^2 is very commonly used, and that an unshifted key is convenient. However, lack of available keyboard space is a constraint. Since square root and x^2 are inverse functions of each other, square root is normally unshifted, with x^2 being the second function.

x^2 can also be performed in RPN by [ENTER][*], which -- along with a limited keyboard -- may explain why the HP-35 didn't have it.

> Quote:
>

This, of course, can be performed by a rectangular -> polar conversion, as well.

Re: Why is x^2 shifted?

*Message #9 Posted by **Gene Wright** on 24 Sept 2009, 11:23 a.m.,*
in response to message #8 by Karl Schneider

Yes, keyboard layout is a tough discussion.

Considerations:

1) Can the function be done another way? x^2 is also ENTER X, so making it a shifted function costs the same keystrokes as ENTER X. Perhaps better to save a key press and make x^2 primary then and save a keypress for the user.

2) How often is the function used? Is SQRT used more often that x^2? If so, perhaps it deserves a primary key.

#2 applies to the LOG/10^x and LN/e^x discussion. Seems as if the natural log functions occur most often and if so, these "ought" to be given a primary key position over the common functions.

Again, the Hp-45 did exactly this with ln and e^x as separate primary keys with log and 10^x as shifted keys. It should be pointed out that the much maligned HP-33s also has dedicated primary ln and e^x keys.

And while we're on the subject of primary keys, I've always liked having separate STO and RCL keys on my basic non-menu calcs. Again, both the HP-45 and HP-33s have these. Unfortunately, I have an early HP-33s with the invisible decimal point, so I don't use it very much.

Oh yes! E.g. assume a small RPN calculator featuring the following primary keys:

```
0 ... 9 . E ± + - * / ENTER Delete
STO RCL x<>y Rv Sigma+
XEQ R/S SST BST ON/OFF
```

Enough space shall be left for secondary (i.e. shifted) functions. Three (3) primary keys are to be filled yet. What would you put on them?

Wouldn't a "small RPN calculator" have none of that programming stuff? Like the RPN Scientifc 4-Banger dream calc some time back?

The difference really comes down to a calculator key layout optimised for programming, and one optimised for manual calculations.
As someone who rarely runs programs, I prefer a layout designed for manual calculations, so I believe all the program keys should be shifted.

But if I only had three keys left I'd put 1/x, X^2 and SQRT

And of course an ON/OFF key is the most useless thing ever invented for a low power calculator.

Dave.

Well, I didn't tell you SST, BST, and ON/OFF are multi-purpose keys like on the 42S. SST and BST browse catalogues as well, and ON/OFF serves also as EXIT. So there are only XEQ and R/S left being primary program keys. My ideas for the three free keys were 1/x, y^x and PI so far, so we agree on one key already. Maybe e^x and LN are a better choice than y^x and PI ?

Re: Why is x^2 shifted?

*Message #14 Posted by **Steve Perkins** on 25 Sept 2009, 4:45 p.m.,*
in response to message #13 by Walter B

I would definately leave PI for a shifted key.

For primary keys, 1/X gets my vote as well, but it's a hard choice between Y^X, SQRT and X^2. I guess I'd go for Y^X and SQRT, leaving X^2 for a shifted function.

It almost pushes me to use the 3 keys for SIN, COS, TAN so their inverses are on the proper shifted key. It's always a matter of tradeoffs in the limited resources world.

I like the Casio method of putting PI on the EXP key.
If you haven't already entered a digit then pressing EXP gives you PI without using SHIFT. But once you enter a digit then EXP becomes the active key.

Dave.

HP's traditional way was using the EEX key to enter 1*10^ directly if no input was pending. E.g. 225 SQRT E 4 * will result in 150,000. Sadly, this way was abandoned recently with the 35s.

EXP & pi key on Casios

Hi, Dave --

I have a 1981 Casio fx-3600P with that feature. (Note: pi is always accessible using the shift key.) I thought it was a clever means of dual-purposing a key.

On the newer fx-115MS, EXP and pi are also on the same key, but pi always requires the shift key. A leading "1" is not necessary; EXP 6 will give "E6" representing 1,000,000 -- more HP-like in that sense.

I agree with Walter regarding the application of the old Casio method to HP's. Not only does it preclude quicker entry of power-of-10 numbers, it is inconsistent with RPN principles and could cause ambiguity in programs.

I find it interesting that the 32s has e^x and ln as primary functions (with 10^x and log10 shifted), but the 42s has log and ln (with 10^x and e^x shifted). Which came first, and why the change?

Re: Why is x^2 shifted?

*Message #19 Posted by **Mike Morrow** on 26 Sept 2009, 12:10 a.m.,*
in response to message #18 by Paul Guertin

They were both introduced in 1988. I suspect the design differences are evidence that the HP42S

was not related to the HP32S in any way except use of Saturn and external appearance. Other than that, these two machines seem to come from two rather different design philosophies with little in common between them. With respect to the problems they were designed to solve, there is much more in common between the HP-15C and the HP42S than there is between the HP-15C and the HP32S, or between the HP32S and the HP42S.

HP-15C/32S/42S top-row math keys

A:

> Quote:
>
> I suspect the design differences are evidence that the HP42S was not related to the HP32S in any way except use of Saturn and external appearance.

"not related ... in any way"? That's a rather sweeping -- and wrong -- conclusion based on just one difference in key layout.

Use of the Saturn microprocessor is a significant similarity because that means identical mathematical algorithms (for functions that are common to both). The virtually-identical appearance resulted from the use of identical packaging and basic layout, as well as a design based on one shift key and menu-based access to many functions.

Of course, the function set, display, programming paradigm, and price were quite different.

As for the minor difference in top-row keys: The HP-42S has an unshifted up-arrow key (convenient for menu and program scrolling), bumping XEQ to the top row and leaving one fewer key for transcedental math functions. This also explains why y^x was shifted. (Walter B. correctly pointed out that the layout of these keys are identical to those of the HP-41.)

Back to the original poster's question: The square-root symbol (x inside a radical) can be difficult to discern in small font. That may explain why square root, instead of x^2, is typically unshifted.

I suspect that aesthetics and consistency of structure played a large role in some of the layouts:

HP-15C:

UNSHIFTED:	sqrt	e^x	10^x	y^x	1/x
SHIFTED:	x^2	LN	LOG	%	%CHG

HP-32S:

UNSHIFTED: sqrt e^x LN y^x 1/x
SHIFTED: x^2 10^x LOG % %CHG

HP-42S:

UNSHIFTED: 1/x sqrt LOG LN
SHIFTED: y^x x^2 10^x e^x

The following should be noted:

- On the HP-15C, the three leftmost pairs are inverse functions, and the three "exponentiated to power x" functions are side-by-side, forming a group.
- On the HP-42S, the three rightmost pairs are inverse functions. Four exponentiated functions are side-by-side, as are LOG and LN. These also form groups.
- The HP-32S is perhaps optimized for convenience; LN and e^x-- which are used more than LOG or 10^x -- are unshifted on two of the five keys.

The 42S inherited the top key sequence of the 41 (and added XEQ to this row). The 32S had the standard top key row of the scientific Pioneers (20S, 21S, 22S). So it's obvious which came first.

I sort of remember that some earlier machines did x^2 using logarithms as a special case of y^x with the result that

1. x^2 was less accurate than x X x, and

2. x^2 was slower than x X x

Do you remember anything like that?

Palmer

Using ENTER^, X will lose the contents of the T register... which may be an important consideration for some (programs, of course).

Re: Why is x^2 shifted?

*Message #24 Posted by **David Hayden** on 24 Sept 2009, 11:47 a.m.,*
in response to message #1 by Frank Rottgardt

That's a good point, Frank. I think you're suggesting that they put x^2 and sqrt(x) on the same key, make sqrt(x) shifted and x^2 unshifted, rather than the other way around.

I wrote a long note on HP's support site shortly after getting my 50g giving some thoughts on the keyboard. I recognize the difficulty in changing such things, but it's still helpful to speculate I think.

More specifically, I noticed that several unshifted keys (TOOL, VAR, NXT, and SYMB) and more than a dozen shifted keys do nothing more than change the soft-menu context. Many others (like APPS, MODE and shifted functions CHARS, EQW and CAT) just start applications. I'd put nearly all of these functions behind a single "Menu" key. Some functions like EQW are really key from a marketting perspective so they might still be on the keyboard.

I'd also change it so that pressing a shift key would change the softkey labels to indicate the new function (shifted soft keys already PERFORM different functions, but the labels don't change to indicate what the new function is). Finally, I'd do two rows of 5 soft keys instead of 1 row of 6 (and two rows of labels on the screen to match). Note that this would allow an extra character in the softkey label that appears on the screen

By adding this emphasis on soft keys, you could now remove a ton of clutter. You'd probably need just one shift key, which would make room for a large ENTER key. With 20 functions available in each menu (10 unshifted and 10 shifted) you wouldn't need the NXT key at all. In the unlikely event that a menu set required more than 20 functions, you could add NXT and PREV soft functions.

Dave

*Message #25 Posted by **Martin Pinckney** on 25 Sept 2009, 11:44 a.m.,*
in response to message #1 by Frank Rottgardt

The 27s gives "equal time" to everybody: SQRTx,x^2,e^x,LNx,10^x,LOGx,y^x,1/x are ALL shifted. Only the trig functions are arranged in unshifted/shifted groupings.

Re: Why is x^2 shifted?

*Message #26 Posted by **bill platt** on 6 Oct 2009, 10:42 a.m.,*
in response to message #25 by Martin Pinckney

Hi Martin,

Actually that isn't completely true. If you are working from the MAIN menu position, then all of the blue "shifted" functions in the top row are direct press (UNshifted) as there are no softkeys active!

Maybe you already knew this but if not, it is useful to know.

gamma approximation in 48/49/50?

*Message #1 Posted by **Eric Smith** on 24 Sept 2009, 3:04 a.m.*

I've been poking around in the 48GX, and I'm curious about the approximation of the gamma function it uses. For real non-integer arguments greater than 6, it uses an approximation which I've rewritten in (ugly) C code:

```
double gamma (double x)
{
  const double k0 = -49.5920119017593;
  const double k1 = 3.03479606073615;
  const double k2 = -7.65594818140208;
  const double k3 = 0.933584905660377;
  const double k4 = -0.121142857142857;
  const double k5 = 0.4;
  const double k6 = 0.918938533204673;

  double tx2 = 12.0 * x * x;  // 12 x squared

  double ln_gamma = x/(k4/(k2/((k0/(tx2+60))+tx2+k1)+tx2+k3)+tx2+k5)-x+k6+(x-0.5)*log(x);
  return exp (ln_gamma);
}
```

(Note that in C the log(x) function is the natural log, and exp(x) returns e to the x.)

This doesn't appear to exactly match any of the approximation formulas I've seen elsewhere. Is this a rearrangement of one of the well-known approximation formulas?

It's possible. I haven't yet figured out how the real gamma function in the 34C works, and I haven't even started looking at the 15C gamma function code yet.

Re: gamma approximation in 48/49/50?

*Message #4 Posted by **Eric Smith** on 24 Sept 2009, 6:54 p.m.,*
in response to message #2 by Ángel Martin

I found the 19C/29C Mathematics Solutions book you're referencing on the MoHPC DVD, and the section on the Gamma function references an HP-25 program in 65 Notes v3n10, which I found on Jake's PPC CD-ROM. It does look similar, though the 48GX code uses more terms, presumably to get more digits of accuracy. It's unfortunate that the authors of that program don't give a derivation or reference. (Then again, maybe it is obvious to someone with a better mathematics education than I have.)

in response to message #4 by Eric Smith

Interestingly HP seemed to have abandoned this approximation in other solutions books published afterwards (see the 67 and 41 HL math for instance) just to return to it (allegedly) on the saturn machines... vagaries of corporate design teams perhaps?

Re: gamma approximation in 48/49/50?

*Message #6 Posted by **hugh steers** on 24 Sept 2009, 11:56 a.m.,*
in response to message #1 by Eric Smith

using this approx on 7.22! gives, 7877.71704167 but my hp50 gives 7877.71717234 which is correct.

do you get the former on your 48gx?

Re: gamma approximation in 48/49/50?

*Message #7 Posted by **Frank Rottgardt** on 24 Sept 2009, 12:05 p.m.,*
in response to message #6 by hugh steers

My 48GX Singapore 3438S02321 give me the same result as you 50g.

Re: gamma approximation in 48/49/50?

*Message #8 Posted by **hugh steers** on 24 Sept 2009, 12:24 p.m.,*
in response to message #7 by Frank Rottgardt

So Eric, is this really the formula used, or could it be to do with the number system in the 48 vs the "C" code?

Re: gamma approximation in 48/49/50?

*Message #9 Posted by **Eric Smith** on 24 Sept 2009, 3:48 p.m.,*
in response to message #8 by hugh steers

It's possible that I didn't transcribe one of the constants from the 48GX correctly, as I was doing it by hand, and I haven't got time to double-check it. (I forgot to write down the address of the code in the 48GX ROM, so I'd have to find it again.) Anyhow, unless I screwed it up, my C code is essentially the logic used in the 48GX factorial function.

They use other code for dealing with integers, and with values less than 6. I assume that they're using the standard reflection formula to handle negative numbers, but I didn't study the code for it.

Presumably they chose 6 as the lower bound of the domain because the approximation is less accurate for smaller values.

My point wasn't the C code would be useful for anything. I just wondered if anyone was familiar with this approximation.

Re: gamma approximation in 48/49/50?

*Message #10 Posted by **Tim Wessman** on 24 Sept 2009, 6:26 p.m.,*
in response to message #9 by Eric Smith

I just looked in the source and there wasn't any clue there at all. Here are the constants pulled out of there to check your transcription.

NIBHEX 395710911029594
NIBHEX 516370606974303
NIBHEX 802041818495567
NIBHEX 773066509485339
NIBHEX 758241758241121
NIBHEX 000000000000004
NIBHEX 376402335839819

For those not familiar with saturn encoding, like all HP stuff it is sdrawkcab. . . :-)

Re: gamma approximation in 48/49/50?

*Message #11 Posted by **Eric Smith** on 24 Sept 2009, 6:49 p.m.,*
in response to message #10 by Tim Wessman

Thanks, Tim! I did drop a digit in the constant I designated k1, so I've updated the code.

On my x86-64 Linux system, it still doesn't perform as well as the actual HP-48GX. IEEE double precision should have just over 15 digits of precision, so I don't think that's the problem. Perhaps the natural log and exponential functions aren't as accurate.

Re: gamma approximation in 48/49/50?

*Message #12 Posted by **hugh steers** on 24 Sept 2009, 9:37 p.m.,*
in response to message #11 by Eric Smith

Something subtle is missing. these constants, they don't much change magnitude are there some exponents missing?

Re: gamma approximation in 48/49/50?

*Message #13 Posted by **Eric Smith** on 24 Sept 2009, 11:53 p.m.,*
in response to message #12 by hugh steers

I think I have the exponents correct, but it would be helpful for someone else to study the actual HP-48 (or -49 or 50) code to see if they spot any obvious mistakes in my C rewrite.

Re: gamma approximation in 48/49/50?

*Message #14 Posted by **Tim Wessman** on 25 Sept 2009, 12:11 a.m.,*
in response to message #13 by Eric Smith

I looked at it quickly when I grabbed those constants. I didn't see anything that looked out of place. I didn't look long though, so I easily could have missed something.

Re: gamma approximation in 48/49/50?

*Message #15 Posted by **Pal G.** on 25 Sept 2009, 12:33 a.m.,*
in response to message #13 by Eric Smith

I do believe Eric's constant k1 and Tim's hexbin line 2 do not match the other constant's regarding their backwardness.

ie.:

```
constant k0 = ABCDEFG : nibhex GFEDCBA
constant k1 = GFEDCBA : nibhex ABCDEFG
constant k2 = ABCDEFG : nibhex GFEDCBA
constant k3 = ABCDEFG : nibhex GFEDCBA
constant k4 = ABCDEFG : nibhex GFEDCBA
constant k5 = ABCDEFG : nibhex GFEDCBA
constant k6 = ABCDEFG : nibhex GFEDCBA
```

Does that matter?

Re: gamma approximation in 48/49/50?

*Message #16 Posted by **Eric Smith** on 25 Sept 2009, 4:11 a.m.,*
in response to message #15 by Pal G.

I appreciate your taking it look at it, but either I don't understand what you are suggesting, or you are mistaken. I double-checked and am fairly certain that all of my k[i] constants are in the reverse digit order of the NIBHEX strings Tim posted. I did have a dropped digit in the middle of k1, which I've since corrected, but that didn't improve the accuracy to match the actual 48GX.

Re: gamma approximation in 48/49/50?

*Message #17 Posted by **Pal G.** on 25 Sept 2009, 11:41 a.m.,*
in response to message #16 by Eric Smith

I apologize Eric. My brain seems to have failed last night. I'm looking at it now and I can't figure out where my head went wrong. I thought k1 was mirrored wrong compared to the other entries.

I will move to another thread and MYOB ;)

Re: gamma approximation in 48/49/50?

*Message #18 Posted by **Steven Thomas Smith** on 25 Sept 2009, 11:46 a.m.,*
in response to message #1 by Eric Smith

That's simply the asymptotic expansion of log(Gamma(x)), rearranged as a continued fraction. For example, you can recognize the k6 constant as log(2*pi)/2 = 0.91893853320467267. The coefficients are all Bernoulli numbers, which are spelled out explicitly in the asymptotic expansion for Gamma(z).

A better implementation would use Lanczos's approximation.

Re: gamma approximation in 48/49/50?

*Message #19 Posted by **Eric Smith** on 25 Sept 2009, 5:25 p.m.,*
in response to message #18 by Steven Thomas Smith

Thanks! I knew someone here would recognize it!

> Quote:
>
> A better implementation would use Lanczos's approximation.

Is that still a better method than the Nemes approximation? Or the Stieltjes approximation, which along with many others is described here?

Re: gamma approximation in 48/49/50?

*Message #20 Posted by **hugh steers** on 25 Sept 2009, 8:06 p.m.,*
in response to message #19 by Eric Smith

maybe it really does use this formula and there is no mistake here. except there is an outer "driver" routine that conditions the input.

say we want 12 accurate digits. I have the (alleged) 48 logic as:

```
double _gamma48gx(double x)
{
    const double k0 = -49.5920119017593;
    const double k1 = 3.03479606073615;
    const double k2 = -7.65594818140208;
    const double k3 = 0.933584905660377;
    const double k4 = -0.121142857142857;
    const double k5 = 0.4;
    const double k6 = 0.918938533204673;

    double tx2 = 12.0 * x * x;  // 12 x squared
    double ln_gamma = x/(k4/(k2/((k0/(tx2+60))+tx2+k1)+tx2+k3)+tx2+k5)-x+k6+(x-
0.5)*log(x);
    return exp (ln_gamma);
}
```

this barely gets about 8 digits for numbers starting at 6. But, if you bump all inputs up to around 100, things are ok.

eg

```
double gamma48gx(double x)
{
    double g;
    double p = 1.0;
    while (x < 100)
    {
        p *= x;
        x = x + 1;
    }
    return _gamma48gx(x)/p;
}
```

ok, its not very good because you have to perform all those multiplies, but it does get the right answer.

so i had a look at what also might be done with the same amount of work (ie 4 divides, some adds plus log/exp), i am finding the Stieltjes forms quite good. for example, i get this:

```
double gammaStieltjes4(double x)
{
    // get 12 digits x > 8
    const double a = 1.0/12;
    const double b = 1.0/30;
    const double c = 53.0/210;
    const double d = 129.0/250;  // adapted

    // would be a constant
    double e = sqrt(2*PI);
    double s;

    s = a/(x + b/(x + c/(x + d/x)));
    return e*exp((x-.5)*log(x) - x + s);
}
```

this starts getting 12 correct digits somewhere between 7 and 8 and would be easy to bump up in the same was suggested above, but with only a few extra multiples (maybe just one). Either that or use the next best version of the approx (ie one more term).

in this example, i got surprisingly accurate results from this 4 divide logic. actually this was a mistake, i had a typo in the last coefficient that turned out to make it *more* accurate!

After some experimentation, it turns out to be a benefit to adjust the last coefficient term to take account of the fact that you are stopping there (can compute the adjustment from the next term ignored). I did this and arrived at my "adapted" term here.

i still don't really know what the 48 actually does.

N-type Zinc Battery

*Message #1 Posted by **Gerson W. Barbosa** on 23 Sept 2009, 12:13 p.m.*

I haven't been able to find alkaline batteries for my 41CX. However I found Vinnic 1.4V zinc batteries, like this one. I preferred to wait until next week, when alkaline batteries are due to arrive. Zinc batteries cost half the price but my concern is about the damage they might cause in case of leaking. Has anyone tried them?

Thanks,

Gerson.

Re: N-type Zinc Battery

*Message #2 Posted by **John Robinson** on 23 Sept 2009, 7:12 p.m.,*
in response to message #1 by Gerson W. Barbosa

Hi Gerson, i have tried both Zinc and Alkaline, and both work fine, except the Alkalines give longer life of course, and are better for using the card reader. If you use the card reader with zinc batteries, you will kill them pretty quickly.

Also, in Australia at least, Alkaline N cells are available from Tandy Electonics (= Radio Shack in US ?).

Cheers, John

Re: N-type Zinc Battery

*Message #3 Posted by **Gerson W. Barbosa** on 23 Sept 2009, 8:08 p.m.,*
in response to message #2 by John Robinson

Hello John,

Thank you very much for the information. Yes, I occasionally use the card reader so I will try them only on the 28S.

Regards,

Gerson.

TI Aims Lawyers at Calculator Hackers

*Message #1 Posted by **jacksonconsult** on 23 Sept 2009, 12:06 p.m.*

The Register

Re: TI Aims Lawyers at Calculator Hackers

*Message #2 Posted by **hugh steers** on 23 Sept 2009, 3:47 p.m.,*
in response to message #1 by jacksonconsult

So this has to be to do with calculators in education. Firstly, it's an enormous amount of work to rewrite a new calculator, or "OS" as they call it. it takes literally years to get all the bugs out - and then you still find some. It's not something that Ti should be afraid of. ie repurposing.

so presumably this is to prevent exam approved calculators from being repurposed into better calculators that can be used to cheat. Frankly, anyone who can repurpose a Ti83 into a Ti89 should be hired by TI !

Re: TI Aims Lawyers at Calculator Hackers

*Message #3 Posted by **Joerg Woerner** on 23 Sept 2009, 4:06 p.m.,*
in response to message #2 by hugh steers

Hugh,

I'm not kidding - there are "kits" available to convert the TI-83 Plus to a TI-89 or a TI-84 Plus to a TI-89 Titanium ;-))

Basically you just swap the printed circuit boards ;-))

Regards, Joerg

Re: TI Aims Lawyers at Calculator Hackers

*Message #4 Posted by **hugh steers** on 23 Sept 2009, 5:12 p.m.,*
in response to message #3 by Joerg Woerner

Hi,

Yes i've heard of these case swaps. So what you're thinking is that you could hack the ti89 firmware to identify itself as a Ti83, then re-sign it and load it onto a ti83 with a 89 internal board, and thus fool the invigilators?

cracking idea!

I'd see *new* OSes more targeted to something special purpose. It's an embedded platform with a screen, I/O, and a keyboard. Could be a game machine, data collector, etc...

Why not embrace this? Have a repurposing kit and a contest.

> Quote:
>
> It's not something that Ti should be afraid of. ie repurposing.

Furthermore the percentage of people that would actually do this rounds to zero.

Maybe on a TI calculator. What would be the percentage on a HP calculator? :-)

Re: TI Aims Lawyers at Calculator Hackers

*Message #7 Posted by **Egan Ford** on 24 Sept 2009, 1:54 a.m.,*
in response to message #6 by hecube

The same. The new 20b and 12C can be repurposed and with HP's blessing. See http://www.wiki4hp.com/doku.php for details. Incredible! However, I'd wager that < 10 people have actually done it. How many 10s of 1000s of HP financial calculators are sold each year?

IMHO, the repurposing of anything (cars, computers, calculators, etc...) will only attract a very small minority.

I'm not so sure. One reason for the success of the Palm Pilot was that they made it easy to customize it and develop new software for it. I think the same is true of the iPhone and iTouch -

they're nice platforms for 3rd party applications.

I'm currently working on an application for the 40gii. When in the field, the calculator will basically be a dedicated platform for this application and will probably not be used as a calculator at all (or very little).

Tim Wessman's surveying program is another example of a repurposed calculator.

Re: TI Aims Lawyers at Calculator Hackers

*Message #9 Posted by **Egan Ford** on 24 Sept 2009, 2:42 p.m.,*
in response to message #8 by David Hayden

Applications for an existing platform using the platform API is not repurposing. It's actually a supported purpose of the device.

silver band rubbing off...

*Message #1 Posted by **juan demin** on 22 Sept 2009, 5:29 p.m.*

Hi, does anybody know how to make the silver band around the front of classic calculators look silver again? Is that a special paint? Any advice? Thanks

Re: silver band rubbing off...

*Message #2 Posted by **db (martinez, ca.)** on 22 Sept 2009, 11:37 p.m.,*
in response to message #1 by juan demin

Juan; All my calc fixin' stuff is in boxes right now and i can't remember the brand name but there was a kind of pen available in the states that would "write" in silver. It was black and silver colored. I used it on a classic's trim and it looked good, just not as shinny.

There will probably be people who will say, IN CAPS LOCK, that it's not kosher to replace paint or labels with non original stuff. Me, i think if a calculator works well after the "pretty" is gone then it was well made. Wasn't it? Dings, scratches, and a funky r/s key on a 41 that has survived 30 years of bulldozer dust are badges of honor.

Re: silver band rubbing off...

*Message #3 Posted by **Thomas Radtke** on 23 Sept 2009, 8:07 a.m.,*
in response to message #2 by db (martinez, ca.)

In my experience, the paint of those pens is easily rubbed of. I ended up with some modeling paint that gave a durable result. I bet I could have made it slightly more shiny by polishing, but it is ok as it is now.

Re: silver band rubbing off...

*Message #4 Posted by **Dan W** on 24 Sept 2009, 1:51 p.m.,*
in response to message #1 by juan demin

That little silver pen others have mentioned works well for the very thin lines to the sides and the bottom edge. These edges are also fairly well protected and I have not had a problem with it rubbing off. These pens are ball-point with a liquid silver paint. Find them at art shops like Michael's in the US.

The top line is another matter. First, it is thicker than the other lines. second, being next to the switch it gets a lot of wear. That silver pen won't cut it.

I use a chrome spray paint and a clear acrylic top coat. Carefully mask off the line - spend as long as needed to get the masking perfect. Then I put the whole calculator in a small plastic bag that has a half inch wide slit cut for the trim to show through. I mask around the slit to protect the calculator from overspray. Then I give it a few coats of the chrome paint, let dry, then a few coats of clear acrylic.

After it has dried and the masking removed, there is typically a lip of paint where the masking edge was. This can be removed by running your fingernail across the edge.

This won't duplicate the chrome plate look. Despite the name of the paint, it's really a silver paint and so it has a matte texture, not the mirror finish of chrome. Still, it looks good IMHO.

Whether or not to do this is up for debate of course. I wouldn't do this on any highly collectible item. But I will often touch-up a run-of-the-mill Classic.

Sealed in bag, ready for painting:

HP-55 with restored chrome. Slightly underexposed to bring out the texture of the top line:

And the complete before-and-after restore:

There is another possibility with metal polishing paint by Gunze Sangyo (H-211 chrome silver, approx. 5$ for 10ml). It is an acrylic based paint that can be applied by brush, or better, by airbrush and be polished after drying. Though I did not use it yet on my 35 and 45 with the typical damage near the off/on switch, I made good experiences in railway modelling with such paint.

Andreas

When I was a young squirt I made a lot of plastic scale models. Back then we didn't have, that I recall, these metalizer paints. You got me thinking about digging around the scale modeler sites. There are quite a few paints that are intended to be buffed out to create a metal-like finish.

Gunze Sangyo may be hard to find but Testors makes a similar product and there are others.

Here's a good site with photos of scale aircraft using these paints.

http://www.clubhyper.com/reference/nmfcb_2.htm

I may have to dust off my old Badger airbrush.

I have had rather nice success with Aluminum leaf. You will plop down about $20-$25USD on

both the 'Size' (the varnish you use to prep the surface for the leaf to adhear to) and aluminum leaf. There are a number of quick videos on how to leaf; it is rather easy, just practice on a couple of times on sacrificial objects.

Spray two very light runs of clear coat afterward about an hour to two apart.

But it looks damned pretty when you are done. (This is also VERY good for voyager badges.)

Re: silver band rubbing off...

HP 42S what can we do with a 2nd rom?

*Message #1 Posted by **nacho** on 22 Sept 2009, 1:29 p.m.*

I know it has been exposed sometimes the fact that 17BII international units have 2 roms in it.

1st Rom (calc Rom) 2nd Rom (Language Rom).

The question I have is if it would be possible to access to a 2nd ROM? XFCN is the key??

So If it was possible what type of ROM could it be? only acces ROM or a substitute of the Original ROM??

Would it be a way to expand the 42S as the 41 series with its rom Modules?

Regards!

Re: HP 42S what can we do with a 2nd rom?

*Message #2 Posted by **davidshenk** on 24 Sept 2009, 11:39 a.m.,*
in response to message #1 by nacho

I don't think there is a lack of interest in this question, just a lack of knowledge. Without some inside information, it's probably impossible to utilize the second ROM. Dave

Re: HP 42S what can we do with a 2nd rom?

*Message #3 Posted by **Raymond Del Tondo** on 24 Sept 2009, 4:10 p.m.,*
in response to message #2 by davidshenk

There were threads about this topic in the past.

To sum them up somehow:
It would be possible to utilize the language ROM space for OS extensions,
but you had to find someone who actually knows how to program the functions, which I guess are only a handful of people,
and someone to burn and wire a suitable ROM/EPROM chip to the location.

The first problem is a rather time-consuming one,
and in combination with the 2nd problem (hardware mod) a rather expensive one.

There may be many people wanting to have and extended HP-42S, maybe with an XFCN ROM
maybe with I/O capability (which works, as Christoph Giesselink demonstrated),
but there are only a few who even let their HP-42S upgrade to 32K RAM,
and maybe not enough people to pay off the effort for making the real h/w extensions, like XFCN ROM and I/O;-)

HTH

Raymond

Re: HP 42S what can we do with a 2nd rom?

Hi,

May be a little too late, but I for one, have built the HW mods in order to create a "Frankens-42-MLDL" with access to the memory bus.

Regrettably I'm on the lowest end on Saturn assembly knowlegde, but since I met Mr. Giesselink at last Alshwill meeting on Nov. '08 I find an interesting field for experiment and development... although (as Raymond has pointed out), most users won't let their valued and valuable 42's in foreing hands under no circumstances. Which turns all this in a project of myown in the long term.

My interest is, by one hand, simply knowledge; and by the other hand, if I only could get...

- a way to create 42's RAM back-ups (may be IR input?) - PC connectivity (serial or serial converted to USB externally) - a real time clock functions set, as those in the TIME module of the 41

... then I may try a 128KRAM upgrade also.... ;-))

Oh, well, it's real late here in the Canaries, may be I'm just dreaming.

Best wishes.

Diego

32sii Quality over time...

*Message #1 Posted by **Michael Plant** on 22 Sept 2009, 12:34 p.m.*

Just a quick question WRT the build quality of the brown bezel 32sii versus the silver bezel version. I have the latter and find it very flimsy feeling compared to my Singapore produced 42s. I'm wondering if the earlier brown bezel versions are noticeably more "substantial" feeling?

Re: 32sii Quality over time...

*Message #2 Posted by **Frank Rottgardt** on 22 Sept 2009, 12:56 p.m.,*
in response to message #1 by Michael Plant

my brown bezel 32sII made in Singapore is very good in terms of build quality. Perfect keys with good tactile feedback that never fail to register, face plate without fading colours or vanishing symbols, sturdy housing, no display glare. But it rocks slightly on the desk (all rubber feets in place) when entering numbers. Moderate daily use at work. Bought it used. The rubber feets were like new when I got it. So the calculator might not be owned by a power user.

Re: 32sii Quality over time...

*Message #3 Posted by **Ed Look** on 22 Sept 2009, 10:21 p.m.,*
in response to message #1 by Michael Plant

I am the original owner of mine, a brown bezel model made in Indonesia. I have had it now coming up on ten years. It still feels fine to me. The keys maybe are just slightly less snappy than the day I bought it, and that aesthetically pleasing Pioneer form factor case feels solid, reminiscent of my old Spice. The colors of the case, bezel, keys, and keyboard, along with the metal plated raised plastic lettering of the logo have not faded to my eye (of course, it's never out in the sun!). There is a little bit of heft to it, not like a Spice series nor a 50g, though.

It's a very pleasing little calculator to use. It makes me wish I did have a 42S.

Re: 32sii Quality over time...

*Message #4 Posted by **Mike Morrow** on 23 Sept 2009, 12:37 a.m.,*
in response to message #3 by Ed Look

You should prowl ebay and find yourself an HP42S! With the economic downturn, prices are generally lower than I've seen in several years, unless the HP42S is new in the box!

The HP42S 21 years after introduction is stunning. I thought that 12 years ago when I got my first one, and I still think that today.

As for color scheme...it's like about everything else that HP produced after 1986. It's disadvantageous, ugly, and sucks big time. It's chosen only for left-coast artsy BS appeal. For the Pioneers, it's suck-butt orange on fecal brown! What could HP management been doped up on to come up with that? I'd love a HP42S++ that also had the capability of its worthy financial cousin, the HP17Bii, and the color scheme of the HP-

15C. Almost perfection!

Perfection would also require that the ENTER key be placed above the /, *, -, + keys, the way it was for pre-Saturn calculators. Putting those keys on the right and leaving the ENTER on the left for the Saturn era was absolute incompetent idiocy by HP! Apparently, the visual appeal of a keyboard with less effectivve key arrangement won.

I'd like a mini-SD card too, but I doubt that the power demands of such a device could long be met by a calculator powerd by a 357 or 2032 battery.

*Message #6 Posted by **Patrick Rendulic** on 23 Sept 2009, 11:46 a.m.,*
in response to message #5 by Michael Plant

I have an 12 year old Indonesian brown bezel model, almost daily use. It still works perfectly and feels wonderful.

I don't like the silver bezel black ones. They feel cheaper and above all, the display response is far worse. Numbers don't appear instantly on the display of the black one when typing. That's annoying.

Re: 32sii Quality over time...

*Message #7 Posted by **Michael Plant** on 23 Sept 2009, 12:44 p.m.,*
in response to message #6 by Patrick Rendulic

Thank you for this - this is what I was looking for, a comparison of both. I'm bidding on some brown bezel units now... It's going to take me some time to pick one up, though, because I'm not in a position to pay the prices they are fetching on the auction site. However, with luck, one of my low ball bids will be successful at some point.

"Why Rechargeable Batteries Are Rarely Cost Effective"

*Message #1 Posted by **Egan Ford** on 22 Sept 2009, 11:38 a.m.*

Interesting read subject to debate: http://lenpenzo.com/blog/id710-why-rechargeable-batteries-are-rarely-cost-effective.html.

Re: "Why Rechargeable Batteries Are Rarely Cost Effective"

*Message #2 Posted by **Dave Shaffer (Arizona)** on 22 Sept 2009, 12:49 p.m.,*
in response to message #1 by Egan Ford

He's probably right for low-current draw equipment.

He didn't mention digital cameras - they are real power hogs and almost everybody has one.

He also didn't do his battery shopping very well. With diligent searching (perhaps at hamfests), you can get the batteries for around a buck. They are less than $2 at Frys anytime. And, you need only one charger, brand names of which can be found on sale for under $10: I've seen (& bought) 4 batteries+charger (Rayovac and/or Energizer) for $9.95 at Target.

Re: "Why Rechargeable Batteries Are Rarely Cost Effective"

*Message #3 Posted by **designnut** on 22 Sept 2009, 2:45 p.m.,*
in response to message #2 by Dave Shaffer (Arizona)

I recently invested in low discharge rate Eneloop Nimh cells and find they do live up to their name. They are hot. Things run faster on them, and I can use them in cameras or infrequently used items. My toothbrush and shaver are speedier, and my pocket radio is hotter than with former cells. I do have big piles of other nimh cells and they do self discharge and fail. Sam

*Message #4 Posted by **Maximilian Hohmann** on 22 Sept 2009, 3:05 p.m.,*
in response to message #1 by Egan Ford

Hello!

> Quote:
>
> ... to debate ...

IMO, there are other aspects involved that are far more important than cost effectivity. Most important to me is that recharchable batteries result in several orders of magnitude less toxic and hazardous waste than disposable batteries do. If we would have to pay all the real and future costs caused by the manufacturing and disposing of single use batteries, than these would be far more expensive than rechargeable ones.

Greetings, Max

Re: "Why Rechargeable Batteries Are Rarely Cost Effective"

*Message #5 Posted by **Garth Wilson** on 22 Sept 2009, 3:47 p.m.,*

Do you have any data on the toxicity? I don't think alkaline batteries have mercury in them anymore.

Re: "Why Rechargeable Batteries Are Rarely Cost Effective"

*Message #6 Posted by **Maximilian Hohmann** on 22 Sept 2009, 4:35 p.m.,*
in response to message #5 by Garth Wilson

> Quote:
>
> Do you have any data on the toxicity? I don't think alkaline batteries have mercury in them anymore.

It is not the mercury in the first place, which makes them toxic, but the mining and processing of the raw materials! The latest figure that I could find is this: in the year 2000 in Germany, 15,000 tons of alkaline batteries have been sold. That means 15.000 tons of zinc, steel (for the casing), plastic, electrolyte (toxic) and manganese dioxide produced to been thrown away shortly thereafter.

Plus the energy required: The manufacturing process of a disposable battery consumes about 300 times (the qouted figures range between 50 and 500 depending of the type of battery) as much energy as is stored in the cell! Rechargeable batteries reduce the amount of raw materials and the amount of energy required by a factor of at least 100. That alone should be a good reason not to buy disposable batteries. I haven't done in 20 years...

Re: "Why Rechargeable Batteries Are Rarely Cost Effective"

*Message #7 Posted by **Mark Edmonds** on 22 Sept 2009, 4:57 p.m.,*
in response to message #6 by Maximilian Hohmann

I haven't read the original linked article but one aspect that niggles me with high power rechargeables in cameras, laptops, phones, etc., is that nearly each device has its own custom battery.

If I put on my cynical hat, the main reason for this is to tie the customer down to having to buy an expensive bespoke battery which the same company sells at a high profit.

We have standard size cells like AA, AAA, etc so surely it is possible if the will exists to design rechargs into 2xAA form factors and so on, standardise manufacturing and remove the waste bought on by having unique batteries for each device.

Mark

Re: "Why Rechargeable Batteries Are Rarely Cost Effective"

*Message #8 Posted by **Garth Wilson** on 22 Sept 2009, 5:12 p.m.,*
in response to message #7 by Mark Edmonds

> Quote:

> is that nearly each device has its own custom battery.

That's mostly why, when I bought a digital camera recently, I insisted that it use AA batteries which I get at $.25 to $.35 each for alkalines and can change in a few seconds. It is also why I won't buy a calculator that requires a custom battery. I don't like today's high price of N cells for the HP-41, but at least I can go a year at a time or more without thinking about batteries.

And for many uses, the self-discharge rate of rechargeables makes them unacceptable.

Re: "Why Rechargeable Batteries Are Rarely Cost Effective"

*Message #9 Posted by **Steve S** on 22 Sept 2009, 7:26 p.m.,*
in response to message #8 by Garth Wilson

<<...for many uses, the self-discharge rate of rechargeables makes them unacceptable...>>

...I was just about to say the same thing.

For equipment that is not in constant use, modern disposable batteries are hard to beat!

Re: "Why Rechargeable Batteries Are Rarely Cost Effective"

*Message #10 Posted by **designnut** on 22 Sept 2009, 8:06 p.m.,*
in response to message #9 by Steve S

<<If I put on my cynical hat, the main reason for this is to tie the customer down to having to buy an expensive bespoke battery which the same company sells at a high profit.>> I find many makers eager to offer replacements for these custom cells. I use google to find them and check prices. Sam

Re: "Why Rechargeable Batteries Are Rarely Cost Effective"

*Message #11 Posted by **Paul Guertin** on 22 Sept 2009, 8:28 p.m.,*
in response to message #8 by Garth Wilson

> Quote:
>
> That's mostly why, when I bought a digital camera recently, I insisted that it use AA batteries

I bought my digital camera five years ago, and did the same thing. I use low-self-discharge NiMH Eneloop batteries in mine and they work very well. On more than one occasion over the years, the possibility of using readily-available AA cells saved the day.

The modern trend toward custom, often non-replaceable batteries worries me. I was shopping for an MP3 player recently, and thought my requirements were pretty simple and reasonable: decent sound, an SD card slot, takes standard AAA or AA cells and has a usable interface for selecting the song order (i.e., not just a shuffle player). No need for video or other PDA stuff.

Well, it turns out that AA/AAA music players are extremely rare nowadays, and most modern MP3 players even have non-replaceable batteries, the idea being that when the battery doesn't take a charge anymore (which may be in 3-7 years), people will just buy a newer model with more features. In effect, you end up renting your MP3 player instead of

buying it.

Re: "Why Rechargeable Batteries Are Rarely Cost Effective"

*Message #12 Posted by **Chan Tran** on 22 Sept 2009, 10:15 p.m.,*
in response to message #11 by Paul Guertin

Most of the argument for the rechargables being less expensive and less toxic waiste based on a high number of expected recharge cycle. I doubt that the rechargable last as long as most people think they do. I found that I have to throw away my rechargables quite often. Typically 2 years, sometimes less sometimes more.

db: You miss an important non-HP RPN calculator!

*Message #1 Posted by **Joerg Woerner** on 22 Sept 2009, 11:31 a.m.*

Dennis,

I just took some time to browse your extensive non-HP RPN calculator collection and found one-and-a-half Texas Instruments calculators:

The TI-51 VI RPN HOAX and the Mickey Mouse calculator.

But you miss the ONLY real Texas Instruments RPN calculator!

How comes? Here it is:

In case you need one - I couldn't resist to put one for sale. Just search for RPN Simulator in our favorite four-letter website (e**y) and think about it.

Regards, Joerg

Re: db: You miss an important non-HP RPN calculator!

*Message #2 Posted by **Namir** on 22 Sept 2009, 11:37 a.m.,*
in response to message #1 by Joerg Woerner

Joerg,

How true to RPN stack operations is the TI-50 RPN module? I never had one to play with, but I have heard, from true HP devotees, that it is more of a toy RPN imitation.

Now since you are THE TI guy (AND a friend of the HP/RPN community) tell me if my impression is correct?

Cheers.

Namir

Re: db: You miss an important non-HP RPN calculator!

*Message #3 Posted by **Michael Meyer** on 22 Sept 2009, 7:25 p.m.,*
in response to message #2 by Namir

If I recall correctly, the RPN simulator module is mainly a translator that allows you to enter some simple RPN programs and convert them to TI-59 code.

Specifically, it did NOT reassign the TI-59 keyboard to an RPN machine.

There were some rpn programs for the TI-59, but the number of keystrokes needed was high, as everything had to be entered via "SBR" (subroutine) commands. And since those ran in a TI-59 program rather than a machine code, these were painfully slow and of no real use....

I was disappointed when this module came out, as it was the TI-59 that took me through college. Despite its limitations, it was a very powerful machine.

They are still pretty cheap to buy ($10-20) and fun to restore, though I've stopped at about 10 working ones...<grin>

Namir: The TI-59 with RPN Module beats the HP 67!

*Message #4 Posted by **Joerg Woerner** on 23 Sept 2009, 8:21 a.m.,*
in response to message #2 by Namir

Namir,

The TI Programmable 59 with the RPN Simulator is the best RPN calculator ever and easily outperforms the HP-67, HP-65 and even the HP-41C! Just buy it, test it for 3 months and compare it with your HP calculators. If you are not 100% satisified - just trade the calculator and module in within 3 months. No questions asked.

May the best calculator win!

No, I am not the sales guy from your local GM dealer - but I represent the Datamath Calculator Museum focusing on Texas Instruments calculators.

But - before I loose my credibilty in this wonderful forum:

The RPN Simulator module is a joke!!!

From the manual:

1) Enter the HP-67 keycodes amd watch your print cradle print the corresponding TI-59 keycodes in a program-listing format. HP-67 keycodes and step numbers are also printed for easy reference.

2) Key the program back into your TI-59 and record it on magnetic cards for future use.

3) Execute the program on your TI-59. Programs included in this library act as subroutines which simulates the RPN instructions.

You really wanted to do this on a daily base???

Hope this helps,

Joerg

Joerg -- Thanks for giving me a big smile.

*Message #5 Posted by **Michael Meyer** on 23 Sept 2009, 1:46 p.m.,*
in response to message #4 by Joerg Woerner

Very fun. No, the TI-59 didn't do RPN. Even if you tried. But it's still a great machine, with a great history, and mine withstood fairly heavy use for years... my original still works... even the card reader (not sure why).

Like most here, I still prefer RPN machines, especially HP's. But I have a respectable collection of TI's, and I enjoy restoring and playing with TI's as well. I have asked people to "keep an eye open" for calculators at garage sales, etc. and I have been brought a large number of TI-55's. Most of them still work as well as they did when they were new.

My HP-25 had such pretty, shiny traces on the circuit board in high school. But those traces were covered with solder, which corroded over the years. Most of the TI's had clear-coated copper traces that ended up being more resistant to battery gassing. (Except that darn SR-52 keyboard)

Anyway, I sure see a lot more dead HP's than dead TI's come my way. When restored, the HP's are amazing. Gotta give those TI's their recognition, though. Thanks for doing that for us.

Michael

*Message #6 Posted by **Michael de Estrada** on 22 Sept 2009, 12:21 p.m.,*
in response to message #1 by db (martinez, ca.)

Hi Dennis,

Thanks for the updates. I have a link directly tied to your list of calculators with the Mostek ROM >>>>

<Mostek>

There now are six (Privileg, Omron, APF, Corvus, GE, Sanyo). Thanks to your heads up, I found an immaculate Corvus 500, which has become one of my collection favorites. I noticed that only the Omron, GE and Sanyo have a DEG / GRAD switch, so I wonder if this is something implemented in the ROM, but not used on the other three calculators.

Regards,

Michael

Edited: 22 Sept 2009, 4:00 p.m.

Re: RPN

*Message #7 Posted by **db (martinez, ca.)** on 22 Sept 2009, 11:59 p.m.,*
in response to message #6 by Michael de Estrada

Michael; How'd you do that? Where'd the titles go? Man, just when i thought i had that thing figured out.....

I'll have to dig out the Corvus and look into the grad function, nice calc - worth finding again.

Re: RPN

*Message #8 Posted by **Michael de Estrada** on 24 Sept 2009, 12:03 a.m.,*
in response to message #7 by db (martinez, ca.)

Dennis,

How did I do it? Well, I did a filter search on "Omron" and the search result was all the Mostek based calcs. Why it does this I have no idea. Anyway, meanwhile, I watched a Garrett CM-35 just go for $71 on e**y. I wonder if the buyer knows it's RPN.

Michael

Re: RPN

*Message #9 Posted by **db (martinez, ca.)** on 24 Sept 2009, 1:04 a.m.,*
in response to message #8 by Michael de Estrada

if he doesn't know now, he will when he trys to use it.

that's a good price for a stylish calc.

Rosetta Stone

HP-41Z module ready (at last)

*Message #1 Posted by **Ángel Martin** on 20 Sept 2009, 3:54 a.m.*

You can stop holding your breath :) The module is ready and good to go to the daylight. I bet you thought it'll never be finished (I for one did!) but sure enough it's reached the "good enough" stage.

A quick recap of its highlights:

- a 4-level complex stack, complete for all the functions and routines.
- simplified/optimized complex displaying. It now uses the "RE+jIM" notation, more legible with real-life numbers (with EEX part)
- The displaying is nor rounded, but Integer numbers will display without trailing zeros in the decimal part. So you quickly tell if it's integer or not (and saves real state in the display).
- common factor is extracted when Re(z)=Im(z), and not zero - somehow I found slightly misleading the line "0(1+j)"
- 8k module, holding more than 120 complex math and complex stack functions, plus about 20 more buffer-related functions, 98% of them in MCODE
- programmable promptimg memory functions - with IND addressing support in run time

Already submitted to TOS, should hopefully be ready for download in a few days time.

Thanks to those who provided suggestions and actual coding, real MCODE programmers out there. Peter, Eric, Egan, Howard... In particular Doug Wilder for his implementation of the programable prompting routine, and Håkan Thörngren for his coaching on the buffer implementation. It would have taken them just a fraction of the time it took me to put it together had they wanted to!

Best, AM

*Message #3 Posted by **Howard Owen** on 20 Sept 2009, 7:15 p.m.,*
in response to message #1 by Ángel Martin

Congratulations on implementing all those improvements! I'm sure the programming wasn't a trivial exercise. I'd like to differ with you on one point however. I almost certainly couldn't have implemented those ideas in mcode anywhere near as fast as you could. The only mcode program I ever wrote was a simple initializer for Hepax memory. Stack and buffer manipulation like you achieved would have taken me a long, long time to write.

Congratulations again!

Regards,
Howard

Re: HP-41Z module ready (at last)

*Message #4 Posted by **Eric Smith** on 20 Sept 2009, 8:02 p.m.,*
in response to message #3 by Howard Owen

I've found that writing microcode for HPs goes much more quickly when I've got a simulator that lets me single-step through it, set breakpoints, etc. Otherwise debugging is extremely tedious.

I have no idea whether Ángel Martin uses such a thing, though.

Re: HP-41Z module ready (at last)

*Message #5 Posted by **Ángel Martin** on 21 Sept 2009, 3:29 a.m.,*
in response to message #4 by Eric Smith

I wish! Is there one available? That'll sure make my day... you're right it's tedious, but also painful and sooo easy to make mistakes. Yet it's as addictive as any programming language can be, maybe even mode.

Re: HP-41Z module ready (at last)

*Message #6 Posted by **Raymond Del Tondo** on 21 Sept 2009, 4:24 a.m.,*
in response to message #5 by Ángel Martin

Of course there are simulators with built-in debuggers.
One of them is part of SDK41 from Warren Furlow,
and the other is part of Emu41 from J.-F. Garnier;-)

Collection Redundancy

*Message #1 Posted by **Michael de Estrada** on 19 Sept 2009, 10:41 p.m.*

Inevitably a collection ends up with more than one sample of any given item. Sometimes it is the result of buying bits and pieces with different accessories in order to complete a set (cases, manuals, AC adapter) or even subcomponents in order to obtain complete functional and cosmetically undamaged units. I had to buy 13 Spice units in order to get 10 good units and at least one sample of each model. However, at some point this redundancy becomes wretched excess, and it's time to prune the tree so to speak. In my case, it's the HP-45. I have 7 complete sets for goodness sake, even though I have already disposed of two additional units. How exactly this happened, I'm not quite sure, but they just seem to reproduce like rabbits. I wonder if any of you have this problem of collectormania, or if it's just inevitable?

Re: Collection Redundancy

*Message #2 Posted by **Karl-Ludwig Butte** on 20 Sept 2009, 5:35 a.m.,*
in response to message #1 by Michael de Estrada

Hello Michael,

I wouldn't see this as a problem. For one side you've got a repository of spare parts just in case the one reaaly good unit needs repair. On the other hand you have items to exchange with other collectors and therefore the chance to get missing items while at the same time come into contact with others who share the same hobby like yourself.

Just in case you like the latter idea just send me an email.

Kind regards

Karl

Re: Collection Redundancy

*Message #3 Posted by **Valentin Albillo** on 20 Sept 2009, 10:51 a.m.,*
in response to message #1 by Michael de Estrada

I plead guilty.

I now have no less than 4 (four) HP-15C and 4 (four!) HP-71B (+ MathROM) ! :-)

Same with some SHARP models as well ... Quite frankly, having just two of each would be more than enough, what with the many excellent simulators/emulators freely available nowadays such as **Nonpareil**, say. Its HP-15C emulation is perfectly adequate for article, program, and challenge writing. Not that I indulge in any of that as of late ...

Best regards from V.

Re: Collection Redundancy

*Message #4 Posted by **Saile (Brazil)** on 20 Sept 2009, 11:55 a.m.,*
in response to message #1 by Michael de Estrada

I have that problem.
For more than 35 years I have been collecting.
My father's collection that was given for me
I have been making everything to organize my collection.
Now I have 600 items.
It still exists more than 8 boxes for me to organize where
they are several HP41CY, HP-01, PC-1600, CFX-200, Ruputer and
several documents and manuals
I am always giving a present my friends calculators and pocktes
that I have more than 2 units

Partially (PDF) of my collection of calculators and pockets (megaupload link)

I hope my children like my collection, because if they don't like
will have to do several happy people donating my collection when it
arrives the moment of my end or I begin of a new life without
worrying with HP Texas Sharp. . . :-)

Excuse my English am not good in the universal language ;-)

> I hope my children like my collection, because if they don't ...

My wife, my children and my friends don't exactly like my collection. They are more properly described as bemused by it, but they do tolerate it and have even helped me add to it.

What will happen to it when I am gone is another matter. What possible use can they make of over 600 old out-of-date hand-held calculators, over 200 old slide rules, an untold number of printers, chargers, battery packs, books and three large anchors (a.k.a. Fridens)?

in response to message #6 by Ron G.

Ron- could you let me know ahead of time? I'll try to do the same. (Though I'll tell me wife to try

to get $5 a piece for mine). Sigh.

Re: Collection Redundancy

*Message #8 Posted by **Palmer O. Hanson, Jr.** on 23 Sept 2009, 9:57 p.m.,*
in response to message #7 by Michael Meyer

It isn't just my calculators and slide rules. It's also my Ohlsson & Rice 23 model aircraft engine; the trowel, brick-hammer and level that I used to pay for college (1944-1950); my collection of cigarette lighters from places like Barber's Point NAS, Iwakuni NAS, Kadena AFB, Clark Field and Wheelus AFB; the Simpson Model 355 Midgettester that I used on F-100, F-101 and YF-12 programs (1957-1966); my Handbook of Chemistry and Physics Mathematical Tables and my AMS-55; my Annals of America and Durant histories; my chain saw; and so on, and on and on.

Re: Collection Redundancy

*Message #9 Posted by **Bart (UK)** on 24 Sept 2009, 5:07 a.m.,*
in response to message #8 by Palmer O. Hanson, Jr.

:) :) So if wait long enough I can start up my own collection really cheaply. Although 600+ calcs @ $2-$5 a piece can still total a few thousand dollars. Maybe the pound will be stronger by then (and pigs may fly).

Re: Collection Redundancy

*Message #10 Posted by **Egan Ford** on 20 Sept 2009, 2:25 p.m.,*
in response to message #1 by Michael de Estrada

I do not suffer from this condition. :-) I suppose that if it where critical to my job/life that I have a working unit 24x7 then I'd need a backup or two. Until recently I did this with my laptop--I always had a close to identical backup. Since I mostly use emulators, my physical calculators are my backup and my source for benchmarking and testing the accuracy of emulators/simulators.

Re: Collection Redundancy

*Message #11 Posted by **Juergen Keller** on 20 Sept 2009, 6:56 p.m.,*
in response to message #1 by Michael de Estrada

If your HP-45s really reproduce themselves like rabbits I would like to buy them :-) Anyway, I know your problem; often I think this unit is even nicer than the one I have, and oops, there is another calc in my collection. But luckily, there are these NOS (new old stock) items which eventually end this loop. But these NOS units have the disadvantage that they look so nice that you do not want to touch them, and I don't want to have calculators to only look at them...

Cheers, Jürgen

As I have said before, I am a user, not collector. But since the calculators I use are all out of production, I keep spares of the most important ones.

Re: Collection Redundancy

*Message #13 Posted by **juan demin** on 21 Sept 2009, 1:48 p.m.,*
in response to message #12 by Martin Pinckney

I've started my collection recently… Without any experience I bought the wrong calcs (of course)… then I realized that cases were important….and manuals too… then I realized that manuals in mint condition were a must…and calculators should not only work but look like new…Even though I bought and sold trying to have only one of each model, I now understand that this is a never ending story… I simple want to have the best and nicest calc fully equipped… Maybe this is not normal, but I check on ebay almost on a daily basis….

Re: Collection Redundancy

*Message #14 Posted by **Michael Meyer** on 21 Sept 2009, 2:06 p.m.,*
in response to message #13 by juan demin

Well... normal from the perspective of collecting. I was very active in collecting for about 5 years, until I had at least one working model, restored and functioning, of each model I wanted. I'm missing very few: 10C, 16C, 10 printing, etc. And I have several of the ones I love... 19C, 67, 97, 41, 71.

While I'm still involved enough to follow the posts here, and buy an occasional model now and then, it's slowed down. I can't justify spending the money for yet another HP-25 just to restore it, though I still throw some losing bids in.

So, don't worry. If it's an ongoing thing, you'll end up trading and selling. If not, you'll slow down when you collect the ones you want.

And if you just keep adding to the collection, there will be a day when somebody else, hopefully, will appreciate what you have done.

Program speed from sd card

*Message #1 Posted by **Iqbal** on 19 Sept 2009, 9:36 p.m.*

I wrote some programs for the 50G that are stored in port :0: (which was originally done to prevent people from copying programs). I just changed them to run straight from the sd card. The problem is that the program is much slower running from a 16mb sd card than the calculator, even though it's identical. Why is this? Is there anything that can be done to improve speed from sd card?

Edited: 19 Sept 2009, 11:20 p.m. after one or more responses were posted

Is there anything that can be done to improve speed from sd card?

The SD card is an external device, and its contents have to be copied to main RAM first to run. Port0 objects are evaluated directly.
There may be tweaks to improve speed somehow, but the principle stays the same;-)

Re: Program speed from sd card

*Message #3 Posted by **Tim Wessman** on 20 Sept 2009, 2:31 p.m.,*
in response to message #1 by Iqbal

Why specifically do they need to be in port 0 and not 2? What type of program is it and how much external data is being access vs. entered locally?

Running directly off the SD card is not really a good way to do it for speed reasons.

TW

Re: Program speed from sd card

*Message #4 Posted by **Iqbal** on 20 Sept 2009, 9:28 p.m.,*
in response to message #3 by Tim Wessman

Originally, I wrote them for the 48G series. And to prevent anyone from transferring via IR, I stored all the

modules in Port :0:. It was not impossible to transfer but very difficult having so many modules. I am using the same programs although I had to change a few to work properly on the 50G. I am a land surveyor and all the programs and related to land surveying. Thanks, for the feedback.

Re: Program speed from sd card

*Message #5 Posted by **Tim Wessman** on 21 Sept 2009, 11:17 a.m.,*
in response to message #4 by Iqbal

Ok. I know a thing or two about land surveying software on the 50g. . . :-)

I assume all of the program is in userRPL since nothing else was specified. Feel free to correct me if needed.

Are you writing and accessing data (points or raw) from the SD card itself? If so, that is probably the largest speed hit. I'd recommend keeping data locally in HOME, and then writing it out to the SD card or port2 with some kind of backup routine. The rest of the commands should be organized into a library or a collection of libraries if you haven't done that yet.

That is what is going on with the surveying software I made. Basically, the program libraries reside in port2, and all variables are created in the hidden directory in HOME. The point database is stored in unused internal system RAM and is read in from the SD card using some C software. The only time it accesses the card is when loading or saving points, writing the RW5 info, saving a copy of current job/software settings, or accessing the code attribute file. In short, only times when speed isn't all that critical as it can take a second or two for some of the operations.

If that doesn't give you some ideas on what to do, or if you'd like some help with it, feel free to email me directly at timwessman_a_t_gmail.com

What type of caps are used in Classic power supply?

*Message #1 Posted by **Dan W** on 19 Sept 2009, 1:37 p.m.*

Hi all,

In the Classic series what type of capacitors are used in the power generating circuits on the main boards? These are the silver radial lead caps, 2.2 uF to 60 uF. They appear to be non-polarized, but I think they might be non-polar electrolytics.

On the HP-67 they switched to Tantalums throughout.

TIA

To make it worse, the small values that are specified in pF (picofarad) are often referred to as so many "puff." This bugged me just a tad when I worked in applications engineering at a company that made VHF and UHF power transistors.

Re: What type of caps are used in Classic power supply?

That's how real electronics guys talk!
And 10uF is "10 mike"
Then of course you have the old timers who refuse to use nanofarads, it's "100,000 puff" son!

Dave.

*Message #7 Posted by **Bart (UK)** on 19 Sept 2009, 6:25 p.m.,*
in response to message #1 by Dan W

Looking at an explanation of the 35 & 45 PSU here, one can see from the photograph of the 45 that they seem to be polarised axial capacitors, with the lead starting with a thicker bit being +ve.

No, polarized for sure as they're Kemet hermetically sealed tantalums... which is why they still work after all these years.

FWIW, HP always noted the + terminals or pin 1 with a square pad on the their pc traces.

Re: What type of caps are used in Classic power supply?

>
> FWIW, HP always noted the + terminals or pin 1 with a square pad on the their pc traces.

Yep, you're right, I see Kemet written on one of them. That's the info I was looking for. thanks. I have 2 cases where I see a problem with a cap but you're right, these caps are rarely the problem.

Funny thing, I went to Digikey today and ordered a set of replacement caps - before I read this, and ended up ordering Kemet axial Tantalums.

On the pads, the square pad for positive is true for the 65 and 67, but not for the 35, 45 or 55. These have a small triangle next to the positive pad.

*Message #2 Posted by **Eric Smith** on 19 Sept 2009, 1:20 a.m.,*
in response to message #1 by hecube

If any calculators with LED displays were manufactured and sold in the last 20 years, it's news to me.

Re: Are there any calculator manufacturers out there...

*Message #3 Posted by **Paul Dale** on 19 Sept 2009, 1:46 a.m.,*
in response to message #2 by Eric Smith

I guess LED backlights don't count :-)

Anyway, my first though was the various Soviet calculators *might* have LED models less than 20 years old -- they certainly have VFD models younger than that. A bit of searching and I found the Elektronika MK-37 which has a LED display and was manufactured less than 20 years ago.

- Pauli

Re: Are there any calculator manufacturers out there...

*Message #4 Posted by **Michael de Estrada** on 19 Sept 2009, 2:21 a.m.,*
in response to message #1 by hecube

Of course there are countless numbers of non-battery powered desktop calculators that use LED displays, such as the following:

<see here>

Were you perhaps thinking of small battery powered calculators, such as the HP classics, Woodstock and Spices (Spicem)?

*Message #5 Posted by **Katie Wasserman** on 19 Sept 2009, 2:35 a.m.,*
in response to message #4 by Michael de Estrada

I think that most of these are fluorescent displays -- even though this manufacturer says it's LED. I did

come across this Casio calculator that has a 2-color display. I have no idea what technology that is, I've never seen a bi-color 7-segment display.

Re: Are there any calculator manufacturers out there...

*Message #6 Posted by **marais** on 19 Sept 2009, 3:06 a.m.,*
in response to message #5 by Katie Wasserman

The name digitron refers to VFD (vacuum fluorescence display) tubes, but the technology does not allow for a segment to have two different colours - only for different segments to have different colours. That Casio is an intriguing machine...

Re: Are there any calculator manufacturers out there...

*Message #7 Posted by **Bart (UK)** on 19 Sept 2009, 5:22 a.m.,*
in response to message #6 by marais

A careful look at the two different colour images shown, it seems that the same digits do not quite line up. So it could be VFD, just different colour segments of each digit next to each other?.

Re: Are there any calculator manufacturers out there...

*Message #8 Posted by **Paul Guertin** on 19 Sept 2009, 1:11 p.m.,*
in response to message #6 by marais

>
> marais

Looking at the pictures of the display, one notices that the shape of the digits is not exactly the same between the two colors. Notice in particular the hole in the upper right part of several digits: 2, 3, 7, 8, 9, 0. This leads me to believe that each segment is actually made from two VFD tubes put side by side.

*Message #9 Posted by **Howard Owen** on 19 Sept 2009, 4:17 a.m.,*
in response to message #1 by hecube

LEDs are being used to make some spectacular computer displays nowadays. A modern LED based calculator might not resemble the old machines at all. Such a calculator certainly wouldn't consume power at the rates the old machines do either.

Regards,
Howard

OLED is already viable, has been for quite some time.
Likely rules out a nice looking 7 segment display version though, unless you pulled a trick or two.

Dave.

Re: Are there any calculator manufacturers out there...

*Message #15 Posted by **Katie Wasserman** on 22 Sept 2009, 9:51 a.m.,*
in response to message #14 by DaveJ

From what I've read recently OLED's have a theoretical efficiency only slightly higher than conventional LED's. This means that they still suck up too much power to be viable for a hand held calculators. Which is why they were abandoned in 1980 (roughly).

I think that Casio got the "right" calculator display on their fx-9860G series with the switchable backlight. I'm not sure what they use but it looks like it's electroluminescent. It's plenty bright and uses just 30mW of power. On 2 AAA cells it provides back lighting for 3 or 4 days of continuous use.

How about a return to the tritium phosphor LCDs that TI and a few other manufacturers used on some LCD watches in 1978? They were wonderful, putting out enough light to be able to illuminate not only the watch display, but also anything held in front of the display as well. In blackened control room conditions on the submarine I was on, those wearing such watches could easily be noticed across the compartment. The display used no battery power, and required no button pushes to read in the darkness. These were the best watch displays ever made, IMHO.

For some reason, by 1979 TI had discontinued all such watches and gone to a power-consuming micro light bulb which required the push of a button to activate.

I've always wondered if it wasn't anti-atomic idiocy that made it politically incorrect for TI to use such displays, especially after Three Mile Island.

One (minor?) problem: Tritium has a half life of just over 12 years.

Depends on your philosophy about how long your calculator should work. It seems that most of us here hope/expect to use our HPs nearly forever. A tritium-powered HP35 from the early 70s would now be only about 1/8 as bright as originally (assuming the brightness of the display is proportional to the tritium decay activity).

I've never seen one of those LCD watches, but still have an alarm clock with a radium painted dial. They still make tritium clocks and watches. But these only have a very small amount of tritium on the face. I realize that the beta particles emitted by tritium are very low energy and won't penetrate a good glass watch face. However, I wonder if there are problems with the radiation heading into modern clock/calculator chips with their sub 100nm transistors and thin epoxy blob coatings. A large area that would be needed for an LCD backlight might generate enough radiation to randomly mess with the microelectronics.

Love the product names on the watch and clock: H3 - the element designator (H) and atomic

weight (3) of tritium.

Latest HP-35 with the "bugs"?

*Message #1 Posted by **Michael de Estrada** on 18 Sept 2009, 3:55 p.m.*

We all know about the infamous "bugs" in the original HP-35, and HP's recall to remedy them. Still, many buggy HP-35s remain in circulation, and I wonder what is the lastest version/serial number that exists with this flaw, that is actually an asset to collectors. I just obtained an HP-35, version 2 with S/N 1249A08206 that is fully buggy, however, my version 3 with S/N 1302A52942 that I bought new in June 1973, already had the corrected ROM. So, someplace between those the manufacture of those two calculators, HP implemented the fix. I'd be interested to know what is the highest S/N version 2 that was buggy, and if there were any early version 3s that were buggy. Perhaps this has been discussed previously on this forum and I have missed it.

I have run across quite a few with the bug. The latest I have seen was 1230A. All were Type-2, dimple on the 5, 2-piece backbone. Most were 1143A.

A ridiculous idea: what if HP sells calculator hardware & software seperately

*Message #1 Posted by **KC** on 18 Sept 2009, 9:48 a.m.*

This comes to my mind when HP decided to sell its calculator emulator on iphone. It sounds great, as one can have a machine with all the good old calculators inside it. But wait, would you ever feel comfortable "pressing the keys" all the way on the screen? I wouldn't. Try entering the Mach number equation on iphone and I'm sure it will drive you nuts.
So here comes a solution: HP builds a "barebone" calculator, with the keyboard, with your favorite HP calculator form factor like the HP41C or HP15C or whatever. The keyboard will be free from labels, of course, much like the HP-41C Option 001. Then much like the iphone, the firmware/software can be sold seperately and downloaded via a USB port on the calculator. Finally, you can buy the appropriate "label" or "faceplate" and attach onto the calculator.
What's the advantage of this?
1. Easy bug fixes.
2. You can upgrade easily to another "calculator".
3. Lots of people will contribute to the calculator software, whether HP likes it or not, and this makes the calculator better and better.
4. The software can be tailor made for you.
5. HP can concentrate to build better calculator hardware such as better key press.
And disadvantages:
1. Surely you cannot bring it to most of the examinations.
2. Emergence of "calculator virus".
Sounds great and ridiculous, isn't it?

KC

Re: A ridiculous idea: what if HP sells calculator hardware & software seperately

*Message #2 Posted by **Martin Pinckney** on 18 Sept 2009, 10:31 a.m.,*
in response to message #1 by KC

Sounds only great to me. I don't think viruses would be an issue; not enough "return on the investment" (glee for causing someone else problems) for the virus-writers.

The trick would be to get HP to consider it a worthwhile project.

Oh, and choosing a form factor that would gain widespread acceptance.

in response to message #1 by KC

We're not so far away from this. Take the HP-20b as an example.

Though its tactile response as well as its display can (and need to) be improved for sure, an interface is given at least.

Ceterum censeo: HP, launch a 43S (on your way to it you may launch something blank as KC suggests, if you prefer, but a good keyboard and display are inevitably necessary, as had been said here many times).

*Message #4 Posted by **Bart (UK)** on 24 Sept 2009, 6:59 a.m.,*
in response to message #3 by Walter B

Has anyone tried reporposing a 20B to a 42S, to replace, as it were, the aging hardware of current user's 42s's? Doing the same as what HP has done with the 12C+ could give a faster 42S with new harware. Just a matter of re-labelling the keys, I remember someone posting that they were struggling to remove the original lettring from the 20B keys?

*Message #5 Posted by **Tim Wessman** on 24 Sept 2009, 10:37 a.m.,*
in response to message #4 by Bart (UK)

The big problem with trying to do that, or to make any scientific out of the 20b is the screen. The LCD driver built into the chip will only support 400 segments, and they are all used on the 20b. It could be possible. . . but I'm not sure how it would turn out. :-(

*Message #6 Posted by **Jeff O.** on 24 Sept 2009, 5:17 p.m.,*
in response to message #5 by Tim Wessman

While not optimal, it seems like the display could be useable for a decent scientific calculator. The dot-matrix area in the upper left side of the 20b diplay could be used as a rudimentary second line, to display the stack-y contents and/or to display the imaginary part or angle for a complex number representation. Last year after HHC 2008 when the 20b repurposing project was active, I played around to see how numbers might be represented in the dot-matrix area. Below is what I came up with. Of course I have neither the knowledge nor the equipment needed to repurpose my 20b, so that's as far as it got.

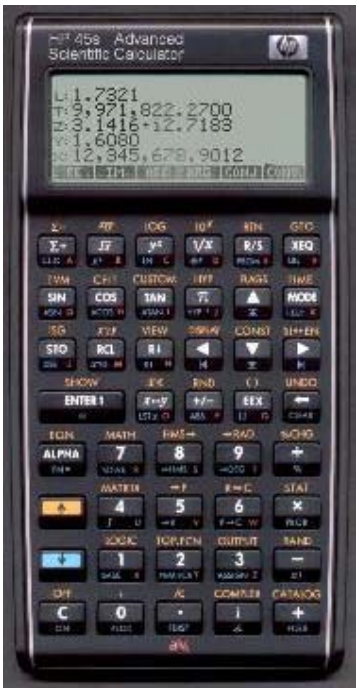
This LCD would be completely unsatisfactory for an HP42S type of calculator.

Re: A ridiculous idea: what if HP sells calculator hardware & software seperately

*Message #8 Posted by **Jeff O.** on 25 Sept 2009, 7:37 a.m.,*
in response to message #7 by Mike Morrow

Hi Mike,
I agree that it would not be ideal. Just to be clear, (and sorry if you are aware), the 20b has a 12 character 7-segment (plus 3 smaller 7-segment characters for the exponent) display area on the bottom of the LCD, with the dot-matix area in the upper left, with 11 or so annunciators in the upper right. So I was not suggesting my crude character display for the main numeric output.

But in any case, I'd certainly rather have this:



Re: A ridiculous idea: repurposing a 20B to a 42S

*Message #9 Posted by **Bart (UK)** on 25 Sept 2009, 11:38 a.m.,*
in response to message #8 by Jeff O.

Nice one Jeff. I had been thinking that the 35s form-factor with a bigger screen would be good.

On the subject of the 20B's LCD: I had looked at it and thought maybe to substitute it for a same physical size generic LCD which means finding another way of displaying the annunciators, or replace it with a custom made screen which might be viable if there were enough takers. But then this would defeat the whole object of repurposing *existing* hardware. I also wasn't aware of the LCD driver's capability limitations in the 20B's hardware. 'twas but a simple idea.

IMHO, such alterations to existing hardware would be a big-time kludge of interest only as an experiment. How would the 20B display be made completely compatible with that of the 42S? What about generating 42S sounds, which can be important to prompt for input? What about IR printer support?

If I lost both of my HP42S units, I'd use my disdained HP32SII before falling back on a Franken-42S. Actually, I'd accomodate the large size and just use a 50G. But I've used one 42S daily for 12 years and it still looks and responds like new, while the other is yet new in the box. The 42S has kept its youthful appearance much better than my HP-15C did after only a few years of routine use.

But a new HP42S-type machine designed from the start in the HP20B-type hardware (but with sound and IR) would be interesting indeed. Much better than any mythological HP-15C re-issue, IMHO.

Well, to be fair, HP did give us the 50g and 35s, not perfect but attempts to return to their roots, and the 12c series is still pretty good...

I would have argued with this if Sam Kim had stuck around. You could at least point to quality improvements in the scientific and graphing models under his watch Now the question is open again in my mind.

Focusing on the high school market is presumably the right move for their business, but what sort of quality standards do you need to compete effectively there? What shortcuts in quality would make economic sense in that market and others HP competes in?

Regards
Howard

If I want to drive a beetle I don´t need a Mercedes Benz chassis. Will say the still expensive calculator hardware needed to implement and run advanced functions is a must for the typical 50g customer, but by far an overkill for the 10s type of guy. So where will the 10s mate buy his next basic scientific calculator? Would the 50g guy be happy to subsidize the lower end market fraction by paying higher prices than necessary?

Further, the 50g customer expects first class keys, the 10s customer expects nothing from the keys. The latter is used to the simple equation "cheap calculator = poor keys". Will he be happy to pay a higher price tag for decent keys?

*Message #16 Posted by **Dan W** on 18 Sept 2009, 1:35 p.m.,*
in response to message #1 by KC

You mean something like this?

Actually I think the technology could be developed to place some kind of character display on each key and the keyboard so that the function labels could be dynamically changed electronically.

Then one would say, why not just have the flat touch screen like an iPod with the complete keyboard electronic? Two reasons. First as you say there is something inherently superior to a real keyboard. Second, a blend of real and electronic keyboard would have a cool factor - flat touchscreens are so yesterday.

I think HP could get 90% of the benefit of your proposal just by providing keyboard overlays for their calculators, just like they did with the HP 41's. I'm not sure which models currently offer user-assignable keyboards, but certainly the 50g does.

On future models, I think they could also make a handsome profit if they made the machines expandable (again, like the 41). Lots of us would pay to add cool extras (like a printer).

With the exception of #5 I get this with an iPhone and soon any number of touch screen devices such-as other phones, touch screen netbooks, tablet PCs, and eBook readers.

If you survey the landscape of calculators out there today and their respective users you'll find that key press doesn't even register as something of importance. However, even small markets can generate revenue. What is the size of the nit-picky calculator market?

I avoided the iPhone for a year because of a bias towards Blackberry style keyboards--rigid, inflexible, reliable. However I--as have many others--have adapted to touchscreen technology. The possibilities of virtual keyboards IMHO outweighs the static (even if you can put your own stickers on it). Look at the work done by i41CX+ and 42s. I like the dynamic labels, the on-demand QWERTY keyboard, the swipe for a 4 line stack, etc... I feel that as a whole it makes me more productive.

It's the end of an era, time to change.

*Message #23 Posted by **hugh steers** on 18 Sept 2009, 8:04 p.m.,*
in response to message #21 by Egan Ford

Hi Egan,

The issues of this thread overlap what I am planning to talk about in Denver next month, so I won't comment.

However, your point on virtual keyboards is interesting; I've been experimenting with free42 on the HTC touch pro 2. On this device and other latest gen handsets (like iphone), the calculator appears on screen almost life sized – at least big enough to actually press the virtual buttons with your finger.

One of the big drawbacks is that you can't feel the keys. Consequently, I've been trying to get some tactile feedback going with the virtual keys. I don't know if the iphone version does this, but it's fairly effective (compared to nothing!). Phone people like to call it haptic feedback, but its not really because true haptic feedback involves fingertip sensation (would be nice to add!).

What Im doing is wiggling the vibration mass inside the phone. I'm picking a number for the duration that gives it about 1 spin or so. For me, its 25ms, for other handsets it could well be different. Anyway, this is a real step forward for virtualised keyboards. It would be even better to have special hardware, like a mass that could move forward and back rather than rotate.

if you're in Denver, I can show you and that goes for anyone else interested.

> One of the big drawbacks is that you can't feel the keys.

That is because you were conditioned to expect to feel it. The next generation will not. Visual and auditory feedback may be sufficient and in some cases mandatory, i.e. a poorly designed mechanical keyboard can give the user a false positive--you'll find multiple threads of missed keystrokes on the 50g and 35s. I'd argue that most pocket calculator users rely mostly on the visual feedback of the LCD.

However that all said I firmly believe that there are applications where a real keyboard cannot ever be replaced. E.g. the weighted keys of a piano.

Being conditioned myself for tactical feedback keyboards I'll admit I do miss the feeling at times and that I cannot substitute certain keyboards with a touch screen, e.g. my computer keyboard--the ridges on the J and F

are critical for touch typing at speed. I imagine that accountants with their 5 key feel the same way. Perhaps the difference lies in speed. The piano, computer keyboard, Blackberry, etc... need tactical feedback for speed. Most calculator and mobile phone users use a single finger and without thinking register each keystroke from the display--relatively slow work.

Most calculator and mobile phone users use a single finger and without thinking register each keystroke from the display--relatively slow work.

What I have found for touch typing is that the positioning of the rows of keys on a slanted keyboard and audible feedback from the keys hitting the platen were more important than the tactile feedback. I went through that when I switched from a mechanical typewriter to an electric typewriter, and again to a modern computer keyboard. When I learned to type on a mechanical typewriter I could do forty to fifty words a minute with very few errors. I held that speed with an electric typewriter but lost it with modern computer keyboards.

In the old days we also had key punch entry machines. Operators never looked at the keys, often (at least as I recall) didn't even have a display, but could achieve phenomenal speeds and accuracy. Engineers didn't need to apply.

*Message #26 Posted by **Alain Mellan** on 19 Sept 2009, 1:08 a.m.,*
in response to message #21 by Egan Ford

Couldn't agree more with you, Egan.

Had a personal iPhone (plus almost every RPN calc that run on it :-) for about a year, and I got outfitted now for work with a Blackberry. The tiny keyboard is totally unusable.

I found out the best way use the various calcs for me was to hold the iPhone in the left hand and "press" buttons with the left thumb, while I can write with the right hand at the same time. YMMV.

Everybody has different needs and ways to use the machine, and the touch screen seems the easiest to use and customize. Look at the discussions on this forum and OpenRPN.org in the past on keyboard layout. Anybody can

potentially make their own with a programmable device like iPhone, it's not limited by the hardware.

Does anyone have any numbers on how long a touch screen lasts? Sometimes I can hardly make the ATM work, and it's not even mechanical-- you can see the conductors for the capacitive sensors when the sun is at the right angle.

One problem with consumer products like the iPhone is that the product life is extremely short-- they're here today and gone tomorrow. If the battery goes out in a few years, there probably won't be one available to fit it anymore. The 41 OTOH was in production for over ten years IIRC, and even today, 30 years after its introduction, you can still get things like Clonix41, MLDL 2000, and of course the older products are available on eBay. I've had programs on mine continuously for over 20 years. In the consumer market you have to move all your programs to another device every couple of years and learn to use it.

I'd argue that most if not all electronic consumer products. My first HP (15C) is still in use and will probably continue to function longer than my 50g and 35s. They just don't make them like they used to. The market has changed to wanting change.

> Quote:
>
> In the consumer market you have to move all your programs to another device every couple of years and learn to use it.

Yep, I did this with my Palms, then Zaurus, then Windows Mobile, now iPhone. Hmmm... also did this with VCR -> DVD -> BlueRay and Vinyl/Tape -> CD -> MP3 and rotary dial -> touch tone -> voice dialing.

And, I also did this with my 15C -> 48GX -> 50g. "Couple of years" in this case was ~10 years.

Change is good. Nothing wrong with learning something new.

> Change is good. Nothing wrong with learning something new

Sometimes. But when new doesn't mean better, it's a waste of time. I got a 50g, and totally lost interest after going through the paper manual. The 41cx meets my needs better. So does my 71.

Re: A ridiculous idea: what if HP sells calculator hardware & software seperately

in response to message #21 by Egan Ford

Neat idea, but given the cost of development for such an endeavor will keep it from getting off the ground. From some of the posts I've read from Cyrille it could theoretically be possible to get HP to make calculator hardware to the specs of the community... Bankrolling it would be the big challenge, though. How many hundreds of thousands of dollars can HP enthusiasts pool to make that happen?

I'll leave it at that, this could be an interesting thought experiment.

> How many hundreds of thousands of dollars can HP enthusiasts pool to make that happen?

As one who has brought many electronic products to market, I am almost tempted to make such hardware myself, if I could give it the time. It would **not** take hundreds of thousands of dollars. For NRE (non-recurring engineering costs), figure a few thousand for a custom LCD (we looked into it 20 years ago and were quoted about $2K, and I suspect that greater efficiency today means the price has not increased much), or maybe better, use an off-the-shelf LCD to avoid the NRE, a few thousand for the keyboard (we looked into that too, with double-shot keys so the labels are actually *in* the keys like the HPs' of the early 80's so they won't wear off), a couple thousand for lexan overlays (we've done those), a few hundred dollars for the first run of PC boards (we've done loads of those, up to 12 layers, but 2 to 4 would be plenty for this), and a few thousand for the case molds. I lay out very dense PC boards all the time, SMT and thru-hole, and up to 500 parts on a single board. Add in the parts for the first run, and we're only up to about $20,000, plus my own time.

Much of that time is probably spent on software and documentation. I believe that is where the *hundreds of thousands* comes from. A single engineer's salary can easily exceed $100K US. And, you need to double that to get the actual carrying cost of an employee (at least in large companies).

I have a dozen incomplete personal projects sitting on my desk (I'll bet Eric has 100 :-). Time is a rare and expensive commodity.

*Message #33 Posted by **Garth Wilson** on 22 Sept 2009, 1:15 p.m.,*
in response to message #32 by Egan Ford

I was figuring that the community of enthusiasts would do the software. I'm happy on a fraction of your $100,000/yr though.

Re: A ridiculous idea: what if HP sells calculator hardware & software seperately

*Message #34 Posted by **Hugh Evans** on 23 Sept 2009, 1:39 a.m.,*
in response to message #33 by Garth Wilson

I've pondered this issue before. Looking at the body of work already available from nonpareil, free42, x48, to name a few. Creating hardware capable of running said software would be relatively trivial.

Re: A ridiculous idea: what if HP sells calculator hardware & software seperately

*Message #35 Posted by **Hugh Evans** on 23 Sept 2009, 1:28 a.m.,*
in response to message #31 by Garth Wilson

My quote of hundreds of thousands was in response to HP taking on the development of said hardware. Your figures are correct. LCDs in many cases waive tooling fees now, injection molding costs vary more than I'd like. As a cost cutting tool, I worked on a procedure for OpenRPN to accomplish the effect of double-shot keys using laser etching with a resin back-fill for key legends. It's a trade-off in terms of cost vs. flexibility.

If you ever want to pursue such an endeavor I would be happy to donate my efforts to see it happen. OpenRPN, for me, was always about bringing at least one more great no-holds-barred piece of calculator hardware to the market.

It looks like TI doesn't like the idea of people running a custom OS on their hardware.

Re: A ridiculous idea: what if HP sells calculator hardware & software seperately

*Message #37 Posted by **Eric Smith** on 23 Sept 2009, 2:29 a.m.,*
in response to message #36 by Bastian

I imagine that a few of the reasons that TI isn't happy about installation of non-standard firmware on their calculators might be:

- risk of losing certification or approval for students to use the calculator model on tests, which would probably dramatically reduce sales
- support costs - if people have calculators with modified firmware, they're going to get some amount of support requests relating to firmware problems
- reputation - suppose someone buys a used TI calculator and doesn't know that it has modified firmware; if it doesn't work right it makes TI look bad

Working on a 9114B HP-IL Disk Drive

*Message #1 Posted by **Gerry Schultz** on 17 Sept 2009, 8:04 p.m.*

To All:

I recently purchased another 9114B floppy drive from that unmentionable place as it was sold "As Is". There was something banging around inside when it arrived so before testing, I opened it (it's so much fun finding the right spline tool) and found a metal tag of some kind. Anyway, it appears to be a pristine unit internally as indicated by a small amount of tape still holding the front of RF shield on the floppy drive itself.

The unit accepts and ejects floppies fine but reluctantly. I tested it with EMU41 and it read a floppy directory so it appears to work. The battery is bad and have ordered a replacement. I am concerned about the extra effort required in ejecting a floppy so I went here to this site and read PeterP's excellent article (876) and Steve's excellent article (78) about repairing the 9114.

It appears most of the problems are with the 9114A version, so should I be concerned with cleaning and lubing the eject mechanism? I have no problems tearing into this unit as I was buying it for parts but it seems to be in great shape so I'm thinking of getting it back in shape. Is there anything special I need to be careful of that is not covered in the articles mentioned before?

Any input about your experiences with the 9114B are appreciated.

Thanks,

Gerry

in response to message #1 by Gerry Schultz

Gerry,

Where did you order the replacement battery from ? Are you just replacing the internal cell/s ?

I have a 9114A with no battery at all that I run from a power supply.

Sean

Re: Working on a 9114B HP-IL Disk Drive

*Message #3 Posted by **PeterP** on 18 Sept 2009, 12:46 p.m.,*
in response to message #1 by Gerry Schultz

Gerry, congrats on finding a good unit, they are rare!

When writing the article (thanks for your generous words) I was actually repairing a B-unit - with the

invaluable help of the master himself, Tony Duell. The B-Unit seems to be generally in better condition etc then the A-units, especially with regards to battery live. I'd try to determine where the stuck eject is coming from. As you have read, forcing a disk out when it is stuck rips off the head and that is, well, bad...

So I would try to figure out where the eject is stuck and lubricate it, starting with minimal dissassembly and working my way towards more intense dissassembly.

Hope that helps.

Cheers

Peter

Re: Working on a 9114B HP-IL Disk Drive

*Message #4 Posted by **Diego Diaz** on 18 Sept 2009, 1:06 p.m.,*
in response to message #1 by Gerry Schultz

Hi there,

I think these pics may be of some help.

The "metal tag" you found rattling inside your unit is more likely the top head cover... (red circle -also missing- in the image) which is supposed to be covering, and magnetic shielding, the upper head circuitry. Your 9114B can live without that... ;-)

The eject mechanism is commanded by the gears and spring inside the green cirle. May be just a bit (use very little please) lubricating grease (not oil!) will help smoothening the ejection.

If you plan to leave your 9114 unit unused for long periods of time, it's highly advisable to put a dummy disk like the one in the picture below. to protect the heads. A cleaning disk can also be used (and are easier to find). Do not leave a real disk inside the unit as the magnetic coating may end up tearing from the disk substrate damaging the heads (as Peter has pointed out above)

Regarding the battery, although the original part (Panasonic LCR-226P) is no longer in production (AFAIK), you can easily find a matching replacement (PM631). Terminals are not in the same position but this can be worked out.

Best wishes.

Diego.

Re: Working on a 9114B HP-IL Disk Drive

*Message #5 Posted by **Gerry Schultz** on 18 Sept 2009, 6:55 p.m.,*
in response to message #4 by Diego Diaz

Thanks, Diego. One picture is work 4K words in this case. I can't remember how many of those 3.5" dummy disks I threw away when I got new drives in. It seems that I just have to be careful when I clean and lubricate the drive mechanism. I've done it before on IBM PC floppy drives so I'm not worried.

You're right about the top head cover. It's the right size and shape. I'm just glad I removed it before I

applied power. What a great way to ruin a new (to me) piece of equipment by having a piece of metal floating around in it.

Peter, your article is very good and thank you for sharing the fruits of your labor with the rest of us. I am lucky to find such a rare drive and I want to have it last for a long time.

Sean, I googled for a PowerSonic PS-628 as, according to Peter's article, it is a direct replacement battery. I ordered two from batteryplex.com as I want to replace a second one as well. They cost only $11.80 and they should get here early next week.

Thanks for all the responses.

Gerry

Re: Working on a 9114B HP-IL Disk Drive

*Message #6 Posted by **Gerry Schultz** on 24 Sept 2009, 1:10 p.m.,*
in response to message #5 by Gerry Schultz

A small follow up to close out this thread. I have received and installed the two PS-628 batteries and they work great. I wrote a small program on the EMU41 that looped through selecting and retrieving directories from the 9114B drives as a way to test the charge/discharge cycle of the power supply assembly. I was looking to confirm that the charging board would properly recharge the battery and it seems fine.

It was interesting to note that running the loop in EMU41's fast mode kept both drives lights on all the time with directory listing whizzing past on the screen. It still took over an hour for the batteries to discharge down to empty.

I will bring them to the HHC 2009 conference that starts in about 10 days.

Thanks, Gerry

Travelling to HHC2009 from outside the US

*Message #1 Posted by **Wlodek Mier-Jedrzejowicz** on 17 Sept 2009, 12:03 p.m.*

If you are travelling to HHC2009 from outside the US, and if you are not a US citizen and you do not have a US visa, then you are either planning to enter on a Visa Waiver or you need to get a visa pronto!

If you are planning to come in from a country that has a Visa Waiver arrangement with the US, then you must register online before you travel. This is a new requirement from the beginning of 2009, so you may not know of it, and so I am posting the information here, with apologies to everyone else.

The scheme is called "Electronic System for Travel Authorisation (ESTA)". Look it up on the web and be sure to fill it in at least 72 hours before you travel.

I have just had it pointed out to me that the official US web site is free at https://esta.cbp.dhs.gov and that others might charge for the same service.

Thanks, normal service is now resumed,

Wlodek

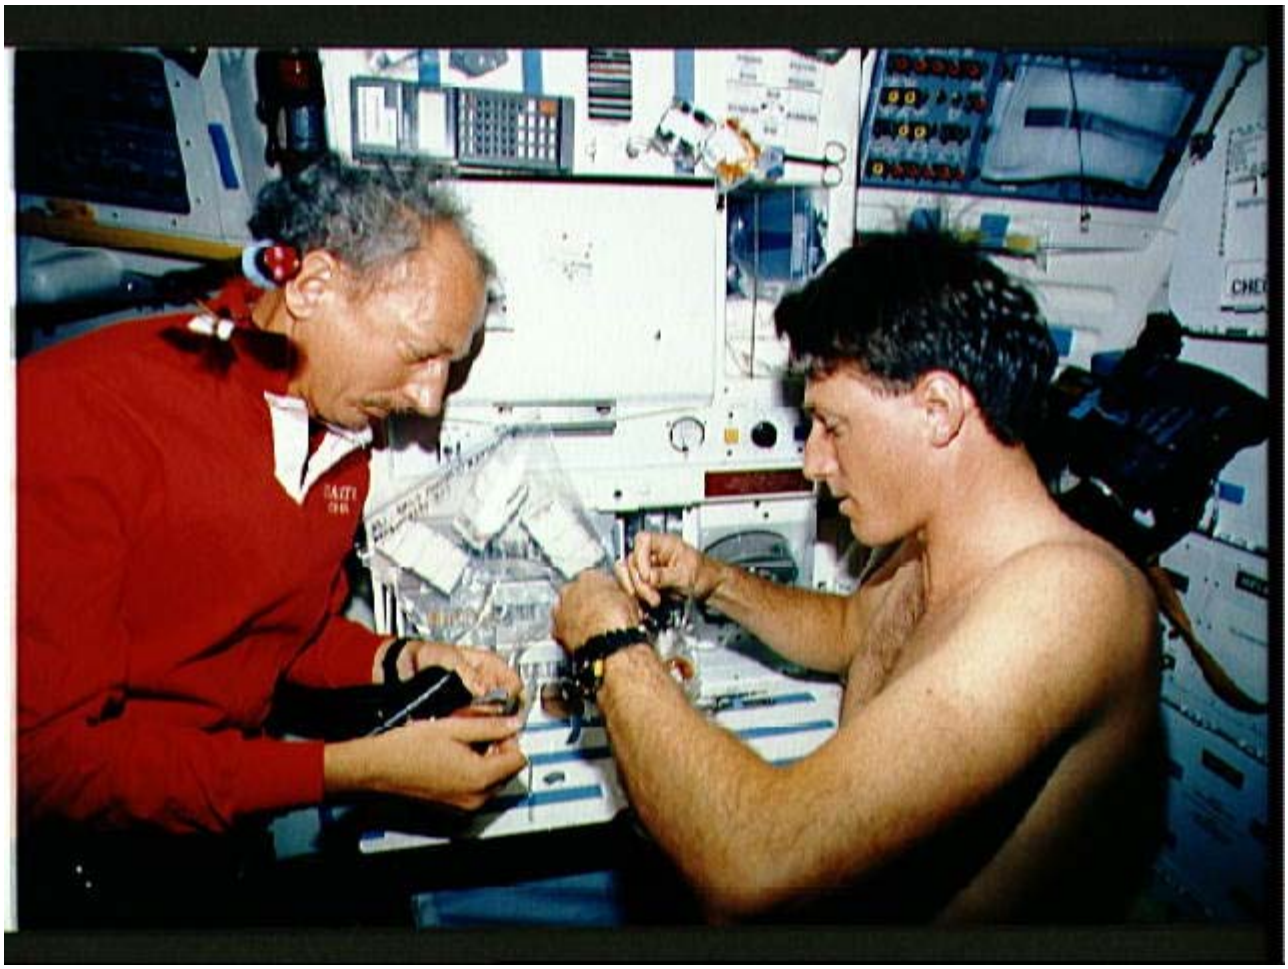
Mystery calculator - not a calculator?

*Message #1 Posted by **Joerg Woerner** on 17 Sept 2009, 9:32 a.m.*

Hi There,

I recently followed the interesting discussions about the "Mystery Calculator" and working 17 years in the Barcode Scanner market (and knowing most western calculators) I have my own ideas....



I doubt that we are talking about a calculator, to me the little thing looks more like a portable data terminal. Just google e.g. for the Telxon PTC-710 and you find a lot of images like these:

What do you think about the similarities?

db, they may have an ENT key - but no RPN. Sorry!

Regards, Joerg

Re: Mystery calculator - not a calculator?

*Message #2 Posted by **David Hayden** on 17 Sept 2009, 11:53 a.m.,*
in response to message #1 by Joerg Woerner

The Johnson Space Center photo archive implies that it's a calculator here. The text description says:

> Quote:
>
> STS-45 Payload Specialist Dirk D. Frimout (left) and Mission Specialist (MS) C. Michael Foale (shirtless) conduct Detailed Supplementary Objective (DSO) 621, Inflight Use of Florinef to Improve Orthostatic Intolerance After Flight, on the middeck of Atlantis, Orbiter Vehicle (OV) 104. The purpose of DSO 621 is to evaluate the efficacy of the drug on postflight orthostatic tolerance using heart rate, blood pressure, stroke volume and other cardiovascular responses to orthostatic stress. A penlight flashlight freefloats above Frimout's shoulder. **The crewmembers are in front of the port side galley with a calculator, food containers, and DSO 621 supplies velcroed to it** [emphasis added]. Behind Foale are a camcorder and the forward middeck lockers.

I sent an email to the curator asking if there's a higher resolution scan of the picture available.

Re: Mystery calculator - not a calculator?

*Message #3 Posted by **hecube** on 17 Sept 2009, 11:59 a.m.,*
in response to message #2 by David Hayden

It might just be a matter of a generic description of the pic by someone not knowing what they're looking at.

Re: Mystery calculator - not a calculator?

*Message #4 Posted by **hecube** on 17 Sept 2009, 11:58 a.m.,*
in response to message #1 by Joerg Woerner

Thanks for your insight. It makes sense.

Particularly puzzling to me was the fact that there were only 4 button columns on the bottom of the

"calculator" when so many calculators have 5 columns.

The fact that there didn't seem to be arithmetic buttons (+ - * /) was also bizarre.

I think you've nailed it.

Re: Mystery calculator - not a calculator?

*Message #5 Posted by **hecube** on 17 Sept 2009, 7:53 p.m.,*
in response to message #1 by Joerg Woerner

So after a lot of research, it seems only these calculator models ever went into space:

HP-35 HP-65 HP-41 HP-48 Elektronik Mk-52

Joerg's picture of the PTC-710 shows keyboard functions such as FIND, INSERT, SEND, DISP (display?), etc. Do you really not see any use for such a device?

Re: Mystery calculator - not a calculator?

*Message #21 Posted by **db (martinez, ca.)** on 20 Sept 2009, 10:45 p.m.,*
in response to message #20 by Palmer O. Hanson, Jr.

> Quote:
>
> Do you really not see any use for such a device?

Yep. I do. For a one function robot, or a gas meter reader. I have had to use things like that and then recall the recorded data to hand input into my 41 or 48 so I could use it. No fun there. I would prefer to use a data collector that also calculates, such as the Precision Surveying Solutions unit based on the hp50g that Tim Wessman and John Evers have demonstrated to us at the HHCs.

So, yes; I see a use for such a device. I just don't like the premise.

in response to message #22 by Palmer O. Hanson, Jr.

I have never used one of these but i'd guess that the INSERT, CLEAR & ERASE hot keys are to interact with things analogous to "descriptor" and "note" fields that could be appended to each record (point, reading, whatever). DELETE might erase the entire shot (reading, whatever). FIND could find and recall a reading (group of entries) by things like point number or a word in the descriptor. God only knows what a reading consists of for them, monitoring scientific experiments in near earth orbit. For me doing surveying it could be Point Number, Northing, Easting, Elevation, Descriptor and maybe a Note. In the warehouse environment that this is made for it could be widget #, shelf #, date, quantity, and a note on condition. Or not.

I just wish that that was a real enter key, but then i'd have to collect *it*.

Classic Series Logic Board - Desoldering Temp ?

*Message #1 Posted by **John Robinson** on 17 Sept 2009, 8:29 a.m.*

Hi, can anyone recommend the best temperature to set a desoldering iron at for removing components from classic series logic boards ? I am finding that I need 400 Celcius but that sounds a little high to me.

Thanks John

Re: Classic Series Logic Board - Desoldering Temp ?

*Message #2 Posted by **Randy** on 17 Sept 2009, 9:12 a.m.,*
in response to message #1 by John Robinson

Never needed more than 310 C. Perhaps you're just out of calibration?

Re: Classic Series Logic Board - Desoldering Temp ?

*Message #3 Posted by **Joel Setton (France)** on 17 Sept 2009, 10:25 a.m.,*
in response to message #2 by Randy

The Classics were manufactured with tin-lead solder alloys (way before the age of lead-free soldering!) which have a low melting point. Start with lower temperatures first, like 290 or 300C which should be OK. Be very careful, as the 5-digit LED displays are VERY sensitive to heat!

I hope this helps,

Joel Setton

Re: Classic Series Logic Board - Desoldering Temp ?

*Message #4 Posted by **Dan W** on 17 Sept 2009, 1:52 p.m.,*
in response to message #1 by John Robinson

I typically use about 600-650F (315-340C) when soldering, which is probably higher than needed. I highly recommend a desoldering gun such as a Hakko 880 when desoldering the chips. The heat is applied only for about 2 seconds each connection and it's clean enough to fall right out.

F to C conversion thanks to my handy HP-55. Now if I could just find some use for the timer. ;)

> F to C conversion thanks to my handy HP-55.

Interesting. I hadn't realized unit conversions (English-Metric, that is) had been built in to calculators that early. Looking at the HP-55 features, I was surprised to learn that it included BTU-Joules and LBF-Newtons, whereas most calcs lesser than say, the 28 series, limit themselves to length, mass, volume, and temperature, and only one of each of the aforementioned.

The HP-45 also had a few conversions: cm/in, kg/lb, ltr/gal. But in this case it offered the conversion factors only, one still had to multiply or divide appropriately. The 55 did the math at the push of the button.

in response to message #1 by John Robinson

Thanks for the feedback all !! Might be a calibration issue.

Dan, my Hakko 808 "chinese clone" has a minimum temp of 350, but I think the Hakko has a minimum of 380 - is that what you use ?

Thanks John

Re: Classic Series Logic Board - Desoldering Temp ?

in response to message #7 by John Robinson

Hi John,

Ah! Now I know who you are - wasn't paying attention.

Anyway I am using whatever the default is from the factory. I haven't tried to measure it.

Question about HP-IL Printer

*Message #1 Posted by **Namir** on 17 Sept 2009, 7:11 a.m.*

Hello All,

I have an HP-IL printer for the HP-41C/CV/CX calculators. The battery pack does not seem to hold much charge. After I try to charge the battery for a few hours and I turn on the printer I get the lights for the power and the low battery indicator. I still cannot advance the paper when I press the advance button. Does that mean the printer does not work or it's the battery that is the problem?

Thanks for any feedback.

Namir

Re: Question about HP-IL Printer

*Message #2 Posted by **Randy** on 17 Sept 2009, 8:20 a.m.,*
in response to message #1 by Namir

The 41 printers are *very* similar to a Topcat - and so they will not work without a good, charged battery installed.

Edited: 17 Sept 2009, 8:21 a.m.

Re: Question about HP-IL Printer

*Message #3 Posted by **Bill (Smithville, NJ)** on 17 Sept 2009, 10:22 a.m.,*
in response to message #1 by Namir

As Randy said, you need a good battery pack for the printer to operate.

You can easily do a test to determine if it's the battery or the printer. Take a good 6-volt lattern battery, carefully clip it on the printer battery terminals and if the printer works, then it's definetly the rechargable battery. Or you can use any other 6-volt battery pack - 4 D Cells in a battery holder from Radio Shack works great. That's what I used in lieu of useing a rechargable pack. 4-D Cells will run the printer for what seems like forever.

Just make sure you clip the battery on the correct terminals - I marked the inside of my printer battery compartment with a large plus and minus next to the terminals.

Note - do not use wall wart power supplies - they usually don't have a consistent voltage control.

Bill

Re: Question about HP-IL Printer

*Message #4 Posted by **P.Hart** on 17 Sept 2009, 4:42 p.m.,*

in response to message #1 by Namir

Is that the HP 2225B? I have one of those which I have not used yet. When I get round to doing so I quite expect the battery will be defunct so the information about alternatives is going to be very useful. Bill, can offer any guidance to an ignoramus on how to decide which are the correct + and - terminals for a set of D batteries?

Re: Question about HP-IL Printer

*Message #5 Posted by **Garth Wilson** on 17 Sept 2009, 6:18 p.m.,*
in response to message #4 by P.Hart

I'm sure they're talking about the little 82162 thermal printer, basically in the same case as the tape drive. I seem to remember the 2225B Thinkjet printer taking two more cells. I think they're sub-C size IIRC, but when mine went out and I found out how much a new battery pack would be, I refused to pay it. I ran it on a 9V alkaline battery briefly while I made myself a 7.8V power supply for it. I had everything I needed except one diode which was fifty cents.

If you look carefully, one end or the other should have aplus or minus sign.

In general, though, for AA, AAA, C, and D cells, the raised button end is the positive end, and the flat end is the negative end.

(What happened to A and B? Maybe B was too confusing with what was known once upon a time as a B battery - the high voltage (often 60-90 volts if I recall correctly) plate supply battery for radios in the 20s-30s-40s)

Re: Question about HP-IL Printer

*Message #7 Posted by **Katie Wasserman** on 17 Sept 2009, 8:31 p.m.,*
in response to message #6 by Dave Shaffer (Arizona)

'A' size cells and shortened versions of them are still made in rechargeable chemistry at least.

NiCd

NiMH

In battery powered tube radios there were 'A', 'B' and sometimes 'C' batteries (not cells) that have nothing to do with modern size cells. The 'A' battery was the filament power supply, the 'B' battery supplied power to the plate and the 'C' for the grid (if there was a separate grid supply).

I don't know why there are no 'B' size cells around (at least I've never seen any in the US). It might be that they did exist at one time and just never got into general use. The 'A' cells are sort of rare at that,

but I have come across them in various rechargeable calculators.

-Katie

Re: Question about HP-IL Printer

*Message #8 Posted by **Martin Pinckney** on 18 Sept 2009, 10:12 a.m.,*
in response to message #7 by Katie Wasserman

The "A" size lives on in the "CR123A". Don't claim to know that much about dry cell terminology, but I am pretty sure the "23A" in this one means "2/3 A". That is, the same diameter as "A" (17mm), but 2/3 the height (34.5 vs. 50mm).

Another "lost" size is "F", which is basically an elongated "D". If you open up a zinc-carbon 6v "lantern" battery (I have), you will find 4 "F" cells, whereas inside an alkaline lantern you will find 4 "D"s and some empty space. Makes me feel cheated a little!

E?

On an aside, ya gotta love a woman who is a storehouse of so much obscure technical information!

Hi, Namir --

I bought several HP-IL printers several years ago. One unit included a NiCd battery pack that would not hold a charge, and got rather warm during charing. I assumed that it had one or more short-circuited cells. Several sellers will provide a rebuilt pack for about $30; you can rebuild your own with new cells.

HP simulator for Nokia smartphones?

*Message #1 Posted by **Jim P** on 17 Sept 2009, 3:39 a.m.*

There may have been an earlier post on this but I haven't seen anything in months that would be up to date. Does anyone know if there are plans to develop an HP calculator simulator for Symbian S60 v3? It looks like the Nokia E71 screen is of just about the perfect proportion to squeeze an HP-15C emulator into.... but I'd settle for a good RPN

Jim

A free Java HP45 is available on hpcalc.org. It's 240x320 pixel, so a bit small on newer high res screens e.g. 5800, but works.>hpcalc HP45 Java<

There is a newer version that fits the 5800 nicely available for purchase (~$8) on sites like Mobile2day or Handango.

Help - broken HP-25

*Message #1 Posted by **Paul Dale** on 16 Sept 2009, 7:57 a.m.*

I've got a HP-25 that is broken and I'd like to fix it if possible.

The battery pack had some corrosion and the contact had some too. I've scraped this off and now the contact is nice and shiny. I've also rebuilt the battery pack, however further tests have been done using a small bench top power supply clipped to the battery contacts (polarity has been observed at all times) while the back is off the calculator.

Initially, the calculator was drawing about 100mA when switched on but without any display.

Okay, open it up carefully and reseat the main circuit board. Now the display shows '8' in random positions. Most typically at the right end but sometimes in other places and sometimes several (2 or 3) at once. No keys respond and the program/run switch does nothing either.

Pull it apart again and I don't find anything obviously wrong. I gently spread the between board connections a little to hopefully improve contact. Reassemble and now nothing. No power draw when on or off.

Does anyone have any suggestions as to what I broke and what the original problem was?

I don't have any *for parts* Woodstocks :-(I've got a working HP-21 which I could extract parts from but would prefer not too since it works.

I'll take this into work tomorrow and check for bad solder joints under the microscope.

So anyone have an idea on any other avenues to follow?

- Pauli

Re: Help - broken HP-25

Re: Help - broken HP-25

*Message #4 Posted by **Randy** on 17 Sept 2009, 8:26 a.m.,*
in response to message #1 by Paul Dale

With no current draw, it sounds like a bad transistor in the SMPS or something as simple as the ON/OFF switch not making contact.

When it was drawing current, it had all the signs of a dead ACT IC.

Re: Help - broken HP-25

*Message #5 Posted by **Mike Morrow** on 17 Sept 2009, 9:35 a.m.,*
in response to message #4 by Randy

Smells like toast. HP's lauded design quality from the good ol' days (one-third century ago!) strikes again.

This is not age-related failure. It could happen to a new Woodstock just out of the box. It should have sparked a class action against HP for the blatantly incompetent and destructive design of the Woodstock charging system. The lowest cost Woodstock, the HP-21, cost $125 in 1975 (equivalent to $500 in 2009). The HP-25 subject of this thread cost the 2009 equivalent of $800. These were never intended to be short-lived throw-away items. The customer deserved far better.

It's a real shame, because mechanically (size, weight, rigidity, keyboard layout, battery pack/door) the Woodstocks are my favorite HP LED calculators. I'd love to have the capability of the HP-34C (so flimsily made...more good ol' time HP quality) available in the sturdy and compact Woodstock configuration, and with a charging system designed by someone more competent than a dull grade school student.

Too bad most Woodstocks around are burned. I still don't have any. This HP-22 is selling for about 60 dollars but it doesn't work... I'd rather get an HP-25C though.

Re: Help - broken HP-25

*Message #7 Posted by **Michael de Estrada** on 17 Sept 2009, 2:37 p.m.,*
in response to message #6 by Gerson W. Barbosa

> Quote:
>
> Too bad most Woodstocks around are burned. I still don't have any.

I somewhat disagree, and would rather say "many" are bad. I purchased my HP-21 a little over a year ago from a seller who was willing to ship internationally (DaveHal2001) for $76 USD and it is in exceptional functional and cosmetic condition. I also have two HP-22's, a HP-25C and a HP-27, all of which are in excellent condition. Admittedly, they are hard to find and you just have to be patient. You can always find one if you are willing to pay enough, it's just a matter of your personal limit. So far, I've yet to find an HP-29C or HP-70 that meets my cost criteria, but I'll just continue to keep looking. The one thing I've learned about Woodstocks is that it is better not to buy one that is untested, because in all likelihood it will be "toast."

Re: Help - broken HP-25

*Message #8 Posted by **Michael de Estrada** on 17 Sept 2009, 4:41 p.m.,*
in response to message #5 by Mike Morrow

> Quote:
>
> It should have sparked a class action against HP for the blatantly incompetent and destructive design of the Woodstock charging system.

I'm no lawyer, however, I do know that there is something known a "failure to inform liability" where a manufacturer fails to alert a consumer as to improper use of a product, which could result in damage. I have the owner's handbooks for all the Woodstock models (HP-21/22/25/27/29C), and only the HP-21 and HP-25 manuals have a specific warning (caution actually) that AC operation without a battery installed may damage the calculator. The other manuals simply state that the calculator will not operate or operate properly, however, there is no indication that any damage could occur. I wonder if this is the one of the reasons it is harder to find undamaged HP-22/27/29C's than Hp-21/25's.

Re: Help - broken HP-25

*Message #9 Posted by **Mike Morrow** on 17 Sept 2009, 7:58 p.m.,*
in response to message #8 by Michael de Estrada

I suspect that the HP-21 and HP-25/25C sold many times the number of units compared to all of the other Woodstock calculators combined. Therefore, just due to the quantity originally built, more survive.

I'd like to come across a decent HP-29C, but I've never trusted the ebay listings that I've seen with respect to the functionality of the item being sold. When it comes to Woodstocks, I'd gladly pay more for a guarantee of complete functionality, and I'd pay nothing for anything less. I have no need of a $200 paperweight that so many Woodstocks have become.

Re: Help - broken HP-25

*Message #10 Posted by **Paul Dale** on 17 Sept 2009, 9:06 p.m.,*
in response to message #9 by Mike Morrow

I'd like a nice 29c too but I'd settle for a working 25 or 25c at the moment. I really like the Woodstock form factor and feel.

- Pauli

Re: Help - broken HP-25

*Message #11 Posted by **Paul Dale** on 17 Sept 2009, 9:03 p.m.,*
in response to message #4 by Randy

Randy,

Thanks for the comments. I suspected a bad ACT IC might be the culprit. I guess that means I won't be able to fix this one unless I decide to break my 21 (assuming the chips are the same in these two models of course).

Oh well,

- Pauli

Re: Help - broken HP-25

*Message #12 Posted by **Randy** on 17 Sept 2009, 9:24 p.m.,*
in response to message #11 by Paul Dale

They are not compatible... as the 21 ACT was unique.

Since the 21 lacked memory external to the ACT, the 1820-1396 omits the DATA signal on pin 11. The 1820-1596 ACT used in the 25 has it... so while you could calculate, you'll have no programmability.

Re: Help - broken HP-25

*Message #13 Posted by **Paul Dale** on 17 Sept 2009, 10:00 p.m.,*
in response to message #12 by Randy

Thanks again Randy, I'll leave my 21 alone :-) The 25 will just have to stay dead.

- Pauli

HP-21 simulator for iPhone/iPod

*Message #1 Posted by **Steve Simpkin** on 16 Sept 2009, 2:19 a.m.*

I just noticed there is a HP-21 simulation available On the App store for the iPhone/iPod Touch. It is called GO-21 SciRPN ($.99). I wonder if a HP-25 is in the works? (I hope, I hope!)

Re: HP-21 simulator for iPhone/iPod

in response to message #1 by Steve Simpkin

Yippee! Another calculator simulator. My iPod math/calculator page is getting crowded. :)

Regards,
Howard

Re: HP-21 simulator for iPhone/iPod

*Message #3 Posted by **Egan Ford** on 16 Sept 2009, 4:24 p.m.,*
in response to message #1 by Steve Simpkin

The ratio of different RPN options on the iPhone to non-RPN options vs. the same ratio in the *real world* is disproportionate.

Clearly the public wants their RPN. Unfortunately, there is no public data on RPN usage on the iPhone or RPN vs. non-RPN sales. It may just be that the type of people that like RPN are just more capable of creating iPhone apps. I.e. RPN people are smarter, more creative, and more motivated. Just my biased opinion. But, years of RPN use has got to affect the layout of the brain.

BTW, why GO-21? I know that on the keyboard GO is parallel to HP and alphabetically G before H and O before P, but I after H and Q after P for IQ21 would have been better.

Edited: 16 Sept 2009, 4:30 p.m.

The numbers are biased though because anyone who is satisfied with algebraic functionality has a good basic scientific calculator by default. Seems like all the calculators that started as algebraic in the app store have added RPN functionality to attract the RPNers that have to go to the app store to get their RPN fix.

Also, most of the RPN calcs are emulations (HP specifically). I'm speculating, but of the natively running calculators I bet more offer algebraic functionality rather then RPN.

Long live RPN!

IQ-21 was indeed on the list but as another noted it was to reminiscent of intelligence quotient, and 21

wasn't such a hot IQ. So, in memory of 2001: A Space Odyssey and the HAL 9000, whose initials preceded IBM, GO was chosen because it precedes HP.

32SII SQRT(NEG)

*Message #1 Posted by **Marnus Malan (RSA)** on 15 Sept 2009, 5:35 a.m.*

Good day everybody!

You may recall I enquired on this forum about getting a 32SII (and got a very good broadly informative response!) The seller said it used to be her late husbands dearest possesion and one had to a) cough up and b) convince her you will be using the calculator "properly". I received it, still boxed with manual and in a perfect "as new" condition, apart from the box that showed som deformation.

Anyway, to my dismay I do not seem able to calculate the square root of a negative number, even though the calculator is supposed to handle complex numbers. The 42S and the 50G don't bother about this.

Is there a way to do this and is it possible with the 33s? My 33s is at home at the moment so I can't check, but I noticed the manuals are about word for word the same, give or take a few exceptions like facilitating examples in algebraic mode.

Regards

Thanks

edit, fixed typo

Edited: 15 Sept 2009, 5:36 a.m.

Re: 32SII SQRT(NEG)

*Message #2 Posted by **Paul Dale** on 15 Sept 2009, 6:16 a.m.,*
in response to message #1 by Marnus Malan (RSA)

Yes it can do this operation but not in a nice manner:

0 ENTER 1 +/- ENTER 0 ENTER 0.5 CMPLX y^x

There isn't a direct complex square root operation.

- Pauli

Re: 32SII SQRT(NEG)

*Message #3 Posted by **Norris** on 15 Sept 2009, 8:20 p.m.,*
in response to message #2 by Paul Dale

Granted, this is a clumsy and inelegant procedure. On the other hand, the 32SII *is* a programmable calculator. So you could easily add an "alternative" square root function for dealing with negative numbers.

I don't have a 32SII handy, but I do have a 33S. On the 33S, you could program:

LBL G
0
X<>Y
0
ENTER
0.5
cmplx y^x
RTN

Now the 33S has two square root functions. The first is the regular built-in function, which only works for positive numbers. But the second function also works for negative numbers. The second function is invoked with XEQ G -- since the G key is also the square-root key on the 33S, this is easy enough to remember.

So for example, you coud calculate the square root of -9 with:

9
+/-
XEQ G

This yields 0 in the X-register and 3 in the Y-register, which is the way that the 33S represents 0+3i.

The program above should work on a 32SII as well. However, the A key is the square root key on the 32SII, so you would want to start with LBL A (instead of LBL G).

Edited: 15 Sept 2009, 8:26 p.m.

Re: 32SII SQRT(NEG)

*Message #4 Posted by **Didier Lachieze** on 16 Sept 2009, 3:26 a.m.,*
in response to message #3 by Norris

Interesting trick! For the 35s you can do:

```
K001 LBL K
K002 i0
K003 +
K004 0.5
K005 y^x
K006 RTN
```

with:

```
9
+/-
XEQ K ENTER
```

you get *0.00i3.00* as the result of the square root of -9 if you're in FIX 2 mode..

Anyway, this is just a workaround and, as already said several times in this forum, it would be good to see a 35sii with full complex operation support, and not a half baked implementation.

Edited: 16 Sept 2009, 4:20 a.m.

Re: 32SII SQRT(NEG)

*Message #5 Posted by **Bart (UK)** on 15 Sept 2009, 6:20 a.m.,*
in response to message #1 by Marnus Malan (RSA)

Hi Marnus,

I do not have an 32SII, but a 32S, I suspect it's the same though.

The way to do this is to type: 0 ENTER -1 ENTER 0 ENTER 0.5 <LS>CMPLX Y^X. You'll have 0 in X and 1 in Y. The complex stack being X: real1, Y:img1, Z:real2, T:img2.

Why the CMPLX SQRT doesn't work and CMPLX Y^X does, I don't know. The 35S is pretty much the same, but easier as the complex number is in one line.

Hope this helps,
Bart

Re: 32SII SQRT(NEG)

*Message #6 Posted by **Mike Morrow** on 15 Sept 2009, 9:51 a.m.,*
in response to message #1 by Marnus Malan (RSA)

The so-called complex number support of the HP32S and HP32SII is very limited, very inconsistent, and just plainly a joke. There have been many postings here over the years about this. It was a extremely poor HP decision to develope such a limited capability compromised unit like the "improved" HP32SII at the expense of dropping the excellent HP42S that you mention, which 21 years after its introduction is still the finest RPN calculator ever made, in many people's judgement.

In 1997 I bought an HP32SII to replace my HP-15C and quickly found out how inferior it was to the HP-15C in this and many other qualities, except speed and precision. Unfortunately, the HP-15C's true replacement, the HP-42S, had been discontinued in 1995. With blind luck, I then found a local university book store that still had two HP42S units, sitting unsold for more than four years! I quickly purchased both and relegated my new HP32SII into my collection bin of "bad-mistake" calculators. It sits there today along with other HP "wonders" like the HP38G, HP28C, and HP6S.

The disappointing HP32SII is no HP42S. Not even close.

Always fascinating how much opinions diverge on this forum. There have been many arguments over the 32sii, and even the vaunted 42s has a few detractors.

Now me, I actually like the 38g, although I suspect in that regard I may be a minority of one on this forum ...

Re: 32SII SQRT(NEG)

*Message #8 Posted by **Ed Look** on 15 Sept 2009, 12:14 p.m.,*
in response to message #6 by Mike Morrow

Yes, compared to a 42S (unfortunately, I've never had nor used one), I'm sure it will look like a knock-off four banger. But I suspect it was intended for a different niche, a different purpose. I one wanted to have an even slightly more involved program, it might not fit on the 32SII. I still use mine (less and less just because I don't want to wear it out or break it; the 33s is taking its place more and more) because it is small, lightweight, and will do most scientific calculations nicely.

Yes, I wish I have a 42S also, but consider also the price differential; I paid $60 US for my 32SII, and I do recall one reason why I never got the 42S was that it cost much more than double that, and at the time, it was not feasible for me. In fact, I do recall feeling quite bad when I one day realized I might need a replacement and found that they not only stopped production of 42S's, but 32sII's, as well!

*Message #9 Posted by **Marnus Malan (RSA)** on 15 Sept 2009, 12:27 p.m.,*
in response to message #8 by Ed Look

Thanks for everybody who replied.

I am somewhat dissapointed, looking back I paid way too much (slightly less than what a new 35 would have costed me. Even though the calculator and the manual is in prestine condition, it seems pretty useless, as it will be relegated to the drawer as I do not think I will be able to adapt to using it instead of my 42s, as I have hoped in order to extend the life of my 42s.

I used to find HP calculators (42s, 41c etc) fairly easy at second hand shops but nowadays they are even more scarce than chicken teeth.

The 50G works fine and I use it a lot for work that another calculator simply wouldn't be able to do, but sometimes it is simply too big to carry around with ease.

So the hunt for more 42s sspecimens is still on...

*Message #10 Posted by **Ed Look** on 15 Sept 2009, 12:36 p.m.,*
in response to message #9 by Marnus Malan (RSA)

Obviously, we are not going to find that kind of power anymore in a small package as we did with the Pioneer form-factored 42S. I guess if you don't need that kind of computing and storage power too often, a 33s or 35s should do, as they are of a small form factor (and light!!). But HP has, I suppose even more powerful calculators in the 48G series, 49G series, but they are big calculators, even if they are quite nice. In fact the latest member of the latter group, the 50g, is fairly hefty.

Marnus,

I agree with your assessment of HP-42S versus the HP-32SII. I also played around with a HP-32SII a few years ago. At first, I loved the large display. For me, it was trying to adjust to letter registers - I was just too used to doing STO xx or RCL xx. I also missed having the rich HP-41 style programming environment of the 42S.

If money is tight (and nowdays it usually is), I'd suggest you pick up a cheap windows Pocket PC

and load the HP-42S emulator on it. One of the best, is the Dell AXIM - I had the 624 MHZ unit and it ran the Emulator Fast - I mean really fast. You also get the ability to save/load programs. The only thing missing is that sastifying pressing of the keys. Side benefit is you'll also have a good PDA.

If your cell phone is windows mobile, then you can put the emulator there. That's my current setup. Of couse, I still carry the actual HP-42s in my briefcase.

Bill

A used or refurbished iPod Touch is another low-cost hand held option for running several different HP calculator emulators. Emulators (or simulators) for the HP-42, HP-41CX, HP-48GX, HP-11C, HP-12C, HP-15C and HP-16C are currently available at the App store. Apple has refurbished iPod Touch (2nd gen) available starting at $150.

While using emulators on ipod or iphones looks cool and fashionable, I can never get used to "pressing" the keys using touchscreen. I would instead recommend the 35S for doing complex calculations if one is looking for the 32S-33S lines of calculators. Though still show SORT(NEG), complex calculations are much easier to manipulate in 35S, mainly due to the primary i key.

Interesting, to each his own I guess. In practice, I rarely work with complex numbers. I have both a 42s and a 32sII (and a 33s).

The 42s has marvelous implementations of things I rarely use, such as complex numbers, matrices, and more. However, it fails on two counts: the display is hard to read, especially in the marginal light in which I do a lot of my programming, and too many of the functions I need often are buried deep in menus (do people really have the patience to fish things out of the huge menu of functions?).

The 32sII and 33s are humbler and less powerful, but they are actually much easier and better for the simple calculations (4-ops, trigs, exps, percentages,...) that make up 99.9% of my calculations.

The result is that I have a 32sII on my desk at home, and a 33s at work, while the marvelous 42s stays, in all its marvel, mostly in a drawer.

Luca

Some comments about the HP38G, HP28C, and HP6S.

A few years ago I purchased an HP-38G from eBay for $12 and it turned out to be intermittent. After opening the case I could not believe how cheaply made it was inside. It looked similar to an HP-48 series on the outside, but it was a rather severe cost saving design compromise inside. In particular the battery contact and power source design (which turned out to be the problem) was very poorly done. It is now sitting on "permanent display" in a drawer.

I had bought a HP-6S years ago for one of my daughters. It was obviously not designed by HP and the color contrast scheme was horrible. It failed a couple of years later after serving its purpose and I threw it in the trash.

The HP-28C on the other hand was a breakthrough 3rd generation calculator with many firsts for a hand held device. Despite its shortcomings (severely limited memory, poor battery cover design, weak hinge design and no I/O for programs), it has a definite place in history and does not deserve to be in the same category as the the above calculators.

Yes, indeed, and it also provided full support for complex number functions and operations as well. This support was continued with the HP-48S/SX and current HP-50g. As far as the memory limitation problem, that was quickly resolved with the HP-28S.

For me the 32sII is a good fellow at work. Sometimes the limited memory is a issue when I want to handle some more equations. Due to this limitations I don´t use it for programs. For this purpose I have a 33s with 10 or so short, but for everyday-use helpful programs for quick calculations.

The reason I keep the 32sII is for its exellent keys and overall craftmanship. It is simply a pleasure to use the 32sII. As some posters here already stated the 33s has grown on me. The two line display is nice. But sometimes the zero key doesn´t register which is pain. As mechanical engineer I never need to make any calculations involving complex arithmetics. So for my needs it is a perfect machine. I understand if EE fellows here have a different opinion.

The 28C(S) is a great calculator. It took me through my college courses and was of great help. The footprint is rather big and many functions are burried in menues, but it was the first calculator doing almost everything. I still have it at work and if I need to convert complicated units I use it from time to time. I also learned RPL on it. And compared with my 48GX the 28S is much easier to master. IMHO it is not fair to state the 28C is a "mistake".

The HP28C that I bought in 1987 didn't have anywhere near enough RAM to be really useable at only 2 kBytes. About all one could do is demonstrate simple capabilities. I bought an HP28S in 1988 with its 32 kBytes of RAM. That was in fact usable...until the battery door structure failed.

HP's "Blue Mauritius" up for auction

*Message #1 Posted by **Rainer Wiedemann (Germany)** on 14 Sept 2009, 8:03 p.m.*

Up for a "Buy it now" auction is a HP Calculator Digest from 1976 for 580 bucks. **Here** you'll find the auction, the gracious seller will ship for free. Is this the Blue Mauritius among all HP calculator literature? Perhaps I should make a best offer then, a block of Lehman Bros. shares ... :-)

Edited: 14 Sept 2009, 9:09 p.m.

in response to message #8 by Gonzalo Fernandez (Spain)

Was it worth it?

Re: HP's "Blue Mauritius" up for auction

*Message #10 Posted by **Rainer Wiedemann (Germany)** on 27 Sept 2009, 9:43 p.m.,*
in response to message #8 by Gonzalo Fernandez (Spain)

Nope, he didn't sell it. It's up for auction again at the same price. Either the seller is pretty sure to find a dude, oops, I mean a buyer, or he doesn't mind paying high ebay fees.

I wonder, what makes this magazine so very special, of course without considering a buy (since my cash cow is constipated for a while :-))

Re: HP's "Blue Mauritius" up for auction

*Message #11 Posted by **Michael de Estrada** on 27 Sept 2009, 10:36 p.m.,*
in response to message #10 by Rainer Wiedemann (Germany)

> Quote:
>
> I wonder, what makes this magazine so very special

Presumably the fact that it is Volume One. The first edition of anything is always considered more valuable than subsequent issues. For example, I have Volumes Five and Seven of the HP Digest, but I imagine that they are less valuable for that reason. Of course, I have no desire or intention of selling them, any more than I would sell my Red Dot. As far as the item not selling at that price, well, the market has spoken and clearly no one has felt it is worth that much.

Restoration of an HP-15C

*Message #1 Posted by **Karl-Ludwig Butte** on 14 Sept 2009, 3:54 p.m.*

Dear All,

I was lucky and got an HP-15C for my collection. Although it's functioning the front of the cabinet is in rather bad shape: - the chrome color of the "HP 15C" nameplate in the upper right hand corner is totally gone - there are lots of scratches on the aluminium bezel. (I made a photo but couldn't load the photo into the message. This would be a very welcome addition to the message editor).

Now my question: On ebay I found a "Glass and Mirrorspray" by a company "Reeves". Does anyone have experiences with this spray or another product to restore the chrome color ? And what can be done about the bezel ? Wasn't there someone in this forum writing a book about restoring HP calculators ?

Any hint will be very much appreciated.

Thank you very much in advance

Kind regards

Karl

*Message #6 Posted by **Geoff Quickfall** on 15 Sept 2009, 1:11 p.m.,*
in response to message #1 by Karl-Ludwig Butte

Hello Karl, and others!

Karl;

unfortunately any spray paint used, even those designed to bond with plastics will wear. If however you want to try it, I suggest that you remove it of course. Clean it with water, soap and a good rinse then after a thorough dry. Give it a light dusting of the silver spray. Follow that with a few coats. Then using a black wax filler pencil, fill in the 15C engraving. Rub off the excess.

These paints never give the 'mirror' finish they promise. The only way to do that is to vacumn plate the plastic.

An alternative is to remove the chrome, then polish the resulting black badge, then fill in the HP15 with silver paint. Not original but attractive and the added benefit of never having to paint it again!

The book: is almost complete, up to 400 photos and should top out at 350 pages. Problem is, information keeps coming up in this forum, like the delrin or nylon ball replacements mentioned in the HP-97 posting below.

Unfortunately it will not be done in time for HCC2009 next month I don't expect a major delay. Also, those attending the HCC will be getting a preview in the form of the talk in which they will see the quality of the photos and text and will be

Cheers, Geoff

p.s. keep an eye out at the auction site as the badges do come up occasionally.

Re: Restoration of an HP-15C

*Message #7 Posted by **Michael Plant** on 15 Sept 2009, 1:44 p.m.,*
in response to message #6 by Geoff Quickfall

Hi Geoff,

I wish I had your talent/hard earned skill! I've successfully "tarted up" my HP-15c's bezel (using techniques you've posted elsewhere on the forum) and it looks infinitely better than it did when I took delivery of the calculator. However, your efforts are beautiful! At any rate, thank you for the advice on the badge. I used a brush and silver

model paint and it didn't turn out that well. However, using your black wax pencil trick has made it passable until I can get organized to re-do it properly with spray paint. Actually, I quite like the reversed colour scheme that you suggested as an alternative. We shall see.

I really wanted to ask if, when the book is finally finished, it will be available for general purchase (ie outside of conferences and meetings)? I certainly hope so!

Thank you again,

Mike

Complex Gamma Function... revisited

*Message #1 Posted by **Angel Martin** on 14 Sept 2009, 2:54 p.m.*

Valid for the complex plane plane where Gamma is defined (i.e. includes Re(z)<0, and excludes negative integers and zero).

Here's the program listing, a nice example of the HP-41Z function set (can you tell it's FOCAL?? :-)

Uses the Lanczos approximation, split in three parts as per the function names clearly show.

More soon...

Re: Complex Gamma Function... revisited

*Message #2 Posted by **hugh steers** on 14 Sept 2009, 5:03 p.m.,*
in response to message #1 by Angel Martin

I have had a lot of trouble with the Lanczos approximation. The coefficients of the series vary wildly and cause large swings in value. This causes a lot of cancellation which destroys accuracy. Currently, Im using increased precision to cope with this problem. I'd prefer a more stable formula than Lanczos. There's another method by Spouge, but you need a lot more series terms for convergence.

it will be interesting to see how many digits you get on the 41.

Re: Complex Gamma Function... revisited

*Message #3 Posted by **Marcus von Cube, Germany** on 15 Sept 2009, 1:40 p.m.,*
in response to message #2 by hugh steers

Go and ask Viktor T. Toth at rskey.org! He's dedicated part of his life to Gamma.

Re: Complex Gamma Function... revisited

*Message #4 Posted by **Namir** on 15 Sept 2009, 2:22 p.m.,*
in response to message #3 by Marcus von Cube, Germany

I think Toth calculates the Gamma function for real arguments only. This way he can apply the Gamma (or Ln Gamma) to a whole collection of programmable calculators.

Re: Complex Gamma Function... revisited

*Message #5 Posted by **Marcus von Cube, Germany** on 15 Sept 2009, 4:29 p.m.,*
in response to message #4 by Namir

Namir, that depends on the calculator. On machines with decent complex support (like the TI-92) he calculates the complex Gamma function.

His general article about Gamma is worth reading.

Re: Complex Gamma Function... revisited

*Message #6 Posted by **Angel Martin** on 15 Sept 2009, 4:50 p.m.,*
in response to message #5 by Marcus von Cube, Germany

That exactly is the source I have used to programm it.

http://www.rskey.org/gamma.htm

To the careful reader it's clear that:

ZGSUM computes the sum of the seven terms (qk * Z^k)
ZGPROD is thhe product of (z+k)
ZGLNC calculates the trascendent part of the formula, and
ZGNZG corrects the expression for Re(z)<0

Cheers,

Re: Complex Gamma Function... revisited

*Message #7 Posted by **Namir** on 16 Sept 2009, 10:31 a.m.,*
in response to message #5 by Marcus von Cube, Germany

Marcus,

You are correct! I did revisit Toth's Gamma function math page (have not seen it for a while) and saw the Lancsoz approximation that is being talked about here.

While series approximation are in general easy to work with, a few here and there are tough to tame! Using the old programmable calculators, series approximation were really time consuming. With today's machine's we have faster CPU and the approximation (again in general) are not too bad.

in response to message #2 by hugh steers

Hugh, I have done a lot of fiddling with Spouge, and the cancellation and digit loss issues persist there--only worse. You need a LOT of guard digits to preserve accuracy. I understand you double precision BCD-20 type has gone a long way to help here.

Re: Complex Gamma Function... revisited

*Message #9 Posted by **Steven Thomas Smith** on 25 Sept 2009, 12:16 p.m.,*
in response to message #2 by hugh steers

See GSL's complex Gamma implementation -- they use Lanczos for the right half-plane, Stirling for the left away from the negative real axis, and reflection to avoid the unstable parts -- actually, they use reflection to avoid Stirling altogether. It's a good implementation.

Nice. How about a complex LogGamma and a complex Lambert W?

Re: Complex Gamma Function... revisited

*Message #11 Posted by **hugh steers** on 15 Sept 2009, 4:15 p.m.,*
in response to message #10 by Egan Ford

You kind-of get LnGamma anyway. Out of Lanczos you wind up with three numbers; S, A and B (say).

Gamma(z) = S*exp(A*ln(B)-B)

so using the same subroutine, you can have,

LnGamma(z) = A*ln(B) - B + Ln(S)

However, the latter might not be the best for larger numbers.

Re: Complex Gamma Function... revisited

*Message #12 Posted by **Angel Martin** on 15 Sept 2009, 4:36 p.m.,*
in response to message #10 by Egan Ford

Here's where I'm going to show my utter lack of math finesse but what the heck:

```
LBL "LNZG"
ZG
ZLN
END
```

Of course this is just a teaser, will look into a proper way during the week-end :)

Cheers,

'AM

> Nice. How about a complex LogGamma and a complex Lambert W?

Wikipedia has an algorithm for Lambert's W function that seems okay and converges in the complex plane: here. This is the one I'm using in the 20b scientific firmware. Start with the approximation and then iterate to the solution - I've limited this to 20 times through.

For complex (and real) LogGamma, I'm using Lanczos. Look for *An Analysis of the Lanczos Gamma Approximation* by Glendon Ralph Pugh pages 134 and 135 for the formula and coefficients of the approximation I'm using.

Re: Complex Gamma Function... revisited

*Message #14 Posted by **Ángel Martin** on 22 Sept 2009, 8:51 a.m.,*
in response to message #10 by Egan Ford

Well, I'll leave Lambert for the real mathematicians out there but here's a pragmatic approach for the LnGamma case.-

The first program is the "brute force" approach, adding terms to the summ until their contribution isn't relevant to the (rounded) result. VERY slow, and not an appropriate method- just good for comparison purposes.

LnG(z) = -Gz - Lnz + SUM [(z/k)-Ln(1+z/k) |k=1,2....]

No doubt you'll recognized Stirling's approach embedded in the second method. The routine calculates LnG(z+7) for enhanced accuracy (about E-9), and adjusts it back appropriately.

MCODE functions from the 41Z module help bring down the execution time to manageable on the real 41, and of course irrelevant on emulators.

2LnG(z)=Ln(2pi)-Ln(z)+z{2Lnz + Ln[z*sinh(1/z)+(1/810*z^6)]-2}

LnG(z) = LnG(z+n) - Ln [PROD(z+k)|k=1,2..(n-1)]

Method-2 is much faster, more accurate and takes less program memory... can you ask for more? Yes, an MCODE version will be implemented on the 41Z during the next few weeks :)

Enjoy, ÁM.

http://space.1337arts.com/hardware

and attach a HP calculator, would the calculator qualify for a post in my blog?

Re: If I do this...

*Message #2 Posted by **Dan W** on 14 Sept 2009, 10:54 p.m.,*
in response to message #1 by hecube

Well your blog is about space exploration, so one would have to get the calculator into space. This group didn't come close. They went 17.5 miles high. There is no sudden transition into space, but space is typically defined as beginning at 100 km, about 62 miles high. The US defines an astronaut as someone who has been at least 50 miles high (though I think this definition was created to award a couple of X-15 pilots their astronaut wings). No balloon will ever get into space. The highest research balloons can get about half way there. You need a sounding rocket.

For one, we have a 747 pilot on this forum. He, or any military pilot, can easily exceed any altitude posted by terrestrial mortals.

However, I believe freight jets fly higher than passenger jets (but not military jets!), so if one can time it right, and have an altimeter attached to I/O, one might get his/her calculator higher than a 747, while not carrying the device.

Re: If I do this...

*Message #19 Posted by **Maximilian Hohmann** on 16 Sept 2009, 4:20 p.m.,*
in response to message #18 by Pal G.

Hello!

> Quote:
>
> However, I believe freight jets fly higher than passenger jets (but not military jets!), so if one can time it right, and have an altimeter attached to I/O, one might get his/her calculator higher than a 747, while not carrying the device.

Most freighters are converted airliners that have the same airframe and powerplants as the passenger version and therefore identical performance values. Typical service ceilings of these aircraft are between 41,000 and 43,000 feet, independently of their configuration. The altimeter in your freighter however will not read more than 8,000 feet because the cargo holds are pressurised!

If you want your calculator taken to higher altitudes, you either put it on board of a Space Shuttle or Soyus spacecraft, a military fighter jet or a business jet. Even "my" (my bosses to be precise, but I get paid for flying it) little Citation reaches 45,000 ft. (Others like Learjets and Gulfstreams go above 50.000ft.) And we have an unpressurised baggage compartment, so your altimeter will actually read that figure. Some of my HP calculators have been there already - but without an altimeter attached to prove it...

And regarding the subject: If anyone wants to reapeat the experiment, _please_ get the necessary permissions from the relevant aviation authority. A one-Kilogram box with equipments can cause millions (Dollars/Euros) worth of damage to an aeroplane and endanger hundreds of people on board!

Greetings, Max

41-MCODE: IND/ST/MATH in prompting

*Message #1 Posted by **Ángel Martin** on 14 Sept 2009, 5:12 a.m.*

Greetings,

I'm looking for information on how's the coding done for prompting functions using the extra options, like IND, ST, IND_ST, and MATH.

It's easy for the standard and simple IND cases, but how about the rest? This should be well know to the community but I can't trace the information anywhere - got no VASM listings myself :(

1.- Standard: reg# address in S&X field of A

2a.- IND: (reg# + 80) in S&X field of A
2b.- IND ST

3.- ST (X/Y/Z/T/L...)

5a.- MATH (+/-/*//)
5b.- MATH IND
5c.- MATH IND ST

Cheers,
ÁM

Edited: 14 Sept 2009, 5:27 a.m.

Re: 41-MCODE: IND/ST/MATH in prompting

*Message #2 Posted by **Meindert Kuipers** on 14 Sept 2009, 2:10 p.m.,*
in response to message #1 by Ángel Martin

Angel,

The VASM listings are a must, and they are on the various DVD's. The listing below is from my disassembler and it has the 2 bits of the last words of the function name combined in the prompt variable, hope this helps!

```
case prompt of
  $00 : Cmt := '';            // no prompting
  $01 : Cmt := 'Prompt: Alpha (null input valid)';
  $02 : Cmt := 'Prompt: 2 digit ST IND IND_ST + - * /';
  $03 : Cmt := 'Prompt: 2 digit or non-null Alpha';
  $11 : Cmt := 'Prompt: 3 digits';
  $12 : Cmt := 'Prompt: 2 digits ST IND IND_ST';
  $13 : Cmt := 'Prompt: 2 digits IND IND_ST non-null Alpha';
  $21 : Cmt := 'Prompt: non-null Alpha';
  $22 : Cmt := 'Prompt: 2 digits IND IND_ST';
  $23 : Cmt := 'Prompt: 2 digits or non-null Alpha';
  $31 : Cmt := 'Prompt: 1 digit IND IND_ST';
  $32 : Cmt := 'Prompt: 2 digits IND IND_ST';
  $33 : Cmt := 'Prompt: 2 digits IND IND_ST non-null Alpha . ..';
```

Meindert

Re: 41-MCODE: IND/ST/MATH in prompting

*Message #3 Posted by **Angel Martin** on 14 Sept 2009, 2:29 p.m.,*
in response to message #2 by Meindert Kuipers

Thanks Meindert, sorry I didn' t explain it better but the issue is not with the coding of the function NAMES (using the leftmost bits of the first two function name bytes as per the table you attached) but with the way the actual values are coded when used.

For instance. I have not figured out where is the input "IND ST Y" stored when using such a prompt. Not in the S&X field of the A register, which only "knows" about the IND part but not about the ST... mystery or plain ignorance on my part? Likely the latter...

Best, 'AM

Re: 41-MCODE: IND/ST/MATH in prompting

*Message #4 Posted by **Meindert Kuipers** on 15 Sept 2009, 12:12 p.m.,*
in response to message #3 by Angel Martin

That will be more difficult, you will have to look for examples using the various types of prompting. If you have a copy (also on the DVD's) of Ken Emery's famous HP41 M Code For Beginners, there is a nice introduction on page 135 and on which should get you started.

Meindert

Re: 41-MCODE: IND/ST/MATH in prompting

*Message #5 Posted by **Eric Smith** on 15 Sept 2009, 2:30 p.m.,*
in response to message #3 by Angel Martin

Is the A S&X field formatted as a postfix byte? If so, isn't the "ST Y" implicit in the postfix value? If not, how are you finding that "IND" is indicated?

If I had to make a wild-ass guess, I'd think that any additional information from prompting might be stored in the "Q" status register. That's where alpha prompting goes, but maybe numeric prompting affects it also.

Re: 41-MCODE: IND/ST/MATH in prompting

*Message #6 Posted by **Håkan Thörngren** on 15 Sept 2009, 4:32 p.m.,*
in response to message #1 by Ángel Martin

A stack argument is stored in the postfix byte of the function, just like numeric registers. Low numbers are for data registers, while higher numbers (112-127) are for stack / status registers. The quick reference card for synthetic programming shows the coding, for example 112 is T register, add 128 for IND T.

Math STOre functions are encoded in the prefix byte, postfix bytes works the same as all others.

Nestler slide rule

*Message #1 Posted by **Peter Klein** on 14 Sept 2009, 12:34 a.m.*

I have an old German Nestler slide rule, mahogany with white plastic (?) overlays. It was probably made in the 1930s. It was my father's, and I believe he used it in college and in his early work as a physicist. I'd like to know the model number and approximate date, but this is hard to find.

The slide rule is very similar to, but a bit more advanced than this one:
http://www.sliderulemuseum.com/Nestler/S403_Nestler.jpg

In addition to what you see in the photo, it has a CI scale in the center of the slide and a K scale under the D scale on the stationary part. Everything else appears identical to the photo linked above, including the screws, the table of equivalents on the bottom, and inch and centimeter scales on the sides that face away from and towards the user, respectively.

I haven't been able to find any references to this exact model anywhere. Can anybody with Old Knowledge fill in the blanks?

Dirk Dykson of H-P?

*Message #1 Posted by **Karl Schneider** on 13 Sept 2009, 5:20 p.m.*

A recent thread provided a link to the following *Wall Street Journal* article about the TI Inspire:

http://online.wsj.com/article/SB125244891686393811.html

The article also stated the following:

> Quote:
>
> *"We've had a bit of a late start," in the high-school market, said Dirk Dykson, head of H-P's calculator division. But the company is renewing its focus on the much larger middle and high-school markets.*

I'd never heard of Dirk Dykson, but a web search reveals that he is based in Fort Collins. Those who are attending HHC 2009 will surely meet him.

I can't recall having learned of this in the Forum. Did he replace Sam Kim? H-P recently sold the complex in Vancouver, WA (where Sam is/was based) to Shin-Etsu, another high-tech firm.

-- KS

Edited: 13 Sept 2009, 8:09 p.m.

Right you are. Part of the recent changes was that calculators got put under the accessories group and jobs got shuffled around. Unfortunately, Sam was not retained. This is a big blow to many of us, as he really cared about what went on, since he was "raised" on HP machines and belonged to the PPC Puget Sound chapter during the HP41 days. As an outsider, I have to say that he will be sorely missed.

Jake Schwartz

Re: Dirk Dykson of H-P?

*Message #3 Posted by **Tim Wessman** on 13 Sept 2009, 8:51 p.m.,*
in response to message #2 by Jake Schwartz

Dirk has been with the calculator group for many years in a more managerial type position (working on deals for textbook/education etc). Wing Cheung, whom many of you met two years back at HHC, was promoted upwards earlier this year. A few months or so before that, the calculator groups was placed into the accessories group (mice, keyboards, general 'doesn't fit anywhere' group)

When the groups were more tightly meshed, there were two R&D managers, and the other group was larger and she had been in charge longer. . .

It was very sad, but the calculator group is in good hands. I will not go into details more as there is a lot of personal info, but I suspect Sam still reads here as he'd always send emails to us highlighting particular posts he found interesting.

He has a very good job working with some good freinds, so don't be worried he is on a street corner somewhere living in a box. :-)

Management changes in HP's calculator division

*Message #4 Posted by **Karl Schneider** on 14 Sept 2009, 12:36 a.m.,*
in response to message #3 by Tim Wessman

Jake and Tim --

Thank you for the update. It's disappointing that Sam Kim is no longer part of the team.

I wonder, though, if Sam had been seeing "the writing on the wall" regarding modest corporate support and emphasis for calculators, as well as for the future of the Vancouver facility.

Sam has appeared routinely in the Vancouver (WA) *Columbian* for his work as a member and president of his local school board, and for community issues. However, the May 14, 2008 edition ran a story on Page C1 that identified him as one of four finalists for the City Administrator position in Bend, Oregon -- at a time when rumors abounded of scaling down at HP's Vancouver facility. When no story followed to announce his being selected for the position, I wondered about his future at HP.

I had read the article, but did not mention it to anyone at HHC 2008.

I agree.

At HHC 2007, (perhaps selfishly), as soon as we broke for lunch, I tracked down Sam and asked if I could see the "prototypes" that were in the special black briefcase. Sam was so kind to spend the first half of his lunch hour talking and showing me the new calculators. He seemed to not mind our

chat and graciously allowed me to keep drooling over the protos, never looking at his watch, so to speak.

Thanks, Sam.

PG

ps - And Karl, I enjoyed our chats on day one too. I sat right next to you, until my wife had some drama that tore me away and home to AZ, before the end of the conferece. I think I still have my raffle ticket in my HP35s User's Guide. I was hoping to take home an HP48SX coffee mug :)

in response to message #6 by BruceH

Sam;
I'm glad to hear that you landed in a good place but sad to hear that you will not be there to guide the calculator division. Thank you for all that you have done for this community and for people who do math (even simple math like me) for a living. You're the greatest. - db

Re: A note to Sam Kim

*Message #8 Posted by **Reth** on 17 Sept 2009, 7:03 a.m.,*
in response to message #7 by db (martinez, ca.)

May I know what exactly did he do to be regarded as "the greatest" by you?

Re: A note to Sam Kim

*Message #9 Posted by **db (martinez, ca.)** on 20 Sept 2009, 2:11 a.m.,*
in response to message #8 by Reth

Reth;
For those who talk American, as opposed to those who speak English; that phrase would be like "the bee's knees" or something to y'all. I was for sure not comparing Mr. Kim to Alexander the Great. Suleiman the Great, Peter the Great, or even Catherin the Great.
Still, taken at face value; why is he Sam the Great? That hp came out with seven or so calculators on his watch and all that i can think of had rpn or rpl, that he included four or so people from this forum (not me) in the design and documentation processes, that he allowed or instructed his subordinates to share info on the architecture and hardware of hp's new machines, that he shared hp's future plans and asked HHC attendees for their input, that he gave out samples of hp's newest calcs at those HHC meetings (i'm easy to bribe). Those are a couple of good reasons.
I was thinking of addressing this note to Reth the Great, but i couldn't think of

anything that you had done for *me* in the past week.

Re: A note to Sam Kim

*Message #10 Posted by **Reth** on 20 Sept 2009, 3:20 a.m.,*
in response to message #9 by db (martinez, ca.)

Oh, I see, you were talking "American". I wasn't aware of such language. Is it how they refer to it at school?
So "the greatest" means nothing in that language. Fair enough. ;)

O.T. Timers

*Message #1 Posted by **designnut** on 13 Sept 2009, 3:42 p.m.*

- I have a digital watch that not only sets itself from WWWB time station but takes more than one reading and digitally corrects it's own rate. Here's one reference to it. http://atomicelmer.topcities.com/clocks/sports.html I had it in Europe for 15 days and it was spot on with the BBC time ticks, then the battery failed. I had a similar watch destroyed by someone who insisted he had to set it after he changed the cell. I found a dressy watch by Casio that had a solar rechargeable cell. http://www.casio.com/products/Timepiece/Waveceptor/WV300DA-7A/ Both watches have a ready time zone change and a display of GMT. I use wall and bedside clocks set by WWWB time. I enjoyed showing the unannounced timer in the HP45 and it was great for short time splits from 0-9, just press the number keys. Sam

Re: O.T. Timers

in response to message #1 by designnut

Here in Germany, rado controlled clocks are quite common. I have several analog ones in my home and a digital clock near my bed. The signal comes from Darmstadt and is known to be very accurate.

My computers set their time from the 'net.

Edit: See Walter's post for a more accurate description where the signal comes from. Or look here. You can search for DCF77 in Google Maps or Google Earth.

Re: O.T. Timers

*Message #3 Posted by **Walter B** on 14 Sept 2009, 1:09 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Like in other countries, the time signal here comes from an atomic clock. Ours is Cs AFAIK and is located at PTB (Physikalisch-Technische Bundesanstalt = German Weights and Measures at Braunschweig, an institute like NIST in the USA). The signal is DCF77, long wave, broadcasted from Mainflingen (some 50 km east of Frankfurt). You can receive it within 1500 km radius, provided you are not behind concrete walls or similar obstacles for electromagnetic radiation.

Way back, I took part in production of radio controlled clocks, so this is what I recall.

The HP-45 is not very accurate as a timer. The timing is controlled by a simple LC circuit - a capacitor and an inductor creating a sine wave at about 800 kHz. But it varies from calculator to calculator because of part tolerances and may vary with temperature.

The HP-55 replaces the LC parts with a quartz crystal at 784 kHz. According to the owner's handbook it is accurate to 0.01%, or 1.5 seconds in 8 hours.

I enjoy using my HP-55 but I haven't found any real use for the timer.

I have a Waveceptor watch and also a digital wall clock that syncs to the WWWB time station. In previous days I would tune a shortwave radio to the time station to sync my watches.

HP-41CX in Space SpaceLab Exhibit (hecube take note)

*Message #1 Posted by **Dan W** on 12 Sept 2009, 4:09 p.m.*

I was in Munich last week and visited the Deutches Museum, which is all about science and technology. A wonderful museum, highly recommended to anyone here.

In the aerospace section I found this small exhibit about a German astronaut using the HP-41CX on the SpaceLab D1 mission in 1985. The English text reads:

> Quote:
>
> D1-SAPCELAB [sic] Mission, 1985 Calculator: Hewlett-Packard, USA, 1984 Voltmeter: Walcher Elektronik GmbH, Kirchheim, 1985
>
> The voltmeter is an instrument for measuring voltage and temperature. It contains an analog-to-digital converter that feeds the measured values to the calculator for processing. The calculator is a slightly modified standard HP 41 calculator. Astronaut Ernst Messerschmid devised this voltmeter to be used for experiments in materials science aboard the 1985 German D1 mission.

The exhibit includes the calculator and the voltmeter, with an interface to one of the expansion slots. There are two notebooks with the handwritten program code, derivation and user's guide. A couple of lines of code are obscured but it would be relatively easy to replicate.

Jimmy, you are welcome to use these photos on your site. The photos are quite large so I am including just the links below for download.

Cheers,

-- Dan

> And damn! Part of the program listing is not visible! Hasn't it occured to the curator that fans might want to try the program on their 25+ years old HP-41?!

Well, let me guess a bit. The steps 18, 19, 20, and 27 through 32 are obscured, some of them only partially. Ernst Messerschmid seems to have been a systematic programmer. So my guess is:

```
18 LBL C          27 LBL D
19 LBL 03         28 LBL 04
20 TRIGGER        29
                  30 VIEW .6
                  31 STOP
                  32 MEAN
```

So there's only one step missing still. Come on ... :)

HTH,

Walter

Woodstock LED Cover Replacement?

*Message #1 Posted by **Michael de Estrada** on 11 Sept 2009, 1:39 p.m.*

I just acquired a functionally perfect HP-27 Woodstock, which has one very annoying cosmetic flaw. The previous owner chose to engrave his last name into the bottom of the red transparent LED cover in the front of the calculator. I have a spare broken Woodstock with a clean cover, and wondered if it is possible to non-destructively remove its red LED cover and re-implant it in the good calculator. I have done this with several Spice calculators, which have LED covers that are simply snapped in place, and are easily removed. However, from what I can tell the Woodstock cover is not removable without being damaged. Perhaps one of you knows otherwise?

Thanks,

Michael

Re: Woodstock LED Cover Replacement?

*Message #2 Posted by **Dallas Osborne** on 11 Sept 2009, 2:57 p.m.,*
in response to message #1 by Michael de Estrada

http://www.hpmuseum.org/20intern.jpg

From what it looks like, you will be able to push from the front once you open the calculator.

I would separate the back by taking off the rubber feet and gently unscrewing the screws underneath. The top will separate with a gentle tug and the bottom connection should lever out.

Now I don't know what the cover is glued in with so you will have to play around a little. Sometimes you can heat it up (hair dryer or heat gun - be careful with a heat gun) and the adhesive will soften up.

Re: Woodstock LED Cover Replacement?

*Message #3 Posted by **Michael de Estrada** on 11 Sept 2009, 4:48 p.m.,*
in response to message #2 by Dallas Osborne

Thanks, Dallas. I already know how to open these up, and in fact have done so many times, but it seems like the red LED cover is stuck on pretty good. I've tried gently prying to no avail. I tried a hair dryer like you said on the donor calculator and it separated on the bottom but didn't budge on the top, so I don't think this approach will work.

Michael

Edited: 11 Sept 2009, 4:58 p.m.

Re: Woodstock LED Cover Replacement?

*Message #4 Posted by **Dallas Osborne** on 11 Sept 2009, 5:48 p.m.,*
in response to message #3 by Michael de Estrada

They may have used a cyanoacrylate type glue or epoxy-ish. It that is the case, you will have a much harder time and heat won't help a bit. I would recommend against the solvent route.

Sorry, Mate; in your shoes, I would pull out a drill, jewelers saw, files, polishing files, lapping cloth, a hot glue gun, and some nice hard plastic. Acrylic is my favorite for this type of thing, but it can shatter if dropped. Making Frankenstein's monster look good is such a fun hobby.

Re: Woodstock LED Cover Replacement?

*Message #5 Posted by **Gordon Strickland** on 11 Sept 2009, 6:34 p.m.,*
in response to message #4 by Dallas Osborne

"Debonders" are readily available for loosening cyanoacrylate glue, at many model hobby shops, for instance. Whether they would harm the surrounding plastic, I do not know. Epoxy glue would probably be a more difficult proposition.

Re: Woodstock LED Cover Replacement?

*Message #6 Posted by **Dallas Osborne** on 11 Sept 2009, 11:23 p.m.,*
in response to message #5 by Gordon Strickland

True and I haven't tested them on the various plastics. I had a bad experience with lacquer thinner when repairing a 41c and have stayed away from solvents.

(I know, I know; that was more than dumb and resulted in my first screen transplant operation. I was clearing flux after solding the new LCD on and grabbed the thinner off my shelf instead of alcohol. It was very sad.)

Slide Rule Apps for the iPod/iPhone

*Message #1 Posted by **Howard Owen** on 11 Sept 2009, 1:32 p.m.*

I just received my slide rule from Think Geek. (The quality is poor, but my expectations were low.) It made me curious about slide rule simulators for the iPhone. It turns out there are several. (Just search for "slide rule" in the App Store.) Has anyone tried one or more of these apps? There's no practical application for these simulators (other than education, I suppose) but perhaps someone else here has the simulation bug as badly as I do?

Regards,
Howard

Re: Slide Rule Apps for the iPod/iPhone

*Message #3 Posted by **Howard Owen** on 11 Sept 2009, 9:57 p.m.,*
in response to message #2 by Martin Pinckney

Can't tell. I'm guessing it is made in Asia.

Sorry for the indistinct lettering. But you should be able to see there is no indication of origin.

As to quality, the center scale can move vertically with respect to the other two, and it sticks on one side. The slide isn't smooth at any point, for that matter. For me a slide rule is just a curiosity, since I was in the first generation that never touched one.

Regards,
Howard

Re: Slide Rule Apps for the iPod/iPhone

*Message #4 Posted by **Palmer O. Hanson, Jr.** on 11 Sept 2009, 10:55 p.m.,*
in response to message #3 by Howard Owen

Howard:

Near the end of the slide rule era companies such as Hoffman, Pickett and Sterling offered some quite well made plastic slide rules in configurations ranging from pocket Mannheims to full size log-logs. I

have a number of spares in my collection of almost two hundred slide rules. So, I hope that you didn't really spend $29.99 for what you got. Can you get your money back?

I also note that the promotional material at the site you provided says in part

> Quote:
>
> ... Here was a simple device with one sliding part ...

Wow! Slide rules have two moving parts -- the slide and the cursor.

Palmer

Back in the day, all quality slide rules were fully adjustable. You could adjust the fit of the slide, alignment of top/slide/bottom and cursor, each side of cursor independently.

> Quote:
>
> ... and it sticks on one side. The slide isn't smooth at any point, for that matter. For me a

slide rule is just a curiosity, since I was in the first generation that never touched one.

The professional ones were made either out of mahogany, bamboo, or aluminum (later some in plastic, as Palmer pointed out), and were very precisely machined. You lubricated the mahogany with talcum powder, the Al with petroleum jelly, the bamboo and plastic with nothing. Even so, some sticking (really just slight hesitation) was not unheard of.

It's just a curiosity for me now, but it was an essential tool when I started out.

Re: Slide Rule Apps for the iPod/iPhone

Agree if "later" means after ca. 1950 in developed countries, and "some" means state-of-the-art slide rules for engineers and scientists. These were made of good white plastic completely, as were well made student's rules. No need for lubrication or adjustment. BTW, my father had a wooden rule laminated with white plastic on its faces, which I found terribly outdated when he offered it to me in the late sixties.

in response to message #8 by Walter B

Athough $29 for a poor quality slide rule is bad news but however, it's a good news that new slide rules are being made. I think it a copy of a Pickett slide rule. The style of the rule as well as the design of the box is a copy of the Pickett.

Edited: 12 Sept 2009, 6:23 p.m.

Re: Slide Rule Apps for the iPod/iPhone

I agree that the style looks similar to the some of the lower cost plastic Pickett slide rules. I don't have my collection here but I think it is also close to some of the Acu-Math's and Sterlings. My recollection is that I have at least one which also uses black connectors at the ends.

Lawrence Engineering Service of Peru, Indiana made some really low cost slide rules in the

1940's which used white paint on pine.

I remember that the slides of the metal Pickett's had a tendency to be sticky even when they were greased. If you work with those today you will find that WD-40 does wonders and is far easier to applly without leaving a sticky residue.

Re: Slide Rule Apps for the iPod/iPhone

*Message #11 Posted by **Eric Smith** on 13 Sept 2009, 3:09 a.m.,*
in response to message #10 by Palmer O. Hanson, Jr.

WD-40 will in fact leave a residue. WD-40 is NOT a lubricant. It is a Water Displacer.

Better to use a real lubricant that is suited to the slide rule material.

Re: Slide Rule Apps for the iPod/iPhone

*Message #12 Posted by **Martin Pinckney** on 12 Sept 2009, 6:15 p.m.,*
in response to message #8 by Walter B

I stand corrected. I did not remember the all-plastic ones in the late 60's. And in fact the engineering students all purchased professional-grade rules.

When I was a university senior in 1970, someone decided they needed my 10" Post Versalog more than I did. I could not afford to replace it at $30, so I bought a 5", $15 "pocket Versalog" with which to finish my studies. As soon as I landed a job and got my first paycheck, I went downtown and purchased another 10" Versalog. I still have both those two today.

Re: Slide Rule Apps for the iPod/iPhone

*Message #13 Posted by **Chan Tran** on 12 Sept 2009, 6:25 p.m.,*
in response to message #12 by Martin Pinckney

I have the Faber Castell 2/83, I think it's one of the better slide rule but made of plastic.

Re: Slide Rule Apps for the iPod/iPhone

*Message #14 Posted by **Walter B** on 13 Sept 2009, 5:11 a.m.,*
in response to message #13 by Chan Tran

Assume there were some patents constraining the choice of materials. Else no company would have stayed with the older ways of composite rules (basis material plus cover layers) or materials requiring lubrication. Though the production times were longer than patents live, so some "choices" may have been tradition, too.

Edited for typos.

Edited: 13 Sept 2009, 7:10 a.m.

Re: Slide Rule Apps for the iPod/iPhone

*Message #15 Posted by **John Mosand** on 13 Sept 2009, 7:06 a.m.,*
in response to message #14 by Walter B

To make something clear: 'plastic slide rules' isn't the same as 'cheap quality'. ARISTO, the world's most successful slide rule manufacturer (with about 1000

models, 1872-1978) made ONLY high grade PVC slide rules from 1936. Their most successful STUDIOs, more than 2 million made, became an engineer's standard outside the US. Also, plastic slide rules should absolutely be kept lubricated! Preferably with vaseline.

Re: Aristo Slide Rules

*Message #16 Posted by **Palmer O. Hanson, Jr.** on 13 Sept 2009, 8:56 p.m.,*
in response to message #15 by John Mosand

I have only a few ARISTO's in my collection. The ones that I have use the so-called Darmstadt configuration where the trigonometric scales are on the frame not on the slider. Slide rules with the trigonometric functions on the slide as in the Mannheim configuration allow direct chained trigonometric calculations such as occur in solid geometry transformations. I haven't figured out how to do chained trigonometric calculations with a Darmstadt without reading a trigonometric function from the frame by eye and entering it at the C scale by eye.

Is it that I just don't know how to use a Darmstadt?

Re: Breaking news.

*Message #2 Posted by **Gordon Strickland** on 11 Sept 2009, 3:31 p.m.,*
in response to message #1 by Pal G.

This looks very nice. For SX and earlier model GX users, this simulated screen is a great improvement. I have a late model GX with the improved black text screen, but this simulation looks even better than that.

I would assume that this simulator would run much faster, and perhaps be free of the annoying garbage collections. However, you are certainly not going to have any tactile feedback on "key" presses. I wonder if you can activate an audible key click.

i48 emulator on iPhone

*Message #3 Posted by **Gene Wright** on 11 Sept 2009, 4:10 p.m.,*
in response to message #2 by Gordon Strickland

1) Free. No charge.

2) Runs this program in 28.96 seconds. << TICKS 1 10000 START NEXT TICKS SWAP - B->R 8192 / >>

3) What does a real 48GX do on that loop?

4) No audible keyclick settings that I can find. No preferences at all.

5) Perhaps if the screen could simply be made white with black pixels it would be more readable?

All for now.

Re: i48 emulator on iPhone

*Message #4 Posted by **Vladan Dugaric** on 11 Sept 2009, 5:45 p.m.,*
in response to message #3 by Gene Wright

Real HP 48GX runs this loop in 29.13 s. The emulation appears to run slightly faster than real calculator speed (my iPod Touch 2G runs it in 22.52 s).

Chess on the HP-200LX

*Message #1 Posted by **Xerxes** on 11 Sept 2009, 9:16 a.m.*

Looking for the best chess program for the HP-100LX/200LX/1000CX, I've tried out many old DOS programs for compatibilty and playing strength. The result of many test games and chess problems is:

Two well playing and nice programs are Psion Chess 2.13 and Rex Chess. For these programs [ON] + [/] is required for correct colour representation of pieces and squares. The estimated playing strength of both is USCF Class B level.

But there is also an outstanding program with the best user interface and display representation, most features and clearly the strongest play: Fritz 2.51 with an estimated playing strength of USCF Class A level.

The three mentioned programs are downloadable for free at http://www.top-5000.nl/cp.htm.

Toward a more user-friendly Forum

*Message #1 Posted by **Martin Pinckney** on 10 Sept 2009, 9:18 p.m.*

In looking over the posts of the last few months, it occured to me that the site could be made a little more user-friendly, by building in some shortcuts. So what follows is a prototype list; perhaps some of you could add some more suggestions. The links are dummies right now; when we all agree (Ha!) on the list, then perhaps one of you web gurus can make the links automatically fill in the subject line. Maybe even include some starter text in the message...

Start a new thread on the deficiencies of the HP 35s

Start a debate on the pros & cons of the HP 48 series vs. 50g

Start a debate on the pros & cons of the HP 15c

Start a debate on the whether it is economically feasible for HP to build a good keyboard today

Start a new thread on why maybe the 33s is actually better than the 35s after all

Start a thread on some newfound bug in the 12c+ that no financial user would ever discover in 1000 years

Start a thread on any odd topic designed to provoke a discussion to liven things up (for hecube only)

Re: Toward a more user-friendly Forum

*Message #2 Posted by **Paul Dale** on 10 Sept 2009, 10:07 p.m.,*
in response to message #1 by Martin Pinckney

Forget about the starter messages. We should be able to completely populate the new threads automatically.

- Pauli

Re: Toward a more user-friendly Forum

*Message #3 Posted by **Walter B** on 11 Sept 2009, 12:54 a.m.,*
in response to message #1 by Martin Pinckney

I'd vote for a COLLECT operation, searching the archives and collecting all the arguments written already about a given topic. This will do the automatic thread generation Paul mentioned. Anybody eventually reaching the end of such a thread will then be generously allowed to append his new idea at the end ;)

Hi, Howard --

Your statement with links to multiple threads on the topic is perhaps incomplete without my "RPL -> Leisure Suit" comparison and responses (which itself was inspired by another's difficulties with RPL).

Howard

Re: Toward a more user-friendly Forum

*Message #7 Posted by **Bart (UK)** on 11 Sept 2009, 5:06 a.m.,*
in response to message #1 by Martin Pinckney

In my opinion all it needs is a better search Forum search engine. Then we could easily find threads on all of Martin's subjects.

BTW, I know there was a thread on forum searchability recently but I couldn't be bothered to use Google to search for it as it doesn't always work (e.g. sometimes the links don't always work when it's recently moved into the archives).

Re: Toward a more user-friendly Forum

*Message #8 Posted by **Mark Edmonds** on 11 Sept 2009, 5:43 p.m.,*
in response to message #7 by Bart (UK)

I'd like to second the suggestion for a better search engine. I've been trying to use the Google hack but the results returned can be very limited.

However, rather than fixing the search engine, it might be worth spending the time on upgrading the entire forum to a more universal and modern standard such as phpBB. I know the existing forum has a certain "charm" with its rather unusual method of operation and style but I am sure that nearly everyone would agree that usability is not its strong-point, especially when compared to a typical php forum.

Having said all that, I do recognise that the current forum might be fairly immune to the majority of hacking/spamming/intrusion methods that target php so if the change was made, administration duties might increase. Perhaps some members might like to volunteer to help with this?

Mark

Re: Toward a more user-friendly Forum

*Message #9 Posted by **Howard Owen** on 11 Sept 2009, 6:54 p.m.,*
in response to message #8 by Mark Edmonds

Phbb has had security issues in the past, to put it mildly. As their security blog shows, they are working hard to address them, and may even have made substantial progress. However I have a longish memory when it comes to that sort of thing.

Regards,
Howard

P.S.
Pardon me for helping to start one of the perennial threads back up. :)

It doesn't need just a better search engine: it also needs to ditch the concept of archives.

Really, a thread should be a continuous conversation until people stop posting to it. With the archive system, you lose a lot of context whenever messages are archived.

If you want to achieve the same thing as viewing threads as if they started on a given day, the forum software should be able to achieve that relatively easily, but you should always be able to painlessly view prior messages if you so desire.

I've always wondered why we have the archiving thing going when the amount of disk space required by the entire history of this forum is probably a tiny fraction of a single modern hard drive...

*Message #1 Posted by **Jan Kromhout** on 10 Sept 2009, 4:43 p.m.*

I have a simple question about transfering data from the emulator to the PC.

I use the emulator to build the executable wit s->exe. After i'm finished how to get this compiled executeble to the PC to download later to my HP50?

should I first store it to a variable and store this variabel, or the object on the stack after using s->exe.

Thanks in advance

in response to message #1 by Egan Ford

I like the feel of a real culculator in the hand. For me it must be at least a basic scientific though (the functions of the original 35 would do just fine). That is why I still have a 32S on my desk. I think the pioneers were just the right size.

For portability when the physical one is too far away, my Nokia 5800 only has a four banger on it - useless. No free42 for it yet, but found a Java HP45 on HPcalc that is a bit small on the screen but works.

Re: Old School Calculators Still Do It For Some

If you need to travel, use a buggy. If you need to move something from one place to another, use a travois. If you need to write something, use a quill pen. And so on.

Let's don't be Luddites!

Re: Old School Calculators Still Do It For Some

*Message #6 Posted by **Martin Pinckney** on 10 Sept 2009, 10:15 a.m.,*
in response to message #5 by Palmer O. Hanson, Jr.

Perhaps the analogies are getting a little muddled. I think Thomas' point would have been better made with 'If you need a hammer, use a hammer, not a multi-tool.'

As far as Luddites are concerned, they were against technological progress. This debate seems more about choosing specific-purpose devices vs. do-everything devices.

No?

Re: Old School Calculators Still Do It For Some

*Message #7 Posted by **Thomas Radtke** on 10 Sept 2009, 10:31 a.m.,*
in response to message #6 by Martin Pinckney

You're right about my intention, Martin.

About Luddites, it seems to be often used as a killer phrase. I'm really tired of this and usually stop any further discussion if it comes up.

Re: Old School Calculators Still Do It For Some

*Message #8 Posted by **bill platt** on 11 Sept 2009, 9:47 p.m.,*
in response to message #6 by Martin Pinckney

I own a "multi-tool" but almost never use it for anything other than merely admiring it's cleverness. A real screwdriver or saw or etc works so much better...

> devices.
>
> No?

In many cases a hammer IS a multi-tool. I probably over-reacted to the "If you need a hammer, use a hammer" idea because of an article on home repairs that one should be able to do which appeared in the St. Petersburg Times. It discussed the idea of using a hammer to tap on a wall to find an underlying stud for support of a heavy picture. You can do it with a hammer -- just like I did it in the mid-twentieth century and my father and grandfather did it before me. Or, you can do it with one of those little magnetic devices which help you find nail heads. But in the twenty-first century the best tool is a specific purpose device known as an electronic stud finder.

*Message #10 Posted by **Bart (UK)** on 10 Sept 2009, 10:59 a.m.,*
in response to message #5 by Palmer O. Hanson, Jr.

If I need to travel 100 yards, do I need a car? If I need to move a crate do I use a truck? Why do I need a computer or a "space ship"-like calculator to do basic maths? I find it quicker & more efficient to have my 32s next to me than to call up the windows calculator & click the functions with a mouse. The 50G impresses others but not so easy to carry around the office in a pocket.

On a closing note I say: use a hammer .... ON the smartphone!! :-)

Re: Old School Calculators Still Do It For Some

in response to message #10 by Bart (UK)

I think Steve Jobs is a genius, but the iphone is not for me. Last night my financial advisor was at my house and he wanted to show me the performance of some mutual fund using real-time wireless data on his iphone. He used his finger to scroll the screen left and right, and yes that is cool. But the final chart he called up had a font so small that I couldn't read it. So, despite the cool technology, what good is it if the final user interface does not convey any useful information? If there is a way to enlarge the font, my guy didn't know it. I want a 19-inch screen I can actually read. And some calculator user "manuals" (really just folded sheets) use fonts so small I need a magnifying glass to read them. They are useless.

HP48SX accuracy questioned.

*Message #1 Posted by **Pal G.** on 9 Sept 2009, 7:08 p.m.*

A few years ago, my boss suggested the HP48sx was not an accurate instrument based on his misunderstanding the following article:

Article here.

The article defines two equations for calculating great circle distances and states the first equation listed is not very accurate depending on what calculation device or software is used. The author states the second equation is more accurate for all devices.

My boss assumed the HP48sx was not accurate due to the error margin in the result of the first equation. I would like to argue any TI calc would give similar results to the 48sx when using equation 1.

In a nutshell:

Equation 1 evaluated with Excel is accurate.
Equation 1 evaluated with HP48sx is not very accurate.
Equation 1 evaluated with TI-XX might not be very accurate either.

Equation 2 evalutated with Excel is accurate.
Equation 2 evaluated with HP48sx is accurate.
Equation 2 evaluated with TI-XX should be accurate.

Would equation 1 evaluated with a TI-XX be more accurate than an HP48SX? Unfortunately, the author of the article did not include several variables, such as a pair of lat/lons, or earth radius.

edit: fixed link.

Edited: 9 Sept 2009, 7:11 p.m.

Re: HP48SX accuracy questioned.

*Message #3 Posted by **Eric Smith** on 9 Sept 2009, 9:56 p.m.,*
in response to message #1 by Pal G.

The first formula (based on the spherical law of cosines) is ill-conditioned for small distances and will have

accuracy problems on almost any computer; it is simply much more sensitive to limited precision than the haversine formula. This is an example of why numerical analysis is important. Just because you have a mathematically correct formula doesn't mean that it will be generally useful on a computer (or calculator).

See also "Virtues of the Haversine", R.W. Sinnott, Sky and Telescope, vol. 68, no. 2, 1984, p. 159.

Re: HP48SX accuracy questioned.

*Message #4 Posted by **hugh steers** on 10 Sept 2009, 9:01 p.m.,*
in response to message #3 by Eric Smith

the idea of a great circle is somewhat misleading in the context of earth navigation. use the spherical formulae for pure spheres, but for earth distances it's a bad idea.

for some time i've been using Meeus' formula. i put some code here,
http://www.voidware.com/earthdist.htm

but recently, i became aware of a formula by Vincenty, http://en.wikipedia.org/wiki/Vincenty's_formulae. I read the paper and coded it up. it's a bit more complicated, but claims to be super accurate. However, i had problems with it not converging for points almost opposite the globe.

in any case, unless you really want to measure distances on WSG84, you're going to have a height difference involved which the, as presented, Vincenty formula doesn't deal with. so, im still happy to use the Meeus approximation for real use.

However, at some point im going to have to try to get something that takes height into account too.

High-end calculators in the WSJ

*Message #1 Posted by **J-F Garnier** on 9 Sept 2009, 12:54 p.m.*

An interesting article in the Wall Street Journal, although mainly related to TI calculators:

Numbers Don't Add Up for a TI Calculator

J-F

Re: High-end calculators in the WSJ

*Message #2 Posted by **hecube** on 9 Sept 2009, 4:09 p.m.,*
in response to message #1 by J-F Garnier

The way to the future is Mathematica on Touch/iPhone devices with a simplified "basic user" overlay.

I think there's a way for dedicated graphing calculators though. Here's my take:

*landscape form-factor: business

*portrait form-factor: scientific

All calculators should have a back-lighted color display that doesn't have to be as big as the iPhone screen. Something nice to look at at any rate.

Whatever Steve Jobs says, there's nothing like tactile feedback for the keys.

To me, the biggest mistake HP ever made starting with the HP-28C is to get rid of stepped programming and treating programs like data. From a theoretical point-of-view and as a LISP fan, I applaud. From a practical point-of-view, it becomes a big obstacle to access the computational power of the calculator. Let's be honest here, no one is ever going to do artificial intelligence research on a pocket calculator. The calculator's main reason to exist is the "immediate result". If I can't get that, it's dead in the water.

I never got around to program my HP-48 but I could program the HP-41 within the first five minutes when I got it.

One last thing: bring back the trapezoidal stylings of yore for the machine itself.

Edited: 9 Sept 2009, 4:10 p.m.

in response to message #2 by hecube

That is true today, but wasn't back in 87 when the 28c came out. I bought one rightaway, and its loyal services got me through my EE studies. At the time, no PC application whatsoever provided the computing power the 28C had. I agree, though, that I have a hard time to program it today, and an even harder time to find worthwhile applications to program. I don't have these issues with my more basic calculators. And mind you, I'm still a professional C++ developer.

A.

In 1984, I was doing symbolic math, numerical integration, and linear algebra on my Apple II home computer using muMATH. The only thing I can think of that an HP 28C could do but not muMATH is graphing, but scientific graphing programs were available too.

That said, I did buy an HP 28S in 1988 and used it almost every day for the next five years.

No debate here..

> Quote:
>
> All calculators should have a back-lighted color display that doesn't have to be as big as the iPhone screen. Something nice to look at at any rate.

Respectfully, I disagree. Backlights are fun for gameboy's but almost useless for a calculator. While I agree it would be nice to have, the cost in $$ and battery life will not nearly make up for the 2x per year I would use the function- and I use my calculators alot. With a gameboy there is no inputs and outputs to the system. you respond to things on the screen by pressing buttons, which changes the display, which causes you to respond... etc...

With a calculator, you almost always have numbers or other data to put in, and something to write down when you're done, and both those things require light or at lest a pen with radioactive ink. Did they ever make a glow-in-the-dark slide rule? <idea>

I also respectfully disagree on the Color LCD. not worth the suck on battery power, and the added color will probably not add any information to the screen whatsoever. I reference Tufte and his many books about Data Ink. If it is not required to display data, get rid of it and Use the ROM/display space/battery life/development costs etc.... for something that does.

> Quote:

There are strengths and weaknesses to both. The power of the 3rd generation calculators 28,48,50g is that you can do more complex functions- for example parallel list processing, multiple data types, longer strings, etc.. Some things are easier on the RPL, some on RPN. I would not trust a 'one is better than the other' statement from someone who has not mastered BOTH- and even then I would suggest there is a large middle ground where either are good. There is also the 71b

BASIC/FORTH language which also has strengths and weaknesses.

> Quote:
>
> Let's be honest here, no one is ever going to do artificial intelligence research on a pocket calculator.

Never say never... that really depends on the heuristics of the program. I've found the decision algorithms in HPChess to be quite advanced for a hand-held calculator. It's not "Deep Blue", but that's beside the point. FYI, in some ways the HP 50G is well beyond the early 1976 Cray-1 Supercomputer. The beauty of it is that a 15 year-old student can do on a 50g what took scores of PHD's to do on a computer in the 1960s- if it was possible. Feynman helped design nuclear weapons and quantum electrodynamics with far less sophisticated machines.

> Quote:
>
> The calculator's main reason to exist is the "immediate result". If I can't get that, it's dead in the water.

May I disagree again? There are many uses for calculators.. Fast and accurate results are one (although computers are better at both). Calculators "boot" in a fraction of a second- even today it takes my computer several minutes to turn on. So I think convenience takes front seat over the 'immediate result'. The other issue is portability. Until recently, you could not really cram a supercomputer into your pocket. Today with a smartphone connected to the internet, you don't need to....you can call up wolfram|Aplha or other site.

> Quote:

Did anyone notice the 5% graphic calc market share for HP in that story? Man, we're lucky HP is still making calculators at all, much less ones that meet any of our retro requirements.

Hi,

As you see, there are many different opinions. A lot is open to personal preference. I loved the 28C. I still have a 28S and enjoy working on it, although by todays standards it is slow.

I thought that the advent of the 28C and RPL would have put stepped RPN programming behind us. To me it was like going from Basic to C.
It was not until coming to this forum that I realised how many still preferred the stepped RPN programming. So perhaps as discussed in the "43S ponderings" thread, both should be incorporated to allow users their preferred method.

> Quote:
>
> I never got around to program my HP-48 but I could program the HP-41 within the first five minutes when I got it.

I could program my 28C within the first 5 mins. Was it not just a case of going back to what's familiar rather than learning RPL? I have that problem with Pascal. When I did my first programming course it was in Pascal. The world uses C/C++. I have tried to switch, but keep jumping back to Pascal because I know it and can do something quickly rather than bother to learn something else.

*Message #11 Posted by **Don Shepherd** on 10 Sept 2009, 7:56 a.m.,*
in response to message #10 by Bart (UK)

For those who like to program programmable calculators, of course some will prefer RPL, some RPN, and some BASIC; we like what we like.

What is truly amazing, IMHO, is this (and I'm going to exaggerate a bit, to make a point): there are roughly 6,783,244,335 people in the world today. Of these, 2,119 write programs on calculators. The amazing thing is that HP continues to make them at all.

Calculators are a typical cash cow. "Profit of $208 million on revenue of $526 million in 2007", that is a profit margin of 40%!*. Since there is no real R&D or marketing going on, production is outsourced and component prices are constantly sinking, calculator manufacturers got low costs too. As long as you are making money (little as it may be) why should you stop?

I love it. If you believe the correspondents in this site most of the 2,119 write their programs using their HP-67's. And, the old TI guys think that they write the rest on their doughty old TI-59's.

Searchable PDFs/HP41 manual/Slightly Off Topic

*Message #1 Posted by **Kevin Kitts** on 9 Sept 2009, 10:37 a.m.*

Hi All, I've been experimenting with a web site (not free) that allows one to upload a PDF of a scanned document - and then does OCR on the the scanned/PDF images so that you can actually search through the document. I'm sure that there are a lot of tools that can do this. The particular site I'm using is called www.evernote.com.

Unfortunately, the HP41 scanned document I have is 50M in size but the site only allows documents 25M or smaller to be uploaded. Is there an easy way to take a 50M PDF and break it into 3 equal size pieces - hopefully at a Chapter boundary?

I tried creating a zip of the file - but - surprisingly it was not any smaller than the origianl. I guess PDFs of scanned documents may already employ some compression...

Thanks,

Kevin

in response to message #1 by Kevin Kitts

try PrimoPDF Its a free pdf converted that works by printing a document. So you can open your pdf, prnit the first n-pages using primopdf and voila, you are good to go.

HTH

Cheers

Peter

PS - cool site! I scanned and OCRed the VASMs a little while ago to make them searchable. Would be great to hear how successful your conversion was. Maybe we can pool together - everyone scans & uploads one manual of general interest and then we all share. A few suggestions with regards to manuals

1. HP41 user Manuals
2. Keith Jarret - Extended Functions Made Easy
3. Keith Jarret - Synthetic Programming made Easy
4. HP Advantage Module
5. CCD Module
6. PPC Module
7. Hepax Manuals
8. Ken Emery - MCODE for Beginners
9. Wlodeks 'Red bible' - Extend Your HP-41
10. Paul Dodin Inside the HP-41
11. Article Index from the PPC journal (this would awesome! There are literally 1000s of pages of PPC Journal and its very hard to find something on a particular subject. I went once through the exercise and organized all PPC, HPCC, CHUU etc articles into themes by printing them out, reading all of them and organizing them by theme. Better, but still very cumbersome. There are some good indices which cover a few years of articles so if we have those OCRed one can search for articles on a particular subject)

Just a thought...

There are some good indices which cover a few years of articles so if we have those OCRed one can search for articles on a particular subject)

For what it is worth, all of the PPC Journal, CHHU Chronicle, HPX Exchange and HPCC Datafile issues have already been scanned into pdf images, over several years. The PPC Journal, CHHU Chronicle and HPX Exchange scanned issues available at http://www.pahhc.org/ppccdrom.htm include all the article indexes which were in the issues, plus some additional ones which were not printed in their time frames. The HPCC Datafile issues are all indexed at their club web site, at http://www.hpcc.org/datafile/. Since the U.S.-newsletter material consists mostly of pasted-up articles typed on regular typewriters, the task of OCRing those indexes might be a challenge.

If you (or a friend) have Adobe Acrobat Professional (not the free reader which everybody has), you can extract arbitrary pages, or range of pages, from a pdf file. Then you save what you extracted (under a new name!), and go back and extract some more. Conversely, you can delete what you don't want.

Can you point on the web to the original pdf you have, or put it on a web site somewhere? If so, I would be glad to break it up into chunks (and put the pieces on my own site).

HP 50 as a stop watch.

*Message #1 Posted by **Stuart Sprott** on 9 Sept 2009, 8:05 a.m.*

Hi,

I wish to use the HP50 as a stop watch to time road runners in a race. It should not be difficult to program to do this.

The only problem is that the calculator can go to sleep if there is a big gap between runners. This means that you could miss time a runner.

I have searched for a internal flag that might control the calculator sleeping, but I have had no success.

Does anyone know how to stop the HP from sleeping during a race?

Re: HP 50 as a stop watch.

*Message #2 Posted by **Nacho** on 9 Sept 2009, 8:19 a.m.,*
in response to message #1 by Stuart Sprott

have you tried with the internal variable TOFF??

you can define an idle time before variable STARTOFF is executed.

Remember 1second = 8192 TICKS

Regards

Edited: 9 Sept 2009, 8:20 a.m.

Re: HP 50 as a stop watch.

*Message #3 Posted by **Stuart Sprott** on 9 Sept 2009, 11:45 p.m.,*
in response to message #2 by Nacho

I must be missing something. I have tried TOFF just by keying it in but get no response. If I do a seach in the electronic manual on TOFF nothing comes up. How do you get access to this command?

The variable STARTOFF is one of your variables?

Re: HP 50 as a stop watch.

*Message #4 Posted by **Tim Wessman** on 10 Sept 2009, 12:31 a.m.,*
in response to message #3 by Stuart Sprott

Store a hexadecimal number as TOFF in HOME. It represents tics (8192/sec)

So #8192d * 60 * min will set a new off time. As for a stopwatch, look here:

HP50g - very inaccurate clock?

*Message #1 Posted by **Mark Edmonds** on 8 Sept 2009, 6:23 p.m.*

I can't find any answer on this by searching.

The internal clock on my 50g is not maintaining accurate time by a large factor.

At 17:00 today, I set the clock.

At 23:00 today, it had already lost 1 min 12 secs !!!

During that time, the calc was off.

What the heck is going on here?!?!?! I only got this machine the other day and the batts are fresh.

Is there a history of inaccurate clocks in the 50g? Or have I just lucked out here?

Mark

Re: HP50g - very inaccurate clock?

*Message #3 Posted by **Gerson W. Barbosa** on 8 Sept 2009, 6:51 p.m.,*
in response to message #1 by Mark Edmonds

Mine is about three hours in advance, but I don't remember the last time I set the time on it (probably three months ago). For timekeeping I never found anything better than my cheap Casio watch (2889 HDD-600), +/- 3 seconds/year but I might just have been lucky as the manual states +/- 30second/month.

Wolfgang Rautenberg's Timeman might be an option. It works nicely on my HP-49G. (I haven't tried it on the 50g yet).

http://page.mi.fu-berlin.de/raut/WR49/Timeman.htm

Gerson.

Re: HP50g - very inaccurate clock?

*Message #4 Posted by **Dave Britten** on 8 Sept 2009, 7:23 p.m.,*
in response to message #1 by Mark Edmonds

I've noticed the same thing. I wrote a tiny program that adjusts for daily clock skew, and the calculated offset on my 50g is probably a few orders of magnitude greater than on my 48GX.

I use a 48G for an alarm clock, so I need accurate timekeeping. :)

Re: HP50g - very inaccurate clock?

*Message #5 Posted by **Michael de Estrada** on 8 Sept 2009, 9:01 p.m.,*
in response to message #4 by Dave Britten

Wow, that's strange. I just checked mine and it's only 5 minutes slow after seven months.

Re: HP50g - very inaccurate clock?

*Message #6 Posted by **Allen** on 8 Sept 2009, 10:20 p.m.,*
in response to message #1 by Mark Edmonds

The only perfectly accurate clock is a dead one-- it's exactly right twice per day. All others are off by some margin- some more than others. :-)

Re: HP50g - very inaccurate clock?

*Message #7 Posted by **Stuart Sprott** on 9 Sept 2009, 8:13 a.m.,*
in response to message #6 by Allen

Hi,

I have used both the HP48 & HP50 as stop watches for sun observations. As a Surveyor I have to determine accurate true North. The method I use requires accurate time. You have to determine the watch error at the time of observation. This can be done on both calculators. I have found both to be reliable.

Re: HP50g - very inaccurate clock?

*Message #8 Posted by **Patrick Rendulic** on 9 Sept 2009, 2:16 p.m.,*
in response to message #7 by Stuart Sprott

On my 48 GX, time is off around 1 second per day. This can be fixed by an alarm program that runs daily. Works perfectly. Even after weeks or even months, the time on my 48 is accurate within several seconds.

On the 50 G this is completely different. I got mine 2 months ago. And it seems that the daily offset is not constant. With CLKADJ I don't manage to adjust the clock within 0.2 seconds. On the 48 I do manage. At the moment I'm trying Timeman. But when the offset is not constant, that program will fail too.

I think the only "workaround" is to write an approximative CLKADJ program and to check the 50 G time always when it must be accurate.

HP do something. You are crippling your wonderful products because of bugs, bad emulation (what a horror), etc.

Programming firmware no longer is an art. Too sad.

Re: HP50g - very inaccurate clock?

*Message #9 Posted by **Mark Edmonds** on 9 Sept 2009, 4:18 p.m.,*
in response to message #8 by Patrick Rendulic

Thanks for all the replies.

I am quite happy to accept a tolerance of about a couple of seconds a day for clock accuracy. Both my 48G calcs are actually better than this.

However, I am not prepared to accept the level of accuracy being shown in my 50G which is currently losing about 5 minutes a day. That is completely ridiculous and I am going to negotiate a refund or replacement from the dealer.

Yes, I can write a simple clock adjust program running off an alarm but it boggles the mind that this should be necessary on what is currently HP's top calc and in theory, one of the best calcs ever made.

The sad thing is that after the huge disappointment of the 35s and now this fiasco with the 50g, can I trust any new HP calc? I've said before that I consider the 48GX to be the last great true HP calc but I never expected it would retain that mantle because its replacement has fundamental problems such as not being able to keep time!

One of the reasons I bought the 50g was to use a style of programming that the 48GX doesn't quite have enough speed for and that style of programming is dependent on clock accuracy.

What an utter huge disappointment all of this is.

Mark

Re: HP50g - very inaccurate clock?

*Message #10 Posted by **Mike Morrow** on 10 Sept 2009, 1:14 p.m.,*
in response to message #1 by Mark Edmonds

My 2003 HP49g+ is pretty consistent, dropping 1.7 seconds/day.

My 2007 HP50g is pretty consistent, dropping 2.1 seconds/day.

My HP48 units are not any better.

I wish the HP50g clock had a SETAF function like my HP-41CX, which gains only a few seconds each month when SETAF is properly set. I instead use a repeat-once-per-day ALARM program \<< 17200 CLKADJ DROP OFF \>> that adds 2.1 seconds (17200 ticks) to the clock. (The well-known erratic behavior of the HP49/50 ALARM function does cause some problem with regularity of activation.)

Edited: 14 Sept 2009, 6:42 p.m.

Re: HP50g - very inaccurate clock?

*Message #11 Posted by **David Hayden** on 14 Sept 2009, 12:23 p.m.,*
in response to message #1 by Mark Edmonds

What else are you running on the calculator? This is pure speculation, but it's possible that the interrupt routine

that updates the clock is low priority, so if some higher priority code is running for long enough, the calculator may skip updating the clock periodically.

As I said, this is pure speculation though.

Dave

Re: HP50g - very inaccurate clock?

*Message #12 Posted by **Bart (UK)** on 19 Sept 2009, 5:50 a.m.,*
in response to message #1 by Mark Edmonds

Reading this thread, I decided to check my 48G and 50G. I used BBC1 terletext clock as reference.

After 8 days:
48G: lost 11 secs
50G: lost 17 secs.

The 48G was used occasionally for simple calculations and the 50G wasn't used at all. Temperature probably between 15 to 25 celcius.

Re: HP50g - very inaccurate clock?

*Message #13 Posted by **Chan Tran** on 19 Sept 2009, 7:37 p.m.,*
in response to message #12 by Bart (UK)

My 50G is right now 7 minutes slow. That in about a year and a half. It's not accurate but it's typical of the 50 I think. With my 2 41's and by adjusting the accuracy factor I could get them to be accurate within a few seconds a year.

Re: HP50g - very inaccurate clock?

*Message #14 Posted by **Mike Morrow** on 20 Sept 2009, 3:47 p.m.,*
in response to message #13 by Chan Tran

That's about a loss of 0.8 seconds per day. That's better than I've ever heard about in a HP49g+/HP50g.

I tried similar for old Palms but they didn't work. Are some different? Are drivers required?

Re: HP 48 serial cable but no serial port in laptop

*Message #5 Posted by **Egan Ford** on 8 Sept 2009, 6:41 p.m.,*
in response to message #4 by Charles Oxford

> Quote:
>
> Are some different? Are drivers required?

Yes and yes/no. OSes now have better support for USB to serial. I picked the Keyspan years ago because it had great driver support. I had to install the drivers on XP and OS/X to use. I have had no problems with my Garmin GPS, Zaurus PDA, and 48GX with the Keyspan on XP or OS/X. It even works with VMware running XP on OS/X.

I'd guess that USB->Serial has matured enough to just work.

BTW, I have also had great luck with Bluetooth to serial. I have two different kinds and both work great with XP, Linux, and OS/X without any drivers required. The only issue with BT->Serial is that

you need to power the device.

in response to message #9 by Dave Britten

I suspect most of these adaptors work most of the time; I have been using a no-name one, not even a single solid piece like the one given here, and it works for my 48G/G+ machines. Mine consists of a USB connector and a serial connector, connected by a length of cable.

Re: HP 48 serial cable but no serial port in laptop

*Message #11 Posted by **Patrick Rendulic** on 9 Sept 2009, 2:20 p.m.,*

I have adapters from HP and from Belkin which both work with the 48. They also work with my GPSs, etc. But I also had serial devices which refused to work with those adapters (a Sarad doseman for measuring Radon concentration in air).

HP 35s modification: Matte LCD cover (and LCD re-alignment)

*Message #1 Posted by **Dallas Osborne** on 8 Sept 2009, 4:39 p.m.*

Replacing the soft, glossy 35s LCD screen cover with a matte version (and fixing LCD alignment):

The new screen material should be about 0.5-0.7mm thick. I used LCD protectors out of a batch of office telephones I found in a dumpster (Lucent multi-function jobs). They were nice and large, 0.7mm thick acrylic with a nice subtle matte surface on one side, gloss on the reverse. You may also find this type of plastic at a custom framing shop and it is available from many vendors online (e.g., http://www.rplastics.com/polycarbonate-film.html). To attach the new screen in place on the front panel I used Scotch double sided tape. A double-sided foam boarder is normally attached to the back side of the screen to make firm contact with the LCD. I had planned on using the 3M 4492 (black, 1/32” (about 0.8mm), double-sided adhesive foam), but found I could slowly remove the old one and recycle it. It is important to reapply this; it will keep dust out and provide positive pressure to the screen. When measuring and cutting the new material, cover the plastic with a clear tape that can be easily removed to protect from minor scratches. Obviously, make sure the area between the new screen and the LCD is free of dust and other particles; it is very annoying to finish the upgrade only to find there is a nasty piece of lint hanging in there.

Photos (these are huge, by the way; it may take a bit of a wait for them to load in some locations): HP 35s Screen Mods

Intro over, the process is as follows:

1. Open the case by removing the batteries, four round rubber screw covers, and the long rubber strip at the bottom of the back half of the case. Put them aside in a safe place. I would suggest sticking a strip of tape on your work surface and put them there; it will be dust-free and release the adhesive easily.

2. Remove the screws and put them in a safe place.

3. Using finger only, slowly pry the case apart along the top and left side with the face down at the work table. Be careful not to tear off the power wires between the two halves; they are on the side of the calculator under the ENTER key.

4. Remove the springs at the top and bottom (the top one is obviously the long spring) and put them in a safe place as well. If you think you should just leave the springs where they are and be careful with the front half, I would suggest you grab a flashlight for when they fall out on the floor.

5. Remove the rubber reset seal and put it away. This is the white/clear round thing that may have fallen off when you opened it up. It will usually stay attached to the reset hole on the back half of the case. (In case you may be tempted, don’t mess around with the black carbon contact part.)

6. Slowly lift up the LCD by using a non-scratching tool. Allow the adhesive to slowly free up. If you pull to fast things will end up messy. I used the handle of a plastic fork. Flip the LCD out and over the PCB, wrap it and the PCB with a soft, lint-free cloth, and tape it all together.

7. Press out the old screen by starting at one corner and S-L-O-W-L-Y let the adhesive give way to firm, slow pressure.

8. Cover the new, matte screen material with removable clear plastic tape on both sides and apply the old screen to the new matte (front) side. This is your template. Cut around it. Don't worry about the blade-cut space; there is enough room in the case for the new one to fit even with a few tens of mils additional material.

9. Remove the tape from the back side of the new screen. Wipe it down very carefully with a lint-free cloth. Carefully remove the foam gasket from the old screen and place it on this cleaned surface. If the old one is torn or stretched out in the process you will need to make a new gasket. I suggest 3M 4492 tape (1.5" width will be adequate to make a new one). Single-sided foam tape will work just fine as well and would be easier to open up later, if you need to.

10. Remove the tape and old screen from the front side of the new screen and wipe it down.

11. Carefully lay new double-sided tape on the edges of the new screen at a width that will allow it to be placed in the front of the case and make contact only to the inside plastic: slightly less than 2mm. As you can see from the last picture, I put a little too much width on the bottom of the one I did and it can be seen when looking in at an angle.

12. Carefully install the new screen. (If you have a crooked LCD, see the note at the bottom.)

13. Check/clean any dust.

14. Take off the cloth and tape from the LCD and lay it back in place.

15. Put the springs back in place.

16. Put the rubber reset button back on its post.

17. Carefully close up the case (making sure the power wires route around the reset post and contact), screw it together, and check the new display.

18. If the case creaked a lot during operation, this is a good time to test out the loose points, apply small dots of adhesive (epoxy, hot glue, anything else you may like) at the key locations and close it back up. I would warn against trying to tighten the screws as a solution; the posts butt up together and won't go any further… and plastic is soft.

19.!Test the reset button!

20. Replace the rubber screw covers and enjoy the matte screen.

One final note: If you have a 35s with a crooked display, this is a perfect opportunity to tilt it back into place. I didn't take pictures of the entire procedure, but here we go: After you pop out the old screen, put the batteries back in and push the LCD back into its socket; turn on the calc and type in a ton of 8's. Take a close look at the margin for mental reference. The idea is to bend/press/mold the right hand portion of plastic up, as seen from the back side of the LCD socket frame, (for most early 35s' that is). This may require gentle nipping at the bracing buttresses with a pair of side cutters. Then shim the LCD and screw post on the lower right. Double check the alignment and shift it around as needed. Make sure the other side of the screw butt will not knock the shim around and put a spot of glue to hold the shim in place. There is a shot of the shim in one of the photos.

Help with HP 29C

*Message #1 Posted by **George** on 8 Sept 2009, 8:55 a.m.*

This otherwise beautiful working calculator suddenly developed a fault displaying 'error' followed by all LEDs randomly lighting some very bright. It then just shuts down with no vital signs. Given a while it again powers-up normally and works for a 20 30 sec until LED flashing starts again. (Batteries are new Li-Ion and well charged). All suggestions welcome. thanks

Re: Help with HP 29C

*Message #2 Posted by **Geoff Quickfall** on 8 Sept 2009, 11:30 a.m.,*
in response to message #1 by George

Until you get some more answers, try substituting the LiIon batteries with some NiCd or NiMH.

The voltage of the LiIon are 1.60 each for a total of 3.2 volts. The design called for NiCd at 1.22 topping out a 2.44 volts.

Normally this would not be a problem but the increased voltage may be to much for the aged circuits. It does sound like a circuit is heating up and then shutting down.

I had a very old Casio calculator (their first battery model). It would only work for 5 minutes until the IC heated and then it shut down. I could get it to work indefinitely if I sprayed the IC with a can of "Cold" (can't remember the brand name) for testing circuits.

My first home computer was a 486 which froze 20 minutes after start up. Shut it down and allow it to cool and it worked again for 20 minutes. Turns out the CPU had 'crept' out of its socket and the heating was enough to disconnect one of the pins. Had to reseat the CPU and all was well.

Cheers, Geoff

Re: Help with HP 29C

*Message #4 Posted by **Geoff Quickfall** on 8 Sept 2009, 2:38 p.m.,*
in response to message #1 by George

George,

It still sounds like a power supply problem and we all know how finicky the Woodstocks are.

I would try tracing the circiuts back from the battery contacts.

Try spraying with a can of Cold spray, various power supply components, when the display appears correct you may have isolated the problem.

cold spray link

It does not sound like the Logic CPU as it cold starts correctly.

Cheers, Geoff

*Message #5 Posted by **George** on 9 Sept 2009, 5:43 a.m.,*
in response to message #4 by Geoff Quickfall

Geoff

filling the display with say, 8888888888, it remains ok for about 20 sec pretty much consitently then gives up until powered down briefly after which it resets nicely. However if you reapeat this enough times it will eventually latch-off for a good while after the display goes erratic which makes me suspect the LED driver chip - or even the clock. I had it open a few days ago nothing obvious at all like dry joints or failed components. Does the Woodstock PSU steps up from 2.4V to 5 or so ?

Designing a calculator housing

*Message #1 Posted by **Thomas Radtke** on 8 Sept 2009, 8:12 a.m.*

Hi,

I have some serious questions to all experts out there. When taking a recent calculator to hand, very often one can immediately find some problems whithin the first couple of minutes.

Example 1: Having keys on a calculator with beveled edges that lie outside the feet of the calculator (HP-20b) is plain silly.

Example 2: Placing an LCD so that small annunctiators lie right under the faceplate makes them easily shadowed (HP-35s).

Now, who does designs like that? Can we really explain such things with low budgets? Is the only constraint to a design that it mechanically works (when not in use)? It would have taken just a few minutes of thought to prevent the problems mentioned in my examples.

Next question, why is there no evolution in calculator housing design? Every new calcultor appears to look completely different, so that problems cannot be corrected but new ones are likely to be introduced.

Especially with HP, calculators seem to have a chance in niche markets only. Allthough some might not be distracted by its design, the 33S was a perfect example of a design that completely ignores its target audience. Last question: Why isn't HP designing for their users? Kids don't need a business or programmable scientific calculator. A student who does will likely have a look at the specs and price rather than if it matches their cell phones.

Or am I completely wrong?

Re: Designing a calculator housing

*Message #2 Posted by **DaveJ** on 8 Sept 2009, 8:52 a.m.,*
in response to message #1 by Thomas Radtke

The problems in product design are many...
- There are so many design issues that it really is easy to overlook what some will see as basic stuff.

- The person or people doing the design usually cannot objectively review a design. Smart product design companies will call upon independent people to overlook the design at all phases of development. But getting people that are good and thorough at this is really hard.

- Even if you do find issues before release it's often too late in the design process to fix them. And many factors may mean you simply can't get these fixes implemented.

- Small things like you mention actually have zero measurable effect on unit sales, so it's often not in anyone's interest to fix things like this. Often design guys like me who raise issues like this will get shot down in flames, so often the natural evolution of that will make it's way into the final product...

You'd be really surprised at how easy it is for simple things to slip through (deliberately or unnoticed), no matter how good your intention or what processes you put in place. You really have to have experience in product design in a big company to appreciate (the often absurdity of) it all.

I've said this before, if HP (and other companies) were *really* smart and open minded they would make use of the "geek factor" and get a bunch of select calculator geeks to review their products at all stages of the design process. But that is a massive leap of faith which would be way too wacko an idea for them to seriously contemplate.

As for kids, their reference point is what the other kids have. And baring any such reference point they will choose whatever matches their phone or has been subliminally put in their heads by advertising or fancy packaging :->

Dave.

Re: Designing a calculator housing

*Message #3 Posted by **Bart (UK)** on 8 Sept 2009, 9:34 a.m.,*
in response to message #2 by DaveJ

If they keep a Lessons Learnt/User Feedback database then after many years/products, will they not have captured just about every possible thing that could be wrong? They would then just have to refer to the database at a few stages in the design before it is too late to make changes.

Re: Designing a calculator housing

*Message #4 Posted by **Walter B** on 8 Sept 2009, 11:02 a.m.,*
in response to message #3 by Bart (UK)

In principle, you're right. Though that would require this database being filled in a way newbies can benefit. The guys working now at calculator division may not understand what their grandfathers wrote ;) No offense to anybody, but mere basic laws of communication. Always a challenge to pass experience to successors, even if you collaborate with them for some time -- and I think there was a somewhat broken line of history in this division, making such tasks even harder.

Re: Designing a calculator housing

*Message #5 Posted by **Howard Owen** on 8 Sept 2009, 11:43 a.m.,*
in response to message #2 by DaveJ

> Quote:

.. and a measurable effect on design costs.

What a company gets back for the investment is a reputation for quality. The Wal Mart effect means that such an advantage has little value for commodities.

While very much agreeing with your general point, I think it's good to remember that HP has recently bucked the Wal Mart tide to a surprising degree. The 50g was a response to consumer push-back on the quality of the 49g+. They actually fixed the keyboard and the color scheme, both of which were roundly (and justifiably) criticized, here and elsewhere. The next calculator they produced was the 35s which, despite flaws minor or otherwise, was astonishing for how it incorporated feedback from long time HP users, many of whom hang out here. (It didn't hurt that an old time PPC member was put in charge of the

tiny calculator division, or that Richard Nelson got his ear.) The large enter key was a direct response to this community. Since we make up a tiny slice of the overall market for the 35s, the effort can only be due to them trying to regain a reputation for quality, using our sensibilities as a guide.

So Wal Mart hasn't completely banished excellence in American corporate product design and production. I'm hopeful HP will continue to design and market high quality calculators, at least at the high end of the product range. If they keep that up, I'll gladly forgive them for pandering to the lowest common denominator with the low end.

Regards,
Howard

For better or worse (worse!) it appears that HP has determined that the current market demands a different package for each machine. You seem to be asking for a return to the era of steadily evolving calculators in the same or similar case. HP has been there, done that.

> Quote:
>
> ... the 33S was a perfect example of a design that completely ignores its target audience. Last question: Why isn't HP designing for their users? Kids don't need a business or programmable scientific calculator.

Problem is, in my view, HP is a company searching for its target audience, at least regarding calculators. I think the 33s was an attempt to woo younger buyers who are attracted to "cool" styling, while the 35s is targeted to the traditionalist side. Perhaps this is a grand experiment by HP to let sales figures guide the future direction of the calculator division.

HPGCC and Steamtable Calculations (IF97)

*Message #1 Posted by **Jan Kromhout** on 7 Sept 2009, 12:53 p.m.*

I have transfered the Steamtable calculation IAPWS-IF97(as you can find on several places on the net) to small subroutines (functions)

With these functios I created the calculations (executable). On this moment I have finished 10 small executables for the HP50g.

Every module is tested with HPAPINE. I love this tool because every time sending the finished routine to the HP and test it cost a lot of time!

I have two questions.

1. When I created to big functions the S->EXE aborts on amount of memmory (I have no programs on the HP). Is it posible to create these exe outside the HP50G.

2. Is the memmory on the SD card seen as physical memmory? Supose I have an programm greater than then the memmory of the HP and stored on the SD Card, can it running?

Thanks in advance.

Jan Kromhout Hellevoetsluis-NL

Re: HPGCC and Steamtable Calculations (IF97)

*Message #2 Posted by **Egan Ford** on 7 Sept 2009, 3:48 p.m.,*
in response to message #1 by Jan Kromhout

> Quote:
>
> 1. When I created to big functions the S->EXE aborts on amount of memmory (I have no programs on the HP). Is it posible to create these exe outside the HP50G.

No. You will need a 50g or 50g emulator. In either case 50G RAM is limited. At least with an emulator you can have a clean slate maximizing your memory available for S->EXE. IIRC, S->EXE fails when the object code size is > ~70K.

The alternative is to use PrRUN. This will require that the ARMToolBox be installed on the 50g to execute. My largest PrRUN binary is 183K.

> Quote:
>
> 2. Is the memmory on the SD card seen as physical memmory? Supose I have an programm greater than then the memmory of the HP and stored on the SD Card, can it running?

No, the SD card is storage. You can store your program on the SD, but when it executes it will load into RAM.

Re: HPGCC and Steamtable Calculations (IF97)

*Message #3 Posted by **hugh steers** on 7 Sept 2009, 4:22 p.m.,*
in response to message #2 by Egan Ford

what happened to hpgcc 3. wasn't this supposed to fix this problem of needing the armtoolbox. or did it come out already?

any chance of C++ on the 50g. actually, i only need the very basics like classes, virtual functions and operator overloading. no need for templates or fancy pants C++ libs like the stl.

Re: HPGCC and Steamtable Calculations (IF97)

in response to message #3 by hugh steers

> Quote:
>
> what happened to hpgcc 3. wasn't this supposed to fix this problem of needing the armtoolbox. or did it come out already?

I do not know. Email to the authors gets bounced back. I still have the beta and the 2.09 custom ROM that eliminates the need for the toolbox.

The last time I heard from Claudio was March 2009. He sent me some x49gp patches so that I could use x49gp as a debugger with Eclipse. Very cool indeed.

> Quote:
>
> any chance of C++ on the 50g. actually, i only need the very basics like classes, virtual functions and operator overloading. no need for templates or fancy pants C++ libs like the stl.

You should be able to use any ARM cross compiler with the c-based libraries. Others have (e.g. David Hayden's Sudoku solver: http://www.hpcalc.org/details.php?id=7062). On my long list of things-to-do-that-will-never-get-done, are new ARM cross compilers with C++, Fortran, Java, and Obj C support for use with the HPGCC 2 C-libs.

JYA's versions of the cross compiler for OS/X and Linux does have C++ ready to go (http://www.hydrix.com/Download/Hp/hpgcc/). I cannot remember where I downloaded my ARM cross compiler for Windows that included C++. Google will know.

Re: HPGCC and Steamtable Calculations (IF97)

*Message #5 Posted by **Tim Wessman** on 7 Sept 2009, 5:58 p.m.,*
in response to message #4 by Egan Ford

It would be unfortunate if HPGCC died. The website has been down for several months now.

I think part of the problem was that every time anyone got excited to work on something, the response was "Well yes, but HPGCC3 has removed that/is no longer needed/is complete/etc". I can understand the desire to have things mostly complete before release, but going too long with no

news just looses the interest that was already there. :-(

Re: HPGCC and Steamtable Calculations (IF97)

*Message #6 Posted by **Egan Ford** on 7 Sept 2009, 6:00 p.m.,*
in response to message #5 by Tim Wessman

HPGCC3 as-is, is awesome. Yes, it'd be too bad.

Re: HPGCC and Steamtable Calculations (IF97)

*Message #7 Posted by **gjermund skailand** on 9 Sept 2009, 6:11 a.m.,*
in response to message #6 by Egan Ford

I agree, especially since HPGCC3 has an compiler option which includes up to 1024bytes of slack space, such that compiled programs can be executed directly from port 2. The program is then not moved to any RAM, simply executed directly from port 2 (flash).

Re: HPGCC and Steamtable Calculations (IF97)

*Message #8 Posted by **David Hayden** on 9 Sept 2009, 1:02 p.m.,*
in response to message #4 by Egan Ford

Thanks for the reference, Egan.

Hugh, there are 3 small tricks to getting C++ to work with hpgcc.

1. Modify the Makefile to use the c++ compiler for c++ code
2. define "new" and "delete" operators
3. Add appropriate glue to jump from the main() program (in C) to the C++ code.

I found one problem related to initializing static variables It was either initializing a static with a function call, or initializing a static within a function.

See my sudoku solver for an example. I used HPGCC 2.0 to compile it.

41C external power options?

*Message #1 Posted by **Egan Ford** on 7 Sept 2009, 10:57 a.m.*

One of the features of my 71B and 50g that I really like is the ability to power externally. What are my options to do this with the 41C? (I did search and found rechargeable solutions, is that all there is/was?)

Thanks.

Re: 41C external power options?

*Message #2 Posted by **Eric Smith** on 7 Sept 2009, 2:32 p.m.,*
in response to message #1 by Egan Ford

Early 41C units had spring-loaded contacts in the side "tunnel" that were intended for an external power adapter that HP never sold. The only external power solution HP offered was the 82120A rechargeable pack, which would accept an 82059A charger (or the equivalent for other regions).

Re: 41C external power options?

*Message #3 Posted by **Raymond Del Tondo** on 7 Sept 2009, 5:40 p.m.,*
in response to message #2 by Eric Smith

HP didn't sell a wall adapter for the early C's with "gold balls",
but a Company named Corvallis Team sold an AC adapter with a suitable slide plug.

I can upload a photo of that adapter on request.

cheater cord 1

cheater cord 2

cheater cord 3

I was talking to Richard Nelson about the power connectors and he came up with the following recollection relating to the cheater cords listed above:

"PPC was the primary promotional force for HP-41 users to power their machine using a readily available so called TV "cheater cord" and a sharp knife to trim some rubber off to make a nice fitting connector. You would cut the rubber off on the "D" side of the connectors. A very common DC source was a lantern battery which cost $2 at the time. Do you have a reference to the PPC article and date or maybe a picture of the modified cheater cord."

Hope this helps, of course the cheater cable could be hooked up to an appropriate adapter.

Cheers, Geoff

Thanks. I have your book. What page?

Re: tv cheater cord and a six volt battery!

*Message #10 Posted by **Christoph Klug** on 9 Sept 2009, 2:35 a.m.,*
in response to message #9 by Egan Ford

Dear Egan,

Please refer to I/O-Board manual Chapter XIII.07

In Chapter XIII I describe a small circuit which activates HP41 by an extern signal (galvanic isolated with help of an opto coupler).

In Chapter XIII.07 I modify the HP41 battery holder with a small +6V backup battery and an 5 pin terminal for external DC supply. I add an micro switch for selecting internal backup battery or external DC supply. The micro switch is activated when the external cabel /harness is pluged in ....

This extenal Dc supply application is helpful for long time interface applications - and for advanced interface applications which need an wake up of the handheld by an external event - and last not least I use the external DC supply when burning ZEPROMS...

Best regards - Christoph

*Message #12 Posted by **Meindert Kuipers** on 9 Sept 2009, 5:36 a.m.,*
in response to message #1 by Egan Ford

I use my MLDL2000 with an external 6VDC adapter. This is directly connected to the BAT line of the module connector. On the HP41CX and CV there is some voltage drop, resulting in the BAT annunciator being on, but this is not really a big problem. Of course, this can only be used if there are no batteries in the calculator!

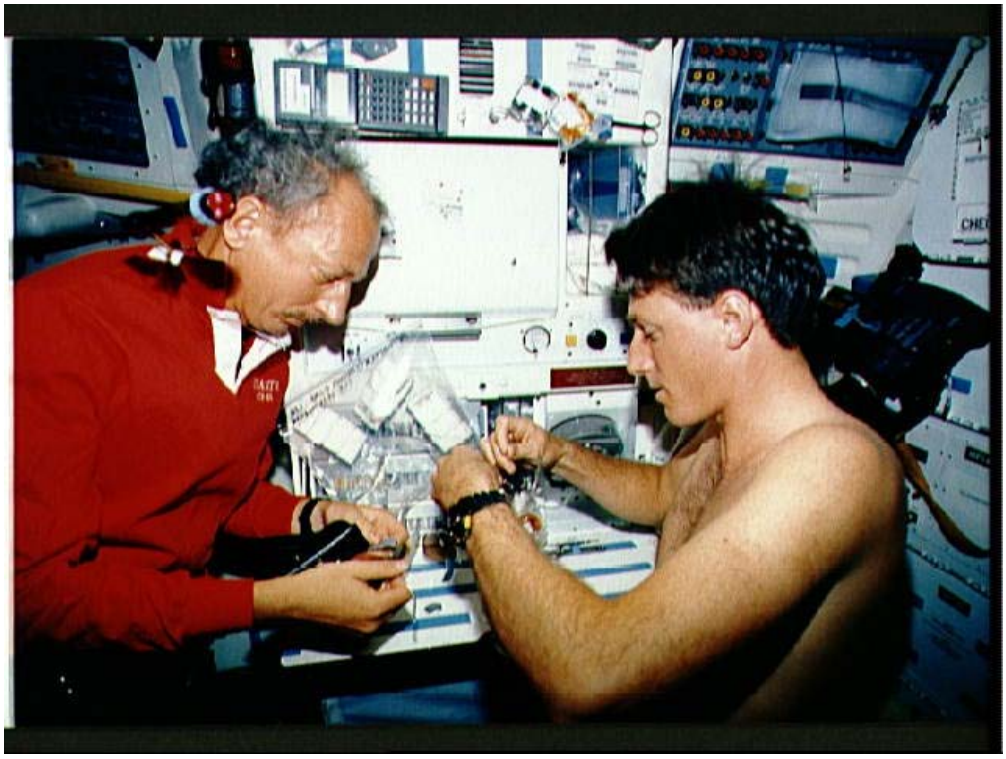
Mystery calculator

*Message #1 Posted by **hecube** on 7 Sept 2009, 12:59 a.m.*

Here's what I found in the Johnson Space Center archives:

- First one is clearly a 48 (pic taken in 1992)
- Second one: mystery calculator (pic taken in 1992)
- Third one is clearly a 41 (pic taken in 1985)

Any ideas about the second one?



Edited: 7 Sept 2009, 11:56 a.m.

HP 48G vs HP 50G

*Message #1 Posted by **Mendl Lategan** on 6 Sept 2009, 4:25 p.m.*

Hi there. I am a civil engineering student (Cape Town, South Africa) and recently bought a 2nd hand HP 48G. I have not started to use the calculator due to time constraints to learn the operation. I am thinking of buying the HP 50G and then rather learn how to use the 50G.

Is the 50G better/easier to learn than the 48G or should I rather just lear to use the 48G? Thank you for any responces.

Re: HP 48G vs HP 50G

*Message #2 Posted by **Michael Plant** on 6 Sept 2009, 4:47 p.m.,*
in response to message #1 by Mendl Lategan

I am far from an expert on the use of either calculator, but I do own both a 50g and a 48gx. I bought the 50g first (April 2009) and the 48gx several months later (July 2009). I find the 48gx far more intuitive and easier to use for the limited number of things that I have done with it. I really can't pinpoint why I feel this way, but I find that I feel less overwhelmed when I'm using the 48.

My feeling is that you should think about what you're going to need to use the calculator for and then compare the specs of the two calculators and then make a decision. The biggest advantage, to my mind, of the 50g is its SD card slot.

Re: HP 48G vs HP 50G

*Message #3 Posted by **Dave Britten** on 6 Sept 2009, 4:56 p.m.,*
in response to message #1 by Mendl Lategan

I find that the usability of the 48 is much, much better. That goes for the software, the physical hardware, and the keyboard layout. I generally use either my 48GX or my 48SX, and only pull out the 50G for stuff those two can't handle (which isn't often).

Now, the 48G will be a bit more constrained for RAM than a 48GX would be, so you'll have to factor that into the equation too.

Re: HP 48G vs HP 50G

*Message #4 Posted by **Raymond Del Tondo** on 6 Sept 2009, 5:53 p.m.,*
in response to message #1 by Mendl Lategan

Hi,

there are many points for the HP-48G series, and also some for the 50g.
As the other posters wrote, one thing to consider is the main usage profile.

However there's another thing to take into account:

A set batteries for the 50g will last a few weeks,
whereas a set of batteries for the HP-48 will last several months.

Raymond

Re: HP 48G vs HP 50G

*Message #5 Posted by **Egan Ford** on 6 Sept 2009, 6:34 p.m.,*
in response to message #1 by Mendl Lategan

I have both the 48GX and the 50g. I switched to the 50g in 2006 because it is still in production and can be easily replaced.

Some other reasons to consider the 50g:

1. Clear and large screen.
2. About 2x faster.
3. Easier to get data in and out (options: USB, SD, and Serial (just like 48GX)).
4. Superset of the 48 functionality. CAS and large integers.
5. Can be programmed in C (cross compiler) and ARM assembly.

I'm not a fan of the 50g keyboard or the layout, but since you have not started on the 48, you'll probably not mind as much. I used my 48GX for 13 years before I got the 50g. It took about a week to adapt.

Both the 48 and 50 have emulators. A huge plus. Both have all docs in PDF, however only the 50g docs can be searched. The 48 docs are scans.

Re: HP 48G vs HP 50G

*Message #6 Posted by **Les Bell** on 6 Sept 2009, 11:57 p.m.,*
in response to message #1 by Mendl Lategan

My advice would be to get started learning and using the 48G. You might find that you just don't like that style of calculator, in which case buying a 50G would be a waste of money.

There are lots of basic concepts to master in learning RPL, and the 48G will do fine for this purpose. The 50G is completely compatible and you'll make the transition quite easily.

Best,

--- Les

Re: HP 48G vs HP 50G

*Message #7 Posted by **Nigel J Dowrick** on 7 Sept 2009, 12:37 p.m.,*
in response to message #1 by Mendl Lategan

I have an HP-50G and a HP-48G+. My personal preference would be for the HP-50g every time. It has a bigger and clearer display; its interface is faster; it has an SD-card slot. Its keyboard is fine - many people prefer the keyboard of the HP-48 series, but that isn't because the HP-50g keyboard is in any way unreliable. It really is just a matter of taste.

In any case, do you really want either of these calculators? The HP-50g especially has many truly obscure

features that I doubt have ever been used by anyone. Something like the TI-89 titanium does far less but will probably do enough for many users (and appears to have fewer bugs). The TI isn't RPN, of course, but despite this its in-built editor makes it surprisingly usable.

Nigel

Re: HP 48G vs HP 50G

*Message #8 Posted by **Michael Plant** on 7 Sept 2009, 3:52 p.m.,*
in response to message #7 by Nigel J Dowrick

The OP already has a 48g so the issue comes down to whether or not what he's already got is enough to see him through or if he should/needs to spend more money for something else. At the moment he's thinking about the 50g, but the TI-89 Titanium might be a valid alternative, especially if that is what his colleagues are using. However, I have TI-89 (non-Titanium) and have yet to warm to it. The most counter-intuitive calculator of any that I own.

EDIT: added in some missing words...

*Message #9 Posted by **Walter B** on 7 Sept 2009, 4:10 p.m.,*
in response to message #8 by Michael Plant

IMHO a HP-48G contains more mathematical features than a civil engineer will ever need in his life. So, yes, a 48G shall do. Save the money for the 50G and buy some good textbooks instead.

My 0,02 Euros.

Re: HP 48G vs HP 50G

*Message #10 Posted by **Bart (UK)** on 8 Sept 2009, 6:15 a.m.,*
in response to message #9 by Walter B

Hi Mendl

When I was in SA, the engineers had an affinity for HPs. As you have a 48G and the 50G is expensive there (I think with the current exchange rate, it is sold at about twice the equivalent US value) you should be fine using the 48G.

As others have said, if you later decide you really need a 50G, it will be easy enough to change over.

Sterkte met die studies.
Groete, Bart

in response to message #7 by Nigel J Dowrick

Quote:

(and appears to have fewer bugs)

Can this be substantiated? Not necessarily by Nigel, but by anyone who knows both calc's buglists well enough.

Re: HP 48G vs HP 50G

*Message #12 Posted by **Nigel J Dowrick** on 8 Sept 2009, 11:54 a.m.,*
in response to message #11 by Pal G.

Now that I have actually looked at a buglist for the TI-89 I think I might retract my claim that it has fewer bugs than the HP-50g. I based what I said on the fact that I have never had the TI-89 give me a wrong answer (although very rarely it hangs), whereas on several occasions I have come across a clear bug in the HP-50g CAS. It also seems reasonable that since the HP-50g does so much more than the TI it is likely to have more bugs, especially as the obscure features will be used by relatively few people.

I really want to love the HP-50g, but unless I give it all my time and attention and stop seeing my other calculators I simply keep forgetting how to use it. The TI is nowhere near so demanding. I'm sure that if the HP-50g is your only calculator and if you take the time and trouble to get to know it properly, then you will be very happy together.

Nigel

Re: HP 48G vs HP 50G

*Message #13 Posted by **Crawl** on 8 Sept 2009, 2:15 p.m.,*
in response to message #12 by Nigel J Dowrick

I have had the TI89 give me a wrong answer, once. The HP gives the same wrong answer.

Consider the expression

(1 + x^2)^(1/6) cos(atan(x)/3) / x^(1/3)

as x tends to the squareroot of -1.

The correct answer is

cuberoot(2)/4 * (squareroot(3) + i)

The calculators give 0.

Of course, even with the calculators, you can get an answer close to the correct one by having x close to but slightly different than i.

Re: HP 48G vs HP 50G

*Message #14 Posted by **Crawl** on 8 Sept 2009, 2:41 p.m.,*
in response to message #13 by Crawl

Opps, I think the correct answer might be the complex conjugate of what I gave.

Anyway, you can "nudge" the TI89 into giving you the correct result by instead entering

(1-x^2)^(1/6)*cosh(atanh(x)/3)

and taking the limit as x->1 (and then dividing by the cube root of i)

It seems like the HP50g still gives the wrong answer, though.... (mostly because it does not reduce that expression to a an algebraic expression)

Re: HP 48G vs HP 50G

*Message #15 Posted by **Hal Bitton in Boise** on 7 Sept 2009, 4:56 p.m.,*
in response to message #1 by Mendl Lategan

If you're new to RPN, go ahead and start learning the 48G. If and when you get a 50G the transition will not be hard. That way, you'll be all set to use the 50G in RPN mode (which is imperative in my opinion). If you're planning on using the 50G in algebraic mode, you might as well just get a TI.
Best regards, Hal

Re: HP 48G vs HP 50G

*Message #16 Posted by **Reth** on 7 Sept 2009, 11:56 p.m.,*
in response to message #15 by Hal Bitton in Boise

I second the above; also by the time he is ready to switch to something more powerful, HP may get it right once for a change and produce something decent like HP50 without CAS and in the HP48 skin but of the HP42 size. :)

Re: HP 48G vs HP 50G

*Message #17 Posted by **Marnus Malan (RSA)** on 8 Sept 2009, 7:18 a.m.,*
in response to message #1 by Mendl Lategan

Hello Mendl,

At which uni / tech are you studying? I own the 48S, 48G+, 50G and a few aother calculators. I started with a 42s and then a 49G. People who have problems with the layout of the 50g started with the 48 series. If you are used to a 48, keep using it, otherwise get used to the 50g and a 48 will feel like a dinosaur. I would recommend the 50g, primarily for the larger screen, the faster execution times AND the ability to power from USB when working at your desk as well as the SD expasion ability. If you use any GX you are stuck regarding memory. Expansion cards for the GX is expensive and scarce. I use my 50g on a daily basis, carry it with me to construction sites and have put it through intense use and it still looks as new - no wear on the keys and I am happy with it. The 48 might be robust but it is just too slow and fiddly with the pre-historic serial connection.

If your calc is allowed in exams the execution time on large matrix, fem and beam statics calculations become invaluable. If it is not allowed, get a 42s. It is also not allowed but it looks innocent enough that nobody notices.

on gumtree you can purchase an as new 50g for R1200 (new is R1800)or order from Eric at hpcalc.org (which I did).

The documentation of the 48 is usefull to understand the workings of the 50g.

Which year are you now? Come and see me, I need engineers and if your profile suits our company I can offer a bursary.

Regards

Marnus

Edit: DONT buy the TI, I have never seen anybody in the engineering industry or at any uni that uses a TI in SA. SA engineers stick to the HP's and that can not be without a reason...

Edited: 8 Sept 2009, 7:23 a.m.

Challenge: Open-ended Dice on the HP-41

*Message #1 Posted by **Geir Isene** on 6 Sept 2009, 8:12 a.m.*

This challenge is derived from creating applications for the Amar role-playing game. It is a challenge involving the extension of the normal dice with 6 sides - a so called open-ended dice throw.

Definition: Take a dice with 6 sides. Now we would like to extend the range of the numbers beyond the intrinsic 1 to 6. A way to accomplish that is to make the 1 and the 6 special cases. Whenever you throw a 6, you can extend the range by making another throw. A throw of 4 to 6 (50%) will add 1 to the original 6. Throw again and a result of 4 to 6 will again add 1 to the number (making it 8) etc. Every throw of 4 to 6 will add one until you get a 1, 2 or 3, then it stops. Conversely, throwing a 1 on the first throw is a special case. Throw again, and a result of 1 to 3 will subtract 1 from the original number. Keep throwing 1, 2 or 3 to subtract one... until you throw a 4, 5 or 6 - then it stops. Now we add a dimension; Whenever you throw two 6's *consecutively* it is marked as a "critical". A throw of two *consecutive* 1's is a "fumble". All this is called an "open-ended" dice throw. A normal dice roll is termed a D6, an open-ended roll is O6.

Challenge: Create a program for the HP-41 that does open-ended dice rolls. It should show whether the roll also includes a "critical"/"fumble". Do this without using any storage registers - i.e. only using the stack (and the Alpha register if you wish).

I will publish my solution for dissection in a few days :-)

Re: Challenge: Open-ended Dice on the HP-41

*Message #2 Posted by **hugh steers** on 6 Sept 2009, 3:29 p.m.,*
in response to message #1 by Geir Isene

i was interested in how far out from [1,6] the "openness" might get. So i hacked up a quick program in Lua to print out a histogram. here's what i get after a million goes:

the first column is the value and the second the percentage of trials hitting that value.

```
1       8.2905
2       16.6888
3       16.6197
4       16.6964
5       16.7057
6       8.3628
7       4.1587
8       2.0964
9       1.0276
10      0.5105
11      0.264
12      0.1336
13      0.0652
14      0.0334
15      0.0141
16      0.0092
17      0.0041
18      0.0024
19      0.0011
20      0.0003
21      0.0002
22      0.0001
```

```
23      0.0002
-1      2.0857
0       4.1388
-2      1.0439
-3      0.5196
-4      0.2631
-5      0.1331
-6      0.0665
-7      0.0324
-8      0.0163
-9      0.0072
-10     0.0041
-11     0.0015
-12     0.0013
-13     0.0008
-14     0.0005
-15     0.0001
-16     0.0001
total   100
critical =      2.7771
fumble =        2.7606
```

So we have a [2,4] plateau (1/6 as expected), then 50% falloff each side. However, it's interesting to note that the "critical" and "fumble" percentages are almost 1 in 36.

This indicates that you don't really get much difference tracking consecutive 1's and 6's after the first go. Consequently, i modified my simulator to count a "critical" as 2 6's at the start and a "fumble" as 2 1's. here's what i get:

```
1       8.2841
2       16.659
3       16.6423
4       16.7312
5       16.7244
6       8.2914
7       4.2017
8       2.0684
9       1.0386
10      0.5212
11      0.2641
12      0.1315
13      0.0618
14      0.0322
15      0.0185
16      0.0073
17      0.0041
18      0.002
19      0.0012
20      0.0006
22      0.0001
23      0.0001
24      0.0001
-7      0.0298
-8      0.0176
-9      0.0072
-10     0.0033
-11     0.0024
-12     0.0006
-13     0.0006
-14     0.0003
-1      2.0799
0       4.1518
-2      1.0266
-3      0.5313
-4      0.2638
-5      0.1286
-6      0.0701
-15     0.0002
total   100
critical =      2.7716
fumble =        2.7501
```

Similar story. So i would say, for the purposes of generating values for Amar, you could simplify your algorithm on the 41c and not track consecutive values. which should shorten the program.

here are my two versions. o6() is the "real" algorithm and "os6plain" is my hacked one.

```
function d6()
   return math.floor(math.random()*6+1)
end

function o6()
   local v = d6()
   local d
   local crit = false
   local fumb = false
   local c = true
   if v == 6 then
      while true do
         d = d6()
         if d >= 4 then
            v = v + 1
            if d == 6 then
               crit = c
               c = true
            else
               c = false
            end
         else break
         end
      end
   elseif v == 1 then
      while true do
         d = d6()
         if d < 4 then
            v = v - 1
            if d == 1 then
               fumb = c
               c = true
            else
               c = false
            end
         else break
         end
      end
   end
   return v,crit,fumb
end

function o6plain()
   local v = d6()
   local crit = false
   local fumb = false
   if v == 6 then
      crit = d6() == 6
      while d6() >= 4 do v = v + 1 end
   elseif v == 1 then
      fumb = d6() == 1
      while d6() < 4 do v = v - 1 end
   end
   return v,crit,fumb
end
```

Re: Challenge: Open-ended Dice on the HP-41

*Message #3 Posted by **hugh steers** on 6 Sept 2009, 3:38 p.m.,*
in response to message #2 by hugh steers

Uh-oh! i made a mistake tracking the consecutive values. The difference is actually more - about 3% instead of 2.7

should be,

```
function o6()
   local v = d6()
   local d
   local crit = false
   local fumb = false
```

```
   local c = true
   if v == 6 then
      while true do
         d = d6()
         if d >= 4 then
            v = v + 1
            if d == 6 then
               if c then crit = true end
               c = true
            else
               c = false
            end
         else break
         end
      end
   elseif v == 1 then
      while true do
         d = d6()
         if d < 4 then
            v = v - 1
            if d == 1 then
               if c then fumb = true end
               c = true
            else
               c = false
            end
         else break
         end
      end
   end
   return v,crit,fumb
end
```

so, it depends on whether you really want to track consecutive values or not.

HPGCC.ORG ??????

*Message #1 Posted by **Jan Kromhout** on 6 Sept 2009, 2:32 a.m.*

Dear All,

When I tried to connect to hpgcc.org (via hpgcc.sourceforge.net) there is no connection to this. Is this adress changed? Is this webside closed?

Thanks in advanced.

Jan Kromhout Hellevoetsluis-NL

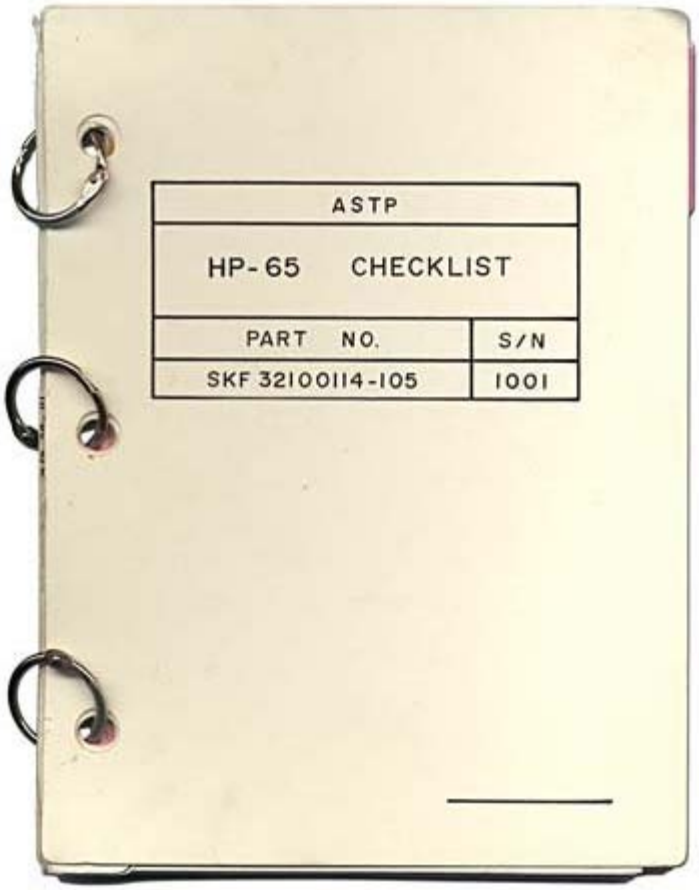
Has anyone ever seen this? ASTP HP-65 checklist

*Message #1 Posted by **hecube** on 6 Sept 2009, 12:56 a.m.*



This three-ring checklist (6"x8") was flown used onboard Apollo-Soyuz by Deke Slayton and has extensive pencil notations in his hand. Pristine condition and unique. Fourteen pages plus front and back cover. A 'Slayton' Certificate of Authentication is included and states, in part: 'This checklist book has been on loan for exhibition to the Astronaut Hall of Fame in Titusville, FL and the Air and Space Museum in Huntsville, AL. Ex-Donald 'Deke' Slayton Estate Collection.

*Message #3 Posted by **Don Shepherd** on 6 Sept 2009, 8:49 a.m.,*

in response to message #1 by hecube

Any information about what is actually in it?

Re: Has anyone ever seen this? ASTP HP-65 checklist

*Message #4 Posted by **hecube** on 6 Sept 2009, 10:20 a.m.,*
in response to message #3 by Don Shepherd

That's all I could find.

Re: Has anyone ever seen this? ASTP HP-65 checklist

*Message #5 Posted by **Don Shepherd** on 6 Sept 2009, 11:49 a.m.,*
in response to message #4 by hecube

Yeah, looks like someone bought it at an estate sale auction and probably paid a mint for it. I'd certainly like to see what's inside, but being a "checklist," I doubt it contains actual HP-65 code, unfortunately.

Re: Has anyone ever seen this? ASTP HP-65 checklist

*Message #6 Posted by **Etienne Victoria** on 6 Sept 2009, 4:02 p.m.,*
in response to message #1 by hecube

Hello Hecube,

On the ASTP program, the Hp-65 is further referenced in the Rendez-vous manual:

- Part 1

- Part 2

where the rendez-vous procedure is extensively described, alas without the HP-65 code...

Best regards

Etienne

Challenge: Keith numbers

*Message #1 Posted by **Don Shepherd** on 5 Sept 2009, 9:48 p.m.*

Number theory has all kinds of identifiers for mathematically unusual numbers. Take Keith numbers, for instance. I think it is easier to give an example of a Keith number than to explain mathematically what it is, so here goes.

Is 14 a Keith number? Yes. Why?

start a Fibonacci-like sequence with the individual digits of 14, and each subsequent number is the sum of the previous 2 (because 14 has 2 digits) numbers:

1,4,(1+4=)5, (4+5=)9, (5+9=)14. Since 14 is in the sequence that begins with 1,4, it is a Keith number.

Is 30 a Keith number? No. Why?

3,0, (3+0=)3, (0+3=)3, (3+3=)6, (3+6=)9, (6+9=)15, (9+15=)24, (15+24)=39. Since 30 is not in the sequence, it is not a Keith number.

What about 3 digit Keith numbers? Is 145 a Keith number?

1,4,5, (1+4+5=)10, (4+5+10=)19, (5+10+19=)34, (10+19+34=)63, (19+34+63=)116, (34+63+116=)213, so 145 is not a Keith number.

So, the challenge is to write a calculator program (RPN, RPL, BASIC, pick your favorite language and calculator) to identify as many Keith numbers as you can. You can verify your results by Googling Keith number. And post your code so we can all benefit from your brilliance!

I can't think of any practical reasons that Keith numbers are important, but there aren't that many of them and this problem does lend itself to solutions on the devices we have come to know and love.

Re: Challenge: Keith numbers

*Message #2 Posted by **Valentin Albillo** on 5 Sept 2009, 11:36 p.m.,*
in response to message #1 by Don Shepherd

Hi, Don:

In the HP-71B, this 5-liner is as straightforward as it gets:

```
1  DESTROY ALL @ OPTION BASE 1 @ DIM D(12) @ FOR N=10 TO 10^12-1 @ N$=STR$(N)
2  L=LEN(N$) @ FOR I=1 TO L @ D(I)=VAL(N$[I,I]) @ NEXT I
3  S=0 @ FOR I=1 TO L @ S=S+D(I) @ NEXT I @ IF S=N THEN DISP N ELSE IF S>N THEN 5
4  FOR I=1 TO L-1 @ D(I)=D(I+1) @ NEXT I @ D(L)=S @ GOTO 3
5  NEXT N

>RUN

  14
  19
```

```
    28
    47
    61
    75
   197
   742
  1104
  1537
  2208
  2580
  3684
  4788
  7385
  7647
  7909
 31331
 34285
 34348
  ...
```

It can be optimized in a number of ways, such as using MATH ROM statements and avoiding loops by just adding one value and subtracting another to keep the running sum instead of computing it in a loop, etc, etc, but what the heck ? The above code took less than 2 minutes to write, enter, and run, and it delivers the correct results, so ...

Try to beat that time (from *nothing* to *correct results*) using RPL ... :-)

Best regards from V.

*Message #4 Posted by **Don Shepherd** on 6 Sept 2009, 11:52 a.m.,*
in response to message #2 by Valentin Albillo

Thanks, V, great solution. I'm working on an RPN solution to run on the super-fast 12c to see what it can do with this problem.

Re: Challenge: Keith numbers on HP-28S

*Message #5 Posted by **C.Ret** on 7 Sept 2009, 5:08 a.m.,*
in response to message #2 by Valentin Albillo

> Quote:
>
> Try to beat that time (from *nothing* to *correct results*) using RPL ... :-)

Well, 2 mins is really a challange.

Except if you are using the ISKEITH? binary function on your HP-28S which returns True(1) for any keith number k given as argument or False(0) otherwise.

```
« DUP ->STR DUP SIZE
  ->  k T n                     @ k-number, T is string representation, n is length
     « 1 n FOR i
            T i i SUB STR->      @ Put any digit of the k-number in the stack
```

```
       NEXT
       DO                          @ main loop performing sum of the n-digits
          n ROLL
          n DUPN
          2 n START + NEXT         @ compute the n-digits sum (additing n-1 times)
          SWAP
          DROP                     @ remove oldest digit from the stack

       UNTIL DUP k >= END          @ loop until sum egals or overpasses k
       n ROLLD
       n 1 - DROPN                 @ remove remaining digts from stack, keeping last sum
       k ==                        @ perform test: last sum of n-digits egal k ?
      »
»
'ISKEITH?' STO
```

The ISKEITH? function/program may be used in any RPL calculator to list Keith's numbers; such as

```
« 10 9999 FOR i
     IF i ISKEITH? THEN i PR1 END
  NEXT
»
```

```
 14 19 28 47 61 75 197 742 1104 1537 2208 2580 3684 4788 7385 7647 7909 ...
```

But, **Don** is right, a lot of optimisation have to be carry out to beat the oberall 2 mins delay :-)

Especely with an HP-28S !

Edited: 7 Sept 2009, 2:29 p.m. after one or more responses were posted

Re: Challenge: Keith numbers on HP-28S

*Message #6 Posted by **Don Shepherd** on 7 Sept 2009, 9:58 a.m.,*
in response to message #5 by C.Ret

C.Ret, thanks for your very elegant RPL solution to this problem. It "almost" makes me want to go out and buy a 50g and learn RPL. I had no idea that the 28s actually has an ISKEITH function, that is amazing.

Great work.

And thanks to Valentin for an equally elegant BASIC solution.

Re: Challenge: Keith numbers on HP-28S

*Message #7 Posted by **Don Shepherd** on 7 Sept 2009, 6:26 p.m.,*
in response to message #5 by C.Ret

Oh, I think I see now, the 28s does NOT have a built-in ISKEITH function. You wrote it and called it ISKEITH, right? My understanding of RPL is not very advanced, I'm afraid.

Yeah, when I did this problem in RPN, I knew I wanted to avoid moving the digits around the registers and adding all the digits to create the next entry each time, and the key was to figure out how to replace the un-needed number (after saving it so you can subtract it from the new sum) with the new sum during each cycle. And that worked fine, even with the 12c's limited indirect addressing. And in lines 26-29 I double the current sum and subtract the un-needed digit from the sum to get the new sum. It took a lot of thought and sheets of paper for me to get this to finally work, but it was worth it.

I've thought about trying create a solution to this problem on the HP-65 or the 17bii+ solver, but the lack of indirect addressing killed that idea.

Re: Challenge: Keith numbers

*Message #8 Posted by **C.Ret** on 7 Sept 2009, 5:27 p.m.,*
in response to message #2 by Valentin Albillo

I was trying to convert the 5-liner HP-71B program from **Valentin** to an oldest Pocket whith a rudimental BASIC (such as a SHARP PC-1211)

Quote:

```
    1  DESTROY ALL @ OPTION BASE 1 @ DIM D(12) @ FOR N=10 TO 10^12-1 @
N$=STR$(N)
    2  L=LEN(N$) @ FOR I=1 TO L @ D(I)=VAL(N$[I,I]) @ NEXT I
    3  S=0 @ FOR I=1 TO L @ S=S+D(I) @ NEXT I @ IF S=N THEN DISP N ELSE IF
S>N THEN 5
    4  FOR I=1 TO L-1 @ D(I)=D(I+1) @ NEXT I @ D(L)=S @ GOTO 3
    5  NEXT N
```

At first, string operation have to be avoid (not possible on a SHARP PC-1211). So mathematics have to be used in order to extract each digit from the N-number.

Second, to compute the sum of the l-digits, manipulation and shifting of D(i+1) to D(i) can easely be avoid. At each step, the new sum of the last l-digits, which can be express as :

```
1 4 5(=1+4) 9(=4+5)   14(=5+9)   23(=9+14)   ...
```

Each new term is egal to the double of the previous minus the droped digit :

```
1 4 5(=1+4) 9(=2*5-1) 14(=2*9-4) 23(=2*14-5) ...
```

This can spare the FOR/TO/NEXT loop computing the sum (see line 3) and D(i) transposition (line 4)!

So, this is a second version of **Valentin** HP-71B program, which stil can be optimize :

```
  1 DESTROY ALL @ OPTION BASE 1 @ DIM D(99) @ FOR N=10 TO 99999
  2 S=0 @ L=1+INT(LOG(N)) @ FOR I=1 TO L @ B=10^(L-I) @ D(I)=INT(N/B) MOD 10 @ S=S+D(I)
@ NEXT I @ I=L
  3 IF S<N THEN I=I+1 @ D(I)=S @ S=2*S-D(I-L) @ GOTO 3
  4 IF s=N THEN DISP N
  5 NEXT N
```

Or the really similar version adapted to SHARP PC-1211:

```
 10: CLEAR :N=10
 20: S=0:L=1+INT LOG N: FOR I=1 TO L:B=10^(I-L):X=INT NB-10*INT
(NB/10):S=S+X:A(26+I)=X:NEXT I:I=26+L
 30: IF S<N LET I=I+1, A(I)=S, S=2S-A(I-L):GOTO 30
 40: IF s=N PRINT N
 50: N=N+1:GOTO 20
```

And a second version of ISKEITH? :

```
« DUP LOG IP 1 +
  -> k n                              @ k tested number, n number of digits
   « 0                                @ initiate sum   S=0
     1 n FOR i
       k n i - ALOG / IP 10 MOD       @ put i-digit into stack
       SWAP OVER +                    @ add it to sum
     NEXT
     WHILE DUP k <                    @ loop while sum is less than k
       REPEAT
         n 1 + ROLL OVER 2 * SWAP -   @ new sum is 2x last sum minus least i-digit
```

```
      END
    n 1 + ROLLD n DROPN              @ save sum and remove remaining digits
    k ==                             @ test sum is k
   »
»
'ISKEITH?' STO
```

These three program are still relatively slow to list all Keith number since most of the running time is used to test any N sequnetially.

We are still waiting for a clever way to pick up keith-numbers !

Re: Challenge: Keith numbers

*Message #9 Posted by **Egan Ford** on 7 Sept 2009, 5:49 p.m.,*
in response to message #8 by C.Ret

> Quote:
>
> We are still waiting for a clever way to pick up keith-numbers !

You'll probably be waiting for sometime. I've looked into this on/off throughout the 3-day US holiday weekend and AFAIK the only known method is by *exhaustive search*. It'd be nice to find a way to eliminate a candidate sooner than later. Of course, I have not done an *exhaustive search* myself for a better solution. It's been a lazy weekend.

There are reverse Keith numbers as well, e.g. 341 following the same logic ends up as 143.

Re: Challenge: Keith numbers

*Message #10 Posted by **Pal G.** on 8 Sept 2009, 10:41 a.m.,*
in response to message #9 by Egan Ford

Per Wolfram Mathworld:

```
"There is no known general technique for finding Keith numbers except by
exhaustive search.
```

http://mathworld.wolfram.com/KeithNumber.html

Re: Challenge: Keith numbers

*Message #11 Posted by **Valentin Albillo** on 8 Sept 2009, 9:17 a.m.,*
in response to message #8 by C.Ret

Hi, C. Ret:

Thanks for your interest in my instant-coffee HP-71B solution, but be aware that in your HP-71B version you've used **LOG** (base e-logarithm) when you actually want to use **LGT** (decimal logarithm) so your HP-71B version as written is faulty.

Also, in the HP-71B you can use **N DIV B** instead of **INT(N/B)** to perform integer division, etc. Not so in the PC-1211 BASIC dialect, which lacks **DIV**.

Best regards from V.

Re: Challenge: Keith numbers

*Message #12 Posted by **Don Shepherd** on 7 Sept 2009, 2:12 a.m.,*
in response to message #1 by Don Shepherd

Well, after considerable frustration with the 12c+ indirect addressing via the cfj command and a nasty bug that took hours to track down, here is a solution for the 12c. Enter the number you want to start with, like 10, and press R/S. It will run until you stop it, and it will display each Keith number and pause for 1 second. If you have an original 12c, it will take a rather long time. If you have the new 12c+ (Arm-based processor), it will go considerably faster. And if you have the 12c Windows-based emulator that HP is selling for $20, it will go faster still (although the original version would not handle the pse command correctly, but they sent me a fix for that).

Here is the code. I used all 5 TVM variables for purposes for which they were not intended.

```
01 clr fin
02 cf0
03 1
04 0
05 /
06 i
07 frac
08 1
09 0
10 x
11 cfj
12 rcl pv
13 +
14 pv
15 rcl i
16 intg
17 x=0
18 goto 20
19 goto 03
20 rcl n
21 fv
22 rcl cfj
23 pmt
24 rcl pv
25 cfj
26 2
27 x
28 rcl pmt
29 -
30 pv
31 rcl n
32 1
33 -
34 n
35 x=0
36 goto 38
37 goto 40
38 rcl fv
39 n
40 rcl pv
41 rcl 0
42 -
43 x=0
44 goto 46
45 goto 49
46 rcl 0
47 pse
48 goto 54
49 rcl pv
50 rcl 0
51 x<=y
52 goto 54
53 goto 22

Re: Challenge: Keith numbers

*Message #13 Posted by **Crawl** on 8 Sept 2009, 7:38 a.m.,*
in response to message #1 by Don Shepherd

Fun! I haven't done one of these in a while.

The gist of this program is that first the initial number's digits, then the running sums, are stored as entries in a row matrix.

You put the number D on the stack, and it exhaustively searches for all Keith numbers with D digits. So, on a real HP50g, if you put 2 on the stack and run the program, you get (after about a minute)

```
14
19
28
47
61
75
```

You might want to run it on an emulator for much larger values of D!

```
%%HP: T(3)A(R)F(.);
\<< 0 0 0 0 \-> D S N J M
  \<< 10 D 1 - ^ 1 + 10 D ^ 1 -
    FOR N N \->STR 'S' STO 1 D
      FOR J S J J SUB OBJ\->
      NEXT D ROW\-> 'M' STO
      DO 2 D
        FOR J M J GET
        NEXT M 1 GET 2 D
        FOR J M J GET +
        NEXT D ROW\-> 'M' STO
      UNTIL M D GET N \>=
      END M D GET N ==
      IF
      THEN N
      END
    NEXT
  \>>
\>>
```

Re: Challenge: Keith numbers

HP41CX x Psion LZ64.

*Message #1 Posted by **Saile (Brazil)** on 5 Sept 2009, 9:15 p.m.*

```
Can we compare a HP41CX with a Psion LZ64?
I am using a Psion LZ64 is is really an excellent equipment.
Can anybody lift a negative point in relation to HP-41CX?
I didn't find none :-)
Whose is the supremacy?

Technical specification Psion LZ64
```

Re: HP41CX x Psion LZ64.

*Message #2 Posted by **Garth Wilson** on 6 Sept 2009, 12:43 a.m.,*
in response to message #1 by Saile (Brazil)

> Quote:
>
> Can anybody lift a negative point in relation to HP-41CX?

Major, major (to me anyway): no HPIL. The 82169A HPIL-to-HPIB interface converter transparently gave the 41 access to many pieces of lab equipment simultaneously. There were other interface converters as well like the FSI164A which went from HPIL to up to eight RS-232 channels, the parallel interface converter, HPIL modem, printers, tape & disc drives, etc., and the 41 could connect to, and handle, all of these simultaneously. My first automated test set-up at work to test a particular communications product in the late 1980's was controlled by a 41cx and a 10-page program.

Also, what kind of OS? Can keys be re-assigned? And does the Psion have a time-of-day clock and calendar plus stopwatch functions, multiple alarms that can wake it up to do a job periodically and put it back to sleep?

Of course, the 41cx wasn't the end-all hand-held, and neither was the 71 with all the user-group additions which was far superior although less practical as a calculator; but the 41cx was amazing and is still very useful.

Re: HP41CX x Psion LZ64.

*Message #3 Posted by **Johnny Bjoern Rasmussen** on 6 Sept 2009, 7:42 a.m.,*
in response to message #2 by Garth Wilson

Having an Psion XP among many PDA's I really am amazed by the capabillities of these little wonders.

Re: HP41CX x Psion LZ64.

*Message #4 Posted by **Saile (Brazil)** on 6 Sept 2009, 8:04 a.m.,*
in response to message #2 by Garth Wilson

```
"Major, major (to me anyway): no HPIL ..."
```

I am only comparing the Calculators no the interfaces for normal
 use but the LZ64 has additional communication port enabling the
 attachment of a wide range of peripherals such as modems,
 printers, bar code readers, CCD scanners, mag card swipes and more.

"Also, what kind of OS?"

PSION OS

"Can keys be re-assigned?"

I can create options in the menu for my programs

"And does the Psion have a time-of-day clock and calendar plus stopwatch functions..."

Yes have a time-of-day clock and calendar plus stopwatch

OPL commands and functions

Re: HP41CX x Psion LZ64.

*Message #5 Posted by **Dave Britten** on 6 Sept 2009, 5:03 p.m.,*
in response to message #1 by Saile (Brazil)

I'd say that for heavy mathematics, the 41 is better prepared out of the box. For software customization, they're probably about on par. (What's the maximum RAM for a 41? I've got a Psion Organiser II XP with 32 KB RAM built in, plus two expansion slots.) An interesting feature of the Psion is that you can write a function in OPL, compile it, and then call it from the built in calculator program like any other internal math function. The Series 3 allowed this as well, though they dropped this functionality from the Series 5, for whatever reason (along with a few other steps backward that I won't get into).

On a related note, I read that the OPL programming language of the Psion is compiled internally to some sort of RPN code.

Re: HP41CX x Psion LZ64.

*Message #7 Posted by **Mark Edmonds** on 8 Sept 2009, 6:42 p.m.,*
in response to message #6 by Saile (Brazil)

I think mine has a spell-checker/thesaurus as well (on ROM).

Sadly, a couple of columns in the LCD stopped working but otherwise, those machines had great

potential and were quick and easy to use. I went through a lot of PDAs after that and it took many years for me to find one which had the same operational ease.

Mark

HP71B mains adaptor

*Message #1 Posted by **P.Hart** on 5 Sept 2009, 10:54 a.m.*

At the back of my HP71B are two sockets for HPIL connectors and another which I presume is for a mains adaptor. Can anyone please inform me what the specification would be for an adaptor?

P.Hart

Re: HP71B mains adaptor

*Message #2 Posted by **Garth Wilson** on 5 Sept 2009, 1:27 p.m.,*
in response to message #1 by P.Hart

In the U.S. it's HP number 82059D, the same one that goes to the 82161A tape drive, the thinkjet printer, the 82169A HPIL-to-HPIB converter, and other things. Output is 8VAC.

Re: HP71B mains adaptor

*Message #3 Posted by **P.Hart** on 5 Sept 2009, 2:40 p.m.,*
in response to message #2 by Garth Wilson

Thanks Garth. I doubt I could get the HP part. I'm hoping to find out the full spec for an adaptor that I could find elsewhere.

P.

Re: HP71B mains adaptor

*Message #4 Posted by **Katie Wasserman** on 5 Sept 2009, 3:38 p.m.,*
in response to message #3 by P.Hart

It's just a transformer, no regulation or rectification at all. Output is rated 8 VAC at 3VA, I measured 12.5 V RMS with no load.

Re: HP71B mains adaptor

*Message #5 Posted by **P.Hart** on 5 Sept 2009, 5:01 p.m.,*
in response to message #4 by Katie Wasserman

Thanks Katie, I should be able to find something to that spec.

For those who are interested in : i59 available on Appstore

*Message #1 Posted by **Jean-Michel** on 5 Sept 2009, 3:36 a.m.*

Hello all,

I know it is not an HP, but as it is also an interesting calc, let me advise you from this new emulator for iPhone/iPod Touch. Sorry, I still haven't downloaded the latest 3.0 OS on my iPod, so I can't copy & paste the link to. (I'm not involved in any way in this emulator, and especially on a money point of view. :-)

At least this emulator will definitively fix the usual problem of bouncing keys of TI calcs from this time.

Kind regards. JM

Re: For those who are interested in : i59 available on Appstore

*Message #2 Posted by **Howard Owen** on 5 Sept 2009, 11:12 p.m.,*
in response to message #1 by Jean-Michel

I wonder how many people on this forum would pay US$5.99 for a *real* TI59?

Just kidding. I own one and paid a bit more than that for it. :) Thanks for the pointer. It's another fun little mathematical toy for my iPod.

Regards,
Howard

Re: For those who are interested in : i59 available on Appstore

*Message #3 Posted by **Egan Ford** on 6 Sept 2009, 11:43 a.m.,*
in response to message #1 by Jean-Michel

I could not tell from the App store description or from their website if it is a simulation (e.g. like Free42) or an emulation (e.g. like EMU42).

Re: For those who are interested in : i59 available on Appstore

*Message #4 Posted by **HrastProgrammer** on 7 Sept 2009, 1:05 a.m.,*
in response to message #3 by Egan Ford

Simulation ...

Re: For those who are interested in : i59 available on Appstore

*Message #5 Posted by **Marcus von Cube, Germany** on 8 Sept 2009, 4:02 p.m.,*
in response to message #4 by HrastProgrammer

I think, no one ever managed to extract the 59's ROM code. BTW, does i59 come with any modules?

Is the card reader emulated in any way?

Re: For those who are interested in : i59 available on Appstore

*Message #6 Posted by **HrastProgrammer** on 9 Sept 2009, 2:00 a.m.,*
in response to message #5 by Marcus von Cube, Germany

You think right, unfortunately ...

Re: For those who are interested in : i59 available on Appstore

*Message #7 Posted by **Eric Smith** on 9 Sept 2009, 4:08 a.m.,*
in response to message #5 by Marcus von Cube, Germany

I could extract the ROM code, but I don't have any information on the enhancements of the TMC0501E as compared to the original TMC0501. There might be more registers, more instructions, or who knows what. It doesn't seem worth investing the time to dump the ROM unless either docs turn up or someone finds the time to reverse-engineer the TMC0501E.

Re: For those who are interested in : i59 available on Appstore

*Message #8 Posted by **HrastProgrammer** on 9 Sept 2009, 5:10 a.m.,*
in response to message #7 by Eric Smith

Just extract the ROM :-)

Everything else could be figured out either from the patents or by tracing through the code, as I already did with TI-57. It will take a lot of time, but I am sure it can be done.

As far as I know, there are no new registers (except maybe KR - I have to see if it is in the original TMC0501) and only 8 new instructions ... see page 2 from US patent #4153937.

Re: For those who are interested in : i59 available on Appstore

*Message #9 Posted by **Eric Smith** on 9 Sept 2009, 2:01 p.m.,*
in response to message #8 by HrastProgrammer

The description of the figure is

> Quote:
>
> FIG. 5h depicts the instruction words decoded on the second ROM chip and **selected** instruction words decoded on the arithmetic chip, but which may be conveniently employed in connection with the utilization of the second ROM chip;

[emphasis added]

Some of these instructions are thus interpreted by the TMC0501E, but these are being presented to explain the support for the second DSCOM, and it's not at all obvious that there are no other enhancements being used in the 58/59.

However, I'll dump the ROMs when I find some spare time. Most likely not until early next year.

For those who are interested in : i59 available on Appstore

HPAPINE

*Message #1 Posted by **Jan Kromhout** on 5 Sept 2009, 3:11 a.m.*

Dear All,

Is it posible to format the stack output (RPL Stack) when using HPAPINE?

I wont to have the maximal digits after the decimal point!

Thanks in advance Jan Kromhout Hellevoetsluis-NL

Re: HPAPINE

*Message #2 Posted by **Khanh-Dang Nguyen Thu-Lam** on 5 Sept 2009, 12:30 p.m.,*
in response to message #1 by Jan Kromhout

HPAPINE is released under the GNU Public License. It means you can read and modify the source code.

To change the printing format, go in the HPAPINE's source root directory and edit the src/saturn/rplapi.c file. In the SAT_DOREAL case, change the format string "%g" in the fprintf() instruction with "%.16f" or whatever you want.

However, HPAPINE is not a emulator. It is an implementation of the HPGCC's standard libraries. You should not expect the math functions of HPAPINE to give the exact same result than with HPGCC.

Re: HPAPINE

*Message #3 Posted by **Jan Kromhout** on 7 Sept 2009, 12:21 a.m.,*
in response to message #2 by Khanh-Dang Nguyen Thu-Lam

Thanks for the information.

Is there some help how to compile a new version with the change yoe mentiod?

Thanks in advance.

Jan Kromhout Hellevoetsluis-nl

Re: HPAPINE

*Message #4 Posted by **Egan Ford** on 7 Sept 2009, 9:59 a.m.,*
in response to message #3 by Jan Kromhout

If you are using the http://sense.net/~egan/hpgcc versions, then you should just have to type 'make' in the 2.0SP2-hpapine directory.

Re: HPAPINE

*Message #5 Posted by **Khanh-Dang Nguyen Thu-Lam** on 7 Sept 2009, 10:00 a.m.,*
in response to message #3 by Jan Kromhout

Just take a look at the Makefiles, then, just run the make command.
http://en.wikipedia.org/wiki/Makefile

Re: HPAPINE

*Message #6 Posted by **Jan Kromhout** on 7 Sept 2009, 4:27 p.m.,*
in response to message #5 by Khanh-Dang Nguyen Thu-Lam

Thanks for all usefull information. I have changed the code as you mentiod, but in HPAPINE output I see :

--- Waiting for stack input on stdin... 100 500 --- Stack reading: done.

--- RPL Stack:

2: 100.0000000000000000 1: 500.0000000000000000

--- RPL Stack:

1: " 3375.06"

How (where) can I change the output so that I see more decimals.

Thanks inadvance.

Jan Kromhout Hellevoetsluis-NL

Re: HPAPINE

*Message #7 Posted by **Khanh-Dang Nguyen Thu-Lam** on 8 Sept 2009, 4:30 a.m.,*
in response to message #6 by Jan Kromhout

What is your program doing? What HPGCC routines does it use? What does a real HP49G+ or HP50g return?

Re: HPAPINE

*Message #8 Posted by **Jan Kromhout** on 8 Sept 2009, 7:17 a.m.,*
in response to message #7 by Khanh-Dang Nguyen Thu-Lam

I use a routine as mentiod "SAT_DOREAL"

My program is taken two values from sthe stack (pressure and temperature) and calculates the enthalpy of steam. In normal operation on the hp50g I set in mode the max alowed decimal positions.

In the output of HPAPINE I wont to have the same behavior, max amount of decimal positions on the anwer.

On my hp50 the anwer is 3375.05844185

Thanks in advance

Jan Kromhout Hellevoetsluis-NL

HP-42s Memory Upgrade

*Message #1 Posted by **DavidShenk** on 5 Sept 2009, 12:45 a.m.*

I'm entertaining the idea of upgrading my 42s but find the listings of computer chips confusing. I have seen this for sale in a few places. Is this what I'm looking for:

62256-70S 32Kx8 70ns CMOS SRAM - SMD

If not, could someone post a link to the exact chip I need to get.

Thanks, Dave

Re: HP-42s Memory Upgrade

*Message #2 Posted by **Diego Diaz** on 5 Sept 2009, 5:55 a.m.,*
in response to message #1 by DavidShenk

Hi David,

The type is ok. In general whichever XX256 memory (28 pin SMD SOIC) will fit the task.

The reponse time (-70... or something like this) is not a concern as HP-42s are slow enough for any memory currently in production to meet the specs. Even if you go thru the 2x speed-up. (See here)

However you should pay attention to the stand-by current drain in order to extend your battery life to the most.

CY62256NLL-70 (Digikey: 428-2039-5-ND) has a 0.1uA typical standby current. It has worked fine for me.

Hope this helps.

Diego.

Edited: 5 Sept 2009, 9:41 a.m.

Re: HP-42s Memory Upgrade

*Message #3 Posted by **DavidShenk** on 5 Sept 2009, 12:17 p.m.,*
in response to message #2 by Diego Diaz

Thank you, that is exactly the info I was looking for. I went ahead and ordered a few from Digikey.

Maybe I should have ordered some crystals too, but one step at a time.

Dave

Dave

Re: HP-42s Memory Upgrade

*Message #6 Posted by **Geoff Quickfall** on 5 Sept 2009, 8:34 p.m.,*
in response to message #1 by DavidShenk

Thanks Deigo for the memory chip order number.

I also have ordered two for my HP42s's which along with my Clonix HP-41CX make up my office duo.

This also will be a section in the pioneer chapter.

Cheers, Geoff

Re: HP-42s Memory Upgrade

*Message #7 Posted by **Diego Diaz** on 6 Sept 2009, 12:54 p.m.,*
in response to message #6 by Geoff Quickfall

Hi all,

Well, crystal Digikey P/N: SER3322-ND is smaller, and is the one I've used. but previous reference will also work.

However, I'd take the "Speed-up" upgrade with a grain of salt... you more likely will lose printing capabilities.

And no, you won't get the IR printer interface back to work when you need it by "simply" writing H'03 into H'40300... it's not that easy... ;-)

IR (red eye) interface, takes the carrier frequency directly from the Xtal. so... Well, you can always install both Xtals and the required switch. Yes, I've done it, and yes it works ;-))

Cheers.

Diego.

Edited: 6 Sept 2009, 12:58 p.m.

Re: HP-42s Memory Upgrade

*Message #8 Posted by **Paul Dale** on 6 Sept 2009, 7:16 p.m.,*
in response to message #7 by Diego Diaz

> Quote:

This is what I was thinking of doing.

Where would the switch fit through the case? There isn't a lot of space for such...

- Pauli

Re: HP-42s Memory Upgrade

*Message #9 Posted by **Andres C. Rodriguez (Argentina)** on 6 Sept 2009, 8:46 p.m.,*
in response to message #8 by Paul Dale

A magnetic reed switch may be a good option.

Re: HP-42s Memory Upgrade

*Message #10 Posted by **Diego Diaz** on 7 Sept 2009, 5:52 a.m.,*
in response to message #9 by Andres C. Rodriguez (Argentina)

Hi again,

Please note that you'll need a changeover reed, as well as a convenient place to hold the activating magnet... In HP-41's this is the way I went, using the PORT-1 cover to hold the magnet... but HP-41 only needs a simple "Open/Close" reed to switch between speeds. Actually I choose the serial capacitor approach to build my 41 speed-up.

I simply hate drilling, cutting, or otherwise "damaging" the housing of one of these bauties... so I go the "Hidden Switch" way for my 42 upgrade.

Just a paper clip tip is enough... even the edge of the IR cover can be used to move the switch up and down.

Here you are the pics:

Hope this be useful.

Regards.

Diego.

Re: HP-42s Memory Upgrade

*Message #11 Posted by **DavidShenk** on 7 Sept 2009, 12:43 p.m.,*

in response to message #10 by Diego Diaz

Thank you for taking the time to post pics. I didn't know changing crystals can effect printing.

I wonder if you can change crystals in the printer as well...?

Dave

Re: HP-42s Memory Upgrade

*Message #12 Posted by **Diego Diaz** on 7 Sept 2009, 3:25 p.m.,*
in response to message #11 by DavidShenk

Hi Dave,

No such things as Xtals inside the 82240A/B IR printers.

It uses a Pi shape resonant circuit (Capacitor-Inductor-Capacitor) which makes the 80C50 microcontroller run at some 3.5 ~ 4 MHz.

Nonetheless, you can replace the inductor with a Xtal. Specs for the 80C50 sets an upper limit working frequency of 6MHz; but it won't change the results. Still good printing at 42's normal speed and nothing at 2x.

Going beyond 6MHz will result in no printing at all... these micros were not very well suited for overclocking... :-(

Sorry for the bad news.

Diego.

Re: HP-42s Memory Upgrade and Speed Doubling

*Message #13 Posted by **Andrés C. Rodríguez (Argentina)** on 8 Sept 2009, 7:36 a.m.,*
in response to message #12 by Diego Diaz

... and with a different crystal, even if the micro eventually runs at higher speed, it is very possible that the timing of outputs which control the mechanism (or the thermal printing pulse duration) will get affected and not working.

And there may be also analog components (filters) on the IR link which are tuned for some pulse-train frequency, and may not work well with a different rate.

Re: HP-42s Memory Upgrade

*Message #14 Posted by **Paul Dale** on 7 Sept 2009, 9:08 p.m.,*
in response to message #10 by Diego Diaz

Very useful thanks.

Hello Hecube!

Thank you for your effort on documenting the Hps in space!

I'm highly interested in your findings.

On your question about the most appropriate french forums to ask info on this topic, I would suggest:

- Le forum de la conquête spatiale

- la section astronautique de futura-sciences

However, the ESA & the various Ariane missions are a collaborative work of 18 european countries and not only France.

Therefore I'd suggest extending your investigations with our european friends on the forum.

Best regards from France!

Etienne

On the missing comma as thousand-separator

*Message #1 Posted by **Luca** on 4 Sept 2009, 5:25 p.m.*

I really like how, on older calculators, the comma (used as thousands-separator) moves as you input a large number. It makes it very easy to enter such numbers quickly and without errors.

This has been eliminated in newer calculators, including the HP-50g and the HP-35s. I have heard repeated that new calculators cannot use this as they accept a more general form of input on the stack. But I think this explanation does not really hold up. It would be very easy to write an algorithm that places commas properly even for arbitrary stack input: simply check that to the left of the cursor you only have digits until a whitespace, and if so, place commas every three digits (taking into account of the decimal point). When a non-digit (such as E, or -, etc) is inserted, freeze the commas where they are, and continue getting input. Why would this not work?

In fact, it would be quite simple to encode the above as a state-machine.

Luca

Re: On the missing comma as thousand-separator

*Message #2 Posted by **Gerry Schultz** on 4 Sept 2009, 6:42 p.m.,*
in response to message #1 by Luca

I have both RPN and RPL machines and I have always preferred the RPN style with a 4-level stack. I do understand the issue in the RPL machine where the command line needs to parse an entry for its data type and extra commas can confuse it. But aren't we dealing with two separate issues? On a 41 when you type in a number, the commas are inserted automatically and maintained by the display but are not a part of the number itself. In the RPL machines, commas are never displayed for either integers or real numbers (as I remember). So, the issue is, as I see it, inputting of numeric data verses the display of numeric data.

As a compromise, why not disallow commas when inputting a real (it has a radix displayed in a 50g) number or integer (no radix in a 50g) number so the command line can properly parse the input. Then, after the number type is identified, have the calculator firmware put commas in the display of those number types only. It's not perfect but it would be a step getting the commas back in a number.

It does raise the question of if you have large numbers in the real and imaginary axises of a complex number, can the firmware also insert display commas? I don't see why it couldn't but I'm no expert. The displaying of all numeric data types would have to be rewritten. Sounds like a lot of work and that would cost.

My 2 cents.

Gerry

in response to message #11 by Katie Wasserman

I am just finishing a program for the 42s that I got from his book *Metamagical Themas* called CopyCat. You enter a string of 6 characters and the calc picks a method and "changes" the string in a certain way, then displays the result. You get three test strings to figure out what the calc is doing, then the calc gives you a string and it's up to you to figure out what it should change to, following the pattern.

Example: ABCDEF to ABCDEG - This could be that the last character is shifted one to the right, or the last character is always 'G'. You can confirm that with more test strings.

Of course, the more interesting ones are much more complicated. Switching and rotating letters around, doing changes depending on what letters are present, etc.

I'll have it done and posted in the next week or so.

Dave

Re: HP-75C Magnetic Cards read by HP-71B card reader

*Message #3 Posted by **Jakob B. Sorensen** on 7 Sept 2009, 11:58 a.m.,*
in response to message #1 by Giovanni Jimenez

Hi Giovanni

Your HP-71 can read LIF1 files made at the HP-75 and then convert them into BASIC programs. At the HP-75 use the command TRANSLATE ['filname'] INTO LIF1 and copy the file to card. At the HP-71 copy the file to memory and execute TRANSFORM filename INTO BASIC.

In praise of hard-copy manuals

*Message #1 Posted by **Luca** on 4 Sept 2009, 12:59 a.m.*

When I bought my first HP calculator, an HP 32SII, it was the manual which impressed me more than the calculator.

The calculator was very nice, but I had had some other Casio and Sharp calculators that, while being in the algebraic style, were also well thought out and quite usable.

But the manual was on a planet of its own. It was written in an outstanding way. It was clear, from the manual, the enormous amount of thought and engineering that went into that calculator. Other calculators were composed of many functions, more or less put together on top of an algebraic setting. But it was clear from the 32SII manual that true engineers and mathematicians had worked at the calculator. It was not a toy, it was the outcome of very sophisticated thought. The impression of quality, attention to detail, was remarkable.

The 33s, which I just bought, had a similar manual.

The manual is part of the reason I never liked the 48, 49, 50g series. The manuals were hastily put together, poorly organized, too large -- a sloppy job. And worse, those calculators were never really useful to me if I did not have the manuals nearby; never being able to use the calculators alone, I never grew fond of them.

The 35s has also a decent manual, but not in hard copy. To me, that is just a statement of cheapness, and lack of attention to quality. I find it strange that the cheaper 33s has a printed manual, whereas the 35s does not. It is as if the 35s wants to be a status symbol, rather than an actually useful calculator. This, to me, is also apparent in other choices of the 35s. The ALL-digits mode is broken, the comma does not appear while typing a large number... yes I heard explanations for the latter, but when I got my first HP calculator, that incredibly useful shifting comma was one little detail that showed the attention to design that had gone into that calculator. Losing that in the 35s is just sad.

I don't buy the argument of going green. If you do care about being green, stop (as I have done) reading newspapers on paper, and read them on the web. I must have saved over ten pounds of paper a week doing that. I think all my HP manuals weigh about 5-6 pounds; my purchase of manuals is a tiny percentage of the books I buy. But for me, the presence of a manual is a sign that the calculator is created to be really used, as a professional, well thought-out instrument.

We will see if there will be models following the 33s, which I now consider to be the last of the classical calculators (the 35s does not qualify due to lack of manual). On some level, calculators will cease to make sense. Everybody will soon have a smartphone (an Android, or Pre, or iPhone, or...), and that will work as a calculator too. I am not sure of what the market will support; it will be interesting to see.

Luca

You are right, because the first production 35s *did* come with a printed manual, then it was dropped.

> Quote:
>
> the comma does not appear while typing a large number... yes I heard explanations for the latter,

The explanations I read had to do with RPL calculators, which the 35s is not. It is in the lineage of the 32sii and 33s, which *do* have that feature. So to me that's no explanation at all.

Re: In praise of hard-copy manuals

*Message #3 Posted by **Tim Wessman** on 4 Sept 2009, 11:21 a.m.,*
in response to message #2 by Martin Pinckney

The thousands shifting is easy on a calculator where you only have one data type (real numbers). On the 35s which can have complex numbers, or vectors, it can't really know what you are typing in until the end. It could *possibly* have been kept that, but would have used up a lot of ROM in an already full ROM.

As for thick, hardbound manuals. . . I doubt you will ever seen them again in ANY consumer product because of cost, "green", and the fact that nobody reads them.

Calculators aren't made for a single group of professionals any more like HP calcs of old. A large included manual isn't enough of a selling point that it outweighs the cost of putting it in. . . :-(

If it was up to us, we'd do it. Very expensive people that study that type of thing in a methodi, scientific method though tend to shape corporate policy.

> Very expensive people that study that type of thing in a methodi, scientific method though tend to shape corporate policy.

But do they *use* their own products?

Re: In praise of hard-copy manuals

*Message #6 Posted by **Gene Wright** on 4 Sept 2009, 3:35 p.m.,*
in response to message #5 by Martin Pinckney

A printed manual was included when the 35s was first introduced. True.

But, being in the consumer electronics business myself, things change. Demands come from special interest groups, investors, corporate boards, retailers, distributors and they are all looking for similar things.

Pack more stuff into the same size boxes or fit more product on the same peg in the store.

Manuals eat paper. Manuals are big. Manuals make packaging big. Few customers even OPEN the manual much less look at it.

Sadly (and it is sad to me), the printed large manual is going the way of the dodo.

Fitting 3 boxes on a peg in a store vs. 6 by having smaller packaging may mean the product is picked up by the store or not. Smaller packaging means more product can be fit into a container from China, reducing costs.

We have redesigned our own packaging several times to reduce materials and make things smaller.

I'm sure HP is no different.

> Sadly (and it is sad to me), the printed large manual is going the way of the dodo

Indeed sad, but true.

Products come with a PDF manual on CD if you're lucky, otherwise a web address to go download one. I guess the assumption is everyone has a computer.

One of the advantages is portability. Need a 50G manual at work? just download it from the HP website - you don't even have to bother remebering the CD, let alone lug the manual along.

Many software packages install large help files in stead of books (I came across my WP5.1 manuals a few weeks ago), but even that's changing - recent MS Office releases go online whenever the help files are accessed.

Change happens. I recently invested in a laser printer - one of the motivaters being to print manuals. I still prefer a printed manual, it's just easier to page through & find stuff and after a while I know pretty much where to open it to find something. I find it more difficult to scroll through a couple of hundred page PDF. Perhaps because I grew up with printed matter and maybe the next generation will not know what to do with a printed book :-))).

Re: In praise of hard-copy manuals - what about ebook readers?

*Message #9 Posted by **Didier Lachieze** on 8 Sept 2009, 7:15 a.m.,*
in response to message #8 by Antonio Maschio (Italy)

Is anyone using an eInk device (Kindle, Sony Reader, Cybook ...) to store and read the HP manuels? I agree with what was said about paper manuals and I appreciate them for the tactile feedback, the portability (you can bring them where you want, on the desk close to the calculator, on the sofa, on the bench, in the bed ...) but I'm wondering if this kind of devices can offer in a close future the reading experience of a paper manual, while providing the e-book advantages: storage of a whole library in a small device, text search ...

Re: In praise of hard-copy manuals

*Message #10 Posted by **Garth Wilson** on 4 Sept 2009, 3:43 p.m.,*
in response to message #3 by Tim Wessman

> Quote:
>
> As for thick, hardbound manuals. . . I doubt you will ever seen them again in ANY consumer product because of cost, "green", and the fact that nobody reads them.

Chicken-and-egg-- no one reads them anymore because no one expects the manual to be any good, because the art of good manual-writing was lost years ago.

But if I'm going to invest in a good tool and the manual only comes in a .pdf file, I'm going to Email it to Kinko's and have them print it for me. It's nice to have the searchable digital version, but I also want to be able to pencil-in my comments and other marks and use post-it notes along the edge. It's much faster to get around a paper manual than the online version if you're not searching.

Just the volume of junk mail I've gotten for Verizon FiOS exceeds the amount of paper it would take to print out an 800-page manual, not to mention all those cereal boxes over the years, the Pennysaver which always goes straight to the recycling, toilet paper, etc., so I don't think "being green" is a concern.

HP-35s -- lack of comma-insertion

*Message #11 Posted by **Karl Schneider** on 5 Sept 2009, 1:25 a.m.,*
in response to message #3 by Tim Wessman

> Quote:
>

You're on the right track, but I can't quite agree with your conclusions. As Martin Pinckney stated:

> Quote:
>
> *The explanations I read had to do with RPL calculators, which the 35s is not. It is in the lineage of the 32sii and 33s, which do have that feature. So to me that's no explanation at all.*

Recall that the HP-42S offered complex numbers, matrices, and alphanumeric strings in addition to floating-point numbers, and still provided the comma or point separators automatically.

I believe that the HP-35s might be borrowing some non-legacy ROM code from the HP-50g and other models, because a few instances of "RPL way" and "business-model way" replaced the traditional "RPN scientific way". In addition to the lack of automatic comma-separator placement (based on RPL's free-format input buffer that accepted input of uncertain data type), the following unwelcome methods were adopted on the HP-35s:

- The awkward RPL-style HEX/OCT/BIN data entry that required the user to append a lower-case base identifier to the alternate-base integer, even with that base selected
- The requirement to prepend a "1" prior to entering the base-10 exponent "E", as with the business models

in response to message #2 by Martin Pinckney

-I just weighed the printed manuals for the 50G including the starter book, in the aggregate 6.5 pounds. It isn't enough, and yet it's too much. The information is hiding in plain sight. There is simply too much NEW information to be digested unless you are strongly motivated. It is too complex to simplify. Paper may be great for simpler cases. You need an html document in your computer to access the information, then too there is a lot to carry in your head. If you have not grown up with the previous calculators that presaged the 50G it seems hopeless to learn all at once. Sam

Printed manuals for the 50g? Did you print them yourself or are they available from HP?

Personally, I think companies should make printed & bound manuals available for a price. That way the people who want them could get them and hopefully the companies could earn a little profit from it.

Re: In praise of hard-copy manuals

*Message #15 Posted by **Dallas Osborne** on 4 Sept 2009, 11:56 a.m.,*
in response to message #2 by Martin Pinckney

True, it was very nice that the first run of 35s calculators came with printed manuals.

The spiral bind is also nice to have.

Re: In praise of hard-copy manuals

*Message #16 Posted by **Michael de Estrada** on 4 Sept 2009, 1:07 p.m.,*
in response to message #15 by Dallas Osborne

Where the heck did you find one with a spiral bound manual? I bought one of the very first ones (CNA 72600865), and it came with a lousy paperback bound manual. Grrrrrrr!

Re: In praise of hard-copy manuals

*Message #17 Posted by **Martin Pinckney** on 4 Sept 2009, 1:19 p.m.,*
in response to message #16 by Michael de Estrada

I think Dallas just took it to a print shop and had it spiral bound.

Re: In praise of hard-copy manuals

*Message #18 Posted by **Dallas Osborne** on 4 Sept 2009, 3:34 p.m.,*
in response to message #17 by Martin Pinckney

Yup, Kinko's did it for $8. I really don't like hardback manuals; they don't lay proper-like.

I also promptly replaced the zipper case with a 33s case. Yes, the zipper case is neat and all, but, again, I just don't like working the dang zipper all the time. Call me lazy, eh?

The 33s case fits perfectly. The only other thing I still have yet to do is replace the soft plastic film over the LCD with a thicker matt-plastic. I have done this with a couple of the 15c jobs with badly scratched screens. I use a matt plastic that is somewhat like the 48 series screen material.

Re: In praise of hard-copy manuals

*Message #19 Posted by **Michael de Estrada** on 4 Sept 2009, 4:01 p.m.,*
in response to message #18 by Dallas Osborne

> Quote:

> I also promptly replaced the zipper case with a 33s case.

Great idea! I never thought of that. My HP 33s has one of the older displays with the invisible decimal point, and I hardly ever use it since getting my HP 35s.

I think I'll head down to Kinko's to get the manual spiral bound, and maybe the HP 32SII manual as well.

Re: In praise of hard-copy manuals

*Message #20 Posted by **Thomas Radtke** on 5 Sept 2009, 7:28 a.m.,*
in response to message #18 by Dallas Osborne

> Quote:
>

It's crucial for a matt-plastic film to make perfect contact to the LCD, right? Did you find a self-adhesive film or is yours stiff enough to ensure it?

Re: (minor hijack) In praise - and endeavor for - of quality LCD covers.

*Message #21 Posted by **Dallas Osborne** on 5 Sept 2009, 7:21 p.m.,*
in response to message #20 by Thomas Radtke

I use 1mm thick foam double-sided tape as a stand-off similar to how the 35s screen is originally installed.

The matt plastic is rather thick - about 0.7mm; I raided it from the LCD covers of some old office phones.

For the 11c/15c screens, I just cut them the same size as the old glossy ones. I hit the front and the aluminum face plate with a heat gun until it is warm and press the old screen out of the bracket. The new ones takes a little flexing to get it started in the slot but will fit just like the old one. Then heat the front up again and press the ends against the glue.

Let me know if you would like photos; I just finished up an 11c and will do my 35s early this next week.

in response to message #1 by Luca

I think one of the last good HP calculator manuals was the spiral bound owner's manual for the HP42S. But it later was changed to a more awkward bound book.

I think the greatest HP calculator manual set EVER is the HP-15C Owner's Handbook with the HP-15C Advanced Functions Handbook. I'd love the equivalent for my cherished and more capable HP42S.

If the fantasy is true that HP may be considering a resurrection of the HP-15C, what are the chances that these two high quality manuals will also be re-issued? (None!)

In fairness to very complex machines like the HP49g+/HP50g, I find that the searchable pdf format manuals are far easier to use overall to sift through those 800 page monsters. I can carry manuals on an SD card or flash drive. Of course, I must have have a PC available.

I printed out the HP49g+ AUR on a high definition printer, four pages on each side of an 8.5x11 inch sheet, and got something light and compact that I can use without having a PC (if I have my best reading glasses).

Yes, wonderful and informative reading. I guess we are fortunate to already have these manuals, as well as the many others that HP published in the early years. I value these manuals almost as much as the calculators themselves. I also very much like the original manual for the HP 12C, as well as those for the HP 91 and HP 34C.

in response to message #25 by Michael de Estrada

Just to note - HP is still shipping bound copies of the manual on request. I just got off the phone with them and my manual is coming via UPS with a 10 to 15 day delivery window.

BTW I've been lurking here for awhile this is my first post!

Good hard-copy manuals; HP-15C engineering

*Message #27 Posted by **Karl Schneider** on 5 Sept 2009, 2:10 a.m.,*
in response to message #1 by Luca

> Quote:
>
> But the manual was on a planet of its own. It was written in an outstanding way. It was clear, from the manual, the enormous amount of thought and engineering that went into that calculator. Other calculators were composed of many functions, more or less put together on top of an algebraic setting. But it was clear from the 32SII manual that true engineers and mathematicians had worked at the calculator. It was not a toy, it was the outcome of very sophisticated thought. The impression of quality, attention to detail, was remarkable.

Luca --

That was a nice short essay, and that particular paragraph hit the nail on the head.

H-P had an impressive "A-Team" of engineers (in the electronic, mechanical, and software disciplines), mathematicians, and technical writers producing the calculators of the 1970's and 1980's. A large professional market and relatively-high retail prices made it possible.

The HP-15C in particular was amazingly cohesive in its broad functionality, which was flawlessly implemented and documented in a pioneering product developed on a fairly-short timeline. Despite that the calculator's specification embodied "uncharted waters", and was implemented on hardware of modest capability, no bugs or avoidable shortcomings were introduced.

Every feature it truly needed to have for practicality was present. The matrix functions provided utilities for solving complex-valued systems, and the complex-number functionality -- although limited by hardware -- worked quite well with it. All the regular and advanced functionality was programmable and available concurrently, without resorting to operating 'modes' so common in other brands.

In addition to sound analytical thinking, certain systematic methods of engineering must have been used in order to achieve such results. I'd like to know specifically what they were.

Thanks, Karl. I fully agree with you; it is this impression of quality and cohesion that makes those calculators so nice to have and use.

My wife has the 15C; I missed out: I went through my engineering degree with a Casio fx-4000p. It was not till I moved to this country and started graduate school that I finally decided to buy a true HP, and I started with the 32SII (which is still my everyday calculator).

I bought an 11C, to also have a Voyager. I find the 42s also gives me a sense of incredible design quality,

more so than the 32sII. However, the 42s never became my everyday calculator, due to the poor readability of the display (I write lots of code, and I often work in ambient -- not bright -- light), and due to the fact that too many of the functions I use are buried too deep in that general, huge, function menu. The 15c, with its power, readable display, and extensive functions on the key, is a very nice balance.

Oh, if they only made a 42sII with better display (like the 33s or 35s) and with more functions on the keyboard!

Cheers, Luca.

Now that's just the right size calculator with the right size screen: a 4 level stack like the 28S.

Make it an RPL machine with 28S ROM (without the "graphics" - that i'll do on a PC) and it'd be the perfect handheld. Oh, just remember USB support for saving / re-loading progs :).

I know many prefer RPN programming, but just think: an (almost) limitless stack - no more keeping track of when you're about to drop something off the top of the stack!

Just my opnion/wish.

Would one really choose to use RPL in a modern design? I've never done RPL myself so I can't

asses it. But, it seems if you are going to go higher level then something like Hugh Steer's hplua would be a better fit. That's what I would choose :)

Why would RPN programming preclude a larger stack?

1. Lots of RPL programs.
2. Stack oriented programing like RPN.

But, I do see your point. Given today's memory sizes I see no reason why I should have to choose. Just have both RPL and Lua.

AFAIK the reason was cost of memory in the ancient times. But nowadays this is no argument anymore. There are RPN calcs with larger finite stacks on the market, e.g. MathU with 16 levels. IMHO, a stack size of 6 or 8 would suffice for carefree calculations while still allowing for stack "gymnastics" like rolling etc.

A settable fixed stack size may include a "compatibility mode" -- i.e. size 4 -- for all the old programs. So sizes 4, 6, 8 would be perfect for my purposes.

> AFAIK the reason was cost of memory in the ancient times.

In the HPs the barrier was broken with the 28C. It could probably have been done in the 41C series.

As far as compatibility with old programs goes, would it be that difficult adapting an old program to a dynamic length stack? There are some differences between models anyway that require small mods to programs (e.g 15C vs 42S vs 35S). If the designers allowed the first 4 levels to be addressed by either 1 to 4 or X Y Z T (allowing e.g. both the use of X<>Y or SWAP) the impact would be minimal, requiring small changes e.g. to ROLL & OVER.

My first HP was a 28C, so keeping track of the stack was never a worry, apart from running out of memory* - which wasn't a problem as I don't recall going beyond 10. I must say that RPN programming has me keeping careful track of the stack when designing programs.

[*The limited memory of the 28C did teach me the discipline of clearing the stack after each use.]

It would be nice if you did your home work before making statements as the quoted ones above.
The HP48S had a perfect, thick manual; the 48G's not too bad either and the 35S had one.

Except that for programmng you really needed the Advanced User's Reference Manual, which had to be purched seperately. Programming is one of the main features of the 48.

Re: In praise of hard-copy manuals

*Message #38 Posted by **Ed Look** on 5 Sept 2009, 12:21 p.m.,*
in response to message #37 by Bart (UK)

This is true, and initially, I was put off because of the need for a separate AUR for the 48G series.

But then it seemed to me that if you included the material of the AUR into the included User's Guide, you'd have large brick that would have required traditional cloth binding to make it usable. Spiral and punched hole binding can accomodate only so many pages before the sheets become torn from the binding just by opening the book, and there are other physical issues.

Now, putting such material online or on a CD or DVD may make them affordably accessible (from both sides of the market), but personally, I find these media harder to use. I truly rather read a printed volume than something of equal size online or from a CDROM.

I learned to program my 48Gs from some awkward places and positions at odd times. Even a netbook or ipod touch would have made that harder, even if they existed at that time, even if I liked those kind of devices.

Re: In praise of hard-copy manuals

*Message #39 Posted by **Reth** on 6 Sept 2009, 12:18 a.m.,*
in response to message #37 by Bart (UK)

That's why I said "not too bad" - the programing capabilities of the 48G overpassed the 48S' so the already thick manual should be at least doubled in size to cover it all. I have no problem buying extra manuals and they were available. Vast majority of users never need them anyway; they don't even read

manuals coming with the calculator. Some participants in this forum included. Which doesn't stop them winging. I bet at least 80% of questions asked here and in the other forum come from people who never read the manual.

Re: In praise of hard-copy manuals

*Message #40 Posted by **designnut** on 9 Sept 2009, 10:46 a.m.,*
in response to message #39 by Reth

-I think there is a limit to how much information one can use printed material to cover. Clearly the 50G reaches that limit. Printing the material means the information is hiding in plain sight. I think the answer is an HTML computer document that lets you jump among various subjects. I have the CD manuals for the 50g printed, in total 6.5 pounds and it is not enough, or it is too much. Won't work. It is unreal to hold up the 15C book as exemplary. It is simple and yet I read the book through and was still puzzled. Only on the second reading did it make sense. There is limit to the rate one acquires new information. Given the amount of new information it forces a long learning period. simple text won't work. You need an HTML document to access what you are puzzled about. Sam

PIL-box connectivity

*Message #1 Posted by **Juergen Rodenkirchen** on 4 Sept 2009, 8:21 a.m.*

Hi all! Lately I ordered my PIL-box, newer version with mini-USB plug. While in pleasant anticipation :-) I checked an electronic parts dealer for an appropriate cable, and found 2 versions: 4- and 5-pin plugs. From Jean-Francois I know that the cable of the HP-50G will work. I do not have an HP-50G, but according to commerce.hpcalc.org/serialcable.php this is a 4-pin style plug. Can anyone confirm this? For those who are in Germany, is the cable AK 637 found at Reichelt.de appropriate for the PIL-box?

Thanks & kind regards, Juergen

An addition to my collection

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 4 Sept 2009, 4:24 a.m.*

Last week I picked up a Commodore MINITEMAN 6X at a flea market for two dollars. Like the NSC 600 and the NOVUS 650 it uses RPN but it is limited to integer arithmetic. It does have a dedicated Enter key, something that the 600 and 650 do not have.

That's a Novus, too...

*Message #2 Posted by **Frank Boehm (Germany)** on 4 Sept 2009, 6:22 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

it uses a National Semiconductor (NS; Novus was the consumer division of NS) MM5736N - the same chip has been used inside the Minuteman 6 (simple RPN, but no Enter key) *and* also inside the Novus 650. So the lack of an Enter key probably was a marketing decision (and maybe even dictated by manufacturing costs, considering the 650 was the cheapest calculator one could buy...)

Completing my collection

*Message #1 Posted by **Michael de Estrada** on 3 Sept 2009, 7:46 p.m.*

Today I came just a little closer to completion of my collection of HP LED era calculators. My basic goal is to have one sample of each model of the Classic, Woodstock and Spice handhelds as well as associated printing desktops. I just bought on auction a complete working HP 27 set, which has proven to be one of the toughest models to find in good condition. I have allowed that certain models are covered by others, such as the HP 25 is covered by the HP 25C, and indeed sold my HP 25 when I found an HP 25C. I may also sell my HP 33E and HP 38E, since I now have both an HP 33C and HP 38C. The only models I now lack are the HP 29C and HP 70. I own a HP 19C, which somewhat covers the HP 29C, and have passed up opportunities to buy an HP 29C at high prices. As to the HP 70, well that may never happen as I've yet to see a good and complete one show up or anything at a remotely reasonable price. But perhaps never having a complete collection will keep me more interested in this hobby.

Re: Completing my collection

*Message #2 Posted by **Don Shepherd** on 3 Sept 2009, 8:48 p.m.,*
in response to message #1 by Michael de Estrada

Michael, instead of the 70, why not go after a 65? I got one about two years ago and it has become one of my favorites. It was the first programmable, and the card reader/writer would be a welcome addition to many models today.

Re: Completing my collection

*Message #3 Posted by **Michael de Estrada** on 3 Sept 2009, 9:38 p.m.,*
in response to message #2 by Don Shepherd

Don, I already have an HP 65, in fact I've got 3 of them, all in perfect refurbished working condition. About a year ago I sold a fourth HP 65 that I'd fixed up, but was not in as nice cosmetic condition. I agree that it is a milestone product, and a lot of fun to use. I've also got 2 of the HP 67 and one HP 97. So I have all of the card reader models except the pre and post classic models. Like I said, I have all of the Classics, except the HP 70. Perhaps, I should have said one of each model rather than sample. I am also the proud owner of an HP 35 Red Dot. I'm only interested in the HP 70 for its uniqueness, since the HP 80 (I've got 4, including a version 1) completely trumps it in features, and besides mostly I use my HP 12C anyway.

But thanks for your observations.

Michael

Re: Completing my collection

*Message #4 Posted by **Don Shepherd** on 3 Sept 2009, 10:49 p.m.,*

in response to message #3 by Michael de Estrada

Oh, OK, now I see. I don't know if you have run into this on your 65s, but I think there is a problem with the y^x function for larger values when y is 10. For example, on my 65, using y^x, 10^1 through 10^6 are all OK, but 10^7 gives 9999999.99, 10^8 gives 99999999.60, 10^9 gives 1.000000003 09, 10^10 gives 1.000000000 10, and 10^11 gives 9.999999970 10. I would be curious if you get the same results. Maybe this was documented somewhere back in 1974 or 75, but I haven't seen it anywhere.

The EEX function works fine.

Re: Completing my collection

*Message #5 Posted by **Michael de Estrada** on 3 Sept 2009, 11:27 p.m.,*
in response to message #4 by Don Shepherd

Yes, all 3 of my HP 65's give the same results that you have. Two of them are version 1 with the serial number inside the battery compartment and indicating 1973 as date of manufacture and the third is a version 2 with the serial number between the bottom feet below the back label and indicating 1976 as the date of manufacture. I also get the same results with a HP 45 and HP 55, however, my HP 67 from 1978 gives the exact correct results. So, apparently this "bug" was common to the early classics, but later corrected in the second generation mag card models.

Re: Completing my collection

*Message #6 Posted by **Katie Wasserman** on 4 Sept 2009, 2:50 a.m.,*
in response to message #5 by Michael de Estrada

According to Wlodek the 91 was the first HP calculator to correctly deal with integer exponentiation. The HP-91 came out on March 1, 1976, the 27 and 29C and 19C came out later and also handled integer exponents correctly. I don't think that HP revised the ROM's of the earlier Woodstocks (21, 22, 25, 25C) even though they continued to produce them for a couple of years after the 91 came out.

Re: Completing my collection

*Message #7 Posted by **Michael de Estrada** on 4 Sept 2009, 12:47 p.m.,*
in response to message #6 by Katie Wasserman

Katie,

I tested my HP 21 (s/n 1710A), HP 22 (s/n 1601A), HP 22 (s/n 1711A) and HP 25C (s/n 1703A) and both the HP 21 and HP 25C give the same erroroneous results, however, the HP 22's give the correct exact results. Curious that a business calculator would be more accurate with large numbers than a scientific calculator.

Michael

Re: Completing my collection - Wlodek are you reading this?

*Message #8 Posted by **Katie Wasserman** on 4 Sept 2009, 2:17 p.m.,*
in response to message #7 by Michael de Estrada

Michael,

You're right my HP-22 works correctly on integer exponents. The 22 came out before

the 91, in fact the serial number on mine is 1601A.... so it was made in January of 1976. I think that the book may have this wrong.

Thanks, Katie

Re: Completing my collection - Wlodek are you reading this?

*Message #9 Posted by **Wlodek Mier-Jedrzejowicz** on 4 Sept 2009, 9:09 p.m.,*
in response to message #8 by Katie Wasserman

Hi Katie, thanks,

And thanks to Gene Wright for pointing out this thread to me.

HP described the increased accuracy of y^x in an article in the HP Journal. (I don't have the exact issue reference to hand, sorry.) The article described the HP-91 as they were writing about the new Topcat series, but I assume that in fact the improved algorithm was also put in the HP-22, which was introduced a few months before the 91, but after the HP-21 and the HP-25. I believe that the HP Journal articles were sometimes written long before they were printed, so someone else could have sneaked a new algorithm into a different model before the article was published, saying the HP-91 was the first model with this algorithm ;-)

Anyway, thanks for pointing this out - something else to change in the next edition,

Wlodek

which calculators use the improved log/exp algorithms

*Message #10 Posted by **Eric Smith** on 5 Sept 2009, 3:37 a.m.,*
in response to message #9 by Wlodek Mier-Jedrzejowicz

The 19C, 22, 27, 29C, 67, and 97 use the newer logarithm and exponential code, verified by studying the ROM code.

The 21, 25, and 25C use the older code, verified by studying the ROM code.

I suspect that the 92 and 95C use the newer code, but I haven't verified it.

*Message #11 Posted by **Mike Morrow** on 6 Sept 2009, 12:36 p.m.,*
in response to message #10 by Eric Smith

I've always found these differences in results for the same calculation to be interesting. Here are three examples that puzzle me a bit. Each is a 2500-iteration Savage Benchmark, where the "perfect" numerical result would be 2500.

HP-25
01 RAD
02 STO 0
03 0
04 STO 1
05 RCL 1

06 1
07 +
08 SQRT
09 X^2
10 LN
11 e^X
12 ATAN
13 TAN
14 STO 1
15 RCL 0
16 1
17 -
18 STO 0
19 X=0?
20 GTO 22
21 GTO 05
22 RCL 1
23 DEG
24 GTO 00
Enter 2500 and press R/S
Result = 2499.079996 after 5940 seconds.

HP-67
01 LBL B
02 RAD
03 ST I
04 0
05 LBL 1
06 1
07 +
08 SQRT
09 X^2
10 LN
11 e^X
12 ATAN
13 TAN
14 DSZ I
15 GTO 1
16 DEG
17 RTN
Enter 2500 and press B
Result = 2499.976148 after 5840 seconds

HP-34C
01 LBL B
02 RAD
03 STO I
04 0
05 LBL 1
06 1
07 +
08 SQRT
09 X^2
10 LN

11 e^X
12 ATAN
13 TAN
14 DSE I
15 GTO 1
16 DEG
17 RTN
Enter 2500 and press B
Result = 2499.969898 after 7530 seconds

The HP-41CX after 3210 seconds and the HP-15C after 5840 seconds produce numerical results identical to the HP-34C.

SUMMARY (Result and time in seconds)
HP-25____2499.079996____5940
HP-67____2499.976148____5840
HP-34C___2499.969898____7530
HP-41CX__2499.969898____3210
HP-15C___2499.969898____5840

The benchmark does not use the Y^X function, so other differences must exist in the numerical algorithms of the HP-25 and the later models.

Suprisingly, the HP-67 result differs slightly from that of all the later pre-Saturn calculators. However, if the benchmark is run for less than 1500 iterations, the HP-67's result is identical to the later calculators!

I don't have a working HP-19C to check results for the 19C/29C models, but I'd bet they show the same strange effect as the HP-67.

Re: which calculators use the improved log/exp algorithms

*Message #12 Posted by **Michael de Estrada** on 7 Sept 2009, 8:56 p.m.,*
in response to message #11 by Mike Morrow

I ran the Savage benchmark on my HP-19C, and the result is 2499.976148 as you predicted. I used pretty much the same code as you did for the HP-25, except that the GTO <line number> are replaced with GTO <label> and labels 0,1,2 were inserted. Also, I inserted a R/S before the last line (GTO 0) to prevent it from looping. I didn't time it precisely, but it took approximately 6600 seconds to run.

in response to message #5 by Michael de Estrada

I have a neat little application on my Palm Treo 650 called CSIM. It simulates the HP-35, HP-45 or HP-55, depending on setup. It also gives the answers above for each model. It is a great little Palm OS program for anyone (like me) not lucky enough to own a real Classic.

I also don't have a 9805A, but am not looking for one, since I only care about HP RPN calculators. The 46 is one of my collection favorites, along with the 91, 65/67/97, 19C and 34C.

I got a lot of mileage from the use of cardboard calculators. They may still be in use as company handouts, though with the internet information highway less useful. They were not precise, but that was not needed as the selection of parts values was more limited and their tolerances considerable. It put your decimal in the right place, a potential danger with the slide rule. Sam 81

The other side of the coin is, with the way we used to have to do calculations in the slide rule days, you were *forced* to figure out what a *reasonable* answer was, since the slide rule only gave you significant digits, not magnitude. With today's automated calculations (computers), there's always the risk of GIGO.

Somewhere in this forum I picked up the idea that you are over eighty years old. If so, then you have got to remember that there were ways to keep track of the decimal point which were akin to the way it is done when using logarithm tables.

I always wanted a slide rule... I remember seeing one in my house when I was a kid, but it was a cheap plastic unit and no one knew where it ended up. But I wanted a good one! Made of bamboo! I like 'old' technology, reading about Briggs and Oughtred and logarithms and have a 12th edition Machinery's Handbook that has a chapter on the slide rule which I love. So last month I bought my first one from the Slide Rule Trading Company - a Hemmi 260 Advanced Engineering Slide Rule. It was brand new (so not cheap...), never-been-used, with instruction manual and new leather case. What a slipstick! I financed the purchase by selling a spare HP-32E to a fellow in Australia who posted in the WTB section.

I am still learning how to use all the scales and am enjoying the experience. I really want to get a vest pocket sized unit next to wear to black-tie affairs and fancy restaurants (and show-off at the office). The 'ultimate' geek symbol. No batteries, works in most ambient lighting conditions, and sure to impress women all over the planet. I love this forum...

I still have a tie clip slide rule. I don't have to wear ties anymore, but it was fun to wear. Always wanted a set of cuff links to go wit the tie clip.

There were all sorts of wearable slide rules. See followin link:

Wearable Slie Rules

Just found a like where you can buy a Slide Rule Tie Clip:

Slide Rule Tie Clip

While I don't use a slide rule anymore, our office does use a lot of special slide rule type charts to calculate pipe sizing, duct sizing, electrical sizing, etc. Companies used to make all sorts of sliding devices - rectangular and circular - that would let you quickly select a particular equipment size. When PC's came out, they stopped giving the sliding charts out and starting giving us disks with computer programs (now they give us CDROM and even DVD's). These were NEVER as easy or fast to use as the sliding charts. That's why we hang onto these 20-30year old charts.

Bill

I was an AeroE and I remember that the twidgits were better with their slide rules than we were. I don't recall that it bothered us very much since we knew that most serious aero work couldn't be done at slide rule accuracy.

They actually work really great for that: I used to use the slide from my K&E for drawing straight lines all the time. It was especially nice when you were using an ink pen (fountain pen - who here remembers, or still uses (!), one of those?) because the ink didn't get sucked under the slide, courtesy of the ridge sticking out, like it would be when using a regular ruler that laid flat on the paper next to the pen tip.

Yes, and I do remember the trouble of using them with rulers, I had a ruler with a ridge, but when I'd use a normal ruler it was a matter of keeping the opposite side down and rotating the side you just used straight upwards, any sliding movement causing that awful smear :)

*Message #32 Posted by **hecube** on 4 Sept 2009, 8:03 p.m.,*
in response to message #1 by hecube

BTW, is there a more dramatic scene with slide rules in any movie than when Mission Control is checking Jim Lovell's conversions with slide rules in the movie Apollo XIII?

Re: Does anyone, in all earnest, still use slide rules for work?

*Message #33 Posted by **Don Shepherd** on 4 Sept 2009, 8:29 p.m.,*
in response to message #32 by hecube

Dramatic, maybe, truthful, probably not. Someone posted recently in one of these threads that the Apollo 13 engineers with the slide rules were double-checking addition results which, I am told, a slide rule cannot do.

Re: Does anyone, in all earnest, still use slide rules for work?

*Message #34 Posted by **Palmer O. Hanson, Jr.** on 5 Sept 2009, 2:47 a.m.,*
in response to message #33 by Don Shepherd

> Quote:
>
> ... double-checking addition results which, I am told, a slide rule cannot do.

A user can do addition within a limited range on slide rules which have the L scale on the slider.

A user who has one of those devices with a slide rule on the front and an Addiator on the back (such as my Faber-Castell 67/22R) can do more extended addition. In fairness, the addition isn't done with the slide rule part.

Another interesting addition to the conventional scales on a slide rule is an appropriately positioned scale on the inside of the frame which allows the device to be used as an inside caliper, as in the A. W. Faber 387 and 1/87m.

Re: Does anyone, in all earnest, still use slide rules for work?

*Message #35 Posted by **Ed Look** on 5 Sept 2009, 12:29 p.m.,*
in response to message #1 by hecube

Well, my boss does, only in jest and very, very, infrequently, just to show the superiority of his "slipstick" over my beloved HP calculators.

The only time I might best him in such peeing contests is when we have slightly more complicated, relative to say, a gas law calculation, or a more than one step conversion, and just by punching in "XEQ <whatever label>", the HP calc renders the result ahead of his laminated wood or plastic or whatever it's made of generating frictional heat.

Unfortunately, I fear his slipstick is more politically correct- it's green and the HP uses batteries. Oh well.

HP 33s much better IMO than the 35s

*Message #1 Posted by **Luca** on 3 Sept 2009, 3:40 a.m.*

Unsatisfied with my HP 35s, I just bought an HP 33s for use at work, and to my surprise, I like it much better than the 35s! These are some of the advantages I see in everyday use:

- When I type a long number, the 33s inserts commas every three digits, so that I can easily see the magnitude of what I have entered (e.g., try to enter 120 millions). Not so on the 35s.
- The ALL mode on the 35s is badly broken, as often the exponent is not fully visible (!!). Not so on the 33s.
- The STO key in the 33s is unshifted; on the 35s, it is shifted.
- The displays are more or less equivalent to me.
- The 35s looks better than the 33s, but the 33s is thinner and ligher, an advantage when you have to carry it around.
- The ENTER key on the 33s is not bad after all; it is placed close to the arithmetic operation keys, and I use all such keys equivalently often.
- The 33s is free from many small annoying things in the 35s, such as the inability of entering 1/3 as 1..3 (.1.3 enters 0 1/3, which is visually more confusing).
- The 33s comes with a real manual.

In summary, I find the 33s a better calculator for everyday use. Do you agree?

Luca

Re: HP 33s much better IMO than the 35s

*Message #2 Posted by **Don Shepherd** on 3 Sept 2009, 10:07 a.m.,*
in response to message #1 by Luca

Agreed. And if you write programs for it, you will find the execution speed a whole lot faster on the 33s.

Re: HP 33s much better IMO than the 35s

*Message #3 Posted by **designnut** on 3 Sept 2009, 10:13 a.m.,*
in response to message #1 by Luca

I buy them on ebay to give to children. They are basically simple math calculators, with added layers of complexity as you advance. After basic math, you can add formula solving, fractions and programming. I'm sorry that someone had to "style" it and add rubber sides which forces the use of the clunky case rather than the thin slip cases of the past. It is an undervalued calculator, Sam now 81

Re: HP 33s much better IMO than the 35s

*Message #4 Posted by **Gene Wright** on 3 Sept 2009, 10:25 a.m.,*
in response to message #1 by Luca

1) The comma issue is due to a change to a process more like the RPL calculators, which have a command line and appear to be unable to parse a number as it is entered to put commas in place. After all, how does an

RPL calculator know if you are entering a number or a pair separated by a comma? If it had already put commas in number for you (with it assuming you were entering a real number) and then you press comma, then the entry is very confusing. I know the 35s does not have that particular issue, but being built on the RPL "shell" or such means it processes values entered in a similar fashion.

2) ALL is troubling. The display will not show all digits with that annoying scroll for the exponent. What should have been done? Show "almost all" and fit the exponent? Not have an ALL mode? Have an "Almost all" mode? :-) This was a problem that was talked about. Not a very good answer, I'm afraid. Not sure the approach chosen is/was the best, but ...

3) STO is a personal choice. Supposedly research exists that shows RCL is used much much more frequently than STO, hence the shifted status. Making STO primary means something else has to go shifted. Keyboard wars are always tough. And, no, I have not seen the supposed research and wish STO were primary myself.

4) The fraction mode is not that big a deal (to me) since it is fairly easy to adjust. Changes happen.

5) The 35s manual is not that bad, if you get a copy of the full manual of course. The quick start guide attempted to fit as much as possible into its 20-something pages. . . so please don't criticize that effort! Retailers often make demands to shrink package size, so perhaps this had something to do with the change. That and the loud requests to go greener from many voices.

My 2 cents and worth probably less than that!

Re: HP 33s much better IMO than the 35s

*Message #5 Posted by **Michael Andersson** on 3 Sept 2009, 1:55 p.m.,*
in response to message #1 by Luca

I agree, I like the 33s and tolerate the 35s. The 35s does have some advantages though, and the added functionality is nice (more variables, built in solutions to 2nd and 3rd order linear equations to name some), but the keyboard layout is not good. It has never taken me so long to learn were the keys are on any calculator as on the 35s. Furthermore, the large enter key uses one extra key space, that could have been used for unshifted STO, and the small ENTER down to the right is much better. Actually on my 48G I found that after a while I started using SPACE (which is placed down on the right) to separate input instead of ENTER because that key was better placed.

The way format ALL works on the 33s (and on my older HP:s) is better than on the 35s. I like the ALL mode because I see more digits than I need and can round it of to the needed precision manually. If there is an exponent it should be fully visible and the rest of mantissa can be called using SHOW.

Re: HP 33s much better IMO than the 35s

*Message #6 Posted by **Peter Klein** on 3 Sept 2009, 3:39 p.m.,*
in response to message #5 by Michael Andersson

A lot of people flamed the 33s for having the little Enter key at lower right. I thought I would hate it, but I've adjusted to it with surprisingly little trouble. Especially since I could program the R/S key to act like Enter most of the time, to ease the transition.

The "Big Enter Key" on the left is almost a religious icon among those of us who Remember the Good Old Days. I'm sure that's why the 35s has the double-width Enter. We complained, and Marketing listened.

Of course, we also want things to be Just the Way They Were in the Good Old Days. We also want lots of new features and no more complexity.

:-)

Mine is a 32S or the 35S. I have some of my more common routines programmed in the calcs, so I can give a quick answer in a meeting if needed.

I use Excel a lot too, just remember that Excel & VBA/Excel use binary FP, thus recreating programs from your fav HP in VBA may result in a slightly different answer akin to Free42Binary. (Unless you redim your vars to Decimal type).

I use EXCEL a lot but use my private HP-48GX as well. On some days I even bring my HP-41CX - this is then a bit like sunday. We bought the HP-35s for our department and most engineers like it. I prefer the older HPs jut for the better keys. The keys are key ;-) to reliable result in my opinion. I've had most of the newer calcs and dumped them all after a while for the bad keys.

Oh come now, I think a 200LX running Lotus 123 2.4 is plenty up to the task. ;) It certainly beats the pants off any Windows CE version of Excel that's been released, and also trounces the Psion's spreadsheet! I often have mine in my computer bag for this reason.

I also keep a 48SX on my desk, and usually carry my 48GX and 17bii with me. (Though the 17bii becomes redundant when the 200LX is on board.)

in response to message #1 by hecube

At work I use both the HP-50g and the HP-33s.

I really prefer the 33s as it's much easier to just pick up and use, but I often have to calculate amounts of reagents and I have Arnold Moy's Periodic Table (and chemical data) stored in my 50g so I often have to use it.

But unless I have some humongous program (at present I don't), I can still just program the 33s, which is keystroke programming, something I am more used to than RPL, so it is faster for me on the 33s.

I always have my 15c and 16c with me and I use whichever is more suited to my current problem.

I often have my one of my 35s, 42s and 32sii with me and they get used when I feel like a change. Sadly, my 49g+ died a while back.

At work I quite often use my 1991 HP-48SX (the last HP I bought new) for quick calculations.

At home, I rotate amongst my HP-25, HP-41C, HP-33S or HP-48G depending on which one is handy or fun for the task at hand.

It's my company, so most calcs I have are company owned. I have a 27s on my desk and another in the conference room, with several equations "programmed" in the Solver.

Ditto a 17b on my desk with Solver routines for payroll taxes etc.

I use Excel for a lot of things, but usually not for engineering calculations. Those are handled by stand-alone software.

For simple computations, Free42 for Linux, and SCI-15C (too afraid to take my 15C to work) or Free42 or i41CX+ on iPhone. For the rest: Python. And as little Excel as I can :-)

I tend to use my 35s and 50g at work -- the former for day to day and latter for more complicated things with equations in the solver. Also I use my 17bII+ for all things financial. Occasionally I'll rotate in the old 48G, and pull out the 33s for some tasks as it's easier to haul around (and I'm not so concerned if it goes belly up!). The 20b, while a nice idea, has such a dreadful keyboard that I'm not too fond of it.

Privately owned, our office equip the inhabitants with Sharp scientific calculators. Somehow I find that I have a certain advantage over my peers who uses the office issue calculators, especially on site.

I use primarily a 50g. On the desk it is powered by the usb cable. Data can be transfered back and forth. Use some macro's to export data from AutoCAD. Excel solvers are not very elegant and aften I get stuck. Solvesys goes a long way for my purposes. Excel is a bit troublesome to carry around on construction sites. Contractors have the ability NEVER to follow the drawings and some situations that arise on site just can't be foreseen on the drawing desk, then the 50g with FEM49 comes into it's own right. As a formwork engineer I love my 50g, it is miles better, as far as usability and speed is concerned, than any of the predecessors.

For simple tasks my 42 is also at hand. I feel a bit sorry for the 42s and got a 33s to relieve the 42s from duty. that was a bad mistake. Yes, it is fast, has lots of memory but the keys are horrible once you are used to the 42s. I recently acquired a 32SII but unfortunately I simply find it inferior to the 42s. I will be looking to sell the 32SII soon, or trade it for a new 35.

I do computer and network support. Most of my calculator use at work is four-banger math and occasional hex and binary arithmetic. For that I use my own 32s.

On my PC, I also sometimes use Free42 or Exalibur, both RPN. And for "what-iffing," I will sometimes use Andrzej

Wrotniak's "Midget," which is a convenient subset of his superb "Kalkulator." But I really prefer to use the 32s--it gets my hands off the PC keyboard, and it somehow feels more satisfying.

Colleagues have mostly TI 4-bangers, variants of the TI-30, and the occasional Casio. There are a few HPs--a 32s and 21s that the company bought years ago, plus a personally-owned 48gx and 49+.

At home, when I want to play with math, it's mostly with the 32sII. Interestingly, I have no trouble switching between the 32s and the 32sII.

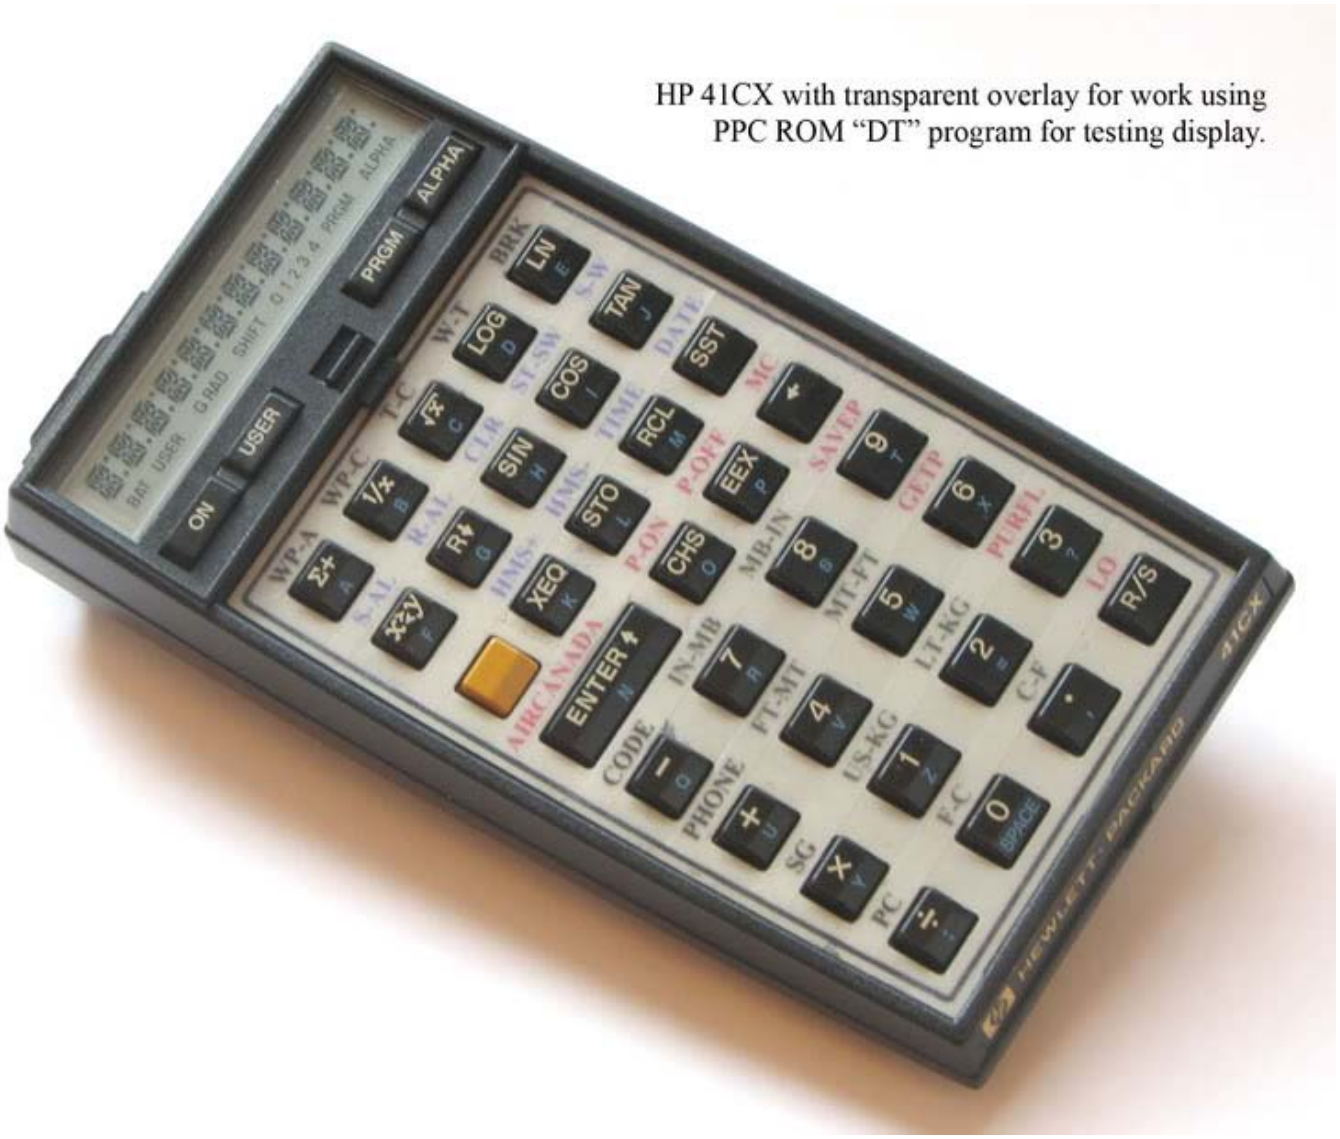
HP-41cx with a dedicated suite of programs, or HP-42S with the same programs but prompting for GMT input or to spice it up with a light show, the HP-67.

Of course I wear the big ugly (as some CALL it) at work. To complete the group I bring the infared printer for hard copy output.

Cheers, Geoff



HP 41CX with transparent overlay for work using PPC ROM "DT" program for testing display.

Wow! Is there anyone else in the world that uses one of these on a daily basis? I have one in my collection and like it a lot, but it's s-l-o-w on all financial calculations. IRR for 9 cash flows can take a couple of minutes to solve, good thing it has a huge keystroke buffer that you can load up while it's number crunching.

I have 32sii and a 12C+ for financial calculations on my desk.

I use my 35S at work. Before I had my 48G but it broke, I tried to replace it with a 50G but could never get used to the keyboard layout after the 48G. Ideally I would use my 42S, but don't want to risk it at work.

To me a handheld calculator, with at least the basic set of scientific functions, is essential to do small calculations in a fast and efficient way.

Our company equips the staff with Sharp scientific calculators. Somehow I feel I have a little advantage over my peers who use company issued calculators, since on my desk sits a 42S in "good condition" for quick and dirty RPN calculations, and a 21S if I need some values of statistical distributions. On my notebook, Free42. I have a 50G at home and once used it for evaluating an integral, but it's too large for daily work and too complicated for my little brain.

I travel for work--a lot. To reduce what I have to carry I use emulators on my MacBook and iPhone. On the iPhone its i41CX+, Free42, SCI-15C. On the Mac its usually 'calc' from the CLI (calc is RPN). Occasionally I use Nonpareil 41CX, Free42, EMU42, EMU41, EMU71, and x49gp (50g ARM emulation).

Before the iPhone I traveled for years with my 48GX, then switched to the replaceable 50g. The 35s was never an option because it cannot be backed-up and has no freely available emulator.

*Message #30 Posted by **Pal G.** on 4 Sept 2009, 12:12 a.m.,*
in response to message #29 by Egan Ford

Egan, you seem to be RPLess now (except for your macbook), compared to when you had your 48GX with you. Or did you use the 48GX to emulate RPN machines, and not bother with RPL at all??

The reason I bring this up is because I thought it was worth mentioning there is no RPL on the iPhone yet, at least not that I know of. And while this may suit some here, I personally would not mind such.

And speaking of emulated RPL, anyone know what happened to Robert H., the developer of Power48? Mobilevoodoo dot com is not even his domain anymore.

Cheers.

This is true and inconvenient. I had to port all my programs to RPN and it was not easy. E.g. I use MSOLVR2 a lot, now I do not have it. Recreating it in RPN was less than simple and is still not as flexible as MSOLVR2, however, I got through it.

> Quote:
>

*Message #32 Posted by **Mike Morrow** on 3 Sept 2009, 1:36 p.m.,*
in response to message #1 by hecube

The HP calculator that I used most productively in my work at the time (nuclear submarine officer) was the HP-67, in 1977-79. (It and accessories cost me more than a month's salary.) Later, I spent a lot of quality time with an HP-41C in civil work.

More than 20 years ago, I settled on regular use of an RPL and an RPN scientific, plus a financial calculator. Subsequently, the RPL machines were HP28C, 28S, 48SX, 48GX, and 49G+. The RPN machines were HP-41C, 41CX, 15C. The financial machine was the HP-12C.

Today, I use the HP50g and HP42S, plus the HP17bii for financial calculations.

The RPN units are (to me) much easier for programming simple problems, compared to the RPL units, hence the two scientifics. Plus, though the HP50g has some financial calc support, what comes built-in doesn't closely match the HP17bii.

My dream machine would be an HP50g that could *also* be programmed in RPN, and that had all the functions of the HP17bii built-in. Then I'd have just one HP in the briefcase.

Getting items posted from the US to UK

*Message #1 Posted by **Richard Reed** on 2 Sept 2009, 2:18 p.m.*

A thread from the end of August speculated on why US shippers of calculators don't like to ship outside the country. I did a little research on shipping from Houston, Texas, in the middle of the US and London, UK. It's fairly complicated to get good security with the cheaper US Postal Service, as opposed to a fast shipper like UPS, which costs at least $76 for a fully tracked and signed-for 2 lb. delivery in 2-3 business days.

All the cheap, secure USPS services claim a 'standard' delivery time of 6-10 business days. For my 2 lb. example, First Class International costs about $33 for Registered Mail, Return Receipt. The maximum indemnity for this is $47.93, the maximum weight is 4 lb. (more money) and the service is "sealed against inspection".

Priority Mail International Parcel costs $30 for 2 lb. and is not a 'sealed' service. Ordinary indemnity is maximum 70.43, or insurance can replace this: the cost of $100 insurance is $3.50. This service claims tracking to major destinations.

Non-tracked, but 'sealed' Priority Mail International Flat Rate Small Box or Flat Rate Envelope are a bad deal for 2 lb. shipments, but can take up to 4 lb at $42. There is no insurance. To get tracking, signed-for and $47.93 indemnity you have to get Registered Mail and Return Receipt for a total of $54.

Hope this clears things up ;-)

Richard
London, UK

Re: Getting items posted from the US to UK

*Message #2 Posted by **Gene Wright** on 2 Sept 2009, 2:44 p.m.,*
in response to message #1 by Richard Reed

Thanks. That just brings up the other problem.

To have paypal seller protection, they want signature on the delivery, even overseas. If you don't have that, the buyer can claim you sent a rock rather than the item and get their money back even though they have the item.

The alternative is to charge VERY high shipping charges, which upset the overseas customer, of course.

In the USA, signature delivery is much cheaper (cheap no-problems with paypal), no customs forms are required.

Couple of reasons why US sellers may not ship overseas.

Of course, present company :-) would not make such claims to paypal, but unless you guys are the ONLY people biuying off that auction site, then the risk is there. Google and you'll find the horror stores.

*Message #3 Posted by **Richard Reed** on 2 Sept 2009, 3:18 p.m.,*
in response to message #2 by Gene Wright

Does Return Receipt not qualify as signature on delivery for PayPal seller protection? I thought that's what I was satisfying.
Richard

Edited: 2 Sept 2009, 3:22 p.m.

Re: Getting items posted from the US to UK

*Message #4 Posted by **Walter B** on 2 Sept 2009, 4:12 p.m.,*
in response to message #2 by Gene Wright

Of course, I can only respond based on my personal experience. This tells me, however, that *none* of the parcels, flat rate boxes, or envelopes carrying my purchases across the Atlantic ever got lost. Nor did any letter disappear. AFAIK postal service is paid to deliver mailings, not to drop, discard, destroy them. And they do their job quite well.

If you ask a large crowd for interesting stories, however, what will you get? Horror stories, since the normal stuff is sooo boring. Here, the internet is collecting the gossip of this planet. No more double-headed cows or headless devils nowadays anymore (I hope), but lost mail and similar exceptional events. And big business is interested in such stories, else nobody would buy an insurance.

OK, I admit my statements are only valid for shipping from one civilized country to another one, both showing a reasonably low level of corruption along the shipping line (think of customs). But such it is. Sorry ;)

Hope this brings this topic on solid grounds again.

Re: Getting items posted from the US to UK

*Message #5 Posted by **Richard Reed** on 2 Sept 2009, 4:41 p.m.,*
in response to message #4 by Walter B

I only ever sold one item on TAS, a mobile phone, but sure enough the Russian buyer emailed me for a reduction on his bid, which I refused, after which I had to wait three weeks for the dispute to expire and re-list.

A particularly insistent US-only seller on TAS had an experience a year ago with a UK buyer who seemed to want delivery before payment. He had 805 feedbacks (97.5% positive), so I wouldn't be surprised if he had been burned more than once. His RAM card got 1/3 the price it would have done in Europe.

I was just trying to point out that shipping from the US is
- expensive, as you might expect
- complicated to get right (tracking, signed-for, PayPal support) without spending double

I do think the "he sent me a rock" thing is rare, if care is taken, but the extra complication and expense in the US to ship overseas, relative to somewhat easier conditions within the richer EU states, puts off many sellers.

Richard

Edited: 2 Sept 2009, 4:50 p.m.

Re: Getting items posted from the US to UK

*Message #6 Posted by **Gene Wright** on 2 Sept 2009, 5:12 p.m.,*
in response to message #5 by Richard Reed

I too hope/think the "he sent me a rock" thing is rare. However, my point was that without a signature delivery receipt (delivery confirmation, return receipt does not count - read the paypal long notice), a buyer can say they did not get it and the seller is out $$.

So, the seller either ships without that to another country and **hopes** the buyer is honest, or the seller charges outrageous shipping costs to the buyer in the other country (which will reduce the bidders outside the USA), or the seller just sells in the USA.

That said, I shipped three items out of the country this week from TAS. One to England, two to Brazil. Hope the buyers are honest.

Gene

P.S. The ONLY country I have ever had any problems with from a postal service is Italy. Took 6 weeks to clear their customs. Buyer kept getting angry at me when I could do nothing. The other problem I had was in Greece. Sent something there and the duties were more than the item was worth by far. The buyer told them to abandon the item.

*Message #7 Posted by **Richard Reed** on 2 Sept 2009, 5:26 p.m.,*
in response to message #6 by Gene Wright

> Quote:
>
> delivery confirmation, return receipt does not count - read the paypal long notice

Shocking! So getting a post card back with the recipient's signature is not as good as a carrier-held delivery signature. That means $75 to UPS for my 2 lb. package, unless the Priority Mail International Parcel is signed-for at my 'major destination'.

I want to blame someone, but not sure who >:-(

It really is easier in the richer part of the EU (well, I know about UK, France, Netherlands and Germany). All the services seem to have reasonable signed-for options.

Richard

Edited: 2 Sept 2009, 5:29 p.m.

Re: Getting items posted from the US to UK

*Message #8 Posted by **Mark Edmonds** on 2 Sept 2009, 5:45 p.m.,*
in response to message #7 by Richard Reed

Is shipping abroad from the States any more difficult than shipping abroad from Europe?

Both require extra work from the seller but as I said in an earlier thread, that extra work is more than compensated for in the higher prices that are available when selling.

The way I work things is to offer a good basic package (Royal Mail International Signed For) which is quite affordable and then allow the buyer to opt for insurance or a faster system if they want it. I've sent lots of items out, some with high value and received lots of items in, some also with high value and never had any lost or any trouble. In fact, the only trouble I have had has been from UPS wanting to charge me a fee for something that didn't have any value which took a couple of weeks to sort out. Otherwise, good-old USPS has never failed me on my purchases.

Mark

*Message #9 Posted by **Richard Reed** on 2 Sept 2009, 6:20 p.m.,*
in response to message #8 by Mark Edmonds

It seems like there is no USPS equivalent to Royal Mail International Signed-for that satisfies PayPal Seller Protection rules.

I was trying to find one that was less expensive than UPS at $76 from Houston to London, but apparently the USPS Return Receipt system doesn't satisfy PayPal seller protection.

Richard

Re: Getting items posted from the US to UK

*Message #10 Posted by **Bart (UK)** on 2 Sept 2009, 6:28 p.m.,*
in response to message #7 by Richard Reed

Why are you all so hung up on PayPal protection. It didn't do me any good when the seller didn't deliver. I only got 15% of my original payment back because the seller's account didn't have any more money in it by the time the dispute got settled. Oh, and the seller had lots of feedback, 100% positive. I've only done about 15 PayPal transactions, and this one has been the only problem. I'm hoping it stays that way.

From PayPal T&C par 13.13:

> Quote:
>
> However, recovery is not guaranteed and may be limited only to the amounts that PayPal can recover from the seller’s Account.

I'm sure you can guess what I think of the "Pay with PayPal and you’re fully protected." slogan.

>
> Why are you all so hung up on PayPal protection.

I think it's a matter of degrees. Things are somewhat more transparent (protection by whatever -- I was helped by a German sellers' group when PayPal wouldn't) and less expensive shipping within EU, from EU to US, and within US than they are shipping from US to just about anywhere else.

That's why many sellers in the US don't bother shipping anywhere else.

Lab-Volt (348?) cpu trainer

*Message #1 Posted by **peter a walker (papwalker)** on 2 Sept 2009, 8:48 a.m.*

I noticed in a post from 2007 that 'Ren' had one of the afore mentioned trainers. I was wondering if he or anyone can answer three and a half quick questions? 1) Is the cpu a 6502? (nmos or cmos)(it's missing)

2) What was the supply voltage (I may yet work this out from the regulator circuit but it would be nice to know for sure)

3) There may be a chip missing beside and between the reset and halt/step switches. The is an empty socket between the 74ls14 Schmitt and the 74s04 inverter.

Hoping like crazy that no-one has played musical chairs with the chips. They're all socketed.

Thanks in advance peter walker

HP-71b used for fire calculations

*Message #1 Posted by **Klaus** on 2 Sept 2009, 7:51 a.m.*

Has this been posted before? pdf-link

This describes how a HP-71b can be used with a special ROM to predict fire in the forrests.

Re: HP-71b used for fire calculations

*Message #2 Posted by **Bill (Smithville, NJ)** on 2 Sept 2009, 8:41 a.m.,*
in response to message #1 by Klaus

Hi Klaus,

Thanks for the link. I've seen several HP-71B show up on the auction site with the Fire Modules. Have always wondered what they were.

Bill

Re: HP-71b used for fire calculations

*Message #2 Posted by **Bruce Bergman** on 2 Sept 2009, 12:16 a.m.,*
in response to message #1 by Tim Wessman

PLEASE consider the Palm Pre (WebOS). The ones that are currently available are pure crap. It's painful.

thanks! bruce

Re: Anyone have an Android phone?

*Message #3 Posted by **tim wessman** on 2 Sept 2009, 11:20 a.m.,*
in response to message #2 by Bruce Bergman

The problem with webOS is that they don't have a good sdk and many capabilities are crippled. For example, you can't read or write a file. Converting everything to javascript wouldn't be fun either. If they ever get around to making c/java/anything else into a non grueling porting experience they will have a lot more applications.

TW

Re: Anyone have an Android phone?

*Message #4 Posted by **Eric Rechlin** on 2 Sept 2009, 1:01 a.m.,*
in response to message #1 by Tim Wessman

I fully intend to get the HTC Hero, assuming it arrives on Sprint next month. It's the first smartphone that I can truly say looks like it will be good. My current mobile phone is 8 years old, so this will be quite the upgrade.

I also plan to use it as a development platform. Once I have two other higher-priority projects finished I intend to make a *good* calculator for it.

Re: Anyone have an Android phone?

*Message #5 Posted by **hugh steers** on 2 Sept 2009, 8:36 a.m.,*
in response to message #4 by Eric Rechlin

Do you know if there's documentation to develop native code for android now?

when it came out, i looked into it and java was the only supported development environment. I dont mind writing java for front ends, but i'd like to have native code back ends for all my existing libs.

Re: Anyone have an Android phone?

*Message #6 Posted by **Eric Rechlin** on 2 Sept 2009, 5:32 p.m.,*
in response to message #5 by hugh steers

I haven't looked into it yet, but I would imagine it shouldn't be too difficult.

What you have is basically a Linux computer on an ARM chip, so you should be able to develop whatever you want on your PC and cross-compile it with GCC. Then you could call the native code from a Dalvik wrapper.

If you prefer .NET, I believe Mono has been ported over as well. That's what interests me most, to be honest, as most development I do these days is in .NET, but I think that the state of Mono on Android is a bit primitive right now.

Re: Anyone have an Android phone?

*Message #7 Posted by **Tim Wessman** on 2 Sept 2009, 7:07 p.m.,*
in response to message #6 by Eric Rechlin

You can wrap c/c++ in wrappers and use them directly, and they just released a native code compiler (with the downside that development is a lot trickier and you don't have access to system OS calls).

Emu28

*Message #1 Posted by **Alexander Wassermann** on 1 Sept 2009, 12:10 p.m.*

Hi everyone,

I am trying to follow the steps for downloading my ROM from a real HP28S to a HP48GX. I have entered the programs from the instructions provided by Christoph Giesselink (thanks for your great work) but cannot get my checksums to match.

Any idea what I might be doing wrong? Thanks, Alex

Re: Emu28

*Message #2 Posted by **Christoph Giesselink** on 1 Sept 2009, 12:52 p.m.,*
in response to message #1 by Alexander Wassermann

This is the wrong emulator. Emu28 is for the HP28C only. Use Emu42 instead please. So the correct program to verify the HP28S ROM image is LEWISCRC.EXE.

Sorry for the confusing. The HP42S was the 1st emulated calculator on Emu42, therefore the name. But the HP42S and the HP28S share the same main chip (1LR2 Lewis), so Emu42 was expanded to emulate the HP28S too. Mainly Emu42 v1.11 is emulating the High-End Pioneer and the 2nd generation of the Clamshell calculator hardware. Forthcoming Emu42 versions will emulate the Mid-Range Pioneer calculator hardware too.

The HP28C (and HP18C) belong to the 1st generation of the Clamshell calculator hardware with different chips (1LK7 CPU, 1LP2 Centipe chipset, ...). So I created a separated emulator for emulating the HP28C.

Cheers

Christoph

Re: Emu28

*Message #3 Posted by **Bart (UK)** on 1 Sept 2009, 1:19 p.m.,*
in response to message #2 by Christoph Giesselink

Thank you for that update Christoph, I hope to do the ROM download for my 28S soon, I'll make a note of this post.

Bart

Re: Emu28

*Message #4 Posted by **Alexander Wassermann** on 2 Sept 2009, 5:45 a.m.,*
in response to message #2 by Christoph Giesselink

Hi Christoph et al,

maybe my question was not quite clear and I will try to explain again:

I have not yet extracted the ROM, so I am not even using either emulator (Emu28 or Emu42). I am still wondering about the procedure to extract the rom using the instructions from the clamshel.txt instructions. The "chk" and the "ass" programs to not provide the required checksums and neither does the MROM28.

I have rechecked my input several times and am quite sure I have no typos.

What might I be doing wrong?

Regards, Alex

Re: Emu28

*Message #5 Posted by **Christoph Giesselink** on 2 Sept 2009, 8:43 a.m.,*
in response to message #4 by Alexander Wassermann

> Quote:
>
> The "chk" and the "ass" programs to not provide the required checksums and neither does the MROM28.

Basicly the checksum of the CHK program must be OK first. It makes no sense to build a checksum with a wrong checksum program.

For the HP28S we have to use this program:

```
CHK [1142] for HP28S Rev. 2BB

<< RCLF STD HEX 64 STWS 48 CF SWAP RCL ->STR 16 STWS
  DUP # 0h 1 ROT SIZE
  FOR j
    OVER j j SUB NUM R->B XOR RL
  NEXT
  ->STR 3 OVER SIZE 1 - SUB ROT STOF SWAP DROP
>>
```

Of course the text <<, >> and -> have to replaced by the correct characters (otherwise you get a syntax error either). It's of course also important that the cases are matching, so a

... OVER J J SUB ...

is different to a

... OVER j j SUB ...

You can't do something wrong with the whitespaces. The code part "RCL ->STR" format the code always in the same way (on the HP28S with ROM rev 2BB, because of this the code for the HP28C looks different).

When you have the correct calculator and typed in the corresponding program correctly the return of

'CHK' CHK

must be "1142" in stack level 1.

Cheers

Christoph

Re: Emu28

*Message #6 Posted by **Alexander Wassermann** on 2 Sept 2009, 10:26 a.m.,*
in response to message #5 by Christoph Giesselink

Hi Christoph et al,

thanks for your clarification, this was exactly what I was referring too.

The problem is that my CHK program is exactly as you typed it (and I redid this three times) and I have no syntax errors (and I confirmed my firmware version by typing # Ah SYSEVAL which returned 2BB). Nevertheless I get "51C3" after 'CHK' CHK and not the required "1142" in stack level 1. And that is why I contacted the Forum for help/assistance.

One question I had was the meaning of "putting the calculator in HEX mode". What I did was SHIFTRED BINARY HEX and thought that was what was meant. I am not 100% sure though if putting the calc in HEX mode means something completely different. Maybe here is a mistake.

I have no other idea at this moment but would be greatful for any more input.

Thanks again for your kind help,

Regards, Alex

Re: Emu28

*Message #7 Posted by **Bart (UK)** on 2 Sept 2009, 6:03 p.m.,*
in response to message #6 by Alexander Wassermann

Hi Alex,

I just tried the CHK program and the checksum is "1142" as Christoph said. I tried setting HEX & DEC before running 'CHK' CHK, but it made no difference, as one would expect (the CHK program puts it in HEX anyway and remembers your previous setting by RCLF & STOF). I'm afraid I cannot be of more help.

Bart

Re: Emu28

*Message #8 Posted by **Alexander Wassermann** on 3 Sept 2009, 3:09 a.m.,*
in response to message #7 by Bart (UK)

Hi Bart and Christoph,

thanks again for your support and input.

Reread again and again what I was supposed to do. Got the mistake finally. When Christoph said J J is different to j j I thought: yes of course, the counter J must be the same cpaital as the variable J and not one upper case and the other lower case. It took until this morning I realized the lower case is a must for all "j's" because the value of the character is used to

calculate the checksum.

Lets see if I can solve the rest of the task.

Regards, Alex

HP 33s display

*Message #1 Posted by **Peter Klein** on 31 Aug 2009, 4:00 p.m.*

Could someone who has both the old and new HP33s displays (pre- and post-CNx524...) tell me if the shadowing and consequent angle of view issues have been resolved in the newer display?

I played with an old-display 33s at home, mostly handheld, over the weekend. Except for the "amazing disappearing decimal point," liked it. Then I took it to work today and found that when I have it on my desk next to my PC keyboard, the display gets harder to read. It's like there are two copies of each number slightly "out of register" unless my eyes are close to vertical with respect to the display.

No such problems with the 32S and 32Sii, where a couple of presses of C and plus or minus optimize the display for either handheld or desktop use.

Presbyopia is a separate issue. Ah, the joys of middle age. Perhaps as the 33s is geared towards the engineering exams, so the display is geared towards the eyes of 15-30 year olds who are the calc's target market :-)

Re: HP 33s display

*Message #2 Posted by **Nigel J Dowrick** on 31 Aug 2009, 6:52 p.m.,*
in response to message #1 by Peter Klein

I only have a new display 33S, but I can confirm that there appears to be no doubling of the pixels when viewed from different angles. The decimal point is clearly visible to me as well. I like this machine a lot (as I may have mentioned in previous posts!).

Nigel

Re: HP 33s display

*Message #3 Posted by **Dave Britten** on 1 Sept 2009, 6:57 a.m.,*
in response to message #1 by Peter Klein

I've noticed the same shadowing effect on quite a few later models. The Pioneers don't do it, nor do the clamshell models or the 48S/SX. That's the main reason there's a 48SX on my desk rather than a 48G.

Re: HP 33s display

*Message #4 Posted by **Peter Klein** on 1 Sept 2009, 12:52 p.m.,*
in response to message #3 by Dave Britten

Thanks, Nigel and Dave. I think I'll pick up a new-display 33s, as the old display is really annoying.

There's no shadowing on my old 11c, either. I wonder what change in LCD design causes the shadowing, and why it was done. You would think that since a calculator is used both in the hand and on the desk, visibility from typical viewing angles would be a consideration. You would think...

Re: HP 33s display

*Message #5 Posted by **Dave Britten** on 1 Sept 2009, 5:37 p.m.,*
in response to message #4 by Peter Klein

I've noticed that LCDs that exhibit the shadowing behavior also display a more uniform contrast over a wide range of viewing angles. I'm inclined to believe the two phenomena are related, but I don't know enough about LCD design and manufacture to hazard a guess why.

Re: HP 33s display

*Message #6 Posted by **Ed Look** on 2 Sept 2009, 5:38 p.m.,*
in response to message #1 by Peter Klein

I have both. I use the newer one specifically because of the much improved, superior display on the newer version. There is no real shadowing and he decimal point is quite visible.

(Now, I think the "font", such as it is, "looks nicer" in the old one, but what is that if it's hard to read?)

Re: HP 33s display

*Message #7 Posted by **Peter Klein** on 2 Sept 2009, 9:19 p.m.,*
in response to message #6 by Ed Look

Thanks, Ed. Looks like the new display is the way to go.

Suppose I order it from Amazon.com. Does anyone know if I am guaranteed to get one with the newer display, or is there a lot of old stock in the supply chain, which might mean what I will get is subject to random chance?

HP-35S Case

*Message #1 Posted by **Juan J** on 31 Aug 2009, 1:44 p.m.*

Hello,

I got an HP-35S a few months ago. Aside from the occasional keystroke miss, which I attribute to entering data too quickly, as it occurs when I am in a hurry, I like it.

It is a good machine for my everyday calculations, and you don't have to worry if it gets lost or stolen.

I noticed the case is handy and withstands abuse. It is better than the one that came with the 33S. I also noticed it fits Pioneers. Can it be ordered separately, as were its predecessors? Has anyone tried?

JuanJ

Re: HP-35S Case

*Message #2 Posted by **Raymond Del Tondo** on 31 Aug 2009, 3:56 p.m.,*

Re: HP-35S Case

*Message #3 Posted by **Reth** on 1 Sept 2009, 6:48 a.m.,*
in response to message #1 by Juan J

> Quote:
>
> occasional keystroke miss, which I attribute to entering data too quickly

It's definitely not "entering data too quickly", the keyboard/its handling is not good enough. Try to miss a keystroke on the HP48 - the last "HP" calculator.

Re: HP-35S Input

*Message #4 Posted by **Bart (UK)** on 1 Sept 2009, 7:01 a.m.,*
in response to message #3 by Reth

I agree with Reth. At first it didn't bother me either, but as I got more fluent with it's use, it has become more of a problem. It could definitely use a keyboard input buffer.

Re: HP-35S Case (and HP48 commentary)

*Message #5 Posted by **Mike Morrow** on 1 Sept 2009, 10:41 a.m.,*
in response to message #3 by Reth

> Quote:
>
> Try to miss a keystroke on the HP48 - the last "HP" calculator.

The HP48-series is great as long as one doesn't mind:

1. The worst LCD display quality that anyone has ever put on a graphing calculator. Very fuzzy, very easily damaged.
2. Overpriced, underfeatured, unreliable, proprietary memory expansion cards (vs. SD cards).
3. Slow speed, and Saturn-only (vs. ARM) capability.
4. No real CAS built-in. Must use third-party.
5. Non-upgradable firmware.
6. The poorest color schemes ever put on any calculator (other than the HP38G!) with respect to contrast and legibility.

I've had an HP48SX since 1991, plus two HP48GXs since 1997. It seemed like a good idea at the time.

Re: HP-35S Case (and HP48 commentary)

*Message #6 Posted by **Bart (UK)** on 1 Sept 2009, 1:14 p.m.,*
in response to message #5 by Mike Morrow

> Quote:
>
> 1. The worst LCD display quality that anyone has ever put on a graphing calculator. Very fuzzy, very easily damaged.

If you're comparing with the 50G, my 50G's display is just as unreliable - six missing pixel rows and increasing with hard resets. My 48SX still works fine.

> Quote:
>
> 2. Overpriced, underfeatured, unreliable, proprietary memory expansion cards (vs. SD cards).

This thread started about the 35s, which doesn't have any external interfaces - but memory for loads of programmes to be lost with hours of re-typing. (Paul Dale's 710-line, ~8kb game took me many hours to type in).

> Quote:
>
> 3. Slow speed, and Saturn-only (vs. ARM) capability.

This thread started about the 35s, so just to be clear it is not an ARM unit. It's actually quite slow.

Quote:

6. The poorest color schemes ever put on any calculator (other than the HP38G!) with respect to contrast and legibility.

I agree WRT the G series, but like the S-series orange/blue scheme.

That all said, I think the biggest gripe remains the keyboard. I think many would welcome a 50G with a 48S/G type keyboard.

Re: HP-35S Case (and HP48 commentary)

*Message #7 Posted by **Raymond Del Tondo** on 1 Sept 2009, 2:07 p.m.,*
in response to message #5 by Mike Morrow

Ok, since we're off-topic already, I'd like to add my point of view.

Quote:

The HP48-series is great as long as one doesn't mind:

1. The worst LCD display quality that anyone has ever put on a graphing calculator. Very fuzzy, very easily damaged.

If you mean the hardware durability:
No, none of my _various_ HP-48 units has a damaged display,
except for the ones where the previous owners managed to break it.
Apart from that, the LCD of every calculator can break if
one misues the unit, or drops it, regardless of the brand.

If you mean the LCD contrast: Yes, the SX has one of the poorest
LCDs, beaten only by the OmniGO 100 and the Olivetti Quaderno,
the GX LCD is much better, and the latest production runs with
high-contrast LCD are simply excellent!

Quote:

2. Overpriced, underfeatured, unreliable, proprietary memory expansion cards (vs. SD cards).

When the HP-48 came out, every memory card of every vendor for every
machine (calc or PC) was expensive compared to today's SD cards.

And since they (HP RAM cards) are not built anymore,
they tend to get somewhat more expensive.

Quote:

3. Slow speed...

Not true. Just try SpeedUI.

Apart from that, it's hard to compare an ARM core with the Saturn.
However I managed to make a SuDoKu solver for the GX which runs
nearly as fast as compiled C programs on the 50g, so what?

> Quote:
>
> 4. No real CAS built-in. Must use third-party.

Exactly. Use 3rd party, when you need it. I never needed a CAS,
so it would be a waste of space if it were built-in.

> Quote:
>
> 5. Non-upgradable firmware.

No need to upgrade, since the GX has a handful of well-known bugs only.
Compare that to the endless bug lists of the 49g/50g.

Apart from that, you _can_ upgrade certain parts of the OS, see SpeedUI.

> Quote:
>
> 6. The poorest color schemes ever put on any calculator (other than the HP38G!) with respect to contrast and legibility.

Again no! The poorest color schema was on the 49g: Dark blue
and dark red on metallic blue. Who had _that_ sillysilly idea?

Ah, I forgot the 6s (non-solar), which was similar. Or the 33s...

> Quote:
>
> I've had an HP48SX since 1991, plus two HP48GXs since 1997. It seemed like a good idea at the time.

I have the HP-48SX with serial 3003A00xxx, bought new
when it came out. Currently I'm using a GX with B/W LCD:-)

Re: HP-35S Case (and HP48 commentary)

*Message #8 Posted by **Juan J** on 1 Sept 2009, 6:13 p.m.,*
in response to message #7 by Raymond Del Tondo

Hello,

Having used (and frequently abused) a 48GX for years, I agree with Raymond. The last true HP calculator.

Regarding missed keystrokes, it only happens when I am entering data too quickly. The 35S never

misses a keystroke at my "normal" typing speed.

Thank you for the info.

JuanJ

Re: HP-35S issues

*Message #9 Posted by **Bart (UK)** on 2 Sept 2009, 5:48 a.m.,*
in response to message #8 by Juan J

Hi Juan,

Your thread has been hijacked by 48 lovers/haters :)))

All other HP RPNs I have, have keyboard buffers. The algebraic 20S being the only HP I have that doesn't, but it's fast enough not to need it - the 35S isn't.

I will cautiously say that, like me, as you become more proficient with the 35S's use, the lack of a buffer will be more apparent.

By the way, here's a link to Pauli's 35S Bug List with other issues to beware of. (You probably knew this).

Many of these bugs are avoidable or not an issue for me in daily use, and I quite like and enjoy using the 35S. However, the missed keystrokes do "catch me out" occasionally and is an irritation.

Bart

Re: HP-35S issues

*Message #10 Posted by **Juan J** on 3 Sept 2009, 7:10 p.m.,*
in response to message #9 by Bart (UK)

Hello Bart,

Yes, the thread was hijacked. Fortunately it happened after my question was answered :-) Glad to see a simple question made everybody come up with interesting opinions/insights.

I think I am begining to feel the buffer lack. I am missing strokes often. However, slowing down helps. Not an excellent solution, but it helps.

Other than the buffer, the 35S is a good calculator. I was aware of the bugs and the sluggish speed; the latter was not a concern (has not been so far) to me. I needed an all-purpose, replaceable RPN calculator for everyday use, and the 35S fit the bill. Interestingly enough, many people I deal with cannot figure it out even in ALG mode, an added benefit. Now older models can stay at home.

Regarding the 48, it is so different that you either get used to it and appreciate its features or you don't and just hate it. RPL is efficient and fun to use but requires some changes in one's mindset, in my humble opinion. Again, either you learn your way into its subtleties or not.

> Other than the buffer, the 35S is a good calculator.

Yes, and it seems to be of a good construction that will outlast it's competitors. And it looks good, always attracting interest when it's on my desk but keeping alg calc users from borrowing it :).

My first HP was the 28C, so to me RPL is quite nice. Apart from loop control & graphics, it is almost RPN programming without line numbers, you still use the stack and the calculator functions acting on what's on the stack. And the advantage of an "unlimited" stack. I find that I have to put quite a bit of effort into keeping track of a 4-level stack when programming "traditional" RPN.

Bart.

Wow. I have been using my HP-48SX almost daily since 1991 and I don't mind any of those "issues". To tell you the truth, I can't say I've even noticed (or in some cases needed) them.

Steve

I bought a 2nd hand 48SX with a faulty Row and Faulty display, very bad treated...

I disassembled it, did a deep clean...reassembled it and it seems near new and of course it works perfect!!!

I found that I have a nice serial number in a 48SX... 2952A00XXX

Regards.

I'll agree with the thought that, for its era of more than 15 years ago, the HP48 series was notable and top-line.

I only question the frequent allegation that it *still* occupies that spot. It doesn't. It's not even close. Today's HP hardware/firmware is far superior, and a lot lower in cost too.

Today's HP calc hardware is pathetic and good for nothing, hugely overpriced for the piece of rubbish it is. There is strong demand for HP48 among surveyors and no one likes 49- and later models.

If you have observed this forum at all, surely you see that many folks like the current 50g. I'm not an RPL man myself, but for those who are, the satisfaction level seems to be very high.

I have 4 relevant calculators: an early HP-48SX, a HP-49G+, a HP-50g, and a HP-48G+. (The first three were all purchased new.)

HP-48SX: very powerful, and its matrix-handling ability was genuinely useful to me at the time. The keyboard was also terrific. However the low contrast of the display coupled with the extreme slowness of the interface made many advanced features hard to use. The equation writer was incredibly slow, and writing programs took for ever due to the slow

editing speed.

HP-49G+: much nicer display; much faster; far more facilities; hopeless keyboard. In practice, unusable.

HP-50g: all the advantages of the HP-49G+ along with a proper keyboard. I prefer the HP-48 layout and keyboard "feel" but that (to me) is a small point. The keyboard on my HP-50g is completely reliable. In every other regard the HP-50g equals or surpasses my HP-48SX comfortably - as it should, given the time between the two releases.

HP-48G+: like the HP-48SX but with a clearer display and much faster in use. Choosing between this and the HP-50g is hard. Based on this machine I can see why people are so fond of the HP-48 series. I think there's a rational basis for preferring either the HP-48xxx or HP-50g depending on exactly what one's needs are.

My opinion: the HP-50g is a great machine and so is the HP-48G+ (and therefore other later models in the HP-48 series). Although I can understand people putting either model first, I can't really relate to fierce condemnation of whichever model they put second!

Nigel

I said surveyors, e.g. professionals, not just folks.
Note when the HP41 came around it killed TI and everything around. HP48 went the same way but never got to level the king (41) in terms of innovations.
To me HP41 is never gonna be matched as of level of importance (innovation, quality, usefulness etc.) as far as handheld calculators are concerned. It was *the pioneer*
The HP48 was the working horse (and still is). It was there at the right time and provided what was necessary. Cheers

My $0.02:

Quote:

> 1. The worst LCD display quality that anyone has ever put on a graphing calculator. Very fuzzy, very easily damaged.

Well, I guess that is subjective to some degree. The contrast isn't so great, but mine is definitely not fuzzy.

Quote:

> 2. Overpriced, underfeatured, unreliable, proprietary memory expansion cards (vs. SD cards).

I got mine for less than half of a 50g. Underfeatured? It is so feature-rich, it boggles my feeble mind.

Quote:

> 3. Slow speed, and Saturn-only (vs. ARM) capability.

We agree on this, it is maddeningly slow.

Quote:

> 4. No real CAS built-in. Must use third-party.

I must not know what this is all about, since I thought the 48 series did have the capability of manipulating symbolic expressions.

Quote:

> 5. Non-upgradable firmware.

Means nothing to me. I expect the manufacturer to build it right the first time. Silly me.

Quote:

> 6. The poorest color schemes ever put on any calculator (other than the HP38G!) with respect to contrast and legibility.

Funny, I bought the SX because I dislike the GX color scheme. If the SX color scheme is horrible, so is that of 32sii, 20s, 21s.

7. No joy stick to play games and mouse support, ah?

1. The b&w display is brilliant and the big system font is better visible than on the toys(hp49-hp50). As reliable as anything, I've got a few from the first years of production till the last - no problems at all. And all these have seen tough times out at the field in any weather conditions.
2. These calculators were and still are worth their weight in gold. They payed back their price thousands of times over the years.
3. Speed has never been a problem. Problem is unreliable keyboard.
4. CAS? you must be kidding. HP48 is a professional tool and not algebra school teacher or OS for playing games like TIs.
5. What about slide rules? Are there upgradeable ones? What is the effect of the "upgradeable" firmware? The fact that you can replace one buggy FW with the next one etc etc?
6. The colour scheme is a matter of personal taste. To my eyes HP48's is perfect and I for one like the 48G colours more then the 48S'

in response to message #5 by Mike Morrow

Mike,

You made a similar post recently which nearly provoked me to replying. At least this time, you have hit on a few better points :)

The worst LCD display? Well, I agree that the S series displays aren't exactly high contrast but in well over 10 years using G series, it never once occured to me that the display was bad.

Fuzzy display? None of mine are like that. Fuzzy implies out of focus and I'm not sure how that would happen in an LCD. Do they have lenses?

Easily damaged? Again, none of mine have ever suffered any damage. I'm not in the habit of throwing them into cement mixers but I am in the habit of applying a bit of sense when storing the calc - and the 48 series cases are amongst the best for ease of inserting/removing the calc.

Memory cards? You can hardly blame the 48 series for not having SD as the technology didn't exist. By this comparison, do we start unfairly criticising earlier calcs that don't feature technology "x" when it didn't even exist at the time? However, the main point with memory cards is that their usage is definitly in the minority. If you took numbers of calcs sold and memory cards sold, I bet you'd only find a very small percentage using the cards. It simply doesn't matter for most users.

Speed? Agreed, some operations can be painfully slow. However, a solution to most of these lies in Raymond's superb SpeedUI which streamlines many front-end elements. Strongly recommended. But, even with the slow features of the 48 series, the calc is still quite a lot faster than probably all calcs before it.

Saturn only? Well, that is what it was built on. Is that a fault of the calc? How many 50G users are programming native Arm code? Not many I expect.

No CAS? Didn't CAS start as a 48 lib which HP then took on board? If yes, then it can be installed. The only time I've ever needed CAS was for programming a solution to a challenge on this forum.

Non-upgradable firmware? Well, no. This is desirable for some situations but there is no need for a calc to have it. In a way, I prefer not to have it as it puts extra pressure on getting the bugs sorted before shipping.

Poorest colour scheme? Last time you said something like "west coast arty"!! Not sure what you meant by that but I quite like the violet/green scheme so this is subjective. I have certainly never had problems with contrast or legibility and it is significantly better than the vile scheme on the 49G! If you think the 48G is bad, try a 22S under overhead lighting.

I think that covers your points. The original 48 series has faults but it also has features going for it that have been lost since the 49G. Like others, I think the GX is the last great proper HP calc and I still use it on a daily basis.

Some other bullet points for and against 48GX or 50G

```
50G has bigger display
50G has numerous software enhancements that are really valuable
50G has benefit of USB connection
50G is a lot faster all round
50G eats batteries and needs a backup battery because of this
50G has a good keyboard but still not as good as the GX
GX keyboard layout is far superior to the 50G
GX menus are not so deeply nested as on 50G
GX doesn't do infuriating mode switching like the 50G does
50G has lots of keyboard kludges - shift hold combinations - that exist as far as I
am concerned to compensate for the poor keyboard layout
```

and now doubt many points more that aren't springing to mind right now.

It is a matter of great regret to me that HP didn't continue developing the 48GX in the right direction. The 49G design was such a backwards step and we are still suffering with the legacy of that. I read on hpcalc.org that the keyboard layout was changed to make it less intimidating! Well, if the removal of 4 keys and the subsequent function changes achieved that, all well and good but it was done at the expense of alienating a large swathe of existing users. The 50G is undoubtedly a good calc but if it hadn't suffered from the poor decisions concerning its keyboard and menu structure, it would be absolutely incredible.

Anyway, I've rambled enough...

Mark

what's wrong with this program? / STO error

*Message #1 Posted by **hpnewbie** on 30 Aug 2009, 2:53 p.m.*

So I purchased a 50g a couple of months ago partly based on this forum's advice, (thank you), and really like it, especially rpn. So I've finally gotten around to trying to program it some. I've written a lot of simple programs for various purposes on my old ti-84, and I wanted to see how much faster rpl is than ti basic by writing a simple prime number finding program where you input a number and the program finds all primes up to that number. This is what I've written: << -> X << 3 X FOR B B 1 - S STO 5 M STO 2 S FOR C IF B C MOD 0 == THEN 1 M STO END NEXT IF M 0 &#8800 [does not = symbol]; THEN 0 M STO B END NEXT >> >> (I tried to keep some formatting and stuff so it's easier to read but it just has spaces on the calc on the stack, and the stuff in brackets isn't in the program).

So every time I run this I get the message "STO error: bad argument type." I can't figure out what is causing this, even though I've tried changing a lot of the STO arguments around and stuff I still get the same error. I was thinking that maybe the debug function could pinpoint what is causing this but I can't figure out how to make that work. I would really appreciate if someone would point out what I'm doing wrong.

BTW I'm aware that this really is not an efficient algorithim at all, but right now I'm just trying to learn enough rpl so that I can do all the stuff I knew how to do on my ti 84 on my 50g.

Thanks again

Re: what's wrong with this program? / STO error

*Message #2 Posted by **Allen** on 30 Aug 2009, 3:11 p.m.,*
in response to message #1 by hpnewbie

To get the STO working, you might need to include 'M' instead of M. I'm not sure what the M in the below program is for. it looks like it might not be necessary at all. Can you share a little bit about what the program is used for or provide a pseudocode explanation for these loops?

```
<< -> X
   << 3 X FOR B
      B 1 - S STO 5 M STO
            2 S FOR C
                IF B C MOD 0 == THEN 1 M STO END
            NEXT
            IF M 0 <> THEN 0 M STO B END
         NEXT
   >>
>>
```

In many cases it is not necessary to use the STO function on a 50g (or other RPL calculator) to keep intermediate values. Try writing the routine to only use the stack- it will make the program much faster and likely more elegant.

Re: what's wrong with this program? / STO error

*Message #3 Posted by **hpnewbie** on 30 Aug 2009, 3:42 p.m.,*
in response to message #2 by Allen

Thanks Allen for the help. I didn't realize that inserting quotation marks could make the difference it did - after putting quotation marks around whatever variable names I wanted to be treated as symbolic and not putting them around variable names that I wanted to be treated as the number they represented I got the program to work in short order.

To try to clarify what I was asking (though I already got it working) the program is supposed to find all prime numbers up to the first value on the stack. Since I couldn't figure out how to insert an early exit command for loops in rpl, I used 'M' as a value which basically represents whether or not the number 'B' has any factors. If it does not, the number is copied to the stack.

Thanks again for the help and now I guess I'll do some more reading and try to figure out how to rewrite this using the stack.

Just as a side-note, is there a way to exit a loop early in rpl? Because I just realized that this program is going to crawl as the numbers get bigger because, even if it's divisible by 2, the program is still going to check for every number up to the number being checked. (Actually I need to change it so it stops looking for factors at half the number being checked.)

Edited: 30 Aug 2009, 3:49 p.m.

Not half, square root.

Re: what's wrong with this program? / STO error

*Message #5 Posted by **Howard Owen** on 30 Aug 2009, 4:36 p.m.,*
in response to message #3 by hpnewbie

The quotes give you a reference to the variable. Unquoted, you get the variable's value placed on the stack.

Re: what's wrong with this program? / STO error

*Message #6 Posted by **Luca** on 4 Sept 2009, 12:33 p.m.,*
in response to message #5 by Howard Owen

Unfortunately, it is more complicated than that.

If M is unquoted, then:

- If M is already defined (i.e., contains a value), then M means the number.
- If M is not already defined, then M means the symbol.

If M is quoted, as in 'M', it always means the symbol.

This means that the sequence "3 M STO" does different things depending on whether M already

contains a value or not: if M does not contain a value, it puts 3 into M; otherwise, it causes an error.

There is this kind of craziness all around the 50g; in general, it is NOT true that the outcome of an operation depends on its operands only. There was a thread some time ago on the way the result of CAS functions depended on which variables were accessible! I wish the designers took good programming language design in mind when coming up with the 50g. To me, it feels that its software has been hastily put together.

Luca

Really? And which "number" exactly it means? What if M consisted of a string, matrix, vector, list, library etc. etc. ?

> Quote:
>
> I wish the designers took good programming language design in mind when coming up with the 50g.

??? What does that suppose to mean? That RPL is not good enough for you? If that's the case there are SysRPL and C. Still not happy?

Re: what's wrong with this program? / STO error

*Message #8 Posted by **Luca** on 5 Sept 2009, 1:14 p.m.,*
in response to message #7 by Reth

> Quote:
>
> ??? What does that suppose to mean? That RPL is not good enough for you? If that's the case there are SysRPL and C. Still not happy?

Yes, that's exactly right. RPL is clearly not good enough for me; I think it is poorly designed. It has two faults.

- The large fault is that a postfix notation does not make much sense in a structured language setting. As others have remarked, there is an obfuscated C context, but with RPL, you don't need the motivation of a context -- the code comes out naturally obfuscated.
- The smaller, more technical fault is that the effect of too many commands, such as CAS commands and STO, depends on the context. Properly designed stack languages, such as Forth, avoid such side dependencies.

SysRPL and C are even worse - I mean, who wants to bother with such low-level stuff when writing code on a programmable calculator? RPN programming is easy enough for

very small tasks. For bigger tasks, if I want a pocketable device, I am waiting till I can simply write Python, Ruby, on my Android cellphone; I guess it will not be long. Those languages are in another universe, regarding usability.

You keep messing up RPL and CAS. CAS has nothing to do with RPL which is a unique language specially designed for HP series of calculators like HP28 and HP48. For many years it has proven it's usefulness. The creators of RPL were nothing short but geniuses. The fact, that nothing better was designed later and RPL platform was used for (to my view) running school kids' stuff like CAS etc. is not a reason to be criticized by people with limited knowledge and abilities in this area. If you know what's best and how to do it, what are you waiting for? Go ahead develop new calculator and proper language for it. HP are waiting for you.

It would be just as helpful if the users used good programming practice.

I.e.
(1) ensure your variables are defined before calling/manipulating them (this was hammered into me as one of the most important practices of good programming, in C if you attemp to use an undefined variable you also get an error).
(2) be _consistent_ when calling your variable, thus always use quotes when referring to the symbol and no quotes when when referring to it's value (making sure you have defined the value!).

Re: Quoted/unqouted variables or read the manual

in response to message #6 by Luca

Luca,

I you wish to continue RPL programming on the 50G, may I point you to the 50G Manuals page (linked for convenience) and suggest you refer to the "HP 49g+ & 48gII_Advanced User's Reference Manual" listed under General Reference. This is an RPL programming reference.

On p1_1 there is a table that clearly states the impact of quoted and unquoted names.

Bart

Not in a way elegant as the "break" statement in the C language, unfortunately.

> Just as a side-note, is there a way to exit a loop early in rpl?

The short answer is no.

The longer answer is to rethink the way you program so that you never need to. In this case, a loop structure that has a continue condition, like do-while, should be used.

The other answer is yes, you can write bad FORTRAN in any language, even one as lovely as RPL, so there's a horrible kludgey way to leave a loop. Enclose the loop in an IFERR <your loop> THEN <optional stuff> END block, then inside your loop you can do IF <cond> THEN 0 DOERR END, and the program will jump to whatever is after the THEN (or END if there is nothing after THEN). Try not to do this, please.

*Message #15 Posted by **P.Hart** on 31 Aug 2009, 5:38 p.m.,*
in response to message #3 by hpnewbie

It is easy to exit early from a FOR loop on the 50g, for example

1 10 FOR j (do something) (if finished before 10 cycles then) 20 'j' STO NEXT

Re: what's wrong with this program? / STO error

*Message #16 Posted by **Mark Edmonds** on 31 Aug 2009, 7:18 p.m.,*

in response to message #15 by P.Hart

Well, as others have said, there is no formal way of breaking out of a for loop and with good reason - doing so is bad programming because it means you are using the wrong structure. There is also no need for it because the designers kindly built in condition based structures for exactly this type of reason: DO...UNTIL and WHILE...REPEAT depending on whether you want the condition tested at the start or end of the loop.

Having said all that, a BREAK statement or equivalent could be useful at times and even though using this is bad practise, will get frowned upon etc., I don't consider it to be such a huge crime as is sometimes said. If you are going to break rules, as long as you do it elegantly and with good reason, it can give you more flexibility and even simplify the code.

Mark

*Message #17 Posted by **Don Shepherd** on 31 Aug 2009, 8:00 p.m.,*
in response to message #16 by Mark Edmonds

Hi Mark. I'm not so sure that the formal requirements inherent in structured programming apply--or should apply--to calculator programming. Good grief, if it's a mainframe program and other programmers may have to make changes to it in the future, then structured programming is appropriate, along with verbose and meaningful comments. But in calculator programming, or programs we write ourselves for ourselves, an emphasis on structured programming may be a bit misplaced.

I once wrote an article on the ultimate in un-structured programming for the 17b solver, in which I described how to exit a loop early by doing a divide by 0. For calculators, just do what works for you.

After all, how could one expect structured programming on a calculator like the 12c, with one of the keys labelled "GOTO"?

:)

*Message #18 Posted by **Mark Edmonds** on 2 Sept 2009, 5:29 p.m.,*
in response to message #17 by Don Shepherd

Hi Don,

I may not have put my point over as clearly as I wanted!

My first paragraph was a purist view - thou shalt not do this.

My second paragraph was being more realistic and admitting that it is done.

However, I still think it is very important to write "elegant" code. All my comments were in relation to UserRPL and not regular step programming where anything goes (the thread being about a 48 program).

I consider step programming to be a bit like doing 8 bit assembler with a fancy CPU and quite low level. In those circumstances, you do whatever you need to do to get the job done - there are no rules.

UserRPL on the other hand is a distinct high-level language which like it or not, imposes structures on the program that you have to follow.

Anyway, as UserRPL doesn't allow loop-breaking by keyword, this is all a bit moot but I still maintain that using the correct loop structure is very important (but not mandatory!).

Mark

*Message #19 Posted by **Don Shepherd** on 2 Sept 2009, 7:17 p.m.,*
in response to message #18 by Mark Edmonds

Thanks Mark. Yes, I was really talking about pure RPN keystroke programming. I had a 49g+ for awhile a few years ago, but its RPL programming was something I could not get used to. I know RPL is a powerful programming language, but for me there are just too many darned commands! I like the simplicity of RPN.

Katie Wasserman and I have been discussing the joys of RPN programming using as few registers and lines of code as possible. I normally just use what I need without paying a lot of attention to the stack, but I recently wrote a small program on the 12c (15 lines) that used two registers, and when I started analyzing the stack usage I realized I could get away with using no registers. I admit, that felt very good!

Hmm -- what if the loop-breaking condition is determined by a non-straightforward calculation using a datum that is read-in upon each executed step of the loop? There is no predictable pattern to the iterations of the loop, and to express the condition as a one-liner would be cumbersome.

Error correction, need an END for the IF:-

1 10 FOR j (do something) IF (finished before 10 cycles) THEN 20 'j' STO END NEXT

Might as well get it right.

Re: what's wrong with this program? / STO error

*Message #22 Posted by **hpnewbie** on 1 Sept 2009, 8:13 p.m.,*
in response to message #21 by P.Hart

Hey thanks everyone for the help. As you probably noticed, I am definitely a beginner at programming and stuff, so thank you. Especially P.Hart - your tip sped up my program by a ton :-). Yeah so this is what I have now and it works fine...

<< -> V X << V X FOR B B [square root symbol] 1 + 'S' STO 0. 'M' STO 2. S FOR C IF B C MOD 0. == THEN 1. 'M' STO S 1 + 'C' STO END NEXT IF M 1 = THEN 0. 'M' STO B END NEXT >> >>

I don't know why the = sign after M 1 = has to be a = instead of a ==, but the double equal signs don't work on my calc. Also, I think the values which you input on the stack as the range of numbers within which to search have to have a period (.) after them.

BTW just in case for anybody who doesn't have the hlp49 library on their 50gs or 49g+s, it's been really helpful to me and contains syntax and explanations for something around 600 non CAS commands - similar to the built in help system for the CAS... so you don't have to lug around a manual everywhere! (I know this is random... just trying to help anyone if I can... :-))

HP38G Hardware - HC74/ HC112 , Connector

*Message #1 Posted by **Thomas Chrapkiewicz** on 30 Aug 2009, 5:36 a.m.*

Hello:

Could someone recommend a site or document that describes the HP38G I/O connector pinouts?

Also, what is the function of the HC74 and HC112 components on the main board?

Thanks in advance,

TomC

Re: HP38G Hardware - HC74/ HC112 , Connector

*Message #2 Posted by **Khanh-Dang Nguyen Thu-Lam** on 30 Aug 2009, 7:58 a.m.,*
in response to message #1 by Thomas Chrapkiewicz

This webpage should fit your needs: http://www.geocities.com/hpcables/hpcables.htm

Re: HP38G Hardware - HC74/ HC112 , Connector

*Message #3 Posted by **Thomas Chrapkiewicz** on 30 Aug 2009, 9:16 a.m.,*
in response to message #2 by Khanh-Dang Nguyen Thu-Lam

Thank you, but... . ....

This page does not describe all 10 pins of the HP38G calculator,

-or-

describe the HC devices within the HP38G.

Regards, TomC

Re: HP38G Hardware - HC74/ HC112 , Connector

*Message #4 Posted by **Khanh-Dang Nguyen Thu-Lam** on 2 Sept 2009, 2:45 p.m.,*
in response to message #3 by Thomas Chrapkiewicz

Sorry, I don't know why I thought you had wanted to make a cable. Well, I would be interested too if someone could tell what the 10 pins of the "serial" connector are. Four of them are used for RS232 and the six others are used by the overhead projector.

The FAQ just tells the name of the six mysterious pins, but there is no detailed description. http://www.hpcalc.org/hp49/docs/faq/#ss1.11. It would be fun to use these pins as an output port for transmitting data at very high speed. I guess some reverse engineering is required...

Re: HP38G Hardware - HC74/ HC112 , Connector

*Message #5 Posted by **Eric Smith** on 30 Aug 2009, 3:14 p.m.,*
in response to message #1 by Thomas Chrapkiewicz

The HC74 and HC112 devices function as dual flip-flops. The hardware is very similar to the HP 48G/GX.

Re: HP38G Hardware - HC74/ HC112 , Connector

*Message #6 Posted by **Thomas Chrapkiewicz** on 30 Aug 2009, 8:33 p.m.,*
in response to message #5 by Eric Smith

Eric:

Thanks for your response. I understand they are flip flops, but what I would like to know is what is their purpose is in the HP38G? These devices are not present in a HP48G or HP48GX.

I'm hoping there is a schematic available of the HP38G, but that does not appear to be the case.

Thanks again, TomC

Re: HP38G Hardware - HC74/ HC112 , Connector

*Message #7 Posted by **Eric Smith** on 31 Aug 2009, 2:59 a.m.,*
in response to message #6 by Thomas Chrapkiewicz

I thought there were some flip-flops in the 48GX, though maybe not in the 48G. If there aren't dual flip-flops in the 48GX, was there a hex or octal flip-flop, something like a 74HC174, 74HC273, or 74HC374, perhaps? My recollection was that some flip-flops were needed to handle the size of the internal ROM as well as the addressing for memory cards. Since the 38G doesn't support memory cards, it wouldn't need as many flip-flops.

Re: HP38G Hardware - HC74/ HC112 , Connector

*Message #8 Posted by **BruceH** on 31 Aug 2009, 3:46 p.m.,*
in response to message #1 by Thomas Chrapkiewicz

I don't have the actual I/O pinouts [1] but I can tell that they serve two purposes:

The first is as an RS232 serial port to allow you to connect the 38G to a PC running the HP supplied communications software. This allows aplets to be transferred from and backed-up to the PC.

The second is to drive an overhead projector display. (Part no F1212-90002). The intention here is to allow a teacher to show a class of students what they should be seeing on their own calcs.

[1] Actually I don't think they were ever officially documented.

So the 50G can print by IR but not link to a 48GX?

*Message #1 Posted by **Mark Edmonds** on 29 Aug 2009, 7:53 a.m.*

I'm confused over this.

I can print from my 50G to the old HP 82240B IR printer which pre-dates the 50G by many years. The printing is very very slow and sometimes I get rows of solid blocks after the print has completed.

However, despite this all working and suggesting full compatibility with the necessary IR protocols, I simply cannot get my 48GX to send to the 50G by IR.

After struggling with the forum search facility, I eventually found a thread about this which says you can't send/recv by IR without explaining why. If the printing didn't work, I'd leave it alone but as that does work, why can't comms with another 48G work?

Taking a detour via the PC is a little nuisance for file transfer but much more irritating is this apparent incompatibility between the calcs. Can anyone shed some light on this please? Is there a magic trick to get a 48GX talking to a 50G over IR?

Thanks :)

Mark

Re: So the 50G can print by IR but not link to a 48GX?

*Message #2 Posted by **Thomas Radtke** on 29 Aug 2009, 8:06 a.m.,*
in response to message #1 by Mark Edmonds

The 50G uses the IrDA protocol for data transfer while the 48GX does not. Obviously, printing works different. Maybe that's because HP doesn't provide IrDA printers. Anyone knows?

Edited: 29 Aug 2009, 8:06 a.m.

Re: So the 50G can print by IR but not link to a 48GX?

*Message #3 Posted by **Dave Britten** on 29 Aug 2009, 9:43 a.m.,*
in response to message #2 by Thomas Radtke

That's pretty much it. The 82240A/B printers use something called the Red Eye protocol. It's a one-way transmission. There's a program for the 48 called INPRT that was originally designed for receiving "printed" data from a 28C/S, Pioneer, etc. that you might be able to use for receiving similar data from a 50G. I played around with this a little bit and didn't get very encouraging results, but you might have better luck than I did.

Re: So the 50G can print by IR but not link to a 48GX?

*Message #4 Posted by **Bart (UK)** on 29 Aug 2009, 10:57 a.m.,*

in response to message #3 by Dave Britten

Hey, this is interesting. About 2 years ago I emailed HP asking about transferring stuff from the 28S to my new 50G. They told me that the IRs (I assumed wavelenths) were incompatible.

However, if a 48G can be made to receive from a 28S, and the 82240B can receive both 48G and 50G, then perhaps something can be figured out to make a 50G receive a 28/48? (& full comms between 48 & 50)

Perhaps I mis-interpreted HPs email, and it is just a protocol issue, I'll see if I still have the email somewhere.

Re: So the 50G can print by IR but not link to a 48GX?

*Message #5 Posted by **Dave Britten** on 29 Aug 2009, 4:39 p.m.,*
in response to message #4 by Bart (UK)

I'd imagine it would be possible to port INPRT to the 50G. I don't know enough SysRPL or Saturn ML to make it happen, though. It would make a great way to transfer small files between that and a 48 - just pass it through ->STR on the sending end, and then OBJ-> on the receiver.

Re: So the 50G can print by IR but not link to a 48GX?

*Message #6 Posted by **Khanh-Dang Nguyen Thu-Lam** on 30 Aug 2009, 8:03 a.m.,*
in response to message #1 by Mark Edmonds

Basically, I was told the IR wavelengths differ, so it is physically impossible to link a 50g with a 48G. I guess the IR printer can receive from a broader IR wavelengths range, including the IR wavelengths of both 48G and 50g.

Re: So the 50G can print by IR but not link to a 48GX?

*Message #7 Posted by **Mark Edmonds** on 2 Sept 2009, 5:36 p.m.,*
in response to message #6 by Khanh-Dang Nguyen Thu-Lam

Thanks for all the replies. So the long and short of it is that comms between a GX and 50G by IR is impossible. Shame. I shall have to take the long-route via a PC!

You know, I really would have thought that one of the main benefits of the IR on the 50G would be for 48 series users upgrading and copying their programs over. I have never seen anyone anywhere using IR to talk to a PC and I think IR ports are a dying breed on mobos. It certainly seems like a curious decision not to support GX IR comms on the 50G. Perhaps this is one area where the 50G's upgradable firmware could be put to good use - by incorporating IR comms in a future upgrade!! (I am probably dreaming....!)

Mark

in response to message #7 by Mark Edmonds

I've always wondered why HP didn't add support for printing to a PCL printer over IrDA. Many HP Laserjets have an IR port. I can print 7-bit ascii to my 6MP by just sending the string out the IR port. They are missing out on combining their two product lines this way. I would think it would be fairly easy to convert GROBS into a PCL image and be able to print anything on the calculator properly. I've

> been tempted to try it myself one of these days, but programming is not really my strongest skillset.

My Los Alamos Lab HP-97 looks like Gort

*Message #1 Posted by **hecube** on 28 Aug 2009, 11:57 p.m.*

I just received an adaptor (thanks to a fellow forum member) for my Los Alamos HP-97.

Upon powering it, here's what I noticed:

- a single old-school red led in the middle of the display. - Digits do not light up - printer does not advance when requested

What the hell is this thing?

Somehow, I get the feeling that the unit is not defective but was modded to act that way.

If all the wires were open-ended, the calculator would work normally. Considering its rude behavior, I have to assume that additional mods were made on the circuit boards...

What do you all think?

Gort:

I can think of two possibilities.

One, you have just armed an experimental nuclear device. Pray the light never goes out.

Two, it could be the low battery indicator.

;)

Re: My Los Alamos Lab HP-97 looks like Gort

*Message #3 Posted by **hecube** on 29 Aug 2009, 12:08 a.m.,*
in response to message #2 by Dan W

Ha ha!

I don't have the 97 manual so I had no idea there was a low-bat indicator.

Thanks...

On the other hand, if the other option is the right one...

in response to message #1 by hecube

Bear in mind that a 97 (or any of the Topcats) will not work properly without a good battery pack installed. You can't just power them from the AC adapter.

For testing, you can power them from 5V DC to the battery terminals, but be VERY careful not to get the polarity reversed.

> Could it be done in the HP-67

There's a very good possibility that it can with some modifications. Looking at Tony Duell's schematic, the keyboard scanning is similar but arranged as 5 x 8 matrix with some non-used keys. The control lines (DATA, RCD, STR) all seem to be used in the same way as on the 97.

My guess is that it will work with minimal code changes for the keyboard scan. The big challenge that I see is finding space inside the 67 calculator to add a chip or two.

Looking at Tony's drawings and taking this a step further, it looks to me like the same keyboard scanning control lines are used on all the "classic", "topcat" and "woodstock" machines, but changed on the "sting" and "spice" series when they combined the anode and cathode drivers on the same chip. I'd need to experiment to confirm if this is really the case though.

I got a 33s

*Message #1 Posted by **Peter Klein** on 28 Aug 2009, 3:04 p.m.*

I just received a used 33s via the auction site. I wanted an RPN calculator I could carry anywhere without major loss if it were damaged or stolen. I prefer to keep my real Pioneers at home or work.

Anyway, the initial review on the 33s is mixed. In many ways I like it:

- It's fast.
- The two-line display is very convenient.
- There's enough memory to store loads of equations w/o running out.
- The chevron keyboard doesn't bother me at all (I thought it would, but no)
- I like the rubber grip surfaces on the side.

But there are problems:

- I got one in near-mint condition, but it turned out to have the original version display. Must have been "new old stock" when the seller got it. I can't really complain for $20. The decimal point is unreadable, especially when next to the number "2," and commas are not much better. I can't believe this got past HP. The "shadowing" at all but near straight-on viewing angles is annoying..

- The keys are a little stiff. This is, I suppose, preferable to the mushy rubber junk on many calcs today, but still...

- Not enough labels to fully take advantage of all that memory (but we knew that).

- I really miss the big Enter key. This is mitigated by the trick (found on this forum) of setting the program pointer to a little program, so that R/S executes an Enter.

LBL E // R/S // Enter // GTO E

Incidentally, this program leaves an extra copy of the entered number in the stack. Eliminating the "Enter" in the program works better for routine number keyin--it puts the number on the stack without duplicating it, and the next number just pushes the stack up rather than overwriting the copy in the X register. But if you actually want to duplicate a number to use twice, it's best to use the real Enter key.

- Those of us who know the 32SII well will have "muscle memory" problems. Because some keys are in similar positions to the 32SII, but others have been moved, it creates some confusion. It's neither the same nor different, it's *both*. Perhaps this issue will fade over time. But I honestly think that most diehard HP users just accept that you reach for the Enter key to the left, and when it's on the lower right, the fingers and mind rebel. I understad the marketing reason for doing this-- a concession to the algebraic mode, where it doubles as an Equals key. But it just doesn't seem right.

The firmware bugs are what they are, at least they are known and can be avoided or worked around in most cases.

Conclusion: They don't make 'em like they used to. And if you've had an old one, you know what you're missing. Still, in many ways a nice little machine for the price.

Re: I got a 33s

*Message #2 Posted by **Thomas Radtke** on 28 Aug 2009, 3:32 p.m.,*
in response to message #1 by Peter Klein

> Quote:
>
> The firmware bugs are what they are, at least they are known and can be avoided or worked around in most cases.

Don't be so sure. Only recently, a new 32SII bug was discovered. I expect more to come for the 33S / 35s models.

Re: I got a 33s

*Message #3 Posted by **Quan** on 28 Aug 2009, 4:41 p.m.,*
in response to message #1 by Peter Klein

I also got a 33s for less than $19 dollar total. Brand NEW in blister pack. Mine luckily, however has the same display, when compared side-by-side, as the 35s.

It's definitely a good toss-around RPN calc. I won't kick myself hard if I happen to misplace it. (Getting old does that to me. Sometimes.)

Re: I got a 33s

*Message #4 Posted by **Ed Look** on 28 Aug 2009, 11:34 p.m.,*
in response to message #1 by Peter Klein

Gentlemen,

I initially had the exact same feeling you all did.

However, this little calculator grew on me. It is actually so easy to use and program once you take a short while and get used it in its own right. I don't now even care anymore about its cosmetic aspects. It feels good in my hand and is a pleasure to use. I would now feel awful if I no longer had it.

It is in some ways reminiscent of the 32SII... and in others of the 34C! I think it's more than just a nice little calc, it's very good little calc.

HP-48 Connectivity Kit

*Message #1 Posted by **Karl-Ludwig Butte** on 28 Aug 2009, 11:55 a.m.*

Hello All,

I tried to connect a 48G to my PC under Windows XP via the COM-port but always get an error message that the HP-Connectivity-Kit (Version 2.3 Build 2436) cannot connect. The Helpfile of the Connectivity Kit gives lots of confusing instructions that first a library has to be installed on the 48G but following the instructions results in an error message that the "Connect using"-Cobobox shouldn't be in Auto-mode. But there's no other value to choose. To tell the truth, it drives me crazy.

May someone be so kind and help me troubleshoot this problem ? And is there a better alternative software I could use instead of the Connectivity Kit ?

Thanks in advance and kind regards

Karl

Re: HP-48 Connectivity Kit

*Message #2 Posted by **Ed Look** on 28 Aug 2009, 1:30 p.m.,*
in response to message #1 by Karl-Ludwig Butte

I had a similar problem. The current connectivity kit works for the 49g+, 50g calculators. I am using another, older I think, connectivity softwarre for my 48G and 48G+. I am not home right now, so I will check later as to what it's called and post back here. I suppose I could e-mail it to you too, as I don't recall it being such a big file (though I could be wrong).

I don't think it's possible anymore with Windows XP to connect a 49g series and a 48G series calculator with the same software package. I am using two different connectivity programs for these two kinds of calculators.

*Message #4 Posted by **Mark Edmonds** on 28 Aug 2009, 5:07 p.m.,*
in response to message #3 by JMBaillard

Call me old-fashioned but I use the old DOS Kermit program HP supplied with their PDL kit. Pretty certain you can download this freely. Even the old PDL is still quite usable and both the PDL and Kermit have minimal footprint, no fancy installation routine and do the job. How often are you going to be transfering files? If not very often, a simple solution like Kermit works a treat.

Mark

*Message #5 Posted by **Ed Look** on 28 Aug 2009, 11:25 p.m.,*
in response to message #3 by JMBaillard

Jean-Marc,

I used to use HPComm 3.4. But one day, there was, I guess, an update to Windows XP and it stopped working. It could not find right COM port so it could not find the calculator.

Re: HP-48 Connectivity Kit

*Message #6 Posted by **Ed Look** on 28 Aug 2009, 10:59 p.m.,*
in response to message #1 by Karl-Ludwig Butte

I trust the file was received in good order?

Re: HP-48 Connectivity Kit

*Message #7 Posted by **JJB299** on 30 Aug 2009, 1:17 p.m.,*
in response to message #1 by Karl-Ludwig Butte

If you have an old 56k modem installed, it may be hogging up the COM1 port.

Try freeing up your COM1 port first: Start > Settings > Control Panel > System

In System Properties, select the "Hardware" Tab. On the Hardware Tab, select "Device Manager" button.

In Device Manager, scroll down to the "Modems". Open up the modems list view. Right click on any modem (and any communications cable) and select "Disable".

While your there, go to the "Ports". Right click on the Communications Port (COM1) and select Properties. Make sure the port settings match the settings in the Connectivity Kit. You should use the HP Connectivity Kit 3.0 free from HP.

Hope this helps.

Re: HP-48 Connectivity Kit

*Message #8 Posted by **JMBaillard** on 31 Aug 2009, 6:29 a.m.,*
in response to message #7 by JJB299

```
Hi,

I had similar problems a couple of weeks ago:
I purchased an USB to RS232 cable but the PC - windows xp -
could not detect the calculator!
An expert help me to solve the problem and "JJB299" advices
are certainly the right things to do: desable and unable the com port,
but if it still doesn't work, simply try to unplug and re-plug
the cable - with the HP48 in server mode, displaying
```

```
"Awaiting Server Cmd." - and it should work well.

Regards,
Jean-Marc.
```

Re: HP-48 Connectivity Kit

*Message #9 Posted by **Ed Look** on 31 Aug 2009, 11:23 a.m.,*
in response to message #8 by JMBaillard

I'm no expert, and maybe someone more knowledgeable can say something, but there is power also in the USB connection. I would be careful is simply plugging and unplugging something connected via USB. Yes, I know many people simply connect and pull out their flash drives, etc., but I think these things are more robust maybe, than a 48G/G+/GX.

Re: HP-48 Connectivity Kit

*Message #10 Posted by **Karl-Ludwig Butte** on 31 Aug 2009, 3:55 p.m.,*
in response to message #1 by Karl-Ludwig Butte

thanks a lot to all who responded, especially to Ed Look who sent me the HP-48-Explorer. It works perfect even under Windows XP using the build-in COM-Port of the PC!

Kind regards

Karl

Another 12C+ Bug

*Message #1 Posted by **Katie Wasserman** on 27 Aug 2009, 6:21 p.m.*

This is a tiny bug, but disturbing in an emulator-based calculator just the same. This simple program will blank the screen and lock up 12C+ in a such way that you need to turn off the calculator to recover from:

```
01 1
02 AMORT
03 GTO 01
```

I'm running firmware dated 7/31/2009, can anyone confirm that this problem existed in earlier firmware 12C+ calculators? (press [ON]+[G]+[ENTER] then [2], [any key] to see the date) On all other 12C calculators that I've tested pressing any key will abort the program, as it should.

-Katie

Re: Another 12C+ Bug

*Message #2 Posted by **Gerson W. Barbosa** on 27 Aug 2009, 6:55 p.m.,*
in response to message #1 by Katie Wasserman

The program terminates when a key is pressed but only after some seconds (sometimes five seconds, sometimes up to 15 seconds). Firmware date: 2008-06-28.

Gerson.

Re: Another 12C+ Bug

*Message #3 Posted by **Don Shepherd** on 27 Aug 2009, 7:20 p.m.,*
in response to message #1 by Katie Wasserman

I have the same firmware date as Gerson (2008-6-28), but no key press on my unit will terminate the program, even after 30 seconds or so. Only turning it off will work.

Re: Another 12C+ Bug

*Message #4 Posted by **Don Shepherd** on 27 Aug 2009, 7:23 p.m.,*
in response to message #3 by Don Shepherd

Oh, I forgot to add, it continues to display "running", but it doesn't flash, just kind of sits there until you turn the calc off to get rid of it.

Re: Another 12C+ Bug

*Message #5 Posted by **Gerson W. Barbosa** on 27 Aug 2009, 7:32 p.m.,*
in response to message #3 by Don Shepherd

I forgot to mention the program would not terminate upon the first key presses, I had to keep trying until I

found one that stopped the program.

Edited: 27 Aug 2009, 7:34 p.m.

*Message #6 Posted by **Bart (UK)** on 28 Aug 2009, 8:02 a.m.,*
in response to message #3 by Don Shepherd

Try rapidly toggling a key, then hold.

Re: Another 12C+ Bug

*Message #7 Posted by **Don Shepherd** on 27 Aug 2009, 8:35 p.m.,*
in response to message #1 by Katie Wasserman

Katie, based upon these bugs that you have found in this ARM-based 12c, I'll bet the financial and real estate firms that buy these for their new employees will want to buy the older (slower) 12c's, because they are dependable. It seems that only the members of this forum are particularly interested in getting the newer units.

Re: Another 12C+ Bug

*Message #8 Posted by **Katie Wasserman** on 27 Aug 2009, 9:02 p.m.,*
in response to message #7 by Don Shepherd

Don,

You might be right, but I don't think that there will be a choice in short order since, only the new (12C+) machines are in production I believe. Isn't that why HP did a silent roll-out of this model?

Given the results reported above, I think that the faster the emulator is the less opportunity it has for program interruption. The firmware dated 7/31/2009 is 2.5 times faster than previous versions allowing little or no time for keyboard interrupts.

-Katie

Edited: 28 Aug 2009, 5:12 a.m. after one or more responses were posted

Re: Another 12C+ Bug

*Message #9 Posted by **Eric Smith** on 28 Aug 2009, 2:49 a.m.,*
in response to message #8 by Katie Wasserman

If the keyboard handling was done the way I recommended, it wouldn't matter how much faster the simulation was than the original. There's no fundamental reason why speeding it up makes it hard for it to be responsive to the keyboard; that's just the effect of a bad decision in how the keyboard scanner code is designed and how it interacts with the simulation, possible as a result of having more concern for speeding it up than making the simulation accurate.

Re: Another 12C+ Bug

*Message #10 Posted by **Bart (UK)** on 28 Aug 2009, 4:20 a.m.,*
in response to message #9 by Eric Smith

Could it be that the speed is causing the processor to scan through the keyboard latches/mux/buffer (whatever) too fast, not allowing the signals to settle on the uP I/O lines causing it to "miss" the

keypress?

Just speculating as I have no clue of the ARM & 12C architecture.

Re: Another 12C+ Bug

*Message #11 Posted by **Eric Smith** on 28 Aug 2009, 4:28 a.m.,*
in response to message #10 by Bart (UK)

No. The scanning is done by software, and the software can do it at any rate the programmer wants (within reason).

Re: Another 12C+ Bug

*Message #12 Posted by **Bart (UK)** on 28 Aug 2009, 5:05 a.m.,*
in response to message #11 by Eric Smith

So my question is not how often the programmer calls the kbd scanning routine - but that, with Katie's short program, the routine now executes too fast, reading the port register before the signal has established itself and the port's register is updated. This is what could be associated with "speeding things up", no measures are put in place to accommodate the latency of the H/W when we merely increase clock speeds or plug in fast processors on existing H/W designs.

If increased speed is achieved by reducing the frequency by which the kbd scanning routine is called, a longer keypress would solve the problem.

If however due to the "shortness" of Katie's program the kbd scanning routine is skipped, then we have a different type of bug - something is wrong in the software and that has nothing to do with speed.

Re: Another 12C+ Bug

*Message #13 Posted by **cyrille de Brébisson** on 28 Aug 2009, 10:38 a.m.,*
in response to message #12 by Bart (UK)

Hello,

the keyboard scanner is under interrupt, so when you press a key, it toggles an interrupt and scans the keypad immediately.

Since there is then no way to detect directly further key presses on the same column or all key releases cases, a timer is set that scans the keyboard every 10ms until all keys are released...

The problem does not stem from there...

The problem stems from the fact that the original 12C WAITED for all keys to be released before going in 'IDLE' mode. This is not a problem for eric's windows based emulator who can just ignore that wait loop.

However, on the real hardware, where a typical keypress last around 250ms but executes in <10ms, this would lead to a lot of wasted battery power...

So, the emulator attempts to detect when the old ROM is entering this 'wait for all key

released mode' and tells the old ROM that all keys have been released (even if they have not), but there is a need to program a lot of special cases to handle this (problems with SST for example, or the PREFIX and MEMORY functions are examples)... and I guess that there is still something wrong with the way the key detection is done in the AMORT function...

regards, cyrille

Re: Another 12C+ Bug

*Message #14 Posted by **Bart (UK)** on 28 Aug 2009, 11:15 a.m.,*
in response to message #13 by cyrille de Brébisson

Hi Cyrille,

I've done some reading up on the AT91 ARM (assuming the 12C+ uses the same as the 20B). I guess you're using a similar structure to their 4x4 keypad example.

From the datasheets the interrupt seems edge triggered, also the "de-bounce" is implemented by delay rather than circuit. I just was wondering if somehow the trigger was missed or the de-bounce not long enough (maybe because of the short routine (??)) - hence my other post advising to try rapid key toggles followed by a hold, to generate multiple interrupts hoping at least one would be caught.

Another avenue of thought I had was that if the AMORT routine used an FIQ, it could mask an IRQ of the keyboard matrix, because Katie's routine pretty much keeps it permanently in the AMORT routine.

Again, just some thoughts.

Bart.

Re: Another 12C+ Bug

*Message #15 Posted by **cyrille de Brébisson** on 28 Aug 2009, 12:12 p.m.,*
in response to message #14 by Bart (UK)

hello,

the debounce is done 100% in software and is done by taking a time stamp when the key is pressed. If it later detects the same key pressed without another keypress inbetween within less than 100ms, it considers the 2nd key as a bounce... so there is no time wasted in doing the debouncing...

the 12C rom does not have any IRQ/FIQ or other...

the problem is that the emulator lies to the ROM when it request information on the keyboard from the emulator. the emulator lies in order to protect battery life... I tried to remove/hide/patch all the side effects caused by this 'lie', but that one, I do not know how to fix.

regards, cyrille..

Re: Another 12C+ Bug

*Message #16 Posted by **Bart (UK)** on 28 Aug 2009, 1:39 p.m.,*
in response to message #15 by cyrille de Brébisson

hi,

> Quote:
>
> the 12C rom does not have any IRQ/FIQ or other...

I thought maybe the emulator takes the keyboard interrupt & key data and passes it on the rom via an interrupt. The FIQ idea was just a stab in the dark.

I think I understand how the emulator's lie about the "key still pressed" works when in calc mode (and you definetly do not want the processor running full blast >25x longer than it needs to). However, when executing a program, would the rom not look for a key press, rather than a key release, to stall execution? Or does the rom have a "glitch catcher" that when it sees a key press followed by a quick release (now due to the lie) it assumes that no key was pressed and continues execution? OK, perhaps this is a bit far fetched, right now I just can't think of another reason why a lie about key release can cause a problem for something that requires interruption via a key press.

I wish you luck with solving this.

regards, bart

Re: Another 12C+ Bug

*Message #17 Posted by **Eric Smith** on 28 Aug 2009, 2:26 p.m.,*
in response to message #13 by cyrille de Brébisson

The code I use on real hardware doesn't ignore the wait loops. In addition to my PC version, I've got simulation code running on three different embedded hardware platform (but not yet on the AT91SAM7L128), and on these platforms it does one of three things:

- drop the clock to 32 kHz and continues polling
- go to sleep with CPU clock stopped but 32 kHz timer clock active, for a periodic wakeup to continue polling.
- go to sleep with all clocks stopped, for a wake on port change when the keyboard input changes

Once the condition of the wait loop is met, it resumes full speed.

Have a simulation ignore ANYTHING that the original did is a recipe for disaster, unless you understand exactly why it did it. Unfortunately neither of us is in the position of knowing exactly why the 12C firmware does a lot of the things it does, without spending a lot more time on reverse-engineering than either of us can likely afford.

Re: Another 12C+ Bug

*Message #18 Posted by **Eric Smith** on 29 Aug 2009, 3:26 a.m.,*
in response to message #13 by cyrille de Brébisson

No, I've got my code running on real hardware, and it does sleep while it's waiting for a key to be released. It's not that hard to do it properly. Just use a timer interrupt to wake it up periodically, check whether the key is still pressed, and go back to sleep if it is. It's really not that difficult.

However, I don't see what that has to do with failing to detect a key press during a running program.

Maybe I should port my own simulator to the 12C+ hardware.

Have you considered porting your 15C simulator to it? It would be awesome, even if the keys and faceplace didn't match the actual functions.

No need for that. There have been some strong indications on this forum that HP will issue a 15C+ sometime in the not too distant future. See this recent thread in particular.

*Message #21 Posted by **Bart (UK)** on 28 Aug 2009, 5:11 a.m.,*
in response to message #11 by Eric Smith

Please note that I'm using coulds & woulds. As I said before I am not familiar with ARM & 12C architecture. I just like to speculate & discuss things - maybe trigger some thoughts.

Re: Another 12C+ Bug

*Message #22 Posted by **Bart (UK)** on 28 Aug 2009, 4:10 a.m.,*
in response to message #1 by Katie Wasserman

Does the memory stay intact? The 35s has a deadlier form of the bug which requires removal of the batteries & results in "memory lost".

Re: Another 12C+ Bug

*Message #23 Posted by **Katie Wasserman** on 28 Aug 2009, 5:23 a.m.,*
in response to message #22 by Bart (UK)

Yes, memory is intact. I haven't seen any memory-related problems with the 12C+. This is strictly a timing issue given that the slower version of the firmware has the same problem but not quite as bad. The other timing issue I mentioned recently is that the keyboard self-test times out in about 2 seconds giving an error message. The original 12C does this too, but it takes several minutes so it's gone unnoticed.

Re: Another 12C+ Bug

*Message #24 Posted by **Bart (UK)** on 28 Aug 2009, 6:26 a.m.,*
in response to message #23 by Katie Wasserman

I remember your previous thread on the keyboard test time-out. I tried some Pioneers, and they timed out after around 1 to 3 minutes. These bugs raise some concern as to whether the I/O and man-machine interface received due consideration when the ARM upgrade was implemented.

Re: Another 12C+ Bug

*Message #25 Posted by **Eric Smith** on 28 Aug 2009, 4:32 a.m.,*
in response to message #1 by Katie Wasserman

On the original 12C, when this program is run does "running" flash, or stay on constantly? I expect that you'll say that it flashes, but that the way that both Cyrille's and my simulators work, it won't flash in simulation. If so, I know why, and can fix it in mine fairly easily. Mine doesn't have any problem with recognizing keystrokes instantly, though, even when I crank up the simulation speed to over 500x original.

Re: Another 12C+ Bug

*Message #26 Posted by **Katie Wasserman** on 28 Aug 2009, 5:18 a.m.,*
in response to message #25 by Eric Smith

On the original 12C and the 25th Anniversary edition, "running" flashes when this program is run.

Re: Another 12C+ Bug

*Message #27 Posted by **Eric Smith** on 28 Aug 2009, 2:27 p.m.,*
in response to message #26 by Katie Wasserman

Thanks. I'll apply the fix to my simulation code.

Re: Another 12C+ Bug

*Message #28 Posted by **Bart (UK)** on 28 Aug 2009, 6:28 a.m.,*
in response to message #25 by Eric Smith

Out of curiousity may I ask if the simulation is purely S/W or some sort of ICE on original 12C H/W?

Re: Another 12C+ Bug

*Message #29 Posted by **Eric Smith** on 28 Aug 2009, 2:27 p.m.,*
in response to message #28 by Bart (UK)

My simulation code is purely software.

Re: Another 12C+ Bug

*Message #30 Posted by **Bart (UK)** on 28 Aug 2009, 7:01 p.m.,*
in response to message #29 by Eric Smith

Which, as i'm sure you'll agree, is not quite the same as real H/W. Besides, an ICE does not cover it all either.

> Quote:
>
> ... without spending a lot more time on reverse-engineering than either of us can likely afford.

I understand this time problem and thank you & Cyrille for allowing me to indulge my thoughts. I always have a desire to get to the root cause of a problem, but -reality check- this is not a critical problem. It is easily solved by switching the unit off & on again and without memory loss.

Re: Another 12C+ Bug

*Message #31 Posted by **Eric Smith** on 29 Aug 2009, 3:29 a.m.,*
in response to message #30 by Bart (UK)

Cyrille's code running in the 12C+ is pure software too. And I've run my code on real hardware (though not the 12C+ hardware).

ICE doesn't enter into this *anywhere*.

Re: Another 12C+ Bug

*Message #32 Posted by **Bart (UK)** on 29 Aug 2009, 6:03 a.m.,*
in response to message #31 by Eric Smith

Hi Eric,

Yes, sorry, I kind of gathered that. My ICE comment was to say that ICE does *not* solve all problems.

Let me just add I am thankful to you & Cyrille for the efforts put into the 12C+.

I currently don't have any 12C H/W (or S/W) to play with, but hope to get a 12C+ soon.

regards, B

HP 67 with some dim leds

*Message #1 Posted by **juan demin** on 27 Aug 2009, 10:18 a.m.*

Hi, I've just bought an HP 67 in really good condition…it is working properly but the leds are not as bright as those of my HP 65. I know some of you have also both calculators….can you tell me if this is normal?

Re: HP 67 with some dim leds

*Message #2 Posted by **Eric Smith** on 27 Aug 2009, 3:39 p.m.,*
in response to message #1 by juan demin

Do the segments have uniform brightness, or are some significantly dimmer than others?

Re: HP 67 with some dim leds

*Message #3 Posted by **David Ramsey** on 27 Aug 2009, 3:39 p.m.,*
in response to message #1 by juan demin

If the brightness is even across the LEDs, it's fine. There is some brightness variation among the LED calculators, sometimes even among different examples of the same model.

The display may be brighter if you're running the calculator off its AC adapter. However, with this model, make sure you have a battery pack installed if you're using the card reader, regardless of whether you're using the AC adapter or not.

Re: HP 67 with some dim leds

*Message #4 Posted by **juan demin** on 27 Aug 2009, 4:44 p.m.,*
in response to message #3 by David Ramsey

Thanks for your answers!!!! All the segments have uniform brightness...just dimmer than the hp67 and yhis is the same using it with or without charger. I was told to use always the charger with the battery pack instaled. Thanks again

Re: HP 67 with some dim leds

*Message #5 Posted by **Geoff Quickfall** on 27 Aug 2009, 4:53 p.m.,*
in response to message #1 by juan demin

Yes it is normal,

I have 5 HP-67's including a New Old Stock model and they all vary in brightness (evenly) between each other.

The two HP-65's I have are both brighter then the HP-67's.

Since the HP-67 is related to the HP-21 through HP-29C series; i.e. it is a Woodstock, one should ALWAYS

have good batteries in it when using the charger. In fact, the best thing to do is to purchase an external reserve power pack 82004A and never use the charger for the HP-67.

Also, modify any Woodstock battery packs (remove the centre spine and this will allow access to the batteries and the ability to swap out dead ones for recharged versions) to accept regular NiCd or NiMh batteries and charge them with a generic rechargeable supply. NEVER NEVER use the chargers with the Woodstocks UNLESS you are certain there is NOTHING wrong with the battery pack. A good rule is to never use the charger/adapters with the Woodstocks including the HP-67.

Cheers, Geoff

Re: HP 67 with some dim leds

*Message #6 Posted by **juan demin** on 27 Aug 2009, 5:45 p.m.,*
in response to message #5 by Geoff Quickfall

Thanks Geoff...!! I wonder if these rules of "battery / Charger" are well known among Woodstock users... As I said, I was once told about not connecting the charger without the battery pack inside, but it was a kind of soft warning... I appreciate the advise very much (unlike you, I have only one!!!!)

Re: HP 67 with some dim leds

*Message #7 Posted by **Mike Morrow** on 27 Aug 2009, 10:15 p.m.,*
in response to message #5 by Geoff Quickfall

I don't believe that the power supply arrangement of the HP-67 is anything similar to the disasterous design of real Woodstock units. The Classic battery charger is used, which uses a three-conductor cable to deliver a feed to the electronics that comes from a regulated supply, and a separate circuit section for the battery charging function. The battery is separated from the electronics when the charger plug is pushed in.

Re: HP 67 with some dim leds

*Message #8 Posted by **Eric Smith** on 28 Aug 2009, 2:59 a.m.,*
in response to message #7 by Mike Morrow

In the 67, if you use the charger without a good battery pack, it won't damage the processor or memory chips, but it apparently is possible for it to damage the custom read/write amplifier chip for the card reader. I'd recommend following the same rules as for the Woodstock series.

Re: HP 67 with some dim leds

*Message #9 Posted by **Dan W** on 28 Aug 2009, 4:06 a.m.,*
in response to message #7 by Mike Morrow

> Quote:

The battery is separated from the electronics when the charger plug is pushed in.

True for all Classics except for the 67 and 65, in which the card reader is powered by 2 additional wires that are connected directly across the battery terminals. When the charger is plugged in, they are then connected to the charging circuit, not the logic circuit.

The charging circuit provides a constant 50 mA current to trickle charge the battery. But the voltage drop can be as high as 16 volts. As I understand it, the battery in effect forces a voltage drop of about 4V give or take. Without a battery, what would happen?

I suppose this was done because the charger logic supply cannot deliver the current needed by the card reader, but the battery can. Is this correct?

Re: HP 67 with some dim leds

*Message #10 Posted by **Geoff Quickfall** on 28 Aug 2009, 8:30 a.m.,*
in response to message #7 by Mike Morrow

Hello Mike,

Eric scooped my response by a few hours! The power I am concerned with in the HP-67 is directed to the card reader circuitry.

But in a more general sense, why subject your 30 year old collectable to any internal charging? Regardless of the family, I would charge all batteries outside the calculator and not stress the aging circuit at all, or subject it to a failing charger.

Cheers, Geoff

Re: HP 67 with some dim leds

*Message #11 Posted by **Mike Morrow** on 28 Aug 2009, 4:04 p.m.,*
in response to message #10 by Geoff Quickfall

I appreciate these several responses which clear up something I've wondered about for more than 32 years, when I got my new HP-67. The manual cautions about damage if the battery pack is not installed when the external charger is being used. But back then I opened and traced the circuit of the charger, which seemed well-designed for calculator operation without a battery installed. I never knew the real basis for the warning in the manual until now.

I suppose the designers wanted the card drive motor current surges to come direct from the battery. But at least the charging design which generates DC in the charger (constant current, IIRC) is better than the real Woodstock's cheap AC-output charger and simple dangerous diode/resistor charge circuit in the calculator. There is no justification for such an incompetent design.

I have always followed the manual's recommendation, and I've always kept a reasonably decent condition battery pack in the HP-67.

Thanks all!

Removing the private status of a file (HP-71b)

*Message #1 Posted by **Klaus** on 27 Aug 2009, 3:50 a.m.*

I am trying to have a look into the HP-2225B printer driver included in the zenwand. Unfortunately, it is private. This forum already contains a thread about that, see this thread.

The HP-2225B printer driver is a basic program that is 953 bytes long. I loaded the JPCROM version F into the HP-71B and managed to peek/poke the file into the main ram. But since it is an exact copy, this new file is also marked private.

I would like to remove this protection with the UNPRIVLX mentioned earlier, but I can't find it. The holyjoe page also says it is included in "OLDISLEX", but I can't find that either.

Can anyone please give me a hint how to remove the private status?

I want to look into the printer driver to see if it will be possible to use other printer with the barcode-printing code included in the zenwand.

Kind regards, Klaus

Re: Removing the private status of a file (HP-71b)

*Message #2 Posted by **Marcus von Cube, Germany** on 27 Aug 2009, 4:25 a.m.,*
in response to message #1 by Klaus

Klaus, have you tried to copy the program to a LIF image via HP-IL and EMU71 and modify it there? Cf. my Math RAM Article.

Re: Removing the private status of a file (HP-71b)

*Message #3 Posted by **Klaus** on 27 Aug 2009, 4:44 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Hello Markus,

the JPCROM contains a hex-editor to modify files, so I could do it on the physical HP-71B. I will try to change the byte 03 at (relative) address 000E to 00, and report the result.

Vielen Dank and kind regards, Klaus

Re: Removing the private status of a file (HP-71b)

*Message #4 Posted by **Klaus** on 28 Aug 2009, 2:58 a.m.,*
in response to message #3 by Klaus

I did not succeed in removing the private status. I think this is because the SYSEDIT-command uses nibble addresses and now byte addresses. I tried different locations, but each time it failed. Where did

you get the file-header information from? Is it the software IDS?

I will see if I can transfer the file to emu71 this weekend.

Kind regards, Klaus

PIL Box Success Stories

*Message #1 Posted by **Jeff Davis** on 26 Aug 2009, 9:15 p.m.*

I am planning to get one of these and wanted to know how everyone is using them and what they have been able to accomplish. Please let me know, Jeff

Re: PIL Box Success Stories

*Message #2 Posted by **Raymond Del Tondo** on 27 Aug 2009, 12:17 a.m.,*
in response to message #1 by Jeff Davis

The PIL Box is the thing I have been waiting for for many years,
and near to the point where I had given up hope that s.t. like this would come true,
our wizard Jean-Francois Garnier announced it!

I have one of the earlier protos, and it simply works as expected:-)
You can easily transfer data between your real HP-41 (or HP-71)
and the virtual HDRIVE using the normal mass storage related HP-IL commands.

IMHO the PIL Box is _the_ interface between modern PCs and your beloved HP-41.

So my advice: Get one while you can!

HTH

Raymond

Re: PIL Box Success Stories

*Message #3 Posted by **Egan Ford** on 27 Aug 2009, 2:48 a.m.,*
in response to message #1 by Jeff Davis

I 2nd everything Raymond Del Tondo said above.

I use the PILBox with my MacBook Pro. Currently the PILBox PC code is Windows-based, so I have to use VMware with XP. Not a problem at all, it works great.

I was working with Khanh-Dang Nguyen Thu-Lam to get something native working with OS/X and Linux, but I had to clear my desk for a work project. I'll pick it up again in 3 weeks.

Edited: 27 Aug 2009, 3:18 a.m.

Re: PIL Box Success Stories

*Message #4 Posted by **Christoph Klug** on 27 Aug 2009, 3:57 a.m.,*
in response to message #3 by Egan Ford

The PIL-Box is the perfect interface solution for modern PC - which only support an USB port. The function test with the prototype I get from Jean-Francois is positive.

As Raymond explains the PIL-Box acts as gateway between your real HP-41 / HP-71 and HDRIVE1 of EMU41 / EMU71. Bidirectional transfer of programs, data and Ascii files is possible.

Not possible is the advanced control of external / real HP-IL devices by EMU41 / EMU71, actual for this applications you need the HP-IL/PC Interface Card.

When your PC supports a RS232 serial COM port you can use the HP-IL RS232 Interface for bidirectional transfer of data and programms (refer to IL2000 Interface System manual).

The software / hardware technology of the PIL-Box includes the needed plattform for future IL-devices, for example an IL-Massstorage Drive with simcard memory as replacement for the CMT-RAM-Disk. This device would be a really nice system extension for HP-41 + MLDL200 / NoVRAM / Clonix....

Best regards - Christoph

Young collection growing...

*Message #1 Posted by **hecube** on 26 Aug 2009, 9:11 p.m.*

Re: Young collection growing...

*Message #2 Posted by **Michael Meyer** on 27 Aug 2009, 1:59 p.m.,*
in response to message #1 by hecube

Uh-Oh. I caught this bug 10 years ago, and it took me years to find, buy, and restore most of the models I wanted. It was the best hobby time of my life.

I still have the bug, but already have a pretty complete collection. But for me, I really enjoy restoration and then the beauty of these remarkable devices.

I hope you enjoy the years to come! Since I was buying all sorts of calculators, I had a motto/wish:

"Another day, another calculator..."

Why do we do this?

*Message #3 Posted by **Mark Edmonds** on 27 Aug 2009, 2:37 p.m.,*
in response to message #2 by Michael Meyer

Remember that line from the film Ghostbusters when the professor-nerd character says he collects "spores, moulds and fungus"? I think he should have said "fungi" really but I digress. Most people would equate collecting calculators to collecting spores, moulds and fungi. Let's be honest about it, collecting calculators is not exactly the sort of hobby which is guaranteed to enhance your charisma during the Friday night party yet we do collect them and enjoy it a great deal.

Why?

If it isn't old hat, perhaps we could write a brief summary of why we do this odd activity and how we came to it? It is always good to see pictures of collections but a little bit of personal reflection on the hobby can be interesting too. I am sure this sort of thing comes up once in a while. Time enough for a new thread on "why we collect"?

Mark

Re: Why do we do this?

*Message #4 Posted by **John B. Smitherman** on 27 Aug 2009, 2:52 p.m.,*
in response to message #3 by Mark Edmonds

Hi Mark.

I'm certainly not an expert but I believe that collecting is due to obsessive-compulsive disorder:

OCD

Regards,

John

Re: Why do we do this?

*Message #5 Posted by **Mark Edmonds** on 27 Aug 2009, 6:43 p.m.,*
in response to message #4 by John B. Smitherman

Hi John,

To be honest, I don't think OCD is accurate unless the collecting habit is causing lifestyles to collapse or go seriously wrong. Elements of the OCD definition are also traits that are perfectly normal in anyone who has an interest in something. Whilst I firmly believe in tracing the root causes for mental patterns, I don't think blanket labelling in the loose way OCD is used is in any way helpful. Many disciplines like to invent labels or terms that sound significant but in reality, offer nothing more than a pseudo-important sounding name with negative connotations.

At least collecting calculators (as long as they are actually used and not kept in their box unwrapped) provides healthy mental stimulus which is more than can be said for activities like collecting .. errr, ... Star Trek action figurines or Friends DVDs.

Everyone here will have a reason for collecting that stems from a particular set of conditions in their life and no one should feel ashamed or stigmatised by that just because someone somewhere decided to associate the word "disorder".

Mark

in response to message #5 by Mark Edmonds

Collecting is also associated with Asperger's Syndrome:

http://books.google.com/books?id=qJZmsp3ZVG8C&pg=PP1&dq=The+complete+guide+to+Asperger%27s+syndrome#v=onepage&q=&f=false (page 178).

However it appears this applies only to unusual objects which hopefully don't include calculators :-) Incidentally I have about twenty HP calculators, but I am not a collector...

Gerson.

Hmmm... User? Your're right, I cannot rationatize on this. Anyway, I said that rather tongue in cheek. I used to use my 50g on a daily basis until June, but I hardly use it anymore as I am on vacations since then. I use the 33s more often lately. Some I don't use at all, like my 19BII, but I want to keep them even if this doesn't make much sense...

Here are some of mine.

Regards,

Gerson.

in response to message #6 by Gerson W. Barbosa

Disorder, syndrome ... who cares? Some soak little paper squares of envelopes, others sort their little flat bits of metal. They call it a hobby, so why shouldn't we? We happen to enjoy the wonders of what a few bits of electronics can do in a handheld sized piece of equipment - and the many different ways it is implemented.

Whether we just appreciate the outer appaerance & functionality or open them up to study & fix - at the end of the day we get enjoyment from it.

Anyhow, that's my 2c worth. What do I know, like Gerson I'm a not a collector. I enjoy using the calcs, looking at them, showing them others who may ot may not be interested...

in response to message #9 by Bart (UK)

Hello,

I think we all agree on the fact that calculators have many more practical uses than stamps or labels...

I remember having read that dinosaurs and means of transportation are usual obsessions in Asperger's Syndrome patients. Calculators do not fit any of these categories.

Dumb (and quite likely inaproppriate) question: has any Forum member been diagnosed with Asperger's Syndrome? There was a guy, a few years ago, who wrote he believed he had it; after a few bitter exchanges he disappeared.

in response to message #6 by Gerson W. Barbosa

Gerson,

Your reference also states that the collection is merely for the sake of having rather than using or enjoying.

Going by the response to mini-challenges etc. on this forum, I'd say most use & enjoy at least part of their collection :)

Bart

Agreed, especially the psychological disciplines. I have had a few conversations on this with my wife, who was a social worker (now a high school teacher: same thing). She says these syndrome or diagnosis labels are just convenient shorthand to refer to a group of symptoms. Unfortunately, in general usage they often come to define a person, and more often than not in a negative way, as you point out.

I'm not a collector; I'm more of an accumulator.

All my HP calculators, starting with a 41C back in '80, were bought new, when they were the latest thing. I wanted them as tools but also wanted to play with all the new features. I read through all the manuals and worked all the examples.

Since I kept the old ones, I eventually wound up with a bunch. All except for the 41C are still in working order and pristine condition.

in response to message #1 by hecube

This is a great start.. One thing that helped me put some context behind collecting HP calculators is reading some of the great literature written around these wonderful machines.

A great place to start would be: Wlodek's book: A guide to HP Handheld Calculators and Computers

I met him last year at last year's HHC conference - he is a gentleman and a scholar his presentations on Tensor Math with HP calcs has been a favorite of mine.

By all means avoid the other Collectors Guide book advertised on the page. With no offense meant to the author(s), it's incomplete, poorly printed, and in my opinion an extremely shallow information source compared to some collector websites.

*Message #19 Posted by **Peter Klein** on 27 Aug 2009, 8:46 p.m.,*

in response to message #18 by Allen

Years ago I wrote an article about a German-American musicologist who had a fantastic collection of original manuscripts. He told me "Collectors are born, not made. Collecting is an instinct, like with the squirrel." He was also extremely gregarious, friendly and warm. No hint of Asperger's.

Thanks to this gentleman, I actually held a piece in Mozart's handwriting in my own two hands. Not to mention pieces and letters by most of the important contemporary composers of the first half of the 20th century. The memory of that afternoon is so moving that I am almost willing to forgive collectors of HP calculators and Leica cameras, who drive the prices up so high that I can't afford them. :-)

Although, I must say I have a few more HPs than I need, so maybe I'm becoming one of THEM....

*Message #20 Posted by **Mark Edmonds** on 28 Aug 2009, 7:00 a.m.,*
in response to message #19 by Peter Klein

I would say that anyone who has more than 2 or 3 calculators is a collector. Exceptions would be a situation where each calculator is different so fits a specialised purpose and is used for that purpose or a situation where many (potentially similar) calcs are acting as measuring/logging instruments. Otherwise, I think the conclusion is inescapable - the person is a collector - and there is nothing wrong with that either.

I am a collector of course and my interest is in certain series rather than having one of everything. I enjoy this on many levels but two areas which I appreciate greatly on this forum are the exchange of knowledge and the programming challenges. Keeping the brain alert by responding to these challenges which give you something to think about that otherwise wouldn't happen, is, no matter how you view collecting calculators, a *good thing*.

As for the various "syndromes" people might attach to all this, I have already made my views clear. They are a nonsense, a falacy and intellectualise or label an aspect of our nature that doesn't need it. The only people that benefit from it are the lawyers and doctors and the patient is made to think he/she has something wrong when they don't. A complete farce.

*Message #23 Posted by **PeterP** on 28 Aug 2009, 11:12 a.m.,*
in response to message #22 by Mark Edmonds

Hi,

I think for me it is mostly driven by finally acquiring and holding in my hands something I always wanted but never could. The HP41 came out when I was in high-school and very quickly became an object of great desire for me. Especially as the temptation was always there for me to see - some class-mates had a 41! One even had the whole chabang with printer, card-reader, wand, x-function, x-memory etc

Through painstaking trades, tutoring, bargain hunting etc I eventually also came in the possession of a 41cv with x-function and card-reader. And then even a Wand (very fortuitous event). Oh the wonders of synthetic programming, ever faster programs for solutions to quadratic and cubic equations, systems of linear equations,...

Yet by then there was the PPC module, CCD module, the famous CY, MCODE programming etc . And the 'true' owners of HP-41s had all of that and showed us the magic and wonders that can be had with this fabulous machine. Again I was left with 'look but don't touch' (great training for a guy during that whole puberty and early tweens period...)

last but not least, I'm also a very haptic person and simply love the feel of the hp-41 key clicks. Which later on cost me again in my voyage as a mini collector (see later down below)

So for the longest time, my collection solely pertained to the HP-41 and related accessories, incl HP-IL. Valenting Albillo gently but consistently pleaded the virtues of the HP-71 and as 'it also has an HP-IL connection' (post-event rationalization? nah...) I extended my collection to this very powerful machine and its accessories (which thankfully are smaller in number than the 41's). Last but not least, I learned about the HP-15c and got my hands on one. What a great form-factor! And that key click...Ahhh. Many in my profession use the HP-12c so I said, what the heck, lets get the Voyager series! And as of a few weeks back, where I finally found an affordable (hmm...) HP-10C this one is complete as well.

Having said all that, I think there is something true in the 'collectors are born, not made'. My dad used to collect stamps and it was a favorite bonding time for the two of us to spend Sunday mornings 'soaking little sheets of paper off envelopes' or go to the stamp auctions in Vienna. I now have his stamp collection (in the shelve right above my HP collection) and it is my most cherished piece of memory.

However, I consider myself a deeply interested user. I have read the manual and played/used at least for some time with virtually every single piece of my collection. I always desired to have them so that I can use them! So for example I was very keen on getting a RSU-2 unit as it provided massive amounts of RAM (which was used for my many digits of PI program in MCODE) but passed on a prototype 71b to a true collector. At work I used, for the longest time, a 41CY but after the price the last one fetched on eBay I am now hesitant to have it sitting around on my desk (I don't have an office, not even a cubicle. You have no idea how many pens I loose a week...) I tried my hand on the 15c in a couple of VA's 15c challenges as well as the 71b (with mostly no or disastrous results with maybe one or two exceptions). And the 16c was a constant companion while working on the Many-Digits-of-Pi MCODE program as I needed hex-dec conversion, word-size, bit-testing etc capabilities.

I generally enjoy solving problems of all kinds and learning new things, exchanging thoughts and ideas, etc. Though my skill level never excees amateur, I/m pretty sure that I would not have gotten so enamored with the HP-41, had it not provided an almost unlimited supply of learning opportunities.

Not to sound trite, but the tremendous wealth of kind help, support and learning that this community provided had (and continues to have) a very material impact on my pleasure related to these calculators. I've 'met' (or really met) some incredibly smart yet kind and fun people over the last few years here and the exchange of ideas, thoughts, programs, math etc here is a constant source of pleasure and recreation for me. Hence a great thanks goes to Dave for giving us such a great 'house' to meet and all the people here that make this such a great place to spend (too much) time.

Cheers

Peter

12c - unique finance capabilities 15c - unique matrix and complex capabilities (surpassing the native hp41c which is why the came out with the advantage mod)

Re: Young collection growing...

*Message #26 Posted by **hecube** on 28 Aug 2009, 1:01 p.m.,*
in response to message #25 by PeterP

Without wanting to insult anyone here but the 12c, or other financials, are not really my cup of tea...

I did buy a brand new 10BII to use at the office but that will be it for financial calculators (well maybe the 20B, but it has trig functions!). Had HP offered a scientific with the 10BII form factor, I would have bought that isntead.

Looking at my collection pic, the HP-67 strikes me as a calc that means business. It looks really menacing...

Re: Young collection growing...

*Message #31 Posted by **Dan W** on 28 Aug 2009, 9:30 p.m.,*
in response to message #30 by hecube

It does have an all business look to it, and it's fairly hefty too. I routinely use a 67 at work and the 97 at home.

This is the part of my collection I use. I also have the other Classics (except for the 70) in a plastic bin under a bed. There's a 48G+ in the pic too but I really don't use it. Never got in to RPL much. The only HP I bought new when it came out was the 42s. I suppose I collect the classics now because I coveted them in high school but could never afford one.

The office, yep the 97 is husky but so is the 9825a!

*Message #32 Posted by **Geoff Quickfall** on 29 Aug 2009, 3:16 a.m.,*
in response to message #31 by Dan W

Young collection growing...

hello hpmuseum: 9825a

The cabinet, nothing like Katie's thought, just the one although you can add the following which are not in shown in the following picture:

- HP 48SX times two
- HP 21
- HP 12C 1984
- HP 12C 2008
- HP 12C 25th anniversary
- HP 11C
- HP 10C
- HP 35S
- HP 17B
- HP 32S
- HP 31E
- HP 38E times two
- HP 38C
- HP 34C
- HP 31E
- HP 35 prototype case
- HP 67 spare NOS 1976 case
- HP 80 times two
- HP 41CV
- two more HP-41CXs
- One tall keys 41C (yese they are actually taller as well as more vertical)

Cheers, Geoff

OT: RPN Casio Guys

*Message #1 Posted by **Chuck** on 26 Aug 2009, 4:47 p.m.*

Hugh's RPN replacement calculator, RECKON, for the Casio Slim (or FX-9860g)prompted me to finally get one, and I must say I'm impressed with the calculator and with RECKON. However, the SDK has me a bit buffaloed right now, so I haven't begun to create my own Add-in replacement. I also have to say a big thanks to Nigel for posting his RPN replacement, CasioRPN. This will certainly help me understand the "C++" coding for the calculator a bit more, and may prompt me to attempt to write one.

Since this is my first Casio (after using 20 HP's over the last 30 years) I went about creating my usual vector analysis program (something I have on several hp's) which does norms, dot and cross products, projections, additions, and angle between vectors, along with some simplistic error checking. I though this might help me understand the little bugger a bit more.

For those with the Casio slim and a desire for it to do some vector calculations, here's my little attempt at programming. I think it should be self-explanatory.

VECANAL

[Back to your regularly scheduled HP discussions] :)

CHUCK

in response to message #1 by Chuck

Hi Chuck,

You might want to flash your ROM to the latest firmware if your model isn't already. there was 2.0 release from casio a while back.

I started using the textbook style display of the built in calculator and it's rather cool. I want to try to add something like that to Reckon at some point. ie formula drawing.

The free c++ compiler in the SDK is good. i've had no problems with it. It would be nice if casio would add more functions to their SDK. Hopefully, they will continue to support the SDK and improve it.

If you find any bugs in reckon, let me know and i'll fix it.

good luck, -- hugh.

*Message #3 Posted by **Chuck** on 27 Aug 2009, 11:49 a.m.,*
in response to message #2 by hugh steers

Hi Hugh. When I received the slim a week ago I flashed it to OS 01.11.0000. The Casio website that OS 2 isn't for the Slim. Now I'm confused. Can I upgrade to 2.0? Also, as Nigel pointed out, there was an error in my vecanal program (still not proficient with FA-124 and what you can and cannot do). I've uploaded a working copy without the return error.

*Message #4 Posted by **hugh steers** on 27 Aug 2009, 12:57 p.m.,*
in response to message #3 by Chuck

there's some doubt now whether casio are distributing the firmware upgrade for the slim anymore. i put of a copy of the official firmware upgrade that _was_ released by casio here,
http://www.voidware.com/tmp/9860slim_osup_200.zip

im not sure if it is still available from the casio website.

Re: OT: RPN Casio Guys

*Message #5 Posted by **Chuck** on 27 Aug 2009, 2:25 p.m.,*
in response to message #4 by hugh steers

Thanks Hugh. It's definitely not available from Casio anymore, and I spent far too long looking for it. :) Thanks for the link.

CHUCK

Re: OT: RPN Casio Guys

*Message #6 Posted by **Nigel J Dowrick** on 27 Aug 2009, 9:35 a.m.,*
in response to message #1 by Chuck

Thanks for the mention! My program CASIOPRN is (sadly) written in C, not C++, but I hope you will still find it interesting. Incidentally there was a bug in it which affected tangents, sometimes; the version now on http://www.mediafire.com/casiorpn no longer has this bug. Upgrade to be safe!

I've tried using your vector program and I like its design. One oddity: I keep on getting error messages that result from the source code containing "IfEndClrText" without a return between "IfEnd" and "ClrText". I've got version 2 of the calculator OS and transfer program installed here, but why that should mess up one particular combination of commands (in several places in the program!) isn't clear.

Keep going with the Casio! The SDK is helpful and enormous fun. Since writing CASIORPN I haven't had the chance to do much more work but I'm looking forward to getting into it again. I think that it's the sheer attractiveness of the hardware (especially that high-contrast display) that makes developing for it such a pleasure.

Nigel

Re: OT: RPN Casio Guys

*Message #7 Posted by **Chuck** on 27 Aug 2009, 10:30 a.m.,*
in response to message #6 by Nigel J Dowrick

Thanks Nigel. That line (lines) of code happened when I tried to edit the program on the computer and not

the calculator (I guess it's not possible). I thought I had posted the corrected file, oops. The corrected one is now posted, so it should work better.

The last time I did any major programming was back in the days of Turbo Pascal. I'm not sure if I want to tackle C or C++; maybe this winter when I'm stuck inside.

Challenge: Maximum Partition Product

*Message #1 Posted by **Kiyoshi Akima** on 26 Aug 2009, 1:45 p.m.*

For a positive integer N>1, what is the maximum product of a partition into the positive integers?

An example will make it clearer. {2, 2, 2, 2}, {2, 6}, and {3, 5} are three of the many possible partitions of 8 into one or more (not necessarily distinct) positive integers. That is, 2+2+2+2 = 2+6 = 3+5 = 8.

Now consider the product of the partition elements. 2*2*2*2=16, 2*6=12, 3*5=15. What is the maximum possible? (Hint: it's larger than 16.)

The challenge is to write a program on your favorite programmable handheld HP that, given N>1, produces the maximum partition product MPP(N).

Next week I'll present my (not necessarily optimal) solution, which is less than MPP(8) steps in length.

Re: Challenge: Maximum Partition Product

*Message #2 Posted by **Mark Edmonds** on 26 Aug 2009, 3:17 p.m.,*
in response to message #1 by Kiyoshi Akima

> Quote:
>
> ...which is less than MPP(8) steps in length.

I have a formula (or rule) for calculating this but I can't code it in anything like the number of steps you are using! That's assuming my value for MPP(8) is what I think it is. My first draft came in at ~32 steps!!! Which calc have you used to get it less than MPP(8) steps? Very puzzled!

Mark

Re: Challenge: Maximum Partition Product

*Message #3 Posted by **Mark Edmonds** on 26 Aug 2009, 4:01 p.m.,*
in response to message #2 by Mark Edmonds

Well, I am going to submit this code so I hope my method of calculation is correct. I am also going to consider this optimised because I don't think this particular method can be reduced any further (although using MOD would save a couple of steps but I assumed most HP don't have MOD).

```
LBL A
ENTER
ENTER
3
/
IP
STO 1
3
*
-
STO 2
3
RCL 1
1
-
Y^X
2
ENTER
2
RCL 2
```

```
Y^X
+
*
RTN
```

Does it work OK?

Mark

Re: Challenge: Maximum Partition Product

*Message #4 Posted by **Steve Perkins** on 27 Aug 2009, 5:24 p.m.,*
in response to message #3 by Mark Edmonds

I enjoyed deciphering your formula. Very clever.

Allow me to optimize it using MOD and stack operations (on a 41C).

```
LBL P
RCL X
3
MOD
3
STO- Z
STO/ Z
RCL Z
INT
Y^X
2
ENTER
R^
Y^X
+
*
END
```

This is close to the 14 step challenge by Kiyoshi Akima! You can do a lot when you combine ideas, right?

Edited: 27 Aug 2009, 5:25 p.m.

Re: Challenge: Maximum Partition Product

*Message #5 Posted by **Mark Edmonds** on 27 Aug 2009, 6:55 p.m.,*
in response to message #4 by Steve Perkins

Thanks Steve :) Actually, I was going to abandon that program as everyone else was coming in with significantly shorter versions. I've got a new one to post which I'll do after Egan's further down as it is more relevant there.

I was having trouble with your optimised version due to variables appearing without being init (I'm not too familiar with the 41 ins-and-outs) until I realised you must be referencing the stack directly, hence use of X, Z, T. What a great feature! I think you can do this in the 42s but was the 41 the first calc to allow direct stack variable manipulation?

Mark

Re: Challenge: Maximum Partition Product

*Message #6 Posted by **Steve Perkins** on 27 Aug 2009, 6:18 p.m.,*
in response to message #3 by Mark Edmonds

One more version. 14 steps, not including initial LBL and END.

```
LBL P
2
RCL Y
3
STO- T
STO/ T
MOD
Y^X
2
+
3
```

```
RCL Z
INT
Y^X
*
END
```

Re: Challenge: Maximum Partition Product

*Message #7 Posted by **Steve Perkins** on 26 Aug 2009, 3:58 p.m.,*
in response to message #1 by Kiyoshi Akima

Here's my attempt. It's 17 steps on a calcultor with LBL and RTN. Only 13 steps on my HP-12C!

It gives MPP(8) = 18

```
LBL A
1
STO 01
CLX
4
X<>Y
LBL 01
X<=Y?
GTO 02
3
STO* 01
-
GTO 01
LBL 02
RCL 01
*
RTN
```

Re: Challenge: Maximum Partition Product

*Message #8 Posted by **Mark Edmonds** on 26 Aug 2009, 4:22 p.m.,*
in response to message #7 by Steve Perkins

Crikey Steve! Nice solution! Somewhat shorter than my version :(:(:(

So trying to salvage something from the rubble, I can justify my code's bloat because it has one advantage - it takes the same amount of time for all numbers. So as near as makes no difference, calculating MPP(8) should take the same time as calculating MPP(500). For small numbers, your solution wins hands-down but for large, mine will pull ahead.

Mark

Re: Challenge: Maximum Partition Product

*Message #9 Posted by **Kiyoshi Akima** on 26 Aug 2009, 6:13 p.m.,*
in response to message #8 by Mark Edmonds

For the record, my current best attempt is a 14-step constant-time program on the 41C, not counting the initial LBL or the final RTN/END. Good thing I denied optimality, since a shorter version has already been posted. But like Mark's, mine is a constant-time program (more or less).

Getting an EXACT answer for MPP(500) will take a little more effort, since that's an eighty-digit number. But the approximation requires perceptibly no more time than MPP(5).

The 14-step 41 program (note the symmetry) was a straighforward translation of a 13-step RPL program. And I suspect Peter is right on one point --- it should be a one-liner on the 71B.

Re: Challenge: Maximum Partition Product

>
> Getting an EXACT answer for MPP(500) will take a little more effort, since that's an eighty-digit number. But the approximation requires perceptibly no more time than MPP(5).

I converted my program to RPL and MPP(500) is:

31,853,582,177,039,572,006,128,297,181,359,762,867,862,759,052,962,792,242,225,097,317,150,555,373,883,058.0 (or 2*3^166)

Hopefully, someone somewhere in the universe will find that number useful.

Mark

Re: Challenge: Maximum Partition Product

*Message #11 Posted by **PeterP** on 26 Aug 2009, 8:59 p.m.,*
in response to message #9 by Kiyoshi Akima

10 Input "N=";N @ Y=Floor(N/3)-Mod(Mod(N,3),2) @ Disp 3^Y*Max(1,N-3*Y)

gives (at least I hope) correct results. Here is how I came up with it. From reading the posts I saw that at least one had come up with a formula rather than my (wrong)iterative approach. Hmmm.

From my original thinking I knew that if you split N into 2 numbers only, you want them to be as close to the mean as possible. Secondly, more numbers is generally (but not always as I learned) better as exponentiation is more powerful than multiplication.

Given that there a)is a formula, b)we want the numbers to be as close to each other as possible or - ideally - identical, I tried to set up p = (N/X)^X and then find the best x, with N/x not necessarily integer.

A little bit of differentiation leads to x=N/e as the only maximum. So in integer world we would want the closest integer to N/x = N/(N/e) = e. Which is 3. This has the - at least for me - astonishing result that independent of N we 'love' lots of 3's! Even though the pgm seems to yield the correct result, this is still quite puzzling to me, so much so, that I don't quite trust my logic.

Anyway, following this nevertheless we now have as the first parts of the partition int(n/3) 3's.

This then leaves us with a remainder r of 0, 1 or 2 so that the sum of the parts gives N. If that r is 0 or 2 we are done - p=3^(N/3) or 3^int(N/3)*2. If we have 1 we actually want to 'steal' one 3, add it to the 1 to get to 4 as the maximum multiplication we can get from 4 is 4 and not 3*1).

This is then easily implemented in the above 1-liner for the 71B which now has the advantage that even for large N it pretty much gives the number instantaneously.

Cheers

Peter

Re: Challenge: Maximum Partition Product

*Message #12 Posted by **Egan Ford** on 27 Aug 2009, 2:26 a.m.,*
in response to message #11 by PeterP

My 71B FORTH version (16 words/steps < 18):

```
: MPP 1 SWAP DUP BEGIN 4 > WHILE SWAP 3 * SWAP 3 - DUP REPEAT * ;
```

Mark mentioned MPP(500), so I thought I'd give that a try, however it looks like I am a bit late (the 71B does not have arbitrary precision integers like the 50g, so a bit of work was needed).

Output:

```
MPP(0100)=7412080755407364
MPP(0200)=6180630876526522472384128360705 8

Re: Challenge: Maximum Partition Product

*Message #13 Posted by **Mark Edmonds** on 27 Aug 2009, 7:10 p.m.,*
in response to message #12 by Egan Ford

This is the right spot to add my RPL version which is based on my original formula. I haven't optimised it, I just did a near 1:1 conversion.

Benefits of this version - significantly faster than the looping versions for very large MMP(n) and the *exact* answer for all values of n upto somewhere in the region of just above 30,000. MPP(30,000) has 4770 digits so I wont type them all in!!

```
\<<
 DUP 3 MOD 2 SWAP ^ 2 + R\->I SWAP 3 / IP 1 - R\->I 3 SWAP ^ *
\>>

67.5 bytes
```

Requirements: any RPL+CAS calc (and a nice example of how powerful that combination is).

Mark

Re: Challenge: Maximum Partition Product

*Message #14 Posted by **Egan Ford** on 26 Aug 2009, 5:11 p.m.,*
in response to message #7 by Steve Perkins

On the 15C you can change:

```
1
STO 01
CLX
```

to

```
MATRIX 1
```

and,

```
RCL 01
*
```

with

```
RCLx 01
```

My 15C version of MPP(n)=3*MPP(n-3) for n > 4:

```
001 - 42,16, 1  MATRIX 1   (aka 1 STO 0 STO 1)
002 -        4  4
003 -       34  x<>y
004 - 42,21, 1  LBL 1
005 -    43 10  x<=y
006 -    22  2  GTO 2
007 -        3  3
008 - 44,20, 1  STOx 1
009 -       30  -
010 -    22  1  GTO 1
011 - 42,21, 2  LBL 2
012 - 45,20, 1  RCLx 1
```

Just enter the number, R/S. Probably best CLEAR PRGM first.

*Message #15 Posted by **PeterP** on 26 Aug 2009, 4:33 p.m.,*
in response to message #1 by Kiyoshi Akima

Hopefully Valentin is not around as he would have done it in 1-2 lines max. Somehow I can't quite remember the syntax for DEF FN. Below is a 71b program which I think works but due to the use of SUB instead of DEF FN takes quite long for larger X. And technically it does not deliver the right result for 2 and 3, which should be 1 and 2 (i think).

Cheers

Peter

```
10 Input "N:=?";N @ P=0 @ Call M1((N),P) @ Disp P
20 SUB M1(N,P) @ IF N < 5 Then P=N @ Goto 40
30   Call M1((ceil(n/2)),p1) @ Call M1((floor(n/2)),p2) @ p=p1*p2
40 End Sub
```

Slightly shorter and way faster, now using a reference and only the stack:

```
Z0001 LBL
Z0002 ENTER
Z0003 ENTER
Z0004 4
Z0005 -
Z0006 ENTER
Z0007 ENTER
Z0008 3
Z0009 INT/
Z0010 2
Z0011 *
Z0012 -
Z0013 3
Z0014 x<>y
Z0015 y^x
Z0016 x<>y
Z0017 +/-
Z0018 3
Z0019 RMDR
Z0020 2
Z0021 x<>y
Z0022 y^x
Z0023 *
Z0024 RTN

LN=144 CK=4D4C
```

Re: Challenge: Maximum Partition Product

*Message #20 Posted by **Kiyoshi Akima** on 31 Aug 2009, 12:08 p.m.,*
in response to message #1 by Kiyoshi Akima

Nice to see that no one tried to generate all the possible partitions for a given N. For those who don't see where the scheme comes from, here's a brief analysis leading to my initial result.

First, there is no point in putting any 1s in the partition, since 1+M > 1*M. Because of that, the only partitions for 2 and 3 are the trivial ones. For 4, {2, 2} and {4} produce the same result (2*2=4). For the rest of this analysis, I'll always use {2, 2}.

For 5, {2, 3} is better than {5}.

For 6, {3, 3} is better than {2, 2, 2} or {6}

For 7, {3, 2, 2} is the best.

Define Q=floor(N/3) and R=N mod 3. This splits the problem into three cases.

If R=0, then MPP(N) = 3^Q

If R=1, then MPP(N) = 4 * 3^(Q-1) = 3^Q * 4/3

If R=2, then MPP(N) = 2 * 3^Q

The formula seems to require getting as many 3s as possible, only throwing in 2s when necessary. Not very surprising,

considering that 3 is the integer closest to e, and 2 the next closest.

Given the 3^Q term in each, the formula can be written as MPP(N) = F(R) * 3^Q, where F(0) = 1, F(1) = 4/3, F(2) = 2. There's an infinite number of functions F(R) which will produce the desired result, including a quadratic, but is there something better?

Consider G(R) = 1/F(R) so that MPP(N) = 3^Q / G(R). Then G(0) = 1, G(1) = 3/4, G(2) = 1/2. Note something about G? It's linear! G(R) = 1 - R/4.

Thus, MPP(N) = 3^Q / (1 - R/4), or written out in full, MPP(N) = 3^(floor(N/3)) / (1 - (N mod 3)/4)

In RPL this led me to the 13-step program

```
<<
 3. DUP2 / IP ^ 1. ROT 3. MOD 4. / - /
>>
```

Translated to the 41C, this led me to the 14-step program

```
001 3
002 RCL Y
003 3
004 /
005 INT
006 Y^X
007 1
008 R^
009 3
010 MOD
011 4
012 /
013 -
014 /
```

Okay, I know I'm cheating a little, since the "RCL Y" is not available on most RPN machines. But then, "Y^X", "R^" and "MOD" aren't universally available, either. So, continuing to cheat, if the PPC ROM is available the program comes down to 11 steps:

```
001 3
002 XEQ 'QR
003 3
004 RCL Z
005 Y^X
006 X<>Y
007 -4
008 /
009 1
010 +
011 /
```

QR is a routine that provides the integer quotient and remainder in one shot.

On a TI-86 it's a one-liner:

```
:Prompt N:3^int (N/3)/(1-.25(mod N,3
```

The one-liner on a 71B should be very similar.

This was as far as I'd gotten when I initially posted this little challenge. But after reading some of the early responses, I was inspired to do a little more.

Continuing to cheat, let's take another look at the problem. This time, define Q=floor((N-2)/3) and R=(N-2) mod 3. Then:

If R=0, then MPP(N) = 2 * 3^Q

If R=1, then MPP(N) = 3 * 3^Q

If R=2, then MPP(N) = 4 * 3^Q

This leads to MPP(N) = 3^(floor((N-2)/3)) * (2 + ((n-2) mod 3))

This led me to a 13-step 41C program

```
001 2
```

```
002 -
003 RCL X
004 3
005 STO T
006 MOD
007 ST- Y
008 2
009 +
010 X<> T
011 /
012 Y^X
013 *
```

and, again using the PPC ROM, this time a 10-step program

```
001 2
002 -
003 3
004 XEQ 'QR
005 2
006 +
007 3
008 RCL Z
009 Y^X
010 *
```

This is still 13 steps in RPL

```
<<
 2. - 3. DUP2 / IP ^ SWAP 3. MOD 2. + *
>>
```

but it has the advantage of being easily convertible to work in exact mode for 1 < n <= 30001. The limitation seems to be that ^ will not accept an argument >9999 in exact mode.

```
<<
 2 - 3 DUP2 / IP ->NUM R->I ^ SWAP 3 MOD 2 + *
>>
```

There are ways around the limitation, using the relationship 3^(a+b) = 3^a * 3^b, but I think this is enough for now.

Nicely done!

And thanks for the challenge.

Re: Challenge: Maximum Partition Product

*Message #22 Posted by **PeterP** on 31 Aug 2009, 1:14 p.m.,*
in response to message #20 by Kiyoshi Akima

Thanks so much for this little challenge and great explanations! I'm very impressed with your knowledge of a wide array of programming languages for the HPs!

From your explanation it would also seem that surprisingly my thinking for the one-liner for the 71b was correct...

Lastly, if you use the Sandbox Rom from Angel Martin instead of the PPC for your very neat trick(!), you can cut th HP41C version down to 10 steps (and a tiny speed improvement)...

```
001 3
002 QREM
003 LastX
004 RCL Z
005 Y^X
006 X<>Y
007 -4
008 /
009 IncX
010 /
```

Thanks again

Peter

HP-65 goes for $250,000

*Message #1 Posted by **Don Shepherd** on 25 Aug 2009, 7:20 p.m.*

OK, it wasn't an HP-65, it was a 1971 Z28 Camaro and the buyer was John Schnatter of Louisville, KY, AKA Papa John of Papa John's pizza. John sold that very same car in 1983 to rescue his father's business, and he always dreamed of getting the car back one day. Well, today it happened.

So when you see an HP-41 or HP-71 sell for $800 or so, it just means that it was worth it to the individual who bought it.

Re: HP-65 goes for $250,000

*Message #2 Posted by **Les Wright** on 25 Aug 2009, 10:22 p.m.,*
in response to message #1 by Don Shepherd

I am not lucky with the estate sale bargains people boast about. I have paid at times too much for a piece and have often thrown quite a bit of money at Randy for repair or occasionally rerepair since I have no talent for such things though I pretend I do--i.e., once Randy refixes the HP-97 I recently buggered up through folly, I will be into that machine for about 400 or 500 bucks since I first got it. But 400 bucks for an HP-65 in good cosmetic and working condition with manuals is worth it, consider the original msrp of 800 in 1974 dollars and its historical importance.

I agree, Les. In fact, I paid close to that for just such an HP-65 two or three years ago, and I have gotten as much joy from that grand old machine as Papa John will get from the car of his youth!

(Re-)acquiring possessions of youth

> Louisville, KY, AKA Papa John of Papa John's pizza. John sold that very same car in 1983 to rescue his father's business, and he always dreamed of getting the car back one day. Well, today it happened.

Seeing an HP-41CV and an HP-34C for sale in a used-electronics store in 2002 got me started in collecting the fine (and expensive) HP calc's of yesteryear. I had coveted the unaffordable HP-41 as a teenager and been intrigued by the HP-34C shortly thereafter, then bought an HP-15C in 1983, turning down the HP-34C I had set out to buy. It's a powerful draw to acquire valued trappings of youth that were lost or never obtained.

Certainly, however, mass-produced examples of those two calc's did not compare even remotely to John Schnatter's particular prized car. It must be comfortable to have a quarter-million dollars of discretionary income (and certainly much more) to indulge such a wish.

Off-topic...

As for the 1971 Camaro itself: It is of the 1970-81 body style that I never found particularly handsome. The original 1967-68 and the crisp 1969 models are generally much more desired, to my knowledge.

It's also understandable why a young man would want to have a 12-year-old American "muscle car" Camaro in 1983 instead of a newer one. Cars in the early 1980's were virtually emasculated in order to comply with tough new emissions and fuel-economy regulations, before advanced automotive technology came along in the mid-1980's. A modest 1983 Volkswagen Rabbit GTI was quicker, 0-60 miles per hour, than a base 4-cylinder 1983 Camaro.

Before I had HP calculators, I had Sharp calculators

*Message #1 Posted by **hecube** on 25 Aug 2009, 7:00 p.m.*

The very first programmable calculator I ever had was a Sharp PC-1201 in 1980. I gave it to my sister when I got a Radio-Shack PC-1. It then got lost somewhere. In recent years, I kept asking my parents where the calculator might have ended up. They don't remember but I suspect it got sold in a garage sale a long time ago.

Anyway, I had to get another one on eBay just for the fun of it. It's a beautiful machine:

Forgive me for this nostalgia post...

Valentin Albillo has written a lot about the Sharp calculators and pocket computers.

Re: Before I had HP calculators, I had Sharp calculators

*Message #3 Posted by **Valentin Albillo** on 26 Aug 2009, 6:44 a.m.,*
in response to message #2 by bill platt

Indeed, both as full-fledged articles as well as many posts in the forum. Just for instance, you can have a look at this article in PDF format:

Know Thy Foe: A New Contender

This is a 12-page article which confronts two great contemporary, ground-breaking machines of the early 80's, the **HP-41C** versus the **SHARP PC-1211**. The article includes no less than 6 excellent side-to-side pictures comparing specific features of both models, a thorough description of their differences, as well as two test-case programs, each of them written for both models, to better see them in action by attacking the very same problem using their respective programming paradigms.

Finally, no less than four additional sample programs for the SHARP PC-1211 are featured, all of them less than 10 lines long yet dealing with fairly complex tasks.

Best regards from V.

Re: Before I had HP calculators, I had Sharp calculators

*Message #4 Posted by **Eric Smith** on 25 Aug 2009, 8:06 p.m.,*
in response to message #1 by hecube

It wasn't programmable in the conventional sense, but the first scientific calculator I owned was the Sharp EL-5100, which had a 24-character display and could store up to 5 algebraic formulae. I had been using friends' HP calculators starting with the HP-67, but couldn't afford to buy my own HP until 1981, when I bought an HP-41CV.

Re: Before I had HP calculators, I had Sharp calculators

*Message #5 Posted by **hecube** on 25 Aug 2009, 10:00 p.m.,*
in response to message #4 by Eric Smith

The PC-1201 was a Christmas gift. It was my choice and it was a toss-up between the El-5100 and the PC-1201. The fact that the EL-5100 had limited programmability clinched the deal for the PC-1201...

The first calculator I ever purchased (August 1981) was a SHARP EL-5813. I also gave mine to my sister about six months later when I got a TI 51-III. It was programmable too, albeit very limited.

This is the first program I ever wrote:

2ndF LRN (((K_2 +/- + (K_2 x^2 - 4 K_1 K_3) 2ndF sqrt) / 2 K_1) 2ndF LOOK + K_2 / K_1) +/- 2ndF

```
LRN
```

The coefficients a, b and c would be stored in K_1, K_2 and K_3, respectively, and the program would solve the quadratic equation.

Thanks for reminding me :-)

*Message #7 Posted by **marais** on 26 Aug 2009, 3:37 a.m.,*
in response to message #6 by Gerson W. Barbosa

Mine too! A cute little machine, my first experience with a programmable, which started an interest that never left me. The intriguing COMP/LRN button which set the calculator apart from the rest. I also like the slim metal case, the excellent display and the good keyboard quality. I had mine only a year or two, when it got stolen in class. I replaced it by a Casio FX-602P, and just for the fond memories got one on ebay many many years later.

*Message #8 Posted by **Mark Edmonds** on 26 Aug 2009, 6:57 a.m.,*
in response to message #7 by marais

My second calc was a Sharp after my wonderful TI57 got stolen from a school locker. The Sharp was the infamous Radio Shack/Tandy PC1 which was a fun and novel experience but rather slow! I still have it of course but the display is bleeding a little :(

When the Sharp PC1500 came out with its 4 colour plotter, extra memory and other accessories, I had the worse case of gear-lust I've ever experienced! I just never had the money for it but over 20 years later, I got one for a fiver. Sadly the plotter pens are dead or missing and where do you get those from today?

Mark

Halcyon Calc for iPhone/iPod Touch : a clone of an HP-28S ?

*Message #1 Posted by **Jean-Michel** on 25 Aug 2009, 3:24 p.m.*

Hi all,

I found this app this evening by doing my usual "calc" search in the AppStore. It's available from 22/08 on only. Has anyone already bought and used it?

I also saw another clone of HP-12C called "Calc 12E", but in this case, the origin is clearly announced!

Regards from France.

J.-M.

Re: Halcyon Calc for iPhone/iPod Touch : a clone of an HP-28S ?

*Message #2 Posted by **Chuck** on 25 Aug 2009, 3:36 p.m.,*
in response to message #1 by Jean-Michel

It looks like it has 28S-ish buttons and some features, but I wouldn't call it a clone (e.g. no graphing); more of an "inspired by the 28S" rpn calculator.

Re: Halcyon Calc for iPhone/iPod Touch : a clone of an HP-28S ?

*Message #3 Posted by **Jeremy Rand** on 26 Aug 2009, 2:33 p.m.,*
in response to message #2 by Chuck

As the author of the program, I can confirm that version 1.0 is intended to be a subset of HP-28S functionality. The subset includes:

- real, complex and integer numbers and strings, lists, symbols and expressions are supported[/li]
- trig, log, real, complex, binary, string, solv, list, stack, store and memory menus (a couple of operations missing from the string menu, transforming the LCD display to a string and back again)[/li]

It also has some nice features which the iPhone interface provides like being able to scroll quickly back through the stack and use your finger to swipe through the menus instead of using Next and Prev.

Some things are still missing, mainly programs, vectors, arrays, plotting, calculus and the algebra menu. I encourage anyone interested in the application to visit our website. There, you can find a poll where you can vote on what I add for the next version and the documentation I have put together which describes what functionality is included in the support section. I hope to also have a video on line within a week or so which will better describe what the application is capable of.

Thanks for your interest and feel free to contact me if you have any questions about the app.

HP 48G Statistics question

*Message #1 Posted by **Ren** on 25 Aug 2009, 11:30 a.m.*

Hello,

In my Chemistry class we will be required to do statistical analysis (mean, std deviation, error, % error) on our lab experiments.

I'm trying to use a HP48G to do this. In one of the sample questions the instructor has supplied, I need to calculate the above stats (mean, std deviation, error, % error) from this data (0.0064, -0.0169, 0.0201, -0.0096).

Using the (right shift)STAT function, I entered the values, (checked Mean, Std Dev, and Total). The SD came out alright, but both Mean and Total came out 0 (zero)

What do I need to do to get more decimal places?

Right now in MODES my Number Format is in STD, But if I use one of the other modes (Fixed, Sci, or Eng) will I need to set the number of decimal places each time I'm given a different data set?

Thanks,

Ren

PScalc95 (48SX sim) on 200LX: Abnormal program termination

*Message #1 Posted by **Dave Britten** on 25 Aug 2009, 10:00 a.m.*

I stumbled across PScalc95 yesterday (48SX sim written specifically for the 95LX), but when I try to run it on either my 200LX or my desktop, I just get "Abnormal program termination" and nothing else. Anybody had any luck getting this working?

It's available here in the pscalc.lzh archive if you guys want to play around with it:

http://ftp.monash.edu.au/pub/palmtop/

I'd love to get it working - it sounds like it could be a significant missing link in functionality for my 200LX.

Re: PScalc95 (48SX sim) on 200LX: Abnormal program termination

*Message #2 Posted by **Chuck** on 25 Aug 2009, 10:56 a.m.,*
in response to message #1 by Dave Britten

Hi Dave. I loaded it onto a memory card and it ran fine out of the filer and out of dos. I'm wondering if your computer didn't expand it cleanly.

Chuck

Re: PScalc95 (48SX sim) on 200LX: Abnormal program termination

*Message #3 Posted by **Dave Britten** on 25 Aug 2009, 11:22 a.m.,*
in response to message #2 by Chuck

Bingo, I expanded it with WinRAR instead and got an exe that's 34 bytes smaller. Weird! I guess I'll have to be wary of using FilZip to extract LZH archives. Thanks!

fixing my newly acquired HP-48sx

*Message #1 Posted by **Hugh Evans** on 25 Aug 2009, 1:07 a.m.*

I purchased a 48sx on ebay for $35 as is (from a surplus lab equipment dealer who didn't feel like testing it.) VG cosmetic condition I should add. It doesn't start and has a bit of wear in the bezel (someone obviously started it by pressing it there for a while to make it start). To make a long story short, it's not starting with a fresh set of batteries (the battery compartment has no corrosion and overall condition is very good).

I've tried resetting with a paperclip with no results, shorted the battery terminals, and pressed in the middle of the bezel with no results. Should I try soaking in in dilute vinegar followed by DI and IPA, and let dry first? Should I go ahead and open it to install a new foam pad?

PS. I can probably access a sonicator if needed. Right now Im leaning towards soaking it in dilute vineagar, bathing in a few trimes in DI under sonication before testing it again.

Thanks in advance!

Need help with test

*Message #1 Posted by **hecube** on 24 Aug 2009, 8:45 p.m.*

I don't have manuals for either my HP-48SX or my HP-38G. I'd like to do a simple test, transmitting something over the IR port from one machine to the other.

Help anyone?

Re: Need help with test

*Message #2 Posted by **Martin Pinckney** on 24 Aug 2009, 9:48 p.m.,*
in response to message #1 by hecube

You can download the manuals from HP for free here. At least they still have the 38g and 48gx.

Re: Need help with test

*Message #3 Posted by **Bart (UK)** on 25 Aug 2009, 5:40 a.m.,*
in response to message #2 by Martin Pinckney

The 48S series operations are somewhat different to the 48G series. The manuals are available on the museum's CDs or DVDs.

After some exhaustive searching, this was the only place I could find them. Get the DVD's and you're set for all future purchases of old HPs.

Why do so many sell old HP calc to US users only?

*Message #1 Posted by **jotne** on 24 Aug 2009, 1:38 a.m.*

If you look at all the HP-15C sold on eBay, most of them do not ship outside US, why?

This exclude all other than the US people to bid on the item.

Re: Why do so many sell old HP calc to US users only?

*Message #2 Posted by **hecube** on 24 Aug 2009, 11:12 a.m.,*
in response to message #1 by jotne

For any kind of item sold on eBay, I delightfully ignore those territorial exclusions. I strongly suspect that sellers set this flag out of sheer ignorance.

Most of the items I bought so far were for US only. There are few cases when eBay blocks you from bidding. A simple email to the seller asking permission to bid solves the problem.

I live in Canada BTW.

Re: Why do so many sell old HP calc to US users only?

*Message #3 Posted by **Jeff Kearns** on 24 Aug 2009, 11:39 a.m.,*
in response to message #2 by hecube

I live in Canada also. In most of the Q&A's I have seen for US only shipping, the seller has stated that he will only sell/ship inside the US, although I don't have any real stats on that... Hopefully you are right and all it would take in 'most' cases is an email/question to seller. --- JeffK

Re: Why do so many sell old HP calc to US users only?

*Message #4 Posted by **Mark Edmonds** on 24 Aug 2009, 11:44 a.m.,*
in response to message #1 by jotne

In nearly all circumstances when I've asked the seller if they would sell to the UK, they have refused. When a reason has been given, it has cited paper work or postal problems. The only time I've been able to persuade someone to post to the UK was for a small item that was easy to post (HP85 ROMs).

Some sellers who do sell internationally don't give themselves any chance of getting outside business because their postage costs are astronomic. The other day, there was an HP9830 on auction that I really wanted to have a bid at but the post cost was about $480!!! Given the additional import charges, I would have been over $600 down before I even made a bid. In those circumstances, there is no point in the seller offering international postage!

Mark

Re: Why do so many sell old HP calc to US users only?

*Message #5 Posted by **Dan W** on 24 Aug 2009, 12:09 p.m.,*
in response to message #1 by jotne

Laziness probably. They see it as an additional hassle. I have found there is quite a demand for HP stuff around the world and marketing outside the US will, if nothing else, raise the bids. ;)

I get a lot of interest from Europe, and especially Australia and New Zealand - very active collectors in these countries. Probably half the calculators I have sold have gone overseas.

There are some countries I will not ship to. Most of South America for example, which seems to have oppressive tax laws. I always get a request from someone in Brazil to lie on the customs forms and declare a value of $27.50. Even Mexico has an annoying amount of paperwork so I don't ship there either. Its a good lesson on how taxes and regulations can quickly shut down economic activity.

Re: Why do so many sell old HP calc to US users only?

*Message #6 Posted by **Gerson W. Barbosa** on 24 Aug 2009, 4:19 p.m.,*
in response to message #5 by Dan W

> Quote:
>
> Most of South America for example, which seems to have oppressive tax laws.

In Brazil electronic items are taxed 60%, which is really high. So I had a good surprise in 2006 when my HP-50g, purchased from Samson's Cables, arrived: despite the $145.99 invoice, I wasn't charged any tax! Even with taxes and $25 shipping & handling it would be a good deal because the 50g price tag here is about $390.

While I agree some tax should be applied to new items it's hard to understand why used and obsolete items, which are not a threat to any national economy, are still being taxed.

Edited: 24 Aug 2009, 4:21 p.m.

Re: Why do so many sell old HP calc to US users only?

*Message #7 Posted by **bill platt** on 24 Aug 2009, 5:32 p.m.,*
in response to message #6 by Gerson W. Barbosa

Any tax which is levied to "protect an economy" is a misguided protectionist regulation which hurts the economy in the end. As you have shown before, these high taxes make it difficult for Brasilian individuals and businesses to acquire the technology they need to compete.

Tax should only be levied, at a reasonable level (no more than say 20% in any category) for the purpose of raising govmt revenue with a minimum of economic distortion. That's my opinion but clearly, many "progressive" politicians see a completely different scenario...

Re: Why do so many sell old HP calc to US users only?

*Message #8 Posted by **Martin Pinckney** on 24 Aug 2009, 1:57 p.m.,*
in response to message #1 by jotne

It may be postal regulations/customs forms is the reason, as some have suggested.

However, I think another big reason is payment issues. PayPal seems the preferred method for most sellers. I

have not checked recently, but times past you could not get seller protection for international shipments. Then if you accept a foreign check, your U.S. bank charges a hefty fee for depositing it. It has to be drawn on a U.S. bank to avoid these charges. Even if the seller states all these conditions in the auction, he can't stop someone from ignoring them and winning the auction. So to avoid dealing with these issues, the seller simply limits the sales to within the USA. My opinion.

Re: Why do so many sell old HP calc to US users only?

*Message #9 Posted by **Gene Wright** on 24 Aug 2009, 5:14 p.m.,*
in response to message #8 by Martin Pinckney

Paypal is a big one. If you want to be paid by paypal and you are in the US and the buyer is overseas, you have no protection as a seller if the buyer files a "He didn't ship it" claim or a "He shipped me a rock instead of the item" claim.

The seller is then out their $$ and their item.

Overseas, I tend to recommend bidpay.com, but that just adds to the "hassle" sometimes.

Sorry. I have lots of friends overseas. :-)

Re: Why do so many sell old HP calc to US users only?

*Message #10 Posted by **DaveJ** on 24 Aug 2009, 8:31 p.m.,*
in response to message #9 by Gene Wright

> Quote:
>
> Paypal is a big one.

On eBay Australia every seller MUST accept PayPal as a payment option, no exceptions.

A sneaky by-product of that monumentally stupid move Ebay Australia tried to push some time back to make PayPal the ONLY form of payment allowed on Ebay. Luckily the government watchdog stepped in and told Ebay to shove it. But the bastards snuck through that rule in all the confusion and protest.

Dave.

Re: Why do so many sell old HP calc to US users only?

*Message #11 Posted by **bill platt** on 24 Aug 2009, 10:24 p.m.,*
in response to message #10 by DaveJ

I have pretty much given up on ebay for that reason. For small stuff, with the required paypal fees, you waste too much money.

Re: Why do so many sell old HP calc to US users only?

*Message #12 Posted by **jotne** on 26 Aug 2009, 5:15 a.m.,*
in response to message #11 by bill platt

PayPal should not be a problem, just look at users stats. If they are high positive, then there should be no problem. I have more than 100 feedback from sellers on what I have bought on eBay, all positive...

Re: Why do so many sell old HP calc to US users only?

*Message #13 Posted by **bill platt** on 26 Aug 2009, 8:46 p.m.,*
in response to message #12 by jotne

Feedback is good--it is the cost that kills it.

Re: Why do so many sell old HP calc to US users only?

*Message #14 Posted by **Walter B** on 24 Aug 2009, 5:20 p.m.,*
in response to message #1 by jotne

Quite often I met US citizens selling on TAS who have never ever sent anything out of God's own country so far. At least they appear this way and/or even claim it themselves. Sometimes I as a foreigner have to tell them the postage or these nice flat rate opportunities USPS offers. Feels a bit strange.

Well, states in Europe are slightly smaller, so most people do international mailing here on a pretty regular basis -- and we benefit from the EU (at least here ;) making it unnecessary to fill extensive custom forms. So it isn't a big hassle when we have to write a word and a number on a tag to satisfy customs for any items to be shipped e.g. to the USA.

Just my 20 milli-Euros based on purely personal experience.

Re: Why do so many sell old HP calc to US users only?

*Message #15 Posted by **Marnus Malan (RSA)** on 25 Aug 2009, 5:16 a.m.,*
in response to message #1 by jotne

Hello,

It is a pain, I agree. I think mostly they don't sell to other countries because they don't have to. Somewhere within a population of 280 million you might just find a buyer for anything. For me the problem is even worse, as very few people want to buy from South Africa, thinking it is another Nigeria. Selling things internationally is the only way for me to aquire the funds to buy stuff from international sellers as the South African Rand is not so strong. US$100 is a substantial percentage of my income. But I understand the hassles of shipping abroad. I may pick up a 42s for 1000ZAR, shipping, packaging & insurance is another ZAR450. eventually I have to sell something I aquired for US$125 at US$180 just to break even. Now try and explain to somebody his money is safe if he buys from you in South Africa...

But international selling widens the horison, most of my collection is sourced from abroad.

Cheers

*Message #16 Posted by **Charles Oxford** on 25 Aug 2009, 10:17 a.m.,*
in response to message #1 by jotne

Mailing to a non US destination requires filling out customs form and placing part inside parcel, a minor hassle.

Some sellers refuse to ship outside the original 48 states. I could find nothing to indicate additional hassle to Alaska, Hawaii, Virgin Islands or Puerto Rico.

I didn't check Fedex or UPS or other services.

Maybe an active seller can give more info.

Re: Why do so many sell old HP calc to US users only?

*Message #17 Posted by **Peter Klein** on 25 Aug 2009, 12:24 p.m.,*
in response to message #16 by Charles Oxford

Alaska, Hawaii, PR and such usually require more postage. I think many US sellers don't want to deal with situations where the postage will have to be discussed with the buyer. There may also be the perception that outside the "Lower 48" states, one has less recourse if the sale goes bad.

You've all seen the questions that get posted on eBay sometimes: "I want purchase widget. How much for postage you send my brother in Paris for him send to me widget in Irkutsk? It travel by dog sled. I pay when I get." A few of those, and people get nervous.

I have sold (a camera lens) to someone in Europe once. It worked out, but it was a hassle. Between language issues, misunderstandings about exact postage costs, etc., I spent a lot more time on it than on a U.S. sale. OTOH, I have purchased from Europe, no problem at all.

Another issue is that many other parts of the world like to pay by bank transfer. This is common in Europe, but US banks charge a huge fee, which often makes the transaction not worth it to the US party.k

Everyone has to decide what their comfort level is. As someone mentioned earlier, with 280 million people, the US is a pretty big market. Some Americans are pretty insular, and may believe that outside our country, it's a confusing and dangerous place. They ought to travel more. :-)

--Peter

*Message #18 Posted by **Charles Oxford** on 25 Aug 2009, 5:22 p.m.,*
in response to message #17 by Peter Klein

To these 4 places {Alaska, Hawaii, Virgin Islands and Puerto Rico) I saw only a slight difference in cost in that the are zone 8. Would people in these places object to a few pennies? I still don't see any additional hardship on a seller.

Re: Why do so many sell old HP calc to US users only?

*Message #19 Posted by **db (martinez, ca.)** on 26 Aug 2009, 12:12 a.m.,*
in response to message #17 by Peter Klein

Back when i was selling off my excess i always said that i'd sell and ship worldwide, except for a couple of very heavy things. Since i've lived and traveled where English was useless; i look at language hassles as a fun obstacle to overcome. I take criticism of my English by ESL speakers less gracefully though.

Anyway; Ive sold stuff on ebaby to folks in France, Italy, Jolly Old England, Poland, Japan, Canada (those bellicose, inscrutable, foreign Canuks!) and i've bought stuff from all over too. The only problems i've ever had on TAS were two as a buyer (one from California and one from Washington State), and one as a seller to a buyer from here in California. The Postage Calculator should take care of questions in shipping costs to other countries. I usually say that i'll only ship by USPS (post office), though this can be a problem in some places like most of South America where nothing coming from the states gets through without at least being opened and "inspected". As an asside; CDs never make it through the Chilean post office even though Chileans are "as honest as a Denver man can be" and

NOTHING, including used toilet paper i assume, makes it through the Ecuadorian Correos.

The paperwork to ship overseas is a time eating problem but the people have been fine so far.

in response to message #16 by Charles Oxford

FedEx & UPS to expensive & forms, broker, etc.

USPS has relieved the hassle of forms. Still forms, but minor fill-in the questions and print the docs. Postage, forms and scan form for tracking are all printable. http://ircalc.usps.gov/default.aspx?Mode=Intl_Single&CID=10013

Fault lies with ignorance and fear of being burned. As stated by another, checking feedback relieves lots of fear. And the USPS Scan form is proof of item being sent.

Ignorance - Send them the above link when asking for beyond US borders and of course mention your 100% feedback. Maybe even send a link to your user profile as many do not even know how to find that or are too lazy.

Fear - Paypal does not discriminate between USA or elsewhere when it comes time to decide that no matter what the seller must pay for the buyer's deception because they could not collect from the buyer. If you really want the item tell them to take a better look at your 100% feedback and of course remain within the TAS email system.

Re: Why do so many sell old HP calc to US users only?

*Message #21 Posted by **Randy** on 25 Aug 2009, 4:20 p.m.,*
in response to message #1 by jotne

There are two main reasons not to deal outside of the US:

1) Ignorance 2) Experience

The first group, well, enough said.

The second group was originally in the first group but they tried it and learned that you can loose both your goods and money by way of Paypal rules with no recourse. Sure, it can be done but most don't want to bother to learn how to do it safely. So, they opt for US only since most would rather have $100 with no hassles than $125 with headaches.

BTW, UPS or FedEx are completely out of reach for the casual seller due to the documentation requirements alone. Then don't forget the very high costs they wack the importer with since they act as the customs agent and many times the fees exceed the transportation costs.

in response to message #1 by jotne

I am based in Australia - About 50% of my HP collection comes from the States, 40% from Europe and 10% from Australia.
I would buy a lot more from the States if sellers were more willing to post internationally - If i'm interested in

an item that is not listed for international shipping I usually ask with about a 60% success rate. The 40% that won't usually tell me that they've had a bad experience, or it's just too hard. In some cases they say they can, but it will cost something like USD100!! I usually have to inform them about USPS, not UPS or TNT ... I seem to know more about using USPS than many sellers in USA it seems - should only cost about USD30 and is very reliable.
To date I have not had any problems with international shipping - especially from the States - it takes about 1 to 2 weeks and doesn't cost too much.
Recently I asked if a 34C could be posted to Australia, with a flat out NO - I think 2 other Aussies asked the same question (they displayed messages on the ebay listing). I then got a friend of mine to buy it, who lives in the States - I won the item for about half what it probably would have gone for if it was open to international bidding! So I was happy, but would have been happier to pay more for the convenience of having it shipped straight to me.
Cheers, Keith

in response to message #22 by Keith Midson

Question time - I've seen "TAS" mentioned a few times here and elsewhere but I don't know what it is. I can guess it stands for "The a??? side" perhaps. What is TAS please?

Regarding selling abroad from ebay, I have done this many times with many high value items and never had a problem. I did have one that got a bit scary when a package to Italy took an age to arrive but it got there eventually.

I am in the UK and the international market is critical to getting the best prices for items. It would be no exageration to say that for some items, I have got close to double the price by selling abroad than I would have got by limiting my market to the UK.

Yes, it is more work when calculating postage costs and logistics but that extra work more than pays off. It is this factor that frustrates me when sellers ignore the potential of the international market.

TAS - That Auction Site or The Auction Site.

Re: Why do so many sell old HP calc to US users only?

*Message #25 Posted by **Mark Edmonds** on 26 Aug 2009, 8:02 a.m.,*
in response to message #24 by Jeff O.

Thanks Jeff!

This now puzzles me so I ask anyone:

Is TAS easier to type than ebay? Why refer to ebay as TAS? Is there an ancient voodoo curse that descends on anyone who types in ebay? Or do the secret service monitor peoples' posts by looking for the word ebay, and if you score more than 10 hits, you get branded as an undesirable?

I can personally guarantee that using the word ebay doesn't result in your hair falling out or cause boils to form in your intestines. So with that in mind, could a brave soul step forward and explain why TAS is used please??!

Thank you :)

Mark

Two sources:

1) There were extended discussions many months ago whether eBay should be mentioned in this forum at all / as often (check what you like best). Reasons are links to that site become useless very soon. So searching the archives will end in a lot of pits. IIRC there were even some agreements / rules (as above) imposed by the community / Dave (...). You may find them searching the archives.

2) You may know TOS. IIRC the name TAS was adopted since it looks alike TOS. You may find this searching the archives as well.

HTH,

Walter

*Message #29 Posted by **Mark Edmonds** on 26 Aug 2009, 6:39 p.m.,*
in response to message #26 by Walter B

Thanks Walter.

I certainly wish I had seen the discussions when they were happening because I might have had some points to make - but too late for that now. I hope I wont cause a problem if I continue to use the word ebay rather than TAS.

Mark

PS: TOS = Atari ST OS, the only connection I can think of with that acronym. More searching needed...!

De-allocating memory locations on HP-35s

*Message #1 Posted by **Paul Kleinkramer** on 23 Aug 2009, 8:33 p.m.*

Hi!

I'm getting acquainted with my new 35s and finding the transition from my daily driver, a 20s, pleasant; and the return to RPN very refreshing! I won a 41CX in a college design contest in 1989 and became hooked on HP. I do miss that calculator...

While getting to know my new 35s, I allocated the full 801 variable locations with indirect (i). I thought this was fine until I discovered the hard way, (memory full), that the amount of memory left for programming was trivially small. A calculator reset solved the problem but subsequent reading, plus trial and error, has not turned up a way to de-allocate memory once its assigned to variables.

Any ideas from those who understand this better than me?

Thanks so much! Great fourm,

Paul

Re: De-allocating memory locations on HP-35s

*Message #2 Posted by **Reth** on 23 Aug 2009, 9:29 p.m.,*
in response to message #1 by Paul Kleinkramer

The memory is dynamic - the more "storage" - the less "program" memory; so you should allocate only the number of storage registers you really need. To release memory taken by no longer used registers store zeros in them; the last not-zeroed one draws the border.
It's all clearly explained in the manual.
cheers

Re: De-allocating memory locations on HP-35s

*Message #3 Posted by **Paul Kleinkramer** on 23 Aug 2009, 11:29 p.m.,*
in response to message #2 by Reth

Well,

It's clearly explained in the manual, yet I couldn't get it to release memory. I thought perhaps there was a non-zero value at 801 but it turned out that they were all set to zero.

I suspect it doesn't actually work as the manual says it should.

Re: De-allocating memory locations on HP-35s

*Message #4 Posted by **Reth** on 23 Aug 2009, 11:43 p.m.,*
in response to message #3 by Paul Kleinkramer

I don't have my manual handy, from memory it all worked; there are a few quirks with the calculator and the manual - all available through this forum - google it for HP-35S bugs

>
> - Pauli

Pauli - I want to add another small bugette to your post but I don't want to edit your post directly so if you agree with this one, could you add it please?

In most HPs, if you want to enter 10^6 for example, you just press E or EEX then 6. With the 35s, you have to enter 1 then E and 6 which adds an extra keystroke and shouldn't be necessary. It also adds inconsistency with nearly all HPs from the Voyagers onwards.

I tried this out on a few LCD HPs at random and the only one that needed the 1 was the 19B which otherwise took the E to be part of an alpha message so went into alpha edit mode.

Small but lots of small things add up!

Mark

Re: De-allocating memory locations on HP-35s

*Message #7 Posted by **Dave Britten** on 24 Aug 2009, 6:56 a.m.,*
in response to message #1 by Paul Kleinkramer

Press RightShift-Clear, then pick CLVARx (item 6). You'll be asked for a number; this is the highest numbered variable that you want to keep. Every indirect register past that number will be wiped/deallocated.

> I would like to know like you organizes yours

I am more a user than a collector, my *collection* is sparse compared to yours and many others I suspect.

I store my calcs in a stack, the order is based on usage. The last calc used is on the top. My stack looks like this now:

```
41CX
15C
50g
10C
```

I only support a stack depth of 4. The rest (about 5 or 6 others) are stored in a nice box on a shelf, not far from *the stack*. Think of my emulators as my L1 cache (both iPhone and OS/X), my *stack* would be my L2 cache, the rest would be in main memory and can be fetched with a latency of about 2 seconds.

Ditto on that. Four Pioneers are variously on my desk at work, on the conference room table, or in my desk drawer.

Two Pioneers sit on a shelf under my desk at home, or on the desk or dining room table, when I bring design work home.

One Pioneer sits in the seatback pocket in my truck for emergencies.

My 48sx gets shuttled from work to home as I try to find time to learn how to use it effectively!

Some 38g's sit in a box right now, to be brought out again someday when I remember how much I liked *actually* using them instead of *attempting* to use the 48sx.

in response to message #1 by Saile (Brazil)

I have several photos in this previous thread.

This is just the books (there is a shelf of accessible calculators) The majority of boxed calculators are on top of my desk out of reach.

Re: How do you organize the collection?

*Message #6 Posted by **Katie Wasserman** on 23 Aug 2009, 8:32 p.m.,*
in response to message #1 by Saile (Brazil)

I'm sure I've posted these pictures here before, but I can't find them:

Case 1 -- mixed hand held calculators

Case 2 -- mixed hand held calculators

Case 3 -- older/larger battery powered calculators

Case 4 -- all HP calculators

AC powered calculators

There pictures are pretty old, the cases are a lot more crowded now, but there are themes on a shelf-by-shelf basis. For example: the top shelf of case 2 are all metric conversion calculators; the next shelf down are all financial calculators. The HP calculators are roughly in chronological order left to right, top to bottom.

Then there's this awesome Ride snowboard featuring some of the calculators in my collection.

Re: How do you organize the collection?

*Message #7 Posted by **Jeff Kearns** on 23 Aug 2009, 9:27 p.m.,*
in response to message #6 by Katie Wasserman

What is your 'exact' address? ;-)

Seriously, that is an awesome display!!! Did you get the display cases made to measure? I would love to have a nice display case for my meager 13-strong HP calculator collection (if I can even call it that after seeing yours)... One shelf could also be dedicated to my newly-acquired Hemmi 260 Advanced Engineering Slide Rule.

Mine currently sit side-be-each on my office fireplace mantle. I don't use the fireplace...

Jeff

Re: How do you organize the collection?

*Message #8 Posted by **Katie Wasserman** on 24 Aug 2009, 1:02 a.m.,*
in response to message #7 by Jeff Kearns

Jeff,

It took a long time to find these cases -- a year of looking around -- but as it turns out they were a stock item at a local "furniture barn" and were reasonably priced. The only customization I did was to order additional glass shelves for them and to install the shelves on an angle. This was easy since the display case supports the shelves on pegs that have many possible positions, adjustments at 3" intervals, so I just offset them to get a forward slope.

I store the manuals in the wooden set of drawers next to the the case with the HP calculators in them. I bought this at the same "furniture barn" also for a reasonable price. Unfortunately this store has gone out of business so I can't give you a pointer to them. However they were clearly mass produced and probably sold to many "furniture barn" type places.

Getting a nice display case really helped me get my collection going. Before I bought my first display case I had filled up a small, junky old bookcase with a couple of dozen calculators and manuals and it wasn't nearly as enjoyable to take them out and play with them. Now I keep all the calculators in the display cases ready to play with by converting them to use Energizer lithium AAA or AA cells. So I never have to charge them or worry about leakage (as far as I know).

-Katie

Is it RPN?!

Re: Other brands of calculators in space

*Message #4 Posted by **Mark Edmonds** on 23 Aug 2009, 4:54 p.m.,*
in response to message #3 by hecube

I've seen a Russian calc on ebay that was claimed to have been in space. I've no idea of the make, nor do I know any Russian makes and I didn't pay much attention because I didn't have much faith in the truth of the auction - too easy to fake something like that and how would you prove it?

I think it would be a fairly safe bet that the Russians never used HP up until they started sharing Mir and then became part of the ISS establishment when HPs would have been on-board. I am only guessing on the last two, simply because those would be the only times the Russians had other country's astronauts on board who might bring along an HP.

HP and Kinpo - Are you Listening ? [HP-01 Inspiration]

*Message #1 Posted by **John Stark** on 23 Aug 2009, 12:27 p.m.*

Regarding the HP.01, an extraordinary achievement in its time, and still useful today...

What do you think of HP/Kinpo following up the HP.01 with an updated "homage" using current solar power and display technology, whilst retaining all the unique functionality of the original, especially its interactive time features ?

Starting point could be the advanced "Casio Pathfinder" watch line with its stout packaging and sophisticated backlighting and solar power.

Combine that with the HP.01's usability in time functions (and calculator) and the result could be interesting; kind of an "HP.35S" for the wrist.

Size would not be much of a factor, what with the popularity of unusually large watches these days ("Panerai", "U-Boat", "Luftwaffe", and many other jumbo size timepieces).

I know there is a move afoot regarding "Kit" watches along these lines, but for us HP junkies without DIY skills, and indeed the rest of the techno-watch market, an elegant, well packaged HP.01 follow up might be a nice thing.

John

Yes we do.

Do you think now is the best time to work on a very risky product?

TW

Re: HP and Kinpo - Are you Listening ? [HP-01 Inspiration]

*Message #3 Posted by **Mark Edmonds** on 23 Aug 2009, 5:14 p.m.,*
in response to message #2 by Tim Wessman

Tim - sorry but I'm not entirely sure of your connection with HP but I gather you are part of the team? If yes, how about a less risky proposition but one that would warm the hearts of many users - a version of the 50G with a keyboard layout similar to the original 48 series with a clear pro-RPN orientation? If it were "done right", it would be such a significant event that it would in one swipe make the original 48 series totally redundant and elevate the 50 to new heights. I'm convinced it would be massive.

Apologies for the temporary hijack of the original thread!

Mark

HP 50G ++

*Message #4 Posted by **John Stark** on 24 Aug 2009, 10:59 a.m.,*
in response to message #3 by Mark Edmonds

Mark:

A great idea indeed, and one with a broader appeal then an HP.01 "homage" (Although Casio and Citizen have proved practicality of solar power in a sophisticated, backlit watch).

An extended version of HP.50G with 48-style key layout in a "swoopy" Classic style case closer to or a bit larger in size than 35-67 series compared to 35.S. By "swoopy" I mean the taper of case from front to rear lengthwise with tilted display area and gradually tapering to bottom of keyboard. This, along with large "Enter" key, is the distinguishing styling feature of "classic" HP RPN units.

Just another $0.02

Great Forum ! - Read it daily !

Re: HP and Kinpo - Are you Listening ? [HP-01 Inspiration]

*Message #5 Posted by **Eric Smith** on 23 Aug 2009, 3:47 p.m.,*
in response to message #1 by John Stark

It's hard to imagine that the cost and volume of a photovoltaic cell and supporting electronics in a watch is actually the least bit worthwhile.

A typical watch uses so little power that the button cell(s) will run it until they fail from self-discharge. A small photovoltaic cell won't extend the life of the button cells in that case.

If the watch uses more power, because it's doing any significant computation, the small photovoltaic cell can't provide enough energy to significantly affect battery life.

> It's hard to imagine that the cost and volume of a photovoltaic cell and supporting electronics in a watch is actually the least bit worthwhile.

Last year I upgraded to a Citizen Eco-Drive watch, which is claimed to never need battery replacement as long as it gets enough light. For me, the benefit is reliability - all the failures I can recall of my previous watches have been when the case has been opened for either battery replacement or minor repair (scratched crystal, frozen bezel, etc.).

I'm hoping this one will last a bit longer, as I really like the functionality.

Of course, this is absolutely not a benefit for the manufacturer. ;)

Best,

--- Les

*Message #8 Posted by **Eric Smith** on 24 Aug 2009, 6:46 p.m.,*
in response to message #6 by Les Bell

If it has a button or coin cell in it, that cell will almost certainly be dead from self-discharge in approximately 10 years. You'd want to replace it at that time even if the watch is still working from ambient light, if for no other reason than to keep the cell from leaking and damaging the watch.

Re: HP and Kinpo - Are you Listening ? [HP-01 Inspiration]

*Message #9 Posted by **Les Bell** on 25 Aug 2009, 7:58 a.m.,*
in response to message #8 by Eric Smith

According to this Wikipedia article, the Eco-Drive watches have a titanium lithium-ion battery which will still retain 80% of the original storage capacity after 20 years. At this point, that gives the watch a reasonably chance of outlasting me. :) It's not as nice as a fine mechanical movement, but it's an acceptable trade-off for the functionality (stepper-motor drive, multiple time zones, multiple alarms, etc.), not to mention the price.

Best,

--- Les

Profound saturday afternoon question

*Message #1 Posted by **hecube** on 22 Aug 2009, 4:18 p.m.*

I noticed in this forum that the emphasis seems to be on restore AND use.

If you had a HP-01 in your collection, would you wear it? Everyday?

Re: Profound saturday afternoon question

*Message #2 Posted by **Maximilian Hohmann** on 22 Aug 2009, 4:32 p.m.,*
in response to message #1 by hecube

Hello!

I have one in unused condition and I never wore it. Too delicate and expensive to risk scratching or damaging it. And who knows, if it still watertight after 30 years?

But I also have a well worn one that is currently not working. If I ever get it to run again, I might wear it occasionally. To be honest: As a watch it is impractical (so big and heavy that you _will_ bang it against something sooner or later, plus you need both hands to get a time reading and the display is tiny) and as a calculator it is even more impractical, because you need a tool to operate it.

Greetings, Max

Re: Profound saturday afternoon question

*Message #3 Posted by **Geoff Quickfall** on 22 Aug 2009, 8:13 p.m.,*
in response to message #2 by Maximilian Hohmann

Hello Max,

I use mine as the functions I need are at my finger tips. I especially like the ability to use a count down timer which continuously displays until selected off.

I have a few of the pens with the nibs and these accompany so I usually input the flight time into the stop watch, then multiply that with the average fuel flow and then swap between the displays. Also the time zone changing function is so easy to implement!

Of course the need for the watch has changed since my early flying days to the 777 cockpit today. Still, the ability to see the watch in the darkness of the cockpit is excellent.

Besides, that and my nixie watch always get comments that my others never do.

Cheers, Geoff

Hi Geoff,

those subtle differences between intercontinental passenger flights and inter-european executive flying :-)

> Quote:
>
> I especially like the ability to use a count down timer which continuously displays until selected off.

We have two of those (luminous!) built into the instrument panel (one each side) plus a timer function in each primary flight display. Never used any any of them though...

> Quote:
>
> ... so I usually input the flight time into the stop watch, then multiply that with the average fuel flow and then swap between the displays.

Our tyical sector length is less than an hour with constant level and speed changes, so there's nothing like an average fuel flow. I would have to guess that, but then I could guess the total fuel amount as well without using a calulator.

> Quote:
>
> Also the time zone changing function is so easy to implement!

We rarely cross time zones (and if so, the difference seldom exceeds one hour) - so again no excuse why I have to take my capital investment to work.

> Quote:
>
> Still, the ability to see the watch in the darkness of the cockpit is excellent.

I bought one of those miraculous (analogue) watches with GTLS (gaseous tritium light sources) hands recently. This thing really glows in the dark! And without the need to press a button. Very pracical beside the bed in the hotel room, when I wake up in the middle of the night.

> Quote:
>
> Besides, that and my nixie watch always get comments that my others never do.

I believe that for sure! If I would start playing with gadgetry at work, my passengers (who can look over my shoulder all the time) would start complaining instantly because they want their breakfast served instead (also part of my job)!

BTW: Have you ever tried to get that nixie watch through a security check in the United Kingdom?

Greetings, Max

Wear it, use it, enjoy it.

in response to message #1 by hecube

I restore vintage watches also. I have over 200 with 130 restored vintage complicated movements.

Included in this are the following three:

```
1  One New Old Stock HP-01 in box with all accessories.

2  One completely restored pre prototype with no serial number in
   mint condition
```

```
3  One restored example which I wear to work.
```

I have 3 modules including one which will work and comes complete with a New Old Stock strap (gold case). The other two supply parts including the LED block.

Enjoy the pictures:

I have repaired and restored 4 others for other users, one in England, and three in the US. All 4 are being used.

So YES, I wear it and use the functions. In fact other than my HP 41CX it is the second most used HP object I have.

Cheers, Geoff

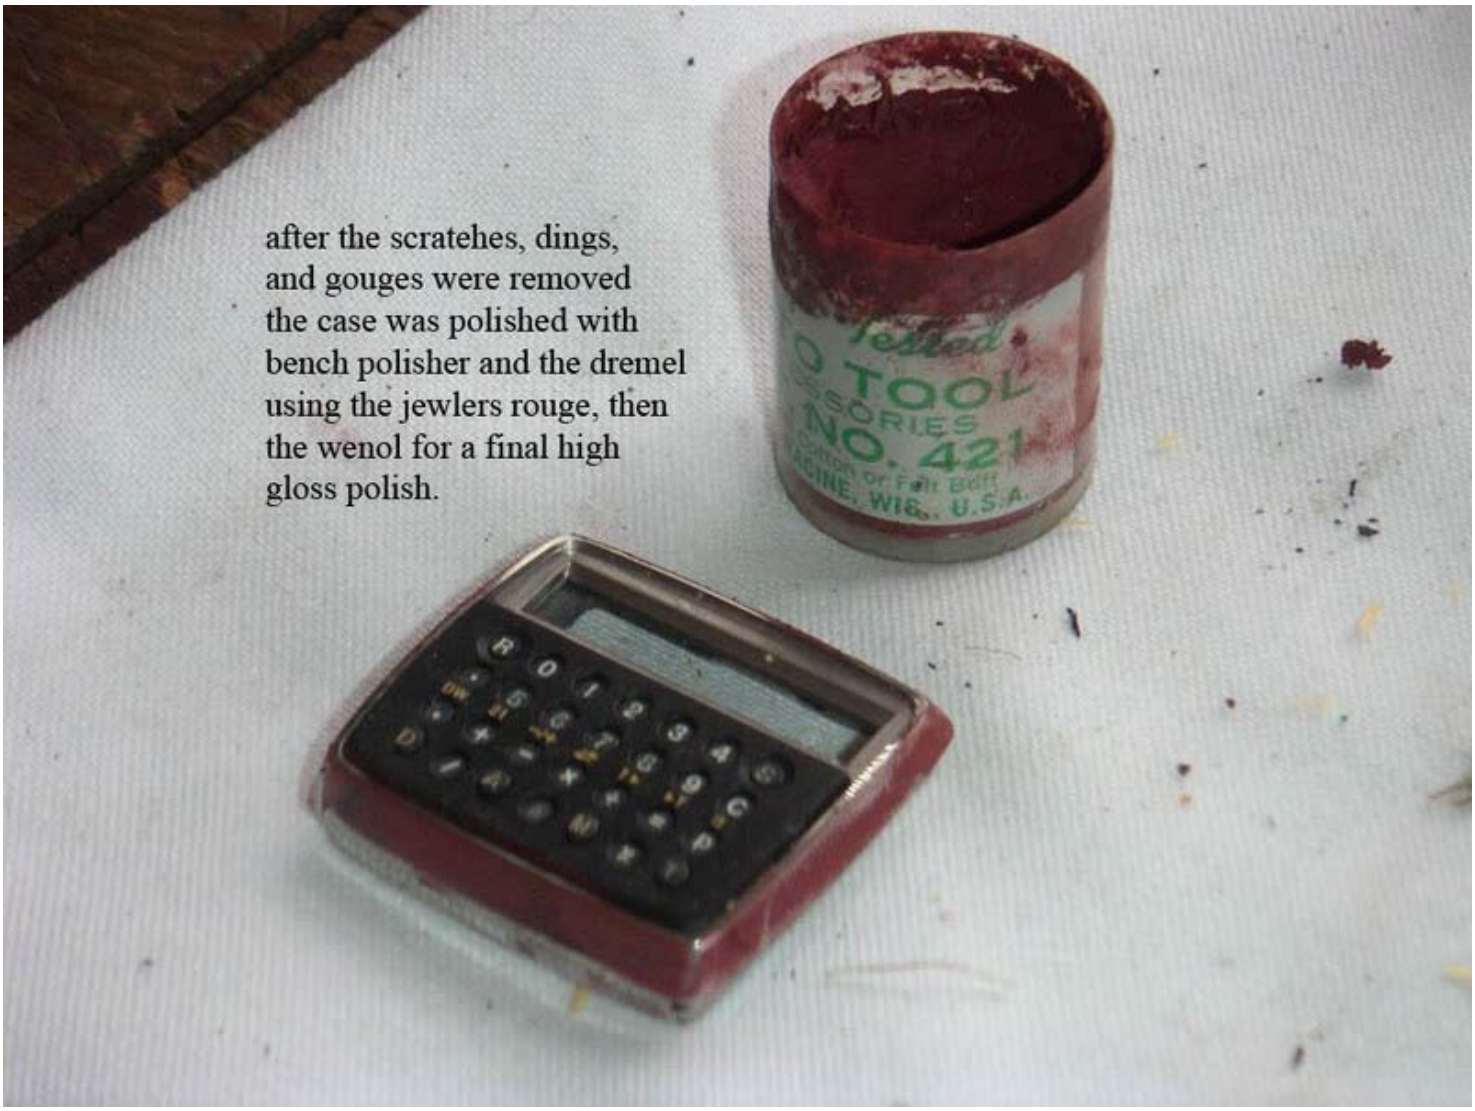
Creating two new plexi glass lens for restoration purposes:

New old stock version:

New magnifying lense installed:

Restored example for client in London:

Prepping a case for the new gloss and brushed finishes:



Prototype top view:

Prototype bottom view with lack of serial number:

Before and After:

All three:

No!

*Message #8 Posted by **Mark Edmonds** on 23 Aug 2009, 4:46 p.m.,*
in response to message #7 by Geoff Quickfall

If I had one, I wouldn't wear it. Main reason not being its expense/antique status/delicate nature or whatever, just simply that I think it is as ugly as hell!!

To be honest, I am not that wild about getting one either and I don't quite understand why people are prepared to spend such large sums on it. Yes, it was a one-off and utilised some clever techniques (as I understand it) but as a calculator or a watch, it doesn't excite me and I don't really understand the fuss over it.

On the other hand, spending the same sort of money (or maybe less) could secure an early desktop with real ye-olde-worlde peripherals like a paper tape reader and getting something like that working would be enormous fun! :)

And as part of the original question, my philosophy on collecting is that the collection is to be used, not stored. Collecting items and leaving them stored in the original packaging and never touching them or switching them on etc is just a waste. What's the point in doing that? Where is the fun and enjoyment? Maybe someone who does collect that way can explain why they do that?

Mark

Fully agree with the above, as far at the rest of it... 8-)

[pre] - It is Gorgeous!!!!!!!!!(but that is purely subjective).

- The dynamic function has not been reproduced on any other calculator watch and I find it very useful.

- don't pay so much, I have yet to spend more then 200.00 for my examples. (lucky on the boxed one, lucky that the others could be fixed). - Money and expense, well, dealing with collectables and etc, we all know how fical this crowd is, besides, collecting is again extremely subjective.

- Some one just paid 600 USd for a clear back HP 67, so there is no accounting for objectivity in collecting.

Cheers Mark,

Wearing one and LOVING it (yeah makes no sense)

in response to message #8 by Mark Edmonds

I thought the HP-01 was less than practical when it was introduced. It never intrigued me at all. Its

collector's appeal is without question, but I'd rather have a red-dot HP-35, if I didn't already have one.

Twenty-five years ago I found the 1983 Casio scientific calculator watch CFX-200 to be valuable in daily use. No tools are needed to operate it, and it is a full-featured scientific calculator. I've still got it, but I don't use it. These once inexpensive models have become pricey collector's items. Here's a picture of the improved 1985 Casio CFX-400. I wouldn't mind having one of them today for actual use. I did not count on Casio discontinuing such products after the CFX-400.

Brown leather pouches history question

*Message #1 Posted by **hecube** on 22 Aug 2009, 10:46 a.m.*

With what model were the iconic leather pouches first and last offered?

Re: Brown leather pouches history question

*Message #2 Posted by **Dan W** on 22 Aug 2009, 12:50 p.m.,*
in response to message #1 by hecube

Do you mean the zip up pouches?

I believe these began with the HP-67. The prior calculators had a black leather case with velcro enclosure. These cases conform to the shape of the calculator. True of the 65 also which has an added pouch to hold the plastic case that held the magnetic cards.

The 67 did away with the plastic case for cards, replacing it with a vinyl notebook. At the same time they changed to a rectangular zip-up case which has a pouch inside for the vinyl card case.

Re: Brown leather pouches history question

*Message #3 Posted by **hecube** on 22 Aug 2009, 12:58 p.m.,*
in response to message #2 by Dan W

Unfortunately, I have to disagree. I have a HP-21 and a HP-25 here with made-to-fit HP brown pouches. These two calculators were released before the HP-67...

Sometimes I forget the 67 really had second gen innards. By made-to-fit do you mean a conformal design or the rectangular zip-up pouch?

Re: Brown leather pouches history question

*Message #5 Posted by **hecube** on 22 Aug 2009, 2:06 p.m.,*
in response to message #4 by Dan W

They are brown HP pouches but smaller than the HP-41 pouch if you're familiar with it...

Re: Brown leather pouches history question

*Message #6 Posted by **Les Bell** on 23 Aug 2009, 10:55 p.m.,*
in response to message #1 by hecube

IIRC, my 45 came with a zip-up brown pouch. They weren't leather, though, they were a man-made plastic material, like Naugahyde. I also bought the black leather belt pouch, which was an optional extra. This was all around April 1974.

I bought a 65 a couple of years later, but it came with the soft black leather pouch that had an extra pocket for an application pac.

Best,

--- Les

NutIP, a web server and TCP/IP stack for HP-41

*Message #1 Posted by **Khanh-Dang Nguyen Thu-Lam** on 22 Aug 2009, 7:40 a.m.*

Hi all,

NutIP is a ROM for HP-41 (C/CV/CX). It implements a full-featured TCP/IP stack and a web server. I never ran the code on real hardware because devices are rare and expensive (one need a HP-41, a HP-IL module, any hardware that let you burn a ROM, a HP-IL/RS232 transceiver...). Though, I managed to run NutIP on emulators. It works well with nonpareil and Emu41.

You can download source code (under a BSD-like license), binaries and documentation at http://perso.orange.fr/kdntl/hp41/.

Hope you enjoy it,

Khanh-Dang

42S for iPhone v. 2.2 in App Store

*Message #1 Posted by **Les Wright** on 22 Aug 2009, 4:57 a.m.*

Includes a few improvements, including an upgrade to Free42 1.4.52 with the most recent BCD-20 as its computational "core". This means more accurate transcendentals and numerical integration, among other things (hugh steers refined his code, Thomas Okken incorporated it, and Byron Foster incorporated Thomas' upgrade).

Thomas discovered a bug in the BCD-20 code and has fixed it, so Free42 is actually now up to 1.4.53. Byron will shortly submit 2.2.1, incorporating this fix, but it takes these things ages to meander through the Apple approval process.

The newest 42s displays the LastX register in small font in the upper right corner of the display. I find this distracting and have asked Byron to consider making this optional and not obligatory in future releases.

The speed improvements and overall performance that came with the move from v. 1 to v. 2 are maintained.

Great little piece of software--my main calculator these days, and I have a real 42s!

Re: 42S for iPhone v. 2.2 in App Store

*Message #2 Posted by **Egan Ford** on 22 Aug 2009, 10:05 a.m.,*
in response to message #1 by Les Wright

There is also a 20-line stack option. PRST can be used to display/print the entire stack.

Re: 42S for iPhone v. 2.2 in App Store

*Message #3 Posted by **Byron Foster** on 23 Aug 2009, 10:42 a.m.,*
in response to message #2 by Egan Ford

There's a couple of additions you've mentioned in the past. The first is that you can toggle the display of the iPhone keyboard in alpha mode by tapping the display. The "auto keyboard" option has become just an option to display the keyboard automatically when going into alpha mode, but it can still be toggled regardless. The other is that you can switch to the Print View while printing and while a program is running. It didn't do this pre OS 3.0 because of the whole event handling thing, and it would get hosed up (I'll avoid going into detail).

As Les said, a version 2.2.1 was submitted last Thursday with Free42 1.4.53 which contains a BCD20 fix. It also provides an option to toggle the display of LastX (also a couple of minor 42s bug fixes). It should be out in about a week, or when Apple is good and ready!

Re: 42S for iPhone v. 2.2 in App Store

*Message #4 Posted by **Egan Ford** on 23 Aug 2009, 7:34 p.m.,*
in response to message #3 by Byron Foster

Excellent. Thanks. The Alpha toggle was much needed.

Re: 42S for iPhone v. 2.2 in App Store

*Message #5 Posted by **Reth** on 23 Aug 2009, 9:34 p.m.,*
in response to message #3 by Byron Foster

I already posted the following in the other forum, but it may get some feedback here:

- I'd replace L register display with the status of first 5 user flags as it is on HP-41 and make both optional
- make 2 <> 4 line display switchable trough program
- make Alpha register longer and able to display on all 4 lines (2 extra L/F)

I find the white rectangle around arrow keys a brilliant idea, please keep that in future releases at least as an option.
Excellent work and getting better!
Cheers,

Re: 42S for iPhone v. 2.2 in App Store

*Message #6 Posted by **Les Wright** on 24 Aug 2009, 12:57 a.m.,*
in response to message #2 by Egan Ford

Egan, several of my programs depend on the familiar behaviour of the 4-line stack (e.g., the duplication of the T register when a binary operation combines the X and Y registers and the stack drops is a fact I use quite a bit in preserving needed data without stashing it into a register).

The 4-stack option is set as default. I think Byron may include in future documentation the caveat that turning on the 20-stack may "break" programs that rely on the traditional 4-stack behaviour. Of course, serious RPN programs already know their stack behaviour and would pick up on this if there were spurious results coming from familiar programs.

Les

Re: 42S for iPhone v. 2.2 in App Store

*Message #7 Posted by **Egan Ford** on 24 Aug 2009, 1:04 a.m.,*
in response to message #6 by Les Wright

As do mine. Hopefully in the future the stack depth can be programmable. It'd be nice to have programs run as-is, and to have a deeper depth for interactive modes.

Complex number in HP35S

*Message #1 Posted by **KC** on 21 Aug 2009, 7:48 a.m.*

This topic has been discussed in this forum for some time, and I would like to give my experience on that.

First of all, I am not an engineer, and I have never use complex number to solve real world problems. Somebody earlier in this forum recommend an excellent book "the history of the square root of minus one", and so I bought one, and started calculating complex numbers on my 35S.

35S is heritaged from 32SII and 33S, and the complex number support for the latter two calculators are awkward. I originally assumed that it would be equally awkward for the 35S, and surprisingly, it found it very pleasant to use. This is mainly due to the primary button for i. I don't need to care for the limited 4 stacks, and in fact, I think entering complex numbers in 35S is as simple as entering real numbers, and is the easiest among any HP calculators I've used before, including 42S and 48G.

One of the main drawbacks people complain about HP35S (and 32SII and 33S) is its limited complex number support. For example, somebody here said that it should have supported ln(-2), arcsin (2), etc. I don't know, but I just wonder, how many times you would ever need to calculate arcsin (2) in real world problems? Maybe some professionals here need to, then would you please inform me about that.

Best regards, KC

Re: Complex number in HP35S

*Message #2 Posted by **Mike Morrow** on 21 Aug 2009, 9:13 a.m.,*
in response to message #1 by KC

I think the "how often" justification for not providing a capability misses the point. How often does one calculate the cosine for angles very close to 90 degrees? The HP33S and 35S have documented defects here. Is it not a problem because one seldom performs this function in the affected range? Various natural operations in the real domain generate results in the complex domain for which the HP35S yields no result. I view this as a defect. AT the least it is certainly an avoidable limitation.

The HP42S and the RPL models, and the HP-15C with a little more effort, perform complex number mathematics without user programming. The HP35S and similar do only complex number arithmetic.

The only thing that is required, at the product design phase, to enable the more complete spectrum of capability is a little bit of firmware. It adds no additional weight or power consumption or user complexity.

There is no excuse today, nor for the last 20 years, for any scientific calculator to lack a full capability for complex mathematics.

Re: Complex number in HP35S

*Message #3 Posted by **Jeff O.** on 21 Aug 2009, 12:57 p.m.,*
in response to message #2 by Mike Morrow

Mike,
I agree that the "how often" justification is not a valid justification. If a calculator does something, it ought to do it right, so that is why the cosine bug in the 35s is not acceptable. However I will point out that the 35s does more than simple arithmetic with complex inputs. The following functions accept complex arguments:

```
+
-
*
/
sin
cos
tan
negate
1/z
z^z
ln
e^z
```

Quite a few higher functions in the above list. Not a full suite, of course, but better than just add, subtract, multiply and divide.

.

Re: Complex number in HP35S

*Message #4 Posted by **designnut** on 21 Aug 2009, 1:23 p.m.,*
in response to message #3 by Jeff O.

While you may be able to take the Ln of a complex function with a calculator, I am eager to ask, does it have a real world meaning? As an EE I became painfully aware of complex numbers and their manipulation, but it always served a purpose' and had real world application. In 51 we had only manual manipulation which was painful. with my first calculator HP 35 I discovered relationships not published in books, and I still think they are unknown, as I had tools the book authors did not. Sam

Re: Complex number in HP35S

*Message #5 Posted by **Bart (UK)** on 21 Aug 2009, 1:24 p.m.,*
in response to message #1 by KC

Both the 32S and 35S can compute LN(-2). Arcsin(2) is a bit more complex (excuse the pun), but can be computed on both using the logarithmic form:
arcsin x = -ix*LN(ix+SQRT(1-x^2))

My 32sii returns the error message LOG(NEG) /!\.

Re: Complex number in HP35S

*Message #7 Posted by **Jeff O.** on 21 Aug 2009, 3:20 p.m.,*

in response to message #6 by Martin Pinckney

Perhaps it would be more accurate to say that both the 32S and 35s can compute LN(-2+i0).

Re: Complex number in HP35S

*Message #8 Posted by **Bart (UK)** on 21 Aug 2009, 5:53 p.m.,*
in response to message #7 by Jeff O.

Quite so, Jeff. My thoughts were: if you expect an answer in the complex domain ....

For the 32s (& sii is probably the same), use the following key sequence: 0 ENTER 2 +/- SHIFT CMPLX LN. (For complex calcs the Y-register is imaginary part & X-register is the real part).

I totally agree that this is not an easy or ideal way, the 42S implementation is what I would have expected myself on the 35S.

Re: Complex number in HP35S

*Message #9 Posted by **Ángel Martin** on 21 Aug 2009, 4:42 p.m.,*
in response to message #1 by KC

The way to input complex numbers on the 35S is indeed very intuitive and convenient - much better than the 42S and perhaps the best of all HP calcs.

That "i" function sure works great. I wish I could mimic it on the 41 but my MCODE skills are *limited* - say partial key sequence, anyone?

Shame the implementation on the 35S doesn't live up to the same user interface. I love it when on the 42S you get a complex result (instead of an error) when the argument of the function doesn't have a real solution

Best, ÁM

Re: Complex number in HP35S

*Message #10 Posted by **Les Wright** on 22 Aug 2009, 4:49 a.m.,*
in response to message #9 by Ángel Martin

Complex number entry is great on the 35S, but the limitations in actually working with entered complex numbers is annoying. The inability to decompose a number into its real and imaginary parts is a nuisance. This can be done with a little custom routine, but this sort of stuff should be built-in. Likewise with moving back and forth between polar and rectangular coordinates and the various angular modes. the 42S seems to manage this all so seamlessly. It doesn't have the "i" key, but the COMPLEX function toggles things back and forth and coordinate and angle modes are always respected without hassle.

But I preach to the choir. This stuff has been debated to death since the otherwise pretty good 35S came out two years ago.

Good deals still to be found!

*Message #2 Posted by **Michael Meyer** on 20 Aug 2009, 8:46 p.m.,*
in response to message #1 by hecube

Years ago I bought a huge lot of adding machine calculators. I mean huge. The guy was upset the whole lot only sold for $10. But, he shipped them anyway in three huge boxes. In with the "junk": 2 HP-97's, 2 HP-91's, a couple of HP-20S's, and two HP-11C's.

Wasn't listed as a calculator auction, but I knew I'd spotted a couple of blurry HP's in the picture.

When I have the time, I still try to look for mis-classified ads. Bought an HP-71B that was listed as a "Log Scaler". Not sure what that is, but it was a 71B in a case with a large, 2-line display. I'm not sure how I found the auction, but I did.... was $20, I think.

Keep up the quest!!!

Not sure if it's a good thing to spill those but what the heck. Let's call them eBay tricks. A good way to seal a good deal is to bid on an auction which ends during the middle of the night for North America's east coast. Who gets up in the middle of the night to push up the bid one last time?

I once bought a near-perfect Classic in an auction which ended during a World Cup final. I was almost the only bidder! It's a pity these finals only happen once every 4 years ;-)

I know a lot of those eBay tricks, too. But sometimes the "trick" that works best is just taking a chance. Like when I got my 42s. As everyone here knows, these usually bring a premium price. I bid on one that had a poor description and blurry picture, so the collectors stayed away. I correctly judged that the seller was unsophisticated, rather than devious. I was rewarded with a USA-made version in *almost* mint condition, for a very reasonable price.

Agreed. I got my 11C in a local auction. It had been advertised as new but the seller provided no picture. Even better, instead of money the seller accepted one of my 12Cs, still under warranty. It happens that 11C had been used only by his late father for a couple of months and been kept in a drawer during the last 20 years...

HP 41CV repair - constant Memory Lost message

*Message #1 Posted by **Nigel Bamber** on 20 Aug 2009, 5:37 p.m.*

I eventually got the materials in order to put a permanent repair to my CV with cracked and broken posts. With some further help from Geoff and following his excellent guide , I managed to repair the posts and the case screws back on successfully. That is the good news.

The bad news is that I have a constant Memory Lost message. I cannot turn the calculator off and it responds to no key presses.

Can anyone help ? I assume its still a contact issue only this time it seems I have the 'reverse problem' to the one I had before the 'repair'.

I had to remove the logic PCA and the silk screen sheet underneath it to repair the broken post. So have I damaged something ?

I await your good ideas.

Nigel

Re: HP 41CV repair - constant Memory Lost message

*Message #2 Posted by **Geoff Quickfall** on 20 Aug 2009, 7:15 p.m.,*
in response to message #1 by Nigel Bamber

This has happened with my half nuts but I am sure it can happen to the fullnut.

Hopefully it is a software, not hardware problem.

It took 48 hours for my two 41CXs to drop the MEMORY LOST lock up. Here is what I did and I am sure others have their methods, but do it in this order and move to the next step if the previous step failed:

```
1   try a master clear,  ON+CLX

2a  if you have a card reader
 b  install it
 c  try to run a card.

3a  remove the batteries
 b  short the far left to far right battery contacts
 c  reinstall batteries
 d  test with the ON+CLX

4a  remove the batteries
 b  reverse their positions in the holder,
 c  install pack with reversed batteries
 d  hold the ON key ON for ten seconds then release
 e  reinstall batteries
 f  test with the ON+CLX
```

```
5a  remove the batteries
 b  reverse their positions in the holder,
 c  install pack with reversed batteries
 d  hold the ON key ON for ten seconds then release
 e  leave calculator OFF over night.
 f  reinstall batteries
 g  test with the ON+CLX
```

These methods were first developed with Synthetic applications, which when handled incorrectly caused a freeze. The freeze was carried even when the calculator was OFF by the capacitor which retains the last memory condition of the software.

The above, all attempt to zero the capacitor leaving the calculator in its original state.

Mine took me to step 5 and I had written both of them off until two days later when I got back from a trip. I picked one up for the curiosity fully expecting it to remain in the OFF condition or with the frozen MEMORY LOST. Put in a battery pack, switched it on and VOILA! it worked. Tried the second machine and it worked!

Be warned, some have reported that it took up to a week without the batteries to unfreeze the calculator.

Hope this helps, Geoff

High precision calculator in Windows 7

*Message #1 Posted by **jotne** on 20 Aug 2009, 4:48 a.m.*

If you need a calculator with lots of digits, try out the calc in Windows 7 and set it to scientific mode.

Pi = 3.14159265358979323846264338327950288419716939937510582097494459230781640628620899862803482534211706798214808651328230664709384460955058223172535940812848111745028410270193852110555964462294895493038196442881097566593344612847564823378678316527120190914564856692346034861045432664821339360726024914127372458700660631558817488152092096282925409171536436789259036001133053054882046652138414695194151160943305727036575959195309218611738193261179310511854807446237996274956735188575272489122793818301194912983367336244065664308602139494639522473719070217986094370277053921717629317675238467481846766940513200056812714522635608277857713427577896091736371787214684409012249534301465495853710507922796892589235420199561121290219608640344181598136297747713099605187072113499999983729780499510597317328160963185950244594553469083026425223082533446850352619311881710100031378387528865875332083814206171766914730359825349042875546873115956286388235378759375195778185778053217122680661300192787661119590921642019880

If you must have RPN, then install calc:

```
$ calc -d1000 pi | fold -w68

Re: Higher precision calculator in OS/X and Linux

*Message #6 Posted by **Les Wright** on 22 Aug 2009, 3:35 a.m.,*
in response to message #5 by Egan Ford

bc has a very limited repertoire of built-in math functions. One needs to know a few trig and inverse trig identities to compute arcsine, arccosine, or even tangent. The scripting language seems really straightforward and I don't think it is too hard to build routines to compute more complicated functions. I may work on something to compute Gamma, a longtime pet project of mine :)

> Quote:
>
> bc has a very limited repertoire of built-in math functions

This is true if you invoke 'bc -l'. dc on the other hand has no such set of functions (although with effort one could write them).

bc -l math functions:

```
s (x)    The sine of x, x is in radians.
c (x)    The cosine of x, x is in radians.
a (x)    The arctangent of x, arctangent returns radians.
l (x)    The natural logarithm of x.
e (x)    The exponential function of raising e to the value x.
j (n,x)  The bessel function of integer order n of x.
```

> Quote:
>
> I may work on something to compute Gamma, a longtime pet project of mine

I'd like to see that. Especially for any scale, e.g. gamma(pi) to 1000 digits :-)

Re: Higher precision calculator in OS/X and Linux

*Message #8 Posted by **Eric Smith** on 22 Aug 2009, 1:39 p.m.,*
in response to message #7 by Egan Ford

The GMPR arbitrary-precision floating point library (based on the GMP arbitrary precision integer library) includes the gamma function, as well as ln(gamma(x)) and ln(abs(gamma(x))) functions.

Now THAT'S a challenge.

The GMPR library that Eric referred me to seems to do it by using the Stirling approximation and predetermining how many terms to go out to given the desired precision and the argument. It then calculates the Bernoulli numbers on the fly.

I have a little routine that does it using Stephen Moshier's qfloat library, but I used a fixed number of terms in the Stirling series for larger arguments, do Pochammer shifting for smaller ones, and I precompute the Bernoulli coefficients and put them in a an array. A qfloat is about 104 or 105 digits, and I get about 102 or 103 of those right. But that is fixed multiple precision, not arbitrary precision.

May look at the Spouge method--no quite as good as Lanczos, but the coefficients are much easier to compute and one can predetermine the number of terms required due to a fairly straightforward error bound estimate.

Les

Gamma to Arbitary Precision

*Message #10 Posted by **Les Wright** on 23 Aug 2009, 1:16 a.m.,*
in response to message #9 by Les Wright

Here is a simple approach that just came to me. This is NOT how Gamma is typically computed in software because it is slower than than the Stirling series and related approaches. However, it is easier to code, and does not require any advance fiddling to figure out how many terms one needs for a desired number of digits.

1. Take your desired argument a.

2. Compute the left sided incomplete gamma by its series for (a, a+1)

3. Compute the right sided incomplete gamma by continued fraction for (a, a+1)

4. Add 'em together.

The only thing one needs to have the code do is derive on the fly a desire convergence epsilon give the desired precision (or scale as it is called in bc).

Code for the incomplete gamma functions is given in Numerical Recipes, and indeed this is what I have ported (indeed, shameless plagiarized) in my various implementations for the incomplete gamma functions and their specialized offspring (like the cumulative normal distribution, error functions, and cumulative chi-square distributions). Some time ago when I was playing around with Stephen Moshier's high precision qfloat library (about 105 decimal digits), this was my adaptation of the Numerical Recipes code:

```
#include <qfloat.h>
```

```
#define ITMAX 1000000

const qfloat fpmin = (qfloat)"1.0e-9800";
const qfloat one = (qfloat)"1.0";
const qfloat two = one + one;
const qfloat qeps = (qfloat)"3e-105";
const qfloat zero = (qfloat)"0.0";
// I have tried to converge to a tinier epsilon but some inputs make the routine belch!

qfloat gser(qfloat a, qfloat x)
{
  long n;
  qfloat sum,del,ap;

  ap=a;
  del=sum=one/a;
  for (n=1;n<=ITMAX;n++) {
                  ap=ap+one;
                  del *= x/ap;
                  sum += del;
                  if (fabs(del)< qeps*fabs(sum)) return exp(-x+a*log(x))*sum;
  }
  puts("a too large, ITMAX too small in routine gser");
  return zero;
}

qfloat gcf(qfloat a, qfloat x)
{
        long i;
        qfloat an,b,c,d,del,h;

        b=x+one-a;
        c=one/fpmin;
        d=one/b;
        h=d;
        for (i=1;i<=ITMAX;i++) {
                an = -i*(i-a);
                b += two;
                d=an*d+b;
                if (d<fpmin) d=fpmin;
                c=b+an/c;
                if (c<fpmin) c=fpmin;
                d=one/d;
                del=d*c;
                h *= del;
                if (fabs(del-one) < qeps) return exp(-x+a*log(x))*h;
        }
        puts("a too large, ITMAX too small in gcf");
        return zero;
}
```

Really should be no trouble to port something this straight forward to a bc script.

Another little challenge!

Les

Arbitrary Precision Gamma for bc

*Message #11 Posted by **Les Wright** on 23 Aug 2009, 10:23 p.m.,*
in response to message #10 by Les Wright

My preliminary efforts go sluggishly.

In the gcf half of the code, I am finding I need to precompute an epsilon that is several order of magnitude larger than what I would expect for a given scale in order to get convergence. I also am trying to figure out that if I compute a result to a given increased scale internally how I can output it so it has

a lower scale and the extra guard digits I have kept are not displayed. As it stands now, a computed result shows all the extra digits, even if I want to reformat the output to show my final result with a different, somewhat slightly smaller scale.

For example, say my desired scale for display is 100. If my code temporarily increases this internally to 110, the output has a scale of 110, even if I set the scale back to the original 100 before returning the result. There must be some way in bc to truncate a result from a higher scale to a lower scale....

Also, the approach is slow for high precisions, as I thought it would be. There is a reason why Stirling or other approaches derived from or inspired by it are used to this day, and my little idea is not!

Les

Re: Arbitrary Precision Gamma for bc

in response to message #11 by Les Wright

I may get more luck implementing [link:http://en.literateprograms.org/Gamma_function_with_Spouge's_formula_(Mathematica)]this[/link].

Spouge's formula is a good option since one can easily set a conservative error bound a priori. For 1000 digits (and a relative precision of 1e-1000), about 1260 terms in the series need to be computed. Thankfully, this can be done recursively--each coefficient is a multiplicative factor of the previous one.

Will give it a go and see what i come up with.

Les

Re: Arbitrary Precision Gamma for bc

*Message #14 Posted by **Les Wright** on 25 Aug 2009, 10:30 p.m.,*
in response to message #13 by Paul Dale

The Spouge series is quite simple to implement and I think easy to implement in arbitrary precision, but I think it can be quite slow compared to a well crafted and properly terminated Stirling series, which to this day seems to be the first choice in the software libraries. That said, I have used Nosy on the HP49G+ and Gamma there looks like either a polynomial or CF approximation of sorts.

I have coded the Spouge series in Mathematica just as I would in C++ or bc, but the bc port is giving me headaches since bc lacks a built in exponentiation function for nonintegers, and the routine I have doesn't like it when the number to be raised to a power is 0 (which it often is with Spouge). I am not good at error trapping either!

That said, bc is a lot of fun BECAUSE it is so stripped down. A challenge. Like trying to program the HP-65 or 33C with so few steps available :)

Re: Arbitrary Precision Gamma for bc

*Message #15 Posted by **Les Wright** on 25 Aug 2009, 10:35 p.m.,*
in response to message #14 by Les Wright

BTW, for anyone who speaks Mathematica, here is the routine I am trying to port to BC:

```
gamma[zin_, n_] :=
    Module[
                {a, c0, ci, sum, gammapos, i, z, zz, out},
                Block[{$MaxExtraPrecision = [Infinity]},
                          z = Rationalize[Abs[zin]];
                          a = Ceiling[n Log[10]/Log[2 Pi]];
                          c0 = Exp[-a]*Sqrt[2 Pi];
                          ci = Sqrt[a - 1]/Exp[1];
                          sum = c0 + ci/z;
                          For[ i = 2, i < a, i++,
                                  ci *= (a - i)^(i - 1/2)*(a - i + 1)^(3/2 - i)/(1 - i)/Exp[1];
                                  sum += ci/(z - 1 + i)
                                 ];
                                 N[(z - 1 + a)^(z - 1/2) Exp[-z + 1] sum, n]
                     ]
                ]
```

I coded it more like C and relied little on Mathematica's built in capabilities (like summing over an index) to make porting easier later. It is several times slower than the built-in Gamma[] at a given argument and precision.

Re: Arbitrary Precision Gamma for bc

*Message #16 Posted by **Les Wright** on 26 Aug 2009, 3:12 a.m.,*
in response to message #13 by Paul Dale

Well, having just ported my little Mathematica routine to c++ and Moshier's 105-digit qfloat library, I have just discovered the Achilles heal of the Spouge series in fixed precision system, albeit one so extended.

Computing the coefficients on the fly with so many evaluations of exp() and log() seems to be contributing to digit loss, where as with my trusty Sterling routine where I have the Bernoulli numerators and denominators stored in a table (I computed them with Maple and just pasted them over) manages to attain 103 or 104 digit accuracy on average.

I am perplexed as to the issue, Moshier's qfloat exp() and log() overloaded functions are well written and seem to give full 105 digit accuracy.

Must be something fishing in my code that perpetuates losing sometimes as many as twenty digits for some arguments.

Still can't get the thing to work in bc either! No clue here....

In the 20b you may want to just precompute and store the coeffiecients rather than compute on the fly each time. For 15 digits of internal precision, that is between 12 and 19 terms, depended on how conservative your error estimate, etc.

In an arbitrary precision environment like Mathematica, spouge works great, but it is slower than the built in function.

hth,

Les

I do precompute the coefficients. Precision on the stack is 16 digits, although internally I'm computing to 39. Not all functions are evaluated to the full 39 digits though.

Re: Arbitrary Precision Gamma for bc

*Message #18 Posted by **Les Wright** on 27 Aug 2009, 4:35 a.m.,*
in response to message #17 by Paul Dale

See the rambling below.

I don't think that precomputing the coefficients will save you from the evils of digit loss due to subtracting large numbers that are so close together.

For 16 digits of stack precision, you will need ever one of your internal digits for large arguments. But if Pi, log, exp, and your power function internally are full precision, your interim results should be okay.

Just keep in mind that digit loss is due to subtraction loss within the alternating series, not the imprecision of the functions used to compute the terms.

Bummer.

Les

Yes, these functions are full precision. I'm using IBM's decNumber library which is a very nice BCD floating point implementation including all the nice extras: infinities, NaNs, sub-normals, packed decimal etc.

However, I might revisit the implementation eventually, this approximation was quick and easy and I [i]knew[/i] it would be accurate enough over the entire domain.

I'm very much aware of the risks of loss of precision having done an amount of numerical analysis over the years.

Re: Arbitrary Precision Gamma for bc

*Message #24 Posted by **Steve Perkins** on 26 Aug 2009, 12:19 p.m.,*
in response to message #16 by Les Wright

I've been very intrigued by this thread. I've been trying to code up a usable arbitrary precision gamma function for a long time.

I've been somewhat successful using the Incomplete Gamma, extending the tail as far as needed until I get convergence following an example by Victor Toth. I didn't, however, think about doing the two halfs with different implementations to get better convergence. I'll have to try that!

Here's my attempt to simplify Spouge for C. It works well if you keep enough guard digits for values less than 10 (like pi). Note that the powers in the inner loop are all integer, with a square root added. The final computation requires non-integer powers, but that could be done with the exp() and log() functions. I hope this helps someone.

I compiled this with my multi-precision package of choice, MAPM. I just define double to be the MAPM extended precision type. I was able to get 100 digits of precision in less than a second. 1000 digits took about 6 minutes on my PC, so that seems too long. I have to define guard digits with 20% more places than my desired output.

I'm still not sure why it takes so many guard digits. Usually I can get away with 8 extra guard digits, but not here.

```
double gamma(double z, int decplaces) {
  int k;
  double a, den, sum, gamma;

  a = decplaces;  // theory says 1.26*decplaces, but this works!
  den = 1;
  sum = sqrt(2*pi);
  for (k=1; k<decplaces; k++) {
    if (k & 1) {  // odd k, add
      sum += sqrt(pow(a-k, k+k-1)) * exp(a-k) / (den * (z + k));
    }
    else {        // even k, subtract
```

```
      sum -= sqrt(pow(a-k, k+k-1)) * exp(a-k) / (den * (z + k));
    }
    den = den * k;
  }

  return sum * pow(a + z, z + 0.5) / exp(z + a);
}
```

Re: Arbitrary Precision Gamma for bc

*Message #25 Posted by **Les Wright** on 27 Aug 2009, 1:44 a.m.,*
in response to message #24 by Steve Perkins

Since the terms of the series alternate in sign I am assuming digit loss due to subtraction?

That is the only thing I can think of. In my C code, Moshier's qfloat exp, log, and sqrt give full 105 digits almost all the time in the ranges I am interested in. I also modified the qfloat.h header file to include an inline qfloat atn() function, which I use to compute pi to full 105 digit precision with 4*atn(1).

I like your vastly simplified code--looks like you took the time to reduce the coefficient formulae to an even simpler recursion than what I came up with. Why don't we try this: run two sums, sum1 and sum2, the first one for odd k, the second for even, and do only one big subtraction at the end? Also, in diagnostics you can return sum1 and sum2 as well as the final output to see if there is anything about the relative magnitude of the numbers that contribute to digit loss when subtracted?

When I find time I will port your code to a qfloat version and see what I get. I like your version a lot better so far.

The adding together the right and left incomplete gammas is pretty good but for lots of digits can be slow, and I am finding with bc it a big challenge to define an epsilon for the continued fraction half that will provide desired convergence for a given arbitrary precision. But with fixed multiple precision qfloat I am pleased. But the approach seems inefficient, and I can see why most libraries seem to want to stick with trusty Stirling, especially if they are able to efficiently generate the bernoulli numbers on the fly for any given precision. I know that my own qfloat gamma with the bernoulli numerators and denominators in a table does really decently.

Arbitrarily extending the series of the left-sided incomplete gamma works fine on fixed precision calculators, but in arbitrary precision settings I don't know how far out you need to go to get desired precision for a given argument. Also, I think if you go too far "noise" gets introduced and precision degrades.

You may want to look up Glen Pugh, the author of this excellent thesis. He is also approachable, and a couple of years ago was very helpful to me when I had questions about his approach to Lanczos, and he even sent me expanded coefficient and error tables (long ago lost when my inbox was corrupted a while back). Here is his webpage.

The 1.26*decplaces estimate of a really is overkill. The wiki page I referred to above uses it, but admits that this is a very generous over estimate, as a key multiplicative factor that can greatly reduce the relative error by a few orders of magnitude is dropped from Spouge's original estimate so that the inequality is easier to solve for a given desired epsilon.

I don't have so much time to come back to this for a few days, but I would be interested to know what you find. This is a great little programming problem.

FWIW, Free42 uses Hugh Steers BCD20, which implements Lanczos with a table of precomputed coefficients.

Les

PS: A question: I am not familiar with "k & 1" instruction. Is this a simple way to test for oddness or evenness? Also, it looks like your routine actually returns gamma(z+1) = z!, which is how Spouge originally wrote it. My routine rewrites the formulae taking the shifting into account at the beginning. This may overly complicate things in my code.

Digit loss mystery solved

*Message #26 Posted by **Les Wright** on 27 Aug 2009, 2:51 a.m.,*
in response to message #25 by Les Wright

Steve, I ported your routine to Mathematica, set it up so that the argument was handled not as an exact number but an arbitrary precision decimal number to the desired number of digits. I worked with 100 just for the sake of speed.

Guess what? If we call "sum" the sum of all the positive terms and "sumneg" the sum of all the negative terms, these numbers happen to be almost identical, and with 100 digits of arbitrary precision the first 16 to 20 or so digits often look identical depending on the argument.

For illustration, here is my Mathematica code. Even if you don't speak Mathematica, it is pretty clear:

```
gamma_steve[zin_, n_] := Module[
  {k, den, sum, sumneg, term, z},
  z = N[Rationalize[zin], n];
  a = n;
  den = 1;
  sum = Sqrt[2 Pi];
  sumneg = 0;
  For[k = 1, k < n, k++,
            term = Sqrt[(a - k)^(2 k - 1)] Exp[a - k]/(den (z + k));
       If[OddQ[k], sum += term, sumneg += term];
            den *= k
         ];
  {sum, sumneg, N[(sum - sumneg) (a + z)^(z + 1/2)/Exp[z + a], n]}
  ]
```

Here is output of sum, sumneg, and the final result for Pi and 100 digits. BTW, your code actually computes Gamma[z+1], hence the shift:

```
In[102]:= gamma_steve[Pi - 1, 100]

Out[102]=
{1.33833580539379797474186122869653723957771294107431333821109559008221287100278168523665937748624671 73*10^54,
 1.33833580539379539546262669962654586359939405706567075046944861838719510536438165869759594423440286 21*10^54,
2.28803779534003241795958890906023392288968815335622244119938074547047100660850428250 07}
```

Mathematica has a built in function that estimates the precision of the final result:

```
In[103]:= Precision[%]
Out[103]= 86.0209
```

The greater the desired precision, the closer together sum and sumneg are, and the more leading digits get lost to subtraction. Hence the need for about 20% more guard digits.

I am thinking Spouge ain't all that good for this application unless one is on a fast machine and can pay the price for so many more guard digits.

FYI, for those who know Mathematica, if I change the definition of z to z=Rationalize[zin], and pass it to the routine as an exact number, Mathematica uses it as such and carries out the computations exactly before converting it to a 100 digit decimal number at the end, maintaining full precision. The N[] command converts it to an approximate 100 digit number, and a cost is paid for that.

Well, at least we know know we aren't going crazy!

Hope you find this helpful. If you have access to Mathematica please email and I will send the notebooks.

Les

The digit loss caveat is actually covered in the pithy wikipedia entry on the approximation [link:http://en.wikipedia.org/wiki/Spouge's_approximation]here[/link].

Bugger :(

Re: Digit loss mystery solved

*Message #29 Posted by **Steve Perkins** on 27 Aug 2009, 2:28 p.m.,*
in response to message #26 by Les Wright

A very nice and helpful analysis!

Spouge's method is the fastest way I've found in my environment to calculate the gamma function to arbitrary precision. Even though I have to keep more guard digits around to do it.

I haven't tackled the problem of evaluating the function for larger arguments, but they could be handled with range reduction.

I'm glad you realized my function was actually calculting the factorial, or Gamma(z+1). I forgot I subtracted 1 before calling it in my main routine.

MPFR gives results that match Wolfram Alpha. Here's the trivial main program:

```
#include <stdio.h>
#include <stdlib.h>
#include <mpfr.h>

#define DIGITS 1000
#define BITS ((DIGITS * 3322)/1000 + 32)

int main (int argc, char *argv [])
```

```
{
  mpfr_t pi;
  mpfr_t result;

  mpfr_init2 (pi, BITS);
  mpfr_init2 (result, BITS);

  mpfr_const_pi (pi, GMP_RNDN);

  mpfr_gamma (result, pi, GMP_RNDN);

  mpfr_out_str (stdout, 10, DIGITS, result, GMP_RNDN);
  printf ("\n");

  exit (0);
}
```

Both bc and dc have long histories. According to Wikipedia "[dc] is one of the oldest Unix utilities, predating even the invention of the C programming language.." bc was traditionally implemented in dc, simplifying the former's terse syntax. The bc page at Wikipedia references a manual page for bc in the Unix v7 manual set. A POSIX draft standard specified bc in 1991. The current bc in most places is GNU bc, a superset of the POSIX bc.

I'm sure you were all dying to know that. :)

Real men can compute transcendental functions using only addition and shifting. :-)

I'm just giving a presentation this afternoon to SVFIG on computing exponential and logarithmic functions without multiplication. It does require having a small table of precomputed constants, though. This is how HP calculators do it, though they use decimal while my presentation only covers binary.

The algorithm is close to one invented by Henry Briggs in 1624, only about 10 years after Napier invented logarithms. There's an explanation and an analysis of the HP-35 firmware on Jacques Laporte's site: http://www.jacques-laporte.org/digit_by_digit.htm

in response to message #1 by Gerson W. Barbosa

A solution with 4 steps excluding LBL that requires manual input before starting program:

```
LBL A
1/x
1
+
RTN
```

To run:

```
1
fA
fA
fA
...
fA
```

Eventually, the value converges to phi. This program implements the continued fraction formula:

phi = 1/(1 + 1/(1 + 1/(...)))

Or, an even shorter solution (3 steps):

```
LBL A
1
+
SQRT
RTN
```

implementing the formula

phi = sqrt(1 + sqrt(1 + ...))

Again, run by pressing fA fA fA ...; this will converge with anything in X that won't cause SQRT to return an error, therefore -1 or anything greater will do.

Or, even simpler (but 5 steps):

```
LBL A
3
6
cos
2
x
RTN
```

because phi = 2 cos 36 degrees.

Or

```
1
ENTER
.5
->P
LSTx
+
```

because phi = 0.5 + diagonal of rectangle with sides (1/2, 1), but this requires 7 steps.

*Message #5 Posted by **Chuck** on 20 Aug 2009, 3:28 p.m.,*
in response to message #4 by Vladan Dugaric

You beat me to it Vladan. I had:

```
Lbl A
1
+
sqrt
GOTO A
```

and press R/S after running a few seconds. As you mentioned, as long as the stack starts with x>-1 it will converge to phi.

Re: A simple 11c/15c mini-challenge (phi)

*Message #6 Posted by **Jeff O.** on 20 Aug 2009, 4:06 p.m.,*
in response to message #5 by Chuck

Since:

```
1
+
SQRT
```

is no shorter than:

```
1
+
1/x
```

I propose the following, which works with all starting values:

```
LABEL A
1
+
1/x
GOTO A
RTN
```

press fA, let run for a while, then press R/S. If not converged, or if stopped with 0.6180339898 in the display, press R/S twice in rapid succession.

This is interesting but **5 sqrt 1 + 2 /** would be one step shorter. The other solutions are also interesting but the one we are looking for is **non-iterative**. Tip: this one (and its variation) will work on the 11c and the 15c, but will not work on any other Voyager.

An older related mini-challenge by Paul Dale:

Something with factorial function perhaps?

HP-11C and HP-15C factorial is actually gamma(n+1) while 12C factorial is just factorial and does not accept decimal values. 16C does not have factorial and I don't know if 10C factorial is gamma or just factorial.

*Message #14 Posted by **Paul Dale** on 20 Aug 2009, 7:41 p.m.,*
in response to message #13 by Gerson W. Barbosa

Okay, here us the unique one then:

```
6
g x^2
2
f ->R
```

Four commands & six keystrokes. It assumes the calculator is in DEG mode so it isn't as good as the other solutions.

I won't spoil the other two :-)

- Pauli

Re: A simple 11c/15c mini-challenge (phi)

*Message #15 Posted by **Valentin Albillo** on 21 Aug 2009, 4:50 a.m.,*
in response to message #1 by Gerson W. Barbosa

Not wanting to spoil the 4-step solutions either, I'll just offer this remarkable HP-15C-specific solution which works in any angular mode:

```
.5
Re<>Im
SIN-1
Re<>Im
eX
```

Best regards from V.

Re: A simple 11c/15c mini-challenge (phi)

*Message #16 Posted by **Gerson W. Barbosa** on 21 Aug 2009, 10:46 a.m.,*
in response to message #15 by Valentin Albillo

Hello Valentin,

Thanks for participating. This is based on formula (26) in http://mathworld.wolfram.com/GoldenRatio.html. I wonder why its hyperbolic counterpart, which only lacks the imaginary constant, is not there. Well, it appears now I have spoiled it all :-)

Best regards,

Gerson.

*Message #17 Posted by **Jeff O.** on 21 Aug 2009, 12:44 p.m.,*
in response to message #16 by Gerson W. Barbosa

So is the anwswer:

```
.5
sinh-1
ex
```

or:

```
2
1/x
sinh-1
ex
```

Either sequence takes me six keystrokes.

...

Re: A simple 11c/15c mini-challenge (phi)

*Message #18 Posted by **Gerson W. Barbosa** on 21 Aug 2009, 1:30 p.m.,*
in response to message #17 by Jeff O.

Yes, you've found 'em!. Interesting isn't it? When googling for "sinh(ln(phi))" I found only six hits. It appears only the German and Polish versions of wikipedia mentions it:

http://de.wikipedia.org/wiki/Sinus_Hyperbolicus_und_Kosinus_Hyperbolicus

http://pl.wikipedia.org/wiki/Funkcje_hiperboliczne (and now I know what the Polish currency, the zloty, comes from :-)

The equality is easy to prove:

```
phi=(sqrt(5)+1)/2

sinh(ln(phi))=(e^ln(phi) - 1/e^ln(phi))/2 = (phi - 1/phi)/2 = 1/2
```

Gerson.

Re: A simple 11c/15c mini-challenge (phi)

*Message #19 Posted by **Jeff O.** on 21 Aug 2009, 3:55 p.m.,*
in response to message #18 by Gerson W. Barbosa

Yes, quite interesting. Thanks for sharing!

I certainly did not find the above references. I looked at equation 26 in the reference of your previous post:

```
sin(i ln(phi)) = 0.5 i
```

Then I found a calculator that can do arcsin with a complex argument (my 42s) and took arcsin(0.5i), which is 0+ i0.48121182506. I guess that told me that ln(phi) is equal to 0.48121182506. You had mentioned hyperbolics, so I wondered if arcsinh(0.5i) might go somewhere, which it did not. Then tried arcsinh(0.5) and found it equals 0.48121182506, previously found to be ln(phi), so I was done. So basically, using the clues you gave, I just fiddled around until I got the right answer.

.

Re: A simple 11c/15c mini-challenge (phi)

*Message #20 Posted by **Gerson W. Barbosa** on 21 Aug 2009, 4:56 p.m.,*
in response to message #19 by Jeff O.

Until yesterday I hadn't looked up any reference either. I was trying to simplify some constants so that they took up less steps on the 11C. For instance, I had found 4 LN HYP SIN was equivalent to 1.875, which was a gain (3 steps instead of 5). For other constants I would do the backward sequence: k HYP^{-1} SIN e^x. I don't remember for what reason, since there's no way to get .5 with less than two steps, I did .5 HYP^{-1} SIN e^x. I recognized the number on the display as phi...

The following is somewhat interesting:

It appears the continued fraction form for 1/n+sqrt(1+(1/n)^2), which is equivalent to e^$sinh^{-1}$(1/n), where n is an integer greater than 1, is always [1; n-1, 1, 1, n-1, 1, 1, n-1, 1, 1, ...]. When n=2, the continued fraction form for the expression will be [1; 1, 1, 1, 1, 1, ...], that is, phi.

Re: A simple 11c/15c mini-challenge (phi)

*Message #21 Posted by **Paul Dale** on 22 Aug 2009, 8:35 a.m.,*
in response to message #18 by Gerson W. Barbosa

My alternate proof of the arcsinh version.

Start with the formula for arcsinh:

```
arcsinh(x) = ln(x + sqrt(x^2+1))
```

Taking EXP of this gives us:

```
e^arcsinh(x) = x + sqrt(x^2+1)
```

Not let x = 1/2 and substitute into the above:

```
   1/2 + sqrt(1/4 + 1)
 = 1/2 + sqrt(5/4)
 = 1/2 + sqrt(5)/2
 = (1 + sqrt(5)) / 2
 = phi
```

Now for my alternate solution:

```
36 2 ->RECT in DEG mode
```

The conversion from polar to rectangular coordinates:

```
    |  STACK IN   |      STACK OUT
 Y  |   theta     |    r . SIN(theta)
 X  |     r       |    r . COS(theta)
```

We don't care about the output in the Y register. So consider the X register output when theta is 36 degrees and r is 2:

```
X = r . COS(theta)
  = 2 . COS(36)
```

Now, a quick look into some trigonometric identities / trigonometric tables or Wolfram alpha :-) gives us this interesting result:

```
COS(36) = (1 + sqrt(5)) / 4
```

Finally, substitute this into the above:

```
X = 2 . COS(36)
  = 2 . (1 + sqrt(5)) / 4
  = (1 + sqrt(5)) / 2
  = phi
```

- Pauli

> Quote:
>
> Now, a quick look into some trigonometric identities / trigonometric tables or Wolfram alpha :-) gives us this interesting result:
>
> ```
> COS(36) = (1 + sqrt(5)) / 4
> ```

And 2COS(36) gives

```
(1+sqrt(5))/2

1.6180339887498948482...

1/2 + sqrt(5)/2

[1; 1...]
```

but no explicit reference to phi...

On the other hand, 1.6180339887498948482 gives

```
Phi+1

(1+sqrt(5))/2

1/Phi, where Phi is the golden ratio conjugate
```

e^ArcSinh(1/2) gives a lot of interesting results though.

Gerson.

This had occurred to me too, but in my tests it always worked. In complex mode, when only the real part is entered (.5) it is assumed the imaginary part is 0 and it will replace whatever value is there. Do you have an example?

Gerson.

*Message #26 Posted by **Kiyoshi Akima** on 21 Aug 2009, 11:53 a.m.,*
in response to message #1 by Gerson W. Barbosa

Do multi-digit number entries count as only one step?

If so, then

```
1.25
sqrt
.5
+
```

Re: A simple 11c/15c mini-challenge (phi)

*Message #27 Posted by **Gerson W. Barbosa** on 21 Aug 2009, 12:22 p.m.,*
in response to message #26 by Kiyoshi Akima

Actually, .5 is part of one of the solutions and that alone takes up two steps on the 11c/15c.

Regards,

Gerson.

Re: A simple 11c/15c mini-challenge (phi)

*Message #28 Posted by **Kiyoshi Akima** on 21 Aug 2009, 12:48 p.m.,*
in response to message #1 by Gerson W. Barbosa

Here's a two-step program that may or may not produce the desired result, depending on how lucky you get :-)

```
RAND
1/x
```

You may have better luck replacing the second step with e^x.

The three-step program

```
RAND
1
+
```

should produce the desired result, if iterated enough times.

Please do not consider these as serious attempts at the mini-challenge.

*Message #29 Posted by **Gerson W. Barbosa** on 21 Aug 2009, 1:44 p.m.,*
in response to message #28 by Kiyoshi Akima

:-)

You only have to find the right seed. See message #9 in the link below:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=112157

Strange as it might seem I considered this yesterday. I thought of trying to find a seed that would generate i/phi. But I realized it would take up more than 2 steps, if it existed...

Gerson.

Touch Up Paint Pen -Silver Paint

*Message #1 Posted by **Alberto Fenini** on 20 Aug 2009, 5:06 a.m.*

Hi everybody, while browsing around I've found this item :160356551826, and I was wondering if anybody has ever tested something similar for retouching the classic units, thanks in advance for your replies and comments, take care, Alberto

Re: Touch Up Paint Pen -Silver Paint

*Message #2 Posted by **Dan W** on 20 Aug 2009, 9:53 a.m.,*
in response to message #1 by Alberto Fenini

I'm not sure I'd buy on auction what I can get from any hobby store or craft supply like Michael's.

I have used these silver paint pens with some success. There are two types, the thick highlighter style like in the auction, and a fine ball-point paint pen. The fine point works on the chrome lines on the sides and bottom well. These are very thin and partially protected areas. I have tried both on the top raised bar. The top is thinker than the sides and harder to paint well. Either works OK but I have been experimenting with spray paint, and it is better.

These paints are not very robust, especially the top rail under the display. It will rub off very quickly. It has to be oversprayed with a clearcoat.

I am planning on posting some photos soon, comparing the pen and spray paint.

EMU41 BIN files

*Message #1 Posted by **Gerry Schultz** on 18 Aug 2009, 8:28 p.m.*

Hello All:

I've gotten EMU41 running pretty well with my PC with many thanks to Christoph Klug for his patient assistance via email. I have a copy Warren Furlow's HP41 DVD and in both the Standard and HP-IL Peripheral subdirectories on the DVD, he has MOD files for each included module.

According to the EMU41 documentation, there is a program called CLBIN41 to convert ROM files to BIN files. Is there a program to convert MOD files to either ROM or BIN files since EMU41 can use either?

If that's not possible or appropriate, are their other sources that make BIN files available for the EMU41 emulator?

Thank you for our comments or suggestions.

Gerry

Edited: 18 Aug 2009, 8:41 p.m.

Re: EMU41 BIN files

*Message #2 Posted by **Gerry Schultz** on 19 Aug 2009, 8:27 p.m.,*
in response to message #1 by Gerry Schultz

Never mind. I went back and re-read the EMU41 documentation and was reminded that the emulator supports both ROM and BIN files. I got so accustomed to using BIN files with EMU41 that I forgot the emulator can use both types. I did a search for both of them in the 1st Warren Furlow HP-41 disk that I bought a few years ago and the new 30th anniversary DVD I just got a few months ago and found some interesting results.

For BIN files the first disk has 39 and for the 30th anniversary disk, it has 10. For ROM files, the first disk has 268 and for the 30th anniversary disk, it has 363. I looked at the files and there are lots of duplications since many of them are related to the different emulator packages included on the disks. Also, I don't know if all these ROM files are compatible with EMU41 but I'll have lots of fun trying them out. I took the 'Games1a' ROM file and "plugged" it in to the emulator and ended up playing a game of Hangman, so I know that worked.

Emu48 v1.49 / Emu48PCC 1.18 released

*Message #1 Posted by **Christoph Giesselink** on 18 Aug 2009, 4:17 p.m.*

Hello I just released new versions of Emu48 at http://hp.giesselink.com/.

Why another release just 5 weeks since the last one. I recognized a nasty bug in all of my emulators, "Edit/Copy Stack" made a mistake copying real numbers in the range of 1E12 <= x < 1E15 to the clipboard. In the clipboard string the exponent was missing.

Another bug was in the Emu48PPC version. Since over a year the "Edit/Save Object..." hadn't worked. I'm wondering that nobody has reported this bug.

What's new:

- Copy/Paste Stack of complex numbers
- MRU is now sorted (last one on top)
- Settings are now saved in the registry (Win32 version)

Especially the last item "Settings are now saved in the registry" made most problems. This was done because on some Windows installations the %WINDIR% is write protected, so writing to the Emu48.ini file wasn't possible. The problem is more or less on the user side. Many users have there special settings and get are getting lost when using the new version. To solve this problem I wrote a small program copying the settings data from %WINDIR%\Emu48.ini to the new location HKCU\Software\Emu48. The program is available at http://hp.giesselink.com/Emu48/E48INI2REG.ZIP.

Cheers

Christoph

I scored a HP-67 for 93 dollars on eBay...

*Message #1 Posted by **hecube** on 18 Aug 2009, 12:22 p.m.*

Is this some kind of record?

Re: I scored a HP-67 for 93 dollars on eBay...

in response to message #1 by hecube

I doubt it... but it's great news!!! Restore it to good health and use it in good health!

Yes, congratulations.

I hope you can get it working. If I wasn't already over budget for the month, I'd have bid more than $92 myself.

Great! However, I scored a working HP 97 (except for card reader)for 65 dollars at a second-hand store in Angels Camp Ca. Carry bag, charger and manual also included. The (original?)battery pack can hold a charge for a few days and the unit is cosmetically clean. I really felt lucky!

Art; If i didn't know you so well i'd think that you just wrote the second literary tall tale to take place in angels camp, but i guess the downturn in our economy has one good side - affordable HPs.

If your poor bemused equals-sign addicted astronomy students weren't confused enough trying to follow you on their TIs before; now you can touch type in values on the 97's full sized keyboard. You're a cruel man.

*Message #7 Posted by **Art Litka** on 19 Aug 2009, 10:47 a.m.,*
in response to message #6 by db (martinez, ca.)

Yeah, I guess they might think I am cruel. I fully intend to brag about my recent (early August 09) 97 purchase after classes start just to show them what a nerdy prof they signed up for! I think rpn will scare the heck out of them.

In France we have almost every week-end what we call "vide grenier". People gather to sell things they want to get rid of. There can be several hundreds sellers.
It's usual to make scores. For instance and just for HP calculators :
- In september 2008 I found a nice HP 32S for 2 euros (+/- 3 dollars), 2 splendid HP 17BII for 1 and 3 euros.
- In march 2009 I found a working HP 48G for 3 euros (+/- 5 dollars).
- In april 2009 I found a nice working HP 97 with battery charger for 3 euros (+/- 5 dollars).
- Three weeks ago I found a non-working HP 42S (but good cosmetic conditions) with its manual in French for 12 euros (+/- 16 dollars).
- Last week-end my wife found 2 nices HP 10B for 10 euros (+/- 14 dollars).... I will use one to test Pioneer's case opening in order to repair the HP 42S

Hello!

> Quote:
>
> In France we have almost every week-end what we call "vide grenier".

Yes. But if you do not especially consider it your hobby to browse through other peoples junk, then going to second-hand stores (I really can't stand that smell!), flea markets, car-boot sales and similar kinds of weekend activities are serious work. Unpleasant work.

I too have bought several HP calculators from flea markets. Some of them really cheap. Incredibly cheap even, like one of these 25th anniversary things, some LCD model that I don't care about to be honest, new and boxed for one Euro. But then, when I ask myself how much time I had to spend at these markets and how long it took me to drive there, and even if I value my time at the cheapest hourly rate, then every single bargain calculaor becomes really expensive in the end...

So I mostly let others do the dirty work and buy the stuff they take home from the flea market from them on eBay. After they have have done a functional test, cleaned the calculator and found a manual for it from another source. And in the end it still comes cheaper and I can spend my Saturdays with the family :-)

And yes, 93 Dollars for an HP67 is a good deal as this certainly is one of the three best pocket calculators ever made. But use it and don't let it rot in some drawer - that's what it was made for!

Greetings, Max

What are the other two?

Re: I scored a HP-67 for 93 dollars on eBay...

*Message #11 Posted by **Maximilian Hohmann** on 20 Aug 2009, 12:16 p.m.,*
in response to message #10 by hecube

Hello!

> Quote:
>
> What are the other two?

That depends on the time of day you ask me and on the phase of the moon and various other factors :-)

Right now I would answer: The HP-67 for carrying along, the '97 for the office and the Ti Voyage 200 as the most powerful (and yet most easy to master) do-everything calculator I have ever used (maybe the nSpire is even better, but I have never seen one close-up).

Cheers, Max

NB: My favourite (but certainly not the "best") pocket calculator is the HP-25. NNB (or NBB?): I got my HP-97 for free (hard to beat...), complete and boxed and still with its first roll of paper in the printer when they cleared out old stuff at my dad's office many years ago.

Flea markets and second-hand store shopping is not not necessarily "unpleasant work" if you enjoy the "thrill of the hunt" for something you like or want to collect. I find it more rewarding than trying to outbid someone online for an item that is not available for you to touch and evaluate in person!

Re: I scored a HP-67 for 93 dollars on eBay...

*Message #13 Posted by **Palmer O. Hanson, Jr.** on 18 Aug 2009, 10:09 p.m.,*

Several years ago I spent 35 dollars at an estate sale and received:

A working HP-67 with a bad reader.

An AC supply

A manual

A Standard Pak

A set of never used magnetic cards.

A large number of cards which supposedly will permit the user to play backgammon but without instructions. I haven't figured out how to to use the cards.

Extract their contents and upload to the software library. I'm sure someone will be able to figure it all out.

I published a short description of what I had and a listing of what I thought was the first card in the program on 21 June 2004 at http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=59020 . There was no response.

A little over a year earlier on 10 May 2003 Gene Wright had asked if anyone knew about this program and there were no responses.

I don't think that is the first card.

A first attempt at a decode:

LBL A looks like the entry of this part of the program.

LBL a is the start of a loop that seems like the calculator and player are taking turns clearing the board.

LBL 0 is a random die roller that increments the chosen register. I assume this is the calculator's move code.

LBL 5 copies the primary to secondary registers and resets the counter in register 9. It uses LBL 6 to store and show the values as it goes.

Paul and Geoff:

Here is what I wrote about the bckgammon program back in 2004:

> Quote:
>
> Last summer I purchased an HP-67 at an estate sale. Among other items included with the calculator is a magnetic card pack labelled Backgammon. There are 36 cards in all. The cards all bear dates from 3.25.77 to 2.12.78. Cards bear labels from PGM LOGIC 1 through PGM LOGIC 5, Filling Home Base, Mask, Locke I/P Data and Locke Prgm. The remaining cards have some sort of seven digit code in formats such as 3 316103, 0 432330, etc. No instructions for playing the game accompanied the calculator. I am hoping to find someone who can provide the instructions.

The things that I do not know are:

1. Did the program really work or was it only in some stage of development. If the program really worked then it seems likely that it would have been published, particularly since there was a published program for the TI-59 in those olden days.

2. Are all 36 cards really needed for the program to run, or were some of the cards "data cards" used during the development or during runniing of the program.

If the program really worked then it was a substantial accomplishment and it would be appropriate to get it published with instructions on how to use it. Clearly, I am not the one to do that since I have never played backgammon. So I will make an offer. If either or both of you are willing to try to publish the program I am willing to send the set of cards to you with the sole provision that if you tire of the project and drop it then you will return the cards.

The cards are stored at my winter home. I expect to be there later this month. Lat me know what you might like to do.

Palmer

I'd be willing to give it a go, however I'm probably not the best choice since I don't have a 67/97 or access to one.

I do have a 41 with card reader but no way to get the programs anywhere useful without copying them by out hand.

If I could get listings (& register contents) from the cards along with the label written on them, I could work from there to decode the program. Anybody set up to extract the contents and generate a program listing?

- Pauli

Paul:

I have an HP-67 with an operating card reader (thanks to Viktor Toth). I will do the downloads if we can't find someone else with an HP-67 to help, but it will certainly be slow going. These 80 year old eyes struggle with the LED readouts after only a few minutes. It is certainly something to do when one has trouble sleeping.

If you want to see what the TI-59 program looks like you can find it at Viktor Toth's site as PPX program 918127 (Thanks to Gene Wright for coordinating the publication of all those old programs).

Hi Palmer,

If you have trouble reading the 67 LED display, I recommend of course, getting a 97! The digits are almost a quarter inch high.

Also I was browsing thru the Museum DVD and in the Key Notes, Vol 1 1977, pg 11, someone had found another solution. They used a Bausch & Lomb reading glass, which is a half cylinder reading magnifier that is supposed to rest on top of a book page. It doubles the size of the digits. They cut it lengthwise to fit across the display.

Cheers,

-- Dan

If you're going to use a 97, just print the cards out and I'll work from that...

Palmer, if you are going to suffer undue hardshhip doing this on a 67, I'll do it one my 41.

I don't have access to an HP-97 and don't have a card reader for my HP-41's. So, if you are willing to give it a try I am willing to send the set of cards to you. Send me a shippiing address if you want to do that.

Are the cards at risk if i send them through the mail?

Palmer

Naturally there is some small risk in sending them by mail. We've had two or three packages go missing in the last 10 or so years.

The risk would be lessened if someone in (I assume) the USA was willing to read the cards. Please anyone?

- Pauli

Pauli writes separately that he thinks that may be the best idea. I need a mailing address. I have no real use for the cards other than to hold them until someone is able to try to run the program. So, when you are done printing them out you could keep them, forward them to Pauli or return them to me.

My question about mailing was not about losing them but rather whether there was a possibility that they might be damaged magnetically. What do you think?

I very much doubt it.

I suspect they are similar to the magnetic strip on the back of all credit cards - all of which that I have ever received (and they all came in the regular mail) seem to work fine.

Excellent Jimmy. I had been watching that auction. My notes were "unpowered, untested, excellent cosmetics". I thought about bidding but I have enough on my plate right now.

Actually I am looking for an HP65 that is a total basket case to restore.

I am glad this thread was initiated, because I see this as a sign: I want to acquire an HP-67 myself, and I have a couple of "packages" to offer in exchange; I will post the trade offer on the classifieds section soon.

N.O.S. for $50 USd.

*Message #34 Posted by **Geoff Quickfall** on 19 Aug 2009, 12:19 a.m.,*
in response to message #1 by hecube

Firstly, let me say, GOOD JOB! Not a bad price for a classic HP-67. I know there have been better deals, but that is rare, especially at EBay.

My find:

Picked up an unused HP-67 in its original box for $50.

In the box was the following:

```
shrink wrapped prgraming pad
shrink wrapped manual
shrink wrapped HP-67 games box
shrink wrapped HP-67 statistics package and box
shrink wrapped external classic battery charger
two unused adapters (wall warts)
two PPC journal copies
the quick reference card
the original magnetic card holder
two unused (but leaked) battery packs in a zip lock from HP
```

I explained to the owner, a 97 year old archeologist, that the package should be valued around $300 plus dollars. He stated that he wanted it working, but that the new rebuilt battery pack would not power the calculator and that for $20 he bought a Casio that would do the statistics he needed for a publication. He did not want it fixed, but wanted a good home for it.

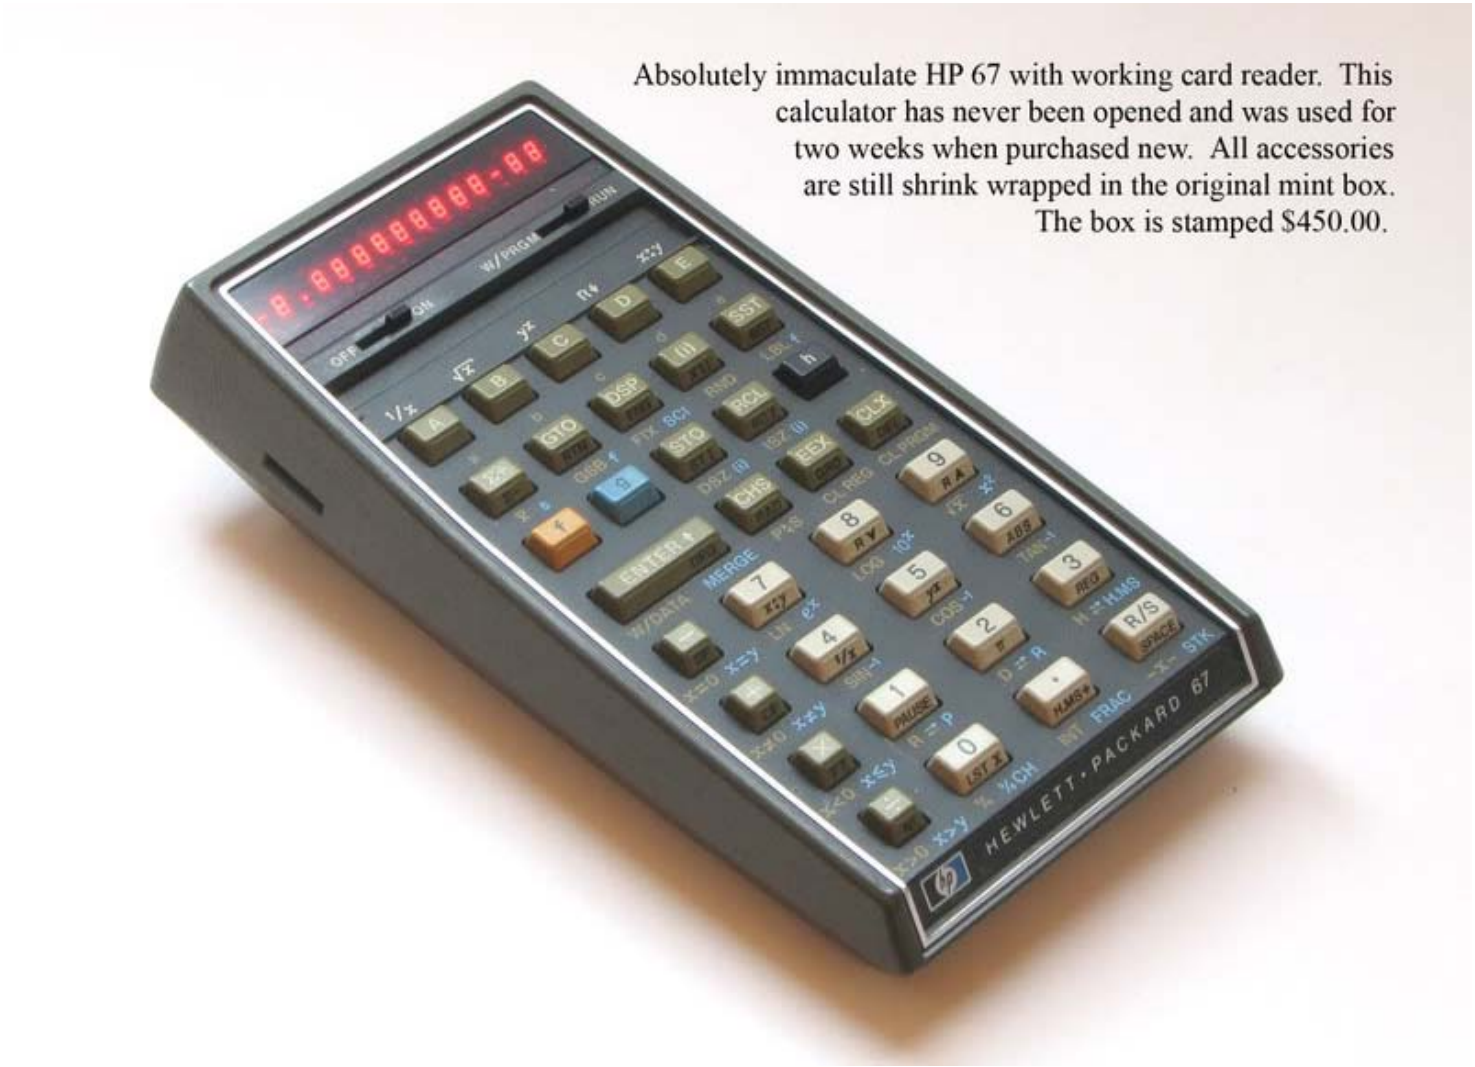
I explained that I would try to fix it but that the card reader would need a new dampening couple and pinch roller. Plus the trouble shoot to find the power supply problem. He did not want to be bothered! So I ended up giving him another $50 for a total of $100. He did not think that was necessary and gave it back to me.

I got home and found out it was the battery pack rebuild that was unservicable. I powered up the 67, tried a card, and it ran perfectly. I removed the battery pack and have kept the unit unsuded since. I did tell him that I got it working and that I

would repair it for him (the card reader) although it did work at the moment.

His response was thanks, but it's yours, enjoy.

Those of you at HCC2008 would have seen this one on display.



Cheers, Geoff

I recently saw a clearly defective HP-65 on eBay being bought for something like 50 or 60 dollars. I figured this was an OK price to pay for a "state unknown" HP-67.

Besides, it seems I've always had some kind of luck with my eBay purchases... they're always better than what I expect.

Re: N.O.S. for $50 USd.

*Message #36 Posted by **Geoff Quickfall** on 19 Aug 2009, 1:20 a.m.,*
in response to message #35 by hecube

I use a simple rule:

"Only buy "broken" or "as is". You are never dissappointed.

I broke that rule on the HP-41C tallnut posting below. It was described as in excellent condition. All keys function. The photo was extremely blurry, in fact, I thought it was a tall keys version with gold contact balls but did not know until it arrived.

When I got it, the right display driver was obviously shot, sending out spurious signals creating a weird display. The case was excellent with the contact hatch still presen and perfect i/o assembly. The keys were perfect and the leatherette case still had it's original foam.

So it should have been advertised as "Funny display but calculator in great PHYSICAL condition." I did not follow up with the questions I usually ask due to the short time limit I had when I found the listing.

98 is excellent for the HP 67 even if you need to repair the pinch roller and dampening couple! Enjoy it.

I have 5 now, one NOS as pictured, another from the first month of the first year in a Nearly New looking case and 3 others. All the readers have been repaired and the cases restored to as new condition.

This is still my favourite calculator, including the 41CX and the 42S which go to work every day I am in the cockpit.

Cheers, Geoff

Ah, the coveted HP 67. Many years ago, I worked for a small city, which shall remain nameless. My boss, the City Engineer, had a 67 which he had requested the City to purchase for his use. When he left the City's employ, the 67 turned up missing. I heard a report that he was questioned as to its whereabouts, to which he replied that it had been "stolen out of his car". Which theft he had failed to report until asked where was the calculator. I remember comments made at the time to the effect that "he just HAD to have that $450.00 calculator..."

I won't say he took it, but I can perhaps understand rationalizing that no one he left behind would have known how to use it.

Except perhaps me.

Martin, is that you!

HP19BII - how to fix the battery compartment

*Message #1 Posted by **eddieuk** on 18 Aug 2009, 10:38 a.m.*

I've had my HP19BII for almost 10years and have managed with a broken battery compartment for about three years by using strong carpet tape...unfortunately the tape gave way today and the last remnant of one of the plastic edges needed to hold the battery cover in place snapped off. New tape on its own was not strong enough to hold the cover.

The battery compartment on the HP19BII is on the uppermost right hand side edge, my uppermost edge of the battery cover still slides into place however the lower edge has nothing left to slide into.

To fix, I have used a small washer and a woodscrew (10 milimetre in length and 5 milimetre head) which I have screwed into the calculator case in the gap where the missing edge has snapped off. I inserted the batteries and held the cover in place whilst I tightened the screw and washer so they overlapped the battery cover but held it in place.

To create the hole in the case, I used a very sharp nail as a nail punch, held the HP19BII in between my knees (to allow movement in case I hit it too hard) and tapped the nail into the plastic until it was fully pierced. I then wriggled the nail around to make the hole big enough for the screw to enter. NOTE - don't use a long screw as it might reach too far inside and damage the electronics.

Works a treat for me! Hope this can help someone else!

P.S. I will try and add a photo, hope that works too!

*Message #3 Posted by **designnut** on 18 Aug 2009, 4:29 p.m.,*
in response to message #2 by Peter A. Gebhardt

I found some 2 part epoxy plastic cement that was strong enough to repair the battery door on a camera. When it was partly hardened I shaped it to fit, and extend the edge of the plastic. The repair held until some other faults damaged the camera. It did cling well and was strong enough. It was at Home Depot.

Sam

HP 41 high-pitch noise

*Message #1 Posted by **Frido Bohn** on 18 Aug 2009, 8:34 a.m.*

Dear all,

I wonder whether some of you have made the same experience with an HP41CX: every time it runs a program or a function is executed I hear a noise of high frequency. This noise has its maximum at the back panel where the alphanumeric code is printed. Interestingly it is only present while the HP41CX is operating - while idle no sound. In contrast, my HP41CV does not show this. Has anyone an idea where this noise does come from? Or even better - has anyone an idea how to eliminate this?

Thanks in advance Frido

Re: HP 41 high-pitch noise

*Message #2 Posted by **Geoff Quickfall** on 18 Aug 2009, 11:32 a.m.,*
in response to message #1 by Frido Bohn

It is definitely comming from the Piezo transducer. The transducer is fixed to the back of the halfnuts and to the logic PCA of the fullnuts.

As to why it is buzzing during execution I would not know. However, try a master reset (ON + CLX) and then reload the programs. This has cleared the problem on a halfnut that 'buzzed' as soon as I reassembled it during restoration.

Hope it helps, Geoff

p.s. if the 'master clear' doesn'e work, remove the batteries and short the first and fourth battery contact. Then replace and try the 'master clear' and then reload the programs.

Re: HP 41 high-pitch noise

*Message #3 Posted by **hecube** on 18 Aug 2009, 11:54 a.m.,*
in response to message #2 by Geoff Quickfall

I used to make my HP-41 freak out back in the early 80s with various manipulations. A high-pitch noise was one of the results.

A simple master-clear should make it right. If not, I can't help any further...

The manipulation I'm talking about is to make the all-clear (clx + on) while the HP-41 is beeping, while the calculator is on. If you're lucky, the HP-41 will then squeal each time you press a key. You have to have the right timing to make it work though...

Re: HP 41 high-pitch noise

*Message #4 Posted by **Raymond DelTondo** on 18 Aug 2009, 12:00 p.m.,*

in response to message #1 by Frido Bohn

Just perform a BEEP or TONE (0..9)

This will reset the suitable CPU reg.

HTH

Raymond

Excellent suggestion Raymond.

*Message #5 Posted by **Geoff Quickfall** on 18 Aug 2009, 1:05 p.m.,*
in response to message #4 by Raymond DelTondo

Always start with the simplest, least invasive fix. In this case, as Raymond states, reset the buzzer register with an overiding new beep command.

I find that the more involved one gets the longer the fix will take when in most cases the KISS principle is the best.

Cheers, Geoff

Edited: 18 Aug 2009, 1:05 p.m.

Re: Excellent suggestion Raymond.

*Message #6 Posted by **Garth Wilson** on 18 Aug 2009, 1:41 p.m.,*
in response to message #5 by Geoff Quickfall

+1. Many of the 100+ synthetic TONEs leave the beep line high when they're done, so the power supply noise gets to the beeper. When the calc is idle, there's less power supply noise. Just BEEP or do a TONE(0...9) so the beep output will finish at ground instead of Vcc.

Re: HP 41 high-pitch noise

*Message #7 Posted by **Eric Smith** on 18 Aug 2009, 2:27 p.m.,*
in response to message #1 by Frido Bohn

You've rediscovered "buzz mode", which is present on the 41CX, and on the final ROM revision (HFF) for the 41C and 41CV.

Re: HP 41 high-pitch noise

*Message #8 Posted by **Frido Bohn** on 19 Aug 2009, 4:39 a.m.,*
in response to message #1 by Frido Bohn

Thank you for your numerous contributions!

However, I turned the HP-41CX on to perform the recommended master clear and was surprised not to hear the noise anymore. Apparently, a rest of two days was sufficient to resolve this problem spontaneously. I was trying to follow-up the cause for that noise and came to the conclusion that an overnight run of the calculator was possibly responsible for the problem. It was attached in an HP-IL loop to run as a data logger. Perhaps a charge which might have developed in the circuits was the origin of the high-pitch noise.

Nevertheless, I will have an eye on this, and the next time I will try to resolve this by the generation of a

TONE or by a master reset, and keep you informed.

Regards, Frido

HP-41C tall nut, full nut 2025Axxxxx close up pictures.

*Message #1 Posted by **Geoff Quickfall** on 17 Aug 2009, 9:08 p.m.*

This arrived today, a NO BUGS (darn it) HP-41C Tall Nut, Half Nut. It had a totally bizarre display on the screen on power up. The display was:

```
0.0000 ' ' ' ' '
```

Executing a master clear gave this display:

```
MEMORY  L@2+
```

Clearing the memory clear message resulted in the first display. The calculator performed all functions correctly, with interpretation involvings some of the displays. In fact, with FIX 9 set there was almost no numeric problem on the display as the correct digits masked the apostrophes correctly.

Switching to Alpha mode displayed the apostrophes and these rode on top of any alpha character.

I tried the master clear, shorting the contacts and reversing the battery (yuck). No joy so I replaced the LCD with a good one from a donor PCA with cracked contact domes and two missing battery posts. Success! What followed was a thorough spa, and back together it went.

I thought you might appreciate a close up of the tall keys versus a normal keys fullnut HP-41C from 1982. These pictures were taken at the same angles for each example. Enjoy.

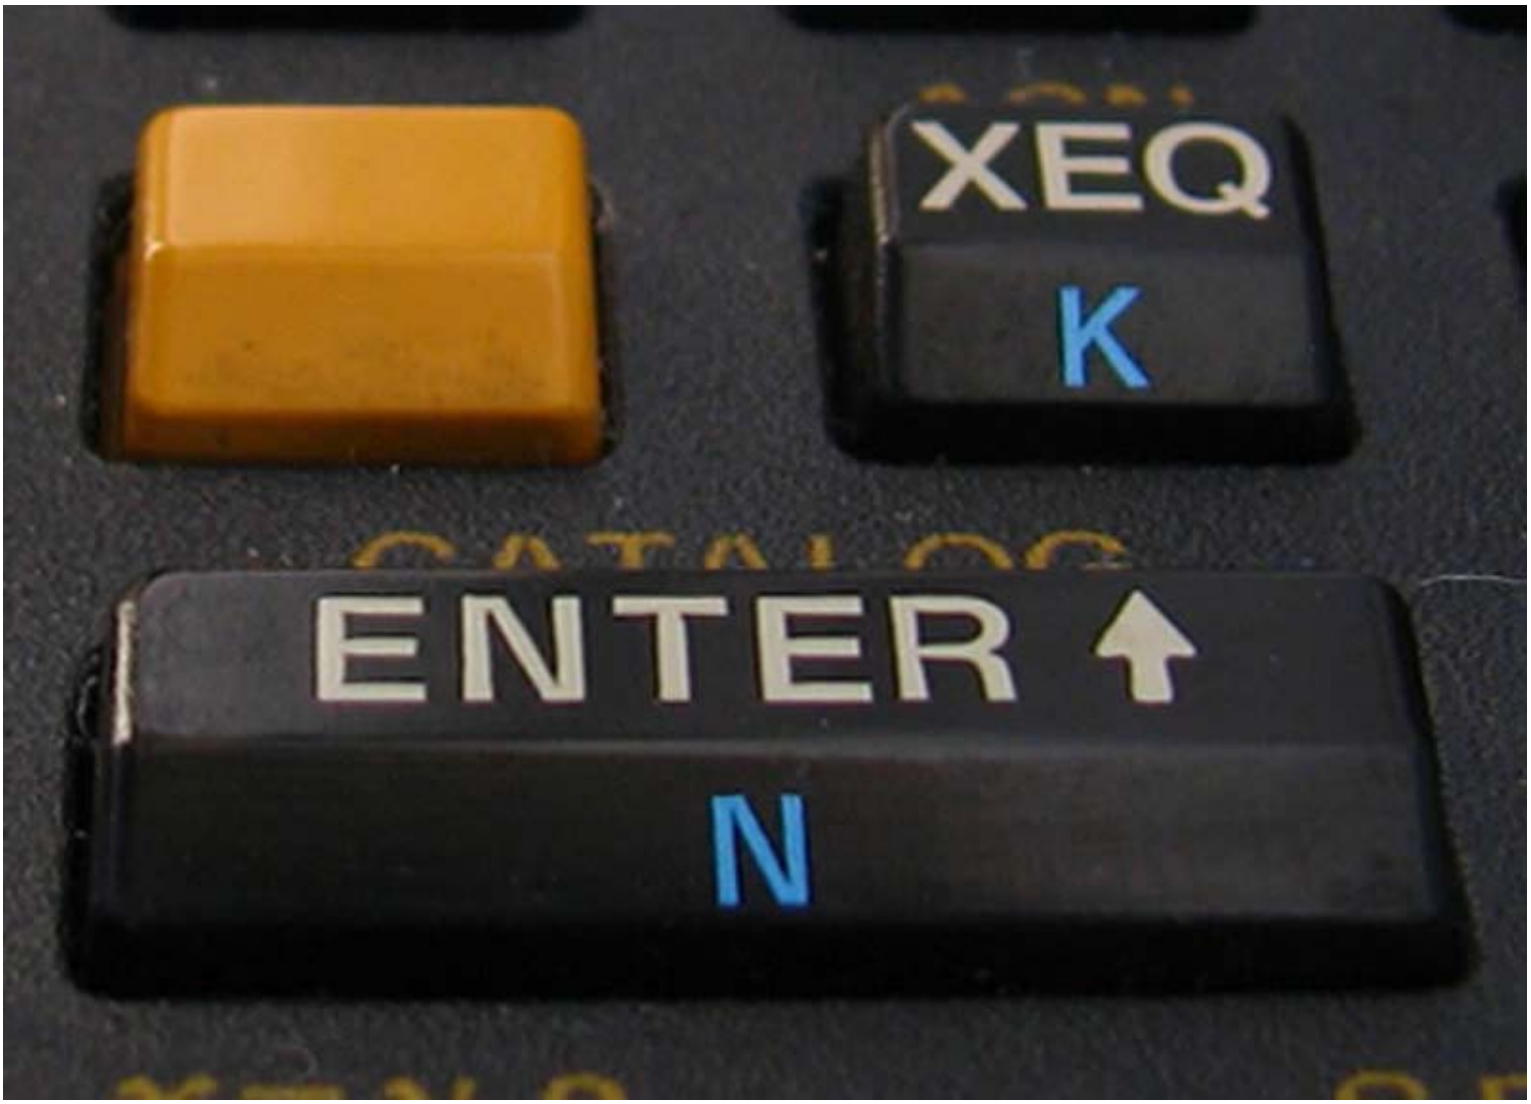
Normal keys top view, note the easily read blue labels from a vertical view:

Tall keys top view, note the hard to read blue labels from a vertical view:

Normal keys side view, note the smooth face

Tall keys side view, note the framed raised portion similar to the classics.

Normal keys front view, again the smooth face.



Tall keys front view, the framed front piece, artistic touch.

Re: HP-41C tall nut, full nut 8025Axxxxx close up pictures.

*Message #2 Posted by **Mike Morrow** on 18 Aug 2009, 10:31 a.m.,*
in response to message #1 by Geoff Quickfall

I purchased my HP-41C in 1980 and it was identical to the one that you show. I sold it in 1984 after buying the HP-41CX that I still have.

I've always regretted a little having sold that HP-41C, specifically because of this early key configuration.

Re: HP-41C tall nut, full nut 8025Axxxxx close up pictures.

*Message #3 Posted by **fbronner** on 18 Aug 2009, 10:39 a.m.,*
in response to message #2 by Mike Morrow

Hi,

Same here. I exchanged my HP-41C for an HP-41CX in 1984, however it is equipped with the normal keys like the 41C in that picture. I find those much easier to read

And yes, I still use it at least a couple of times per week...

Edited: 18 Aug 2009, 10:43 a.m.

Tall nut keys not hard to read!

*Message #4 Posted by **Geoff Quickfall** on 18 Aug 2009, 11:55 a.m.,*
in response to message #3 by fbronner

It is interesting to note that the Tall Keys version has the same key design of every Classic and Woodstock and Spice ever made.

No one complained about hard to read keys on those versions but the HP-41C Tall Keys is refered to as a hard to read key. Personally I like the look and the added artistic design.

The photo of the 1982 normal version is my first, purchased new, and over the next 2 years it was upgraded to quad memory, x-functions, x-memory, wand, card reader, printer, HPIL, plotter, floppy drive and statistics module. Finally it got stored as a spare and replaced by a 1984 CX which I still have and is my main work calculator.

Cheers, Geoff

Re: Tall nut keys not hard to read!

*Message #5 Posted by **fbronner** on 18 Aug 2009, 12:08 p.m.,*
in response to message #4 by Geoff Quickfall

I wouldn't say they were hard to read.

But I would say the somewhat more angled keys were easier to read then the tall one. And when I'm at my father's place and I grab his old 41C, I always find mine easier to look at... :-)

And yes, he still uses it. In fact he has been using it every workday since he bought it in 1982 !!!!!

I gave him the Advantage, Math and Time modules when I sold my 41C. They have been in there ever since!

It still ticking...Better then that Energizer bunny!!

Bug in SIMPLIFY? (hp 50g)

*Message #1 Posted by **Luca** on 17 Aug 2009, 12:41 p.m.*

I am very surprised by the behavior of SIMPLIFY. I am in a directory where I have two variables defined:

- M value 0.1
- Q value 0.8

(I have some other variables as well). I type the expression, in the equation writer:

```
 1 + M - M
-----------
 3 + M
```

I press SIMPLIFY, and I get 1 / (M + 3), which is the expected answer. Now, I try with another expression:

```
 Q * M - (Q - 1)
-----------------
 Q * M + 1
```

I hit SIMPLIFY, and I get... 0.259259259... !!!

Why in one case it simplifies only down to symbols (correctly) while in the second, it also substitutes values into variables??? I consider the second behavior a bug... can it be prevented? Why is the behavior inconsistent? This with ROM C-2.15.

Many thanks,

Luca

Re: Bug in SIMPLIFY? (hp 50g)

*Message #2 Posted by **Hal Bitton in Boise** on 18 Aug 2009, 11:50 a.m.,*
in response to message #1 by Luca

Hi again Luca,
Hmmm...When I work your scenario, I get numeric results for both equations. It's only when I purge both M and Q that I get symbolic results.
The only suggestion I could make is to be sure you're not inadvertantly mixing upper and lower case variables (ie, M and m would be two separate variables).
It's pretty much axiomatic that any variables involved must be purged if you don't want them evaluated during operations. Either that or the variables must be put in a directory where the calculator can't reach them (such as in a lower or parallel directory).
Best regards,
hal

Re: Bug in SIMPLIFY? (hp 50g)

*Message #3 Posted by **dbatiz** on 18 Aug 2009, 2:55 p.m.,*
in response to message #1 by Luca

I recommend sitting down with the manual and doing a quick read on approx -v- exact mode and the different types of numbers. Imagine "1" is handled differently than "1." Yes, the decimal tells the calculator to handle it as a value and not a number.

For example, on the stack type 1 ENT 2 / If you are in exact mode, the 50G will return 1/2

If you type 1 ENT 2. / the 50G will return .5

Once you figure out how to manage your variables, and get solid on the types of values you have stored and where they are, you'll get predictable behavior.

There are several great tutorials available through links here in the forum and at the HP site,

Very respectfully,

David

Re: Bug in SIMPLIFY? (hp 50g)

*Message #4 Posted by **Luca** on 19 Aug 2009, 12:37 a.m.,*
in response to message #3 by dbatiz

Thanks...

I don't think the problem is approx vs. exact mode.

The problem is that I think it is a very bad idea that expression simplification involves also substituting into the expression the numerical values of variables, fishing these variables from the directory and its parents in the directory tree. I think it would have been a much cleaner design to let simplify act on the expression on the stack, and reserve some other function for such substitution. After all, commands usually work on their argument, not on the argument plus extra information that they go hunting for around in the calculator.

This "bug" (which, to some, may be a feature) prevents me from using the 50g as a full-fledged calculator: either I use it to do symbolic manipulation (in which case I have to be careful not to have numeric variables), or as a numerical calculator (in which case variables are ok).

I may still find a work style that works for me, but I disagree with the design decision on SIMPLIFY.

Luca

Re: Bug in SIMPLIFY? (hp 50g)

*Message #5 Posted by **Nigel J Dowrick** on 19 Aug 2009, 5:30 p.m.,*
in response to message #4 by Luca

I've looked at this and I find it confusing too. I've defined the variables Q and M as you have. An expression containing only one of the two variables (e.g., Q^2+3) is unaffected by SIMPLIFY. However, an expression containing both (e.g., Q^2+3+M) gets converted into a number at once! I do not fully understand the reasoning behind this difference in behaviour. (Neither the "numeric" nor the "approx" mode settings are ticked.)

Of course, there are many "simplification" commands on the HP-50g: EXPAN, EXPAND, SEVAL, plus lots specific to trigonometry, powers, and logarithms. Give me a TI-89 for elementary algebra any day! Less powerful, no doubt, but it does what is expected.

To get around your problem (assuming you don't have a TI-89) you can create a subdirectory of HOME in which you store no variables. So long as you store no numeric variables in HOME either, you can simplify without risk of numeric substitutions if you change to this directory first. Not an ideal solution, and I can't help feeling that there ought to be another way around this, but it should work.

Nigel (still rather puzzled)

Re: Bug in SIMPLIFY? (hp 50g)

*Message #6 Posted by **Luca** on 20 Aug 2009, 12:41 a.m.,*
in response to message #5 by Nigel J Dowrick

Yes, indeed you are right: SIMPLIFY has a different behavior on one or two-variable expressions.

I created a directory with only two variables, T and M, which have real numbers as values.

- If I type 1/M in the equation writer, select it all, and press SIMPLIFY, nothing is simplified.
- If I type 1/(M+T) in the equation writer, select it all, and press SIMPLIFY, the expression is evaluated to a real number.

I think this can only be considered a bug, and a major one. Perhaps the 50g CAS was designed around schoolkids, who need to simplify one-variable expressions but evaluate multi-variable ones? It certainly does not make sense to me.

It is too bad, because this severely limits the usefulness of CAS, which should be the shining point of this calculator. For quick math, my 32SII is a lot faster and simpler to use (and I do not need a .pdf manual to find what I need).

I will give the TI-89 a try... I have the impression that the 50g is complicated without being really advanced.

Luca

Re: Bug in SIMPLIFY? (hp 50g)

*Message #7 Posted by **Nigel J Dowrick** on 20 Aug 2009, 5:03 p.m.,*
in response to message #6 by Luca

Just to be clear about the TI-89: it too will substitute in numeric values when a symbolic expression is entered. However:

- its behaviour in this regard is consistent
- there's an easily accessible command "Clear a-z" that clears all one-character variables in the working directory
- the "|" (substitute) function is a very convenient way to give variables numeric values. For example, "(x+y)/z | x=4 and y=5" evaluates straight to 9/z. I know the HP-50g can do this too, but the syntax is different in algebraic and RPN modes, and I can never remember how to substitute for more than one variable at a time without looking it up.

Despite my complaints, I feel that the HP-50g is far more powerful than anything that TI has produced: it has an awesome number of advanced mathematical functions and functionality programmed into it. However, I just do not find its use intuitive or memorable. The vast power is unavailable even to serious users unless they constantly consult the manual - which you only get in electronic form, unless you print out the 1000 pages yourself!

I know the TI is an algebraic machine, but its editor that lets you paste any previous entry or result into the command line gets around the usual disadvantages of algebraic logic, at least for me. As scientific calculators, I love both machines; the Multiple Equation Solver of the HP machine is truly wonderful. But for algebra or elementary calculus give me the TI any time. It just works!

HP 32SII

*Message #1 Posted by **Marnus Malan (RSA)** on 17 Aug 2009, 4:47 a.m.*

Hello! Does anybody have first hand experience of this calculator? Is it worth aquiring for day to day use, how much does it have in common with the 42s programming and how much should one be willing to cough up for a good specimen? Kind regards

Re: HP 32SII

*Message #2 Posted by **Walter B** on 17 Aug 2009, 6:28 a.m.,*
in response to message #1 by Marnus Malan (RSA)

Hello Marnus,

> Quote:
>
> Is it worth aquiring for day to day use

Depends on what you need. Please compare the features of the 32S -- it's the 32SII without fractions. Compare the two layouts, too. And there is a 35S readily available being -- well -- a 32SII in todays quality for a reasonable price. Please search this forum for a lot of information about the 35S.

> Quote:
>
> how much does it have in common with the 42s programming

A lot. Please check this museum.

> Quote:
>
> how much should one be willing to cough up for a good specimen?

Up to you d:-)

HTH,

Walter

A 42S is far more capable, but the 32S II is a nice machine to have. If you plan for everyday use, the 33S or 35S may be better... only because they are available now and you can buy a replacement if needed; if you lose

a 32S II or other old machines, you will just be sorry. Suggestion: if price is not too high, just buy it.

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 18 Aug 2009, 12:40 a.m.,*
in response to message #4 by Bill (Smithville, NJ)

I agree, but prefer to leave the 42S, and even the 32S II at home, and have a 33S at my lab desk, where it can be lost, dropped, etc. So I can use RPN at work, and use the older models at home.

That said, I remember in my university days, some students (me included) carried their HP 25 with them all the time. Such calculators showed some marks of heavy use, they were certainly "not mint" by today standards; but we knew how to apply them to many problems, and they helped us learn a lot more than the then current curriculum specified. There were other students, who also had an HP 25, but never have it on their hands or hanging from their belts. These calculators looked almost new (something a collector would appreciate nowadays), but their owners only bring them to class on final exam events. Needless to say, they barely know how to turn them on, so they benefited very little from the experience of using the calculator almost every day. Of course, I'm more in the side of "users", not that much in the "keepers", but I do reflect on the chance of never being able to replace a lost or broken "oldie".

Just my 0.02$

If you search elsewhere on this site, you will see that the programming paradigms are somewhat different; the 42s is more like the 41C in that regard.

As mentioned above, there are two newer variants of the 32sII, and the one that resembles it most in terms of capabilities is the 33s - relatively ugly but a great machine nonetheless. Since you are looking for a 32sII experience, I recommend it over the 35s for reasons explained elsewhere on this site such lack of rectangular to polar conversions.

They are expensive and can cost you upwards of $200 on EBay, so unless you are adamant about getting one

right away, try one of the newer and less expensive models first.

Hi Joel,

Here at the museum is a benchmark article, by Xerxes. It features a long list of calculators (incl. non-HP calcs), their benchmark times, and source code of the various N-Queens programs used for benchmarking. By the source you can contrast or identify programming patterns across various models.

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=700

I used FIND (and NEXT FIND) and "42s" and "32sii" to get around the article quickly.

in response to message #1 by Marnus Malan (RSA)

Yes, I have one, and use it occassionally, mostly for fraction work, and as back-up for an employee who has one she uses daily.

My take is this: If you just want the functionality, the 35s is readily available brand new at a consistent price of about $60, has a lot more memory, and a two-line display vs. one-line, and thus would be a better choice. Personally, I could never get used to the ugly 33s.

However, if you, like me, prefer the look and feel of the Pioneers, and don't need the extra memory, then the 32sii is a better choice. As far as price and availability, they are always available on eBay, and can be had for as little as $80 for a used specimen in nice condition, to well over $200 for a an "as new" one, as Jeff points out. Shop smart.

> Does anybody have first hand experience of this calculator?

Yes. I acquired a 32SII after reading many positive comments here. I was very disappointed.

Personally I wouldn't spend $5 for a 32SII for daily use (I'd just resell it).

I was raised on the 15C and now use the 41CX and 42S daily (emulated on my iPhone). My 15C is on my desk, I still break it out to marvel at its design from time to time. The 32SII was a giant leap backwards. But, that is just my opinion.

If you really like the 32SII feature set, then save yourself some coin and try a 35s, its the follow-on to the 32SII/33s (unless you need it to fit in your pocket).

*Message #14 Posted by **Luca** on 17 Aug 2009, 11:33 a.m.,*
in response to message #12 by Egan Ford

Interesting; I have both a 42s and a 32SII, and the one that gets all the use is the 32SII. It is ideal for the kind of quick calculations that I need to do all the time; it is one of the very few objects that has a permanent place below my PC monitor. It has a clear, legible display, and direct access to most of the functions you are likely to use.

I have a 42s, and from an engineering point of view, I admire it, but I hardly ever use it. The display is too difficult to read in the sometimes dim light I use to work at the PC, and too much of its functionality is hidden in long menus -- it is no fun at all to have to go fish in the function catalog even the %CH (percent change) function, which I use relatively often. Yes, I could program it as one of the custom soft-keys, but then I lose access to top-level key functions...

I could never warm to the 35s. The three chief drawbacks, in my opinion, are: the STO key is shifted; when you type a long number, no "," separators are inserted while you type (only after you enter it), making it difficult to enter them correctly; and it has some bugs that decrease my confidence.

So in the end I always go back to the 32SII. It is the only calculator that, when I use it, I do not wish I were using something else.

The 42s used to be the perfect design point (or close to it) in an era when access to PCs was more difficult. Nowadays, when more complex things tend to be done on PCs, I think the 32SII is the best pocket calculator there is. Simple, fast, direct, well-engineered.

*Message #15 Posted by **Mike Morrow** on 17 Aug 2009, 10:48 a.m.,*
in response to message #1 by Marnus Malan (RSA)

The HP42S is far more capable and elegant. I bought an HP32SII to allow me to retire my ten year old HP-15C. I mistakenly assumed that the 32SII would be at least as capable as the much earlier 15C. Bad assumption. Calculations using or producing complex number results are extremely poorly implemented on the 32SII, for just one example. Completely ignoring any collector value, the HP42S is still the best all-round RPN calculator ever made in many people's judgement, 21 years after its introduction. IMHO, the HP-15C is next best, yet far behind, while the 32SII doesn't even rate a mention. The only things the 32SII has better is more speed and larger characters on a less informative LCD.

The later butt-ugly HP33S and the oversized HP35S also have very poor complex number support similar to the HP32SII. What is it about HP's calculator design philosophy that continues this persistent defect in all their calculators except the 15C, 42S, and the RPL models? It would only cost a little firmware development to duplicate 42S capability.

Well, thanks to everyone.

I use a 42s and a 50g on a daily basis. (The 42s stays at home, the 50g being the real workhorse) I also do own a 33s but find the keys and layout not very practical. That said it is much faster than the 42s on similar tasks, but there is a lot the 33s can't do that the 42s can. Also, all examples in the 33s is for algebraic mode, which really sucks.

Apart from the above mentioned models, I also own a 48S and a 82240B printer.

I'll just make the guy an offer and see if I can get it fairly reasonable, then take it.

in response to message #17 by Marnus Malan (RSA)

Since you're accustomed to the HP42S, you'll likely find the HP32SII rather disappointing. It is several years later than the 42S, so it is faster, but only by about 50 to 100 percent depending on the operations performed. The display's characters are larger and clearer, but anything otherwise would be surprising since far less information is shown. Like the earlier HP-15C, it has no sound-making (beep) function, and it has no infrared printer output. It's quite a come down from its more accomplished older brother.

I wish they had produced an HP42SII and dropped the HP32S fifteen years ago, instead of the reverse.

My numbers are wrong. I've just run some extended looping comparisons between the 32SII

and the 42S. These show a 32SII speed advantage of only about 35 percent.

Many have stated that the 35s is slower than the 33s. Have you compared the speed of the 35s to the 42S?

Re: HP 32SII

*Message #22 Posted by **Mike Morrow** on 17 Aug 2009, 4:14 p.m.,*
in response to message #21 by Egan Ford

I don't have an HP35S. The firmware quirks that have been pointed out over the past two years have discouraged me, plus it is unfortunately (and unnecessarily) a little too large for a pocket calculator.

I use the very simple, well-known, and often criticized Savage Benchmark, very slightly modified, to get an initial estimate of speeds. It is a simple 2500 iteration loop equivalent of:

A = TAN(ATAN(e^LN(SQRT(A)^2)))+1

How close the final result is to 2500 gives a feel for the precision and effects of rounding errors, and how long it takes can be used for relative speed comparisons.

For the HP42S (Runs in 605 seconds):

```
01 LBL "SB"
02 2500
03 RAD
04 0
05 LBL 01
06 1
07 +
08 SQRT
09 X^2
10 LN
11 E^X
12 ATAN
13 TAN
14 DSE ST Y
15 GTO 01
16 BEEP
17 DEG
18 END
```

For the HP32SII (Runs in 460 seconds):

```
S01 LBL S
S02 2500
S03 STO A
S04 RAD
```

S05 0
A01 LBL A
A02 1
A03 +
A04 SQRT
A05 x^2
A06 LN
A07 e^x
A08 ATAN
A09 TAN
A10 DSE A
A11 GTO A
A12 DEG
A13 RTN

If someone with an HP35S programs the equivalent and reports the run time, we'd have a better feel for relative speeds.

FYI, the HP50g runs the equivalent program in USER RPL in about 64 seconds, while the HP-15C runs it in about 6100 seconds. The HP-34C requires about 7900 seconds, and the HP-41CX full-nut requires about 3300 seconds.

I entered the 32SII program above on an early-production 33S, and got a time of 7:55, or 475 seconds.

Based on the times listed above, the 33S appears to be slightly slower than the older 32SII, but significantly faster than the younger 35S.

> Does your 33s have fresh batteries?

Nope, they apparently haven't been changed since January 2006. That likely accounts for the time difference.

When I change batteries, I write the date on a piece of tape stuck to the back of the battery cover.

I took the PE exam with the 33S in early 2006, and apparently took the precaution of replacing the batteries before the exam. I have not used the 33S extensively since then. It got me through the PE exam, but I've never grown particularly attached to it. For the most part, I only pull it out of the drawer if the 11C is buried somewhere under the papers on my desktop

Thank you Christoph. On mine, I get 391.5 seconds with result being 2499.99946106.

So, I wonder why so many of us are getting different results for the same models? Could it be something simple like battery condition? Or could it be down to the use of memory in the calcs with other variables present, etc.? I cleared all programs out before running the benchmark but I didn't clear the variables.

Mark

Re: HP 32SII

*Message #32 Posted by **Mark Edmonds** on 19 Aug 2009, 7:33 a.m.,*
in response to message #31 by Mark Edmonds

Did another attempt but this time I did a "Clear All" before typing in the program just in case memory usage could have a bearing on the result. I reasoned that Clear All would be one step away from resetting the calc.

The result.

As near as damnit, exactly the same.

So, some of us have fast 32S and some of us have slow 32S. Is it temperature related? Could it be simple manufacturing variances? Could this mean that we can't get accurate benchmark results for any calc unless we take a wide survey from many machines?

Mark

You question is correct. Especially the program memory usage will have an influence. IFAIK the program dispatcher can only jump forewards. At the end of program the interpreter jumps to program top and continue searching.

My 32S was totally empty before doing the benchmark.

A 2nd reason is the frequency multiplier. IFAIK all Saturn based calculators use a 32768Hz crystal oscillator. A frequency multipier generates the CPU clock out of the crytal frequency. Several physical ambient factors have an influence to the frequency multipier, mostly the ambient temperature.

That's the reason why every Lewis chip based calculator measures the CPU speed before sending data over the Redeye interface. On these calculators the complete IR pulse timing is generated by the CPU.

But how the CPU can measure there own speed? All newer Saturn based calculators have a 8192Hz timer which is directly derived from the 32768Hz crystal (dividing by 4) . When you now compare the CPU the with 8192Hz timer speed you get factor how much faster the CPU based on the 8192Hz signal is.

I hope this helps to solve some of the mysteries about speed differences.

Christoph

Re: HP 32SII

*Message #34 Posted by **Mark Edmonds** on 19 Aug 2009, 11:23 a.m.,*
in response to message #33 by Christoph Giesselink

Thanks for the details Christoph. My instinct tells me that the warmer the calc, the faster it should run and today when I did the timing tests, it is a very hot day here in the UK. But does high temp actually equate to slower speed?

Regarding memory usage, when I cleared the calc before doing another test, that test was about 1.5 seconds slower than before when I left the vars as-is and only cleared program memory. I'll run some more tests for consistency.

Mark

Re: HP 32SII

in response to message #30 by Christoph Giesselink

```
HP32S Sn: 2820Axxxxx
Execution time = 387s

HP32S Sn: 2901Axxxxx (50th Anniversary)
Execution time = 370s

HP32SII Sn: ID7440xxxx
Execution time = 458s

HP32SII Sn: ID0100xxxx
Execution time = 417s
Execution time = 426s (after replacing weak batteries with
fresh)
```

Did a Clear All before testing. Same numerical result.

I love the 42S for its power, memory, and 2-line display.

But for everyday use and simple programming and equation solving tasks, the 32S is simple and uncluttered. The display is very easy to read. And clearly it's a bit faster for complex tasks. It's also not too hard to obtain or replace so far.

The 32SII is obviously close, but the keyboard seems too busy after using the 32S. Just my opinion.

Re: HP 32SII

*Message #36 Posted by **Bart (UK)** on 21 Aug 2009, 7:14 a.m.,*
in response to message #35 by Steve Perkins

Interesting that fresh batteries actually slow down the calculator. I remember a similar observation on a battery operated bedside clock I had

once, it gained time when the battery started getting weak.
So if you want a fast calculator, use weak batteries with the risk that it may die just before it completes the calculation :).

I too prefer the less cluttered 32S. I like menus. When I got my 28C (later replaced by a 28S), it seemed the natural progression for calculators to add more functions to without umpteen shift buttons (eg the fictitious 67CX, although the interest in this machine seems to indicate my views may be the minority).

-It's all in the eye of the beer-holder.

However: my 32S was made in the same place and the same week of the same year as Christoph's.

In the first runs I had 136B free mem. I have cleared all and retyped the prog. Now I get 369 seconds, 15s (~4%) slower than Christoph.

Another option is to try new batteries (I can't remember when last they were replaced).

My UserRPL Savage benchmark program is below. I store the following program as SB:

<< RAD TICKS 0. 1. 2500. START 1. + SQRT SQ LN EXP ATAN TAN NEXT SWAP TICKS SWAP - B->R 8192. / DEG 800. 2. BEEP >>

The program ends by displaying in stack level 2 the final value after 2500 iterations, and displaying in stack level 1 the time (seconds) that it took to complete the looping. This is followed by an 800 Hz tone.

Typical results for an HP50g:

2: 2499.99946106
1: 64.5230712891

In the listing above, SQRT is the square root symbol, and B->R is the binary-to-real conversion function. It is important to have the decimal points on the constants within this program, otherwise they will be treated as binary integers (bints). This this can almost double execution time!

Oops, I forgot, it's a financial calc :(

Re: HP 32SII - Savage Benchmark vs new 12C?

*Message #49 Posted by **Katie Wasserman** on 18 Aug 2009, 9:44 p.m.,*
in response to message #48 by Bart (UK)

If you remove the trig functions, I get a time of 260 seconds (result=2499.99999938) on the 32Sii and a time of 31 seconds (result=2500.000035) on a 12C+ (with the latest firmware). This isn't a totally fair comparison though since the 12c+ doesn't have DSE and x^2 and therefore requires more commands. Here's the code I used:

```
01 2
02 5
03 0
04 0
05 STO 0
06 0
07 ENTER
08 1
09 +
10 SQRT
11 ENTER
12 x
13 LN
14 e^x
15 RCL 0
16 1
17 -
18 STO 0
19 x=0
20 GTO 23
21 Rv
22 GTO 08
23 Rv
24 GTO 00
```

Although it does seem to imply that that if HP were to release a 15C+ or (heaven forbid) a 42S+, it would beat the socks off the 32's.

Interesting though that my 20S does not do too badly in the Savage test (350sec) even with no stack and no DSE.

Free42/42s savage benchmark

*Message #51 Posted by **Byron Foster** on 18 Aug 2009, 2:16 p.m.,*
in response to message #45 by Christoph Giesselink

My results with Free42/42s are similar to Reth at 7 seconds, with a result of:

2500 . 00000 00000 00001 704613

I compiled up a binary math version of 42s, and it runs in less then a second (hard to tell exactly how much less), and it gets a result of:

2500 . 00000 00015 816

Re: Free42/42s savage benchmark

*Message #52 Posted by **Reth** on 19 Aug 2009, 7:00 p.m.,*
in response to message #51 by Byron Foster

... and the new just released 42s Version 2.2 (Free42 1.4.52) returns 2,500 exact for 6 second (before the BEEP)! Brilliant!
actually subtracting 2,500 from it gives 1.704613e-15

Re: HP 32SII

*Message #54 Posted by **Paul Dale** on 17 Aug 2009, 11:13 p.m.,*
in response to message #53 by Howard Owen

The loop should terminate <2500 not <=2500.

You also need to output the result or the compiler is free to optimise the loop out of existence.

Even then, the compiler would be allowed to computer the result of the loop and just print that....

- Pauli

Re: HP 32SII

*Message #55 Posted by **Kevin Brown** on 18 Aug 2009, 7:09 a.m.,*
in response to message #54 by Paul Dale

I don't believe the compiler will do any optimization unless you use -O or one of its variants (-O2, -O3), or request specific optimizations of it (e.g., -funroll-loops).

Re: HP 32SII

*Message #56 Posted by **Paul Dale** on 18 Aug 2009, 5:54 p.m.,*
in response to message #55 by Kevin Brown

And in an albeit somewhat silly speed test, wouldn't one routinely turn the optimiser on? I know I would.

- Pauli

Re: HP 32SII

*Message #57 Posted by **Howard Owen** on 18 Aug 2009, 11:12 a.m.,*
in response to message #54 by Paul Dale

Hi, Pauli

Taking a look at the assembler code produced by gcc, it's clear the loop is structured as coded.

```
mymac> gcc -S -o savage.s savage.c
```

and a portion of the output:

```
        jmp     L2
L3:
        cvtss2sd        -16(%ebp), %xmm0
        sqrtsd  %xmm0, %xmm0
        mulsd   %xmm0, %xmm0
        movsd   %xmm0, (%esp)
        .
        .
        (calls to libm for the rest of the computation)
L2:
        cmpl    $2500, -12(%ebp)
        jle     L3
        .
        .
```

Regards,
Howard

Timing for a 27S

*Message #59 Posted by **Mark Edmonds** on 19 Aug 2009, 5:32 p.m.,*
in response to message #22 by Mike Morrow

If you modify the benchmark for the 32S very slightly by making it a summation of the returned values, you can re-write it to run in the Solver. This enables timings on the 17B, 27S, 19B, etc..

Timing for a 27S at ambient temp 25C is 274 seconds. The fastest of the Pioneers!!

Mark

Re: HP 32SII

*Message #60 Posted by **Christoph Giesselink** on 19 Aug 2009, 6:58 p.m.,*
in response to message #22 by Mike Morrow

For those who cannot accept that the HP42S is slower than the HP32SII. Here's a small trick. The HP42S has a Lewis chip inside, and the Lewis chip has a RATE register controlling the CPU speed.

This register at 40300H can be modified with the internal memory scanner from 7H to FH for maximum speed. But don't exit the memory scanner with the regular <ON><SK3>. This would reset the RATE register back to 7H. Best, working on all High-End-Pioneers, is to execute address 00000H. This executes a warmstart but leave the RATE register and the memory content intact.

Pressing the <ON> key will also reset the RATE register. So start the benchmark just after the warmstart and enjoy the fastest original HP42S you ever seen. ;-)

Christoph

HP-42S speed setting

*Message #61 Posted by **Karl Schneider** on 21 Aug 2009, 2:17 a.m.,*
in response to message #60 by Christoph Giesselink

> Quote:
>
> The HP42S has a Lewis chip inside, and the Lewis chip has a RATE register controlling the CPU speed.
>
> This register at 40300H can be modified with the internal memory scanner from 7H to FH for maximum speed.

Gene Wright posted details about this procedure in 1997:

http://www.rskey.org/gene/hpgene/hp42fast.htm

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv009.cgi?read=26022

I suppose that 7 hexadecimal is the middle speed; F hexadecimal is the maximum speed. Values lower than 7 would slow it down.

Only the original versions of the HP-42S (reflective, non-recessed display window) allow the speed setting to be changed by program.

Re: HP-42S speed setting

*Message #62 Posted by **Christoph Giesselink** on 21 Aug 2009, 7:50 a.m.,*
in response to message #61 by Karl Schneider

TNX for remembering Gene Wright's article.

The CPU speed is calculated by ((RATE + 1) * 524288 Hz) / 4.

So the nominal speed is ((7 + 1) * 524288 Hz) / 4 = 1048576 Hz

You can verify this in the single step self test mode <ON><SK4> with

<SK1>.

Christoph

Re: HP-42S speed setting

*Message #63 Posted by **Diego Diaz** on 1 Sept 2009, 11:33 a.m.,*
in response to message #62 by Christoph Giesselink

Hi all,

Or... if you're concerned about 42's speed, replace the internal 32.768KHz Xtal with a 65.536KHz one and you won't need to worry about the [ON] key ever more... (unless you still want to get it doubled again (4x) by altering H'40300 register to H'0F... regrettably, it won't go beyond H'09 - a 2.25x from original speed - figures above this will render an unreadable display.)

BTW, once opened you may also consider a memory upgrade to 32KB... ;-))

I've made these mods for several users as well as on my own 42's and they really work!

However, in my experience, both models of 42's can be speeded-up by changing reg H'40300.

Cheers.

Diego.

*Message #64 Posted by **Nigel J Dowrick** on 17 Aug 2009, 2:33 p.m.,*
in response to message #17 by Marnus Malan (RSA)

I own a 32SII. I would emphasize one point that others have already made: the memory is really very small indeed. Don't get the idea that you can store a library of equations there, plus a few useful programs: you can't. Apart from this, I find it to be an excellent machine for day-to-day use. However, I prefer the HP-33S because of the greater memory and the two-line display.

Quote:

The later butt-ugly HP33S and the oversized HP35S also have very poor complex number support similar to the HP32SII

Actually, the 35s has much better complex number support. Having the "i" key (with the shifted angle) was in my mind a great leap forward. The problem is that the functions which will accept a complex argument are limited, and of course the lack of either this menu:

or these these functions on the keyboard:

...

Re: HP 32SII

*Message #66 Posted by **Mike Morrow** on 17 Aug 2009, 1:01 p.m.,*
in response to message #65 by Jeff O.

I consider that real support of complex numbers only happens when complex numbers are accepted and results generated whenever they naturally occur. Examples:

sqrt(-3), -5.1^-2.7, i^i, arcsin(1.5), ln(-3.1), cos(i4.2), manipulation of matrices with complex elements, etc., etc.

AFAIK, the HP35s does NOT naturally process most of these types of operations. The HP42S and the RPL models handle them with ease. The HP-15C does too, with a little bit more effort.

There is no valid excuse for calculators such as the HP35S (and anything coming out later) not having this capability which had been beautifully implemented in calculators introduced more than two decades earlier!

Re: HP 32SII

*Message #67 Posted by **Katie Wasserman** on 17 Aug 2009, 1:24 p.m.,*
in response to message #66 by Mike Morrow

I agree that calculators that support complex number should do so all the way. However, I don't think that all scientific calculators need to support complex numbers -- certainly financial/scientific calculators like the 20b don't need them. The 32SII does a really poor job at complex number support and set a precedent for the 33S and 35S. Even though I don't often need complex numbers I still find some of what they do useful even for non-complex number manipulation. In particular, you can use the sequence <0> <ENTER> <COMPLEX +> to duplicate the last 2 entries on the stack.

Although I have and use virtually all the HP calculator models I *love* the 32SII. It's the one I use daily and keep one handy everywhere (they used to be cheap on ebay). Programming on the 32SII

is a pleasure, you have nearly instant access to all functions, memory isn't too big to keep what you're doing in your head, there are only a handful of flags to know and the display is large and easy to see in bad lighting.

Re: HP 32SII

*Message #68 Posted by **Mark Edmonds** on 17 Aug 2009, 2:12 p.m.,*
in response to message #67 by Katie Wasserman

I have to agree with Katie - I love the 32sII. It is really well-balanced calc with very little hidden, good feature set, great keyboard and ergonomics and despite the relatively small memory size, I actually like that because it encourages efficient programming that explores all the techniques and commands.

One area that people rarely mention when comparing the 32sII with the 35s is base conversion and the two calcs are very different here. With the 32sII, you set it to the base you want and carry on working with no special procedures. With the 35s, despite setting the base, you still need to specify each number to be in that base which requires totally redundant but enforced extra keystrokes. This feature drives me nuts and I cannot understand why it was implemented.

On top of that, the 35s has a poor keyboard, bad ergonomics, an ugly display and even though it has a lot lot more memory, you still only have 26 labels and have to use line addressing - hardly encouraging for writing large programs.

The 35s has a few extra useful commands (binary logic for example) but given a choice between this and the 32sII, I would pick the 32 without any hesitation. It really is a great, fun little calc.

Mark

Re: HP 32SII

*Message #69 Posted by **Ed Look** on 17 Aug 2009, 2:30 p.m.,*
in response to message #68 by Mark Edmonds

I'll have to agree with the two above posters; the 32SII is a pleasure to use, though after having used the 33s and 35s, the memory space allotted for programming might just be a tad small on the 32SII. Otherwise, it was the first calculator I reached for after my 34C went down, until recently, because I am... afraid... of wearing it down, too, so now I prefer the 33s (over the 35s).

I like the feel and arrangement of the 35s keyboard. I'd like it to be a bit smaller, but that is my only ergonomic complaint, unless shifted STO is an ergonomic complaint. As far as programming, I think it would be fair to say that 26 labels and 384 bytes (not sure of exact figure) of memory is also hardly encouraging for writing large programs.

Don't get me wrong, I like the 32s/sii but given the choice (a choice that I have), I pick up the 35s, primarily for the complex capabilites discussed above (or below, depending on how you view your threads.)

Although cumbersome for interactive usage, the capabilities are still quite useful for programming:

http://www.hpmuseum.org/software/32acxfer.htm

The built-in complex-number capabilities of the HP-32SII were the same as those of the HP-32S, which apparently used the HP-41 Math Pac as a template.

> Quote:

Yup, I use it most routinely for those reasons. It's also about 12 times as fast as an HP-15C, and better-suited to maintaining small programs in permanent residence (easier to follow and organize).

> Quote:
>
> Very nice program and an excellent fit on the 32Sii! Do you work in electrical power engineering?

Katie --

Yes; at least several of us Forum participants do.

You may have noticed that several versions of my program have been uploaded, each tailored for the HP-32S, HP-32SII, HP-33s (RPN and ALG). I've also submitted versions for the HP-35s, but these were just crude, direct portings of the HP-33s programs.

The posted HP-32SII program omits a small refinement I made -- lines P29 through P33 should read as follows:

```
P29  STO P
P30  x<>y
P31  STO Q
P32  VIEW P     Show P injected into line(s)
```

```
P33  VIEW Q     Show Q injected into line(s)
```

A power-system equation I keep in the meager 384-byte memory is the following:

```
M=K*A*SQRT(3)/100/10     3-phase (MVA) = (kV)*(Amp)*sqrt(3)/1000
```

Expressing "/1000" as "/100/10" saves five bytes, because non-negative integers lower than 255 on the HP-32SII require only 1.5 bytes of storage for programs or equations.

Or, one can save a byte and gain some speed by entering a (trivially-)calculated constant in the equation:

```
M=K*A*1.73205080757E-3
```

Certainly, direct-solution programs can also be stored for this purpose (and that is what must be done on the HP-32S), but, well, there's that storage-space issue...

I agree, the 35s *should* do as you say. But I would say that accepting complex inputs for all valid functions is only part of the story. The other part is entry and display of complex values. In my opinion, the 35s' method of entry is **far** superior to both the 15C and 42S, and its display is almost as good as the 42s and again superior to the 15C. Of RPN machines, the 35s is the only one in which four complex values can be naturally and easily entered onto the stack. While it certainly has shorcomings, I think the 35s deserves some credit for the things it got right.

> Quote:
>
> There is no valid excuse for calculators such as the HP35S (and anything coming out later) not having this capability which had been beautifully implemented in calculators introduced more than two decades earlier!

It is not my intention to make excuses for HP. I will note that the 35s was an extension of the 32S/32Sii/33s line. Aside from the improvements in entry and display, it also offered a full 4-value stack depth, and eliminated the need to tell the calculator you want to treat x and y (and maybe z

and t) as components of a complex value by pressing "COMPLEX" before executing a function. So, again in my opinion, I think the 35s succeeded in improving on the complex number capabilities of the 32S/32Sii/33s line.

Agree on this. That was the reason why I recommended to Marnus to compare the keyboards of the 32S and the 32SII in my first response above.

Re: HP 32SII

*Message #79 Posted by **Marnus Malan (RSA)** on 18 Aug 2009, 5:49 a.m.,*
in response to message #78 by Walter B

Well-well, you guys certainly have been busy. I noted last night that with program execution the 33s is substantially faster when executing the same / similar programs, BUT NOT AT ALL much faster when solving equations. I used Colebrook-White/Darcy-Weissbach equation for flow in pipes and also the TVM implimentations (rewriting the 33s textbook equation so that the I%YR is entered as is, without the need to /12 beforehand).

Anyway, I've made an offer for the 32SII, thought I could always obtain a 35S later should I not like the 32SII, but the other way round would be more difficult.

Thanks for all the input

How to prevent automatic substitution during SIMPLIFY

*Message #1 Posted by **Luca** on 16 Aug 2009, 8:14 p.m.*

I am new to the HP-50g, and I am noticing the following problem. If I have an expression, say,

```
M * Q * (Q+1) * (Q-1) + 1
-------------------------
M + M * Q
```

and I hit SIMPLIFY, then the 50g tries to find definitions for M and Q, not only in the current directory, but (at least) in all the path from the current directory to the root. So if, say, one level above while working on something else I have variable M with value 0.3, when I click SIMPLIFY the value will be plugged into the expression, and the result will not be an expression in M and Q any more. This is true also for EXPAND. COLLECT works "correctly", just working on the equation at hand.

Is this the intended behavior? How can I prevent variable expansion from taking place? I would simply like to be able to work on an expression, regardless of what variables I might have defined at an upper level (or at the same level).

I am using the latest ROM, C-2.15, if this makes a difference. Many thanks!

Luca

Re: How to prevent automatic substitution during SIMPLIFY

*Message #2 Posted by **Jonathan Eisch** on 16 Aug 2009, 9:50 p.m.,*
in response to message #1 by Luca

Hello Luca,

Many of the users of this forum primarily use the older HP calculators. The hp-50g is based on the hp-48 series of calculators, and you will probably have better luck finding your answers on a list devoted to those, such as the comp.sys.hp48 newsgroup (easily accessible using google groups). I'd suggest using the search function, as that list has probably answered similar questions from someone in a position similar to yourself.

You can also find most of your answers in the Users Guide or the HP 50g Advanced User's Reference Manual.

Generally speaking, the answer to "Is this the intended behavior?" is "yes" as the ROMs are very mature.

-Jonathan

Re: How to prevent automatic substitution during SIMPLIFY

*Message #3 Posted by **Luca** on 17 Aug 2009, 2:48 a.m.,*
in response to message #2 by Jonathan Eisch

Thanks, I will follow this advice. I also usually use older calculators (the 32SII is my favorite, due to speed of operation, followed by the 42S); I got a 50g for its CAS abilities -- but I have difficulties making it work as I like.

Best, Luca.

Help: how to get the hp-50g to work on expressions.

*Message #1 Posted by **Luca** on 16 Aug 2009, 6:55 p.m.*

I am having great troubles with my HP-50g. It seems that there is a big clash between the way I am used to working with math, and the way the 50g is able to help me. Let me tell you what I need to do, and in what ways the 50g fails me. I am hoping that my frustration is simply due to inexperience (and bad documentation)... so any help would be very much appreciated.

A typical flow for me is this. I define a few expressions, for instance (not in HP notation, does not matter),

> Quote:
>
> p1 = q / (m * (m + q^2))
> p2 = q (m + 1) / m

I then compute p1 * p2, and store it in another variable, say, p. At this point, p contains a function of m and q, which are two variable that are meaningful in the problem I am studying. I then want to simplify this expression: nothing is easier: I go into the equation editor, hit simplify, then re-store the result in p. So far, so good.

Then I hit the first bump. I would like to evaluate p, and I would like to do it in a way that resembles the equation mode of the good ol' 32SII: I would like the calculator to prompt me for values for m and q, showing me any previous value held by the variables, and then evaluate the expression p based on the new values. I don't see any quick way of doing this. The only way seems to be to create variables m and q, store values in them, then retrieve p, and hit EVAL. Is it really necessary to go through this? Is there a better way?

Once I play with p (and m and q) for a little while, I change something in the problem I am analyzing (maybe I make a change in the algorithm I am analyzing, whatever), and I get a new p2, for instance,

> Quote:
>
> p2 = (m+1) (m-1) (m-q) / (m^2 + q)

Great, I recompute p1 * p2, and store the result in p. So far so good.

But now I hit the second, and bigger, bump. When I try to simplify p, the calculator simplifies it all the way down to a real number! Just the presence of variables m and q in the directory caused the simplify algorithm to behave not only as simplify, but also as numerical substitute and evaluation!

This is absurd. If I have an equation on the stack, and call a command on that, the result should depend only on that -- not also on side factors like what other variables I have defined in that moment!!

This is also incredibly inconvenient. I want to have a simpler form of p first, so I can stare at it (and, e.g., infer by eye its asymptotic behavior, or whatnot). Only when I choose, I want to substitute the values of m and q into p and get a number!

Am I missing something?

Can I make the HP-50g work with my flow of playing with math? Many thanks!

Luca

Re: Help: how to get the hp-50g to work on expressions.

*Message #2 Posted by **dbatiz** on 17 Aug 2009, 12:19 p.m.,*
in response to message #1 by Luca

There are many ways to accomplish your goal. I believe the 50G's strength is also its weakness, it's very flexible. Some of the gurus here who can drive the equation solver will probably have other more elegant ways of addressing your concerns, but here is my first effort:

Make sure "m" and "q" are not already defined. (PURGE them)

I put your two expressions in the stack, and stored each as "p1" and "p2"

Now simply by pressing the VAR key, they appear above the soft keys. F1 F2 Multiply EVAL produces the combined expression you were after.

Leave your combined equation on the stack, or hit enter a couple of times to make however many copies you need.

Now here's where you can do all kinds of magic, this works for me: Get the following line on the stack: {q 2 m 3}

Be mindful of the spaces. Literally Bracket, no space, q, space, 2, space, m, space, 3, Bracket.

Now Right Shift Tool (it looks like a vertical line). This prompts the calculator to substitute the variables in the brackets into the equation above in the stack. Then press EVAL, you should (depending on your settings) get 16/63.

If you need to do this repeatedly, feel free to replicate the equation in the stack as needed, and consider storing the bracketed variables in a new variable (I used "v").

Once you get inside the head of the 50G, you'll be right at home!

Very respectfully,

David

How to compute the value of symbolic expressions in HP-50g?

*Message #1 Posted by **Luca** on 16 Aug 2009, 3:37 p.m.*

I realize this must be a very simple question, but how do I evaluate expressions containing symbols? Suppose you have a simple expression, for instance:

```
X*(M-1)
-------
X*(M+1)
```

I would like to press on a key that did:

- Prompts for all the values of the symbols, such as X, M in the example, showing the previous value if any.
- Returns the value of the expression.

This seems to be rather basic functionality, similar to the equation mode, so I am sure that there is a way to do it... but which way? Many thanks... as you can see, I am a beginner with my 50g.

Luca

Re: How to compute the value of symbolic expressions in HP-50g?

*Message #2 Posted by **Hal Bitton in Boise** on 16 Aug 2009, 8:16 p.m.,*
in response to message #1 by Luca

No problem, Luca,
Just use the equation solver thusly:

Assuming your equation is on the stack level 1:
...copy it (up arrow and put the pointer on level 1, right shift, copy, enter)
...open the equation solver (right shift, num.slv, option 1 (which is Solve equation).
...with the Eq field highlighted, hit paste (right shift, paste) and enter. (note; if your equation is stored in a variable, just hit CHOOSE and navigate to your variable)
...The application will put the equation into the field, and it's variables will appear below. Select any variable and put a value into it (by keying in the number and hitting enter). Highlight the variable you want to solve for and hit solve (f6 softkey). You can put an initial guess into the variable you want to solve for prior to solving if you want to. You can change the values and or solve for any of the variables you want to.
...note that when you exit the solver application, the solution(s) found by the equation solver have automatically been put on the stack as a tagged object(s), which can then be used in subsequent calculations.
best regards,
hal

*Message #3 Posted by **Luca** on 17 Aug 2009, 2:36 a.m.,*
in response to message #2 by Hal Bitton in Boise

Thanks! This helps.

I just wish that the numeric solver would display the value it computes when I assign values to the variables and press EXPR= , rather than just leaving the value on the stack.

I did not know I had to use the solver even for evaluating an expression, but I see that it works well. Thanks!

ROM version C-2.15 for HP-50g: what is the benefit?

*Message #1 Posted by **Luca** on 16 Aug 2009, 5:37 a.m.*

I have an HP-50g with the standard ROM v.92 (11 Aug 2006). I read here on the forum that an upgrade is available: C-2.15. What are the benefits? What I mostly care is bug-fixes; I do not really need new features, but I would like to have as bug-free a calculator as possible... Many thanks! Luca

Re: ROM version C-2.15 for HP-50g: what is the benefit?

*Message #2 Posted by **Tim Wessman** on 16 Aug 2009, 11:05 a.m.,*
in response to message #1 by Luca

Did you look at the nice changelog included in the installation instruction document? If not, download the zip file and that will probably answer you questions. In short, it includes all the bugfixes from 2.09 ->2.10, plus adding in the new streamsmart application and making space for future additions.

41Z Breakthrough: 4-level Complex Stack

*Message #1 Posted by **Ángel Martin** on 16 Aug 2009, 6:52 a.m.*

Well, maybe not a *real* breakthrough but nevertheless important enough for some :)

Get ready for an enhanced revision of the 41Z module, with FOUR levels of COMPLEX Stack... made possible by ustilizing a buffer that holds the 3rd. and 4th. levels (the standard stack keeps track of the first two, of course).

The "Complex" buffer (id#=1) is created upon calc being turned on, and maintained by the module. Totally transparent to the user. If it somehow fails, a two-level stack is always available regardless. Maybe not a perfect solution but surely the PERFECT compromise!

The module functions work more or less as before, but the 4-level stack lift and drop has been implemented into all non-monadic functions of course.

My thanks go to Peter Platzer for encouragement (his MPL module proved it was possible) and to Häkan Thörngren, who wrote the base routines for buffer creation and handling tat I've built upon.

So stay tuned... I'm in programmer's paradise this weekend (which of course includes lots of Pizza), should come up with the final release pretty soon...

Best,

ÁM

PS. you said four? hmmm, no reason to go over that, provided that enough free registers exist to increase the complex buffer size...

Awesome Angel, you are clearly on a roll!! Looking forward to playing with it! Cheers

Peter PS: thanks for the kind words, pretty sure I don't deserve them but they are very much appreciated just the same.

Re: 41Z Breakthrough: 4-level Complex Stack

*Message #4 Posted by **Ángel Martin** on 17 Aug 2009, 7:25 a.m.,*
in response to message #3 by PeterP

Glad to see you're interested, Egan & Peter. I'm done with the changes and was about to upload the new module on TOS, but there's something that is bothering me about the whole data input process.

I'll explain. Yes the new complex stack is 4-levels deep, and has the expected functionality built into it:

- Levels 1&2 are held into the standard "real' stack.
- Levels 3&4 are held into a dedicated memory buffer. They are "created" upon CALC_On event and survive power cycles and Key assignments.
- There are three new functions to manage it: ZENTER, ZRDN, ZR^, and ZCLST.
- supports Complex stack drop upon execution of non-monadic functions, with duplication of the 4th. complex-level into the 3rd. one.
- supports complex stack lift upon data recall (from a complex storage register or LastZ).

For example, suppose we want the following complex numbers input into the stack:

L4: 4-4j
L3: 3-3j
L2: 2-2j
L1: 1-1j

Either one of the following sequences will accomplish the task:

4, CHS, ENTER^, 4, **ZENTER** ... (or: 4, CHS, ENTER^, CHS, **ZENTER**)
3, CHS, ENTER^, 3, **ZENTER** ... (or: 3, CHS, ENTER^, CHS, **ZENTER**)
2, CHS, ENTER^, 2, **ZENTER** ... (or: 2, CHS, ENTER^, CHS, **ZENTER**)
1, CHS, ENTER^, 1 ..... (or: 1, CHS, ENTER^, CHS)

The issue is the **automatic stack lift**. Say you have your complex numbers stored into the stack, and then you input any real number (into the X register). Then ***the real-stack would lift***, and as a result *the second complex level will "spill over"* - since T is gone - partially losing its value.

I checked on the 42 and it appears to me that *the same problem exists as well* - only that it'll be the fourth stack level instead of the second partially losing its content.

So what gives? Do we have 4 complex stack levels that cannot be kept without losing some information upon other events? One solution (work-around rather) is using **ZSTO** and **ZRCL** to fill the stack - which BTW are prompting functions, thus will allow an easy manipulation of memory but...)

I'd like to hear your suggestions on how to deal witht this sticky glitch - pls. let me know what you think.

Best,
ÁM

Re: 41Z Breakthrough: 4-level Complex Stack

*Message #5 Posted by **Howard Owen** on 17 Aug 2009, 7:46 a.m.,*
in response to message #4 by Ángel Martin

You could "shadow" the entire complex stack in a buffer or two. When a destructive real stack lift

occurred, you could then tidy things back up from the shadow levels 1&2. Another way to look at it would be to regard your buffers as the genuine complex stack with the 41C's stack merely displaying the first two levels.

Regards, Howard

Re: 41Z Breakthrough: 4-level Complex Stack

*Message #6 Posted by **PeterP** on 17 Aug 2009, 4:30 p.m.,*
in response to message #4 by Ángel Martin

Just a thought: maybe set a flag to put the calc in complex mode. When in complex mode all keys have their complex function (+,-,*,/,enter, etc). This way all complex numbers will stay together all the time. This 'flag' can be a real user flag, a higher number flag or (probably preferred for compatibility reasons) just uses a byte in the header register of the buffer. A little bit trickier might be the complete reassignement. One way is to simply write a routine to assign the new functions to all keys (similar to my assugnement function in the m pl which out of lazyness I wrote in focal). The other, far more involved way would be to use the interrupt points and send any normal function to your complex equivalent if the complex mode is set (similar to the ccd modules extension of the cat and 'sto'/rcl functions.

Just a thought

Peter

Re: 41Z Breakthrough: 4-level Complex Stack

*Message #7 Posted by **Egan Ford** on 17 Aug 2009, 5:38 p.m.,*
in response to message #6 by PeterP

I like this idea. Sorta like the 15C and flag 8. I'd also add that I think the stack should work that way as well (like 15C). The stack would contain the reals and the buffers would contain the imaginary.

As for complex input, how about number i number were i = shift 4. Seriously, who uses BEEP in interactive mode. I know nothing about MCODE or the 41 internals, so this may be impossible or impracticable.

Re: 41Z Breakthrough: 4-level Complex Stack

*Message #8 Posted by **Ángel Martin** on 18 Aug 2009, 2:24 a.m.,*
in response to message #7 by Egan Ford

Great minds think alike, they say...

Sure enough I've looked at the 15C implementation, with its parallel real and imaginary stacks - the imaginary stack must also be a buffer, but the difference is that the 15C OS is written to respect its needs. For instance, when you input a number in X, both the real and the imaginary stack lift, allowing for consistent operation. The only way to do this would be (again) using the dreadful IO interrupt approach, which I won't touch with a 12-foot pole so far.

Then it's the fact that all math in the 41Z module is written using the real stack as L1 and L2 complex levels, and that would have to go away if changing to the 15C-way. Not looking forward to re-writing the whole thing!

As per the data input process, I've used SHIFT-SHIFT for complex input, but this doesn't bring

any benefits (when compared to the real ENTER^ for instance) because the stack lift continues to be active regardless of how you fill the complex stack.

The way it works now is: Im(z), ENTER^, Re(z), ZENTER.

It's hard to explain without seeing it work, let me send you the module and you see for yourselves.

Re: 41Z Breakthrough: 4-level Complex Stack

*Message #9 Posted by **Ángel Martin** on 18 Aug 2009, 2:12 a.m.,*
in response to message #6 by PeterP

Great to see you guys engaged on this, let's see if we can pull it off together.

Howard's "shadow" buffer is an excellent route, but I've got the feeling the required overhead for its management and synchronization with the real stack could be too heavy. Worth trying a proof of concept for sure. I was keeping the real stack part because all math happens using the real stack (things like [TOPOL], [TOREC], and other mainframe routines - this is how I first wrote the 41Z module, so it'd take a complete re-write from the ground up... ufff}

The "Complex flag" is what I have implicitely done, using the USER mode as the Complex mode (alas flag 27 then). As Peter, I have mapped the complex functions to the calculator keyboard (using a MCODE routine in my case, which in turn I lifted from one HP module - forget which one). This works beautifully while you stay within the assigned functions, and it is mostly compatible with the "normal" operation - save the infamous "stack lift" issue.

Since there's no way one can assign everything to user keys, the better approach is of course the interrupt vectors (a la CCD or ZenRom). This would either prevent or enhance the "normal" behavior of the calculator, respecting the complex stack all the time.

I always regarded this as equivalent to subclassing a process and replacing its code upon certain events in the windoze world (which I've used many times), but in the MCODE world however, such approach is beyond my programming skiils, I'm afraid. I remember experimenting with the IO interrupt, what a mess...

Here's the rub: just entering a number (i.e. pressing a numeric key) could damage things, sending the contents of T to limbo, and thus your L2 complex stack is also gone. How do you "prevent" for this, such a common occurrence?

And remember, the same thing happens on the 42S - albeit losing L4 is not as bad as losing L2, I agree...

If you're game I'll send you the current incarnation (including the commented source code), I'd like to get your comments once you've seen it work for yourselves, it's hard otherwise. Pls. send me your email addresses if not available.

If you don't use a buffer as the authoritative stack, then it seems to me you'd have to do stack lift detection. You could then make the real stack a genuine stack, and shadow it in the buffer. If you can detect stack lift, then you ought to be able to fix things up with the backup copy in the buffer. I'm not sure if the stack lift is directly detectable in mcode though. If not, you might be able to track it with heuristics, but that would probably be ugly in assembler. (It would be in a high level language too.) But the advantage would be you wouldn't have to rewrite all your routines that operate on the standard stack.

I'm back where I can program my Nov64, so I could try it out.

My address is "egbokalaka at gmail dot [the most common top level.] " :)

Regards,
Howard

Re: 41Z Breakthrough: 4-level Complex Stack

*Message #11 Posted by **Håkan Thörngren** on 17 Aug 2009, 3:49 p.m.,*
in response to message #1 by Ángel Martin

Maybe the entire Z stack could go into the buffer, along with its own stack lift flag. It would take 11 registers with some care and perhaps you want to (temporarily?) take some extra scratch registers in the buffer area if needed? You could even keep an open mind to allow for a larger stack when writing the code.

Another alternative would be to use an XMem file. That memory is of course not always available, but when it is, people will probably find it easier to part with some of it rather than the buffer area.

However, as you do not take that many registers, and it works on all machines, I think using the buffer area is the prettier solution.

Then provide some command(s) for retrieving numbers from the Z stack to the RPN stack.

P.S. I was taken a bit by surprise being mentioned. You are of course very welcome to use whatever code I wrote from long time ago. I am not even sure if I am worth the credit, or if I more or less borrowed the code from HP. It was a long time ago...

Re: 41Z Breakthrough: 4-level Complex Stack

*Message #12 Posted by **Ángel Martin** on 18 Aug 2009, 2:35 a.m.,*
in response to message #11 by Håkan Thörngren

Greetings Håkan, glad you showed up!

There's much to thank you for - regardless of whether the code you used being "inspired" by HP's the fact is you managed to put it together in new and creative ways, and at a time when it wasn't really a done deal.

This particular buffer stuff I took from your SEED/RNDM articles published on PPCCJ back in 1986 if memory serves. More impressive were your other projects on RAMED, ARCLCHR, RSTCHK and HEXIN. All of them a source of inspiration and MCODE learning...

Thanks for your ideas on the XMem file - I agree it's probably better to stick with the buffer approach for the reasons you mentioned.

So how about dusting off those MCODE skiils of yours and rolling up your sleeves on this IO interrupt thing?

Best,

ÁM

Re: 41Z Breakthrough: 4-level Complex Stack

*Message #13 Posted by **PeterP** on 18 Aug 2009, 7:38 p.m.,*
in response to message #11 by Håkan Thörngren

After some more pondering of the use of the io interrupt I must say I like this idea of all z numbers in the buffer. This would allow easy switching between complex and normal operation via the user key. I guess the recoding would be messy for all functins but not necessarily more so than trying the io route. (there would be quite a number of situations to be considered....) it might even bring some code simplificTion as stack drops now happen in continuous memory and there is no need to capture the break between z2 (in normal stack) and z3 (in buffer) one thing I used in the mpl is to store useful information in the header reg as this is the reg that gets 'found' (eg the absolute adress, number of stack levels, etc) maybe we can write some generic 'get z-number' routine that could replace the read x and read y etc functions. Anyway, I look forward to the mod and it's code, maybe we can all pitch in a little...

Cheers

Peter

Re: 41Z Breakthrough: 4-level Complex Stack

*Message #15 Posted by **Ángel Martin** on 19 Aug 2009, 3:10 a.m.,*
in response to message #14 by Ángel Martin

I too am leaning towards the full complex stack solution. I *think* I have figured out all the situations where it would come to place, see if you find something missing:

Design Criteria:

1. The complex Buffer has 5 levels, from L0 (for lastZ) to L4 - plus its header. Each level holds 2 registers, thus 11 regs in total, called b0 (header) to b10 (imaginary part of L4).

2. The Mapping with the real stack is as follows: X=b3, Y=b4, Z=b5, T=b6. L=b1

3. All functions take their input from X,Y (if monadic) or [X,Y,Z,T] if dual. The output is placed also on the stack, no interaction with the buffer during the calculation phase.

4. It's upon the function to save the operand into L0 (LastZ) prior to executing the math, and to synchronize the stack with the complex buffer upon completion.

Once these criteria are defined, we need to properly structure the "Special events", as follows:

A.- ZENTER^.
1. writes (X,Y) into L1 (b3,b4)
2. buffer *normal* lift: L3->L4; L2->L3; L1->L2
3. synch: writes [b3-b6] to stack [X,Y,Z,T]
(this is for consistency with other processes, as it only requires writing (X,Y) into (T,Z).

This is the key point that solves the previous issue: now it doesn't matter what happens to the real stack (like T spilling over) because the complex buffer L2 remains untouched upon execution of ZENTER^. Naturally one must be disciplined and *ALWAYS execute ZENTER^ upon complex data input*, or otherwise the real stack and the complex buffer will de-synchronize.

B.- LASTZ.
1. buffer *long* lift: L3->L4; L2->L3; L1->L2; L0->L1
2. synch: writes [b3-b6] to stack [X,Y,Z,T]

C.- ZRDN.
1. saves L1 (b3,b4) into scratch (M,N), keeps Alpha untouched
2. buffer drop: L2->L1; L3->L2; L4->L3
3. writes scratch into L4 (b9,b10)
4. synch: writes [b3-b6] into stack [X,Y,Z,T]

D.- ZR^.
1. saves L4 (b9,b10) into scratch (M,N)
2. buffer *normal* lift: L3->L4; L2->L3;, L1->L2
3. writes scratch into L1 (b3,b4)
4. synch: writes [b3-b6] into stack [X,Y,Z,T]

E.- ZRCL__.
1. buffer *normal* lift: L3->L4; L2->L3; L1->L2
2. writes X,Y into L1
3. synch: writes [b3-b6] into stack [X,Y,Z,T]
(done like this for consistency sake, other sequences are also possible)

And here's how these are being used during the execution flow:

I. Monadic Function:
0. Save (X,Y) into LastZ [L0]- (b1,b2)
1. Execute function (all within stack)
2. write X,Y result into buffer L1
3. synch: writes [b3-b6] to stack [X,Y,Z,T]
(this is for consistency with other processes, as it's NOT really required if the function was executed right after ZENTER^, but provides more flexibility for quick-access)

II. Dual Function:
0. Save (X,Y) into LastZ [L0] - (b1,b2)
1. Execute function (all within the stack)
2. write X,Y result into buffer L1
3. perform buffer drop: L3->L2; L4->L3
4. synch: writes [b3-b6] to stack [X,Y,Z,T]
(this is for consistency with other processes, as it only requires writing L2 (b5,b6) into (Z,T)

So things are getting ***complex*** (no pun intended?). Whilst not an easy scenario it's doable just the same - if tedious sometimes. My head is spinning with RAM SELECT and READ/WRIT DATA statements, I'm going to print this out and memorize before continuing with the code writing!

Do you see any other situation missing on the above lists??

Best,
ÁM

in response to message #15 by Ángel Martin

Angel, looks good to me. Couple thoughts, for what its worth: I think the need to do ZENTER for complex number input is totally fine. Maybe assign it to the shift enter key? (as the user needs the enter key to get the two parts into x and y)

Related to this are your help-functions that work between a real number and a complex number (x^z and z^x for example). One might consider doing away with them as the user would still have to do real part of x, enter, o, zenter to enter the real number x. Personally I think this is acceptable for the user. One last question - I personally think of complex numbers as real part, complex part. So the natural way to enter them would be real part, enter, complex part, zenter. Is that how you have defined the stack? (I could not glean it from the description below) One function you might or might not have that RPN people love to use is 'X<>Y' so one might want to create a function Zx <> Zy. Depending on space availability, one could extend this (similar as to your RPN extensions from the Sandbox) to Zx <> Zz and Zx<>Zt and maybe even a RCLZ_y, RclZ_z, though I agree that some of those are very rarely used. I only mention them as given the code that has to be created anyway, they might come quite 'cheap'.

Looking forward to the module (and source if you can)!

Cheers

Peter

or real_part, comma, imaginary_part, enter. If you don't do the imaginary part, it's automatically 0. The comma is on the same key LASTX and "." are on. "." has to stay; but I use LASTX less than CATALOG, such that I have LASTX re-assigned to PACK, but I use that seldom enough too that making it go to the imaginary part of an entry would be fine.

To take care of various aspects like STO & RCL (including IND) and I/O functions will be an amazing accomplishment.

Anyone who used the 41 regularly is bound to have half the keys re-assigned, so I think any solution will require going in and out of USER keyboard a lot. I'm not complaining, just saying that's the way it will have to be. My Catalog 6 (USER key assignments) is a list of 34 keys. In place of BEEP I have my alarmclock program assigned.

Re: 41Z Breakthrough: 4-level Complex Stack

*Message #20 Posted by **Ángel Martin** on 21 Aug 2009, 4:54 p.m.,*
in response to message #19 by Garth Wilson

my preferred way would be the same as the 35S:

Re(z) "i" Im(z) ENTER

If I were a real MCODE programmer (instead of a pattern-recognition expert... but that's a nother story) that'd be the way I'd programm it. Unfortunately the "partial key data entry" ML routines are a complete mystery to me so I'll have to live with this:

Im(z) ENTER RE(z) ZENTER

But first things first - I'll get to these enhancements after the base module is code-complete... getting very close!

Best, ÄM

*Message #21 Posted by **Ángel Martin** on 21 Aug 2009, 5:14 p.m.,*
in response to message #17 by Garth Wilson

ZSTO__, ZRCL__, Z<>__ and ZVIEW__ are **programmable prompting functions** (uses a trick written by Doug Wilder, similar to the HEPAX implementation).

Thanks to them complex memory management is easy and convenient, just input the Complex register (pair) number at the function prompt (or add a second line in a program to take it from).

It still does not support IND__ or ST_, but maybe one day ...

Besides, ZTRP does exactly the Re<>Im swap (in XY *and* L1)

Best, ÁM

Re: 41Z Breakthrough: 4-level Complex Stack

*Message #22 Posted by **Ángel Martin** on 21 Aug 2009, 5:09 p.m.,*
in response to message #16 by PeterP

the "hybrid" functions (Z^X, x^Z, etc...) don't require any imaginary part for the "real" number. It's like a shortcut, as follows:

Im(z)
ENTER
Re(Z)
ZENTER^
x
Z^X (or other hybrid function)[n]

Upon completion, the following actions take place:

Re(z), Im(Z) are stored into L0 (lastZ level of rhe buffer)
Result is stored into both L1 and (X,Y)
L2 is copied back into T,Z for sncronization purposes.

Best, ÁM

Oops. I see you've gone a long way beyond the point where I made my last reply just now. What you have there sounds good to me too.

One thing: can't you always guarantee that the standard stack is in sync with the complex stack by rewriting the former with the latter at appropriate points? Would that allow you to use the regular enter key? That would only be an issue if you were supporting complex operations while not in user mode. You could reassign ENTER otherwise. If you couldn't do that, I'm just imagining how hard it would be to retrain my fingers. :)

Regards,
Howard

Re: 41Z Breakthrough: 4-level Complex Stack

*Message #24 Posted by **Ángel Martin** on 21 Aug 2009, 5:01 p.m.,*
in response to message #23 by Howard Owen

The logic is more involved that what I first thought, I must confess I was tempted to give it up many times but I think I finally managed to get in under control.

Here's how it works:- the real stack is like a scratch pad to work out the complex data input. You can use XYZT as required, and when ZENTER^ is executed it performs an update of the L1 level in the complex buffer level (copying from XY) *and* a refresh of T,Z using L2 from the complex buffer.

So it doesn't matter if T spills over (or even Z for that matter). And thus it is now a full 4-level complex stack (buffered!)

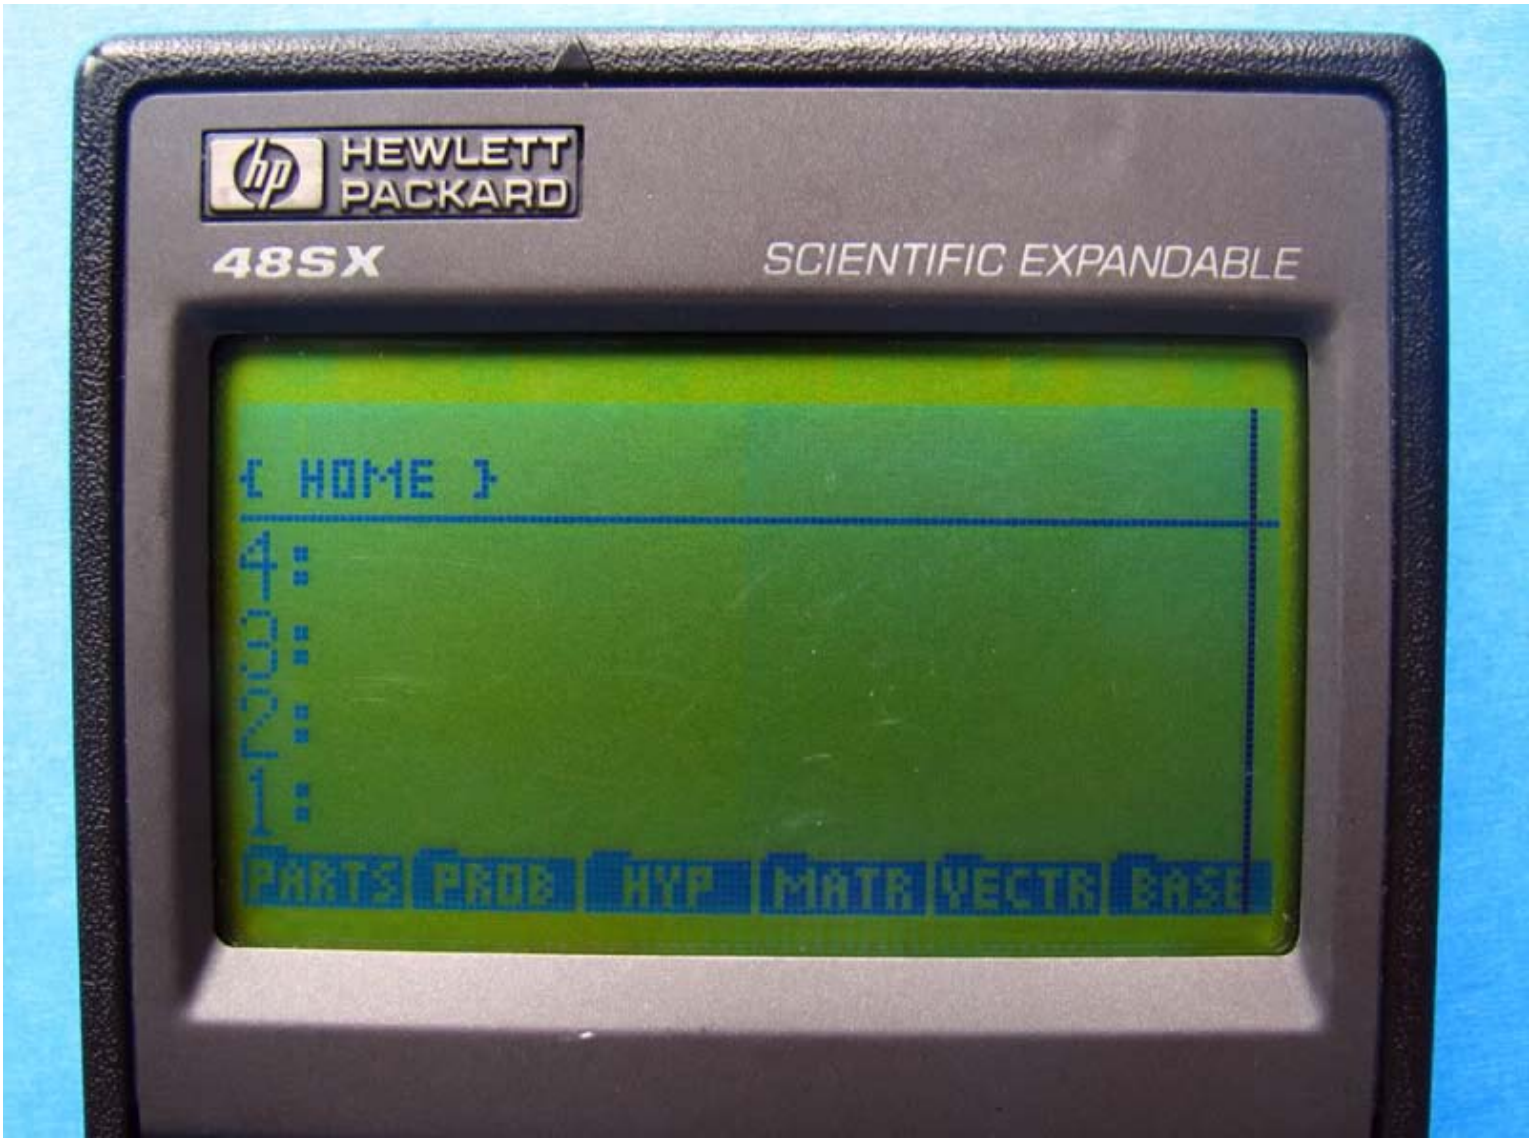
HP48SX LCD problem...

*Message #1 Posted by **Geoff Quickfall** on 15 Aug 2009, 5:06 p.m.*

I picked up a completely non functional 48SX about 5 months ago hoping it would be the deteriorated contact foam under the keyboard flex ribbon. That is the foam which holds the the keyboard flex ribbon agains the logic PCA contacts.

It was, and after disassembly, a thorough cleaning of all contacts, including the LCD zebra connectors and a new foam inser the calculator worked perfectly. In fact I removed the connectors, cleaned them, ensured no dust on the PCA contacts or connectors, and then reassembled the calculator.

I put the calculator away without batteries for 4 months. Today I picked it up, installed the batteries (using this example for Chapter 13, Stretch Pioneers) and it now powers up with a vertical line to the extreme right of the display.



Today in an effort to remove the line I have:

```
1  disassembled and cleaned all contacts again!
2  reset with the reset under the foot.
3  reset with batteries out and reset under the foot.
3  tried all the diagnostics, it passes!
```

The line is still there! Any ideas?

I found the following link which may explain the problem, alas, not fixable:

HP48SX display problem

My serial number is 3147Sxxxxx

Cheers, Geoff

in response to message #1 by Geoff Quickfall

Since it was OK before you stored it, I would suggest taking a closer look at the contacts on the connector and the display under a magnifier.

Or the display becomes defective?

Re: HP48SX LCD problem...

*Message #3 Posted by **nacho** on 15 Aug 2009, 6:29 p.m.,*
in response to message #1 by Geoff Quickfall

Have you tested it with another 48LCD?

I replaced a faulty LCD in a 48S with a 49G LCD and it works perfect. (Black LCD).

I installed the faulty LCD in the 49G and it still is faulty.

Regards

Thanks Quan and nacho

*Message #4 Posted by **Geoff Quickfall** on 15 Aug 2009, 7:54 p.m.,*
in response to message #3 by nacho

Yes, have checked the connector strips, LCD panel and contact points on the logic PCA. I actually cleaned them again!

Every thing looks good.

The idea of swapping with a good LCD panel on the 49G never ocurred to me so thanks for that.

At the moment the location of the line is not affecting the display but it is annoying.

So I will look out for a bad 49G (as is not working) for a spare LCD replacement.

Cheers, Geoff

the cost of memory

*Message #1 Posted by **juan demin** on 14 Aug 2009, 10:31 p.m.*

Probably the cost and volume of memory had a strong influence in the evolution of design and programming languages (the magnetic cards writer/reader to storage programs… the RPL vs RPN…the rigid registers/programming lines of the classic calculators). I am amazed to notice that in 1980 the quad memory module for the HP-41C cost $100 (I personally bought one of them) and it had 1792 bytes….Today an 8 Gbyte SD card for the HP-50G is around $10…The rate? 48 million times cheaper!!! Probably I am wrong and I should not compare them so easily…but I am tempted to… I do not know how much a RAM card for the HP-48SX cost in 1990…But if you have any idea, please let me know.

Re: the cost of memory

*Message #2 Posted by **bill platt** on 14 Aug 2009, 11:02 p.m.,*
in response to message #1 by juan demin

Even in 1995, memory was very expensive. I spent over $150 to upgrade my 486 back then. I think I ended up with 16MB instead of 4MB.

You are correct about the importance of memory. Computing cost--and memory is a distinct significant part of that--has fallen dramatically--and was very high initially.

Of course everything was about economy of memory, or utilizing every last drop of horsepower. We really didn't have a choice.

Today's computing is a whole different ethos. There is now excess horsepower. How many watts do we just fritter away idling, or simply typing into a browser window? Calculators of the 1970s used much more of their capacity for utility on average versus modern computers, which mostly just use power for "OVERHEAD."

The consumer and small-business machines of today are similar to the automobiles of the late 1930s--huge, inefficient, powerful, imaginative, beastly dinosaurs which are merely an awkward developmental stage.

In the future, we will have much more elegant machines which do not need to "boot up" for 5 minutes, do not need to idle, do not consume 300 watts doing absolutely nothing. We will have efficient, flexible, reactive machines which handle swiftly, smoothly etc.

In the early 80th, my computers came up almost instantly (Sinclair ZX81, Spectrum, later the C64). Later, the 8MHz Amigas, Apples and PCs took some time to boot, but that was never a problem. Boot times went up with CPU speed and memory and have increased until now.

Hope your prophecy will come true.

Re: the cost of memory

*Message #4 Posted by **Howard Owen** on 15 Aug 2009, 2:53 p.m.,*
in response to message #3 by Thomas Radtke

Bloat, bloat, bloat. A compelling argument for burning more memory, CPU time or I/O bandwidth is that these things are increasing in capacity along an exponential curve. (At least according to the most optimistic predictions.) Moore's law still hasn't played out for CPU and RAM. For I/O, improvements have lagged, but still have experienced astonishing rates of performance improvements. Trouble is, those changes take the lid off marketeer's imaginations. They order up new products, or changes to existing ones, with the raw rate of increase in mind. But they don't allow the time it would take to implement the new products in such a way as to make efficient use of the new computing power. So engineers deliver slapped together products that are, at best, 80% finished. Not only do these travesties take more time to load, but their long list half-baked features and enormous bug list sap performance once the system is up and running, not to mention the effect on the user's productivity or peace of mind.

The 80% rule is evil, IMHO. Our beloved calculators came to market during a time when excellence took priority over marketability.

Howard

I picked up a 128KB card for my 48GX sometime in the early 90s. 93/94 perhaps. I do remember it was < $500 because I used a $500 check an airline gave me for bumping me off a flight (now they just give you

credit to use on the airline). I am thinking $200 - $300 US.

I still have it in my 48GX. Great times.

*Message #7 Posted by **Norris** on 17 Aug 2009, 12:26 a.m.,*
in response to message #6 by Egan Ford

hpcalc.org used to compile the prices of HP48GX memory cards from a variety of sources. The oldest archived results, from October 1998, are still available here.

As the hpcalc page indicates, there was a huge price difference at that time between "official HP-approved" cards and "unofficial non-HP-approved" cards. The unofficial cards were mostly produced by small outfits in Germany.

I bought two "unofficial" Cynox cards from Germany at about that time: 128 KB and 512 KB. The Cynox cards were produced in two formats: covered on both sides (with the electronics concealed) or uncovered on one side (with the electronics exposed). I got the covered cards, which cost more. The hpcalc list indicates that Cynox charged 56 DM for a covered 128 KB card, and 95 DM for a covered 512 KB card. There were, of course, substantial additional charges for shipping from Germany to the US.

My recollection is that my total costs for 640 KB of unofficial, non-HP-approved memory cards were nearly $100. That seems in line with the Cynox prices on the hpcalc list and contemporary dollar-mark exchange rates. This was still much cheaper than equivalent HP-approved cards, which apparently would have cost around $300, based on the hpcalc list.

I still have the Cynox cards in my 48GX and they still work fine, though the batteries have been replaced several times.

Here's a bit from the Educalc catalog #52 which I received in '91. Battery-backed HP RAM cards for the HP-48: 32K for $70, 128K for $160 ($110 for a similar one from CMT).

When I made my first home-made computer in about 1985, an 8Kx8 SRAM IC was $40 at Jameco. I think I bought only one, and wondered if I did the right thing. Soon after, it was down to $8, and it was found that it was because the Japanese were dumping, selling at a loss in an effort to drive their competitors out of the memory business. The flash you mention of course can't be used like RAM, but even SRAM (not to mention DRAM) is a teensy fraction as expensive now as it was back then. The idea of having many megabytes seemed ridiculous, but we didn't couldn't imagine having the gigabytes necessary for digital audio recording and video which are no big deal anymore.

I remember in the Apolo 11 movie one of the astronauts was giving a tour, and said something about the prospect of having a million bits of computer memory all in one room.

I remember at JSC, late 80's, in one lab we had 5 or 6 hard drives, each the size of a small top loading washing machine. Each held a 300 MB drive.

The hard drives could be swapped in and out. Each was about the diameter of an LP (a vinal record) but had a stack of perhaps five disks. To swap out the drive we'd open the top and insert a plastic cover, lock it down then lift out the whole unit like a round cake cover thingy (I'd have to ask my wife what those are called).

Then of course we had banks of half-inch tape drives to back everything up.

I liked watching the strip-chart recorders most.

Hi, Garth --

Apollo 11 was the successful first-landing mission in July 1969, whose 40th anniversary was recently celebrated. The fine movie "Apollo 13" was about the ill-fated mission of April 1970, which incidentally was the first specific news event I remember...

Another memorable scene involving technology was where a few operators were asked to verify a calculation. One by one, they got busy on their slide rules and confirmed the result. Two years before the HP-35...

If we could go back in time to the year 1957, then at that time one byte transistor flip flop costed $392, so for 8GB we should give 3 trillion US$:-) Price dropped significantly in a few years, so the same size of memory would cost as few as 40 billion US$ in 1960. Of course nobody never dreamt of such huge memory at that time, since the biggest affordable memory was 32K (IBM 1401).

Re: the cost of memory

*Message #13 Posted by **Eric Smith** on 15 Aug 2009, 12:47 p.m.,*
in response to message #12 by Michael Eckstein

I'm not sure where you got the cost of $392 per byte, but in 1957 computers did not use transistor-based flip-flops for main memory. Most computers of that time used Williams tube memory, core memory, or magnetic drum memory, all of which were substantially less expensive than any kind of flip-flop. At that time core memory cost less than $0.10 per bit, nearly a factor of 500 less expensive than your quoted cost of transistor-based flip-flops.

Re: the cost of memory

*Message #14 Posted by **Michael Eckstein** on 15 Aug 2009, 4:37 p.m.,*
in response to message #13 by Eric Smith

Hi Eric,

I don't know the purpose for which was that transistor flip plop memory used, but price for that memory was $392 in 1957, the information was acquired from the page www.jcmit.com/memoryprice.htm, where memory prices are followed from 1957 to 2009

Regards, Michael

in response to message #14 by Michael Eckstein

Discrete-transistor-based flip-flops were generally used for processor registers. In high-speed computers, it was necessary for the processor registers to operate significantly faster than main memory. Typical core memory cycle times in 1957 were around 5 microseconds, while transistor-based flip-flops would operate at least ten times faster.

In 1964, the DEC PDP-6 was designed to be able to use 16 words (36 bits each) of core memory for the processor registers, but there was an optional "fast memory" that replaced those with discrete-transistor flip-flops. The "fast memory" option provided 576 bits of registers, occupied a six foot tall 19" equipment rack, and cost approximately $50,000. By comparison, the 163C core memory had 16K words (36 bits each), was only slightly larger than the "fast memory", and cost $126,000. Thus the core memory had about 1000 times the bit density and cost 1/400 as much per bit.

More memory seems to demand for more memory in the human brain also ;-). I can take any of my old calculators and start using them again at any time. To master my 48G, I'd have to immerse myself again into the manual - after only about one year since last usage.

Even the 35s is way more complex than the 32SII, just to deal with its large memory. You have to keep a lot of things in mind.

OTOH, this way it is unlikely for a manual to vanish ;-).

Right, Thomas, and that's the perfect exercise!!! much better than solving a sudoku to keep mind running... The challenge of those days was to reduce program lines not to run out of memory and to optimize speed... Look at the forum and this "days between dates challenge for 11c"...That's all about!!!!!

Any mental process that isn't used for a while will decay and need exercising again to get fit but I believe that the basics are like riding a bicycle - once learnt, never forgotten. The RPL calcs are vastly more powerful and complex than the older step-programmed calcs and even those of us who program RPL on a regular basis keep the AUG available on the desk. I am sure you are being hard on yourself to suggest you would forget it all in just one year!

Mark

Are you serious? I think 48G series are calcs that when you know how to use them is difficult to forget it.

I'm talking from my point of view, knowing where each key is (and functions) with an overlay on it.

Of course I'm workin near daily with a 48GX from 1994.

Regards

Another days between dates challenge for 11c

*Message #1 Posted by **Don Shepherd** on 14 Aug 2009, 10:29 p.m.*

In this challenge, you are to develop an RPN program for the HP-11c that correctly calculates days between two dates. It must handle dates from Oct. 15, 1582 to Nov. 25, 4046 (same as the 12c). The evaluation criteria are the same as in an earlier thread on this subject: score = number of lines + 7*number of registers used (not including lastx or stack) + 2*number of labels used. The lowest score wins. The evaluation criteria are designed to reward those whose programs make the most economical use of scarce resources on the 11c.

Each entrant should calculate their score and post it with their code.

in response to message #2 by Katie Wasserman

The following is based on the method used in the TI-59 Master Library Module (page 76). Day of the Week has also been included. The program is far from optimized: 91 + 3*7 + 3*2 = 116.

```
001-    LBL A
002-    GSB 0
003-    x<>y
004-    GSB 0
005-    -
006-    RTN
007-    LBL 0
008-    0
009-    STO 0
010-    Rv
011-    EEX
012-    2
013-    *
014-    ENTER
015-    FRAC
016-    EEX
035-    *
036-    STO+ 0
037-    Rv
038-    ENTER
039-    ENTER
040-    .
041-    4
042-    *
043-    2
044-    .
045-    3
046-    +
047-    INT
048-    STO 2
049-    Rv
050-    1
069-    RCL 1
070-    EEX
071-    2
072-    /
073-    INT
074-    1
075-    +
076-    .
077-    7
078-    5
079-    *
080-    INT
081-    STO- 0
082-    RCL 1
083-    4
084-    /
```

```
017-    4                   051-    -                   085-    INT
018-    *                   052-    3                   086-    STO+ 0
019-    STO 1               053-    1                   087-    RCL 2
020-    3                   054-    x<>y                088-    STO- 0
021-    6                   055-    *                   089-    R^
022-    5                   056-    STO+ 0              090-    RCL 0
023-    *                   057-    Rv                  091-    RTN
024-    STO+ 0              058-    1                   092-    LBL B
025-    Rv                  059-    LSTx                093-    GSB 0
026-    INT                 060-    x>y                 094-    ENTER
027-    EEX                 061-    GTO 1               095-    CHS
028-    2                   062-    x<>y                096-    7
029-    /                   063-    STO- 1              097-    /
030-    INT                 064-    CLx                 098-    INT
031-    LSTx                065-    STO 2               099-    7
032-    FRAC                066-    LBL 1               100-    *
033-    EEX                 067-    Rv                  101-    +
034-    2                   068-    Rv                  102-    RTN
```

Date format is MM.DDYYYY

GSB A: works just like DeltaDYS on the 12C.

GSB B: similar to DATE on the 12C, but requires only one argument, the date, and returns 0=Sat, 1=Sun, ... 6=Fri.

Equivalent TurboBCD program:

```
Program DaysBetweenDates;

var days, dt1, dt2: real;

function f(dt: real): real;

var d, m, y, t, x: real;

begin
  y:=1e4*(Frac(100*dt));
  m:=Int(dt);
  d:=Int(100*(Frac(dt)));
  x:=Int(0.4*m+2.3);
  t:=365*y+d+31*(m-1);
  if (m-1)<=1 then
    begin
      y:=y-1;
      x:=0
    end;
  f:=t+Int(y/4)-Int(0.75*(Int(y/100)+1))-x
end;

begin
  ReadLn(dt1,dt2);
  days:=f(dt2)-f(dt1);
  WriteLn(days:7:0)
end.

>

He is not counting the LBL B and the last eleven steps as those are for the day of the week calculation and are not needed for days between dates

Recent correspondencc from Richard Nelson tells me that at one time there was a set of biorhythm programs for the SR-56. That should have some routines for a machine with a limited repertoire similar to that of the HP-11. So far I haven't got my hands on the programs. I'm working on it.

Palmer

*Message #8 Posted by **Don Shepherd** on 17 Aug 2009, 12:33 a.m.,*
in response to message #7 by Gerson W. Barbosa

Thanks for that link, Gerson. It is absolutely fascinating. Reading that thread, I see some names we haven't seen here very much recently, like Valentin Albillo and James Prange. You can always count on Valentin to defend the 15c (and the 71, as I recall), as he did in that thread. If V or James Prange are still lurking out there, I for one would welcome their regular return to this forum. We would all gain from their participation.

*Message #9 Posted by **Bart (UK)** on 17 Aug 2009, 8:26 a.m.,*
in response to message #2 by Katie Wasserman

Hi Katie,

That formula does look more "compact" than the JD formula I based my routines on. I cannot better the code, but I have a suggestion for optimising the maths.

As (365*y) is an integer, then I assume (365*y) + INT(y/4) = INT(365*y + y/4) = INT(365.25*y)

This would save 2 steps in your program.

Perhaps maths gurus could comment on the validity of my assumption?

Bart

in response to message #9 by Bart (UK)

In this particular case, on this platform, I think you could get away with it, but in the general case (even an emulated hp-11) you should not (and should expect to have a horrible bug to catch!)

Re: Another days between dates challenge for 11c

*Message #11 Posted by **Bart (UK)** on 18 Aug 2009, 7:08 a.m.,*
in response to message #10 by htom trites jr

My reasoning is as follows:

The first term we know is an integer say INT1, the second term is INT2.FRAC1, the integer of which is INT2, thus the sum is INT1+INT2.

If we did not take the integer of the second term before summation, the sum will be [INT1+INT2].FRAC1, if we then take the integer part it is INT1+INT2, as before.

Some rules apply

1) One term must be an integer to start with
2) Both must be of the same sign

As far as I see, both these rules are adhered to within the scope of the implementation of this formula.

Re: Another days between dates challenge for 11c

*Message #12 Posted by **htom trites jr** on 18 Aug 2009, 9:35 a.m.,*
in response to message #11 by Bart (UK)

The problem is in the nature of the actual implementation of floating point arithmetic. Values that are the results of the division of an integer by a power of 2 are "special", in that they can sometimes have exact representations in both decimal floating point and binary floating point. In general, this is not true; in this particular case it works. Change the divisor to, say, 53, and things won't be so neat.

*Message #16 Posted by **Steve Perkins** on 18 Aug 2009, 3:21 p.m.,*
in response to message #9 by Bart (UK)

An excellent observation!

If I'm not mistaken, it should save 3 lines.

And it should work on a real 11C because of the BCD math, and a simulated 11C because .25 is an inverse power of 2 as pointed out below.

It makes me wonder if we could include the other year terms in the constant on a real (or correctly emulated) HP-11C?

```
INT (y * 365.2425)
```

Certainly worth a try, right?

*Message #20 Posted by **Steve Perkins** on 18 Aug 2009, 6:42 p.m.,*
in response to message #17 by htom trites jr

Here's my corrected version. I have more confidence in this one.

I don't need to recall the year to divide by 400, I use the year divided by 100 already there and

just divide that by 4!

I also shortened the (m*306 + 5)/10 part by 1 line.

I tested these improvements to be the same. If someone finds a counterexample, I'd like to know.

Score 79 lines, 2 regs, 1 label = 95

Now why didn't I think of that!!

One caution though, you seem to be taking INT[INT[y/100]/4], rather than INT[[y/100]/4], which may lead to errors in some cases.

Bart

Re: Another days between dates challenge for 11c

*Message #22 Posted by **Steve Perkins** on 19 Aug 2009, 11:14 a.m.,*
in response to message #21 by Bart (UK)

You are right, I am taking INT[INT[y/100]/4] intentionally. In my tests it was the same, and saved a step.

Let me know if you still think it's different, especially if you can show an example.

I wrote a 'C' program to check all year values and I think I'm OK.

A purist would have used a calculator program, but I was lazy I guess.

As it is we are interested in removing the leap days of whole centuries but counting every fouth one of those.

So your formula should indeed work fine.

HP-IL/RS-232-C Interface

*Message #1 Posted by **Bill Lafferty** on 14 Aug 2009, 8:49 p.m.*

I picked up a HP82164A through eBay some time ago. It came without an AC adaptor. Can any one tell me what I can use to connect to Australian power, which is 240V? Thanks. Bill Lafferty in Cooma

Re: HP-IL/RS-232-C Interface

*Message #2 Posted by **Raymond Del Tondo** on 14 Aug 2009, 9:12 p.m.,*
in response to message #1 by Bill Lafferty

Don't know the HP part number for the Australian adapter, but it's the same AC adapter as for the 82143A/82162A printer.
In Germany, it's always the HP 82066B for nearly all kind of peripheral stuff. It should provide about 12V AC on the secondary side terminals w/o any device connected,
and about 8V AC with a device.

HP-10bII

*Message #1 Posted by **hecube** on 14 Aug 2009, 6:21 p.m.*

I just received a HP-10bII I intend to use at work. I was just a wee bit apprehensive about the quality of the product. I must admit I'm impressed: the unit feels solid in the hand, it's lightweight and it's beautiful. The processor feels sluggish though...

Of course it's not RPN but it's ok.

The only head-scratching design flaw that jumps at me is having to use the shift button in order to use parenthesis...

Re: HP-10bII

*Message #2 Posted by **Gene Wright** on 14 Aug 2009, 7:04 p.m.,*
in response to message #1 by hecube

The parentheses are a carry over from the original HP 10b back in the late 1980s. This model functions EXACTLY the same as that original model in order to be an exact duplicate. Sadly, that means no algebraic hierarchy and shifted parentheses. Just the way it is.

Why didn't HP upgrade this model to add that stuff? They did...it is called the HP 20b. ;-)

Much, much more bang for your buck for the 20b than the 10bII, IMO.

Why were the parentheses shifted and why was algebraic hierarchy left off the original HP 10b? I can ONLY guess that someone inside HP felt that "business" people don't do real math or that hierarchy might confuse them.

GREAT news is that the internal HP people have been disabused of that notion. Newly designed business calculators from HP that have algebraic have hierarchy. Yay!

HP-67 with clear (transparent) back cover

*Message #1 Posted by **Giovanni Jimenez** on 14 Aug 2009, 8:59 a.m.*

Does anybody know if this type of HP-67 was actually manufactured by HP (as a pilot maybe), or is this a "customized" fix ?

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=200373093484&ssPageName=ADME:X:RTQ:GB:1123

Thank you!

Giovanni

it's official

*Message #2 Posted by **Frank Boehm (Germany)** on 14 Aug 2009, 9:43 a.m.,*
in response to message #1 by Giovanni Jimenez

My understanding is, that those were manufactured as sales demo units. A serial# is barely visible, so it's very likely not a prototype unit.

Weird Voyager Behavior and 12C+ issue

*Message #1 Posted by **Katie Wasserman** on 14 Aug 2009, 1:01 a.m.*

In playing with the new 12C+ latest firmware (2009-07-31) I found that there's a 2 second timeout when running the keyboard self test (ON + divide). If you wait more than 2 seconds between pressing keys you'll get an Error 9 -- the same as if you had pressed a wrong key. I thought that this was just a new 12C+ bug but all Voyagers do this, the 12C+ just does it 75 times faster than the original ones.

Furthermore, after the Error 9, the X register will display 0.1 times <the number of keys that you pressed + 1> before you timed out. However that displayed number is not-a-number, at least not a legal number. For example, if you start the keyboard self test and let it time out without pressing any keys (2 minutes 18 seconds on my 11C) then press any key, you'll see 0.1 in the X register -- now try taking the reciprocal of this and you'll get 0.0.

It's hard to imagine that this would have ever been noticed on the original Voyagers before, but it's certainly going to be noticed on the new 12C+ and I think will result it many calls to HP support for help with their broken calculator.

-Katie

well, this is an original 12C bug, you can not say that it's a 12C+ bug at least!!!

cyrille

Re: Weird Voyager Behavior and 12C+ issue

*Message #4 Posted by **Bart (UK)** on 14 Aug 2009, 9:57 a.m.,*
in response to message #3 by cyrille de Brébisson

Cyrille,

I'd hesitate to call it a bug. Perhaps it was a feature that if the calculator was put into test mode (on purpose or accidental) and left unattended, it would time-out. Or for some other reason (original design team thought it would be a good/sensible idea). Without a RTC the time-out would have been based on the CPU speed.

By the way, my 32S times out in about 2m 45s and first shows "KBD 01 - 00" with a warning trianle and upon ANY keypress shows "32S - FAIL 8".

Just my 2c worth.

Bart

Edit: Playing around now
32S:
Start test (ON & y^x), continue to kbd test, then leave:
2m 45s "KBD 01 - 00" with a warning trianle
2m 45s after that "32S - FAIL 8"
2m 45s after that, returns to normal operating mode.

20S:
Start test (ON & y^x), continue to kbd test, then leave:
1m "20 - FAIL 8"
15s after that, returns to normal operating mode.

20S:
Start test (ON & y^x), then leave:
1m display changes, does this about 3x
1m after that "20 - FAIL 8"
15s after that, returns to normal operating mode.

Trivia Question

*Message #1 Posted by **Mark Edmonds** on 13 Aug 2009, 7:46 p.m.*

Sometimes, really obvious observations take a long while to happen. This is certainly true with myself and this tidbit that I have only just realised.

If you discount anything from the HP48 onwards and anything from any of the single-line calculator series, there is one particular feature unique to the Voyager series. What is it? (I'm not thinking of the landscape format).

Please don't lose any sleep over this one. If you hadn't realised it and work it out, you might think to yourself, "Oh yes, so it is!" in a slightly amused way. On the other hand, if you know what I am talking about before you've even read this far, just take a deep breath whilst the slow amongst us catch up!

Mark

I'm not quite sure what is meant by that, but the HP-41 and HP-71B could be considered "single-line series".

The HP-41 has an ON/OFF button that is not shared with CLEAR (turn off in one keystroke),

The HP-71B -- which resembles an HP-15C on steroids -- also has a vertical key that serves as "ENTER", called "END LINE".

Voyagers are on their second set of batteries? Some might even still be on their first set.

I don't understand the "single-line" comment either.

- Pauli

Re: Trivia Question

*Message #6 Posted by **Dan W** on 13 Aug 2009, 11:10 p.m.,*
in response to message #5 by Paul Dale

I think "single line" meant a single line of characters in the display.

Re: Trivia Question

*Message #7 Posted by **Raymond Del Tondo** on 14 Aug 2009, 3:23 a.m.,*
in response to message #5 by Paul Dale

I also think it's the long life of the batteries,or the overall size:
The voyager series is the most pocketable of the real HP calcs.

ON/OFF with a single key is not a unique feature of the Voyers series,
since the HP-41 has it, too, and even the older HP's with
a mechanical slider switch have it - the single ON/OFF switch.

As was already noted, landscape and vertical ENTER key are in the HP-71B, too.

Egan, these things are personal of course :) I think the Voyager series is cute and idiosyncratic but I wouldn't really consider it beautiful. For a landscape calculator that surpass the Voyagers, I would recommend you pick up a Sharp EL5100. It isn't until you actually handle one and use it that you realise how incredibly thin it is and the delicate feel of those super-soft-click buttons. Svelte is one word that suits the EL5100! If I can embed a photo in a post, I'll try and upload an image showing the thickness of an EL5100 compared to a Voyager.

Using "P/R" for mode switching?

Re: Trivia Question

*Message #15 Posted by **Mark Edmonds** on 14 Aug 2009, 4:44 a.m.,*
in response to message #14 by Walter B

No one has got it yet which surprises me. Maybe this isn't such a well known factoid as I thought?

The single-line comment means any series based on a single calculator such as the HP01, HP71, HP41, HP94 and so on.

Mark

Re: Trivia Question

*Message #16 Posted by **Jeff Kearns** on 14 Aug 2009, 5:42 a.m.,*
in response to message #15 by Mark Edmonds

A unique feature of the Voyager series is the form factor. The ratio of the length to the width closely approximates the 'magical' number phi, or the Golden Ratio which is 1.618.... Of course, the actual Voyager length/width ratio falls a little short of this number as I eye-ball the measurement in cm with a ruler, but it's close... The width dimension given on this website seems a little low.

So the uniqueness is the almost perfect shape!

Jeff Kearns

Edited: 14 Aug 2009, 5:55 a.m.

Re: Trivia Question

*Message #17 Posted by **Mark Edmonds** on 14 Aug 2009, 7:34 a.m.,*
in response to message #16 by Jeff Kearns

Interesting suggestion Jeff. I'll need to examine why there is this "Golden Ratio" to find out what it is about. My own measurements of a Voyager give a ratio of 1.6125 and for a Pioneer which is the closest I could think of, the ratio is 1.85.

Mark

>
> Bart

Well done Bart! That was what I suddenly realised last night. Also, it wasn't just that it was the first series where every single model across the range is programmable, it was also the only series HP ever produced that had this distinction.

Now, some of you will be saying, what about the 41 series or the 48 series? That is why I added the condition to ignore series based on a single calculator. The 41 and 48 series (and 75 and 94) are just revisions of the same basic calculator. The Voyager series kept programmability across 5 separate models and that was and remains unique.

Hope it was worth the brain power everyone!

Mark

Re: Voyager Trivia Question

*Message #20 Posted by **Karl Schneider** on 15 Aug 2009, 1:59 a.m.,*
in response to message #19 by Mark Edmonds

> Quote:
>
> Also, it wasn't just that it was the first series where every single model across the range is programmable, it was also the only series HP ever produced that had this distinction.

Durn! I shoulda got that one, because I've commented on Voyager programmability issues in the past.

It should be noted that there are four basic paradigms of RPN programmability -- two of which are represented in the Voyager line.

```
        Examples
Type A: HP-41, HP-42S
Type B: HP-32S, HP-32SII, HP-33s, HP-35s
Type C: HP-67, HP-34C, HP-11C, HP-15C, HP-16C
```

```
Type D: HP-55, HP-33E/C, HP-38E/C, HP-10C, HP-12C
```

The distinction of "first all-programmable series" may be largely due to the Voyagers being the first line with Continuous Memory across the board.

The HP-12C and predecessor HP-38E/C are the only business models with RPN keystroke programmability. Later business models were based on AOS. Of those, the cheaper ones were nonprogrammable (programming was not very popular with business types anyway); the better ones had the advanced equation solver. Earlier business models used LED displays, and only the HP-38C had Continuous Memory.

The "Type C" programmability of the HP-15C (as well as the HP-34C) was *essential*, due to the need to define user functions for SOLVE and INTEG. This kind of programmability was very useful in the HP-16C for nonstandard data conversions, but was mainly a nicety in the HP-11C.

The "Type D" programming paradigm of the HP-10C and HP-12C was rather substandard, lacking insert/delete editing. I've stated before that the HP-10C ought to have been a *non-programmable with more built-in mathematical functions*. That would have made it more practical, provided greater separation from the HP-11C and HP-15C, and met the criterion of non-progammability for those users who required that.

IIRC, at the time the 25C appeared it was the first scientific using CMOS. So some extra dollars were for that revolutionary new feature. Justified or not, the customer was willing to pay them. As Dave wrote, this feature became standard pretty fast, so no more extra margin with the 33C but, as you wrote, presumably filling a niche with the 33E. Remember 20 US$ were a significant amount then.

Days between dates - another solution

*Message #1 Posted by **Bart (UK)** on 13 Aug 2009, 2:02 p.m.*

In the recent challenge a formula was provided for days beteen dates, but didn't work in some instances. Actually it won't work when dates include any century years not divisible by 400.

> Quote:
>
> 2.281900
> 3.011900
> --> 2 using this algorithm (incorrect)
> --> 1 on a real 12c (correct, because 1900 is not a leap year)

A single failure, ie a single time that it does not work means the program's broken.

OK, so flame me for being pedantic.

However, I offer a solution. I thought to base my solution on finding the difference between Julian Days using the Julian Day formulae:

a = INT[(14-month)/12]
y = year+4800-a
m = month + 12*a - 3

For a date in the Gregorian (current) calendar:
JD = day + INT[(153*m+2)/5] + y*365 + INT[y/4] – INT[y/100] + INT[y/400] - 32045 (this is for whole days)

Observations:
As the JD numbering starts in 4800BC, and assuming that we're only interested in 0 AD onwards, discard the 4800 in the "y" formula.
Also, as we're interested in the difference between 2 JD's and "-32045" is a common factor, discard it too.

My first implementation is on the 32S,

```
A01   LBL A        B21   +          B47   -
A02   STO A        B22   5          B48   RCL C
A03   x<>y         B23   ÷          B49   400
A04   STO B        B24   IP         B50   ÷
A05   100          B25   RCL B      B51   IP
A06   STO D        B26   RCL D      B52   +
B01   LBL B        B27   *          B53   RCL B
```

```
B02   RCL B        B28   FP          B54   FP
B03   IP           B29   RCL D       B55   RCL D
B04   +/-          B30   x^2         B56   *
B05   14           B31   *           B57   IP
B06   +            B32   RCL E       B58   +
B07   12           B33   -           B59   RCL A
B08   ÷            B34   STO C      B60   STO B
B09   IP           B35   365         B61   x<>y
B10   STO E        B36   *           B62   STO A
B11   12           B37   +           B63   x<>y
B12   *            B38   RCL C       B64   FP
B13   3            B39   4           B65   x>0?
B14   -            B40   ÷           B66   GTO B
B15   RCL B        B41   IP          B67   x<>y
B16   IP           B42   +           B68   LAST x
B17   +            B43   RCL C       B69   -
B18   153          B44   RCL D       B70   RTN
B19   *            B45   ÷
B20   2            B46   IP
```

This is 5 registers, 2 labels and 76 lines. I tried a mix of registers & code and this gives me the best combination (as numbers in lines seem to use lots of memory). 178 bytes calculated as (free mem before code and with cleared registers) subtract (free mem after coding, execution and leaving registers un-cleared).

I thought a challenge would be implementing it on a 20S. Being algebraic, it takes more steps to do things. It has a fixed 99 step memory and the register memory is separate. Unfortunately I could not find a solution without having to pre-enter data on some registers (6 to 9 see below listing).

```
01   LBL A         34   IP          67   RCL 3
02   STO 0         35   +           68   /
03   SWAP          36   1           69   4
04   STO 1         37   2           70   =
05   C (ON)        38   *           71   IP
06   LBL B         39   RCL 2       72   -
07   RCL 1         40   -           73   (
08   IP            41   3           74   RCL 3
09   +/-           42   =           75   /
10   +             43   STO 4       76   RCL 9
11   1             44   RCL 1       77   )
12   4             45   FP          78   IP
13   =             46   *           79   =
14   /             47   RCL 9       80   +
15   1             48   =           81   RCL 3
16   2             49   IP          82   /
17   =             50   +           83   RCL 6
18   IP            51   (           84   =
19   STO 2         52   RCL 8       85   IP
20   RCL 1         53   *           86   RCL 0
21   *             54   RCL 4       87   STO 1
22   RCL 9         55   +           88   FP
23   =             56   2           89   x=0?
24   FP            57   )           90   GTO D
25   *             58   /           91   LAST
26   RCL 9         59   5           92   STO 0
27   x^2           60   =           93   GTO B
28   =             61   IP          94   LBL D
29   -             62   +           95   LAST
30   RCL 2         63   RCL 7       96   -
31   =             64   *           97   RCL 0
32   STO 3         65   RCL 3       98   =
33   RCL 1         66   +           99   RTN
```

Pre-program the following numbers:
100 STO 9
153 STO 8
365 STO 7
400 STO 6

Executing:
D1 INPUT D2 XEQ A

Now I do not have an 11C, nor emulator, but I Imagine the code would look like this:

```
01   LBL A        30   5            59   RCL 3
02   STO 0        31   3            60   ÷
03   x<>y         32   *            61   INT
04   STO 1        33   2            62   -
05   1            34   +            63   RCL 2
06   0            35   5            64   4
07   0            36   ÷            65   0
08   STO 3        37   INT          66   0
09   LBL B        38   RCL 1        67   ÷
10   RCL 1        39   RCL 3        68   INT
11   INT          40   *            69   +
12   +/-          41   FRAC         70   RCL 1
13   1            42   RCL 3        71   FRAC
14   4            43   x^2          72   RCL 3
15   +            44   *            73   *
16   1            45   RCL 4        74   INT
17   2            46   -            75   +
18   ÷            47   STO 2        76   RCL 0
19   INT          48   3            77   STO 1
20   STO 4        49   6            78   x<>y
21   1            50   5            79   STO 0
22   2            51   *            80   x<>y
23   *            52   +            81   FRAC
24   3            53   RCL 2        82   x>0?
25   -            54   4            83   GTO B
26   RCL 1        55   ÷            84   x<>y
27   INT          56   INT          85   LAST x
28   +            57   +            86   -
29   1            58   RCL 2        87   RTN
```

It would get a score of 119 (87lines + 7*4registers + 2*2labels). I could probably have saved on registers but was worried about program length as I think the 11C has max 99 lines (not sure about this as it dynamically re-allocates memory between registers?).

Closing observations: a = INT[(14-month)/12] gives 1 if month is <=2 and 0 if >2. Perhaps using flags could save some lines.

I am not a great programmer, so the above could probably be optimised. It would be particularly useful to see solutions for the 20S not requiring pre-entering data in some registers.

Bart

Re: Days between dates - another solution

in response to message #1 by Bart (UK)

Hi,

you can simplify your formula a bit more. set m = month + 12*a + 1, then lose the 2/5 in the JD formula.

This is what i did for the original problem, except i also chopped the y/100 and y/400 terms so as to get the wrong answer!

Bart, good work.

The challenge on the other thread noted that the algorithm in the 12c manual does not handle century years correctly, but since Katie and I had already developed 11c programs for that algorithm, we wanted to limit the entries to implementations of that specific algorithm.

Here is a link to another algorithm that does work for all years. Katie found this one and it is relativey easy to implement.

Thanks for your interest. I wonder how many dbd algorithms out there acutally don't handle the century years correctly.

Re: Days between dates - another solution

*Message #4 Posted by **Palmer O. Hanson, Jr.** on 13 Aug 2009, 11:14 p.m.,*
in response to message #1 by Bart (UK)

I noted that the program for days between dates in my HP-12C correctly handles the leap year for years divisible by 100 with one exception -- the year 4000 when the modified Gregorian calendar calls for that year not to be a leap year. The program in ML-20 of the Master Library module for the TI-59 operates in the same way. I compared the equations for days between dates on pages 208-209 of the HP-12C manual with the equations on page 76 of the manual for the TI-59 Master Library module and found that they were the same except that the TI-59 version has an additional term to take care of the years divisible by 100. For March through December the additional term is

INT(.75(INT(YYYY/100)+1))

For January and February the additional term is the same except that YYYY has been decreased by one. You can look at the ML-20 documentation at either Viktor Toth's or Joerg Woerner's site.

I did down-load the ML-20 program, altered it to bypass the last terms and verified that the omission did cause a problem at years divisible by 100 but not divisible by 400.

While looking at all of this I noted that both the HP-12C and TI-59 programs implement error trapping of the input such as not allowing the number of months to be greater than 12, etc. I don't know how much memory is used in the HP-12C for input error trapping. The entire TI-59 program for days between dates is 172 steps where 68 of those steps are used for input error trapping.

Bart wrote "Flame me for being pedantic." Here's an example of really being pedantic. Way back when, some purist discovered that input error trapping in the TI-59 program limits the number of days of any month to 31, but does not limit the days of the months that do not have 31 days to the lesser number. Thus, the TI-59 program will return the number of days between January 1, 1900 and March 3, 1900 as 61 days, but will also return the number of days between January 1, 1900 and February 31, 1900 as 61 days. I suppose someone, but not me, could argue that February 31, 1900 is really the same as March 3, 1900. The HP-12C program will indicate "Error 8" if a user tries to enter a February 31 date.

in response to message #4 by Palmer O. Hanson, Jr.

Hi Palmer. Regarding the year 4000 not being a leap year, apparently that idea was never officially adopted by whomever it is that makes such rules. Reference. It seems that the Earth is slowing down somewhat, which may make that adjustment unnecessary by the time 4000 rolls around. Of course, none of us will be here to have to worry about it.

On the other hand, today's date (August 14) is a VERY special day: it's my birthday!

in response to message #6 by Bart (UK)

Thanks Bart. I wondered, "how did he know 59" and then I remember the dbd example I did in the other thread. The interesting thing about the 12c dbd algorithm in the manual is that it differs from the actual implementation, because the real 12c does handle years like 1900 and 1700 correctly, so it doesn't exactly follow the algorithm in its manual. In fact, the manual (in later versions) has a disclaimer beneath the algorithm: "Additional tests are performed in order to ensure that the century (but not millenium) years are not considered leap years." Unfortunately, the disclaimer is not exactly correct either; some century years are leap years (2400), and some are not (2300), and some millenium years are leap years (2000), and some are not (3000). I guess if I had to choose for either the code to be correct or the documentation, I'd choose the code. I wish HP had documented the actual algorithm they used in the manual, however.

I teach math (and social studies sometimes), and it's always fun to ask the kids why we even have leap years. I bring in a lamp (the Sun), put it in the middle of the room, turn out the lights, and then carry a globe in a circle around the room, rotating it as I go, to illustrate what really happens in the world with the southern and northern hemispheres. And I note the tilt of the Earth on its axis, which is the reason we have seasons and is the practical reason that leap years are necessary (because I want to be surfing in June, not building snowmen!).

*Message #8 Posted by **Palmer O. Hanson, Jr.** on 14 Aug 2009, 9:55 p.m.,*
in response to message #7 by Don Shepherd

Don:

First, I will add my wishes for a happy birthday.

I note that the TI-59 code does provide the desired result where years divisible by 100 are not leap years unless they are also divisible by 400 in which case the years are leap years. I have no idea whether or not the additional terms in the TI-59 implementation are optimized, and I can't recall an effort in the TI community to do so. Since the solution was in a module where memory was essentially not a limitation there would have been no real incentive to reduce keystrokes. Why not extend the challenge that Katie and you issued to include a complete solution for the HP-11C? Can such a solution be more efficient than the one that Bart

proposed?

That's a good idea. I'll start a new thread for that purpose. Bart, you can put a link to your 11c program in this thread in the new thread. Let's see what folks can do with a "correct" algorithm, that handles century years correctly. I may not post something myself, since I tend to use more registers and I don't like to keep a close check on what's in the stack. But we'll use the same rules for evaluation: lines of code + 7*registers + 2*labels.

Bart, I think in the 11c you can actually have up to 203 program lines, but you would have no registers to work with except the index register I!

Yes, the 11c is limited to 203 lines. The 34c can goto 210. In both cases, you'd only have I left as a register. The reason for the difference? Most likely because the 11c has a random number generator which uses a register for its seed.

Re: Days between dates - another solution

*Message #11 Posted by **Bart (UK)** on 14 Aug 2009, 5:53 a.m.,*
in response to message #5 by Don Shepherd

Thank you all for your responses. Definitely some more food for thought - and options to try in programs.

I started this as a new thread because it did not implement the 12C manual's formula, which was the purpose of the previous thread.

In retrospect, that solution is not a problem within the scope of current affairs, i.e. 1 March 1900 to 28 Feb 2100.

However, as I find interest in working out such things on historical events (just for fun), I'd rather use a

more complete formula.

Footnote: I found the American date format actually useful here as the month is easily extracted and used for both "a" & "m".

Fun with the Casio fx-180p / fx-3600p

*Message #1 Posted by **Thomas Radtke** on 13 Aug 2009, 10:25 a.m.*

Recently, I shot a Casio 9850GB+ on a "different" aucion site for cheap. After playing with it for some _minutes_, I decided to put it up on eBay and asked myself, when was the last time I've been amazed by a Casio calculator. Well, it probably was when the fx-180p came out. Since then I wrote a lot of programs for it.

Today, I pulled a 3600p (one brother of the 180p) out of my drawer and found it still kept a program in memory that does something interesting. Took me quite some time to find the flow chart to this program. My question is, how would you solve the following problem on either the 180p or the 3600p (probably the programming model on the rare 190p is the same, so you can use it, too):

For any x >= 0, find the smallest y >= x that is the square of an integer.

E.g., for 0, the calculator should return 0. For 5, it should find 9

You likely have to use both P1 and P2.

Hope some of you are owning one of these wonderfull calculators and enjoy programming as mch as I do!

*Message #2 Posted by **Chuck** on 13 Aug 2009, 1:52 p.m.,*
in response to message #1 by Thomas Radtke

Unfortunately I don't have one of those calculators, but I did get an FX-9860G slim yesterday; first casio I've ever had. On this, I created the function Y1=(Intg(-sqrt(x))^2. The "Intg" is the greatest integer function, and so should work on any calculator that has this function. Just not sure how to impliment it on the aforementioned calculators. :(

*Message #3 Posted by **Thomas Radtke** on 13 Aug 2009, 2:50 p.m.,*
in response to message #2 by Chuck

Thank you for your interesting answer, Chuck! It's a nice idea to use the floor function on a negative number. Unfortunately, the old Casios don't have any of those integer functions, so a loop has to be considered. The problem is to keep it inside the 38 steps limit of these calculators. In addition, they offer very limited branching capabilities. And of course, you're typing in programs blindly.

A solution in 9 steps on the FX-3900Pv with the same programming model but with an editor and 300 steps in four areas:

```
P1: Min 1 +/- M+ +
P2: 1 + x^2 x<=M
```

I have a 180p Plus, which must be a close relative to your 3900Pv. Unfortunately, none of these "late successors" seem to be able to handle fractions.

> Quote:
>
> ```
> P1: Min 1 +/- M+ +
> P2: 1 + x^2 x<=M
> ```

Much shorter than my program, thank you, Xerxes!

But there's a way to calculate it faster. For x = 1000001, my solution appears within a second, while your program takes about 30 seconds on the 180p Plus.

Any other solutions? :-)

Re: Fun with the Casio fx-180p / fx-3600p

*Message #6 Posted by **Xerxes** on 14 Aug 2009, 1:34 p.m.,*
in response to message #5 by Thomas Radtke

An even shorter version with 8 steps:

```
P1: Min 1 M- -
P2: 1 + x^2 x<=M
```

or 7 steps only, if x=0 is excluded:

```
P1: Min 1 M-
P2: 1 + x^2 x<=M
```

and a very fast solution with 14 steps excluding x=0:

```
P1: Kin1 Min 1 M- Kout1 SQR FIX0 RND NORM -
P2: 1 + x^2 x<=M
```

Re: Fun with the Casio fx-180p / fx-3600p

Excellent :-)

This is my solution, not optimized in any way but fast and includes 0:

```
P1: kin1 sqrt - .5 = kin2 fix0

P2: kout2 + .5 = kin2
    kout1 - kout2 rnd x^2 = x>0
    kout2 rnd x^2 nrm
```

Due to the lack of the K vars, only the short solutions are usable on the FX-190/191.

The FX-180P was my first programmable bought in 1980, so thank you for the fun with the powerful keystroke dialect of this calculator. ;-)

It was also my first programmable :-). Thanks for participating!

Kepler Orbits for the 42S

*Message #1 Posted by **Les Wright** on 13 Aug 2009, 2:34 a.m.*

Even though I know this won't advance the space program, I thought I would share this little routine I have put together that really seems to make excellent use of the 42S/Free42:

```
00 { 152-Byte Prgm }
01>LBL "KEPORB"
02 MVAR "PER"
03 MVAR "ECC"
04 MVAR "PH"
05 MVAR "T"
06 VARMENU "KEPORB"
07 RAD
08 STOP
09 EXITALL
10 PI
11 RCL× "T"
12 RCL÷ "PER"
13 STO+ ST X
14 STO "MA"
15 PGMSLV "KEPEQ"
16 STO "EA"
17 SOLVE "EA"
18 0.5
19 RCL× "EA"
20 TAN
21 1
22 RCL+ "ECC"
23 1
24 RCL- "ECC"
25 ÷
26 SQRT
27 ×
28 ATAN
29 STO+ ST X
30 ENTER
31 ->DEG
32 X<>Y
33 COS
34 RCL× "ECC"
35 1
36 +
37 1
38 RCL+ "ECC"
39 X<>Y
40 ÷
41 RCL× "PH"
42 RTN
43>LBL "KEPEQ"
44 RCL "MA"
45 RCL- "EA"
46 RCL "EA"
47 SIN
48 RCL× "ECC"
49 +
50 .END.
```

The routine returns the heliocentric polar coordinates of a planet's orbit given the orbital PERiod, ECCentricity, and PeriHelion (i.e, nearest to the Sun) distance at a given time T (with the understanding the T=0 is at perihelion). The program returns the distance from the sun in the X register and the angle of rotation in degrees (with the understand that the angle is zero at perihelion) in the Y register.

To use XEQ KEPORB, enter the orbital parameters for your planet (easily found all over the place--I use Wikipedia) into the menu variables PER, ECC, and PH, enter the desired T into that menu variable, hit R/S, and the result is returned as described.

Units obviously must be consistent. If the PERiod entered is in days, the T entered should also be in days. The distance returned will be in the same units as that of PeriHelion distance provided.
