*Message #1 Posted by **Michael de Estrada** on 10 Apr 2009, 11:41 p.m.*

Has anyone encountered or used the pental (base 5) number system? I came across it by chance when I was playing around with my grandson's Sharp EL-531W scientific algebraic calculator, which we had just bought for him at the supermarket for $12.99, so it's pretty much a low end calculator similar to the HP SmartCalc 300s. I am familiar with binary, octal and hexadecimal numbers for use in programming and computer applications, but I have never before seen the use of pental numbers (e. g. 6 decimal = 11 pental). So, at the risk of appearing grossly ignorant, what would be the application for such a number system? I've never seen it on any of my HP calcs; even the mighty HP-50g lacks it.

Please help me before I lose face with my grandson, who thinks I am the eternal fountain of knowledge.

Michael

in response to message #2 by Sancerre (Phoenix)

OK, so I see it has been discussed before, but no explanation as to its practical use. Perhaps it has some mystical or religious meaning as in a pentagram? Or maybe some insane programmer at Sharp just put it on their calculators to scare away evil spirits.

I'm going to guess it is something to do with the abacus.

Here's another Sharp pental calculator :-)

Egan,

Your photo of the hybrid calculator is awesome! At first I thought maybe you were pulling my leg, however, after doing some research I find that it is legitimate. Soroban

> Quote:
>
> I'm going to guess it is something to do with the abacus.

Or more specifically, the Japanese version of the abacus. It makes sense that since Sharp is a Japanese company and that early Sharp calculators were manufactured in Japan, then they would incorporate the Japanese abacus into their calculators. I have seen old Japanese storekeepers still using the Japanese abacus, as I have seen Chinese using the Chinese abacus. Perhaps Sharp incorporated the pental number system into some of their more recent calculators to teach Japanese schoolchildren about the Japanese abacus.

Thanks for your contribution,

Michael

in response to message #1 by Michael de Estrada

Some math textbooks for middle school kids have used base 5 to teach kids about other number bases, so they can better understand and appreciate our base 10 system. But I have never seen any teacher spend any time on this at all. Since base 10 is, supposedly, based on our 10 fingers, base 5 would represent one hands-worth, I guess. It has no practical value.

I don't know any machine using the pental number system, but I know one exemple of a ternary (base 3) computer:

Setun computer

J-F

Re: OT: Pental number system?

*Message #9 Posted by **hugh steers** on 11 Apr 2009, 12:24 p.m.,*
in response to message #8 by J-F Garnier

ternary was apparently quite popular. There's some trick you can do with -1, 0, 1 being your system.

but pental?

aren't roman numerals a bit pental. They appear to be based around changing the symbol at units of 5.

maybe.

Re: OT: Pental number system?

*Message #10 Posted by **Nigel Bamber** on 11 Apr 2009, 1:20 p.m.,*
in response to message #9 by hugh steers

I think the correct word for a number system based on five is quinary.

Here is an interesting link :

The Quinary System

But as to why the calculator has it in these modern times, I have no idea ?

OT: Vintage Calculator

*Message #1 Posted by **SteveH** on 10 Apr 2009, 4:08 p.m.*

Not much to do with HP calculators so I hope I'm permitted a bit of latitude on this one. I thought these pictures might be of interest to HP users too. The originals are all on Flickr from here

Tonight I powered up my first calculator again for the first time in years. It's a Sinclair Cambridge, powered by AAA batteries, with glorious red LEDs and taking about 2 seconds to calculate a cosine!

Re: OT: Vintage Calculator

*Message #2 Posted by **Michael de Estrada** on 10 Apr 2009, 4:58 p.m.,*
in response to message #1 by SteveH

Hello Steve,

I have the Sinclair Scientific (w/o the "Cambridge"). It is very similar, except that it is RPN and scientific notation only. Yours is lightning fast when compared to mine, which takes 4 seconds to compute the cosine!

Regards,

Michael

Cousin to my Radio Shack (mine is the pregnant version with a 9-volt). I sill have the one inch thick application program manual. Amazing what you could program using 30 steps. Also, amazing how inaccurate it was.

Radio Shack 4001

CHUCK

Re: OT: Vintage Calculator

*Message #4 Posted by **Michael de Estrada** on 10 Apr 2009, 5:57 p.m.,*
in response to message #3 by Chuck

To say it was inaccurate is an understatement! With only 5 significant digits, mine can't even get past the second trig calculation before losing all digits in the calculator forensics test. Furthermore, it does not do any error checking for illegal operations, such as LN <=0 or ARCCOS >1 or <-1. So you can end up with a numerical result, and never realize that an error has occured.

Sinclair Scientific RPN

Re: OT: Vintage Calculator

*Message #8 Posted by **hugh steers** on 11 Apr 2009, 12:17 p.m.,*
in response to message #4 by Michael de Estrada

The sinclair did not do any range reduction or checking. If you give it sensible input, it will not take ages, but the accuracy still wasn't 5 digits.

These calculators were quite cheap and were more accurate than a (normal) slide rule.

out of interest, the cambridge programmable had an undocumented feature whereby you could interrupt program execution by pressing divide. R/S would then continue.

I remember developing many fun games using this feature:

eg. whack-a-mole reaction-timer dice stopwatch

it's a pity there was not a fifth "games" library.

:-)

I LOVED that Radio Shack version! It was so cool to have a tiny little programmable. No matter that it didn't calculate things right, had precision problems, and would sometimes get caught in an endless loop -- it was still mondo cool for the day.

Sadly, I found mine about 10 years ago and it was not salvageable.

Fond memories though.

thanks, bruce

*Message #10 Posted by **Dave Britten** on 10 Apr 2009, 11:23 p.m.,*
in response to message #1 by SteveH

Very nice. The Sinclairs have a pretty cool form factor, if you can ignore the lack of precision. I've got the Sinclair Cambridge Programmable, which I used for some chemistry exams in high school, around 1998 or so. We weren't allowed to use a "programmable calculator" (read: TI grapher), so I brought in the Sinclair for shock value. They would have never expected such a tiny relic to be "programmable"! Not that you could write programs sophisticated enough to do any significant cheating anyway. ;)

I've still got mine kicking around, and I just put a fresh 9V in it recently to confirm it's still in working order. There's a bit of info about it here: http://www.rskey.org/detail.asp?manufacturer=Sinclair&model=Cambridge+Programmable

I remember aspiring to the programmable model but it was so far beyond my (parents) reach.

The other model that was around at the time was the Sovereign which was available in a variety of finishes, including gold, to celebrate the Queen's silver jubilee back in the 70s. Even then I knew that this model was for *executives* rather than engineers.

Re: OT: Vintage Calculator

*Message #12 Posted by **ncrook(UK)** on 11 Apr 2009, 5:07 p.m.,*
in response to message #11 by SteveH

The Cambridge Scientific was my first calculator. I remember the woman in the shop trying to

demonstrate it to me, but giving up because her long fingernails prevented her from pressing the keys. Later on, I swapped it with my Sister for her cassette player, which I needed as a mass storage device for my NASCOM 2.. and she threw the Cambridge away (sob).

I read that Clive Sinclair invented the LED display with built-in magnifiers. I also read that the reason for adopting RPN on some models was that he and another engineer were holed-up in a hotel room in Texas re-writing the code for the processor chip. They managed to implement a scientific calculator in the (internal) ROM space that everyone else needed for a typical 4-function machine of the day. The "sacrifice" was to use RPN instead of algebraic notation.

I was pretty happy with my Cambridge Scientific, as an alternative to 4-figure tables at school. Then my friends started appearing with nice Casio machines that had green elecro-fluorescent displays and which could:

- handle trig on angles greater than 90 degrees

- accept fractional input, and give fractional output

- accept angles in degrees/minutes/seconds

- accept key-presses without the occasional bounce

boo hoo. I did toy with another Sinclair; the Enterprise Programmable (key design faults: total absence of non-volatile storage, extremely high power consumption and therefore low battery life). I eventually migrated to Casio FX-501P which served me through school and university and is still going strong today.

thanks for the memories.

Neal.

in response to message #12 by ncrook(UK)

Small red led displays with built-in magnifiers are used in the HP35 and its siblings (80, 45...); such displays were featured in HP optoelectronics leaflets and "Measurement & Instrumentation News" in 1973 (I'm recalling this from memory, excuse some lack of precision). While I admired many Sinclair products, from that tricycle car to the nice calculators to the ZX80 personal computer, I doubt such displays were his invention. But... maybe...

I bought a Sinclair ZX81 in 1971 as my first computer. As I recall it came with 1 Kb of RAM, which could be expanded to 2 Kb with an external plug-in module. It cost 250 USD, which would be over 1000 USD today. It had a horrible membrane keyboard that was almost impossible to use without missing or repeating. Attempts to save and load BASIC programs using an audio cassette tape were very unreliable. I used a black & white TV as the monitor.

Michael

Re: OT: Vintage Calculator

*Message #16 Posted by **Andrés C. Rodríguez (Argentina)** on 11 Apr 2009, 11:08 p.m.,*
in response to message #15 by Michael de Estrada

The Sinclair ZX80 or 81 does not match some of your description. It cannot possibly be from 1971, as the microprocessor was yet to be invented. While its keyboard was rather basic, it was useable, and BASIC functions were associated with each key, relieving from spelling each keyword. I bought one in 1984, in the order of U$S 30-40, IIRC. I think it came with a RAM memory expansion (perhaps 16 KBy, not sure) and it was built with a very low chip count, apart of the Z80 processor. For many people here in Argentina, it was an affordable way to approach programming, as a PC costed here U$S 7000 at the time (and a professional salary was below U$S 800 per month). I have fond memories of it, but I concur it was limited.

in response to message #16 by Andrés C. Rodríguez (Argentina)

It's usually best to add ten years to dates given by Michael. :-)

The ZX80 was indeed an early 1980's machine. I've still got one somewhere around here, purchased at a K-Mart after prices started dropping when much better alternatives appeared.

Someone actually bothered to write a version of VisiCalc for it!

Re: OT: Vintage Calculator

*Message #18 Posted by **Michael de Estrada** on 12 Apr 2009, 12:29 a.m.,*
in response to message #16 by Andrés C. Rodríguez (Argentina)

Andres,

The date is a typo. It was 1981, specifically October 13, 1981. The following year, the Kaypro II suitcase computer with 64 Kb and 2 5.25" floppy disk drives, that also used the Zilog Z80 CPU, came out, but I could not afford its $1595 price. I waited until 1984 when I bought a Sanyo MBC 555 PC clone with 256 Kb and 2 5.25" FDDs, and it used the NEC V20 CPU that was a functional copy of the Intel 8088 CPU used in the first IBM PC. At that point I sold the Sinclair ZX81 along with the B&W TV and audio casettes to a friend who wanted to practice Basic programming. I certainly can't criticize the Sinclair for affordability, and maybe the one you bought had a better keyboard so

you have a more favorable memory of it.

35s next to a Pioneer?

*Message #1 Posted by **Dave Britten** on 10 Apr 2009, 11:18 a.m.*

Anybody got a few photos of a 35s next to a Pioneer? (Any model.) I'm just curious how they compare in terms of size. A side shot to gauge thickness would be helpful too.

Re: 35s next to a Pioneer?

*Message #2 Posted by **Michael de Estrada** on 10 Apr 2009, 11:39 a.m.,*
in response to message #1 by Dave Britten

Dave,

I don't have a photo, however, comparing my HP-32SII with my HP-35s, the HP-35s is approximately 3/8" taller (longer), about the same width at the ends (it bows out about 1/8" at the middle), and its thickness varies from maybe 1/8" thicker at the bottom including key button height to 1/4" thicker at the top (display end). So, overall, the HP 35s is larger. It is also heavier at 141 gm, vs. 118 gm for the HP 32SII. I'll tell you one thing for sure, the Pioneers fit a lot easier in a shirt pocket or small hand like mine than the HP-35s.

Michael

Please look here.

Re: 35s next to a Pioneer?

*Message #5 Posted by **Jeff Kearns** on 10 Apr 2009, 2:56 p.m.,*
in response to message #4 by Walter B

There are other high res. pictures out there showing a 15C, 32sii, 33s, and a 35s together but I can't recall whose site it is on... The 35s is a big enough machine alright, and substantially bigger with the case. It hardly fits in a suit jacket pocket with the case. I carry it mainly during the fall to spring period in a coat pocket. Otherwise, it goes in the carry bag, if at all. The Pioneer series is an ideal size (although the Voyager footprint is even better) for a jacket pocket.

Up until I saw the obove photo, I wasn't aware that that the 27s had a built-in TVM function. I wish my 32sii had a TVM function also in order to free up some memory.

Jeff

Does anyone own a HP-45 Version 1?

*Message #1 Posted by **Michael de Estrada** on 9 Apr 2009, 8:09 p.m.*

There are presumably 4 versions of the HP-45, similar to the HP-80. The first two versions have a stainless steel strip that runs horizontally just below the display and above the OFF/ON switch, instead of the silver painted strip used on later versions. The only difference between version 1 and version 2 is that the front label on version 1 only has "Hewlett Packard" on it whereas version 2 has "Hewlett Packard 45" Now, I know this is true for the HP-80, because I own both versions, however, I have never found a version 1 of the HP-45, just the version 2, which has a very early serial number 1301A06579, and makes me wonder if such a thing as an HP-45 version 1 even exists. The HP-80 came out before the HP-45, within a year of the HP-35, so it makes sense that there would be an HP-80 version 1 with the generic front label.

So, I ask the question of all you hardcore collectors, do any of you own an HP-45 version 1, or is its existence just fiction?

Michael

Edited: 9 Apr 2009, 8:11 p.m.

Re: Does anyone own a HP-45 Version 1?

*Message #2 Posted by **Etienne Victoria** on 10 Apr 2009, 12:39 a.m.,*
in response to message #1 by Michael de Estrada

Yes such an HP-45 version 1 does exists.

I had one and sold it a few months ago. I prefer the Hp-80 "Version 1" :-)

It has a front label saying only "Hewlett Packard" AND a metal bar under the display instead of the the usual paint that wears off.

Etienne

Clearing the menu line

*Message #1 Posted by **Lawrence Hare** on 9 Apr 2009, 11:54 a.m.*

I have a 42S I use almost daily. I have long since lost the manual but most of what I remember is enough - except one thing that irritates me all the time. If I have a menu on the bottom of my two line display, how can I get back to the two line data display? In other words, how do I get rid of the menu without using anything on it? The only way I seem to know is to go to Clear and do a ClearAll of memory. But there must be an easier way to simply clear the menu display without doing anything with it.

Thanks - Lawrence

Re: Clearing the menu line

*Message #2 Posted by **Ken Shaw** on 9 Apr 2009, 12:54 p.m.,*
in response to message #1 by Lawrence Hare

I don't have a 42S in front of me, but I think the EXIT key clears the menu line.

Re: Clearing the menu line

*Message #3 Posted by **Thomas Okken** on 9 Apr 2009, 11:07 p.m.,*
in response to message #2 by Ken Shaw

> Quote:
>
> I don't have a 42S in front of me, but I think the EXIT key clears the menu line.

That is correct, but it's not the whole story. The HP-42S menu system has several levels, and EXIT only takes you out of the current level, up to whatever menu level was active before. There is no key that takes you out of all menus all at once.
An extreme example is this: from having no active menu, press STAT, CFIT, MODL, PGM.FCN, [down], X?0, STO, [.], IND, ENTER, ABCDE.
From the state the calculator is in by then, you have to press EXIT seven times to get rid of all the menus. There may be ways to get to states where you need to press EXIT even more times to get out of all menus, but I can't remember them offhand... Fellow HP-42S enthusiasts, please chime in!

Long story short: the HP-42S does not have a key that gets rid of all active menus all at once. The EXITALL function comes close but it's not on the keyboard.
Just press EXIT until the menus are gone. You'll hardly ever have to press it more than 2 or 3 times.
Enjoy the HP-42S menu system; it's one of the best there is. :-)

- Thomas

Hi, Thomas --

EXITALL is indeed the best solution for these situations. That's why I assign it to the first level of my CUSTOM menu.

Other assignments of useful or repeatedly-used functions that are not accessible by a single keystroke:

CLV, %CH, R_up, VIEW

Second level of the CUSTOM menu: The six hyperbolic functions...

> CLV ? Isn't it 2 keystrokes away in both cases?

Actually, *three* including shift, for a single execution. The point here is "repeatedly-used": If the user is housecleaning to purge multiple unused variables, the CUSTOM menu persists to allow single-key access to clear the next variable.

in response to message #1 by Lawrence Hare

> Quote:
>
> I don't have a 42S in front of me, but I think the EXIT key clears the menu line.

Indeed; that's why the lower-left button is labeled "EXIT", instead of "C" (for Clear) as on other Pioneer-series models.

Start EMU48 instead of calc.exe in XP - possible?

*Message #1 Posted by **George Bailey (Bedford Falls)** on 9 Apr 2009, 7:21 a.m.*

Is it possible to start EMU48 instead of calc.exe on a Windows machine? I know I can just double-click on EMU48 to start it ;-) but this is not what I mean. I want to be able to start EMU48 from a dedicated calculator button on my keyboard.

Edited: 9 Apr 2009, 7:21 a.m.

Re: Start EMU48 instead of calc.exe in XP - possible?

*Message #2 Posted by **Marcus von Cube, Germany** on 9 Apr 2009, 7:37 a.m.,*
in response to message #1 by George Bailey (Bedford Falls)

You need to know what this button exactly does. If it goes to the desktop and opens a program object (link) you can simply modify this link to point to EMU48. Did you install a custom driver for your keyboard?

Re: Start EMU48 instead of calc.exe in XP - possible?

*Message #3 Posted by **George Bailey (Bedford Falls)** on 9 Apr 2009, 11:39 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Unfortunately, there was no custom driver installed for the keyboard. And I have no way to configure the keys. It seems as if the dedicated calc-key only starts the Windows calc.exe. Other keys will start my favorite Firefox browser or my Thunderbird email, which I defined as standard applications. I'm looking for a way to define another calculator program as the XP standard calculator...

Renaming calc.exe is not possible, it is always replaced with the original calc.exe. At least I have found no way to change this.

Re: Start EMU48 instead of calc.exe in XP - possible?

*Message #4 Posted by **Ken Shaw** on 9 Apr 2009, 12:18 p.m.,*
in response to message #3 by George Bailey (Bedford Falls)

I think it could help if you specified the model of your keyboard, as somebody might be familiar with it.

It's unusual for an "internet keyboard" not to have a special driver, which usually would allow customizing the extra keys.

Re: Start EMU48 instead of calc.exe in XP - possible?

*Message #5 Posted by **George Bailey (Bedford Falls)** on 9 Apr 2009, 12:54 p.m.,*
in response to message #4 by Ken Shaw

Thanks everybody for helping and sharing your ideas. It turns out that there was no special driver

application in the box but one was downloadable from the manufacturer's well hidden website. Now I can configure most of the keys to my heart's content.

You can likely just rename EMU48 as calc.exe and put it into the windows directory. Move the old calc.exe somewhere else or delete it. Support files will need moving too. Unless there is something strict with paths in the installtion it should work. But most keyboard drivers can be programmed to change what the macro keys point to.

Dave.

> Support files will need moving too.

Sorry, that's wrong. The Emu48 install path must point to the directory with the support files (KML, bitmaps, ROM images, ...), the Emu48.exe file itself can be located everywhere.

Christoph

in response to message #1 by George Bailey (Bedford Falls)

I use Free42 on my desktop, and get to it very quickly (with my generic keyboard) by having defined <ctrl> <alt> <C> as the shortcut key combination for the program. Having to press three keys simultaneously, rather than just one, is only very slightly more trouble. Obviously something similar could be done with EMU48.

Dave.

Re: Wow

*Message #5 Posted by **Dan Grelinger** on 8 Apr 2009, 6:22 p.m.,*
in response to message #1 by Michael

That auction is not even close to being over. I don't read German (even with a last name of Grelinger), but it appears there are almost 3 days left to go.

And, the high bidder placed two more bids after winning high bid, who knows how much more he is willing to go.

What all is in this calculator. Obviously two 82181As, and it is accelerated (nice switch on the side). Does it have an

MLDL built in? With 64K of quasi-ROM memory?

That would be quite a treat to own one of those.

Dan

in response to message #5 by Dan Grelinger

In case you don't know, the W&W HP-41CY is _the_ ultimative HP-41,
with built-in 64K RAM box, consisting of two 32K pages and switchable via software.
And yes, this is an HP-41 calculator with 2x 32K MLDL RAM pages built-in.

It also features a turbo/speedup switch, which lets the unit run at 1.7x (approx).

According to the article description, the additional X-Mem and the CCD are not built-in, but given as separate modules.

The CY has been discussed now and then here in the hpmuseum. Please check the archives for more info.

HTH

And no, I don't know the seller.

Manuals:

HP-41 CX User Manual, Volume I HP-41 CX User Manual Volume II HP User's Program Library Europe (multilingual) HP-41CX Quick Reference Guide HP 82181 Extended Memory Modules Multilingual Instructions HP CY-41 Turbo, RAMBOX II manual for the famous HP41 by W & W

Status:

The calculator is fully functional and has a few scratches on. The batteries are ok, time and date function. The built Rambox can check without errors, Pages can be initialized, stored Programs can be retrieved. The turbo mode is ok.

The keys have a smooth pressure point, the display is clean (no dust) and not scratched. The rubber feet have small traces of wear and tear. The battery compartment and contacts are in a clean, very good condition. There are all covers (4 slots, power supply) is available. There are small scratches on the side bar to see (via the turbo button above the battery compartment).

Answer questions about the offer I like. Better do I send pictures on request. A site visit (ZIP 28857) is required.

Prepayment, only shipping insurance. The shipping costs (6.90 EUR) is paid by the buyer. Since it is a private auction, no warranty is excluded.

Reclaimed HP41CV calculator - picture

*Message #1 Posted by **Nigel Bamber** on 8 Apr 2009, 4:38 a.m.*

For those of you who were interested enough to comment on this earlier, attached are two images of the 'reclaimed' calculator, which seems to me to be in good shape (apart from the battery/module problem) and for $42 to be worthwhile buying. So I will be !

It seems to be quite a neat solution.

Thanks for all your help

Nigel

Thanks Marcus. I did wonder why the links didn't quite work, have changed both in the first post and they appear to work.

Nigel

Re: Reclaimed HP41CV calculator - picture

*Message #4 Posted by **Raymond Del Tondo** on 8 Apr 2009, 6:49 a.m.,*
in response to message #3 by Nigel Bamber

After some trials, I was able to see the 2nd pic, which shows the back side.
No luck with the proposed 1st pic so far.

Tip: Please avoid using spaces in file names.

From the serial numnber it's a halfnut (rounded display window corners).

The external battery pack solution looks adventuruous. Are the pack and cable detachable from the calc,
or is it soldered to the battery holder, or worse soldered to the battery contact foil ?

Re: Reclaimed HP41CV calculator - picture

*Message #5 Posted by **Nigel Bamber** on 8 Apr 2009, 7:53 a.m.,*
in response to message #4 by Raymond Del Tondo

As I understand it, the corrosion affected the 'cable' linking the batteries and module to the main PCB and the seller has got round this.

This is the comment from the seller "The electrolyte "wicks" up the flexible PCB and corrodes the internal PCB's distroying the unit. On some, only the first flexible PCB is affected. I remove this, clean up any residue and fit a usb power lead You can then power it from your PC or monitor. Alternatively I can supply a "wall-wart" for mans operation or an external battery box that takes 4xAA cells".

I intend to go for the latter.

I suspect the cable is soldered but not sure to which part. Why is it worse being soldered to the battery foil?

Front again

Nigel

PS links should work, but you may need some patience. I used some free web server to host the pics and their webserver may not like it if you look at both pictures at the same time or perhaps other people are trying to download the same image ?

HP-41 a M-Code question

*Message #1 Posted by **JMBaillard** on 7 Apr 2009, 7:14 a.m.*

```
Good morning,

does anyone know if it is possible to create
one or several extra register(s) in the ROM of an HP-41
and instructions like STO U RCL U  STO V RCL V  ... ?

Many thanks in advance.
JMB.
```

Re: HP-41 a M-Code question

*Message #2 Posted by **Dan Grelinger** on 7 Apr 2009, 9:53 a.m.,*
in response to message #1 by JMBaillard

JMB,

Your question is a little confusing. You may be confusing synthetic techniques with micro-code capabilities.

Extra registers, accessible through normal HP-41 programs (using functions such as STO and RCL) are available through synthetics, and are limited. Depending on what else is going on in the calculator at the time from 1 to maybe 5 or 6 are available.

The standard ROM of the HP-41 is truly "Read Only Memory" which means that nothing can be written to it, or changed. It is hard coded during manufacture to always be the intended value.

There is such as thing as quasi-ROM (which is special 3rd party hardware) that the HP thinks is ROM, but can be changed using special micro-code functions, again supplied by a third party. But, STO and RCL don't work with such memory, only the special 3rd party functions do.

Dan

Re: HP-41 a M-Code question

*Message #3 Posted by **PeterP** on 7 Apr 2009, 10:09 a.m.,*
in response to message #2 by Dan Grelinger

JMB,

to expand on Dan's excellent comments - the ability to store data-registers is made available by devices such as the W&W rambox, the Profiset as well as the NoV (and Clonix). In general they are called MLDL devices (Machine Language Development Laboratory IIRC) and they provide what is commonly called QROM (Quasi-ROM) as it actually is RAM.

The above mentioned operating systems provide functions to treat this Q-ROM pretty much the same way as you use X-Memory and allow storage of data-registers, ASCII files and Program files.

If you want specific STO V, STO W functions for convenience, it would be quite easy to implement in MCODE. However, you would never be able to say burn an EPROM with that code as you need the Q-ROM functionality. But you could burn it into a NoV for example. There is a configuration of the Clonix where you have 512 words of Q-Rom available which would be enough to generate a whole alphabet soup of extra registers.

The underlying MCODE function that is uses is WROM (040h) which writes the content of a portion of the C-register to a specific QROM location. Care has to be taken to make sure your MCODE is not portdependent as the user could plug in the Q-ROM in any port. But for simple STO V and RCL V functions, this is quite easy.

HTH

Cheers

Peter

Re: HP-41 a M-Code question

*Message #4 Posted by **JMBaillard** on 7 Apr 2009, 5:39 p.m.,*
in response to message #3 by PeterP

```
Thank you for your responses.

I precisely would like to create a M-code function
( STO U for instance ) that takes the content of register X
and store it in a part of a (quasi) ROM.

I have a HEPAX module that does have the 040 WROM instruction.
However, I don't see what could be the sequence of words to perform that!

Regards,
JMB.
```

Re: HP-41 a M-Code question

*Message #5 Posted by **Dan Grelinger** on 7 Apr 2009, 8:49 p.m.,*
in response to message #4 by JMBaillard

There are two different ways you could put this together. The simpler way is to create "STO U" and "RCL U" m-code functions that move the X register to/from a quasi-ROM register that is reserved for that storage. You would have to create two functions for every register (U, S, T, U, etc.) that you would like to use, and the normal -41 STO, RCL, and X<> functions would not be able to access those registers.

The more complex way would be to reproduce the register sto-rcl-exchange functions in ROM, and grab control from the HP-41 system ROM through the use of an polling vector; I believe the CCD module does this, and could be considered a reference. I'm not the expert on m-code programming; I've read some, but never tried it.

Dan

Re: HP-41 a M-Code question

*Message #6 Posted by **PeterP** on 7 Apr 2009, 10:22 p.m.,*
in response to message #5 by Dan Grelinger

Not surprisingly, fully agree with Dan's excellent explanation (and don't be fooled when he says 'I'm not an expert', he is very good at these things!)

Given that e.g. RCL M and STO M are 2 bytes anyway, I don't think there is any pressing reason to try to go the hard way via the polling points. Below is a simple, non-optimized MCODE for a STO function that should get you going. For the RCL function, use the same principle but use CXISA which reads from QRAM. You can find explanations about WROM and CXISA for example here (SDK41 Manual) (BTW - the SDK41 kit is a fantastic MCODE development environment that I highly recommend...)

Basically you reserve a fixed space in your QROM for each register. The version below does this in a very inefficient way - storing only 2 bytes per QROM word and hence using 7 words per register. You can adopt this for your needs if for example you only want to store normalized numbers you can compress the storage. Each word in QROM can only carry values from 000h - 3ffh so you might need dec->hex conversions.

Please be aware the code below is written for simplicity, not tested (so most likely it will have typos and bugs) and not optimized in any way. Nevertheless, I hope it helps.

Cheers

Peter

```
;*****************************************

Re: HP-41 a M-Code question

*Message #7 Posted by **JMBaillard** on 8 Apr 2009, 4:54 p.m.,*

in response to message #6 by PeterP

Hi, Dan and Peter.

Thank you very much for your detailed explanations.
After reading them, I've written the following routines
to store (and recall) X-register at the 7 addresses
FD4A FD4B FD4C FD4D FD4E FD4F FD50

```
FD51  097  "W"              "STOW"  ( I should have inserted a space )
FD52  00F  "O"
FD53  014  "T"
FD54  013  "S"
FD55  0F8  READ 3(X)
FD56  0EE  C<>B ALL
FD57  130  LDI S&X
FD58  006  006
FD59  106  A=C S&X
FD5A  15C  PT=6
FD5B  3D0  LD@PT- F
FD5C  350  LD@PT- D
FD5D  110  LD@PT- 4
FD5E  290  LD@PT- A
FD5F  0C6  C=B S&X          loop
FD60  042  C=0 @PT
FD61  040  WRIT S&X
FD62  3AE  RSHFB ALL
FD63  3AE  RSHFB ALL
FD64  23A  C=C+1 M
FD65  1A6  A=A-1 S&X
FD66  3CB  JNC -07
FD67  3E0  RTN

FD68  097  "W"              "RCLW"
FD69  00C  "L"
FD6A  003  "C"
FD6B  012  "R"
FD6C  130  LDI S&X
FD6D  006  006
FD6E  106  A=C S&X
FD6F  15C  PT=6
FD70  3D0  LD@PT- F
FD71  350  LD@PT- D
FD72  110  LD@PT- 4
FD73  290  LD@PT- A
FD74  31C  PT=1
FD75  330  FETCH S&X        loop
FD76  0EA  C<>B PT<-
FD77  0EE  C<>B ALL
FD78  23C  RCR 2
FD79  0EE  C<>B ALL
FD7A  23A  C=C+1 M
FD7B  1A6  A=A-1 S&X
FD7C  3CB  JNC -07
FD7D  0EE  C<>B ALL
FD7E  0E8  WRIT 3(X)
FD7F  3E0  RTN
```

"RCLW" simply overwrites X-register
So, it would be better to replace the last 2 words by

```
FD7E  028  WRIT 0(T)
FD7F  3B5  ?NCGO  goto
FD80  052  14ED   roll up
```

I have some experience in writing maths functions in M-Code,
but I still have many things to learn on handling memory instructions.

Many thanks again,
Best regards,
Jean-Marc.

Re: HP-41 a M-Code question

*Message #8 Posted by **PeterP** on 8 Apr 2009, 10:26 p.m.,*
in response to message #7 by JMBaillard

Love the writ 0, rollup trick! Very cool. One thought: your code currently only works if you have a mldl rom plugged into port 4 and mapped to the f page. I never trust myself to remember such things so I try to make my code port independent, but that's just my preference.

What math functions have you written?

Cheers

Peter

Re: HP-41 a M-Code question

*Message #9 Posted by **JMBaillard** on 9 Apr 2009, 6:10 p.m.,*
in response to message #8 by PeterP

```
Hi,

I've written many maths functions in focal programs
and many of them are in the HP-41C library.

A few years ago, I began to study M-Code
and among the routines I wrote, there are for instance:

-Hyperbolic functions and their inverses ( of course )
-FLOOR , X+1 , X-1 , XROOT , Y^X that returns 0^0 = 1
-CBRT ( cube root that returns an integer if the argument is
 the cube of an integer )
-Gamma function
-Hypergeometric functions
-Kampé de Fériet functions ( hypergeometric functions of 2 variables
)
-DOT & CROSS products, norm of a 3-D vector.
-Product, quotient, square, square-root, inverse of complex numbers.
-Carlson elliptic integrals
-A test that I've named X#Y?? that skips the following line
 if X is approximately equal to Y
 ( to avoid infinite loops when using Newton's method for example )
-Linear regression & linear estimate
-Discrete Hartley Transform

Most of these have been sent to the MoHPC and they probably appear
in the museum at the next update.
I've sent 69 new or updated pages to Dave since 2007
but I don't know when he makes the next update.
These programs are not all written in M-Code, but several however.
Some of them are also for the HP-48.

-By the way, what functions do you have in your own ROM ?

 In my HP-41, there are ( currently ) - all in block F

-5 focal programs  "EE"  equatorial-ecliptic conversion
                   "KPL" to solve Kepler's equation
                   "GEO" to compute geocentric coordinates
                   "R-S" & "S-R" rectangular-spherical conversion
```

```
-And 59 M-code routines, namely:

LCB   to perform the calculations needed to play "le compte est bon"
      that is a French TV game
SQRTF square root of n! ( I've remarked that the HP-41 calculates
                          99! correctly )
GAM   gamma function
RND0  rounds X to the nearest integer
J2000 computes the number of days since 2000/01/01
STOW  and RCLW ( extra-registers )
HGF+  hypergeometric function ( including regularized functions )

Who and How Much for a Red Dot in Poor Shape

*Message #1 Posted by **Michael de Estrada** on 6 Apr 2009, 6:23 p.m.*

(See Here)

Well, the auction is over for a Red Dot in very poor condition, and two questions are now answered:

1) How much would someone be willing to pay? Answer: 202.49 USD

2) What would be the location/nationality of the buyer? Answer: Hong Kong, China

What does this say about the valuation of rare collectables and the importance ascribed by different cultures with regards to American memorabilia? I offer this up without further comment, judgement or opinion.

Michael

*Message #2 Posted by **Walter B** on 7 Apr 2009, 1:08 a.m.,*
in response to message #1 by Michael de Estrada

Hey, what did happen there in the battery compartment?

nothing special

*Message #3 Posted by **Frank Boehm (Germany)** on 7 Apr 2009, 5:14 a.m.,*
in response to message #2 by Walter B

there is a split :) Actually it's much less visible when properly assembled, the owner obviously lacked some screwing skills <g>

Btw. I'd say the price is OK, considering the rarity and importance as a technology landmark.

Re: nothing special

*Message #4 Posted by **Michael de Estrada** on 7 Apr 2009, 9:41 a.m.,*
in response to message #3 by Frank Boehm (Germany)

Actually, several of my HP-35's which I know have *never* been opened have the noticeable "split" in the battery compartment. I think it's something that comes from the factory that way, either due to faulty manufacture of the parts or original assembly. Nonetheless, the exposed screws are a dead giveaway that the calculator housing has been opened. The extremely clean appearance of the battery compartment and contacts makes me suspicious that the internals are not original, and parts from a later version may have been used to fabricate a Red Dot using only the outer casing parts. Since the calculator is non-operational, we will never know since the "bug" tests cannot be performed.

HP28S battery cover

*Message #1 Posted by **Keith Midson** on 5 Apr 2009, 11:10 p.m.*

Hi HP world, Are battery covers available for the HP28S from HP, repairer, or custom made replicas (would also fit HP28C, 18C, 19B and 19Bii models). I did send a message to HP from their website enquiry, but i've had no response yet. I'm keen to get a new cover if they are still available. Thanks, Keith

Re: HP28S battery cover

*Message #2 Posted by **Walter B** on 6 Apr 2009, 1:41 a.m.,*
in response to message #1 by Keith Midson

Sorry, but I doubt it. That Clamshell battery cover is known to be a bad design tending to break. AFAIK nobody has started a replica production yet. Market is a bit small.

Re: HP28S battery cover

*Message #3 Posted by **Johnny Bjoern Rasmussen** on 6 Apr 2009, 2:44 a.m.,*
in response to message #2 by Walter B

If you count in the users of Clamshell Business calculators like HP-19BII the marked might be big enough for a replica.

Cheers!

Johnny

Re: HP28S battery cover

*Message #4 Posted by **Raymond Del Tondo** on 6 Apr 2009, 3:17 a.m.,*
in response to message #3 by Johnny Bjoern Rasmussen

Hi,

the 19BII has a darker case than the 28S,
so it might not look too good using a 19BII batt cover on an 28S;-)

OTOH, the latest incarnation of the 19BII uses a battery door on the back side,
which is much better than the original and extremely fragile construction.

<OT> Battery doors never were a strong part of the HP hardware development department.
Ok, the doors in the HP-71B and HP-48 were designed well,
at least I didn't find broken doors on these machines so far.

Remember the batt doors on the Woodstocks, or on the Spices? Awful!
And the batt door for the HP-41 in combination with the very sensitive contact foil
was such a bad design that I still wonder how many of these doors are still around.</OT>

Re: HP28S battery cover

*Message #5 Posted by **Mike Morrow** on 6 Apr 2009, 6:27 a.m.,*
in response to message #4 by Raymond Del Tondo

> Quote:
>
> Remember the batt doors on the Woodstocks...
>
> And the batt door for the HP-41...

The Woodstock battery/door assembly is IMHO one of the *best* of such HP designs. The only problem from that assembly comes when old packs are allowed to leak and corrode.

A troublesome detail of the HP-41 design is the small charger connection port cover. It is extremely flimsy, needlessly so, and easy to break or lose.

But the HP-28 cover is tops in the poor design competition.

Re: HP28S battery cover

*Message #6 Posted by **Michael de Estrada** on 6 Apr 2009, 8:46 a.m.,*
in response to message #5 by Mike Morrow

Yes. The Woodstock battery pack design with the integrated "door" was a great concept, especially for field use. It was very easy to swap out a spent pack with a fresh spare. No chance of losing or damaging a separate door because there was none. Also, the battery contacts were very sturdy, relying on the pack springs to provide the connection pressure and to secure the pack inside the calculator housing. Although neither HP nor the aftermarket manufactures replacement packs any more, it is very easy to re-cell them with store-bought AA NiCads.

Too bad HP also chose to make the NiCad pack part of the AC adapter circuit, which is why today there are very few remaining functional Woodstocks.

To the original poster, if you find a cheap source of clamshell battery doors, please let me know. My HP-28S is out of commission with a broken battery door.

Michael

Re: HP28S battery cover

*Message #7 Posted by **Nigel J Dowrick** on 6 Apr 2009, 12:55 p.m.,*
in response to message #6 by Michael de Estrada

If you are interested in functionality rather than beauty it is possible to cut a thin piece of metal sheeting to the correct shape and to slide it in in place of the battery cover. The slot around the edge of the aperture is enough to keep the metal in place; a small amount of insulating tape secures it. Sticking some thin dark plastic on top would even make it look quite nice, although I didn't bother to do this.

Nigel

Re: HP28S battery cover

*Message #8 Posted by **Michael de Estrada** on 6 Apr 2009, 1:27 p.m.,*
in response to message #7 by Nigel J Dowrick

Nigel,

About what thickness gage would you estimate is required? Should it be the same as the current metal part?

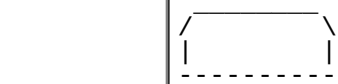
Thanks for your suggestion.

Michael

Re: HP28S battery cover

*Message #9 Posted by **Nigel J Dowrick** on 6 Apr 2009, 7:43 p.m.,*
in response to message #8 by Michael de Estrada

I don't have a way of measuring the thickness of the piece of metal that I used, but it looks to be about 0.2mm thick. It is thin enough for me to have been able to cut it into shape with a pair of scissors. It fits into the slots at the sides and also the slot at the "back" of the battery compartment. It is this sort of shape:



I hope this helps.

Nigel

Re: HP28S battery cover

*Message #10 Posted by **Allen** on 6 Apr 2009, 7:55 p.m.,*
in response to message #9 by Nigel J Dowrick

I really would not recommend spending monumental effort repairing the door.. the moment you get it fixed, Murphy says the plastic around the battery door will break, leaving you something with more CA smell, and risk of breaking further at any moment.

If you're looking for something vintage, I suggest the 48SX instead, or else the 42s, or the current 35s/50g- it really depends on how you use your machine...

Re: HP28S battery cover

*Message #11 Posted by **Michael de Estrada** on 6 Apr 2009, 8:22 p.m.,*
in response to message #10 by Allen

Allen,

I already have a HP-48SX and even a HP-50g, which I use 99% of the time. I have not used the old HP-28S for years because of the busted battery door, so I really don't have anything to lose in trying to resurrect it. Actually, the case plastic has already begun to break around the door opening, so it's on its

last legs anyway. I can always hook it up directly to my bench DC power supply if I just want to play with it. But thanks anyway for your advice.

Michael

Re: HP28S battery cover

*Message #12 Posted by **Allen** on 6 Apr 2009, 6:28 a.m.,*
in response to message #1 by Keith Midson

best bet is to buy a (non) working 18c and steal the batt. cover. The color is very similar, and the cost won't put you out. I agree with earlier responses that the small market will keep both HP and replicas out.

Re: HP28S battery cover

*Message #13 Posted by **Dan Grelinger** on 6 Apr 2009, 9:47 a.m.,*
in response to message #1 by Keith Midson

HP was still selling the battery covers about 10 years ago, I was able to purchase one from their parts department, along with some replacement cells for the HP-67 battery pack (82001?). I tried to get the replacement cells recently, and checked the part number at their site, and got nowhere. The same may have happened to the HP-28S battery door.

Re: HP28S battery cover

*Message #14 Posted by **Randy** on 6 Apr 2009, 10:10 a.m.,*
in response to message #13 by Dan Grelinger

HP was out of stock years ago with no plans to change the situation. The last source I knew of was Calcpro.com but he too no longer as any stock.

Gone the way of the Dodo bird...

if in doubt, consult your dentist

*Message #15 Posted by **Hans Brueggemann** on 6 Apr 2009, 3:18 p.m.,*
in response to message #1 by Keith Midson

because he has very fine epoxies at hand..
you might simply glue the broken pieces together with CA and ask him, whether he can do a copy of it.
textures of copied parts are just excellent and a good paint job (car paints) will do the rest.

Re: if in doubt, consult your dentist

*Message #16 Posted by **Keith Midson** on 6 Apr 2009, 10:42 p.m.,*
in response to message #15 by Hans Brueggemann

Thanks everyone for your enthusiastic response! This was my first posting to the forum, and I didn't realise how active everyone would be in this forum.

By way of background I have the HP collecting bug - I now have 44 HP's (along with a bunch of pocket computers and graphing calcs from inferior brands ...).

So, I do use other vintage HP's (I have a working collection as an engineer), but my trusty 28S was the

very first HP I've owned from 1990, so it's the sentimental value of keeping it alive that brings me to this thread. I actually have a "like new" 28S, as well as a 28C, 18C, 19B and 19Bii, all in excellent condition with no damage to the battery door, but I would like to bring my original back to life. I think based on all the above discussion I will try cutting some metal sheet - i'll let everyone know how it goes.

Cheers, Keith

the solution

*Message #17 Posted by **db (martinez, ca.)** on 8 Apr 2009, 12:59 a.m.,*

HP 41CV Battery Question

*Message #1 Posted by **Chuck** on 5 Apr 2009, 2:13 p.m.*

I was given a 41cv several years ago which the owner claimed died. Cosmetically it's in excellent condition, very little use. However, the battery holder is cracked in half, and the little springs are missing. With all the talk about the 41's I figured I should actually find out if it is indeed not working. So, here's a start...

...can somebody look at their batter holder and tell me the configuration of the springs. Are the outside pairs connected?

Thanks.

CHUCK

Re: HP 41CV Battery Question

*Message #2 Posted by **Michael de Estrada** on 5 Apr 2009, 2:39 p.m.,*
in response to message #1 by Chuck

Yes. The outer pairs of battery cells are in series via the springs. The polarities are marked on the outside of the holder.

Michael

Re: HP 41CV Battery Question

*Message #3 Posted by **Chuck** on 5 Apr 2009, 2:47 p.m.,*
in response to message #2 by Michael de Estrada

Thanks Michael. That's what I figured. I'll give this thing a go finally.

Re: HP 41CV Battery Question

*Message #4 Posted by **Geoff Quickfall** on 5 Apr 2009, 3:23 p.m.,*
in response to message #1 by Chuck

Chuck,

Just a note about the springs. Am I correct that you are using the original HP springs?

If not make sure the replacements are not to stiff, as this will lead to cracked battery posts or missing bonded screw head washers.

See this post:

Not the battery posts!

for an explanation of the turning force that the battery hatch imposes on the module/battery block and then to the posts and screw heads. The explanation is in the conclusion section.

I have actually chosen to compress my springs a bit to releave the stress.

Cheers, Geoff

Broken Woodstock Question

*Message #1 Posted by **Michael de Estrada** on 4 Apr 2009, 10:37 p.m.*

I found a dead HP-27, which had corroded batteries that had leaked inside and damaged the circuit board traces. I tried powering it directly on the circuit board to no avail. I disassembled it completely and tried to determine if the OFF/ON slider switch was working, but of course on this model the keyboard is heat-staked to the front cover, so it is not possible to do this directly. Can someone familiar with the innards of this model tell me what points on the back of the keyboard to check with an ohmmeter to see if the OFF/ON switch is working, and if not I can short these points to further test the calculator?

Thanks for any help.

Michael

Re: Broken Woodstock Question

*Message #2 Posted by **Geoff Quickfall** on 5 Apr 2009, 2:34 a.m.,*
in response to message #1 by Michael de Estrada

Hello again Michael!

A really simple test, before you even take the guts out or unscrew the case. Of course this works after the guts are removed and you have cleaned the PCB as much as possible.

```
1   select resistance on your ohmeter
2   place a probe on the -ve battery contact and the other
    probe on the  +ve battery contact
3   cycle the on off switch and observe the needle deflect from
    high resistance to low resistance.
```

The deflection indicates that the slide contact is working. Also, use extreme caution when cleaning the keyboard silk screening. Do not rub clean or rub dry the surface of the silkscreened numbers. They are extremely sensitive and the clear laqueur that protects them has probably degraded.

The woodstocks are very problematic. Typically when the batteries started to build up internal resistance and decay they still held a charge. This led the user to plug the calculator into the mains with the adapter while leaving bad batteries in the calculator. This has disasterous effects on the PCB and is unrepairable.

Some times you see someone on ebay state that "it worked when the plugged it in but it doesn't work now" so it must need new batteries. Well, it's too late by then!

Good luck, I have a 21 here that looks mint outside and gave an erratic display. The batteries were welded inside from corrosion and the removeable PCB was pure blue. I soaked this in vinegar, (what else, it was a write off) and got it to work a little bit better, but still erratic.

Also, when you jury rig a power source use two rechargeable batteries at 1.2 volts each. These woodstocks become tempermental with age and two 1.55 volt alkalines may be enought to send the calc into cardiac arrest.

Cheers, Geoff

Re: Broken Woodstock Question

*Message #3 Posted by **Michael de Estrada** on 5 Apr 2009, 9:57 a.m.,*
in response to message #2 by Geoff Quickfall

Hello Geoff,

Thanks again for your very detailed and expert advice. The OFF/ON switch is definitely working at the keyboard level (I figured out that the top two traces are the switch circuit), so that is not the problem. The resistance at the battery terminals is very high with the ON/OFF switch in either position. I powered it both with a proper NiCad battery pack and my bench regulated DC power supply at 2.5 Vdc with no response whatsoever in the LED array. Externally the calculator looks very nice, so it looks like I have my first non-functional pretty collectable. It's a shame because the HP-27 is quite rare, and whenever they appear for sale the asking price is astronomical.

Best Regards, Michael

HP35 IEEE Celebration 4/14/09

*Message #1 Posted by **Jake Schwartz** on 4 Apr 2009, 2:19 p.m.*

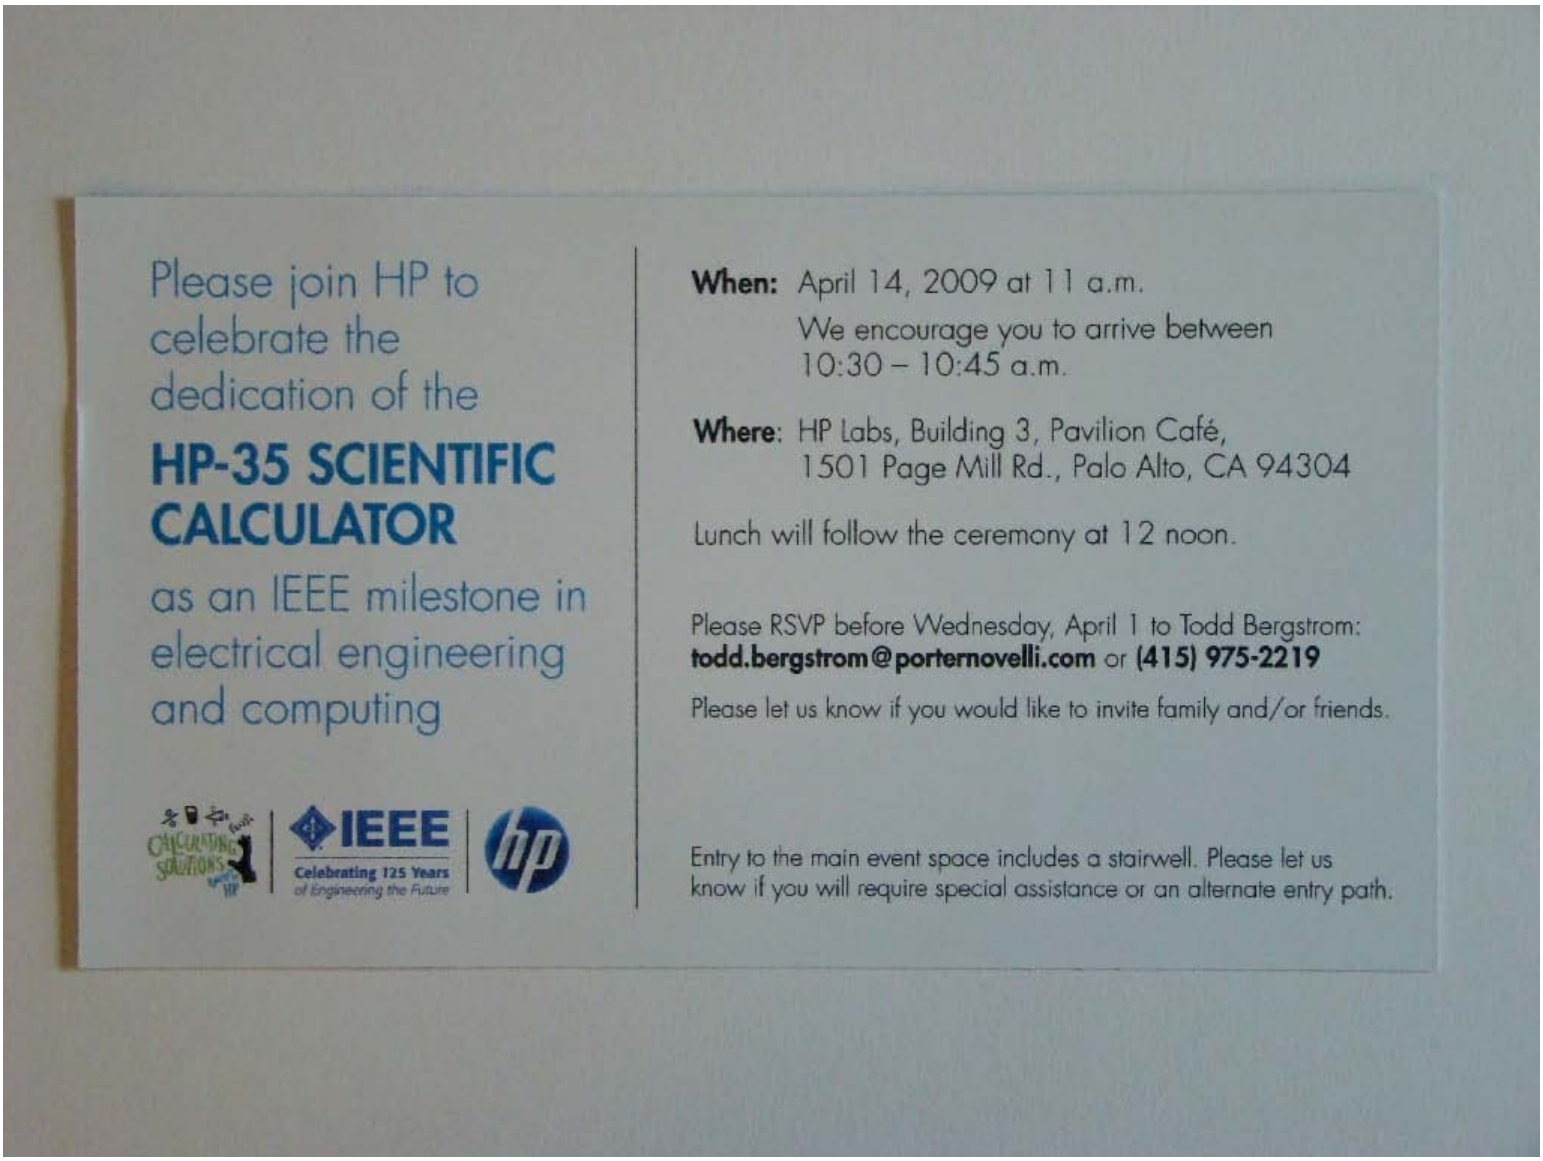
Hi,

On Friday, I received this from the IEEE:

The "pocket protector" was stuffed with a card:

and on one side of the card was a life-size image of the HP35:

and on the reverse side of the card was an invitation to an IEEE celebration for the HP35:



Did anyone else receive this?

Jake Schwartz

Re: HP35 IEEE Celebration 4/14/09
*Message #2 Posted by **Jake Schwartz** on 4 Apr 2009, 2:25 p.m.,*
in response to message #1 by Jake Schwartz

It should be mentioned when I emailed about it to Richard Nelson yesterday, he responded that earlier this year he was asked for an image of the HP35 and so he shot one with the Golden Ratio in the display and sent it in. It is his image on this card. Perhaps some of you who live in the area of this event might wish to try to sign up. Despite the fact that the RSVP date was April 1st, I didn't even receive the letter until the 3rd. And since I'm on the Right Coast, I'll be there only in spirit...

Jake

*Message #9 Posted by **Katie Wasserman** on 15 Apr 2009, 12:50 a.m.,*
in response to message #8 by Jake Schwartz

Very Nice!

So where can we buy this latest ARM-7 based 12c that Sam said is available now?

Re: HP35 IEEE Celebration 4/14/09

*Message #10 Posted by **Dave Hicks** on 15 Apr 2009, 2:09 a.m.,*
in response to message #9 by Katie Wasserman

Basically it's an unannounced change so they are shipping now but you must shop carefully. Sam gave me a clue about serial numbers but I'm not sure if he meant it to be totally open information as people might pick over inventories just to get the newest thing even if they don't plan to use it. But I think if you send me an email, it's OK to tell a few people. And I'm sure if you plan to develop some Apps, Sam will be happy to get you the stuff you need.

Something that probably didn't show up on the video was an even earlier HP-35 prototype. It looks like the yellow-key prototype shown on the HP-35 page except that it has a beige case. There are also different fonts on the keys and the back of the case hadn't had any texture applied yet. Texture was controversial because the more you added, the less the plastic wanted to come loose from the mold. I got some mediocre snap shots and will add it soon. It still works, of course.

Oh and an HP-01 proof of concept with a whole bunch of tiny wires running into an HP-35 where its real brains lived.

Lots of nice stories and great people! A really fun day!

I'll have some more to say about the trip later but it's been a long/great day.

Speaking of long days, Richard drove 750 miles each way!

Edited: 15 Apr 2009, 2:12 a.m.

Hi,

Do you have more details on the connectivity capabilities of the new 12C? This feature opens up a developer market for the platform that intrigues me.

--Tod

Re: HP35 IEEE Celebration 4/14/09

*Message #12 Posted by **Dave Hicks** on 15 Apr 2009, 12:55 p.m.,*
in response to message #11 by Sancerre (Phoenix)

Essentially, the 12C has what the 20b has. The latter is more public about it since it is not rolling new features into an existing product.

If you download the 20b developer kit I think you'll get some ideas.

Essentially both calculators have serial ports and developer replaceable firmware.

Re: HP35 IEEE Celebration 4/14/09

*Message #13 Posted by **Andrés C. Rodríguez (Argentina)** on 15 Apr 2009, 4:47 p.m.,*
in response to message #12 by Dave Hicks

IIRC, there was a message from Cyrille de Brebisson some weeks ago, detailing the "newer" 12C capabilities. Just from memory, I think he said that the JTAG port (which is easily implemented in the 20b) is not available on the new 12C. It may have to do with ESD considerations. But the serial port was maintained.

Please check and disregard any mistake on my side.

Re: HP35 IEEE Celebration 4/14/09

*Message #14 Posted by **BruceH** on 15 Apr 2009, 4:27 p.m.,*
in response to message #9 by Katie Wasserman

Katie, the new 12Cs are available in the UK. I can point you at a suitable dealer if you want to ship. Alternatively, just look carefully through the blister pack since the new version has a double width battery compartment.

Re: HP35 IEEE Celebration 4/14/09

*Message #15 Posted by **Katie Wasserman** on 15 Apr 2009, 11:03 p.m.,*
in response to message #14 by BruceH

I'll keep an eye out for them in the local stores. Was the packaging changed to say that the calculator takes "2 x CR2032" cells instead of "1 x CR2032"?

*Message #16 Posted by **Charles Oxford** on 17 Apr 2009, 10:01 p.m.,*
in response to message #9 by Katie Wasserman

I went to my local Fry's to get speakers so I could hear the video. I checked the calc dept and they didn't have the 20B but they had 3 12C's, 2 of which had a double length battery door visible from the top of package. Price is 69.99 USD plus 8.33% tax. No difference in the packaging of the 2 styles of 12c. Does the battery door width mean it will have the port on the back?

If you click on the thumbnail image in the lower portion, it should start playing the 53-minute video.

A visual quiz! What is it?

*Message #1 Posted by **Geoff Quickfall** on 3 Apr 2009, 10:23 p.m.*

I just recieved this functional calculator. It is specialty designed, i.e. it applies to a certain industry.

I don't remember seeing such an HP keyboard mimic (I know the keys have an extra column below the Enter key row) before complete with ENTER key. The clincher is it also has an = key. This was made in the late 80's.

I have sanitized the shifted markings but left the key labels for you as a hint. I will post the actual calculator picture soon enough:

It raises some interesting questions. Any guesses as to:

```
1     brand?
2     industry used for
3     whether algebraic or RPN or both?
4     has any other calculator got the enter key (other than
      the 12 C clones posted below)?
```

Re: A visual quiz! What is it?

Message #2 Posted by ***Thomas Okken*** *on 3 Apr 2009, 11:44 p.m.,*
in response to message #1 by Geoff Quickfall

Hi Geoff,

Given that you're an airline pilot, I couldn't help but guess that's what that calculator is for. I also vaguely remembered reading about special-purpose non-HP RPN aviation calculators... That picture looks like a

Navtronic (http://spyropoulos.net/calcs-aviation/aviationcalcs.htm). Whether the presence of the = key means it supports algebraic operation, or if it serves some other function, I have no clue, though.

*Message #4 Posted by **Thomas Okken** on 4 Apr 2009, 12:59 a.m.,*
in response to message #3 by Geoff Quickfall

What about questions 3 and 4, though?
Anyone? Anyone? Bueller?

Re: ARRRGGGGGG, to easy!!!!!!

*Message #5 Posted by **Geoff Quickfall** on 4 Apr 2009, 1:23 a.m.,*
in response to message #4 by Thomas Okken

I will answer number #3

it is algebraic and the enter key is to input data to memory registers. The variables in the various hidden memories are used for equations such as:

```
lat1 and lon1
lat2 and lon2

     gives rhumb line and track

wind speed
wind direction
aircraft heading
aircraft true airspeed

     gives aircraft track and ground speed.
```

all addition, subtraction and etc. are computed algebraically.

Cheers, Geoff

Re: A visual quiz! What is it?

*Message #6 Posted by **Maximilian Hohmann** on 4 Apr 2009, 5:45 a.m.,*
in response to message #1 by Geoff Quickfall

Good Morning!

Too late again... but a few answers to #4:

How about the Navtronic 1701 (/ T / TR) and Navtronic 16, the beautiful luminous brothers of the one in your photo, that have the unique vertical row of LEDs to prompt for input values?

And most the Ti graphing calculators (e.g. Ti73, Ti89, Voyage 200, ...) have a big "Enter" key.

Some Ti Basic calculators have it (Ti-74S)

And the asa CX-1 pathfinder has it. An Sporty's electronic E6B.

All those cheap USB-calculators that can be used as a numeric keypad for notebook computers have one (e.g. Sigma PC6012 USB, ibico 121X)

Sharp Organisers (like IQ-8100M) have big Enter keys.

These are only those that are stacking up on my desk because I haven't entered into my database yet...

Greetings, Max

Anyone else find this HP-41CX strange?

*Message #1 Posted by **Dan Grelinger** on 3 Apr 2009, 10:09 p.m.*

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=260387140137&fromMakeTrack=true

Described as never opened and never repaired. However, evidence MAY indicate otherwise. Any ideas?

Dan

Re: Anyone else find this HP-41CX strange?

*Message #2 Posted by **Geoff Quickfall** on 3 Apr 2009, 10:29 p.m.,*
in response to message #1 by Dan Grelinger

Dan, unless I am blind and can't see the forest for the trees, I see nothing wrong with this. It appears identical to my HP41CX halfnut.

The keys are standard and not tall, the trim appears gold, the feet look good as well as the label at the foot of the case.

What appears out of place to you?

Cheers, Geoff

Re: Anyone else find this HP-41CX strange?

*Message #3 Posted by **Garth Wilson** on 3 Apr 2009, 10:45 p.m.,*
in response to message #2 by Geoff Quickfall

Did you see the one that went last week for $522 IIRC?! That was with no modules or accessories. Even the rubber feet looked brand new.

Re: Anyone else find this HP-41CX strange?

*Message #4 Posted by **Dan Grelinger** on 3 Apr 2009, 10:49 p.m.,*
in response to message #2 by Geoff Quickfall

What is the earliest half-nut serial number?

Dan

Re: Anyone else find this HP-41CX strange?

*Message #5 Posted by **Geoff Quickfall** on 3 Apr 2009, 11:07 p.m.,*
in response to message #4 by Dan Grelinger

Mine is 3019S20239 indicating 1990-week 19-Singapore-20239.

In conversation with Wlodek even some 41C's are floating around with a half nut due to waranty repair. I think he stated the first 41cx showed up around 1985. I see that this one is 1984 which would put it at the same age as my spare, also 1984, but mine is not a half nut. I see what you mean, was it sent in for repair? He states not but then he is not the original owner.

Also check out this HPmuseum posting which pushes the date back to 1985:

earliest halfnut production

Now if you have a 41C halfnut, wow, that would be rare. I guess there are no halfnut tall keys out there!

Cheers, Geoff

Edited: 3 Apr 2009, 11:11 p.m. after one or more responses were posted

Re: Anyone else find this HP-41CX strange?

*Message #6 Posted by **Dan Grelinger** on 3 Apr 2009, 11:11 p.m.,*
in response to message #5 by Geoff Quickfall

This site (MoHPC) indicates that the earliest half-nut serial number is 40 weeks after the listed ebay calculator. That early of a serial number would indicate a repaired unit. But the seller describes it as never repaired, never opened.

Re: Anyone else find this HP-41CX strange?

*Message #7 Posted by **Randy** on 4 Apr 2009, 8:27 a.m.,*
in response to message #6 by Dan Grelinger

But the seller never said he was the original owner. In fact, he says he bought it several years ago, how does he know the full history? Maybe never repaired by him would be true but that's a stretch...

IMO it is a repaired unit, HP put the customers old back on a halfnut service exchange. It's what they did after they ran out of fullnut service parts. Standard procedure.

I've seen many CX's in this exact state - fullnut serial number bottom on a halfnut top. Woop-de-do, nothing special here.

Edited: 4 Apr 2009, 8:29 a.m.

Now we know the answer!

*Message #8 Posted by **Dan Grelinger** on 4 Apr 2009, 12:59 p.m.,*
in response to message #7 by Randy

If you check the auction this morning, you will see the seller has come clean. The photo he posted for this item was not of the actual item he was selling. He had substituted a photo of a different calculator without disclosing it, until now. The new photo he added this morning is of a non-halfnut HP-41CX.

Re: Now we know the answer!

*Message #9 Posted by **Michael de Estrada** on 4 Apr 2009, 1:15 p.m.,*
in response to message #8 by Dan Grelinger

Well, with about 9 hours to go, the price is up to $566 with a recently placed bid. Certainly, waaaay more than I would be prepared to pay. What will be interesting is to see the nationality/country of the winning bidder. I remember once several years ago seeing a clean working HP-67 with accessories go for about $1000 to a Japanese bidder.

Michael

Re: Now we know the answer!

*Message #10 Posted by **Raymond Del Tondo** on 4 Apr 2009, 3:01 p.m.,*
in response to message #8 by Dan Grelinger

Actually the updated pic shows a calc which looks better than the calc on the first pics.
The pics of the halfnut CX show a well used and dirty unit with a shiny ON key, scratches on the front label and U-shaped case separator,
and heavily used rubber feet, according to their abrased state.

All in all, the pics of the halfnut show a rather ugly unit, whereas the, umm,
pic of the maybe-actual unit show a unit which seems to be in much better condition.

I still can't understand why the seller doesn't show the whole calc...
...however I can't understand the bid amount which was based on the first ugly unit, too.

Re: Now we know the answer!

*Message #11 Posted by **MikeO** on 4 Apr 2009, 6:22 p.m.,*
in response to message #10 by Raymond Del Tondo

Based on their apparent ebay sales experience, it seems odd that they wouldn't post an original picture. Wow up to $610 now - that's about three times over what I payed last year for a CV in mint condition.

Are the CX's really that much more rare?

-MikeO

Re: Now we know the answer!

*Message #12 Posted by **Michael de Estrada** on 4 Apr 2009, 7:15 p.m.,*
in response to message #11 by MikeO

No, they're really no rarer than the HP-41CV, and usually go for maybe $50 more, usually less than $300 in a straight up auction. My two HP-41CV's (one mint halfnut and one very clean fullnut) both cost me less than $200. Even a certain notorious overpriced seller wants much less than this: (See here)

As I said above, it will be interesting to see the location of the eventual winner.

Michael

Going, going, going.....Gone!

*Message #13 Posted by **Michael de Estrada** on 4 Apr 2009, 10:20 p.m.,*
in response to message #11 by MikeO

Well, the massive $610 bid held up. The winning bidder has a feedback rating of 55, so he/she is not a complete newbie. Seems to me waaaaay too much was paid. Anybody want to give me $500 for one of my HP-41CV's? ;<)

Michael

Re: Going, going, going.....Gone!

*Message #14 Posted by **MikeO** on 5 Apr 2009, 2:04 a.m.,*
in response to message #13 by Michael de Estrada

Nope! But I'm sure you find the calculators way more fun than $500 would be - right?

Re: Going, going, going.....Gone!

*Message #15 Posted by **Ed Austin** on 7 Apr 2009, 6:00 p.m.,*
in response to message #14 by MikeO

Thats waaaaaaaaaay too much.... I'd say $200 was a fairer price! I'd pay that for a pristine mint in box (with working reader) HP67C though!

Re: Going, going, going.....Gone!

*Message #16 Posted by **Michael de Estrada** on 7 Apr 2009, 8:56 p.m.,*
in response to message #15 by Ed Austin

Wow! An HP-67C, huh? So, why does it even need a card reader?

Re: Going, going, going.....Gone!

*Message #17 Posted by **db (martinez, ca.)** on 7 Apr 2009, 11:18 p.m.,*
in response to message #16 by Michael de Estrada

Michael; He might be referring to this. - db

2 More Years of HPCC Datafile Issues Available on Compilation CD

*Message #1 Posted by **Jake Schwartz** on 3 Apr 2009, 8:04 p.m.*

Hi,

Recently, the Handheld and Portable Computer Club made two additional years of issues of their British magazine, Datafile, available for inclusion in our PPC CD #3, now bumped up to version 5. It is now called "26 Years of Datafile 1982 - 2007" and contains 165 issues of Datafile, covering over 6300 pages. The issues starting with year 2000 are based on the original pdfs which were submitted to their professional printer and so those pages are of crisp quality and all images contained therein are high resolution and in color. For information on obtaining this disk, check http://www.pahhc.org/ppccdrom.htm .

Thanks,

Jake Schwartz

See you at the HHC2009 Conference at the HP facility in Vancouver, Washington on October 3-4, 2009.

Re: Looking for Users Library Programs

*Message #2 Posted by **Thomas Chrapkiewicz** on 4 Apr 2009, 1:34 p.m.,*
in response to message #1 by Dave Hicks

Hello Dave:

What machine are these for?

As you know, I am in the process of scanning a number of HP65 User Library programs - some submitted by me back in the day.

I also plan on scanning the library catalog which I have.

Thanks, TomC

in response to message #1 by Dave Hicks

Dave,

I can provide titles for some of the ones that are missing them. Here are the numbers and titles:

```
00009C  New Moon and Full Moon Day of Month
00097C  Baseball Simulator
00098C  Magic Squares
00099C  Script Letters
00216D  Mastermind Deluxe
00336C  Graphics Aid Program ("GAP")
00390C  Roots of Polynomials
00476C  High Resolution Plot Routing -- (Relatively) fast version
00479C  Petals around the Rose
00508C  Sunrise, Sunset & Twilight from 1900
00513C  Word Guessing Game
00514C  Mastermind
00524C  Banner
00530C  Banner
00577C  Row Plot (High resolution plot)
00732C  Plot of 2/3 Functions on one graph
00763C  High Resolution Plotter
```

```
00766D  Equations of Particle Motion
00788C  Equations of Particle Dynamics
00796C  True Battleship
00834C  Banner Printer
00866C  Wompus
00869C  Partial Fraction Expansion
00903C  Reversi
01888D  Curve Fitting
02418C  Audio Tape Counter / Time Conversions
02921D  LEM LANDER _ An Orbital Mechanics Game
02999D  Predicting The Apparent Wind
03139D  Curve Fitting
03290D  Doppler Effect - Interchangeable Solutions
03949D  Relativity - Interchangeable Solutions
```

Woodstock glue?

*Message #1 Posted by **james summers** on 2 Apr 2009, 5:57 p.m.*

Greetings all.

Any recommendations as to the best glue for sticking the battery holder used in the Woodstocks together? I've just acquired an HP25C where the battery holder sides have become detached from the solid part (ie that bit which forms the bottom of the actual calculator when the battery holder is in place) and remedial action is required.

TIA

James

Re: Woodstock glue?

*Message #2 Posted by **Randy** on 2 Apr 2009, 6:37 p.m.,*
in response to message #1 by james summers

Plastic welding solvent cement for styrene models. Available at any good hobby shop.

Re: Woodstock glue?

*Message #3 Posted by **Michael de Estrada** on 2 Apr 2009, 7:11 p.m.,*
in response to message #1 by james summers

Superglue works very well and you don't need a lot of it. Just apply a drop at about 1 cm intervals, and then immediately press the two parts together for about 30 seconds. Clean both contacting surfaces thoroughly first and remove any burrs or loose bits of plastic.

Re: Woodstock glue?

*Message #4 Posted by **Geoff Quickfall** on 2 Apr 2009, 8:33 p.m.,*
in response to message #1 by james summers

I have used liquid plastic cement and clamps.

```
1.  clean up the edges
2.  rough up the surfaces that are to be glued with 400 grit
    sandpaper
3.  apply glue to both sides and then place pieces together
4.  clamp until dry, give it an hour or so
```

This will give a permanent bond to the woodstock battery pack.

Cheers, Geoff

Whether to buy a "reclaimed HP41CV"

*Message #1 Posted by **Nigel Bamber** on 2 Apr 2009, 4:28 p.m.*

Having got the bug of the HP41 calculator range from using the I41cx on the Iphone, I have been watching Ebay auctions but prices seem to be around £170 for a CV or a CX which is just too much just to try to feel and hear the satisfying click of the keys and to handle a real machine.

I have got the chance to buy a reclaimed CV , no modules or battery but which is powered by an external battery pack or a USB cable link to a PC. Cost only £ 28.00. Is it worth this ?

So do I buy that or wait for the real thing or will buying this reclaimed calculator just fuel my desire to get a real one !!

Comments and thoughts welcomed !

Nigel

in response to message #2 by bill platt

Please, save us all some suspense, and tell us why.

I've seen similar advice over the past 10 years or so that I have had the HP collecting bug. Sometimes it is good to wait. Most times it is not.

Re: Whether to buy a "reclaimed HP41CV"

*Message #4 Posted by **bill platt** on 2 Apr 2009, 9:05 p.m.,*
in response to message #3 by Dan Grelinger

Well, let's see...shall we go back to 2003 or whenever it was that the 32sii was canceled? Or to a little while later when the 48GX was finally put to rest? Or when the 50G established its presence?

In every case, prices for useful (not shamtique) machines changed markedly. 32sii spiked when canceled. But after the 33s came out, the prices fell. A lot. 30% down and stayed there.

The 48GX was going for much more after it was canceled, but the only replacement was the 49G. Even the G+ didn't do much. But the 50G did. Now you can get a 48GX for $120 easily. They were $250.

Now we have a big recession. Potentially dodgy old calculators are going to tank. NIB perfectimundos may hold value, but the old workhorses won't.

Considering the time value of money, and use and wear, and calculators really aren't a good investment--and now there is going to be a down trend.

Re: Whether to buy a "reclaimed HP41CV"

*Message #5 Posted by **Michael de Estrada** on 2 Apr 2009, 9:59 p.m.,*
in response to message #4 by bill platt

Actually, I'm already seeing a significant drop in the prices of all vintage calculators when compared to the last few years. As you said, excepting the mint NIB complete items and perhaps some exceptionally rare models (HP-41C/CV/CX are common as dirt), prices are consistently lower. I managed to buy an HP-46 for $255 and an HP-91 for $215, both in perfect working condition and very good cosmetically, which is much lower than I had seen previously. On the flip side, I only got $176 when I sold one of my HP-65's, which was also fully functional and very good cosmetically. Whether this is due to the current economic situation or

simply a lot of old engineers dying and their widows selling their old calcs I don't know. What is clear to me is that it is a buyer's market right now, and likely to remain so for a while at least.

Greetings.. do you have any Empirical Data to support this hypothesis? I suggest the quoted claim and Bill's suggestion that it is a "buyers market" are both Recency Effects.

There are a number of holes in the "buyer's market", "collector=bad-investment" theory, namely (based on my experience):

1. One of the main markets for the 48gx is surveying, and alot has happened there in the last few years other than the 50g, so while I agree that the prices of 48gx have fallen, I do not believe it's causal.
2. While I agree in general about the comment RE time value of money, the argument posted does not take into account purchase price, date purchased, time held, inflation, and the like. So it is not logical to say "because of TVM" all calculators are bad investments. QED
3. Related to previous comment, the price of any globally-traded commodity in dollars is not a true reflection of the health of it. Calculator exchange sites like ebay are also global exchanges, and the variation in the currency markets have not been taken into account in the recent comparison of $USD prices. One must also consider the relative strength of trading currencies, esp YEN, AUD, EUR, and GBP.
4. The reason I suggest a "recency effect" of the summarily falling prices may be a standard seasonal dip following the December Sale season. I note a similar trend in previous years of data I have collected.
5. Lastly, No (or very little) consideration has been given to Price elasticity of Demand for the vintage (non-survey) models. Even with very specific data on thousands of calculator purchases, price, shipping, country, etc.. I have only a superficial understanding of all of the factors effect calculator prices on any given day.

The market for used HP calcs is so small, and mainly through only one channel (eBay), that it is possible a sole individual can have a major influence on any perceived "market trend". Good luck to anyone trying to track that.

Even better luck to anyone who is in it just as an investment. I suspect vintage calculators will almost certainly become a poorer investment the longer you hold on to them. As vintage HP and other calculators are really only of a perceived value to those who have a nostalgic value attached to them. And these people will slowly disappear with time.

So good luck to anyone planning on leaving the collection to the kids in say 30 years time...

Dave.

in response to message #6 by Allen

Or in other words, we have both seen the same thing: the relative non-trending of many models. They go up, they go down, there is a run for a few weeks, then a retrenchment. Since 2000 at least, the 11c has been remarkably stable long term--maybe a slight upward. I remember finding them averaging $80 or so back in $2000, now they are maybe $120 (and condition of calculator varies). For 9 years on, with a lot of unreported inflation, that isn't a real rise in price.

I see the seasonal effects you speak of, too.

BTW you can trust wikipedia as far as you can throw it.

*Message #10 Posted by **Dan Grelinger** on 2 Apr 2009, 10:19 p.m.,*
in response to message #4 by bill platt

If it is the recession that is going to do in collectible calculator prices, it better happen real soon! It appears we have passed the panic stage, market lows have been recorded, and the press is becoming guardedly optimistic.

If it is something else, then I still remain unconvinced. HP-32SII prices seem to be rising nicely at this time (your reasoning does not explain that). Even though the topic was HP-41 prices, you did not provide any reasoning supporting that its prices would fall in the next six months. The big difference between the HP-48 story and the HP-41 story is that if you know the HP-48GX, the learning curve for the HP-50G is very quickly travelled. There is a natural upgrade tendency. Is there a book written "HP-48GX to HP-50G Transitions"? The HP-41C is quite a different machine, no user who loves that one would ever be satisfied with only an HP-50G.

But, perhaps you have knowledge of the HP-41CG? As an HP-50G is to an HP-48G, and HP-41CG would be to an HP-41C? If such a beast will be released in the next six months, then perhaps you are correct. It might be the HP-41C killer! Please share more details!

But, wait, now I see it, in a slightly later post! What you really mean is "Don't buy any HP-41CX at all, now or in the future, it is just junk." Your opinion, I certainly won't try to disuade you. But it makes reasonable the conclusion that you are not recommending an HP-41 to the original poster.

And where did the initial poster indicate he would buy an HP-41C for an investment? That did not seem to be either his purpose, or his expectation.

Dan

Re: Whether to buy a "reclaimed HP41CV"

*Message #12 Posted by **Thomas Okken** on 3 Apr 2009, 1:47 a.m.,*
in response to message #11 by bill platt

If anyone actually knows how to predict the market, we should be able to identify them by the fact that they are filthy rich, not by them writing articles in economic columns that happen to turn out to be correct -- right?

What little respect I ever had for economic analysts in the media went down the drain when the price of oil collapsed while the US dollar did not. Who saw *that* coming?

I doubt that the press is "guardedly optimistic" in order to support the "Obamanation". The press has *always* been optimistic, guardedly or otherwise, for at least the last 20 years or so, or as long as I have been paying attention (i.e. since the late 1970s)... Good news sells better than bad.

ObHP: maybe I should start looking for a nice 41CX, or even a working HP-27 (Woodstock, not 27S!). The news is so gloomy lately, if it is accurate maybe I should just jump off a cliff, and if it isn't, this *must* be the time to buy. :-)

Hmm. Buffett. Smart or just lucky? He didn't catch on to the huge rise of the euro against the dollar until it was mostly over, and that makes me wonder.

Re: Whether to buy a "reclaimed HP41CV"

*Message #15 Posted by **bill platt** on 4 Apr 2009, 9:32 a.m.,*
in response to message #14 by Thomas Okken

It makes sense. Buffett's whole disciplined approach is to look for underlying value--to calculate the true value of the company--and to only buy when an entity is undervalued by that metric. In the case of the Euro-Dollar fluctuations, there was nothing there--just monetary policy + trade deficit + carry trade = gambling.

An example of his value idea was a huge investment in silver back in 2002 or 2003. He bought a bunch of it. At the time, silver was trading at less than its production cost. He figured that couldn't last!

Bill,

A couple of differences in our posts I've noted:

You removed the "it appears" when you pulled the quote from my post. I qualified my assessment. And I continue to stand by my assessment, qualification included.

You make your statements of the future out to be absolute fact. My observations are those that claim to know the future beyond any doubt, don't. And secondarily, maniacal laughter generally gives away a ?_____?

Only the future will tell what will happen. Shall we make an appointment on this board in a year to see who turns out to be the most correct?

Dan

Re: Whether to buy a "reclaimed HP41CV"

*Message #17 Posted by **bill platt** on 3 Apr 2009, 10:33 a.m.,*
in response to message #16 by Dan Grelinger

Hi-hi on the maniacal laughter! :-)

"It appears" appeared to be attached to the "panic" not to the "market lows"--that's how I read you. Panic is not quantitative so I didn't want to quote it.

What goes up, must come down is how I see it. And real estate hasn't actually come down yet, so I see a lot more unwinding yet to come. (Florida and Nevada real estate have come down, but not the rest of it. In the north east you are still seeing housing at 6 times yearly earnings rather than 3 to 4 times. That has to come down as it is not sustainable). The more the congress spends our tax money to "stimulate" us, the more we will fall into a longer deeper hole and as that is where we are going (stimulus--even money for new cars!) I don't see any way to justify the idea that we will *not* slide a lot deeper in the next 6 months....and calculators will feel it, too.

All calculator "collectors" are investors--just bad ones;-)

There is already a "50CG". Just go get Hrastprogrammer's emulator. It is fantastic. I use it on my 48GX when I want to use a legacy keystroke program.

Re: Whether to buy a "reclaimed HP41CV"

*Message #19 Posted by **Dan Grelinger** on 2 Apr 2009, 6:17 p.m.,*
in response to message #1 by Nigel Bamber

Nigel,

I bought my first HP-41CV in August of 1983, and it has been my primary calculator since then. I've tried others, but always come back to my HP-41CX. I own an HP-28S, HP-42S, HP-48SX, HP-48GX, HP-49G, HP-50G, HP-32SII, HP-33S, HP-35S (2), HP-30S (yuck!) HP-10S, and even an HP-12C. I know the newer ones blow the HP-41 away in speed and built in capability. The main reasons I (and likely others) stay with the HP-41 are two; We KNOW the machine (it takes an investment to know any complex machine). And, it was so well architected, designed, and for the most part, built (there ARE a few weak points in its build design).

If I were you, I'd jump at the opportunity to pick up the cheap "starter HP-41". Do it in the spirit of a chasing after your first love. Throw all care to the winds!

"Tis better to have loved and lost, than to never have loved before."

Screw posts.

Zebra strips.

Battery corrosion gone inside.

I've been disappointed once with a 41cv and I won't make that mistake again! (for $50 [2004] with complete box and manuals I suppose it really isn't a burn though!).

Compared to a Voyager, the 41C is cheap brittle junk.

in response to message #1 by Nigel Bamber

Buy it! I bought an HP41CV several months ago for less than £30, missing one module cover and the battery pack. It's still missing the module cover, but I've built a reasonably robust battery holder out of metal strips, foam, black-painted cardboard, and insulating tape. I now have both a fully-functioning HP41CV and the satisfaction of having "restored" it! So long as the battery contacts are in good condition you should have no trouble doing something similar. It will look great in your shirt pocket and the keys feel absolutely wonderful - I've never felt better keys on any calculator.

Nigel (another one)

*Message #22 Posted by **Michael de Estrada** on 2 Apr 2009, 8:17 p.m.,*
in response to message #1 by Nigel Bamber

I'd definitely buy it at that price, especially because it's in working condition. Since all you're doing is playing around with it and portability is not important, I would not worry about it being tethered to an external battery pack. Besides, you can use the money you saved to buy a proper battery holder and 4 N-cells. I have several old non-HP calcs that I connect directly to my variable DC power supply when I want to play with them.

That's how I killed an original TI-30, many years ago, when its disposable 9V cell got low, and I had no spare. (I'd long since given up on the crummy rechargeable pack provided.) Maybe I did it wrong...

If you use a properly regulated adjustable DC power supply, correct voltage and polarity, connected to the proper points, you can't hurt any piece of electronic equipment. There must have been something wrong with it or there was an inadvertent short in the circuit. When I hook something up for the first time I gradually increase the voltage while monitoring the current draw. If the current is excessive (usually it should be less than 200 mA even with all LED's lit up), then I shut off power until I can figure out what is wrong.

I'd buy it in a hot second!

Actually, I probably wouldn't now, since I have lots of 41Cs - they are my absolute favorite HP calculator. I'm an enthusiast first and a collector second. So the raised-from-the-dead 41 would interest me if I had no 41 to play with.

As to market bottoms, the short term dynamics of the collectible calculator market or politics, I have no opinions I'd like to share here. But I do observe that the supply of 41C machines is finite, and that it is inevitably shrinking with time. So over the long term, they are probably a good investment. Unless you purchased one new, back in the 80s, when the prices in real terms were 4-5 times what they are today. But in that case,

you presumably would have taken out the value in use over time.

Regards,
Howard

Edited to add this postscript: If that USB cable turns out to do more than just provide power, please let us know. :)

Collecting, restoring, displaying, using, but not an investment. ;-)

*Message #26 Posted by **Geoff Quickfall** on 3 Apr 2009, 12:02 a.m.,*
in response to message #1 by Nigel Bamber

Nigel, BUY IT and play with it.

Collectors and users should not be in this for the investment. Collectables and their styles come in go in cycles.

Right now for me, the HP classics are there for nostalgic reasons. In some cases they are still being used as I tend to be lazy programmers and I have all the routines in RPN due to the era I went to university

My HP 41CX is my powerhorse only because I know how to maintain it, fix it and bring it into the 21st century thanks to the efforts of Diego and others. I have fixed the posts, screw heads, replaced the foam in the zebra fitting and changed displays for it. The keys work and there was never battery discharge as I take care of my electronics. I also have a spare 41CX.

I also have many proprietary programs that will not convert to the HP42S as they depend on dynamic time functions. I also have HPIL accessories which still function to make the 41C adaptable to work and play but will not function with the HP48, 49 and 50 series

Having said the above, programming and calculator restoration is a hobby, not an investment. Sure if, and when I am selling them I hope to recoup some of the cost but will not be disappointed if I do not. I would however like them to go to a nice appreciated home!

These have all been been restored and are as new. The fun is in the restoration for me, and for use at work, albeit, not required for work. There are more as projects for rainy days and they to will be restored to as new. As any one at the last HPCC will know, I do this for fun and not profit! Now, do you need a watch (wink, wink, nudge, nudge!!!!)

This picture lets you see the Nixie clock I built from a kit from EBAY:

Hello!

> Quote:
>
> This picture lets you see the Nixie clock I built from a kit from EBAY

Mine is still unassembled because I can't decide which nixie tubes to use (I have three complete sets now ... maybe I have to build three clocks?).

Regarding the original question: I would wait for a complete, pocketable 41 with its own battery! With a little patience, you can find a good one for less than 50 Euros/Dollars/Pounds. Over the years, I bought five or six and never paid more than that, some came with accessories!

But as much as I try, I simply don't like the '41. I only like things that glow in the dark :-)

Greetings, Max

in response to message #26 by Geoff Quickfall

I seem to have stirred up some kind of debate , which is always fun :-) . It even had a touch of a political 'swipe' in there (not a view shared by me but he is not my president so what do I care !). Dan's quote was hilarious but it sort of sums it up nicely!

Thanks for all the comments which are clearly meant to helpful, so I will share a few back and maybe an additional question or two.

Just for clarity, I understand the PCB connecting the modules to the main PCB on this reclaimed machine is perished through battery corrosion , so I assume there is no chance of connecting modules in the future - unless you guys know differently ?

It seems to me that £28 vs £170 to get a chance just to play around on a real model is probably a no brainer.

I realise of course that I am potentially going down a dangerous road here. Once I start collecting , where will it end.

The funny thing is that I only came into this situation via the I41cx+. Prior to that I had this Commodore programmable calculator that sat in my desk drawer seeing the light of day every few years. I also bought a Casio programmable and graphing calculator much more recently but it somehow didn't hold my attention.

I had never come across RPN or a Stack before and now I have developed this strange fascination for it.

At the moment the Voyagers hold no appeal to me (probably this is because my love or memories of calculators goes back to their plasticy feel), but that may change over time. It is also the expandibility of the 41 series and its basic but raw power and the ability to program and hack it that grabs my attention.

But I am in this for fun not making money. On the other hand I don't want to be Mr. Gullible when buying. I am in the UK. Is Ebay the best place from where to buy ? Also I am getting the message that the HP41 models are fairly ubiquitous. Is £170 too much to pay for one ?

Thanks for hearing me out.

Nigel

in response to message #31 by Nigel Bamber

Nigel,

I too am a collector of things that I find interesting. I have never collected anything with the idea of making a monetary profit. Most of my calculator collection has come after I retired from my job for 35 years as an engineer, where I used calculators as tools, nothing more. I recently bought two HP-41CV's (one half-nut and one full-nut), simply to play around with and stimulate my aging brain to avert senility. I also enjoy the challenge of fixing things, and old vintage calculators provide this opportunity. I don't worry about whether the price is reasonable; if I want it and can afford it, then I buy it. I might sell something that is redundant (I currently have accumulated 7 HP-45's) or that I acquired in a lot and can't use (memory module that works only in an HP-41C), but I don't expect to make a profit, and the proceeds are quickly consumed by another purchase. So, is there a risk of overpaying? Sure. But, how can you place a value on something like this, which from a purely practical standpoint is obsolete?

Re: Collecting, restoring, displaying, using, but not an investment. ;-)

*Message #33 Posted by **Dan Grelinger** on 3 Apr 2009, 11:23 a.m.,*
in response to message #31 by Nigel Bamber

Nigel, you've got some very good questions, I'll try to do them as must justice as I can.

The HP-41 "PCB" you reference is not really a PCB. It is a flexible copper/plastic connector wrapped around a plastic block, that delivers power from the batteries to the main circuit boards, display logic, and I/O ports. And it also connects the I/O ports to the main circuit boards, through a set of contacts that are made through pressure. If the battery corrosion made its way far enough along this connector, then it would easily interfere not only with the main logic connection to the I/O ports, but also with power delivery to the rest of the calculator, due to corrosion at the pressure contact with the rest of the system. Bottom line is, if the corrosion heads 'south' out of view, then there is a chance that some or all of the I/O ports won't function.

Generally, non-working battery corroded HP-41CVs and CXs will go for $40-$50 ballpark pricing, on ebay. Therefre I would say that 28 pounds would be a fair price for a battery corroded, modified, but working unit.

By the way, it is possible, with the correct part, periodically supplied by a third party HP-41 guru, to fix the problem that you describe. His name is Diego, he posts here often, and is truly a scholar and a gentleman.

Where will it end? Well, we all know that all endeavors undertaken by men end up only one place. But, as has been eloquently stated before, it is the journey, not the destination. I very strongly suspect, based on what you have posted here, that you will catch the bug, and thoroughly enjoy your time with all things HP-41C. There are few things I would rather do than sit down with a new HP-41C manual or book, and read about some new piece of gear that I just aquired, or learn something new about the HP-41 internals. Check out the "Memories" section of this site. About 10 years ago, I wrote about my early experiences with the HP-41.

Concerning the other calculators that you mentioned; compare the huge investment people have made in HP-41 web related content with any of those others. That is an indication of how strong the HP-41 'bug bite' can be.

Ebay is good, and ebay is not so good. It is a convenient way to find new HP-41 stuff and have an opportunity to purchase it. Better deals can be had elsewhere, but the effort required to find them is at least an order of magnitude higher. But, ebay deals generally come at a high price. And sometimes there are nasty surprises, although in my experience, if one is willing to put forth the effort both before and after the sale, they will come out eventually satisfied. Ebay and Paypal know that buyers have to continue to trust the market they have built, or their business dies. I have had to file a few PayPal complaints on calculators, but have always received satisfaction.

Concerning your last question; Since you are in this for fun, and messing around with stuff that does not work quite right can be really fun, initially stay away from the prime units on ebay, the ones that would go for 170 pounds. Start with the ones that need some help, like battery corrosion that can be repaired. I have fixed up a few of these types, aquired for around $50, and they make useful work tools to carry abound in my laptop bag. After that, if you want a complete set in excellent condition from ebay, then yes, you'll spend 170 pounds (or more) buying one, but you'll have a much better idea of what you are doing.

Happy collecting! Long live the HP-41!

Dan

> Quote:
>
> But, ebay deals generally come at a high price.

Yes, absolutely, but I've found that the judicious application of certain rules in online auctioneering can minimize the chances of being really taken to the cleaners.

1) Never pay a "Buy It Now" price and never bid on "Reserve" auctions.

2) Ask the seller questions, even if you don't need to, just to see if you will get a reply and if it is not evasive. I will never bid on an item if I do not receive a satisfactory reply.

3) Understand the risks you are taking with an untested item. An untested Woodstock or Spice is far more likely to be broken and unfixable than a Classic.

4) Avoid auctions by "Power Sellers" with very long discourses on legalities and very little tangible information on the item itself.

5) Don't get into bidding wars with ignorant newbie zero-feedback bidders, who will push the price up to astronomical levels. Decide in advance on what you are willing to pay, and stick with it. It's 100% certainty that this will *not* be the last time this item will

come up in auction. Learn to be patient and deliberate in your quest.

Michael

Michael,

That is very good advice on ebay auctions. May I add to it?

> Quote:
>
> 1) Never pay a "Buy It Now" price and never bid on "Reserve" auctions.

The concept of an auction is that you pay a small increment more than what the next higher bidder is willing to pay. "Buy It Now" many times should be more aptly named "Suckers - Buy Here", and Reserve Price Auctions have always been mis-handled by ebay in that you are bidding against the seller in addition to other bidders. It is the manner in which ebay lets you shill your own auction.

> Quote:
>
> 3) Understand the risks you are taking with an untested item. An untested Woodstock or Spice is far more likely to be broken and unfixable than a Classic.

I go further. Beware the 'untested item'. When I see that, I carefully examine the seller's on-line information; current sales, past items for sale, feedback, to see what they have sold and bought before. Too often unfortunately, unethical sellers think that if they know an item is broken, that it is really OK simply to say 'untested.' Like the 25 year old 'untested' HP-41 Card Reader, being sold by a well-known purveyor of HP items for very high prices, who sells 'tested and working' units on occasion. Give me a break, do we all look that stupid? Well, I guess from such sellers perspective, they only need one.

> Quote:
>
> 4) Avoid auctions by "Power Sellers" with very long discourses on legalities and very little tangible information on the item itself.

The legalities can be annoying, but I really am suspicious of sellers that copy reams of information on the item from well-known information sources, and say little, if anything about the item they are selling. I've seen feedback from buyers who received items that were not working, and this was never mentioned in the title or description.

> Quote:
>
> 5) Don't get into bidding wars with ignorant newbie zero-feedback bidders, who will push the price up to astronomical levels. Decide in advance on what you are willing to pay, and stick with it. It's 100% certainty that this will *not* be the last time this item will come up in auction. Learn to be patient and deliberate in your quest.

I'd recommend not getting into bidding wars period, no matter who you may be bidding against. Research recent sales, carefully examine all available information and photos on that specific item and on the sellers past sales and feedback, and then pick the price you would not be kicking yourself for if you win. Bid once, and be done with it. Once competitive emotions take hold in a bidding war, you might as well be throwing your money out your window.

Re: Collecting, restoring, displaying, using, but not an investment. ;-)

*Message #36 Posted by **Michael de Estrada** on 3 Apr 2009, 4:18 p.m.,*
in response to message #35 by Dan Grelinger

Dan,

Thanks for your added comments. Certainly, your advice on researching sellers is very useful. Caveat emptor!

Regarding "underderstand the risks", I was thinking more along the lines of assessing the likelihood that a genuinely untested item might be defective, despite showing no outward signs such as corrosion on battery contacts. Whereas a Classic series calc cannot be harmed by being operated off the AC adapter with the battery removed (excluding the card reader models), a Woodstock or Spice series calc can and probably will be. Therefore, even if a Woodstock or Spice looks outwardly very

clean, it's not possible to determine if it may have been ruined unless its life history is known. For example, I bought an HP-45 from a seller that normally sells miscellaneous antiques and curios, knew nothing about calculators and was missing the AC adapter, so it could not be tested. The calculator looked immaculate. I asked for and received a close-up photo of the battery compartment, which showed no evidence of corrosion, so I felt it was a reasonable risk and bought it. It turned out to be perfect, and had clearly seen very little use. It was clear to me in this instance that the seller was not being coy or deceitful, when she stated that it was untested. I am well aware of some of the weasels out there who mince words when it comes to the condition of items, and never even bother to bid on their auctions.

*Message #42 Posted by **Geoff Quickfall** on 3 Apr 2009, 12:23 p.m.,*
in response to message #41 by Hal Bitton in Boise

Hello Hal (got a spare, cheap?) ;-)

Your correct, no 19C YET.

As described earlier, maybe the price will come down. Got the partner there, the 29C and it actually gets used when I want RED GLOWING DISPLAYS in the cockpit!

The 41CX, 42s, 15c, 67, and lately the 48GX and 35s have made it to the office!

Also just added a restored 48SX and a 41CV. The 48SX I posted below and the CV needs a little cosmetic work.

The 41C, CV, CX will come with me to HPCC in Vancouver this fall. We will be setting up a large HPIL 41C working display. It will include printers, plotters, tape drives, floppy drives, laser wands and any other HPIL we can get a hold of.

Cheers, Geoff

Re: Math Curiousity...an old fashioned approach

*Message #43 Posted by **Michael de Estrada** on 3 Apr 2009, 2:52 p.m.,*
in response to message #42 by Geoff Quickfall

Just last week I picked up a HP-19C in perfect working and excellent cosmetic condition for under $200. I don't know if you would consider that a reasonable price, but from what I've seen in the past it seems pretty good.

Is the bottom middle calc an HP-10, and the bottom right an HP-91 or HP-92?

Michael

Re: Math Curiousity...an old fashioned approach

*Message #44 Posted by **Walter B** on 3 Apr 2009, 4:37 p.m.,*
in response to message #43 by Michael de Estrada

IMHO the bottom center calc looks like a HP20b, and the bottom right is a HP91.

Re: Math Curiousity...an old fashioned approach

*Message #45 Posted by **Michael de Estrada** on 3 Apr 2009, 5:23 p.m.,*
in response to message #44 by Walter B

Very good Walter. The middle calculator clearly has the wrong keyboard arrangement to be a HP-10 and the right calculator lacks the second blue shift key, so it cannot be an HP-92.

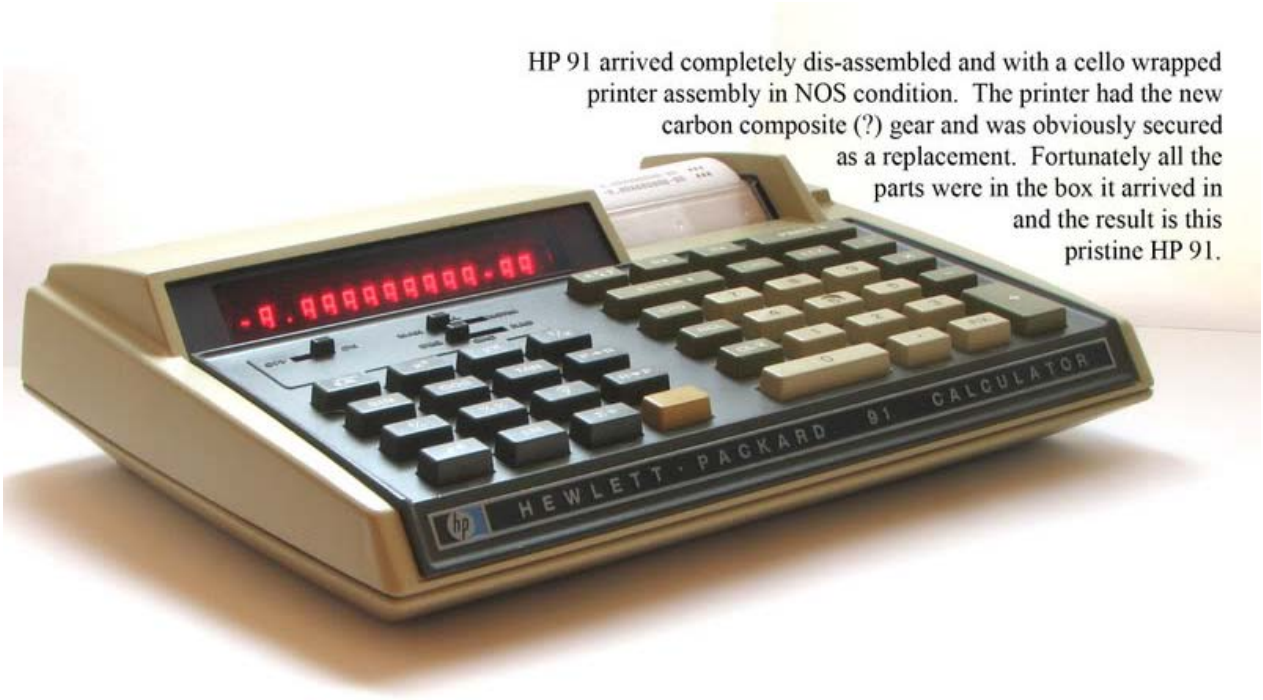
Re: Math Curiousity...an old fashioned approach

*Message #46 Posted by **Geoff Quickfall** on 3 Apr 2009, 10:01 p.m.,*
in response to message #45 by Michael de Estrada

Walter is right,

The 20B was lasts years HP gift for attending the HPCC 2009.

The 91 is an interesting story. It arrived in pieces in a box with a printer assembly still shrink wrapped. I had no idea if all the parts were there or not.



HP 91 arrived completely dis-assembled and with a cello wrapped printer assembly in NOS condition. The printer had the new carbon composite (?) gear and was obviously secured as a replacement. Fortunately all the parts were in the box it arrived in and the result is this pristine HP 91.

Well the new printer assembly had a carbon composite gearing system which precluded the need to repair the old gummy gear. I now have both printers systems working having repaired the gummy wheel on the original.

The only thing missing is the dust cover over the printer roll. Not bad for $25 USd.

Cheers, Geoff

PS:

```
top row     35, 45, 55, 65, 67
2nd row     41C, 41CV, 41CX  (cv was out for a spa),48G, 48G+, 48GX
3rd row     25C, 29C, 2 classic external battery charges, one
            topcat external battery charger, 41 card reader
            32E, 34C, 32SII, 42S
4th row     10C, 11C, 15C, 16C, 12C platinum, 71B metal back, 71B
            newer plastic back
5th row     97, 20B, 91
```

Since that photo I have added the 48SX posted below, a HP 28S and a new 35S.

Cheers, Geoff

evolution of computer power/cost

*Message #1 Posted by **db (martinez, ca.)** on 2 Apr 2009, 1:00 a.m.*

i just thought someone here might find this interesting.
http://www.dai.ed.ac.uk/homes/cam/images/MoravecsLaw.jpg
i wonder where the 41 and 48 fit in here.

unfortunately, it's old

*Message #2 Posted by **Frank Boehm (Germany)** on 2 Apr 2009, 8:14 a.m.,*
in response to message #1 by db (martinez, ca.)

Stopping at 200MHz (PII) (or PPC601 180MHz). Extrapolating 15 years of exponential growth (or is it even faster?) is quite hard - and then there's the "target" of 100 Million MIPS, is it equivalent to a human brain? Or do we need 10 times/100 times/a million times as many MIPS? I'd say nobody knows :)

Re: unfortunately, it's old

*Message #3 Posted by **Marcus von Cube, Germany** on 2 Apr 2009, 9:59 a.m.,*
in response to message #2 by Frank Boehm (Germany)

Brain is all about parallel processing and automatic pattern matching. I wouldn't try to measure that in MIPS.

Re: unfortunately, it's old

*Message #4 Posted by **Michael de Estrada** on 2 Apr 2009, 10:27 a.m.,*
in response to message #3 by Marcus von Cube, Germany

Very true. That is why chess engines tend to rely on the brute force approach with ever faster computers until they overwhelm even the best grand masters. Still, AI remains an elusive goal and Lieutenant Commander Data's positronic brain is just as much fanciful fiction as a mass transporter.

Re: unfortunately, it's old

*Message #5 Posted by **PeterP** on 2 Apr 2009, 11:08 a.m.,*
in response to message #4 by Michael de Estrada

hmm, some people beg to differ. I recently heard Ray Kurzweil at a conference in New York and then went on to read his books. He has very convincing arguments that we will achieve human brain capacity calculations in our life-time (and far beyond).

He estimates the processing power of the human brain to be between 10^14 and 10^16 MIPS (100 bn neurons x 1000 synapes per neuron x 200 calculations per second)

> Quote:

> The human brain has about 100 billion neurons. With an estimated average of one thousand connections between each neuron and its neighbors, we have about 100 trillion connections, each capable of a simultaneous calculation. That's rather massive parallel processing, and one key to the strength of human thinking. A profound weakness, however, is the excruciatingly slow speed of neural circuitry, only 200 calculations per second. For problems that benefit from massive parallelism, such as neural-net-based pattern recognition, the human brain does a great job. For problems that require extensive sequential thinking, the human brain is only mediocre.
>
> With 100 trillion connections, each computing at 200 calculations per second, we get 20 million billion calculations per second. This is a conservatively high estimate; other estimates are lower by one to three orders of magnitude. So when will we see the computing speed of the human brain in your personal computer?

(the whole article can be found here) Another related article about this can be found on his very informative web-page The Law of Accelerating Returns His book, 'The Singularity is Near' is definitely worth a read and I would guess the crowed here would generally enjoy it. A Wiki-summary can be found here

Last but not least, I found the slides he showed during his presentation. They are worth a quick peak. I find they quite convincingly show the smoothness and predictability of exponential growth. Highly recommend to take a peek...Graphs & Slides

Cheers

Looking at slide #81 in the Powerpoint presentation, we're only a year away from the disappearance of computers, when we'll all be wired directly to the internet. Pretty scary, really, but the ultimate dream for any totalitarian state.

Edited: 2 Apr 2009, 1:44 p.m.

Re: unfortunately, it's old

*Message #7 Posted by **Jeff Kearns** on 2 Apr 2009, 8:15 p.m.,*
in response to message #5 by PeterP

I have met Ray and read his "The Singularity is Near' book. All good stuff and well worth a perusal.

Frank Tipler, a professor of mathematical physics at Tulane University wrote "The Physics of Immortality" in the early nineties. Also a good read. In it, he estimates the storage capacity of the brain at 10^15 bits and the processing speed at 10 teraflops. He predicted that we will have machines capable of human-level processing capability (power and storage capacity) by 2030.

Time will tell...

So you thought only HP still makes RPN calcs

*Message #1 Posted by **Michael de Estrada** on 1 Apr 2009, 10:39 p.m.*

Victor V12

db's collection

Although most non-HP RPN calcs went out of production decades ago, you can still buy this one online, although I have never seen one in a store. Of course, HP doesn't really make the HP-12cp either, so I wonder who owns copyright on the code?

Michael

Edited: 2 Apr 2009, 11:06 a.m. after one or more responses were posted

Re: So you thought only HP still makes RPN calcs

*Message #2 Posted by **Howard Owen** on 1 Apr 2009, 10:52 p.m.,*

There was another 12C knockoff some years ago. I wonder how they get away with copying the 12C like that. I doubt HP still holds active patents on the 12C interface or algorithms, but surely they still hold a copyright on the ROM. So if the clone maker reimplements the machine, then maybe that's legal, or at least lawsuit resistant.

Regards,
Howard

Re: So you thought only HP still makes RPN calcs

*Message #4 Posted by **Marcus von Cube, Germany** on 2 Apr 2009, 3:13 a.m.,*

in response to message #3 by Michael de Estrada

It's a 12cp clone which has a rewritten OS. It might be possible that HP is only a licensee of this ROM and design and that the original Chinese manufacturer has the right to license the code elsewhere.

TDS 500K dead battery, pictures of the inside of the card and the battery.

*Message #1 Posted by **Geoff Quickfall** on 1 Apr 2009, 10:02 p.m.*

Well, I am hoping the rechargeable battery is actually the problem. The card 'PINIT" correctly and when I follow the TDS recharging suggestion:

Set alarm to wake calculator every 299 seconds, for 24 hours, thus recharging the TDS battery. This gives me about 40 hours of memory on the card with the calculator 'OFF', not the 30 days that it should.

After cycling the battery with charge up and run down cycles there was no change in the charge holding rate. The only option is to take the card apart:

```
1 heat the card with a hair dryer to soften the glue holding the metal label.

2 using a knife peel the label off, heating as necessary as you go

3 remove the battery

4 replace the battery

5 glue the back label in place
```

Interestingly I tested the card with the back off and the battery not attached. The card was "PINIT" and I archived the programs resident on the 48GX to :5:BU (port 5 label BU for backup).

The card worked and I could restore the calc from the archive using restore, port 5 and 'BU'. Of course I did not turn the calc off during this operation as there is no battery attached. This proved that my 'operating on the card' did not damage the card.

Do to the recharging system built into the card I cannot replace the battery with a regular lithium battery. I was thinking of this by creating a hole in the back label where the battery sits, installing a battery holder and voila, a replaceable battery system. But can't do it due to the charging logic of the memory card.

Here are some shots:

TDS 500K dead battery, pictures of the inside of the card and the battery.

TDS 500K dead battery, pictures of the inside of the card and the battery.

Thanks and use it well!

Finding the battery is a problem. One source in London,England quotes 10 pounds per battery ($15 Canadian).

No one in town will import them for the low demand although they appear to be the battery of choice for Casio solar powered watches.

ML-2016

Cheers, Geoff

Re: TDS 500K dead battery, the battery has been ordered. Thanks Katie!

*Message #5 Posted by **Geoff Quickfall** on 2 Apr 2009, 11:23 p.m.,*
in response to message #4 by Katie Wasserman

Thanks Katie,

I will get the dimensions as this is a tight fit. The label does not have to go back on once the new battery is in place. The internal cover of the HP is well protected.

Cheers, Geoff

hp 48SX repair success!

*Message #1 Posted by **Geoff Quickfall** on 1 Apr 2009, 5:32 p.m.*

Hello All;

Coincidentally this post seems relevant to a few differing posts below. Lets start with the story! I purchased this at the auction site with the following seller description:

THIS IS A HP 48SX CALCULATOR POWERS UP KEYS FUNCTION THE ITEM NEEDS NEW BATTERIES.

Not letting the word “function” confuse an otherwise cryptic description, I purchased with a “buy it now” thinking “ it would make a good rainy day project. Well, it is raining and the package arrived this morning.

Totally non-functional with the original batteries of which one had leaked! After cleaning out the battery hatch and installing new batteries I turned the calc on and no response.

Well, I read a previous post which suggested the foam rubber pressure pad for the keyboard contact to PCB may have flattened or rotted. Pressing on the keyboard just under the lcd panel and above the A – F keys did return functionality to the calculator. Of course not good enough as my carpentry clamps are to large to use! I did the selftest for the keyboard and rom/ram and they both passed as long as I kept pressure on the keyboard/PCB interface.

So I soaked the calculator, upright in luke warm diluted vinegar/water solution with the LCD panel above the water line. Followed this by a sequence of soak, wash and rinse baths always keeping the LCD panel dry. I did this in the attempt to dislodge dust and clean away any chemicals left over from the battery leak.

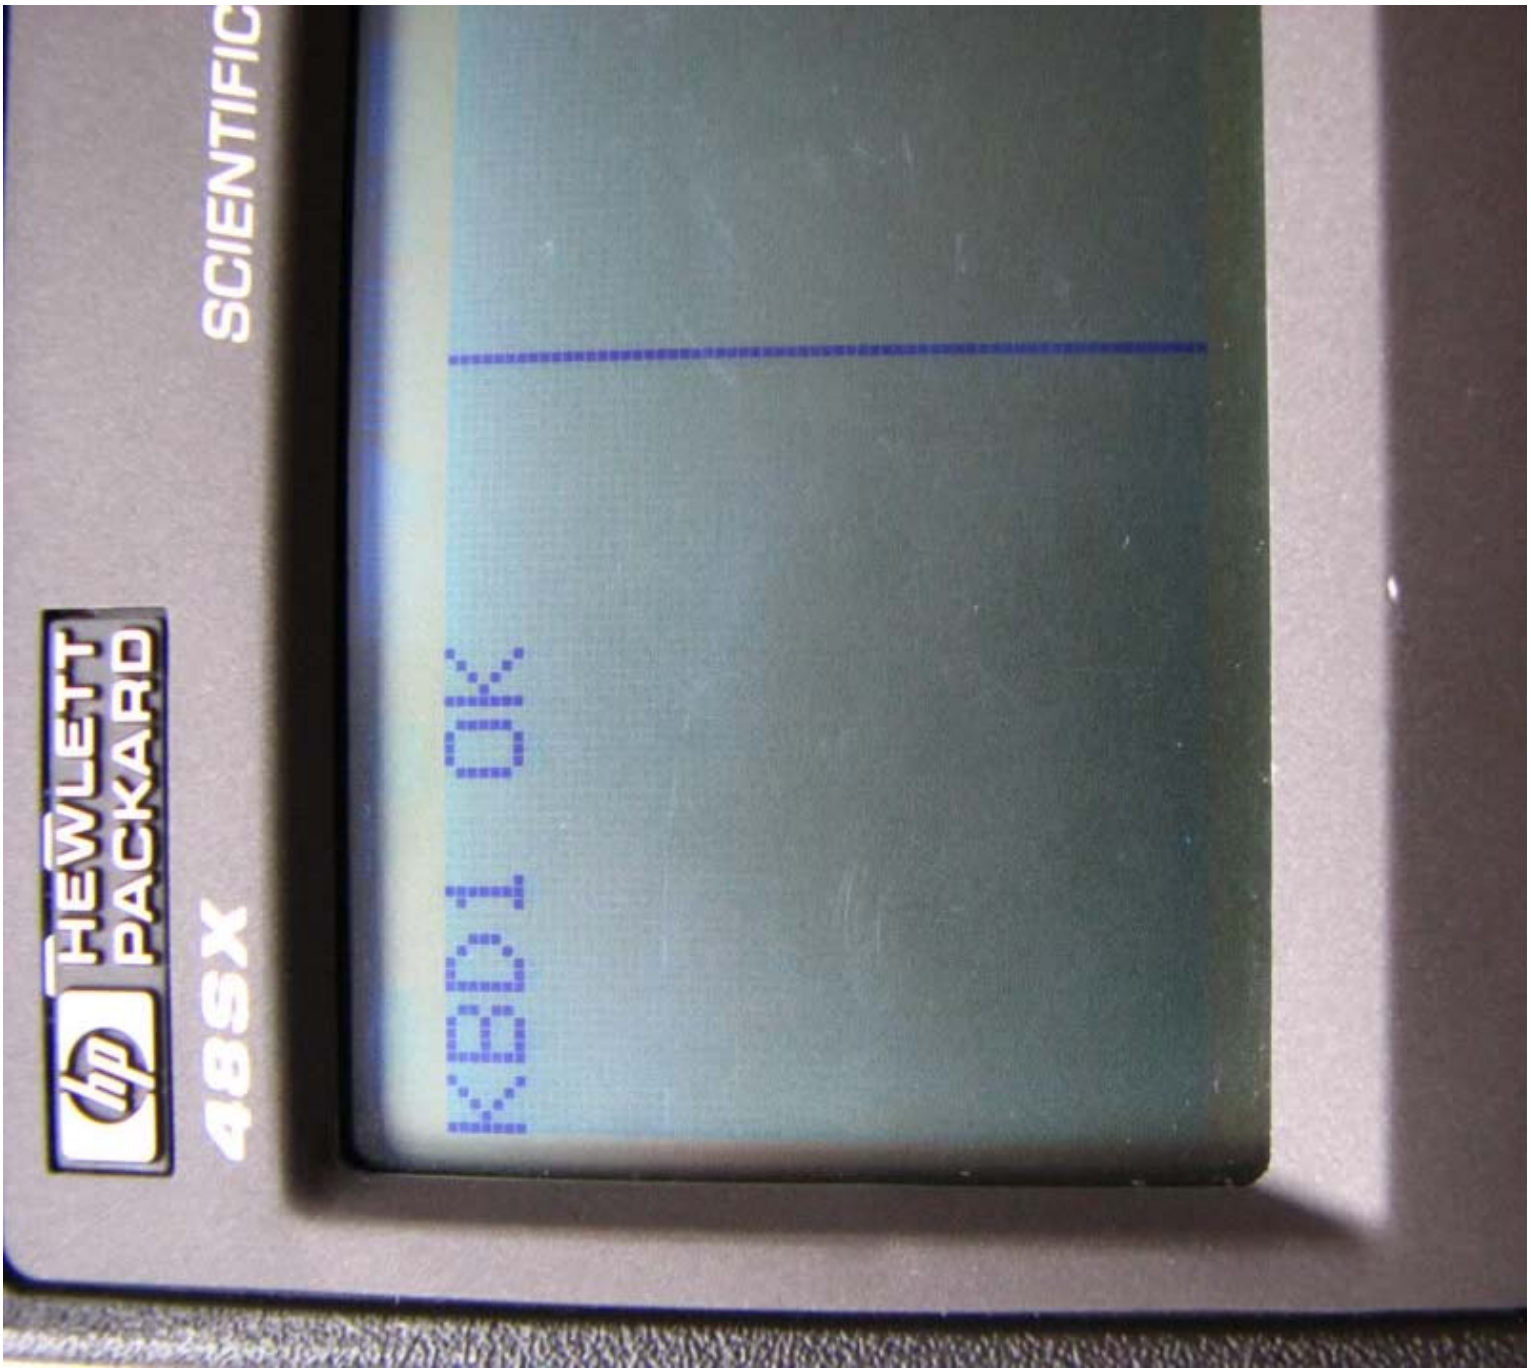
I then dried the entire calc with the ram access panel and battery hatch removed in a drying box:

Picture of drying box, the hair dryer has 2 3 position switchs. Fan (off-low-high), heater (cold-low-high)

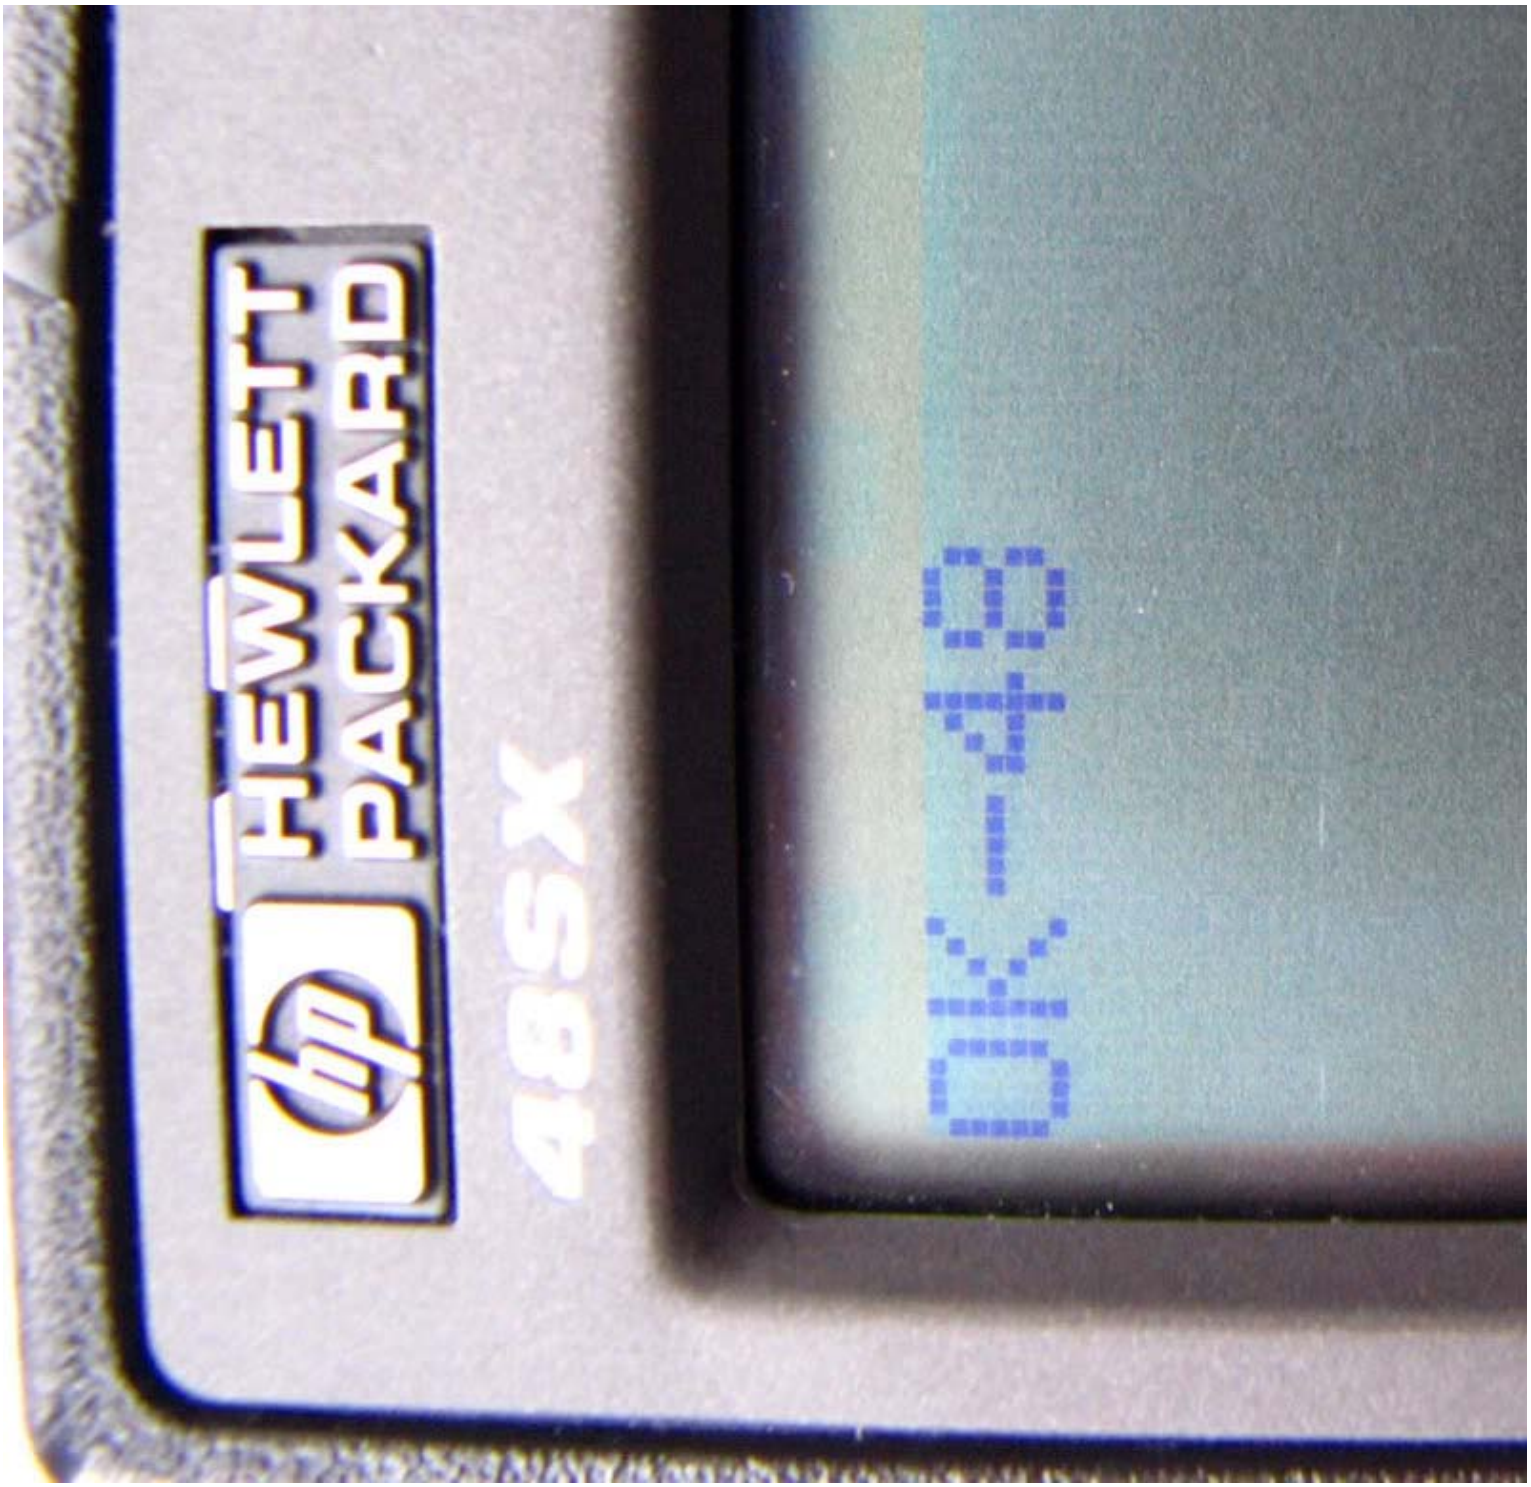
ZENITH
TRANS-
OCEANIC
D700Y
SHOE BOX OPENED
SHOWING HP 15C
SUPPORTED.

This did not fix the keyboard contact problem so next step was to open up the calculator. Using a few photo explanations I settled on opening the case without cutting or damaging the snap rivets. I carefully pried the case apart following the instructions.

After separating the case I removed the PCB by twisting the 6 tabs. This allowed me access to the keyboard foam, which I removed and replaced with a Mouse PAD foam cut to shape. Inserted this in the now empty slot, cleaned the PCB and LCD connections while I was at it. Then reassembled with the outcome shown:



SCIENTIFIC
HEWLETT PACKARD
48SX



HEWLETT
PACKARD
48SX

The calculator is snapped back together and the "function"s have been returned. The case is in excellent condition and the surgery left no scars.

Cheers, Geoff

48GII USB adaptor for serial cable

*Message #1 Posted by **Carl** on 1 Apr 2009, 1:49 p.m.*

Hello,

Are there any precautions I should be aware of when buying a USB to serial adaptor for my 48GII? I am under the impression that I need a USB connection to dump the ROM. I am using Conn4x for PC to 48GII communication.

Thanks!

Re: 48GII USB adaptor for serial cable

*Message #2 Posted by **Michael de Estrada** on 1 Apr 2009, 2:21 p.m.,*
in response to message #1 by Carl

It depends. If your HP48Gii already has Xmodem, then it should work fine. The adapter itself will register in the USB port as "new hardware", and you will install the drivers that came with the adapter. Once installed, it will show up in Windows Device Manager as a new serial port, which on my computer is COM3. When you connect your calc and run Xmodem, then Conn4x will find it on the new serial port. However, I have an HP-48SX, which does not have Xmodem, so I had to copy the file XSrvr48.hp from the Conn4x folder to my old DOS PC and then upload it via serial cable and Kermit from the PC to the calc. After that I had to attach it to the library in the calc before it could be run.

One other caveat. If you also have a HP-50g with a USB port that you are connecting to your PC, its USB drivers will be overwritten by those for the adapter, and it will no longer be recognized by the USB port. You would have to re-install those drivers, at which point the drivers for the adapter would be overwritten. Since I have a HP-50g, it was not worth the hassle, so I am no longer using the adapter. What I do instead is connect the HP-48SX to HP-50g via serial cable and connect the HP-50g to the PC via USB.

Hope this wasn't too confusing.

Michael

*Message #3 Posted by **Carl** on 1 Apr 2009, 3:11 p.m.,*
in response to message #2 by Michael de Estrada

Great information Michael. I only have a 48GII and it has Xmodem built into it. As a matter of fact, that is what I use to connect using the serial cable.

Do you or anyone else happen to know if I can dump the ROM using only the USB connection.

Re: 48GII USB adaptor for serial cable

*Message #4 Posted by **Michael de Estrada** on 1 Apr 2009, 3:46 p.m.,*
in response to message #3 by Carl

I don't know why it would matter. Either way, you are connecting via serial. In one case it is a primary COM port on your PC, in the other it is being emulated, but as far as your PC and the calc are concerned there is no difference. As long as the communication protocols are the same (Xmodem) and the settings such as BAUD and translation code match, then it should work either way.

Re: 48GII USB adaptor for serial cable

*Message #5 Posted by **Chuck Sommer** on 1 Apr 2009, 4:53 p.m.,*
in response to message #1 by Carl

Yes there are precautions, because you don't need an adapter. Your calculator should have come with a USB cable and your calculator is a USB device which should plug right into your computer (using the USB cable provided). If you don't have the cable for your calculator, you can purchase one, or find another device that you already own that uses the same cable. The cable is a USB-A to USB-MINI-B (some please comment if I got this wrong). If you own an MP3 player (not IPOD), Camera Card reader, PDA or digital Camera, there is a reasonable chance you already have a cable that will work.

Best of luck ... Chuck

> Best of luck ... Chuck

Chuck,

All I can say for myself is "DUH!". I looked right at that mini USB on the calculator side and did not make the connection, so-to-speak. My 48GII came with a serial cable. Of course, I have many of the USB-A to USB-MINI-B cable around here.

It has been so long since I worked with the HP connectivity and programming. I had my 48G+ for so long before the keys gave out. I no longer need ALL the features of the old girl but still wanted RPN and some programming capability.

Thanks for your input.

Carl

Re: 48GII USB adaptor for serial cable

*Message #7 Posted by **Egan Ford** on 1 Apr 2009, 6:07 p.m.,*
in response to message #1 by Carl

Why dump the ROM when you can download the ROM? It in debug4x as ROM.49G or Google file:ROM.49G.

The latest 48GII has both USB and Serial ports on them (same as 50g). With the 50g you can transfer equally as well via USB or Serial. Via Serial you need a special cable (http://commerce.hpcalc.org/serialcable.php), via USB, just a standard USB cable (no need for serial to USB). You would only need a USB to serial adapter if you wanted to use the 48GII serial port with the special cable to a PC that did not have a serial port.

As for ROM dumping, I have no idea if it dumps to a file and you transfer or if you have to dump to cable. If you have to dump to file then USB or Serial should be fine.

Egan,

Since I am new to the 48GII, I did not realize its ROM is as you have stated. Thanks for the info.

I wanted the ROM for Emu48. I find it is easier to try out programs by typing on my keyboard as opposed to keying into the calculator.

As I stated in a previous reply, my 48GII came with a serial cable. Probably an older version. I am going to try the USB connection Chuck mentioned.

Thanks for your help.

Carl

Re: 48GII USB adaptor for serial cable

in response to message #8 by Carl

EMU48 is part of debug4x, get that and you will have EMU48 setup to emulate everything from the 48GX to the 50g.

Tried the USB connection today and received a message that the devise is unknown. OS is XP sp3.

Re: 48GII USB adaptor for serial cable

*Message #12 Posted by **Egan Ford** on 3 Apr 2009, 12:51 p.m.,*
in response to message #11 by Carl

You need to install the HP 48g, 49g, 50g series Calculator Connectivity Kit. If you cannot find it try this link, however I do not know if this is the latest version.
ftp://ftp.hp.com/pub/softlib/software7/COL4344/ca-14082-8/Conn4x_English.exe

Google for a newer version if this does not work for you. If you also use Linux or Mac, then search for HPTalk (Linux) or HPConnect (Mac).

Re: 48GII USB adaptor for serial cable

Carl,

You have the latest version. See my comment below.

Michael

Re: 48GII USB adaptor for serial cable

*Message #15 Posted by **Carl** on 3 Apr 2009, 2:20 p.m.,*
in response to message #13 by Carl

Well, looks like I have the most recent version. I guess I can do without the USB connection.

Re: 48GII USB adaptor for serial cable

*Message #16 Posted by **Egan Ford** on 3 Apr 2009, 2:59 p.m.,*
in response to message #15 by Carl

Search the comp.sys.hp48 archives. And post any questions there as well, since that is the primary site for the 48, 49, and 50.

Re: 48GII USB adaptor for serial cable

*Message #17 Posted by **Michael de Estrada** on 3 Apr 2009, 2:16 p.m.,*
in response to message #12 by Egan Ford

I think he already has Conn4x installed. He just needs to start the new hardware wizard and browse for the drivers in the folder C:\Program Files\Hewlett-Packard\Conn4x\USBDriver.

Re: 48GII USB adaptor for serial cable

*Message #18 Posted by **Carl** on 8 Apr 2009, 11:42 a.m.,*
in response to message #17 by Michael de Estrada

Well, still no luck. I see the drivers, but I cannot get them to install.

When I connect the 48gii via USB I see an "Unknown Device" in my hardware device manager. When I try to install the driver from here or from the balloon that pops up at the lower right of my monitor, the computer can either not find it, even though I give it the location, or it tells me it is the wrong driver.

Go figure!

Which scientific calculator?

*Message #1 Posted by **M Manning** on 1 Apr 2009, 8:35 a.m.*

Hello everyone - this is my first posting to the forum.

Like a large proportion of the UK population in the 1980's I went through my school and University (BSc Chemistry) education armed with a Casio FX82 calculator having never heard of the joys of RPN. An allergy to lab solvents (not practical to be an organic chemist if you're sneezing constantly!) meant I left formal science for a career in finance and an introduction to RPN via the HP12C.

I planning to start an Open University maths degree later in the year and wondered what recommendations you may have re RPN calculators as I don't really want to go back to the FX82. Do I try and source an 11C or 15C to match the 12C or is a new 35S a better route.

Many thanks.

Re: Which scientific calculator?

*Message #2 Posted by **Michael de Estrada** on 1 Apr 2009, 9:25 a.m.,*
in response to message #1 by M Manning

I'm an old RPNer, who began with an HP-35, and progressed through an HP-15C and many other HP RPN scientific calculators to the present with a HP-35S and HP-50g. While I certainly feel that the HP-15C was the best all-around calculator HP ever made, from a practical standpoint, I think the most cost-effective solution would be an HP-35S. The quality seems to be reasonably good, the keys work well and it has a wealth of built-in functions. The problem with sourcing a HP-15C in good condition and including the manual is that it will cost you a fortune, since they are currently very much in vogue. One thing for sure, avoid the HP-33S, which has a horrible display and keyboard.

Good luck in your studies.

Michael

Re: Which scientific calculator?

*Message #3 Posted by **Nigel J Dowrick** on 1 Apr 2009, 1:49 p.m.,*
in response to message #2 by Michael de Estrada

My 33S has a lovely display and keyboard! I don't think it's just a matter of taste: I believe that the HP-33S was indeed of poor quality to start with, but this certainly isn't true of more recent models. See the wikipedia page on the HP-33S for more details.

Even though the HP-33S is no longer manufactured it can still be picked up new here and there. It does have some advantages over the HP-35S, such as: more of the important functions available unshifted; more useable base-N support; the exponent part of an answer always fits on the display. The HP-35S of course has many features that the HP-33S lacks, and these may be important to you.

The HP-42S is far better than both! (but much more expensive)

Nigel

Re: Which scientific calculator?

*Message #4 Posted by **designnut** on 1 Apr 2009, 2:17 p.m.,*
in response to message #3 by Nigel J Dowrick

I was startled to read thee 33s is no longer being made, so I looked at /www.shopping.hp.com/webapp/shopping/can.do?landing=calculator&category=Scientific&catLevel=1&storeName=storefronts and it is indeed listed for sale at $34. It has no learning curve and RPN programming. I think it's a great practical calc easy to use as a simple calc, has a great equation solver, I buy them on ebay as gifts. Sam 80

Re: Which scientific calculator?

*Message #5 Posted by **Michael de Estrada** on 1 Apr 2009, 2:39 p.m.,*
in response to message #3 by Nigel J Dowrick

Nigel,

Being from the UK, I assume that you use the comma (,) as the fractional separator. As a American, I use the period (.), and on the HP-33s display, it is almost invisible when certain numbers are entered. Try using . as the separator with 222222.222 entered. See my point (pardon the pun)?

Greetings from the other side of the pond, Michael

Re: Which scientific calculator?

*Message #6 Posted by **designnut** on 1 Apr 2009, 5:02 p.m.,*
in response to message #5 by Michael de Estrada

The problem with the invisible decimal on the 33S is so bad I suggest they abandon the simple period dot and use a more visible symbol, a short vertical dash or semicolon. For my use I switch to the EU method of using the comma as a bit easier to see. Sam

Re: Which scientific calculator?

*Message #7 Posted by **Nigel J Dowrick** on 1 Apr 2009, 5:17 p.m.,*
in response to message #5 by Michael de Estrada

In the UK we still use decimal points (.) for decimals and commas for thousands separators, just as in the US, although as a teacher I try to encourage my students to use spaces as separators to avoid confusion with the rest of Europe! Yes, I do see your point: however, it is only between pairs of 2's that I find the decimal hard to see. I had never noticed this before! With other pairs of digits the point is much more visible, at least to my (spectacle-enhanced) eyes. I assume that the HP-35s is superior in this regard.

Nigel

Re: Which scientific calculator?

*Message #8 Posted by **Michael de Estrada** on 1 Apr 2009, 6:01 p.m.,*
in response to message #7 by Nigel J Dowrick

Yes, the HP-35s is very superior to the HP-33s in this regard. Interestingly, the decimal point is the same size, however, the individual numbers are narrower, such that there is a greater separation between the base of the number and the decimal point. It is still not very good, mind you, but at least you don't need a magnifying glass to find it. If you want to see what a really good clear and legible display looks like, fire up any Voyager (HP-11c, HP-12c, HP-15c etc). Also, the HP-50g is very good in this regard, as it allocates a full space between adjacent numbers for a decimal point or comma.

Re: Which scientific calculator?

*Message #9 Posted by **Chuck Sommer** on 1 Apr 2009, 6:06 p.m.,*
in response to message #8 by Michael de Estrada

I believe that sometime during the hp33s product cycle they changed the display (about 1-2 years before the release of the hp35s). The hp35s was build with this new display. So if you get an hp35s you are guaranteed to get the better display, but you only have a 50-50 chance with the hp33s, unless you are knowledgeable about serial numbers.

Chuck

Re: Which scientific calculator?

*Message #10 Posted by **Michael de Estrada** on 1 Apr 2009, 6:28 p.m.,*
in response to message #9 by Chuck Sommer

I wonder if it also got the funky uncentered mantissa minus sign to go with the uncentered exponent minus sign. I've never been able to get used to that.

BTW The serial numbers for my HP-33s and HP-35s are CNA 430xxxxx and CNA 726xxxxx, which place their respective dates of manufacture at 30th week for 2004 and 26th week of 2007. I bought the HP-35s very shortly after it was first released.

Michael

Edited: 1 Apr 2009, 7:37 p.m.

Re: Which scientific calculator?

*Message #11 Posted by **Nigel J Dowrick** on 2 Apr 2009, 5:56 a.m.,*
in response to message #10 by Michael de Estrada

My HP-33s has a serial number starting CNA 702xxxxx, so it dates from the second week of 2007. I've looked at a few pictures of the HP-35s and its display looks very similar to that of my HP-33s, so perhaps there is no longer such a problem.

FYI, my HP-33s has a centred mantissa minus sign, but the exponent sign is level with the top of the "E"! So much variety.

Nigel

35s is fine for everyday number crunching, but the 50g would be much more useful to a math major like you.

Re: Which scientific calculator?

*Message #13 Posted by **Mike Morrow** on 1 Apr 2009, 10:28 a.m.,*
in response to message #1 by M Manning

Having used the HP-15C (I've got two) for more than 24 years, I am of the opinion that it is the most overrated and over-praised calculator that HP has ever made. It truely has a "cult" following, in every sense of the word. The facts are that it is very slow, it lacks the precision of later models, it is *very* awkward to use while holding in the hand (absolutely insane for a "hand-held" calculator!), it has very limited memory, it is non-intuitive to use without referral to the manual when dealing with advanced built-in functions (especially matrices), it has very limited display, it has no alphanumeric display, etc. etc. etc. ALL of these deficiencies are corrected in the later HP42S, with many many additional features added as well.

I carry one of my HP-15C units when there is some chance that harm could come to the calculator I'm carrying. It wouldn't hurt much to lose it, compared to one of my HP42S units.

Unfortunately, should one choose either an HP-15C or an HP42S, one will likely pay several hundred dollars for it. But there's excellent relief! Get a low-cost, modern, fast, fantastically-featured HP50g. But also obtain a printout of the 653 page HP49g+ Advanced User Reference (Yes...HP49g+, not HP50g). The manual that comes with the HP50g has little useful detail.

IMHO, the HP50g is the only calculator that competes in favor with the HP42S (though they are very different machines).

> I carry one of my HP-15C units when there is some chance that harm could come to the calculator I'm carrying. It wouldn't hurt much to lose it...

WOW! I've never heard such outright hatred for a product that literally saved HP's hide in the aftermath of the disastrous Spice series calcs. This product was extremely high quality and durable, which is why your 2 HP-15c's are still working today after apparently rough use. Of course it was slow and had limited capacity when compared to the modern calcs like the HP-50g; it was introduced almost 30 years ago! At that time, pre-PC microcomputers had a maximum of 64K RAM and were less than a thousandth the speed of current PCs. It may not have been good as a hand-held device, but was very shirt-pocketable and wonderful as a mini-desktop with its horizontal keyboard layout. And its key action was as good as any; certainly better than the HP-50g.

Yes, I agree that it makes more sense for the initial poster to buy a new modern calculator, be it the HP-35s or HP-50g (see my above reply), however, I think one should not vilify the HP-15c, which at the time was quite revolutionary with its capabilities and kept HP in the high-end RPN calculator business.

Hatred? Hardly. I have no emotional attachment to nor revulsion for things inanimate.

With respect to the HP-15C, there are a number of archived messages on this forum in which I'm on record stating that the HP-15C is the second best RPN calculator ever made. But the 27-year old HP-15C is a *very* distant second best, compared to the first place 21-year-old HP42S. There is simply NO rational justification for any preference for the HP-15C over the vastly superior, very negligibly larger, very much more capable yet easy to use HP42S. One only dreams what possibilities exist with modern technology today in the same size package.

So, no, I don't want to see a re-issue of a Chinese copy of the HP-15C. The commonly expressed desires for such are, IMHO, uninformed by knowledge of what was available in the HP42S six short years after the HP-15C first appeared, more than two decades before today. The unchanged HP42S would be a far better candidate for re-issue. Even better would be a modern version...like Walter's hypothetical HP43S.

in response to message #14 by Michael de Estrada

I'll offer my opinion of the importance of the HP-15C in "saving" HP's calculator business: It's nonsense.

At the time that the HP-15C was announced, the HP-41-series was the very successful premier calculator in HP's line. The LED-display Spice series was by then inconsequential and obsolete (although I am rather fond of my HP-34C, over my 1977 HP-67).

The Voyager series (HP-10C, 11C, 12C, and later the 15C and 16C) was directed at those who couldn't afford (in cost or size) the HP-41 system. The HP-15C especially was remarkable in its design capable of complex math, matrix math, a solver, and an integrator, all in a simple and small package (but more awkward due to the style-over-substance "cute" landscape keyboard design), all of which required ad hoc programming in the HP-41. I purchased an HP-15C just because of all it offered that my HP-41CX didn't without programming or the "Advantage" module.

I'd say that while the Voyager series helped HP's calculator business, it was the HP-41 series that was the real star all through the years that the Voyagers were being made.

I think you are waffling on this. First you say "I have no emotional attachment to nor revulsion for things inanimate" Now you say "I am rather fond of my HP-34C"

Anyway, I owned one of them crappy junky HP-34C things that fell apart after little more than a year, and the HP-15c was pretty much a functional equivalent for it. It cost about the same, did everything I needed from it and was bulletproof. Sure, the HP-41C was a lot more sexy, but it cost

3 times as much, and by the time you equipped it with modules and periferals, the cost skyrocketted. I propose that a lot more Voyagers were sold than HP-41C's to ordinary practical engineers like myself, who didn't need anything real fancy and just wanted a very simple and affordable device with all the functions directly accessible from the keyboard. For example, I used hyperbolics a lot and on the HP-15c you just hit f or g shift HYP and the function. On the HP-41C, you have to first buy a Math module, and then either type in the function name after XEQ or assign it to a key. Quite a tedius and expensive way to do something simple. So trying to compare the Voyagers to the HP-41C is meaningless. I still say that HP saved the day in the basic calculator business after the bad taste that the Spice calcs left with their replacement by the Voyagers.

That "cute" design seems to have really caught on with finance types. I even know some engineers that prefer it, though it's certainly arguable either way.

> Quote:
>

I agree with this, except that HP never stopped making Voyagers. (Arguments that latter day 12Cs aren't "real" Voyagers will be summarily dismissed. :)

> Quote:
>
> The facts are that it is very slow, it lacks the precision of later models,

The 1982 HP-15C has the same processor as the 1979 HP-41 (albeit "declocked"). The faster Saturn processor, programmed for 12-digit results, did not appear in RPN models until 1988. Six years was a long time to wait for an affordable RPN alternative to reserving time on the mainframe or buying an expensive, primitive early PC.

> Quote:
>
> it is *very* awkward to use while holding in the hand (absolutely insane for a "hand-held" calculator!),

But it's superb for desktop use, with the user's hand moving in a natural side-to-side motion, instead of back-and-forth. The display is moved closer to the user with the calc near the edge of the desk -- as with students, and engineers before they had PC's with pulled-out keyboard tray on their desks...

> Quote:
>
> it has very limited memory,

More than the base HP-41C (and more than the successor HP-32S/SII)...

The 64 allocatable and 3 non-allocatable registers (two used for matrix indices) made it possible to invert an 8x8 real-valued matrix.

> Quote:
>
> it is non-intuitive to use without referral to the manual when dealing with advanced built-in functions (especially matrices),

I disagree vehemently with that -- espcially when one compares usage of SOLVE and INTEG with that of the HP-42S. Linear algebra on the HP-15C requires the user to perform more manual steps, but these are methodical and logical. It is important that the HP-15C user understand linear algebra.

I rarely if ever need to consult the HP-15C's excellent manual. One exception would be inversion of a 4x4 complex matrix -- better to use an HP-42S or RPL-based model for that. But it *can* be done on an HP-15C...

> Quote:
>
> it has very limited display, it has no alphanumeric display,

It is what it is, but the display is easy to read...

Needless to say, this topic has come up before:

The HP-15C is a quality-made device, especially after the early models (which have all that bizarre

black ESD and moisture intrusion plastic wrap and multi-piece PCB construction inside) were replaced by the simple single open PCB versions. The Voyager-series LCD clarity, keyboard feel, and overall appearance are among HP's best ever.

Many of the comparisions that are being made refer to advantages of the HP-15C compared to earlier or contemporary HP models. I agree with those comparisons...there wasn't IMHO an overall better RPN calculator being made than the HP-15C *before* the HP42S. My comparisons have always been of the HP-15C to this later HP42S, in which one would naturally, logically, and correctly assume that the earlier HP-15C would suffer. But to monitor this and other related discussions, the uninitiated would be led to believe that the older unit not only performs as well, but is actually preferable in most respects. HP-15C fanatics seem to be affronted by any assertion that anything better ever replaced it. That outlook simply does not reflect reality.

FWIW, here are a couple of additional features which HP-15C fans don't often point out. Have you ever wanted to record the output? The HP42S IR printer output makes this easy. Have you ever run a program that required user input during the run? It would be nice if a beep or other sound could be generated when the program halts for input. That's no problem with HP42S. The Voyagers provide neither I/O feature.

I contest the HP32S/SII being suggested as the successor to the HP-15C. It very definitely was not, as anyone who had used the HP-15C would quickly discern (with great disappointment, as I did) after buying a 32SII as a replacement. The 32S/SII was much more a replacement for the HP-11C.

Only the HP42S was the worthy non-RPL successor to the HP-15C. This was true in 1988, and it is still true today, more than two decades later.

FWIW, it was strictly for ESD protection. Within the calculator engineering group it was affectionately referred to as "the black diaper".

Yes. Finally, something we can agree on. The HP 32SII lacked matrix math, which the HP 15C first

introduced. I never bought an HP 32SII, however, a non-RPN colleague gave me one the company had given to him, and he never used. The only thing I ever used it for was to perform fractional arithmetic. By that time, I had bought an HP-48SX, which I used for all my heavy lifting, while I still used my HP-15C for simple non-programming tasks.

Re: Which scientific calculator? (HP-15C)

*Message #24 Posted by **Egan Ford** on 2 Apr 2009, 5:10 p.m.,*
in response to message #19 by Karl Schneider

I'll also add that the 15C was/is better built. I'm on my 2nd 42S and it has problems (resets itself when pressure applied to upper corner).

Another 15C plus is seeing all the functions right on the front. And anything missing is on the back, printed on metal. Although, I like the 42/48... menus as well, but, I do wish the 42S had that 3rd function/key.

Lastly, I'll just express my opinion. The Voyager series is with out a doubt the most visually appealing of any calculator (with the exception of the 71B which as we all know is just a Voyager++ :-). The layout of the Voyager is stunning, the metal, the lines, the medallion, the use of *gold* on the 12C, the metal legend on the back, the recessed keyboard, the high contrast clear labels, the slanted keys. The Voyager is a work of fine functional art. And, if only business types buy it (12C) today, well then, they just have good taste.

P.S. I've posted this before. When my daughter painted her interpretation of a calculator she was secretly draw to the Voyager for inspiration:

I second Mike's opinion. In the set of RPN calculators, the 42S is by far the best you can get. Please note the 50G is RPL, i.e. something different (see earlier discussions in this forum).

If you need a quality calculator for number crunching, the 42S is the one IMHO. If you want faster results, and some way to backup your programs, get Thomas Okken's Free42 on your PDA. If you look for more math, get the 50G or a nice application for your notebook.

Having used the 15C since 1983 and the 49G+/50G for some years, I would definetly recommend the 15C. Not only for the size and cult status, but more for the reason that you most probably will not be allowed to use the 50G on a written exam... You can get the work done on a 15C, just need to learn a bit more math yourself (and not to rely on the awesome math-machine). However if you may use it, then bear in mind that there is a

tremendeous power in the 50G, but it takes the hours (looong and many, many :-) to get the full potential out of it.

Cheers, Matti (Sweden)

Since you will be pursuing a math degree, I would recommend a 50g, since a graphing calc may well be required for some classes. Last year I took two refresher college math classes where that was indeed the case. My 50G served me very well, and it was fun to (sometimes) trump the Ti89's that dominated the rest of the class.
Best regards, Hal

> Best regards, Hal

I agree. Thiel College has a Maths faculty that uses the HP 50G with RPN as the OS of choice.
http://www.thiel.edu/Mathproject/CalculatorLessons/Default.htm

It's true that the 50g has a steep learning curve, but I have persevered and sought out as many non-HP resources on the calculator to reinforce my understanding of the calculator.

This topic was bound to set off a cascade of strong opinions here. :) It's actually one of the forum's perennial topics, though I always love reading new variations on the old theme. This time around I even see a detractor of the HP15C. That's definitely heresy, and I find it refreshing and interesting, even though I love my 15Cs.

You say you are transitioning from a career in finance. That may mean you could afford a 35S *and* a 50G. They both have strengths and weaknesses that have been noted here already. And if you get really crazy, you could start buying up some of the classic models, and become an HP calculator addict like most of us here. :)

I might add that a math degree on Open University has its own requirements. If you start from scratch (you probably won't, with your background) with MU120 & MST121 they expect you to use a TI-83. In MST121 MathCad is included and from there on my guess is that you don't need a calculator (there are several software packs used in the courses, but they are included in the course fee) and that a calculator like 50g might not be allowed on exams.

I suggest that you contact the University, they will be able to advice you. When that is straightened out, go ahead and but a HP RPN anyway, I have a 34C, a 35S and a 49g+ - and I am an OU addict.

Organic Display Technolgy - Don't miss TI's latest Four-Banger!

*Message #1 Posted by **Joerg Woerner** on 31 Mar 2009, 11:21 p.m.*

Dear HP calculator collectors,

You heard probably from Canon's latest "Think smart - Think green" initiative in Europe and Australia. Calculators manufactured from recycled copiers! One copier generates about 4 lbs of re-usable plastic material, enough for more than 50 four-bangers.

For sure, the manual and box is made from recycled paper.

Texas Instruments once again proofed its leadership in calculator technolgy and released - forty years after the invention of the single-chip calculator circuit and shy 3 weeks before the Earth Day - the latest model called Execulator.

It is manufactured from renewable resources, uses neither batteries nor solar cells, and sports even the latest organic display technolgy. Due to the limited logic elements of the technolgy it lacks a percent function but has one constant memory!

There are only few images available yet, but the Datamath Calculator Museum received one of the very first prototypes.

Have a nice week!

Regards, Joerg

HP 20b: test-menu

*Message #1 Posted by **Thomas Klemm** on 31 Mar 2009, 6:05 p.m.*

Recently I wanted to change the display mode on my HP 20b to show all digits but I did't remember how to do that. I didn't find the answer in the small booklet that came with the calculator so I searched online where I finally found it in the training module Operating modes, clearing options and error messages.

Why not in Interest rate conversions or Hyperbolic functions I wondered.

However I was happy to find what I was looking for and of course it suggests itself to use FIX = -1 for that in the Mode-menu whereas you have to use the dot in the *shift-shift-digit*-shortcut, if you know what I mean.
The important thing is always: be consistent!

For a moment I remembered a recent post of John H Meyers on comp.sys.hp48 where he stated:

> Quote:
>
> ```
> In 48GX, the STAT DATA menu (...) contains a [\GSDAT] label.
>
> The left and right shift keys cause that menu key
> to generate STO\GS and RCL\GS commands, respectively
> (best seen when editing in PRG mode).
>
> This is similar to how STEQ and RCEQ commands are generated
> by the [EQ] label in the SOLVE ROOT menu (menu 75 on "G" series).
>
> A number of other menus generate useful complete structures
> when shifted, e.g. the various labels in PRG BRANCH
> (menu 23 in "G" series):
>
> LS IF -> IF THEN END
> RS IF -> IF THEN ELSE END
>
> Try all the others and see!
> ```

Obviously there were times people at HP designed things very clever.

But the worst thing of the Mode-menu is pressing the [=] button until the number of digits you want is displayed. The stack is cluttered with all the numbers you went through and your worthy results are lost. You should have known better not to use the [=] button!

However all this has nothing to do with the subject but that's how I found the lines with the description on how to perform a MEMORY CLEAR:

> Quote:
>
> The "master clear" of the HP 20b is accomplished when the following sequence is executed:

- press and hold [ON/CE]
- press and hold [N]
- press [FV]

DO NOT DO THIS IF YOU WANT TO KEEP ANY INFORMATION THAT IS IN YOUR CALCULATOR.

I can assure you that you will not loose any memory. I tried it several times. And then I tried [ON/CE] [N] [Amort] as I would do on most other HP-calculators and

All Reset

appears.

Then I tried the other button [PMT] next to it on the left since you knewer know, right? And alas we enter a test-menu:

- Tst Screen
- Tst Keyboard
- Checksum
  - 213.213
- Tst Battery
  - Bat Lvl = 3.0
- SW Version
  - 6 24 2008 2
- (c) Copyright 2008 HP Dev. C., L.P.
  - 2,048.000
- TSys
  - On
  - Off

In the screen-test you can press any key and the anounciators and the display will be shown which is always funny to do. So after a while playing with that I entered the keyboard-test which was a big mistake: first you may think you have to press them in a specific order but then you might try to produce an error and skip one and nothing happens and then you start wondering which of the keys will bring you out of this menu and at the latest now you're relieved somebody at Apple invented the paperclip-trick.

However if you skip keyboard-test and succed to exit the menu you will find that this is yet another method to set FIX = 3 on this amazing machine.

No wonder the ratings in the customer reviews are so bad.

Kind regards
Thomas

BTW: Any idea what this TSys-menu is for?

Re: HP 20b: test-menu

*Message #2 Posted by **Gene Wright** on 31 Mar 2009, 8:21 p.m.,*
in response to message #1 by Thomas Klemm

Gene responded in a rather foul mood...

Thomas wrote: "Why not in Interest rate conversions or Hyperbolic functions I wondered."

Gene: Well, how much redundancy do you want? I guess the material in Operating Modes module could have been reproduced in every other module. And, who is to say that someone needed to change the number of decimal places in those modules you mention? One other thing on this point - the shortcut to set -1 as the FIX setting was mentioned in the Datafile review I prepared for the machine. The shortcut of shift shift was added very late. I didn't find out almost until the review was done. Should every module have instructions on how to turn the calculator OFF?

Regarding the keys, you'd have to ask someone at HP. I wish they clicked too. The small guide is what it is. Menus are a philosophical choice to not have large quantities of functions on the keyboard. "Most" buyers don't like cluttered keyboards - they don't seem to buy calculators that have them. I am not "most" buyers and neither is anyone else here. If the choice is to have a menu such as the MATH menu that has 4 probability distributions or to have none at all, what choice should be made? I'll take the menus.

Yes, there are trade-offs compared to the "key per function" 12c style machine. The 20b still beats the pants off the TI competition.

Thomas wrote: "BTW: Any idea what this TSys-menu is for?"

Gene: Yes.

Re: HP 20b: test-menu

*Message #3 Posted by **Thomas Klemm** on 1 Apr 2009, 6:24 p.m.,*
in response to message #2 by Gene Wright

Hi Gene

Hope you're in a better mood again. It was not my intent to upset anybody here in this forum and if I did I would kindly ask to accept my apologies.

After all it was my fault. I should have looked in the User Manual first where I would have found the information I was looking for. However I faintly remembered it might be in one of the training modules so I was searching there first. But there are several documents and I didn't know exactly what to search for.

So in the end, the documentation concerning this issue is ok. Still I think it's missing in the printed booklet I have at home.

> Quote:
>
> If the choice is to have a menu such as the MATH menu that has 4 probability distributions or to have none at all, what choice should be made? I'll take the menus.

Most of all I prefer a calculator I can trust. What's the use of a logarithm in a menu when it doesn't give the correct answer? It's not that I have to rely on that in my daily life. But at least I start to mistrust the whole machine then.

> Quote:
>
> The 20b still beats the pants off the TI competition.

The only TI calculator I've ever bought was a TI-25. But that was quiet a few years back. So I can not really tell. Still I can compare the HP 20b to some other HP-calculators.

Kind regards
Thomas

hello,

>I didn't find the answer in the small booklet that came with the calculator..

it is there in the first chapter, 'Basic feature' page 9 of the user manual.. you probably spiked toward more advanced features and missed that one... the function is located in the Mode menu like in most of the other modern HP calculator like the 49 series.

>But the worst thing of the Mode-menu is pressing the [=] button until the number of digits you want is displayed. The stack is cluttered with all the numbers you went through and your worthy results are lost. You should have known better not to use the [=] button!

That might be something that I can fix, but no guaranties here I am running out of ROM space :-(

> [memory clear] Where did you see the documentation about ON+N+FV? we need to correct that...

> [test menu] Well, the test menu is not designed for end users, so don't complain there :-) to exit the keyboard test, press ON+PMT again by the way. the FIX=3 is set in order to make sure that the checksum shows OK and the system was not designed for a menu to have an action executed at exit (ran out of memory space), so sorry about leaving that at 3... but as stated above, you don't have much needs to go to the test system menu. BTW, if you set test system to ON, it will drain your battery fast as it enables the auto test system and continuously runs the CPU at full speed listening to the RS232 port...

Hi Cyrille

Thanks a lot for your clarifications.

May I ask you a few questions in relation to this issue:

- Is there a list of known/fixed bugs together with the release?
- What is the desired procedure for us to post a bug?
- And how should we report issues with the documentation?

Kind regards
Thomas

hello,

> Quote:
>
> Is there a list of known/fixed bugs together with the release?

so far, the known 'bad/math' bugs that I can remember are - the log bug (when |exponent| is >=10) which has been corrected (althrough I do not remember the new release date) - the IUTPN bug for number 1e-14..0.13 and 1-previous interval they are of course some other bugs, mostly UI or crashes, but these 2 ones are the only ones that will return a bad result..

- What is the desired procedure for us to post a bug? send em an email, or contact HP and it should get back to me

- And how should we report issues with the documentation? same as above.

Bug in HP 20b: nCr with non-integer r

*Message #1 Posted by **Thomas Klemm** on 31 Mar 2009, 3:28 p.m.*

In RPN mode I tried to calculate:

```
1
INPUT
0.5
nCr
```

The calculator then hangs with a blinking shift-indicator. The keyboard doesn't respond. Even trying to reset the calculator with the triple keys: [ON/CE] [N] [Amort] doesn't work. I had to press a paperclip through the small hole on the back, after removing the cover.

SW Version 6 24 2008 2 is used.

Is this well known?

Now you tell me I should instead use:

```
   n!
---------
r! (n-r)!
```

And funny enough it works.

Edited: 31 Mar 2009, 3:41 p.m.

Re: Bug in HP 20b: nCr with non-integer r

*Message #2 Posted by **Michael de Estrada** on 31 Mar 2009, 4:42 p.m.,*
in response to message #1 by Thomas Klemm

nCr is valid only for integer values, so what you were getting was an error indication. OTOH, n! is valid for fractional values in the general case of the Gamma function, so it works. However, the calculation that you did was meaningless, as there is no such thing as the combination of 1 items taken 0.5 at a time. As to why your calculator would not reset, perhaps it became very angry at an attempt to misuse its functions and decided to lock you out. ;>)

Re: Bug in HP 20b: nCr with non-integer r

*Message #3 Posted by **Paul Dale** on 31 Mar 2009, 5:49 p.m.,*
in response to message #2 by Michael de Estrada

nCr can easily be extend to majority of the complex plane:

```
                1
nCr = ----------------------
      (n+1) beta(n-r+1, r+1)
```

Is this sensible? Who knows :-)

in response to message #2 by Michael de Estrada

> Quote:
>
> so what you were getting was an error indication.

The error indicator for the same entries for nPr is:

```
ER: oo Result
```

While for other invalid like r > n values you would get:

```
ER: Invalid Input
```

One of the above I could accept as an error indication but not blocking the whole calculator.

> Quote:
>
> However, the calculation that you did was meaningless

You are kindly requested to scroll down to "Generalization to real and complex argument" in this article about Binomial coefficients.

Actually I was just playing around with the calculator and wondered what if I wanted to calculate "Newton's binomial series" for an exponent of 0.5? And then I got it wrong and mixed n and r. So at least for me it makes perfectly sense to calculate say nCr(0.5, 5):

It's the coefficent of x^5 in the Taylor series expansion of $(1 + x)^{1/2}$.

In a way it's exactly the same as you probably would expect if n were an integer. So the interesting thing in math is to give meaning to seemingly meaningless things.

Re: Bug in HP 20b: nCr with non-integer r

*Message #5 Posted by **Michael de Estrada** on 31 Mar 2009, 7:22 p.m.,*
in response to message #4 by Thomas Klemm

The intended purpose of the nCr and nPr functions are to compute combinations and permutations of discrete objects, such that the n and r values must be integers to have any meaning. The calculation of these functions is made using the integer factorial function, which is defined for only non-negative integer values. The fact that this a special case of Gamma, which extends to real numbers or even complex numbers is irrelevant to the intent of the nCr and nPr functions. I have yet to find a calculator with these two functions that permit non-integer values.

As far as your calculator locking up, well of course I was just joking when suggesting that it should do this. Some of my older calcs blink to indicate an error message, and I don't own an HP 20b, so I'm not familiar with its error indications.

An error indication could be easily cleared so the user could continue to use the calculator. In this case, the calculator froze up completely, so I'd call it a bug.

Re: Bug in HP 20b: nCr with non-integer r

*Message #7 Posted by **Chuck** on 31 Mar 2009, 4:43 p.m.,*
in response to message #1 by Thomas Klemm

My guess is that the factorial function actually utilizes the gamma function, and nCr has an algorithm that does not utilize gamma.

<Michael got there first>

While working on this, I decided to try it out on the HP-42S. Of course the nCr button with non-integers doesn't work. The factorial function also doesn't work because there is a built in gamma function. Here's a little program I wrote for the HP-42S to do it...

```
01 LBL "NCR"
02 STO 01
03 Rolldown
04 STO 02
05 1
06 +
07 GAMMA
08 1
09 RCL+ 01
10 GAMMA
11 /            "divide"
12 RCL 02
13 RCL- 01
14 1
15 +
16 GAMMA
17 /
18 RTN

Put two numbers on the stack and execute NCR
```

It's most likely not the shortest such program, but works like a charm on your non-integer problem. But, now the REALLY STRANGE PART....

...in doing a problem like 5 nCr 5 or 5 nCr 0 on the 42S I get for an output

```
Out of Range
x: 1.0000
```

However, stepping through the program to trouble shoot it, there is no "Out of Range" warning. And, executing the SAME program using Free42 on my ipod I get no "Out of Range Error". Can someone explain that to me?

HP-42S: nCr with non-integer r

*Message #11 Posted by **Karl Schneider** on 1 Apr 2009, 2:25 a.m.,*
in response to message #7 by Chuck

Chuck --

Your program works just fine on my HP-42S models with different ROM's (1989 flat screen 2939Sxxxxx and 1990 recessed-screen 3047Sxxxxx).

One obscure point: The numbered storage registers must be dimensioned to store real-valued numbers, not complex. Taking ABS of a recalled number before GAMMA is a work-around if the recalled value is x + i0 or x ∠ 0.

A related point: There is a minor bug of COMB and PERM in the *redesigned* (recessed-screen) versions of

the HP-42S:

Re: HP-42S: nCr with non-integer r

*Message #12 Posted by **Chuck** on 1 Apr 2009, 11:06 a.m.,*
in response to message #11 by Karl Schneider

I'm still baffled. When I set flag 24 to ignore "Out of Range" errors I get 0 as a result for 5 nCr 5, and 5 nCr 0. And, setting flag 25 in program (skip error) to pinpoint which step is causing the error, I discovered two different situations.

1) "Out of Range" error occurs on the LAST gamma function for the 5 nCr 5 problem

2) the SECOND gamma causes the error on the 5 nCr 0 problem

The error doesn't occur when I reprogram with the factorial function (but this defeats the non-integer usefulness).

So, clearly there is a bug with GAMMA when executed in a RUNNING program (I don't get the error when stepping through the program.) If not a bug, then I have a very unique calculator.

I'll keep exploring.

*Message #15 Posted by **cyrille de Brébisson** on 1 Apr 2009, 10:27 a.m.,*
in response to message #1 by Thomas Klemm

hello,

1 0.5 nCr should return an Invalid Input error. However, I do seem to recall that early version of the SW had a bug there and were not checking on the inputs.

the calculator does not use the factorial formula because it would lead very rapidly to numbers above the calculator precision and cause lost of precision, instead it uses a loop... as a result, of course, if you have i=0.5 and loop doing i-1 until i=0.... you never end and crashes the calculator :-(unless you have the version that actually tests for it...

Cyrille,

Finally, a logical explanation. What is the actual algorithm that is used here? I know you say it is iterative, but exactly how does it work?

Michael

Re: Bug in HP 20b: nCr with non-integer r

*Message #17 Posted by **Paul Dale** on 1 Apr 2009, 5:10 p.m.,*
in response to message #16 by Michael de Estrada

I'd imagine the iterative algorithm used is:

$$nCk = \frac{n}{k} \cdot \frac{n-1}{k-1} \cdot \frac{n-2}{k-2} \cdot \ldots \cdot \frac{n-(k-1)}{k-(k-1)}$$

I cannot think of a better alternative.

However, I'd use:

```
nCk = EXP( lngamma(n+1) - lngamma(k+1) - lngamma(n-k+1) )
```

With a round to nearest integer if the inputs are both integer.

yep, exactly, and since it gets to maxreal realy fast for inputs that overflow, time is not critical there...

cyrille

Re: Bug in HP 20b: nCr with non-integer r

*Message #19 Posted by **Michael de Estrada** on 2 Apr 2009, 10:51 a.m.,*
in response to message #18 by cyrille de Brébisson

So, are you saying that the loop counter is on the denominator, and that it checks for exactly = 0, rather than <= 0, so it continues looping indefinitely? By my reckoning, the second product will produce 0, so all subsequent products will be 0, such that an overflow condition will never occur, which would then halt the calculator with an overflow error indication.

Re: Bug in HP 20b: nCr with non-integer r

*Message #20 Posted by **Paul Dale** on 2 Apr 2009, 10:17 p.m.,*
in response to message #18 by cyrille de Brébisson

True so long as you also reduce things via:

```
nCk = nC(n-k), when k>n/2
```

Otherwise you could be in for a long long wait...

Think 1,000,000 C 999,999

A pair of 21S with sticky keys

*Message #1 Posted by **Peter Klein** on 30 Mar 2009, 11:39 p.m.*

I have been given a pair of HP21S calculators--algebraic Pioneers with a lot of statistical functions. The problem is that both have had something sticky spilled onto and into the keyboards--probaby sugared coffee or tea, or soda pop.

One of them works, mostly, but many the keys are sticky and a couple are intermittent. The other one is like the first, only worse.

As they are not RPN, I'm not really interested in them for myself, but hey, they're HPs. I know the Pioneers are difficult and risky to open, and I really don't want to get into that myself. I'm wondering if there's a way to flush them out and dry them without opening. If I can get them to work, I'm sure they'll make someone happy. If not, no great loss, and they could be used for parts.

Can anyone point me to online instructions for dealing with this kind of issue? Thanks!

--Peter

Re: A pair of 21S with sticky keys

*Message #2 Posted by **Philippe Lasnier** on 31 Mar 2009, 8:42 a.m.,*
in response to message #1 by Peter Klein

Hi Peter,

I guess that if you don't really want to open up the Pioneers, then the only thing remaining is trying to clean them "from the outside".

My somewhat narrow experience in the matter dates from a few months ago. I had read that besides the usual boil-in-this boil-in-that directions, you could also clean up using an ultrasonic cleaner. One guy in particular was reporting that he always cleaned mobile phones (as a business reselling them) that way.

Having acquired an HP-48SX whose keyboard was constantly playing up, I thought I had nothing to lose; I bought an ultrasonic cleaner with a large enough tank to fully immerse the calculator, and put it through a few cycles with warm water and the built-in heater full on.

I actually overdid it a bit, because the paintwork on the bezel became dull, and flaked off where it had been impacted (the impacts sites were not visible beforehand) - BUT the keyboard worked again! :-)

Later on I tried the same on an HP-28S which was unbelievably dirty, grimmy, and seemingly melted in places, but working. I was less successful: I managed to clean it in a major way, but I've lost 6 pixel columns on the display.

So, a 50% success rate. If you've got nothing to lose, then I would suggest that you clean up the calculators as much as you can first by hand, and then cycle it a few times in an ultrasonic cleaner (assuming you can get access to one).

Take the batteries off first, obviously, and short the battery contacts briefly (or leave the calculator untouched for a while) to discharge any residual energy (the one used for preserving the memory while the batteries are off). After cleaning, leave somewhere warm for a while (like an airing cupboard, e.g. 50C/125F), a day or two, so that all moisture will evaporate.

The problem with sugary stickyness is that an ultrasonic cleaner (which dislodges dirt particles by cavitation) may not be able to shift it right away. The sticky stuff would need to disolve in the water first, so you may need to "soak".

This posting is longer than I thought - sorry. I hope it helps, or gives you ideas.

Philippe

Re: A pair of 21S with sticky keys

*Message #3 Posted by **Ronald** on 31 Mar 2009, 9:07 a.m.,*
in response to message #2 by Philippe Lasnier

Hi,

I used an ultra sonic cleaner myself but kept the calc's in such a way tha he display was never submerged. Also keep temp. below 25 degrees C and use only half the amount of advised soft cleaner addition. Try it for 2 minutes and rinse. If it is a sugar drink or thee wih sugar it should be clean. If not then I think the ultrasonic is not the right tool.

Carefully will do it 9 out 10 cases.

Good luck

Ronald

Re: A pair of 21S with sticky keys

*Message #4 Posted by **Dan Grelinger** on 31 Mar 2009, 12:00 p.m.,*
in response to message #1 by Peter Klein

I have cleaned a few HP calculator keypads with the following procedure. It has worked every time but once, when the contamination was not water soluble. It has never ruined a calculator.

Equipment and supplies:

Distilled water
Eye-dropper (or something else that can apply water in a precise location)
Wet/dry vacuum (the more airflow the better, and non scratching [plastic] crevice tool)

Procedure:

Remove batteries and discharge capacitor.
For each sticky key; place one drop of water down around the key with the eye dropper. As soon as the drop seeps around the key, turn the calculator keys-down, and work the key for about 10 presses. Use the wet/dry vacuum for about 10 seconds to suck all possible water from around the key (still hold the calc keys-down).
Test the key. If any stickiness remains, repeat.
If no stickeness remains, do it one more time for good measure.
Go to next key and repeat (If there are several keys, I will do a row at a time)
When done with all keys, use the wet/dry vac to remove all possible moisture for a minute or two around all

the keys. I still leave the calc keys-down during this step.
Place in a low-humidity environment with airflow for a day (when my heater or A/C is on, I'll put it near the vent - either heating or air conditioning the air drys it out.)
Try out all the keys. If the contaminent is water soluble, I've never had to repeat the process, but it might be possible if you did not get it all out the first time.

Dan

Pioneers and 48's with gooey keys

*Message #5 Posted by **Randy** on 31 Mar 2009, 8:52 p.m.,*
in response to message #1 by Peter Klein

Wow! Just way too complicated here for my way of thinking. This is not rocket science... it is just a dirty calculator. Having cleaned more than my fair share of HP's, I'll add my thoughts and experiences with a few dirty HP's over the years:

While you could use an ultrasonic cleaner, it is overkill for basic cleaning and might well do more damage to the bezel than is necessary than you need to get it functional.

For gooey keys, the toughest thing is to know what you're dealing with. Chances are it is sugar based which is easy... the tough part is being patient while you wait for it to dry... Coffee, tea, soda, all no problem since it is water soluble.

Start by getting the batteries out of the unit and *do not* let them near it for at least two days after the point were you think it might be dry. Seriously, I'm not kidding. Two days.

Once the batteries are out, just submerge it in some warm (100°f) distilled water. Let it soak for 2-3 minutes and then pull it out and press all the keys several times. Submerge again and repeat. Change the water and repeat. Once you have done that, shake well, shake again, dry the surface and place in a warm area to dry for, well, at least two days.

About a day into the process, give the keyboard a try. If it is still tacky, abandon all hope, it can't be helped this way... if it feels okay, return it to its warm place and let it really, really dry. After two days, put the batteries back in, replace the battery door and go back to work 'cause you're done.

Honestly, if it doesn't clean up with water, it's a lost cause. I've seen units sprayed with WD40 and other such nonsense... those make pretty paper weights...

Re: Pioneers and 48's with gooey keys

*Message #6 Posted by **Dan Grelinger** on 1 Apr 2009, 2:49 p.m.,*
in response to message #5 by Randy

Immersing the entire unit in water might be OK for the more modern LCD calculators, but I recently ruined an LED calculator following exactly the procedure that you describe above. I think the problem has to do with removing the water by shaking. Very fine (almost invisible) wires are generally used on the old LED displays to connect the diodes to the display driver circuitry. When shaken, the water can flow fast enough to drag and bend these wires such that they contact (and remain in contact) with other wires or objects. The result is a largely non-functional LED display.

Dan

*Message #7 Posted by **Michael de Estrada** on 1 Apr 2009, 3:03 p.m.,*
in response to message #6 by Dan Grelinger

I don't know if this is applicable, but I cleaned a Spice series keyboard by washing in alcohol, and moisture was retained between the two film layers that constitute the switch circuits. Attempts to removed the moisture by shaking were unsuccessful. I found that placing in an oven at 150 degrees F for about 3 hours cured the problem without damaging the materials, but this may be too hot for an LCD.

Pioneer and 48 keyboards are similar to the layers of a Spice. That is why I recommend the long dry times - as it really does take that long for even a small amount of moisture to evaporate once it is inside the layers. If you put the batteries back into a wet Pioneer or 48, you risk damage to the keyboard by way of electrolysis. That's the real enemy, not the moisture itself.

FWIW, the vast majority of the original Spice keyboard failures are caused by fractures in the metal strips that run through the top snap dome sheet. HP knew they failed way too soon which is why they redesigned the keyboard using same keyboard technology used in the HP41. That keyboard pc board also eliminated the awful pressure fit construction as well - leaving users with a good unit with its only weaknesses being the battery contacts and unsealed LED array.

I seriously doubt it, more like the wire bond in question was already compromised. This is very common with older units that have been subjected to battery outgassing, especially HP Spice machines since nothing in these old chip on board parts is sealed.

Mechanical shock will cause the ball to un-bond, it usually happens on the LED die side. Just dropping a calculator is usually more than enough shock to find the weaknesses :(

Fun with a 17bii

*Message #1 Posted by **Dave Britten** on 30 Mar 2009, 10:07 p.m.*

I recently acquired a nice second-hand 17bii (the real deal, not the + model). My wife and I have been house shopping, so I've got an excuse to grab a financial model to complement my stack of scientifics.

So with that out of the way, let's (ab)use the solver a bit. Here's about 10 minutes of tinkering and familiarizing myself with the cooler features: the Fibonacci sequence.

```
FIB:IF(S(NEXT):NEXT:INIT+L(A:0)+L(B:0)+-L(NEXT:1))=L(B:G(A))+L(A:G(NEXT))
```

Solve for INIT to get the first term of the sequence, and solve for NEXT to fetch subsequent terms.

Anybody else have some interesting - and not necessarily useful - solver routines? I'm sure a chess-playing program is out of the question, but has anybody tried tic-tac-toe?

Oh, and it does a damn nice job of financial calculation too. :)

Re: Fun with a 17bii

*Message #2 Posted by **Marcus von Cube, Germany** on 1 Apr 2009, 10:14 a.m.,*
in response to message #1 by Dave Britten

Dave, it works equally well with a 27S. (The unit has just arrived. Customs must have made some dents in it but it still works.)

Can you explain it a little. I do understand what happens if you solve for NEXT:

```
NEXT=L(B:G(A))+L(A:G(NEXT))
```

This returns the sum of A and B and replaces B by A and A by NEXT. So far, so good. But the other case...

```
INIT+L(A:0)+L(B:0)+-L(NEXT:1)=L(B:G(A))+L(A:G(NEXT))
```

What I can see is that you set A=B=0 and NEXT=1 on the left side of the equation and then B=0 and A=1 on the right side. This results in...

```
INIT+-1=1
```

It looks to me that the "-" before L(NEXT:1) is superfluous.

Did I get it right?

Re: Fun with a 17bii

*Message #3 Posted by **Dave Britten** on 1 Apr 2009, 5:51 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Yeah, that should have just been something like "...L(B:0)-L(NEXT:1)...". That's what I get for figuring

this stuff out so late at night. :) I'm sure it could be cleaned up a lot in other areas, too.

That's pretty much how it works. Solving for INIT resets A, B, and NEXT, and returns 1 (the first term of the sequence). Solving for NEXT gives you all the subsequent terms. It doesn't really matter what INIT gets set to, so I just fiddled with the equation so it gives you the first term (one).

LCD Failure?

*Message #1 Posted by **Bob Macklin** on 30 Mar 2009, 9:12 p.m.*

I am a retired EE. I purchased my HP 49SX in 1993. After I retired in 2K I only used it to balance my checking account. But a few years ago I started doing that on-line and the calculator sat unused on top of my VCR.

A few months ago I got it out to do some math that I dould not do with the Windows calculator. When I tried to turn it on I got no display. I figures it was the batteries so I put new ones in and it still did not work.

Today in reading the manual it says the if you don;r get a display when you turn it on to hod the ON button down while repeatedly pressin the "+" key.

I tried this for an extended period. No sign of life in the display.

Do these LCD displays have a failure mode due to age or non-use?

Bob Macklin Seattle, Wa.

Re: LCD Failure?

*Message #2 Posted by **Allen** on 30 Mar 2009, 9:16 p.m.,*
in response to message #1 by Bob Macklin

the 48sx has a pretty high failure rate on the LCD. You can also try a soft reset by pressing ON+A+F at the same time, or by inserting a paperclip into the reset hole under the top left foot. If you do get it to come on (or not, I suppose) you can also try pressing firmly with your thumb above the B and C keys while toggling power this applies extra pressure to the LCD display connector. Others?

Re: LCD Failure?

*Message #3 Posted by **Bob Macklin** on 30 Mar 2009, 10:34 p.m.,*
in response to message #2 by Allen

The LCD is not dead! Pressing above the B & C keys while pressing th power button made it come to life! But I have to press ther to turn it off also. It seems that any operation involving the "ON" button requires the pressure above the B & C keys.

Once on it seems to function normally. Since I have not used it in many years I now will have to get reaquited with it!

Thanks for the clue!

Bob Macklin Seattle, Wa.

That might be the cause of the failure.
The top of a VCR get get fairly warm.
Sit a calculator there for several years and it's probably not going to like it too much.

Dave.

in response to message #4 by DaveJ

Heat and humidity (especially the combination) kill LCDs, but not particularly by making them just plain quit, but rather by darkening the background slowly until it's useless. UV isn't good for them either. I had a cheapie LCD clock stuck on the dashboard of a car (where it was always shaded) for 12 years though, and in spite of all the heat, it remained fine.

in response to message #3 by Allen

here's the link, I see the 15% discount is there

http://www.shopping.hp.com/calculator

p.s. anyone knows where to get online manual for the new HP SmartCalc 300S scientific caclulator? I can't get it at the SmartCalc page.

Edited: 30 Mar 2009, 11:08 p.m.

Re: HP Calcs on Sale. 15% off, and free shipping on everything.

*Message #5 Posted by **Dan Grelinger** on 31 Mar 2009, 11:43 a.m.,*
in response to message #3 by Allen

I checked again this morning. The deals are still there. I was not dreaming. I used hpnut's link, and that one works, too.

With the free shipping and the 15% off, it is a very good time to consider the less expensive calcs.

10S $8.49

300S $12.47

I've bought a couple recently from HP at this site. I think they do add sales tax though.

Dan

Re: HP Calcs on Sale. 15% off, and free shipping on everything.

*Message #6 Posted by **Tom Mathes** on 31 Mar 2009, 12:33 p.m.,*
in response to message #5 by Dan Grelinger

Thanks. That link did work. For me though it's not much of a deal. I can get a comparable price at Amazon when sales tax is added to HP's offer.

in response to message #1 by hugh steers

Brilliant!, just brilliant Hugh!

Which Chess engine does it use?

Dave.

Re: Chess on the uWatch !

*Message #4 Posted by **hugh steers** on 30 Mar 2009, 8:58 a.m.,*
in response to message #3 by DaveJ

The chess engine is Tom Kerrigan's Simple Chess Program (TSCP).

http://www.tckerrigan.com/Chess/TSCP

As you can see, right now, ive only got the very basic move IO up and running. I had to adapt TSCP to run in 4K of RAM. Things like the book moves had to go, although i've noticed it makes traditional openings anyway.

I've written to Tom Kerrigan to ask permission to use his work. If he is happy i might improve the interface and add more features. for example, it would be nice to have a "postal" mode, whereby you can switch out of chess back to clock/calc and later back into chess to make a move whilst continuing the same game. other easy features are; swap sides, undo, set level etc.

it's been suggested already to draw the board as a scrolling two line square of letters (usual notation) and use the other screen space for move IO.

I'll see what Tom says first. currently this is a demo.

Re: Chess on the uWatch !

I know TSCP well, I adapted it not that long ago to run on an Altium Nanoboard in a soft core MIPS processor on an FPGA:

That was the first hacked version, I subsequently got it working with bitmap pieces. The interface is touch-screen QVGA. I was also in the process of translating some of the code into hardware (C to VHDL compiler) to make it run faster. No problems with memory of course, easily ran in 32K.

Tom is cautious of it being redistributed, so I wouldn't be surprised if he says no to having the code merged with a GPL open source project.

Dave.

Re: Chess on the uWatch !

*Message #6 Posted by **hugh steers** on 30 Mar 2009, 6:14 p.m.,*
in response to message #5 by DaveJ

Cool picture!

I have had a reply from Tom, basically, he wants to retain copyright of TSCP, which is quite reasonable. But he has given us permission to use the code in the uWatch. I have repackaged TSCP into uWatch-chess.c and have agreed to add a header which states clearly that it contains a derivative work of TSCP and that the copyright remains with him. As with the TSCP original source code, people will have to acquire his permission to use it in their own projects. The fact that we are using his code does not make it become GPL nor open.

quote: "Sounds like you understand all my concerns and you have permission to redistribute the source/game/algorithms as long as I maintain all my copyright rights. However you think that should happen is up to you."

So, i might have a go at drawing a board on the uWatch - don't expect too much ;-)

Re: Chess on the uWatch !

*Message #7 Posted by **hugh steers** on 30 Mar 2009, 7:07 p.m.,*
in response to message #6 by hugh steers

However, now i come to think about it, it seems that Tom's license is not compatible with the GPL.

Originally, i was thinking just about copyright. the GPL does not require Tom to give up his copyright, but it does require freedom to re-use and distribute and the latter is something Tom wants to retain except where expressly allowed.

not sure now.

Re: Chess on the uWatch !

Yes, I've heard that is a common "gotcha" with GPL. Something along the lines of any code packaged with a GPL product has to then be freely distributable and repackagble in other GPL products by others with hindrance or permission, even though the original author still retains copyright.

Dave.

Re: Chess on the uWatch !

*Message #9 Posted by **Nigel J Dowrick** on 31 Mar 2009, 5:42 a.m.,*
in response to message #8 by DaveJ

I'm not an expert on the GPL, but the following paragraph from Section 6 of the GPLv3 might be relevant:

> Quote:
>
> A compilation of a covered work with other separate and independent works, which are not by their nature extensions of the covered work, and which are not combined with it such as to form a larger program, in or on a volume of a storage or distribution medium, is called an “aggregate” if the compilation and its resulting copyright are not used to limit the access or legal rights of the compilation's users beyond what the individual works permit. **Inclusion of a covered work in an aggregate does not cause this License to apply to the other parts of the aggregate.**

(my emphasis). In this, a "covered work" means a work covered by the GPL. Could the combination of the chess program with the rest of the software be viewed as an aggregate, or is it too tightly integrated with the rest of the software for this?

From a philosophical point of view, including the chess code without granting the right to modify and redistribute it at will is not imposing any *additional* restrictions on what users can do with the code, so it seems to be compatible with the spirit of the GPL. However, I realise that such arguments are of little use in a legal context!

Re: Chess on the uWatch !

*Message #10 Posted by **ncrook(UK)** on 31 Mar 2009, 7:14 a.m.,*
in response to message #9 by Nigel J Dowrick

Hugh,

if you and Dave Jones own copyright to all of the code in uWatch you could decide to licence future versions of uWatch under dual licence:

1/ gpl (version without chess)

2/ modified licence (version with chess).

seems like the act of linking chess with the existing uWatch code *and then releasing it to anyone* would violate the GPL. If Linux is a guide, you could use Linux loadable modules as an analogy (tho there is much debate about that). In which case, implement a run-time plugins loader for uWatch and compile chess as a plugin. Sounds like an interesting little project...

Neal.

Do the X-ray machines at airports damage electronic equipment?

Re: HP41C x-ray
*Message #8 Posted by **Garth Wilson** on 31 Mar 2009, 12:47 a.m.,*
in response to message #7 by Michael de Estrada

My cameras and calculators have gone through airport X-ray machines many times with no damage or memory loss.

Re: HP41C x-ray
*Message #9 Posted by **Mike Morrow** on 31 Mar 2009, 12:48 a.m.,*
in response to message #6 by Ed Look

I've been passing my HP42S, HP50g, and HP17BII almost daily through the x-ray screening at a U.S. nuclear power plant for many years. It's at least as penetrating as the airport

version. Before that, my HP-41CX and HP-15C made daily trips through the machine.

I'd say empirical evidence says that there's little to fear.

Re: HP41C x-ray

*Message #10 Posted by **Michael de Estrada** on 31 Mar 2009, 1:16 a.m.,*
in response to message #9 by Mike Morrow

Actually, it's all about the dose rate and the vintage of the IC's. Dose rates less than about 5000 rad gamma will not hurt anything, and I think X-ray machines are way below that level. Also, older IC's are more robust than newer ones because they keep reducing the size of the circuitry. I had one project where I had to source some new old stock IC's manufactured before 1985 to ensure that they were made on a larger circuit gage to withstand radiation within reactor containment.

Edited: 31 Mar 2009, 11:52 a.m. after one or more responses were posted

Re: HP41C x-ray

*Message #11 Posted by **Ed Look** on 31 Mar 2009, 11:36 a.m.,*
in response to message #10 by Michael de Estrada

I see. I was wondering because of talk in the past about radiation-hard components. This made me think that the old silicon could not handle higher energy radiation.

Re: HP41C x-ray

*Message #12 Posted by **Mike Morrow** on 31 Mar 2009, 7:11 p.m.,*
in response to message #10 by Michael de Estrada

> Quote:
>
> Actually, it's all about the dose rate and the vintage of the C's.

The total integrated dose is typically more significant than the dose rate.

> Quote:
>
> Dose rates less than about 5000 rad gamma will not hurt anything, and I think X-ray machines are way below that level.

You've cited a dose, NOT a dose rate. Dose rate is expressed in RAD per unit of time.

The dose received in a typical x-ray screener is likely at least six orders of magnitude smaller than the value cited.

Re: HP41C x-ray

*Message #13 Posted by **Michael de Estrada** on 31 Mar 2009, 7:39 p.m.,*
in response to message #12 by Mike Morrow

Yes, you are absolutely correct. I should have said that the threshold TID for damage to ICs is above 5000 RAD gamma. During a lifetime of passes through an X-ray machine, the TID would be much lower.

X-RAY from five TI calculators

Is It Possible to "Overload" HP-48G+ Memory?

*Message #1 Posted by **Ed Look** on 28 Mar 2009, 9:29 p.m.*

I tried to use the <left-shift> MEMORY function to look at the contents in my 48G+ when I got an "Insufficient Memory" message displayed across the top of the screen instead of file or object names.

Initially I got the same message when I tried to redisplay the clock, as it disappeared from the top line when I turned on the unit, and when I tried to use the <left-shift> MODES function. I tested its batteries, and they were next to totally kaput, so I put three fresh AAA 1.5 Duracell batteries in to replace them.

The clock came back, I could access the MODES menu, but MEMORY still gives the the "Insufficient Memory" message.

I *COULDN'T* have maxed out the 128K of RAM, right??

Or, is something wrong on the circuit board?

Re: Is It Possible to "Overload" HP-48G+ Memory?

*Message #2 Posted by **Raymond Del Tondo** on 28 Mar 2009, 10:07 p.m.,*
in response to message #1 by Ed Look

Actually you already gave the answer to your, ahem, question?

Since the batts were nearly flat, you should take into consideration
that memory contents are corrupted.
A coldstart (ON+A+F, then YES) will help.

HTH

Re: Is It Possible to "Overload" HP-48G+ Memory?

*Message #3 Posted by **Ed Look** on 28 Mar 2009, 10:19 p.m.,*
in response to message #2 by Raymond Del Tondo

Ugh. I don't like cold starts.

Oh, well. I hope I don't lose anything.

Thank you, sir!

EDIT:

It worked! And, all I lost were the contents of the stack, which is okay; I was done with those figures.

Thanks again, Raymond!

HP41/42 Unit Conversion

*Message #1 Posted by **Egan Ford** on 28 Mar 2009, 11:19 a.m.*

The recent thread on 50g Unit Conversions reminded me just how awesome the 48 and 50 unit support is.

So, what do you all use for the 41 and 42? Any good programs/modules for unit conversion?

Thanks.

Re: HP41/42 Unit Conversion

*Message #2 Posted by **PeterP** on 28 Mar 2009, 11:57 a.m.,*
in response to message #1 by Egan Ford

I'm not sure but one of the ROM's has a built in unit conversion. It might be the petroleum pack, but I'm not 100% sure.

Re: HP41/42 Unit Conversion

*Message #3 Posted by **Mike (Stgt)** on 30 Mar 2009, 4:48 a.m.,*
in response to message #2 by PeterP

It is in the Petroleum Pack (ROM), and in the Thermal Transport ROM too. The unit conversions slightly differ - no-no, not in the conversion factors, sure - but in the number of units for conversion.

Ciao.....Mike

Re: HP41/42 Unit Conversion

*Message #4 Posted by **Allen** on 28 Mar 2009, 12:07 p.m.,*
in response to message #1 by Egan Ford

(Albeit limited) unit conversions on the keyboard -- one of the few things that the 32sii has over the 42s and the 41.

Re: HP41/42 Unit Conversion

*Message #5 Posted by **Mike Reed** on 30 Mar 2009, 4:07 p.m.,*
in response to message #4 by Allen

I dunno, but it seems to me that the whole issue is a waste of calculator memory. I just memorized (years ago) the conversion constants for the conversions I used frequently, then just "did the math" on my HP when i needed a conversion. When I need another conversion, I just memorize a new constant - I have WAY more memory than the calculator! Fer instance (from memory) 1 US Survey Foot is 0.30480060960 meters, 1 International Foot is 0.304800000 meters, the coefficient of expansion of steel is 0.00000654 units per unit per degree Fahrenheit, the value of PI is 3.14159265358979323846264338327950288419716939937510582097 494459230781640628620899862803482534211706 7..., etc. (OK, I fudged a little on that last one >;o) I DO know it to 12 places though!)

Re: HP41/42 Unit Conversion

*Message #6 Posted by **Walter B** on 28 Mar 2009, 12:21 p.m.,*
in response to message #1 by Egan Ford

The 41C/42S are known "scientific" calculators. In science, almost no unit conversions are needed - some physical constants are more important. I can explain the reasons if you want to ;-)

Re: HP41/42 Unit Conversion

*Message #7 Posted by **Andrés C. Rodríguez (Argentina)** on 28 Mar 2009, 4:25 p.m.,*
in response to message #6 by Walter B

Walter: 100% agree!

Re: HP41/42 Unit Conversion

*Message #8 Posted by **Geoff Quickfall** on 28 Mar 2009, 1:12 p.m.,*
in response to message #1 by Egan Ford

User assigned keys, for specific work applications, but no built in conversions to speak of:

```
Key 1:      quick calculations to convert U.S. gallons (as boarded
            in the States) of JET A fuel into Kilograms for
            comparison to onboard guages calibrated in Kilo's.
            (using standard day temperature as a quick reference)
Key 2:      quick calculations to convert litres(as boarded in
            the everywhere else!) of JET A fuel into Kilograms for
            comparison to onboard guages calibrated in Kilo's(using
            standard day temperature as a quick reference).
Keys 4, 5:  Meters to feet and feet to meters, for airspace altitude
            confirmation with altimeter calibrated in feet.  China,
            Russia and Mongolia to name a few.
Keys 7, 8:  Inches of mercury to Millibars and vice versa.  Used at
            the flight planning computer which always shows data in
            inches of mercury, whereas, most European and Asian
            airports give air pressure in Millibars/hPa.
Keys ., 0   the ubiquitous requirement for Celsius to Farenheit and
            back!
```

Cheers, Geoff

Of course! Some years ago, I helped out a (now defunct) company based in Mainz by flying their Cessna 421s every now and then - so I should still be find the way. But in view of the beers, I would rather take the train (it's a 2 1/2 hour trip)...

Looking forward to it, Max

in response to message #12 by Karl Schneider

Your right on that, but unfortunately they did not have the correct measurements from the maintenance drip!

The drip sticks were in inches, converted to pounds in the manual, which had to be back converted to metric kilograms for the guages.

A dog's breakfast, so to speak. Compoumd that with unserviceable cockpit totalizers and fuel guages, a bad MEL book explanation, new equipment to the company (B767) and you can see the " Swiss Cheese " accident waiting to happen.

I think the fuel was metered by the fueler in gallons no less.

In a nut shell:

```
gallons - inches - pounds - liters - kilograms.
```

Each step completed by a differing department with no onboard confirmation or procedure due to a bad MEL.

I always do an independent check of the fuel using the two keys depending on the departure requirements/ I never rely on the onboard system for the complete answer.

Cheers, Geoff

in response to message #14 by hpnut

Hello Hpnut!

The phone, code, keys are programs with attached data bases. A primitive PIM in fact which I created before PDA's.

Phone key initiates the prompt "Contact?" By inputting at least the first 3 letters of the phone number you want to see you get the completed number as well as the completed name. The name and number reside in the X-memory.

Codes are the door codes for access to the ramp at various airports. Place the correct airport identifier in the alpha register after the prompt "AIRPORT?" and you get the code.

The WP-A key works the same way. Press the key and you get the prompt "AIRPORT?". Enter any 3 letter airport code; SYD for Sydney, Australia. Get a second "AIRPORT?" prompt and enter the second airport code in; YVR for Vancouver. The result is the Initial True Track and Great Circle distance between the Airports. This is because the Lat and Lon of each Airport is stored in x-memory with the airport code tagged to it.

Cheers, Geoff

*Message #16 Posted by **Steve Keeley** on 28 Mar 2009, 3:44 p.m.,*
in response to message #1 by Egan Ford

The HP 41 Thermal and Transport Science module added unit conversion capability to the 41. As I recall, you would place the number you wanted to convert into the X register and into the alpha register the string of units you wanted to convert from - to. ("ft*lbf/s - BTU/hr") and then hit a "convert" function.

Unit checking/conversion was built into all the programs on it as well. If you opted for "Units" when running the program, then after prompting for the value, it would prompt for the units, which you would enter as an alpha string. It gave instructions for incorporating this capability into your own programs. As a chemical engineering major, this ROM was worth more than its weight in gold to me. The Petrloleum Engineering PAC also included this capability.

Re: HP41/42 Unit Conversion

*Message #17 Posted by **Jeff Kearns** on 28 Mar 2009, 6:47 p.m.,*
in response to message #16 by Steve Keeley

The Machine Design Pac for the 41C series also has a similar unit conversion capability.

1. You key in the unit string in the Alpha register (it has a virtually unlimited set of unit conversions due to the ability to combine unit control characters *, /, -, and 1-9 with unit strings and equations).

2. Key in the numeric value to be converted

3. The program is executed with either FCON for forward conversion or BCON of backward conversion using the same unit conversion string.

I find this program very handy and often more convenient for complex units than the RPL models - as long as you assign FCON and BCON to keys! I am amazed at the number of conversions that are possible using this program.

Jeff

*Message #18 Posted by **Ángel Martin** on 31 Mar 2009, 9:10 a.m.,*
in response to message #16 by Steve Keeley

This thread reminds me of another item on my "ToDo list" - namely adding electrical units to the unit conversion libraries, as implemented on the different 41 modules... which I always found a very elegant and effective way to do it.

With 82 units built-in, the Petroleum ROM has the more complete set, followed by the Thermal ROM (54) and the Machine ROM (42). Some are unique to one module but many are present on more than one. There are a "grand total" of 87 different units amongst the three.

Here below are listed, FWIW - not that this adds any useful data to this subject though.

Best, ÁM

> So, what do you all use for the 41 and 42?

Just write tiny programs for the conversions you use and assign them to keys. One I use sometimes that's probably not in any module is wire diameter to wire guage and vice versa. Another is musical note to frequency and vice-versa.

*Message #24 Posted by **Richard Garner** on 30 Mar 2009, 1:31 a.m.,*
in response to message #23 by Martin Pinckney

There is an HP 48S/G type unit conversion program for the Hp 42S on Thomas Okken's web site. I have thought about adding to it to make it more like the 48 version, but have not found the time to study what is being done in the program to add to it.

Re: HP41/42 Unit Conversion

*Message #25 Posted by **Thomas Okken** on 3 Apr 2009, 1:24 a.m.,*
in response to message #24 by Richard Garner

The unit conversions in the Machine Design Pac (FCON, BCON), Petroleum Fluids Pac (CON, INCON), and the

Thermal & Transport Science Pac (SI-, -SI) are all machine language functions, which makes it a bit of a pain to port them.

I'm interested in adding some sort of unit conversion functionality to Free42; could someone point me to a list of officially sanctioned conversion factors?

Note: for those of you who use Palm PDAs, there is a neat unit conversion utility called YAUC (as in Yet Another Unit Converter). It's not supported but I think it is still floating around on the 'net here and there. I use it regularly for U.S./SI conversions; it has a ton of units, but it doesn't deal with compound units like the RPL calculators do (or the above 41 pacs). Still, worth a mention.

So there is a wish list? I'd add displaying flags 0-4 as in 41 and fraction input as in HP35s.
Cheers

Re: HP41/42 Unit Conversion

*Message #33 Posted by **Thomas Okken** on 6 Apr 2009, 1:48 a.m.,*
in response to message #32 by reth

Hmm, well, I can add those to my to-do list, but whether they will get done any time any time soon is another matter. The problem with fractions is that that requires adding a new data type, and that affects just about everything. Huge, huge amount of work. You're probably better off using a 50g instead.
Adding annunciators to the display is a lot easier, but it will require changes to all the skins. At least those changes are a lot easier than the changes that would be needed to support a 4-line display...

Re: HP41/42 Unit Conversion

*Message #36 Posted by **Fred Lusk** on 30 Mar 2009, 2:05 a.m.,*
in response to message #23 by Martin Pinckney

Martin....

It's still on my "to-do" list :-(

Actually, several years ago I nearly completed the re-write for the 41CX version that I mention in the program description. I just haven't had time to do the last bit of checking, polishing, and documenting. The new version will more easily port to the 42S than the original because of reduced reliance on XFUNCTIONS. However, a new granddaughter and other things in life have pushed this back on the priority list.

I don't do FIF calculations that much anymore, but for day-to-day use I wrote an Excel spreadsheet that allows me to enter as many dimensions as I need. The spreadsheet includes a multiplier for each dimension so I can do things like x*A + y*B ...

One of these days....

Fred

>
> It's still on my "to-do" list :-(

Fred,

Wow, you are worse than me... will I live long enough to make a dent in my To Do List?

I still need to do FIF calculations frequently. I regularly just do them by first mentally converting to decimal feet, if precision is not so important. Or if it is, I use the 32sii fraction mode for the inches, then convert back to feet. Now that I finally obtained a 42s, I would like to make use of its power with a program that like the one you wrote.

Of course, if I was really practical, I would just buy a Calculated Industries calculator. But it wouldn't be an HP...

Anyway, thanks for responding, that was a nice surprise.

HP50g Units Conversions

*Message #1 Posted by **Elliott W Jackson** on 27 Mar 2009, 10:27 p.m.*

I recently got an HP50g and have been plowing through the (shockingly bad) manuals. I was reading about the units capability, and stumbled on a trick I thought I would pass along.

TASK: Convert a value from one unit to another. Example: Convert 100 cm to yards.

Assuming Flag117 is set (Soft menus), and RPN, and assuming the UNITS menu is already displayed (Rightshift UNITS)

the method documented in the manual is as follows:

```
100 Length "cm"
0 (or any value, this value is not actually used) "yd"
Next Next Next Units Tools Convert
```

That "Next Next Next Units Tools Convert" sequence is clumsy. Here is a much simpler method, relying on the calcutor's ability to add dissimilar units and do unit conversion as needed on the fly:

```
100 Length "cm"
0 (this time the zero is important) "yd"
+
```

I'm sure the 50g old-timers knew this, but I found it useful when I stumbled onto it.

Best, Elliott

in response to message #3 by Elliott W Jackson

Elliott,

You have only scratched the surface of all the information that is NOT included in the documentation for the HP-50g. The only reason I knew this is because I also own a 19 year old HP-48SX, which has wonderfully complete and clear spiral-bound printed documentation. Ah, those were the days!

BTW - Additional information is contained in the Advanced User's Reference Manual for the HP-49g+/48gII from the hp website (see here) This information also applies to the HP-50g.

in response to message #5 by Peter Klein

Peter,

All the commands, functions and reserved variables used in the HP48 are listed in the HP49g+ reference manual in section 3. Of course, many commands have been added, which do not apply to the HP48. Also, the HP48 lacks the CAS (computer algebra system) and the development library, so chapters 4 and 6 in the reference guide do not apply. One section I find especially useful is Appendix C, which lists and explains all the system flags. Only flags -1 through -64 apply to the HP48.

Why not just use the 48G Series AUR. It is probably closer to the 48S.

in response to message #1 by Elliott W Jackson

I don´t own any HP-50g but a 48gx. My first HP calculator was a 28s that has been of great help during my

university years. In my opinion the unit coversion on the 28 series is more straight forward compared with the 48gx (50g?). The unshifted alpha keyboard is very useful when entering units. There is no need to plow through any menus, not even if one wants to convert rather complex&combined units that could be written as simple strings. Of course the 28s could not "calculate" with units. But I never thought this is a limitation. Generally I think the complexity of the 28s is already borderline and the 48 series was one (maybe two) steps to far in terms of intuitive use. With the 48gx I always feel somehow lost without the manual.

with the 28s (no menus needed):

100 "cm" "yd" convert

in response to message #10 by Frank Rottgardt

Frank: I know what you mean about the 48 series' complexity. After years with RPN calculators (25, 11C, 32S, 32Sii), I just found a 48S on Craig's List for $30, and couldn't resist. I don't have a printed manual yet, and the Museum DVD's 48S/SX manual is graphics only (no searchable text), so the learning curve has been a bit steep.

But I remembered what a friend of mine who has a 48GX told me--"I can't remember how to do most things with it anymore, but it's worth having around just for the unit conversions). This thread came at exactly the right time to inform me about using the left shift key for conversion--thanks, Michael!

So now I can answer the age-old question: "If a train leaves Chicago at 6:00 AM traveling 50 mph, and a second train leaves New York at the same time, and they meet in Buffalo, what is the speed of the second train in furlongs per fortnight?"

Hmmm. Depending on which Buffalo, somewhere around 86,738 f/f possibly?

Someone had to. ;)

Re: HP50g Units Conversions

*Message #13 Posted by **Jeff Kearns** on 29 Mar 2009, 8:09 p.m.,*
in response to message #12 by Chuck

I get 93,930 furlongs/fortnight.

I am glad to know that others are willing to admit that they keep this extremely complex and capable device around for one function only... although I do use my 48sx occasionally for other tasks, using "canned" programs I downloaded...

Thermal paper size for HP 19C?

*Message #1 Posted by **Michael de Estrada** on 27 Mar 2009, 8:24 p.m.*

I bought a HP 19C printing calculator and it came with some rolls of Radio Shack thermal paper that are 1 7/16 inches wide (3.7cm). However, they appear to be too narrow, as the paper is a very sloppy fit and wobbles side to side as it advances. It appears that the correct width is approximately 1 1/2" inches wide. Does anyone know what the correct size is and the HP part number? Assuming the HP product is no longer available, is there an alternate brand equivalent.

Thanks, Michael

Re: Thermal paper size for HP 19C?

*Message #2 Posted by **Bruce Bergman** on 27 Mar 2009, 10:18 p.m.,*
in response to message #1 by Michael de Estrada

Search the archives for "19c" -- we discussed this a few months ago, I think. I'd look it up for you, but I'm sick in bed today (sorry).

Bottom line: get Staples paper. It's cheaper, fits perfect and works just fine. You can buy it in rolls of 9 or 12, I believe. I've used it my 19c for a while with no problems.

thanks, bruce

Re: Thermal paper size for HP 19C?

*Message #3 Posted by **Michael de Estrada** on 27 Mar 2009, 11:02 p.m.,*
in response to message #2 by Bruce Bergman

I could not find this in the archives, however, I did find out that the HP part number is 82051A and that the width is indeed 1.5". Staples online does not list this size paper so I'll call a store tomorrow to see if I can order some.

Thanks and hope you get well soon.

Michael

Re: Thermal paper size for HP 19C?

*Message #4 Posted by **Katie Wasserman** on 28 Mar 2009, 1:27 a.m.,*
in response to message #3 by Michael de Estrada

Here's some. HP sold it in 30' rolls, so you could make 275 rolls for $36. What a deal, if only your 19C printer mechanism would last that long.

Re: Thermal paper size for HP 19C?

*Message #5 Posted by **Michael de Estrada** on 28 Mar 2009, 2:11 p.m.,*
in response to message #4 by Katie Wasserman

Thanks Katie,

After calling Staples and some other business supply stores I came up empty, so I ordered the 1 case with 1.56 miles of thermal paper from your recommended source. I was thinking of buying 15 cases (23.44 miles), since the unit price drops from 71 cents/roll to only 63 cents/roll. However, it occured to me that given the slow print speed of the HP 19C, it would take over a century of continuous use to exhaust the supply, and unfortunately given my age and the current life span of human males that this would be a bad choice.

Michael

Re: Thermal paper size for HP 19C?

*Message #6 Posted by **Katie Wasserman** on 29 Mar 2009, 11:52 a.m.,*
in response to message #5 by Michael de Estrada

Even with one just case your cost is $0.13 per HP-19C size roll! You could buy 15 cases and make a business of selling them pre-cut for HP calculators on that electronic body of water that uses 4-color lettering in their name.

Computing Square Roots

*Message #1 Posted by **Thomas Klemm** on 27 Mar 2009, 5:43 p.m.*

While this might be obvious to some of you I only recently realized that the method used to calculate the square root in probably most HP-calculators is in fact closely related to Horner's method.

Let's assume we want to calculate the square root of 41 thus solving the equation:

$x^2 - 41 = 0.$

First we apply a trick which can be found in Cochran's patent and multiply the whole equation by 5:

$5x^2 + 0x - 205 = 0$

Now let's consider the following simple coordinate transformations:

1. shift: x' = x - 1
2. zoom: x' = 10 * x

What happens to a quadratic equation if we apply these transformations?

Shift

$$\begin{aligned} P(x) &= ax^2 + bx + c \\ &= Q_1(x)(x-1) + c' \\ &= (Q_2(x)(x-1) + b')(x-1) + c' \\ &= (a'(x-1) + b')(x-1) + c' \\ &= (a'x' + b')x' + c' \end{aligned}$$

Thus by continued polynominal division we can get the coefficients of the transformed polynominal.
We can use Horner's method to calculate the remainders.

Zoom

$$\begin{aligned} ax^2 + bx + c &= 0 \quad | * 100 \\ 100ax^2 + 100bx + 100c &= 0 \\ ax'^2 + 10bx' + 100c &= 0 \\ a'x'^2 + b'x' + c' &= 0 \end{aligned}$$

By comparing the coefficents we get:

$$\begin{aligned} a' &= a \\ b' &= 10b \\ c' &= 100c \end{aligned}$$

Example

Here I assume you're familiar with the Horner scheme:

```
          5              0          -205

1         5              5          -200
          5             10
          5
---------------------------------------
          5             10          -200    step

1         5             15          -185
          5             20
          5
---------------------------------------
          5             20          -185    step

1         5             25          -160
          5             30
          5
---------------------------------------
          5             30          -160    step

1         5             35          -125
          5             40
          5
---------------------------------------
          5             40          -125    step

1         5             45           -80
          5             50
          5
---------------------------------------
          5             50           -80    step

1         5             55           -25
          5             60
          5
---------------------------------------
          5             60           -25    step

1         5             65            40    here we turn the wheel back

          5            600         -2500    and zoom
```

From now on I've chosen a shorter format:

```
          5            610         -1895    step
          5            620         -1280    step
          5            630          -655    step
          5            640           -20    step
          5            650           625    back
          5           6400         -2000    zoom
          5           6410          4405    back
          5          64000       -200000    zoom
          5          64010       -135995    step
          5          64020        -71980    step
          5          64030         -7955    step
          5          64040         56080    back
          5         640300       -795500    zoom
          5         640310       -155195    step
          5         640320        485120    back
          5        6403100     -15519500    zoom
          5        6403110      -9116395    step
          5        6403120      -2713280    step
          5        6403130       3689845    back
          5       64031200    -271328000    zoom
```

Now Cochran's trick becomes evident: In the second column appears the result 6.40312.
We could have also used a separate counter but it's not necessary.

What are we actually doing?

We move our coordinate system step by step to the right until we step over the root. Then we go one step back and zoom. Thus our unit becomes one tenth of what it was before. Then we continue ...

In pseudocode:

```
for (1 .. 12):
    while c <= 0:
        step
    back
    zoom
```

The same algorithm could be used to solve the cubic root or $x^2 = x + 1$. Unfortunately Cochran's trick won't work in these cases.

Personally I consider this algorithm a beautiful pearl. It's quiet amazing that the same algorithm was used in all these calculators over the years with only minor changes.

Re: Computing Square Roots

*Message #2 Posted by **Bob Patton** on 27 Mar 2009, 9:00 p.m.,*
in response to message #1 by Thomas Klemm

This post reminded me of something I wrote for my kids a while back. It mighty be of passing interest to this forum.

```
                        Square Roots

When I was going to school, one mark of an educated person was the
ability to find a square root with pencil and paper.  While
personal calculators have largely eliminated that need,
you might still have a problem finding an exact root of a very
large number, say 30 digits.

I doubt that they teach the process any more.  It's somewhat akin
to long division.  In fact, I wonder if it's not already
essentially lost except for those who study ancient methods.  I
decided to try and document it.  It was hard to remember and it's
fairly difficult to describe in words alone.  I came up with a
fairly compact description that relies on a somewhat algebraic
description. Here it is.

Square Root - pencil/paper digit by digit method

NTBR = Number to be rooted
ASF = answer so far, ignoring any decimal point
BAL = balance
```

```
Group NTBR in pairs from the decimal point.

Start with left-most pair (or single left-over digit.)
Find largest n such that n^2 less-than-or-equal the pair.
Subtract n^2 from the pair to get remainder.
This n is the first digit of the answer.

Repeat for as many digits as wanted:

Create next BAL by appending next-2-digits to remainder.
If next BAL is ever 0 you have an exact square root at that point.

Then find largest n
such that (20ASF + n)n less-than-or-equal BAL.

Subtract (20ASF+n)n from BAL to get remainder.
This n is the next digit of the answer.

You can set up the mechanics of this somewhat like the long
division process with pencil and paper

Example: square root of 125

      1  1. 1  8  0  3
     _______________
    \/1 25.00 00 00 00
      1               1^2 = 1
      --
   2_|0 25
    1|  21       <-- 21 X 1
     +----
   22_ | 4 00
     1 | 2 21      <-- 221 X 1
       +-----
   222_ |1 79 00
      8 |1 78 24     <-- 2228 X 8
        +-------
   2236_  |   76 00
       0  |       0     <-- 22360 X 0
          +--------
   22360_   | 76 00 00
        3   | 67 08 09     <-- 223603 X 3
            +---------
               8 91 91
```

Re: Computing Square Roots

*Message #3 Posted by **Thomas Klemm** on 28 Mar 2009, 7:24 a.m.,*
in response to message #2 by Bob Patton

No wonder this reminds you of the traditional digit-by-digit method since essentially they are the same. It's just a different way to look at it.

Your example using Horner scheme:

```
         1             0          -125

10       1            10           -25
         1            20
         1
-------------------------------------
         1            20           -25
```

```
1         1             21             -4
          1             22
          1
-------------------------------------
          1            220           -400

1         1            221           -179
          1            222
          1
-------------------------------------
          1           2220         -17900

8         1           2228            -76
          1           2236
          1
-------------------------------------
          1          22360          -7600

0         1          22360          -7600
          1          22360
          1
-------------------------------------
          1         223600        -760000

3         1         223603          89191
          1         223606
          1
```

Re: Computing Square Roots

Thomas and Bob --

Thank you for posting the traditional square-root technique and the links.

I was taught the "paired digit" technique in school, but we didn't spend much time on it, and all I remembered was the pairing of digits and the first step.

I didn't know that there was an *IBM Journal*. Perhaps it was the inspiration for *Hewlett-Packard Journal*.

Re: Computing Square Roots

*Message #5 Posted by **Michael de Estrada** on 28 Mar 2009, 9:33 p.m.,*
in response to message #4 by Karl Schneider

I went to college in the 1960's pre-calculator days, and we were equipped with a slide rule and a book with tables of trig and log functions. The "trick" we were taught to find a root of a number was to use logarithms as follows:

nth root of X = anti-log [(log X)/n]

Based on the relationship log a^b = b * log a

Hence, the cube root of 27 = anti-log [(log 27)/3] = 3

I do remember in elementary school learning long division, however, I can't remember learning to find square roots. Of course, all of this became unnecessary when I bought my HP-35.

Michael

Re: Computing Square Roots

*Message #6 Posted by **Garth Wilson** on 29 Mar 2009, 1:05 a.m.,*
in response to message #5 by Michael de Estrada

We spent almost no time at all on the paired-digit method, so I doubt that any of us remembered it more than a few days. What you can do on paper though, in a pinch, is to estimate the answer, divide the original number by it, and then know that the real answer is between your estimate and the preliminary answer; so you can take the average of the two, skew it down slightly if you want to, and repeat. It's not as efficient, but it's unlikely you'll forget it. Back then, myself, I just used the slide rule.

Re: Computing Square Roots

*Message #7 Posted by **Marcus von Cube, Germany** on 29 Mar 2009, 5:03 a.m.,*
in response to message #6 by Garth Wilson

Your method reminds me on the starting point for Newtons method:

$f(x)=x^2-A$
$f'(x)=2x$
$x_{n+1}=x_n-f(x_n)/f'(x_n)$
$x_{n+1}=x_n-(x_n^2-A)/2x_n$

Let's try an example: A=5

$x_0=2$
$x_1=2-(2^2-5)/(2*2)=2+1/4=2.25$
$x_2=2.25-(2.25^2-5)/(2*2.25)=2.2361$

Re: Computing Square Roots

*Message #8 Posted by **Khanh-Dang Nguyen Thu-Lam** on 29 Mar 2009, 6:43 a.m.,*
in response to message #7 by Marcus von Cube, Germany

Interestingly enough, the Newton's method is the same than the formula one gets with the geometrical interpretation. Let's rewrite the Newton's formula as:

$x_{n+1} = (x_n + A/x_n) / 2$.

At step n, x_n may be interpreted as the width of a rectangle of height A/x_n. The rectangle's area is just width times height, that is to say, A.

At step n+1, x_{n+1} is the mean of the previous width and previous height. x_{n+1} is the new width and A/x_{n+1} is the new height. You still have a rectangle of area A, but it looks more and more like a square: the width is getting smaller, whereas the height is getting larger.

When n goes to infinity, the width and height converge to the same value which may be interpreted as the side of a square of area A.

Re: Computing Square Roots

*Message #9 Posted by **Thomas Klemm** on 29 Mar 2009, 11:15 a.m.,*
in response to message #7 by Marcus von Cube, Germany

The Horner schema can be used with Newton's method as well:

```
                  1                  0                 -5

 2                1                  2                 -1 = f(2)
                  1                  4 = f'(2)
                  1
-------------------------------------------------------------------
                  1                  4                 -1              dx =
0.25 = - (-1) / 4

 0.25             1                  4.25               0.0625
                  1                  4.5
                  1
-------------------------------------------------------------------
                  1                  4.5               0.0625          dx =
- 0.01389 = - 0.0625 / 4.5

-0.013889         1                  4.486111          0.000193
                  1                  4.472222
                  1
---------
 2.236111
 ========
```

Or you might use Cochran's trick:

```
                  5                  0                -25

 2                5                 10                 -5
                  5                 20
                  5
-------------------------------------------------------------------
                  5                 20                 -5              dx =
0.25 = - (-5) / 20

 0.25             5                 21.25               0.3125
                  5                 22.5
                  5
-------------------------------------------------------------------
                  5                 22.5               0.3125          dx =
- 0.01389 = - 0.3125 / 22.5

-0.013889         5                 22.430556          0.000965
                  5                 22.361111
                  5                 =========
```

Now you get the sum of the differences gratis.

However I assume Newton would have used a different method as I already noted in a previous thread.
As can be seen from the recursion formula it's a cubic polynomial we have to evaluate but now the difference contains only a cheap division by 2:

$$x_{i+1} = x_i + x_i \frac{1 - d * x_i^2}{2}$$

Here's the same calculation using Horner schema:

```
                 -5                 0                 1                 0
```

```
     0.4           -5            -2             0.2           0.08
                   -5            -4            -1.4
                   -5            -6
                   -5
-------------------------------------------------------------------
     0.4           -5            -6            -1.4           0.08         dx =
0.04 = 0.08 / 2

     0.04          -5            -6.2          -1.648         0.01408
                   -5            -6.4          -1.904
                   -5            -6.6
                   -5
-------------------------------------------------------------------
     0.44          -5            -6.6          -1.90400       0.01408      dx =
0.00704 = 0.01408 / 2

     0.00704       -5            -6.6352       -1.95071       0.00035
                   -5            -6.6704       -1.99767
                   -5            -6.7056
                   -5
-------------------------------------------------------------------
     0.44704       -5            -6.7056       -1.99767       0.00035      dx =
0.00017 = 0.00035 / 2

     0.00017       -5            -6.70647      -1.99883       0.00000
                   -5            -6.70733      -2.00000
                   -5            -6.70820
                   -5
-------------------------------------------------------------------
     0.44721       -5            -6.70820      -2.00000       0.00000

     0.44721
   * 5
     -------
     2.23607
     =======
```

Of course later in his life Newton used his HP-10C a time voyager left on his journey.

Re: Computing Square Roots

*Message #10 Posted by **John B. Smitherman** on 29 Mar 2009, 3:52 p.m.,*
in response to message #1 by Thomas Klemm

Thanks for the post Thomas. With the introduction of pocket calculators I hadn't thought about this for quite awhile but I remember learning the Babylonian method as discussed here:

http://en.wikipedia.org/wiki/Methods_of_computing_square_roots

Regards,

John

*Message #11 Posted by **cyrille de Brébisson** on 30 Mar 2009, 12:00 p.m.,*
in response to message #1 by Thomas Klemm

hello,

the method used by all HO calculators from the 71 is described at: in the HP Solve: Volume 5 (June 2008)

newsletter at: http://h20331.www2.hp.com/Hpsub/cache/580500-0-0-225-121.html

regards, cyrille

Re: Computing Square Roots

*Message #12 Posted by **Thomas Klemm** on 30 Mar 2009, 3:26 p.m.,*
in response to message #11 by cyrille de Brébisson

These are the figures copied from the newsletter where the square root of 2 is calculated:

```
 i             mantissa              result           increment

12     100,000,000,000     100,000,000,000     100,000,000,000
11     200,000,000,000     140,000,000,000      10,000,000,000
10     595,000,000,000     141,000,000,000       1,000,000,000
 9     302,000,000,000     141,400,000,000         100,000,000
 8     191,800,000,000     141,420,000,000          10,000,000
 7     503,795,000,000     141,421,000,000           1,000,000
 6     795,315,500,000     141,421,300,000             100,000
 5     882,088,750,000     141,421,350,000              10,000
 4     335,606,320,000     141,421,356,000               1,000
 3     527,636,078,000     141,421,356,200                 100
 2     103,372,009,355     141,421,356,230                  10
 1     437,705,999,155     141,421,356,237                   1
```

And that's what you get when using the Horner schema:

```
      5                   0                  -10

      5                  10                   -5
      5                  20                   10
      5                 100                 -500

      5                 110                 -395
      5                 120                 -280
      5                 130                 -155
      5                 140                  -20
      5                 150                  125
      5                1400                -2000

      5                1410                 -595
      5                1420                  820
      5               14100               -59500

      5               14110               -45395
      5               14120               -31280
      5               14130               -17155

5      1414213562300      -10337200935500

5      1414213562310       -8922987373195
5      1414213562320       -7508773810880
5      1414213562330       -6094560248555
5      1414213562340       -4680346686220
5      1414213562350       -3266133123875
5      1414213562360       -1851919561520
5      1414213562370        -437705999155
5      1414213562380         976507563220
5     14142135623700      -43770599915500
```

As I already mentioned: looking at the same thing from a different angle.

PS: Our first lines disagree. Could it be that the first line shold read instead:

```
12     500,000,000,000     100,000,000,000     100,000,000,000
```

At which line of the program should I assume is the printing of the variables?
If I suppose it's before the while-loop then *result* is still 0 wheras when it's after the while-loop *mantissa* has already been diminished.

*Message #2 Posted by **Namir** on 27 Mar 2009, 11:45 a.m.,*
in response to message #1 by designnut

Amazon sells theHP50g for $104.99 with free shipping. Is HP's offer still cheaper if you include shipping for one calculator?

Namir

Edited: 27 Mar 2009, 11:45 a.m.

Re: HP 50g listed at $99 on HP site, But you can't buy.

*Message #3 Posted by **Dan Grelinger** on 27 Mar 2009, 11:47 a.m.,*
in response to message #1 by designnut

If you click the link to buy it, the price shows as $149. It may be a sign of a sale price in the works. Worthwhile if you were thinking about buying one.

Dan

Re: HP 50g listed at $99 on HP site, But you can't buy.

*Message #4 Posted by **Steve Keeley** on 27 Mar 2009, 11:07 p.m.,*
in response to message #3 by Dan Grelinger

No, it's not an upcoming sale but just a misprint. That price has been on that page at least since December.

in response to message #1 by designnut

Perhaps a new model is arriving soon? If so, it could be a "51", and it may even be a "15" reversed (reverse engineering, that is).

How to enter 2E-3 on a HP-19B2

*Message #1 Posted by **Mike (Stgt)** on 27 Mar 2009, 6:17 a.m.*

Sorry if I disturb with such a dull question, RTFM, I know, but I was quite surprised that I was not able to enter 2E-3 on an HP-19BII (emulated). In any case the minus sign was set before the 2 so with all my effort I only got -2E3 what is not what I expected.

I should find a real HP-19B2 and some working batteries to test on a real thing, but may be someone here may shed some light on this matter before I get lost in the dark and dusty archives of my collection.

Ciao.....Mike

*Message #2 Posted by **Egan Ford** on 27 Mar 2009, 8:37 a.m.,*
in response to message #1 by Mike (Stgt)

```
2 shift +/- - 3
```

The shift +/- is E. The - is minus, not +/-.

in response to message #3 by Mike (Stgt)

My guess is that would be the natural way an accountant would enter such a number.

*Message #6 Posted by **Mike (Stgt)** on 29 Mar 2009, 2:53 p.m.,*
in response to message #5 by Peter A. Gebhardt

Yes, I can! See here. It works on PC and Windoze-Emulators (Izi-Bizee-Weeene or Wine or alike, no: WineHQ). Years ago I had put together a list of those emulators, but as it's about 4 years old some links are dead, I warned you.

Ciao.....Mike

Re: How to enter 2E-3 on a HP-19B2

*Message #7 Posted by **Peter A. Gebhardt** on 29 Mar 2009, 5:52 p.m.,*
in response to message #6 by Mike (Stgt)

Mike,

Thx. for your answer, but as I feared (and already knew) - the 19bII can't be emulated w/o HP's ROM ...

Because of your question (dedicated to the 19bII), I hoped that you were able to get a working version. So until HP changes it's mind and releases at least an educational PC Emulator, we are out of luck.

Best regards,

Peter A. Gebhardt

PS: Although I'm the happy owner of several 200LX, I was interested to get my hands on an HP19bII Emulator for EQN comparising purposes, because all remaining calculators offered on auctions have usually a broken battery cover and are somewhat useless for day to day use.

HP-19B2 on HP200LX (was How to enter 2E-3 on a HP-19B2)

*Message #8 Posted by **Mike (Stgt)** on 30 Mar 2009, 4:33 a.m.,*
in response to message #7 by Peter A. Gebhardt

Hello Peter!

You own several HP200LX? Is it possible we know each other from a "HP200LX-Treff" (I try not to say "Stammtisch") in Waiblingen near Stuttgart? If you are interested just see here and drop Thomas a note (scroll down to bottom and on the next page too).

You probalby know that the calculator on the 200LX is a DOS-port of the HP-19B2, the same comes with it's Connectivity Pack. Both are compiled from the same sources. I still hope to finde someone who may help making an 200LX emulator as good as Chr. Gießelink's Emu42(because the

Connectivity Pack is not a complete replacement of the real machine).

Ciao.....Mike

in response to message #8 by Mike (Stgt)

Mike,

Sorry no - we didn't meet in the past.

Before Daniel Hertrich moved his residence, he was living about only 20 miles (35 kms) away from the town I live. At that time I bought one of his 6MB DS systems.

I started collecting 200LXs about two years ago (because of my profession - Financial Advisor), to have a working stock of systems available for the next 20 years or so ,-)

I'm aware of the CPACK200 which does run under VPC (on XP). There are small differences still in the implementation of the 19bII on the 200LX which made me looking for an emulator for the 19bII specifically.

Best regards,

Peter A. Gebhardt (Abensberg, Germany)

in response to message #9 by Peter A. Gebhardt

What is the difference you know? On the 200LX I may save the formulas I entered in a DOS file, yep, now what else?

And, what makes the 19B2 so specific that you do not use a 17B, 17B2, 17B2plus?

Ciao.....Mike

I'd think that you could just use Bochs. Can you extract the 200XL file system and test on Bochs?

Emulator for HP200LX

*Message #12 Posted by **Mike (Stgt)** on 31 Mar 2009, 5:49 a.m.,*

in response to message #11 by Egan Ford

IMHO Bochs or Qemu or equvalent may do, alas the "internal" file system is hidden and "scrambled" (as far as I understand it), so only smal blocks of ROM are continious, at the boundary of each block the address where to continue execution is calculated. To get this calculation is the big hurdle to take.

The aim is, to allow the 200LX specific task-switching w/o closing the task you leave.

As I am not a PC specialist I have no idea where to start.

Ciao.....Mike

HP41 - Programmable CAT1?

*Message #1 Posted by **Howard Owen** on 26 Mar 2009, 5:21 a.m.*

Is there an mcode or synthetic program that will dump a CAT1 listing into a series of registers? It's not a feature any of my favorite modules, nor can I locate such a function in a quick search of the module documentation at TOS. Any help would be appreciated.

Regards,
Howard

Re: HP41 - Programmable CAT1?

*Message #2 Posted by **Meindert Kuipers** on 26 Mar 2009, 7:58 a.m.,*
in response to message #1 by Howard Owen

Hi Howard,

the -ML ROM (or M2K ROM) contains a few functions that you could use to achieve this, but these work only for XROM's (CAT 2), not for any other CAT. See the user code of XCAT in M2K ROM. I assume you would like to have a list of user code programs in your registers?

Meindert

Re: HP41 - Programmable CAT1?

*Message #4 Posted by **Dan Grelinger** on 26 Mar 2009, 5:01 p.m.,*
in response to message #3 by Howard Owen

I am not the foremost HP-41 expert, but I can't think of a way to get a CAT 1 listing into a usable format for your purpose.

But, in theory, it would be possible to replicate CAT 1 functionality using synthetic means. The Global Label / End chain pointer format is available, and could be used to construct a synthetic program that finds the first label before every END, as well as the last label in the chain, writing them to HP-IL disk as each one is identified. Using this method, there would be no need to store the labels in registers.

Dan

> .. a synthetic program that finds the first label before every END, as well as the last label in the chain..

Actually, I was thinking of finding *every* global label in the chain. I might (and probably would) prefer to use the first label in a given program as the name to store the program under.

> Quote:
>
> writing them to HP-IL disk as each one is identified. Using this method, there would be no need to store the labels in registers.

The advantage of storing them in registers is that it is more general. There's no reliance on HP/IL, so you could use this list to, for example, save programs to extended memory. The big disadvantage of this approach, which Mike's solution and yours get around is the possible lack of register space, especially if there are a lot of programs in memory. But I think a PCAT1 routine ought to be able to compute in advance whether this would be a problem. There's also the question of a routine like this destroying preexisting data. So perhaps the solution of doing the listing incrementally would be better. You could have X contain the index of the entry you wanted to start at, and Y a bbb.eee.ccc loop specifier for the data registers to use, which would also select multiple entries. A -1 in X would mean "reset". The routine could return the highest index number actually returned, in case the total number of entries left was exceeded.

Howard

*Message #6 Posted by **Dan Grelinger** on 27 Mar 2009, 11:18 a.m.,*
in response to message #5 by Howard Owen

"Actually, I was thinking of finding every global label in the chain. I might (and probably would) prefer to use the first label in a given program as the name to store the program under."

Given your stated purpose, finding all the labels in the chain is not very helpful and confuses what needs to be stored. The first global label in a program would seem to be the logical one to use. You can always rename it whatever you want upon the actual store.

Concerning storing them in registers, if you use the standard alpha format, you can't store label names of over 6 characters, seven being the supported number of characters in a label. You

could store them as non-normalized, but then they are not real useful.

My theoretical solution should be able to be done using only synthetics. No M-Code required. M-Code would be faster and more efficient, as always, but not required. Once you load each label name sequencially in the Alpha Register, you can do with it what you want. Save it to HP-IL storage. Save it to Extended Memory. Save it to mag cards. Even put it in a register if you want (6 character limitation if being stored as alpha data).

Dan

Re: HP41 - Programmable CAT1?

*Message #7 Posted by **Howard Owen** on 27 Mar 2009, 2:30 p.m.,*
in response to message #6 by Dan Grelinger

Ah, missed that disparity in register and label length. So PCAT1 would have to return one label at a time in alpha on successive calls. Using the alpha register has the benefit that registers need not be disturbed. Good idea.

The reason I want all global labels is for generality. *I* may want the first label, but *you* may want the last. Also, perhaps the label names are needed for some other purpose than to store the programs. Returning them all, plus the ENDs, on successive calls is slower, but more general.

The question I have about a synthetic FOCAL program has to do with lowering the curtain to expose the labels. You have to go all the way down to the .END. to get all the labels. Will the synthetic program driving happily execute when it's registers are interpreted as data by the rest of the system?

I actually think it might be fun to implement this in FOCAL and in mcode also. :)

Regards,
Howard

The HP-41CX operating system does not really care that what it considers 'memory registers' and 'program registers' overlap, as long as the user keeps things straight during execution (e.g. NOT writing into 'memory registers' that really need to remain 'program registers') and the program puts things back before the program finishes. The program counter is not checked to see if it remains in program mememory space during program execution. That is one benefit that can be taken advantage of on several occasions, such as running programs that are stored in Extended Memory without having to recall them to main memory.

Quote: "I actually think it might be fun to implement this in FOCAL and in mcode also. :) "

Yes it would!

*Message #9 Posted by **Mike (Stgt)** on 26 Mar 2009, 8:34 a.m.,*
in response to message #1 by Howard Owen

IMHO it would not be useful to save the CAT1 output in registers as at least by synthetic means you may create labels waaay too long to store in one register. An ASCII file in XFunction would be more useful. To get that I would add an HP-71B to the IL-Loop and make it a look like a printer for the HP-41. Then do CAT 1 in trace mode and transfer the result back to the HP-41.

Simple, isn't it!

Ciao.....Mike

Re: HP41 - Programmable CAT1?

*Message #10 Posted by **Howard Owen** on 26 Mar 2009, 11:30 a.m.,*
in response to message #9 by Mike (Stgt)

Hi, Mike

I think I can live with not being abe to process synthetically created labels over 7 characters long. A greater difficulty might be overflow of available registers with all the alpha labels. You'd need to store all END instructions in registers too, to account for the possibility of multiple global labels in a single program. Perhaps PCAT1 could be implemented so as to return just one label per call. Either it could return the Xth such label, or it could keep track of the last label returned in an I/O buffer and return the next one on successive calls. There would have to be some sort of reset mechanism for that to be useful. I think I favor the former solution.

That's an hilarious solution using the 71B! I think you might actually be able to do it, too. But I want my PCAT1 to work regardless of the presence or absence of an HP/IL loop.

Regards,
Howard

in response to message #10 by Howard Owen

Howard,

Do you want each file to have a seperate entry on the HP-IL drive? if not, there are some MCODE functions that write the whole main memory onto an IL-drive. They could be modified to only write all the program registers out (using reg c to figure out where to start and stop).

Cheers

Peter

Re: HP41 - Programmable CAT1?

*Message #12 Posted by **Howard Owen** on 26 Mar 2009, 5:31 p.m.,*
in response to message #11 by PeterP

There are routines in the HP/IL interface module that will store and retrieve the whole calculator state (WRTA and READA). But I want to be able to take one of my 41s (or an emulator), loaded with a bunch of programs, and store them all out to HP/IL as separate programs. Then I can take another 41 (or an emulator) and selectively load some of those programs.

It ought to be possible to do this with synthetic programming, but I wonder about moving the curtain to uncover the program headers. It seems to me that a synthetic PCAT1 wouldn't be able to run in calculator RAM. (Of course, that's the case with mcode too.)

Regards,
Howard

Although I can't offhand think of a built-in way to have a program store *all* the programs separately (it seems like I've done it but I'm rusty on HPIL storage now), WRTP does indeed write the alpha-specified program to HPIL storage without the overkill of WRTA. Is that not what you want to do?

Howard

Re: HP41 - Programmable CAT1?

*Message #17 Posted by **Dan Grelinger** on 27 Mar 2009, 11:42 a.m.,*
in response to message #12 by Howard Owen

I believe that it is possible to do with with synthetic programming. And all synthetic programs can run in calculator RAM.

My sythetic programming skills are very rusty, but here is what I can put together for a flow chart.

Recall and process the c register to resolve the location of the permenant END (.END.)

Move the curtain down the appropriate amount to make the register containing the .END. recallable as a numeric register.

Decode the register to determine the address of the next highest Global Label or END. Read that label and store it if it is not an END.

Decode that register to decode the type (Label or END). If it is an end, determine if this is the last (first) label in the chain, and use that to return a designator (flag?) back to the calling routine that all labels have been processed. Grab the last label stored, and return to a mother routine for processing (program storage or whatever you want to do with it) after storing some intermediate pointers for the next time through the subroutine and moving the curtain back to where it belongs.

Not easy, but should work.

Dan

Re: HP41 - Programmable CAT1?

*Message #18 Posted by **PeterP** on 27 Mar 2009, 3:52 p.m.,*
in response to message #17 by Dan Grelinger

two further suggestions/thoughts:

1. There are Non-normalizing recalls available from quite a few roms (Zenrom, CCD, Sandbox, ...) So one could do this without having to disturb the curtain.
2. I'm not sure but I think it could be possible to have an end go across a register boundary. Which would make decoding it a bit more tricky but still doable.

Part of me is actually quite surprised that such a PCAT1 routine does not exist...

Cheers

Peter

Re: HP41 - Programmable CAT1?

*Message #19 Posted by **Dan Grelinger** on 30 Mar 2009, 10:00 a.m.,*
in response to message #18 by PeterP

Using non-normalizing recalls for other ROMs would be helpful, but since (AFAIK) these are micro-code functions, it would not be possible to reproduce them in a synthetic program.

Yes, the fact that an End can wrap between registers makes the address decoding a bit trickier, but not excessively so.

It is surprising that a PCAT1 type program does not exist. The HP-41CX has the EMDIRX for Extended memory, but no equivalent for program memory.

Dan

Re: HP41 - Programmable CAT1?

*Message #20 Posted by **PeterP** on 30 Mar 2009, 10:07 a.m.,*
in response to message #19 by Dan Grelinger

... see the program I did over the weekend. It uses functions from the CCD and does not need any curtain lifting etc (and actually no synthetics either thanks to the CCD)

Cheers

Re: HP41 - Programmable CAT1?

*Message #21 Posted by **PeterP** on 31 Mar 2009, 4:10 p.m.,*
in response to message #17 by Dan Grelinger

Dan,

I spent some more time thinking about this and currently I don't know how this can be done in synthetic FOCAL programming alone. At some point or the other one needs to do a non-normalizing RCL from a specific register and IIRC this can not be done with synthetics alone.

Allowing the use of the X/F module, I think there is a way using the EM. There are a couple of functions that don't normalize (see page 182 in KJ EFME or here)

The sequence would have to be something like this:

1. Create/change type of a tmp file with length 2 in XM to Data
2. Lower the curtain to make 3 registers around the desired address(as an end can and most alpha labels will span 2 and up to 3 registers) directly accessible (say R00-R02)
3. Use SAVER (probably, not 100% sure) to save R00-R02 to the tmp file
4. Change the file type to Asci (by moving the curtain and overwriting the file-type)

5. Locate and read out the individual bytes from EM using ASCI access functions and ATOX
6. Rinse and repeat

Probably not very fast but doable. There are some PPC module functions for which we have the FOCAL/synthetic listing that one could use to make some of the absolute register calculations and decoding. Yet it would seem to be a trickier undertaking than I first imagined (which might explain its absence) and would need at least the X/F module.

All in all, I'm glad we have MCODE... (and the CCD)

Would love to hear thoughts from others on this little problem.

Cheers

Peter

Re: HP41 - Programmable CAT1?

*Message #22 Posted by **Dan Grelinger** on 31 Mar 2009, 6:59 p.m.,*
in response to message #21 by PeterP

I knew that there were exceptions to register normalization, and thought (mistakenly?) that it would be possible to use one of them to get the register. You have the best solution I can think of, below.

You might have to do something extra though. Their is a byte stored at the beginning of each record of an ASCII file that indicates the record length. You may need to create a 4 register file as an ASCII file, create a record that is 27 characters long (first byte is record length (27D), the following 27 characters are dummy characters, switch the file to data, SAVER as you describe below, but first SEEKPT to the second register (don't mess with the first, it has the record pointer in it that needs to be preserved), save the three target registers in the last three registers of EM file, and then change the file type back to ASCII, SEEKPT to the seventh character of the first record (0) and read the record into the alpha register.

Quite convoluted, to say the least.

Dan

*Message #23 Posted by **Mike (Stgt)** on 27 Mar 2009, 6:00 a.m.,*
in response to message #10 by Howard Owen

Well, at least you need a XFunc/XMem where you may save the programs your future routine found. If you like to store them on floppy - DARN! - you need an IL-Loop <VBG>. The _hilarious_ use of an HP-71B as a printer evolved only from the idea to re-use the the trace output of the build-in CAT 1. (That way I got allmost all ROMs.) I never tried to set up a floppy to catch trace output in a file.

For an IL-free solution I would not store any data in registers that is contained already in main memory, I would only save a hint where to find it. How about a buffer (one register is enough) with an ID you rarely use to store the last and 2nd to last address PCAT1 found something to tell the user. Without code to keep it at ON it may be flushed with PACK or OFF/ON. The adress of global labels are "chained" bottom up satarting with the permanent .END. (BTW, that is the reason that CAT 1 gets

faster to the end of the list.) Do I need to tell more of my idea?

But, IMHO, those programs which build a ROM from user code need something similar to build the FAT. Nothing useful found there?

Ciao.....Mike

It's a great idea. It was"hilarious" in the sense something unexpected is. :)

> Quote:
>
> Without code to keep it at ON it may be flushed with PACK or OFF/ON.

Hmm. This would be an issue with any solution that tried to return different results on successive calls

> Quote:
>
> The adress of global labels are "chained" bottom up satarting with the permanent .END. (BTW, that is the reason that CAT 1 gets faster to the end of the list.) Do I need to tell more of my idea?

Right, this is the chain that would have to be walked with either mcode or FOCAL. The former wouldn't require moving the curtain, however.

> Quote:
>
> But, IMHO, those programs which build a ROM from user code need something similar to build the FAT. Nothing useful found there?

Ah! Great idea! Steal.. er..borrowing code is always easier :)

HP41 program for programmable CAT 1

*Message #25 Posted by **PeterP** on 29 Mar 2009, 8:05 p.m.,*
in response to message #1 by Howard Owen

Hi,

The program below will show in reverse sequence all alpha labels as per Owain's request. It makes good use of CCD functions that help decode the ENDs and Alpha Lables (and thanks to Clonix, et al they should be available to most of us in some shape or form). I hope it is at least a useful starting point.

Usage:

1. Execute a GTO.. (to be save…)
2. XEQ 'PCAT'
3. See all alpha labels in reverse sequence.

PCAT only uses R00, leaving all other registers for any processing of the labels. Any such additional processing (e.g. saving to HP-IL) can be readily added to the LBL 'CA' (Check for Alpha label). An extension to only show the top level alpha is 'straight forward and left to the 'interested reader' :-) (god, did I dread these words in my math books…)

The structure of the ENDs and alpha LBLs is (as everything else) exceptionally well explained on pp498-504 in Wlodeks 'Extend your HP-41' (if I'd be allowed only one book to bring about the HP-41, it would be this…). The first two bytes have always the structure |C bbbr | rrrr rrrr|. bbb is the number of bytes and r|rrrr rrrr| the number of registers to the next CAT 1 element. For alpha labels, this is followed by |F n+1 | kkkk kkkk | tttt tttt |…|, where n is the number of chars in the alpha label, |kkkk kkkk| is the keycode if it is assigned to a key and |ttttt tttt| are the chars.

CCD Functions used

- 'DCD' – decode a NNNin x and append to alpha
- 'A+' - add one byte to the absolute address (in dec) in X
- 'PEEKB' – read the byte from absolute address in X
- 'A+B' – add the number of bytes in X to absolute address in Y
- 'S>' – shift X one bit to the right
- 'bS?' – check if the bit in X is set in the number in Y

Note: The listing below is not optimized for speed, elegance, length etc yet only meant as a starting point. (e.g. I used the unnecessary alpha labels and ends to test the program basically on itself…) I hope it is still helpful.

Cheers

Peter

Re: HP41 program for programmable CAT 1

*Message #26 Posted by **Howard Owen** on 31 Mar 2009, 8:20 p.m.,*
in response to message #25 by PeterP

Here's the gist of some out-of-band communications Pete and I have been having regarding this code. Using my CCD version A module, this code freezes every one of my three halfnut 41CX machines when the code attempts to AVIEW in CA. Pete diagnosed the problem as a bug in the CCD A module, that was fixed in the B version. Unfortunately, I'm having difficulty getting the CCD B module images to work in my NoV64. The symptoms are that some of the instructions, visible in CAT2, give NONEXISTENT when you XEQ them. DCD is one of the problematic functions. I'm going to try to load the CCD pages into HEPAX RAM on the NoV64 to see if that makes a difference. Does anyone recognize this symptom with the NoV32/64? My MLDL2000 is broken (bad memory, apparently) so I'm stuck unless I can get past this problem

Regards,
Howard

in response to message #27 by PeterP

Hi, Peter.

I was stopped in my attempt to reset my Nov64 by the fact that there is no NovClr64.hex file in my distribution from Diego. I had intended to email him, or post here about it, but I didn't get around to it. I'm rushed at the moment, but I'll try to do a post here later regarding this.

Howard

Re: HP41 program for programmable CAT 1

*Message #29 Posted by **PeterP** on 3 Apr 2009, 4:14 p.m.,*
in response to message #28 by Howard Owen

Howard,

here is the Clean-Novram file for you: Clear NoV64

And here is the description from Diego on how to clean it.

> Quote:
>
> Regarding your question, there should be a CLR-RAM4.HEX file in your CD, and therefore in your working directory. This file not only erases the whole 64K of RAM but also checks its functionality by writing and reading very single word.
>
> Once you burn that file into your NoV-64 just plug it into your calculator (make sure its running at normal speed). A good set of batteries is highly recommended. After about 25 seconds your calculator will Auto turn ON and a message will let you know the result of the checking/erasing procedure:
>
> [CLR OK] (the more likely... :-) or...
>
> [NO CLR] (some fault has been found...) if this was the case, please repeat the procedure to make sure the failure is consistent.
>
> Should it ends up as expected, turn your calculator OFF, remove NoV-64 and re-configure it as usual with HEPAX emulation and other images you may want... if any.

HTH

Peter Clear NoV64

others interests of hp calc users

*Message #1 Posted by **Iqbal** on 26 Mar 2009, 2:37 a.m.*

I have always wondered what are some of the other interests of HP calculator collectors/users. Myself, I play cricket (not a bug for the US guys),table tennis (ping pong). I also love hunting, fishing and airgunning. BTW I am a licensed land surveyor and I have been an addict to HP calculators since September 1987.

A rough overview of some of my interests:

```
Philosophy; Free will
Mathematics; Statistics, number theory, category theory
Physics; Astronomy (star gazing), astrophysics, cosmology, particle physics, quantum mechanics
Music; From classical and opera to hard trance and even jazz
Other art; Writing poetry and short stories, creating 3D digital art
People; Doing seminars on people relations and communication, helping individuals
Role-playing games; Playing the Amar RPG and also live RPG
Sports; Foosball, down-hill skiing, coaching a football team of 9 year olds
Programming; Raven, Ruby, MCODE, Focal, Forth
Business; Doing seminars on free software, ITIL and just about anything else
```

But family first.

And; See my web page for more.

I'm an electronics designer, I currently design THIS during my work hours.

In my spare time my main hobby is ELECTRONICS, and everyone knows about my uWatch.

I'm a gym junkie, and developed THIS workout program for iPods.

I'm also into CANYONING and edit the yearly CALENDAR . I'm also the most active member of the OzCanyons Group, and host that site too.

I'm also into sustainable living, and have a webpage for my HOUSE.

I've also developed a Solar Air Heater for fun.

I'm also one of the early pioneering members of GEOCACHING in Sydney, and used to edit the Australian Geocaching Newsletter.

I'm also the world's foremost expert and author on Internet Dating.

Dave.

*Message #5 Posted by **Valentin Albillo** on 26 Mar 2009, 9:09 a.m.,*
in response to message #1 by Iqbal

Hi, **iqbal**:

My main interests in no particular order:

- Mathematics, both dead serious and recreational
- Music: many genres, both modern and classic, most especially Bach and Mozart, most especially Opera
- Photography and multimedia: video and audio creation and edition
- Everything Science: physics, computing, engineering, biology, neurology, the works
- Japanese culture: history, language, cinema, art in general, literature, the works
- Sci-Fi, Comics, and serious science literature
- Movies: both vintage (even B&W and/or foreign) and modern
- Japanese martial arts, most especially anything having to do with ***nihonto***
- Chess and some other classic games (backgammon, reversi, card games, etc)
- HP & SHARP vintage handhelds collecting
- Programming (anything and everything in any language)
- Social engineering, human relationships, pedagogy, children education, dealing with people in general
- Modern-times wars, most especially WW II

Things I'm **NOT** interested in:

- Money
- Politics
- Religion
- Power
- Philosophy
- UFO's, "New Age" thingies, "ghosts", mediums, paranormal "powers", and any such drivel
- Losing my time, most especially dealing with morons or moronic ramblings.

I have left *many* in both counts but there you are !

Best regards from V.

*Message #6 Posted by **Mike (Stgt)** on 26 Mar 2009, 9:16 a.m.,*
in response to message #1 by Iqbal

First collateral interest of HP calculators is emulating HP calculators (by simulating their CPU to make a firmware interpreter). Rest see here. I re-activated cooking in the last 3 years, hounting for old recipes from farmer's society in the last 2 or 3 centuries or so (like Aligot and such alike, have a look at Cholera), and inventing new stuff like "devilry-wheel" what is a yeast cake with chestnut, some white pepper, etc. (It was a big success at a local midsummer nite art fair, where fire was the main theme.)

Ciao.....Mike

*Message #8 Posted by **Erik C** on 26 Mar 2009, 10:29 a.m.,*
in response to message #1 by Iqbal

Iqbal,

-engineering: aerospace and mechanical areas

-travel
-family
-coffee
-PBS (a television station that is essentially non-commercial)
-tinkering, building, designing (lately little time for this)
-programming (non-HP stuff, right?) Matlab, C, and recently found the opportunity to dive into some internet scripting - it's all the same when one can relinquish the affections over a single language (Perl users...?)
-recreational and professional mathematics; I'm an engineer, but not a bull-pen occupant :)
-graduate studies...it does occupy my time
Erik

ah- forgot the recent venture into cooking my own food, hahaa...quite fun indeed!

I am a civil (most of the time) engineer who owns a small design firm.

I am married 31 years and have 3 grown children.

These two activities have consumed most of my energy for the last 32 years.

My other interests include (beside HP calculators):

Worshiping God, studying the Scriptures, and fellowship with other Christians.

Shooting.

Reading history and biographies.

Miniature machining.

Photography using Nikon F2 cameras.

Politics.

- My wife and kid. We love board games (mostly German) and have about 100 of them.
- High Performance Computing (my job). Collecting and programming mid-80's vintage calculators always reminds me to think smarter and not harder.
- Math, Physics, Programming.
- Mountaineering, Canyoneering, Snowboarding (I live in Utah).
- Domestic (US) movies that do not make me think.
- Foreign films that do make me think.

- 20 years ago I would have said cycling, but now that's been replaced with travel and food. Working to get that changed to travel and cycling.
- Almost anything with blinking lights.

In no particular order:

- Walking - English / Welsh / Scottish hills, or the English countryside.
- The music of J.S.Bach (and some other lesser composers as well)
- Physics (especially particle physics, cosmology, and quantum mechanics)
- Teaching Physics
- The History of Science
- Linux
- TeX (a typesetting program)
- Programming for fun
- Horror / fantasy fiction (e.g., Lovecraft)
- 19th Century English novels

Hello all, just thinking about this post

```
• My 1973 Celica purchased during high school in 1974.
• Clock restorations including my last project.
• HP Calculators of course.
• Watch restorations, over 200 so far including 9 HP 01's.
• Some interesting slide rules (yes I used a Post 1461 in
  first year).
• Golfing.
• Hiking, although not recently!
• Photography.
• My job flying is also a hobby making me one lucky person!
• Still persuing studies related to my 1988 MSc, 'climate change'.
```

- Not interested in Woo Woo psuedosciences.

RESTORED WATCHES:

LATEST CLOCK RESTORATION (last summer)

Cheers, Geoff

*Message #18 Posted by **Chuck** on 26 Mar 2009, 4:29 p.m.,*
in response to message #17 by Geoff Quickfall

Nice watches! The 4th watch, second row, first picture brings back memories. My dad received one similar for graduation in 1948. It was a Lord Elgin, but I think not as square? Unfortunately it was taken in a home robbery 20 years ago. :(I'll have to keep my eye on the lookout for a replacement for him.

Re: others interests of hp calc users

*Message #19 Posted by **Geoff Quickfall** on 26 Mar 2009, 8:04 p.m.,*
in response to message #18 by Chuck

Yes, the Lord Elgins were the higher end of the Elgin line. Nice watches but not that common.

The one you refer to in the photo is a Hamilton circa 1950, 21 jewel manual wind with engraved movement.

Cheers, Geoff

- Programming. Been doing professionally for my entire career. No interest in management.
- Family and kids
- Photography
- Almost anything to do with water - swimming, boating, beach etc.
- Indoor rowing. Wonderful exercise and the cheapest piece of olympic training equipment you can buy (less than $1,000)
- elementary education - I'm on the Board of Trustees at both my kids' schools.
- Historic preservation
- Scotch
- Travel and Food

I see a lot of the expected, some of the unexpected, but where are the model rocketry buffs?

Re: others interests of hp calc users

*Message #22 Posted by **Mike T.** on 26 Mar 2009, 6:03 p.m.,*
in response to message #1 by Iqbal

Family - better put them first just in case they ever read this, I have a very patient wife and two young teenage boys. I'm not exactly short but the eldest is already at least a couple of inches taller than me and the second one is catching up fast.

Calculators - HP 21, 25C, 32, 33C, 34C, 10C, and 11C. I would like to own an HP97 one day, as this was the first 'computer' I ever used.

Computers - particularly small uVAXen (VMS), Linux, and Windows NT. I've got a couple of DEC Rainbows here somewhere too.

Programming - nearly all self taught, (HP Calculator simulators elsewhere on this site). I'm trying to get to my head around how to write programs using KDE or GNOME but I'm not getting very far, you seem to need loads of 'stuff' just to do anything in C!

Food - despite the interests above I'm into more than just Pizza! I prefer a good Chinese or French restaurant but don't get out very frequently.

Swimming - but not nearly often enough to counteract the effects of eating a little too much (I think I used to be quite good but I'm far too unfit now).

Walking - I'm not into hiking as such but if I'm somewhere new and interesting I will wander about for miles just exploring.

Model Railways - mostly Z Gauge (1/220 scale), collecting this stuff is a slow process as you spend most of your time saving up..

Electronics - can't remember much of the theory at all and haven't actually made anything for ages. I learnt the hard way to keep one hand in your pocket at all times when working with thermionic valves.

Photography - still have a couple of old Minolta X-GMs and X-700s (with some rather nice lenses) but never seem to have enough time to do much anymore, and English summers don't help!

Physics - last but not least - a brilliant subject, just wish I'd been better at Maths!

Basically I like fiddling with 'stuff'.

Re: others interests of hp calc users

*Message #23 Posted by **Matthias Wehrli** on 26 Mar 2009, 6:22 p.m.,*
in response to message #22 by Mike T.

Well, let me say I have many other hobbies:

- singing in a choir - archery - geocaching

Maybe I will list them on my website (some are already).

Matthias

*Message #24 Posted by **Paul Dale** on 26 Mar 2009, 6:43 p.m.,*
in response to message #1 by Iqbal

My hobbies and interests in no particular order after the first:

- My wife and children first and most importantly.
- Woodworking - too many things to build, so little time.
- Meccano (also Erector & Marklin Metall) - working mechanisms mostly.
- Role playing games - just about any kind.
- Board games - mostly Euro games but some others.
- Painting miniatures.
- Puzzles - designing, making and solving.
- Programming - calculators and others.

- Music - just about anything except opera.
- Judo - coaching now rather than competing.
- Dr Who.

Things which I used to do a lot but don't do much anymore (lack of time more than lack of interest):

- Bushwalking.
- Lots of other martial arts.
- Windsurfing and sailing.
- Swimming.
- Chess.
- Bridge.
- Mathematics.
- Handball.

My current job is embedded programming, although I've done stints in computer security, mine site design & super computing.

in response to message #1 by Iqbal

I could copy almost everyone's hobbies. However, here's a short list off the top of my own head:

*music (I play trombone in several groups: the symphony, opera, community band, local playhouse, and other various small time gigs.)

*photography (nature, and fine arts)

*gardening

*sports (although age is making participating a little more difficult)

*math stuff...collecting math "junk", analytical excursions, and career (math puts food on the table.)

*you might say checking in on hpmuseum several times a day is also an enjoyable hobby.

I'm reading an interesting book on Sir Francis Walsingham. Also reading "Hell in a Very Small Place" about the French at Dien Bien Phu. Finally, reading a book about Chinese exploration in the 14th ct'y and possible profound influence on the course of European exploration.

Re: others interests of hp calc users

*Message #37 Posted by **Tony Duell** on 28 Mar 2009, 5:08 a.m.,*
in response to message #1 by Iqbal

Might as well post mine :

HP desktop calculators and computers (or is that 'hp calcs'?)

Old Computers in general. No, not 486 PCs, but things like PDP8s, PDP11s, PERQs, Philips P800s, anything I can understand at gate level.

Electronics. All electronics. Valves, transistors, ICs, etc. Building, repairing, tweaking, etc. I do have an amateur radio license, but I'm not active, and I'd rather not post the callsign.

Clocks/timekeeping. Everything from sundials to atomic clocks. One of my aims is to make a mechanical clock from scratch (and not just follow a published design, but design the thing too).

Film photography.

And related to that : Repairing cameras. Everything from sub-miniature to large format.

Home shop machining. There's not really a UK term for this, the closest is 'model engineering', but I don't really want to make models. I mean using machine tools at home to make stuff.

I hesistate to mention this one, but I love my cat :-)

Things I am NOT interested in :

Anything athletic/sporting. Neither taking part nor watching.

Pseudoscience/occult/related mumbo-jumbo.

Science fiction. Science fact is quite entertaining enough :-)

Making money. Sure I want to be able to enjoy my interests, but my aim is not to have a large bank balance

Religion. I don't want to get in a flame war, suffice it to say that your beliefs are your business, and I'll happily respect that. Just don't expect me to share them.

Re: others interests of hp calc users

*Message #38 Posted by **Geoff Quickfall** on 28 Mar 2009, 12:58 p.m.,*
in response to message #37 by Tony Duell

Hello Tony,

Yes, I agree about the home shop:

```
*  small shop lathe
*  CNC for metal as well as plastics
*  gear cutting wheel
*  good HP41c program for determining tooth count given the other
   main gear counts.
*  design a clock from scratch and then build.
```

I have a set of plans for a wooden clock based on the design of an 1820 American 30 hour clock. Most of the base plates are done and the only brass will be the anchor escapement.

Your correct, real science is exciting enough, no room for WOO WOO (aka mumbo jumbo)!

By the way, 486's are not old, even 8086 or 8088 based machine are not old to me, but then I think I am dating myself. I would rather step even further back, like you!

Speaking of which the 9825A project here is comming along nicely. Machine is almost finished and just looking for a QIC tape for testing the drives read/write capability. This one came with EXTENDED IO, SYSTEMS PROGRAMMING and STRING-ADV PROGRAMMING.

I know how you feel about film and agree, just not in my buget considering how many shots I take. I tend to throw out 50 negatives for every 1 I keep. I do use slide film for special occasions and the digital for backup.

Just finished restoring a Zenith transoceanic. Nice design on the transistor, they are plug in and easily swapped out without the mess of soldering.

Trans-Oceanic
ZENITH

ZENITH
SERVICE MANUAL
MODELS "ROYAL D7000, ROYAL D7000-1
AND ROYAL D7000-2"
"TRANSOCEANIC"
CHASSIS 500MDR70
SOLID STATE AC/BATTERY PORTABLE
LW/AM/FM/SW/WB RADIO
ZENITH RADIO CORPORATION
1900 N. AUSTIN AVENUE
CHICAGO, ILLINOIS 60639
OPERATING GUIDE TO HELP YOU ENJOY YOUR NEW

Hi,

My interests other than programming calculators are.

Maths, Physics, Surveying, Astromomy, Cosmology, running half Marathons, reading fiction and non fiction books, collecting old scientific books and during the last couple of years learning to play the Violin.

I must say that learning to play the Violin at my age (65) has been one of the most difficult tasks I have undertaken and also one of the most rewarding.

Hi from Australia,

I consider myself to be weird, not just for collecting HP's. My interests are:

- Windsurfing - Underwater hockey (5 time Australian representative, won 2 world titles) - Traffic engineering/ transport planning (University was my first encounter with HP's), run my own small consultancy. I did my first engineering degree with a 28S, then two Masters degrees with a 48G, now I have over 44 HP's (and growing every day it seems ...) - Photography - Swimming

Most of the above (apart from HP collecting and work of course) has taken a back seat now that i'm married with three children. Interesting that my two eldest boys love playing with my 95LX and 200LX!! I'm thinking of getting a couple of cheap 95LX's for them to keep them happy!

Cheers, Keith

HP 67 Calculator emulator for PC.

*Message #1 Posted by **aranda1984** on 26 Mar 2009, 1:11 a.m.*

My first HP was the 25 in 1976! In 78 I got myself an HP 67 and from there on, it was love and respect for that beauty.

I still have both, but time and daily usage killed the 25 and cripled my beloved 67 also. (Not bad, eh? ... 30 years! The card reader is no longer functioning, the rubber is gone. You can no longer use the 67 with batteries, it must be plugged in all the time. New battery pack is no help! I have quite a few other HP RPN calculators, 28s; 42s; 35s; 50g etc. I use them, but I don't like any of these as much as I love the 67!

I can't describe how happy I was when I found and bought a program for my PC that actually works as my old HP 67 calculator.

However, my happiness was not quite complete.

...May I voice a couple of observations to all the 67 lovers...

Not having the tactile sensory feedback of the keys is a reason for my mistakes while putting in the new programs with the cursor. A click or any other sound would be a good solution to this problem.

Not being a computer programmer, I must ask any who could give me an answer, is there a reason why this emulator program stops at 224 program steps instead of taking advantage of the nearly unlimited program steps possible in the computer?

The simplicity of programming what made the 67 so great. We have gone full circle. The touch screen devices in use today, are practically the same as the 67 was!

... Am I a single lonely (and old) voice in the wilderness?

Fact! ...Wheneven I meet older engineers, we talk about the simplicity and the good old days of the HP67 (97)!

I would trade my 50g with a 1 Gig memory, in an instant for a decent and fully functional 67! Sorry, but I can't get used to it... and I won't even mention the manual!!!

With respect to all the HP50g lovers...

Stephen I. Molnar

in response to message #1 by aranda1984

There is another (different) simulator on this website here along with a few others!

Since I know that there are a couple of places where my HP67 simulator does not behave *exactly* like the real thing I'd suggest that the other Mike's simulator is probably a better choice right now unless you are using an older version of Windows - however I'd welcome any feedback you care to provide.

Mike T.

> If only we could get that much satisfaction out of our jobs...

I think that, beyond our love for our hobbies, the element of voluntary participation is crucial to our enjoyment of them. If I had a job as curator of a calculator museum (a physical museum, not an online version) I would enjoy my work immensely. But if I felt pressed for time, or ill, or just plain lazy, there would still be an obligation to perform my curatorial duties. The element of play is what makes hobbies relaxing, and big part of that is the greater ability to call it quits when fatigue sets in. Goodness knows, you can still choose to press beyond the ragged edge of fatigue pursuing your hobby. But the word "choose" is

crucial there.

Strange X-Functions Module

*Message #1 Posted by **Juergen Rodenkirchen** on 24 Mar 2009, 2:25 p.m.*

Hi all!

I've an HP-41 module that is labled XFUNCTIONS on the front-side and with HP-description HP 5061-5256 (instead of HP 82180 A) on the bottom. In my HP-41CX a CAT2 produces EXT FCN 1C and 2-times EXT FCN 2D (where one EXT FCN 2D is clearly CX-build-in). It seems that the module has no EXTENDED MEMORY build in. Does anyone has any information on this module?

Regards, Juergen

Edited: 24 Mar 2009, 2:26 p.m.

Re: Strange X-Functions Module

*Message #2 Posted by **Raymond Del Tondo** on 24 Mar 2009, 4:20 p.m.,*
in response to message #1 by Juergen Rodenkirchen

Hi,

it's better to check an X-Functions module with a C or CV, not a CX,
because you won't see more X-Memory for obvious reasons...

It's similar to trying to check a QUAD Memory module in a CV: It simply doesn't make sense;-)

At some point in production, HP seemed to have either renumbered the module itself not to carry the package name anymore,
at least I have seen many X-Functions modules which don't have the 82180A printed on their back,
while the whole product (module, manual, box) is still the HP 82180A.

HTH

Raymond

Re: Strange X-Functions Module

*Message #3 Posted by **Philippe Lasnier** on 24 Mar 2009, 4:56 p.m.,*
in response to message #1 by Juergen Rodenkirchen

Just like Raymond, I agree that the XFUNCTIONS module is not going to do anything in a HP-41CX (it may even conflict - although I haven't confirmed that). In particular, you're not going to get access to the X-MEMORY part of it, i.e. the 127 registers (I *have* tested that ;-).

All my XFUNCTIONS modules report -EXT FCN 1B. You obviously have a later version.

Philippe

Re: Strange X-Functions Module

*Message #4 Posted by **Juergen Rodenkirchen** on 25 Mar 2009, 5:04 p.m.,*
in response to message #3 by Philippe Lasnier

Raymond, Philippe, thanks for your input. And, yes, I know that it makes not much sense to have a XF in a CX ;-) it was just to see what the CAT2 would reveal due to the strange description that I couldn't interprete. Meanwhile, I got my hands on a CV and checked again: You're right, it's just an ordinary XF (Version 1C) with 124 regs. Thanks again!

Best Wishes, Jürgen

Re: Strange X-Functions Module

*Message #5 Posted by **Philippe Lasnier** on 25 Mar 2009, 7:20 p.m.,*
in response to message #4 by Juergen Rodenkirchen

You're welcome; I'm glad to see that you actually knew what you were doing :-)

I wonder how many of these 1C versions there are out there?

Philippe

in response to message #7 by db (martinez, ca.)

Dennis,

Just to let you know the Corvus 500 arrived today, and like you said, it's really solid and well made, much better than my HP-32E. It's in great like new condition with no wear on the gold legends above the keys and gold trim. I think the styling is really elegant, the keys work well and the display is clear. It seems to be very accurate but also very slow. Just computing the tangent of a number takes about 3 seconds! The ability to use any type of AA battery cells is really nice and it also works with my universal AC adapter (it didn't come with the OEM adapter). I'm really impressed with its 12 digit display, which is only rivaled by my HP-48SX and HP-50g, and also by its comparable forensic number. I already had an original manual for an APF mark 55, which is identical except for key arrangement, so I don't need to print out a bulky 8.5 x 11 PDF copy of the Corvus manual. So, thanks again for alerting me to the auction.

Michael

New Release of HP9800E

*Message #1 Posted by **Achim (Germany)** on 23 Mar 2009, 4:25 p.m.*

Dear friends and collectors of vintage computers and calculators,

there is a new release 1.40 of HP9800E available from

http://sourceforge.net/projects/hp9800e

New features are integration of user instructions for each plug-in ROM, configuration and validation of allowed ROM slots, high-speed output mode for printers and plotters, and three levels of calculator configuration files.

Have fun, Achim

Buzzer in HP-01 watch: how to get a replacement

*Message #1 Posted by **Ronald** on 23 Mar 2009, 9:30 a.m.*

Hello,

I aquired a HP-01 in bad shape and am trying to bring it back again. The piezo buzzer in the watch back cover is broken.

Do you have any idea were to get a spare part that would fit?

Thanks for your help

Ronald

Re: Buzzer in HP-01 watch: how to get a replacement

*Message #2 Posted by **Geoff Quickfall** on 23 Mar 2009, 2:08 p.m.,*
in response to message #1 by Ronald

Hello Roland,

I have yet to replace the buzzer, although I did have a completely loose one.

They should be available from a good electronics supply house. Find the correct size and reattach it. Check the old glue attachment point. That will be your target for the new glue. Excess glue or the wrong position for gluing will decrease or stop the peizo effect and therefore the 'buzz'.

Also, the watch is very finicky vis-a-vis the postion of the contact to the buzzer from the battery hatch. The hatch must be in perfect alignment to the circuit board buzzer contact point to battery hatch contact or you will get a reduced sound or no sound at all. Sometimes it takes only a minor tweak of the battery hatch position to get the loudest sound.

I had a buzzer that was missing a chunk from one edge but it still functioned perfectly. On another I made the mistake of gluing the rim of the buzzer into place which stopped it from buzzing! Had to remove it and still haven't figured out where to apply the glue correctly. Of course I may have a dead buzzer.

Let us know how it goes.

Cheers, Geoff

Recommendations for storing calculators

*Message #1 Posted by **Michael Lopez** on 23 Mar 2009, 6:26 a.m.*

Hi all,

After having used a variety of HP calculators for the last 30 years I have just started collecting a few I really liked such as the 41CV & CX, 48GX etc. but as I mainly use my 50G in day to day I was wondering what your recommendations were for storage? I've read some conflicting comments about whether to take the batteries out or leave them :(but any comments/suggestions would be appreciated.

Thanks,

Michael

in response to message #3 by Michael Lopez

I'm a school Physics teacher; I bring a different one to work each day! Today it's the 48G+, a late model with a high contrast screen. Tomorrow - who knows?

most important rule

*Message #5 Posted by **Frank Boehm (Germany)** on 23 Mar 2009, 8:22 a.m.,*
in response to message #1 by Michael Lopez

Remove the batteries, depending on the brand, they will start to leak sooner or later, probably sooner. Once they have leaked, take care of proper cleaning up the mess - the fluids are highly corrosive and will damage the calculator.

Re: Recommendations for storing calculators

*Message #6 Posted by **Phil K** on 23 Mar 2009, 12:23 p.m.,*
in response to message #1 by Michael Lopez

The recommendation to remove the batteries is completely correct. The reason they begin to leak has to do with each of the individual batteries never actually having exactly the electrochemical composition as the others, and so, never have exactly the same amount of stored power. They also all drain at different rates due to the same reason, as well as having been charged at the factory at different times and on different equipment, all which cause ever so slight variances, but enough to cause a problem.

The result is that one or more of the batteries connected in series will eventually drain completely before the others in series, and then that battery will begin to take a negative charge due to being in series with the others which still have some current left. The effect causes the chemicals to become imbalanced and begin to expand and eventually seep out of the vents built into the batteries at the top (+ terminal). Those vents are there to prevent the battery from bursting while being charged or discharged, but they normally only release a gas. Unfortunately when the battery is reverse charged, even ever so slightly, the gas comes off the opposite end of the battery instead, causing reverse pressure in the closed end battery can and forcing the liquid chemical out of the vents at the top. This chemical is usually an Alkaline composition (hence the name Alkaline batteries). It will be highly detrimental to the terminals and can also cause substantial, permanent damage to the circuit board.

The same effect can be caused by accidentally inserting one or more batteries in backwards. ALWAYS observe polarity (+ to - to + to -).

ALWAYS remove batteries if the unit is sitting for more than a few months.

Also, NEVER run on batteries from different appliances. ALWAYS use a BRAND NEW set of batteries from the SAME RETAIL PACKAGE. NEVER MIX USED AND NEW BATTERIES. Finally, when the low battery indicator appears, REPLACE ALL BATTERIES AT THE SAME TIME, AND PROMPTLY, don't wait until they are completely dead, or you may find corrosive chemicals have already leaked out.

Phil

Edited: 23 Mar 2009, 12:27 p.m.

Re: Recommendations for storing calculators

*Message #7 Posted by **Chuck Sommer** on 23 Mar 2009, 2:31 p.m.,*
in response to message #6 by Phil K

To this (leaky batteries) I say you cannot be too careful. I have an HP 49G (yes rubber buttons) that had a cell leak. These batteries were all on the new side and the interesting thing is that the unit still ran without any Lo-Bat indicator active. I believe I checked the stack and found all 3 cells operating within nominal voltage range.

Chuck

Randy Sloyer from www.fixthatcalc.com has developed a way to actually repair a calculator that has had leaking battery damage.

Lithium AA batteries ongoing experiment.....

*Message #9 Posted by **Michael Meyer** on 23 Mar 2009, 7:46 p.m.,*
in response to message #8 by Iqbal

There was a discussion on the forum 6 or 8 years ago about my use of AA lithium batteries to power my Classics and Woodstocks and other calculators.

Results to date: All of my calculators still appear to function perfectly when I take them out of the display cases to use them or show them off. To date, no cells have failed or leaked. To date, none of the calculators seemed to be bothered by the little extra voltage.

I will update this again in another 5 years or so...

Has anyone yet seen one of these AA cells leak?

Re: Lithium AA batteries ongoing experiment.....

*Message #10 Posted by **Katie Wasserman** on 23 Mar 2009, 8:04 p.m.,*
in response to message #9 by Michael Meyer

I too have replaced all the nicads in virtually all my HP and non-HP calculators with AAA or AA lithium cells several years ago For the HP calculators that use 3 AA nicad cells in a pack I used a modified 3xAAA plastic holder and loaded it with primary lithium cells. Similarly for those that have 4 sub-C nicad cells in a pack I used a modified 4xAAA plastic holder and loaded it with primary lithium cells. I have around 250 calculators that I've done this for using various AA and AAA cell holders with Energizer lithium cells. None and leaked and no calculator has been damaged (by the higher voltage).

Re: Lithium AA batteries ongoing experiment.....

*Message #11 Posted by **db (martinez, ca.)** on 24 Mar 2009, 12:56 a.m.,*
in response to message #9 by Michael Meyer

Dr Meyer; Your calculators might appear to function normally and may not seem to be bothered by the excess voltage. However; they could be sublimating their desires or repressing their emotions. How do they really feel?

But seriously: what a great idea. I looked them up and not only aa and aaa sizes are available but 9v and N cells too. That would take care of my 48 & 41 series, a couple of Novus/Nat Semis and their clones, the Corvus & it's clones, a few of the Ruskies and the Privilegs. Most of my toys really. The only problem is that i have already invested in rechargeables and the chargers for those - and i'm cheap. BTW: the charger and deep cycler for the N cells work because Katie told me how to build them.

Re: Lithium AA batteries ongoing experiment.....

*Message #12 Posted by **Eric Smith** on 25 Mar 2009, 11:09 p.m.,*
in response to message #11 by db (martinez, ca.)

Are you talking about 1.5V Lithium N cells? Where did you find them? I've only seen lithium iron disulfide (1.5V) in AA and AAA.

The lithium 9V batteries I've seen contained three 3V cells, most likely lithium manganese dioxide.

I'm tempted to make a rechargeable lithium-polymer battery pack for my 41. It would require either a boost regulator (for one cell) or a buck regulator (for two cells). A buck regulator with burst mode should be very efficient. Without a card reader, it should power the 41 for quite a long time between charges (much better than the 82120A).

Has anyone measured the peak current draw of the card reader?

Re: Lithium AA batteries ongoing experiment.....

*Message #13 Posted by **db (martinez, ca.)** on 26 Mar 2009, 1:38 a.m.,*
in response to message #12 by Eric Smith

Eric; These are all i found. http://www.shootnhunt.com/batteries/1604415.html

BTW:Since people were talking about historic lithium cells, here's my "golden age of batteries" memory. Back in about '78 a climbing buddy who we had nicknamed "REI" got a new toy. It was an MSR headlamp, with a twist. The designer, Larry Penburthy, supplied it with Lithium cells and 4 bulbs of increasing sensitivity that were easily changed. Since the batteries had such a flat discharge rate; when your lamp got dim you'd just pop in the next bulb in the series. One set of batteries would last an incredible (but now forgotten) amount of time and that weight one saved by not carrying multiple sets of cheap alkalins mattered when you were dragging it, and all your wet clothing & gear, up 8000 feet in the Seattle rain. That man had the best toys.
I still have my MSR G type stove, bivi sack, locking beaner and Thunderbird ice axe. They'll outlive me.

Re: Lithium AA batteries ongoing experiment.....

*Message #14 Posted by **Katie Wasserman** on 26 Mar 2009, 4:24 a.m.,*
in response to message #13 by db (martinez, ca.)

> Quote:
>
> http://www.shootnhunt.com/batteries/1604415.html

This ad is mistaken, they are alkaline N cells. Energizer doesn't make lithium N cells and as far as I know no one else does either.

Re: Lithium AA batteries ongoing experiment.....

*Message #15 Posted by **Michael Lopez** on 26 Mar 2009, 2:35 a.m.,*
in response to message #11 by db (martinez, ca.)

I've searched "high & low" but can't finf Lithium N size batteries for my HP41C's. Do any of you have a link or recommended supplier you have come across?

Thanks,

Michael

Re: Lithium AA batteries ongoing experiment.....

*Message #16 Posted by **Michael de Estrada** on 24 Mar 2009, 1:34 a.m.,*
in response to message #9 by Michael Meyer

What voltage rating AA's are you using? Certainly if you use the 1.5 V ones, you won't have any problems with potential harm to your calculators. The calculator voltage rating is a minimum value under load for proper functioning of the calculator and the maximum safe value is much higher. The no-load DC voltage output of a classic charger on the calculator adapter side is over 5 V, whereas a charged NiCad pack will be between 4 V and 4.5 V, and the rating on the calculator back label is only 3.75 V. So, assuming that a new AA Lithium will show maybe 1.7 V no load voltage, 3 x 1.7 = 5.1 V will not hurt your calculator. I've experimented with an old beat up HP-45 (I have 7 of these suckers so I can afford to torture one of them) by hooking it up to my DC power supply, and ran it for a week non-stop with all LEDs lit with a constant 6 Vdc input, and nothing burned up. I do like your idea of using Lithium AA's for calcs that normally would use alkalines, but still like to use traditional NiCad battery packs in my classics and other LED models that normally use them. I never leave the packs installed, except when I'm actively using them.

Michael

lifespan rating of lithium cells

*Message #17 Posted by **Frank Boehm (Germany)** on 24 Mar 2009, 4:54 a.m.,*
in response to message #9 by Michael Meyer

to my knowledge, these are usually marketed with "10 years lifetime", so one could assume they are built to last that long :) Btw. I have one calculator (Datamath), that still has the original NiCd-cells installed - they still look like new, no signs of leakage at all. I assume they have never been charged.

Re: lifespan rating of lithium cells

*Message #18 Posted by **Michael de Estrada** on 24 Mar 2009, 7:35 a.m.,*
in response to message #17 by Frank Boehm (Germany)

My own personal experience with NiCads is that the have an almost indefinite shelf life if they remain new and uncharged. I have several National Semiconductor LED caculators which I bought completely new and unused in the box with built-in NiCads, and I was able to initially charge all of them fully. However, they only lasted a very few charge cycles, and then went bad. Two of them then began to leak badly. It was at that point that I removed them and replaced them with new NiCads. Also, I have seen several very old (over 20 years) HP battery packs that seemed to work perfectly and were not leaking even after many charging cycles. So I think maybe not all NiCads are created equal.

> My own personal experience with NiCads is that the have an almost indefinite shelf life if they remain new and uncharged ... I think maybe not all NiCads are created equal.

I agree with the last statement, but my experience is not the same as indicated in the first. I have collected and used Nikon F2 series cameras for about 28 years. Nikon is arguably Japan's most respected camera manufacturer. In seeking out various pieces

years ago, I found that brand new NiCads that had been on the dealers shelves for 10+ years simply would not hold a charge. Once I figured this out, I just had my own new ones built up, or in some cases adapted cordless phone batteries myself. (Of course Nikon did not make their own NiCads, usually obtaining them from Yuasa).

I have also purchased NOS EverReady NiCad C cells that would not hold a charge.

in response to message #21 by db (martinez, ca.)

Surely Cyrille has also read this glowing (perhaps overly so) review of the 50g. Not that I disagree, but perhaps the XKCD author could humor us with a comic on HP calculators :-) (since as the XKCD Warning states: this *HP museum forum* occasionally contains strong language (which may be unsuitable for children), unusual humor (which may be unsuitable for adults), and advanced mathematics (which may be unsuitable for liberal-arts majors)

Re: Recommendations for storing calculators

*Message #23 Posted by **Phil K** on 24 Mar 2009, 12:21 p.m.,*
in response to message #7 by Chuck Sommer

Chuck, were all these batteries installed from a fresh pack and all at the same time? If not, even if all the batteries appear to be "in the normal range", if they are not nearly identical in voltage, the increased current through the on lowest voltage battery will cause it to heat up and if it does heat beyond the normal "gas leak" range, some of the Alkaline fluids can leak causing the problem you had.

As far as Lithium batteries, I have never seen one leak, nor heard of one leaking. I believe it is because they are essentially "dry cells", where the Lithium between the Anode and Cathode (Negative & Positive), is of a dry solid composition (actually a Lithium salt disolved in an organic solvent, but drier than an Alkaline battery). Also, if it did leak, I believe the PH of the solvent would not be Alkaline and so would not cause corrosion, but I could be wrong.

See below; "The latest non-rechargeable lithium batteries utilize an even newer chemistry, that delivers dramatically higher energy capacity than even the very best of alkaline batteries. The operating lives (run times) of lithium batteries will often be two to six times that of the same sizes of alkaline batteries, depending upon the drain rate and usage cycling of the application. And the disposable lithium batteries provide amazing typical initial shelf lives of ten years (and up to fifteen years for certain types), depending on quality.

Lithium batteries also weigh less and tolerate temperature extremes better than most other types, but they usually cost much more, and can become hazardous if damaged. Because of their extraordinary storage lifespans, and because most have a built-in vent to relieve any buildup of gasses, leakages of disposable lithium batteries are relatively rare, unless they are mishandled or improperly installed. So the remainder of this article will address the lower cost carbon and alkaline battery types, which will leak very readily.

When carbon or alkaline batteries have become discharged, the chemistry of the cells will degrade and some hydrogen gas will be generated. This out-gassing will result in increasing pressure within the battery. Eventually, the excess pressure will either rupture the insulating seals at the end of the battery, or bulge and rupture the outer metal canister, or both. When this happens, an acidic (for carbon cells) or caustic (for alkaline cells) electrolyte gel will ooze from the battery. In addition, as the battery ages, its zinc (for carbon cells) or steel (for alkaline cells) outer canister may gradually corrode or rust, and this can further contribute to leakage failure. Extremely high temperatures, such as those in the vehicle glove box during the summer, can also cause batteries to rupture and leak, even when they are relatively new.

The leaking electrolyte can corrode the metal housing and battery contacts of a simple flashlight, and it can damage or destroy the delicate circuitry of an expensive electronic flashlight. Furthermore, swelling of the battery canisters can render one or more of the batteries hopelessly jammed within the flashlight body. One leaking battery can cause a chain failure, when its leaking goo corrodes the adjacent ones so that they then leak. A five dollar set of dead batteries can and will destroy a five hundred dollar instrument if you let them. Countless numbers of otherwise perfectly fine flashlights are discarded every year due to battery leaks. Only you can prevent the tragedy of death by leakage.

The most important thing to remember is this: dead batteries will eventually leak. And all batteries will gradually self-discharge (even if they are not operating the device they are installed in, and even when they not installed at all but just sitting on a shelf or in a drawer, they will slowly lose energy capacity over the passing of time). So, no matter how good the brand name, your batteries will eventually go dead even if you don't use them, and when they go dead they will eventually leak. These simple facts lead to just three easy rules, which must be followed without exception to protect your investment in flashlights and other battery-operated equipment.

Always remove dead batteries immediately - All dead batteries are subject to very rapid leakage. When the batteries can no longer effectively power the device, remove them at once and take them to a recycling center. If the device has several batteries, always replace every one of them at the same time.

Remove batteries when equipment is stored - Whenever a given device will not be used for any extended period of time (one month or more), remove and properly store its batteries. In extreme conditions, such as the car glove box in the summer in hotter climates, install the batteries only when needed.

Properly store and dispose of your batteries - Store uninstalled batteries in resealable plastic bags or battery carrier boxes, so that if they leak they will not damage nearby items. Check them every month or so for any swelling or leakage. Do not throw away weak or aging batteries, and do not just toss them into a drawer, but instead take them to a nearby battery store or recycling center for proper disposal. Note that some states and municipalities now mandate recycling for all consumer battery types. Please help to reduce the environmental impact of the billions of batteries that expire each year, recycle them as if your future depends on it.

So what do you do if some batteries have already leaked and ruined your flashlight or other device? Some technicians will tell you that you can wet a toothbrush or a cotton swab with a solution of baking soda, and scrub away the acidic goo and crust from a leakage caused by carbon / zinc batteries. Or similarly, apply a solution of household vinegar to scrub away the residues from a leakage caused by alkaline batteries.

This may actually work in some instances, but the cleaning solution could damage the delicate electronics in sophisticated flashlights or items such as radios and tape players. And while you may be able to open both ends on some flashlights to push out swollen batteries, some flashlights can only be opened from one end such that you cannot dislodge batteries that have become jammed due to swelling."

Re: Recommendations for storing calculators

*Message #24 Posted by **Dan Grelinger** on 24 Mar 2009, 1:32 p.m.,*
in response to message #23 by Phil K

I wanted to add a note to this fine post on energy cells.

Some suggest dissolving baking soda in, or adding vinegar to, water for the purpose of cleaning up spilled electrolyte. I have found that this is rarely, if ever, the best course of action.

Pure water, distilled if you have it handy, works best. Vinegar is an acid, and baking soda is alkaline, so the 'clean-up' that you do could further damage the device you are cleaning. Whereas 'a bit of the hair of the dog' might work for your Sunday morning hangover, it won't help your precious calculator.

All electrolyte spills I have cleaned up are readily dissolvable in pure water. A good cleaning with water will remove all acid and alkali from the device. And in the absence of an electric potential (i.e. batteries and power supply removed), pure water is not corrosive (unlike vinegar and baking soda). Just make sure it is completely dry before adding batteries or power to the device after cleaning.

Dan

Calculators STOLEN today...

*Message #1 Posted by **Phil K** on 21 Mar 2009, 9:45 p.m.*

Alas, I am sad today as I had three of my most prized calculators stolen.

My favorite calculator, a 27S, along with a 17BII and a 12C, were all in a backpack which I mistakenly left behind the driver's seat of my Durango due to my being frustrated and in a hurry. I parked at the corner of North 21st & Cuthbert Streets, between North 21st and North 22nd, in Philadelphia, PA this morning at about 10:25am. I had never parked in that lot before, but a co-worker told me the lot is free on the weekends, since there is no attendant. He has parked there many times before.

Today, I got a call from him at 11:43am to tell me the rear driver's side window in my truck had been smashed out. I was parked at the Northeast most parking spot right on the corner, parallel and right next to North 21st Street and directly opposite Cuthbert Street with the passenger side facing Cuthbert Street. This break-in happened within a time-frame of only 1 hour and 13 minutes.

I had been frustrated by the traffic this morning which made me over 1/2 hour late, due to some dim bulb for a brain that decided Saturday morning, on one of the first days in a while with bright sunshine and moderate temperatures, was a good day to shut down the right lane of a two-lane road (I-76 East from I-476 North to City Line Avenue for those who know the area) which is VERY heavily traveled, bringing traffic into Philadelphia. It was a good day for people to go to the Zoo, or the Art Museum, to take in some Theater, or to stroll the stores and shop.

The closing of that right lane turned what Google Maps says should have taken 10 minutes, into a 45 minute to 1 hour backlog on the road, no doubt costing many thousands of dollars in wasted fossil fuels for the tens of thousands of cars and trucks which were forced to crawl for over an 8 mile stretch of this 2-lane road. The estimated fuel cost for 4mpg (assuming an average of about 6 MPH) for this run is $4.08 in gasoline, multiplied by several thousand cars (not to mention the DIESEL FUEL COSTS), means it easily cost us all many thousands. What did it save in pay for the workers to do it at 10:00am instead of perhaps 2:00am? Maybe a few hundred dollars?

This frustration caused me to be off my game and I completely forgot to grab my backpack from the car before walking to the office.

Anyway, if anyone knows anything, PLEASE respond.

I lost many other electronic items in that same backpack, including headphones, 2 RIO Karmas, a portable notebook scanner, Compact Flash cards, telephone headsets, a digital dictation recorder...all told, probably several thousand dollars in "retail" pricing, though many of those items were 10+ years old. I will be submitting a claim to the insurance company, but I would rather have the items back.

Please be on the lookout for the calculators if they are coming from the Philadelphia area. The 17BII and 27S both have solver formulas in them that I could use to identify them.

Thanks. Phil

Re: Calculators STOLEN today...

*Message #3 Posted by **Phil K** on 22 Mar 2009, 1:22 a.m.,*
in response to message #2 by bill platt

I have had my car broken into perhaps 6 times in my entire life, and some of that life I was living immediately off campus at the Widener College in Chester, PA (also not a real nice place to visit), but I have never had my car broken into anywhere else other than Philadelphia.

Each time, they destroy a side window and take things, but this time the perp. tried to break the laminated glass for the electric window on the rear door, left about a dozen nicks in the glass, and cracked it pretty well before giving up and punching out the non-laminated rear side glass.

I did a quick spreadsheet of items in the backpack and it is really depressing. I know I am to blame for leaving the bag in the car, but this was the one time I totally forgot to grab it. I have NEVER left it in the car before, and wouldn't you know, it happened today of all days.

The repairs will cost me $400 on Monday. Just what I need during such an economically unforgiving time. Here I am trying to help people save their homes and eek out a meager while I am struggling to pay my own, and this happens.

*Message #4 Posted by **Mad Dog ebaycalcnut** on 22 Mar 2009, 9:28 a.m.,*
in response to message #3 by Phil K

My car has been broken into also a few times. What sucks too is when they don't end up taking anything and just leave damage. Police explain that they are looking for guns, which I don't have in my cars.

I am so sorry. I empathize.

Re: Calculators STOLEN today...

*Message #5 Posted by **Peter A. Gebhardt** on 22 Mar 2009, 7:39 a.m.,*
in response to message #1 by Phil K

Phil,

I feel sorry with you. Once you (an myself too) spent so much time in developing the basics of one's day-to-day formulas for these calculators, one becomes (say) paranoic at some point in time not to loose his precious work ;-)

I always keep formulas as a written copy (or now with the 200LX on CF Cards) as a secondary backup.

Although I doubt, that someone will return your belongings to you - given the circumstances of the theft - I hope for you, that you will be able to find proper replacements on auctions to come.

Best regards,

Peter A. Gebhardt

PS: Feel free to email me to get eventual support conc. rebuilding your required formulas.

Mini challenge - coin toss

*Message #1 Posted by **MikeO** on 21 Mar 2009, 7:54 p.m.*

You want to play a game that requires a coin toss, but you have no coins to toss. Fortunately, you have your trusty HP-67 or (fill in your favorite classic HP programmable calculator.)

Create the shortest program you can that will provide a randomized coin toss result.

-Mike

Edited: 21 Mar 2009, 8:07 p.m.

Re: Mini challenge - coin toss

*Message #2 Posted by **Namir** on 22 Mar 2009, 9:35 a.m.,*
in response to message #1 by MikeO

Here is a **starting point** for the HP-67:

```
LBL A
PI
+
3
Y^X
FRAC
STO A
2
*
INT
R/S
RCL A
GTO A
```

To operate:

```
Set the display mode to DSP 0 and then perform the following steps:

1. Enter a seed value and press [A].
2. The program displays 1 for head and 0 for tail.
3. Press R/S to see the next head or tail value.
```

The program uses register A to maintain the current pseudo-random number.

I think you can shorten the program if you use a less-than-obvious steps to generate the random numbers.

Namir

Edited: 22 Mar 2009, 9:48 a.m.

Re: Mini challenge - coin toss

*Message #3 Posted by **Namir** on 22 Mar 2009, 9:52 a.m.,*
in response to message #1 by MikeO

Here is a shorter version for the HP-67:

```
LBL A
1/X
FRAC
STO A
2
*
INT
R/S
RCL A
GTO A
```

Using 1/X to generate a random number for a coin toss "might" be an acceptable trick. Initial seed should be 0.1 < seed < 0.9 AND 1/seed <> integer. Avoid "nice" fractions that lead to reciprocals that are integers.

Here is an HP-41C version (which is 1 step shorter than the HP-67 version shown above) that does not use any memory registers, except the stack:

```
LBL COIN
1/X
FRC
STO Y
ST+ X
INT
STOP
X<>Y
GTO COIN
```

To start the program, set FIX 0, enter a seed value (0.1 < seed < 0.9 AND 1/seed <> integer), and execute the command XEQ COIN. You get the first coin toss. Press the [R/S] key to view subsequent coin tosses.

Namir

Re: Mini challenge - coin toss

*Message #4 Posted by **Chris Dean** on 22 Mar 2009, 2:58 p.m.,*
in response to message #3 by Namir

Here is my solution for the 15c

```
g RAN#
.
5
+
g INT

0 represents Heads or Tails 1 the other. This of course assumes
the coin does not land on its side, it is evenly balanced and therefore a toss of the
coin may be represented by the Uniform distribution.

There is no need for a label just press R/S.
```

Edited: 22 Mar 2009, 3:01 p.m.

Re: Mini challenge - coin toss

*Message #5 Posted by **Paul Dale** on 22 Mar 2009, 5:13 p.m.,*
in response to message #4 by Chris Dean

And a step shorter is:

```
g RAN#
2
*
INT
```

And on a 41 with games module:

```
XEQ RNDM
ST+ X
INT
```

or even:

```
2
XEQ RNDMW
```

What would your code look like for an HP-67?

Re: Mini challenge - coin toss

*Message #7 Posted by **Gordon Strickland** on 23 Mar 2009, 7:16 p.m.,*
in response to message #4 by Chris Dean

Message #4 notes that one must exclude from the analysis the possibility that the coin lands and stays balanced on its edge. It is perhaps equally important to exclude the possibility of a passing magpie snatching the coin in mid-air and making off with it.

Here's an old coin flip story from my college days. An engineer and his date were trying to decide whether to go dancing or to a movie. His date said "Heads we go to a movie; tails we go dancing." The engineer asked "What if the coin stands on its edge?" His date replied "Then, we'll take a hotel room for the night." The engineer flipped the coin, it rolled into a crack in the sidewalk and came to rest standing on its edge. His date suggested "Shouldn't we make it two out of three?"

Re: Mini challenge - coin toss

*Message #13 Posted by **Andrés C. Rodríguez (Argentina)** on 22 Mar 2009, 5:31 p.m.,*
in response to message #1 by MikeO

While it is possible to use the linear congruential method to create pseudorandom sequences of the form

x(i) = FRAC ((x(i-1) * a + b)

as some of the answers to this challenge suggested, not every value for "a" and "b" gives acceptable random behavior.

The matter is throughly discussed in Knuth's "Art of Computer Programming", Vol 2. There, you can find a nice example of a complex and apparently good random generator which, after a few cycles, begins to oscillate within a few answers that repeat themselves in an obviously non-random manner.

Knuth dixit: "Never use a random method to generate random numbers"

One of the better tests for randomness is the "Spectral test", also discussed in the same book.

HP took care, when creating pseudorandom generators, in the HP 25 Applications Manual, and in the HP 41 Standard Pac, to publish programs that pass the Spectral test. I have long memorized them, and used them from time to time. While they are not the shortest, they are short (and fast) enough for usual purposes.

For the HP 41:

```
RCL 00
9821
*
.211327
+
FRAC
STO oo
```

For the coin toss, simply add:

```
2
*
INT
```

(An answer of 0 is "heads", an answer of 1 is "tails")

Of course, the pseudorandom "seed" can be any number between 0 and 1, stored in Register 00

Re: Mini challenge - alternate PRNGs

*Message #14 Posted by **Mike T.** on 26 Mar 2009, 7:44 p.m.,*
in response to message #13 by Andrés C. Rodríguez (Argentina)

I long ago memorised the following short(ish) pseudo random number generator routine for use on my HP33C.

I *think* this uses a seed value (.5284163) copied from a similar routine somewhere in the HP97 manual - I can't check that anymore and it might not even be the first number in the sequence generated by the HP97 pseudo random number routine, as I used it at the time because I found it the easiest to remember.

```
01 -          73 .
02 -          5  5
03 -          2        2
04 -          8        8
05 -          4        4
06 -          1        1
07 -          6        6
08 -          3        3
09 -  14 74         PAUSE
10 -          9        9
11 -          9        9
12 -          7        7
13 -        61         x
14 -  15 33         g FRAC
15 -  13 09         GTO 09
```

On re-reading the HP33C manual a couple of years ago I found a similar routine on page 66 with the same multiplier, but using a different seed value (.2315478).

Obviously by the time I stopped borrowing my father's HP97 and actually owned my first HP calculator I'd already given up reading the manuals or I might have decided to memorise a different seed value!

I do remember that the seed value was an important factor in determining the number of random numbers that the routine above would generate before beginning to repeat itself. (I guess that one day I'll have to try to find out if the seed given in the HP33C manual is actually any 'better' than the one I used).

Interestingly the more complicated routine given above for the later HP41C that allows the user to use any number between zero and one as a seed, also appears on page 67 of the HP34C Applications Guide.

Re: Mini challenge - coin toss

*Message #15 Posted by **Michael de Estrada** on 22 Mar 2009, 7:07 p.m.,*
in response to message #1 by MikeO

Did this on my HP-50g using the built-in clock to generate the random number instead of the RAND function. It also works on my HP-48SX.

<< TIME 10000 * FP 2 * IP >>

where TIME yields the current clock time, FP and IP take the fractional and integer parts of the number.

Michael

Re: Mini challenge - coin toss

*Message #16 Posted by **Khanh-Dang Nguyen Thu-Lam** on 23 Mar 2009, 4:16 a.m.,*
in response to message #15 by Michael de Estrada

<< TICKS 1 R->B AND >>

This one is shorter but gives an integer. Append B->R if you really need a real.

I guess it also provides more randomness than your version, at least on Saturn-based models because the clock tick is 1/8192. I don't know how the TICKS and TIME commands are emulated on ARM-based calcs.

The program above assume nothing about the wordsize (see the STWS and RCWS commands). If you assume the wordsize is 1 bit (e.g. run the << 1 STWS >> before), you can hardly write something shorter than:

<< TICKS >>

Again, append B->R if you really need a real.

Re: Mini challenge - coin toss

*Message #17 Posted by **Michael de Estrada** on 23 Mar 2009, 2:51 p.m.,*
in response to message #16 by Khanh-Dang Nguyen Thu-Lam

I agree that your version is shorter, and it is also more elegant IMO. However, I don't think there is any difference in the "randomness" of the results from the two different approaches. If you are thinking that randomness somehow relates to precision, then there will be no difference between your method and mine. Your method requires the calculator to have slightly less than 4 significant digits for decimal fractions of a second. The internal precision is 12 decimal digits of which 6 are consumed for whole hours, minutes and seconds, leaving 6 digits for fractional seconds. Therefore, when a clock tick is converted to HMS format, there is no loss of accuracy.

As to what constitutes "randomness", perhaps one of the statistical mathematicians among us can propose a test.

Michael

in response to message #1 by MikeO

Some creative answers so far.

Namir provides both HP67 and HP41 versions. Andrés provides both an algorithm and a practical alterative when batteries are low, or missing - simply toss the calculator. Hilarious. Michael de Estrada provides a quick RPL version.

Here's my contribution (RPN) for HP97 - 2 lines:

```
001 X<->Y     -41
002 GTO(i)  22 45
```

To run: store -1 in register I, then 0 Enter 1. Then press R/S to flip and R/S to view it. Repeat as often as needed.

Re: Mini challenge - coin toss

*Message #21 Posted by **Namir** on 23 Mar 2009, 2:59 a.m.,*
in response to message #20 by MikeO

Does the hp97 code simulate random coin tosses?

Re: Mini challenge - coin toss

*Message #22 Posted by **Howard Owen** on 23 Mar 2009, 4:29 a.m.,*
in response to message #21 by Namir

The randomness derives from the precise time you press R/S the second time. The coin toss will be as random as the choice of time interval between presses of r/s is. If you make that choice based on some physically random event like radioactive decay, this program will pass the spectral test with flying colors :)

Regards,
Howard

Re: Mini challenge - coin toss

*Message #23 Posted by **Namir** on 23 Mar 2009, 6:30 a.m.,*
in response to message #22 by Howard Owen

Ok, I see. The R/S simply interrupts the program execution showing either 0 or 1.

Interesting solution, making the user as part of the program!

*Message #25 Posted by **Namir** on 23 Mar 2009, 12:51 p.m.,*
in response to message #24 by Howard Owen

I agree. Mike should have been a bit more specific about how to write the solution. Using machines with random number generators saves many steps. Also I coded my solution to run as a proper program.

Namir

in response to message #25 by Namir

I dunno, Namir.

> Quote:
>
> Create the shortest program you can that will provide a randomized coin toss result.

The 2 line program does fit the given criteria. Of course, like I implied, that's what you would expect from the poser of the challenge. :)

It appears to me that a solution of this kind is not possible on the 41C in two steps. The best you could do would be three lines:

```
LBL 01
X<>Y
GTO 01
```

Where we use a short form GTO for speed. But this program needs one less setup step - the preloading of the i register.

On the 35S, a similar program is:

```
R001 LBL R
R002 X<>Y
R003 GTO R002
```

Still 3 lines, but you could say the initial label isn't actually used, and that this is really a 2 line program. Except you probably couldn't since the label is mandatory. Let's say this is a 2.5 line program. :)

Howard

Re: Mini challenge - coin toss

*Message #29 Posted by **Namir** on 24 Mar 2009, 9:58 a.m.,*
in response to message #28 by Howard Owen

I think in future challenges, the author of the challenge should specify how the solution works (whether to write a program or a set of keystrokes)--what to input and what and HOW you get the output.

Namir

Re: Mini challenge - coin toss

*Message #30 Posted by **Walter B** on 24 Mar 2009, 2:12 p.m.,*
in response to message #29 by Namir

Come on, isn't it part of the fun to see the different approaches -- or using another word: to see the Ansatz ;)

I won't regulate too much. But that's strictly my personal opinion.

Re: Mini challenge - coin toss

*Message #31 Posted by **Namir** on 24 Mar 2009, 3:20 p.m.,*
in response to message #30 by Walter B

Had Mike described how the solution he is looking for works, we'd be more unified in our answers.

Re: Mini challenge - coin toss

*Message #32 Posted by **Howard Owen** on 24 Mar 2009, 3:59 p.m.,*
in response to message #31 by Namir

What's the point of being unified? A lot of the fun is seeing lots of different approaches and interpretations. I'm normally an observer on these challenges, but I love to read them because I usually learn something about the math *and* the calculators. Mike's solution made me think about the difference between random and pseudo random processes.

Obviously, we rely on pseudo random processes in computation because a reliable source of dynamic disorder isn't usually available. You can't have a geiger counter and radioactive source built in to every mobile and stationary computing device. And we also may need randomness at a rate far greater than nature can conveniently provide, such as in Physics simulations on a supercomputing cluster.

So Mike's solution won't work in those cases. But it could be useful in the case where all you need is a literal toss of a coin. It could even produce a better random series than any pseudo random algorithm, again depending on the method you use to choose the interval between key presses.

On the other hand, I found that I kept getting the same answer with my key presses because I had an unconscious rhythm going. On my HP41, the numbers were oscillating slowly enough that this rhythm would result in a long series of 1s or 0s before it drifted out of phase far enough to flip over to the other state. If I tried to consciously vary the frequency of my key presses, I got better results. But that made me think about how I was choosing my intervals. Was it truly random? Since it was based on a cognitive process, I'll bet not.

So that's an awful lot of thought generated by all the solutions presented here and especially by the attendant discussions. And that means *all* the solutions and *all* the discussion. None of the attempts to solve the more conventional (and useful) case of pseudo random number generation are invalidated by a clever solution addressing a different level of the problem.

Regards,
Howard

Edit: Another benefit to a pseudo random process is that it is repeatable. Physically random process by definition do not repeat indefinitely. (You could record and play back such a sequence, however.)

Edited: 24 Mar 2009, 4:04 p.m.

Re: Mini challenge - coin toss

*Message #33 Posted by **MikeO** on 23 Mar 2009, 8:33 p.m.,*
in response to message #23 by Namir

> Quote:
>
> Interesting solution, making the user as part of the program!

The solution occurred to me as a direct analogue of flipping a coin - with the program simulating the spinning coin, and hitting R/S simulating the toss and catching of the coin.

Although a bit tongue-in-cheek, I think the technique might be a good way to randomize a seed value in some way on machines that don't have built-in random number routines.

I noticed you had a couple different formulas for pseudo random number generators. These are interesting.

Thanks Namir!

*Message #34 Posted by **htom trites jr** on 23 Mar 2009, 3:54 p.m.,*
in response to message #1 by MikeO

Random from a computer is beyond hard. You can get beyond some of the simple woes using a version of the Von Neumann Coin procedure.

```
Begin
Repeat
 R1 <-- random(head,tail);
 R2 <-- random(head,tail);
Until R1 <> R2;
Return R1
End
```

This strips out simple constant biases towards head or tail (actual coins are usually slightly biased to head.) The procedure is not perfect, however.

Survey about convergence of iterations

*Message #1 Posted by **Namir** on 21 Mar 2009, 10:10 a.m.*

Hello All,

When performing iterative processes you often compare one of more values between the current and last iterations. This comparison involves a tolerance value used to determine whether or not the current iteration has generated good enough results.

My question to all out there is "Do you prefer comparing the absolute difference between iteration values or a **percentage** absolute difference with a tolerance value? Keep in mind that the tolerance value or % can be specified with the arguments to the procedure performing the iterations. Fixing the tolerance value or % is a bit more tricky since it may not be able to handle a wide variety of problems.

Thanks

Namir

Edited: 21 Mar 2009, 10:12 a.m.

Re: Survey about convergence of iterations

> Quote:
>
> Do you prefer comparing the absolute difference between iteration values or a **percentage** absolute difference with a tolerance value?

The former. Usually something like:

```
if |diff| < 1E-desired precision then end loop
```

Re: Survey about convergence of iterations

*Message #3 Posted by **Mad Dog ebaycalcnut** on 22 Mar 2009, 3:25 p.m.,*
in response to message #1 by Namir

Actually, I concur. If you pick a reasonably small absolute value, and I do mean reasonable compared to the solution values, you should not need to mess with the headache-y percentage tolerance.

It would be interesting to try a coupled algorithm where you first try an absolute value tolerance, get a solution, then switch to a percentage tolerance using as initial values solutions from the absolute value tolerance problem. I guess this would essentially be a double convergence.

Re: Survey about convergence of iterations

*Message #4 Posted by **Karl Schneider** on 22 Mar 2009, 4:05 p.m.,*
in response to message #1 by Namir

Namir --

If the calculated value(s) that establish convergence are large in magnitude, they can be normalized by scaling.

One application is power-flow programs for complicated AC networks. Sums of calculated values of power establish network convergence when they match known injection values. These values are large -- typically in megawatts (MW) and megavars (MVAr) -- along with voltage in kilovolts (kV) and current in hundreds of amperes (A). The powerflow calculations are done utilizing normalized "per unit" values, typically ranging from zero to ten. Mismatches are then small in magnitude, so absolute tolerances are employed.

Screen comparison and annunciator question

*Message #1 Posted by **Marcus von Cube, Germany** on 19 Mar 2009, 8:38 a.m.*

I've put a photo of four graphing HPs on my website as a response to a discussion in the French MySilicium forum. Here is a translation of my original post:

> Quote:
>
> A picture tells more than a million words, as we say here:
>
> >
>
> The production dates of these machines (week/year):
>
> 48S : 14/1992
> 48G : 39/1996
> 38G : 25/1995
> 39G : 21/2000
>
> The screens of the 48G and 38G are equivalent.
>
> Who can explain how to get rid of the annunciators on the 39G screen?

As an additional info: Reset did not turn those annunciators off.

Re: Screen comparison and annunciator question

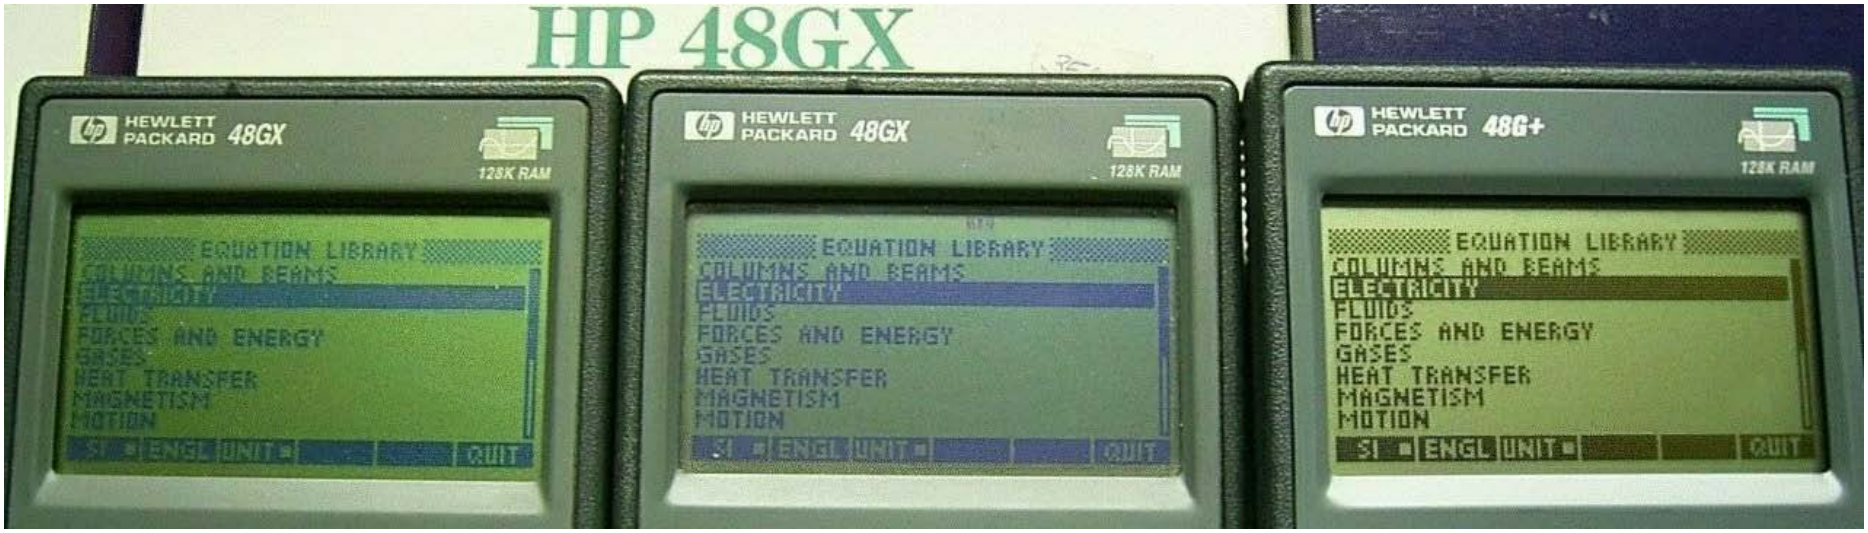
*Message #2 Posted by **Raymond Del Tondo** on 19 Mar 2009, 12:41 p.m.,*
in response to message #1 by Marcus von Cube, Germany

Hi,

I don't know how to put off the annunciators on your 39g,
maybe it has suffered from bleeding?
But your pic reminded me of a pic series I made some years ago.

HP-48G Series Screen comparison

The pic links of the original thread are dead,
but I just uploaded one of the pics to my guest account:



Short summary: All three LCD types have been used in the HP-48G series calcs.
Left calc: Typical GX LCD; Middle: GX with SX LCD; Right: G+ with high contrast LCD.
From today's perspective it's incredible that they used the left and middle LCD at all!

Cheers

Raymond

Annunciator problem still unsolved

*Message #5 Posted by **Marcus von Cube, Germany** on 20 Mar 2009, 4:52 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Has anybody an idea, why the 39G lights the two rightmost annunciators? It's not bleeding, they are extinct while the machine is turned off. They've survived different reset attempts (I haven't tried a memory clear yet.)

Is this a hardware or a software problem?

Re: Annunciator problem still unsolved

*Message #6 Posted by **Martin Pinckney** on 20 Mar 2009, 9:34 a.m.,*
in response to message #5 by Marcus von Cube, Germany

Marcus,

The shot is not very distinct, but it looks to me like the two annunciators are the hourglass (busy) symbol and scroll right arrow. This may be a dumb question, but can it be as simple as the calculator is waiting for you to scroll right to see part of the graph that is off the screen? Or do these always appear no matter what mode?

Martin

Re: Annunciator problem still unsolved

*Message #7 Posted by **Marcus von Cube, Germany** on 20 Mar 2009, 10:26 a.m.,*
in response to message #6 by Martin Pinckney

The right arrow is the I/O annunciator. But the calculator is neither busy nor doing any I/O. As I've already mentioned, they appear even directly after a reset of the machine.

Still puzzled...

Re: Annunciator problem still unsolved

*Message #8 Posted by **Michael de Estrada** on 20 Mar 2009, 10:58 a.m.,*
in response to message #7 by Marcus von Cube, Germany

Well, so far has anyone else reported this behavior with a HP 49g? Perhaps, it is just a hardware/firmware fault with your particular unit. Did it always do this, or just recently?

Re: Annunciator problem still unsolved

*Message #9 Posted by **Marcus von Cube, Germany** on 20 Mar 2009, 1:02 p.m.,*
in response to message #8 by Michael de Estrada

I wish I knew. The device is on a shelf most of the time.

Re: Annunciator problem still unsolved

*Message #10 Posted by **Nigel J Dowrick** on 20 Mar 2009, 1:52 p.m.,*
in response to message #9 by Marcus von Cube, Germany

My 19-year-old (or so) HP-48SX has had some annunciators permanently visible whenever the machine is switched on for some years now. It also has a dead column of pixels. I have always assumed that the annunciator problem is simply to do with the age of the display.

Sorry I can't provide a picture; my HP-48SX is currently elsewhere!

Re: Annunciator problem still unsolved

*Message #11 Posted by **Thomas Radtke** on 20 Mar 2009, 2:35 p.m.,*
in response to message #7 by Marcus von Cube, Germany

> Quote:

> The right arrow is the I/O annunciator. But the calculator is neither busy nor doing any I/O.

Could you check if it is able to do any?

Re: Annunciator problem still unsolved

*Message #12 Posted by **Randy** on 20 Mar 2009, 3:11 p.m.,*

in response to message #11 by Thomas Radtke

All stuck annunciators I have seen to date are either a defective LCD or logic board, never a software issue.

It is a faulty LCD at least 95% of the time.

Re: Annunciator problem still unsolved

*Message #13 Posted by **Marcus von Cube, Germany** on 20 Mar 2009, 3:16 p.m.,*
in response to message #12 by Randy

Thanks Randy for the clarification. Its more of a cosmetic issue and does not affect the functionality of my 39G.

Re: Annunciator problem still unsolved

*Message #14 Posted by **Marcus von Cube, Germany** on 20 Mar 2009, 3:14 p.m.,*
in response to message #11 by Thomas Radtke

I just had success with printing via I/R. The annunciators are still lit.

Re: Annunciator problem still unsolved

*Message #15 Posted by **Raymond Del Tondo** on 21 Mar 2009, 9:20 a.m.,*
in response to message #5 by Marcus von Cube, Germany

Another idea:
The calc is busy trying to get out of that ugly housing.
It's crying: "Get me out of this depressing algebraic existence, and transform me into a real and exciting HP-48!"

SCNR;-)

Re: Annunciator problem still unsolved

*Message #16 Posted by **Marcus von Cube, Germany** on 21 Mar 2009, 4:46 p.m.,*
in response to message #15 by Raymond Del Tondo

I don't think that the case. An algebraic calc lacks the sense of it own deficiency. ;)

Someone mailed me with another idea: The voltage of the batteries might be a cause for the sticky annunciators. I'll have to check if his assumptions hold (by checking the batteries and their voltage.)

Re: Annunciator problem still unsolved

*Message #17 Posted by **Mike (Stgt)** on 23 Mar 2009, 1:49 p.m.,*
in response to message #16 by Marcus von Cube, Germany

Just use a good emulator (Emu48) and copy/paste a screen shot to Paint Shop Pro or what you prefere and get rid of your funny annunciators. What? You still use real HW? I go with George Clinton in that song (from Prince): "... and virtual is real."

Ciao.....Mike

Another Red Dot Auction - Very Bad Condition

*Message #1 Posted by **Michael de Estrada** on 19 Mar 2009, 12:01 a.m.*

Well, another HP-35 Red Dot is up for auction, and this one is in very poor condition. It is not working and has obviously been opened, so who knows what is going on inside. The only included accessory is the AC adapter, which is not original. It does appear to be authentic, however, so it will be interesting to see what the final price turns out to be.

(see here)

Re: Another Red Dot Auction - Very Bad Condition

*Message #2 Posted by **Don Shepherd** on 19 Mar 2009, 8:57 a.m.,*
in response to message #1 by Michael de Estrada

Personally, I wouldn't pay one cent for it. Maybe I'm weird, but I want a calculator that works.

Re: Another Red Dot Auction - Very Bad Condition

*Message #3 Posted by **Namir** on 19 Mar 2009, 8:21 p.m.,*
in response to message #2 by Don Shepherd

I am with you Don. A non-working calculator is no fun!!!

Namir

Re: Another Red Dot Auction - Very Bad Condition

*Message #4 Posted by **Don Shepherd** on 19 Mar 2009, 8:37 p.m.,*
in response to message #3 by Namir

I see Coburlin is in the running for it (his signature .88 bids). Let's hope he doesn't win and relist it for $12,000.

Re: Another Red Dot Auction - Very Bad Condition

*Message #5 Posted by **Michael de Estrada** on 19 Mar 2009, 8:56 p.m.,*
in response to message #4 by Don Shepherd

Nah. He's already overbid, and never re-bids. I know because he's bid on my auctions, which always start at a low initial price and are no-reserve. He'll put in a baby bid and then go away when the serious bidding starts. Don't you think $12,000 is kinda low? ;>)

Re: Another Red Dot Auction - Very Bad Condition

*Message #6 Posted by **Jeff O.** on 20 Mar 2009, 8:53 a.m.,*
in response to message #2 by Don Shepherd

> Quote:
>
> ...I want a calculator that works.

It might be trivially easy to fix. For example, classic chargers are notorious for developing open-circuits in the cord and plug, so perhaps the charger is all that does not work. Or it might be completely filled with corrosion from battery leakage. But if you want a red-dot, it might be worth the risk.

...

Re: Another Red Dot Auction - Very Bad Condition

*Message #7 Posted by **Michael de Estrada** on 20 Mar 2009, 9:06 a.m.,*
in response to message #6 by Jeff O.

I might be inclined to agree with you, except that I'm suspicious that the problem may be more serious because the calculator has clearly been opened. If battery acid leaked through the contact openings and onto the circuit board, serious damage could occur. And then there's the real possibility that the logic board is missing.

Edited: 20 Mar 2009, 9:07 a.m.

Re: Another Red Dot Auction - Very Bad Condition

*Message #8 Posted by **Jeff O.** on 20 Mar 2009, 12:17 p.m.,*
in response to message #7 by Michael de Estrada

Agreed. If I were going to bid on this unit, I would like to see a picture of the battery compartment or at least get a statement regarding its condition. I guess one could ask the seller - "is the logic board present?" Answer would likely be "I don't know, selling as-is." Caveat emptor.

...

Re: Another Red Dot Auction - Very Bad Condition

*Message #9 Posted by **Michael de Estrada** on 20 Mar 2009, 12:26 p.m.,*
in response to message #8 by Jeff O.

FWIW - I have sent a message to the seller requesting precisely that, not that I have any intent on bidding since I already own a very excellent and complete red dot. Just curious to see what the answer will be. No answer yet.

HP-35 problems

*Message #10 Posted by **Frank Boehm (Germany)** on 20 Mar 2009, 12:48 p.m.,*
in response to message #6 by Jeff O.

usually, the 35s have been opened to clean the on/off-contacts Btw. if this one doesn't have a PCB installed, you are mostly out of luck - the PCB connector is different from later versions (I think the early V2 still uses the red dot type, but you certainly don't want to rip that one apart...). It should be possible to replace the inner assembly though, if you want a red-dot-looking machine.

Re: HP-35 problems

*Message #11 Posted by **Michael de Estrada** on 20 Mar 2009, 1:29 p.m.,*
in response to message #10 by Frank Boehm (Germany)

I think the ON/OFF switch design is different on the early HP-35 versions like the red dot, than on later versions and other classics (HP-45, HP-80 etc.). I have opened many classics to clean and re-grease the ON/OFF contacts with silicone dielectric compound, but my red dot switch appears different and works perfectly. Needless to say, it has never been opened and I have no intention of doing so.

Re: HP-35 problems

*Message #12 Posted by **Randy** on 20 Mar 2009, 3:23 p.m.,*
in response to message #11 by Michael de Estrada

> Quote:
>
> I think the ON/OFF switch design is different on the early HP-35 versions like the red dot, than on later versions and other classics (HP-45, HP-80 etc.)...

Incorrect, red dots are identical to later 35's. The only obvious differences are that the red dot slides have a dot of florescent red paint on them and the calculator top has the small hole though which the paint shows when in the on position.

That is why there have been counterfeits - it's easy to duplicate to the untrained eye. There are several tells that reveal a fake but I really don't want to publish them... for fear of helping the unsavory.

Re: HP-35 problems

*Message #13 Posted by **Michael de Estrada** on 20 Mar 2009, 4:05 p.m.,*
in response to message #12 by Randy

I disagree as to the switches being identical. The ON/OFF slider switch on my red dot protrudes much less above the surface of the keyboard than my later HP 35 v3 or all my other classics with the single large slider switch. The red dot switch protrudes less than 2mm, whereas the HP 35 v3 switch protrudes 3mm. Also, the two switches have a very different and distinct feel to them. The later version switches all have a very noticeable detent at the full OFF and ON positions, whereas the red dot has none.

Nonetheless, you are correct about fakes, as there are other signs of this, which I too will not reveal here.

Re: HP-35 problems

*Message #14 Posted by **Randy** on 20 Mar 2009, 8:06 p.m.,*
in response to message #13 by Michael de Estrada

You are correct, the height of the slide is quite different. It was one of the things I originally had mentioned but then removed... when I realized I was writing a how-to guide on building a fake...

BTW, having looked at the mechanics of the slides and cases, the click and feel differences appear to best explained by the lack of or presence of lubrication on the two slide detents.

in response to message #1 by bill platt

I don't understand the summation range (i=16 to i=1?). Perhaps I am taking this too seriously.

OT: Does anyone own an APF mark 55?

*Message #1 Posted by **Michael de Estrada** on 17 Mar 2009, 11:22 a.m.*

In my never ending quest to find everything RPN, I have come across a very interesting non-HP RPN calculator, manufactured in the late 1970's by APF Electronics Inc. The company was headquartered in New York, USA, however, the calculators were manufactured in Japan. One of their calculators, the APF mark 55 used RPN, and what makes it interesting is that it introduced built-in hyperbolic functions before HP did on the HP-32E. AFAIK this is the only time that a non-HP RPN-based calculator introduced a feature or technology before HP did. I have been trying in vain to locate one of these unique calculators, and wondered if any of you forum participants were lucky enough to include one of them in your collection.

See this photo on Katie's website: APF mark 55

Re: OT: Does anyone own an APF mark 55?

*Message #2 Posted by **hpnut** on 17 Mar 2009, 8:53 p.m.,*
in response to message #1 by Michael de Estrada

It's a nice calculator. The buttons looks like they are Canon-OEM. I love the red LEDs.

Re: OT: Does anyone own an APF mark 55?

*Message #3 Posted by **Bruce Bergman** on 17 Mar 2009, 11:47 p.m.,*
in response to message #1 by Michael de Estrada

Interesting! They've actually packed quite a few features into that little thing. Very nice.

It LOOKS, to me, like a rebadged Commodore of that era. I wonder if there was some reciprocal agreement at the time?

thanks, bruce

Re: OT: Does anyone own an APF mark 55?

*Message #4 Posted by **Michael de Estrada** on 18 Mar 2009, 12:57 a.m.,*
in response to message #3 by Bruce Bergman

I don't think Commodore had anything like this.

Notice how the INV key serves to reverse just about every key function, such that only half as many explicit items are required. For example, e^x is obtained by typing INV ln. If you want to convert from rectangular (default) to polar coordinates, you type >pol and if you want to convert back from polar to rectangular coordinates, you type INV >pol. Also, you can take any root of a number by preceding the Y^X key with the INV key, e.g. the cube root of 86 is obtained by typing 86 ENT 3 INV Y^X. The INV key was even used to switch between normal and scientific notation and for reversing the direction of unit conversions. The HP-65 did something similar with its two shifted yellow keys, one for normal and one to do the inverse.

Pretty clever, I think.

Michael

Re: OT: Does anyone own an APF mark 55?

*Message #5 Posted by **Marcus von Cube, Germany** on 18 Mar 2009, 8:02 a.m.,*
in response to message #4 by Michael de Estrada

So clever, that even TIs use INV from their very beginning...

For me INV is very intuitive. I prefer it over (f) and (g) prefix keys. But I'm a former TI user, so don't take me too seriously. ;)

Re: OT: Does anyone own an APF mark 55?

*Message #6 Posted by **Michael de Estrada** on 18 Mar 2009, 9:58 a.m.,*
in response to message #5 by Marcus von Cube, Germany

Marcus,

No doubt the TI's also had an INV key, however, it was not used to the extent that the APF did. For example, the TI-55 used the INV key to invert trig and hyperbolic functions, but not for logarithmic functions. The APF mark 55 had 30 large key buttons, whereas the TI-55 had 40 small buttons, and I personally prefer fewer large buttons on any device than many small buttons.

Michael

SMART INV keys?

*Message #7 Posted by **Joerg Woerner** on 18 Mar 2009, 10:11 a.m.,*
in response to message #5 by Marcus von Cube, Germany

Marcus,

We both know TI calculators - the INV-key wasn't always the best choice.

INV SUM+ -> SUM- .... okay

INV EXC -> PI ... you really think that way ;-))

INV x! -> CSR (Clear stat registers) ... OOPS

To be honest, sometimes I receive customer emails asking "how do I access the 2nd functios of my TI-30 STAT!"

Regards,

Joerg

TI-30: SMART INV keys?

>
> INV EXC -> PI ... you really think that way ;-))
>
> INV x! -> CSR (Clear stat registers) ... OOPS

At least those are shown on the key faces; but really, they are 2nd functions.

Unfortunately, the original 1976 TI-30 -- and probably the TI-30 STAT -- do not perform the following perfectly-sensible inverse function:

INV 1/x = NOOP (No Operation)

;-)

On the TI-58/58C/59 2nd CLR does yield a clear command but with code 20 instead of code 25.

The HP-65 did something similar with its two shifted yellow keys, one for normal and one to do the inverse.

The INV key cleans the keyboard, no doubt. It is, however, less versatile than a general shift key (or you get those effects as shown by Jörg). IMHO this was one of the reasons why HP used it on the HP-65 only.

Re: OT: Does anyone own an APF mark 55?

*Message #14 Posted by **Don Shepherd** on 18 Mar 2009, 12:10 p.m.,*
in response to message #13 by Walter B

The f^{-1} key on the HP 65 is interesting in that it assumes a level of math competency on the part of the user that few other calculator designs have required. The keyboard tells you that f ->OCT converts to octal; you have to know (or remember) that f^{-1} ->OCT means convert to decimal. Same with integer part and fractional part; same with sqrt(x) and x^2 and ten other functions. I think the designers assumed that, if you could afford the $795 to buy and use the calculator, you could probably remember the correct functions associated with the f^{-1} key.

Re: OT: Does anyone own an APF mark 55?

Presumably a correct assumption at that time.

Re: OT: Does anyone own an APF mark 55?

*Message #16 Posted by **Michael de Estrada** on 18 Mar 2009, 12:42 p.m.,*
in response to message #15 by Walter B

I think the issue is not the cost, but the particular consumer that would buy such a highly-technical machine. Only a scientist or engineer would be the likely market for such a product.

OT: Commodore SR4921 RPN

*Message #17 Posted by **Michael de Estrada** on 21 Mar 2009, 11:59 a.m.,*
in response to message #3 by Bruce Bergman

Here is Commodore's RPN calculator: (see here)

Notice that it looks nothing like the APF, and is made in Hong Kong instead of Japan. However, it too uses an INV key, however not to the same extent as the APF, although it does one trick that the APF does not. Namely, if you precede the stack rotate key by INV, it reverses the direction of rotation (i.e. roll up instead of roll down). This capability is offered on certain HP calculators, such as the HP-15C, where roll up is a g(blue) shift function.

Credit should go to db, Katie W. and T. Spyropoulos for this information on non-HP RPN calculators.

Michael

Re: OT: Does anyone own an APF mark 55?

*Message #18 Posted by **db (martinez, ca.)** on 18 Mar 2009, 12:27 a.m.,*
in response to message #1 by Michael de Estrada

Michael;
I have one. It's ok but it's cousins-with-the-same-chip, the Corvus and Privileg, are better, and at least equal to the HPs they were marketed against (IMHO). HP didn't have All the firsts. Just most of them. Elektronika had an RPN with Eprom memory, National Semiconductor RPNs have a built in stat function that HP never did, The Robotron RPN combined built in functions that HP didn't. However; no one else even came close to the 41 series (and again IMHO, HP never did again). -db

Re: OT: Does anyone own an APF mark 55?

*Message #19 Posted by **Michael de Estrada** on 18 Mar 2009, 1:22 a.m.,*
in response to message #18 by db (martinez, ca.)

db,

I see what you mean. The Privileg SR 54 NC also has hyperbolics, and pretty much the same features as the APF. Which National Semiconductor model are you referring to with a stat function, and what function is it? I have the models 4640, 4525, 4615 and 4510, and from what I can tell they are quite mundane. These are all LED models. Did they make any RPN LCD models? I presume you are referring to the Elektronika MK-52 with the EEPROM, which was used for backup of programs and data. I have an Elektronika MK-61, which is programmable, but does not have EEPROM. I will soon be taking delivery of a mint NIB Sinclair Scientific, which is incrediby crude in comparison with the APF and Privileg.

Thanks for all the good info.

Michael

Re: OT: Does anyone own an APF mark 55?

The 4510 has an M + x^2 function which I discussed in Article 437.

Re: M + X squared

*Message #21 Posted by **db (martinez, ca.)** on 19 Mar 2009, 11:11 p.m.,*
in response to message #20 by Palmer O. Hanson, Jr.

....as does the Argentine Microcifra 10, and the Unitrex 90sc made in Hong Kong, and the Novus Mathematician from California.

There were a lot of RPN calcs in use back before 99% of math teachers let T.I. tell them how to teach, and before copying an equation verbatim onto a screen and pressing "=" replaced thinking.

BTW: 97.473% of all quoted statistics are made up on the spot.

Re: M + X squared

*Message #22 Posted by **Michael de Estrada** on 19 Mar 2009, 11:32 p.m.,*
in response to message #21 by db (martinez, ca.)

FYI, the National Semiconductor/Novus 4510 and Mathematician are one and the same. The National Semiconductor version has nice click buttons, whereas the Novus has crappy spongy buttons.

Re: M + X squared

*Message #23 Posted by **Palmer O. Hanson, Jr.** on 21 Mar 2009, 9:01 p.m.,*
in response to message #21 by db (martinez, ca.)

> Quote:
>

You can believe that if you want to but that's not the way it happened. TI worked with the National Council of Teachers of Mathematics through workshops and conferences and financial support and **listened** to the teachers. That other company insisted that the teachers do it that conpany's way using a silly system which pretended that parentheses didn't exist in mathematics.

Re: M + X squared

*Message #24 Posted by **Michael de Estrada** on 21 Mar 2009, 9:40 p.m.,*
in response to message #23 by Palmer O. Hanson, Jr.

Ah, the great war between the algebraists and rpners erupts again! It's kind of like the constant battle between the conservatives and liberals, republicans and democrats, appleists and ibmers, DOS and Windows, Coke and Pepsi (my dad worked for Coke and told me that the people who worked for Pepsi were all a bunch of commies). One thing is for sure, nothing good ever comes from these contests and no untruth is left unturned. To quote Rodney King, "can't we all just get along?"

Peace, Michael

Re: M + X squared

*Message #25 Posted by **Marcus von Cube, Germany** on 23 Mar 2009, 6:38 a.m.,*
in response to message #24 by Michael de Estrada

You forgot the 6502 versus Z80 debate : Apple and Commodore against TRS-80 and others.

Re: OT: Does anyone own an APF mark 55?

*Message #26 Posted by **Michael de Estrada** on 19 Mar 2009, 11:20 p.m.,*
in response to message #20 by Palmer O. Hanson, Jr.

Yes, I was aware of the M+x^2 capability of the 4510 and 4615, but db had stated that the

NS/Novus calculators have a stat function that HP *never* did have. As you point out in your article, although the HP-45 did not have a M+x^2 key, it provided this automatically with the summation key, and also had the mean and standard deviation on the keyboard as well. Still, the NS 4510 was a direct competitor for the HP-35, and to that extent it was ahead of the game. Also, it has an x^2 key, M+ and M- keys, and can switch between degrees and radians, which are lacking on the HP-35.

The NS 4640 is a very strong competitor to the HP-45 with all its features, and true units conversions similar to the HP-55. Another neat feature is a "clear shifted function", so if you accidentally hit the shift (F) key, you can immediately follow it with the shifted function "CF" to cancel this action. It wasn't until much later that HP introduced toggling of the shift function keys. Unlike the 4510 and 4615, it has a 4-level stack, with cyclic roll down. It's only serious flaw is that it has only 3 storage registers, and these are all used by the summation function to store sum x, sum x^2 and n count. The HP-45 has 9 storage registers.

RPN or algebraic

*Message #1 Posted by **designnut** on 16 Mar 2009, 6:14 p.m.*

Received from Kenneth Kuhn in an exchange. The good news is that this year I have the best batch of students I have had in a very long time. The bad news is that none of them use HP calculators and most seem to have an aversion to them. So the nice methods in your paper are lost to them. They spend a horrific amount of time doing calculations with their TI and Casios -- calculations you or I could do in seconds with an RPN HP. I just do not know what the world is coming to. How could we go backwards over the years. Last year I showed the few students who did have an HP some of the methods you and I use and they were impressed at how fast calculations could be done. Although they had an HP calculator they were not aware of how to make use of RPN Sam designnut@cox.net

*Message #3 Posted by **Walter B** on 18 Mar 2009, 12:12 p.m.,*
in response to message #2 by Joerg Woerner

Hallo Jörg,

If the SmartCalc 300S would be customizable like the HP-20b, it will be a nicer platform than this, since its display is far more versatile. Alternatively, if this LCD could be driven by an advanced HP-20b (featuring also an improved keyboard), we'll be better off.

Ceterum censeo: HP, launch a 43s.

Walter

OOPS: HP SmartCalc 300S - INSIDE PICTURE

*Message #4 Posted by **Joerg Woerner** on 18 Mar 2009, 3:00 p.m.,*
in response to message #3 by Walter B

Oops - it's NOT identical with the Citizen SR-270X!

Three differences up to now:

1) Algorithm seem to be identical but display results are rounded to 14 internal digits instead 16 internal digits. Mike Sebastian's forensics reports the same result, rounded to two digits less.

2) Cursor logic is different, if you press a key long enough, it "auto-scrolls".

3) Display features better contrast, the indicators are smaller.

BUT: All key-functions, menu structures, display fonts, capacity of input buffer, limits in table mode etc are IDENTICAL.

And even the User Manual sports similiar typo's:

Page 1: "Use's Guide" instead User's Guide Page 29: "Calculator Memeory"....

By the way: It took just four screws (two hidden under the rubber feets):

Enjoy!

Regards, Joerg

*Message #6 Posted by **Katie Wasserman** on 18 Mar 2009, 10:43 p.m.,*
in response to message #5 by DaveJ

Is this diode used for reverse battery installation protection? If so, are they using the larger thru-hole diode because it can handle a larger current and therefore offer real protection?

The LED is missing from this board, but they use one in the HP-6S solar apparently as a cheap way of voltage regulation from the solar cells. They also have a thru-hole diode for reverse battery protection. Does anyone know who actually manufactured the HP-6S solar, was it Casio?

Re: OOPS: HP SmartCalc 300S - INSIDE PICTURE

No, it's in series, used to prevent charging from the solar cell. Nothing to do with power (FYI SMD ones can handle just as much anyway). So it's probably a cost/substitute thing, there would have to be a zillion surplus through hole diodes on the market that can do the job, just pick whichever one you can get for 0.00001 cents this week.

> Quote:
>

Re: HP SmartCalc 300S - on its way!

*Message #9 Posted by **Michael de Estrada** on 19 Mar 2009, 11:22 a.m.,*
in response to message #1 by Joerg Woerner

Joerg,

How does the $17.49 retail price of the HP SmartCalc 300s compare with similar products with other brand names? I realize that these low end calculators have the same manufacturer, and was wondering how much extra the HP name might bring to market pricing. Does the HP design bring any tangible improvement to the product?

Michael

Re: HP SmartCalc 300S - on its way!

*Message #10 Posted by **Joerg Woerner** on 19 Mar 2009, 11:52 a.m.,*
in response to message #9 by Michael de Estrada

Michael,

If we talk about brand names - they are all in the $15..$20 range. There is only one reason to buy the HP SmartCalc 300s - it looks damned cool!

I placed all MultiView calculators (TI-30XS, Casio fx-300ES, Citizen SR-270X, Sharp EL-W535 and the SmartCalc 300s) on my table and EVERYONE looked first at the HP!

Even with more than 2,500 TI calculators in the basement - I'll use it for some time in my Office.

The pros:

+++ It's styling

++ The keyboard is better than the average, stiff, good response, easy to read and (for me) a perfect layout. Sorry - no ENTER key.

+ Intuitive Casio menue structure, high-contrast display with the nice Casio Textbook fonts.

+ RUBBER feet - once again!

The cons:

--- The plastic material looks and feels very cheap, it is already full of finger prints.

-- You can't snap the protection cover on the backside of the calc - where to stow away?

- Don't try to replace the battery, I broke two finger nails to remove the battery cover ;-))

It's much better than these HP 6s, 9s, 10s, 30s junk.

Regards, Joerg

Hi Don,

I guess you didn't see Richard Nelson's January-23rd article on the HHC2008 website, announcing that we all have permission to access HP's "Channel Partners" web page which contains pretty high-res images of all the current products. The article is located at http://holyjoe.net/hhc2008/Quality%20Calculator%20Images.pdf and the direct link to HP's website is http://www.hp.com/united-states/calculators/toolkit/index.html where there is a prompt for a username and password. Everyone should use "hpcalc" for the username and "calc4hp" as the password to get in. Then click on "Images & Fact Tags" in the lefthand column, click on "HP SmartCalc 300s" in the middle and finally click on the leftmost thumnail image of the machine. It will then reveal a 1200-by-2265 resolution image of the keyboard. The other images of all the other machines are also very useful for reference.

I think that must be the first calculator I have seen with a general base logarithm button. My students would have liked that a few weeks ago.

*Message #16 Posted by **Michael de Estrada** on 19 Mar 2009, 10:32 p.m.,*
in response to message #15 by Chuck

I see that! Aside from being a mathematical curiosity, where would one use such a function? I'm an engineer, not a mathematician, so I only use mathematical relationships that are useful in solving problems.

Michael

*Message #17 Posted by **Paul Dale** on 19 Mar 2009, 10:45 p.m.,*
in response to message #16 by Michael de Estrada

I use log-base 2 quite a bit so I can see a use for this. Occasionally, I do logs to other (non 10 and e) bases.

The 20b rewrite has log-base 2 and arbitrary base logs :-)

in response to message #15 by Chuck

Log base 2 is useful in information theory, but is also easy to obtain as ln(x)/ln(2) or equivalent formulas.

RIP OFF - Price already lowered

*Message #21 Posted by **Joerg Woerner** on 19 Mar 2009, 11:57 a.m.,*
in response to message #1 by Joerg Woerner

I paid this Monday $17.49 - now it is just $14.99 on the HP website.

Regards, Joerg

Re: RIP OFF - Price already lowered

*Message #22 Posted by **Bruce Bergman** on 19 Mar 2009, 11:57 p.m.,*
in response to message #21 by Joerg Woerner

Welcome to the club! ;-)

I've noticed this too. It's almost as if the S&MB division sets a price THEY think it will go for, and after the first few go out, someone tells them the correct price.

When I first ordered the 20b, I paid $49 for it. A week later, it was $39.

I ordered my 300s the same day you did, and paid the same price you did. Now it's less.

I only have one word: (((***sigh***)))

:-)

thanks, bruce

in response to message #23 by Maximilian Hohmann

You want mine? It was opened only twice, battery is still like-new. How do you think about EUR 45?

Just kidding - the EUR is very strong these days. But HP's pricing in Euro-zone is sometimes strange, too.

But even TI sells currently the TI-84 Plus Silver Edition for EUR 162.35 in Germany - that converts to USD 220! Here (Upstate NY) it is $139 plus 8% tax list but "usually" you get it for $119.98!

Regards, Joerg

Hallo Jörg,

HP's pricing policy for Europe makes me wonder whether they are linked to the tourist board ;) Easy calculation how many HP calcs you must buy in the USA and sell in western Europe to get your trip paid. Else it would be a bit far off fair trade :(

Signed Logic PCB

*Message #1 Posted by **Ignazio Cara (Italy)** on 16 Mar 2009, 12:58 p.m.*

Have you never seen a classic series logic PCB signed with 'PCM' near the 1820-1189 ROM? Look at the picture linked at:

HP_70_logic_PCB

Regards from Italy

Ignazio

Re: Signed Logic PCB

*Message #2 Posted by **Randy** on 16 Mar 2009, 2:20 p.m.,*
in response to message #1 by Ignazio Cara (Italy)

I've seen initials and other notations on most classics, especially those with ceramic packages.

Most pre-1990'ish Voyagers have initials of the final assembler under one of the foot pads.

"signing"

*Message #4 Posted by **Frank Boehm (Germany)** on 17 Mar 2009, 8:47 a.m.,*
in response to message #1 by Ignazio Cara (Italy)

this is a manufacturer mark, added to the finalized layout by the PCB manufacturer (so you could track down faulty parts); it's nothing personal :)

Re: "signing"

*Message #5 Posted by **DaveJ** on 18 Mar 2009, 5:58 a.m.,*
in response to message #4 by Frank Boehm (Germany)

Quote:

> this is a manufacturer mark, added to the finalized layout by the PCB manufacturer (so you could track down faulty parts); it's nothing personal :)

It's either a PCB manufacturers mark, or a "signature" of the board designer. If it's not on all boards, then most likely a manufacturer mark.
But I've had cases where my own "signature" on my boards have been eye-balled by management and removed in subsequent runs. At my current company we aren't allowed to add signatures to our works of art :-(

Dave.

Another RPN calculator program for the Casio FX-9860!

*Message #1 Posted by **Nigel J Dowrick** on 16 Mar 2009, 11:15 a.m.*

Here's **another** RPN scientific calculator for the Casio FX-9860G Slim (and related models). It's much simpler than Reckon (announced on this forum a few weeks ago); there's no graphing, no matrices and no high-precision arithmetic. The calculator has a twelve-level stack, with the lowest six levels displayed on the screen. All of its functions accept complex arguments.

The executable file, the source, and the documentation are all available for you to download freely from here:

http://www.mediafire.com/casiorpn

(The image file in this directory contains a screenshot.) This is the first program that I have written in C ; if you do look at the source code, don't judge me too harshly!

I have become very impressed with the FX-9860G Slim during the writing of this program. I have always liked the hardware; seeing my unoptimised code running on it has made me appreciate how fast this calculator really is. I am also impressed that Casio has provided such a helpful and powerful SDK.

Re: Another RPN calculator program for the Casio FX-9860!

*Message #2 Posted by **hugh steers** on 16 Mar 2009, 2:30 p.m.,*
in response to message #1 by Nigel J Dowrick

I like it!

Another great RPN calculator for the fx-9860g. You have the same motivation, i liked the physical calculator but wanted my own style of operation.

Also, I like your "tagged" value idea. I've always thought modes trip you up and instead, maybe the type of value should go with it rather than be subject to a pre-assumed mode. It's an idea im currently experimenting with. I'll probably end up with modes as well because different people see things differently.

Your formatting to 6 digits is nice for the display. i have the same problem, i just spit out the value to 16 digits which looks ok for real numbers, but rather messy for complex ones. neither is perfect i agree. I can understand you having the same problem with output formatting, because it needs to be tackled in conjunction with the general cases of fix, sci, eng and also complex and angular forms. An area i have to fix too.

the menu system works nicely and this is an improvement over Reckon. Im trying to resist putting in a menu system mainly because it starts to bind the implementation to this calculator. i always have in the back of my mind the idea of porting to different platforms. nevertheless, some customisation is important. eg the use of custom characters.

Actually, i spent some time investigating my own scalable font rendering on the calculator. scaling fonts in 128x64 mono is not fun. I have a demo if anyone wants to see it, but the appearance is never quite as good as the hand-drawn built-in versions. nevertheless, im thinking of using it a bit on the graph screen. The other idea was to try to draw formulae on the main screen using scaling fonts to draw fractions, superscript and subscript

nicely.

I agree the SDK is very good. through use of it, im no longer convinced the output code is unoptimised, although i wouldn't like to claim it's totally optimised either. whilst debugging, it's clear the compiler has already eliminated any dead code, inlined functions and removed anything bogus. This is good news as i think if it were totally unoptimised it would have generated a lot more code.

Also thanks for giving out the code and writing the excellent manual!

Re: Another RPN calculator program for the Casio FX-9860!

*Message #3 Posted by **Nigel J Dowrick** on 17 Mar 2009, 3:47 p.m.,*
in response to message #2 by hugh steers

Thank you for your kind words - particularly nice since they come from someone whose knowledge of calculators I have long admired! I never had any idea of porting my program to another machine (running my RPN calculator on the HP-50g would be pointless, although having Reckon there would be great!) so I didn't hesitate to implement menus.

The low-resolution display on the Casio is a problem, but I suppose that the 1k of video RAM it implies is part of the machine's charm and one reason for its speed. The limit is only really a problem for complex numbers, when I want both parts displayed on one line. If complex numbers are only used occasionally, then displaying them with the built-in minifonts might be bearable. I hadn't previously realised how complicated display formatting can be!

I like the angle tags in use too, but behind the scenes the code that currently supports them is ridiculously complicated. I suspect that this is due more to messy programming than anything else - I must review the code.

Anyway, thank you again for your comments. Writing my own calculator has certainly given me a lot to think about - I suspect it might become addictive! I think you'd probably agree.

Re: Another RPN calculator program for the Casio FX-9860!

*Message #4 Posted by **hugh steers** on 18 Mar 2009, 2:47 p.m.,*
in response to message #3 by Nigel J Dowrick

One of the good bits about writing your own calculator is, once it has reached the actually working stage, it's fairly easy to add stuff. I'm planning to add stuff that i find useful. On another calculator, this would have to be a program.

You are right about the display formatting. the C/C++ language does not have a lot of fine control over display of numbers. I have another such problem with matrices. Currently, Reckon formats each number as 6 figures when inside a matrix in the vague hope that it will fit on the screen - mostly not. To do this properly really requires a matrix "viewer" which can scroll. Also how do you peek at one entry to full precision. These things are significant work if done properly.

For complex number display, what i did on the uWatch (www.calcwatch.com) which has a 16 character screen is convert the real part and iparts to strings, then build the display string and see if it is too big. If so, i reduce the ipart a bit otherwise i reduce the real part a bit and try again. Furthermore, i try to trim away any unecessary chars in the numbers (leading zeros etc.). The whole thing is messy, but i was happy that it managed to get the most on the screen most of the time.

code snippets:

```
// tidy as many unnecessary chars as possible from a sci number
static void tidyNumber(char* p)
{
    if (*p == '-') ++p; // skip sign
    if (*p == '0' && p[1] == '.')
    {
        // 0.xxx
        strcpy(p, p+1);
    }

    p = strchr(p, 'e'); // exponent?
    if (p)
    {
        ++p;
        if (*p == '+')
            strcpy(p, p+1);

        if (*p == '-') ++p; // '-' allowed

        if (*p == '0') // leading zero in exponent
            strcpy(p, p+1);
    }
}

void FormatValue(char* dest,
                 double value, double ivalue,
                 int space, BOOL tidy)
{

   ....

           if (ivalue == 0)
            {
                // fit into `space's on screen
                int p = space-1;
                int l;
                if (value < 0) --p; // adjust for sign

                for (;;)
                {
                    sprintf(dest,"%.*g", p, value);
                    l = strlen(dest);

                    if (l <= space)
                        break;

                    if (tidy)
                    {
                        // try tidying
                        tidyNumber(dest);
                        if (strlen(dest) <= space)
                            break;
                    }

                    p -= (l - space);
                    if (p <= 0) break; // fail safe
                }
            }
            else
            {
                int l;
                char c = '+';
                int id = 6;
                int d = 7; // cooked guesses at rp, ip sizes

                if (ivalue < 0)
                {
                    ivalue = -ivalue;
                    c = '-';
```

```
                }

            again:

                // textify the real part
                sprintf(dest,"%.*g", d, value);

                // tidy to save precious chars
                tidyNumber(dest);

                l = strlen(dest);
                dest[l++] = c;
                dest[l++] = 'i';
                dest[l] = 0;

                if (ivalue != 1)
                {
                    int li;
                    // now fit as much of the ipart as we can
                    for (;;)
                    {
                        sprintf(dest + l,"%.*g", id, ivalue);
                        tidyNumber(dest+l);

                        li = strlen(dest);
                        if (li <= space) break; // done

                        id -= (li - space);
                        if (id <= 0)
                        {
                            // very rarely we cant fit ANY of the ipart
                            // on display. shorten the real part and
                            // try again.
                            d -= 2;
                            id = d-1;
                            if (d > 2) goto again;
                        }
                    }
                }
            }

            // ensure we dont overrun whatever.
            dest[space] = 0;

...
}
```

The underrated hp-20s

*Message #2 Posted by **hugh steers** on 16 Mar 2009, 9:00 a.m.,*
in response to message #1 by Frank Rottgardt

I agree, the hp-20s is a great little calculator, if you can survive without RPN.

A while back, I acquired a new one thinking it wouldn't be long before you couldn't buy new anymore. It struck me as a great little scientific calculator for normal use – and it's programmable, which has become a rarity nowadays.

The screen is very clear (segments) and the keys work well. Mine had that hp quality build you don't get anymore and reasonably priced.

All in, I think the 20b has been mostly overlooked and is generally underrated. I think this is because it doesn't do anything particularly outstanding. However, in today's world, most things are afflicted with some problem or other that makes things worse. This calculator does what it says on the tin and it works.

The idea of pre-storing some ROM programs for problems like solve, integrate and matrices, although somewhat of a cop-out, are actually a welcome bonus on a machine that otherwise would not have this function at all.

Re: The underrated hp-20s

*Message #3 Posted by **Marcus von Cube, Germany** on 16 Mar 2009, 11:18 a.m.,*
in response to message #2 by hugh steers

I've picked one up some time ago in an auction. It's somewhat battered and it has an electrical instability that makes it crash to an extend where only shorting the battery terminals helps. Sometimes a software reset/keyboard test makes it work again; sometimes not. As a former AOS customer (my first full AOS machine was an SR-56, its predecessor in my possesion, the SR-51A had only multiply/divide/exponentiation before addition/subtraction and no parenthesis) it was just interesting to see

what HP did in that area. The chain mode only business models are somewhat disgusting in this respect.

The 20S is a nice little programmable calc. Today, looking at key codes instead of mnemonics isn't much fun but for a frequent user, this may become second nature (as it was for me back in my SR-56/TI-59 days.) Today an HP-21S has arrived. It seems to work flawlessly and will replace the 20S in most cases where I want to play around with a programmable AOS machine from HP.

I'm still looking for a 27S...

The 21S is a really unique little calc, replacing a lot of statistical tables in most compact and portable format. It sits on my office desk for that reason. If it only had a ALG/RPN switch, I'd avoid erasing results by putting in the next argument for calculation ... ;-)

Rare?
Casio have no less than 5 current programmable non-graphing models:
http://www.casio-intl.com/calc/programmable/

The old 50-F has just been discontinued, but still available in plenty of places:
http://www.casio-intl.com/calc/programmable/past.html

Dave.

I believe that's correct, but when has that ever stopped anyone in todays global market?

You can't buy my uWatch in the US, but probably 80% of my customers are from the US.

Dave.

Re: The underrated hp-20s

*Message #8 Posted by **bill platt** on 16 Mar 2009, 8:23 p.m.,*
in response to message #7 by DaveJ

Um, no sizable number of people will go hunting for programmable calcs. They will simply buy what's on the shelf, assume there is no such thing and use their computers.

Uwatch etc are afficianados.

Re: The underrated hp-20s

Of course, I wasn't talking about the general population, just pointing out there are no shortage of non-graphic programmables out there. The small number of people who really need or want a non-graphic programmable calc will have little trouble finding or buying a current model.

Joe Average would assume a programmable calc these days is one of the big graphics one, as that's all that is on the shelves in most places I suspect.

Dave.

Re: The underrated hp-20s

*Message #10 Posted by **bill platt** on 16 Mar 2009, 10:01 p.m.,*
in response to message #9 by DaveJ

But I do find it curious why the US is conspicuously absent from marketing plans. Why are Americans not interested, or perceived as not interested in programmables? Why is the rest of the world interested?

I remember someone on here saying some time back that it had to do with the US education policy(s) or something to effect, so there is effectively zero market in the US by way of some form of quasi-regulation?

Dave.

Re: The underrated hp-20s

*Message #12 Posted by **bill platt** on 17 Mar 2009, 12:12 a.m.,*
in response to message #11 by DaveJ

Schools are run at the local level in the US. There is no national policy except for bribery--and the overwhelming majority of money for public schools comes from local, followed by state. Of course almost no school district would eschew the federal handouts but it requires all sorts of stuff---the latest federal initiative is called "No Child Left Behind" and has to do with testing and school performance...

There is certainly no consistent calculator policy across the U.S. for schools.

There is a national policy (not government) regarding professional engineer license tests--it is a private testing company with national scope which forbids graphing calcs but allows programmables as long as they have no I/O and no QWERTY--which has evolved to a "permitted list" which included the 33s and 35s.

But no other programmables in wide circulation is interesting though I think the reason may be that other areas have an education market that uses them? Just a thought.

I agree too, I like the 20S and used it as my daily work calc for some time.

Two annoying things got to me though, the exponent key being shifted was a huge mistake, makes it tedious to do engineering work. It should be were the backspace key is IMO.

The other thing was the annoying "E" display for the exponent, it is not obvious at a glance. Underscore or a space should have been used instead.

It's available in two colour schemes too, mine is the less appealing (IMO) green and purple.

Dave.

Why did they do that - the shifted E? clearly a design error.

Also biggest thing that hacks me off with the 71b is the shifted delete key. shifted delete!! what were they thinking?

I'm at a loss as to why any scientific calc would have a shifted E key. I can't imagine it ever getting past any sensible design review meeting... Oh, now I get it...

Dave.

> The other thing was the annoying "E" display for the exponent, it is not obvious at a glance. Underscore or a space should have been used instead.

I agree about the 'run-together' mantissa and exponent in the low-end Pioneers with 7-segment LCD's, but I suspect that the reason was to provide more uniformity of source code between Pioneer models. The other models displayed such numbers the same way, but the dot-matrix displays of the mid- and high-end Pioneers allowed a more distinct "E" to be displayed. Subtle detail: The HP-32S displayed a full-size "E", but the HP-32SII displayed a reduced-size "E".

Hugh Steers stated,

> Quote:
>
> The idea of pre-storing some ROM programs for problems like solve, integrate and

matrices, although somewhat of a cop-out, are actually a welcome bonus on a machine that otherwise would not have this function at all.

I suppose that having these functions as keystroke programs in ROM is better than not having them (especially for marketing!), but here are the fundamental problems with the HP-20S implementation:

1. Usage and protocol of the special functions is not at all intuitive, so the manual would generally be needed.

2. Suppose that the user has programmed a function, evaluates it at a few points, then wants to integrate or root-solve it. The user initiates the special function in PRGM mode through the LOAD function, and -- *poof!* -- the user's function in program memory is wiped out. That kind of impractical silliness would have been kept out of the HP-15C as an unwavering design objective.

HHC 2008 Programming Contest revisited

*Message #1 Posted by **David Hayden** on 15 Mar 2009, 11:32 p.m.*

While surfing around the other day, I came across the [link:http://home.comcast.net/~genela/HHC2008 Programming%20Contest.pdf]HHC 2008 Programming Contest[/link] and This thread discussing solutions.

I wrote my own solution before checking how others had done it. Mine turned out to be similar to Gjermund Skailand's: convert the points to (row,position) format, expressed as a complex number, and then see if the points match one of the required shapes. There's no point in showing that implementation since I think Gjermund's is better :).

This morning I thought of a slight modification which is shown below. After converting to row,column format, I normalize the shape so that the length of P2-P1 is 1.0 and P1 is at (0,0). Once the shape is thus normalized, I can compare it to the 6 normalized solutions. The main program is thus quite small. A trivial optimization would be to remove the first before comparing to the solution set since normalizing guarantees that the first point is (0,0)

This solves the test set as given in Egan's "PROBS" program and timed using TEVAL on my 50g in 2.75 seconds. It is still slower than Egan's final solution.

```
«
    @ Convert to row,column format

Wonderful solution!

I have been very happy with the reception the contest received here at the forum.

My only real regret is that I fear this contest was way too involved to be done AT the conference.

Perhaps this year I'll have two contests... one for actual conference attendees and the other for our virtual attendees here.

Of course, that would mean I would have to have a "door prize" of some sort for the fastest / best solution within a period of time.

I think I can work that out. :-)

I think it's a double edged sword. The problem received a lot of attention here because it's fairly interesting

and difficult and can be attacked in several different ways. But those same qualities may have made it too hard to tackle during the limited time available at the conference.

I wasn't at the conference but as I recall from reading the schedule, attendees basically had Saturday night to write their code. So I'd think that the contest should aim to be solvable in about 3 hours (gotta let people get some sleep ya know!) :)

Here's something to consider: ask a few trusted people who wont' attend the conference to preview the problem and attempt to solve it in, say 3 to 6 hours. They could send you their solution, the time it took to solve and any comments on the problem. That might help you gauge the difficulty of the problem.

I see no reason why you could not have announced the contest 7 days before the conference and then have collected the results during the conference. That would allow more time for more people to work on more interesting puzzles. I would recommend not posting publicly however to avoid spoilers. I would announce, then privately send out a PDF to interested individuals. This will also work for a contest that may involve a free-bee given to conference attendees. At least the problem is in their minds. And, I believe that you'll get more participants.

> Quote:
>
> Perhaps this year I'll have two contests... one for actual conference attendees and the other for our virtual attendees here.

That sounds like a lot of work for you. I'd stick to one.

> Quote:
>

Wasn't that the case? Fastest solution in 24 hours? Personally I like days to think about a problem. It

allows me to explore many avenues and make multiple discoveries without the stress of having to produce my best in a short amount of time.

Re: HHC 2008 Programming Contest revisited

*Message #5 Posted by **Thomas Klemm** on 29 Mar 2009, 8:40 a.m.,*
in response to message #1 by David Hayden

Your solution is really beautiful! It made me have a closer look at the contest. Unfortunately I didn't have the time when it was posted. May I suggest some improvements?

1. To get the row number the quadratic equation doesn't have to be solved exactly since only the integer part is used. Therefore it's enough to use this formula:

   ```
   r = ip(sqrt(2n) - 0.5)
   ```

2. The absolute value of the column isn't important since only the difference to the head counts. Thus adding 1 can be eliminated.

3. Using n in the procedure RC saves a DUP and a SWAP. I assume this is faster but I might be wrong.

4. Since RC is used only once the procedure can be inlined. Here again it's just my assumption that this is faster than using a local variable. I wanted to remove the other local variable n as well since it wasn't really used. But DOLIST needs that.

5. Skip (0 0) as you suggested.

6. I've added "ERROR" to the list of messages. Don't know whether this makes it any faster. At least it's shorter.

Here's what I got:

```
%%HP: T(3)A(D)F(.);
\<<
  SORT           @ Sort points by position
  \<<  \-> n     @ Convert n to (row,col) format
    \<<
    n
    2 *
    \v/ 0.5 -
    IP  @ That's the row number.
    @ Save it and get the starting value for the row
    n
    OVER
    DUP 1 +
    *
    2 /
    -
    R\->C
    \>>
  \>> DOLIST     @ Convert points to (row,col) format
  DUP 2 GET
  OVER HEAD
  -              @ P2-P1
  ABS /          @ Normalize length
  DUP HEAD -     @ Normalize position
  TAIL           @ Skip (0 0)

  @ List of messages
  {
    "ERROR"
    "TRIANGLE"
    "TRIANGLE"
    "PARALLELOGRAM"
    "PARALLELOGRAM"
    "PARALLELOGRAM"
```

```
    "HEXAGON"
  }

  @ List of the normalized shapes
  {
    { (1 0) (1 1) }
    { (0 1) (1 1) }
    { (1 0) (1 1) (2 1) }
    { (0 1) (1 0) (1 1) }
    { (0 1) (1 1) (1 2) }
    { (0 1) (1 0) (1 2) (2 1) (2 2) }
  }
  ROT POS      @ Position of shape in the list
  1 + GET      @ Return message
\>>
```

And then I was thinking whether we could also get rid of the division by 2 when calculating the column. This changes the list of normalized shapes but my tests suggest that it makes it indeed a little faster:

```
%%HP: T(3)A(D)F(.);
\<<
  SORT          @ Sort points by position
  \<<  \-> n    @ Convert n to (row,col) format
    \<<
    n
    2 *
        DUP
    \v/ .5 -
    IP  @ That's the row number.
    @ Save it and get the starting value for the row
    SWAP
    OVER
    DUP 1 +
    *
    -
    R\->C
    \>>
  \>> DOLIST    @ Convert points to (row,col) format
  DUP 2 GET
  OVER HEAD
  -             @ P2-P1
  ABS /         @ Normalize length
  DUP HEAD -    @ Normalize position
  TAIL          @ Skip (0 0)

  @ List of messages
  {
    "ERROR"
    "TRIANGLE"
    "TRIANGLE"
    "PARALLELOGRAM"
    "PARALLELOGRAM"
    "PARALLELOGRAM"
    "HEXAGON"
  }

  @ List of the normalized shapes
  {
    { (1 0) (1  2) }
    { (0 1) (.5 1) }
    { (1 0) (1  2) (2  2) }
    { (0 1) (.5 0) (.5 1) }
    { (0 1) (.5 1) (.5 2) }
    { (0 1) (.5 0) (.5 2) (1 1) (1 2) }
  }
  ROT POS      @ Position of shape in the list
  1 + GET      @ Return message
\>>
```

I used a 48gx for timing (Egan's method):

```
Your original program:   4.45s - 4.77s
My first solution:       4.15s - 4.47s
My second solution:      4.09s - 4.38s
```

Though the intervalls are overlapping they suggest that the last solution is the fastest.

Good point. Thanks. In a later version, I used the fractional part of the result to quickly get the column number. I'll have to experiment with this to see which way is faster overall.

> Quote:
>

Whoops! Thank you for pointing out these inefficiencies. It always amazes me how another set of eyeballs looking at some code can improve it.

Creating RC has a local variable came from my original solution which I didn't post here. I used it in a couple of places in that version and when I came up with the one that I posted, it never even occurred to me to check whether I was calling it multiple times.

On the other hand, I suspect that in-lining the function will make only a small difference in performance since accessing a local variable is very fast. Hmmm... Thinking about this more, it might be fastest to have the file put RC in a global. That way the time requires to skip over the function gets pushed to "file load time" instead of run time, and the goal is to reduce run time.

> Quote:
>
> - Skip (0 0) as you suggested.

> - I've added "ERROR" to the list of messages. Don't know whether this makes it any faster. At least it's shorter.

That last change is downright embarrassing :) I should have thought of that one myself. It's much cleaner.

Thanks again for the improvements.

Dave

Sounds interesting. Let us know your results.

> Quote:
>
> it might be fastest to have the file put RC in a global.

Without knowing the details I still assume in-lining is faster since you don't need the time for the look-up of the variable.
However I agree that you won't gain much since it's done only once. Whatever is done in the DOLIST-loop weights much more.

> Quote:
>
> I should have thought of that one myself.

I was only inspired by your ideas.

Kind regards
Thomas

HELP: Solver routine for original principal loan amount?

*Message #1 Posted by **Phil K** on 15 Mar 2009, 11:11 p.m.*

I have several model HP calculators, including the 12C, 17B-II, 19B, and 27S and love them all. Though the 27S is probably my favorite overall for its wide built-in functionality, I like the 17B-II for its simplicity and suitability for a specific purpose, and the 19B for its alphanumeric keyboard. I guess am somewhat of a junior collector, but not for collecting, so much as for business purposes. Like most who work in the mortgage or investment industries, I started out on a 12C, but although I like RPN, I felt the 12C was too complicated and too slow so I graduated to the 17B-II and that's what started the process. Once I discovered the Solver functionality, I was hooked. I have yet to discover the pleasure of working with the high-end graphing calculators and might be interested in a suggestion of which one I would want to try based on the information below.

I have written some fairly long custom solver routines using nested if-then statements in combination with algebraic equations, though I am not a mathematician by any stretch of the imagination. Most of the time I am flying by the seat of my pants by slicing and combining portions of known formulas, coupled with trial and error to work towards a functional formula for my specific purposes. Often times I create a short formula for one result, then repeat that process for other desired results until I have all the results I wish to obtain. Finally I compile all the formulas together into one solver routine. Not the best way to do things, but it works for me. Some things I have done are a moving average commission calculator formula for a commission versus draw compensation plan, and a pricing scheme for a very involved sales process of foundation repair which included many options, each with their own costs and with a graduated discount pricing structure. In that formula, I even incorporated a commission calculator so I could see how much I was earning real-time as I was pricing the job.

In one example several years ago, I was able to get almost all the correct results every time from a very complicated formula I created but it had one error. After speaking with a Tom Helm at HP technical support, he not only found the error for me, but he informed me my formula was about 4 times as long as needed and showed me a much shorter (and faster) solution using built-in USPV & USFV functions and rearranging the formula to find for 0.

He even taught me a layout technique where I could place all the variables at the beginning of the solver routine in the order I wished them to appear on the keys (A+B+C+D+E+V+W+X+Y+Z*0:), so I could enter the data on one screen, hit the "more" key, and in the second screen I would have all the keys to find the desired results. Pretty neat if you ask me. Unfortunately, I can't track him down now since tech support has all been outsourced to India (could be partly why we Americans are in this "recession" and are losing jobs and homes, but don't get me started on that soapbox). I know he would have had an answer for this present dilemma. So I decided to toss it out there and see if anyone can help me.

Which brings me to today's dilemma...I am evaluating clients with existing mortgages for possible modification of terms to reduce interest rate, possibly reduce principal amount, and even change terms to effectively reduce the monthly payment amount, thereby making it more affordable and preventing the need for foreclosure and Sheriff's sale. In order to do this properly, I need to know exactly what they have now.

This may not surprise most here, but it is shocking to me to see just how many people who purchase houses don't know what kind of loan they have or how it is calculated. As a result of economic downturn coupled with their lack of understanding of how the loans work, these people are now unable to pay and are at risk of losing their homes to foreclosure. For many, it's due to the aggressive predatory lending practices of the mid to late 2000s, being forced to borrow more than they should have.

Often times they were confronted with completely different terms than that which they had agreed to before. In those cases, they were forced to sign new "Truth in Lending" forms once they reached the closing table, basically absolving the mortgage broker of any "wrongdoing" such as a bait and switch. Some may say that's why they shouldn't own homes to begin with and that they deserve what they are getting (buyer beware), but I am not one to judge, I just want to help them keep their homes (and earn a fair income doing it).

I often have clients who not only don't know how much they originally borrowed, but many also don't know exactly what their interest rate is now or even what it may have started at. They may not even remember what month and year they took the loan out to determine how many payments have been made so far. Normally most, if not all of this information can be gleaned from a recent statement, but sometimes it only gives me a remaining loan balance and payment amount.

What makes this so difficult is that I am evaluating them mid-stream and often only have information about the exact position they are in now on the amortization cash flow stream (PMT & BAL), and a relatively rough estimate of when they started (i.e. "summer of 2005), and without the necessary 4 variables (N, I%, PMT, & FV), finding the 5th (PV) with the built-in TVM is impossible. Then there are the adjustable rate loans and of course, if it has adjusted one or more times, there is no way to actually back into the multiple rates it has adjusted through. There may also be an odd period payment at the end. Still there is a blended rate that can be solved for which yields essentially the same results.

In order to properly evaluate them, based on their known present monthly payment amount, and known number of years the loan was originally taken out for (i.e. $1,467.63 for 30 years), and using the remaining balance ($194,897.81), I have to come back to an original principal loan amount and an interest rate. Sometimes, I know the rate and can simply find for present value using the built-in TVM program, but I know that the solver can be programmed to use iterative solving to obtain a solution from less than the necessary known variables. In fact, I have found an online calculator that essentially does most of this (though it still needs 4 variables), but I can not extract the formula from that site to do the same thing. See http://www.webcalcsolutions.com/Mortgage-Calculators.asp and choose "Existing Mortgage Analysis". To see how the results for original loan amount are obtained, mouse over the result (Original Loan Amount). I have tried to recreate this formula on the 17B-II, but I can't figure it out.

This calculator works iteratively to solve for PV, but it does need both the interest rate and the original terms to accomplish this. I know the same can be done with the TVM built-in, using the known variables (N=360, I%=8, PMT=1,467.53, FV-0) to find PV=$200,000. Still, it seems likely that with ONLY the remaining balance (BAL), the original terms (N), the payment amount (PMT), and the ending balance (FV) that the rate (I%) AND original principal amount (PV) could be iteratively solved for, though it might need a seed and there could possibly be several solutions if the terms are not known. Still, if it gets me in the ballpark (i.e. PV=$200,000.12), the rest is obvious (PV=$200,000).

To still further complicate things, these mortgage payments often include an escrow for taxes, insurance, and PMI, and many times the portions are not disclosed on the statements. In those situations, I only have a balance and terms and an estimate of rate to work with. Using an approximate rate, the present balance and terms, it seems that again, an iterative solution could be found that would equal 0 at the end of 30 years, and work back to a balance at a guessed rate, and provide a payment amount accordingly. If again it gets me in the ballpark on the initial loan amount, that works.

Can anyone lend a hand in this project? I would be forever grateful if I could get a formula on the calculator that does this, and it would be used for a very good cause considering I am ultimately keeping people from losing their homes to the mortgage companies.

By the way, a plethora of very nice calculators for a myriad of purposes are free for demonstration use online here (http://www.webcalcsolutions.com/Calculators.asp). It would be one heck of a portfolio of solver routines for us if someone could intuitively extract them from the online versions. Perhaps someone or persons could create a database of solver routines that we could all share and work from to customize for our own purposes (hint)? Just a thought. ;-)

in response to message #1 by Phil K

Phil,

Next time, could you not be so parsimonious with your words? ;-)

I'm afraid I can't help you with your dilemma, but I can suggest that, if you are using your 17BII so effectively, why consider a graphing model? I have both the 17B and 27S, and I share your love for the solvers on these. I also have a 48SX, and, at least for me, it is maddeningly difficult to use, and excruciatingly slow at that. As someone once said, I cannot do much more than some simple calculations without getting out the manual(s).

Many here sing the praises of the 50G as much faster and a better screen, but still it must be complicated to use. I am sure you will get many opinions.

in response to message #2 by Martin Pinckney

Well, now you see why my solver routines were so long too! LOL!

Re: HELP: Solver routine for original principal loan amount?

*Message #4 Posted by **Phil K** on 16 Mar 2009, 1:40 a.m.,*
in response to message #2 by Martin Pinckney

By the way, thanks for the calculator suggestions. I have a co-worker who uses a 48g (I think?), and his TVM is all on one screen, multiple lines. He can change a variable and the rest update on screen (COOL!) I will have to do this eventually, but for now I want to learn more about Solver and build my math skills as well.

(Could I have said that in 20 words or less...yes...would it have been representative of me...well, no.)

LOL!

Re: HELP: Solver routine for original principal loan amount?

*Message #5 Posted by **Phil K** on 16 Mar 2009, 1:43 a.m.,*
in response to message #2 by Martin Pinckney

I will post the routines I wrote before, perhaps others can gain some insight as to how powerful Solver really is. I used to program in BASIC (never graduated to more powerful languages), and Solver is in many ways similar to BASIC, with respect to IF/Then/Else/Else. I really enjoyed seeing the fruits of my many hours of mental labor. Some will see it as pure overkill, but then...you already know me, so it won't surprise you.

Cheers!

Re: Other Solver routines (was "HELP: Solver routine for original principal loan amount?")

*Message #6 Posted by **Phil K** on 16 Mar 2009, 3:29 a.m.,*
in response to message #5 by Phil K

Here's the one I wrote to price out basement waterproofing, including many feature options, variations in pricing, and a full commission calculator based on several factors including tenure and commission scale, cost per foot discounting, three pricing schemes (residential, commercial, realty), and completely arbitrary profit padding. This tool allowed one to price on the spot, negotiate better pricing to get the sale, and all the while keep watch on how much commission he/she was gaining/losing based on the various features and pricing schemes (since it was 100% commission based compensation).

Disclosure: Those selling were only doing what they were hired to do and weren't breaking any laws. Negotiating the price for a particular job is completely legal and if the homeowner agrees to a specific price, it is their prerogative.

The basement waterproofing world is one of the most profitable construction trades there is, and it is a high-pressure, sell on the spot, "one-call close" world, where pricing is all across the spectrum, as is the type of work being done. The company this was written for was at the time, the largest company in the country, and in my opinion did the finest quality work of any, and provided the strongest warranty in the industry. It may very well still be, but I can not say for sure.

What I can tell you is, if you have a leaky basement, NEGOTIATE THE PRICE DOWN LIKE YOUR LIFE DEPENDS ON IT! NEVER settle for the first price, or the second, or even the third from the same company. Stick to your guns and the price will come down. They want your business and will only give up negotiating (usually days later) when it is no longer profitable. The price for a typical basement water management installation job can range from a couple thousand dollars for a shoddy installation, to well into the 5 digits (can be $20,000 or more for a 300 linear foot basement) for a top quality water management system.)

This one should cause a few questions... :-)

I apologize for not formatting (indenting) this out to show the nested if/then statements properly. I think it's supposed to be a new indentation for each set of parenthesis, but I don't know for sure. Since I don't know the proper way to show this, perhaps someone can clean it up for all.

Thanks for the info. I didn't realize he was an author. I did try to contact him and he did respond today! I will likely talk to him tomorrow, but I didn't have time today.

Thanks.

I will have to buy one of his books, but I may also buy one other book I saw mentioned that is mentioned as another "bible" for the HP 17B-II.

Re: HELP: Solver routine for original principal loan amount?

*Message #11 Posted by **Marcus von Cube, Germany** on 16 Mar 2009, 11:41 a.m.,*
in response to message #1 by Phil K

Phil, even if I can't answer your question, a few things come into my mind:

1) Banks and mortgage brokers tend to be scrupulous; not all of them of course. ;)

2) People are stupid. For me it is unbelievable that someone buying a home has no idea of the details of the mortgage and no written records of past payments or a schedule of upcoming financial burdens.

3) The 17b and its relatives have one big problem: there is no way to save (and reload) your formulas to an external system or device. The HP-48 family (from 48SX to 50g) are much better equipped in that respect. A PC (or an SD card for the 49g+/50g) serves as a backup storage medium. Your complicated formulas deserve a safe place to live. Editing your formulas on a PC is an added benefit.

Marcus

Re: HELP: Solver routine for original principal loan amount?

*Message #12 Posted by **Michael de Estrada** on 16 Mar 2009, 12:10 p.m.,*
in response to message #11 by Marcus von Cube, Germany

1) Hmmmm, maybe in your country...

2) Caveat emptor.

3) The HP-50g also has the added benefit of a built-in TVM solver under the FINANCE key.

Still, I wonder if problems of this kind might not be easier to handle using a PC spreadsheet such as EXCEL. I've solved a lot of engineering "what if" problems this way.

Perhaps... but not nearly as much fun.

Jeff Kearns

Re: HELP: Solver routine for original principal loan amount? (correction)

*Message #14 Posted by **Phil K** on 20 Mar 2009, 1:26 a.m.,*
in response to message #13 by Jeff Kearns

Jeff,

You may very well be right. I would describe a spreadsheet as a geometric look at mathematics (or that's my take on it anyway), and by way of cell relationships it can be used to replicate calculations X# of times quite easily. I am just not sure of the relationships between the variables I often have to work with and therefore can't devise a working model.

It seems to me that there should be a way to find for the original loan amount using ONLY the balance, term of 360 months, and payment amount. I say this since from my perspective there should be only ONE point in an amortization at which any loan balance is exactly what is stated to the penny (and possibly even to the dollar), at a certain payment - call it an intersection if you wish (such as in a spreadsheet). This of course would be based on X number of times a known full payment amount has been made within a defined period of 360 payments, and where the future value of 0 is known, even without knowing the exact rate of interest.

Further, it seems that the narrower the interest rate range (i.e. 2% - 18%) and the fewer the possible variations of the rate straying from a whole number (i.e. 6.5%, 7.25% or 8.625%), the less likely there would be more than one possible intersection in the same 360 months payments. In a similar relationship, if the rate, the balance, and the term are known, then the payment should be solvable for the same reason as above. Once you know the so-called missing variable(s) in either example, then

the number of months paid versus how many are remaining to be paid should be obvious as well.

I mean, I might be going out on a very thin limb here, but if I were to throw a specific dollar amount for balance out, and tell you it could be anywhere within 48 to 60 payments into a loan of 360 months without divulging the interest rate, shouldn't there only be perhaps a very few possible solutions (or even only one) using the ranges of rates and limited fractions thereof above? I could even limit the range of rates to perhaps between 6 & 8%, and that should further eliminate possible other solutions to bring me to within the range of the desired solution.

I am imagining a massive spreadsheet or series of spreadsheets with 360 month amortizations for all the possible rate combinations eluded to above, to minimum fractional percentages of 32nds, and then search for the exact amount of that one known balance to see if there are any more cells than one in which that exact balance can be found. Since there are only 360 possible balances for each interest rate, and far fewer at any value near that balance, it should be extremely low odds that a number which is potentially in the hundred thousands and 2 decimal places is duplicated in different interest rates.

So, if we have 17 possible interest rate whole numbers (2% through 18%), times 6 possible fractional variations (whole number, 1/2, 1/4, 1/8, 1/16, 1/32), times the 360 possible monthly remaining balance values, the total possible number of amortized cells is 36,720, but each could be valued at everything from zero to the maximum value of the original loan amount that we are finding for, though only a relatively few could be within a range of the known balance value.

Right?

Perhaps an appropriate question to ask first is, can a formula be designed to allow you to enter "guesses" or "seed" values into certain variables registers and have the calculator use those estimates to start its iteration?

Forgive me if my logic is anything but...as I am no mathematician. I know enough to be dangerous, coupled with an analytical mind and an IQ to make it interesting. I am simply looking for a way to find these answers using fuzzy logic if it can be done.

Re: HELP: Solver routine for original principal loan amount?

*Message #15 Posted by **Don Shepherd** on 20 Mar 2009, 8:59 a.m.,*
in response to message #14 by Phil K

Phil, I have been thinking about, and experimenting with, this problem for a few days now. The web site you referred to is able to calculate the original loan amount given the current balance, interest rate, length of loan, and monthly payment. I see what they are doing (iterating), I just don't know how they know to stop iterating at a certain point and call that the original loan amount. I admit that their method works, but I just don't quite know how. If I knew how, I might be able to implement that method on the 17bii+.

I admit that, theoretically, it should be possible to determine the original loan amount given the current balance, term, and payment amount. It would probably take an Excel VBA program and a PC to do it, however; I doubt that could be done using the solver on the 17bii+, but I would like to be proved wrong on that.

Did John Tirone give you any insights you can share with us regarding this problem?

Re: HELP: Solver routine for original principal loan amount?

*Message #16 Posted by **Phil K** on 21 Mar 2009, 12:19 a.m.,*
in response to message #15 by Don Shepherd

Don, I appreciate the fact that you took an interest and the analysis you did. Yes, it is an iteration, but just as you, I can't figure it out. The 17B-II and the other cousins are capable of iteration, but how to implement it is the issue.

Also, knowing you feel as though it should be possible to solve with only the 3 variables, makes me feel good that my analytical mind isn't so far from center (unless we're both out in left field)! if you or anyone else can come up with an answer, it would be very useful for my function.

As for Mr. Tyrone, I have received a couple calls from him but none that actually solve the problem. I haven't gotten a chance to actually speak with him, they were long voicemail messages, and one email response. I'll try to capsulize and post later.

Thanks.

Re: HELP: Solver routine for original principal loan amount?

*Message #17 Posted by **Peter A. Gebhardt** on 21 Mar 2009, 8:20 a.m.,*
in response to message #16 by Phil K

Phil, Don,

I doubt that there is a "one-and-only-one" single solution of Phil's problem.

As a crude verification one could put Phil's numbers into a 19bII or 200LX Cash-Flow program and use PLOT to verify.

For each an every other CF0 (CF-zero) Cashflow the PLOT function shows only one (different!) solution for I%YR.

So I suppose there is an unlimited combination of interest rates and loan amounts possible.

BUT, I'm open for any arguments proving me wrong ;-))

Best regards,

Peter A. Gebhardt

Re: HELP: Solver routine for original principal loan amount?

*Message #18 Posted by **Don Shepherd** on 21 Mar 2009, 11:47 a.m.,*
in response to message #16 by Phil K

Phil, see this link. I figured out how that website knew when they were at the iteration for the original loan amount. They just figured out what the monthly payment would be if that was the original loan amount, and if that payment was very close to the actual payment, Bingo!

This works on the 17bii+. It takes advantage of the fact you can exit a loop early (so you don't have to iterate all 360 times, for example) by dividing by 0 AFTER storing the values

you are interested in in some variables, and RCL'ing the variables after the execution stops. I learned this a couple of years ago from another member of this forum (Mike Ingle).

This equation essentially duplicates the functionality of the web site you referred to. If you know current loan balance, APR, term (months), and monthly payment, it will tell you how many payments have been made and the original loan amount.

I would have liked to use the solver functions USFV or USPV, but I couldn't make them work with loan balances, only savings account values. I'm sure there is a way, I just couldn't determine it.

This has been fun!

Re: HELP: Solver routine for original principal loan amount?

*Message #19 Posted by **Phil K** on 21 Mar 2009, 8:48 p.m.,*
in response to message #18 by Don Shepherd

Don,

Well done!

I typed that equation into my 19BII, and at first, it kept coming back not failing to find a solution, and with 0 for a value in PV & PTD. I tried several times until I went back and re-read your instructions and realized you had indicated (mos) for TERM. I was actually typing in 5 (years) instead of 60 (months) for the example and when I changed to 60, it worked like a charm.

Since I am so used to using the years rather than months on the 17BII (30, shift, N), and since that habit tripped me up, I changed the formula to add the blind variable "N", edited the menu selections to add "YEARS", and changed the variable "TERM" to "L(N:(YEARS*12)" in both locations. Now I can enter 30 for years and it converts to 360 months.

That was really neat. Next, it would be interesting to see if the USFV & USPV can be incorporated, since they are much faster at computations. Eventually, it would be neat to see whether it can figure out the same solution with only 3 variables, rather than 4.

Now, is there anyone up to the task of modifying that formula to include the ability to find with less variables? Again, it seems to me that there should only be one, or at most a couple solutions to the scenario I described before, where only 3 variables are known, or even more interesting, where only 1 or 2 are known, but others are within a range of guesses.

I may be pushing my luck here, so I will say THANK YOU FOR WHAT YOU DID! It was spectacular to see it come to fruition. Now I have to study it and understand what's happening internally.

This is a great education for me.

Re: HELP: Solver routine for original principal loan amount?

*Message #20 Posted by **Don Shepherd** on 21 Mar 2009, 9:01 p.m.,*

in response to message #19 by Phil K

Hey Phil, I figured part of USPV out:

```
PV=PMT*USPV(I%/12:TERM)
```

where I% is like 6 for 6% and TERM is in months. This gets reasonably close to the original loan amount without iterating and without requiring loan balance!

I'm still working on using USPV to determine payments-to-date.

Re: HELP: Solver routine for original principal loan amount?

*Message #21 Posted by **Don Shepherd** on 21 Mar 2009, 9:31 p.m.,*
in response to message #19 by Phil K

Phil, this much simpler formula seems to work, using USPV for both original loan amount and payments to date:

```
CALC=0*L(PV:PMT*USPV(I%/12:TERM))+0*SIGMA(I:1:TERM:1:
0*IF(ABS(PMT*USPV(I%/12:I)-BAL)<.2:L(PTD:TERM-I)+PV+PTD/0:0))
```

Re: HELP: Solver routine for original principal loan amount?

*Message #22 Posted by **Phil K** on 21 Mar 2009, 10:02 p.m.,*
in response to message #21 by Don Shepherd

Don, YES it DOES work seemingly identical. Excellent work. I didn't try the short formula above yet, but that's next.

I have played with USFV & USPV before, but today I lost 3 calculators (a 27S, a 17BII, and a 12C) along with my 17BII manual that had MANY solver routines I had written, added in as notes, and of course, it explains the USPV/USFV in the back. I guess it will be a while before I have another manual to refer to and am able to experiment with them, and I may never be able to recreate some of the formulas I had written in that book.

Fortunately I still have 2 of the 17BIIs and I had my 19BII in my coat pocket. I would have been totally smashed if I had lost the 19BII as well.

It makes me sick that someone would smash a car window to steal something. I can't imagine being so selfish and uncaring of others. This is a stark contrast to you and the others on this forum - you are all so giving and genuinely interested in the common good. Others need to take a lesson.

This country is in the mess it is in, due to a similar mentality as the one the person was operating under when he/she decided to destroy my day for their own personal gain. If I had caught someone in the act of similar aggression toward anyone, I would have detained them, called the police, and then applauded and cheered loudly while they were cuffed and taken away.

They ruined my entire mental state for probably weeks to come.

Re: HELP: Solver routine for original principal loan amount?

*Message #23 Posted by **Don Shepherd** on 21 Mar 2009, 10:35 p.m.,*

in response to message #22 by Phil K

Phil, this formula is not as exact as the others, but it will probably suffice for your purposes, and it lets the calculator iterate and find the solutions for PV and PTD, and it doesn't do the funky divide by zero thing. Enter values for: BAL, I%, TERM (months, you can adjust), PMT. Solve for PV (original loan amount) and PTD (payments to date):

```
0=IF(S(PV):PMT*USPV(I%/12:TERM)-PV:PMT*USPV(I%/12:TERM-PTD)-
BAL-PTD)
```

I think I've taken this about as far as it can go. Let me think about your other request (no APR neeeded).

Re: HELP: Solver routine for original principal loan amount?

*Message #24 Posted by **Phil K** on 22 Mar 2009, 12:49 a.m.,*
in response to message #23 by Don Shepherd

Don, I think perhaps the finding of the APR may relate to the IRR of the stream of payments, but I can't put my finger on it.

Perhaps if we know the payment amount, and know the balance, we could first apply the payment against the balance as the PV, to find the I%, using the full term of the loan. This would give us a false I% because we would both be shorting the PV (initial loan amount), and exceeding the remaining payments. Still, once that I% has been computed, perhaps it could be applied toward the payment amount using a close guess for the term remaining and allow it to iteratively find for the real rate. Or the inverse, where we would know the rate but would not know where in the exact amortization stream we are.

I don't know, I may be totally off base, but it seems to make sense somehow in my twisted way of thinking.

Re: HELP: Solver routine for original principal loan amount?

*Message #25 Posted by **Don Shepherd** on 22 Mar 2009, 9:53 a.m.,*
in response to message #24 by Phil K

Phil, I know IRR exists, but I don't really understand much about it. I'm not a financial guy, but I do enjoy finding solutions to problems using the 17bii+ solver. When I first saw the web site you referred to, I couldn't figure out how they knew when to stop iterating, so I thought about it and finally figured it out. And I had a feeling that I could use the USPV or USFV functions, but I couldn't relate them to loan balances until I actually took a simple loan ($1000/12 months/12%APR) and wrote down the loan balances after each payment, then I wrote down the USFV and USPV amounts for those same periods, and I noticed an inverse relationship between loan balance and USPV amount, and that led me to my final formula using USPV for both original loan amount and payments-to-date. This was a rewarding exercise!

If you eventually find a way to determine original loan amount and interest rate, please post it on this forum; I know that myself and many others would like to see it.

Re: HELP: Solver routine for original principal loan amount?

*Message #26 Posted by **Phil K** on 22 Mar 2009, 9:54 p.m.,*
in response to message #25 by Don Shepherd

Don, I will surely let everyone know if I do find a solution. This is alive and well in my mind at the moment, so I will be thinking about it even when I sleep. Strangely, some of my best results came right after a good night's sleep. I have woken up and realized a breakthrough several times before.

I will keep you all informed.

Thanks for all the help. Phil

I'm no financial formula expert, but I think the answer is yes. (I did once upon a time derive from scratch the formula for mortgage payment given loan amount, rate, and number of payments. I leave that as a challenge to the members of the forum.)

To see the answer for the payment amount, check out mortage formulas . That reference also has a time value of money equation. I think that if you take your current balance as the future value and the original loan balance as the beginning value and combine that with the payment formula, you can derive an equation with the original balance as the unknown. It may be a challenge for a SOLVER, though - it includes an Nth root, where N is the total number of payments.

TVM loan payment derivation

> (I did once upon a time derive from scratch the formula for mortgage payment given loan amount, rate, and number of payments. I leave that as a challenge to the members of the forum.)

I did, too -- during my high school years, after we had covered finite series and limits. I showed dad my work, and we verified the equation by calculating the mortgage payment.

The derivation is basically a straightforward, "grind it out" application of algebra.

Re: TVM loan payment derivation

*Message #29 Posted by **Phil K** on 21 Mar 2009, 8:39 p.m.,*
in response to message #28 by Karl Schneider

Karl, wouldn't that be the same formula that's in the back of the manual?

Might you be so kind as to provide an explanation or formula? By the way, Don's solution DOES WORK. If we could build on that, and perhaps even bring in the USFV & USPV into the mix, it could be a very powerful formula for my purposes. I am working with people in many cases, who know nothing more than how much they are paying, and they often don't even know what their taxes or insurance payments are, but they do many times know APPROXIMATELY what the interest is, and MAY KNOW how long they have been there...

It's like trying to lead a whale out to sea, only to have them circle in the bay.

Phil

Manual? Dave and I didn't need no stinkin' manual!

;-)

Phil, I think that you're misunderstanding what Mr. Shaffer and I said. Long ago, we had each derived the standard Time Value of Money equation from scratch. I'd never even *heard* of "TVM"; I just wanted to determine what would be the level periodic repayment (PMT) for completely amortizing a loan (FV = 0), given the loan amount (PV), interest rate (I), and number of periodic payments (n).

in response to message #30 by Karl Schneider

LOL! I guess you are right, I didn't understand. So you two are (perhaps loosely said) pioneers in the TVM world?!

I just realized something as I looked to my right and saw my hardbound copy of Time & Money by Robert M. Crowe. He was a teacher at the college I went to, and I never knew it. I live in Pennsylvania, USA, near the American College in Bryn Mawr, and Robert M. Crowe Referenced himself at the American College in Bryn Mawr, Pennsylvania, which is not more than 15 minutes away from my home! Small world, I guess.

in response to message #11 by Marcus von Cube, Germany

Marcus,

> Quote:
>
> 3) The 17b and its relatives have one big problem: there is no way to save (and reload) your formulas to an external system or device.

although your point is correct, I kindly reject your proposed solution:

1. I stopped using the 50G for finance calculations, because of its heritage lying mostly in egineering, calculus and analysis. It's one thing needing only the readily available programs of John H. Meyers or Mr. Mc Donald. Another one is to programm the 50G based on readily available finance routines - say for "wrap arounds" etc. similar to Phils problems.

2. There is still an alternative available (which also has more options and less physical footprint than the 50G) - the 200LX. This system (available mostly in good shape through auctions) offers Phil the stated

"Save/Reload" capability and also as an undisputed advantage the literal code compatibility of hundreds of dedicated finance equations ready to be typed in into the HP Solver.

Best regards,

Peter A. Gebhardt

Re: HELP: Solver routine for original principal loan amount?

*Message #37 Posted by **Peter A. Gebhardt** on 17 Mar 2009, 6:31 a.m.,*
in response to message #36 by Sancerre (Phoenix)

Tod,

especially the L() and G() functionality is lacking on the 50G - that alone makes it time consuming to transfer (and later maintain/support) equations written for the 19bII/17bII family to (on) the 50G.

Believe me, I tried it. And yes: If you could come up with a functional replacement of the above mentioned functions, I will change sides ... ;-))

Best regards,

Peter A. Gebhardt

Re: HELP: Solver routine for original principal loan amount?

*Message #38 Posted by **Marcus von Cube, Germany** on 17 Mar 2009, 12:18 p.m.,*
in response to message #37 by Peter A. Gebhardt

Peter, the solver can solve programs too. Or you can create a simple wrapper function around an RPL program so that it accepts arguments in algebraic notation and can therefore be used in the solver with ease.

in response to message #38 by Marcus von Cube, Germany

Interesting... I will have to explore that and see if perhaps the 50G is not after all, the better calculator.

Thanks

Re: HELP: Solver routine for original principal loan amount?

*Message #40 Posted by **Phil K** on 16 Mar 2009, 10:57 p.m.,*
in response to message #11 by Marcus von Cube, Germany

Marcus,

Thanks for the suggestions. I would definitely go with a unit that has TVM built-in, so the 50G would be a likely choice if I were to go with the 48 family calculators. I would also want one with an SD card slot, so again the 50G makes sense. Finally, being able to edit the formulas on a PC would be a HUGE +++++!

Still, the suggestion of the 200LX by Mr. Gerhardt makes sense as well. I would likely get both just to play around, but may settle on one or the other for personal reasons.

Thanks. Phil

Re: HELP: Solver routine for original principal loan amount?

*Message #41 Posted by **Peter A. Gebhardt** on 22 Mar 2009, 7:28 a.m.,*
in response to message #1 by Phil K

Gentlemen,

Phil's original question was:

> Quote:
>
> It seems to me that there should be a way to find for the original loan amount using ONLY the balance, term of 360 months, and payment amount.

Solving an equation of 5 unknowns with only 3 knowns (lacking I% and PV) was asked for. This is impossible - unless someone proves me wrong.

All other questions can (and could) already be solved with standard TVM solver routines available within the calculators mentioned.

Best regards,

Peter A. Gebhardt

Edited: 22 Mar 2009, 7:29 a.m.

Re: HELP: Solver routine for original principal loan amount?

*Message #42 Posted by **Don Shepherd** on 22 Mar 2009, 9:34 a.m.,*
in response to message #41 by Peter A. Gebhardt

Peter, I originally thought that a program could solve this problem, but upon reflection I don't think it can.

You would be asking which unique combination of principal/interest rate would produce a specified balance and payment amount, and I imagine there might be an infinite number of such combinations. I tend to agree with you, I don't think it is solvable.

Re: HELP: Solver routine for original principal loan amount?

*Message #43 Posted by **Phil K** on 24 Mar 2009, 2:40 a.m.,*
in response to message #42 by Don Shepherd

Gentlemen,

I have also been summoning the support from another forum, namely Google's Sci.Math forum, and more specifically this thread (http://groups.google.com/group/sci.math/browse_thread/thread/1a1f7c6552e53b1c/01d8091cca8db871?hl=en#01d8091cca8db871).

There are some helpful things there as well. I am still not totally convinced that finding both the original loan amount and interest rate from only a payment amount and mid-stream balance, assuming a standard 30/360 loan term and a guess for the rate is impossible. I agree that there may be an infinite number of solutions, but it seems to me that those infinite number of solutions would be at such varied interest rates (and carried out to so many decimal places) that most of those rate solutions would easily be ruled out from being a viable lending rate, considering lending rates are either whole numbers or fall no longer than 3 decimal places and they are often divisions of 8ths (i.e. 8 3/8 or 8.376), though rarely to 16ths or 32nds.

For instance, suppose that we use a simple $100,000 loan at 8% over 360 periods, 30 years. It works out to $733.76 per month. Now if someone gave me a payment of $733.76 (PMT) from their statement, and they could tell me that the balance on that statement is $93,608.47 (FV), and that they believe they bought the home about 6 years ago, I could guess 72 for the payments, and could also guess the term to be 30/360. Given that, I would use 72 as N. Now I need either an original loan amount or an interest rate. So again, I guess perhaps 7.5% (I%). Let's see what it produces for initial loan amount (PV).

The result for PV is $102,209.17. Now if I reverse the process using that as an initial loan amount and make it a full 360 month term, and with a future value of 0, what's the payment amount? Well, it falls off the charts at $714.66. So now I know that the original principal amount is too high, or the rate is too low (or both). So I adjust the rate up to get a higher payment...well, 7.625% gives me $723.43 (too low), and 7.75% gives me $732.24 (still too low), and 7.875% gives me $741.09 (too high).

So I suspect the original principal balance is wrong because it doesn't jibe with a standard % rate of 8ths, but I also know the closest rate was 7.75%. Let's look at the remaining balances around 72 payments...well, from 69 through 77 payments all result in remaining balances well above the known $93,608.47, in the $95,000 range. So I now suspect the original principal balance is considerably too high resulting in balances at around 72 payments well in excess of what the known balance is.

So I try to work with a standard rate of 7.75% which is my new best guess, and let's see what it gives me as a initial loan amount using the known payment amount. Well this time it results in an even higher original loan amount of $102,421.48, so I now know the rate is too low. So I push the rate up to 7.875 and let it bring the loan amount down. Now it results in $101,198.59. So let's see the payment stream's effect on the remaining balance at near 72 payments...at 70 payments, it's $95,035, so that's still too high, and at 74 payments, it is still $94,478.12. At 82 payments, it's $93,666.04, and at 83 payments, it's $93,546.96, so I know it is still too high of an original loan principal amount. So let's push up the interest rate another 1/8% to bump down the original loan amount and let's see what we get.

Now, at 8%, the result is $99,999.38. Let's see what 72 payments look like...$93,824.72, too high, but real close...how about 73 payments...now it's $93,716.46, almost there...at 74 payments, it's $93,607.48, only $0.99 away. I now know the rate is essentially dead on, and that the borrower has mad 74 payments, not

72. It's just the loan amount that's off, and by how much?, how about rounding the loan to $99,999.00? Well that would push the rate to a higher number by about 4/100,000 and that's obviously not a legitimate lending rate, and pushes the balance at 74 payments to a lower number, $93,607.18, 30 cents less and not what we want. SO if I round UP to $100,000 and push the rate back to 8% flat, what is the result for the payment amount? $733.76, and the balance at 74 payments? Well, you know the rest.

If it can be figured out mentally that way, why then can't the calculator do the same cross iteration calculations? It seems that a series of if/then/else statements with < & > tests should be able to come up with a solution, as long as you limit the interest rates to perhaps 3 decimal places.

If anyone can tell me where my logic is flawed, please do. I know I am chasing a difficult task, but I believe it is one even better suited for a computer than the human mind, and yet the human mind can accomplish it (with a standard formula, mind you).

So I come back to my claim that for a certain known remaining balance, and at a certain rate not to exceed 3 decimal places (within a range of perhaps 2% to 18%), and if kept to divisors of 8, there is only one possible solution for an initial loan amount that is not greater than 2 decimal places long, and only one possible solution for number of payments past.

Likewise, for a known interest rate (at 8ths max) and known number of payments, and at known balance, there is only one possible payment amount, again limited to 2 decimal places that results in an original loan amount also limited to 2 decimal places.

Finally, it is very rare that an original mortgage loan amount is carried beyond a whole dollar amount into pennies. So if we eliminate the 2 decimal places for the original loan amount, then we further narrow the possibilities to only 8ths in the rate, and 2 decimal places in the payment amount. I think at that point, again the numbers for balance, payment amount, rate, and original loan amount can only converge at one possible solution for all variables. Even more limiting is that in many cases the loan amount ends in even hundreds, such as $275,200.00, although the financing in of closing costs and other charges can squash that possibility.

Remember, these are all assuming P&I payments, and are also assuming 30/360 terms. There may even be enough data available from those converging numbers to nail down the term as 30/360, and eliminate other possibilities such as 20/240, or 40/480, etc. as well, but I don't know.

I would like to be proven wrong (and I know there are minds out there that if it is possible, they could do it), so I can put this exercise to rest. I will be posting this exercise on the Sci.Calc Google site as well. Let's see who can come up with a working model for the above. The closest I have now is Mr. Don Shepherd's two routines and the combined routine he sent via his link on the comment several posts above.

Phil

Re: HELP: Solver routine for original principal loan amount?

*Message #44 Posted by **Don Shepherd** on 24 Mar 2009, 8:15 a.m.,*
in response to message #43 by Phil K

Phil, it occurs to me that if you have a recent statement showing the loan balance and payment applied, perhaps the client also has the statement for the previous month laying around the house somewhere, and if that's true, couldn't you calculate the APR using those two statements? I don't know, as I said I'm not a financial guy, but if you had two statements wouldn't that solve your problem?

Re: HELP: Solver routine for original principal loan amount?

*Message #45 Posted by **Phil K** on 24 Mar 2009, 12:01 p.m.,*
in response to message #44 by Don Shepherd

Don,

That's an excellent point, and something I had completely overlooked. Even if they were more than 1 month apart, the number of periods is a known since the statements are dated, so the irr could be figured out, and from that, perhaps the information could be culled to determine the APR.

It is often that the statements don't show the APR, so we are often going on what the client "remembers", which is often close, but often also inaccurate. Thanks for that suggestion. Perhaps someone can help me to create a formula to use two balances and the payment amount to determine the APR...

...no, wait...

...if the two statements have the remaining balances, and also the payment amount, then the earlier balance would be the PV, and the newer balance would be the FV, and then the known number of periods (by statement dates), coupled with the payment amount (another known), would give me the APR!

Don, I think you've got it!

I have to go and test it now! I am excited by this new information. You may have pointed out an obvious solution to the problem for me.

I'll let you know how it goes.

Thank you.

Phil

Re: HELP: Solver routine for original principal loan amount?

*Message #46 Posted by **Phil K** on 24 Mar 2009, 5:46 p.m.,*
in response to message #44 by Don Shepherd

Don,

The solution you suggested works!

I did a quick analysis of a loan for $100,000 at 8% and for $733.76. I then took the 74th ($93,608.47) and 75th ($993.498.77) payment balances from the amortization and used them as PV & FV, for 1 month period, and solved for the interest rate, and it computed the right amount of 8%. That gives the calculator the right information to properly evaluate the loan.

Once that has been done, I simply replaced the FV with a ZERO and solved for PV, and it came back with $99,999.01. Close enough to assume $100,000.

It does solve one scenario for me, that is, where the client HAS at least 2 statements and can give me balances along with a payment amount. This gives me both their mortgage rate AND the principal balance, essentially finding for 2 variables (and they said it couldn't be done!) Truthfully,

it is really only finding for one variable, since the number of periods is known to be 1, but it is essentially a back door to the solution.

Now that this works, I am still not giving up on the idea that with the limited set of only 3 variables; payment amount, present balance, and term (number of periods), you can still solve for the other 2 unknowns; interest rate and original loan balance.

It should be interesting to see what comes of it.

Thanks. Phil

Re: HELP: Solver routine for original principal loan amount?

*Message #47 Posted by **MikeO** on 25 Mar 2009, 12:34 a.m.,*
in response to message #46 by Phil K

I think the best you'll end up with is a set of infinite solutions. However, as you hinted at earlier, the two unknown values will likely fall into some reasonable intervals. You could treat them as random variables. Then, statistically, you'd have some reasonable subset of solutions centered around average values.

If you know two consecutive values over a known period of time, you should be able to use law of organic growth to determine the growth rate (interest rate). That will reduce your problem to one unknown.

-Mike

Re: HELP: Solver routine for original principal loan amount?

*Message #48 Posted by **Phil K** on 25 Mar 2009, 9:58 p.m.,*
in response to message #47 by MikeO

MikeO, "reasonable intervals"...that's exactly what I meant. I couldn't have put it any better than that. I believe that the word "reasonable" sums it up nicely. It is unreasonable to think that the interest rate on a mortgage could be beyond, say...20% (I've seen 16%!), and it is also unreasonable to be less than perhaps %1.5%, so the real question is "how many intervals are there between those two most reasonable of the unreasonable rates (those outside the two)?".

Then by using the most reasonable rate of the range of reasonable interest rates, the same holds true for the initial loan amount. Once you have reasonable rate, it should be even easier to nail down to a range of reasonable numbers for the PV. It is highly unlikely and therefor unreasonable to think there is more than one interval within a range of for example, between $0.00 and $200,000.00 for PV when the payment is 733.76 (PMT), and the current remaining balance is $93,666.04 (using it as FV), especially if I can guesstimate that the number of periods elapsed is approximately 7 years at 12 periods per year (N=84). For there to have been more than 50% of the principal paid down in such a short time with as low a payment as that would be unreasonable, unless the interest rate were a negative (bank pays you to borrow money), and that is again unreasonable.

It seems to me that a formula could be used that would land on an iterative solution that shows perhaps 2 results just slightly above $100,000 (or is it below $100,000?), indicating the result is likely near $100,000. Then if I plug in $0 into the formula as a known variable for FV and solve for periods (N), it should come back with a number near 360 and some

change. Since the number of periods has to be a whole number, and since we know that nearly all mortgages are in increments of 5 years (15, 20, 30, 40, etc.), the obvious answer would be 360 (30 yrs, 12 periods per year). At that point, I could solve for PV and it should result in almost exactly $100,000.00.

Again, my logic may be flawed, but then I am not a mathematician. I am waiting for those who can either confirm or deny my suspicions.

Maybe the Recession is Affecting Old HP Calcs

*Message #1 Posted by **Dan Grelinger** on 15 Mar 2009, 6:43 p.m.*

If you look at actual sales on the auction site by coburlin over the past 2 weeks, you will see that he sold..... NOTHING.

Maybe he'll have to have a 2% off sale to drum up some more business.

Fair and complete disclosure: My ebay id is "kctongo", and I have never purchased anything from coburlin.

Dan Grelinger

Re: Maybe the Recession is Affecting Old HP Calcs

*Message #2 Posted by **Michael de Estrada** on 15 Mar 2009, 7:17 p.m.,*
in response to message #1 by Dan Grelinger

From what I can tell, he's been trying to sell the same classic items (HP55, HP65, HP67) for many years with no luck. My favorite was the boxed HP67 with a bad card reader for nearly $1000. He did have it on auction recently, but I don't see it now, so maybe he found a buyer. After all, there's a sucker born every minute.

Still you may have a point about the recession. It seems like classic calculators are selling for less than they did last year. I sold one of my working HP65's recently for much less than I paid for it. But, on the other hand, I bought an excellent working HP46 for only $255. So in times like this, it's truly a buyer's market.

OT: slide rules still in use

*Message #1 Posted by **Frank Rottgardt** on 15 Mar 2009, 9:49 a.m.*

For the slide rule lovers among us: (Please don´t get that link wrong. It does not express my political orientation)

check between 2:23 to 2:30

You tube film

even nowadays slide rules have their niche. Russians always seem to rely on prooven technology as long as it fulfills their needs instead of developing fancy new electronics. During the early days of space flight the NASA put some effort on getting ball pens working at zero gravity while the russians solved the problem by using a pencil.....

I know that pilots around the world still get some training on mostly circular slide rules for basic in flight calculations. As I learned we have at least one professional pilot on this forum. Don´t know if he still uses slide rules on board. I think he was far more interessted in this famous HP-calculator watch :-)

You say that so negatively, if it weren't for this we might not have the Fisher Space Pen. I love my space pens, they always work. It's an indirect spin-off of the space program that has down to earth benefits.

Edited.

*Message #6 Posted by **Michael de Estrada** on 15 Mar 2009, 11:42 a.m.,*
in response to message #1 by Frank Rottgardt

I was still taking my slide rule into the field until the late 1970's when LEDs gave way to LCDs and I no longer had to lug around spare battery packs.

As far as the Russian philosophy regarding technology is concerned, I remember seeing a TV piece on a post-cold war exchange between US and Russian fighter pilots in which the US pilot flew a Mig and the Russion flew an F-15 (I think). They simulated a scramble situation in which the pilots ran to the plane, got in and took off as quickly as possible. It took less than a minute to scramble the Mig, but nearly 3 minutes to do so in the F-15. The Russian pilot bragged that he'd be ready for combat while the US pilot would still be stuck on the ground, fumbling around with all his fancy technology.

> As I learned we have at least one professional pilot on this forum. Don´t know if he still uses slide rules on board. I think he was far more interessted in this famous HP-calculator watch :-)

I know that you are talking about a different person... but as far as I am concerned: No, I do not use my circular slide rule at work. Never did, actually.

I was forced to buy one for the theoretical exam >20 years ago when electronic calculators were not yet

allowed. For practical purposes however, I always used an electronic calculator, mostly dedicated aviation calcualtors. But there is really nothing left to calculate now. All the flight planning is done with dedicated software on some desktop computer (in my case, I get it done by our operations staff), and in the air, the flight management system (so to say the "onboard computer") takes care of everything. It is connected to all sensors of the aeroplane so that error prone data entry is avoided.

But I take two calculators with me most of the time: A little Casio thingy in my bag that can calculate with hours and minutes for filling out the logbooks, and a Ti85 (that I got for 1 Euro from that auction site) for unit conversions when refuelling. I never dare to take my precious calculator watch to work...

Greetings, Max

*Message #8 Posted by **Geoff Quickfall** on 15 Mar 2009, 1:43 p.m.,*
in response to message #1 by Frank Rottgardt

Hello Frank,

I have two slide rules, one they still force me to carry due to air regs in Canada which still demand a non electronic back up. This is due to poor GPS coverage in Northern Canada combined with a lack of navigational facilities in sparsely settled areas. Also GPS units must be 'approved' for use and not necessarily attached to the aircraft systems (handheld). And we all know what batteries can do if they rundown!

They are:

```
1.   My jeppeson CR2 which does a wonderful graphic representation
     of point to point navigation.

point to point discussion

CR 2 flight computer

2.   My post 1461 for the heck of it.  Although it does monetary
     conversion rates faster than a calculator.  Line up the 1 of
     the C scale over the actual exchange rate on the D scale.
     Now any total can be converted to the 'exchange total' using
     the cursor alone.

3.   This also works for time remaining on fuel flows and any
     other calculation requiring ratios.  Once the ratio is input
     using the C and D scale one only has to move the cursor slide
     to determine the next answer.
```

Yes, I always use the HP 01 in the flight deck! The dynamic functions are wonderful.

-Insert the total time for the flight in the stop watch. Multiply the stopwatch by the average fuel flow for the flight and up comes the burn.

-At takeoff start the stopwatch and watch the time count down. The flight attendants want to know the time remaining for service.

-Hit the equals sign when you want to know the fuel burn remaining that is required for the remaining flight time. Watch the burn dynamically count down as each second passes.

I am with Katie on the Fisher Space Pen front. Bought my first one in 1977 and have used it at work and during my research in the field while doing my MSc. It worked in the rain, on wet papar, below zero (-30 centigrade) and on my plasticized field note book. The pencil smeared in the water and smudged in the field

book.

Cheers, Geoff

Hi!

> Quote:
>
> I am with Katie on the Fisher Space Pen front. Bought my first one in 1977 and have used it at work and during my research in the field while doing my MSc.

Ah the Space Pen :-) I am still with my first one (a gift from my wife when I passed my ph.d. exam (aerospace) in a previous life). I always carry it at work - but for real writing, I prefer a PaperMate fountain pen that I have been using for something like 30 years now.

And regarding the watch: I am not allowed to use times from my own watch at work! The technicians download the data from the flight managemet computer for their records, and there must be no discrepancy between the technical records and the operational logs filled in by the flying crews. Therefore, we must use the times from the FMS display... On most days, I do not bother to carry a watch at all.

But our environment is quite different from Geoff's then: If our navigation system fails, we will have crossed two state borders here in central Europe by the time it takes to locate the backup-slide-rule in our cramped and packed bizjet cockpit... By then, two fighter jets will already be flying beside us, escorting us to a suitable landing field!

Greetings, Max

Hello Max,

How is the HP 01 project going?

> Quote:
>
> By then, two fighter jets will already be flying beside us, escorting us to a suitable landing field!

Same here, if you miss a radio frequency change and ATC cannot communicate with you via your company or VHF, we too have fighters on our wing. It can happen even when you do not cross borders!

> Quote:
>
> And regarding the watch: I am not allowed to use times from my own watch at work!

Quite correct, FMC on the 777 is GPS synched, but I wear mine for cross checking. I have seen incorrect data in data bases which is why I still carry the HP 41CX and complete my own *independent* navigational checks as well as fuel management and etc..

In fact, the requirement for an on board *sweep second hand* timepiece is still in the air regulations and the HP 01 fails that definition miserably ;-)

Cheers, Geoff

P.S. I do alot of Europe flying crossing one country to the next. Tel Aviv comes to mind; leaving from Toronto you cross Greenland, Iceland, Scotland, Amsterdam, Germany, France, Italy, Greece and into Tel Aviv. So navigational accuracy and prompt communications are mandatory!

Cheers, Geoff

Interesting country counting d;-) But as long as GPS works ... many happy landings!

Just for my curiosity: Do you have a stopover in Amsterdam (NL) and relatives in Scotland (GB)?

Why is there still a requirement for a sweep second hand?

Re: OT: slide rules still in use

*Message #13 Posted by **Geoff Quickfall** on 15 Mar 2009, 8:46 p.m.,*
in response to message #12 by Brent Hillebrenner

Simple answer, the regulation required an independent timepiece consisting of a sweep second hand.

It was written prior to the digital age. Even after the advent of digital watches, the digital technology was not 'proven' therefore sweep second hands were still required.

Even today, although the onboard clocks have digital components, we still have an analog display with a sweep second hand.

They call it "human factors" in the nuclear power industry. Control rooms in nuclear power stations are required to have mostly analog indication for many processes and to indicate control positions. The idea is that human minds are basically analog, and we perceive quantities in terms of physical distance, rather than numbers. The sweep second hand lets your mind see how far it has to go in time to get to a certain milestone, such as the next whole minute.

Makes sense. A digital displayed number could easily be transposed in the mind and/or on paper.

Analog and airplanes

in response to message #14 by Michael de Estrada

Back when I worked avionics, if I needed to check a potentiometer for smooth output (such as the output of an AOA probe, which was 0-28vdc off of a precision potentiometer), I always reached for a Simpson analog multimeter. Any noise in the pot could easily be seen as a disruption in the smooth sweep of the wonderful, jeweled movement of the Simpson meter. In this application a digital multimeter was useless, except as a paperweight on a windy flight line.
I need to find an old HP analog multimeter for my collection...

About ten years ago I did some consulting with a firm that was making instrumentation for fire trucks. The firemen needed to be able to read the displays from some distance away. Due to the extreme vibration when the pumps were running digital displays and standard meter displays were useless. We developed bar graph displays which were readable from a distance.

Got me! Didn´t know about that.

Anyway, I wonder if USAF crews onboard a B52 still use slide rules as their russian counter parts do as we could see.

Last summer the swedish Army held a "open house" day in Karlsborg. Among other units there was a heavy mortar platoon with a lot of electronic survey instruments and computers for range finding etc. Since I have been working as surveyor years back I enjoyed talking to the guys.

To my surprise they also showed up a box filled with special artillery slide rules and table books with the proud remark that they still would be able to fire even if all the electronics should fail (scandinavian winters). When I started asking them questions about the use of this gear the soldier told me that he did not receive any training on it and walked away for an officer to show me. He came back with a higher rank and also he confessed that he wasn´t able to handle this equipment.

I guess we really entered the electronic age with no way back. Already old fashioned calculators with one row LCDs without "like in the text book" dot matrix seem to be a hurdle.

I guess I start growing old.

This remminds me of the electromechanical Mk1A fire control computer that I studied in the Navy back in 1952. When fully operational it took the necessary information for the solution from synchro inputs from the Mk25 radar, gyroscopic systems, etc. and automaticallly delivered train, elevation and fuse settings to the guns. Every synchro input was backed up by a mechanical input capability with a hand crank. Input information could be received from the sound powered phone system and a degraded solution would be available to "fight the ship".

Hi George,

I guess the bar fact that I am a foreigner living in Sweden put me on their list? Until some years ago there were still areas in Sweden foreigners were not allowed to enter, but where no limitations at all existed for swedes. For example outside Karlskrona, one of Swedens naval bases. But they took away these stupid rules as far as I know. Certainly the insight grew that these measures don´t really give more security.

Basic questions about Clonix41 & Nov32/64?

*Message #1 Posted by **Michael Lopez** on 15 Mar 2009, 1:41 a.m.*

Hi all,

Have recently visited Diego's Clonix41 site as the product sounds interesting but am confused about it's purpose/range of functions & how it overlaps with the Nov-32/64 modules :(? . A simple explanation would be much appreciated as it sounds like a benficial add on to my HP41CX.

Cheers,

Michael

Re: Basic questions about Clonix41 & Nov32/64?

*Message #2 Posted by **Howard Owen** on 15 Mar 2009, 3:29 a.m.,*
in response to message #1 by Michael Lopez

Hi, Micheal,

Except for one word, the Clonix has only flash memory. With memory that requires a burner to be changed, you can use the vast majority of the modules out there that think the ROM address space on the 41C is - well - ROM. What the NoV32 and NoV64 give you is 32K and 64K respectively of static RAM. This allows you to run all of the modules the Clonix will run, but also the "MLDL" setups, which treat part of the 41C's ROM address space as RAM. These systems allowed development of mcode programs right on the calculator.

Regards,
Howard

Re: Basic questions about Clonix41 & Nov32/64?

*Message #3 Posted by **Dan Grelinger** on 15 Mar 2009, 6:25 p.m.,*
in response to message #2 by Howard Owen

Howard, I don't have a Clonix (only NoVRAM and NoV-32) but Diego's spec sheet says that Clonix has 512 words of RAM. At time of programming these 512 words can be addressed at F000. Not much, but enough to put in a few user code programs or M-Code functions. Those specs may be old, but when I communicated with Diego last year I thought they were still correct.

Re: Basic questions about Clonix41 & Nov32/64?

*Message #4 Posted by **Howard Owen** on 15 Mar 2009, 8:41 p.m.,*
in response to message #3 by Dan Grelinger

Reading the Clonix41 manual, I see that you are correct. I only own Nov-32 and NoV-64, so I have no direct experience with Clonix41. I thought the bank switch port at x4100 was the only writable memory

on a Clonix41. Of course, that's wrong in another way too: the Clonix41 doesn't have this memory mapped register, since there are no banks to switch.

Thanks for clearing that up.

Regards,
Howard

Re: Basic questions about Clonix41 & Nov32/64?

*Message #5 Posted by **Geir Isene** on 15 Mar 2009, 5:17 a.m.,*
in response to message #1 by Michael Lopez

CLONIX41: 24K ROM (6*4K HP-41 ROM images). You burn this with a burner from your PC.

NoVRAM: 8K ROM (2*4K ROM images) + 16K HEPAX RAM (you can save programs to this RAM and run them from this RAM space. You can also save XM-files and the whole calculator RAM. Or you can save ROM images into this RAM [rather useless as this would be the same as the Clonix41, only the Clonix is cheaper]. And, you can use the HEPAX RAM to create your own MCODE programs (!))

NoV-32: 8K ROM + 32K HEPAX RAM (divided into two blocks of 16K each where only one block is accessible at a time. You choose which block to access by writing the WORD "0" or "1" into the address 4100h [see the HEPAX manual for doing this via the function HEXEDIT or do it via the ICEBOX ROM which would then have to be one of the 4K ROM images]).

NoV-64: 2*8K ROM (two blocks, one accessible at a time) + 64K HEPAX RAM (four blocks of 16K, one accessible at a time). Use HEXEDIT or ICEBOX ROM to switch between the various ROM and RAM blocks: In address 4100h, write the WORD x0y where x is the ROM block to activate ["0" means no active block/no ROM, "1" means first 8K ROM block active, "2" means second block] - y means which RAM block to activate: "0", "1", "2" or "3".

CLONIX-D: 2*24K ROM images in two block. The active block depends on which port you plug the module into (really cool).

HTH,

Geir

in response to message #6 by Michael Lopez

Hello,

One question: how much power do these modules use?

HEPAX can be power hungry, drainig betteries rather quickly, son I am curious.

JuanJ

Re: Basic questions about Clonix41 & Nov32/64?

*Message #9 Posted by **Geir Isene** on 15 Mar 2009, 1:57 p.m.,*
in response to message #8 by Juan J

From what I can see; just slightly more drain while in sleep or standby, but around 4x drain on actual run. In practice; Not a problem, use rechargeable batteries.

Re: Basic questions about Clonix41 & Nov32/64?

*Message #10 Posted by **Dan Grelinger** on 15 Mar 2009, 6:39 p.m.,*
in response to message #8 by Juan J

Diego has the power usage specs for Clonix on his web site. Based on the RAM that is used for the NoVram versions, there should not be any additional power consumed, except during writes into that memory.

Sleep (HP-41 turned off) 10 micro-Amps

Standby (HP-41 on, but just sitting there, doing nothing) 100 micro-Amps

Run (HP-41 running a program) 13.5 milli-Amps

Re: Basic questions about Clonix41 & Nov32/64?

*Message #11 Posted by **Dan Grelinger** on 15 Mar 2009, 6:34 p.m.,*
in response to message #5 by Geir Isene

Gier, some corrections are in order:

NoVRAM has 24K of Flash ROM, just like Clonix. In the standard configuration (HEPAX emulation) 16K is used for the HEPAX code, and the other 8K is avaiable to use as another ROM.

NoV-32 - Same 24K of Flash ROM.

NoV-64 - Has 48K of Flash ROM. 16K for HEPAX ROM, 16K in block 1 ROM, and 16K in block 2 ROM. (I really need to get one of those!)

Dan

HP 41CV gone nuts

*Message #1 Posted by **Richard Carter** on 14 Mar 2009, 1:03 p.m.*

My venerable HP 41CV seems to have gone crazy. It started by displaying ?.?.?.?.?.3 when I touched the "3" key. The same thing would happen with the "6" or "9" key. I tryed to reset it by touching the Enter, left arrow, and "On" at the same time. The more I messed with it the more keys that would not function. At time the only thing it will do is to display "10.0000 CC" for about 10 sec. and then off for about 1 sec and then repeating this cycle.

Any help in solving this would be greatly appreciated. I would love to get my old calculator working again.

Re: HP 41CV gone nuts

*Message #2 Posted by **db (martinez, ca.)** on 14 Mar 2009, 9:39 p.m.,*
in response to message #1 by Richard Carter

first, a question: did you unplug any peripheral or twist the body -with the calculator on- just before this started?

second, something that steve from austrailia posted on 24 Mar 2001,

Reseting an HP41

Quite often people post questions in the forum asking how they can reset their HP41 with or without losing the programs.

It seems that HP41's do tend to lock up more than we'd like to think they do, especially when turning them on the first time for a while, or when connecting some odd peripheral.

Perhaps it's static, perhaps it's the ghost of long forgotten TI calculators extracting revenge? I don't know.

Anyway, here is a list of things you can try to reset the calculator. Note that these are not my ideas they come from an excellent book "Extend Your HP41" by W Mier-Jedrzejowicz. I recommend you get a copy!

Following is a slightly updated copy of something I posted in the forum some time ago, and that I refer people to. However it's probably easier to find here.

In the book Extend your HP41, section 4.1, a number of methods are given to revive a calculator that won't turn on.

1) Press backarrow and/or shift to see if the blank display is caused by alpha blanks in the X register. To see how deceiving this is, turn on your HP41, press Alpha, then Shift STO . X, then alpha. Turning the HP41 on and off will appear to do nothing. Quite evil!

2) Press on then backarrow, then on, then backarrow a few times, pausing about 10 seconds between keystrokes

3) Remove all modules and try again (there's also mention of the use of an AM radio here too, as well as chacking for dirty battery terminals, flat batteries, and incorrectly inserted batteries). When the HP41 is active it radiates some RF and an AM radio (remember those?) not tuned to a station can often pick these up. The sound will change when the calculaor is doing different things, and thus you can tell (maybe) if the calculator is turning on, even in the absence of a display)

4) IF YOU HAVE A NEWER HP41, try pressing backarrow and enter then on, then releasing all three. The newer HP41's have a keystroke that does sort of a soft-reset invoked by this combination of keys. BEWARE this will cause a hard reset (losing memory) if tried on an older HP41

5) If you have a wand try reading some barcode. Reading barcode will turn on the calculator. It will also tell you if the batteries are supplying power by checking for the red light!

6) Try pressing R/S

7) Attach a card reader and run a card through it. This will also turn on the calculator, but be careful of the card you choose because it will be read. Actually on this point using the first card of a WALL set (if it reads) will allow you to hard reset the calculator by interrupting it. If your batteries are flat, the card may stop part way through -- change the batteries and reinsert the card reader.

8) Take out battery and reinsert. then press ON a few times. This also seems to reset the calculator, but this may have been the reason why you lost control in the first place! This will also clear the date and time if you have a CX or a Time Module.

9) Obscure Crashes due to errors in the buffer error (typically after synthetic programming mistakes) have equally obscure methods to recover from them.

10) memory lost (aaagh!) As per the manual, hold the backarrow, press and release the ON button then release the backarrow. This will alledgedly work if the calculator can be turned off, so strange crashes may be due to the calculator not being able to be turned off Hmmmmm.

11) take out batteries for a LONG time OR insert batteries the wrong way (using old batteries) (POOR ADVICE IN MY BOOKS), This discharges the internal capacitor that maintaind the HP41 battery. The HP41 is protected by reverse polarity by diodes, so this shouldn't damage the HP41 OR short the battery terminals (place wire or foil over the gold connectors. It's the outside two that you need to short, but you can connect all of them without any problems). I prefer this because there's no chance of killing the calculator. Either way -- 15 minutes is advised. I actually used the reverse battry approach on a CV in the early 80's and it worked (I only left the catteries in that way for a minute or two though)

12) Really nasty. The sugestion is that the battery may be dead or dying, or perhaps there's a bad connection. But you would have tried new batteries first, right? Apparantly in older HP41's low batteries can cause the display drivers to fail to synchronize. A recommendation is to take the calculator apart and leave it that way for a while! -- I told you it was nasty.

13) Even worse. Send to HP to get it repaired.

I used to have a card with an autoexecute program on it. The program was simply STO c. That worked for me once too. It is actually mentioned in step 10 in this book too.

Good luck.

Also mentioned (in step 12) is to put the calculator on a hard surface, lift up one end about an inch, and set it down fairly firmly. I hav also heard "drop one end about an inch" as an alternative. I'm not advocating this either.

I've found that it may also be worth squezing or gentley twisting the calculator. This is especially true if there are some intermittent faults. If this makes any difference, then it points to bad internal connections, a problem which is reasonably common.

If the calculator rattles and seems to hace some loose plastic inside of it, especially if it looks like it's been dropped or opened, then suspect the internal posts as being broken. This will eventually cause problems as the tension proveded by these posts holds internal contacts together

Happy Pi Day

*Message #1 Posted by **Egan Ford** on 14 Mar 2009, 12:09 p.m.*

For the last few weekends I have been exploring faster and faster ways to compute Pi to 1000 digits on the 71B. The 71B is an incredible machine. I am always amazed at what this little hand-held computer can do.

If you are more interested in newer calculators, then check out my 50g Pi programs:

- Example: Pi Shootout
- Sidebar: P2F
- Vieta Accelerated

NOTE: This is a subset of a larger article I will finish someday. I will have more results, hopefully before the next Pi day (22/7).

Draft

Subject: 1000 Digits of Pi on Pre-1990 Hand-Held Calculators and Computers

The genesis of this article originated with the following statement from Gene Wright, *"Looks like the race to 1000 digits on a machine prior to 1990 now belongs to TI? Can we beat the 5.81 hours on the TI95 with the HP71B?"* (http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=53988)

As of early 2009 this challenge has remained unanswered--until now...

I've spent the last few weekends exploring various ways to meet this challenge. The most amazing result is Ron Knapp's RPN code running on the 71B (entry 5). The quest to best 5.81 hours could have ended in 1985 with a HP-41 Translator Pac equipped 71B!

	Algorithm	Platform	Language	Memory	Digits	Time(s)		
1.	Atan Stormer[1]	HP-71B	Forth	3360 B	1002	3172	(0.88 hr)	(53.87 min)
2.	Atan Stormer	HP-71B	Forth	3360 B	1002	3434	(0.95 hr)	(57.23 min)
3.	Atan Machin[1]	HP-71B	Forth	3360 B	1003	3561	(0.99 hr)	(59.35 min)
4.	Atan Machin	HP-71B	Forth	3360 B	1003	3825	(1.06 hr)	(63.75 min)
5.	Atan Machin[2]	HP-71B	RPN	220 R?	1001	6034	(1.68 hr)	
6.	Spigot	HP-71B	Forth	17.1 K	1002	6720	(1.87 hr)	
7.	Atan Machin[3]	TI-95	AOS		1001	~20916	(5.81 hr)	
8.	Atan Machin[2]	HP-41CX	RPN	1540 B	1001	~30600	(8.50 hr)	

[1]*1000 decimal digits represented as base 2^{20}.* [2]*Ron Knapp implementation.* [3]*Bob Fruit implementation.*

Table 1 *Summary of Results < 9 Hours*

Entries 1 and 3 are the same as 2 and 4 respectively, just timed differently. All four were computed base 2^{20} to get the most out of the 20-bit Saturn architecture, however entries 1 and 3 stopped the clock after 168 base 2^{20} digits

were computed, whereas entries 2 and 4 stopped the clock after the number was converted to base 10. Since it takes ~3.5 minutes just to display the results and without any clear rules on the subject I opted to report both. I expect that most will agree that 1000 decimal digits of Pi must be represented as 1000 decimal digits making entry 2 the fasted pre-1990 hand-held leader.

Entries 5 and 8 are based on Ron Knapp's original program published in 1981 (V8N6P69 of the PPC Calculator Journal).

Output and Code

1. **HP-71B Arctan Forth**
2. **HP-71B Spigot Forth**
3. **HP-71B Arctan RPN**
4. **TI-95 Arctan AOS**
5. **HP-41CX Arctan RPN**

1. HP-71B Arctan Forth

Output of entries 2 and 4 (1 and 3 are the same but have different times reported. (see above)):

5. HP-41CX Arctan RPN

This was originally written by Ron Knapp. Minor changes were made to address output formatting, timing, and duplicate labels (labels were changed to increase readability).

NOTE: The timing was from EMU41, the orginal time was ~8.5 hours. The final article will have a 41CX retiming.

Output:

```

Egan,

Wow, you've been a busy guy! I need some time to digest all this, but thank you for all your work on Vieta Accelerated. I didn't know about Kreminski's formula, very interesting.

-Katie

Egan:

The article that you included with the TI-95 program was originally published as part of the documentation of a TI-59 program on V7N4/5P27-29 of *TI PPC Notes* back in mid-1982. You can access that at Viktor Toth's site. The procedures described for running the TI-59 program do not apply to the TI-95 program. There is also an error in the article where it states "... There is a linear relationship between the number of decimal places and the running time of the program. ..." Actually, the relationship should be, and usually is very close to a squared relationship.

The material in *TI PPC Notes* includes the TI-59 program. Unfortunately, the program listing is incomplete in that the first forty steps of program II-B are missing. If anyone would like to run the TI-59 program I can provide a listing of the missing steps.

The TI-59 program is limited to 460 digits by memory limitations. There was a program published in the French magazine *Science et Vie* which was substatially slower but which would find 1287 digits of pi. That is particularly impressive since the TI-59's user memory is only 1300 digits.

Palmer

Palmer,

I was a bit confused myself about the pairing of that article and the source. They were sent to me as a single 3 page PDF. I've removed the article to avoid any ambiguity.

Do you have any links, articles, etc... about the TI-95 Pi program and its 5.81 hour result? Any corroborating or anecdotal information would be great.

Thanks.

*Message #5 Posted by **Marcus von Cube, Germany** on 16 Mar 2009, 11:45 a.m.,*
in response to message #4 by Egan Ford

Could you please repost the link to the removed TI-59 article? My former printout of your post is incomplete and I'd like to read the document.

Marcus

in response to message #5 by Marcus von Cube, Germany

Here is the original PDF that was sent to me. It is higher resolution than the images posted here (MoHPC size limitation).

http://sense.net/~egan/ti-95pi.pdf

Hi Egan,

thanks for the download. I might have caught the PI disease.

Marcus

in response to message #7 by Marcus von Cube, Germany

I do not find the number Pi that interesting. A handful of digits can solve many practical problems. E.g. with less than 100 digits you can calculate the *circumference of the universe accurate to the radius of a hydrogen atom.*

What I find interesting is all the different math that can be applied to computing Pi.

And, what I find *most* interesting is the computational methods used to compute Pi, especially on machines with limited resources. As I explore this history I am truly amazed at the ingenuity and determination of the individual programmers. Especially the TI programmers. AFAIK, the 41 and 71 outclass the 59 and 95 in terms of I/O and memory

forcing the TI community to think smarter. Fascinating!

The following notes accompanied my transmission of the TI-95 program to Gene Wright:

> Quote:
>
> 1. A direct translation would yield bad results if the number of digits asked for was greater than 770. I "fixed" it by changing from using ten digit registers with only the three guard digits available for carries from one register to the next to using nine digit registers with four digits available for the carries. The completed program is a hybrid which uses ten digit registers for up to 770 digits and nine digits for more than 770 digits. This yields about a ten per cent increase in speed for requests for less than 770 digits. Flag 3 controls whether 9 or 10 digit registers are used.
>
> 2. It would have been possible to simply print out the nine digit registers, but that made it difficult to check the answers against my pi table which was printed in groups of ten digits so I added a routine at the end which will either print or display the nine digit registers in a ten digit format. I could have used the same routine in another way to simply rearrange the 9 digit information back into the registers as 10 digit information but I didn't.
>
> 3. The TI-59 proram used two HIR registers to save two data registers for the calculation. My conversion replaced HIR 07 with data register 470 and HIR 08 with data register 471.
>
> 4. The TI-95 does not permit comparisons with the t register without using assembly language techniques. My conversion used data register 472 as a comparison register. Where the t register was used only as a place to park a value for later recovery I used the TI-95 t register as at lines 0408 and 0415.
>
> 5. I also used data register 474 to store the number of places desired and data register 473 to store the number of data registers to be used for the number of places desired.
>
> 6. In Bob's discussion of his program he says that "There is a linear relationship between the number of decimal places and the running time of the programs." Actually, the relationship is essentially a square relationship with an upward tail at the low end driven by the initialization routines and by the initializations for each iteration. You can see that in the plots.

That is all the supporting documentation that there is other than my handwritten programming notes and some run time results where the run time results are included in the graph that accompanied the

transmission to Gene.

Some years ago I assembled a fairly thorough summary of the work with pi on the TI-59 including references to *TI PPC Notes* for details. It runs several pages. If you send an e-mail address I will send it to you.

HP41 Virtual Memory - Terabytes?

*Message #1 Posted by **Raymund Heuvel** on 13 Mar 2009, 9:56 p.m.*

Virtual memory architectures are based on swapping "external memory" into actual address space.
(I am not an expert on this so don't kill the amateur - a building engineer ...)

Owning just a HP41 and a HP71B, both with IL it seems not so easy but ...

Considering synthetic programming: Bringing the instruction pointer in the alpha registers (M,N,O,P) and executing an INA on the HP41 and OUTPUT :LOOP;X$ on the HP71 where X$ holds the program for the HP41 would modify the HP41 program on the fly.

I wrote a few small programs (not optimized, just to see if it is possible) and yes it works, but only in SST mode on the HP41. In RUN mode it simply won't work.. any hint from the synthetic specialists?

Here some experimental listings, goal of the miniproject: "Hello World" AVIEW.
Big leap target ... a WALL function ??

HP41 Listing:

```
 01LBL "V"              Just the label
 02 STOPIO              seems to clear all IO (IFC HP-IL msg)
 03 1                   Assumung the HP-71 is #1 (Could also be
                           anything else sending bytes
 04 SELECT
 05 SF 25               See HP71B listing ...
 06 XEQ 01              To bring the program from Alpha regs back via return
 07 RTN                 or STOP, GOTO 'END' or anything else
 08 GTO 02
 09LBL 01
 10 RCL b
 11 "`     "            96 7 0 0 0 0 0 Instruction pointer => Byte 6 of reg 7 (M)
 12 X<> [               X<>M
 13 "AAAAA"             append just 5 'A' (or anything else)
 14 STO [               STO M
 15 "AA"                append just 2 'A' (or anything else)
 16 RCL \               RCL N
 17 "  |"              167 29 145 124
                       The instruction code for REG M ... see below
                       167 29   => XROM 28,29  -> HP41-IL INA function
                       145 124  => STO b
 19 STOP                For convenience SST usage (see below)
 18 STO b               and jump into M (see line 12, falls through '0' bytes'
 19 END
```

The HP71B program:

```
10 CONTROL OFF
20 M$=CHR$(167)&CHR$(29)&CHR$(173)&CHR$(25)&CHR$(133)&CHR$(178)&CHR$(130)
40 O$=CHR$(240+11)&"HELLO "
50 N$=CHR$(206)&CHR$(119)&CHR$(113)&CHR$(0)&CHR$(0)&CHR$(0)&CHR$(0)
60 C$=O$&N$&M$
70 OUTPUT :LOOP ;C$
140 O$="WORLD"&CHR$(126)&CHR$(133)
150 N$=CHR$(206)&CHR$(119)&CHR$(206)&CHR$(113)&CHR$(0)&CHR$(178)&CHR$(4)
160 C$=O$&N$&M$
```

```
170 OUTPUT :LOOP ;C$

Comments per line:
10 Just to cooperate with the HP41
20 M$ (REG M) holds code equivalent to HP41:
        INA             167  29
        FC? 25          173 25
        RTN             133
        GTO 01          178 130 => a COMPILED GTO thus a jump to start of register N (needs
                        no label, restriction: do not PACK or anything else that destroys
                        the jump bytes
40 O$ (REG O) holds code equivalent to HP41:
        "Hello "        251 + "HELLO" xFB (length 11) as first part of the string
50 N$ (REG N) holds code equivalent to HP41:
        X<>O            206 119 And bring O (The "Hello ") to
        X<>Y            the Y Register
                        + 4 NOPS ('0' Bytes) => The Instruction pointer falls to M ...
60 Add the whole bunch for sending
65 Just to follow the 71
70 Send to the 41
140 O$ :
        "WORLD"         The rest of the "Hello " String (NO APPEND !)
        AVIEW           126 Display it
        RTN             133 and a normal return (To HP41 V Program line 8)
150 N$ :
        X<>O            206 119
        X<>Z            206 113 Put 'WORLD' in 'Z'
        NOP             0 => to make the compiled goto (next line) easier ...
        GTO 01          178 4 => a COMPILED Jump to REG Y, Byte 6 (Left Byte)
165
170     And send it to the HP41

What happens ... In abstract
In 'V' the bootstrap instructions are loaded for the initial INA function in Line 18
This could be improved with M$ code as in HP71 but I was to lazy ..

In Detail:
<IP> means instruction pointer, located at the byte to start with
Void fields means a '0'(Zero) Byte (<IP> falls through these as NOP)

       <IP>   falls through ...  <IP>
|Byte|   6    |   5    |    4   |    3   |   2    |   1    |   0    |
-------------------------------------------------------------------
| M  |        |        |        |        INA      |       STO b     |
-------------------------------------------------------------------

The first INA results in:

|Byte|   6    |   5    |    4   |    3   |   2    |   1    |   0    |
-------------------------------------------------------------------
| O  |251 (FB)|  'H"   |   'E'  |   'L'  |  'L'   |  'O'   |  ' '   |
-------------------------------------------------------------------

-------------------------------------------------------------------
| N  |      X<>O       | X<>Y   |        |        |        |        |
-------------------------------------------------------------------
                                                  <IP>
-------------------------------------------------------------------
| M  |      INA        |    FC? 25       | RTN    | GTO 01  (R:N,B6)|
-------------------------------------------------------------------

So a jump to N follows to the cuntional code, putting FB+Hello in Y and falls
in M with the next INA resulting in ...

|Byte|   6    |   5    |    4   |    3   |   2    |   1    |   0    |
-------------------------------------------------------------------
| O  |  'W"   |   'O'  |   'R'  |  'L'   |  'D'   |  AVIEW |  RTN   |
-------------------------------------------------------------------
```

```
-------------------------------------------------------------------
| N  |      X<>O       |       X<>Z      |        |GTO 01 (R:Y,B:6) |
-------------------------------------------------------------------
                                            <IP>
-------------------------------------------------------------------
| M  |      INA        |    FC? 25       | RTN    | GTO 01  (R:N,B6)|
-------------------------------------------------------------------
```

So assuming INA works fine, code jumps to N and then to Y:Byte 6 where it finds

```
      <IP>
|Byte|   6    |   5    |    4   |    3   |   2    |   1    |   0    |
-------------------------------------------------------------------
| Y  |251 (FB)|  'H"   |   'E'  |   'L'  |  'L'   |  'O'   |  ' '   |
-------------------------------------------------------------------
| Z  |  'W"   |   'O'  |   'R'  |  'L'   |  'D'   |  AVIEW |  RTN   |
-------------------------------------------------------------------
```

Loading "Hello World" in the ALPHA regs (therefore this code is in Y,Z), doing an AVIEW and return to "V" line 08 (subsequent the XEQ 01 => We preserved the return value in REG b).

Start as follows:
Run the HP71 Program (Output statements are buffered)
Run the HP41 Program, perform the extra R/S to continue after the STOP in 18 => Rubbish in Display

AND NOW ... This works when in SST mode on the HP41 (SST from line 18 onwards or from line 1 ...)
=> A nice "HELLO WORLD" is Aviewed ...
Step until you encounter RTN to return to the "V" program!!
Otherwise your program pointer remains in the status register.

Its a pain in the brain but I can't find the bug... Somebody has an idea??
It could open therabytes of virtual memory for the HP41 of this works

Something like this as boot-trap loading some bigger program doing bigger things doing ....

When it workes, Yes Yes I will, I'll make it an article ....

Best regards

Raymund

Re: HP41 Virtual Memory - Terabytes?

*Message #2 Posted by **Howard Owen** on 13 Mar 2009, 10:37 p.m.,*
in response to message #1 by Raymund Heuvel

This is wicked cool...

But the HP71 can't handle terabytes, so it would have to be talking to a PC using a HP 82973A. But a PC with an ISA slot probably can't handle terabytes either, so it in turn would have to be using a decent 64-bit server (running Linux, for speed) in order to manage the multi-gigabyte chess program someone will undoubtedly write once this capability is available.

Don't you love this hobby? :)

Regards,
Howard

Raymund,

I don't know anything about synthetic programming or details of the HP 41, but I know something about computer architectures. Modifying code is often tricky because the computer assumes just the opposite - that it won't be modified. This lets it do things like keep recently used instructions in cache, or soon-to-be-executed instructions in an internal pipeline.

The upshot is that if you modify the instruction stream, you have to flush the cache and the pipeline. I don't know if the HP41 has either of these things, but your symptom is pretty classic for the problem.

Good luck, and do keep up posted.

Maybe the MCode programmers can give a statement to this?

Re: HP41 Virtual Memory - Terabytes?

*Message #6 Posted by **PeterP** on 15 Mar 2009, 5:09 p.m.,*
in response to message #1 by Raymund Heuvel

Raymond,

Fabulous idea! No specialist here, but just a couple thoughts (don't have any HP with me currently but will try your set-up at home and share any further thoughts if I have any)

1. I think register M is number 5 and not number 7 (T=0,Z=1,Y=2,X=3, L=4, M=5, N=6, O=7). As your line 17 clears all alpha it does not create a problem. Maybe one can use 48/5/00000 in your line 11 for byte 3 of reg 5
2. very neat and clever separation of the first return address and program pointer and replacement with the wanted program pointer
3. INA behaves differently depending on Flag 17 on the HP41. If that Flag is cleared, it expects/wait a CR/LF to end the transmission. If it is set, it just accepts the whole string until either alpha is full (24 chars) or the full string has been submitted. Maybe in SST mode the INA gets completed even without the CR sent, but not in Run mode. Have you tried running your experiment with Flag 17 set?
4. Sorry for being slow, but can you explain the purpose of the Sto B after the INA that you place in Reg M? Doesn't INA wipe out Alpha and hence the StoB as well? As I said, I don't have any HP with me right now so I can't try it out myself, my apologies.
5. In run-mode, I believe AVIEW has some extra features (e.g. print-out, halt of program depending on some printer flags etc). The other thing I am not sure currently is the treatment of the Alpha-register itself with AVIEW. In Run-Mode the calc normally shows the goose which it does not in SST mode, so I'm not sure if there is something here as well. Have you tried instead of Hello World to e.g. fill some registers with say Pi?
6. I think there do exist WALL like functions that read/write the complete content of the calc (or subsections like EM, Status regs, user regs etc) to an HP-IL mass-storage device. To read(write) the whole memory of an HP41 to(from) the HP71 one could simply use on the many available Non-normalized sto(recalls) for each register, rcl M(sto M) and INA(OUTA) but I guess it might take a while.
7. If you want to use the 71 as a source of a loooong program for the 41, it might be tricky to write a meaningful program that can have no loops >20 bytes (the length of alpha)

Again, fascinating idea, do let us know how it goes!

Cheers

Peter

Re: HP41 Virtual Memory - Terabytes?

*Message #7 Posted by **Raymund Heuvel** on 15 Mar 2009, 9:49 p.m.,*
in response to message #6 by PeterP

```
Hi Peter
1)    Yes, you are correct. Legacy from previous experiments
3)    Yes, I did, no effect (same "rubbish")
4)    Legacy but it would bring IP back to main program where it does
      the stop (if inserted) in case INA fails. Better would be to
      use the M$ code of the HP71 in M (then 96/5/00000 in line 11 !)
5)    I did not try but soon I will -> Keep you informed
6/7)  My fantasy goes more in the direction of a small loader that
      loads (or writes) a number of registers, moves the curtain
      (or vice-versa) and then finalizes the whole thing by
      a "GTO ..". Then a WALL or READP, WRITEP look-a-likes could
      be possible.
      Yes the mass storage functions have these functions and I
      have a tape, but also a RS232. The latter would open my
      Terabytes disks for my HP41 environment in a total different
      way.
      e.g.: run a default bootloader on the HP41 (An extended
      version of the actual "V") and then the PC can step by step
      put the HP41 into a desired state.
      Why should we do this: because we can (I hope ..)
```

```
     Some actual observations:
     It looks as if the ALPHA register does not receive (all)
     data from the second INA / Output sequence.
     I have the feeling that maybe the INA uses some scratch in P.
     I'll create a programm that moves the INA into e.g. L
     (or ...) but not one of the ALPHA regs and do a
     CLA before the INA.

     But this next week. Some busy times ...

     Thanks for your remarks and help, to be continued

Raymund
```

Re: HP41 Virtual Memory - Terabytes?

*Message #8 Posted by **PeterP** on 16 Mar 2009, 10:16 p.m.,*
in response to message #7 by Raymund Heuvel

Raymond,

Thanks for the feedback. Seems that F17 did not help but based on your suspicion that the second INA does not receive all I feel more certain that one of two things are happening.

1. Either the 41 keeps on waiting for the string to finish but does not so in SST mode
2. Or the two INA's write consecutively into the Alpha reg. It then gets too full and hence the calc does not receive the full amount.

However, if a WALL with a loader-program is your desire, I'm not sure that this way is the easiest possible to achieve this (aside from the pure intellectual pleasure to have programs run in Alpha. In the heydays(?) of the 41, Valentin Albillo developped a whole series of articles which where based on obfuscating programs by running it in Alpha only. The program basically was a series of synthetic alpha strings with a STO b to start the whole program...)

What about the following pseudo HP-41 program to receive the data from the 71:

```
Lbl 'GetPGM'
'move curtain so that desired program location starts at STO 00
'place number of registers to read from 71 into L
CLA
CLST
LBL 01
  INA 'read in three registers worth to minimize HP-IL overhead
  CLX
  RCL M
  NNSTO IND Y (there are a number of non-normalized STO available
               they have slightly different syntax)
  ISG Y
  NOP
  CLX
  RCL N
  NNSTO IND Y (there are a number of non-normalized STO available
               they have slightly different syntax)
  ISG Y
  NOP
  CLX
  RCL O
  NNSTO IND Y (there are a number of non-normalized STO available
               they have slightly different syntax)
  ISG Y
  NOP
  CLX
DSE L
GTO 01
'move curtain to previous position and hence making the stored bytes available.
```

This is a basic principle that was used for various tricks IIRC.

One thought though: I'm not sure how INA works with non-display characters and if it can be always trusted. Also, I'm not sure if it does not add a '01' in front of each register M/N/O for each set of 6 strings. This would have to be tested. However, even if that fails, one could do a series of

```
INA (read in 14 characters representing 7 bytes in hex)
CODE (and one of the many available versions can work)
NNSTO IND Y
```

It would be twice as slow but would definitely work.

Still hope you can figure out what is going on with INA etc, its simply a very cool idea even though I think there might be better ways to achieve what you are aiming for.

HTH

Cheers

Peter

```
Hi Peter & all

Moving the INA part of the code to L and performing CLA before INA helps.

I learned that compiled 2 byte GTO's do not work in Status Regs.
Compiled 3 Byte GTO's do!

My first "Hello World" is there, keep you posted after cleaning up
the code and having time for proper documentation.

Latest Version of EMU41

*Message #1 Posted by **Gerry Schultz** on 13 Mar 2009, 7:18 p.m.*

To All:

I'm looking for the latest version of EMU41. I have resurrected my old Win98 PC with ISA slots and installed an HP82973A HP-IL to PC I/F card. I have an older version of EMU41.exe dated 10/18/97 which appears to run properly (I do have the 41CV and CX binary image files). I also have a copy of EMU41.exe dated 2/22/04 which appears to support HP-IL but it crashes when I run it on my work PC. I also have Christoph Klug's latest book, "HP-41 Input/Output Board" which I am using to help set up the HP-IL to PC I/F card.

When I search using Google, I find lots of links to EMU41 but the ones that work are to the 1997 version of EMU41. The links on the version 6.2 of the HP Museum disks to EMU41 are dead so if anyone knows where to look, I would appreciate it.

As I remember, The full version of EMU41 has been released to the public. If that is true, then that's the version I'm looking for as I want to take files from my HP82161A cassette drive and HP9114B floppy drive and store them on my PC. I also want to use the LIF utilities to try formatting some double-density floppies that the 9114 reported as having bad media on my PC's 3 1/2" drive.

Thank you for the help.

Gerry

The latest version (2.45) of EMU41 works with the HP-IL ISA card. However, I cannot get to JFG's site (http://www.jeffcalc.hp41.eu/). I can send it to you if you cannot find it elsewhere.

The latest LIFUTIL for DOS can be had here:

http://www.home.agilent.com/agilent/faqDetail.jspx?cc=FR&lc=fre&ckey=1000002597:epsg:faq&nid=-536902437.536881997.02&id=1000002597:epsg:faq

in response to message #3 by Egan Ford

Thank you all for all the responses.

Egan, yes, please email me version 2.45 of EMU41. You can send it to my work email address and if you could add my home email address g_schultz AT ca DOT rr DOT com I would appreciate it. Thank you for offering it. Also, thanks for the link to the LIF utilities. I'll follow up with that this weekend on my Win98 PC.

Gerry

in response to message #1 by Gerry Schultz

JF's site at http://www.jeffcalc.hp41.eu was back online when I checked just now

Re: Latest Version of EMU41

*Message #6 Posted by **Gerry Schultz** on 16 Mar 2009, 3:21 p.m.,*
in response to message #5 by Howard Owen

Egan, Howard, everyone, thanks for all the information. JF's website is indeed up and I have downloaded the latest versions of EMU. Please note that EMU41 2.47 beta is now available. I also got Warren Furlow's latest HP-41Archive DVD just this morning. I only ordered it Friday so thanks to Warren for the fast shipping.

Egan, I got your emails and links. Thank you for all your help. Yesterday, after I got all the "honey-dos" done, I put in the HP-IL card in my Win98 machine and cranked up the latest version of EMU41 (2004) and it didn't crash. I was able to get the internal HP-IL loop to work with FDRIVE1. I put a floppy in my PC drive formatted and storing a 41 program from my 9114b and the EMU41 successfully did a DIR. With the fully implemented EMU41 I can try my HP-IL devices on my PC and see if they work. Then I can start playing with the LIF utilities. I have some floppies to test.

Finally, I just won an auction for a HP-71 on that unmentionable website. It includes the HP-IL loop so I can use my external devices with it. I guess I'll have to get the full version of EMU71 to link it to my PC.

Oh, where does it end???

Gerry

Re: Latest Version of EMU41

EMU41 should be fine for supporting the HP-71. AFAIK the real HP-41 is unable to give up control of the loop but the emulator does so if no I/O is under way or while it is idle.

It doesn't. There are 32/80 column video adapters to be had, HP-IL to serial projects (e.g. see my X10 home automation hack: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=763, and how to set your 71B clock with a GPS: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=746), Plotters, etc...

*Message #12 Posted by **Khanh-Dang Nguyen Thu-Lam** on 18 Mar 2009, 5:57 a.m.,*
in response to message #11 by Egan Ford

I guess there will be nothing to do if the PILBox uses protocols such as RS232 or serial USB. Under Linux, things would work just fine if you open the right device file (say /dev/ttyS0 for a RS232 serial port or /dev/ttyUSB0 for a USB port), then write data to or read data from this file. Actually, for the USB "driver", there would be just one single program line to add to the Linux sources saying "Hi serial USB driver, would you mind to bind to any device which USB ID is the one of PILBox?".

What would be more interesting is to write a HPIL library so that users wouldn't have to remember the codes for PIL commands. Who really cares about the Ready Send Data

PIL frame being 0x560?

Anyhow, thank you for your offer, that's nice!

Re: Latest Version of EMU41

*Message #13 Posted by **Egan Ford** on 17 Mar 2009, 7:02 a.m.,*

Re: Latest Version of EMU41

*Message #14 Posted by **Gerry Schultz** on 17 Mar 2009, 1:53 p.m.,*
in response to message #13 by Egan Ford

Hi All. Just wanted to follow up with this thread. I put EMU41 version 2.45 on my Win98 machine last night and successfully loaded and ran a program from the 9114 on the external loop into the EMU41. So I now know that the HP-IL I/F card is functioning properly in my Win98 machine.

As I have been using EMU41, a couple of questions came up. First, is there any way to save the 41 machine state? I do some key assignments for HP-IL functions and when I quit to edit the EMU41.ini file, I have to re-do the assignments manually again. I need the "C" in 41C. In the ini file, I saw some bin files listed I didn't know what they are; like ccd_osx.bin and xiola.bin. What do these bin files represent? Is osx Apple's OS X? Is there any further documentation on EMU that goes into more detail about the bin files and the devices section of the ini file.

Thank you for your patience and help,

Gerry

CCD_OSX is another community created module. You have the docs on your HP-41 Archive DVD.

XIO, is the HP-IL Extended I/O module. Very nice to have. Documented in Klug's book as well as the MoHPC DVD.

> Quote:

*Message #17 Posted by **Howard Owen** on 17 Mar 2009, 2:10 p.m.,*
in response to message #13 by Egan Ford

Oh, man, I just saw that JF will release the source to ILPer. That means that a Linux/Mac USB driver *is* the priority, so we can port the virtual loop too.

NutML -> DOS/C -> Windows/VB -> (Linux|OSX)(C|Python|??)
Quite a journey that knowledge will have taken.

If the implementation language is C, it would facilitate the writing of an HPIL/IP router. :)

Regards,
Howard

P.S Thanks :)

Why not create something in Java. As long as the USB is recognized as a serial port, the Java Comm API should be able to handle it.

What you get: portability, GUI, object oriented design, ... The compiled code should run an any platform with javax.comm installed. Makes it interesting!

:-)

Java ought to be fine for the simulator. But I'm thinking about routing IP frames to IL and back - that's probably a little too close to the real machine for Java.

*Message #20 Posted by **Howard Owen** on 17 Mar 2009, 8:31 p.m.,*
in response to message #18 by Marcus von Cube, Germany

Having thought a little bit more about this, I can see that the implementation language of the loop is not so important. What is needed for an HPIL/IP router, or for any software using HP-IL is loop access to both the physical and the virtual loops. The driver interface should give access to the physical loop, but the virtual loop emulation could make this easier by providing loop architecture administration as well as emulation So Java, C, FORTRAN, whatever, the virtual loop implementation should define an interface to the emulated loop. Further, the emulation interface should allow selecting shared or standalone mode. That is, in shared mode, the loop emulation would put the frames it receives from external software onto the physical loop after running them through the emulated devices. In standalone mode, it would instead return the frames to the external software. There could also be an "invisible" mode where the emulation would simply transfer frames between the loop and external software, without performing any emulation beyond that. Switching modes on the fly would be cool, too, rewiring the virtual loop on an ad hoc basis.

What I'm obsessed with is the idea of using your 9114 drive from my HP41C, us being at arbitrary distance over the Internet. :) Also, and I think I mentioned this here several years ago, you could have a cluster of 41s working in parallel on a problem. What is the processing power of all our 41s put together? How far up the mips (never mind gips) scale could we go?

Regards,
Howard

Howard, check this out: http://pagesperso-orange.fr/kdntl/hp41/nonpareil-patch-doc.html.

It's a patch to nonpareil and it provides some very nice HP-IL capabilities, including a TCP interface. As soon as the PIL-Box releases and a driver created I image that this could also be linked in to act as your proxy. And it is in C.

Re: Latest Version of EMU41

*Message #22 Posted by **Howard Owen** on 17 Mar 2009, 11:59 p.m.,*
in response to message #21 by Egan Ford

That does indeed seem to be a big chunk of the solution. The patch must be GPL, since it doesn't change the license text in README. So now I wonder what license JF will use for his release. For the sake of arbitrary combination, derivation and downright happy hacking, it would be best if he used the GPL too.

Regards,
Howard

Re: Latest Version of EMU41

*Message #23 Posted by **Khanh-Dang Nguyen Thu-Lam** on 18 Mar 2009, 6:14 a.m.,*
in response to message #20 by Howard Owen

There is no need for a HPIL/IP router, just let your HP41 talk TCP/IP, directly :)

I am writing a ROM (written in MCODE) called NutIP which encodes/decodes TCP/IP frames. A web server is provided as a proof of concept. The work is nearly done, I just need to do a lot more testing and to implement the TCP retransmission part (not the hard part of NutIP, though).

I haven't released NutIP yet, but the documentation (kind of teaser) is available at: http://pagesperso-orange.fr/kdntl/hp41/nutip/.

BTW, I would like to see NutIP running on real hardware before releasing it. I still don't have a HP-41 + PIL ROM + (MLDL or Clonix or NoVRAM) + (the HP82164 HPIL/RS232 interface or PILBox or HPIL PC card). Is there anyone living near Paris who would like to do some tests and who is lucky enough to have all the hardware mentioned above?

Re: Latest Version of EMU41

*Message #24 Posted by **Howard Owen** on 19 Mar 2009, 6:08 p.m.,*
in response to message #23 by Khanh-Dang Nguyen Thu-Lam

Wow, SLIP! Why not PPP? Smaller I'll bet.

This is also way cool! Native TCP/IP would be great to have. Of course you'd need applications layered on top of the native IP. For example, wouldn't Something like SMB or NFS be required in order to share mass storage? Both the client and the server parts of the protocol would have to implement IP <-> HP/IL translation, and at multiple layers. You'd have to do that over for each service/application too. I can see this would be a great challenge for an ace mcode programmer. Fitting the application(s) into 8K or even 4K would be quite an acheivment. Of course, a more clever architecture than the simple-minded one I have in mind could make the whole thing more feasible

I'm more interested in doing a router because all those translations can be done in a high level language and with better resources. I would also like to accomodate/incorporate virtual HP-IL devices.

But the prospect of a native web server running on an HP-41C is just too tasty to pass up. I think both approaches have merit. :)

Regards,
Howard

The IP Loop

*Message #25 Posted by **Marcus von Cube, Germany** on 18 Mar 2009, 9:00 a.m.,*
in response to message #20 by Howard Owen

I've a possible scenario in mind which is independent of the implementation language. Not knowing very much detail about the HP loop, others might need to jump in if necessary.

Each device is an independent piece of software. These pieces may be implemented in any language and need not necessarily be independent processes, tasks will do, as long as they all talk the same language: UDP. This is the connectionless and thus simpler form of IP connectivity. Each device listens on a specific port and talks to its neighbor on the neighbor's port. For simplicity, lets assign port 50001 to device 1, 50002 to device 2, and so on. Configuration is per device: The port to listen to and the port to talk to. The IP address can be the broadcast address or a specific host. Devices can be spread across the network at will. Since the same UDP port can be listened to from several processes, even a kind of automatic loop arbitration and address assignment may be possible. (A device stopping service can brodcast a quit message that is honored by its left neighbor and causes its reconfiguration.)

How to connect the real HP-IL world to this? With the HP-IL card, you only need a small driver in your DOS PC under the table which talks to the card and translates the data to UDP for its neighbor in the virtual loop, or from UDP to HP-IL in the other direction. The USB-HP-IL bridge just needs the same functionality implemented for different hardware. An implementation may even be based on the Xport connected to some small micro controller. This can either act as an IP-HP-IL bridge or be a device by itself. Others may even consider a wireless implementation of the same idea.

Marcus

Re: The IP Loop

*Message #26 Posted by **Howard Owen** on 18 Mar 2009, 12:54 p.m.,*
in response to message #25 by Marcus von Cube, Germany

I think that a single device per software module ought to be possible, or multiple devices. Either way, the modules would take in HPIL frames and emit them. What happens to the frames in between should only concern the particular module. Other modules - or real IL devices - would learn about those internal events via loop messages.

It's very important to define a set of interfaces that everyone can code to.

There seem to be several of us interested in this idea. I'd also like to get JF involved in the conversation around the design of a distributed, IP based HPIL extension. I suggest we call it VL, for Virtual Loop. (It could be HP-VL, but HP might get annoyed.) I'm not able to put a great deal of time and/or effort into this, but for now, here's my first shot at a high level requirements list. These are completely ad-hoc and subject to revision. They also incorporate many ideas from many folks. I'm just aggregating them into a requirements list

- VL will be a generalized, software based extension of HP-IL accommodating both real and virtual HP-IL devices.
- VL will be an object oriented system, with virtual devices implementing VL standard messaging interfaces. Otherwise the internal state of such objects will be opaque.
- Communication transports should be completely transparent to virtual devices. (i.e. the network should be invisible)
- Virtual devices will communicate both in-band and out-of-band
    - In-band communication with loop messages should adhere to the HP-IL spec, modified by the requirements of real HP-IL devices.
    - Out-of-band mechanisms will allow extended communication between software modules for such things as loop reconfiguration.
- Source and target of in-band communication should be dynamically configurable via out-of-band mechanisms. (This will allow, for example, "captive" virtual loops under the control of a master virtual device. This could be one way to do extended loop addressing.)
- VL reconfiguration should be possible using in-band communication (via HP-IL frames) and out-of-band (so that one software module could replace another transparently.)

That's all I have time for at the moment. Comments?

Regards,
Howard

Re: The IP Loop

*Message #27 Posted by **Eric Smith** on 20 Mar 2009, 12:32 a.m.,*
in response to message #25 by Marcus von Cube, Germany

I was working on HP-IL support for Nonpareil back in October-November, though I haven't had time to finish it up, and since then Khanh-Dang Nguyen Thu Lam has published patches for Nonpareil to support HP-IL, along with emulation of some HP-IL peripherals. I have not had time to try his code.

My own plan was roughly what you describe, with datagrams over UDP (or Unix-domain sockets) to pass the frames between devices and a "loop manager" process. However, I didn't plan to assign port numbers to positions in the loop. I just planned that each device would send a "connect to loop" message to the single UDP port of the loop manager, and the loop manager would assign and track the device position within the loop and route the HP-IL messages appropriately.

The loop manager could provide some means for a user to order the devices within the loop, possibly by a GUI interface. The devices would have no knowledge of where they are within the loop (just as in a real loop).

My plan for supporting physical HP-IL was to allow for a "device" on the virtual loop to be a physical loop. In other words, there would be some process acting as a proxy, participating in the virtual loop by UDP, and in the physical loop. In principle there could be more than one physical loop particpating in a virtual loop, or even more than one virtual loop participating in a physical loop. There could be proxies for the 82973A card, JFG's PIL-Box, or other hardware.

I got as far as defining a basic datagram format for HP-IL messages and loop management messages, and writing code for two different HP-IL interfaces, one directly from the state machines defined in the HP-IL spec, and the other based on the 1LB3 chip spec. When I left off, these were feature-complete but only slightly tested.

80 column HP-IL interface

*Message #1 Posted by **Egan Ford** on 13 Mar 2009, 6:09 p.m.*

After a long wait I finally obtained an 80-column HP-IL interface for my 71B. For analog video I use a video capture USB dongle on my Mac Book Pro. It works great with the 32-column interface and the 80-column in 40-column mode, but in 80-column mode it looks terrible. However on a CRT TV it 80-columns looks readable. It's been over 20 years since I've seen 80-column video on a TV (Apple][e, IIRC). IIRC, it never really looked that crisp.

What are you all using for your 80-column output device? Have any had luck with video capture devices?

Thanks.

P.S. I forgot to add, that is looks a bit better in PAL mode with video capture.

Edited: 13 Mar 2009, 6:11 p.m.

Re: 80 column HP-IL interface

*Message #2 Posted by **Garth Wilson** on 13 Mar 2009, 6:49 p.m.,*
in response to message #1 by Egan Ford

> Quote:

> What are you all using for your 80-column output device? Have any had luck with video capture devices?

HP92198 (made by Mountain Computer) in 80-column mode, and a Zenith monochrome monitor with composite video input (not RF). It's plenty sharp for 80-column.

Edit: I should add that there's no reason you can't do 80 columns (or more) on a 41. In an automated test equipment set-up I did in the late 80's, the 41cx fed data to the monitor or printer with the ACA (accumulate alpha) and ACX (accumulate X) instructions to form 80-character lines. And with synthetic programming, you can have quoted strings with any characters including lower case, inverse video, and control characters, far more efficiently than using XTOA.

Edited: 13 Mar 2009, 7:07 p.m.

in response to message #2 by Monte Dalrymple

but more seriously,

does anyone have a better way to screen the digit sum.

i'm doing (y + m) == 0 mod 9, as a first approx, then summing the year and month digits for 9?

Re: Friday the 13th Challenge, "Make 13 on the 13th"

*Message #6 Posted by **Gerson W. Barbosa** on 14 Mar 2009, 10:38 p.m.,*
in response to message #1 by Egan Ford

A straightforward approach on the HP 50g:

```
FR13:
<< { } RCLF -42 CF UNROT SWAP
130000 + 132009 SWAP
  FOR i i 1000000 / 1 12
    FOR j 1 + DUP 0 TSTR 1 1
SUB "F" ==
      IF
      THEN DUP 1000000 * SOD
13 ==
        IF
        THEN DUP ROT + SWAP
        END
      END
    NEXT DROP
  NEXT REVLIST SWAP STOF
>>
SOD:
<< 0 SWAP 1 8
   START 10 / DUP FP 10 * ROT +
SWAP IP
  NEXT DROP
>>
```

2040 FR13 returns {5.132011 4.132012 12.132013 2.132032}

Hopefully no typo (no connectivity kit installed on this computer).

Regards,

Gerson.

Re: Friday the 13th Challenge, "Make 13 on the 13th"

*Message #7 Posted by **Gerson W. Barbosa** on 14 Mar 2009, 11:33 p.m.,*
in response to message #6 by Gerson W. Barbosa

It's better to replace *FOR j* with *START* in the program above since the local variable *j* is never used.

Alternative SOD (sum of digits) routine:

```
SOD2:
<< DUP LN pi sqrt * SWAP 10 MOD + IP >>
```

It works for the following random examples:

7221961, 12345678, 41179453, 79, 9612 ;-)

It would be great if such a formula existed...

Just a curiosity. These are all ocurrences of those Fridays the 13th in the period from 1583 to 9999:

{ 1.132006 10.132006 5.132011 4.132012 12.132013 2.132032 1.132051 10.132051 5.132101 2.132122 11.132122 1.132141 10.132141 1.132204 4.13221 12.132211 11.132212 4.1323 12.132301 2.13232 6.133 3.133012 1.133032 11.13304 2.133103 11.133103 1.133122 10.133122 1.133212 11.13322 1.133302 10.133302 4.134001 12.134002 3.13402 1.13404 2.134111 11.134111 1.13413 10.13413 2.134201 11.134201 10.13422 10.1344 3.135001 1.135111 10.135111 10.138 }

http://mathworld.wolfram.com/DigitSum.html

Clearly there is a pattern, but nothing to simply return a digit sum.

Thanks for the interesting and enjoyable challenge Egan, which I solved by writing my first proper 'program' for 25 years on my I41cx+ !

I am not sure it was the most elegant or efficient but it worked in the end , once I had worked out the differences in the effects of a XEQ and a GOTO jump.

Great fun.

Nigel

> Quote:
>
> Using your favorite calculator find a future Friday the 13th where the sum of the digits that make up the date equals 13. E.g. if the date were MM/DD/YYYY (or DD.MM.YYYY) then M+M+D+D+Y+Y+Y+Y = 13. E.g. today is 13.03.2009, 1 + 3 + 3 + 2 + 9 <> 13.
>
> Can you find the next one after that?

Thanks to all that participated and provided solutions.

As Monte quickly pointed out the first two are:

5-13-2011 and 4-13-2012

I created 3 solutions for the 12C. The 12C has two date functions:

1. DATE. Put a date in Y and a number in X and DATE will compute the future (or past) date and will also display the day-of-week, however the day-of-week is not stored, so it cannot be used in a program.
2. Delta Days. Put two dates on the stack and DDYS will return the difference in days.

My first program uses brute force to find the next and future Friday the 13ths with a digit sum of 13. To use, set the 12C in D.MY mode (cannot be programmed) and input any Friday date on the stack in D.MY format (e.g. 13.032009) and then press R/S. This program will test each Friday until another 13th is found, then a digit sum is used to check. After discovered you can press R/S again to get the next date.

NOTE: The DATE function includes a built-in PSE. Yup, its slow.

Time to first solution: 7 min 26 sec

Code:

```
01  f6          14  Rv          27  x=0
02  ENTER       15  STO 1       28  GTO 30
03  7           16  0           29  GTO 20
04  DATE        17  STO 0       30  RCL 0
05  ENTER       18  RCL 1       31  9
06  INTG        19  FRAC        32  -
07  1           20  1           33  x=0
08  3           21  0           34  GTO 37
09  -           22  x           35  RCL 1
10  x=0         23  INTG        36  GTO 02
11  GTO 14      24  STO+ 0      37  RCL 1
12  Rv          25  LSTx
13  GTO 02      26  FRAC
```

My 2nd program works like the first, but skips by month. To use, set the 12C in M.DY mode and input in any 2009 or later 13th (e.g. 3.132009) and press R/S. After discovered you can press R/S again to get the next date.

Clearly skipping by month instead of week *should* be ~4x faster. However, this code is a bit more complicated because there is no easy way to check that each 13th of each month is on a Friday. The constant 12.282008 is a Sunday and is used to calculate day-of-week.

Time to first solution: 2 min 5 sec

Code:

```
01  STO 1          22  -              43  x              64  0
02  f6             23  1              44  -              65  STO 0
03  1              24  EEX            45  5              66  x<>y
04  2              25  6              46  -              67  1
05  .              26  CHS            47  x=0            68  0
06  2              27  +              48  GTO 51         69  x
07  8              28  GTO 33         49  RCL 1          70  INTG
08  2              29  Rv             50  GTO 14         71  STO+ 0
09  0              30  Rv             51  RCL 1          72  LSTx
10  0              31  1              52  FRAC           73  FRAC
11  8              32  +              53  LSTx           74  x=0
12  STO 2          33  STO 1          54  INTG           75  GTO 77
13  Rv             34  RCL 2          55  EEX            76  GTO 67
14  ENTER          35  RCL 1          56  2              77  RCL 0
15  INTG           36  DELTA DAYS     57  /              78  9
16  1              37  ENTER          58  x<>y           79  -
17  1              38  ENTER          59  .              80  x=0
18  x<>y           39  7              60  1              81  GTO 84
19  x<=y           40  /              61  3              82  RCL 1
20  GTO 29         41  INTG           62  -              83  GTO 14
21  Rv             42  7              63  +              84  RCL 1
```

My final program takes a 4 digit year as the input and returns a "magic" number that represents all the months with Friday the 13ths. Unfortunately I ran out of steps (and time) and was unable to generalize this to produce exact solutions without a bit of aid.

Magic Number Table:

Magic Number	Months with Friday the 13ths
1	May
2	August
2	February, August (leap year)
3	February, March, November
3	March, November (leap year)
4	June
5	September, December
6	April, July
7	January, October
7	January, April, July (leap year)

E.g. 2011 will return 1, so 05-13-2011 is a Friday the 13th. Do the digit sum manually.

E.g. 2012 will return 6, so 04-13-2012 and 06-13-2012 are both Friday the 13ths. Again do the digit sum manually.

E.g. 2020 will return 3, but 2020 is a leap year, so only 03-13-2020 and 11-13-2020 are Friday the 13ths.

4046 is the largest year supported by the 12C.

Code:

```
01  STO 1          17  1              33  4              49  0
02  1              18  .              34  /              50  0
03  2              19  0              35  FRAC           51  /
04  .              20  1              36  x=0            52  FRAC
05  2              21  +              37  GTO 39         53  x=0
06  8              22  DELTA DAYS     38  GTO 56         54  GTO 56
07  2              23  ENTER          39  RCL 1          55  GTO 58
08  0              24  ENTER          40  4              56  1
09  0              25  7              41  0              57  STO- 2
10  8              26  /              42  0              58  ENTER
11  STO 0          27  INTG           43  /              59  5
12  RCL 1          28  7              44  FRAC           60  RCL 2
13  1              29  x              45  x=0            61  1
14  EEX            30  -              46  GTO 58         62  -
15  6              31  STO 2          47  RCL 1          63  -
```

```
16  /               32  RCL 1          48  1
```

HP9100A back to

*Message #1 Posted by **paolo** on 13 Mar 2009, 1:56 p.m.*

I just got an old HP9100A that was in a dump together with other rubbish by a research lab. It was not working due to two short-circuited rectifier diodes in the main power supply assembly (which off-course also blown the 1A fuse on the trasfo primary side), now I fixed it and it seem to work, or at least the display is working and it can execute calculations input from the keyboard. Its magnetic core memory still retains the last program loaded maybe 25 years ago... It is a very nice piece of hardware and I would like to study it a little more in detail. What I would like to test is the magnetic card reader, the D-shaped rubber wheel seem to be in very good condition, but I have no original card available. I read somewhere that it should be possible to reconstruct a working card starting from plastic sheet and videotape, I'm not pretty sure it could actually work but I' would try anyway if I knew the card specifications. Could someone in possesion of a original card give me the exact dimensions of it (including thickness) and the dimension/position of the magnetic bands ?

Thank you

Re: HP9100A back to

in response to message #1 by paolo

Hello Paolo,

I would not advise to test your reader with something else than an original magnetic card.

Alternatively, you have mail :-)

Best

Etienne

HP-3468 HP-IL and HP questions

*Message #1 Posted by **Michel Beaulieu** on 13 Mar 2009, 1:46 p.m.*

Hi, i just receive a HP-3468A multimeter and i have a surprise to discover that there is a HP-IL interface on the back. Can i connect my HP-41 or 75C on it and what will they talk about?

Also, where can i find a manual for this multimeter? I search on HP site but no trace of multimeter.

Does HP still manufacture multimeter and oscilloscope; i can't see anything else than computer on their site. Is there another site for "industrial" products that HP still produce?

Thanks

Michel

Re: HP-3468 HP-IL and HP questions

*Message #2 Posted by **PeterP** on 13 Mar 2009, 2:13 p.m.,*
in response to message #1 by Michel Beaulieu

yes, indeed you can and it is indeed a very fun thing to do. As usually with all IL related things, having the XIO helps.

Manuals can be found here (first couple hits) including the service manual etc.

There also is a Osci with HP-IL and frequency counter with HP-IL. I have both but have not used the HP-41 to interface with them yet. They are a bit more expensive as well, but you can get them. Manuals can be found here (for the osci, can't find the frequency counter right now)

Next to MCODE, I find the HP-IL world the most fascinating subject of the HP-41 toys. Especially as this is anno 1985...

Cheers

Peter

HP split, and now what used to be the instrumentation portion of the company is called Agilent. Virtually all

the instrumentation they have with HPIB (IEEE-488) can be interfaced to an HP-41 if you have the HP82169A HPIL-to-HPIB interface converter.

hp42s owner manual PDF pleeeease .....

*Message #1 Posted by **manudo** on 13 Mar 2009, 12:30 p.m.*

Hello everybody,

i just buy a hp42s. this calculator is really great but i bought it without manual. I use for the moment the "alternate manual for the HP42s", but i 'd like to read the original one.

Can someone send me the HP42s owner manual (pdf) , it will be great ! i know there is a DVD existing, but i only need one file !!

thanks

HP 48GX or HP 50G?

*Message #1 Posted by **Chris Foley** on 13 Mar 2009, 11:00 a.m.*

Hello,

I own an HP 48SX with a 128Kb memory card.

I've tried to download the Meta Kernel program, but it doesn't seem to be working. Does the MK need an HP 48GX to work properly? (although I didn't find anything saying that it wouldn't on an 48SX.)

Anyway, if I can't use the MK with my HP 48SX, I would like to know which is the best: buying an HP 48GX upgraded to MK or an HP 50G?

I'm also interested in ML programing, I think the HP 50G has everything installed in memory (MASD...).

Thanks for your answers.

Oh, I forgot to mention: I get this annoying message at start "Invalid card data". I'm supposed to use the 'PINIT' command but when I type it, nothing happens (it appears on the stack).

Chris.

Actualy no, even using the *several eons* option :-(.

Re: HP 48GX or HP 50G?

*Message #4 Posted by **Raymond Del Tondo** on 13 Mar 2009, 2:41 p.m.,*
in response to message #1 by Chris Foley

Hello,

my usual suggestion is to get an HP-48GX, and load the SpeedUI package into it.
That's a real and up-to-date alternative to the very outdated MK for the HP-48.
SpeedUI accelerates nearly every part of the UI,
adds new features to the UI, and is very modular.
And if you really want to develop SysRPL/ML on the machine,
you can use JAZZ as kinda plug-in for SpeedUI.

However, if you really want to use the quirky MASD syntax, get a 50g...

About the memory card error: IIRC the SX doesn't have the PINIT command,
but there's an easy way to initialize the card.
Just MERGE it, then free it again. But note that the FREE command takes a list parameter,
which holds the objects to be moved from Port 0 to the freed card.
Consult the User Manual for details.

HTH

Raymond

Outdated? I thought the MK was still used nowadays in the 50G? (Or is it a newer and much better version?)

Is *SpeedUI* compatble with the HP 48SX? I've never tried JAZZ; MASD has always been hepful when I begun ML.

Hopefully, you could use both (JAZZ or MASD).

in response to message #5 by Chris Foley

Hi,

to answer your questions in short:

IIRC the latest MK version for the HP-48 dates from about fourteen years ago.
It was in beta stage at best, and there's no support of any kind for that version.

The 'MK' fiddled into the 49g/50g is a much newer beast...

I had thought about an SX version of SpeedUI,
but there were very few responses so far,
and after all the G+/GX offers much more in every respect:
More RAM, more ROM, more features, more speed, much better display, etc...

Someone ported JAZZ to the 49g/50g.

HTH

in response to message #1 by Chris Foley

Get both, but if you have to pick one then I'll have to weigh in on the side of the 50g. I have a 48GX and it's a great machine and it has served me well from 1993 until 2006 (and its as perfect as the day I got it). In 2006 I opted to give the 50g a try and I was not disappointed for the following reasons:

1. Faster.
2. Larger, easy to read display (if you get a 48GX, get the black/white display).
3. SD Card for file I/O. No more RAM cards.
4. Serial, USB, and IR I/O.
5. Has emulators (as does 48GX)
6. Can be programmed in C.
7. Is easily replaceable.
8. Cheaper than 48GX (~$100US).

The 50g keyboard is not as good as the 48GX. Key placement and feel could be improved. I also expect my 50g to fail before my 48GX. I'll simply get another or replace it with then next thing (if any good). There is more software for the 48GX.

Doesn't most if not all USER RPL programming for the 48 work on the 50?

Re: HP 48GX or HP 50G?

*Message #9 Posted by **Egan Ford** on 13 Mar 2009, 6:06 p.m.,*
in response to message #8 by bill platt

Yes it does, but the 48GX still has more software if you count all the SysRPL and ASM code that does not work on the 50g. Code that I never run, so it was never an issue for me.

Re: HP 48GX or HP 50G?

*Message #10 Posted by **Mike Morrow** on 13 Mar 2009, 7:48 p.m.,*
in response to message #9 by Egan Ford

I was an original purchaser of an HP48SX in 1991, and of two HP48GX units in 1997. These were enough to convince me then that after more than 20 years as an HP calculator user, I wouldn't be buying any more. I found them rather disappointing. The LCDs must be the poorest quality (unless you find one of the very late black/white LCD units) that have ever been put on any graphing calculator. The display is rather easily damaged. The hardware is very slow. Accessories were (and are) very expensive for what you get. The color scheme of the body and the labeling is "left-coast artsy" crowd inspired, with very poor contrast.

Then, I bought a used HP49g+ for $20. I was amazed at the excellent LCD quality, speed, and CAS (MK) firmware. Sure, there were keyboard quality and a few cosmetic issues. But I liked it enough to buy a new HP50g when it came out. It is a far better performer, with outstanding built-in fuctions (including essential financial and enhanced MK functions) than the HP48GX could ever be. Very important too is the SD memory card support and the ability to easily upgrade the firmware (Try that with an HP48!). The only thing I like much better about the HP48GX is the display format of date and time.

I rank the HP50g and my HP42S as the finest calculators of their type ever made. I carry them both in my briefcase. All my many other HPs purchased in the last 32 years just satisfy my antique-collecting obsession.

Re: HP 48GX or HP 50G?

*Message #11 Posted by **Reth** on 14 Mar 2009, 12:35 a.m.,*
in response to message #10 by Mike Morrow

I have almost completely different views. First your taste about colours is for yourself, I for one like HP-48 ones more than the rest and I'm not colour blind. Secondly all accessories I ever bought were worth their money million times. I never bought HP-49 - it was non-HP calculator as I saw it, it looked and felt cheap. As a professional surveyor (and we press a lot of buttons) I find HP49 useless as well as HP49+ and HP50 - more of the same !@#$. The HP-42S is ok and can be made brilliant in the form of Thomas Okken's free42 with some enhancements as far as I'm concerned.
Regards,
Reth

*Message #12 Posted by **Chris Foley** on 14 Mar 2009, 6:36 a.m.,*
in response to message #11 by Reth

I new the answer wouldn't be just black or white.

My only concern is not being able to use programs written for the HP 48GX on a 50G (RPL, SysRPL and ML).

I've heard of some issues with the keyboard on older versions of the 50G, I hope it's not the case anymore.

@Egan: thanks, I was expecting such an answer about the 50G. This is why I'm still wondering which is best: quality and compatibility vs speed and capacity.

HP48 Series RAM Cards (potentially) available.

*Message #1 Posted by **Thomas Chrapkiewicz** on 13 Mar 2009, 9:37 a.m.*

Hello All:

I am considering producing HP48 RAM cards (128k or 512k).

Two questions:

1. Where can I obtain the engineering drawing of the mechanical specification of the original card (perhaps the original Epson spec?)? I do have a sample HP and other suppliers cards, but am interested in the original spec.

2. Please let me know (either here or via email) if you have any interest. Based on demand, I can determine a cost structure.

Thank you, TomC

7470A Plotter Purchasing Assistance Required

*Message #1 Posted by **Egan Ford** on 12 Mar 2009, 5:40 p.m.*

I think I need a 7470A Plotter. I've noticed that they come in 3 different flavors: Serial/RS-232, HP-IB, and HP-IL.

Questions:

1. HP-IL models are rare, very rare, I've never seen one for sale. Since I want to use with my 41 and 71, can I use a HP-IL to Serial Interface (82164A) or a HP-IL to HP-IB Interface? I own the former, so that would be better. Has any done the former? I'd also prefer the former so that I can test PC-based 7470A emulators. NOTE: I have scanned the archives and a post indicated that using the 82164A would not work, but I thought I'd ask just in case.
2. Replacement pens suggestions.
3. Any thing I should look for ask when getting a used plotter? Never owned or used (or seen) one.

Thanks.

I haven't tried it, but I can't think of any reason it wouldn't work, except that I have a 41cx with the XIO module integrated with the HPIL module, so I tend to forget which functions might not be there if you only had for example a 41cv with HPIL and no XIO or XFCN module. I have the plotter manual and the plotter language is pretty easy.

Do you really "need" it, or want it?

I had one 20 years ago, and basically got rid of it when/because computer graphics and color printers far surpassed its capabilities. So, if you need to do computer graphics, there are other better ways.

Of course, if you want to play with it for old time's sake, which I suspect it the case, then go for it. In fact, just two days ago, I pulled out of a drawer an RS-232 adapter that I made for it. I think it is basically a pin 2/3 swapper. If you want/need it, I'd be glad to send it to you.

I got mine from an electronic leasing firm (it may have been Leasametric). I have seen them for sale in the last year or two from such outfits, but the prices were outrageous. The advantage of buying from such a firm, though, is that it will come in working condition, they will almost certainly warrant it for some time period, and it probably will come with a manual, whereas on e**y you never quite know. I'd ask any e**y sellers to show you a plot they have made recently.

They definitely do not surpass a pen plotter in ease of programming though, and there will always be applications where the colors and typset-looking 2-point characters that a modern printer can do are of no value. There will always be that odd lab job for which there's no commercial software available but you could write your own HP-41 program for it in an hour, including graphing results on a pen plotter.

I "want" to create a 7470A emulator for Nonpareil, so I think I'll "need" one to do a proper job.

Re: 7470A Plotter Purchasing Assistance Required

*Message #6 Posted by **Juergen Keller** on 13 Mar 2009, 3:54 a.m.,*
in response to message #1 by Egan Ford

Buy one with an HP-IB interface, they are not so hard to find as those with HP-IL interface. Together with an HP-IL -> HP-IB interface they work fine. For the 41 you can use a plotter ROM, for the 71 you can directly send the appropriate plotter commands. Be warned: with the 41 plotting is sloooow; it's so slow that it's not too much fun. The 71 is faster, but I would suggest using a 75. Pens are not a problem; replacement pens are available at eBay or from Internet shops, Google will help you.
I did some drawings with the HP-85 and an 9872B, and my daughter (and of course me, too) was fascinated when she saw the pen moving around and drawing a nice rose curve. There are other calculators/pocket computers with plotters like the Sharp PC-1600 or the Casio PB-700. Not the good HP quality but nevertheless interesting and a lot of fun.
Best Regards from Switzerland,
Juergen

in response to message #1 by Egan Ford

Egan,

If you try a serial version of the 7470A with the 82164A interface, please let us know how it works. I have been looking for an HP-IL 7470A for awhile, but they are very difficult to find. I bet many of them have ended up in the trash when someone looks at the interface jacks and thinks "What is this? It can't interface to anything I know of." I found one about 10 years ago, but did not want to pay the price at the time.

Dan

That seems to refer only to printing bar code with it; but in the other thread referenced there, Emmanuel in Normandy, France says he has done it.

in response to message #1 by Egan Ford

BTW - if one has to go via HP-IB, any reason one should not go for the 7475 which has 6 pens? Can the 41 address all siz pens or only 2 pens? And the 71? They both seem to be equally hard to find...

Cheers

Peter

Re: 7470A Plotter Purchasing Assistance Required

*Message #12 Posted by **Garth Wilson** on 17 Mar 2009, 2:46 a.m.,*
in response to message #11 by PeterP

There's no reason you can't form the instructions to use more pens with the 41. Use the "SPx" ("select pen") instruction where "x" is the pen number. HPGL instructions are just text, with semicolons separating the instructions. If you can form and output text over the appropriate interface (HPIB, RS-232, etc.), you can feed the plotter. With a 41, you would form each instruction and send it with ACA. I have the manual in front of me. The plotter has quite a rich instruction set. Each instruction is two characters (like "PU" for "pen up") followed by one or more parameters when appropriate.

Besides the number of pens, another difference with the 7475 is that it can handle 11x17" paper, not just 8.5x11"

in response to message #12 by Garth Wilson

One more question - I just spoke with a vendor of used 7470a's and 7475a's and he said the the true problem is to calibrate the plotters. For which one needs a calibration sheet from HP which they sell for the bargain price of $700. I searched the forum but could not find anything about this here. Any one has any experience in this?

Cheers

Peter

Re: 7470A Plotter Purchasing Assistance Required

*Message #15 Posted by **Garth Wilson** on 18 Mar 2009, 5:06 p.m.,*
in response to message #14 by PeterP

We used a 7475 at my last place of work to plot PC boards (back when we had to plot them ourselves instead of just Emailing files to the PC board manufacturers), and we were always amazed at how extremely accurate the 7475 was. As I remember, it has stepper motors, not servos, and the pen is moved by a notched belt, and the roller that moves the paper has something like carbide particles on it, so it won't wear down. I would say calibration is a non-issue. It's not an analog X-Y plotter.

Edited: 18 Mar 2009, 5:07 p.m.

Re: 7470A Plotter Purchasing Assistance Required

*Message #16 Posted by **PeterP** on 18 Mar 2009, 5:20 p.m.,*
in response to message #15 by Garth Wilson

Thanks Garth, you are a well of information! I think I'll give it a shot. Prices for 7470a and 7475a are almost the same so might as well go for 6 pens :-)

One last question, I did not find a place online with the manuals for the 7475a, do you know of a place? Or can I use the 7470 for starters?

Cheers

Peter

I don't know where to get one. The graphics language (HPGL) would be the same, although there might be limitations on one unit, for example not being able to select pen 5 if it only has two, or going for an X-Y coordinate that does not exist on the smaller paper.

Re: 7470A Plotter Purchasing Assistance Required

*Message #18 Posted by **Dan Grelinger** on 18 Mar 2009, 5:29 p.m.,*
in response to message #14 by PeterP

I used an HP plotter way back in my undergraduate days in engineering school 25 years ago. The precision those instruments provided was amazing to me. I was not involved in their calibration, but I would assume that the cost of the calibration sheet or fixture was related to the precision and linearity requirements for the plotter output. The specs were likely very stringent, but would not be required for anything but the most demanding applications.

Besides some basic data plots of the tested physical properties of materials, I also used the plotter to make custom Christmas cards! They were very unique! Although I doubt I was testing the limits of precision or linearity with either of my applications.

By the way, does this vendor of used 7470A's have any Opt. 3's available?

Dan

Re: 7470A Plotter Purchasing Assistance Required

*Message #19 Posted by **PeterP** on 18 Mar 2009, 5:44 p.m.,*
in response to message #18 by Dan Grelinger

Dan,

Good to hear from you.

I have never found an opt3 anywhere so far... Would love to, but no luck so far.

So this means I have to go via HP-IB anywhere which is why I thought why not use 6pens instead of 2. They both are about $110 inkl of shipping but I'm hoping to find something cheaper. Problem is that shipping is normally very expensive...

Cheers

Peter

Re: 7470A Plotter Purchasing Assistance Required

*Message #20 Posted by **John Peterson** on 31 Mar 2009, 8:53 p.m.,*
in response to message #19 by PeterP

Just joined today and caught this message thread.

Years ago I attended a talk given by an HP engineer that said that the rollers actually imprinted the paper with small indentations that effectively registered the paper with the plotter so that alignment is maintained extremely accurately. Such that even they were impressed with their achievement.

Reading my HP-41 Plotter Module Manual, though it gives examples with the 7470, it states that it will work with any HPGL device. When you initialize the plotter module it will read the X-Y limits (in mm) from the plotter. And the plotter determines what pen it uses when you do a pen select, the 7470 uses the left pen for any odd value and the right pen for any even value, so it should work just fine with the 7475.

(I have a 7470A with HP-IB and drive it from my HP-41 using a HP-IL/HP-IB interface)

A friend of mine used this on a junky HP21 of mine while he was doing his Vic-20 and I am impressed with the results.

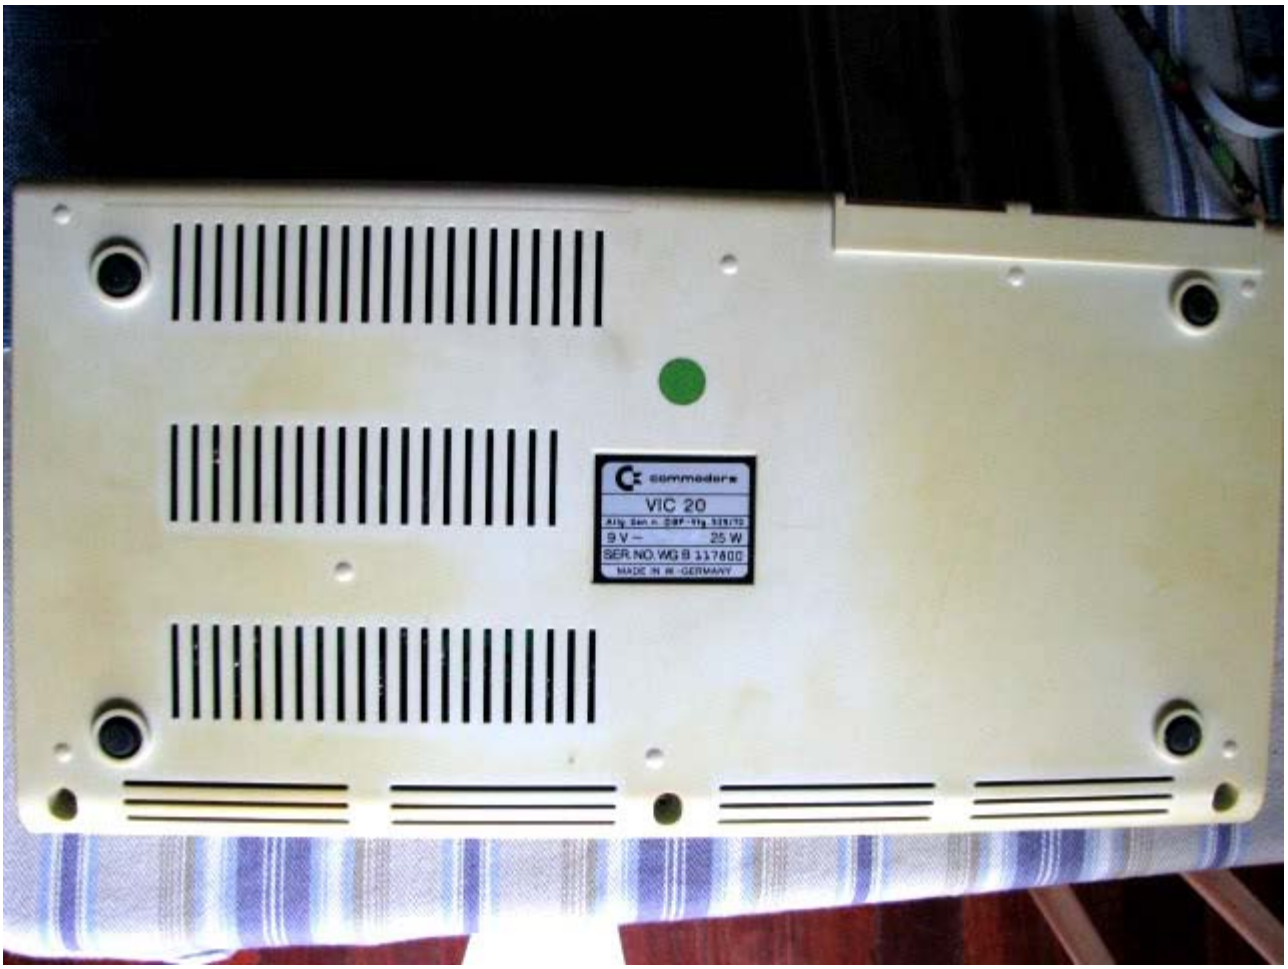
My HP21 was nowhere as discoloured as his Vic-20, but the difference is significant.

I have photos if anyone is interested.

Re: Restoration Help

*Message #3 Posted by **Steve (Australia)** on 25 Mar 2009, 11:20 p.m.,*
in response to message #2 by Steve (Australia)

Here are the images I have at present.



Tim's Vic-20 prior to Retr0brite. This had been stored by a previous owner inverted, on a desk in the sun with stuff piled on it. It looks dirty, but this is actually yellowing of the plastic.

I delivered the HP21 to Tim a couple of hours after he had started his Vic-20 case "cooking". His case is partially done here.

He tool a close-up of the HP21 to show the foam on it. We have a bloody great hole in our ozone layer here, so this probably works better/faster than for northern hemisphere people.

Tim only gave them 3 or 4 hours rather than the all day that is recommended. He used a 6% H2O2.

Here are 2 HP21s. They both looked pretty much the same colour previously. The one on the left is now almost completely un-yellow.

I might try a similar trick on the keys of this HP21. They're not that yellowed, but it would be valuable to know if the keys will be affected. This HP21 has a number of serious cosmetic problems already, so it won't be a huge loss for me if it goes pear shaped.

Re: Restoration Help

*Message #4 Posted by **Charles Oxford** on 25 Mar 2009, 11:38 p.m.,*
in response to message #3 by Steve (Australia)

What effect did it have on the feet?

Re: Restoration Help

*Message #5 Posted by **Steve (Australia)** on 26 Mar 2009, 10:44 a.m.,*
in response to message #4 by Charles Oxford

It wasn't put on the feet. The stuff is a gel or a foam and can be applied pretty much where you want to put it.

If this calculator were a good one I would have taken the other feet off, or masked them with something. (you may be able to see a masked label on the Vic-20)

Maybe I'll subject the feet (and other parts -- e.g. metal parts) to this stuff to see what happens.

HP-75 HP-IL software/hardware needed - Trade?

*Message #1 Posted by **Walt Devaney** on 12 Mar 2009, 12:25 p.m.*

It has been a long time since I last posted..... I am using an HP-41 plus a HP82164A HP-IL/RS232C Interface to send data from a HP3421A to a laptop. The application is whole house monitoring using current transformers to profile the electrical usage. I have an HP-75D with the HP 82718A expansion pod that I would like to use instead of the 41. I have the HP-75 talking to the laptop using the pod built-in acoustic modem and a terminal program in the laptop. It makes a nice simple system, one less box than the HP-41 (or an HP-71) approach. But to make it work I need either the I/O ROM for the 75 (unlikely?, I am willing to pay or trade) or copies of the I/O utilities SENDIO & ENTIO$ on magnetic cards. I have various items I would be willing to trade for the utilities on cards: an HP 82176A tape cartridge still in its original plastic, or a new tube of 30(?) magnetic cards for the 75, or a 35/45 charger are possibilites. I have gone through the archives and found some leads, but none that worked out. I am open to other suggestions - downloading the LIF(?) files might be possible with what I have, but I would prefer to avoid that if possible. I can be contacted by e-mail through the museum. Any help would be appreciated. I would be happy to answer questions.

Re: HP-75 HP-IL software/hardware needed - Trade?

*Message #2 Posted by **Egan Ford** on 12 Mar 2009, 12:47 p.m.,*
in response to message #1 by Walt Devaney

So you use a 41 to collect data from a 3421A, then you walk that over to a laptop connected to an 82164A, then you attach your 41 to transfer the data?

Why not just put the 82164A on the 3421A and connect your laptop directly to the 82164A and get the data without a middleman?

Re: HP-75 HP-IL software/hardware needed - Trade?

*Message #3 Posted by **Walt Devaney** on 12 Mar 2009, 1:01 p.m.,*
in response to message #2 by Egan Ford

I was unclear. The HP-41 is the HP-IL controller. It requests readings from the HP3421A, reformats them as lines of Excel compatible CSV (comma seperated values) data and sends the lines through the HP 82164A HP-IL/RS232C interface to the waiting laptop running Hyperterminal. The data is stored on the laptop as a .txt file. No data is stored on the HP-41. The .txt file on the laptop is inputted later into Excel for analysis. If the computer crashes, the data already in the .txt file is not lost. The HP-41 (or something equivalent) is necessary as a controller in the HP-IL loop. It is also necessary to reformat the data into something Excel can accept.

Re: HP-75 HP-IL software/hardware needed - Trade?

TDS 512k RAM CARD acting up

*Message #1 Posted by **Geoff Quickfall** on 12 Mar 2009, 8:14 a.m.*

I have resurected my HP 48GX. Haven't used it for a few years. Of course when selected on I got the 'Warning' about the invalid card.

I ran the PINIT command and then followed the TDS web site discussion on setting the alarm to charge the card. I then archived my programs. For the next few days all was well, until...

After leaving the calculator off for a few days (having charged the memory card) the Warning returned and of course the archive in port 2 disappeared. I did a few charge cycles to see if I could reset a bad NiCad memory cycle but to no avail. The card will not hold a charge and therefore the memory for more than a few days.

The card battery is obviously losing it's charge, and I suspect the internal rechargable battery is the cause, either due to a poor 'memory' or bad battery.

Has anyone open one of these up and replaced the NiCad cell? Or am I missing something?

Cheers, Geoff

HP SmartCalc 300s

*Message #1 Posted by **Frank Rottgardt** on 11 Mar 2009, 6:47 p.m.*

Have I missed something? Found a picture of a new HP calculator on HPs calculator pages with a remark "coming soon"

HP SmartCalc 300s

Maybe this calculator has already discused here?

Re: HP SmartCalc 300s

*Message #2 Posted by **Katie Wasserman** on 11 Mar 2009, 6:59 p.m.,*
in response to message #1 by Frank Rottgardt

Yes, it was discussed some here

Re: HP SmartCalc 300s

*Message #3 Posted by **Bruce Bergman** on 12 Mar 2009, 12:25 a.m.,*
in response to message #1 by Frank Rottgardt

Yeah, what Katie said. ;-)

If you want one right now, you can get it here:

http://www.officedepot.com/a/products/404490/Ativa-AT-30SX-Scientific-Calculator/

Just scratch off the old logo, get a Sharpie and write "HP".

So, even though the above was written with sarcasm in mind, I did have to pause for a moment and reflect that I really probably *would* pick up a SmartCalc 300s if it had an HP logo on it, even though I probably wouldn't even consider picking up the Office Depot version.

Weird how that works (at least in MY psyche) -- slap an HP logo on it and I'm inclined to buy it. ;-)

thanks, bruce

Well. Here's another OEM-mess HP got us into.

Re: HP SmartCalc 300s

*Message #5 Posted by **Bruce Bergman** on 13 Mar 2009, 1:52 a.m.,*
in response to message #3 by Bruce Bergman

So, interesting fact here...

I had to go to Office Depot tonight to pick up some toner for my printer, and decided to check out the calculators. They had the 12cp, the non-silver 17bii+ (hmmm...) and the very sharp looking new 10b. They also had a QuickCalc for $4.99, so I bought one in each color.

The also had the Aptiva 30x, so I decided to check it out. Upon pulling the first one from the rack, I noticed its LCD display had leaked into the viewing area. Bummer. I grabbed the next one, and it had the SAME problem. In the rack of eight of them, three had some sort of bleeding issue with the LCD fluid. Not a good sign. This may be something related to the 30x model, as they had other Aptiva's there and none of the ones I saw had LCD issues.

FWIW.

thanks, bruce

HP20b Log error

*Message #1 Posted by **Jeffrey Herrington** on 11 Mar 2009, 5:05 p.m.*

I have the same problem with my HP20b not getting the correct answers as reported in archive. Emailed HP and they have told me to press "On" "N" "Amort" to reset calculator. Done this but still does not give the correct answers. I will be sending my reply back tomorrow. They said in there email that there HP20b gives the correct answer.

I must say they have been very friendly and helpful via email an over the telephone.

Re: HP20b Log error

*Message #2 Posted by **Allen** on 11 Mar 2009, 6:51 p.m.,*
in response to message #1 by Jeffrey Herrington

Can you provide the input, output, and ROM version. To find the SW version, Press ON + PMT and press the DOWN arrow three times.

I have sw versions: 06/24/08 and 08/01/08. Both return the same values on a few nominal input cases {5,100}.

Re: HP20b Log error

*Message #3 Posted by **Michael Andersson** on 12 Mar 2009, 2:48 a.m.,*
in response to message #2 by Allen

I also have these problems with my HP20b as reported here before. The SW version of my unit is 06/24/08. Apart from the log-errors I've also found errors when calculating with the normal distribution.
/Michael

*Message #4 Posted by **Tim Wessman** on 12 Mar 2009, 11:13 a.m.,*
in response to message #3 by Michael Andersson

You mean inverse normal calculation? Or something else?

TW

Re: HP20b Log error

*Message #5 Posted by **Michael Andersson** on 12 Mar 2009, 12:39 p.m.,*
in response to message #4 by Tim Wessman

I mean the functions concerning the normal probability distribution, LTND and inverse.

An example: LTND(0.5)=0.69146... on the 20b which is also in agreement with the table in Abramowitz & Stegun: Handbook of mathematical functions

now taking the inverse on the 20b: LTND-1(0.69146...)=0.5 which is the correct and expected answer.

Next, LTND(1.5)=0.93319... still a correct answer,

but: LTND-1(0.93319...)=1.5484... Wrong answer!

Also LTND-1(LTND(2))=2.0269... Also wrong.

I think the LTND function gives corrects answers but not LTND-1 for larger arguments.

/Michael

Re: HP20b Log error

*Message #6 Posted by **Jeffrey Herrington** on 12 Mar 2009, 1:14 p.m.,*
in response to message #1 by Jeffrey Herrington

The SW Version = 06-24-2008

HP emailed me this morning and said they would replace the calculator if I send the proof of purchase,serial number and address it was sent too.

Many thanks for all your advise.I like the site and my calculator.

Re: HP20b Log error

*Message #7 Posted by **Jeffrey Herrington** on 18 Mar 2009, 1:57 p.m.,*
in response to message #6 by Jeffrey Herrington

I received the replacement HP20B today in the post. Send back the duff one without the batteries as requested.Postmarked for HP in France. I have noticed that the replacement HP20B they have fixed the Shift button so it does not show the shift arrow on the screen when the calculator is in off mode. Thank you HP for some good customer service.

Re: HP20b Log error

*Message #8 Posted by **Jeffrey Herrington** on 19 Mar 2009, 1:09 p.m.,*
in response to message #7 by Jeffrey Herrington

Just too let you know that the replacement calculator has the same bug as the replaced calculator. HP assured me that there HP20b gave the correct answer and they would replace mine. I thought that meant it would have the bug fixed. Looks like I thought wrong. The only way to overcome this bug is for me too upgrade too another calculator. Any idea's or suggestions welcome.

I use calculator all day long working out weeks between dates and calculating how much should have been paid over each week. I can do it on a computer but its one program too input the dates to get how many whole weeks and then another to calculate how much money should have been allocated to each week etc.

Re: HP20b Log error

*Message #9 Posted by **Gene Wright** on 19 Mar 2009, 2:26 p.m.,*
in response to message #8 by Jeffrey Herrington

Tell us exactly how this bug affects how you use the calculator?

The Log bug is fairly esoteric. If memory serves correctly, you have to computer e^16 and then the natural log of that rather large number to have it show up.

Can you not use the days between dates functionality in the 20b and then divide by 7 to get the weeks?

How does a log function figure into what you're trying to do?

That might help us suggest an alternative.

HP-67: The Red Dot Low Battery LED almost always lighting

*Message #1 Posted by **Albert Tocar Loseggs** on 11 Mar 2009, 3:57 p.m.*

After rebuilt the lateral PCB (totally new, between the card reader and the CPU main board), my HP-67 works fine. But a small malfunction happens. Even the battery pack (3 x Ni-Cd 1.2 V) is fully charged, after few minutes, the Red Dot Low Battery LED (RDLBL, right – bottom on the display) lighting. The only way to turn-off the RDLBL is moving the ON/OFF switch 1 mm left => normal function / right timing. I cleaned the ON / OFF switch in order to avoid undesirable electrical contacts, but no success. I don't know if a resistor / capacitor could be sick. Suggestions? Thanks.

Re: HP-67: The Red Dot Low Battery LED almost always lighting

*Message #2 Posted by **Michael de Estrada** on 11 Mar 2009, 4:31 p.m.,*
in response to message #1 by Albert Tocar Loseggs

It definitely sounds like a poor switch contact (high resistance) problem. First,clean both the switch contact as well as the gold contact points (traces) on the circuit board. Coat the contact and circuit board with silicone grease (dielectric compound). Finally, sometimes it helps to bend the contact out slightly to get more contact force on the circuit board.

Buena suerte,

Michael

Re: HP-67: The Red Dot Low Battery LED almost always lighting

Solving Exponential Equations

*Message #1 Posted by **Hal Bitton in Boise** on 11 Mar 2009, 2:38 p.m.*

Hi folks, Please consider the very simple exponential equation 3^x-9=0.
The obvious solution for x is 2, but there is an infinite series of complex solutions as well, as alluded to by the fact that when solving this equation symbolically on my 50G , I get as a solution:
(2*e^(ipi/2)*n1*pi + 2*ln3)/ln3. Indeed, this solution satisfies the original equation when any integer is substituted for n1. Quite an impressive feat of number crunching by the 50G, I must say.

When I solved this equation on my TI89 emulator, and noted that only the principle solution of 2 was returned, with no mention of the complex solutions. I was just wondering if there is a reason for this seemingly incomplete solution from the TI (perhaps the complex series is considered superfluous?), and is there a way to get it to deliver the complex solutions?

Any insights appreciated.
Best regards, Hal

Re: Solving Exponential Equations

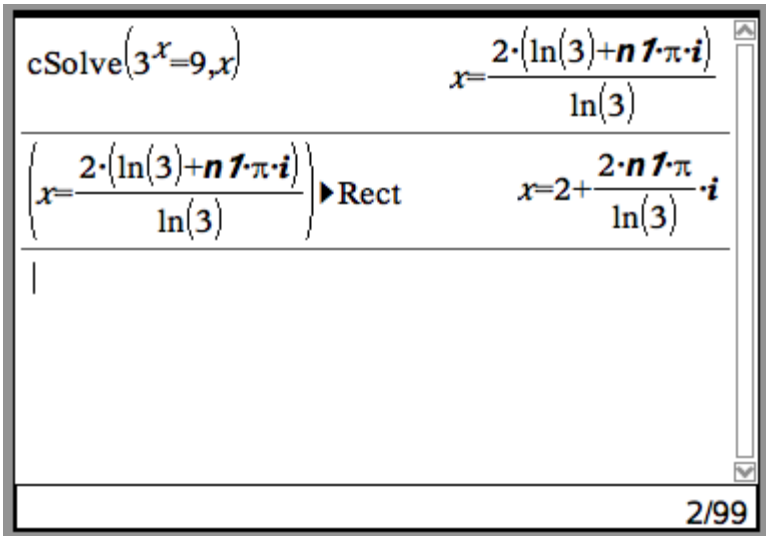
*Message #2 Posted by **MacDonald Phillips** on 11 Mar 2009, 4:11 p.m.,*
in response to message #1 by Hal Bitton in Boise

The TI-89 and TI-NSpire CAS use cSolve() to solve for complex (and real) roots.

Re: Solving Exponential Equations

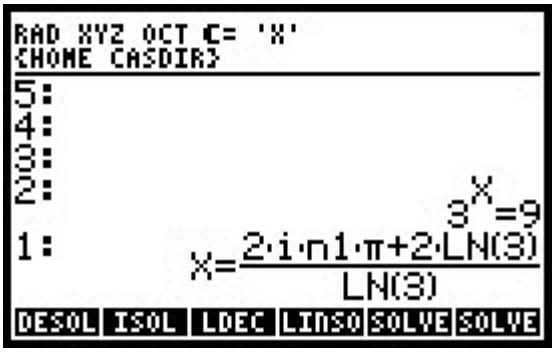
*Message #3 Posted by **Marcus von Cube, Germany** on 12 Mar 2009, 6:39 a.m.,*
in response to message #2 by MacDonald Phillips

Here is what the Nspire CAS Mac/PC Software returns:



The second line was created by just selecting >Rect from the menu, Ans has been replaced by the calculator in the history view.

BTW, the HP-50g returns essentially the same solution:



I used the SOLVEVX softkey (F5) after a DUP to have both expressions on the screen. I just couldn't find a simple way to split the solution.

I couldn't get it to work on my HP-40gs: SOLVEVX(3^X=9) returns an error: Non unary operator.

Re: Solving Exponential Equations

*Message #4 Posted by **Chuck** on 11 Mar 2009, 7:39 p.m.,*
in response to message #1 by Hal Bitton in Boise

What's odd is that the 50G doesn't make it a little simpler: x = (n 2 pi i)/ln(3) + 2 (for any integer n).

Edited: 11 Mar 2009, 7:40 p.m.

Re: Solving Exponential Equations

*Message #5 Posted by **Michael de Estrada** on 11 Mar 2009, 7:57 p.m.,*
in response to message #4 by Chuck

I think you're asking too much of it. It would take a pretty sophisticated simplification algorithm to figure out that:

e^(i pi/2) = i

Re: Solving Exponential Equations

*Message #6 Posted by **Steve Keeley** on 12 Mar 2009, 9:15 p.m.,*

If you delete the "X=" leaving

(2*LN(3)+2*i*n1*pi)/LN(3)

and then execute PARTFRAC, you will get

2+(2*i*n1*pi)/LN(3)

Re: Solving Exponential Equations

Hmm, this doesn't work on my HP-49G -- I'm still seeing

```
2*n1*pi     [    pi]
-------*EXP[i*---] + 2
 LN(3)      [    2 ]
```

[sarcasm]Maybe flag -279 isn't set set correctly...[/sarcasm]

Seriously, the question everyone ought to answer for themselves is... "Can I solve this on pen and paper?"

-- KS

Re: Solving Exponential Equations

*Message #8 Posted by **C.Ret** on 13 Mar 2009, 8:00 a.m.,*
in response to message #7 by Karl Schneider

May be du to the 'general solution' versus 'principal value' mode setting. On the HP-28C/S, this is drive by the flag 34:

```
34 SF '3^X=9' X ISOL  returns                          2.
```

which is the ‘principal value’ or obvious value.

```
34 CF '3^X=9' X ISOL  returns   (2.1972+2*pi*n1)/1.0986
```

which is the ‘general solution’ solution.

The ‘principal value domain’ is definite for each analytical function of your calculator and is give on any good user manual by a graph.
I am not sure that the ‘principal value domain’ definitions are exactly the same on any calculators, variations may exist between HP and TI, or between models from the same brand (due to technology evolution and mathematical choices).

As it can be seen there, the HP28S/C don't give a pure analytical solution with ISOL command such as HP49 or HP50. To get it the same form as HP-50g, a HP28C/S user have to follow the following method which is close to the 'by hand' resolution.

Principal(real) solution

To avoid resolution of an unknown *x* at power of a number *a*, one may use the logarithm to transform the equation from $a^x = b$ to $ln(a^x) = ln(b)$ assuming a^x is strictly positive (principal or obvious solution) and NOT complex (general solution).

Remember the logarithm property of transforming products into additions: $ln(a^x)$ is transformed into $x.ln(a)$.

Thus, the equation is now writen as:

$x.ln(a) = ln(b)$.

As far as *a* is not unity, $ln(a)$ is not zero, so we get:

$x = ln(b)/ln(a)$.

N.A.: '3^X=9' give principal solution 'X=2' since $ln\ 9 = 2.ln\ 3$.

We also have to verify that $3^2 > 0$ and 3=/=1, which is true, so 'X=2' is a valid 'principal' solution.

The general (complex) solution

As the principal one, the general solution is obtained by using logarithm, but considering X as a complex.

If *x* is complex, we know that it can be expressed as a function of its argument *t*and module (absolute value) *r*: $x = r.e^{i.t}$

The equation is now :

$a^{r.e^{i.t}} = b$ to

which may be transform into by using logarithm :

[italic]$ln(a^{r.e^{i.t}}) = ln(b)$

$r.e^{i.t}.\ ln(a) = ln(b)$

$r.e^{i.t} = ln(b)/ln(a)$

To found the general solution of $3^X=9$, we have to found all the possible value of (r,t) which satisfy the equation:

$r.e^{i.t} = 2$

Two complex are equal when their modules (absolute value) and arguments are both simultaneously equal.

Since $2 = 2+0.i = 2.e^{0i}$, we have to solve the system:

1. $r = 2$
2. $e^{i.t} = 1$

By definition, $e^{i.t}$ is $cos(t)+i.sin(t)$:

1. $r = 2$
2. $cos\ t + i.sin\ t = 1$

Equation 2 is true for any t = ... -6pi, -4pi, -2pi, 0, 2pi, 4pi, 6pi, ...

We can express that t have to be zero modulo 2pi or *t = 2.pi.n*

```
Thus x = [ ln(b) + 2pi.n.i ]/ln(a)
     x = [ 2.ln(3) + 2pi.n.i ]/ln(3)
     x = 2 +2pi.n.i/ln(3)
     x = (2, 5.7192n)
```

Conclusion, 'general solutions' are all complex number of module (absolute value) 2 and argument 0 modulo (2pi). This can be expresse as $3^x=9$ for any $x = 2 + 2pi*i*n/ln(3)$ where *n* is any integer.

The 'principal value' solution is found at $n = 0$ where $x = 2$

Re: Solving Exponential Equations

*Message #9 Posted by **Karl Schneider** on 14 Mar 2009, 3:00 a.m.,*
in response to message #8 by C.Ret

"C.Ret" --

Thank you for showing about flag 34 on the HP-28C/S, and its effect on ISOL.

Here is an old thread that suggests increasingly better performance of ISOL on the HP-28, HP-48, and HP-49 for a fairly straightforward problem:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=70012

Thanks also for writing your approach for obtaining the solution manually. The solution seems fairly obvious in retrospect, after it has been methodically derived by this or another method.

35s strangeness

*Message #1 Posted by **db (martinez, ca.)** on 11 Mar 2009, 1:02 a.m.*

I gave a 35s to my honey's daughter for her astrophysics class and she really likes it. So far she only uses it in algebraic but i'm not going to rush things. Anyway; she came home saying it was in some weird mode. It was. It was locked up in hex and when i tried to put it back into decimal it just gave me a "syntax error". It said that when i tried to put it into RPN too. I tried the paper clip method. No dice. It also wouldn't reset by shorting both the battery contacts. I finally got it back to newborn status, and able to change modes and logic systems, by reversing the batteries (so it just shorted the contacts - it won't reverse the power) while holding down the reset for 10 seconds. She didn't have any programs or data stored so this was acceptable.
Does this happen to anyone else or does the dam thing just miss me?

Re: 35s strangeness

*Message #2 Posted by **Jeff Kearns** on 11 Mar 2009, 4:59 a.m.,*
in response to message #1 by db (martinez, ca.)

I have not experienced that problem. But up until this past week, I was more or less satisfied with the unecessarily bulky but still portable 35s, despite its well-documented shortcomings (e.g. lack of straight-forward polar to rectangular conversion, useless checksums, shifted STO, and the list goes on...). What has ultimately changed my mind about the 35s is the 'missed keystroke' problem that others have experienced and from which I thought my unit was spared, being somehow of bettter quality!?! It misses the odd keystroke consistently for me when I enter multiple x,y data points for curve-fitting - and believe me I am not pressing buttons too quickly. It usually misses the first digit of one or more of the new data points when it exhibits this behaviour. That is unfortunate (especially when you get the wrong answer...). I now find myself not trusting the tactile feedback of the legendary oil-can HP buttons on this unit and have to look at the display after every number entered - just to be sure. My 30 year old HP 32E has a more reliable keyboard, as does each of my other older HP calcs (pre 1995).

Re: 35s strangeness

*Message #3 Posted by **Patrick Rendulic** on 11 Mar 2009, 11:24 a.m.,*
in response to message #2 by Jeff Kearns

Welcome to the club!

There must be a design problem with those key issues. I still believe that the problem is firmware/software based. The problem only appears during certain operations.

A shame for HP. Still remember the 35 when they noticed a bug in the firmware ... . That's company evolution ... .

Edited: 11 Mar 2009, 11:27 a.m.

Re: 35s strangeness

*Message #4 Posted by **Michael de Estrada** on 11 Mar 2009, 12:25 p.m.,*
in response to message #3 by Patrick Rendulic

The HP of today is totally different from the HP of Bill Hewlett and Dave Packard. The old HP was founded on the concept of honor and integrity, which is totally lacking in the current company. This is reflected both in the quality and design of their current products as well as the poor service and documentation. It is a true shame, and I think it is reflective of the current state of the world in which greed and avarice are pervasive in all industries. Were it not for forums like this one, I think the situation would be totally hopeless.

Don't worry. Everything is changing.

Re: 35s strangeness

*Message #6 Posted by **Jandro Kirkish** on 11 Mar 2009, 3:01 p.m.,*
in response to message #5 by bill platt

I certainly hope so. The 35s, for all its strangenesses and shortcomings, is exhibit A for me. The mere fact that HP *tried* to recreate the calculators of yore I find encouraging. Say what you will about it, it has a solid (dare I say well-built?) feel to it and is quite useful for me at work and at home. At the risk of sounding like an apologist for HP, I think their calculator division is conscious of the fact that they've "lost their way" over the past few years and are interested in reclaiming the HP signature of quality calculators for professionals. Now if only they will be kind enough to prove me right and bring back the 15C!

Re: 35s strangeness

*Message #7 Posted by **Michael de Estrada** on 11 Mar 2009, 4:17 p.m.,*
in response to message #6 by Jandro Kirkish

Well, the HP-15C (I still have mine) and other Voyagers were particularly important to HP in that they reversed a bad trend in declining quality of their small calculators. When HP first introduced the Classics (HP-35 et al), they represented the pinacle of quality, durability and good design. Although TI and others brought out less expensive competitors, HP maintained a loyal following due to the superiority of their products. Then, they started to lower their standards in a vain attempt to compete on price in order to increase their sales. Finally, they hit bottom with the Spices, which almost destroyed their calculator market. I became fed up with HP when both my HP-32E and HP-34C fell apart after only a year's worth of use, and might not have ever purchased another HP calculator had they not introduced the Voyagers. The Voyagers restored HP's reputation as the world's premium manufacturer of calculators, and they need to return to that mindset if they are to get on track again.

in response to message #4 by Michael de Estrada

Yes, I for one wish today's HP calculator was the same quality as those of 35 years ago. I'd love to be able to, say, buy a Woodstock with its wonderful AC charging system which was guaranteed to fry the expensive calculator if one did something as innocent as connect it with a missing or degraded battery pack. That was a hallmark of *real* quality.

I'd certainly be willing to pay today's inflation-adjusted equivalent of the cost of HP calculator of 35 years ago for this quality. The simplest HP calculator of 1975, the humble HP-21, was a mere $500, inflation adjusted to 2009. Yes, things were so much better 35 years ago.

But then, maybe yesterday wasn't all that great, and maybe a calculator with the characteristics of the HP-21 wouldn't sell well at $500 today. Maybe even an HP50g built with all the quality of the original HP-35 Classic series wouldn't sell well at $500 today.

Be careful what you wish for. I've been a follower and frequent purchaser of calculators since the HP-35 came out in 1972 (except I couldn't afford an HP calc until 1976). The capabilities and negligible cost of today's HP50g are extraordinary and were unimaginable 35 years ago.

I know yesterday...I'll take today and be very thankful for it.

I think your implication that the cost today of good quality would be the same as it was 35 years ago is faulty, because improvements in manufacturing methods have drastically reduced costs for all electronic devices. My first TV had expensive vacuum tubes and a lot of circuit board components that required manual assembly. Modern TV's cost much less, however, there is still significant variations in quality between premium brands and no-name discount brands. It would not cost HP that much to upgrade the quality of its current calculators to the same level as, say, the Voyagers. And, even if they had to increase pricing, we're talking maybe increasing the price of an HP-35S from $60 to $80, which would not be a deal-breaker. But making a "premium" calculator with a faulty keyboard is simply not an option if HP wants to distinguish itself from the el-cheapo competition. Also, I was not just talking about physical quality, but also quality of design, documentation and service.

It's clear that HP **can** make a quality calculator today - the HP-50g. People might complain that it's too big, or that the ENTER key is too small, or that they don't like RPL, but the build quality in my opinion is superb. I've used mine for a long time now: the keys continue to work perfectly and everything still feels really solid. I think it deserves a place amongst the classics - I can't understand people who go weak at the knees when talking about the HP-48SX but dismiss the HP-50g out of hand!

Re: 35s strangeness

*Message #16 Posted by **Michael de Estrada** on 12 Mar 2009, 9:39 a.m.,*
in response to message #15 by Nigel J Dowrick

I agree with you that the build quality of the HP-50g seems to be very good, so we'll just see how well it holds up after 30 years of heavy and hard use. My HP-48SX is nearly 30 years old, and still works perfectly. I find the keys on the HP-50g to be heavy and clunky in comparison with the HP-48SX, although the display is much clearer. My main complaint with the HP-50g is not with the hardware, but instead with the incompleteness of the documentation that was provided with it. Were it not for the help I've received from the good folks on this forum, I would probably still be floundering around trying to figure out how to use the I/O capabilities.

My comments above are in reply to the initial string dealing with the HP-35S, and its quality problems. I also own an HP-35S, and it does not appear to be as sturdy as the HP-50g, although I have not to date had any problems with it. Of course, the HP-50g costs three times as much as the HP-35S and is the HP calculator flagship, so perhaps these differences are deliberate.

FWIW - I have never gotten weak-kneed over a calculator; only once when I proposed to my wife.

Greetings from across the pond, Michael

*Message #19 Posted by **Nigel J Dowrick** on 13 Mar 2009, 7:58 a.m.,*
in response to message #16 by Michael de Estrada

I agree with what you say. I certainly didn't want to criticize the HP-48SX; I bought

one in about 1992 and used it heavily for a long time. (The keyboard is still fine, but one line of pixels has gone.) The lack of documentation is definitely a real weakness with the HP-50g: why do HP produce such a calculator and provide no option for obtaining the documentation in printed form? It's not even as though this would involve them in much work; they could simply use one of the many print-on-demand services if they didn't want to print it themselves. The people who make such decisions probably do not really understand the true capabilities of the HP-50g; maybe that's why no fully adequate documentation has been prepared for it.

Of course, this trend away from printed manuals isn't confined either to HP or to calculators! Here in Europe consumer goods often come with inadequate printed instructions in a dozen languages. At least for calculators we can get support from groups like this!

Re: 35s strangeness

*Message #20 Posted by **Michael de Estrada** on 13 Mar 2009, 10:17 a.m.,*
in response to message #19 by Nigel J Dowrick

The documentation issue with the HP-50g is worse than simply not having printed manuals. Even the electronic documentation is incomplete or missing. The manual for the HP-48SX had a complete and very thorough section (Part 5) that dealt with the topics of printing, data transfer, and plug-ins. It even covered the use of the optional RS232 serial interface kit. In stark contrast, neither the HP-50g printed User's Manual or "more complete" electronic (CD) User's Guide cover these topics. One has to go to the HP site and look at the HP-49g+ Advanced User's Reference to find any detailed information, and it is not organized in a very friendly manner for novices. There is no one section that discusses the organization of all the menus on the HP-50g, which is more important than on the HP-48SX, because many items such as printing have been moved from dedicated keyboard entries to submenus. I needed assistance from a member on this forum to find printing under APPS > I/O Functions > Print. Also, the HP-48SX came with a Quick Reference Guide, which fit inside a front pocket in the soft case, so you didn't have to lug around the two volumes of the Owner's Manual.

Perhaps the eventual solution is to add a "help" capability to the next generation of this calculator, which is becoming more computer than simple programmable calculator. Such an advanced feature should be possible due to the increased processor power and larger ROM/RAM memory size that is now available. Oh, and while I'm asking for pie-in-the-sky, how about a color display to boot.

- Michael

> Please elaborate. Which model had this problem?

My HP-27 has the twist problem. I can't really say how prevalent the problem was. I only have two other Woodstocks in my collection, an HP-22 and an HP-25, but both are inoperative due to the charger problem.

I think that there were also some curious problems with the early Spice units. Viktor Toth's site says "...Initially, the calculator's components were held together by pressure; electronic components were not soldered onto the machines flexible circuit boards. This led to numerous reliability complaints so eventually H-P returned to a more traditional design. ..." I have five Spice units in my collection. One has been damaged by the charger problem. Two have had the battery contacts destroyed by battery leakage. Two turn on but don't operate properly.

Even so, these kind of problems pale to insignificance when compared to the charger problem. It isn't as if HP didn't know how to do it properly. Page 31 of Wlodek's book notes "... Only the early models with a 3-pin charger and without a built-in card reader

can be used from an AC adapter without a battery pack. ..."`

in response to message #25 by Palmer O. Hanson, Jr.

Well, certainly the Spice models were a low water mark for HP in design quality. I had 2 of them, an HP-32E and HP-34C, and they both fell apart within a year. It was a time when HP made the near fatal attempt of trying to compete with TI and others on price, and drastically reduced the durability of their calculators. It almost cost them their market, which is why when they brought out the Voyagers, they increased their quality and allowed the prices to increase accordingly. I think most will agree that the Spices were the worst pieces of crappy junk than HP ever made, while the Voyagers are among the best. That's why today you see Voyagers in perfect working condition commanding regal prices at auction, while most of the Spices are being sold non-functional for parts or nostalgia. I bought my HP-15C in 1982, and used it heavily at work for 25 years without incident and only once replacing the batteries. So HP is capable of producing very high quality and durable products when they want to.

As to the Woodstock issue, I still have my HP-21, which still works fine today on a rebuilt battery pack with alkaline AA cells. Since I never removed the battery pack when using the charger as instructed on page 54 of the owner's handbook, I never damaged it. I'm sure that the reason HP went to the different charger design in the Woodstocks from the Classics was to reduce costs, since it was much simpler to have a single ac/ac transformer circuit, than the dual circuit rectifying ac/dc design. I currently also own an HP-25C, which works perfectly except for one hard key. Of course, none of this is pertinent today, since the days of NiCad batteries and chargers are long gone with the universal use of LCDs.

The HP-34C was partially redesigned in early 1982 to remedy the unsuccessful solderless construction and the stiff keyboard. (However, the flimsy battery contacts remained.) I have examples of each version.

Unique to the HP-34C at the time was built-in microcoded SOLVE and INTEG, so it still had a functional niche -- despite its LED display and limited-capacity rechargable batteries. It was commendable of HP to develop and release a reliable version of the HP-34C, because the HP-15C was to be released later that

year. That model provided the same SOLVE and INTEG, plus much more, eclipsing both the HP-34C and HP-11C.

I suspect that the high inflation of the late 1970's might also have been a factor. "Cutting costs by cutting corners" was prevalent in many areas of manufacturing and service.

Also, the initial US$150 list price of the HP-34C was higher than the initial US$135 of the HP-11C and HP-15C -- an even greater difference when that dreaded inflation is taken into account.

Eh, I'll have to disagree on one point, though I might just have been simply fortunate.

I bought the original solderless 34C as a college kid, used it through until way after graduate school, and the poor thing was dropped, opened (the case, that is; I'm not so brave now, though), and banged around... ... and it still worked for many, many years until it just wore out from use. I thought it was one of the hardiest (and fully featured) calculators ever. My TI (SR-40) from those days didn't last even a fraction of that time.

(Fortunately, the replacement for this beloved unit is a 32SII, which is still going well... maybe needs new batteries, but if that's all, I have no complaints!)

Re: 35s strangeness

*Message #29 Posted by **Michael de Estrada** on 16 Mar 2009, 12:23 a.m.,*
in response to message #28 by Ed Look

I think you were very lucky and the exception to the rule. I did not abuse mine, yet within a year several of the keys began repeating badly, the ON/OFF slider switch got funky, the LED assembly connections got loose (nothing is soldered inside the thing, just press fit) and I had to bitch slap it periodically to get all the LED segments to light up, and one of the battery contact rivets got loose so it was constantly flickering and showing the low battery charge dot. On my HP-32E, the circuit board traces for the charger connector corroded and separated, so I could no longer charge the battery inside it. In short, a very bad and cheap design that could not be repaired.

Anyway, I bought the HP-15C, which had all the capabilities of the HP-32E and HP-34C without all the crappy reliability and durability issues. I also have an HP-32SII, and agree that its a great little calculator. I particularly like its fractional arithmetic mode.

Spice quality (and several anecdotes)

*Message #30 Posted by **Karl Schneider** on 16 Mar 2009, 1:55 a.m.,*
in response to message #29 by Michael de Estrada

Michael --

> Quote:
>
> ...and I had to *bitch slap* it periodically to get all the LED segments to light up,

In the auction description, the seller of the first (old design) HP-34C I bought on eBay used the phrase "smack the sice out of it" to get the display to work properly. That might have been a bit better...

That calc didn't work very well, then I ruined the faceplate trying to restore its sheen and vibrancy of color. I suppose that it could be a parts donor. However, I got an excellent manual and working charger (which I wouldn't recommend using).

I bought my first old-design HP-34C from a local electronics reseller.

Later, from another eBay auction, I got a redesigned HP-34C with case and manual. It works great, but has broken battery contacts. The seller thought it was missing the battery cover, but it was present and intact in the case. On that one, I asked questions to ascertain whether it was a redesigned unit. The seller answered, then trumpeted the verdict in the auction. A knowledgeable bidder tried to snipe me with a series of incrementally-escalating last-second bids, but I foiled him with a last-minute rather high bid that wasn't even reached. (Heh, heh...) It goes to show that, if you really want something, the best strategy is simply to decide what you're willing to pay, bid that amount in the last partial minute of the auction, and hope for the best.

> Quote:
>
> ...the ON/OFF slider switch got funky...

It just needed some lubrication. Unfortunately, this entails removal of the back cover, which can cause breakage if that is done wrongly. Other models prior to the Spices had mechanical slide switches for ON/OFF and PRGM/RUN. H-P was wise to replace them with keystroke electronic switches.

> Quote:
>
> Anyway, I bought the HP-15C, which had all the capabilities

of the HP-32E and HP-34C without all the crappy reliability and durability issues.

Back in November 1983, I bought an HP-15C. I had intended to buy an HP-34C that I'd wanted for several years, but the knowledgeable sales clerk steered me to the new and improved offering. I still prefer the looks of the HP-34C, and I would have gotten a redesigned unit. However, the HP-15C was a far better product (despite its "dressy" appearance), as I grudgingly had to admit.

Re: 35s strangeness

*Message #31 Posted by **Ed Look** on 16 Mar 2009, 12:08 p.m.,*
in response to message #29 by Michael de Estrada

You know, it *could* be that I got a soldered unit in return for the one I sent in for service... for one or two bad keys (I forget which, it's been a looooong time).

I noticed that the S/N and the faceplate were different on the one I received back after sending it in to HP (in Corvallis). Anyhow, if the one in my possession is actually a soldered unit, that would explain things.

But as to the ON/OFF switch, one temporary fix (oh, about several months to almost a year) was to open the cover (tough job which I no longer have the stomach for) and take a CLEAN pencil eraser and rub the contact strip of the switch. I found that it was either or both of oxidation or dirt buildup that kept the switch from working well.

But you know, considering it was designed in the '70s, released in the late '70s or early '80s, I think it was a fairly nice piece of functional technology for its size. I mean, you could have more reliable switches and keys or more memory, but I wonder how big it would have been, not even thinking about cost!

Re: 35s strangeness

*Message #32 Posted by **Michael de Estrada** on 16 Mar 2009, 9:48 p.m.,*
in response to message #31 by Ed Look

The keyboard problem was only one of the issues with the Spices. HP fixed that late in the production run, but there was still the issue with the other loose parts like the LED connection or even the IC's were press-fit against the PCB traces, and could cause malfunctions (and yes, I know this because I have completely dis-assembled several Spices). The battery/AC adapter contact design was terrible and guaranteed early failure of the unit. The battery contacts would break due to stress fatigue and the AC adapter traces would corrode (much the way edge connectors go bad on the old PC bus cards) and separate

from the board, so you could no longer recharge the battery. The Spices were HP's version of the infamous Chevy Vega, which had about a 30K mile engine life. By the time GM fixed the problem, the damage to their image was done, and even renaming the car to the Monza could not restore its sales. Fortunately, unlike GM that is now on the brink of bankruptcy, HP came out with the Voyagers, which have proven to be among the highest quality and most durable calculators they have ever made.

Re: 35s strangeness

*Message #33 Posted by **dbatiz** on 12 Mar 2009, 10:13 a.m.,*
in response to message #1 by db (martinez, ca.)

IMHO it is a matter of leadership. The genius of the 35 was the vision that a desktop machine could actually fit in a shirt pocket. The willingness to take a significant gamble by going against the recommendations of the marketing folks and commitment of company resources by leadership made the project possible.

I dare say the last such example of innovation through leadership was Steve Jobs at Apple and the Ipod. In essence, it's just an MP3 player. But Mr. Jobs pushed his engineers to new limits on the interface. I cannot find the article now, but I hear he repeatedly kicked the product back with a note saying, "Too many buttons."

I think the ingredients for a revolutionary new calculator include a leader with a vision and high standards who's willing to take a risk. With the advances in processing power, batteries and displays, the sky is literally the limit. When/if the ingredients line up, there will be a new and amazing thing to play with,

Very respectfully, David

HP-41 I/O Circuit Strip

*Message #1 Posted by **Bob Pedigo** on 9 Mar 2009, 11:21 p.m.*

I am looking for a new i/o circuit strip (HP part number 80020) for a HP 41CX calculator. This is the flexible strip in the battery compartment that connects to the main circuit board and to the four i/o ports on the top end of the 41. I would also consider a used, non-working HP-41 for parts as long as the battery terminals are clean and show no signs of having corrosion. My old 41 had the batteries leak into the battery compartment and one of the flexible circuit runs was damaged by the corrosion. I was able to repair this by soldering a small jumper over the defective area, after a good cleaning with isopropyl alcohol. My calculator works now, but I'd like to restore it to like new condition if I can. I e-mailed a fellow in the Canary Islands who had a procedure posted with pictures on how to replace this flexible I/O strip, but I haven't yet heard back from him. Is there a source for old non-working calculators to be used for parts, or a source for this I/O strip that I need?

Re: HP-41 I/O Circuit Strip

*Message #2 Posted by **Randy** on 10 Mar 2009, 8:32 a.m.,*
in response to message #1 by Bob Pedigo

The only source for an original part is from another 41.

> Quote:
>
> Is there a source for old non-working calculators to be used for parts,

That would be eBay, the Wild West of eSales.

Diego's replacement circuit is the only after-market solution. He'll get back to you at some point, I believe he is semi or full time retired?

Motorola NiMH Batteries

*Message #1 Posted by **Juan J** on 9 Mar 2009, 5:42 p.m.*

Hello,

I got a Motorola NiMH battery for a Talkabout radio. It is 3.6 V, 1400 mAh and very close in size to the Classics power pack.

I checked its size on my HP-65. Acouple pads in the sides (like tha batteries Mike Hoskins sells) and it fits in the battery compartment. But...

There is no indication on Classic calculators battery pack polarity, and I am afraid of any damage due to wrong installation.

Now the questions.

Is it safe to use this battery on a Classic calculator? Which terminal is positive and which is negative on the calculator?

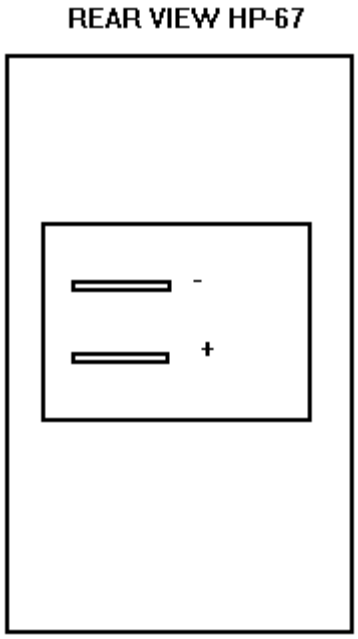
Thanks in advance.

Re: Motorola NiMH Batteries

*Message #2 Posted by **Randy** on 9 Mar 2009, 7:10 p.m.,*
in response to message #1 by Juan J

You can use the battery but I would not recommend charging it with the original HP charger - they are not suitable for NiMH cells as it is not voltage limited.

Terminal polarity of all classics is the same, here is a poor example but it is all I could find, the (-) is towards the top of the unit, the (+) terminal is toward the label.



Re: Motorola NiMH Batteries

*Message #3 Posted by **Michael de Estrada** on 9 Mar 2009, 7:13 p.m.,*
in response to message #1 by Juan J

Top terminal is negative (-) and bottom is positive (+). It is safe to use any battery, provided the voltage is correct, which in your case it is. However, the HP charger was not designed for NiMH batteries, so I can't say if charging might not damage it.

Re: Motorola NiMH Batteries

*Message #4 Posted by **Juan J** on 10 Mar 2009, 10:55 a.m.,*
in response to message #3 by Michael de Estrada

Hello,

Thank you so much.

Fortunately I have the HP Reserve Power Pack Charger, and I do not charge batteries within the calulator. Using it helps a lot, no worries about fried ICs.

I did try to use the charger with the Motorola battery but since it is smaller than HP packs (without pads) it simply does not fit.

Chargers for NiMH batteries are easy to get. That is the next step. Then I will put a couple pads on the battery to test it. I will post my progress on this.

Re: Motorola NiMH Batteries

*Message #5 Posted by **Randy** on 11 Mar 2009, 9:54 a.m.,*
in response to message #4 by Juan J

> Quote:
>
> Fortunately I have the HP Reserve Power Pack Charger, and I do not charge batteries

within the calulator. Using it helps a lot, no worries about fried ICs.

The "Reserve Power Charger" is a totally passive device, all the electronics are within the wall plug in so there is no difference if the batteries are in the calculator or reserve pack, it is not advisable to charge NiMH cells with either method. A proper, external NiMH specific charger is the only solution.

It is 100% safe to operate classics without card readers from the charger with no battery in place. Stated in the reverse, the 65 and 67 must have a battery in place to operate safely with the charger connected.

Hope that helps.

Re: Motorola NiMH Batteries

*Message #6 Posted by **Juan J** on 11 Mar 2009, 7:18 p.m.,*
in response to message #5 by Randy

Hello,

Thank you for the safety tip.

Since reading a similar warning on the HP-65/67 Owner's Manuals, I never charge batteries with the calculator.

I just got a Motorola charger for the NiMH batteries. I will add some padding and test them when I get back home in a few days.

HP-49g+ and SD Cards

*Message #1 Posted by **Ed Look** on 8 Mar 2009, 6:20 p.m.*

I didn't want to hijack the existing thread on the use of SD and SDHC cards with a 50g, seeing as how they are fairly different. But this observation seems relevant to some of the things said there:

I had, at separate times starting several years back, a 128 MB and a 64 MB SD card in my 49g+ and in both cases, the calculator took so long to turn on, times reaching up to a minute, I began to suspect there was something wrong with it, or that the last ROM update killed it. And when it finally turned on, use of the card was not easy at all, as it took a long time to navigate as well.

Then I recently bought a new camera and it came with a 32 MB card. I switched that into the 49g+ and it powers on instantly! Searching the SD card in the calculator was also now actually fast enough to be of use. I wish I had been able to procure a smaller capacity SD card much earlier.

I suspect however, that 32, or 16 or even 8 MB for that matter, is really all a HP calculator user could ever need, even if he collected many of the user created programs out there in HP calc-fandom.

Now I fear that with my aging CPU (Athlon 64 skt 754), if I get a bigger hard drive, I'll need a week to find files... imagine if my old brain got more cells for memory; I'll remember everyone I meet, what I had for lunch each day for ten years, and remember to drop off the mail or pick up some milk... a month later.

Re: HP-49g+ and SD Cards

*Message #2 Posted by **Tim Wessman** on 8 Mar 2009, 6:59 p.m.,*
in response to message #1 by Ed Look

Format those other ones as FAT, not FAT32 and they will be just as speedy. Unfortunately, the implementation is such that the calculator scans all clusters on powerup. This means that since fat32 has millions more, it takes longer. :-(

*Message #3 Posted by **Egan Ford** on 8 Mar 2009, 7:46 p.m.,*
in response to message #1 by Ed Look

I'll also add that newer larger cards are generally faster than older smaller cards in the 50g/49g+. See: http://sense.net/~egan/hpgcc/#Sidebar:%20Memory%20Card%20Performance (all cards were FAT formatted).

Re: HP-49g+ and SD Cards

*Message #4 Posted by **Ed Look** on 9 Mar 2009, 11:54 a.m.,*
in response to message #3 by Egan Ford

Tim and Egan, thanks for the information. Just to satisfy my curiosity, I might try a 4 GB class 6 SDHC in

there and see what happens. I'll most likely stay with the smaller, older card, however, since the calculator requires the least memory space, out of all the uses I need SD cards for.

Re: HP-49g+ and SD Cards

*Message #5 Posted by **Tim Wessman** on 9 Mar 2009, 1:09 p.m.,*
in response to message #4 by Ed Look

It has to be a plain SD card. What will happen is the calculator won't power on with an SDHC in there. :-(

OT: TI-95 Manuals

*Message #1 Posted by **Egan Ford** on 8 Mar 2009, 6:11 p.m.*

I am looking for PDF scans of TI-95 user and programmer manuals for use with Hrastprogrammer's TI-95 emulator. All Google hits were dead links.

Thanks.

Re: OT: TI-95 Manuals

*Message #2 Posted by **Marcus von Cube, Germany** on 9 Mar 2009, 6:40 a.m.,*
in response to message #1 by Egan Ford

Hi Egan, I could salvage part of the users guide from the wayback machine (originally on reher.de):

http://www.mvcsys.de/temp/ti95_UsersGuide.zip

Re: OT: TI-95 Manuals

*Message #3 Posted by **Katie Wasserman** on 9 Mar 2009, 12:51 p.m.,*
in response to message #2 by Marcus von Cube, Germany

This users guide looks to be complete except for Appendix A. I've scanned it and put it here

The programmers guide is a pretty thick manual, I'll try to get around to scanning and posting that too.

Re: OT: TI-95 Manuals

*Message #4 Posted by **Egan Ford** on 9 Mar 2009, 12:53 p.m.,*
in response to message #3 by Katie Wasserman

Thanks all (Namir too). I now have the User's Guide. And Chp 1, 2, and 4 of the Programmers Guide. It was enough for me to get started using an emulator.

Thanks!

Daylight Savings Time

*Message #1 Posted by **Peter A. Gebhardt** on 8 Mar 2009, 1:25 p.m.*

Three cheers for the 200LX !!! It flawlessly changed the US timezones.

For the unaware readers (and also current & future 200LX users) reading this:

You should have updated your file C:_DAT\TIMEZONE.DAT with

```
Northern
3:8-14 6 1:00
11:1-7 6 0:00
```

http://isc.sans.org/diary.html?storyid=5971

Best regards,

Peter A. Gebhardt

Re: Daylight Savings Time

*Message #2 Posted by **bill platt** on 8 Mar 2009, 6:56 p.m.,*
in response to message #1 by Peter A. Gebhardt

I suppose it should be possible for me to write a program to do that in the 48GX, too.

Re: Daylight Savings Time

*Message #3 Posted by **Bob Patton** on 8 Mar 2009, 8:25 p.m.,*
in response to message #2 by bill platt

Here is my version of DST for a 48G. It's part of another program, but you can reformat the code to your needs.

Pgm 'EDST' sets DST global to 1 or 0 for Daylight Savings ---------- « -> m d y « y 100 / IP @century on stack y 100 MOD DUP @ yy on stack twice 4 / IP + SWAP 4 MOD 5 * + 7 MOD 30 SWAP - @ Last Sunday April DUP 22 - 7 MOD 1 + @ First Sunday April 10 + DUP 14 IF < THEN 7 - END @ Second Sunday March SWAP 5 + DUP 31 > «7 -» IFT @ Last Saturday October -> b e « m 100 * d + DUP 300 b + >= SWAP 1000 e + <= AND 'DST' STO » » »

In program EDST: Daylight Savings originally started on the last Sunday in April. Then it was moved to the first Sunday in April. Than it was moved again the second Sunday in March. It was easier for me each time to just adust the previously calculated date.

Re: Daylight Savings Time

*Message #4 Posted by **Bob Patton** on 8 Mar 2009, 8:27 p.m.,*
in response to message #3 by Bob Patton

Well, I should have previewed that. It didn't honor my new_lines, But, how do I force them?

Re: Daylight Savings Time

*Message #5 Posted by **bill platt** on 8 Mar 2009, 8:45 p.m.,*
in response to message #3 by Bob Patton

```
Pgm 'EDST' sets DST global to 1 or 0 for Daylight Savings ------------------------
------------------------------
« -> m d y
« y 100 / IP                                @century on stack
y 100 MOD DUP                               @ yy on stack twice
4 / IP + SWAP 4 MOD 5 * + 7 MOD 30 SWAP - @ Last Sunday April
DUP 22 - 7 MOD 1 +                          @ First Sunday April
10 + DUP 14 IF < THEN 7 - END               @ Second Sunday March
SWAP 5 + DUP 31 > «7 -» IFT                 @ Last Saturday October
-> b e « m 100 * d + DUP 300 b + >= SWAP 1000 e + <= AND 'DST' STO » » »
```

Thanks!

Re: Daylight Saving Time: Clarification and commentary

*Message #6 Posted by **Karl Schneider** on 9 Mar 2009, 1:20 a.m.,*
in response to message #3 by Bob Patton

> Quote:
>
> In program EDST: Daylight Savings...

First, several clarifications:

1. In the US, the term is *Daylight Saving Time* (not "Savings").

2. DST in the Eastern Time Zone is abbreviated "EDT". "EDST" would cause ambiguity with Standard Time (EST), and looks like a typo, since "D" and "S" are adjacent to each other on the standard keyboard.

The calendar extension of Daylight Saving Time several years ago in the US was largely a gimmick, as far as I'm concerned -- a so-called "energy-saving" measure that doesn't require any real sacrifice or commitment to save energy.

From Winter 1940-July 1945 during WWII, Great Britain observed year-round "Summer Time" DST, and a 2-hour-advanced British Double Summer Time during the summers. This actually made sense, as a significant proportion of electrical load was incandescent lighting, and the advanced clock helped to better match daylight hours to people's waking hours. This also lessened the impact of summer blackouts intended to discourage nighttime air raids.

In the US, however, the average climate is considerably warmer. In this era, lighting typically is efficient fluorescent and a significant proportion of electrical load is air conditioning -- both at home and in the workplace or school. In the heart of summer, keeping people awake and active during the warmer evening hours, instead of the cooler morning hours, does not necessarily save energy. This is why hot-climate Arizona (outside of Navajo Nation) does not observe DST.

Re: Daylight Saving Time: Clarification and commentary

*Message #7 Posted by **Martin Pinckney** on 9 Mar 2009, 6:47 a.m.,*
in response to message #6 by Karl Schneider

It is my recollection that in the U.S., originally (1950's) it was not about energy saving, but rather recreation.

Supposedly the "blue collar" workers all got off work at 4:00 pm, and during the summer months they would all make use of the extra hour of daylight on a weekday afternoon to go fishing or play pick-up baseball.

Well, now, thanks to "free trade", and Sam Walton, we no longer have any blue collar workers, and since Karl has just proven that it really doesn't save any energy, maybe we can do away with the d**n thing.

Right.

As I remember it from rural Minnesota in the 1940's and later the townspeople loved it for the recreation but the farmers hated it. The farmers talked about standard time as "God's time".

I never understood the "farmer argument." Can't a farmer can get up any time he wants to tend to his fields, and go to bed whenever he wants, regardless of what the clock says?

Re: Daylight Saving Time: Clarification and commentary

*Message #10 Posted by **Bill (Smithville, NJ)** on 10 Mar 2009, 10:06 a.m.,*
in response to message #9 by Jeff O.

A good friend of mine is a farmer. Your right in that he'll start work at daylight, regardless of what the clock says. He says the problem the farmer's have (or at least he has) with daylight savings time is that the farm machinery/repair/parts suppliers close earlier. So if he has problems with his equipment in the field and the parts house is closed, he may loose several hours of daylight work since he can't get the parts for repair.

I'm originally from Indiana, where over the years we have had several implementarions of daylight savings time. In high school, we lived right on the boarder between two time zones. At home, we were on daylight savings time, while the high school I atended was on standard time. So it was important to state which time reference whenever you set up a meeting time. We took to refering to daylight savings time as "Fast Time" and standard time as "Slow Time". So we'd say, I'll meet you on Wednesday morning at 9 Fast Time or 9 Slow Time. That way there never was a problem knowing which time a person was referring to.

I remember a period in the 70's, where the county I was living in decided to dictate the "Official" time for the county. They chose Standard Time. But the county was next to a large city in the neighboring State that was on daylight savings time. Since a large majority of the people in the county worked in the neighboring city, the county ended up placing an "Official Clock" in the courthouse that displayed the official time. But every one, including the court house emplyees use Daylight Savings Time as their standard clocks. Sounds confusing, but it's really not. As long as everyone uinderstands each other, then there's no confusion.

Bill

I can see that, but, I would expect that such businesses would adjust their operating hours to accommodate their customers and stay open an hour later as soon as DST kicks in. Of course, if everyone just adjusted when they did things relative to the clock instead of adjusting the clock relative to the sun, that would eliminate the need for DST in the first place.

> Quote:
>
> I'm originally from Indiana, where over the years we have had several implementarions of daylight savings time.

I live in a state that neighbors Indiana and have observed Indiana's DST trials over the years. They recently adopted DST on a more-or-less statewide basis. In my opinion, they should have then gone into the Central Time zone where they belong geographically. Since time zones should theoretically be 15 degrees wide, the US Eastern time zone (GMT-5) should extend from 67.5 to 82.5 degrees west longitude, with adjustments as needed for political and social boundaries. Those adjustments are of course not trivial, especially for a state that may span the mathematical border.

The Ohio/Indiana border is at 84.8 degrees West longitude, and all of Indiana is west of this line, so it would make a fine political and social boundary. I think they preferred the eastern time zone for social/financial/business reasons, i.e., to be aligned with the east coast.

Just my observations and opinions, no offense to any Hoosiers!

...

Exactly - well actually more to be aligned with the neighboring large city in adjacent state. There's two main areas - the 60 mile region around Cincinnatti, Ohio; and the 60 mile region around Louisville, KY. A large percentage of people in each of those areas work/compute to the big city. So it makes sense for them to be on the same time zone as where they work and do most of their shopping. Over the years, I lived in both of those areas.

But I always get amused when people mention Indiana's time zones. As long as you remember "Fast Time" versus "Slow Time", you'll do okay. :)

Bill

> I can see that, but, I would expect that such businesses would adjust their operating hours to accommodate their customers and stay open an hour later as soon as DST kicks in.

That sounds reasonable but as I remember it that wasn't always the way it happened.

Back in the olden days the primary problem occurred on Saturday night when the farm families came to town to do their weekly shopping and the stores stayed open until 9 PM. But with DST and a 9 PM closing a farmer who worked from sunup to sundown couldn't get his family to town in time to shop. The farmers asked for a 10 PM closing but the townspeople didn't always want to comply.

One year one town tried to stay with 9 PM closing when a nearby town changed to closing at 10 PM. Guess where the farmers shopped. In a short time the town with the 9 PM closing changed it to 10 PM. "The customer is always right!"

*Message #16 Posted by **Patrick Rendulic** on 9 Mar 2009, 10:15 a.m.,*
in response to message #6 by Karl Schneider

For me DST (living n Europe) is wonderful. Why? Easy: During DST, when coming home from work, I have one additional hour of light for my outdoor activities: walking, trekking and photography.

That's why I would like to have DST during the whole year, or, for ordinary people the ordinary working hours should be 6h to 16h instead of 8h to 18h.

Re: Daylight Saving Time: Clarification and commentary

41 RPN LBL GTO rules

*Message #1 Posted by **Egan Ford** on 7 Mar 2009, 6:05 p.m.*

Hello All,

I have a rather large 41CX program (not written by myself) that has a number of duplicate LBLs. I am trying to run this program using the 71B 41 Translator ROM, but it fails to run. I think it has to be an issue with the duplicate LBLs.

The manual states that when a GTO is encountered a scan is performed going down, then from top down, until found. But what if their are multiple local LBLs with the same name/number? It is the first or last? Furthermore the docs state that it is cached and not searched again. Is that only true for the original GTO or all GTOs to the LBL?

I'll admit I'm being a bit lazy and can setup an experiment to find the answer, but, well, I'm feeling lazy today. I am also looking for some insight as to why a person would code with duplicate LBLs. Is it a trick to be leveraged? Have others had issues with RPN code and duplicate LBLs on the 71B 41 Translator ROM?

Thanks.

Re: 41 RPN LBL GTO rules

*Message #2 Posted by **Thomas Okken** on 7 Mar 2009, 7:41 p.m.,*
in response to message #1 by Egan Ford

Local GTOs and XEQs jump to the first matching label following the instruction. This means that for non-overlapping forward jumps, you can reuse labels; in my HP-41 days, I usually reserved LBL 00-02 for forward jumps, and higher numbers for backward jumps.

Once the local label is found, the offset from the GTO or XEQ is stored *in that GTO or XEQ*, so subsequent executions of that same instruction don't have to perform the search again. The cached offset stays valid until you edit or PACK the program; editing causes all local GTO and XEQ offsets to be invalidated. Offsets in other programs are not affected.

Given that there are 115 local labels to work with in the 41, there may not seem to be much incentive for reusing them, but keep in mind that LBL 00-14 are "short form" labels, occupying one byte less than the regular variety. Likewise, GTOs to those LBLs are also one byte shorter (but they also have a smaller jump offset field, so you should avoid using LBL 00-14 as target for long-range jumps, where "long range" means more than 112 bytes.

Note that the rules for global labels (ALPHA) are different; those are searched for backwards, starting from the .END. You cannot use duplicate ALPHA labels; if you do, only the last one will ever be reached.

- Thomas

Re: 41 RPN LBL GTO rules

*Message #3 Posted by **Raymond Del Tondo** on 7 Mar 2009, 7:51 p.m.,*

in response to message #1 by Egan Ford

Hello Egan,

re-using local labels inside a FOCAL program is a common technique.
You can save bytes (or reduce program size) if you manage
to use the one-byte local labels 00-14 more than once,
instead of local labels like LBL 22, which take two bytes of memory.
Also, the associated GTO's use two bytes for label 00-14,
but three bytes for numeric labels above 14.

As you know, the primary search direction is forward,
so when a GTO <local> is encountered the first time the program is
run (or after an edit or GTO..), the OS will search for a suitable label,
from the current PC ot the end, and then from the start of the prog.
If found, the offset will be noted in the label opcode,
so the next time the program is run a jump to the label will be faster.

Also note that the two-byte GTO's have a restricted offset field,
so farther jumps will have to be computed each time.

IIRC, the translator ROM produces at least an intermediate file
before actually compiling the FOCAL program.
This processing stage would be a point to jump in.

But for FOCAL programs of which you plan to convert them to FORTH anyway,
I'd replace the duplicate local labels on the HP-41 beforehand.
Just take care to adjust the correct GTO/XEQ statements.

Also be aware of another potential obstacle:
Many HP FOCAL programs make use of indirect addressing.
This feature works for jumps, too!
Something like XEQ IND X will jump to the label whose name or number is in X.

There may be more tricks to be aware of, but I don't have them handy right now:-)

HTH

Edit: Thomas' response was earlier and more precise in less words;-)

Re: 41 RPN LBL GTO rules, LBL after ENTER?

*Message #4 Posted by **Egan Ford** on 7 Mar 2009, 11:44 p.m.,*
in response to message #3 by Raymond Del Tondo

Thomas, Raymond,

Thanks. This helps. I think I figured out this program and my confusion. LBLs were being used as NOPs. LBLs after ISG, DSE or conditionals make sense to me. But LBLs after ENTER do not and if I remove them I get incorrect results. What's up with that?

Thanks.

Re: 41 RPN LBL GTO rules, LBL after ENTER?

*Message #5 Posted by **Thomas Okken** on 8 Mar 2009, 1:27 a.m.,*
in response to message #4 by Egan Ford

The LBL after ENTER re-enables stack lift:

CLST 1 ENTER LBL 00 2 => T:0 Z:1 Y:1 X:2
CLST 1 ENTER 2 => T:0 Z:0 Y:1 X:2

Pretty obscure programming style IMHO. RCL X achieves the same result and is a lot more obvious... But maybe ENTER LBL 00 is faster?

Yeah, but I've never seen a scientific version, they always 4-Bangers.

Dave.

Not RPN, but he may be talking about this one. I still have a radio shack version of this (EC-4009) I got in the mid-80s and wouldn't part with it for the world.

The Radio Shack version of the Casio lacked, IIRC, combination and permutation functions. I have the Casio model that you show. These were sold new in 1985. I bought several to give as gifts.

There was an earlier credit card Casio scientific available in late 1978! It is the fx-48. It doesn't have quite as many functions, and it isn't solar powered. It is very slightly smaller. I bought the one I have in January 1979.

In 1983, Casio sold a scientific wrist watch calculator, the CFX-200. It was quite useful, and it isn't much larger than other digital watches. I've still got one, but the calender and DOW function does not work properly after 12-31-1999. Later, a more elegant model in the form of the CFX-400 came out.

So the era of popular, consumer-grade, readily available scientific credit card or smaller calculators arrived more than 30 years ago and vanished more than 20 years ago. I suppose the market didn't support them.

Set your unit to 1998 and all will be fine (except for the year, of course).

See years matching 2009 if you want to pick a different year.

I checked my radio shack and it's actually the other way around. Mine has both of those as inv functions on parentheses keys, but I don't see them anywhere on the casio picture.

Got mine in high school before I discovered HP. Once my science classmates saw it, several went out and bought them for $12-$15 in '84 or '85, IIRC. Now they show up on ebay now and then for several hundred dollars (almost vintage HP territory). So there's at least some demand for a small scientific like this.

Anyway, thanks for the other info. These are great little calcs. Too bad they're extinct. The only thing I don't like is that dust easily gets in the display/solar panel.

I remember my Dad showing me his pocket Casio in response to my HP-15C when I was an undergrad. I didn't remember the exact details, so I asked.

> Quote:
>
> I still have it. It is labeled "Casio Scientific Calculator fx-88." It is the size of a credit card, 88x59x4 mm. It is light powered: solar, fluorescent or incandescent light. It's probably 20 years old or more. The paint on the cover is deeply scratched. It still works.
>
> Its functions are: x!, x(square) and squareroot; log and ln; 10 the x power; e to the x power; hyp, sin and arcsin; cos and arccos; tan and arc tan); x to the y power and x to the 1/y power; cube root; and statistical functions mean x; sigma n, sigma n-1, sum of x; sum of x squares; random number generator and pi.

I wouldn't trade it for my 15C, but he really liked it as a replacement for his shirt-pocket sized 6-inch slide rule!

I was surprised that neither Google nor *'the auction site that shall not be named'* seemed to know anything about that model Casio.

Five or six years ago I found a small chinese scientific calculator under the tradename KADIO. About a credit card size, +/- 6 mm thick, landscape form, silver painted plastic (black in the back). With P-R and base convertions capabilities. Despite the tiny keyboard, it was a pretty and cheap toy, so I could not resist and bought it.

It fit nicely and easily in my shirt pocket. In the first day I put it in the pocket, one of the independent silicon keys popped out from the body. It lasted not more than 2 hours of continuous usage before the display fails... Well, the important is that someone has recently produced a credit card size scientific calculator.

If you carry a mobile phone, another option might be to find an RPN calculator for your phone.

Lygea do a few variations on the 12C, 10B, 10C, 15C etc. for Blackberry and Windows Mobile: http://lygea.com . I have the 12C and 10C on my BB Curve. They've moved the keys around to make better use of the Blackberry keyboard, and some features such as programmability are missing, so it's not truly 'emulated'. Still, it's great just to have an RPN calc with me whenever I need it.

I love the lygea calcs as well. The Windows Mobile version of the 15C IS programmable just like the real thing. Simply brilliant. And of course you can have a 28/42/48/49/50g with emu48 for windows mobile. I run all of those on my windows mobile phone. I made a 49g KML that looks just like the lygea. Check it out HERE. And download it HERE.

Yes, this isn't a "credit card" calc. As far as I know there has never been a true "credit card" scientific calc. Those Casio's weren't credit card thin either.

A true credit card calculator is one you can slip into your wallet. Only available as 4-Bangers unfortunately.

Dave.

The screen on the iPhone is just a bit smaller than a credit card. So any usable emulator form factor on the iPhone would also work as a credit card calculator. That means I could have a usable 15C or 41CX in a credit card form factor. To fit in your wallet it'd have to have a membrane keyboard. To avoid battery thickness solar would be a plus. Of course BT for I/O. With e-Ink the keyboard could be virtual.

Dave, I think I see your next great project.

in response to message #3 by Prabhu Bhooplapur

I have 2 HP-IL ISA cards and still have an old computer or two with ISA sockets.

The problem is the software.

1) I thought the original software required a "slow" computer.

2) I don't actually have the old software anyway :-(

in response to message #1 by jotne

I have a couple of Verbatim brand ones I bought from EduCalc back in the day, and they worked fine. They're 100% compatible with my HP82161A cassette drives. The label on the front of the cassette itself is light blue with silver lettering that says to the left of the window:

```
MI
80
```

and underneath the window says, all in lower case,

```
mini data cassette
```

On the top edge are printed numbers in blue ink, possibly serial and lot numbers:

```
6029 6879
```

on one and

```
6035 6879
```

on the other. Here's what they look like:

front: (The silver lettering on the blue background is hard to read.)

back:

top edge:

I believe these tapes to be made by the same company that made the HP-label 82176A tapes.

The Date code/Contract number format is the same- I have a lengthy response on this issue somewhere in the archives of the forum, but can't seem to find it google or otherwise.

Re: 82176A Mini Data Cassette equivalent?

*Message #8 Posted by **Steve (Australia)** on 7 Mar 2009, 6:31 p.m.,*
in response to message #7 by Allen

A question I have concerns the life of these tapes.

As someone who tries to maintain a "working" collection, there are a number of time-related maintenance issues.

Some of those time-related issues are card-reader bearings and pinch rollers, and gummy lubricant on early disk drives.

Another one is the deterioration that may occur of the tape used by the tape drives (and of any pressure pads etc that might be inside the cassette).

Has anyone documented the *inside* of these tapes and looked at replacing the tape with something else?

Replacement could be either new tape (from a cassette, or a DAT or something???)

Re: 82176A Mini Data Cassette equivalent?

*Message #9 Posted by **db (martinez, ca.)** on 7 Mar 2009, 10:00 p.m.,*
in response to message #8 by Steve (Australia)

hi steve; one thing i have learned will be obvious to you: don't leave tapes sitting in the unit. you can always demagnetize the head but you can't put info back on the little directory area. any info is lost that the drive doesn't have a location for, even though the tape is fine.

in response to message #10 by Diego Diaz

Thanks. That was *exactly* what I was after.

My concern is that 60min tapes may have tape too thick to fit the required length into the space in the HP cassette. Do you recall if this was an issue?

Another poster in that thread noted that he had written something about replacing the foam pad inside the cassette. Do you know if that is available anywhere?

I am very pleased that the required materials are not terribly exotic :-)

Re: 82176A Mini Data Cassette equivalent?

*Message #12 Posted by **Dan Grelinger** on 20 Mar 2009, 10:25 a.m.,*
in response to message #11 by Steve (Australia)

I completed a repair of a faulty 82176A cassette on Wednesday night. The felt pad had fallen off, and the tape would not read. I would alternately get "Medm Error" or "Dev Error" before the repair.

Tony Duell graciously sent me his 82176A repair article from years past, and I used that as a basis for the repair.

I got the case apart, although it would not cleanly split along the seams; the separation departed from the seam on the side of the cassette opposite the tape head. I used a blade to try and split the seams, and realized that the full tape spool was dangerously close to the cassette edge. I may have nicked the clear tape leader that was wound on the outside of the spool when trying to open the tape, but I could not see any damage when I unspooled the leader.

I still had the felt pad, and I scraped the backside with a blade to remove most of the remants of the deteriorated foam, so that I could re-use it. I could not find the foam double stick tape that Tony recommended, but I did find its specifications, and it is 1 mm thick. I had some 3M permanent double stick tape that was 1 mm in thickness, so I used that and stuck the original felt pad to it.

I tried isopropyl to clean the metal spring strip, and had to scrap it with a blade to get it clean.

Once the pad was replaced, and I got the tape back together, it read fine.

I am going to try to repair another one, but this time I am going to try and do it without opening up the tape case.

Does anyone know the thickness of the tape? From what I've read about standard cassettes, the 45 minute and 60 minute tapes are the same thickness, the 90 minute tapes are thinner, and the 120 minute tapes are even a ittle thinner than that. I would like to replace the tape in one of my mini-cassettes to maximize its future life, and tape thickness will be important to match.

Dan

*Message #16 Posted by **Patrick Rendulic** on 11 Mar 2009, 7:21 a.m.,*
in response to message #13 by Saile (Brazil)

This is a good example of what happens when a manufacturer stops producing a dedicated media and remaining supplies are tending to virtually 0.

Why didn't HP use "standard cassettes" for this task? Was it a decision of miniaturisation or was it to earn supplementary $$$?

Re: 82176A Mini Data Cassette equivalent?

*Message #17 Posted by **Steve (Australia)** on 12 Mar 2009, 7:59 p.m.,*
in response to message #16 by Patrick Rendulic

or even a standard mini cassette, the sort that were used for dictating machines and which are still available.

They even *look* similar. http://en.wikipedia.org/wiki/Mini_Cassette

Interestingly they say that the lack of a capstan makes them "unsuited to any task other than voice recording".

I'm pretty sure the 82176A doesn't have a capstan, and I'm also pretty sure that this device performs a task other than voice recording.

EDIT: I *know* these are not equivalent. Don't try them -- they don't work.

EDIT2: An answer for your question. These days HP would do it for the money. In those days HP did it to ensure quality and to introduce technical features that made engineering sense.

Is it possible to load documentation onto an sd card onto the hp 50g

*Message #1 Posted by **hpnewbie** on 6 Mar 2009, 5:23 p.m.*

Hi. I'm new here and to hp calculators. I'm considering purchasing a hp 50g in lieu of a ti 89 or ti-nspire CAS. One of the things I've read about the 50g is that it has a relatively steep learning curve. Another is that it does not have a good printed manual. Since it's relatively impractical to be constantly looking up functions of a calculator on a computer, I was wondering whether or not it was possible to load the documentation onto an sd card in a usable format and therefore access it from the calculator itself. It just seems so logical to me - since you have like a gigabyte of storage with the sd card, you could load the entire 800 page manual onto the calculator.

Also, is the 50g limited to using 1 gigabyte of storage on a sd card?

Thanks for helping.

in response to message #1 by hpnewbie

If you intend to use the calculator to solve all types of equations easily or program in a BASIC-type language, you will be happier with the NSpire CAS.

Try a 50g emulator. There are emulators for Win/Mac/Lin for the 50g.

Windows: http://www.debug4x.com/

Mac/Linux: http://x49gp.svn.sourceforge.net/viewvc/x49gp/README.QUICKSTART

As for learning curve, I started with HP RPN/RPL calculators, the 50g was easy. I still struggle to use my kids 83, I just do not get it. Learning curves are relative.

You can printout the AUR. That is a great manual. You can also store it on the SD card, but the limited screen resolution would make for difficult reading and navigation.

The 50g CAS system has online help/reference. For the non-CAS commands install this: http://www.hpcalc.org/details.php?id=5973. This is a library + reference (to be stored on SD). It's not a manual, but a lifesaver as a reference.

> Quote:
>
> Also, is the 50g limited to using 1 gigabyte of storage on a sd card?

No, 2GB cards work just fine, but appear as 1GB to the filer. Just ignore.

IMHO, get an emulator, give it a try before you buy.

P.S. C programming on the 50g is easy.

*Message #7 Posted by **Tim Wessman** on 6 Mar 2009, 10:59 p.m.,*

in response to message #6 by Mike Reed

Yup. They work fine. I just wish the stupid SD group hadn't made SDHC the exact same form factor. I know why they did it, but it causes a lot of consumer confusion. . .

I guess now that everything pretty much includes SDHC capable slots the issue will go away sooner rather than later. I have had to explain why my mom's fancy new memory card doesn't work at least twice now though. Got myself a few cards out of the bargin, so I guess it is ok. :-)

Having downloaded the Emulator, grab a copy of the Users' Guide from HP's web site: www.hp.com/calculators. Click on "graphing calculators" on the left, then click the 50G, then "HP Support and Drivers", then "Manuals" and finally "HP Users Guide"

The User's Guide is a greatly expanded version of the printed manual that comes with the calculator.

OT: 4.1 Billion Mobile Phones and Counting.

*Message #1 Posted by **Egan Ford** on 6 Mar 2009, 3:44 p.m.*

What this means is that the device most people will likely use and rely on in the future will be the cell phone, above all else. -- http://blog.wired.com/gadgets/2009/03/report-60-of-wo.html

That's a lot of phones. And I'd wager that each has a primitive calculator (4 banger), possibly making the mobile phone the number one calculator in terms of volume.

My phone of choice is the iPhone.

My iPhone with i41CX+ has become my primary calculator (desktop and on the road). The overlay support, QWERTY entry, printer, I/O, speed, and size of the iPhone w/ i41CX+ outweighs the to-be-missed tactile keyboard of the original.

Free42 for the iPhone is a serious contender, but lacks a few critical features such as I/O and saved printer output. As they become available its going to be hard to pick (but, do I really have too?).

Of course there are Eric's lovely Voyagers. Still my favorite calculators of all time. If I had to rebuild civilization, I'd be with a real 15C and it's 20 year battery life. So, why is i41CX+ my favorite you ask? Because I can use it single handedly with one thumb. With the 15C, I'd have to take my other hand of the steering wheel. (just kidding :-)

I see a bright future for emulators and even original ideas for touch screen phones. E.g. the SpaceTime calculator. It's almost like Mathematica or Maple in your pocket.

Oh, I'll continue to collect and use the *real* thing, because I want to, because its my passion to make these *old things* do amazing things. I and suspect that this is true for many here as well.

Edited: 6 Mar 2009, 4:00 p.m.

I recently got a new phone, a Motorola, and was astonished to discover that the calculator observed correct algebraic precedence.

> Quote:
>
> My phone of choice is the iPhone.

To me a phone is a phone, a camera is a camera, and a calculator is a calculator. I deliberately avoid buying phones with excess features.

> Quote:

As for me, I just buy them to use them. That's what they were made for, right?

+1. Some of the integration the consumer electronics industry tries to sell us is about as apetizing as combining the toilet and the food processor into one appliance. Like someone said here recently, "You'd be surprised how much of the product design is done my marketing and not engineering" (or something like that).

Try close to 100%, In the big companies particularly. And since the big guys dominate in terms of volume, that means nearly 100% of available products are designed primarily by marketing departments. Naturally, the resulting design has to have some engineering input, but that doesn't mean engineering will drive the process. In my opinion the best we can hope for out of the big companies in this regard is enlightened self interest. Some may believe that engineering quality will translate to market success. But although that works in some segments, (think Apple vs Dell) as Walmart shows us, often the very opposite is the path to commercial success.

Walmart forces its suppliers to strip products to their essentials. The innovations that make the products cost less are often ones that also reduce quality in some respect. Or else the innovation is in packaging that makes the product cheaper to sell, and does nothing for quality. Walmart is doing very well during this downturn since low prices are more attractive than ever now. But I'm guessing their leverage with their suppliers will go down as more and more of them face tough choices in the struggle to survive.

I'd also like to think that if the consumer credit binge is slowed if not stopped by the current economic crisis, consumers will be more wary of manipulative marketing and more conscious of value beyond mere price. My mother and father were extremely frugal, both being children of the depression era.

Perhaps another generation of tough customers will emerge from this disaster. But betting on a change in consumerism might be foolish.

Microproduction may help as well. As others have noted, the new 12C, with flashable software, allows smaller markets to be addressed more economically. Yes, some production and marketing costs aren't affected by the common platform, but many are, and the overall effect is to reduce costs and allow more targeted design. Smaller markets may mean that more engineering attention will have to be paid to demands for quality. The postulated new 15C will be of higher quality for people like me when compared to the 12C on the same hardware, because its software will be superior for the targeted market segment.

Regards,
Howard

But what about your PDA? I do not have a single colleague or acquaintance that still owns and uses a PDA (I was the last holdout). They have merged with the phone to create a better solution. Most people I know *used* a calculator in school, but just use the one on their phones or laptops. Convergence happens. The next generation expects and demands it. Good luck finding lotech phones, it gets harder and harder. E.g. my colleagues that work with the US Government. Finding phones without cameras is getting harder and harder. Of, course the same is true for laptops with embedded cameras.

I am happy that on my travels I no longer have a phone, PDA, and calculator. Having one device makes my life easier. But I draw the line at the camera. Phone cameras blow (at least for now).

> Quote:
>
> As for me, I just buy them to use them. That's what they were made for, right?

As did I when I used them more frequently. But many calculator functions have been replaced with more powerful alternatives. i.e. the computer. My 15C was my first "computer", I still have it, but often need to find reasons to use it. And given how rare good calculators are I try to avoid traveling with them.

What's a PDA? (Seriously, I do know what one is, but I don't have any use for one. I do keep a small notebook in my truck, and I always have matching Zebra pen and mechanical pencil in my shirt

pocket).

> Quote:
>
> But many calculator functions have been replaced with more powerful alternatives. i.e. the computer.

For the calculations I use a calculator for, the computer would be extremely cumbersome. In other words, in these cases the calculator is not a poor substitute for a computer, rather it is superior. On the other hand, I do use a computer for most final design calculations. One exception was a particular design problem for which I found a freeware HP48 program, but could not find a computer program for!

For making notes, a plain old paper notebook is indeed superior to a PDA, and for an appointment calendar and address book, the paper variety is also as good as ever. I do like my PDA for several other reasons, though: it can store passwords **securely**, and between my job and Internet shopping, I have dozens of those; I can set it to remind me of appointments, which is good because I tend to forget them otherwise; and it can do double duty as a fancy calculator and for playing games -- a few solitaire varieties can be nice if you have some time to kill while waiting at the airport or whatnot.

I use my 41cx for that. Every time I turn it on, it checks the date and looks in the DAYTIMR text file to see if it's supposed to remind me of anything. If not, it will display how long 'til the next alarm is due, and if there are no alarms pending, it just displays time and date.

But sometimes the excess features are hard to avoid! I bought an iPod touch because it was the best hand-held web surfing device I could find (better than the Nokia tablets, as far as I'm concerned)... I didn't want the MP3 player, YouTube player, and general-purpose application platform functionalities, but now that I have them, I do find myself using them, rather a lot.

Be careful, the drug pushers are fiendishly clever. ;-)

in response to message #9 by Thomas Okken

In my own smartphone debate I settled on the Blackberry Curve 8900, since the device and usage costs over time will be considerably cheaper than the iPhone for what I am looking for. I think it is a superior communications and organizational tool, but it is weak as a media player or web surfer. However, I still use the built in browser frequently, particularly for sites like Facebook that have faster loading mobile versions, and I have downsampled quite a few mp4 videos for easy playback on the smaller screen. My iPod touch has gathered dust for a few days now. Funny how that works out.

Re: OT: 4.1 Billion Mobile Phones and Counting.

*Message #11 Posted by **Jandro Kirkish** on 6 Mar 2009, 5:21 p.m.,*
in response to message #1 by Egan Ford

I fully agree. I use free 42 and the 15c emulator on my iPhone, but the 41cx emulator is almost uncanny with its actual key-click sounds and printer sound effects. And Spacetime has fulfilled my dream of having a CAS in my pocket. But the best part of these hp emulators is that they are cheaper than 810 bucks .

On a side note, rumors on this forum have it that HP may bring back the 15c this year, and one supporting piece of evidence is HP's apparent reclaiming of their rights to nonpareil's Voyager emulations. Yet the iPhone 15c is still available. Any ideas why HP would let this slide?

Even though I have the 15c emulator on my iPhone I would buy the real thing in a heartbeat (provided it costs considerably less than $810.00). These emulators are teasers for the real thing!

I loved my 29C because I could use it one-thumbed. It's a great feature that I haven't seen since from HP or anyone else (although I haven't paid nearly as much attention to calculators as most forum members have.

It would be hard to make a graphing calculator that could be used that way, but I think a scientific calculator like this would be great. It also means that it could fit in your pocket easily.

Re: OT: 4.1 Billion Mobile Phones and Counting.

*Message #13 Posted by **Michael de Estrada** on 6 Mar 2009, 8:27 p.m.,*
in response to message #12 by David Hayden

Indeed. The Woodstocks like your HP-29C were the best hand-held and shirt-pocket calculators HP ever made. Yes, the Voyagers like my HP-15C were thinner and lighter, but their sideways layout made one-handed use impossible and two-handed difficult. In fact, I've always thought of the Voyagers as the smallest desktop calculators HP ever made. So, what is my calculator of choice when I'm out shopping at the supermarket figuring out unit costs etc? Why, it's my trusty old HP-21, with its battery pack retrofitted with a pair of 2500 mAH AA NiMH cells, which last for a month's worth of shopping on a charge (I charge them outside the calculator to prevent damaging it). Another benefit is its LED display, which is visible in poor lighting conditions.

And sure, I also have a basic flip-up cell phone with the blasted camera that keeps turning on accidentally and running down the battery.

*Message #3 Posted by **Michael de Estrada** on 6 Mar 2009, 3:02 p.m.,*
in response to message #1 by Geir Isene

What I find most interesting about this forum is the incredible diversity of its participants. It's much more than just a few HP calculator buffs, spanning the whole spectrum of human professions and avocations. I also find tremendous creativity and intellectual curiosity here. Even though I am already in my 60's, I am more than ever interested in learning new things, and every day I learn something new on this forum.

BTW - I visited your neat website, and enjoyed your offerings.

Thanks,

Michael

Not really. We only represent a **very narrow** cut from the spectrum of humankind: age wise (45ish), profession wise (mostly math and technical) and gender wise (very man'ish), I even suspect ethnic/race

wise (assumed from the conference photos) and religion wise (assumed from the seasons greetings). I still like us, though! ;-)

Agree with all but the "very man'ish" part. While I'm probably the only regular woman on this forum I feel comfortable because it's very gender neutral in content. I suspect that without reading the name of the poster it would in most cases be difficult to tell the gender of the author.

Members are very supportive of each other, no one ever curses and it's free of guns, sports and monster truck talk!

in response to message #4 by George Bailey (Bedford Falls)

Well, I've never been to an HP conference, so perhaps everyone there is a WASP, but I see a lot more diversity in others on this forum. Certainly, I'm no WASP. As far as professions go, math is not so much a profession as it is an academic subject. Even if you teach mathematics for a living, your profession is educator, not mathematician. The term "technical" covers a very wide swath of related professions, such as engineering, education, information, medicine, applied sciences, social services, finance, etc. Among the forum members I've seen a psychiatrist, astro-physicist and financial planner. So I stand by my statement that there is diversity here. I have a personal friend who is a theologian and a real calculator nut. What could such a person possibly want with a calculator? He's trying to calculate the number of angels that can fit on the head of a pin.

Michael

This also reminds me the THEOLOGY ROM for the HP-71B, with its powerful CREATE ALL statement (the regular HP-71b has DESTROY ALL, PURGE ALL and END ALL statements).

Below is an excerpt from HPX Echange, V1N3p17 May/June 1987 :

```
Titan File #12, by Joseph Horn

+--------------+
! THEOLOGY ROM !
+--------------+

As the astute noticed, the Quick Reference Guide in "HP-71 BASIC Made Easy"
(pg. 147) refers to the CREATE ALL statement in the THEOLOGY ROM.  This
is just one of the many keywords to be found in this huge lexfile.  It is
based
on a higher source code, which unfortunately this magazine is too small to
contain.  But I just have to tell you about CREATE ALL; you are sure to get
a
big bang out of it!

CREATE ALL, as the name implies, creates everything.  Since this is such an
immense task, it takes about six DAYS (!) to finish, after which the
configuration code works for another 24 hours making sure that what was
CREATEd
is indeed good, during which time the HP-71 will appear to have gone into
deep
sleep.  Of course, CREATE ALL only works if ALL does not already exist.  If
ALL
already exists, CREATE ALL gives the "File already exists" error.  If this
```

```
occurs, it isn't enough to PURGE ALL or even DESTROY ALL.  The THEOLOGY ROM
has an expanded version of END ALL that does the trick.  Proper use of END
ALL
is vital, since further action by users who have ENDed is impossible.  The
following is suggested: "END ALL @ CREATE ALL" on one line!

If interested in CREATE ALL and END ALL, please look for a subset lexfile
called GENESIS on a future swapdisc!  But PLEASE use it carefully!
```

Hi, Thomas --

> Quote:
>
> ...**W**, but quite a few of them are not **AS** (I'm not, being from the Netherlands) nor **P**...

Hmm, I'd thought of The Netherlands as Anglo-Saxon, due to its location between England (Anglo) and Saxony (a region of Germany), as well as the extensive similarity of the Dutch language to English and German.

"Anglo-Saxon" is quite distinct in many ways from Romanic (Italian, French, Spanish, Portugese, and -- of course -- Romanian).

I also just learned that Holland is only a region of The Netherlands, and not a synonymous or obsolete term for it, as countless others have believed.

That's quite a Wikipedia article about Major Charles Winchester, with links to other M*A*S*H-related articles. The iconic American television series has dedicated fans.

"Anglo" and "Saxon" actually *both* refer to regions in present-day Germany, the former being Angeln, now part of Schleswig-Holstein, on the Baltic coast.

Regarding language similarities, you could have fooled me, I grew up speaking German and Dutch, and I found learning English to be quite the chore. If the proto-WASPS had done a better job in 1066, the gap between English and the other Germanic languages would probably be a lot smaller now! ;-)

Karl; Extensive similarity is one way to put it. I've seldom heard my friend form Holland speak Dutch but when she has; i feel like i'm on the verge of understanding (kind of like programming in RPL). Written, it's even closer. I downloaded some Star Trek with Dutch subtitles and it made some sense w/o sound, all that "starfloaten" stuff... To me Dutch *looks* a little like English with almost all the Latin conjugates removed and a bunch of German nailed on in their place. They say that Frisian is even closer. - a Whitish Agnostic Sometime-Programmer

For a German who lives not too far from the border in the Rhineland (my wife has grown up there) Dutch is kind of understandable. In written language it is even closer to German. Some words make us Germans smile. :)

Hello,

Dennis hit the nail. Take out French and Latin structures from English and the remainder is very close to German.

The English language is a close relative to German, and both descend from a so-called Proto-German, which originated in India. Experts refer to both English and German as Indian languages.

The first to unravel this origins were the Grimm brothers. While compiling Germn folk stories that became fairy tales, they noted similarities of German and some Hindu languages and started work on a dictionary that was completed a century later. "Aschenputtel" may not seem related to Cinderella, but Asche and Ash are quite similar to each other.

After the defeat at Hastings in 1066, the English language received a heavy influence of Latin and French. Latin grammar and French terms were added, and over the years the language changed into its present form. File comes from Filum, Latin for origin (if I remember correctly,) and eventually became the term for archive, and so on.

Once Jorge Luis Borges referred to the English language as "Latin-embedded German." A short but elegant description.

My two cents.

My mom took classes at college with the man who coined the term, WASP!

Digby Baltzell was his name.

Most of us WASPS are actually much more polyglot in actuality. After 10 generations you have 1024 grandparents after all. Who can keep track of where they all came from! I have a number of "WASP" friends who discovered that an ancestor was even black, or native American.

in response to message #1 by Geir Isene

I agree wholeheartedly!

But there are more friendly places on the net and many friendly people. Just to cite a single story that is just happening while I write this:

I'm a frequent follower of the French MySilicium Forum (my French getting better with time :)). Another famous member of the pocket computer community, Piotr Piatek (http://www.pisi.com.pl/piotr433/index.htm) follows the "pocket" area of this forum, even if he cannot read French and asks Google to kindly translate it for him. He picked up a query of mine for a TI-67 Galaxy: As he had a backup sample of this type, he has not only kindly offered it to me for a reasonable price, he is giving it away for free, even covering the transport fee.

Those calculator people are a little crazy, aren't hey? ;)

Love the forum and the friendly people! HP Calculator enthusiasts are a special bunch... and always somebody ready to answer questions... love it. Ed

Shameless plug for HHC2009 Was: Seriously; You are the best!

*Message #25 Posted by **Allen** on 6 Mar 2009, 8:55 p.m.,*
in response to message #1 by Geir Isene

I generally agree. One thing that a truly enjoyed was meeting several of the forum members at HHC2008 last year. That really helped me put a face to many of the respected members here, and with infamous HP developers like Cyrille (Vive la France), and restoration experts like Geoff (Vive la Canada), and local

Algorithm experts like Namir (Vive la Solution)- and of course the expert curator Dave (Vive la DVD!). Hope I can go this year and meet more folks.

I also met some of the authors whose books I've been reading about in the Educalc Catalog ever since I was a kid: Joe Horn (and his brother), James Donnelly, and Wlodek J. (A Great presentation on Tensors!)

My wife is convinced that Calculator addiction is a solitary event, I disagree... we have a wonderful support group, and although I'm probably 1 (or more) sigma below the average forum age, I still have had a HP calculator more than half my life.

FWIW, I'm thinking of returning to graduate School sometime soon, and participating here in the forum (especially the challenges) has interested me in Algorithm development and Computer Science in General.

Re: Shameless plug for HHC2009 Was: Seriously; You are the best!

in response to message #25 by Allen

I could not have said it better Alan,

Putting faces to names and places was fantastic. I will see you next year in Vancouver, Washington.

The graduate school idea is wonderful and a great experience, especially if self directed towards a dissertation.

My connections here and the friends that I have made have also inspired me to return to grad school. Another chance to get the HP41CX and HPIL to aid in data crunching.

Cheers, Geoff

Hi Allen!

I"m a professional computer programmer with nearly 25 years experience and I really love it (have ever since I was a young teen). If you'd like some input from the trenches, feel free to email me.

If you're interested in numerical algorithms, you can browse the 1992 version of Numerical Recipes in C here: http://www.nrbook.com/a/bookcpdf.php

In fact, I'll assign you a homework problem :) Browse the book and pose a challenge here on the forum!

Dave

Do it, Allen! I went back at the age of 50, and am now well into my PhD. I wish I'd done it much, much sooner, but I'm hugely glad that I'm doing it in the end.

Best,

--- Les

*Message #29 Posted by **PeterP** on 6 Mar 2009, 11:00 p.m.,*
in response to message #1 by Geir Isene

I couldn't agree more with what is said. When I started getting into HP calcs a few years back I was the totally new kid on the block. This forum's member where and continue to be great teachers who's willingness to help is only outshine by their incredible knowledge and experience. It has given me hours and hours of pleasure in learning new things and it is next to my email probably the site I visit most often.

A very warm-felt thanks to David for making this forum available to us and keeping the hp spirit alive (can't wait for the next version of his DVD...)

Cheers

Peter

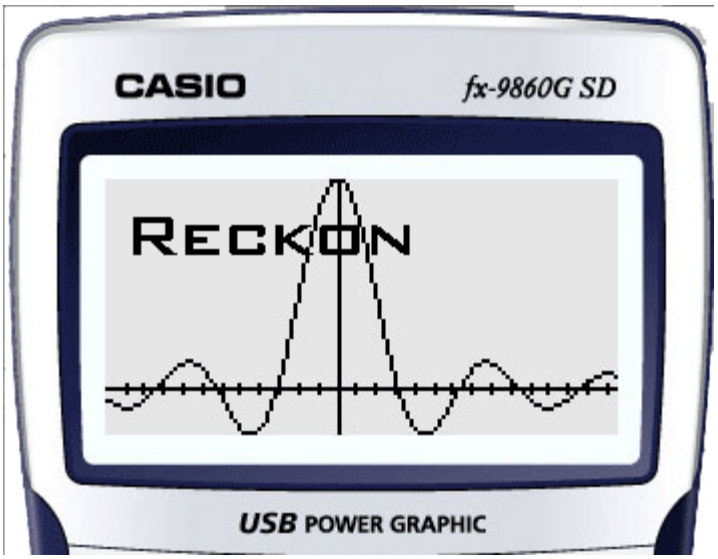
Reckon 1.0 beta released

*Message #1 Posted by **hugh steers** on 5 Mar 2009, 1:30 p.m.*

Hi, This is not about HP calculators, sorry, but it does have RPN!

As promised a while back, i've released Reckon, a free replacement calculator for the casio fx-9860g.



I've created a page where you can download the latest version and also the PDF manual. The manual explains how to operate it.

http://www.voidware.com/reckon

I'm quite pleased with the RPN mode. You can temporarily use ALG subexpessions from within RPN, just by opening a bracket "(". This is really handy for entering formulae.

Give it a go!

Re: Reckon 1.0 beta released

*Message #2 Posted by **Chuck** on 5 Mar 2009, 3:06 p.m.,*
in response to message #1 by hugh steers

Excellent Hugh. I was intrigued about this earlier. Now I have to track down an appropriate Casio.

*Message #3 Posted by **Paul Dale** on 5 Mar 2009, 5:29 p.m.,*
in response to message #2 by Chuck

Mine arrived yesterday. Just in time :-)

Now to figure out how to download the new software.

Still, it is a reasonable little calculator although the complex support seems a bit patchy.

Re: Reckon 1.0 beta released

*Message #4 Posted by **Marcus von Cube, Germany** on 6 Mar 2009, 10:33 a.m.,*
in response to message #3 by Paul Dale

Paul, the extension g1a is only honored when you click on the right most icon in the toolbar to switch to the mass storage view. Then, you can import the file in the "Computer" panel and do a cut&paste to the calculator panel.

Re: Reckon 1.0 beta released

*Message #5 Posted by **Paul Dale** on 8 Mar 2009, 8:35 p.m.,*
in response to message #4 by Marcus von Cube, Germany

My comment was more to do with the fact that I run Windows nowhere and that I'd have to find non-Casio software to allow a download.

I've done this and am playing with Reckon. Look for *xfer9860*.

- Pauli

Re: Reckon 1.0 beta released

*Message #6 Posted by **Katie Wasserman** on 5 Mar 2009, 7:00 p.m.,*
in response to message #1 by hugh steers

Hugh-

Fantastic! Great additional stack depth (in RPN) and super numeric precision and range. I love being about the compute 3000! then take the log of it and find out it's a 9131 digit number. There's a lot to try out in this calculator before I can comment on it.

Thank you so much for this wonderful alternative to the Casio calc and especially for RPN.

-Katie

Re: Reckon 1.0 beta released

*Message #7 Posted by **hugh steers** on 6 Mar 2009, 8:11 a.m.,*
in response to message #6 by Katie Wasserman

Thanks for your kind words,

Im trying some experimental ideas. For example the idea of using a notational operator to denote degrees rather than radians. This might seem a bit odd at first. It has been suggested already that, when i get around to the output format preferences, i implement a default rad/deg mode than can always be overridden by notation, but nevertheless allows for a default as is normally expected.

Whether to have modes and how many is something im experimenting in. Im planning to put output format preferences in the next release. FIX, SCI, ENG etc.

Re: Reckon 1.0 beta released

*Message #8 Posted by **Katie Wasserman** on 5 Mar 2009, 8:01 p.m.,*
in response to message #1 by hugh steers

Hugh,

Do you have some site set up for bug reports, etc., should we email directly to you? This is probably not the best place to post them given the OT nature of this app (even if it is RPN).

-Katie

Re: Reckon 1.0 beta released

*Message #9 Posted by **hugh steers** on 6 Mar 2009, 8:14 a.m.,*
in response to message #8 by Katie Wasserman

Good idea, i'll try to set up a forum that people can post bugs, suggestions and ideas.

A while back i had a forum, but very quickly it became overrun with spambot postings, so i disabled it. I'll have to find out which one people now use that's not going to get hijacked in 24 hours!

I Reckon I will go out and get another calculator ;-)

*Message #10 Posted by **Geoff Quickfall** on 5 Mar 2009, 11:25 p.m.,*
in response to message #1 by hugh steers

Thanks alot HUGH

Now I have to go out and purchase another calculator.....

I don't always get to London for Saturday anymore, usually during the week so how about a pint sometime.

I would need your phone number for that!

Cheers, Geoff

in response to message #1 by hugh steers

Excuse me, Hugh,

may I ask a couple of (perhaps stupid) questions? I don't own an fx-9860g or an fx-9860g slim, but:

1) does Reckon run on both models?
2) Once you have uploaded Reckon, is the original OS lost forever, or Reckon runs upon it as a program, and thus it can be stopped anytime?

Thanks in advance.

-- Antonio

Re: Reckon 1.0 beta released

*Message #14 Posted by **Marcus von Cube, Germany** on 6 Mar 2009, 10:38 a.m.,*
in response to message #13 by Antonio Maschio (Italy)

Reckon appears as an additional application. If you exit it (by selecting another app via the menu) and return later, you're back where you left off. I didn't find a proper EXIT function yet. You loose nothing except some free space. ;)

Re: Reckon 1.0 beta released

*Message #15 Posted by **Antonio Maschio (Italy)** on 6 Mar 2009, 2:43 p.m.,*

*Message #17 Posted by **Patrick Rendulic** on 6 Mar 2009, 12:54 p.m.,*
in response to message #1 by hugh steers

Hello. This seems to be interesting.

I suppose that it also works on the 9860 SLIM? I will get one to try it out.

HP, wake up !!! I started recommending the Casio fx-991ES to my high school students and most have bought one. Lost terrain for HP.

Re: Reckon 1.0 beta released

*Message #18 Posted by **hugh steers** on 6 Mar 2009, 3:01 p.m.,*
in response to message #17 by Patrick Rendulic

Absolutely it works on the "slim"!

Actually, i only have the slim so it's the only _real_ version i've tested. The SDK comes with a virtual version of the non-slim, so i was able to test it insofar as the emulator worked on the non-slim.

The keyboard matrix is different on the two machines. that is the only area that differs in the code. Also, the slim has the backlight and help button. if you push the HELP or F1 key. there is a popup with the current version. Unfortunately, i have to call the OS for this popup to appear and on the slim, you can "escape" into the help system for a while.

Good luck!

Re: Reckon 1.0 beta released

in response to message #19 by Namir

thanks for the comments. I've just posted a v1.01 BTW, it fixes a minor problem with DUP.

Re: Reckon 1.0 beta released

*Message #21 Posted by **Marcus von Cube, Germany** on 9 Mar 2009, 5:45 a.m.,*
in response to message #20 by hugh steers

It comes up with 1.02. And I know which bug must have been fixed. ;)

(Try 69! ENTER F-D)

Re: Reckon 1.0 beta released

*Message #22 Posted by **hugh steers** on 9 Mar 2009, 9:00 a.m.,*
in response to message #21 by Marcus von Cube, Germany

1.01 has the stack lift fixed, 1.02 there are no new features. but last night i was testing proot and

discovered a rare problem with input parsing of vectors. embarrassingly, it would sometimes read 1 character off the end of the input and go bad.

proot is looking quite good tho. I know it wasn't on my list, but i had some half-finished code that didn't make it to the original release.

Is a HP-15C worth 810 bucks?

*Message #1 Posted by **Rainer Wiedemann (Germany)** on 4 Mar 2009, 5:18 p.m.*

A few minutes ago, a HP-15C auction ended at 810 bucks! If you don't believe, have look here: HP-15C auction

Is that little machine really worth that much?

If so, I should look for a safe instead of keeping my collection in a glass cupboard :-).

If the seller reads these lines - congratulations!

Rainer

P.S.: I didn't bid on this item, I only watched and wondered.

Re: Is a HP-15C worth 810 bucks?

*Message #2 Posted by **Paul Dale** on 4 Mar 2009, 5:22 p.m.,*
in response to message #1 by Rainer Wiedemann (Germany)

No.

Exactly.

Re: Is a HP-15C worth 810 bucks?

*Message #7 Posted by **Rainer Wiedemann (Germany)** on 4 Mar 2009, 6:29 p.m.,*
in response to message #5 by Michael de Estrada

Michael,

regarding Picasso et al. you raise a difficult question. What is the value of art? I won't even dare an attempt of an answer, because it's impossible to answer. IMHO the difference between a Picasso (or in general an artwork) and a pocket calculator is the intellectual uniqueness of the artwork, an outstanding effort of the artist, whereas the calculator is an industrial mass product (I do not want to debase the effort of the engineers, I am one, too). So I don't think these can be compared to each other.

Following the link in your posting I noticed, that this HP-42S was the buyer's first auction. The HP-15C was the 33rd article of its new owner. So I conclude, that the extreme bids must also have to do with their buyer's little experience and lack of information. Maybe they had better visited this site before bidding.

Just my two cents.

Have a good night,

Rainer

Re: Is a HP-15C worth 810 bucks?

*Message #8 Posted by **Michael de Estrada** on 4 Mar 2009, 8:00 p.m.,*
in response to message #7 by Rainer Wiedemann (Germany)

Rainer,

I agree wholeheartedly that comparing a vintage calculator to a piece of art like a Picasso is absurd. The point I was attempting to make is that human valuations of collectable items, be they machines like calculators or paintings like a Picasso are often based more on human desire to possess than serious and educated analysis. Many times the purchasers are ignorant but wealthy enough to push selling prices up to ridiculous amounts. I am far from wealthy enough to own an original Picasso or Monet or Degas, so I am perfectly happy to have framed prints of them adorning my walls.

Michael

Re: Is a HP-15C worth 810 bucks?

*Message #9 Posted by **DaveJ** on 4 Mar 2009, 9:44 p.m.,*
in response to message #8 by Michael de Estrada

> Quote:

> I agree wholeheartedly that comparing a vintage calculator to a piece of art like a Picasso is absurd.

Not absurd, just different in the way they are viewed and valued. They can both equally be deemed to be works of art, it's merely a point of view.

The Picasso is a one-off work of art, where the collectible value is deemed to be in the original and not the mass produced copies. Mass produced copies are all but worthless due to their limitless ease of reproduction. Yet the mass produced copy can still be viewed as a work of art.

Calculators like the 15C on the other hand were mass produced in countless quantities, where the collectible value is deemed to be in the physical condition of the original unit. Once production is stopped, they are not easy to reproduce.

Hence if the new 15C comes out that faithfully emulates the look'n'feel of the original, the collectible market will more than likely plummet.

With a mass produced product like a calculator, the "work of art" is usually viewed as the mass produced version itself, and not the original prototype. Although the original prototype would have a collectible value in it's own right.

> Quote:
>
> The point I was attempting to make is that human valuations of collectable items, be they machines like calculators or paintings like a Picasso are often based more on human desire to possess than serious and educated analysis.

Indeed!
But to quote Seinfeld - "Not that there's anything wrong with that!"

Dave.

Re: Is a HP-15C worth 810 bucks?

*Message #10 Posted by **DaveJ** on 4 Mar 2009, 6:34 p.m.,*
in response to message #1 by Rainer Wiedemann (Germany)

It's obviously worth that much to someone.

And just like anything else, other people think it's worthless and would throw it out.

I'd love to see what happens to 15C prices if/when the new emulated 15C is released, it could be a very bad investment indeed!

Dave.

Re: Is a HP-15C worth 810 bucks?

*Message #11 Posted by **Michael de Estrada** on 4 Mar 2009, 8:45 p.m.,*
in response to message #10 by DaveJ

Anyone who buys vintage calculators as an "investment" is a fool. I would hope that most visitors and participants on this forum are collectors, and buy them for the simple joy of ownership and nothing more. I will occasionally sell one of my redundant HP models at auction, but do not expect to make any profit, just

hopefully break even.

As far as the impact of the introduction of a retro HP-15C, I agree that it would likely drastically reduce the prices of the original units at auction. Certainly, we have seen this with the HP-12C, as the original units do not command significantly higher prices than the new units, even though I believe the older units are better quality.

Re: Is a HP-15C worth 810 bucks?

*Message #12 Posted by **Chan Tran** on 4 Mar 2009, 9:47 p.m.,*
in response to message #11 by Michael de Estrada

It's worth that much to the person who bought it! It's not even worth the original price tag to me, otherwise I would have one.

I've heard this before. Is this merely a rumor, or is the new/emulated 15C really on the horizon anytime soon?

As far as Ebay goes, I've learned to just hope someone with more money than sense doesn't get interested in any auctions I'm on.

Re: Is a HP-15C worth 810 bucks?

*Message #16 Posted by **DaveJ** on 6 Mar 2009, 12:39 a.m.,*
in response to message #15 by MikeO

> Quote:
>
> I've heard this before. Is this merely a rumor, or is the new/emulated 15C really on the horizon anytime soon?

It's just a rumor, but it's based on a couple of recent events, namely:
- HP using Eric's nonpareil emulator in the new 12C model
- Nonpareil support has been removed for all other voyager models citing "licensing issues"
- HP recently did a customer survey (through a third party?) that (depending on how you interpreted it) was aimed at swaying the vote toward the 15C.

HP have the new 12C hardware platform in production and the emulator is working, so the only thing they have to do to produce a 15C again is plug in the existing 15C firmware and change the key legends. Bit of a no-brainer decision really...

Dave.

in response to message #17 by Didier Lachieze

> Quote:
>
> .. plus some other things easily overlooked but required for any new product introduction, adding cost that can influence the decision in those tough economic times:

Sure, but the 15C would probably represent a fraction of the cost of a totally new calc design. Calcs based on the new 12C and 20B platforms would I suspect get viewed more favorably due to the GFC. I greatly doubt they will stop working on or releasing calcs entirely.

Actually, during bad times it's well known that technology companies use this as a chance to ramp up their R&D and change direction. HP shaking up the market with a "retro" calc like the 15C may actually be viewed favorably by "the powers that be".

Quote:

- get appropriate regulatory certifications for the new 15C
- prepare user documentation and sales documentation in all languages needed for the targeted countries
- update hp.com web site for all targeted countries
- train service centers and stock service parts
- product launch communication, adds ...
- ...

Excellent, keeps people gainfully employed!
HP have so many new products being released all the time I suspect a few calcs will barely appear on the budget radar...

Dave.

Re: Is a HP-15C worth 810 bucks?

*Message #24 Posted by **Gonzalo Fernandez (Spain)** on 6 Mar 2009, 7:18 a.m.,*
in response to message #23 by Michael de Estrada

These prices are fabulous, I doubt people pay such prices, there must be an arrangement between the seller and buyer to set a fair price after auction ends. I don´t have such sum on money to spend for a calculator, the maximum I have spent on a single calculator was $180 for a very well condition HP41CX with the case and manuals.

Re: Is a HP-15C worth 810 bucks?

*Message #25 Posted by **Dan Grelinger** on 6 Mar 2009, 11:27 a.m.,*
in response to message #24 by Gonzalo Fernandez (Spain)

Those are pretty outrageous suggestions. I have bought and sold stuff on ebay as a collector for almost 15 years, and never have I participated in such a transaction, or even been approached about one. It may be possible that the bidder backs out of the deal before paying (happens rarely, but happens), or tries to negotiate a lower price after receiving the item, due to it perceived to not be as described. Otherwise, there is no motivation for a seller to negotiate a lower 'fair price' after auction end.

Re: Is a HP-15C worth 810 bucks?

*Message #26 Posted by **Michael de Estrada** on 6 Mar 2009, 11:50 a.m.,*
in response to message #25 by Dan Grelinger

I agree. I have sold a dozen or so calculators over the years, and have yet to have a problem with payment or buyers approaching me with under-the-table deals. Of course, I am very detailed in my listings, such that the likelihood of any misunderstanding regarding the condition of the item is minimal. Also, I am very cautious regarding the bidders that I accept, and if someone were to email me with a proposed questionable transaction I would block him (e.g. the Brazilian who asks that I lie on the customs form).

Re: Is a HP-15C worth 810 bucks?

in response to message #26 by Michael de Estrada

I could be wrong, I never have sold items in Ebay, but some time ago I commented to a local Ebay seller the high prices reached by vintage calculators, he was aware of this and told me that were arrangements if the final auction price was very high.

Re: Is a HP-15C worth 810 bucks?

*Message #28 Posted by **Michael de Estrada** on 6 Mar 2009, 2:43 p.m.,*
in response to message #27 by Gonzalo Fernandez (Spain)

Well, none of my items have sold for unreasonable amounts, and I have never bid stupidly high amounts that I was unwilling to pay. Yes, there are all kinds of people buying and selling on various sites, but generally the dishonest ones don't last very long.

Re: Is a HP-15C worth 810 bucks?

*Message #29 Posted by **Don Shepherd** on 6 Mar 2009, 3:30 p.m.,*
in response to message #27 by Gonzalo Fernandez (Spain)

I'd say that local Ebay seller was misinformed. If I were a seller (which I've only been a couple of times) and one of my items ended at a very higher than normal price, I would expect the buyer to pay that price, or I would report him/her to Ebay. I wouldn't "bargain."

What's the place of a handheld calculator?

*Message #1 Posted by **David Hayden** on 3 Mar 2009, 9:02 p.m.*

When calculators were first developed, they had unquestionable value. Simple scientific calculators had much higher precision than slide rules or tables, and they were easier to use. But in today's world of PCs, laptops, cell phones and PDAs, what do you think is the place of a calculator?

Personally, I think calculators have the following useful qualities:

1. inexpensive
2. instant on
3. relatively long battery life
4. relatively durable
5. ease of use for what they do

I see two main uses for such an appliance. The first is education. Graphing calculators and symbolic solvers can help kids learn math concepts (although one can argue that they also make people lazy about applying the concepts too!). Basic scientific calculators are as useful in schools today as they were 30 years ago.

The other use is for special-purpose applications that are performed "in the field" where a PC or laptop may be cumbersome. A quick check of hpcalc.org will show lots of such applications. Just today I pondered using a calculator as an employee time clock.

I'm curious what others think is the place of our beloved calculators in today's world?

Dave

Re: What's the place of a handheld calculator?

*Message #2 Posted by **DaveJ** on 3 Mar 2009, 9:18 p.m.,*
in response to message #1 by David Hayden

I'd add to the list

- Ubiquitous

They are cheap enough to have one everywhere. On your desk at work or home, in the lab bench, in your toolbox, stuck on your fridge, in draws etc.

- Relatively consistent user experience

With some exceptions, most people can pick up ANY calculator and do basic math. The same can't be said of PC's or phones etc in which you have to *find* the calculator first and then struggle with whatever app they have.

I can't ever imagine not having a handheld calc on my desk at work or home, they are just so essentially convenient. I only use a phone or PC if a handheld calc is not readily available, and about the only place that

happens is when I'm mobile.

As an electronics engineer my handheld calc is essential simply because it's hand held. I can put in on my schematic or catalog when I calculate stuff, I can take it into a meeting, I can swing around to my colleagues desk with it in hand, it's right on the lab bench when I need it etc etc. I don't have to look up at some PC screen on the adjacent desk and struggle for the mouse etc. The PC isn't even close to that functionality, and phones are a pain, mine sits in the bag where it belongs when I'm at work or home.

As always, horses for courses.

Dave.

in response to message #1 by David Hayden

They are still indispensable for engineers engaged in basic design calculations, field work and testing. I was a practicing engineer for nearly 40 years, and used my pocket calculator as much at the end as I did at the beginning, despite the availablility of computers and other gizmos. My last calculator (which the company issued to me) was an HP-32SII, which I found uniquely useful because of its ability to do fractional arithmetic, since many civil/mechanical general arrangement and layout drawings show dimensions as fractions. I could take my tape measure out to the shop floor, obtain some dimensions, and then combine them so the draftsman could make a drawing. I am not aware of any cell phones or PDA's that can do this. Also, I just like the feel of mechanical click buttons.

Michael

In my shirt pocket, save for the 41 which was a huge clunk. Useful at the desk or in conference. The 65 and later saved your work so you could take it home. There was no computer option so it sufficed for all. It was there where you were when you needed it. My boss used my 35 to win a spirited negotiation with a large company throwing new numbers at him, he threw numbers right back. You get handy with it so it speeds your work. Sam

in response to message #6 by designnut

For me, my shirt pocket. A minimum of a dozen times a day I take my calc out of my pocket to do some number crunching. Cannot imagine not having one available within hands reach, though I have four or 5 various HP's on my desks. Having always worked in a very dusty environment (farmer/rancher) I chose a clamshell RPN calc...the Aurora FN1000 (crummy key board and all). Knowing they were no longer manufactured I bought some extras. The pda's (have several TX's also) and cell phones have their place, but they will never replace a calc for me.

I find is strangely comforting that someone working in a profession that pre-dates writing, numbers and even civilization itself finds a handheld calculator indispensible.

in response to message #5 by Antonio Maschio (Italy)

Reth,

I think you hit it on the head. In my opinion, it is the main reason why this web site exists, why we attend HHC conferences each year, and so on. I think we associate something special with these machine--a special time in our lives where we had so much promise and potentials.

The truth is, the least powered laptop today can run circles around the vintage programmable calculators. I have several power PCs that can do things that I could only have dreamed of in the seventies and eighties!!!

Re: What's the place of a handheld calculator?

*Message #10 Posted by **Michael de Estrada** on 4 Mar 2009, 1:51 p.m.,*
in response to message #9 by Namir

I disagree. PC's do not replace simple hand-held calculators (HHC), they complement them. I ported my Fortran engineering programs from mainframe computers to PC's when the latter developed the necessary capacity and speed, however, I still needed my HHC for many simple tasks and for its mobility. I also used it to check the results from canned engineering programs on my PC, because however sophisticated a program, it cannot think and is still vulnerable to the GIGO principle (garbage in garbage out). Performing calculations manually on a HHC forces you to

think, whereas, PC computer programs do not.

Just my 2 cents, Michael

Re: What's the place of a handheld calculator?

*Message #11 Posted by **Garth Wilson** on 4 Mar 2009, 5:07 p.m.,*
in response to message #10 by Michael de Estrada

It is irrelevant that a laptop has loads more power. My 71 with its modules has loads more power than my 41cx and its modules, yet I seldom use my 71, and I use my 41 every day, sometimes even starting the day with it (as my 41 and 71 are my only alarm clocks). A laptop is not nearly as portable, and I don't have room for one on the workbench. There's also the matter of stability that is so lacking in laptops, cell phones, and other consumer equipment. Some of the programs I've used on my 41 have been in it continuously for 20+ years. I don't have to think about moving them over to a new platform every couple of years.

I use my 48 and 49 calcs as alarms. I program my own "songs" that are in weird keys--going from consonance to dissonance.

Does the speaker get worn out?

The HP 20B direction?

*Message #13 Posted by **Geoff Quickfall** on 4 Mar 2009, 1:44 p.m.,*
in response to message #1 by David Hayden

The question:

That is a good question and should elicit as many differing responses as there are members! I think this is the quandary HP finds itself in today.

Can you make money on a stand alone calculator. Of course, if you can corner the high school and university market with an “approved” calculator, that would be lucrative. But calculator for the masses, we have them, ranging from the generic to the high end graphing systems.

My use today:

I still use my HP41CX system in the cockpit. The current cockpit is a state of the art Boeing 777, yet the on board system still does not correct altimeters for temperature differences below -10C. On legs greater than 9 hours we have extra crew which relieve the acting pilots to allow rest periods. Rest periods have been automated by my HP 41CX and the infrared printer. These rest periods are not simply equal time periods but are tailored to flight length, passenger meal service (noisy) and pilot preferences. My 41 program adapts to all possible choices I have encountered.

What I would like to do:

Now I realize I can do this all on my HP 210 with a 41-emulator, which I have. I chose the 41-emulator as the programs do not have to translated for use. Problem with the emulator is you require a $200 to $400 hand held system to use it (HP210, iphone, etc.,). I am examining the possibility of converting the HP 20b into a

dedicated, in house system that other pilots would desire (DUE TO THE LOW COST AND PILOTS BEING INHERENTLY CHEAP). The program set would be tailored to aircraft type, route structure and provide the suite of applications that the onboard system does not supply.

The suite of programs include:

```
1.      latitude/longitude keys for Great Circle/True Track
        computation.  This is not for flight planning but as an
        independent check of the onboard navigation system.  This
        would eliminate gross navigational errors due to vendor
        (data base supplier info) and input error (pilot).  That
        is, the old garbage in; garbage out

2.      altimeter temperature corrections which would apply to
        specific airport local altitudes used on approaches.
        Strictly a northern or cold weather specific application.

3.      altimeter error on days with barometric pressure greater
        the 31.00mb

4.      a break schedule program

5.      a gmt time/day/date program

6.      a data base for various static data; phone numbers, door
        codes…..
```

Conclusion:

The calculator (20B) provides an excellent cost versus the multi function platforms. A dedicated keyboard with preformatted silk screened keys or overlay would make the operation an ease. Programming language be it simple RPN, RPL, Basic need not be required for the operator.

I think that is the direction that calculators appear to heading. Preformatted, dedicated systems used by specific industries.

Cheers, Geoff

I agree and I hope that HP is reading this thread. That's part of why I posted the question. If they can clearly define the purpose of an HHC then they can build better ones.

> Quote:
>
> I think that is the direction that calculators appear to heading. Preformatted, dedicated systems used by specific industries.

Yes, I think this is an important use for HHC's. Over the past few months I've made several posts in different forums advocating for keyboard overlays on a 50g successor. Without them, dedicated applications seem quite hard to me. And HP could make some money selling overpriced overlay templates. :)

Thanks for sharing your thoughts, Dave

*Message #15 Posted by **Jandro Kirkish** on 4 Mar 2009, 2:16 p.m.,*
in response to message #1 by David Hayden

What everyone said. Especially speed, though. Often I reach for a handheld for a quick calculation, or to confirm what I've worked out in my head, and to wait while a computer or pda sim initializes sort of takes the spontenaeity out of it. And the UI of a real calc can't be beat--I could never use a calculator with a mouse for long. Too slow! (The iPhone/iPod Touch HP emulators come close, but they still take time to initialize.) I use my HP35s when I work with fractions or solving simple equations like calculating the magnification of a telescope eyepiece given its f ratio, aperture and focal length--or any permutation of the above. Solving a RPN program is a real timesaver and is very simple on the HP-3X series calcs. I've been reading a lot of astrophysics books for fun lately and find the built in units in the HP-28s indispensable when working the problems, once I organized them into submenus like length, time, mass etc. a la the 48-50g series. I can do more on my 50g but it fails the all-important pocket test. Moreover, while I like the CAS available on newer models, I more often need a number as opposed to a symbolic solution. Let's just say I haven't needed to calculate with Groebner bases in quite a while.

in response to message #1 by David Hayden

Working as an engineer (with questions concerning materials and structrural integrity) I use my calulator a lot. Doing simple calculations on a PC (or a PDA for that matter) is much slower than using a calculator. Of course, for heavy number crunching the handheld calculator cannot compete and you need a PC, but far from all calculations are like that. Looking around at my colleagues desks I see calculators on all of them so I certainly think they still have their use.

> /Michael

Indeed they do. The simplest tool will always win. For example, you don't see many people using those fancy interchangeable tip screwdrivers on a daily basis, as you just can't beat the simplicity of having a

basic #1 Philips driver on hand when you want to take out just one screw.

Same with calculators. And looking at my colleagues desks, the simpler the tool wins there as well. And being curious over the years I've asked lots of people about the calculator they have on their desk, and the response is almost always the same - they just want something simple to do basic calculations. Most of them had a fancier programmable calculator in school/uni, but now most of them have switched to a basic scientific or even a 4-Banger because that's all they need 99% of the time. And why don't they just use their PC or phone? - because they are a PITA to use, about as far from simple and effective as you could imagine.

I've also found HHC's even more appropriate for non-technical people, as they just find their PC or phone too fiddly to use when all they want to do is add up their credit card bill.

Dave.

Hello,

For some of us a Swiss Army knife with a Phillips screwdriver will do. It is not a one-size-fits-all thing, though, but it does the job.

It is the same thing with a calculator. Like paper and pencil and most tool, it is an extension of our brains, or so it seems to me.

This made me notice something.

Last week I had to check GPS data for a car trip. I used one of my HPs to do it, and left it in the car. It has been sitting there for about ten days now, and I am beginning to think of it as another tool to have aboard.

Geoff has told us about his 41 (and 67) and its applications onboard a sophisticated jet.

Dumb question: does anyone have an HP on his/her car?

> size-fits-all thing, though, but it does the job.

Now this is an interesting example that again highlights my point that an optimised tool is often the preferred choice.

I *always* carry a SAK in my pocket, and it has a very nice philips screwdriver on it. Yet I will almost always go that little extra to reach into a draw and pull out a real screwdriver when I need to undo one screw - why? It's because the "user interface" on a real screwdriver is optimised for the job, it's just quicker and easier to use. I don't have to flip the SAK to the right side, then the right rotation, then open the blade, then twist it all around to get it into a comfortable position. The real screwdriver I just pickup and use.

The same goes for the ball-point pen on my SAK. Very useful when I don't have a proper pen with me, but I'll reach for a proper pen over the SAK any time. And I'll carry a proper pen with me when I go into a meeting for example.

There are countless other examples, like my new Nokia E71 phone for example. Great for surfing the web, email, GPS etc, but hopeless at just making a simple phone call. My old Nokia 6300 was MUCH better in that respect because it was a phone and not much more, and my older phone before that had even fewer features...

Dave.

I keep my HP 28C in the car (the 28S is in my apartment) along with a flashlight and one of those thick Swiss Army Knives with dozens of features. I chose the 28C for auto duty because it's otherwise the least used and the conversions come in handy.

For me, a hhc is used primarily for....SURPRISE...calulating and playing "what if" with numbers via a pgrm. I find it comforting to do it where I please; desk, easy chair or in " the field" something I cant do with a computer-The small size, the reassuring click of the keys and no noise. I think the pefect analogy would be reading a a real book vs an electronic box, no batteries,lighted screen, buttons to push etc. besides did you ever try to press a leaf with the electronic reader?!

*Message #22 Posted by **Ed Look** on 5 Mar 2009, 11:43 a.m.,*
in response to message #21 by Howard Lazerson

I was about to post something similar- I can take my Spice (when it was still fully functional), Pioneers, even my HP graphing calcs (whatever their line is called) to do a quick and dirty calculation, full-blown-thought-out calculation, program, even play a game...

... in bed, or in front of a ballgame on the couch.

I don't like the idea of that with a laptop, and heh, imagine a desktop PC sitting on the covers over your belly, with the monitor on top... and then you want to get out of bed for a glass of water.

sigma function in solvers

*Message #1 Posted by **Don Shepherd** on 3 Mar 2009, 12:36 p.m.*

Yesterday a college student asked me if it was possible to use the solver in the 17bii+ to implement the following equation:

I created the following solver formula:

```
ERLANG=(R^M/FACT(M)) / (1+SIGMA(I:1:M:1:R^I/FACT(I)))
```

Since many formulae require the summation, or sigma, function, I was wondering why it was not included in the 33s and 35s. Did the designers assume that, since those models allow keystroke programming (so you could "roll your own" sigma function), it just was not necessary? I would think it would have been nice to include the sigma function in the solver without requiring the user to learn keystroke programming.

Re: sigma function in solvers

*Message #2 Posted by **Peter A. Gebhardt** on 3 Mar 2009, 4:18 p.m.,*
in response to message #1 by Don Shepherd

Don,

how do you solve for M (the # of servers in the ERLANG B formula, if given R "Erlangs")???

Just tried it on my 200LX - and get "Bad guesses".

Best regards,

Peter A. Gebhardt

Re: sigma function in solvers

*Message #3 Posted by **Don Shepherd** on 3 Mar 2009, 7:15 p.m.,*
in response to message #2 by Peter A. Gebhardt

Peter, the student that asked about this, he knows R and M, and he solves for ERLANG. I don't know enough about it to say more than that, but it seemed to be an easy formula for the 17bii+, given the sigma function.

Re: sigma function in solvers

*Message #4 Posted by **Peter A. Gebhardt** on 4 Mar 2009, 6:47 a.m.,*
in response to message #3 by Don Shepherd

Thx. Don.

So I repost my above question to the other readers:

What causes the HP200LX solver (and I guess the 17b/19b-family solvers too) to refuse to calculate M in Don's above implementation?

Is this a problem of the solver 'per se' or a mathematical 'impossibility'?

Best regards,

Peter A. Gebhardt

Re: sigma function in solvers

*Message #5 Posted by **Marcus von Cube, Germany** on 4 Mar 2009, 8:27 a.m.,*
in response to message #4 by Peter A. Gebhardt

My 19Bii fails early: It does not seem to allow the FACT function in a solver equation. :(

EDIT: That must have been a typing mistake, now the formula works. It looks like the problem does not have a solution for certain combinations of R end ERLANG.

What does the formula compute and what would be reasonable input?

Edited: 4 Mar 2009, 8:46 a.m.

ERLANG B Was: sigma function in solvers

in response to message #7 by Marcus von Cube, Germany

Marcus, the student that asked me about this provided a copy of a page of his textbook which showed that, for r=0.67 and m=3, the probability is 0.0255 (from a lookup table in the textbook). My formula returned probability 0.0258. I can send that page to you if you want, because is does describe this function with a bit more detail.

Re: ERLANG B Was: sigma function in solvers

*Message #9 Posted by **Marcus von Cube, Germany** on 5 Mar 2009, 2:58 a.m.,*
in response to message #8 by Don Shepherd

Just offer a scan for download here. I'm hopefully not the only one who is entertaining his brain with some "new" math. :)

With the given values, the 19BII solves happily for M. If I change the value of ERLANG to the result given in the original paper, the solver approaches 3 but cannot reach the exact value for ERLANG, due to the fact that FACT returns an error for non integer arguments which makes the solver retry.

I've modified the equation slightly:

```
ERLANG=(R^M/FACT(IP(M)) / (1+SIGMA(I:1:M:1:R^I/FACT(I)))
```

Now I get 3,02707 for ERLANG. It's the continuous R^M part that makes this possible.

in response to message #9 by Marcus von Cube, Germany

Here is that little textbook writeup on this function, along with the lookup table.

Re: ERLANG B Was: sigma function in solvers

*Message #11 Posted by **Marcus von Cube, Germany** on 5 Mar 2009, 9:51 a.m.,*
in response to message #10 by Don Shepherd

OK, I got it. Erlang B is the probability of loss (all servers busy) where R is the ratio of service time : average arrival rate and M is the number of servers.

Thanks for the link.

Re: ERLANG B Was: sigma function in solvers

*Message #12 Posted by **Peter A. Gebhardt** on 5 Mar 2009, 5:11 a.m.,*
in response to message #9 by Marcus von Cube, Germany

Marcus,

Thx. a lot! From your findings an advice given (independently of SIGMA) could be:

"One should check the usage of variables that are supposed to stay integers

during the whole calculation."

Best regards,

Peter A. Gebhardt

in response to message #1 by Don Shepherd

Don,

We explored the possibilities of the 35S solver here and concluded the it needs a G() function to solve equations like this but has a functional L() and can iterate. I don't know why they allowed for STO in equations but not RCL, it make no sense at all.

-Katie

Don, Greetings! Excellent post! Two quick observations:

1. The sigma function can be implemented in loops if not explicitly accessible. This is often faster since many of the Calcs that have a SIGMA function also incorporate single/double/x^2/y^2 etc into the Sigma+ key (e.g. 42s). I think most of the time these are not needed, so it's faster to run a summation loop to sufficient accuracy.

2. For many (I think not all..) summations, there is a general closed-form solution. (e.g the Change for a Dollar solution that Egan Provided)

Re: sigma function in solvers

*Message #15 Posted by **David Hayden** on 3 Mar 2009, 8:47 p.m.,*
in response to message #1 by Don Shepherd

The hard part about calculating the Erlang formula is that it's easy to exceed the precision of the calculator if you do the calculations in the wrong order.

Dave

Hi, Don --

> Quote:
>
> Since many formulae require the summation, or sigma, function, I was wondering why it was not included in the 33s and 35s.

The crux of the matter is that the HP-33s/35s equation editor is fundamentally the one ported from the algebraic HP-22S into the RPN HP-32SII in 1991 and subsequently carried forward; it is not the more-advanced implementation of the HP-17B/27S.

The Sigma operator for the HP-17B/27S equation editor will, by looping, compute finite series using an expression that defines every term. (Sigma+, by contrast, only adds a single datum to a summation.) The HP-17B/27S does not use summation for statistics, so there is no Sigma+ function.

The HP-22S equation editor allowed only programmable calculating operations -- or most of them -- defined on its keyboard. Sigma+ is one that was not supported, because it is not very practical for an equation. Sigma as a construct used in equations, however, might have caused confusion with Sigma+.

Restoring the colour of ABS plastic

*Message #1 Posted by **Steve (Australia)** on 2 Mar 2009, 10:58 p.m.*

Seems like some people have been researching good ways to reverse the yellowing of ABS plastic with age.

This may be useful to somebody here too :-)

http://retr0bright.wikispaces.com/

Re: Restoring the colour of ABS plastic

*Message #2 Posted by **Walter B** on 3 Mar 2009, 1:23 a.m.,*
in response to message #1 by Steve (Australia)

Hmmh, I read this (the last picture made me suspicious) and checked the links a bit, and eventually that's looking like a hoax to me d:-)

Edited: 3 Mar 2009, 1:27 a.m.

Re: Restoring the colour of ABS plastic

*Message #3 Posted by **Steve (Australia)** on 3 Mar 2009, 6:14 p.m.,*
in response to message #2 by Walter B

What, you don't think there's be anyone who's collect stuff as weird as Commodore 64 computers? :-)

There's a lot of discussion about this on the web, and it seems there's some history too. I wouldn't be so quick to declare it a hoax.

However I do wonder if it will result in any long term issues.

I have a friend who is a Commodore 64 collector (wait, do they exist?) and he plans on trying this technique on a particularly badly affected unit. If he does so, I'll get back with the results.

Re: Restoring the colour of ABS plastic

*Message #4 Posted by **Ronald P** on 3 Mar 2009, 10:59 a.m.,*
in response to message #1 by Steve (Australia)

Hi,

I did put some yellowed casing in a mxture of +/- 25% Cloric and 75% water, that is chloor containing cleaner for the toilet and heated this to around 40 degrees. If you ensure the solution is stirred regularey you will also see it bleaches the yellow color away. Be carefull were you do it, the vapour is 200% sure not healthy to breath.

Re: Restoring the colour of ABS plastic

*Message #5 Posted by **Earl Kubaskie** on 3 Mar 2009, 10:01 p.m.,*
in response to message #4 by Ronald P

Take care with your eyes, too. I had a case of conjunctivitis once, triggered by fumes from the use of bleach to clean tile.

Waking up in the middle of the night, unable to open your eyes, is NOT fun!

Re: Restoring the colour of ABS plastic

*Message #6 Posted by **Steve (Australia)** on 4 Mar 2009, 4:16 a.m.,*
in response to message #4 by Ronald P

I'd be careful with that, Chlorine is reported to make ABS plastic brittle.

Still Looking for new scans

*Message #1 Posted by **Dave Hicks** on 2 Mar 2009, 11:36 a.m.*

I'm working on the 7th version of the DVD and CD sets so I'm looking for more document scans. If we can find enough new material, Version 7 should come out some time this year.

Here's what we have:

Documents already on DVD V6

Documents already promised for DVD V7

I'm looking for any manuals that are missing. There should be many more Non-English manuals than we have. There are probably still a few English manuals missing as well.

Also I'd like to get scans of individual User's Library Programs. I have the ones listed in the document above but I'm sure there are many more floating around...

Also HP-65 Key Notes. I have only Volume 1 numbers 4 and 5, and volume 2 number 1. Others are needed. - This is HP-65 Keynotes - published from 1974 to ... 1977? - not the later HP Key Notes which we already have on the DVDs.

Here's information on scanning and transmitting documents.

There are basically two standards for scanning: for new manuals, they just need to be readable, though as nice looking as possible is always nice. If you want to submit an improved color scan of an existing manual, my standards are higher. For replacements, I'm looking for really nice scans - fully illuminated from corner to corner, straight etc.

If you have some manuals you can scan, please contact me and I'll add you to the list.

Currently I have a big stack to scan myself, so I'm looking for scans rather than loans of more manuals to add to my stack. If you have a manual but not a scanner, please try to contact someone on the forum for scanning.

Re: Still Looking for new scans

*Message #2 Posted by **Didier Lachieze** on 2 Mar 2009, 12:09 p.m.,*
in response to message #1 by Dave Hicks

Hi Dave, first many thanks for the work your doing on the DVD set. It's amazing to see such a collection of valuable HP calculators related documents going even better!
Now a few points regarding the documents promised for the DVD V7 (my little contribution):
1) The HP-41C/CV Dutch Operating Manual I've sent to you is missing on the DVD V7 page.
2) I'm currently scanning the HP-32S French Owner's Manual (180 pages done already - high quality, as much as I can)
3) I've two others manuals you can add to the DVD V7 list: HP-41C Standard Applications (French) & HP-41C Stat Pac (French)

Re: Still Looking for new scans

*Message #3 Posted by **Dave Hicks** on 2 Mar 2009, 6:03 p.m.,*
in response to message #2 by Didier Lachieze

OK, I've added those to the list plus a couple that were emailed. Thank you!

Re: Still Looking for new scans

*Message #4 Posted by **Bob Patton** on 2 Mar 2009, 9:28 p.m.,*
in response to message #1 by Dave Hicks

Hi Dave, I have HP-65 Key Note V2N3, V2N2 and V2N3 I can scan for you.

Re: Still Looking for new scans

*Message #5 Posted by **Dave Hicks** on 3 Mar 2009, 12:16 a.m.,*
in response to message #4 by Bob Patton

Thank you Bob! Two of those numbers look the same to me. Are there 2 or 3 issues?

Does anyone have any other HP-65 Key Notes?

Re: Still Looking for new scans

*Message #6 Posted by **Bob Patton** on 3 Mar 2009, 9:47 a.m.,*
in response to message #5 by Dave Hicks

Sorry about that typo. It's V1N3.

Re: Still Looking for new scans

*Message #7 Posted by **Dave Hicks** on 4 Mar 2009, 1:10 a.m.,*
in response to message #6 by Bob Patton

Thank you Bob! I've added these to the list.

Re: Still Looking for new scans

*Message #8 Posted by **Philippe Lasnier** on 4 Mar 2009, 8:36 a.m.,*
in response to message #1 by Dave Hicks

Hi David,

Sorry to butt in, but in scanning your list to see if I could help (in my very modest way), I noticed that you mention "The HP 48 Handbook (James Donnelly)".

Would that be the first edition, or the second edition?

They are quite different (I noticed that while looking around - I am still looking for the 2nd edition).

Regards,

Philippe

HP-42S ROM download to HP-48G?

*Message #1 Posted by **Thomas Okken** on 1 Mar 2009, 1:31 p.m.*

Hi all,

Some time ago, the hard drive where I used to keep Emu42 and my collection of Pioneer ROM images died, and it appears I don't have a back-up of it either. I would like to get at least the HP-42S ROM image back, since I need it for testing Free42 (occasionally I have to compare it to "the real thing" to make sure I've gotten the little details you can't find in the manual right)... For now I'm using my real HP-42S, but I feel a bit uneasy using that museum piece for testing. ;-)

I downloaded the latest Emu42 from Christoph's web site, and also his Pioneer ROM extraction package, but it turns out that you need at least an HP-48G+ to receive the ROM image, and I only have a humble HP-48G, which of course does not have enough RAM to hold the whole HP-42S ROM in once piece.

Is there a way to download the ROM in smaller pieces? Or would someone be willing to help me with this -- I could send them my 42S, or they could send me their 48G+, etc., I would of course pay for all costs incurred in the operation.

- Thomas

Problem sending data via IR from HP48 to HP50g

*Message #1 Posted by **Michael de Estrada** on 1 Mar 2009, 12:30 p.m.*

I am having trouble sending data from my HP 48SX to my HP 50g via the IR ports. I have both calculators configured for I/O via IR, binary data, CKSM = 3, and 9600 baud (I don't think this matters). I have tried setting the HP 50g to be both an Xmodem server and manual receive. When I issue the send command on the HP 48sx, it goes through several retries, then times out with an error. Similarly, the HP 50g using manual receive tries unsuccessfully to communicate with the HP 48sx.

Any assistance will be appreciated.

Thanks, Michael

HP 48 cannot communicate with HP 49/50 via IR

*Message #2 Posted by **Michael de Estrada** on 1 Mar 2009, 11:11 p.m.,*
in response to message #1 by Michael de Estrada

I've done some more research, and it appears that the IR communication port in the HP 48 series calculators (except the HP 48gII) is not compatible with the later HP 49 and HP 50 series calculators. Although the protocols and commands are the same, the actual signals are not, so the two calculators cannot communicate. Therefore, the only way for me to transfer my equations and programs from my old HP 48SX to my new HP 50g will be the tedious process of 1) transfer files from HP 48SX to old DOS PC using serial cable 2) transfer files from DOS PC to floppy disk 3) transfer files from floppy disk to Windows XP PC 4) transfer files in Windows to HP 50g using USB cable.

Well, I guess this is the price of progress.

Re: HP 48 cannot communicate with HP 49/50 via IR

*Message #3 Posted by **reth** on 1 Mar 2009, 11:49 p.m.,*
in response to message #2 by Michael de Estrada

You can skip all tedious steps by buying >$5 serial to USB adapter

in response to message #4 by Michael de Estrada

http://www.newegg.com/Product/ShowImage.aspx?Image=12-200-141-01.jpg&S7ImageFlag=0&WaterMark=1&Item=N82E16812200141&Depa=0&Description=StarTech%20ICUSB232%20USB%20to%20RS-232%20Serial%20DB9%20Adapter

I'm sure you can figure out how that works. :-)

You'll want to get one that uses the prolific chipset. The easiest way is to look for one that is tranparent blue on the case and has those two pointed nobs on the top and bottom. I have used almost all chipsets availalbe on the market and none of them have been problem free at less common baud rates, flow control, etc.

in response to message #7 by deleted

You send whatever from hp48 to your computer (win-xp) first and then from the computer to HP50. You can't connect HP48 to HP50 directly with those adapters

Edited: 2 Mar 2009, 12:43 a.m.

Re: HP 48 cannot communicate with HP 49/50 via IR
*Message #9 Posted by **Michael de Estrada** on 2 Mar 2009, 12:56 a.m.,*
in response to message #8 by reth

Aha! (Light bulb goes on inside aging DOS brain). I did not know that an RS232 serial port could be morphed into a USB port. So, the only thing I'm not sure of is will Windows recognize my HP 48SX calculator as the device attached to that port, given that the USB drivers are meant for the HP 50g. Anyway, it's worth a try for less than $10.

Thanks for your patience and help.

Michael

It will for sure, hey, that's the great HP48 after all ;)
Cheers

Re: HP 48 cannot communicate with HP 49/50 via IR
*Message #11 Posted by **Tim Wessman** on 2 Mar 2009, 9:57 a.m.,*
in response to message #9 by Michael de Estrada

Another posibility is that you can actually connect the calculators directly to transfer if you buy the 50g serial cable sold on hpcalc.org. The 50g serial cable will plug into the 48 serial cable and you can talk using kermit. The 50G has a non-standard serial that needs some power and circuitry to work its magic.

Re: HP 48 cannot communicate with HP 49/50 via IR
*Message #12 Posted by **Michael de Estrada** on 2 Mar 2009, 11:21 a.m.,*
in response to message #11 by Tim Wessman

Now you're talking! This is what I really wanted to do in the first place. The price of this cable is about the same as one of those USB to RS232 serial adapters with the fancy Prolific chipset. I already have the RS232 serial cable for my HP 48SX, so I'm set, and there's no need to load new software on my computer. This reduces the 2-step procedure (HP48SX to PC to HP50g) down to a 1-step direct procedure (HP48SX to HP50g).

After checking out the hpcalc.org site, I learned something else about my HP 50g. I can save the batteries, by powering it from the PC with the USB cable. Apparently, the HP 50g has the smarts to do this, similar to other USB devices like my mpeg player.

Thanks for the help!

Michael

Glad to know that will work best for you.

Those prolific ones tended to be on the cheap end of the scale when I was last looking for a supply a year ago. Wonder what happened since. . .

Can an HP 50g print via IR port?

*Message #1 Posted by **Michael de Estrada** on 1 Mar 2009, 10:19 a.m.*

I recently purchased an HP 50g after living for nearly 20 years with an HP 48SX. The HP 50g seems to have all the capabilities of the HP 48SX, except that it seems to lack the capability to print via the IR port to my HP 82240B IR thermal printer. I cannot find any printer keys or menus on the calculator, or any reference to printing in the documentation (user's guide and user's manual). Curiously, there appear to be some flags that relate to printing, such as flag 34, which toggles between "Print via IR" and "Print via wire". This is the same flag that is used in the HP 48SX, but I am thinking that this may just be vestigial for a feature (printing) that is no longer supported in the HP 50g. Anyway, if anyone can shed any light on this, I'd appreciate it.

Thanks, Michael

Edited: 1 Mar 2009, 3:45 p.m. after one or more responses were posted

Re: Can an HP 50g print via IR port?

*Message #2 Posted by **Mike Morrow** on 1 Mar 2009, 10:30 a.m.,*
in response to message #1 by Michael de Estrada

Yes. AFAIK, the HP82240 printer is the ONLY one supported by the HP50g for printing, even though it is no longer sold. The B version is default, but the older A version can be used with support of the OLDPRT command.

The CAT function will show you a lot of recognizable print commands starting with PRxxx (but most listed PRxxx commands are not printer related).

If you download the HP50g User Manual and the HP49g+ Advanced User Reference, then search the pdf file for "print", you'll see all that's available.

The IR output range of the HP50g is very very short, so try again with the IR ports aligned very closely.

*Message #3 Posted by **Michael de Estrada** on 1 Mar 2009, 12:04 p.m.,*
in response to message #2 by Mike Morrow

Thanks for your help. The HP 50g user's manual, which I already have, contains nothing on this subject, however, as you point out the HP 49g+ advanced reference manual does cover this subject. I just verified functionality with the PRST (print stack) command on my 82240B printer. I find it amazing that HP makes no mention of this in either the printed or CD documentation that is included with the calculator. This is in stark contrast with the excellent detailed documentation that HP provided with my HP 48SX.

in response to message #4 by reth

Actually, the HP 82240B IR printer is a very common item on ebay, and costs a lot less than the source that you list. I paid about $50 for mine several years ago, including the ac adapter and a very nice HP soft leather case, and it was in mint condition. Right now as I write there is an ebay auction going on with less than 2 hours to go for a new one in the box and the price is still under $40.

Re: Can an HP 50g print via IR port?

*Message #6 Posted by **reth** on 1 Mar 2009, 11:43 p.m.,*
in response to message #5 by Michael de Estrada

I only pointed that they are still sold... I have one too, 18 years old now, with AC adapter and plenty of paper but haven't used it at all for the last 6-7 years. BTW Free42 does a lot better job as far as printing is concerned.
Cheers

*Message #7 Posted by **Graham Gibbs** on 2 Mar 2009, 3:48 p.m.,*
in response to message #1 by Michael de Estrada

Hi Michael - If you press the 'APPS' button on your 50g and select '2' from the list (I/O Functions, then options 3 (print display), or 4 (print..) should be what you need. The 50g needs to be very close to the IR printer to work. Hope this helps!!

Graham

Re: Can an HP 50g print via IR port?

*Message #8 Posted by **Michael de Estrada** on 2 Mar 2009, 5:32 p.m.,*
in response to message #7 by Graham Gibbs

Thanks Graham. Yes, I didn't expect to find it there under APPS > I/O. The HP 48SX has a dedicated PRINT key, which provides direct softkey access to all the print commands. The HP 50g manuals make no mention of this topic, whereas the HP 48SX manuals cover it in detail. In fact, The HP 50g documentation is woefully inadequate on the whole I/O communication subject. I did find detailed info on printing and I/O in the HP49g+ Advanced User's Manual, which I downloaded from the HP website. HP should have included this manual on the CD that came with the HP 50g. Anyway, I've now gotten the HP 82240B IR printer to work with the HP 50g.

Michael

Re: Can an HP 50g print via IR port?

*Message #9 Posted by **Graham Gibbs** on 3 Mar 2009, 12:03 p.m.,*

in response to message #8 by Michael de Estrada

I also struggled with the documentation. For a calculator with IR, USB and RS232 connectivity, not to have a chapter on this in the manual is scandalous!! I had to refer to a HP48 manual for help initially & keep this chapter handy for reference. Maybe one for the next update of the 50g manual? - Come on HP!! But glad you're up and running!!

Some kudos for HP

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 28 Feb 2009, 8:42 p.m.*

Pages 17 and 18 of "A special report on waste" in the February 28 issue of *The Economist* gives HP high marks for its implementation of "extended producer responsibility" with respect to computer related products. The article states in part that HP

> Quote:
>
> ...has always tried to design its products not just from cradle to grave, a spokesman explains, but from cradle to cradle -- meaning with recycling in mind. Its laptops are 90% recyclable and its printers at least 70%. By last year HP had recycled over 450,000 tonnes of used equipment....
>
> ... An engineer explains how a decade of such work has taught HP how to make the process simpler and cheaper. It now uses screws instead of glue wherever possible. ...
>
> ... But the firm would like to go further, designing computers so that they can be easily upgraded rather than replaced. ...

And a little bit of history from the olden days: The use of screws rather than glue reminded me of a situation that occurred with an airborne computer back in 1960. The manufacturer had replaced screws with epoxy to hold the joints in the construction of the case. The epoxy joints came apart during vibration testing. I suggested that we reinforce the epoxy joints with screws and the repaired devices passed with flying colors. .

*Message #3 Posted by **John B. Smitherman** on 1 Mar 2009, 9:12 a.m.,*

in response to message #1 by Palmer O. Hanson, Jr.

Palmer, thanks for the post. It got me to thinking about how this cradle to grave thinking applies to HP's calculator line as well. As we've noted on this forum some of HP's calculators have provided a lifetime of use to help solve relevent problems daily. In some cases no battery changes are required for years. These aspects of HP's designs have helped to keep more material from being thrown in the waste bin.

Regards,

John

Can we beat the 5.81 hours on the TI95 with the HP71B? Gene, Yes we can!

*Message #1 Posted by **Egan Ford** on 28 Feb 2009, 5:13 p.m.*

This question was originally ask by Gene in the following post: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=53988:

> Quote:
>
> Gene: This is a write-up I just received from Palmer Hanson, who edited the TI PPC Notes for many years in the 1980s - early 1990s. Thought it might be interesting. Looks like the race to 1000 digits on a machine prior to 1990 now belongs to TI? Can we beat the 5.81 hours on the TI95 with the HP71B? :-)

I was not a member of this fine forum at the time of this post. But its never too late (just under 5 years late).

I wrote a spigot program in FORTH and ran it on my 71B this morning. I selected the spigot algorithm for the following reasons:

1. Spigot programs are very small. Mine is 2x larger because I unrolled the first outer loop. This avoids a conditional statement in the inner loop. Consider the initial loop a method to initialize the array A.
2. This spigot algorithm requires integers only. A benefit for FORTH.
3. Spigot programs allow you to watch the action. No need to wait for the final result.

Output:

```

I compiled C source with HPGCC for HP-50g and run on it - ~10.5sec @12MHz without sys_slowOff() and ~1.5sec @75Mhz with sys_slowOff()

How to overcklock HP-50g with HP49G+ Clockspeed Adjustment Tools ? May be somebody have sources of this utilities and post it here to adapt them for 50g?

Edited: 1 Mar 2009, 12:27 a.m.

At 1.5 seconds it probably took longer to start the program than to run it. :-) Sadly the 50g was not available before 1990. Gene was looking for pre-1990 calculators.

The 49G+ and 50G differ only by the number of ports and batteries, and cosmetically. The *49G+ Clockspeed Adjustment Tools* should work as-is with the 50G.

BTW, with HPGCC3 you can overclock to 192MHz.

Where do we draw the line between computers and calculators? If we go by machines listed on this forum, considering just hand-held devices, I'll bet that a 94d/e/f programmed in assembly will beat anything else from HP. The 94 BASIC is not terribly fast, but it might give Forth on 71b some

competition. I'll have to try it.

IMHO, GPS units, dive computers, battery-operated watches, and calculators are all computers, albeit fixed or limited purpose. A difference in generation may mean the difference between fixed/limited and general purpose.

I would consider the 71 and the 41 general purpose because they have bidirectional programmable I/O and an alphabet. The book *Control the World with HP-IL* illustrates how to use the 41 and 71 for many non-calculator specific tasks. Many other calculators, while programmable, lack programmable I/O and an alphabet, limiting it to a fixed or limited purpose.

I know little about any TI. I just downloaded and ran a TI95 emulator. It looks a lot like the 71B. I think Gene's request was fair. I'd like to know if TI95 ASM can best the 71B with the same algorithm.

Unfortunately the 71's Forth was a very poor implementation. Many Forth words could be sped up dramatically by just redefining them in Forth, without even using assembly language. For example, instead of using the built-in CHR$, doing this:

```
1 STRING CHR$$    "   " ( ie, 2 spaces) CHR$$ S!
CHR$$ DROP CONSTANT CHR$ADR
: CHR$ COMPILE CHR$ADR  COMPILE C!  COMPILE CHR$$ ; IMMEDIATE
```

takes more memory, but is fourteen times as fast without even resorting to assembly.

> Quote:
>
> The book *Control the World with HP-IL* illustrates how to use the 41 and 71 for many non-calculator specific tasks.

Nice book, but totally lacks the ambition of interfacing the huge array of available IEEE-488 lab instrumentation through the HP82169A HPIL-to-HPIB interface converter box.

True, but I'm still happy its there.

BTW, can you speed this up for me:

```
SWAP OVER UM* SWAP 2SWAP UM* D+
```

It takes a double and a single and returns a double product. Something missing from 71B Forth.

An alternative I have tried:

```
SWAP OVER * >R UM* R> +
```

is actually a bit slower.

Thanks.

So am I-- I was just airing my disappointment that it wasn't nearly as good as it could have been with the same hardware.

> Quote:
>
> BTW, can you speed this up for me:

I have the execution times for a lot of words, but definitely not all of them, and I expect that the multiplication here is the limiting factor. I never got into the assembly language. It would be interesting to know if it's using a BASIC routine (as too many words apparently do), possibly even converting to and from floating-point, instead of having a well-written primitive to do 20-bit fixed-point multiplication with 40-bit result.

Re: Can we beat the 5.81 hours on the TI95 with the HP71B? 71B result in < 2 hours.

*Message #13 Posted by **Egan Ford** on 2 Mar 2009, 4:41 p.m.,*
in response to message #1 by Egan Ford

Ok, I think this will be my last optimization.

My original version was developed for 16-bit machines, but the 71B is 20 bits. Using 20 bits I can now calculate 6 digits/outer loop (was 4). This also reduces the overall iteration count by 1/3.

Output:

```
31415926535897932384626433832795028841971693993751058209749445923078164062862089986280348253421170679821480865132823066470938446095505822317253594081284811174502841027019385211055596446229489549303819644288109756659334461284756482337867831652712019091456485669234603486104543266482133936072602491412737245870066063155881748815209209628292540917153643678925903600113305305488204665213841469519411560943305727036575959195309218611738193261179310511854807446237996274956735188575272489122793818301194912983367336244065664308602139494639522473719070217986094370277053921717629317675238467481846766940513200056812714526356082778577134275778960917363717872146844090122495343014654958537105079227968925892354201995611212902196086403441815981362977477130996051870721134999999837297804995105973173281609631859502445945534690830264252230825334468503526193118817101000313783875288658753320838142061717766914730359825349042875546873115956286388235378759375195778185778053217122680661300192787661119590921642019893

Next HP scientific calculator

*Message #1 Posted by **Elliott W Jackson** on 28 Feb 2009, 1:40 p.m.*

Hi folks - anyone want to gaze into their crystal ball and predict when the next HP scientific calculator might be released?

Re: Next HP scientific calculator

*Message #2 Posted by **DaveJ** on 28 Feb 2009, 5:17 p.m.,*
in response to message #1 by Elliott W Jackson

Ok...
Eye spy with my little eye, a new HP15C using the new 12C ROM emulation scheme - by, oh, lets say mid year.

Caveat - I could be totally wrong. The next calc might be a Hello Kitty or My Little Pony branded algebraic, out next week.

Dave.

Yes, I would agree this is much more likely than, say, a 45s or Walter's 43s...

As usual, something conservative is more likely than something new. After more than 20 years :-/ But better than nothing.

I'm wondering if hp would provide new manuals for this new 15C or just provide scans of the old 15C excellent manuals ...

Re: Next HP scientific calculator

*Message #6 Posted by **Mike Morrow** on 1 Mar 2009, 11:51 a.m.,*
in response to message #3 by Martin Pinckney

First, I don't ever expect to see re-issues of the HP-15C or the HP42S, in any form. But...

A reincarnation of the HP42S (with a more attractive external color scheme) would be far better than wasting effort on the HP-15C. The HP42S has a two-line alphanumeric display, ten times the effective speed, 15 times the RAM, several orders of magnitude greater precision, audible beeps, IR printer output, alphanumeric program steps, more natural complex number handling (yea, I know you can't directly manually enter four complex numbers to the stack...big deal), much more natural matrix handling, a user accessible machine-level debugger, and other features that the HP-15C lacks or implements weakly. Overall, the increased capabilities and ease of use of the HP42S are an order of magnitude better. Plus, a "landscape" keyboard on a hand held calculator is cute (appeals to those business users of the HP-12C), but it is less effectively usable than the "portrait" arrangement when actually being used hand held!

Like many other calc nuts, I occasionally like to take a particular program I've written for a recent calculator, and implement it on older machines such as the HP-25, HP-34C, HP-41CX, HP-15C, and HP42S. Any time I use anything earlier than the HP42S, the advantages of the HP42S become immediately obvious.

I'm not knocking the HP-15C. IMHO, it's the second-best RPN calculator of all time. I've had one since 1986, using it daily at work for 11 years. But its HP42S replacement is simply stunning. Only the color scheme and display sharpness are inferior.

I believe that HP adapted the "Pioneer" HP17BII to Chinese technology (HP17BII+ ??), so the same could be done for the "Pioneer" HP42S. Even if Walter's HP43S could never be made, a re-issued HP42S would still be welcome.

The HP42S...I guess you could say I'm a fan. :-)

in response to message #6 by Mike Morrow

Mike, I agree with everything you said; but I was responding to DaveJ's original answer, not what makes the most sense from a user's standpoint.

My opinion is based in part on HP's little poll they conducted a couple of months ago, which, IMO, was biased so that the 15c would come out on top. This suggests to me that HP has been considering just what DaveJ postulated.

It would seem that would be the easiest route for HP to take. The next easiest would be something based on the 20b platform.

Yes, and add to the fact that HP have recently "reclaimed" rights to all the Voyager ROM's as such.

http://nonpareil.brouhaha.com/

From a development point of view, a ROM emulated 15C is essentially trivial. I'd be very surprised if the HP engineers don't already have a proto on their desks (if anything, just for fun).

A new 15C in the market would have to be marketed with clear vintage/retro and form factor appeal, otherwise it's limited display/user interface would be considered a joke in the modern market.

> Quote:
>
> It would seem that would be the easiest route for HP to take. The next easiest would be something based on the 20b platform.

20B is the new HP platform so it's almost inevitable that we'll eventually see a scientific calc based on that platform. Just add firmware and a front panel. But please HP, fix the silly high clock speed/battery life design issue.

Dave.

Let us hope that HP will invest enough to produce it with keys that are at least close to the look and feel of the original ones, with rounded edges and true colors, not like the cheaper-looking ones on the 12c Platinum 25 anniv. ed., (red-orange shift which should be yellow).

I would think the form factor is essentially trivial too, since they already have it - more or less - in the 12c. I also think the 15c style calculator is still very useful in today's workplace... Easily carried, can be used at the desk or in the field to do simple or more complex calculations. And it's programmable!

I've never owned a 42s but I suspect most people today use its extended capabilities to exercise their mind and not necessarily for production. Of course exercising retro geeks minds is a worthy proposition, I don't think it's profitable for HP.

Cheers,

Brent

Yep, the only thing they would have to change is the key legends and front plate. The electronics platform is already in place, they could even use the same PCB, just requires different firmware.

It would even be worth it to do as a premium cost low volume niche market product. And I believe HP even once indicated they were willing to discuss such low volume (1000's) custom products with the appropriate people.
i.e. if someone was entrepreneurial enough to approach HP and say they would buy say 5000 15C's HP might actually consider it.

Dave.

Same can be said of the new 17BII+. No reason it cannot be a 42S as well. Number/position of keys and the display are the same. I say, do them both. If HrastProgrammer can emulate the 42S with the original 42S ROM on the 48GX, then anything is possible.

Does anyone knows which processor is used on the HP17BII+ silver?

Re: Next HP scientific calculator

*Message #15 Posted by **Walter B** on 2 Mar 2009, 2:22 a.m.,*
in response to message #14 by Didier Lachieze

Bonjour Didier,

you may find an answer here.

Re: Next HP scientific calculator

*Message #16 Posted by **reth** on 2 Mar 2009, 12:56 a.m.,*
in response to message #13 by Egan Ford

HP17BII+ has a lot better looking slanted keys and looks better than the HP42S overall, I hope the keys are as good mechanically as the ones on the original HP42S

Re: Next HP scientific calculator

*Message #17 Posted by **Walter B** on 2 Mar 2009, 1:31 a.m.,*
in response to message #16 by reth

> Quote:
>
> I hope the keys are as good mechanically as the ones on the original HP42S

Only time can tell. But the tactile feedback feels definitively good - big advantage over the 20b as is.

The advantage the 17bii+ silver platform has over the 12cpt+ is it replaces a 28 year old LCD by a 21 year old. Soft keys are featured on the 17bii+, but impossible on the 12cpt+. OTOH the 12cpt+ is more compact and less load for the shirt pocket.

What a difference soft keys make was told here repeatedly. For example, a scientific "17bii+ silver" may look like this. The display window would allow for better LCDs.

Re: Next HP scientific calculator

*Message #18 Posted by **reth** on 2 Mar 2009, 4:05 a.m.,*
in response to message #17 by Walter B

I love your designs but where is the "silver" part here? 17BII+ looks cool partly because of that. I assume () is there to serve the equation writer, isn't it? But where are P-R and R-P? I'd stay away from 35S shortcomings.
Always enjoying your ideas
Best regards,
Reth

BTW nice place for R/S - exactly where it should be ;)

Edited: 2 Mar 2009, 5:25 a.m.

Re: Next HP scientific calculator

*Message #19 Posted by **Walter B** on 2 Mar 2009, 6:12 a.m.,*
in response to message #18 by reth

Thanks, reth, for your friendly words. Of course, you can get this with a silver keyplate, too. Just the contrast of gold on silver is a bit low ;) but we'll find a solution for that.

> Quote:

> I assume ( ) is there to serve the equation writer, isn't it?

Correct. And it takes care of our algebraic friends.

> Quote:
>
> But where are P-R and R-P?

P>R and R>P are in the menu CONVERT. Keyboard space is limited.

After all, the 44s is just another second best solution - I prefer a 43s if I had a choice.

Best regards,

Walter

That's exactly what us design engineers need to do to get a useful product out the door, instead of one that was designed by marketing!

I think you'd actually be surprised, in general, how little say design engineers have in the final released product design in large companies like HP.

Coincidentally, I almost applied for a job in the HP calculator design group way back when they were in Melbourne Australia and they advertised for a hardware designer. I think they went belly-up not long after, so probably wouldn't have been a good move.

Dave.

Judging from what I've observed over the last 20 years, I am not surprised.

Re: Next HP scientific calculator

*Message #23 Posted by **David Hayden** on 2 Mar 2009, 11:23 a.m.,*
in response to message #1 by Elliott W Jackson

I think HP could greatly improve the 50g with two minor changes. Both changes make User-defined keys much easier to use.

1. Keyboard overlays similar to the 41 series. You could place these over the keyboard and a spring clip held them in place. You write the user-defined functions on the overlay to you knew which key did what. This would require some physical changes to the case and, of course, the overlays themselves. But they could charge for the overlays.

2. On the HP 41, if you pressed and held a key for a few moments, the display would show the function that they would perform. Continue holding the key for about 2 seconds and the display would change to "NULL" which meant you could release the key now and it wouldn't do anything. This was another handy way to know what user-defined keys did in case you'd forgotten (or lost your overlay :)).

With these changes, you could modify the keyboard to suit the problem at hand. Doing calculus today? Slap in your calculus overlay and load the calculus key definitions. No need now to hunt through the menus for the functions and you can use the soft keys for other things. Doing some programming this evening? Drop in the programming overlay and definitions.

N cells revisited

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 27 Feb 2009, 11:51 p.m.*

A recent thread indicated that N cells may be hard to find without going to specialty battery stores. I have been getting mine at Home Depot at about two for four dollars. I checked today and they are still 2 for $3.97 plus tax.

That means over eight dollars for a set for an HP-41 and explains why three of my four HP-41's don't have a working battery pack installed.

Re: N cells revisited

*Message #2 Posted by **Jandro Kirkish** on 28 Feb 2009, 12:39 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

I've found mine for 20 years at radio shack. Just bought some more 2 weeks ago for about $4.00...

Re: N cells revisited

*Message #3 Posted by **Philippe Lasnier** on 1 Mar 2009, 6:48 a.m.,*
in response to message #2 by Jandro Kirkish

There was a thread a few days ago about that.

Here (UK) I can get alkaline N cells in packs of two for £1.21 (approx. $1.70), and in packs of 20 for £8.96 (approx. $12.55). I can also get NiMH 500mAh N cells for £1.87 ($2.62) each. All these prices include VAT/Sales tax, but exclude posting/handling, although buying enough (or with other stuff) would make that negligible.

In other words, if you look around, you can still find them for reasonable prices.

Printing on a 82143A with HP-75C

*Message #1 Posted by **Giovanni Jimenez** on 27 Feb 2009, 4:19 p.m.*

I am wondering if I could print on a HP-82143A printer from a HP-75C. The original printer (82162A)for the HP-75C looks identical to the 82143A, except of course for the connector. So how do I map the 7 pins of the 82143A to the 4 pins (2 IN and 2 OUT) of the 82162A? Can I even do that ? do the signals use the same voltage levels? I assume so as they are both HP-IL, right ?

Thank you!

Giovanni

Re: Printing on a 82143A with HP-75C

*Message #2 Posted by **Winfried Maschke** on 27 Feb 2009, 4:35 p.m.,*
in response to message #1 by Giovanni Jimenez

Hi Giovanni,

there is no way to connect the 82143A to the HP-75C. The signals are different. Inside the 82162A there is a special HP-IL chip which you will not find inside the 82143A. The first 82143A was built years before the 82162A and it will only work with the HP-41.

Regards Winfried

Questions for the HP-01 restorers...

*Message #1 Posted by **Maximilian Hohmann** on 27 Feb 2009, 4:08 p.m.*

Hello!

There have been a few threads about restoration of HP-01 calculator watches in the past. Names like Geoff and Bryan come to mind, but there may have been others too. I just got my second HP-01. The first one is a near-mint complete-with-everything stainless steel model that cost me more than I will ever confess to my wife and that will probably spend the rest of it's days hidden away somewhere for fear of scratching it.

So I looked for another one, less expensive, preferably golden (for the sake of completing the collection) and in a state of use that will allow me to actually take it along from time to time without fear of damaging my pension money. So here it is.
And my dilemma starts: I really hate golden watches. Anything golden that is. Always did. I never had a golden watch because I knew I wouldn't like it. I tried to make an exception this time because it's an HP-01, but I don't think I want to wear this thing. Which means that:
a) I will have to look again for a well-worn stainless steel HP-01 to wear myself
b) I may have to restore this golden specimen to a collection-worthy state.
(or c) forget about completing the collection and trade the golden watch for a stainless one in similar, wearable shape?)

Anyways, I would kindly ask the experts to take a look at my photos below (caution - large images - do not download on your mobile phone...) to assess, wether or not a restoration attempt will be worth the effort. I think, the overall shape is not too bad - from a distance of half an armlength you won't notice most of the defects - but the chipped glass and the scratch across the keyboard are very prominet once you look closer. As is the damaged stripe of black paint around the housing and the worn gold plating in some spots.

So what do you think/suggest? Are there some easy fixes maybe, that will cover most of the defects without requiring total disassembly? Can this glass crystal be fixed somehow (expoxy resin maybe)? What paint to use for touching up the black stripe? How to polish out the scratches from the glass(plastic?) without removing the "Hewlett Packard" label in the process?

And yes, I found Bryans site on the web and will use this as guidline in case I have to disassemble the watch.
BTW: What has become of the project of getting replacent glass crystals mass-produced?

Many questions, I'm afraid... Greetings, Max

OT Weekend Challenge

*Message #1 Posted by **Chuck** on 27 Feb 2009, 2:43 p.m.*

Test your algebra skills on this one.

Given f(x)=b^x and g(x)=log(b,x) find all possible values for b so that f and g are tangent.

The HP's may be able to numerically find b, but it's more challenging on your own.

Have a good weekend. :)

CHUCK

> Given f(x)=b^x and g(x)=log(b,x) find all possible values for b so that f and g are tangent.

Do you mean the Logarithm is tangent at some *particular* point, at *least one* point, or is there some other missing piece of information? Unless I'm mis-read something, it seems the problem statement is incomplete since f and g are functions of x but we are "finding b such that..."

Re: OT Weekend Challenge

*Message #3 Posted by **Chuck** on 27 Feb 2009, 8:32 p.m.,*
in response to message #2 by Allen

The challenge is to find the unique base b which makes the exponential function with that base b, and the logarithm function with that base tangent at a particular point. Finding the point the two functions are tangent at is most likely a necessity.

C

*Message #6 Posted by **Chuck** on 28 Feb 2009, 11:12 a.m.,*
in response to message #5 by C.Ret

They have something to with it, but those are not the answers. It's not a really challenging problem, but it does have an interesting solution.

Re: OT Weekend Challenge

*Message #7 Posted by **Chuck** on 28 Feb 2009, 11:08 a.m.,*
in response to message #4 by Namir

Heavens no. This is a problem I came across from a math archive two years ago. The "answer" was given, and it turned out to be an interesting problem in that I came up with two solutions instead of their one. I'm not teaching calculus this year so I think it would be a little too challenging for my algebra students. Cheers.

Re: OT Weekend Challenge

*Message #8 Posted by **Gerson W. Barbosa** on 28 Feb 2009, 9:54 p.m.,*
in response to message #1 by Chuck

I thought of trying to solve the following system:

ln(b)*b^x = 1/(x*ln(b)) ; the first derivatives of f(x) and g(x) must be the same at that point so they are tangent to each other

b^x = ln(x)/ln(b) ; both functions must have the same value at the tangent point

By replacing b^x with ln(x)/ln(b) in the first equation we get b = e^(1/(x*ln(x))). Well, at this point I got lost as solving for a particular x was not enough to find b such b and x were solutions to the system. Perhaps you might explain why deriving e^(1/(x*ln(x))) and equating it to zero gives x=1/e and allows us to compute b=e^(-e), which are solutions to the system.

Gerson.

Re: OT Weekend Challenge

*Message #9 Posted by **Namir** on 28 Feb 2009, 10:04 p.m.,*
in response to message #8 by Gerson W. Barbosa

Gerson,

I followed much the same steps in working with equating the functions and their derivatives. I look at them as two nonlinear equations with two variables.

Anyone can solve the system of 2 nonlinear equations?

Namir

Re: OT Weekend Challenge

*Message #10 Posted by **C.Ret** on 2 Mar 2009, 8:37 p.m.,*
in response to message #9 by Namir

Shall I propose to start over from start:

Given **f**(x) = b^x and **g**(x) = $\log_b(x)$, we have to found all possible value of *b* so that given function ***f*** and ***g*** are tangent.

Domain of definition:

As a first approach, I suggest to only consider the real space of definition of ***f*** and ***g***. The complex space may be investigating the same way and may lead to supplementary solutions, but a non-obvious graphical approach have to be explained.

The (real) natural logarithms *ln x* is only define for strictly positive real argument *x*.

Since $log_b\ x = ln(x)/ln(b)$, ***g*** is real only for *b>0* and *x>0* and undefined (division by zero) at *b=1*.

This greatly simplifies the domain of definition for ***f*** as a real function too. Since b^x is real for any (strictly) positive value of b and x. The study of this function is much more complex for negative b especially where $|\ x\ |<1$.

```
f:  |R+     . |R+    -------> |R+
   (    b    ,  x  )          bx

g:  |R*+-{1} . |R*+   -------> |R
   (    b    , x   )          ln x / ln b
```

More rigorously (or mathematically) we have to found any pair (b, x_0)

Rigorously, we have to consider only strictly positive value of the real *b* and *x* with b not equal to unity.

Real vs complex plan considerations

In the domain of real definition the two given function ***f*** and ***g*** are tangent is their graphs plotted as $y = \boldsymbol{f}(x)$ and $y = \boldsymbol{g}(x)$ cross each other only one time at an intersection point x_t and that the slope of the two curves is identical at this point so that a tangent line passing at this intersection point can be draw.

This graphical situation can be express as a system of two non-linear equations:

1. $y = \boldsymbol{f}(x_t)$ and $y = \boldsymbol{g}(x_t)$
2. $s = d/dx\ \boldsymbol{f}(x_t)$ and $s = d/dx\ \boldsymbol{g}(x_t)$

System of equation:

1. $f(x_t) = g(x_t)$
2. $f'(x_t) = g'(x_t)$

1. $b^{x_t} = ln(x_t)/ln(b)$
2. $ln(b).b^{x_t} = 1/(x_t.ln(b)$

1. $b^{x_t} = ln(x_t)/ln(b)$
2. $ln(b)^2.b^{x_t}.x_t = 1$

By substituing expression of given in 1) into equation 2),

(eq.) $ln(b).ln(x_t).x_t = 1$ where $b>0$, $x_t>0$, $b<>1$ and $x_t<>1$.

This last equation (eq.) give the relation between the slope of the tangent and the position on the curbe (through the abscisse *x*). More precisely the relation between the logarithm of the slope and the x position.

This equation is a product and, since $x > 0$, the both logarithms $ln(b)$ and $ln(x_t)$ must have the same sign.

As a consequence,

- if a tangent exist with b less than 1, it may only exist at x positions in interval] 0 ; 1 [
- if a tangent exist with b more than 1, it may only exist at x positions greater than 1 ( ] 1 ; oo [.
- no tangent point is possible at $x_t = 1$ or $b = 1$.

From (eq) : $ln(b) = 1 / (ln(x_t).x_t)$

Case 1 : $b > 1$ Supposing a tangent of correct slope exist with $b > 1$, we have to verify that an unique intersection also exist at a point $x_t > 1$.

In the case $b > 1$, we have $ln(b) > 0$, thus equation 1. of the initial system is:

1. $b^x = ln(x)/ln(b)$
2. $ln(b) = 1 / (ln(x).x)$

In order to avoid x^x terms we may use the logarithm of this first equation 1. Knowing sign of $ln(b)$, (since $ln(b)>0$ as $b > 1$) the system is transformed to :

1. $ln(b^x) = ln(ln(x)/ln(b))$
2. $ln(b) = 1 / (ln(x).x)$

1. $x.ln(b) = ln(ln(x)) - ln(ln(b))$
2. $ln(b) = 1 / (ln(x).x)$

Replacing any occurrence of $ln(b)$ in 1. :

1. $x / (ln(x).x) = ln(ln(x)) + ln(ln(x).x)$
2. $ln(b) = 1 / (ln(x).x)$

1. $x / ln(x) / x = ln(ln(x)) + ln(ln(x)) + ln(x)$
2. $ln(b) = 1 / (ln(x).x)$

1. $1 / ln(x) = 2.ln(ln(x)) + ln(x)$ where $x > 1$
2. $ln(b) = 1 / (ln(x).x)$

Posing $y = ln(x)$, we get :

1. $1 / y = 2.ln(y) + y$ where $y > 0$
2. $ln(b) = 1 / (ln(x).x)$

Again, we have to take care of the sign of ln(y) and define three domain :

- if $ln(y) = 0$ then the system accept a solution : $y = 1$ ---> $ln(y) = 0$ and the system admit an unique intersection $x_t = exp(1) = e$.
  1. $1 / 1 = 0 + 1$
  2. $ln(b) = 1 / (1.e^1)$

  Equation 1. is OK from $1 = \ln(x_t)$ we get intersection coordinate and b parameter :

  1. $x_t = e$ which is > 1
  2. $ln\ b = 1 / e$

  1. $x_t = 2.7183$
  2. $b = 1.4447$

  Intersection coordinate are (e,e) and slope of the tangent is 1 (i.e. 45°)

- if $ln(y) > 0$ then the system accept no solution :

  Since ln is a growing function, $ln(y) > 0$ imply that $y > 1$. In this case, the left side of equation (1.) $1/y$ is less than one and can never be equal to the right side $2.ln(y) + y$ which has two raisons to be greater than one.

  No solution can be found for any x greater than e (where y >1, x > 1, b >1).

- if $ln(y) < 0$ then the system accept no solution :

  Since ln is a growing function, $ln(y) < 0$ intimate that $y < 1$. In this case, the left side of equation 1. $1/y$ is more than one and can never be equal to the right side $2.ln(y) + y$ which has two raisons to be less than one.

  No solution can be found for any x in the interval $] 1 ; e [$ (where y <1, x>1, b>1).

The only solution in the x > 1 (and b > 1) range was found at $x = e$ where $y = ln\ e$ is exactly one and $ln\ b = 1/e$.

Case 2 : $b < 1$ Supposing a tangent of correct slope exist with $0 < b < 1$, we have to verify that an unique intersection also exist at a point $0 < x_t < 1$.

In the case $0 < b < 1$, we have $ln(b) < 0$, thus equation 1. of the initial system is :

1. $b^x = ln(x)/ln(b)$
2. $ln(b) = 1 / (ln(x).x)$

1. $ln(b^x) = ln(ln(x)/ln(b))$
2. $ln(b) = 1 / (ln(x).x)$

Since $ln\ x < 0$ and $ln\ b < 0$, we get :

1. $x.ln(b) = ln(-ln(x)) - ln(-ln(b))$
2. $ln(b) = 1 / (ln(x).x)$

Replacing any occurrence of $ln(b)$ in 1. :

1. $x / (ln(x).x) = ln(-ln(x)) + ln(-ln(x).x)$
2. $ln(b) = 1 / (ln(x).x)$

1. $x / ln(x) / x = ln(-ln(x)) + ln(-ln(x)) + ln(x)$
2. $ln(b) = 1 / (ln(x).x)$

1. $1 / ln(x) = 2.ln(-ln(x)) + ln(x)$ where $0 < x < 1$
2. $ln(b) = 1 / (ln(x).x)$

Posing $y = -ln(x)$, we get :

1. $1 / y = y - 2.ln(y)$ where $y > 0$
2. $ln(b) = 1 / (ln(x).x)$

- if $y = 1$ then $ln\ y = 0$ an acceptable solution exist at position $1/e$ where $1 = -ln(x_t)[\italic]$

    1. $[italic]\ x_t = 1/e = .3679$
    2. $b = 0.0660$

- if $0 < y < 1$ or $y > 1$, no solution can be found.

The only solution in the 0 < x < 1 (and 0 < b < 1) range was found at $x = 1/e$ where $y = -ln(1/e)$ is exactly one and $ln\ b = -e$.

Slope of the tangent is -1 (315°). Note that the two curve are tangent but still crossing.

Conclusion:

The only two values of b so that $\mathbf{f}(x) = b^x$ and $\mathbf{g}(x) = \log_b(x)$ are tangent, considering only real space graph, have been found at positions (x,y) = (e,e) and (x,y)=$(1/e,1/e)$ where $b = e^{1/e}$ and $b = e^{-e}$ respectively.

in response to message #11 by Gerson W. Barbosa

Thank you, I correct my conclusion from this typo (it is hard not to be lost in the cut/paste composition due to the numerous [italic] and other formatting flags.

Re: OT Weekend Challenge

*Message #13 Posted by **Chuck** on 4 Mar 2009, 1:09 a.m.,*
in response to message #12 by C.Ret

Wow, excellent analysis C.Ret, and nice graph Gerson. Here was my solution when I came across the problem last week.

```
Since f(x)=b^x and g(x)=log(b,x) are inverse functions we know that they'll
be
tangent along with y=x for some number x=a.  This means,

a=b^a   and   a=ln(a)/ln(b)   (using a change of base for g(x))

Also, since they are tangent , their derivatives will also be equal at some
x=a, or

b^a ln(b) = 1/(a ln(b))

These three equations allow us to solve for a.  Using the first two
equations (into the
third) we get

   a ln(b) = 1/ln(a)
     ln(a) = 1/ln(a)
 (ln(a))^2 = 1
     ln(a) = +/- 1

so, a = e^(+/-1)
```

```
Therefore, since b=a^(1/a) we have b=e^(1/e) and b=1/(e^e), giving the two
solutions
and the nice graphs Gerson made.
```

The source I found the problem in incorrectly assumed that the function had to be tangent to y=x (because they are inverse functions) meaning they have to have a slope of 1, hence only one solution, and not the more interesting 1/e^e base.

Fun problem, and thanks to all who played along.

CHUCK

EDIT Addendum - - Why I find b=1/e^e more interesting is that the functions are not only tangent at x=e^-1 (look at Gerson's graph), but also intersect and have the same concavity (not equal to zero). This is amazing! Try to sketch two curves that are tangent, intersect, and have a concavity not equal to zero (or at least one with 0 concavity) . My limited artistic ability this quite challenging.

Military 41C for auction

*Message #1 Posted by **Marcus von Cube, Germany** on 27 Feb 2009, 3:44 a.m.*

This is not about selling or buying, it's just a technical question about the 41C in this auction.

The seller states the machine needs to be reprogrammed because it's running a special software. What do you think how this is implemented? A replacement ROM or a soldered in module which autostarts?

For the records: my eBay name is mvcube.

I won't believe that

*Message #2 Posted by **Frank Boehm (Germany)** on 27 Feb 2009, 4:07 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Using a module is the way to go, I don't believe HP ever made a calculator with a modified internal ROM. So either they are plain broken or the seller doesn't know how to use them (which is somewhat more likely in this case). Judging by the images, there seems to be remains of a water/dustproof overlay on top of the calculator, I'd certainly ask if these remains are removable or if they are glued onto the calculator.

Re: I won't believe that

*Message #3 Posted by **Martin Pinckney** on 27 Feb 2009, 10:02 a.m.,*
in response to message #2 by Frank Boehm (Germany)

Perhaps the seller just means that the calculators just have a "mortar fire" program in main memory, not that the ROM is different.

Re: I won't believe that

*Message #4 Posted by **Michael de Estrada** on 27 Feb 2009, 10:18 a.m.,*
in response to message #3 by Martin Pinckney

Assuming that either the batteries are dead or missing, how long would a program be retained in memory? These calculators may have been sitting idle for decades.

Re: I won't believe that

*Message #5 Posted by **Martin Pinckney** on 27 Feb 2009, 10:51 a.m.,*
in response to message #4 by Michael de Estrada

Well, he says "This item is in working condition", so they must have charged batteries in them. Perhaps they were only sold off by "the army" as surplus recently.

Re: I won't believe that

*Message #6 Posted by **Charles** on 1 Mar 2009, 4:04 p.m.,*

in response to message #5 by Martin Pinckney

This reference indicates that the HP41 was used in the British Army until 2003. I doubt the batteries would have lasted that long.

dot matrix in crayon

*Message #1 Posted by **db (martinez, ca.)** on 27 Feb 2009, 12:43 a.m.*

There is now a simple wikipedia (simple.wikipedia.org). It features simple words and grammar, and has a help page called simple talk. This Wiki has no section on RPN. We should create one.
Since they suggest writing “without technological jargon” and keeping it basic; i believe we will need to describe RPN by using AOS.

4915 digits of pi - MCODE 41 (19660 digits optional)

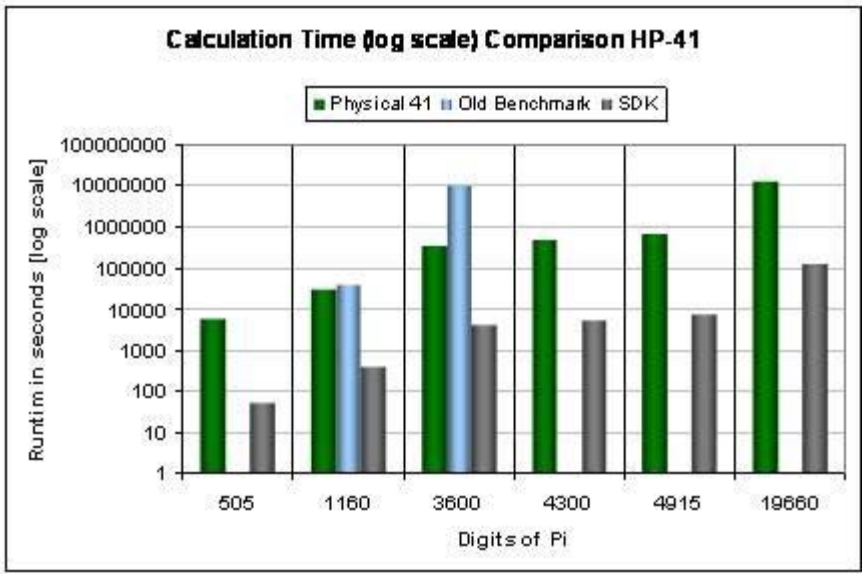
*Message #1 Posted by **PeterP** on 26 Feb 2009, 5:27 p.m.*

Hi,

A few months back Katie insidiously infected me with the Pi bug (see here), from which I had been save until then. She has created a series of deeply impressive programs for a variety of HP calculators:Katie's Pi article. Not knowing anything about the field I proceeded to read her programs as well as follow the kind explanations, links and book suggestions from her and Egan. Especially the Spigot algorithm was suggested as an interesting candidate.

Looking through the form I also found numerous threads for Pi calculations on the hp41. JFG had a program that calculated 560 digits in 22hours (see here). A program 'Deep Pi' is discussed here but seems to have extremely long run times. The first 6 digits take 38 minutes. And 625 digits take tens of days…
According to an old post from Gene Wright (see here) about a challenge between the TI-59 and HP-41 it would seem that with reasonable times, 1160 digits (15.5 hours) was the top mark. Allowing unreasonable run times, the incredible number of 3600 digits could be reached, albeit only in 4 month…

Please find below my own little contribution to the Many-Digits-of-Pi story on the HP-41 using MCODE. It is neither particularly elegant or ingenious (quite the opposite) but it does deliver 1160 digits in about 9 hours (instead of 15.5), 3600 digits in about 4 days (instead of 120 days), and 4915 digits in about 8 days. Using a RSU-2 unit with 128k (and a small extension of the code to switch banks, not implemented) one could calculate 19660 digits of pi in about 21.5 weeks. See a logarithmic comparison chart:



The code implements a straight forward Spigot mechanism (see Pi Unleashed, thanks Egan) using MLDL ram to store the intermediate results. Each intermediate result (the a(i)'s) are stored in 2 MLDL words (left and right Nybble). The right Nybble is converted to hex as each word can store at most 399d but can store 3ffh(=4096d). As the numbers don't grow larger than 399,999, we can leave the left nybble in dec format. Also, as there are no 5 or 6 9's consecutively in Pi in the first 20,000 digits, we don't have to worry about that either.

The code asks for three inputs: The page where the MLDL ram starts to use, the number of digits and the base b to use (max = 5 for 5 digits at a time). One can set Flag 0 and the calc will stop at each group of digits and wait for a key to be pressed, otherwise it just keeps calculating, calculating, calculating… Setting Flag 1 will store the found digits in the same compressed format – each group of up to 5 digits is stored in 2 words, with the right nybble converted to hex. They are stored in reversed order though.

Runtimes are quite accurately n^2 (see table 1 below). Actual run-times on physical HP's where done up to 505 digits and above I used the SDK emulator. Times marked with (*) are extrapolated from existing times using a power fit through the first 9 data-points up to 4915 digits with an R2 of 0.9992 so they should be quite accurate.

Digits	Note	Physical 41	SDK	Old Benchmark	Configuration
505		1h 32m 49s	54s		MDOP in page 9, Rambox using page A
1160	old top mark	9h 01m 00s(*)	06m 32s	11h 30m 00s	MDOP in page 9, Rambox using page A, B
3600	old abs max dig	4d 04h 00m 00s(*)	1h 07m 03s	120d 00h 00m 00s	MDOP in page 9, RAMBOX using page A,B,C,D,E,F
4300	max without Clonix/Zeprom	6d 00h 06m 48s(*)	1h 25m 42s		MDOP in page 8, RAMBOX using page 9,A,B,C,D,E,F
4915	max without bankswitching	1w 0d 23h 08m 32s(*)	2h 07m 06s		MDOP in page 6, RAMBOX using page 8,9,A,B,C,D,E,F
19660	max with RSU-128k	21w 01d 11h 01m 49s(*)	1d 12h 30m 50s(*)		MDOP in page 6, RAMBOX using page 8,9,A,B,C,D,E,F x4 banks

Cheers, Peter

in response to message #1 by PeterP

Impressive! Thanks for this further MCODE example.

in response to message #1 by PeterP

Make an article of it, or it will be buried under thousands of posts in a few months.

Anyway: Impressive!

Hi, **PeterP**:

Impressive work. Just a quick note:

PeterP wrote:

"Also, as there are no 5 or 6 9's consecutively in Pi in the first 20,000 digits, we don't have to worry about that either."

That's not true. The string "999999" (6 9's) ***does*** occur at position **762** counting from the first digit after the decimal point (the 3. is not counted). Just as a visual check:

Re: 4915 digits of pi - MCODE 41 (19660 digits optional)

*Message #5 Posted by **Katie Wasserman** on 28 Feb 2009, 12:28 p.m.,*
in response to message #1 by PeterP

This is very impressive piece of code, I don't know MCODE but it almost makes me want to learn it! I'm glad that my article helped inspire your obsession for pi calculations maybe you'll figure out a new algorithm for it.

One of the best places I've found to seriously indulge this obsession is Simon Plouffe's home page. Follow the links to the articles sections and dig it. Eventually I found this paper. Read the section on the Borweins (at the very end), there is an amazing, simple formula given relating pi, 10 and e with the very curious statement: "The following is not an identity but is correct to over 42 billion digits."

```
pi ~ ( 1/10^5 * SIGMA(n,exp(-(n^2/10^10)),-inf,+inf) ) ^ 2
```

Although I'm not a mathematician (although I started out that way) how could this not be an identity? Must there at least be a conjecture that this is an identity?

Re: 4915 digits of pi - MCODE 41 (19660 digits optional)

*Message #6 Posted by **Valentin Albillo** on 28 Feb 2009, 9:35 p.m.,*
in response to message #5 by Katie Wasserman

Hi, Katie:

Katie posted:

> *"there is an amazing, simple formula given relating pi, 10 and e with the very curious statement: "The following is not an identity but is correct to over 42 billion digits."*
> *pi ~ (1/10^5 * SIGMA(n,exp(-(n^2/10^10)),-inf,+inf)) ^ 2*
> *Although I'm not a mathematician (although I started out that way) how could this not be an identity? Must there at least be a conjecture that this is an identity? "*

It's **not** an identity and actually it's quite straightforward to demonstrate that it produces about 42.8631472996... { Pi^2*10/Ln(10) } billion correct digits of Pi, but no more.

The demonstration makes use a well-known transformation formula of a theta function. For similar **sums which give a large number of correct digits of some constant but nevertheless eventually differ**, have a look at sum #7 and sum #8 in my Short & Sweet Math Challenge #13: Adding up to infinity

Regards from V.

Awesome. Can you provide a MOD file? Your excellent SDK update doc ends short of documenting the process to create a MOD file. I'd like to give it a try on my 41.

Thanks.

HP 95LX prototype PCB

*Message #1 Posted by **Frank Boehm (Germany)** on 26 Feb 2009, 11:52 a.m.*

Well, that 95LX was only semi complete and didn't power up - so I disassembled it. Look what I found:

No wonder it didn't boot: this one has 3 x 256kB RAM installed - but no ROM. It probably used a Flash card to boot.
Both ICs are prototypes: marked as "SAMPLE" and "ES" (aka "Engineering Sample").
(it came in a standard enclosure with standard SN, no hint of a prototype...)

MathU RPN calc for iPhone

*Message #1 Posted by **Bruce Bergman** on 25 Feb 2009, 5:13 p.m.*

Disclaimer: I neither own, nor endorse, the iPhone platform. I have seen several of the HP clones for the iPhone, and wish I had one. ;-)

I do own the MathU RPN calculator (modeled after an HP-like calc) for the Palm Treo. They just sent me an email saying that their port of the MathU calc for the iPhone is available for a limited time for $0.99 from the iTunes store.

So all you iPhone geeks, go give it a try and let us know what you think! ;-)

thanks,

bruce

Re: MathU RPN calc for iPhone

*Message #2 Posted by **Steve Cote** on 27 Feb 2009, 12:48 p.m.,*
in response to message #1 by Bruce Bergman

The graphics on the app look good but it is setup more like a financial calculator than a scientific like it's name implies. Most of the functions I'd use are shifted. I didn't get it.

Re: MathU RPN calc for iPhone

*Message #3 Posted by **Walter B** on 27 Feb 2009, 5:32 p.m.,*
in response to message #2 by Steve Cote

FYI, you can customize the keyboard to a very large extent. So if you don't like the financial functions, replace them. If you want something unshifted, assign it this way.

BTW, my ideal virtual calc may be a blend of MathU and Free42. My MathU does not feature matrix functions, nor solve nor integrate. My Free42 does not allow customizing, at least AFAIK. And both are only virtual. Nothing comes close to a real keyboard.

Disclaimer (for the US): I'm in no way linked to Creative Creek. I'm just a happy user (on my PDA, no iPod).

Ceterum censeo: HP, launch a 43s.

Walter

in response to message #3 by Walter B

> Quote:
>
> Free42 does not allow customizing, at least AFAIK.

Free42 does allow customizing to some extent, by creating custom skins. In the packages on the Free42 web page, there are a few skins that map the area just above the keys to the corresponding shifted keystrokes (SemiAuto*, Khor), that map the area just to the right of some keys to letters of the alphabet, allowing text to be entered a bit more easily (Khor), and that map Roll-up (42ck, 42ct, Sven320x240mini) and CLST (42ck, 42ct) to the keyboard.
Special-purpose skins that map, say, statistics or matrix functions to keys are also possible. I'll admit it's not really a substitute for a built-in skin customizer like MathU has, though.

Re: MathU RPN calc for iPhone

*Message #5 Posted by **Steve Simpkin** on 28 Feb 2009, 12:36 p.m.,*
in response to message #1 by Bruce Bergman

I recently bought an unusual RPN calculator for the iPhone (iPod Touch) called TouchRPN ($5.99). It has more to it than looks at first glance. It has an infinite stack, can use units within calculations, all keys are customizable and you can write programs for it in MP-FORTH (Multi-Precision FORTH). One feature it desperately needs is a way to import or export its configuration and programming. It appears to be very powerful and has potential but I am struggling to get a handle on its operation.

512K Memory Card

*Message #1 Posted by **Farz** on 24 Feb 2009, 6:50 p.m.*

I have a 512K GX TDS Memory card. When I insert the Memory Card into HP48GX, It gives an Invalid Card Data eroor. Is there a formatting or initialization involved with a new card?

Thank you for your help

Farz

Re: 512K Memory Card

*Message #2 Posted by **Geoff Quickfall** on 24 Feb 2009, 7:49 p.m.,*
in response to message #1 by Farz

Normal, as you have no data in the ports.

check left shift library and then ports. you should have 5 showing; 4 from the card and one internal.

once you port over a programm or data to any of the ports the message will not appear.

you can reference the manual for this info.

cheers geoff

Re: 512K Memory Card

*Message #3 Posted by **Reth** on 24 Feb 2009, 11:05 p.m.,*
in response to message #1 by Farz

Did you use PINIT command ?

Re: 512K Memory Card

*Message #4 Posted by **Geoff Quickfall** on 25 Feb 2009, 6:48 p.m.,*
in response to message #3 by Reth

Reth is correct;

the PINIT command will remove the message at start up. This however is temporary unless you actually stick something in one of the card ports.

the manual says that the card, once installed is ready and to ignore the warning, or if you choose not to ignore the warning use the PINIT command which will not alter the contents of the card.

Cheers, Geoff

Let's see if we can get this back on track.

*Message #5 Posted by **Randy** on 25 Feb 2009, 8:44 p.m.,*
in response to message #4 by Geoff Quickfall

Because this thread is derailed. There is a lot of effort here but the content is from the wrong manuals.

The most common TDS 512k cards do not have replaceable batteries. They instead have a small rechargeable cell that charges when the GX is powered up. The most common problem is for the cards to loose their charge and therefore loose memory when the calculator is powered down. The HP 48 manual assumes you have the lithium battery backed HP cards. Therefore, the comments in the manual when discussing a non-removable battery TDS card are not in proper context. There are also some flat out wrong statements being made with respect to the GX.

> Quote:
>
> the PINIT command will remove the message at start up. This however is temporary unless you actually stick something in one of the card ports.

Doing a PINIT on a good card will clear the message, end of story. You do not need to write anything to a port once the PINIT has been done.

> Quote:
>
> the manual says that the card, once installed is ready and to ignore the warning, or if you choose not to ignore the warning use the PINIT command which will not alter the contents of the card.

Unfortunately, wrong again. This is from the SX manual. If you receive the message after a PINIT, the card either lost its contents or cannot be read correctly. Further, PINIT does indeed alter the contents of the card, as in destroying anything that may have been there...

The content that will help is on TDS website. Worth a read:

http://www.tdsway.com/support/knowledge_base/survey_pro/on_the_hp_48gx/general_tips/KB704

HP 17BII

*Message #1 Posted by **Peter Leyssens** on 24 Feb 2009, 12:13 p.m.*

Hi,

I just bought myself a brand new HP 17BII (without the +). That's right, I found a shop who found a couple of crates with old calculator stock that never got sold, so I'm now the proud owner of a 1987 Indonesia 17BII that never got used.

Except for the fact that the original batteries were flat, it works great ! I bought it as a tool to help me find the right loan for my house and as I flip the virtual pages of the manual I downloaded, I know it's going to be more help than I expected.

Aside from that, I know there's a separate buy/sell section, but would it make sense to buy all the shop's crates and sell them off on an auction site ? The 17BII I bought was a little expensive, but he also has 32BII's and 10B's and I might get a discount if I buy everything. He actually claims he already threw away hundreds of calculators because it was just too much. The heretic !

Thanks for the great forum & website,

Peter.

> ... but would it make sense to buy all the shop's crates and sell them off on an auction site ?

These brand new 17BIIs have already appeared on _the_ auction site, at least on the german part of it, so obviously somebody had the same idea than you... I have not bothered to look how much they are selling for, because I paid one Euro for my 17BII and they won't be able to beat that!

Greetins, Max

> 2. its solver is great and has none of the problems of the solver in the pluses

Hi Don,

The solver and what I read about iterative solutions + let/get, is exactly why I got myself a second-hand-new 17bii instead of a 17bii+ ! Talking about which, I will want the Technical Applications book. After googling, I found one link to a PDF file, but it was dead. I know it's on a Museum CD, but since I just need this one file, I wonder if somebody can mail it :-S (If that's not illegal, of course... if it is, I'll order the CD).

Peter.

Re: HP 17BII

*Message #5 Posted by **Karl-Ludwig Butte** on 25 Feb 2009, 3:26 p.m.,*
in response to message #4 by Peter Leyssens

Hello Peter,

there may be a better way to get the pdf-file: Please post the dead URL here in the forum and we may all try if the WayBackMachine has archieved it. WayBackMachine is an Internet-Archieve I often use when I come across a dead URL.

Kind regards

Karl

Karl,

Thanks for reminding me of the WayBackMachine (WBM). The page with the link is

http://www.thimet.de/calccollection/Calculators/HP-19BII/Contents.htm and the link itself is http://www.thimet.de/calccollection/Calculators/HP-27S/NC-2719TECH.PDF but unfortunately, the WBM doesn't recognise the latter. It probably was a file the author of the former page wanted to put online, but failed to.

Peter.

But no HP42S units??? Way too bad!

HP32SII units, for reasons not at all apparent, seem to have appreciated in value on the auction market. Maybe those could turn a profit, especially if they are new, old-stock, with the original manual and all the packaging.

HP-32SII desirability

*Message #8 Posted by **Karl Schneider** on 25 Feb 2009, 1:29 a.m.,*
in response to message #7 by Mike Morrow

> Quote:
>
> But no HP42S units??? Way too bad!
>
> HP32SII units, for reasons not at all apparent *(emphasis added)*, seem to have appreciated in value on the auction market.

Here, I'll point 'em out:

- LARGE AND LEGIBLE DISPLAY THAT IS NOT SENSITIVE TO VIEWING ANGLE
- Equations
- Fractions
- x-th root of y
- Population standard deviation
- Imperial <-> metric conversions
- Conversions clearly shown and accessible by two keystrokes, instead of from a menu
- Programming functions clearly shown and accessible by two keystrokes, instead of from a menu
- %CHG and Roll_up clearly shown and accessible by two keystrokes, instead of from the function catalog
- Hyperbolics clearly shown and accessible by three or four keystrokes, instead of from the function catalog

Of course, the HP-42S has numerous functions and capabilities that the HP-32SII doesn't. Many users don't really have a need for them, though.

I use an HP-32SII primarily, and an HP-42S only for calculations involving complex numbers and matrices.

Re: HP-32SII desirability

*Message #9 Posted by **Mike Morrow** on 25 Feb 2009, 1:57 p.m.,*
in response to message #8 by Karl Schneider

In 1997 I bought an HP32SII so I could "save" my cherished 11-year old HP-15C. I immediately found the complex number handling to be very poor and incomplete. There were other things I didn't like, but that was the major issue.

I then went looking for an HP42S as a worthy replacement for the HP-15C. HP discontinued it in 1995. Fortunately, the student bookstore at the University of Alabama (Huntsville) apparently did not believe in lowering prices to clear old stock. It had two crispy new HP42S units (with dead batteries) in the display case, unsold since 1993. They cost me $114 each.

The HP42S immediately became and remains my favorite RPN calculator of all time. IMHO, the HP32SII (which I still own) ranks way below the HP42S in capability and features except for being a little faster. It is inferior to the much older HP-15C in many aspects.

Re: HP-32SII desirability

*Message #10 Posted by **bill platt** on 25 Feb 2009, 2:08 p.m.,*
in response to message #9 by Mike Morrow

You are right. The reason for the inferiority is that the 32sii was a souped-up replacement for the 11c and the 42s was a souped-up replacement for the 15c--with 41c compatibility added as well (without the peripherals of course!).

I went from an 11c to a 32sii and it was basically all better than the previous--except for that voyager solid brick feeling etc.

Re: HP-32SII desirability

*Message #11 Posted by **allen** on 25 Feb 2009, 7:01 p.m.,*
in response to message #8 by Karl Schneider

I agree with Karl, As an RPN 4-banger, nothing is faster/easier than the 32s(ii). For programming I prefer the 42s/48gx/50g. There are 2 calculators within reach at all times: The 32sii and 17bii.

Away from the desk I grab a 20b and stuff it in a coat pocket, but generally don't use it's full features.

Re: HP-32SII desirability

*Message #12 Posted by **Michael de Estrada** on 25 Feb 2009, 7:40 p.m.,*
in response to message #11 by allen

I think the main point here is that we all use more than one calculator, because it is impossible for a single calculator to serve all purposes. In my case, the "4-banger" is the HP-15c, the programmable is the HP-48SX and the business/financial is the HP-12c. Each is brilliant at performing its intended function, but falls short of the mark when used otherwise.

Regarding the HP-32SII, I do own one, but prefer the arrangement of the shifted functions on the

HP-15c, which places one legend above the key and the other below on the sloped front of the key. HP has since reverted to this arrangement on the HP-35s. I only use the HP-32SII when I need to perform math with fractions.

Re: HP-32SII desirability

Hi, Allen --

"Four-banger"? "*Four*-banger"??

Ah, but it's so much more than that!

It is evident from the linked program that the HP-32SII's complex-number functions -- albeit awkward and incomplete, as Mike Morrow said -- are very nice to have for programming.

Peter --

Yes, NOS discoveries of desired older models always create a stir. A couple quibbles:

> Quote:
>
> I'm now the proud owner of a 1987 Indonesia 17BII that never got used.

The HP-17BII wasn't made until 1991, nor was any Pioneer-series model released until 1988 (US-made), to my knowledge. A serial number that begins with "ID7" is surely a 1997 model, after production switched from Singapore.

> Quote:
>
> but he also has 32BII's

I'm sure that you meant, "32SII".

Hi,

Of course it was the 32SII, my bad. Funny about the 17BII. I'm very certain the plastic of the calculator itself says 1987 on the back. But I'll check the serial number, it's probably 1997 then. Shame, I thought I got myself a 20+ year old calculator.

Peter.

> I'm very certain the plastic of the calculator itself says 1987 on the back.

What you have on the back of the Pioneer models as the 17BII is a Copyright mention which is the same AFAIK for all units: "(c) Hewlett-Packard Compagny 1987"
This is not the manufacturing date which you can approximate from the serial number: Decoding Serial Numbers
Example of the back of a Pioneer made in Indonesia in 1997: 1997 HP-32S II

Re: HP 17BII

*Message #22 Posted by **Marcus von Cube, Germany** on 26 Feb 2009, 6:34 a.m.,*
in response to message #21 by Peter Leyssens

STAFF is a German method for annuities and annual effective rate calculation, called "Staffelzinsmethode". I found an explanation in the 17BII+ manual.

Re: HP 17BII

*Message #23 Posted by **Peter A. Gebhardt** on 26 Feb 2009, 6:33 a.m.,*
in response to message #21 by Peter Leyssens

Peter,

This special German extension to the "Annuity" (classic TVM) menu on the HP17bII International ROM is because of the different requirements within the classical accounting used by German banks (only?).

Differently to the e.g. US way of reckognizing compounded interest (the TVM way), German banks add up linear interest per day and account for compounding effects only once a year.

Therefore the TVM method does not represent the accounts balance within a year exactly! Think of a passbook (savings account)where the STAFF method makes sense, because taking care of interest on savings/withdrawals with simple multiplication was easier in the days before the calculator revolution.

The way interest was calculated then: 10% interst per year divided by 360 (accounting) days then multiplied by the number of days a balance was bearing interest on that account.

Best regards,

Peter A. Gebhardt

PS: Look up the term "capitalized simple interest" here

http://www.margill.com/Interest-calculation-White-paper.htm

Re: HP 17BII - Solver anomaly ?

*Message #24 Posted by **Marcus von Cube, Germany** on 27 Feb 2009, 3:18 a.m.,*
in response to message #1 by Peter Leyssens

In the french MySilicium forum we did some simple calculator benchmarking: Let the machine loop for a minute and check how far it gets. Here is my "loop" for the 17BII/17bII+:

B=A+SIGMA(N:1:1E99:1:L(A:N))

Solve for B and do a RCL A after the stop.

Whatever the initial values for A or B, the 17bII+ starts looping. This is different on the 17BII: After a CLR DATA, it returns B=0 as a direct result. The solver does not take the L(A:N) into account. To make it loop, store a nonzero guess in A before solving for B. In my opinion, this is a bug in the original solver implementation.

Re: HP 17BII - Solver anomaly ?

*Message #25 Posted by **Don Shepherd** on 27 Feb 2009, 9:25 a.m.,*
in response to message #24 by Marcus von Cube, Germany

Marcus, I have noticed this same behavior on the 17bii+'s before. If you press B twice, it will execute the loop, even after a Clear Data when A has nothing in it. Strange.

Re: HP 17BII - Solver anomaly ?

*Message #26 Posted by **Don Shepherd** on 27 Feb 2009, 9:26 a.m.,*
in response to message #25 by Don Shepherd

I'm sorry, on the 17bii's before. The plusses seem to process it as one would expect.

Re: HP 17BII - Solver anomaly ?

*Message #27 Posted by **Peter A. Gebhardt** on 27 Feb 2009, 10:11 a.m.,*
in response to message #26 by Don Shepherd

Marcus & Don,

So what should we take as a reference now?

The venerable 17BII, the 19BII (200LX HPCALC as well)???

Is the honorable John Tirone wrong in stating, that he could no longer recommend his own book wholeheartedly, because of changes in the L() & G() handling in the newer HP17BII+ - because (as it seems from Marcus post) he was misguided in "using" the eventual bug in the HP17BII to develop his fine solver solutions for real-estate practioneers?

Will the "HP-27S/19B Technical Applications" document be of some help?

Best regards

Peter A. Gebhardt

Re: HP 17BII - Solver anomaly ?

*Message #28 Posted by **Didier Lachieze** on 27 Feb 2009, 11:10 a.m.,*
in response to message #27 by Peter A. Gebhardt

I'm not sure if this is related to the chapter "How LET and GET Change an Equation" page 14 of the "HP-27S/19B Technical Applications" and when a direct solution may be found by the solver while it would not be "correct":

After the CLR DATA we have two formal variables unknown: A and B, each appearing once for the solver and we solve for B without initializing A ...

HP-97 card reader woes

*Message #1 Posted by **GanjaTron** on 24 Feb 2009, 10:28 a.m.*

Hi folks,

after successfully reviving the card reader in an HP-65, I tried the same on an HP-97, but no luck.

I replaced the gooped up pinch roller with silicone tubing and glued the clutch. While I can consistenly read the preprogrammed cards, there's no way in hell I can write and subsequently read a blank card, no matter how I adjust the roller's eccentric shaft. Writing usually occurs without an error, but when a read error occurs, the card reader suddenly speeds up just as the card exits, as if it was trying to read beyond the end of the card.

I then resorted to fiddle with the leaf switch adjustment screws as a last ditch attempt, but no luck there either.

The motor warbles audibly and sounds like it fluctuates in speed. I've tried 3 different pieces of tubing for the roller, with the same results. I suspect the clutch itself is eccentric. Running the motor by itself from a bench supply also produces noticeable flutter.

Any hints before I give up?

Regards,

--Roland

Re: HP-97 card reader woes

*Message #2 Posted by **Michael de Estrada** on 24 Feb 2009, 11:23 a.m.,*
in response to message #1 by GanjaTron

Roland,

Having refurbished a HP-67 card reader myself, including the clutch, there are several things that come to mind:

1) Make sure all electrical wire connections are good (motor to PCB, AC adapter connector pins to motor and keyboard PCB). These are press-fit connections which use the tinned wire as the male pin, and sometimes are a loose fit. Also, make sure these connections don't come apart and the wires are not pinched when you re-assemble the case.

2) Make sure you have not bent any of the spring connector pins on the keyboard PCB or motor control PCB.

3) Make sure the motor shaft is fully inserted through the clutch into the center hole in the worm gear shaft, that the tip of the worm gear shaft is inserted into the hole in the frame and that the rebuilt clutch is not rubbing on the frame. If you have not already rebuilt the clutch, then you probably need to.

4) Lubricate the motor bearings. It is possible to inject some sewing machine motor oil past the shaft seal by orienting the motor upright with the shaft on top, and manually rotating the shaft. Afterwards clean off any

excess on the outside and shaft.

5) When you re-assemble the card reader, make sure the little white plastic roller is properly inserted in its slot. Also, I assume you have cleaned the card pathway on the read head side and that your cards themselves are clean.

Finally, a word of encouragement. I'm a total amateur in these matters, and if I can figure it out then I'm sure you can too. Just put it down for a few moments, have a beer, take a deep breath, then come back when your heart rate has returned to normal. You will eventually fix it, of this I am sure.

Bon chance, Michael

Re: HP-97 card reader woes

*Message #3 Posted by **Rainer Wiedemann (Germany)** on 24 Feb 2009, 3:45 p.m.,*
in response to message #1 by GanjaTron

Hi Roland,

from your description I suppose that you got two problems left over.

First I'm not sure whether your card reader is writing at all. Getting no error message after writing doesn't mean that the card was written at all. The reader does not verify while writing. If you also own a HP-41 with card reader, you can try to read the card written by your 97. If the 97 is writing, the 41 will read it (but your 65 won't). If not so, check all of the connections between r/w head and 97 pcb, check the wires for correct order and shorts or intermittent contact. If you have access to an oscilloscope, check the write signals to the head. Use a resistance meter and check the r/w head for broken windings.

I guess your second problem is indeed the kind of tubing you are using. Tygon tubing (outer diameter 6.4mm, inner diameter 3.2mm) has always worked for me, have a look at German ebay shop "gromotec.de", article number 350165752412 (no, that's not my shop :-)) !).

If the clutch is not properly centered you would have to fix this first, otherwise the worm gear will rapidly wear.

It's also not a bad idea to lubricate the motor bearings and worm gear but don't flood the pinch roller and card guide. Some axial clearance of the motor shaft is ok, but excessive radial clearance would indicate worn bearings and can cause the described flutter too.

Never give up, good luck.

Rainer

Re: HP-97 card reader woes

*Message #4 Posted by **GanjaTron** on 24 Feb 2009, 8:28 p.m.,*
in response to message #3 by Rainer Wiedemann (Germany)

Thanks for the hints, fellas.

I disassembled another (earlier) HP-97 here and applied the same procedure to the card reader's clutch and pinch roller. The motor screeches like a dentist's drill! Amazingly, it reads and writes flawlessly, despite the racket it makes. I was hesitant about lubricating the motor shaft, but I guess it's absolutely necessary here.

The other card reader still gives me agro. It definitely sounds slower and strained compared to the other

one (when it doesn't screech). I'll try a bit of lube on that motor too.

Other than that I've done pretty much all you mentioned except dragging out the o-scope to check the r/w signals. Might be a bit tough without the service manual.

Thanks for the hint with the Tygon tubing, Rainer. Right now I have to make up for the .4 mm difference with a layer of vinyl tape under the silicone tubing. Works, but certainly not as elegant as getting the proper diameter.

Oh, and I'll have that beer *after* I get it working. ;^)

Regards,

--Roland

Re: HP-97 card reader woes

*Message #5 Posted by **GanjaTron** on 26 Feb 2009, 7:46 a.m.,*
in response to message #4 by GanjaTron

Well, lubricating the motor shaft achieved nothing. I even swapped the pinch roller and axle with those from the "good" reader. No luck. I'm starting to wonder if it writes at all. Guess it's time for the scope. Should I measure directly at the head or the chip (and which pins)?

Anyone know how to adjust those leaf switches? How do I detect if they're misadjusted?

Boy, have I wasted a lot of time on this is a DOG of a card reader. I guess there's a reason this particular HP-97 is in such great cosmetic shape... ;^)

Re: HP-97 card reader woes

*Message #6 Posted by **Randy** on 27 Feb 2009, 8:47 a.m.,*
in response to message #5 by GanjaTron

A scope will tell you nothing.

If you receive the "Error" message when writing, the switches are most likely out of adjustment. You said earlier you "fiddled" with the leaf switches. Do you know how to set them correctly? I ask because it is a black-and-white procedure, no "fiddling" involved.

If you do not have a copy of the 97 service manual from the MoHPc dvd set, it is time to invest in one. The service procedure is well documented and leaves nothing to chance or guesswork.

Yes, some readers take more effort than others but I suspect it is your lack of documentation that is root cause of your frustration.

Hi Johnny

There has been talk about a case several times, but none of those avenues have worked out I'm afraid. Yes, it's not as rugged as a normal watch, but it does stand up to some abuse. The crux is the glued on band pin supports.

A case would also increase the size of the watch considerably over its already rather large-ish size.

Dave.

Insufficient Memory

*Message #1 Posted by **Farz** on 23 Feb 2009, 1:34 p.m.*

My HP48 works and I am trying to use COGO GX/SX, After I enter COGO48 it shows the menu, but as soon I enter any function, it give me the "Insufficient Memory" message. I cleared memory by using AF and ON keys already.

I appreciate your help Farz

Insufficient Info...

*Message #2 Posted by **Raymond Del Tondo** on 23 Feb 2009, 4:06 p.m.,*
in response to message #1 by Farz

What does the associated documentation tell about memory requirements?
Maybe you're using an SX without an additional RAM card.
The SX only has 32K RAM built-in, whereas the GX has 128K onboard.

Does the manual provide any examples, and if yes, do they work?

Questions over questions;-)

HTH

Re: Insufficient Memory

*Message #3 Posted by **Randy** on 23 Feb 2009, 4:14 p.m.,*
in response to message #1 by Farz

Remove the cogo card from the calculator and clean the contacts of the card with isopropyl alcohol and a cotton swab. Let dry. Clear the memory of the calculator again with the three fingered salute and turn off. Reinsert card, restart with COGO48 and see what you get.

If that doesn't work, try the card in another GX. That way you'll know if it is the card or the calculator.

Re: Insufficient Memory

*Message #4 Posted by **Forrest Switzer** on 23 Feb 2009, 8:22 p.m.,*
in response to message #1 by Farz

Farz,

Depending upon the card and calculator you may be required to have a memory card. Also there is probably a proceedure described in the manual where you clear memory, enter the COGO card, turn on the calculator, turn off the calculator, insert the memory card and the COGO card and turn on the calculator.

Is this a TDS COGO card? Raymond is right - there is insufficient information given. There are a couple of

companies that make these cards and a number of different levels to the cards (basic COGO to Data Collector and on up into Road Works).

Didn't you get a manual with the card?

Forrest

It was sufficient for me...

*Message #5 Posted by **Randy** on 23 Feb 2009, 9:04 p.m.,*
in response to message #4 by Forrest Switzer

TDS COGO does not require additional memory, only SURVEY and SURVEY PRO need it.

SMI COGO is fine without a card as well.

> Quote:
>

in response to message #6 by Forrest Switzer

I have both 48SX and 48GX, and I don't have a Manual them. TDS COGO that I have worked on 48GX before, I exited the program to try on 48SX and it's no longer working. It show the menu for COGO and as soon as I enter any function, it kicks out and give the Error "Insufficient Memory".

Farz

Re: It was sufficient for me...

*Message #8 Posted by **Forrest Switzer** on 24 Feb 2009, 7:22 p.m.,*
in response to message #7 by Farz

Are you saying that it will not work on the GX now, or only that it wont work on the SX?

Forrest

Re: It was sufficient for me...

*Message #9 Posted by **Forrest Switzer** on 24 Feb 2009, 11:37 p.m.,*
in response to message #7 by Farz

Sorry about the formating, but this is about the best I can do.
It seems to reformat the numbering.
I have about 4 different TDS manuals for HP-48 and one TDS Manual for the HP200. The only card I have is for the HP200.

I think this manual is the most basic COGO.

From my TDS-COGO48 User's Manual (1990)

INSTALLING YOUR TDS-COGO48 CARD

Be certain tha you have three AAA alkaline battery cells properly installed in your HP-48SX before you begin the card installation process. If you have no cards plugged into your HP-48SX, you may go to step 3.

1) Turn your HP-48SX OFF
2) Remove any IC cards you may have plugged into your 48.
(This will cause a system memory loss if your plug-in RAM is configured as part of the main system RAM.)
3) Turn your HP-48SX ON
4) Turn your HP-48SX OFF
5) Insert your TDS-COGO48 Card into Port 1 of your HP-48SX.
(Port 1 may be identified by the graphic on the back of the unit.)
Cards are installed with the card graphics facing up when the 48 is inverted (keyboard down).
6) Turn your HP-48SX ON
7) Turn your HP-48SX OFF
9) Your HP-48SX is now properly configured

Yes the manual has omitted number 8

The numbers then continue with 10 regarding the installation of a RAM card.

Then the manual covers running the TDS-COGO48

To run the COGO Card Software, first press the alpha key twice

Now in alpha mode type "TDSCOGO" and [enter]

You should now see the main menu.

Installing a RAM Card

10) Install an HP-82214A or HP-82215A RAM Card in Port 2
(Port 2 may be identified by the graphic on the back of the unit.)
Cards are installed with the card graphics facing up when the 48 is inverted (keyboard down).
11) Turn your HP-48SX ON. When you turn on your TDS-COGO48 the first time, you will get and "invalid Card Data" error message. This is normal. Ignore this error message and proceed with running your TDS-COGO48. If you have installed the RAM card properly and you get a "No RAM card in port 2" error message, you probably have the write protect switch on your RAM card set. Try adjusting this switch which is located on the top edge of the card.
12) The first time that you attempt to use a RAM card which has not been used previously with the TDS-COGO48 or a TDS-48, the unit will prompt you with the message "Can I erase all data in port 2? Be certain that you do not want to save any information which may have been recorded by other applications before you press "Y".

Cant help more than that because I dont have the card.

```
Forrest
```

Re: It was sufficient for me...

*Message #10 Posted by **bill platt** on 25 Feb 2009, 8:17 a.m.,*
in response to message #9 by Forrest Switzer

Hi Forrest,

If you use the [pre] [/pre] delimiters, you have to put the carriage returns in yourself...that's all.

For instance:

```
The quick brown fox
Jumps over the lazy dog
```

There is a manual carriage return after fox.

Edited: 25 Feb 2009, 8:20 a.m.

Re: It was sufficient for me...

*Message #11 Posted by **Forrest Switzer** on 25 Feb 2009, 8:06 p.m.,*
in response to message #10 by bill platt

Thanks Bill,

I kinda figured that out. I had typed it in word and converted to text, then previewed it and all the numbers had been stacked after each other. Then I selected preformatted, put the text where it needed to be and the preview looked ok, but of course it wasn't.

Forrest

Re: It was sufficient for me...

*Message #12 Posted by **bill platt** on 25 Feb 2009, 10:01 p.m.,*
in response to message #11 by Forrest Switzer

Almost every time I use [pre]\ with a substantial amount of text, I end up having to edit after I post--the proofreading in the edit window creates "gotchas" :-)

Re: It was sufficient for me...

*Message #13 Posted by **Marcus von Cube, Germany** on 26 Feb 2009, 4:43 a.m.,*
in response to message #11 by Forrest Switzer

Forrest, you can still edit your posts and correct the formatting. The PRE tags are useful for code listings but not for body text, because the word wrap is disabled in preformatted paragraphs. There is more formatting available: Advanced formatting options.

A Replacement Calculator for Casio's with RPN!

*Message #1 Posted by **hugh steers** on 23 Feb 2009, 2:03 p.m.*

Hi,

I bought one of these Casio fx-9860g *slim* calculators - I like the shape.

It's a convenient form factor, folds up neat and fits in your pocket, with the screen protected so you don't need an outer case. Despite claiming to be *slim*, it's depth and height are about the same as a hp50g, but the length is significantly less. The screen is quite clear and the buttons work well. There's also a backlight and a USB connector.

However, i don't much care for Casio's actual calculator. So i've been developing my own "replacement" calculator called **Reckon**. It's not finished yet, but i made a sneak preview video if you want to have an early look.

It also does RPN!

VID (fuzzo-vision): http://www.youtube.com/watch?v=-uBY8kbyKEE

[NB: on the vid, the graphing is blurred. this is a framerate alias. it's not actually like this!]

I'm hoping to release a beta into the wild around the end of this month.

Very nice and quite fast.

Re: A Replacement Calculator for Casio's with RPN!

*Message #3 Posted by **Katie Wasserman** on 23 Feb 2009, 2:43 p.m.,*
in response to message #1 by hugh steers

GREAT! I was just about to start in of my own app for this calculator, but I was thinking more along the lines of something programmable, a FORTH-like language.

Since you say that it's 25 decimal digits I assume that you wrote your own math routines. Did you figure out how to call any of Casio's built-in functions other than those provided in the SDK?

-Katie

Re: A Replacement Calculator for Casio's with RPN!

*Message #4 Posted by **hugh steers** on 23 Feb 2009, 5:11 p.m.,*
in response to message #3 by Katie Wasserman

It could do with a better program language. Casio has that weirdo basic-alike but not really language that they've had for years. It would be really easy to port another language. LUA would be very easy.

one thing tho': It's got a lot of flash memory for code but only 64k of ram. this puts the kibosh on anything too fancy.

I do use all my own math routines, although you do get the IEEE754 float/double library with the SDK. I used mine because, in any case, it's software emulation and mine are decimal floats.

There are a lot of undocumented syscalls out there. Various people are endeavouring to discover them and make them public. I have used a few already, such a nonblocking keyboard read and locating the screen RAM.

Its not a bad little machine to program.

Why not the IBM decNumber library? Last time I looked it was way better at packing things for a low memory (RAM) devices.

8 byte reals gives you 16 digits. 16 byte reals are 33 digits long. Plus infinities, not numbers, sub-normals. I.e. IEEE 854 decimal floats.

- Pauli

Re: A Replacement Calculator for Casio's with RPN!

*Message #6 Posted by **hugh steers** on 24 Feb 2009, 2:53 p.m.,*
in response to message #5 by Paul Dale

Hi,

The decnumber library does not operate internally in the packed form, you have to unpack, operate

and then pack to use this form.

This would raise the question of whether i should always perform this triple - which would impact performance, or only to pack when i store in variables etc.

However the variable storage is on the heap, so usually this means sizes are a multiple of 4. Using your examples, this would mean i could use 8 bytes = 16 digits or 16 bytes = 33 digits. Maybe it could fit 24 in 12 bytes - which would be a good combination. That would save 4 bytes per variable. There would still be a hit when accessing variables.

Also, i already have infinities, but no denormalised floats.

Re: A Replacement Calculator for Casio's with RPN!

> Quote:
>
> This would raise the question of whether i should always perform this triple - which would impact performance, or only to pack when i store in variables etc.

The 20b rewrite I'm working on does the latter. The stack and registers are 16 digit packed format and all computations are performed using 39 digits unpacked numbers. Entire computations are performed without packing. Only when the result is known does packing occur.

> Quote:
>

Maybe it could fit 24 in 12 bytes - which would be a good combination. That would save 4 bytes per variable. There would still be a hit when accessing variables.

You'd get 25 digits in 12 bytes when packed. Digits are stored three per ten bits. I don't really see why you'd need 20+ digits except during internal computations though. Even the 16 I'm carrying seems like overkill :-)

Very nice. Now I have to get one.

Re: A Replacement Calculator for Casio's with RPN!

*Message #9 Posted by **hugh steers** on 23 Feb 2009, 5:16 p.m.,*
in response to message #8 by Egan Ford

Hi Egan,

Do you know if hpgcc works with c++ now? last time i looked, version 3 was by request only, so i've lost track of progress.

If so, i could easily make a hp50g port. the 50g is actually a lot more powerful, 2x CPU and a lot more RAM. Also more pixels!

However, i do recommend getting one of these, I find it nicer to carry.

Others have with version 2. The libraries are all C, but you should be able to use any GCC compiler language as long as you can bind to C.

Someone posted to comp.sys.hp48 a Sudoku solver written C++ for HPGCC 2. I think I still have it if you are interested.

Hi Hugh,

I posted the sudoku solver in C++ that Egan referred to. You can get it here:
http://www.hpcalc.org/details.php?id=7062

This is a port of a windows program that I wrote.

See glue.cpp for the details of moving between C and C++. You need to implement "new" and "delete" in terms of malloc() and free() (it's easy) and any C++ file that includes the hpgcc header file will need to enclose the #include inside extern "C" { ... }. Finally, it appears that static variables inside functions aren't supported because the static initializer code isn't there.

Dave

Re: A Replacement Calculator for Casio's with RPN!

*Message #12 Posted by **hugh steers** on 25 Feb 2009, 9:16 a.m.,*
in response to message #11 by David Hayden

Thanks for the Sudoku program reference.

I notice the program has to resort to guesswork (brute force) for some of the hardest puzzles. I had the same problem in my own sudoku solver (which I wrote in lua for the hp50g). I used the methods suggested by Philip Belben from his HPCC datafile articles; “A General Method for Solving Sudoku” V24N6P23 and “More on Solving Sudoku” V25N1P4.

Philip was working on a set of canonical rules that would solve any puzzle. Unfortunately his rules didn’t quite get there, but were interesting nonetheless. To date, I still do not know if there is a (small) set of simple rules to defeat any puzzle.

His rule set was based on 5 increasingly involving rules derived from his experiences solving puzzles manually. When I coded them up I discovered that rule 5 (when generalised) dominated rules 3 & 4. Ie a program with rules 1,2 & 5 solves the same puzzle set as 1,2,3,4,5. So I removed rules 3 & 4 from the implementation. Of course, those rules are still handy for manual solving because they are easier mentally than rule 5.

Then there were the puzzles that were not solved by these rules. In these cases, I found that by guessing a number from a suitable (least unknown) square I would wind up with a solution, stalemate or contradiction. Latter almost always leading to full solution once the original rules are reapplied. Furthermore, I found the puzzle always solvable by one such guess. There were never cases when all guesses to minimum unknown squares failed to reach a solution or contradiction. That being the case meant my guess method did not have to be recursive – which was nice for the calculator memory!

good stuff.

Re: A Replacement Calculator for Casio's with RPN!

*Message #13 Posted by **David Hayden** on 25 Feb 2009, 10:51 a.m.,*
in response to message #12 by hugh steers

Hi Hugh,

You can find lots of information about solving and generating sudoku here:
http://www.setbb.com/phpbb/index.php?mforum=sudoku

Knuth's Dancing Links algorithm can solve any sudoku puzzle. There are lots of different algorithms that can be applied, but after the first half dozen or so, they all look suspiciously like "guess a value and see where it leads" to me.... :)

My solver applies successively more difficult methods to try to make progress on the puzzle, where progress means you can eliminate one or more possible values from a square. If any progress is made, it goes back to the easiest algorithms again. If none of the logical algorithms can solve the puzzle then it applies the one you mention: find a square with the fewest number of possibilities, assume one possibility is correct, and recursively repeat the whole process, starting with the logical algorithms first. Eventually you end up with a solution or an inconsistency, in which case the recursive call exits and you move on to the next possibility for a square. To me, the "guess and see where it leads" method is faster at that point, even for a human.

I haven't checked the number of recursive calls, needed, but doing it by hand with the windows version, I think I've seen a few puzzles that required two levels of recursion.

It was a fun exercise to port the C++ program to the calculator. The solver itself operates in just

a few microseconds. All the time needed to run the program comes from the User RPL wrappers that convert from an array to a string and back again.

I think the program is a nice example of the calculator's underlying speed and what can be done in C++.

Re: A Replacement Calculator for Casio's with RPN!

*Message #14 Posted by **Paul Guertin** on 26 Feb 2009, 4:03 a.m.,*
in response to message #13 by David Hayden

A few months ago, I wrote a sudoku solver using dumb backtracking (always starting with the entry having the fewest number of possibilities). It solves most newspaper-level sudoku problems in a few milliseconds on my slow computer, and the hardest problem I could find on the web, shown below, takes 0.15 second to solve.

My program reads a single sudoku problem from standard input, in the following format:

```
.......12
........3
..23..4..
..18....5
.6..7.8..
.....9...
..85.....
9...4.5..
47...6...
```

(A dot or the number 0 represents an empty space, and the newlines are optional, so the whole problem could also be entered on an 81-character line.)

Here is the program:

```
/* Sudoku solver by Paul Guertin <pg@sff.net>, August 2008 */

#include <stdio.h>
#include <string.h>

int neighbor[81][20];   /* lists of all 20 neighbors of each cell 0..80 */
int popcnt[512];        /* count of 1-bits in 0<=i<512 written in binary */
int nbsol, nbcalls;

void init_tables()
/* Initializes the neighbor[][] and popcnt[] tables. */
{
    int i, j, p, n[81];

    for( p=0; p<81; p++ ) {
        memset( n, 0, 81*sizeof(int) );
        for( i=0; i<9; i++ )
            n[p/9*9+i] = n[p%9+9*i] = n[p/27*27+p/3%3*3+i/3*9+i%3] = 1;
        for( i=j=0; i<81; i++ ) {
            if( (n[i] == 1) && (i != p) )
                neighbor[p][j++] = i;
        }
    }
    for( i=0; i<512; i++ ) {
        for( j=popcnt[i]=0; j<9; j++ )
            popcnt[i] += (i>>j) & 1;
    }
}

void set( int *board, int pos, int val )
/* Puts the value (1..9) in entry pos (0..80) and updates neighbors. */
{
```

```
    int i;

    board[pos] |= val<<9;
    for( i=0; i<20; i++ )

Re: A Replacement Calculator for Casio's with RPN!

*Message #15 Posted by **hugh steers** on 26 Feb 2009, 9:28 a.m.,*
in response to message #14 by Paul Guertin

Hi Paul,

Thanks for posting your sudoku program. I like it, it's very short and concise.

Also, your example puzzle is very tough! Has anyone had a go at solving it by hand? I put it into my program and made a discovery – it doesn't get solved by my, so called, one level guess. So this shows that there are puzzles that need a recursive solve approach.

Because your program is highly recursive, its not suitable for calculators in its current form, but could be adapted. For example, the max depth will be the same as the number of initial unknowns. Eg 64. So we need 63 boards on the stack ~ about 20k. This is a lot for a small stack machine, but not for the heap. Otherwise I think it would work quite well. I also like the fact that it will find all solutions, which is nice to know, in case the puzzle is ambiguous.

Your program demonstrates that trying to translate methods a person would use into a program aren't always any better than a program that solves by brute force, but in a very streamlined way.

Certainly for this scale of branching factor anyway.

Re: A Replacement Calculator for Casio's with RPN!

*Message #16 Posted by **Marcus von Cube, Germany** on 26 Feb 2009, 11:33 a.m.,*
in response to message #15 by hugh steers

I've tried it on my Casio Z-1GR (8088, C interpreter). Some modifications were (and still are) necessary because:

1) No ANSI prototypes.
2) memset, memcpy are missing.
3) sizeof works on variables only, not on types.

3) The output scrolls off the display.

I plugged in an external power supply and started the program with the hard to solve puzzle as input. I had to enter the numbers manually, there is no input redirection, but at least the solver started.

A few hours later, the solution was on the screen (scrolled off but obviously found). The program was still working, trying to find more solutions. I stopped it...

Memory wasn't a problem, at least on my system with some 40k free RAM, but execution times could be considerably improved by adding a few heuristics.

Here is the modified code:

```
/* Sudoku solver by Paul Guertin <pg@sff.net>, August 2008 */
/* Casio-C (non ANSI) MvC, Feb 2009 */

/*
#include <stdio.h>
#include <string.h>
*/

int neighbor[81][20];   /* lists of all 20 neighbors of each cell
0..80 */
int popcnt[512];        /* count of 1-bits in 0<=i<512 written in
binary */
int nbsol, nbcalls;

memset( buff, val, size )
char *buff;
int val, size;
{
    while( size-- ) *buff++ = (char) val;
}

memcpy( dest, src, size )
char *dest, *src;
int size;
{
    while( size-- ) *dest++ = *src++;
}

init_tables()
/* Initializes the neighbor[][] and popcnt[] tables. */
{
    int i, j, p, n[81];

    for( p=0; p<81; p++ ) {
        memset( n, 0, 81*sizeof(i) );
        for( i=0; i<9; i++ )
            n[p/9*9+i] = n[p%9+9*i] = n[p/27*27+p/3%3*3+i/3*9+i%3] =
1;
        for( i=j=0; i<81; i++ ) {
            if( (n[i] == 1) && (i != p) )
                neighbor[p][j++] = i;
        }
    }
    for( i=0; i<512; i++ ) {
        for( j=popcnt[i]=0; j<9; j++ )
            popcnt[i] += (i>>j) & 1;
    }
}

set( board, pos, val )
int *board, pos, val;
/* Puts the value (1..9) in entry pos (0..80) and updates neighbors.
*/
```

```
{
    int i;

    board[pos] |= val<<9;
    for( i=0; i<20; i++ )
        board[neighbor[pos][i]] |= 1<<(val-1);
}

int input_board( board )
int *board;
/* Reads a sudoku board from stdin.
   Returns 0 if OK, 1 if EOF, -(1..81) if invalid entry found. */
{
    int c, n;

    n = 0;
    memset( board, 0, 81*sizeof(n) );
    while( n<81 && (c=getchar()) != EOF ) {
        if( c>='1' && c<='9' ) {
            if( board[n] & 1 << (c-'1') )
                return -n-1;
            else
                set( board, n++, c-'0' );
        }
        else if( c == '.' || c == '0' )
            n++;
    }
    return n<81;
}

print_board( board )
int *board;
/* Pretty-prints a sudoku board to stdout. */

    int i;

    for( i=0; i<81; i++ ) {
        if( i==27 || i==54 )
            puts( "\n---------+---------+---------" );
        else if( !(i%3) )
            putchar( i%9 ? '|' : '\n');
        printf( " %c ", board[i]>0x200 ? '0'+(board[i]>>9) : '.' );
    }
    putchar( '\n' );
}

solve( board )
int *board;
/* Prints all solutions to a sudoku problem. */
{
    int i, maxblock, maxpos, keepboard[81];

    nbcalls++;
    for( i=maxblock=0; i<81; i++ ) {
        if( board[i] < 0x200 && popcnt[board[i]] > maxblock ) {
            maxpos = i;
            maxblock = popcnt[board[maxpos]];
        }
    }
    if( maxblock == 0 ) {
        print_board( board );
        nbsol++;
    }
    else if( maxblock < 9 ) {
        for( i=0; i<9; i++ ) {
            if( !(board[maxpos] & 1<<i) ) {
                memcpy( keepboard, board, 81*sizeof(i) );
                set( board, maxpos, i+1 );
                solve( board );
                memcpy( board, keepboard, 81*sizeof(i) );
            }
        }
    }
```

```
}

int main()
{
    int board[81], error;

    /* Each item in the board[] array represents an entry.

I also like the fact that it will find all solutions, which is nice to know, in case the puzzle is ambiguous.

One way to shrink the data required is to recognize that you don't need to store the entire board when you recurse. Instead you can store the value of the square that you're currently guessing, along with the values of it's 20 neighbors. That's because these are the only things that change when you set the value of the square.

A further optimization would be to recognize that you're only changing one bit of the neighbors, so you can store the previous value of the current square, plus a bit for each of the 20 neighbors.

I entered it into Wayne Gould's Sudoku program and it said it was not a valid puzzle. The message included a note that about 1 in 700 puzzles printed in books and magazines are actaully impossible.

I then entered it into Angus Johnson's "Simple Sudoku" and it only got one step before it was stumped.

Both these programs use methods a human solver would go through. This puzzle may only be solvable by brute-force-trial-and-error.

David Hayden pointed out some possible optimizations that can save much memory. There is also an easy way to drastically cut the recursion depth:

For the sake of simplicity, the function solve() recurses even when there is only one possibility for a missing digit (i.e. when the variable maxblock is equal to 8). It is a simple matter to add a few lines of code so that it doesn't recurse until maxblock is less than 8. When I tried it, the maximum depth of recursive calls for the tough problem went from 63 to 24, and most newspaper-level problems seem to require a depth around 5.

Hi Hugh,

nice application. I've received my machine just yesterday, went to the edu.casio.com download site, logged in and tried to get the SDK. Somehow I do not qualify for the download. :(What are the steps to take for a developer to get the necessary tools?

Another question to the public: Would the Casio qualify as a free42 platform?

Re: A Replacement Calculator for Casio's with RPN!

*Message #21 Posted by **hugh steers** on 24 Feb 2009, 5:30 a.m.,*
in response to message #20 by Marcus von Cube, Germany

Hi Marcus,

You have to type in the numbers from the back of the unit to download the SDK. It's a bit silly i know.

I'm not really sure whether this is to validate you are a true owner or just some kind of data collection idea.

If it's not some kind of license restriction, it would be an excellent way for people here to try stuff out. The SDK comes with an emulator which can run apps under windows.

in response to message #22 by Marcus von Cube, Germany

Soon will be. I'm going to release a public version in about a week or so. I have a list of minor wibbles to fix first.

Then i'll just try it out for a bit first, trying to head off that embarassing bug (that always gets out there) before the release.

Got a 32s, musing about the 33s

*Message #1 Posted by **Peter Klein** on 23 Feb 2009, 2:54 a.m.*

I managed to snag a nice 32s off of "the auction site." It's got a couple of scratches on the bezel that kept the collectors from bidding it up too high, and everything works. So far I'm very pleased. I *love* the Pioneer form factor and keys.

I don't have a manual yet, so I downloaded HPs PDFs of the 32sii and 33s manuals to figure things out. I was fooling around with the RPN solver and the TVM equation Jeff Kearns posted last month (thanks, Jeff!). And something dawned on me.

The 33s has 32K of memory. People have balked because it has the same limited number of variables and labels as its ancestors. But then I realized what the memory is for--equations.

It takes a lot of equations to make much of a dent in that 32K, right? You can easily store variations of your most-used equations to solve for the variables you need, and run them directly, without ever having to use the Solver. Meanwhile, you've still got plenty of program space when you need it.

Now, if only we could retrofit a 32K memory chip in 32s and 32sii. And all the best calculators could benefit from a a USB port to plug in an SD card reader/writer for backup and restore. I know the latter will never fly on the current models due to the exam certification requirements. But hey,I can dream, can't I?

Re: Got a 32s, musing about the 33s

*Message #2 Posted by **Walter B** on 23 Feb 2009, 3:06 a.m.,*
in response to message #1 by Peter Klein

You're invited to a little roaming through the museum archives to see where dreaming may take you to.

Ceterum censeo: HP, launch a 43s.

Walter

*Message #3 Posted by **bill platt** on 23 Feb 2009, 11:10 a.m.,*
in response to message #1 by Peter Klein

Haha, there was an enormous amount of unfounded griping about the lack of variables in the 33s (like, go get a 48GII or a 50G!). Like, the 32sii was so limited in memory, you could never use all the variables and labels, so with increased memory everyone's griping the other way!

Yes, the real bonus is the equations and simply the inexhaustible space for equations or programs. Even better, you can use equations as labels (that is also true in the 32sii which you don't have on the 32s). With essentially unlimited memory, you can put in long descriptive equations which actually make it possible to keep infrequently used equations or programs in memory with some chance to actually know what they are and how they work!

All of this also applies to the 35s except that it has a huge number of indirect memory addresses.

Re: Got a 32s, musing about the 33s

*Message #4 Posted by **Michael de Estrada** on 23 Feb 2009, 11:58 a.m.,*
in response to message #3 by bill platt

Let me guess. It's the maximum deflection at the center of a simply supported beam with a uniformly distributed load, where W=wL = total load and there should be a 384 in the denominator to the right of the ExI. Just asking out of idle curiosity; I'm a retired civil engineer.

As far as memory is concerned, the HP-32SII has a puny 384 bytes of memory, but the HP-42S has a reasonable 7K of memory, which has always been plenty for me. All my long programs are loaded onto my HP-48SX, which has 160K memory with an expansion card and serial communication with my DOS PC. I just bought a used HP-50g on "that auction site", and am looking forward to experimenting with it.

HP designs

*Message #5 Posted by **designnut** on 23 Feb 2009, 1:11 p.m.,*
in response to message #4 by Michael de Estrada

I find the solver in the 33S ideal in that it makes direct solutions where possible. It is sad that someone found it necessary to "style" it so it looked like a rocket ship and made it hard to repair due to the rubber side strips which rules out a slipcase like former calculators and led to the bulky horrid case. Sam

User RAM on the HP-32S and HP-32SII

*Message #6 Posted by **Karl Schneider** on 24 Feb 2009, 2:01 a.m.,*
in response to message #4 by Michael de Estrada

> Quote:
>
> As far as memory is concerned, the HP-32SII has a puny 384 bytes of memory, but the HP-42S has a reasonable 7K of memory,

The HP-32S had an already-miserly 390 bytes, then its successor HP-32SII lost six bytes even as the capability to store equations was ported from the HP-22S. This made the RAM even more inadequate.

The programming paradigm was good enough on both models to make it worthwhile to retain crafted user programs in permanent residence. Unfortunately, that can leave little room for other things -- very annoying.

I'd say that 2 kB would have been just right for the HP-32S/SII -- including 216 bytes reserved for 26 letter variables and the indirect register "i", so as not to illogically declare a variable nonexistent if its value happened to be zero.

Why couldn't the RAM from the HP-28C have been used?

The HP-32SII *does* offer a byte-saving trick: Non-negative integers not exceeding 254 can be stored in a program or equation using only 1.5 bytes, instead of the 9.5 bytes that all other numbers would require.

Here's an equation-based example for calculating balanced 3-phase apparent power [in MVA] from phase-to-phase rms voltage [in kV] and rms current [in A]:

```
M=K*A*SQRT(3)/1000      26 bytes

M=K*A*SQRT(3)/100/10    21 bytes
```

The latter runs a bit slower, but saves five bytes of RAM because "100/10" consists of three 1.5-byte objects, while "1000" is a 9.5-byte object.

Users really ought not to have to resort to tricks like that, though...

Interesting observation about Circuit City

*Message #1 Posted by **Martin Pinckney** on 22 Feb 2009, 6:15 p.m.*

As most U.S. members probably know, Circuit City is going out of business. They had a sidewalk placard guy at the local store yesterday, advertising "up to 60% off". (Ever notice how they never seem to get "up to" the advertised percentage on the items you are interested in)?

Anyway, out of curiosity, I went in. There was lots of "stuff" still on the shelves, but NO calculators left! (Save a couple of TI's). I got the impression the calcs have been gone for a while.

Curious, in this day when supposedly ordinary consumers are just not much interested in calculators anymore, they did not last long in the sale! (I bet the HP's went first). Did any members recently snag a 12c, 17bii+, or 35s at CC?

Re: Interesting observation about Circuit City

*Message #2 Posted by **Bill (Smithville, NJ)** on 23 Feb 2009, 8:35 a.m.,*
in response to message #1 by Martin Pinckney

I usually avoid all going out of business sales. Not sure what the rules are in other states, but in New Jersey you can "Go out of Business" for not more than 90 days in each calendar year. We have companies that have made a living out of going out of business. Following is NJ Staute:

> Quote:
>
> 56:8-2.8. "Going out of business sale" ; time limits It shall be an unlawful practice for any person to advertise merchandise for sale as a "going out of business sale" or in terms substantially similar to "going out of business sale" for a period in excess of 90 days or to advertise more than one such sale in 360 days. The 360-day period shall commence on the first day of such sale. For any person in violation of this act, each day in violation shall constitute an additional, separate and distinct violation.

What I really like about the Circuit City "going out of business" ads on TV is they state "New merchantdise arriving daily".

Another possibility...

HP may not allow discounting on their calcs, so they may have been pulled (or at least, not restocked) before the big discounts.

We don't have a Circus Pity in our city, were any of the "premium" TI's (i.e. 84+++ or 89 Plutonium) discounted to 60%? I doubt it...

I ended up there on the first saturday to take care of some cell phone stuff and was curious. I wandered to the calculator area and someone was grabbing the last 50g. There were pegs for all the other HP calculators, so I expect the small stock sold out quickly. When I went back in about 2 weeks later to buy a better power strip there was still a nice selection of 84s and 89s.

Amazing how when stuff at circuit city was 40-60% off it finally started to get close to online prices. . . that is why they failed.

Circuit City failed because they were a terrible operation in every imaginable way, be it customer service, product availability, technical knowledge and value. There is not sifficient space on this forum for me to chronicle all my horror stories with this outfit.

As an example, I purchased a laptop computer with Windows Vista Home Premium (another decision I have since regretted), which came with 1G memory. I had heard that 1G was inadequate, so I decided to have Circuit City install an additional 1G. When I started to use the laptop, I encountered sporadic problems with it locking up, so I took it back to the store for testing. After two weeks, they informed me that there was nothing wrong with the machine, so I took it back, but continued to have problems. Circuit City informed me that they would not warrant the machine or exchange it with another. I then took it to an independent shop, who told me that the problem was that the additional memory that Circuit City had installed was the wrong speed (it was too slow), and after replacing it with the correct memory, the laptop has performed flawlessly ever since (except for unrelated Vista issues). When I returned to Circuit City with the bill from the shop and the removed memory for credit, they just told me to take a hike.

So, I don't think deep discounting of product would have saved them. Brick and mortar stores survive on good service and technical support, and Circuit City had neither.

Circuit City

Well put. I purchased a 50 inch plasma TV there last year. The employees I dealt with acted like they were put out to have to help me. A pathetic outfit.
Pres. Obama, don't bail these guys out!!

Not at the Circuit City in St. Petersburg on February 24 where the only remaining calculators are four 12C Platinum's priced at $60.89.

The next day I checked the Circuit City in Clearwater, Florida. There were no calculators of any kind for sale.

I also did a price comparison at Office Depot. They have the 12C Platinum listed at $89.99 with a ten dollar discount for a current price of $79.99.

My Circuit City in Louisville had one HP50g yesterday, but they wanted $120 for it and I was only prepared to pay about half that. Considering you can get one at Amazon for about $104, it would seem that Circuit City just doesn't get it. Even during a storewide clearance sale, there are no bargains.

HP-35s Stat Pac Free to download!!

*Message #1 Posted by **Namir** on 22 Feb 2009, 5:17 p.m.*

Hi All,

I posted my HP-35S Stat Pac on my web site. You can access the software's web page by clicking here.. At the bottom of that web page you will find a link to download the ZIP file that contains the 440-page PDF file-formatted manual.

Enjoy!!

Namir

In defence of a 4 stack

*Message #1 Posted by **designnut** on 22 Feb 2009, 3:44 p.m.*

I found the 4 stack no limitation in the real world. It makes possible the repeating t register which I really took advantage of. When you have 3 memories like the original 35 you have to squeeze what you can out of few resources. I used the t register to store Resistance in a divider ans solved for the divider fraction and the output resistance. My solution has no precedence but it works. I used 2(Pi)F repeatedly fo solve the resonance equation at a fixed frequency. 2(Pi)F multiplied twice by L or C and invert to see the resonant element. I used it similarly for 2(Pi)FRC-1 to solve RC corners for compensation of Op amps. I note a dearth of younger and older MOHPC members around the central cluster. TI in the classroom? Too bad HP abandoned the field. Sam

Re: In defence of a 4 stack

*Message #2 Posted by **Walter B** on 22 Feb 2009, 4:12 p.m.,*
in response to message #1 by designnut

Hello Sam,

for sake of clarity please note a repeating t register is not bonded to 4 level stacks, but may also be present with any other fixed stack depth. Having 6 stack registers, x y z 4 5 t for example, will allow you all the tricks you do with 4 levels PLUS straight forward computing of more complicated equations than a 4 level stack can take.

Best regards,

Walter

> True but I find it very difficult to keep tabs with more than 4 stack registers at a time

May I point you to another post?

Your preference may depend on the dominant use of your calculator: If it's stack gymnastics, I agree 4 levels are enough, but if it's number crunching, a few (!) more levels are beneficial. That was why I vote for a settable fixed stack depth. 4 levels in vintage mode and e.g. 6 or 8 levels in power mode.

Cordialmente,

Walter

I would suggest different set of options for the stack:

1. An infinite stack such as on the 28 and 48.

2. A settable stack depth with the vintage type of t register replacement at the top, but not because I would personally use it.

How did HP choose the four level stack mechanization? Was there some sort of efficiency study at the time the 35 was designed, or was it mostly a matter of memory limitations?

Palmer

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=701 Nobody responded to this. The resistive divider solution is novel. It was discovered by playing with numbers. Yes I amuse myself at times with calculator tricks. When I was faced with limited calculator resources I rewrote the classic EE equations to be amenable to the calculator. It gave me the horrors seeing people program solutions that were patently straightforward to me. With the HP65 I set out match many curves in books and succeeded. For thermistors I found if I added a large number to the temperature and used Ln with a few constants I found an easy match to the resistance VS temperature curve. I used repeated trials to correct my constants. I think we are needlessly hampered by packaged solutions, but they have their uses. http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=780 E. HP-71B with a dead piezo speaker - repairable?

*Message #1 Posted by **Philippe Lasnier** on 22 Feb 2009, 2:55 p.m.*

Hi All,

I've got an HP-71B on which unfortunately the piezoelectric speaker doesn't work anymore. The best it does is emit a very faint "squeek" on a beep or tone command (and won't do it again until you wait for a few minutes).

I don't know if it is the speaker itself which doesn't work, or if it is the driving electronics.

Does anybody know something about this?

Also, where could I find some instructions on how to disassemble the HP-71B, or at least some pictures of the inside, as I'd rather know what to expect before I starting taking all the screws off :-)

Regards,

Philippe

Re: HP-71B with a dead piezo speaker - repairable?

*Message #2 Posted by **Allen** on 22 Feb 2009, 3:28 p.m.,*
in response to message #1 by Philippe Lasnier

I recommend buying a T6-size Torx screwdriver for your project. If you have the metal-backed 71b with the two very small brass screws on the back- use caution- they are small enough to obey Hisenberg's Uncertainty Principle if removed. - My $0.02 stimulus package

Re: HP-71B with a dead piezo speaker - repairable?

*Message #3 Posted by **Philippe Lasnier** on 22 Feb 2009, 4:14 p.m.,*
in response to message #2 by Allen

Ah wait <rumble><rumble>...damn! The smallest I've got is T9. I guess this can wait until I get the proper size. And yes, it's a 1984 model with the metal back, so I know I've got to be careful with these small screws.

Say, I wonder, assuming it's the piezo itself which is dead, if one from a dead HP-41 would do? (I've got one lying around) I guess I'll find out when I've disassembled the 71B.

Philippe

Re: HP-71B with a dead piezo speaker - repairable?

*Message #4 Posted by **Garth Wilson** on 22 Feb 2009, 9:28 p.m.,*
in response to message #3 by Philippe Lasnier

Piezo elements are very common and inexpensive. If you don't have a greeting card with one that you want to use, buy one or even a hundred from someplace like Mouser, from the lower part of the page http://www.mouser.com/catalog/637/1814.pdf , figure "S". One of about 20mm diameter should be fine. I've used this kind of thing for many projects, even cutting them down with scissors to fit narrower spots. They never fail by themselves, but you do have to be careful not to damage the plating on the center part when you solder to it.

I like the greeting card idea...

Piezo speakers are such a pain to solder. I suggest keeping the leads attached to the donor speaker/squeaker and either connect to the old leads or directly to the circuit board.

Re: HP-71B with a dead piezo speaker - repairable?

*Message #6 Posted by **Rainer Wiedemann (Germany)** on 23 Feb 2009, 12:57 a.m.,*
in response to message #1 by Philippe Lasnier

I'd first try to solder the wires to the beeper, on both the pcb and the beeper itself. Maybe you only got cold solder joints. Since the beeper vibrates when making tones, this may be stress to the solder joints. I found this problem on several 71 and 41 calcs, the symptoms were similar to yours.

The following link is pointing to the 71B service manual, it gives detailed disassembly instructions and shows the beeper's driving circuit: 71B Service Manual

In case you lost the two tiny brass flat head screws, these are size 00-90 x 1/8". You might find them in a model railroad shop.

Good luck!

Re: HP-71B with a dead piezo speaker - repairable?

*Message #7 Posted by **Philippe Lasnier** on 23 Feb 2009, 9:24 a.m.,*
in response to message #6 by Rainer Wiedemann (Germany)

Thanks Rainer,

Ah! I **knew** I had seen this manual before. It's embarrassing because I remember now that it was at the exact place you pointed me to.

Thanks for the info. As indicated in Gareth's comments (thanks Gareth), and implied in yours, it's unlikely the piezo itself would have failed.

I'll check this out and let you know how I got on (I need to get the right screwdriver first though).

Philippe

*Message #8 Posted by **John Pierce** on 23 Feb 2009, 12:29 p.m.,*
in response to message #6 by Rainer Wiedemann (Germany)

Rainer, Thank you for the link to the HP-71B service manual, I had never seen the manual. Now I have a lot to read. Thanks!!

Re: HP-71B with a dead piezo speaker - repairable?

*Message #9 Posted by **Etienne Victoria** on 23 Feb 2009, 1:57 p.m.,*
in response to message #1 by Philippe Lasnier

Hi Philippe,

I second all the advice you have received from our fellow forum members.

As you requested a picture of the innards, you'll find one below, showing the speaker location.

Pretty easy to access and solder after opening the Titan.

And no, you won't have all those red wires all around. I've wired them to replace the zebra connector which also frequently fails in the 71B as it does in the 41C.

Best

Etienne

Re: HP-71B with a dead piezo speaker - repairable?

*Message #10 Posted by **Rainer Wiedemann (Germany)** on 23 Feb 2009, 2:27 p.m.,*
in response to message #9 by Etienne Victoria

Looks almost like mine :-) Would be interesting to know, how many 71Bs are still in the original state using the zebra connector. I got both of mine defective, and both perfectly work after I replaced the zebra connector with wires.

@Philippe: Hope your little gem is soon back to healthy condition.

@John: the site I linked to above has a lot of more service manuals and other docs, it's a great complement to the museum dvd of this site although it's not solely dedicated to HP pocket calculators.

Re: HP-71B with a dead piezo speaker - repairable?

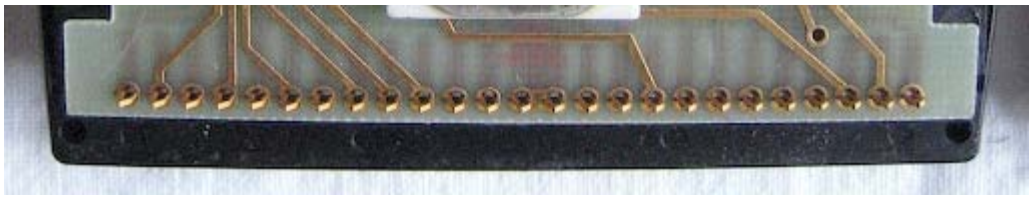
*Message #11 Posted by **Etienne Victoria** on 23 Feb 2009, 5:08 p.m.,*
in response to message #10 by Rainer Wiedemann (Germany)

Hallo Rainer,

Over the seven 71B, I have repaired, 3 had a severely damaged zebra strip, such as this one:

On the 41 fullnuts, also prone to this kind of failure, the zebra strip can be replaced from a parts machine but one day, will always end up like this:

These were the times when Hp quit the connectors they used on valuable former models such as the beloved, unmatchable, elegant Hp-80:



Or maybe was this earlier with the Spice series...

Anyway, I only recall seing these connectors in Classic & Woodstock series but I stand corrected if somebody has a better info.

Best

Etienne

*Message #12 Posted by **Philippe Lasnier** on 23 Feb 2009, 6:08 p.m.,*
in response to message #11 by Etienne Victoria

Hi Etienne,

Thanks for the picture of the HP-71 innards - and now I'm going to be even more careful opening it up in case I damage this zebra connector...

I should know very quickly what's wrong with the piezo speaker.

Merci et bonne soirée ;-)

Philippe

41C zebra

*Message #13 Posted by **bill platt** on 23 Feb 2009, 9:03 p.m.,*
in response to message #11 by Etienne Victoria

Well, maybe I should get my 41CV out of its box and repair it! I think the only problem I have is some corrosion to the zebra...maybe that is worse? Ultimately you have to wire it up? And how to prevent corrosion continuing...and what sort of soldering equipment is best?

Re: HP-71B with a dead piezo speaker - repairable?

*Message #14 Posted by **Garth Wilson** on 23 Feb 2009, 10:58 p.m.,*
in response to message #11 by Etienne Victoria

A zebra strip is an elastomeric compression-type connector with alternating conductive and non-conductive layers that go perpendicular to the PC board. It is not a flex-circuit-type ribbon. http://www.fujipoly.com/design/genDesignGuidelineArticle.asp?ContentItemID=dga_1010 shows the scheme.

Re: HP-71B with a dead piezo speaker - repairable?

*Message #15 Posted by **Philippe Lasnier** on 25 Feb 2009, 4:08 p.m.,*
in response to message #10 by Rainer Wiedemann (Germany)

Progress report: zilch.

I did try, but all the five TORX screws have basically seized up. By soaking with WD-40 I managed to free up one of them. The other four will have to wait because I've eroded all the teeth on the screwdriver (cheap).

Re: HP-71B with a dead piezo speaker - repairable?

I agree, but I had just borrowed a set from the office which turned out to be a cheap one :-) I'll go and buy myself a **proper** T6 screwdriver...

Re: HP-71B with a dead piezo speaker - repairable?

*Message #18 Posted by **Philippe Lasnier** on 7 Mar 2009, 3:53 p.m.,*
in response to message #17 by Philippe Lasnier

I'd like to let you know how I got on. I've got partial success...read on...

We had left it with screws stuck, and no screwdrivers...

After a few days I managed to get some proper T6 screwdrivers, and the WD40 having done its magic in the meantime, I was able without effort to remove the remaining screws.

After opening up, it was easy to locate the beeper. By the way, my HP-71B being a 1BBBB version from 1984, with the metal back, it didn't quite look like the picture that Etienne posted on 23/Feb. For a start, there wasn't this zebra connector prone to failures - I had a flex cable joining the PCBs on short sides of the two halves of the shell. (I'd happily post a picture, but the only way I've read to do that is to ftp the file to the site's incoming directory, and wait for David to move the file manually. Isn't there a more automated way?)

The wires from the beeper to the PCB looked ok. Nevertheless I re-did the soldering on the PCB side, then tried. It worked, of sort; faint beeps. Then it stopped working. I jiggled the wires, resoldered on the beeper itself, tapped and prodded. Eventually it worked again, and I became suspicious that the beeper itself was simply "glued-up" from not being used in 10 (or 20) years, so I wrote a short program to exercise various frequencies and volumes, and let it run for 2 hours.

So far, so good. The next morning, it still worked loud and clear. The next day, it still worked loud and clear. I didn't check for about a week, and tonight it wasn't working again, just like when all this started. Just a faint 'pic' sound. A few BEEP commands later and the sound is quickly better and clearer. Over the last few minutes, it's been exactly like that: it works eventually, then I leave it for a few minutes and it's back to square one again.

I don't know if this is an electronic problem. From the symptoms, and especially from the fact that it initially worked for hours, and was ok the next two days, it feels like it's the beeper which is past its best-by-date (and I haven't got an oscilloscope to check the signals).

I'm reluctant to remove it until I've got a replacement, but what's its technical data (apart from "coming from a greeting card";-)?

Re: HP-71B with a dead piezo speaker - repairable?

*Message #19 Posted by **Garth Wilson** on 7 Mar 2009, 4:43 p.m.,*

Quote:

> I'm reluctant to remove it until I've got a replacement, but what's its technical data (apart from "coming from a greeting card";-)?

Different ones will have different resonant frequencies, but those will be changed by the surface it's taped onto or the enclosure you put it in anyway. They also have different capacitances, but it won't matter at all for this application. You could just get one that's about the same size and it will be ok.

But although one could get damaged in an accident, they do **not** go bad simply with time. You seem to have a different problem.

Re: HP-71B with a dead piezo speaker - repairable?

Pardon my ignorance, but besides frequency and capacitance, these things also have rated voltage, e.g. 12V, 15V, 30V. Does that really not matter?

> Quote:
>
> But although one could get damaged in an accident, they do not go bad simply with time. You seem to have a different problem.

Ok, but any idea what that could be?

Thanks for the help.

They're kind of like a speaker. More signal voltage makes them put out more volume. The 71 won't put out enough signal voltage to damage any of them though. If exact sensitivity or issues of sound quality (low distortion, good frequency response, etc.) were a consideration then yes, you'd be looking for details; but that's not the case. I've built countless workbench prototypes of our products over the last 20+ years using these piezoelectric elements so the beeps could be heard without always having to use headphones which will be used in the final product in the cockpit, and never seen a bad one, never seen one go bad, etc.. I just drive them with an AC signal coming from 5V CMOS logic.

These prototypes are usually to prove the software before the product is built, so all I need from the piezo element is the annunciator beeps, much like the 71 produces. I know I could take out any of the old breadboards and blow the dust off them and fire them up and the beepers would still be the same as I left them many years ago. In fact, sometimes I have re-used them from old things I didn't need anymore.

>
> Ok, but any idea what that could be?

If it's the piezo element at all, it had to have been bad right out of the factory (which I doubt); but if that were the case, I think you'd see a crack, delamination, or something like that. I think you have a problem on the circuit board, but I don't have any info on what's in there. Has the unit experienced some sort of accidental abuse? I would suspect something like a cracked surface-mount solder connection (although those are more common in the newer products made with solder with no lead in it), or a cracked chip capacitor (which is something you don't need in series with a piezo element anyway). You might need to resort to fixthatcalc.com since you don't seem to have any test equipment.

Edited: 8 Mar 2009, 9:44 a.m.

Re: HP-71B with a dead piezo speaker - repairable?

*Message #22 Posted by **Philippe Lasnier** on 8 Mar 2009, 10:28 a.m.,*
in response to message #21 by Garth Wilson

Ok, thanks Garth.

There was nothing I could see in terms of cracked solder connection or anything else like damaged capacitor or the piezo itself, but of course, besides the obvious, I may not be looking in the right place.

Effectively, the conclusion is that without testing equipment, a full diagnosis is beyond me.

I've thought of fixthatcalc, although I think that they are still not accepting new orders. Because I'm in the UK though, this makes fixing this rather uneconomical.

The service manual gives the full instructions for diagnosing speaker problems, but I need an oscilloscope. Of course, I could get one, but unless I'm going to use it for other repairs, this is an expensive proposal. I'd also need a proper workbench, etc. (Sigh)

You asked about accidental abuse: I wouldn't say that there was any. There is

an indentation on the metal bezel above the display obviously from a knock, but it's minor; that's about it.

Oh well. I may carry on poking at it from time to time, but I think I will have to accept the problem.

Thanks for all the help.

HP-41 broken plastic display - how to fix?

*Message #1 Posted by **Geir Isene** on 22 Feb 2009, 1:04 p.m.*

The calc is otherwise perfect (41CX halfnut), but the display plastic window is broken.

Can I remove it with a very sharp knife without opening up the calc (I believe it has never been opened before) and fasten a replacement from another broken calc?

Re: HP-41 broken plastic display - how to fix?

*Message #2 Posted by **Randy** on 22 Feb 2009, 2:31 p.m.,*
in response to message #1 by Geir Isene

> Can I remove it with a very sharp knife without opening up the calc (I believe it has never been opened before) and fasten a replacement from another broken calc?

In a word: No.

It is crystal polystyrene, very hard to cut with a knife, it is quite brittle which is why it broke. You'd also destroy the LCD in the attempt. Further, the window was installed from the rear of the assembly and ultrasonically welded into place. Any attempt to remove/replace from the front would be an absolute disaster.

The fact that it is a halfnut posses the major problem in that the keyboard/logic board would need to be removed from the unit to properly replace the window. Even after the board is out, there is a fair amount of just plain luck involved in getting both the broken window out and the replacement removed in usable condition.

It can be done but is not something I would agree to do without a complete understanding that it may not be a successful transplant :(

Symbolic differentiation on HP35s

*Message #1 Posted by **Peter Niessen** on 22 Feb 2009, 9:42 a.m.*

Hi guys,

I don't know if Vincze reads here anymore. Coming back on how to do symbolic differentiation on the 35s (see this thread), here's a little C++ program which shows how to do symbolic diffrentiation on a RPN expression. You could use the HP35s's storage array as the equivalent of the deque in C++, I guess. Of course, the whole thing would be more academic, since the 16 (?) levels of subroutines won't allow too much of the necessary recursion.

Hoping it's ok to cut and paste here,

```
// deque.cc
// How to do symbolic differentiation on RPN expressions.
// PN Sat Feb 21 13:15:19 CET 2009

#include <deque>
#include <string>
#include <iostream>

// this is our stack.
// the push_front is equivalent to pressing ENTER
typedef std::deque<std::string> ds_type;

void print (ds_type &d);
ds_type pop_expr (ds_type &d);
ds_type diff_expr (ds_type &d);
ds_type smpl_expr (ds_type &d);

/*****************************************************************/

int main () {

  ds_type expression;
  ds_type diff;
  ds_type smpl;

  expression.push_front ("2");
  expression.push_front ("x");
  expression.push_front ("/");
  std::cout << "This is the orig expression" << std::endl;
  print (expression);

  diff = diff_expr (expression);
  std::cout << "This is the diff'd expression" << std::endl;
  print (diff);
  smpl = smpl_expr (diff);
  std::cout << "This is the smpl'd expression" << std::endl;
  print (smpl);

}
```

```
/*****************************************************************/

void print (ds_type &d) {

  std::cout << "************************************************"
            << std::endl;
  for (ds_type::const_reverse_iterator i = d.rbegin (); i != d.rend (); i++)
    std::cout << *i << std::endl;

  std::cout << "================================================"
            << std::endl;
}

New member - HP41 link

*Message #1 Posted by **Nigel Bamber** on 22 Feb 2009, 7:34 a.m.*

Hi

Just thought I would say hi as a new member. I have always had an interest in programmable calculators since I saw and purchased the Commodore PR100 back in the 1970s when I was 16, which I still have and which still works:-)

I have got myself re-interested in such 'beasts' by virture of a virtual HP 41 CX, (sorry its not the real thing),courtesy of the Itouch and the excellent ic41cx+. Have started reading about the history, the various user clubs and also started to delve into various books like Extend your HP41, synthetic progamming etc. All very satisfying.

I haven't quite understood the point of synthetic programming but assume it was an excuse for people to 'hack' into the HP41 , as well as the fact that it saved progamming memory and enabled additional functionality - but it does seems pretty complex to achieve all of that.

In trying to find a manual online for the CCD module, I came across this link to a manual for :Intelligence Aid for Evaluating Enemy Courses of Action (ENCOA): Guide for Manual and HP41-C/HP41-CV Calculator Procedures". Its a shame that the manual itself isnt available and but it shows the extent of the usage of the HP 41 in its heyday, which I thought might interest you.

Also came across a current add on Ebay with a proce of Euro 600 for new HP41 cassette tapes !! Now that does seem a bit over the top.

cheers

Nigel

Nigel, there is a certain "Buy it Now" only seller who's nick shares some letters with my last name. His way of doing business isn't well acknowledged here. I must admit that the forum members are right in there opinion. His prices are totally off.

Re: New member - HP41 link

*Message #4 Posted by **Philippe Lasnier** on 22 Feb 2009, 1:15 p.m.,*
in response to message #1 by Nigel Bamber

Hi Nigel,

I'm new myself - having joined just a few days ago; however, probably like a lot of members, I've been reading the forum for a while before joining.

I actually rekindled my love of HPs barely a year ago, after wondering if I could able to find the HP-41CV of my youth. It's amazing what you can miss when you're not looking, and I hadn't been looking for about 24 years...I looked on eBay, and this has been the source of all my calculators since.

eBay is a big place, and you have a few sharks around. Like Marcus mentions, there's one guy in particular who sells at over-inflated prices. There's a directory of eBay HP calculators fans maintained in an eBay guide. It's far from exhaustive (I'm not on it ;-), but it has a few good [bad!] names. Look for "HP calculators directory" in the Guides section.

Regards,

Philippe

in response to message #5 by Michael de Estrada

Sure,

I don't know if it's good manners in this forum to paste actual links (please let me know if I make a "faux pas"), but here we go:

The guides (and reviews) section is here:

<http://reviews.ebay.co.uk/>

And the particular guide I was talking about is here:

<http://reviews.ebay.co.uk/The-2008-eBay-community-HP-calculators-fans-directory_W0QQugidZ10000000002255358>

Philippe

Re: New member - HP41 link

*Message #7 Posted by **Michael de Estrada** on 22 Feb 2009, 3:19 p.m.,*
in response to message #6 by Philippe Lasnier

Philippe,

Rest assured that there is nothing faux about your pas. Providing and sharing useful information among members is what this forum is all about. I found the equivalent to this link on the USA ebay (ebay.com) as follows:

http://reviews.ebay.com/The-2008-eBay-community-HP-calculators-fans-directory_W0QQugidZ10000000001918599

I am quite familiar with some of the bad names on this list. Unfortunately, some of the good seller names like davehal2001 are no longer active, having become discouraged with ebay's ever increasing fees and lessening protection for sellers.

Thanks for your contribution,

Michael

Re: New member - HP41 link

*Message #8 Posted by **Philippe Lasnier** on 22 Feb 2009, 4:00 p.m.,*
in response to message #7 by Michael de Estrada

Thanks for the kind words Michael,

I'm still making my first gingerly steps in here. It's a bit like stepping into a room full of people sharing the same passion, and knowing some of them by reputation, but they don't know you, and being a bit awed by it - and not knowing exactly what's the best way to behave, or the full etiquette.

Oh well, I'll get better with time I guess ;-)

Philippe

Re: New member - HP41 link

*Message #9 Posted by **Howard Owen** on 23 Feb 2009, 2:20 a.m.,*
in response to message #6 by Philippe Lasnier

Adding links is encouraged. If you look at the bottom left of your edit window, you'll see a button marked "Link." Pressing that will give you a series of two popups, first for the address, and second for the text attached to the link. That makes the link clickable, with the attendant minor convenience to your readers of not having to cut and paste the address. :)

I also reawakened my love for HP calculators by using an emulator. For me, it was Nonpareil by Eric Smith. My subsequent collecting mania and time gobbling technical obsession can be laid at his door. (Hi, Eric :)

Regards,
Howard

How to care for 9114 batteries?

*Message #1 Posted by **Steve (Australia)** on 22 Feb 2009, 1:15 a.m.*

I've recently had to replace my SLA battery for my 9114B and advised another person to do so too (it fixed their problems).

What is the best way to care for these batteries?

I know that lead acid batteries prefer to be kept topped up, but I am not sure if the 9114B's charger circuit is good enough not to over-charge them.

An idea that I had (which I tacked onto another post earlier) is to place the charger on a timer and allow it to charge for some short time every week.

Any better suggestions?

Re: New method of typing numbers?

*Message #3 Posted by **Don Shepherd** on 21 Feb 2009, 3:36 p.m.,*
in response to message #1 by Saile (Brazil)

It is interesting, but I can't imagine that a market exists for such a thing. Most people enter numbers in spreadsheets like Excel, and I can't see Bill Gates adopting this as an add-on to Excel number entry. And a new keyboard with dedicated keys for a thousand or million would not seem to be very practical.

Re: New method of typing numbers?

*Message #4 Posted by **Dusan Zivkovic** on 21 Feb 2009, 4:02 p.m.,*
in response to message #1 by Saile (Brazil)

However, if the authorities decide that the preferred way out of the crunch is hyperinflation, there will be a nice market for such an intuitive number system pretty much everywhere (but only for a short while, though).

Personally, I prefer Roman numerals. This way, you can eliminate all the numbers on a keyboard. ;)

Re: New method of typing numbers?

*Message #6 Posted by **Donald Ingram** on 21 Feb 2009, 4:59 p.m.,*
in response to message #1 by Saile (Brazil)

Is it really that different from what has existed for many years on hp instruments ?

Re: New method of typing numbers?

in response to message #6 by Donald Ingram

Yet another example of a useless granted patent.

Finding prior art would be easy I'm sure, and it's obvious to any practitioner in the field.

Dave.

American vs. European version

*Message #8 Posted by **George Bailey (Bedford Falls)** on 22 Feb 2009, 2:49 a.m.,*
in response to message #1 by Saile (Brazil)

Can anyone explain what the difference is between the American and the European version of the full keyboard? At least they didn't consider that continental Europe doesn't use Billion for 10^9 but Milliard (France,

Germany, Italy, Spain).

Edited: 22 Feb 2009, 2:51 a.m.

Re: New method of typing numbers?

*Message #9 Posted by **Karl Schneider** on 22 Feb 2009, 3:04 p.m.,*
in response to message #1 by Saile (Brazil)

Saile --

I'd seen this before.

The keyboard is useful only as an enhanced version of a regular keyboard -- complete with decimal point *and base-ten exponent*. Keystrokes are saved only if the number contains multiple zeroes -- in particular, significant zeroes between non-zero digits. Otherwise, it's just as quick (or quicker) to enter numbers in the usual manner using "E".

For scientific calculators, the four positions needed for the unshifted 'hundreds', 'thousands', 'millions', and 'billions' keys are just too valuable to employ in this manner.

For applications in science and engineering, numbers with many digits are generally not entered from the keypad -- those would imply more significant digits than are justified. One exception to that, pi, invariably has a dedicated key for entry.

For many years, cash registers and calculators for accounting have had special keys for "00" and "000".

Not just a thing of the past: Recently I got a new HP OfficeCalc 200 (just for completeness of the collection - but this thing is not really worth being collected) and it also has these double- and triple-zero keys.

Greetings, Max

Elektronika MK-61 Russian Manual Translation?

*Message #1 Posted by **Michael de Estrada** on 21 Feb 2009, 11:09 a.m.*

Some time back I acquired a Soviet era Elektronika MK-61 RPN programmable calculator, which has a Russian cyrillic alphabet instruction manual. Although I have decifered the keyboard and am able to perform the basic key operations, programming this beast has eluded me. I was hoping that perhaps someone on this forum with a knowledge of Russian and familiarity with the Elektronika calculators might provide some assistance, so that I might enjoy playing with this interesting piece of calculator history.

Thanks - Michael de Estrada

Edited: 21 Feb 2009, 11:21 a.m.

Re: Elektronika MK-61 Russian Manual Translation?

*Message #2 Posted by **Katie Wasserman** on 21 Feb 2009, 11:31 a.m.,*
in response to message #1 by Michael de Estrada

Although not a full translation, this is a command reference in English.

Re: Elektronika MK-61 Russian Manual Translation?

*Message #3 Posted by **Walter B** on 21 Feb 2009, 11:54 a.m.,*
in response to message #2 by Katie Wasserman

Hi Katie,

thanks from my side, too. I acquired this calc some time ago without any manual, and ran into the same problem as Michael.

Re: Elektronika MK-61 Russian Manual Translation?

*Message #4 Posted by **Michael de Estrada** on 21 Feb 2009, 12:18 p.m.,*
in response to message #2 by Katie Wasserman

Thanks Katie! That was a big help. I thought the right slider key was used to change between program and run modes, when in fact it is just used to set angular mode (rad/grad/deg). I just wrote and executed my first program, area of a circle.....wooooohoooo!

Re: Elektronika MK-61 Russian Manual Translation?

*Message #5 Posted by **db (martinez, ca.)** on 21 Feb 2009, 11:56 a.m.,*
in response to message #1 by Michael de Estrada

This might help some. It's about the b3-34, but it's in English.
And this one contains two links to info and programming examples on your machine.

Re: Elektronika MK-61 Russian Manual Translation?

*Message #6 Posted by **Michael de Estrada** on 21 Feb 2009, 12:34 p.m.,*
in response to message #5 by db (martinez, ca.)

Very helpful. Thanks.

Synthetic Programming and the HP-41C

*Message #1 Posted by **Trent Moseley** on 20 Feb 2009, 10:44 p.m.*

Question-is synthetic programming available for only for the 41 Series?

tm

Re: Synthetic Programming and the HP-41C

*Message #2 Posted by **MikeO** on 21 Feb 2009, 12:41 a.m.,*
in response to message #1 by Trent Moseley

Yes, it's peculiar to that model and its variants. The technique depends on a command sequence that allows you to delete code bytes between successive instructions, causing the resulting concatenation of byte codes to form instruction codes that aren't programmable via the keyboard.

Re: Synthetic Programming and the HP-41C

*Message #3 Posted by **Howard Owen** on 21 Feb 2009, 12:48 a.m.,*
in response to message #1 by Trent Moseley

There was something on the 67/97 that was called "synthetic programming" -- here is an old discussion on the topic.

Synthetic programming on the HP41 was so called because instructions unavailable from the normal keyboard were put together from pieces of standard instructions. (I suppose it could also have been called "analytic programming," since you have to bust the instructions apart first.) As far as I know, the 41 is the only HP calc that hack was possible with.

Regards,
Howard

Re: Synthetic Programming and the HP-41C

*Message #4 Posted by **Garth Wilson** on 21 Feb 2009, 1:29 a.m.,*
in response to message #1 by Trent Moseley

Some synthetic programming was also possible on the TI-58/58c/59, but wasn't as useful.

There are a couple of pages about it, specifically accessing the HIR registers, at the end of the "book" (if you can call it that-- it's about 5/8" thick and stapled only in the corner) called "User Survival Guide for TI-58/59 Master Library" which I bought from EduCalc. It's by Fred Fish, who, at the time of printing (probably just photocopying or mimeographing), had a Tempe AZ address.

Re: Synthetic Programming and the HP-41C

*Message #9 Posted by **Howard Owen** on 22 Feb 2009, 1:47 a.m.,*
in response to message #8 by Garth Wilson

There was a Fred Fish in Arizona who compiled the largest collection of Amiga freeware ever seen. This was in '85, going forward for at least 10 years.

Regards,
Howard

The HP Calculator Calendar for 2009 Still Available

*Message #1 Posted by **Jake Schwartz** on 20 Feb 2009, 4:14 p.m.*

Hi,

Just a note to say that we still have plenty copies available of the HP Calculator Calendar for the year 2009. This 8-1/2 by 11-inch glossy keepsake showcases every HP handheld calculator ever made in color photos and is useful throughout the year. It also includes images of the new low-cost machines (OfficeCalc 300, EasyCalc 100 and SmartCalc 300s) introduced just last month at the 2009 Consumer Electronics Show. Information for obtaining the calendar is available at http://www.pahhc.org/2009/Calendar.htm on the web. Also, if you are in Europe and an HPCC member, Wlodek Mier-Jedrzejowicz (HPCC chairman) has some copies of the calendar available for sale from London. For information, email Wlodek at chair <at> hpcc <dot> org.

Thanks,

Jake Schwartz

HP48 compatible SRAM memory cards

*Message #1 Posted by **Andrés C. Rodríguez (Argentina)** on 20 Feb 2009, 3:38 p.m.*

It would be very helpful for me if someone could suggest where to buy one of these cards (used may be OK as long as it works). I know I can try an auction site; but perhaps some member of this Forum has a better or different idea.

Thank you in advance,

Andrés

PS: if you prefer not to answer via this Forum, please contact me at the following email address:

"a.rodriguez" (at) "ieee.org"

Re: HP48 compatible SRAM memory cards

*Message #2 Posted by **Martin Pinckney** on 20 Feb 2009, 5:17 p.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

Andrés,

If you are wanting a card for the 48SX, apparently HP used the 82215A (128KB) card for some products other than the calculators. There are some vendors out there that still stock these. I myself purchased one for $99 some time ago. Here are some websites that display a reference to this item, but it is hard to tell if they actually have them for sale!

http://www.ptltest.com/spectrum_analyzers.htm

http://www.xsequip.com/Product%20Photos.html

http://www.geocities.com/survcalc/access.html

On the other hand, if you are looking for the higher capacity cards for the 48GX, these were made by a number of 3rd party companies. I have not searched for these, since I cannot use them.

Hope this helps.

Re: HP48 compatible SRAM memory cards

*Message #3 Posted by **Garth Wilson** on 20 Feb 2009, 5:25 p.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

Aren't they just PCMCIA cards (PC cards)? How about the ones on the lower-right corner of Digi-Key's catalog page at http://dkc3.digikey.com/PDF/T091/P1165.pdf which go out to eight megabytes?

Re: HP48 compatible SRAM memory cards

*Message #4 Posted by **Eric Rechlin** on 20 Feb 2009, 5:38 p.m.,*
in response to message #3 by Garth Wilson

No. In fact, they might even pre-date PCMCIA cards.

HP 48 cards have contacts on the side that look a little like the contacts on an SD card, but they are covered by a protective metal shutter on HP-approved cards; PCMCIA cards have contacts on the end inside tiny holes.

What happened to William Wickes?

*Message #1 Posted by **David Hayden** on 19 Feb 2009, 2:13 p.m.*

As I learn to program in System RPL, I see William Wickes's name all over everything, but a google search doesn't show him. Does anyone know what happened to Dr. Wickes?

Dave

Re: What happened to William Wickes?

*Message #2 Posted by **Johnny Bjoern Rasmussen** on 19 Feb 2009, 3:07 p.m.,*
in response to message #1 by David Hayden

Hi Dave

William Wickes, also known as Bill Wickes, is fortunately AFAIK alive, well and still going strong.

Please correct me if I'm wrong: I have read in the HPCC magazine "Datafile" that William has been working for Hewlett Packard on a video conference system called HALO.

I don't know if Bill reads this. It could be interesting to have an update on what he is working on at the time. As you write he really is a key (!) person on HP calculator history indeed.

Regards from denmark

Johnny Bjoern Rasmussen

Edited: 19 Feb 2009, 3:14 p.m.

Re: What happened to William Wickes?

*Message #3 Posted by **Namir** on 19 Feb 2009, 7:08 p.m.,*
in response to message #2 by Johnny Bjoern Rasmussen

Hi,

I met Bill Wicks in 1980 when he was a professor of physics at the University of Maryland (College Park). I was well aware of his involvement in synthetic programming since the HP-41C came out. Jim De Arras and I would drive from Richmond, Virginia, to College Park to attend the Maryland chapter of the PPC. The meetings usually ended by midnight and we were home by 2 or 2:30 am! So I got to see Bill frequently. I am impressed that someone like Bill Wicks went from a customer of HP calculator to someone who influenced their design as a member of HP.

Namir

Re: What happened to William Wickes?

*Message #4 Posted by **Jake Schwartz** on 19 Feb 2009, 10:46 p.m.,*
in response to message #2 by Johnny Bjoern Rasmussen

Hi,

It was Bill who arranged for us to hold our HHC2008 HP Handhelds Conference in the HP Corvallis facility back in September. It also turned out that he would have attended the conference, had it not been that he had a family committment that weekend and had to be out of town. Bill has been in charge of the R&D for the HP Halo "telepresence" devices and in fact, 15 months ago, a few of us got to sneak away from the HHC2007 conference in San Diego and use the local Halo system to conference with Bill up in Corvallis for around 90 minutes. Here is an image of Bill in Corvallis from 2007 when we communicated with him from inside the San Diego Halo:

Perhaps we can convince Bill to participate in HHC2009 on October 3-4th at the HP facility in Vancouver, Washington when we commemorate the 30th anniversary of the HP41.

Re: What happened to William Wickes?

*Message #5 Posted by **Richard J. Nelson** on 20 Feb 2009, 9:48 a.m.,*
in response to message #4 by Jake Schwartz

Hello,

Bill still works for HP and lives in Corvallis. His famous green book on HP-41 Synthetic Programming (self published in several languages) is probably one of the few books that actually made money. Bill

promised a trilogy of books covering the transition of 41 to 48, but he didn't finish the third volume, if memory serves. By that time, early 90's, the market for books was drying up and he wasn't sure it it would be worth the effort. If his son went away to college he would finish the manuscript, if he stayed home, he would not. His son stayed home. I discussed that with Bill as New product Manager at EduCALC at the time.

I remember when Bill called me at home one evening saying that he had been offered a job at HP. He was seriously debating making the move from Academia to Industry. Long after he accepted the HP offer he commented to me that he paid more in taxes working for HP than he earned as a physics professor.

As Halo R&D manager he has the claim of working on the smallest HP consumer product AND the largest HP consumer product.

X < > Y, Richard

My brother-in-law works for HP in Corvallis (large format printer applications?). He has a few older HP calculators and a while ago he happened to mention there was an employee that worked near the office he was in that was involved with HP calculators in the past. I asked what his name was and he said Bill Wickes! Small world.

Thank you for the update Richard. And thank you for verifying that the ROM was the latest version before selling me my HP-48SX in 1991. I use it every day and it still works great.

Re: What happened to William Wickes?

*Message #7 Posted by **Steve Keeley** on 20 Feb 2009, 8:08 p.m.,*
in response to message #5 by Richard J. Nelson

There was "HP 41/HP 48 Transitions" published in 1990, "HP 48 Insights Part I: Principles and Programming" in 1991, and "HP 48 Insights Part II: Problem-Solving Resources" in 1992. I count that as three books. (One could argue that the "Insights" are two volumes of the same book.) I can't imagine there was much left to say after Part II (parts I and II total 718 pages).

How to HP-71B and HP-41CX via HP-IL?

*Message #1 Posted by **ZOleg** on 18 Feb 2009, 11:26 p.m.*

I connect HP-71B, HP-41CX and HP-82161A cassete to HP-IL loop.
When execute on HP-41CX:
2 XEQ SELECT - select HP-82161A drive
XEQ DIR
directory readed from tape and listed on screen
When execute on HP-71B:
CAT :TAPE
i receve error message: *HPIL ERR: Invalid mode*
How to read on HP-71B data from HP-82161A simultaneously connected to HP-41CX?

Re: How to HP-71B and HP-41CX via HP-IL?

*Message #2 Posted by **PeterP** on 19 Feb 2009, 12:04 a.m.,*
in response to message #1 by ZOleg

IIRC the HP41CX is always in Controller mode yet a HP-IL loop can have only one controller. So the HP71 is not a controller and hence can not get the directory.

Check if you can get the dir from the 71b if you turn off the 41cx. Also, check the HP-IL docu of the 71b and see if there is a command to make the 71b the controller and see if you can successfully execute that command.

However my HP-IL knowledge is very limited...

Cheers

Peter

*Message #3 Posted by **ZOleg** on 19 Feb 2009, 12:22 a.m.,*
in response to message #2 by PeterP

I tried with HP-41CX power off - no luck.
On HP-71B i tried **CONTROL ON** - error: *HPIL ERR:Loop Broken*

Re: How to HP-71B and HP-41CX via HP-IL?

*Message #4 Posted by **Raymond Del Tondo** on 19 Feb 2009, 4:17 a.m.,*
in response to message #3 by ZOleg

To use an HP-41 and an HP-71B at the same time in the same HP Interface Loop,

the HP-71B has to be in device mode: CONTROL OFF.

To have the HP-71B to be the HP-IL controller again you have to remove the HP-41 from the loop. It's not sufficient to turn the HP-41 off, since the loop is broken, as you experienced...

To reset the HP-IL state after removal of the HP-41 from the loop,
perform RESET HPIL on the HP-71B. The loop must be closed, of course;-)

HTH

Re: How to HP-71B and HP-41CX via HP-IL?

*Message #5 Posted by **Marcus von Cube, Germany** on 19 Feb 2009, 4:19 a.m.,*
in response to message #4 by Raymond Del Tondo

Raymond, what is the difference between:

CONTROL ON
RESTORE IO
RESET HPIL ?

Can you explain these in some more detail?

Re: How to HP-71B and HP-41CX via HP-IL?

*Message #6 Posted by **ZOleg** on 19 Feb 2009, 5:13 a.m.,*
in response to message #4 by Raymond Del Tondo

I cannot remove HP-41 from loop bacause i have only one HP-IL cable.

Re: How to HP-71B and HP-41CX via HP-IL?

*Message #7 Posted by **Marcus von Cube, Germany** on 19 Feb 2009, 4:17 a.m.,*
in response to message #3 by ZOleg

You will have to take the 41 off the loop to allow the 71B to access the loop. The 71B can talk to the 41 when in CONTROL OFF mode thru ENTER or OUTPUT commands. It's some time ago that I've last played around with these but someone else might chime in here and provide a better explanation.

A question to the experts: Would it be possible to write an MCODE function to make the 41 give up control of the loop? Or is this hard coded into the HP-IL module and cannot be worked around?

Re: How to HP-71B and HP-41CX via HP-IL?

*Message #8 Posted by **Mike (Stgt)** on 19 Feb 2009, 4:42 a.m.,*
in response to message #7 by Marcus von Cube, Germany

This MCode exists in the HP-IL "Devil" (Developement Module), try function MONITOR. This is the only way I know to use the HP41 in an IL-Loop _not_ as controler.

Ciao.....Mike

Re: How to HP-71B and HP-41CX via HP-IL?

*Message #9 Posted by **ZOleg** on 19 Feb 2009, 7:47 a.m.,*
in response to message #8 by Mike (Stgt)

Thanks for the hint!
I flashed *HP-IL Devel*, *HP-IL Diagnostic*, *Extended IL*, *Extended IO* rom images to NoV64, inserted NoV64 to HP-41, **XEQ MONITOR** but **MONITOR** dont help.
SCOPE function helped, it switched HP-41 from controller to observer mode.
After execute **CONTROL ON** on HP-71B i readed directory from tape and saved my program on tape - all ok.
But there is one little trouble - all HP-IL commands are executed very slowly, as their intercepts and displays the HP-41.

How do I glue the back label of an HP-16C back on? (or of most Voyagers, for that matter)

*Message #1 Posted by **Philippe Lasnier** on 18 Feb 2009, 5:10 p.m.*

Hi all,

I have an HP-16C which had its back metallic label/plate damaged and amateurishly repaired (before I got it). I managed to remove the plate (with lots of patience, Un-Du, and some string), but I will need to put it back at some point. I need to know what's a good glue or double-sided tape to use...

I am reasonably sure that this information must be somewhere on this forum already, but I can't find it. I ask for your indulgence, I'm probably not searching the right way...

I got the HP-16C a while back. The metal plate looked like it had been impacted off-centre, which had managed to lift off the bottom-right section of it. The previous owner apparently super-glued it back on (two "corners", one on either side of the rubber foot), but the plate was now slightly buckled of course. The end result, after many years, was one corner unglued, the other corner (by the contact spring) still holding, and both corners having had the black paint rubbed off from friction (there is so little clearance with these rubber feet).

What I managed to do was remove the plate, with minimal creasing (not easy!), and not lose the minute contact springs. However, the old glue is effectively wasted. The plate was held in place by what looks like pressure sensitive adhesive (PSA) double-sided tape. The tape itself is actually very thin, and I'm pretty sure that standard double-side adhesive tape uses a far thicker medium. The problem now (after I manage to roll the plate 100% flat again) is to glue the plate back on properly. The old tape is damaged somewhat (both from old, and from my "work") so it would be best to replace it completely. Hence my original questions...

Thanks in advance for all your help.

Re: How do I glue the back label of an HP-16C back on? (or of most Voyagers, for that matter)

*Message #2 Posted by **Adrian Godwin** on 19 Feb 2009, 2:39 p.m.,*
in response to message #1 by Philippe Lasnier

I used some double-sided sticky tape to fix the display bezel back on a Voyager. It worked very well, and I think the same stuff would work on the back plate.

Unfortunately, I don't know what it is : it's on an unnamed reel, so probably just generic stuff from an art shop.

However, it's thinner than some types : the tape is really just a backing carrier, and when it's peeled away the only thing left on the surface is a thin layer of glue. This is probably better than something that has a core that stays in place in the joint.

I also had to roll the bezel flat (or rather, indented in the proper way). This was fairly successful except for a small crease. Are replacement bezels still available ? Maybe the 12c platinum uses one ?

Re: How do I glue the back label of an HP-16C back on? (or of most Voyagers, for that matter)

*Message #3 Posted by **Philippe Lasnier** on 19 Feb 2009, 4:30 p.m.,*
in response to message #2 by Adrian Godwin

Thanks Adrian,

I guess the tape you used sounds right, but I'm just worried about the strength of the adhesive (and the fact that I don't want it to dry up and become brittle). I looked around a bit more, and the thinnest tape I could find was rated at 0.5mm. Somehow that still seems too thick to me...And of course the type/strength of the glue is another matter.

Asking at an art shop is a good tip. I hadn't thought about that (I was thinking electronics/DIY shops).

I've never heard of replacement Voyager bezels, but I'm no expert.

Re: How do I glue the back label of an HP-16C back on? (or of most Voyagers, for that matter)

*Message #4 Posted by **David Ramsey** on 21 Feb 2009, 11:40 a.m.,*
in response to message #3 by Philippe Lasnier

I wouldn't recommend double sided tape. As you noted, even the thinnest tape is quite thick.

Any auto supply store will carry spray-on trim adhesive. As you'd expect, it's a spray can that sprays glue; normally, it's used to apply things like headliners.

Lay your label face down on a newspaper in your garage and spritz the back side with a brief burst of adhesive. Slap the label on the calculator. Wonder what to do with the remaining 99% full can of adhesive...

Re: How do I glue the back label of an HP-16C back on? (or of most Voyagers, for that matter)

*Message #5 Posted by **Philippe Lasnier** on 22 Feb 2009, 12:59 p.m.,*
in response to message #4 by David Ramsey

Hi David,

Thanks for the tip. That sounds good, I hadn't thought about that. I'll look it up, but do you know if that type of spray-on would be as strong as the original glue? Would it also be semi-permanent, i.e. could it still be removed with e.g. UnDu? I mean, I wouldn't want it to act like super-glue...

As for the remaining 99%, well, I could always offer my services ;-)

The history of my calculators

*Message #1 Posted by **SteveH** on 18 Feb 2009, 5:08 p.m.*

I thought I woud write down a brief history of how I cam to own six HP calculators, as much for my own interest but I also thought it might be of interest here and I would also be delighted to hear about other users' collections and how they use them. In some ways the story is similar to Peter Klein's *My calculator, my self?* article.

I still recall being awe struck when my father came home with a Rockwell Scientific Slide Rule he had bought to use at work. This was truly a thing of wonder - it had red LEDs and it could work out sums! My own first calculator was a Sinclair Cambridge which came in a case that resembled a Star Trek communicator and you could actually see the numbers flicker with the effort of calculating a sine. It was a great toy and I still have it and it still works (something of an achievement for a Sinclair product)

I got my first HP calculator in the summer of 1982 after my first year of studying engineering at the University of Dundee in scotland. My choice of calculator turned out to be prescient as I chose and HP-15C over the HP-11C and the next year's maths syllabus introduced me to matrix maths and the calculator was a God send. It didn't avoid having to do the calculations but it was useful to be able to check things. The 15C was equally useful all the way through university and the first couple of years of my working life.

At that point I made one of the strangest decisions ever and decided to sell the 15C because I had started working with digital designs and software and wanted to have base conversions available. This was not a daft move but I chose to buy a TI calculator and really couldn't get used to it after years of using RPN. It probably wasn't a bad calculator but I needed to get back to the one true faith . At that point I bought an HP-42S which I have now used for years very happily.

I do think the 42S is a great calculator but there is something fantastic about the form factor of the Voyager series calculators. They are small, pocketable, well laid out and run forever on a set of batteries. I was very lucky and had sold my 15C to a friend and he was quite happy to give it back to me as it was gathering dust at the time. I did highlight to him the silly prices that were being paid on eBay for HP-15C at that time but he very generously returned it to me.

This brings me into the 'backup' phase of my collection when I realised that I can only really use HP calculators but don't like any of the modern models so decided to stock up on a few older models from eBay when something reasonably priced came up. So over the next few years I picked up an HP-41CX (classic design but haven't ever adapted to the layout of the algebra keys), an HP-16C (niche product) and an HP-28S (let's just say we don't get on).

The most recent phase is that I thought I should 'retire' the two that I use all the time, the 15C and the 42S and all the backups. Given the amounts of money these things are going for on eBay it seems a little crazy to be using these things at work in an open plan office environment. At least at home I'm insured. The iPhone emulators for the 15C and the 42S are excellent and James Thomson's PCalc is an excellent all-rounder.

Still, it is nice to have a physical calculator in your desk. So I've just picked up an HP-48G off eBay...

*Message #2 Posted by **Philippe Lasnier** on 18 Feb 2009, 5:24 p.m.,*
in response to message #1 by SteveH

Hi Steve,

Actually, what happened to you HP-15C rings a bell with me, although in my case it was with an HP-41CV, and I bought a Casio "computer", and I loved that too (still have it), and I never got the 41CV back...Ok, ok, so maybe not so much the same as you :-) I always regretted selling my 41CV, but there was no way I could afford the bits as a student. Still, forward 24/26 years, and I got an HP-41CX...and another. And another. And a HP-16C (my second purchase). I got a bit mad after that, catching up on many years in the wilderness. What I do is keep my "precious" mint machines at home, and take the slightly beat ones to work. Funny, I don't like the HP-28S so much either...

Re: The history of my calculators

*Message #3 Posted by **bill platt** on 18 Feb 2009, 6:42 p.m.,*
in response to message #1 by SteveH

```
Brief history:
1982: 11c
1985: factory replaced 11c from damage
1995: lost 11c on airplane somewhere over tennesee
1995: bought 32sii
1998: destroyed 32sii in fit of anger and bought another
2001: lost 32sii and bought a silver 32sii
2003 or so, thought I should get a backup--discovered HP was dropping
out entirely! Went crazy and started collecting. Now have too many
calculators! (Over 20....I've lost exact count)
```

To think it started out with an 11c, and that I made it 10 years without any replacement necessary...

HP-41 HP-IL Issue

*Message #1 Posted by **Gerry Schultz** on 18 Feb 2009, 5:08 p.m.*

Hello everyone. I have now collected enough hardware, software and knowledge to start playing with HP-IL and my HP-41. Over time, I have collected two 82160A HP-IL Modules, two 82161A Tape Drives, an 82162A Printer, an 82163A Video I/F, an 82164A RS-232 I/F, an 82973A PC I/F and an 82183A Extended I/O Module. Last week I got the final piece I wanted, a 9114B 3 1/2" Disk Drive.

I've also been reading the HP-IL Introductory Guide as recommended in the Extended I/O manual which is a good read to learn more about how HP-IL works. Included in one of the tape drives is a tape that has the software for demonstrating the capabilities of the 41 system. I ran that over the weekend and successfully tested the tape drives, the printer, the video I/F and the Extended Function and Time modules built into the 41CX. So far so good.

I have about a dozen tapes (about half being new in their wrappers) and I want to make a backup of the demo tape. Since I just got the 9114 along with 10 disks, I thought I would use the Mcopy command in the Extended I/O module to copy the data from the tape to a 3 1/2" disk. Even though I reformatted the disk using Newm, I get hardware handshaking errors when I try copying the media on the 41CX.

I hooked just the two tape drives and had similar problems along with when trying to get a Dir from the tape drives and it reports invalid media even though they read fine before. So, I've broken the loop down and all peripherals appear to work when they are alone on the loop with the 41CX.

I suspect that some of the interconnecting loop cables are bad or perhaps one of the HP-IL connectors is intermittent. My question is, finally, can I use Mcopy (loop is set to 1=tape drive, 2=disk drive) to copy files from the tapee to disk? Also, are there any issues I need to be aware of to keep the HP-IL loop reliable? Finally, when using Nmda what number should I use for the directory size? 080?

Thanks for the feedback.

Gerry

in response to message #1 by Gerry Schultz

Dear Gerry,

more helpfully tools for operating HP-IL with HP-41 are the CCD-Module (CAT 0 lists the devices) the EXT-IL or better the EXT-IL-Plus module and last not least my new 700 page book "HP-41 Input / Output Board & IL2000 Interface System" wich includes a great collection of knowldege about HP-41 & HP-IL. An alternatively solution for printing- and mass storage applications is EMU41 in combination with the HP-IL/PC Interface Card...

Best regards - Christoph Klug

Thanks Christoph. I looked into ordering your book, "HP-41 Input / Output Board & IL2000 Interface System" last December but the publisher's website was in German and I couldn't figure out how to order it. I went down to my local Borders and gave them the ISBN number but they couldn't find a listing for it. I also checked the classified ads on this web site but didn't see your book listed. How do I order a copy of your book? I live in Los Angeles, Ca.

Thanks,

Gerry

Re: HP-41 HP-IL Issue

*Message #4 Posted by **christoph klug** on 20 Feb 2009, 3:47 a.m.,*
in response to message #3 by Gerry Schultz

Dear Gerry,

inside Germany the transfer of the 708 page book is free, and you can order it from any local book shop or from ebay Germany (enter HP-41 for starting a search). For locations outside Germany you have to pay the transfer costs, I send out the book worldwide - for supporting HP-41 enthusiasts. Please get in email contact with me (christophdotklugaddgmxdotde)to arrange the order of the book.

Connect HP-41 & HP-IL to future - best regards - Christoph

*Message #5 Posted by **Philippe Lasnier** on 20 Feb 2009, 9:17 a.m.,*
in response to message #4 by christoph klug

Hi Christoph,

I had noticed that book appearing regularly on my HP-41 searches on eBay recently, although I hadn't spotted that it was from you. The thing I couldn't figure out is if its content was in English or not. A search in the Forum archives reveals that you answered that question last November - English. Is it alright if I contact you by e-mail as well?

Regards,

Philippe

in response to message #5 by Philippe Lasnier

Dear Philippe,

thanks for your interest about "HP-41 Input / Output Board & IL 2000 Interface System" book in English language. Yes - contact me via email...

Regards - Christoph

Re: HP-41 HP-IL Issue

*Message #7 Posted by **Gerry Schultz** on 23 Feb 2009, 1:52 p.m.,*
in response to message #6 by christoph klug

I wanted to add an ending on this post. Last night while my wife was watching the Oscars, I put my HP-IL loop back together to see if I could figure out what was going on. I put in the loop a tape drive, the floppy drive and the printer along with the 41CX. This time everything worked great. I was able to use Mcopy to make a floppy and tape copy of the 41 demo cassette. Looking back, the only thing I really did different was that I didn't plug the card reader to the 41. Are there any conflicts between HP-IL devices and the card reader?

Finally, I just found out that the '8' button on my 41CX isn't working. I had to finish my work using my 41CV. I was able to load a program into the CV on magnetic cards (11 sides) and save it to a floppy without any problems. Go figure.

Thanks, Gerry

HP-35 x^y key

*Message #1 Posted by **Antonio Maschio (Italy)** on 18 Feb 2009, 10:22 a.m.*

Hi, just a curiosity...

In the HP-35 calculator page (the first pocket calculator), I read it had a x^y key instead of the modern y^x; my question is perhaps silly, but I have not a HP-35 to play with, so if one of you can explain me...

to get, say 2^5 on my HP-12C I type 2 ENTER 5 y^x; what have I to type on a HP-35 to perform the same operation? I believe that, according to the x^y symbols, I should type 5 ENTER 2 x^y: is it correct?

Thanks!

-- Antonio

Re: HP-35 x^y key

*Message #2 Posted by **Ignazio Cara (Italy)** on 18 Feb 2009, 11:13 a.m.,*
in response to message #1 by Antonio Maschio (Italy)

Oh yes Antonio, this is correct on every HP-35, with red-dot or without.

Regards from Sardinia.

Ciao

Ignazio

*Message #3 Posted by **Arnaud Amiel** on 18 Feb 2009, 11:18 a.m.,*
in response to message #1 by Antonio Maschio (Italy)

The 35 does not have a 10^x key either so the x^y helped there. I still much prefer the 45 to the 35.

Arnaud

Re: HP-35 x^y key

*Message #4 Posted by **Karl Schneider** on 19 Feb 2009, 3:10 a.m.,*
in response to message #1 by Antonio Maschio (Italy)

Hi, Antonio --

The topic of the x^y key on the old HP-35 came up several years ago, but I didn't bookmark the thread. It's possible that "x raised to the y" with y residing above x in the stack was the rationale for the convention. However, I believe that the *real* reason for x^y instead of y^x is absence of a 10^x key, as Arnaud mentioned.

10 x^y will easily compute the antilogarithm of a result.

Especially when "-" computes y-x and "/" computes y/x, y^x is the natural definition.

INIT-Module for ERAMCO RSU-2 Rambox

*Message #1 Posted by **PeterP** on 17 Feb 2009, 3:41 p.m.*

Summary

Based on Diego Diaz's great article about the Softselect feature of the RSU-2 unit from Eramco, I set out to build a module that would greatly increase the easy of reviving a RSU-2 unit. The result is this INITRSU module. It comes with a set of functions that help the user to restore operation, clear parts or all of the RSU and load the operating system, all of this for all available banks and in a very convenient and save way. Last but not least, it also includes the original SETBANK, PORTON and PORTOFF functions from the RSU operating system. For the curious user, please also find the documented source code at the end of this document. Especially the documentation of the SETBANK instruction might be interesting to study.

Quick-Reference-Guide for functions of INITRSU

```
XROM 04
01      INIT-RSU        no function, module header
02      PORTON( )       the original function to turn on a port (-1 = 8, +3 = F)
03      PORTOFF(1)      the original function to turn off a port
04      SETBANK(1)      the original function to select a bank from 1-4
05      CLPOLLA         function that clears all polling points in all pages and banks
06      CLRSUA          function that clears all pages in all banks. CAREFUL!
07      CLPOLLB         function that clears the polling points in bank specified via X-reg
08      CLRSUB          function that clears all pages in bank specified via X-reg
09      CLBL( )         clear a block specified in X, can clear across page boundaries
10      COPYP(2)        copy page S to page D, SD in alpha
11      CODE(2)         code a NNN into X from Alpha
12      DECODE(2)       decode a NNN from X into Alpha
13      ROMSUM(2)       calculates and stores the correct checksum for a page
14      HEXIN( )        direct entry of a NNN
15      BLCAT(3)        Block-cat showing the content of each page
16      RAMWR(2)        MCODE Hexeditor to write directly into the RSU
17      SAVEROM(2)      Save a page from X to HP-IL with name from alpha
18      GETROM(2)       Get a page from HP-IL with name in alpha to page in X
19      LOCA(2)         Find a specific MCODE word starting at address AAAA in alpha
20      LROM(2)         Find last word in MLDL starting search backwards from AAAA in alpha
21      LDRSU           Load the original operating system into pages E&F from HP-IL for all
banks
```

Original functions come from the ERAMCO MLDL OS ,the Sandbox or the original RSU OS, though I did make certain changes here and there to the original code to fit the particular needs of this module.

In theory one would only need the functions CLRSUA (which clears all pages in all banks) and LDRSU (which loads the OS from HP-IL). However I find it useful to have some other tools at my disposal when trying to resurrect a dead Rambox.

File locations

You can find the complete manual here, and the actual files here.

Please let me know of any errors and suggestions.

Cheers

Peter

Emu42 v1.11 is available now

*Message #1 Posted by **Christoph Giesselink** on 17 Feb 2009, 2:46 p.m.*

A new version of Emu42 is available is available at http://hp.giesselink.com/.

Sorry that I haven't published a new version for over a year now. The new Emu42 version got some improvements under the hood

- debugger disassembly with symbolic entries
- RPL object viewer inside debugger (UNRPL engine)
- GIF bitmap image support (Free42 decoder)
- some minor cosmetic changes
- all bugfixes of the last year

For the symbolic disassembly an entry point list is necessary. For further details how to enable this feature look into the Debugger.txt document please.

The new HP28S entry point list now contain over 2200! entries. I don't know further public entry point lists for the other emulated calculators.

When you want to go through the HP28S RPL objects, open the debugger and add the HP28S entry point list first. Call the RPL object viewer and also open the Find dialog in the context menu of the Memory section.

In the "Find what:" field type in "76C20", thats the RPL object prolog in reverse order, and press the "Find Next" button. With every "Find Next" you jump to the next object. You see, there're still many objects whithout a name. Finally enjoy your journey through the decoded HP28S RPL objects.

Cheers

Christoph

Aristo M16 (HP parts)

*Message #1 Posted by **Stefan Hauschild** on 17 Feb 2009, 2:10 p.m.*

Recently I got an Aristo M16 from 1977. It is "Made in Germany" by a manufacturer of slide rules and drawing accessories. There are some interesting details in the actual design but maybe it varies from lot to lot.

First: The on-off-switch is made of "Aristopal". This is something like Astralon and a characteristic material of "Aristo"-slide rules. The other keys are made of the same PE as the cases of some newer Aristo slide rules. So far for the slide rule collectors.

The keys have the same haptic appearence as the old HP-keys and they are based on the same mechanic principle. Inside there is an original HP-Singapore display. In operation it is brilliant and offers much more contrast than the average cheap display used in simple calculators of that era. It looks like a smaller version of the HP97-display

The processor is a Rockwell B5000, hand-soldered with the unnessecary pins cut on the copper side of the PCB.

This calculator is genuine german (not from Taiwan or somewhere else) but maybe it was designed with some help from HP (to sell some parts they don´t need anymore)?

Re: Aristo M16 (HP parts)

*Message #2 Posted by **Walter B** on 18 Feb 2009, 2:37 a.m.,*
in response to message #1 by Stefan Hauschild

Sources in the net confirm HP display modules being used in ARISTO calcs, though not for the M16 being a rather late model (the last one "Made in Germany"?).

more HP displays

*Message #3 Posted by **Frank Boehm (Germany)** on 18 Feb 2009, 4:55 a.m.,*
in response to message #1 by Stefan Hauschild

ARISTO obviously used mainly HP displays (for their LED cals). I have found others too (only listed up to "I"): CASIO ROOT-8S Commodore 3101, Minuteman 2 Corvus 310, 322, 411, 415 DALTONE POCKET 80 Faber-Castell TR1 Interton PC4007, 4008, 4009

HP was "just another source" of LED displays, I assume the Bowmar, Litronix, TI and HP displays were compatible and exchangeable, so it was just a matter of pricing and availablity.

Re: more HP displays

*Message #4 Posted by **Stefan Hauschild** on 18 Feb 2009, 7:11 a.m.,*
in response to message #3 by Frank Boehm (Germany)

Interesting for me was the fact that the keyboard of the M16 is designed like an HP35-keyboard (with the keys molded to the frame on the lower edge). The older Aristos have the usual keyboard with the central spring. This led me to opening it and discovering the display - ok, maybe I would have opened it anyway,

like I do with all my old stuff. The display is a lot better than the one on my other cheaper calculators of that era but obviously HP has sold its display bars to all the main manufacturers.

Calc Benchmark - HP41 MCODE - 11.05 seconds

*Message #1 Posted by **PeterP** on 16 Feb 2009, 8:42 p.m.*

Hi,

Inspired by another member here to write the 8-Queens problem for the HP41 in MCODE and add this to the Benchmark I used a sprained ankle to do just that. Below you find the MCODE which models as closely as possible the Basic code. Runn-time 11.05 seconds on my normal speed CX. For a reference, the RPN version runs 17+ minutes...

I used a very simple program and the 41cx internal clock to time this so the 11.05s have a tiny bit of RPN overhead for the timing program. If there is a better way to time the actual code, please let me know.

Would be great if that can be added to the great Benchmark article on calculator speed.

Cheers

Peter

Thanks for this impressing implementation of the test code. ;-)
I'm not sure about the correct CPU description and the CPU clock speed for adding into the benchmark. Is "Nut @ 0.355 MHz" right?

Re: Calc Benchmark - HP41 MCODE - 11.05 seconds

*Message #4 Posted by **Egan Ford** on 17 Feb 2009, 8:40 a.m.,*
in response to message #3 by Xerxes

The nonpareil source code has it at 375200 Hz. Another will have to confirm.

*Message #5 Posted by **PeterP** on 17 Feb 2009, 12:38 p.m.,*
in response to message #3 by Xerxes

Egan, Xerxes, thanks for the kind words, having the BASIC template available helped a great deal.

According to the 'Detailed Description of the CPU' document (p4, see TOS, Internal Documentation), the NUT processor runs at 340-360khz in the HP41 (and 200-230khz in the HP11C and 12C, which I did not know!)

Cheers

Peter

in response to message #5 by PeterP

I've updated the benchmark list with the rounded down value of 11.0 seconds due to your comment about the RPN overhead for timing.
Thanks for your nice contribution.

Re: Calc Benchmark - HP41 MCODE - 11.05 seconds

*Message #7 Posted by **Thomas Klemm** on 18 Feb 2009, 1:39 a.m.,*
in response to message #1 by PeterP

Very nice indeed! Did you already have a look at Raymond's contribution: HP-48GX / Saturn Assembly?
He uses the nibbles of a register for the array. You will find a documented listing at the end of this thread:
Calculator Benchmark 48GX/hp48xgcc and 50g/HPGCC3 results

Cheers
Thomas

*Message #8 Posted by **PeterP** on 18 Feb 2009, 10:23 a.m.,*
in response to message #7 by Thomas Klemm

Actually I had not. It is very neat indeed, a true 'RDT'!

My first version used apparently the same idea, that is storing the array in nybbles. However that version took 42.1 seconds as compared to this version due to some shortcomings of the nut instruction-set. \

Cheers

Peter

HP-71B Math RAM Article

*Message #1 Posted by **Marcus von Cube, Germany** on 16 Feb 2009, 8:09 a.m.*

I've added an article to the articles section of this forum. I've managed to download the HP-71B Math Pac to a RAM port in my physical HP-71B.

Link to articles section.

Edited: 17 Feb 2009, 3:43 a.m.

...genial, pretty easy to perform, how long did it take you to find out?

Re: HP-71B Math RAM Article

*Message #3 Posted by **Marcus von Cube, Germany** on 17 Feb 2009, 12:30 p.m.,*
in response to message #2 by Roland Storz

I had the idea when I first saw that the ROM appears as a file in a CAT ALL listing. How to reset the protection bits is detailed in the internal design specification, vol. I.

HP41 - fill HDRIVE1

*Message #1 Posted by **Roland Storz** on 16 Feb 2009, 6:15 a.m.*

Hi all,

exchanging files with my HP71 to/from PC incl. EMU71 and HDRIVE1 works absolutely great with u.m. specs.

However, since I'm new to the HP41 I simply did not get how to "fill" my HDRIVE1.dat with programs and data (from the software library or even from a DOS file) to transfer them to my physical HP41?

Sorry for asking such a basic question. Can anyone explain the steps required.

Many thanks in advance, Roland

my specs: HP41CV EMU41 HPIL Interface HP 82160A HP-IL/PC Interface ISA Card

Re: HP41 - fill HDRIVE1

*Message #2 Posted by **Marcus von Cube, Germany** on 16 Feb 2009, 8:12 a.m.,*
in response to message #1 by Roland Storz

Why not use EMU71 and its COPY command to transfer files from :DOSLINK to :HDRIVE1 ? The 71B should understand HP-41 files.

Re: HP41 - fill HDRIVE1

*Message #3 Posted by **Egan Ford** on 16 Feb 2009, 10:56 a.m.,*
in response to message #1 by Roland Storz

Here is one way:

1. Setup EMU41.INI with HDRIVE1.DAT and HDRIVE2.DAT (you can use any name you like, but internally to the 41 they will be HDRIVE1 and HDRIVE2).

2. From EMU41 use NEWM to format HDRIVE1:

```
[ALPHA]HDRIVE1[ALPHA]
FINDID
SELECT
NEWM
```

3. Then use HP41UC (http://www.hpmuseum.org/software/41uc.htm) to convert your code to LIF format, then copy that LIF to HDRIVE2.DAT, e.g.:

   Say you have the following program:

```
LBL "HELLO"
"HELLO"
AVIEW
END
```

To convert to LIF type:

```
HP41UC.EXE /t=HELLO.TXT /l=HELLO.LIF
```

Then to use with EMU41:

```
copy HELLO.LIF HDRIVE2.DAT
```

4. Then from EMU41 type:

```
[ALPHA]HDRIVE2[ALPHA]
FINDID
SELECT
[ALPHA]program name[ALPHA]
READP
[ALPHA]HDRIVE1[ALPHA]
FINDID
SELECT
WRTP
```

Once you know the IDs you can just type (assuming IDs of 3 and 4):

```
[ALPHA]prog name[ALPHA]
4
SELECT
READP
3
SELECT
WRTP
```

You could also use DOSLINK with .DAT files with INP/OUTP, IIRC.

Yeah, not like anything going on here at the HP Museum! Now if you'll excuse, I'm going to get back to my 25 year old calculator.... :)

That's all playing is about, isn't it? It may lead to something nevertheless.

There's already a musical machine that will repeat itself until someone throws a block at it. They're called banjo players.

Re: OT: Siftables, the toy blocks that think

Good morning!

> Quote:
>
> There's already a musical machine that will repeat itself until someone throws a block at it. They're called banjo players.

Hahaha - that's a real good one :-)

I think that it's important to experiment with new man/machine interfaces as much as possible (and how I would love to get paid for playing with these Siftable thingies ...)! I am convinced that long-time slide rule users initally made fun of electronic calculator users, and that investing money in the development of the HP35 was as brave from HP then as it is now MIT regarding these "toy block" computers.
And didn't we old time "punch-card-and-command-line" computer users laugh about the first workstations with GUI and mouse from Xerox, Atari and Apple?
At least I would like something like this "siftable" comcept to become reality!

Greetings, Max

I was a slide-rule user but went to calcs for the programmability.

> Quote:

> And didn't we old time "punch-card-and-command-line" computer users laugh about the first workstations with GUI and mouse from Xerox, Atari and Apple?

I'm still not too fond of GUI, and I keep all the stupid little pictures on mine turned off, since you can't tell what they are anyway without the words under them. You don't need GUI to have graphics, or to have point-and-click, or to have windows, all of which I have in my DOS software I still use although with a hi-res monitor. Our son is turning into somewhat of a Linux expert and he prefers the command line. I hate touch screens though, with their paralax and looking through that grime on the screen, the gizmos where you sign for a credit-card transaction or a delivery confirmation (I never can make it look like my signature on there) and I liked the ATM interfaces at the banks before they made them color and made them unusable when the sun is low and shining right on them. There are a lot of new technologies I like, and a lot of other ones I wish would quickly go extinct like the talking cars of the 80's.

I remember when the Apple Newton first came out and I was reading about the handwriting recognition that was supposed to replace the quaint keyboard. The technology was impressive, but I thought,

"Someone has forgotten that the reason we used to type letters before we had computers was that it was faster-- a *lot* faster!" I hope the keyboard never goes away in favor of voice recognition, because I can type a lot better than I can talk.

Any love for the 28's?

*Message #1 Posted by **Steve Keeley** on 15 Feb 2009, 11:52 p.m.*

In the topic on the $600 42S, Jandro Kirkish wrote:

> Quote:
>
> ...and my favorite, my 28s -- a calc that I have really grown into

I was interested by this because, having lurked here for a long time, I've seen little love expressed for the 28C and 28S.

I know for my own part, my 28's are the least used of my calculators. They were so totally eclipsed by the 48S and X that they fell into disuse. The 15C and 42S were handier to grab for a quick calculation, and for more heavy-duty work the 48's were both more capable and easier to handle. (Nowadays the 50g does most of the hard work.)

But during their brief moment at the top of the heap, '87 - '90, they were indespensible to me. I can still remember how amazed I was by their algebraic capability. The unit conversion capability, while awkward compared to the 48 implementation, was extremely useful at the time. The solver let you store an eqation and then solve for any of the variables, a most impressive feature then even if we take it for granted now.

I bought my 28C several months before taking the FE exam and there were quite a few questions where I was grateful to have it; I could solve them almost instantly. I still have a wooden stand designed to hold it in the fully open position which I bought from EduCalc. (I didn't really get the hang of RPL programming until I got the 48, and still prefer the old keystroke method.)

But at the time, the 28's offered an amazing amount of capability that no other handheld I'm aware of could compare to. Does anybody else have any kind words for the 28s?

in response to message #1 by Steve Keeley

I remember taking a Math/Computer Science programming class during my Master's Degree in '88 or '89. One of the course projects was to create a program that would optimally solve a fairly nasty boundary value ODE problem. Since I had no computer access at the time I asked the prof if I could use my 28S instead. He said if I could provide printout of the program and results I could try, but he was more than positive it wasn't possible (I also had, and still have, the printer). After several days of programming and an all-nighter until 5:00AM I produced a program and output that rivaled the computer programs of the day. I still have that calculator (although the the thermal printout has faded), but must admit I feel REALLY clumsy using it today. I can't remember where 90% of the functions are. I should pull it out of the collection this summer and give it another go for posterity.

The 28S is one of my favorites. Although the 48 is more powerful, I like the user interface of the 28S better. The dedicated alpha keyboard has always seemed much better than the alpha shift of the 48. If only they'd had a clamshell with better I/O capabilities...

I second that. I bought the 28C when it came out (at the time I had a friend working at HP who made me benefit from his company rebate) - i was an EE student at that time and the 28C helped me get through a number of exams. AFter about a year, its memory was entirely stuffed with programs I had written, and I immediately jumped on the 28S that came out just at the right time. As a student, these were huge investments for me, but well worth it. Today the 28C is my office calculator (my other HP calcs are too valuable). I bought the 48 later, but I never came to like it. The display is of lesser quality, but what is worse for me, I don't like the looks: It's ridiculously big and almost intimidating with all these buttons. The 28 has a certain elegance about it. Of course, I regret the missing input capability, and became a victim of it once when I lost 14k of valuable programs, but hey, looks matter too!

As Eric said, the dedicated alpha keyboard is a lot easier to use than the shifted alpha keys of the HP-49/49/50.

> Quote:
>
> The unit conversion capability, while awkward compared to the 48 implementation

For conversion of simple units (such as length), I agree. For compound units, the HP-28's capability is very useful, particularly when Imperial<->SI engineering conversions are needed. I also like the HP-28's units library with definitions.

> Quote:
>
> I bought my 28C several months before taking the FE exam

I found my HP-15C perfectly adequate for the EIT/FE exam in 1994.

Marias said,

> about a year, its memory was entirely stuffed with programs I had written,

I managed to fill the HP-28C's puny 2 kB of RAM just trying out solutions in symbolic algebra -- completely inadequate for its capabilities. I wish that the HP-32S/SII had that 2 kB, though...

> Quote:
>
> I regret the missing input capability, and became a victim of it once when I lost 14k of valuable programs

A few years ago, I made the argument that HP was wise not to release an HP-42S with the 32 kB of RAM it could support (instead of its built-in 7 kB), unless I/O were added. If users are given much RAM, they will use the calc as a repository of programs or as a data collector, then will inevitably get burned without electronic upload/download.

I, too, have been attracted to the 28s because of the dedicated alpha and less-cluttered keyboards. My main interest is in units conversion. I even went so far as to purchase some period HP literature (a 22-page 8.5x11 booklet) that compares the 28s and 48sx. Unfortunately, it just does not answer my questions!

Can someone elaborate on this?

Is the 28s units conversion capability equal to the 48sx (which I have)?

Can it append the unit to the numerical value like the 48sx?

Thanks.

in response to message #7 by Martin Pinckney

I have both a HP-28S and a HP-48SX, and IMHO the HP-48SX wins hands down over the HP-28S in the units department. The HP-48SX can create units objects, which associate (append) the unit type to the numerical value. You can perform arithmetic operations on two values, you can even combine two objects with different units, and it will automatically convert them to a common unit and perform the arithmetic operation, for example: 100 cm^2 ENTER 1 m^2 + yields 1.01 m^2. The HP-28S can't do any of this. Also units conversion is much simpler on the HP-48SX. Simply enter the value with its initial unit, then hit Left Shift and the final unit, and voila the conversion is made. The units are grouped by type on the HP-48SX (length, force, temperature etc), making them much easier to find than the alphabetized list on the HP-28S. Bottom line, the HP-48SX can do anything with units that the HP-28S can do, it can do more and it can do it better.

Re: Any love for the 28's?

*Message #9 Posted by **Steve Keeley** on 17 Feb 2009, 2:08 a.m.,*
in response to message #8 by Michael de Estrada

As Mike said, there is no comparison between the 28 and 48/49/50 units utility.

On the 28, you would enter the number you want to convert on one level, enter the "from" units as a string on the next level, then enter the "to" units string on the final level, and then hit "CONVERT." As such:

3: 25
2: "ft * lbf / s"
1: "Btu / h"

You'd be left with:

2: 115.656071711
1: "Btu / h"

You couldn't incorporate the units into the solver then enter mixed units for the variables and have the calculator automatically check for dimensional consistency and convert units.

At the time, it was very useful (it sure beat looking up all the unit conversions and doing them one at a time). But it wasn't a breakthrough; the HP 41 Thermal and Transport Science module added this capability to the 41, and unit checking/conversion was built into all the programs on it as well. If you opted for "Units" when running the program, then after prompting for the value, it would prompt for the units which you would enter as an alpha string. It gave instructions for incorporating this capability into your own programs. As a chemical engineering major, this ROM was worth more than its weight in gold to me.

*Message #11 Posted by **Michael de Estrada** on 16 Feb 2009, 10:29 a.m.,*
in response to message #1 by Steve Keeley

Actually, the HP-28 series was revolutionary in many respects, not just RPL. They were the first HP's (to the best of my knowledge) to replace the fixed 4-level stack (x,y,z,t) with an unlimited stack. This was important when performing RPN calculations with more than three pending (parenthesis for algebraic notation) operations. It also introduced contextual and definable soft keys. I particularly like the simple layout with only one shifted key.

But my HP-28S also has unique problems due its design. When fully opened to use its alphabetic keyboard, it has a large footprint and ceases to be a hand-held device. I find it awkward to keep shifting my eyes (and head) from the alpha keyboard on the lower left to the display on the upper right. Unless the surface it is placed upon is completely flat, the alpha keyboard (which has no rubber feet) tends rattle around as I press the keys. And finally, the lack of calculator to PC I/O is a real killer, especially with the 32K HP-32S, which is why I later bought a HP-48SX. Not only do I save my HP programs and data on my DOS PC, I find it easier to write/edit my programs using a text editor on my PC and then port them to my HP.

I had been using my HP-28S occasionally until a few years ago when the battery door broke (another design flaw of the HP-28). So now it just sits in its pretty accessory soft leather case, sans batteries.

*Message #12 Posted by **Jandro Kirkish** on 16 Feb 2009, 1:02 p.m.,*
in response to message #1 by Steve Keeley

Wow it's nice to have "inspired" a thread on one of my favorite topics-the 28s! This is really the only vintage hp I own but the longer I have it the more impressed with it I seem to get. I bought my 28s back in 1990 because I had come into some cash and had been lusting after it for years and was impressed by my friends 11c and RPN in general. I was in my early 20's and going through kind of a "loser" phase: college dropout etc (perhaps some of you fellow Gen-X-ers can relate). I hadn't even taken a calculus class yet. I loved the 28s from day one, but really didn't have the math background to fully appreciate it, save for solving and graphing equations. Long story short, I was back in school around ten years later getting a math degree ... It was only then that I fully appreciated that d/dx key--wow, my hp can do *that?* (It was around this time that I discovered this Museum, and my obsession with hp calcs blossomed) I saw my fellow math & engineering friends with their 48g's and I thought they were pretty cool but I felt I had the advantage with the dedicated alpha keyboard, just one shift key and a remarkably uncluttered keyboard for such a powerful machine. I got my math degree but physics and engineering are my real interests, plus my amateur astronomy hobby, and the hp 28s has served me well in all of these dabblings. (And in my day job too as a scientific programmer.) So 20 years later I find myself saying less often "Wow my 28s can do *that?*" and more often "*Of course* my 28s does that!" Recently I have found the ability to define custom units is very handy in astrophysics as but one example ...

I agree with the praise as well as the criticisms raised by the other posters: I just wrestled with the battery door last night putting in new batts, the thing creaks and crackles like it going to fall apart--and it did once; thanks superglue!--but it has always been that way. And its still working. Many of these flaws are related to the

clamshell design, which is paradoxically one of its strengths, as other commenters have noted - and if you can put it on a desk, it makes it a lot easier to key in programs and expressions. I am constantly hunting for functions on my 50g where most buttons have three or more function apiece, but on the 28s it is a snap. Also it fits nicely in a jacket pocket (it is in my pocket now as I write) whereas a larger RPL model would not. So Steve, you ask if there is any love for the 28s--well clearly there is plenty from my corner!

Cheers, Jandro

I like the 28 series too. Got my first at the end of my undergraduate degree and spent the vacation writing chess for it.

The dedicated keyboard wins it for me. When I enter programs or even call functions on either the 28, 48 or 49, I do so in alpha mode. I never remember where the function I want is located in the menus but I usually remember the name.

in response to message #1 by Steve Keeley

Being a long time HP-41 addict (incurable since 27 years), some time ago I bought a mint HP-28S for my collection. It was love at first sight! What a machine! I also own a HP-48G. Comparing both units the 28S is miles ahead. Great user interface, well-arranged keyboard, excellent manuals (I own both HP-28S and HP-48G manuals), everything one expects from a good calculator, it allows almost an intuitional handling, everything on it gives me a feeling of quality . Now I'm looking for a second one for work, since I don't wanna wear the one from my collection. For today's calculator usage its memory is sufficient, the HP-35S I recently bought doesn't offer more. I'm doing more complicated calculations via PC (Octave, Scilab, Mathematica, Excel). In my opinion this calculator still represents everything HP stood for in the "good old days". Yes, I think it comes close to my all-time favorite HP-41. Hopefully my enthusiastic posting doesn't start a flaming war about the best calculator, it is purely my two cents.

Rainer

P.S.: I found a HP-42S for 15€ on a flea market, with manual, two books, pouch and box, 3 months ago. It looked like new, after replacing the batteries it works. IMHO paying more than 600 bucks for such a machine is crazy ...

German flea markets trading HPs? You're a lucky guy, aren't you?

Re: Any love for the 28's?

*Message #16 Posted by **Rainer Wiedemann (Germany)** on 17 Feb 2009, 7:30 p.m.,*
in response to message #15 by Marcus von Cube, Germany

Marcus,

I have many of my collection items from flea markets, but I admit, it's a time consuming hunt occupying many weekends. I found the 42S among a bunch of computer crap, the seller himself announced his sales as "Computerschrott" (=computer scrap). When I took a look at his offerings I was amazed seeing the HP-42S. He was convinced it would be defect, so I dealt for the books and the supposed to be dead calc as a give-away, and it worked :-). I was absolutely happy about ...

Unfortunately opportunities like this one are very rare.

IMHO the "Bay of Pigs" - or how you ever want to name it - became one of the most expensive ways to complete a collection of HPs, bargains are rare, though sometimes possible. I ask myself who is weird enough buying heavily worn Voyagers for almost 300$, or hp-il peripherals for irrational sums from the same seller.

OK, this was a little bit off topic, sorry.

So I'll close with a "Horrido!" to all hunters of vintage HP calcs, and beware of being ripped off.

Kind regards,

Rainer

*Message #17 Posted by **Allen** on 17 Feb 2009, 8:42 p.m.,*
in response to message #16 by Rainer Wiedemann (Germany)

According to my age-predictive calculator model, Nearly everyone who hails the HP 28C/S was born from 1970 to 1974- a very narrow range of years. Any earlier and people tend to migrate to the Voyager, any later and they would migrate to the Pioneer or Charlemagne series.

I have both the 28s and 28c. While I find them adequate, the battery door and leaky N-cell batteries are enough to prevent their employment for all but special use, and for the size, I'd rather have a slightly smaller Pioneer (32s,32sii,42s) in an Astech Case, or a 48g series calculator.

I did not fully appreciate the RPL legacy of the 28 series until I read Chapter 1.1 of William Wickes' Book: "HP 48 insights". After learning the 3rd generation calculators started with the 28S series, I decided to add all the clamshells to an otherwise complete collection of Nut, Voyager, Pioneer, and Charlemagne Calculators. The former see the least use of any other family, for stated reasons.

I was planning on quoting the same information. The HP-28C was the first calculator that could use equations as arguments (Wickes said this much more elegantly that I did). This (and other features) help justify its place in history as the first 3rd generation calculator.

Slightly OT: 28's RPL -> 50G RPL

*Message #22 Posted by **Peter A. Gebhardt** on 20 Feb 2009, 10:15 a.m.,*
in response to message #1 by Steve Keeley

Could somebody shed some light on the fact and reasons, that the representation of calculating a numerical integral (and possibly other function implementations & stack diagrams too) have changed in the course of development of the newer calculators:

```
As an example (28 Pocket Book)
------------------------------

3: 'X^3+4*X+8'
2: {X 1 3}
1: .00001

2: 52
1: 5.1992166102E-4
```

If entered on my HP50G - "Integral: Too Few Arguments"

Because that might have been discussed "ad nauseam" in the past, pls. point me to the relevant postings then.

Best regards,

Peter A. Gebhardt

Re: Slightly OT: 28's RPL -> 50G RPL

*Message #23 Posted by **Michael de Estrada** on 20 Feb 2009, 12:17 p.m.,*
in response to message #22 by Peter A. Gebhardt

Peter,

I do not own a HP-50g, however, I do own a HP-48SX, which I believe works the same way, and in order to perform integration you need 4 stack entries as follows:

Level 4 - Lower Limit (1)

Level 3 - Upper Limit (3)

Level 2 - Integrand ('X^3+4*X+8')

Level 1 - Variable of integration ('X')

The accuracy is specified by the display mode, i.e. in your case it would be FIX 5. To do numerical integration, as opposed to symbolic integration, you must set Numerical Results Mode (set flag -3). Also, on the HP-48SX it is much easier to do this using the EquationWriter application and I assume the HP-50g has something similar.

Hope this helps.

Michael

Level 2 - Integrand ('X^3+4*X+8')

Level 1 - Variable of integration ('X')

The accuracy is specified by the display mode, i.e. in your case it would be FIX 5.

Yes indeed, the stack arguments for integration in the HP-28 differ from those in the HP-48/49/50.

I recall mentioning that in a thread from 2004 you might find interesting:

Quote:

"Arnaud's (HP-48) *program can't even be run on a 28C because its integration accepts arguments in a different format (dummy variable and limits enclosed in a list), which I don't know how to automate. It also didn't accept value-loaded variable names for the limits."*

It should be noted that the integrand-function uncertainty provided in stack level 1 in the HP-28 does not specify the same thing as the ACC parameter in the HP-42S and HP-71B Math ROM.

An excerpt from my post of 28 Nov 2005:

Quote:

28C, 28S:

(These models) specify uncertainty in a particular decimal digit as a numerical parameter to the INTEG function.

42S, 71B Math ROM:

(These models) specify a relative uncertainty as a per-unit fraction of the function-value magnitude, as a numerical parameter to the INTEG function.

Also, from a thread in 2006:

FIX for integrand-function uncertainty in the HP-48/49/50 works as in the HP-33s/35s, not as in the HP-15C, HP-34C, HP-32S/32SII, and HP-41 Advantage.

Yikes! $630 for a HP-42S

*Message #1 Posted by **Michael de Estrada** on 15 Feb 2009, 8:18 p.m.*

The world is falling into a deep economic recession, people are losing their jobs and homes, retail businesses are going bankrupt. But, never mind, someone just paid $630 for a new complete HP-42S in an ebay auction. According to this museum, finding an HP-42S is "fairly easy" and the highest reported price was $400, well at least until now. I've heard that the safest investment in these uncertain times is gold bullion, but now I'm thinking that my HP calculator collection may actually be even better.

LCD darkening

*Message #1 Posted by **Peter Klein** on 15 Feb 2009, 3:20 p.m.*

In scanning ads for HP calculators, I have noticed a couple of photos that show significant darkening of the pixels. It looks like every pixel and annunciator in the display is half-darkened even when they are not active. I'm wondering if this is real burn-in, or just an artifact of the camera flash going twice through layers of the LCD as it reflects back at some angles.

Here's an example: http://www.auctiva.com/hostedimages/showimage.aspx?gid=103745&image=229927191&images=229927173,229927191,229927213&formats=0,0,0&format=0

in response to message #1 by Peter Klein

The camera angle was just not what the LCD's viewing angle was set for. If you adjust one or the other so they match, the "off" pixels will be pretty much invisible.

Re: LCD darkening

*Message #3 Posted by **Juergen Keller** on 15 Feb 2009, 3:32 p.m.,*
in response to message #1 by Peter Klein

The contrast can be adjusted by pressing and holding the "C" key, then press "+" for darker and "-" for lighter display.
Never heard that LCD displays can burn-in (but unfortunately, they can leak). The effect on the picture you referenced is just a matter of viewing angle (and perhaps a high contrast setting).
Juergen

Belated Valentine's Day Fun

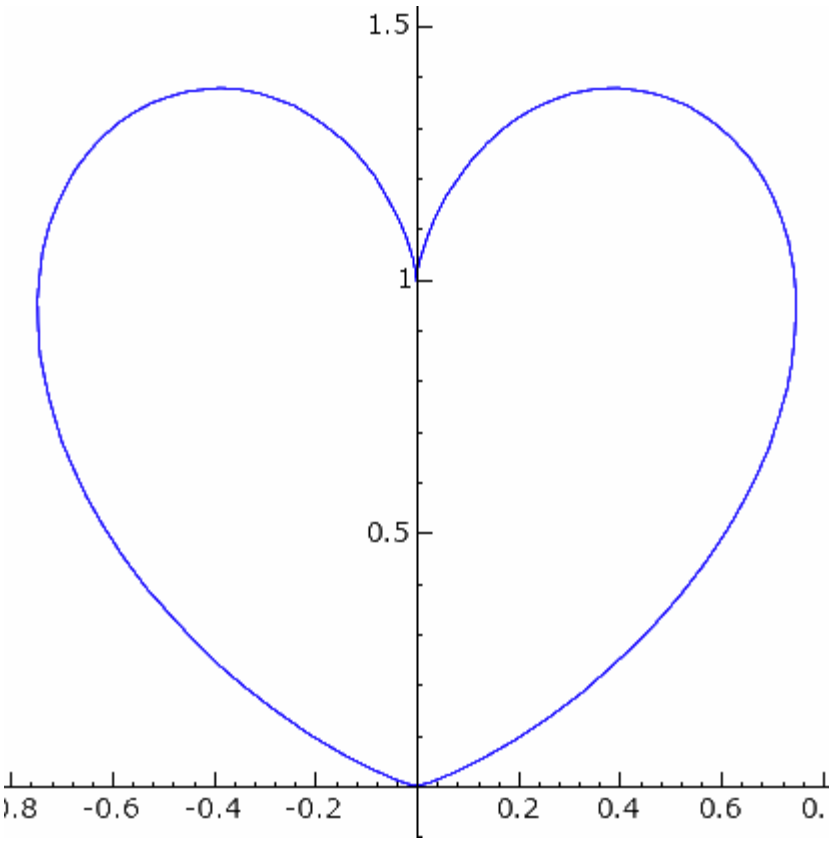
*Message #1 Posted by **Egan Ford** on 15 Feb 2009, 12:36 p.m.*

I do not recall where I found this, and I was too busy to post before Valentine's Day:

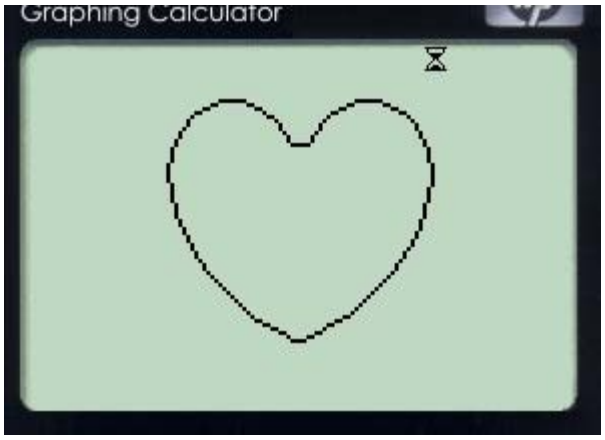
$r=|\tan(t)|^{1/|\tan(t)|}$

Sage output:

```
r=polar_plot(lambda t:abs(tan(t))^(1/abs(tan(t))),0,pi)
r.show(ymin=0,ymax=1.5,xmin=-0.75,xmax=0.75,figsize=[5,5])
```



50g output:



Edited: 15 Feb 2009, 4:01 p.m. after one or more responses were posted

in response to message #1 by Egan Ford

V-day? It seems there are different meanings of V-day. Ciao.....Mike

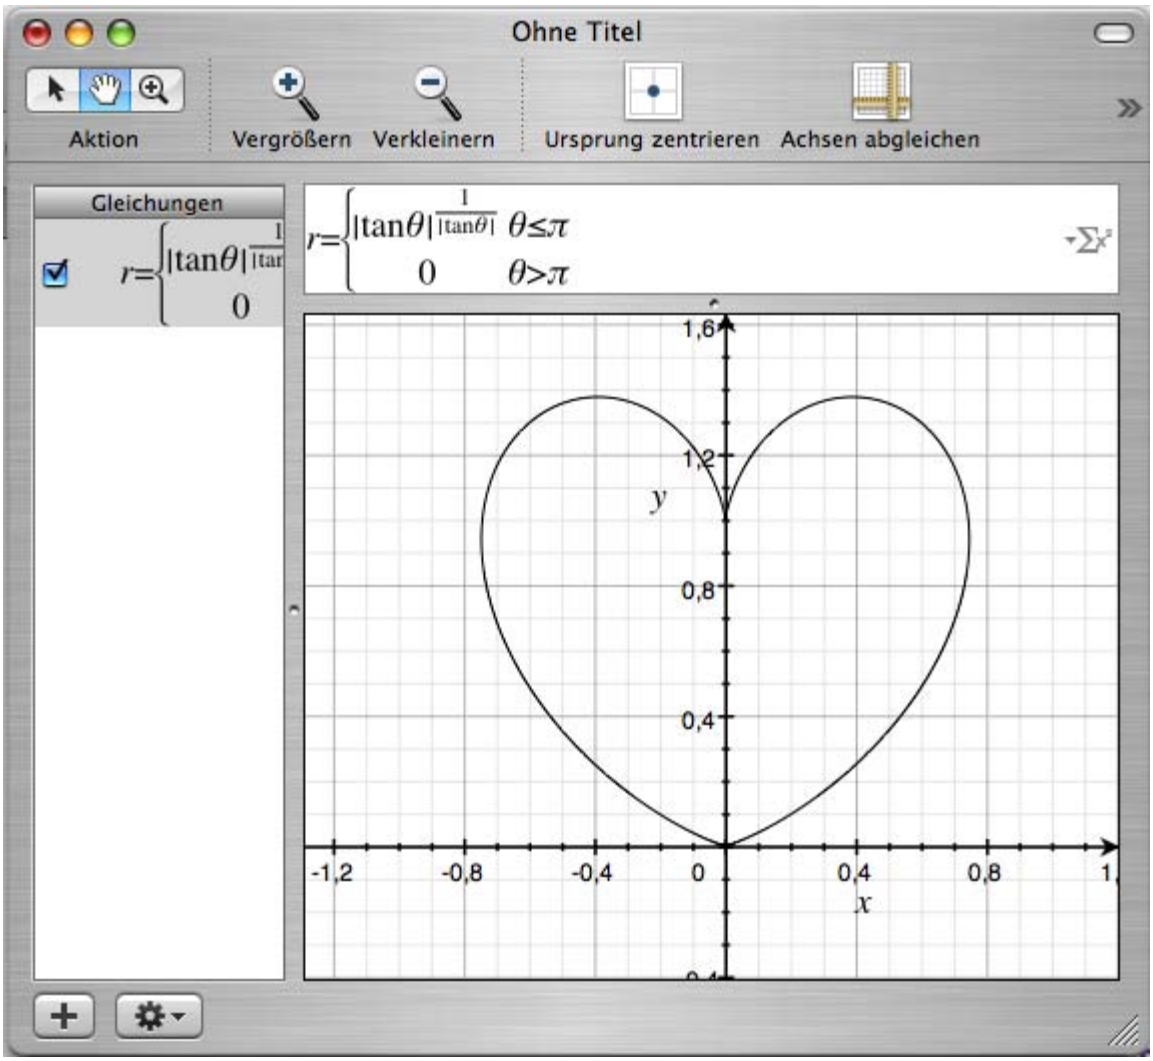
Valentine's Day. Ambiguity removed (above).

Edited: 15 Feb 2009, 4:30 p.m.

Re: Belated V-day Fun

*Message #4 Posted by **Marcus von Cube, Germany** on 15 Feb 2009, 3:35 p.m.,*
in response to message #1 by Egan Ford



On my Mac... This is the built in Grapher app. I din't find an option to restrict the range for theta, therefore the two part formula.

Re: Belated V-day Fun

> On my Mac...

On Apple II it would look like this:

AppleWin: free

Writing your own equation plotter program: priceless!

Not a competitor to Graphmatica though :-)

Regards,

Gerson.

HP 35s Bubble Sort

*Message #1 Posted by **Elliott W Jackson** on 14 Feb 2009, 12:12 a.m.*

The Wiki site claims the Gnome Sort to be the simplest, but it turns out that converting the Bubble Sort to HP GTO-ese is actually simpler, and has faster run times too.

Pseudo code:

```
procedure bubbleSort( A : list of sortable items ) defined as:
  n := length( A )
  do
    swapped := false
    n := n - 1
    for each i in 0 to n - 1  inclusive do:
      if A[ i ] > A[ i + 1 ] then
        swap( A[ i ], A[ i + 1 ] )
        swapped := true
      end if
    end for
  while swapped
end procedure
```

Program listing:

```
S001    LBL S
S002    STO Z           bbb.eee
S003    CF 0            start of do-while
S004    0.001
S005    STO- Z          bbb.(eee - 1)
S006    RCL Z
S007    STO I           for (I = bbb; I <= eee - 1; i++)
S008    RCL I
S009    1
S010    +
S011    STO J
S012    RCL(J)          A[i+1]
S013    RCL(I)          A[i]
S014    x<=y?
S015    GTO S020
S016    STO(J)          A[i+1] = A[i]
S017    RDN
S018    STO(I)          A[i] = A[i+1]
S019    SF 0            swapped = true
S020    ISG I
S021    GTO S008
S022    FS? 0           swapped = true?
S023    GTO S003
S024    RTN

LN=78   CK=B7E4
```

And finally, some timings:

```
21 registers, 10.030:  23 seconds
21 registers, 10.030:  24 seconds
101 registers, 10.110:  ~10 minutes
```

So, even the much-detested Bubble Sort is superior to the cutesy Gnome Sort I started this project with.

Re: HP 35s Bubble Sort

*Message #2 Posted by **Marcus von Cube, Germany** on 14 Feb 2009, 4:36 a.m.,*
in response to message #1 by Elliott W Jackson

Bubble sort isn't bad, if the items are "in almost sort order" at the beginning of the algorithm. If all items are already sorted, a single pass is all to find that out. Bubble sort is stable, too, that is, it leaves the original sorting of items considered "equal" by the comparison algorithm intact.

HP 35s Gnome Sort

*Message #1 Posted by **Elliott W Jackson** on 13 Feb 2009, 10:52 p.m.*

Well, I decided to try my hand at something a bit more ambitious than my last little project (linear interpolation, released here to stunning, and yet oddly silent fanfair. I'm sure everyone was just over-awed and unable to comment. Yeah, that's the ticket).

I thought maybe a simple sort routine would be a good project. I did a search, and found a nice page on Wiki with all sorts of algorimthms, with a nice summary of speed, complexity, storage requirements, etc.

I selected the Gnome Sort, since it seemed to be the smallest, simplest. Pseudo-code follows:

```
void gnomesort(int n, int ar[])
{
    int i = 0;

    while (i < n)
    {
        if (i == 0 || ar[i-1] <= ar[i])
            i++;
        else
        {
            int tmp = ar[i];
            ar[i] = ar[i-1];
            ar[--i] = tmp;
        }
    }
}
```

Couldn't be much simpler, right?

Well, as I set about transforming this simple, benign bit of C code into HP-calc-ese, with all it's GTO and lack of labelling capability glory, I quickly re-learned the lesson of why I haven't used a "goto" command in over two decades. Goto sucks.

I REALLY struggled to transform the if-then-else logic into goto-ese. It was made more complex because the operand of the if() statement is a compound statement with OR logic. I'm quite confident someone could turn that into something better than I came up with, I ended up kludging it together with several GTO statements and Flag 0.

For better or worse, here is the program. It is called assuming

bbb.eee

is in the X-stack, and will then gnome-Sort the contents of memory registers 'bbb' to 'eee', in ascending order. Note that it will not sort complex or vector contents.

Memory registers used: I, J, Y, Z Flags used: 0

```
S001    LBL S
S002    INTG
S003    STO I
```

```
S004    STO Y           first register to be sorted
S005    LASTX
S006    FP
S007    1000
S008    *
S009    STO Z           last register to be sorted
S010    CF 0            start of while (I < n) loop
S011    RCL Y           first register
S012    RCL I           current register
S013    x == y?         if(i==0)
S014    SF 0
S015    1
S016    -
S017    STO J
S018    RCL (I)         ar[i]
S019    RCL (J)         ar[i-1]
S020    x <= y?         if(ar[i-1] <= ar[i])
S021    SF 0
S022    FS? 0           if ( (i==0) || (ar[i-1] <= ar[i]) )
S023    GTO S030
S024    STO (I)         ar[i] = ar[i-1]
S025    RDN
S026    STO (J)         ar[i-1] = ar[i]
S027    1
S028    STO- I          i--;
S029    GTO S032
S030    1
S031    STO+ I          i++;
S032    RCL Z
S033    RCL I
S034    X <= Y?         while(i<n)
S035    GTO S010
S036    CF 0
S037    RTN

LN=118  CK=B393
```

A useful little program to load a bbb.eee range of memory registers with random numbers is as shown:

```
A001 LBL A
A002 STO I
A003 RANDOM
A004 STO(I)
A005 ISG I
A006 GTO A003
A007 RTN
```

Some timings:

```
21 registers, 10.030:  33 seconds
21 registers, 10.030:  37 seconds
101 registers, 10.110:  ~15 minutes
```

Clearly the advantage of this program is simplicity at the cost of run time, but given we are talking about a calculator without the ability to move software on/off electronically, simplicity becomes pretty important.

I may try a bubble sort, and if I get crazy, a heap sort.

Can the HP 38G do Binary, Hexadecimal, or Octal base

*Message #1 Posted by **kmaciej** on 13 Feb 2009, 5:37 p.m.*

Hello,

I was wondering if the HP 38G graphing calculator will do binary, hexadecimal, or Octal base conversions??

You may email me at kevinmaciej@usfamily.net

Thanks,

Kevin

Re: Can the HP 38G do Binary, Hexadecimal, or Octal base

*Message #2 Posted by **Marcus von Cube, Germany** on 13 Feb 2009, 6:31 p.m.,*
in response to message #1 by kmaciej

I couldn't find anything in the manual. So at least it's not officially supported. I haven't checked whether the 39G or 40G can do binary, octal or hex, but I doubt it.

Re: Can the HP 38G do Binary, Hexadecimal, or Octal base

*Message #3 Posted by **BruceH** on 17 Feb 2009, 7:28 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Nope, none of them have it built-in. There is a library lurking around Colin Croft's site somewhere for the 38 and (possibly) the later models that does it but it is a bit clunky.

HP-32s Engineering Applications Manual

*Message #1 Posted by **Hansel** on 13 Feb 2009, 2:03 p.m.*

Hi,

Does anyone know where I can get either the book or a downloadable copy of the book entitled "Engineering Applications" which was written for the HP-32s? ISBN 00032-90057 (or58?)

Thanks, Hansel

Re: HP-32s Engineering Applications Manual

*Message #2 Posted by **Jeff Kearns** on 13 Feb 2009, 3:04 p.m.,*
in response to message #1 by Hansel

Hansel - I have a copy of "Engineering Applications Step-by-Step Solutions for Your HP-32S Calculator", edition 1, dated June 1998 that I bought from HP in 1994 when I purchased my HP-32sii. The reorder number 00032-90057 is not an ISBN AFAIK.

I do not see this manual on the DVD nor have I seen it for sale elsewhere. If all else fails, maybe I can scan my copy for you (and for the museum at the same time). There are 108 pages plus front and back cover. It would go a bit faster if I did it at the office photocopier but it looks like it would take me a bit of time nonetheless. Let me know how you make out. Jeff Kearns

Re: HP-32s Engineering Applications Manual- Already planned for DVD V.7

*Message #3 Posted by **Allen** on 13 Feb 2009, 4:47 p.m.,*
in response to message #2 by Jeff Kearns

FYI, before you get too far. There is already a color copy included for the DVD Version 7 (not yet released).

Re: HP-32s Engineering Applications Manual

*Message #4 Posted by **Hansel** on 13 Feb 2009, 5:49 p.m.,*
in response to message #2 by Jeff Kearns

Thanks for your input. I guess from the email following your email, it looks like they will put this book on the next DVD. Do you have any other items of interested related to the 32s? It doesn't seem that the 32s is as popular as others. I have a 32s, a 41CV, and a 48GX, but I like the 32s the best because it is very handy for quick calculations and its small size. Since I am not in school anymore (BS and MS in Engineering) I don't have the need for the power found in the 41CV or the 48GX. I am keeping all of the HPs for my kids when they get into college and get away from the brainwashing of the school system with the TIs. One of my gripes about the 48GX is that it doesn't float the comma, like a 32s, 41CV and other HPs, unless someone has a download to fix this issue.

This reflects the perception of many members of this forum that our students would somehow be much better off if the schools were using HP RPN calculators rather than calculators from TI. As an educator, I would guess that maybe one-half of one percent "might" be better off. They would be the really bright kids who might embrace RPN as something different and they might gain some useful mathemtatical insights from using HP RPN calculators in school and at home. But for most kids, RPN would just be something else they would not understand at all in math class, and believe me there is plenty they don't understand today, and RPN would not fix that.

I agree that math instruction (actually all instruction) in the US is woefully inadequate, and I--like most teachers I know--try every day to make a positive difference in my students' lives. But RPN is not the answer. And TI calculators are actually pretty good.

in response to message #5 by Don Shepherd

Maybe I miss directed my disloyalty to TIs. Let me tell you my story of fate. When I was a junior in high school, in 1981, I had received a TI-59. It was a wonderful calculator, it even had a magnetic card reader for programs. Then one day during school, someone absconded with it. I never did recover the TI. Then a coworker of my dad showed me his HP-41. And I have been hooked on it ever since. RPN is not for the faint of heart. I would only recommend it to high school students with a high apptitude for math. Is is a godsend when you have many numbers in an equation to solve such as ((2x45)+(34+8))/(sqrt(65*898)*(45+999)). Try doing this once and only once with a TI and see if you don't mess up the stinking parenthesis! I race my fellow TI owners at work to do a similar problem and they just stair in awe when I am done and they are still trying to remember which parenthesis goes with which! For now, my kids will use the TIs that the school "recommends" for them to use. It is dispecable that they use any calculator at such an early age. And don't even get me start with the state of how mathematics is taught!

Hansel, I agree that some bright high school kids might find RPN worthwhile, and I would encourage that. Gosh knows they would appreciate a challenge!

I worked in the information technology field for 28 years, then decided to become a math teacher, thinking I would make a positive difference in my students' lives. When I got into the public school middle school classroom, however, reality hit me. While there are some bright spots, public school education is boring for the kids, stressful for the teachers, and a disappointment for almost everyone associated with it. It is a wonder that kids learn anything at all. And don't even get ME started on principals; I'm sure there are good ones out there, but unfortunately I worked under one who cared more about advancing her own career than the kids (or, by the way, my career). I am reminded of the Simon and Garfunkel lyric: "when I think

back to all the crap I learned in high school, it's a wonder I can think at all".

Unfortunately, there are no easy answers for making education better. I have just resigned myself to doing what I can do with my own little group of students (I currently volunteer teach in a very small private school with 11 students). The state curriculum guidelines in my state say that we have to teach middle school kids about box and whiskers plots, although I know from experience that they will never see these idiotic things in their life once they leave middle school. I wrote the education department in the state capital and some bureaucrat just said they think there is "some" value in them. Good grief.

OT: Paul Simon, Kodachrome, film photography, and "crap"

*Message #8 Posted by **Karl Schneider** on 14 Feb 2009, 2:50 a.m.,*

Hi, Don --

> Quote:
>
> Simon and Garfunkel lyric: "when I think back to all the crap I learned in high school, it's a wonder I can think at all".

Ah, but it was only a *Simon* lyric in the song "Kodachrome", which was part of his second solo album following the duo's breakup. At least one radio station bleeped out "crap" many years ago; today, anything goes... ;-)

Production of Kodachrome film by Eastman Kodak has all but ceased, largely a victim of digital photography. Apparently, only Kodachrome 64 (ISO 64 slide film) is still available.

Several years ago, I bought a handsome 1978 Olympus OM-2S 35-mm SLR camera from the same local used-electronics shop where I bought a few of my HP calc's -- mainly to own an example of fine vintage engineering. It even uses the same button cells as the Voyagers and Pioneers!

I soon took a few photos and had the prints developed. Film-developing services are getting scarcer, and I suspect that within a few short years, purchase, developing, and printing of film will be available only at specialized sites by mail or parcel service.

Digital photography is much more flexible, convenient, and less risky in so many ways, but I wonder how many people will fail to get their valuable and irreplaceable photos printed before losing the small SD card or thumb drive that carries them. Or copying them to a PC hard disk that later crashes. Or subsequently being unable to read an obsolete digital format or storage medium. Or...

And finally, back to Don's quote including "crap": This superb 2005 short comedy video from JibJab sprinkles the word liberally as a term for low-quality unessential goods. You-know-who is skewered for its role in the decay of the American economy. The critique is spot-on.

As Paul Simon sings, I also got a Nikon camera. To tell the truth, I own several pro-sumer and high end analog as well as digital Nikons. And I use both systems. And both systems have their advantages and both systems can fail me: the digital files could become unreadable in the near future and the analog slides can burn or get lost. The latter of those two is one reason why I love digital: it's so much easier to copy and to store at different locations, hundreds of miles apart.

Alas...

I still have some in my freezer, but will the processing still be available when I shoot it?

I also have some 35mm Technical Pan in my freezer, but I can develop that myself.

Nikon itself has quit manufacturing nearly all film cameras...

Karl; I too bought an OM2 in 78. What a great piece of equipment, light reliable and intuitive. The chosen camera for astronomers. With it's Vivitar rubber normal lens, mine's been down the Grand Canyon, to nearly 7000 meters in the Andes, and lots of points in between. I used to burn Kodachrome 25, and yes; it's gone. "They" say that today's 64 is equal to what 25 used to be in terms of grain. OK. The only bad thing is that last time i went to get some they wouldn't sell just two rolls. I had to buy a whole stick but it was worth it. Like they said on WKRP: "They're solid plastic, so don't settle for imitations". -db

Well, that may have been true during the early years, but now with textbook display (available on HP RPL machines as well), there are no problems with "messing up" parentheses. Even with some non-RPL models (e.g. 17b, 27s), you at least see all open parentheses.

I remember my college roommates, who at the time were EE students, with their Casios with the full screen to show all of the parts of the equations including the paranthese. They were still punching in the numbers and paranthese while I had my answer and went on to solve the next problem.

Limitations of RPN (was: HP-32s Engineering Applications Manual)

*Message #14 Posted by **Thomas Klemm** on 16 Feb 2009, 12:51 p.m.,*
in response to message #6 by Hansel

The limitation of RPN is of course the restriction to 4 registers in the stack. This made me think about the simplest algebraic expression that can't be calculated with a typical HP-calculator:

```
((1 + 2)*(3 + 4) + (5 + 6)*(7 + 8))*((9 + 10)*(11 + 12) + (13 + 14)*(15 + 16))
= 236964
```

There might be different ways to do that in RPN but it will be something like:

```
1 2 + 3 4 + * 5 6 + 7 8 + * + 9 10 + 11 12 + * 13 14 + 15 16 + * + *
```

Whichever solution you might choose you will always run into a stack-overflow and what's worse you probably won't even notice. In the example above you will end up with: 556738.

Neither TI-57 nor TI-59 have problems with the expression above. Agreed, they have other limitations concerning the maximal number of open parenthesis.

Of course there are ways to circumvent the limitation using LASTx or other registers. But that's rather cumbersome.

Actually I never ran into this limitation myself but on the other hand this expression isn't that complicated neither. Compared to your example I'd even say it's not that far away.

Tools have their limitations. Best is to know them.

PS: Can anybody think of an even simpler expression that can't be calculated using RPN?

in response to message #14 by Thomas Klemm

You bring up a very important point regarding most HP RPN calculators, which have a fixed 4-level stack. However, several HP models do not have this limitation, notably the HP-28C, HP-28S, HP-48S and HP-48SX, which have a stack limited only by free memory. I don't own any of the more recent HP calculators, such as the HP-50g, so I don't know if they also have unlimited stacks. I use these calculators when performing long chained calculations with many levels of pending operations.

The 50G is based on the same 48G paradigm. Essentially any user program written for the 48 will run on the 50 but it needs to be recompiled from the high-level user RPL language.

Yes, you can run out, if you aren't paying attention. RPN is not a "fire and forget" system. It was devised in the early 1970s and when it became clear that memory was cheap enough, and demand for more capability present, the 28 series was invented. That some of us choose to use the simple tool from the early 70s and know how to use it--paying attention to stack depth--really isn't that big a surprise. Many more people continue to use "4-bangers" with a ludicrous form of chain logic--which is also the product of memory-limitations and ease of machine programming from the 70s....

Of course you already know all of that :-)

*Message #18 Posted by **Gene Wright** on 16 Feb 2009, 3:44 p.m.,*
in response to message #17 by bill platt

Yes, you can run out even if you ARE paying attention.

In circumstances like this, you'd have to store off an intermediate result to a register.

That said, it does not necessarily follow that a semi-infinite stack is the solution.

I remember articles from the PPC Journal proposing a 5-level stack. Would have been interesting.

Hi, Thomas --

Well, no, the 4-level fixed stack is not a chracteristic or RPN *per se*, but rather an effective compromise of what is useful, necessary, and practical. Three levels is inadequate (which, alas, did not stop National Semiconductor in the 1970's), but most people have difficulty keeping track of more than four values in the stack.

I've advocated a settable value for fixed RPN stack depth, with mimimum = default = 4; and maximum = 9 or 19, set respectively by a command on the HP-35s such as "STKD 9" or "STKD .9". (An HP-43s might require "STKD 09" to support indirection.)

> Quote:
>
> ```
> ((1 + 2)*(3 + 4) + (5 + 6)*(7 + 8))*((9 + 10)*(11 + 12) + (13 +
> 14)*(15 + 16)) = 236964
> ```
>
> Neither TI-57 nor TI-59 have problems with the expression above.

Sure, as long as all the required parentheses are properly placed in the expression, and meticulously entered during calculation.

> Quote:
>
> Of course there are ways to circumvent the limitation using LASTx or other registers. But that's rather cumbersome.
>

> ```

If the blank spaces between numbers indicate use of the "SPACE/SPC" command, that's RPL, which handles this problem just fine.

> Quote:
>
> There might be different ways to do that in RPN but it will be something like

an expression that is not too cumbersome:

```
1 ENTER 2 + 3 ENTER 4 + * 5 ENTER 6 + 7 ENTER 8 + * +
STO 0
9 ENTER 10 + 11 ENTER 12 + * 13 ENTER 14 + 15 ENTER 16 + * +
RCL* 0 (or RCL 0 *)
```

> Quote:
>
> PS: Can anybody think of an even simpler expression that can't be calculated using RPN?

If the "gotcha" does not entail limited stack depth, I'm not sure what it would be. Entering inputs when usable and reversing with x< >y, instead of left-to-right, helps to avoid the problem.

So did I in my draft of a 43S in 2007: fixed settable stack depth, 4 through 12 levels. Today I'd reduce it to the choice of 4, 6, and 8 levels. This shall be sufficient for all reasonable equations in real life ;) while 4 levels are a bit tight some times.

Re: Limitations of RPN (was: HP-32s Engineering Applications Manual)

*Message #21 Posted by **bill platt** on 16 Feb 2009, 6:15 p.m.,*
in response to message #20 by Walter B

I like the idea of RPL with RPN subset. Actually, 4 level, 8 level, and RPL would be everything. The value of a replicating "t" register would be available with 4 and 8 level stack; the infinite RPL will handle anything.

The interesting thing is that there are perfectly good ways to use RPL to take care of *everything* regular RPN guys like, but we find ourselves always reaching for our o9ld favorites. At least that's what I do.

It seems to me that a compact RPL machine, with a built-in RPN mode emulator would do everything. The likelihood of such a model is very remote as it would directly steal from the large graphing machines. Perhaps what really needs to be done is to start making the RPL graphing machines smaller. The cumbersome size is the only real downside. That's the only reason I really see to have a 32sii around any more...that and my familiarity and nostalgia...

I've used the 41cx emulator on the 48GXquite a lot. What I think wold be even better going forward would be a "native" sort of RPN emulator or shell for the 50G. Call it "quick-calc" or something...

Actually, not all National Semiconductor (aka Novus) calculators had a 3-level stack, such as the model 4510 Mathematician and 4615 programmable. The model 4640 featured a 4-level stack with x<>y exchange and stack roll down and was a virtual clone of the HP-45 in terms of features. It even attempted to mimic the appearance of the Hp's with a black pebble grain case with silver trim. Unfortunately, the simililarity ended there, as the keys were tiny with no feel and the internal NiCad batteries were not

replaceable.

In other words, to get the correct answer, you have to enter the problem correctly.

Is RPN any different in this regard?

I just entered this expression into my 22s and got the answer above on one try. Why shouldn't I?

Gene, Karl, Michael;
There was one 5 level stack RPN scientific, marketed by Heathkit. It was very well designed and used the best parts available in America that were not already getting bolted onto an HP. The only improvement i can see would have been to paint or mold the functions onto the keytops, but that would have surly broken the bank for this specialized and limited production run.
This has links to Katie Wasserman's and Joerg Woerner's pages on it. - db

*Message #25 Posted by **Thomas Klemm** on 16 Feb 2009, 9:39 p.m.,*
in response to message #19 by Karl Schneider

Hi Karl

> Quote:
>
> If the blank spaces between numbers indicate use of the "SPACE/SPC" command, that's RPL, which handles this problem just fine.

You might also think of an HP-41 program without line numbers. Actually I used the unix command *bc*:

```
echo "((1 + 2)*(3 + 4) + (5 + 6)*(7 + 8))*((9 + 10)*(11 + 12) + (13 +
14)*(15 + 16))" | bc -c

 1 2+ 3 4+* 5 6+ 7 8+*+ 9 10+ 11 12+* 13 14+ 15 16+*+*ps.
```

But you're right you could as well use ->*RPN* from the HP-48 examples to get the same result.

> Quote:
>
> an expression that is not too cumbersome:
>
> ```
> 1 ENTER 2 + 3 ENTER 4 + * 5 ENTER 6 + 7 ENTER 8 + * +
> STO 0
> 9 ENTER 10 + 11 ENTER 12 + * 13 ENTER 14 + 15 ENTER 16 + * +
> RCL* 0 (or RCL 0 *)
> ```

So how do we know at that point that we need to keep an intermediate result for later? That's all but trivial because you have to parse the whole tree in your mind. Just assume that one of the terms is shorter, say instead of (5 + 6) we have just 5. In this case you don't need an additional register but you could rearrange the calculation so that this term is the last one. But then you have to start calculating the right expression first.

What I meant with cumbersome is the following:
Let's assume I'm not so clever as to keep the intermediate result in register 0 until the last addition when all of a sudden I realize: Now I can't enter 16 or I'll loose register T. So what will I most probably do?

```
R^
STO 0
RDN
```

And later I can use register 0 as you suggested. But what's happening when the expression gets bigger and bigger using 32, 64, 128, ... numbers? Either you use different registers for each intermediate result at the risk of running out of registers or you try to use them cleverly as a stack. But then you have two stacks to synchronize. And that's definitely the moment where I'd quit and use a different tool without this limitation.

Personally I prefer a 4-level stack calculator to any other. I wouldn't need 5, 8 or more levels. I'd be completely lost with them since I can't remember more than three things at a time. I'd be scrolling up and down the stack all the time to find my intermediate results again.

Kind regards
Thomas

FYI, you don't need to remember all level contents. Nobody operating an RPL model is able to remember the infinite stack ;) You just push the intermediate results on it and know they will pop out when you need them.

The advantage of a finite stack - top level repetition - will remain for e.g. 8 levels, too. To ease calculations with constants, a FILL command shall copy x to all stack levels at once.

Viele Grüße,

Walter

A similar problem was proposed in this Forum back in 2006 where the only difference was that a divide was used in the middle instead of a multiply. You can read about it in my 3 November 2006 thread titled "It Can Be Done" I have reproduced the essentials of my solution below:

> Quote:
>
> Cuppo wrote:

>
> and see 1.71428 ... = 108/63 in the display.

So I suggest that you try something similar on your slightly different problem. If you really can't get there after trying then let me know and I will give it a go. I admit that it took me a couple of hours and several false starts before I got the solution. So, a user really shouldn't try to do this instead of using a memory location for intermediate results. But it was an interesting programming challenge.

This whole issue of whether AOS or RPN is better has been an ongoing issue with the AOS people contending that RPN is limited and difficult and the RPN people contending that they just can't handle parentheses. On page 39 of his book *A Guide to HP Handheld Calculators and Computers - Fifth Edition* Wlodek wrote

> Quote:
>
> Many users - and not only those brought up on Friden calculators - prefer RPN. Others find it a total mystery - or at least profess to do so. I do not really believe it - ...

I am hoping to convince Wlodek to include a corollary in the next edition which would read something like this

> Quote:
>
> Many RPN afficianados profess that they simply can't cope with the parentheses inherent in AOS. I do not really believe that either.

in response to message #27 by Palmer O. Hanson, Jr.

I am a total RPN afficionado, however, calculators for me as an engineer are practical tools, not toys. I want them to provide the simplest methodolology for providing fast and reliable results. As such, when confronted with a problen such as discussed above, the simplest methodology for me is to perform the operations from left to right, rather than

moving around the expression and playing with stack operations or changing division into multiplication. It is here than I run into problems with the fixed 4-level stack, and revert to my HP-48SX, which has an unlimited stack.

Re: Limitations of RPN (was: HP-32s Engineering Applications Manual)

*Message #29 Posted by **Thomas Klemm** on 19 Feb 2009, 6:03 p.m.,*
in response to message #27 by Palmer O. Hanson, Jr.

Hi Palmer
Very clever the trick to use distributive law. But then you can always use a function like *SQRT* or *LN* which is not distributive:

```
SQRT(LN(1 + 2)*SQRT(3 + 4) + LN(5 + 6)*SQRT(7 + 8))*SQRT(LN(9 +
10)*SQRT(11 + 12) + LN(13 + 14)*SQRT(15 + 16))
```

Actually I'm happy the expression has to be more complicated. I'm still wondering what the limitations of a 4-level stack are.

It seems there are other people disliking parentheses as well:

> I'm still wondering what the limitations of a 4-level stack are.

I'm not sure that I really care. I struggled writing RPN programs until I took the time to understand the stack. If I suspect that I may run into a problem then I take the time to carry forward a stack diagram.

> Quote:
>
> It seems there are other people disliking parentheses as well:

I suspect that most of the engineers who say that they just can't keep track of parentheses really could if they tried.

The problem that you proposed is one of those that has been around for some time and was generated by someone who wasn't really conversant with what can be done with RPN. The RPN folks have devised their own test problems which they say can't be solved with AOS -- the Mach Number problem is a classic case. But any self-respecting AOS guy can handle it with ease, and there is the Wozniak comment to consider.

I am a little bemused by all the back and forth talk about difficulty in programming because whether in RPN or AOS it is all so easy relative to the "good old days" (actuallly, not so good) with airborne computers where, for example, it took about ten word times to complete a multiply and the programmer needed to be doing other calculations in the interim, but be ready to read the result of the multiply when it was done. In those days programming was as much an art as a science.

*Message #31 Posted by **bill platt** on 20 Feb 2009, 9:03 a.m.,*
in response to message #30 by Palmer O. Hanson, Jr.

All of it is "trivial" in the world of physics...just different logical systems with advantages and disadvantages.

In ad-hoc manual solutions, you need to keep track of the stack in your head. This is a skill that an RPN user should develop. It prevents t-register drop-off. Yes, it is a potential weakness and as we have seen,the infinite stack eliminates the problem for manual problems.

In programming, the problem can get more complicated, depending on how the program works. If there is dynamic memory and stack use, you can end up with unanticipated t-register drop. But in AOS you can also have unanticipated things happen.

The real advantage of various improvements to AOS or EOS etc is that the user doesn't need to change his thinking as much. But the RPN defender will point out that most of us speak of taking the sin, taking the log (rather than log[x] or sin[x] we really think x sin), and of the pencil and paper write a number, write another, act on it...so I am afraid the argument will be perpetual. Gives us all something to do :-)

Stack? What stack? You guys actually worry about what is in the stack? I have used an HP calculator for 8 years of college (BS and MS) and never once worried about what was in the stack. That is the simplicity of the RPN system!

in response to message #32 by Hansel

You must never have to do anything particularly long or any calculations that have deep parenthesis then...it is really a matter of what sort of calculations you end up doing.

If oyu use your 48 most of the time, then of course you don't worry.

These days I usually go to the computer for long things anyway...

> 16))
> ```

It turns out that this problem is a very simple extension of the previous problem if the user only remembers that SQRT(A)*SQRT(B) = SQRT(A*B). Then the user doesn't do the SQRT before LN(1+2) or the SQRT before LN(9+10) as in the expression but rather does a single SQRT at the end.

The answer for the expression is 19.8983982... . I checked that by doing the problem as written in BASIC. I did run into a problem when trying to use the BASIC in the CC-40 or TI-74 because of the length of the expression. So I had to store some intermediate results to get the answer. The BASIC in my Radio Shack Model 100 handled the expression without difficulty.

I suspect that the problem would become significantly more difficult to solve if the first SQRT was changed to a LN. I wouldn't say that is couldn't be solved without storing an intermediate result since I hadn't needed to use LAST X in the solutions for the previous problems. What do you think?

Palmer

That's exactly what I had in mind. Close, but no cigar.

> Quote:
>
> What do you think?

Obviously not enough before posting.

I'll try one last time:

```
sqrt(sqrt(sqrt(1 + 2) + sqrt(3 + 4)) + sqrt(sqrt(5 + 6) + sqrt(7 +
8))) + sqrt(sqrt(sqrt(9 + 10) + sqrt(11 + 12)) + sqrt(sqrt(13 +
14)  + sqrt(15 + 16)))
```

The same expression in postfix-notation (v ~ sqrt):

```
 1 2+v 3 4+v+v 5 6+v 7 8+v+v+v 9 10+v 11 12+v+v 13 14+v 15
16+v+v+v+
```

And here's the result:

```
4.696150115171
```

I doubt that *LASTx* might be useful here. But most probably you teach me something different ...

Thomas

The RPN solution is much easier than in my earlier response

> Whichever solution you might choose you will always run into a stack-overflow and what's worse you probably won't even notice. In the example above you will end up with: 556738.
>
> ---

I responded with a solution that does not run into stack overflow which was based on an earlier solution that I had developed for a similar problem back in 2006. That solution involves the use of three Roll Down commands and two x<>y commands. While it will yield a correct answer it is admittedly a cumbersome way to do the problem. It turns out that there is a much more straightforward way to do the problem which only requires the use of plus and multiply commands. All you need to do is multiply the left hand half of the expression by the right hand half of the expression which yields a modified form of the expression which looks like this

```
(1+2)*(3+4)*(9+10)*(11+12)+ ...      ... +(5+6)*(7+8)*(13+14)*(15*16)
```

and solve in the standard RPN manner. With just a small amount of attention you do not actually have to write out the modified expression but just enter the elements directly from you original expression.

Before you do that, and we have to invoke the DMCA and have you carted off to Gitmo[1], why don't you ask Wlodek's permission first? He often posts to MoHPC.

And to the earlier poster who wanted a scan - why don't you first ask Wlodek if he has any left for sale?

[1] This is probably not true - the penalties for breaching the DCMA are far more severe than trying to overthrow the US. ;-)

Average Age in hpmuseum forum

*Message #1 Posted by **Nacho** on 13 Feb 2009, 1:57 p.m.*

Hi everyone,

I would like to know more or less the average age of this forum, it's just about curiosity and the profile of HP calcfans.

It's strange because as many here I like very much technology progression and evolution in every aspect but with HP calcs I have the opposite reaction...

I started with a 48GX 9 years ago (I'm 26) and now I'm more interested in older calcs than newer...

This is happening also with HP LX and with PSION...

Just feel that now everything is more standarized and less engineered it's just a feeling, probably I'm getting older than what my age shows...

HP should release 15C and 42S thanks Raymond.

I am 45 years old

I had my first experience with an HP35 that my brother-in-law bought for my sister to use in her college classes in 1974. I bought my first HP, a 41CX, in 1983 while in college. I have owned various HP over the years, 41CX, 15C, 42S, 20S, 28S, 48SX, 48GX, 33S & 35S. The ones I return to the most for quick calculations and programing are the 41CX and the 42S. About all I use the 48GX for these days is to do unit conversions.

40. My first HP was purchased for me by my high school for competition. Then, just after joining the military, one of my first paychecks (actually, it as about 40% of a paycheck) went to buying my very own 11C. It suffered a tragic laundry accident, and has been replaced with another 11C, 49g+, 50g, and most recently, a 35s.

in response to message #8 by dbatiz

I am 40. Bought the 28s in 1989 and am still amazed at what it can do. Encouraged (enabled?) me to buy the 49g (eek), the 49g+ (better), the 50g (quite nice IMO). Then came the 12c, the 33s and finally the 35s, which is my "go-to" calc for quick conversions and equation solving. (The 35s has received mixed reviews

on this forum but I like it a lot.) But which do I take to a desert island? The 28s.

Re: Average Age in hpmuseum forum

*Message #10 Posted by **David Hayden** on 13 Feb 2009, 5:18 p.m.,*
in response to message #1 by Nacho

I'm 45. Bought a 29C my freshman or sophomore year in high school, then a 41C around 1980 and a 41CV a couple years later. Loaned the 29C to a girlfriend around 1986 and haven't seen it since. The 41CV is in my desk drawer and was my primary calculator until about a year ago when I had to buy a TI 83 plus for my daughter and I wondered what HP had done with calculators in the past 25 years. Bought a 50g and I've been goofing off learning about it, UserRPL, systemRPL, Saturn architecture, HPGCC etc. Just bought a 48gii for a paying gig.

The market for calculators has shrunk a lot and the price people are willing to pay is tiny, at least compared to what we paid 20 years ago. So the engineering suffers proportionately.

41. And, since this is the year of the 41 (30th anniversary), I have decided to do most of my programming for the 41.

I started with the 15C in 1985 (still use it), then progressed to the 48GX (retired for a 50g, my 48GX was gift from father and I did not want to lose it on my travels).

I started to collect in 2006 when I discovered that the only way to get a good 'new' calc was to get a good 'used' calc.

I am most fascinated with models with I/O (41, 71, 48, 50). But if I had to rebuild civilization, it'd be the indestructible 15C with it's 20 year battery life. IMHO, a calc with bidirectional I/O and alphanumerics is a computer. The 15C is all calculator.

I am but a wee babe. I'll be 36 this year, meaning that I'm (embarrassingly) younger than the HP-35.

My first HP was a 48sx. I badgered my parents into buying it for me in high school, when a $250 calculator was a huge investment.

I used it until 2003, when I bought a 50G. A few weeks after that, I found a 48gx at a swap meet, and got suckered into the world of collecting HPs that I'd wanted as a kid, but could never afford.

I'm 64, retired civil/structural designer/drafter. In 1972 a student employe brought in an HP 35 which was instant hit with the engineers and surveyors. My fist calc came shortly after thru a promotion by Chevron, a 4 function plus percent key. Our computer guy wrote some routines to do square roots and something else I forget what. My first hp was a 25c bought on clearance in Cheyenne, wy 1978. My needs and pay didn't warrant HP so I spent most of my working years with other calcs. 1995 I came to Phoenix and employer bought me a 32sii which is more than I need but it gota lot use doing trig and conversions.

I got into this in my early 20's. I would have gotten into it in my teens if I could have afforded it. Get kids interested in engineering again instead of video games and tagging, and they'll become customers.

I never went for "cool," and I didn't care what others had or wanted. If I could afford anything I wanted back then and the graphing "supercalculators" had been available at the time, I still would have chosen the 41 and/or 71 for HPIL's ability to control equipment on the workbench and take data.

*Message #35 Posted by **Vladan Dugaric** on 14 Feb 2009, 6:39 a.m.,*
in response to message #1 by Nacho

My age is 43.

My first contact with a calculator was in 1975 when my father got an HP-35. In 1977 he got an HP-21. I was

using only RPN from 1975 to 1980.

In 1982 I got Casio FX-602P and FX-702P, then in 1986 I finally got an HP-71B with Forth ROM and Math ROM and a card reader. Later still, in 1991, I got an HP-48SX, then in 2007 an HP-50g and an HP-48GX, and finally in 2008 an HP-41CX (I wanted to have an HP-41CV since 1982 but could not afford it then) and an HP-12C.

I also use emulators on a PC, Windows Mobile phones and iPod Touch: nonpareil, Emu48, Emu71, V41, Free42.

Vladan, it appears that you were even more spoiled with gadgets than I remember. I couldn't afford more than a humble Sharp while you were flashing the 71B at the university. But all of these? Were you luckier wirh your financiers?
Or is it a generation gap? I am 41 (41CV, Calculator Veteran), starting with a Privileg of some sort, a 4-banger, no RPN, but as early as in 1974. To this day, I still have the same feeling about red LED displays. First programmable, TI 53 in 1982. First pocket computer, Sharp 1211 in 1984. First HP, HP 32E which my wife inherited from her sister. I neglected it and it died when its NiCd pack leaked. D'oh. (I let a red LED HP die. I thought it would be like my Sharps, indestructible. What was I thinking?!) HP for life, 12C. It is just so right. I wish I discovered how good and useful it was much much earlier than in this century.

Hello!

I'm 46 - haven't kept track of the average so far, but intuitively I would say that I'm pretty close. Incidentally, this is also the average age of motorcyle drivers in my country - whatever this may tell us.

My first (own) HP calculator was a '97 that they wanted to throw away at the office arond 1990 and which more or less started me collecting these things. When I really would have needed them, they were much too expensive, so I had to rely on products of the competition to help me through my degrees.

Greetings, Max

NB: I got my latest HP calculator just yesterday, an "HP OfficeCalc 200". But I'm afraid this is just another mass produced Chinese throw-away-article and HP really should not need to stick it's logo on such things.

Statistical Analysis

*Message #41 Posted by **Michael de Estrada** on 14 Feb 2009, 10:52 a.m.,*
in response to message #1 by Nacho

So far the number of age data values is 35 with the following results (rounded to the closest integer value):

Average age = 47

Standard deviation (s) = 10

Minimum age = 26

Maximum age = 70

Over half the respondents (18 of 35) were between 40 and 49.

I'll leave it to the philosophers and socialogists among you to determine the significance of these results. Personally, I find the varied professions more interesting than the age data.

I am 47.

I bought a 41CV as a freshman in college with financial aid money, added the card reader and printer to it, and later upgraded it to a 41CX. I had a few other ROM's and accessories for it, including the synthetic programming books/rom.

I bought a 15C soon after leaving college and joining the nuclear navy, since alpha-numeric-capable devices were not allowed in the classrooms (security reasons - makes me wonder what they do now, given the capabilities everyone has on phones, PDA's, etc).

...and those 2 calculators (41CX and 15C) have served me well for over 2 decades, until the "1" key on the 41CX began misbehaving several years ago. I finally added a 35s, and am having fun playing with it (see my review/rant about it elsewhere in this forum).

I'm still in the nuke industry.

43 - for another three months...

I am a mechanical engineer and part-time LeanSigma practitioner. I acquired my first HP in university in 1986 - a slightly used HP-15C. I have since added a dozen or so different models to my collection, not including a spare 15C that I got at a yard sale for $5. It is still my favourite 'pure' calculator (non I/O capable), but the

32sii is a close second. Rating these machines in terms of preference is a challenge. I have become sentimental about them (how embarrassing) and would have a hard time parting with any of them, as I am sure others on this forum can relate.

Do any of you rotate your calculators? I find myself bringing different models with me from time to time (e.g. 41C with Advantage Module, 42S) and I like the retro units like the 32E for number crunching and basic stats. The RPL models are kinda bulky so I leave them at home.

What would your HP-35 have cost you in 1973 dollars? I bought mine in June 1973 in the USA for $295, just after HP brought out the HP-45 and lowered the price of the HP-35 from $395. Even at "only" $295, this represented nearly two weeks take-home (after income tax) salary for me. It must have been an astronomical cost for you!

I'm 55. I've been the composer/lyricist for a childrens' theatre company, a classical music radio announcer, a freelance writer on the arts, a technician in a chemical lab, a technical writer, and a network admin and IT support person.

Got my first calculator in 1976, a cheap, simple four-function. This was quickly replaced by a Novus Mathematician (a scientific RPN calculator). That led to an HP-25 in 1977. I learned a lot of math and programming playing with that HP-25. All through high school I thought I was lousy at math. Having the calculator showed me that I was reasonably good at math, I was just lousy at doing arithmetic on long strings of digits, especially in my head.

I got an HP-11C in about 1987. It's been my everyday calculator ever since. I'm currently lusting after an HP32S or HP32Sii for its nicely-spaced keys. Or maybe one of the current scientific models. Stay tuned.

in response to message #57 by Bob Patton

I'm a retired EE age 80.when I got a 35 I learned to squeeze the maximum out of it's limited resources. I was doing a lot of resistive dividers and developed a shortcut to get the divider fraction and Thevenin equivalent using RPN solutions, archived here at MOHPC. I immediately rewrote the RC frequency corner as 2(Pi)FRC=1, multiply the knowns and invert to get the unknown. LC frequency became {2(Pi)F}^2LC=1. can't stand algebraic as I seldom want a single answer. Run 2(Pi)F up the stack and you can simply multiply twice and invert to find resonant elements. I turned on a couple of 50g today and found I had to replace both the AAA and coin cells which exhausted my coin cell supply. Since I gift 33S calculators to young students I found 20 coin cells at auction for 4$05 inc. shipping. I want to support RPN addiction, plus it is a big preference and work horse for me. E. Age 60, practicing civil engineer (own a small design firm). Started in the slide rule/pencil & paper era. Left the engineering profession soon after I started, just about the time electronic calculators first came out (1971). Returned to it just when they were really getting useful (1977). First purchase was a TI59. Loved it and used it until (you guessed it) the keyboard malfunctioned; bought a TI36 solar, which lasted only about three years. By then I was getting tired of TI quality (or rather lack thereof). So I went looking and was pleasantly surprised that HP was making algebraic models. Bought a 20s (1993), which I still have. Eventually obtained 38g, 48sx, 22s, 27s, and 32sii. Tried 35s and 12cp 25a, found both wanting.

I celebrated my 80th birthday on February 1.

Two days ago I received a letter from the AIAA (technical society for aerospace engineers) telling me:

> Quote:
>
> As an Emeritus Lifetime Member you are now part of an elite category of members who no longer have to pay any dues to AIAA.

Now I really feel old!

In the late 1970's I was doing statistics on a shared computer at Honeywell. My supervisor had obtained an HP-45 and suggested that I try it. When I found that it couldn't store the entries for later recall I told the supervisor that I had no use for it.

The first handheld which could do the statistics and matrix work that I needed was the TI-59.

The first HP that I purchased was an HP-11. I got one of the early ones which has the bug.

I have 42 HPs in my collection.

I'm 41.

My first exposure to an HP RPN calculator was in the early 90's in statistics class while earning my Civil Engineering degree. My TI ran out of batteries during a test and the professor provided me with his 11c or 15c. I can't remember which one but I definitely remember the form factor. I fumbled with it and was completely lost. Couldn't even add or subtract with the thing.

In the late 90's while doing survey crew work - all surveyors and engineers at my work had HP 41's - I finally realized the beauty of RPN and HP. We had some spare 32SII's and some 48G's and I got work learning how to program them both. I have had a blast with them ever since. And for the past 6 or 7 years I have immensely enjoyed reading the posts and participating in the mini-challenges posted on this site. Thanks to all of you.

Cheers, Brent

Adding my .02

I'm 44. I have to admit I did use my parent's friend's TI datamath2500II while in junior high ('77-'78) but then discovered that my father had an HP35. I've been hooked on RPN ever since. It just seemed to... work... with my brain. It was how I think...

Got my father's (yes, he continued to upgrade) 41C for use in high school when he purchased a 41CX. Still remember my math teacher looking at the 41C during a test (took it out of the case) and looking at me like... WTF??? Then inserting it back into the case with that OMG! look on his face. Priceless!

I did purchase an HP 28S during college and an HP 32SII after that.

I collect them now, just to reminisce. And, yes, I still use them on a daily basis. I change-up every few days, just for fun. I love these devices!

70, Started with Sharp 5813 [30 steps in prgrm mode]in the 80's for lens calculations in my practice,then got Casio FX 602P for astronomy hobby-great features but small keys and hard to program. One day I saw a nice looking calculator in a display case,[11C] clerk told me " forget it" it uses reverse polish notation!-I thought he was joking. REVERSE POLISH NOTATION-what the h..l is that! When I tried it out , the keys felt positive and the display was nice so I bought it not noticing lack of an equal key. After reading the manual and doing some simple math problems, I was hooked! Later got 41cx ,32ii and my favorite-42s and 35s.

41.

My first prgrammable calculator was the amazing Casio fx-180p. Started my HP addiction with a 20S in 1991 and soon upgraded to a 32SII. Both calculators are still alive, but not used anymore. Recently, I gave up on physics and started a career in technical writing. For that, my 18C/19B calculators are way better suited ;-).

Hi,

My present age is 65. I started in Surveying using a curta calculator and trig tables. The HP 35 was just revolutionary at the time. I was hooked. Since then I have had the following calcs.

HP25, HP25c, HP41, HP42, HP48 and currently a HP 50. I have always written my own programs and still continue to write them.

I am still active in Surveying.

Mr Sprott can you contact me please

40. Purchased a 15C at high school (Christmas 1983) at age 15. Started at university in 1989 and did *not* purchase either the 42S nor the 28S - the first had to little memory, the 28 a too clumsu configuration (had used the 28C a friend of mine borrowed to me during his mil. service for a year). Instead I thought that "there is better to come..." - and there was. Bought the 48 SX in the summer of 1990 after 1 year at University. Later bought the Mac cable and also later a PC cable. One of these cables cost about a fourth of the price of the 48 SX.

Then after having completed my studies I have aquired some other models (in no particular order), such as a second 15C, 12C, 12C platina, 19Bii, 17Bii+, 71B, 41CX, 97C, 11C, 48GX, 48G+ with 2.3 MB RAM extension, 25, 25C and finally a HP-50G that is the best of them all in my opinion. Why? Because it bears the heritage from the 41->48->49Gxy->50 and does that with a fast processor. Second best is the HP-15C it fits in a pocket and runs many a click per set of batteries.

I'm 56.438065482395 years old.

My first scientific calculator was a TI-30 when I started college back in 1977. A year later I upgraded to a TI-58. In late 1980, I agonized over whether to get a TI-59 or an HP 41C. The TI-59 would have been cheaper, more powerful out-of-the-box (I'd have to get the 41's Math and Stat ROMs and card reader to have the same functionality), would be easy to adopt to after the 58, and didn't require me to learn how to use that silly RPN. But the 41C had more growth potential, and the alphanumeric capability made the difference. I bought the 41C, figured out RPN in 15 minutes, and it's been HPs ever since.

I no longer have the 41C; it got a fatal zap in the mid-80s.

Since then: 15C, 28C, 28S, 42S, 20S, 48SX, 48GX ...(14 year lull)... 35s and 50g. All of these are still working.

*Message #88 Posted by **Karl Schneider** on 15 Feb 2009, 6:38 p.m.,*
in response to message #1 by Nacho

Well, in the interest of disclosure, I ought to chime in...

45 -- bought my HP-15C new in 1983 after having coveted the HP-41 and HP-34C, but not being able to afford them.

I started collecting in 2002 after seeing and buying the "foregone" HP-34C and and HP-41CV in a local used-electronics store. My collection now includes at least one of each model in three series -- HP-41, Voyager, and Pioneer. My collection represents RPL with the HP-28C, HP-48G, and HP-49G. I also have the HP-71B.

For those who are compiling statistics of this data on an RPN-based HP calc, I'd recommend *not* the HP-21S Stat/Math, which utilizes the summation method for calculation of mean and standard deviation. Instead, I'd use the HP-17B/BII or HP-27S. These models save all input data for sorting, and the calculation of median, minimum, maximum, and range. I believe that all the RPL-based models will do the same.

So far --

```
responses: 85   (includes Eric Smith's, which is not as obscure as it might seem...)  ;-)

median:    46
minimum:   22
maximum:   82
mean:      48.0 (closer to 48.5, if reported ages were not rounded down)
std dev:   11.9 (sample)
```

I'll post final results and a makeshift histogram when the responses stop coming in...

The average ages are about what I expected, based on previous instances of this topic. The era in which scientific calculators debuted, and later became capable and affordable, coincides with the late youth and young adulthood of the majority of us.

I was introduced to RPN on my brother's 25 back in the late 70's, but my first calculator was the 32C, purchased new in 1981. Since then I've been an HP-only fan, most recently keeping my classic 11C and 32S running at my deskside. Things have brightened up, though. The classic calculators have been lovingly retired and I now have a 35S and a 50g deskside and the amazing i41CX loaded on my iPhone

Oh, and I'm 52 and I've worked in the mapping, charting, survey and geodesy field most of my career.

in response to message #89 by brianh

I'm 52, born June 23, 1956.

I got my first HP, a 41CV, rather late (1988). I used a TI-58 in college.

I learned to use a slide rule for high school chemistry and physics (1973-4).

Currently, I'm licensed as both a land surveyor and civil engineer in California. I use a 41CX with a survey pac almost daily at work.

I've collected a large amount of HP 41 items from the auction site over the past 8+ years.

I've enjoyed reading the responses on this thread.

Thanks, Mark A. Taylor

Just turned 46.

Software developer, pilot.

Although I remember playing with an HP-35 briefly, my first real exposure to HP calculators (my father's) was the HP-65, and eventually the HP-97. The first HP calculator of my own was the HP-16C, acquired shortly after I started with Boeing as a software developer. Still have that these.

Wrote emulators for the HP-67 and HP-97 - which I use at least a few times a week. For example, calculating Eric Smith's age in Earth years - based on his given age in cesium beats... Eric, wow..

Loving the 50g now too.

-Mike

Halo,

I just turned 43, civil engineer.

First encountered HP calc was HP 9800 family dusted machine at the colleague in early 80s which I was only the one interested in and (probably) the only one who learned to use it. Around that time, the special „roadshow“ HP bus came to Prague mainly with measurement equipment and also one 41C. We were able to see and even touch it! Any HP was only a dream for me. The most I could afford (and buy in the special luxury western goods shop with special money-coupons obtained on the black market) was TI 58C for which – not to be able to reach to TI 59 - I made a paper punch card reader/programmer (just U shape trace out of the copper laminated board with the row of small springs making shortcut of the row and column keyboard matrix when twin openings in the punch card get under and simulated key presses) while I managed to solder external socket to the keyboard conduits into the machine.

I found this forum quite some time before I get my first RPN calculator (not counting kind of RPN simulator for TI) HP 35s. I am not brave enough to contribute to math discussions and astonishing solutions (I get sucked with Valentines' factorial Mini challenge for almost a year), but I enjoy to follow this forum.

in response to message #96 by Joerg Woerner

Current age: 52 (53 in 3 weeks, though...)

Used TI calcs through late high school and most of college, because I couldn't afford HPs. My last year of college I did have a 19C that a friend of my father gave me. I bought my first HP, a 41C, after college when I had no earthly use for it.

The HP deprivation of my formative years warped my young brain and inculcated a lifelong passion. *Now I have them all.*

The scientifics, that is. A couple of financials have come through, but I donated my cherry HP-70 at the 2006 club meeting as a door prize.

Re: Average Age in hpmuseum forum

*Message #98 Posted by **Herbert Crepaz (UK)** on 16 Feb 2009, 8:37 p.m.,*
in response to message #1 by Nacho

Age 36, to lower the average a bit.

I started my addiction with a TI-30 Galaxy around 1985 which I bought mainly because it featured a Voyager

like form factor with large = key and I could not afford the HP offerings at that time.

When I entered mechanical engineering college I opted for the 11C. Moving on to University in 1992 I decided its time to splash out and get a 42S, the ultimate in shirt pocket sized excellence(..if it had only i/o, a simple equation editor...)

Now as a postdoc in experimental physics I do the daily number crunching with a new 35S or Free42 (some backup from Matlab/Mathematica included ;-)).

One thing is interesting. The best selling HP model is probably the 12C/P which you wouldn't guess reading through this thread/forum. Where are the business folks (and the woman)? Seems they are immune to this special kind of (in)affection.

Greetings Herbert

*Message #99 Posted by **Don Shepherd** on 16 Feb 2009, 9:26 p.m.,*
in response to message #98 by Herbert Crepaz (UK)

I would guess that about 99.99% of the people who buy the 12c:

1. have never visited this forum
2. have never discovered (or needed) keystroke programming
3. couldn't care less about RPN, and use algebraic mode if they have a 12cp or use a desktop calculator for normal arithmetic if they have a 12c

I like the 12c for its simple programming model, and I look forward to getting the super-charged version later this year, hopefully.

Re: Average Age in hpmuseum forum

Pretty much every person that works at every one of my wall street clients has a 12C on their desk. Based on that, I'd like make some comments on your comments.

> Quote:
>
> 1. have never visited this forum

True!

> Quote:
>
> 2. have never discovered (or needed) keystroke programming

They typically use some simple program that they plug when they get a new calculator, but they don't know how to program.

> Quote:
>
> 3. couldn't care less about RPN, and use algebraic mode if they have a 12cp or use a

> desktop calculator for normal arithmetic if they have a 12c

They don't care about RPN nor do they really understand it, but they are so set in their ways that changing to algebraic entry causes them to screw up. So they use RPN more even on the new 12C's.

Re: Average Age in hpmuseum forum

*Message #103 Posted by **Katie Wasserman** on 17 Feb 2009, 4:59 p.m.,*
in response to message #101 by Don Shepherd

Exactly! They have no idea what a stack is and have probably never used more than the X and Y registers. But they do use must of the financial functions, of course, and will probably appreciate the super fast speed in the next release, once they learn to trust it.

Which reminds me of a question I had.... If the next release is indeed running the original code in an emulator, how long will a PSE instruction last for? It seems to me that this is just a timing loop in the original 12C, if so it's going to go by in the blink of an eye.

I suspect the Wall Street types are all in banking and investments. I think the answers are (slightly) different for the actuarial community. I'm being presumptuous here, but I'd guess:

1. True.

2. Partly true. But most would never program a 12C. The programming capabilities of the 12c weren't really useful to actuaries. The IBM PC quickly appeared on desks in the early 1980s, where APL was the preferred programming paradigm. Interestingly, APL syntax is quite similar to RPN (it's largely postfix but reading from right to left). This all changed when Excel came on the scene.

3. True. Don't care and prefer algebraic calcs. Many use a 4-banger or adding-machine style business calc, and do anything more complex in Excel.

Many years ago, before all of the customer representatives at financial institutions had a computer terminal at their desk, I was doing a CD rollover. The representative did the various cases that I wanted done on her HP-12C. When I selected one option she entered some calculations on her old desktop calculator that had a printer. She had to do that because the paperwork that she had to assemble had to have a printout.

When she was doing the various cases I was checking her results with my TI-66. She had no idea how a customer could do that.

Even earlier than that I encountered a situation where I had reinvested a CD at a higher rate during the year but the accumulated interest at the end of the year was smaller than the previous year. I went to the customer rep with my trusty TI-59 in hand, prepared to explain what had happened. I hit a blank wall. After a long time I finally got to see the head of data processing who was able to understand what I was saying.

Banking has always been a scary endeavor!

in response to message #105 by Palmer O. Hanson, Jr.

Hello All,

Well, I'm 32 (and a Ham as well).

Actually, I ended up getting my mortgage through a local bank because of the 12C (interesting story). I use one exclusively as my career rarely requires the use of trig functions (although I envy the fine functions as delivered by Valentin).

My wife and I got pre-qualified at two financial institutions. The first experience was unsatifying as the loan officer made a glaring error in the payment calculation (later rectifying it). Needless to say, he was using the computer to calculate the schedule. I was not impressed.

The experience at the second bank was one of pure enjoyment. I first met with the loan officer (who promptly broke out her 12C). She then brought her young assistant in (he brought his 12C). The branch manager (a friend of my father's) then brought his in. It was wonderful and refreshing to see people who know what's going on. We decided to do business with them. I later found out that the loan officer and her assistant both have two 12Cs (you know, just in case one needs batteries).

While this story may seem outrageous, it leads me to believe that HP users are professionals. That has value.

Now, when are the HP-HAMS going to get together at Dayton?

Best,

Tony (AB9IO)

Hi everybody,

I am 51.

During the 70s and during studies (physics) I used TI calcs (SR56, TI59) because HPs where too expensive for me. Later I switched to Sharp (PC-1500 a really wonderfull machine I still use for aviation, I developed a bunch of assembler programs for it).

My first contact to HP was a HP9810A we had at school in 1973. I really loved this machine but it was completely unaffordable with $2500 (10000DM) at that time.

My real HP-time began after my doctorate when I worked in several IT projects as IT consultant and developer with HP workstations (400 and 700 series) and HP-UX servers. Today I'm working in the management of a media company.

I'm collecting pocket calcs since the late 70s (lots of TIs, e.g. the rare SR-60, later also HPs). Since 2001 I'm collecting and restoring the heavier machines (9810/20/30, 9825/31/35/45 and lots of peripherals).

Since 2006 I'm developing the HP9800 emulator for those machines (www.sourceforge.net/projects/hp9800e) in my leisure time.

Cheers, Achim

156 days older than Mark Taylor.

Graduated in Physics but ended up in the financial services industry, where I do reinsurance analysis and pricing work.

My university calc (1975) was the Radio Shack EC-425, a rebadged TI SR-10. My first HP was a 12C supplied to me when I was an actuarial student. My daily calc is a 17BII. It was on this forum that I first learned about the Solver in this calc. Prior to that I had simply used it as a 12C replacement. I kept lamenting the lack of programming on the 17 and never thought to check the manual! Like some others here, I think this is an underrated machine, and prefer the algebraic solver to the clunky implementation in the 42S. An RPN version of the 27S would be my ideal calc.

Re: Average Age in hpmuseum forum

*Message #111 Posted by **Joel Setton (France)** on 17 Feb 2009, 4:42 p.m.,*
in response to message #110 by Ken Shaw

I'm 55 and counting...

My first contact with HP calcs was a 1973 ad, but the price of the HP-35 was way beyond anything I could afford at that time.

The first HP I owned was an HP-25 in 1976, which made me part with my first paycheck. I've been an RPN addict since that day. Now my collection includes an HP-35, HP-45, HP-55, HP-67, HP-97, HP-32E, 33E, 34C, 32S, 20S.

And on a few rainy Sunday afternoons, I programmed a Motorola 68HC11 microprocessor to emulate an RPN calculator, just for the fun of it -- and it WORKED. Talk about an RPN addiction!

in response to message #112 by Michael de Estrada

Er - I didn't buy the 20S, it was given to me! And even though it's not RPN, it's an HP calculator... and an HP calculator should never go to waste!

I'm 44, and about 5 minutes old on the MoHPC; but I've been interested in HPs since the late 1970's, when I managed (can't remember how) to get an HP-41CV. I loved it! Sadly, I parted with it about 2 years afterwards, although I always regretted it. It's only recently, about a year ago, that I realised (finally) that surely I could afford another HP-41CV, if only they still existed...I must have been blind all these years :-) I've gone a bit collector-mad now...probably the over compensation from a good 24 years of privation.

Wow! What a thread !

49.9, had a Canon, a Commodore and a Casio through school and bought my first HP, a 16c, in 1985 when I tried and failed to get a Casio pocket Basic machine to handle hex conveniently.

Always an HP instrument fan, I liked the calcs just as much but used the 16C almost exclusively until I started collecting them in about 1995, partly because I came across a cache of HP35s.

I now have all the 10C series, 10,35,45,65,70,41CV,71B,32SII,48SX. The 16C is still my favorite, the 15C is very popular and the 32SII is used when I don't want to risk taking a Voyager. The 16C is the only one I ever bought new and is still the most I paid, though the 10C came quite close.

*Message #122 Posted by **Chris McCormack** on 20 Feb 2009, 2:33 p.m.,*
in response to message #1 by Nacho

My age (47) hits close to the mean, and I'm an electrical engineer.

My HP history was an HP-29C I bought using newspaper money in high school (late 70's). That was displaced by an HP-15C in college (1981?) and supplemented by an HP-48GX when they first came out in 1993 (special deal at ASEE conference) when I went back for a doctorate. My latest HP is the HP-50G.

I currently have the HP-15C in my briefcase, and the HP-50G in the desk drawer at work.

While I don't 'collect' HP calculators, things get more interesting when you add other family members. My wife is one of the few women (the only woman) I know who carries an HP-11C around in her purse. (She bought it while an undergrad in engineering.) My daughter (a sophmore ME student) uses an HP-49G+. (She 'likes' the color scheme better than the 50G - but she is having some keyboard issues.) My son in high school has an HP-48G. The junior high son is using an HP-33.

Missing in action are: the HP-29C (might have gone to my younger sister, then disappeared); the HP-48GX and two memory cards (possibly left in a hotel or on an airplane); and the HP-32SII my daughter used in junior high (stolen).

Killed in action: the HP-49G+ with the smashed screen, a victim in my daughter's backpack.

Waiting in the bullpen: two HP-49G+ calculators with the new keyboard (got a good deal on that auction site) - one to replace the flaky keyboard calculator my daughter has, and one to replace the 48G with faster/better capabilities (the 48G will trickle down to the HP33 user, and the 33 will go to the youngest, currently without any calculator); and a spare HP33.

Finally, there is the HP 6S, but that's in a dark drawer, and we don't talk about it much :)

I'm 45. First calculator an HP41CV in 1981 (I think). At the time I was tossing up between HP and TI but the alpha capabilities did it for me.

My wife more recently completed a Medical Science degree and asked me "With all those calculators, surely there's one I can take to uni?" I asked her to pick the one she wanted to use and she picked an HP28S. She graduated and is now a Senior Diagnostic Medical Scientist, I'm sure in part because of the calculator ;-)

I started re-collecting HP stuff about 10 years ago, with my basic intent to get as much HP41 related material as possible. My collection is large enough that I make sure my wife never sees it all at once :-D

I am 52. I'm new to posting here, but I've been coming to this site for many years now. My first HP was an HP-15C which I bought back new in early 1986. It is still working wonderfully. Since then, I've acquired an HP-28C, HP-28S, HP-48GX, HP-32SII, HP-48SX, HP-39G, HP-49G, HP-49G+, HP-50G, HP-6S Solar, HP-30S, HP-9G, HP-42S, HP-20S, HP-32S, HP-33S, and an HP-35S. I also have an HP-42S application on my iPhone. I still have all of the above calculators, with the exception of the HP-28C, and they are all in great working order. When I saw the change in the quality of some of the newer HP calculators, I worked hard to get my hands on some of the older models.

I know this is a small collection, compared to many of you. I'm proud of it. As a math teacher, I've had hands-on experience with many different types of calculators. However, I do prefer RPN/RPL over any other entry-system logic, bar none.

Updated final statistics: Average Age in HP Museum forum

*Message #126 Posted by **Karl Schneider** on 22 Feb 2009, 12:01 a.m.,*
in response to message #1 by Nacho

After eight-plus days, and responses dwindling to a trickle, maybe it's time to tabulate the results, using an HP-17B. I'd say that our sample is quite significant in a statistical sense:

```
responses: 92

median:    46
minimum:   22
maximum:   82
mean:      48.0
std dev:   11.5 (sample)
modes:     52(8), 45(7), 42(6)
```

A numerical histogram (with the help of the SORT function):

```
[age in years]
[number of respondents]

20 21 22 23 24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39
       1           2  1        1     1  1     1  3  1  2  1
```

```
40 41 42 43 44 45 46 47 48 49 50 51 52 53 54 55 56 57 58 59
 5  4  6  4  3  7  3  5  1  3  4  1  8  3  1  2  2

60 61 62 63 64 65 66 67 68 69 70 71 72 73 74 75 76 77 78 79
 3     2  1  1  2              2        1

80 81 82 83 84 85 86 87 88 89 90 91 92 93 94 95 96 99 98 99
 2     1
```

Middle-aged people definitely characterize this group. I still believe that is attributable to the "genesis era" of the product being discussed. The average age of PPC members back in the 1980's might have been lower.

Heh, seems I'm late to the party, but my data point won't change much.

Age: 40.

Calculators: first, an HP-35, bought second-secondhand cca 1982, introduced me to RPN. I've been a fan ever since. The calculator still works. Then, a 15C, 1986. It was a more than brilliant high school calc, passed on to my sister for college. (She managed to put it close to a space heater once, so it has an ugly molten gash on its case, but it still works.) Then, in 1990, 48SX. My college calculator, has helped me tremendously and still works. I can use it blindfolded.

Age: 44. HP calculator user since 1977, an HP-25. I don't have it any more, since I had to sell it to help raise the money for the HP-19C that would replace it, but if you have one with a small dent made by the tip of a hot soldering iron on one of the sides, and a Brazil serial number 1706Bsomething, you could have my old high school calculator in your hands. Oh, yes, it is an HP-25C now; it broke once and I had to send it in for repair, and it came back as the fancier version. It was out of warranty but they only charged Dfl. 25. Now that's service you don't see every day. :-)

- Thomas

My calculator, my self?

*Message #1 Posted by **Peter Klein** on 13 Feb 2009, 2:31 a.m.*

Is a calculator more than just a calculator?

I've been pondering this recently. My post the other day about my "RPN addiction" was actually spurred by a couple of old algebraic calculators.

My father, who was a theoretical physicist, died three years ago. My mother died a month ago. In her apartment was an old TI-30 SLR solar-powered calculator that my Dad had used.

http://www.datamath.org/Sci/Modern/TI-30SLR_2.htm

I took it home and started playing with it. Using it now and then somehow makes me feel more connected to my Dad, despite the fact that I much prefer HP RPN calculators.

My Dad retired in 1986. He was decidedly from the slide rule, pencil and paper era. In his later years, he used the TI to revisit some of the math he'd used in his career. Some years back, he gave me a Radio Shack EC-4014, basically a rebadged Casio

http://www.voidware.com/calcs/fx85m.htm

Dad said that he'd bought the EC-4014 because it did more than the TI-30 SLR. But he liked the TI better.

Now that old TI-30 SLR is actually a nice little machine. It seems well-made, better than many with the TI-30 moniker. The buttons, while not of HP quality, feel much better than the squishy-rubbery buttons of the EC-4014.

Dad was right--the TI is simple and elegant, and feels good to use. Every button has but one purpose, and the INV key makes appropriate functions do their opposite. It just feels... right. If only it had an ENTER key.

That "right" feeling made me think about how right the HP-25 felt when I first got it in 1977. And how it somehow influenced how I related to numbers, and what those numbers meant. I viewed math through the lens of that HP-25 just as surely as my Dad viewed it through his old wooden German slide rule in his heyday, and through the TI in his latter years.

My calculator, my self? Maybe that's why I'm so picky about which one I use. Even though I mostly use it to balance my checkbook. Many would suffice, but few will truly do.

*Message #2 Posted by **Steve Simpkin** on 13 Feb 2009, 2:55 a.m.,*
in response to message #1 by Peter Klein

As we get older, we remember the times when we were young and everything was new and exciting. We remember the joys of learning and discovery. We associate these memories with the toys or tools that allowed

us to discover new things. As these material items become part of these exciting memories, they take on a life of their own. We become attached to them as if they were alive. They help remind us of when we were young and the world an exciting place and also when our occupations were challenging and important (at least to us). I know I will never get rid of my HP-25.

Re: My calculator, my self?

*Message #3 Posted by **Michael de Estrada** on 13 Feb 2009, 8:42 a.m.,*
in response to message #2 by Steve Simpkin

I think there's more to it than just human nature. It is also generational. I'm 62, and when I was in school, much of our time was consumed simply learning how to solve problems manually. The affordable personal calculator was truly revolutionary to us, and had a drastic impact on our professional lives. I remember spending several days performing engineering calculations with my K&E slide rule (I still have it) and CRC Handbook of log and trig tables. When I purchased my HP-35 (I still have it) after the price had just been lowered from $395 to $295, days became hours. I would sit at my desk with my hands crossed, waiting for my supervisor to bring me more work. Young engineers and scientists today take all of this for granted, by for those of us from that generation it was nothing short of miraculous.

*Message #4 Posted by **Fred Lusk** on 13 Feb 2009, 12:38 p.m.,*
in response to message #1 by Peter Klein

I consider my first programmable calc (HP-55) to be my first personal computer. To me, a calculator has always been more personal than a computer, probably because calculators are much easier to learn, operate, and personalize, and they are pocketable. Even though I now use a computer a lot more than my calcs, I like to think that if my HP-42S ever dies I will have to retire.

Hello,

Nicely put and true. Some would even say thay as time goes by, these items have a soul, at least for their owner.

Fond memories, attachment, nostalgia, you name it. But it feels good anyway.

My two cents.

> Even though I mostly use it to balance my checkbook.

In my part of the world, checkbooks have disappeared together with the LED calculator... it must be over ten years ago when I last could talk someone into accepting a check. Since then I am in a desperate search of anything useful to do with my redundant calculators - luckily, I never adopted the "My calculator, my self" principle, otherwise I would have felt quite useless myself during that last decade ;-)

Greetings, Max

HP-29c malfunction symptoms

*Message #1 Posted by **Xavier A. (Brazil)** on 12 Feb 2009, 4:09 p.m.*

Hello everybody,

Last time I posted in this previous thread, everything were OK with my HP-29c: After changing the conventionnal battery pack for a new NiMH one, I could make some calculations, even type a little routine in PRGM mode and make it run: I was satisfied, thanks to this Forum (I didn't thank Dick, but I think to do it another way one day, true), and those who took some time to answer me very friendly.

Well, I let two days ago the NiMH pack during a whole night in the Hp and, I was surprised the day after to find one more time the display:

000000000000

Bad news! could say Katie, as she said here (I'm really very impressed with her knowledge). Well, perhaps not so, since I could modify this display by pressing some keys or moving the switch ON/OFF a lot of times.

Here are some examples NOT IN SPECIFIC ORDER (unless for the beginning) of what I succeed to display:

```
1234567890AB (just a duodecimal grid)

           0 last digit (0) very very bright
     0     0  both digits (0) very bright
Er.........-
81.8-0000000
-           -
-0-         - then blank
-0-000000000 then blank
 -         -.
.  .........
999999999999
..6111111100 with dots after each digit, unless the last one
000000000006
Error0000000 with a display full of zeros (unable to represent here) at half intensity

Error....... then blank
```

290000000000 *a secret code of this HP? fuzzy & intermittent display and then blank*

f *and hexadecimal countdown (f, e, d ,c, etc.) at a frequence surely < 0.7 s (appr.), and then blank*

(another time, the HP displayed

999999999999 *, then began an HEX countdown which could have reached*

99977886fb99 *if I didn't stop it two hours later)*

This time, I finally obtained:

Error
0
0.....
0.
0.00
0.00..... *(fuzzy dots) and then blank; or*
0.00..... *(fuzzy dots) but stay on; at this point, pressing the '1' key, I obtained:*

98.. ..23.1. *or*
97.. ..23.1. *or*
0.00 . *(last dot was fuzzy)*

AND FINALLY

0.00

After that, I was (and I am usually) able to do some calculations:

sum, division, etc.
Log, sqr, etc.
Angle calc., etc.

Stack is working. First registers as well, indirect as well (I only checked R15 and R29). Operations on registers are OK as well.

At this stage, I still have two permanent problems:

1/ when I am typing some number keys, (4, 5, 6 most of the time), the HP sometime displays wrong signs (h, or a, or another number, 4 for 6 for example);

2/ It is impossible to program more than 10 instructions: at this time, the HP displays

000000000000 and stays frozen. The only way to 'debug' it is to put away the battery pack half an hour, or so, and begin again all the process.

I think it is not a RAM or ROM or ACT problem,

I think it is a dirty cicuitry problem, with this solution:

> Quote:
>
> Re: Have to agree with Katie on this... Message #9 Posted by Geoff Quickfall on 6 Dec 2008, 10:46 p.m., in response to message #8 by Stan McFarland
>
> Hi Stan,
>
> I think it sounds like the battery rivet. To answer your first post:
>
> 1. remove the case back 2. remove the top circuit board (this will allow access to the power tracings from the rivets.) 3. with one probe on the rivet work backwards from the rivet to identify the problem 4. reverse the board and test the second rivet and trace. 5. IF the problem is found clean the board (vinegar rinse followed by water rinse followed by alcohol and then a thorough drying. (I use a shoe box with a hair dryer on COLD setting) 6. apply silver conducting paint.
>
> On the second point,
>
> 1. clean the rivet with a fiberglass brush; fine wire brush; or sand paper. 2. If blue residue exist clean with vinegar. 3. rinse with 90% alcohol. 4. just stick a little solder flux on the rivet, 5. then apply the solder iron and heat until the existing solder flows, add some if required. 6. clean rivet with alcohol to remove acidic flux.
>
> There is enough spring action in the battery to force the contact between the rivet and battery terminal. I doubt the rivet is worn flush with the circuit board, if I interpret your question correctly. If it is then try filing some of the circuit board back to expose more of the rivet edge to the battery. OR, build up the rivet with solder.
>
> Hope this helps, Geoff

If so, thank you Geoff.

IDEAS AND COMMENTS ARE WELCOME. (sorry to have been so heavy).

Regards,

Xavier

IS THAT SAFE?

*Message #2 Posted by **Xavier A. (Brazil)** on 13 Feb 2009, 7:51 a.m.,*
in response to message #1 by Xavier A. (Brazil)

Just some additionnal informations:

I finally succeeded in typing a 30 steps program, but after running it two or three times, I had the same problem of mad and frozen display.

Well, I am going to do this:

1/ Disconnect the battery pack and let the HP without current during an half day or more;

2/ Disassemble the calc., and IMMERGE the whole parts into vinegar (UNLESS THE LED DISPLAY) during an hour;

3/ Immerge the same parts into water from tap during 15 minutes;

4/ Immerge into 90° alcohol during 5 minutes;

5/ Dry at 50°c in a black box exposed to sun during a week.(storage max. temp. is 55°c);

6/ Reassemble.

QUESTION: IS THAT SAFE?

Many Thanks for advices.

HP 49g+

*Message #1 Posted by **Fernando** on 11 Feb 2009, 10:08 p.m.*

Hi all...

Can someone tell me please why when I enter:

DERVX(X^2)

I get 0 (zero)

I already set functions to symbolic and the arithmetic mode is set to exact, what am I doing wrong?

thanks in advanced

in response to message #1 by Fernando

Check if variable X is defined and purge it. If X is defined, X^2 evaluates to a constant of which the derivative is zero.

OT: TI-89 (Dumb Question)

*Message #1 Posted by **Juan J** on 11 Feb 2009, 9:25 p.m.*

Hello,

I have been "playing" with a TI-89 today. Interesting calculator, reminds me of Mathematica's user interface.

I understand there is an RPN emulator of some kind for this beast. Is this true? If so, where can I get it?

Thanks in advance.

in response to message #1 by Juan J

Another possibility is rpn89, available for download at

http://www.ticalc.org/pub/89/asm/math/

However, I have not personally tried this program.

Re: OT: TI-89 (Dumb Question)

*Message #4 Posted by **Juan J** on 13 Feb 2009, 5:06 p.m.,*
in response to message #3 by Gordon Strickland

Hello,

Thank you. I will give these a try.

Do these programs work on the TI-84?

Re: OT: TI-89 (Dumb Question)

*Message #5 Posted by **Marcus von Cube, Germany** on 13 Feb 2009, 6:19 p.m.,*
in response to message #4 by Juan J

I'm afraid they wont unless a specific version is available for that machine.

The 89 is technically close to the 92+ and the Voyage 200, driven by a 68000 Motorola processor. The

TI-84 (and its predecessors TI-80, 81, 82, 83 as well as another series: TI-85/86) are all driven by a Z80 processor architecture.

Re: OT: TI-89 (Dumb Question)

*Message #6 Posted by **Juan J** on 14 Feb 2009, 7:33 a.m.,*
in response to message #5 by Marcus von Cube, Germany

Hello Marcus,

Thank you for the info. Duly noted.

I can understand where HP got the ideas for the 49/50 design without the big ENTER key. Fortunaltely the 89 can run on RPN. And I thought the 50G's menu system was annoying... At least you can change it to the 48 series' style.

UCODE programs in MCODE modules

*Message #1 Posted by **PeterP** on 11 Feb 2009, 5:24 p.m.*

Hi,

I had a few times the wish to combine normal usercode programs and MCODE functions in a custom module. The procedure below works yet I wonder if there is a more efficient way to accomplish this.

Building MCODE functions is most easily done via the SDK41 package from WF. It allows the use of a normal text-editor on a PC to write the code and comment it. Additionally it provides a rapid testing environment where the newly written code can be immediately checked for errors and tested (in single step mode if wanted). AFAIK there is no faster MCODE development environment around. However, sometimes the need arises to add a user-code program to the MCODE functions in the same module and there is no fast way to convert a user-code program into the correct MCODE bytes that have to be loaded that I know of. So I am using emu41 and then SDK41 or M2k to generate the dissasembled code that can then be easily meshed with the MCODE to create one annotated text-file for the whole module.

Prepare EMU41

Create a EMU41.ini file which includes the WWOS as well as a standard 8k MLDL RAM that is provided with EMU41. My .ini files looks like this

```
;-----------------------------------------------------------------
; emu41.ini        emu41 init file

[MODULES]
; page size filename
0  12 rom41cx.bin
3   4 cxfcn2d.bin
5   8 cxtime2c.bin
7   4 hpil1h.bin
; ------------
8  4 WWOSa.bin
10 8 mldlram.dat
15 4 CCD_osx.bin

[DEVICES]
DISPLAY
HDRIVE1
;-----------------------------------------------------------------
```

It has the W&W Rambox OS on page 8, the 2 pages of free MLDL Ram on pages A&B and the CCD-OSX for convenience on page 15 (Thank you Raymond…)
Save your .ini file in the same directory as you have your emu41.exe file and run emu41.exe.

Enter your PGM

Now you can enter your program that you want as part of your MCODE module. If it is just a short module, I suggest to just type it in with emu41. If it is longer and you do have a HP-IL card you can also load it in from another PC via the HDRIVE1. (In short: Load the program into a physical HP via finger, Wand, cards, etc – save it

to the HDRIVE1 via the HP-IL card – turn off the physical HP41 – load it into memory from HDRIVE1 with emu41).

Store the program in the MLDL Ram

Using the functions of the W&W OS we can easily prepare a page and store the program on it. The steps below assume you have the same emu41.ini file as above and the MLDL ram is at page 10 & 11 (A&B)

1. 10, xeq CLPG ------------------> this clears page 10
2. alpha UCODEMOD alpha --------> the name of the module
3. 8,enter,10 xew INITPG ------------> this initializes the module with XROM number 08
4. alpha NAME_OF_PGM alpha
5. 10; xeq LDPGM ---------------------> this compiles and stores your program in the MLDL
6. alpha UCODEMOD,RE-01 alpha ---> to add revision number and chksum at end of module
7. 10 xeq ENDPG, xeq PGSUM, xeq PGSUM, xeq ENDPG -----> this ensures that we have a valid module just in case

Convert MLDL Ram to .ROM

1. exit emu41
2. copy MLDLram.dat to MLDLRAM.bin
3. clbin41 MLDLRam.bin MLDLRAM.rom /b ;this converts the .bin file into a .rom file

Disassemble the .ROM file

There are two ways to disassemble the .rom file to get simple text that you can include into your other MCODE source text.

1. Use D41 from the SDK41 to get a .src file which has the exact hex codes needed to have the UCODE program in the MLDL-ram. The first two bytes are the header for the UCODE followed directly by the bytes for the global Label of your program.
2. Use M2K Manager's disassembly function to also generate a text file which has additionally the UCODE steps in it as well. However one needs to do some post-processing to use this file as an input in the SDK41. Alpha-strings and Alpha labels show their hex-codes to the right in the listing. This needs to be corrected by making them separate lines.

Personally I like the UCODE description from M2K and so I post-process them using the D41 assembly as a guideline. This gives me a nice code like the example below.

```
;------------------------------------------------------------------------
06BD 013                        #013            ;UserCode: 137 bytes (19 regs + 4 bytes)
NONPRIVATE
 06BE 240                       #240
 06BF 1CC       [LDRSU]         #1CC            ;*LBL  "LDRSU"         ; 4C 44 52 53 55
 06C0 000                       #000
 06C1 0F6                       #0F6
 06C2 000                       #000
 06C3 04C                       #04C
 06C4 044                       #044
 06C5 052                       #052
 06C6 053                       #053
 06C7 055                       #055
 06C8 1F9                       #1F9            ;... 002  "RSU1-FL:?"          ;
 06C9 052                       #52
 06CA 053                       #53
 06CB 055                       #55
 06CC 031                       #31
 06CD 02D                       #2D
 06CE 046                       #46
```

```
 06CF 04C                       #4C
 06D0 03A                       #3A
 06D1 03F                       #3F
 06D2 18C                       #18C            ;... 003  AON
 06D3 18E                       #18E            ;... 004  PROMPT
 06D4 18B                       #18B            ;... 005  AOFF
 06D5 111                       #111            ;... 006  1
 06D6 1A8                       #1A8
 06D7 000                       #000            ;... 007  SF   00
 06D8 1A1                       #1A1
 06D9 003                       #003            ;... 008  XROM 04,03 - SETBANK
 06DA 111                       #111            ;... 009  14
 06DB 1A1                       #1A1
 06DC 011                       #011            ;... 010  XROM 04,17 – GETROM
;-------------------------------------------------------------------
```

This code can now easily be combined with the rest of your MCODE source file that you can compile with A41 & L41. Just remember that with the M2K Manager you can easily convert .ROM files into .MOD files in case you need them (for your iPhone for example or V41)

Please let me know of any improvements to this process.

Cheers

Peter

Re: UCODE programs in MCODE modules

*Message #2 Posted by **Meindert Kuipers** on 12 Feb 2009, 8:15 a.m.,*
in response to message #1 by PeterP

Peter,

This is a good tutorial, thanks for that. I am (in the background) working on a disassembly mode for M2kM that allows direct assembly with D41 from a disassembled file, so that would remove the need for post processing the user code.

Worth of HP 41 Accessories?

*Message #1 Posted by **Howard Boardman** on 11 Feb 2009, 3:25 a.m.*

I have several accessories for an HP 41C Calculator. I have the original box, memory cards, manuals and a pamphlets (advertising HP items) as well as a synthetic programing book. What do you figure these are worth? These were my uncles and he has no interest in them, although he still has the HP 41C he no longer uses much. Is it worth ebaying these? Thanks

Re: Worth of HP 41 Accessories?

*Message #2 Posted by **Greg Swartz** on 11 Feb 2009, 12:11 p.m.,*
in response to message #1 by Howard Boardman

The 41C isn't going to fetch as much as a CX but if the whole package is in great shape, you might get $100-$200 for it (that is absolutely a guess). Too many variables to pick a value for certain. Tall keys, corrosion, which program modules, etc. can make quite a difference. Easy way to check if it's worth your time is to just search the "Completed Listings" on eBay and see what the items you currently have are selling for at the moment.

Re: Worth of HP 41 Accessories?

*Message #3 Posted by **Michael de Estrada** on 11 Feb 2009, 12:55 p.m.,*
in response to message #2 by Greg Swartz

It also depends on whether you ship worldwide or only to the USA. I've seen the very same item go for twice as much when shipped worldwide than when limited only to the USA. One thing I've learned about selling on ebay is that a good detailed description and lots of clear photos will get a lot more attention and a better price. You definitely need to show a good photo of the display with all segments and annunciators turned on.

RPN is an addiction

*Message #1 Posted by **Peter Klein** on 11 Feb 2009, 3:01 a.m.*

Unlike most of you, I'm not an engineer or a programmer. I'm just a humanities guy cleverly disguised as a computer and network support person for economic purposes. And my mathematical needs are modest.

But I'm a confirmed RPN addict. I started back in 1976 with a simple National Semiconductor RPN calculator, soon replaced with an HP-25.

I taught myself some math and programming on the "25." I wrote a simple program using the HMS<->H functions to add up timings for classical music recordings when I worked in public radio. I wrote a program to calibrate the bandspread dial of an old Hallicrafters shortwave radio for the international broadcast bands, so I could find stations without hunting. Trivial stuff, but useful.

Eventually I got my beloved 11C, which I still use, albeit mostly to balance my checkbook. There are only two things I wish were different about the 11C:

- I wish it did hex/octal/binary math.

- I have big hands, so I wish the spaces between the number buttons were bigger. I need about 4mm or more of space between the left side of the "1" button and the right side of the "3" button to be comfortable "touch keying."

Recently, I pulled out my old HP-25, and discovered that the program memory, registers and Last X no longer hold any values. And I though, "Uh-oh, what if the 11C bites the dust?" So I began searching, and found out about the new 35s. But I read about the keyboard issues, the virtually unusable hex entry, and the shifted "STO" function, and I thought, "No, I probably wouldn't be happy with this."

So they don't make what I want. I'm kind of stuck. Algebraic calculators just don't cut it for me. The big graphing calculators are overkill for my needs. I wish HP still made something like the 32s or 42s, which would probably be fine for me. But even those are getting old these days, and cost plenty.

And here I am, longing for the proverbial Good Old Days. Those old HP calculators are an addiction, that's for sure.

Re: RPN is an addiction

*Message #2 Posted by **Nigel J Dowrick** on 11 Feb 2009, 7:10 a.m.,*
in response to message #1 by Peter Klein

I probably won't get too much support for the opinion I'm about to express, but I think that the HP-33S is worth considering if what you want is a scientific RPN machine. In many people's eyes it is not a thing of beauty, and it doesn't have that magic double-sized ENTER key. However, a lot of the negative opinions you'll find online refer to the first version which really did have major quality issues. I've used my later version heavily for several years. The keyboard is fine; the display is beautifully clear. It has unshifted STO, RCL, 1/x, x^2, and sqrt(x) keys. It's light and feels comfortable in use. I don't have a 35S to compare it to, but from the reviews I've read I like my HP 33S better! Then again, you shouldn't always believe reviews...

Re: RPN is an addiction

*Message #3 Posted by **Don Shepherd** on 11 Feb 2009, 7:25 a.m.,*
in response to message #2 by Nigel J Dowrick

I second that. I have an early 33s with the small decimal point, but it has never bothered me, and I don't mind the chevron layout either. Other things I like about it:

- the keys are spaced well to accomodate large fingers
- you can document your programs with comments, using EQN
- bases hex, oct, and bin work like they should
- the program execution speed is orders of magnitude faster than the 35s; it is FAST FAST FAST
- it has linear regression
- it is recent enough that you can buy it cheaply

Re: RPN is an addiction

*Message #4 Posted by **Jeff Kearns** on 11 Feb 2009, 9:54 a.m.,*
in response to message #2 by Nigel J Dowrick

I also agree with you, regrettably... The HP-33s, despite its non-traditional design, is what the 32sii should have been. My biggest gripe with the 32sii was the pitiful amount of memory it had - but it is such a great little machine!

The 33s is better than the 35s (I have one of those too) in so many ways, keyboard layout (ignore the chevron), polar to rectangular, checksums that mean something, and unshifted STO to name a few. It does lack the practical ability to use all that memory with the small number of storage registers for labels etc., but it is so much faster! Karl Schneider has commented elsewhere on why this is so.

Despite all the negative reviews that the 33s has received, I would recommend it over the 35s in your case. Good luck!

Jeff Kearns

I believe that you're referring to this thread:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=124094#124094

I suspect that the HP-35s is slower than the HP-33s in order to provide respectable battery life. The thread comparing speeds to the HP-32SII was in reference to numerical integration, for which the HP-33s/35s used a different means of specifying uncertainty than did the HP-32SII. In some cases, the HP-33s/35s would be slower.

More about integration uncertainty:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=96784#96784

in response to message #4 by Jeff Kearns

You know, initally, I truly believed the 35s was better than the 33s; in terms of cosmetics, as in the keyboard layout, overall color scheme of the machine, and the cute zipper case, I still do believe.

However, over the time I have owned and used the 35s, I find the 33s to be more user-friendly, even, I daresay, for scientists, engineers, surveyors, etc. The choice of functions on the unshifted keys are much more convenient.

Re: RPN is an addiction

*Message #8 Posted by **Mike Reed** on 12 Feb 2009, 10:35 a.m.,*
in response to message #7 by Allen

```
Hello, My name is Mike, and I'm an RPN user... (hello, Mike)

It all started back in the 70's with an HP-11c, and that was SWEET!
It wasn't long though till I got into heavier stuff: the HP-41's
and synthetic programming, then HP-45's, HP-67's and worse to
follow. I kept it under control pretty much till HP-came out with
the HP-48sx; RPL pretty much took over my life and the HP-48GX only
made it worse. I used the HP-32s, Hp-33's and HP-42s for everyday,
and an HP-200 for fieldwork, but they couldn't match the high from
the HP-48's. I thought maybe I could get off RPN/RPL myself, but
then HP-introduced the 49 - a bad fix for sure. I ALMOST beat it
when the HP-50 came out and now I'm hooked even more! It's not just
RPN anymore, now it's HPGCC too! I can't even THINK about using a
standard algebraic anymore! My kids won't let me help them with
their math homework; they are afraid they might get my addiction.
Fellow workers don't ask to borrow my calculator, or help solve
their math problems. I don't know what to do. Please help. Thanks
for listening to me.
```

in response to message #8 by Mike Reed

LOL

It's OK Mike.

The good news is that you are among friends that share your addiction and understand the profound satisfaction you get from seeing, touching and using your HP RPN calculator.

The bad news is that once infected, there is no know cure. In fact, most RPN addicts would not take a cure even if it was offered to them.

I don't know what would happen to my sanity if I stopped using RPN, but I'm not about to find out.

Steve

Re: RPN is an addiction and I am Cured

*Message #10 Posted by **bill platt** on 12 Feb 2009, 11:46 a.m.,*
in response to message #9 by Steve Simpkin

I am finally cured. I am far less RPN dependent now than I was when I discovered the museum years ago. Paradoxically my exposure to all of these RPN types opened my eyes to other solutions--because we have a wide ranging group of thinkers and communicators here, I learned about the 27s, the Sharp PC series, the Casio ideas, etc.

Today, I like my 27S a lot. And I find that the 48/49/50 series is great for algebraic, too--I often put in algebraic objects within '...' and then evaluate.

When I use my 35S, for larger problems I go into equation mode rather than the stack, and work out a problem algebraically. No worries about running out of memory, you get to correct the input if it doesn't work, etc. Far superior to the simple RPN interface. I found the same idea useful in the ill-fated hp 30S.

in response to message #11 by Martin Pinckney

Haha!

I can't take credit as the first though. That would be Valentin Albillo.

Or maybe even HP...I find this particular machine really interesting...

http://www.hpmuseum.org/hp9820.htm

"The calculator compiled each algebraic expression into an RPN style sequence. Such compilation of algebraic expressions was a common practice on larger computers of the time, however the HP 9820A went a step further by also providing an uncompiler that converted the internal RPN sequence back to algebraic. This allowed only the RPN version to be stored. All of this was automatic." -Dave Hicks (on this site)

And here I am, longing for the proverbial Good Old Days. Those old HP calculators are an addiction, that's for sure.

Peter, I understand exactly where you are on this. But don't despair. I have solved my problem by buying used Pioneers off eBay. No, you cannot just decide to buy and order right away, like ordering from a retailer, but you can actually buy for reasonable prices, if you are patient. Although some 32sii go for $150, I have seen many in excellent condition go for around $80. Compared to $60 for 35s, and considering the quality difference, these are reasonable prices. There are other similar bargains to be had; the key is patience and perseverance.

in response to message #1 by Peter Klein

Well, the way you feel is why the 32sii and the 11c get over $100 on ebay. Some of us are willing to pay what is effectively a very small token premium to get what we are accustomed to.

Best regards,

Bill

Re: RPN is an addiction

*Message #16 Posted by **Michael de Estrada** on 11 Feb 2009, 11:15 a.m.,*
in response to message #1 by Peter Klein

You stated,

"Uh-oh, what if the 11C bites the dust?"

It won't. In fact, it will probably outlive you. I bought my HP-15c brand new over 27 years ago, and have been using it nearly every day since then. It still works perfectly. I also gave my HP-11c to my boss, who is a real key-pounder, 20 years ago and it is also working to this day. The HP Voyagers are absolutely the highest quality and most durable calculators HP has ever made.

Also, your HP-25 may just need a new battery, so don't throw it away quite yet.

You might find these two routines helpful to translate from decimal to binary and vice versa:

```
001 - 42,21,13   LBL C          024 - 42,21,14   LBL D
002 -    44  0   STO 0          025 -    44  0   STO 0
003 -        8   8              026 -        8   8
004 -       34   x<>y            027 -       16   CHS
005 - 42,21, 0   LBL 0          028 -       34   x<>y
006 -        1   1              029 - 42,21, 2   LBL 2
007 -        0   0              030 -        2   2
008 -       34   x<>y            031 -       34   x<>y
009 -        2   2              032 -        1   1
010 -       10   ÷              033 -        0   0
```

```
011 -   43  44   INT                 034 -       10   ÷
012 -   43  40   x=0                 035 -   43  44   INT
013 -    22   1   GTO 1               036 -   43  40   x=0
014 -       33   R-v                 037 -    22   3   GTO 3
015 -       20   ×                   038 -       33   R-v
016 -       33   R-v                 039 -       20   ×
017 -       20   ×                   040 -       33   R-v
018 - 44,40, 0   STO + 0             041 -       20   ×
019 -       33   R-v                 042 - 44,40, 0   STO + 0
020 -    22   0   GTO 0               043 -       33   R-v
021 - 42,21, 1   LBL 1               044 -    22   2   GTO 2
022 -    45   0   RCL 0               045 - 42,21, 3   LBL 3
023 -   43  32   RTN                 046 -    45   0   RCL 0
                                     047 -   43  32   RTN
```

Example:

```
45 GSB C          101101
10011 GSB D       19
```

Hint: Exchanging 2 and 8 in the program will result in a dec-oct converter.

*Message #18 Posted by **John B. Smitherman** on 11 Feb 2009, 10:03 p.m.,*
in response to message #1 by Peter Klein

Peter, you should consider a 12c or 12cp. Although it's weak on scientific functions a 12c would provide the same form factor and keystroke programming paradigm as your 11c. The 12c could serve as an RPN four banger while the 11c could be reserved for other uses.

Regards,

John

Re: RPN is an addiction

*Message #19 Posted by **bill platt** on 12 Feb 2009, 10:00 a.m.,*
in response to message #18 by John B. Smitherman

The keystroke programming on the 12c is not the same paradigm as the 11c. The 11c is much better--the 12c is crippled in this respect. No editing allowed. You have to use a GTO pair and append modifications to the end of the program.

Too too weird. My first RPN calculator was a National Semiconductor Mathematician that I bought used around 1976. http://spyropoulos.net/calcs-other/4510Mathematician.jpg

I had been lusting after the HP-25 since I saw one in a Canadian department store in 1975. I couldn't afford it

at the time so I ended up getting the Mathematician. I finally bought my HP-25 in 1977. I used it through high school, college and the first few years of work. After it started to malfunction in 1987, I replaced it with a HP-11C. I eventually moved onto a HP-28C, HP-28S, HP-48SX and HP-48G.

Me too.

> Quote:
>
> "Recently, I pulled out my old HP-25, and discovered that the program memory, registers and Last X no longer hold any values."

My HP-25 went through a year or two in the late 1980's where it would malfunction but it was just temporary and it works fine now! DO NOT CONNECT A CHARGER TO THE HP-25!!!! Use alkaline batteries instead.

> Quote:

I have to agree with the other posters here about the HP-33S. I received a HP-33S as a joke gift from my wife (she heard me comment on how ugly it was). I was pleasantly surprised at how good a calculator it is (after you get over the looks of it). Got it refurbished for around $20 on eBay.

> Quote:
>

in response to message #20 by Steve Simpkin

Thanks to everyone who responded. You're a really friendly group of "enablers." :-)

I just rediscovered something very helpful. There is a great generic do-everything RPN calculator for Windows called Excalibur. It isn't specifically an HP emulator, but it was clearly inspired by the HP line. The usual freeware disclaimers apply, particularly with respect to floating point accuracy on a PC.

I'd used Excalibur before, but forgotten about it. The latest version is here:
http://www.geocities.com/dbergis/freeware.htm

Excalibur has good binary/hex support, so I can just use that at work when I occasionally need it. With that, I really don't *need* to do anything more immediately. My 11C is still going strong.

So I can sit back and watch ads and see if an affordable sample of the "big hands friendly" later models appears. Getting a 12C as a spare four-function is certainly possible (they're plentiful and cheap). As is picking up a 33s, if I can get past the fact that the Enter key isn't where God and Hewlett ordained it to be.

Thanks again, everyone! --Peter

I wish I still had that Hallicrafters, and the National we had, too. My father and I were fixing them back in 1994. Then he sold his house and I was busy working and all that old tube Ham radio stuff went.

My father bought me my first calculator--an HP 11c --in 1982.

I started my ham radio operations in 1960 (when a freshman in high school) with a Hallicrafters S20R which my Dad had purchased just after World War II in 1946 (about when I was born!). This model receiver is shown on the bottom level of the rack in the picture in Bill's reference. This predates my HP addiction by 13 years! A few years after that, I blew my budget on a used SX101 MkIII.

For the electrical engineering afficionados amongst us, the S20R used the speaker coil as the smoothing choke in the DC power supply!

Up until about 10 years ago, my Dad still had that S20R receiver, but it seems to have disappeared when he and my mom moved to their retirement community.

HP48 gx Connectivity Tips

*Message #1 Posted by **JJB299** on 9 Feb 2009, 5:59 p.m.*

After battling with the hp48 for a couple days over connection problems, I wanted to share some of my findings with the community.

I am using the hp48 as data collector (with TDS surveying software) for my surveying business. I borrowed it from a friend, and didn't get the full story with how to download data from it to my PC. My current setup is using a Windows XP PC that has a COM port.

Wanting to connect to the hp48, I searched the web and found several programs that connect to the calculator: the original Kermit DOS program, hp48explorer, HPcomm Connectivity Kit, and Conn4x. After I connected the hp48, set up the transfer settings, and put it into server mode, nothing would work for me.

So here are a few pointers for those of you that have the same headaches as I have had:

1. Serial cable

I highly recommend finding the original serial cable that came with the calculator to hook it up to a PC. But if that is not an option, I have found a good set of instructions on how to build your own serial cable here (about 3 quarters down that page): http://www.faqs.org/faqs/hp/hp48-faq/part3/ I managed to find a serial mouse that was mentioned in the article at Radio Shack and I snagged a tiny connector that fits into the hp48 jack from an old CDROM. The connector that the author of the link is talking about isn't found in newer computers.

Note: for surveyors who use an "environmental case" with a serial connection, see surveyors' topic below.

2. Device Manager settings

Even after a good serial cable is hooked up to the computer's COM port, you still might have problems connecting to a PC. All the programs I mentioned above would still not recognize the calculator I was using. I found that the COM port might need to be freed up.

If your computer has a dial-up modem installed, you need to disable it (hopefully you are using a separate LAN card for your internet connection). The modem that is installed (mine is an old 56k) will usually be taking up the COM1 port. My setup had a modem that was taking up COM3 and a "communications cable" that was taking up COM1.

Go to the Properties menu of My Computer. Go to the Hardware tab. Click Device Manager. Under Modems, right click on any modems that are installed and choose Disable. Under Modems, right click any "connection cable between two computers" and choose Disable. Close all windows.

This should free up the COM port and allow you to connect to the PC. I was able to connect no problem after this.

3. Surveyor's environmental case

If you use an environmental case with your hp48, you may have problems connecting that case to your PC.

I am using the hp48 with an environmental case to connect to a TOPCON GPT3000 total station and using the TDS software for surveying commands. That environmental case (a plastic case to protect from the elements) has a serial port that connects to the hp48 serial jack. The serial port works great with the TOPCON instrument, but wouldn't allow me to connect to the computer.

I found out that the RX (receiving) pin and the TC (transmitting) pin on the case port was switched when it was soldered on. This naturally had something to do with the way the TOPCON instrument communicates with the hp48.

The proper pin arrangement is this: (see this website: http://www.faqs.org/faqs/hp/hp48-faq/part3/)

HP48 rs232-9 serial cable 1 shield, not needed 2 2 3 3 4 5

Where HP48 pin 1 is the pin closest to the upper right side of the calculator screen.

I found this out the hard way when I tried to connect the case to the computer with a female-female rs232 serial cable. I got errors like "unexpected packet received" and "could not open port".

If the female-female serial cable is the route you want to take, you need to cut the cable in half, find out which wires go to which pins (you only need pin 2, 3, and 5), and then switch the 2 and 3 pin wires. Keep the pin 5 wire where it is. And try to figure out which end belongs to which device.

Note: I had a radio shack RS-232C cable, part number 26-152B. Here is the procedure I took: Cut the wire so there is a short piece (hp48) and a long piece (computer). Keep the yellow wire together (pin 5). On the short side (hp48) connect the red wire to the brown wire on the long side (PC). On the short side (hp48) connect the brown wire to the red wire on the long side (PC). Connect the short side to the hp48 environmental case and the long side to the computer.

I do not recommend this option, try to connect directly to the hp48 and cut out the middleman. (see above for where find out how to make your own serial cable.)

4. Surveyor's software.

To get your data our of the calculator (the coordinate file and the RAW file), you need to use a surveying software program. The above mentioned programs (Kermit, hp48explorer ... etc) cannot retrieve these files. I recommend Carlson Survey or TDS Foresight. Both are available as free trials offers if you need them in a pinch.

The instructions for downloading from Carlson is found here: http://update.carlsonsw.com/kbase_main.php?action=display_topic&topic_id=465

That's all. Good luck.

Re: HP48 gx Connectivity Tips

*Message #2 Posted by **bill platt** on 9 Feb 2009, 9:01 p.m.,*
in response to message #1 by JJB299

I think you should copy that into the ARTICLES forum, which doesn't go way into Archive land. It is a very nice reference summary!

You might get some good feedback here that you can add to it, too.

in response to message #1 by JJB299

Someone here, I think (obviously I forget who) suggested I get a serial to USB converter and then plug my HP-48G and HP-48G+ into a USB port on my WinXP PC when I had connectivity issues.

That worked, but only if I use a particular one of the connectivity programs you mentioned with it. Again, I forget which one, though I just used it several weeks ago; I think it was Conn4x. I'll check and repost on this thread. The others couldn't see the calculator.

ERAMCO MLDL OS - other version?

*Message #1 Posted by **PeterP** on 9 Feb 2009, 3:32 p.m.*

Hi,

the normally (e.g. on TOS) available Eramco MLDL OS manual describes a very handy RAMWR function which allows to directly write into the MLDL ram, similar to HEXEDIT from HEPAX or MCED from Zenrom.

I'd like to add such a function to a little tool-rom I am putting together for myself.

However, all the .MOD files I can find have a version 7b which does not have the RAMWR function (and in general has quite a different set of functions than described in the manual).

I was wondering if anyone either has a different Eramco MLDL OS version which has the RAMWR function or a standalone code for a RAMWR function that I could use. I don't want to try to dissassemble e.g. the HEAPAX and try to find all pieces that are needed for its HEXEDIT functions...

Thanks!

Peter

Re: ERAMCO MLDL OS - other version?

*Message #2 Posted by **Meindert Kuipers** on 10 Feb 2009, 9:28 a.m.,*
in response to message #1 by PeterP

Hi Peter,

I have searched as well, and I do not have the ROM image, but I do have the sources (and so do you ;)

BTW disassembly is much easier with M2kM ...

Meindert

HP-29c Power (?) problems

*Message #1 Posted by **Xavier A. (Brazil)** on 9 Feb 2009, 11:34 a.m.*

Hello everybody,

At first I really do apologize for my english (well, better than my school's english, but not perfect).

I have a problem with my oooold HP-29c that I would like to expose here :

I stored this little machine years ago, WITH the battery pack inside (approximately during 20 years). When I realized it was a mistake, I put it away (about 6 months ago); true, this makes 19.5 years of ignorance.

Well, I put a charger with the battery pack inside the HP, and observed some kabbalistic signs on the display, those who seem to indicate some corrosion problems. But in fact, the battery compartment was very clean. Pressing the keys just made the display a little more silly (or mad), so I decided to open the beast.

It was pretty clean inside: so I just cleaned the keyboard with white vinager (50% v, 50% water), letting it into this solution during 15 minutes, pressing the keys meanwhile. I changed the liquid, using only water, and rinsed the keyboard. Then I tried to use a (cold) hairdryer to dry it, but it had no effect since the keyboard is constituted of two very very close plastic panels. So I just let it in a black box, in the sun light (here it is summer, and the temperature in the box should have reach the 50 °celcius) during a whole week.

Finally, I reassembled the whole machine a week ago and it was OK! No more kabbalistic signs, keys were working for the best, and I even made a program to verify everything, and I was very, very happy (this machine belonged to my grandfather...).

Yesterday, I put away the battery pack to charge it in a HP-21. This is a pretty good battery pack for its age : while I am typing here, the machine is displaying Pi since two hours and a half without the charger.

But I just tried this morning to put it in the 29, just to use this machine a little more...

and then, after the usual 'error' message indicating the memory loss, the display and keyboard became one more time completely mad!

So what ?

- I can not believe this is a corrosion problem.

- I can not believe, (but I am not so sure) that the keyboard is so dirty that some dust has 'moved' in the machine last week.

But perhaps this is another thing that escaped to me. Perhaps battery requirements are different between an Hp-29c and an HP-21. Perhaps...

Well, if someone has an idea, or just want to suggest something... it would be a pleasure. Thank you for your attention.

Re: HP-29c Power (?) problems

*Message #2 Posted by **Marcus von Cube, Germany** on 9 Feb 2009, 2:21 p.m.,*
in response to message #1 by Xavier A. (Brazil)

If you didn't fry your 29C (charger with bad battery is a deadly combination), you should remove the NiCad cells and replace them with normal alkalines. Don't forget to put the charger in a safe place like the dust bin. ;)

Re: HP-29c Power (?) problems

*Message #3 Posted by **Xavier A. (Brazil)** on 9 Feb 2009, 3:14 p.m.,*
in response to message #2 by Marcus von Cube, Germany

One more time, thank's for your help, Marcus.

In fact, after having posted this, I let completely discharge the batteries. Then I put it back in the HP-29c, plug it to the adapter, and you know what? it works.

This means that the Hp-29c is NOT supporting the full charge of the pack (and this is the next question for me : why ?). I don't have any voltmeter yet, but I shall make some measurements next week-end. I'll let you know, thank you.

Re: HP-29c Power (?) problems

*Message #4 Posted by **Walter B** on 9 Feb 2009, 6:06 p.m.,*
in response to message #3 by Xavier A. (Brazil)

Boy, are you lucky!! But don't you ever do this again!!! Life will not let you get away with this a second time.

Re: HP-29c Power (?) problems

*Message #5 Posted by **Xavier A. (Brazil)** on 10 Feb 2009, 6:30 a.m.,*
in response to message #4 by Walter B

Thank you for this, too.

The charger is a 82041A. The HP-29c is from Singapore, serial 1903S...; maybe the electronic of this latest generation is better?

Math Curiousity...an old fashioned approach

*Message #6 Posted by **Hal Bitton in Boise** on 9 Feb 2009, 3:26 p.m.,*
in response to message #1 by Xavier A. (Brazil)

Hi Xavier,
Rest assured, your english is excellent.
Yes, all the Woodstock series machines use the same battery pack.

I have a 29c (which I purchased new in 1978) that exhibits the same behavior as yours from time to time. It will work one day, then "go mad" the next. What I have found to be the cause of this problem is bad electrical contact between the battery pack and the machine, and even within the battery pack itself. If I remove the battery pack and scrub the contacts, and the ends of the batteries lightly with a pencil eraser (or sometimes an alcohol swab) it fixes the problem. If you are using a rebuilt battery pack, there may no longer be the spot welded metal strip to form the internal connection between the cells (at the closed end of the battery pack). If so, then the connection is made only by the internal spring (which also supplies the preload to hold the battery

pack in place), and that interface must be kept clean and polished also. If the battery pack still has the center bridge, and shows no sign of being opened at the seam, it's probably factory original.

One more ***very important*** re-iteration I would make is that you never, ever connect the wall charger to your 29C. The battery pack also serves as the voltage regulator when the charger is connected, and if the battery pack has a bad contact, an over-voltage is applied to the machine, which can spell disaster. This would hold true even if you don't turn the 29C on while connected to the charger, as the CMOS circuitry (which implements the continuous memory) is exposed to battery voltage even when the machine is off. Using a 21 to charge the battery pack (as you mentioned) is OK as long as you don't turn the 21 on while connected to the charger.
I've cut the center bridge out of my battery pack, which lets me remove the cells and charge them externally (I use AA NiMH).
Hope this helps.
Best regards, Hal

Re: Math Curiousity...an old fashioned approach

in response to message #6 by Hal Bitton in Boise

Well, my battery pack is not so new, batteries have the writing 'Hong-Kong' on their rose-red plastic dresses... a pretty sexy battery pack, indeed.

Thank you for this advice, Hal, I think I'll do as you said, will use AA NiMH (and try to find them in Brazil). Do you know how much time may a program work until discharge ? Regards, Xavier

HP 29C battery

*Message #8 Posted by **Hal Bitton in Boise** on 9 Feb 2009, 4:44 p.m.,*
in response to message #7 by Xavier A. (Brazil)

First of all, I must apologize for my whacky browser...I asked it to remember my password, and it also remembers the subject line at the time "Math Curiousity...an old fashioned approach" and inserts it every time. This must look absurd (thanks Google Chrome!)

If you are referring to how long will the calculator retain memory with the battery pack out, it's easily long enough for you to change the batteries (even if you have to remove them from the pack and re-insert charged cells). I recall I've had the battery out of my unit for an hour or so, with no loss of data. To be sure of data retention, you should have a spare pair of cells, ready to be exchanged with the discharged ones.
Hal

Re: HP 29C battery

*Message #9 Posted by **Xavier A. (Brazil)** on 9 Feb 2009, 5:43 p.m.,*
in response to message #8 by Hal Bitton in Boise

Thank you again, this advice will be very useful; I didn't know that, I used to know that the Hp-41 had this feature, but I'm very pleased to learn it for the 29.

Well, if I want to launch a BIG program (for ex., calculate Pi with 300 decimals), do you think one battery cells pair would be enough ? In other words, can this kind of power supply deliver a sufficient current during more than 24h, or better?

Best regards,

Xavier

P.-S.: I realize that my question is a little silly: actually I only need to stop the program, change the pack, and run again, isn't it ? By the way, the autonomy of your cells is interesting, and if you know it...

Re: HP 29C battery

*Message #10 Posted by **Hal Bitton in Boise** on 9 Feb 2009, 6:28 p.m.,*
in response to message #9 by Xavier A. (Brazil)

Well, the original battery pack would run the machine for about 4 hours or so. So I'm thinking that even high capacity Nimh cells would give at best 6 hours (but that's only a guess). I'm sure they wouldn't last 24 hrs.
hal

HP-29C

*Message #1 Posted by **Jorge Sanchez** on 8 Feb 2009, 11:10 p.m.*

Hey there,

I recently bought an HP-29C on eBay. When I turn it on the display show all 0´s (ceros) and they keyboard does not responde. The batteries are a reconstructed NiCd I use on a HP-25C where they work flawlessly.

Does anyone know what I could try to fix this issue? Or point me in the right direction?

Thanks in advance!

HP-67 clutch rebuild problem

*Message #1 Posted by **Michael de Estrada** on 8 Feb 2009, 3:11 p.m.*

The clutch metal sleeve has separated from the worm gear shaft and all the hard filler material (glue or epoxy?) has clumbled and separated from the worm gear shaft. How do I re-attached the sleeve to the worm gear shaft so that it is tight and concentric?

Re: HP-67 clutch rebuild problem

*Message #2 Posted by **Rainer Wiedemann (Germany)** on 8 Feb 2009, 3:38 p.m.,*
in response to message #1 by Michael de Estrada

Michael,

maybe this article (http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=262) is helpful. There might be even more informations in the museum's article forum.

You could also consider have somebody turn a sleeve, which fits directly on the motor shaft with one end, the other end matching the worm gear diameter and glue the parts together thereby giving up the clutch at all. This would yield perfect centering of all parts.

Considering the size of the sleeve, this would have to be a skilled watchmaker.

Re: HP-67 clutch rebuild problem

*Message #3 Posted by **Michael de Estrada** on 8 Feb 2009, 7:54 p.m.,*
in response to message #2 by Rainer Wiedemann (Germany)

Rainer,

Thanks for your assistance. I decided to make a coupling using wire insulation and eliminated the clutch operation. I used wire insulation with an ID = motor spindle OD and OD = clutch sleeve ID. I then bored out the insulation piece at the worm gear end until it was a very tight fit and used a modeling knife to remove sufficient outside material so I could force the sleeve over it and secure it to the worm gear shaft. I applied a tiny drop of superglue to the motor spindle and pushed it though the captive insulation piece and into the end of the worm gear shaft. Of course by doing this I have eliminated the clutch function, but I have tested the card reader by applying 1.5V directly to the motor and pulling a card through repeately, and there was no sign of the motor laboring or the card jamming. Everything is now very smooth and quiet now, so hopefully this will prove a safe fix.

My review, HP 35s

*Message #1 Posted by **Elliott W Jackson** on 8 Feb 2009, 10:53 a.m.*

I recently picked up the new HP 35s, and have spent a week or so playing with it, and thought I would post my thoughts.

Background: I went through college from '80 to '84 for my engineering degree, in the heyday of the HP 41 series, and lived and died by that thing. My first was the HP41CV, and later I replaced it with the HP41CX. I had the card reader, the printer, and a couple of the ROM pacs. I had the books on Synthetic Programming, and the ROM for it. I subscribed to the various HP journals of the day.

This was back in the day when my wife and I didn't have 2 dimes to rub together, so all those things represented a signficant investment, and I was COMMITTED to that thing, both fiscally and emotionally, heh. I was an advocate, exchanging programs with my other equally-demented HP friends, and other users across the campus. I wrote dozens of programs for it as I progressed through my courses.

In recent years my old HP41 has been used less and less, as PC's, cell phones, and Blackberries/PDA's have replaced some of the functionality we used to crowbar into the calculator. But I still use it for lots of things, and when the keyboard began to misbehave a few years ago (the "1" key would sometimes register a 1, and sometimes not, making using it a bit exciting), I began to look around for a replacement.

This was around the early 2000's, and the models at the time just left me cold, I had no desire to purchase one. I have just been limping along with my occasionally-"1"-key-challenged HP41CX and making the best of it. However, I recently ran across the new HP 35s, and thought "aaahh, finally, HP is going back in the right direction!" and bought one. After a week of playing with it, I have a few thoughts to offer:

Positives:

- Love the old-style tactile keyboard

- the Equation Editor, and how it integrates with the Solver and the Integrator, is just great.

- the Solver is a huge addition from the HP41 days, wow, nice

- the Integrator is nice too

- the ability to handle complex and vector types natively, as single entries in storage memory or on the stack, is great

- the Linear Regression functions are nice and well done

- Like the Base conversions, although I'm still a bit confused about how to use them. I'll figure it out though.

Opportunities to Improve (see, I'm being kind in my language):

- I'd like to know who decided that "STO" should be a shifted key, and that "MODE" needed to be unshifted. That one just boggles my mind. Did the design team who came up with that actually have anyone on the team who uses

these things? The MODE key allows you to switch between Degrees/Radians/Grads, and Algebraic/RPN modes. Here's a hint: I go between Degrees and Radians very infrequently, and when I do, it's a one-time thing I do at the beginning of a calculation sequence, not on the fly. I've never used Grads in my life, and I'll never use Algebraic mode. And even if I hated RPN and preferred Algebraic, my comment would be "I'll never use RPN mode", my point being, people are either one way or the other with ALG/RPN, they don't need to switch. The selector between ALG and RPN could be a toggle switch in the battery compartment, as frequently as it will ever be used. There is just nothing the MODE key does that merits it being a primary, unshifted key, particularly if it displaces some other function that should be unshifted, such as "STO". STO is a key I use constantly, on the fly, during calculation sequences, to stash some intermediate value for later recall and use, and the fact that it is shifted is just really irksome. If there is a glaring fault on the ergonomics of this calculator, this is it.

- Ok, I feel better now having gotten that out. But seriously...

- In this day and age, there really needs to be a USB connection capability, with the ability to move equations and programs back and forth between the PC. All my phones and PDA's have that, with robust connectivity options. Calculators have to step it up and make this a standard feature. Without some mechanism to store/retrieve programs, a programmable calculator is extremely hobbled - no "serious" software will ever be written for it.

- The "10^x" and "LOG" functions should probably go on one key, and likewise the "e^x" and "LN" functions. Right now those functions are actually on different keys (10^x / e^x are on one key, and LOG / LN are on another). I have no problem with them all being shifted, but since they are inverse functions they likely should go on the same key, like the trig functions. That one is not as big a deal as my STO/MODE rant above, but it does lead me back to the question of who was on the design team that thought that 10^x/e^x and LOG/LN went together, rather than e^x/LN and 10^x/LOG. Yes I understand that "textually" they look better the way they are, but mathematically it doesn't make sense. I don't use them that often, so when I need "LN" for example I go scanning and maybe I see "e^x" and think "ok, there's e^x so LN should be ... nope not there." Again, not that big a deal, more of an ergonomic zit.

- All the unit coversions built onto the keyboard really could have been in one of the menus. Every engineer will use some of them, but most won't use them all, and trying to guess which ones we'll all use is just a recipe for wasted keyboard real estate. Another ergonomic zit.

- the mechanism for indirect addressing is a bit clumsy, in that you have to use the I and/or J variables. I preferred the HP41 paradigm, where any register from 0-99 could be used as an indirect register.

- it would be really nice if you could both directly and indirectly access any register. The HP 35s allows you to indirectly access any register (A..Z, the statistics registers, and 0..800), but only allows direct access to the named A..Z registers.

Summary: While I've spent more time ranting about the negatives than the positives, I still like and recommend this calculator. It has some huge improvements over my old HP41's, and huge ergonomic improvements over the more recent HP calculators, in the keyboard if nothing else. My rant about the STO key is really more of a "but it could have been so much BETTER" comment, rather than a "this calculator is a step down" comment.

So, message to HP: You're doing the right things, you're going in the right direction again, and you've managed to stir the passions of this old calculator user at least. Now, get that STO key back on the unshifted keyboard, demote the MODE key to something shifted unless you have keyboard real estate to burn, and get a USB port in there. Fix the silly e^x/10^x LOG/LN layout if you get around to it, and consider demoting all those unit conversions to a menu somewhere.

Thanks, Elliott

in response to message #3 by Elliott W Jackson

I fear, its just a virtual dream. ;)

Re: My review, HP 35s

*Message #5 Posted by **Elliott W Jackson** on 8 Feb 2009, 1:31 p.m.,*
in response to message #4 by Marcus von Cube, Germany

Ah. I also see now, from digging through the archives, this topic has been discussed at length before - apparently I am late to the party!

I do see lots of other comments about the shifted-STO key and lack of USB connectivity.

Re: My review, HP 35s

*Message #6 Posted by **bill platt** on 8 Feb 2009, 1:43 p.m.,*
in response to message #5 by Elliott W Jackson

Late to the party, Hihi!

Some of us even deconstructed different ROM versions of the HP 33s that came a few years ago. We tracked every little change, ad absurdum. You have met the Holy Grail of Afficianado Calculatorum.

Best regards,

Bill

Re: My review, HP 35s

*Message #7 Posted by **Walter B** on 8 Feb 2009, 6:16 p.m.,*

in response to message #6 by bill platt

Yeah, late to the party :) That party lays siege to HP like a wolf pack, with the grey ones howling in chorus "Bring back..." -- then the chorus splits into single voices "... the 15C", "... the 41CX", "... the 42S", "... quality". Only very meddlesome, nosy wolflings rise their little voices "Launch a 43s!" d;-)

Re: My review, HP 35s

*Message #8 Posted by **Patrick Rendulic** on 9 Feb 2009, 5:26 a.m.,*
in response to message #7 by Walter B

It is never too late to "complain" about what you dislike. If complains get forgotten there won't be an improvement in future calculators.

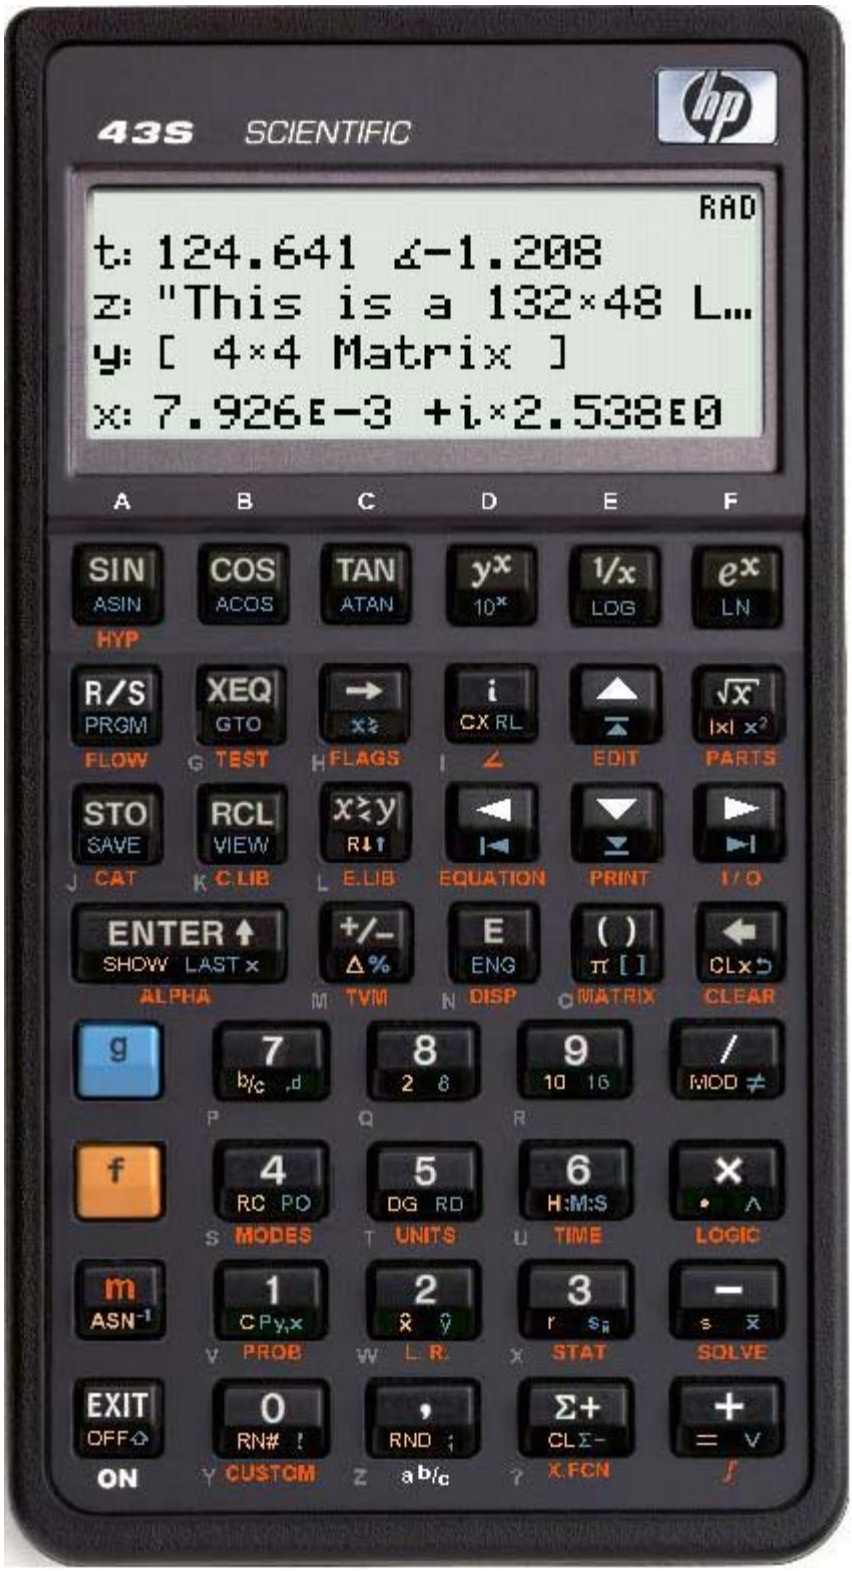
What about the keyboard problems? My 35s still misses keys when I do fast additions, that's also the reason why I stopped using it. The display scratches easily. That's not the case on the 32sii. Definetely not an improvement.

As for the 43s, ..., that would be really nice! I would just add one minor change, an alpha keyboard like the one of the 41c. There could even be a flag setting to switch between the 42 and 41 manner to enter text and commands so that everyone gets satisfied. For new "users" 42-like entering text is too frustrating.

Re: My review, HP 35s

*Message #9 Posted by **Walter B** on 9 Feb 2009, 4:45 p.m.,*
in response to message #8 by Patrick Rendulic

"Well spoken, Patrick", the fairy whispered, "your modest wish shall be fulfilled."



Ceterum censeo: HP, ...

Walter

P.S.: As long as the LCD allows for soft keys, I'd prefer the cleaner keyboard. YMMV.

Re: My review, HP 35s

*Message #10 Posted by **Patrick Rendulic** on 10 Feb 2009, 1:26 a.m.,*
in response to message #9 by Walter B

@ Walter. Thanks! When will you start producing this beast ;).

@ HP. Wake up! There are indeed people willing to buy this.

Re: My review, HP 35s

*Message #11 Posted by **Ángel Martin** on 10 Feb 2009, 3:50 a.m.,*
in response to message #9 by Walter B

Thumbs up to the direct alpha keyboard - I never liked the soft-alpha entry like in the 42S, the 41 spoiled me from the very beginning :-)

Oh such a machine... Will this dream ever become a reality? I doubt it, so we'd better enjoy the dreaming!

Best, ÁM

I second statement 1, but not 2. The 28C features an ABCD keyboard,

a type which's only right of living is to cope with NCEES rules. This layout isn't reasonable for quick text input. OTOH a QWERT keyboard may even be done on a Voyager, as I showed years ago (more may be seen here and in further posts) -- it's a pity they have NCEES in the US of A. blocking such solutions.

Re: My review, HP 35s

*Message #15 Posted by **Jeff O.** on 9 Feb 2009, 7:38 a.m.,*
in response to message #5 by Elliott W Jackson

Elliott,
In case you did not discover the reason for the lack of USB or other means to upload and download data: if the 35s had such capability, it would not and could not be permitted for use when taking Professional Engineer and Professional Surveyor examinations sponsored by National Council of Examiners for Engineering and Surveying (NCEES) in the US. The NCEES prohibits any calculator with such capabilities, and produces a a list of approved calculators each year for use on the following year's examinations. The 35s is on that list, as is the 33s. These are the only rpn-capable calculators allowed on the test. Without the market driven by rpn-users taking the PE/PS examinations, the 35s might very well not exist.

The wisdom of the NCEES policy has been the subject of lively discussion here, search if you are interested.

Edited: 9 Feb 2009, 7:39 a.m.

Re: My review, HP 35s

*Message #16 Posted by **David Hayden** on 8 Feb 2009, 3:14 p.m.,*
in response to message #1 by Elliott W Jackson

Thanks for posting Elliot. I too was in college in the early 80's, had (and still have) a 41CV with printer and card reader.

For what it's worth, the nits that you mention are all addressed in the 50g, except perhaps for the STO problem. On the 50g, STO is unshifted, but variable names are arbitrary, so to STO something in variable "K", you have to press 4 keys (in RPN mode) ' ALPHA K STO. If the variable already exits and the soft keys are showing variables, you can store to K by pressing Left-shift <K soft key> so that helps.

I agree 200% about the USB port. By preventing the easy saving/loading of programs, they've severely limited the usefulness of the calculator.

Dave

Re: My review, HP 35s

*Message #17 Posted by **Elliott W Jackson** on 8 Feb 2009, 6:07 p.m.,*
in response to message #16 by David Hayden

Thanks for the note. I did download the manual for the HP50g, and it doesn't go into a lot of detail about the USB port. They talk a lot about the SD card.

Can someone briefly describe how the USB port works on the HP50g? What all information can be stored/retrieved, how difficult is it, where does the information show up on the PC, does it take proprietary PC software to send/receive, etc?

Re: My review, HP 35s

*Message #18 Posted by **Marcus von Cube, Germany** on 9 Feb 2009, 2:52 a.m.,*
in response to message #17 by Elliott W Jackson

You will need the software on the PC that came with the calc (or you find on the Net) or something similar in nature: An X-Modem or Kermit client that "sees" the USB connection as a serial device.

The Conn4x software package by HP works as a kind of file manager: You have read/write access to the directories on your calc and you can move the files on your PC where appropriate. The transfer format can be set to ASCII: This way, you can edit the RPL code on your PC and transfer it back to the calc. Import/export of lists, vectors or matrices into and out of a spreadsheet should be possible, too, probably after some fiddling with the file format.

Re: My review, HP 35s

*Message #19 Posted by **David Hayden** on 9 Feb 2009, 11:12 a.m.,*
in response to message #17 by Elliott W Jackson

Elliot,

For what it's worth, I hardly ever use the USB connection to my 50g, and instead transfer files via the SD card. I have a card reader on my desk, so it's quite easy to slap the card in the reader, drag & drop a file into it on the PC, and then yank the card out of the reader and drop it in the calculator.

Re: My review, HP 35s

*Message #20 Posted by **Elliott W Jackson** on 10 Feb 2009, 11:03 p.m.,*
in response to message #16 by David Hayden

After reading this note, I keep going back to the HP50g manuals and whatnot, and I just can't get past the look. It doesn't appear that the keyboard is any good (although I've read other folks talk about how deep and tactily the keys feel, almost to a fault according to some, but I sure can't see how that is true, given the pictures I'm looking at).

Also - am I confused, or is the RCL key shifted on the HP50g? It looks like STO is unshifted, but RCL is shifted? Ugh. See my rant that kicked off this thread, and replace every occurrence of STO with RCL and it's just as true. Ugh. And that Enter key...I can hear HP saying "hey, man, size doesn't matter!" While I will happily accept that delusion in regards to certain other topics, I am not willing to accept it here. Size matters.

I WANT to want a 50g, or any calculator really with a capability to store/retrieve info. But I can't make myself want it. I'm stuck waiting on the next generation 35.

It's ok I guess. I like my new 35s toy. I just can't get too fired up to write some crazy programs for it, given the inability to store/retrieve them.

Edited: 10 Feb 2009, 11:05 p.m.

in response to message #20 by Elliott W Jackson

>It looks like STO is unshifted, but RCL is shifted? Ugh

Have you ever used a 48 series calc before (just curious)? RCL doesn't really make sense as a direct key as almost all recalling will be done on a menu. Storing as well once the object exists. They are done using the menu keys. And if you don't like it. . . go ahead and redefine the whole keyboard to your desire. You have 10 built in key planes.

> While I will happily accept that delusion in regards to certain > other topics

Must . . . resist . . . joke . . .

:-)

You will not use STO/RCL on the 50g as much as you may expect. Most use the soft menu keys to recall/execute and left-shift-soft-key to STO and right-shift-soft-key to RCL (no execute). When programming STO is used, but variable recall is achieved by just stating the variable name. No need for RCL.

> Quote:

> will happily accept that delusion in regards to certain other topics, I am not willing to accept it here. Size matters.

I have heard various rationals for the location and size of the ENTER key. What about the location of the arithmetic operators? No arguments there? They moved from left (with the ENTER) to right (without the ENTER) and the order (top to bottom) changed, then the ENTER moved right (50g/33s), then left again (35s).

I will share one observation about location. I find using the 41 with the operators and ENTER on the left with numbers and R/S on the right very natural. OTOH, I find the 50g with the operators and ENTER on the right also natural and easy to use. But, I have to admit, aesthetically the double-wide ENTER is missed.

> Quote:
>
> I WANT to want a 50g, or any calculator really with a capability to store/retrieve info.

Get a 50g. In every sense it is a superior device compared to the 35s. You'll adapt to the keyboard layout in no time.

Not only do I refuse to use calculators without I/O for production use, but I also refuse to use calculators without an emulator. I prefer to develop and test on my laptop then download to the real thing or iPhone emulators. I do make one exception and that is my 15C. The programming capacity is relatively limited and can be backuped to paper in minutes and restored in minutes.

Back to the 50g. There are two emulators (one for Windows and the other for Linux/Unix/OSX). Just about every other HP RPN model also has emulators for Windows/Linux/OSX. Absent is the 35s.

> Quote:
>
> I just can't get too fired up to write some crazy programs for it, given the inability to store/retrieve them.

Get a 50g emulator and give it a try.

Re: My review, HP 35s

*Message #25 Posted by **Martin Pinckney** on 9 Feb 2009, 10:37 a.m.,*
in response to message #1 by Elliott W Jackson

> Quote:
>
> - the Solver is a huge addition from the HP41 days, wow, nice

Elliot,

Ironic, because I had the 35s for a while, and got rid of it, one of the main reasons being the Solver.

Actually, the Solver IS great ... unless you have used the one on the 27s (17b, 17bii similar). With these you get full alpha capabilities, so that, for instance, you can name a variable "DISTANCE", instead of just "D". Imagine the huge difference this makes, if you have several equations with different "D's" in them. You can also name equations, so that when you scroll through the equation list, it is clear what they are, instead of having to figure it out by looking at the terms in it.

This illustrates my beef with the present-day HP. The calculator would make better use of all that memory if they had implemented the 27s type of Solver (and also if they incorporated some of your other comments). But (apparently), HP would rather put together a quickie, taking the easiest route (just upgrading the 33s firmware), than to spend the money and time to produce a truly great calculator.

I agree on this solver aspect. It seemed to be an incremental step from the 32sii. The big enormous improvement over the 32sii and hte33s solver is the ability to edit the equations--previously you had to backspace over code to get to where you needed to change!

It would be a good idea, from a product sales aspect, to continually improve the 35S line. It should definitely have full alpha variable naming. It should also have the nifty softkey variables system of the 27S/17b.

Other upgrades that should be done is to bring back a real rectangular to polar conversion, the ability to decompose vectors and to build them from stack objects (with the latter, the former might be accomplished anyway),

improved Octal/Hex/Binary--more like previous models,

Ability to move equations in and out of the equation list and program memory--in other words a "copy/paste" capability,

Ability to integrate and solve in the same program, a la 15C.

Full indirection

Put store on a primary position and bury mode as a shifted function.

If they keep adding new features every two years, people will keep buying them--just like the old days! Maybe anyway....

HP 36S next year, retire the 35S, use the same tooling...

Please not exactly the same tooling, but move the cursor cross one row down to make way for a complete line of 6 soft keys. Jake suggested this several times here, too. See above in this thread for a design which can be projected easily on such a 36s as well.

Ceterum censeo: HP, launch a 43s (you may also call it 36s).

Walter

The Solver on the 17bii, 17biiS (Silver) and the rest of that family, FAR outpaces the 35s. It would be a dream if the 35s had this capability. I -- like many others -- underestimated the Solver on the 17bii for the longest time, and then once I had one, it was like "wait, where did THIS come from?!".

The 35s is a great machine. But go check out the other Solvers and you'll be even more impressed.

thanks, bruce

>
> go check out the other Solvers and you'll be even more impressed.

I keep finding nifty features that I hadn't noticed before.

For instance, did you know that you can STO and RCL the Solver variables, and therefore do operations with them? To do this you use the soft keys to access the variable name. So to use the results of several different equations you scroll the equation list and press CALC, STO or RCL the variable name, exit the equation to scroll and pick up the next variable you need... all the while your HP keeps track of your pending operations!

Maybe "everyone" already knows this, but it was a cool discovery for me.

Hi Martin:

Have you discovered the Let and Get functions yet? They will blow your mind.

See the L(...) and G(...) in the following:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=222

I love it when W.B. states, "Anyway, being an engineer, I break out in a rash if I don't have access to the trigonometric and inverse-trig. functions." :-D

Bill,

I had heard of them, but never investigated. Now you have tweaked my curiosity!

I have used SGN and nested IF's, though, which make for some powerful routines.

*Message #32 Posted by **Michael de Estrada** on 9 Feb 2009, 1:56 p.m.,*
in response to message #1 by Elliott W Jackson

I agree 100% with your comments as well as many made by others in reply to your post. I would add the following gripes I have with this model:

1) The decimal point is very hard to pick out in certain situations. Type in 22,222.222 and then try to find the decimal point. This is in stark contrast to my beloved HP-15C, which I believe had the best display ever (as well as the best keys). Still, it's a vast improvement over the HP-33s, where the decimal point was impossible to see.

2) Why even bother to have algebraic mode at all? As you point out, there are RPN people and there are algebraic people. If HP eliminated this unneeded option by making this a pure RPN calculator, this would free up a lot of key label space through the removal algebraic constructs such as = () [].

3) One of the few features I liked about the HP-33s were the soft rounded grippers on the sides of the case, which made it very comfortable and secure when holding the calculator in my hand. The HP-335s is hard slick plastic, and several times the calculator has squirted out of my hand. Well, at least it past the drop test.

Still, there's more to like than hate with the HP-35s, and it's a vast improvement over the HP-33s (except for the shifted STO), which had simply awful ergonomics, keys and display.

Equations in programs are a useful feature and you will not give up vectors or complex numbers: The parentheses are neccessary.

Re: My review, HP 35s

in response to message #33 by Marcus von Cube, Germany

You bring up a very valid point, which occured to me after I made this posting. Due to the very limited capabilities of the HP-35s with only single letter variable names, no matrix capabilities, and no calculator to PC communication capability, I have never used mine for equation writing or programming. Instead, I use my beloved HP-48SX for these purposes, and just use the HP-35s as a fixed-function calculator. Not to split hairs here, but parentheses () are useful for equations, brackets [] are required for vectors, and neither are required for complex numbers. Also, the equal sign = is required to write an equation. So, maybe HP will bring forth the HP-43s and make us all happy? (when pigs fly)

To get a bigger market share, without having to produce two different calculators.

> Quote:

I am one of those algebraic people. But when I had my 35s, I would switch to RPN when doing repetitive unary functions. In fact, that's how the older algebraic calculators worked, so it is familiar to me. I can learn to live with SIN(X) [the 35s way], instead X SIN [the 27s way]. But MILE(X)? This is taking algebraic notation to an extreme. I could give other examples, but my point here is that there are user (not just marketing) benefits to having a dual-mode calculator.

*Message #37 Posted by **Michael de Estrada** on 9 Feb 2009, 10:15 p.m.,*
in response to message #36 by Martin Pinckney

I would be interested to know how much added market share HP has obtained though the addition of algebraic mode to the HP-35s. I suspect it is negligible, since there are numerous very competitive and more cost-effective purely algebraic alternatives from competitors such as TI, Sharp and Casio. I think HP's reputation in the area of high-end scientific calculators was built on RPN, and I think any attempt to corner the market by pleasing everyone is ineffective. I seem to remember a fable by Aesop with the moral that if you try to please everybody, you end up pleasing nobody.

*Message #38 Posted by **Patrick Rendulic** on 10 Feb 2009, 2:42 a.m.,*
in response to message #37 by Michael de Estrada

After the discussion was launched 2 days ago, I decided to give my 35s a second chance. I checked two things: ALG Mode, which I never used up tp date and I checked whether my machine still misses keystrokes.

As for ALG mode, well in comparision to a Casio with Natural Display, the ALG mode of the 35s is by far outdated. Some think that ALG mode gives HP better sales. For my part, I never saw a person use an 35s at my school. Take average people wanting a calculator. Do you really think that they buy a $60 HP when they can get a $20 Casio with a far better and intuitive user interface? My students have become more than enthousiastic after I showed them how to use their Casio to solve quadratic equations, linear systems, how to integrate numerically and how to do regression statistics. They would never have bought the HP for three times the money but with less obvious functions.

As for the keyboard issue, I did a full reset to have a clean calculator. I then did usual calculations, in my case additions of scores my students obtained at a test. And again, it was not possible to get the right answer at once. When doing additions I am quite fast and the 35s misses my keystrokes. This happens, when I key in numbers and when the "busy" annunciator is lit on. It seems that there is no buffer, or a bad buffer, for storing key inputs. All my other HPs DON'T show this behaviour, they are faster than I am. In my view this is simply a design fault (and a big shame). The 35s is UNUSABLE for my applications as I cannot rely on the results it displays.

So this evening the 35s will again disappear in its drawer and the felow 32sii will be the workhorse.

The additional market share I was speaking of is among practicing engineers/engineering students, not "average people". Believe it or not, there are those of us who value both ALG mode and HP quality/look/feel.

Another HP35s bug

*Message #40 Posted by **Ian Stanley** on 13 Feb 2009, 9:38 a.m.,*
in response to message #1 by Elliott W Jackson

thanks for the review - just got mine yesterday and working through the manual.

I like to return to an old style keyb layout even if it is not quite the quality of the 42s or 10C... series

Even several months on HP still seems to be shipping buggy units and quite a few of the HPMuseum's bug list are still present

After working through the manual ... I'd like to add a new one ....

On page 14-6 we have an example of Combinations of People.

[2] [4] [enter] [6] [left shift] [nCr]

works fine

the second part of the example is slightly different :

[2] [4] [enter] [6] [left shift] [nCr] **[x<>y]** [divide]

Unfortunately after processing the nCr the 35s clears the stack **and does not return the TOTAL NUMBER OF COMBINATIONS into the Y register**

Re: Another HP35s bug--it isn't one

*Message #41 Posted by **bill platt** on 13 Feb 2009, 10:14 a.m.,*
in response to message #40 by Ian Stanley

Hi Ian,

That is not a bug. You are misinterpreting the manual.

First you should edit your message--it is page 4-16.

In the worked examples, first you calculate the number of combinations of 24 people, 6 a time. That result (134596) is in the x-register. The next worked example is 14 women grouped 6 at a time. You do this problem without doing any clearing or rolling etc of the stack. Once you have solved this problem, you will see (3003) in the x-register and (134596) in the y-register. X<>Y exchanges them, and / gives you the probability.

This works the same as the HP 32sii.

HP-71B sunk key

*Message #1 Posted by **Marcus von Cube, Germany** on 8 Feb 2009, 9:52 a.m.*

My otherwise fully functional HP-71B has a sunk [=] key. It works and even clicks. It just sits a little deeper in its hole. Anything I could/should do about it?

Marcus

Re: HP-71B sunk key

*Message #2 Posted by **Vladan Dugaric** on 8 Feb 2009, 10:36 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Marcus,

My HP-71B over time developed three sunk keys - gold f, blue g, and right arrow, and space and down arrow were getting softer. In addition, there was a bit of dirt under many keys and some of them were getting stuck or did not register unless pressed firmly.

After many years I decided to disassemble the keyboard by cutting the heat stakes, and found out that all the snap discs were fine, without any cracks or dents, but the rubber film that is between the key caps and the snap discs got punctured by plastic posts that project from the middle of each key and press the snap disc. My solution was to turn the rubber film over around the horizontal axis, so that bottom was now top, and front was now back. The holes in the film that correspond to the heat stakes are almost symmetric with respect to film, but slightly shifted up, so you either have to cut off a millimetre or so from the other end of the film, or just tuck it in (what I did). Then reassemble (after cleaning all snap discs and key caps and contacts as needed).

Beware: you only have one go at re-melting the heat stakes; check carefully that you did not misplace some key caps, since if you re-melt heat stakes and then realise you need to break them again, you will be left with too short heat stakes.

After that, the keyboard is nice again, without any sunk keys. Gold-f is still somewhat soft, but that is probably because it was used a lot and the hole in the rubber hole under that key is a little larger than other few holes that were punched through by the keys.

Vladan

Update on my 9114 repairs in 2000

*Message #1 Posted by **Steve (Australia)** on 8 Feb 2009, 9:41 a.m.*

In September of 2000 I wrote this article http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=78 describing my 9114A repair journey.

I've recently looked around and found some references to my article and I am very flattered that people have considered it useful. I would like to complement whoever suggested isopropyl alcohol, and PeterP who has written a very useful reference.

A couple of months ago I tested the disk mechanism again and found it was gummed up again. Without thinking I pulled the disk out and immediately thought I had probably just ripped a head off it :-(

Anyway, someone got in contact with me regarding a problem with their 9114 and I thought it best to dive back into mine again before I risked theirs :-)

I searched and found a reference to using isopropyl alcohol, and having a spray bottle of it I gave it a shot. Well, 2 small squirts later (it probably helped that I knew where to squirt) the drive is ejecting again.

I have lubricated the drive again and I expect I'll have to repeat the process in another 7 years or so.

The good news is that because the drive had been stored with no disk in it, the heads had stuck up and out of the way, so I didn't need to bend heads back into shape again (lucky because my eyes are a hell of a lot worse than they were).

I guess I'm going to advise a couple things at this point:

1) if you have a 9114A, expect to have to do some maintenance every 5 to 10 years :-)

2) it may be best to store it without a disk in the drive.

3) if you do have a problem ejecting a disk, *don't* just pull it out.

My 9114B is still operating beautifully with no signs of any sticking.

The problem with the drive that was sent to me seems to have been simply that the battery was partially dead. I could say terrible things about how people treat their batteries, but mine was far "deader".

Since I've just replaced mine again (albeit with a smaller 1.3AHr battery that happened to be available on a Sunday afternoon in Perth) I am now considering how best to maintain it.

I'm not fond of the idea of leaving it permanently on charge as the potential for overcharge is real.

What I'm thinking of doing is leaving a charger on a mechanical timer set to charge the battery for (say) 30 minutes a week. Other than the actual time required (that I would adjust so that the charge does not slowly drop) can anyone think of any counter arguments or better solutions?

I'm probably going to do the same for my HP110 after I get the cells in that replaced.

NiCads are another issue. I'm sure that keeping them topped up is not the appropriate answer. I'm torn between using primary cells and making up packs using newer battery technology (NiMH, LiIon, LiFe, LiPo etc.) Any suggestions here?

HP 35s "Low footprint" Linear Interpolation

*Message #1 Posted by **Elliott W Jackson** on 8 Feb 2009, 8:55 a.m.*

Hello,

I went to college from '80-'84, and lived and died by my HP 41CV. I wrote dozens of programs for it as I progressed through my courses.

I recently picked up a new HP 35s, and decided to convert one of my oldest, most-used HP41 programs to the 35 as a learning exercise mainly.

The program just does simple linear interpolation. Suppose we have a table of data such as

```
...
X1    Y1
X2    Y2
...
```

Given any value X, it simply estimates Y using linear interpolation. The equation to do that is brutally simple, it is just such a frequent need that it is a great candidate for a quickie program.

As a further requirement however, I decided that I wanted to make it "low footprint," i.e. such that it only used the absolute minimum of the 26 A..Z named storage registers, and relied instead on the 800 indirect-addressed unnamed storage registers for any temporary storage requirements. I'm not sure how strong a need that is, frankly, but I thought it might be, to preserve the named registers for use as variables in equations, and allow those values to remain unmolested and untrampled-upon. That design decision did complicate things a bit, resulting in some muddy-looking code as the program plays games with the stack, but it's not too bad.

Program Name: "L" (it lived for years as "LIP" in my HP41 calculators)

Named storage registers used: I

Un-named indirect addressed storage registers used: "n" through "n+3", where the value of "n" is set early in the program and can be easily changed if needed. Default = 10.

```
L001    LBL L
L002    10      Base register 'N' for storage
L003    STO I   N stored in I
L004    SF 10
L005    X2,X1,X Prompt for X2 enter X1 enter X
L006    CF 10
L007    STO(I)  X stored in N
L008    1
L009    STO+ I  N+1 stored in I
L010    RDN
L011    RDN
L012    STO(I)  X1 stored in N+1
L013    1
L014    STO+ I  N+2 stored in I
L015    RDN
L016    RDN
L017    STO(I)  X2 stored in N+2
L018    1
L019    STO+ I  N+3 stored in I
L020    SF 10
```

```
L021    Y2,Y1   Prompt for Y2 enter Y1
L022    CF 10
L024    STO(I)  Y1 stored in N+3
L025    -       (Y2-Y1)
L026    1
L027    STO- I  N+2 stored in I
L028    RDN
L029    RCL(I)  X2
L030    1
L031    STO- I  N+1 stored in I
L032    RDN
L033    RCL(I)  X1
L034    -       (X2-X1)
L035    /       (Y2-Y1)/(X2-X1)
L036    RCL(I)  X1
L037    1
L038    STO- I  N stored in I
L039    RDN
L040    RCL(I)  X
L041    X<>Y
L042    -       (X-X1)
L043    *       (X-X1)*(Y2-Y1)/(X2-X1)
L044    3
L045    STO+ I  N+3 stored in I
L046    RDN
L047    RCL(I)  Y1
L048    +       (X-X1)*(Y2-Y1)/(X2-X1) + Y1
L049    RTN     Y is left in X-register

LN=166  CK=FC9A
```

As mentioned, the linear interpolation equation is trivial and straightforward and not really worthy of much discussion. The only thing possibly novel in this program is my attempt to make it "low footprint", and use the un-named storage registers as much as possible for temporary storage needs, rather than the named A..Z registers. That decision did complicate the code a bit, as I had to manipulate I in the middle of the "real math", which complicates the listing somewhat.

Best, Elliott

Re: HP 35s "Low footprint" Linear Interpolation

*Message #2 Posted by **Cliff V** on 15 Feb 2009, 8:04 a.m.,*
in response to message #1 by Elliott W Jackson

thanks for the program.

step 23 is missing.

Re: HP 35s "Low footprint" Linear Interpolation

*Message #3 Posted by **Elliott W Jackson** on 15 Feb 2009, 8:39 p.m.,*
in response to message #2 by Cliff V

Oops, thanks for noticing. It's actually not missing, my line numbers are just messed up. The LN and CK numbers are correct, and the program should end on line L048.

HP 29c power requirements

*Message #1 Posted by **Todd Rockwell** on 7 Feb 2009, 12:02 a.m.*

does anyone have power requirement stats for a 29C?? specifically, can it be powered by AA or AAA batteries or is the rechargeable pack required. and if so, what are the specs of that pack??? i sold one on ebay that was in questionable condition (stated so in the ad) and now the guy that bought has informed me that it doesn't work. i just wanna make sure that he is using a battery with the correct voltage etc.

thank you for any help you can offer.

Todd

Re: HP 29c power requirements

*Message #2 Posted by **Randy** on 7 Feb 2009, 8:45 a.m.,*
in response to message #1 by Todd Rockwell

Two AA alkalines will power a 29C without issue and is by far the safest way to test and otherwise use it.

Never attach the charger of a twenty series unit to the calculator without a known good rechargeable battery in place. A bad battery, bad contact or doing so without a battery in place will destroy the unit.

Re: HP 29c power requirements

*Message #3 Posted by **Todd Rockwell** on 7 Feb 2009, 10:58 a.m.,*
in response to message #2 by Randy

thanks for your help. I am certain that the unit has been on AC power with a crappy battery in it, and is probably toasted. is the unit repairable??? i have sold it and did not mean to mislead the buyer. I want to make good on the deal whatever that means, whether that is a repair or refund.

thanks again... Todd

Re: HP 29c power requirements

*Message #4 Posted by **Randy** on 7 Feb 2009, 11:31 a.m.,*
in response to message #3 by Todd Rockwell

If it has internal damage, and it most likely does, repair isn't practical since the required parts must come from a good 29C.

You'd be ahead of the game by getting it back and giving a refund. Then resell it as a parts machine, not working, as-is, no returns. Somebody will buy it for the battery tray and the keyboard, especially if it is in decent cosmetic condition.

Re: HP 29c power requirements

*Message #5 Posted by **Todd Rockwell** on 7 Feb 2009, 4:14 p.m.,*
in response to message #4 by Randy

Thanks again Randy, the thing is in excellent cosmetic condition, the keyboard and display are perfect, and the battery comp is too except for a spec of corrosion on one of the contacts.....do you have any idea what a unit sold for parts is worth??

Re: HP 29c power requirements

*Message #6 Posted by **Randy** on 7 Feb 2009, 4:17 p.m.,*
in response to message #5 by Todd Rockwell

IMO, I'd say at least $50. Might go for double that, just no way to know. Good photos = better bids.

Re: HP 29c power requirements

*Message #7 Posted by **Todd Rockwell** on 7 Feb 2009, 4:22 p.m.,*
in response to message #6 by Randy

thanks for the info.... youve been a great help.

Todd

Re: HP 29c power requirements

*Message #8 Posted by **Michael de Estrada** on 7 Feb 2009, 10:38 a.m.,*
in response to message #1 by Todd Rockwell

The power requirements of all 20 series (Woodstock) calculators are stated on the label on the back of the unit, located between the 2 bottom rubber feet, and are 2.5V, 500 mW. The source of the power does not matter, provided it is applied at the battery terminals inside the calculator, it is DC, and proper polarity is observed (the positive terminal is on the left side of the calculator, same side as OFF/ON switch). As stated by Randy, NEVER operate the calculator with the AC battery charger, unless a good NiCad battery is installed. This also applies to the 30 series (Spice) calculators.

How to get rid of the period on HP50G?

*Message #1 Posted by **Chan Tran** on 6 Feb 2009, 7:51 p.m.*

When the number in the stack is an integer my calculator display with the period at the end (i.e 2.). How can I get it to display 2 only?

Re: How to get rid of the period on HP50G?

*Message #2 Posted by **reth** on 7 Feb 2009, 12:35 a.m.,*
in response to message #1 by Chan Tran

turn it to exact mode so you see = on top of display

IBM 360 is 45 years old!

*Message #1 Posted by **Don Shepherd** on 6 Feb 2009, 1:45 p.m.*

An article in my local newspaper from 2004, on the 40th anniversary of the IBM 360. In 1964, there were no PCs....

Re: IBM 360 is 45 years old!

*Message #2 Posted by **Garth Wilson** on 6 Feb 2009, 2:48 p.m.,*
in response to message #1 by Don Shepherd

So interesting: http://en.wikipedia.org/wiki/IBM_System/360

The 360 was the first computer I had real contact with in school. We had to write our Fortran programs out by hand on paper, then go to the punch-card machines and put one line of the program on each card, rubber-band the set together with our account number and so on, put it in a cubbyhole, and come back a couple of hours later to get a printout of all the reasons the program wouldn't run, then try to fix it, and try again. The people who could actually touch the computer seemed next to God. Running our simple programs got so much easier when I got myself a programmable calculator.

Which version of FORTRAN did you use? I used FORTRAN IV and it was at my second job doing engineering problems. I've since used FORTRAN 77 for DOS PC's and Lahey FORTRAN 90 which is Windows compatible, except not Vista. I remember putting statements in my programs directing the computer techs to mount tapes, and they would actually physically mount a tape on a tape drive. My first mainframe computer was an IBM 1130 using paper tape input and programming in pseudo assembly code as a graduate assistant at MIT. Output was binary LED on a console.

in response to message #5 by Jon S Canale

Fortran II, in 1966 on a GE 225, I believe with probably 8K of memory and about 8 huge tape drives. Problem - just dump memory to paper and find it. Three years later - a different world. Probably I am a couple years older than you. Let's see in 1966 I was 23.

I, too, can't throw anything out. I still have my copy of WATFIV that I used when I was introduced to FORTRAN on a Sigma 5 in the 1970's. I also have the FORTRAN AUTOTESTER, the pocket manual before there were pocket calculators.

My first digital computer was a RemRand (later UNIVAC) 1103 at the University of Minnesota in 1960. I still have my class notes including a "Repertoire of Instructions". My notes say the 1103 had a 1024 word fast memory (CRT storage) and a 16,384 word slow memory (magnetic drum). Input was paper tape, magnetic tape or IBM cards. Outtput was paper tape, IBM cards, or magnetic tapes. Other computers mentioned in the class were the IBM 701-704-709 which had 2048 words of electrostatic storage and 8192 words on a magnetic drum.

My second digital computer came in 1960 as an M-252 airborne machine manufactured by Hughes which was part of an inertial system by Honeywell installed in a drone by Fairchild. My third digital computer came in 1963 as an airborne machine manufactured by Honeywell which was part of an inertial system by Honeywell which was installed in the black birds. My fourth digital computer came in 1966 wih an airborne machine manufactured by Honeywell which was part of the first airborne inertial system using electrically suspended gyros. Programming on all of these machines was in ones and zeroes. We did our own scaling. I still have (I really can't throw anything out!) a set of "Numeric Conversion Tables from Octal to Decimal and Decimal to Octal" published by American Bosch Arma in 1959.

My fifth machine came in 1968 and was actually the Honeywell computer network based on a DDC

516 in Minneapolis. That was where I learned BASIC.

Then came the Sigma 5 and FORTRAN. A little story about my experience with the Sigma 5. We used IBM card input. For our first programs the instructor took my program cards, combined them with the program cards from other class members and submitted the batch to the machine. Later we were allowed to submit our own programs, but the insructor failed to mention the use of a couple of additional cards which would terminate our program, say in case we had an infinite loop in our program. One of my programs had a infinite loop and as luck would have it, it was the last program in the queue for the night which was run unattended. The machine ran all night and the accumulated charges would have been astronomical except that we hadn't been told about the additional cards which were needed.

Memories arise! :)

I onced managed to stop our university /360 with a WATFIV program. WATFIV (at least for us students) was a manged environment with very strict rules what could be done and what could not. I tried to exercise a sort of some kind on a virtual file defined with a DD statement. There was something wrong with the statement but the error handler was buggy and so the system stalled. This could be seen easily on the outside of the machine room which was separated from the data entry room with the card reader and punchers by a glass wall. There was a red/green light on the outside that turned read. And there were some people looking stunned at the machine's console.

The problem was solved later by changing the DD card to use physical temporary storage and I could continue learning how to do a data sort in FORTRAN IV. I've never learned the successors of FORTRAN IV, I did some SIMULA programming for the Gesellschaft für Mathematik und Datenverarbeitung (GMD, now Fraunhofer Gesellschaft) in St. Augustin. After I left into the industry in 1985, I've never touched a mainframe terminal myself again.

Marcus, just four years older than the /360...

Hey!!

That's what I learned it with. But, as late as just a few years ago, I taught FORTRAN 77 to p-chem students. (Yeah, the nice ones grinned and the bad ones challenged me as to why I was using archaic things. But they all finally, at least in my presence, and at least verbally said my line that it gave them the basic mental framework for learning ANY programming language from that point on.)

Sounds so familiar I could have written this myself! So it seems that when I entered engineering school at USC (the **real** USC, not Southern Cal!) in 1967, the 360 system there was practically brand new. Used it for Computer Science and Advanced Structural Analysis.

Eleven years later in graduate school (this time at Louisiana Tech), they still had the same 360 (370?) set-up, except you could actually put your stack of cards in the card reader, and get your results right off the master printer yourself. They also had "dumb" terminals in the Civil Engineering department. However, having been away from the engineering profession and computers for years, I went with what I already knew, and made many trips to the computing center with my stack of punch cards. Because it was so busy during the day, I would go down there in the wee hours, when I could run my stack through the reader, and then in a few minutes (sometimes seconds) get my results right off the printer.

A story to tell on myself: one graduate project was to write a simplified user-manual for a complex FORTRAN program to do pipe network analysis. The professor gave me the source code on paper. I spent **many** hours coding and debugging until I finally got it working. Only then (after proudly informing my prof) did I learn that the program was already on disk, I only needed to write the manual!

:-) makes me think of a similar goof I did during one of the first weeks of my -psst - MBA...

We had to analyze how bottlenecks in serial processes can hold up total through-put time and how to improve on through-put, cycle time etc by parallizing etc.

They assignment questions said something about using a simulation program and I naturally assumed that we had to write a program to simulate things. This sounded quite the logical thing to do for me.

So I wrote a - rudimentary but nevertheless quite functional - simulation program and answered all the questions. A class-mate had some trouble with the assignment so he asked me for help, which I did, showing him my little program and we went to class. He was a bit surprised that it needed a program

and mentioned something about 'who the hell here can write a program like this'. This did not make a whole lot of sense to me, it was not that difficult to write in the end, so I did not think much of it. Boy was I wrong...

When we went to class and started working through the assignement questions, it became apparent that our distinguished institution had purchased a simulation program for X k USD for the students to avoid overheating of grey matter.

Literally with pressing of a few buttons it would answer the assignment questions. No need for writing it yourself (or thinking for that matter)

Boy did they laugh about me (my friend could not help but tell 'only his best friends in the section' that I had written a program instead of reading the assignment carefully and downloading it...

Cheers

Peter

That is classic. I'll remember your little story forever. Being a software developer at heart, I am pursuing my MBA and will finish in a few months. Your story is totally plausible, as hard as that might seem to be for the non-techies in your MBA. Naturally, I have no need to justify your response to the vast majority of the HP forum members.

By the way, I have to tell a confession --> one of the best parts of getting an MBA is utilizing my modest arsenal of HP calculators.

Re: IBM 360 is 45 years old!

*Message #14 Posted by **Mike Morrow** on 6 Feb 2009, 11:09 p.m.,*
in response to message #1 by Don Shepherd

At Georgia Tech in the late 1960s and early 1970s, the IBM System/360 was in an admin building and was restricted to university administrative (financial and academic records) services. The scientific and computer services were handeled by Univac 1108 and Burroughs B5500 systems in another building.

I spent many an enjoyable evening with the U1108, especially after I got ASR33 terminal priviledges. The B5500 stack machine, with Algol as its principal programming tool, remains to me the most intriguing system. I always considered the HP RPN stack machine calculator and the Burroughs RPN stack architechture to have much in common.

Following university graduation and naval service, I attended for short while (in 1980) the U. of Arkansas. There I got my first actual experience with the System/360 in the form of the later System/370. Does anyone here recall IBM's cryptic Job Control Language (JCL), and acronyms such as HASP (Houston Automatic Spooler Program)? There was a famous (but likely ficticious) bumper sticker of that era that read "Honk if you love JCL!" I will say one thing...I wrote IBM Corporation as an EE grad student for technical documentation for that System/370 and received without charge several hardware manuals totaling several thousand pages.

I wonder if there are any System/360 or /370 units still in operation in the world today. For that matter, are there any Univac 1108 or Burroughs B5500/6500 type systems still in operation? These are all great milestones in the history of computing.

Re: IBM 360 is 45 years old!

*Message #15 Posted by **Don Shepherd** on 6 Feb 2009, 11:31 p.m.,*
in response to message #14 by Mike Morrow

Yes, I too learned JCL for the 360. It was maddening! Like you, I later worked on Univac 1108's at the Census Bureau beginning in 1974, using EXEC-8 and FORTRAN-V, as I recall. One thing I remember from those days at Census was that they did not use the standard FORTRAN I/O; they claimed it was much too slow, and the Bureau's processing was much more I/O oriented than CPU crunching. So the Bureau systems guys wrote a custom I/O package that all of us programmers used. The systems guys also wrote a custom security sign-on system for the "demand" terminals, when they replaced the keypunchs and ASR-33 teletypes.

I doubt that many of these old systems exist anymore, outside of a few museums. The first commercial installation of a digital computer--Univac 1--was right here in my hometown at General Electric Appliance Park, around 1953 or 1954. I wrote them a few years ago to see if they still had that historic system in some warehouse somewhere, but it had vanished over the years, much like my Beatles record albums, unfortunately.

The Burroughs B5000/B5500 descendants and the Sperry 1100 descendants are the current Unisys Libra and Dorado product lines. The high-end machines in the product lines still use proprietary processors, but the rest of the two product lines use Intel processors executing the same machine code as the high-end machines but in virtual environments.

Re: IBM 360 is 45 years old!

*Message #19 Posted by **Karl Schneider** on 8 Feb 2009, 3:38 a.m.,*
in response to message #1 by Don Shepherd

Hmm, lots of quotes in this thread to which I can relate...

Quote:

Does anyone here recall IBM's cryptic Job Control Language (JCL), and acronyms such as HASP (Houston Automatic Spooler Program...

Yes, I too learned JCL for the 360. It was maddening! Like you, I later worked on Univac 1108's at the Census Bureau beginning in 1974, using EXEC-8 and FORTRAN-V. One thing I remember from those days at Census was that they did not use the standard FORTRAN I/O; they claimed it was much too slow, and the Bureau's processing was much more I/O oriented than CPU crunching. So the Bureau systems guys wrote a custom I/O package that all of us programmers used.

In the latter 1980's, I programmed on Sperry/Univac 1170/1180/1190's. These had replaced IBM System/360 mainframes, I was told.

Sperry's Executive Control Language and unique terminology could also be arcane. Its command for printing was @SYM, for "symbiont". Executable files were called "absolutes", and compiled object-code files were called "relocatables".

Our organization also wrote custom I/O programs based on Sperry's I/O functions, because they were much faster than standard Fortran I/O. Later, a directive came down to make our software as ANSI-standard as possible.

Quote:

I used FORTRAN IV and it was at my second job doing engineering problems. I've since used FORTRAN 77...

Fortran 77 was the standard in the 1980's, but some of the earlier software had been written in Fortran IV.

Quote:

> *We had to write our Fortran programs out by hand on paper, then go to the punch-card machines and put one line of the program on each card, rubber-band the set together...*
>
> *...put your stack of cards in the card reader, and get your results right off the master printer yourself. They also had "dumb" terminals in the Civil Engineering department.*

The Sperry systems included an industrial-grade card-reader in case the "dumb-terminal"-based I/O failed.

> Quote:
>
> *Problem - just dump memory to paper and find it.*

Sperry's core-dump files were encoded in octal, to match the 36-bit words in RAM. I wrote a program on my HP-15C specifically to decode the floating-point numbers printed on a stack of fan-fold paper. Had I known about the HP-16C, I might have bought one and written a more-refined program. However, the HP-15C did the job.

Sperry merged with Burroughs to form Unisys in 1988.

Re: IBM 360 is 45 years old!

*Message #20 Posted by **Forrest Switzer** on 8 Feb 2009, 4:37 p.m.,*
in response to message #19 by Karl Schneider

Yep, Octal dumps on fanfold paper, until memory got too large, then we had to set up a way of printing variables at different points through the program to make sure that everything was progressing properly.

We wrote card images on pads of paper - 25 lines (cards) per sheet and 132 columns per line. We then gave these sheets to card punch operators where each letter or number on each line, in each column, was typed and each line became a card. Then the cards were given to another card punch operator where each card was again verified. I thought at the time that this must be the worst job in the world. Eight hours per day, 5 days per week making sure you typed every character in the correct column. I figured I had it easy - writing flow charts and the Fortran commands on the sheets.

In 1966 I could walk in and talk to the computer operator while he ran my code. In 1969, the computer facility was in a building with wire mesh in the walls to prevent the possibility of monitoring the computer from the outside. There were two doors you had to be buzzed through to get into the computer. The punch card room and the computer room were classified secret, with special times where that was even more restricted.

When I left in 1970, we were running 24-7 and sending stuff to Befesda(sp?) Maryland, Slidell Louisana, Boulder Colorado, and Port Hueneme California. I still can't believe that I was involved in such an incredible growth period during those years.

My last day at that job, I drove out, stopped at the computer building, looked at what was run the night before, made some suggestions on the printout, and drove 1800 miles home for Christmas.

Too many years ago.

Forrest

The Early Days!!

*Message #21 Posted by **Stuart Goldberg** on 8 Feb 2009, 9:17 p.m.,*
in response to message #20 by Forrest Switzer

I started as a programmer trainee on a Univac 490 Real Time system at Bethlehem Steel in Bethlehem, PA, back in 1965. We wrote our programs in an assembly language called "SPURT" (Symbolic Programming for Univac Real Time) computers. We were just starting to play with COBOL. To create a COBOL executable, we ran our source code through a pre-compiler which created a SPURT program which then had to be assembled. I still remember proofreading a listing of a program punched card deck as opposed to "wasting" computer time compiling it right back from keypunch.

On one of my program tests of an assembly program, my instruction sheet to the operator requested a memory (core) dump of the program area after the program had ended as I had left several "breadcrumbs" in memory rather than printing them out. The operator forgot to perform the manual memory dump request and I therefor had to re-run the test. When I called the operator to complain the next morning, he innocently (and in all seriousness) asked "Where was your program loaded? I can print that memory area for you now!"

Today, almost 45 years later, I can still recite the major U-490 machine instructions and their octal op codes. I have several sheets of core memory from that old machine on my desk today and enjoy explaining to the young computer kids today how the destructive read-out worked. They believe me when I tell them it was invented by my cousin, "Rube Goldberg". :-)

Several years later, I was providing support to the U.S. Navy's Univac 494 systems at the Aviation Supply Office in Northeast Philadelphia. I remember helping programmers debug their COBOL programs by reading thru the octal memory dumps and reverse compiling the instructions by hand back into assembly language which I could logically link back to the original COBOL source to follow the internal flow of the program. Some of the programmers were astounded that the core dumps did not contain the literal text of the COBOL instructions (e.g. multiply ordered_quantity by unit_price giving ordered_cost.)

HP-65 reads but does not write

*Message #1 Posted by **Michael de Estrada** on 6 Feb 2009, 11:05 a.m.*

I recently opened up an HP-65 which had previously worked fine with a gummy wheel fix both reading and writing without errors. I opened the card reader to clean the card guides and small parts (balls and pinch roller) and also the keyboard. I reassembled, and everything works except it won't write cards properly. No errors, just garbage on the cards. I tried several blank cards to no avail. Any thoughts? Thanks.

Re: HP-65 reads but does not write

*Message #2 Posted by **Geoff Quickfall** on 6 Feb 2009, 12:35 p.m.,*
in response to message #1 by Michael de Estrada

got to make this short [wifi] on a bus in toronto.

first check wire connections to reader board.

next clean connectors to main circuit board and card reader board.

Then try rotating the pinch roller axle a few degrees as this will raise or lower the pinch roller and thus the card with reference to the reader.

then if that does not work the capacitor for the read may be deteriorating.

Search google hpmuseum hp65 card reader for explanation of electronics

hope this helps

cheers geoff

Re: HP-65 reads but does not write

*Message #3 Posted by **Michael de Estrada** on 6 Feb 2009, 1:27 p.m.,*
in response to message #2 by Geoff Quickfall

Tried everything to no avail. Now its even worse, won't read or write. I noticed a significant increase in motor noise. Would a bad cap affect the motor? Do all those flat contacts below the nylon balls have to make contact with something? Anyway, thanks for the help.

Re: HP-65 reads but does not write

*Message #4 Posted by **Ignazio Cara (Italy)** on 6 Feb 2009, 3:52 p.m.,*
in response to message #3 by Michael de Estrada

Look at the clutch betwen motor shaft and worm-gear. Perhaps this could be your problem, if it does not writhe/read the cards and you hear bad sounds from the reader.

Try again.

regards

Ignazio

Re: HP-65 reads but does not write

*Message #5 Posted by **Michael de Estrada** on 6 Feb 2009, 10:11 p.m.,*
in response to message #4 by Ignazio Cara (Italy)

Actually, I think both the clutch and wheel were rebuilt previously by another owner, however the motor bearings were very dry so I relubed them. After re-assembly, it is now working properly and quietly again. The actual problem turned out to be a broken wire solder connection between the reader control board and the main LED/Keyboard. Thank you for your help.

Re: HP-65 reads but does not write

*Message #6 Posted by **Geoff Quickfall** on 6 Feb 2009, 4:14 p.m.,*
in response to message #1 by Michael de Estrada

Ignazio is correct:

typically the clutch is ignored when the pinch roller is replaced.

the noise is the clutch failing, as it is made of the same material as the roller.

oprn the case and remove the moter from it's housing via the two small screws. pull the clutch off and soak and clean with alcohol. Find a small diameter wire and remove the outer insulation.

the insulation should fit snugly into the clutch sleave. the motor spindle should fit into the hole in the insulation that carried the wire. this method alows the clutch to slip on a jammed card but provides enough friction to drive the card thru with minimal noise.

cheers geoff

I always replace the clutch at the same time as the roller as a new rollerwill stress the clutch.

HP50g Problem with KEY, SAME

*Message #1 Posted by **DK2ZA** on 6 Feb 2009, 8:58 a.m.*

Hello,

this little program does not work on my HP50g as I expected:

DO UNTIL KEY END 95 SAME

It should wait for a keystroke and then put a 1 on the stack if the PLUS key is pressed or a 0 if any other key is pressed.

Instead it gives 0. for all keystrokes (that is a zero with a decimal point).

The reason seems to be that the KEY command does not return an integer (TYPE 28) but a real Number (TYPE 0) with no decimals. So for the PLUS key it returns 95. but not 95 which is not the SAME.

I found a workaround using R->I, but maybe I overlooked something and there is a simpler solution as this code had worked as expected on my former HP48SX (whose main board is hanging decoratively on the wall of my shack).

So, if somebody here can help me that would be fine.

Regards

Helmut

Re: HP50g Problem with KEY, SAME

*Message #2 Posted by **Massimo Gnerucci (Italy)** on 6 Feb 2009, 11:23 a.m.,*
in response to message #1 by DK2ZA

What about:

```
/<< DO UNTIL KEY END 95. SAME />>   ?
```

Works on a 49g...

Greetings,
Massimo

in response to message #1 by DK2ZA

You seem to have answered your entire question yourself in the first post. Not sure what you are asking really. Like you said, it is a real vs integer thing. Why not just use == ?

TW

Re: HP50g Problem with KEY, SAME

*Message #4 Posted by **DK2ZA** on 7 Feb 2009, 2:03 a.m.,*
in response to message #3 by Tim Wessman

Thank you for your suggestions, Massimo and Tim.

What puzzles me is that in the advanced user's reference manual for the hp49g+ Edition 1.1 Printed Date: 2006/3/20 on page 1-46 there is exactly this program:

<< ... DO UNTIL KEY END 95 SAME ... >>

There is no decimal point after the 95 and it always gives the result 0. (zero with decimal point). After changing 95 to 95. it answers the +key with 1.

A discrepancy between the manual and the machine?

Regards

Helmut

Edited: 7 Feb 2009, 2:04 a.m.

Re: HP50g Problem with KEY, SAME

*Message #5 Posted by **Reth** on 7 Feb 2009, 4:32 a.m.,*
in response to message #4 by DK2ZA

SAME and various tests return type 0 result and not type 28 (integer) so what manual says is obviously wrong for the 49/50 series, but right for the 48 where it's been copied from. On the other hand using SAME in this case is not justified. As Tim suggested == should be used.

Interestingly == returns an integer value

Cheers, Reth

Card reader pinch roller dimensions?

*Message #1 Posted by **GanjaTron** on 5 Feb 2009, 7:24 a.m.*

Hi folks,

still trying to fix my HP-65's card reader (and one from an HP-97, for that matter). I bought 6mm silicone tubing which seems to fit nicely, but it doesn't pull the card through. Looks like it's fractions of a milli too small!

Can anyone here give me the *exact* diameter of the original pinch roller wheel? While we're at it, anyone happen to have the same for the TI-59's card reader (also awaiting repair)?

Thanks for the info,

--Roland

Re: Card reader pinch roller dimensions?

*Message #2 Posted by **Rainer Wiedemann (Germany)** on 5 Feb 2009, 5:24 p.m.,*
in response to message #1 by GanjaTron

Hi Roland,

I never fixed a HP-65 card reader yet, but a bunch of HP-41 readers. IMHO considering the pinch roller the differences are not that big between HP-41 and HP-65 reader. The silicon tubing has always worked perfect for me, so I suppose a problem with either the motor clutch or it's simply a matter of adjustment.

Try to watch the worm gear and pinch roller gear. Do they continuously keep spinning or do they stop while the motor continues turning. This would point at the motor clutch as root cause. Remove the motor, apply some 2.5 volts to it and try to stop the worm gear with your fingers. If this is easily possible you should have gotten it. The clutch is attached to the motor side end of the worm gear. In the articles forum you'll find instructions how to fix it, some suggest a simple fix with magic glue.

If the clutch turns out to be ok and the card stops while pinch roller and worm gear keep spinning, then you will have to adjust the pinch roller pressure to the card.

The axle of the pinch roller is excentric. By turning it the pinch roller's distance and therefore its pressure towards the card can be altered. Do not make the pressure too high, the card should be pulled through without the motor getting throttled down much or making strange noises. The adjustment procedure is much easier operating the motor from an external 2.5 volts supply outside the calculator. So you don't depend on your batteries' state.

Would be nice to hear from you posting a message when you got it to work.

Regards,

Rainer

Re: Card reader pinch roller dimensions?

*Message #3 Posted by **GanjaTron** on 10 Feb 2009, 12:29 p.m.,*
in response to message #2 by Rainer Wiedemann (Germany)

Hi Rainer,

thanks for the hints, the clutch seemed to be the primary problem. I fixed it with superglue. One thing to watch out for is that you don't stick the shaft to the motor housing (I hooked the motor up to a lab power supply and let it spin slowly as the glue hardenend, just to make sure).

I got the pinch roller to work after applying a layer of vinyl tape on the roller's metal axle (cut to proper length to avoid over/underlap) before shoving the silicone tube over it while stretching it with a pair of tweezers. The extra 0.2mm (or whatever) was apparently enough to generate enough friction, and I didn't need any glue for the tube.

The eccentric slotted axle didn't even need any adjustment on my card reader (thank god, considering it's barely accessible on the HP-65). Remarkably, it could read & write straight away!

Now I hope this procedure's gonna work on the HP-97 too...

Regards,

--Roland

Re: Card reader pinch roller dimensions?

*Message #4 Posted by **Randy** on 7 Feb 2009, 4:16 p.m.,*
in response to message #1 by GanjaTron

Final diameter mounted on the gear should be 6.35mm. The tubing that works here in the US is 7/32" (5.5mm) with an 0.063" (1.6mm) wall thickness.

HP-41C Card Reader

*Message #1 Posted by **Roy Welch** on 4 Feb 2009, 3:14 p.m.*

I have a question on something I see after removal of the drive assembly from my HP-41C card reader. I can send some photos to anyone, showing a red arrow pointing to the component in question here. I don't know how to attach the image to this posting. It looks like a clear cased LED. In my reader one of the two gold leads to the clear "LED" case has broken from the "LED" head. Is this really an LED and if so what does it do and can anyone give me the specifications for it if I need to replace it?

Also, if it does need to be replaced, how do I get the circuit board out that it is soldered to? Does that whole assembly just lift out of the case, circuit boards and all? It appears that it is just stuck in with some adhesive. Perhaps just cutting the two gold leads and soldering the new component to the old leads.

Thanks, Roy

*Message #2 Posted by **PeterP** on 4 Feb 2009, 3:36 p.m.,*
in response to message #1 by Roy Welch

if the image is somewhere on the internet, you can include it via: 'open square bracket' img:http://www.hpmuseum.org/gto.gif 'close square bracket'

see the advanced formatting features http://www.hpmuseum.org/artfmt.htm

Re: HP-41C Card Reader

*Message #3 Posted by **Roy Welch** on 4 Feb 2009, 8:16 p.m.,*
in response to message #2 by PeterP

Thanks Peter, but the image is a JPG image from my camera. However I have finally found that this must indeed be an LED that shines through a small hole to a detector above it on the small circuit board on top of the slot assembly. I suppose it is to detect the card insertion and start the motor since the card interrupts the light from hitting the detector when it is inserted. Now, all I need is to find what kind of LED it is so I can replace it. It looks like a small 3mm diameter LED but I don't know the voltage and current rating of it.

Roy

Re: HP-41C Card Reader

*Message #4 Posted by **John Bjornholt** on 5 Feb 2009, 12:21 a.m.,*
in response to message #1 by Roy Welch

The entire assembly does come out, but first you need to remove the top cover of the piece that plugs into the HP41. It is a little tricky, but it does come off. It is easier to snap it back into position than it is to get if off in the first place. However, once the cover is off, the entire circuit board assembly can be lifted out enmasse. This

will allow you to unsolder the old LED leads and replace it with a new one. I believe the LED is a standard IR diode, the same type used in TV remote controls. Should be able to get one from Radio Shack. Make sure you get the polarity right. Voltage and current ratings should be compatible. Regards, John B

Re: HP-41C Card Reader

*Message #6 Posted by **Rainer Wiedemann (Germany)** on 5 Feb 2009, 12:37 a.m.,*
in response to message #5 by Roy Welch

The LED is part of the write protection electronics, there's a photo transistor on the switch pcb (the little golden "nipple" pointing downward), driving the write protect switch signal WPS.

If this transistor receives IR, it drives WPS active and the card is protected. Unclipped cards block the IR from the transistor and the protection is off. So your reader should already work without the LED, at the cost of missing write protection.

Good luck!

Re: HP-41C Card Reader

*Message #7 Posted by **Roy Welch** on 5 Feb 2009, 12:12 p.m.,*
in response to message #6 by Rainer Wiedemann (Germany)

Thanks Rainer.

Which one is the IR emitter and which one is the detector? The clear LED is on the bottom PCB below the card slot assembly. The small photo transistor (?) is on the top of the card slot on the switch PCB as you described. I went to look at some parts this morning and the IR emitter units were in a dark package and the detectors were in a clear package. The part that is broken is the clear LED (?) on the bottom PCB and it looks to be a 3mm size. A larger size will not fit up beside the transport wheel to see the small hole that looks up toward the photo transistor(?)on the switch PCB. I hope this is not too confusing a description.

If all else fails I will just go ahead and use it without the write protection.

Re: HP-41C Card Reader

*Message #8 Posted by **Roy Welch** on 5 Feb 2009, 10:41 a.m.,*
in response to message #4 by John Bjornholt

John, regarding the polarity of the IR LED, it is usually shown by having one lead shorter than the other or by the LED lens having a flat shoulder on one side. Off hand do you know which of the two leads is the cathode? Looking at the reader from the front, the side next to the calculator, is the cathode the left lead, toward the five colored wire leads or the right pad, toward the motor? The LED lens is shattered here and of course the leads were trimmed when it was installed.

Roy

Re: HP-41C Card Reader

*Message #9 Posted by **Rainer Wiedemann (Germany)** on 5 Feb 2009, 4:58 p.m.,*
in response to message #8 by Roy Welch

If you have a brand new IR led without already clipped leads, the longer lead is the anode, the shorter one is the cathode.

The anode has to be installed into the card reader, that the anode points towards the five colored wires, the cathode has to point towards the motor side.

The IR led is the light transmitter, the photo transistor is the receiver, if it detects IR radiation, it will switch write protection on, preventing the card reader from overwriting a magnetic card. Please note, that the IR led is pulsed for a very short time just in the right moment when the card edge passes by. So you cannot measure a permanent voltage applied to the led.

Bend the top of the led in a 30-40° angle against the leads towards the calculator side of the reader, the highest point of the led lens should be about 0.8 inches (some 20mm) above the pcb, before you solder it.

Don't forget to insulate the lead wires with a strip of Scotch tape towards pins of the integrated circuit in front of it. Otherwise the led my be bended towards the ic pins during assembly, causing a short circuit and killing the whole thing.

A short test with a clipped card should be performed before completely assembling the card reader.

Don't worry, sounds much more complicated than it actually is.

Re: HP-41C Card Reader

*Message #10 Posted by **Roy Welch** on 5 Feb 2009, 5:21 p.m.,*
in response to message #9 by Rainer Wiedemann (Germany)

Hey, thanks Rainer! That's exactly what I needed. I have the IR LED, actually two of them, one for a spare. They are 3mm devices, a little bit smaller than the original but they should fit nicely. I was able to get the bottom PBC board assembly out all OK. I had identified the leads OK on the new LEDs but I could not on the old one since the case was broken. Now I can put it all back together with your very good information.

Thanks again, Roy

Re: HP-41C Card Reader

*Message #11 Posted by **Roy Welch** on 6 Feb 2009, 8:17 p.m.,*
in response to message #9 by Rainer Wiedemann (Germany)

Well, it is all back together again. I replaced the sticky wheel with two #60 O-rings, (1/8"ID and 1/4"OD). They work fine. The only problem is that it will not detect a write protected card. It writes on it anyway. I guess the small IR LED is not going to do the job. I installed it with the anode (long lead) toward the five wires and the cathode (short lead) toward the motor. Radio shack has IR LEDs but they are 5mm packages and are too large to fit the placement for the LED. It isn't really a problem though. I'll just be careful to not to insert a program card while in the program mode.

Roy

Re: HP-41C Card Reader

*Message #13 Posted by **Roy Welch** on 11 Feb 2009, 7:24 p.m.,*
in response to message #12 by Ignazio Cara (Italy)

I have my card reader repaired now. I repaired the clutch without using super glue, at least for now. We shall see if it stays repaired. If not I can add the glue. I also found the plastic tubing for the replacement of the gooey roller at a hobby shop. I had temporarily repaired it with two O rings but the tubing is better I think. The LED, DS1, is not an IR LED. I tried replacing it with an IR LED and the write protect didn't work. I have now replaced it with a 3mm clear white light LED and it works fine. I can see the LED flash at the beginning of each card read and it protects clipped cards until Flag 14 is set, after which it will write OK on the clipped card. My thanks to all who have responded.

HP 41CV card reader

*Message #1 Posted by **John Bjornholt** on 4 Feb 2009, 11:54 a.m.*

Does anyone have any technical info on the HP41CV card reader, such as schematics, block diagrams, trouble-shooting procedures, etc? I recently sucessfully repaired the drive wheel on mine, but now I get a "malfunction" display when it tries to read a card. I have an o-scope and other necessary test equipment to check for waveforms, voltages, etc.

Re: HP 41CV card reader

*Message #2 Posted by **PeterP** on 4 Feb 2009, 12:01 p.m.,*
in response to message #1 by John Bjornholt

IIRC, TOS has the Card Reader Repair Manual from HP. Also a Google on 'repair card reader site:www.hpmuseum.org' or something along these lines will bring up many threads with potentially useful information. There recently was one where a defect cap was the source of reading problems.

HTH

Cheers

Peter

in response to message #1 by John Bjornholt

Hi, I have a similar problem with the drive wheel where the friction wheel seems to have "dissolved". Could you let me know how this could be replaced/repaired? Are parts still available from hp? Thanks for your help!
Carl Vanden Bulcke _ Belgium

Re: HP 41CV card reader

*Message #7 Posted by **Michael de Estrada** on 9 Feb 2009, 3:48 p.m.,*
in response to message #6 by Carl Vanden Bulcke

This is commonly referred to as the "gummy wheel", and it can be repaired either with plastic tubing or O-rings. There are several articles under the "card reader repair" heading in the articles section of this forum. You can find suitable O-rings on ebay, and I have had success with this method on several card readers. Parts are not available from HP. Also, I don't know if the HP-41 series card reader has a motor clutch similar to the HP-65 or HP-67, but if it does, it may also need repair.

Re: HP 41CV card reader

*Message #8 Posted by **Ignazio Cara (Italy)** on 10 Feb 2009, 2:17 a.m.,*
in response to message #7 by Michael de Estrada

The coupling between motor shaft-worm gear is surely the same of 65, 67 and 97.

Perhaps it's different in Malaysia, but disposble alkaline "N" cells are not at all hard to find in the US for about $5 for a pack of 2. Rechargable "N" cells are not readily available in regular stores, but specialty stores and mail-order firms seem to have them, according to other posts.

It still seems pointless to me for people to use rechargable cells in an HP-41, unless accessories that don't have their own power source (e.g, card reader, IR transmitter, HP-IL) are being used very heavily. It also seems that the "BATT" low-voltage warning would occur sooner.

googling "nimh n cells" gives lots of mail/internet sources for n cells that will last for years at only 3 to 4 bucks each. why butcher a battery holder and mickey mouse the connectors when you can use what's intended?

Use N Cells!

*Message #10 Posted by **Randy** on 22 Feb 2009, 3:44 p.m.,*
in response to message #9 by db (martinez, ca.)

I second that DB, I really don't understand the "butcher" approach either.

Every major manufacturer of alkalines still makes N cells. Eveready, Rayovac, Varta, Panasonic and Kodak are the first that come to mind.

While they might be difficult to find in retail locations, they are certainly available through any good electronics/battery distribution channel.

Re: Use N Cells!

*Message #11 Posted by **Michael de Estrada** on 22 Feb 2009, 4:23 p.m.,*
in response to message #10 by Randy

Also Duracell makes them, which is a division of P&G Inc., a Canadian company. Curiously, I think the original poster was Canadian, and stated that N-cells were hard to find in Canada. The last time I checked, you could buy 4 N cells for an HP-41C for less than $10, including tax. I get over 5 years use in my 2 HP-41CV's, which admittedly I do not use very much anymore. Also, FWIW, the HP-28C/S use 3 N-cells. I buy mine at Batteries Plus Stores.

Re: Use N Cells!

*Message #12 Posted by **Randy** on 22 Feb 2009, 5:51 p.m.,*

in response to message #4 by ZOleg

Hello all,

In France, I know a very good supplier for batteries with digressive price depending on quantities. Their job is mainly to sell batteries.

It is called 'La boîte à piles' in Reims. http://www.laboiteapiles.com/

Re: Cheap Batteries for anything in France

*Message #18 Posted by **Stefan Hauschild** on 24 Feb 2009, 2:03 p.m.,*
in response to message #17 by Patrice

In Germany it is Reichelt Elektronik (www.reichelt.de).

One LR1 (also known as lady-cell or N-type battery) for 61 eurocents. That´s ok for me...

-Stefan

Re: Cheap Batteries for anything in France

*Message #19 Posted by **Peter A. Gebhardt** on 24 Feb 2009, 5:22 p.m.,*
in response to message #18 by Stefan Hauschild

Stefan,

How many LR1 do you order in one shipment? ;-)

Motivated by your post, I gave it a look and was somewhat repelled by their minimimum order & charges ...

(A problem which is inherent with most internet orders anyway).

Best regards & Thx. anyway,

Peter A. Gebhardt

Re: Cheap Batteries for anything in France

*Message #20 Posted by **Stefan Hauschild** on 25 Feb 2009, 2:36 a.m.,*
in response to message #19 by Peter A. Gebhardt

Peter,

it´s worth the shipping fees if you order some parts, cables, semiconductors or anything else there. If I need only one or two cells I go to my local flea markets on sundays. The "turkish-battery-wholesale-companies" there sell the n-cell (new, of course) for 1 eur and the button cells for 50cents.

-Stefan

HP-27 Woodstock Thermal Problem

*Message #1 Posted by **Robert Hollyer** on 3 Feb 2009, 9:33 p.m.*

I have been attempting to repair an HP-27 that has the common thermal power on problem. The symptoms are as described in other threads. At power on the display is blank until the ACT eventually "warms up". The HP-27 can then be power cycled and it functions correctly.

I traced the problem to the ACT 1.6KHz clock output that is incorrectly doubled in frequency to 3.2KHz. I made an initial assumption that the ACT might have an internal hold time problem or a race condition. In order to slow the circuitry down, I decreased the VGG supply voltage. No effect on the thermal problem. I then swapped the DC-DC converter zener diode with sequentially lower value zener diodes to decrease all supply voltages. No effect. I individually varied each supply using an external lab power supply. No effect. I tried the suggested grounding solution, in the unlikely event that there was a ground bounce problem. No effect. The VGG supply is somewhat noisy, so I filtered that. No effect. At this point I am stumped by the problem. Other than an internal ACT pre-heater this issue seems unsolvable. The ACT temperature doesn't need to be raised much above ambient in order for the calculator to function correctly so it could be easily warmed up.

Just curious if anyone has identified other solutions to this problem? It would be interesting to have a schematic diagram of the internal ACT circuitry, to understand the source of the problem. I also searched the various retro IC databases in case any old stock of the ACT was still in existence. Couldn't find anything.

The performance of the HP-27 was impressive in that it functioned over an amazingly large voltage range. The lower limit was the point at which the LED display was no longer visible. Other than that, the HP-27 continued to function correctly.

Re: HP-27 Woodstock Thermal Problem

*Message #2 Posted by **Katie Wasserman** on 4 Feb 2009, 10:05 a.m.,*
in response to message #1 by Robert Hollyer

Robert,

You mentioned lots of things you tried to fix the double speed clocking problem but I don't see that you tried the solution mentioned here, resistively coupling the clock signal to the rest of the circuit.

This worked for me when all else failed that's why I wrote it up.

-Katie

Re: HP-27 Woodstock Thermal Problem

*Message #3 Posted by **Robert Hollyer** on 4 Feb 2009, 10:11 p.m.,*
in response to message #2 by Katie Wasserman

Katie,

Thanks for the suggestion. I tried modifying the circuit using a 20K resistor as your article recommends.

But the modification didn't solve the clock problem on this HP-27. I still have a 3.2KHz clock at cold start. Maybe I will try some other values of resistors and see if that has any effect. It's difficult for me to theorize why this clock problem occurs given the insensitivity to voltage. That's odd.

The NMOS ACT is marked with HP's logo. It's not marked with an AMI, Mostek, or other IC manufacturer's logo from that timeframe. I am curious if this was an internally designed HP IC.

Rob

Custom menus

*Message #1 Posted by **Ian Stanley** on 3 Feb 2009, 6:33 p.m.*

Just ordered a HP35s to replace my dead 15c.

I have looked at the PDF manual which says I can use EQN to display text.

Has anybody managed to cobble together a working custom menu on the 35s (presumably using EQN to display the text followed by an input)?

in response to message #3 by Maximilian Hohmann

I saw this too. The really cool thing is that it was done with a fairly ordinary camera (Canon G10). The trick is the robotic mount that takes a mosaic of photos, and the software that stitches those photos together.

*Message #6 Posted by **Dave Shaffer (Arizona)** on 3 Feb 2009, 4:20 p.m.,*
in response to message #5 by Don Shepherd

If somebody moves between images, it's hard for the software to fix things!!

All in all, it's pretty amazing. I have used much better cameras and (not so great) commercial stitching software with worse results.

[humor]

I have discovered evidence that aliens are now in control of the US government! In the photo referenced, just above and to the left of the president in the second row is a man *with four eyes!* No, I'm not talking about eyeglasses, I mean *actually four eyes, sockets and all!!*

All of those rumors that the president was a crypto-buddhist, that he had consorted with 1960's pastry chefs and had trampled an apple pie underfoot, all of these pale before the revelation that he invited an alien to the inauguration. Or was he *forced* to include the abominable creature by virtue of the control exerted over him??

Check the next edition of the Weekly World News for more..

[/humor]

More Challenges

*Message #1 Posted by **Chuck** on 2 Feb 2009, 8:40 p.m.*

Since I didn't get to play with the latest challenges a whole lot, I thought I'd make one up. Here's a little problem I gave my students today...

Consider: f(x) = Floor[1/x]/x (or the greatest integer of 1/x, divided by x).

We were talking about the derivative of such a beast, and found some interesting things. Can you find if or where f'(x) = 1, 1.5, 2, or 3. We'll need to bend the rules of differentiation a bit and consider one sided limits on a few of the values (graph it and you'll see why).

I'd be curious if one could write/run a program on an Hp to solve f'(x)=3 to an accuracy enough to "guess" the exact value. So far, even Mathematica hasn't found the solution explicitly (bisection method yes, but no Solve), but it's more of a user error than a software limitation error.

My luck, someone here will get the answer(s) in 7 minutes or less. :)

Re: More Challenges

*Message #2 Posted by **Allen** on 2 Feb 2009, 9:08 p.m.,*
in response to message #1 by Chuck

not sure I understand the question.. Can you give an example of the "Floor" function, since it does not behave the same way I expect.

Here's they way Excel and HP calculators interpret this problem:

```
F(3) = Floor(1/3)/3 = Floor(.3333...)/3= 0/3= 0
Excel: FLOOR(1/3,1)=0
RPN: 3 [1/x] FLOOR -> 0
Wolfram:Floor(1/3)=0
```

Am I missing something?

Edited: 2 Feb 2009, 9:08 p.m.

Re: More Challenges

*Message #3 Posted by **David Hayden** on 2 Feb 2009, 9:12 p.m.,*
in response to message #2 by Allen

I think it gets interesting for 0 < x < 1. As you've discovered, for all x > 1, f(x) = 0

Dave

Re: More Challenges

*Message #4 Posted by **Allen** on 2 Feb 2009, 9:11 p.m.,*

in response to message #1 by Chuck

perhaps I am having a hard time reading the f'(x).. This looks almost exactly like f(x) in times new roman font.

Re: More Challenges

*Message #5 Posted by **Chuck** on 2 Feb 2009, 9:38 p.m.,*
in response to message #4 by Allen

Agree, the font is not great. Also, the "Floor" function is Mathematica's name for the greatest integer function. Here's another go at it...

```
let f(x)=Int[1/x]/x

find where f'(x)=3
```

David is correct, it's not very interesting for x>1, but is interesting for x<1. Our interest actually lies on the interval [-1,0].

CHUCK

Re: More Challenges

*Message #6 Posted by **David Hayden** on 2 Feb 2009, 11:09 p.m.,*
in response to message #5 by Chuck

Okay, my calculus is really rusty, but here's what I came up with. There's a good chance that I've gotten something horribly wrong, in which case, corrections will be cheerfully accepted.

To keep my head from hurting, I recast the problem:

```
Let u(x) = 1/x
Let g(u) = floor(u)*u
Then f(x) = floor(1/x)/x is the same as g(u(x))

If N is a negative integer then For u = ( N , N+1 ], floor(u) is the constant N+1
and g(u) = (N+1)*u.

Inside one of these intervals, the derivative of f(x) is:
f'(x) = g'(u) * u'(x) = (N+1) * -1/x^2
      = -(N+1) / x^2
      = -(N+1) * u^2

Now we can find where f'(x)=3:

    3 = -(N+1) * u^2
    u = sqrt(-3/(N+1)) or -sqrt(-3/(N+1))

Since we already said that N is a negative integer and u is in the interval (N,
N+1], that means u is a negative number also, so we can get rid of the positive
solution and we're left with:
    u = -sqrt(-3/(N+1))

Now lets try some solutions.  N=-1 won't work because -3/(N+1) causes division by
zero.

How about N=-2?
    u = -sqrt(-3/(-1))
      = -sqrt(3)
      = -1.732050...
```

```
Checking our assumption:
    N <? u <=? N+1
    -2 < -1.732050... <= -1
That works.

Last but not least, we solve for x:

u = 1/x
-sqrt(3) = 1/x
x = -1/sqrt(3)
```

Re: More Challenges

*Message #7 Posted by **Chuck** on 3 Feb 2009, 12:57 a.m.,*
in response to message #6 by David Hayden

Aha. Very close, but off by a small factor. I think there may be a slight error with the floor function on negative intervals with how you defined g. However, your method got me the answer analytically, or at least agrees with what I found earlier.

CHUCK

Re: More Challenges

*Message #8 Posted by **David Hayden** on 3 Feb 2009, 8:49 a.m.,*
in response to message #7 by Chuck

Thanks, Chuck. I suspect I've got the definition of floor() wrong. If floor(x) is "the largest integer that's less than x" rather than "the integer formed by lopping off the fractional part" then I get:

```
If N is a negative integer then For u = [ N , N+1 ), floor(u) is N and g(u) =
N*u.
So f'(x) = -N*u^2
And if f'(x)=3 then u = -sqrt(-3/N)
So for N=-1, we get u = -sqrt(3) which is outside the interval [-1,0).  But
for N=-2, we get u=-sqrt(3/2) which is within the interval [-2,-1].

So with u=1/x, that means the final answer is x=-1/sqrt(3/2)
```

OT: Casio VX-4

*Message #1 Posted by **Saile (Brazil)** on 2 Feb 2009, 8:24 p.m.*

```
I would like to have information (site, manual in pdf) on Casio VX-4 in English

I thank for the attention
```

Re: OT: Casio VX-4

*Message #2 Posted by **Marcus von Cube, Germany** on 4 Feb 2009, 12:35 p.m.,*
in response to message #1 by Saile (Brazil)

The VX-4 was never released outside Japan. It's an educational model and therefore all the docs are in Japanese. You can get some useful information from studying the manual of a PB-1000 or FX-850P (the latter is closer to the VX-4). Since I have a VX-4 in my collection, its BASIC is part of my BASIC comparison sheet. You should find enough info there to make use of your VX-4.

http://www.mvcsys.de/doc/basic-compare.html

Removing rubber feet from HP27S

*Message #1 Posted by **Strath Clarke (Sydney, Australia)** on 2 Feb 2009, 7:02 a.m.*

I have a HP42S which has the bottom pair of rubber feet on one side missing. I also have a HP27S. I would like to remove the feet from the 27S and install them on the 42S. Can it be done? Is there a recommended method? Any advice would be welcome. Thanks.

Noooooooooo!!!!

*Message #2 Posted by **BruceH** on 2 Feb 2009, 8:55 p.m.,*
in response to message #1 by Strath Clarke (Sydney, Australia)

Don't!

The 27S is every bit as much a classic calculator as the 42S and there is no good reason for ruining one, much less over something so trivial as rubber feet.

Just cut up a bicycle inner tube or something.

Edited: 2 Feb 2009, 8:55 p.m.

Re: Noooooooooo!!!!

*Message #3 Posted by **Stefan Hauschild** on 3 Feb 2009, 5:07 a.m.,*
in response to message #2 by BruceH

That would be vandalism !

But isn´t there this ebay seller who had new made rubber replacement sets for some of the voyagers?

-Stefan

Re: Removing rubber feet from HP27S

*Message #4 Posted by **Randy** on 3 Feb 2009, 8:41 a.m.,*
in response to message #1 by Strath Clarke (Sydney, Australia)

The better reason not to attempt it is because they (the feet) are integral to the case bottom, as in molded onto the case. Any attempt to remove them will result in unusable bits of rubber.

Edited: 3 Feb 2009, 8:42 a.m.

Re: Removing rubber feet from HP27S

*Message #5 Posted by **Strath Clarke (Sydney, Australia)** on 10 Feb 2009, 6:13 a.m.,*
in response to message #4 by Randy

Thanks for your comments. I have abandoned my idea of salvaging the feet from the HP-27s. I made the

feet for my HP-42s from some neoprene rubber, a sharp craft knife and steel ruler, and several attempts to get the dimensions just right. The HP-27s escaped unscathed and is now for sale on eBay.

BASIC comparison sheet updated again

*Message #1 Posted by **Marcus von Cube, Germany** on 2 Feb 2009, 6:50 a.m.*

A some may have noticed I've removed the OT tag from the title. The sheet now contains enough information about the HP-71B and HP-75 to consider it on topic for this community. :)

Read more: http://www.mvcsys.de/doc/basic-compare.html

I don't have an HP-75 so some of my information may be incorrect or incomplete. I'd be glad to correct any mistakes that you find. The same is obviously true for any information in the sheet.

Marcus

Re: BASIC comparison sheet updated again

*Message #2 Posted by **Marcus von Cube, Germany** on 8 Feb 2009, 9:43 a.m.,*
in response to message #1 by Marcus von Cube, Germany

I've updated the sheet again. Now, it contains the Epson HX-80 and the Tandy Model 100. MS BASIC is not made for mathematicians or engineers: most functions on the Epson are single precision (the Tandy uses double precision as default!), trigs are RADIAN only, PI as a constant is missing, and even such functions as ASN or ACS are not implemented. The HP, TI, Sharp or Casio BASIC machines are much better calculators (and worse typewriters.)

HP-200LX owners could be tempted to run GW-BASIC on their machines. Numeric precision is as poor as on the Epson. :-(I'll include GW-BASIC in a later release of my document.

A question to HP-75 owners: Could you please check whether my findings are correct? They're all based on the manual because I don't own such a beast. What would have to corrected for a system with an additional HP-IL ROM?

*Message #3 Posted by **Namir** on 31 Jan 2009, 4:25 p.m.,*
in response to message #1 by Martin Pinckney

While all of these packages are very good to good, Matlab seems to have a large following (count the number of Matlab books!). It is easy to use and has found a niche with many users.

All these application run circles around our good old hp calculators. I sed to dream about carrying out the kind of calculations made possible by Matlab, Maple, Mathematica, and so on.

Namir

Re: MatLab, Maple, MathCAD

*Message #4 Posted by **Fred Lusk** on 1 Feb 2009, 8:27 p.m.,*
in response to message #1 by Martin Pinckney

Martin....

I am a civil engineer with 29 years of experience and I use Mathcad once in a while. When I need to document a calculation, it's far better than Excel or a calculator. I've never used Mathematica or MatLab.

I don't use Mathcad as much as I used to because I'm not doing that much design any more (unfortunately). That's why I haven't upgraded beyond version 8--Mathcad won't help me with project management. That being said, I am current working on a Mathcad calcuation related to some factory destructive testing I witnessed for a client.

None of the young engineers I supervise have any interest in Mathcad, and only one is a good spreadsheet writer. Another one is pretty good with her HP-48GX. Their computer expertise is oriented more towards Autocad and hydraulic modeling software (water, sewer, storm drainage). I have yet to see much aptitude for creating new and unique calcualtions from scratch, which is Mathcad's forte.

challenge for a snowy day...

*Message #1 Posted by **Don Shepherd** on 31 Jan 2009, 9:36 a.m.*

OK, here's a simple challenge for a snowy day (in Louisville Kentucky USA). How many ways are there to use coins to make $1? Coins are: $1, .50, .25, .10, .05, and the lowly .01.

Re: challenge for a snowy day...

*Message #2 Posted by **Gene Wright** on 31 Jan 2009, 9:47 a.m.,*
in response to message #1 by Don Shepherd

How many of each coin are present?

One of each or ?

Re: challenge for a snowy day...

*Message #3 Posted by **Don Shepherd** on 31 Jan 2009, 9:50 a.m.,*
in response to message #2 by Gene Wright

As many as you need to make $1, like one way would be 10 dimes, another way would be 3 quarters + 2 dimes + 5 pennies.....

:)

Re: challenge for a snowy day...

*Message #4 Posted by **Allen** on 31 Jan 2009, 12:32 p.m.,*
in response to message #1 by Don Shepherd

Ironically, The answer is on the last page of the book I'm reading this weekend.

Re: challenge for a snowy day...

*Message #5 Posted by **David Hayden** on 31 Jan 2009, 12:39 p.m.,*
in response to message #1 by Don Shepherd

I get 293 using a recursive approach. I suspect that some of the members who remember their math better than I do will come up with much more clever solutions.

Below is my solution in RPL. To use it, store the program in 'COINS' (it must be called COINS because it's recursive). Put the list of possible coins, valued highest to lowest on level 2, put the number of cents you're trying to come up with on level 1 and run the program.

Example for the challenge given:

```
{ 100 50 25 10 5 1 } ENTER
100
```

COINS

It returns the answer on level 1.

Dave

```
@ This is a program to find the number of ways
@ to get a total from a set of coins.  For example,
@ how to get $1.00 from coins worth $1, $0.50,
@ $0.25, $0.10, $0.05 and $0.01

@ The program is recursive and assumes it is called
@ "COINS"

@ arguments:
@ Level 2: list containing the value of each coin
@          as an integer. The list must be sorted
@         (highest to lowest)
@ Level 1: the total that you're looking for.
@
@ Results: Total number of ways on level 1.
« 0. 0. 0. 0.  coinList
                total   @ list of coins
                result  @ # ways for this
                highCoin @ val of highest coin
                fewerCoins @ coin list without highCoin
                maxHighCoin «   @ max # of highCoin
                              @ coins that you can use
        IF total 0. >
           coinList SIZE 0. >
           AND
        THEN
            @ initialize local vars
            coinList HEAD
            'highCoin' STO
            coinList TAIL
            'fewerCoins' STO
            total highCoin / IP
            'maxHighCoin' STO

            @ 1 solution if you can do it with
            @ just the highest coin
            IF highCoin maxHighCoin * total ==
            THEN
                'result' INCR DROP
            END

            IF fewerCoins SIZE
            THEN
                @ Now add in the solutions with fewer
                @ coins.  For example, if your total is 75 cents
                @ and your highest coin is a quarter, then
                @ there's a solution of 75 cents in smaller coins,
                @ plus 1 quarter and 50 cents in smaller coins,
                @ plus 2 quarters and 25 cents in smaller coins.
                0 maxHighCoin
                FOR i
                    fewerCoins
                    total i highCoin * -
                    COINS
                    'result'
                    STO+
                NEXT
            END
        END
        result
    »
»
```

in response to message #5 by David Hayden

Hi David. I did the brute-force approach in VBScript. It executed in about 3 seconds, and found 293 also.

```
' find out the number of ways to combine coins to make a dollar (ans=293)
for i = 0 to 1  'dollar
  for j = 0 to 2  'half-dollar
    for k = 0 to 4  'quarter
      for l = 0 to 10  'dime
        for m = 0 to 20  'nickel
          for n = 0 to 100  'penny
            t=i*100+j*50+k*25+l*10+m*5+n
            if t=100 then
              p=p+1
            end if
          next
        next
      next
    next
  next
next
msgbox p
```

in response to message #6 by Don Shepherd

You can cut your iterations by almost 5x if you treat 5 pennies as a different type of nickle. I.e. 5 will always divide the number of pennies.

Change:

```
for n = 0 to 100  'penny
  t=i*100+j*50+k*25+l*10+m*5+n
```

To:

```
for n = 0 to 20  'penny
  t=i*100+j*50+k*25+l*10+(m+n)*5
```

> Quote:
>
> more clever solutions.

This problem is discussed in detail in *Concrete Mathematics*, Ch 7, *Generating Functions*. Mathematically the answer is:

$$\binom{6}{4} + 45\binom{5}{4} + 52\binom{4}{4} + 1 = 293$$

50g:

```
6 4 COMB 5 4 COMB 45 * + 4 4 COMB 52 * + 1 +
```

I'll try to come up with a general solution for any type of coin and sum.

in response to message #9 by Egan Ford

Thanks for that reference, Egan, I'm going to check it out. And thanks also for the 5x speed improvement. I noticed that

```
for n = 0 to 100 step 5 'penny
```

has the same effect. I'm going to make that change and try it again on my NSpire. The original version was still running after about 5 minutes when I shut it off. I hate to waste batteries!

There are other simple optimizations that you can also do to reduce your number of iterations. I do not know how do this in basic, but here is my Perl prototype:

```
$c = 1;

for($i = 0; $i <= 100; $i+=5) {
    for($j = 0; $j <= 100; $j+=5) {
        $A = $i + $j;
        if($A > 100) { last; }
        for($k = 0; $k <= 100; $k+=10) {
            $B = $A + $k;
            if($B > 100) { last; }
            for($l = 0; $l <= 100; $l+=25) {
                $C = $B + $l;
                if($C > 100) { last; }
                for($m = 0; $m <= 100; $m+=50) {
                    if($C + $m == 100) { $c++; }
                }
            }
        }
    }
}

print "$c\n";
```

IANS, since all of your loops increment, check for excess of 100 and skip rest of loop and inner loops.

Your original program iterated 349965 times. With the 'step 5' for your pennies it will iterate 72765 times. With the above checks only 4758 times. Of course David's recursive approach only iterates 337 times.

I should add that your dollar loop is costing you 2x your time, and if you do the above checks in your loops you will be better off with pennies as your outer loop, then nickels, etc...

IANS? Don't know that one.

OK, I see what you mean about checking for excess of 100 and exiting the loops at that point. Good idea. By my calculations, my original VBScript version iterated 2x3x5x11x21x101 = 699,930 times, and the "step 5" reduced it to 138,600 times, I think. That optimization had little effect on the PC, but it did let the NSpire get the answer in a couple of minutes.

Yes, the dollar loop takes twice as long. If we change the goal to "how many ways can you make change for a dollar" instead of "how many combinations of coins comprise a dollar, including the dollar coin," then we can get rid of the outer dollar loop.

It's an interesting problem. I am intrigued by the use of combinations to solve it. I don't have the book you mentioned; can you elaborate some on why those particular combination parameters work in this problem? Thanks.

Or just get rid of it and add one to your sum, or start with one. I do not think its necessary to calculate the obvious. That is why my iterative counts are 1/2 of yours.

in response to message #5 by David Hayden

Here's my recursive version again in C. On a PC, it gives the answer instantly. Takes one command line argument - the number of cents that you're trying to find (100 in the example)

```
#include <stdio.h>
#include <stdlib.h>

int
ways(int total, int *coins)
{
  int result = 0;
  int highest;                  // value of the highest coin
  int *withoutHighest;          // list of coins without highest
  int maxHighest;               // maximum number of "highest" coins
                                // that you can have in a group of "total"

  if (total == 0) return 0;
  if (*coins==0) return 0;      // coins list is empty

  highest = *coins;
  withoutHighest = coins+1;
  maxHighest = total/highest;

  if (maxHighest * coins[0] == total) {
    result += 1;
  }
  if (*withoutHighest == 0) {
    return result;              // no coins left
  }
  for (int i = 0; i <= maxHighest; ++i) {
    result += ways(total - i*highest, withoutHighest);
  }
  return result;
}

int main(int argc, char **argv)
{
  int coins[] = {100, 50, 25, 10, 5, 1, 0};
  int total = atoi(argv[1]);
```

```
  int result = ways(total, coins);
  printf("%d ways\n", result);
  return 0;
}
```

in response to message #1 by Don Shepherd

Here is my little solution to the problem in C.

This should be small enough to convert over to a keystroke RPN and still have it finish.

```
#include <stdio.h>

int main() {
  int c100, c50, c25, c10, c5;
  int n = 0;

  for (c100=0; c100 <= 100; c100+=100)
    for (c50 = c100; c50 <= 100; c50 += 50)
      for (c25 = c50; c25 <= 100; c25 += 25)
        for (c10 = c25; c10 <= 100; c10 += 10)
          for (c5=c10; c5<=100; c5 += 5) {
            printf("%04d: $1 %d\t.50 %d\t.25 %d\t%10 %d\t.05 %d\t.01 %d\n",
                n++, c100, c50-c100, c25-c50, c10-c25, c5-c10, 100-c5);
          }
  return 0;
}
```

> OK, here's a simple challenge for a snowy day (in Louisville Kentucky USA). How many ways are there to use coins to make $1? Coins are: $1, .50, .25, .10, .05, and the lowly .01.

I finally found some time yesterday to work on this. Below is my Perl prototype I developed with a 41 RPN version in mind. I took an iterative approach since a recursive approach using the same logic would have been more difficult to code for the 41.

```
my @c = (1,5,10,25,50,100);
my $n = 100;
my $z = 0;
my @b = (1);
```

- The array @c contains the coins (sorted).
- $n is one dollar.
- $z is the number if iterations.
- The array @b is initialized with one element, the first element is one.

```
for(my $i = @c - 1; $i >= 0; $i--) {
    $g[$i] = gcd($c[$i],$g[$i+1]);
}
```

This first loop caches the GCD from the largest coin to the smallest. The GCD is computed between the last GCD and the current coin.

```
for(my $i = 0; $i < @c; $i++) {
    for(my $j = $n % $c[$i]; $j <= $n; $j += $g[$i]) {
        if($j - $c[$i] >= 0) {
            $b[$j] = $b[$j - $c[$i]] + $b[$j];
        }
        $z++;
    }
    print $c[$i] . "\t" . $b[$n] . "\t" . $z . "\n";
}
```

The outer loop iterates through all the coins, while the inner loop counts up the permutations. The inner loop is accelerated by using a step of the cached GCD.

At the end of each coin a running total is printed, e.g.:

```
1       1       101
5       21      122
10      121     143
25      242     148
50      292     151
100     293     153
```

The first column is the coin, the 2nd is the number of ways the current and all previous coins can make 100 (one dollar). The last column is the number of iterations required. This is a lot less than the aforementioned 699,930 and 337. As the GCD between pairs of coins gets larger as does the acceleration. One way to cut the iterations in half (specific to this problem) is to use 2 different types of nickels and replace the pennies with one of them. This can only be done if the GCD of all of the coins, the target total ($n = 100), and the first coin are the same. In this case 1 or 5 is safe:

```
5       1       21
5       21      42
10      121     63
25      242     68
50      292     71
100     293     73
```

However in the case of the *Canadian Quarter* a penny must be a penny and not a special nickel:

Correct

```
N = 100

  c       n   gcd
---   ------  ---
  1       1     1
  5      21     1
 10     121     1
 17     310     1
 25     533    25
 50     607    50
100     608   100

TIME: 00:05:14.89
```

WRONG!

```
N = 100

  c       n   gcd
---   ------  ---
  5       1     1
  5      21     1
 10     121     1
 17     127     1
 25     248    25
 50     298    50
100     299   100

TIME: 00:05:12.84
```

Canadian Quarter: A while back an article was published about a mathematician that determined if the US had a 17-cent-piece then the average number of coins that a person carried would be reduced. A reader followed up with, "we do have a 17-cent-piece, it is a Canadian Quarter." Before the US economy started to head south, it was actually close to true. :-)

Larger denominations can also be quickly calculated. E.g. by changing @c and $n to:

```
my @c = (5,5,10,25,50,100,200,500,1000,2000,5000,10000);
my $n = $c[@c-1]; # $n = last value in array @c.
```

you can quickly calculate all the ways to make change for $100.00:

```
5       1               2001
5       2001            4002
10      1002001         6003
25      134235101       6404
50      6794128501      6605
100     139946140451    6706
200     1248652567476   6807
500     4292026472606   6828
1000    7980922016001   6839
2000    9764693427886   6850
5000    9823546661905   6853
10000   9823546661906   6855
```

Most of the work is with the smaller coins. Above, after the number of ways to change $100 with pennies, nickels, and dimes have been calculated the rest quickly add up. I'd be curious how the other posted solutions to this problem would fair. :-)

41CX Version

My 41 version is the same as my Perl version. However, most of the code is fluff (prompting for input, sorting the input, pretty print, etc...).

Limitations:

1. Because this algorithm requires one register for each penny $n must be <= 100. This can be optimized if the problem is known ahead of time.
2. I have also restricted the number of coins to <= 9.

Output:

Original Problem:

```
N = 100                         N = 100

  c       n   ncd               c       n   ncd
---   -----   ---             ---   -----   ---
  1       1     1               5       1     5
  5      21     5               5      21     5
 10     121     5              10     121     5
 25     242    25              25     242    25
 50     292    50              50     292    50
100     293   100             100     293   100

TIME: 00:02:08.26               TIME: 00:01:00.78
```

99 Cents:

```
N = 99                          N = 99

   c       n   gcd                c       n   gcd
 ---   ------   ---              ---   ------   ---
   1       1     1                5       0     5
   5      20     5                5       0     5
  10     110     5               10       0     5
  25     213    25               25       0    25
  50     252    50               50       0    50

 TIME: 00:01:58.00               TIME: 00:00:54.45
```

2nd Challenge

When Polya wrote about this problem in 1956 the US did not have 50 state quarters (or 50 states :-). Answer the original question, but consider the value *and* type of each quarter.

Update: fixed GCD issues

Edited: 10 Feb 2009, 1:27 a.m. after one or more responses were posted

Absolutely fascinating. Thanks to Egan and all who participated. Such elegant and insightful solutions to a simple problem! I showed the problem (and solution) to my middle school kids and they were fascinated as well.

Thanks for the detailed description of your solution Egan. I particularly appreciate the explanation of the code.

Dave

Would this run faster if you treat the pennies like I did and compute them last up as the difference between the rest of the coins and the target value? I guess a possible slight loss of generality for a currency without a unit cent (like ours BTW).

The extended challenge is an interesting extension but shouldn't be a lot harder -- think combinations and permutations.

- Pauli

Give it a go.

It is not that hard. A 10 digit model can find the answer.

Quote:

> The inner loop is accelerated by using a step of the GCD of the current and the next coin (that is why the last coin is doubled, the alternative would be to check for last coin and then step that value, but then each outer loop would have an extra "if" statement--the goal was to optimize for the 41).

The gcd trick works for the original challenge, but not for the case of the Canadian quarter. For that case (adding a coin worth 17 cents), I get 608 combinations, not 152.

I believe the GCD trick only works when each coin is worth an even multiple of the next cheapest coin.

Re: challenge for a snowy day..., Fast 41CX version, Canadian Quarters, a 2nd Challenge, and more...

*Message #23 Posted by **Egan Ford** on 10 Feb 2009, 1:33 a.m.,*
in response to message #22 by David Hayden

My original (non accelerated) version got 608 as well. In my haste to post before vacation I did not verify all output (my bad).

I have updated my previous post with a different GCD calculation. This time it starts from the largest to the smallest. The GCD is computed from the previous GCD and the current coin. This allows the same acceleration with the original problem and some acceleration with the Canadian Quarter.

50 State Quarters Solution

*Message #24 Posted by **Egan Ford** on 10 Feb 2009, 10:27 a.m.,*
in response to message #17 by Egan Ford

Quote:

> OK, here's a simple challenge for a snowy day (in Louisville Kentucky USA). How many ways are there to use coins to make $1? Coins are: $1, .50, .25, .10, .05, and the lowly .01.

No takers?

The answer is: 650868

Perl Prototype

```
#!/usr/bin/perl

my @c = (5,5,10,25,50,100,100);
my $n = 100;
my $z = 0;
```

```
my @b = (1);

for(my $i = 0; $i < @c - 1; $i++) {
    my $g = gcd($c[$i],$c[$i+1]);
    for(my $j = $n % $c[$i]; $j <= $n; $j += $g) {
        if($j - $c[$i] >= 0) {
            $b[$j/5] = $b[($j - $c[$i])/5] + $b[$j/5];
        }
        $z++;
    }
    print $c[$i] . "\t" . $b[$n/5] . "\t" . $z . "\n";

    if($c[$i] != 25) { next }
    $k++;
    if($k > 50) { next }
    $i--;
}
```

Previous version differences:

1. 5 pennies must be a special nickel to conserve memory.
2. GCD is not cached and is calculated up. This was required to conserve memory and will work in most cases where the GCD of the next larger coin matches the current or previous coin.
3. The addresses for the @b array are divided by 5 to reduce the number of registered required to 21 (that is why pennies must be grouped).
4. There is a hack at the bottom that continues through all 51 quarters (50 state and one regular).

Results:

```
  5       1   21       25    9526  123       25   77692  193       25  293691  263

 25    3763  103       25   47751  173       25  210172  243       25  607646  313
 25    4864  108       25   54263  178       25  229151  248       25  648892  318
 25    6176  113       25   61399  183       25  249363  253       50  650867  321
 25    7722  118       25   69196  188       25  270859  258      100  650868  323
```

The first column is the coin, the 2nd is the number of ways the current and all previous coins can make 100 (one dollar). The last column is the number of iterations required. In this case only 323 iterations where required to find the solution. On a PC this takes a second. A 41 takes a bit longer (~5.5 minutes).

To verify my results I wrote a program to generate a brute force program (see end of post).

41CX Version

In addition to the above the following differs from my previous version:

1. Hardcoded coins and sum.
2. No requirement for SIZE 130 (SIZE 40 will do).
3. No GCD printed.

Casio FX-9860G Slim available again...

*Message #1 Posted by **Bruce Bergman** on 30 Jan 2009, 11:35 p.m.*

[Excuse the non-HP message, but I know there are some interested parties who were tracking this calc.]

There was a lot of discussion here a couple of months back about the awesomely powerful Casio FX-9860G, "Slim" version. Katie W. found an awesome deal on it at geeks.com and they sold out fast. I just got informed that they are back in stock, and still at the $54.95 price, which is a STEAL. I also found a 10% coupon that you can use with that, bringing it down to $49.95.

If you want one, I'd suggest you order soon. Here's the link:

Casio FX-9860G Slim version

http://www.geeks.com/details.asp?invtid=FX-9860G-SLIM

For the coupon code, use "DEALTAKER" when you go to checkout. Enjoy!

thanks, bruce

Thanks for watching the market :)

Very nice features, but they want me to pay 43US$ at least for shipping :(Sorry, I'm not willing to pay that much for getting this to Europe. Will wait for the next international travel.

Re: Casio FX-9860G Slim available again...

*Message #3 Posted by **Nigel J Dowrick** on 31 Jan 2009, 6:05 a.m.,*
in response to message #2 by Walter B

If you're in Europe, have a look at www.studentcalculators.co.uk (in the UK, obviously!). They've got it in stock for £44.95. I don't know what delivery will cost (it depends where you are in Europe, I expect) but it would probably work out cheaper than delivery from the US.

Visiting the site gives me an "expired certificate" warning. If you'd rather not use their site because of this, their email address is info@oxford-educational.co.uk .

In case you are wondering I have no connections with this company, although I have dealt with them before with no problems.

Re: Casio FX-9860G Slim available again...

in response to message #3 by Nigel J Dowrick

Thanks for the link. The real price the customer has to pay would be 68,94 Pounds incl. tax and shipping.

A webserver running on a HP-41 and HPIL patch for nonpareil

*Message #1 Posted by **Khanh-Dang Nguyen Thu-Lam** on 30 Jan 2009, 9:05 p.m.*

Hi all,

I were looking for a HP-41 emulator that provided good support for HPIL and unfortunately, I found none that fitted my needs. (I need some HPIL debugging output, you'll understand why in the next paragraph.) So, I've been working for a few days on a patch for nonpareil (Eric Smith's microcode simulator). As Eric's program is free software under the GPL license, I could modify the code and so did I. My patch implements HPIL for a HP-41 emulated by nonpareil. It also provides support for a few HPIL devices, namely the HP82162 printer, the HP82163 and HP92198 video interfaces, and the HP82164 HPIL/RS232 interface. The patch also adds a few minor features for nonpareil (such as autoloading files on startup). You'll find more details there:

http://pagesperso-orange.fr/kdntl/hp41/nonpareil-patch-doc.html

I needed an emulator that could provide HPIL debugging tools because I had a project about programming a web server with minimal TCP/IP stack on a HP-41. I already wrote a FOCAL implementation of such a webserver. It's called WWWD and you can download it there:

http://pagesperso-orange.fr/kdntl/hp41/

You can already ping your HP-41 as you do with any host on Internet. You can also request a web page from your HP-41.

Well, this version is just a preview. It is slow. The emulated HP-41 takes approximately 155 seconds to answer a ICMP echo request (a so-called "ping" request). An HTTP request takes several long minutes, I can't even remember how many exactly.

I am planning to write a MCODE version of WWWD. Hopefully, it could answer a ping or an HTTP request in less than say 5 or 10 seconds.

Hope you enjoy,

Khanh-Dang

Re: A webserver running on a HP-41 and HPIL patch for nonpareil

*Message #2 Posted by **PeterP** on 30 Jan 2009, 10:04 p.m.,*
in response to message #1 by Khanh-Dang Nguyen Thu-Lam

Great project Khaan-Dang, I thought about the project once (for about 2 minutes or so...) thinking it would be really cool to hook up the 41 to the internet.

Doug Wilder wrote some pretty wicked MCODE stuff with HP-IL so he might be a good source for chatting about this project. Or just studying his code (all the MCODE source listings are on TOS) might help.

Anyway, looking forward to hearing more about it and then trying it!

Cheers

Peter

HP-IL on HP-41 questions

*Message #3 Posted by **Khanh-Dang Nguyen Thu-Lam** on 31 Jan 2009, 5:30 p.m.,*
in response to message #2 by PeterP

Glad you like it!

By the way, since I discovered the HP-41 and HP-IL world, I have been wondering about a few questions. I couldn't find a clear answer, although I had read all the specification documents and all the manuals I could have found; and unfortunately, I haven't got the corresponding hardware so I cannot even try to reverse-engineer it.

What does the so-called printer switch located on the HP-IL module exactly and how does it works? Is it connected to a CPU line or something?

Say I have a HP-41 with the HP-IL module and the video interface device (HP82163) on the HP-IL. In my emulation code, the HP-41 doesn't detect the HP82163 is actually not a printer. It acts instead as if the HP82163 is a thermal printer. The question is: is that behavior expected? (Actually, this question remains for any other HPIL devices other than the HP82163.)

Well, I know I could answer the latest question by decompiling the HP-IL and Printer2E ROMs, but I've found no decompiler* that could decompile the SELP opcodes correctly. Not that I am that lazy to decompile the ROM by myself, but if anyone has a kind of VASM listing of the HP-IL ROM, things would be a lot easier, I guess.

PeterP, I haven't found on TOS the HP-IL MCODE stuff by Doug Wilder you are talking about. Could you please give me some more precise references?

Cheers,

Khanh-Dang

Edit: *: I wrote compiler instead of decompiler.

>something?
```

The switch is to deactivate the HPIL Printer ROM because there was a thermal printer with direct connect to the HP41 witch embed a printer ROM too.

And you don't want 2 ROMs with same functions (same XROMs) in your 41.

Re: HP-IL on HP-41 questions

*Message #5 Posted by **Khanh-Dang Nguyen Thu-Lam** on 1 Feb 2009, 6:29 a.m.,*
in response to message #4 by Patrice

OK.

I think I've just found how this printer switch works.

When the printer switch is enable, the HPIL Printer ROM is at page 6. Thus, you can use all its commands as expected. This printer also defines some interrupt vectors: both the so-called "Pause loop" interrupt vector and the "I/O service" interrupt vector are defined to the same subroutine. I'm not sure when these interrupt vectors are precisely executed by the system. They may check for a HPIL printer or so.

Now, the interesting part is when the printer switch is disable. This forces the HPIL Printer ROM to be at page 4. Page 4 is normally reserved for the service ROMS. ROMs at page 4 can take over the system. (See "ZENROM manual", page 97) I guess ROMs at page 4 have no FAT table and their first executable word is directly at address 000 of the ROM. Now, what happens when the Printer ROM is at page 4?

Here is the first bytes of this ROM (remember ROM bytes are 10-bit). Interpretation follows.

```
000:  01D
001:  01B
002:  007
003:  1BB
```

When the ROM is at page 6 (printer switch is on), the ROM is considered as a normal ROM, with a FAT table. So, these first bytes shall be interpreted as:

```
000:  01D     ; XROM 29 (This is the ROM ID)
001:  01B     ; FCNS 27 (There is 27 commands in this ROM)
002:  0071BB  ; DEFP4K 7BB (This is the first "command" of the ROM
              ; it points to the "-PRINTER 2E" message)
```

When the ROM is at page 4 (printer switch is off), the bytes remain the same, but they are to be interpreted as executable code:

```
000:  01D01B  ; GOLC 0607
003:  007     ; GOC +0
004:  1BB     ; GONC +55 403A
...
03A:  3E0     ; RTN
```

As the carry is not set when these bytes are executed, they basically do a RTN. So, I guess, when the system do a GSUB 4000 (question: when does this happen?), nothing happens.

I am not really sure about all I've just written but it seems to me quite convincing.

Re: HP-IL on HP-41 questions

*Message #6 Posted by **Eric Smith** on 3 Feb 2009, 1:33 a.m.,*
in response to message #5 by Khanh-Dang Nguyen Thu-Lam

Yes, your analysis is basically correct. The beginning of the FAT of the HP-IL printer ROM is very carefully crafted to do a return when addressed at page 4.

AFAICT, the reason for this is that the original 4Kx10 ROM chips used in the 41 family had inputs that could change bits 13 and 14 of their address, but no input that would disable them entirely. Moving the ROM between 6000 (required for printer ROMs) and 4000 is a clever hack

that avoided needing to change the design of the ROM chip.

Fantastic! After updating scons on my Mac it built just fine. The emulated video interfaces, serial, and tcp are welcome additions. If you can manage it, can you add 9114B emulation as well (to an image on the disk of course). Tony Duell's lifutils for Linux may help.

Thanks!

in response to message #8 by Egan Ford

Adding emulation code for a peripheral is not so hard. The only difficulties I had to face up to the fact the documentation is very poor.

I've just taken a look to the 9114B manuals, and there is even not a word about HP-IL operation! The difficult part will be to reverse-engineer the HPIL ROM. But now that nonpareil can act as a HPIL sniffer thanks to its debugging output, things are easier, I hope.

He he.

I've just discovered the HP-41 world two weeks ago, or so, because I've read a topic in this forum about HP-41's 30th birthday. Then I thought it could be a nice idea to bring TCP/IP on the HP-41. I was quite surprised nobody had done it before.

Well, I still have a few month left to write the finish the MCODE version of WWWD :-)

HP-97 Card Reader NOT gummy wheel problem

*Message #1 Posted by **ZOleg** on 30 Jan 2009, 7:54 p.m.*

HP-97 card reader feeds cards OK, writes OK, but cannot read cards. HP displays "Error" each time I feed a card through.
I changed gummy wheel to new O-rings from Mark Hoskins, cleaned the head and still no luck.
Has anyone experienced a similar problem? What else can I check?

*Message #3 Posted by **Geoff Quickfall** on 31 Jan 2009, 11:21 a.m.,*
in response to message #1 by ZOleg

Hi there, check out this link:

card reader assymetric axle

Since you replaced the o rings you had to remove the white pinch roller axle. There are two physical possibilities;

```
the o-rings are not the same Outer Diameter (OD)

the o-rings have the correct OD but the axle was not installed
in the same position as it was removed from.
```

The axle is assymetric which when turned in position will raise or lower the pinch roller thus raising or lowering the magnetic strip away from or towards the reader head. I have seen this incorrect height of the pinch roller to cause Read errors but not write errors.

Cheers, Geoff

This assumes the electronics are not a fault as in this case: capacitor

Re: HP-97 Card Reader NOT gummy wheel problem

*Message #4 Posted by **ZOleg** on 3 Feb 2009, 7:12 p.m.,*
in response to message #1 by ZOleg

Problem was not in the capacitors and not in the roller, but in the damaged cable which connect the card reader board and the main board.
I replace it to self made cable (from IDE cable) and it work well - write and read.

Gamma (and Factorial) for 12C/12CP

*Message #1 Posted by **Les Wright** on 30 Jan 2009, 2:31 a.m.*

Inspired by Egan Ford's work for the 12C and 12CP (and now his "new" 10C) I thought I would offer an admittedly leaner but less well appointed variation.

If you visit this page of Peter Luschny and scroll down to the section entitled "Which Approximation to Choose?", you find in blue pseudocode the following version of the Stieltjes continued fraction estimate of the Gamma function:

```
Sqrt[ 2*Pi/y ] Exp[ y (Log[y] - 1) + 1/(12*y + 2/(5 y + 53/(42y))) ]
```

Now I have played around with this at some length in Mathematica and am convinced that simplifying the innermost coefficient of 53/42 to 5/4 doesn't compromise overall accuracy too much. So on making the substitution and doing a little rearranging that is friendly to the 12C/12CP, I get this.

```
Exp[ y (Log[y] - 1) + 1/(12*y + 2/(5 (y + 1/(4y)))) ] Sqrt[ 2*Pi ] / Sqrt[y]
```

This gives the following 28 steps for the 12C/CP:

```
STO 0
4
*
1/x
RCL 0
+
5
*
2
x<>y
/
RCL 0
g 12x
+
1/x
RCL 0
g LN
1
-
RCL 0
*
+
g e^x
RCL 0
g sqrt
/
RCL 1
*
```

The setup is to first store the constant Sqrt [2 Pi] in register 1, which can be done manually or by program code if there are steps left. I like to take advantage of all 12 available digits on the 12CP so this is what I key in: 2.506628274 STO 1 63 EEX 11 CHS STO + 1.

That done, assuming the program is the top one in memory, in run mode I hit f CLEAR PRGM, enter my positive argument, hit R/S, voila. E.g., on my 12CP:

```
5.5 R/S gives 52.34277784 (actual is 52.34277778)
```

```
2.25 R/S gives 1.133003995 (actual 1.133003096)
.127 R/S gives 8.540153601 (actual 7.409558064)
10 R/S gives 362880.0000 (exact to 10 digits)
15.8 R/S gives 7.567994848E11 (exact to 10 digits)
```

I don't have a 12C "classic" to test, but I would not expect the full 10 digit accuracy for the larger input values since values on that calculator carry only 10 and not 12 digits on the stack and there would be more rounding error accumulation.

Folks interested in gamma/factorial approximations know that for most (the exceptions being things like the Lanczos and Spouge formulae) accuracy goes down for smaller values but can be improved by repeatedly applying a "shift and divide" trick based on the identity Gamma[x+1] == x Gamma[x]. Egan's routines for 12C/CP and 10C include this but as of yet mine does not. Also I do not yet handle negative arguments, since this requires a way to compute the sine function as required by reflection formula. Egan's 99 step 12C routine builds this in.

Also keep in mind that the little routine computes Gamma straight up, not x!. To get the same behaviour as f x! on the 15C, simply add 1 to the input argument before running this routine.

I hope this little offering is of interest. Keep in mind though it is very similar to Egan's work, it is not exactly the same, computing Gamma rather than x! and using a slightly different formula that, at least in my foolings, seems to be a little more accurate, especially with the user accessible 12-digit precision of the 12CP. I hope this inspires some discussion by special function lovers.

Re: Gamma (and Factorial) for 12C/12CP

*Message #4 Posted by **Les Wright** on 30 Jan 2009, 7:45 p.m.,*
in response to message #2 by Michael Andersson

The Lanczos approximation for the gamma function is ill-suited to the 12C or 12CP since every decimal constant needs to be pre-stored and this is labour intensive. The program itself is also somewhat longer. Going with an asymptotic series or continued fraction approximation with small constants is a lot "tighter". The drawback here is that a Pochhammer shift-and-divide is needed for the smaller arguments to improve accuracy there. Not necessary for Lanczos, which can have high accuracy for all nonnegative reals.

The Lanczos and similar Spouge approximations are actually better suited for high precision or arbitrary

precision environments where pre-storing the decimal coefficients poses no huge hardship. For example, Thomas Okken (courtesy of Hugh Steers' library) uses a Lanczos approximation to compute the built-in Gamma and Factorial functions of Free42 to high accuracy.

I expect that once I include some shift-and-divide steps, my little routine will provide as good or better performance as the Toth Lanczos routine, only with lower set up time. I also note that Viktor's treatment of Gamma provides excellent coverage of Lanczos, but I would recommend that one check out Peter Luschny's extensive list of other approximations when seeking options better suited to the step- and register- limited calculators like the 12C, 10C, and 33C/E. The modified Stieltjes CF that I use just happens to be my favourite.

Les

Enhanced version optimized for 12cp

*Message #5 Posted by **Les Wright** on 31 Jan 2009, 4:25 a.m.,*
in response to message #1 by Les Wright

Here is my enhanced routine, where the initial 12 steps carry out the the Pochhammer shift-and-divide correction. Basically, the argument is incremented until it exceeds the integer threshold stored in register 2 (I have been experimenting with 7 thru 10, and seem to like 9 so far), computes the gamma of the incremented argument, and divides out the accumulated Pochhammer product in register 3 at the end. If anyone is familar with Jean-Marc Baillard's routine GAM+ in the HP41 library, I have simply adapted his approach to the Pochhammer shift to the limitations of the 12CP, but, unlike him, I have stuck with the Stieltjes continued fraction for the main computation (whereas he uses a traditional Stirling series):

```
STO 0
1
STO 3
RCL 0
RCL 2
g x<=y?
GTO 013
x<>y
ST* 3
1
ST+ 0
GTO 004
RCL 0
4
*
1/x
RCL 0
+
5
*
2
x<>y
/
RCL 0
g 12x
+
1/x
RCL 0
g LN
1
-
RCL 0
*
+
g e^x
RCL 0
g sqrt
/
RCL 1
*
RCL 3
/
```

The usage is similar to that reported in my initial post. I store the 12-digit version of sqrt(2Pi) in register 1 and the desired threshold in register 2 (in my case, this means 9 STO 2). And then I compute gamma for positive values exactly as described earlier. Some examples, once I have stored sqrt(2Pi) in R1, 9 in R2, and reset the program pointer with f CLEAR PRGM (in run mode):

```
.25 R/S returns 3.625609908 (all 10 digits correct)
5 R/S returns 24.00000000 (all correct)
3.222 R/S returns 2.478039436 (actual is 2.478039437)
5.5 R/S returns 52.34277778 (all correct)
.5 R/S returns 1.772453851 (this is sqrt(Pi), all digits correct)
.0001 R/S returns 9999.422884 (actual is 9999.422883)
12.771 R/S returns 269174672.9 (actual is 269174673.0)
```

Speed is really good too, though the smaller arguments take a little longer since the Pochhammer shift loop takes a few more trips in its augmentation of the argument. Of course, larger arguments that don't need shift lead to quicker results.

The routine WILL handle negative arguments since the Pochhammer shift steps will move the argument into positive territory, but for negative arguments with larger absolute value this can be rather inefficient. For example, -65.126 R/S will return the correct result of 5.831779435E-91, but it is much slower than for positive values since the Pochhammer shift loop has to go around seventyish some odd times to get the argument above 9. (That said, we are talking only a dozen or so seconds as opposed to a couple.) Programming the sine function to use the reflection formula, as Egan did, is much more efficient.

Also, keep in mind that the impressive accuracy is an advantage of the 12CP over the 12C--stack and register computations use 12-digit numbers all the way through, even though only 10 are displayed. A 12C version of this would NOT give as impressive results since rounding errors affect visible digits, not "hidden" ones.

Folks who insist that the routine return the factorial just like the f x! key sequence on the 15C need only increase the argument by 1, either manually or right at the beginning of the program, since of course Gamma[x+1] = x!

I really love programming the oft maligned 12cp, since I find the 12-digit accuracy and speed of the calculator are strong advantages (though the stubborn keyboard is not). I hope folks enjoy this and will see it as a supplement or alternative to Egan's excellent contribution.

Les

Re: Enhanced version optimized for 12cp

*Message #6 Posted by **Rodger Rosenbaum** on 31 Jan 2009, 6:39 a.m.,*
in response to message #5 by Les Wright

Very nifty, Les.

When you get tired of this, I suggest as your next project to code some functions that just aren't available as built in functions on any calculator, AFAIK, such as Bessel functions and Jacobi Elliptic functions.

I did some work on the Jacobi Elliptic functions years ago, but I haven't looked at them lately.

*Message #8 Posted by **Les Wright** on 2 Feb 2009, 1:06 a.m.,*
in response to message #6 by Rodger Rosenbaum

Programming Bessel functions and the like is really challenging on our calculators, but I think J-M Baillard has some routines in the HP41C software library.

Due to my interest in statistical distributions I have routines for the incomplete gamma and incomplete beta functions (from which one can derive the error function and the cumulative normal, t, chisquare, and F distributions) for the 41C, 42, and 35S, and with respect to the prolific M. Baillard I actually prefer them over his versions. I have simply adapted the Numerical Recipes routines and I particularly like using more modern techniques for computing the continued fractions, since the centuries old Wallis technique is prone to overflow errors that need to be trapped. Indeed, using the "left" and "right" incomplete gamma functions to compute the complete gamma is a theoretically feasible yet fairly inefficient strategy. But it does work. I have SysRPL versions of my incomplete gamma stuff, but haven't looked at the beta stuff, which is about three times as long.

All of this of course is for amusement. Anyone in their right mind who really needs any of these functions to high accuracy in real life is going to count on something like Maple or Mathematica. Indeed, I use the latter as my gold standard when testing my calculator programs.

Les

Some further comments

*Message #9 Posted by **Les Wright** on 2 Feb 2009, 12:51 a.m.,*
in response to message #5 by Les Wright

I did port this to the Crimson Research emulation of the 12C classic (I don't have a real one) and to a real 33C, and found the accuracy is not as impressive as on the 12cp, which by carrying those two extra digits off the display substantially mitigates rounding error. It still gives about 8 to 9 good digits fairly consistently on the 33C, and fits very well in the meagre 49 steps of the calculator. My gross experience is that it is not quite as good as with the Baillard 41C version, which requires 70 steps, uses the Stirling series taken out to several terms, and gives 9 digits usually and fully 10 digits often. Losing a digit of accuracy seems to be the trade off for a much simpler program that is almost half the size. I would like to see Egan try it out on his 10C and see if he is as happy with it as his own version.

Some time back Valentin posted a challenge asking how one would compute the sine function on a 15C with a missing or malfunctioning SIN key. This lead to a discussion of the very elegant and fascinating factorial (or Gamma) reflection formula. It turns out that if the angle x is in DEGREES (not radians),

```
sin(x) = Pi / Gamma(x/180) / Gamma(1-x/180) = Gamma(.5)^2 / Gamma(x/180) / Gamma(1-x/180)
```

Unfortunately, there is no subroutine return capability on the 12cp, so my gamma routine can't be programmatically called from another program. But it works pretty well when the formula is applied manually, except for angles close to multiples of 90 where rounding error starts creeping in. It also can't be used directly for angles that are multiples of 180, where Gamma(1-x/180) is a pole. But I thought it was cool to point out the relationship.

Re: Some further comments

*Message #10 Posted by **Egan Ford** on 2 Feb 2009, 6:18 p.m.,*
in response to message #9 by Les Wright

> Quote:
>
> Egan try it out on his 10C and see if he is as happy with it as his own version.

I only have one 10C and no emulator. Since my 10C and 12C (classic) gamma versions are the same I should get the same results. I put your version on my 10C and compared to my version on my 12C.

Results:

n	50g	10c Les	12c Egan (n - 1)
1.1010	.950948396	.950948404 (+.000000008)	.950948397 (+.000000001)
2.2020	1.103003815	1.103003818 (+.000000003)	1.103003815
5.5679	58.42037200	58.42037204 (+.00000004)	58.42037190 (-.00000010)
7.7777	3230.547120	3226.060157 (+.000037)	3226.060131 (+.000011)
8.8888	31802.28101	31802.28129 (+.00027)	31802.12908 (-.15193)
9.1234	52556.73243	52556.73292 (+.00049)	52556.73244 (+.00001)
10.0001	362961.7210	362961.7214 (+.0004)	362961.7209 (+.0001)

Both versions vary little except for the 8.8888 test (7.8888 for the 12C). This number is very close to my shift boundary of 8. Hmmm... I'll have to see if 7 or 9 do better.

10C code:

```
01  STO 0      14  RCL 0      27  2          40  SQRT
02  STO 2      15  4          28  *          41  /
03  1          16  *          29  +          42  2
04  STO 1      17  1/X        30  1/X        43  PI
05  RCL 0      18  RCL 0      31  RCL 0      44  *
06  9          19  +          32  LN         45  SQRT
07  X<=Y?      20  5          33  1          46  *
08  GTO 14     21  *          34  -          47  RCL 1
09  X<>Y       22  2          35  RCL 0      48  /
10  STO* 1     23  X<>Y       36  *          49  GTO 00
11  1          24  /          37  +
12  STO+ 0     25  RCL 0      38  E^X

HP-41CX Zengrange: remove rubber fragments

*Message #1 Posted by **Rainer Wiedemann (Germany)** on 29 Jan 2009, 7:32 p.m.*

Hello all,

for quite some time now I'm reading the articles in this forum, and I am really enjoying the enthusiasm and dedication which can be experienced by reading your postings, and as a freshly registered user I hope I can make contributions, too.

Today I'm asking for help. Recently I bought a HP-41CX on the auction site not to be mentioned. Technically it's perfect, but it is a Zengrange model, which was previously wrapped in a rubber protection coating around the keyboard. The former owner has ripped off almost of that rubber, but a residual amount of it is still sticking to the keyboard panel and around the display window. This stuff refused any attempt of smoothly removing it. I'm afraid of scratching the calculator's surface causing irreversible damage by cleaning up.

Does anyone know how to remove this rubber stuff or has already done it without scratching the calculator? Any advice is highly appreciated.

Thanks in advance and best regards,

Rainer

HP-46 find

*Message #1 Posted by **GanjaTron** on 29 Jan 2009, 5:48 p.m.*

Today I did a good deed: I rescued an HP-46 from the dumpster. No kidding, the lab was actually gonna toss it out!

I fired it up and it's perfect -- even the ribbon still prints. This thing is weird; apart from its hefty weight and size, it has the peculiarity of running a loud motor when you turn on the printer, almost giving the impression there's a hard disk lurking within! And man, is that printer clunky; reminds me of a telex machine!

Anyway, just thought I'd share that with you guys. Wonder what's gonna turn up next in the dumpster... ;^)

*Message #3 Posted by **Michael de Estrada** on 29 Jan 2009, 8:01 p.m.,*
in response to message #1 by GanjaTron

Does it have the optional LED display? I remember lusting over one of these in the display case of a store in 1974.

Re: HP-46 find

*Message #4 Posted by **George Bailey (Bedford Falls)** on 30 Jan 2009, 4:07 a.m.,*
in response to message #3 by Michael de Estrada

> Quote:

> Does it have the optional LED display?

I just read about this machine on this museum page. How was it operated without the LED option? Was every single keystroke directly printed?

Re: HP-46 find

*Message #5 Posted by **GanjaTron** on 30 Jan 2009, 6:42 a.m.,*
in response to message #3 by Michael de Estrada

Yep, it does have the LED option. The dinky display looks pretty out of place on such a large machine. The printer doesn't echo every keystroke, only when you enter operands or operators, so I suspect the

absent display is no fun. Amusingly, hitting CLEAR literally prints the same. Anyone know why it uses a black and *red* ribbon?

Regards,

--Roland

Thanks Katie, you're right. Wasn't in a "negative" mood to try it out until now. ;^)

The red's kinda faded tho. That grinding printer noise really freaks me out.

And yep, these calcs with their red negs might just come into fashion again these days...

Have a great weekend,

--Roland

Re: HP-46 find

*Message #9 Posted by **Katie Wasserman** on 30 Jan 2009, 5:14 p.m.,*
in response to message #8 by GanjaTron

New black/red ribbons are very easy to come by as this seems to be a standard size still in use in modern accountant's calculators. (I think I bought some of these: Porelon 483-B/R).

I might start selling red-only ribbons, there must be some money in that these days. They say

that many law firms have switched from doing real estate deals to doing bankruptcies.

Re: Graphing Calculators and education

*Message #1 Posted by **Martin Pinckney** on 29 Jan 2009, 11:06 a.m.*

> Quote:
>
> Being an rpn user primarily, I found that whenever I borrowed a machine I had to be very thoughtful about how to use it--always aproximating the answer in my head or on paper.

Please understand that exactly the same thing is true for us algebraic users when we pick up an RPN machine.

Many the time I have grabbed an employee's 32sii (or in years gone by an 11c) and started pecking away, expecting it to follow precedence rules, only to get garbage answers and then start over. Finally I learned to think first, then calculate...

> Quote:
>
> The other thing I tend to do with unfamiliar machines is to avoid any chain or parenthesis work--rather keep finding intermediate results and continuing on. This is the most sure-fire way to muddle through with even the most recalcitrant calculator logic!

Well, you **could** use the parenthesis keys (if available), just like you learned in algebra class, but for us there are none on the RPN machine!

Which is one reason why HP started making dual mode calculators.

HPLink, DOSLink, Trans41 etc

*Message #1 Posted by **Roland Storz** on 29 Jan 2009, 6:19 a.m.*

Hi all, does anybody have a clou where to get or where to download one of the above mentioned DOS exe files? Which one would be your favorite? Many thanks in advance, Roland

Re: HPLink, DOSLink, Trans41 etc

*Message #2 Posted by **Egan Ford** on 29 Jan 2009, 10:58 a.m.,*
in response to message #1 by Roland Storz

The above are all DOS-based and will only with DOS or Windows on DOS (e.g. Windows 98) or Linux with DOSEMU. IIRC, some of them have problems with faster machines.

I sent you a TOS link with the above (sans the etc... :-)

etc...:

A better alternative is EMU41 and EMU71. Both support the HP-IL ISA adapter and provide a superset of functionality, with the possible exception of Link+. Link+ has the ability to emulate the HP and Mountain View HP-IL Video Interface. EMU71 has some type of video interface as well, but I am unsure if it emulates any or all the ESC codes (something that I have been meaning to test).

Another alternative primarily for the 41C is HPILCOM. It is a Windows-only (XP OK) program and requires a connection to your 41C via an RS-232 HP-IL Interface. It is not publicly available. You will have ask the author (Hans Brueggemann) to send it to you. BTW, EMU41/71 can also from XP, DOS, Linux/DOSEMU communicate via the RS-232 HP-IL Interface.

If you are a Linux user you can use Tony Duell's LIFUTIL. This provides CLI tools for 9114 formatted floppies (read and write), and tools to get and put 41/71 programs and data.

Lately I have been too lazy to setup all my HP-IL gear just to transfer programs to my 41CX. I find that using http://www.hpmuseum.org/software/41uc.htm to create barcodes and wanding them in is more convenient.

Just ordered a 50G...now what?

*Message #1 Posted by **Ryan McLean** on 29 Jan 2009, 3:16 a.m.*

When I got my (Blue) 49G there were about 10 things that it seemed power-users liked to change right away, so I changed those right away so I could learn to be a power user. Now I'm wondering what need to happen to a new 50G.

The first thing that will happen out of the box is RPN will be turned on. What other settings/flags are popular to adjust? Do I need to adjust the keytime?

Can I just transfer my programs and things straight over from my 49G? WIll they 'just work' on the ARM processor?

Re: Just ordered a 50G...now what?

*Message #2 Posted by **Egan Ford** on 29 Jan 2009, 11:13 a.m.,*
in response to message #1 by Ryan McLean

1. Hang out here (too): http://groups.google.com/group/comp.sys.hp48/topics. There are more 50g users.
2. Get an SD card. 2GB or less.
3. Since you have a Mac get HPConnect to transfer programs and data (or you can just do SD card shuttle transfers): http://hpconnect.sourceforge.net/.
4. Get a 50g emulator for your Mac so that when you leave your 50g at home you are not stranded: http://x49gp.svn.sourceforge.net/viewvc/x49gp/README.QUICKSTART.
5. Create a STARTUP script with << 256 ->KEYTIME 256 ATTACH 257 ATTACH >>. This will fix keyboard issues and will give you access to some developer libraries. You may want to dump your flags in there as well.
6. Search comp.sys.hp48 for a good backup script that will get all programs and settings. Or write your own.
7. RTFM on how to adjust contrast.
8. Get the PDF of the 50g manual and the 49g+/50G AUR.
9. Shop for programs here: http://www.hpcalc.org.
10. Become a C programmer (HPGCC 2 and 3).

Re: Just ordered a 50G...now what?

*Message #3 Posted by **Sancerre (Phoenix)** on 29 Jan 2009, 5:28 p.m.,*
in response to message #2 by Egan Ford

Where do you place a startup script?

Re: Just ordered a 50G...now what?

*Message #4 Posted by **Egan Ford** on 29 Jan 2009, 7:42 p.m.,*
in response to message #3 by Sancerre (Phoenix)

Create a program call 'STARTUP' in your HOME directory on your 50g, then warm start (ON-C) your 50g.

From a previous thread or private email exchange (I forget).

Re: Just ordered a 50G...now what?

*Message #7 Posted by **Dave** on 29 Jan 2009, 4:47 p.m.,*
in response to message #1 by Ryan McLean

For a more 48-like experience, I also turn on approx mode and soft menus. Choose mini-font also looks better to me. I've never needed to change keytime.

I assign PURGE to a user key, as well as assign all the hyperbolic functions to user keys.

And I can't live without Bill Markwick's brilliant hlp49 on hpcalc.org, which I also assign to a user key.

Have fun with your new toy.

Re: Just ordered a 50G...now what?

I completely forgot to mention soft menus and mini font. That is a must. Put -117 SF -90 SF in your STARTUP.

Re: Just ordered a 50G...now what?

*Message #9 Posted by **Ryan McLean** on 29 Jan 2009, 11:39 p.m.,*
in response to message #8 by Egan Ford

Ok, sounds basically like 49G stuff all over again -- no surprises there ;-)

Whilst I was just looking through the 49G flags I remembered another important one -- turn the BEEPs *OFF* (Maybe less-required for those of you not in academia, nothing more annoying than a beeping, clicking calculator)

Too bad there's not just a Migration Assistant for Calculators...kind of like the one that comes with a new...Mac.

Re: Just ordered a 50G...now what?

*Message #10 Posted by **Ryan McLean** on 31 Jan 2009, 1:15 a.m.,*
in response to message #8 by Egan Ford

Alright, it's here, I'm excited. This is one of those threads where it looks like I'm going to ramble on to myself ;-)

1 - I ordered from newegg. I LOVE NewEgg. It came quick and...

2 - It came in a bonus pack with a 1 Gb SD card. Score!

Got my flags set. The UI is /so much faster/...so much to do...

Re: Saturday Night Live skit about some of us

*Message #1 Posted by **Karl Schneider** on 29 Jan 2009, 1:40 a.m.*

> Quote:
>
> I could be wrong, but I think many here may miss the point of the skit.
>
> ...
>
> IMHO, the point of the skit was show us all how stupid these (Wii) kids are.

Hi, Egan --

Thank you for the context and insight. However, if "Wii-mania" was the point, it was an easy one to miss. Note how the object of the geek twins' obsession is introduced well before the Wii is opened. The script -- such as it was -- dwelled on the twins, before and after the opening of the presents.

It seemed to me that the emphasis of the skit was ridicule; I'd describe the writing as sophomoric and unfunny. Many users and enthusiasts of TI models were likely as unamused as I was.

On a different note, readers can click a link to read about an infamously shameful example of Wii-mania.

Re: Mini Challenge

*Message #1 Posted by **Thomas Klemm** on 28 Jan 2009, 9:30 p.m.*

First I was looking for LBL B in your program for the HP 15C but then I realized that this is not the only problem. I tried to fix it leaving as much as possible unchanged with the hope it's what you had in mind:

```
001 - 42,21,11   LBL A
002 -    44  0   STO 0
003 -        1   1
004 -       26   EEX
005 -        6   6
006 -       16   CHS
007 -    44  1   STO 1
008 - 42,21,12   LBL B
009 -    45  0   RCL 0
010 -   43  11   x²
011 -        1   1
012 -       40   +
013 -        2   2
014 -       10   ÷
015 -    44  2   STO 2
016 -       11   SQRT x
017 -    45  1   RCL 1
018 -       40   +
019 -   43  44   INT
020 -   43  11   x²
021 -    45  2   RCL 2
022 - 43,30, 6   TEST 6
023 -   22  13   GTO C
024 -        1   1
025 -       30   -
026 -        2   2
027 -       20   ×
028 -       31   R/S
029 - 42,21,13   LBL C
030 -        2   2
031 - 44,40, 0   STO + 0
032 -   22  12   GTO B
```

It has to be started with:

```
1 GSB A
```

Since internally a digit by digit method is used to calculate the square root I'm confident that taking the root of a square-number won't show any rounding errors. That's different from using an iterative algorithm and might be even worse when a binary representation for the numbers is used.
Therefore you can confidently omit lines 003-007 and 017-018 from the program above.

Gamma and Factorial for 10C/12C/12CP (thread hijack)

*Message #1 Posted by **Les Wright** on 28 Jan 2009, 5:02 p.m.*

> Quote:
>
> Out of context (i.e. calculator nerd bashing), I found it quiet funny. Especially because I got a calculator for Christmas and then proceeded to write a Gamma function for it. Details here: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv018.cgi?read=145337#145337.

Egan, in original 12C post you use the following to approximate the factorial:

```
x! = x^x*sqrt(2PIx)*e^(1/[12x + 2/(5x + 5/4x)] - x)
```

Very elegant, with simple constants, and seems to work pretty well--indeed for calculator use with limited steps it is hard to get much better, especially if you use the shift-divide correction for the smaller arguments.

But I notice that it is a slight variation of a Stieltjes continued fraction. (stieltjes3 at Peter Luschny's site is the analagous formula.) The only difference is that in the version I know and which I can find on on Viktor Toth's site, the innermost term is actually 53/(42x).

I am curious whether you made the choice to approximate 53/42 by 5/4 yourself, or did you see another version of the formula on an earlier version of Viktor's site? I have to admit that deciding on the slight modification of that term is very wise, especially on the 10C and 12C where every digit is a keystroke.

I am kind of preoccupied myself with computing gamma on calculators that don't have it for noninteger values, so I am curious on the provenance of the formula you chose. (Right now I am experimenting with a variation of the Windschitl formula, but I think it takes more steps without any huge improvement in accuracy. With a 10 or 12 digit calculator, rounding error becomes significant quickly and mitigates the benefit of adding too many correction terms!)

Les

Re: HP-25 fails to store programming steps

*Message #1 Posted by **Mike Morrow** on 28 Jan 2009, 3:34 p.m.*

Your point is well taken, Randy.

I did not mean to endorse the extremely poor, incompetent, negligent HP design of the Woodstock battery charging system. I do like the mechanical aspects of the Woodstock battery pack, with its integrated compartment door.

The cheapest Woodstock, the HP-21, cost the equivalent of $494 2008 dollars. I can't imagine why HP thought it would be acceptable to market an expensive product that could be destroyed easily and innocently while connected to the charger if the battery pack was missing, poorly connected, or so degraded as to not provide the charging voltage clamp needed to prevent the spikes that kill the machine.

Whenever I hear fanatical declarations of HP design excellence, I think in response immediately of this Woodstock charging system, the HP magnetic card reader roller, the early Spice series press-fit circuit construction, and the flimsy case, poor battery compartment design, the needlessly complex charger connector plug of all the Spice series, the HP-28 battery door, etc.

I will admit that my 33-year old HP-21 and HP-25 Woodstocks are still going stong today, but likely more from luck than prudent usage. I didn't even know about the charger problems until a few years ago.

Re: HP-25 fails to store programming steps

*Message #2 Posted by **Michael de Estrada** on 28 Jan 2009, 4:24 p.m.,*
in response to message #1 by Mike Morrow

Actually, my original HP-21 failed not because of battery/charger issues, but because several keys began to malfunction, and I could not remove the keyboard for cleaning because it was heat-staked to the front half of the case. I could have broken the plastic staking posts, but there would be no way to re-secure the keyboard. Compare this to the HP-35 and other classics where everything was screwed together, and it could be completely disassembled for repair and then re-assembled. Still, I truly loved the very small size of my HP-21; it was the only truly pocket size LED calculator HP ever made.

On a side note related to the topic of the original post, I personally believe the Voyager series were the highest quality calculators ever made by HP, and the keyboard on my heavily used HP-15c still works perfectly to this day.

Nicotine stains on Woodstock keyboard

*Message #1 Posted by **Xavier A. (Brazil)** on 28 Jan 2009, 10:17 a.m.*

Hello,

I searched the entire archives without finding any solution to this : I am trying to clean some simple nicotine (or cigarette stains) on a Woodstock calculator, particularly on the keyboard (the keys are almost yellow). I don't want to damage it, so I don't want to try anything. Does anybody have a... solution ? Regards.

P.-S.: searching the entire archives is pretty long, according to my method (searching through archives 1 to 18 one-by-one) ; is there another one? Yes I am a newbie!

Re: Nicotine stains on Woodstock keyboard

*Message #2 Posted by **Marcus von Cube, Germany** on 28 Jan 2009, 4:04 p.m.,*
in response to message #1 by Xavier A. (Brazil)

Google is your friend. Add "site:hpmuseum.org" to your search pattern.

Re: Nicotine stains on Woodstock keyboard

*Message #3 Posted by **Xavier A. (Brazil)** on 28 Jan 2009, 4:21 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Thank's a lot, it is a great idea, even if I don't know if Google is more my friend than my boss.

Finally I decided to wash the keyboard with some diluent for painting. It worked well. Regards.

Which HP series are the best hardware built?

*Message #1 Posted by **Nacho** on 28 Jan 2009, 8:46 a.m.*

Hi everyone!

I'm asking that because when we start a collection (in my case) I think for how long will last my calcs working in good condition.

I see lot of people with theirs nearly 30 y/old HP41 as a daily use calc and think if my 48GX year 94 with heavy use will work perfectly in 15 years...

Regards!

Re: Which HP series are the best hardware built?

*Message #2 Posted by **David Hayden** on 28 Jan 2009, 9:04 a.m.,*
in response to message #1 by Nacho

Yes, my 41CV purchased in 1981 or 82 (I think) is still in perfect shape. On the other hand, the card reader and printer are not.

Re: Which HP series are the best hardware built?

*Message #3 Posted by **David Ramsey** on 28 Jan 2009, 9:49 a.m.,*
in response to message #1 by Nacho

Good question. How long a calculator will be usable depends on two things, in my view:

1. The initial quality of construction.

With a few notable exceptions (the Spice units, for example), the quality of design and construction of HP calcs is very good. My first 28S failed, but that's the only failure I can recall (from a new calculator that I bought myself).

There are some unknowables: is the keyboard in a 35s more or less durable than the keyboard in a 1972 HP-35? Does the higher reliability of an LCD (vs. LED display) overcome the inherently flawed nature of a rubber pressure-strip connector?

2. How easy it is to repair when something goes wrong.

This is the kicker. Once you get into the late 80s and onwards, HP calcs are simply not designed to be taken apart. You can still repair them, but it takes mad skilz and not a trivial amount of luck to do so.

I think the answer's probably that the first couple of generations of calcs are built to a quality level not seen any more in this class of device, simply because they cost a boatload of money. The $395 for a 1972 HP-35 equates to close to $2,000 today.

About the only thing that ever goes wrong with a first-generation HP is LED and keyboard failures, and even those are rare, and easy to fix albeit with donor parts from another unit.

3. How heavily the calculator is used.

A current HP-35s that's sitting on a shelf with no batteries would likely fire up with no problem a century from now, whereas the solderless connections in a Spice will virtually certainly have degraded by then, rendering the calculator useless. But a Spice in good working condition might hold up better over years of day to day use. This is another one of those "unknowable" things.

FWIW, I think some of the older desktop calcs would turn out to be the robustness and longevity champs, if only for their exceptional keyboards.

Re: Which HP series are the best hardware built?

*Message #4 Posted by **Jeff Kearns** on 28 Jan 2009, 11:22 a.m.,*
in response to message #3 by David Ramsey

> Quote:

> ... simply because they cost a boatload of money. The $395 for a 1972 HP-35 equates to close to $2,000 today.

Whenever I see statements like: "In today's dollars..." I get suspicious and wonder if the quoted figure makes any sense. Just trying to relate to someone spending the equivalent of $2,000.00 on a handheld calculator (in 2009 dollars, that is) is difficult for me. So I researched it. Here is what I found:

1. The average annual inflation rate for the quoted $2000 would have to be 5.3%. I initially found that to be unbelievably high, expecting something along the lines of 2% to 3% - on average. This would give a top end estimate of just under $900. More believable perhaps, but realistic? I do live in Canada but cannot imagine the inflation rates in our two countries to have differed significantly over that period.

2. The following site: http://www.measuringworth.com/calculators/inflation/result.php gives the US inflation rates for the period in question and averages it out to 4.68%. In today's dollars, a HP-35 would therefore cost about US$1600.

This is still a lot of money. I tend to compare the novelty of the HP-35 in 1972 with that of the iPhone in 2008. But the price tags don't compare so well.

Regards, Jeff Kearns

great link Jeff!!!

BTW, you might know this already, but just in case - if you want to enter a clickable link into your post, you can use the 'Link' button (first button on the left at the bottom of the edit window where you type your post) and it will insert a clickable link.

Cheers

Peter

Apples and oranges. :-).

The original 35 fulfilled a specific need for a specific audience (professional scientists and engineers). It was not a general purpose device like the iPhone, the computer, or today's calculators.

Compare the professional (non-student) price of Mathematica, MATLAB, or Maple with your inflated 35. I think you'll find a better comparison in both cost and use.

Shrug. Comparing prices of items like this is always a "guesstimate"; inflation occurs are different rates for different things, and advances in technology make it hard to compare directly.

But I think the $400->$1600 comparison is reasonably accurate. I saved for months to buy my HP-45 (also $395), and it sure SEEMED like a lot of money at the time! This might be difficult for you to appreciate if, as I suspect, you grew up with inexpensive electronic calculators as common things.

Such price drops are even more pronounced today, over much shorter periods of time. I built what at the time (2005) was a very high end PC using an AMD Athlon X2 4800+ processor. It cost over $1,000. Last week I bought the very same processor at Fry's for $39.

> First of all, the intent of my post was to indicate that your estimate was in fact, accurate! Not the opposite. Secondly, using my HP15C delta% function, I calculate that the equivalent price drop for the referenced processor is: $1000 in 2005 = $1127 in 2009 down to $39 so a 96% drop in price!

You'd have a better appreciation of the $2000 estimate if you had been around to purchase such items in 1972. Inflation rates in the second half of the 1970s and early 1980s were as high as 14 percent per annum.

The $2000 estimated 2009 dollars is almost exactly what the US Bureau of Labor Statistics Inflation Calculator predicts ($2007.27). Unless one has a method of unquestionably better pedigree, any other estimate amounts to just being of "I feel that..." or "It seems to me..." quality.

While I was attending Ga. Tech. in 1973, a friend scraped together enough money to buy a $395 HP-45. That was to the rest of us an exorbitant amount of money. He was the envy of us all, but I kidded him (accurately) that he could had purchased a pretty decent used car (which none of us had) for that.

The four-function Bomar 901 was the only calculator I could almost afford, at $120 in late 1972. That corrects to $610 today. I have no doubts at all that the value of the $120 that I spent then equates well to the value of $600 today.

What cost $395 in 1972 would cost $1937.58 in 2007. This is from http://www.westegg.com/inflation/. Your $2000 is very close. Cannot believe I spent $350 for a 41C in 1979 (or 1980?). This calc has probably given me more satisfaction than almost anything I have ever bought. No regrets.

Maybe not.

I forget the exact part number of the Amtel ARM processor used, but the internal FLASH memory on ATMEL ARM 7 devices is only rated for 10 years guaranteed data retention.

After that is anyones guess.

Dave.

I bought an HP-41C in 1980, followed by an HP-41CX in 1984. I still have the HP-41CX today, in almost the same condition as it was when new. It has the best keyboard feel of any calculator I've ever used, but it is slow and not very good for complex number handling.

I own a couple of HP48gx units. The keyboard is much inferior to the HP-41-series, but even more bothersome is the LCD display quality. IMHO, the HP48-series have the poorest quality LCDs of any HP calculator. It is fuzzy and indistinct. It was that way even on a brand new unit, seems to get worse with age. I've heard that very late HP-48 units had a clear black LCD such as the HP49g+ and HP50g possess, but I've never seen such an animal.

My favorite HP hardware is the HP42S for RPN (mine is still going strong and appears almost new, even after 16 years) and the HP50g for RPL.

Oh, they do exist. The display on these 'late" units appears identical to the black display used on the 49/50 series.

I have two-- one slightly beat up, one very nice...

Hi everybody

The voyager series were very solidly built. They had extremely good keys and the display is well protected. No movable parts except the battery door.

Regards
Peter

Re: HP 49G+ stopped working. Please Help

*Message #1 Posted by **reth** on 28 Jan 2009, 3:59 a.m.*

Well this sounds like a hardware problem then. On the other hand 3+ years of usage for so badly built calculator is quite long time. I'd just dump it.

in response to message #1 by reth

Yeah, the build quality wasn't great. And the screen drivers were wrong when I first got it.

But you have to admit the colour scheme was attractive and easy-to-read.

Any advice for convincing HP that it is in their interest to give me a discount on a 50 to replace the 49?
