That has been on the mental drawing board ever since I was greeted to a at91sam7l128 COB entombed in a blob of epoxy upon popping open the first 12c+. But assorted pros/cons exist for the sam7l relative to legacy voyager models to consider:

The pcb is sized to the keypad area alone. So for use of this real estate in a new PCB layout, vias must dodge the tactile dome contact lands on the other side of the board. Blind vias are one option ($$) or a dual laminated board can be used as a economical approach to achieve the same (potentially better) result. (Perhaps clearance exists to extend the PCB into the LCD area, I'm looking at disassembly jpegs ATM and can't tell for certain).

The LCD mates to the PCB via carbon ink conductive ribbon, itself joined to the PCB via an anisotropic conductive tape adhesive. Freeing that connection requires care to avoid damaging the carbon ink and new anisotropic adhesive to reestablish the connection to a new board. Moreover controlled heat and pressure via a specialized hot bar tool are typically used to form a reliable seal.

The LCD is a segment configuration using a higher multiplex rate (lower contrast) characteristic. So perhaps we just want to displace it altogether with a matrix display. That decision is the easy part -- finding an off the shelf glass which suitably fits the existing window area will be somewhat of a challenge but arguably worth the effort. Plus a graphic matrix glass will realistically require a separate controller. If we were incredibly lucky we might find a COG or TAB mount glass + controller to suit but I wouldn't expect so.

The heat stake posts (at least for the version I'd disassembled) appear to be hollow and are a total of 9. The hollow core probably will accept a M1.6 or M1.4 screw which dispenses with recementing post heads for reassembly. Doing so may have been planned as a manufacturing option or perhaps the posts were molded hollow reducing mass to ease the staking operation.

The power supply (finally) is supplied by two CR2032 lithium coin cells which roughly provide double the energy of three LR44 button cells. This was likely to accommodate the substantially higher "off" current draw of the 91sam7l, but it is only a plus if we use a SoC with a lower quiescent current. The lower rail voltage (3V0) is directly digestible by contemporary SoCs where the legacy 4V5 supply will require a buck regulator to drop the voltage in operation and a very low quiescent current linear regulator to provide "off" voltage regulation for SRAM retention. I haven't found a suitable linear regulator which could live in a < 1uA budget. Although use of external nvSRAM and external logic may allow the entire core to be powered off while providing true non-volatile storage.

I personally like the tactile feel of the full domes present in the legacy

Voyagers which have a more muted inflection. But that's just my preference and there is no reason otherwise why the 12c+ cut/legged domes couldn't be reused.

The 12c+ AFAIK thus far uses surface printed keycap legends which while a concession to manufacturing economy, are a better starting point if we'd like to engrave/fill new legends.

3V Power Supply

*Message #1 Posted by **Lode** on 30 Aug 2011, 6:47 p.m.*

Hi,

I think this might be a bit off topic, but communicating through RS232 with a HP 30b while it has batteries annoys me because I don't know how much power it's drawing while the cable is attached, and, because you can't see whether it's on or off if its firmware is empty.

Would connecting the output of a 3V power supply to one of the battery holders work?

What kind of power supply could do that? If I search for linear dc power supplies on the internet I mostly find expensive ones.

Thanks!

Edited: 30 Aug 2011, 6:56 p.m.

Re: 3V Power Supply

*Message #2 Posted by **Katie Wasserman** on 30 Aug 2011, 7:26 p.m.,*
in response to message #1 by Lode

The 20b/30b do use a lot of power, 30mA or more, when communicating via SAMBA and will run down new cells in very short order, maybe under 1 hour. You can use an external power supply but you'll need to remove both cells -- not just one -- since you'll be feeding current into the remaining cell (there's no blocking diode in there).

Instead of a linear power supply, I'd recommend 2 AA cells in a plastic battery holder with some short wires to aligator clips. That will be able to supply 30mA for 100 hours if you use alkaline cells and be very inexpensive to put together.

Re: 3V Power Supply

*Message #4 Posted by **Marcus von Cube, Germany** on 31 Aug 2011, 2:41 a.m.,*
in response to message #1 by Lode

The cable alone draws power while connected, even with the caculator turned off. The level shifters are driven by the 3V contact in the socket.

You may feed three volts through the serial connector if you remove the batteries before you connect. On my development machine, I've connected a short cable to the battery terminals and run it off a cheap wall wart (switching PS).

On my carry around device, I've connected a stereo socket for the serial communication and connect it directly to a 3V FTDI USB cable.

WP 34S and USB.

Degrees conversion for trigonometric function

*Message #1 Posted by **Beth Snipes** on 30 Aug 2011, 3:03 p.m.*

I have an HP 15c. I am trying to calculate sin 60 degrees, but I can't seem to convert to degrees for this calculation. My calculator recently started displaying a "c" near the lower right side, but I don't know if this is significant. Please help, and thanks!

Re: Degrees conversion for trigonometric function

*Message #2 Posted by **Dieter** on 30 Aug 2011, 3:16 p.m.,*
in response to message #1 by Beth Snipes

The "c" tells you you're in complex mode. Here all angles are assumed to be in radians, as usual.
So simply turn complex mode off. This is done by clearing flag 8. Press [g] [CF] [8]. CF is the blue-shifted function of the "5" key.

Generally, the angular mode is set by using the DEG RAD and GRD mode functions (blue-shifted functions of the "7", "8" and "9" keys).

Dieter

Confirmed sellers of the 15C LE?

*Message #1 Posted by **Peter Murphy (Livermore)** on 30 Aug 2011, 2:19 p.m.*

Can Forum members provide links to sites at which the 15C LE is positively for sale, and the prices at which they're offered?

Thanks.

*Message #3 Posted by **Ethan Conner** on 30 Aug 2011, 3:01 p.m.,*
in response to message #1 by Peter Murphy (Livermore)

At least as of a few weeks ago Samson Cables was taking "orders" or maybe more accurately selling places in line for 109.95$. That's where i put my money. You could try there. I think they are calling it the "special 1". You have to get on their new calculator mailing list then they will send you a link to "order" the 15c.

Re: Confirmed sellers of the 15C LE?

*Message #4 Posted by **Lincoln R.** on 30 Aug 2011, 10:53 p.m.,*
in response to message #3 by Ethan Conner

Hm, interesting. I did notice that for sale, I'm just rather suspicious given the turmoil at HP. I just hope that I'll be able to buy one when/if they come to market.

Re: Confirmed sellers of the 15C LE?

*Message #5 Posted by **Steve Fennell** on 30 Aug 2011, 3:06 p.m.,*
in response to message #1 by Peter Murphy (Livermore)

I don't think it's for sale anywhere. I placed an order at Samson Cables, but they have since pulled the listing from their catalog. I e-mailed them after that and they said they took down their listing until an official announcement was made. They expected an ETA of October through December this year.

With that said, and that is all the information I have, I really wonder if it will be released given the HP

corporate gyrations taking place. I certainly hope it will be released, but until there's an official announcement everything is just a rumor. At this point the only "evidence" of a release are HP websites listing the item unofficially, and suppliers willing to take pre-orders.

Re: Confirmed sellers of the 15C LE?

*Message #6 Posted by **Ethan Conner** on 30 Aug 2011, 4:42 p.m.,*
in response to message #5 by Steve Fennell

Be encouraged. There is a article on engadget that states hp is making another run of touchpads this fall to satisfy demand. So if they are willing to do that for one item in the midst of their upheaval maybe this will translate to the 15c. I believe this has to do with overwhelming demand which may or may not translate to the 15c le. It looks to me like they do pay attention to an item selling out.

Re: Confirmed sellers of the 15C LE?

*Message #7 Posted by **Paul Gaster** on 31 Aug 2011, 1:12 a.m.,*
in response to message #6 by Ethan Conner

The Touchpad story makes me cringe. They had to be selling those at a huge loss, so they decide to make another production run? What? Are they not hemorrhaging enough money fast enough?

Re: Confirmed sellers of the 15C LE?

*Message #8 Posted by **Katie Wasserman** on 31 Aug 2011, 1:44 a.m.,*
in response to message #7 by Paul Gaster

It costs $306 to make the 16G model that they now sell for $100. So they lose $206 for each unit they sell, but they make it up in volume :-)

Corporate suicide, the HP Way!

Edited: 31 Aug 2011, 1:44 a.m.

Re: Confirmed sellers of the 15C LE?

*Message #9 Posted by **Michael de Estrada** on 31 Aug 2011, 2:56 a.m.,*
in response to message #8 by Katie Wasserman

HP is just following the current federal government economic model of "stimulating" the economy by spending more money than they bring in from taxes as a result. It kinda reminds me of this stock broker who told me that I had lost a bundle in the market, but the good part was I could write it off on my income taxes.

Re: Confirmed sellers of the 15C LE?

*Message #10 Posted by **Eric Smith** on 31 Aug 2011, 3:02 a.m.,*
in response to message #8 by Katie Wasserman

I don't believe any of the BoM cost figures in any of the published tear downs. The analysts don't seem to have realistic estimates for the costs of components in the volumes in which consumer goods are actually manufactured. Those component prices may be the published prices from the component vendors, but large customers such as HP, Apple, Dell, etc. negotiate much better deals.

Imagine if automobile magazines tried to estimate the cost to GM of manufacturing a new Corvette based on parts prices from AC Delco. They would conclude that a Corvette costs GM $500,000 to manufacture.

That said, I also do expect that HP was losing money at the $99 price point. I just don't believe that the loss was anywhere near $206/unit.

Re: Confirmed sellers of the 15C LE?

*Message #11 Posted by **Calum Tait** on 31 Aug 2011, 4:32 a.m.,*
in response to message #10 by Eric Smith

I agree that this cost seems excessive. For instance DDR2 DRAM is trading at the moment for less than a dollar per Gb yet they have costed 8Gb at $26.00! I also know from experience that when you start getting quotes for components in the hundreds of thousands then the prices become staggeringly low. I would seriously doubt that the Touchpads cost much more than $150.00 to make delivered to the US.

Re: Confirmed sellers of the 15C LE?

*Message #12 Posted by **Howard Owen** on 31 Aug 2011, 4:58 a.m.,*
in response to message #7 by Paul Gaster

Well, others do it for strategic reasons. Amazon has an Android tablet coming that they are expected to sell below cost. They hope to get more coming in from integration with their main lines of business, of course.

Second production run of TouchPad

*Message #13 Posted by **Vladan Dugaric** on 31 Aug 2011, 7:30 a.m.,*
in response to message #7 by Paul Gaster

If HP purchased components or made a firm commitment to purchase, they cannot just pull out; for them it might actually be cheaper to just produce them than not.

In such case, selling them for $100 apiece will reduce their unit loss by $100 less cost they incur in transport/sales. That makes economic sense even if on the surface it does not.

This is a very frequent thing in various commerical contracts, especially public purchases (government IT contracts, weapons contracts, etc.). Almost always the contract terms are made to effectively remove the option of cancellation even in the face of escalating cost of the project. It then becomes less costly to go ahead and complete a loss making order than to cancel it.

Vladan

Re: Second production run of TouchPad

*Message #14 Posted by **Paul Gaster** on 31 Aug 2011, 10:19 a.m.,*
in response to message #13 by Vladan Dugaric

I bet you are correct, and it makes sense. I worked as a project engineer for a contract manufacturing company for just over 10 years so I should have caught that to be honest. Once in a great while we would have a customer back out of a project for various reasons or they would introduce a revision that involved changing materials. They were always on the hook for parts we had ordered, anything in process or already made at the factory, and anything in

transport to us or them.

What doesn't make sense is for HP to have made a rash decision to have a firesale without having a handle on the goods and materials in process first.

What about Europe?

*Message #15 Posted by **Lode** on 31 Aug 2011, 7:33 a.m.,*
in response to message #1 by Peter Murphy (Livermore)

Will the price in Europe be similar or will it be 3x as high as usual?

Will there be enough of them released in Europe?

HP41 battery holder, are there any CAD drawings?

*Message #1 Posted by **Ian Phillips** on 30 Aug 2011, 12:34 p.m.*

I am fortunate enough to have two spare 41CVs and would like to make use of them but I do not have the battery holders.

Being a calculator user rather than a collector I am not bothered about originality or cosmetics so I am thinking about making some battery holders by fabricating/milling or even by SLA techniques.

As I have got one good holder I could create my own drawings but thought that if any drawings did exist (I have searched the archives) then it would make my task easier, hence my request.

Out of interest, I bought my first HP41c in the Singapore duty free shop in 1979 and it cost $670 dollars.

Ian

in response to message #2 by Gerson W. Barbosa

For fabrication of small lot plastic parts, Shapeways http://www.shapeways.com does miracles in the 3D printing arena.

In addition to the holder itself, you would need to source the paired battery terminal springs. Anyone have a source? I have several used battery holders with springs that have completely corroded. These could be put back in service if I could just find replacements for the springs.

Mark Hardman

Re: HP41 battery holder, are there any CAD drawings?

*Message #4 Posted by **NateB** on 30 Aug 2011, 1:25 p.m.,*
in response to message #1 by Ian Phillips

Someone is already selling an aftermarket holder on TAS. It is not identical, but close. I think they are ~$35. I don't know if you could produce your own for less.

Making it myself would be totally uneconomic, but it would give the satisfaction of having done it. Machining Acetal or PVC is very easy and I am sure I could fabricate the sprung contacts out of phosphor bronze or nickel silver sheet.

When I mentioned the SLA though it was because someone I know has a friend that knows someone that has the equipment as his place of work. certain favours might be exchanged without recourse to real money!

Its a good idea. I was going to use 'N' cells just because of simplicity and also I was not considering doing these on a commercial basis.

I got over 4 years usage out of my last set of alkaline cells (I use it frequently but only for short periods). With Lithium cells I might get 10 years!

Well, this may be true for a 41 in its basic configuration. If you look at the old problem with the power consumption of the magnetic card reader or at the newer extensions (41CL and some modules) which drain batteries very fast, a rechargeable solution based on lithium cells would be very much appreciated.
That of course applies for the guys who want their 41s primarily running and not just in a showcase ;-)

Re: HP41 battery holder, are there any CAD drawings?

*Message #9 Posted by **Dieter** on 31 Aug 2011, 5:42 a.m.,*
in response to message #8 by Frido Bohn

A rechargeable solution based on Li-Ion batteries would provide 7,2 Volts (two cells) nominally, right after a complete charge even 8 Volts and more. So it will not fit without additional electronics. This point has been discussed here every once in a while. ;-)
Otherwise a commonly used camera battery would be a nice solution.

On the other hand, single-use Lithium-batteries with their 6 or 6,2 Volts should be fine. A common 2CR5, as found in any photo store, provides about 1500 mAh, i.e. almost twice the capacity of a regular N-size cell.

Dieter

The 4 year battery life I mentioned earlier was for a 41cv with no peripherals (just Machine and Thermal Pacs).

In fact I only took the cells out when I got the 'low batt' warning when I tried the cardreader for the first time in about 5 years. I might put the cells back in now that I have fixed the gummy roller just out of curiosity.

Strange HP-10 Printer behavior

*Message #1 Posted by **aj04062** on 30 Aug 2011, 6:08 a.m.*

Can anyone steer me in the right direction to correct this behavior?

At the beginning of the strip the battery was nearly dead, but the printer seemed to work fine. So I charged the batteries overnight. When I tried again, I get the solid lines across diagonally as the paper advances then across again. It doesn't stop until I turn off the calculator.

If I plug the calculator BACK IN, it works correctly. See correct prints midway.

Re: Strange HP-10 Printer behavior

*Message #2 Posted by **Marcus von Cube, Germany** on 30 Aug 2011, 6:20 a.m.,*
in response to message #1 by aj04062

You should stop using the calculator until the issue is fixed. It looks like two segments of the print head are permanently heated which will most certainly kill them over time.

It seems to be a driver issue, not a print head issue. May be an intermittent short circuit on the board.

Re: Strange HP-10 Printer behavior

*Message #3 Posted by **aj04062** on 30 Aug 2011, 8:31 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Ah, duly noted.

Is there anything in the two separate power supply circuits that would lead to this?

Re: Strange HP-10 Printer behavior

*Message #4 Posted by **Marcus von Cube, Germany** on 30 Aug 2011, 9:00 a.m.,*
in response to message #3 by aj04062

I've no detailed info about the printer mechanism but here are knowledgeable people on the forum which will help you. My answer was just an interpretation of the what the picture shows.

Re: Strange HP-10 Printer behavior

*Message #5 Posted by **aj04062** on 31 Aug 2011, 7:06 a.m.,*
in response to message #1 by aj04062

Power Supply Schematic

Can someone help explain this circuit to me? I am a ME by training, not an EE. I am guessing that something unique to the battery circuit has failed and allowed the voltage or current to differ from the intended design, thus causing the odd behavior only when the battery is fully charged or NOT hooked to the charger.

Edited: 31 Aug 2011, 7:06 a.m.

Re: Strange HP-10 Printer behavior

*Message #6 Posted by **Kees van der Sanden** on 31 Aug 2011, 3:22 p.m.,*
in response to message #5 by aj04062

I doubt this strange behavior is caused by the power supply circuit. The thermal elements of the printer head take a lot of current and i expect they will be supplied directly from the battery. I agree with Marcus that this behavior is caused by the printer head driver circuit.

Re: Strange HP-10 Printer behavior

*Message #7 Posted by **aj04062** on 31 Aug 2011, 4:36 p.m.,*
in response to message #6 by Kees van der Sanden

Well I don't agree about the intermittent description as I seem to able to reliably recreate the behavior.

I am going to measure some of the voltage drops with and without the power supply and see if I discover anything.

Re: Strange HP-10 Printer behavior

*Message #8 Posted by **aj04062** on 31 Aug 2011, 11:33 p.m.,*
in response to message #7 by aj04062

when I plug it in with the battery the printer is noticeably faster and higher pitched when it prints.

Does that help anyone help me?

WP 34S: Emulator has learned new tricks

*Message #1 Posted by **Marcus von Cube, Germany** on 30 Aug 2011, 6:02 a.m.*

I've taught the Windows GUI emulator a few new tricks. This should improve the usability. It's all around the secondary mouse button, MB2, for most of us the right one.

You can now use MB2 to press and hold the shift keys. The key symbol stays inverted and the code is sent to the application. When you now press any other key (keyboard or mouse), the presence of the shift is being sensed. Most commands behave the same as if the shift key were simply pressed before it. On some commands, this produces a slightly modified behavior, notably the base 2, 8, 10 and 16 commands which switch to a temporary display when executed while the shift key is down. The special display stays active until you press another key.

As long as the shift key is inverted, all keys are preceded by the respective shift. The real device behaves the same.

Use MB2 again on the same shift to release it. Pressing the shift with MB2 twice in a row will let the key symbol in the display stay active: This is just the same as pressing and then releasing the key on the real device.

Pressing any of the other keys with MB2 will execute the green function of the key. This is handy for switching between catalogs.

Edit: I forgot to mention that I've fixed a bug which made it impossible for the emulator to react properly on PC keyboard input with shifted keys. On a German keyboard it should now be possible to execute multiplication with shift "+" (talking about the PC shift key of course). You may have to update the skin files to the newest version together with the emulator DLL and the wp34sgui executable.

Cruel Doubt :-(

*Message #1 Posted by **robertoataulfo** on 29 Aug 2011, 8:14 p.m.*

```
I have 40 years.
Since the 15 years I've collected pocket computers and calculators and accessories for them
(HP, Texas Sharp, Casio, Aristo and Other)
Only scientific and programmable except for Casio Melody
I have more or less about 1200 items.
All are in perfect state of conservation and use.
I separate two hours a week to keep the collection always perfect
I have a tera byte of documentation in pdf format including photos of each item
My question: Will I here about 20 years, these items will be worth selling?
```

I very much doubt it. They have their peek prices NOW because now there are potential buyers/collectors at the peek of their personal economic possibilities (they never had that much money before in their lives, nor will they ever have as much to spend) who used those calculators in their formative years and therefor value and worship them mainly out of nostalgia. In 20 years from now, the then economically active generation will possibly focus on vintage iphones, but not on calculators in general.

Re: Cruel Doubt :-(

until quite recently, McDonald's were not in the burger business! at least measured by revenue.

they used to make more money on the real estate, when buying buildings for franchise and leasing them to the franchisee than actually on burgers. weird huh!

it's why they were consistently rated the worst burger.

was cleaning CPUs using alcohol this weekend with a friend from high school (class of '73). He's been in the Silicon Valley computer business for about 35 years. He knows what a Luddite i am and said in passing that sales of laptop and desktop computers (the business as we know it) is about to disappear and be replaced by the tablets and pads. Maybe hp is in on this "secret".

The reason for him saying that was to tell me that in 2 or three years, all the fooling around will be done on those ipad type things (with programs running on the internet) leaving very little real work to be done (ie autocad etc.) - and less sales for - laptops and such. So he said that this generation of what we call computers will be the last "cheap" one. In the next couple of years there will be fewer made, fewer companies, less competition, and twice to three times the price for the next generation of what i am typing this on.

Not sure which direction this post paddled the canoe towards, but there it is.

HHC is less the 4 weeks away

*Message #1 Posted by **David Ramsey** on 29 Aug 2011, 11:38 a.m.*

...and yet there's still almost nothing on the web site...it would be nice to have schedules, activities, etc.

Re: HHC is less the 4 weeks away

*Message #2 Posted by **Eric Smith** on 29 Aug 2011, 12:26 p.m.,*
in response to message #1 by David Ramsey

Someone can correct me if I'm wrong, but I don't think the schedule ever firms up until a day or two before the conference, and there are sometimes big last-minute changes to the schedule even then.

If anyone is waiting to see the schedule before deciding whether to attend, don't wait. Just attend. AFAICT, very few people have ever left these conferences disappointed.

Re: HHC is less the 4 weeks away

*Message #3 Posted by **Geoff Quickfall** on 29 Aug 2011, 1:12 p.m.,*
in response to message #1 by David Ramsey

Erics right on all counts.

in fact, i was going to give a presentation but two things have happened:

completing the book for the conference and the topic is going to change to the "practical application of the 41CL" (maybe!).

some people don't even know they will be there until the day it starts and then decide to give a talk that was un-announced.

Very layed back, intense and FUN.

Cheers, Geoff

Re: HHC is less the 4 weeks away

*Message #4 Posted by **Richard J. Nelson** on 29 Aug 2011, 2:10 p.m.,*
in response to message #3 by Geoff Quickfall

Hey, it isn't even September yet. One way to know what is "planned" is to check the Attendee list on the HHC website. I have two new firm papers to add after I post this. Those who are seriously interested attend, and as others have said, no one is disappointed. That is the history of HHCs, but this year is truly exceptional.

If you believe the press (as in Irene storm coverage)you could think that this might be the last HHC. It won't be the last, but this year has so many new and interesting topics to cover that if you are able to attend

you will have attended one of the very best. I can't say why, (there are the obvious reasons), but this this one is indeed special.

The best place to get the latest and most accurate information is by signing up on the HHC List.

X < > Y,

Richard

Gummy wheels for 41 series card readers

*Message #1 Posted by **William L. Drylie** on 29 Aug 2011, 11:01 a.m.*

Hi;

It has been a long while since I have been on this site. Lots of exciting things have been going on I see. Sad, what has been happening to hp. I really hope the ships Captain knows where he is sailing! I am sure this question has been asked before, but does anyone know the size of the O rings that go in the card readers? I purchased my card reader for my 41C in 1990, and the O rings finally degraded or whatever they do. Motor runs, but card barely feeds. Sounds bogged down. I guess I am lucky the O rings have lasted this long. There is a shop not far from where I live that claims they carry or can get any O ring made. I would like to try the repair.

I had to go back to Using my 41 since my 49G+ keyboard malfunctions too much. I have to watch it like a hawk, as it types in too many digits on several keys. Never was able to get it repaired properly. I believe a ROM update was tried that was supposed to help, and it was sent back to hp once, the calculator returned with no change. It has been shelved. Too bad, as I rather liked that calculator aside from it's crazy keyboard.

I used a TI N-Spire CX-CAS the other day, wow! Lots of bells and whistles and I like the color screen! It looks like a really fine learning machine.

Be well and Thanks.

*Message #2 Posted by **M. Joury** on 29 Aug 2011, 11:14 a.m.,*
in response to message #1 by William L. Drylie

They are easy to find at any Lowe's or Home Despot. Problem is I am not at home and don't have any with me and don't remember the dimensions off the top of my head. I am sure someone will be able to help there but I can tell you the you will need two of them (at least the ones I usually use). You can also use silicon tubing but it is usually more work.

Cheers,

-Marwan

Re: Gummy wheels for 41 series card readers

*Message #3 Posted by **Geoff Quickfall** on 29 Aug 2011, 12:38 p.m.,*
in response to message #1 by William L. Drylie

two options, my preference is silicon tubing with MIL specs, fancy way of saying the hole in the tube is centered. found at the local hobby shop or remote controlled vehicle outlet (gas powered model planes, cars and etc.)

The o-rings are listed below as well as some pictures of the pinch roller

```
Silicon tubing
inner diameter  =       2.5mm
outer diameter  =       5.5mm

O-rings
inner diameter  =       2.6mm
outer diameter  =       6.1mm
```

SILICON TUBING; THE SAME USED IN REPAIRING PINCH ROLLERS ON THE HP 41, 65, 67 & 97,

OR THE O-RINGS ALSO USED FOR PINCH ROLLER REPAIRS.

Re: Gummy wheels for 41 series card readers

*Message #4 Posted by **William L. Drylie** on 30 Aug 2011, 11:21 a.m.,*

in response to message #3 by Geoff Quickfall

Hi Geoff;

Thanks for the repair tips. Really great pictures too! I'll try to get some of the milspec fuel line, I want to look at it. The guy at the O-ring place says he can get o-rings in different materials also. He says there are "application materials" now. When I go there and If I learn something of interest, I'll share it with everyone.

He supplies Duke University labs and research facilities in Triangle park. Yes, I do not live in North Dakota anymore. I live near Durham N.C. now. Great weather! My wife seems to think the wheels on my card reader lasted so long because of the frosty North Dakota air, ha ha. Thanks for your effort.

Re: Gummy wheels for 41 series card readers

*Message #5 Posted by **Randy** on 29 Aug 2011, 1:31 p.m.,*
in response to message #1 by William L. Drylie

The correct o-rings are US size 005.

Size	Fractional		Actual	
	ID	OD	ID	OD
005	7/64"	15/64"	0.101"	0.241"

Re: Gummy wheels for 41 series card readers

*Message #6 Posted by **William L. Drylie** on 30 Aug 2011, 11:26 a.m.,*
in response to message #5 by Randy

Hi Randy;

Thanks for your reply. The size you gave is what I was looking for. I'll give the O-ring fellow those specs, he thinks he can come up with O-rings made of a different material that would be more suited to that application. I'll see what he comes up with and pass it on here with info and pics. Thanks Randy

hp30b SAMBA questions

*Message #1 Posted by **Lode** on 28 Aug 2011, 7:47 p.m.*

Hello,

I've got a few questions about SAMBA and flashing a 30b:

1)

When you simply turn the calculator on, and connect the SAMBA software to it, it says "No valid processor ID found". Only when doing the erase, reset, etc..., procedure, it can connect to it and show the whole GUI of the SAMBA program.

Is there any method, to make it not give that error message and go into the GUI, *without* erasing the ROM of the calculator? I ask this so that I can test whether or not SAMBA 2.9 is properly working in Wine in Linux, in a non destructive way (it currently never seems to work). And also for writing a program that can flash it in C.

2)

How much different types of memory does the calculator have, and how much of these can be accessed with the flashing, and which not?

3)

Are there sequences of bytes or strings you can send to the calculator through RS232 such that it will respond at least some bytes back that I can check, again without erasing its ROM?

I'm currently not getting back bytes after sending certain sequences while I would expect it, and am not sure if it's due to the RS232 library I'm using or something else. It's probably an error in my code. But it'd be nice to be able to test basic sending and receiving of anything, no matter what, without erasing the ROM :)

Should the calculator be on or off for this?

4)

What is the meaning of the reset button? My current guess is that erase deletes ROM, reset deletes non volatile user memory... Is there a possibility that apart from deleting things, these buttons also set the calculator to certain states related to the RS232 connection?

5)

How much baudrate would the calculator prefer to have if you connect to it?

Thanks!

Edited: 28 Aug 2011, 7:55 p.m.

Re: hp30b SAMBA questions

*Message #2 Posted by **Marcus von Cube, Germany** on 28 Aug 2011, 10:16 p.m.,*
in response to message #1 by Lode

Lode,

Many questions some of which are best answered by going to the Atmel site and downloading the specification documents for the AT91SAM7L128 chip. There is a chapter about SAM-BA. I'll do my best anyway.

> Quote:
>
> 1)
>
> When you simply turn the calculator on, and connect the SAMBA software to it, it says "No valid processor ID found". Only when doing the erase, reset, etc..., procedure, it can connect to it and show the whole GUI of the SAMBA program.
>
> Is there any method, to make it not give that error message and go into the GUI, *without* erasing the ROM of the calculator? I ask this so that I can test whether or not SAMBA 2.9 is properly working in Wine in Linux, in a non destructive way (it currently never seems to work). And also for writing a program that can flash it in C.

No, because the GUI only works after having sent a small program to the device to which it then talks. It's kind of a boot strap mechanism. The boot ROM with a limited command set is activated through resetting a single bit in the processor called GPNVM1. The Erase button not only clears the flash memory, it also resets the bit which makes SAM-BA start on the next power cycle or reset. What I've included in the WP 34S firmware is a means of clearing GPNVM1 by the software without erasing the hole flash area. This will start SAM-BA on the next power on and will allow to read out the flash from the GUI. The original firmware does not offer this possibility and therefore needs Erase to get into SAM-BA boot mode.

> Quote:
>
> 2)
>
> How much different types of memory does the calculator have, and how much of these can be accessed with the flashing, and which not?

The little RAM in the machine is used by SAM-BA for the boot strap software which is downloaded when the GUI starts up. So RAM is always overridden. You can only read the flash memory at 100000 and the SAM-BA ROM at 400000. The memory mapped setup registers should be readable, too. The only writable memory is flash. SAM-BA can set the status of GPNVM1 which is necessary to boot to the newly downloaded flash image.

> Quote:
>
> 3)
>
> Are there sequences of bytes or strings you can send to the calculator through RS232 such that it will respond at least some bytes back that I can check, again without erasing its ROM?
>
> I'm currently not getting back bytes after sending certain sequences while I would expect it, and am not sure if it's due to the RS232 library I'm using or something else. It's probably an error in my code. But it'd be nice to be able to test basic sending and receiving of anything, no matter

what, without erasing the ROM :)

Should the calculator be on or off for this?

Read the Atmel documentation for details. SAM-BA uses a baud rate tuning loop because the RC oscillators do not provide a reliable timing source. The tuning loop at the beginning of the connection between the GUI and the device modifies the processor clock until the data can be reliably transmitted back and forth.

Of course nothing will happen with the chip powered down.

Quote:

---

4)

What is the meaning of the reset button? My current guess is that erase deletes ROM, reset deletes non volatile user memory... Is there a possibility that apart from deleting things, these buttons also set the calculator to certain states related to the RS232 connection?

Erase erases flash and resets GPNVM1 as already stated. Reset restarts the firmware currently active. With GPNVM1 reset this is SAM-BA, otherwise the flash image is started.

Serial I/O needs to be programmed by the application running. WP 34S has some commands for this.

Quote:

---

5)

How much baudrate would the calculator prefer to have if you connect to it?

SAM-BA runs at 115 kbaud while WP 34S does its transmissions at 9600 baud.

Re: hp30b SAMBA questions

*Message #3 Posted by **Lode** on 29 Aug 2011, 7:48 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Cool, I found the spec and it mentions which characters to send and receive, that's helpful, thanks a lot!

Re: hp30b SAMBA questions

*Message #4 Posted by **Hubert Weikert** on 29 Aug 2011, 11:31 a.m.,*
in response to message #3 by Lode

There is a python implementation of Sam-Ba, designed for CDC, for AT92SAM7S controllers, Sam I Am, with a GNU license. Had up to now no success to get it working with serial SAM-BA.

I am able to communicate with SAM-BA manually (e.g. with minicom on Linux), thru a FTDI USB-to-serial converter. There are issues with some Linux Kernel versions, see e.g. Linux4SAM.

Have not yet managed to get SAM-BA working with wine. Hope you have more success.

Hubert

Re: hp30b SAMBA questions

*Message #5 Posted by **Lode** on 29 Aug 2011, 12:33 p.m.,*
in response to message #4 by Hubert Weikert

The RS232 library I'm using, is this one:

http://www.teuniz.net/RS-232/

Somewhere in a forum about this library, it was mentioned that it should work with a FTDI USB-to-serial converter, because the operating system abtracts it for you, it presents it as a virtual COM port.

I'm testing with an actual hardware COM port on my PC though, which is /dev/ttyS0 (and which would called COM1 in Windows).

In wine, as long as I give regular user permissions to /dev/ttyS0, it shows up as COM1 in the dropdown in the SAMBA 2.9 application. However, even with the calculator fully erased and ready to be flashed, it always gives the "No valid processor ID found" error in wine.

EDIT: on a later attempt it worked with wine. Seems like pressing reset and on one more time can help (in addition to the reset and on the flashing instructions for windows end with).

Immersing in alcohol

*Message #1 Posted by **David Ramsey** on 28 Aug 2011, 2:38 p.m.*

70% isopropyl, actually. And I'm talking about my 9810 printer, which I started trying to clean today.

What a mess! Massive quantities of tarry black goop that obscure some components so much that I can't even see what's under it.

Is there any reason I couldn't let large portions of the printer mechansim (circuit boards, printhead, mechanical bits at the front, not the motor of course!) simply soak in a tub of isopropyl for a few hours?

UPDATE: It seems this is a common method of cleaning electronics, but with 90+% iso rather than 70%.

Edited: 28 Aug 2011, 4:35 p.m.

Re: Immersing in alcohol

*Message #2 Posted by **db (martinez, ca.)** on 28 Aug 2011, 4:37 p.m.,*
in response to message #1 by David Ramsey

I can't think of anything in the (other types of) hp printers i have had apart that alcohol would destroy but the already-destroyed rubber rollers. I wonder where that much goop came from.

Re:soaking. I use the "little bit for the printer, little bit for the printer rebuilder" method.

Re: Immersing in alcohol

*Message #3 Posted by **Martin Pinckney** on 28 Aug 2011, 5:08 p.m.,*
in response to message #1 by David Ramsey

The 70%, with more water, will be slower to evaporate. The other risk is that some part may retain water.

What about the Carbon Tet replacement? Trichloroethylene, I think. Risk to plastics?

Re: Immersing in alcohol

*Message #4 Posted by **Katie Wasserman** on 28 Aug 2011, 5:20 p.m.,*
in response to message #3 by Martin Pinckney

Most good drug stores (not most of the chain ones) sell 99% isopropyl alcohol.

Re: Immersing in alcohol

*Message #5 Posted by **aj04062** on 28 Aug 2011, 7:14 p.m.,*
in response to message #4 by Katie Wasserman

Is it generally agreed that 99% is the best to use on restoration projects due to the low risk of leaving

water behind?

Re: Immersing in alcohol

*Message #6 Posted by **David Ramsey** on 28 Aug 2011, 10:09 p.m.,*
in response to message #1 by David Ramsey

So far, I've gone through a quart of 91% just cleaning the printhead and its associated ribbon cable and PCB. Yuck.

Re: Immersing in alcohol

*Message #7 Posted by **David Ramsey** on 29 Aug 2011, 1:14 a.m.,*
in response to message #6 by David Ramsey

Hm. 1.5 quarts of 91% alcohol later, and the 9810 printhead/flex cable/PCB has graduated from "buried in goop" to "very dingy". Most of the remaining goop is cosmetic, but some isn't: for example, the minute traces in between the printhead resistors.

I don't think it would be a good idea to heat that goop up!

I think I've reached the limit of what I can do with alcohol and a toothbrush. Any suggestions on where to go from here? I have some acetone, but I know it can dissolve plastics (it's good for hand cleaning after getting the goop all over them, though...)

Re: Immersing in alcohol

*Message #8 Posted by **Tony Duell** on 29 Aug 2011, 4:24 a.m.,*
in response to message #7 by David Ramsey

Err, yes. That gunge is really nasty, and gets everywhere. I've even had it inside the edge connector between the keyboard cable and the backplane (located unfer the printer) where it can cause bad conenctions.

The only way I've found to get rid of it is to completely dismantle the printer. Some parts are not likely to be affected by any common solvent (e.g. the side plates, metal spindles, etc), others might be (like the plastic gears). I remember trying all sorts of things on my printer, but I think propan-2-ol (ispropyl alcohol, isopropanol) was what I used most of the time. And yes, I used a lot of it. Propan-2-ol will not attack any part of the printer AFAIK.

Acetone/Propanone will not damage any of the metal parts. I am pretty sure the plastic bearings in the front section are PTFE and will not be attacked by acetone either. Try it carefully on the flexible PCB (I am pretty sure it's OK) and on the printhead.

I can see no good reason not to leave most of the bits sitting in a bath of solvent. It's not going to damage them. But I wouldn't leave the printhead or PCBs soaking in acetone, just in case.

You probably want to separate the printhead from the driver PCB 'tail'. Loosen the allen setscrews in the clamp and it'll all come apart. Realigning it when you put it back is not that hard. Take great care when cleaning the head (you can crack it!) and the flexible PCB tail.

There's probably no need to dismantle the motor (the gunge rarely gets that far back!), but it is possible. From memory, you take off the rear cap (3 screws) and the plastic sleeves under it. Then take off the drive pinion and spacer, the circlip and washers from the spindle, and slide the rotor out. Handle that with care, it's brittle!. Then unlock the rear plate on the stator by rotating it, take that out, the large

spring washer, and then take out the stator parts one after another. Mark the coils so you get them back in the same order and the same way up (otherwise it may run backwards when you reassemble it).

Re: Immersing in alcohol

in response to message #8 by Tony Duell

> Quote:
>
> You probably want to separate the printhead from the driver PCB 'tail'. Loosen the allen setscrews in the clamp and it'll all come apart. Realigning it when you put it back is not that hard. Take great care when cleaning the head (you can crack it!) and the flexible PCB tail.

I had hoped to avoid this since I worry about getting the alignment right when reassembling it. But the gunk is way down in the crevices, and I suppose I should if only for completeness.

Re: Immersing in alcohol

*Message #10 Posted by **Tony Duell** on 30 Aug 2011, 4:35 a.m.,*
in response to message #9 by David Ramsey

There are 3 things you have to get right when you refit the printhead :

1) The traces on the end of the flexible PCB tail line up with the pads on the printhead

2) The printhead is 'level', not sloping too much to one side or the other relative to the clamp and the PCB tail

3) The printhead is about the right distance above the clamp (this can be compensated for by the adjustment cams, but they have a limited range).

It's a bit of a fiddle to get right, expect to have to slacken off the clamp and refit it a couple of times. I am sure they had some kind of jig to hold it at the factory, but I've never needed to make one.

Re: Immersing in alcohol

*Message #11 Posted by **Martin Pinckney** on 29 Aug 2011, 5:58 a.m.,*
in response to message #7 by David Ramsey

Again I refer you to Trichloroethylene. Carbon tetrachloride was "the" non-destructive degreasing solvent of choice before it was phased out. Trichloroethylene is its replacement. As always, you should test on some hidden area of plastic before wholesale use.

Re: Immersing in alcohol, HP35 ??

*Message #12 Posted by **Stuart Sprott** on 29 Aug 2011, 7:50 a.m.,*
in response to message #11 by Martin Pinckney

At work there is an old HP35 lying around. It was used by one of our Surveyors back in the 1970s. Unfortunately he has a reputation of being rough with calculators. In the same period of time he has gone through about twice the calculators I have. Calculators have been stood on droven over and one left out in a field. He finally remembered that he had left the calculator in the field and when

he returned he found that a bush fire had been through and burnt the calculator.

I have keept some of his calculators; the ones with damaged screens. They work in a sort of a fashion.

Getting back to the HP35. None of the keys work, where the charger plugs into the calculator is badly damaged, the charger is damaged and of course the battery pack is no longer usable.

I have often thought about trying to restore it, but I suspect that it is probable beyond restoration. I have never tried anything like restoration before.

Your talking about imersing parts in alcohol aroused my interest.

Just how hard is this all to do? I guess I cannot do any further damage to it. We are moveing office in a few weeks time. Already old stuff is getting thrown out. So I just might make the decision to bring the calculator home.

Re: Immersing in alcohol, HP35 ??

*Message #13 Posted by **Jeff O.** on 29 Aug 2011, 1:35 p.m.,*
in response to message #12 by Stuart Sprott

The HP35 is ridiculously easy to open and work on. I doubt that you will need to soak anything, as it can be completely disassembled so you can get at all parts to clean directly. By all means, take it home, or send it to me :-)

Take a look here and here for some disassembly information.

Good luck!

Re: Immersing in alcohol

*Message #14 Posted by **Paul Berger (Canada)** on 29 Aug 2011, 9:21 a.m.,*
in response to message #11 by Martin Pinckney

When I was first servicing DP equipment we used trichloroethylene a lot for cleaning but be careful it will dissolve some plastic, and adhesives. My brother is a survey technician and he told me that they used it to test pavement, they would use the trichloroethylene to dissolve the asphalt out of the mix.

Re: Immersing in alcohol

*Message #15 Posted by **Alexander Oestert** on 29 Aug 2011, 10:53 a.m.,*
in response to message #14 by Paul Berger (Canada)

I had very good results immersing my HP 41 in an optician's ultra sonic cleaner bath. No part of the calculator dissolved and after drying everything worked fine and looked like new.

Re: Immersing in alcohol

*Message #16 Posted by **David Ramsey** on 29 Aug 2011, 2:03 p.m.,*
in response to message #15 by Alexander Oestert

Hm. I have a Branson ultrasonic jewelry cleaner. It's small but the printhead would fit...fill it

with acetone, insert printhead, hope vibrations don't crack it...

Re: Immersing in alcohol

*Message #17 Posted by **Alexander Oestert** on 29 Aug 2011, 3:54 p.m.,*
in response to message #16 by David Ramsey

Why acetone? The optician had a very soft cleaning fluid in it. It's the ultra sound that's supposed to do the job!

Re: Immersing in alcohol

*Message #18 Posted by **David Ramsey** on 29 Aug 2011, 6:01 p.m.,*
in response to message #17 by Alexander Oestert

Acetone because you need some sort of organic solvent to have any hope at all of getting this goop off. 6 hours soaking in alcohol didn't do it; I suppose I could try ultrasound with alcohol first.

Re: Immersing in alcohol

*Message #19 Posted by **David Ramsey** on 29 Aug 2011, 6:39 p.m.,*
in response to message #18 by David Ramsey

So...are these clean enough?

Re: Immersing in alcohol

*Message #20 Posted by **Tony Duell** on 30 Aug 2011, 4:37 a.m.,*
in response to message #19 by David Ramsey

That looks pretty good. The resistive elements are naturally black. I'd just try it. If the some columns are missing when you print, then check it as normal (check the resitance of the element between the driver transistor and diode on the driver PCB, check the diode). If that all checks out, clean the head again. But I don't think that will be necessary

Re: Immersing in alcohol

*Message #21 Posted by **John Robinson** on 29 Aug 2011, 7:28 p.m.,*
in response to message #1 by David Ramsey

I find it best to immerse myself in alcohol instead :-)

Cheers, John

A problem....

*Message #22 Posted by **snaggs** on 30 Aug 2011, 3:50 a.m.,*
in response to message #1 by David Ramsey

After this post I decided immerse to myself in alcohol, I have noticed a reduction in accuracy of my calculations.

Interestngly this seems to be independant of the calculator used.

Triangle solver for WP34s

*Message #1 Posted by **fhub** on 28 Aug 2011, 10:50 a.m.*

Here's my next program for the WP34s: a complete triangle solver. :-)

http://www.hpmuseum.org/guest/fhub/trigon.zip

Have fun,
Franz

PS. I've also uploaded my prime-factorization program because someone asked for something like this in an other thread:

http://www.hpmuseum.org/guest/fhub/pf.zip

Edited: 28 Aug 2011, 10:50 a.m.

Re: Triangle solver for WP34s

*Message #2 Posted by **Marcus von Cube, Germany** on 28 Aug 2011, 11:16 a.m.,*
in response to message #1 by fhub

Thanks Franz!

I've had a short look at PF and I assume there is a bug or at least something I do not really understand. Here is the code for discussion:

```
/*
  Prim-Faktor-Zerlegung (Prime Factorization)

  Input:  X:n (positive integer)
  Output: X:pf1 [R/S] pf2 [R/S] ... [R/S] 0 (L:n)
  Used:   XYZT, IK
*/

001 LBL'PF'
002 INT?
003 x<1?
004 RTN
005 STO K
006 2
007 RCL Y
008 [sqrt]
009 IP
010 STO I
011 DROP
012 x>? I
013 SKIP 11
014 [cmplx]ENTER
015 RMDR
016 x=0?
017 SKIP 03
018 DROP
019 NEXTP
020 BACK 08
```

```
021 DROP
022 STOP
023 STO/ Y
024 BACK 17
025 DROP
026 STOP
027 CLSTK
028 x[<->] K
029 [times]
030 RTN
```

Line 13 (SKIP 11) seems to skip to line 24 (BACK 17). Maybe I haven't fully understood the algorithm but this looks a bit strange.

--- Edit: I'm not good at counting. :-(SKIP takes the number of steps to skip. I was stopping on the 11th step.

Skipping more then a few steps may save labels but does not improve readability of the program. Have you considered using the preprocessor features (symbolic labels)? ---

I haven't yet looked at the triangle solver.

in response to message #5 by Lode

> Quote:
>
> I'm new to the WP34s myself, and never worked with a 41C on which this one is based, but, wouldn't SKIP 11 skip the next 11 lines, and thus end up at 025 DROP?

Yes, you're right of course.

I also don't like the concept of SKIP very much: BACK nn jumps back nn steps, but SKIP nn jumps forward nn+1 steps (skipping nn steps).

It's always a bit confusing when writing a program, and I would definitely have prefered a combination BACK/FWD instead of BACK/SKIP.

Re: Triangle solver for WP34s

*Message #7 Posted by **Dieter** on 28 Aug 2011, 11:46 a.m.,*
in response to message #6 by fhub

This could be overcome by a general relative jump command, similar to those in the '67/97 or 34C (yet only backwards). While BACK nn in fact works like a "jump back nn lines", just as in the mentioned earlier models, SKIP nn in fact means "jump forward nn+1 lines".

A relative jump could handle both cases it (and only if) it could handle both positive and negative arguments. This has been discussed earlier regarding the current SDL and SDR commands which also would become much more useful if they were replaced by one common command which was able to handle positive and negative arguments. Pauli explained why this is currently not implemented, but maybe the benefits of a common relative jump command may help finding a solution. ;-)

If this is not possible SKIP could be replaced by another command that simply does the same as SKIP nn+1, which might be slightly less confusing. But I could also live without that. ;-)

in response to message #7 by Dieter

> Quote:
>
> If this is not possible SKIP could be replaced by another command that simply does the same as SKIP nn+1, which might be slightly less confusing.

Yes, that's exactly what I meant with FWD nn (instead of SKIP), jumping nn steps forward (as BACK nn does backward).

Re: Triangle solver for WP34s

*Message #9 Posted by **Paul Dale** on 28 Aug 2011, 5:41 p.m.,*
in response to message #6 by fhub

Why all the problems with SKIP and BACK? SKIP nn skips the next nn steps. BACK nn goes back nn steps.

If we called the SKIP command FWD or FORWARD then it would operate differently but it isn't. It is called SKIP.

These commands have a bit of a sordid history. Originally included for internal xrom programming only but they turned out to be a useful way to reduce the step count so they were pushed mainstream. Now that we've lots of program steps in flash they are less relevant but still useful enough to include I think.

Finally, if you don't like them just use GTO/LBL instead. Nobody is forcing anyone to use these. They make debugging and altering programs more difficult, they take more keystrokes to enter and they don't necessarily have a speed advantage over LBL.

SKIP 11 means that the next 11 lines are skipped and the program continues with the 12th, i.e. line 13 + 12 = 25. ;-)

Well, the preprocessor doesn't run here with my old TinyPerl, and I definitely don't want to install a 80MB package for just one little Perl script!
(BTW, since you've removed RCLS/STOS A again, also Neil's assembler isn't uptodate anymore - it gives an error message for these 2 commands.)

And for 'readability': my triangle program you couldn't even 'read' (i.e. understand) WITH symbolic labels. ;-)

I've tried it already:
1) horribly slow
2) creates BIG temporary files in Windows\temp folder and doesn't delete it at the end, so either I have to remove them manually or this folder grows with each run

Conclusion: thanks, that's not a tool I would like! ;-)

I presume you are not using SVN then. I am suspecting that you may be manually downloading the assembler script from the Source Forge website. If so, then you are likely not also copying the wp34s.op table that is there as well (same directory).

While the embedded table within the assembler is **not** updated on every twitch and whim of the rest of the project, the ./trunk/tools/wp34s.op table **is** essentially (semi)automatically updated during the build process. The assembler searches for the wp34s.op op-code table in the following order: 1) where you said it was using the -op command line switch, 2) the directory you are running the script from, 3) where the script itself is located, and finally, if none of the previous are true, 4) the assembler uses its internal table as a *last resort* fall-back.

When you run the assembler, it will report which table it used -- both its revision number (if known), and its location (something about "internal" if it could find one).

It is possible that the assembler reports 2 **warnings** (not errors!) about duplicate op-codes with regard to STOS A/RCLS A. Regardless, the 2 warnings it reports are harmless and can be ignored -- unless you happen to be trying to use STOS A and/or RCLS A. Depending on which revision of the calculator design you are using, the STOS A and RCLS A instructions may or may not exist.

With respect to the EXE versions, they were fully documented to behave as you state (slow -- on the **1st** decompression run, and large -- being about 15M footprint). Additionally, the reasons for this were also documented. So no surprises there.

None the less, the ability to use "JMP DoThatThingAgain" instead of SKIP 78 or BACK 23 is a large benefit to self-documented, readable code (it will do a better job counting steps than the human as well!). The tool figures out these n+1 issues for SKIP and deals with them accordingly. Furthermore, if the JMP exceeds the dynamic range of the the SKIP/BACK instruction, the PP tool automatically *promotes* the branch instruction into a GTO instruction (inserting a LBL at the correct spot, only if required).

Well, I'm indeed manually downloading both your assembler script AND the wp34s.op whenever one of them changes.
And I know that at the moment (SVN1535) it's working again - but I'm sure not for long time: at least when Pauli awakes again those assembler warnings will reappear ... ;-)

Re: Triangle solver for WP34s

*Message #19 Posted by **Neil Hamilton (Ottawa)** on 28 Aug 2011, 4:22 p.m.,*
in response to message #18 by fhub

> Quote:
>
> I know that at the moment (SVN1535) it's working again

I would be somewhat surprised if the assembler stopped working. It was (is?) issuing the warning messages about duplicate op-codes because of an internal matter within the design team. But, as far as I am aware, it never produced illegal code or failed to assembler a source file** (at least in the last month or so). If you have a set of files that it is failing against, can you please share the details?

When the internal matter regarding STOS A/RCLS A is finalized, the assembler will be updated. Until then, you can safely ignore the warnings.

** Unless you were using the STOS A/RCLS A instruction -- and then it depended on which specific version of the calculator you were using -- and then it simply said you were using an illegal instruction (being STOS A and/or RCLS A).

Re: Triangle solver for WP34s

in response to message #20 by fhub

> Quote:
>
> And of course these STOS/RCLS warnings aren't your fault

I prefer to think of these things as nobody's *fault*. They are part of an evolving architecture that has some pretty healthy debate happening behind the scenes.

(My tool has its share of issues as well. I am just luckier that they have mostly been caught in that behind the scene evolution. Pauli found a bit of a howler in the PP last week. It would not allow 1/x through unmolested -- to keep the theme going -- under certain circumstances.)

> Quote:
>
> Well, this will be a never ending story I'm afraid. ;-)

I, and more than a few others, hope not! However, this one will be resolved quite soon -- of that I am confident.

Re: Triangle solver for WP34s

*Message #22 Posted by **Patrice** on 28 Aug 2011, 3:21 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Hi all,

My apologies if already discussed.

I understand that labels are just a waste of place and time in a program (at least when it is fully debugged and frozen).

But when you edit a program, labels are helpful because you don't have to keep track of the lines inserted or removed to know how far you have to jump.

When you remove a label, if not on purpose, you can bet that a GTO or an WEQ will fail soon or late. If the label is not there, you have chances not notice.

It is just my opinion, but you can have guessed that I don't like the SKIP and BACK commands with relative jumps, because you have to do maths when the calc can display the useful result directly.

In the contest of removing the labels, I would have preferred a JUMP command with an absolute line number (with same range as BACK and SKIP). (or GTOL for a GTO Line programmable)

Even better, having 2 more commands:
the first one SHRINK, non programmable, would convert the current program with labels to the form without labels (at least the numerical ones from the HP41C point of view).
The second one EXPAND, non programmable, doing the reverse, aka reinserting the labels.

The EXPANDed form would be (need to renumber the lines):

```
001 LBL'PF'
002 INT?
```

```
003 x<1?
004 RTN
005 STO K
006 2
    LBL 03
007 RCL Y
008 [sqrt]
009 IP
010 STO I
011 DROP
    LBL 02
012 x>? I
013 GTO 00
014 [cmplx]ENTER
015 RMDR
016 x=0?
017 GTO 01
018 DROP
019 NEXTP
020 GTO 02
    LBL 01
021 DROP
022 STOP
023 STO/ Y
024 GTO 03
025 DROP
    LBL 00
026 STOP
027 CLSTK
028 x[<->] K
029 [times]
030 RTN
```

The SHRINKed form:

```
001 LBL'PF'
002 INT?
003 x<1?
004 RTN
005 STO K
006 2
007 RCL Y
008 [sqrt]
009 IP
010 STO I
011 DROP
012 x>? I
013 GTOL 25
014 [cmplx]ENTER
015 RMDR
016 x=0?
017 GTOL 21
018 DROP
019 NEXTP
020 GTOL 12
021 DROP
022 STOP
023 STO/ Y
024 GTOL 7
025 DROP
026 STOP
027 CLSTK
028 x[<->] K
029 [times]
030 RTN
```

Hi Patrice,

Have you looked at the off-line preprocessor for the assembler? If not, have a look at chapter 8 of the assembler document.

Re: Triangle solver for WP34s

*Message #24 Posted by **Patrice** on 28 Aug 2011, 3:54 p.m.,*
in response to message #23 by Neil Hamilton (Ottawa)

Is it an assembler program ?

In this case, apologize, I thought it is a 'FOCAL' user program.

Patrice

Re: Triangle solver for WP34s

*Message #25 Posted by **Marcus von Cube, Germany** on 28 Aug 2011, 4:14 p.m.,*
in response to message #24 by Patrice

"Assembler" here is the same what "Focal" is for the 41C. It was Neil's decision to call his perl script neither translator nor compiler but assembler. The "assembly language" is just the keystroke programming model of WP 34S.

Re: Triangle solver for WP34s

*Message #26 Posted by **Patrice** on 28 Aug 2011, 5:30 p.m.,*
in response to message #25 by Marcus von Cube, Germany

In my 30 years of computer programming experience, I have always heard of "assembler" or "assembly language" as being a more or less readable form of the language of the microprocessor.

Using the word "assembler" for the user keystroke programming language is quite unusual for me.

Patrice

> Is it an assembler program ?
>
> In this case, apologize, I thought it is a 'FOCAL' user program.

Sorry, I have only heard of FOCAL used in the context of the '41. I did not understand your comment until Marcus' note.

The assembler will do several things. Firstly, it will *dis*assemble a binary image extracted from the user programmable spaces (ie: key-stroke programmable area) in either the calculator or the emulator. Secondly, it will take an ASCII source (either a previously disassembled one or one you have written using an editor) and create a binary image that can be loaded into the key-

stroke programmable sections of either the calculator or the emulator.

Recently there was a new addition to the tool chain, that I am calling a preprocessor (or PP), that does some symbolic manipulation of the source. The output of the PP can be fed into the assembler. (The assembler can also be requested to spawn a PP job directly via a command line switch as well.)

Your comment about superfluous labels, JUMP instructions, counting, etc. is essentially exactly what the PP does.

Again, if you have not had a chance, read the WP34s_Assembler_Disassembler.pdf document in the WP 34S offering. It should answer many questions. Chapter 8 deals specifically with this topic.

Regards...

Me too, this is why I writed 'FOCAL', would you have preferred "User Keystroke Programming Language" ?

My SHRINK and EXPAND commands were for the real thing, to help programming live. Try to program and debug something without the help of a computer or a sheet of paper and you will see my point about the labels.

It is named "Help" in older versions. In the latest it is called "Symbolic Preprocessor". The latest version went online about 2 weeks ago. Look here.

I can't help you with the "live" programs. That is not my department. :-)

You mean direct jumps to line numbers?
Yes, that would of course be (a bit) easier than all this counting for BACK or SKIP.

*Message #36 Posted by **Miguel Toro** on 29 Aug 2011, 6:08 p.m.,*
in response to message #1 by fhub

Hi,

Here is maybe a dumb question: how do you create an instruction like:

048 [alpha]'on:'

in your triangle program? I cannot see how I can add a special character like ':' and in this instruction.

Thanks,

Miguel

Edited: 29 Aug 2011, 6:12 p.m.

Re: Triangle solver for WP34s

*Message #37 Posted by **fhub** on 29 Aug 2011, 6:22 p.m.,*
in response to message #36 by Miguel Toro

Sorry Miguel, but unfortunately I can't answer your question.
I'm not entering my programs directly on the emulator, I just write my programs in a texteditor, compile them and load them into the emulator.

Franz

Re: Triangle solver for WP34s

*Message #38 Posted by **Paul Dale** on 29 Aug 2011, 6:29 p.m.,*
in response to message #36 by Miguel Toro

See page 9 of the manual for the alpha to keyboard map.

Due to some internal limitations, the various alpha catalogues are not available during the three character alpha entry sequences. This means that you will have to enter the ':' character as a single character alpha.

The assembler accepts more than can be entered from the keyboard and the execution engine doesn't care. This applies not only to alpha triples but to labels as well.

HP-41 resource allocation registry?

*Message #1 Posted by **Håkan Thörngren** on 28 Aug 2011, 9:38 a.m.*

I wonder if there is a registry of resources for the HP-41? I am thinking of such things as XROM numbers, buffer numbers and the unused bits of register 13?

At the moment I am mostly concerned with register 13 since it is fairly easy to change buffer or XROM numbers. Has anyone documented the use (misuse?) of these bits? I would very much like to allocate a bit of my own there, if I possible.

Re: HP-41 resource allocation registry?

*Message #2 Posted by **Ángel Martin** on 28 Aug 2011, 1:03 p.m.,*
in response to message #1 by Håkan Thörngren

Here's the modules I know use bits in the c register (status register 13)

1. CCD ROM, used for Continuous Auto Start (CAS), and Lower_Case Alpha flag. From memory, I think they are bits c(16) and c(15)

2. AECROM, used to flag the selected unit mode (Foot, Meter, etc)

I suspect the ZENROM also uses those bits, therefore the incompatibility amongst them.

Will check my notes for others.

Cheers, 'AM

Re: HP-41 resource allocation registry?

*Message #3 Posted by **Ángel Martin** on 29 Aug 2011, 3:40 a.m.,*
in response to message #2 by Ángel Martin

Incidentally, I considered using one of the "available" bits for the 41Z POLAR/RECT mode, but I decided against it to avoid compatibility issues - so I ended up using one bit in the complex-stack buffer instead for safety, despite the obvious speed penalty.

Isn't it time to update the museum?

*Message #1 Posted by **Graham D. Wilson** on 28 Aug 2011, 2:30 a.m.*

The last calculator that is presented in any detail in the museum is the 2001 HP Xpander.

Isn't in about time to update the museum to include pages for other significant discontinued models such as the 48g series, 32sii, 17bii, 19bii, 49g?

Re: Isn't it time to update the museum?

*Message #2 Posted by **Xavier A. (Brazil)** on 28 Aug 2011, 11:20 a.m.,*
in response to message #1 by Graham D. Wilson

I do agree.

We fared pretty good - just a few branches down and no major flooding. We live a little north of Atlantic City, NJ and about a half mile west of Route 9. Everyone east of Route 9 was manatory evacuation, so we didn't have to leave. Although my neighbor took it as an opportunity to take his family west for a long vacation weekend. Luck him.

Hope everyone else here are okay.

Bill

in response to message #13 by db (martinez, ca.)

Lots of power outages around here (Westchester country NY) and some trees down but not that much flooding. I never lost power which was a shame since I was going to light up my house with the glow from thousands of tiny red LED segments. It was mild compared to the some of the unnamed nor'easters we've had in recent years.

Well **somewhere** I'd hope if things devolved to that state seeing as the legacy arguably lives or dies with the existence of this group.

Incidentally I'm certainly appreciative of the benefit from this forum. But there are a few things I'd offer might make life easier for participants such as e-mail notification for follow-on posts to threads in which one may be interested. I've never felt the archive search was as user friendly nor effective as it could be. And there appears to be a seam between daily/recent posts and those archived where links to the former expire.

Perhaps a more contemporary forum management package would address the above and provide more mainstream features such as poster default signatures which I believe I've heard raised before.

*Message #17 Posted by **Giancarlo** on 28 Aug 2011, 1:26 p.m.,*
in response to message #1 by Graham D. Wilson

I agree on updating the museum with "new" calculators; specially with the 48/49 models...

Thanks

Giancarlo

Re: Isn't it time to update the museum?

*Message #18 Posted by **Lode** on 28 Aug 2011, 1:51 p.m.,*
in response to message #17 by Giancarlo

Also the 35s, and the 20b/30b and how they can be turned into the WP34s.

Re: Isn't it time to update the museum?

*Message #19 Posted by **db (martinez, ca.)** on 28 Aug 2011, 4:28 p.m.,*
in response to message #18 by Lode

Dave has always waited till after a calculator is discontinued to put up a museum page for it. An "historical" overview of the 20/30 series might be tempting fate, like keeping crutches after a broken leg has healed.
Articles are another thing.

Re: Isn't it time to update the museum?

*Message #20 Posted by **Martin Pinckney** on 28 Aug 2011, 5:21 p.m.,*
in response to message #19 by db (martinez, ca.)

Under "The Other Models"

"This page lists calculators that are *too new* to be considered museum pieces." [Emphasis added]

He has the following *discontinued* models:

10B 14B 17BII 19B 19BII 20S 21S 32SII 38G 48G(X) 95LX 100LX 200LX... Tired of typing.

To say it needs an update is like saying Irene had a little rain in it.

Re: Isn't it time to update the museum?

*Message #21 Posted by **Walter B** on 28 Aug 2011, 5:46 p.m.,*
in response to message #20 by Martin Pinckney

FWIW, I made this proposal more than once in the last eight years - leaving sufficient intervals in between. Last on 2010-12-14 via museum mail to the curator:

> Quote:
>
> Coverage of "Other" models in your museum
>
> Hi Dave,
>
> having entered this final museum room after many months again, I respectfully suggest updating the text therein. E.g. claiming the 38G being "still in production" is a bit far from truth today. And since production ceased for most models mentioned there, the museum is perfectly safe against surprising new facts. So if and when you've got some time for dusting the museum premises, that's the room where your effort will be most beneficial IMHO.
>
> Best regards

No reaction :-/ So autopilot seems being turned on for quite a while. Hope Dave is well.

Walter

Focus more on Texas Instruments' calculators ;-))

*Message #22 Posted by **Joerg Woerner** on 28 Aug 2011, 4:21 p.m.,*
in response to message #1 by Graham D. Wilson

Different story here at the Datamath Calculator Museum - just received a whole bunch of new calculators from TI to include in the Museum.

A full graphing calculator SMALLER than the HP-30B - watch out!

Cheers, Joerg

Re: Focus more on Texas Instruments' calculators ;-))

*Message #23 Posted by **gene wright** on 28 Aug 2011, 4:41 p.m.,*
in response to message #22 by Joerg Woerner

Hey Joerg!

Just have two pages on the Datamath museum.

One for the TI-30 and all its variants.

The other for the TI-83 and its children.

That covers 95% of all TI models.

:-)

Wish you could come to HHC in San Diego this year!

Re: Focus more on Texas Instruments' calculators ;-))

*Message #24 Posted by **Joerg Woerner** on 28 Aug 2011, 9:10 p.m.,*
in response to message #23 by gene wright

Gene,

You are right - look at this one:

TI-30 (1976 - 2010)

Sorry, I won't make it this year to San Diego. HHC 2011 scheduled right between two trips to Germany and Las Vegas (both for business reasons..).

Next year!!!

Joerg

I can't sell what I don't have.

Re: Isn't it time to update the museum?

*Message #30 Posted by **Bart (UK)** on 28 Aug 2011, 7:05 p.m.,*
in response to message #1 by Graham D. Wilson

First sentence of the website:

"The Museum of HP Calculators displays and describes Hewlett-Packard calculators introduced ***from 1968 to 1986*** plus a ***few interesting later*** models."

That says all it needs to say. It's Dave Hick's site - he can put on what he wants. If he doesn't find post '86 models interesting (over and baove those he has already), he doesn't have to include them.

Re: Isn't it time to update the museum?

*Message #31 Posted by **Martin Pinckney** on 28 Aug 2011, 8:05 p.m.,*
in response to message #30 by Bart (UK)

OT: Interesting Documentation - Sanyo Calculator

*Message #1 Posted by **Katie Wasserman** on 27 Aug 2011, 8:35 p.m.*

On TAS I found a binder full of service information on a few old Sanyo ICC calculators and have scanned the documents for the ICC-0081 (this is the only one of the 4 calculators included in the binder that I have).

Disassembly

Parts

Logic

PCB (part 1)

PCB (part 2)

The level of detail seems extraordinary to me and I wonder if any other calculator manufacturer in the early 1970's produced this level of documentation. I have some service details on HP calculators and on Wang from this time but they don't some close to this.

-Katie

Re: OT: Interesting Documentation - Sanyo Calculator

*Message #2 Posted by **Nick R** on 27 Aug 2011, 10:46 p.m.,*
in response to message #1 by Katie Wasserman

Was there any service information on the Sanyo ICC-808D in the binder? I believe it came out a year later than the ICC-0081.

Nick

Re: OT: Interesting Documentation - Sanyo Calculator

*Message #3 Posted by **Katie Wasserman** on 27 Aug 2011, 11:13 p.m.,*
in response to message #2 by Nick R

Unfortunately not, the service documents cover: ICC-0081, ICC-1121, ICC- 1141 and ICC-2161.

Re: OT: Interesting Documentation - Sanyo Calculator

*Message #4 Posted by **Palmer O. Hanson, Jr.** on 28 Aug 2011, 3:01 a.m.,*
in response to message #1 by Katie Wasserman

Katie:

The combination of the service manual and the patent provided a rather thorough documentation for the TI-59

including circuit descriptions, schematics, parts list, troubleshooting procedures and listing of internal code. But of course, that was the late 1970's not the early 1970's.

Docs

*Message #5 Posted by **Frank Boehm (Germany)** on 29 Aug 2011, 8:54 a.m.,*
in response to message #1 by Katie Wasserman

I have several early 70s Canon service manuals (including Pocketronic). They come with complete schematics, timing diagrams, plus PCB positives(?) - ready for reproduction of your own PCBs (sheets printed in black, left blank on the other side). Since other manuals I have (Denon, Olympia, Diehl) show almost the same level of detail, it seems to have been common to have *useful* service manuals. Funny enough, they were numbered and company property :)
But, honestly, it was not needed for later calculators - reduced to only a couple of parts, they were repairable by simply replacing one of the five key components.

Re: Docs

*Message #6 Posted by **Katie Wasserman** on 31 Aug 2011, 2:18 a.m.,*
in response to message #5 by Frank Boehm (Germany)

Frank,

I'd love to have a copy of the Pocketronic service manual for my website. Do you have that scanned?

Katie

HP48G purchase from "that list site"

*Message #1 Posted by **Ethan Conner** on 27 Aug 2011, 6:56 p.m.*

Found a 48G from "that list site". It has a ding just below the display but is otherwise in very good shape. It came with all the manuals,case,pc interface cable and disk. All for 50 dollars. It has a aprox. 2 inch by 3/8 inch adhesive backed blanking plate that i have no idea what it's for. Made in Singapore. Passed the self tests of course and has clean battery terminals.

Re: HP48G purchase from "that list site"

*Message #2 Posted by **Thomas Radtke** on 27 Aug 2011, 7:10 p.m.,*
in response to message #1 by Ethan Conner

You could engrave your name into the plate. It will fit somewhere on the 48's back.

Edit: Congratulations, btw. I also got a complete set for little money (Indonesian model only, but otherwise in perfect condition). The 48G is heavily underestimated :-).

Edited: 27 Aug 2011, 7:15 p.m.

HP Touchpad crazy prices 50,000 EUR!!!!

*Message #1 Posted by **Keith Midson** on 27 Aug 2011, 6:33 p.m.*

Hi all, I've been watching the prices of Touchpads out of interest. I missed out on the fire sale, so i'm tracking how the market responds to 'free' pricing.
It's been reasonably stable in the last few days, but then there's ebay items: 150653839696 and 300592032942 !!!
Can anyone figure out what is going on there? That is just insane (50,000 Euros and 10,000 Euros with days of bidding to go)!! Cheers, Keith

Card Reader pressure roller diameter?

*Message #1 Posted by **Ian Phillips** on 27 Aug 2011, 3:44 p.m.*

I successfully replaced the gummy wheel on my 41CV card reader but got careless and lost the tiny nylon roller that applies pressure to drive the card movement.

I searched the floor and my bench several times fruitlessly so I plan to make a replacement roller as I have a lathe and the means to do it.

I have searched the archives but cannot find a drawing or any sizes so I would be grateful if anyone could tell me the dimensions of the nylon roller please. For simplicity I will put a hole through the roller and run it on a separate spindle.

TIA

Ian

*Message #2 Posted by **allen** on 27 Aug 2011, 3:56 p.m.,*
in response to message #1 by Ian Phillips

Can you vacuum the floor with a clean bag and then search the bag? That might be faster, if much less entertaining??

I've dropped those rollers before, only to be found through prayer and prostration, chiefly the latter.

Re: Card Reader pressure roller diameter?

*Message #3 Posted by **Michael de Estrada** on 27 Aug 2011, 4:21 p.m.,*
in response to message #1 by Ian Phillips

I measured one I have with a digital vernier caliper and got the following:

Roller diameter = 2.68mm

Roller length = 2.22mm

Pin diameter = 0.97mm

Re: Card Reader pressure roller diameter?

*Message #4 Posted by **Ian Phillips** on 27 Aug 2011, 4:42 p.m.,*
in response to message #3 by Michael de Estrada

Thanks for the replies.

As to finding the original part I have mostly given up. I'm pretty sure it did not get to the floor, which is jet black dense short pile carpet so its usually easy to find things on. Its not trapped in my clothing or anywhere on the bench either.

Since I asked the question I have made a roller out of PTFE, I worked out it should be 2.1mm long but I have made it 3.8mm diameter so its probably too large. I'm not sure my loose pin idea will work though because it looks like it will project into the gap under switch 'rocker' and stop it working. I am just going to cut some 1mm ground shafting to length and try it though.

As a matter of interest, are there only two 'switches' actuated by the card insertion? there looks to be three locations but I only found two gold springs and two actuators (one of which hardly has any movement).

Ian

Re: Card Reader pressure roller diameter?

*Message #5 Posted by **Randy** on 27 Aug 2011, 4:59 p.m.,*
in response to message #4 by Ian Phillips

There are only two switches, one turns the motor on, the other says the leading edge of the card is over the head.

As for the roller, any non-magnetic material should be fine, brass would be an easy choice to machine. The diameter is not critical but I suspect a few thousands (of an inch) over-sized would be better than under.

Re: Card Reader pressure roller diameter?

*Message #6 Posted by **Dan W** on 27 Aug 2011, 6:10 p.m.,*
in response to message #1 by Ian Phillips

If this is the same roller in the 65/67/97 card readers, I have a spare I could mail you.

If you want to make your own, be advised the pin/cam on the end is slightly offset so that rotating the roller will change the pressure. I have a good photo of the end showing this offset, from which you could take some measurements, if that would help.

Send me an email if interested in either.

Thanks for the offer, but I have made a PTFE roller that runs on a pin that is a snug fit in the recesses. The card move through cleanly every time but I have not managed to find what is causing the 'Malfunction' or Checksum Error messages since I reassembled it, although it was working fine last time I used it (about 6 years ago!)

Using the card reader with new 'N' cells I sometimes get the 'Low batt' message too. I have an old (single) memory module that I am thinking of using as a temporary connector so that I can measure the battery volts on load or alternatively use a bench PSU to see just how much current is being drawn.

[WP34s] suggestions

*Message #1 Posted by **Lode** on 27 Aug 2011, 1:31 p.m.*

The more I use the WP34s, the more I love it. Nice work! It's really worthy!

Here are some suggestions that I have that could improve it a bit for me:

1)

Display less annunciators by default. By default the following ones are lit:

360 RPN BEG

The problem with this is, the display looks quite busy with lots of information while it isn't really needed.

I think the RPN one can be left unlit without problems, it's always on so it gives no information at all. It looks like the RPN symbol goes off while it calculates something. Maybe it can be inverted: It's off when not busy, and briefly turns on when the calculator is busy.

The 360 one isn't needed either. There's already a RAD symbol for radians, and the 'g' for gradians. So it's not needed to display another annunciator for degrees. You know it's in degrees if RAD nor 'g' are shown.

The BEG one is annoying. It indicates that the program pointer is at 000, but why do I need to see a BEG symbol forever in the screen for that even when not running programs? And doesn't the XEQ button already start running things from the start of a label? If you write all your things with a label, is the info where the program pointer is useful at all?

2)

In addition to combination and permutation, add Stirling numbers of the second kind. (http://en.wikipedia.org/wiki/Stirling_numbers_of_the_second_kind)

3)

Add prime factorization. This doesn't have to return all prime factors: Instead it could return two numbers, the lowest (or highest) prime factor, and the input number divided through that prime factor. By repeated application you can get all prime factors this way.

4)

In the manual, add more tables. It's easier to look certain things up in tables than plain text:

-A tabular listing of the meaning of each annunciator

-A tabular listing of each keyboard key (including the f, g, h functions of course) with a short description of its function and PDF link to the page where it is explained in more detail.

-In the section about display and modes, also have a table of the modes and a short description of their meaning, in the same order as they appear in the mode menu. E.g. if the short description of 2COMPL would just say "2's complement", I would already immediately know what it does, and know that it does not mean "complex number notation somehow involving a 2".

5)

In the manual, under complex operations, say that you enter imaginary part, then ENTER, then real part. Currently, the manual says

"The key CPX is employed as a prefix for calling complex functions. E.g. CPX COS calls the complex cosine, and it is displayed and listed as CCOS"

It would be good if it said how to enter and read complex numbers somewhere at that point.

6)

If you enter 1..2, have "1/2" instead of "1 0/1". I don't think anyone ever needs to enter a fraction of '0/1', so it's a bit of a wasted shortcut now :). I already know that .1.2 gives 1/2.

7)

Why does it bother adding 0/1 or /1 behind integers when in fraction modes?

8)

Correct me if I'm wrong, but there doesn't seem to be a button to toggle between fractional and decimal point notation? If the screen is displaying 1/2, is there no button to show it as 0.5? Maybe I'm just missing it. But going to the 'mode' for this is an overly long procedure in any case. The quickest way I discovered is pressing './,' twice in a row, but it's weird that changing an international setting would be the interface to this, and the button to switch to fractional again is on the opposite side of the calculator (the ab/c at the top).

The HP35s has the FDISP button to toggle between fractional and decimal. Some Ti's have an 'F<>D' button for this.

Also:

If you enter a fraction, it goes to fraction display mode. If you enter a decimal value, it doesn't go back to decimal display mode. I think your choice of display mode should be independent of how you enter numbers... If you're in decimal display mode and enter 1/2, it could be displayed as 0.5, since you didn't ask it to switch to fraction mode. The opposite is already true now: if you enter 0.5 while in fraction mode, it displays it as 1/2 instead of as what you entered.

9)

Entering binary base mode seems easy. Going back to scientific numbers appears to be a lot harder though, going to the mode menu, choosing base there, and guessing that entering 0 there will make things normal again. Maybe if you press the '2' button while already in base 2, or the 8 button when already in 8, and so on, could toggle this off and go back to floating point numbers?

Or maybe it's already possible with some easy way, in that case I missed it, sorry.

10)

loggamma function.

11)

Examples in the manual could be nice!

12)

The following are huge feature requests and I guess they aren't there for a reason (limitations etc...): numerical differentiation, matrix and vector math (multiply, determinant, invert, cross product, ...), solvers like linear equations, quartic function, ...

As you can see, the suggestions are for things that are way less worse than the problems of the 35s, so this means I find the 34s really really good. Thanks for all the work put into this!

Re: [WP34s] suggestions

*Message #2 Posted by **Cristian Arezzini** on 27 Aug 2011, 2:17 p.m.,*
in response to message #1 by Lode

For points 8) and 9): yo can go back to normal, floating point mode, pressing [f]RCL. The label "H .d" means "go back to normal mode"... I agree it's not intuitive but it works.

I agree with your other points, especially about the display, fraction mode, and manual! :)

Re: [WP34s] suggestions

*Message #3 Posted by **Marcus von Cube, Germany** on 27 Aug 2011, 3:08 p.m.,*
in response to message #1 by Lode

The big applications (matrix and such) will appear as libraries written in user code. Gene has already started porting stuff from the PPC ROM. The libraries can be installed via the serial interface.

Re: [WP34s] suggestions

*Message #4 Posted by **Lode** on 27 Aug 2011, 3:16 p.m.,*
in response to message #3 by Marcus von Cube, Germany

Is there enough user memory, and is it fast enough that way, for good such libraries?

Re: [WP34s] suggestions

*Message #5 Posted by **Marcus von Cube, Germany** on 27 Aug 2011, 4:00 p.m.,*
in response to message #4 by Lode

We have 8 program regions for libraries, each good for more then 500 steps. User programs are very compact in nature so you can expect quite some functionality from these libraries to come. Adding functions in native code is more demanding on flash space. So if the extended internal precision is not needed, user code is the better choice.

Re: [WP34s] suggestions

Feel free to offer patches implementing some of these :-)

> Quote:
>
> In addition to combination and permutation, add Stirling numbers of the second kind. (http://en.wikipedia.org/wiki/Stirling_numbers_of_the_second_kind)

I did seriously investigate implementing these. Unfortunately, they are not worth the space it would consume to do so natively -- flash is too full. A user program to calculate them could be put into one of the user flash segments and run from there. I'd probably rework the formula to calculate log of the Stirling number and take the exponential at the end (and perhaps round to integer) to avoid overflow issues but apart from that it won't be difficult.

> Quote:
>
> Add prime factorization. This doesn't have to return all prime factors: Instead it could return two numbers, the lowest (or highest) prime factor, and the input number divided through that prime factor. By repeated application you can get all prime factors this way.

We have code to find the smallest prime factor of a number but it isn't complied in (about half a kilobyte of flash to include it). It is top of the list of new features to go in if flash space magically appears. A user mode program to do this would be possible of course. We do, however, have a next prime function which can be used to factorise numbers.

> Quote:
>
> loggamma function.

This is there. Look in the manual or the X.FCN catagloue (real, complex or program modes only). Supported for real and complex numbers. This is used very heavily internally so exposing it cost us a dozen or two bytes in total and it is quite useful in of itself.

Digamma is implemented but not included for space reasons (a bit over 1k bytes for this natively).

> Quote:
>
> The following are huge feature requests and I guess they aren't there for a reason (limitations etc...): numerical differentiation, matrix and vector math (multiply, determinant, invert, cross product, ...), solvers like linear equations, quartic function, ...

- Numerical differentiation is present already -- look up f' and f'' in the manual for a description.
- Vector maths is in a user code library 3D only.
- Matrix maths in user code is being worked on.

Finally, just about any HP-41 program will run almost unchanged on the 34S so missing pieces of functionality are often easy to find and port. Many of the above feature requests are already available from the Museum's library or other Internet sources.

Thanks for your remarks. That's a long list. In addition to what Pauli and Marcus did tell you already, you'll get an answer from me as well, especially regarding the documentation points. But it's past midnight here, so I ask for your patience.

Good night!
Walter

More Suggestions

*Message #8 Posted by **Lode** on 28 Aug 2011, 11:43 a.m.,*
in response to message #1 by Lode

Got some more suggestions in the meantime :)

1)

In the MODE menu, show some selector symbol next to the currently active modes!

2)

I find E3 in E3ON and E3OFF a really strange name for thousand separator... Would SEPON and SEPOFF make sense? I would have been able to guess what it was with such names!

3)

Is 1e384 the highest possible number you can enter? A search for "largest", "biggest", "highest", "represent" and "up to" did not return anything related to this in the manual. And even the section about out of range error didn't say it!

4)

Someone reading the manual but not frequenting this forum, will never know what the special cable is, not even when opening the linked PDF by Tim Wessman (except the photos of it).

The Index of Operations in the manual is really handy by the way, thanks!

in response to message #8 by Lode

> Quote:
>
> In the MODE menu, show some selector symbol next to the currently active modes!

This one won't be small to implement but would be possible. pretty much all the catalogue code is

common. There are extras to check for constants and conversions and display the bottom line appropriately. These apply to the entire catalogue. Doing this will require decoding and checking every entry in the MODE catalogue -- i.e. more code that I'd be willing to commit to.

> Quote:
>
> Is 1e384 the highest possible number you can enter? A search for "largest", "biggest", "highest", "represent" and "up to" did not return anything related to this in the manual. And even the section about out of range error didn't say it!

Yes. We use the decimal64 format for numbers and this is limited to that maximum exponent.

- Pauli

No need for guessing - please look at the index whenever you find a command name you don't know at least.

Walter

Re: More Suggestions

*Message #11 Posted by **Lode** on 28 Aug 2011, 8:09 p.m.,*
in response to message #10 by Walter B

Ok, in the meantime I found indeed that the big table is the place to look for any unknown function. I'm better trained at both finding my way around the manual, and using the calculator, now.

So consider some of the suggestions to be things a new user may encounter :)

The reason I never read through the complete manual, is I never printed it out. I've used it more to look up things when I needed them. The first thing I wanted to do just after I flashed the calculator, was set the modes to my liking, so I ended up in the modes section of the manual without knowing the large table covered every single command!

Too bad that it won't do the fractions like HP-32SII :(Is it possible that in some locales, fractions are always written as a mixed number, even if the integer is 0, hence the input method favoring that way? I almost never enter a fraction in mixed mode, I expect the calculator to convert it to that for me :) Typing two dots in a row could be a shortcut for the fraction symbol... It's not *that* inconsistent imho...

Re: More Suggestions

*Message #12 Posted by **Walter B** on 29 Aug 2011, 1:22 a.m.,*
in response to message #11 by Lode

Why don't you simply key in .127.4 ENTER ? The WP 34S will do what you want :-)

BTW, if we'd copy the errors of our ancestors always, there will be no progress ever ;-)

Walter

Edited: 29 Aug 2011, 1:24 a.m.

Re: [WP34s] suggestions

*Message #13 Posted by **Walter B** on 28 Aug 2011, 6:45 p.m.,*
in response to message #1 by Lode

OK Lode, here we go:

> Quote:
>
> 1) Display less annunciators by default. ...
>
> I think the RPN one can be left unlit without problems, it's always on so it gives no information at all. It looks like the RPN symbol goes off while it calculates something. Maybe it can be inverted: It's off when not busy, and briefly turns on when the calculator is busy.

Good idea. We'll think about it. For running programs, we employed RCL flashing already.

> Quote:
>
> The 360 one isn't needed either. There's already a RAD symbol for radians, and the 'g' for gradians. So it's not needed to display another annunciator for degrees. You know it's in degrees if RAD nor 'g' are shown.

Here I disagree. It's present and we show it.

> Quote:
>
> The BEG one is annoying. ...

I understand your intention. Personally, I don't need BEG. We'll check.

Your suggestions 2 & 3 were answered already.

> Quote:
>
> 4) In the manual, add more tables. ...
>
> -A tabular listing of the meaning of each annunciator

... is found at the bottom of page 21, plus some text at the top of page 22.

> Quote:

> -A tabular listing of each keyboard key (including the f, g, h functions of course) with a short description of its function and PDF link to the page where it is explained in more detail.

Sounds like the index reverted. More work than I can afford spending in next weeks. And I will definitively not implement some 500 additional links, I still presume people know the alphabet. Please also remember I've got a regular job to do as well.

> Quote:
>
> -In the section about display and modes, also have a table of the modes and a short description of their meaning, in the same order as they appear in the mode menu. E.g. if the short description of 2COMPL would just say "2's complement", I would already immediately know what it does, and know that it does not mean "complex number notation somehow involving a 2".

Come on, you find the information in the index. That's what it's for.

> Quote:
>
> 5)In the manual, under complex operations, say that you enter imaginary part, then ENTER, then real part. Currently, the manual says "The key CPX is employed as a prefix for calling complex functions. E.g. CPX COS calls the complex cosine, and it is displayed and listed as CCOS" It would be good if it said how to enter and read complex numbers somewhere at that point.

It's explained there just a few lines below, and there's a link to the stack mechanics tables as well.

> Quote:
>
> 6) If you enter 1..2, have "1/2" instead of "1 0/1". I don't think anyone ever needs to enter a fraction of '0/1', so it's a bit of a wasted shortcut now :). I already know that .1.2 gives 1/2.

This example is mainly included since it highlights an improvement compared to the 35S. You'll understand it looking to the text next to it as well.

> Quote:
>
> 7) Why does it bother adding 0/1 or /1 behind integers when in fraction modes?

Else you can't see you're in that mode.

> Quote:
>
> 8) Correct me if I'm wrong, but there doesn't seem to be a button to toggle between fractional and decimal point notation?

Press [f] [.d] for decimals. Return to proper fractions via [f] [a b/c].

> Quote:
>
> If you enter a fraction, it goes to fraction display mode. If you enter a decimal value, it doesn't go back to decimal display mode. I think your choice of display mode should be independent of how you enter numbers... If you're in decimal display mode and enter 1/2, it could be displayed as 0.5,

> since you didn't ask it to switch to fraction mode. The opposite is already true now: if you enter 0.5 while in fraction mode, it displays it as 1/2 instead of as what you entered.

We took this special entry to fraction mode from the 32SII and it's successors. You're right, it's asymmetric. But such is life ;-) I don't want to change that.

> Quote:
>
> 9) Entering binary base mode seems easy. Going back to scientific numbers appears to be a lot harder though, going to the mode menu ...

Simply enter [f] [.d]. That's all :-)

Your suggestion 10 was answered already.

> Quote:
>
> 11) Examples in the manual could be nice!

There are a few. I agree on more would be better, but please look at answer 4 above. Feel free, however, to send me some examples if you've got nice ones, and I'll try to implement them in due course.

Your suggestion 12 was answered already.

HTH at least a bit.

HP-41 Beer Brewing Computer

*Message #1 Posted by **Juergen Keller** on 27 Aug 2011, 12:19 p.m.*

Recently I got an HP-41CX which most probably was used in the beer brewing process. Sure one of the most serious and beneficial application you can ever think of ;-) It has an overlay (glued onto the keyboard) which is labelled 'Courage Lager Computer'. Courage is a beer brewing company in the UK (now owned by Heineken). Unfortunately, I have got no software (module or magnetic cards, I don't know) with it. Does anybody know anything about this custom HP-41 version? Any hints, thoughts, etc. highly appreciated!

Re: HP-41 Beer Brewing Computer

*Message #2 Posted by **Ángel Martin** on 28 Aug 2011, 2:27 a.m.,*
in response to message #1 by Juergen Keller

I saw the auction as well, passed on it since no module was included - but I certainly like the overlay. Unfortunately I have no information at all on source/purpose, there goes another undocumented jewel to the pile... thanks for sharing the pic.

Re: HP-41 Beer Brewing Computer

*Message #3 Posted by **BruceH** on 28 Aug 2011, 5:10 p.m.,*
in response to message #1 by Juergen Keller

There was a 42S version as well. I think both were produced by Zengrange.

(Edited to fix the image link)

Re: HP-41 Beer Brewing Computer

*Message #4 Posted by **Bill (Smithville, NJ)** on 28 Aug 2011, 6:10 p.m.,*
in response to message #3 by BruceH

Hi Bruce,

That a pretty neat overlay for the Hp-42S. I didn't realize that overlays were even made for the 42s.

Does anyone know of any other 42S overlays?

Also, do you have the 42s Code, or just the overlay? It'd be interesting to see what the programs look like.

Bill

Re: HP-41 Beer Brewing Computer

*Message #5 Posted by **Calum Tait** on 28 Aug 2011, 7:09 p.m.,*
in response to message #4 by Bill (Smithville, NJ)

I have a feeling that these calculators would have come on to the market via a disposal sale as the Courage brewery closed last year. I would imagine any software would have been removed as this would contain details of ingredient ratios and timings which would be trade secrets. The overlays look pretty neat though and they are probably a decent investment if bought for the right price as breweriana collectors would probably be very interested.

Re: HP-41 Beer Brewing Computer

> I would imagine any software would have been removed as this would contain details of ingredient ratios and timings which would be trade secrets.

You would think so. But.... If the calculator was being disposed of by an employee, then the code "might" still be there. We could only hope.

It is amazing how much stuff gets sold with data still intact. I have bought used cell phones from a supplier in Hong Kong where the phones came with all the phone numbers, phone call history, etc, still intact. No attempt was made to erase or reset the phones.

A few years ago, I picked up a tablet computer that still had the database code for a hospital system. And also picked up a tablet computer that had the programs for crash reporting for a police department. While the programs were there, neither had stored data on them. The actual data would have been transmitted to a central computer for storage.

So it would not surprise me if a calculator gets sold with the code still intact.

Bill

Re: HP-41 Beer Brewing Computer

*Message #7 Posted by **Lincoln R.** on 28 Aug 2011, 7:28 p.m.,*
in response to message #3 by BruceH

What kind of code could a 42S have had? I imagine they would have used a ROM module for the HP-41, but a 42S? I doubt they had HP program custom code into them, so I guess that leaves IR or some guy keying in a keystroke program.

Re: HP-41 Beer Brewing Computer

*Message #8 Posted by **Juergen Keller** on 31 Aug 2011, 3:21 p.m.,*
in response to message #7 by Lincoln R.

Probably, there was no 41C ROM module either. There were many application packages that only exist on magnetic cards. On the other hand, if this custom version was produced by Zengrange as BruceH supposed, I would assume they put the software into a ROM module.

:-D Oh yes, such ports are really a big help for mankind. What a progress along the lines of consumer interest!

Re: HP-41 Unknown Interface

*Message #4 Posted by **Randy** on 27 Aug 2011, 4:52 p.m.,*
in response to message #1 by Juergen Keller

Based upon the position of the wires that I can see connected, the interface is a simple extension of the keyboard row and column matrix, allowing external switches to input data into the 41.

Re: HP-41 Unknown Interface

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 27 Aug 2011, 4:57 p.m.,*
in response to message #1 by Juergen Keller

Just guessing, it may be a "paralell keyboard matrix" interface, in which external switches simulate keypresses. A 3x3 matrix, allowing (for instance) for digits 1 to 9 (but not 0) can be done with six wires, as shown.

If someone wanted to export the HP41 bus signals (clocks 1 and 2, Flag Input, Data, ISA) it would had make sense to pick them at one of the backplane ports

Again, this is just a quick guess.

Re: HP-41 Unknown Interface

*Message #6 Posted by **Howard Owen** on 27 Aug 2011, 5:28 p.m.,*
in response to message #5 by Andrés C. Rodríguez (Argentina)

There appear to be three more wires, terminating somewhere on the reverse side of the circuit board. It's nine pins, built inside what looks like an HP/IL female connector.

Re: HP-41 Unknown Interface

*Message #7 Posted by **Andrés C. Rodríguez (Argentina)** on 27 Aug 2011, 6:58 p.m.,*
in response to message #6 by Howard Owen

With three more wires a 5x4 matrix is possible, allowing for numeric data, decimal point, R/S and some more...

Re: HP-41 Unknown Interface

*Message #8 Posted by **Ángel Martin** on 28 Aug 2011, 2:24 a.m.,*
in response to message #1 by Juergen Keller

Wow, that's elaborate hacking - wonder if it's part of a data input mechanism different from the original keyboard - maybe an industrial bar-code reader?. I have no recollection of such being published anywhere, but yet, the 41 series was such a versatile platform - and this proves it again.

Bought a 42s, need a case

*Message #1 Posted by **snaggs** on 26 Aug 2011, 8:37 p.m.*

Well I came across a mint (except for one mark on the side of the case) 42s for $200 and bought it!

I hope its all its cracked up to be. Only thing is, it doesnt have a case. Does anyone know where I can get one?

Daniel.

Re: Bought a 42s, need a case

*Message #2 Posted by **Paul Gaster** on 26 Aug 2011, 9:50 p.m.,*
in response to message #1 by snaggs

All of the Pioneer series calculators were the same size. If you were in the US I would say check TAS...that auction site..for a cheap 10B. Here they sell for under $20 shipped sometimes, and often they have a case with it. Sometimes here people try to sell the cases alone for almost that much, but it doesn't make any sense when you get the case and a calculator for the same price if you just look a little.

Thankyou all!

*Message #3 Posted by **snaggs** on 27 Aug 2011, 6:54 a.m.,*
in response to message #2 by Paul Gaster

Ill do that, are the leather ones a good fit? They looked a bit generic.

Re: Thankyou all!

*Message #4 Posted by **Martin Pinckney** on 27 Aug 2011, 8:17 a.m.,*
in response to message #3 by snaggs

All of the Pioneer cases that came with the calculators were simple heat-welded vinyl (early ones) or seam-stitched leatherette (later ones). HP sold genuine leather cases as an accessory. These can be identified by a flap that tucks in a strap near the open end.

Re: Thankyou all!

*Message #5 Posted by **Paul Dale** on 27 Aug 2011, 8:25 a.m.,*
in response to message #4 by Martin Pinckney

There is also a hard case for these calculators. Very protective and a bit cumbersome.

If you can get a leatherette case -- the ones without seams on the outside. Altogether a nicer case than the vinyl ones.

There are also 3rd party leather cases available. The one I've got looks great but isn't as protective as a genuine leatherette case.

Some appear to shrink over the time. My 20S doesn't fit its case anymore w/o applying a significant amount of force. It's better with my (former - I gifted it) 10B and its vinyl case. Anyway, the fabric ones are much better and certainly appropriate for a 42S.

Agreed with the other two, look for a 10B on TAS. I got one in near perfect condition with a case for $10 or 15 (it's been a couple years) because I needed a case for my 32S. 10Bs aren't terribly valuable, but I did manage to trade mine for an HP-35 battery pack.

Times have changed

*Message #1 Posted by **Nick R** on 26 Aug 2011, 6:33 p.m.*

I returned my HP35S this morning with mixed feelings. I was glad to see the last of it and its shortcomings but on the other hand I was sorry it turned out to be so disappointing. When I returned it the person at the store didn't have the slightest interest as to why it was coming back. The last time I took back a calculator was in 1985 when my HP41CX had an intermittent fault in the PRGM / ALPHA switch and the reaction was much different. The store wanted to know exactly what the problem was and no doubt passed the information up the line. That was when you could actually try out a calculator before you bought it as they weren't sealed in plastic sarcophagi.
I'll be watching with interest to see if another model is released by HP and will probably be unable to resist the urge to try it out to see if should keep it or throw it back.

Nick

in response to message #1 by Nick R

The 35s was close to what many forum members wanted. I was just one of several people excited about its appearance in 2007 and was convinced for years, that either an update will follow, or the 35s gets dumped. It still sells, and that's the wrong signal :-(.

[Edit]

I'll put it up on TAS this weekend.

HP41/71b Formatted Media

*Message #1 Posted by **Gerry Schultz** on 26 Aug 2011, 3:30 p.m.*

I have the HP 82161A tape drive and an HP 9114B floppy drive. Now I know that a standard 41 can fully format a tape but only partially format a floppy. A 71b can fully format both a tape and a floppy, so if I format a floppy using the 71b, can I store HP 41 files on it and am I restricted to the first 141K or can I use the full 720K disk?

I read in the "HP-IL Files: Where, What, Why, How, etc." article on this website: "The Swap Tape program evolved into a "Swap Disk" program, where the same thing would happen using disks for media instead of tape. A single disk would contain programs for the HP-41, HP-75, and HP-71."

How did that work? (I hope there's no partitioning involved!:))

Gerry

I believe the limitation is in the HP IL commands in the 41 module.

To access space beyond the 128K, you need the EXT IL rom by SKWID. It allows full access to the disk after it is formatted with his new NEWM command.

That is a very rare module, but the image is included in the wonderful HP 41CL (woohoo).

Another good reason to get one.

From USING YOUR DISC DRIVE - Supplement to manual P/N dated August 1, 1984, page 12:

"**Series 40/9114 Utility**

The Series 40 calculators can access 130 kbytes of the HP-9114A's

630 kbytes. The following utility, when entered into a Series 40,

allows you to access the full 630 kbytes. The utility requires that

the 82183A Extended I/O Module be installed in your calculator.

Additionally, this utility is available from the User's Library (#41-

09114) on 3 1/2-inch media".

Re: HP41/71b Formatted Media

*Message #7 Posted by **Raymond Del Tondo** on 26 Aug 2011, 5:04 p.m.,*
in response to message #6 by Gerson W. Barbosa

Yes, you can use lower level functions from the X I/O . However the X IL (or the X IL+) is much more user-oriented.
The X IL (+) offer enhanced versions of the most commonly used functions for storing/recalling mass media content, and much more.

Re: HP41/71b Formatted Media

*Message #8 Posted by **Howard Owen** on 26 Aug 2011, 7:39 p.m.,*
in response to message #1 by Gerry Schultz

Many LIF types can freely coexist on a LIF formatted disk. Whether the host OS can make sense of them depends on whether the specific types are supported. But regardless, modulo the size limitations, each machine ought to be able to pick out its native file formats from the menagerie.

Here's some Perl code I wrote that lists the numeric LIF types together with names derived from Tony's.

```
# $Id: LIFtypes.ph,v 1.1.1.1 2011/04/11 19:37:34 hbo Exp $
# Based on Tony Duell's lif_dir_utils.c
our $LIFtypesByNum = {
                  1          => "TEXT",
                  0xE0D1 + 0 => "STEXT",
                  0xE0D0 + 0 => "SDATA",
                  0xE0F0 + 0 => "DATA71",
                  0xE0F1 + 0 => "SDATA71",
                  0xE204 + 0 => "BIN71",
                  0xE205 + 0 => "SBIN71",
```

```
 0xE206 + 0 => "PBIN71",
 0xE207 + 0 => "SPBIN71",
 0xE208 + 0 => "LEX71",
 0xE209 + 0 => "SLEX71",
 0xE20C + 0 => "KEY71",
 0xE20D + 0 => "SKEY71",
 0xE214 + 0 => "BASIC71",
 0xE215 + 0 => "SBASIC71",
 0xE216 + 0 => "PBASIC71",
 0xE217 + 0 => "SPBASIC71",
 0xE218 + 0 => "FORTH71",
 0xE219 + 0 => "SFORTH71",
 0xE21A + 0 => "PFORTH71",
 0xE21B + 0 => "SPFORTH71",
 0xE040 + 0 => "WALL41",
 0xE050 + 0 => "KEY41",
 0xE060 + 0 => "STAT41",
 0xE070 + 0 => "ROM41",
 0xE080 + 0 => "PROG41",
 0xE052 + 0 => "TEXT75",
 0xE053 + 0 => "APPT75",
 0xE089 + 0 => "LEX75",
 0xE08A + 0 => "VCALC75",
 0xE0FE + 0 => "BASIC75?",
 0xE088 + 0 => "BASIC75",
 0xE08B + 0 => "ROM75",
};
```

These are types I'm aware of from just the 75C, 71B and 41C machines. The HP-85 can share LIF images up to a point. So can the Hp9000/200 and 300 machines. (I forget the details, but those machines have some incompatible extensions to LIF, but can read the older disks.)

WP 34S : [->] command question

*Message #1 Posted by **Miguel Toro** on 26 Aug 2011, 12:50 p.m.*

Hi,

I apologize if this has been answered already, but I do not quite understand how [->] works in order to convert temporarily an integer from a base to another. Here are some examples :

In base 2, 11000b : [->][blue 8] = 30o [->][blue 16] = 18h , and I do not need to use [h] to do so. So, What is the combination to get the base 10 conversion?

Now if I switch to base 16, how do I convert to other bases? [->] alone gives the "Eh" value, of course, but trying to use a combination like [f][->] to try to make it work, gets me an error message : "Bad mode error".

What am I doing wrong?

Thanks,

Miguel

Edited: 26 Aug 2011, 1:00 p.m.

Re: WP 34S : [->] command question

*Message #2 Posted by **Marcus von Cube, Germany** on 26 Aug 2011, 2:06 p.m.,*
in response to message #1 by Miguel Toro

Miguel, the sequence for temporary display in another base is ->, followed by the shift key, followed by the base. As you have already found out, the f shift key is optional.

Re: WP 34S : [->] command question

*Message #3 Posted by **Miguel Toro** on 26 Aug 2011, 2:41 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Thanks a lot Marcus,

Now I get it.

Regards,

Miguel

Re: WP 34S : [->] command question * Update *

*Message #4 Posted by **Miguel Toro** on 26 Aug 2011, 3:03 p.m.,*
in response to message #2 by Marcus von Cube, Germany

That does not seem to work in hexadecimal mode, based on what the manual says (page 8):

To use [->] in hexadecimal mode, I have to press [f] first then [->]but if I do that:

[f][->] gives a "bad mode error"

What could be the problem there?

Thanks,

Miguel

Re: WP 34S : [->] command question * Update *

*Message #5 Posted by **Marcus von Cube, Germany** on 26 Aug 2011, 3:05 p.m.,*
in response to message #4 by Miguel Toro

This looks like a bug which needs to be fixed by us.

Edit: Found (and fixed) the bug but I need to build and commit it.

Edit again: The issue should be fixed now. In integer mode f, g and -> may be pressed in any order. In a base that takes E as a digit, f must precede ->. A second press of f after -> is not necessary.

Edited: 26 Aug 2011, 3:30 p.m.

I assume it's still this way and I simply mixed it up in my comments here. Can you check with the latest emulator? I didn't change anything *after* the arrow, just the arrow detection itself which was definitely broken.

Victor V12 (HP-12c KIRF) on sale today $8.77

*Message #1 Posted by **Bruce Bergman** on 26 Aug 2011, 12:49 p.m.*

For those of you interested in picking up one of the Victor HP-12c clones, it's on sale today for $8.77 at justdeals.com. Tax in California, shipping is $5 each unit, but if you use coupon code DEALNEWS1 you can get it $5 off. Or you can add them as a friend on Facebook and get free shipping.

Note that this is one of those "timed deals", so it will expire at about midnight Eastern timezone.

$8.77 is pretty good for this calculator; previously I've only seen them at about $20 on sale. I have no relation to justdeals.com or Victor - just an RPN calculator collector! ;-)

Thanks,

Bruce

*Message #5 Posted by **Walter B** on 26 Aug 2011, 7:31 p.m.,*
in response to message #4 by fhub

Franz,

The development team had a long discussion about this. Result: we decided to allow saving the stack to a block of 4 or 8 general purpose registers and recalling it from such a block. First register of said block may be 00 ... 92 for SSIZE8 and 00 ... 96 for SSIZE4, respectively. ROMA LOCVTA CAVSA FINITA, or in German: "Des iss jetzt g'schwätzt."

Walter

Ah, let's see...

> Quote:
>
> VIEW immediatly displays the register when encountered during execution of a program. When followed by PSE or STOP, the display persists. Only the next PSE or STOP will revert to the normal X display

This means that - unless VIEW is directly followed by STOP - there is no way to VIEW a certain value and then quit the program a few steps later with this value still in the display (while there may be something different in X). Which is something I always liked on the '41.

> Quote:
>
> There is no way to get the "Running Program" message back once it has been replaced by a programmed display

What about a simple CLD command like the one in the 41/42? There also is another benefit: If VIEW was changed so that it behaved in the proposed way, using CLD or not would leave it to the user whether to keep the display as it is or return to the standard X-display.

Dieter

You got me! :) The word "directly" is to harsh, as you have correctly pointed out. VIEW followed some other commands followed by STOP will behave the way you want: The VIEW display is retained until a key is pressed. I meant that the sequence VIEW, PSE, STOP with or without some other statements in between will return to the X display when STOP is executed. The same is true for VIEW, PSE, PSE.

You will not need CLD to display X again, just do another PSE or VIEW X.

Re: WP 34S: New Release in the Works

*Message #8 Posted by **Dieter** on 26 Aug 2011, 3:56 p.m.,*
in response to message #7 by Marcus von Cube, Germany

To make things clear let's consider an example:

```
#Pi
VIEW X   ; display 3,14159265359
9
9
9
9        ; sufficiently large number for the emulator,
9        ; omit a few nines on a real 20b or 30b
9
DSZ X
BACK 01  ; keep the 34s busy for a moment..
RTN      ; and quit
```

This should display Pi, run a second or two while still displaying Pi, and finally stop. According to what you said: with Pi still in the display. But it doesn't. As the program finishes the display switches to zero, i.e. the value in X after the DSZ loop.

Try the same on a HP-41...

```
01 Pi
02 VIEW X
03 99
04 LBL 01
05 DSE X
06 GTO 01
07 RTN
```

...and it behaves as expected: it displays Pi, runs for a few seconds and then stops with Pi still in the display. Insert a CLD before the RTN and is quits with a zero, just as the 34s emulator does now.

Is it still an old version I use or didn't I get you right?

Dieter

Re: WP 34S: New Release in the Works

*Message #9 Posted by **Marcus von Cube, Germany** on 26 Aug 2011, 4:43 p.m.,*
in response to message #8 by Dieter

Nice catch!

It works the same as the 41C if you don't change the register contents between the VIEW and the STOP. The technical reason is that stopping the program causes a display refresh. In order to display the last VIEWed register again, the firmware stores the index of the register in memory. So when the program stops, a VIEW with the same register is carried out. Your program has changed the contents of this register before the stop. So it's not the same display but only the same register that is displayed.

We will most probably correct the documentation, not the behavior.

Three weeks ago we had this discussion regarding the good old '65 accepting digits > 7 in octal numbers. Technically, this should be qualified as a bug, but since it was documented in the manual... ;-)

Honestly, I did not expect this in a sophisticated project like the 34s. After your explanation I now understand why using VIEW gives the results it does, but I also think this should get fixed. In the code, not in the documentation.

Re: WP 34S: New Release in the Works

*Message #11 Posted by **Marcus von Cube, Germany** on 28 Aug 2011, 12:11 p.m.,*
in response to message #10 by Dieter

Dieter, we can only fix it if it does not need more RAM because the non volatile is simply full. I have an idea but don't hold your breath.

Re: WP 34S: Display bug should be fixed

in response to message #8 by Dieter

Hello Dieter,

the display bug should be fixed in SVN. Can you try your examples again?

Marcus

Re: WP 34S: Display bug should be fixed

*Message #13 Posted by **Dieter** on 29 Aug 2011, 3:25 p.m.,*
in response to message #12 by Marcus von Cube, Germany

The previous example now behaves as expected. Pi appears in the display, the program runs one or two seconds, and finally it stops with Pi still in the display. Works with aView as well. Fine.

There is just one thing: usually (well, on the HP-41, that is... ;-)) a VIEW or AVIEW message in the display can be cleared with the backspace key, so that X shows up again. Simply the same way an error message can be cleared. This is different here. Pressing the backspace key clears X, thus showing a plain zero. Like any other key in this situation, backspace does the same thing it usually does - it clears X. On the '41, pressing backspace while a message is displayed simply clears the message and shows X again. I think the 34s should also behave this way. And finally... a CLD command sounds useful now. 8-)

Re: WP 34S: Display bug should be fixed

*Message #14 Posted by **Marcus von Cube, Germany** on 29 Aug 2011, 3:37 p.m.,*
in response to message #13 by Dieter

The BS behavior is one thing I don't like either. As usual, not easy to implement without breaking things.

CLD is not necessary, a PSE with any delay (even 0) does nicely. The first call to PSE should preserve the display but the next refresh (either by another PSE or by a program stop) will restore the standard view.

Re: WP 34S: Display bug should be fixed

*Message #15 Posted by **Paul Dale** on 29 Aug 2011, 5:29 p.m.,*
in response to message #13 by Dieter

Pressing backspace has always cleared X even after a VIEW or AVIEW (in alpha mode it back spaces).

As Marcus pointed out changing this without breaking other things will be more invasive than it appears. By the time the backspace key is detected and processed, the knowledge that a message or status is being displayed is gone. Status messages are set all over the place in the code.

I'm sure the behaviour could be changed, it isn't quite so simple as:

```
if (message) then
    redraw
else
    process backspace
```

An alternative is to press a prefix key and this is documented in the manual I believe.

Then again, we could just say the 41 got it wrong introducing an unnecessary mode :-D

*Message #17 Posted by **Marcus von Cube, Germany** on 30 Aug 2011, 2:38 a.m.,*
in response to message #16 by Walter B

It nevertheless bugs me. I've ideas how to detect a temporary display. It needs another bit of RAM which I will hopefully find. :-)

As some may have already noticed, the RPN annunciator now presents more information then before. It was, until now, only used to visually indicate that a key is being processed by going off for a short while after a key press. This has been extended slightly: RPN is only displayed when the LCD shows the actual value of X in the current mode. Temporary displays kill the annunciator. I cannot read out this annunciator directly (for technical reasons) but I can keep a shadow bit with the same information in non volatile memory somewhere. This may then be used to detect a temporary display and dismiss it on <-.

Edit: I've made an attempt to implement this. Would you please try it out?

Edited: 30 Aug 2011, 4:19 a.m.

Which is perfectly understandable. ;-)

> Quote:
>
> I've ideas how to detect a temporary display. It needs another bit of RAM which I will hopefully find. :-)

Hmmm... maybe it's roughly similar to the way the HP-41 did it: it had a dedicated message flag (50). ;-) This flag can even be tested in a user program to

check whether a message is displayed or the goose is flying.

> Quote:

Calculator "Epochs"

*Message #20 Posted by **Jake Schwartz** on 29 Aug 2011, 4:05 p.m.,*
in response to message #19 by Namir

It is funny....in the past, Richard Nelson has attempted to mark "calculator time" by naming "epochs" based on generations of calculator capabilities. This would approximately be (if I remember correctly) the HP65/67 as epoch 1, the HP41/71 as epoch 2 and the HP48/49/50 being epoch 3. But thinking about what has been happening over the past year or so (or perhaps longer), maybe the same time period could be partitioned a slightly different way - with epoch 1 being when people primarily wrote programs; epoch 2 being when they wrote "modules" (for the HP41 or 71) or "libraries" (for the RPL machines) and epoch 3 being when they wrote entirely new calculators (such as the 34S)!

I've updated the ZIP file with the latest changes. There might still be things to correct so be patient if anything is broken. OTH, any reports about bugs are very welcome. (Not the bugs, the reports!)

Re: WP 34S: New Release in the Works

*Message #22 Posted by **Dieter** on 30 Aug 2011, 2:51 p.m.,*
in response to message #21 by Marcus von Cube, Germany

I tried the new "backspace cancels message" feature. Works fine, even for cancelling the SHOW display.

I encountered a problem with the right mouse button as a shortcut for the h-key. I cleared the display and right-clicked on the decimal point. As expected, it changed from comma to point and vice versa. However, after a few times the "f" announciator (!) came on and the 34s started to behave strange. The comma/point switch showed no reaction, and suddenly "Rg X" showed up in the upper left corner of the display. I had not noticed this display before, it seems to list the contents of the registers (up/down keys show the stack, the lettered registers, then R00, R01, R02... etc.). I'm sure this is not a secret feature and documented somewhere. #-)

Once the emulator even showed the f-key with inverted colors, just as if the key was pressed permanently. There was not way to return to normal operation except a restart. No, right-click f did not help.

First I was not sure if some of this was exactly the way the new secondary mouse button features you described are supposed to work. But at least I can reproduce the error with the right-click on the key with the decimal point. After a few consecutive clicks the "f" announciator comes on, and things start getting a bit weird. ;-)

Dieter

I must admit that the whole button and keyboard business is a bit convoluted and my additions have added to it. I'm pretty sure I'll do a complete rewrite of the emulator some day. But not before HHC.

The register browser is started with f EXIT. So you must have somehow managed to get a permanent f down situation. The way, a pressed key is displayed by inversion of the button area isn't reliable enough. HP has done some tricks to make it work correctly but there have always been situation where a key was left in the inverted state.

Normally you can just exit the emulator (Alt+F4) and restart it without losing any work. I must admit that this is not optimal but the emulator has always been a testbed for the real firmware so I has only second priority. Nonetheless I'll have another look at it when I find the time.

BTW, to press a shift key, the PC keyboard can be used, too. The Keys F, G and H are mapped to the three shifts.

question for lyuka and the Ostrowski method - bumped!

*Message #1 Posted by **hugh steers** on 25 Aug 2011, 7:54 p.m.*

Hello Lyuka, Namir and any interested parties.

Sorry for the delay (been painting). I manually bumped this thread as the original is way down the list.

Lyuka, thanks for the much improved Ostrowski method code. I have been trying it out.

Firstly, it gets good results in almost all cases, beating many other methods. Also, you have fixed the case for the water equation.

i'll just cover this again for detail,

```
here is the water vapor pressure from temperature:
Value Vwat(Value t)
{
    Value x;
    t = t + 273.15;
    x = 0;
    if (t > 0) {
        x = -6096.9385 / t + 16.635794 - 0.02711193 * t + 0.00001673952 * t * t + 2.433502 *
log(t);
        x = exp(x);
    }
    return x;
}
```

which you were solving. i mention this again just to add some background and also to point out the way it is normally solved.

The inverse is called Twat :-) and proceeds usually with a baked in method of newton using both sides:

```
Value Twat(Value e)
{
    Value td = 0.0001;
    Value ta = 1e-7;
    Value T = 100;
    int c = 0;
    if (e >= 0) for (;;) {
        Value dt = 2 * td * (Vwat(T) - e) / (Vwat(T + td) - Vwat(T - td));
        T -= dt;
        ++c;
        if (fabs(dt) < ta) break;
    }

    printf("twat count = %d\n", c);
    return T;
}
```

which gives good results for this special case.

now to give some results of your latest code against others in my test:

```

```

you can see the improved Ostrowski method gets good results, but often with a few more iterations than ridders. ridders is fooled by my (x-1)^2-1 quadratic when i gave bad bounds.

bounds are generally a problem with black box solvers since how is one to know good bounds to start?

anyhow, Ostrowski struggles with a very flat curve at (x-1)^5. the other methods get 1.00000 but Ostrowski stops at 1.020561, which is not so good.

i havent tried Namir's 4th order Ostrowski method. would that be better at this?

thanks for the input, -- hugh.

Re: question for lyuka and the Ostrowski method - bumped!

*Message #2 Posted by **Namir** on 25 Aug 2011, 8:43 p.m.,*
in response to message #1 by hugh steers

I got somewhat different results for (x-1)^5. When the initial guess is 1.5, tolerance for the root is 1e-7, and tolerance for the function value is 1e-15, I get:

```
1. Newton 5635 iterations and 11271 function calls to get root =  1.00190837280905.
2. Halley 4763 iterations and 14290 function calls to get root = 1.00176867211809.
3. Simple Ostrowski 18 iterations and 22 function calls to get root = 0.999148573.
4. Ostrowski 4th Order (Grau  and  Diaz-Barrero) 71 iterations and 76 function calls to
get root = 1.00048060997239.
5. Ostrowski (Luyka) 28 iterations and 31 function calls to get root = 1.00096671.
```

I modified Luyka's implementation to take one initial guess and calculate the second and third one based on that one initial guess--this way it is on par with the other methods.

All the above methods are close to the solution of 1 by about 0.0001. The equation (x-1)^5 seems to pose a problem for methods that use first and second derivatives.

Namir

in response to message #2 by Namir

Hi,

I modified the code (Rev.3.01) to cope with the very flat region near the multiple root.

When the solver encountered to that region, it will temporary change the strategy to use extrapolation.

The behavior of the program for (x-1)^5 == 0 is as follows. (epsilon = 1e-50)

Re: question for lyuka and the Ostrowski method - bumped!

*Message #4 Posted by **Lyuka** on 25 Aug 2011, 10:01 p.m.,*
in response to message #1 by hugh steers

Hi hugh steers, Namir and all who interested.

I've modified the code (Rev.2.94) to struggle to escape from the flat region or extremes, this morning.

Now, it can solve the water saturation pressure equation started at the very flat region e.g. [-273.15, -273.0].

Please try the latest code (Rev.2.94).

Quote:

```
/*s(x) : Water saturation pressures (Sonntag)*/
double
s(x)
    double          x;
{
    double          t;
    double          p = 1e-5;

    t = x + 273.15;
    if (t < 0) return -p;
    return exp(((16.635794 + 2.433502 * log(t) + 0.00001673952 * t * t) -
0.02711193 * t)
               - 6096.9385 / t)  - p;
}
```

```
main: s(t) is 'P_water_sat_Sonntag'

Re: question for lyuka and the Ostrowski method - bumped!

*Message #5 Posted by **Namir** on 26 Aug 2011, 9:27 a.m.,*
in response to message #4 by Lyuka

I changed your implementation so that it uses the following pseudo-code to use one guess, A, and then generate the other two guesses, B and C:

```
Given the guess A for root:

  Shift = 0.1 ' or any other value near 0.1
  ' obtain guess B from the value of A
  If A > 0 Then
    B = (1 + Shift) * A
  ElseIf A < 0 Then
    B = A + Shift * Abs(A)
  Else
    B = Shift
  End If
  FA = Fx(A) ' evaluate function at A
  FB = Fx(B) ' evaluate function at B
  C = (A + B) / 2 ' calculate C as mid-value between A and B
  FC = Fx(C) ' evaluate function at C
```

The above modification seems to work well for all the cases and initial guesses I used.

Re: question for lyuka and the Ostrowski method - bumped!

*Message #6 Posted by **C.Ret** on 26 Aug 2011, 11:49 a.m.,*
in response to message #5 by Namir

Hi,

May I suggest a small modification to your last implementation which appears to me quite clever since it is using the *Shift* parameter to automatically create the second "user guess";It is a good idea. I we may discuss the relation between this *shift* amplitude and the system accuracy *eps* used as zero approximation. It may be an implicit relation between these two parameters and the resulting number of iterations.

But, you can go one step forward, your *shift* parameter may be used for the computation of the third point as well.

For clarity, let $H = Shift / 2$. Now we have the three initial values x_A, x_C and x_B equidistant :
x_A = user input.
$x_C = x_A + H$
$x_B = x_C + H = x_A + 2.H$

Please account for my following modification of your small modification from the original implementation:
The algorithm may now be :

```
INPUT “System accuracy (zero approximation)”; eps
INPUT “User guess (first root approximation)”; XA
INPUT “Initial step (or initial scale in % )”; shift

LET H = shift * ( ABS(XA) + 1 – SIGN(ABS(XA)) ) / 2
‘                where SIGN(x)returns -1, 0 or +1 respectively for x negative, null
or positive.
‘                where ABS returns absolute value of its argument x.

LET XC =  XA + 1*H
LET XB =  XA + 2*H

LET  FA = FN Fx(XA) ' evaluate function at A
LET  FB = FN Fx(XB) ' evaluate function at B
LET  FC = FN Fx(XC) ' evaluate function at C
...
```

Note, that in the code *H* may be negative, depending on how you are considering intervals in negative parts. The following computation of *H* also works, but negative user's guess have to be greater (on the right) than expected negative root, when positive guess have to be less (on the left) than expected positive root.

```
LET H = shift * ( XA + 1 – SIGN(ABS(XA)) ) / 2
```

Re: question for lyuka and the Ostrowski method - bumped!

*Message #7 Posted by **Namir** on 26 Aug 2011, 2:44 p.m.,*
in response to message #6 by C.Ret

Your suggestion should work too.

Question about the last equation? Should be SIGN of X sub-A, without the ABS function?

Namir

in response to message #1 by hugh steers

I just wanted to comment about the methods that enhance Ostrowski's method (itself a refinement to Newton's method). These methods calculate 2, 3, and even 4 intermediate refinements in each step. You can think of these algorithms as having additional sub-steps. That is why counting function calls seems more relevant than counting iterations (of course it's good to know both counts). It seems that these methods are vulnerable to equations with non-smooth curves (such as (x-1)^5).

[WP34s] DIY overlay laminated
*Message #1 Posted by **Alexander Oestert** on 25 Aug 2011, 12:18 p.m.*

Hi all,

I just wanted to share my DIY way to a very usable overlay:

I printed the overlay png that comes with the WP34s package on a color laser printer at a width of 68mm. I cut it out and laminated it, then folded it in the appropriate places and just scotch taped it together on its rear. The laminated overlay is flexible enough to get accurate key response. The overlay is easily applicable and removed again. The only problem is the [ON] key which is a bit flatter than the rest and needs some special care to press.

The work took me about 15 minutes, 10 minutes taken by the heating of the laminating machine. ;-)

Edited: 25 Aug 2011, 12:21 p.m.

Re: [WP34s] DIY overlay laminated
*Message #2 Posted by **Walter B** on 25 Aug 2011, 1:12 p.m.,*
in response to message #1 by Alexander Oestert

Very nice indeed. Follows the well known 80/20 rule: 80% of a job are done taking 20% of the time (the remaining 20% take 80% :-)

So if you want to proceed one step, take a very sharp knife and cut your overlay along the left, top, and right edge of each key. Each key will then be covered by a little flap. Doing this for the ON key only will will improve the action there. Doing it for all keys will allow for an overlay being easily fixed on the keyplate using three tiny strips of double-sided tape (at the top, bottom, and between ENTER and STO).

Walter

Thanks for a simple, easy to use forum
*Message #1 Posted by **Bill (Smithville, NJ)** on 25 Aug 2011, 11:13 a.m.*

Okay, I know I have previously made comments on why the HPMuseum forum should change to one with categories, etc.

But.....

I have come to realize the beauty of the current forum. I participate in many web based forums. Most are ad supported and have flashing ads all over the page. Every sentence has underlined words that if you mouse over will either pop up more ads or links or useless definitions. I have to watch the page to make sure my mouse pointer in in a "no-pop-up zone". Each page takes forever to load. I could go on and on. If it wasn't for the good information that is buried on these sites, I wouldn't even think of particpating.

So, thanks to Dave for giving us a clean, easy to use, web site and forum. It may not have all the bells and whistles, but it has what it needs to do the job.

Bill

Agreed...

In the greatest and most useful forums, you don't have ads scattered everywhere, categories of limited value and unwanted restrictions to post.

One good example is this one :-) :

*Message #11 Posted by **Egan Ford** on 25 Aug 2011, 4:23 p.m.,*
in response to message #9 by Steve Fennell

I would prefer tags over categories. The problem with categories is that all messages are members of a single category. Whereas with tags a single message can span multiple categories.

With tags you can filter. E.g. I want to read all messages not tagged with 34s AND development.

Just my $0.02US.

*Message #13 Posted by **Paul Guertin** on 27 Aug 2011, 5:56 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

This is a small forum and I rather enjoy the simple interface. But please allow an old fart to vent his spleen about web forums in general.

Coming from Usenet, I was amazed at the lack of features and general unusability of web forums, compared to a decent late-1980s vintage NNTP newsreader. I imagined it would soon be corrected, but that was more than 15 years ago, and there have been few improvements.

No threading, no scoring, no regexp-powered searching or killfiles, no way to automatically read all new articles just by pushing the space bar. Plus, every forum lives on its own web page with its own password and its own idiosyncrasies, and of course you cannot type one command that will fetch all new articles from all forums that you frequent and cache them locally, so you can read them without having to wait for the network.

Web forums in general are awful to use, and that's why I only read a handful these days, compared to the dozens of newsgroups I used to follow in the 1990s. Thanks to scoring and killfiles, it was easy to find what interested me, and since I never had to wait for a web page to load in order to read the next message or thread, I could skim a newsgroup as fast as I could read.

But now you can type :-) and get a yellow smiling face. I guess that counts for something.

Re: Thanks for a simple, easy to use forum
*Message #14 Posted by **Bill (Smithville, NJ)** on 28 Aug 2011, 11:07 a.m.,*
in response to message #13 by Paul Guertin

Hi Paul,

I was a CompuServe member back in the dial up days. I used an offline reader, TAPCIS, that would let you log on, grab all the threads/forums you were interested in, then logoff. You then could review the threads at your leasure, reply to them, even mark files for download, and then the program could log back on and upload your comments, update the threads, download the files, etc. Not exactly real time, but boy was it efficient.

I remember when I lost interest in CompuServe - they went to WEB based that was just awful. Of course I was still on dial up, so that didn't help my experience.

I really like the TAPCIS program and the way it worked. Sometimes simple and elegant works best.

Bill

*Message #15 Posted by **Paul Guertin** on 28 Aug 2011, 3:25 p.m.,*
in response to message #14 by Bill (Smithville, NJ)

I was on GEnie (CompuServe's competitor) and there was a similar program called Aladdin. With a $7/hour fee and a 1200 bps modem, it was pretty much the only way to go.

Re: Thanks for a simple, easy to use forum
*Message #16 Posted by **Egan Ford** on 29 Aug 2011, 1:45 p.m.,*
in response to message #13 by Paul Guertin

I came from Usenet as well--since the early '90s. All of the capabilities that you list, and one that you didn't (offline/local reading/posting), was a feature of the newsreader.

Web forums are the evolution of the BBS. Neither are client/server, both require that you are online with a terminal or browser. And they all vary with pros/cons, but you are correct, none come close to eclipsing Usenet/Newsreaders in capabilities.

Usenet is still active. But not to the extent of the past. However, the quality is good since it is old-timers that remain. I still read each day: comp.sys.apple2, comp.sys.hp48, comp.sys.cpm, and alt.folklore.computers.

Newsreaders are available for all platforms. I use NewsTap on my iPhone/iPad.

Recently my provider Deutsche Telekom has shut down its NNTP server. Do you know a free server to connect to?

Re: Thanks for a simple, easy to use forum
*Message #18 Posted by **Egan Ford** on 29 Aug 2011, 3:14 p.m.,*
in response to message #17 by Marcus von Cube, Germany

If you do not mind using a Web interface, then there is groups.google.com. Since Google has every Usenet post, I use this for searches. The Web UI is not that bad. See for yourself: http://groups.google.com/group/comp.sys.hp48/topics. Tip: Click "Options" in the upper-left area to switch to threaded view.

If you need a free (text-only) NNTP server for your own client, then use news.eternal-september.org. Visit http://eternal-september.org for details.

If you want binaries via NNTP, then you'll probably have to pay. I hear that giganews is good for that.

P.S. I forgot to plug my ISP. For $10/month you can get a shell (Linux) account with xmission.com. Then you'll have access to their NNTP server, have about 5-10GB of storage, your own website, e.g. http://xmission.com/~egan, etc... It's owned/run by a friend of mine. We both got on "the net" and Usenet via UUCP in the good-ol-days. I do not think Pete will ever give up on NNTP.

P.P.S. I think xmission.com NNTP is text only. I do not do binaries, so I never checked.

*Message #20 Posted by **Dieter** on 29 Aug 2011, 3:40 p.m.,*
in response to message #17 by Marcus von Cube, Germany

Yes, T-online no longer supports usenet. But that's no problem, there are even better options. IMHO the by far best one is the newsserver at Freie Universität Berlin.

Please take a look at www.individual.de - their service is simply great and has an excellent reputation in Germany. Simply click on "Überblick" and see what they offer. They provide a fast and complete newsfeed in excellent quality, messages come in virtually in real time. The whole thing will cost you not more than 10 Euros per year, giving access to their nntp server with the newsreader of your choice. Yes, it's not "free like in 'free beer'" but 83 Cents per month comes quite close. ;-)

The HP35S

*Message #1 Posted by **Nick R** on 25 Aug 2011, 12:35 a.m.*

I recently bought an HP35S so I could see for myself if it was as bad as some have described. A printed copy of the user's guide was not supplied, apparently because HP has "gone green", or in other words, would rather leave it up to the purchaser to print out the 348 pages. I noticed that the white paint on the top of the keys is a lot thinner than the blue and red on the sides. Unfortunate, as the top key markings will get the most wear, particularly when the calculator is slid in and out of its slip case in field environments. I won't comment on the confusing use of the theta symbol in polar complex form as others have gone over that at length, but can't understand why the designers didn't use the same angle symbol that was used on the 42S. The way you have to enter hexadecimal characters A through to F is just plain idiotic. The raised position of the negative prefix is almost as irritating as the shifted STO function. Makes me wonder what what the ultimate goal of the designers was - it certainly wasn't to produce a calculator that was a step forward from its outstanding predecessors. If this is the best they can come up with, perhaps its time HP does get out of the calculator business. There were other objections I came across but I've decided not to waste any further time on this device and will accordingly be returning it without delay.

Re: The HP35S

*Message #2 Posted by **Tim Wessman** on 25 Aug 2011, 12:52 a.m.,*
in response to message #1 by Nick R

No, that is what the calculator group at the tail end of the "let's outsource all our software and hardware development and make stuff just as good but cheaper and quicker" stage was able to produce under the management and with the budget allocated.

User manuals were cut to fit more units per box. When retailers say "we need to fit <N> more units per box or we are de-assorting you" there is little choice there. Anyone who's ever worked in retail can tell you about those kinds of things.

The A-F hex was a direct result of the 700 page specification document not specifying the exact keys and UI for base 16. Since it wasn't exactly specified, they did what they wanted and be damned the result.

The goal was to a) make money, b) fix the abomination that was the 33s (hey look! It has a modern shape and shiny colors! Look how cool it is!), and c) to give a nice improvement in capability and functionality while still meeting NCEES requirements.

Since then, you've seen the 20 and 30b, 12c+ and 10bII+ which were all done completely in house. Apart from the poor keyboard on the 20b (long story there) and some complaints regarding the shape on the 20/30b, I don't think there are real serious complaints about any of those (cue usual lack of feature X comments here). Now that the finance bump is out of the way. . .

Yet I've got the feeling that a somewhat smaller scientific rpn/eos alg - keystroke/formula programmable, just keeping the professional look of the 35s or 30b, with an usb port, small memory, upgradeable firmware, and running on 2xAAA batteries, for about $100 would still sell like hot cakes... (Throw in alps switches and make it $150 :).)

Not any new information here. This has all been mentioned or discussed at various points over the

years.

Besides, a) is obvious, b) and c) are quite obvious from observation.

I wasn't around back then. The only bit of "inside" knowledge is the size of the specification documentation, and that has been discussed several times at various HHCs. :-)

Hi Tim,

I like mine, though a few tweaks would be welcome. When the inventory sells through a 35sII would be welcome.

Given the project was outsourced and the team who built it probably long disbanded, does this mean you couldnt bild on whats done?

One positive thing bout the 35s was that it was not old roms run in an emulator. It could have been the start of a new series.

I'm in the software business also and when my management asks why we can't just write specification documents that completely explain what we want, I tell them "if you can completely an unambiguously specify exactly what you want, I'll write a compiler to turn the specification directly into code."

The point isn't flippant. To specify exactly what you want, you need something at the level of source code.

>
> The point isn't flippant. To specify exactly what you want, you need something at the level of source code.
>
> Dave

With the complexity of modern systems it is inevitable that there there are gaps in the specifications. Ideally there would be some to-and-fro communication between specifier and implementer to iron these things out. However, management's unrealisticly tight timescales get in the way and the implementer does what he thinks best (he is already getting blamed for the project being late and thus doesn't have time to go back to find out what exactly was meant) - so the implementation may be the opposite of what the specifier wanted. That is why I have had systems reporting a helicopter going up when it's going down (the sign for vertical speed was not clearly specified) and swapping x and z axis, to name a few. These errors were found during integration testing. That is why in the past I have made comments about having a proper test programme, but again time scales and lack of resources (because of profit reasons - what else) get in the way.

So Tim,
To yourself and please convey to the rest of your team, my thanks that in this current time of management principle that "with impossibly low resourses and little time" you are trying to bring us the products we want.

*Message #11 Posted by **Thomas Radtke** on 25 Aug 2011, 1:26 a.m.,*
in response to message #1 by Nick R

Never had a problem with the shifted STO. The function allocation was one of the few strong points about the 35s, and certainly better than the 32SII allocation.

@Tim, I'd have loved a debugged 35s, or even a 35sII w/ full P<>R implementation. Many people would, I guess :-(.

Re: The HP35S

*Message #12 Posted by **Lutz Jacob** on 25 Aug 2011, 3:17 a.m.,*
in response to message #1 by Nick R

You should give the 33s a try if you could get one. I does not look as good as the 35s, but in daily use other points are more important. Numbers are displayed with full precision in a readable form, hex/bin are much more usable, sto/rcl are unshifted and the arrangement of keys is ok for me even without a large enter key.

Re: The HP35S

*Message #13 Posted by **Frido Bohn** on 25 Aug 2011, 9:06 a.m.,*
in response to message #1 by Nick R

I really do not understand the objections against such a fine machine the HP 35s is. It has all we expect from a scientific calculator: it looks very sophisticated – not to say complicated – and thus thoroughly cool. It has seemingly endless rows of buttons, and the majority of them with three to four functions. Due to a wise use of psycho-physiological engineering in the fields of para-optical perception (aka visual illusion) some buttons seem to have at least five functions. The color scheme is marvelous. Its deep-chocolate brown base used for the panel and the buttons, and the combination of titanium white, lapis-lazuli blue, pumpkin yellow and cranberry red is a paramount example of post-industrial neo-expressionism. If the HP 35s was part of the still life in Vincent van Gogh's "Still life with coffee pot, dishes and fruit" no one would have noticed it –it would have fit into the scene so perfectly!
I hear some people moan about the poorly organized keyboard. They possibly claim if there were awards for "clutteredness" the HP 35s would be at least among the nominees. But let's analyze this issue closer: Beyond the section of numerals and basic arithmetic operators, the functions appear to be randomly distributed. But this impression is only true for half-hearted scientists. Have you ever seen a scientist's lab? They have all their peculiar system of order, and the HP 35s has a match to the organization of an average lab with bounds of 0.85 to 1.25 within a 95% confidence interval. So it is merely "cluttero-equivalent" to a standard scientific lab. What is the mean access time you need to grab a random instrument from your bench, tweezers, Phillips screwdriver or the like? And what is the mean access time for a random function HP 35s? You see what my point is: the HP 35s inconspicuously adopts the usability of an arbitrary everyday tool so you never will abstain from it once you have found the button to switch it on.

Its form factor and size alludes to the good ol' classic series, and eventually, the 35s is a reminiscence of the first pocket scientific calculator ever made. OK, you will have to go to a second-hand market to get a shirt with pockets wide enough for the HP 35s, but on the other side, you will never desperately look for it as it may happen with those tiny electronic gadgets people use nowadays in the case they are lost, perhaps in a shirt pocket. The calculator fits perfectly in a man's hand, of course, in a true man's hand with a minimum glove size of 8 (22 cm circumference at the knuckle – for conversion into inches use your HP 35s).

Bug list? Superficially seen, yes, but it is rather an entertainment list because it challenges thousands of users who then may become angry, amused or finally try to circumvent those seeming shortcomings with the most astounding suggestions. Ever imagined how boring a device would be if it was perfect? No postings in the HP Forum with endless threads around similar issues, no engineering of such marvels as the 41CL or the WP34s. The 5th anniversary of the HP 35s is coming soon and it created so much priceless imagination…

(If there was a font for emphasizing a sarcastic undertone I would have used it. So please, don't take this contribution too serious.)

in response to message #14 by Lyuka

I've used fourteen different models of HP calculators starting with the HP35 in 1973. Each one performed well and was built to last (the battery door of the HP28S being an obvious exception). There is a corporate objective statement inside the front cover of the HP25 owner's handbook that states: "The success and prosperity of our company will be assured only if we offer our customers superior products that fill real needs and provide lasting value, and that are supported by a wide variety of useful services, both before and after sale". Personally I don't believe the 35S meets this criteria. Its impaired complex number handling make it useless for computation of survey coordinates in the field. The indifferent response you get from HP's Customer Care facility when you request a copy of the user's guide (promised in the superficial quick start guide) certainly falls short of the kind of support that kept me coming back to buy HP calculators.
"Anniversary" and "Limited Edition" calculators are all very well if you're mainly interested in collecting such things, but I want a calculator that's a robust and helpful working tool, and am willing to pay more for quality.
Just for interest, I challenge anyone to compare the 35S against a simple calculator such as the TI-36X Solar and see which one is less frustrating when you're working with coordinate geometry.

Would that be the model that was being sold at a discount at McDonalds fast food outlets? Interesting joint venture - I wonder what Bill Hewlett would have thought of it.
I certainly don't mean to denigrate the good work done by those people developing calculators, as they have to work within the constraints set by those at the top of the corporate food chain.

Nick

Try this simple traverse:
S64 degrees 50'00"E 134.43 ft
S25 degrees 08'45"W 162.09 ft
N59 degrees 27'40"W 185.0 ft
N24 degrees 13'08"E 145.12 ft
Find the bearing and distance to close.

Although I'm certainly no fan of the HP35s, it seems like it could handle this problem quite easily, by entering the survey coordinate values as complex numbers in polar form, and adding them. Am I missing something here ?

Re: The HP35S

*Message #23 Posted by **Nick R** on 25 Aug 2011, 10:57 p.m.,*
in response to message #22 by Michael de Estrada

You run into difficulty when you try to adjust signs of latitudes and departures before adding when working with quadrant bearings. This wasn't a problem on the 48G which could convert from complex to real form.

As has been discussed on the forum ad nauseam, the 35s is from the 32S lineage - it does not have the 15C or 42S capabilities and is nowhere near comparable to the RPL series of calculators (you should then rather get the 50G).

Admittedly the R->P and P->R is crap, but it does have better complex number representation than it's 32s/33s predecessors.

BUT, it has 32kB of programming space, surely more than enough (infinitly more than the TI-36X you quoted) to write something to handle your coordinate geometry needs. (e.g. have you looked in the articles section and the internet at large for R->P and P->R solutions? And the many other programmes available?) It is simple keystroke programming, so it shouldn't be too difficult to even write your own.

Re: The HP35S

*Message #25 Posted by **Nick R** on 27 Aug 2011, 9:45 a.m.,*
in response to message #24 by Bart (UK)

It's easy enough to write a program for calculating traverses, but my point was to compare the two machines' keyboard functions without the aid of a progam.

Re: The HP35S

*Message #26 Posted by **Bart (UK)** on 27 Aug 2011, 10:20 a.m.,*
in response to message #25 by Nick R

But then comparing the 35s to the 48G is totally irrelevant.

Re: The HP35S

*Message #27 Posted by **Norman Dziedzic** on 27 Aug 2011, 9:47 p.m.,*

I had no clue how to do this but remembered I had a 41CV with a surveying I module. That made the problem easy as pie. :-)

Re: The HP35S

*Message #28 Posted by **Reth** on 27 Aug 2011, 1:39 a.m.,*
in response to message #21 by Nick R

That looks easy. How do you enter this on other calculators? Do you supply quadrant number, so DMS and 1-4?

Re: The HP35S

*Message #29 Posted by **Nick R** on 27 Aug 2011, 9:58 a.m.,*
in response to message #28 by Reth

On calculators where the X and Y coordinates can be separated it's just a matter of setting polarity with +/- and X<>Y depending on the quadrant. N E + +, S E - +, S W - - and N W + -

Good point. The Woodstock models were never ideal for use on a desk due to the shape - they seemed prone to tipping. Not to mention the difficulty of reading the display in bright sunlight. I'm still fond of the early LED models regardless, as they were a quantum leap from using a Curta and a book of six-place tables.

Woodstock quality (was Re: The HP35S)

in response to message #31 by Nick R

Tipped in desktop use? Bright sunlight? Never experienced that with my 25C in the seventies. Usually held it in my hand while calculating or had it sitting next to a teletype, on a pile of papers, an open book or the like. It did hardly ever see the sun in the lab or during our beam times in accelerator bunkers. And I don't know what I did wrong then, never had a charging problem (bought a repaired unit, maybe they tuned the circuit a bit). But that calculator fitted (and fits) my hand perfectly :-) Those were the days ...

Re: Woodstock quality (was Re: The HP35S)

*Message #33 Posted by **Nick R** on 27 Aug 2011, 1:08 p.m.,*
in response to message #32 by Walter B

The tipping problem could possibly have had something to do with the 'desktop' often being our table in the beer parlour. We found the dim environment much better for reading the display on bright sunny afternoons.

Guys, you're not being fair to the 35s. It took courage to build a reminescence to the 35, and in some way, it marked HPs re-entry into the market. It's far from perfect, but it shows HPs willingness to stay in the calculator business, and at the same time, it is an acknowledgement of HPs glorious past. With that in mind, the 35s deserves standing ovations from our community. And remember, the best is yet to come.

in response to message #43 by marais

A company of this size receives just one information: The number of units sold. If you buy one, HP has no intention to ask why you did so.

In the HP forum, there's a thread called something like 'HP listens'. I thought that would be a good place to leave some critics, but got confronted with questions unrelated to the product, so I stopped participating.

There's obviously no chance to give HP a feedback other than buying or not buying a product. If you do buy it, it is perceived by the company as if the quality were ok. If enough people don't buy anymore, the business is given up at all. That's how a kid would react. All large companies seem to work that way. The larger, the more simple the mechanisms.

The HP 50G is, objectively, the best calculator that is available from anyone, as long as the size and the RPL "feature" are not counted against it. It's made in China.

It's an amazingly powerful machine at a very reasonable price...the opposite to the abominable and obviously substandard HP 35S.

This opinion comes from one who worships at the altar of the HP 42S (whose never-matched 23-year-old feature set will still place it legions ahead of the forthcoming HP 15C LE).

Edited: 25 Aug 2011, 4:58 p.m.

Surprise? No - the 42S was the successor of the 15C, and in those simple times long long ago, a successor used to be clearly ahead of its precessor :-)

FWIW.

No you can't. HP stopped making them a long time ago and will tell you they don't have anymore. They ran out at least 6 months ago, which is when I called and found this out. There were others on this forum and other places who were told them same thing when they called.

The only way to get a full manual now is TAS or print it yourself.

Huh. According to my amazon order history I bought my 35S the last week of March of this year. I called HP after I'd had the calculator a couple weeks, and didn't have any problems getting them to send me a manual then.

Amazon?
Look at the reviews for the calculator.
Search for "manual".
Here are the first two reviews with that keyword:

Lacks a printed manual, **September 22, 2010**
By Wayne Scott
Amazon Verified Purchase(What's this?)
This review is from: HP 35s Scientific Calculator (Electronics)
This is a great calculator, but I am really annoyed that it no longer ships with a printed version of the manual. It does come with a PDF of the ~350 page manual but you have to read it online.
I appears that HP used to mail free copies of the manual if you requested from customer support, but I was told they discontinued that program.
Now to see if I can get it printed at Kinkos.

Good solid HP for the FE exam, **October 26, 2010**
By J. P. Cuzzourt
Amazon Verified Purchase(What's this?)
This review is from: HP 35s Scientific Calculator (Electronics)
Bought it to use on the FE exam next April (a test I should've taken 16 years ago!) As a long time HP calculator user, I appreciate the solid feel. The somewhat limited functionality is what allows it to be used on the exam, but it provides fast rpn calculations and I was able to transition easily from my 48GX.
At first i was disappointed with the crappy Getting Started guide. I expected a manual. Then, at the end of the getting started guide, HP promises to send you a full manual free of charge if you call HP customer service. But, when I called, HP informed me that they weren't honoring that promise because they'd run out of manuals and weren't planning to print any more! They put me on a "waiting list" but I expect to wait roughly forever for the promised manual.
Of course you do get a pdf of the full manual, but that just doesn't cut it for me.

If they started up that program again, that would be news to me. I was also told this switch was done for green reasons.

Edited: 26 Aug 2011, 8:51 a.m.

I don't know. I called the number in the little leaflet that comes with the 35S. I told the guy who answered that I'd just bought a 35S and the leaflet said to call to get a printed manual, so that's what I was doing. He said he'd have to check to see if he could do that, came back and asked for an address, and I got the manual in the mail about a week later.

Re: The HP35S

Possibly some of the support people are more familiar with the computer section (where manuals have long since dissapeared) and don't know about the calculator manuals, they

just regurgitate the standard "they are not available". Maybe try a couple of times and you might get lucky?

Re: The HP35S

*Message #58 Posted by **Paul Gaster** on 27 Aug 2011, 9:23 a.m.,*
in response to message #57 by Bart (UK)

Maybe they got a few complaints, changed their mind, and then printed some more. Or maybe they found a few boxes or a pallet of manuals they didn't know they had so they decided to give them out again. It is hard to say for sure, but I am glad someone reported they were available again. It is worth a shot to call and try to get one.

Re: The HP35S

:-) I'd love to to be able to have a go at re-purposing any calc having

1. a reasonably small footprint,
2. a state-of-the-art display,
3. an uninterrupted row of keys next to the display,
4. slanted keys with tactile feedback,
5. sufficient memory and an interface for accessing it.

The HP 35S falls short in more than point.

Walter

> The HP 35S falls short in more than point.

It looks like the 35s only satisfies #4 above. However given its mechanical construction it is possible to design a retrofit PCB for the unit which for the most part wouldn't require heroics for the average user to install. The display heat seal interconnect is the major stumbling block although given the oddball character display I'm not sure it would be worth salvaging as part of a retrofit upgrade.

I may be in the minority but the form factor of the 35s doesn't particularly appeal to me. However for those who feel otherwise it wouldn't be too difficult for a prospective upgrade to swap in a 128x32 or 128x64 graphic panel. Navigating the mounting screw land mines will probably make the board layout interesting and would most likely need to be 4 layer. The original board appears to be ~1.3mm so it may be possible to sandwich two 0.8mm (or perhaps 0.6mm if the clearance is tight) boards such that you don't need to additionally navigate around the dome PCB lands on the opposite side.

Could be a fun project particularly if it gets rid of that character matrix display.

I too think the 35s is rather disappointing if measured by the defacto benchmarks HP themselves set years ago. But it **isn't** years ago and some folks here seem intent to hold HP to a combination of market * technology * price_point no longer relevant in modern times. I'd hazard the collective audience here contributes to substantially less than 1% of total revenue for current HP calculator products. So frankly catering to such an insignificant segment of their market doesn't seem worth their time, resources, and effort. I suspect any HP representation lurking here is more likely the result of good will and perhaps personal interest on behalf of the individuals present.

I have no idea how to effectively influence HP calculator marketing direction, or whether it is even feasible. But folks might consider cutting them a little slack seeing as they have adapted to the present day market in order to viably compete in it.

I would for a dux nuts keep for 20 years model, but would you? Hp calculators of yore wernt cheap. If you take their old rrp (not the clearance end of life price) and appreciate it, youll realise they cost some between an iPad and a MacBook. Expecting that mechanical quality for $59 is unrealistic.

It is also, the flaw in hp's dcisions, they never had the budget market, yet thats where they tried to go.

> that mechanical quality for $59 is unrealistic.

Is it? We're talking about a 30-40 year mature technology here. Bringing the required technologyies into existence in the 70s was a substantial investment which now are far more prevalent and feed a plethora of other product development efforts. If someone can't manufacture and profitably market a modern day 15c, 42s, <whatever> of construction equal to or surpassing the original versions for US$59, something else is at play. This is of course assuming business/market demand exists to justify the effort and recoup the development expense.

> Quote:
>
> It is also, the flaw in hp's dcisions, they never had the budget market, yet thats where they tried to go.

I think it is easy for us all to play arm-chair critic and point out alleged mistakes, deficiencies, incompetence, etc.. in HP's strategy. But HP holds the award for defining (and during a substantial term) ruling the calculator market. So I'd hazard they must have done something right to find technical professionals some 30+ years later obscessed to the point of frequent slug fests over their ancient products.

Re: Would you pay $500 for a calculator

*Message #70 Posted by **Mark Hardman** on 27 Aug 2011, 1:30 p.m.,*
in response to message #69 by Walter B

Walter,

In this case "slug fest" is not a reference to a festival celebrating the lowly gastropod mollusk. It is an English idiom for "fist fight" or "brawl".

I really doubt it could be done well for $59. One son's cell phone had a cracked display and he was eligible for a new one, supposedly free (turns out it's not really free), and when we were going to get it, my wife said she wanted one too because "I like new things!" With the new one that was nearly free, the letters on the keyboard of the one in the display case were already wearing off from customers opening it and poking at it. You won't find that with HP's double-shot keys. The contacts of the phone's keyboard definitely won't last 25 years of daily use like

my HPs' either.

The cell phones are cheap partly because of huge production volumes, which you'll never get in a quality scientific programmable calculator. A new calc will definitely be cheaper after adjustment for inflation than they were 30 years ago, because of not having to design a new processor and custom ICs; but LCDs, injection-molded cases, and PC boards were quite commonplace in 1980.

It is really a question of volume such that the up-front engineering costs could be reclaimed which I'm assuming is the case for sake of argument. Besides an injection molded case and double shot keycaps the bill of materials include a gold/nickel plated 2 or 4 layer board, 1-2 commodity ICs, tactile domes, matrix/segment reflective LCD and a handful of discrete electronic and mechanical components. $59 was just an estimate but my sense it would be in the reasonable ballpark. The other question is whether manufacturing could be accomplished within that budget while maintaining legacy HP quality.

Re: Would you pay $500 for a calculator

*Message #73 Posted by **Garth Wilson** on 27 Aug 2011, 10:58 p.m.,*
in response to message #72 by uhmgawa

I'm sure the case mold would be by far the biggest up-front cost. Our company owner wanted to do a particular product recently and changed his mind when faced with the $50,000 mold cost. Double-shot keys are a lot less as I remember, and a custom LCD tool-up was only a couple thousand dollars when I looked into it for another product over 20 years ago. First article cost on PC boards is piddly by comparison.

It's called the "Triumph of Crapitalism". When too many people are perfectly willing to put up with an inferior product, it becomes economically unviable to produce a high-quality product, because the necessary economy of scale isn't there. The fact that we have nearly 40 years of technological advance to draw upon isn't sufficient to make it cost-competitive with cheap crap.

No one is going to produce a calculator today with double-shot molded keys and metal dome keyswitches, because people are perfectly willing to purchase calculators with key legends that rub off and unreliable switches. This is exacerbated by the fact that consumers don't *expect* a product to last, so they aren't willing to pay more for one that is claimed to. If the marketing materials for the calculator claim that it will last for years, no one will believe it, because marketing materials are all lies anyhow.

Unfortunately I couldn't agree more. I'd add to this the fact HP of yesteryear was pushing new frontiers which I suspect allowed them the freedom to engineer products as engineers, for use by engineers. Beyond being a noble goal it was a legendarily successful effort, but ironically successful to the extent contemporary HP is now held accountable to the high benchmark they themselves have set.

All disturbingly true. HP did and perhaps still could have competed on the premise of extreme quality. But I hesitate to second guess their marketing data and direction in this area. Still adapting in order to survive in a sink-or-swim economy consumer electronic market where scientific calculators of respectable ability (albeit disposable) sell for US$15 at the local MalWart has likely forever retired that marketing differential from the playing field.

Incidentally the arm7 12C and 35s still have metal domes although the cut/legged version perhaps to simplify board routing. I don't think they compare favorably to the full domes formerly used but most probably don't care.

I understand your point, but I think this view puts all the blame on the consumer. To my

knowledge, no one wrote Winchester in 1964 and requested they start making 1894's with stamped parts instead of machined ones. No one wrote Emco in 1964 and requested Unimats be cast out of Zamak instead of iron. No one wrote HP in 1990's and asked them to start making calculators with painted key legends. And no one requested HP in 2007 to bring out a crappy 35s for $60 instead of a good one for $100.

> Quote:
>

*Message #77 Posted by **Eric Smith** on 29 Aug 2011, 12:00 a.m.,*
in response to message #76 by Martin Pinckney

Of course consumers didn't write those letters. They voted with their wallets. If people had continued buying large numbers of the HP models that we in this forum all want, then HP would have continued making them.

The fact that people buy cheap crap puts too much pressure on the companies trying to make a higher quality product, and forces them to reduce their quality also.

I don't see how this can be realistically blamed on anyone OTHER than the consumers who are willing to buy cheap crap.

Another way of looking at it is that if consumers were not willing to buy cheap crap, then there wouldn't be millions of factories in China turning out cheap crap.

Re: Would you pay $500 for a calculator

*Message #78 Posted by **Michael de Estrada** on 29 Aug 2011, 12:39 a.m.,*
in response to message #77 by Eric Smith

I think this is a bit simplistic. Companies have different marketing strategies, and in the early days HP was like Mercedes or BMW, and they catered to a higher class of consumer that wanted the best quality and was willing and able to pay for it. Their volume was lower, but they still made a healthy profit. In the late 1970s, they made a mistake with the Spice series trying to compete on price with TI, and it almost cost them their calculator market. Fortunately, they regained their sanity with the Voyagers, which cost more but had superbe quality and sold extremely well. But HP quality went far beyond the calculators themselves, and extended to the printed documentation as well. I think the quality over price consumer market still exists and can be exploited by HP, because nobody else has entered it and of course there's those three letters R P N. We recently bought, or should I say invested in a Kirby vacuum cleaner system, made in the good old USA and expensive as heck. But it will last forever, is completely rebuildable, built like the proverbial brick outhouse and works better than anything else. It was painful writing a check for several grand, but it sure beats the crappy old plastic Hoover we bought at K-Mart. Just like my old HP-35.

The equivalent in vacuum cleaners here is Vorwerk. These are built like tanks and you can get spare parts for the oldest units. OTH, a single part can cost you the price of a cheap vacuum cleaner.

I think, going cheap and hoping to keep the same customer base will mostly fail. Looking at German car makers, their low end offerings weren't the biggest success and were quickly replaced by higher standard cars with a better reputation, leaving the low budget markets to other manufacturers.

I don't know if the calculator business has the same potential but quality tools normally sell good enough to return their investment.

in response to message #77 by Eric Smith

> Quote:
>
> Of course consumers didn't write those letters. They voted with their wallets.

Indeed. Winchester aficionados *stopped* buying their guns after they cheapened them. "Pre '64" Winchester became term of quality.

> Quote:
>
> I don't see how this can be realistically blamed on anyone OTHER than the consumers who are willing to buy cheap crap.

My point is that manufacturers often make internal decisions about "what consumers want" that are in error. Consumers did not want the change, did not initiate it, and did not have a buying alternative after the change. To postulate that all these cheapening changes were caused by consumers just isn't accurate, IMO.

> Quote:
>
> Another way of looking at it is that if consumers were not willing to buy cheap crap, then there wouldn't be millions of factories in China turning out cheap crap.

Again I find your logic only partially correct. Yes, consumers are certainly *willing* to buy the cheap Chinese crap, but they only got the opportunity after a) political decisions to allow "free" trade, and b) corporate decisions to move to China to undercut competition. Both not initiated by consumers.

What if Walmart has mounted a huge advertising campaign in 1980 that went like this: Dear consumer, we propose to start moving procurement to China soon. You will be able to buy a 20" box fan that now sells for $20, for $12 in 2010! And you will trade your fathers/brothers/husbands good-paying jobs for your children making minimum wage at our huge number of Superstores.

How would consumers have voted?

Re: Would you pay $500 for a calculator

*Message #81 Posted by **Eric Smith** on 29 Aug 2011, 12:31 p.m.,*
in response to message #80 by Martin Pinckney

They would have **said** that they didn't want that, but when the $12 box fan showed up, they would have bought it rather than the $20 box fan. That's voting with their wallet, and it is an historical fact that this is what happened. What consumers **say** they want, and what they'll **actually buy**, are often very different. What they **say** they want is totally irrelevant.

*Message #84 Posted by **Manolo Sobrino** on 29 Aug 2011, 2:49 p.m.,*
in response to message #77 by Eric Smith

I agree, there is short-sightedness in the attitude of buying always the cheapest. But the decisions are made by the 90% of the customers, and that's what they expect, unaware that it is not realistic to get what they want for what they're willing to spend.

I fear the time when it'll be impossible to get a new well engineered tool, as sometimes anything else would simply not do. It takes vision to do what Steve Jobs did with Apple, showing that you can make people to pay good money for your product if it is worth it (actually, that's not always the case with the i-whatever).

HP didn't have that vision. After disassembling a 50g I realised that I couldn't trust such bad soldering and clumsy design, that you would never be able to overcome a failure of the flash boot sector, and that arm emulation was a kludge cheaper than writing a more efficient native OS. I can't pay 200€ (department store, no fuss and easy warranty reclamation) for that, even though I really love the software.

I was willing to get a 35s, but the bugs are annoying, its strengths rather weak, and if I'm not going to get anything better than my casios and ti, there's no point in it.

I really want to get a decent hp calculator, not a collector's item, and I'm sure it can be done with profits for the company (as others have done it). Let's hope it's a question of time.

I had an old Panasonic tough book with a solid metal case and it was cast light alloy that was machined where necessary.

Thanks

*Message #97 Posted by **snaggs** on 28 Aug 2011, 10:57 p.m.,*
in response to message #95 by x34

And I do agree lots of manufacturers used to make some nice products, remember old thinkpads? However, in consumer PC's that I can see at my local department store, theyre all pretty flimsy.

I was just thinking that theres not many products made like they used too, except Apple, and they charge a premium.

If HP were to make a calculator today with attention to constructioon quality, it would likely need to sell at a premium over current models, dont you think?

Im not suggesting it would cost $1500, but maybe 20% above current prices?

That's impressive by any measure and a breath of fresh air contrasted with the modern day stamp-out-more-cheap-crap disposable electronic goods migrane. I'd nominate Apple to the list for an "HP Manufacturing Award of Excellence".

I had toyed with the idea of milling housings for prototype calculators from Al -- actually a poured casting to minimize the amount of material removal. Compared to doing the same from a block of ABS (or a glued up blank emulating what you'd start with with the Al casting), Al is obviously more durable structurally and easier to machine in thin dimensions. Also the texturing achieved with injection molded ABS isn't going to be replicatable with a milled ABS approach. However it would be possible to sand/bead blast an AL frame to get an approximation.

The point where I paused was that of aesthetics wondering how to get an agreeable finish on the surface. Leaving it natural after blasting seemed a little non-traditional for a calc but maybe I'm just hung up on legacy HP color schemes. Anodizing it whatever color will look ok until the anodizing wears and it is downhill from there. ABS to me also feels more inviting for a handheld device vs. a cold block of metal. But that may be just what I'm used to.

On the plus side an Al substrate gets us away from heat staking and is able to hold threads far better than plastic. So from a serviceability POV a screw-attached PCB is an improvement. It also provides an inherent ESD cage.

I see a market opportunity here.

Introducing the ***Crapulator 2020***

More features than you'll know what to do with. Including such vital things as:

- Over two thousand functions which give at most 1 significant digit of accuracy.
- Floppy spongy keyboard that is guaranteed to last at least fifteen key presses. It feels much better than an acid soaked rag to wipe your eyes with.
- Lots of unreliable flash memory to store your unimportant data in. We even guarantee this wonderful memory for up to two writes or fifteen seconds retention. Trust us, your data is safe.
- Did I mention the 2k+ functions? You'll never need another calculating device again.
- Awesome black on black display with a totally insane 2k by 1.5k resolution, so long as everything is black.
- Over 350 percentage functions to make making up statistics easier.
- The satisfaction rate with our large user base is well over 115%.

You will love the *Crapulator 2020* or your money back in our accounts.

- Pauli

> The USB spec. does not allow a hand-held battery-powered device to be a controller though. Booooo USB!

There are exceptions to this rule. You can connect two TI-84s or two Nspires through their USB ports. Looking at the cable you can easily see that one connector has a slightly different shape which will not fit into a standard mini USB B socket. The TIs have a modified socket. This is following a specification named "USB On-The-Go".

*Message #109 Posted by **Eric Smith** on 29 Aug 2011, 12:36 p.m.,*
in response to message #106 by Garth Wilson

Does the USB spec actually prohibit that? I haven't read it cover to cover, but I wasn't aware of any such restriction.

However, a USB host is required to provide 5V at 500mA (2.5W) to a downstream device or hub, and that would blow the power budget of most handheld battery-powered devices.

Re: Would you pay $500 for a calculator

*Message #110 Posted by **Marcus von Cube, Germany** on 29 Aug 2011, 1:39 p.m.,*
in response to message #109 by Eric Smith

In the case of USB OTG, the device may limit the current to less then that. The specification contains a definition of a table of supported devices that may be part of a USB OTG controller. Only the mentioned devices are required to work.

Nothing illustrates the nature of the contributors to this forum better than that a recent thread "Thanks for a simple, easy to use forum" was followed in just a few days by a thread "Isn't it time to update the museum?"

This proves some people here are able to distinguish between the forum and the exhibition. Worthwhile in real museums as well, IMHO.

OT: What Your Old Graphing Calculator Says About Technology

*Message #1 Posted by **NateB** on 24 Aug 2011, 7:16 p.m.*

There is an article about graphing calculators and their failure to evolve in the Atlantic. (The HP-50g is #6 on the list of Top Twelve best-selling graphing calculators on Amazon)
Link

Re: OT: What Your Old Graphing Calculator Says About Technology

*Message #2 Posted by **Howard Owen** on 24 Aug 2011, 7:32 p.m.,*
in response to message #1 by NateB

What about calculator evolution in the Pacific? I might have to gear up for a little electronics fishing soon ...

Re: OT: What Your Old Graphing Calculator Says About Technology

*Message #3 Posted by **Lode** on 24 Aug 2011, 7:49 p.m.,*
in response to message #2 by Howard Owen

"In one of the purest computing tasks imaginable -- calculations and the graphic display thereof -- people choose a decade old technology."

Calculators still evolve fast compared to washing machines, vacuum cleaners, light switches, etc.....

Re: OT: What Your Old Graphing Calculator Says About Technology

*Message #4 Posted by **Mike Morrow** on 24 Aug 2011, 8:14 p.m.,*
in response to message #1 by NateB

Number 12 is the TI-89 Tit, presumably hardware version 4.

I'm surprised the HP 50G sells as well as it does, in light of TI strength in the GC market. But in objective reality, the HP 50G is a far more capable and easier machine to use for almost any purpose, compared to the less (Amazon sales) popular TI-89. The TI-89 Tit has a terrible display and lacks SD card support and many other hardware and firmware features that are standard on the HP.

Store stocks of the TI-89 Tit HW4 were cleared out last year at my local Wal-Mart for $42.50! I got one at that price (to go with my 14-year-old TI-89 HW1) and I still think it's overpriced!

Re: HP Caesium atomic watch

*Message #5 Posted by **Ren** on 25 Aug 2011, 1:05 p.m.,*
in response to message #4 by Jim Yohe

It does have a battery pack. That allows it to continue running when transporting it to and from calibration as well as during power outages.

I liked the other article on that site about taking a trio of them up to 5400 feet above sea level to verify Einstein's theory about time and space.

What's the best way to re-assemble a Voyager?

*Message #1 Posted by **jbssm** on 24 Aug 2011, 5:43 p.m.*

Hi all,
so my HP-15C keyboard was in a really bad state and in whim of youth I decided to take it apart.
Now, the good news is that it was only dirt as I expected. The bad news is that I have to put it back.
I kept all the plastic pin heads I cut to reach the keyboard, and has I recall seeing somewhere in this forum I tried to put it back by melting them with my soldering iron.
That doesn't work. When I try to heat them, they get all shrunken and they do now mend with the rest of the pin back at the calculator.

So, are there any other ideas to put it back? I tough about using a strong glue on the pin heads. Has anybody tried that?

Also, there are some small scratches in the keyboard metal part (the black one), do you recommend some painting to cover it with a brush?

Re: What's the best way to re-assemble a Voyager?

*Message #2 Posted by **Artur-Brazil** on 25 Aug 2011, 2:40 p.m.,*
in response to message #1 by jbssm

Hi, I have done this to many calculators: You'll need:

- a 10 or 15 minute liquid(gel) epoxy glue; it is sold in two parts; it doesn't get spread too much, as it is a gel and is of fast cure;

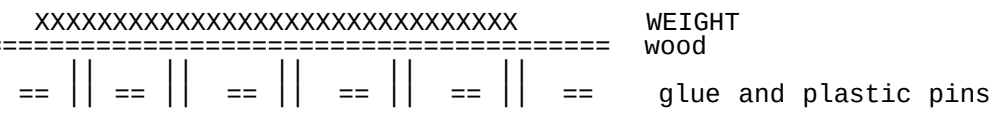
- around 10 to 15 small pins that you will put over the pcb. They must have around 1cm heigth (all same height!!!) and less than 1cm in diameter; you will put them over the pcb, between the holes where front part plastic pins come accross of;

- a small piece of wood or other plan material (15x20cm); you will put it over the pins;

- some heavy material, around 2 or 3kg. You will put this over the wood;

Procedments: - put the front part with keyboard down on a table; - insert the pcb on it - so, the plastic pins of front part will arise by the holes on pcb; - prepare some glue and quickly deposit small drops on all the holes where the plastic pins of front keyboard arise - don't spread them - the epoxy will spread by itself over and tight front part pin to pcb; - put the small plastic pins you got over the pcb, between the epoxy drops (but not let them be glued to pcb); - put the piece of wood over these pins; - put the weight over wood and let there for one hour or more;

See the schematic, as my English is very poor:



```
 -+-----+-------+------+------+------+-   pcb on the place
  |     |       |      |      |      |    plastic pins from front
 ======================================  calculator facing down
```

Please, do not use an extremelly heavy weight to press everything, as you would bent the front part and pcb.

At the end, you'll see you HP with a tight keyboard as new!!

Need to clean the alummium bezel? Use a soft sand paper and after removing scratches, apply a lacqueur.

My best wishes!!! Artur - Brazil

Re: What's the best way to re-assemble a Voyager?

*Message #3 Posted by **jbssm** on 29 Aug 2011, 9:13 a.m.,*
in response to message #2 by Artur-Brazil

Hi Artur (I send the messa in Portuguese bellow in case it's easier for you),
So, today I was finally going to do it but I got stuck in a part.

You say I should use pins with 1cm heigh and about 1 cm diameter. But if I use pins with 1 cm heigh they are too big and I will not be able to put the back part of the calculator back.
Can you explain better?

Thank you.

Agora em Português.

Olá Artur,
hoje ia finalmente tentar usar o seu método mas fiquei empancado.

Você diz para utilizar pinos de 1 cm de altura por 1 cm de diámetro, mas se tiverem 1 cm de altura são muito altos e não consigo pôr a parte de traz da caixa da calculadora de volta.
Podia explicar melhor o procedimento, é que talvez eu não esteja a entender bem.

Before you put the shebang back together I'd recommend rotating the tactile dome strips between the more frequently used keypad locations and those of lesser wear. You did mark from where each tact strip originated of course? Yea I forgot enough times too but you can detect any wear of substance by tossing a strip on a

~200gram scale and measuring any differential dome inflection force.

> Quote:
>
> I kept all the plastic pin heads I cut to reach the keyboard, and has I recall seeing somewhere in this forum I tried to put it back by melting them with my soldering iron.

I can't imagine that method resulting in a successful re-staking comparable to the original post heads. Besides needing to replace the head you need to do so under controlled conditions of temperature, pressure and time. There is also the consideration of the overlay elastomer membrane which should be (and was) compressed in the original staking operation. Rather than rebuild the posts to subsequently heat deform, I've just cut new head blanks from 1/8" ABS welding rod on a lathe to solvent weld one-by-one onto the beheaded posts under pressure. (A sharp set of diagonal cutters with jaws flat on one side may work too.) It is a bit slow but will result in a joint of far more substantial strength compared to having at it with an (over temperature) iron.

You may want to use a solvent cement (with filler) such as ABS pipe cement vs. say, acetone and apply it to only the new head blank and not the target post. Doing so will minimize the likelihood of creating a bond between post and PCB which will frustrate any future disassembly attempts. A jewelers loupe, tweezers, and hypodermic syringe for dispensing the cement will go far to insuring a neat job.

> Quote:
>
> That doesn't work. When I try to heat them, they get all shrunken and they do now mend with the rest of the pin back at the calculator.

The posts were likely (or should have been) cut flush with the top of the PCB such that they are the correct height to automagically gauge the reassembly pressure. If that isn't the case or they are further deformed by an attempt to rejoin the cut heads with an iron you may have some experimentation ahead. In any case cut a piece of stiff foam (eg: carpeting base) to fit just inside of the external keypad area which clears the upper display bezel and right/left housing. Put the calc face down on the foam (posts pointing up) and using a small drill press with a bit mounted backwards in the chuck, apply pressure to the head+post to be rejoined. A weight hung on the on the quill handle will help achieve consistent joints. ABS solvent-based cement will set sufficiently such that joint pressure can be removed in a few minutes depending on type of cement and amount applied. If this procedure is followed carefully the PCB should be removable (and restake-able) as above for subsequent repair.

[WP34s] Emulator: Where does it get its rom?

*Message #1 Posted by **Lode** on 24 Aug 2011, 5:28 p.m.*

Hi,

Does anyone know where the WP34s emulator loads the ROM from? There's no file that looks like a ROM in its directory, and after renaming calc.bin in the 'real' directory, the emulator still works so it's not loading that file.

Regards,

-Lode

Re: [WP34s] Emulator: Where does it get its rom?

*Message #2 Posted by **Paul Dale** on 24 Aug 2011, 5:31 p.m.,*
in response to message #1 by Lode

It doesn't load a ROM. It is a native compile of the firmware.

- Pauli

Re: [WP34s] Emulator: Where does it get its rom?

*Message #3 Posted by **Lode** on 24 Aug 2011, 5:56 p.m.,*
in response to message #2 by Paul Dale

Ok, I see, thanks...

The emulator program works really well in wine in linux.

But it seems like all these developer tools and running the emulator with a different rom really are designed purely for visual studio and nothing else, no other C++ compiler, let alone another OS, can do anything useful at all with this :(

Hard to create and debug a custom ROM without emulator of course, I mean, the calculator can only be flashed a few 1000 times...

Edited: 24 Aug 2011, 5:58 p.m.

Re: [WP34s] Emulator: Where does it get its rom?

*Message #4 Posted by **Paul Dale** on 24 Aug 2011, 6:13 p.m.,*
in response to message #3 by Lode

Our builds are done on Windows.

It is possible to compile the firmware on other operating systems using a gcc-arm tool chain but nobody I'm aware of has tried to flash such an image.

There is a text console emulator that works on Linux and MacOS which is extremely useful for development and debugging -- better access to view much of the internal state. I use this for all of my development and debugging efforts.

- Pauli

Re: [WP34s] Emulator: Where does it get its rom?

*Message #5 Posted by **Marcus von Cube, Germany** on 25 Aug 2011, 2:25 a.m.,*
in response to message #4 by Paul Dale

As Pauli stated, there is no attempt to emulate the hardware on the PC. We've just more than one environment to compile the sources for: The hardware, Windows and Unix (Mac, Linux).

In order to debug the logic it's almost always enough to do this with the tools on the PC. I'm using Visual Studio 10 but the free Express edition will do in most cases. It's a pure Windows thing because the emulator is built upon the work of HP. The original sources are part of the 20b/30b SDK put together by Cyrille. The GUI part was written with the Microsoft Foundation Classes and is Windows only. I did a split between the GUI and the calculator engine by putting the GUI in a DLL. So it's perfectly possible to create a new GUI implementation that is no longer dependent on HP's Windows code.

For the hardware port I added a JTAG connector to my development 20b. It's connected to my development system via an Olimex ARM-USB probe which allows source level debugging from within the Eclipse debugger. It's not as comfortable as the Windows debugger but for pure hardware stuff like interrupt handling it's the only choice.

Flash endurance

*Message #6 Posted by **Eric Smith** on 25 Aug 2011, 4:58 a.m.,*
in response to message #3 by Lode

> Quote:
>
> the calculator can only be flashed a few 1000 times...

The endurance spec is 10,000 times, with 10 year retention. This means that at 10,000 writes, the flash will still give valid data at all combinations of the chip's specifications, such as low voltage at low temperature, low voltage at high temperature, high voltage at low temperature, and at all process corners. And still meet the 10 year data retention specification. It doesn't mean that it will fail on the 10,001st write.

In other words, there's a good chance that your calculator can be flashed a lot more than 10,000 times, because you probably only operate it at room temperature, and not at any temperature extremes (or high voltage extreme), and because Atmel is probably fairly conservative in specifying the endurance at 10,000, but if it does happen to fail on the 10,001st write, it's your problem and not Atmel's.

If you were using a calculator based on this part for development (rather than a simulator), it would take quite a while to try 10,000 code images. The calculator isn't that expensive, so even if it does fail on the 10,001st write, you can buy a new one, and not feel like you didn't get your money's worth for the first one.

I'm doing some firmware development now on a different vendor's ARM chip. I don't have a simulator.

I might work 12 hours in a day on it, but I don't think I've ever reflashed it more than about 50 times in a day, and usually not nearly that many.

Re: Flash endurance

*Message #7 Posted by **Paul Dale** on 25 Aug 2011, 5:45 a.m.,*
in response to message #6 by Eric Smith

In my previous job I got tasked with stress testing some flash to destruction. I don't remember if it was rated to 10k or 100k erase/write cycles.

Needless to say, we gave up testing before the first failure. This was well beyond the specified number of cycles.

And as Eric wrote, a replacement calculator isn't expensive and 10k write cycles is a very long time.

- Pauli

Re: Flash endurance

*Message #8 Posted by **Marcus von Cube, Germany** on 25 Aug 2011, 10:37 a.m.,*
in response to message #7 by Paul Dale

The limit gets in the way if you start storing more or less volatile data in the flash memory. We could easily create commands to store registers in flash if we wanted to. But this would probably stress the flash beyond specification.

We have a (distant) plan to use flash for regular program storage and we need to implement some smart caching in order to avoid excessive writes to flash. (Don't do it for every program step input by the user!) Register storage will remain in SRAM but some file I/O (41C like) to flash seems possible.

Re: Flash endurance

*Message #9 Posted by **Garth Wilson** on 25 Aug 2011, 3:40 p.m.,*
in response to message #8 by Marcus von Cube, Germany

Although I'm not familiar with them, I know there have been wear-leveling algorithms developed for this reason. The idea is that if you keep writing small portions of the flash, rather than always writing them to the same pages and wearing those out while the rest of the flash has lots of life left in it, you move them around so the wear load is shared.

Re: Flash endurance

*Message #10 Posted by **Marcus von Cube, Germany** on 25 Aug 2011, 4:14 p.m.,*
in response to message #9 by Garth Wilson

This is the main task of the flash controllers built into flash memory cards. Special flash file systems are designed for embedded devices which have do do this in software.

Re: Flash endurance

*Message #11 Posted by **Eric Smith** on 25 Aug 2011, 9:55 p.m.,*
in response to message #8 by Marcus von Cube, Germany

Right. I interpreted the original point I was responding to as being about flashing firmware during development, which is a much different usage model than data storage. Using 10K-rated flash for user data storage requires a lot more care.

*Message #12 Posted by **Patrice** on 25 Aug 2011, 1:07 a.m.,*
in response to message #11 by Namir

Yes

I am registered

Re: Actually, the 30b firmware...

*Message #13 Posted by **Howard Owen** on 24 Aug 2011, 8:19 p.m.,*
in response to message #9 by Namir

It's the Mayans, not the Aztecs. The Mayans are going to destroy the world in 2012 unless they get HP-15Cs.

I may have that wrong ...

Re: Actually, the 30b firmware...

*Message #14 Posted by **Mike Morrow** on 24 Aug 2011, 8:23 p.m.,*
in response to message #13 by Howard Owen

The Mayans are much more sophisticated than that. They want HP 42S's.

Re: Actually, the 30b firmware...

*Message #15 Posted by **Namir** on 24 Aug 2011, 11:57 p.m.,*
in response to message #13 by Howard Owen

Let's hope HP brings out the HP-15C LE for the Mayans to redo the calculations .. and quickly!!

:-)

Namir

Re: Actually, the 30b firmware...

*Message #16 Posted by **Thomas Radtke** on 25 Aug 2011, 12:26 p.m.,*
in response to message #4 by gene wright

Hi Gene,

I guess the 30b F/W is tied legally to the 30b? If not, I'd like to try it on my 20b (don't own a 30b, unfortunately).

Thomas

Re: Actually, the 30b firmware...

*Message #17 Posted by **Marcus von Cube, Germany** on 25 Aug 2011, 1:27 p.m.,*
in response to message #16 by Thomas Radtke

I don't know if that's possible at all but TW once stated that HP has tried hard not to allow the 30b firmware to run on the 20b hardware.

Re: Actually, the 30b firmware...

*Message #18 Posted by **Walter B** on 25 Aug 2011, 1:30 p.m.,*
in response to message #17 by Marcus von Cube, Germany

And the 30b keyboard runs circles around the 20b. So you should get one anyway ... :-)

Re: Actually, the 30b firmware...

*Message #19 Posted by **Thomas Radtke** on 25 Aug 2011, 1:43 p.m.,*
in response to message #18 by Walter B

I'm sure it does, but my calculator budget has to be preserved for the 15C LE(*) ;-).

(*) if it doesn't appear, I'll get the 30b in the next fire sale when Leo dumps the calc devision ;-(

Re: Actually, the 30b firmware...

*Message #20 Posted by **Jeff O.** on 26 Aug 2011, 7:41 a.m.,*
in response to message #19 by Thomas Radtke

I just picked up two 30b's for $23.95 each from Amazon, with free shipping. Took 6 days from ordering to arrival.

Re: Actually, the 30b firmware...

*Message #21 Posted by **Thomas Radtke** on 26 Aug 2011, 8:31 a.m.,*
in response to message #20 by Jeff O.

Should I ask the US government for shelter from european prices? ;-)

Re: Actually, the 30b firmware...

*Message #22 Posted by **Jeff O.** on 26 Aug 2011, 7:36 p.m.,*
in response to message #21 by Thomas Radtke

Sorry Thomas, it was not my intention to highlight worldwide price inequities. I wish they did not exist.

Re: Actually, the 30b firmware...

No, it's XP Home Edition Version 2002 Service Pack 3

Re: [WP34s] Flashing with USB adapter successful using Windows 7

*Message #27 Posted by **Gerry Schultz** on 24 Aug 2011, 11:48 p.m.,*
in response to message #26 by Alexander Oestert

I too just had success flashing my WP-34s to version 2.11388. As I mentioned in a previous post, I recently purchased an HP Pavilion laptop PC and I've been curious about if I could flash my WP-34s to the latest firmware on it. This PC is running Windows 7 Professional and I used an ES-U-1001-R100 USB-to-RS232 (FTDI) adapter. After reading Bart's article on "How to get started with a WP-34s", I googled SAM-BA 2.10 and downloaded it from Atmel's website. It's the first download listed. In the description on their website, it stated that SAM-BA 2.10 was for Win7, so I didn't try setting the compatibility mode as recommended in Bart's article.

It installed without a problem and ran fine. I noticed that it takes a long time to start up so I had to be patient. I closed the program and connected up the USB-to-RS232 adapter and Win7 identified it

immediately and installed it successfully. I did go into the Device Manager and change the assigned serial port from Com 3 to Com 1 but that's not important. I then followed the 20b reflashing procedure and it worked the first time!

Very Cool. If there are any questions about my setup or what I did, please post.

Gerry

The week of repairing calculators

*Message #1 Posted by **David Ramsey** on 24 Aug 2011, 11:20 a.m.*

Well, so far:

-- 9830 tape drive problem: Paused until I can drive to San Jose and have a debugging session with EE friend that actually has a logic analyzer.

-- 9810 printer repair: Awaiting Cold Shrink™ tubing. Printer removed and will clean today.

-- Secondary 9810 display repair: see item #1. This parts machine might not have been my wisest purchase.

-- SR-60 card reader gummy wheel repair: finally got around to this yesterday. Turned out to be much simpler than I'd thought it would be, about on par with 9810 card reader work. Typical O ring repair that works perfectly.

-- SR-60 power supply(?) repair: sadly, the SR-60-- which, for a few shining minutes, was completely functional-- promptly died in the middle of running a test program. Display blanked out and calculator appears dead. When turned off and on the display will flash for a brief second, and sometimes the printer stutters. Will check PS voltages today.

So, overall...not doing that well (though certainly not for the lack of helpful suggestions from the folks here!) I think I really need to learn some basic electronics and graduate beyond a $10 Radio Shack multimeter.

Re: The week of repairing calculators

*Message #2 Posted by **Dave Shaffer (Arizona)** on 24 Aug 2011, 12:54 p.m.,*
in response to message #1 by David Ramsey

> Quote:
>
> graduate beyond a $10 Radio Shack multimeter.

Depending on your investment so far (in the machines themselves!), look into used test equipment on TAS. I got a 200 MHz dual-channel Tektronix scope a few years ago for not much more than $100. The front panel is a little beat up, but it works fine.

Re: The week of repairing calculators

*Message #3 Posted by **David Ramsey** on 24 Aug 2011, 5:34 p.m.,*
in response to message #2 by Dave Shaffer (Arizona)

The SR-60 thing seems to have been a bad connection, which is fixed (crossed fingers) now. Unlike HP machines of the same era, the SR-60 is not full of gold.

I assume a "dual channel" scope simply means I can view two simultaneous inputs, right?

Re: The week of repairing calculators

*Message #4 Posted by **Dave Shaffer (Arizona)** on 24 Aug 2011, 7:18 p.m.,*
in response to message #3 by David Ramsey

> Quote:
>
> I assume a "dual channel" scope simply means I can view two simultaneous inputs, right?

Yep. Typically, you can view them in alternate mode (one channel shows, then the other, as triggered either on the signal or with some kind of external sync), add them (not so great, usually, although you can invert an input, so they are in fact subtracting), or "chop," where the display alternately selects one or the other input at a rate faster than the sweep, so you are really viewing them both (nearly) simultaneously. Works best for relatively slow signals.

Re: The week of repairing calculators

*Message #5 Posted by **Tony Duell** on 25 Aug 2011, 4:10 a.m.,*
in response to message #2 by Dave Shaffer (Arizona)

Test equipment is undoubtedly very important (in that you can't 'see' the logic signals without it), but remember that there is no magic box you can plug into a calculator which will say 'Replace U3 on the Memory Addres PCB' (or whatever).

IMHO the most important piece of 'test gear' is a brain. Seriously. You can get a long way with simple instruments if you (a) know exactly what they tell you and (b) know how to interpret that information.

That said, I do find a good logic analyser to be very useful when repairing CPU/memory problems in the 9800s. I don't find a 'scope all that useful actually, but that's a personal thing.

Re: The week of repairing calculators

in response to message #5 by Tony Duell

> Quote:
>
> IMHO the most important piece of 'test gear' is a brain.

Agreed!

I feel like I need a new one, though. The one I've got now is definitely past its "best by" date. The data retention has substantially deteriorated, and I don't think the processing is working as well as it once did.

The ability to use a logic analyzer effectively in cases like this requires a degree of hardware knowledge and experience most of us don't have. I've been a programmer since the 70s, but that doesn't help much!

Still, I wrote numeric display drivers for the Motorola 6800, so I know the basic principles behind them (turn the segments on and off real fast and let persistence of vision convince the user they're looking at an "8" instead of 7 segments flickering on and off). So I might be able to repair the 9810 display board since I actually understand how it works.

I might also add that in addition to a brain, a community of helpful folks like this is important, too.

15C Reissue is actually a carefully disguised printer?

*Message #1 Posted by **Lincoln R.** on 24 Aug 2011, 7:33 a.m.*

This seems to have appeared, wonder how long it'll stay up. http://www8.hp.com/us/en/products/printers/product-detail.html?oid=5153395

Re: 15C Reissue is actually a carefully disguised printer?

*Message #2 Posted by **robertoataulfo** on 24 Aug 2011, 7:49 a.m.,*
in response to message #1 by Lincoln R.

Addition loop test, completed in HP labs. Up to 100X faster than original HP 15c. :-))

Re: 15C Reissue is actually a carefully disguised printer?

*Message #3 Posted by **Katie Wasserman** on 24 Aug 2011, 11:06 a.m.,*
in response to message #2 by robertoataulfo

Assuming it uses the exact same emulator inside the latest version of the 12C+ -- I see no reason why it should not -- then it should run 150x faster than the original 15c.

Re: 15C Reissue is actually a carefully disguised printer?

*Message #4 Posted by **Michael de Estrada** on 24 Aug 2011, 11:31 a.m.,*
in response to message #3 by Katie Wasserman

What is the battery life on the 12C+ ?

Re: 15C Reissue is actually a carefully disguised printer?

*Message #5 Posted by **Katie Wasserman** on 24 Aug 2011, 12:15 p.m.,*
in response to message #4 by Michael de Estrada

> Quote:
>
> What is the battery life on the 12C+ ?

So-so. Here are my approximate current measurements:

```
OFF = 0.004 mA
ON/idle = 0.05 mA
ON/running AMORT or tight loop = 20 mA
```

The two CR2032 cells have a combined capacity of about 450 mAh (depending on brand) at a standard current draw of 0.2ma. So the OFF state current draw is fine, implying a "shelf life" of 12 years.

The ON/idle state implies a lifetime of about 1 year, still pretty good.

However the running time is horrible, since the capacity of these cells drops precipitously beyond their standard rating of .2 ma. Manufacturers don't rate these to work at 20ma, so I can only guess (or test, I suppose) the capacity at 20ma. If I had to guess I'd say it's about 40mAh. Giving the calculator about 4 hours of continuous run-time use -- it might be less than this.

If you're not running "loopy" programs however, the quick 20ma current burst won't kill the batteries nearly as fast as a continuous draw. So basic math functions should allow for decent battery life.

Re: 15C Reissue is actually a carefully disguised printer?

*Message #6 Posted by **Pal G.** on 24 Aug 2011, 1:14 p.m.,*
in response to message #5 by Katie Wasserman

Katie,

I enjoy reading your posts. Can you give us a rough estimate (years?) for "decent battery life", and without me having to search the forums, can you tell us the estimated battery life of the original 15c or 12c?

I am wondering how close the old and new compare for folks who do not run "loopy" programs.

Thanks.

Re: 15C Reissue is actually a carefully disguised printer?

*Message #7 Posted by **Katie Wasserman** on 24 Aug 2011, 10:11 p.m.,*
in response to message #6 by Pal G.

Measuring an original 12C I get these approximate current measurements:

```
OFF less than 0.0001 mA
ON/idle = 0.01 mA
ON/running AMORT or tight loop = 0.4 mA
```

If the calculator is powered by Energizer 357 (silver oxide) cells that are rated at 150mAh at .2ma current draw the OFF state will be dependent only on the battery self-discharge. For silver oxide cells this can be 20 years at room temperature or maybe 50 years at zero Celsius. ON/idle state will be about 1.5 years similar to the 12C+, the big difference is when running long functions or loops.

The 12C can run for around 300 hours before exhausting the cells, while the 12C+ is only good for a few hours at best. Of course the 12C+ runs 150 times faster so the number of execution steps per set of batteries is about the same, surprisingly (or maybe not).

I can't really give an estimate on how long a set of batteries will last in either calculator under normal conditions unless those conditions are defined carefully. But from the above it seems pretty clear that if you do the same functions on a 12C and a 12C+ you can expect similar overall battery life.

-Katie

Memory : 65 registers

*Message #8 Posted by **snaggs** on 24 Aug 2011, 7:53 a.m.,*
in response to message #1 by Lincoln R.

What does this mean? Is it just an emulation or an improvement?

Re: Memory : 65 registers

*Message #9 Posted by **Jeff O.** on 24 Aug 2011, 8:57 a.m.,*
in response to message #8 by snaggs

On the 15C produced from 1982 through 1989, the memory pool included 67 total registers, R_I, R_0, R_1 ... R_{65}. Registers R_I, R_0, and R_1 could not be allocated to program storage, but the remaining 64 (R_2 ... R_{65}) were allocatable between data and program storage. Each numbered register (above R_1) could be converted to 7 bytes of program memory. At power up, the memory pool was split such that there were 21 data storage registers (R_I ... R_{19}) and 322 bytes of program memory (7 bytes each for R_{20} ... R_{65}.) Since the highest numbered register was called R_{65}, the specification for 65 registers appears to be consistent with the capabilities of the original 15C.

...

in response to message #12 by John B. Smitherman

When i discovered the hp calculator emulator apps for the iphone they didn't have good reviews

compared to the "aftermarket" emulators. So i went with all "aftermarket" emulators and have no complaints.

Re: Memory : 65 registers

*Message #14 Posted by **Norman Dziedzic** on 24 Aug 2011, 1:46 p.m.,*
in response to message #13 by Ethan Conner

I wanted to see what a close to true 15C was like so I ponied up for the HP iPhone 15C. I never had a real one to compare it but I'm guessing all the functionality is there.

My 1 real beef and the reason I don't use it more is that the keyboard click is so loud it is annoying. There is no way to turn it down other than turning the whole sound down on the phone but this affects the ringer which I need up due to where I work.

The other complaint I have read is that while it says it contains a manual, it only contains the first half of the manual and ends before the programming section.

My Go-To iPhone calculators are the i41CX+ and Free42 except when I need to graph something and then I use PocketCAS lite.

in response to message #1 by snaggs

I had to make two & a half year "desert island" decisions at the end of '96 for lots of things: a calculator, 10 CDs/tapes, climbing equipment, books. Ended up choosing a CX with the early TDS ROM & full X memory, lots of Grateful Dead and Segovia, Lowe & MSR, Jung & Castaneda.

Almost maxed out the X mem and had to write a program to do one thing that the 48sx version already did, but it wasn't a desert and there were rainy days.

Today; i might take the WP-34 and try to port the D'zign programs onto it. Would need a lot of rainy days though.

Re: 1 calculator : LED or LCD

The 41CX for sure!

Re: 1 calculator : LED or LCD

*Message #6 Posted by **M. Joury** on 24 Aug 2011, 11:26 a.m.,*
in response to message #1 by snaggs

Between the 41C/CV/CX and 34C I would take the 41C/CV/CX. However, why limit oneself? The HP34 is one of my favorite LED calculators. Attractive, compact, powerful. No I/O however (65 or 67 for that if you are looking for an LED calc).

The 34C used to be very easy to find. I don't see them quite as frequently now.

Cheers,

Marwan

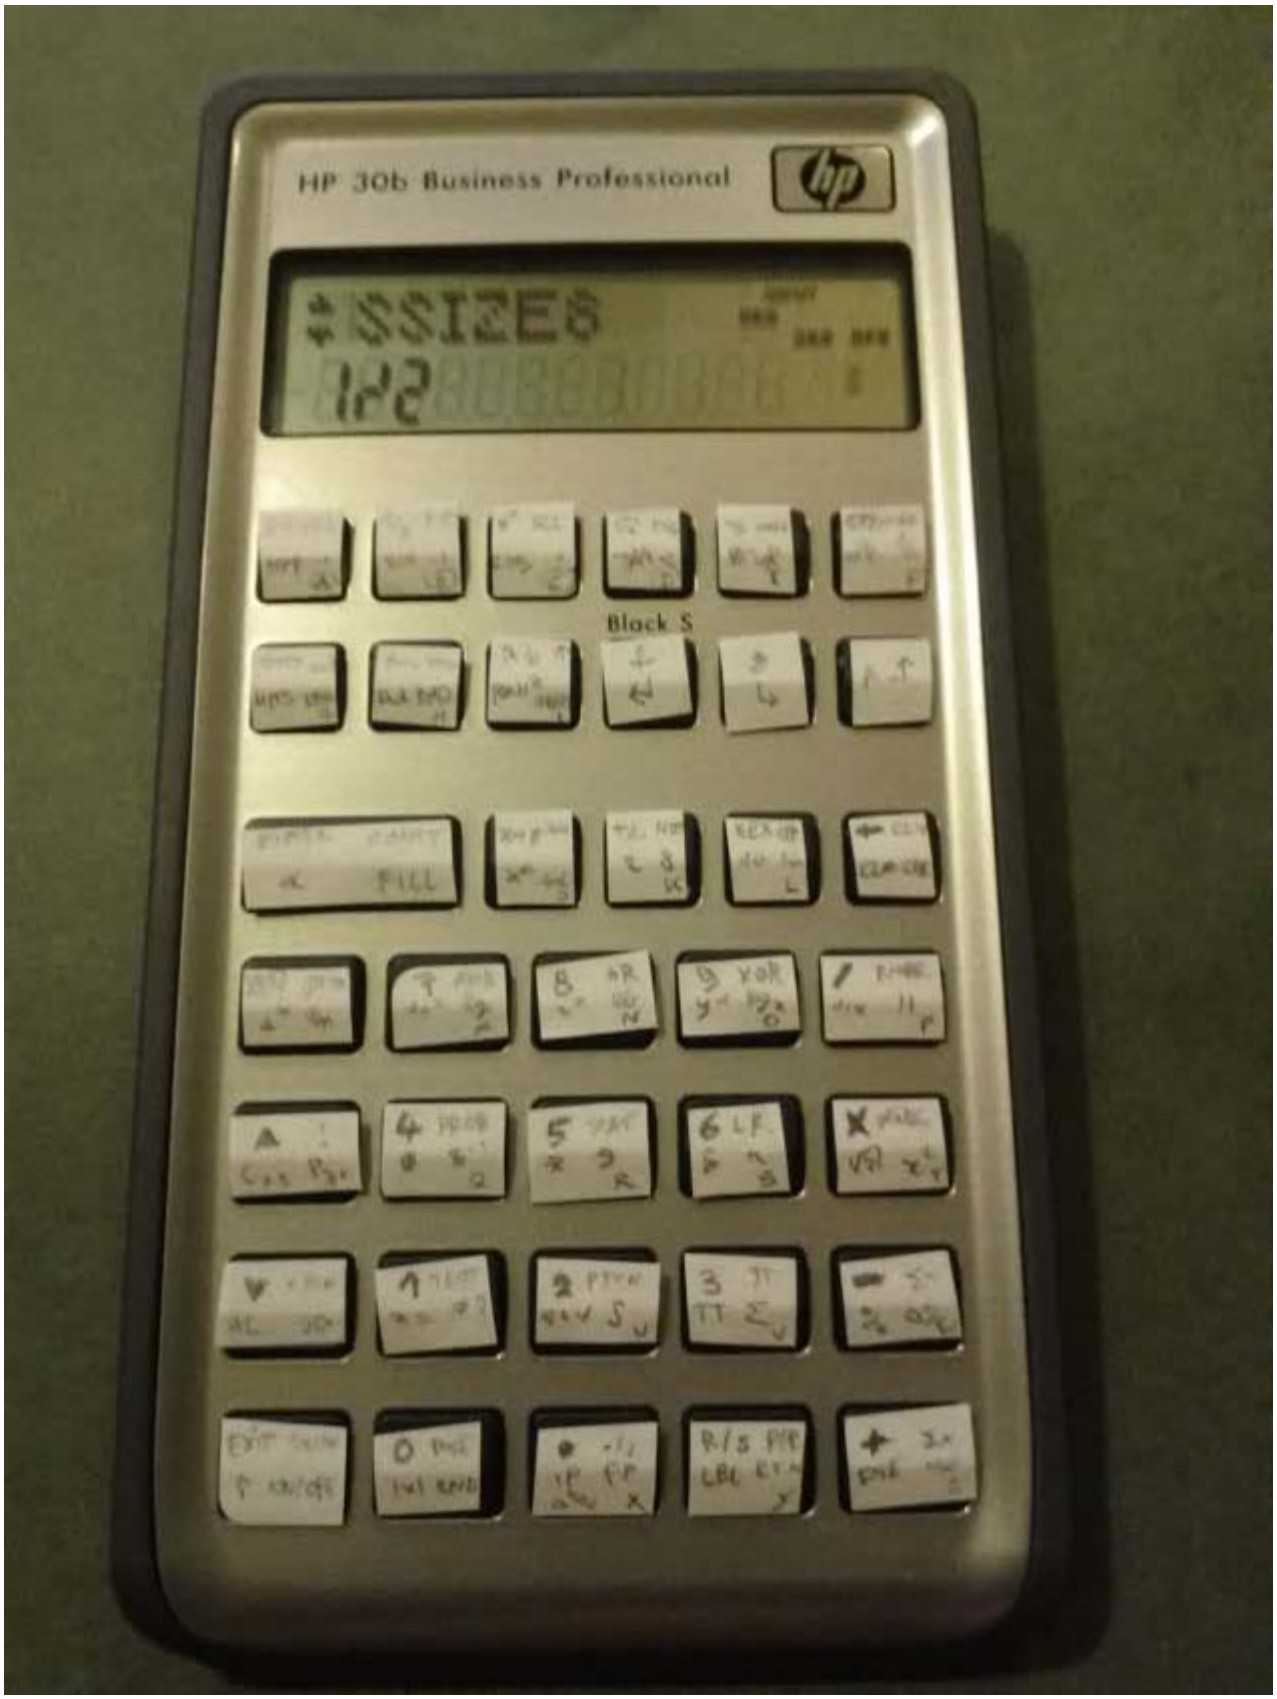
WP34s with custom finish :)

*Message #1 Posted by **Lode** on 23 Aug 2011, 4:08 p.m.*

I managed to flash a WP34s, after having all components (the cable and the calculator of course). It went without problems from the first time. Well, the only problem was finding a Windows machine, since in Wine the port COM1 refused to show up in the Samba v2.9 program, even when linking to /dev/ttyS0 in ~/.wine/dosdevices.



I'll just be honest, the custom key labels I stuck onto it are a pain on the eyes due to being too small and low contrast, but they're easy to remove.

One day I hope to be able to write a multiplatform program that can flash ROMs to this calculator through the serial port, and, to write different ROMs to put on this nice piece of hardware :)

Re: WP34s with custom finish :)

*Message #2 Posted by **Marcus von Cube, Germany** on 23 Aug 2011, 4:25 p.m.,*
in response to message #1 by Lode

Why *different* ROMs? ;-)

It's time for Eric Rechlin to get productive again. WP34S is gaining momentum and his overlays are unsurpassed until now.

Re: WP34s with custom finish :)

Re: WP34s with custom finish :)

*Message #5 Posted by **Walter B** on 23 Aug 2011, 6:22 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Until said overlays will be available, please look here. Just a little adjustment: print width shall be 6**8** mm. Further help is found at the archives :-)

Re: WP34s with custom finish :)

*Message #6 Posted by **Lode** on 23 Aug 2011, 7:07 p.m.,*
in response to message #5 by Walter B

A grey variant could be nice!

Re: WP34s with custom finish :)

*Message #7 Posted by **Walter B** on 24 Aug 2011, 2:34 a.m.,*
in response to message #6 by Lode

Could be. Colours, however, were optimized for a next to black background. And be assured, it looks great on the 30b :-)

Re: WP34s with custom finish :)

*Message #8 Posted by **Eric Rechlin** on 24 Aug 2011, 2:42 a.m.,*
in response to message #2 by Marcus von Cube, Germany

I will make more once I can. I need a new blade for my cutter. I ordered 3 new ones in July and they haven't even shipped yet, so a week ago I ordered 3 more from an Italian seller, but apparently Europeans don't believe in working in August so they aren't going to ship until next week. I seriously hope to have some made in time for the conference but I wouldn't expect them any sooner.

Eric

Re: WP34s with custom finish :)

*Message #9 Posted by **Alexander Oestert** on 24 Aug 2011, 7:14 a.m.,*
in response to message #8 by Eric Rechlin

Hi Eric,

do you keep a list of people interested in your overlays? Where can I put myself on it - for one or two?

Regards, Alexander

(who has the cable but still waits for the 30b to be delivered.)

EDIT: (who just got the calc and is now a happy WP34s owner with a dire need for an overlay!)

Edited: 24 Aug 2011, 12:41 p.m.

41 halfnut character question

*Message #1 Posted by **Eric Smith** on 23 Aug 2011, 5:35 a.m.*

The LCD drivers in the "Halfnut" versions of the HP-41 series added 32 new characters to the displayable character set, though unfortunately HP did not revise the mainframe ROM code to give access to those characters, so they could only be displayed by custom microcode.

The characters were shown in the CHHU Chronicle Volume 2 Number 4 Page 11.

It is obvious what many of the characters, such as the lower case Roman alphabet, are supposed to be. Some are probably intended to be Greek characters, such as:

```
110 lower case pi
111 lower case alpha
112 lower case beta
113 lower case gamma
115 lower case sigma (non-word-final)
117 upper case gamma
11e lower case lambda
13c lower case delta
```

The one that's completely baffling me is code 114 (sixth row, fifth column). Does anyone have a guess as to what that is supposed to represent?

There are suitable Unicode code points for almost all of the 41 characters other than the "hangman" series, although any given font may not include them. For instance, the "alpha append" character (which I usually refer to as "lazy T", is approximated pretty well by Unicode point 22a2, "right tack". Even the left- and right-facing geese are vaguely similar to 2977 (leftwards arrow through less-than) and 2b43 (rightwards arrow through greater-than). Close enough for government work, anyhow.

I'm using DejaVu Sans Mono for a project, and am disappointed that it does not have 2221 "measured angle", which would be suitable for the HP-41 angle character.

I'm not trying to create a font that looks like the HP-41 14-segment display, as Luiz Vieira has already done a great job of that. Rather, I'm trying to put together a monospaced sans-serif font that has representations of the 41's special characters in a style to match a conventional font. I'm struggling through editing a TrueType font with Fontforge, which seems like a good program but I haven't yet mastered it. If anyone here is interested in helping with my little project, please send me email. The fruits of these labors will be demonstrated at the upcoming HHC 2011 conference.

No idea :-(

It kind of fits the "hangman" scheme of the characters following although not very well.

> The one that's completely baffling me is code 114 (sixth row, fifth column). Does anyone have a guess as to what that is supposed to represent?

I am looking at the LCD character table on page 108 of Ken Emery's "MCODE for Beginners" and assume that code 114 represents a lower case delta. This assumption is nurrished by the observation that lower case "a, b, c, d" are just one row above, and "a, b, c" are in-line with lower case alpha, beta and gamma.
However, code 114 resembles more a downwards directed satellite dish than delta :-)
Well, this is only my impression I get when I look at the said table. As long as we don't ask the author of this character set, the interpretation of some signs will remain speculative.
An idea would be to look at the Quick Reference Card for Synthetic Programming. There, all characters are depicted which were ment to be represented by the HP41 (via a printer). So, some characters may be ruled out, others may give an idea for which they stand in the LCD display.

Re: 41 halfnut character question

*Message #4 Posted by **Eric Smith** on 23 Aug 2011, 1:51 p.m.,*
in response to message #3 by Frido Bohn

Using code 114 for lc delta would make sense, but 13c looks far more like a lower-case delta, and it doesn't seem like they were too worried about having codes in order.

The suggestion of looking at the printer character set is a good one. I thought of that just after turning off my computer this morning.

I think my guess of 113 as lower case gamma, which was partially based on order, is probably wrong. Now I think that was supposed to be a lower case tau, since the 82143A also has a lower case tau, but not a lower case gamma.

While the 82143A does have an lc alpha, maybe 111 is intended as an uc delta, despite its diminutive size. But I'm still inclined to think of 111 as an ls alpha, because the 14-seg could do a much better uc delta, e.g., by taking the greater than (13C) and adding the two rightmost segments. I guess that would look like an italic uc delta.

Re: 41 halfnut character question

*Message #5 Posted by **Walter B** on 23 Aug 2011, 2:02 p.m.,*
in response to message #3 by Frido Bohn

Many characters in this set require a lot of phantasy, see e.g. lower case x which could compete as pi as well. And I find no reason why particular characters are featured twice, especially the hangman stuff. But anyway, looking for Greek letters, IMHO there are (may be) Alpha (001), beta (112) and Beta (002), Gamma (117), delta (13C) and Delta (111), epsilon (13B) and Epsilon (005), Zeta (01A), Eta (008), Theta (038), iota (129) and Iota (009), Kappa (00B), lambda (11E), mu (10C) and Mu (00D), nu (136) and Nu (00E), omikron (12F) and Omikron (00F), pi (110), rho (130) and Rho (010), sigma (115) and Sigma (10E), tau (113) and Tau (014), Ypsilon (019), no phi, Chi (018), and neither psi nor omega. Some of them coincide with some Latin letters. FWIW

Re: 41 halfnut character question

*Message #6 Posted by **Eric Smith** on 23 Aug 2011, 2:09 p.m.,*
in response to message #1 by Eric Smith

One of the mysteries of the new halfnut characters is why there are duplications of some between row 10x and row 11x, rather than having even more new characters. I think I've figured that out. Obviously they didn't want to change any of the original characters, so that the existing mainframe ROM code would work unchanged (without supporting the new characters). However, they also wanted to be able to use the new characters with only a minor ROM change, though unfortunately they never actually put that ROM change into a product.

The relevant ROM code is in the last quad (2c00-2fff) at the lable "mask", using the table "asctbl" of special characters at 2c00. asctbl is indexed by the LCD character code minus 0x100, and the contents of each entry are the "41-ASCII" character code to be mapped to that LCD code.

By changing the "mask" code to map ASCII 0x60-0x7f to LCD 0x120-0x13f, they deal with all of the lower case characters, as well as high-t, uc sigma, and lazy-t. That frees up seven slots in asctbl, and those are the same seven positions that are filled with new characters if the specials come from 0x110-0x11f rather than 0x100-0x10f, while the remaining slots in 0x110-0x11f have characters matching 0x100-0x10f so that the nine unchanged entries in asctbl would still work.

I studied the "mask" code back in 1985 when the CHHU article showing the halfnut character set appeared, and back then I thought I'd come up with a patch that would enable all of the new characters while fitting entirely in the original space occupied by the mask routine. However, either I was mistaken or I was more clever back then, because now I can't find a way to do it that doesn't require using up a little bit of ROM patch space elsewhere. There's a little bit of patch space left near the end of ROM 2 (even in the 41CX) that could be used for this purpose.

It's a shame that there's no easy way to use Monte's NEWT processor (41CL upgrade) in a halfnut, as that would allow the mainframe ROM to be patched to support the new characters.

9810a display question

*Message #1 Posted by **David Ramsey** on 22 Aug 2011, 7:12 p.m.*

So, if I put this second-generation 9810a display board in a known good 9810 and see this at power on:

...it seems reasonable to assume that it's a driver problem rather than a miraculous co-incidental failure of the same LED segments in each row, right?

That being the case, what components would I replace? It would be nice if it was that big vertical row of large transistors, 'cause that looks as if it would be easy.

Re: 9810a display question

*Message #2 Posted by **Tony Duell** on 23 Aug 2011, 4:30 a.m.,*
in response to message #1 by David Ramsey

It might be those transistors, it might be an IC. The good news is that it's unlikely to be the displays themselves, and that the ICs are not hard to get.

Download 'my' HP9810 scheamtic and look at pages 60 and 61. The latter shows the anode (segment) drivers for the displays. Now, in the X register you're missing segments c,d,e (at least). Those all come from sections of U16 (page 61 of the diagrams), so that IC could be faulty (FWIW, I've had these ICs where all sections have failed at once). Use a 'scope or a logic probe to see if the outputs are changing state. If not, change U16, if they are, check the associated transistors (you'll have to trace the tracks to find them). Basically, for each missing segment, check the output of the associated 7403 gate, if that's not toggling, change that 7403, if it is, test the transistor.

I notice you're missing the d segment (the bottom one) from all displays. This might just mean all the drivers have failed, it might also mean they're getting no input. Look at page 60 of the schematics, you'll see that the segment drive lines are buffered (bottom right corner of the page). See if the output of U17b is changing state. If not, change it.

Need technical specs for HP 17b calculator display

*Message #1 Posted by **Ken H** on 22 Aug 2011, 6:43 p.m.*

I dropped my 17b (original version from 1988)and part of the display "leaked" and is now all black all of the time. It should be a pretty easy fix if I can find the correct replacement lcd. Anyone have a part number or detailed spec or source for this original? Also, any tricks or suggestions about how to open the case would be appreciated. Thanks!

Edited: 22 Aug 2011, 6:51 p.m.

Re: Need technical specs for HP 17b calculator display

*Message #2 Posted by **Jeff O.** on 22 Aug 2011, 8:08 p.m.,*
in response to message #1 by Ken H

See this article and this one by Paul Brogger for some tips and tricks to open and work on pioneers.

Regarding a source for the display, my guess is most will say the only source is another 17b, or 17bii, or 42s, or 27s...

The display of the current version of the 17bii+ looks the same, no telling if the display would be compatible.

Good luck!

Edited: 22 Aug 2011, 8:09 p.m.

*Message #3 Posted by **Ken H** on 22 Aug 2011, 11:05 p.m.,*
in response to message #2 by Jeff O.

Thanks for the link to the article. It's got great info on disassembly. I had assumed there were press lock latches which could be pried apart. Didn't realize drilling would be required. Think I'll go with a replacement instead of repairing this one.

Re: Need technical specs for HP 17b calculator display

*Message #4 Posted by **allen** on 22 Aug 2011, 10:36 p.m.,*
in response to message #1 by Ken H

Unless you just want to learn how, I suggest saving yourself the repair time and trouble and buying a used 17b online. You'd have to buy one for a donor screen anyway.

The prices for non-RPN models has come down by 30% compared with a few years ago.

Re: Need technical specs for HP 17b calculator display

RM mode and its effects on RRM determinant of AM1 matrix

*Message #1 Posted by **Gene wright** on 22 Aug 2011, 5:55 p.m.*

```
RM Mode       Determinant
-------   --------------------
  0       0.99999 711935 38228
  1       0.99999 720675 30552
  2       0.99999 709507 09280
  3       1.00000 009178 43880
  4       0.99999 711925 74617
  5       1.00000 895891 46320
  6       0.99999 718613 18536
```

Looks like RM 3 is closest to 1. Fairly significantly closer, it appears.

Re: RM mode and its effects on RRM determinant of AM1 matrix

*Message #2 Posted by **Paul Dale** on 22 Aug 2011, 6:16 p.m.,*
in response to message #1 by Gene wright

RM 3 is round half up. It being closer is most likely a fluke.

This does show that the algorithm isn't overly sensitive to rounding mode which is goodness.

Alpha prompts in the WP34S

*Message #1 Posted by **Namir** on 22 Aug 2011, 5:47 p.m.*

Hi All,

I decided to spend my spare time on the beach playing with the WP34S emulator to get the hang of the machine.

How does one build prompting messages (to be displayed by the PROMPT command) which also include the question mark. How do you display a result (like Root=1.94983) that concatenates the text "Root=" with the contents of the stack or a memory register.

I know it is supposed to be similar to the HP-41C. Your assistance is appreciated. A short example will go a long way!

Namir

Edited: 22 Aug 2011, 5:48 p.m.

Re: Alpha prompts in the WP34S

*Message #2 Posted by **Paul Dale** on 22 Aug 2011, 6:13 p.m.,*
in response to message #1 by Namir

The question mark is on h-shift Q (h-shift 4). This is a fairly recent change.

To get a number into alpha properly formatted use [alpha]RC#

- Pauli

Re: Alpha prompts in the WP34S

Display of Complex Numbers on wp34s

*Message #1 Posted by **Jeff O.** on 22 Aug 2011, 2:50 p.m.*

My biggest wish for wp34s is that it handled and displayed complex numbers more like the 42s and 35s. I think I understand why that was not practical, or at least did not seem practical at the beginning of development. And the way wp34s handles complex numbers is probably as good as can be without adopting a paradigm similar to the 42s/35s. I also understand that Walter and perhaps others on the team felt that the dot-matrix part of the display was not suitable for "full-time" numerical display and better used for status, annunciators and messages. But for some reason I recently wondered how it would look to use the dot-matrix area to display the imaginary part or angle of a complex number. Not sure if it is new, but I was recently made aware of the aRC# (using small "a" for alpha) command and it occurred to me that I could use it to simulate imaginary or angle display. So I wrote two small programs, as follows:

```
Command      Comment
LBL 16       so I can press XEQ CPX for this one. Depending on your version you might have to
press XEQ 16
CLa
ai
aRC# Y
PROMPT
RTN

Command      Comment
LBL 41       so I can press XEQ XEQ for this one. Depending on your version you might have to
press XEQ 41
CLa
a∠           that is the first symbol (looks like the 42s angle symbol) on the h-test menu in
alpha mode
aRC# Y
PROMPT
RTN
```

Key in the above programs, I'll wait….

Set your calculator to FIX 4. Press 4 ENTER, 3, XEQ CPX. The dot matrix area should be displaying "i4.0000", and I think it looks pretty good. Now press g ->P, then XEQ XEQ. Now the dot-matrix area should be displaying "∠53.1301", and again, I think it looks pretty good. I realize that I would be free to use the above at my leisure to display rectangular complex and/or polar complex values as I desire. But, it got me thinking, maybe a little of this display methodology could be built into the 34s. Not some sort of complex display mode that would always display as such, just a couple little things as follows:

1. Create two new internal commands that would temporarily display the Y register as the imaginary component or angle. By temporary I mean the same as the SHOW command, active only until some other key is pressed. Call one RDISP, one PDISP for rectangular display and polar display, respectively
2. Upon execution of the ->REC command, temporarily put in RDISP mode, so you can see both the real and imaginary components you just created without doing an exchange.
3. Upon execution of the ->POL command, temporarily put in PDISP mode, so you can see both the magnitude and angle you just created without doing an exchange.
4. Upon execution of ANY Complex command, temporarily put in RDISP mode so you can see your complex result without doing an exchange.
5. Upon pressing CPX, put in RDISP mode (instead of displaying the small "C" annunciator) to both indicate

that you are about to treat the x and y registers as a complex rectangular value, (i.e. execute a function on a complex argument) and let you see both values you are about to use.

The programs work in other display modes besides FIX 4 of course, I just specified FIX 4 for my example because it looks good. In other display modes, the dot-matrix area might be forced to use the small font. It still looks fine to me, but looked best in large font. If my suggested RDISP and PDISP commands are adopted, perhaps they could always truncate the Y value so it could be displayed in the large font. That brings me to one last question, I noticed that the small font version of the ∠ symbol looks like a “less than” symbol, i.e. “<”. Any reason it could not simply be the left three columns of the large font symbol, i.e. in ASCII art:

```
  *
 *
***
```

Or maybe the right three columns:

```
  *
 *
*
***
```

I realize that as usual, it is easy for me to suggest things and there may be many reasons why the above cannot or will not be implemented by the developers, from technical coding reasons to not liking the ideas even if they are feasible. But I would be interested in hearing comments on the ideas, positive, negative or in between.

Best regards

Jeff

.

Re: Display of Complex Numbers on wp34s

*Message #2 Posted by **Lode** on 22 Aug 2011, 5:06 p.m.,*
in response to message #1 by Jeff O.

I think a complex number should be displayed like this:

1.234E499i1.23 499

Where the E symbol is made out of the 7-segment display, the i is one short vertical stripe of the 7-segment display, and the exponent of the imaginary part uses the 3 small digits while the exponent of the real part uses the E notation.

For polar notation, the i would become a short L.

For those into electronics where j is often used instead of i, it could also be a mirrored L symbol instead, like a J (again short, taking only half a 7-segment digit, so that you spot the non number symbol easily).

If the imaginary part is 0, it automatically doesn't add the i etc... to the number.

The way the WP34s handles complex numbers was a big disappointment to me. The 35s has it almost perfect, with its dedicated i key, except they screwed it up totally by not allowing the sqrt, sin-1, sinh, log10, etc... functions to use it.

A calculator which uses a i key, i notation, and supports all operations on complex numbers as if they're native values, would be perfect for me. And when in deg mode, it should do the conversion from deg to rad even for complex numbers for the trig functions (and only the trig functions).

I'm not sure if I would like the way your display suggestion would look, but that is just a matter of taste. I believe the bigger problem with it is that it would require major changes to wp34s. The way wp34s "holds" and operates on complex numbers is pretty well set in stone, I think. I'm just trying to add a few tweaks to make it a little easier (on me, at least, don't know about others.)

I am a big proponent of the "i" key and full operating support for complex values. Maybe we can get closer to our ideal on the "next" project. Or, wp34s is open source and we are free to make any changes we like.

*Message #4 Posted by **Walter B** on 22 Aug 2011, 6:46 p.m.,*
in response to message #3 by Jeff O.

WP 34S *is* open source, so you can change what you like, but will be responsible for your changes as well [:-)

We (Pauli and me) had discussed the complex display a year ago IIRC, and we came to the result Pauli explained below. YMMV

Source code generally looks like greek to me, so I'll stick with your product. Learning C might be possible, I learned _gasp_ *Fortran* once. But the rest of the development chain looks like a tall, tall mountain to climb. Maybe when I retire I can learn the requisite skills, although I am not sure I would live long enough unless I retire pretty darn soon.

in response to message #6 by Walter B

Knowledge of Fortran will put you in good stead. I haven't played too many tricks or used the weird features of C all that much. There are a few pointers but not many e.g.

The numeric code should read easily to anyone familiar with a programming language. This won't necessarily make it obvious why I've done what I did of course.

in response to message #8 by Lode

You are not the first person to change their impression of the 34S's complex support after using the device :-)

At least the 34S has a very complete suite of complex functions unlike several of its predecessors.

in response to message #9 by Paul Dale

I do have one more trouble with the complex numbers in fact, and that's that you have to enter the imaginary part first and then the real part. That's extremely confusing and annoying! Every notation of complex numbers uses real part first, then imaginary part!

I guess this was done to have the real part in the X stack and imaginary part in the Y stack, but it's still backwards to enter them in the wrong order to me. On the HP 42s you also enter the real part first.

Maybe it could be an option what order is taken, in the modes?

Exactly what I was going to suggest and exactly what I do when I need to test the complex functions :-)

Not that I'd recommend it, but you could relabel 'x<>y' with 'i' and your initial desire for this key will be satisfied as well ;-)

Re: Display of Complex Numbers on wp34s

*Message #13 Posted by **Jeff O.** on 24 Aug 2011, 9:30 p.m.,*
in response to message #10 by Lode

If there is an "i" key as on the 35s, or a "complexify"* operation as on the 42s and 15C, then I agree with you that it is preferable to key in real then imaginary. But if the components must occupy separate stack levels, then I prefer the 34s approach.

* - I do not claim that "complexify" is a real word. However, I find it nicely descriptive of pressing f - I on the 15C or shift - COMPLEX on the 42s to shove the value in stack X into the imaginary "slot" and drop the value in stack Y into the real slot, thus creating a complex number.

> My biggest wish for wp34s is that it handled and displayed complex numbers more like the 42s and 35s. I think I understand why that was not practical, or at least did not seem practical at the beginning of development.

There are two reasons we didn't do better complex support:

- The display problems. We couldn't honour the user's display settings on the top line. We couldn't even get close for many mode settings.

- No type identification in registers. We don't and cannot know if what is in the stack is complex or not. The 42s and 35s do know this.

Pauli

*Message #15 Posted by **Jeff O.** on 22 Aug 2011, 7:45 p.m.,*
in response to message #14 by Paul Dale

It was not my intention to complain about your complex number support, just throwing out ideas. I was aware of the second point above. Regarding the first point, I guess I was "seduced" by the good looking results I got with my initial simple trials. My simplistic idea would be to not honor the display settings in the top line, it looks like FIX 2 would allow 3 digits for any number with any 3 digit negative exponent. But then it is not so simple to implement, as I would guess that you would have to do a lot of finagling with the number to get the best fit. Perhaps too much trouble for "temporary" displays of the imaginary part/angle.

> I noticed that the small font version of the ∠ symbol looks like a “less than” symbol, i.e. “<”.

:-) The large font version of the "<" symbol shall be a "less than" symbol as well. Look at TEST in alpha mode (e.g. on page 68). I didn't include an angle symbol like featured by the 42S for obvious reasons.

Results of new root-seeking methods

*Message #1 Posted by **Namir** on 22 Aug 2011, 12:08 p.m.*

Hi All,

Fellow forum members Hugh Steer and Lyuka have opened an interesting door. Hugh mentioned the Ostrowski algorithm for finding nonlinear function roots. I went on a little online crusade to find more on the Ostrowski algorithm. I found several improvements (some just a few years old) on Newton's method and Ostrowski's methods, and a few improvements on Halley's methods. I came out with about 30 algorithms/variants starting with Newton, Halley, Ostrowski, and so on. I included the version of Ostrowski algorithm that Luyka mentioned in his web site.

I tested all these methods with many nonlinear functions. The results???

1. The simple Ostrowski algorithm ranked the best in the battery fo tests. Its simplicity (compared to the sophisticated enhancements given by various mathematicians) kept the number of function calls and iterations low.

2. The Ostrowski 4th Order (by Grau and Diaz-Barrero) was ranked second best.

3. The Ostrowski algorithm as implemented on Lyuka's web site came third. A special mention to the way the Ostrowski algorithm is implemented since it had only one function call per iteration!!! Very clever!!

Here is the basic scheme used by the simple Ostrowski algorithm:

```
y = x - f(x) / f'(x)
x = y - f(y)(x - y) / (f(x) - 2 f(y))
```

Here is the basic scheme used by he Ostrowski 4th Order (by Grau and Diaz-Barrero):

```
y = x - f(x) / f'(x)
u = (x - y) / (f(x) - 2 f(y))
z = y -  f(y)
x = z - u * f(z)
```

Check Lyuka's web site algorithm version and implementation here

Re: Results of new root-seeking methods

*Message #2 Posted by **Marcus von Cube, Germany** on 22 Aug 2011, 12:42 p.m.,*
in response to message #1 by Namir

I would rank the methods based on different criteria:

1. How many function evaluations are necessary for a given accuracy? The reasoning behind this is that the evaluation of f is more expensive than the operations that the algorithm does with the values. If algorithm (a) uses twice as many function evaluations as algorithm (b) it's ranked better only if the number of iterations is less then half of that of algorithm (b).

2. How stable is the algorithm for some nasty functions or with bad initial guesses? Is it able to solve more problems then some other algorithm? E. g. Newton will fail if started at or near an extremum.

Re: Results of new root-seeking methods

*Message #3 Posted by **Namir** on 22 Aug 2011, 2:30 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Marcus,

I have ranked the various algorithms based on the number of function calls. Some of the sophisticated enhancements on Newton or Ostrowski require 4 or 5 function calls!! Several of these methods will give a refined root value (within the specified accuracy) in two or three iterations.

As far as stability, again some of the sophisticated enhancements become unstable depending on the combination of test function and the initial values.

Re: Results of new root-seeking methods

*Message #4 Posted by **C.Ret** on 22 Aug 2011, 3:28 p.m.,*
in response to message #1 by Namir

Thank you Namir for pointing me out this stable and fast root-finding method. I ‘m now using it instead of a more classic but slow search by dichotomy algorithm.

The code for HP-42S (ref. *OST ‐ Rev 2.8: Mar. 22 2011 ‐ Copyright(c) 1998-2011 Takayuki HOSODA, All rights reserved.*) is great as it returns root, value,status and give the oportuniti to select with register to solve for. But, it is a bit too much sophisticate for my own application; Such I compose a personal version which is much less sophisticated. In counterpart, usage is simplest and number of lines is reduced to 70 only. But there no more ‘status flag’, and the user have to always start with two guess. Then the code is finding a root, run forever or die.

Before a search can start, the two registers R04 and R05 have to be initialized respectively with expected accuracy *eps* (i.e. 1E-6 is a good enough) and the name of the function (i.e. “FCT1” as following exemple).

The function have to be programmed in the calculator as taking its only argument from the stack *x* register and return the value of the function at this point into the same *x* stack-register. The function code may use other stack registers (convenient for complicated function lucubrations) as the code always consider that at each call of the function, all content of the stack as well as LastX are lost, except the *x* register returning *f(x)*.

```
-- - PROGRAM  -            ----- STACK REGISTER -----
-- ------------            t:    z:      y:      x:
01 LBL"FCT1                                   x
02 E^X                                        exp(x)
03 LastX                        ~       exp(x)  x
04 x^2                                  exp(x)  x^2
05 3                    ~       exp(x)  x^2     3
06 *                    ~       ~       exp(x)  3.x^2
07 -                    ~       ~       ~       exp(x)-3.x^2
08 RTN                  ~       ~       ~       f(x)
-- ---------------
```

Registers to be initialized :

R04: eps
R05: "F"

Used Registers :
R00: i evaluations/iteration counter
R01: x_n R06: $y_n = f(x_n)$
R02: x_{n+1} R07: $y_{n+1} = f(x_{n+1})$

R03: x_{n+2} R08: $y_{n+2} = f(x_{n+2})$
R04: *eps* expected accuracy
R05: "FCT1" name of function program/code
R09: -t last value of t used for computing next x_n+3 position.

```

```

Structure of program:

Instruction 01 to 17 :
- initialize search; input and store x_0 and x_1,
- compute $y_0=f(x_0)$, $y_1=f(x_1)$, as well as first intermediate point $x_2=(x_0+x_1)/2$ and $y_2=f(x_2)$.
- Initialized iteration counter (R00).

Instructions 18 to 67 :
- Main loop composed by two tasks , both combine in one code:
compute next point x_{n+3} *from [italic]t*
and translate registers so that value of $x_{n-…}$*and [italic]*$y_{n-...}$ are at the correct registers for next iteration.
- Program loops until $|f(x_n)|$ is small enough, i.e. less than expected accuracy *eps*
- During root-search, the calculator display iteration number *i* and best root estimate $x_n)|$ so that user can observe progress.

Instructions 68 to 70:
- recall best root estimate in stack register *x* and end program.

HP Touchpad Fire Sale

*Message #1 Posted by **Namir** on 21 Aug 2011, 10:18 p.m.*

A friend in Europe asked me to buy the discounted HP Touchpad. Since I was on vacation at the beaches of North Carolina (far from major retail electronics stores) I asked my son who lives in the Phoenix area to do the shopping. He went today Sunday morning to several electronics retail stores and discovered that all the discounted HP Touchpad were sold. When he called me to tell me, I rushed to my computer to order online. While online I saw the web page updated to say SOLD OUT!

I chatted with my son about what happened. We both felt that HP should have sold the Touchpad at the reduced prices to gain a foothold in Apple's territory. Rather, HP felt they could charge more money for their tablets.

I feel that HP made two mistakes. Overpricing their Touchpad and then dumping it. The speed in which their product sold tells me that their initial pricing was wrong and their impatience was even more wrong!

Namir

Unfortunately this is probably more true than not.

Re: HP Touchpad Fire Sale

*Message #6 Posted by **Namir** on 22 Aug 2011, 11:02 a.m.,*
in response to message #4 by John B. Smitherman

I agree with Marwan. The truth is HP executives should lament at the major faux pas they did. Just because Apple was top dog in the tablet business does not mean they will always be. There is always a plan to change that. Think of the how Lotus 123 dethroned Visicalc and then how Excel did the same to Lotus 123. If the executives of the companies behind these products had the HP executives attitudes, we'd still be using Visicalc (version 12.5???) today!!

*Message #8 Posted by **Bruce Bergman** on 21 Aug 2011, 11:35 p.m.,*
in response to message #7 by John B. Smitherman

Yeah, I've been watching it since Friday night, when the announced the fire sale. Saturday at noon there were reports that 1.5 million units were sold. Best Buy was going to return their inventory (270,000 units), but last night they decided to sell them all, and most are now gone.

This morning, they were saying as many at 4 million units were sold. Crazy.

thanks, bruce

That should make their personal systems group more attractive to a buyer.

Re: HP Touchpad Fire Sale

*Message #10 Posted by **M. Joury** on 22 Aug 2011, 1:10 a.m.,*
in response to message #1 by Namir

I know. I have been trying to grab one since Saturday morning. I tried Best Buy first thing this morning after their change of mind in what to do with their units and they were sold out before the store even opened!

Several stores still have not reduced their prices and MacMall did so late today/tonight. I managed to grab 2 (*MAYBE* won't actually believe it until I see them on my doorstep) but had to call. Their web site was a total disaster, could not handle the load and kept timing out. I was on the phone for 75 minutes but after that the order went through really quickly and I even received a confirmation email.

According to those stores that post inventories there are probably over 50,000 units still out there (minimum at a guess--if that makes any sense) waiting for stores to follow the trend and drop their prices.

There have been several interesting articles on how this will effect tablet prices down the road. It is obvious from this that people really do want the things but are not willing to buy in at $500+. Anyway, lots of comments in the press about the future.

I myself would probably have just let the whole thing pass except that my wife just got a Palm Pixi Plus and I was *VERY* impressed with the simplicity and the apparent stability of the OS compared to the Android units I have played with. When the Touchpad came down to 99/149 my thought was: "wouldn't a Pixi with a large screen be great" and I went hunting.

I have to say that I am really disappointed in the way this was handled and I feel that WebOS is too good a system to just get thrown away. here's hoping that it is resurrected by some other party. Of course, if it does not get resurrected, this won't be the first time that the better technology loses out--anyone remember the old Shark 2.5", 250MB removable drive? Way better than anything Iomega had back then but it lost out.

Cheers,

-Marwan

in response to message #1 by Namir

I think it's unfortunate how they have handled the whole thing.

I don't think the Touchpad was overprized. Apple reportedly sells the iPad with a tight margin, and one just needs to look at the prices of the competitors.

So, what's wrong? Probably they should have kept up development and waited for one year more before releasing a product. They should have released a great product, but seems they released something immature.

Unfortunately, nowadays executives think short-term instead of adopting a long term strategic approach.

Sad, because WebOS had the potential to bring some real competition to the market.

I use Mac OS X (Unix user 30 years ago), and really find Apple products outstanding. But of course I don't like the current situation, with a leader and lame competitors behind.

With WebOS I truly thought that a bit of the old HP could come to life again. Pity I was wrong.

One thing HP could have done, long before trying to see if the market will like a tablet w/o apps (duh!), is sell the TouchPad at these prices to developers (or give them away for free).

10,000 devices would have produced 50,000 apps, some very swiftly, and, voila, there would have been apps! (A very small investment to get apps, if you're 2 years late in the game!)

I signed up as developer and intended to port my RPL calc to the TouchPad. With a user base of 4 mio users, I might still do this now... Waiting for discounts to become active in Europe. (Here they still want your 400 euros, in another apparent misunderstanding about the relative value of USD vs. EUR.)

For a small developer (and most are; if you look at the average income of iOS apps) the price you pay for the HW makes a difference whether you will develop on that platform, or not.

*Message #21 Posted by **M. Joury** on 22 Aug 2011, 5:59 p.m.,*
in response to message #15 by NateB

I suspect that retailers are going to be royally *PISSED* with HP. This has caused a real problem for them with web sites crashing and phone lines swamped. Insight closed down shop 5 or so hours early today (after 3:00 PM their phone system was reporting that they were closed for the day--they are supposed to be open 8-8).

Interestingly you can't tell if they (Insight) have any units left or not. Earlier in the day they were reporting nearly 7K units and then shortly after they shut down their phone lines the listing(s) dropped off their page *EXCEPT* if you had saved a link to the actual item page. In that case you can still get to the page and

order (at full price) and stock is still high although it shows that it is going down slowly. I would love to know what is going on.

Anyway, I would bet that there are a lot of really angry retailers out there. This was as badly thought out as it could possibly have been. Unless... This is some sort of super clever trick to really boost sales of the Touchpad and kill sales of competing units for at least a short period of time. People did not want to pay $500 for a tablet before this happened... Now even fewer will cough up the bucks as a number of Touchpad stories on the web are suggesting that this will force other manufacturers to reassess what their units are really worth.

Cheers,

Marwan.

Re: HP Touchpad Fire Sale

*Message #22 Posted by **Bruce Bergman** on 22 Aug 2011, 10:20 p.m.,*
in response to message #21 by M. Joury

Yeah, I'm seeing the same thing... *chuckle*

MacMall, who is also OnSale.com and PCMall, also crashed multiple times. Plus, their inventory system freaked out and incorrectly showed amounts. So many were dead that MacMall said they were going to cancel ALL orders. The interwebs were royally pissed off at MacMall all day today, and they were vocal about it, completely trashing the vendor in their reputation forums.

The Insight.com thing you mentioned was also a case where their inventory couldn't keep up. No matter how many units were sold, they still showed 7,000 in inventory. They WAY oversold the unit.

Staples almost completely went off the intermap yesterday with that insane $49 price tag, but I imagine they got rid of every unit.

Amazon ran two Lightening Sales today. One last 20 minutes, the other one was apparently only FOUR minutes long before it sold out.

Newegg.com refused to match the HP price drop at all, which incensed a bunch of the interwebs, who promptly launched a DDoS attack and brought down their site. Now Newegg is at odds with every other vendor out there, flatly refusing to honor the price drop.

Walmart says you have to SHOW them an ad with the reduced price (stupid).

it's crazy out there. Slickdeals.com has been the only reputable source of truth about where to get them, and there are more than 9,000 posts on their forums about this topic.

Again, crazy.

:-)

Re: HP Touchpad Fire Sale

*Message #23 Posted by **M. Joury** on 22 Aug 2011, 10:59 p.m.,*
in response to message #22 by Bruce Bergman

I talked to Insight reps twice today and on both occasions I was told that they were still awaiting a

decision from on high on pricing. So it sounds like they were out of sync at all levels.

B&N way oversold as well and was getting trashed last I saw. People saying that they kept the item up so as to gather personal info for their Nook marketing effort. Who knows if it's true but does not look good for them.

Best Buy did a reverse face and maybe reversed again with some stores saying that most of their units are going to be returned to HP. And HP says that they are *TEMPORARILY* out of stock. So maybe still some out there to be had.

People buying multiple items now have dozens on eBay for a $150 profit.

The whole thing was badly handled at all levels and will leave a sour taste in people mouths for some time to come I fear.

> Quote:
>
> HP should have sold the Touchpad at the reduced prices to gain a foothold in Apple's territory.

I fully agree with you and I was surprised by the way HP managed this Touchpad launch. One of the reason for the success of the iPad, besides ease of use, is the high number of application available for this platform. If you want to come into the tablet game as a challenger, you must address this issue first. Having a good hardware and OS is not enough to gain success (see Next, BeOS). There is no need to have a MBA from Harvard to figure this out and I don't understand how could HP overlook this...

... or could it be that all this was just a clever marketing buzz, created in purpose in order to get everyone's attention and to develop a solid WebOs user base ? (just dreaming ...)

What's this HP leather case for?

*Message #1 Posted by **Peter Murphy (Livermore)** on 21 Aug 2011, 9:01 p.m.*

I found a heavy black leather HP case in a thrift shop. It holds a 42S in its slipcase quite nicely, but it was probably not intended for that.

Flip-over top with a push-though snap closure; about 6.5 in. high and 4 in. wide. Two 4-in. long belt-loop slots on the back. (That's about 16 cm x 10 cm.)

Does anyone know what it was for?

Re: What's this HP leather case for?

*Message #2 Posted by **aj04062** on 21 Aug 2011, 9:36 p.m.,*
in response to message #1 by Peter Murphy (Livermore)

I have a leather slip case for my 42S

Re: What's this HP leather case for?

*Message #6 Posted by **Peter Murphy (Livermore)** on 21 Aug 2011, 10:44 p.m.,*
in response to message #5 by Michael de Estrada

It's much heavier than the one in the linked auction; the leather's about 1/8 in. (2.5 mm) thick, and not very flexible.

Case for an instrument sounds like the right direction.

Does that make this OT?

Thanks for the input.

Questions to the HP calculator group/community about HP 40gs/50g successor

*Message #1 Posted by **bluesun08** on 21 Aug 2011, 4:37 p.m.*

Hello,

i‘m a mathematic-teacher on an german high-school (called „Gymnasium“). In the next year the ministries of education will introduce CAS calculators in the high-schools and the examinations could be written with such a calculator. Every school could select his own CAS calculator for his students.

I‘m a HP-User for a couple of years (40gs /50g) and wish the employment of the HP 40gs because of the (subjective) easier userinterface in comparison with the 50g. Although i‘m the responsible person for calculators in our school, i have no chance to introduce HP calculators because of the lack of a built-in dynamic-geometry application and a spreadsheet application. These applications are obligatory. By the way: This is also the reason why Colin Croft turn away from 40gs, see (13.01.10): [url:http://www.hphomeview.com/what's_new.htm]

So i have a few questions for the HP calculator group respectively the HP community:

1. Is there a successor/improvement of the 40gs (respectively 50g) in the pipeline, which contain (built-in) geometry and spreadsheet. If yes, would this released before PSG spin-off?

2. If no, why HP focus in the past new products in the business/office lines (sometimes relaunches) instead of making innovations in the „high end“ CAS/graphical line (geometry, spreadsheet, integration of CAS in all applications, increasing of the display resolution, colored display)? In my opinion the concentration on the „high end“ product line could be the best promotion for future customers. What a pity ...

Best regards

Alexander

*Message #4 Posted by **Calum Tait** on 21 Aug 2011, 8:19 p.m.,*
in response to message #1 by bluesun08

Your question is quite interesting to me as I haven't been in a school since I left high school some 24 years ago. I am surprised that such calculator features should be deemed desirable let alone a mandatory requirement - in my day, if calculators had such capability, they would have been banned from the mathematics class lest we "cheat". Teachers used blackboards for practical demonstration and we used to plot graphs on squared paper and used very wide ruled paper spreadsheets for statistical recording. I think we learned mathematics quite well without the need for electronic devices. That's nostalgia for you when you feel wistful for graph paper!

Re: Questions to the HP calculator group/community about HP 40gs/50g successor

*Message #5 Posted by **bluesun08** on 22 Aug 2011, 3:06 p.m.,*
in response to message #4 by Calum Tait

Hello Calum Tait,

to me it's interesting, that you think that teaching mathematic is nowadays the same as that from 24 years ago.

For students it's very fascinating to find out geometric relations independently. And it is very awesame to change a figure dynamicly. Also it's very interesting to deal with real problems, for which exists no standard derivation or antiderivate. All this things make the classes more attractive.

Sure, to learn mathematic you don't need a calculator or even a graphical calculator. A few people say a "slide rule" will do it. Also sine & cosine tables will do it.

But is this seasonably? We are in 2011 ...

Alexander

I wouldn't call such tools high end but rather educational. They might be useful at school where it seems not practical to use notebooks, but that's about it. Many years ago, HP gave up on this market by *not* producing the Xpander.

in response to message #1 by bluesun08

Alexander, the rules seem to be written around the offerings of TI (Nspire or Voyage 200/TI 98) and Casio (Classpad or Algebra FX. The new Prizm machines lack the CAS).

From an integration standpoint, the Casios are horrible, just a bunch of unrelated applications. The TIs do much better. As a calculator, I would prefer the Voyage 200 because of the larger screen, the querty keyboard and the well integrated CAS. Cabri Geometry is an add on which comes for free. As an education tool, the Nspire stands out once you get used to it. Its integration is almost perfect but every day usage as a tool is limited by the document concept.

You already know the 40gs and the 50g. The CAS is very well integrated in the 50 and kind of rucksack in the 40gs. The limited screen resolution limits the amount of fun you (and your students) will have with both devices. The feature set of the 50g may be just too much for a math class.

As a teacher I would vote for the NSpire together with its PC counterpart. As a user, the 50G or Voyage 200 would be preferable because they can be easier used instantly as a calculator.

Hello Alexander,

> Quote:
>
> When the things exists, why HP do not integrate the geometry and the spreadshet in his calculators?

This is a good question. Ask the HP and Mr. Parisse. And why the HP do nothing with his scientific calculators recently? The next quote is from Bernard Parisse's foreword from this pdf:

http://www-fourier.ujf-grenoble.fr/~parisse/degraeve/cas49_1.pdf

```
"Sometimes, I am asked this question: why put symbolic manipulation capabilities
into a
calculator, while specialized computer software for this is now either cheap, or
available for free?
In my opinion, a calculator is the most effective way to integrate calculation
aids with the
teaching of mathematics, because it is both easy to carry out with you and to use
in a classroom."
```

George

As a father of four children who go to German Gymnasium I would vote not to use any of these CAS calculators, because they are quite expensive to purchase (50G around 130 EUR), which is prohibitive to many. Instead, they should do CAS, spread-sheet and dynamic geometry on school owned PCs and have a simple scientific non-programmable calculator of their own. (I'm happy to say that this is exactly the way it is here in Hamburg!)

Yeah, for college, in an STEM field, I would recommend a CAS calculator. It's not any more expensive than most of the many books you would need to buy, anyway, and it can serve you for many years of your career.

But for highschool it's too expensive to ask students to buy. And I think at that level, its (or any graphing calculator, actually) use is doubtful.

Hello Alexander,

as you see i would prefer the 40gs which cost EUR 69,90 (www.arizone.de).

Furthermore when i teach CAS, spread-sheet and dynamic geometry on PC, i have to go for every graph-drawing and for every non-standard-calculus (real problems for example) in PC-Room. Also every mathematic-examinations have then take place in PC-Room. Hmmm ...

Which still is an awful lot of money for some people and not really consistent with 'Lehrmittelfreiheit' in Germany.

Well, do just one unit of CAS in every course, followed by one exam, so you only have to go to the PC room once and can spend the rest of the year in the classroom teaching math! There are plenty of topics for which you don't need an expensive toy.

in response to message #28 by Alexander Oestert

I assume you are a professional. So you certainly know that the participation on a CAS-course is optional. Alternatively you can participate on a non CAS-course. If Hamburg do not offer this freedom than it is a very unindividual school system. I won't be life there.

PS: Handys are more expensive. But everyone set the focus on another toy ...

No, I'm not a professional teacher.

> Quote:
>
> So you certainly know that the participation on a CAS-course is optional.

No, I didn't know that and did not encounter such a course with one of my four children.

In the case of an optional CAS course, I would find it ok to purchase a calculator if everyone agrees. Still, I would imagine that there might be a lot of potential participants who would like to choose that CAS course but won't because they can't afford to buy a 70 EUR calculator.

> Quote:
>
> PS: Handys are more expensive. But everyone set the focus on another toy ...

I myself own several mobile phones and calculators and love these toys. Nonetheless I would not find it ok if I was forced by the school to spend a relatively huge amount of money on a calculator that most students won't ever use again after that one semester course.

Couldn't you maybe organize some kind of fund that purchases a whole class set of calculators for the students to borrow during the semester? This way you could even handle the firmware update on all of them and make sure all the 50G's have spread sheet and geometry software on

it... ;)

BTW, what state (Bundesland) are you from?

*Message #31 Posted by **bluesun08** on 24 Aug 2011, 8:33 a.m.,*
in response to message #30 by Alexander Oestert

Hallo Alexander,

because of my bad english, i have decided to answer in german. Please, Forum, apologize profusely.

Ich finde Deinen Vorschlag nicht schlecht, dass die Schule einen Fundus an Geräten kauft und anschließend an die Schüler verleiht.

Machen wir ein Rechenbeispiel für den HP 50g. Dieser kostet (Dynatech, Arizone, Amazon) im Schnitt 120 Euro. Gehen wir von 5 Jahren Nutzungszeit aus, wären das 24 Euro "Leihgebühr" pro Jahr. Bei entsprechend längerer Nutzungszeit würde sich der Betrag reduzieren.

Machen wir noch ein Rechenbeispiel für den HP 40gs. Dieser kostet ca. 70 Euro. Bei 5 Jahren Nutzungszeit wären das 14 Euro (oder weniger, bei längerer Nutzungszeit).

In der Tat haben wir an unserer Schule auch schon über dieses Modell diskutiert. Vermutlich würden die Beträge auch für Dich tragbar erscheinen.

Ebenso finde ich Deinen Vorschlag mit dem (kollektiven) ROM-Update für den 50g (mit Geometrie und Tabellenkalkulation) sehr interessant. Leider habe ich mich noch nicht an ein solches Update herangewagt. Ich habe diesen Ansatz noch nicht weiter verfolgt, weil ich nicht weiß, wie die Applikationen von Bernard Parisse ausgereift bzw. für den produktiven (schulischen) Einsatz geeignet sind. Hat Hr. Parisse die Applikationen bereits fertiggestellt oder handelt es sich nur um Entwürfe?

Am liebsten wäre es mir, wenn die Applikationen (Geometrie und Tabellenkalkulation) auch auf den 40gs portiert werden könnten, da hier das gesamte Bedienkonzept (auch für Schüler) einfacher ist und der 40gs einfach weniger kostet.

Lassen wir unseren Gedanken freien Lauf und treiben die Sache etwas weiter: Das einzige, was der TI Nspire CX den HP Rechnern wirklich voraus hat sind: 1. das farbige / höheraufgelöste Display 2. das dokumentbasierte Bedienprinzip, d.h Abspeicherung der Rechnungen und Zugriff auf das CAS von allen Dokumenten aus. 3. Dynamische Geometrie und Tabellenkalkulation (was halt einfach von unserem Kultusministerium gefordert wird).

Meines Erachtens wäre HP mit dem 40gs nicht weit davon weg, dem TI Konkurrenz zu machen:

Zu 1: Ein farbiges bzw. höheraufgelöstes Display ist halt heutzutage Standard. Natürlich würde auch das schwarz-weiß-Display des 40gs reichen. Aber wer würde denn heute noch einen schwarz-weiß-Fernseher kaufen, obwohl man damit alle Fernsehsendungen sehen kann? Die meisten Menschen kaufen sich halt bei einer Neuanschaffung einfach einen

Farbfernseher (bzw. LCD-Display). Wenn man als Schüler oder als Verantworlicher an der Schule entscheiden muss, dann wird man zu dem attraktiveren und zeitgemäßeren Taschenrechner mit Farbdisplay greifen. Kann es denn für ein Technologie-Unternehmen wie HP so schwer sein, seine Taschenrechner mit Farbdisplay auszustatten? Wenn ja, dann hat es wirklich nichts mehr auf dem Markt zu suchen. Und hier kann man nicht immer auf Charly Fiorina verweisen. Es ist die Calculator-Group von HP gefragt, hier die Initiative zu ergreifen.

Zu 2: Das dokumentbasierte Bedienprinzip ist mit den "Aplets" im 40gs schon zu 90 % sehr schön realisiert. Eigentlich würde das bereits genügen. Mit minimalen Aufwand könnte man es perfekt machen

Zu 3: Wenn doch schon Geometrie und Tabellenkalkulation von B. Parisse für den 50g vorhanden sind, warum macht man nicht noch den kleinen Schritt und portiert dies auf den 40gs. Warum schaltet man Jean-Yves Avenard nicht noch einmal ein?

Aus meiner Sicht liegt alles schon vor unseren Füßen. Man müsste es nur noch aufheben und zusammenfügen. Implementiert man noch RPN in den 40gs, dann hat man einen Top-Rechner. Ich wäre bereit, hier mitzuhelfen, aber alle müssten einen kleinen Schritt machen. Noch einmal: Man kann nicht alles auf Fiorina und HP schieben. Wir, die Anwender, das Forum und die Calculator-Group müssen mithelfen.

Lass mich bitte noch einmal auf den Grund meines Postings zurückkommen: Ab 2014 KANN hier in Bayern das Mathe-Abi auch mit CAS geschrieben werden, d.h. diese Schüler bekommen gesonderte Aufgaben. Wer will, kann mit CAS schreiben, wer nicht will, schreibt ohne CAS (mit normalen Taschenrechner) und erhält "normale" Aufgaben.

ALLE Schulen in Bayern stehen nun vor der Entscheidung, welchen CAS-Rechner sie einführen wollen. Als überzeugter HP-Anwender möchte ich natürlich, dass HP Rechner eingeführt werden. Das scheitert aber an der Vorgabe des Kultusministeriums, dass die Rechner Geometrie und Tabellenkalkulation haben müssen. Wir müssen das halt so akzeptieren, egal ob CAS im Allgemeinen bzw. Geometrie und Tabellenkalkulation im Besonderen Sinn macht. Es ist halt so und wir müssen interessierte Schüler auf das CAS Abi vorbereiten.

Bestimmte Bundesländer haben bereits CAS und die anderen Bundesländer werden nachfolgen. Diese Entwicklung hin zu CAS ist nicht nur in Deutschland sondern auch in ganz Europa und vermutlich auf der ganzen Welt zu beobachten. Was mich ärgert ist, dass HP (und wir) sich diesen Markt entgehen lässt. Was gäbe es denn für eine bessere Werbung für HP, wenn jeder Schüler einen Taschenrechner mit HP-Logo hätte. Schließlich sind die Schüler die Entscheider von morgen und wenn später mal eine Entscheidung Privat oder im Betrieb für eine EDV-Infrastruktur (PC, Drucker, Server) ansteht, wird man sich an das Logo und an HP erinnern. Microsoft hat es doch vorgemacht!

Der Grund meines Anfangspostings war, dass meine Gedanken über das HP Forum an das HHC 2011 und an Tim Wessman transportiert werden, um sie zu diskutieren. Ich habe absichtlich etwas zynische Formulierungen gewählt, um das Forum aufzuwecken und nicht dauernd über die Vergangenheit zu diskutieren, dass der 42s und der 28s die besten Rechner waren oder dass die Handbücher früher besser waren. Was bringt denn der 34s oder der 15c? Wir brauchen doch konkurrenzfähige Produkte. Natürlich würde der 40gs für das Gymnasium technisch auch reichen, aber er lockt halt einfach niemand mehr von dem Ofen vor. Und HP wäre nicht mehr weit von einem neuen Produkt weg, das sich aus meiner (obigen) Sicht relativ einfach realisieren lassen müsste.

Noch einmal: Wir dürfen nicht die Schuld auf Fiorina oder HP schieben. Wir, das Forum,

die HHC sind indirekt als Lobbyisten und die Calculator group ist direkt gefragt, Einfluss zu nehmen.

Ich bin bereit mitzuhelfen!

Bitte entschuldige meine langen Ausführungen. Es sind halt meine Gedanken ... und meine Leidenschaft.

Viele Grüße

Alexander

Frankly, I thought it best to have it come out of the school budget. Actually, if the state is requiring (at least in the near Bavarian future) students to have a CAS calculator, the school should provide it. Remember: 'Lehrmittelfreiheit'!Another alternative could be to seek funding from local businesses, engineering companies or such in exchange for their company logo sticker on the calc.

Well, you will have to polish up your English. It won't help you any further to try to convince me or the German audience of this forum. HP, after all, is a US company and this forum is mainly non-German. ;)

Would the English speaking audience of the forum help you with your quest to boost HP calculator sales?

I believe this is not on many people's agenda right now. Take me for example: Apart from having some Sharps, Casios and TIs, I like HP calculators and RPN a lot. But I don't think it is important which brand of calculators my kids use at school, nor do I think that the distinction Algebraic vs. RPN matters when it comes to CAS.

If **you** deem it important to teach CAS on HP calculators at your school, find out if sponsorship from local businesses is legal (!) in Bavarian schools and then raise the needed sum to provide your favorite calculator to your future classes.

How important can this issue be if generations of excellent engineers were taught with chalkboard and sliderule?

Especially in Germany, we have a different problem at schools, and that's students not even mastering the german language.

As I wrote above, being a father of four children in German schools I might be the one forumer here closest to your interests as a math teacher and HP fan. And if **I** don't care what calculator my kids use in math lessons, much less what brand they use, probably no one else will care.

What I **do** care about concerning math lessons is that they are taught important math concepts and *thinking mathematically*. This is very much different from what I myself was interested when I was a student. Back then I didn't like stochastics, statistics, probability and some such. Today, I'm convinced that a deeper knowledge in those disciplines is key in understanding politics, society, risk taking and life in general to everyone and not only to some math geeks. If people taking AIDS tests, not using their bicycle helmet or being afraid of flying in an airplane would only know more about evaluating results, risks and probabilities! :-(They could do with much less knowledge about CAS, trigonometry or integrals

- as much as I like those topics.

You convinced me: It make no odds which brand the calculator have. So i decide me to acquire the new TI Nspire CX for our students, because the TI fulfil a priori all the requirements of our ministry of education (see my initial posting). Furthermore the TI Nspire series are already in use by a couple of universities (also universities of applied sciences). I think i should rather spend my time and energy in good math lessons.

Yesterday i had a dream:

Some people need a PC-Equipment and Apotheker said: „Why HP, please go to Dell, Acer or Lenovo!“ Some other people need a TouchPad and Apotheker said: „Why HP, please go to Apple, Asus or Archos!“ Some other people need a Smartphone and Apotheker said: „Why HP, please go to „Samsung, HTC or Blackberry!“ Some other (highschool)people need a further developed CAS/graphic calculator and the HP-FORUM said: „Why CAS/graphic on highschool? O.k. only if absolutely necessary, but why HP, please go to TI or Casio!“

After i awake from the dream i read the anwers to my posting in the forum and think: „What a strange world ....“ But now i‘m understand: HP and the Forum don‘t care about the 3000 highschools and the 750000 highschool students (and potential customers - yearly) alone in germany. The big deal (about 17 % yield) and preservers for HP are the business/scientific calculators. No harm meant.

*Message #3 Posted by **Hubert Weikert** on 21 Aug 2011, 1:49 p.m.,*
in response to message #1 by Bart (UK)

Good news, thank you for!

Still trying to get SAM-BA working with the WP34S on Linux. Unfortunately Atmel supports on Linux only the CDC version. Serial SAM-BA requires some specialities not supported by the CDC variant, like sending some kind of sync characters for auto-baud initialisation, and probably others.

I use a FTDI chip based USB-to-serial converter. Promising is the open source Sam-I-Am tool, but designed also only for CDC. Initial sync and auto-baud work now, but other commands except SAM-BA version query fail.

A further, less comfortable alternative for flashing may be sam7utils but up to now I get errors when the program tries to open the usb-serial port, with invalid ioctl() calls.

Hubert

What is the _cdc version? I know it exists but have no idea what it is for.

Re: HP-30b successfully re-flashed to a WP-34s in Vista with SAM-BA 2.10 & USB-RS232 converter

*Message #5 Posted by **Hubert Weikert** on 22 Aug 2011, 5:47 a.m.,*
in response to message #4 by Marcus von Cube, Germany

As far as I get it, CDC is a serial port emulation 'on the far end', for two systems interconnected by USB. The embedded system uses then a own USB driver and hardware on chip, and no serial RxD and TxD pins anymore.

CDC stands for "Communication Device Class". Some explanation can be found in this Atmel App-Note.

Essentially, as the two system are now interconnected by USB, there seems to be no need anymore to be concerned about restrictions as given by a hardware serial connection. CDC supports also multiple interfaces, e.g. mass storage and networking.

Apparently it's a Dual D-Type Flip-Flop. That's all I know though...

So it can't be doing more than remembering two single boolean states of whatever the wires connected to it represent.

Re: Sharp PC-1211 strange

*Message #6 Posted by **Bart (UK)** on 21 Aug 2011, 11:41 a.m.,*
in response to message #1 by robertoataulfo

Is there a switch on it? (magnetic reed switch perhaps?) to select an extra RAM bank?

Edit: On seeing your second photo (the IC is a flip-flop), perhaps a bank change is done using a POKE command? (E.g. similar to using a 32Kb module in the PC-1500).

Edited: 21 Aug 2011, 11:48 a.m.

in response to message #9 by Dominic Richens

Looks like this is not the only one:

J'ai un circuit en trop sur mon 1211 !!

No plausible explanations though.

Re: that's quite the barnacle!

*Message #12 Posted by **Bart (UK)** on 21 Aug 2011, 4:37 p.m.,*
in response to message #9 by Dominic Richens

The date of the flip-flop is 1992, as these were originally produced in the early '80s this mod was done long after.

This certainly also does not look like a one-off type add-on PCB, it seems like the mod was intended to be for a number of units. I would guess an upgrade similar to the HP-200LX memory upgrades. Hence my suspicion that it might have to do with a memory upgrade, however it may have to do with some other custom added functionality. One would have to trace out the wires/tracks to see exactly where it all connects to.

Re: that's quite the barnacle!

*Message #13 Posted by **Gerson W. Barbosa** on 21 Aug 2011, 6:35 p.m.,*
in response to message #12 by Bart (UK)

Wire assignments clockwise from farther left yellow one, if I haven't done any mistake:

```
    yellow: D
    yellow: Q
 red/white: VDD
blue/white: VSS
 red/white: CK
```

Not of much help though.

Re: that's quite the barnacle!

*Message #14 Posted by **Bart (UK)** on 21 Aug 2011, 6:47 p.m.,*
in response to message #13 by Gerson W. Barbosa

One would also need a circuit diagram for the 1211, or reverse engineer it, a lot of trouble for something not more than a novelty :(

Re: that's quite the barnacle!

*Message #15 Posted by **Gerson W. Barbosa** on 21 Aug 2011, 7:31 p.m.,*
in response to message #14 by Bart (UK)

The second D-type flip-flop is not used, as we can gess by the shorted pins. This document mentions a controller inferface for a submersible pump. Two excerpts therein:

```
"The heart of the timer control package is a Sharp PC1211 pocket
computer with16K memory capability. This has been slightly modified by
hard wiring an external plug to the key pad and battery contacts of the
PC1211."

"At the end of the "delay" time, the PC1211 sends a "Beep  2"
signal which reverses the state of 1/2CD 4013 flip-flop."
```

Might that PC-1211 be a remnant of that system?

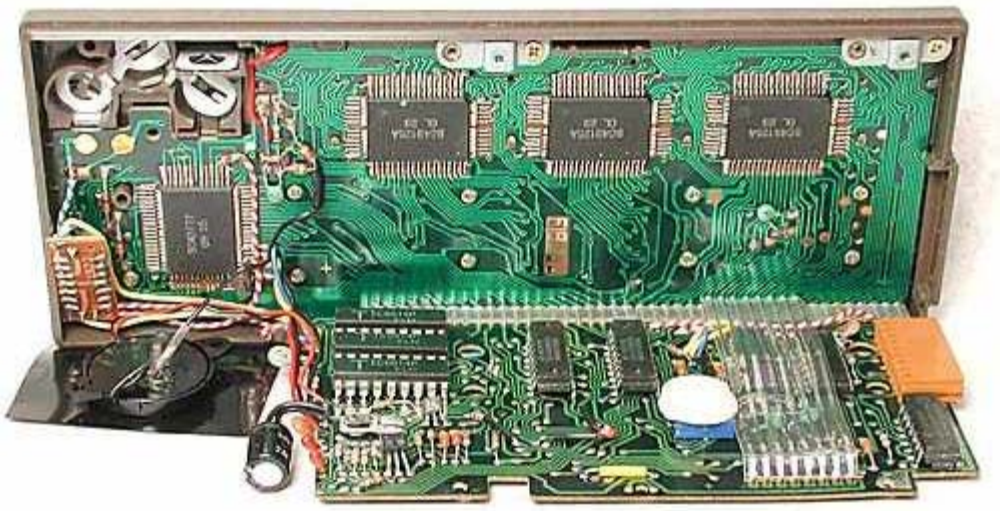
This image from the Vintage Calculators Web Museum shows the exact same modification--right down to the color of the wires involved.



My vote is that this is a factory modification necessary for certain hardware revisions.

Very likely, as there appears to be a lot of them.

Gerson.

in response to message #17 by Gerson W. Barbosa

Wow. Well if that's a factory mod, it's a pretty sloppy one. The little board is just loose in there and could potentially short. They should have at least used some rtv or other material to secure and insulate it.

Re: that's quite the barnacle!

*Message #19 Posted by **Bart (UK)** on 22 Aug 2011, 5:20 a.m.,*
in response to message #18 by Michael de Estrada

No, not a factory mod, but a third party mod. As I mentioned previously, the date of the flip-flop IC is about 10 years after the initial production of the units (and like the 200LX mods I mentioned which were also 3rd party mods). The fact that a custom etched PCB was used shows that it certainly was not a "one-off", so I would expect some number of these modified units to exist.

Now, could you verify, for the sake of curiosity, a funny "feature", if it works?

I have a Sharp PC-1430 and I discovered a buffer overflow error that would allow you to replace the password without damaging the stored program much.

The trick is to fill the input buffer completely (I think it's 80 character long) and, when full, pressing the insert key repeteadly. You will see that you are actually dumping memory contents. At least on a PC-1430 you even see characters not available to BASIC programs. (Not available on the keyboard and if I recall correctly the BASIC doesn't have a CHAR() function).

One of the most frequent "alien" characters you see is "~", which I guess is 0.

So, if you keep pressing INS and dumping memory, which not only dumps it, but seems that shifts some contents, you will eventually fill the password with "~~~~~~~~". Now you just clean up the input buffer so that you keep eight tildes, insert PASS " before and hit enter. And voila!

Re: Sharp PC-1211 strange

*Message #22 Posted by **Eric Smith** on 24 Aug 2011, 12:35 p.m.,*
in response to message #21 by Borja

The PC-1210/11/12 used two four-bit microprocessors sharing the work, probably because they couldn't put enough ROM in a single CMOS microprocessor at that time. The microprocessors used "Harvard architecture", which means that the RAM and ROM weren't even in the same address space, and that the ROM contents can't be read as data in the same way as the RAM. The user memory was in an external chip, so there were actually five independent memory address spaces in the part (compared to two in the HP-41C and only one in more typical computers). This makes it unlikely that there is any clever way in the PC-1211 to get at memory that you're not supposed to from the keyboard, and I've never heard of anyone finding a way to do it.

Sharp used a single eight-bit processor (usually LH5801/3, SC61680, or related parts) in almost all later models. (The PC-1600 has the 61680 and a Z-80.) These processors use a conventional "von Neuman architecture", with the ROM and RAM in a unified address space. That gives a lot more potential for making them do interesting, unintended ("NOMAS") sorts of things.

If anyone has a broken PC-1210/11/12, it would be interesting to decap and photomicrograph the two microprocessor chips, as the folks at Visual6502 have done with other microprocessors.

Anyway, in the PC1430 I'm sure I read RAM, not ROM. The curious characters were simply the result of reading arbitrary numbers.

My 1430 has an upgraded RAM. It's possible to solder a second 6116 chip.

*Message #24 Posted by **Eric Smith** on 29 Aug 2011, 12:38 p.m.,*
in response to message #23 by Borja

On the later ones, it is possible to get at RAM or ROM by various means, because they are in a single, shared address space. My point was that it would be almost impossible to do anything like that on the 1211 family.

Re: because of RPL

*Message #4 Posted by **Maximilian Hohmann** on 21 Aug 2011, 5:46 a.m.,*
in response to message #1 by snaggs

Hello!

I like the form factor of the 28. Dedicated alpha keys are great. And if you don't need them, you just fold the lid backwards and have a normal calculator. Excellent idea! When closed, the calculator is well protected enough that it dosent need a pouch or case. The display is surpisingly good for an LCD (contrary to the later 48 series!).

BUT: What good is a programmable calculator that (almost) nobody can program? Having to work one's way through a 1000-page manual before being able to write the most simple program puts off 99% of all users. Me included. It was the invention and implementation of RPL that cost HP the education market. What good is an educational tool that not even the teachers can understand and use?

But we've had this RPL discussion a hundred times already...

Regards max

So it only does RPL and not RPN? Isnt RPL simpler for many things?

Re: because of RPL

*Message #6 Posted by **Maximilian Hohmann** on 21 Aug 2011, 6:55 a.m.,*
in response to message #5 by snaggs

Hello!

> Quote:
>
> So it only does RPL and not RPN?

In a way, it does both. RPN (reverse polish notation) is the logic implemented for keystroke calculating and RPL (reverse polish lisp) is a programming language.

> Quote:
>
> Isnt RPL simpler for many things?

Well, it is simpler for complicated things. If you look at some programming examples, you will find RPL programs that solve really complicated problems using only a few lines of code. But mind you: Putting together these few lines of code may take a normal person a whole week...

For the usual simple problems (e.g. formulas that need to be recalculated for different input values) RPN keystroke programming as implemented in all HP calculators before the 28 is a very simple, quick, intuitive and efficient approach. You basically type in your formula with the first set of values in PRGM-mode and have written your program in the process. Coming from that background, RPL was a huge slap in the face for most users. Because normal users do not need to solve the 8-queens-problem or sudokus on their calculators...

Regards Max

Addition: If you are familiar with Star Trek, you may consider the Hp28 as the ideal calculator for Mr. Spock: A totally logical and super-intelligent person who needs to solve problems, that mere mortals can not even understand. On the other hand, Scotty, the engineer, needs to recalibrate the matter-antimatter-ratio inside his warp-engine NOW, otherwise the starship will blow up in a few seconds. Nothing else but an Hp42 (or 41 or 65 or 67) can save him and his ship (and the whole universe because thats what the Enterprise's task is). The universe contains only one Mr. Spock, but many Scotty's. Therfore, mot many people are happy with their Hp28!

One real show stopper on Mr. Spocks 28 was that it always returned 'an unknown form of energy' on any imput ;-).

Re: because of RPL

*Message #8 Posted by **Cristian Arezzini** on 21 Aug 2011, 12:28 p.m.,*
in response to message #6 by Maximilian Hohmann

I think all this RPL versus RPN thing boils down to how you grew up. My first HP was a 48, the second a 50g, and not until very recently I had a RPN calc; and I quickly learnt how to program the 48 (and I'm in no way above-than-average in intelligence). A few weeks ago I wrote a simple program to draw a bifurcation graph, pixel-by-pixel, and it took me about an hour, including debugging. Conversely, I've never managed to "reverse-engineer" a RPN program - i.e. if I read a listing, there's no way I can understand what it's supposed to do. And all that "stack-lift" just confuses me - I prefer the 48's way, where every time you enter a number, it goes to X and everything else lifts, so that i.e. if there's a number in X, I can press "2 +" or "2 ENTER +" and the result is the same... And I *love* the "infinite stack", I think it's way more powerful than just having 'n' hard-coded levels. So I for one find RPL very straightforward, and RPN a little awkward - though I'm getting used to it with the 34s - but as I said, I think it's down to what we learned first...

Cristian

> Quote:
>
> I think all this RPL versus RPN thing boils down to how you grew up.

It boils down to what is needed, imo. I rarely program my calculator, but when I have to, I take my 32SII and just do it. Since RPL is more complex and not consistent about pre-/postfix, the right syntax is hard to remember for me.

But you're right, too. When I'm used to directly edit the x-register on input numbers, RPL appears to be strange. There's a logic behind how stack lifting works on RPL machines (and the 20b/30b), that's for sure, but it's very different from RPN and produces unexpected results when used to RPN. Vice versa, RPN stack lifting must appear strange to the RPL user.

To each his own.

All that said, I like using my 48G for its advanced functions :-).

Re: because of RPL

*Message #10 Posted by **Thomas Falk** on 21 Aug 2011, 1:15 p.m.,*
in response to message #6 by Maximilian Hohmann

I don't understand this oposition against RPL. It is an extension without which the use of the features of the HP28 and the later calculators would not be possible. Just think about directories, names for variables and programs and the larger screen.

If you want to stay with RPN, even this is possbile. The handbook to the HP28s even has a chapter

for users of older - meaning RPN - calculators. If you read this, you will find explanations why some of the features of RPN are different in RPL. RPL is a consquent development from RPN.

About the complicated programming: You only have to start the input of the program with << and then you can simply type in your keys as you would have done it on the older calcs. If you are done, you have the program as on object on the stack, which you can simply store. If you have to debug a program on the older calculators, the first step would be to write it down on paper to get an overview. On a RPL calculator you can show it on the display.

So if you want RPN only, you are restricting yourself. But HP has done both: you could buy the RPL calculators (HP28, HP48) and RPN calcuators (HP32S etc) at the same time. Both user groups were satified.

I prefer the 28S, but maybe that's because of nostalgic value - it was the 28C/S (got both) that got me through my EE studies. At the time I was very proficient in programming the 28S, but I agree that the learning curve is steep, and I admit I no longer know how to program it. I later got myself a 42S, mostly out of curiosity, but we never got friends.

Re: Why dont people like the 28s as much as the 42s?

*Message #20 Posted by **Dominic Richens** on 21 Aug 2011, 7:15 a.m.,*
in response to message #1 by snaggs

So at the end of 3rd year EE, I bought a (recently discontinued) HP-15C and my friend bought an HP-28S. For 4th year, we used them extensively.

key layout: On the HP-15C (similar to HP-42S) all the trig and log functions were right there - on the 28 you had to shift->key to get the TRIG or LOG menu first, then press the menu key to get the function.

programming: programming on the fly was easy on the 15c as you basically pressed the same keys in the same order that you would if manually calculating it. Not so on the hp-28s - the difference is like using macros versus visual basic in Excel.

However, I did program my friend's 28S to play "home, home on the range" - can't do that with a 42s

Hello!

> Quote:
>
> This is another calculator that looks fascinating?

It IS fascinating indeed! But the 71 is not really a pocket calculator, rather a minicomputer that fits in a (large) pocket if necessary. The BASIC language is very powerful and quite easy to master for stupid engineers like me. But for simple pocket-calculator tasks it is not the ideal machine.

If you want to know whats possible with a 71b, search for Valentin Albillos challenges on this forum in the last five years or so. You will be surprised.

Regards, Max

Re: So what about the 71b?

*Message #27 Posted by **Garth Wilson** on 21 Aug 2011, 3:48 p.m.,*
in response to message #26 by Maximilian Hohmann

I definitely agree. The 71 is a powerful hand-held computer that is not very practical as a calculator. I have used mine a lot; but when I want a calculator, I reach for my 41. (I have used my 41 also for controlling and taking data from many pieces of lab instrumentation at once too though.) It is unfortunate that HP mismanaged the sales of the 71 so badly. What an absolute disgrace that was!

*Message #29 Posted by **allen** on 21 Aug 2011, 7:54 a.m.,*
in response to message #1 by snaggs

The 28c/s was fairly quickly replaced by the more capable 48 RPL series with Serial Connection and/or

Expansion ports. This redesign also replaced expensive "N" batteries with more common "AAA" and the fragile battery door with a sturdy replacement. The 48 screen is larger, with more memory and SySRPL capability, and numerous other advancements that made the 28c/s almost obsolete the day the 48sx came out.

In contrast,no advancement in RPN machines has been made past the 42S.

Just bought a 48g+.

*Message #30 Posted by **snaggs** on 21 Aug 2011, 8:02 a.m.,*
in response to message #29 by allen

I had a 48 in first year uni but it got nicked. I replaced it with a 49+ which I still have but have never gelled with.

Im enjoying my 35s, will be interesting to compare to my memory of the 48, which was not as "fat" as the 49g+ if my memory serves me.

As a programmer, i dont think RPL will bother me. Ive read its like forth. I played with that on a Commodore Plus/4 many yeats ago :)

Actually, I love the 28S. It was the first HP calculator I ever owned and I got it during my EE studies, and programmed it extensively. I felt that menu's were the next logical step for complex calculators (e.g. I prefer the 32S to the cluttered 32SII). I also thought that RPL was the next step up from keystroke programming. Even though I have a 50G now, I sometimes still prefer the 28S as the 50G has become incredibly complex loaded with so much more functionality. The 28S does feel incredibly slow now though ;-).

*Message #38 Posted by **Mike Morrow** on 22 Aug 2011, 12:14 p.m.,*
in response to message #32 by Egan Ford

There's a very good reason that there were relatively few HP 42S purchasers during the seven years (1988 to 1995) that it was in production. **All** of HP's marketing emphasis was on the HP 28S (1988), followed by HP 48SX (1990), followed by HP 48GX (1993)...plus some wasted effort on that HP 38G dead end. About

the only mention that the HP 42S received was in Edu-Calc catalogs.

The HP-15C (1981) had as similarly-capable competition during its production history *only* the HP-41C series. The HP-15C was, out of the box, much more sophisticated than the HP-41C series for many things, especially complex functions. It grossly outperformed any other Voyager as a scientific or programmable machine.

So there's no mystery *at all* why the excellent and still unmatched capability of the HP 42S never gained significant notice while it was in production. For **every** second of that period, HP purposefully hid the RPN HP 42S behind the RPL systems that HP wished to convince potential customers was what they *really* wanted, if only they were sufficiently sophisticated.

RPL, admittedly very powerful, is what wilted HP calculator popularity for many. A wise person on this forum many years ago distilled the issue with: "The surprising thing about RPL is not how *easy* it is for hard problems, but how *hard* it is for easy problems."

> For every second of that period, HP purposefully hid the RPN HP 42S behind the RPL systems that HP wished to convince potential customers was what they really wanted, if only they were sufficiently sophisticated.

And in my eyes they were right, the 42S was only there to support those archaic users that wanted something to replace their beloved 41C_'s (which it failed miserably to do because it was crippled by lack of expandability & I/O).

(Mike - please do not take me seriously, I am just putting in a lighthearted jab in this "argument" ;-).

Re: Why dont people like the 28s as much as the 42s?

*Message #40 Posted by **Paul Gaster** on 22 Aug 2011, 1:57 p.m.,*
in response to message #38 by Mike Morrow

I graduated from high school in 1990 and went into college to be a mechanical engineer right afterwards. The details are a little fuzzy, but I remember that one of our professors told us we would need a good calculator for all of our classes. He explained that we needed something that would handle matrices and simultaneous equations among other things, but those were really important. HP must have been recommended because that is all that we students bought. Back then there was no internet so that we could check reviews or do research. I ended up at a local store and I had to order my calculator. I am fuzzy on the choices, but I remember one option being about $60 or $80 and it had limited abilities for matrix and simultaneous equations, so maybe that was a 32S, but I could be wrong. The next option was a 42S at $120, and the last option I think was a 28S at $235. The 42S would do what I needed and was about half the price of the 28S so that is what I got. I didn't understand how the 28S could be worth so much extra money, and keep in mind I had to use part of a student loan to order the 42S. It served me well for all of college and I passed the FE exam with it as well. I didn't even know much about programming and never really tried to learn. The quadratic equation program was the only thing I remember ever putting into it, but I knew that one by heart so it was pretty much pointless

anyway. Others back then splurged for the 28S, but most seemed to have a 48S or later on a 48G. I even remember one or two having the 48SX or GX. I was in so much awe of a calculator that could load programs, information, and formulas on the cards. At the time I felt like I was at a disadvantage to a certain degree with my little 42S. Now there are so many who wish we could still get such a small little calculator.

in response to message #1 by snaggs

When I was studying engineering I bought the HP 28S. Just the possibility to solve a linear equation system (3 x 3 or whatever) with complex coefficients by allocating the two matrices in the stack and clicking a key was enough to convince ALL my schoolmates to run and get one. At that time other people already had a Casio PB 1000 or even an HP 41 but they had to admit the HP 28S was far superior for everyday calculation. I don't know much about the HP 42S but I guess that the screen and RPL language offered by the HP 28S makes this one the right election. And we should not forget the possibility to have in the same enviorenment real numbers, matrices, lists, many objects. A luxury that other older calcs could not afford.

in response to message #41 by LMMT

The HP-28S was my second HP calculator, purchased exactly because of the very reason you mention. Although no user program was necessary for that task, I preferred to use this one then. The HP-42S has a nice linear system solver as well. Limited I/O is their great weakness, however.

1) RPL.

2) Not easy programming for those who were familiar with the classic paradigm.

3) Little memory on the 28C.

I remember the enthusiasm and then the intense disappointment the 28C caused me when a friend lent me one for a couple of days (1987?)...

Ah, the perennial RPN vs RPL debate. :)

I learned to program on an HP-41C. I used RPN before I learned BASIC, let alone C. The HP-41 way of doing things is still the most natural for me. I had a career as a programmer and systems specialist, and cranked a lot of code over the years. After I rediscovered HP calculators in 2005, I bought some RPL machines and set out to write non-trivial programs as an exercise. My experience was that RPL was hard to

learn. I'm sure that had partly to do with my RPN hard-wiring but I also think that it's manifestly true that RPL is more challenging, merely measuring that by the flexibility it offers over RPN. However that may be, I came to greatly enjoy RPL on the 48GX.

As a diehard 41C fan, I will always regret that HP took the direction it did with RPL. In the late 80s, calculators were still relevant in the broad market of computing devices. If they had chosen to build on the RPN model, it's likely that we'd have HP machines today that I could love without reservations. But that is a selfish and atavistic attitude. HP went with RPL, and that branch of the calculator tree flourished in a technical, if not a commercial sense. I rejoice to see that other RPN troglodytes, like me in tastes but with greater technical chops, have taken up the challenge of moving the RPN model forward. I'm bringing my 30B to HHC for some post-HP RPN hot-flash TLC. I hope to see some of you there.

Regards
Howard

I love the 28S - it was my first HP at university. I upgraded it to a 48G a few years later and was disappointed. Now I have a large collection of HP's, including 2x42S's and 7x28S's (some examples of mine here: 28S clear, 28S normal and 42S) I have 28S's made in USA, Singapore and Indonesia, as well as 100th anniversary edition and clear case.
What I love about the 28S is the separate alpha keyboard, which makes programming so much easier, the easy access menus, and the overall layout. It does fold into a neat little closed case which is well protected. Downside is of course the battery door, but if you are careful then they can survive well. I agree with earlier posts that it has a lot to do with what you are used to.
For daily use, I have a 28S, 42S and 48GX on my desk. I tend to mix it around a bit (just because!!). Cheers, Keith

hp97

*Message #1 Posted by **Anthony Allen** on 20 Aug 2011, 3:22 p.m.*

Greetings:

Could I run an hp 97 without the battery, if I turn it off after each use

Thanx in advance

Anthony

Re: hp97

*Message #2 Posted by **Michael de Estrada** on 20 Aug 2011, 8:11 p.m.,*
in response to message #1 by Anthony Allen

According to Randy, you can damage the card reader sensor by operating the calc off the ac adapter w/o a battery, regardless of whether you use the card reader. This is because the card reader circuit is powered directly off the battery charger side of the ac adapter, which outputs about 16 vdc no-load. Randy can provide more specific details on this. The same caveat applies to the HP-65.

Re: hp97

*Message #3 Posted by **Paul Berger (Canada)** on 20 Aug 2011, 8:38 p.m.,*
in response to message #2 by Michael de Estrada

I believe it is the 67 that can have the card reader damaged by operation without a battery. In the 97 the voltage supplied to the reader as well as the rest of the calculator is regulated. The service guide says the the 97 will not be damaged by operation without a battery but it will not operate correctly. I just tried it with the 97 on my desk and the display flickers and neither the card reader or printer will work due to the limited amount of current the charger can provide.

Re: hp97

*Message #4 Posted by **Michael de Estrada** on 20 Aug 2011, 8:52 p.m.,*
in response to message #3 by Paul Berger (Canada)

Yes, you are correct. I was thinking of the HP-67 too, and missed the fact that the OP was asking about the HP-97 instead. My mistake.

Re: hp97

*Message #5 Posted by **Geoff Quickfall** on 20 Aug 2011, 8:21 p.m.,*
in response to message #1 by Anthony Allen

Michael is correct,

In fact here is a quote from the HP 91 manual and the HP 97 manual:

```
NOTE:  OPERATING THE HP-91 (OR 97) FROM THE AC LINE WITH THE
BATTERY PACK REMOVED MAY RESULT IN WRONG OR IMPROPER DISPLAYS.
```

Although these are not as supseptable to the Woodstock power catastrophes, they were not designed to work without a FUNCTIONAL battery pack.

Cheers, geoff

added after the above posts:

as noted above, the hp 91 manual also does not mention damage, question is, should it have or was the statement in quotes above meant to discourage the use?

hp 39gs/40gs applet setup on hp-50g

*Message #1 Posted by **Erturk Kocalar** on 20 Aug 2011, 2:55 p.m.*

Hi all,

I recently got a hp 39gs from amazon for about $31.

I have a 50g but I'm starting to like the 39gs, especially the concept of applets. I discovered it saves the environment/settings between different applets. so for example, as an electrical engineer, so I created one applet that has the electrical formulas I use and the mode is set to engineering mode. I also have another applet for normal calculations, with format set to standard. It makes it easy to switch back and forth between different purposes. almost I have multiple calculators.

however, I would like to use the hp50g because it is much faster and powerful. I am not a power user (so don't know much about programming). How can I set up 50g in an "applet" fashion?

thanks,

Edited: 20 Aug 2011, 2:55 p.m.

Re: hp 39gs/40gs applet setup on hp-50g

*Message #2 Posted by **Gilles Carpentier** on 20 Aug 2011, 3:49 p.m.,*
in response to message #1 by Erturk Kocalar

Hi Erturk ,

I never use a 39gs. But if I understand well what you want to do, PUSH and POP command is what you need.

PUSH and POP : The PUSH command saves the current status of the flags, and the current directory path. This allows the user to change the flags or the directory path, then restore them all with the command POP

For exemple :

```
PUSH
 -105 SF @ to go in 'APPROX' mode
 -103 SF @ Set complex mode on
 ...
 Your program
 ...
POP @ restore the environment as it was at the last PUSH command
```

It works also when you change the standard/engeneering etc mode

So, in resume, you only need a PUSH command at the beginning, then set all the flags as you want and a POP at the end of your program

PS : you can also combine this with the STOF and RCLF commands. This is explained in the advanced user reference manuel.

Re: hp 39gs/40gs applet setup on hp-50g

*Message #3 Posted by **Tim Wessman** on 20 Aug 2011, 5:17 p.m.,*
in response to message #1 by Erturk Kocalar

You can't really do the same concept of "aplets" on the 50g. You could potentially do some saving of flags and directories as stated, but the 50g really isn't set up to do task switching which is the whole basis of aplets.

Interestingly enough, there is some code still left in the 50g when a former calc engineer was planning to enable support for aplets on the 50g. The work was never finished though. There wasn't much interest for it either.

I do think that everyone discounts the 39/40 though - especially here since they are algebraic only. They are very simple to operate, and even simpler to explain how to use, but that simplicity definitely puts of those wanting to do things more than 1 or 2 ways that are supported. The 50g shines in its flexibility.

Remove those limitations (such as give it units, more flexibility in programming, and some more customization) and I think more people would be willing to give it a shot.

TW

Re: hp 39gs/40gs applet setup on hp-50g

*Message #4 Posted by **M. Joury** on 20 Aug 2011, 9:40 p.m.,*
in response to message #3 by Tim Wessman

I am an old time HP RPN user and for that reason put off trying the 38/39/40 series calcs for years. A little more than a year ago I decided I needed something new to play with and purchased the 39gs. I have to say that I love it. It is not an HP50 or even an HP48S/X but it has some really cool features.

Overall, I have been very impressed with the machine and it's capabilities and the more I play with aplets the more I like them. I do wish that the programming language were a little more powerful (the ability to call a subroutine within a program would be nice for example) but even with the current limitations one can do a lot with the calculator. I also really like the keyboard color which even though it dies not look quite as "professional" as the 50g is much easier on my eyes. Add RPN, a wide enter key, and a few additional features and this machine would be a real winner.

I did implement an RPN mode for it that provides the approximate capability of a HP45 so that I can get my RPN fix and I am just getting back (after 9 months being busy with other things) to working on converting this app to SysRPL to improve the speed (I just wish I could figure out how to load libraries into the Emu48/39g emulator since I currently have an issue with my Parameterized Outer Loop and keep trashing memory during debugging <g>).

Cheers,

-Marwan

Re: hp 39gs/40gs applet setup on hp-50g

*Message #5 Posted by **David Hayden** on 21 Aug 2011, 8:43 a.m.,*
in response to message #4 by M. Joury

I'll second Marwan's comments. I really like the colors of the 39gs. And although I'd prefer RPN, I

think the 39gs completely blows away the TI 83 which is it's main competition. Aplets are exactly what teachers need in the classroom.

Re: hp 39gs/40gs applet setup on hp-50g

*Message #6 Posted by **Erturk Kocalar** on 21 Aug 2011, 2:59 a.m.,*
in response to message #3 by Tim Wessman

Thanks for the comments, everyone. Push/pop commands with some programming could be a partial work-around. I think Tim hit it on the head by saying task switching, which is what I was looking for.

> Quote:

> I do think that everyone discounts the 39/40 though - especially here since they are algebraic only. They are very simple to operate, and even simpler to explain how to use, but that simplicity definitely puts of those wanting to do things more than 1 or 2 ways that are supported. The 50g shines in its flexibility.

yes, it is easy to learn and operate. The build quality is same as 50g. I was able to show the concept of graphs to my 7 yrs daughter. (she was asking for a graphing calculator afterwards :)). It also helped me understand the capability and expandability of 50g because I would go back and try to do the same thing on 50g.

> Quote:
>
> Remove those limitations (such as give it units, more flexibility in programming, and some more customization) and I think more people would be willing to give it a shot. TW

within a week of use, i don't have a strong feeling of anything missing (for its purpose). Units would be nice and also if one could enter multi-character variables in solver. however, after using 50g and 40gs, I find there is a fine line between keeping it simple and complicated. For my use, I would keep 40gs as is (=cessna) and use the 50g (=fighter jet + airbus). :)

I haven't started programming yet. the views reminded me the event-driven programming. It looks like it is possible to add pictures to applets, which will be nice. I'm thinking about making tools for calculating pcb trace impedances. Also, when I calculate the impedance of a cap or inductor, I want to see a plot of the impedance vs freq with cursor at the entered freq (maybe this is the split view.)

Now if i can figure out how to overclock this calc, that'll be cool :)

Comments on HP status

*Message #1 Posted by **Tim Wessman** on 20 Aug 2011, 11:55 a.m.*

Hello,

I wanted to write a short message to everyone and hopefully allay some concerns. This is not any sort of official statement from HP, but just some observations that are relevant to those whom visit here for love of calculators.

1. We (everyone here on this sit and within calcs) have always known that calculators are not really a good fit within HP anymore. In fact, I think calculators is the oldest group left within HP by far. In the past decade or so, it has been shuffled around quite a bit trying to find a fit. Currently, we are under accessories which does both aftermarket consumer things (mice, keyboards, audio, etc) and things like batteries, docking stations, power cables and the like. This as been a very good fit for calcs, and there has been a ton of support to grown the business and do exciting things.

2. Accessories falls under PSG which is being looked at with this announcement. Nobody really seems to have any idea what will be happening, but if you look at the analysts it ranges from completely selling PSG, to doing nothing at all.

3. It will take a long time for any decisions to be made. On Thursday when the announcement came out, a lot of people cleared out of the Ft. Collins office that afternoon. There was a lot of worried talk as it was a big surprise to everyone. By Friday everyone had absorbed the news, and we'd mostly all come to the decision that it really wasn't that bad. In fact, there are some definite upsides.

4. HHC this year is still going on. We will still be there, and there will be some really great things you won't want to miss.

5. Are calculators done? Well, if you've asked some people here they'd say it already happened with the discontinuation of <insert_favorite_unit_here>.

6. What about long term potential for calculators? In all honesty, nothing has changed at all. I was quite worried on Thursday, but I am over that. I am potentially more optimistic now then I was then. Simply due to the strange fit within HP, there has always been the potential someone would decide to shut it down.

I'd just like to encourage everyone to remain calm. More than that though, you should come to HHC. If it does turn out that this is the last one ever (doubtful), let's go out with a bang! :-D

--

TW

Although I work for the HP calculator groups, the thoughts and comments I express here are my own.

As a veteran of corporate restructuring myself, I know that these events can take unexpected turns and curious reversals. I hope that your (guarded, I am sure) optimism turns out to be justified and that your operating unit survives and hopefully prospers.

As an interesting footnote, my family entertained a Russian business student at our home this past weekend. By coincidence, it was her birthday, so we gave her an HP-10 as a gift and memento of her visit to the states. She was THRILLED with it! It's clear that HP calculators still have the power to impress. Let's all hope that HP senior leadership realizes the same thing...

Good luck...

To me, the sad thing about HP leaving the PC business is that they bought compaq in 2002 for $25 billion and now they're getting out. To me it shows very poor management at the top to make such a large investment and then change their mind a short timer.

HP-41 strange Memory Module found.

*Message #1 Posted by **Diego Diaz** on 20 Aug 2011, 10:18 a.m.*

Hi all,

This is nothing but a "cosmetic rarity" but just want to share it and ask if someone else has ever found such a type of "error".

As a result of the several USB power cables I've built lately, I've seek all the posible candidate modules to use their case and connectors, in the bottom of the "usable module box" I found the one in the picture:

The module is a simple 82106A with the peculiarity that the external label was printed upside-down.

BTW, it works as any other Memory Module... (i.e. if you enter "1.2345" into one of its registers you won't get "5432.1" when recalling it... sorry, couldn't resist... ;-)

Have you ever found any other wrong labelled module (any type)?

Best from the Canary Islands.

Diego.

PS. The label is of course "printed", it's not a sticker labelled module.

µWatch2 Back Again

*Message #1 Posted by **DaveJ** on 20 Aug 2011, 9:26 a.m.*

Well, it's been around 2 years wince I last floated ideas for my µWatch2 project. Lots of things have happened since then which left zero time and enthusiasm for it, but as with all my projects it's back again.

This time it has a new concept and a new look, which I really like and think will work much better than any previous designs.

It is designed to be a "clip-in" watch calc, so it works equally well as a calc watch, or a tiny pocket calc. Just snap it in and out of the rubber watch band.

Specs are:
- 168x144 mono LCD. No backlight yet, it's designed for very low light conditions. But maybe I can add an even backlight as the LCD is transflective.
- 41mm x 55mm x 10mm alloy or SS case with screw on back plate
- 20 key keypad, with recessed legend overlay. 100g tact switches. 6.5mm key spacing
- Powered from 2 coin cell batteries. (estimate 1+ year life with continuous display)
- Processor choice is up in the air. Suggestions? Needs to be low power, I want to run continuously at 32KHz. Microchip 24F XLP perhaps. Would shoot for say 64KB & 8KB minimum as per the Mk1 uWatch. If it could play chess again I'd be happy.

The LCD and keys are FIRM, and the case design is almost complete to fit actual hardware. According to eMachineShop it should be manufacturable. First design was 60mm wide with an extra column of keys, but I thought this was too big.

The concept is not a super high end feature watch, with USB and all sorts of fancy stuff. The idea is now low power, long battery life, ruugged, good nerdy calc watch looks, functional, with a basic Casio CFX-400 style shifting key style calc interface. Might even have an internal micro SD card for storage, maybe

It will have a mineral glass protection for the LCD. Though I'm not sure how these are best mounted. At present it will just sit inside the case against the LCD. If it can some how be glued(?) on a front recess or something then I'll do that.

It will have a 0.1" I/O header pin interface on the left side, for, whatever...

Been thinking about a temperature compensated crystal for a super accurate watch, but that would increase the consumption maybe 10 fold.

Cost is not really factoring into the design, I want this to be a proper commercial quality calc watch you can wear everywhere and have it look good and last.

Buttons and spacing are designed so you can actually use the thing.

Previous designs have gone for powerful 32bit micros, rechargable lithium ion batteries, touch screen or cap sense buttons, and USB etc. But touch screen watches are now a dime a dozen, and I think cap sense will just be too variable at a small key spacing.

I want something with real calc buttons that screams "I'm a NERD!"

It is designed to fit the massively popular existing iPod Nano TikTok watch band. So it's the exact same height as a nano (41mm), but longer, so it would simply hang over each side of the watch band.

As always, feedback welcome.

Dave.

in response to message #1 by DaveJ

Using the existing TikTok band is a good idea, but you'd want the edges of the case to be very close to the curvature of the iPod Nano for a good fit.

It's not obvious from the photos of the band, but the Nano's belt clip sits "down" in a 1mm or so recess in the bottom of the watch band's case area. This is what secures the watch from potentially sliding sideways out of the case. Your watch back should have something similar.

Given that it's a high quality silicone rubber with a tight fit and almost 40mm of contact surface area on both edges, I would not expect any slip against an anodised aluminium case.

But I could be wrong, will have to suck it and see I guess.

Dave.

For what I can tell after reading the description, this looks like a great tool... sign me up for one! :) It isn't stated, but I assume it will be RPN, right? Will it have upgradeable firmware, and installable apps? +1 for the Micro SD, it opens a lot of possibilities for easy backup, data transfer, firmware upgrade, and so on...

About the belt clip recess: if it's to be used also as a tiny desktop calc, I wouldn't want a belt clip on it...

Cristian

>
> About the belt clip recess: if it's to be used also as a tiny desktop calc, I wouldn't want a belt clip on it...

I agree on the belt clip.

It will be open source hardware and software, so you can do whatever you want with it.

As stated many times, I am not afraid to say that I am NOT an RPN fanboy, and that I prefer algebraic. So it will have algebraic off the bat. I added RPN to the first watch to make it novel, so will likly do the same with this one.

I couldn't care less about installable apps personally or anything else software, my first priority is to get working hardware.

Upgradable firmware, of course. But whether or not that that's via an easy to use external connector, or via an internal connector, or requires a special programmer etc remains to be seen.

If I stuck a USB connector on the side for instance, then the feature creep starts. You need a faster processor and crystal, and a boot loader to download firmware via the USB etc. Then it chews the batteries, so you start thinking of a USB rechargable lithium ion battery to power it all etc etc...

I'm now thinking that if I use a rubber membrane keypad and don't have any external connectors, then the thing would be fairly water resistant (not waterproof)

Dave.

Hi Dave! Glad to see you are working on this. Though to be honest, I'd be happy with one of the original µWatchs (I discovered it too late to buy).

Just beware of feature creep. If you listen to us, we'll be asking for an HP-42s with a color graphics display and GPS/GSM/WiFi/HDMI/bluetooth/SD card, web cam, and a TV remote control. ;)

But basic HP-45/55 type functionality would do.

Trust me, you wouldn't!
It looks far better in the photos than it actually looks and performs in real life.
It was never designed as a commercial product or everyday watch, it was designed to win a design contest and just satisfy my desire to see if it could be done using off the shelf parts.
The battery life was abysmal, the watch band attachment always fell off, and it was a bulky. It was a terrible watch, but a neat project none the less.

in response to message #1 by DaveJ

Actually, an accuracy factor such as the HP 41CX or a correction factor found in the Synchronar Mark one thru four would be more preferable then the temperature compensated crystal

Using the correction factor, a number between 200 and 700 I have gotton the synchronar to within 2 seconds a year on my wrist. Each correction digit (1) is a 4 second per year change to the count of the crystal:

You want to avoid trimming capacitors as they are subject to temperature effects. So finding an accurate cut to the crystal and combinging that with an accuracy factor would solve the power consumption and give the user better control of the watch environment.

Cheers, Geoff

(yes, i have a synchronar)

Re: µWatch2 Back Again

*Message #10 Posted by **David Ramsey** on 21 Aug 2011, 7:46 p.m.,*
in response to message #9 by geoff quickfall

I have a Synchronar, too, but the batteries have long since ceased to hold a charge. Changing them is a huge pain but I suppose I should get the Dremel out and have a go.

in response to message #1 by DaveJ

Hi Dave,

As happy Mk1 user I will for sure want a Mk2. The idea with the TikTok band is nice, I like it!

> Quote:
>
> Been thinking about a temperature compensated crystal for a super accurate watch, but that would increase the consumption maybe 10 fold.

With the TI eZ430-Chronos some guys took care of to increase the accuracy, see this article at watchuseek.com the most accurate astronomical wristwatch in the world? (This link points to an entry about the new Astro-watch firmware, time precission discussion, measurement and analysis is in earlier articles).

The developer there (Catalin) offers several firmware versions, e.g. data-logger, sports-watch, worldtime and astronomical.

eZ430-Chronos uses a 32 kHz crystal, even without any external capacitors.

Hubert

in response to message #1 by DaveJ

Hi!

Your new watch project looks very promising! Count me in on one...

For me, it dosen't really matter if it will be an RPN or algebraic calculator. If it can do what the HP-01 can do (especially basic time claculations would be nice) and maybe has one or two unshifted (user defineable) constant keys for currency and/or unit conversions, I will be more than happy! If you need votes for adding backlight, count me in on that too. And please don't clutter the little keyboard with triple-shifted functions (but I understand that this has never been your intention anyway).

Does the display allow a constantly running analog watch when not in calculator mode?

And will it fit other iPod nano wristbands other than the one proposed by you? I get very uncomfortable if I wear such large plastic/rubber bracelets for longer and would prefer a "breathing" bracelet made of fabric or leather (there are plenty to chose from and most of them much cheaper than the TocToc band, at least in Europe).

Regards, max

Yes. Continuous display of anything you want on the dot matrix display. Analog, digital, Klingon, whatever.

> Quote:
>
> And will it fit other iPod nano wristbands other than the one proposed by you? Any band that allows added height and extra width would work. Not the fully enclosed types though, as that would require the exact form factor as the Nano. I could do that of course, but then there is no room for the keypad.

Dave.

HP 30b bricked when repurposing

*Message #1 Posted by **scalpa49** on 20 Aug 2011, 9:00 a.m.*

Hi,

I recently tried to repurpose my HP 30b using Gene's cable (using windows Vista + SAM-BA 2.10). In the middle of the flashing process the calculator stopped to respond, display is now off. I removed the batteries and inserted new ones, used the reset switch, tried self-test... but every attempt was unsuccessful. Is there anyone having the same problem or is the calc definitively bricked ?

Re: HP 30b bricked when repurposing

*Message #2 Posted by **gene wright** on 20 Aug 2011, 10:25 a.m.,*
in response to message #1 by scalpa49

I have never seen a calculator end up totally bricked when doing this.

My suggestions that seem to work (some obvious - no offense intended) :-)

1) Make sure to reboot the PC 2) Go through the steps in the flashing a 20b document carefully point by point.
3) Make sure you do not have Samba open or running until the appropriate point in the instructions.

I had one that I thought was totally dead which I have to Tim Wessman at an HHC meeting and it flashed right away. I had messed up on the procedure.

Best suggestions I can give you. Sorry. Good news is I really have never seen one that was killed

Re: HP 30b bricked when repurposing

*Message #3 Posted by **Lode** on 20 Aug 2011, 10:50 a.m.,*
in response to message #2 by gene wright

For the flashing process, does the calculator require something valid in the ROM before flashing to let it work, or could the ROM chip contain complete random garbage, all zeros, a half-interrupted combination of old and new data, and would the flashing still work?

Is the processor of the calculator itself involved in the flashing, or is it only the cable and the ROM chip doing stuff?

If flashing the BIOS of a computer fails, you're screwed, since to be able to flash it you need to have a PC that's able to boot up as far as needed for flashing it. How does flashing a calculator compare to this?

Thanks.

in response to message #3 by Lode

> Quote:
>
> a half-interrupted combination of old and new data

I have had SAMBA lock up in the middle of a flash and had to kill the process via Task Manager. When I restarted it, I used the "Erase all Flash" script within SAMBA to clear out whatever may have been written before, and I started the procedure from the beginning. I followed the steps where you turn the calculator on and off while going through the button presses, even if the calculator didn't show anything on the display. I just went through the steps anyway. I have always been able to recover from a bad flash that way, and get back to a calculator that will boot.

*Message #5 Posted by **Tim Wessman** on 20 Aug 2011, 11:33 a.m.,*
in response to message #3 by Lode

It is impossible to "brick" the unit while flashing.

The chip has the serial built in the hardware (does not require firmware to work) and the first step of the flahing process is to upload a tiny program that pulls the input from the serial and writes it to flash.

All you need to do to get up an going once the flash has been erased is use the RESET button on the cable, then press ON. I like to hold RESET for 5 seconds, release, then ON for 5 seconds(sometimes the chips doesn't see it fora second or two).

TW

in response to message #5 by Tim Wessman

Thanks for your answers. I've already tried to redo the flashing steps carefully with no luck. But i missed the "erase all flash" script in sam-ba. I a few days i'll have access to a windows XP box that seems to be more stable (i already successfully flashed another hp 30b with it). Is it also possible that a wrong voltage has been sent to the calc during the flashing process, burning the electronics inside it ?

*Message #7 Posted by **Walter B** on 20 Aug 2011, 4:49 p.m.,*
in response to message #6 by scalpa49

As previous posters, I've never heard of a 20b or 30b "bricked" in flashing. I had, however, a similar experience here employing a suboptimal USB/serial converter and Windows 7. Please note - if you didn't yet - you need Windows XP for flawless flashing. AFAIK, Vista won't do it. Don't ask me why d:-)

Walter

Re: HP 30b bricked when repurposing

*Message #8 Posted by **Marcus von Cube, Germany** on 20 Aug 2011, 5:52 p.m.,*

in response to message #6 by scalpa49

The SAM-BA boot loader is in ROM, not in flash and cannot be bricked except when you really fry the complete device. SAM-BA eats the batteries. You should check if the voltage is still near 3 V.

> Quote:
>
> It is impossible to "brick" the unit while flashing...

If you have a bad flashing cable, The 20b/30b will appear "bricked" even though you follow the directions by letter to the millisecond.

Don't spend too much time and money like I did replacing computers/USB adapters/drivers until you have a tested cable!

Not that this happened to me or anything. :)

There is a point during the process that the calculator screen remains blank (step 8 of the PDF guide), just continue with the process.

Re: HP 30b bricked when repurposing

*Message #11 Posted by **Marcus von Cube, Germany** on 21 Aug 2011, 4:04 p.m.,*
in response to message #10 by Bart (UK)

A soon as the flash is erased and SAM-BA takes over the chip, it has no notion of the display connected and therefore cannot show anything. The boot loader just waits for serial data and only talks to the serial connection (SAMBA-BA software) and not to the user. There isn't even a way to turn the unit off except by a battery pull.

Well the calc finally revived ! It was the batteries fault, drained by the first flashing.

Inserting new ones and carefully redoing the flashing steps solved the thing. A great thank for your invaluable help, all of you in this forum !

Re: HP 30b bricked when repurposing

*Message #14 Posted by **Alexander Oestert** on 26 Aug 2011, 7:51 a.m.,*
in response to message #13 by scalpa49

My guess is, that the original batteries are not necessarily dead but that it was only the taking-out and inserting batteries again that did the trick. Try the old ones on the flashed machine, they might still be good. I think after a corrupt flashing process the calc needs some kind of reset which is done by taking out the batteries and putting them back in. I had the very same unresponsive state in my 30b when I tried switching (!) between WP34s and the original firmware. SAM-BA wouldn't connect to the calc and taking out the batteries was the last resort - that worked. I suspected them to be dead, but they weren't. Marcus and Bart hinted at that above.

Lyuka and the Ostrowski method's for Root Seeking

*Message #1 Posted by **Namir** on 19 Aug 2011, 2:44 p.m.*

A few threads back Hugh Steers pointed out a method for finding the roots of a nonlinear function by Russian mathematician Ostrowski. I checked Luyka's web page which discussed that method and presented the code for the algorithm. It did real well.

I further searched the Internet for articles about root-seeking method based on Ostrowski's method. I found several articles that further accelerated the convergence for that algorithm. A few articles were published by Chinese mathematician Zou (and colleagues) and offer somewhat elaborate enhancements to Ostrowski's method. These enhancements can solve for a root in TWO iterations (requiring 9 function calls) as compared to 6 iterations (and 12 function call) with Newton's method!. The fast Halley's method required 3 iterations and 9 function calls. The basic Ostrowski method took 3 iterations and 7 function call.

So thank you Lyuka for pointing me to Ostrowski's method. I really enjoyed learning about it and about its variants.

More gems in the root-seeking toolbox. Just when I thoght I learned about all the algorithms available, I get to learn about new and even more efficient ones!!

Namir

Re: Lyuka and the Ostrowski method's for Root Seeking

*Message #2 Posted by **Lyuka** on 20 Aug 2011, 11:03 a.m.,*
in response to message #1 by Namir

Hi,

The Ostrowski's method is a kind of root finding algorithm that uses reverse-interpolation to approximate the root.
So, any other interpolation, such as Lagrange interpolation, can be used as a root finding algorithm.
If you use that of n=3, a recurrence equation

can be used instead of Ostrowski's

This can be tested replacing a line in _ost.c

> Quote:
>
> ```
> t = (h * a - b) / (h - 1.0);
> ```

by

Quote:

```
t  = a * e * f * (f - e) - b * d * f * (f - d) + c * d * e * (e - d);
t /= (f - e) * (f - d) * (e - d);
```

Though the convergence of the method shown above is almost quadratic (order of about 1.8) for a zero of multiplicity 1 in a neighborhood of the zero, it's NOT recommended as it tends to diverge when the guess is not near the zero.

IMHO, the most important thing as a root finding algorithm is not the order of convergence, but the stability of convergence, i.e. ability to find a root with very few chance of divergence.

Regards,
Lyuka

WP34s "resources"

*Message #1 Posted by **Bruce Bergman** on 19 Aug 2011, 11:33 a.m.*

Sorry for posting this as a separate thread, since it was discussed many moons below, but I wanted to at least make sure this got covered (offered).

I would be HAPPY to provide resource space for the WP34s project, if anyone in that group, or other fanboys ;-), would find that useful. That could be public AND/OR private discussion forums, blogs, hosting space, bug trackers, wikis, source code library, etc. Essentially whatever might be needed to help that worthy and amazing project out.

I currently maintain the wiki4hp.com site, but that doesn't mean you have to use the wiki software. I can pretty much host any software needed or requested.

I understand that the project is hosted on SF right now.

I understand and AGREE that the readers of THIS forum are hugely participatory in the development of the WP34s and I too would hate to see that shrink merely because discussions about it occur on another site.

If Dave can't spawn off a subset forum of this one, one solution might be a prominent link here to off-site forums, so that the users here would be able to see and participate. If Dave and I can work out some sort of single sign on solution, perhaps that would solve the access issue so that users wouldn't have to sign up again. I'm quite willing to work on this if Dave has the time and resources on his side (and I know he's a busy guy, FWIW).

Anyhow, I'm just putting this offer out there. I'm not framing it in any one solution path. If there's a different need or different software desired, I'm fine with that. I'm just offering the free hosting services for whatever might be needed. I'm a huge fan of this project and want to help make it successful and polished.

So. There ya go. :-)

thanks, bruce

Re: WP34s "resources"

*Message #2 Posted by **Walter B** on 19 Aug 2011, 4:57 p.m.,*
in response to message #1 by Bruce Bergman

Bruce,

Thanks for your kind offer. I appreciate it - nevertheless I hope we won't need it. From the opinions posted so far in said other thread, I conclude there's a majority voting for letting the WP 34S continue its life here among the other calculator topics treated.

Thanks again,
Walter

Does wp34S Have A "MANT" Function?

*Message #1 Posted by **Jake Schwartz** on 19 Aug 2011, 10:18 a.m.*

Hi,

The other day I was searching for a MANTISSA function on the 34S and couldn't find one. I understand that if it had been a BCD machine, MANT would be fairly straightforward; and that it can always be computed with something like:

LBL A
LOG10
FP
x<0?
INC X
10^x
RTN

....but I just wondered if I had missed something while scanning through the manual.

Thanks, Jake

Jake,

You're right: we don't feature a MANT function in the WP 34S so far. We'll talk about it in due course. Any specific application you want it for?

Walter

Re: Does wp34S Have A "MANT" Function?

in response to message #2 by Walter B

Eh, you never quite know. Number manipulation tools are always good to have in the arsenal. SHOW exists which shows the mantissa, but depending on how much space it takes, a MANT function would be helpful to go along with IP and FP. Just provide the value without an exponent.

> Any specific application you want it for?

I was actually looking into some multiple-precision arithmetic and how it was being done by users as published in old PPC Journals for the HP67 and HP41. Some required entering portions of the number, each with all digits to the right of the decimal point. In giving thought to how to implement a multiple-precision (or perhaps only a very-large-integer) arithmetic scheme this time around, I found myself envisioning a possible need to extract the mantissa of a number separate from its exponent. It was then that I realized that it would be trivial with a BCD math "engine" under the hood, but much less so otherwise.

Currently, I've been looking into possibly utilizing the fact that numbers may be passed back and forth between the floating-point and integer "worlds" on the 34S. Since 64-bit math is available with integers, that would at least permit integers at least 19 digits long, and with double-word math, perhaps as high as 38 digits. There is an ultimate goal in mind, but first a set of arithmetic (plus remainder) functions for large numbers would have to be in place.

Your MANT implementations uses LOG and 10^X so that roundoff errors may occur. I think this is a better implementation:

```
LBL A
ENTER
LOG10
FLOOR
10^x
/
RTN
```

Works for the same domain (x>0) and requires no test since FLOOR returns the smallest integer less than or exqual to x, even for x<0.

If SDL and SDR would accept negative values there even was a much more elegant "true 34s style" method. ;-)

Anyway, I would like to second your suggestion of a MANT function. It can be implemented easily (simply clear the exponent), and of course we also need its counterpart EXP, which returns x / mant(X).

BTW - I still think the SHOW command needs an improvement. It simply does not work "as advertised": The manual says "Shows the full mantissa until the next key is pressed", but it doesn't. It only shows the first 12 digits of the mantissa, and even this display is rounded. Yes, I know there are only 12 digits in the display, but I am shure this forum's ingeniuity will find a way to overcome this limit. Maybe the display can be scrolled. But everything is better than a mantissa rounded to 12 digits.

Also, unlike all other HPs I know of, the command does not show trailing zeroes. In other words, things look like this:

```
Value in X     SHOW should display          SHOW actually displays
                     (IMHO)
    3          3000000000000000            3,
   Pi          3141592653589793            3,14159265359
  2/3          6666666666666667            6,66666666667 E-1
```

At least the 12th digit should not get rounded.

Yes, and with a small change it even works also for x<=0 and doesn't move the stack: :-)

```
LBL'EXP'
ABS
x[!=]0?
LOG[sub-1][sub-0]
FLOOR
RTN

LBL'MAN'
STO I
XEQ'EXP'
10[^x]
STO/ I
x[<->] I
RTN
```

You are using older firmware. SHOW shows all sixteen digits now.

Implementing a MANT function would be straightforward. What exactly should it do? Return x.xxxxxxxxx

or xxxxxxxxx??

It is replacing five - seven program steps so it is unlikely to be a good space trade. Defining this as a built in functions will take something like sixty bytes for even a little more.

- Pauli

Re: Does wp34S Have A "MANT" Function?

*Message #9 Posted by **Dieter** on 20 Aug 2011, 6:46 a.m.,*
in response to message #8 by Paul Dale

I looked at http://sourceforge.net/projects/wp34s/files/ and found a zip-file dated 2011-08-03, i.e. the version I am using right now. All I got is the emulator. Which files have to be replaced and where do I find them?

If a MANT function is implemented it should return a value between 1 and 10. Regarding space: well, there are several functions whose main purpose is making programs more elegant, but not significantly shorter. For instance, SIGN can be replaced by ABS X<>0? RCL/L, so it saves just two steps. The vast number of tests could be halved by simply adding one dummy test instruction that always tests false, thus inverting any other test.

If space is an issue these valuable bytes could be used for something more useful. I've got this very conservative opinion that a calculator should provide results as precise as possible. Currently ln1+x and e^x-1 are useful instructions that really help doing so. But there are others. In another math package I recently found a function that returns sqrt(1+x)-1. I think that's a great idea.

Or think of the x-th root of y. Some time ago CUBERT was implemented. I really appreciate this because it avoids significant errors when using the workaround 1/x y^x. Try the cuberoot of 512 that way - should be trivial but you'll get 7,999...998 (which on the other hand is fine since it's the correct result for x^0,333...333). So, CUBERT is nice and was a step in the right direction. But why don't we have a universal XROOT command? This is a standard command on many other calculators, including HP's.

As I think about it, I am sure there are some more useful commands that can help to get more precise results. ;-)

If you want to flash a 20b or 30b, you shall use calc.bin. If you are looking for the newest emulator, search for wp34sgui.exe. Watch out since the latest build(s) may contain severe bugs, while the zipped package collects more stable material.

> Quote:

I've got this very conservative opinion that a man shouldn't forget what he learned. Remember good old Taylor series? IMHO these are very well suited to this kind of "problems". For my generation, there were some important pages in Bronstein, Semendjajev ;-)

> Quote:
>

IIRC there was never a reasonable HP RPN calculator containing XROOT, but "Wenn's der Wahrheitsfindung dient ..." :-/ Anyway, that statement is easy for me but more difficult for Pauli, so I leave the decision to him :-)

Yes, I know, but as I said before, I only have the emulator.

> Quote:
>
> If you are looking for the newest emulator, search for wp34sgui.exe. Watch out since the latest build(s) may contain severe bugs, while the zipped package collects more stable material.

So the last stable material is the version dated 2011-08-03. That's what I already got - without the improved MANT command. Is wp34sgui.exe really the only file that needs to be replaced to get the latest version of the emulator? In other words, does this file contain the complete firmware with the latest changes?

> Quote:
>
> I've got this very conservative opinion that a man shouldn't forget what he learned. Remember good old Taylor series?

I don't know the English term for "Totschlagargument", but if this is what you think about useful instructions that help getting better results, ln1+x and e^x-1 should get deleted immediately - these cases can be handled by simple series expansions as well.

BTW that's how I code them in VBA. It doesn't even take a Bronstein/Semendjajew for this - my good old Schülke from more than 30 years ago will do just as well. 8-)

> Quote:
>
> IIRC there was never a reasonable HP RPN calculator containing XROOT, ...

What? No reasonable calculator? Hard to believe. Anyway - in that case the 34s would be the first one.

> Quote:
>
> ...but "Wenn's der Wahrheitsfindung dient ..." :-/

Yes, it does. It helps finding the mathematical truth. Example: try the 7th root of 4782969. Should be trivial since that's 9^7. But instead, requiring the [1/x] [y^x] workaround, the 34s returns 9,000000000000006. That's six (!) ULP off! #-\ The 35s returns the result with an error of -2 ULP. But here we can do better: the result returned by the XROOT command offered by this device of course is exactly 9. Great, isn't it?

Dieter, if you always want to be up-to-date, then bookmark this link:
http://wp34s.svn.sourceforge.net/viewvc/wp34s/

'Directory revision:' at the top shows you the latest version, and clicking on this number gives you a list of the changed files.
For the emulator you need wp34sgui.exe and emulator.dll (only when it has been changed).

Re: Does wp34S Have A "MANT" Function?

*Message #13 Posted by **Dieter** on 20 Aug 2011, 9:43 a.m.,*
in response to message #12 by fhub

Ah, thank you. I first got nothing but command window popping up and closing immediately. But it eventually worked after I replaced three files: wp34sgui.exe, wp34s.exe and emulator.dll

I see the "design team" chose the obvious way for the MANT display and used the three

digits of the exponent. However, the sixteenth digit had to move to the alpha line. I wonder if this looked ..."cleaner" if the complete four last digits were displayed in that line.

Dieter

*Message #14 Posted by **Walter B** on 20 Aug 2011, 12:57 p.m.,*
in response to message #13 by Dieter

I share your view about the distribution of the sixteen digits of the full mantissa. BTW, it's the *first* digit being shown top left. As you suggest, displaying the first four digits up there may be the better alternative. Since the mantissa will disappear with the next keystroke, overlap with status indicators up there should not be an obstacle.

Walter

Re: Does wp34S Have A "MANT" Function?

*Message #15 Posted by **Dieter** on 20 Aug 2011, 1:17 p.m.,*
in response to message #14 by Walter B

Yes, in the meantime I realized it's the *first* digit that is shown in the first line. #-)

Concerning the distribution of the digits, what about this: First 8 digits on the first line, last 8 digits on the lower line. Even the exponent can be displayed without loss of information. The display for e^99 would look like this:

```
98890303
19346947  42
```

By the way: I just notice that "copy number" on the emulator only copies the rounded 12 digit value, as displayed. Why doesn't it copy the the full precision 16-digit result?

Dieter

*Message #17 Posted by **Dieter** on 20 Aug 2011, 3:06 p.m.,*
in response to message #16 by Walter B

Of course both digit groups should be left-justified. Also the exponent may be at the right end of the second line. But I am not sure if this looks better or is more useful than the current solution using the three smaller exponent digits.

The copy command uses the same routine that formats the display. This

routine is limited to the 12 digits. We may change this in a future release .

*Message #21 Posted by **Paul Dale** on 20 Aug 2011, 7:17 p.m.,*
in response to message #13 by Dieter

This is a work in progress. I quickly threw together the show display and we'd already had different viewpoints raised about what to display and where.

I figured we should work out what we want and just do that... Then the discussions got redirected as they oft do.

4+12 sounds reasonable to me as well. I'd prefer to not do the exponent as well since we're running a different code path here and that will mean more bytes for little or no gain. Likewise, the decimal and thousands separators aren't being shown.

*Message #25 Posted by **Alexander Oestert** on 21 Aug 2011, 4:59 a.m.,*
in response to message #24 by Paul Dale

What about displaying the mantissa just in the lower row. Eight digits

at a time - waiting for a few seconds or a keystroke - and then the second eight digits? Or by scrolling them from right to left? The mantissa could even be longer than 16 digits if done this way.

Re: Does wp34S Have A "MANT" Function?

*Message #26 Posted by **Paul Dale** on 21 Aug 2011, 5:01 a.m.,*
in response to message #25 by Alexander Oestert

Our numbers are only sixteen digits in length so going longer is pointless.

I also detest scrolling displays. The 34S has none and it is going to stay that way ;-)

in response to message #28 by Walter B

The (very minor) minus in simplicity brings a (huge) plus in aesthetics, don't you think? :)

And it could be a consistent way to display even longer numbers - should someone strive to calculate pi or whatever to the gazillionth digit.

Re: Does wp34S Have A "MANT" Function?

*Message #30 Posted by **Dieter** on 21 Aug 2011, 7:16 a.m.,*
in response to message #22 by Paul Dale

What if the first (!) 12 digits were displayed in the second line and the last four on top, right-adjusted. This way the second line would show the unrounded 12-digit value and the alpha line displayed the four guard digits. Maybe even with three leading dots to make it as clear as possible, like this:

```
    ...9793
314159265358
```

Dieter

Re: Does wp34S Have A "MANT" Function?

*Message #31 Posted by **Paul Dale** on 21 Aug 2011, 7:19 a.m.,*
in response to message #30 by Dieter

Aren't you interested in the final digits if you use SHOW for this? They should be in the lower line. First leading digits are easy to see normally.

I'm happy to add some dots after the digits on the top line...

```
3141...
592653589793
```

Or a space and a down arrow. Or something similar.

My main objection to the 4/12 split is the top line isn't nicely spaced and doesn't look as good (to me) as the earlier 1/12/3 split. Still, I can live with either.

Re: Does wp34S Have A "MANT" Function?

*Message #32 Posted by **Dieter** on 21 Aug 2011, 8:51 a.m.,*
in response to message #31 by Paul Dale

> Quote:
>
> Aren't you interested in the final digits if you use SHOW for this?

Sure, that's why I think it's nice to display these otherwise invisible digits separately.
So the display would switch this way:

```
                      [h]              ...9793
  3,14159265359     [SHOW]     314159265358
```

In other words, SHOW would simply add the last digits that were invisible before.

But the current implementation is fine by me either.

You say it still looks ugly. This might be because of the proportional font used for the dot matrix line. In most cases that's fine and helps to make the most of the limited space, but there is one exception: I think that at least the digits 0 to 9 should have the same width. Just like the Arial font (this way providing properly aligned numbers for instance in Excel where it is set as the default font). But something deep inside me tells me that Walter will not change this in a million years. :-)))

How do you know? Feel free to change the fonts from the year 2525 on ;-)
Seriously, we don't support tables here (in 1.5 rows :-/). Instead, we have to live with 43 pixels HP allows us, so space-saving is essential IMHO. YMMV

The 50g sounds like a "reasonable" calculator to me...

> Quote:
>
> But here we can do better: the result returned by the XROOT command offered by this device of course is exactly 9. Great, isn't it?

Yes, it is. I'm convinced and thank you for the info. The next update of ND1 will have the XROOT function, though I don't yet know how to implement it. I tried 4782969, enter, 1/7, enter, ^ in ND1 which displays as "9" but really is "8.999999999999999998" (two ULPs

off). An alternative interface to XROOT will be exponentiation with a fraction.

If you ever feel like "austoben" yourself with numerical accuracy improvements in a (leading) RPN app, please get in touch with me. I admire your mathematical mind and stance toward accuracy.

The advantage of the XROOT command is its higher precision due to the internal guard digits. Usually there are three digits more than you see, on the 34s it's even 39 digits internal precision while only 16 are returned to the user. This additional precision avoids the following error. The example assumes 16 significant digits.

The 7th root of x is x^(1/7). But we connot provide the exact value for 1/7 on any limited-precision calculator. On a 16-digit machine, all that can be done is providing the best possible exponent, thus calculating

$$\text{7th root of } x \;=\; x^{1/7} \;\approx\; x^{0,1428\ 5714\ 2857\ 1429}$$

On a perfect calculator the exponent is off by at most 0,5 ULP. In this case it's 0,43 ULP. If we call this deviation dx, with a bit of calculus it can be shown that, in the final result, this causes a possible relative error of

```
  rel. error = dx * ln x
             = 0,42857 E-16 * ln 4782969
             = 6,592 E-16
or
  abs. error = rel. error * exact result
             = 6,592 E-16 * 9
             = 5,93 E-15
```

Which is exactly what we get in the example:

$$4782969^{0,1428\ 5714\ 2857\ 1429} \;=\; 9,000\ 0000\ 0000\ 0005\ 93...$$

which finally is rounded to ...006.
The result for a 12-digit calculator is better since here the rounded value for 1/7 is only 0,14 ULP off, so that the absolute error is "only" 1,98E-11 or 2 ULP.

The above calculation can be used to find out how many digits are required to ensure a full 16-digit result for the n-th root of x. <8)

> I don't know the English term for "Totschlagargument", but if this is what you think about useful instructions that help getting better results, ln1+x and e^x-1 should get deleted immediately - these cases can be handled by simple series expansions as well.

No way are those two going away ever. They are far too useful internally.

Series expansions aren't the best way to calculate many of these BTW.

Let alone externally where all we have is 16 digits. ;-)

So, ln1+x and e^x-1 now have a sister, helping to get the best possible results. Now come on, Walter, let's give XROOT a warm welcome. :-D

I have had time to do precious little programming in this highly restricted environment :-(These functions matter with the 39 digits held internally and are every bit as important if not more so in the sixteen digit setting.

> Quote:
>
> So, ln1+x and e^x-1 now have a sister, helping to get the best possible results. Now come on, Walter, let's give XROOT a warm welcome. :-D

Let us hope I got XROOT correct :-) I'm not too confident about the many integer cases :-(

I'm tempted by a few others (in the name of accuracy and stability):

- versine(x) = 1 - cos(x)
- sqrt(1 + x) - 1
- 1 - sqrt(1 - x)

And their inverses which are also unstable when calculated naïvely.

Sigh, flash is full.

in response to message #10 by Walter B

> Quote:
>
> Anyway, that statement is easy for me but more difficult for Pauli, so I leave the decision to him :-)

Since this has been asked for several times by several different people, it seems worthwhile enough. I've added the XROOT command. it appears in the X.FCN catalogues. It works in integer, real and complex modes. Integer was a right annoyance to get right.

Consider this in temporarily at the moment. It will depend on the number of bugs I've also included, the amount of flash consumed and our current flash head room.

Re: Does wp34S Have A "MANT" Function?

*Message #44 Posted by **Dieter** on 21 Aug 2011, 7:01 a.m.,*
in response to message #43 by Paul Dale

Right - that was exactly the solution I had in mind when I wrote

Quote:

If SDL and SDR would accept negative values there even was a much more elegant "true 34s style" method. ;-)

But since SDL and SDR don't seem to work with negative arguments this is not a solution here. Consider numbers less than one where floor(log10(x)) gets negative.

This leads to the question why no negative arguments are allowed. If they were, one of the commands could be omitted: n digits left-shift means -n digits right-shift. Or is this already implemented in a newer version I do not know of yet ?-)

Dieter

Re: Does wp34S Have A "MANT" Function?

*Message #45 Posted by **Paul Dale** on 21 Aug 2011, 7:09 a.m.,*
in response to message #44 by Dieter

The command processing code doesn't handle negatives.

Making it do so would require a fair amount of effort and the result is a few commands merged.

Not to mention the display issues due to the extra character in the command name and the lack of space in the op-codes to store a sign.

- Pauli

> The command processing code doesn't handle negatives.

I see that this is not possible for direct input, like SDL -3 or so. But it may work with an indirect call like SDL -> Y.

> Quote:
>
> Making it do so would require a fair amount of effort and the result is a few commands merged.

Using my very limited insight in the 34s' internal structures I imagine that it could be handled by a simple test: if the argument in SDL is negative, use its absolute value and jump to SDR (and vice versa). But I'm sure it's not that trivial, is it?

Dieter

Re: Does wp34S Have A "MANT" Function?

*Message #47 Posted by **Paul Dale** on 21 Aug 2011, 7:41 a.m.,*
in response to message #46 by Dieter

We could do it that way but, for consistency, we'd also have to include all the other shifts, rotates, masks and any other commands for which a negative argument would be possible. Flash space.

The indirection code path checks the argument to ensure that it matches the range allowed for user input (which always starts from 0). We'd need to either relax this code and allow much evil (i.e. the user can break things) or extend the checking so that every argument command has extra range information. Flash space again.

So yes, it would be possible but it is unlikely to happen anytime soon.

Concerns about HP's new direction

*Message #1 Posted by **Namir** on 19 Aug 2011, 9:18 a.m.*

Hi All,

It took me a while yesterday for HP's decisions to sink in. By the time I went to sleep I was very worried about the fate of HP calculators (present and future) and the fine men and women who work in producing them. Yesterday, I had written a thread to invite many folks on this forum to the HHC2011 saying that it will be a historical event. I HAD meant historical from the technical aspect of the cool topics discussed. It may be even more historical from the aspect of the fate of the calculator division. As I understood the reports from yesterday, it seems that HP's top leaders don't want to waste their time with making chump change. They want to go after the big bucks (IBM style) and the big customers--government and big corporations. You and I do not belong to that exclusive club. Moreover, our most beloved calculators do not belong to the "high dollar" item (actually service) category. I can easily see some company (most likely Chinese) buying the HP computer business, but who will buy the very small HP calculator business??? I shutter at the idea that our beloved HP calculators are heading for oblivion because they do not rack up the big bucks.

I am truly sad and shaken about what I perceive will happen in the next few months and the next year.

:-(

Namir

Re: Concerns about HP's new direction

*Message #2 Posted by **Thomas Radtke** on 19 Aug 2011, 10:16 a.m.,*
in response to message #1 by Namir

Someone will jump in, as always. Personally, I don't mind if the next good calculator won't have an hp label slapped on it. It might be as well 'wp', 'tc' or whatever one could imagine.

Have a look at Commodore. It's gone, but the machines and fans are still there, and there are even new things coming out all the time.

I'm sure there's a market, and that market will be served. Up to now, I always had one colleague also using an HP calculator, refusing to use something else but RPN. Last time it was the 15C, currently it is a 32SII - same as I use :-).

Don't think we're a small group. We're not. It pays to deliver machines we want ;-).

Re: Concerns about HP's new direction

*Message #3 Posted by **Namir** on 19 Aug 2011, 11:22 a.m.,*
in response to message #2 by Thomas Radtke

Thomas,

I hear what you saying. HP calculators may survive at the hand of small companies that consider the sale of these calculators as providing adequate income. I don't see a big corporation taking on HP calculators since they don't generate big bucks anymore! This means that the smaller company who will take on HP calculators may not be able to provide the quality we are used to.

Namir

Your analogy with Commodore may be a good one. It still exists:

"Commodore USA, LLC was founded by Barry Altman in April of 2010, with the express purpose of reviving and re-establishing the famous Commodore computer brand. We are Commodore and AMIGA fanatics, just like many of you."

http://www.commodoreusa.net/CUSA_C64.aspx

Perhaps a group of HP calculator enthusiasts need to do the same thing to keep it alive.

Re: Concerns about HP's new direction

*Message #7 Posted by **Thomas Radtke** on 19 Aug 2011, 1:49 p.m.,*
in response to message #6 by Dan W

> Quote:
>
> It still exists:

It does not. Commodore USA just licensed that name to produce PCs. Their OS is Linux. It's generally ok besides being extremely expensive, but has as much to do with old Commodore products as e.g. the HP-30S has with a Voyager.

*Message #8 Posted by **Iqbal** on 19 Aug 2011, 5:02 p.m.,*
in response to message #7 by Thomas Radtke

If HP sells off its calculator division, it may be for the best. Maybe the purchaser will finally take into account what the people are asking for.

Re: Concerns about HP's new direction

*Message #9 Posted by **Gerry Schultz** on 19 Aug 2011, 5:15 p.m.,*
in response to message #8 by Iqbal

I'll tell you what I'm concerned about. I just bought a 17.3" Pavilion laptop from HP and now they are getting out of the PC business? This reminds me of when I bought an 2 GHz iMac G5 in 2005 and a month later Apple announces it's migration to the Intel processor.

Okay, let's have a poll of which PC manufacturer we want out of business and I'll order a PC from them.

Gerry

*Message #10 Posted by **Walter B** on 19 Aug 2011, 5:26 p.m.,*
in response to message #8 by Iqbal

AFAIK this "calculator division" consist of very few people, backed (at least sometimes) by the resources of a huge company. I doubt said division can live on its own, though I'll be more than happy if proven false.

Remember we saw many "next generation calculators" announced by small companies or groups failing in the last decade. There is merely one exception, and this project (which must not be named here anymore for sake of not hurting the souls of our littl'ones) succeeded only since it relies on HP hardware. But we won't get HP hardware without HP :-/

Just my 20m€,
Walter

> will finally take into account what the people are asking for.

I can't see that ever happening. if it did get sold, then I can't see anyone buying for anything but the niche targeted educational and engineering products already produced.

And this reminds me, this huge shake-up might just mean there is a chance the new 15C won't actually make it out.

I'm willing to bet that it was "business as usual" up until the internal announcement for this shakeup. But once that announcement was made, EVERYTHING changes instantly internally, on a dime. Pushing the 15C out the door might be very hard indeed, no matter how close it is.

Dave.

Re: Concerns about HP's new direction

*Message #12 Posted by **Paul Dale** on 20 Aug 2011, 3:28 a.m.,*
in response to message #11 by DaveJ

Financial Dave. Financial calculators is where their income is.

They pretty much lost the educational and engineering markets a long time ago :-(

Now if you can build us a credit card sized calculator with decent amounts of memory we'll be able to make something decent from it.

- Pauli

Re: Concerns about HP's new direction

*Message #13 Posted by **Howard Owen** on 19 Aug 2011, 6:24 p.m.,*
in response to message #1 by Namir

It's not a slam dunk that the calculator group will be axed by the next owner. I believe HP actually makes money off calculators now, albiet a drop in the bucket compared to the overall balance sheet. The thought struck me that perhaps the calculator business might look more attractive to a company used to lower margins.

Another thing I realized is that I've got essentially zero understanding of the dynamics driving HP and a prospective buyer or buyers. Predicting what happens to HP calculators is therefor an exercise in ungrounded imagination for me.

It's a very uncertain time, no doubt.

Re: Concerns about HP's new direction

*Message #14 Posted by **Namir** on 19 Aug 2011, 7:13 p.m.,*
in response to message #13 by Howard Owen

Howard,

If HP feels the income from the PC market is not worth it, they will feel the calculator division to be like a tiny mosquito!! HP is interested in making LOTS of money ... and ONLY LOTS of money.

My concern is that the calculator division will have "most misfortunate fate" and go into oblivion. Sorry Tim and Cyril! You guys rock!! We as a club and all the collectors on eBay are really small potatoes.

Re: Concerns about HP's new direction

*Message #15 Posted by **Andreas Grund** on 19 Aug 2011, 8:08 p.m.,*
in response to message #14 by Namir

If they even sell the PC business, then there is no chance that the calculator business will be kept, lets say, survive. The new CEO, coming from SAP, where he did not act with much fortune, seems to turn HP into another SAP. Who needs? The market for biz software is almost satured, I am afraid, this HP approach is doomed to fail and in a couple of years HP is just a brand without content left.

Andreas

Re: Concerns about HP's new direction

*Message #16 Posted by **Artur-Brazil** on 23 Aug 2011, 7:42 a.m.,*
in response to message #15 by Andreas Grund

Hi, all! As seen in 2000, when Ms. Carly Fiorina put out the great HP division of equipments (now Agilent) and would invest on PCs market, I only said to my coleagues: HP is dead! They will compet with China in making PCs ... Well, I'm just waiting the final punch. Each new CEO - or God, as market put them - that came from a bankrupted firm and enters to HP brings that bankrupted enterprise into HP and discards HP's history. Now, HP is moving into a market that anyone with a minimal structure can offers too. It's just a question of time and we'll not anymore see HP logos in anywere, beyond museums of technology and science.

in response to message #16 by Artur-Brazil

Don't know about Carly's dark history before HP, but Leo's former company is far from bankruptcy. FWIW

Re: Concerns about HP's new direction

*Message #18 Posted by **Howard Owen** on 19 Aug 2011, 8:09 p.m.,*
in response to message #14 by Namir

I share your concern, Namir. I was just pointing out that being sold with the rest of the PSG might not be the death knell for our friends. A new owner that considered the PC business to be worth engaging in might also look at the calculator business as worthwhile. I was really commenting on the uncertainty of the situation. The possibilities might include better outcomes than we fear.

I will now go back to counting rainbows and feeding the leprechauns. :)

Leo Apottheker employment

What is the budget of the HP calc division ?

Re: Concerns about HP's new direction

*Message #20 Posted by **DaveJ** on 20 Aug 2011, 3:15 a.m.,*
in response to message #1 by Namir

Wouldn't it be awesome if they just open sourced *everything* from the calculator division?

And I'm talking source code, CAD files, all documents and masks etc

Better than letting it die, and I can't really see anyone buying it, except for being bundled as part of the computer division - which would be the same as letting it die.

It's a shame when companies and/or projects just die, and the massive amount of engineering and sweat and tears that went into them just dies too.

Dave.

Maybe awesome for the crowd here and any responsible curators of that intellectual property. But you can bet someone would soon be supplying the local dollar store with 15C keychain knockoffs. So there is risk to the brand image which can lessen the value and perhaps enjoyment of these devices.

> Quote:
>
> Better than letting it die, and I can't really see anyone buying it, except for being bundled as part of the computer division - which would be the same as letting it die.

It is an ultra-niche market which I expect to continue shrinking and I'd hazard the associated IP will transition into (or merge with) a more contemporary product. But my crystal ball even with a fresh set of batteries isn't giving me anything concrete.

> Quote:
>
> It's a shame when companies and/or projects just die, and the massive amount of engineering and sweat and tears that went into them just dies too.

Quite true. But given the mind boggling pace at which this general technology space advances, it isn't too surprising for a market defined and ruled by HP in the early 70's to be a little different some 40 years later. The fact they are still around speaks volumes of the engineering accomplishments and market presence of HP.

in response to message #1 by Namir

When the HP/Compaq merger was announced some members of the Hewlett family were against it:

> Quote:
>
> Walter Hewlett said acquiring Compaq would significantly increase HP's exposure to the PC market, which he said is "neither growing nor profitable." (http://news.cnet.co/2100-1001-275466.html#ixzz1VYp0MmTP)

I think he was right. Leo has to correct Carly's wrong decisions in the past, even if it hurts. Recently, HP didn't catch up with new trends in PC and tablet business, now they have to pay the bill.

Re: Concerns about HP's new direction

*Message #24 Posted by **Namir** on 20 Aug 2011, 8:45 a.m.,*
in response to message #23 by Juergen Keller

Yes I have an iPad that we use at home and while traveling, but I mainly use PC's that are networked at home--I have a desktop PC and several laptops. I enjoy a nice keyboard, screen, and connection with many USB devices (many external hard disks, SD card readers, cameras, etc) and the built-in DVD drive. And yes I use my new iPhone to check email, eBay, CNN, Facebook, movie times, while I am away from home. BUT .... I still enjoy using a PC. It maybe be another decade before I become more tablet-PC oriented. Besides, PC sales are low because of the general world economy!!!

Namir

> Quote:
>
> Besides, PC sales are low because of the general world economy!!!

That might be a reason; another reason is that people have several devices (mobile phone, tablet, laptop, PC) and they don't buy a new PC each year anymore. One of the success factors of Apple is that they have the full line of products, from mobile phone to PC, all with a quite consitent user interface, app store, music store, etc.

Recently, I bought a HP laptop for my daughter, and I have to admit that I didn't found yet anything that sets it apart from a laptop of any other manufacturer, nothing left from the old spirit of quality and innovation ...

Re: Concerns about HP's new direction

*Message #26 Posted by **Oliver Unter Ecker** on 20 Aug 2011, 8:49 a.m.,*
in response to message #1 by Namir

Yes, Namir, it's sad.

I feel for the guys in the calculator group and wish them all the best. I bet that group's product's are high-margin within the PC group, so maybe (hopefully) HP will just keep the group as is.

As far as heading into oblivion, I don't think so. The RPN idea is here to stay. Not as a mainstream thing, but as a viable alternative for whoever wants/needs it.

As far as new products from HP, it sounds like (though I do lack the insight) the calculator group at HP was sized for "maintenance", rather than radical new product development. So, with or without there being change at HP, truly new products were kind of unlikely anyway. (If someone has info that suggests otherwise, please correct me.)

As far as where will the RPN ideas live on, I think it's important to realize the importance of the smartphone/tablet. There're hundreds of RPN apps out there, with downloads in the thousands per day (I say this based on hard numbers I have access to). That's where the security comes from that RPN will survive. It's nice to have keys, but it's also nice to carry just one device. And a touch-screen is the better control for anything graphing. For a one-line RPN calc, I opinion the sweet spot lies with the smart device. And for a graphing calc, tablet HW can't be beat.

To me, of greatest interest would have been a new development that continues the -48, -49 line. That would be a major undertaking, demanding many millions in investment (if you don't do it very smartly...), and it looks like HP really wasn't going to pull this off. If there's (dim) hope that someone could pick up the IP (and people) behind the HP calcs, and take to the skies with new development, then maybe the changes at HP could be for the better.

It's amazing how dumb big corporation can be. I worked at Warner Bros. when Time Warner decided (with 99% shareholder approval) to buy AOL. It was so dump a decision, I almost quit the company over that. Sure enough, it turned out to be the fiasco that any one with a bit of technical savvy could have predicted.

Do these big mergers, upheavals ever work? I think the big cats are under emotional stress to do big changes to justify their outsized salaries. Sadly, rarely people of intelligence steer the big ships.

What's in a name? "Apotheker" is "pharmacist" in German. Talk about high-margin, service-oriented business.

Pioneer keyboard quality discrepancies?

*Message #1 Posted by **Lincoln R.** on 18 Aug 2011, 8:49 p.m.*

I use an HP 32s as my everyday calculator (Made in USA, Serial # begins with 2836A). It looks like it got dropped into a wood chipper, when I got it it didn't work right, and I had to disassemble it and replace the keyboard to PCB foam strip. However, this calculator has a great keyboard. Every key clicks firmly and feels like it should. My 32sII and 48g (both made in Singapore, one in 1994, one in 1997) are almost as good.

A while back I bought another 32s, this one is a 50th anniversary edition one (Made in USA, serial starts 2901A) that looks nearly perfect except that the faceplate is scratched near the top and peeling off. It works fine, but the keys are mushy. Not rattly like the later production Indonesian-made ones often are, but just plain mushy. Some are better than others, but they're not as good as I would expect.

What causes this, and is it something that can be fixed? The calculator doesn't seem to have been used much, I don't see any of the wear from being taken in and out of the cover that my other 32s has (It's so worn that all the texturing has worn off of the sides of the rear case). I did notice that the ones near where the faceplate is peeling are worse than the others, and was planning to remove/reglue the faceplate anyhow, could that be it?

Interesting overview of the HP-15C limited edition

*Message #1 Posted by **From Hong Kong** on 10 Aug 2011, 1:23 p.m.*

Interestingly, I found the following overview taken from a page snapshot that appeared on August 6, 2011.

[url:http://webcache.googleusercontent.com/search?hl=en&biw=1003&bih=463&gs_sm=e&gs_upl=547l9047l0l10375l15l14l1l2l2l0l359l3000l0.2.5.4l11l0&q=cache:3XBAGI0_1h4J:http://www8.hp.com/us/en/products/calculators/product-detail.html?oid=5153395+hp-15c+limited+edition&ct=clnk]

Overview

HP¡¦s Popular 15c Scientific Calculator in a Limited Edition. The HP 15c Scientific Calculator combines intelligent design with advanced scientific calculations. Benefit from faster processing power, great shortcuts like RPN and an intuitive, horizontal interface.

Features

Intelligent design meets portability

- The HP 15c scientific calculator presents an intuitive, horizontal interface, just like the original.
- The compact size and light-weight metal frame of the HP 15c allow scientists and engineers to easily carry this powerful calculator from meeting to meeting.

Powerful problem solver

- Run calculations quickly. This HP scientific calculator touts up to 100x faster processing power than its predecessor.

Advanced scientific calculations

- Gain a scientific calculator with programmable functions and built-in support for complex numbers, matrix math, numerical integration and root solving.
- Store complex calculations directly in the memory for rapid retrieval.
- Reduce the number of keystrokes with RPN capabilities.

HP classic available as limited edition

- This HP classic features a unique production number and ¡§limited edition¡¨ script, making it a great gift for collectors, scientists and engineers. Learn more about HP calculators.

The only feature missing is a reasonable display - reflecting the progress in 30 years since the launch of the original. Come on, HP :-) you don't want to bring a new calculator with key code programs in 2011, do you?

right, but it's even unaltered way better than the last scientific 35s with it's limited program labels!
My personal killing feature!
(But that is personal preference of mine and that might not always be convincing to others.)

Are you saying that the 15C has MORE program labels than the 35S? Or are you complaining about single character labels (I agree with you there).

HP Getting out of the PC market?

*Message #1 Posted by **Richard Garner** on 18 Aug 2011, 1:46 p.m.*

A news report on MSNBC said that HP has announced that it will be spinning off or selling its PC business. HP plans to keep the enterprise market but spin off the Personal Computer business to someone else. Does anyone have more definate information?

Re: HP Getting out of the PC market?

*Message #2 Posted by **Eric Smith** on 18 Aug 2011, 2:14 p.m.,*
in response to message #1 by Richard Garner

Didn't HP buy Compaq largely because it would improve their economies of scale to merge Compaq's and their own PC businesses? Couldn't they have saved a metric *@&load of money by just spinning off or selling off their PC business back then, and NOT buying Compaq?

Re: HP Getting out of the PC market?

*Message #3 Posted by **Seth Morabito** on 18 Aug 2011, 4:29 p.m.,*
in response to message #2 by Eric Smith

I've been so puzzled by HP's directions since Bill and Dave died. It seems like HP should have kept everything they spun off to Agilent, and spun off the computer division instead.

I wonder what impact (if any) this will have on whatever remains of the DEC properties? OpenVMS is still alive and kicking, I suppose they'll still be supporting that on Itanium, since it's part of their Enterprise group.

OpenVMS

*Message #4 Posted by **Eric Smith** on 18 Aug 2011, 10:41 p.m.,*
in response to message #3 by Seth Morabito

Speaking of OpenVMS, I wonder why they haven't ported it to 64-bit x86? (Officially, that is; I wouldn't be surprised if they have it running in-house.)

Of course, if they did release such a thing, they'd ensure that it couldn't easily be made to run on commodity hardware, but it would give them a lot more flexibility in designing the enterprise-grade hardware to run it.

The first two items on this obviously very out-of-date FAQ are absolutely hilarious: OpenVMS on HP Integrity servers

Some of the other items are laughable now as well, such as item five which says that "Over the next few years, Itanium will exceed x86 performance by as much as 2X." That was apparently written around 2007, and yet Itanium is still significantly slower than x86. The supposed availability features of the Itanium are present in some Xeons, so Itanium doesn't win there either.

It was obvious at the Itanium introduction ten years ago that it was NOT the architecture of the future, and nothing has changed that since. The Itanium sales forecasts have been downgraded several times a year, and yet are still absurdly optimistic.

The conclusion I draw from it is that HP is perfectly happy to relegate OpenVMS to a legacy niche, and will likely drop it within a few years, like they did the HP 3000 systems and MPE.

*Message #5 Posted by **John B. Smitherman** on 18 Aug 2011, 11:05 p.m.,*
in response to message #4 by Eric Smith

We still have 10 DEC VAX/VMS machines in service at work - 6 each 4300's, 3 each 4710's and 1 each Alpha. One had a power supply failure last weekend which had been in service since 1991. Over the last 20 years we've had very few failures - a small number of power supplies and hard drives. Not too bad.

in response to message #2 by Eric Smith

With the Compaq deal they acquired Digital and Tandem which are valuable assets in the high end market. The NonStop Systems which now are build mainly from stock HP hardware still run the unsurpassed NonStop Kernel operating system invented by Tandem for almost unlimited scalability and very very high reliability. It's the top of the line system (besides the Super Dome Unix boxes) for mission critical enterprise applications.

*Message #8 Posted by **Paul Gaster** on 18 Aug 2011, 5:13 p.m.,*
in response to message #2 by Eric Smith

Here is another HP story for today:

HP Killing WebOS http://gizmodo.com/5832291/

"A terse line in a press release from the company today reads "HP reported that it plans to announce that it

will discontinue operations for webOS devices, specifically the TouchPad and webOS phones." WebOS phones are great devices, much beloved by users, but they haven't sold well. It seemed like good news for webOS when HP bought Palm, but despite HP's clout, the phones still failed to catch on. There weren't enough apps. There weren't enough updates. And consequently, there weren't enough users. It was already clear that webOS was in very, very much trouble. Especially after Jon Rubinstein's recent departure."

So, that seems to be 1.2 Billion dollars wasted in under a year and a half. Is that some sort of record?

http://www.engadget.com/2010/04/28/hp-buys-palm/

"HP has just announced that it's acquiring Palm to the tune of $1.2 billion,.."

in response to message #1 by Richard Garner

IBM got out of the consumer PC market several years ago. Low margins and slow growth, even in good times, isn't a winning combination.

But since the calculator division is part of the potential deal (per Tim Wessman's post) this holds special interest for me. You might think that calculators were iconic products that HP would want to retain. I'm pretty pessimistic about that. IBM sold an iconic product, the IBM Thinkpad, to Lenovo with the rest of the PC business. Lenovo got the right to continue calling it the "IBM Thinkpad" for some time after the sale, in order to better enjoy the benefit of good will. So much for "iconic."

Who would a likely buyer be? Lenovo comes to mind right away.

Re: HP Getting out of the PC market?

*Message #20 Posted by **JustinM** on 18 Aug 2011, 5:51 p.m.,*
in response to message #19 by Howard Owen

My money's on Acer or Asus. The Thinkpads went to Lenovo in China, and I think only the computer companies in SE Asia will continue to produce commodity, low-margin systems. There's no growth left in desktop PCs and laptops are rapidly losing their niche to tablets.

I think in ten years your "computer" will be your phone. On the chance that you need a big screen and a keyboard, you'll just dock your phone like you do your laptop now. No more syncing a phone with a base computer - the phone will be it.

HP saw the writing on the wall this week with the stories of thousands of TouchPads sitting unsold in Best Buys. Apple and Google will be the 800 lb. gorillas of the next phase of personal computing so it makes sense to pull back to their core enterprise services and compete with IBM in the server room.

Re: HP Getting out of the PC market?

*Message #21 Posted by **Ethan Conner** on 18 Aug 2011, 6:46 p.m.,*
in response to message #20 by JustinM

"in ten years your computer will be your phone" It's NOW my computer...and other people that i know. I was laid off earlier this year and found another job,filled out the application and completed the background check all on my iphone. I was even in the interim doing all the unemployment paperwork on the phone. The only reason i ever touch the laptop anymore is to "sync" the phone and that is coming to an end soon. The future is now.

Re: HP Getting out of the PC market?

*Message #22 Posted by **JustinM** on 18 Aug 2011, 10:53 p.m.,*
in response to message #21 by Ethan Conner

You miss my point. I am fully aware that some people have replaced their desktops and laptops with phones. I wasn't saying that it will take ten years for phones to be capable of typical computing activities. My point was that in ten years a "computer" will be a phone - desktops and laptops won't exist anymore. We aren't there yet. Corporate offices don't have phone docks on their desks - they still have desktops and laptops. Have you written a 200 page report on your iPhone lately? What's missing is a means to seamlessly connect the phone to a real input device and a screen you can stand to look at for nine hours a day.

Not entirely.....no i have not written a 200 page document on my iphone. To quote a famous phrase among iphone owners.....or android, "there's an app for that." :)

Maybe a move back to engineering?

*Message #24 Posted by **snaggs** on 18 Aug 2011, 7:38 p.m.,*
in response to message #19 by Howard Owen

They still have printers, maybe theyll move the calculator division back there. It could be good news.

Daniel.

Re: Maybe a move back to engineering?

*Message #25 Posted by **NateB** on 18 Aug 2011, 8:34 p.m.,*
in response to message #24 by snaggs

The calculator transitioned from engineering tool to teaching device years ago. I'd think that most of HP's scientific calc sales are due to the FE/PE/PS exams and financial calc sales are due to the financial and real estate exams.

There was mention that HP was going to stop producing the 12c. Perhaps this is why. Bummer. With this news I think the 10,000 15c's will sell out rather quickly. Hopefully I'll be able to get at least two...

in response to message #27 by snaggs

> Quote:

> Wow, I thinks thats a good analysis.

(Sic!) That's no analysis at all - it's a comment. IMHO, a major share of the financial troubles in recent years stem from the fact these people were named "analysts" for whatever reason (maybe for getting higher wages?), and John Doe (hardly capable of spelling correctly :-(but writing about everything nevertheless) thinks that must be something close to scientific work. Forget it! They are traders, nothing more. [/rant]

Disclaimer: I apologize in advance for spelling and grammar errors - it's a foreign language for me.

Re: HP Getting out of the PC market?

*Message #30 Posted by **Calum Tait** on 19 Aug 2011, 8:53 a.m.,*
in response to message #1 by Richard Garner

Unfortunately, I can't see the calculators line surviving and I suspect it won't be long before the printers line gets spun off or sold off either. Both are de facto consumer products. Perhaps Kinpo will buy the rights and re-brand the calculators - or it may not be profitable enough for them. I think we are seeing one more step here towards the end of HP. It sadly reminds me of a once great British brand, GEC, built up over decades by the single-minded and famously penny concious Arnold Weinstock up to become Britain's largest and most profitable diversified technology company and a world leader in many fields. GEC succumbed to short-termist profit demands from gung-ho management and institutional shareholders. They saw in the 1990s, high profit margins from their telecommunications divisions, mainly due the expansion of the internet and subsequent dot-com boom. They decided this would be their "core business" and divested themselves of all the other divisions of the company which at that point were less profitable. They renamed the company "Marconi" and for a couple of years were popular investment due to high dividends. When the dot-com bubble burst and the telecoms equipment market went flat they had nothing to fall back on and within 10 years of being the largest conglomerate in the UK, they went bust. The old GEC was able to trade on its reputation for innovative, quality products and its wide portfolio of product types from components to systems allowed them access to the majority of markets and to cross-sell products. Further, the company's size allowed them to recruit in quantity the best engineers and designers who would then cross-fertilise ideas and solutions, even between separate businesses within the group. The parallels with HP are compelling and sad for me as we seem to learn

nothing from historical errors of management. Is a time when enterprises and governments worldwide are reducing spending the right time to put all your eggs in the basket of enterprise level computers and software? Especially when an upturn in the market doesn't seem to be in near sight. When a company has invested heavily in acquiring a software platform (WebOS) which has a number of advantages over the market leaders and then further invested in providing an excellent tablet and phone platform for it, is it wise to withdraw the product 2 months after launch? It all comes down to short-term profit from a quick sale of businesses and instant cash injections resulting in large management bonuses. It is this greed and near-sightedness which is a fatal flaw in our current market system. I do hope that the HP name survives as it is a brand with a tradition to be proud of and of course I think it would be a crying shame if the last maker of RPN calculators were to cease production. I can't help but feel pessimistic though.

*Message #32 Posted by **Namir** on 19 Aug 2011, 3:21 p.m.,*
in response to message #30 by Calum Tait

It seems that HP's most trusted analysts projected that the PC market will be fading and that HP, like IBM, need to hone in on rich customers and make a lot of profit. They have missed one important point. If the market they are gunning for is cash-rich, there will be many more players in that market. I really can imagine many Asian Indian and Chinese companies getting a big piece of the pie for that market AND providing these services for less than HP. What will HP do then??? Greed does not have patience and that's a bad thing. I remember when Microsoft came out with MS-Word and Excel for DOS. They were not instant hits. This did not push Microsoft to ditch these products. Instead they stood by them and refined them. When Windows 95 rolled out Microsoft was able to jump ahead of the line and make their office products the best sellers, dethroning Word Perfect who had the lion's share in the word processing market, and likewise Lotus 123. Patience and strategic move pays off--not that they are easy or simple.

Ok for Word, but Excel?

Microsoft made Multiplan for DOS and Excel for Windows in 1987, after several months of delay (I remember well since I was eager to test it against Multiplan and Lotus 1-2-3). They released it for Mac at first.

Greetings,
Massimo

*Message #11 Posted by **Michael de Estrada** on 18 Aug 2011, 9:28 a.m.,*
in response to message #1 by snaggs

According to what has been published so far and then removed, it will be a replica of the original 15C with a much faster CPU. It will have the same package of the 12C+ with 2 CR2032 batteries. No dual line dot matrix display and no algebraic (gasp) mode.

Edit: Miguel beat me to it. HP keeps putting up and taking down pages.

Edit #2: At the bottom of the HP webpage it says "Addition loop test, completed in HP labs. Up to 100X faster than original HP 15c." This definitely points to the 12C+ processor and clocking, and the actual existence of this product, at least in prototype form. It also indicates that it will be much faster than a 35s.

*Message #12 Posted by **Marcus von Cube, Germany** on 18 Aug 2011, 11:15 a.m.,*
in response to message #11 by Michael de Estrada

If you look at what we know about the 12C+, the matter should be clear from the beginning. The 12C+ is an exact work-alike of the classic 12C because it runs the original firmware in an emulated

environment.

Guess what HP did to resurrect the 15C? It's just a 12C+ with differently painted keys and the firmware image replaced by that of the 15C. I assume that there were some adjustments to the emulator to support the larger memory space of the 15C compared to the 12C, but this should be minor.

The emulator runs on an Atmel ARM7 microprocessor in a shell that closely resembles the original voyager housing. This explains the speed improvement over the original.

in response to message #1 by snaggs

It will look and behave like a thirty-year-old pocket calculator, just compute 100x faster.

Very nice compact package, quick and easy access to the functions printed on the keyboard. Well suited for advanced calculations on the fly. OTOH outdated programming model (still key codes :-(instead of mnemonics), very limited memory, plain numeric display, no I/O. Original functionality and original UI - no progress but speed-wise in thirty years.

Ceterum censeo: ... you probably know.

Walter

Re: So what will a 15C LE be like?

*Message #15 Posted by **Gerson W. Barbosa** on 19 Aug 2011, 5:10 p.m.,*
in response to message #14 by Walter B

> Quote:
>
> no progress but speed-wise in thirty years.

That's enough for me. It was my first HP calculator and I still can read the key codes :-)

There is only one thing I may not like in it: on the back of my HP-12C+ it reads:

```
Product of China
Fabriqué en Chine
Hecho en China
Fabricado no China
```

English, French and Spanish are ok but Portuguese is wrong. China is a feminine noun (as most nouns ending in **-a**), therefore the correct contracted form of the preposition plus the definite article is **na** (em + a): Fabricado **na** China. Spelling and grammar mistakes in Chinese products, no matter the language, are generally an indication they are counterfeit. This reason alone might justify the correction. I think I mentioned this before here, but the error is still present in the back of the HP-20b. I wish I had a more persuasive way to convince them to fix it :-)

Romans go home (from Monty Python's Life of Brian)

Gerson.

I can even predict the initial reviews in this forum.

First, we will complain about the keys and the display. Both of them will not be up to ancient Voyager standards.

Next, we will attack the sorry battery life, compared to the original 15C. Someone will be claiming his 15C still runs on the original batteries after the batteries of his new 15C LE have already gone dead.

Finally, we will lose ourselves in the emulation vs. simulation debate. Some will argue that a simulation with expanded memory and additional features would have been better, while others will contend that a simulation will always contain some bugs (<cough> 35s <cough>) that a true 15C emulation does not exhibit.

*Message #18 Posted by **Michael de Estrada** on 18 Aug 2011, 7:25 p.m.,*
in response to message #17 by Jeroen Van Nieuwenhove

I doubt it. Your first complaint will be that you were unable to get one, because only a very small number were available outside the USA. You will then be forced to buy one on TAS for even more than the vintage ones cost.

At least SC offered to ship anywhere, and all who really care likely preordered one. Nothing to complain here, imo.

You seem to be in the know. Please tell us more ;-) We Europeans might have to wait a little longer and we surely will pay a little more, but eventually these 15C LE will find their way to my local retailer/webshop. I trust a limited edition does not mean that HP will not try to maximize their potential profits from this product.

*Message #26 Posted by **Håkan Thörngren** on 19 Aug 2011, 4:02 p.m.,*
in response to message #25 by Walter B

Hopefully it will not have a decent display. Please keep that useless thing that cannot display alpha characters. Do not put a HP-41 style display in!

Because otherwise I would feel a strong need to repurpose it with my own software, wasting countless hours of work that I could use for other non-HP projects...

So please do not put a decent display in, so I can just ignore it. :/

*Message #27 Posted by **Paul Gaster** on 19 Aug 2011, 7:46 p.m.,*
in response to message #26 by Håkan Thörngren

I just thought of something that made me a bit sick to my stomach. What if, and this is a big IF, HP somehow used some 35S code for trig functions in the new 15C LE? That would truly be sickening. I wonder how many would buy it then?

Is it even possible to reuse the code from a 35S? I am hoping that someone says no....

Re: So what will a 15C LE be like?

*Message #28 Posted by **Lincoln R.** on 19 Aug 2011, 9:21 p.m.,*
in response to message #27 by Paul Gaster

Probably not possible, the 35S was 6502 based, and the 15C LE will almost certainly be Atmel ARM. Also, I believe the 35S's software was written by Kinpo (the company that was making HP's calcs at the time) and not by HP.

I honestly suspect it will be a new style 12C with different labels and firmware. The modern 12C apparently emulates a Voyager chipset on an ARM, IIRC the displays in Voyagers were the same or quite similar, so HP has little development cost in this other than tracking down the original 15C ROM and getting it to run in the existing emulation,

and having their manufacturing contractor (I think they've mostly been using Inventec lately) print different key labels.

For that matter (and here's a real pipe dream), this architecture would make it trivial to build new 16Cs.

I'm not quite sure what is going on there. I've followed it somewhat with interest of a potential HP response to the apparent resale of Voyager firmware but I'd assume from the above they haven't taken issue with it as of yet.

The other interesting comment I'd seen was an initial claim the emulator in use was nonpareil based. Seemed likely by association as the rom image appears to be the cosmetically modified version bundled with a former nonpareil version.

But when the subject of source availability per compliance with GPL licensing arose, it wasn't

nonpareil based anymore:

A nice trade

*Message #1 Posted by **Chuck** on 17 Aug 2011, 1:23 p.m.*

A good friend of mine had a 41cx from way back (1984) and decided he didn't use it as it should be used and wanted a good caretaker for it. However, he still wanted a calculator with RPN and I had a few duplicates (28S, 12C 35S, 48SX...). He liked the 35S, so.... a new family member.....

It's in impeccable condition, just a little dust from years of sitting; came with the Financial I module and the PPC ROM, of which I know nothing; and has the PPC ROM Pocket Guide that appears to be a preliminary request for routines that culminated in the "phone book size" manual. The commands in the pocket guide are gibberish to me,

but hopefully I'll figure some of it out. Rest assured, I'll be a good caretaker.

Cheers

OT: Hrast Programmer's Cool Music

*Message #1 Posted by **Namir** on 17 Aug 2011, 1:11 p.m.*

Hi All,

Fellow HP programmer Hrast Programmer who is well know for his cool HP calculator software and a member of this forum is sharing his talents in music too! He has launched his first album, "Harmony of the Machines", on Musiczeit music service.

What is cool about this music, IMHO, is that when I listen to it I feel it is like the music generated by the internal circuitry of our beloved calculators when they are running a program.

Any case, it is very nice music and I look forward to his upcoming three albums that will be released between the near future and the next year.

Namir

Edited: 17 Aug 2011, 1:12 p.m.

Re: OT: Hrast Programmer's Cool Music

*Message #2 Posted by **HrastProgrammer** on 18 Aug 2011, 1:42 a.m.,*
in response to message #1 by Namir

Hi Namir,

Thanks a lot for the support :-) It is nice to find at least one fan even here, on the forum not related to (electronic) music at all.

In fact, I used HP calculators there, not to produce the actual sound, but to calculate various things while developing my sequencer and some other software I needed ...

9830 tape drive question

*Message #1 Posted by **David Ramsey** on 17 Aug 2011, 11:49 a.m.*

I recently snagged a beautiful 9830a from a long-time HP reseller in San Jose. The machine is in spectacular cosmetic condition; it looks as if it came out of the box just a few months ago.

It has the 8K memory upgrade and I grabbed a slew of ROMs as well as an equally-snazzy 9866 printer.

Everything works great except the tape drive. I can read the pre-recorded Math and Stat packs reliably; the system test cassette reads perhaps 20% of the time, and although I can successfully MARK the two NOS HP tapes I got with the calculator, I've never been able to write anything to them and read it back without getting an ERROR 59 (checksum error) or ERROR 58 (misc tape error: door open, STOP pressed, clear leader problem, etc.) In the latter case there is no obvious physical problem I can see, and yes, the internal tape light works.

I've cleaned the head with alcohol and wiped it down with a microfiber cloth.

Now, this could just be cruddy 35 year old tapes. I've ordered new tapes and a head deGausser which I should receive next week.

The tape drive makes a continuous "tap..tap..tap" sound as the tape is read or recorded at normal speed. With the top of the computer off, a finger on the driving spool motor will feel each "tap" distinctly. Is this sound normal? And does anyone have any suggestions for things I could try?

Re: 9830 tape drive question

*Message #2 Posted by **Tony Duell** on 18 Aug 2011, 4:37 a.m.,*
in response to message #1 by David Ramsey

No, tht sound is not normal, and may be part of the problem.

Unlike audio cassette recorders, the HP9830 tape drive doesn't use a capstan and pinch roller, it just drives the spools. The tape speed is not constant therefore, but that doesn't matter as the data encoding is essentially self-clocking.

Anyway, there are 2 motors inside the drive on a rocking beam, which is moved by a pair of solenoids, one each side. Each motor spindle can be forced against the rubber tyre of the drive spindle. My first guess is that these tyres, which are simple O-rings, have decayed.

I would take out the tape drive, open in up and look at it.

Start by removing the top cover and the keyboard, then undo the fixing screws and lift the tape drive up and out, it's plugged into an edge connector on the backplane. Take out the screws on each side and ease off the mounting bracket. This carries the connector PCB, and the various parts of the tape drive are connected to this by 'plugs' which are actually little PCBs fitted with pins. Carefully unplug all 4 of these.

There's a metal bracket across the back of the motor assembly. It's held on by 5 screws (2 each side, and one in the centre). Take this off, and slide the motor assembly out too. You can now see the drive wheels and the

tyres. There's a sliding brake plate which is sprung against the tyres when the drive is stopped, and this might have made notches in said tyres.

Normally you don't have to remove the drive spindles themselves, but if you want to, take off the front cover next (1 long through-bolt, slide out the window before it falls out, and unscrew the ground wire). Then take off the leaf spring from the back of the drive spindle (1 screw), the circlip on the front side, and the plastic washer. The spindle will slide out rearwards.

My notes suggest a size BS219 O-ring is the right part to use.

Feel free to contact me privately for more information if you need it (and for that matter about any other aspect of the 9830 and 9866).

Re: 9830 tape drive question

*Message #3 Posted by **David Ramsey** on 18 Aug 2011, 4:22 p.m.,*
in response to message #2 by Tony Duell

Why, yes, there is a small notch in one of the O-rings:

That probably accounts for the sound. Guess I'll order some more O-rings. I'll let you know if that makes a difference.

Re: 9830 tape drive question

*Message #4 Posted by **David Ramsey** on 19 Aug 2011, 11:41 a.m.,*
in response to message #3 by David Ramsey

Pending the arrival of new O rings, I swapped jthe existing rings to each other's wheels.

The rings were soft and flexible, indistinguishable from new except for the notch in one of them. Perhaps the computer was stored in an inert atmosphere.

The tapping noise is greatly reduced, although still present. I can now reliably read the systems test cassette, although there's still no joy marking and recording and reading back from a blank tape. About half the time, doing a MARK 3,5000 results in the tape slowly moving all the way to its end, and a subsequent ERROR 58. On the occasion that the MARK operation appears to succeed, attempting a STORE operation will result in ERROR 59 (checksum error); if that succeeds, the error will occur on the LOAD operation.

Hopefully this is bad tapes or a head in need of deGaussing.

Re: 9830 tape drive question

*Message #5 Posted by **David Ramsey** on 19 Aug 2011, 10:07 p.m.,*
in response to message #4 by David Ramsey

Dang. New tapes and deGaussing had no effect; although I will replace both O rings, I suspect that won't have any effect, either. Further suggestions solicited...

Re: 9830 tape drive question

*Message #6 Posted by **Tony Duell** on 20 Aug 2011, 4:30 a.m.,*

in response to message #5 by David Ramsey

OK, it seems like the reading problem was due to the O-rings, since you can now read the pre-recorded tapes you have.

This also pretty much means that the head is OK. As you probably know, the head has 2 windings both of which are used for reading and writing. And much of the electronics must be working too.

The tape interface is one section of the machine which was supposed to be repaired to component level in the field, so the service manual (available from the Australian museum site) has some troubleshooting information. But I will try to provide some more here.

The unit writes 2 tracks. A pulse on one track is a 0, a pulse on the other track is a 1, and a pulse on both together is a byte marker. Tape words are 9 bits long, the middle bit (and thus in the same position relative to a marker no matter which way the tape is moving) is used to indicate a file header.

I don't think the 9830 verifies after writing or marking, so it's perhaps not surpising you don't get errors there.

You want to start on the Read/Write PCB, 09865-66563 (blue and orange handles, of course). When doing a write operation, look at TP2 and Tp3 with a 'scope or logic analyser. These are the outputs of the write encoder circuit. You should see pulses on both of them, as described above.

Now connect the 'scope or LA to the otuputs of the read amplifier. That's the outputs of U4a and U4b -- page 81 of 'my' schematic. Read a good tape to see what to expect, then try to read one of your tapes. See if either signal is missing (or garbled).

If one channel is bad, it shouldn't be too hard to trace the problem. Possibly the write driver circuit on the tape drive head PCB (page 87 of my schematics).

Re: 9830 tape drive question

*Message #7 Posted by **Tony Duell** on 20 Aug 2011, 4:39 a.m.,*
in response to message #6 by Tony Duell

It's also possible the write clock is running way off frequency. When marking a tape (or similar), look at TP1 on the tape controller PCB (09865-99652, blue and red handles, page 79 in 'my' schematic). It should be about 3kHz.

HHC 2011 is 5 weeks away --- bring your 20b/30b to be flashed and the programming contest...

*Message #1 Posted by **gene wright** on 17 Aug 2011, 11:33 a.m.*

If you are coming to the HHC 2011 conference in San Diego next month, great!

If you have an interest, bring your HP 20b or HP 30b and we will get it flashed with the most recent (at that time) 34s firmware.

The committee is thinking of having the programming contest have a category ONLY for the 34s.

Might be interesting to see how the unique abilities of the 34s play out with a programming problem put to a group.

HHC 2011

Re: HHC 2011 is 5 weeks away --- bring your 20b/30b to be flashed and the programming contest...

*Message #2 Posted by **Eric Smith** on 17 Aug 2011, 12:37 p.m.,*
in response to message #1 by gene wright

I respectfully request that the committee add a programming contest category for the HP-41 family, as there are several new -41 developments recently.

Re: HHC 2011 is 5 weeks away --- bring your 20b/30b to be flashed and the programming contest...

*Message #3 Posted by **gene wright** on 17 Aug 2011, 2:02 p.m.,*
in response to message #2 by Eric Smith

Any programming problem for the 34s would be doable on the 41c family. No problem.

Re: HHC 2011 is 5 weeks away --- bring your 20b/30b to be flashed and the programming contest...

*Message #4 Posted by **Namir** on 17 Aug 2011, 1:41 p.m.,*
in response to message #1 by gene wright

Woooohhooooooooooo ... burning HP-20b/30b calculators!! Yeaaahhh baby ... Yeaaah baby!!! Now that's what I call fun!!!!

If we don't agree to do something special for Monday, then we should sit at the hotel lobby and burn firmware!!!

<G>

Namir

Re: HHC 2011 is 5 weeks away --- bring your 20b/30b to be flashed and the programming contest...

*Message #5 Posted by **Jim Horn** on 17 Aug 2011, 1:50 p.m.,*
in response to message #4 by Namir

Namir, Namir, Namir... Wait until MONDAY? I suspect there will be more-or-less continuous burning whenever a 20b or 30b appears! Who would want to wait while all sorts of software and such is being exchanged?

Still hope to be there, re-purposed 20b, cable, laptop and all in tow... Maybe will even pick up a 30b just for the event.

Re: HHC 2011 is 5 weeks away --- bring your 20b/30b to be flashed and the programming contest...

*Message #6 Posted by **Namir** on 17 Aug 2011, 3:55 p.m.,*
in response to message #5 by Jim Horn

Jim,

I apologize ... perhaps I misspoke and skipped a few steps. Of course the burning of 20b/30b (sounds like an evil Nazi event that happened in the 30s) will start on Friday! BUT ..... again BUT ... I bet you the smart folks attending HHC2011 (and you know who you are .. besides your brother Joe) will find NEW BUGS (I cannot believe I am saying this) in the machines ... soooooo .. we go back to the drawing board .... more firmware burning ... WHEN?? ... I am listening???? ..... ON MONDAY!!!!!!!!!!

I rest my case!

<bows down>

Namir

Sigh ... it's tough being a genius. So many people misunderstand me ... and think I am being funny!!!

Edited: 17 Aug 2011, 4:40 p.m. after one or more responses were posted

*Message #10 Posted by **Namir** on 18 Aug 2011, 10:52 a.m.,*
in response to message #9 by Jim Horn

Jim,

My logic is so off the wall, it scares me sometimes!! :=]

It will be a pleasure to see you again Jim. I can tell this HHC meeting is going to be out of this world!!!

Namir

Re: HHC 2011 is 5 weeks away --- bring your 20b/30b to be flashed and the programming contest...

*Message #11 Posted by **Richard J Nelson** on 18 Aug 2011, 12:59 p.m.,*
in response to message #9 by Jim Horn

HHC 2011 will be exceptional this year. It is the 30th year (actually 32 years of manufacturer) of the HP-12C and I am asking attendees to bring their machines so we may compare them and take a group photo.

Wlodek will bring his collection of 12C's - if he can get the time - and he says that there have been subtle case changes over the years.

And yes, bring your HP-41.

Speaking of the 15C the Swiss machine has been cancelled, but there is a new design planned. see http://www.rpn-calc.ch/.

X < > Y,

Richard rpn-calc

Re: HHC 2011 is 5 weeks away --- bring your 20b/30b to be flashed and the programming contest...

*Message #12 Posted by **Marcus von Cube, Germany** on 17 Aug 2011, 4:02 p.m.,*

in response to message #4 by Namir

Burning the firmware is boring. :-/

Applying the overlay is tedious. :-(

Playing with the result is fun! :-)

Re: HHC 2011 is 5 weeks away --- bring your 20b/30b to be flashed and the programming contest...

*Message #13 Posted by **Namir** on 17 Aug 2011, 4:39 p.m.,*
in response to message #12 by Marcus von Cube, Germany

Maybe I should bring my wife's nephew with me. He is 19 and can put the overlays on the 30b buttons like an artist!!!

:-)

Namir

Let's keep our fingers crossed ... :-/

Re: HHC 2011 is 5 weeks away --- bring your 20b/30b to be flashed and the programming contest...

*Message #17 Posted by **Tim Wessman** on 17 Aug 2011, 11:05 p.m.,*
in response to message #15 by Martin Pinckney

You'd probably better leave a lot of space in your bag. See, the LE stands for Limited Eyesight. We recognized that most of the 15C fans are getting on up there in years. The "images" have been a bit deceiving since there is no reference point. We decided a unit that was about 5x the size of the original would hit the target demographic quite nicely. . . ;-)

TW

P.S. It runs on D batteries.

I think at that size you could program a Twister game on it...

```
Left foot on trig function-
Right hand on arithmetic-
```

Or use it with your feet like the floor piano in the movie Big with Tom Hanks. It could double as exercise!

I like it ;-)

Tim, you missed the last design review meeting. We had to switch to 6v lantern batteries, in a belt worn by the user.

HHC 2011 COME ON ALL!

*Message #23 Posted by **Namir** on 18 Aug 2011, 11:37 a.m.,*
in response to message #1 by gene wright

I sure would like to see some of the folks on this site, who have not been to previous conferences, attend HHC2001. Folks like Katie would simply glow in the meeting. I hope she takes the time and fly over to San Diego. There are many other nice folks that contribute here whom we have never seen. Come on out and let's party (am talking here party 34s style!). We love to meet you all in person. I am sure you are tons of fun and so are we (the veteran attendees). All this electronics communication is fine and convenient, but meeting in person is something to behold!

In the past years I have had a blast sitting right next to folks like Vokto Toth (of the www.rskey.org site), Joerg Woerner of the TI DataMath museum (I had fun teasing him about his low-end TI prototype calculators), and Goeff Quickfall's very first HHC conference in Corvallis. They left really special memories, the kind you can never get online!

So get some time off, gather your pennies, gather your courage (if you fear flying) and come on down! YOU WILL NOT BE SORRY! I PROMISE! THIS HISTORY IN THE MAKING.

Maybe calculators are not as important as they used to be, but our love and enthusiasm for them and for that special fellowship we have with each other, is very much alive and kicking.

in response to message #24 by David Hayden

Why should Eric sell 20bs or 30bs on HP's premises? :-?

Re: HHC 2011 is 5 weeks away --- bring your 20b/30b to be flashed and the programming contest...

*Message #26 Posted by **Tim Wessman** on 21 Aug 2011, 11:47 a.m.,*
in response to message #25 by Walter B

Why not? Wouldn't bother me.

That way anyone still wanting one could be sure there was one to get.

Considering that 3 years ago everyone was given a 20b, the year after that a 30b, and the year after that I had some spare 20b units for anyone to grab. . . seems kind of unlikely that we'd give out the same thing again.

Strange HP-35 auction on TAS

*Message #1 Posted by **Michael de Estrada** on 16 Aug 2011, 8:22 p.m.*

I just saw this rather strange HP-35 for sale in a TAS auction. It's strange because it presumably is an early version with "the bug" and the s/n is consistent with an early version 2. However, the keyboard and case front appear to be a later version 4. The rear label appears to be undisturbed. It's almost as if someone mated the internals and rear case from a buggy version 2 to the front case and keyboard of a version 4, but I don't know how it was done without any evidence of damage to the label. Anyways, I thought y'all might find this interesting.

Re: Strange HP-35 auction on TAS

*Message #2 Posted by **Dan W** on 16 Aug 2011, 9:20 p.m.,*
in response to message #1 by Michael de Estrada

Definitely a Franken Calculator.

I got quite good at removing the back label and replacing it without leaving much trace. It can be done, but this example is quite excellent. Could be a repro but repro's I have seen are just slightly thicker.

IIRC there should be a short label between the lower rear feet on a Type-2 back.

Re: Strange HP-35 auction on TAS

*Message #3 Posted by **Michael de Estrada** on 16 Aug 2011, 9:48 p.m.,*
in response to message #2 by Dan W

The thicker repro labels I bought from Ben Ong do not have the text at the bottom, e.g. "Made in U.S.A., 3.75V 500mW", but instead the thin silver border line is continuous. All HP-35 versions have some sort of label at the bottom, either a s/n or a label "Hewlett Packard 3.75V 500MW Made IN .... PATENT PENDING". Also, that serial number is quite unusual in that the prefix 1143A is typed, not printed in black, and the 1s are Is.

Edited: 16 Aug 2011, 9:50 p.m.

Re: Strange HP-35 auction on TAS

*Message #4 Posted by **Dan W** on 16 Aug 2011, 10:19 p.m.,*
in response to message #3 by Michael de Estrada

Yea, good catch. I've never seen an HP-35 serial number label all typed like that.

Maybe a factory repair unit.

*Message #5 Posted by **Frank Boehm (Germany)** on 17 Aug 2011, 4:56 a.m.,*
in response to message #1 by Michael de Estrada

The serial number puts it in the range of early V2s with the serial number attached between the lower feet, as

does the bottom part of the case. The sticker looks legit.
However I am a little bit concerned about the ln bug, this should not be present in a factory repair unit - but they did a ROM replacement on the customers PCB for the bugged uints, maybe they ran out of parts?
Btw. there have been original labels on ebay (a couple), so it's not impossible to recreate a 35 - but due to the limited value of a non-red dot, that's a pointless effort.
Alltogether an interesting unit, but probably only for a hardcore collector :)

Re: Strange HP-35 auction on TAS

*Message #6 Posted by **Randy** on 17 Aug 2011, 3:37 p.m.,*
in response to message #1 by Michael de Estrada

The SN label is an HP replacement and as such, the unit was most likely a service exchange unit. I'd bet the unit is all V4, inside and out, and does not have buggy roms. Nothing remarkable, they did this all the time, back in the day.

Re: Strange HP-35 auction on TAS

*Message #7 Posted by **Michael de Estrada** on 17 Aug 2011, 4:07 p.m.,*
in response to message #6 by Randy

But how can you explain the serial number, itself ? The prefix 1143 was used only on the version 1 (Red Dot) and early version 2. By the time the version 4 came out, the s/n prefix, which is presumably a date code, had been changed to a later value. And would HP type a capital "I", instead of the numeral "1" on the label ? As to the bug, well I guess only the eventual buyer will know for sure.

Service replacement ser#

*Message #8 Posted by **Frank Boehm (Germany)** on 18 Aug 2011, 4:08 a.m.,*
in response to message #7 by Michael de Estrada

There are service replacements of later HPs known without a serial# burnt in, instead the original serial# has been stickered on. So I assume this is common practise (concerning the inventory tracking of larger companies, this is the easiest way to go).

HP41 Card Reader 1E

*Message #1 Posted by **Richard L. Taylor** on 16 Aug 2011, 7:43 p.m.*

Hi members and guests, I was playing around with the card reader on my HP41cx and came up with a strange display. With the card reader plugged in, I gave the command SIZE 25 not 025 just key in a 2 and a 5. Then with the back arrow key, delete the 5 then delete the 2. You will end up with a display that shows the number 2 on the left side of the display and the word SIZE on the right side of the display. The back arrow will not clear the display but any other key will. Has any one seen this before?

Re: HP41 Card Reader 1E

*Message #2 Posted by **Eric Smith** on 17 Aug 2011, 12:49 p.m.,*
in response to message #1 by Richard L. Taylor

That's a well-known bug in early versions of the card reader ROM. It happens with any function that gives a three-digit prompt, and I think it may happen under some circumstances for two-digit prompts.

I'm not sure whether it is fixed in 1F, but I believe it is fixed in 1G. A more serious bug fixed in 1G is that the card reader can corrupt the contents of an extended memory module in port 2 or port 4.

I spend some time studying the backarrow bug last month, and found that it was due to the card reader ROM overflowing the four-level hardware return stack in the I/O service poll.

question for lyuka and the Ostrowski method

*Message #1 Posted by **hugh steers** on 16 Aug 2011, 7:13 p.m.*

hi,

wanted to try out this method. took the code here,

http://www.finetune.jp/~lyuka/technote/fract/ost.html

and tried one of my tests. this is smooth test from the temperature industry.

```
double f(double t)
{
    /* example from pressure */
    double x;
    t = t + 273.15;
    x = 0;
    if (t > 0) {
        x = -6096.9385 / t + 16.635794 - 0.02711193 * t + 0.00001673952 * t * t + 2.433502 *
log(t);
        x = exp(x);
    }
    return x - 1e-5; // value = 1e-5
}
```

not very pretty i know, but it should have a real world solution to a value of 1e-5 (hardcoded) between -275.15 and 100, say.

i do this:

```
int main()
{
    double          a, b, root;
    int             r;

    printf("vwat\n");
    r= ost(a=-271.15, b=100.0, f, EPSILON, ITERATION, &root);
    printf("main: %g, %g, f(%.18g) = %g, %d\n", a, b, root, f(root), r);
    return 0;
}
```

and it gives me -256.

here's the results from my other methods,

```
37 iterations
solve vwat=1e-5 in [-273.150000, 100.000000] with brentRoot = -106.310044
100 iterations
solve vwat=1e-5 in [-273.150000, 100.000000] with secantRoot = -1.#IND00
8 iterations
solve vwat=1e-5 in [-273.150000, 100.000000] with ridderRoot = -106.310044
2 iterations
solve vwat=1e-5 in [-273.150000, 100.000000] with ostRoot = -256.086474
```

secant blows, but brent and ridder are fine. ost is the -256 as mentioned.

is there a way to fix for this, otherwise the method has failed.

thanks for any info, -- hugh.

Re: question for lyuka and the Ostrowski method

Re: question for lyuka and the Ostrowski method

*Message #5 Posted by **Namir** on 17 Aug 2011, 7:58 a.m.,*
in response to message #2 by Namir

Lyuka's article about the Ostrowski algorithm comes in an interesting time. For the last week, I have been playing with basic root-seeking algorithms trying to use random numbers as a tool to tweak and improve these algorithms. Here is the pseudo-code for a method that is interesting. It is based on Bisection and uses random numbers:

```
Given:

1. Function Fx(x)=0
```

```
2. Function Rand() that generates uniform random numbers in interval (0,1).
3. Interval {A,B] containing the root of function Fx(x)=0, such that A < B.
4. The Factor value used to tweak root guesses. Optimum value is around 0.75.
5. Toler is smallest size of interval [A.B] used to obtain the root.

FA = Fx(A)
FB = Fx(B)
bFlag = False ' compensation mode flag
Do
  H = Abs(B - A) / 2
  ' do we need to compensate for the last iteration's failure
  ' to shrink the size of interval [A,B] by more than half?
  If bFlag Then
    ' compare the absolute function values at A and B to determine
    ' which end of the interval we will shift the new guess
    ' towards, in hope of getting closer to the root
    If Abs(FA) < Abs(FB) Then
      ' closer to A
      X = A + H * Rand() * Factor
    Else
      ' closer to B
      X = B - H * Rand() * Factor
    End If
  Else
    ' get a random value inside interval {A, B] replacing the
    ' typical Bisection step of calculating X as (A+B)/2
    '
    ' The new value of X reflects success using random numbers
    ' if it shrinks the size of the interval [A,B] by more than
    ' half.
    X = A + (B - A) * Rand()
  End If
  FX = Fx(X)
  If FA * FX > 0 Then
    A = X
    FA = FX
  Else
    B = X
    FB = FX
  End If
  ' did the last iteration fail to shrink the size of
  ' the interval [A,B] by more than half?
  ' If yes, then random selection has failed and we need to
  ' compensate in the next iteration
  bFlag = Abs(B - A) > H
Loop Until Abs(A - B) <= Toler
Refined guess for root = X
```

I have been running solutions in batches of 10000 iterations. The above algorithm does better than the Bisection method between 20% to 50% of the time and saving between 1 to 8 iterations (in significant frequencies). The results depend on the interval [A,B] and where the root is located within the interval. If the root is near the initial boundaries of interval [A,B] then the above algorithm shows more success. Using the "Factor" is the latest aspect of tweaking the algorithm. I am still studying the effect of using Factor and its optimum values.

The above algorithm is not the greatest improvement on Bisection. Like I said before I am looking at using random numbers in tweaking basic algorithms I have used the approach with Newton and Halley's method. So far no success.

Namir

Re: question for lyuka and the Ostrowski method

*Message #6 Posted by **Lyuka** on 16 Aug 2011, 11:40 p.m.,*
in response to message #1 by hugh steers

Hi hugh,

Thank you for your interest on the page " Ostrowski's method " and "SOLVE alternative for the HP 42S " (necessary not to be OT ;-)

Take a look at the return code, it would be '3' for your initial guesses of {-271.15, 100.0}, which means

> Quote:
>
> 3 : The search concentrated in a local flat region of the function. f(x_{n+2}) == f(x_{n+1})

It would occur mainly because of too wide set of initial guesses.
If you try that of {-271.15, 0} or {-100, 100},
the solve will converge to the correct answer of -106.310044029008282.

> Quote:

```
main: -271.15, 100, f(-256.651643757074339) = -1e-05, 3
main: -271.15, 0, f(-106.310044029008282) = 1.52466e-20, 1
main: -100, 100, f(-106.310044029008282) = 1.52466e-20, 1
```

Best regards,
Lyuka

Edited: 17 Aug 2011, 1:38 a.m.

Re: question for lyuka and the Ostrowski method

*Message #7 Posted by **Namir** on 17 Aug 2011, 1:48 a.m.,*
in response to message #6 by Lyuka

I like your C code because it examines the function values for the initial guesses and is able to exit if any of these guesses are at or close to the root. This is what I call the "deluxe version" of an implementation where all scenarios are handled.

Namir

Re: question for lyuka and the Ostrowski method

*Message #8 Posted by **Lyuka** on 17 Aug 2011, 2:05 a.m.,*

Lyuka

Re: question for lyuka and the Ostrowski method

*Message #9 Posted by **Namir** on 17 Aug 2011, 8:56 a.m.,*
in response to message #8 by Lyuka

Hi,

I was looking at the following part of your C code:

```
   if (0.0 == (f - e) * (f - d)) {
        c = (a + 3 * b) * 0.25;
        if (0.0 == (f = (*func)(c))) { *x = c; return 0; }
```

```
        if (0.0 == (f - e) * (f - d)) { *x = c; return 7; }
    }
```

How about something like:

```
   while (0.0 == (f - e) * (f - d)) {
        c = a + (b-a)*rand()/RAND_MAX;
        if (0.0 == (f = (*func)(c))) { *x = c; return 0; }
    }
```

The suggested code calculates c as a random value in the interval [a,b].

Namir

Re: question for lyuka and the Ostrowski method

*Message #10 Posted by **Lyuka** on 17 Aug 2011, 9:39 a.m.,*
in response to message #9 by Namir

Hi,

It seems good an idea, however the iteration limit must be used.
If the condition kept false several times, it must be concerned that it would be occurring because of too narrow initial guesses, or not.
In such case, the third guess 'c' would better be put outside of the 'a' to 'b' region.
This kind of 'pivot' strategy is difficult to decide.

Best regards,
Lyuka

Re: question for lyuka and the Ostrowski method

*Message #11 Posted by **Namir** on 17 Aug 2011, 10:37 a.m.,*
in response to message #10 by Lyuka

You are right. After I posted the message I thought teh while loop perhaps needed a counter? Also the range for calculating c may need to be wider. You are not obligated to have a < c < b.

Re: question for lyuka and the Ostrowski method

*Message #12 Posted by **Lyuka** on 18 Aug 2011, 4:53 p.m.,*
in response to message #11 by Namir

Hi Namir,

Inspired by your hints of using random() function,
I modified the _ost() function to deal with the case f(x_n+2) == f(x_n+1)
by pivoting the value to the random position between two previous values.

Quote:

```
if (0 == (f - e)) {
    if (p++ > MAXPVT) { *x = c; return 3; }
    c = a + (b - a) * (1.0 + (double)random()) / M2E31;
    f = (*func)(c);
    continue;
}
```

It seems to work well, also for the case of hugh steer's temperature related function.

Best regards,
Lyuka

Edited: 18 Aug 2011, 5:10 p.m.

Re: question for lyuka and the Ostrowski method

*Message #13 Posted by **Namir** on 16 Aug 2011, 11:43 p.m.,*
in response to message #1 by hugh steers

Hugh,

I got to play with Ostrowski's method using f(x)=e^x-3*x^2 and comparing it with Newton's method and the faster Halley's method. Since Ostrowski's method uses two initial guesses (and calculates a third guess as the average of the first two), I used the average of these guesses for the Newton and Halley methods, to even up the score a bit. In this case, Ostrowski's method did better than Newton but not better than Halley.

If I use the first guess for Newton and Halley methods, then depending on that guess and the second guess (used only by Ostrowski's method) I get a few cases where Ostrowski's method outperforms the other two!

Thanks for the fantastic article (and thanks for Luyka for writing that web page). It is a true gem in numerical analysis and for a root-seeking junkie like me!!

Namir

Edited: 17 Aug 2011, 1:23 a.m.

Re: question for lyuka and the Ostrowski method

*Message #14 Posted by **hugh steers** on 17 Aug 2011, 7:12 a.m.,*
in response to message #13 by Namir

all credit goes to lyuka for the article. i followed his post earlier (seems to have disappeared) to investigate this method. yes, i am interested in root methods too. mostly i use ridders method and find it very stable. the code is also small. i wanted to try this method out and compare it.

to lyuka, thanks. it looks like the method finds my function flat. it is true that the curve has a flattened end. this has fooled other methods too. the annoying thing is that this particular example comes from a real world case.

now im thinking if there's a hybrid method involving ostrowski and other ideas.

-- hugh.

Re: question for lyuka and the Ostrowski method

*Message #15 Posted by **Lyuka** on 22 Aug 2011, 4:40 p.m.,*
in response to message #1 by hugh steers

Hi hugh steers,

I've been tried to make my implementation of Ostrowski's method to be able to solve the water saturation pressure related equations, as you shown above, for various initial guesses.

Now, the latest version of the program (Rev.2.8) seems to work well for such kind of equations with almost any initial guesses within the range of [-273.15 : 100], except when the two guesses are at flat region near -273.15.

I've tested the program using the water saturation pressures equations by Sonntag and Wexler as well, to solve it for the pressure to be 1e-5.

Quote:

```
double
s(x)
    double          x;
{
    double          t;
    double          p = 1e-5;

    t = x + 273.15;
    if (t < 0) return 0;
    return exp(((16.635794 + 2.433502 * log(t) + 1.673952e-5 * t * t) -
2.711193e-2 * t)
               - 6096.9385 / t) * 100.0 - p;
}

double
w(x)
    double          x;
{
    double          t;
    double          p = 1e-5;

    t = x + 273.15;
    if (t < 0) return 0;
    return exp(((18.87643845 + 2.858487 * log(t))
        + t * (-2.8354721e-2 + t * (1.7838301e-5 + t * (-8.4150417e-10 + t *
4.4412543e-13))))
        + (-6017.0128 -2991.2729 / t) / t) - p;
}
```

Here is the results of test run of the program.

A Math Challenge (kind of)

*Message #1 Posted by **Namir** on 16 Aug 2011, 3:20 p.m.*

Hi All,

I am interested in the algorithm that allows me to determine the coefficients (A) and order of a polynomial (N) that:

1. Passes through a specified set of roots (n1 roots).

2. Passes through a specified set of minima (n2 minima).

3. Passes through a specified set of maxima (n3 maximum).

Doing just #1 is easy as pie!! Doing 1 and 2, 1 and 3, or 1, 2, and 3 is hard. Any ideas?

Namir

Edited: 16 Aug 2011, 3:22 p.m.

Re: A Math Challenge (kind of)

*Message #2 Posted by **Marcus von Cube, Germany** on 16 Aug 2011, 4:20 p.m.,*
in response to message #1 by Namir

Namir,

is n1 the exact number of roots or the minimum number of roots?

for #1 alone, this is simple, it's just the product (x-xi) where xi are the roots. To put #2 or #3 into the equation, you may or may not need to multiply in more factors so that f'(x) has roots at the specified minima or maxima and f''(x) is positive for #2 and negative for #3.

Can you give a concrete example of values so that we can experiment with the problem?

Re: A Math Challenge (kind of)

*Message #3 Posted by **Namir** on 16 Aug 2011, 4:40 p.m.,*
in response to message #2 by Marcus von Cube, Germany

n1 is the number of roots that you choose (and specify the values of the roots).

Namir

Re: A Math Challenge (kind of)

*Message #4 Posted by **Namir** on 16 Aug 2011, 5:33 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Here is an example:

1. Roots at -1, 0.125, and 1.

2. Maximum at 0.

3. Minimum at 0.5.

Edited: 16 Aug 2011, 5:33 p.m.

Re: A Math Challenge (kind of)

*Message #5 Posted by **C.Ret** on 16 Aug 2011, 7:39 p.m.,*
in response to message #4 by Namir

Namir,

I have to repeat the question of [u][b]Marcus[/u][/b] which is of primary importance. If the three roots you give are the only one of the polymer, there is no solution to your problem.

If -1, 1/8 and 1 are the only and simple roots of the polymer P(x), then P(x) is exactly of degree 3. We have to found the four coefficients a, b, c, and d of P(x):

$$P(x) = a.x^3 + b.x^2 + c.x + d.$$
$$P'(x) = 3a.x^2 + 2b.x + c$$
$$P''(x) = 6a.x + 2b$$

For the three roots $x_1 = -1$, $x_2 = 1/8$ and $x_3 = 1$;

$$P(-1) = 0 \quad -a + b - c + d == 0 \quad \text{(eq.1)}$$
$$P(1/8) = 0 \quad a/512 + b/64 + c/8 + d == 0 \quad \text{(eq.2)}$$
$$P(+1) = 0 \quad a + b + c + d == 0 \quad \text{(eq.3)}$$

From (eq.1) and (eq.3) we have $2b + 2d == 0$, thus $d = b$.

As explain by [u][b]Marcus[/u][/b] at the extremum (minimum and maximum), the first derivate P'(x) is zero, thus :

$$P'(0) = 0 \quad c == 0 \quad \text{(eq.4)}$$
$$P'(1/2) = 0 \quad 3a/4 + b + c == 0 \quad \text{(eq.5)}$$

From (eq.4) and (eq.5) b = -3a/4

The point 0 is a maximum if P"(0) negative.

$$P''(0) < 0 \quad b < 0 \quad \text{(eq.6)}$$

The point ½ is a minimum if P"(1/2) is positive.

$$P''(1/2) > 0 \quad 3a + 2b > 0 \quad \text{(eq.6)}$$
$$3a - 3a/2 > 0$$
$$3a/2 > 0$$

At this point , we have to found a set of coefficients : a > 0, b= -3a/4, c=0 and d=b=-3a/4.

From (eq.2) :

$$a/512 - 3a/128 - 3a/4 == 0$$
$$a == 0$$

Thus, no such a polymer exist ! It may only be a solution if the polymer is of a greater degree.

OK, I found no evident solution, but my approch clearly show that an appropriate algorithm may be lead by linear algebra, system of equations and inequations.

in response to message #5 by C.Ret

A polynomial with a higher degree is fine. This means it will have additional roots (real or complex) and that's fine. As long as the resulting example polynomial has the properties I gave.

Thanks for your efforts!!

Namir

The solution (i.e. the lowest degree polynomial) to this problem is:

f(x) = k*(-88*x^5 + 75*x^4 + 88*x^3 - 76*x^2 + 1)

where k can be any positive number.

in response to message #7 by fhub

Thank you!!

The whole idea about getting a "custom" polynomial arose when I was trying to select simple polynomials to study the calculations of their roots. Using the form of p(x)=product(x - root(i)) was intuitive but yielded a few polynomials that did not have much rise in values between two roots that I was interested in. So I began to ask about getting custom polynomials where I cans specify not only the roots but also certain maxima and minima between these roots.

Namir

Re: A Math Challenge (kind of)

*Message #9 Posted by **fhub** on 17 Aug 2011, 9:19 a.m.,*
in response to message #8 by Namir

Well, if your requirements (given in your first post)

```
1. Passes through a specified set of roots (n1 roots).
2. Passes through a specified set of minima (n2 minima).
3. Passes through a specified set of maxima (n3 maximum).
```

fulfill the condition that all your given extrema are **between** 2 roots **and** maxima and minima are **alternating** (i.e. root,min,root,max,root,min,root, etc), then the algorithm is quite simple (and has been mentioned already in parts):

1) Choose a polynomial of degree n=n1+n2+n3: (highest coeff can be 1)
f(x) = x^n + c[n-1]*x^(n-1) + c[n-2]*x^(n-2) + ... + c[1]*x + c[0]
2) build its derivative f'(x)
3) substituting the zeros in f(x)=0 and the extrema in f'(x)=0 gives you a linear equation system of n equations and variables with a unique solution for all n coeffs c[0]...c[n-1]
4) finally substitute any of your extrema in f''(x) to check the sign, and if this sign is wrong then multiply the function with -1.

I did even use a bit shorter way:
one part of the polynomial you can build directly from the zeros (as you already mentioned), so you just need another part for the extrema, and that's now a polynomial withe the degree n=n2+n3 only!
Looks like this: (for your given example)
f(x)=(x+1)(x-1/8)(x-1)*(x^2+a*x+b)
Now do the same as above, but you only need to substitute the extrema, and you have only a 2x2 system for a and b.

One problem still remains:
If your extrema don't fulfill the conditions I wrote above (e.g. if you want both 0 and 1/2 to be maxima (or minima)), then such a n=n1+n2+n3 polynomial doesn't work - you always get one as maxima and the other as minima (or vice versa, depending on multiplying it with -1 or not). So far I don't know how this problem could be solved too - I've tried an even higher polynomial, but this also didn't work.

BTW: if you don't only give the arguments (x-value) for the extrema but also the function value (y), then of course you'll have to increase the polynomial-degree by 1 for each additional condition.

Franz

Re: A Math Challenge (kind of)

*Message #10 Posted by **bunuel66** on 17 Aug 2011, 3:48 p.m.,*
in response to message #9 by fhub

It seems that the roots for minima and maxima should be alternated. If there is a minimum at x1 then the derivative will have its sign being negative on the left of x1 and positive on the right (- +), conversely for a maximum (+ -). Then lets assume that two minima are consecutive we shall have a sequence of (-+)(-+) for the sign of the derivative, but then we

also have a sequence -(+-)- which shows that there is local maximum between the two minima, which is contradictory with the initial hypothesis. Then if the derivative is continuous (should be for a polynomial) minima and maxima are interleaved. In other words there is no polynomial solution if this condition is not satisfied.

Regards

*Message #11 Posted by **Kiyoshi Akima** on 17 Aug 2011, 6:07 p.m.,*
in response to message #10 by bunuel66

I don't believe the original requirements stated that all of the maxima (or minima) are given. It's possible for a polynomial to have more than one minima and maxima between two roots.

Franz, you caught me on the finish line, I was just verifying my results with Derive. :-)

My normalized result (pasted from Derive):

$$- 88 \cdot x^5 + 75 \cdot x^4 + 88 \cdot x^3 - 76 \cdot x^2 + 1$$

The idea:

P(x)=A(x)*B(x) where B(x) is the product of $(x-x0_i)$ and A(x) is a yet to determine polynomial. I tried with:

$B(x)=u*x^2+v*x+w$.

After some pencil and paper computations I arrived at:

v=8, u=-11/8*v=-11 and w=v/8=1

It has all the requested properties, especially the derivative is 0 at 0 and 1/2 and the second derivative is negative for 0 and positive for 1/2. I let Derive do the dirty work of computing the coefficients of A(x)B(x) and did the normalization by hand.

Well Marcus, we both seem to be quite similar and come from the same 'good old school'! ;-)

I also did it almost exactly the same way as you, and I also did use Derive (for such simple tasks I even use the old DOS Derive 3!) - really funny! :-)

hi Marcus,

Are you sure about the polynomial of degree 5 ?

I agree that I did not play with polynomials since a very long time. But as far as I remember, a polynomial of degree 3 can have 3 roots and 1 minima and 1 maxima.

Patrice

I'm not Marcus, but nevertheless ... ;-)

If you construct a 3-degree polynomial with the 3 given roots, then its maximum and minimum are NOT at the given x-values (unless it's by chance). So you have to choose a higher degree to fulfill also these extrema conditions.

Franz

in response to message #4 by Namir

Hi Namir,

Just to be precise, how should I understand the values ?

```
1)
1. Roots at (-1,0), (0.125,0), and (1,0).
2. Maximum at (0,Mx1).
3. Minimum at (0.5,Mn1).

or

2)
1. Roots at (-1,0), (0.125,0), and (1,0).
2. Maximum at (Mx1, 0).
```

```
3. Minimum at (Mn1, 0.5).
```

Patrice

*Message #18 Posted by **Gilles Carpentier** on 17 Aug 2011, 8:58 p.m.,*
in response to message #4 by Namir

Hi,

here is an HP50G program based on the analyses of Marcus and Franz. It would be easy to generalise it and input the roots, minima and maxima as parameters. I don't verify here the sign of extremums (mini maxi)but it's easy to change (by example in exploring the TABVAR result, and the Up / Down variation around the extremum (Down Up) give a minimum and (Up Down) a maximum).

I got :

```
Eq       : '(144*X^5-116*X^4-144*X^3+121*X^2-5)/144'
Roots    : { -1 '1/4' 1 '-((-5+sqrt70)/18)' '(5+sqrt70)/18' }
Extremum : { '1/2' '-((-13+Sqrt(21949))/180)' '(13+Sqrt(21949))/180' 0 }
TABVAR   : {'-inf' + '-((-13+sqrt(21949))/180)' - 0 + '1/2' - '(13+sqrt21949)/180' +
'+inf' } @ Extract of TABVAR

The prog (must be in 'exact mode', and no numeric of course):

 [ -1 1 '1/4' 1 1 1 ] FCOEF @ Generate the first part of f(x). The even parameters
are for single or multiple roots. Here we suppose single roots so 1
 'X^2+a*X+b' *               @ here we have got f(x) with 2 unknows a and b
 DUP                         @ Garde le résultat au chaud (in french in the text)
 DERVX 0 =                   @ f'(x)=0
 {'X=0' 'X=1/2' } SUBST      @ { f'(0)=0 f'(1/2)=0 }
 AXL ['a' 'b'] SOLVE         @ To solve the system of 2 equations
 EVAL AXL
 1 « SUBST » DOSUBS          @ replace a and b by their values in f(x)
 EXPAND                      @ simplify the equation
 @.............................
 @ And now verify if all is OK
 @.............................
 DUP        'X' ZEROS
 OVER DERVX 'X' ZEROS
```

For generalisation, could be something like :

{ Root1 Multiplicity Root2 Multiplicity etc. }
{ Extremum1 '!' Extremum2 '!' etc....} @ ! is Up or Down arrow char like do the TABVAR command POLY

and change dynamically the number of a b c d... parameters depending of the number of extrema ... and manage the errors and "no solution" issue (mini / maxi inconsistency like 2 max that follow without min ?)

Gilles

PS : generic version :

```
@ INPUT
@   Level 2 : Array of roots ex : [ -1 '1/4' 1]
@   Level 1 : Array of extrema ex :  [0 '1/2' ]
@ OUTPUT
@   Level 1: a polynomial solution ex : '(144*X^5-116*X^4-144*X^3+121*X^2-5)/144'

«
 DUP AXL
 1 « DROP NSUB 96 + CHR STR-> » DOSUBS      @ { 'a' 'b' 'c' ...}
  -> abc
  «
   « 'X' SWAP = » MAP                       @ [ X=Extr1 X=Extr2 ... ]
   SWAP
   AXL 1 « 1 » DOSUBS AXL FCOEF             @ Gener fisrt part of f(x)

Should 34S go off-list?

*Message #1 Posted by **Bill (Smithville, NJ)** on 16 Aug 2011, 7:19 a.m.*

First, let me say I am amazed at the work that has gone into creating the 34S. It really looks like a great product. But I am concerned that the forum is becoming overly dominated by the development details. When I scroll down the forum, it's hard to pick out the non-34S discussions.

I do NOT wish to create a long discussion of why or why not it should go off-list. But I know in just raising the topic, I'm afraid that is what will occur - and that is not what I wish to happen.

On the one hand, by having it on the forum, it may have have encouaged some to participate that might not have if it was at a different location.

On the other hand, a new HP user might get discouraged from seeing such long single topic threads and not participate in the non-34S threads.

I can see it both ways.

Just a thought.

Bill

Re: Should 34S go off-list?

*Message #2 Posted by **Marcus von Cube, Germany** on 16 Aug 2011, 8:20 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

We have had this discussion already and the consensus was that we simply do not have an equivalent platform easily available to our primary audience: the regulars of this forum.

BTW, most of the discussion is off-list. My email folder contains about 3600 messages about the subject.

Re: Should 34S go off-list?

*Message #3 Posted by **Don Shepherd** on 16 Aug 2011, 8:44 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Well, Source forge reports 13,261 forum posts. Obviously, someone is using that forum. Since that is where you are developing, doesn't it make sense that that is where the these discussions should occur? Why can't the 34s users (you know who you are) go there? I would think that issue tracking would be much easier in a dedicated environment.

You guys have obviously done good work, but maybe it's time to take these discussions somewhere else. Like Bill, I find this forum much less interesting these days.

Re: Should 34S go off-list?

*Message #4 Posted by **Alexander Oestert** on 16 Aug 2011, 9:36 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Please, please, don't go! Why shouldn't many different interests live under one museum's roof?

*Message #5 Posted by **Katie Wasserman** on 16 Aug 2011, 10:06 a.m.,*
in response to message #4 by Alexander Oestert

We were asking if Dave could partition this forum somehow for the 34s and other long topics, but never heard from him, IIRC. It would be a very useful enhancement I think.

Re: Should 34S go off-list?

*Message #6 Posted by **Bill (Smithville, NJ)** on 16 Aug 2011, 11:06 a.m.,*
in response to message #5 by Katie Wasserman

Katie,

Partitioning the forum would be nice. Not sure what the forum software Dave is using and whether it can even be partitioned. Most of the other forums I participate in have subjects or categories. Of course, by having it all in one forum does expose me to items I might not read if they were separated by subjects or category.

I don't mind reading about the general current status of the 34S project. It's the mind numbing (to me) nitty gritty details that bogs me down. Of course I don't have to read them, if I don't wish to.

Bill

Re: Should 34S go off-list?

*Message #7 Posted by **Marcus von Cube, Germany** on 16 Aug 2011, 12:03 p.m.,*
in response to message #6 by Bill (Smithville, NJ)

I agree that sometimes the discussions go astray, especially if humans are involved. ;-)

Normally I try to move detail discussions to our internal E-Mail especially if they concern implementation details which are not visible to the user. But sometimes I want to discuss details with the forum members ("Shall we have shortcuts?", "What functions to include?"). Where can I do that if not here?

Re: Should 34S go off-list?

*Message #8 Posted by **Didier Lachieze** on 16 Aug 2011, 12:09 p.m.,*
in response to message #7 by Marcus von Cube, Germany

I have a question about the implementation of the PSE function on the 34s vs. 41C or 42s. What would be the best place for it? This forum, the SourceForge forums or email?

Edited: 16 Aug 2011, 12:10 p.m.

Re: Should 34S go off-list?

*Message #9 Posted by **Marcus von Cube, Germany** on 16 Aug 2011, 12:24 p.m.,*
in response to message #8 by Didier Lachieze

If it's a question about something that might be of general interest, just ask in the forum. If in doubt or if it's just a question which might be answered by a short look into the manual(s), email is the best way to ask.

I'm the one who implemented the PSE command in WP 34S so I'm the one to ask in this special case. Use E-Mail please.

*Message #10 Posted by **Cristian Arezzini** on 16 Aug 2011, 10:06 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

I for one, wouldn't even have been curious about the 34s if I hadn't seen all the many posts here. And I think that many other HP users might have felt the same curiosity as I did. And I fear that if discussion is moved away, many people who would be curious, won't know enough about this project if it isn't discussed here... I myself have tried in the past to open discussions about the 34s here only if I thought the topic could be interesting for others too; for other things I emailed the developers directly. I for one think this is a good compromise... And after all, the 34s is a project that is very active in the present (and future) as opposed to the past, hence the many posts; and if there seem to be too many posts about it, it could be because at this moment there aren't many active discussions about older models...

All this IMO of course! :)

Cristian

Re: Should 34S go off-list?

*Message #11 Posted by **Thomas Radtke** on 16 Aug 2011, 11:37 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

I was the the evil one raising that topic before :^).

I think development discussions should go to somewhere else, while application cases *should* stay. But likely the development will lead the project to some stable state in the near future, so traffic will eventually go down on the internal issues. That's my hope, and apparently most users either don't mind or even support this branch. So, I'll shut up about it now ;-).

*Message #18 Posted by **Christoph Giesselink** on 16 Aug 2011, 12:48 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

Just had a look at the "Daily view for frequent visitors."

Not counted, but it seem that over 60% of the messages are 34S related. IMHO that's too much for a "The Museum of HP Calculators" forum.

Christoph

Re: Should 34S go off-list?

*Message #19 Posted by **Alexander Oestert** on 16 Aug 2011, 1:19 p.m.,*
in response to message #18 by Christoph Giesselink

By coming here once a day I'm still able to read through *all* 100% of the postings in a couple of minutes. The WP34s topics are easily distinguished from the rest by the [WP34s] tag that is consistently used; it's

easy to ignore them if you want to. BTW 60% means a lot of users being interested in the WP34s.

Although the soft- and hardware of the WP34s are both new and still manufactured, by being RPN the whole package is obviously in the museum's realm: dead technology ;) - and I love that!

*Message #28 Posted by **Walter B** on 16 Aug 2011, 1:32 p.m.,*
in response to message #18 by Christoph Giesselink

We had this discussion once before. The WP 34S is perfectly within the forum rules:

> Quote:
>
> This forum is for discussion of HP calculators including usage, repairs, sources of replacement parts, general information etc. ... Users of this site ... will discuss topics of interest to our community.

This seems to be the case.

As long as we don't have subfora here, people visit this one big forum and "talk" about what does interest them. So IMHO, anyone thinking there's too less "museum talk" shall feel free to change that by raising more interesting "museum topics" instead of complaining about other topics.

My 20m€ only.
Walter

No - Just my 1/2c worth.

I compleatly understand the reason for asking the question but think that particiants on this forum should be able to continue to discuss any topic related to HP calculators (and RPN). If it wasn't for the interest in the subject shown on this site I'm not sure the 34s would have happened and doubt that I would have heard of it otherwise.

Mike T.

Re: Should 34S go off-list?

*Message #31 Posted by **Howard Owen** on 16 Aug 2011, 11:19 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

The problem with banning the topic (or politely asking for it to go away) is that many members apparently find the WP34S to be intensely interesting. I count myself among that number, so I have to make an effort to see your point of view. But I concede that I might be annoyed if it were some other subject that didn't interest me.

It's ok with me if the developers take their nuts-and-bolts topics off to Sourceforge, but I do take Thomas

Radtke's point about use cases. How a particular function or feature on the 34S should function from the user's point of view is very much on topic IMHO. That's an extension of the huge volume of opinion expressed here over the years on how the ideal RPN programmable should work. Those discussions may annoy some users as well, but there's no question they have been considered on-topic here.

Regards,
Howard

It is as if we are all in the same room with only a single speaker at a time and we all have to listen or listen enough to see if it is worth listening too. Like a support group. Wait a minute. This IS a support group! We are all so messed up. Competing in programming contests with '80s tech, writing our own firmware for stock calcs, TVM, spending $100s and $100s on our addiction. When will it end. :-)

Hi, my name is Egan, and I am addicted to RPN. It all started when my Dad gave me an 11C--a device with no equal. I was only 13 and I couldn't stop ...

Hmmm... my wife raises an eyebrow in mild, unbelieving disapproval every time I get excited about something concerning old calculators... but OK, she's not actually my family blood...

My father loves gadgets of every kind, but he just doesn't understand RPN. I first discovered RPN at college when I bought a 48G... I saw it every day at the book store, and loved it, but I had never actually used or held one. The day I finally bought it, and took it home, my father was there and said cheek-in-tongue something like, "well, it's really nice, but can it do 2+2?" as a joke because it

looked like such a modern, powerful machine. Back then, neither of us even knew that RPN existed. Imagine my frustration when it turned out I actually couldn't make it calculate 2+2... :) But I like such challenges, and of course then it became my favorite calculator, ever.

Cristian

*Message #38 Posted by **db (martinez, ca.)** on 17 Aug 2011, 9:02 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

No, because this has been as much an RPN forum as an hp forum for the 11 years i've been reading it. "It's a family tradition".

But that's just my opinion, not a vote. This isn't a democracy. It's Dave's site and i'm a guest. So if he thinks there's too much 34s here i guess i'll have to start looking at that sourceforge place too, instead of getting the Readers Digest version here.

Re: Should 34S go off-list?

*Message #39 Posted by **Andrés C. Rodríguez (Argentina)** on 17 Aug 2011, 9:10 a.m.,*

in response to message #1 by Bill (Smithville, NJ)

I would like to keep it here. Eventually Dave Hicks may open a special category (today there are specific "articles" and "memories" forums, with different behavior with regards to persistence of messages, threads, etc.). 34S belongs here IMHO.

Re: Should 34S go off-list?

*Message #40 Posted by **Michael de Estrada** on 17 Aug 2011, 11:28 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

According to the title line of this forum: "This forum is for discussion of HP calculators including usage, repairs, sources of replacement parts, general information etc." So, frankly, much of what is posted here could be considered off-topic. However, I think the opened nature and inclusiveness of this forum is a benefit, rather than a hindrance, and I've learned a great deal as a result. Also, the development of alternatives to the mainstream HP products is a healthy process, given the stagnation at HP over tha past 20 years. I can live with the slight inconvenience of scanning past threads that don't interest me in order to find those that do.

Re: Should 34S go off-list?

*Message #41 Posted by **Martin Pinckney** on 17 Aug 2011, 12:00 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

It would certainly be preferable to me if the 34s did not so dominate the forum. This has caused me to lose interest in reading or posting.

But that is my personal opinion because I have little interest in the 34s and do have interest in other HP calculator topics. But unless Dave has an opinion that causes him to change the way the forum is structured, it will be whatever the posters want.

in response to message #41 by Martin Pinckney

If it were just the team members, the 34S dominance could be easily dealt with. It's mostly a conversation outside our inner circle that fills the threads here. Some members have started to carry the discussions over to our internal email. I appreciate this because it shows a certain feel for the sentiments these discussions have caused for other forum members.

You are invited to ask any of the team members for assistance if you have problems with 34S, be it getting started or solving a specific programming problem. OTH I invite everybody to post interesting solutions to problems of the type we love to deal with in this forum publicly here.

*Message #45 Posted by **Cristian Arezzini** on 18 Aug 2011, 2:29 a.m.,*
in response to message #44 by Don Shepherd

What I don't get is this: OK, the 34s has a lot of activity now. But it's still a RPN calc based on HP hardware so it probably is interesting to most people. And high activity on one topic happens every time there's a new product out, even if some people aren't interested in that product. There have been lots of topic I'm not interested in - i.e. I'm not interested at all in financial calcs, I'm not interested in desktop calcs, nor in things like the HP67 because it's so expensive I'll never be able to afford one... and so on... but I don't think that posts on these subjects detract from my forum experience. If I want to read those topics just out of curiosity, I do; otherwise it's really easy to skip them. I just don't understand why all these topics can't coexist together. If the 34s is moved to another forum, what will probably happen is that I will either stop following this forum, or the new one... I don't think I have the time and commitment to add another forum to the list of things to check daily! :)

Re: Should 34S go off-list?

*Message #47 Posted by **Don Shepherd** on 18 Aug 2011, 3:55 a.m.,*
in response to message #45 by Cristian Arezzini

Cristian, you make some good points.

I would not dispute that the 34s is within the guidelines of what this forum is about, and many people are interested in it. And, like you, there are many topics here that don't interest me, like how to repair calculators or HP-41 things or (and especially) possible HP-15c reissues, and so on. It's easy to ignore the things that don't interest me only because the volume of posts for those things is relatively small. But the volume of 34s things is not small, and it's easy to overlook a topic I might be interested in simply because there are so many 34s posts that take up space on my screen at one time.

I think the developers of the 34s were correct in using this forum to announce this project and get feedback from the folks here. But all of these detailed design discussions that have flooded the forum really take away from the usefulness of the forum, in my opinion. It's impossible to know how many former regular members do not access the forum these days because of the 34s, but I suspect the number is not insignificant. And potential new members who arrive here probably think this forum is just for discussing a homebrew calculator that they are not interested in. So, it's really more than just coexisting together. It does detract from the forum experience when so many posts are just endless discussions of product design issues that really should be tracked at another location.

The moderator has not commented on this topic. I have a feeling that Dave would be very reluctant--and righfully so--to prohibit any type of discussion unless it was personally offensive to the members. The 34s discussions aren't offensive, they are just volumnious!

My hope is that these discussions will decrease after HCC next month.

I see your point, and I can see what you mean. But I noticed one thing: many improvements or features that we have on the wp34s now, were suggested/asked here by "normal users", even recently. I think these non-34s-fans, regular users, would never follow discussions elsewhere, and so we would loose the precious input and suggestions that they make.

I really don't see a way to make everyone happy... :(

Cristian

*Message #49 Posted by **Cristian Arezzini** on 18 Aug 2011, 3:12 a.m.,*

in response to message #1 by Bill (Smithville, NJ)

I just did a check, just for fun... I opened all the 34s-related messages in the forum's main page (before archival). I checked, and made a list... and there have been 24 unique users posting on these threads. This is a small community, so I think 24 users is a fair share. My point is that I believe there is enough interest here, for a significant portion of the forum users... Funny fact: I kept track of how many posts people made, and... the three main developers are *not* at the top three places! :)

EDIT: I didn't count posts in this thread of course, that would have been a bias.

Cristian

Re: Should 34S go off-list?

*Message #50 Posted by **HrastProgrammer** on 18 Aug 2011, 4:11 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

Wow, I find it fascinating when people want such a wonderful thing named 34S to "go off-list", so they can "read about 15C" or whatever ... ?!? Does 34S prevent anyone from writing anything about other HP calculators, emulators, other equipment, etc? Certainly not!

In my opinion at least, 34S is such a big achievement that has emerged in recent years, that it fully deserves to be part of this forum. Does it dominate the forum at the moment? Yes - but various themes have dominated it in the past, for a few weeks or even months, this is normal when something like that appears. Would the number of posts increase if 34S goes off-list? No - the forum will just return to as it was before, with a few posts per day, 75% of them being "look-what-I-found-on-ebay".

I slowly started to loose interest in following this forum at around 2007-2008, to the point that I didn't look at it for weeks. But, after I read about 34S, I returned its URL to my bookmarks :-)

So, yes, be my guest - remove 34S, this is what we need now ;-)

Just my 2 cents ...

Hi,

I am curious: Let's say that the wp34S had actually been introduced by Hewlett-Packard as the "HP34S" in its current exact form - in a case like the 20b/30b (let's say in 20b color but 30b LCD and physical keys) and the same hardware platform. And let's say HP did the crazy thing of giving the R&D developers (Tim, Cyrille?) the unenviable task of requesting feedback directly from the community on the firmware *before its release* so it could be essentially debugged and improved by the collective veterans of the HP users. I bet that the traffic here would be at least as high and possibly higher. And I wonder if anybody would be complaining that the effort should be taken off list then.... If the answer was "no", then I would assert that it belongs here now.

Thanks, Jake

*Message #53 Posted by **Davd F** on 18 Aug 2011, 5:37 p.m.,*
in response to message #50 by HrastProgrammer

I agree completely. This is an project using stock HP hardware and development tools, emulating classic calculator behavior. I can't think of something more relevant. It's also a beautiful opportunity to have a real discussion on the development. For me it means perhaps once again there will be the possibility of having a really great HP calc in hand, brand new, without going through Ebay, and being able to use it in the lab like the tool it is, without worrying about scratching a collectible. THAT is what HP calculators are about.

I can say that I had been following the forums less in the past few years, but now I check in frequently (also to pick up the 15c rumors.)

That said, it would probably be worthwhile packaging up the current form as a "classic forum" searchable archive, and moving to a more modern forum software package with a few key subforums.

Dave

*Message #54 Posted by **Jeroen Van Nieuwenhove** on 18 Aug 2011, 7:24 p.m.,*
in response to message #50 by HrastProgrammer

I agree with Hrast as well. The volume of 34s postings is not overwhelming and these postings can easily be ignored by those who are not interested in this project. There was a similar discussion some years ago about frequent postings concerning auctions on TAS. The frequency of those postings dropped naturally and I think the same will hold for 34s postings. Once the 34s repurpose project becomes more and more mature, postings will be less frequent. Also, let's recognize the 34s pioneers are very busy polishing the ultimate RPN calculator. They deserve more than some credit on this forum for that.

wp 34s Overlay

*Message #1 Posted by **Morten Nygaard Åsnes** on 16 Aug 2011, 2:12 a.m.*

I just flashed my hp 30b with the latest wp 34s firmware, and it works, great. Thanks to Paul and Walter for this awesome project, and thanks to Gene for sending a cable all the way to Norway!

Now, the only thing missing is the keyboard overlay, I find it quite hard to use the calculator without it. Any news on when a new batch of overlays will be available? What can I do in the meantime? Is there a source image available that I can print and cut out to use as a rudimentary overlay?

Re: wp 34s Overlay

*Message #2 Posted by **Walter B** on 16 Aug 2011, 2:43 a.m.,*
in response to message #1 by Morten Nygaard Åsnes

God dag Morten,

> Quote:
>
> What can I do in the meantime? Is there a source image available that I can print and cut out to use as a rudimentary overlay?

You can take this:

Find a good printer, adjust the width of the picture if necessary (to 69 mm IIRC), and use it :-)

Walter

Re: wp 34s Overlay

*Message #3 Posted by **Marcus von Cube, Germany** on 16 Aug 2011, 3:19 a.m.,*
in response to message #2 by Walter B

Morten,

in the the distribution there is another bitmap which does not use the key tops but arranges all key legends around the keys. It was my first attempt at an overlay. You just need to cut out the keys and tape the overlay onto your keyboard. I had painted the keys of my 30b black (except those that don't change such as the digits.)

Re: wp 34s Overlay

*Message #4 Posted by **Neil Hamilton (Ottawa)** on 16 Aug 2011, 5:52 a.m.,*
in response to message #3 by Marcus von Cube, Germany

Hi Morten

Here is an example of both the real overlay and the paper one referred to above. I used the paper ones for a good long time before my overlays arrived. They are serviceable but you will certainly appreciate the overlay when you get it -- so much better!

One thing that no one else seem to have had issues with is that you want to make sure you clean your keys pretty well before applying the overlay stickers. A few of mine are lifting ever so slightly and I am reasonably sure it was *my* failure to sufficiently clean any remnant finger oil. Maybe someone can recommend to you a good way to do that (alcohol?) that doesn't damage the keyboard. Other than that one (minor) issue, the overlays are just great.

(wp34S) Am I Using alphaRCL Correctly?

*Message #1 Posted by **Jake Schwartz** on 15 Aug 2011, 4:28 p.m.*

Hi,

In the 34S (version 1444 at present), when I store 1.0 in Register 00, clear the alpha register and do alphaRCL 00, alpha shows the "x-bar" symbol. I was expecting it to show the characters for the numeric value in R00 (such as "1.00"), similar to in the HP41. The manual (version 1457) on page 52 indicates that alphaRCL "Interprets the content of the source s as characters and appends them to alpha". Am I interpreting the meaning of alphaRCL incorrectly?

Thanks, Jake

Re: (wp34S) Am I Using alphaRCL Correctly?

*Message #2 Posted by **Paul Dale** on 15 Aug 2011, 5:30 p.m.,*
in response to message #1 by Jake Schwartz

Yes, you're misinterpreting it. Try [alpha]RC# instead.

We've got no way to distinguish between numeric and alpha data in registers so we needed two different commands to recall them. [alpha]RCL treats the register as containing alpha data, [alpha]RC# treats it as numeric.

Something slated to be addressed in the successor.

in response to message #5 by Paul Dale

I think we've packed so much into the WP 34S it will be hard to find an habitat for another scientific based on the same hardware. Things will change with a better display, but hardly earlier IMHO.

Walter

Re: (wp34S) Am I Using alphaRCL Correctly?

*Message #7 Posted by **Paul Dale** on 15 Aug 2011, 8:03 p.m.,*
in response to message #6 by Walter B

I know how to pack lots more software into the hardware. It will require a lot of code to be rewriting.

Other things mentioned include using flash for programs not RAM. This will ease pressure on the most precious resource on the device. Which will, in turn, allow us to tag register contents as integer/string/real/complex/whatever.

I also suggested removing the 16C integer mode in favour of a more 50g like integer mode. Maintaining carry and overflow requires quite a bit of code space and execution time. People who want these features will still have the 34S which pushes them pretty much to their limits.

But as Walter wrote, the display is the big impediment to doing lots more.

Correct - with the amount of flash memory available, a lot more is loadable in addition to some quite arcane stuff we've got even now. But IMHO the UI is pretty much loaded already, and I regard this as the limiting factor. So after Gene will have completed his matrix package, including reliably solving systems of equations, I can hardly imagine anything important missing. Perhaps a second constants catalog for esoteric mathematical stuff? ;-)

34s: Matrix success!

*Message #1 Posted by **gene wright** on 15 Aug 2011, 2:31 p.m.*

It isn't pretty yet and has LOTS of room for optimization (I did not even use recall arithmetic so far ha!) but the translation of the PPC ROM M1 thru M5 routines, the QR, BE and BX routines, and the RRM application program from the PPC ROM manual to run on the 34s works.

I successfully computed the determinant of a 7x7 matrix. Ran FAST.

Problem I have at the moment is my batteries are nearly dead (the program showed BYE! as it quit running).

This program will use memory registers 0 through 9 for internal storage. I started the matrix location at register 10 and up. This means an 8x8 determinant or a 6x6 inverse or 6x6 system of linear equations can be done within the 100 register "limit". It is presently 207 steps, but that will go down with recall arithmetic of course.

Now to do a LOT more testing and cleanup of the code before publishing it. Jake and I will have something soon and if not, perhaps it will be unveiled at the HHC conference in a few weeks.

Re: 34s: Matrix success!

*Message #2 Posted by **Neil Hamilton (Ottawa)** on 15 Aug 2011, 3:11 p.m.,*
in response to message #1 by gene wright

Gene,

Do you think this could be a guinea pig for the symbolic add-on to the assembler tool chain? If so, you can send me the code (hopefully with some embedded comments so I can trace it -- I haven't worked with a matrix since i graduated 'a while ago') and I will map it to the new format and send it back to you.

The new tool is designed to make things easier to code. Gone are BACK, SKIP, and GTO. Instead you use the single JMP mnemonic with a symbolic label at your target. The tool figures out the rest.

Calling subroutines becomes a bit more obvious as well: "XEQ 04" becomes "XEQ Calculate_Determinat_but_not_on_Thursday".

Both should make maintenance much easier.

Let know if I can help.

Cheers...

Results from AM1 (Albillo Matrix 1) for the 34s

*Message #4 Posted by **gene wright** on 15 Aug 2011, 3:57 p.m.,*
in response to message #3 by gene wright

Time was right at 2 seconds to do the determinant of this 7x7 matrix.

The true determinant is 1.

The 34s RRM program returns: 0.999997119354

Not bad.

For reference, these were the results for other machines from a thread back in January 2008:

Thread

```
HP-15C          1.080204421
HP-71B          0.97095056196
HP-28S          0.970960198039
HP-35s          1.00282960115
CC-40:          1.0028267103..
TI-95           1.0006767082..
TI-85           0.999646804338
HP-48G          0.999945522778
```

Re: Results from AM1 (Albillo Matrix 1) for the 34s

*Message #5 Posted by **Marcus von Cube, Germany** on 15 Aug 2011, 4:05 p.m.,*
in response to message #4 by gene wright

Gene, have you considered to use the complex multiply to increase the accuracy of some computations? The intermediate computations in 34S are done at a much higher accuracy then can be achieved with the 16 user visible digits.

Re: Results from AM1 (Albillo Matrix 1) for the 34s

*Message #6 Posted by **gene wright** on 15 Aug 2011, 4:07 p.m.,*
in response to message #5 by Marcus von Cube, Germany

No, I have not. This is a first stab at a matrix routine for the 34s. I am merely translating the program and not trying to make it much better. I hope others will be inspired to do that, as it isn't in my quiver of abilities. :-)

Re: Results from AM1 (Albillo Matrix 1) for the 34s

*Message #7 Posted by **Paul Dale** on 15 Aug 2011, 6:00 p.m.,*
in response to message #4 by gene wright

Looks like the loss is about two thirds of the significant digits. The matrix was chosen well.

Complex multiply might assist here. We could also enable the fused multiply add instruction -- although it isn't much easier to use than the multiply. What's really required is a suite of these to handle various stack arrangements.

I'll have a dig though some of the numerical analysis texts I've got to see if there is a "better" algorithm. The Algebraic Eigenvalue Problem or Matrix Computations are probably a good start. Although I'm not sure either covers determinants -- somewhat surprisingly they don't seem to be

calculated all that often.

- Pauli

Re: Results from AM1 (Albillo Matrix 1) for the 34s

*Message #8 Posted by **gene wright** on 15 Aug 2011, 6:12 p.m.,*
in response to message #7 by Paul Dale

Well, I ran the AM1 test because it is a good test.

With the data registers in the 34s, we can "only" do a system of 6x6 or an inverse of a 6x6 system. Determinants can, however, go up to 8x8, so the test was possible.

In reality, I can't imagine (really) anyone today EVER doing something larger than a 6x6 on a handheld. Go find Excel or some PC software package! :-)

But doesn't that leave the device less capable than a 15C?

Re: Results from AM1 (Albillo Matrix 1) for the 34s

*Message #11 Posted by **Marcus von Cube, Germany** on 17 Aug 2011, 11:34 a.m.,*
in response to message #10 by Palmer O. Hanson, Jr.

My assumption is that the 6x6 limit is imposed by keeping the original matrix together with its inverse. Larger matrices may be processed, given an algorithm that allows inversion in-place.

Re: Results from AM1 (Albillo Matrix 1) for the 34s

*Message #12 Posted by **gene wright** on 17 Aug 2011, 12:31 p.m.,*
in response to message #11 by Marcus von Cube, Germany

I hope to present some timing results using AM#1 (a 7x7 matrix) run on the 34s, 41CL at 1X speed, 41CL at 50X speed, and the original 15c soon. Palmer, you remember that matrix because in an earlier thread, you did some analysis on it using even the TI-59 ML02 program. :-)

The RRM approach on the 34s can compute the determinant of an 8x8 matrix.

This is a limitation only because of the 100 register hard limit on the 34s. The 41C (and 41CL) can handle bigger matrices because you can have up to 319 registers available.

Re: Results from AM1 (Albillo Matrix 1) for the 34s

*Message #13 Posted by **Palmer O. Hanson, Jr.** on 17 Aug 2011, 9:10 p.m.,*

Marcus must be correct (see the previous post) about keeping the original matrix intact. The TI-59, which did NOT keep the original matrix intact and also had only 100 registers could do determinants or inverses for 9x9, and 8th order simultaneous equations. So the obvious question is what's more valuable, keeping the original matrix intact, or solving higher orders?

Re: Results from AM1 (Albillo Matrix 1) for the 34s

*Message #14 Posted by **gene wright** on 17 Aug 2011, 10:32 p.m.,*
in response to message #13 by Palmer O. Hanson, Jr.

The RRM program (from the PPC ROM manual) uses the following structure for the matrix:

nxn for the original matrix elements.

another nxn for an identity matrix

and a nx1 column for the coefficients for a system.

So to compute a determinant of a matrix, you just need the square original matrix. The RRM program uses memories 0-9 so the matrix elements can start in memory 10. Since you have 90 registers free, that means you can do an 9x9 determinant. 10 + 81 < 100.

To invert a matrix, you need nx2n registers. That means you can invert a 6x6. 6x(12) + 10 < 100 but 7(14)+10 is not. No 7x7 inverses.

To solve a system of equations, you need nx(2n+1). A 6x6 would use 6(13)+10 < 100 registers, but a 7x7 system uses too many.

(My math was wrong before - I think you can solve a 9x9 determinant, but only a 6x6 inverse or system.

Re: Results from AM1 (Albillo Matrix 1) for the 34s

*Message #15 Posted by **Marcus von Cube, Germany** on 18 Aug 2011, 2:40 a.m.,*
in response to message #14 by gene wright

Gene, what's the reason to store a nxn identity matrix? This can certainly be stored more compact.

Re: Results from AM1 (Albillo Matrix 1) for the 34s

*Message #16 Posted by **fhub** on 18 Aug 2011, 5:53 a.m.,*

> Quote:
>
> Gene, what's the reason to store a nxn identity matrix?
> This can certainly be stored more compact.

I don't have the PPC-ROM manual, but I guess it uses the following method for the inverse:
Transforming the original matrix to an identity matrix (e.g. with Gauss elimination) - applying the same steps to an identity matrix makes this one then the inverse of he original.

But the n*(2n+1) requirement in his statement "To solve a system of equations, you need nx(2n+1)" is something I don't understand (except the routine uses the inverse):
Gauss elimination (even with pivoting) requires no more than n*(n+1), so definitely 9x9 system could be solved.

Franz

Re: Results from AM1 (Albillo Matrix 1) for the 34s

*Message #17 Posted by **gene wright** on 18 Aug 2011, 7:36 a.m.,*
in response to message #16 by fhub

Those are the register requirements for the PPC ROM application program RRM.

It always computes the inverse if you are solving a system of linear equations.

Example:

3x3 matrix is stored as:

```
1   2   3   1   0   0    6
4   5   6   0   1   0   15
7   8   9   0   0   1   24
```

To do a determinant, you need only the square 3x3 matrix.

To do an inverse, you need the 3x6 matrix.

To solve a system, you need the entire 3x7 matrix.

Again, that is how the RRM program works, which is what has been translated so far.

Seeing as how there has not yet been any other matrix software written for the 34s... ;-)

Here's the link to the PPC ROM documentation for the M1 through M5 routines and the RRM application program. When Jake and I were talking about documentation earlier, this is what we were meaning. No real questions here how something works.

PPC ROM Matrix Routines

Edited: 18 Aug 2011, 7:40 a.m.

Re: Results from AM1 (Albillo Matrix 1) for the 34s

*Message #18 Posted by **fhub** on 18 Aug 2011, 7:50 a.m.,*
in response to message #17 by gene wright

> Quote:
>
> It always computes the inverse if you are solving a system of linear equations.

Yes Gene, that's what I guessed. ;-)

Although this needs of course more registers, it also has one advantage: for solving additional equation systems with the same coefficient matrix you can now just use the already computed inverse and don't have to re-calculate everything.

Thanks for the manual,
Franz

No problem and I would *love* for others to write a better routine :-)

*Message #19 Posted by **gene wright** on 18 Aug 2011, 8:31 a.m.,*
in response to message #18 by fhub

All I did was translate the great work done 30 years ago by the PPC ROM authors. I am certain improvements can be made for a 34s-specific routine.

Re: Results from AM1 (Albillo Matrix 1) for the 34s

*Message #20 Posted by **Dieter** on 18 Aug 2011, 3:15 p.m.,*
in response to message #17 by gene wright

A matrix can be inverted with several methods. One of them simply adds a unit matrix and uses elementary row operations to convert matrix A into its inverse C. Assuming a 3x3 matrix it looks like this.

```
 a11 a12 a13  1  0  0          1  0  0  c11 c12 c13
 a21 a22 a23  0  1  0    =>    0  1  0  c21 c22 c23
 a31 a32 a33  0  0  1          0  0  1  c31 c32 c33
```

With a bit of tricky programming this algorithm does not require n*2n registers but just n*(n+1) or so.

However, I would like to show a different method which requires not much room and is able to solve linear equation systems and invert matrices. I used this approach thirty years ago for an HP-41 program. The idea is as follows:

A matrix can be inverted by solving a set of linear equation systems with different unit vectors:

```
 First column       Second column        Third
column
  of inverse:        of inverse:          of
inverse:

           1                  0
0
  A * x1 = 0       A * x2  =  1         A * x3  =
0
           0                  0
1
```

The inverse matrix then consists of the three solution vectors x1, x2 and x3.

So, what we need is an algorithm that is able to solve various linear equation systems with the same matrix A, but different vectors b on the right side.

This can be done in a clever way without additional registers. It is best explained with an example of a linear equation system with n = 3 variables:

```
     A      *   x   =   b

  1  1  1      x1       6
  2  3 -2   *  x2   =   2
  4 -2  1      x3       3
```

Usually various elementary row conversions are applied to obtain a matrix with zeroes below the diagonal elements (Gauss algorithm). This is done by adding multiples of certain rows to others:

```
  1  1  1
  2  3 -2   next: add (-2) * row 1
  4 -2  1   next: add (-4) * row 1

  1  1  1
```

```
  0  1 -4
  0 -6 -3   next: add (+6) * row 2

  1  1  1
  0  1 -4
  0  0 -27
```

And we're done.

Now the same row conversions have to be applied to vector b. Usually this is done at the same time the matrix is converted. But since we want to solve for a whole set of vectors b1, b2 and b3 this is done after the matrix has been processed. This means that the factors (-2), (-4) and 6 used for the matrix row conversions have to be stored somewhere. This can be done - and that's the key of this method - by storing these factors in those places that now show the zeroes (here shown in parentheses):

```
  1   1   1          1   1   1         1   1   1
  2   3  -2   =>  (-2)  1  -4  =>  (-2)  1  -4
  4  -2   1       (-4) -6  -3      (-4) (6) -27
```

Now, the same transformations can be applied to vector b:

```
  6                         6
6
  2 add (-2) * row 1 =>   -10                    =>  -
10
  3 add (-4) * row 1      -21 add (6) * row 2       -
81
```

The rest ist trivial: x3 = -81 / -27 = 3, insert this in row 2 to get x2 = 2, insert x3 and x2 in row 1 to get x1 = 1.

This way it is possible so solve multiple linear equation systems with the same matrix A and different vectors b. If b are unit vectors, the solutions are columns of the Inverse of A.

The only drawback here is the fact that the Inverse is not calculated as a whole, i.e. first column 1 of the Inverse is evaluated, then column 2, finally column 3. The inverse matrix cannot be used directly for further calculations.

A real-world algorithm would use some more registers to keep track of exchanged rows to optimize accuracy, but that's another story. ;-)

Dieter

Re: Results from AM1 (Albillo Matrix 1) for the 34s

> Quote:
>
> That means you can invert a 6x6. 6x(12) + 10 < 100 but 7(14)+10 is not. No 7x7 inverses.

This would total 108 required for 7-by-7's and it is interesting that the 34s actually has 112 registers but sadly, the original 4-level stack occupies positions 100 to 103 here. I am almost certain that the X, Y, Z and T registers were numbered at the lower end of the 100-through-111 positions for good reason, but had X through T been at the top of the list instead, there might have been exactly enough registers to achieve the 7-by-7 case :-)

Re: Results from AM1 (Albillo Matrix 1) for the 34s

*Message #22 Posted by **Marcus von Cube, Germany** on 18 Aug 2011, 11:18 a.m.,*
in response to message #21 by Jake Schwartz

Jake, switch to a different algorithm and an 8x8 linear system shouldn't be a problem. All the lettered registers in the 34S have a special meaning and can only be used with care for other purposes.

Actually there isn't a good reason for putting them there, it is more a bit of an historic accident that is fiddle to remove. A, B, C, D, J and K were later additions (so was I but it was not too late) and at that point there were many assumptions about the stack being registers 100 - 104. I've been removing these as I notice them but I'm not confident that all are gone yet.

As Marcus points out all the lettered registers are used for various purposes so rearranging things to free a few more doesn't seem ideal either.

Timing results for the AM1 matrix determinant

*Message #24 Posted by **gene wright** on 18 Aug 2011, 12:20 p.m.,*
in response to message #12 by gene wright

Running the RRM program:

41CL at "Normal" speed: 263 seconds

41CL at TURBO 50 speed: 14 seconds

34s: Just under 2 seconds

15c using Matrix 9: About 14 seconds as well

The Exact determinant is 1.

The HP 41 gets -1.797514... as the determinant.

the 34s gets 0.999997... as the determinant.

FWIW, here are values for the determinant from other calculators.

HP-41 Math Pac -1.814762704

HP-28S 0.970960198039

TI-59 0.9983600987185

TI-95 1.000676708424

TI CC40 1.00282671

HP48S 0.970960198039

HP48G 0.999945522778

TI-86 0.999646804338

*Message #27 Posted by **Marcus von Cube, Germany** on 19 Aug 2011, 6:16 p.m.,*
in response to message #26 by gene wright

Gene, the rounding modes don't affect the FIX display or the ROUND command, they are only used when switching back from the internal high precision to the 16 digit register format. Maybe there will be a difference when the programs are using some tricks to benefit from the higher internal precision. Let Pauli have a look at the code.

Re: Results for AM1 in different FIX modes

in response to message #30 by gene wright

Gene, simply open the PDF manual (here it's version 2.1) and search for "math geek". ;-) The RM and RM? commands are listed on page 43 of 87, right before RMDR.

Dieter

Foiled again... version 2.1 build 1321 does not have them

*Message #32 Posted by **gene wright** on 20 Aug 2011, 1:53 p.m.,*
in response to message #31 by Dieter

on page 43.

So, 1321 version 2.1 did not have these commands, which is the version I had been using.

Version 2.1 Build 1464 appears to.

I do wish the manual numbering system in the file name had the date or version number, rather than merely on the first page.

Re: Foiled again... version 2.1 build 1321 does not have them

*Message #33 Posted by **Dieter** on 20 Aug 2011, 3:10 p.m.,*
in response to message #32 by gene wright

My manual says it's version 2.1 1381 from 2011-08-03. ;-)

But at least you found it now. The manual's file name indeed should contain the version number. I think that's a good idea.

Dieter

Re: Foiled again... version 2.1 build 1321 does not have them

*Message #34 Posted by **Walter B** on 20 Aug 2011, 4:02 p.m.,*
in response to message #32 by gene wright

Looking at SVN, you find the date the file was committed. Looking into the manual, you find the # of the last windows build covered on first

page, and you see the date of issue on the last page (release notes!). The version # in the file name doesn't make a lot of sense recently, but helps me in my own directory. All will be in line with the next official release. In between, I ask for your understanding - you know you are watching a development project in progress.

No tests with the Advantage MINV???

Re: Timing results for the AM1 matrix determinant

*Message #37 Posted by **gene wright** on 23 Aug 2011, 7:35 a.m.,*
in response to message #36 by Ángel Martin

No, only because the real test is the 34s RRM routine. The 41CL times were only in comparison to the 34s running the same code. :-)

I think someone did the 41 ADV module for the determinant but I was really comparing RRM.

Re: 34s: Matrix success!

*Message #38 Posted by **Marcus von Cube, Germany** on 19 Aug 2011, 8:30 a.m.,*
in response to message #1 by gene wright

Gene, how are the matrices laid out? In rows or columns? Where is the dimension stored?

I'm just working on some support commands which may help to create a comfortable matrix editor/viewer in user code. In principle I try to provide a means to detect numeric input from the user and suspend the program for number entry. R/S will then store the value and return control to the viewer so that up/down, left/right work for navigation.

If we ever release the features, the commands will be KTP? (determine key type) and PUTK (put key into keyboard buffer). They complement the KEY? command already there.

Don't rely on that, maybe they will carry different names :-) It is not discussed yet.

Link to AM1 Matrix and answers to Marcus' questions

*Message #40 Posted by **gene wright** on 19 Aug 2011, 11:41 a.m.,*
in response to message #38 by Marcus von Cube, Germany

AM1 matrix can be found in the forum here:

AM1 Matrix

Marcus, the matrices are laid out in rows.

Register 07 contains the starting register for element (1,1).

Register 08 contains the number of columns.

Register 09 contains the number of rows.

Registers 00 through 06 are used by the RRM program suite.

So if you wanted a determinant of a 3x3, register 07 contains 10, registers 8 and 9 both contain 3, and register 10 contains (1,1), register 11 contains (1,2), register 12 contains (1,3), register 13 contains (2,1), etc.

For inverse calculations and systems, the columns are increase to contain the identity matrix values and the coefficients.

Here's a link to the PPC ROM matrix routine write-up from the manual. The entire manual is well worth reading. :-)

The RRM routine begins on page 3 of the linked PDF as "Application Program 1". Actually, it looks to me as if the RRM suite can solve a system of equations using only n(n+1) registers - the inverse matrix storage may not be necessary after all from looking at example 1. That means the RRM suite could solve a 9x9 system (90+10 =< 100).

PPC ROM Matrix routines

in response to message #41 by fhub

Ah, but you may have to be careful.

The HP 50g has a flag that senses when all the elements of a matrix are integers, then it will make sure the determinant is an integer.

It is possible something like that is going on with the TI-92+.

It is nearly impossible to get a 1 without exact integer arithmetic on something like the HP 50g flag thing. :-)

Well, since the TI-92+ is a CAS calculator I have of course used it in exact mode (which is its default).
Now I've tried it again and forced it to do in approximate mode, and here the result is 0.999718.

But of course it's nonsense to have a CAS calculator and then not to use its full capabilities ... ;-)

Some clarifications first:

The HP50G has no "flag that senses" anything at all. Flags are for setup, not for "sensing". It is the software of the system that sets flag -105 (for approximate mode) as soon as some real number (with a decimal point) is found in the matrix in the process of calculation of the determinant. So the "sensing" is not done by the flags themselves but the flags rather indicate "what should happen" or "what happend". The flags are no "active" parts of the software, that is.

On the HP50G in exact mode no reals but only integers or rationals are involved in calculations. The determinant of AM1 is returned as exactly 1 in 1.7 seconds. (No decimal point, so this is no rounded real or anything like that but a nice integer - as it should be.) There is also no kind of "rounding trick" involved during the calculation since this is a symbolic exact calculation of the CAS of the HP50G, which is way superior for accuracy but also much slower of course. (You can even find determinants of symbolic matrices, etc.) Turning AM1 to a numeric matrix with ->NUM and then calculating its determinant will return 0.999945522778 in 0.4 seconds. This is not a CAS calculation and so the result is quite close but not exact, as we see. And also much faster.

Now, on another point of view, and I have to say that I will be harsh. I apologize a-priori but my mathematical moral is getting angry! Really angry!!! Unbelievably angry!!!

This whole story about re-cooking and re-re-cooking and re-re-re-cooking the same old soupe of numerical recipes as a "mathematical thing" starts getting really dull. Nothing else than dull!! Sorry to say that, but if we think that mathematics is just arithmetic and the word "calculation" applies mainly to real numbers then we do nothing more than insisting to live back in the times of Wilkinson and the ACE project, when the guys were trying to understand numerical phenomena. I understand nostalgia but, ladies and gentlemen, in the mean time we reached 2011 and we have the HP50G or the TIs or other similar devices, all of them small versions of Mathematica if you will. But no, we won't go beyond real numbers and we simply won't get that there are much much much greater questions than the numeric accuracy of AM1 or any other matrix. Yes sir, this is our calculations, but finding a space of categories that maps the triples of semantic computing onto a self-supported sequence is no calculation - this is what this mania with numbers is equivalent to. (Guess what? The above problem can be done on an HP50G that is used for some things more than the never ending numeric contests.) And this is also one of the reasons for many companies to not even think of taking the evolution of calculators any step further - why should they? The kids want just numbers. Oh, but then we complain about HP not developing calcs anymore. Well, what for??? We stagnate ourselves! They gave us jet planes and we insist on driving them like bicycles or even inventing new bicycles. We behave as if using a formula of physics for finding a solution to a problem is physics itself, while finding the formula itself is no physics. This is what we do and nothing more!

Now, if the guys after the first computing machines were so stuborn to exclusively stick on to numbers forever then I would not be able to type this message now (, which I assume would be better too for the polite climate of the forum). But I can type this message and I really *have* to get nervous with this kind of numericology and all the numeric contests that are presented as "mathematics". Mathematics! Hear that, hear that, finding a number that does this and that, or finding the determinant of AM1 is finding an exceptional mathematical truth!! It is not the theorem that is the mathematical truth, no, it is the number, the result of the theorem!! And if this is our exceptional mathematical truths for which we use such tools then it becomes evident that there will be no further evolution of these tools. There will never be any sufficient demand for the next step, be it Sage on an iPhone or some new calc. (I mean really new and not the re-re-re-cooked numeric soups that we run behind.)

With such a thing like the HP50G available we should work on theorems, not on numbers!!!

Now I have to get into my fridge for cooling down a bit. This was really too much for one night.

Ciao.

```
Some further clarifications...
on the 48G/49G/50G, real mode
The flag in question is flag -54 'Use tiny element'.
When set (don't remember if that is default or not), the DET of AM1 is
calculated as 0.999945522778
When flag -54 is clear, the DET routine will first analyse the matrix and
determine (sense ;-) whether it is all-integer or not.
If it is, it will round the result to the nearest integer. Hence, when
calculating the determinant of AM1 in real mode, flag -54 clear, it will
return exactly 1.
```

Which of course supports my original contention.

Exact mode is one thing.

Tiny Element in approximate mode "cheats" because the 50g "senses" that a matrix is made entirely of integers.

Thanks,

>
> Thanks,

There are several different possible combinations here.

A) In exact mode:

A1) Matrix made of integers. Flag -54 makes no difference, as it should be. The result is always 1. This is the right way.

A2) Matrix made of reals.

A2a) Use tiny element, result: 0.999945... , since the HP50G senses the presence of reals and calculates using numerical methods for DET without any replacing of tiny elements to 0. (This is OK under the main principle of doing things approximately or exactly according to the available arguments.)

A2b) Tiny element -> 0, result 1. Again the same thing considering choice of exact vs approx. The presence of reals causes the calculator to use numerical methods of DET which is OK. But this time it sets all tiny elements to 0, which is also OK considering the state of flag -54.

Note that in both A2a and A2b there is no switch over to approx mode, which suggests that this is only using a numerical method in exact mode. It is not a general switch to approx mode. So the calc is able to do things approximately (if necessary) in exact mode too.

B) In approx mode:

B1) Matrix made of integers.

B1a - Gene's case of interest) Use tiny element, result: 1. (and not 0.999945... !) The HP50G uses exact calculation under approx mode because it finds an exact matrix, and then it just converts the exact result to a real. There is no "cheating" whatsoever. If the HP50G used approximate methods here, the result had to be 0.999945.... and not 1 since it would have to use tiny elements, which would introduce the non-exact result.

B1b) Tiny element -> 0, result 1. Same thing as in B2a. If we take into consideration the case B2a then this suggests that the state of flag -54 is not important when calculating the determinant of an exact matrix in approximate mode. The calc uses the exact method and then simply converts the result to a real.

B2) Matrix made of reals.

B2a) Use tiny element, result: 0.999945... . This is the expected result since we have a numeric matrix and we use tiny elements.

B2b) Tiny element -> 0, result 1. Again, this is the expected result since we have a numeric matrix and we set tiny elements to 0.

Note again that there is no kind of mode switching. The choice of calculation method is taken according to what the HP50G is fed with.

For me this is absolutely the correct behavior. The usage or not of tiny elements should not interfere anyway when using exact integers. Much like Mathematica which will keep on calculating exactly until the user tells it to make approximate results, or will calculate approximately when it finds real numers in its arguments.

The whole concept of exact vs approx "mode" seems to be quite a yesterday to me, anyway. If you can analyze the arguments then you can find out how to calculate. The presence or absence of a dot in the numbers should be enough to let the engine decide what to do. Add a command for conversion frot/to integers/reals and that's it. The rest is thinking in modes - never a good idea.

Ciao

That is not true I'm afraid.
When the matrix contains reals, the same (numeric) algorithm is used whether you're in approx or exact mode.
Clearing flag -54 (Use tiny element) has the following effect:
- it checks up front whether the matrix contains only integers
- if so, it will *round* the computed determinant to the nearest integer.
That constitues *fiddling* with the result, no matter how you look at it. I'm pretty sure it is possible to come up with an example where the exact determinant is x and DET computes x+1 or x-1.
It must be said that the flag's name is misleading. 'Use tiny element' is what it does in SVD and EGV calculations, but not in LU decomp.

Re: Link to AM1 Matrix and answers to Marcus' questions

*Message #49 Posted by **Werner** on 25 Aug 2011, 9:06 a.m.,*
in response to message #48 by Werner

.. and an example is very easy:
just take the AM1 matrix from above, but multiply it by 4.
The exact determinant is then 4^7 or 16384, while DET (with flag -54 clear) returns 16383.
If you take AM1*5, the exact result is 78125, DET returns 78118.
This is what fiddling does: it leads you to believe 78118 is the exact determinant, and it is not.

BTW taking AM1*10 results in a perfect 10000000 again, so the 'integer-determining' algorithm is a bit more sophisticated than that, and actually determines the position at which the determinant should be rounded.

in response to message #46 by gene wright

Some thoughts here about "modes" and why it is not really a good thing on a calculating machine of that caliber. (I use 0.999945.... here just because I am too lazy to write all digits each time.)

When doing mathematics one does not first set the brain to some "exact" or "approximate" mode. We just use the right symbols. A mathematical assertion is clear and unambiguous not because of setting modes but because of the strict language it uses. (Even its inconsistencies are clear. ;-)) This language is made of symbols like numbers, letters, indices, operators, etc. (And we try to keep clarity along with strictness using the least possible concepts and the lest possible symbols.) For example, one could write Det(AM1)=1 or Det(AM1)≈0.999945.... but never Det(AM1)=0.999945..... since the determinant of AM1 is *not* equal to 0.999945.... It is only *approximately* equal to 0.999945.... , which is expressed using ≈ and not = .

The above example, translated to the language of the HP50G would mean that the statement Det(AM1)=0.999945..... is true under the additional premise of approximate mode. In this case using approximate mode is like writing the symbol "≈" . So one could also say that the mathematical symbol "≈" is available on the machine by using approximate mode.

But: As we see here and in so many other examples the usage of modes is anything but clear. The result of the operations in this example can imply that Det(AM1) *is* actually 0.999945..... , and then additional consideration of the state of flag -54 corrects the statement to "Det(AM1) is approximately 0.999945.....". In this case it not so difficult for the user to keep in mind the states of the related flags, but in many many other examples one has to remember many more things that are valid implicitly. In other words the explicitness of the statement is lost. Compare for example the explicit clarity of statements like:

Det(AM1)=1

or

Det(AM1)≈0.999945....

with the implicit clarity of:

Det(AM1)=0.999945.... | approximate mode and usage of tiny elements

where the part "| approximate mode and usage of tiny elements" is not explicitly written but kept as a setting under the numerous modes of the machine.

To make it even more complicated just multiply some numder of AM1 with the variable X and retry the cases in my last message. A completely different behavior just because of the presence of a variable in the matrix.

It seems that the concept of modes was OK for machines with limited RAM that offered some few flags for angles or number representations, but I doubt that this concept is a good choice for a CAS with much RAM. There are many too many things for the user to be aware of, and this makes lowers unnecesserily the clarity. The part "| approximate mode and usage of tiny elements" is simply the symbol "≈" - not really an economic translation, is it? And also not quite obvious when there is no kind of announciator for usage or not of tiny elements. And even less obvious when it is not visible anywhere in the machine what actually "tiny" means, but that's a very long story. (The explanation about "tiny" in the manual is only a tiny part of this long story, which can be used against this statement too. ;-)) And even less less obvious when we take symbolic variables in the matrix. And, and and....

All the above is of course more of an issue about user friendliness through consistency, but there is also a second but: Using so many flags and modes and states introduces hidden dangers against consistency due to unexpected interferences. To make it even worse, the different types of operations like commands, operations, functions, analytic functions, programms etc., the behavior of which is influenced by the modes, don't really help to avoid confusion. Just consider the several representations of a complex number on the HP50G in combination with all the relevant modes under usage of the power function. You will get a lot of possible sub-cases and a lot of possible different results for one and the same mathematical thing, namely (a,b)^c. In many of these cases the result is absolutely correct but in many others of these cases the result is at least not easily understanable. It is not right and it is not wrong and it is both at the same time.

The above is much like the Toolbox of the Mac before OS X. Thousands of functions doing the same thing a bit different - sometimes so, sometimes the other way around, according to "modes". Nobody could manage it consistently anymore and so it started showing severe inconsistencies that were not avoidable. And so the only right decision was to through it away and start from scratch for something else. This brought us OS X. Much more consistent and with much less hidden dangers that can evolve to catastrophes. (I wonder how long it will take until it starts declining under its own growing weight.)

So,

a) just consider the HP50G in exact mode and enter 1 1 + . The result is 2, so it is OK.

b) Now switch to approx mode and enter 1 1 + . The result is 2. since entering the two 1s (without the decimal point) converted them both to 1. For me it is also OK.

c) Now switch to exact mode, enter 1 1, then switch to approx mod and press +. You get 2, an integer and not a real though you are in approx mode. Let's accept that as a consistent result because we are operating with integers, and let's say that integer results should be obtained when integer arguments are used - no matter of mode.

d) But now switch to exact mode, enter 0 1 'X' 'X', then switch to approx mode and integrate. You get 0.5 and not 1/2. Hmm... is that consistent when we have accepted (c)???

You see where it goes to.

Ciao.

Re: 34s: Matrix success!

*Message #51 Posted by **Paul Dale** on 20 Aug 2011, 10:37 p.m.,*
in response to message #1 by gene wright

While I was away a few days, I started fiddling with what I'd like to see a 34S matrix package look like.

I'd like matricies to be written as descriptors of the form BB.RRCC, where BB is the first register, RR is the number of rows in the matrix and CC the number of columns. Simple to use and very easy for the user to remember. Conversion into other forms will be part of the library internals.

Matrix operations should take one or more of the descriptors from the stack as well as any other required arguments and return a result descriptor to the stack & perhaps stored in I if on the stack doesn't make sense for a particular operation. Storing the result descriptor in I might be worthwhile regardless. Attempts to preserve the stack do not seem worthwhile at least to me unless they fall out naturally.

I've coded some utility routines to take a descriptor from the stack and to return the base and dimensions, loop iterators for all elements or for row or column elements.

I used these to code matrix addition and subtraction.

I started thinking about matrix multiply. I'd really like to use the internal SUM command for each result value since it does a Kahan sum which should increase the accuracy a little much of the time and it doesn't use any of the visible registers.

None of this is opposed to what Gene has done either. The M1 - M5 routines will be required in any matrix library and converting them to use slightly different inputs shouldn't be tricky.

- Pauli

Re: 34s: Matrix success!

*Message #52 Posted by **fhub** on 21 Aug 2011, 8:47 a.m.,*
in response to message #1 by gene wright

Looking for matrix routines I remembered a very efficient, accurate and small algorithm (Faddejew-Leverrier), which calculates the determinant, inverse and characteristic polynomial of a nxn matrix in just n iterations - maybe not everyone here knows this method, and so I've made a short pseudo-code for it:

```
----------------------------------------------------------------------
Input: nxn-Matrix A

B := 0  // 0 = nxn zero matrix
c[n] := 1  // c = (n+1)-vector or list [c(n),c(n-1),...,c(1),c(0)]
for k := 1 to n
  B := B + c[n-k+1]*I  // I = nxn identity matrix
  if k = n then Inv := B
  B := A*B
  c[n-k] := -trace(B)/k  // trace = sum of diagonal elements
endfor
B := B + c[0]*I

Output: if B <> 0 then return "iteration not convergent"
1) Det := (-1)^n*c[0] ... determinant |A|
2) if Det = 0
     then return "singular matrix"
     else Inv := -Inv/c[0] ... inverse matrix A^-1
3) CharPoly := Sum(c[k]*x^k,k,0,n) ... characteristic polynomial cp(A)
```

- -

I've coded it for my TI-92+ (although it has functions for 'det' and 'inv') which needed only a few lines, and tried it with the Albillo matrix AM1 - and even running it in approximate mode it returns the exact value 1 for the determinant!

Unfortunately this algorithm would be no advantage for the WP34s, because it also needs a 2nd nxn matrix (B), so the limit would also be a 7x7 matrix for these functions.

OT, but interesting

*Message #1 Posted by **Don Shepherd** on 15 Aug 2011, 12:05 a.m.*

I graduated from high school in 1968 and enrolled in a computer programming school called ECPI (Electronic Computer Programming Institute). To get into that school, I had to take a "Data Processing Aptitude Test." One of the questions on that test was:

> Quote:
>
> In a certain company, 3/5 of the employees can type, 1/4 can take shorthand, and 1/5 can do both. What percentage can neither type nor take shorthand?

It was a multiple-choice question, with 5 possible answers. I won't list the possible answers. Disregarding the fact that being able to answer this question has almost no bearing on being able to succeed in "data processing," what is the answer? I didn't know it in 1968, and I'm not all that sure I know it in 2011.

I suspect that even if you scored zero on the aptitude test, they would still take your money and enroll you.

Re: OT, but interesting

*Message #2 Posted by **Paul Dale** on 15 Aug 2011, 12:22 a.m.,*
in response to message #1 by Don Shepherd

1 - (3/5 + 1/4 - 1/5) = 1 - 0.65 = 0.35 = 35%.

Minus 1/5 because both the 3/5 and 1/4 included it already and we wouldn't want to double count it.

> In a certain company, 3/5 of the employees can type, 1/4 can take shorthand, and 1/5 can do both. What percentage can neither type nor take shorthand?

my answer would be 35% (or 7/20).

(3/5) - (1/5) can only type = 2/5
1/4 can at least take shorthand, and some of these may also be able to type
(2/5) + (1/4) = 13/20 can either type, or take shorthand, or both.

the remainder (7/20) can do neither. my reasoning is that in conversational english the assertion "60% of our

staff can type" would always include those staff who can both type and do other things. similarly for shorthand.

Don,

I had a similar experience many years ago when I applied for a position with Xerox to repair copiers. They gave each applicant a very long test that included word problems and various logic problems. The test had to be completed in a very short time. They wanted to see how fast you could analyze the problems and come up with an answer. Logic problems actually made a lot sense, since the copiers in those days were controlled by relays, a lot like the early relay computers.

I didn't get the job - it came down to me and one other person. Overall, I scored higher, but they gave the job to the other guy since "I was single and he was married with kids, and needed the job more than I did." Believe it or not, that was exactly what I was told when I was turned down for the position.

I think you just can't open it. The ball you see are not solder bumps, the keyboard is held together by "nails" which were just pushed-in with a press. They won't come out without destroying the whole thing.
Joel Setton

Re: 9815 Keyboard Disassembly

*Message #3 Posted by **Tony Duell** on 15 Aug 2011, 4:23 a.m.,*
in response to message #1 by aj04062

Those aren't solder blobs, they're metal pins. Some HP9815 keyboards were assembled by screws (lots of them!), others with these pins.

I think you can get them out by warming them with a soldering iron and then using a pair of cutters to grip them and pull them out, Once they're all free, the PCB comes off, and the keys will fall out (I learnt that the hard way!).

If you can find some small self-tapping screws, I think I'd use those to reassemble it.

As to whether it's worth doing, I'd probably not bother. Too much risk in damaging something that still works. Now if a key didn't work at all, I'd take it apart.

WP34s: Which donor?

*Message #1 Posted by **Dan W** on 14 Aug 2011, 8:18 p.m.*

Hi all, thinking of plunging into the WP34s. Simple question, what do you think is the better donor calculator, the 20b or 30b?

I have never actually seen or used either one. But I am hearing/reading the buttons on the 30b are better, and the display might be better. Is the hardware really significantly better?

The 20b color would probably look better with the overlay, and the cost is a bit less.

Thoughts? Any other important differences?

Edited: 14 Aug 2011, 8:18 p.m.

HP 41 key assignment file and x memory

*Message #1 Posted by **Geoff Quickfall** on 14 Aug 2011, 6:59 p.m.*

Hello,

now that I have all the xroms available (almost) on the Cl I would like the capabiltiy, similar to the 71B of saving a keyfile to x-memory. This is due to the fact that some XROM take over the CL and configure the key assignments throwing your personal assignments in the trash. Using SK and RK on PPC allow suspension and reactivation of your personal key assignment but store the assignment strings in the main register memory where they can be corrupted by other program usage. I would like to store the key assignments in x-memory where xroms do not have access to them. That way they are available at any time to recall and reactivate.

Using SK and RK on the PPC seem like a good start. SK (suspend keys) uses two storage registers of your choice to store the key assignments. They can be reactivated by RK (reactivate keys).

The two NNN numbers that SK uses are stored in a user defined register set. For example 0.00 in x; followed by xeq SK; stores the key assignments in R00 and R01.

So you would think it would be an easy thing to create a keyfile for xmemory along the lines of:

```
10
"KEY"
CRFLAS

LBL "KEYI"
XEQ "SK"
0
"KEY"
SEEKPTA
CLA
ARCL 00
INSREC
CLA
ARCL 01
INSREC
END

LBL "KEYR"
0
"KEY"
SEEKPTA
CLA
GETREC
ASTO 00
CLA
GETREC
ASTO 01
CLA
XEQ "RK"
END
```

the first three lines create the KEY text file to store the R00 and R01 NNN for recall by SK.

"KEYI" only needs to be run once to store the R00 and R01 contents in the x memory location 00 and 01.

"KEYR" should recall the NNN to their respective storage registers for use with RK at any time.

Instead I get nothing but ABS assigned to all keys as opposed to the original keys.

So you have an idea of what I want, surely an XROM has this routine or function built in somewhere. Again the idea is to create a TEXT or DATA file in xmemory which will allow me to reinstall the key assignments that is safe from main memory REG manipulation. The failing of RK and SK is that they rely on the main REGs which may be altered by any number of routines called upon by an XROM whereas the X-memory is safe from that manipulation.

Any ideas.

also ran the the above programs treating the R00and R01 registers as data, that is I created a DATA file named KEY in x-memory. But that did not work either!

Cheers, Geoff

Re: HP 41 key assignment file and x memory

*Message #3 Posted by **Geoff Quickfall** on 14 Aug 2011, 7:53 p.m.,*
in response to message #2 by Raymond Del Tondo

Thanks Raymond,

well i have access to all your CCD roms (currently using osx version) but may have to switch to the full CCD again. Considering they are all built into the CL, not a problem. I can call the CCD and plug it in with a routine, save the keys and uplug if the port is required. A routine will do this in less then a second.

Then when i am finished with the current key state, another routine will plug CCD, restore assignments and unplug CCD, again in less then a second.

Thanks for directing back to the CCD, I knew the existed somewhere. Now to find the manual!

Cheers, GEoff

Re: HP 41 key assignment file and x memory

*Message #4 Posted by **M. Joury** on 14 Aug 2011, 8:07 p.m.,*
in response to message #1 by Geoff Quickfall

Hi Geoff,

Maybe I misunderstood what you were saying but...

> Quote:
>
> SK (suspend keys) uses two storage registers of your choice to store the key assignments.

I am not 100% sure on this and I don't have a manual handy but I seem to remember that SK/RK only saved and restored the bit-fields denoting that a key was assigned. They do not actually store the key assignments themselves. I believe that it is impossible to store all possible key assignments in two registers--remember that each register can hold 2 key assignments.

What is going on with SK is that it stores the bit-fields denoting that currently reassigned keys and then clears those fields so that the calculator thinks that nothing is assigned. The actual assignments are still in memory. RK restores those bit-fields and thereby reactivates the assignments--the actual assignments are already in memory.

As noted, this is all from memory and it has been a long time since I have messed with any of this so I could very well be mistaken...

Cheers,

Marwan

Re: HP 41 key assignment file and x memory

*Message #5 Posted by **geoff quickfall** on 14 Aug 2011, 8:39 p.m.,*
in response to message #4 by M. Joury

your memory is correct Marwan!

that is one of the problems with SK and RK. Now CCD actually creates a KEY file in x-memory with the use of SAVEK and GETK.

It appears, however that they only save calculator function keys and not global routine labels.

So the search is still on: " a way to create a key x-memory file which includes the entire key assignment state: both calc-functions and global labels."

The treat with the CL is that you carry around in your pocket the entire created ROM library with few exceptions. Some of these ROMs take over the keyboard and overwrite your key assignments without allowing you to return to your assignments unless you:

CLKEYS and then reassign your keys.

With SAVEK and GETK at least the 6 calculator functions I have assigned come back. Still leaves 12 Global routine labels to reassign.

Further, there is an ability on the 41CL to restore a calculator state from the flash memory. But I am trying to circumvent the need to do that by just recalling a key assignment state.

Cheers, Geoff

Re: HP 41 key assignment file and x memory

*Message #6 Posted by **M. Joury** on 14 Aug 2011, 8:57 p.m.,*
in response to message #5 by geoff quickfall

I am holding my breath and waiting for the next production run of the CL. I have my name in for one.

I also remember the SAVEK and GETK routines. I guess the reason that they don't save the global program assignments is that those are associated with and stored as part of the program labels.

Here is one approach that you could use although not very elegant. Create a program that is just composed of global labels and XEQ calls to your regular programs. Make the key assigmnets to the global labels in this new program. You can then save this one program to Extended memory and the key assignments should (IIRC) get saved with it. Then when you need to restore your assignments just restore the program from extended memory. I just tried it. Key assignments get saved as part of the file and will be restored when the program is read back into memory.

Cheers,

-Marwan

*Message #7 Posted by **geoff quickfall** on 14 Aug 2011, 9:46 p.m.,*
in response to message #6 by M. Joury

WHAT AN IDIOT I am!!!!!

Global labels in a program and in conjunction with SAVEK and GETK. I actually used to do that! This is what happens when you put a calcualator away for years. You forget.

Thanks Marwan.

once you have a CL you will put everything away (except the 34S!!)

Geoff

*Message #8 Posted by **M. Joury** on 14 Aug 2011, 10:41 p.m.,*
in response to message #7 by geoff quickfall

Glad I could be of some help :-).

I got through my last 3 years of college with my old 41 and I used to know the darn thing inside and out. These days I sometimes have to go back to the manual for stuff that I once knew backwards and forwards. Must be old age setting in and messing with my memory <g>. I actually had to test my idea to make sure that I was remembering right--I was pretty sure that worked with the card reader but was not 100% sure it worked with extended memory.

Cheers,

Marwan

EDIT:

Does the order in which you do it matter? I think it might--GETK before you read back the

program?

Edited: 14 Aug 2011, 10:44 p.m.

Re: HP 41 key assignment file and x memory

*Message #9 Posted by **geoff quickfall** on 14 Aug 2011, 11:09 p.m.,*
in response to message #8 by M. Joury

the 41CX was my tool during my Masters program. It ran 4 pieces of my lab and was my plotter, data cruncher and printer.

I too new synthetics inside and out but yep, it is a case of:

```
0, STO C
```

;-)

i will check on the order tonight. I just got word I am off to London tomorrow and have to get Wlodek's CL up to snuff for him.

Cheers, Geoff

Re: HP 41 key assignment file and x memory

*Message #11 Posted by **Garth Wilson** on 14 Aug 2011, 11:10 p.m.,*
in response to message #1 by Geoff Quickfall

Why not just write programs full of PASN instructions? They won't actually read your key assignments, but you can have a program written to make all the assignments for each USER keyboard you want, and since you probably assigned the keys by hand according to how you wanted it, you can put the same thing in the program. Keys that don't get re-assigned can keep their old assignments. The programs can be kept in extended memory if desired so they're not usually resident in main memory. A CX with no modules at all can do this.

Edited: 14 Aug 2011, 11:11 p.m.

Re: HP 41 key assignment file and x memory

*Message #12 Posted by **M. Joury** on 14 Aug 2011, 11:47 p.m.,*
in response to message #11 by Garth Wilson

That would work as well. I actually thought of this but for some reason that I can not define gravitated to the other solution. This method is actually more memory efficient since, as you noted, it does not have to

reside in main memory. You could read it, run it, and program it to delete itself when done. Nice and clean. You could also code the GETK call into it so everything is done in one place.

Cheers,

-Marwan

Edited: 14 Aug 2011, 11:48 p.m.

Re: HP 41 key assignment file and x memory

*Message #13 Posted by **Geoff Quickfall** on 15 Aug 2011, 12:42 p.m.,*
in response to message #1 by Geoff Quickfall

Well I resorted to brute force:

```
LBL "KEYG"
"WA"
-11
PASN
"WC"
-12
PASN
"ST"
-13
PASN
.
.
.
"LO"
-84
PASN
"KEYF"
GETK
"BK"
GETP
END
```

So here is the calc and the reason for the key assignment program. The CL is loaded with:

```
CCD PLUS
PPC 1981
EXT-IL
PRINTER 3B
YFNS-1E
CLUTILS 1H
```

At any time I can plug and unplug any other ROM of choice. Some of these ROMs like the blood glucose ROM assigns functions to the keyboard removing my custom keyboard. To return my keyboard I must remove a program "BK" (full up) and bring "KEYG" to main memory.

XEQ "KEYG"

on the CL immediately loads the custom keyboard, erases itself and calls "BK" back to main, all in a split second. I also have in FLASH another 41CL image, called IGCP. This is a full suite of main memory programs and x-memory data bases that I wrote in 1984 fo my Masters in Palynology. I dug up the cards (I am currently collating data for another article), loaded the routines including assignments. I then using a routine which copies the entire suite of programs into the CL and thence to FLASH. These calculator 'states' contain the key assignments as well as the entire x-memory, flags and main memory including any data in storage registers. Once in FLASH they are protected from Memory Lost or power failures.

Now I just swap the FLASH and have a IGCP or aviate calculator at my whim. Many calculator states can be copied to the FLASH allowing you to have many custom calculators in your pocket!

Ran the CL in the cockpit to Hong Kong from Vancouver (for a total of 6 hours both ways). Not a single ESD event, usually occured on the standard 41 at least once due to the dry cockpit air.

Cheers, Geoff

A design rule for WP34s library software?

*Message #1 Posted by **Dieter** on 14 Aug 2011, 10:14 a.m.*

The recent discussions on various software to be included in the WP34s library show that there are certain rules and limitations that need to (or at least should) be concerned. So I think it's a good idea if there was something like a standard for such software, a kind of programmer's guide. This might include the following topics and more:

- Which registers can be used or should preferably be used? Some (most? all?) lettered registers are used for internal purposes (stack, parameters etc.), maybe there are one or two that can be used as "official" scratch registers. Or the rule recommends a range like R90-99 or R80-99 for library programs so that the user knows not to use these for his own software (as long as the library is used).
- The same goes for flags. Since there is a vast number of available flags, the use of flag 90-99 could be recommended.
- What about the stack? Consider the quadratic solver. X, Y and Z hold the coefficients, so do we need to preserve the higher registers on return? Should they be zeroed? Does this matter anyway?
- What about initializing modes and handling/changing modes inside library software? For instance, software using trig functions should either use the current angular mode and, if necessary, convert angles to this mode. *If* modes are changed during the library call, they should be reverted to the original setting before return. The same goes for stack mode, display settings, etc.
- What about documentation? What information is mandatory, what is optional?

I am sure this is not a complete list. ;-)

Dieter

Re: A design rule for WP34s library software?

*Message #2 Posted by **Walter B** on 14 Aug 2011, 3:45 p.m.,*
in response to message #1 by Dieter

Thanks for raising this topic. There are no standards yet, but the following may form the base for a discussion here:

> Quote:
>
> - Which registers can be used or should preferably be used? Some (most? all?) lettered registers are used for internal purposes ...

All of them have a specific use: please see the first page about "Memory" in the manual. So I don't recommend using these nor the ones employed for statistics if you want to avoid interfering with such commands. Beyond those, feel free to chose whatever registers you like. I think it's good practice to document them in the program header.

> Quote:
>
> - The same goes for flags.

No user flags but the lettered ones have a specified meaning so far. So here the door is wide open for you. Enjoy (but document)!

> Quote:
>
> • What about the stack? Consider the quadratic solver. X, Y and Z hold the coefficients, so do we need to preserve the higher registers on return?

Depends. I'd vote for some cleanup at the end of a routine. E.g. if a routine uses X, Y, and Z for input and X and Y for output, then it shall work in a 4-level stack like shown below:

```
Stack level   Content at start  ... at end
          T   t                    t
          Z   input parameter 3    t
          Y   input parameter 2    result (part 2)
          X   input parameter 1    result (part 1)
```

I leave it as an exercise to transfer this to an 8-level stack ;-) Remember the commands STOS and RCLS.

> Quote:
>
> • What about initializing modes and handling/changing modes inside library software? For instance, software using trig functions should either use the current angular mode and, if necessary, convert angles to this mode. *If* modes are changed during the library call, they should be reverted to the original setting before return. The same goes for stack mode, display settings, etc.

I concur. STOM and RCLM will help in hosekeeping.

> Quote:
>
> • What about documentation? What information is mandatory, what is optional?

I can't force anybody to document what (s)he does in his/her routine, but I'd welcome documenting registers and flags used as well as input and output. With the housekeeping suggested above, nothing more will be necessary IMHO.

What do you think?

Walter

At least for register "J" I haven't seen any usage yet, so this should be safe as scratch register.

in response to message #4 by Walter B

> Quote:
>
> Not my fault ;-) Please read said page again 8-)

Well dear Walter,

I'm quite sure that register J was NOT mentioned as being used for statistical calculations in former manual versions - that's the 1st point.

And the 2nd point is that you yourself suggest "Unless required for the purposes just mentioned, A-D,I,J and K are available as additional general purpose registers."
So what now?

If I'm sure to be in SSIZE4 mode (or switch to this mode) in a program, I absolutely see no reason to NOT use any of these 'upperstack' registers A-D - they can be perfectly used e.g. as a backup of the usual X-T stack.

Waiting for your next disagreement ... ;-)

Re: A design rule for WP34s library software?

Well, I also have quoted **you** - with exactly the words you use in your manual.

So do we have 2 Walters here, a 'forum Walter' and a 'manual Walter'?
Both contradicting statements above let me almost believe this.

Re: A design rule for WP34s library software?

*Message #8 Posted by **Walter B** on 14 Aug 2011, 6:11 p.m.,*
in response to message #7 by fhub

IMHO both statements are not contradicting each other :-)

(I'm willing to explain this on request, but am confident you won't need it after reading carefully.)

Re: A design rule for WP34s library software?

*Message #9 Posted by **Paul Dale** on 14 Aug 2011, 6:55 p.m.,*
in response to message #1 by Dieter

The recent discussions were for code in xrom which is a very different beast to a library. Code there cannot touch the user's state and must preserve modes and stack -- xrom exists to implement commands that, to the user, appear exactly like internal ones.

Libraries, on the other hand, are far less restricted. Basically, so long as what the function does and what resources it uses is documented I don't see a problem. Still, it would be nice to avoid using the lettered registers and flags and the statistical registers -- you as a library writer don't know what the user is doing.

- Pauli

Re: A design rule for WP34s library software?

*Message #10 Posted by **Marcus von Cube, Germany** on 15 Aug 2011, 5:38 a.m.,*
in response to message #9 by Paul Dale

I think losing the stack isn't an issue for some 'large scale' applications. If you just create a useful

subroutine of sorts it should more or less look like an internal command, even if it needs additional registers to do its work.

Stack size is very much a matter of user preference and a routine or application should only change it if absolutely necessary. The user interface of the VEC application starts with a SSIZE8 command for good reasons and a matrix program may opt for inputing the rows or columns of a matrix via the stack which makes an appropriate stack size mandatory. I don't see a way to restore the user preference because an interactive application does not have complete control all of the time.

OTH, a library routine that needs a specific stack size to operate should make use of STOM and RCLM. The latter routines are designed to directly transfer the state from and to a register and don't interfere with the stack contents.

Re: A design rule for WP34s library software?

*Message #11 Posted by **Paul Dale** on 15 Aug 2011, 5:40 a.m.,*
in response to message #10 by Marcus von Cube, Germany

I can't disagree with any of this. A library is a library and can do anything.

However, XROM isn't a library, it must look exactly like internal commands.

WP34s: linear equation system

*Message #1 Posted by **fhub** on 14 Aug 2011, 8:52 a.m.*

Now that we have an extended quadratic equation solver, what about a simple linear equation system solver for 2 variables?
I know this would be handled by a matrix package, but for 2 variables/equations it's just a few bytes and would fit quite well to SLVQ. ;-)

Here's my code for this (SLVL, SLVS or SLVLS ?):

```
/*
  Linear Equation System
  a*x + b*y = c
  d*x + e*y = f

  Mode:   SSIZE8
  Input:  a [ENTER] b .... e [ENTER] f
  Output: X:x Y:y Z:det (or "Invalid data" if det=0)
  Used:   Stack
*/

001 LBL'LS'
002 RCL B
003 RCL[times] Z
004 RCL B
005 RCL[times] A
006 -
007 x=0?
008 ERR 18
009 RCL C
010 RCL[times] Z
011 RCL B
012 RCL[times] B
013 -
014 RCL/ Y
015 RCL B
016 RCL[times] A
017 RCL D
018 RCL[times] A
019 -
020 RCL/ Z
021 0
022 ENTER[^]
023 [cmplx]R[v]
024 RTN
```

It preserves the coefficients of the 2nd equation (d,e,f), puts the coefficient determinant to Z and the solution x,y to X,Y.
Of course it works only in SSIZE8 mode!

With the use of Pauli's 'private' ;-) internal registers it could even preserve ALL coefficients, if e.g. the determinant would be stored to register L (or simply ignored).

If you want you can include it in the XROM, if not then it's just one more little user program ... ;-)

Franz

So a library routine it will have to be.

- Pauli

Re: WP34s: linear equation system

*Message #3 Posted by **fhub** on 14 Aug 2011, 7:24 p.m.,*
in response to message #2 by Paul Dale

Yes, I was already afraid that SSIZE8 might be a problem for XROM.
But I can't store 6 values on a 4-level stack - and using registers instead is no good idea IMO, because it's much more complicated to input.

Now for another idea I had today: ;-) Currently register "I" is only used in complex operations and stores the previous imaginary part (Y-value).
What if the same would be done also for real (duadic) operations, i.e. before executing any of these operations the Y-value is stored in I (together with X in L)?
So also for real operations the I-register would work like a "LastY" - this would almost allow a kind of "UNDO" function: after any duadic operation (e.g. done by mistake) you could just do DROP, RCL I, RCL L, and you have the previous stack back again.

I think this would be very easy to implement (if I don't overlook something?), because such a "STO Y to I" could simply be done whenever X is stored in L.

Good idea or not? ;-)

Franz

Re: WP34s: linear equation system

Is there a reason you've got three cross products (of the form a b - c d) here but aren't using complex multiply to maintain accuracy?

- Pauli

Re: WP34s: linear equation system

*Message #5 Posted by **fhub** on 14 Aug 2011, 7:38 p.m.,*
in response to message #4 by Paul Dale

> Quote:
>
> Is there a reason you've got three cross products (of the form a b - c d) here but aren't using complex multiply to maintain accuracy?

Yes, there are even a few reasons! ;-)

1) I would have to put all 4 values (used in [cpx]*) at the right position on the stack, which would cost a lot of program steps
2) this correct positioning would also need much more than the 8 stack registers, because the values used for any [cpx]* are used in the following step(s), too (and without actually trying it I doubt that I could use both the real and imaginary part of the complex product, so one of them would always be useless)
3) last but not least I don't care SO much about EXTREMELY high precision (anywhere at 16 digits) like you - when do you (in every-day-problems) really have a linear equation system (2x2) with coefficients which would give wrong results if you don't use your favoured "super-high-precision-tricks"? ;-)

Franz

Re: WP34s: linear equation system

*Message #6 Posted by **Marcus von Cube, Germany** on 15 Aug 2011, 5:19 a.m.,*
in response to message #5 by fhub

Franz, neat little program. One more idea which might even allow for Pauli's idea to compute the determinant with a complex multiply: Why not enter the complete system column wise or coefficients first, then right hand side? If the routine would preserve the coefficients in stack levels Z, T, A & B and a allow to enter another set of values for the right hand side to solve a similar system without reentering the matrix.

Pauli, even if in XROM the stack mechanics a nailed to 4 levels, all 8 registers are still available so that a program which expects data in registers A to D can still be written. It may consume more steps but we have some room left.

Re: WP34s: linear equation system

*Message #7 Posted by **Paul Dale** on 15 Aug 2011, 5:36 a.m.,*

XROM is for built in commands. Playing games like this with the stack & registers really isn't appropriate :-(The command has to work regardless of the stack size and the user's settings.

In a library, things are very different however.

- Pauli

Re: WP34s: linear equation system

*Message #8 Posted by **fhub** on 15 Aug 2011, 5:45 a.m.,*
in response to message #6 by Marcus von Cube, Germany

> Quote:

Yes Marcus, the idea with preserving the coefficients is indeed a very good one, and also using the complex multiply would be preferable, but both ideas require to use additional registers Rnn - it's just not possible to do this with an 8-level stack (at least not without dozens of "stack-swappings"). So if you would say using additional registers is ok, then I would certainly give it a try ... ;-)

But what surprises me a bit more at the moment: my idea above (having an additional "LastY" (i.e. storeing Y in "I") to the usual "LastX" in L) doesn't even seem to be worth any answer!?
- And this although such a "LastY" after a duadic operation would certainly be just as useful as "LastX" for further calculations.
- And this although it would just need an internal "Y -> I" command whenever X is backup'ed in L.

Franz

For me your suggestion about LastY sounds reasonable. Let's wait what the others think about it.

Re: WP34s: linear equation system

*Message #10 Posted by **Paul Dale** on 15 Aug 2011, 5:54 a.m.,*
in response to message #8 by fhub

Since you are pushing the point, I hope you can deal with a bit of negativity :-)

We considered a last Y a long time back. It doesn't work and introduces inconsistencies. Ignoring the lack of RAM for extra registers for a moment...

Complex dyadic operations would require a complex equivalent of last Y. Triadic operations would require a last Z. Fortunately, there are no complex triadic operations yet or we'd require more.

We simply can't stay consistent treading this path.

Now think about the number of times you've used register I as a temporary (& I've seen your

code doing just this and I've done the same many times). Users can and will do this. Adding a last Y using "I" will impact this use of the register.

So, yes we considered this and rejected it.

Now, we could use our final bit in the mode word to specify an optional stack backup before every operation or not. That would achieve pretty much the same thing. Is this worthwhile? I really don't know.

- Pauli

This reminds me of the "Last Stack" feature of the RPL machines. I think it's overkill. We should consider to put STOS and RCLS on the keyboard instead (where ITOA and ATOI reside now) and to allow register A as the destination if in SSIZE4 mode.

Allowing A is problematic and would require some work in the argument processing code.

I also think it is overkill.

- Pauli

Yes, I know. But I still thinks it's worth the effort. So with a 4 level stack, A to D can assume the role of a quick backup.

LOL, that's funny: exactly **my** idea from a few days ago ...

All 3 features (Save/Restore/Swap-stack between the lower- and upper-stack were my suggestions a few days ago (and I've even provided user-code for all 3 commands), and what answer did I get? "not needed, you can use STOS and RCLS instead"

And now when Marcus (and even Pauli himself) 'suggest' exactly the same features, they are now suddenly "useful"?

Sorry, but I couldn't resist ... ;-)

Some suggestions just take their time... ;-)

Re: WP34s: linear equation system

*Message #17 Posted by **Paul Dale** on 15 Aug 2011, 5:44 p.m.,*
in response to message #14 by Paul Dale

I've figured out the "best" way to do the swap4 command:

```
LBL'SW4'
```

```
    [cpx]SWAP C
    [cpx]SWAP Z
    [cpx]SWAP C
    [cpx]SWAP A
    RTN
```

Seven instructions = 14 bytes. To introduce an internal command table entry takes 12 bytes and to add a function that does nothing pushes things closer to 40 bytes. To add the relevant swaps pushes this higher. So this is the most compact implementation I can think of.

The question is to do this as a user subroutine -- no extra flash bytes but 7 user steps -- or put it in xrom as is -- 14 bytes -- or to put it in xrom with an internal command to call it -- 30+ bytes -- or to write a dedicated command -- 60+ bytes.

I'm leaning towards letting the user do this one.

- Pauli

Re: WP34s: linear equation system

*Message #18 Posted by **Marcus von Cube, Germany** on 16 Aug 2011, 2:10 a.m.,*
in response to message #17 by Paul Dale

Now add another label, LBL 32, and XEQ x<>y does the swap from the keyboard as long as the PC is positioned in the correct region.

> Quote:
>
> Since you are pushing the point, I hope you can deal with a bit of negativity :-)

Well, a **bit** of negativity won't be a problem for me, but as far as I can remember **each and every** idea or suggestion from me to improve the 34s has been rejected by you so far - either "not useful" or "not possible"!

So since it seems that **all** my ideas are in fact that bad, I guess it's better for me (and you) if I completely resign from the 34s project.

Franz

> Quote:
>
> Grow up.

I would rather say **you** should grow up!
Your usual stubborn argument "because it won't work for **all** functions, we don't implement it **at all**" is pure nonsense, and I really can't hear it anymore!
Because you won't have a LastZ for a **few single** 'exotic' triadic functions (or for complex functions), you don't implement such an extremely useful LastY feature at all?
Just because a few percent of functions (certainly used very seldom) can't profit from such a feature, all other (maybe 95%) functions shouldn't profit from a LastY, too?
Sorry, but that's just ridiculous.
(I guess you would also reject a 2nd prize in a lottery just because you didn't win the 1st prize?)

> Quote:
>
> We've taken several of your suggestions on board

May I laugh?
Yes, I'm good enough for you to improve and optimize some code (crossproduct, TVM, SOLVQ), but when it comes to ideas or suggestions your opinion is that I should better shut up.

Thanks, but I'm not your slave - it's really enough now!

Goodbye - an my best wishes to the WP34s team,
Franz

My IR-printer 82240A doesn´t print right

*Message #1 Posted by **Matti Övermark** on 14 Aug 2011, 4:24 a.m.*

I have an HP IR printer of the first model (A). It has worked flawlessly even though I bought it second hand. S/N is 272**S**10269.

Now there is one or maybe rows missing on the output on paper. * indicates successful printing, - no printing.

```
******       ***        ***********
*       *    *     *           *
**      *    *     *           *
*******      ******            *          and so on
*       *    *     *           *
        -    -     -           -
        -    -     -           -
******       *     *           *

Other data.
* No change with fresh/old batteries, neither when using charger.
* Version D as indicated last in the testpage.
* Prints as requested from all calculators that I have access to.

I tried to see on Randys (fixthatcalc) page, but I found no help.
Anyone know how to solve it?
TIA Matti
```

Re: My IR-printer 82240A doesn´t print right

*Message #2 Posted by **Michael de Estrada** on 14 Aug 2011, 8:04 a.m.,*
in response to message #1 by Matti Övermark

Pending a reply from one of the more expert forum members, I'm going to suggest that the print head has some bad elements. Either that or possibly the connector ribbon has some broken lines or bad connections.

Re: My IR-printer 82240A doesn´t print right

*Message #3 Posted by **Tony Duell** on 15 Aug 2011, 4:27 a.m.,*
in response to message #1 by Matti Övermark

The printhead consists of a vertical column of elements (each corresponding to a dot row), and it appears that some of yours have failed.

I would open it up, disconnect the printhead ribbon from the PCB and check the elements for continuity. If some are open-circuit, you need a new print mechanism (I don't think the printhead is a replacable part, alas).

If the printhead checks out, it could be the driver chip on the PCB (I think that's a standard part and can be replaced) or the microcontroller (custom programmed, only source is another similar printer).

There's a schematic of the 82240B on the HPCC CD-ROM. There are differences, of course, but it might be a start.

WP34S Symbolic preprocessor online

*Message #1 Posted by **Neil Hamilton (Ottawa)** on 13 Aug 2011, 5:41 p.m.*

Hi Y'All,

Based on a spec mostly worked out by Pauli, we have cobbled together an interesting addition to the WP 34S assembler tool chain. This is an assembler preprocessor (PP) that currently has the following features:

- It releases the user from the scourge of having to write those darn BACK and SKIP instruction (no more counting!). Just use "JMP SomeLabel" in place of BACK, SKIP, and GTO. Let the tool figure it all out for you.

- You can now use 'soft' labels with any instruction that would take a numeric or single-letter label, such as "XEQ DoThisReallyCoolThing" rather than "XEQ 25" (what's up with that?). Obviously there is a matching symbolic label at the target end of this as well.

- You can now use double quoted strings directly in the source and the tools will figure out that "WP 34S rocks!" needs to get parsed into 4 triple [alpha]'xxx' and a single [alpha] X.*** (Note that there a still a few known bugs in this feature if you decide to use any characters that mean something to regex. Working on it...)

*** Note that this specific example will overrun the alpha window on the screen so perhaps it is not such a good one to try :->

There are at least 3 sample programs in the library as example source for this tool. They are all knockoffs of the originals, suitably modified to take advantage of most of the features above (there is no 'promotion' of JMP to GTO in the example set -- though if you are sharp you may be able to figure out how to force it to occur).
- vector_pp.wp34s
- WHO_pp.wp34s
- 8queens_pp.wp34s

There is a new Assembler document (WP34s_Assembler_Disassembler.pdf, v0.5) that describes much of this in pretty reasonable detail (see Section 8), but basically to assemble any program that has PP code you need to add a new command line switch (-pp):

```
$ wp34s_asm.pl -pp vectors_pp.wp34s 8queens_pp.wp34s WHO_pp.wp34s -o wp34s-4.dat
```

If you don't want to use the new features, just don't use the '-pp' switch. Everything should still work as it did before. However if you feed it PP source without the '-pp' switch...

There are definite restrictions for using this PP code format. The most important is:

- DON'T PUT YOUR OWN NUMERIC LABELS IN UNLESS THEY ARE FOR A SPECIFIC PURPOSE! Use the symbolic labels wherever you can. There are places where this 'rule' cannot be followed (indirect LBLs for example and those connected to hot-keys) and the tool will work with what you have but label re-use is NOT ALLOWED with this tool. However, in most cases, they are just **not** required anymore -- the tool will select and fill these in for you if and when they are required. You might even see some code compression if you are used to using LBLs willie-nillie.

After a run, intermediate information is available in a file called wp34s_pp.lst in the directory you ran from. This file has the post-processed source that was actually assembled. Use this file if you want to debug your program on a machine or the emulator. It will have fully resolved line numbers, etc. (At the moment it does not retain your original comments. Not crapping please! A 'fix' may be in the works but it **is** complicated.)

Note that this is currently ONLY available in Perl so if you are using the EXE version of the assembler, you may have to wait a wee bit.

Probably still more bugs in this so let me know. (For a 'simple' little idea for an extension Pauli just tossed out, the code for this feature set is larger than the whole damn original assembler! :-)

We hope you enjoy it!

Source:

```
LBL'Roc'
CL[alpha]
"WP 34S rocks!"
XEQ Rocks_View
RTN

Rocks_View:: [alpha]VIEW
PSE 08
RTN
```

Into:

```
$ wp34s_asm.pl -pp rocks_pp.wp34s -o wp34s-4.dat; cat wp34s_pp.lst
```

Yields:

```
// Source file(s): rocks_pp.wp34s,
// Source File(s): .__0.894647826747136.tmp
// Preprocessor revision: $Rev: $
001 /*               */ LBL'Roc'
002 /*               */ CL[alpha]
003 /*               */ [alpha]'WP[space]' // "WP 34S rocks!"
004 /*               */ [alpha]'34S'
005 /*               */ [alpha]'[space]ro'
006 /*               */ [alpha]'cks'
007 /*               */ [alpha] !
008 /*               */ XEQ 99 // XEQ Rocks_View
009 /*               */ RTN
010 /*               */ LBL 99
011 /* Rocks_View:: */ [alpha]VIEW
012 /*               */ PSE 08
013 /*               */ RTN
// %LBLs:
//  Label Step
//  99 => 011
// Total of 1 elements
```

(...and before you tell me "That's wrong. LBL 99 is actually at step 010!", its 'effective' location is 011 for the purposes of this tool... :-)

I never said it would be a simple extension :-) It is a useful one.

- Pauli

Re: WP34S Symbolic preprocessor online

*Message #3 Posted by **Neil Hamilton (Ottawa)** on 14 Aug 2011, 9:39 a.m.,*
in response to message #2 by Paul Dale

Nah, I was just teasing Pauli!! :-) But is was a strain for my poor brain.

It certainly is a useful concept and I hope someone gives it a good shake. Both the soft labels and JMP instruction should be **very** attractive to people writing code. Your suggested mods to Franz's code with reminder to "...fix the skips up" after the changes then becomes obsolete! Fantastic -- let the tools do the ugly work while the programmer concentrates on more creative tasks. (My soap box/marketing moment...)

I have checked new versions of both the assembler and PP that fix a few bugs related to regex-active characters within the double quote strings (eg: []^$*()\). You can now even embed a double quote itself within the string (I had thought that one was a permanent goner).

Document is updated to remove the dire warnings in the double quote section. (In retrospect, giving bugs some document space was not such a good idea.)

Now given:

```
"a= [pi]r[^2]"
"c=2[pi]r"
"s/^(tu)\s*"$/\1\w{3,4}/"
"So, like, she said, "When?""
```

PP gives you:

```
001 /*    */ [alpha]'a=[space]' // "a= [pi]r[^2]"
002 /*    */ [alpha]'[pi]r[^2]'
003 /*    */ [alpha]'c=2' // "c=2[pi]r"
004 /*    */ [alpha] [pi]
005 /*    */ [alpha] r
006 /*    */ [alpha]'s/^' // "s/^(tu)\s*"$/\1\w{3,4}/"
007 /*    */ [alpha]'(tu'
008 /*    */ [alpha]')\s'
009 /*    */ [alpha]'*"$'
010 /*    */ [alpha]'/\1'
011 /*    */ [alpha]'\w{'
012 /*    */ [alpha]'3,4'
013 /*    */ [alpha] }
014 /*    */ [alpha] /
015 /*    */ [alpha]'So,' // "So, like, she said, "When?""
016 /*    */ [alpha]'[space]li'
017 /*    */ [alpha]'ke,'
018 /*    */ [alpha]'[space]sh'
019 /*    */ [alpha]'e[space]s'
020 /*    */ [alpha]'aid'
021 /*    */ [alpha]',[space]"'
022 /*    */ [alpha]'Whe'
023 /*    */ [alpha]'n?"'
```

Before, the tool chain would have done some pretty strange things -- if one or both section didn't lock up!

Cheers...

in response to message #1 by Neil Hamilton (Ottawa)

Hi Neil!

Thanks for your preprocessor - looks indeed to be a very useful tool. :-)

Unfortunately I have again a problem with it: with my TinyPerl it doesn't work - I get the following error message (already when I try to show the helpscreen with -h).

Global symbol "@label" requires explicit package name at (eval 24) line 244.
Global symbol "@label" requires explicit package name at (eval 24) line 254.

Maybe you can have a look at this problem with TinyPerl - but only if it's easy to fix and doesn't make you too much troubles. ;-)

Franz

Hi Franz,

This is **exactly** the same TinyPerl parser bug that showed up in this thread. The TinyPerl parser is faulty! You already know of my love [not] for TinyPerl.

Why don't you just bite the bullet and get a real Perl environment? Unless you are extraordinarily cramped for disk space, 85MB of space is not really that much in the grand scheme of things.

I will see if I can work around it but it is &^$##$ annoying to have to deal with bad tools when there are perfectly serviceable ones out there. :-<

Glad to hear it! I am sure that the EXE version will be along soon.

My fear is that it would be the first layer of a very large onion -- this is such a **very** common syntax in Perl (and a great many other script-type languages as well). Maybe you could ask the people who wrote TinyPerl to fix *their* tool instead. That would certainly fix the fundamental problem and would be the better long-term solution.

I look forward to hearing back about what they have to say when you make your request for a bug fix! Please post an update to this forum.

Cheers...

Re: WP34S Symbolic preprocessor online

Well, if you look at the TinyPerl website you can see that this project's last update was 2003 (and the last posting in the feedback section is from 2005).
So I'm quite sure that nobody is still working on this project.

Re: WP34S Symbolic preprocessor online

*Message #9 Posted by **Neil Hamilton (Ottawa)** on 14 Aug 2011, 11:45 a.m.,*
in response to message #7 by Neil Hamilton (Ottawa)

> Quote:
>
> I am sure that the EXE version will be along soon.

I have the EXE version up in the SVN as well. Just as the initial run of *wp34s_asm.exe* resulted in a **BIG** delay while it was dynamically decompressing itself, the combination of *wp34s_asm.exe* spawning a copy of *wp34s_pp.exe* will result in a doubly long initial delay!

Fear not, my experience is that they are cached *somewhere* on your disk so subsequent runs should be quicker. (As I pointed out in earlier posts, this is a function of the Perl PAR Packer tool that created them. I got it to work and comple and I even reduced its size somewhat but don't know a whole lot more about it besides that.)

I have done some initial testing on one Windows installation so if anyone runs into problems with it, let me know.

Source for 3M 8242-8 Cold Shrink

*Message #1 Posted by **David Ramsey** on 13 Aug 2011, 12:32 p.m.*

I'm ready to start cleaning the amazing amount of goop out of my 9810 printer and repairing the platen with cold shrink tubing, as described by Tony Duell. The specific part number he mentions is "3M 8242-8 Cold Shrink", but I can't find this anywhere. Most online sites seem to use different criteria; for example, shrinkcon.com specifies minimum and maximum diameters the tubing can handle, rather than part numbers.

If anyone could point me to exactly what to get, I'd appreciate it.

Re: Source for 3M 8242-8 Cold Shrink

*Message #2 Posted by **NateB** on 13 Aug 2011, 1:14 p.m.,*
in response to message #1 by David Ramsey

Here is the PDF spec sheet for the tubing. Perhaps he meant 8424-8. It lists a min/max diameter of 0.1-0.82 inches, which is close to the diameter of 0.85 inches mentioned in this thread.

Re: Source for 3M 8242-8 Cold Shrink

*Message #3 Posted by **David Ramsey** on 14 Aug 2011, 12:40 a.m.,*
in response to message #2 by NateB

I suspect you're correct; I'll order an 8424 kit and cross my fingers...

Re: Source for 3M 8242-8 Cold Shrink

*Message #4 Posted by **Tony Duell** on 14 Aug 2011, 3:19 a.m.,*
in response to message #3 by David Ramsey

Indeed I did mean 8424-8. Sorry....

An Attempt to Challenge the Bisection method for root findin

*Message #1 Posted by **Namir** on 13 Aug 2011, 12:18 p.m.*

Early this morning I had a curios idea in my head. How do the following two modifications to the Bisection method stack up against the Bisection method for finding roots?

1. A Random Method where we select a point at random inside the root-bracketing interval. The selected point's function value determines which part of the interval [A,B] to keep in order to zoom in on the root.

2. A Hybrid method in which we alternate between a regular Bisection step that chooses the midpoint in interval [A,B] and random step that chooses at random a point inside [A, B].

I ran 100,000 iterations to find the zero in [3,4] for my function e^x-3*x^2 = 0. The results are:

1. The hybrid method outperformed the Bisection method only in 5% of the iterations. The maximum saving in iterations was 10. The average and std deviation in iterations saved were about 2.0 and 1.26 iterations. 2. The Random method outperformed the Bisection method only in 2% of the iterations. The maximum saving in iterations was 11. The average and std deviation in iterations saved were about 2.5 and 1.72 iterations.

The histogram for the savings in iterations for both methods looks like an exponential decay.

So for now, the Bisection has done better than the above two suggested modifications.

That was fun!!

Namir

Re: An Attempt to Challenge the Bisection method for root findin

*Message #2 Posted by **Marcus von Cube, Germany** on 13 Aug 2011, 5:46 p.m.,*
in response to message #1 by Namir

It simply depends on how smooth your function is. The close the two points are the more the function between them looks like a straight line and bisection would give the exact result. (Or did I just mix up bisection with the Regula Falsi?)

Re: An Attempt to Challenge the Bisection method for root findin

*Message #3 Posted by **Namir** on 13 Aug 2011, 7:18 p.m.,*
in response to message #2 by Marcus von Cube, Germany

The Bisection looks only at the sign of the functions' values. The Reguli Falsi uses the function values as weights to estimate the new guess inside the root-bracketing interval. I developed the Quartile algorithm a few years ago, which performs better than the Bisection. The new method compares the absolute values of the function to calculate the refined guess (also inside the root-bracketing interval).

Re: An Attempt to Challenge the Bisection method for root findin

*Message #4 Posted by **Dieter** on 14 Aug 2011, 9:41 a.m.,*
in response to message #2 by Marcus von Cube, Germany

> Quote:
>
> (Or did I just mix up bisection with the Regula Falsi?)

Yes.

Bisection simply means that, if f(x=2) is > 0 and f(x=10) < 0, try x=6 next.

The regula falsi (linear interpolation) uses a *weighted* average instead. If f(x=2) is 8 and f(x=10) is -4, i.e. "twice as close" to zero, the new estimate divides the x-interval [2; 10] the same way. So the next value is 7,33.

Dieter

Re: An Attempt to Challenge the Bisection method for root findin

*Message #5 Posted by **Namir** on 14 Aug 2011, 10:06 a.m.,*
in response to message #4 by Dieter

Reguli False has a little negative feature in that it does not intuitively shrink the root-bracketing interval like Bisection does. If you are using Reguli Falsi, you might as well switch to the tangent method. I believe the HP-34 Solve is based on the tangent method.

Namir

>
> I believe the HP-34 Solve is based on the tangent method.

Since you say HP-34 and not WP-34 I think you refer to the HP-34C. As far as I know the 34C uses a modified secant method, i.e. a variation of the regula falsi. The WP-34s uses Brent's algorithm where several methods are combined.

I assume that "tangent method" refers to something like Newton's algorithm, i.e. place a tangent to the graph and find its intersection with the x-axis. Such a method requires just one initial guess, while HP Solve (just as the 34s) requires two guesses, preferably with opposite signs of the function result.

Dieter

Re: An Attempt to Challenge the Bisection method for root findin

*Message #7 Posted by **Paul Dale** on 14 Aug 2011, 5:57 p.m.,*
in response to message #6 by Dieter

I'm pretty sure the 34C uses a modified secant method. It has checks for going too far and escaping a bracketing interval.

The 34S uses Brent's method which fits a quadratic in the best case. it also has guards and interval bracketing in place.

Problems with repurposing the HP20b/30b

*Message #1 Posted by **Namir** on 13 Aug 2011, 11:09 a.m.*

Hi All,

I have been trying to burn the wp34s on an HP20b and an HP-30b. Gene Wright has kindly mailed me the old serial port cable that connects a PC with either calculator model.

At first I try to use an serial-to-USB adapter cable with Gene's cable to connect my current laptop (running Windows 7) to the calculator. That did not work. No real surprise here.

I then bought an old IBM Thinkpad laptop with Windows XP. I used the same cable system to connect the laptop's USB port to the calculator. That did not work either.

Last night I found in my house and old compact PC that has the old serial port and runs Windows 2000. I powered the old PC up, got to work, and copied the related firmware burning files to that old PC. I then used the serial cable that Gene sent me to connect the old PC and either calculator model. It DID NOT WORK EITHER.

I am using SAM-BA version 2.10 that I got from Gene to burn teh firmware. The cable he sent me was able to easily and quickly erase HP's firmware on the 20b and 30b. But when it comes to burning the wp34s firmware, I am getting a message that the software did not connect with either calculator. In the case of the SAM-BA 2.10 it sees COM1 and am able to select the board type (following a new instruction file I got from Gene) but it is unable to make the connection with either calculator.

Any help is appreciated. What am I doing wrong? Is the Windows 2000 not helping? Do I need to press the Reset and ON button in a particular order and duration before I run the SAM-BA 2.10 application?

Namir

Re: Problems with repurposing the HP20b/30b

*Message #2 Posted by **Marcus von Cube, Germany** on 13 Aug 2011, 11:23 a.m.,*
in response to message #1 by Namir

In order to get it to work on with an USB to serial adpater choose one from FTDI. The prolific chips don't work. I've tried it on Windows XP without success.

The erase feature is totally independent from the serial port, it's just a pin on the chip which is tied to high while the processor is running. Once erased, the only software in the device is the SAM-BA boot loader. After the erase, you need to reset the processor and then turn it on again. While not experimenting with it **remove the batteries!**. SAM-BA has no provisions to turn the device off and makes no attempt at saving power. It may be that your batteries are already flat.

*Message #3 Posted by **Namir** on 13 Aug 2011, 11:44 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Thanks for the tips. I did take the batteries out of both machines. I used a voltmeter to test the batteries and they seem ok. Whem I put the batteries back and tried to burn the 30b .. IT WORKED!!!I have a wp34s flahsed. YEAAAAAAAAAAAAHHHHHHHHHH!!!

Thanks

Namir

Re: Problems with repurposing the HP20b/30b

*Message #4 Posted by **Katie Wasserman** on 13 Aug 2011, 1:01 p.m.,*
in response to message #3 by Namir

I've re-flashed the 20/30b/12c+/10bii+ many, many times and have also found that a battery pull is frequently "the fix" when I have trouble with a firmware downloaded.

The other tip I'll offer is to pull out and reinsert the 6-pin pogo connector. Sometimes those pogo tips don't make good contact with the pads on the PCB.

I really wish that the firmware download process wasn't so difficult with these ARM machines. The whole system seems inherently problematic: built-in ARM boot routine, the PC software, USB to serial converter, the pogo-pins and the high current draw needed ROM these small power cells, not to mention user error.

I realize that HP never intended these programing ports to be used so frequently, but now that they are the whole process is in need of a makeover. Any suggestions?

Re: Problems with repurposing the HP20b/30b

*Message #5 Posted by **Namir** on 13 Aug 2011, 2:11 p.m.,*
in response to message #4 by Katie Wasserman

Katie,

Thanks for your tips. I will try them. I stayed up last night until 2:30 am working with the old PC and trying to burn the firmware. After getting getting the tip about the batteries from Marcus, the SAM-BA software connected and I was able to burn the 2p34s. My wife's nephew (who is staying with us to study locally) was kind enough to put the overlay labels that I had bought from Eric.

I agree wholeheartedly with you about how complex the setup is. I wish Cyril would write a firmware-burning program that works smoothly with Windows 7 and the USB ports.

Again, thanks for the additional tips.

Namir

*Message #9 Posted by **Namir** on 13 Aug 2011, 9:59 p.m.,*
in response to message #8 by Paul Dale

Well the cable that burns does not work reliably. It's like gambling in Las Vegas. What can I say?? Wiping out the firmware is by far the most reliable part of the whole operation. Writing the new firmware is a major gamble. Your software is cool and I would like to be able to update the firmware, without having to harass Gene Wright (the man has been very patient and most cooperative with me).

:-)

Namir

PS: I was showing my wife the wp34s calculator. I had a smile from ear to ear. You guys did a fantastic job.

Surprising success with repurposing the HP20b/30b

*Message #10 Posted by **sjthomas** on 13 Aug 2011, 10:48 p.m.,*
in response to message #9 by Namir

Not directly related, but . . .

Last night -- just for the heck of it -- I tried re-flashing both a 20B and a 30B with my early 2008 MacBook (OS X 10.7 Lion), running Windows XP inside a Parallels 6 virtual machine. I used a USB-to-serial adapter cable which is not branded with any name or other identifying information, which I found in a box of computer cables in my garage. Although I didn't expect it to, I was pleasantly surprised that this combination worked!

Stephen

*Message #15 Posted by **Tim Wessman** on 14 Aug 2011, 9:33 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Apparently something has changed, because prolific chipset converters were the only USB<=>serial sevices I ever could get to work reliably with all my serial stuff (long before I started for HP). My adapters work just fine.

They are several years old though. Someone else I know bought one recently and just had a terrible time getting it to work. No exactly conclusive, but I sure see a lot of people complaining about them online now. . . :-(

Re: Problems with repurposing the HP20b/30b

*Message #16 Posted by **robert rozee** on 14 Aug 2011, 12:09 p.m.,*
in response to message #15 by Tim Wessman

the problems with USB to serial bridges based on the Prolific chip, the PL2303, are twofold:

(1) chinese manufacturers have cloned the PL2303 chip design and are supplying 'fake' devices that only work with certain versions of the drivers - they never developed their own, relying on consumers downloading the drivers from Prolific. the silicon implementation in the fakes is far from perfect, and Prolific have responded by making their drivers try and detect the fakes and refuse to work with them.

(2) the PL2303 was originally designed to be an 'all in one' solution, able to drive and receive RS232 signal levels without the need for a level shifter (such as a MAX232). even the genuine devices do this very poorly, so most reputable manufacturers pair up the PL2303 with a line driver/receiver. needless to say, the cheap bridges you buy on ebay for a couple of dollars out of china don't bother with the line driver/receiver.

if either (1) or (2) hold, you have little hope of any success. BUT, if you can get a bridge that uses a real PL2303 and uses a separate line driver/receiver, then it will work as good as any other (such as an FTDI or Silicon Labs CP2102 based bridge).

Edited: 16 Aug 2011, 4:15 a.m. after one or more responses were posted

Re: Problems with repurposing the HP20b/30b

*Message #17 Posted by **Marcus von Cube, Germany** on 15 Aug 2011, 3:55 a.m.,*
in response to message #16 by robert rozee

Chinese crap, sigh! When will they start to sell fake FTDI devices?

For SAM-BA to work, the chip must reliably support 115 Kbps.

Namir, once flashed with 34S there is no need to press the Erase button on the cable, just do ON+D and ON+S (the latter twice).

Re: Problems with repurposing the HP20b/30b

*Message #18 Posted by **Paul Dale** on 15 Aug 2011, 3:59 a.m.,*
in response to message #17 by Marcus von Cube, Germany

They sell fake everything else.

That one is awesome -- it is worthwhile to manufacture a fake controller chip just for this. I imagine the fabrication costs for the chip are huge so these things must sell **very** well.

Sorry, for the late reply.

I believe what Pauli was really asking was whether the runtime context (user stack and register memory) was available between models such that exchange of data was possible.

That of course exists by default as memory is just one flat space with individual data context being structured identically. The task of shuffling data between models is really an external UI effort as it is unlikely we're going to be patching the legacy firmware to implement such a feature.

That said, depending on the mechanism for prospective data sharing, it would still be quite helpful to have annotated firmware source for all of the Voyager series particularly in the case such sharing involved tweaking individual RWM image context unbeknownst to the corresponding firmware.

I have bits and pieces of the 15c firmware documented from cases where I was chasing KEMU issues. A more comprehensive and scalable approach would be to modify a NUT assembler to accept hex binary in addition to instruction mnemonics so we could start with the binary image, reconstructing the source incrementally, "reassembling" and verifying the image as needed after annotation changes. This assumes some sort of open source like effort to address entire firmware images (and ideally a nod or minimally some indication from HP not to contest such an effort). Having this available is likely useful to HP as well but perhaps not something at the top of the to-do task list.

This is exactly what I was wishing for. I'd be happy with just the stack and could make do with just X. For some of the Voyagers the location of X and the stack is known already.

rounding, from another posting, a question...

*Message #1 Posted by **geoff quickfall** on 13 Aug 2011, 12:19 a.m.*

funny, but I was taught to round in a statistics course the following way. If the digit was even followed by a five then round up. If the digit followed by a five was odd, round down.

Statistically this resulted, when using a large enough sample, a 50/50 ratio of rounding up for 5 and rounding down for five.

```
132.5 = 133
133.5 = 133
```

cannot find the cite for this anywhere. Calculators certainly do not follow this rule. This means, on a large enough sample the rounding is on majority, upwards, that is .5 is always rounded up even though it is a midway point between the higher and lower answer.

Any thoughts,

Cheers, Geoff

still playing with the 41CL but will get involved with the 34S soon, well after the book and HCC...

;-)

Re: rounding, from another posting, a question...

*Message #2 Posted by **Paul Dale** on 13 Aug 2011, 12:28 a.m.,*
in response to message #1 by geoff quickfall

This is what is known as rounding half to odd. It is well known and unbiased as is ruonding half to even. The latter is more popular.

These should only be used if the fractional portion is exactly 0.5. If e.g. it is 0.5001, then you should always round up. If you are only calculating the single extra digit then every 5 rounds weirdly of course.

The 34S does rounding half even by default. It supports six other rounding modes but not rounding half to odd.

- Pauli

Re: rounding, from another posting, a question...

*Message #3 Posted by **Marcus von Cube, Germany** on 13 Aug 2011, 4:43 a.m.,*
in response to message #2 by Paul Dale

This rounding on the 34S is not done for FIX display, only for rounding the intermediate results of the internal algorithms to register format.

Re: rounding, from another posting, a question...

*Message #4 Posted by **Walter B** on 13 Aug 2011, 5:38 a.m.,*
in response to message #3 by Marcus von Cube, Germany

Please see page 44 of the manual :-)

*Message #5 Posted by **Paul Dale** on 13 Aug 2011, 5:51 a.m.,*
in response to message #4 by Walter B

Nicely written.

The default is round half even which isn't mentioned on page 44 :-)

- Pauli

Re: rounding, from another posting, a question...

*Message #6 Posted by **Walter B** on 13 Aug 2011, 5:56 a.m.,*
in response to message #5 by Paul Dale

Thanks. Added - though it's for math geeks only as stated there ;-)

Re: rounding, from another posting, a question...

*Message #7 Posted by **Paul Dale** on 13 Aug 2011, 6:08 a.m.,*
in response to message #6 by Walter B

Nah, it is for people who care about getting correct answers :-)

Most maths geeks wouldn't know what to do with the different rounding modes :-(Neither would most programmers numerical or otherwise :-(

One quick way to detect many numerically unstable algorithms is to repeat the same computation after changing the rounding mode (e.g. start with round to -infinity and change to rount to +infinity). A stable algorithm will produce a similar result regardless and an unstable one will often produce wildly varying results. This doesn't catch all unstable algorithms but it is an easy starting point.

The OTHER guys calculators

*Message #1 Posted by **Earl Kubaskie** on 12 Aug 2011, 11:28 p.m.*

Hello all. I saw today an ad for the TI Inspire CX series. Any opinions here on these units? In my mid-fifties now, and approaching the 40 year mark as an HP owner/user, I hesitate to dig too deeply into the dark side...

Especially that icky algebraic notation.

Re: The OTHER guys calculators

*Message #2 Posted by **Don Shepherd** on 13 Aug 2011, 1:06 a.m.,*
in response to message #1 by Earl Kubaskie

Earl, I'm just a tad older than you, and a math teacher at middle school level.

It's somewhat of a misnomer to call the NSpire CX series a "calculator." It's really more of a "student mathematical experimenting or learning device." Truthfully, it's more of a PC than a true calculator, containing "apps" for calculator, graphs, geometry, lists/spreadsheet, data/statistics, and notes. A variable or function defined in one app is accessible in the other apps, so, for example, you could use the calculator app to define a function like $f1(x)=3x^2+7$ and use that function in the spreadsheet or, of course, graph app. So it's kind of dynamic. In it's latest iteration, like the Casio Prizm, you can draw or import a picture of something, select some points along a line or curve on the object, and have it derive the equation. That's kind of neat for students discovering math principles, but not terribly useful for an engineer, for example, I think. Or you can dynamically change the shape of a graphed curve (by pointing and dragging) and see how the related equation changes in realtime. If these types of things interest you, you may find it worthwhile. If you're just looking for an engineer's calculator, you probably won't like it.

It's color screen is fantastic, but at my age the letters are a tad on the small size.

And it's not cheap.

Re: The OTHER guys calculators

*Message #3 Posted by **Namir** on 13 Aug 2011, 2:15 p.m.,*
in response to message #2 by Don Shepherd

I have the new TI nspire CX CAS. It is slick and cool. I love the colors and also the power of the CAS part. The symbolic computational part is like having a built-in mathematical handbook. I learned a few years ago that creating some of the nice TI calculators (including the early TI nspire) involved ex-HP folks who had worked in Corvallis.

I am waiting for the replacement of the HP-50g that will put the fear of the digital gods in the TI nspire.

Namir

34s work-around for 41c quirk

*Message #1 Posted by **gene wright** on 12 Aug 2011, 5:53 p.m.*

The HP 41 SIGN command returns +1 for a value of 0.

The 34s returns 0 for a value of 0.

So, what's an efficient way to code around this difference?

Could be:

```
X=0?
SKIP 01
SIGN
```

What do you think?

Re: 34s work-around for 41c quirk

*Message #2 Posted by **fhub** on 12 Aug 2011, 6:14 p.m.,*
in response to message #1 by gene wright

> Quote:
>

>
> Could be:
>
> ```
> X=0?
> SKIP 01
> SIGN
> ```
>
> What do you think?

No, that won't work: it gives 0 if x=0 (because it just skips the SIGN in this case).

If you replace SKIP 01 by 10^x (or e^x) it would work as you want!

Franz

PS: Dieter's solution INC X is indeed better (because faster) than my 10^x - I'm just not used to this INC X because none of my other calculators has it.

Edited: 12 Aug 2011, 6:31 p.m.

Re: 34s work-around for 41c quirk

*Message #3 Posted by **Dieter** on 12 Aug 2011, 6:14 p.m.,*
in response to message #1 by gene wright

> Quote:
>
> The HP 41 SIGN command returns +1 for a value of 0.

Yes. And that makes sense. The idea behind this is the ability of the HP41 to check for alpha data:

```
HP-41 series:
SIGN returns
   +1  for x>=0  (i.e. also for x=0)
   -1  for x<0
    0  if x contains alpha data
```

If you want a plain "mathematical" sign-function on the '41, simply use

```
X<>0?
SIGN
```

which requires just a single byte more.

So, returning 1 even for x=0 was and is okay on the HP-41 series since it has an additional benefit. But why should one duplicate this feature on another, different calculator whithout this special background that is the reason for this ..."special" behaviour? Do we really need a SIGN41 function on the 34s ?-)

BTW, as far as I see the code you proposed will not change anything, If x is zero the sign command is skipped and x remains zero (not one). If you really want to duplicate the HP-41 way, this could be done with

```
X=0?
INC X
SIGN
```

But, as already mentioned, I don't think this makes sense on the 34s.

Dieter

Re: 34s work-around for 41c quirk

*Message #4 Posted by **M. Joury** on 12 Aug 2011, 6:26 p.m.,*
in response to message #3 by Dieter

My initial thought was that it should work. But you are right, it doesn't. Your solution does however.

I guess if you were converting an HP-41 program this might be useful.

Re: 34s work-around for 41c quirk

*Message #5 Posted by **Paul Dale** on 12 Aug 2011, 6:36 p.m.,*
in response to message #3 by Dieter

Dieter is correct and suggested the same workaround I thought of when I saw the question :-) The only difference with the workaround is Last X is set incorrectly when X is zero.

We've a total inability to distinguish alpha data from numbers unlike the 41 series. I think I could work around this with reals either by reducing the number of digits by one or reserving lots of NaN values as alpha data. This is pointless since we also support integers for which there is no space available to

distinguish.

This is something that will definitely be addressed in the 34S successor. I'd still differ from the 41 series though. SIGN would still return -1, 0, +1 for negative, zero and positive numbers. We've got NaN for the string case :-)

- Pauli

Agreed, but I need a 41 SIGN equivalent

*Message #6 Posted by **gene wright** on 12 Aug 2011, 6:40 p.m.,*
in response to message #5 by Paul Dale

I am converting some HP 41 programs that store a -1 or 1 depending on the value in X.

Don't think LastX will be a problem, so I think Dieter's approach will work.

I am not advocating for a SIGN41 function. :-) and I like the SIGN function on the 34s, just wanting to make sure I had not overlooked something...

Edited: 12 Aug 2011, 6:51 p.m.

Don't worry there is no chance of a SIGN41 function :-)

There is a better solution that does Last X correctly too:

```
SIGN
X=0?
INC X
```

Put this into a S41 subroutine if you are keen.

Re: WP34s: a small request

*Message #7 Posted by **fhub** on 12 Aug 2011, 7:36 p.m.,*
in response to message #6 by Paul Dale

Yes I know, but I just thought that such a "no solution" message would be useful for many programs.

BTW, another question:
is it possible anyhow to switch on (in a program) the big "C" announciator as it is done automatically after a [CPX] operation?
I've tried it with 0 ENTER [cpx]+ at the end of a program before RTN (which doesn't change the results in the previous X and Y) to indicate a complex solution, but in a running program this doesn't seem to work: the "C" just didn't appear when the program stopped!?

I did it then with alpha commands, but that needs quite a few bytes ...

Franz

Re: WP34s: a small request

*Message #8 Posted by **Paul Dale** on 12 Aug 2011, 8:02 p.m.,*
in response to message #7 by fhub

You found the way: use alpha.

It doesn't use quite a few bytes BTW: three instructions I think. Clear alpha, a 'C' and one of the alpha views. The big 'C' is just a capital 'C'.

- Pauli

Yes, that's exactly as I did it. :-)

It was just for a little extension of the implemented SLVQ, which also return complex solutions:

```
/*
  Quadratic Equation:
  a*x^2 + b*x + c = 0

  Input:  a [ENTER] b [ENTER] c
  Output: X:x1 Y:x2, or X:Re(x0) Y:Im(x0) for complex solution (alpha:"C")
  Used:   Stack
*/

001 LBL'QE'
002 CL[alpha]
003 RCL/ Z
004 x[<->] Z
005 RCL+ X
006 /
007 +/-
008 x[^2]
009 RCL L
010 x[<->] Z
011 -
012 x<0?
013 SKIP 05
014 [sqrt]
015 RCL+ Y
016 x[<->]y
017 RCL- L
018 SKIP 05
019 ABS
020 [sqrt]
021 x[<->]y
022 [alpha] C
023 VW[alpha]+ X
024 RTN
```

*Message #10 Posted by **Marcus von Cube, Germany** on 13 Aug 2011, 4:37 a.m.,*
in response to message #9 by fhub

Franz, be aware that the following two lines are not the same:

```
[alpha]'C'
[alpha] C
```

The first line creates a multi byte string which is long enough to hold three characters in just two steps, the second one is just a single step. The effect on the alpha register is the same.

In order to enter a three letter alpha from the keyboard (only available in program mode) press f ENTER f ENTER. You'll see the single quote after [alpha] as a visual feedback.

Well, although not much more code to do it this way, I don't think this would be worth the troubles (or extra bytes).
What then do with complex solutions (i.e. if b^2-4ac<0)? Make a complex division? Well, I guess this would destroy again the accuracy gained from these formulas.

And even with these special formulas you get completely wrong result for ill-conditioned equations - take for example:
x^2 + 10^8*x + 1 = 0

You'd need an internal accuracy of at least 16 digits to get correct solutions for this equation.

I think you're wrong :-) Numerical mathematics is a bizarre and arcane art quite unlike the rest of mathematics. This sort of attention to detail makes a difference.

> Quote:
>
> What then do with complex solutions (i.e. if b^2-4ac<0)? Make a complex division? Well, I guess this would destroy again the accuracy gained from these formulas.

I doubt the more complex formulas are losing accuracy here either :-) The accuracy is coming from the b - sqrt(...) where the sqrt(...) term is approximately b. i.e. b - b produces a catastrophic cancellation.

The b^2 - 4ac also risks cancellation but this is less critical. One does have to be careful about calculating this for b^2 approximately equal to 4ac however since it is easy to get the sign wrong :-(e.g. a simplistic application of a fused multiple add here can cause problem. Fortunately the 34S has a complex multiply that can achieve the desired calculation without any rounding issues.

> Quote:
>

> You'd need an internal accuracy of at least 16 digits to get correct solutions for this equation.

Clearly, this is exceeding the precision available. But there are plenty of cases in the middle where b^2 >> 4ac and the naïve formula results in b - almost(b) with a huge loss of precision and a resulting incorrect answer.

This middle region is where these more complicated formulas come into their own. Try this reference for a better description.

Correct, and that's exactly the reason why I don't like it very much. ;-) And if I really need such an excessive accuracy - well, them I'm using a CAS with almost _arbitrary_ precision. :-)

Re: WP34s: a small request

*Message #16 Posted by **Paul Dale** on 13 Aug 2011, 6:01 a.m.,*

The 34S needs to produce correct results and retaining accuracy is mandatory. Look at the trouble I had with the statistical functions. With Dieter's assistance, we've managed to get them accurate with correct rounding.

As I mentioned in the discussion about the 35s, a calculator **must** produce correct results all the time. It is a tool and the tool must work properly.

A quadratic solver using the stable formulas which also handles complex roots is pretty much guaranteed to be included. I rate correct and stable answers as more important than everything else :-)

The reason the current solver is there is because it is very small, neat and concise. It is a lovely example of keystroke programming. That it suffers from instability is a minus that should be corrected in due course (sorry Gerson).

In the complex case the cancellation isn't a problem except for the term below the square root. The subtraction b - sqrt(..) is never carried out. :-)

> Quote:
>
> In the complex case the cancellation isn't a problem except for the term below the square root. The subtraction b - sqrt(..) is never carried out. :-)

Correct - and right I'm finished with it! :-)

With LBL and RTN it's 37 steps (compared to 16 in xrom.c), could be made 3-4 steps shorter by removing 2 tests (like e.g. a=0?) but this would give 'strange' error messages for some cases.

Two things are not optimal:

- I needed an extra register to get it working also in SSIZE4 mode (I've used "I")
- after execution the solution is in X and Y, but Z and T contain 'garbage' (intermediate results): avoiding this would need quite a few more bytes or at least other Rnn registers, and I don't think this would be a good idea

So let me know if these circumstances are ok and I should post my solution, or if I can throw it away ... ;-)

Franz

That's suboptimal indeed, since "I" is the second half of complex last x. How about taking "A" instead? Another opportunity may be confining this function to stack size 8 (I knew we would need this stack size for certain tasks d:-)

> Quote:
>
> - after execution the solution is in X and Y, but Z and T contain 'garbage' (intermediate results)

Applying your measure of tidyness (of an earlier thread), the stack levels not needed for the result shall contain what was on the stack before calling complex SLVQ.

Just my 20m€,
Walter

Re: WP34s: complex SLVQ

in response to message #22 by Walter B

> Quote:
>
> That's suboptimal indeed, since "I" is the second half of complex last x.

And where's the problem???
"I" is not used at all in this calculation, and also "L" contains garbage at the end - what counts are the 2 solutions in X and Y, nothing else!

> Quote:
>
> Applying your measure of tidyness (of an earlier thread), the stack levels not needed for the result shall contain what was on the stack before calling complex SLVQ.

How could I retain 3 coefficients (a,b,c) AND return 2 solutions (x1,x2) on a 4-level stack, can you please explain this? So the best solution would be _replacing_ the 3 coeffs by the 2 solutions - but this would need again (not so few) bytes.

Ok, I've now finally lost my interest in trying to fulfill your extremely high 'requirements' - if you want and need all these conditions then do it yourself. :-(

in response to message #24 by Walter B

Sorry, don't you really get it or do you just want to annoy me?
"I" is NOT used for CALCULATION but just for STORAGE!

> Quote:
>
> I don't get it. How do you place 2 complex solutions in two stack levels :-?

Since these 2 solutions are complex conjugates, it's enough to put Re(x0) in X and Im(x0) in Y.
The 2nd solution is just Re(x0)-Im(x0)*i

Edited: 13 Aug 2011, 2:09 p.m.

Re: WP34s: complex SLVQ

*Message #28 Posted by **Paul Dale** on 13 Aug 2011, 8:30 p.m.,*
in response to message #22 by Walter B

> Quote:
>
> How about taking "A" instead?

No no no no no!!!!!!! Lettered things are

special and shouldn't be used in libraries.

Fortunately, this is intended for XROM. With a suitable prologue and epilogue added to the code, there are another five registers available. These are numbers 00 through 04 and they are completely separate from the same numbered registers the user sees. There are also fifteen extra flags 00-14 FWIW. XROM also operates with a stack size of four regardless of what the user sets -- this might cause problems with stack drop.

So, what I'd be doing is to preserve T & I in two of these extra registers, use a third for the temporary storage of the value. A fourth preserving X if you want Last X done like an internal operation.

Then do the calculation and finally fix things up at the end. Yes this will take more steps. Often quite a few more.

For the b^2 - 4ac calculation use a complex multiply.

Assuming a, b & c are in X, Y & Z respectively (also should work for c, b & a in X, Y & Z).

```
    4           a b c T
    *           4a b c T
    RCL Y       b 4a b c
    cpx *       b^2-4ac b(4a+c) b
c
    x<>y        b(4a+c) b^2-4ac b
c   if only we'd kept the DROPY
instruction :-)
    DROP        b^2-4ac b c c
```

Which, assuming I've got that correct, will calculate the difference without any loss of precision. Also, 4a is still in I.

Re: WP34s: complex SLVQ

*Message #30 Posted by **Marcus von Cube, Germany** on 13 Aug 2011, 5:40 p.m.,*
in response to message #21 by fhub

The register isn't a problem if your code makes it to XROM because we have some private registers there for exactly this purpose. I wouldn't mind that the stack gets used, other functions do the same. It's just not a standard function but a routine. With the help of the private registers we may even save stack level T and restore it. I have no idea what would be the "correct" result for L in this case.

Please post your solution! Chances are high that it will replace what we have now.

Re: WP34s: complex SLVQ

*Message #31 Posted by **fhub** on 13 Aug 2011, 6:20 p.m.,*
in response to message #30 by Marcus von Cube, Germany

Well, with additional internal registers many thing would of course be much easier to code. And about "L" I won't care at all - after such a lot of operations there's just no useful value which should intentionally be placed in "L".

I've now checked all 8 test equations at the link of Gerson, and for 7 of them I get exactly the same solutions. Only in Case 5 my program returns 2 equal real solutions (the same as the real part on this site), when in fact there is a imaginary part, but it is about 3e-10. For this special equation (Case 5) both expressions b^2 and 4ac are VERY big and differ only at the 17th or 18th digit, so that's of course far beyond the 34s precision.
Although I would have an idea how to solve even this problem (b^2-4ac could be factorized as (b+2*sqrt(ac))*(b-

2*sqrt(ac)) which avoids those big numbers and would certainly work), but I don't think it would be worth the troubles and many extra bytes (again an extra codeblock if ac<0!). But also this method could not guarantee always correct solutions if the numbers are still bigger.

So here's my code:

```
/*
  Quadratic Equation (extended
precision)
  a*x^2 + b*x + c = 0

  Input:  a [ENTER] b [ENTER] c
  Output: X:x1 Y:x2, or X:Re(x0)
Y:Im(x0) for complex solution
(alpha:"C")
  Used:   Stack, I
*/

in response to message #31 by fhub

Steps 19, 20 and 21 are a complex conjugate, so replacing them with CONJ

saves two more steps. Then the conditional can be reversed and the skip removed for a third step saved.

That is replace:

```
017 x<0?
018 SKIP 03
019 x[<->]y
020 +/-
021 x[<->]y
```

with

```
017 x>0?
018 CONJ
```

and fix the skips up.

A nice trick indeed! (maybe you should make a doc file "tips & tricks for 34s programming" ;-))

But this CONJ also changes RegI (where I have stored the coefficient b), so I hope you haven't overlooked this.

> Quote:
>
> there are another five registers available. These are numbers 00 through 04 and they are completely separate from the same numbered registers the user sees

Hey, that's quite unfair if you have more registers than we have! ;-)
Why can't we use them in our programs too? That would simplify programming

a lot ... :-)

You can have them if you're willing to forgo solve, integrate, sum, product and the derivatives. Oh and now the quadratic solver. I'm sure most people would like to keep these functions and not have the extra registers.

It is also not a case of having an extra five registers. All the above are limited to using no more than these five registers in total. They don't even get the luxury of having the stack preserved across callbacks to user code.

Ok, then it's no problem.

BTW, since you mention accuracy:
What do you think about using (b+2*sqrt(ac))*(b-2*sqrt(ac)) instead of b^2-4ac ?
This would eventually help when b^2 and 4ac are VERY big and their difference is beyond the 34s precision - I guess this could also solve example 5 in Gerson's link!?
OTOH it would require quite a few bytes more, so I'm not sure if it's really worth to be used.

And one more thing (rather for Walter than for you):
If I have understood your code in xrom.c, then SLVQ skips the next step (in a program) for complex solutions but NOT for real solutions, right?
This should be described clearly in the manual, because it's not so obvious.

Franz

It should address the overflow issues, or at least push them off a bit. I'd be concerned about the second term when b is approximately 2 sqrt(ac). It might not be an issue, but it would have to be investigated.

> Quote:
>
> This would eventually help when b^2 and 4ac are VERY big and their difference is beyond the 34s precision - I guess this could also solve example 5 in Gerson's link!?

The current code handles example 5. The complex multiply addresses the b^2 - 4ac precision loss concerns. The internal code evaluates the multiplies exactly and does the subtraction without any rounding or truncation until the result is returned. i.e. it should be as good as is possible without resorting to extended precision.

- Pauli

Well, but anywhere you would have to stop - what should you do when those 2 terms are almost equal? You can't completely avoid subtractions in any cases ...

> Quote:
>
> The current code handles example 5. The complex multiply addresses the b^2 - 4ac precision loss concerns.

Aaah, that's fine - so this problem seems to be solved at least with this extended precision. Of course we can't never handle ALL situations correctly when the numbers are getting to big.

That's really good news!

Palmer O. Hanson has written an excellent quadratic solver that handles some really tough examples:

A "Cadillac " Quadratic Solver for the hp 33s and HP35s

Gerson.

Bad luck - calculators are numerical mathematics all over ;-)

Here's my first attempt at it. Like Franz's, it handles Palmer's examples (except number 5). Too many steps though, "cut a few and it'll be perfect" :-)

Gerson.

```
// Source file(s): wp34s-0.dat

I guess these 3 "STO[times]" should be Y,Z and T instead. With X,Y and Z in fact none of these values is changed.

8207: 2f02       RCL/ 02
8208: 5d01       XEQ 01
8209: 5e29       GTO 41          -> Normal exit code
820a: 0205       ABS
820b: 020a       [sqrt]
820c: 2f02       RCL/ 02
820d: 2b66       RCL Z
820e: 2f02       RCL/ 02
820f: 0003       +/-
8210: 5d01       XEQ 01
8211: 019c       TOP?
8212: 5301       SKIP 01
8213: 5e2a       GTO 42
8214: 0171       CL[alpha]
8215: 4143       [alpha] C
8216: 9d64       VW[alpha]+ X
8217: 5e29       GTO 41          -> Normal exit code
8218: 5b01       LBL 01
8219: 2b00       RCL 00
821a: 246c       STO L
821b: 2b04       RCL 04
821c: 246d       STO I
821d: 0108       [cmplx]x[<->]y
821e: 2b04       RCL 04
821f: 2b01       RCL 01
8220: 0108       [cmplx]x[<->]y
8221: 013a       RTN
```

Label 40 is the standard entry code -- checks for nesting in xrom.

Label 41 is basically a RTN.

Label 42 is a RTN+1.

It deals with all of Palmer's examples properly.

A few WP34s questions

*Message #1 Posted by **Cristian Arezzini** on 12 Aug 2011, 3:03 a.m.*

I was playing with the newest version today, and I have a few questions.
1 - In program mode, if I press LBL then a key, it enters the keyboard scan code. Is this intended? Wouldn't it be more intuitive to enter the letter associated to the key?
2- After pressing LBL, if I press [g][ENTER] the display shows LBL' and then I can enter letters; is there a way to modify the overlay to show that if you want to enter ' you have to press [g][ENTER] and not [f][ENTER]?
3- After pressing LBL, if I just want to enter a single letter, I expected to be able to press [f][ENTER] which should be 'alpha'; but after pressing those keys, the display shows LBL 31. Again, is this intended?
4- Do three-letter alpha-commands take more than one step? Because after adding a few, the sum of total program steps plus free space isn't 506 any more...
5- If in run mode, I press XEQ then [f][ENTER], expecting to be able to enter a label, a program runs instead (I think it's the program I labeled 'A'). Again... is this intended?

I don't know if something changed lately or if it's always been like that and I didn't notice. But I seem to remember that the handling of [f][ENTER] was more consistent in always entering INPUT mode, while right now it only does so while in RUN mode, and not after XEQ or LBL. Also [g][ENTER], sometimes it enters " ' " (after LBL or XEQ, it makes you enter several alpha characters) and sometimes just enters the single letter H. That is, unless I totally messed up, after all the last two nights I only got 3 hours of sleep... in which case I apologize in advance! :)

Cristian

This is intentional but we've not yet decided if the experiment is final or not. The concept is to allow shortcuts to some of the numeric labels which means faster entry and an association between keys and functions. Seems like it is causing confusion for you rather than being useful. It is also less consistent in its use of [f] and enter.

> Quote:
>
> 2- After pressing LBL, if I press [g][ENTER] the display shows LBL' and then I can enter letters; is there a way to modify the overlay to show that if you want to enter ' you have to press [g][ENTER] and not [f][ENTER]?

Do you have a pen? :-)

Just ENTER works to get the ' the [f] has always been optional here. Now it does something else.

> Quote:
>
> 3- After pressing LBL, if I just want to enter a single letter, I expected to be able to press [f][ENTER] which should be 'alpha'; but after pressing those keys, the display shows LBL 31. Again, is this intended?

Yes, the shortcuts again. Omit the [f] and it will do what you want.

> Quote:
>
> 4- Do three-letter alpha-commands take more than one step? Because after adding a few, the sum of total program steps plus free space isn't 506 any more...

These instructions take two steps of memory.

> Quote:
>
> 5- If in run mode, I press XEQ then [f][ENTER], expecting to be able to enter a label, a program runs instead (I think it's the program I labeled 'A'). Again... is this intended?

If you press an otherwise undefined key or [f] the a key, you get a shortcut to numeric labels.

Yes things changed recently. I'm not convinced it is a change for the better anymore.

When does it produce a single H ? That isn't intentional and would be a bug.

in response to message #2 by Paul Dale

Hi Pauli, thanks for the reply! :)

> Quote:
>
> When does it produce a single H ? That isn't intentional and would be a bug.

Well, I was mistaken in that it's not a capital H, but a capital greek eta. But they do look exactly the same! :) It happens simply when you are in alpha mode (i.e. [f][ENTER][g][ENTER]). Still, I have to admit that when key combinations do different things in different situations, I get a little confused...

Cristian

Re: A few WP34s questions

As advertised 8-)

Re: A few WP34s questions

*Message #6 Posted by **Marcus von Cube, Germany** on 12 Aug 2011, 4:13 p.m.,*
in response to message #2 by Paul Dale

To use f as the "make any key available" prefix is arbitrary and can be changed to any other prefix but f has a similar meaning in some other circumstances (switch between characters and digits in alpha mode) so I decided to use it. We can remove the f prefixing altogether.

What do we gain with the shorthand addressing (with or without f)?

With the removal of the extended single letter labels (such as I) we lost the ability to use more than the four hot keys A to Z in a user interface. Having to remember a numeric label or having to type XEQ ENTER I ENTER instead of a simple XEQ I to enter the interest rate in a TVM application is awkward. So I had the idea to allow a shortcut addressing to some numeric labels. We already have the KEY? command with its row/column codes and it seemed natural to resolve labels following the same scheme. There are still many keys which cannot be addressed this way such as the digit keys or, as you already found out, ENTER. I introduced the f prefix as a way to escape the default meaning of the keys. This makes, as a side effect, XEQ A call a different routine then XEQ f A.

All the changes are in the user interface, to be more precise in the label prompting code. The runtime is

totally unaffected. Pauli and Walter didn't like the somewhat random selection of single character labels beyond D which lead to a silent removal of this feature.

If we remove both the single letter labels and the shortcuts, Franz' TVM application will suffer as will the user interface of the Vector program.

I agree that TVM will suffer if these are removed. The vector code was intended to be a suite of subroutines rather than a stand alone application -- the latter was added later. Having both in the same flash segment as applications risks confusion since they don't define the same shortcut labels....

HP 12C Platinum CHS bug?

*Message #1 Posted by **M. Joury** on 11 Aug 2011, 5:10 p.m.*

I know this has come up before but what I read did not have much info so here goes again...

I was searching for some other info today and came across mention of a weird stack/CHS bug in the 12C Platinum. Specifically the following:

10 ENTER CHS 2 + returns 12 and not -8.

Ok, I guess I can live with that. However, the following was also noted in a post I came across:

```
10 ENTER CHS 2 +
5 ENTER 5 + CHS 2 +
```

Give different answers. This strikes me as being totally inconsistent. So here is my question: Is this considered a bug and does this bug (idiosyncrasy if you prefer) exist in all the 12C Platinum versions? It certainly exists on mine (CNA 01705175).

BTW, I tried this on all the calculators I have out at the moment and the only other ones to exhibit this behavior are the HP65, HP45, and HP25 although it was argued that this is documented in the HP25 manual and therefore is NOT a bug. I don't have any of the manuals available right now so I can't verify one way or the other. With the listed machines the behavior is identical with respect to both examples given above. The HP35 (NOT S) does something completely different returning 8 for both examples above (at least it is consistent).

Cheers,

Marwan

Re: HP 12C Platinum CHS bug?

*Message #2 Posted by **Michael de Estrada** on 11 Aug 2011, 5:43 p.m.,*
in response to message #1 by M. Joury

These are not bugs, but simply the way the calculator executes a stack lift. On the HP-35, Once you press ENTER, any further operations apply to the next value being entered into the X register, so the 10 in your example has been lifted into the Y register, and the negative sign is applied to the 2 that is keyed in after it. So in this case you have +10 -2 = +8. On the HP-45, when you ENTER the 10, a +10 is lifted into the Y register, then the CHS is cancelled when you key in the 2, so you end up with +10 in the Y register and +2 in the X register, and the result is +10 +2 = +12. Basically, the proper and consistent way to use any RPN calc is to key in all parts of a number (mantissa, sign, exponent, sign) prior to entering it into the stack to avoid this type of problem. The proper way to calculate -10 + 2 = -8 is to key in 10 CHS ENTER 2 +

Edited: 11 Aug 2011, 5:49 p.m.

Re: HP 12C Platinum CHS bug?

*Message #3 Posted by **Vladan Dugaric** on 11 Aug 2011, 6:12 p.m.,*

in response to message #2 by Michael de Estrada

Standard 12 gives -8 when 10 ENTER CHS 2 + is keyed in, so 12C+ definitely gives a different result.

HP-41CX also gives -8, so it is likely that the emulation in 12C+ has a bug somewhere (it is supposed to give the same result as the emulated 12C).

Even Nonpareil emulation of 12C gives -8 (and it is likely that 12C+ is based on nonpareil emulation).

Vladan

Edited: 11 Aug 2011, 6:14 p.m.

Re: HP 12C Platinum CHS bug?

*Message #4 Posted by **Michael de Estrada** on 11 Aug 2011, 6:18 p.m.,*
in response to message #3 by Vladan Dugaric

Not a bug, just improper user entry. Try 10 CHS ENTER 2 +, and you'll get the correct answer -8 on every machine, every time.

Re: HP 12C Platinum CHS bug?

*Message #5 Posted by **M. Joury** on 11 Aug 2011, 8:43 p.m.,*
in response to message #4 by Michael de Estrada

Sure, that works, and that is how I would usually do it. But the results are inconsistent among calculators so if nothing else it is an idiosyncrasy.

Re: HP 12C Platinum CHS bug?

*Message #6 Posted by **Marcus von Cube, Germany** on 11 Aug 2011, 6:18 p.m.,*
in response to message #3 by Vladan Dugaric

Vladan, M. Joury is talking about the 12C Platinum which is a complete reimplementation of the 12C with enhancements. The software writers introduced a few bugs in the process of reinventing the wheel. The 12C+ emulates the 12C hardware and runs the original ROM so the results on a 12C+ should match those of the 12C.

Re: HP 12C Platinum CHS bug?

*Message #7 Posted by **M. Joury** on 11 Aug 2011, 8:41 p.m.,*
in response to message #6 by Marcus von Cube, Germany

It does.

-Marwan

Re: HP 12C Platinum CHS bug?

*Message #8 Posted by **Marcus von Cube, Germany** on 11 Aug 2011, 6:15 p.m.,*
in response to message #2 by Michael de Estrada

The sequence 10 ENTER CHS 2 + on my 15C puts 10 in X, duplicates the value (stack lift disabled) then executes a monadic operation on X, replacing X by -X. This enables stack lift again so that the 2 pushes 10 into Z, -10 into Y and 2 in X. + adds -10 to 2 and replaces X by the result, dropping both input values so

that 10 is now in Y which can be easily checked with Rv.

Re: HP 12C Platinum CHS bug?

*Message #9 Posted by **M. Joury** on 11 Aug 2011, 8:39 p.m.,*
in response to message #8 by Marcus von Cube, Germany

Yup. 15C was one of the machines I tried. As was the WP34S <g>. Both gave -8 as a result for both problems. So do the following machines:

```
HP-41
HP-42
HP-67
HP-32Sii
HP-33S
HP-35S
HP-12C
HP-12C+
HP-34C
HP-32E
```

Edited: 11 Aug 2011, 8:40 p.m.

Re: HP 12C Platinum CHS bug?

*Message #10 Posted by **Tommy** on 12 Aug 2011, 4:46 a.m.,*
in response to message #9 by M. Joury

Yes, it is a bug. The CHS is not listed as a neutral operation (15C manual Appendix B)

The CHS is neutral during digit entry.

"After digit entry termination, CHS and EEX are lift-enabeling". The ENTER terminates the first number

/Tommy

Re: HP 12C Platinum CHS bug?

*Message #11 Posted by **Ken Shaw** on 12 Aug 2011, 10:44 a.m.,*
in response to message #10 by Tommy

This answer is the most sensible to me.

In the 15C and others, the sequence "10 ENTER CHS" appears to intentionally enter 2 numbers (+10 into Z and -10 into Y), so that anything following will replace the display. Most of us performing this sequence probably don't think about the Z value and intend only to work with the X and Y registers, making -8 the expected result.

But if you think about what Michael Estrada said, our habit of ignoring the Z value is equivalent to an incorrect input method for RPN, where if we didn't want +10 in the Z register, we really should be typing "10 CHS ENTER" and not "10 ENTER CHS".

Just my C$0.02

Edited: 12 Aug 2011, 10:47 a.m.

Re: HP 12C Platinum CHS bug?

*Message #12 Posted by **M. Joury** on 12 Aug 2011, 11:13 a.m.,*
in response to message #11 by Ken Shaw

Unless I am misunderstanding what you are saying, I don't think that is right.

'Z' never gets involved. Assuming a clear stack to begin with (all zeroes) on the 15C:

```
10 CHS ENTER -->  Y: -10;  X: -10
10 ENTER CHS -->  Y: 10;  X: -10
```

Nothing ends up in 'Z'.

You get the EXACT same results on the 12CP, *BUT* on that machine CHS after ENTER appears to DISABLE stack lift (see my additional comments at the end). So any digits entered after that overwrite the -10 in the X register.

Per Tommy (from the HP-15C manual:

> Quote:
>
> "After digit entry termination, CHS and EEX are lift-enabeling". The ENTER terminates the first number

This is identical to the operation of *MOST* hp calculators that I have tested including the original HP-12C and the HP-12C+.

I agree with Michael that this entry method is suspect and probably not the best way to do things but most other HP's handle it as I would expect. Also, see Gerson's reply in this same thread for an example where the behavior of the 12CP might get you in trouble.

One final point (made earlier) is that the result is not consistent. CHS after ENTER behaves differently than, say, after '+'. Try:

```
5 ENTER 5 + CHS 2 +
```

This gives you a result of -8 on every machine I have tested *OTHER THAN* the HP-35 which gives you 8. In the above example the CHS operation either enables stack lift or is neutral ('+' enabled it), either way the result is different.

I just realized that I think I know what is going on:

On most HP's CHS is neutral *EXCEPT* after digit entry (as suggested by the HP-15C manual). On the HP-12CP it is *ALWAYS* neutral and since ENTER disables stack lift CHS (neutral) leaves stack lift disabled and the next digit overwrites 'X'. That also explains the behavior with 5 ENTER 5 + where '+' enables stack lift and CHS (neutral) does not effect it so -10 is 'lifted' into 'Y when the next digit is entered. I will have to play around with this some and see if my assumption is consistent.

Cheers,

-Marwan

Re: HP 12C Platinum CHS bug?

*Message #13 Posted by **Ken Shaw** on 12 Aug 2011, 3:46 p.m.,*
in response to message #12 by M. Joury

No, you didn't misunderstand. I made a mistake in trying to be too brief with my post. By leaving out the "2" following "10 ENTER CHS", of course nothing ends up in Z, so I should have left the original sequence intact. Reconsider my post with the extra digit entry at the end.

I was just trying to emphasize the important difference when the CHS came before ENTER rather than after. The benefit of the 15C method of entry with the additional stack lift is that it keeps the concept of CHS being postfix. When it's applied to the "2" as a prefix notation, the result is unexpected for most of us. But if we kept to the rule as suggested by Mike Estrada, the problem wouldn't arise.

Hopefully I've cleared up the mess I started.

Re: HP 12C Platinum CHS bug?

*Message #14 Posted by **M. Joury** on 12 Aug 2011, 4:50 p.m.,*
in response to message #13 by Ken Shaw

Makes sense to me. But to address one thing you said:

> Quote:
>
> When it's applied to the "2" as a prefix notation, the result is unexpected for most of us.

I think that this is only happening on the HP-35. On the HP-12CP and the other machines with the same behavior the CHS is *NOT* applied to the '2'. It simply is completely neutral as far as enabling stack lift and the '2' overwrites the -10 in the 'X' register.

In other words the 'Z' register is NOT effected on the 12CP. What you end up with after 10 ENTER CHS 2 (before the final '+'):

```
On the 15C:  Z:   10;  Y:  -10;  X:    2
On the 12CP: Z:    0;  Y:   10;  X:    2
On the 35:   Z:    0;  Y:   10;  X:   -2
```

So we have here 3 different approaches to handling this keystroke sequence. 1 and 3 at least give consistent results when considering the other example given earlier (5 ENTER 5 + CHS 2 +). I believe that, per the HP-15C manual, CHS should ENABLE stack lift after digit entry termination.

As it happens I generally use the approach offered by Michael, but I am sure that, as suggested by Gerson in his posting, I have on occasion forgotten the CHS until after I pressed enter. On the 12CP this would return an unexpected result.

Cheers,

-Marwan

Re: HP 12C Platinum CHS bug?

*Message #17 Posted by **M. Joury** on 11 Aug 2011, 8:34 p.m.,*
in response to message #2 by Michael de Estrada

I would agree that the HP35 action does not qualify as a bug since, at the very least, the results for the two problems are consistent. On the HP35 the monadic +/- appears to push the leading sign onto the stack and any digits entered thereafter are negative. But the inconsistency with the results on the HP-12C Platinum (and others mentioned) makes it appear like a bug to me.

Furthermore, with the 12CP the monadic negation operator simply disapears. It does not effect 10 and it does not effect 2. The reason, of course, is that CHS appears to disable stack lift on the 12CP and therefore -10 is overwritten by 2. So what you end up with is 10 in the Y register and 2 in the X register. This is not how *most* HP calculators appear to work.

It would appear that CHS after ENTER on the 12CP (and some others) operates differently than at other times (with 5 ENTER 5 + CHS 2 + the CHS operator does NOT disable stack lift or else the final result, assuming an initial stack filled with zeroes, would be 2).

Cheers,

Marwan

Re: HP 12C Platinum CHS bug?

*Message #18 Posted by **Marcus von Cube, Germany** on 12 Aug 2011, 4:23 p.m.,*
in response to message #17 by M. Joury

On the 12CP, CHS simply leaves stack lift alone which is a bug because it acts on the number in X (changing the sign) without preserving this changed value as an "automatic intermediate result". If you read the explanation of RPN in the 12C manual you know what I mean.

Re: HP 12C Platinum CHS bug?

*Message #19 Posted by **M. Joury** on 12 Aug 2011, 5:18 p.m.,*
in response to message #18 by Marcus von Cube, Germany

Yes, as I mentioned elsewhere, I suddenly realized that on the 12CP the CHS is *ALWAYS* neutral as far as enabling or disabling stack lift. Per the HP-15C manual (quoted by Tommy):

Quote:

"After digit entry termination, CHS and EEX are lift-enabeling".

So, one could argue that other machines that have this behavior are "as designed" but for the 12CP which is supposed to be a more advanced version of the 12C I would say it is a bug. It would appear that at some point (at least two) the implementation of RPN changed. It changed after the HP-35 (all other classics have the second implementation?) and, apparently, again after the Woodstocks. The Implementation of the 12CP is a throwback to that in the HP-45, HP-65, and Woodstocks. Was the HP-67 the first with the third implementation? BTW, the HP-55 can be added to the machines that do it the second way.

Cheers,

-Marwan

Re: HP 12C Platinum CHS bug?

*Message #20 Posted by **Marcus von Cube, Germany** on 12 Aug 2011, 5:45 p.m.,*
in response to message #19 by M. Joury

We had some stack lift problems with the 34S firmware recently. The whole stack lift business is a bit convoluted at best. On the 34S we could easily change the way ENTER works: Instead of duplicating X and lifting the stack it could simply terminate digit entry. In such a scenario, stack lift is **always** enabled. With this approach (borrowed from the RPL machines) 2 ENTER x will no longer produce the result 4 as on a classic RPN calculator. But it would ease the implementation significantly and there will be no ambiguities left.

Re: HP 12C Platinum CHS bug?

*Message #21 Posted by **M. Joury** on 12 Aug 2011, 6:03 p.m.,*
in response to message #20 by Marcus von Cube, Germany

Marcus, I hear what you are saying. I have implemented an RPN simulator for the HP-39gs and the hardest part to get right was the stack lift. It seems so easy and yet it is not really trivial.

Cheers,

-Marwan

Re: HP 12C Platinum CHS bug?

*Message #22 Posted by **Katie Wasserman** on 12 Aug 2011, 10:55 p.m.,*
in response to message #20 by Marcus von Cube, Germany

Quote:

With this approach (borrowed from the RPL machines) 2 ENTER x will no longer produce the result 4 as on a classic RPN calculator

... and thus be duplicating the behavior of the base 20b/30b machine.

I don't like this option at all and is one of the reasons why I don't use the 20b/30b.

Re: HP 12C Platinum CHS bug?

*Message #23 Posted by **BruceH** on 11 Aug 2011, 6:16 p.m.,*
in response to message #1 by M. Joury

> Quote:
>
> Is this considered a bug ...

I would say so: it's not the same as the original 12C (which gives -8) so it's certainly a bug in the sense that keystroke programs published for one machine won't necessarily work on a Platinum.

> Quote:
>
> ...and does this bug (idiosyncrasy if you prefer) exist in all the 12C Platinum versions? It certainly exists on mine (CNA 01705175).

It's in my Anniversary Edition Platinum.

Re: HP 12C Platinum CHS bug?

*Message #24 Posted by **Gerson W. Barbosa** on 11 Aug 2011, 6:45 p.m.,*
in response to message #23 by BruceH

If this is not a bug it is a very cumbersome feature, to say the least. In article #654, last edited on 12/30/2006, I wrote:

> Quote:

```
3) Pay attention to what appears to be a bug in the HP-12C Platinum: negating
a number just entered by pressing
   the CHS (change sign) key does not work the way it used to on the classic
HP-12C. For instance:

   Keystrokes                Display

   45 ENTER                   45.00000000
   CHS                       -45.00000000          The number displayed by the
calculator is negative,
   5                          5.
   +                          50.00000000          yet it has been interpreted
as a positive number.

   15 ENTER                   15.00000000          we've just entered 15,
   CHS                       -15.00000000          but then we rememember we
want to compute sin(-15) and press CHS
   R/S                        0.258819045          then R/S. Wrong result, the
calculator shows sin(15) instead!

   So, either we enter the correct number the first time or we remember to
press ENTER after pressing CHS:

   15 CHS R/S                -0.258819045          sine(-15)
   15 ENTER                   15.00000000
```

```
CHS ENTER              -15.00000000
R/S                    -0.258819045          sine(-15), as expected.
```

Desperate For HP 17BII Help

*Message #1 Posted by **Michael Roback** on 11 Aug 2011, 3:15 p.m.*

I recently inherited a 17BII calculator that had been in storage without batteries installed for a long time. I cannot power it on with the on button. However when I depress the on button with a function key it powers on. Also, I can do the self test and it comes back with the calculator being okay. While powered on, I can scroll through the functions but when I go to enter data, the numbers do not always register. I have put batteries in backwards to clear and reset with no success. Also I am unable to turn the calculator off by pressing the shift and off key. I have to take batteries out to turn the calculator off. I of course have installed brand new batteries. Any help or ideas? Is the calculator toast. Should I throw it away. It is probably more expensive to repair than it it worth. Can it be disassembled and the contacts cleaned?? Not sure how to do that. I am stuck. Please help if you can. Thank you! I appreciate any help :).

Re: Desperate For HP 17BII Help

*Message #2 Posted by **gene wright** on 11 Aug 2011, 5:49 p.m.,*
in response to message #1 by Michael Roback

A used 17BII costs between $30 and $50 on the auction site e b a y.

Consider that vs. your time/effort to try to repair the unit, which may not work in any case.

That's how I would approach the decision. I would lean toward finding another unit, but that's just me.

Re: Desperate For HP 17BII Help

*Message #3 Posted by **BruceH** on 11 Aug 2011, 6:25 p.m.,*
in response to message #2 by gene wright

Don't bother with all the risks of buying a second-hand old model on TAS when the current 17bII+ is a very nice machine indeed. Buy new.

Re: Desperate For HP 17BII Help

*Message #4 Posted by **Jose Gonzalez Divasson** on 12 Aug 2011, 3:08 a.m.,*
in response to message #3 by BruceH

Both machines are excellent and worth their prices in their own way. The original with its excellent key feel, better pocketability (for your jacket pocket: it's thinner, and the case is thinner as well); the new with its far superior LCD screen, different but equally excellent key feel and the additional currency menu (I doubt that anyone would fill the additional 24 kb of memory - in fact I doubt that anyone used up the 8 kb of the original)

A deeper comparison can be found Here

Talking about the WP 34s at the internal HP calculator forum

*Message #1 Posted by **gene wright** on 11 Aug 2011, 2:55 p.m.*

This is an internal forum at HP where people can post questions, etc about calculators. I have tried to drum up some interest in the WP 34s and 41CL there.

You will probably have to register to view the content. FYI.

Business Support Forum on the HP Servers

Re: Talking about the WP 34s at the internal HP calculator forum

*Message #2 Posted by **Walter B** on 11 Aug 2011, 3:30 p.m.,*
in response to message #1 by gene wright

Everything's readable without registration for me. Thanks for posting. There seems to be far less activity in months, however, than at a single day on the museum forum. So well, it's another channel, but apparently a minor one.

Thanks anyway,
Walter

Re: Talking about the WP 34s at the internal HP calculator forum

*Message #3 Posted by **gene wright** on 11 Aug 2011, 4:03 p.m.,*
in response to message #2 by Walter B

Good! Did not know you could read it without registration.

Yes, it has quieted down, but I wanted to again point people in the direction to find out more info.

On another note...I have the first draft of the matrix programs for the 34s keyed in. Debugging now. 197 lines is all it takes. Could do a 6x6 system or inverse, 8x8 determinant. That's a limit based on 100 registers available.

Re: Talking about the WP 34s at the internal HP calculator forum

*Message #4 Posted by **Walter B** on 11 Aug 2011, 4:49 p.m.,*
in response to message #3 by gene wright

Sounds good. With respect to matrix size requirements, please note I posted a statement in another thread recently.

Just my 20m€, of course, as usual :-)

Re: Talking about the WP 34s at the internal HP calculator forum

*Message #5 Posted by **gene wright** on 11 Aug 2011, 4:52 p.m.,*
in response to message #4 by Walter B

Oh, I agree. 8x8 determinant is more than enough and 6x6 system / inverse is really awfully big too.

These should handle the "normal" matrix work, assuming they are debugged well. :-)

Would be good to put a "check mark" in the box on "matrix math" with the 34s description, IMO.

34S matrix programs

*Message #6 Posted by **Marcus von Cube, Germany** on 11 Aug 2011, 4:59 p.m.,*
in response to message #5 by gene wright

Gene, I was wondering how a usable editor / browser for matrix data could be implemented with the current command set. Or do the routines depend on manual data entry?

Re: 34S matrix programs

*Message #7 Posted by **gene wright** on 11 Aug 2011, 5:23 p.m.,*
in response to message #6 by Marcus von Cube, Germany

The plan is to also include the PPC ROM application program "MIO" from the PPC ROM manual. It helps with the loading / viewing of the matrix.

What you say? You don't have a copy of the PPC ROM manual? :-) Shame on you! lol.

Re: 34S matrix programs

*Message #8 Posted by **Walter B** on 11 Aug 2011, 5:39 p.m.,*
in response to message #7 by gene wright

Everyone owning a museum DVD has got a copy of said telephone directory. And I've even got a printed one :-)

Re: 34S matrix programs

*Message #9 Posted by **gene wright** on 11 Aug 2011, 5:47 p.m.,*
in response to message #8 by Walter B

Good! No wonder you made many very good decisions on the 34s. ;-)

But, what I am working on is a very vanilla port of M1 through M5, BX, QR, BE from the PPC ROM and then RRM and MIO from the M1 routines application programs.

First draft, which should fit into the 506 step flash bank with few problems, will not use the REG-SWAP features of the 34s because the programs are written assuming XX.YY in X and TT.ZZ in Y for register swaps, for example. Once it is *working* then refinements can be worked on.

So, no secret what these will look like. They will be as much like those in the PPC ROM manual as possible. :-)

OT: PPC Manual

*Message #10 Posted by **Mark Hardman** on 11 Aug 2011, 9:30 p.m.,*
in response to message #7 by gene wright

I have a copy of the PPC manual--in fact you were the source! I traded a HP-19C **case** for the manual. Boy, did I get the better end of that deal!

Mark Hardman

Re: 34S matrix programs

*Message #11 Posted by **Paul Dale** on 11 Aug 2011, 5:58 p.m.,*
in response to message #3 by gene wright

Great news.

197 steps? I think there isn't enough functionality there. You've got 506 steps for this library :-)

Check the back of the 15c for a start. Then consider:

- Eigen decomposition
- Joran normal form
- SVD
- Smith canonical form
- Cholesky decomposition
- Matrix log and exponential
- Anything from JMB's superb site.

Remember the 34S motto: "if something is worth doing, it is worth utterly overkilling". I just made that up, it isn't really the motto but it is almost apt.

- Pauli

in response to message #15 by Walter B

> Quote:
>
> How about "r2;c2" ? Or - if space is really tight - "2;2" based on everybody knowing it's "row;column"? Just crossed my mind.

Good ideas, but I have a very similar and slightly different suggestion. How about we use the 42S notation? The first element in a matrix on a 42S is 1:1=0.00 Most would be familiar with this notation already, but any slight variation would be fine and people would recognize it easily.

Re: Talking about the WP 34s at the internal HP calculator forum

*Message #17 Posted by **Marcus von Cube, Germany** on 12 Aug 2011, 4:32 p.m.,*
in response to message #16 by Paul Gaster

The problem is the available set of commands in the 34S for handling the alpha register. The only available command aRC# formats the number according to the current display format. If you just want 2 instead of 2.0000 (depending on what is set by the user) you need to set a proper format first. For single digits adding 48 and using XTOA helps but is not the best possible solution.

Re: Talking about the WP 34s at the internal HP calculator forum

*Message #18 Posted by **Dieter** on 12 Aug 2011, 5:56 p.m.,*
in response to message #17 by Marcus von Cube, Germany

Maybe there's something I miss here, but isn't the [alpha]IP command intended for exactly this case? It appends the integer part of a number to Alpha, no matter which display format is currently set, without any decimals, trailing zeroes or radix marks.

Dieter

Njet, forget it!
The loop with checking for the 4 arrow keys and displaying the current matrix element would be no problem, but when the user enters any number (to change the current matrix element) things would become VERY complicated.

This would definitely be MUCH easier to do with internal code.

Edited: 13 Aug 2011, 6:13 a.m.

Re: Talking about the WP 34s at the internal HP calculator forum

*Message #23 Posted by **Marcus von Cube, Germany** on 13 Aug 2011, 10:49 a.m.,*
in response to message #22 by fhub

I agree. It looks like a viewer would be easy to implement while an editor would be much harder.

Re: Talking about the WP 34s at the internal HP calculator forum

*Message #24 Posted by **Paul Dale** on 13 Aug 2011, 8:10 p.m.,*
in response to message #23 by Marcus von Cube, Germany

You need an "edit this element" key which is a bit more cumbersome.

Doing a full fledged editor in flash wouldn't be fun. The command line support just isn't set up for it. Adding a command to parse alpha as a number would be a bit easier.

Something to think about...

- Pauli

Re: Talking about the WP 34s at the internal HP calculator forum

*Message #25 Posted by **Marcus von Cube, Germany** on 15 Aug 2011, 2:27 a.m.,*
in response to message #24 by Paul Dale

Maybe the following works:

Navigate to the element in question
Hit R/S
Enter a number
Hit R/S

The loop which queries the keyboard for the arrow

keys needs to check the ENTRY? flag to determine if it has been interrupted and needs to store the modified value in the currently selected location. The first R/S may be made automatic by a new command that allows to feed a key into the keyboard buffer so that the loop can terminate itself as soon as the user presses a digit entry key. Another command my help to detect if a key code is one of the digit entry keys 0-9, ., +/- or EEX.

Use STOM and RCLM ???

This is exactly the kind of thing they are inlcuded for :-)

- Pauli

Re: Talking about the WP 34s at the internal HP calculator forum

*Message #27 Posted by **Paul Dale** on 11 Aug 2011, 7:11 p.m.,*
in response to message #14 by Marcus von Cube, Germany

Something like this ought to work:

```
LBL 00
RCLM L
FIX 00
aCLR
aRC# X
alpha ;
aRC# Y
STOM L
RTN
```

- Pauli

Re: Talking about the WP 34s at the internal HP calculator forum

*Message #28 Posted by **gene wright** on 11 Aug 2011, 8:03 p.m.,*
in response to message #27 by Paul Dale

That may work well, Pauli and could help with the MIO port.

But...

Don't you guys go getting too excited. This is a basic port and I'm not doing much intelligence with it. I had a math *minor* in college and never had linear algebra. What I know (which isn't much) I learned studying for the actuarial exam (several times).

Oh well. I did an awful lot of maths at university and loved linear algebra but that was a long time ago and much has been forgotten over the years. Use it or lose it really applies.

I'd love to find some time to spice up the matrix library but I'm kept pretty busy playing with the lower level firmware.

I forgot, a least squares solver could be handy too. Done via one of the standard decompositions rather than the more usual formula (X'X)^-1 X' Y.

- Pauli

> Pauli, you know we had a more elegant solution which was removed with the advent of the register browser. I vote for having a variant of aRC# which only converts the integer part without a trailing dot.

A wonderful solution would be a kind of matrix browser (like the register browser), where you navigate with the 4 arrow keys within the matrix, the current position is shown in the alpha display and the value in X. And if you type in a value and [ENTER] the value would be stored in the current matrix element.

But this could certainly only be done in the firmware itself and not by a user program - and I doubt that there's enough space left for such a feature.

Franz

in response to message #31 by fhub

The size of a row or column is not known to the firmware, only to the user program. In a future version which may natively support matrices, such an editor is a viable option.

Well, of course I meant that the browser should be called "with a special matrix", and the information about this matrix is stored anywhere (e.g. in a register with a value ss.rc, meaning: ss=start register, r=#rows, c=#cols of the matrix)

> Quote:

WP34s: flash problems

*Message #1 Posted by **fhub** on 11 Aug 2011, 4:18 a.m.*

I've reported 2 problems about programs in flash lately:

1) line numbers of programs in flash are one too high (program starts with 002)

2) executing a program in flash which ends with a RTN kicks the programcounter out of flash

Any idea if (and when) this will be fixed?

Franz

Re: WP34s: flash problems

*Message #2 Posted by **Paul Dale** on 11 Aug 2011, 4:28 a.m.,*
in response to message #1 by fhub

The line number will be fixed very soon.

The RTN issue is more complex and we've not decided what to do yet.

- Pauli

Not "very soon" - it's already done (as I just can see)! :-)

> Quote:
>
> The RTN issue is more complex and we've not decided what to do yet.

I'm just curious: what's the problem with it?
Won't it be logical to just reset the programcounter to the top of the current flash area? (as it is done in RAM, too)

Re: WP34s: flash problems

> I'm just curious: what's the problem with it?
> Won't it be logical to just reset the programcounter to the top of the current flash area? (as it is done in RAM, too)

There are two reasons to use a flash segment for a library. One is as a mini-application like your TVM code. In this case you want the PC to go back to the start of flash. The other is a library of utility subroutines, in this case you don't want the PC going back to the start of the flash segment.

So yes, it is logical to do what you're asking and it is also not logical at the same time.

And that is exactly all I'm going to say on this matter at this time.

HP 41C display problem

*Message #1 Posted by **Alexander Oestert** on 11 Aug 2011, 4:01 a.m.*

Hi experts!

I have recently acquired a 41C, serial No. 1947..., with a screwed on CPU PCB, so not easily removed.

Keying in numbers or letters shows something like this

The flaw occurs on the third position from the left, its shape depending on the number/character I'm keying in on the first (!) position. Most characters give something like an R shape on the third position, characters like "I", "J", "1" or "7" will produce a more slender shape in the third display position. In any case there is also an underscore in the second position and some semicolon and points all around. If this is too hard to understand I will make a video... ;)

I've helped myself by putting a program on a key in USER mode that shifts the display by four alpha spaces to the right. But this is not very convenient.

Does anyone know what can be done against this? Is it a matter of (ultra sonic) cleaning the keyboard and display? Is the graphic engine gone for good?

Thanks in advance!

Re: HP 41C display problem

*Message #2 Posted by **Raymond Del Tondo** on 11 Aug 2011, 4:32 a.m.,*
in response to message #1 by Alexander Oestert

Two causes come to mind:

- contact problem of either CPU pcb and/or LCD tray pcb
- defective LCD driver

In any case, you may have to remove the CPU pcb and check the contacts.
Often there is some acid residue (or corrosion, the green stuff) from leaked batteries.
Also check the contact points between the LCD and the kbd pcb.
I had various of the old units where at least one of the metal strips had gone loose.

Re: HP 41C display problem

*Message #4 Posted by **Alexander Oestert** on 11 Aug 2011, 5:19 a.m.,*
in response to message #2 by Raymond Del Tondo

I disconnected the CPU PCB from the keyboard PCB and found it clean. Nevertheless I cleaned it with isopropyl alcohol.

Then, I found the leftmost (looked at from the back) of the connections between the LCD and the keyboard PCB to be loose. I soldered it back on to the keyboard PCB, but there seems to be no lead coming from the soldering point on the keyboard PCB. It looks like I soldered it to the PCB plastic?!?! Should there be something?

Edited: 11 Aug 2011, 5:19 a.m.

Your opinion about this custom USB charger for vintage Calculators

*Message #1 Posted by **Namir** on 10 Aug 2011, 9:09 p.m.*

Hi All,

The TAS site has the following auction. The auction sells custom made USB cables that will charge HP-35, 45, 65, 80, and 67. The seller explains the voltage and current provided by his custom USB cable.

Your opinion? Ok to buy?

Thanks,

Namir

Edited: 10 Aug 2011, 9:09 p.m.

CostCentral (Erie) update on HP-15C LE

*Message #1 Posted by **Mark Henderson** on 10 Aug 2011, 2:41 p.m.*

I ordered a 15C LE from CostCentral (Erie) on 7/25 and inquired about order status today, here's what they replied (quickly):

"HP is not releasing the calculator until October; they have not specified an exact date yet."

I am continuing to hold my breath, despite all the very valid arguments presented here :-)

Re: CostCentral (Erie) update on HP-15C LE

*Message #2 Posted by **Lode** on 10 Aug 2011, 2:48 p.m.,*
in response to message #1 by Mark Henderson

Yeah, it's October in the US and November in Europe. It's unfair :(

Re: CostCentral (Erie) update on HP-15C LE

*Message #3 Posted by **Thomas Radtke** on 10 Aug 2011, 3:40 p.m.,*
in response to message #2 by Lode

To enter the european market, you need to translate documentation and ensure compliance to local regulations. That could be a reason to have a later launch over here, if that will be the case in the first place.

It's interesting that I can still import it as a private person. Did so with the 35s and, of course, got english docs, which violates the regulations. Hopefully, it works out with the 15C LE the same way.

The cost is probably the same.

Re: CostCentral (Erie) update on HP-15C LE

*Message #4 Posted by **Michael de Estrada** on 10 Aug 2011, 3:54 p.m.,*
in response to message #3 by Thomas Radtke

I think it would be a relatively simple matter to replicate the old documentation that was written in other languages such as German. For example, looking at my original handbook in English, it seems that that only significant changes would be to Appendix F, which deals with batteries, warranty and service.

*Message #6 Posted by **Michael de Estrada** on 11 Aug 2011, 9:10 a.m.,*
in response to message #5 by Thomas Radtke

I understand that, but wouldn't most of those other factors be taken care of by the fact that very similar products such as the 12c+ are already being sold worldwide. Can you show me a concrete example where I'm wrong in this assumption?

Re: CostCentral (Erie) update on HP-15C LE

*Message #7 Posted by **Thomas Radtke** on 11 Aug 2011, 10:05 a.m.,*
in response to message #6 by Michael de Estrada

Since I don't know the hardware of the 15C LE, I cannot comment on what's necessary to bring it to the european market.

However, I'm a Technical Writer concerned with docs and regulations (and risk analysis since we're producing machines). As always, it is not as trivial as it looks. You're invited to visit my office :-).

Re: CostCentral (Erie) update on HP-15C LE

*Message #8 Posted by **bill platt** on 11 Aug 2011, 11:04 a.m.,*
in response to message #7 by Thomas Radtke

It seems like the European market has more barriers to entry than the U.S. Or do you see the same amount of regulatory overlay going from EU to US now, too?

Re: CostCentral (Erie) update on HP-15C LE

*Message #9 Posted by **Thomas Radtke** on 11 Aug 2011, 11:46 a.m.,*
in response to message #8 by bill platt

While we do export AHUs to the US and non EU countries in eastern europe and do care for all regulations to be met, the US isn't much of a problem since placing is done by an independant office. If the company I'm working for would have been liable for its devices, we wouldn't have entered the market in the first place, since any problem with a larger machine can ruin a small company like ours quickly. So, regulations aren't a problem, but legal practise is.

Re: CostCentral (Erie) update on HP-15C LE

*Message #10 Posted by **Paul Dale** on 10 Aug 2011, 5:07 p.m.,*
in response to message #2 by Lode

Quote:

Yeah, it's October in the US and November in Europe. It's unfair :(

Down here in the antipodes, if past history is anything to go by, it will be 2014 before it gets released at a very inexplicable price in the $350 - $400 range. That's assuming it even gets released.

- Pauli

Re: CostCentral (Erie) update on HP-15C LE

*Message #11 Posted by **Erturk Kocalar** on 10 Aug 2011, 9:48 p.m.,*
in response to message #10 by Paul Dale

I'm surprised why oct? I would have released it before school starts so some students get it. By October, it is more a Christmas gift category. Which could be from HP to us :)

My fingers crossed.

Re: CostCentral (Erie) update on HP-15C LE

*Message #12 Posted by **Walter B** on 11 Aug 2011, 12:53 a.m.,*
in response to message #11 by Erturk Kocalar

Don't expect anything rational. Though the individuals in the calculator "department" are good guys AFAIK, the overall organisation of this launch looks like a big mess from outside.

My 20m€ only.

Re: CostCentral (Erie) update on HP-15C LE

*Message #13 Posted by **Howard Owen** on 11 Aug 2011, 3:13 p.m.,*
in response to message #11 by Erturk Kocalar

My guess is they will hand it out at HHC (9/24 - 9/25) and announce it around the same time. I expect the product launch will take place at the VAR meeting, thus vindicating Tim Wessman's statement that it would NOT be launched at HHC. Availability in stores a week later would be consistent with an October date.

Caveat conference goer: I am totally blowing smoke on these predictions. If you buy a ticket to HHC and they **don't** hand out 15Cs, don't blame me. :)

Re: CostCentral (Erie) update on HP-15C LE

*Message #14 Posted by **Thomas Radtke** on 12 Aug 2011, 11:13 a.m.,*
in response to message #11 by Erturk Kocalar

In one of the links presented here, HP stated it would be a "great gift" IIRC, indicating that xmas is targeted.

Interesting overview of the HP-15C limited edition

*Message #1 Posted by **From Hong Kong** on 10 Aug 2011, 1:23 p.m.*

Interestingly, I found the following overview taken from a page snapshot that appeared on August 6, 2011.

[url:http://webcache.googleusercontent.com/search?hl=en&biw=1003&bih=463&gs_sm=e&gs_upl=547l9047l0l10375l15l14l1l2l2l0l359l3000l0.2.5.4l11l0&q=cache:3XBAGI0_1h4J:http://www8.hp.com/us/en/products/calculators/product-detail.html?oid=5153395+hp-15c+limited+edition&ct=clnk]

Overview

HP¡¦s Popular 15c Scientific Calculator in a Limited Edition. The HP 15c Scientific Calculator combines intelligent design with advanced scientific calculations. Benefit from faster processing power, great shortcuts like RPN and an intuitive, horizontal interface.

Features

Intelligent design meets portability

- The HP 15c scientific calculator presents an intuitive, horizontal interface, just like the original.
- The compact size and light-weight metal frame of the HP 15c allow scientists and engineers to easily carry this powerful calculator from meeting to meeting.

Powerful problem solver

- Run calculations quickly. This HP scientific calculator touts up to 100x faster processing power than its predecessor.

Advanced scientific calculations

- Gain a scientific calculator with programmable functions and built-in support for complex numbers, matrix math, numerical integration and root solving.
- Store complex calculations directly in the memory for rapid retrieval.
- Reduce the number of keystrokes with RPN capabilities.

HP classic available as limited edition

- This HP classic features a unique production number and ¡§limited edition¡¨ script, making it a great gift for collectors, scientists and engineers. Learn more about HP calculators.

HP 35S keyboard problem

*Message #1 Posted by **Nick R** on 10 Aug 2011, 10:26 a.m.*

I'm interested to know what the final consensus is on the HP 35S keyboard. Is it prone to mechanical defects that causes missed keystrokes or is the problem caused by keys being pressed too quickly, or off centre?

Re: HP 35S keyboard problem

*Message #2 Posted by **M. Joury** on 10 Aug 2011, 10:32 a.m.,*
in response to message #1 by Nick R

Personally I have never had a problem with the 35S keyboard. From what I have read it appears to me that the problems seen are a software rather than hardware issue caused by rapid input. I have never *tried* to break it with rapid keystroke sequences and in normal use I have not encountered any issues. People that are actually having problems can tell you more.

Cheers

Re: HP 35S keyboard problem

*Message #3 Posted by **Thomas Radtke** on 10 Aug 2011, 11:35 a.m.,*
in response to message #1 by Nick R

Cursor-up key is more or less gone on my sample, but it seems I'm the only user in this forum to have such a problem.

I guess care needs to be taken when pressing the 35s' cursor keys as they are not hinged. Very bad design decision, imo.

Re: HP 35S keyboard problem

*Message #4 Posted by **NateB** on 10 Aug 2011, 1:17 p.m.,*
in response to message #1 by Nick R

I think it is a problem with the keys being pressed too quickly. The 50g has a similar problem that can be fixed by changing the keytime setting to a smaller value.

If I press a key as fast as possible, the 35s will only register 8 of the 10 presses.

Re: HP 35S keyboard problem

*Message #5 Posted by **Morten Nygaard Åsnes** on 10 Aug 2011, 1:27 p.m.,*
in response to message #1 by Nick R

I don'tthink it can be a software problem. For me it only happens with the RCL key. I have to press it very firmly to make sure it registers.

Re: HP 35S keyboard problem

*Message #6 Posted by **Bart (UK)** on 11 Aug 2011, 9:30 a.m.,*
in response to message #5 by Morten Nygaard Åsnes

I believe there is defintely a software issue with the keys. At first when I was learning the 35s I did not have a problem, but as I got more used to it I began getting missed key strokes. This becomes partcularly apparent when typing in programmes or working through a formula I am familiar with. Quite often the 'busy' annunciator will come on too. It was particularly annoying when I was typing in Pauli's game (see article 1035).

-B

Re: HP 35S keyboard problem

*Message #7 Posted by **Silvio A. Bensi** on 10 Aug 2011, 1:52 p.m.,*
in response to message #1 by Nick R

I bought my 35s in 2009 (CNA 72701623) and use it daily, although not heavily. Missed keystrokes due to quick typing is not new for me, but 2 months ago the "+" key started to fail. When I press it on the inferior left side, it fails 5 to 6 times in 10. I feel the click, but it does not conclude the operation. There is another mechanical problem with the "SIGMA+" key: it is unbalanced and inclined to the left, though it continues working with no fail.

Silvio

Re: HP 35S keyboard problem

*Message #8 Posted by **Nick R** on 10 Aug 2011, 4:48 p.m.,*
in response to message #7 by Silvio A. Bensi

It sounds like there's definitely doubt as to the durability of the keys on the 35S. That's enough to put me off buying one at the retail price. I'd thought of getting one to sit next to my vintage HP35 as a comparison, but that would be like parking a Lada next to a Ferrari. It seems that in the last few years the reduction in the MSRP of certain makes of calculator has been matched by a reduction in MTBF. I'd call this the China Syndrome. If the much-anticipated HP15C LE does actually materialize, I doubt that the construction quality will prove to be much better, and perhaps LE may end up standing for Lousy Engineering. I hope I'm wrong.

Nick

I doubt it. It should be physically identical to the HP-12C+, which AFAIK is quite good and solid, and nothing like the junky and flimsy construction of the HP-35s. I would expect it's quality to be closer to that of the HP-50g, which is quite good and much better than the HP-35s.

Re: HP 35S keyboard problem

*Message #10 Posted by **M. Joury** on 10 Aug 2011, 5:54 p.m.,*
in response to message #9 by Michael de Estrada

Michael,

Your bias is showing <g>. While the 35S does have faults I don't find the construction to be one of them.

The problem with this approach to inquiring about quality is you have no idea whether those NOT responding are having problems or not. The number of responses to the original query does not really indicate a hardware problem since you WILL get failures--that's simply the nature of the beast--the question becomes what is the failure rate. Anecdotal evidence of the kind being gathered here does not provide an answer. You need a far larger sample to unequivocally answer that question. I even have a 41 that after years and years of dutifully registering every keystroke, every time, suddenly began missing the '5' key. Does that make the 41 "junk"? Hardly.

I am not saying that there is NOT a hardware problem, just that it is very hard to be sure there is one with the answers received so far. And yes, I have seen other complaints about missed keys, but, again, is that hardware or software, I don't know. Even Pauli (I believe it was) said that they would have used the 35S as a basis for their work had it been flashable.

Cheers,

Marwan

Re: HP 35S keyboard problem

*Message #11 Posted by **Michael de Estrada** on 10 Aug 2011, 7:06 p.m.,*
in response to message #10 by M. Joury

The issue here is one of durability and consistent quality. If a calculator like your HP-41C works for decades before finally experiencing a failure, it is much better made than a calculator like the HP-35s that fails after only a few years of use. I have a heavily used HP-32SII whose keyboard buttons work as well as the day it was removed from it's box. Not to mention an even older and more heavily used HP-15C. When was the last time you ever heard anyone complain about the quality and durability of a Pioneer or Voyager ? Also, just because you don't hear a lot of complaints, doesn't mean there aren't a lot of people that simply haven't reported them, because most users don't even frequent this forum.

Re: HP 35S keyboard problem

> Also, just because you don't hear a lot of complaints, doesn't mean there aren't a lot of people that simply haven't reported them, because most users don't even frequent this forum.

And there's the rub. Until we have a nice large sample we can't tell how bad (or good) the situation is.

And yes, I do agree with your statements about the quality of the machines you mention. The point I was getting at was that sample size is important even when discussing durability.

My first 41C had a memory problem (failure) very early on in it's life. It was fixed under warranty and never had a problem after that. However, I could have assumed that because it failed soon after purchase that the durability of the machine was questionable. That would have been a bad assumption based on too small a sample size.

I am not arguing that the 35S has great hardware--although I have not had a problem with mine. What I am saying is that given the sample size I simply don't know. Remember, the squeaky wheel gets the grease, in this case that might mean that those most dissatisfied with their machines are the most vocal.

Another example is my 50g. I have two and one of them has a funny sound to the click on one of the keys. Still responds fine but it does not sound right to me. I could jump to the conclusion that quality control is poor since 1/2 does not meet my version of spec. I might even be right but again the sample size does not warrant a conclusion one way or another.

I would love to see a true random sample of say 1000 units tested to verify hardware functionality. Now if the sample set was truly random that would probably be a valid basis on which to make a conclusion as to the quality of the machine's hardware. Unfortunately that isn't going to happen on this forum.

I would add that I probably agree that the quality of the 35S does not match that of earlier machines such as the 32Sii but I would argue that that does not make it "junk" in it's own right.

I would also say that my one really big complaint about the 35S is that they never bothered to fix anything. Is this the only mid-range/high-end HP that has never had a ROM update?

Edited: 10 Aug 2011, 9:49 p.m.

Whats flimsy about the 35s

in response to message #1 by Nick R

I really don't know how fast you guys can type, but personally, the fastest I can manage is about 12 digits per second on my 35s (I can enter 123123123123 in just under a second) and they all register consistently and reliably. I don't know if I have a faster than average calculator, or if I just type too slow for you, but does anybody *really* need the capability to type more than 12 digits per second?

Cristian

You have to include operations too. I suggest you to try a chain of one-digit calculations in RPN mode. The longest, the best. And try to use two fingers (both thumbs, for example.

Re: HP 35S keyboard problem

*Message #16 Posted by **Marcus von Cube, Germany** on 10 Aug 2011, 4:29 p.m.,*
in response to message #15 by Silvio A. Bensi

Typing with two fingers may be a special problem if the keyboard does not have two key roll-over. This is a software thing to implement or not. Without it, only one key is detected and a second key pressed at the same time is ignored. With two key roll-over properly implemented the second key is accepted even while the first one is still down. This is what I've done in WP 34S. (At least I tried to implement it correctly.) To get multi key roll-over (three or more) you need diodes in the key matrix which would increase the production costs and is only really useful on large keyboards, not on a calculator.

Re: HP 35S keyboard problem

*Message #17 Posted by **Cristian Arezzini** on 11 Aug 2011, 12:15 a.m.,*
in response to message #16 by Marcus von Cube, Germany

I made a few quick tests, and a second key pressed while the first one is still down is correctly detected in every case I've tried. It also works for many three-key combination - i.e. press 1 and hold, press 2 and hold, press 3 - the display shows 123 and it doesn't change regardless of how you release the keys. It also works for 789, 147, 258, and many more. Two I've found that don't work are 456 and 753 - for these, only the first two keys pressed register. I suppose it has to do with the row/column key encoding?

I've also noticed that digits are entered as soon as the key is *pressed*, while operations are performed when the key is *released*. Do you know why?

*Message #18 Posted by **Marcus von Cube, Germany** on 11 Aug 2011, 6:50 a.m.,*
in response to message #17 by Cristian Arezzini

Cristian, thanks for testing. It looks like the keyboard driver is not too bad.

Executing a function on key release may be associated with SST/BST showing the step and executing it when the key is released or something to that avail. Maybe it's a provision for NULL (like on the 41C) without ever being fully implemented.

I can press as fast as Ilike

To write an equation on a program line, just press [EQN] and copy the equation given in the example. Note that the first minus sign is a unary minus, thus has to be keyed in with [+/-]

My 35s reproduces this bug. That is really weird and gives me the creeps. Apart from that, I love this machine for everyday math!

Here I disagree. The last computer I had that crashed if the user entered a continuous loop, was the Commodore 64, and that only if you programmed it in machine language. With any modern programmable device, a continuous loop can crash the program, but not the whole operating system. What would you say if in your computer, you wrote a small program with a loop, and that, besides locking the whole computer, also wiped all your personal data and programs? :) There should always be a way to stop execution of a user program, on a

modern programmable machine.

[alpha][space] in WP34S

*Message #1 Posted by **fhub** on 10 Aug 2011, 5:36 a.m.*

Marcus has put the text "TVM Slv" at the beginning of my program, but unfortunately this [alpha][space] doesn't really separate both words, it's almost looking like TVMSlv. :-(

But if I look at some error messages (e.g. "Bad mode") this 'space' is ok, it has the full width of a character.

In the opcode table I see [alpha][space] twice, so are there maybe 2 different definitions of the 'space' character (one for normal and one for small text)?

If not then maybe the appearance of this 'space' character could be made a bit wider?

Re: [alpha][space] in WP34S

*Message #2 Posted by **Paul Dale** on 10 Aug 2011, 5:49 a.m.,*
in response to message #1 by fhub

One space is narrow, the other isn't. I've renamed the narrow one which is being picked up by mistake here.

This has nothing to do with the small font which applies to the entire display or not at all.

- Pauli

Re: [alpha][space] in WP34S

*Message #3 Posted by **fhub** on 10 Aug 2011, 5:56 a.m.,*
in response to message #2 by Paul Dale

Ok, then the problem is solved, thanks. :-)

But I'm just curious: for what purpose one would need such a narrow-space when it's almost invisible?

Re: [alpha][space] in WP34S

*Message #4 Posted by **Paul Dale** on 10 Aug 2011, 5:58 a.m.,*
in response to message #3 by fhub

Making the various status indicators on the top line line up correctly. The various indicators don't move around when other indicators are present or not.

- Pauli

Re: [alpha][space] in WP34S

*Message #5 Posted by **fhub** on 10 Aug 2011, 6:06 a.m.,*
in response to message #4 by Paul Dale

Ok, now I got it!

One more question: if I find the same name (token) in the opcode table more often then only once (with 2 different opcodes), is this then a mistake (i.e. should I report it), or is this normal?

Re: [alpha][space] in WP34S

*Message #6 Posted by **Paul Dale** on 10 Aug 2011, 6:14 a.m.,*
in response to message #5 by fhub

It depends on the op-code.

You already know about CLx being there twice. +/- is the other one that legitimately has two definitions.

There are no other duplicates but if they ever appear, it is likely bad.

- Pauli

Re: [alpha][space] in WP34S

*Message #7 Posted by **fhub** on 10 Aug 2011, 6:30 a.m.,*
in response to message #6 by Paul Dale

> Quote:
>
> You already know about CLx being there twice. +/- is the other one that legitimately has two definitions.

But then I wonder how Neil's assembler can handle these 2 tokens?
A short look at his perl script I don't see anything 'special' for these 2 tokens, so how should the assembler know WHICH opcode it should produce when he finds one of these 2 names in a source file?
Or don't the 2 opcodes (in this case) matter because they have the same code?

Re: [alpha][space] in WP34S

*Message #8 Posted by **Neil Hamilton (Ottawa)** on 10 Aug 2011, 7:12 a.m.,*
in response to message #7 by fhub

Well spotted Franz. This had been discussed previously here.**.

I am a bit with you that I am not exactly sure of the end effect but I suspect that it only has a real difference when editing keyboard entry. Pauli will have to confirm this.

What happens in the assembler is that, when the op-code map is expanded it is placed into 2 hashes. One is keyed on the op-code (hex value) with the payload being the mnemonic (op-code => mnemonic). The other is the opposite: mnemonic => op-code. The first is primarily used by the disassembler, the other by the assembler.

Since I don't over-write any key that previously exists in a hash***, in both cases (CLx and +/-), the duplicate mnemonic in the mnemonic=>op-code table is not recorded -- it is just abandoned. The effect is that when assembling source you will **always** get the first op-code in the op-code map for these respective mnemonics. This results in a definite

loss of information when in source form. (This was also noted in the thread mentioned above.)

So far I don't think it has caused any problems but...

** Note that the date stamps on the thread are often inverted and non-linear. Don't try and follow it linearly from top to bottom.

*** I discovered the duplicates because of the defensive programming habit of always checking a hash table for an existing entry before loading a (key,payload) pair. I think you can still enable the original warning message associated with this by using an undocumented (to the outside world, that is) debug switch on the command line.

Re: [alpha][space] in WP34S

*Message #9 Posted by **fhub** on 10 Aug 2011, 7:29 a.m.,*
in response to message #8 by Neil Hamilton (Ottawa)

> Quote:
>
> This had been discussed previously here.**.

Ahhh, I must have overlook this discussion, thanks Neil!

I came across this problem with this [alpha][space] in the TVM program, and as you explained: your assembler just took the first opcode in the table, and exactly this was the 'narrow' space.

> Quote:
>
> So far I don't think it has caused any problems but...

Well, the 'space' above was the first then, but I'd say it's indeed a very dangerous situation - as Pauli explained the CLx and +/- go indeed to different code parts, it's just a matter of "which comes first in the opcode table" whether it would work or not.
Not a good solution IMO ...

Re: [alpha][space] in WP34S

*Message #10 Posted by **Neil Hamilton (Ottawa)** on 10 Aug 2011, 7:37 a.m.,*
in response to message #9 by fhub

As I said, there is a loss of precision in source form (predicted and documented)...

The only solution is to add some differentiating information to the two mnemonics. Otherwise I cannot tell them apart.

Re: [alpha][space] in WP34S

*Message #11 Posted by **fhub** on 10 Aug 2011, 7:53 a.m.,*
in response to message #10 by Neil Hamilton (Ottawa)

> Quote:
>
> Otherwise I cannot tell them apart.

Yes, I know it's not your fault of course ... ;-)

Now to a completely different question (about your assembler):
While writing my TVM program it happened a few times that I had to insert or delete a line in the source code. Now of course all following line numbers changed, and to get them in order again I've used the following method so far: assemble the source and the disassemble back the *.dat file.
But now in my source I've added several comments in many code lines (after the command with a //), and of course all those comments are gone with my assemble/disassemble method above, so I always had to put these comments in again.

Now my question: is there any (undocumented) trick for your assembler, so that I can use it to ONLY renumber the source lines (without producing any 34s code) and it would keep all comments?

I know I could just write a small program for that purpose myself, but if we already have such a powerful tool like your assembler, I thought that maybe this could be done with your tool, too. ;-)

*Message #12 Posted by **Neil Hamilton (Ottawa)** on 10 Aug 2011, 8:00 a.m.,*
in response to message #11 by fhub

I am not sure I totally follow. Are you looking for the '-ns' switch to turn step numbers off completely? I think there is a section in the manual about this -- along with the reason for it being there (differencing).

Step numbers are an all or northing deal in the output. They are **totally** ignored on input.

Re: [alpha][space] in WP34S

*Message #13 Posted by **fhub** on 10 Aug 2011, 8:17 a.m.,*
in response to message #12 by Neil Hamilton (Ottawa)

> Quote:
>
> I am not sure I totally follow.

Oh god, that's the problem explaining something in a foreign language! ;-)

No, I meant something else:
I have a program listing (WITH linenumbers) produced by your disassembler in *.wp34s format.

E.g. now I add/insert one more command quite at the beginning of the program, so I would have to change all following line numbers manually (I know it's not absolutely necessary because re-assembling this changed file just ignores line-numbers, but it just doesn't look nice).
So all I would want is that the assembler could take this file with the added line and produce a new source(!) file with all line-numbers corrected.

Pauli must have any tools which can do this, because yesterday I posted a few changes to my TVM program, and already a few minutes later these changes were updated in the SVN file and all line-numbers were fixed, too.

But I guess your assembler isn't prepared for this task ...

I don't have any tools to do this. I used the UNIX command line utility "cat -n" to renumber the relevant sections followed by some clean up editing. It was a manual effort using preexisting tools.

- Pauli

*Message #17 Posted by **Neil Hamilton (Ottawa)** on 10 Aug 2011, 8:48 a.m.,*
in response to message #13 by fhub

I am not sure I follow yet -- language or no language.

The assembler regenerates the 'step' numbers from scratch unless you ask it not to with the '-ns' switch. (They are really steps, not lines.)

If you are trying to compare 2 files, one with step numbers to one without step numbers or with "different" step numbers, you can use a variety of command line tools to do this. Many O/S's have a command called "cut". You could try this on the files with line numbers and compare the 2 outputs:

```
$ cut -c 4- your-file-with-step-numbers > your-cleaned-filename
```

The 4 is appropriate for a file without the "000" type step numbers. If you have "000:" style, use "-c 5-".

If the comment sections get in the way, you will have to scrub those through other means. (This is more difficult with "/* ... */" because you need a state machine -- this is the main reason I personally favour the "//" style comment. They are trivial to deal with.)

```
$ grep -v "^[ \t]*//" your-file-with-step-numbers | cut -c 4- > your-cleaned-filename
```

Or, count the lines that need to be removed from the top:

```
$ tail -40 your-file-with-step-numbers | cut -c 4- > your-cleaned-filename
```

Where you must replace '-40' with the number of lines **counting from the bottom** that you are looking to compare.

Repeat this process for both files, if required, and run them through your favorite compare utility.

You're right Neil, better let's forget it. ;-)

You're talking about completely different things ...

Re: [alpha][space] in WP34S

*Message #19 Posted by **Neil Hamilton (Ottawa)** on 10 Aug 2011, 11:55 a.m.,*
in response to message #18 by fhub

OK, I guess I finally got what you are looking for. Try this. If the line currently doesn't have any step number it will pass straight through. If it does have a step number, it will be regenerated in sequence (lines with no step number will put a hole in your final sequence). Hint, it is keying on the step number being there -- doesn't matter what it is though -- every line could be 000 for all it cares.

We'll call it "renum.pl".

```
#!/usr/bin/perl -w
my $step = 1;
while(<>) {
  chomp; chomp;
  if( /^\s*\d{3}(:{0,1}.+)/ ) {
    printf "%03d%0s\n", $step++, $1;
  } else {
    print "$_\n";
  }
}
```

You use it like this:

```
$ renum.pl < my_disjointed_step_num.wp34s >
clean_step_num.wp34s
```

No doubt it could be written much shorter or in any one of a dozen other languages.

No support offered... :-)

Edit: There was a typo in the formated print line: one too many %0s specifiers. Now fixed. (I guess I have supported it now, haven't I. :-)

WOW, it's working perfectly, many thanks! :-)

If I look at something like "if(/^\s*\d{3}(:{0,1}.+)/)" I must really say that this Perl is a horrible language - but it seems to be quite powerful OTOH if it needs just so few steps to perform this task.

And IMO these few lines are indeed worth being included in your assembler (maybe with a new option - renum), would be a nice enhancement.

Thanks again,
Franz

Re: [alpha][space] in WP34S

*Message #21 Posted by **Neil Hamilton (Ottawa)** on 10 Aug 2011, 12:59 p.m.,*

>
> If I look at something like "if(/^\s*\d{3}(:{0,1}.+)/)" I must really say that this Perl is a horrible language - but it seems to be quite powerful OTOH if it needs just so few steps to perform this task.

While Perl supports this structure, this is standard search terminology available in many languages called regular expressions (often called regex for short).

That particular one is not as ugly as it at first appears:

```
/  /   -- the evaluation delimiters
^\s*   -- zero or more (*) whitespaces
(\s)
\d{3}  -- exactly three ({3}) numerals
(\d)
:{0,1} -- 0 or 1 colons (could also be
written :? but I find the more verbose one
clearer)
.+     -- 1 or more (+) of any character
(.)
(  )   -- retain this pattern as a temp
variable called $1
```

Piece of cake!

The rest is Perl and it is a wonderful language for doing this sort of thing. So, respectfully, many many people would take some amount of offense to Perl being called ugly. There are many other languages I would use that term with before I labeled Perl with such a moniker.

And, no, this will not be going in the assembler. You now have the script you need as a separate tool.

The assembler is not a Swiss army knife. It is a screw driver. Occasionally you might want to pry a can open with it, but is not appropriate for carving a roast beef or opening wine bottles.

Re: [alpha][space] in WP34S

*Message #22 Posted by **Marcus von Cube, Germany** on 10 Aug 2011, 12:43 p.m.,*
in response to message #17 by Neil Hamilton (Ottawa)

I can't follow your discussion. ;-)

The first thing I do with a line numbered source file before I start adding contents to it: Get rid of the nasty numbers. YMMV but my preference is not to have them in the source.

Neil, what if your assembler had a listing option which produced a file with all comments intact and the step numbers added along with the binary output? One such file shall be generated per assembly run. The numbers can help those who prefer to type the stuff in on their calculator instead of loading it.

Re: [alpha][space] in WP34S

*Message #23 Posted by **Neil Hamilton (Ottawa)** on 10 Aug 2011, 1:40 p.m.,*
in response to message #22 by Marcus von Cube, Germany

I don't bother using step numbers either but I don't necessarily get rid of existing ones unless I need to for a secondary purpose (such as diff-ing). The assembler simply ignores them. But if they exist, by garr!, they had better be in the proper 3-digit format with or without a single colon. Otherwise the assembler declares an error and dies. It is very strict on this because it would otherwise be very difficult to parse some of the other operations (single digits, for example).

As far as another output from the assembler, it is possible but I would have to be convinced it had to be within that tool. My preference is for single purpose tools. Maybe we

could expand upon the one-off I threw out (above) to do what you want. It works but its error control is nonexistent. If I put the comment FSM into it (about 30 lines of Perl all by itself), it could assign line numbers as required.

> Quote:
>
> Neil, what if your assembler had a listing option which produced a file with all comments intact and the step numbers added along with the binary output? One such file shall be generated per assembly run. The numbers can help those who prefer to type the stuff in on their calculator instead of loading it.

I am not sure I get this. If they are typing it in to the calculator, this is implying an assembly-type operation. If that is the case, then the source already exists (possibly pencil-and-paper type). Maybe what you want is just a source formatter that assigns step numbers. If that is the case, stay tuned for the next stage of the assembly project -- that you saw an advanced peek at last week (a symbolic label preprocessor). That tool will essentially do mostly what you want, albeit with scrubbing of comments. But it does assign line numbers. I might be able to figure out how to retain comments within that development. That was not a priority when it was started because it was intended to be an intermediate file format flow-through tool. Let me think on that a bit....

Re: [alpha][space] in WP34S

*Message #24 Posted by **Marcus von Cube, Germany** on 10 Aug 2011, 4:21 p.m.,*
in response to message #23 by Neil Hamilton (Ottawa)

When I started IT, the compiler used to produce a listing of sort as a standard feature. So did any of the assemblers which used to output the source together with the generated op-codes. The op-codes aren't too interesting in this respect but step numbers are.

Pauli brought up the argument of type-in type usage due to lack of the cable. If you are going to type in a complete library, any help in verifying the result is helpful, including step numbers. You can of course use the disassembler but then you lose all the manual formatting (empty lines, indentation) and the comments. A nicely formatted listing is a good documentation, too.

Why complain about the 35s? I love it!

*Message #1 Posted by **snaggs** on 10 Aug 2011, 5:33 a.m.*

Gone back to Uni to do a Maths major. I went to the bookshop and examined the Casio calculator on the booklist and thought, what a piece of crap!

So I went home and rumaged around for my old HP 32sII calculator. Couldn't find it, but did find my 49g+ which I'd mistakingly bought thinking it would be better than my 32sII.

Ffter a week was still struggling to use the bloody thing, and remembered why I hated it all those years ago. Big, FUGLY and stupid.

Back on the internet, time to just get a calculator for "calculating". I found this forum, and started reading and reading.. apparently the new calculators are crap.. the old ones are better, so then..

32sII was crap, the 32s was better No!! the 42s is the best ever made, I mock your 32's 42s? What about the I/O please, give me my 41 Are you kidding me? It all stopped in 1979 with the 15C

After spending a week on ebay searching and loosing on some very pricey auctions for 2nd hand caculators, I thought, stuff it, I'll buy the 35S. At least it will let HP know I'm interested while I wait for a NOS 42s unopened in box to turn up for $50.

Well, my 35s arrived. Its fantastic! I don't have 10 years under my belt with a particular calculator, so some small change is fine with me.

I find the 35s very easy to use. I like the double stack, its small, nice buttons, easier to find things. Way more functions on keys and not hidden in menus (like the 49g+).

To top it off, it looks like its from the set of Battle Star Galactica, ORIGINAL VERSION.

Whats not to like?

So, if your not a die hard 35 year HP user like some people hear, don't worry, you'll love it and in 35 years you'll probably be complaining about the discontinuation of the 35s.

Daniel.

That's easy: If you manage to memorize the buglist, and take into account some still undiscovered problems (what's already there indicate some kind of careless programming of the firmware), then this calculator is maybe for you.

If you, OTOH, are a professional and depend on good results, the 35s is not for you.

How many strange bugs must a calculator have to easily find something like this early after the 35s was released, hm?

HP abandoned support of the incompetently designed HP 35S immediately after introduction, as shown by the massive list of firmware errors that have been ignored in the five years since. But...you are correct...the HP 35S sure does looks pretty.

Performance-wise, the HP 35S is a fine product for those who aren't concerned about reliability, accuracy, or usability of results...people who are indifferent students, professionals whose work does not use a scientific calculator, or people who are otherwise not invested in any meaningful or philosophical manner to what the machine produces.

If that's you, then you've got something that will bring you much satisfaction. Enjoy!!

Thats very patronising

*Message #8 Posted by **snaggs** on 10 Aug 2011, 9:44 p.m.,*
in response to message #7 by Mike Morrow

Gven its been along time since I've done maths, Ive been revising *everything* from Year 8 maths onwards, doing about 50 problems a day to cath up. Havnt got a wrong answer yet.

Ill let you know when find I find one.

The massive list is filled with irrelevant boundary testing.

Bugs 1, 9, 15 and 16 are all potentially serious. Some more so than others. None of these are "boundary" conditions.

Programs that lock up the device? (16)

Weird crashes and lock up requiring battery removal? (1 -- although the specifics of these have never been isolated).

Plain wrong results when not near any singularities or ill conditioning (15).

Incorrect display (9).

These are not boundary testing, they are a sure sign of poor implementation. Bugs 4 and 5 also fall squarely into this category. Didn't anyone do even a shallow test of these two?

Bug 15 is the clincher for me. The answer isn't even remotely correct. It is completely bogus. I cannot trust any calculator that cannot evaluate expressions properly -- that is what a calculator is primarily for after all.

Many of the others are pretty esoteric I'll agree but the sheer number of them and that the more serious ones above are present is indicative to me and others of many underlying yet undiscovered problems.

I really wanted to like the 35s when it was released. It looks nice and it has a decent keyboard. Then the bugs started being discovered :-(

Which? And how?

Especially given that at least one third are not bugs. The list is also by someone who has a bias as the creator of his own calculator software (which is ironically buggy).

Not fair. First, I believe that the list was a compilation. Second, this list came out well before the WP34S. And, third, bugs in the WP34S actually get fixed!

Cheers,

Marwan

Seconded!! I too have a 35s and I honestly like it, and for the way I use it I have never encountered the bugs; but it's true that the developers of the 34s fix bugs almost immediately. I myself have reported a few and I think that no company could give such a wonderful "customer support". They even added a few feature I requested, mere hours after I requested them!! And bear in mind that the whole 34s project has been brought on by 3-4 people in their spare time, for free, and they don't have a huge company backing them, which makes their achievement all the more incredible IMO. That said, I still like my 35s, and I don't want to bash it, but it would have been only fair (and standard practice for a serious company) to release a fixed rom after the bugs were discovered... after all, they have had the time, and they're a business, and they need to "fidelize" customers...

Cristian

I dont get these bugs

16. Im still new to RPN programming, how do I find SF 10?

As for the rest, youve written a loop without an exit conditiom. Isnt this just bad prgoramming? I once crashed a big As/400 with a bad loop I wrote, did use 200 gig of virtual memory first (this was alot 10 years ago).

>
> As for the rest, youve written a loop without an exit conditiom. Isnt this just bad prgoramming?

Yes, but with the PSE present, the loop can be broken by pressing the R/S button and no loss of memory. In point 16 example, you are likely to loose all memory i.e. ALL 32k of programmes, formulas, etc. (I have tried all kinds of techniques to break out of the loop and *allways* ended up loosing all memory).

So, knowing this I keep a written backup (no I/O!) of my programmes. If I do make a mistake and lock up the calculator (it happens right?), I can key in my programmes again (which takes hours - did anyone mention this machine has no I/O?) - **only to be impeded by the annoying missed keys syndrome**!

Otherwise, it's quite a nice calculator (at least the nCr works properly)

I refuse to do any large-scale "permanent" programming on any non-IO machine. I just think it is crazy.

I was seriously behind the curve, living happily with my 11c all the way up to 1995 and then until 2001 with a 32sii. Then I discovered I/O. Why waste any time on non I/O for anything other than small ad-hoc programming?

Re: I dont get these bugs

*Message #17 Posted by **Michael de Estrada** on 11 Aug 2011, 11:58 a.m.,*
in response to message #16 by bill platt

I agree 100%. That's why the limited memory of the HP-32SII doesn't bother me one bit, and the massive memory of the HP-35s is irrelevant. All my serious programming is contained in my HP-48SX and HP-50g.

Re: I dont get these bugs

*Message #18 Posted by **snaggs** on 11 Aug 2011, 5:13 p.m.,*
in response to message #16 by bill platt

Fair enough. Given all of the custom roms being written, Im suprised no one has done a usb i/o hack for the 35s. The box itself is nice. If they could also work out how to implement multi-labels the job would be done.

Re: I dont get these bugs

*Message #19 Posted by **Marcus von Cube, Germany** on 11 Aug 2011, 5:30 p.m.,*
in response to message #18 by snaggs

The 35S lacks any possibility to update / extend the functionality once the thing is built because the ROM is just that, read only. So there isn't a chance for an outside party to enhance or bug-fix the device. Only HP or their contractors have the option to create new ROM contents and only for newly produced machines.

I dont get the COS bug either?

*Message #20 Posted by **snaggs** on 10 Aug 2011, 11:18 p.m.,*

On my 35s

89.99999999 (is that close enough to 90 to make the bug happen?). I get;

1.74532925199 E-10

On the 42s on my iPhone I get, wait for it;

1.74532925199 E-10

Clearly I'm missing something. I can take a photo if you want.

My serial is CNA 03701109

Daniel.

Re: I dont get the COS bug either?

*Message #21 Posted by **M. Joury** on 10 Aug 2011, 11:39 p.m.,*
in response to message #20 by snaggs

I am also having trouble recreating this one. 89.99999999 COS matches answer on 42S and 48SX. Ditto for the TAN bug.

EDIT:

Never mind. I see the problems. For COS I see a problem with the following:

89.99

89.999

89.9999

89.99999 (truncated?)

89.999999 (truncated?)

89.9999999 (truncated?)

89.99999999 (correct?)

How very odd...

Mind you, I have to question whether the error is really significant given that the error at ir's worst appears to be less that 1E-14. It is a bug however. The errors are more significant for TAN. Reason I didn't see it initially is that for 89.99999999 TAN both the 35 and the 42 give the same answer.

Cheers

Interestingly, more accurate than 42s for other values

*Message #22 Posted by **snaggs** on 11 Aug 2011, 12:46 a.m.,*
in response to message #21 by M. Joury

I agree, is a bit sloppy that they're loosing nth degree accuracy (for no good reason), not sure its the end of the world, given we should all know our exact values for 90 degrees!

Interestingly, have a look at the wildy different accuracy's of trig functions on calculators;

http://www.rskey.org/~mwsebastian/miscprj/models.htm

In order of accuracy for arcsin (arccos (arctan (tan (cos (sin (9))))))

HP 35S, 8.99999986001
HP 42S, 8.99999864267
HP 32S, 8.99999864267
HP 41C, 9.000417403
HP 15C, 9.000417403

Funnily, its more accurate than the 42S etc for other trig values. Its obviously a different algorithm, but maybe not a bug??

Edited: 11 Aug 2011, 12:48 a.m.

> Quote:
>
> I agree, is a bit sloppy that they're loosing nth degree accuracy (for no good reason), not sure its the end of the world, given we should all know our exact values for 90 degrees!

You're doing maths. You will do most everything in radians. Asking for people to know exact multiples of Pi / 2 is a very different thing.

Quickly, which of these numbers isn't a near multiple of Pi/2?

```
 26.7035375555
-36.1283155163
  7.85398163397
 17.2877595947
  9.42477796077
```

Since your calculator cannot be relied on to return accurate results, you have to do this by eye.

As I've mentioned, I like the esthetics of the 35s and have written what must be one of the largest programs for it. However, a calculator must instill faith in its results and the 35s lets me down here.

For almost any other HP calculator I have faith that the answer I get is as close to right as is reasonable. I have confidence that a program I write will operate as written.

- Pauli

Re: Interestingly, more accurate than 42s for other values

> HP 41C, 9.000417403
> HP 15C, 9.000417403

I think you'll find this is demonstrating the exact opposite of what you hope :-)

Calculating these operations with intermediate results correctly rounded to 10 and 12 significant digits:

```
Operation       10 digits       12 digits

9               9.000000000     9.00000000000
SIN             0.1564344650    0.156434465040
COS             0.9999962727    0.999996272743
TAN             0.01745499985   0.0174549998555
ATAN            0.9999962724    0.999996272744
ACOS            0.1564416604    0.156434441642
ASIN            9.000417403     8.99999864267
```

I see the values in the final row in the table you presented above but for the older HPs not the 35s. This indicates that the older HPs are performing their calculations with correct rounding in the last digit for all these operations. You cannot ask for better accuracy than that.

The 35S on the other hand certainly isn't correctly rounding its results. That the final result appears "better" is a pure fluke of randomness not because it is better designed or implemented -- it isn't.

Sorry I cant do nice formatting on this forum like you did, but 35s

9 0.15643446504 0.999996272743 0.0174549998555 0.999996272743 0.156434462627 8.99999986001

Whats wrong that? The first Atan is more accurate than the 42s, and it ends up with a more accurate result.

How can you say its not doing it correctly?

Re: Interestingly, more accurate than 42s for other values

*Message #26 Posted by **Paul Dale** on 11 Aug 2011, 4:46 a.m.,*
in response to message #25 by snaggs

I'm using *pre* tags to format this nicely.

Here are your results again slightly annotated:

```
9
0.15643446504     SIN
0.999996272743    COS
0.0174549998555   TAN
0.999996272743    ATAN
0.156434462627    ACOS
8.99999986001     ASIN
```

> Quote:
>
> Whats wrong that? The first Atan is more accurate than the 42s, and it ends up with a more accurate result.
>
> How can you say its not doing it correctly?

ATAN(0.0174549998555) is to thirty significant digits **0.999996272743**534515028695045928. I've made the first 12 significant digits bold. Look at the thirteenth digit, it is a **5**. I don't know about you, but I was taught to round things larger than 5 up.

In this case the *correctly rounded* result is **0.999996272744** which is what the older devices are getting. This is the correct answer for *any* device producing results with 12 decimal digits. The 35s is *wrong* here. It isn't rounding its results correctly. Yet another reason to not trust its arithmetic. This is cascading in later calculations and in this case just happens to produce what appears to be a more "accurate" result. It isn't, the 42s is producing the ideal perfect result for this calculation for a device using 12 decimal digit numbers.

Don't believe me? I'd suggest some further reading from William Kahan's pages. He designed the algorithms the older HP devices are using and he also writes quite well and has plenty of examples where seemingly silly insignificant errors like this cascade out of proportion and completely ruin all the later results.

- Pauli

Rounding half even is for the exactly halfway case only. That's why I wrote *larger than 5 up* :-)

Exactly 5 is a special case. i.e. if the result were 0.99999627274350000000000000000000 then round half even would come in to play. Not that it matters in this case.

But its not wrong, it is the right result, the original ended with a 3, and the inverse does of tan comes back. Have you thought they might actually be storing some variables in a higher resolution?

How can you say its more accurate for the Atan result to be different from what the original was! Thats madness.

Thanks, I will have a read.

Im just happy there is a 35s, otherwise there would be no future. Im probably a bit younger than some here and have another 30 years to cover. What do you think my chances of getting a NOS 42s in 2041 will be?

Its not perfect but there is nothing else close available new. If someone starts building brespoke low volume calculators at exhorbitant prices Id buy one. At the moment there is no other alternative.

I think the nit picking in this forum exagerates the delta between the 35s and nirvana.

Ps. Just had a read, basically Matlab is inaccurate on anything less than 68k based Apple Mac. I trust you will dutifully dispose of your new computer and buy a vintage Mac.

Not madness, just floating point arithmetic. Forget just about everything you know about normal arithmetic, it doesn't apply anymore.

A couple of examples to confuse:

- a + (b + c) is not always equal to (a + b) + c.
- With binary arithmetic, x * 0.01 is not the same as x / 100.

Have a look at the WP34S, it is more akin to what the 35s could have been. I'm biased of course, but I've tried to make the results as good as possible.

I understand floating point, 19 years as a programmer.

1. Does the 35s store itermediatory values in higher precision 2. Why does it get more accurate answers?

Where can I buy a 34s? What about the bug reports posted at the top of the forum?

As I said, make a bespoke calculator and Ill buy it. (people criticise the printed 35s keys and your talking stickers?). There are some double standards here.

The former doesn't necessary follow from the latter :-) See What Every Computer Scientist Should Know About Floating-Point Arithmetic. I'd be surprised if just about any programmer didn't learn something.

> Quote:
>
> Where can I buy a 34s? What about the bug reports posted at the top of the forum?

The 34S is a repurposed 30b. It is available ready flashed. e.g. http://www.thecalculatorstore.com/ but there might be others.

Yes, there have been bugs and no doubt there will be more. They have always addressed quickly. We've also had no numeric issues for quite a while now and not many of those ever. e.g. the forensic test gives the proper correctly rounded result for a sixteen decimal digit device.

> Quote:
>
> As I said, make a bespoke calculator and Ill buy it. (people criticise the printed 35s keys and your talking stickers?). There are some double standards here.

The stickers are an economy measure. Commit to buying a couple of thousand devices and we can get a printed keyboard ;-) I'm not willing to commit to that kind of quantity.

Why dont you offer the OS to HP license free? Where can I read more about the UI etc. Im sure I can learn more but years ago I did units on scientific computing where we had to evaluate algorithms for significance. Mainly C and fortran.

If HP released the 34s would the 42s crowd be happy?

1000 units is not that much. If you can deliver youd raise that in pre-orders.

Daniel.

Ps. Sorry for the criticism of the stickers, but its not a serious alternative.

We already did. Weren't interested.

> Quote:
>
> Where can I read more about the UI etc.

The manual is on the sourceforge site both separately and in the zip archive -- there is a windows gui emulator there to play with too. The leading edge is in subversion.

> Quote:
>
> If HP released the 34s would the 42s crowd be happy?

Probably not, it isn't a complete super set of the 42s :-) I think a lot of people would be happy with it though.

> Quote:

> 1000 units is not that much. If you can deliver youd raise that in pre-orders.

I wrote thousands :-) I'm not willing to commit to purchasing that many in the hopes that it sells.

> Quote:
>

The stickers are very good and quite usable. Mine aren't showing any sign of wear after quite a bit of use. Also no sign of coming off. If they ever do wear, they can be replaced.

Hmmm... So what, if they did? I didn't even see what the other photo was, but the second picture is what a 34s looks like, if you do it properly. So if the previous photo was of some home-made, hand-cut, flimsy early prototype cover, it's only normal that it looked uglier. The 34s as it is, is a wonderful calculator, and with the professionally-cut vinyl stickers it looks much better than many other commercial calcs. You should at least try the emulator before bashing it. As I said elsewhere, I too have a 35s and I like it, but for everyday use I use the 34s. Of course, I wish it had the two-line display of the 35s, and its nice body shape...

Coverup? not at all. lol

in response to message #41 by Cristian Arezzini

The first photo which you linked to in my public dropbox account ...

(which by the way is great...email me to get a referral so I can get even more space to store stuff online ...free)

... was the very first attempt at an overlay from a .jpg file I printed and taped over the 20b.

About 1-2 weeks later, Eric Rechlin had created the overlay system in use now which is marvelous.

If you were trying to get / use a 34s today, it would look like the picture you see now in this thread, not the one I did about 3 days after the firmware was running on the calculator.

So, please, no accusations of bias, which are unfounded.

Unfortunately, it would look an awful lot like a stock 20b or 30b, since the overlays haven't been available for almost two months.

Overlay status

Thanks for the update, Marwan. I emailed him about a month ago through his website and didn't get a response. I didn't want to bother him again.

On the other hand, using a "blanknut" 34s will probably help once I do get an overlay. I've memorized a lot of the layout just by referring to the diagram in the manual and picturing it on the 30b. I've gotten where I don't really even "see" the 30b's keyboard anymore. I shouldn't have too many problems finding functions once the keyboard is actually labeled!

A major difference to take into account

*Message #49 Posted by **Walter B** on 11 Aug 2011, 4:38 p.m.,*

Feel free to use whatever calculator you prefer. We - being older members of this forum - can

only recommend. And FYI, some of us (not me) are real hardcore experts in this matter.

I think, however, that you tend to compare apples and oranges:

- The HP 35S is put on the market by a huge company. HP was famous for its calculator quality decades ago already, so they should really know how. And they came out with a pretty buggy 35S - falling short of their own quality standards as incorporated in earlier calculators.
- The WP 34S is the work of a small gang (two heads most of the time, three since March, with occasional support by a few more). It's a hobbyist project as you can read here (3.5MB Owner's Manual).

Being hobbyists we know we can't compete in packaging and cosmetics with an industrial process. HP is not interested in making keys and keyplates for this project - and we can't put the money of our families in a stock of some 10,000 calculators. With the adhesive overlay Eric Rechlin produced, however, the UI of the WP 34S comes as close to a true calculator as it can in this economic world IMHO. And we take pride from the fact we offer a comparable, if not better RPN scientific calculator than HP provides for the time being.

Just FYI,
Walter

Does your critique apply to just the iOS version or does it apply to Free42 on any platform?

Are you aware of any difference in calculation results between Free42 (decimal) and the HP 42S? (Free42 iOS is only decimal math.)

Re: Photo of 42s vs 32s on TAN, where is the bug?

*Message #54 Posted by **Andrés C. Rodríguez (Argentina)** on 12 Aug 2011, 5:59 p.m.,*
in response to message #53 by sylvandb

It's not a critique, just something I believe may be convenient to clarify.

I understand that any details about Free42 internals (such as precision, algorithms, etc.) applies to all versions, not just iOS versions.

I understand that Free42 Decimal works with more precision than the physical HP-42S calculator. You can look at the Free42 website or contact Thomas Okken for detailed information.

Best regards,

(Please disregard any idiomatic mistake)

*Message #57 Posted by **Calum Tait** on 10 Aug 2011, 7:30 a.m.,*
in response to message #1 by snaggs

I too like my 35s which I bought a couple of years ago as a replacement for the dreadful 33s I had endured for about 5 years. It is definitely much better in some respects, most noticeably the key feel, larger Enter key and slightly better display. I have two 35s', one which I use at work and one at home and for most things it has reasonably utility. There are however some quite major annoyances in the method of operation not to mention bugs. Like you, I searched for a reasonably priced older model to try and after a long wait eventually found one at a

reasonable price in the shape of an early 11C which, while lacking some of the features and speed of the 35s, is just much more pleasant and logical to use and program. It also feels much more durable. The 11C is now my regular calculator at home (I wouldn't risk it at work as I have lost a few items there unfortunately) and I am enjoying writing simple but useful programs for it. So much so that I also now like the idea of a 41C eventually for the card expansion and storage. I expect a good one will come along at some point at the right price - like most collectables, it is just a case of waiting for the right one. So while I would concur with you that the 35s is usable as a day-to-day calculator, I can see the point of seeking out the older models, not just as collection pieces but to use as working calculators. They come from a time when HP cared about their products and sought to give their users the best experience they can. The newer products unfortunately tend to feel what they are - the product of a third party who has developed and assembled a cheap product which emulates older, higher quality models and is trading on the back of an established brand name. That seems to be the way of the world now sadly.

I think the logical argument is subjective. Im not saying your opinion is invalid, just that it might not be shared by everyone.

I find it better than the 32sIi with the exception of live comma's during input.

Put it this way;

1. How does the 35S compare to the Casio or TI counterparts? 2. Do you think its more than a few tweaks away from perfect?

Daniel

Re: Why complain about the 35s? I love it!

*Message #59 Posted by **Paul Gaster** on 10 Aug 2011, 11:34 a.m.,*

I think the 35S is vastly inferior to the Casio FX-115ES. The Casio can do these things out of the box that the 35S cannot: vector cross product, matrix math, as in determinants, inverse, etc., solve a quadratic and cubic equation, straight forward rectangular to polar conversion, ..and maybe more too, those are just off the top of my head

You can get most of that with programming the 35S, but it is very hard. You cannot just use the programs in the manual because many of those programs use the same labels. The 35S does not allow you to reuse labels, so you need to rewrite the programs or find alternates. Then if you get it programmed correctly you have to pray you never run the batteries dry because you would lose everything.

Seems like this question gets asked and answered every few weeks. For the record:

A major market -- quite possibly the biggest single market -- for the HP-33S or 35S is for use on NCEES exams. These are the professional licensing exams required for engineers (particularly civils) and surveyors in the US. If you look up the 33S or 35S at Amazon.com, for example, you will see that the "Customers Who Bought This Item Also Bought" list includes numerous NCEES study manuals.

Today, the vast majority of people who buy advanced programmable calculators choose graphing calculators. But graphing calculators are not permitted on NCEES exams -- so this is a niche (perhaps the last remaining niche) for traditional scientific calcs only. And a 33S or 35S is the most powerful allowed option for these exams. In fact, some vendors still sell 33S/35S

exam software (perhaps the last remaining form of commercial calculator software).

NCEES disallows calculators with I/O capabilities. If the 35S had them, it would be banned from this market, just as graphing calcs are.

The Casio fx-115ES (a.k.a. fx-991ES) is one of the most remarkable handheld machines I've ever come across in the past 39 years...and it now sells for about $13 at some of the major US retail stores. It's the first non-RPN/RPL machine that I found worth learning to use comfortably.

But of course, it's not (very) programmable. It has those built-in functions you mention, plus numerical differentiation and integration (using Gauss-Kronrod quadrature). Plus, 40 constants and 40 unit conversions. It's just a very nice, very capable, very low cost but durable unit that I've carried around and used daily for more than three years!

IMHO, its biggest downside is the auto-shutdown that takes place after about three minutes of non-use. Any results that were shown in the display will be gone when the machine is turned back on.

I'd take it along before I'd take an HP 35S (four times the price). I also greatly prefer it to TI handhelds, including the TI-89 Titanium HW4. I see only two attractive calculators in the current HP product line: HP 50G and HP 30b.

The point is that inexpensive calcs like the Casio FX-115ES feature capabilities such as vector cross product as intrinsic operations, whereas they have to be programmed into the HP-35s, which is an inexcusable omission for a calc sold at its price. Also, given the limited 1-character label system in the HP-35s, the cross product program alone consumes the 3 letters R, E and C, so they are no longer available for other programs. Of course, HP decided to discontinue the great HP-42s, which allows variable and label names up to 7 characters long and has the vector cross product as a built in function along with complete matrix capabilities, even with complex numbers. Now, admittedly, the HP-35s inherited all these limitations from the HP-32SII, however, it's really just a cheaper version in a pretty modern looking package that only has emotional value IMO.

Ok, but the Casio isn't programmable, isn't RPN and isn't built as well. I'm sure your right, but you'll also get more features in a Toyota compared to a BMW for the money, or a bigger engine in a Ford.

I still don't think it detracts from the HP 35s. Which is very cheap at $59 compared to what they used to cost in the past. Personally, I'd rather they increase the price and further increase quality (i.e. include paper manual). However, this would further reduce value for money.

> Quote:
>
> Also, given the limited 1-character label system in the HP-35s, the cross product program alone consumes the 3 letters R, E and C, so they are no longer available for other programs.

You could re-write it to use 1 variable. Some people break down their programs into routines for re-use, but I'm sure you already know that.

> Quote:
>

But you'd agree the HP 35s is better than the HP 32S, the 32Sii, has more memory, more variables. It also has a two line display. Its also 1/3 to 1/4 of the price of a 32sII on ebay!

My point is its a good calculator! Is it the last best calculator that HP ever need to make? No, but from what I read in these forums, you'd think it was terrible!

If they sell alot of these and bring out a mkII, it really wouldn't take much to turn it into a 42s killer.. if you had multi-label programs, and a SD card reader, it would be pretty close right?

Yes, my point was the program listen on 17-11 of the user guide for Vector cross product uses 3 labels, but with the GOTO feature in the 35s, it doesn't need to. You could re-write it to use just 1 label.

Sure, your still limited to 26 labels, and doesn't replace the 42s, but its not the end of the world, and better than the 32s or 32sII, which don't seem to have the same level of dersion heaped upon them.

Daniel.

Yes, you are correct. I wasn't looking at the program and focused on your use of the word "variable", sorry.

And yes, I made that exact point about label usage in a recent discussion of the 35S. It is far superior to the 32S, 32Sii and 33S in regard to labels (and some other things too).

I had one and sold it. Did you try to see what labels are used by these programs? Do you not understand the amount of work involved to get a 35S to be at the same level of capabilities as the Casio?

Let me try to explain in detail this time.

That page you linked to has the quadratic formula on it. He has no program for vector cross product, or matrix operations, or the rectangular to polar conversion. So your statement "Has most of the things you listed." is incorrect. He has one thing we need, the quadratic program. For that program, you use one label, Q, and yet still can't do a cubic like the Casio. You could try the program in the manual too if you like.

The rectangular to polar in the manual is a bit of a hack and has its shortcomings. People here had a better solution. If you ask HP about this they send you a PDF with the solution that the guys here came up with. No kidding, and that's how I had to get it. Label used for this program: Z

Vector Cross product. Yes, go ahead and use the manual. Labels R, E, and C get used up.

If you want matrix operations, you can go here and type in all 400+ lines:
http://www.stefanv.com/calculators/hp35s_matrix_multitool.html He did a great job, but over 400 lines, yikes. Good luck.
Label used: M

That's a lot of work to get a 35S to do the same things as the Casio, and the Casio is under $20 at Walmart, Office Max, etc. so it's cheap and easily replaceable as well.

If you do get the 35S programmed with all the above then you have to be nervous about losing battery power, because if you do, it's all gone. And, since HP decided to put the rubber feet on the battery door of the 35S, it is possible that you can knock the door off and the batteries could get dislodged. I know that is it a long shot, but stranger things have happened. The 33s did not have this problem since it had metal plates to hold the batteries in place, plus the door had no feet on it. You could lose the battery door of a 33s and it wouldn't even matter. That was a major ergonomic step backwards for the 35S in my opinion.

Anyway, you seem to like your 35S so enjoy. Good luck with all the programming.

> Quote:

> I had one and sold it. Did you try to see what labels are used by these programs? Do you not understand the amount of work involved to get a 35S to be at the same level of capabilities as the Casio? ... That's a lot of work to get a 35S to do the same things as the Casio, and the Casio is under $20 at Walmart, Office Max, etc. so it's cheap and easily replaceable as well.

How do I use the Casio with RPN? Seems like that is even more work. Or if your criteria is cheap then that $20 is easily beatable.

In 1985 I needed something with more oomph than the TI-30 I'd been using since 1976, and a programmable was strongly recommended. After comparing what was available for under $200, the choice was either a TI with LEDs and I/O, or the HP 15C. The 15C had no I/O, but seemed to be higher quality, but used RPN. The 15C was a newer design, and more expensive than the TI. I decided on the 15C and never regretted that decision.

After using RPN for 25 years anything else is just a toy, not a tool. I wish Casio, Sharp, etc. would produce RPN calculators comparable to their current products. But they don't. And as such any comparison I see with an RPN calculator has only one possible outcome -- RPN or nothing.

My next calculator tool was a 28S (gift from my wife, and she got a 48SX!). Now I mostly just collect them... A toy would do all I need from a calculator, but why buy a toy that causes me to lose my place and/or my results when I use it?

I have several old HPs now, and a new 12c (25th platinum) and a 35S. The 35S seems fine. It has never caused me to lose my place in a calculation or lost my results forcing me to rekey. I cannot say the same for the TI-84's my boys are required to have for school.

Probably someday I'll pick up a 30b or maybe two, and maybe one of the faster 12c's. They just aren't quite special enough yet for me to lay out the cash. Now if my HP stock would get back to $65 or so...

I switched to a 35s for a while. Before that, I switched to a 33s for a while. Going back to the 32sii was like coming home :-)

Actually, I use all these devices less and less, to a trivial extent now. And my favorite isn't even RPN any longer!

I bought my children 33s machines. They are much better than the 35s. The keyboard "looks funny" but the direct feature set and non menu function set is way better. And you can decompose polar to rectangular. In other words, it is a *useful* calculator that doesn't cost a lot. Whereas the older HPs which are better, cost a lot.

I got rid of my HP-33s, because I didn't like the buttons, the decimal point was invisible (early S/N, later ones fixed that), and it ate batteries. The HP-35s is much better in this regard, however, I still use my HP-32SII a lot more. If I do in fact receive the HP-15C LE that I've ordered, I may put the HP-35s up for sale as well.

Right. I think that the point he was trying to make is that each generation is considered worse than the last by some. -- 35S is crap compared to the 32Sii and before that the 32Sii was denigrated in comparison to the 32S, etc.

OK, perhaps I misread him. Sorry.

I haven't noticed many complaints about the 32sii vis a vis the 32s. I've got both and I really like them. I know the sii is a bit slower at program execution, but not in a major way. I like the simplicity of the keyboard of the 32s, and I like the alpha prompt capability and algebraic solver and fractions of the sii.

... and especially the 35s had a warm welcome here. I remember very well the excitement, and even when the first problem was encountered (P<>R), people solved it in a real community effort. Together we managed to write two programs doing it and leaving the stack intact. But the many bug reports eventually killed all excitement. It became clear that the 35s is impossibly a serious tool to the professional.

The original poster may use it ... at his own risk ;-).

Theres a bunch of guys in HP who make calculators. im sure Carly did give them a beating as a non-core business unit in her new HP.

However, when these guys finally get approval to take a scientific calculator to market, and the old voices get listened to i terms of look and feel etc, then if you want a better and improved 2nd iteration, you better support whats left of the old guys in the calculator division and buy one.

Buying 20 year old calculators on ebay doesnt turn up on the calculator divisions balance sheet, and lack of interest in RPN becomes a self fullfilling prophecy.

Re: I still dont think boycotting helps

in response to message #84 by snaggs

I don't quite see how buying an unsatisfactory product brings an improved version that much closer. From the sound of it, there hasn't been any move by the company thus far to correct the software bugs that have been discovered by end users.

Re: I still dont think boycotting helps

*Message #86 Posted by **Michael de Estrada** on 11 Aug 2011, 10:14 a.m.,*

I think the attitude of the OP is that we should all be grateful that HP even sells any RPN calcs anymore, regardless of how faulty they are because there are no alternatives. Fortunately, there are a few afficionados who have provided alternatives outside the HP corporate circle. Meanwhile, I'll continue to use and enjoy my many vintage HP and even non-HP RPN calcs that are still fully operational due to their robust construction. IMO the only currently produced HP scientific calc that is worth a dang is the HP-50g, and it wouldn't bother me one bit if they discontinued production of all the other models, including the HP-35s. Were it not for the various PE and NCEES exams, I'm not sure the HP-35s would have a significant market, given that for the same price one can buy a decent graphing calc, which is what most students and professionals prefer. I retired 2 1/2 years ago from my company, where only the older engineers such as myself used RPN calcs, and the company was supplying the junior engineers with TI graphing calcs. As to what I used when I took my EIT exam, it was a slide rule and a CRC book of math tables.

I'd love to be wrong, and somebody please correct me if you _know_ otherwise, but I wouldn't describe the team as being "a bunch" and I'm pretty sure there are no old calculator guys doing calculators at HP.

In other words, the last products the old calculator guys did were the pioneer line, the first of the RPL and graphing models, the palmtops (95lx, 100lx, 200lx) and some of the early laptops (omnibook 300, remember the funky little popout mouse?). Those products were designed in corvallis. The calculator responsiblity was relocated to singapore (or somewhere asia-pacific) without personnel, and everybody in corvallis went on to other things.

That's when calculators mostly languished and died at HP. Responsibility moved from asia to australia, and then most recently to a kind of distributed operation again with all new folks.

I agree with supporting the calculator folks at HP. They are doing great work in a challenging environment.

Just don't be confused into thinking the current folks have inherited anything from the folks that did the old machines that everyone here is always raving about. The old guys are gone and 99% of what they did was lost during the shuffle starting in the early to mid-1990's. Those old calculator guys don't even recognize HP as being the same "Hewlett-Packard Company" that they used to work for, because it isn't -- neither figuratively nor technically (the old Hewlett-Packard Company of California split apart and the part that kept the name was acquired by HP of Delaware and the intellectual property was transferred to yet another company, Hewlett-Packard Development Company L.P. of Texas, with HP Delaware allowed a perpetual license under condition that any new IP would be owned by HP Texas).

Slightly OT, but not too far:

The late production HP-32S (not II) used the same recessed LCD as the 32SII , which means much better readability due to larger "digits" and non-glare LCD cover, and the much nicer relatively uncluttered keyboard of the 32S, of course;-)

Other than display contrast and no memory I/O, the only real complaint about the HP 42S by knowledgeable people has been the lack

of any subsequent HP RPN scientific that even approaches the capability of the 1988 HP 42S since that was discontinued in 1995.

Many of us had hoped that the HP 35S, whose "35" designation is said to honor the original HP-35, would motivate HP to **finally** produce a new RPN machine that was similar to or better than the 20-year old HP 42S. But HP grossly failed the opportunity. (HP doesn't even have enough attention to detail to get arrows on the yellow and blue shift keys pointing the correct direction...yellow functions are UP, not UP AND LEFT, and blue functions are DOWN, not UP AND RIGHT. Sheesh...how hard would that have been?)

Sadly, the HP 35S is a worthy successor to nothing...well, except maybe to the HP 6S (if you can live without the solar cell). :-)

The HP 41C had sloped keys like the 35s and it has BLUE on the bottom of the key, same as the 35s.

Its easier to read than the 32sII was, thanks to the sloped keys. I see it as an improvement, and is consistent with previous products.

Other than your hopes that it would replace the 42s not being met (which given its a 30 series, what ever gave you that idea?), why isn't it?

If you ranked all HP RPN scientifics made, it would have to be in the top four, some people don't mind the lack of IO and love the 42s, some people want horizontal format, and want a 15c, but after that, the next best is the 35s.

For $59, it probably doesn't deserve the kind of derision your directing at it.

Daniel.

This entirely depends on what criteria you use to rank them. I certainly wouldn't rate it in my top four based on any criteria I really care about. I suspect very few here would. 41c, 41cv, 41cx, 15c, 42s, 32s, 32sii, 11c, 34c, 32s, 67. All are superb calculators and all for good reason. Toss the 34S and 41CL into the mix as well (they are kind of HP RPN calculators).

For accuracy, 15c, 11c, 10c, 32s, 32sii, 42s would be my top six. William Kahan designed the algorithms for the Voyagers and did a splendid job of it. Most subsequent HPs have used these.

For esthetics, the list is very variable. Many people only like red LEDs, other hate dot matrix. It would be impossible to make a list that everyone would agree on but for some people it would make the top four for others the bottom.

Light weight? It would go okay there.

In terms of most known bugs, it scores very well indeed :-)

Battery life? The three scientific Voyagers would have to be top of the list followed by the 41 series. 20+ years one on set is not unheard of for a Voyager.

Ones I reach for to do casual calculations? Definitely not even mentioned on that list.

In the class of HP RPN scientific dot matrix calculators with over 16kb of RAM it is number 1 or 2.

Speed? It goes okay here some of the time.

Still, if it is what you like use it. You are not going to convince anyone here that it compares well with the classics...

Can we really realistically expect anyone to make a red LED calculator. Heck, why not nixie tubes. Not sure this is a valid criteria.

I like the old machines too, but for a non-collector, HP newbie, should I get a Casio or TI or HP 35s?

I think you can say its a good calculator.

Daniel

*Message #95 Posted by **bill platt** on 11 Aug 2011, 12:23 p.m.,*
in response to message #94 by snaggs

The market speaks. It is Ti and Casio, with the HP being a niche.

That is a sure sign that HP blew the opportunity. I agree with Mike Morrow on that point.

New products ultimately need to be better than old products and need to be superior to competing new products. The Casio comparison is apt.

Re: Youve misunderstood

*Message #96 Posted by **M. Joury** on 11 Aug 2011, 1:58 p.m.,*
in response to message #92 by snaggs

I am one of those that actually likes the 35S. But no, sorry, not in my top 4. I think that Pauli makes some good points that no matter how you choose your criteria for rating this machine there are not many areas in which it is top 4.

That does not make it a *bad* machine in my opinion but neither is it an all-time great by any measure.

Better than the 33S? Yes (IMHO). Better than the 32Sii? In some ways--worse in others. Better than the 42S? Not even close. Better than the 41 series? Even less close. Better than the 15C? It has some advantages over that machine (actual mnemonics in programs) but many, MANY, disadvantages. Better than the 34C? Not in my book. The 55, 65, 67? Again, not in my book.

I like the 35S and use it now and again but it will never replace my 41 or 42 (never mind my RPL based machines) and with the 34S available it actually slipped one place (still waiting for the keyboard overlay to become available again).

> Quote:
>
> The HP 41C had sloped keys like the 35s and it has BLUE on the bottom of the key, same as the 35s.

OK...let's try this again.

Look at the yellow shift key. See the arrow going UP and to the LEFT? That should indicate that the yellow function label associated with any key is...yes...ABOVE and to the LEFT of the associated key. But it's not. It's **directly ABOVE** the key.

Look at the blue shift key. See the arrow going UP and to the RIGHT? That should indicate that the blue function label associated with any key is...yes...ABOVE and to the RIGHT of the associated key. But it's not. It's **BELOW and slightly LEFT** of the central face of the key.

Clear?

When so little attention even to small and easily corrected cosmetic detail has been exercised by the manufacterer, it's a certainty that much more significant problems will be found elsewhere. In that respect, the HP 35S more than **fully meets** all expectations!

> Quote:
>
> Other than your hopes that it would replace the 42s not being met (which given its a 30 series, what ever gave you that idea?), why isn't it?

Sigh! The HP 35S is **NOT** part of any "30 series" that you just attempted to fabricate from whole cloth. The 30-series machines are the Spice models of the late 1970s and early 1980s, such as the HP-34C. There have also been other HP machines that are "thirty-something", such as the HP-35, HP 38G, HP 39GS, and HP 30b, to list some. Do you imagine these to be part of *your* 30-series too? In fact, the HP 32S and 32Sii are part of the Pioneer series. The HP 33S is not part of any other series, **nor is the HP 35S**. Some study before posting could *possibly* aid you if a factual presentation is a goal.

> Quote:
>
> If you ranked all HP RPN scientifics made, it would have to be in the top four...

I'll assume that what you intended to say was actually "If all models of HP RPN scientifics ever made were ranked, the HP 35S would have to be in the top four..."

That, of course, is patent nonsense and an indicator of unfamiliarity with the subject. The errors of the HP 35S design, uncorrected after almost five years of production, earn it well the status as possibly the worst design that HP has ever tried to pawn off.

> Quote:
>
> For $59, it probably doesn't deserve the kind of derision your directing at it.

In an age where a capable laptop or notebook PC can be had for less than $300, the persistently defective HP 35S is a very poor value indeed and in fact.

Throughout, your argument seems to be that as long as *most of the time* a correct result is produced, the product is satisfactory. In that view, if the HP 35S added 2.000 plus 2.000 and got 4.001, that would be acceptible because only one case out of an infinite number of possibilities was incorrect. Unlike programmers, most in the scientific and (especially) engineering professions must have significantly higher and better standards.

Those whose standards are, er, "relaxed" may certainly relish their HP 35S hot dog. But don't expect knowledgeable members of this forum to bestow an *imprimatur* to the selection, nor accord the praise and approval that you are obviously seeking. It's not going to happen.

I also have used my HP 35s since I got mine in 2008. Its been a blast for me personally. I'm certain that for more demanding engineering area's of use this may be inadequate in terms of accuracy and what have you, but then there are people like myself who want a *quality* calculator that they can buy brand spanking new, and go through a couple years of College along with it and apply their own scuffs, scratches, and bumps on their HP 35s. Each of which I could tell a story about years later. I'm going to be starting my second year here at Purdue, and I have had a lot of fun working with this thing. I love the looks. I love the feel (vs calcs. of today). And I love programing it and discovering new ways to do problems. My personal HP 35s have been drenched in rain countless times while waiting for the city bus, and

still works perfectly. I have also not replaced the batteries yet in the 3 years of steady use and ownership. So all in all I am happy with the HP 35s. It was either this or getting the TI-30XA's! (cant use multi-line calcs, but some profs. haven't noticed what i use. . . yet)

*Message #99 Posted by **Jeff Johnson** on 11 Aug 2011, 10:34 a.m.,*
in response to message #98 by Brandon Poindexter

Been eyeballing the posts and want to throw my 2 cents worth in. Nobody is really wrong here. For the purists, the 35S doesn't stack up to some of the vintage hardware. But for those who use the 35S for everyday calculations, it's a great performer. The keyboard has a better feel than any other brand on the market. The bug list? To be honest, my real-world, daily "engineering" calculations consist of basic algebra, logs and trigs. No boundary extremes, only a few short programs that I wrote and regularly use. For that purpose, it truly is a nice, daily driver calculator. I don't care for the feel or methodology of the TI or Casio calcs. Would I love to have all the bugs fixed and the keyboard layout re-done? You bet. But I can also wait without grousing all the time.

Frozen HP-71B

*Message #1 Posted by **aj04062** on 9 Aug 2011, 8:12 p.m.*

I recently pulled my HP-71B out of it's box to experiment with again. I had left some brand new alkalines in it. I know it was working when I put it away. When I went to turn on it came on but is now frozen. I don't know if the characters are important (looks like the last values that we put in) but they are: 22222220**-*7 cursor then a strange character

I have tried several discharging approaches with no success. Does anyone have a foolproof way to discharge the cap? It sure seems like this is the issue.

I've tried shorting the contacts, repeated ON button pressing and letting it sit 24hrs.

I also tried most ideas on this link old thread

*Message #4 Posted by **Vladan Dugaric** on 10 Aug 2011, 4:38 a.m.,*
in response to message #1 by aj04062

To discharge, take the batteries out, then open the card reader port and short pins 1 and 11 (or all of them) using something conductive. This only takes a second or so, no need to keep shorted for a long time. Then put the batteries back in and the 71 should be completely reset.

Vladan

Re: Frozen HP-71B

*Message #5 Posted by **aj04062** on 10 Aug 2011, 7:57 p.m.,*
in response to message #4 by Vladan Dugaric

Shorted Pins 1 & 11 and installed new batteries. Nothing but a blank screen. I then cleaned the battery contacts as I discovered one spring set was corroded and wasn't passing current.

IT's ALIVE!

THANKS ALL!

WP34S: Alpha Labels and Alpha Catalogs

*Message #1 Posted by **Didier Lachieze** on 9 Aug 2011, 12:03 p.m.*

With the RTN+1 instruction on the WP34s you can code routines that behave as test instructions with a return to the step following the routine call if the result is True, or to the step after if the result is False.

So I was trying to program a new "y=z?" test when I realized first that with 3 characters allowed for Alpha labels I have to shorten the name. So I decided to try with LBL 'y=z' (which may not be the best name for a test ..).

However I've not been able to enter the '=' character which is in the [TEST] Alpha Catalog. It seems that when entering an Alpha label (after entering [f][LBL][ENTER]) you cannot access any Alpha catalog while you're supposed to be in Alpha mode.

I've not seen this limitation documented in the manual, so I don't know if it's a bug or a feature :-)

Re: WP34S: Alpha Labels and Alpha Catalogs

*Message #2 Posted by **Marcus von Cube, Germany** on 9 Aug 2011, 2:39 p.m.,*
in response to message #1 by Didier Lachieze

It's obviously not the full alpha mode. I've recently worked on all this and I may look into it again in more detail but I cannot promise any success in this special case. Maybe Pauli has an idea.

EDIT: I'm afraid this will not be an easy task. I've just reread the code and mixing the two states "alpha label entry" and "alpha entry" with full catalogue support is next to impossible.

Edited: 9 Aug 2011, 3:15 p.m.

Re: WP34S: Alpha Labels and Alpha Catalogs

*Message #3 Posted by **Walter B** on 9 Aug 2011, 4:23 p.m.,*
in response to message #1 by Didier Lachieze

Bonsoir Didier,

Good find! You can't access any alpha catalogue while you are in temporary alpha mode. So all the characters shown on page 9 are accessible, almost all those stored in the catalogues are not. Frankly, I never tried inserting such a character, so thanks for pointing this out. Due to some specialties I'll add another page after page 9 showing what's possible in label-entry mode. Maybe we can bring the '=' to the surface nevertheless, but I'll have to check.

Merci bien,

Walter

Re: WP34S: Alpha Labels and Alpha Catalogs

*Message #4 Posted by **Paul Dale** on 9 Aug 2011, 5:55 p.m.,*
in response to message #3 by Walter B

I knew about this little problem and was wondering how long until it was noticed by others :-)

We're looking to see if we can allow catalogues during label entry. As Marcus mentioned, it isn't easy but just might be possible.

We can, however, map additional characters to some of the otherwise unused keyboard locations (including catalogue keys). Up and down arrow are already present on the arrow keys e.g. We don't have complete freedom over where to put such characters but there is some wriggle room still.

- Pauli

Re: WP34S: Alpha Labels and Alpha Catalogs

*Message #5 Posted by **Didier Lachieze** on 10 Aug 2011, 3:07 a.m.,*
in response to message #4 by Paul Dale

Talking about the Virtual active keyboard in alpha mode I find a bit disturbing that [h][3] doesn't bring the lower case Pi symbol as indicated on the layout but instead the pound symbol and that to get the lower case Pi symbol you have to press [f][EXIT] to go to lower case and then [g][/] ...

As you associate the $ to the S letter ([h][6]), Euro to the U letter ([h][2) and Yen or Yuan to the Y letter ([h][R/S]), I would have put the pound with the P letter on [h][/] and have used [h][3] for the small Pi which is more intuitive, at least for me.

Re: WP34S: Alpha Labels and Alpha Catalogs

*Message #6 Posted by **Walter B** on 10 Aug 2011, 6:43 p.m.,*
in response to message #5 by Didier Lachieze

Bonsoir Didier,

> Quote:

Re: WP34S: Alpha Labels and Alpha Catalogs

*Message #8 Posted by **Didier Lachieze** on 11 Aug 2011, 3:28 a.m.,*
in response to message #7 by Paul Dale

Thanks!

I've seen in your comments that with this change you're losing the ^-1 from the keyboard, however I've looked to the key mapping and I see that now lower case PI is available at three locations: [h][3] , lower case [g][/] and also [h][EEX]. I don't think we need the latest one which could be a good location for ^-1, unless you have other plans.

Re: WP34S: Alpha Labels and Alpha Catalogs

*Message #9 Posted by **Paul Dale** on 11 Aug 2011, 3:34 a.m.,*
in response to message #8 by Didier Lachieze

pi shouldn't have been on the EEX key. It will be gone from there.

I don't see a relationship between EEX and ^-1 and I doubt Walter will either so it doesn't make sense to put ^-1 there. It is in the alpha superscripts catalogue so it hasn't been lost.

It kind of makes sense on h-shift B to associate it with 1/x.

- Pauli

Re: WP34S: Alpha Labels and Alpha Catalogs

*Message #10 Posted by **Walter B** on 11 Aug 2011, 3:15 p.m.,*
in response to message #8 by Didier Lachieze

> Quote:
>
> lower case PI is available at three locations: [h][3] , lower case [g][/] and also [h][EEX].

That was very old washing: lower case pi lived under [EEX] in the last quarter of 2010. It went to [3] thereafter for obvious reasons. It's regular habitat as a letter, however, is [g][/] as explained on pp. 9 and 10 of the manual.

And for all the characters beyond what's directly accessible on the keyboard, please look on page 67. All letters for tout le Français are featured d:-)

FWIW,
Walter

10 or 12 digits?

*Message #1 Posted by **Kiyoshi Akima** on 8 Aug 2011, 11:00 p.m.*

Just playing around with the 12CPlatinum, I discovered that it's a 12-digit calculator, unlike the other Voyagers I've played with (excluding the 16C in integer mode, of course). So I have to ask, is the 12C+ a 10-digit or 12-digit machine?

Re: 10 or 12 digits?

*Message #2 Posted by **Tim Wessman** on 8 Aug 2011, 11:45 p.m.,*
in response to message #1 by Kiyoshi Akima

10. Pure emulator.

12c platinum has a sorted history. First version with the silver body used binary math and had serious issues. Later versions fixed all the issues with the SW and began using a 12/15 digit BCD math library.

Issues with the SLV command in WP34s

*Message #1 Posted by **fhub** on 8 Aug 2011, 5:45 p.m.*

I've tested now the new error message "Solve failed" for the SLV command and in principle it is working. But in my tests I saw that SLV is still working unreliable.

I've used the simple function x^2-3 and found that the solver has big problems when the 2 initial guesses are equal - and this may happen quite quickly when the user presses the ENTER key after his 2nd guess and before calling SLV.
Ok, I know that this is in fact an user error, but who has really never done this before: entering 2 start values? - well, 0 ENTER 1 ENTER - and now call the solver? - ok, [f]SLV.
But now of course X=1 and Y=1 and SLV is called with 2 equal guesses - and it fails! Unfortunately not with the new error message "Solve failed" but with completely wrong 'results' in X and Y, and a function value in Z which is far away from 0 (what it should be) - but for THIS problem a bit later.

For the above mentioned function x^2-3 this happens for all initial guesses from -1.7 to +1.7 whenever both guesses are the same.
So I would say that the SLV routine should definitely make sure that it is NOT called with 2 equal inital guesses - either it should give any error message in this case, or the 2nd guess should automatically be changed a bit. One possible solution might be the following short code at the begin of the SLV routine:
x=y?
INC X (or any other change of X)

This might of course lead to another problem when the changed X-value is not within the definition interval of the function, but this would certainly happen not very often and would definitely be better than a wrong result.

And now to the other problem mentioned before: also if (because of such 2 equal start values) the solver fails, it should of course not give wrong results but display the new implemented error message - but it doesn't do it (at least not for the above function and all values -1.7...+1.7.

So there must still be something not ok in the SLV routine; it should in fact NEVER provide a 'solution' (which is none) whenever the function value in Z is not (at least nearly) zero - not even if the last 2 calculated argument values (which are in X and Y) are very close to each other.

You see, this SLV routine needs indeed some further improvements ...

Franz

Been a while since I looked...

*Message #1 Posted by **jimi** on 8 Aug 2011, 3:29 p.m.*

..at the prices on older HPs. I have to say I'm a little shocked. It looks like prices on my two favorites have really changed. The 15C seems to have taken a dump, maybe based on speculation about the LE? The 41CX though, holy cow. There is a boxed one on that auction site going for over $1000 right now, and there isn't a decent one to be had for less then about $400. Unreal. I guess they all go through trends. I sort of wished I hadn't looked.

Re: Been a while since I looked...

*Message #2 Posted by **Michael de Estrada** on 8 Aug 2011, 3:43 p.m.,*
in response to message #1 by jimi

You need to just keep watching for a while. Prices are all over the place, such as this .

I wouln't draw any sweeping conclusions from one particular auction. Also, just because someone asks a particular price, doesn't mean they will get it.

Re: Been a while since I looked...

*Message #3 Posted by **Namir** on 8 Aug 2011, 5:05 p.m.,*
in response to message #1 by jimi

Prices are down in general.

Namir

Re: Been a while since I looked...

*Message #4 Posted by **Michael de Estrada** on 8 Aug 2011, 6:31 p.m.,*
in response to message #3 by Namir

It's hard to generalized when they fluctuate so wildly. My previous post showed a recent example of a low price, however, this is an example of a very high price on a recent auction.

Re: Been a while since I looked...

*Message #5 Posted by **M. Joury** on 8 Aug 2011, 7:11 p.m.,*
in response to message #4 by Michael de Estrada

Yes, but you have to admit it appears to be in immaculate condition. I have several 65's and in general they are in better condition than my 67's but none that nice.

Re: Been a while since I looked...

*Message #6 Posted by **Michael de Estrada** on 8 Aug 2011, 7:20 p.m.,*
in response to message #5 by M. Joury

I've seen mint HP-65 complete sets with handbook, leather and hard case go for a lot less. That one doesn't even include the AC adapter, which in IMO is absurd for that price.

I won all :-). I thought the offer of the day.

*Message #7 Posted by **robertoataulfo** on 8 Aug 2011, 8:37 p.m.,*
in response to message #6 by Michael de Estrada

I won all :-). I thought the offer of the day !!!!

*Message #8 Posted by **M. Joury** on 8 Aug 2011, 8:42 p.m.,*
in response to message #7 by robertoataulfo

OK, that's insane. I might even be tempted to sell one of my brand new in the box HP41CX's if I thought it would fetch that much! I might even throw in a card reader and printer.

Funny, mine happens to be in Albuquerque as well...

Edited: 8 Aug 2011, 8:43 p.m.

Re: I won all :-). I thought the offer of the day.

*Message #9 Posted by **Howard Owen** on 8 Aug 2011, 10:02 p.m.,*
in response to message #7 by robertoataulfo

That is a hoot!

In addition to having brass bearings on price, the guy has lifted the entire Wikipedia page on the 41C, complete with hyperlinks.

Re: I won all :-). I thought the offer of the day.

*Message #10 Posted by **Randy** on 8 Aug 2011, 10:05 p.m.,*
in response to message #9 by Howard Owen

Anybody notice the N cell batteries installed incorrectly in the battery tray?

Re: I won all :-). I thought the offer of the day.

*Message #11 Posted by **Michael de Estrada** on 8 Aug 2011, 10:25 p.m.,*
in response to message #10 by Randy

Well, technically, only two of the four cells are installed incorrectly, so he's half right. I think that's one of the old Los Alamos calcs, so maybe it works on 0 vdc.

Edited: 8 Aug 2011, 10:30 p.m.

Re: I won all :-). I thought the offer of the day.

*Message #12 Posted by **Walter B** on 9 Aug 2011, 1:27 a.m.,*
in response to message #11 by Michael de Estrada

Do you mean also the Pu battery is included? That would explain the price indeed!

Re: Been a while since I looked...

*Message #13 Posted by **jimi** on 8 Aug 2011, 10:28 p.m.,*
in response to message #5 by M. Joury

> Quote:
>
> Yes, but you have to admit it appears to be in immaculate condition. I have several 65's and in general they are in better condition than my 67's but none that nice.

Oh I know. When I first saw the auction, it was only in the high 200s, and I was thinking I'd like to have a nice CX. I've had Cs and CVs, but never a nice CX. I know I wouldn't lock mine away though...I'd use that sucker.

I got an original 41C when I was 15, which was pretty fundamental in teaching me a lot about programming in general, not to mention all the cool stuff I did with it. I had to sell the whole boxed set about ten years ago during some hard times (lost job), and it kills me that I'll never get it back. I figured if I found another nice one, that it would at least make me feel a little better about it.

I had dug out a couple of 15Cs and a 16C to sell, which was when I saw the prices.

Re: Been a while since I looked...

*Message #14 Posted by **M. Joury** on 8 Aug 2011, 10:58 p.m.,*
in response to message #13 by jimi

From what I have seen 41's vary wildly in price. Some go cheap some go for a ridiculous sum. I have yet to figure out the rhyme or reason to why but if you keep looking you may come upon something decent that you are willing to spring for.

The 15C has been much more consistently high until recently. I personally have not noticed a drop in prices but anecdotal evidence seems to indicate that it might be happening.

The 42S generally fetches pretty high prices as well (or it did when I last checked) and at that point they were generally fetching more than an equivalent condition 41. I just looked and there appear to be two 42S's listed at the moment, both well above $300 and at least one in apparently terrible condition. That one is listed by an individual that I believe is well known on this forum and his prices are generally way out of line.

Re: Been a while since I looked...

*Message #15 Posted by **Michael de Estrada** on 8 Aug 2011, 11:24 p.m.,*
in response to message #14 by M. Joury

All models vary in price over time. For a long time there were no HP-70s listed on TAS, and when they started to appear, initial prices were very high. One sold for nearly $1000, and it wasn't perfect or complete. Then over time as more and more appeared, prices came down to the point that I recently picked one up for $123.50. So, patience is a virtue in collecting vintage calcs. I paid $200 for a very clean HP-42s, which included the spiral bound manual and new batteries. Tonight, two auctions concluded with very low prices for the items that were sold, to wit:

A complete and mint boxed HP-67 for $385

A working HP-29C for $208.50

I really had to restrain myself from bidding on those.

Re: Been a while since I looked...

*Message #16 Posted by **M. Joury** on 8 Aug 2011, 11:46 p.m.,*
in response to message #15 by Michael de Estrada

Yes, true, prices do vary over time. What I was getting at is that from what I have seen over the years prices for 41s vary greatly during the same period. Right now there is a 41C listed for 175 right along with the one mentioned earlier for 2,500. At the moment there are not a whole lot of listings for 41s but at times there are quite a few listed at once with a great discrepancy in price.

BTW, I was also tempted by the two auctions you mentioned. <g>

Cheers

Re: Been a while since I looked...

*Message #17 Posted by **Michael de Estrada** on 10 Aug 2011, 8:47 a.m.,*
in response to message #16 by M. Joury

Also, last night a clean working HP-27 with handbook sold for only $208.51. Another low price record. Another example of what happens when there is only one high bidder. Since the winning bidder put in a snipe bid with only 3 seconds to go in the auction, I suspect that the actual bid was much higher to guarantee a win.

Re: Been a while since I looked...

*Message #18 Posted by **Frido Bohn** on 10 Aug 2011, 6:56 a.m.,*
in response to message #3 by Namir

> Quote:
>
> Prices are down in general.

For a special case I can confirm this. I recently made a bargain while winning this auction.
And imagine: as I unpacked the engine I discovered an HP-IL module in its port!
The HP71 is in mint condition - the bezel a little bit scrached - but it works as it should. Obviously, the selling guy did not know what he had in his hands and placed the auction in a not so favorable section ("historical data processing").

Re: Been a while since I looked...

HP 35 Keyboard Malfunction

*Message #1 Posted by **aj04062** on 7 Aug 2011, 7:10 p.m.*

I just got an early 35 with the BUG and a raised dot on the 5. I was testing it out after getting it going and I noticed the whole row of keys starting with the 1/x key register as different keys. I disassembled and cleaned the keyboard but that did not cure.

Ideas?

I cleaned the keyboard to motherboard contact some but not thoroughly yet.

Thanks!

Edited: 8 Aug 2011, 6:45 a.m. after one or more responses were posted

Re: HP 35 Keyboard Malfunction

*Message #2 Posted by **John Robinson** on 7 Aug 2011, 11:53 p.m.,*
in response to message #1 by aj04062

I'd look for corrosion shorting two of the "row" lines, which could be on the keyboard circuit board or on the logic circuit board. Although if two lines were shorted, then you would expect odd behaviour from two rows of keys. Maybe there is somewhat of a short from the row line to another line causing the problem.

Have you tested for continuity from a keyboard row all the way through to the CPU chip ?

Cheers, John

Little help about 17bII+

*Message #1 Posted by **Horacio R** on 7 Aug 2011, 6:57 p.m.*

Hi, years ago I had a 17bII+ silver, nice machine, however due to missing keystrokes (specially 1 and 0) ended up in warranty claim, HP honored the warranty but again they sent another faulty unit. Both were discarded :(

Does any one knows if this issue has been cleared? I would appreciate any input in this theme. I believe/hope that in some point this issue has been solved, however there must be some units that still have this problem then the serial number becomes important...

Thanks HR

Re: Little help about 17bII+

*Message #2 Posted by **Paul** on 8 Aug 2011, 1:35 p.m.,*
in response to message #1 by Horacio R

I too have a silver 17bII+ (following an unfortunate combination of tea and a gold 17bII).

Occasionally I've had missing keystrokes, like you mainly with the "1". Over time I've come to believe this is a buffering problem rather than mechanical and reflected my habit of repeatedly pressing the CLR button before beginning a new calc. Now I've put myself on the straight and narrow and only press the CLR button once all seems good - no missing keystrokes.

I guess when one pays a lot for a calculator one has to learn to live with its eccentricities. Indeed I've just bought an expensive push bike and when I commented that the peddles were “plasticky”, the dealer thought I was lucky to get peddles included - there's something about paying more for less.

Re: Little help about 17bII+

Hello!

Beautiful. I wish I had the space for showcases like yours... But now I know, that I understand the two most important Danish words: "Hewlett" and "Packard" :-)

Did you say the HP25 was the first programmable when you held it in the camera?

Regards, max

Johnny,

Nice to see the Epson HX-20 / HC-20 - for sure one of the important milestones in mobile computing.

Congratulations for your wonderful presentation!

Good for you to collect HP calculators, my TI collection would fill easily a 2 hours documentation ;-))

Cheers, Joerg

A very nice collection. Unfortuantelly there is no TV show in Switzerland like this (or they never thought about showing my collection).... So I have to make my presentations on the web.. Maybe I should give them an update....

in response to message #8 by Matthias Wehrli

Matthias,

Any TV shows that presents your collection has to do at least a 2-hour show! You have the best collection I have seen in person--well worth the six-hour train ride between Geneva and Basel. Recently, I visited Richard Nelson in his house in Arizona (not too far from where my own son is living now). His collection is very nice too, and occupies many rooms. Recently, my wife re-organized my own collection. Makes it easier to locate various models.

Thank you all for your very kind words. I am deeply thankfull and honored. I find my collection to be quite humble and not so unique as some of your collections but the working units are there to be played with. Both the HP's and the other stuff.
If any of you find your way to Denmark you are very welcome to pay a visit to our house to see and play with the items in my collection.
I will also like to express my wishes to some kind of mainland European conference or meeting. Our house is open to such idea.
Matthias, you have held a couple of meetings earlier. Have you any plans in for future meetings?

Great idea! Although Matthias' home is much closer to me. I really enjoyed the last meeting in Allschwil and would join a meeting even if it's as far away as Denmark. Currently there are many interesting things to show and talk about.

Very nice collection and superb presentation! I would not even dream of being able to pull anything like that off.

I once tried to build a collection, but stopped due to the slow progress I had and also the cost involved. I tried to be a bit cheap and mostly picked things up locally, and they were far between...

I managed to at least get a couple of LED machines and some voyagers. I would really have liked to get a 10C, a woodstock and a 97, but sadly no.

Extended TVM-solver for the WP34s

*Message #1 Posted by **fhub** on 6 Aug 2011, 11:09 a.m.*

I've now finally finished my extended TVM-program. :-)

The first version of such a TVM-solver I've written in the good old HP-41 days, and since then ported it to many other different calculators (Sharp PC-1500, HP-48, TI-92+ ...).

I call it 'extended' because it has 2 additional parameters NP and NI (in English PF and CF for payment/compound frequency) which allows to set different periods for payments and compounding.
And furthermore it also handles 'perpetual payments' (i.e. where N=infinite), anticipative discount rates (NI<0) and continuous (or theoretical) compounding (NI=0).

It has 256 steps and is in *.wp34s format, so it can be compiled with the WP34S assembler - and a quite detailled description is included.

Let me know if there's any interest - I could either post it directly here in the forum or upload the file to my website.

Franz

For sure there's interest! I'd suggest uploading your file to SourceForge where the WP 34S lives. If you agree, please send it to any member of the development team, and we'll put it in for you :-)

Well Walter, I prefer a place where I have access to.
What if I would like to change anything?
Or what if a bug has to be fixed - although that's very unlikely because my programs never have bugs. ;-)

I've sent it now to Marcus ...

Of course feel free to add my 'Extended TVM-Solver' to your project site at Sourceforge if you want, but first make sure that it will meet your high quality standards for WP34s programs ... :-)

*Message #4 Posted by **Marcus von Cube, Germany** on 6 Aug 2011, 3:13 p.m.,*
in response to message #3 by fhub

I'm sure it will meet our standards. :-)

WP 34S features are still emerging and so it may be necessary to adapt existing software. Remember the recent discussion about labels beyond A to D. We are willing to keep the included programs in sync with the current feature set. If we find any discrepancy between used and available features we will happily adapt the code included in the package, including yours.

Re: Extended TVM-solver for the WP34s

*Message #5 Posted by **fhub** on 9 Aug 2011, 5:55 a.m.,*
in response to message #4 by Marcus von Cube, Germany

A short note, Marcus:

I guess your changes of the shortcut labels are now permanent, so maybe it would be a good idea to also fix the TVM-solver code, because with the current build it doesn't work anymore as expected.

LBL G, H and I (in lines 047, 054 and 061) should be changed to LBL 21, 22 and 23 resp.

And there's a small typo in the description at th beginning:
After "Keyboard-Layout:" in 00N the 00 should be replaced by 2 spaces - I don't know where these 2 zeros are coming from!?

And maybe the 3 occurences of 'FIN' could be changed to 'TVM', but that's just a matter of taste and I let this be your decision. ;-)

Re: Extended TVM-solver for the WP34s - Update!

*Message #6 Posted by **fhub** on 9 Aug 2011, 6:14 a.m.,*
in response to message #5 by fhub

BTW, I've found a nice trick for the problem to clear the stack but retain the X register (which

was in discussion about my previously used method):

```
RCL- X
FILL
RCL L
```

Of course no big deal, but saves one byte again ... ;-)

PS: Once again I forgot something: since now there's this new error message for SLV, I've also changed this message in the program.
And furthermore I've also included the financial equations which are used in TVM in case someone is interested in these formulas.

The updated current version of TVM can be found here:

> Any reason for this? The program should work fine in the library space.

Well, I've made some 'strange' experiences while testing the program, and since I have no explanation for this I thought it would be safer to have it in RAM.

The problem was the following:
I've opened the catalog with [h]CAT and clicked ENTER. I don't know exactly what internally happens when doing this, but it seems that the program-counter is then in the Flash-ROM and everything is working fine: I can list the program with [h]P/R and I can XEQ the shortcut labels, but: only those which end with a GTO 00 statement - if e.g. I do a XEQ 09 (which ends with RTN) to evaluate the TVM expression, the program-counter seems to be 'out of flash' after this RTN, and from that moment on none of the number-labels (00-09) is working anymore: trying to XEQ them just gives "No such label" (and also [h]P/R doesn't list the program anymore). I have to select the TVM program once more from the catalog to make it work again. Exactly the same happened after I made a GTO.. (I just wanted to restart it with R/S to reset all values) - after that the 34s also seems to 'forget' my TVM program.

So I believe that manually starting or excuting a program that ends with a RTN (or doing a GTO..) sets the program-counter back into the RAM, and so the program in the flash-ROM is no longer accessable (unless you chose it again).
I'm not sure if this is intended this way, but I just have too little internal knowledge about the WP34s - and I also haven't found any detailed infos about this so far.

I'll check it with Pauli. Thanks for the info. As long as you stick to the hot keys, everything is fine from the library space.

Re: Extended TVM-solver for the WP34s - Update!

*Message #12 Posted by **fhub** on 9 Aug 2011, 1:08 p.m.,*
in response to message #11 by Marcus von Cube, Germany

I just saw another small issue: when you go to program mode and view the listing of a flash program, then the first step starts with 002 (and also all other line numbers are one too high).

And for the other problem above - I think it's just the way RTN is implemented:

if a RTN at the end of a subroutine is executed, then it goes back to the address on the return-stack IF the subroutine was call from within a program. But if the user executes this subroutine manually, then there is no return address on the stack, and so the RTN command just jumps to the beginning of the programspace in RAM!

And this is the point: maybe it should not always return to the top of the programspace in RAM, but to the top of the 'currently selected' programspace, i.e. to the top of the Flash when this Flash was the last being used.

Re: Extended TVM-solver for the WP34s - Update!

*Message #13 Posted by **Marcus von Cube, Germany** on 9 Aug 2011, 2:35 p.m.,*
in response to message #12 by fhub

Regarding the listing issue I need to check it for myself.

You have fully understood the RTN problem. I've started a discussion with Pauli what the best way to treat this would be. Your proposal is one possible option.

Re: Extended TVM-solver for the WP34s - Update!

*Message #14 Posted by **fhub** on 9 Aug 2011, 6:49 p.m.,*
in response to message #11 by Marcus von Cube, Germany

> Quote:
>
> As long as you stick to the hot keys, everything is fine from the library space.

Yes, but - after thinking more about it - this is also working only because my hotkey routines don't end with a RTN but with a STOP command. If they had a RTN at the end then after the first call of such a routine the program counter would be out of the flash again and every further hotkey usage would fail.

So it's indeed really a problem for every program called or used directly from the flash space. :-(

Re: Extended TVM-solver for the WP34s

Ask and I'll give you subversion access.

> Quote:

> Of course feel free to add my 'Extended TVM-Solver' to your project site at Sourceforge if you want, but first make sure that it will meet your high quality standards for WP34s programs ... :-)

The program looks good. Only two very minor things to consider changing. Alpha registers are special so the saving and restoring the value into K at steps 13 and 15 isn't the best -- it will prevent using the statistical distributions and this financial package together. I'd suggest using L for this since that has been destroyed anyway rather than a grabbing another numeric register. Damn, CLSTK wipes out L so that won't work :-(

The other is the relevance of some of the error messages -- "bad mode" is used everywhere else to indicate that the device is in integer/real mode and the operation selected is only valid in real/integer mode. Like I said, fairly minor.

There are also a couple of SKIP statements that SKIP to a RTN. Why not just replace them with a RTN. e.g. Lines 78 and 84. Also, we're in the process of rethinking the extra labels again so there will likely be further changes in this area.

Anyway, a good library routine to have.

- Pauli

Edited: 6 Aug 2011, 8:08 p.m.

Re: Extended TVM-solver for the WP34s

*Message #16 Posted by **Paul Dale** on 6 Aug 2011, 8:18 p.m.,*
in response to message #15 by Paul Dale

How about this to avoid using K:

```
010 LBL 00      // return after input or calculation
011 FS?C 00
012 SKIP 04
013 STO L
014 0
015 FILL
016 RCL L
017 STOP        // wait for input or calculation
018 BACK 01     // [R/S] -> clears ENTRY? flag
```

Costs one step and saves using one register.

This also avoids zeroing the I register which CLSTK does.

- Pauli

Edited: 6 Aug 2011, 8:20 p.m.

Re: Extended TVM-solver for the WP34s

*Message #17 Posted by **fhub** on 7 Aug 2011, 5:11 a.m.,*
in response to message #16 by Paul Dale

> Quote:
>
> Costs one step and saves using one register.

Well, I've now changed it (a 2nd time) to:

```
010 LBL 00      // return after input or calculation
011 FS?C 00
012 SKIP 03
013 STO 09
014 CLSTK       // remove intermediate results
015 RCL 09
016 STOP        // wait for input or calculation
017 BACK 01     // [R/S] -> clears ENTRY? flag
```

Now it uses R09 instead of K - this register is only used internally and is always re-initialized before any new calculation, so using it here won't hurt (and all following line numbers don't change with this method).

Haha, using L is exactly what I also tried first.

> Quote:
>
> The other is the relevance of some of the error messages -- "bad mode" is used everywhere else ...

Well, it's the best error message I found for this case. ;-)
Trying to use a 'final' value (FV) for an 'infinite' number of periods (N) is something that could also be seen as "being in a bad mode". :-)

> Quote:
>
> There are also a couple of SKIP statements that SKIP to a RTN. Why not just replace them with a RTN. e.g. Lines 78 and 84.

That's just my tidiness: I like to have a 'logical' program structure, and one thing that belongs to this is that a procedure of function has exactly one entry point and one exit point. So it's easier to see where the end of a subroutine is: just look for the next RTN - with several RTNs this is a bit confusing.

And for your other suggestion to replace this register K usage:
Well, clearing the stack at the end won't really be necessary at all - once again the fault of my tidiness. ;-) I just don't like to have any useless (intermediate) results on the stack. But maybe a simple FILL (the stack with the result) would be the best solution and even save a few bytes more!? :-)

Franz

Hmmmh, my understanding of tidiness at the end of a routine is having the result in X, and the other levels containing what was therein before calling said routine. Finishing a routine with CLSTK or FILL is a strategy of "burnt soil" IMHO ;-)

Yes, in a strict sense you're right, Walter. :-)

But this would require saving the stack before and restoring it after any calculations.
And since there's no such command in the WP34s (unless you're using still other registers Rnn), you would have to code it yourself.
Ok, not really a big problem (in SSIZE4 mode):

```
SaveStack:
cpx STO A
cpx x<>y
cpx STO C
cpx x<>y

RestoreStack:
cpx RCL C
cpx RCL A
```

But this would cost another few bytes in the (always too small) RAM ... ;-)

BTW, the 2 routines above together with

```
SwapStack:
cpx x<>A
cpx x<>y
cpx x<>C
cpx x<>y
```

would be a nice enhancement of the 34s commands: S-SAVE, S-REST and S-SWAP (or S-STO, S-RCL and S-SWP) like the similar R-commands, won't it? :-)

(SaveStack and SwapStack work even in SSIZE8 mode, only RestoreStack needs some modifications for SSIZE8)

> We don't have a swap stack command but it doesn't seem all that useful to me.

You can never have enough stack manipulation commands ... :-)
Such a SwapStack command would be like a 'quad' x<>y (compared to the existing 'cpx' x<>y)

Franz

in response to message #21 by Paul Dale

> Quote:
>
> What about STOS and RCLS ??

I just had another idea:
What if these commands would accept A as destination (STOS A and RCLS A)?

Of course this should only use 4 stack registers (storing XYZT and recalling ABCD) even in SSIZE8 mode - this would then (almost) exactly do what I've intended with my above SaveStack and RestoreStack: in SSIZE4 it saves and restores XYZT, and in SSIZE8 it would just act as XYZT->ABCD (for STOS A) and ABCD->XYZT (for RCLS A).

You're right in principle, but

1. I won't like to deal with them, since IMHO matrix math exceeds the limits of the UI of such a small scientific calculator - people are used to viewing a whole matrix at once nowadays, which is obviously impossible with the HW given,
2. if I were forced do deal with them, I won't employ any matrices larger than 4x4,
3. even with 5x5, two complete different systems of linear equations are easily stored simultaneously in the memory provided so far,
4. I didn't hear a widespread request for matrix math library routines yet.

Thus I don't see a problem here :-) YMMV

Re: Extended TVM-solver for the WP34s

*Message #29 Posted by **fhub** on 9 Aug 2011, 5:55 p.m.,*
in response to message #28 by Walter B

Yes, I agree with you in (almost) all points - matrix math is definitely "one shoe number too large" (as we say in German ;-)) for the 34s.
And if you have to address them via sequential register numbers Rnn (instead of A[i,j]) the handling would in fact be a nightmare.

But I'm using it on the HP48GX and the TI92+ without problems, and especially on the latter it really makes fun - but of course not 100x100 monsters. :-)

HP-15C Close to perfect

*Message #1 Posted by **Tommy** on 5 Aug 2011, 7:00 p.m.*

While waiting for the re-birth of this so-much-spoken-of gadget, I'm reading the Owner's Handbook (in Swedish 1983) and playing with the details. My question was, is it worth so much fuzz? In my opinion I must say it is almost perfect. A little bit slow perhaps. But yes, it is still competitive after 30 years!

But I found something odd when working in complex mode. Why does it force you to use radians in trig and log? If it *must* use radians, why not automatically switch the trig-annunciator to RAD? Or even better, allow all trigonometric modes when working in complex mode (as when calculating P <-> R conversions in complex mode).

If you enter complex mode by accident (key f I) and you are using degrees, you will get wrong results. Every non-complex calculation should give the same result in C-mode as in normal mode.

One final detail: It would be nice if the f-CLEAR-REG key also made a CF-8 (exit complex mode) (f-CLEAR-"REG/C").

Still, I love my 15C. Still, waiting…

/Tommy

Re: HP-15C Close to perfect

*Message #2 Posted by **Michael de Estrada** on 5 Aug 2011, 7:55 p.m.,*
in response to message #1 by Tommy

Only trig, not log, require input in radians. This is because radians are the true primary unit for trig functions, and the conversion to degrees or grads is just a convenience that has been implemented as the default in most calculators. I used to program computers in Fortran, and the trig units were radians. Some primitive calculators such as the Sinclair Scientific require radians as the trig units with no provision to change the mode to degrees.

Re: HP-15C Close to perfect

*Message #3 Posted by **Namir** on 6 Aug 2011, 11:10 a.m.,*
in response to message #2 by Michael de Estrada

Recently I began to find software packages that define trig function sind(), cosd(), and tand() to take angles in degrees. The same packages also offer sin(), cos(), and tan() to take angles in radians. I think it's nice touch to have the degree-flavor of trig functions.

Of course you can always define the sind(), cosd(), and tand(), asind(), acosd(), and atand() in your favorite programming tools if they only support radian versions of the trig and inverse trig functions.

Namir

> Why does it force you to use radians in trig and log?

What's the expected result of say: *ln(-1)*? Do you really want to make that dependant on the trigonometric mode? This would result in a different value for $(-1)^i$ when using the following formula:

$z^w = e^{ln(z)\,w}$

In *RAD*-mode: $ln(-1) = i\,Pi$, thus $(-1)^i = e^{i\,Pi\,i} = e^{-Pi}$

In *DEG*-mode: $ln(-1) = i\,180$, thus $(-1)^i = e^{i\,180\,i} = e^{-180}$

In *complex*-mode the trigonometric functions are coupled to the exponential function by means of Euler's formula: $e^{i\,x} = cos\,x + i\,sin\,x$

Therefore you can not redefine the trigonometric functions depending on a mode without violating fundamental laws of mathematics.

> Quote:
>
> If it *must* use radians, why not automatically switch the trig-annunciator to RAD?

Because then you couldn't enter a complex number in polar mode with the angle in degrees. And that's something convenient.

IMHO it's perfect as it is implemented. It's the same in the HP-42s or HP-48.

Kind regards
Thomas

Re: HP-15C Close to perfect

*Message #6 Posted by **Tommy** on 7 Aug 2011, 4:54 a.m.,*
in response to message #5 by Thomas Klemm

> Quote:
>
> Do you really want to make that dependant on the trigonometric mode?

No, that is the same as with SQRT(-1). All perfect in normal mode

But in C-mode I would say Yes.

In normal mode the polar conversion functions uses the x- and y-registers. But in C-mode the polar conversion functions uses the Re x and Im x registers. That means that the user must know what he is doing.

And in C-mode the HP15C quietly changes mode to RAD. I do not like when a program quietly changes anything.

My first thought was that it was impossible to handle degrees in C-mode. That it violated something fundamental.

But when I realized that it accepted values in degrees in the Im x register when using the P<->R functions but not when using e, I was starting to think. (Page 134 in Owners handbook)

Suppose You want to solve the following problem: What is the angle, in degrees, corresponding to the value of i?

Solution A using ->P, C-mode and degree–mode: 0 ENTER 1 f-I f-(i) g->P Result: 1 and f-(i) shows 90 degrees (as expected)

Solution B using Eulers formula, C-mode and degree-mode: 0 ENTER 1 f-I f-(i) g->LN Result: 0 and f-(i) shows 1,57 degrees (NOT expected) (Angle in RAD)

In my opinion, this is inconsistent.

Further more, if the user by accident enters the C-mode and makes a simple 45 ENTER TAN (in degree-mode) he will be really confused. In my opinion, that is an erroneous behavior.

If this user doesn't find page 121 in Owners manual "Deactivating Complex Mode" , he is in big problems.

Best regards /Tommy

I asked:

> Quote:
>
> Do you really want to make that dependant on the trigonometric mode?

Your answer was:

> Quote:
>
> No

But then you state:

> Quote:
>
> C-mode and degree-mode: 0 ENTER 1 f-I f-(i) g->LN Result: 0 and f-(i) shows 1,57 degrees (NOT expected) (Angle in RAD)

Which I interpret as: yes, I want *ln* to behave differently depending on the angle-mode. But then you will get wrong results as the example in my previous post shows.

> Quote:
>
> In my opinion, this is inconsistent.

I'd rather say your answer to that question is.

It seems I failed to explain to you, why you can't make a calculator behave the way you expect it and at the same time make it consistent with mathematics. On the other hand I understand your frustration beeing caught in **C**-mode and not finding out how to deactivate it. It's just your proposed solution doesn't work.

Cheers
Thomas

*Message #8 Posted by **Ángel Martin** on 8 Aug 2011, 3:01 a.m.,*
in response to message #5 by Thomas Klemm

I'm probably getting too high-level here but to me this dilemma is not representative of what a complex number represents when used as argument of a function - in RECTangular form.

For instance, what's the meaning of "angular mode" when calculating SIN(1+i)? Certainly not angles, or radians, or GRADs either, just a complex value with real and imaginary parts.

So to me the angular mode is a value conversion for real magnitudes, not applicable to the complex plane.

Things get blurry of course when you enter real-only arguments in complex mode (or using complex functions, like in the 41Z). In this case the assumption is that they are just real parts, thus must be RAD. Also P<->R tend to make things a little confusing, as that surely depends on the selected angular mode.

The angular mode only comes to the picture when you want to display the number(s) in POLAR form, and then the calculator must adhere to the selected mode of course.

So for instance the 41Z has a POLAR mode. If you enter a complex argument in this form it'll look at the angular mode to interpret the proper "units" of the angle, and then proceed accordingly. This is done by the function "^IM/AG" in the input stage, and function ZAVIEW in the output step.

All other inputs are assumed to be in rectangular form, and thus independent from the angular mode settings.

Cheers, ÁM

> Quote:
>
> For instance, what's the meaning of "angular mode" when calculating SIN(1+i)? Certainly not angles, or radians, or GRADs either, just a complex value with real and imaginary parts.

As far as I understood Thommy, he's not so much concerned about something like *SIN(1+i)*. His scenario goes more like: my calculator is accidentially in *complex*-mode and I want to calculate something like *sin(60)*, but that darn little beast doesn't behave as I expected and instead ignores *DEG*-mode.

So what's this *DEG*-mode and why can't we have it in *complex*-mode? In *DEG*-mode the entry to the three triangular functions *sin*, *cos* and *tan* are scaled to radians **before** entering the actual function. On the other hand the result of the inverse trigonometric functions is scaled back from radians to degrees **after** leaving it.

Does this *DEG*-mode has any influence on the exponential function in *real*-mode? Of corse, no! But in *complex*-mode *exp*, *cos* and *sin* are coupled through Euler's equation.

In fact all the other transcedental functions can be expressed using only *exp(z)* and its inverse *ln(z)*. So we only have to consider these two. If anything goes wrong with them the others will be affected as well.

So what's happening when we calculate z^w by using *exp(z)* and *ln(z)*? First we'd calculate *ln(z)*. The imaginary part of this expression is an angle so in fact this could be transformed to degrees as Thommy suggested. But you would never do that with the real part. However, scaling only the imaginary y-axis introduces an asymmetry. Nothing goes wrong as long as w is a real number. But when you allow the exponent to be a complex number the two axes are rotated. In the case of $w = i$ both axes are exchanged. Before we apply the exponential function we must transform the angle back to radians. So we will scale the imaginary axis back again. But alas, what we thought was the imaginary axis is in fact the real axis but rotated due to the multiplication by i.

Instead of scaling up and down the same axis we end up magnifying the imaginary axis and shrinking the real axis which of course is not the same as what we get when we'd refrain from scaling alltogether. Thus we can't have angular modes with the complex version of the exponential and logarithmic functions. Since they depend on these the same is true for the trigomometric functions as well.

Best regards
Thomas

I fully agree. So, back to my original post:

> Quote:
>
> If it *must* use radians, why not automatically switch the trig-annunciator to RAD?

Of course you must sacrifice the ability to use degrees when P <-> R in C-mode. The price is either exiting C-mode or convert the answer using g ->DEG. What would you gain? You would gain a calculator even closer to perfect, which was my main concern.

Best regards

/Tommy

*Message #11 Posted by **Ángel Martin** on 10 Aug 2011, 6:40 a.m.,*
in response to message #10 by Tommy

I concur with you: if it takes RAD as de-facto mode it should indicate it so setting RAD on.

Alternatively a clearer complex mode, or a complex prefix (like in the 41Z) will eliminate any doubts, yet I can imagine how tight things must be in the 15C firmware, so space probably was at a premium to sacifice it in those usability enhncements.

Cheers, ÁM

SAMBA flashing

*Message #1 Posted by **Lode** on 5 Aug 2011, 3:46 p.m.*

Hello,

This site leaves many questions unanswered for me: http://www.wiki4hp.com/doku.php?id=34s:quick_start

Some of the questions I have are:

1) What's the name of the cable mentioned in point 3? It's hard to find it without knowing its name.

2) There's a red warning saying the serial port version only works on Windows XP. USB looks much more convenient to me though. Is there any reason why one would want to do it with serial port? Does the USB way work with HP calculators?

3) How can one get such a cable in Europe?

4) Is it hard to make a ROM for this calculator? Is it done in assembly? Is an emulator available? For Linux? Is a compiler available? Again, for Linux?

Thanks!

Re: SAMBA flashing

*Message #2 Posted by **M. Joury** on 5 Aug 2011, 3:58 p.m.,*
in response to message #1 by Lode

To answer one (implied?) question: I certainly could not get it to work under Windows 7 even with all the compatibility mode settings turned on. Maybe someone else has succeeded and can tell me how. Luckily I had a Windows XP desktop available and was able to complete the flashing that way.

Re: SAMBA flashing

*Message #3 Posted by **Cristian Arezzini** on 5 Aug 2011, 4:04 p.m.,*
in response to message #2 by M. Joury

Why don't you try installing a virtual WinXP "inside" one of your hard disks, using VirtualBox? VirtualBox works great for me under Linux, but it exists for Windows too... and it can surely emulate XP under 7.

Cristian

Re: SAMBA flashing

*Message #4 Posted by **Marcus von Cube, Germany** on 5 Aug 2011, 4:15 p.m.,*
in response to message #3 by Cristian Arezzini

Virtual PC from Microsoft is free, too. But you need a copy XP to install within. Why XP? Only Atmel and Microsoft can tell you.

The cable is a custom made one which was originally available through some HP people here in the forum and is now distributed by Gene Wright for the cost of shipping.

Re: SAMBA flashing

*Message #5 Posted by **M. Joury** on 5 Aug 2011, 5:44 p.m.,*
in response to message #4 by Marcus von Cube, Germany

Yes, I could do that. I have tried various virtual machines over the years and for this sort of thing they should work great. However, I was hoping for a native Windows 7 solution. As long as I have a WinXP box sitting around I guess I will just live with that. Of course if I had a 64 bit machine and Win7 Pro or Ult. I could simply use XP mode. Ah well, all sorts of solutions when the time comes to ditch XP.

Cheers

As far as I know:

> Quote:
>
> 1) What's the name of the cable mentioned in point 3? It's hard to find it without knowing its name.

It's a special programming cable made by HP, you won't find it for sale. On that same point 3 it says who to ask to, he's in these forums.

> Quote:
>
> 2) There's a red warning saying the serial port version only works on Windows XP. USB looks much more convenient to me though. Is there any reason why one would want to do it with serial port? Does the USB way work with HP calculators?

I run Linux, and I used the serial cable connected to a good quality serial-to-usb converter, and flashed the calculator using a virtual install of WinXP under VirtualBox. Worked on first try. I don't know if there is a native flasher for Linux...

> Quote:
>
> 3) How can one get such a cable in Europe?

See point 1! :)

> Quote:
>

There's a development kit, it is programmed in C (or C++?) and compiled for that CPU. There's an emulator, made for Windows but runs great in Linux using Wine.

Cristian

Re: SAMBA flashing

*Message #9 Posted by **Lode** on 5 Aug 2011, 4:20 p.m.,*
in response to message #7 by Cristian Arezzini

Sounds cool. Virtualbox is quite a fragile program on my PC (for various reasons, such as being the only program which requires special babysitting everytime the kernel upgraded and me being dependent on an older version of it). So it sounds like a pain in the neck to program these HP calculators in Linux :(

Being able to program such devices with such nice keys, and learn some assembly for that kind of CPU, sounds like an interesting hobby project, so I'm pondering. All this windows emulation stuff seems, as I said before, a pain in the neck though, so it seems like it'd be an annoying hobby project.

These cables seem something really mysterious though :/ What do they cost? Gene Wright, are you here? :)

What standard do these cables use? Is it an open standard?

And again, why does only the serial port version, and not the USB variant, of these cables work with HP calculators?

Thanks!

Email me through the forum.

Include your email address.

Sadly, my retirement fund will not be appreciably increased by the handling of these cables. :-)

Re: SAMBA flashing

*Message #11 Posted by **Marcus von Cube, Germany** on 5 Aug 2011, 5:01 p.m.,*
in response to message #9 by Lode

The plug on the calculator side has connections for resetting the processor and for erasing the flash memory. This makes the cable so special. On the PC end it's a plain old serial connection. With a proper FTDI chip it would have been trivial for HP to support USB instead of RS232. I've made a USB connection through a cable available from FTDI (USB to TTL 3.3V) which works fine for serial connections but which does not provide a means to reset the calculator or to erase the flash. With the WP 34S firmware this works also for flashing but it assumes that the firmware is actually working because setting the SAM-BA boot bit is performed through software.

The WP 34S firmware is free, it's on wp34s.sf.net. It's not written in assembly language but in C. HP's firmware and the SDK is partly written in C++ and is based on an expensive toolkit by IAR. WP 34S is compiled with GCC. See yagarto.de for the package we are using.

Writing software for the device is relatively straight forward if you start with HP's SDK or with WP 34S as a basis. Starting from scratch may be fun but will take its time to get the hardware running. On the Atmel site are some base files to get the chip running.

Re: SAMBA flashing

*Message #12 Posted by **Katie Wasserman** on 5 Aug 2011, 5:19 p.m.,*
in response to message #11 by Marcus von Cube, Germany

I've been able to flash using Win7 32-bit and SAMBA version 2.6. I have to try this with an FTDI converter but it works fine on my laptop that has a built-in serial port (even though it's a new core i5 machine).

SAMBA 2.6 seems to work the best of all the versions. It's no longer available on the Atmel site but I've got it here. You'll need install to the EXE and then copy the patch files in the ZIP into the correct folders.

So, how can the Mark I have been "The World's First *Electronic* Calculator", when it wasn't an electronic calculator? It was an electro-mechanical calculator, as a glance through its operation manual clearly shows.

Unless the distinction between solid-state circuitry and gears and relays isn't important in defining the world's first "forerunner of all modern computers", of course.

In other news, Curtas Do Not Look Like That.

So in a news story purporting to give us some interesting historical tidbits on early calculators, they photoshop a Curta to look like a grenade. And they present it as truth, never bothering to state it was, apparently, a joke.

Mainstream news is disgusting to me. Every story I see, which I have some detailed knowledge of (mainly aerospace or astronomy topics) has falsehoods that could easily be corrected if they cared.

I remember after this huge duststorm that hit Phoenix last month I decided to watch one of the alphabet national news shows to see what they had to say. In a story about 1 minute long there were 4 falsehoods. All of them designed to make it more extreme, unusual, and apocalyptic than it really was.

the HP-65 required more from the user

*Message #1 Posted by **Don Shepherd** on 5 Aug 2011, 12:19 p.m.*

OK, let's discuss something other than a 15c reissue. That conversation is getting boring.

I've always found it interesting that the F^{-1} shift key on the HP-65 has no key legend present on (or next to) the actual key. HP obviously assumed that the HP-65 user would be astute enough to know about inverse or complementary functions. These are the actual F and F^{-1} functions on the 65, and none of the F^{-1} functions are labelled on the keyboard:

key	F	F^{-1}
-	SF1	CF1
+	TF1	TF1 not
x	SF2	CF2
/	TF2	TF2 not
7	LN	e^x
8	LOG	10^x
9	SQRT	x^2
4	SIN	ARCSIN
5	COS	ARCCOS
6	TAN	ARCTAN
1	R->P	P->R
2	D.MS+	D.MS-
3	->D.MS	->decimal
0	->OCT	->decimal
.	INT	FRAC

It seems that current calculator keyboards might be simplified if manufacturers assumed that users knew these things. But I guess that may not be true anymore.

Here's another interesting find in the HP-65 manual:

> Quote:
>
> As an additional feature, the "octal to decimal" conversion will accept non-octal arguments containing the digits 8 or 9. A non-octal number such as 998 will be interpreted as $(9x8^2) + (9x8) + 8 = 656$.

Wow! That's a "feature"?

Re: the HP-65 required more from the user

*Message #2 Posted by **Marcus von Cube, Germany** on 5 Aug 2011, 12:45 p.m.,*
in response to message #1 by Don Shepherd

The HP 35 has an ARC key inverting the trig functions. The assumption that HP calculator users know about math is older then the 65. :-)

TI calculators used to have an INV key which works the same but without the implicit shift function as on the 65. On a TI-59 the RTN command is entered as INV SBR.

The downside of an INV or f^-1 key is that a generic additional shift offers more options for assigning functions to keys. In many cases, g acts as f^-1 on HP calculators for the functions/keys where it makes sense but not as a general rule. What is the inverse of |x|? The WP 34S maps RND to the blue shifted and |x| to the yellow shifted zero.

Yes, the "2nd" key had to be pressed. And in LRN mode (i.e. during program entry) the sequence even had to be INV 2nd, not the other way round.

> Quote:
>
> What is the inverse of |x|?

That's easy: |x| makes the answer non-negative, so the inverse function makes it non-positive - like |x| CHS. #-)

Ah, great. :-)

> Quote:
>
> I've always found it interesting that the F^{-1} shift key on the HP-65 has no key legend present on (or next to) the actual key. HP obviously assumed that the HP-65 user would be astute enough to know about inverse or complementary functions.

This technique has been used by TI in various calculators. They had an INV key for similar purposes. On the one hand its use was quite obvious with functions like sin or lnx, on the other hand there were others where it was less so. For instance, on the 58/59 an INV SBR was a simple RTN, pressing INV List printed the data registers, and INV Mean returned ...the standard deviation. #-)

Today most sophisticated calculators offer more functions than even a keyboard with three prefix keys and an additional INV or F^{-1} can handle. That's why there are menus. The basic problem regarding the keyboard layout is the question which functions might go into a menu and which have to be accessed directly.

>
> Today most sophisticated calculators offer more functions than even a keyboard with three prefix keys and an additional INV or F-1 can handle. That's why there are menus.

This was already the case with the HP-41. The solution was a fully customizable keyboard with overlays. I like this concept because each individual has its own preferences regarding key assignments. Together with

the extensibility via modules it was easy to create a fully customized calculator for special applications. That was a key feature why the HP-41 was so successful.

Re: the HP-65 required more from the user

*Message #8 Posted by **Ángel Martin** on 8 Aug 2011, 3:15 a.m.,*
in response to message #7 by Juergen Keller

I completely agree with Jürgen here on the 41 approach: it was a paradigm shift (pun intended), just compare the arguable cluttered 67's keyboard with three (no less!) shift keys to the unassuming simplicity of the 41: a deceiving impression of lack-of power for some, but a masterpiece in human factors design if you ask me.

I've taken the single SHIFT key concept to its full extent on the 41Z, with the "Z" key. Pressed once it "turns" the normal functions into their complex-mode equivalents (no need for key assignments but ZKBRD of course). Pressed twice it accesses the "secondary" complex keyboard (in red on the overlay).

Combining it with the standard SHIFT key produces more options, like "Z"-SHIFT accesses all the shifted-complex keyboard functions (in blue on the overlay), and then "Z", SHIFT, SHIFT goes to the "dedicated" function groups, like Hyperbolics, Multi-valued NEXT, and Bessel functions. A feast of options from within just a single (well, two) key(s).

Cheers, ÁM

Re: the HP-65 required more from the user

*Message #10 Posted by **Michael de Estrada** on 5 Aug 2011, 1:07 p.m.,*
in response to message #1 by Don Shepherd

Corrections:

key_____ F_____ F-1

1_____ R->P_____ P->R

2_____ D.MS+_____ D.MS-

Anyways, I never found this system to be very convenient and never understood why HP adopted it, since all their other calcs, such as HP-55 and HP-67 use the f (yellow) and g (blue) shift convention with all the legends being shown. It doesn't really simplify anything, since it has the same number of keys and shifted keys as the HP-67. I imagine that's the reason HP abandoned it on subsequent models.

Interestingly, some non-HP calcs also use this system, such as the Mostek chip based RPN calcs (Corvus 500, Omron 12SR, APF Mark 55 etc.). I find that there is always a slight delay as my brain tries to remember what the inverse function is for one of the missing legends.

As to the octal "feature", I can only say wow ! That's pretty nerdy.

*Message #11 Posted by **Don Shepherd** on 5 Aug 2011, 1:28 p.m.,*
in response to message #10 by Michael de Estrada

Thanks Michael, I changed the original per your note.

Yeah, that octal "feature", I can't imagine a valid use for such a thing. If you're going to convert octal to decimal, a non-octal digit in your input would be an error I would say, as Dieter pointed out.

Nonpareil stuck

*Message #1 Posted by **Arnaud Amiel** on 5 Aug 2011, 4:25 a.m.*

I am using nonpareil 0.77 on windows. All calculators work fine except the 45. Luckily I have the real one on my desk just next to me but on the nonpareil, the digits keep running like crazy, the exponents are stuck at 00 but the rest is just changing very quickly and randomly. Asking reset in the menu does not help in any ways. How can I get the 45 to work again?

Thanks for your help

Arnaud

Hits awful close to home!

*Message #1 Posted by **Dave Shaffer (Arizona)** on 4 Aug 2011, 2:55 p.m.*

Found THIS while wandering around the web.

An appalling number of these apply to me, and I suspect a lot of others here. In particular, about 40% of the way down is an explicit reference to our favorite type of calculator, and the last couple are relevant to anybody who has an HP-01.

I suspect the above link will be around only for today, so I have put a copy at my site where it will reside for a while.

I actually did something very similar to the following:

An engineer comes home after work one day and his wife greets him and asks "i need something from the store, but I'm busy and can't go just now - would you mind going for me?"

"No problem" he replies, "What do you need?"

"I need a gallon of milk. If they have eggs get six."

He goes marketing and returns home about 45 minutes later, carrying 6 gallons of milk.

"Why the hell did you get 6 gallons of milk?" his incredulous wife demands.

He replies in confusion "They had eggs!"

How much would you pay? The "avalanche" of pre-orders hasn't/won't affect any plans for HP.

Re: HP 15C LE: "Discontinued"

*Message #5 Posted by **Norman Dziedzic** on 4 Aug 2011, 3:02 p.m.,*
in response to message #3 by Borja

There has definitely been a breakdown somewhere in the system. Whether it is at HP or the distributors who listed the hardware or both of them, something went awry.

Given the current situation, I can't imagine why HP does not make a statement to clear up the confusion and let some of it's most loyal calculator users know what is going on. I can see absolutely no down side for HP to be straight and honest with the few 1000 (maybe optimistic here...) people on this forum as to the status of the illusive 15C LE. Unless, of course, they mean go all Oprah and surprise us with our own free calculator (see, this is how rumors get started).

Mistakes happen all the time. Owning up to them and being open an honest with your customers is the only upstanding way to deal with them. Do they think that if they tell us good news or bad news that it will change the sales of the 15C LE (or anything other calculator for that matter)? I mean it's not like TI or Casio or anyone else is going to beat them or surprise the market by releasing their own landscape, RPN scientific calculator.

I urge Mr Wessman to make an "official" HP statement regarding the appearance and disappearance of the 15C LE calculator at HP internet distributors. I believe after this debacle that HP does owe it to it's loyal customers and fans. My customer's would expect nothing less of my and my company and I expect no less from HP.

[I will now return to the idealistic world I came from ;-)]

Re: HP 15C LE: "Discontinued"

*Message #6 Posted by **Eric Smith** on 4 Aug 2011, 3:28 p.m.,*
in response to message #5 by Norman Dziedzic

You're completely missing the point. From HP's point of view there definitely is a downside to talking publicly about unannounced products, and there is not enough upside to making a statement here for it to be worthwhile, since any statement they make here is definitely public. Expecting a public statement about this is absurd.

So something went slightly awry? So what? Things go awry all the time. HP hasn't done anything seriously wrong, i.e., anything that has caused harm to their customers. It's not like they absconded with your money. It's arguable that they haven't done anything even slightly wrong.

If you have actually already placed an order with an HP reseller, it is a matter between you and that reseller. They will most likely give you a choice between keeping the order active pending a product announcement, or cancelling the order.

Re: HP 15C LE: "Discontinued"

*Message #7 Posted by **Norman Dziedzic** on 4 Aug 2011, 4:11 p.m.,*
in response to message #6 by Eric Smith

I guess I will respectfully agree to disagree with you. This is so small in the scope of hp I bet the entire production of a 15c LE would be eclipsed by a week or maybe a day of inkjet cart. sales.

I believe no matter what they say or don't say, if the calc is real sales figures will be the same.

Since you didn't state an example of a negative repercussion of letting us know (at least at a very simplistic level) what is going on, I still cannot see a down side. Upside to me is building trust with a customer base.

Regarding Pre-orders, luckily I am a procrastinator and have not place an order.

in response to message #7 by Norman Dziedzic

> Quote:
>
> you didn't state an example of a negative repercussion of letting us know

The same reasons most companies NEVER talk about unannounced products.

One reason, but certainly not the only one or even the most important one, is the Osborne Effect.

The most important reasons have to do with legal liability, and I'm not qualified to give legal advice.

> Quote:
>
> Upside to me is building trust with a customer base.

With you and the maybe two other "customers" who feel slighted? That's a totally insignificant upside for HP. Frankly, they don't care whether you and those two other people never buy another HP product again as long as you live; in fact, they might see THAT as an upside. They didn't do anything to harm you, and they certainly are not going to apologize for not harming you, or explain how it came to pass that they did whatever it was that didn't harm you.

Disagree all you want, but I'd gladly wager on HP's continued silence on this matter. If you really feel so strongly that HP owes you something, you should write to their CEO, rather than complaining here.

Of course, this is all my opinion, and I don't work for or speak for HP.

Re: HP 15C LE: "Discontinued"

*Message #10 Posted by **Norman Dziedzic** on 4 Aug 2011, 8:45 p.m.,*
in response to message #9 by Eric Smith

Thank you for the link to the Osborne Effect. It was interesting reading.

You are right that I should have directed my request to HP in general and not any individual.

Tim, I apologize for using your name in my rant.

Legal issues are everywhere I suppose. I don't even pretend to understand most of them.

I do think more than 2 people are concerned, excited, frustrated etc at the prospect of a new 15C but your underexageration perhaps matches my overexageration that there might be 1000 people looking at this forum.

I guess big business is a lot different than the small business I am involved in on a daily basis. Following your comments, shame on me for thinking a big business could care about their customers. But I have to believe that a big business still is a bunch of individuals who want to take pride in their jobs and the products they make and sell. I do think that the people in the calculator group care. Their rules and laws obviously prevent them from reacting to one geek's rant but that doesn't mean they don't care to me.

Re: HP 15C LE: "Discontinued"

*Message #11 Posted by **gene wright** on 4 Aug 2011, 8:49 p.m.,*
in response to message #10 by Norman Dziedzic

1) Legal issues cannot be minimized. People in general are nuts. Companies must take that into account.

2) The Osborne effect is real. Suppose HP announced today that next June they would ship the HP 67CXi for $29. If that showed up in the paper, how many calculators would people buy in the meantime?

Re: HP 15C LE: "Discontinued"

*Message #12 Posted by **Michael de Estrada** on 4 Aug 2011, 9:20 p.m.,*

But last I checked the year is 2011, not 1982. How is this relevant to the current discussion? What current product would we consumers stop buying if they made the HP 15C LE announcement now? The 15C LE is a grain of sand in the HP financial ocean. Personally, I don't care whether they announce it now or later, just as long as they actually produce one within my lifetime and I am able to buy one without having to get a second mortgage on my home.

Re: HP 15C LE: "Discontinued"

*Message #13 Posted by **gene wright** on 4 Aug 2011, 10:49 p.m.,*
in response to message #12 by Michael de Estrada

Companies learned through things like the Osborne effect that if you pre-announce products, people quit buying existing products. Period. Obviously, existing practice by companies around the world confirm what Eric and I are talking about.

This doesn't even cover the legal aspects of announcing products in advance. That can lead to all sorts of legal problems. If you don't know what those are, then please don't be so quick to dismiss these real concerns.

The only times companies announce products in advance are:

1) When they want to stifle a competitor. By announcing Product XYZ, perhaps our competition will give up.

or

2) When they do not have a similar product from which sales will be taken away.

Suppose Company A, let's call them, makes tablet computers. It is selling pretty well but they decide "Let's announce that we are introducing an improved model at 1/2 the cost with 10X the features in 3 months!"

What happens to sales once that is on cnn.com and all over the web?

I'm with Eric. Should be intuitively obvious to all.

Re: HP 15C LE: "Discontinued"

*Message #14 Posted by **Michael de Estrada** on 5 Aug 2011, 12:44 a.m., in response to message #13 by gene wright*

I guess I'm not intuitive, because it's not obvious to me. Also, I don't subscribe to the notion that people in general are nuts.

Re: HP 15C LE: "Discontinued"

*Message #15 Posted by **gene wright** on 5 Aug 2011, 8:39 a.m., in response to message #14 by Michael de Estrada*

Maybe that's why Apple is so open about their future product plan? After all, they have nothing at all to lose by revealing what they will begin selling in 2 months. It won't affect customer purchases at all.

Given our un-litigious society, no companies are ever sued for vaporware products or for having products that in any way don't live up to hype or leaked information.

And, yes, you may not be intuitive or at least, you may not have been exposed to a business environment.

Those who have been exposed, who have been sued, who have seen sales dry up for current products because customers are waiting for future ones, see things differently.

Re: HP 15C LE: "Discontinued"

*Message #16 Posted by **Michael de Estrada** on 5 Aug 2011, 8:51 a.m.,*

To twist Gene's words:

Companies in general are nuts. People must take that into account.

Re: HP 15C LE: "Discontinued"

*Message #21 Posted by **Thomas Radtke** on 5 Aug 2011, 1:34 a.m.,*
in response to message #13 by gene wright

Hi Geen!

> Quote:
>
> Companies learned through things like the Osborne effect that if you pre-announce products, people quit buying

> existing products. Period. Obviously, existing practice by companies around the world confirm what Eric and I are talking about.

It may be overlooked here, even by the original poster, that this thread was not about forcing a pre-announcment. Actually HP already did that indirectly and additional forces came into play (still not customers).

So, things are different because the prospect of a new 15C was given with the first 15C LE sighting.

I further didn't took the original post as rant or intended to get an 'apologize', but maybe I'm wrong.

Last not least: HP might not care, as the calculator market likely is next to nothing in HPs revenues, but the 15C LE won't touch current sales of other calculators, and I'm sure you agree with me here. There's no product to replace with it. It's a gesture maybe, or something to enter the retro-market, don't know. And it just looks wrong how things developed and HP could correct that.

Before Eric gets a heart attack: I request *nothing*, I'm just stating what I think (we had this discussion in another thread, and I got the impression Eric's all over me just because I find it *reasonable* for HP to comment the situation).

Thanks.

Re: HP 15C LE: "Discontinued"

*Message #22 Posted by **Eric Smith** on 5 Aug 2011, 1:51 a.m.,*
in response to message #21 by Thomas Radtke

I wasn't intending to jump all over anyone, and I'm sorry if it seemed that way. I've only been trying to explain why I think that anyone who expected or requested HP to publicly clarify anything regarding the appearance of an officially unannounced calculator on some web sites (including HP's) will be disappointed.

Maybe for the reason the HP-15C is properly designed, can handle P<>R conveniently, and has a smaller footprint? But I admit it's just an old calculator (though a quite good one) featuring an old fashioned display :-/

Ceterum censeo ...

Walter

Edited: 5 Aug 2011, 6:37 p.m.

Re: Le HP 15C: "Finis"

*Message #27 Posted by **gene wright** on 5 Aug 2011, 10:56 a.m.,*
in response to message #24 by Namir

It is a general thing.

HP corporate simply has policies, like ALL large companies will, that they do not announce future products for the reasons given in a separate post.

If a leak of a possible future product comes out, they will certainly not confirm or deny such a leak because it would go against those policies. To expect otherwise is not aware of the business world.

Again, why do companies not just tell the world what they are going to sell next year or next month?

1) Legal implications

and

2) Sales Erosion

and

3) Corporate policies put in place because of risks from #1 and #2.

There may or may not be a future product actually coming out. If it were coming out, there may or may not be any sales erosion.

However, point #3 above has been put into place in almost every large publicly traded company because of #1 and #2 having happened to them or to other companies previously.

Regarding my earlier statement about people in general being "nuts", my observation is based upon the speed with which lawsuits are brought because someone buys "hot coffee" and then burns their mouth when they drink it without seeing how hot it is first, etc.

Re: Le HP 15C: "Finis"

*Message #28 Posted by **Namir** on 5 Aug 2011, 2:17 p.m.,*
in response to message #27 by gene wright

Gene,

I am certainly in agreement with you about the rights of corporations to keep matters under wrap, until the right moment arrives for a product launch. It just that the HP15-C LE is a

"nostalgic" product and not one with cutting edge technology (such as color graphing CAS calculators). It's like AT&T or Verizon relaunches an old rotary land-line phone. A product like this will not interfere with the sales of digital mobile phones.

Namir

Let's assume HP actually wants to sell 10K units. Perhaps they have found a way to realize a long cherished dream of this community without losing too much money. (Actually, I suspect they have a plan to make a modest amount off the product.) How can we possibly bitch at them for trying to execute a normal product release?

THEY ARE BRINGING BACK THE 15C FOR CRYIN' OUT LOUD!

IF HP's apparent foul up reduces the impact they wanted to achieve with the 15C LE product launch, I think that's regrettable. Anything that tends to hurt their chances at meeting their bottom line expectations means they'll be less likely to throw such juicy bones to this community in the future.

Re: Le HP 15C: "Finis"

*Message #30 Posted by **Jean-Michel** on 5 Aug 2011, 3:58 p.m.,*

Re: Le HP 15C: "Finis"

*Message #35 Posted by **Namir** on 6 Aug 2011, 9:48 a.m.,*
in response to message #34 by Geoff Quickfall

I hear you. But the name "Boing" itself makes me nervous. Does it describe the LANDING sound their first airplane made?? I can imagine it now. The prototype lands bouncing and making a succession of "boing" noises!!! This might answer the general question "What's in a name?"

Maybe the airplane should have been named VAROOM or WOOSH .... sounds more confidence inspiring. I can see it now ... The Woosh Jumbo 747 ...

:-)

Wasn't there a planet called VAROOM in The Hitchhiker's Guide to the Galaxy? This particular word doesn't inspire confidence in my ears at least ;-)

OTOH, I've got a "Boing" flyer in my family, but landing more like WOOSH so far :-)

Tongue in cheek:

```
1. it is called a bus!
2. maintenance require a glue gun.
3. maintenance must know where the
reset button is.

statements over heard on the flight
deck:

trainee airbus pilot:  "Now what is it
doing?"

oldtimer airbus pilot 1: "Oh look, it
is doing it again!"
```

Cheers, Geoff

A tad cynical, Gene. People in general are pretty decent and constructive - just look at the community that exists around HP calculators. However, it only takes one or two nuts to cause a problem for a company, so your point is still correct.

Best,

Large companies do care about their customers, as a large collection of people. However, they don't have the resources to care about the obscure concerns of a very small number of potential customers. I could be wrong, but it seems to me that only a small fraction of the people participating in this forum think that HP did anything in this case that would require them to issue any public statement.

If a single customer had a concern about something that was of potential concern to a large number of customers, there would be a reasonable chance that they would do something. It's been known to happen in the past. But that's not the case here. Only a handful of people are upset about some information that leaked out about a product that may or may not be in development. That's not something that concerns a large number of customers.

Again, this is just my opinion.

Correct. There is nothing HP need to do in this case, there is no crisis to solve or anything to answer, so they will say nothing.

As part of my video blog I have caused a great deal of "PR nightmare" to companies like Agilent (formally HP), Microchip, Fluke, Extech, and Telstra. And all of them have responded to the issue raised publicly in record time. But ONLY because they saw it as a huge deal and a potential PR disaster for them. And it helps that companies are paranoid about social media issues these days ;-) Microchip thought an issue I raised was such a big deal, the CEO called me up personally to apologise and set the record straight.

Dave.

I'm siding with Eric on this one too.

The reason companies don't make statements like this are many, but it basically comes down to risk and company procedure. For reasons that are probably many and complex, which almost certainly have nothing at all to do with the calculator division. Tim or another calc division employee wouldn't be stupid enough to make a statement without getting it cleared from "higher up". And can you imagine them trying to get approval to say something on the companies behalf on a calc forum? If you think that would be easy, then you haven't worked in such an industry or big company. The answer is ALWAYS no.

You want a downside scenario? Ok. How about HP make a statement announcing the product and date to appease a few calc nerds. Excellent. All the re-sellers start taking pre-orders again all is right with the world. Then something goes wrong, horribly wrong, and they can't deliver, for a long time (or maybe not at all?) for any one of a dozen reasons I could easily envision.

Oops, the proverbial has hit the fan. HP get a bad rep, re-sellers get pissed off, and maybe even legal problems somewhere along the line...

All that risk to satisfy a few calc nerds on a forum? I don't blame them for keeping their mouth shut.

Dave.

I wouldn't be too harsh. This kind of thing happens all the time to huge companies like this with countless websites in countless countries, countless resellers, and embargoed press releases going out to all and sundry. Things slip out easily.

As a product reviewer who often gets products to review before release under an embargo, I see info slip out like this all the time.

Dave.

I work in an Engineering Company with over 260 international offices, and over 15,000 employees. You certainly will not see something on our own web site, that hasn't been clearted by multiple levels of management. I can see things happening by mistake at outside retailers, but not for more than a couple of hours, without HP putting a stop to it. HP had to understand what was happening almost instantly. Is there no one in their own sales department that has a clue about when, and what, gets released. This went on for days.

We have talked before about the crazy things that happen in HP sales. Where

they don't know what they are selling. We have also talked before about goofy things at their web site. Releases without supporting documents, etc.

Unfortunately this all seems to me to point to a total lack of support and/or concern about their calculator business. If it isn't an embarrasement to HP, then that is even a worse sign.

And, Tim - you know that none of my rant applies to any participant (or former) in this forum. You guys are great.

Forrest

15,000 employees? Let us know when your company outgrows t-ball. Seriously. That's like a 1 year old trying to play in the majors with the 20-somethings. Multiply your employee count by 20+ to get into the ballpark of HP.

Checked out how many employees HP has lately? (well over 300,000 last I checked, and even more than 15,000 contract/temp employees)

Checked out how many levels of management? And how many were added by the previous two CEOs while claiming to "flatten" the organization and "increase the span of control" ? (While I was there it went from 6 to 9 levels between the CEO and I, and neither of us changed our placements on the org chart.)

More people means each individual's span of control is reduced, and more levels of management means more working up the chain on your end and down the chain on the other end to get to someone who can do what needs to be done. It never happens quickly, especially for unusual things like "unpublish those pages".

Calculators are almost insignificant to HP. They can't "wag the dog" because calculators aren't even big enough to be noticed by the tail. That means limited special requests, and definitely minimal leverage to try and change corporate policy and practice.

I would bet that everything published on the HP page was approved by many levels of management.

I would also bet that HP employees are people and sometimes make mistakes which can cascade thru many levels before being caught, and the more levels it passes the harder it is to fix.

Finally, don't forget that when there are so many people involved, the people that know (the calculator folk) are not allowed and are not able to touch the websites, and the people that touch the websites don't know (calculator products and schedules). It makes it aggravatingly difficult to do anything off the typical production path, like clean up after the mistaken publication of an unreleased product.

www8.hp.com *is* HP because hp.com is HP. To fake a sub-domain you need access to the respective DNS server for that domain. www8 is just one of the many servers which are necessary to carry and deliver all the info HP is willing to share over the Net. www.hp.com is the central portal which redirects most of the requests to the other servers.

"www8" is just one host in a web server farm. You see the same thing if you visit IBM's web site and browser around - within a click or two you're on www-304.ibm.com or similar. Any sufficiently complex web site is distributed across multiple servers to support different applications, not to mention scalability and reliability.

And that host name is definitely in the hp.com domain, under HP's control.

Best,

We certainly have been damaged! Our lust for the 15C has not been satisfied, nor quenched in the cold reality of an official denial that any such machine was planned. Many of us, who have pined after a reissue of this beloved Voyager, must defer gratification until September (I predict.) How dare HP build a calculator specifically designed to appeal to antique HP calculator fans, without telling us in advance, *particularly when they have apparently already told their dealers about it?*

We sure are hard to please. :)

I love the tongue firmly paced within the cheek! Whole heartedly agree!

So what that HP did an "oops!"? We'll just have to wait a bit longer. No real harm unless you are put out by the fact that you jumped the gun and put in an order for a product that clearly wasn't shipping.

> Quote:
>
> ...in the cold reality of an official denial that any such machine was planned.

However, I seem to recall that they did not deny that it was **planned**. They denied that there was

an **ongoing launch**.

I note that a jaundice person might take Tim Wessman's queries about merged steps as an attempt at misdirection, seemingly to make us think that any such pending launch might be further away than it might actually be.

Good thing I am not a jaundice person -- my bilirubin level is well within the norm!

Re: HP 15C LE: "Discontinued"

Hoping for something, or finding something HP could do reasonable doesn't mean to insist on it (in my understanding of the english language).

When I was taken wrong it probably was my own fault due to language problems - I'm not a native speaker.

BTW, long live the HP-15C! I hope Valentin Albillo is well.

When I was working for hp, anything I posted on a forum such as this one had to be followed by something along the lines of "These are my views only and do not represent anything official form hp". Company policy made it so that I had to attach this to my signature. Isn't it still the case?

That is quite common.
At my previous company they actively encouraged us to participate in forums but didn't require that statement, we just had to use "common sense" and "think before you post". Everything was fine until you said something (with the best of intentions) someone higher up didn't like for whatever reason, and then you got hammered for it :->

Most learned very quick to simply keep their mouth shut most of the time and didn't bother participating.

Dave.

I don't think it's a big deal. I mean, the unexpected disclosure, etc. They will eventually sell it, we will be happy (or will start to fumble about the printing quality of the carton box barcode...) ;)

But I wonder about the HP's marketing department. Remember that April 1st hoax, when several people insisted on ordering two non existant calculators at a really hefty price?

HP is perceived as a grey brand just like Dell. Except that they sell a product with an Apple-esque following: calculators. Now, there's an information leak and some of their dealers get a lot of orders. I don't know how many have been ordered, but I'm sure some of the dealers don't get queries from abroad often.

I hate to tell you but I am pretty sure you're at least an order of magnitude away from the truth about the number of forumers, probably even two. I'd guess (without counting) there are some 30 ± 10 people showing up here every once and a while. Certainly less than 50. Though these may be peers for an unknown number of quiet readers, it's far below the numbers HP marketeers may start to look at.

This forum is a place at least one HP guy visits regularily for different reasons, but certainly no place where HP recruits its customers - we are all addicts already ;-)

Pardon me while I turn this thread in another direction....

Walter,

Interesting that you think the number of people here is so low. I'm sure that your right in that fewer than 50 people post semi-regularly but I'm willing to bet that several times that number read this forum at least occasionally and go for years without posting, if ever. The only real evidence I have to support this theory is the occasional email that I receive from someone I've never seen post, asking me about such and such thing related to a post of mine. I'm willing to bet that all the regular posters on this forum get such emails and that for every email like this we get there are many people who never email us but still read our posts.

OTOH, a "few 1000" seems like a very high number to me but I suppose possible. Perhaps Dave has some statistics on unique visitors to this site and their frequency of visitation, maybe

he can give us more insight on this. (Are you still there Dave?)

-Katie

Thanks for counting :-) So my guess may have been low by a factor of 5, Norman's high by a factor of 10. And please note I've mentioned above the active forumers *may be peers for an unknown number of quiet readers* - where unknown means I've really no idea about its size. A number in the range of some 1E4 would look plausible to me, however.

Walter

It's called the "1% rule" or the 90-9-1 rule. And it applies to virtually every online forum, including this one I'm sure:

http://en.wikipedia.org/wiki/1%25_rule_(Internet_culture)

In this case the lurkers would include transient visitors and viewers from search results.

Dave.

Katie; Your "several times 50" sounds about right to me. You remember about four years ago when Giancarlo compiled a .pdf of the 60 people that had mentioned where they live and in some cases: their age, work and which hp they use. I'd believe that about 3 times that many people didn't bother to respond or didn't feel that they "qualified" as part of the community yet. Even with a couple of hundred of us though; on a planet with nearly seven billion people we truly are insignificant by percentage.

btw: If anyone is newish and wants to see who we were (cattle ranchers or physicists, from 20s to 80s) or to add yourself- Giancarlo's pdf is linked in the 102nd post here

Amplifying on what Katie said, HP doesn't look for customers here, but for advocates. We feel strongly about old HP calculators. We can (quite justifiably) be counted on to applaud new machines that tend to bring back an earlier era when quality was king. I find it tempting to overestimate our influence, but notice they have Richard Nelson, a well known advocate for the sort of values many of us subscribe to, editing HP Solve. Members of this forum often contribute. It's a social media strategy in the very best way. They get a lot of free marketing assistance, as long as they keep paying attention to our perspectives and values.

If they sell out the 15C LE, it won't be due to members of this community buying 3 apiece. But the influence we may yield with our co-workers, families and friends lists could make a difference.

When ACO was in charge of calculator production, I had asked the CEO to purchase 10,000 Hp42S calcs.(I was getting some financers). At this point they had just discontinued the 42S service calculators. This could have been sometime in 2002 or therabouts. He told me for them to even think of it, they would have to get an order of at least 100,000 units.

Well I suppose by the above measure most of us can wear that label at some point being guilty of buying (or not) based on passion and emotion in general. This is just one instance.

I may well have missed it in the collective flurry surrounding this issue, but perhaps it was all just part of a well intentioned plan by HP to reintroduce the model? With a final component to gauge the bottom line consumer interest by bringing it as close as possible to a commercial reality and examining the pre-sales numbers to estimate the required manufacturing ramp?

Similar story here, though most often I use the 55 or 67/97.

Which leads me to my main interest in the 15C - the form factor. These Classics are great but not really that pocketable. IMHO there really is a market for a small RPN, and not just with collectors.

It is possible to reduce the vertical profile by perhaps half, but there really isn't too much you can do to compress the other two dimensions. The pitch on the keypad is about as minimal as it can comfortably get and still accommodate human digits and readable key legends. Anything much less and you'd need to have at it with a stylus or fingernail for accurate entry. It is possible to move some keys into the bezel location, perhaps even reducing the size of the display, but that seems clunky. I believe there are well thought out reasons for the footprint to be as it is.

One alternate possibility is a clamshell housing but that will require the display to be offset to either side or changed to portrait profile -- assuming the goal was to have the calc fold in its longest dimension.

Realistically I'm not sure whether a pocket-able calc is a real world use case at the present. Even back then I suspect that metric was more of a marketing commentary on its size than expected usage. Could just be me though.

Well, I don't often post here but all this speculation about the reissue of an old machine that has no alphanumerics AND which may or may not ever see the light of day again does show a serious passion about an iconic device!

That only the 12C remains in production out of this series is a mystery since it doesn't have any trig functions (OK so most of us don't ever need them!) but every other competitor (eg TI, Sharp, Casio) with a financial calculator sticks them in, and so does HP in its 20b and 30b models. And the 10bII+. SO....

Kindly build an HP12C, stick the trig functions onto a third shift function (and the other 15C goodies) and sell it for the same price. You'll keep all the accountant customers and get a few of the engineers/scientists as well. And you might make everyone here a bit happier. Call it 12Cb++SE or something. (You could also build a 15C, put the financial functions on it with another shift key, and get the same effect.)

Or is this just being plain silly...?

True, but I suspect that the majority of 12C users don't ever program them and the programming features are extremely limited. If you are really seriously interested in programming, then it makes more sense IMO to base the combo scientific/financial calc on the 15C. I own both original 12C and 15C calcs, and have programmed the 15C extensively, but only programmed the 12C using a simple example in the manual so I could learn how to do it. The only use I have for the 12C is TVM, which is built in and requires no programming. The 27 is a really neat little calc that fits in both my shirt pocket and my hand. The Voyagers, while very shirt pocketable, leave much to be desired as hand helds, due to the landscape layout.

I've never really understood this complaint. I don't think there's ever been a calculator I can key faster than a Voyager series. When I'm using one I'm holding it with both hands and keying with my thumbs. This works out to being something like touch typing---because both hands are `anchored' on either side of the calculator, once you know where everything else you can locate it without having to watch what you're doing. With most handhelds, I end up holding the calculator in one hand and keying with the other. Since my keying hand isn't `anchored' in the same way, I'm left essentially doing `hunt and peck' keying, which is much slower.

> I've never really understood this complaint.

The basis is obvious...you stated it! The only people who find the Voyagers anything but an abomination as a **handheld** calculator are those who don't mind that it takes **both** hands to operate one. Portrait models suffer no such limitation, and can be used with ease in either one- or two-hand mode.

Then, there's that specious and baseless argument that Voyagers are really intended as **desktop** machines, so it really doesn't matter if one-hand operation is horrendously awkward. Portrait models serve equally as well in desktop use.

It's disappointing that HP is digging up another Voyager relic, when an HP 42S resurrection would have added some real value to the current HP line. Though the 42S is at least an order of magnitude better machine than the 15C in almost every detail except cosmetics, its alphanumeric capability by itself would have justified its replacement of the 15C.

A modern equivalent to the 24-year old HP 42S (complete with its full DM display, tone function, and IR output) in the excellent HP 30b package would have been far more exciting and useful. Throw in more memory and real-time clock/calendar and financial functions and one would have a machine that would still be popular 50 years from now. Technology has been available for much more than a decade to do all of that.

A new HP 15C **Limited** Edition??? Humbug! "Limited" applies to more than just quantity. As the Obamas would say...We are not impressed!

Re: HP 15C LE: "Discontinued"

*Message #101 Posted by **Eric Smith** on 6 Aug 2011, 2:56 p.m.,*
in response to message #100 by Mike Morrow

It would be far easier for HP to bring back the 15C than the 42S, because the 15C hardware is very similar to that of the 12C, and they already did all of the engineering to reimplement the 12C with a modern microprocessor. Since that has been done, reissuing a 15C would be relatively easy.

Bringing back the 42S would require a great deal more engineering. While I agree that it would be nice if they would do it, I don't think we should hold our breath.

It is also far from obvious that a reissued 42S would sell as well as a reissued 15C. The 15C was a huge success in the mid-1980s, while the only available evidence (admittedly anecdotal) is that the 42S didn't sell well by any dealers other than Educalc. Obviously a reissued 42S would sell well to the people in this forum, but that doesn't indicate that it would sell well to anyone else.

HP has very limited resources to spend on calculator engineering, so they have to invest those resources where they expect to get the best return. Even if a reissued 42S would sell just as well as a reissued 15C, it wouldn't be as effective a use of the limited resources due to the much larger engineering investment it would require.

The 32S and 32SII apparently sold far better than the 42S, and that market segment

is now covered by the 33s and 35s.

[The usual disclaimer applies: this is just my opinion, and I don't speak for HP.]

I'm sure you're correct...it will never happen. It just seems sad that there will never be a successor to the finest RPN calculator of all time, so I lament what will never be...a small, handheld, non-RPL machine with all the capabilities of the 42S. But one can't help thinking that such a machine could be ordered by HP from Kinpo, in a 30b package, and be ready within a year.

> Quote:
>
> > It is also far from obvious that a reissued 42S would sell as well as a reissued 15C. The 15C was a huge success in the mid-1980s, while the only available evidence (admittedly anecdotal) is that the 42S didn't sell well by any dealers other than Educalc.

I owned an HP-41C and -41CX, but I was a very enthusiastic purchaser and user of the HP-15C after I found out all that the little wonder could do that wasn't natively available on the HP-41. (IMHO, the Advantage Module did a rather poor job of adding some HP-15C function to the HP-41.) The 15C was my favorite for eleven years of daily use.

I did not learn of the massive advance that the 42S represented over my favorite 15C, of its unique capabilities in the HP product line, until after the 42S was discontinued in 1995. It took several years to finally acquire a couple, but the wait was worth it.

I think you are correct about the 42S not selling as well, but HP did a very poor, unenthusiastic, half-assed marketing job for the 42S. I kept up with the calculator market 20 years ago. All the HP marketing emphasis was on the HP 28S in 1988 and HP 48SX in 1990. For the contemporary 42S...little was said! Had I known what the 42S offered, I'd have had one in 1988. But I did **not** know, and that was **all** HP marketing's fault.

The alphanumeric capability of the 42S makes it far easier to use and program than the 15C. The complex number handling is far more natural and comprehensive. A long-term 15C user (like me), who is not just hung up on 15C cuteness, **simply must** fall in love with the 42S once what it offers above the 15C is appreciated.

> Quote:

> The 32S and 32SII apparently sold far better than the 42S, and that market segment is now covered by the 33s and 35s.

I bought a 32SII when I couldn't get a 42S, hoping that the 32SII had most of the capability of the 15C as a subset of its functions. I was very wrong, especially about the absolutely terrible complex number support that was "Pioneer"ed by the 32S/SII, then drearily continued with the 33S and 35S. I had to continue using my 15C until I found a 42S.

The 35s does not share the complex number support system of the 32s/sii and 33s. Key in the real part, press "i", then key in the imaginary. Superior to the 42s, IMHO.

*Message #104 Posted by **Neil Hamilton (Ottawa)** on 7 Aug 2011, 11:53 a.m.,*
in response to message #103 by Jeff O.

> Quote:
>
> Superior to the 42s, IMHO.

While I generally like the 35S (and own one but not a 15C or 42S -- just emulators/simulators for those I'm afraid), the 35S does make it awkward to do things like the denominator of the "problem" presented on page 135 of the 15C manual:

```
          2i(-8+6i)^3
-----------------------------
(4-2(sqrt(5))i)(2-4(sqrt(5))i)
```

While it is possible, you have to "do the limbo" to do it. This is much easier on the 42S/15C/33S etc.

That being said, the complex stuff in the 35S is very intuitive. Too bad about the R->P/P->R though.

I guess you can't win.

> ```
>
> While it is possible, you have to "do the limbo" to do it. This is much easier on the 42S/15C/33S etc.

I would do that example as follows (key functions in brackets):

```
Keystrokes         Display
8[+/-][i]6[ENTER] -8.0000 i6.0000
3 [y^x]           352.0000 i936.000
[i] 2             i 2
[x]               -1872.0000 i704.0
5[sqrt]           2.2361
[i]2[+/-]         i-2
[x]               0.0000 i-4.4721
4[+]              4.0000 i-4.4721
5[sqrt]           2.2361
[i]4[+/-]         i-4
[x]               0.0000 i-8.9443
2[+]              2.0000 i-8.9443
[x]               -32.0000 i-44.721
[/]               9.3982 i-35.1344

28 total keystrokes
```

I guess I do not view the above as requiring the limbo bar to be too low, just familiarity with the 35s. The keystroke sequence presented in the 15C manual takes 34 keystrokes. With the 35s, you do have to start "inside" the values in the denominator (with the square root of 5) to avoid pushing the previously calculated value for the numerator off the top of the stack, but I consider this to be more of a typical 4-level stack management issue than any defect in the 35s complex number support. In fact, when I tried it on my 42s, I had to start inside the bottom factors for the same reason, plus I had to then do some swaps to get the values in the right places in the stack before turning them into complex numbers. It is possible to do the problem on the 33s without storing intermediate values, but requires pretty careful stack management and "limbo-esque" entry of the denominator values due to the fact that it has only a two level complex stack. (Actually the 15C requires the same stack manaement, i.e., you must divide the numerator by the first factor in the denominator, then enter the second factor in the denominator and divide again. With the 35s, you can calculate the numerator, then enter both factors in the denominator, multiply, then divide. Not a big deal, just shows what's possible.)

For the sale of completeness, here is the keystroke sequence require on the 32S/32SII/33S

```
32S/32SII/33s sequence:
Keystrokes              Display
```

```
6[ENTER]                6.0000
8[+/-]                  -8.0000
0[ENTER]                0.0000
3                       3
[shift][CMPLX]          CMPLX
y^x                     352.0000 (on the 33s you can see
the imaginary component of 936 in the y register)
2[ENTER]                2.000
0                       0
[shift][CMPLX]          CMPLX
[x]                     -1872.0000 (on the 33s you can
see the imaginary component of 704 in the y register)
5[srqrt]                2.2361
2[+/-]                  -2
[x]                     -4.4721
4                       4
[shift][CMPLX]          CMPLX
[/]                     -295.4551(on the 33s you can see
the imaginary component of 154.3288 in the y register)
5[srqrt]                2.2361
4[+/-]                  -4
[x]                     -8.9443
2                       2
[shift][CMPLX]          CMPLX
[/]                     9.3982(on the 33s you can see the
imaginary component of 35.1344 in the y register)

34 total keystrokes on the 33s, 35 on the 32s/32sii if
you want to see the imaginary part by exchanging x and y

...
```

Re: HP 15C LE: "Discontinued"

*Message #106 Posted by **Mike Morrow** on 7 Aug 2011, 2:33 p.m.,*
in response to message #103 by Jeff O.

> Quote:
>
> Key in the real part, press "i", then key in the imaginary.
> Superior to the 42s, IMHO.

Entering a new complex number is only the **smallest** part of any machine's complex number processing. But to discuss this aspect, a new complex number is manually entered on the 42S by entering the real part on the stack, then the imaginary part, then hitting the COMPLEX key. That is consistent with related operations such as entering and converting polar or rectangular coordinates. The only alleged down side, which seems to have caused a few folks a bit of self-generated anguish, is that one can't fill the four-level stack with four new differing **manually-entered** complex numbers. But should this ever threaten to be a problem, one simply has to perform the appropriate pending operations to collapse the stack and ensure that the X and Y level are then available to support manual entry of a new complex number.

To claim **true** complex domain support, a machine must execute all of its functions that are mathematically defined in the complex domain by operating on or generating the appropriate values. For a few random examples, try that 35S to evaluate these:
1. arcsin(2)
2. ln(-2)

3. arctan(1+i)
4. cosh(1+i)
5. cos(1+i)
6. arcsinh(1+i)
7. ln(1+i)
8. exp(1+i)
9. i^i
10. arccosh(0.5)

The 42S handles all these (as do the RPL machines). Its sophisticated firmware creates a generalized complex domain machine capable of operating on or producing complex results naturally with the same ease as most machines do only in the real domain. (FWIW, the 15C is similar but slower, though with its limited display what is child's play on the 42S requires some mental effort to keep things straight on the 15C.)

The 35S is very much akin to the unsatisfactory 32S and 33S, in which only an extremely limited and unnatural set of **exceptions** are allowed for which the complex domain is supported...and these are all nothing but the most trivial complex functions. That is **fundamentally and monumentally** inferior to the 42S.

Edited to remove "doubled" word and to add example 10.

You *can* perform the log computation if you enter the value as a complex number, i.e. 2 +/- i 0 ln. However, it certainly is more convenient in the HP 50g, where you simply type 2 +/- ln.

in response to message #106 by Mike Morrow

I did not meant to imply that there are not a lot of shortcomings to the 35s complex number support, only that it is not really a simple extension of the 32s/sii/33s family. I think that the ability to directly enter the number by keying in the "i", (or angle, if you wish), with the complex value then held in a single stack level, with the ability to have a 4-level stack full of directly entered complex values, was a major advancement on the 35s. If you put an “i” key on a 42sii++ (or whatever), with the ability to upload/download programs, it would be just about the perfect calculator.

Yes, yes, YES! Only put it in the 17bii+ package (the real descendant of the Pioneers and it already has the dot matrix LCD in place) and give me I/O. Sure I'll buy 3 HP15C LE's but I would probably buy 6 HP42S machines with Mike's upgrades and I/O for offline storage. OK, maybe not 6, but you get the point.

Re: HP 15C LE: "Discontinued"

*Message #110 Posted by **Michael de Estrada** on 6 Aug 2011, 4:49 p.m.,*
in response to message #109 by M. Joury

I/O for offline storage is key for any calculator with more than 1 Kb of non-volatile memory. it's not an issue with the 15C or 32SII with their very limited memory, but it is the main shortcoming of the 42s and others like the 35s and 28s. Imagine having laboriously keyed in 5 Kb or more worth of programs and data, only to have to reset the machine and lose it all. That is why I do most of my programming on the 48SX and 50g with their Serial RS232 or USB and SD card capabilities. It's also a lot more convenient to develop and / edit programs on a text editor on a PC or Mac than in the calculator.

It's true that a very good argument can be made that, just as the Voyager HP-12C framework remains upon which to resurrect the 15C, the Pioneer HP 17bii framework remains upon which to resurrect the 42S. I believe there are few hardware differences other than keyboard markings and firmware that separate the 17bii from the 42S.

However, the HP 30b industrial design is very easy to like...it's compact and very mechanically solid. IMHO, it is one of the best in HP calculator history. That's why my hypothetical New-42 would use something like that. Plus, truth be told, I have always hated the color scheme of the Pioneers...brown and orange...blah!

And the processor speed of the 30b is stunning...it completes the old Savage benchmark at 10 times the speed of the 50g, and 100 times the speed of the 42S, producing identical numerical results! I'd like to have something equivalent to that under the hood of a New-42, capable of a full dot-matrix display and much more RAM.

*Message #112 Posted by **M. Joury** on 6 Aug 2011, 6:43 p.m.,*
in response to message #111 by Mike Morrow

Well maybe a combination of the two...

I was referring to the new 17bii+ with it's silver front and sloping keys. That would make a very nice basis for the keyboard of a 42S IMHO. The LCD is already in place with basically the same capability as the one in the 42S (maybe even the very same LCD?). And with 32K of non-volatile RAM there is more than enough room for programs and data.

However, I have to agree an updated processor such as that in the 30b would be spectacular however it would need more non-volatile memory than is available in that machine. The 32K in the 17bii+ would work nicely.

Here is an interesting article on this subject: HP Solve #23

Cheers

1+

The 17bII+ Silver has the best housing of all HP calc since the Pioneers IMHO. Even if the internal electronics of the 17bII+ Silver may be outdated from today's view, it has the best overall form factor, and it has a really good high-contrast dot matrix LCD with anti-glare cover, not that awful not-fish-not-flesh partly alphanumeric (ugly) LCD like the 20b/30b with super shiny surface.

Too bad that the 17bII+ Silver doesn't have the pcb 6-pin connector for firmware updates. Let's hope for a successor with the same housing and LCD, but with the suitable connector and firmware update support:-)

*Message #114 Posted by **Eric Smith** on 6 Aug 2011, 9:12 p.m.,*
in response to message #113 by Raymond Del Tondo

The 17bii+ doesn't have a connector for firmware updates because it doesn't have flash memory. If I'm not mistaken, it uses a masked-ROM microcontroller from GeneralPlus, with a 6502-equivalent core. Those are extremely inexpensive, not well suited to running C code, and not available with flash memory.

On the other hand, suitable microcontrollers with flash memory generally don't have enough LCD drive for the 17bii+/42s display. They either have segmented LCD drive for no more than a few hundred segments, or a "controller" but no on-board drivers for an active matrix LCD, which is far more expensive and uses too much power for disposable coin cells.

One possibility would be to use two microcontrollers, one with flash memory for the "brains" of the operation, and one with masked ROM and LCD drive just to serve as an LCD controller. Of course, this pushes up the cost by a non-trivial amount.

I imagine that HP may eventually have a calculator with a 17bii+ like graphic display and flash upgrade capability, but probably not in the near future.

It may just be more straightforward and less expensive to use a chip-on-glass graphic LCD. I've never encountered a conventional uC with a controller able to drive a graphic panel of significant resolution. Even dismissing that, the interconnect between controller and LCD glass becomes complex, expensive, and less reliable at such interconnect counts where a COG is more attractive if the device in question can accommodate the modest asymmetry of the panel.

A CoG LCD is generally more expensive than a microcontroller or driver under a blob of epoxy with a heat-sealed flex cable to a bare LCD. That's why you find that construction in just about every LCD calculator that has a midrange dot matrix display, including things like the Casio fx115ES and Sharp EL-W516B.

At higher dot matrix resolutions that becomes impractical, but I'm not sure about the 131x16 resolution of the 17bii+. I haven't taken a 17bii+ apart so I'm not sure how it is constructed.

Presumably the extremely low cost of the GeneralPlus (formerly SunPlus) 6502-core microcontrollers with their ability to drive a moderately large dot matrix LCD made them the most cost-effective solution for calculators like the 17bii+. Cost is undoubtedly a huge concern, far more than firmware update capability.

Low-end calculators usually use microcontroller chips from other Taiwanese and Chinese microcontroller vendors that are even less well-known to mainstream electronics and software engineers. At one of the HHC conferences a few years ago I was given some breadboard

prototypes of low end scientific calculators (possibly the HP 8s or 10s), and they had microcontrollers I'd never heard of before, but I was able to dig up some documentation on them (in English, even!) by a Google search.

My greatest beef with heat seal interconnect is reliability. Nearly every LCD display I've encountered with intermittent drive problems was of heat seal construction. Frankly I'm amazed it works as well as it does considering the Rube Goldberg inspired process. But to be fair the approach does avoid bloating the glass footprint compared to COG and like COG has a slimmer vertical profile than zebra interconnect. Maybe I've just had bad luck with cheap heat seal products.

The arm7 12Cs (and 35s IIRC) use a heat seal interconnect so time will tell how those products fare in this respect.

Special purpose uCs with LCD controllers may have more design consideration to quiescent current draw. IMHO not all LCD controllers do as well as they could in this respect. LCD modules are often the worst offenders frequently using simple passive resistive voltage dividers to generate the bias voltages.

But agreed cost constraint appears to be the predominant design consideration for contemporary products, regrettably HP included. I suppose that is just a non-negotiable reality of competing in today's market.

The Casio fx-115ES screen presents an interesting comparison to the HP 42S or HP 17bii, because many more display elements are required for the fx-115ES.

The fx-115ES has a 31x96 (2976 pixel) LCD with 18 annunciators.
The 42S/17bii have a 16x131 (2096 pixel) LCD with 8 annunciators.

Whatever hardware is controlling the fx-115ES display has about 50 percent more capacity than would be needed for a 42S display.

The fx-115ES can operate from the small solar cell in the corner, or, it is claimed, for about 1000 hours from one 357 bettery. Total power consumption of this fairly capable system must be very low.

The heart of the fx-115ES is under one of those blobs of black epoxy.

I have an fx-115ES from the local MalWart which was collecting dust after I lost interest and and stuck it back in the blister pack. Your comments above made me curious so I popped it open and had a look:

```
current draw (LR-44)          Notes

630nA                         "off"
21.5uA                        idle, blank screen,
cursor blink
57.8uA                        idle, setup menu
52-52.5uA                     running trans forensic
"9", display off
```

So that 1000 hours estimate may be quite conservative and under conditions of the processor running continuous -or- idle with perhaps a 50% pixel drive of the display. Depending upon the dropout voltage for the device (or perhaps the polarization threshold of the panel) it could be double that for an LR44 at 60uA draw. Also it seems the display is blanked during processing likely to avoid brownout when powered solely from the PV cell under modest illumination. I didn't think to check if the 3x charge pump was disabled when the panel was blanked but it wouldn't be a surprise.

> Quote:
>
> Whatever hardware is controlling the fx-115ES display has about 50 percent more capacity than would be needed for a 42S display.

Indeed. However while I'm unfamiliar with the 42S the display of the fx-115ES has about the worst contrast I can recall in a calculator, likely as a result of keeping the LCD dynamic power consumption in check. How does the 42s display compare?

> Quote:
>
> The heart of the fx-115ES is under one of those blobs of black epoxy.

Although my presence lurking here probably gives away my bias, I have to admit the fx-115ES is a pretty slick effort given the design constraints, resulting product and price point. But admittedly my familiarity with it is superficial.

Eric,

why isn't the 6502 well suited for C-compilers? IIRC, the RISC route was taken because compilers can optimize better on limited instruction sets, while CISC CPUs are best when writing asm-code by hand, but I might be wrong here.

Another question comes to mind: Has the 35s firmware been written by hand? That would indicate why there never was a firmware update ;-).

Thomas

Re: HP 15C LE: "Discontinued"

*Message #121 Posted by **Eric Smith** on 7 Aug 2011, 4:56 a.m.,*
in response to message #120 by Thomas Radtke

The 6502 is a CISC processor. It is certainly "reduced" in some ways compared to the 6800 that was its predecessor, but it lacks some of the important distinguishing features of a RISC, which are a large number of general registers (typically 16 or 32), and orthogonality of use of registers and address modes.

The 6502 is poorly suited for C code because of the 256-byte limit on the stack, which often necessitates using a software-maintained stack, and the lack of a stack-relative addressing mode for accessing local variables in a stack frame. Both result in significant problems with code size and execution time.

I've written quite a lot of 6502 code over the years. While C isn't as big a step up from assembly as I would like, I definitely find myself much more productive in C than in 6502 assembly. As a result, I would definitely be biased toward microcontrollers that are better suited for execution of C code.

I've been told that the 33s, 35s, and 17bii+ firmware are written in C.

All true. The other issue which compounds the problem of 8-bit processors as efficient C runtime models is lack of the ability to natively manipulate an address bus and/or std int width data type.

> Quote:
>
> I've written quite a lot of 6502 code over the years..

In the dim past I used to work for MOS Technology/Commodore.

The 6502 still figures prominently into my nightmares.

> Quote:
>
> I would definitely be biased toward microcontrollers that are better suited for execution of C code.

Thoroughly agree. It appears NXP has been quite aggressive introducing ARM uCs at price points below many of the 8-bit competition. They still IMHO have some work to knock out what I'd call "clunk factor" in the overall products but are nevertheless impressive. I picked up a lot of lpc1114 in lqfp-48 for about US$1.50/ea a few months ago from Avnet.

The only people who find the Voyagers anything but an abomination as a **handheld** calculator are those who don't mind that it takes **both** hands to operate one. Portrait models suffer no such limitation, and can be used with ease in either one- or two-hand mode.

I don't think I see the distinction you're trying to make. Either you're holding the calculator in both hands or you have it sitting on your desk and you're keying with one hand. If you're holding a Voyager in both hands, it is faster than a Pioneer or 41C (for example) because you can reach the entire keyboard without moving your hands. If you've set your calculator on your desk you're keying a Voyager or a Pioneer in exactly the same way (hunt and peck).

So what's the disadvantage? In one usage case the Voyager is faster and in the other case they're the same as any other calculator (if we're just talking about keying speed).

Nope...there's another mode: Holding the calculator in one hand and keying it with that same hand....easily done for quick ad hoc calcs that come up, while the other hand is busy with a pen or other tool. Of course such is not too comfortable for a long programming or debugging session, but I do that far less frequently. I've often done one-hand ops with portrait calcs ever since acquiring my first

(Bomar 901B) in 1972. Of course, my Voyagers don't allow any of that...they're much more difficult to use with one hand than even the much larger and heavier 50g.

My objection to landscape goes away if the width of the keyboard can be easily spanned by the width of the palm as it is for most portrait calculators. HP has never made anything like that, but Casio and others did.

I see what you're saying, although I find doing this with any calculator about equivalently awkward. Perhaps this has something to do with different hands or different thresholds for aggravation.

Even given that, though, I still think that when I'm evaluating a tool I do so in terms of what it's good at, not what it isn't. When I'm thinking about how easy (or hard) it is to use a calculator, I'm thinking of using it for whatever it is it's capable of doing. With an advanced scientific programmable, it strikes me as odd to evaluate it in terms of how comfortable it is for `quick ad hoc calcs'. I'm not saying that you're wrong to think this way yourself. I just don't see much of an argument there. I mean you would probably find it easier to use a simple four function calculation for the sort of thing you're talking about, but I don't think it follows that non-four function are an `abomination' (as you characterised Voyagers) because they're slightly less convenient to use when you only need the basic four functions.

Though the 42S is at least an order of magnitude better machine than the 15C in almost every detail except cosmetics, its alphanumeric capability by itself would have justified its replacement of the 15C.

That seems quite high praise for the 42S. I've never owned a 42S so I'd be curious to hear the opinion of other folks.

From a quick dig it appears there is sufficient data to produce an experimenter's clone. And given once we drift away from reuse of an existing Voyager carcass, a 15C work-alike requires a graphic LCD. So there may be an argument to do so for a model which has native support for a matrix display rather than using the same for little more than the convenience of effecting annunciators under an emulated segment display.

*Message #128 Posted by **M. Joury** on 8 Aug 2011, 11:08 p.m.,*
in response to message #127 by uhmgawa

This may be sacrilege here, but give me a 42S over a 15C any day. The 15C was (and is) a great machine but the 42S is just hands down (IMHO) a better calculator. As stated, the alpha capability alone is a big bonus never mind partitioned programs, named variables, powerful solver, more memory, and faster speed. If you know the 41 just consider the 42S to be the same machine on steroids in a Pioneer package without I/O. Had the 42S had I/O it would be my all time favorite HP calculator. As it is it is a close second to the 41.

Come out with a new 42S with I/O, time capability such as is available in the 17bii and 27S, and 32K RAM and HP would have a winner.

Again, this is just my 2 cents worth...

Cheers,

FYI, HP's persistant refusal to launch a successor of the 42S while OTOH releasing financial calcs every once and a while caused our WP 34S project. You'll find lots of information about alternative calculator designs - including display discussions - when you search the archives for the last eight years at least.

Though I agree financial calcs seem urgently necessary, I see little to no effect of HP's sales in the last four years. So perhaps the almost unlimited susceptibility of this market segment explains HP's strategy ;-)

I could be wrong, but from what I've heard around here and elsewhere, the HP-12C owes part of its success to conservatism in its user base. That is, financial professionals adopted it as a standard and it has stuck. As a group, they are reluctant to abandon a tool that works. If that's so, a nice new calculator that adds functions, an additional shift key or what-have-you might not appeal to those users.

I'd sure buy one though. :)

WP34S: cpx DROP & CLx ?

*Message #1 Posted by **fhub** on 4 Aug 2011, 6:23 a.m.*

While developing my TVM program I came across 2 problems:
I wanted to use [cpx]DROP and [cpx]CLx but couldn't do it.

What's the right way to get a [cpx]DROP ? After [cpx] I opened the menu [h]P.FCN and selected DROP, but the [cpx] wasn't accepted.
Then I just tried [cpx][<-] but the left-arrow just canceled the [cpx] again. So how to do it?

And with [cpx]CLx there's also a problem: [cpx][h][<-] doesn't work too for the same reason - the left-arrow key cancels also this attempt.
BTW, I've now looked in the opcode-table and saw that there is no [cpx]CLx at all!? But the token CLx appears twice, with opcode 0x0001 and 0x0140. Is this a bug?

Franz

> What's the right way to get a [cpx]DROP ?

Complex DROP is in the complex X.FCN catalogue. I've had this argument with Walter several times and splitting functions between the complex X.FCN and the P.FCN catalogues is inconsistent to my mind. Having a complex function not in the complex X.FCN catalgoue is inconsistent to Walter.

Anyway, every complex function not on the keyboard is in the complex X.FCN. Or should be.

> Quote:
>
> And with [cpx]CLx there's also a problem: [cpx][h][<-] doesn't work too for the same reason - the left-arrow key cancels also this attempt.

Complex CLx makes no sense as a command.

There is a shorthand to get to the complex X.FCN. Just CPX and [V] are needed, the green shift is optional. :-)

DROP in P.FCN and cpxDROP in X.FCN ???
That's indeed more than inconsistent!
And BTW: DROP is not a function but a command (or an operation).

> Quote:
>
> Complex CLx makes no sense as a command.

Well, that's a matter of opinion. If almost all other stack operations have a CPX counterpart, it would just be consistent if CLx would have, too (deleting X and Y registers at once).

We once had it but the problem is what to do with stack lift here. CLx disables stack lift such as ENTER^ does. But we cannot disable stack lift for two entries as would be needed if you wanted to replace X and Y after the cCLx. The equivalent of CLx for complex numbers would be cDROP in this case. I admit it is a bit tricky to replace X & Y with zero each but it can be done with CLx; ENTER^ if you don't care about the rest of the stack or with CLx; STO Y.

Yes I know, every CPX stack manipulation can be emulated by a few 'normal' operations (with more or less effort), and this missing [cpx]CLx isn't really a big problem. It's just so that after I saw this CPx twice in the opcode-table, I thought you might have just overlooked to tag one of them with the [cpx] property.

Can't you just put it in X.FCN and P.FCN as well? Or would that take too much memory?

Re: WP34S: cpx DROP & CLx ?

*Message #9 Posted by **Marcus von Cube, Germany** on 4 Aug 2011, 7:52 a.m.,*
in response to message #8 by Alexander Oestert

That's certainly possible. If we do it, cRCF (RCL from flash) and cDROP will both be duplicated. The rest in CPX X.FCN are math functions which only belong there.

Re: WP34S: cpx DROP & CLx ?

*Message #10 Posted by **Paul Dale** on 4 Aug 2011, 8:19 a.m.,*
in response to message #8 by Alexander Oestert

The most likely outcome is that complex drop stays in the *complex* x.fcn catalogue and drop will appear in both the x.fcn and p.fcn catalogues. This way we maintain consistency both ways -- all complex operations are in the complex x.fcn catalogue and their counterparts are in the x.fcn. The p.fcn copy is for utility only.

Still, I'm waiting for Walter to chime in -- he's been very busy with a new job recently and is far less responsive than previously.

Re: WP34S: cpx DROP & CLx ?

*Message #13 Posted by **Marcus von Cube, Germany** on 4 Aug 2011, 2:48 p.m.,*
in response to message #12 by Paul Dale

Sorry, I misunderstood you. You aren't duplicating cDROP but DROP. But then the same question arises for cRCF versus RCF. The latter two are I/O commands which belong entirely into P.FCN. Solving all consistency problems looks like solving the Gordian nod to me.

The documentation doesn't give the keystroke sequence for complex DROP. That is an issue.

- Pauli

Re: WP34S: cpx DROP & CLx ?

*Message #16 Posted by **Walter B** on 4 Aug 2011, 5:10 p.m.,*
in response to message #15 by Paul Dale

You're right. The manual is corrected now but not committed yet :-)

And you're right again: Every complex operation not accessible on the keyboard directly is found in [CPX][X.FCN]. Thus that's the place to find [^c]DROP as well 8-)

Some background: Sorting items in catalogs is not trivial, since ASCII has some very special order for whatever historical reason. So we had to define our own sorting sequence. By no means, however, you'll get e.g. [^c]DROP following DROP directly in a sorted list.

And finally, [CPX][CLx] doesn't give any return on invest. You'll reach the same result via [CLx][CLx] with the same number of keystrokes.

Walter

Are you sure about that? I think if I punch [CLx][CLx], the second [CLx] is redundant since the stack did not drop. (At least that is the way my SVN 1356 works -- and my 11C.)

Re: WP34S: cpx DROP & CLx ?

*Message #18 Posted by **Walter B** on 4 Aug 2011, 5:41 p.m.,*

WP 34S: Another poll about single letter labels

*Message #1 Posted by **Marcus von Cube, Germany** on 4 Aug 2011, 4:46 a.m.*

We've had a recent discussion about the single letter labels available in the 34S firmware. The original set of labels included only the four letters A to D. We recently expanded this set to a somewhat random looking set of A, B, C, D, G, H, I, J, K, L, P, T, W, Y, Z. The restrictions are mainly forced by how the keyboard works for alpha entry. Letters on keys which have a meaning when answering a label prompt are missing from the list. X is missing because it conflicts with GTO.nnn, a direct command to navigate program memory.

We have three options:

1.) Go back to A to D for the sake of a clean interface. Remove the other labels.

2.) Leave it as it is now. Not very consistent but working and of some use as long as we don't have a user keyboard.

3.) Expand it to all letters of the alphabet. This would be a consistent approach. It's easy to implement on the external assembler tool but it would need a redesign of the handling of the input on a label prompt. I would vote for giving GTO.nnn a new home and using LBL .X (X being any letter) in cases where the key in question would otherwise be interpreted as a digit or ->. The dot would be optional in the unambiguous cases.

My own favorite is option three. We'd like to hear your opinions.

Re: WP 34S: Another poll about single letter labels

*Message #2 Posted by **Paul Dale** on 4 Aug 2011, 5:04 a.m.,*
in response to message #1 by Marcus von Cube, Germany

We need to fill in the context here about the cleanness and consistency of the layout and loss thereof with the extras.

There was also a fourth option that Walter suggested which hasn't got a mention.

And my suggestion of arithmetic labels for the four operator keys which was only commented on by one person outside the development team.

I'm not going to comment on the third since that is elsewhere in the forums and it doesn't seem all that sensible. I'll let Walter comment on the first two.

- Pauli

Re: WP 34S: Another poll about single letter labels

in response to message #2 by Paul Dale

Quote:

> And my suggestion of arithmetic labels for the four operator keys which was only commented on by one person outside the development team.

Well, that was me! ;-)
And my main point was: why display "LBL +" instead of "LBL Z" in program mode, when the keystrokes are exactly the same?
This "LBL +" is looking really ugly (something like redefining the addition operator), and what would be the next consistent step? Labels with names like "LBL x<>y", "LBL +/-" or "LBL Rv"?

Now to Marcus' poll: I also prefer his 3rd solution.
Maybe the GTO.nnn could be changed to GTO[^]nnn and GTO[v]nnn where [^] and [v] are the up/down-arrowkeys (if they don't already have any other meaning after GTO).

Franz

Please understand this as a complete layman's viewpoint ;)

Couldn't this problem

> Quote:
>
> Letters on keys which have a meaning when answering a label prompt are missing from the list.

be overcome by preceding the letter key with any combination of f, g and h (that is different from any otherwise meaningful combination) if it's meant to be a single letter label and thereby making the whole alphabet available?

Re: WP 34S: Another poll about single letter labels

Well, that would need at least 2 additional keystrokes (e.g. [f][g]X) preceding the letter key, so there's no difference to just enter the alpha-mode (with [ENTER]X[ENTER]).

And it would make it a bit complicated in other situations when you've pressed the wrong prefix for a function: then you couldn't just fix this by pressing the other (correct) prefix.

Franz

At the moment these keys do nothing in label entry mode so they are free.

As for GTO.nnn and GTO..: The current implementation needs two key strokes for GTO (h+XEQ) plus the dot plus the address while h+dot do nothing while not in alpha mode. We could either make the prefix h redundant for GTO. (XEQ. does nothing now) or the key GTO so just h+. does the trick. We will lose quick jumps in alpha mode but these are a bad idea anyway because alpha mode would still be active at the new position. The h+. solution would free the dot as a prefix for short labels.

Re: WP 34S: Another poll about single letter labels

*Message #7 Posted by **Didier Lachieze** on 4 Aug 2011, 6:13 a.m.,*
in response to message #1 by Marcus von Cube, Germany

I also prefer the third proposal, but when I started to use the 34S I was pleased to find that the GTO.nnn and GTO.. are supported and work as on vintage HP calculators, so I would be disappointed to loose them.

What about using the up arrow [^] (or down arrow [v]) as suggested by Franz, but to access the single letter labels? Such as [GTO][^][X] for GTO X.

Re: WP 34S: Another poll about single letter labels

*Message #9 Posted by **Paul Dale** on 4 Aug 2011, 10:55 a.m.,*
in response to message #1 by Marcus von Cube, Germany

I really don't like option 3. It breaks consistency of the layout and doesn't really save much. LBL . X vs LBL ENTER X ENTER. The latter keeping consistency, allowing shifted characters (more labels) and extra characters (many more labels). The former confusingly allowing the . to be omitted for some keys but not others -- most people would end up always putting the . in I suspect.

The second and third options break our layout consistency in several ways which haven't been mentioned publicly. Walter can and likely will put this better than I will but I'll try...

Currently, all commands with a single alpha argument are special.

Alpha flag operations change how the device operates (or turn an annunicator on or off). They are not freely changeable like the numeric flags, they have side effects. Thus, these are *special*.

Alpha registers **all** have system defined purposes that make them not general purpose registers. Thus, these too are *special*. That we let users use the ones they don't otherwise require as general purpose registers is simply a bonus.

Alpha labels are our hot keys. In this way they are different to and distinct from numeric labels. Thus, these are also *special*.

See the trend here? Introducing these shortcut alpha labels completely breaks this internal consistency. Some labels are now general purpose, some aren't. Both Walter and myself dislike this and I'm usually the one pushing for weird and wonderful extra features and getting beaten down.

The keyboard and entry engines are very consistent currently and this makes them easy to use. I believe that this is the main reason why people are finding that the 34S is nice and easy after the initial shock of the very cluttered keyboard. Once you get the hang of things, everything is where you expect and logically arranged. I really would like to maintain this.

Adding the extra labels leaves new (and even experienced) users in a bind. Is this one special or not? Do I need the . prefix or not. We've already had one query about why no X label and that from somebody who is quite familiar with the device. Marcus thought this important enough to explicitly spell out in the description above. None of this is good.

There is another far more minor issue to do with indirect access. The numeric positions of the lettered registers vs the flags and labels don't match up currently and these proposals make things much worse. This is quite minor however.

Even Walter's alternative suggestion (which is for some of the additional letters to be usable as labels) grates with me. I'll let Walter put this forward if he so desires.

> Would be nice for the SLV command when it fails ... :-)

BTW, I just found that the SLV command in manual mode (i.e. not running in a program!) just returns a nonsense result when the equation has no solution (I've tried it with x^2+1).

So if you use SLV manually in calculator mode you don't see if the returned value is in fact a solution, or just a temporary value of the solving process when it fails.
That's not really nice - maybe any error message (like my "no solution" above, or at least a "false") could be displayed in this case!?

> Error or step jump from solve is a lot harder than it looks :-(

Hmmm? I don't understand!?

I had a short look at the SLV routine in xrom.c and I see there a few EXITp1. Aren't these exactly the places where the solver fails and thus makes a RTN+1?
So why not just add here a command to display "false" (only in manual mode, not for a running program)?
Or do you want to say that SLV isn't working correctly (i.e. skipping the next instruction on fail) in program mode, too?

Franz

Re: WP 34S: Another question

*Message #16 Posted by **Paul Dale** on 8 Aug 2011, 5:52 a.m.,*
in response to message #15 by fhub

Of course those are the places. The problem isn't where to put the change but what the change needs to be.

The suggestion of a command that displays false if not run from a program isn't the answer -- the solver code is a running program. It is indistinguishable from a user program.

The problem boils down to solve doesn't know where it came from.

I've no idea what you're getting at with your last question. Solve must skip a step in the calling program if it doesn't converge. This is not negotiable.

Displaying "false" on failure in run mode isn't ideal either although it matches other conditional tests. An error is more appropriate and matches older devices' solver better.

I'm still thinking about this one, it hasn't been forgotten.

- Pauli

Ok, not knowing one's origin is of course always bad. ;-)

I just don't understand this problem in comparision with all other test functions (like SF?, x=0? etc.). Why do these functions 'know' if they have been called from within a program or directly from a user input, but SLV does _not_?

Re: WP 34S: Another question

*Message #18 Posted by **Paul Dale** on 8 Aug 2011, 6:17 a.m.,*
in response to message #17 by fhub

Solve is *****not***** a conditional test from the firmware's point of view. It is a user program. This should be clear enough from looking at the xrom dump.

The RTN+1 command is *faking* a conditional test. No more no less.

- Pauli

> Solve is *****not***** a conditional test from the firmware's point of view. It is a user program.

Ok, but: although I don't know the complete 34s structure, but shouldn't there at least be a 'higher-level' routine (the parser) which would (or should) know whether the state is "program running" or "user mode" when it 'sees' a SLV command? And so this 'parser' could set any internal flag (running yes/no) before it calls the SLV routine?

But maybe I'm completely wrong with my understanding of this internal flow ...

Re: WP 34S: Another question

*Message #20 Posted by **Paul Dale** on 8 Aug 2011, 6:31 a.m.,*
in response to message #19 by fhub

That would require some RAM to store the flag.

RAM is full.

Completely full.

Doing it this way would work but it would also mean losing something else.

That said, I think I've got a solution which I'm in the process of testing.

- Pauli

Oh my god, not even a few bytes left? Poor WP34s! :-(

Maybe you should work on a RAM extender ... ;-)

Re: WP 34S: Another question

*Message #22 Posted by **Paul Dale** on 8 Aug 2011, 6:50 a.m.,*
in response to message #21 by fhub

Nope, not a byte of battery backed RAM left (which is where this must live).

I think there is one bit left in the user mode settings word which isn't useable here.

There are a few bits free in the LCD bitmap memory but they don't survive the lower power modes and thus can't be used in the solver.

We've really pushed the hardware to the limit :-)

- Pauli

Re: WP 34S: Another question

Well, looking at your recent changes (TST_TOP, TOP? and isTop) - isn't this exactly the way I've suggested?
Of course I don't have your internal knowledge of your code, so I can't say exactly what to put in where and which commands have to be added in detail, but what you have done know is just what I meant: testing whether SLV is called from within a program or by the user (TOP).

So not everything someone else suggests is just nonsense - but it seems to be hard to admit this ... for some people ... ;-)

Re: WP 34S: Another question

*Message #24 Posted by **Paul Dale** on 8 Aug 2011, 7:46 a.m.,*
in response to message #23 by fhub

No it isn't anything like any of your suggestions.

Your suggestions in order were:

- *So why not just add here a command to display "false"* -- there is no command to display false. The new error message isn't sufficient by itself.
- *I just don't understand this problem in comparision with all other test functions (like SF?, x=0? etc.).* -- solve still isn't a conditional test and cannot be made into a real one.
- *And so this 'parser' could set any internal flag (running yes/no) before it calls the SLV routine?* -- no such flag exists.

You did get the location of the changes correct and I'd already said they were the spots.

> Quote:
>
> testing whether SLV is called from within a program or by the user (TOP).

You never wrote this anywhere.

I can't read minds here let along halfway around the world.

That said, this is the obvious path to the solution, the difficulty is detecting this state. Checking for an empty return stack hasn't been mentioned before this.

> Quote:
>
> So not everything someone else suggests is just nonsense - but it seems to be hard to admit this ... for some people ... ;-)

I think you need a chip removed from your shoulder.

Re: WP 34S: Another question

*Message #26 Posted by **Marcus von Cube, Germany** on 8 Aug 2011, 9:51 a.m.,*
in response to message #25 by fhub

Franz, don't give up!

We are working on a solution. When we're done, SLV will behave like a conditional test, hopefully. :-)

BTW, I've worked hard on the keyboard handler. This saves us space in flash but needs thorough testing. The latest version in SVN contains the changes. Please report back any findings! Try the catalogues and all keyboard commands.

Re: WP 34S: Another question

*Message #27 Posted by **fhub** on 8 Aug 2011, 11:04 a.m.,*
in response to message #26 by Marcus von Cube, Germany

> Quote:

> Franz, don't give up!

Well Marcus, I don't give up the WP34s project (zumindest NOCH nicht), but I give up talking to and discussing with Pauli because his arrogance is just annoying me!

I made a suggestion for this SLV problem, he answered "impossible!" and then, just a few minutes later, he implemented it almost the same way as I had described it. And finally he even denies that my idea had anything to do with 'his' solution - that's simply incredible!

But ok, let's forget it and talk about your latest changes to 34s:
Although for the user there's no difference now in accessing these additional XEQ shortcuts, in my opinion this internal change from e.g. LBL G to LBL 21 is no good idea.
Why? Well, I would say that these number labels LBL 00-99 are mostly used for subroutines but it's usually not indended that a user calls such a subroutine directly with XEQ 00-99.
But as it is now the chance is quite high that a user might press any of these 'shortcut' keys after XEQ **by mistake**, and so this would run the corresponding subroutine.
My consequence from this new 'feature'(?) is, that it's the best to avoid using in programs any of these labels with keycode-numbers(with the exception of course that exactly this key would be wanted as a shortcut key).

Well, just my opinion of course, but this change is probably a source of confusions and mistakes in future programs.

Franz

*Message #29 Posted by **Walter B** on 4 Aug 2011, 6:02 p.m.,*
in response to message #1 by Marcus von Cube, Germany

Pauli has explained most of the reasons already why we prefer option 1 over 2 and 3. The only thing I want to add is: Perhaps the easiest way to get an idea what's the point is looking to the manual, page 18. And remember you are using a calculator which will not change its physical surface entering temporary alpha mode (see page 9 showing only a virtual change).

So I'd recommend reading at least page 18 thoroughly. Thereafter (!), if there will be anything you'll be missing still, please tell me.

Walter

Well Walter, I still don't understand what's the (or your) problem with option 2 (keeping the current state).

Ok, it may be a bit inconsistent, but that happens with other things too (think of STO/RCL with Z and T, which also is handled differently than e.g. X and Y).

The current use of extended labels (option 2) is working already (so it needs no additional programming), it definitely requires less keystrokes for those additional label than having to use them with [ENTER], and if someone doesn't like this - well, nobody is forced to use this shorter way.

Franz

*Message #31 Posted by **Walter B** on 4 Aug 2011, 6:59 p.m.,*
in response to message #30 by fhub

Well Franz, the current state is option 1 8-)

Re: WP 34S: Another poll about single letter labels

*Message #32 Posted by **Marcus von Cube, Germany** on 5 Aug 2011, 5:27 a.m.,*
in response to message #31 by Walter B

It's just a conditional compile and I'm not happy with Pauli's decision to silently disable it. I'm still more with Franz then with Walter and Pauli. Option two is a pragmatic approach. I'm a pragmatic person.

The problem with *not* having one of option 2 or 3 or a variant thereof is that we just lose functionality which cannot be replicated with the remaining features. Let me explain. If we tell users to stick to pure alpha labels instead at the expense of having to press one or two additional keys, they will still lose an important aspect of the short labels, their locality. If you want to have more than one application making use of let's say a variable named I or a function to add two objects, this will not be possible without distinctive names for the operations because alpha labels are global and the search order is independent of the current state of the program counter.

HP-28S/Clamshell Keyboard Test

*Message #1 Posted by **aj04062** on 3 Aug 2011, 8:40 p.m.*

I have tried this test on several calmshells I own. I can't get any of them to pass this test. I start at "A". Is this right? It seems odd that 5 of these all flunk, but seem to work fine.

Re: HP-28S/Clamshell Keyboard Test

*Message #2 Posted by **Geoff Quickfall** on 3 Aug 2011, 8:50 p.m.,*
in response to message #1 by aj04062

try invoking the keyboard test as follows:

turn on calculator:

while pressing the 'on' key, press and release the 'next' key. then release the 'on' key. you will get the promptm "keyboard test".

now, as before, start at the left keyboard starting with 'a' and press each key left to right descending one row at a time until the left keyboard is complete. move to the right keyboard and repeat starting with the upper right assignable key.

Cheers, Geoff

YouTube demonstration of the 41CL

*Message #1 Posted by **Geoff Quickfall** on 3 Aug 2011, 4:11 a.m.*

This video demonstrates for the beta testers the use of the simple routine "YCTOF" which was sent to them via a PDF. I you would like a copy email me.

This also for any die-hard HP 41C fan as it demonstrates a fantastic option available to the CL user. The ability to copy many calculator-states to the FLASH memory where it resides impervious to MEMORY LOST states or power interupts.

In fact, lets say you use the Blood Glucose monitor XROM. This XROM takes over the calculator at turn on. Reserves 100 storage registers and reassigns the entire keyboard. It actually turns the 41C into a dedicated Blood Glucose monitor to the exclusion of all other routines.

The CL will allow you to record your Blood Glucose data and the store the entire calculator state to FLASH. Once there, another state can be recalled to the calculator memory.

In my case, I record lab data to a calculator state which has a suite of Palynology Climate routines. Then when I go to work, I copy the Palynology state to the CL board and recall my aviation suite of programs from the FLASH.

Enjoy the video (my second youtube adventure)

The use of the "YCTOF" routine and a short plug unplug routine at the end...

Cheers, Geoff

in response to message #2 by robertoataulfo

A little more explanation please ;-)

I am not familiar with HEPAX although I intend to be. Do you store the contents to a specific location and then when prompted, supply the location.

Can the function store to more then one location? Does it store X-memory contents also?

Cheers, Geoff

Re: YouTube demonstration of the 41CL

*Message #4 Posted by **Geoff Quickfall** on 3 Aug 2011, 2:50 p.m.,*
in response to message #3 by Geoff Quickfall

Ah! I see, HEPAX is fantastic:

HEPAX QRG link

But this works with a physical HEPAX module only? If so can the virtual HEPAX module contained in the CL be used to store to multiple locations on the CL of many calculator states. Does the HEPAX module have more then one 4K location for the storage of the calculator states.

Questions and more questions. Also, how long does the entire transfer to the safe memory location work. 22 seconds on the CL becomes minutes without TURBO50 initiated.

Cheers, Geoff

Re: YouTube demonstration of the 41CL

*Message #5 Posted by **gene wright** on 3 Aug 2011, 3:45 p.m.,*
in response to message #4 by Geoff Quickfall

The CL can run Hepax and it will be as if you have a Hepax installed.

However, I believe the Hepax "save the calculator state" functions save them to memory within the Hepax structure itself - at the expense of having one of the 41CL port locations hold the Hepax module as well as the space for the saved files.

Probably two port locations used.

And, finally (ha), the Hepax memory locations are probably mapped to RAM locations within the 41CL structure, which would not survive a total power loss the way your approach of copying to the calculator state to flash.

Don't think Hepax can be running on the 41CL with the Hepax memory mapped to flash.

Re: YouTube demonstration of the 41CL

*Message #6 Posted by **Geoff Quickfall** on 3 Aug 2011, 4:46 p.m.,*
in response to message #5 by gene wright

Thanks Gene for the explanation. I was thinking along the same lines, plus not many states can be stored as in the CL.

The CL can do the following:

```
save the data collected on the a survey to the flash (acting as a survey
dedicated computer).

recall the aviation calculator state to fly out of the survey zone acting as a
flight computer.

swap that state with the Palynology lab data I have turning the it into an
Palynology computer.

swap and recall the data loaded into the Blood Glucose monitor (acting as a
Blood Glucose dedicated monitor) for that days intake, swap that back to FLASH
```

```
and recall whatever else you have loaded.
```

So the above hypothetical example has created 4 devices in one without the need of a physical module or the other mass storage HPIL, RS232 connections required by other systems. Also as you stated, protected from prolonged power interupts... In fact, you can swap the CL board out of a damaged shell and into a spare shell and all the data goes with it.

Cheers, Geoff

Re: YouTube demonstration of the 41CL

*Message #7 Posted by **Ángel Martin** on 5 Aug 2011, 8:11 a.m.,*
in response to message #5 by gene wright

HEPAX RAM is mapped to the ROM ports of the 41 address bus. The CL has a whole different memory structure, and only part of it is addressed to the 41. So you could have different SETS of HEPAX RAM stored into either CL flash or CL-RAM, ans swap them at will using MMU commands.

Gene's right for the HEPAX to work it has to be in CL-RAM, otherwise the WROM instruction wouldn't work.

What the HEPAX HGETA/HWRTA functions will do for you is a convenient write all / read all. That combined with the MMU y-functions makes an unprecedented control and versatility - way beyond the CY, or even the ML2k - although the ML2k has the incredible advantage of being all PC-controlled using the USB bus.

Cheers, ÁM

Re: YouTube demonstration of the 41CL

*Message #8 Posted by **Raymond Del Tondo** on 3 Aug 2011, 4:19 p.m.,*
in response to message #4 by Geoff Quickfall

Slightly OT, because CY not CL:

Restoring a W&W 41 CY (2x 32K) from my special CY-INIT ROM takes ~70 seconds with normal speed (speedup not active).
This includes:
- storing RAMBOX64a and -b
- my CCD OS/X
- David Assembler
- my Ext IL+
- Mainframe Labels
- clearing the remaining pages A,C,E

The above actions are performed twice, once for each of the two banks.
So copying 10 pages takes ~50 seconds, and clearing 6 pages takes ~20 seconds.
Not very fast compared to a CL, but still not bad for a device with age ~25 years;-)

Ray

Amazing! An HP-32SII is faster than an HP-35s

*Message #1 Posted by **Michael de Estrada** on 2 Aug 2011, 9:34 p.m.*

I've always preferred my old HP-32SII over my HP-35s for many reasons: better keys, better display, more solid feel, better primary key assignment such as separate STO and RCL keys etc. However, I've always assumed that at least the HP-35s would be faster with it's more modern processor, but such is not the case. I wrote a simple benchmark program to loop on the calculation of natural logarithm and exponential functions, and found out that the HP-35s takes 50% longer to run this benchmark. All this despite the fact that the batteries in the HP-32SII last much longer. IMO, the HP-35s not only is *not* an improvement over the much older Pioneer calc, it is actually a step backwards. How sad ! :-(

Re: Amazing! An HP-32SII is faster than an HP-35s

*Message #2 Posted by **bill platt** on 2 Aug 2011, 10:46 p.m.,*
in response to message #1 by Michael de Estrada

Interesting. But I think it gets more complicated, in terms of speed, if you do other tests you will get results which favor the 35s...

Re: Amazing! An HP-32SII is faster than an HP-35s

*Message #3 Posted by **Michael de Estrada** on 3 Aug 2011, 12:06 a.m.,*
in response to message #2 by bill platt

Can you provide an example ?

in response to message #4 by gene wright

Not to forget the super high speed when it comes to draining batteries in the 35s:-)

(Has been mentionned somewhere here, but suits well as a knock-down...)

Re: Amazing! An HP-32SII is faster than an HP-35s

*Message #6 Posted by **Thomas Radtke** on 3 Aug 2011, 4:57 a.m.,*
in response to message #1 by Michael de Estrada

We discussed this years ago. As the 35s has to consider more datatypes, it is expected to have slower execution speed. The 32SII is slower than the 32S, btw.

The 35s is not a step backwards. It just has too many bugs :-(.

Re: Amazing! An HP-32SII is faster than an HP-35s

*Message #7 Posted by **Don Shepherd** on 3 Aug 2011, 5:07 a.m.,*
in response to message #1 by Michael de Estrada

> Quote:

Michael, part of this may be the looping commands, ISG/DSE. I don't have a 35s handy, but I found out a long time ago that the looping commands on the 33s were not terribly efficient, in terms of speed (I even put a postit note in my 33s manual: "Don't use ISG/DSE"). If you have some significant loops, it is much faster on the 33s to code them without using ISG/DSE, even though it requres more instructions. The 33s itself is a pretty fast machine, but the looping commands are not.

I don't know if the 35s inherited this looping slowness from the 33s.

I do know that the 32sii looping commands are fast.

Re: Amazing! An HP-32SII is faster than an HP-35s

*Message #8 Posted by **Miguel Toro** on 3 Aug 2011, 8:51 a.m.,*
in response to message #1 by Michael de Estrada

Speed is not the only criterion to assert improvement. I wrote this Cash Flow Analysis program using vectors and indirect addressing. Something like this cannot be programmed on a HP 32sii (which I love, Pioneers are my favorites).

Regards,

Miguel

Re: Amazing! An HP-32SII is faster than an HP-35s

*Message #9 Posted by **Michael de Estrada** on 3 Aug 2011, 10:37 a.m.,*
in response to message #8 by Miguel Toro

Actually, the HP-32SII also has indirect addressing capabilities and the vector capabilities of the HP-35s are very limited (3 dimension maximum, no cross-product). The HP-35s does indeed have a few additional capabilities such as a catalogue of physics constants, but not enough IMO to offset its other deficiencies. Certain operations, such as rectangular-polar coordinate conversions are simpler and more convenient on the 32SII than the 35s.

Edited: 3 Aug 2011, 10:38 a.m.

Re: Amazing! An HP-32SII is faster than an HP-35s

*Message #10 Posted by **bill platt** on 3 Aug 2011, 1:15 p.m.,*
in response to message #9 by Michael de Estrada

Two egregious errors in the 35s were the elimination of a "simple" rectangular to polar method (35s requires the imaginary number business and even worse was the totally messed up and elaborate base conversion which is next to useless for normal things.

Re: Amazing! An HP-32SII is faster than an HP-35s

*Message #11 Posted by **Thomas Radtke** on 4 Aug 2011, 2:16 a.m.,*
in response to message #10 by bill platt

> Quote:
>
> [...] 35s requires the imaginary number business [...]

That would have been ok for infrequent use, imo. Unfortunately, and I guess that was the point the developer simply forgot, polar coordinates cannot be easily composed/decomposed from and to stack, respectively - one has to type them in :-/.

After all those years, I still cannot understand why there never was a new revision of the firmware, or even better, a 35sII w/o those silly cursor keys.

Re: Amazing! An HP-32SII is faster than an HP-35s

*Message #12 Posted by **bill platt** on 4 Aug 2011, 11:03 a.m.,*
in response to message #11 by Thomas Radtke

Yes, exactly the problem. Here you have an advanced calculator, with gbs of memory, full programmabiliy, and yet you cannot pull R-P/P-R to/from the stack? Just ridiculous!

It is a great mystery that HP has not reworked this machine. They put real effort into straightening out the 33s. Why not the 35S?

Re: Amazing! An HP-32SII is faster than an HP-35s

*Message #13 Posted by **Thomas Radtke** on 4 Aug 2011, 11:17 a.m.,*
in response to message #12 by bill platt

Maybe a larger production run and fewer sales than with the 33s. It would be interesting to know production dates of recently sold calculators. I wouldn't be too surprised if all were produced in 2007 and 2008 at last.

Re: Amazing! An HP-32SII is faster than an HP-35s

*Message #14 Posted by **Miguel Toro** on 3 Aug 2011, 7:49 p.m.,*
in response to message #9 by Michael de Estrada

The point was that the 35s allows to do things and to create applications that are not possible or very difficult on the 32sii, even if it is buggy as everyone knows, that is enough not to dismiss it completely.

It is really nice to have some financial programs in my scientific calculator, so not to carry a 12c around. The 35s allows having this done very easily so I carry it everywhere letting me to keep my old pioneers save at home. Just check the link.

Vector capabilities are limited but combined with indirect addressing and the amount of memory in this calculator, as in this case, then a lot of very fun programs may be done.

Just my two cents...

Miguel

Then use the 32sii with the TVM program listed in its manual. And if you ever need to do work in other number bases, you'll find it's a breeze on the 32sii but you'll probably take a hammer to the calculator if you try to do it on the 35s.

I'd use a 33s before a 35s, and the 32sii tops both of them. But that's just my opinion, and we're all entitled to one.

Re: Amazing! An HP-32SII is faster than an HP-35s

*Message #16 Posted by **Miguel Toro** on 3 Aug 2011, 8:37 p.m.,*
in response to message #15 by Don Shepherd

I use this and this instead. The first is not in the manual (cannot be done in the 32sii, either) and the second is more accurate. TVM is not the only trick the 35s can do, financially ;-)

Miguel.

Re: Amazing! An HP-32SII is faster than an HP-35s

*Message #17 Posted by **Michael de Estrada** on 3 Aug 2011, 9:23 p.m.,*
in response to message #16 by Miguel Toro

Thing is, both the 32SII and 35s are scientific calculators, and that's how I use them. Anyway, I don't do a lot of fancy programming on either of those calculators; instead, I use my HP-50g.

But getting back to the topic of my orginal post, namely relative speed of these two calcs, I pulled up an example that is shown in the manuals for both calculators, finding the root of a cubic polynomial using the solver. Again, the 32SII is faster than the 35s, so it seems that in many real world ways the 35s is not an improvement.

Re: Amazing! An HP-32SII is faster than an HP-35s

*Message #18 Posted by **M. Joury** on 3 Aug 2011, 11:36 p.m.,*
in response to message #17 by Michael de Estrada

Michael,

While I like the 32Sii it is near the bottom of my list when I grab for a calculator so maybe I should just stay out of this :-). However, while it is true that the 32Sii is faster than the 35S in many areas this is largely due (as discussed earlier) to the greater number of data types that the 35S can handle.

So, the question becomes, aside from speed how else can these calculators be compared? Let's start by accepting the fact that the 35S has bugs that are problematic for some (so far I have not been effected by them) and that this in and of itself may make the 35S unusable for many. For those it may be that the 32Sii or the 33S are the only choices.

For me, however, programming capability is a big draw. I play with these things to program them. It has been many years since I have needed the "higher math" capability of any of my calculators (I think the last time was when I took my Astronomy Comprehensive Exams to graduate from college and that was more years ago than I am willing to share--I will say that the 41 I used back then was in it's relative infancy).

In the area of programming the 35S has many nice additions over the 32Sii and even the 33S.

1. A less cluttered keyboard thanks to the sloping face keys. At least I find it easier to use the keyboard on the 35S than I ever did on the 32/33 (leaving aside the really silly placement of STO as a shifted function).

2. Much more memory than the 32Sii. For some programs this is essential although I love trying to squeeze every last byte out of a program to make it fit in the 32.

3. Many more memory registers, although you have to address them indirectly. Depending on what you are trying to do this can be a huge plus.

4. Two indirect addressing register (I and J) instead of one. The 32/33 do get a little back here since, with them, the indirect register (i) is separate from the 26 primary registers while with the 35S the I and J registers are part of the 26 primary register set.

5. Can jump to line numbers. For example GTO A100. This allows much better utilization of the available memory than is offered by the 33S which is limited to 26 labels. Good luck trying to use all of the 32K available with 26 labels. I guess one could have lots (and LOTS) of equations. With the 35S one can have 26 separate programs labeled A-Z whereas this is not possible with the 32/33 for anything but the most trivial programs. At an extreme with the 35S one could even have multiple programs with a single alpha label.

6. The ENTER key is in the right place (this is a dig at the 33S and obviously does not refer to the 32Sii which also has it's ENTER key in the right place).

7. The arrow keys are primary which is a bonus when single stepping. In this case the 33S beats the 32Sii as it also has it's arrow keys in the primary plane.

I might be able to think of other features that are improved on the 35S but my point here is not to try to convince you that the 35S is better (as noted earlier it may not even be

usable for you) but to show that it does have certain advantageous features. Whether your requirements make use of these features is for you to decide and from what you said it would seem that the 32 suits your needs better and is the better solution for you.

Finally, as I stated earlier, the 32Sii is one of the LAST calculators I reach for. This is also true of the 35S. My calculators of choice are (somewhat in order) the 41, 42, 48 (S/X, G/X), and (believe it or not) the 39GS which I like playing with for a completely different set of reasons. The WP34S is also becoming a go-to machine for me (Thanks Pauli, Walter, and Marcus!) and, oh yes, I like the 17bii for it's solver. All these machines have one thing in common: Separate programs (functions in the 17bii) that can be named by multi-character labels that make it clear what the program/function is supposed to do. Maybe I am getting old but trying to remember what the program labeled 'A' is supposed to do just seems like too much trouble.

Cheers,

Marwan

You've never needed to checksum a program (for archival purposes e.g.)? That is one bug I think just about everyone who programs the 35s will have hit :-)

Is it a show stopper? No. However, it does indicate a carelessness of implementation that is unforgivable in what is supposed to be a precision instrument. Lets face it, long gone are the days when calculators producing dubious results is tolerable. They are ubiquitous and cheap. They should just work.

I'd even go as far as claiming that most if not all of the 35s bugs are indicative of such carelessness :-(

That all said, I actually quite like the 35s: lots of memory, decent keyboard, okay display. It isn't, however, my grab for calculator. To the extent I gave mine to one of my children for their entertainment.

*Message #20 Posted by **M. Joury** on 4 Aug 2011, 12:39 a.m.,*
in response to message #19 by Paul Dale

Yes, I am aware of the checksum bug, and yes, I guess it is one that does "concern" me. But as you say, not a show stopper. I guess, having programmed on so many machines that do not offer this feature, I never really missed it.

Although, again, I agree with you that the bugs in the 35S show a lamentable

carelessness, what I find worse is that those same bugs, to the best of my knowledge, have NEVER been fixed! That is truly a sad commentary on how much importance the developers place on their work. It would have been wonderful if the calculator was flashable and HP provided ongoing updates to cure it of it's ills.

Re: Amazing! An HP-32SII is faster than an HP-35s

*Message #21 Posted by **Paul Dale** on 4 Aug 2011, 1:06 a.m.,*
in response to message #20 by M. Joury

If it were flashable, the 34s would have used that as a basis instead :-)

>
> 1. A less cluttered keyboard thanks to the sloping face keys. At least I find it easier to use the keyboard on the 35S than I ever did on the 32/33 (leaving aside the really silly placement of STO as a shifted function).

Yes indeed, the arrangement of the functions/keys is way better on the 35s. I love the 32SII and got used to it, but the key assignment is somewhat strange. STO being a shifted function was no show-stopper to me. I don't use it often.

Re: Amazing! An HP-32SII is faster than an HP-35s

*Message #23 Posted by **bill platt** on 4 Aug 2011, 11:01 a.m.,*
in response to message #14 by Miguel Toro

The 33s did that, too, without messing up all the useful functionality of the32sii. In fact the 33s improved a few things, once the bugs were fixed--which HP did make sure to do.

in response to message #1 by Michael de Estrada

I have a HP-35s, but for everyday calculations I always find myself using unconsciouslessly either my old HP-11C or my newer (but old styled) HP-12C.

Who knows....

*Message #25 Posted by **Neil Hamilton (Ottawa)** on 4 Aug 2011, 1:08 p.m.,*
in response to message #24 by Antonio Maschio (Italy)

Antonio,

I find myself in the nearly the same situation (minus the 12C). My trusty old 11C, S/N from May '82 (and on my 3rd or 4th set of batteries!), is still my first choice for most calculations though my new crop of 34S machines (one at home, one at work) are what I am reaching for when I have to do HEX or logical stuff.

I must say that I love the complex math on the 35s. I find it more intuitive than the 42S (though I only have free42). I too miss the R->P and P->R functions but Pauli's published workarounds help out there.

I have an emulator for 15C on my iPad but find the complex math somewhat of a challenge to keep straight with the (effectively) limited stack (even with the parallel imaginary stack). The 34S takes a bit to get used to with the complex math but the 8-level stack sure helps.

I really can not get my knickers in a knot over the issues with the 35S. Probably because I don't use it for much programming. The keyboard is worlds ahead of the 33S and the display is positively lovely. If the form factor were smaller (and maybe landscape!) and it was flashable, what a machine it could become! Sigh!

A speed comparison of the 41CL versus the 41CX (and my first YOUTUBE video)

*Message #1 Posted by **Geoff Quickfall** on 2 Aug 2011, 6:36 p.m.*

The video captions say it all, and it is a short video!

For all of you, the calculator states are identical:

```
x-memory
program registers
storage registers
plug in xroms
plug in modules
```

The program uses synthetics and CCD functions along with an x-memory data base.

here is the link: speed comparison

Cheers, Geoff

p.s. I will try to make the next one a little more entertaining.

Edited: 2 Aug 2011, 6:41 p.m.

in response to message #5 by Marcus von Cube, Germany

Hi,

Really nice video, the video camera is perfectly fixe and the two calculator displays perfectly readable. It's not as easy as it seem to get it right.

So, I notice that the HP-41 on the right (CX) is much fair that the one on the left (41CL) because she adjust running time to leave you time to enter any data on the first one and only prompting you for an entry when you have already finish with the first one and are ready to process.

Did anyone else notice how the 41CX is spending all her time not to stress you by spreading too much result at the time and prompting you for entries without a delay?

Really, the 41CL is not good for stress and too fast at business, ...

And you know, the more you do at work, the more your boss ask you to do!

HP7470A plotter with the HP-IL interface

*Message #1 Posted by **Richard L. Taylor** on 2 Aug 2011, 1:19 p.m.*

Of all the user programs written for the HP41, how come there are very few if any, written for the HP 7470A plotter with the HP-IL interface using the plotter module?

Re: HP7470A plotter with the HP-IL interface

*Message #2 Posted by **Garth Wilson** on 2 Aug 2011, 1:43 p.m.,*
in response to message #1 by Richard L. Taylor

HPGL is just text, and you can write your own programs and don't need the plotter module, although I suspect it has functions in Mcode so it would run faster. There's a related topic at http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv019.cgi?read=148248 .

HP 41CL update from a user

*Message #1 Posted by **Geoff Quickfall** on 2 Aug 2011, 12:46 p.m.*

Well, what to say, where to start!

Monte Dalrymples package is superb.

I have just created a routine which will allow you to store in FLASH RAM up to four CALCULATOR-STATES protected from power loss and the dreaded "MEMORY LOSS".

For example, I have a set of routines which require 100 memory registers and 500 lines of programming. This set of routines requires reassigning of all the keys to specific sub routines. Also included are synthetic commands and synthetic routines which sort data and etc... I created this set of programs back in 1984 in the lab during my Palynology/Climate research.

Today I have as set of routines with SIZE=25 and 3 PRGM REG left over. Also an assigned set of keys:

Well I got a call the other day from my University supervisor asking about co-authouring an article based on my

data from 1984 so I dug up my Palynology Magnetic cards and lo and behold, they work.

Firstly, I copied my AVIATION suite of programs to the CL flash memory and then downloaded with the card reader my Palynology routines.

That got me thinking, HOW DOES ONE save multiple calculator states in a CL for future reference using a routine to automate the procedure.

Firstly a definition: CALCULATOR-STATE is the unique set of memory registers applicable to a specific set of duties; for example I have the requirement for two CALCULATOR-STATES:

```
AVIATION          280 PRGM registers used, x-memory data and asci files, key assignments
PALYNOLOGY        217 PRGM registers used, 100 STO registers required
                  x-memory alpha data, synthtetics, key assignments.
```

Another CALCULATOR-STATE state may involve the data stored in a number of registers such as a SURVEY routine. After collecting data, store the calculator state in a FLASH RAM address and then do the next days transect and store that CALCULATOR-STATE in another location.

So here is the routine and you can see how flexible the entire system is:

```
LINE    COMMAND                 DESCRIPTION

1.      LBL "YCTOF"             CALCULATOR TO FLASH
2.      TURBO50                 GO FAST
3.      "1: 0C9  2: OD1"        DISPLAYS CHOICE OF FOUR DIFFERENT LOCATIONS:
4.      AVIEW                   0C9000, 0D1000, 0D9000, 0E2000
5.      PSE
6.      "3: 0D9  4: OE2"
7.      AVIEW
8.      GETKEY                  USES THE KEYPRESS TO CHOOSE THE CORRECT SUB ROUTINE.
9.      "COPYING"               COPYING IS DISPLAYED UNTIL "DONE" APPEARS SO YOU DON'T
10.     AVIEW                         FREAK OUT WHILE IT IS RUNNING!
11.     GTO IND X               USED TO DIRECT THE PROCESS TO THE CORRECT SUB ROUTINE.
12.     LBL 72                  IF 1 SELECTED USE ADDRESS STARTING AT 0C9000.
13.     XEQ 20
14.     "0C9000"                ERASE THE ADDRESS BLOCK.
15.     YFERASE
16.     "800>0C9"               COPY THE CALCULATOR-STATE TO THE ADDRESS BLOCK.
17.     YFWR
18.     GTO 13
19.     LBL 73                  IF 2 SELECTED USE ADDRESS STARTING AT 0D1000.
20.     XEQ 20
21.     "0D1000"                ERASE THE ADDRESS BLOCK.
22.     YFERASE
23.     "800>0D1"               COPY THE CALCULATOR-STATE TO THE ADDRESS BLOCK.
24.     YFWR
25.     GTO 13
26.     LBL 74                  IF 3 SELECTED USE ADDRESS STARTING AT 0D9000.
27.     XEQ 20
28.     "0D9000"                ERASE THE ADDRESS BLOCK.
29.     YFERASE
30.     "800>0D9"               COPY THE CALCULATOR-STATE TO THE ADDRESS BLOCK.
31.     YFWR
32.     GTO 13
33.     LBL 62                  IF 4 SELECTED USE ADDRESS STARTING AT 0E2000.
34.     XEQ 20
35.     "0E2000"                ERASE THE ADDRESS BLOCK.
36.     YFERASE
37.     "800>0E2"               COPY THE CALCULATOR-STATE TO THE ADDRESS BLOCK.
38.     YFWR
39.     GTO 13
40.     LBL 20                  PLACES YFNS IN RAM SO YFERASE AND YFWR ARE AVAILABLE.
41.     062>80C
42.     YMCPY
43.     80C-RAM                 PLACES YFNS RAM IN TO PORT 1 LOWER.
44.     PLUG1L
45.     RTN
46.     LBL 13                  PLACES YFNS BACK IN PORT 1 L.
47.     "YFNS"
48.     PLUGIL
49.     DONE                    DISPLAYS "DONE" TO LET YOU KNOW THE ROUTINE HAS
```

```
50.     AVIEW                   FINISHED.
51.     END
```

• WHEN THE USER ABORTS THE ROUTINE AT THE ADDRESS LOCATION PROMPTS BY PRESSING “C” THE CALCULATOR EXITS THE PROGRAM IMMEDIATELY WITH THE DISPLAY “DONE”.

• WHEN THE USER SELECTS AN ADDRESS THE ROUTINE TAKES ABOUT 22 SECONDS TO COMPLETE AND “DONE” IS DISPLAYED WHEN THE ROUTINE IS COMPLETED.

Some standard caveats when dealing with any type of FLASH RAM:

DO NOT INTERUPT THE PROGRAM AS IT IS RUNNING, THIS IS DUE TO THE YFERASE AND BELIEVE ME YOU DO NOT WANT THE CONSEQUENCES ON YOUR HEAD!!!

MAKE SURE YOU HAVE A GOOD SET OF BATTERIES AS YFERASE IS VERY UNFORGIVING!!!

The upshot is that we are finding so many new and exciting ways to use the HP 41CL.

Last night, I loaded from withing the XROMs the CL has in its Library the ZENROM XROM. I saved 5 program registers just converting some commands to the synthetic equivalent.

I now have a QRG pocket PDF produced (if you want one, email me) which records which routines I need and in which XROM they are located.

My CL has the following XROMS loaded and displayed by CAT II:

```
1  -EXT FCN 2D
2  -CX EXT FCN
3  -TIME 2C      PHYSICAL TIME MODULE
4  -CX TIME
5  -PRINTER 3B   PHYSICAL IR MODULE
6  -YFNS 1C      CL FUNCTIONS (ALWAYS RESIDENT)
7  -CCD"OS/X     VIRTUAL XROM FROM RESIDENT XROM LIBRARY
8  C PPC 1981    VIRTUAL XROM FROM RESIDENT XROM LIBRARY
9  EXT IL ROM    VIRTUAL XROM FROM RESIDENT XROM LIBRARY
10 -CLUTILS 1H   ANGEL MARTINS CL UTILITIES ROM FOR THE CL!
   -SYS/EXT      ANGEL MARTINS CL UTILITIES ROM FOR THE CL!
```

The CLUTILS 1H XROM was loaded via Diego Diaz's CLONIX in a very simple procedure. However, some of the testers (and myself) are now experimenting with the serial port built into the CL and using a stereo jack in a port cover to RS232 on the computer. More on this later.

At any time I can swap out, or add more XROMS up to the standard limit of pages. YFNS must always reside in a 4K page so it stays in PORT 1 Lower. But that leaves 7 4K pages for 7 4K ROMS or 3 8K ROMS or, well you get the picture. The IR module and time module do not occupy the pages available for XROM images.

Well I can go on but...maybe later!

Geoff

oh, did I say it was fast!!!

Message to Diego Diaz about HP 41 flex PCB

*Message #1 Posted by **Alexander Oestert** on 2 Aug 2011, 8:57 a.m.*

Hi Diego,

I tried to contact you from your Clonix site about the replacement flex PCBs you are describing there. Are there still some you would sell? I would be glad if you could contact me about this via forum email.

Does anyone else know a source for flex PCBs to repair the HP 41? Can they be (easily!) DIYed? Is there another way to replace a corroded flexible PCB in order to have a working module compartment?

Thanks to all!

A.

WP34 S 2.1 released on SourceForge

*Message #1 Posted by **Marcus von Cube, Germany** on 2 Aug 2011, 7:00 a.m.*

We've updated the release package on SourceForge. As usual, it's still a beta package.

Serial I/O should now reliably work on devices without a crystal installed. If your calculator is a bit on the slow side, just enter 95 or some such as the percentage value for the real speed compared to the nominal speed before you use one of the serial I/O commands like RECV or SENDP. Values between 80 and 120 are valid. Other values are ignored, as is generally the case on the emulator or with the crystal installed and activated.

To determine the speed, time a short loop CLx; INC X; BACK 01 for 30 seconds. The result should be about 191000. To get the correction factor for your calculator, divide the actual value by 1910.

Re: WP34 S 2.1 released on SourceForge - installing the library

*Message #2 Posted by **Marcus von Cube, Germany** on 2 Aug 2011, 4:23 p.m.,*
in response to message #1 by Marcus von Cube, Germany

You may have noticed that the commands 'TVM' and 'WHO' had to be removed from the image due to space reasons. But not all is lost! Leave the calculator connected to the cable and transfer the newly available library file wp34s-1.dat via the serial interface:

Start the emulator with the file in its directory so it is automatically installed in region 1. CAT should show a bunch of alpha labels. A file wp34s.ini needs to be in the same directory with the name of the COM port in the first line of the file. Mine reads COM9: which is the same port that is used by SAM-BA. Quit SAM-BA before you attempt to use serial I/O on the emulator.

Now start RECV on the calculator. It's located in P.FCN as are the other I/O commands. If you have the crystal modification installed, activate it first for better reliability, if not you may need to provide a speed correction factor in X as mentioned in the previous post.

On the emulator, the new command SENDL with an argument of 1 for the library region sends the file to the calculator. "OK" should be displayed on the emulator and "Program" on the calculator. Disconnect the cable after the successful transfer as it draws power from the batteries.

Now issue the command PSTO 1 (or any other area) to save the library in flash. The program memory may be cleared for your own use thereafter.

Enjoy!

P.S.: My modified WP 34S (a former 30b) with its FTDI 3.3V cable worked perfectly fine with SAM-BA and the I/O commands. No need to connect the programming cable. Just a paper clip for the necessary reset after flashing was needed. :-)

Edit 1: I've heard of a case where the calculator runs only at 80% nominal speed and is unable to communicate via the interface. I'd be interested to hear from your experiences.

Edit 2: The serial commands have moved from X.FCN to P.FCN in the most recent upload as of today.

OT: Help with Testing Random Number Generators

*Message #1 Posted by **Namir** on 1 Aug 2011, 12:05 p.m.*

Hi All,

I am interested in learning about testing for high performance random number generators that can be used in Monte Carlo methods. Such methods require "Rolls Royce" versions of RNG and not you regular "Ford" versions (apologies to car makers for comparison).

Any good links to such tests?

Thanks!

Namir

Edited: 1 Aug 2011, 12:06 p.m.

Re: OT: Help with Testing Random Number Generators

*Message #2 Posted by **spb** on 1 Aug 2011, 5:57 p.m.,*
in response to message #1 by Namir

The standard starting point for serious randomness testing is probably Marsaglia's diehard tests. It is over a decade old, and it doesn't include some modern approaches (phase space visualisations, for example), but it's probably a pretty good starting point.

What's the application? It isn't really meaningful to talk about any measure of randomness in the abstract; you can only meaningfully talk about whether some measure is suitable for a particular application, threat model, or whatever.

Re: OT: Help with Testing Random Number Generators

*Message #3 Posted by **allen** on 1 Aug 2011, 7:07 p.m.,*
in response to message #1 by Namir

Chapter 3 of TAOCP is devoted to RNG entirely. Although I'm sure other people have done more recent work, it's still worth the 175 pg read.

Re: OT: Help with Testing Random Number Generators

Reviews about loose keys: Is it really that bad?

*Message #1 Posted by **Lode** on 1 Aug 2011, 8:34 a.m.*

In the reviews of recent HP calculators, it is often mentioned that keys get loose and don't register, so numbers you type might miss some digits etc...

I'm wondering: is it really that bad, or are the reviews exaggerated?

I've got this old Ti calculator with rubbery keys. These keys are annoying and mushy compared to the nice clicky keys of several HP calculators. However, after 6 years of spending in a secondary school backpack and heavy use, and living on many years after that, the keys of this Ti still work and register every press.

So this Ti definitely has very cheap keys. But they don't break or get loose.

So is it really true that HP has managed to make keys that are even worse than this Ti, and break after just a few months, on its recent models?

Thanks.

Is there something wrong with my post? I didn't want to troll in any case. Please let me know how I can improve my posts and I'll take it into account. Thanks.

Re: Reviews about loose keys: Is it really that bad?

*Message #4 Posted by **Marcus von Cube, Germany** on 1 Aug 2011, 10:17 a.m.,*
in response to message #3 by Lode

To me, your post looks perfectly ok. I don't understand Michael's humor. ?-(

Back to the key question: The mechanics of the very first HP calculator keys are quite sophisticated, say expensive. With a retail price of several 100 dollars this is no problem. When prices dropped, cheaper mechanics needed to replace the former key construction. HP has managed (at least to some extent) to preserve the typical feel of the keys but in some cases not the durability. I've a 71B with a sunk key. It still works but there must be something broken inside.

TI and other manufacturers have had a similar problem. The keyboards of the SR-50(A) and its twins were quite good. The step to the cheap TI-30 construction (carried over to the high end TI-59) was a disaster. Bouncing keys everywhere. :-(They learned their lesson and switched to the mushy but reliable rubber dome technique. The keys are quite reliable but the feeling is a bit less pleasing then it could be.

HP-71B keys are reliable

*Message #5 Posted by **Vladan Dugaric** on 1 Aug 2011, 11:03 a.m.,*
in response to message #4 by Marcus von Cube, Germany

it is the neoprene membrane between the key and the snap dome that got a hole in it and that is why the key is sunk.

I opened mine and de-staked keyboard from case, turned rubber membrane over (it is slightly asymmetric, so now the key hits a slightly different place on the membrane and all keys are fine now), then re-staked the keyboard.

You can only do this once, though, if you don't want to reconstruct the heat stakes.

Vladan

in response to message #5 by Vladan Dugaric

Vladan, thanks for the tip. I'll leave it untouched for the time being except when more keys start to sink in.

Re: Reviews about loose keys: Is it really that bad?

*Message #7 Posted by **Don Shepherd** on 1 Aug 2011, 10:41 a.m.,*
in response to message #1 by Lode

I don't have the most recent HP10bii+, but I think people have said that its keys are fine. I do have a 30b and 12c+ from the last two years, and those keys are great.

Re: Reviews about loose keys: Is it really that bad?

*Message #8 Posted by **John B. Smitherman** on 1 Aug 2011, 10:59 a.m.,*
in response to message #7 by Don Shepherd

Lode, I have trouble with the 35s recognizing keystrokes if I try to press the keys too quickly. Slowing down improves the accuracy.

Regards,

John

Re: Reviews about loose keys: Is it really that bad?

*Message #9 Posted by **gene wright** on 1 Aug 2011, 12:08 p.m.,*
in response to message #8 by John B. Smitherman

I believe that is due to the keyboard processing routines in the internals of the unit, and not the

keyboard itself.

As far as I know, the 35s keyboard really does not miss keys, but if you press them VERY VERY fast, it appears the scanning routines can miss a keystroke.

And, that is a somewhat educated guess on my part.

Re: Reviews about loose keys: Is it really that bad?

*Message #10 Posted by **Lode** on 1 Aug 2011, 12:17 p.m.,*
in response to message #9 by gene wright

I don't seem to have any problems at all with the 35s keys. I can press them as fast as humanly possible and they all register. The only minor issue is that the "+" key makes a different sound than all the other keys...

Re: Reviews about loose keys: Is it really that bad?

*Message #11 Posted by **Thomas Radtke** on 1 Aug 2011, 1:07 p.m.,*
in response to message #9 by gene wright

> Quote:
>
> I believe that is due to the keyboard processing routines in the internals of the unit, and not the keyboard itself.

I thought the same. But after about one year of moderate use, the Arrow-Up key failed to register reliably. You hear the click, but got a response only after pressing slightly harder. As other keys are ok, probably this is due to the strange arrangement of the curser keys and the fact that they aren't hinged.

Much more of a desaster is my 20b, on which all keys need a firm press to register.

Hopefully other HP calculators do better.

Re: Reviews about loose keys: Is it really that bad?

*Message #12 Posted by **Marcus von Cube, Germany** on 1 Aug 2011, 6:31 p.m.,*
in response to message #11 by Thomas Radtke

Thomas, it would be interesting to see if the keyboard of your 20b becomes more responsive with the 34S firmware. If yes, the HP firmware may be part of the problem.

Re: Reviews about loose keys: Is it really that bad?

*Message #13 Posted by **Thomas Radtke** on 2 Aug 2011, 6:55 a.m.,*
in response to message #12 by Marcus von Cube, Germany

I installed it once, but haven't noticed any improvements on this. It's probably about *how* the keys are pressed. There's no guidance, and it literally feels like balancing the keytop on this rubber dome when touching any 20b key.

Anyway, the 20b doesn't have a good concept mechanically at all. Function follows form. Looks great, works terribly. And that's really sad, since it is small and has an excellent LCD. A 30b without the extremely bevelled edges would have been a good thing, imo.

Re: Reviews about loose keys: Is it really that bad?

*Message #14 Posted by **Katie Wasserman** on 1 Aug 2011, 1:04 p.m.,*
in response to message #7 by Don Shepherd

Yep, the keys on the 10bii+ are quite nice. No missed keystrokes, and all have nice "click" with just the right amount of force needed to activate. But I slightly prefer the keys on the 12C+ with their higher profile and longer travel.

Re: Reviews about loose keys: Is it really that bad?

*Message #15 Posted by **Bart (UK)** on 2 Aug 2011, 5:42 a.m.,*
in response to message #14 by Katie Wasserman

I have the 10bII in that shape (i.e. the second version), and find it quite nice. The keys are a bit lower than the 12C & 12C+, but still good none the less. Apparently it is the fisrt 10bII (brown model) that is quite bad - but I do not have personal experience of that.

Re: Reviews about loose keys: Is it really that bad?

*Message #16 Posted by **M. Joury** on 1 Aug 2011, 11:08 a.m.,*
in response to message #1 by Lode

I have used many of the recent HP calculators including the 12C+, 12CP, 14Bii, 35S, 20B, 30B, and all the graphing calcs and so far the only one I have had problems with is the 20B which has a mushy key feel and does not always register for me.

To add a disclaimer... I have not used any of these machines the way I used (and still use) my HP-41 and so long term reliability is still an unknown for me.

Hello!

> Quote:
>
> So is it really true that HP has managed to make keys that are even worse than this Ti...

Some series of HP-48s have entire rows of keys failing (I also have one of those...), something that I have never seen in any other brand of calculators. The reason however lies not in the keys themselves, but in the poor connection between the keyboard and the main PCB. The construction of the calculator makes it very difficult or almost impossible to repair this simple fault.

loose keys: Is it really that bad?

*Message #18 Posted by **bill platt** on 1 Aug 2011, 11:52 a.m.,*
in response to message #17 by Maximilian Hohmann

A long time ago I read an article on how to fix this problem. You can actually take the 48 apart without

destroying anything. The pressure pad under the zebra connector is the problem.I have one machine with this problem. If I press on the faceplate, above the F button, it works perfectly.

I also heard from someone else that merely taking the batteries out and soaking in distilled water, then drying for a week under a fan, will do the trick. Doesn't sound permanent though. I haven't been able to find either of these old posts or writings and I am too impatient to care (and have too many 48 machines that work fine anyway).

Problems with the 35s keys not registering were quite different from the old "TI-itis" of the 1970s. Problems with the 1st batch of the 49G+ were mechanical in nature and were remediated by a key-rubbing process, though a warranty replacement was offered if I remember correctly. HP changed them to work better and then made the 50G and that apparently made the problem go away completely. I don't have a 50G and never even held one in my hand.

Re: Reviews about loose keys: Is it really that bad?

*Message #19 Posted by **Nigel J Dowrick** on 1 Aug 2011, 4:35 p.m.,*
in response to message #1 by Lode

I think that the **real** low point was the HP-49G+, released in 2003. At the time this was the highest of HP's high-end calculators, with sophisticated software and expandability. However its keyboard felt and sounded like a cheap toy and was equally (un)reliable. The machine was unusable. Since then HP has released the HP-50g, with similar features and (in my view) an entirely satisfactory keyboard. If it's this machine you are thinking of buying, you'll have no problems. The same is true for most recent machines (the HP-20b and the HP-35s are the only two with question marks over them so far as I know, and my HP-20b works fine).

I don't understand the comment about Belgium either!

Nigel (UK)

Merged Steps?

*Message #1 Posted by **Tim Wessman** on 1 Aug 2011, 1:00 a.m.*

Ok, I feel really dumb for asking this, but I am definitely one of the younger generation and never really used RPN programmables. The 49 was where I really cut my teeth. With the talk of the wp34 i keep seeing "merged program steps" and wasn't 100% certain I understood that.

Does "merged steps" just mean encoding the f or g into the byte with the keycode as well? Would things like GTO then just take an extra byte for the number part? What other commands would require more space? Would there ever be a 3 byte command?

For a simple example, if you have a calc with 100 merged steps this means you could do 100 simple steps, or 50 more complicated ones (yeah, not useful, but I am just checking my understanding).

Thanks for clarifying my ignorance! :-)

TW

Re: Merged Steps?

*Message #2 Posted by **David Ramsey** on 1 Aug 2011, 1:08 a.m.,*
in response to message #1 by Tim Wessman

Yes, "merged steps" means multiple keystrokes only take one program step.

Under the hood, this means designing an instruction set that can handle all possible valid keystroke combinations, and then encoding/decoding keystrokes so that something like "STO IND 04" can be represented in one instruction.

The concept's only valid on keystroke-programmable calculators; for calcs like your 49 that have an actual programming language, it's not an issue.

Re: Merged Steps?

*Message #3 Posted by **Eric Smith** on 1 Aug 2011, 1:18 a.m.,*
in response to message #1 by Tim Wessman

The HP-12C is a fair example of "merged program steps". Anything that can be a program line in a 12C occupies exactly one byte of program memory, and there are no multi-byte instructions.

I'm not sure whether that's true of the 12c Platinum.

Re: Merged Steps?

*Message #4 Posted by **Tim Wessman** on 1 Aug 2011, 1:27 a.m.,*
in response to message #3 by Eric Smith

Hmm. I could see that working fine on the 12c due to the limited nature of things. I am guessing the 15 has some multibyte commands then since it had quite a bit more memory.

Dunno what the 12cp does. Since it was done by china and I've looked at the 35s code, I doubt it is pretty!

Yes, it would, but apparently it did not:

```
Specifications
Memory
Memory registers
65
```

Re: Merged Steps?

*Message #8 Posted by **robert rozee** on 1 Aug 2011, 2:00 p.m.,*
in response to message #7 by Gerson W. Barbosa

but if it is using a simulator to run the original 15c rom image, then all one needs to do is get a copy of the firmware, patch it as documented elsewhere, and the extra memory will be there.

of course, this would require HP to make available the firmware, which they are only likely to do if a bug is found, necessitating making a replacement available...

Re: Merged Steps?

*Message #9 Posted by **Gerson W. Barbosa** on 1 Aug 2011, 3:15 p.m.,*
in response to message #8 by robert rozee

Now that speed is not a problem anymore, double memory should be the next goal. It this can be achieved with a simple firmware patch, so much the better. I'd like the 15C to be able to solve at least a 3x3 complex linear system. It does, but then programs are limited to about 150 steps and 11 memory registers (R0

through R9 plus I) when complex mode is set. Not so bad, but it could be better.

Who said "65 registers is all you'll ever need"? :-)

Re: Merged Steps?

*Message #11 Posted by **Paul Dale** on 1 Aug 2011, 1:27 a.m.,*
in response to message #1 by Tim Wessman

A calculator with non-merged steps pays one step of programming memory for each key stroke. The very earliest programmables are in this category as is the 30B.

Fully merged means that every possible instruction takes a single step. e.g. the 34C, 11C, 16C.

Then there are partially merged where some commands are merged even though they are multiple keystrokes and some aren't. The 65 and 15c fall into the category.

The 41 series kind of mixed things up by having properly variable length instructions -- many commands are one byte, those with an argument are two and ones with text arguments or text itself are longer. Talking about merged steps here starts becoming meaningless. The 42S must have extended this scheme to fit all its functions in.

The 34S is strictly partially merged. Although, for most intents and purposes, fully merged is more appropriate. The only instructions which aren't a single step are those that take an alpha argument. i.e. alpha labels and commands that use alpha labels. All other commands including those that reference numeric and hot key labels are a single step. This is regardless of the number or type of key strokes required to access them and regardless of the argument or if indirection is being used. I managed this by increasing the op-code size to sixteen bits: we've 26489 legal op-codes currently and 504 distinct commands.

- Pauli

Re: Merged Steps?

*Message #12 Posted by **Tim Wessman** on 1 Aug 2011, 1:32 a.m.,*
in response to message #11 by Paul Dale

Yeah, 16 bits would definitely give the needed space. :-)

I was wondering how so much was getting put in a "merged" step thinking that meant 8.

TW

Re: Merged Steps?

*Message #13 Posted by **Paul Dale** on 1 Aug 2011, 1:39 a.m.,*
in response to message #12 by Tim Wessman

We're close to having used half of the sixteen bits and it wouldn't be hard to envisage needing a lot more on a device with extra RAM.

Right from the start I decided that the op-codes would have to be larger than eight bits and sixteen is the next natural size. We've got more distinct functions than will fit in a byte and I thought this would be the case well before implementing many of them. So either I'd need a system of command prefixes and more code in the instruction decode state machine or a longer word size.

I'm surprised you didn't look at the sources to answer your step related questions ;-)

- Pauli

Re: Merged Steps?

*Message #14 Posted by **Tim Wessman** on 1 Aug 2011, 1:51 a.m.,*
in response to message #13 by Paul Dale

Why bother when I can just ask? ;-)

Also, I tend to try avoiding looking at sources if possible to anything remotely close to a calculator. Saves the potential of ever being influenced by something I see and potential legal issues if someone ever claims something was copied.

Fair enough. The lawyers rule as usual :-(

I can't think of anything in the 34S you would want or need to copy -- you've got the hardware support and power management, you've got a trustworthy maths library. The keyboard decode and instruction execution aren't anything special. Our floating point format is more compact but part of the IEEE standard. We do some clever things with function pointers to save space (128Kb even aligned instruction addresses fit into 16 bits :-) but again nothing a competent embedded software guy wouldn't be able to do. And everything is open source and meant to be read.

Still I do understand where you're coming from.

- Pauli

Re: Merged Steps?

*Message #16 Posted by **Katie Wasserman** on 1 Aug 2011, 1:57 a.m.,*
in response to message #12 by Tim Wessman

The 32s/ii is a great example of a fully merged programmable calculator. It puts all functions into one step taking 1.5 bytes and includes small integers (0 thru 254) in that as well. Furthermore it stores all other numbers in packed format so that they take a fixed amount of space and appear as one program step too. This means that the number 100 takes 1.5 bytes and that the number 1000 takes 9.5 bytes, and the number 1.23456789012E123 also takes 9.5 bytes. While this might seem like a waste for numbers like 1000, in practice this calculator is extremely efficient with program storage and extremely easy to program.

Re: Merged Steps?

*Message #17 Posted by **Paul Dale** on 1 Aug 2011, 2:06 a.m.,*
in response to message #16 by Katie Wasserman

This would put the 32s/ii into the partially merged category wouldn't it? Likewise, the equations/prompts in programs are a single step but multiple "base units".

Still, one of my favourite calculators BTW.

It could be that I'm not understanding your comment correctly but.....

I don't think that "fully merged" was ever meant to include arbitrary length string data like equations and alpha prompts, how could it unless string data were simple stored outside of the code stream and be pointed to by the code. Non-base 10 numbers work the same as base 10 numbers on the 32s/ii taking up 9.5 bytes each. You could argue that it's not fully merged becasue numbers are 9.5 vs 1.5 for everything else, but I'd extend the meaning to "fully merged" to allow for this.

I can't think of any calculator that makes better use of memory.

Re: Merged Steps?

*Message #22 Posted by **Thomas Chrapkiewicz** on 1 Aug 2011, 8:45 a.m.,*

Yeah, and the key codes made sense, representing the row and column number of the key. To my horror, on the 9810, the key codes are essentially random. And no, nothing's merged.

Yeah it's seemingly random and it's in octal so only the digits 0 thru 7 seem to make any sense at all. OTOH if you have the Printer Alpha ROM you can read the mnemonics which makes programming much easier. The blindingly fast speed of this beast helps compensate for the lack of merging of keystrokes.

Re: Merged Steps?

*Message #25 Posted by **Tony Duell** on 6 Aug 2011, 4:39 a.m.,*
in response to message #24 by Katie Wasserman

The HP9810 keycodes make a certain amount of sense -- to the machine, but not to the user.

They are 6 bit numbers, hence 2 octal digits. They are the keycodes sent by the keyboard, and the codes stored in the logically 6-bit wide program memory (this memory is physcially 3 bits wide, consisting of 3 1103 DRAM chips, each keyciode occupies 2 consecutive loctions in the physical DRAM, odd-numbered bits in one location, even numbered bits in another. No I've not just been reading the current Datafile...)

You can work out the keycodes from the keyboard schematic diagram of course, but I will agree a Printer Alpha ROM is very handy...

Re: Merged Steps?

*Message #26 Posted by **Bart (UK)** on 1 Aug 2011, 10:43 a.m.,*
in response to message #1 by Tim Wessman

I think that the concept of merged program steps really "comes into its own" in fixed-number-of-steps key-stroke programmable calculators. I also wish to differentiate from RPN programmable and key-stroke programmable (i will explain later).

Being a *slightly* younger member of the forum, my first programmable calculator was the 28C, i.e. RPL like your 49. However, later I obtained the 20S on which I learnt key stroke programming. It is an algebraic, but I think the same concept of key-stroke programming holds for RPN calculators with key-stroke programming too.

A key-stroke programmable just records the actual key strokes and plays the back as if the keys were being pressed by the user. So unmerged step programming would result in e.g. shift-asin to be 2 program steps for one function. Some of the first models had some merging e.g. "STO 1" & "RCL 1". Now the 20S has 99 programming steps, irrespective of number

of keystrokes per step. So being fully merged, you basically have one program step for a function such that things like "Lshift-hyp-sin" are three steps merged into 1 line, allowing the user much more efficient use of space (numbers take 1 step per digit, therefore it's more efficient to load constants for a program into memory registers - e.g. the 20s does not share prog & register memory).

Now, the 32s was mentioned, this has RPN programming. The concept of "merged steps" becomes mory fuzzy. Again a single function per line, but now the function name or symbol is diplayed e.g. 10^x or SINH. However, the 32s counts bytes, all functions are defined and use 1.5 bytes, as do numbers from 0 to 99. Now, to have a number say 100 in the program costs 9.5 bytes, so it is "cheaper" to do e.g.:
...
A02 10
A03 x^2
...
this "unmerges" steps but only uses 3 bytes compared to 9.5!

As mentioned, the 32s diplayes the function name or symbol, key-stroke programmables display all the key-codes of the keys used to access the function, in the one merged line. e.g. this pic on wikipedia: HP20s.jpg displays the keycodes for Rshift-LBL-A. Do these point to a reserved function thus using a fixed number of bytes? Or is there enough memory for the max. number of keycodes per line * max number of available lines? I don't know.

The 35s of course adds even more complexity to it's programming, allowing whole formulas to be put on one line - but this is not merged program steps, it just eats memory. Of course, where lines refer to a function accessed using multiple keystrokes, it is a merged step.

Anyway, a long post revealing my personal observations made by playing around on various programmables.

-Bart

Re: Merged Steps?

*Message #27 Posted by **gene wright** on 1 Aug 2011, 12:14 p.m.,*
in response to message #26 by Bart (UK)

Some of the early TI programmables were really really bad at using memory locations for program steps.

INV SIN took two bytes or program steps.

The 30b does something similar.

Essentially (to me) it is as if a non-merged step calculator program is recording and playing back a macro instead of encoding the actual instruction to be executed.

Pressing g GTO 09 on the 12c requires pressing 4 keystrokes but is encoded as one byte and takes one step.

On the very early SR 52, GTO 174 would take 4 steps of the available 224, which made it very tough to program.

Re: Merged Steps?

*Message #28 Posted by **Andrés C. Rodríguez (Argentina)** on 1 Aug 2011, 3:55 p.m.,*
in response to message #1 by Tim Wessman

Merged steps were introduced in the HP-25, IIRC. Around November 1975, HP published a 2-page ad in Popular Electronics magazine (that's the one I had, perhaps there were other similar in other magazines) in which the HP-25 was introduced. The HP-25 was shown as a new programmable, with the HP-65 and HP-55 behind it in the main photo.

The HP 25 has only 49 program steps, but introduced what was then called "key phrases", meaning something similar to the "merged steps" of our time. As the possible commands were less than 256, each operation used just one byte, but this was not the main concern. Nobody was counting bytes, but we were surely counting the very scarce steps (or program lines).

I never had a 65 or 55, so this is not from direct experience, but I understand that a command like "GTO 33", "FIX 9" or "STO + 5" needed more than one program line (or step) on those models. In the HP 25, such operations take just one program step each.

The display showed the program line number on the left side and up to three keycodes (row and column, except for digits). For instance, if program step # 18 contains "GTO 10", the diaplay will show "18 13 10".

It's interesting to see how the available 256 opcodes were assigned to the possible operations on the HP-25.

We had:

```
10 digits
10 FIX
10 SCI
10 ENG
08 conditionals
50 GO TO (GTO 00 was a special case)
06 trigs
02 >Rect & >Polar
01 Pi
04 logs
02 square and square root
01 power
02 1/x and %
02 INT and FRAC
01 ABS
03 Sigma +,- and clear sums
02 Mean and Sdev
04 Basic Math
08 RCL
08 STO
32 STO arithmetic
03 Programming (STOP, PAUSE and NOP)
07 Stack & registers (Enter, x<>y, Roll Down, CLx, CHS, EEX, LASTx)
02 Clear Stack and Clear Regs
01 Decimal point
02 HMS and HR
03 Angular modes (DEG, RAD, GRAD)

194 in total.
```

Such an arrangement leaves some opcode space free, which was put to use on the HP-29, but with many differences. For instance, having more registers and 98 program steps would not permit keeping the same scheme. Label addressing (instead of step number addressing) and secondary registers were some of the measures taken to keep opcode space. On the HP 67, the usage of register bank switching via the "P<>S" operation, and the separation of display mode and number-of-digits choice also were measures to keep opcode space (DSP 0-9 and FIX-SCI-END consumed only 13 opcodes, instead of the 30 needed before).

Disclaimer: These data are just from my memory as I'm writing this answer, and are believed to be true; but I'm not doing research to fully support them, so there may be some inaccuracies. Detailed and precise information about opcodes in those old models are to be found in Eric Smith's works and also in articles in his web site.

Re: Merged Steps?

*Message #29 Posted by **Jake Schwartz** on 1 Aug 2011, 7:47 p.m.,*
in response to message #28 by Andrés C. Rodríguez (Argentina)

In that same month, the November 1975 HP Journal had a nice Woodstock article, including a discussion of HP25 programming with merged keystrokes and "key phrases":

ory. Eight comparisons allow the program to react depending on the data in the calculation stack. Together with the GTO (Go To step number) operation, programs can branch and loop based on numeric results. A function that is new to pocket calculators is PAUSE. When encountered in a program, the calculator stops for a second, displays the most recent result, and then continues the program. This is useful when programming iterative functions because one can

Fig. 3. *HP-25 Programmable Scientific Calculator*

HP-25 Programmable Scientific

The HP-25 was originally conceived as an advanced scientific calculator. It was specified as having 2048 microinstructions, twice as many as the HP-21. Also, it was to contain a new integrated circuit, a sixteen-register data storage chip. Because of improved microinstructions and experience gained by microprogramming the HP-21, the HP-25 finally appeared not only as a scientific calculator with many more functions than the HP-21, but more importantly, with 49 steps of user programming.

The real power of the HP-25 is its easy programming. The programming is based on key phrases rather than keystrokes. A key phrase is simply a sequence of keystrokes that together perform one function or operation. For example, both f SIN and STO + 5 are key phrases, but they contain two and three keystrokes, respectively. The program memory contains numbered locations for 49 key phrases. When the user writes a program, the calculator merges keystrokes into key phrases and stores the instructions in program memory.

Editing a program is particularly easy. In program mode, the display shows the step number and the key phrase stored there (see page 6). The key phrase is displayed as the row-column coordinates of the keystrokes that make it up. The digit keys are represented by a zero followed by the digit, and the other keys are described by a row digit followed by a column digit. For example, the f key is in the first row of keys and the fourth column, so its coordinate is 14. The key phrase f SIN appears as 14 04, and STO + 5 appears as 23 51 05.

One innovative feature of the HP-25 is the behavior of the SST (Single Step) key in run mode. This key was designed to help the user debug programs. It allows the user to execute his program one key phrase at a time. When the SST key is held down, the display shows the line number and the key phrase that is to be executed next. Releasing the SST key executes just that key phrase, and the numerical results appear in the display. This new feature makes debugging programs quite easy because the user can tiptoe through his programs, seeing both the key phrases and their results, one phrase at a time. The display when the SST key is held down includes the step number, so checking program flow and branching is easy.

The HP-25 contains a number of functions that make programming simpler. In program mode, the SST key and the BST (Back Step) key allow the user to step forward and backward through the program memwatch the function converge or diverge.

The HP-25 has line-number-based static programming. Key phrases go into numbered locations in memory, overwriting the previous contents. Branching in the program is to the step number of a phrase. This is in contrast to the HP-65 type of programming.[3] In the HP-65, keycodes shift around in the unnumbered memory as steps are inserted and deleted, and branching goes to label keycodes contained in the memory.

The HP-25 merges keystrokes into key phrases using a microcoded finite state machine. The machine carefully checks for undefined key sequences. When a valid key phrase is completed, an eight-bit code is fabricated. If the calculator is in run mode, the code is immediately decoded and executed. In program mode, the code is copied into the program memory and then decoded to generate the row-column display. The data registers used for program storage are 56 bits long. Each register can contain seven key phrase codes. Seven such registers comprise the program memory, so all together there are 49 key phrase locations.

The HP-25 contains a data storage integrated circuit with sixteen registers of 56 bits each (14 BCD digits). Seven registers are for user programming, eight are for user data, and one is used for the LAST x function.

Another innovative feature of the HP-25 is a new mode of formatting the displayed result, called engineering notation. This is a selectable format that makes calculated answers easier to understand. Imagine a problem that deals in physical units of measure, such as seconds. Say the answer to the problem in scientific notation is 5.00 −05. Now this is a valid answer, but not as clear as it could be. Setting the HP-25 into engineering notation gives the answer as 50.0 −06 which is easy to read instantly as 50 microseconds. Engineering notation forces the power-of-ten exponent to be a multiple of three and adjusts the decimal point to give the correct answer. If the above answer is multiplied by 10, it gives 500. −06 or 500 microseconds. Multiplying again by ten gives 5.00 −03 or five milliseconds.

in response to message #1 by Tim Wessman

Funny how one's perspective changes. When discussing merged program steps I now instantly gravitate to the memory efficiencies discussed above. But when I started out with the HP-25 it only meant a nice improvement in the LED-based user interface, particularly to someone just learning programming.

Also, I'd like to take this opportunity to note that "Merged Steps" would have made an awesome name for a 80's dance band.

Bob

WP34S: more direct LBLs and XEQs

*Message #1 Posted by **fhub** on 31 July 2011, 10:43 a.m.*

Hi,

I've just seen that now almost all 1-letter labels can be used directly - an excellent improvement! :-)

But maybe even one more could be added, and that is X. This X is on the decimal point, and this point is not used when entering other numeric labels, so it could be added, too.
Well, at least if I haven't overlooked something ... ;-)

Franz

Re: WP34S: more direct LBLs and XEQs

*Message #2 Posted by **Marcus von Cube, Germany** on 31 July 2011, 12:59 p.m.,*
in response to message #1 by fhub

You have overlooked something. GTO.nnn moves the PC directly to a step number. This isn't a programmable command but its existence makes it impossible to input a GTO X statement. And a label which cannot be reached by all available commands is not as useful as it could be. So we decided to leave this one out.

BTW, the change triggered another change because we have again exhausted all flash. In order not to lose another library region, I have started moving things from XROM to a default library. 'WHO' is already gone from XROM and TVM will leave next. They are not lost but you need to install a library file on the emulator or the device to get them back.

Edit: The change is in (TVM and an enhanced WHO are now in a library.)

A new command, LSEND n, directly sends a library region from the emulator to the calculator (where it arrives in RAM first). The command name may change later but the function will likely not.

*Message #6 Posted by **Paul Dale** on 31 July 2011, 5:21 p.m.,*
in response to message #1 by fhub

Very observant :-) These extra labels haven't actually been properly agreed on yet :-) They've been implemented as a proof of concept only at this stage.

However, I'd expect them or something similar to stay since they seem to be quite useful.

We can change the names of the labels freely so long as they remain a single character. Arithmetic labels anyone?

*Message #11 Posted by **Marcus von Cube, Germany** on 31 July 2011, 6:33 p.m.,*
in response to message #10 by fhub

The goose will fly from right to left if you discover the secret key combination. :-)

To get this on track again: We will NOT have the possibility to make '+' doing anything different than adding X to Y and leaving the result in X.

Except...

Except if you precede it with some other key like XEQ. In fact, the newly available label Z

is just designed for this purpose. Write something sensible behind the label Z and it will be executed when you press XEQ +. Easy and useful I'd say.

Re: WP34S: more direct LBLs and XEQs

*Message #12 Posted by **Paul Dale** on 31 July 2011, 6:37 p.m.,*
in response to message #11 by Marcus von Cube, Germany

Marcus is right. The arithmetic keys won't change their behaviour. Precede them with XEQ and a routine will be called. I was suggesting the name of that routine be '+' instead of 'Z' as the example.

- Pauli

Yes, and it's very comfortable as it is.
I was just afraid that by this 'arithmetic labels" it was meant that this LBL Z should be rnamed internally to LBL +, and we had to write LBL + or XEQ + then in a program. THIS would look a bit strange (if not ugly).

Re: WP34S: more direct LBLs and XEQs

*Message #14 Posted by **Marcus von Cube, Germany** on 31 July 2011, 6:45 p.m.,*

15C LE - official statement?

*Message #1 Posted by **Thomas Radtke** on 31 July 2011, 3:55 a.m.*

Sorry if I missed it in the various 15C LE threads: Is there an official statement about the 15C Limited Edition? SC still lists my preorder at $94.99, but pulled the 15C LE from the product page.

Will it appear in 2011, or can I forget about the preorder.

Thanks.

Re: 15C LE - official statement?

*Message #2 Posted by **Michael de Estrada** on 31 July 2011, 8:49 a.m.,*
in response to message #1 by Thomas Radtke

I think we have all jumped the gun on this and ignored statements made by those who truly have meaningful knowledge of the inner workings at HP. Two weeks ago Tim Wessman made the statement:

> Quote:
>
> There is no 15c launched in Japan, or anywhere else.

To me that is about as official a statement concerning the status of an HP 15C Limited Edition as you are likely to get.

Re: 15C LE - official statement?

It is NOT reasonable to expect HP, or any large company, to comment on unannounced products, even if there may have been some inadvertent release of information. HP doesn't *owe* us anything.

That said, HP has been much more forthcoming about providing information about their plans to the user community than they ever used to be. Old-timers will remember the famous "HP Blank Stare" that questions about unannounced products *always* elicited back then.

If a new product is in the works, we'll all find out about it when it is officially announced. Until then, don't expect anyone from HP to confirm or deny. As the Mission Impossible taped orders always stated, "...the secretary will disavow any knowledge...", or in the immortal words of Lao Tzu, "those who know do not speak, and those who speak do not know".

Re: 15C LE - official statement?

I think it was the resellers who jumped the gun.

Honestly, so many authorized resellers offering the same product all at once seems to me to rule out the possibility that the 15C LE doesn't exist. Clearly someone leaked the official photo, and the dealers felt they were released from their NDAs. (Such agreements often contain clauses stating that obligations end once the information is made public elsewhere.) Then, I'm guessing, HP got back to each of those dealers, and gently pointed out that they might not continue to be authorized resellers of they didn't pull the information and cease taking pre-orders.

The timing of the release may or may not have been affected by this fiasco, but the fact that a 15C rerelease product exists is confirmed, in my opinion.

> Quote:

English makes no sense. :)

Launched can be present tense, "it is launched," past tense, "it was launched" or future, "it will be launched." The verb "to be" is carrying the tense. An implied "to be" is present tense, at least in this case.

I'm not enough of a language wonk to give you a detailed explanation, and the above may have errors, but that's how it works.

Edit: There is a "to be" verb in the sentence.

> Quote:
>
> There *is* no 15c launched in Japan, or anywhere else.

And "is" signifies present tense. I don't know if such a thing as "implied to be" exists. :) My former emphasis of *launched* was incorrect.

Edited: 1 Aug 2011, 8:11 p.m.

Re: 15C LE - official statement?

*Message #27 Posted by **Michael de Estrada** on 1 Aug 2011, 8:15 p.m.,*
in response to message #25 by Walter B

IIRC from my school days, there is a "present perfect tense" where a verb preceeding a past participle carries a past action into the present time. So if we say "launched", we are implying "HP has launched" in this case. It's like saying it's a fait accompli. It is a condition that is active in the present and carries forward to the future until we are told otherwise. So, I take TW's statement to mean "whoa boys, don't count yer chickens 'til they're hatched." Maybe there will be a HP-15C LE in the future, and maybe not. But, right now, regardless of what has been posted on the WWW, and regardless of how many orders have seemingly been placed, it's just like vaporware. Hopefully, it will all come to pass, but I'm not certain that it will, any more than I'm certain that the world

economy is not reeling inexorably in a death spiral towards extinction.

Folks might find this interesting. It is a project I've had on the back burner for some time.

Although recently I fabricated boards and built a prototype which is depicted here:

KINOMI Project

[Note you'll need to enable the YouTube closed captioning feature to render the accompanying explanation. It is the red "CC" button in the lower right of the video window.]

Indeed, injection molding (particularly the double-shot key legends) isn't at all cheap. Although CNC milling of key blanks and perhaps even the shell may be feasible in prototype quantities. 3D printing might get you part way there but not an equal.

Incidentally, although HP long ago abandoned double-shot molded key legends in favor of printing, from a repurposing perspective they are more useful. The printed legend can be buffed/polished off leaving a blank key. The blank can be cnc engraved and filled with epoxy paint which will effectively get you back to the service of double shot molded keys. The blue g-shift key legends which were

always painted can also be redone as such.

The other issue is the keyboard and bottom legend plate. I must be missing something as I'm unsure why HP is still printing on top of an aluminum base. Using a bottom printed polycarbonate label would be far more durable and probably no more expensive even with a metalized layer added as a static shield.

I have a Casio FX-4500p, on which this polycarbonate lable (I guess it is one) became loose on one edge. Don't know if it is just a protective layer or if the legends are printed on it, but it doesn't look nice anymore. In addition, the legends are hard to read.

> Quote:

> Hey, that's great work! Buy and carry one, get three free :-) Want to buy! (instead of a LE)

The original motivation for the effort was experimental with the goal of producing a minimal footprint NUT/Voyager emulator, yielding competitive performance (emulation speed, power consumption, new features) on contemporary microcontrollers. I believe that has been achieved as the KINOMI module demonstrated employs a commodity 8-bit flash uC running at 8Mhz. The emulator is written in C without (yet) any comprehensive code analysis nor optimization outside of being carefully implemented for that execution environment. That said it achieves a general throughput of 5-6x over native when executing on an 8-bit uC running at 8Mhz.

In minimalist form the core NUT/Voyager emulator is only about 8KB of code. In addition to this exists support for a serial debug console, an ISA bus driver for interface to the LCD controller, and in the version depicted logic to support firmware selection between multiple images. The largest component of the footprint is the actual Voyager/NUT firmware which weighs in at 7.5~15KB per model. Even then a single purpose 15C KINOMI module can be realized with a $2 32KB flash microcontroller. The prototype demonstrated including 11c/12c/15c/16c firmware has an overall footprint of 52KB, with the entire emulator and associated support code consuming only 14.5KB of that total.

Most of the module configurations thus far contain external flash in the form of high endurance EEPROM (1e6 erase cycles) such that user data can be retained indefinitely without relying on the internal button cells. In addition to this the module version demonstrated has an IRDA (optical) interface allowing data to get in/out of the unit without a physical connection. Getting this to fit in the 14x14.6mm real estate void of the original 44-pin LQFP NUT was a substantial challenge.

If there is sufficient interest, I may just release the work as an open source project.

Thanks,

-john

I am very interested in this kinomi project. It is a great work and I looked in awe.

After viewing the video, I would like to ask some quesrtions concerning this.
1.What kind of 8-bit ÂµC did you use? Is it kind of BGA?
2.How did you mount the whole board onto the LQFP site?
Caould you post a bigger picture of it? (I cannot see clearly in the video.)
3.How did you program the ÂµC?

Thanks in advance.

By the way, I happen to find out the analogy between *kinomi* (æœ¨ã®å®Ÿ) and *nuts*.
(Of course, after consulting the dictionary.)

Best regards,
Edward CG

> 1.What kind of 8-bit ÂµC did you use? Is it kind of BGA?

The packages are 0.5mm pitch MLF. The uCs used are either an atmega328p (single image) or atmega1284p. However considering the relatively small price difference and the fact the 1284p has sufficient i/o ports to drive the key matrix directly, I don't see any reason to continue on with the 328p. Especially as we gain 4x flash (128KB) and 8x SRAM (16KB) capacity with the 1284p.

> Quote:
>
> 2.How did you mount the whole board onto the LQFP site?

The bottom side of the KINOMI pcb was needed for bypass capacitors as I was out of top surface real estate and that was the compromise of avoiding a 4 layer board. In order to keep the vertical profile minimal and allow a FFC debug connector on the module, the KINOMI board thickness was reduced to 0.8mm and the bottom side components are all 0201 surface mount devices.

Adding on the IRDA transceiver bumped off even the FFC connector so debug connection to that version of the module is accomplished with plated vias in the board to which mates a custom connector constructed from tempered stainless steel probes. This is not as cumbersome as it sounds.

The bottom of the KINOMI board has land pads mating with those on the Voyager main PCB. Connection is via copper standoffs of 0.4mm diameter oriented with and sandwiched between each set of mating pads. A layer of 0.05mm kapton tape acts as a insulation guard between the bottom SMD and Voyager PCB traces.

> Quote:

> Caould you post a bigger picture of it? (I cannot see clearly in the video.)

Yes, I will put together something in a bit. It may just be the schematics, gerbers and a few jpegs in an archive.

> Quote:
>
> 3.How did you program the ÂµC?

The uC was physically programmed with a avrdude running on a linux box.

The emulator "KEMU" used in the project was written in C as a linux application, and then ported to an SH1, SIMAVR (an AVR core emulator), the m328p, and finally m1284p. The SH1, SIMAVR and m328p ports probably no longer build and are inconsequential at this point.

I would love to have avoided the AVR core 328p/1284p uCs. But except for raw speed of the current Cortex-M0 devices, the AVRs require far less power consumption (particularly in power-down mode) and provide larger on-chip flash and RWM in uCs offering these minimized power levels relative to ARM counterparts.

Use of an 8-bit cpu as a C language target is amazing in the fact gcc works as well as it does. But there are numerous issues which manifest as code inefficiencies which aren't or can't be optimised out. The harvard architecture of the AVR core is also maddening when dealing with storage of constant data in flash. But it is workable with effort and I myself was amazed the KEMU core weighed in under 8KB.

I have support (somewhere) for rendering to a 128x32 graphic module which works out well using a 9x20 proportional font for the main display and a 7x9 fixed font for the annunciators. It also has the obvious benefit of freeing you from trying to intelligently encode user interaction into 7 segments. But I sense attempting such improvements may put the effort on a slippery slope in terms of feature creep where you're departing from the elegance of the original design.

The other more practical issue is I've never seen a suitable graphic display which approached the contrast quality of the low 2:1 multiplex rate segments used in the original voyagers, although they were designed out from 1988.

Sure you're right. And I agree the present KINOMI 4-in-1 model is so great it should be released. Nevertheless I'd welcome a further step (for a KINOMI 2.0) incorporating such a 128x32 dot matrix LCD (or something alike) for allowing exactly what you rightfully avoided so far: feature creep :-)

Why? We experienced our WP 34S being severely limited by - among others - its low resolution LCD. A dot matrix as you mentioned would open a wealth of opportunities for an open-source calculator allowing softkeys and menus like the high end Pioneers did. And the Voyager package features a very attractive mechanical environment for such a project IMHO :-)

Of course, these are only my 20m€. YMMV

Walter

While I think that this is an interesting project, like the other 15C-clone project won't HP assert its copyright over the ROM images used in the KINOMI project? I wouldn't fault them for doing so at all since they have the existing 12C+ and (apparently) soon to be released 15C+ using the same ROM images.

-Katie

Hey HP, are you considering a 16C+?

> While I think that this is an interesting project, like the other 15C-clone project..

Wow, I hadn't realized there was a related project underfoot. I've been away from this forum too long. I suppose I'm happy to have been ignorant of it until I finished the KINOMI prototype otherwise it would still be collecting dust. :P

But this is a little bizarre as I'd considered using an LPC1114 and in fact have prototypes in development. However while fast, it has a flash size limitation of 32KB precluding on-uC support of multiple images. Locating the firmware in say an external SPI flash, even with hardware assist, slows execution dramatically and the emulator instruction fetch needs to implement some sort of caching scheme which adds its own overhead. Ask me how I know.

The specified current consumption for the LPC1114 is a factor of 10 higher than any uC used in a KINOMI module when in its respective lowest power-down mode retaining data in R/W memory. Also for KINOMI use the voltage limit for an LPC1114 would require a regulator to drop the 4.5V supply and potentially a level translator to drive the ISA bus. Not too agreeable within a 14x14.6mm module. However to be fair the attraction of using a dirt cheap Cortex-M0 is so compelling that the LPC1114 is still on my list for other configurations.

> Quote:
>
> won't HP assert its copyright over the ROM images used in the KINOMI project?

Personally I don't want to take on that argument with HP. KINOMI doesn't have any relation to the legacy firmware other than being able to execute the images faithfully, and includes sufficient voyager emulation to support a serial console, alternate (graphic) displays, keypad scanning, ISA bus protocol driver, etc.. Voyager firmware images are available from unauthorized sources, however I've used images extracted from devices I own personally -- which is why a 10C is missing from the lineup.

One use case for KINOMI was as a single model functional upgrade (or repair) module for Voyagers. In that scenario a KINOMI could be swapped for the NUT, and upon first boot extract the R2D2 rom image(s), self-programming them into it's on board flash. Doing so we haven't distributed the originally purchased firmware outside of the device so we shouldn't have any concerns.

> Quote:
>
> I wouldn't fault them for doing so at all since they have the existing 12C+ and (apparently) soon to be released 15C+ using the same ROM images.

Personally and honestly I have a great deal of respect for HP and in particular their engineering achievement in these devices. This has been the primary motivation here. Otherwise actually gainful use of my time exists invested in other pursuits. However back when I started poking at KINOMI, there was no promise of a reintroduced 15C/16C and dealing with the near casualty cases on EEEbay at mind-numbing prices was IMHO insane.

The prototype I've demonstrated is really just a proof of concept device. I suppose it might be productizable in some scenario, perhaps with key legend overlays but that doesn't seem to have general appeal and I doubt it is going to make anybody rich. It may be attractive to some as an expermenter's device which is why I considered making it an open project.

Thanks,

-john

Removing the segment display also gets rid of the R2D2 ISA driver which, believe me, was somewhat of a haunted house to drive reliably due to undocumented timing/logic quirks.

I was avoiding the need to cut the heat stakes for board removal and found a way to extract a NUT lqfp without destroying it nor cook the elastomer zebra strips on the other surface of the board. However an LCD upgrade would require board removal and honestly, resetting the ABS heat stakes isn't that horrendous. What will trip up the effort though is finding a suitable graphic display with the same window area as the original segment display. And it needs to be a straight reflective (not transreflective) device in order to avoid further reduction in contrast. Reflective LCDs are quite rare off-the-shelf these days.

Once the main PCB is removed we have some flexibility to mill the window area to a new footprint and perhaps replace the aluminum bezel, but this is starting to approach the point of diminishing returns. IOW we'd probably be better off to make the actual enclosure needed.

Wow!! A fantastic project :-)

I had been thinking along the lines of using the 12C+ to re-make the 15C, just as everybody else here has;-).

My thoughts for a dedicated 15C:

- The code would have to be re-written to avoid HP copyright, else convince HP to allow free distribution for re-flashing 12C+'s, they'd be getting their money from those anyway.
- Eric Rechlin could make keyboard overlays, they would probably be easier to apply that the 20b/30b as the voyagers have a slight recess.
- Dallas Osborne has already made metal badges for voyagers, and could make 15C ones.
- Next challenge would be the keys. If they made the same as the original silver 12C platinum keyboard then perhaps replacement ones can be made. Assuming the insides of the 12C+ is the same as the platinum in the link above, they can be replaced quite easily and the PCB re-fastened with screws as demonstrated.
- the last but by no means least challenge would be the bezel. It would have to be cleaned of the gold lacquer and re-done with clear lacquer. Or make a gold (brass?) 15C badge and have our own "special gold edition" 15C?

Anyway, some of my thoughts of the challenges, which although are not minor - they also not insurmountable.

> I had been thinking along the lines of using the 12C+ to re-make the 15C, just as everybody else here has..

I didn't realize until a few days ago there was semi-credible (+/-) evidence an encore 15C was looming from HP. Up to that point I'd been picking up occasional 91sam7l 12Cs from EEEbay with the intention of doing a KEMU port. I still may as with 128KB of flash multiple firmware images can be supported. The problem however is battery backed RWM being limited to 2KB which is a little tight although probably a 15C/16C/12C is feasible.

It would have been be helpful if HP laid out the board for a (depopulated) high endurance SPI EEPROM as that could have been used as secondary storage for "swapped out" images. EEPROM is useful in general to hold model image context and lessen the reliance on residual battery energy to hold a near brown-out power rail while the user fumbles with battery replacement. An EEPROM could be grafted on but the COB entombed in a blob of epoxy substantially frustrates that option. Note the specified erasure wear limit for EEPROM of interest is 1E6 cycles which is the same order of magnitude as the cycle life of the keypad tactile dome switches. Ironically the EEPROM would be the easier replacement of the two.

One thought I had was to create a retrofit PCB in order to address such issues as well as adding on perhaps an IRDA/optical communication so the device isn't a closed box. That's the one feature I feel the Voyagers have been lacking but no one really can fault such a shortcoming in an 1981 design. ;)

Anyway if a 15C+ does surface in the form of a repackaged 12C+ it would be enough motivation to create an upgrade board minimally including the above enhancements.

What code are you referring to? If that of the Voyager model specific firmware, I don't think it would be realistic to replicate given it has 30+ years of soak in a

deployed product and was originally blessed by William Kahan.

I was referring to HP objecting to the use of the actual ROM image (see the "News" statement at the top of the Nonpareil page). However, they may even object to a re-implementation that exactly mimics the 15C.

There are some simulators for sale, however, I don't know how good they are as I haven't tried any of them.

To me, the most interesting aspect of the 15C code is that it's probably without important bugs.

Exactly. With someone like William Kahan overseeing the numerical algorithm development and 30+ years of soak in the hands of professional consumers, that's a pretty tough effort to eclipse.

Although I've seen some interesting behavior of the 15C firmware during the development of KEMU such as scenarios where the subroutine stack is allowed to overflow. And keycodes which aren't generated by the voyager key matrix causing interesting things such as toggling between '.' <-> ',' modes, entering firmware self test, causing an unconditional power-off. At one point I recall finding read accesses to nonexistent memory however that could have been related to a bug I was chasing in KEMU at the time.

That certainly seems to be grey area. I pinged Eric some time ago on what may have transpired there but he was mum on the subject.

Realistically I don't think HP is going to call the cops on anyone experimenting with firmware images which they legitimately own. Beyond that I suspect you get to conduct a different kind of experiment. I think crossing the line of selling the firmware for profit in any scenario, will result in a thoroughly unpleasant interaction with HP.

The DM-15C clone may well be the canary in the coal mine in that respect unless HP dismisses that effort with a 15C re-release some time soon.

In the 34S I've overcome the RAM limit by writing to the flash from within the firmware. The flash survives minimum 10,000 writes. That should be good for some context switches.

There are eight GPIO pins bought out from the processor in one of the non-populated headers. These could be used to support a serial EEPROM or some serial RAM to expand the capabilities of the device.

I don't see anything I'd call a header on the unit in front of me. Did you rather mean depopulated 0603 devices, of which there are several?

Incidentally was a schematic for this device ever included in the developer's kit or otherwise made available? I didn't find anything close in what I'd squirreled away about a year ago.

Thanks.

There was/is a schematic in the 20b's development kit.

The pads I was talking about are labelled J8 just below the big exoxy blob. The connection pin outs are also published. Both for the 20b.

I've not opened a new 12c but I was hoping there are similar inside but am probably wrong :-(

Pauli, you are talking about the 20b. The device in question is the 12C+ which is obviously different.

> The problem however is battery backed RWM being limited to 2KB which is a little tight although probably a 15C/16C/12C is feasible.

2kb is a many times more than any voyager has. The 15c has 64 registers (plus a few extras). The rest have half this. There should be space for all the voyagers with some to spare. The 34S firmware uses less than 100 bytes for system stuff -- a lot less in fact. (2048-100) / 7 = 278 voyager registers. Four models with 32 registers and one with 64 is 192 registers total. This leaves 86 for the stuff I glossed over about -- that is 17 registers for each model.

Take out the 10c and the space equation gets even better.

Of course, the effort to rework the emulator to use the available RAM efficiently is another matter entirely :-)

Finally, I'd be more than happy with a 12c/15c/16c combination. The 11c and 10c don't add any functionality beyond what these three have.

Any possibility of preserving the stack registers across mode changes?

- Pauli

Other data exists in addition to that visible from the user's application perspective. Even within a single emulation scenario, CPU and hardware registers need to be maintained which consumes additional memory. Eg: KEMU currently uses 95 bytes per virtual NUT cpu context alone.

Requirements such as the host's runtime stack and overall global state data are most conveniently located in RWM which persists over power-down events. Add to that other optional features such as the command line interface, etc.. and that 2K starts to get full pretty quick. For example the 4-model build as demonstrated weighs in at:

```
/usr/bin/avr-size kemu_m1284p.elf
   text    data     bss     dec     hex filename
  51322     220    2019   53561    d139 kemu_m1284p.elf
```

data+bss total already exceeds 2K and we still haven't accounted for the host runtime stack. Some of this can surely be steered into the 91sam7l's 4K volatile RWM but not much.

> Quote:
>
> Of course, the effort to rework the emulator to use the available RAM efficiently is another matter entirely :-)

Footprint minimization was one of the primary motivations for KEMU. And I'd say it is quite conservative in terms of flash and RWM consumption. Actually with over half of the flash currently unused in the m1284p 4-model build, there is an opportunity to relax code reuse and introduce more efficient special-purpose routines where warranted. Reconfiguring-in features such as the disassembler is another possibility.

I took a look at where the m328p build was, configured with a single 15c model and dropping out the firmware select logic:

```
/usr/bin/avr-size kemu_avr.elf
   text    data     bss     dec     hex filename
  25779     162     726   26667    682b kemu_avr.elf
```

That still includes CLI support, keypad scanner, and ISA bus driver so you could easily bandsaw another 2~3KB off that total depending upon interface requirements leaving you with an excess of 8K to glue KEMU into the intended application.

> Quote:
>
> Finally, I'd be more than happy with a 12c/15c/16c combination. The 11c and 10c don't add any functionality beyond what these three have.

I agree. The 11c was tossed into the mix only because I own one and had a firmware image lying around. I can't think of a reason to include the 10c other than for historical completeness.

> Quote:

> Any possibility of preserving the stack registers across mode changes?

Maybe the demo didn't make that clear or perhaps the closed captioning was problematic -- I myself had trouble getting the caption text to render without the most recent Adobe flash player.

Anyway each image is independent and persistent across firmware re-selects and of course power off events. The entire memory content, device state, and NUT virtual cpu context is maintained for each model version. One generalization which is possible given the current structure is supporting multiple instances of each model subject to memory limitations. Eg: allowing a number of independent 15c instances among which the user could select as needed. This is really just a UI/packaging issue as it otherwise should drop into the current structure. On that note the presence of high endurance EEPROM would be a natural location to contain "swapped out" instances with the added benefit of being retained across battery failures.

*Message #62 Posted by **Paul Dale** on 4 Aug 2011, 1:16 a.m.,*
in response to message #61 by uhmgawa

The 34S manages with the stack in the 4kb of volatile RAM. It is written as a single event processing loop and thus the idle state doesn't require any return stack to return from.

We also found another 55 bytes of RAM in the LCD controller which can be used to store things that have to survive the on but idle state but not complete power off. Much of our user interface state has ended up here. It is copied to and from the 4kb of volatile RAM.

It is surprising how much stuff we moved from persistent RAM to volatile RAM.

I wouldn't outright discount at least a 12c/15c/16c version on the 91sam7l. Dropping the 11c will reclaim nearly 400 bytes which is probably sufficient or at least quite close. Otherwise some restructuring of the logic is needed to deal with prospective volatile state. For example the current KEMU implementation leverages the simplification of being able to power-down at arbitrary points during emulator execution.

Some packing may be possible in the NUT cpu context for idle images. Also the CLI and display decode buffer don't need to be persistent.

But I think saving idle images to EEPROM is conceptually a preferable solution. Unfortunately it requires a modification to the 91sam7l version. Somewhat ironic as there is more than enough empty component side real estate where an MLF EEPROM could have been placed.

I've already mentioned it in this thread. You can always consider the on board flash memory as writable from within the firmware.

> Quote:
>
> I've already mentioned it in this thread. You can always consider the on board flash memory as writable from within the firmware.

Indeed it is. The difference is Atmel specifies the 91sam7l flash with an endurance of 10K erase cycles where the eeprom of interest has an endurance of 1M cycles (and about 20x longer projected data retention.) Depending on intended write frequency wearout could be a concern. Logistically an external 8-pad MLF part reaching wearout is also much more easily corrected vs. die eternally bonded to the pcb. Even replacement of a 0.5mm pitch lqfp-128 pin version of the 91sam7l isn't a welcome task. If vacant space exists my inclination would be to add an 8-pad MLF land prospectively to the pcb for these collective reasons. If left depopulated it isn't costing us anything.

Although my bias is to avoid feature creep, another option is use of socketed transflash (micro SD) in SPI mode. Acceptable voltage range may need to be accommodated and active current consumption could be an issue. But the option of end user demountable storage is quite compelling.

SpeedUI 11.07 supports RainEQ

*Message #1 Posted by **Raymond Del Tondo** on 30 July 2011, 11:07 p.m.*

Hello all,

here's an update for SpeedUI.

SpeedUI 11.07 is a minor update only, but with deep impact for users of the Eqation Writer.
If RainEQ (raineq.lib) is installed, it will be used instead of the built-in EQW.
This means that existing equations will be edited in RainEQ,
and new eqations will be created using RainEQ.

The display/editing speed difference is dramatical:
The built.in EQW needs much time to display the equation,
but RainEQ displays the equation nearly instantly!

RainEQ and some related documentation is available on www.hpcalc.org .

For installation/uninstallation, please take a look into
StartHere.pdf supplied with the latest SpeedUI archive.

The new version is available here:
http://www.hpmuseum.org/guest/deltondo/speedui.pdf (Walkthrough PDF)
http://www.hpmuseum.org/guest/deltondo/sui_1107.zip (SpeedUI zip archive)

but not on www.hpcalc.org (since the site has not been updated for a long time)

Have fun:-)

Raymond

HP19C printer head...yeah! I know!

*Message #1 Posted by **Geoff Quickfall** on 30 July 2011, 3:33 p.m.*

I have searched the archives for print head replacement, repair, HP 19C repair and etc.

Lots of useful data there including resistance readings on older IR printers compared to newer printer heads.

The print heads are a different size in the IR printer then the 19C. It appears the print head in the 97 series is more similar.

The question is, and most of the postings cease at this point (going back to 2003):

Has anyone been successful in transplanting either the IR print head or the 97 or other series print heads into a 19C?

Cheers, Geoff

Edited: 30 July 2011, 3:34 p.m.

Re: HP19C printer head...yeah! I know!

*Message #2 Posted by **BobVA** on 31 July 2011, 9:59 a.m.,*
in response to message #1 by Geoff Quickfall

Did both of the 19's you were working on have duff print heads? Or are you trying to get both working?

Given the comments in this post it sounds like the 97 may be the only bio-compatible transplant donor. A repair procedure was all sketched out there, but if anyone tried it it they didn't post back.

If you take a shot at it, shoot lots of pictures and post the travelogue!

OT: I spent yesterday restoring a very forlorn HP-97S; practically like working on a tractor, compared to the brain surgery required for the 19c.

Interestingly enough the 97s didn't have an interface cable attached. I was wondering if the poor, battered fellow got promoted to office duty in his dotage and some fastidious engineer or accountant removed his cable.

Good luck with the 19c! Bob

Re: HP19C printer head...yeah! I know!

*Message #3 Posted by **Katie Wasserman** on 31 July 2011, 1:20 p.m.,*
in response to message #2 by BobVA

The 97/97s is indeed a pleasure to work on especially compared to the 19c. Unfortunately 97s' with missing cables and pods are pretty common I have one too. I was thinking of creating a pod of my own

and invest,igated the signal lines in the (missing) cable. Once I had that I figured a single microcontroller with a ton of i/o lines would be an relatively easy way to replace the pod, but instead came up with this. One other regular on this forum followed my design (and caught a schematic error, thank you) and has enhanced their calculator too.

Re: HP19C printer head...yeah! I know!

*Message #4 Posted by **Geoff Quickfall** on 31 July 2011, 1:36 p.m.,*
in response to message #3 by Katie Wasserman

Well, I have two 19Cs, one prints the top half only and has a lower section printer head that is dead. I watched it happen but was not quick enough to save it.

The lighting was low. The printing had stopped but the head did not park. It started to glow. Immediately turned of the calc and cooled the head with compressed air.

Not in time to save it. The donor, which is a pretty looking battery charger with no hope of resurection (corrosion, missing traces and etc) actually melted the guide bar and imbedded the printing head in it!

So I have a working 19C with a half dead print head and a non working 19C which I got an LED to light up. A dead ACT chip. But it works as a charger!

I too found about 10 postings going back 10 years but there were no follow ups of the 97 procedure. I only have one 97 fully working and pristine with Katies mod on the printer and a fully functional card reader so I AM not experimenting with it. I do have four IR printers but the heads are different sizes and the resistance values are completely different.

This project will have to wait!

Geoff

maybe printing two of the book!

97S Interfacing / 19C print head replacement

*Message #5 Posted by **BobVA** on 31 July 2011, 4:41 p.m.,*
in response to message #4 by Geoff Quickfall

> Quote:
>
> ... I watched it happen but was not quick enough to save it.

Uggh - I HATE it when something like that happens. My sympathies.

I'll keep my fingers crossed that TAS offers up the right half of a bisected 97 to you (perhaps the victim an unfortunate industrial accident in a saw mill.) They tend to work so well, that may be what it takes to get a junker. I've got one parts machine, but unfortunately it didn't have the printer assembly when I got it. (And some guy was standing on it at a ham fest.)

Katie: Thanks for that pointer. I've added that to "The List of Stuff I've Got To Do". Looks like a nice project. I haven't written any interrupt driven code in a decade or more, so I was glad to see you didn't need any. I'm pretty familiar with the BS2, so perhaps I'll be able to grasp the SX.

The photos were also interesting - whoever swiped the cable from my 97s didn't have the courtesy to replace the cap on the IDC connector.

I recently built a clock from a old power plant tachometer (whose scale was handily was numbered zero to twelve) using a BS2, a DAC to drive the meter movement and a 1302 RTC. One gimmick from that that you may find handy: I wrote a "signal" byte (i.e. known value) at the start of the 1302 RAM. My code uses it as a start-up check to detect a back-up power failure and react accordingly. (I'm using a cap for backup, so it's only good for a couple of days.) Might be fun to do something similar with your circuit, perhaps writing a checksum of bytes 0-30 in byte 31.

I'd been idly thinking about building a PC interface box for a spare 97 card reader to allow a PC to read/write 67/97 cards, but I'm now thinking the approach you suggested is a *lot* simpler.

Sending a program from a PC to the 97 using your interface looks pretty straight-forward, and I think that would cover 95% of the use cases for such an arrangement. (Probably not that much call for reading a card into a PC.)

Cheers,

Bob

PS: While I had the hood up on the 97, I used the technique described in this post of jumping test points "F" and "H" on the reader circuit board to allow writing to a write-protected card (I needed to fix a damaged HP Standard Pac card). It got me thinking about adding a switch to do this in the future, but perhaps it would be an ideal "f" function to add to your board (driving a reed relay to close the circuit between the points.)

Edited: 31 July 2011, 5:07 p.m.

Re: 97S Interfacing / 19C print head replacement

*Message #6 Posted by **Katie Wasserman** on 31 July 2011, 7:01 p.m.,*
in response to message #5 by BobVA

Bob,

Yeah, this code doens't use interrupts (probably one of the only SX programs I've written that doens't) so it might work with a higher-speed version of the BS2.

You're idea for the DS1302 signature is a good one and I use something similar for the "macro" function in my 97 code, but it's not needed for knowing the the RTC needs to be reset. The backup CR1225 cell will keep the clock running for close to 20 years, in theory.

I like your idea of implementing an 'ff' function to override the card write protection!

-Katie

in response to message #1 by robertoataulfo

I take it you still want to save/load files to the Casio & Sharp, but don't wish to use cassettes? If so, I don't think MP3 compressed files will work. I tried a couple of times and never could get it to work. I have used a small recorder that will save in WAV files with no compression and that works fine.

For the Sharp pocket computers, there's several programs that will convert WAV files to BIN files to TXT files. They work pretty good. See the following link:

WAV2BIN

I've used the method described to transfer some cassette programs I had and they worked fine.

Bill

Re: OT:Retiring an old friend :-)

*Message #4 Posted by **Marcus von Cube, Germany** on 30 July 2011, 6:36 p.m.,*
in response to message #3 by robertoataulfo

You may not want to use a computer for regular or portable storage but it's still a good place to store an archive of your software. The above mentioned WAV2BIN for Sharp and my own package CASette I/O Utilities for Casio and friends are very useful because you can translate the WAV files to BASIC text and vice versa. If your portable recorder can create a WAV file, it should be easy to copy it to the PC for further treatment.

Re: OT:Retiring an old friend :-)

*Message #5 Posted by **Bill (Smithville, NJ)** on 30 July 2011, 7:30 p.m.,*
in response to message #3 by robertoataulfo

Well, you can use some of the small digital recorder/players that will record in high qualty (minimum compression). Best is one that creates files with no compression. I use a Edirol by Roland Model R-09 that will save in WAV format as well as MP3 on a SD card. Works great. Bought it mainly to record live concerts, but it works great with my Sharp pocket computers.

Bill

Re: OT:Retiring an old friend :-)

Re: OT:Retiring an old friend :-)

*Message #8 Posted by **Bill (Smithville, NJ)** on 30 July 2011, 8:03 p.m.,*
in response to message #7 by Steve Leibson

Hi Steve,

I'm going to hi-jack this thread. :)

Just looked at the specs on the Zoom H1 and it looks interesting. Have you used it for live concerts? How did it do?

Couple of years ago, I was looking at two digital recorders - the Edirol R-09 and the M-Audio Microtack. They were basically comparable but the R-09 had replaceable batteries versus non-replaceable rechargables on the M-Audio. I went with R-09 and am very pleased with it. But it wasn't cheap at the time.

So, was just wondering how a $100 recorder today compares with an older more expensive recorder. I know prices keep coming down, while features go up.

We have free concerts on the beach here, and I've been very pleased with the recording results. I usually sit about 20-30 feet from the stage and the sound system speaker are about 15-20 feet either side. I do get some low level chatter from the people around me, but it's really not too bad. Occansionaly, catch the sounds of a motor boat or airplane, but that's just the ambiance of recording live.

Sorry for hi-jacking the thread, but was curious abot the H1.

Thanks,

Bill

H1 performance

*Message #9 Posted by **Steve Leibson** on 1 Aug 2011, 9:42 a.m.,*
in response to message #8 by Bill (Smithville, NJ)

Hi Bill,

I've not recorded concerts with the H1. Mostly, I use it for 1-on-1 interviews. I am really impressed with the quality of the recording. I cannot compare it to other digital recorders myself, but there are a few reviews to read on amazon.com and sweetwater.com.

Is it just that you want something smaller? How about a microcassette recorder? The Sony M-670V is an excellent one, as microcassettes go.

The front is about two by four inches, and thickness is about 3/4". IOW, it's very small! I got mine on TAS for around $20, although you'll have to watch for awhile to find them that cheap. Frequency response in high-speed mode is 6kHz. I've been using a couple of them, although I have not tried with data. I have not noticed any dropouts with TDK MC90 tapes.

Re: OT:Retiring an old friend :-)

*Message #14 Posted by **Bill (Smithville, NJ)** on 30 July 2011, 7:40 p.m.,*
in response to message #13 by Garth Wilson

Hi Garth,

I've tried some of the microcassette recorders with some good results. You need to use good quality tape and the tape, while readable on the source recorder, wasn't always readable on a different recorder. But I seem to remember that was true with the data recorders also.

For several of the Sharp computers, you could buy a printer/microcassette accessories. I have several, and they all have mixed results on re-reading the microcassettes. I'm thinking the speed control on the microcassete drives are varying or the belts have expanded or slipping.

The best is still a wav file - you can easily share the programs with other users and it's easy to create safe, backup copies.

Bill

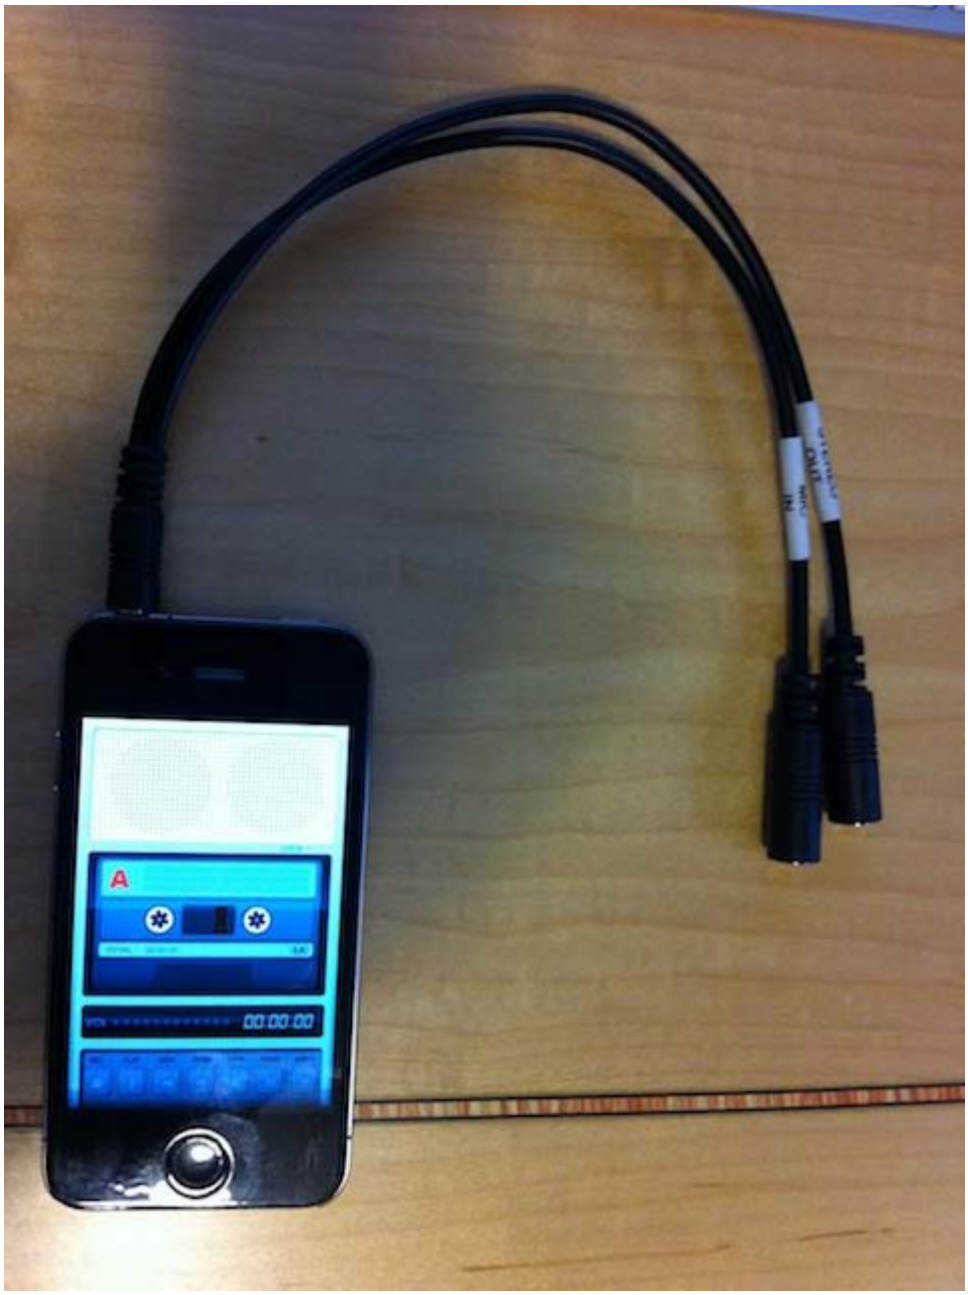
This may be an option:



It's an iPhone app. I am sure there are others like this for other smart phones. I tested it with my Apple //e cassette ports. I was able to download a BASIC program audio file and play it to my //e and run it.

One less gadget to carry around. Just a thought.

HP-41 cryptography

*Message #1 Posted by **Geir Isene** on 30 July 2011, 1:26 p.m.*

The program CRYPT implements the Vigenére cipher for the HP-41, and as long as the key is at least as long as the XM file to be encrypted, you will have perfect security (a one-time pad).

Check out the program here.

Key: HP-41C

I updated the CRYPT program (v. 0.4) to accommodate for keys with lengths up to 300 characters. Now you can get a one-time pad of up to 300 characters on your HP-41 :)

This not quite true. Or rather it is only true if the key is random noise, which is probably not true for most uses of a Vigenére system.

If the key is a random bitstream, then you're getting one bit of randomness for every bit of key. In that case if your key is at least as long as your plaintext then the encrypted text is unconditionally secure (in the information theoretic sense---you could still screw up and accidentally disclose your key in some way, reuse it, or something like that). If your key is an English word (or a string of them) then you're only getting *maybe* 1 bit of randomness per character. Assuming an 8 bit encoding for both the plaintext and the key, that's only 1/8th of the randomness you'd need for the kind of security you're talking about.

It's also probably worth noting that if you *are* using a truly random key and you're interested in unconditional security then just XORing the key and the plaintext to obtain the encrypted text is almost certainly preferable to using a Vigenére system: it's much less prone to errors due to implementation problems because of its simplicity, and it is certainly going to be faster.

In the real world all of this probably doesn't actually matter, particularly if the messages you're encrypting are relatively short (and therefore correspondingly difficult to cryptanalyse). I'm just making a (somewhat pedantic) point about the claims to be equivalent to a one time pad.

Re: HP-41 cryptography

*Message #8 Posted by **Geir Isene** on 2 Aug 2011, 2:53 a.m.,*
in response to message #7 by spb

Despite the good pedantic points; Given that the user does indeed supply a truly random key - the file would result in a One-time pad. So, possible.

HP-71B package

*Message #1 Posted by **fhub** on 30 July 2011, 11:33 a.m.*

Similar to my HP-50g package some time ago I've now also made a complete HP-71B package, including ROMs and improved keyboard support.

The two main enhancements are:
- directly clickable shifted functions (only for the larger view)
- full keyboard support, i.e. you can enter everything (also all special characters) on the usual PC keyboard (no need anymore for getting these special chars by complicated key combinations)

I've made a German, a US and a UK(GB) keyboard version, if you have a US keyboard then just run 'Keyb-US.bat' once (for a UK/GB keyboard run 'Keyb-UK.bat' once).
And you should look at the file 'Keys.txt' for special keyboard shortcuts.

To make full usage of the PC keyboard I had to use the 2 keys <Shift> and <Ctrl> in a special way: if you press&release one of these keys, then they act as the 71B prefix-keys [f] and [g], but when you press <Shift> in combination with another PC-key, then you just get the corresponding keyboard character.
(but I've also made <F1> and <F2> as alternatives for [f] and [g] in the usual way)
For the German keyboard even <Ctrl> or <AltGr> work for the special characters @{[]}.

If you're interested in this very comfortable way of using the HP71B emulator - you can find it here on my website:
http://fhub.110mb.com/HP71B.zip
Update: Added UK keyboard and fixed a bug in US keyboard.

And still some other good news:
I've found an official website where you can download all 3 manuals (Owner/Reference/Service) for the HP71B:
http://www.hpmuseum.net/collection_document.php
Just scroll down a few pages to "Handheld" where you can find links for all these 71B manuals.

Much fun with this fantastic HP71B emulator made by Christoph Giesselink! :-)

Edit: Since now my website server is working again, I've now also put my last HP-50g package (incl. the update) there:
http://fhub.110mb.com/HP50g.zip

Yes, but for the 71B the mouse in fact isn't necessary at all - you can operate it completely with your PC keyboard and the usual keys.

Only operating it by voice would still be more comfortable ... ;-)

Aren't these on the shifted 9 and 0 keys on your US keyboard? Or do you have any other country layout?

For KeybGR they are on 8 and 9, but of course I can't make files for a few dozens of different countries. ;-)

Franz

Re: HP-71B package

*Message #10 Posted by **fhub** on 30 July 2011, 1:29 p.m.,*
in response to message #1 by fhub

BTW, since I don't have a US keyboard here, I've made this US version after a file with the layout and the scan codes of such an US keyboard. So I hope I got everything right!?

Let me know if any key doesn't work as it should, i.e. produces any other character than usual ...

Only for the 2 keys with `~ and \| there is no mapping because the 71B doesn't have any key combination for these chars (and also not for the underscore _)

Franz

Re: HP-71B package

*Message #11 Posted by **Vladan Dugaric** on 30 July 2011, 7:05 p.m.,*
in response to message #10 by fhub

I was tinkering with your US keyboard layout and made one for British keyboard. There were just several modifications necessary to get there from the US KMI file.

Here are the changes for KBD-US.KMI to make KBD-GB.KMI:

Replace Scancode 50 section with:

```
Scancode 50                     # 2 "
        SetFlag 0
        IfPressed 16
                Map 50 403
                Map 50 312
        Else
                Release 314
                Map 50 312
        End
End
```

Replace Scancode 51 section with:

```
Scancode 51                     # 3 #
        SetFlag 0
        IfPressed 16
#               Map 51 403
        Else
                Map 51 313
        End
End
```

Replace Scancode 221 section with:

```
Scancode 221                    # ] }
        SetFlag 0
        Map 221 403
        IfPressed 16
                Map 221 113
        Else
                Map 221 309
        End
End
```

Replace Scancode 222 section with:

```
Scancode 222                    # # ~
        SetFlag 0
        IfPressed 16
        Else
                Map 222 403
                Map 222 313
        End
End
```

Replace Scancode 192 section with:

```
Scancode 192                    # ' @
        SetFlag 0
        Map 192 403
        IfPressed 16
```

```
                Map 192 314
        Else
                Map 192 111
        End
End
```

In addition, create a new .bat file Keyb-GB.bat:

```
@echo off
cls
copy KBD-GB.KMI HP-71B.KMI > nul
echo.
echo Keyboard-Layout: GB
echo.
```

This maps all existing characters on HP-71B keyboard to the appropriate keys on British PC-105 keyboard. All nice features of the US keyboard package are retained.

Franz, I think the best thing would be if you added these two files to your version so that it would be hosted in only one place instead of scattered all over the net. If it would be easier for you, I can email them to you so you don't have to edit the .KMI file.

Vladan

Many thanks Vladan, very good job! :-)

I've now included also your British keyboard and uploaded a new version (same link as in the first posting) - I just named it UK instead of GB, because I think this is more usual. ;-)

And your work had still another advantage: I saw that I had forgotton one line in the US keyboard for the key "] }", so they won't work correctly in my first version - it's now also fixed in the new upload.

Thanks again,
Franz

Re: HP-71B package

*Message #13 Posted by **fhub** on 31 July 2011, 6:48 a.m.,*

> ...

Well, the first bug has appeared with the US keyboard:
I forgot one command, and so the right brackets] and } didn't work correctly.

It's fixed and also includes a UK keyboard now, so if you have a US or UK keyboard, please download the file again:
http://fhub.110mb.com/HP71B.zip

41 MCODE Question - Page #4 Library

*Message #1 Posted by **Ángel Martin** on 30 July 2011, 6:32 a.m.*

Greetings fellow MCODErs, here's a question for those still practicing the arcane arts..

ok, so I have successfully compiled a library of frequently-used MCODE routines and they are placed in a custom-made page#4. It is not a take-over rom, it just sits there and waits for the other modules to call upon it.

This Lib#4 can be configured in the ML2k, Clonix, and of course the CL - so not a problem. Also V41 supports it, so emulation is possible for trouble-shooting.

Works like a charm, finally all that unused space is put to work for a practical cause. BTW I have reserved addresses 0x4100 to 0x41FF for NoVRAM 64 settings, not a problem,

And the question, you ask? Well I though it'd be a nice touch if upon startup the library page announced itself with a friendly message, something like "#4 ON-LINE". Problem is page #4 does not offer polling points as interrupts, so no chance to use that method.

I tinkered a bit using the take-over address 0x4000, with the sole purpose of showing the message and then returning control back to the OS - but all my attempts have failed so far. It just keeps repeating the message upon every light-sleep event, duh.

Can anyone offer some suggestions? Sure the work-around is for another module to check for its presence and report on its behalf, but that's not so elegant.

Best, 'AM

Re: 41 MCODE Question - Page #4 Library

*Message #2 Posted by **Håkan Thörngren** on 30 July 2011, 5:43 p.m.,*
in response to message #1 by Ángel Martin

I would say don't. I rather have my HP-41 come up as fast as possible, no need for a splash message.

If you really need to do it, I suggest you look at the return address on the stack. It will be different if you come from deep or light sleep. You should probably also call PACH11 (0x3f5).

Re: 41 MCODE Question - Page #4 Library

*Message #3 Posted by **Raymond Del Tondo** on 30 July 2011, 8:25 p.m.,*
in response to message #2 by Håkan Thörngren

> Quote:
>
> I would say don't. I rather have my HP-41 come up as fast as possible, no need for a splash message.

1+

Back in the early eighties, when I learned how to use the interrupts, I also made startup messages.
I thought it would be cool if the calc showed me some random greeting text upon turn-on.
But soon the messages became disturbing, and thus I removed the code.

If you can't live w/o a msg flash, I'd suggest to make it optional, using a flag or s.t. ;-)

Re: 41 MCODE Question - Page #4 Library

No startup message please :-)

Re: 41 MCODE Question - Page #4 Library

*Message #5 Posted by **Ángel Martin** on 31 July 2011, 2:28 a.m.,*
in response to message #4 by gene wright

So you guys must love working with your Windoze systems, right? Coming to think about it, they do little more than putting up splash messages the whole time...

I've changed the approach and now it's only a warning message when the library is NOT on-line - done by the other modules that use it, of course.

Eric's reminder of the disabled printer ROM is timely and important: that would create a conflict, so it's up to the user not to let that happen.

Re: 41 MCODE Question - Page #4 Library

*Message #6 Posted by **Eric Smith** on 30 July 2011, 11:16 p.m.,*
in response to message #1 by Ángel Martin

Warning: using page 4 is problematic on a real 41 if you have the HPIL module installed with the printer functions "disabled". The switch on the module doesn't actually disable the printer ROM, it just moves it to page 4.

Woodstock LED question

*Message #1 Posted by **Mark Henderson** on 29 July 2011, 1:01 p.m.*

In my Woodstock collection I have 2 distinct types of LED displays:

1. Small, round decimal point 2. Larger, triangular decimal point (dropped down a little relative to digits)

Did one pre-date the other? Which one?

Re: Woodstock LED question

*Message #2 Posted by **Adam Vaughn** on 29 July 2011, 1:17 p.m.,*
in response to message #1 by Mark Henderson

Both were made at the same time. The difference is due to the fact that, in Europe, the comma is used where a decimal point would normally be used in the US, and vice-versa. I'm not sure about the Woodstock series, but the Spice series calculators have a jumper inside which allows the display to show either one. -Adam

Re: Woodstock LED question

*Message #3 Posted by **Michael de Estrada** on 29 July 2011, 1:51 p.m.,*
in response to message #2 by Adam Vaughn

I have several Woodstocks, all made in the USA based on the "A" serial numbers, and they exhibit both types of decimal delimiter (period and comma), so I'm not sure that this is a strictly sales market issue. OTOH, it is definitely the case with Spices, and is indicated in the serial number with an asterisk (*) prefix.

Edited: 29 July 2011, 1:52 p.m.

Re: Woodstock LED question

*Message #4 Posted by **Mark Henderson** on 29 July 2011, 5:16 p.m.,*
in response to message #3 by Michael de Estrada

Interesting... All the Woodstocks I'm looking at (and I have about 7...) are "A" models. Originally I thought the oldest models had the "comma", but now I'm thinking it's the later models (in my collection). I'll have to look at the S/Ns more carefully... Or is it by model? My HP25 and 25C both have "points". My HP21s, HP22s and HP29 all have "commas"... I prefer the "point", BTW.

Re: Woodstock LED question

*Message #5 Posted by **Michael de Estrada** on 29 July 2011, 5:47 p.m.,*
in response to message #4 by Mark Henderson

I don't think it's model-specific. My HP-25 has a comma and my HP-21, 22 and 29C have points.

Re: Woodstock LED question

*Message #6 Posted by **Kees van der Sanden** on 30 July 2011, 3:33 p.m.,*
in response to message #5 by Michael de Estrada

Some time ago I repaired a few Woodstock models. I observed that two different types of displays were used. One was coded 1990-0495 and the other 1990-0559. At first sight they look identical. Unfortunately I didn't look for a difference on the point/comma.

Re: Woodstock LED question

*Message #7 Posted by **Kiyoshi Akima** on 29 July 2011, 5:26 p.m.,*
in response to message #1 by Mark Henderson

Okay, I realize the 19C is only related to the Woodstocks, but if you have one then look at the decimal point through a magnifying glass. It's neither a dot nor a comma.

Re: Woodstock LED question

*Message #8 Posted by **Mark Henderson** on 29 July 2011, 5:35 p.m.,*
in response to message #7 by Kiyoshi Akima

Yes, the 19C is "Special" in this regard (that little HP logo)! There is also something else special about the 19C (compared to Woodstocks) - the decimal point takes up a whole digit position, like the Classics did (and I love that about Classics). Interesting that the 29C and 19C share so much but differ in this regard? IIRC correctly the HP-65 follows Classic convention, the HP-67 follows Woodstock convention (because the 67 is of course more related to Woodstock than to Classic).

Re: Woodstock LED question

*Message #9 Posted by **Michael de Estrada** on 29 July 2011, 5:50 p.m.,*
in response to message #8 by Mark Henderson

I'm not sure what difference you mean, but the displays on my 2 HP-67s look the same to me as all my Classics. The only change was the addition of a separate low battery indicator LED dot.

Chinese Calculator Prices

*Message #1 Posted by **DaveJ** on 29 July 2011, 6:54 a.m.*

A spin-off from another thread:

80 cent chinese scientific calculators

The link says it all.
And they would be making a profit on those bulk prices...

80 cents is what it cost for just ONE key switch on my uWatch, even in bulk.

Dave.

Re: Chinese Calculator Prices

*Message #2 Posted by **DaveJ** on 29 July 2011, 7:00 a.m.,*
in response to message #1 by DaveJ

I just noticed that *everything* on their entire site seems to be 80 cents!

Dave.

Re: Chinese Calculator Prices

*Message #3 Posted by **Maximilian Hohmann** on 29 July 2011, 7:21 a.m.,*
in response to message #1 by DaveJ

Hello!

> Quote:
>
> And they would be making a profit on those bulk prices...

Absolutely incredible! But not only calculators. Recently I bought a watch from Hongkong through eBay "Buy it Now": Modeled after an Omega Seamaster (but not a fake or replica watch as these get confiscated by our customs), all stainless steel case and bracelet, automatic movement with glass bottom and mineral glass crystal, packaged in a nice gift box. Directly from the manufacturer. The price? One Euro. A replacement mineral glass crystal for watches can not be found for less than 20 Euros here. How much longer can this go on?

Regards, Max

*Message #5 Posted by **Crawl** on 29 July 2011, 9:08 a.m.,*
in response to message #4 by Bart (UK)

Some of them seem like Casio ripoffs.

This one seems like its keyboard is almost, if not exactly, the same as this one.

Re: Chinese Calculator Prices

*Message #6 Posted by **Bart (UK)** on 29 July 2011, 7:32 a.m.,*
in response to message #1 by DaveJ

It gets better, I select curency to GB pound and the prices change to £0.06!!

Likely a fake company.

*Message #7 Posted by **Frank Boehm (Germany)** on 29 July 2011, 8:35 a.m.,*
in response to message #1 by DaveJ

No company data: buyer beware.
I'd suggest to check with Alibaba (they recently removed lots and lots of fake sellers, so the present sellers are more or less trustworthy...).
While some list calculators for less than 1 USD, most are in the 2-3 USD range.
The huge problem: most listed sellers are just traders and not manufacturer, so not the first choice place to purchase your goods from.

Re: Chinese Calculator Prices

*Message #8 Posted by **robert rozee** on 29 July 2011, 10:16 a.m.,*
in response to message #1 by DaveJ

dave - have you looked at the prices for small components (including switches) on ebay? the prices out of china are pretty good, and the quality is mostly quite passable. for instance, i've just bought (just 10 as samples) the following through-hole small switches:
10,ALPS 6X6X5MM Tactile Push Button Switch Momentary
these are for an hp-15c desktop clone i'm working on.

or there's these ones, much like the ones you use in the uWatch:
15× EVQPJS04K PUSHBUTTON TACT SWITCH 6×3½×4.3mm SMD/SMT

Re: Chinese Calculator Prices

*Message #9 Posted by **Katie Wasserman** on 29 July 2011, 10:26 a.m.,*
in response to message #8 by robert rozee

I sometimes buy electronic parts directly from sellers in China via ebay, DealExtreme or other such places

and am generally very pleased with the quality and especially the price. They usually ship for free or nearly so but that's the the rub, it can take a month to get things.

Edited: 29 July 2011, 10:26 a.m.

Re: Chinese Calculator Prices

*Message #10 Posted by **DaveJ** on 29 July 2011, 6:57 p.m.,*
in response to message #8 by robert rozee

Yes, occasionally I check ebay if I don't care about component quality.
The problem with projects like the uWatch is that many of the components are chosen for very specific physical and/or as aesthetic functional purposes as well as electrical/functional. It's not like buying regular components to just populate a PCB in a box.

Dave.

Re: Chinese Calculator Prices

*Message #11 Posted by **bill platt** on 29 July 2011, 7:41 p.m.,*
in response to message #10 by DaveJ

The supply chain seems to matter. For instance if you want a good LED, you have to buy a known chip through a cmpany with a track record. They are all made in China, but the "warrantee" is what matters....because they all look the same, even when they are not.

Undocumented 50g shortcuts ?

*Message #1 Posted by **Glenn Shields** on 29 July 2011, 12:00 a.m.*

After being inspired by the 50g AUR shortcut listing, I stumbled upon a 'feature' which I can't find in the AUR or user's guide or anywhere else: in the EQW, enter a fraction (like 2/(3+4)), highlight either the numerator or denominator, then press L.S. followed by either R.A. or L.A. and the fraction flips, with the highlighted part still hightlighted. Then, select the 3 or 4 alone. Now these keystrokes will reverse them (3 + 4 becomes 4 + 3, highlight remaining). Also, another shortcut which I read on some post (where?) that in a 3D plot window, using TOOL and NEXT will rotate the plot around a 3rd axis not available using the four arrow keys alone. Does anyone know where, if at all, these features may be mentioned? Thanks in advance, Glenn in West LA

Re: Undocumented 50g shortcuts ?

*Message #2 Posted by **George Litauszky** on 29 July 2011, 12:29 p.m.,*
in response to message #1 by Glenn Shields

There are lot of shortcuts in the 48G UM too.
Note: I discovered that in a 3D plot window I can to enlarge and reduce the plot's size with the "+" and "-" buttons.

*Message #3 Posted by **Glenn Shields** on 29 July 2011, 5:28 p.m.,*
in response to message #2 by George Litauszky

Thanks, that is nice.

Re: Undocumented 50g shortcuts ?

*Message #4 Posted by **Glenn Shields** on 4 Aug 2011, 12:21 p.m.,*
in response to message #3 by Glenn Shields

One more thing, the 50g remains so interesting, and "deep" as Tim Wessman said in his recent Community post (about the "?" function). After 2 years of being challenged by the AUR to modify the Phonelist program to add a "delete" routine, a solution presented itself (I have been using it as an organizer, along with the flash memory so nothing gets lost). The main problem to solve is the fact that the choose box returns only the second item of the list {"name" "number}, so in order to modify the 'names' list to let POS search for the position of the item to delete, I added a routine to combine each element into one string, using DOLIST. Then with the result of POS, the original list can be broken down using SUB into two pieces (without the item to be deleted), then combined with "+" . The method of modifying 'names' and re-storing it is pretty inelegant, but is the method given in the AUR.

So, first add a third choose item, {"DELETE AN ENTRY" 3}, and a third CASE element, "c 3 ==", then copy the same "you must add a name" routine, then ELSE names 1 << obj-> drop " " swap + + 1 ->list >> DOLIST 'nms' STO

This rewrites 'names' into single-string items, to be operated on by POS. This is entered between ELSE

and WHILE. After WHILE comes "DELETE AN ENTRY" 1 CHOOSE REPEAT nms swap POS dup names swap 1 swap 1 - SUB names ROT 1 + swap dup SIZE rot swap SUB + 'names' STO.

This uses POS to pick out all entries up to (POS - 1), then uses SIZE to pick out (POS + 1 throuth SIZE). As for the case if the entry is first or last on the list, it turns out that SUB is a very forgiving function -- if the indices fall outside the range of the list, it returns a blank list {}. How convienient!! Then throw a 'nms' purge at the end to clean up. What fun!!

*Message #4 Posted by **Neil Hamilton (Ottawa)** on 29 July 2011, 1:10 p.m.,*
in response to message #1 by Paul Dale

This reminds me of the "gifts" that get passed out by vendors at technical seminars. Such as the USB memory stick I got who's activity LED would go out when the thing was actively writing/reading -- the exact opposite of what the 1 page instruction sheet said it did, or the original 486sx's with the broken floating point unit (now that was a clever "Say, how about we do this!?" over a few beers on a Friday afternoon!) -- or was that just an urban myth?

I suspect some marketing-type (no offense intended toward marketing-types -- some of my best friends are marketing-types -- I would just be sad if my sister/brother married one :-) figured that they would make the best of a bad situation and try and sell a dud design anyway. Kind of clever actually.

Re: Not HP but I want one

*Message #5 Posted by **PeterP** on 1 Aug 2011, 2:39 p.m.,*

no urban myth. I had one of them...

Re: Not HP but I want one

*Message #6 Posted by **Norman Dziedzic** on 29 July 2011, 4:02 p.m.,*
in response to message #1 by Paul Dale

This reminds me of a story a friend of mine told me.

His family had a small business and right before he left on vacation he altered the keys on a standard desktop "10-key" calculator. Normally they sit 1-2-3 bottom row and up to 7-8-9 on the top. He swapped the top and bottom rows to look like a phone kyepad.

He thought he'd get a good laugh when he got back and did...especially when he found out his father had sent it out for service and the manufacturer said they couldn't figure out what was wrong with it!! :-)

Re: Not HP but I want one

*Message #7 Posted by **Lode** on 29 July 2011, 4:34 p.m.,*
in response to message #1 by Paul Dale

One that always gives 80085 as an answer could be called the "Boobulator"!

Re: Not HP but I want one

in response to message #1 by Paul Dale

> Quote:
>
> Maybe the 34S should have a "wrong" mode added :-)

The Soviet-era Elektronika MK-54 had an `Error' button.

The Elektronika MK-52 (not 54) is a fairly well-known calculator; it was used as a backup onboard the Soyuz missions. It was replaced by the MK-61, which was designed to be functionally identical to the MK-52 but have a different form factor (the 61 being a Pioneer to the 52's Voyager).

Similarly, the MK-54 was designed to be functionally equivalent to the earlier B3-34, which was a hugely popular early Soviet programmable. But for some reason or other---presumably to save manufacturing costs---the MK-54 used *exactly the same body* as the MK-61. This might make sense until you realise that the MK-61, like the MK-52, has two shift keys while the B3-34 has only one.

So the MK-54 ends up with a shift key it literally has no use for. As a result, using it as a prefix before any other function yields an immediate `Error'; an error button.

34s: TVM problem?

*Message #1 Posted by **gene wright** on 28 July 2011, 4:30 p.m.*

I can get the TVM example in the manual to work to solve for a payment, but I can't get it to work solving for the interest rate.

I don't see any disclaimer about the interest rate being a special case... ?

Here's what I did:

-800 STO 80

90000 STO 81

0 STO 82

0 STO 83

360 STO 84

Then set up a program for:

LBL IYR

SLV 01

NOP

RTN

LBL 01

STO 83

XEQ TVM

RTN

and I get positive infinity as the result seemingly regardless of the initial guess.

The answer should be about 0.85 (or 0.0085 since it does not use the x100 view).

Help?

Gene

Re: 34s: TVM problem?

*Message #2 Posted by **Marcus von Cube, Germany** on 28 July 2011, 4:43 p.m.,*
in response to message #1 by gene wright

What happens if you XEQ 01 with your estimated solution in X?

Re: 34s: TVM problem?

*Message #3 Posted by **gene wright** on 28 July 2011, 5:02 p.m.,*
in response to message #2 by Marcus von Cube, Germany

I single-stepped to LBL 01.

Keyed in 0.008 and pressed R/S. I saw -36.6560 in the display.

Re: 34s: TVM problem?

*Message #4 Posted by **Marcus von Cube, Germany** on 28 July 2011, 5:09 p.m.,*
in response to message #3 by gene wright

If your assumption is correct, the result should be near zero. Maybe you didn't get the signs of the parameters right?

Re: 34s: TVM problem?

*Message #5 Posted by **Dieter** on 29 July 2011, 9:49 a.m.,*
in response to message #4 by Marcus von Cube, Germany

The result actually *is* close to zero - for i = 0,008 it's just 36,66 "money units", which is close to nothing compared to the other values. The correct interest rate (0,00846072 to six significant places) returns a value less than 0,0003.

Gene's problem most probably is the TVM routine not handling zero interest rates combined with the requirement of two non-zero initial guesses. See my other post below.

Dieter

Re: 34s: TVM problem?

*Message #6 Posted by **Paul Dale** on 28 July 2011, 5:41 p.m.,*
in response to message #3 by gene wright

The 12c give 0.85 as the answer to this problem so there is an issue with the TVM routine in XROM. I couldn't be bothered fixing a financial function though :-)

The TVM code is exactly:

```
LBL'TVM'
RCL 80
RCL 81
RCL+ 82
1
RCL+ 83
RCL 84
y[^x]
DEC X
/
RCL+ 81
RCL[times] 83
FC? 80
SKIP 03
```

```
RCL 83
INC X
/
+
RTN
```

Anyone care to try fixing the equation?

The solver also makes mistakes from time to time...but that doesn't seem to be the issue here.

- Pauli

Re: 34s: TVM problem?

*Message #7 Posted by **Jim Horn** on 28 July 2011, 8:08 p.m.,*
in response to message #6 by Paul Dale

Perhaps I'm mistaken, but the formula shown in the manual is "PMT-"..., not "PMT+"... so I'd expect the second from last step to be a "-", not a "+". Yes?

Re: 34s: TVM problem?

*Message #8 Posted by **Paul Dale** on 28 July 2011, 9:16 p.m.,*
in response to message #7 by Jim Horn

I think the + is correct.

If you set the initial bounds to .8 and .9 the solver finds the root in about ten iterations: 0.008460723396753903.

Some other bounds I tried failed. So this is more like the solver going awry.

- Pauli

Re: 34s: TVM problem?

*Message #9 Posted by **Miguel Toro** on 28 July 2011, 10:30 p.m.,*
in response to message #8 by Paul Dale

Hi Pauli,

I think that Jim is correct. I compared the program with the formula in the manual and based on that the last instruction before RTN should be "-", if I am not mistaken.

Salut,

Miguel

Re: 34s: TVM problem?

*Message #10 Posted by **Paul Dale** on 28 July 2011, 11:44 p.m.,*
in response to message #9 by Miguel Toro

The solver gets the correct answer with a plus and not with a minus but I'll verify the formula this evening.

- Pauli

Re: 34s: TVM problem?

*Message #11 Posted by **Paul Dale** on 29 July 2011, 12:07 a.m.,*
in response to message #6 by Paul Dale

I checked this and I am fairly confident the function is correct.

I don't know where Walter got the equation in the manual from but the one being solved is:

```
PMT + I/k (PV + (PV + FV) / ( (1 + I)^n - 1 ) = 0
```

This is a rearangement of the PMT = equation in the manual.

I don't see where people are coming from saying the first + should be a -.

- Pauli

Re: 34s: TVM problem?

*Message #12 Posted by **Miguel Toro** on 29 July 2011, 1:25 a.m.,*
in response to message #11 by Paul Dale

Hi,

Yes, you are right. The equation in the manual should then read "PMT +" and so on and not as it is now.

Thanks,

Miguel

TVM

in response to message #13 by Walter B

Editions of the manual from at least 1.4 up to Edition 2.0 released with build 1107, p72 has the formula incorrect.
Later Edition 2.0 (again) of the manual released with build 1173, p73 has the formula corrected.

Suggestions:

Walter:
Better version numbering (many changes were made to the manual released as version 2.0) - perhaps add an alphabetical letter to it?
Forumers:
Use the lateast version of the manual (latest I can find is version 2.1 released with build 1344)

Note: these are observations and suggestions, I am not telling anyone what to do. Please take it in the spirit of trying to help.

Re: 34s: TVM problem?

*Message #15 Posted by **Miguel Toro** on 29 July 2011, 9:00 a.m.,*
in response to message #14 by Bart (UK)

Thank you Bart for pointing to the lastest version of the manual.

By the way, I would like to thank Pauli, Walter and Marcus fos this amazing development of a calculator. This is an awesome work what you are doing here, guys!

Regards,

Miguel

Re: 34s: TVM problem? Something about our manual

Thanks for your report and suggestions. No need for excuses - we've proven we can take whatever comes, but you have to take our response as well ;-) That said, let's start:

- Edition 1.4 didn't contain TVM at all.
- Please note you are closely watching a development project. Almost everything we do is reflected in SourceForge. I don't know any other calculator

development being so open to the community. OTOH you may see a lot of errors, features coming and going again. If you don't want to cope with that, please wait for the official release.
- With respect to edition counting: You may have noticed we update our files frequently. If each and every little change or correction would get a new number, the editions would run up to hilarious values IMHO. So we refrain from doing this.
- But help is near: SourceForge does the counting for us :-) And you find a screen shot of a recent build on the title page of each manual - this may give you some idea what's covered.
- Real bugs are still found - thanks to the community for reporting them.
- IF you want to see the latest committed edition of the manual, look here: http://wp34s.svn.sourceforge.net/viewvc/wp34s/doc/ and choose the file "Manual_wp_34s_...". Again, this may be full of errors still - TIA to everybody reading it and reporting to me whatever (s)he thinks is wrong / misleading / arcane / annoying / whatever ... There will happen nothing worse than you get an answer thanking you (see above) etc. ;-)

Disclaimer: This is written to advance understanding, no offence intended.

HTH,

Walter

Yes, my last sentence intended to convey that these are observations, not criticisms. As I commented in this thread I hold you all in high regard and am very thankful for the effort and time spent on this project.

> Quote:
>
> - With respect to edition counting: You may have noticed we update our files frequently. If each and every little change or correction would get a new number, the editions would run up to hilarious values IMHO. So we refrain from doing this.

The TVM section changed from one formula to four formulas, which I personally think is quite a major change.
However:

> Quote:
>
> - But help is near: SourceForge does the counting for us :-) ...

Indeed, we can always reference a manual together with the sourceforge no. i.e. "edition 2.1 - 1327" ;-)

Thank you again for all the effort,
Bart

Three more formulas in a 80 page paper, well ... YMMV :-)

Re: 34s: small manual error

*Message #19 Posted by **fhub** on 30 July 2011, 10:09 a.m.,*
in response to message #18 by Walter B

For Walter:

Looking in the manual for S.L and S.R I found a small bug:
The statements about multiplication or division with a factor 10^n are correct, but not the **decimal point/comma** is shifted left or right (for S.L

or S.R) but the number itself, i.e. its **digits** are shifted as the function name suggests - the radix is in fact shifted exactly in the opposite direction as the function name says.

Franz

But then it won't correspond anymore with the shifting functions of binary integers. I would just say you should simply explain it in the manual as "shifting the numbers/digits left or right" instead of the radix, which is also the usual understanding for binaries.

Franz

in response to message #23 by fhub

SDL and SDR would nicely translate to Shift Decimal (or Digit) Left / Right.

In the various binary modes the commands could even be context sensitive shifting the digits depending on the base.

Oh, I think this would give a problem when you use this command in a program - running it in different base modes would then give different results. :-(

*Message #26 Posted by **Paul Dale** on 30 July 2011, 7:38 p.m.,*
in response to message #22 by Walter B

We're those two my initial suggestions? Or at least quite like to them? Just checked -- I used SLD and SRD :-)

I'd prefer not making these commands available in integer mode if I can help it. They are provided to make breaking a real number into and out of digit fields quick and easy --

they operate by incrementing or decrementing the real's exponent field directly. Combine them with IP and FP and a lot of steps are saved in addition to executing faster.

In integer mode, they'll correspond to multiplication or division by a power of the base (which can be any value 2 through 16). There is no way to simplify the operation into shifts and adds and all the overflow and underflow conditions will have to be detected and handled. More effort than it is worth for a specialised function.

I forgot: We also have a date in the very last row of the release notes - on the last page of the manual. So belt and braces ... :-)

Walter

Re: 34s: TVM problem?

*Message #29 Posted by **Dieter** on 29 July 2011, 8:02 a.m.,*
in response to message #6 by Paul Dale

I haven't checked the formula, but there is one thing I would strongly recommend: Please avoid coding the TVM-formula literally, i.e. do *not* write it as (1+i)^n - 1. We should be glad to have ln1+x and e^x-1 on the 34s, so please, please use it and write this term as e^x-1(n*ln1+x(i)):

```
...
RCL 83
LN1+x
RCLx 84
e^x-1
...
```

It's shorter and, most important, provides exact results even for low interest rates. If you're not convinced, please see the example in the 15C Advanced Functions Handbook p. 173 and 180ff.

I also do not know what initial guesses for the interest rate are used for the 34s solver routine. The standard pac of the 34C with its included TVM program might be a useful source here.

Dieter

Re: 34s: TVM problem?

*Message #30 Posted by **Paul Dale** on 29 July 2011, 8:26 a.m.,*
in response to message #29 by Dieter

Dieter, thanks for that. I can't believe I missed this improvement :-(

The 34S doesn't provide any initial guesses, the user gets to do that.

Re: 34s: TVM problem?

*Message #31 Posted by **Dieter** on 29 July 2011, 9:41 a.m.,*
in response to message #1 by gene wright

Gene, you will get an +/- infinity error because the TVM routine cannot handle zero interest rates - in this case it tries to divide by zero. You can see this if you enter values very close to zero (0.0001, 1E-10, 1E-15...) followed by XEQ 01 and the results will approach -550, while i = 0 returns the mentioned error. This would not happen if the TVM equation was programmed so that it can handle this case as well.

$$i \to 0 \quad \Rightarrow \quad \frac{(1+i)^n - 1}{i} \quad \to \quad n$$

Instead, the TVM routine tries do divide by (1+0)^n - 1 = 0 and therefore throws an error. Due to the limited precision of the current implementation this is the case for i < 1E-15 (results first lose precision and finally the error message appears).

The Solver does not provide any intial guess for the interest rate, so it's up to you to set two estimates in X and Y. If X or Y are zero the mentioned error will abort the calculation. If there are two good guesses before invoking SLV 01 (say: 0,001 ENTER 1), the 34s will return the correct result. I tried this on the emulator (an old version, 2.0 1054) and it returned the correct result 0,00846072 or 0,846%.

So, the problem occured because of two ...special features of the TVM routine: First, it does not provide any intial guess - it's up to you to set guess1 ENTER guess 2. And second, the TVM equation is unable to handle i = 0. It should be rewritten to do so.

So your approach was fine - and you will get the correct result if (and only if) you provide two non-zero guesses for the interest reate.

Dieter

Re: 34s: TVM problem?

*Message #32 Posted by **fhub** on 29 July 2011, 10:40 a.m.,*
in response to message #31 by Dieter

Hi Dieter,

it seems I'm not the only 'financial interested guy' here. ;-)

Here's my TVM routine which handles also i=0 correctly, and I've also rearranged the equation a bit to make the code shorter (except the new i=0 handling of course):

```
LBL 'TVM'
RCL 83
x!=0?
SKIP 03
RCL+ 84
RCL* 80
SKIP 10
1/x
FS? 80
INC X
RCL* 80
RCL+ 81
RCL 83
ln1+x
RCL* 84
e^x-1
*
RCL+ 81
RCL+ 82
RTN
-------
20 steps
```

I've tested it with the above mentioned values and it works perfectly, almost any initial guesses (except complete nonsense values of course) now give the correct solution, and the first guess may even be 0 now. :-)

But the problem that most users forget to give 2 initial guesses still exists - and I'd really prefer if the values for I would have to be entered in % (and not as interest 'rate', i.e. divided by 100), because this is much more usual for us humans (and also easier to input).

Franz

PS: my rearranged TVM formulas:

i=0: n*PMT+PV+FV=0

i!=0: ((1/i+k)*PMT+PV)*((1+i)^n-1)+PV+FV=0 with k=0 for END payments and k=1 for BEG payments

And if the interest value "I" is given in %, then TVM looks like this:

```
LBL 'TVM'
RCL 83
x!=0?
SKIP 03
RCL+ 84
RCL* 80
SKIP 13
1
%
STO Y
1/x
FS? 80
```

```
INC X
RCL* 80
RCL+ 81
x<->y
ln1+x
RCL* 84
e^x-1
*
RCL+ 81
RCL+ 82
RTN
-------
23 steps
```

That code comment is from the Saturn Math library. I imagine you want more info about the Napier math library though.

Napier is a platform independent C recreation of the saturn math library developed using the Saturn ASM from several units. Developed as part of the 20b and since used in the 30b, 10bII+,

12cp iphone app, some other software calculators (like what comes with the calcpad), and will be used in things moving forward.

That is why the solver in the 30b gets exact results as the 48 series, and the forensics are identical.

Ah thanks. I did not see a reference that two guesses were required in the manual.

But, hey... my question may lead to a better TVM routine in the unit. Woohoo.

To TVM or not to TVM?

*Message #37 Posted by **Dieter** on 29 July 2011, 1:46 p.m.,*
in response to message #36 by gene wright

In fact we now got a proposal for a better TVM routine in the 34s. Maybe there's an even better solution - let me think one step further:

Mathematically, the TVM equation usually does not require any guesses at all to solve for one of their variables. This is because for PV, FV, PMT and N there are more or less simple closed form solutions that do not require any guessing - if you want to know the value for an annual payment, simply calculate it directly. The interest rate is the only exception here - for this case there is no explicit solution, so the Solver is required for an iterative approach. This leads to the Solver numerically solving the TVM equation for the interest rate i, which in turn requires two guesses given by the user.

In other words, providing a TVM equation is only useful for this single case, i.e. when the interest rate is unknown. This is where the 34s differs from the way other HPs work:

The 35s, for example, also can store such an equation in order to solve for any of its variables. The essential point here is the ability of the 35s to solve for all variables (except i) **without any interaction of the user**. No initial guesses are required as the user wants to solve for PMT, FV or other values, and the result shows up immediately because it is calculated **directly** by the 35s. The solver built into this device is able to realize that every variable (except i) shows up only once in the TVM equation, so that it can solve directly for this variable by rearranging the equation. No guesses required. Only if it's the interest rate that has to be solved for, it has to rely on an iterative approach, requiring two guesses.

This is what makes the difference between a "sophisticated solver" like the one in the 35s and a purely numeric solver like the one in the 34s (and 34C, 15C etc.). The more "intelligent" version like the one in the 35s is a nice example for using the solver with not more than just one single equation, even in cases where an explicit solution exists - the calculator will return this explicit solution without any initial guesses or more or less time-consuming iterations.

On devices where such a solution is not possible, I think it's much better to code the direct solution for every single variable. So does the TVM program in the HP-41 standard pac: variables like PV, FV, PMT and N are evaluated directly, while the interest rate is calculated by iteration. A first estimate is set by the program, the user does not have to care about this.

So, what's the use of an TVM equation in the 34s? It is nice for determining the interest rate, using the built-in solver, after the user has provided two initial guesses. Simply because there is no other way to solve for this variable. For all other cases a simple direct solution exists - but since the current approach uses the iterative solver in these cases as well, the user has to enter two estimates for each and every variable - and hope that they are good enough to lead to the correct result.

That's why I think the TVM equation does not make much sense in the 34s. As opposed to calculators with more sophisticated solvers like the 35s. For other devices, I think four routines with the explicit solutions of the four variables are a far better solution. So I would recommend to either omit the TVM equation completely, or, if this functionality is really required, provide the four direct solutions. If you dislike both suggestions, at least there should be a clear hint in the manual and the given example, pointing out that using the TVM equation does not only require calling the solver but also two initial guesses. No, I do not think that "this is obvious because it applies to every call of the solver anyway". Just to be sure. ;-)

Dieter

Re: To TVM or not to TVM?

*Message #38 Posted by **fhub** on 29 July 2011, 2:27 p.m.,*
in response to message #37 by Dieter

> Quote:
>
> So I would recommend to either omit the TVM equation completely, or, if this functionality is really required, provide the four direct solutions.

Well, of course your 2nd suggestion would be the best solution, but there's just not enough space for all 4 formulas, and financial calculations are simply not of high priority in the WP34s project (I know what I'm talking about - I made some experiences in the past here with my suggestions about this issue ;-)).

But I definitely don't agree with your 1st suggestion - although the method with the solver is not optimal, but why should then this TVM equation be completely removed now that my improved version above works so much better and it uses just a few bytes?

With the same argument you could remove the whole solver because it can't solve EVERY equation - or the integration routine because it certainly can't integrate EVERY function.

And back to TVM:
If someone really needs a better TVM routine, there's always the possibility to write those 4 rearranged solution formulas by himself.

Franz

Re: To TVM or not to TVM?

*Message #39 Posted by **Marcus von Cube, Germany** on 29 July 2011, 4:32 p.m.,*
in response to message #38 by fhub

There are certainly better TVM machines then the 34S. Take the 30b for example. ;-)

TVM was implemented as a goody and it still needs some coding around to be useful. It's more of a proof of concept or nice example with some generic value.

It shouldn't be too complicated to code the four equations for a direct solution and set up a routine for the i solver with automatic guesses. This can then be put in a library file and stored in flash. That's the preferred way of adding features to the 34S which do not require extended precision (only internally available) or hardware support (like serial I/O). Many math problems can be solved in user code and be provided as a library. Matrix and vector arithmetic is one the areas which needs a volunteer to port some existing code.

Re: To TVM or not to TVM?

*Message #40 Posted by **Paul Dale** on 29 July 2011, 7:14 p.m.,*
in response to message #37 by Dieter

I looked at including individual routines to solve for each of the parameters using the closed form formulas where possible and the space require was larger than I could justify for a piece of functionality that really is just a nice to have tack on in a scientific calculator.

That doesn't mean I'm closed to the idea, just that I'm not going to spend the time writing very compact but still properly functioning versions of this for each of the five possibilities.

Thanks for the suggestions. I've modified the TVM routine to handle the i of zero case. Initial estimates of 0 and 1 work now. So do estimates of 0.8 and 0.9 which aren't even close to bracketing the solution. It is still possible to confuse the solver with estimates that are on the silly side.

- Pauli

I've looked at your modification, but it's not quite ok.
As you do it (with the PLUS and then the SKIP(11) jumps again to the last PLUS), the value PMT is added once more, so your expression is now PV+FV+N*PMT**+PMT**.

Simply making SKIP(11) to SKIP(12) would be ok, BUT it leaves the first entered PMT on the stack, so there has to be done a bit more (e.g. move this first PMT at the end before the last PLUS)

BTW, why don't you use my code posted above which is just 20 steps compared to your 24?

Franz

The code as written is fine. It leaves PMT in Y but that is harmless since this routine is meant to be called by the solver and the solver does it own thing with the stack.

> Quote:
>
> BTW, why don't you use my code posted above which is just 20 steps compared to your 24?

I tried your code, it didn't work starting with guesses of 0.8 and 0.9 :-(It was easier to fix my code than figure out what was wrong.

Re: 34s: TVM problem?

*Message #52 Posted by **Paul Dale** on 30 July 2011, 4:20 a.m.,*
in response to message #51 by fhub

I just tried your code again and the answer it gives for starting guesses of .8 and .9 is 0.4891696495606895. The solver is getting confused and convergence is *very* slow reaching its iteration limit before a solution is obtained.

I've triple checked what I've typed in against what you wrote above and am pretty sure I've got the code right. Could you verify that what you're running matches what you entered above.

Just to be absolutely sure, the code I'm running is:

```
ADDR  OPCODE     MNEMONIC

0001: 5b64       LBL A
0002: 6100       SLV 00
0003: 013a       RTN

Yes, it's the same code.
But I must stand corrected: I've in fact confused this 4.89E-1 with the true value 8.46E-3, so with these guesses my routine does indeed not work.

But that doesn't change anything on the above mentioned fundamental problem you seem to have with me ...

in response to message #53 by fhub

Franz,

Based on my experience, some people here are not accustomed to the direct way we learn in our country. OTOH, you can't expect others being excited about your suggestions everytime, so some "marketing" may be worth considering. And never forget you may get answers of a similar kind - so get used to take them.

in response to message #53 by fhub

I'd don't have any major issues with you or what you write, your input has been very useful thus far (in fact one of the most useful) and I think that every problem you've identified has been improved upon. We've both made silly mistakes today and I can live with that. Mistakes are part of life. If nobody made mistakes, life would be really dull. If you report a problem & I can't reproduce it means we've got a misunderstanding, not that either of us is wrong. Believe it or not, I actually believe testers' reports unlike many software developers.

However, this is (at least) the fourth time you've threatened to stop reporting problems. Either stop reporting them or stop saying you'll stop reporting them -- it gets tedious :-) I'd prefer you kept reporting issues and short comings -- we still need all the constructive input we can get. I'm hopeful of a final software release for the HHC in September.

BTW: I like problem reports regardless of who makes them or what they are about. Just don't expect your pet solution to be implemented blindly -- every issue you've raised thus far has resulted in an email discussion between Marcus, Walter and myself. I'll freely admit that we've not implemented your pet solution for many of these issues, but that is usually due to short comings that we'd prefer to avoid. We're trying to make the 34S the best calculator we can and we've got to consider the global impact and community response rather than just avoiding the local problem. That said, I believe we've adequately explained these short comings each time but I might be mistaken.

There is a lot going on with the 34S and I've only so much time to dedicate to it -- I'll also admit that I've been a bit abrupt at times, that is often a result of a bad day at work flowing over. For this I apologise. There is also a language barrier between us which might or might not have excited things -- again I apologise. My German is almost unheard of and your English is very good. Deceptively good in fact -- at times I forget that it isn't your native language. I've had the same problem with Dieter's posts at time as well :-(And Walter's myriad emails.

I've certainly not ignored all your suggestions, your vector cross product code is in the library, a very nice and compact piece of code and a good programming effort. I tried your TVM solution (twice now) and I don't know why it isn't working globally but I don't think I can commit the time to figuring this out for the sake of eight or ten bytes of flash.

I also thought about adding the percentage interest rate to the TVM code instead of the raw value. I'm quite undecided on this one. BTW: "S.R 02" is equivalent to dividing by 100 and much faster. This would be a viable replacement for % in your code.

Since you are actually coding for the 34S and have an interest in the TVM calculation, how about trying to implement the financial bank I mentioned? I can pretty much guarantee than a reasonable attempt will be included.

- Pauli

Re: 34s: TVM problem?

*Message #57 Posted by **Paul Dale** on 30 July 2011, 3:28 a.m.,*
in response to message #1 by gene wright

I've got a suggestion.

First up, I remove TVM from the xrom segment. What is there does what we wanted of it when we decided to include it, however it seems that it doesn't do what the community wants.

Secondly, this community writes a suite of financial functions in user code. We then include this code as the one of the user program flash segments as part of the build process. The contents and nature of this suite is completely open. Use the solver or use the dedicated formulas. Add other financial functions. The only limit will be the whole shall be one program flash segment only. That's 506 steps unless some trickery is performed.

I'll make a few suggestions and ideas but nothing hard and fast:

- Avoid using lettered registers as temporaries, they are the easiest ones for users to use and firmware ought to avoid them.
- The four hot keys are available if a program stops with a R/S rather than a RTN.

- Subroutines are cheap and space saving, use lots.
- Make the source compatible with the assembler.

So what do people think of this suggestion?

What other functionality suites could be included in a similar manner?

Volunteers?

- Pauli

PS: I'd do the two steps in the opposite order -- get the suite going and then I'll remove the TVM routine.

Re: 34s: TVM problem?

*Message #58 Posted by **Marcus von Cube, Germany** on 30 July 2011, 3:53 a.m.,*
in response to message #57 by Paul Dale

I second Pauli's suggestion. Here is a head start for a library application:

```
LBL 'FIN'
SSIZE4        // We need registers A to D
CLa
"Finance"
aVIEW
LBL 00
STOP
LBL A
ENTRY?
SKIP 01
XEQ 'F-A'    // compute A
STO A
GTO 00
LBL B
...
```

This allows A, STO A, RCL A as keys to compute, set or examine parameter A. Hitting A will compute A if the entry flag was not set, otherwise it will store A. You will have easy access to four different parameters. Giving the subroutine that does the actual work an alpha label will make it available to other programs.

After each computation, the PC is moved to the beginning of the application in order to make the hot key labels the first to be found when the respective keys are pressed.

This suggestion is not in contradiction to Pauli's hint not to use the lettered registers. In this case, it's the user interface and it makes perfect sense to use the lettered registers here, because they match the hot key labels.

Happy coding!

Pauli, I'd like to have some more special labels such as "I" so that XEQ I may be used.

Edit: Added command to set stack size to 4. This might not be the best idea but somehow, A to D need to be made available for general use.

Edit: Corrected SSIZE4.

I've started working on it but will not have the time to finish it this WE. Maybe Pauli can take over.

Re: 34s: TVM problem?

*Message #62 Posted by **Dieter** on 30 July 2011, 9:14 a.m.,*
in response to message #58 by Marcus von Cube, Germany

Fine - let me add some remarks:

First, "Finance" is much, much more than TVM, so I would suggest something more like a simple "TVM". ;-)

Using registers and labels with the same letter is not new, but still a good idea. That's how basically all TVM programs since the days of the 65 worked. ;-) However, all these solutions had one major advantage: there were five (!) hotkeys A to E, which really is quite nice if there are also five variables. ;-) These five softkeys would match the five financial keys of HP's financial calculators. Even the sequence was the same:

```
N    I%   PV   PMT  FV
```

Looks like a quite logic and intuitive layout to me. Compare that with the current TVM equation which

uses registers 80 - 84 for PMT, PV, FV, I%/100 and N.

So, to make your idea work there has to be a fifth hotkey, something like this XEQ I you suggested. Or maybe there even is a solution for a fifth "E" hotkey ?-)

Regarding the mathematical part and its coding for the 34s: The solution in the 41C standard pac may give a first idea. It can be found on this website. There are some details in this program that deserve a closer look:

Basically the 41C program works just like your idea: The "Entry?" test is handled by flag 22, and even STO A or RCL A can be handled by the HP-41 since pressing "A" to "E" here is a shortcut for the register addresses 01 to 05 used by the program. The question wheter to use an interest rate in percent or its decimal value is answered by simply using both: input and output are percentages (R02) while the program internally uses i/100 (R09) and 1+i/100 (R07).

If the interest rate has to be calculated the program first checks whether there is a periodic payment or not (PMT=0?). In the latter case the interest rate can be evaluated directly. Otherwise the usual iterative approach is required. Since the 41C does not feature a solver, a kind of Newton's method is used here. Before that, an initial guess of plus or minus 1E-9 is set, so that the routine will correctly find either a positive or negative interest rate. For the following iteration the choice of the equation to solve is crucial. The two different TVM equations given by Franz and Pauli show the importance of this point.

BTW - setting a common endpoint for each routine, in your example at Lbl 00, was good practice in the days of the 67/97 and even 41 (when local Alpha labels were used). But does it really make a difference in a calculator as fast as the 34s? Anyway - I like it as it reminds me of the good old days when the '41 was new. ;-)

Dieter

Re: 34s: TVM problem?

*Message #63 Posted by **Marcus von Cube, Germany** on 30 July 2011, 10:35 a.m.,*
in response to message #62 by Dieter

Dieter, if you have more then one application that uses hot keys in the same region it makes a difference where the PC is positioned. So good practice isn't the only explanation.

Having "only" 4 hot keys is a problem here where 5 variables need to be accessed. It's hopefully not to hard to overcome this in the firmware. If LBL I will not be implemented by Pauli, still LBL 'I' can be used which is called by XEQ ENTER^ I ENTER^. For setting the interest rate, STO I will then be the quicker manual key stroke sequence.

TVM is certainly the starting point. However, if we're putting aside a whole page of flash for this, a

lot more than just TVM will fit.

Project Euler Problem 39: Statistical Mode on the HP 48GX?

*Message #1 Posted by **Peter Murphy (Livermore)** on 28 July 2011, 2:12 p.m.*

Problem 39 in effect seeks the (unique) statistical mode of 325 positive integers, each 1000 or smaller. I sorted the list, used 2 << minus >> DOSUBS to identify the positions of the boundaries at which values changed, used DeltaLIST to find the distances between those positions, and deduced the mode from the MAX of those distances.

That worked, but it's roundabout. Can anyone point me to a standard approach, on the 48GX, to finding the mode in such a case? Thanks.

Re: Project Euler Problem 39: Statistical Mode on the HP 48GX?

*Message #2 Posted by **C.Ret** on 29 July 2011, 3:24 a.m.,*
in response to message #1 by Peter Murphy (Livermore)

Hi,

As you, I am trying to solve most of the Euler's Problems by using only vintage system.

I see nothing wrong with your roundabout to found the most frequent value from a list (statistical mode).

What’s trigger me is why are you saying that you have to seek the most frequent perimeter value in a list of as much as 325 elements when 190 only is enough.

How are you building this list of 325 elements? Is there no way to detect the most frequent value (statistical mode) during the building process?

In my code, I use one array (counting array) to record occurrences of each perimeter. No need to record perimeter elsewhere, since the index of this counting array gives the perimeter value (since only integer values are valid for this exercise). I simply have to track the max value position in this counting array to get the answer immediately at the end of the list building process.

Re: Project Euler Problem 39: Statistical Mode on the HP 48GX?

*Message #3 Posted by **Paul Dale** on 29 July 2011, 3:38 a.m.,*
in response to message #2 by C.Ret

> Quote:
>
> Is there no way to detect the most frequent value (statistical mode) during the building process?

In general no, there is no exact method.

There are several method for estimating the mode with one pass through the data. These are estimates only

and not terribly precise. I referenced a few when I did my PhD thesis (which had a chapter on mode estimation) many many many years ago. I've no idea if the state of the art has moved along since then or not.

The mode is definitely the poor cousin of the three common measures of centrality.

Re: Project Euler Problem 39: Statistical Mode on the HP 48GX?

*Message #4 Posted by **Peter Murphy (Livermore)** on 29 July 2011, 9:44 p.m.,*
in response to message #3 by Paul Dale

Thanks C .Ret and Paul for helpful replies.

Given that my roundabout approach works, and given Paul's implication that once-through methods are likely to be good approximations only, I think that I'll go on to another Project Euler problem.

I will treat this as an application of a pauli exclusion principle.

So I bought a Casio 115ES and an HP Smartcalc 300s

*Message #1 Posted by **Brian K** on 28 July 2011, 1:54 p.m.*

I purchased those two calculators for the purpose of picking one for my son to use in his upcoming school year.

Well, I got them both and have now gotten around to opening them up, and to my surprise they're the exact same machine under the hood.

Same screen, same buttons with the same functions.

The Casio has a built-in equation solving function, the HP has arguable better aesthetics and buttons.

I guess I shouldn't have been surprised... At least they were cheap!

Re: So I bought a Casio 115ES and an HP Smartcalc 300s

*Message #2 Posted by **Gerson W. Barbosa** on 28 July 2011, 2:09 p.m.,*

Casio fx-115 ES offers numerical integration. Does Smartcalc 300s also?

Re: So I bought a Casio 115ES and an HP Smartcalc 300s

*Message #3 Posted by **Brian K** on 28 July 2011, 2:38 p.m.,*
in response to message #2 by Gerson W. Barbosa

It appears it does not.

Re: So I bought a Casio 115ES and an HP Smartcalc 300s

*Message #4 Posted by **Gerson W. Barbosa** on 28 July 2011, 2:42 p.m.,*
in response to message #3 by Brian K

So it is more like the fx-85 ES, perhaps.

Re: So I bought a Casio 115ES and an HP Smartcalc 300s

*Message #5 Posted by **Brian K** on 28 July 2011, 3:20 p.m.,*
in response to message #4 by Gerson W. Barbosa

That may be the case, I haven't had time to really dig into either of them.

I was simply struck by the fact that they initially appeared almost functionally identical.

Re: So I bought a Casio 115ES and an HP Smartcalc 300s

*Message #6 Posted by **Gerson W. Barbosa** on 28 July 2011, 5:14 p.m.,*
in response to message #5 by Brian K

The fx-115 ES has an outstanding numerical integrator, as discussed in this older thread:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv019.cgi?read=160194

I guess the Smartcalc 300s would cost a bit more if it were a rebranded 115-es.

Re: So I bought a Casio 115ES and an HP Smartcalc 300s

*Message #7 Posted by **Paul Gaster** on 29 July 2011, 10:58 a.m.,*
in response to message #6 by Gerson W. Barbosa

The Casio also can solve a 2x2 or 3x3 system of equations, do some matrix math, solve a quadratic or a cubic equation, cross or dot product with vectors, work with complex numbers, and probably a few other things I have forgot. It's a nice calculator for the money.

*Message #6 Posted by **Maximilian Hohmann** on 28 July 2011, 4:46 p.m.,*
in response to message #5 by Lode

Hello!

> Quote:
>
> Are those calculating smarties, um, edible?

Well, with enough beer to go along, it may just be possible to swallow them in one piece!

I went looking: The small Smarties calculator measures 64mm across, so it's slightly larger than the Casio micro-mini. But it has proper hard plastic keys, not rubber keys! And it's less than one centimetre high, so the volume is smaller than the Casio.

I also remember several keychain and cigarette-lighter calculators (can't find them in my mess right now...) that are quite small, but I don't remember what type of keys they have.

Regards, max

Re: OT: You know a smaller calculator?

*Message #19 Posted by **DaveJ** on 29 July 2011, 6:34 a.m.,*
in response to message #18 by Paul Dale

I think when I was looking at the time there was only one distributor, and the units had to be factory ordered, with no stock. Hence a larger minimum. But now there seems to be no shortage of dealers for it. Yeah, 400 would probably be doable.

Dave.

Re: OT: You know a smaller calculator?

*Message #20 Posted by **DaveJ** on 29 July 2011, 6:47 a.m.,*
in response to message #19 by DaveJ

There you go:

LINK

80 cents each in 5000qty

Dave.

Re: OT: You know a smaller calculator?

*Message #21 Posted by **robert rozee** on 29 July 2011, 8:16 a.m.,*
in response to message #20 by DaveJ

i was able to select 20 units at $0.80 each, $5.00 total shipping,
but when i got half way through the checkout process hit the following:

"Payment Method
Sorry, we are not accepting payments from your region at this time.
Please contact us for alternate arrangements."

:(

Re: OT: You know a smaller calculator?

*Message #22 Posted by **Paul Dale** on 29 July 2011, 8:33 a.m.,*
in response to message #21 by robert rozee

It is probably due to the failing US economy :-)

Seriously though, the Australian dollar price is more in line with the European and UK prices (A$0.13). 5k units wouldn't be excessively expensive -- unless the 5k minimum is cartons. At thirteen cents each, I'd spring for a hundred or two to help make the MOQ.

- Pauli

Re: OT: You know a smaller calculator?

*Message #23 Posted by **robert rozee** on 29 July 2011, 2:26 a.m.,*
in response to message #15 by DaveJ

ditto here - if someone got a bulk lot i'd be happy to buy a dozen for own use and to hand out to friends. last time i looked at this model i couldn't find anywhere to buy it from :(

Re: OT: You know a smaller calculator?

*Message #24 Posted by **Bart (UK)** on 29 July 2011, 7:24 a.m.,*
in response to message #13 by DaveJ

I recognise the Sharp EL-506P keys here. Let me gues, the statistics functions on the memory keys are accessed by entering the STAT mode using 2ndF-ON? (altough STAT mode is not shown on the ON key?)

WP34S: ALL n mode

*Message #1 Posted by **Didier Lachieze** on 28 July 2011, 2:41 a.m.*

I've noticed the following while using the ALL n mode with rev. 1324:

1. When in mode ALL n (n#0), at power ON the number in X is displayed in mode ALL 0. Any key press restores the ALL n mode.
   Exemple:

   ```
   h ALL 4 3 1/x EEX 3 /
   ```

   Display shows: 0.00033333333

   ```
   g OFF ON
   ```

   Display shows: 3.33333333333 E-4

   ```
   Press a key (f, g, h STO or RCL)
   ```

   Display shows: 0.00033333333

2. Not all numbers are displayed the same way under ALL n (n#0).
   Exemple:

   ```
   h ALL 3 3 1/x EEX 3 /
   ```

   Display shows: 3.33333333333 E-4

   ```
   3.33 EEX 4 +/- ENTER
   ```

   Display shows: 0.000333 instead of 3.33 E-4

Seems like a bug :-(

> Quote:
>
> Not all numbers are displayed the same way under ALL n (n#0).

By design. If all digits fit on the screen in a fixed like mode, they will be shown as such. ALL has always

worked this way. Our ALL is simple less aggressive about switching to scientific mode base on the argument.

- Pauli

>
> - Pauli

A bug in the manual ? ;-) The manual says:

```
For x > 10^13 or x < 10^n, display will switch to SCI
or ENG with the maximum number of digits displayable
(see SCIOVR and ENGOVR).
```

so according to the manual 3.33 E-4 should be displayed in SCI or ENG mode under ALL 3 mode.

Re: WP34S: ALL n mode

*Message #4 Posted by **Paul Dale** on 28 July 2011, 3:18 a.m.,*
in response to message #3 by Didier Lachieze

Sounds like a problem with the manual.

ALL mode has always stayed in FIX if all the digits fit the display. That is what this is doing.

- Pauli

Re: WP34S: ALL n mode - bug fixed

HP15C Redux in Canada?

*Message #1 Posted by **Les Wright** on 27 July 2011, 10:44 p.m.*

CostCentral.com, which seems to be everyone's source here, ships only to the US.

Any Canadian fans catch wind of a Canadian distributor? My googling efforts are failing me...

Les

Re: HP15C Redux in Canada?

*Message #2 Posted by **aj04062** on 27 July 2011, 11:03 p.m.,*
in response to message #1 by Les Wright

Try these guys:

http://www.fticomputer.com/

They seem to be the only ones left taking orders:

Can anyone confirm this is the correct P/N? HP 15C SCIENTIFIC CALCULATOR [NW250AA#ABA]

Re: HP15C Redux in Canada?

*Message #3 Posted by **Michael de Estrada** on 27 July 2011, 11:13 p.m.,*
in response to message #2 by aj04062

Yes, that is the correct P/N. However, who are these guys and can they be trusted ? Payment is by PayPal, which means you are charged immediately rather than at shipment time.

Re: HP15C Redux in Canada?

*Message #4 Posted by **Les Wright** on 27 July 2011, 11:15 p.m.,*
in response to message #2 by aj04062

Thanks. Just ordered two, paid thru PayPal, accepted a Canadian shipping address. They only ship UPS, which I normally hate, because brokerage fees are often well in excess of the sales taxes that would've been assessed by Canada Customs had it come in by USPS.

Hope this is legit!

Les

P.S. That is the right part number. Googling took me to a Samson Cables page which said the item wasn't for sale!

Re: HP15C Redux in Canada?

*Message #5 Posted by **Les Wright** on 28 July 2011, 9:26 p.m.,*
in response to message #4 by Les Wright

Just got an email from that company indicating that that item has been discontinued and my PayPal amount will be refunded.

Does this thing REALLY exist? Or is it a hoax like the 67CX?

Re: HP15C Redux in Canada?

WP34S Program Labels

*Message #1 Posted by **M. Joury** on 27 July 2011, 10:08 p.m.*

I have tried to search the web to see if this was ever discussed and have found nothing. So I ask: Why was the decision made to limit program labels to 3 characters?

While FAR superior to what is available on the 32/33/35 and obviously better than the Voyager series it would have been nice to have the capability of the 41/42 calculators in this area. Was there some specific implementation limitation that did not allow for longer labels or made such an implementation more difficult?

Re: WP34S Program Labels

*Message #2 Posted by **Paul Dale** on 27 July 2011, 11:47 p.m.,*
in response to message #1 by M. Joury

It was discussed, just not here.

Implementing longer names is more difficult as you guessed.

Three characters fit nicely into two op-codes in program memory and I implemented double length op-codes just for this. Going longer would require some design work to allow longer op-codes in program memory. This would have the advantage that strings and numbers could possibly be merge into single steps. But I'm under no delusions as to the difficulty involved.

As usual feel free to submit a patch :-)

- Pauli

Re: WP34S Program Labels

*Message #3 Posted by **Marcus von Cube, Germany** on 28 July 2011, 4:55 a.m.,*
in response to message #2 by Paul Dale

Having longer labels or packing strings and numbers in variable length op-codes would be really nice but I have no illusions that it will be easy. The main problem is navigating backwards in the code either manually or via BACK.

A relatively simple implementation would involve a single "add another three characters to the previous instruction" instruction which is automatically appended if a label gets longer. The instruction is otherwise treated as a NOP. But it will affect label search, the label browser and most probably more pieces of the code.

I can imagine the feature will appear some time but there is no free lunch: Adding features will definitely cost us another library region. I've recently made a suggestion to Pauli and Walter for kind of a user keyboard (using -> as a prefix as suggested here). Both features together will probably fit in another K of flash sacrificing a library region for the purpose.

Re: WP34S Program Labels

*Message #4 Posted by **M. Joury** on 28 July 2011, 9:03 a.m.,*
in response to message #3 by Marcus von Cube, Germany

It sounds like you have given this some thought. Implementation details would be interesting and I don't know enough about how it is currently implemented to make any suggestions. My simplistic approach would be an opcode to denote "label-characters follow" followed by a length. For going backwards you would need something similar on the end as well but probably with the order reversed (length.TerminatingOpcode). Unfortunately this uses 4 bytes just to manage the strings even if you have a single character label and this gets expensive. A hybrid approach could retain the current 1/2/3 character labels you have now and implement the above idea for labels longer than 3 characters. And then of course there is the approach you suggest which, given your familiarity with the code, is probably a better approach.

As the source code is primarily C I'd like to take a look, time permitting, and see if any ideas jump out at me. Unfortunately at the moment I am pretty much swamped with my real job so it may be a while before I get to it.

Thanks for the info that you and Pauli provided!

Re: WP34S Program Labels

*Message #5 Posted by **Paul Dale** on 28 July 2011, 5:29 p.m.,*
in response to message #4 by M. Joury

I won't go into top many details but a rough outline is possible.

Op-codes are two byte integers. For alpha labels two of these are paired into four byte integers. Stepping forwards is easy, we know the length of the op-code by partially decoding it. Stepping backwards is more difficult, we have to look at every possible length to see if there is an op-code of that length ending just before where we are. Currently, there are only two op-code lengths and thus two places to look so this isn't too bad. Going to op-codes of 1 - 17 bytes like the 41 series would make this more difficult. I think the 41 solves the problem by rescanning from the start to find the previous instruction -- we could do this too and certainly have the speed to do it instantly but it isn't how it is coded currently.

Then we come to label searches. Since we've only two op-code sizes (2 and 4 bytes), I take a big short cut here and build the label op-code in an integer variable. Then I can quickly search for this label using a tight loop that pretty much just does an integer compare and a pointer increment. Again, this could be coded around but it will be more involved matching longer opcodes.

These decisions were made a long time ago before the possibility of using internal flash for program storage was realised. Would I do things different if we started again? Definitely.

- Pauli

Re: WP34S Program Labels

*Message #6 Posted by **Marcus von Cube, Germany** on 28 July 2011, 6:06 p.m.,*
in response to message #5 by Paul Dale

Pauli, my fault. :-(

;-)

Re: WP34S Program Labels

*Message #7 Posted by **Paul Dale** on 28 July 2011, 6:20 p.m.,*
in response to message #6 by Marcus von Cube, Germany

Not at all. It is good to elucidate about what turned out to be sub-optimal decisions.

At the time the decision was made I was sure it was a good way to do things. If the ground rules hadn't changed in the meantime, it would still be a good way.

Of course back then the device had about 500 program steps and no possibility for more step or backups. It has grown considerably.

We learn from our mistakes after all :-)

- Pauli

Re: WP34S Program Labels

*Message #8 Posted by **M. Joury** on 28 July 2011, 6:39 p.m.,*
in response to message #7 by Paul Dale

Thank you both for your outline of how the code currently works. If I may ask two questions: What module would you start with if trying to decipher the opcode parsing and IP increment code? And what compiler are you currently using?

I would like to take a look to see if any ideas strike me for a way to implement variable length opcodes to handle labels. As far as that goes, are there any other areas that would benefit from multi-byte opcodes? I believe that string handling was mentioned earlier?

Thanks,

Marwan

Re: WP34S Program Labels

*Message #9 Posted by **Paul Dale** on 28 July 2011, 7:10 p.m.,*
in response to message #8 by M. Joury

You will want to look in xeq.c for the instruction decode and execute xeq() is the function that handles all command execution. Both user commands from the keyboard and programs go through here -- keyboard commands are converted to op-codes (in keys.c). If we're in program mode, they are stored and if not, they are executed. This is another thing I'd do differently, I'd have the command tables have a flag to decide if something is stored or executed in program mode -- there are specially coded exceptions for CLP, CLALL and DELp.

As for increment and decrement of the PC, inc() and dec() again in xeq.c Be very very careful with these, they are fragile beyond belief but don't appear to be.

I don't know the compiler, Marcus handles that aspect now.

Strings and numbers could benefit from longer op-codes. I've a disabled command that appends three characters to alpha but no keyboard interface for it. I have a good idea how to do the same for numbers but again no real idea how to present this to the user.

Better than packing keystrokes would be to store the compiled number and strings directly -- this is greatly complicated by integer and real modes however.

The next iteration (with a different model number) will likely address all this and more. Don't hold your breath waiting :-)

- Pauli

Re: WP34S Program Labels

*Message #10 Posted by **M. Joury** on 28 July 2011, 7:22 p.m.,*
in response to message #9 by Paul Dale

Thanks Pauli,

I'll take a quick look. However, any in-depth work may have to wait a while. As you noted elsewhere we all do this as a hobby and unfortunately my day job is demanding my attention these days <g>.

Cheers,

Marwan

Re: WP34S Program Labels

*Message #11 Posted by **Marcus von Cube, Germany** on 29 July 2011, 3:57 a.m.,*
in response to message #10 by M. Joury

Marwan, we are using a GCC 4.2 cross compiler (yagarto.de) for the real build and Visual Studio 10 (or VC++ Express) for the emulator.

Re: WP34S Program Labels

*Message #12 Posted by **M. Joury** on 29 July 2011, 9:34 a.m.,*
in response to message #11 by Marcus von Cube, Germany

HP 19C continuing saga...pictures!!!

*Message #1 Posted by **Geoff Quickfall** on 27 July 2011, 8:05 p.m.*

One simple question.

I spent an hour working on this calculator mechanically removing the cemented blue corrosion. I used a dental pick and fiberglass brush. Ethanol and a natural bristled paint brush to rinse with.

What can I soak this in to dissolve the blue corrosion.

Now to the calculator. I purchased this one for parts for the ACT chip and swap to the 19C from this post:

The other 19C

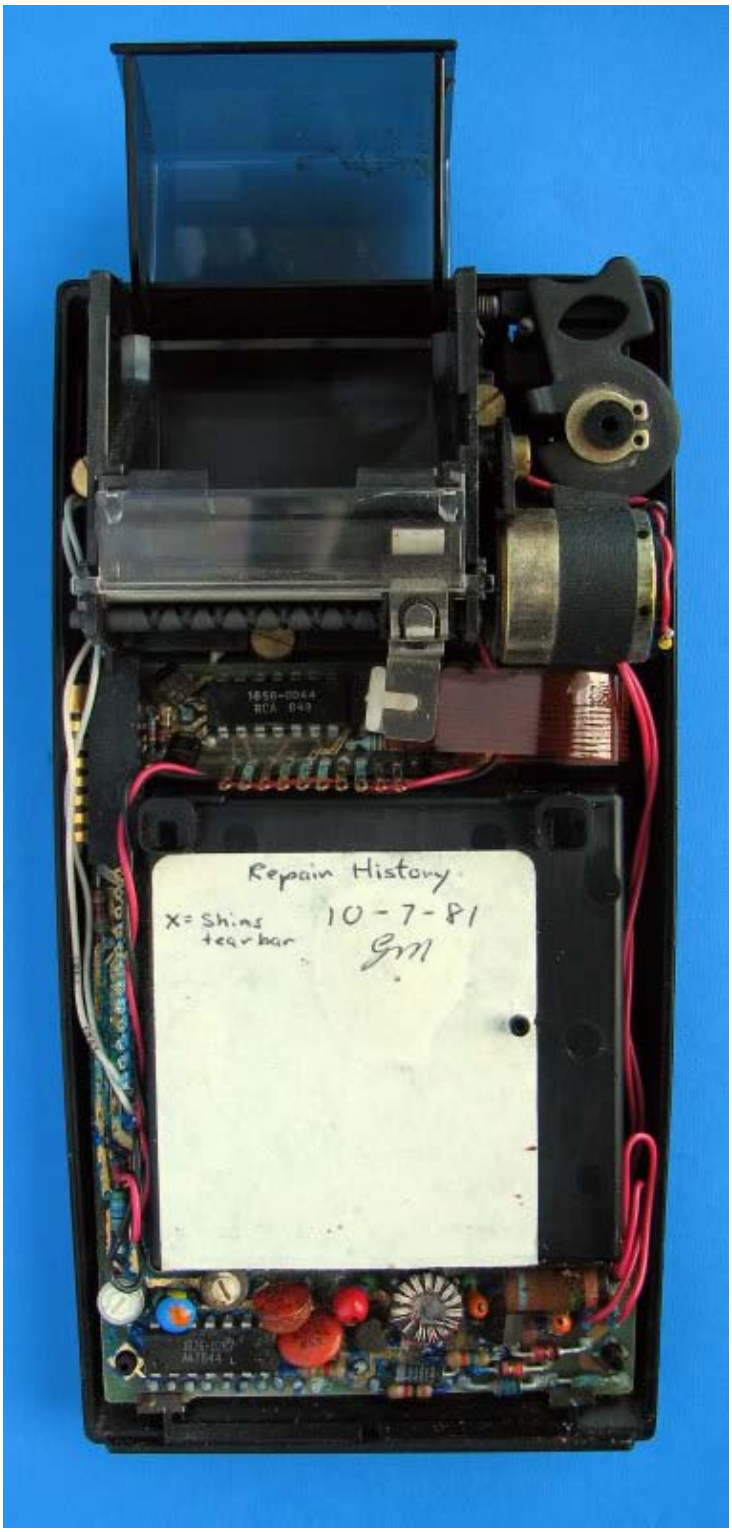
The calculator was missing the LED red plastic lens and the calc was described as non-working, with original battery pack. So I had no illusions that it would function. Wasn't cheap (100USd) but I can justify as it is for the book.

Here is a top view with the missing lens:

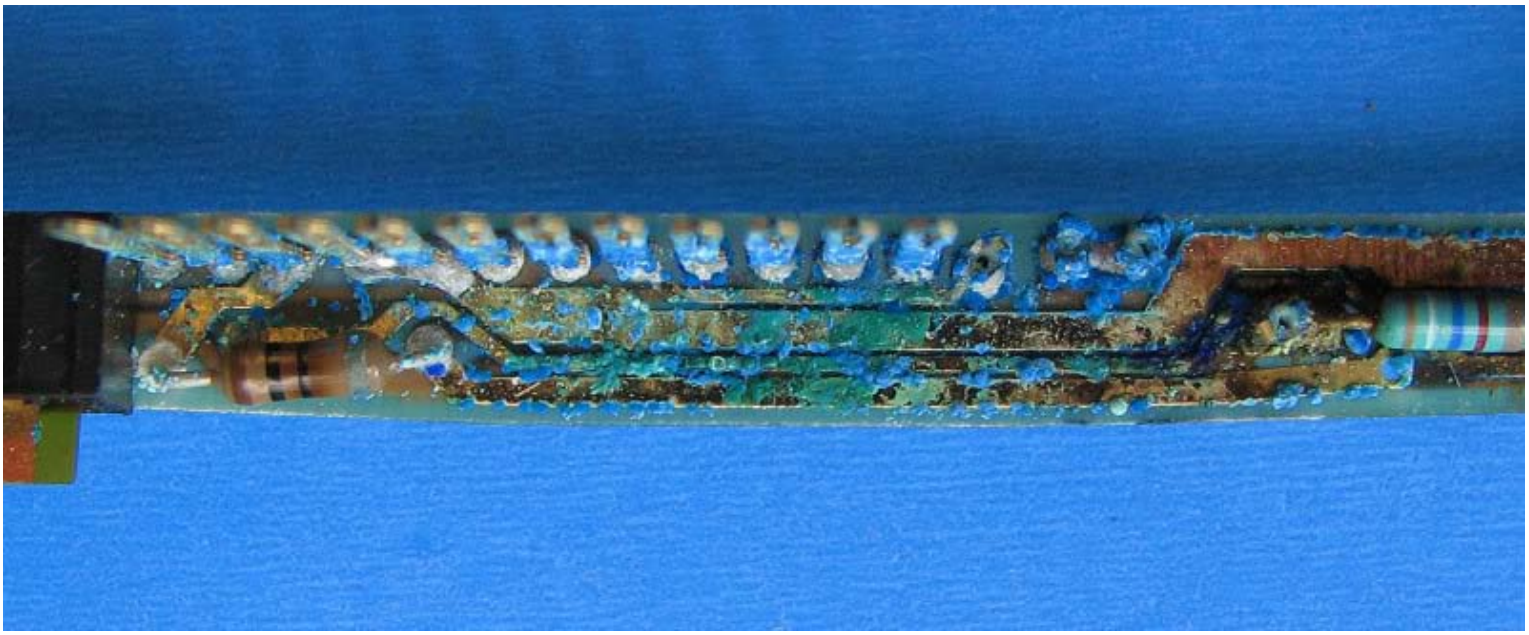
For the heck of it, I removed the battery pack (not bad) and cleaned the minor dusting of white powder off the contacts. Then attached an alternate battery pack with clips to the appropriate contacts.

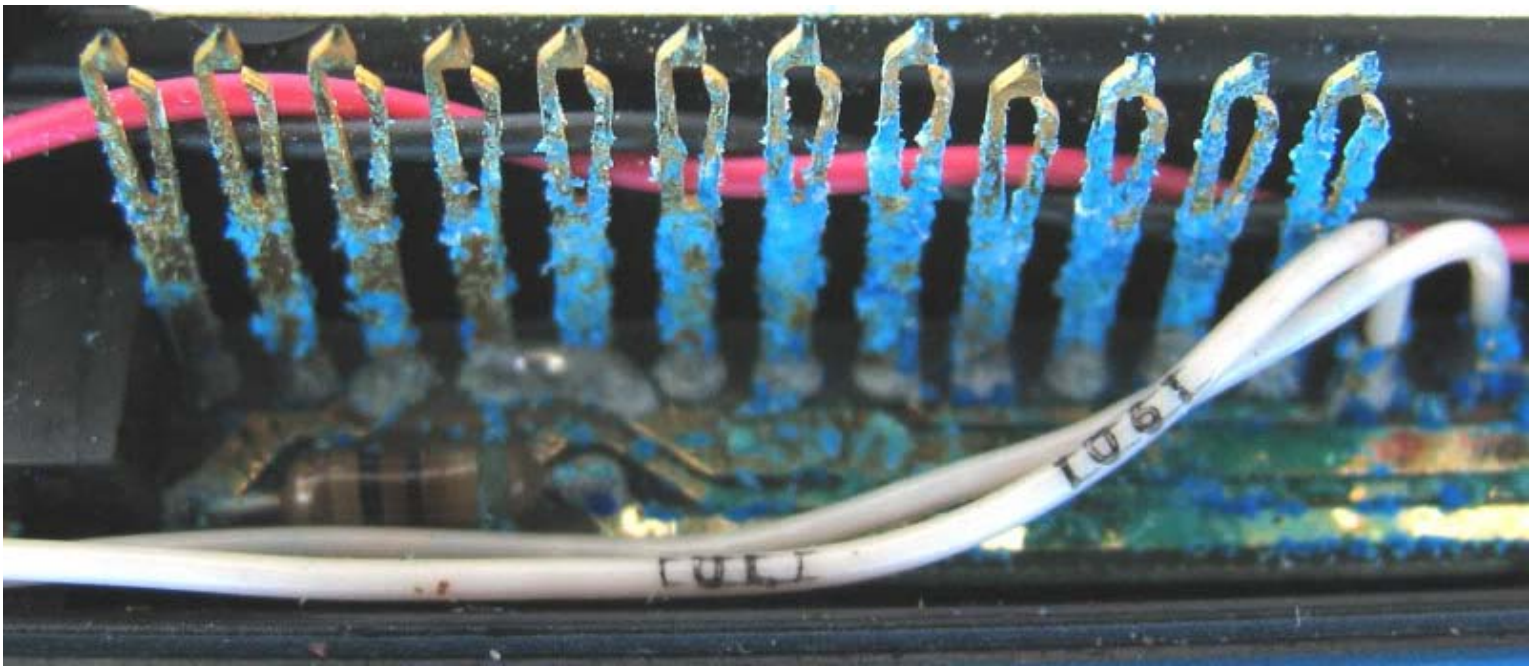
It not only lit up but PRX printed the display. All 98 program registers and functions were perfect!! So now the "Other calculator" is to be the donor.

Started to disassemble and was met by this internal label:

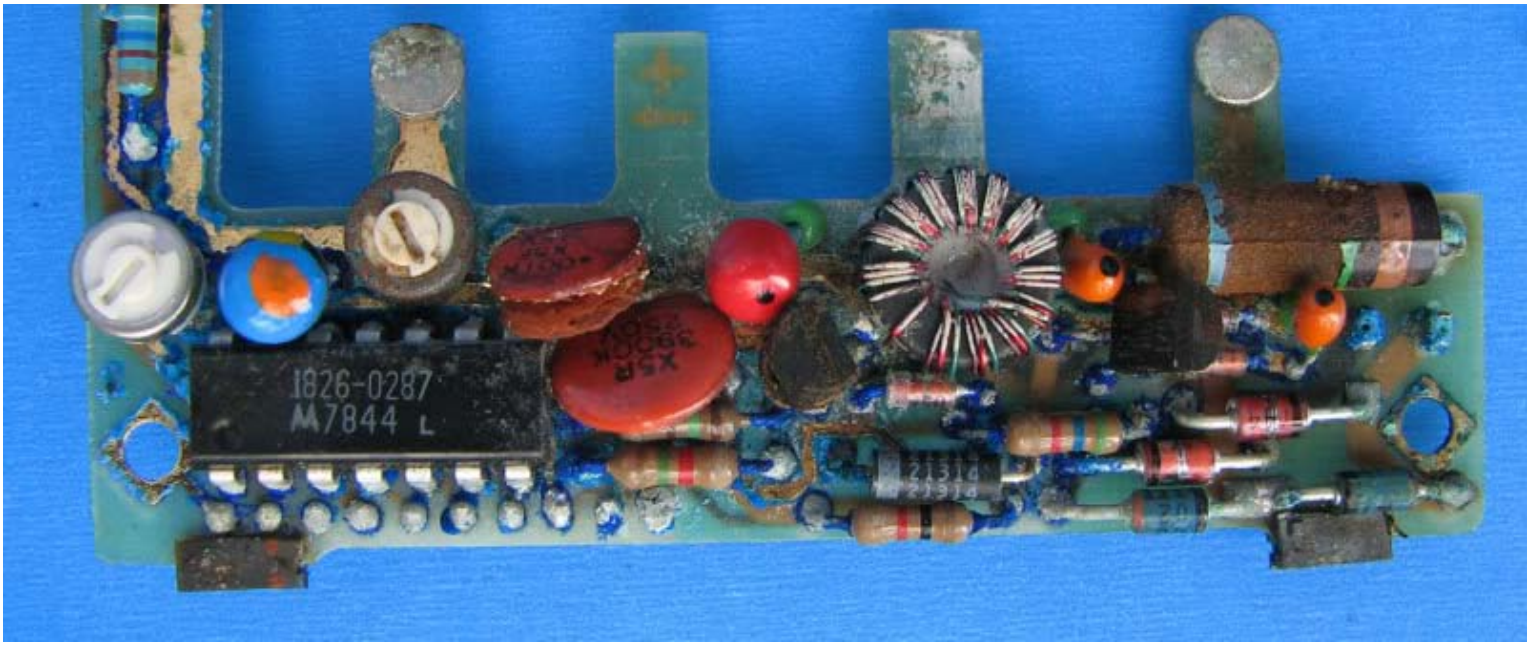


Investigating further; HOLY COW look at the before pictures and you tell me if it should have lit up!!!!

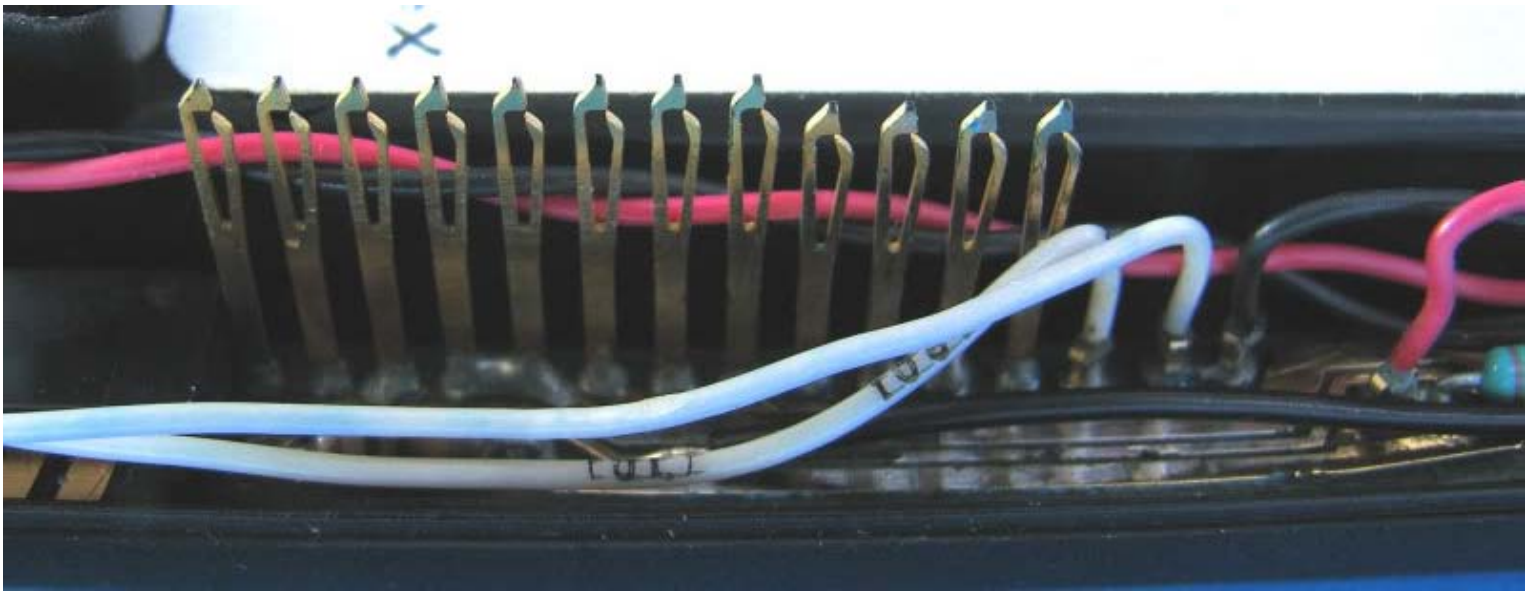


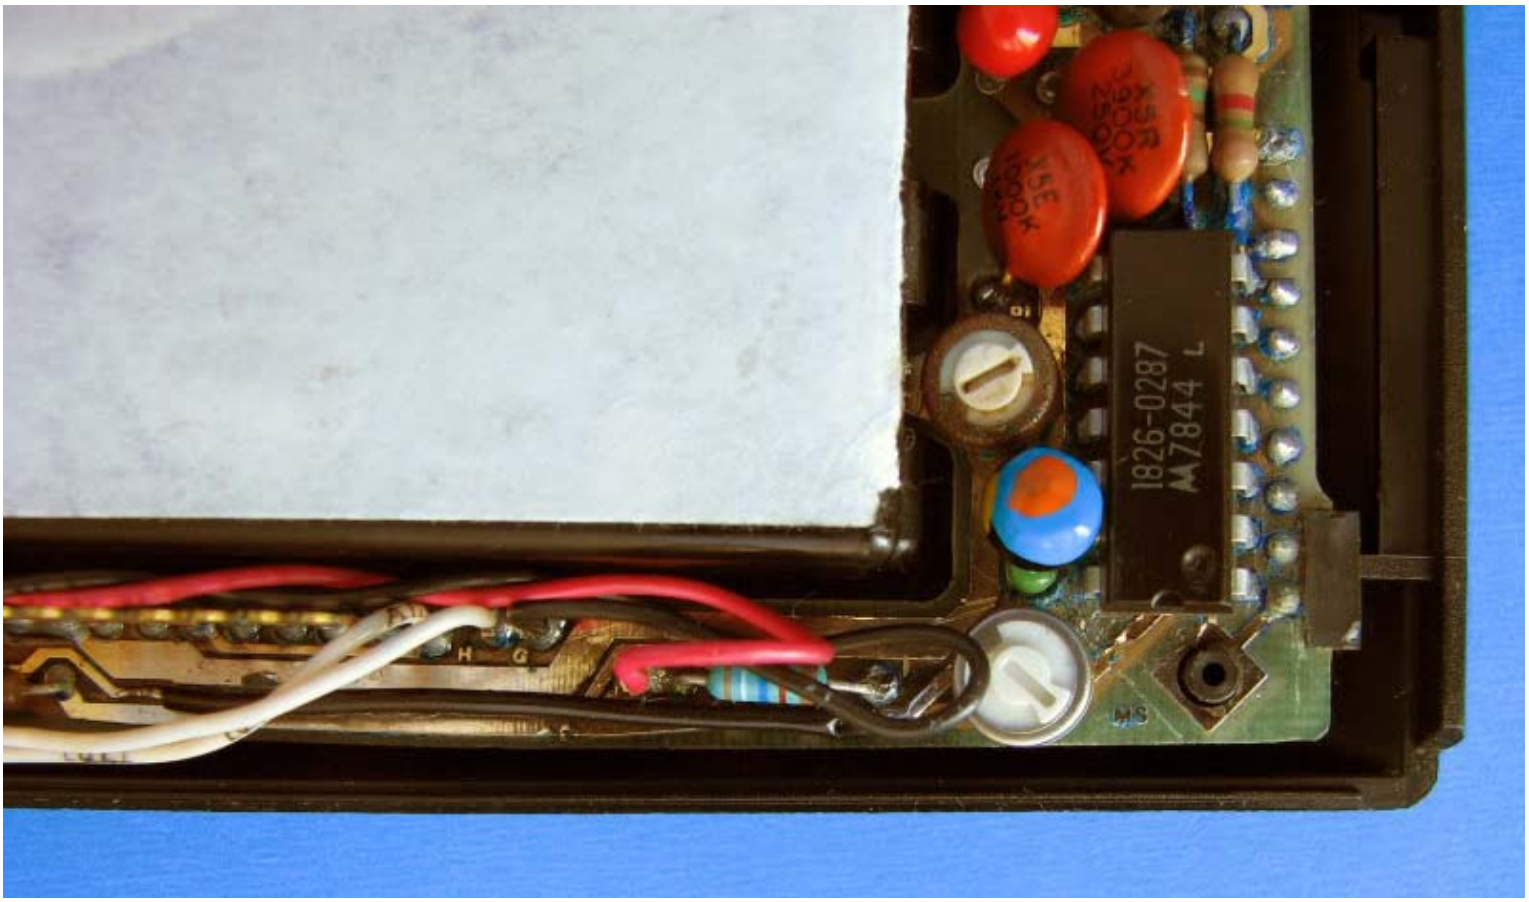


Even the two capacitors at the battery contact PCA were delaminated and rotting. I actually thought there were three caps on this board:

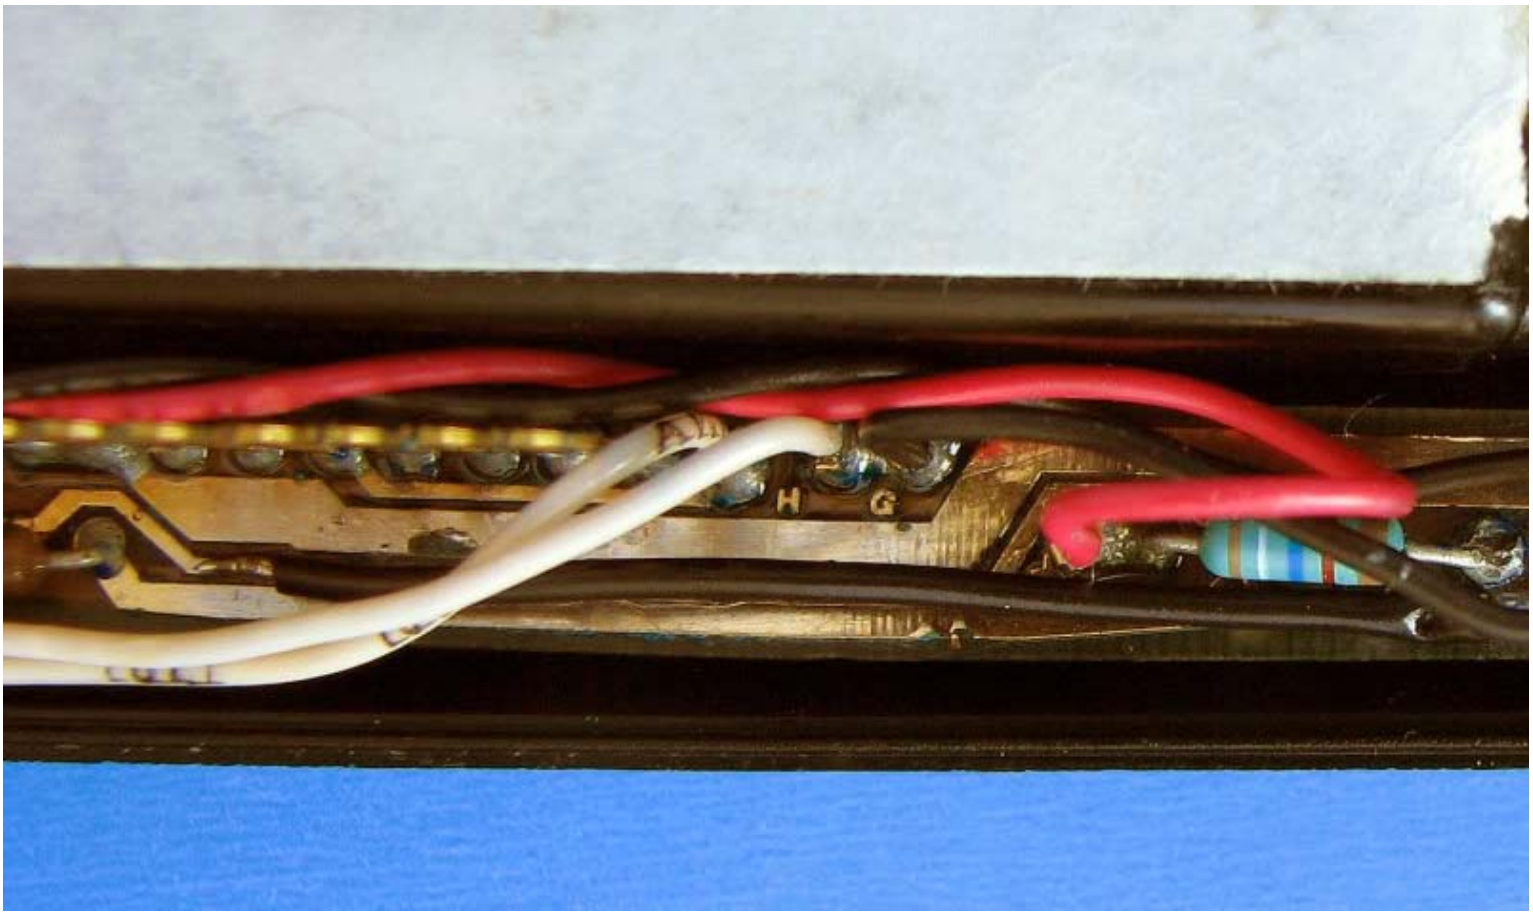


So time to clean up.

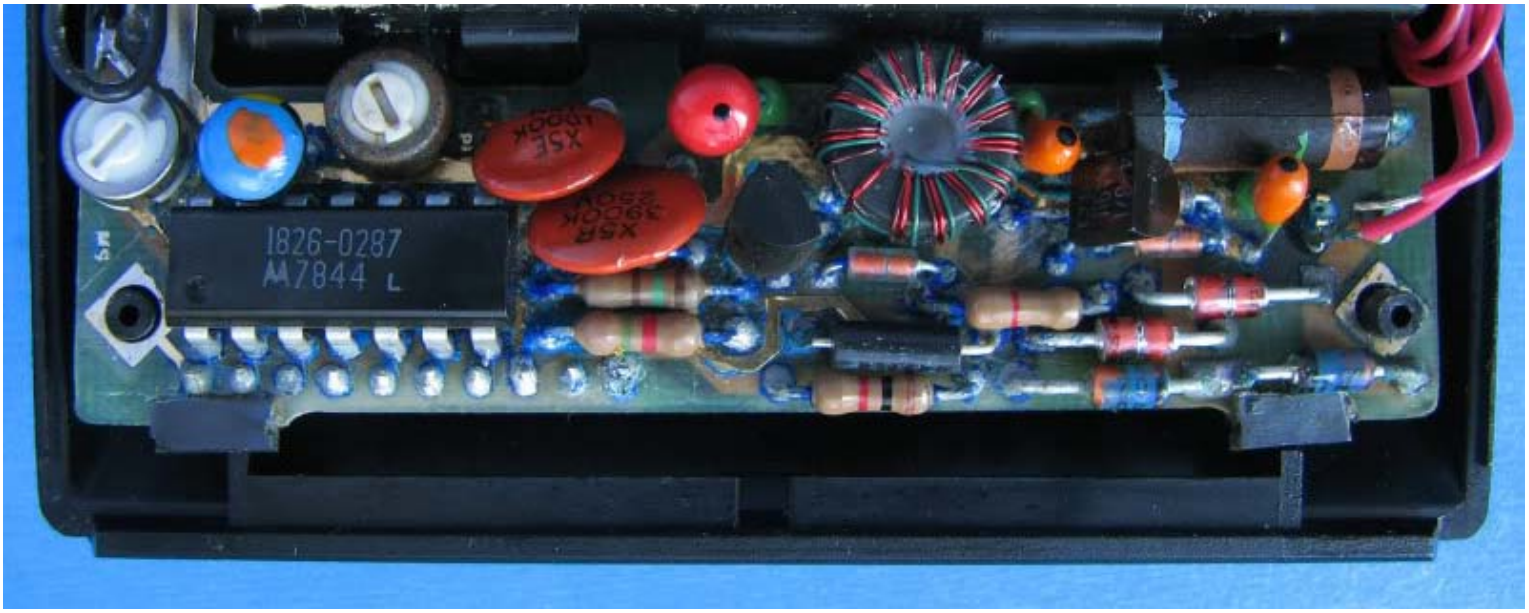




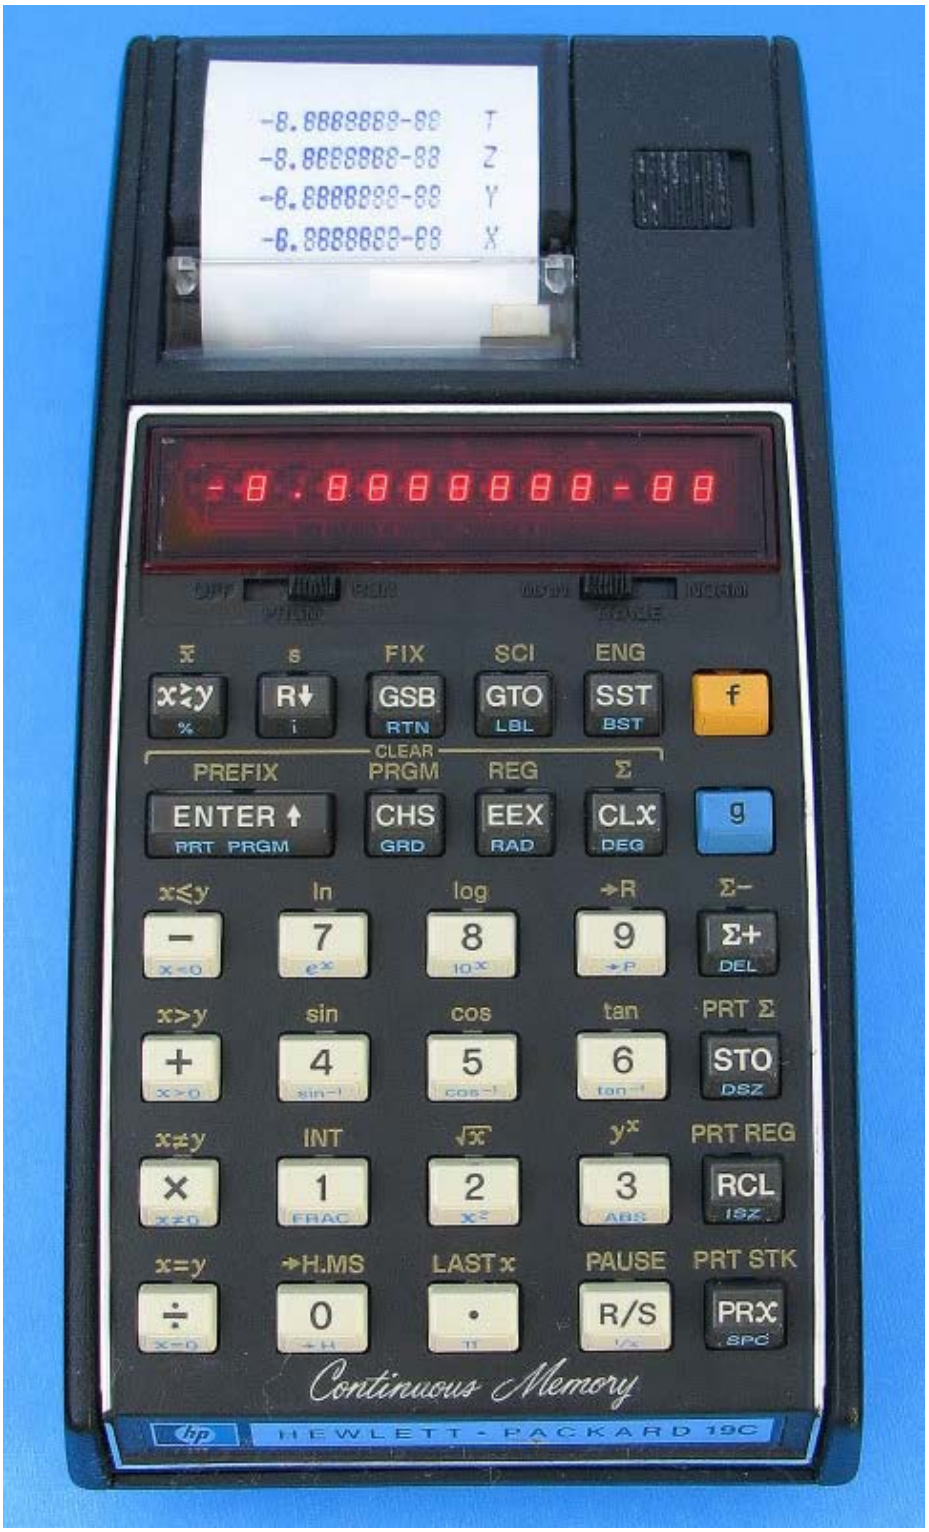
On these two photos most of the contaminant was removed and unfortunately a trace was missing a section after cleaning. Corroded through for a 1cm section. This was bridged by a black wire seen below.



I used the donor with two good caps to replace the two bad caps (but functioning):



So now here it is with the donor lens in place and back to the first question. What does one use to dissolve the blue (vinegar bath?).



-8.8888888-88 T
-8.8888888-88 Z
-8.8888888-88 Y
-8.8888888-88 X
-8.8888888-88
Continuous Memory
HEWLETT - PACKARD 19C

Cheers, Geoff

THE CL is AWESOME! it is the only calculator I use now! Unsolicited advertising for the CL.

Edited: 27 July 2011, 8:06 p.m.

Re: HP 19C continuing saga...pictures!!!

*Message #2 Posted by **aj04062** on 27 July 2011, 8:41 p.m.,*
in response to message #1 by Geoff Quickfall

Hoochie Mamma, that's a wicked lot of corrosion.

I've used vinegar baths. I usually warm it up in the microwave so the acid can really be active. It's fun watching the chemistry experiment in action.

I usually place it under the vent in my kitchen as I have no idea what gaseous byproducts are being emitted.

Adam

Re: HP 19C continuing saga...pictures!!!

*Message #3 Posted by **Bart (UK)** on 28 July 2011, 4:54 a.m.,*
in response to message #1 by Geoff Quickfall

Hi Geoff,

Here is some advice our good friend Luiz gave me some time ago (he refers to pictures that are unfortunately no longer available):

"The TI59 board (right side) has a lot of oxidation, and the TI58C board (left) seems cleaner, right? They had both about the same oxidation level before I left the TI58C resting for about 20 hours in a solution of 30 to 40% alcohol vinegar with hot water (could touch it without feeling pain...). You can see some of the copper oxide in the TI58C´s PC100A contacts, and also notice the missing copper (parts totally destroyed).

Battery leakage is mainly basic (PH), and the alcohol vinegar is acid, so they react with each other and the remains of the reaction (a salt, right?) is easily removed with a paint brush, current water and neutral detergent. As you can see, I removed the LED display, power supply and some components (transistors, elect. caps, "SSS" module contacts, etc.) prior to clean it up.

I have been doing this for some time (woodstocks and these TI's, mostly) and have successfully removed copper oxide from them. In one particular case, a TI59 board with extensive oxidation damage, had the remains of many copper tracks being dissolved or popped out of the mainboard.

The hot water accelerates the reaction, but after some time its temperature raises down and the reaction decelerates as well. Anyway, I always keep my eyes over the board during the process and never let it stays for more than 20-22 hours."

Hope this helps
Bart

Re: HP 19C continuing saga...pictures!!!

*Message #4 Posted by **Mark Henderson** on 28 July 2011, 3:08 p.m.,*
in response to message #3 by Bart (UK)

Yesterday I worked on a non-working 29C purchased in January from TAS. Upon opening it had the (expected) corrosion, not as severe as the 19C here, but clearly enough to cause problems. Soaked for only a few minutes in warm water with white vinegar and a drop of dish washing liquid, brushed with a nylon brush, air-blast dried. Some cleaning of the case and keys, reassemble - and it WORKS! Perfectly!! So happy! I also have a working 19C and love the calc (especially that the X-register is preserved through power-off, unlike all the other LED "C" models). So today all my work is being done on my almost-as-new-looking 29C!!!

HP calculator model unknown

*Message #1 Posted by **Guzzi850** on 27 July 2011, 4:37 p.m.*

I just bought a HP calculator at a garage sale last week and was wondering if someone might be able to identify the model. It looks like the calculator is built on a HP-10C chassis. The square HP logo in the upper right hand corner fell off and there is no "HEWLETT PACKARD" sign in the lower left corner because under the "ON" button is a yellow "ON/OFF", under the "f" button is a yellow "USER 1" and under the "RCL" button is a yellow "USER 2". The ten key and decimal section is outlined in yellow and the top 3 keys in the upper left (yellow functions) is marked "FURLONGS, TIME and LENGTH". The serial number is 2838A68406.

Thanks for any info.

OT: The Tau Manifesto

*Message #1 Posted by **Howard Owen** on 27 July 2011, 12:51 p.m.*

"If you were still a [Pi] partisan at the beginning of this section, your head has now exploded. "

The Tau Manifesto

Re: OT: The Tau Manifesto

*Message #2 Posted by **Crawl** on 27 July 2011, 3:14 p.m.,*
in response to message #1 by Howard Owen

I was half-way to being convinced before I even read that article. After all, pi is the ratio between circumference and diameter, but how often do we use *diameter* in equations? We always use radius.

And the "prettiest" formula with pi, as he himself mentions, is

pi*r^2

which, again, uses radius, not diameter.

Re: OT: The Tau Manifesto

*Message #3 Posted by **Gerson W. Barbosa** on 27 July 2011, 3:51 p.m.,*
in response to message #2 by Crawl

3:14 p.m.

Does this mean some resistance? :-)

Re: OT: The Tau Manifesto

*Message #4 Posted by **Csaba Tizedes (Hungary)** on 28 July 2011, 3:21 a.m.,*
in response to message #2 by Crawl

Err... The radius is not measurable. No one science will be lives without applications and experiments - and all theories in all science fields based on measuring. The diameter is MORE acceptable than a "theoretically founded" distance, like radius. BTW I'm a mechanical engineer :P :)

Re: OT: The Tau Manifesto

*Message #5 Posted by **Gerson W. Barbosa** on 27 July 2011, 3:45 p.m.,*
in response to message #1 by Howard Owen

I quite agreed with the idea when I first read about it some years ago but I disliked the proposed symbol. The new symbol (pi without one leg rather than with an extra one) is definitely a better choice. Incidentally the Portuguese word for lathe is *torno*, which makes sense since it's a turning tool.

A bit late for Tau Day, anyway here is the first pandigital approximation to tau :-)

```
sqrt(sqrt(51432/((6*7-9)*8^0)))
```

Re: OT: The Tau Manifesto

*Message #6 Posted by **Paul Dale** on 27 July 2011, 6:02 p.m.,*
in response to message #1 by Howard Owen

The PI Menifesto has a less rabid and one-sided view of the cases for and against both. Well worth the read.

HP 41 magnetic cards

*Message #1 Posted by **Giancarlo** on 27 July 2011, 11:32 a.m.*

Hello, i have a HP41c and a card reader. Testing them together i have the following error when trying to store a program on the card: CARD ERR

it is the first time i am able to test the refurbished card reader.

The card reader manual shows that this happens when the card is not recognized as a HP41 one.

Do you know how i can understand if a card is made for the HP41 or for the HP67 or HP97?

Do you think that the issue is a different from my understanding?

Thanks

Giancarlo from Italy

Re: HP 41 magnetic cards

*Message #2 Posted by **M. Joury** on 27 July 2011, 11:39 a.m.,*
in response to message #1 by Giancarlo

Are you asking if perhaps you have a 67/97 card and that is why it is not working? Or are you asking if perhaps you have something OTHER than a 41/67/97 card?

If it is the first question the answer is that the 41/67/97 cards are all the same. If the second I would assume that the only other possibility would be a 65 card and I believe that even those are compatible.

Also a damaged card will potentially show a variety of errors so if you have not already done so try another card.

Cheers

Re: HP 41 magnetic cards

*Message #3 Posted by **Geoff Quickfall** on 27 July 2011, 12:22 p.m.,*
in response to message #1 by Giancarlo

Try writing with the card reader a simple TEST program:

```
LBL TEST
"TEST"
AVIEW"
END
```

Write it to the card, then CLP "TEST". Then read the card. This will confirm the card reader read and write ability. If the other card continues with CARD ERROR then it is the card. Corrupted by age or magnetic field.

sometimes, rarely, some card reader that have been repaired do not function in other card readers. Also the capacitors will dry with age and need replacing. I have a card reader that when readin,g tells me CARD ERROR or CHECKSUM intermittantly but these cards are perfect in other card readers. I have tried everything physical to this reader; new pinc roller, new dampening couple, head cleaning. Next will be capacitor replacement.

Geoff

Re: HP 41 magnetic cards

*Message #4 Posted by **Dieter** on 27 July 2011, 2:50 p.m.,*
in response to message #1 by Giancarlo

Here are some basic facts that may help to find out what's going on.

- Magnetic cards are the same for the 41, 67 and 97. AFAIK they can even be used in the 65. When the 41 appeared there were no new cards - the card reader simply took the same cards that had been used with the 67/97 before.
- The 41 card reader is able to read both its own data formats (programs, data, status cards etc.) as well as cards written by a 67 or 97. In the latter case the 67/97 program or data is translated by the card reader.
- Cards can be checked by using the verify command (XEQ "VER"). The card reader then asks for a card, and after it has passed trough the reader the card type is identified: TYPE: P TR 02 for instance means that this is the second track of a card or card set with a 41-program. HP67/97 cards are type 7P (program) resp. 7D (data).
- So a valid 67/97 card does *not* return an error message, instead the card is correctly identified as what it is.
- CARD ERR shows up if the VER function cannot identify the information stored on the card currently checked. This may be a card that is completely empty (does not contain any information at all) or a card that cannot be read properly (no valid information can be retrieved).

So, if a VER-test of the card in question returns a CARD ERR, the card reader could not read any kind of useable information. This can mean two things: Either the card is blank or has been erased, or become faulty in some other way. Or there is some valid information on the card, but your card reader is unable to read it (try the same card in another reader). If the card may be overwritten, just try to store some information on it, as Geoff already proposed. Write a short program, XEQ PACK, switch back to program mode and pass a card through the reader. Clear the program and try to read it back. Also try a VER, which should display TYPE: P TR 01.

Dieter

Re: HP 41 magnetic cards

*Message #5 Posted by **Giancarlo** on 28 July 2011, 3:32 p.m.,*
in response to message #4 by Dieter

Hello and thank you so much for helping me debugging this issue.

I tried Geoff program but i got a CARD ERR trying to store it on the card.

The VER command shows the same CARD ERR. I tried a dozen of cards. Unfirtunately tha cards are part of the same lot some they all can be damaged.

I should try these cards on a different reader but there are few hp41 around me. I will contact other italian

members of the forum to help.

If you have other suggestion please do not hesitate to help.

My first hp has been a hp28 so the hp41 is new to me...

Thanks

Re: HP 41 magnetic cards

*Message #6 Posted by **M. Joury** on 28 July 2011, 4:09 p.m.,*
in response to message #5 by Giancarlo

I believe that you will get a CARD ERR if the card is empty. So if you don't have any recorded cards you may not be able to test the read capability.

When you try to record a program how do you do it? Are you in program mode? If not the card reader is trying to READ the card and will give an error since there is no data on it. I realize that you are probably aware of this but since you said that you were new to the 41 I thought I would mention it.

Re: HP 41 magnetic cards

*Message #7 Posted by **Dieter** on 28 July 2011, 5:16 p.m.,*
in response to message #5 by Giancarlo

You say you are new to the HP-41. So once again I would like to stress two points of my previous post that are absolutely essential here:

- If you acquire a batch of magnetic cards, they most probably are completety empty. As already mentioned, any empty card will result in a CARD ERR when using the VER command. Simply because there's no recognizable info on it. The same is true if you attempt to read a blank card. Once again: CARD ERR is **perfectly normal** if you try to **read** (!) or **VER**ify a blank, empty card!
- How exactly did you try to write a program to an empty card? Please state every single step. As mentioned, the HP-41 must be in **program mode**! You have to see the current program step in the display when the card is inserted in the card slot! If you see a number like 0.0000 the reader tries to **read** (!) this most probably empty card, resulting in a CARD ERR.

Giancarlo, please precisely tell us every single step you do when you try to record a program.

Dieter

Great. :-)

> Quote:
>
> Sorry but i didn't know that i had to switch to programming mode to write data on a card.

That's why I wrote "...**switch back to program mode** and pass a card through the reader" in my first post. ;-)

Finally, here are some useful details:

- The calculator has to be in program mode only if you want to record a **program**. This does not apply if you are recording the content of data registers or if you want to create a status card etc., because in these cases dedicated functions like WDTA, WDTAX, WSTS, WALL etc. are used. Please see the manual for further details.
- Before a program is recorded it is strongly recommended to remove all useless Null-bytes from program memory. They would occupy valuable memory and slow down the calculator. These Null-bytes should be removed with XEQ PACK. Insert the card after this packing operation.
- A card has two sides (tracks), each of which can hold up to 112 bytes. That's not very much, so in most cases it is useful to check how many tracks a program will occupy, and if a short program will fit on a single card or if a second or third one is required. There is an easy way to do so: use WPRV. This function originally is intended for recording programs with an additional protection, so that they cannot be read, modified or printed afterwards. But it is also useful to check the number of tracks required for a program. So, after XEQ PACK try a WPRV and see something like RDY 01 OF 03, in this case prompting for the first track of three total tracks required to record this program. Press the cancel key (backspace) to abort this function and record your program the usual way by simply inserting a card in program mode.

Dieter

Re: HP 41 magnetic cards

*Message #10 Posted by **M. Joury** on 29 July 2011, 11:37 a.m.,*
in response to message #9 by Dieter

I will add a few more details.

1. As noted you should remove NULL bytes. Another way to do this (and to add an END to the end of your program is to press **GTO ..** although if you do this you have to position back to the program using GTO or the **CATALOG 1** function before going back into program mode to write the card.

2. The HP41 is a pretty clever little beastie. One of the things it does when a program is first run is to "compile" the branches (GTO and XEQ) so that after the first time through the calculator knows where to go and does not have to search for the label. There are short form and long form jumps but that is a whole 'nother discussion. The point here is that if you run your program and execute all jumps before you write it to a card the compiled version will be recorded and the program will run a little faster the first time after it is read back in. Not a big difference (although it can add up a little for a long program) but every bit helps. Also a **PACK** or **GTO ..** instruction will decompile the program since after packing the jumps destinations are no longer valid. So **PACK** first and then run the program to compile it and then write it to card.

3. Any key assignments for global labels within the program being written are also written out to the card. To use these key assignments later the calculator has to be in **USER** mode when the card is read back in.

4. While reading in a program if you do not have an END at the end of the last program in memory the program being read in will replace it.

5. The 41 card reader can read and translate HP 67/97 programs. The card reader basically duplicates those functions that are not found on the HP 41 such as **P<>S**.

I would strongly suggest that you get hold of a manual for the HP41 and any peripherals that you own if you do not already have them. This is quite a complex system and it will be hard to learn all the idiosyncrasies and tricks all on your own. This site offers a soft copy of all the manuals if you are interested. I actually own the manuals but find myself using the soft copy more often than not on those rare occasions (very rare after 30+ years of playing with the darn thing(s) <g>) that I need them.

Cheers

Did CostCentral remove the HP15C page?

*Message #1 Posted by **Cristian Arezzini** on 27 July 2011, 9:14 a.m.*

I went to the CostCentral site to pre-order my two 15C's, but the page redirects me to the homepage. I can't seem to find the 15C in their shop anymore. What's going on? Have they already pre-sold all their allowance? :(

Cristian

Re: Did CostCentral remove the HP15C page?

*Message #2 Posted by **Bart (UK)** on 27 July 2011, 9:29 a.m.,*
in response to message #1 by Cristian Arezzini

Yes, and so did compsource. and Samson Cables upped the price to $109.99 (they must have noticed too and decided to milk their monopoly).

Re: Did CostCentral remove the HP15C page?

*Message #3 Posted by **Cristian Arezzini** on 27 July 2011, 10:11 a.m.,*
in response to message #2 by Bart (UK)

Hmmm... that's too bad. I'm wondering, did they also cancel the already made pre-orders? Or will they honor them?

Cristian

Re: Did CostCentral remove the HP15C page?

*Message #4 Posted by **Michael de Estrada** on 27 July 2011, 10:18 a.m.,*
in response to message #3 by Cristian Arezzini

My pre-ordered HP-15C still appears active in the CostCentral system. I'm keeping my fingers crossed.

Re: Did CostCentral remove the HP15C page?

*Message #5 Posted by **M. Joury** on 27 July 2011, 10:43 a.m.,*
in response to message #3 by Cristian Arezzini

I contacted them for information and they said that my order will ship out when the calcs come in. So it looks like they intend to honor pre-orders. I am trying to get more information out of them but they are being pretty close-mouthed (or should that be closed-mouthed) about it.

Cheers

Re: Did CostCentral remove the HP15C page?

*Message #6 Posted by **M. Joury** on 27 July 2011, 2:03 p.m.,*
in response to message #5 by M. Joury

I did get a response. Basically I had asked why the item was pulled and if the 12C 30th Anniversary Edition was going to be relisted (it was also pulled). To paraphrase the answer I received:

>>>>>>> I believe that we pulled the item due to the number of orders received. <<<<<<<

Seems like maybe they are not sure they can fill all the orders? This may be bad news for those that don't get their orders in early since it might mean skyrocketing prices.

I really wish that HP would just make 100,000 of the darn things and alleviate the whole supply/demand problem. I am quite sure that they will be able to sell even that many though it would certainly take longer.

*Message #9 Posted by **Michael de Estrada** on 27 July 2011, 11:18 a.m.,*
in response to message #8 by robert rozee

I think there is sufficient circumstantial evidence that it does exist at least as a prototype. However, the exact production quantities and dates are still uncertain. I think that some suppliers have pulled back

due to the flood of greedy speculators trying to place enormous orders.

They are an interesting case. They claim to be an authorized retailer, but then they violate the restrictions imposed on authorized retailers (notably, the prohibition of shipping overseas), so I'm not sure what is going on there. It's why I am not an authorized retailer, because I don't want to be prevented from shipping overseas.

Somehow, these guys manage to get your charge in in milliseconds, but why does the refund take 3 days? !?!

Has anyone else noted that the speed of light (even allowing for coax cable velocity factor) seems awfully slow for some financial transactions? Stuff that should happen in seconds takes days.

*Message #15 Posted by **Michael de Estrada** on 27 July 2011, 1:04 p.m.,*
in response to message #14 by Dave Shaffer (Arizona)

A better question is why they charged your card / bank account prior to the actual ship date ? All the outfits I deal with don't do that and CostCentral did not do this on the HP-15C order. The only time it is acceptable to bill for something prior to shipment is when it's a custom-built item, such as the Levolor blinds I recently bought through Lowes and I had to pay up front when I placed the order.

It's common practice. The company takes advantage of the "float." PayPal does this on all transactions. Uploads of $ are instant, downloads take several business days. Obviously it's a conscious decision.

Never put down to malice what can be attributed to stupidity. Then apply Occam's razor.

There was nothing underhanded or sinister about this, HP released some details to their distributors and some shops jumped the gun. HP realised the oops and asked for the items in question to be pulled.

Nice simple explanation fitting well with the administrivia of every large organisation I've ever worked for :-)

Re: Did CostCentral remove the HP15C page?

*Message #27 Posted by **Jeroen Van Nieuwenhove** on 28 July 2011, 7:12 p.m.,*
in response to message #26 by Paul Dale

I agree with Pauli. Let's calm down. Even assuming that roughly 5.000 15C enthousiasts are jumping up and down right now and have made pre-orders or are simply contemplating making pre-orders for (in total) 10.000 units, I am quite sure that a production run of only 10.000 units for a new item is quite unsound from a commercial point of view. If HP has finally decided to reissue a 15C, I wager that they need at least 50.000 sold units to recoup their investments.

My guess is that they are trying to find out the ideal MSRP for this product. All this jumping up and down is only going to affect the price setting for this product. Calm down and wait, there will be enough units of this product for everyone. It is ultimately a niche product, TAS prices nonwithstanding.

I for one am going to wait at least until an official announcement and a MSRP price from HP before ordering this product.

If this reissue is really going to happen, I would like to thank those who have convinced HP management of this. Thank you, really.

Useless HP-41 observation of the day

*Message #1 Posted by **Eric Smith** on 27 July 2011, 7:04 a.m.*

I was looking at differences in CATALOG behavior on the 41CX vs. the earlier models. The 41CX adds CATALOG 4 (EMDIR), 5 (ALMCAT), and 6 (key assignments), and shows byte counts on ENDs in CATALOG 1.

Anyhow, I happened to notice something that I thought was broken on the 41CX, but it turns out was unchanged from the 41C and 41CV.

If you put the value 1 in a register, say register 21, you can use "CATALOG IND 21" (pressing shift for indirect) and get catalog 1.

However, if you put the value 1 in a stack register, such as X, then press "CATALOG IND ST X" (pressing shift for indirect then decimal for stack), you get catalog 3. It appears that catalog indirect from the stack always gives catalog 3, regardless of the selected stack register.

Re: Useless HP-41 observation of the day

*Message #2 Posted by **Ángel Martin** on 27 July 2011, 12:17 p.m.,*
in response to message #1 by Eric Smith

Interesting observation. To tell the truth I've got so used to the CCD catalog(s) that never use the "standard" feature.

[IND] is handled by the OS very differently from the [ST] so it's not so surprising. I realize I'm saying this to somebody who nows it much better than myself, but it's my only idea about root causes.

Nothing Useless in the HP-41 observation of the day

*Message #3 Posted by **Geoff Quickfall** on 27 July 2011, 12:38 p.m.,*
in response to message #2 by Ángel Martin

;-)

I am with Angel, I have been using CCD for years now so don't see the normal cat functions. Got to admit though, never IND cat functioned before!

in response to message #4 by robert rozee

Robert & Eric,

If you have an Android Tablet, you can get it free from the Android Market in Books. I grabbed it, but it seems I have to be connected to the internet to read the book. Not sure if there's a way to download so I could read it offline. First time I grabbed a book from the marketplace, so I'll have to play around with it.

Not sure if you would be able to read it on a phone, but it's fairly easy to read on the tablet.

Bill

I got the PDF directly from the USITC web site: USITC - 337 Publications Past Years

Lots of other interesting cases there, like the one on floppy disk drives.

WP34S: how to delete a program?

*Message #1 Posted by **Didier Lachieze** on 27 July 2011, 1:55 a.m.*

Hello, I'm sorry if this has been already discussed but if you have several programs in the RAM, how do you delete only one of them?

CLP clears all program memory and I've not found in the manual a way to delete a single program, except by deleting it set-by-step.

Would it be possible to add a END instruction similar to the one in the 41/42 so that CLP 'lbl' would delete the program from the label 'lbl' to the next END?

Re: WP34S: how to delete a program?

*Message #2 Posted by **Paul Dale** on 27 July 2011, 2:02 a.m.,*
in response to message #1 by Didier Lachieze

> Quote:
>
> CLP clears all program memory and I've not found in the manual a way to delete a single program, except by deleting it set-by-step.

These two are the only ways.

> Quote:
>
> Would it be possible to add a END instruction similar to the one in the 41/42 so that CLP 'lbl' would delete the program from the label 'lbl' to the next END?

Possible, certainly. Simple no.

- Pauli

What about a DEL instruction which takes as its argument the number of steps from the current

position forward to delete?

Just an idea.

Re: WP34S: how to delete a program?

*Message #5 Posted by **Marcus von Cube, Germany** on 27 July 2011, 9:15 a.m.,*
in response to message #4 by gene wright

Interesting idea. Can you think of a keyboard mapping?

Re: WP34S: how to delete a program?

*Message #6 Posted by **gene wright** on 27 July 2011, 10:34 a.m.,*
in response to message #5 by Marcus von Cube, Germany

No keyboard mapping for access other than perhaps simply putting it into the P.FCN catalog.

Re: WP34S: how to delete a program?

in response to message #4 by gene wright

The same idea I've been thinking about how to implement... Can't promise it will happen.

- Pauli

Re: WP34S: how to delete a program?

*Message #8 Posted by **Didier Lachieze** on 27 July 2011, 7:15 p.m.,*
in response to message #4 by gene wright

Good idea! I understand that moving to individual programs separated by END instructions can have a huge impact on lot of functions at that stage of development. A DEL instruction as suggested in the P.FCN catalog would be very nice to have.

Such an END statement won't be a problem at all, if it were just ignored by the usual interpreter and only used for clearing programs (something like a 'dummy' instruction or a NOP).
It could be only used by the CLP command, which would then clear the program where the program counter currently is, from the above END (or 000 when it's the 1st program) to the following END statement. With this method the user won't even have to enter any line number(s) for CLP, it would simply delete the 'current' program.

Or CLP could ask the user (as it does now for confirmation) if it should clear the "Current" or "All" programs.

in response to message #9 by fhub

> Quote:
>
> Such an END statement won't be a problem at all,

Since it seems so easy to you, I look forward to seeing your implementation.

It is not this straightforward.

Also, END cannot act as a NOP, it has a defined behaviour. It has to act like a return, catch skips over it in either direction and stop label addressing searches.

- Pauli

Re: WP34S: how to delete a program?

Once again you don't understand at all what I mean!

Maybe you should read a bit more detailled what I wrote:
"...if it were just **ignored by the usual interpreter** and only used for clearing programs"

Re: WP34S: how to delete a program?

*Message #12 Posted by **Paul Dale** on 27 July 2011, 7:58 p.m.,*
in response to message #11 by fhub

I understood your suggestion, you seem to misinterpreted my response.
Implementing END as you suggest will bring calls for it to be done *properly* that is what my last sentence was about.

Even if we just do what you suggest, I don't think it is as simple or easy as you are making out. Feel free to implement it and prove me wrong here.

- Pauli

Re: WP34S: how to delete a program?

*Message #13 Posted by **fhub** on 27 July 2011, 8:15 p.m.,*
in response to message #12 by Paul Dale

> Quote:
>
> Implementing END as you suggest will bring calls for it to be done *properly*

Sorry, but I've no clue what you mean with this!?
My idea of such an 'END' (or you can call it whatever you want, even a '---' would be possible) is that it should just work as a physical separator betweeen programs which have no connection to each other. And this separator can of course be simply ignored by an routines which e.g. search for any labels.

What I mean looks like the following structure:

```
LBL 'PRG1'
...
...
...
RTN
END (or ---)
LBL 'PRG2'
...
...
RTN
END
LBL'PRG3'
...
etc.
```

So where would any problem when the program counter is e.g. within PRG2 and you execute a CLP: this would just delete the block from LBL'PRG2' to (and including) the next END.

So this END should simply act as an additional marker for the CLP command, but otherwise should be ignored by any other program routines (like searching for labels etc.).

Re: WP34S: how to delete a program?

*Message #14 Posted by **Paul Dale** on 27 July 2011, 8:52 p.m.,*
in response to message #13 by fhub

> Quote:

> Sorry, but I've no clue what you mean with this!?

Read the HP-41 or HP-42 manuals. They have an END that finishes programs. This is what will be wanted.

- Pauli

Re: WP34S: how to delete a program?

*Message #15 Posted by **M. Joury** on 27 July 2011, 9:47 p.m.,*
in response to message #14 by Paul Dale

You are absolutely right. That IS what would be wanted <g> plus more. This is one of my big complaints with the 32/33/35 series as well as the Voyager calcs. Program separation was a great feature to have in the 41C and 42S.

Among the advantages you mention I would also add that labels within a program are local so reuse is not an issue. Plus all programs would start at step 1 no matter where they were in memory.

So you are right, more would be asked for and it is NOT easy to implement.

Re: WP34S: how to delete a program?

*Message #16 Posted by **Walter B** on 28 July 2011, 1:23 a.m.,*
in response to message #15 by M. Joury

Originally, CLP was meant to work as requested now:

> Quote:
>
> Clears current program after confirmation.

in v1.2. This request was explained further in v1.11:

> Quote:
>
> Clears the current program after confirmation. This program is the one the program pointer is in.

but never made it into the code, so I removed it from the manual in v1.18.

Walter

Re: WP34S: how to delete a program?

*Message #17 Posted by **Paul Dale** on 28 July 2011, 3:02 a.m.,*
in response to message #4 by gene wright

> Quote:
>
> What about a DEL instruction which takes as its argument the number of steps from the current position forward to delete?

Done :-)

There is a DEL[sub-p] command in the program catalogue. This command takes an argument 00 - 99 and that many steps will be deleted starting with the current step. If the argument is zero, all

steps from the current one to the end of program memory will be removed.

The name is subject to ratification by Walter and quite likely will change. The implementation is probably full of bugs where I missed corner cases.

About one third of our bug fix flash buffer was used adding this feature.

*Message #19 Posted by **Paul Dale** on 28 July 2011, 4:50 a.m.,*
in response to message #17 by Paul Dale

Looks like we're having a slight change of plan. I think I'll be able to implement a delete up to but not including a label instead. Almost as good as a program END.

- Pauli

Re: WP34S: how to delete a program?

*Message #20 Posted by **Marcus von Cube, Germany** on 28 July 2011, 5:00 a.m.,*
in response to message #19 by Paul Dale

A proper name would be DELto, taking a label in any case. What will happen, if the label is not found? Abort or delete to end? How to delete to end? DELto . nnn might mean delete up to step nnn.

Re: WP34S: how to delete a program?

*Message #21 Posted by **Paul Dale** on 28 July 2011, 5:02 a.m.,*
in response to message #20 by Marcus von Cube, Germany

No DEL.nnn Step numbers are the reason for the change to labels. I'm not going back :-)

- Pauli

Re: WP34S: how to delete a program?

*Message #22 Posted by **Paul Dale** on 28 July 2011, 5:01 a.m.,*

A first attempt is committed to SVN.

DEL[sub-p] takes either a numeric, hot key or alpha label and deletes up to but not including that label.

Ok, I'm coming back to 'END' again: ;-)

I can guess what confused you with the word 'END' as end-marker for a program: you probably thought you would have to completely change you code for searching labels (after a XEQ) in memory.
But in fact this END could just be an alternative (synonym) for RTN, with the only difference that RTN could also be WITHIN a program (even more often than once, e.g. after a conditional test), whereas this END should really exist only at the intended/physical end of a program.

With this method you won't even need a new command like DELp, you just need to modify the existing CLP routine to delete all lines upto and including the next END statement (any maybe even backwards to but not including the previous END). No need to change any other routines (like searching for labels) at all ...

And this method would have the further advantage that the user doesn't have to know (and enter= the name of the next label when he just wants to delete the current program.

Franz

*Message #26 Posted by **Marcus von Cube, Germany** on 28 July 2011, 6:58 a.m.,*
in response to message #25 by fhub

It's just respect for the ingenious implementation in the 41C and 42s calculators.

Don't understand us wrong, please! We know that the feature is useful and your simplified approach will certainly work. But it will trigger a lot of further requests which we cannot fulfill.

There will be another incarnation of what is now the 34S that's oriented closer on the 41C and 42s. But it requires a mayor rewrite of most of the firmware and will most likely be renamed to another number then 34.

Re: WP34S: how to delete a program?

> It's just respect for the ingenious implementation in the 41C and 42s calculators.

Well, then why not just call this new statement EOP (end-of-program) instead of END ?

Re: WP34S: how to delete a program?

*Message #28 Posted by **Paul Dale** on 28 July 2011, 7:21 a.m.,*
in response to message #27 by fhub

What's in a name? That which we call a rose by any other name would smell as sweet.

Re: WP34S: how to delete a program?

*Message #29 Posted by **fhub** on 28 July 2011, 7:49 a.m.,*
in response to message #28 by Paul Dale

> Quote:
>
> What's in a name?

Well, it was just to avoid your dislike of the name END. ;-)

BTW, although it's certainly more than 15 years when I've used my HP41 the last time, but I absolutely don't understand (or remember) what could be so 'special' (or ingeniuos) about this

END statement!?

I've just had a look the the HP41 programs on JMB's site (which you always use as reference), and I see that every program there terminates with an END.
So if a user would like to port any of these HP41 programs to WP34S, then what should he use instead of this END statement of the HP41? I guess a RTN is the correct (and only) choice, right? But this RTN does also NOT behave exactly as the END on the HP41 (as you've stated), so why could not just be used an END statement instead of this RTN (with the SAME behaviour as RTN)? This would at least making the deletion of a program easier.

Re: WP34S: how to delete a program?

*Message #30 Posted by **Marcus von Cube, Germany** on 28 July 2011, 11:57 a.m.,*
in response to message #29 by fhub

Franz, I'm thinking about a proper implementation of END as known from the 41C. It doesn't come for free. We need to sacrifice some program steps or even numeric registers for the proper handling of the current program and the return stack. You will not talk us into a half hearted implementation just for the sake of a simple program delete command. Be patient, let's discuss the ramifications internally, and if we come to a solution we'll talk about it here.

Re: WP34S: how to delete a program?

*Message #31 Posted by **M. Joury** on 28 July 2011, 1:41 p.m.,*

Re: WP34S: how to delete a program?

*Message #33 Posted by **Paul Dale** on 28 July 2011, 7:42 a.m.,*
in response to message #23 by fhub

I think I've got a fix for END issue.

When **you** write *your* programs, finish each with a LBL'END' or a LBL 97 or LBL

whatever.

To delete a program: DELp'END' or DELp 97 or DELp whatever.

You get your no-operation END. Nobody will complain that it isn't a real END.

Problem solved :-)

- Pauli

Re: WP34S: how to delete a program?

*Message #34 Posted by **fhub** on 28 July 2011, 7:59 a.m.,*
in response to message #33 by Paul Dale

> Quote:
>
> Problem solved :-)

Well, I would say there's an even better solution:

I'll stop reporting any bugs or making any suggestions to improve the WP34S in the future - problem solved, too!

I guess this is the first time you agree with me, right? ;-)

Re: WP34S: how to delete a program?

*Message #35 Posted by **Cristian Arezzini** on 28 July 2011, 10:43 a.m.,*
in response to message #34 by fhub

Well, I don't think that stopping reporting bugs will improve anything... I think that suggesting new things and reporting bugs is great, but we shouldn't expect them to implement everything we wish. After all, they're doing this for fun. I too made a few suggestions (some privately, too) and many were not accepted. I was disappointed but I accepted that, and I kept on reporting and asking! :) It's too bad that I can't program C, if I could I would probably try to submit patches myself, but being unable to do so, I can just suggest and hope that those who can program, agree with my ideas. And in this case, the suggestion of a "Lbl 'End'" makes sense... if it's not possible to have a proper 'End' command, this more or less does what you need - as you can put one after each program, and so the calc will delete until the end of the current program. So, in a way, it is problem solved.

This is all in my opinion of course, but I really don't think we should take these things personally - after all it's their project and their free time, we can't expect them to do what we want, not until we pay them! :)

Cristian

Re: WP34S: how to delete a program?

*Message #36 Posted by **Marcus von Cube, Germany** on 28 July 2011, 12:00 p.m.,*
in response to message #35 by Cristian Arezzini

Cristian, we have had the same type of discussions internally for some time. Many "brilliant" ideas weren't implemented because they either were too demanding on space (flash and ram) or they were just not so "brilliant" as they seemed to be.

Re: WP34S: how to delete a program?

*Message #37 Posted by **Paul Dale** on 28 July 2011, 6:31 p.m.,*
in response to message #35 by Cristian Arezzini

I agree with Cristian here. Reporting bugs is always helpful. I think everything you've reported thus far has been improved upon if not fixed.

Making suggestions as to how to you'd like the problem fixed are also welcome.

Resolutely sticking to these suggestions or trivial variations thereof after they been explained to be flawed isn't so helpful.

Getting upset is positively counter-productive.

Chill out, it is a hobby for us all.

- Pauli

Switched from 48G to 50G and need shortcut to RAND function

*Message #1 Posted by **Travis (Kansas)** on 26 July 2011, 7:51 p.m.*

So I received a 48G in High School for Christmas in 1992 and it got me through engineering courses in college and has served me well for the better part of two decades. It started flaking out a few months ago and sadly couldn't be fixed with fresh batteries like in the past.

My wife though is super-awesome and did the research to buy me a new 50G for my birthday. I enjoy the new things in can do, as well as the familiar stuff that the old 48-G did.

My only complaint is that my work requires the use of a random number generator and while the 50-G has it (in several places!), it requires several keystrokes to get there. On the 48G, I could go to Math mode, choose probability, and then just hit F4 any time I wanted to spit out a random number. If I needed 8 in a row, I could just hit F4 and 8 random numbers would be in my stack.

Can anyone suggest a faster way to achieve the same thing on the 50G? I tried HP customer support, and they suggested this forum (because supporting their own products isn't a good business model?).

Thanks in advance for any ideas.

Re: Switched from 48G to 50G and need shortcut to RAND function

*Message #2 Posted by **Norris** on 26 July 2011, 8:12 p.m.,*
in response to message #1 by Travis (Kansas)

> Quote:
>
> On the 48G, I could go to Math mode, choose probability, and then just hit F4 any time I wanted to spit out a random number. If I needed 8 in a row, I could just hit F4 and 8 random numbers would be in my stack.

On my 50G, I get to the RAND function as follows:

Left-shift (white arrow key)
MTH (P key)
NXT (L key)
PROB (A key)

Then RAND is F4 (D key) and you can hit it as much as you like, as on the 48G.

I think this is basically the same approach that you used on the 48G, but it may take one or two extra keystrokes on the 50G (don't have a 48 for comparison right now).

****

If it seems like the 50G requires too many keystrokes to reach the RAND key, you could make a custom menu

that included the RAND function (and any other functions that you might want quick access to). Then you could bring up the custom menu, with your desired functions, at any time with:

Left-shift (white arrow key)
CUSTOM (H key)

****

If that still seems like too many keystrokes to reach the RAND key, then you could try writing a program does nothing except run the RAND function:

<< RAND >>

Save this program as a variable named: Rand (You can't call it RAND because that name is already used by the function)

Then you could bring up a list of variables at any time with one keystroke:

VAR (J key)

This should display an F-key labeled "Rand", which will run the program (and therefore the RAND function) every time you hit it.

However, this approach will not be as effective if you accumulate lots of variables (i.e. more than 6) in the current directory. In this case, the VAR key may not show the "Rand" variable at first. You would have to push NXT (the L key) to scroll through all the variables until "Rand" shows up.

Edited: 26 July 2011, 9:00 p.m.

Re: Switched from 48G to 50G and need shortcut to RAND function

*Message #3 Posted by **NateB** on 26 July 2011, 9:15 p.m.,*
in response to message #2 by Norris

You can also assign << RAND >> to a specific key that can accessed by putting the 50g in USER mode.

For example,

```
<< RAND >>
ENTER
44.0
ENTER
ASN
```

Would assign RAND to the SYMB key (4th row,4th column, unshifted = 44.0). When the calc is in USER mode, you'd only need press the SYM key. See Ch.20 of the HP 50g user's guide for more on customization.

in response to message #1 by Pascal

Cool pictures, but brown text as a jpg image on a background with busy patterns made out of the same brown? Really? That's pretty hard to read!

Re: Outstanding collection of HP-01

*Message #3 Posted by **Pascal** on 27 July 2011, 1:21 a.m.,*
in response to message #2 by Lode

I fully agree with you and I think the author did this in purpose in order to protect the web site content from being copied (see also all images watermarked).

Re: Outstanding collection of HP-01

*Message #4 Posted by **Cody** on 27 July 2011, 2:34 p.m.,*
in response to message #3 by Pascal

No one will stay on that site long enough to steal any content. It looks like it has some interesting information, but I closed the page after I tried to read the first sentence, and I never plan on visiting again.

Also, by making the text into images, web crawlers will not load the site into their search engine index, making the site hard to find.

Maybe the author could read the content because he knew it by heart, but for the rest of us, the site is a painful reminder of just how poor the internet can be.

Re: Outstanding collection of HP-01

*Message #5 Posted by **Jim Horn** on 26 July 2011, 7:53 p.m.,*

Nice to see info about the HP-02. I remember seeing the HP-01 on the hand of an Iraqi HP rep (working out of Athens). I thought the 01 was way too expensive and I still do!

:-)

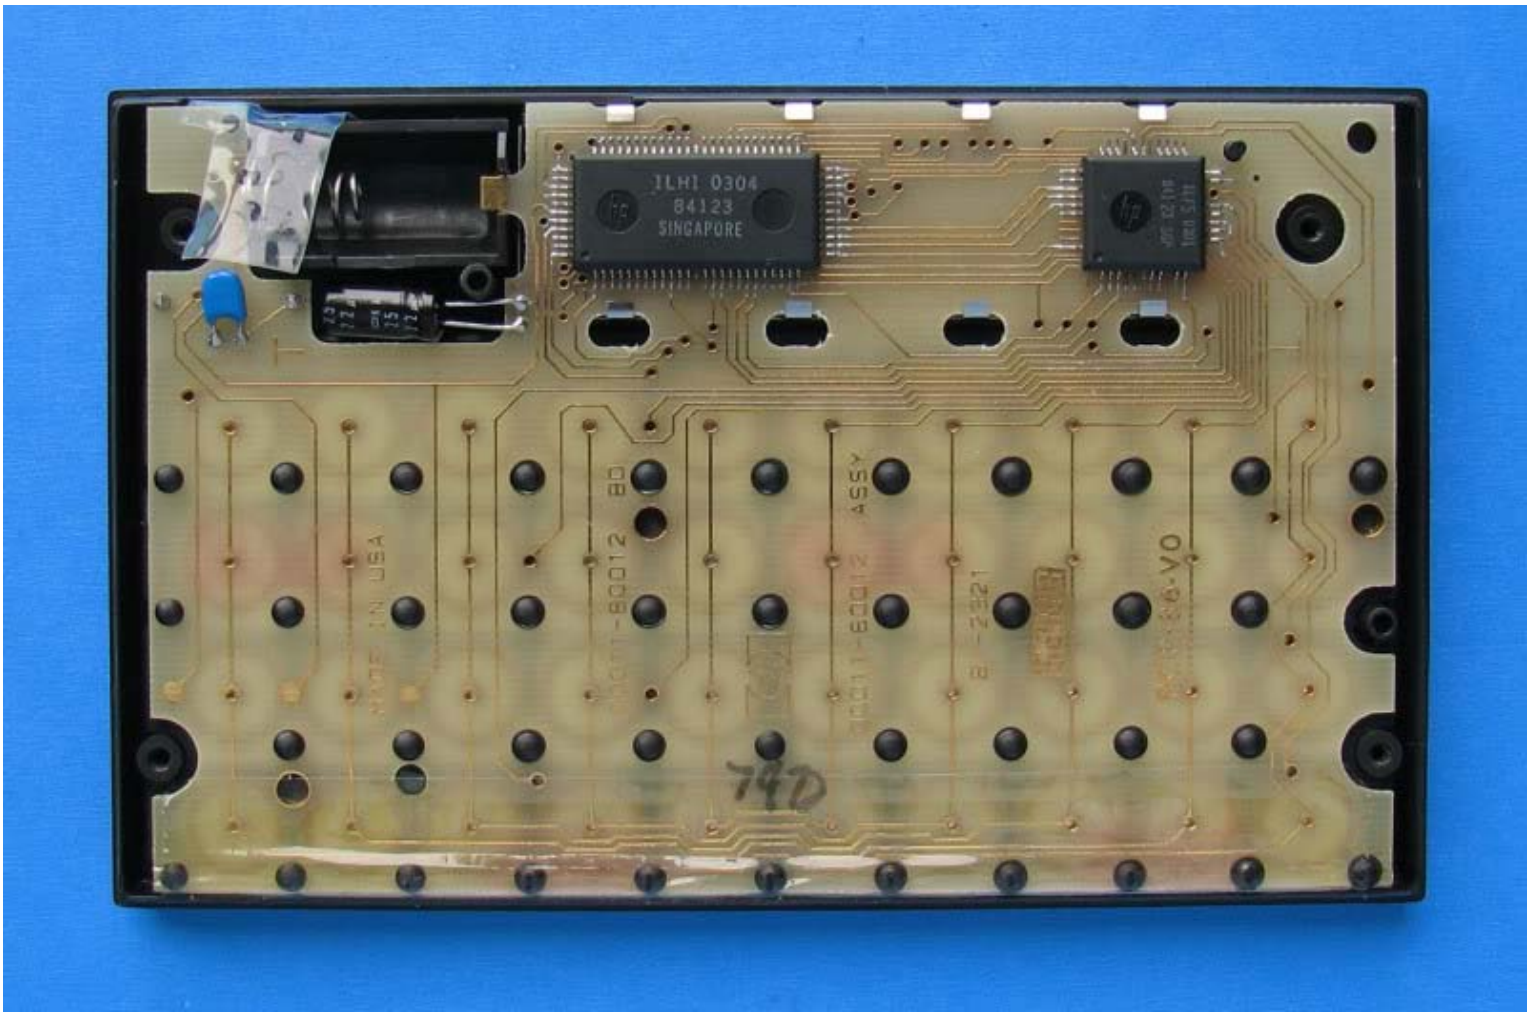
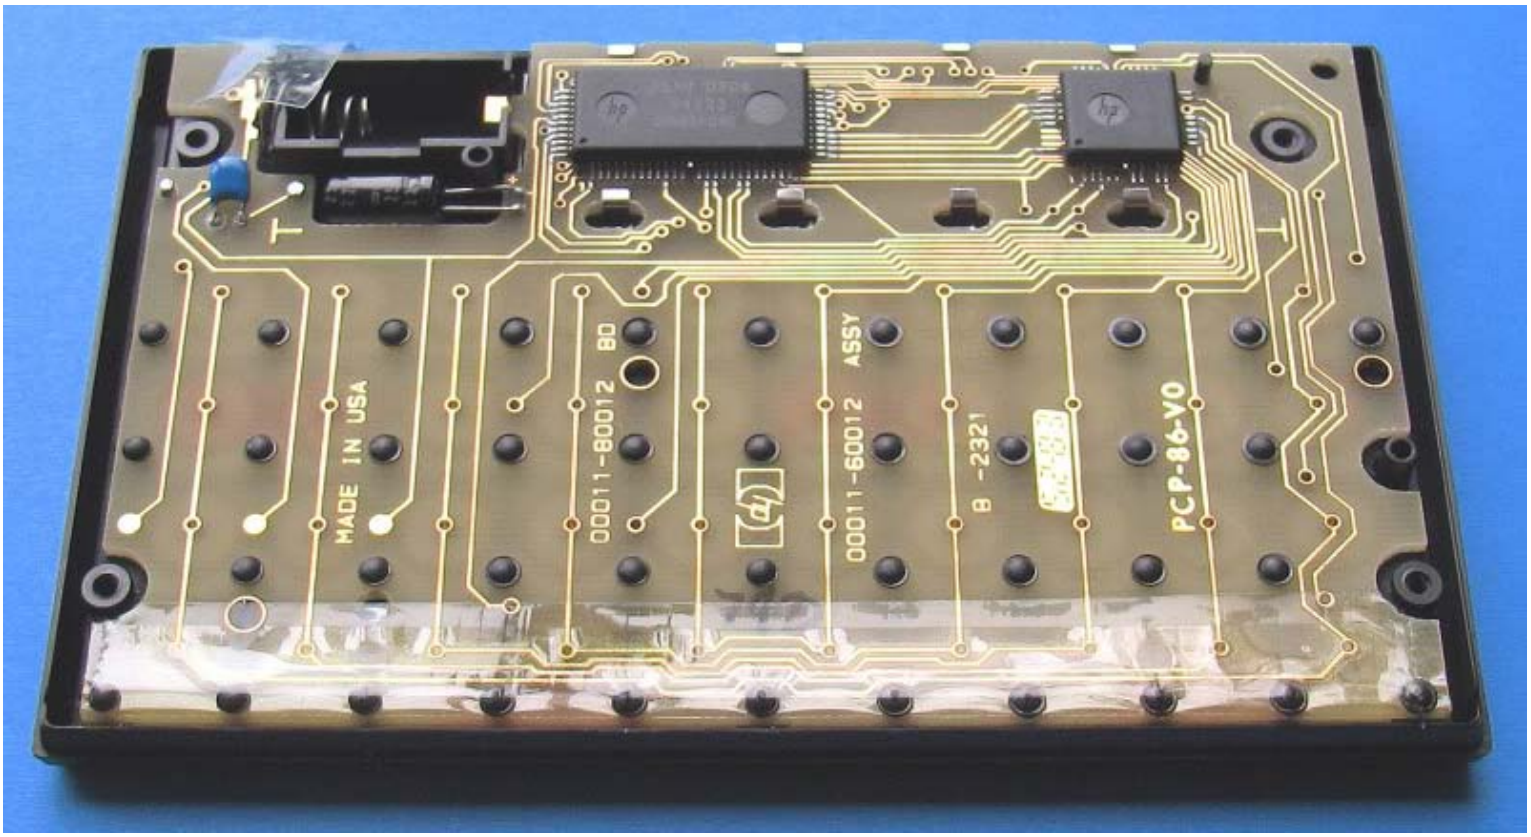
Question about HP calculator traces.

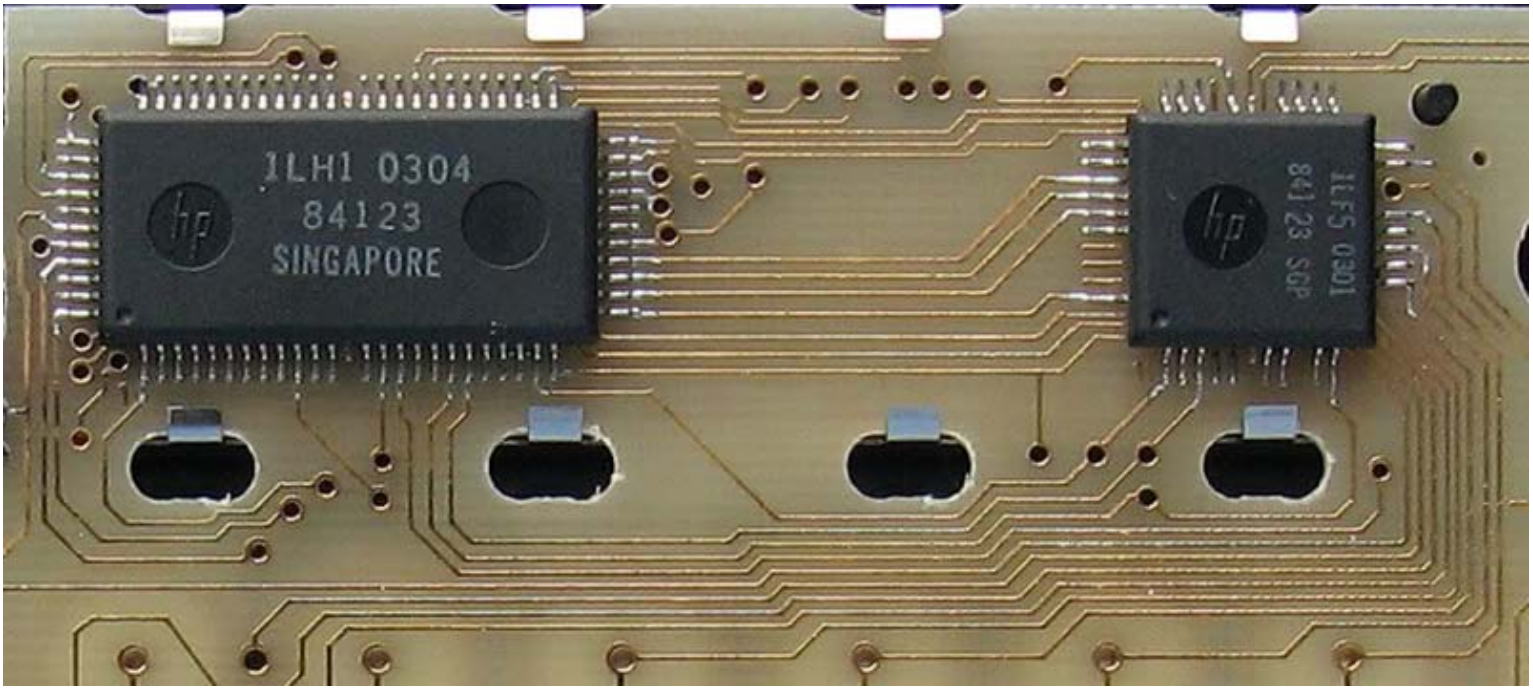
*Message #1 Posted by **Geoff Quickfall** on 26 July 2011, 2:46 p.m.*

hello experts,

I was just asked, are the traces gold in HP. Specifically the 12C (see pictures) and subsequent models. I remember reading a brochure about the traces in the early 80's but cannot find and citations for the trace composition.







Geoff

Re: Question about HP calculator traces.

*Message #2 Posted by **Cristian Arezzini** on 26 July 2011, 3:35 p.m.,*
in response to message #1 by Geoff Quickfall

I don't know for sure but I'd say copper, plated with gold. I don't think it's solid gold because I've seen total corrosion on some traces, and gold should be really resistant to chemical attacks; on the other hand, if it wasn't gold at least externally, it wouldn't be so shiny after 20+ years (I've seen bare metal traces from old Russian calculators, they were dull and whitish, badly oxidised though still working).

Cristian

Re: Question about HP calculator traces.

*Message #3 Posted by **Jim Yohe** on 26 July 2011, 5:09 p.m.,*
in response to message #1 by Geoff Quickfall

Most PCB traces are made of copper covered with a coating of soldermask with very few were ever fully plated with gold. Those that were and not covered with soldermask are from the early history of etched PCBs. If what you're seeing (photos) is in fact gold it's only a light plating, otherwise it could just be very clean copper that hasn't oxidized.

The electronics industry realized it wasn't necessary to fully plate traces with gold for two very good reasons, (1) oxidation could be stopped with a light plating of nickel, and (2) solder-mask could be used to cover traces and in between pads to serve both purposes of reduced oxidation and eliminate bridging/shorting during the wave solder process.

Today the composition of a PCB trace (actually contact pads) that will need gold plating is usually:

1) Base copper, before scrubbing, of about 1/2 oz or 1.4 mils (thousandths of an inch) (12.7 um) (sorry ... my "u" is supposed to represent a micron or micrometer),

2) Plated copper of about 18 to 25 um,

3) Nickel of between 1 to 2.5 um, and finally

4) Gold of between 0.8 to 1.3 um.

Edited: 26 July 2011, 5:11 p.m.

Re: Question about HP calculator traces.

*Message #4 Posted by **Jim Horn** on 26 July 2011, 5:31 p.m.,*
in response to message #1 by Geoff Quickfall

Hi, Geoff,

For much of that period (I was with HP's Instrument Group from 1979 through 1989) the standard HP circuit board process was what you show in the pictures. Specifically, the bare boards were coated with photoresist. The resist was removed where the traces were to be (*not* where they were to be removed as is usually the case). The boards were then gold plated. The resist was removed. Finally, the board was etched.

Note that the gold plating provided the etch resist function - i.e. the copper was etched where it was *not* gold plated. The resulting boards were very solderable (gold wets very easily with PbSn eutectic solder) and don't degrade over time. Connector pads are "free" too, as were key pads for snapdome switches which were popular in HP designs including top-of-the-line lab instruments.

As mentioned, solder resist, HASL (hot air solder levelled) tinning of the pads, screened solder resist, etc. have made this all obsolete. Today's high density surface mount packages (I've seen .25mm lead spacing) make newer techniques necessary. We won't be seeing many boards done this way any more.

Re: Question about HP calculator traces.

*Message #5 Posted by **Geoff Quickfall** on 26 July 2011, 7:06 p.m.,*
in response to message #4 by Jim Horn

Jim,

many thanks for that description of the HP technique. Richard was looking for some answers and I am supplying the pictures.

Would I be correct in the assumption that a 1980 11C would have a similar trace pattern to the 12C, but of course, a different ROM set.

Cheers, Geoff

thanks for all the responses here, I was specifically looking at the HP technology.

Geoff

Re: Question about HP calculator traces.

*Message #6 Posted by **Jim Horn** on 26 July 2011, 7:52 p.m.,*
in response to message #5 by Geoff Quickfall

The whole family (for that matter, all Corvallis machines) used that board process. So the 11C should be the same.

That said, my '11C (HP property - so I don't have it anymore) was, if I recall, a blob coated IC on the back of the display with no other ICs in the calculator. I believe I got it in the later '80s though, and don't believe they were out by 1980. So they may have changed the chip packaging from the earlier SMD parts to the bonded / 'blob' approach.

Re: Question about HP calculator traces.

*Message #7 Posted by **Eric Smith** on 27 July 2011, 5:37 a.m.,*
in response to message #6 by Jim Horn

Interesting. I've seen the innards of many Voyager-series calculators, and I haven't seen any of them with blobs prior to the 12C Platinum (introduced 2003). Maybe yours was a test of a cost-reduction that didn't get put into production?

in response to message #4 by Joel Setton (France)

Where are you pre-ordering from? HP or a third party?

I was wondering if these were available for pre-order in the UK but haven't seen any sign of them yet.

Re: How many HP-15C will we buy?

*Message #6 Posted by **Bart (UK)** on 26 July 2011, 8:10 a.m.,*
in response to message #5 by SteveH

Samson Cables are taking pre-orders and ship to the UK:
http://www.samsoncables.com/catalog/prodDetail.cfm?Prod_ID=434&Sku=HP15C

It'll cost you ~£90.50 in total to get to the UK via the cheapest shipping option (breakdown using current pricing and exchange rates which will likely be different by the time it ships and is charged to your account/card).

Hi Dave, I had seen that quote, but I didn't know it was official. It sounded to me more like speculation. If it's 10.000, well then I'll buy two immediately! :) Incidentally, this would also mean that they're unlikely to be found used on TAS for $20...

Cristian

Re: How many HP-15C will we buy?

*Message #12 Posted by **M. Joury** on 26 July 2011, 10:08 a.m.,*
in response to message #11 by Cristian Arezzini

In fact I was thinking quite the opposite. I was thinking that with only 10,000 units some TAS sellers may hoard if they are tracking this and try to make a killing when all supply is gone.

Cheers.

> Quote:
>
> why is it being produced with the thin li batteries rather than the older button type which last for a longer time- my 11c is still is still goingstong on 3 yr old batteries, Howard

Because it's a completely new processor architecture that uses an ARM processing running an emulator.
This means it has to run at a higher frequency than the old processor, and hence consumes more power.

And if it's still like the original 20B design then the processor runs in bursts of 30MHz when it does something (e.g. key press, processing or whatever).
This makes it MUCH faster than the original 15C, at the expense of a drastic reduction in battery life.

If the new 15C does that, then it would be a very poor design decision IMO.

I talked about this way back in an old blog:
http://www.eevblog.com/2009/04/16/eevblog-4-low-power-calculator-design-and-fpgas/

Cyrille (the HP calc designer) said at the time:

> Quote:
>
> I will try to make things better to only going to high speed when doing calculations that I

> know are likely to be slow in the future…

They probably could have used button cells if they really optimised the power consumption, but CR2032 cells are a much more sensible choice IMO.

Dave.

Re: How many HP-15C will we buy?

*Message #26 Posted by **Tim Wessman** on 27 July 2011, 11:12 a.m.,*
in response to message #25 by DaveJ

The way it works on the 20/30b (currently), and the 10bII+ is that certain keys and operations kick the speed up high when intense calculations are possible, while it normally cruises along at a minimal speed.

In the case of the 10bII+, this means the best fit stat operation, inverse student, the IRR key, the NPV key, and the I key. If the operation takes more than 200 iterations to complete, the speed is also dropped again from the high speed.

Other than this, it cruises along at 2mhz normally when running, and shuts everything down except the screen and a keyboard interrupt between calculations. However, the power usage between 1, 2, and 15mhz really is not hugely significant (32mHz will definitely take a bite out of things though as above a certain level the chip loses efficiency quickly) . The screen, with the accompanying LCD driver, is the biggest consumer of power by far.

The biggest power saving is if you can drive the LCD without a regulator. The 12c and 10bII+ can use this (which is why there is no contrast adjustment, it is running directly from batteries) while on the 20/30 you can adjust the contrast. To support the higher pixel density it has to be regulated.

You will never get the same battery life as the original nuts. Chip designers just don't care much about super efficient battery life anymore. The biggest drain in devices now is the screen. This includes the atmel based calculators.

It's not so much that they don't care, but that it's not possible. With the much smaller lithography they are using in all fabs now, there is a lot more leakage of current that you just can't get around.

Eric

Re: How many HP-15C will we buy?

*Message #28 Posted by **Lode** on 28 July 2011, 3:54 a.m.,*
in response to message #27 by Eric Rechlin

Don't say it's not possible, it is possible, get machines with larger lithography for battery efficient chips. Apparently there exists an older technology that has an advantage in one parameter over the current ones, so why completely drop it?

It's not possible unless you want to front a billion dollars to build a fab. Sure, everything is technically possible, but from an engineer's perspective something can be impossible if you can't find someone to build it.

Eric

Re: How many HP-15C will we buy?

*Message #30 Posted by **Eric Smith** on 28 July 2011, 12:36 p.m.,*
in response to message #29 by Eric Rechlin

If you want larger process geometry (lithography), you certainly don't need to spend a billion dollars building a fab. There are still plenty of 350, 250, and 180 nm fabs in operation churning out chips that don't need to be in sub-100 nm. There are even some 500 nm (0.5 micron) fabs running. The mask costs at 250 nm or larger are MUCH less than at 180 nm and smaller, so it is actually quite cost-effective to get chips made on a larger, low-leakage process.

You only have to spend billions of dollars when you're building new bleeding-edge fabs, which you obviously don't do when you want to make low-power chips for calculators and other low-end consumer electronics.

The tradeoff of using an older, larger process is that they don't run as fast, and you don't get as much on-chip memory. For any calculator other than a high-end graphing, that's not a problem.

I'm not sure what process geometry is used for the Atmel AT91SAM7L128 (used in the 10bii+, 12c, 20b, 30b), but it is almost certainly NOT being made in a sub-90nm process.

The Energy Micro EFM32G "Gecko" microcontrollers Richard Ottosen and I are using for our latest prototypes use an ARM Cortex-M3 core in a TSMC 180nm ULP (ultra-low-power) process, and can achieve under 1uA current in a low-power sleep mode with a 32kHz timer running, with 16KB of battery-backed internal SRAM

(unlike the Atmel part, which only battery-backs 2KB).

In our prototype, my firmware is waking up at 100 Hz running on a 40kHz crystal, and we're seeing sleep current of around 10.1 uA. When we having it running at roughly 14 MHz (on an internal RC oscillator), we have a total current of around 7.2 mA, of which about 1.5 mA is from a character LCD module, so the microcontroller is only consuming about 5.5 mA. At that clock rate, we're seeing performance about 14x that of the HP-41C (or about 25x that of the original 12C/15C), and that is on a very unoptimized code base in debug mode, so I expect that we will eventually have much higher performance for the same clock frequency and current.

Re: How many HP-15C will we buy?

*Message #31 Posted by **Marcus von Cube, Germany** on 28 July 2011, 4:34 p.m.,*
in response to message #30 by Eric Smith

Eric, these are interesting figures. I was thinking, the Atmel would consume only little power but having an active timer at such a low power rate is stunning. Would you mind measuring the current draw of an original 20b or 30b in different situations and likewise the 34S. I'm unable to measure to great accuracy what you have obviously done with your design.

Re: How many HP-15C will we buy?

WP 34S Power Requirements

*Message #1 Posted by **Marcus von Cube, Germany** on 26 July 2011, 6:14 a.m.*

After having worked on the power saving code recently, I just made new measurements of the power drain of my lab 20b. Here are the results (all values in mA):

```
State      FAST    SLOW
-----------------------------------------------------
off           0             No display
sleep      0.15             LCD running
idle       0.82             LBL B; PSE 99; GTO B
debug      1.66             ON+D
serial     6.60     3.15    without the cable connected
run        20.5     8.99    LBL A; GTO A
```

SLOW can be set with the SLOW command or ON+1 (the latter behaving exactly like a low power situation). The SLOW command survives a power cycle, ON+1 is transient.

I'll probably reduce speed to the slow mode (20 MHz) for serial I/O if it proves to be reliable enough, just to save some power during the "Wait..." phase. The cable furnished by HP draws about 1.5 mA alone, even while the calculator is turned off!

I'd love to see measurements by people with better lab equipment then mine. How is the original firmware by HP (20b and 30b) performing in a similar setup? I'm looking forward to your feedback.

Re: WP 34S Power Requirements

*Message #2 Posted by **Paul Dale** on 26 July 2011, 7:05 a.m.,*
in response to message #1 by Marcus von Cube, Germany

The converse of SLOW is (of course) FAST.

SLOW slows the device down and saves power, FAST speeds it up again. By default the 34S runs in FAST mode.

As Marcus, mentioned the speed setting is preserved over a power cycle and the state is saved in the mode flags (STOM/RCLM) and in the flash backup. This means that the speed setting is pretty sticky.

Re: WP 34S Power Requirements - (especially but not only for DaveJ)

*Message #3 Posted by **Marcus von Cube, Germany** on 27 July 2011, 4:57 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Having viewed DaveJ's Video Blog #4 I'm rethinking my approach at the high operating speed versus power loss in the batteries.

I might reduce the normal operation speed in manual mode (no program running) to a much lower value and bump it up to maximum speed only for long running calculations. This will slow down operations like factorial

considerably but would save battery power while the calculator is used for manual calculations. What do you think and what slow down factor wold be acceptable?

Dave, your opinions, please! You're probably the one to verify my measurements.

Re: WP 34S Power Requirements - (especially but not only for DaveJ)

*Message #4 Posted by **DaveJ** on 27 July 2011, 6:54 a.m.,*
in response to message #3 by Marcus von Cube, Germany

I don't have a WP 34S, so cannot verify anything unfortunately, but I can't think of a good reason why slower speed wouldn't be a wise default choice for non-programming mode.

To me, battery life is top of the priority list for a hand held calculator. As the device is useless if it doesn't work. And the lower the power consumption the longer "bonus time" you have between the battery indicator coming on and having it just die on you.

Is the battery indicator used in the WP 34S?, and if so, at what voltage? (and is it adjustable?)

Perhaps have it as a user option if possible? Defaulting to the lowest power, and have an optional "turbo" mode.

Dave.

*Message #5 Posted by **Paul Dale** on 27 July 2011, 6:58 a.m.,*
in response to message #4 by DaveJ

If you've got a 20b or 30b I can "improve" it for you :-)

We have two speed settings. Marcus should be able to elucidate as to the exact settings and the low battery thresholds. I do know the clock is slowed if the battery voltage drops too low.

Which is good, since I have wanted a uWatch for a long time but you won't make a new batch, and so I can't wait for a Mk2 to come out (though I'd also be happy to find an old, used mk1! :)

Cristian

Re: WP 34S Power Requirements - (especially but not only for DaveJ)

*Message #8 Posted by **Marcus von Cube, Germany** on 27 July 2011, 9:10 a.m.,*
in response to message #6 by DaveJ

Dave, I thought you were collecting every electronic toy you can get at. ;-)

The battery indicator comes on at 2.4V and slows down the device to a maximum of 20 MHz. The same effect can be achieved by the user with a command. Somewhere near 1.9V the device will be turned off by the firmware.

Most of the time, the processor sleeps with the core completely turned off and only the LCD drivers and PIOC running to wake it up. Then there is a more active idle mode with interrupts running. This mode can be seen with the PSE command. The mode is used whenever the firmware does more then just waiting for the next keystroke but not executing a command.

Whenever the calculator is doing something beyond this, it's switched to either 20 or 37 MHz.

Damn, so there is!

> Quote:
>
> Put me on the pre-order list :-)

Helps if I design it first :->
I think I'll scrap my existing designs with the capacitive touch keyboard like on the uCalc.
I'm now eyeing off a nice large touch screen. Albeit still only 128x64, but it's big so you can actually use it.
And now I have a bright idea of utilising an existing commercial modular watch band attachment, allowing the unit to simply snap in and out of the watch band, so it could be used as either a watch or a tiny pocket calc.

Alas, consulting work just popped up this last hour which will be whipping my butt for the next week at least :-(

If anyone knows of any small low power touch screen LCD's, please link them my way.

Dave.

WP 34S Assembler bug fix and doc update

*Message #1 Posted by **Neil Hamilton (Ottawa)** on 26 July 2011, 6:08 a.m.*

Bug fixed in assembler when using output of disassembly with specified opcode tables ('-opcodes' switch). It emitted a "#" as a comment marker instead of the accepted "//" causing the disassembled output to not be directly re-accepted by the assembler.

SVN documentation updated with several typos fixed in the same area (section 5.2). As well, you can find a 'diff' version at:

http://web.ncf.ca/njsdham/wp34s/doc/WP34s_Assembler_Disassembler_diff_9Jul2011_to_26Jul2011.pdf

34S broken build :-(- Please update!

*Message #1 Posted by **Marcus von Cube, Germany** on 26 July 2011, 3:07 a.m.*

I've just fixed a major problem with writing to flash. Power saving is a nasty thing on this platform.

You will need to update your device before you try to write to flash! If you have already loaded user code that you do not want to lose, use the new serial I/O to backup to the emulator first.

Working HP-70 sells for $123.50 on TAS

*Message #1 Posted by **Michael de Estrada** on 25 July 2011, 10:58 p.m.*

Last Thursday a very clean fully functional HP-70 sold on TAS for only $123.50, after we've seen similar units sell for much more and even almost exceeding $1000. It was advertised as clean but untested, although the seller did allow for returns. So, how do I know that it is in good working condition ? Yes, indeed, I'm the lucky guy who won it, and I'm still amazed that I got it so cheap. I suppose the fact that the seller refused to ship outside the USA had something to do with it, and perhaps some of you outside the USA were watching and would have bid more if you had been given the opportunity. Still, I'm amazed that no one here was willing to bid more. The only other mitigating factor was that the auction ended at an awkward time, late afternoon on a weekday, when many people are between work and home, which is not an issue for me since I'm retired. I was fully expecting a last minute sniper bid, but it never came. So, today I received the HP-70, and the only issue is a touchy ON/OFF switch, which needs to be positioned half-way to work consistently and worn silver trim under the display. No corrosion, no cracks or scratches, labels intact and perfect, perfect keyboard and display, perfect battery door and latches etc. According the the MoHPC, the HP-70 is rated "Very Difficult" to find, and the lowest price recorded is $285. Perhaps it is time to downgrade its rarity ?

Re: Working HP-70 sells for $123.50 on TAS

*Message #2 Posted by **M. Joury** on 25 July 2011, 11:25 p.m.,*
in response to message #1 by Michael de Estrada

I saw that particular auction and was VERY tempted to bid on it. In fact last year or even 6 months ago I would have. At this time however pretty much anything is out of range for me (I had money put aside for the HP15C :-) but anything unplanned is a non-starter). So yes, I believe that the economy is having a negative (positive? depending on your view) impact on prices.

Cheers.

Re: Working HP-70 sells for $123.50 on TAS

*Message #5 Posted by **Michael de Estrada** on 26 July 2011, 12:39 a.m.,*
in response to message #4 by M. Joury

Well, there were six other bidders in this auction, so it's not like I was the only one that was interested. And one of those bidders a month ago was willing to bid twice as much on another HP-70 that he or she didn't win. Anyway, I'm just glad I got lucky in this case, and won't question my good fortune. Who knows, maybe an HP-95C will just show up at my door some day.

HP-28S Keyboard

*Message #1 Posted by **aj04062** on 25 July 2011, 10:46 p.m.*

Hi,

I just obtained a beautiful condition 28s with the leather case. Only problem is that the on key does not register unless you press on the keyboard contact.

I took the overlay off and tried to seat the cover down harder by pressing on the case and melting the stakes nearby. This did not work.

Is the only solution to remove all the stakes and replace the contact foam?

Re: HP-28S Keyboard

*Message #2 Posted by **Geoff Quickfall** on 25 July 2011, 11:53 p.m.,*
in response to message #1 by aj04062

check out the following link:

shucking the clamshell

You have discovered the main flaw of the clamshells. large case and a lot of flexing. in fact there may be many stakes that look good from under the keyboard bezel but are broken at the base. they look whole but are not.

so you will see the repair i did. once painted on the back it looks good and is a lasting repair.

The keyboard stakes most supseptable are the ones by the clasp section. this combined with the depressed foam causes the failure. yes, all the stakes must be milled and then remelted. the broken ones must be replaced. quite a common failure unfortunately.

Get an HP 41CL and get rid of the rest ;-) Of course just kidding. email me if you need more info.

Geoff

this repair is in the book for this HCC

Re: HP-28S Keyboard

*Message #3 Posted by **Ron Ross** on 26 July 2011, 1:43 p.m.,*
in response to message #1 by aj04062

Sadly, but I advise to remove the battery cover, remove the batteries and then repair the calculator via replacement from e**y. The battery cover and batteries may come in handy with the new clamshell.

Any other repair solution will take lots of time and still have a high probabilty of failure. Just my thoughts.

Re: HP-28S Keyboard

*Message #4 Posted by **Geoff Quickfall** on 26 July 2011, 2:27 p.m.,*
in response to message #3 by Ron Ross

Got to mildly disagree with the following Ron:

> Quote:
>
> high probabilty of failure

of course, it is dependent on how much time you want to input. This repair was done over two hours with an overnight set on the styrene solvent.

Problem is, this is such a ubiquitous failure (design) at the latch area heat stakes that finding a donor will be problematic. Just ask Randy and his 19BII failure rate.

In any case (pun intended) I have repaired 7 of these in the manner indicated and they are running perfectly! Use the 28S pictured in cockpit to see how durable the new stakes are and the foam replacement is.

Working fine, great machine, poor case design. Now if the hinge was broken then that would be a different story.

Cheers, Geoff

Re: HP-28S Keyboard

*Message #5 Posted by **aj04062** on 26 July 2011, 4:39 p.m.,*
in response to message #4 by Geoff Quickfall

I'll try the repair at some point in the future.

It's a shame as the unit is unscathed on the outside. Probably just sat there and broke on it's own... Leather case looks really nice too.

*Message #4 Posted by **Jake Schwartz** on 26 July 2011, 10:43 a.m.,*
in response to message #1 by gene wright

Ironically, the last high point in conference attendance (after the low of 19 on 9/15/2001 in Chicago, just 4 days after September 11th) was also in San Diego (in 2007) when the 35S was introduced. If I remember correctly, roughly 70 folks showed up to celebrate the 35th anniversary of the HP35. Perhaps this time we should be lighting 30 candles on a birthday cake for the PPC ROM, since the machine on which it runs is being reborn in the 41CL, not to mention that the 34S continues the sophisticated programming language of the 41 series.

Jake

in response to message #5 by David Ramsey

There is a "love" gift (said with tongue and cheek) that you "offer" when you register.

:-)

Namir

Yes, there is a cost for the conference, but ...

*Message #7 Posted by **gene wright** on 26 July 2011, 1:24 p.m.,*
in response to message #6 by Namir

It is usually fairly minimal.

Depends on the conference expenses.

Years when we have to pay for the meeting area / conference room tend to be more expensive than when we have the conference at a facility where the meeting space is donated, as it is this year.

The committee will be discussing the cost, but I certainly !! expect it to be less than $50 and more than $0.

Already forgot how to use a normal calculator...

*Message #1 Posted by **Brian K** on 25 July 2011, 11:43 a.m.*

I think in an earlier post I detailed how I always wanted to learn RPN/RPL, and was working my way back through college algebra/geometry/trigonometry on an HP 48g and 50g.

I've spent so much time lately in RPN that I needed to do some simple math, and the only calculator I had available was Windows CALC.EXE.

I was absolutely stymied by calc.exe's apparant inability to add five numbers together and divide by five.

"Why is it telling me the average is 5?"

"I wish I could see the stack, how can I be screwing this up?"

After about thirty seconds I realized my error, and then it was actually painful to make myself think in... infix notation, I think it's called?

"Enter the number, plus, second number, plus, keep going, now 5, divide, crap, that should have been divide, THEN five, but wait it only divided the last value by five" etc. etc. etc.

Re: Already forgot how to use a normal calculator...

*Message #2 Posted by **Marcus von Cube, Germany** on 25 July 2011, 12:41 p.m.,*
in response to message #1 by Brian K

Get yourself a Mac. The included calculator can be made into RPN mode. :-)

Re: Already forgot how to use a normal calculator...

*Message #3 Posted by **Gerson W. Barbosa** on 25 July 2011, 1:57 p.m.,*
in response to message #2 by Marcus von Cube, Germany

One of the reasons I haven't got a Mac yet is it lacks a Brazilian ABNT2 keyboard.

Re: Already forgot how to use a normal calculator...

*Message #4 Posted by **Thomas Radtke** on 25 July 2011, 2:25 p.m.,*
in response to message #3 by Gerson W. Barbosa

... and an intuitive UI. But then, who needs all this if he can have RPN! ;-P.

Thomas - waiting for a free42 port to AROS ;-).

Re: Already forgot how to use a normal calculator...

*Message #5 Posted by **Thomas Radtke** on 25 July 2011, 12:55 p.m.,*

in response to message #1 by Brian K

Besides lerning that keystrokes, don't forget to find out first if there is operator precedence or if trig functions are maybe still postfix. Brian, where's your head? You cannot just *use* an algebraic calculator! ;-)

I still remember when I got my 32SII. I was so upset about RPN (at that time, I was used to the 20S), that I was about returning it to my dealer. Fortunately, he convinced me to keep it and gave me a 25% (roughly) discount. Only one week later I was in love with this machine :-).

Re: Already forgot how to use a normal calculator...

*Message #6 Posted by **Bart (UK)** on 25 July 2011, 1:01 p.m.,*
in response to message #1 by Brian K

Yep, you're hooked ;-)

There are several Windows RPN calculators you can try, the two I have are:
A simulator of the HP-42S by Thomas Okken: Free42
A windows-calc like calculator with RPN mode: Calc98

Cheers

Re: Already forgot how to use a normal calculator...

*Message #7 Posted by **Paul Guertin** on 27 July 2011, 9:03 p.m.,*
in response to message #6 by Bart (UK)

Under Windows, I've been using Bernt Ribbum's Xcalc for the past 15 years or so. It isn't skinned like an HP calculator, but works very well, has never surprised me and it has a mini-mode that uses very little screen real estate (though this was more important in the days of 800x600 14-inch CRTs). It's always been freeware, but now it's open source as well. You can find it here.

Re: Already forgot how to use a normal calculator...

*Message #8 Posted by **Egan Ford** on 25 July 2011, 1:03 p.m.,*
in response to message #1 by Brian K

I thought RPN was "normal", are you saying that I am abnormal? :-)

Re: Already forgot how to use a normal calculator...

*Message #9 Posted by **Jim Yohe** on 25 July 2011, 2:28 p.m.,*
in response to message #8 by Egan Ford

Exactly! RPN has been "normal" for me for so long it's hard to switch back and forth when using various HP calc's (RPN/Alg).

Re: Already forgot how to use a normal calculator...

*Message #10 Posted by **Brian K** on 25 July 2011, 3:06 p.m.,*
in response to message #9 by Jim Yohe

You know, it's funny, I now completely understand why someone would purchase even a simple RPN pocket calculator and carry it around all the time.

Fortunately I can just load up an HP calculator emu on my android and have the same utility without my wife making quite as much fun of me.

Although there is something tantalizing about the HP 50G compatible belt holsters out there...

Re: Already forgot how to use a normal calculator...

*Message #11 Posted by **designnut** on 25 July 2011, 4:54 p.m.,*
in response to message #10 by Brian K

I started with the 35 so no problem there. Iworked with a texh that could use either alternately. Practice makes perfect. I do wonder of most users of the 39-50 can actually use them beyond the math keyboard. I hear "I don't do much progrramming" so whats the point? sam

Re: Already forgot how to use a normal calculator...

*Message #12 Posted by **Ren** on 26 July 2011, 1:42 p.m.,*
in response to message #1 by Brian K

A few years ago, probably through this forum, I found WRPN was a nice RPN "app" for a windows machine.

I think I have it "handy" on a few USB thumb drives as well.

So, find it, install it on your PC, and get back to "normal"!

B^)

in response to message #12 by Ren

And how could I forget..., our good curator has a list of HP and RPN simulators and emulators:
http://www.hpmuseum.org/simulate/simulate.htm

Re: Already forgot how to use a normal calculator...

*Message #14 Posted by **Chris Randle (UK)** on 26 July 2011, 3:02 p.m.,*
in response to message #1 by Brian K

My eight-year-old just pulled an HP 10s from my desk drawer. A few seconds later she came back and said, "Where's the enter?". Have I done a good job, or what?!!

It gets better. She swapped it for a 50g which had been reset to factory settings. Back again a minute later with, "How do you get this back to normal?"

Of course, she'll have to attend remedial classes when she gets given a Casio at school, so I shouldn't be too smug.

Corrected command to build WP 34S assembler tables

*Message #1 Posted by **Neil Hamilton (Ottawa)** on 25 July 2011, 6:38 a.m.*

Hi All,

There is a typo in the Assembler documentation regarding building new opcode tables for SVN revision translations. Section 5.2, Figures 5.2 and 5.3, give incorrect command lines for doing this. The command line parameter "opcodes" is missing.

The correct command is (your path may vary):

```
$ calc opcodes > svn_XXXX.op
```

I will issue an updated manual in the next little while.

Sorry for the inconvenience (and thanks for spotting this Cristian!).

Wp34s unit conversions

*Message #1 Posted by **Cristian Arezzini** on 25 July 2011, 1:33 a.m.*

I just had to use the wp34s conversions in "real life" for the first time yesterday, and I had a problem with the user interface. Basically, I had to convert a few values from cm to inches. I entered the value, entered the Conv menu, chose the appropriate conversion, and read the result on the display. Then to convert the other values I had to do it all again, because if you try to enter another number, the calculator just changes units, keeping the same argument, until you press Enter or Exit. Now, in real life it never happens that if, for example, you need to convert 12.34 cm in inches, then you have to convert 12.34 lbs to kg or whatever; it's much more likely that if you are converting cm to inches, you will need to convert more of the same units.

So I would suggest the following modification: you enter the Conv menu, choose the units, then press Enter to acknowledge the actual conversion you need; then you can repeatedly enter arguments and they are all converted, without the need to re-do everything from scratch. Then if you press Enter twice, the calc could exit the conv menu leaving the latest value on the stack; or pressing Exit would just exit without modifying the stack.

What do you all think? I think this (or something similar) would be much more user-friendly in "real life" than it is now! :)

Cristian

in response to message #1 by Cristian Arezzini

Ciao Cristian,

I'm not sure I got you right. When I do some conversions of the same kind, e.g. cm to inches, I work like this:

```
12,3
[f][CONV][C][v][v]
[XEQ]
3,4
[f][CONV]
[XEQ]
5,6
[f][CONV]
[XEQ]
etc.
```

This looks easy enough for me. YMMV.

Walter

Re: Wp34s unit conversions

*Message #3 Posted by **Cristian Arezzini** on 25 July 2011, 2:29 a.m.,*
in response to message #2 by Walter B

Walter, I just tried it again, and it works as you said - and it indeed is easy enough. I could have sworn that yesterday, everytime I re-entered the Conv menu, it started again from the first item in the menu. I have re-flashed since yesterday, but I doubt anything has changed there - I suppose I was just doing something wrong. Again. :(Anyway, it is ok indeed, just disregard my above post!

Cristian

*Message #4 Posted by **Marcus von Cube, Germany** on 25 July 2011, 4:20 a.m.,*
in response to message #3 by Cristian Arezzini

Cristian, which revision are you running and on which hardware? I'm still tracking down the lock-ups other users have reported.

The strange behavior of the CONV menu might be caused by just reading the values while still in the menu and then trying to reenter the new input value which will definitely not work. You need to XEQ or ENTER^ first.

Re: Wp34s unit conversions

*Message #5 Posted by **Paul Dale** on 25 July 2011, 5:02 a.m.,*
in response to message #1 by Cristian Arezzini

The conversions are designed to change the value in X rather than just viewing the converted value. The latter is useless in a program. The lower line display was a later addition and is useful but the primary purpose is still to do a conversion. Press XEQ or ENTER to convert and exit the catalogue.

I suspect your typing digits caused the catalogue to navigate elsewhere which confused things. Digits enter alpha characters and these cause navigation like all catalogues.

New HP15C Priced at $129

*Message #1 Posted by **DaveJ** on 24 July 2011, 7:17 a.m.*

This supplier has it listed:
http://www.costcentral.com/proddetail/HP_15C_SCIENTIFIC_CALCULATOR/NW250AAABA/11421304/

with an MSRP or $129
But they have it on sale for $80.52

Dave.

The 15C market on ebay will no doubt plummet.
Gone instantly will be the market of enthusiasts who still buy them to use.

I wonder if they have nailed the battery life, or still run the thing at a crazy high frequency?

Dave.

in response to message #3 by DaveJ

as i recall there was a simple(ish) patch that could be made to the 15c rom to double the available memory space when run on the nonpareil emulator. given the new hardware will have more than enough spare ram available, i wonder if (1) the new 15c will make use of this extra ram, or (2) if someone will be able to do a little hacking of the (new) firmware package to implement said end result...

Well I did get an email from TheCalculatorStore containing this:

"**The Financial Anniversary model**

The second is the 30th anniversary of a current product. After this anniversary release, I have been told that the product "will be put to sleep", in dog's parlance. So it will be time to make our final purchase. Same shape as the above, it will be packed as well as a collector's item."

Though it might be that they will put the 12c 30th AE "to sleep" but it seems likely that the 12c in general will be gone in a few years or less.

Edited: 24 July 2011, 11:14 p.m.

I'm sure that the 30th AE will end at some point within the year, but why do you think that HP will discontinue this incredible product that they have? That would be madness.

Did you know that real estate associations give regular for-credit classes courses on how to use an HP-12C. It's not just a calculator it's an institution!

Re: New HP15C Priced at $129

Yes, this just doesn't make sense.
They went to all the effort to redesign the Voyager architecture using the new ARM processor so that they could keep the massively popular 12C alive. (The 15C is just a simple spin-off from that effort, just a different ROM and keycaps basically)

I know nothing about the finance industry, but I was of the understanding that the 12C was THE only calculator to have?
They could probably charge double and still have the same market?

Dave.

*Message #44 Posted by **Pal G.** on 25 July 2011, 10:40 a.m.,*
in response to message #34 by Nigel J Dowrick

Perhaps the most interesting item mentioned in the "The Calculator Store" blog post is this (in bold):

"I have received this week information about two new products. Now we are getting more details: suggested retail price, packaging, distribution, **number of units to be produced**, date of distribution."

Re: New HP15C Priced at $129

*Message #45 Posted by **hpnut** on 25 July 2011, 11:24 a.m.,*
in response to message #34 by Nigel J Dowrick

I received this newsletter from thecalculatorstore:

As you know, there is a lot of noise about a couple of new "old" products from HP. Let us elaborate about both of them. As we have seen them in several sites, we don't know if our commitment to keep silent until they are announced is void - in any case, we will refrain from "calling names".

The Scientific Reissue

The first of them has been spotted in the indian HP website, in Japan, and as available in some distributors. It is not: HP confirmed me that is intended to ship in mid september, and that it is not distributed yet anywhere.

It is a scientific calculator with LCD screen, and "in landscape format". It will come in a collector's edition gift box, with a higher quality pouch than its current financial sibling (yet another hint), with a printed manual and a CD with the advanced functions manual and a Windows emulator. It is limited to 10.000 units, and it will be priced around 100 €. I still do not have the final cost number to make my own pricing.

The Financial Anniversary model

The second is the 30th anniversary of a current product. After this anniversary release, I have been told that the product "will be put to sleep", in dog's parlance. So it will be time to make our final purchase. Same shape as the above, it will be packed as well as a collector's item.

For both units I have pictures that I cannot publish - but you can readily find them on the web!

As I do not know the final price, I am not taking any order for any of them - but I am taking reservations. Do not worry - it'll be competitive!

I'll post no link until I am authorised to."

well, well - limited edition means 10 000 units? that's way short of 83 377 predicted by the Bring Back the HP 15C people at hp15c.org :-)

Re: New HP15C Priced at $129

*Message #46 Posted by **Michael de Estrada** on 25 July 2011, 12:55 p.m.,*
in response to message #45 by hpnut

Well, 100 € = 144 USD at the current exchange rate, which is a bit more than the $129 MSRP in the USA. The real question is whether there will be any discounting off MSRP. I ordered mine in the USA at a 37% discount and another reseller is offering a 34% discount.

Also, it would be interesting to see how the projected production run of 10000 units is distributed to the various resellers. I know that one of the USA resellers had ordered 4750 units, which is a bit less than 5% of the total projected number. Maybe 50% USA and 50% for the remainder of the world ?

Re: New HP15C Priced at $129

*Message #47 Posted by **M. Joury** on 25 July 2011, 1:37 p.m.,*
in response to message #46 by Michael de Estrada

4750 / 10000 a little less than 5%? Is there a misprint somewhere? Are there actually 100,000 units being made? Or did you mean a little less than 50%? If a single distributor is getting nearly half the available units that won't leave many to go around.

Cheers

Given the US$129 MSRP, I'd guess the wholesale buy price for the dealers is around the $60 mark.

10,000 units at circa $60 is $600K gross income for HP.
So I guess that's the minimum point at which it becomes interesting enough to HP to do a new product.
Unless someone was able to convince the powers-that-be to do it for the love.
But of course a large part of the design has been amortized over the new 12C units.

An interesting figure none the less.

Dave.

Too bad it doesn't work that way. The wholesale price for HP calculators is typically around 75% of MSRP, not the 47% that you are assuming.

I'm actually very surprised that the 15C is being listed for $80 with a claimed MSRP of $129. I suspect the real MSRP is probably closer to $99 given a street price of $80.

Eric

Re: New HP15C Priced at $129

*Message #57 Posted by **DaveJ** on 26 July 2011, 3:26 a.m.,*
in response to message #56 by Eric Rechlin

The practical difference between $600K and say $750K is pretty moot, so the exact figure doesn't really matter. But thanks for the clarification.

So either the suppliers have the MSRP quite wrong, or this calc has a lower wholesale price, or the suppliers are "doing it for the love" :->

Dave.

Wouldn't that depend upon the volume, as in most industries? I would assume that Office Depot pays less for a 12c than a reseller who sells 2 or 3 per month.

Somewhat. You can buy from HP's top-level distributor if you do a very high volume, and then you can get the best prices. Otherwise, if you don't sell hundreds of calculators a month, you have to buy from a second-tier distributor. That's what I have to do.

However, it has now gotten ridiculous. Presently I am buying my calculators from Amazon.com just like anyone else, because it is now cheaper for me to buy a calculator on Amazon.com (even in quantities of 1!) than to go through any of HP's second-tier distributors. Yes, that means the wholesale price of, say, an HP 50g is now higher than the Amazon.com price.

It's like HP is trying to put me out of business.

Eric

in response to message #59 by Eric Rechlin

They probably are. As far as they are concerned, the transaction cost for small customers is not worth their time, and that is why they have distributors...and so on...and Direct to Market is effectively a Huge distributor. The same dynamic has occurred with music sales.

Since you are in the US, just order it from the CostCentral site above. You can't beat the ~$89 shipped price going with anyone else. It's not like I'd be making much money off it; I'm sure I'll have to sell them for more than that just to avoid losing money.

Eric

Yes, but I do not yet have a specific date so I haven't wanted to list it.

My guess is Samson Cables saw the $80 price, ordered some himself, and figured that he could resell them at a profit for $95. Then he listed it to snatch up the pre-order market.

I would rather not list it for pre-order until I have a specific availability date, because that can lead to false expectations. However, maybe I should just stoop to Samson's level and list it for pre-order as well at the same price, with the same vague timing suggested for delivery.

Eric

Card reader bug

*Message #1 Posted by **Eric Smith** on 24 July 2011, 6:47 a.m.*

There is a card reader bug that is present in the 1E version of the card reader (and probably 1D), and fixed in the 1G version. I haven't got a 1D or 1F to check. I discovered the bug around 1981, and I think I saw it mentioned by someone else in the PPC Journal at one point.

With the card reader plugged in, press the key sequence

```
GTO . EEX 0 0 backspace backspace
```

What you should see after that is

```
GTO .1__
```

If you have the bug, the display rotates so it reads

```
0      GTO .1
```

From study of a instruction trace, it appears that the bug is due to the card reader ROM's I/O service poll routine violating one of the requirements of the mainframe polling code. From the mainframe source code:

> Quote:
>
> All subroutine levels are available except in I/O service entry. If PKSEQ is set then I/O service routines must either preserve three subroutine returns on the subroutine stack or else terminate the partial key sequence.

The CR-1E I/O service poll code uses two levels of subroutines. Perhaps the CR-1G ROM was changed to not need two levels of subroutines, though I haven't yet disassembled the code to determine what the actual changes are.

Re: Card reader bug

*Message #2 Posted by **Les Bell** on 24 July 2011, 7:02 a.m.,*
in response to message #1 by Eric Smith

Hi, Eric,

Mine has the bug, but how can I tell which version it is?

The serial number is 2036S45246, if that's any indication.

Best,

--- Les
[http://www.lesbell.com.au]

Re: Card reader bug

[http://www.lesbell.com.au]

Re: Card reader bug

*Message #5 Posted by **Eric Smith** on 24 July 2011, 3:11 p.m.,*
in response to message #4 by Les Bell

Without a version letter in the catalog, it is probably 1D. I haven't heard of anyone finding the earlier versions, so 1A-1C were probably only in prototypes.

If you really want to check, you can use the diagnostic ROM's ROM check, which will display the full identifier, or you can use the ZenROM or other means to look at ROM locations EFFB through EFFE.

Re: Card reader bug

*Message #6 Posted by **Ángel Martin** on 25 July 2011, 6:08 a.m.,*
in response to message #5 by Eric Smith

> Quote:
>
> other means to look at ROM locations EFFB through EFFE

Function PGTRAIL in the TOOLBOX-II module (and others) will show the last four words before the checksum (a.k.a. the "page trail"). Input is the page#, 0-15.

Re: Card reader bug

*Message #7 Posted by **Les Bell** on 25 July 2011, 6:15 a.m.,*
in response to message #5 by Eric Smith

I don't have those ROM's, but comparing with Geoff's serial number list, I'd say it's a 1D.

Best,

--- Les

Re: Card reader bug

*Message #8 Posted by **Geoff quickfall** on 24 July 2011, 3:01 p.m.,*
in response to message #1 by Eric Smith

I have a 1E, 1F, 1G and three that state Card Reader only:

```
display      version       serial number

CARD RDR     1E             2056S46900
CARD RDR     1F             2319S81056
CARD RDR     1G             2703S80162
CARD READER  ??             2044S45132
CARD READER  ??             2023A00100
CARD READER  ??             1935A00179
```

It would seem that the early card readers just state "CARD READER" with a CAT II display.

I will check the bug on 1F and I think Wlodeks book mentions it in the bug section.

Cheers, Geoff

HP-41CV "HFF" ROM set

*Message #1 Posted by **Eric Smith** on 24 July 2011, 5:12 a.m.*

For the first half of the product life of the HP-41CV, and the tail end of the product life of the HP-41C, the mainframe ROMs used were the "GFF" ROMs, which fixed most of the serious known bugs of earlier ROMs. Some of those bug fixes upset early synthetic programming fans, such as fixing "bug 2" which allowed program memory and status registers to be accessed by addresses that wrapped around, and "bug 3" which allowed altering system flags. Of course, other methods were developed for doing those things without reliance on bug 2 and bug 3.

Around late 1983, the HP-41CV changed to using the "HFF" ROM set. As far as I know, there is no published explanation of the difference between ROM 0 revisions G and H. Aside from the version number and checksum, there are two actual changes, at address range 01c9..01f3, and the single word at 081a. I haven't figured out the latter, but I've discovered what the 01c9 change does.

The HP-41 mainframe ROMs have code to support expansion ROMs using "buffers" of registers allocated in main RAM, just after the key assignments. The first register of a buffer contains two copies of the buffer number, used by an expansion ROM to identify the buffer it owns, and a buffer length which is used to locate the next buffer, or the end of the buffers.

There was a longstanding bug in the mainframe ROMs which would cause a hard lockup if the length of a buffer was mismarked as zero. The code to scan the buffers would sit in a tight loop looking at the same zero-length buffer forever. This situation could easily be caused by buggy synthetic programs. The ON-backspace trick wouldn't recover from this, because the buffer check happened before the ON-backspace check. Recovery generally requires removing the batteries until the RAM contents are lost.

The code change at 01c9 in the 0H ROM, and also the 0N ROM of the 41CX, fixes this bug! They reversed the order of the tests, so that the ON-backspace test is done before the buffer scan, so that it can avoid the zero-length buffer lockup.

It has been reported that the 41CV with HFF ROMs may have the "buzz mode" of the 41CX (PPCJ v10n9p24), but I don't have a 41CV with HFF ROMs so I can't confirm that.

Edited: 24 July 2011, 5:13 a.m.

I've been looking at the code, but I haven't puzzled it out yet.

Re: HP-41CV "HFF" ROM set

*Message #4 Posted by **Håkan Thörngren** on 26 July 2011, 8:35 a.m.,*
in response to message #3 by Eric Smith

I checked and understand. It is a bug. It used to increment the number of instructions in an XROM before checking if a given instruction number was in range.

If you have an instruction XROM **i,j** and look it up for execution, it will scan the ports for a module with ID **i** plugged in. Now if **j** is just one instruction beyond was is actually in the FAT, it will incorrectly think it found the instruction, take the FAT 0,0 trailer and build an execution address from it.

What it should do is keep looking for another module with the same ID **i**, but with more FAT entries. This is what happens in H ROM.

To take an example, if you look for XROM 10,30, it means you are looking for a module with at least 31 instructions (it starts with 0). So it starts scanning for XROM 10. When found it will load the number of instructions in the FAT. Say it is 30, meaning it has instructions 0-29. In H ROM it loads the instruction count and compare 30<30, so it is false and it will keep looking for another XROM 10 with more instructions. In G ROM it increments the count and compare 30<31, which is true and it will build an instruction address using the FAT trailer words. It should end up executing from the first address in the ROM page.

Interesting article in August 2011 Scientific American

*Message #1 Posted by **Don Shepherd** on 23 July 2011, 9:47 p.m.*

It's called "Why Math Works" and it asks the question "Is math invented or discovered." The author is an astrophysicist and the discussion is a bit deep, but it is an interesting read for the layman, including those of us who push buttons on HP calculators.

Re: Interesting article in August 2011 Scientific American

*Message #2 Posted by **dbatiz** on 24 July 2011, 2:39 a.m.,*
in response to message #1 by Don Shepherd

I'm sure there are more profound thinkers out there that will take issue with my opinion. However in the spirit of discussion I offer the following: When either using linear regression to approximate values between data points, or using calculus to predict planetary movements; math seems to be validated by how well it can represent and predict situations in the real world. As such, all the interactions, cause/effect, variables and relationships already exist and are waiting patiently to be discovered by intellects capable of seeing beyond obvious, quantifying the subtle, and finding the connection between the apparently un-related.

Again, only my opinion, each discovery sheds light on the fantastic complexity, elegance and care of our creation.

Very respectfully,

David

*Message #3 Posted by **Thomas Radtke** on 24 July 2011, 3:08 a.m.,*
in response to message #1 by Don Shepherd

My view on this topic:

As math originated from natural philosophy, its foundation reflects our perception of the world. If a farmer owning n cows buys another cow and subsequently counts the herd, he will likely reckon n+1 cows.

Thousands of years later, observations in our nature still guiding the way math is being developed, e.g. Newtons calculus. Few hundered years ealier, Cavalieri failed to invent it. There had to be a question in physics to do it right ;-).

Careful there Thomas. Walter will be all over you that it was indeed Leibniz that invented the calculus first and not Newton. For once I'd actually agree with him ;-) Furthermore, Leibniz's invention of the calculus stemmed from his pure mathematical studies into the "tangent problem."

I don't want to discuss that in depth, especially not with Walter ;-). To me, Newtons way to solve the problem is much more obvious. It just looks like Leibniz had taken the idea from Newton to make a theory, where other mathmaticians had to fail.

in response to message #1 by Don Shepherd

Math is a model of the physical world. The properties of the physical world are definitely discovered, not invented.

The model (math) is both invented *and* discovered. We invent pieces of it and then discover the various properties that follow from the pieces to keep it consistent. The value "i" is a perfect example. We invented i=SQRT(-1) and huge amount of math followed from this.

Re: Interesting article in August 2011 Scientific American

*Message #10 Posted by **Tommy** on 24 July 2011, 11:16 a.m.,*

And yet, if we were a species of infinitesimally small beings and lived in a quantum space where the laws of physics that govern the trajectories of cannonballs and planetary orbits no longer applied, I wonder what sort of mathematical framework we would have invented. It certainly would not have been the calculus of Newton and Leibniz.

OOT: connector for ribbon cable

*Message #1 Posted by **PeterP** on 23 July 2011, 9:33 p.m.*

Hi, very off off topic, but a quick plea to the electronic gurus here:

I have a 16 wire rainbow flat ribbon cable attached to an LCD that I want to connect to my Arduino. Soldering single leads on the 16 cables sounds tiresome and full of risk of shorts so I would like to attach a header, ideally via press on (or crimp on? not sure what the right term is)

I've searched all the usual subjects (digikey, mauser, etc) but kind find a suitable connector.

I can work with a single row connector or with a double row connector, ideally male but I would take a female single row as well at this point. (the 2-row female ones dont work because they have the wrong wiring - the one that I have on the board is also a female 2-row one so you cant make them work together (I tried all sorts of tricks but it wont work).

So - where can I find either

1. single row male 16 wire crimp on header to attache to 16 wire flat ribbon cable
2. single row female 16 wire crimp on header to attach to 16 wire flat ribbon cable
3. 2-row male 16 wire crimp on header to attach to 16 wire flat ribbon cable

Thanks so much for your kind help and please accept my apologies for the OOT.

Cheers

Peter

Re: OOT: connector for ribbon cable

*Message #2 Posted by **Garth Wilson** on 23 July 2011, 10:30 p.m.,*
in response to message #1 by PeterP

IDCs for ribbon cables are dual-row female. You can put the ribbon in from either side and turn it over if you need to. There should be a way that will work.

Re: OOT: connector for ribbon cable

*Message #3 Posted by **PeterP** on 23 July 2011, 11:09 p.m.,*
in response to message #2 by Garth Wilson

Thank you guys for the responses, seems it makes sense I was not able to find a male single row 16 wire header, as they dont really exist. Good to know. As for the IDC, Garth if you can help me out, I was not able to make it work.

The internal makeup of the IDC female connectors seems to be as follows:

```
2 4 6 8 10 12 14 16
```

```
1 3 5 7 9  11 13 15
```

so whichever way you feed in the cable, you always have it going from left to right from 1/2 to 15/16.

the receptor on the board is *ALSO* a IDC female, so it has the same wiring. To make the two work together, I would need a connector that looks exactely the opposite and I dont think you can fashion one from the IDC connectors (I tried it all four ways):

```
1 3 5 7 9  11 13 15
2 4 6 8 10 12 14 16
```

You can never have the '1' pin on the 'far' side of the cable.

What am I missing?

Thanks again for your help!

Cheers

Peter

Re: OOT: connector for ribbon cable

*Message #4 Posted by **Garth Wilson** on 24 July 2011, 2:34 a.m.,*
in response to message #3 by PeterP

Your first pinout is industry standard. The second one is not, but you can get it if you put the pin header on the oposite side of the board.

Re: OOT: connector for ribbon cable

*Message #5 Posted by **Paul Berger (Canada)** on 23 July 2011, 10:35 p.m.,*
in response to message #1 by PeterP

I looked at a picture of an arduino and it look like the connectors are the standard 1/10" or 2.5mm spaced connectors in groups of 8, it also appears that the gap between the groups of 8 is wider than 1/10" which would likely mean that you would not be able to use a single 16 pin strip. It would be helpful to know what sort of ribbon cable you have, but the most common type that is used for Insulation Displacement Connectors (IDC) has wires spaced at 1/5" or 1.25mm and is designed for two row IDC with the wires alternating between rows, I have never seen a single row IDC like this, it would likely require a different pitch of ribbon cable.

I will also warn you about separating, stripping and soldering the wires onto a connector, not only is it tedious, the wires are quite fine and when solder they are a bit on the fragile side and if flexed at the solder joint break off easily.

The ideal connector for single rows like this, uses individual wires with a metal connector crimped onto the end and fit into a plastic shell, however special tools are required to crimp on the connectors.

Re: OOT: connector for ribbon cable

*Message #6 Posted by **PeterP** on 23 July 2011, 11:11 p.m.,*
in response to message #5 by Paul Berger (Canada)

there are various configurations, the header that I have is the standard 1-row 16 header female or a standard IDC 2-row 16 wire headers (they are on a separate PCB which I use to drive an LCD with only one wire from the Arduino instead of the normal 8 needed)

Cheers

Peter

CORDIC in Degrees vs. Radians

*Message #1 Posted by **Mike Fikes** on 23 July 2011, 12:27 p.m.*

On a Voyager (15C) in degrees mode, cos 60 = 0.5. The same is true for a Pioneer (20S).

If, instead, this is performed in radians mode, first converting 60 degrees to radians using ->RAD, this results in

```
15C: 0.5000000002
20S: 0.499999999997
```

My question: How do these machines produce exactly the right answer when in degrees mode?

Is CORDIC internally performed always either degrees or radians (with the necessary conversions of input being done first)? Or is it internally performed using the mode that the calculator is set to?

Re: CORDIC in Degrees vs. Radians

*Message #2 Posted by **Gerson W. Barbosa** on 23 July 2011, 1:36 p.m.,*
in response to message #1 by Mike Fikes

HP calculators round the answer to the number of digits of the display. Thus, on the 32SII 60 -> RAD returns 1.04719755120, a worst approximation to pi/3 than 1.04719755119660 which would be used internally when in DEG mode. In RAD mode the internal results are

```
   cos(1.04719755120 rad) = 0.499999999997054
cos(1.04719755119660 rad) = 0.499999999999998
```

or

```
0.499999999997
0.500000000000
```

respectively, when rounded to 12 digits.

Gerson.

Re: CORDIC in Degrees vs. Radians

*Message #3 Posted by **Mike Fikes** on 23 July 2011, 2:06 p.m.,*
in response to message #2 by Gerson W. Barbosa

Is the following accurate?

When in degrees mode, the 15C internally converts the input to a radians representation that employs guard digits (in other words, a representation with more than 10 digits), which is then passed to the CORDIC routine. The (greater than 10-digit) output of CORDIC is then rounded to the 10 digits of the display.

Re: CORDIC in Degrees vs. Radians

*Message #5 Posted by **Mike Fikes** on 23 July 2011, 4:31 p.m.,*
in response to message #4 by Gerson W. Barbosa

Yep, post #16 in the first thread you referenced indicated the following with respect to trig in degree mode on the 15C:

> Quote:
>
> For example, the HP41, HP15, etc., are known to do internal arithmetic with 13 digits although final results are only 10 digits. That is, a 13 digit approximation to PI/180 is used to convert the argument from degrees to radians.

Thanks :)

Re: CORDIC in Degrees vs. Radians

*Message #6 Posted by **Eric Smith** on 24 July 2011, 4:49 a.m.,*
in response to message #1 by Mike Fikes

It is possible to do CORDIC operations in degrees, grads, or other angular units, but generally HP calculators don't do that. They internally convert to radians. As Gerson has noted, they use extra digits in internal calculations to get a more accurate result than if you did the conversion from the keyboard.

I say "generally" because I have no idea how models like the 6s, 8s, 9s, 9g, and 30s work internally.

HHP-16K EPROMS on HHP PE

*Message #1 Posted by **Prabhu Bhooplapur** on 23 July 2011, 7:47 a.m.*

Hi,

Can anyone confirm if the EPROMs of HHP PE can be used on HHP-16K unit?

Is there anyway to ascertain the proper functionality of HHP-16K unit? The setup instructions booklet is silent on this topic.

Thanks,

Prabhu

WP 34S: missing vector cross product

*Message #1 Posted by **fhub** on 23 July 2011, 5:34 a.m.*

I saw that the cross product is still missing in the vector library, so that's a good chance to write my first WP34s program. ;-)

Here's the pure code which fulfills all conditions required in vectors.txt (at least I hope so) - you just have to give it a label of your choice:

```
STO C
RCL* B
RCL T
RCL* T
-
x<>y
STO I
RCL* T
RCL A
RCL* D
-
x<>z
STO J
RCL* A
RCL B
RCL* I
-
R^
STO L
Rv
```

Just 20 steps, not so bad for my first program ... :-)

Franz

Re: WP 34S: missing vector cross product

*Message #2 Posted by **Paul Dale** on 23 July 2011, 6:39 a.m.,*
in response to message #1 by fhub

Give me a break, I only added vectors.txt yesterday.

I'll add your code instead of writing my own :-)

- Pauli

Re: WP 34S: missing vector cross product

*Message #3 Posted by **Paul Dale** on 23 July 2011, 6:52 a.m.,*
in response to message #1 by fhub

The vectors.txt file is updated. vectors.wp34s will be in due course I expect. I think that 112 steps is pretty lean for this lot :-) Thank to Franz for the final piece.

- Pauli

Re: WP 34S: missing vector cross product

*Message #4 Posted by **fhub** on 23 July 2011, 7:18 a.m.,*
in response to message #3 by Paul Dale

I must say that writing this cross product was really a nightmare:
taking care of where all those stack values are moves during the calculation, avoiding stack overflows and finally fulfilling your conditions about storing the 2nd vector to L,I,J (and keeping the 1st one on the stack) increased the number of my grey hairs. ;-)

And with all these troubles I had an idea which would greatly simplify such calculations (with so many parameters on the stack):
What about having a 2nd copy of the 8 stack registers?
One command could duplicate the original stack into this 2nd copy, and then you could just do all calculations with these '2nd-stack' registers on the usual stack: since the order (and naming) of the 2nd-stack won't change, it would be much easier to adress the stackregister names.

Maybe this 2nd stack registers could be named with a dot preceding the names (.X, .Y, ...C, .D) and adressed with the sequence RCL XEQ (because XEQ is almost the only key which is still free to use after a STO/RCL), which would then display "RCL .__" and wait for any stackregister name (X to D).
Of course this should also work with STO XEQ, and there should be 2 commands to copy (or backup) the normal stack to this 2nd stack and vice versa (maybe STO STO and RCL RCL).

Well, just a dream of me - but it would indeed make programming much easier ...

Franz

PS: I know this could be done with the usual registers Rxx (and STOS), but I also know that you don't like changing any registers during 'usual' calculations within a program.

Edited: 23 July 2011, 7:22 a.m.

Re: WP 34S: missing vector cross product

*Message #5 Posted by **Paul Dale** on 23 July 2011, 7:22 a.m.,*
in response to message #4 by fhub

Not possible: no RAM left.

We do have save and restore stack operations: STOS & RCLS. They save/restore the stack to the numbered registers only.

- Pauli

Re: WP 34S: missing vector cross product

*Message #6 Posted by **fhub** on 23 July 2011, 7:44 a.m.,*
in response to message #5 by Paul Dale

> Quote:
>
> Not possible: no RAM left.

Ok, and what about a few more stack manipulation commands?

It would be nice to have something like Rv and R^ not for the whole stack but just for a part of it (e.g. only do a roll-down/up on the first 3 registers X,Y,Z).

Edited: 23 July 2011, 8:43 a.m.

in response to message #7 by gene wright

> Quote:
>
> While we are thinking of stack commands :-) how about something like these?

Yes, not a bad idea - my HP-48GX has much more (useful!) stack manipulation commands than are available on the WP34S.
But the major problem is certainly the limited space on the WP34S, wheras the 48GX doesn't suffer from such space restrictions. ;-)

Re: WP 34S: missing vector cross product

*Message #9 Posted by **Paul Dale** on 23 July 2011, 7:43 p.m.,*
in response to message #7 by gene wright

And the other four stack levels??

- Pauli

Re: WP 34S: missing vector cross product

*Message #10 Posted by **gene wright** on 23 July 2011, 7:51 p.m.,*
in response to message #9 by Paul Dale

True true... but I do think at least these for the standard 4 levels would be useful.

How about a general <> function?

Is that possible?

X<> already prompts for the other location. Is it possible to code for both? :-)

Re: WP 34S: missing vector cross product

*Message #11 Posted by **Paul Dale** on 23 July 2011, 8:00 p.m.,*
in response to message #10 by gene wright

It isn't possible. The op-codes used for commands don't have enough space to hold two register addresses. So it would have to be a separate command for each at about eighty bytes per -- even supporting just swaps of Y, Z and T with anything will eat into our feeble memory reserve. It is possible I could streamline things and reduce the space use a little by reusing code profusely. I don't think supporting the specific individual functions will be any smaller.

I did have a general rearrange the (4 level) stack plus last X in a completely general manner instruction but it was lost. It replaced a lot of the traditional stack operations rather nicely but would have been really confusing for users.

There is hope however, define them yourself and stash them in a flash segment. For example:

```
LBL'Z<>T'
X<> Z
X<> T
X<> Z
RTN
```

or

```
LBL'Z<>T'
cpx Rv
x<>y
cpx R^
RTN
```

- Pauli

Re: WP 34S: missing vector cross product

*Message #12 Posted by **htom trites jr** on 23 July 2011, 7:55 p.m.,*
in response to message #9 by Paul Dale

Cleanest is to implement "stack-dup and stack-pop". Upon entry, your code does a stack-dup; this gives you a copy of the current stack and status. Do what you will (including calling other program segments.) When you're done, you explicitly write results into the lower stack and status registers, and then execute a stack-pop, which throws away all of your unsaved values, leaving the calling code with your results. Stack-pop gets really messy if you modify the structure of the "top stack".

Re: WP 34S: missing vector cross product

*Message #13 Posted by **Marcus von Cube, Germany** on 24 July 2011, 2:16 a.m.,*
in response to message #12 by htom trites jr

You will need a register area from the numerical registers for this. DUP is already there: STOS. Recalling only part of the stack can be done with R-CPY. R-CPY needs X for its argument so you need to take care of this in an extra step.

Pauli, a command ROLLv with an argument for the number of rolls might be helpful.

Re: WP 34S: missing vector cross product

*Message #14 Posted by **Paul Dale** on 24 July 2011, 5:08 a.m.,*
in response to message #13 by Marcus von Cube, Germany

> Quote:
>
> Pauli, a command ROLLv with an argument for the number of rolls might be helpful.

Number of rolls as in the number of times Rv is executed or the number of registers being rolled?

I suspect this suggestion will upset the RPL haters :-)

To be honest, I've never needed either nor even wanted the capability and I've done more than a little RPL programming in my time.

- Pauli

Re: WP 34S: missing vector cross product

*Message #15 Posted by **Marcus von Cube, Germany** on 24 July 2011, 3:19 p.m.,*
in response to message #14 by Paul Dale

Pauli, I meant the number of rolls to perform.

Re: WP 34S: missing vector cross product

*Message #16 Posted by **fhub** on 24 July 2011, 3:54 p.m.,*
in response to message #15 by Marcus von Cube, Germany

> Quote:
>
> I meant the number of rolls to perform.

Well, I would say Rv and R^ only the first n stack-registers is more important. Performing n rolls (as you suggest) needs just pressing the same key (Rv or R^) n-times, but imagine the following situation:

You need the value from stack-register A during your calculation, and after that it's not needed anymore. In this case a "R^ A" would be very comfortable, wheras you would have to key in the following sequence to achieve the same:

```
x<>y
x<> Z
x<> T
x<> A
```

And you know how many keystrokes this would need
(especially the "x<> _") ... :-(

Happy Pi Day! (again)

*Message #1 Posted by **Gerson W. Barbosa** on 22 July 2011, 3:14 p.m.*

Pi Day is a harmless nerdity, so no problem having two of them in the same year, 130 days apart from each other :-)

For people using the European date system (dd/mm/yyyy), 22/07 matches exactly Archimedes' upper bound for pi. Without algebra, trigonometry and a positional number system, Archimedes was able to place pi between the bounds $6336/2017\frac{1}{4}$ and $14688/4673\frac{1}{2}$. He widened very slightly the interval and established the more simple approximations $3\frac{10}{71}$ and $3\frac{1}{7}$, the latter being the *de facto* value for pi in Europe during more than fifteen centuries, so much that some believed that was an exact value, not an approximation. Archimedes used Euclidean geometry. Essentially, he established those bounds by calculating the perimeters of two 96-gon polygon, one inscribed and the other circumscribed to a one-unit diameter circumference, having started with hexagons and doubling the number of the polygons five times. There are evidences went even further, but because accumulated copying errors along the centuries the bounds in a surviving palimpsest are way off: 211875/67441 and 197888/62351. 211872/67441 and 195888/62353 are plausible reconstructed values and implied Archimedes might have gone up the 1536-gon.

The Archimedes' Method was the first analytical method for computing pi. It is far from being efficient, but it is simple and beautiful nonetheless. It offers only linear convergence, giving 0.6 decimal digits per iteration and requires the extraction of square roots. However, there are hidden relationships between the bounds that allows for two-, three- and four-fold speed-ups, perhaps even more.

In another post, I have presented some programs and a couple of formulas that give 1.8 digits per iteration. I've found a relationship between them and had WolframAlpha solve the equation (just submit "solve (p-(27*(a^2*b)^(1/3)-4*(2*a+b))/15)/((9*a*c/(4*a-c)-7/3*(a-4*c))/10-p)==128/19 for p" to W|A). The result can be simplified to:

```
  pi ~ (513*(a^2*b)^(1/3) - 24*a*(288*a/(c - 4*a) + 97) - 76*b + 1792*c)/2205

where
  a = lower bound
  b = upper bound
  c = next lower bound
```

This gives 2.4 digits per iteration.

For checking purpose only, we can use trigonometry and evaluate the following:

```
n:=14
a:=3*2^n*sin(pi/(3*2^n))
b:=3*2^n*tan(pi/(3*2^n));
c:=3*2^(n+1)*sin(pi/(3*2^(n+1)))
p:=(513*(a^2*b)^(1/3)-24*a*(288*a/(c-4*a)+97)-76*b+1792*c)/2205
```

On W|A the input line "compute {n=14, p=(513*(a^2*b)^(1/3)-24*a*(288*a/(c-4*a)+97)-76*b+1792*c)/2205, a=3*2^n*sin(pi/(3*2^n)), b=3*2^n*tan(pi/(3*2^n)), c=3*2^(n+1)*sin(pi/(3*2^(n+1)))} to 42 places" will return:

```
a ~  3.14159265145076765170425364049221902044 8
b ~  3.14159265786784441984400852933675983498 5
c ~  3.14159265305503684169112318041547420225 7
n ~ 14.00000000000000000000000000000000000000
p ~  3.14159265358979323846264338327950288406              (our underlining emphasizes the matching digits)
```

Notice that the perimeters of the inscribed and circumscribed 49152-gons (3*2^14) and the perimeter of the inscribed 98304-gon give only 9 digits of accuracy and yet the relatively simple expression involving them, evaluated only in the last iteration, gives out pi to 36 significant digits.

As a comparison, in early 17th century Ludolph Van Ceulen used a polygon with 2^62 sides to achieve the same accuracy. If he had investigated how the bounds related to each others, for only the first few iterations, he might have discovered at least the simple weighted mean, which would have allowed him to find the first 50 digits. The lack of mechanical calculators, however, did not encourage numerical investigations.

The Excel sheet excerpt below may require some editing for clarity, but it gives an idea how the limits can be found numerically:

```
        A       B       C                       D                       E                       F                       G
H                       I                       J
 1                      (lower bound)           (upper bound)
 2      n       3*2^n   (3*2^n*sin(pi/(3*2^n))  (3*2^n*tan(pi/(3*2^n))  (pi - an)/(pi  - an+1)  (pi/an - 1)/(pi/an+1 - 1)
(4*an+1 - an)/3 (3*an*an+1)/(4*an - an+1)       (H-pi)/(pi-G)   (7*G + 3*H)/10
 3                      (a)                     (b)
 4      0       3       2,59807621135332        5,19615242270663        3,83859210528741        4,43242437059372

Happy Pi Day to you too!

Excellent article. Thanks.

BTW, for those that may have missed my "official" Pi Day post here it is again: Pi Day Rematch: Apple II vs. HP-41C and a follow-up: Post Pi Day Post.

*Message #3 Posted by **Gerson W. Barbosa** on 22 July 2011, 3:43 p.m.,*
in response to message #2 by Egan Ford

Thank you, Egan!

Notice that the post time is 3:14 pm and the edit time 3:18, the digits of 1/pi since today is 7/22 also. Well, the latter was not intentional but the explanation fits nicely :-)

I certainly didn't miss your really excellent Pi Day post. I have yet to run Robert Bishop's Apple PI on the emulator. By the way, my first computer was a somewhat limited Apple II clone. When I was studying Calculus I wrote a graph plotting program for it:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv019.cgi?read=146977

Too bad the picture is missing. It was a nice heart!

Regards,

Gerson.

For your enjoyment: This

```
6666,-2%{2+.2/@*\/10.3??2*+}*
```

generates the first 1000 digits of Pi in GolfScript, a stack-based language. Taken from GolfScript Examples.

*Message #8 Posted by **Gerson W. Barbosa** on 24 July 2011, 11:03 p.m.,*
in response to message #1 by Gerson W. Barbosa

This approach can be carried out one step further when we eventually obtain a formula that yields 3 digits per iteration:

```
pi ~ (640*c*(28*c-139*a)/(c-4*a)+4*b*(3737+14256*b/(d-4*b))+1056*d-2568*a-6453*(a^2*b)^(1/3))/11655

where

  a: lower bound
  b: upper bound
  c: next lower bound
  d: next upper bound
```

This is a five-fold improvement over the original method. At least two iterations have to be executed since the approximation formula requires two successive sets of bounds. Here are the results obtained from the first four iterations, starting with hexagons and dodecagons:

```
  6-12    3.141592925577355371
 12-24    3.141592653812338501
 24-48    3.141592653590001584
 48-96    3.141592653589793440
    pi    3.141592653589793238
```

The digits per iteration ratio approaches asymptotically 3 as the number of iterations increases. It is a bit greater initially, as we can see. Notice that the 48-gon suffices for the approximation to pi displayed in 12-digit calculators.

*Message #9 Posted by **Gerson W. Barbosa** on 29 July 2011, 8:00 p.m.,*
in response to message #8 by Gerson W. Barbosa

My HP-50g has boldly computed the first 1000 decimal places of pi using this algorithm (up to the 6*2^333-gon, 10.5 times more sides than a *googolgon*!) in "only" 2h 59m 11s, thanks to the use of the formula above. Otherwise, it would have taken about fifteen hours to go up to the required 6*2^1667-gon. It is a good calculator, I won't ask it to "compute to the last digit of pi" :-)

As a comparison, the second program (Brent-Salamin algorithm) does it in only four minutes. Both programs require the LongFloat library for the HP-49G/50g by Gjermund Skailand and Thomas Rast.

Did HP or any 3rd party make a 64K card for the 48 series?

*Message #1 Posted by **mr-scorpio** on 22 July 2011, 12:41 p.m.*

Hi there, As the Subject enquires, did HP or any 3rd party make a 64K card for the 48 series? It seems common opinion is that the 32K cards are too small, thus next to useless? (Is 32K useful still though?)

Then there seems to be a leap in size from 32 to 128K .. which are like gold dust & extremely expensive for what they are. I've actually seen a 256K card for only $10 more than a 128K ..

Thus as a middle ground?, did anyone make a 64K card?

Cheers

Edited: 22 July 2011, 12:41 p.m.

Re: Did HP or any 3rd party make a 64K card for the 48 series?

*Message #2 Posted by **Alejandro Paz (Germany)** on 22 July 2011, 12:45 p.m.,*
in response to message #1 by mr-scorpio

The thing is that 32kx8 SRAM and 128kx8 SRAM are common, while 64kx8 were less common...

Re: Did HP or any 3rd party make a 64K card for the 48 series?

*Message #3 Posted by **Martin Pinckney** on 22 July 2011, 11:50 p.m.,*
in response to message #1 by mr-scorpio

I do remember seeing a reference to a 64k card once, but that's about it.

As far as utility of the 32k ones, probably as program storage rather than simply dding to memory, but it all depends on personal usage.

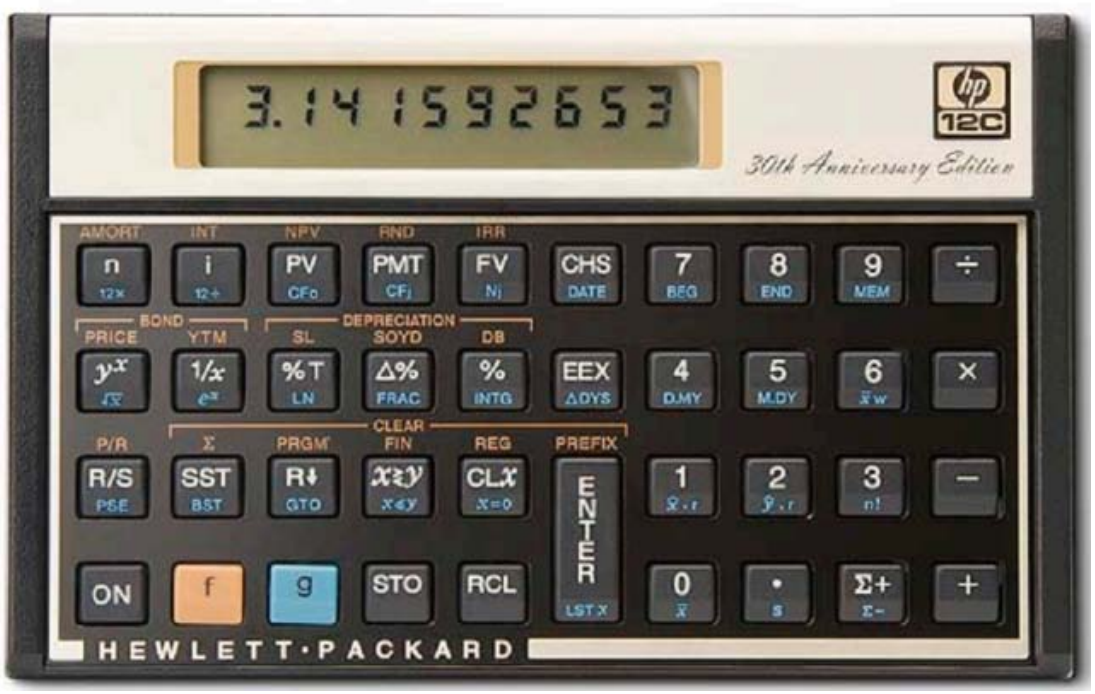
12c 30th Anniversary Spec Sheet

*Message #1 Posted by **NateB** on 21 July 2011, 8:43 p.m.*

I ran across the Spec Sheet for the 12c 30th Anniversary Edition today.



Re: 12c 30th Anniversary Spec Sheet

*Message #2 Posted by **Alexander Oestert** on 22 July 2011, 2:04 a.m.,*
in response to message #1 by NateB

Hey, it's a pure RPN machine!

And this picture at least explains the keyed in PI on the '15C Limited Edition', probably done by the same photographer...

Is this the 12c+ or yet another incarnation?

John

Re: 12c 30th Anniversary Spec Sheet

*Message #5 Posted by **Katie Wasserman** on 22 July 2011, 8:18 a.m.,*
in response to message #4 by John B. Smitherman

It looks to me like just the 12C+ with some writing on it. The 25th Anniversary Edition of the 12CP used the same font, BTW. I think that these anniversary releases are a great way to sell extra machines to those of us that feel we need to collect every edition.

HP has a history of releasing anniversary editions, where just a label is added, of some calculators, the 14B, 32s, and 28s come to mind. Are there others?

HP wants to hear your 12c stories...

*Message #1 Posted by **Gene Wright** on 21 July 2011, 4:58 p.m.*

Thought I would forward this along.

Please do not email your stories to me! :-)

Gene

==========

“Hi all,

Our PR team will be putting together a sizzle reel of complimentary quotes and stories about the 12c. Ideally, they’d like to include a combination of everyday people and business VIP’s. Would you be interested in sending an e-mail out to the calculator User Group to let them know that I am looking for people with interesting stories, complimentary quotes, etc. about the 12c that they would like to share with us to include in our broadcast media pitch?

Thanks!

If you are an HP-12C user and you are interested in participating send your email to:

CalcEnthusiasts@hp.com

Re: HP wants to hear your 12c stories...

*Message #2 Posted by **Martin Pinckney** on 21 July 2011, 5:27 p.m.,*
in response to message #1 by Gene Wright

They want enthusiasm? Tell 'em to solicit comments about 15c, 27s or 42s.

What's a 12c?

Re: HP wants to hear your 12c stories...

*Message #3 Posted by **Dan W** on 21 July 2011, 5:44 p.m.,*
in response to message #2 by Martin Pinckney

I agree. I have a great 42S story I'd be happy to share.

Why is it that HP focuses so much on financial calculators?

Re: HP wants to hear your 12c stories...

*Message #4 Posted by **Laura (San Diego)** on 22 July 2011, 7:43 p.m.,*
in response to message #2 by Martin Pinckney

HP Can do that too. just send your thoughts/stories about the 15c to calcenthusiasts@hp.com

Re: HP wants to hear your 12c stories...

*Message #5 Posted by **Alexander Oestert** on 21 July 2011, 5:30 p.m.,*
in response to message #1 by Gene Wright

Dear HP,

I'm willing to share lots of complimentary stories about my new 'HP 15c Limited Edition' as soon as you will sell it to me. Send some and I will send a nice story by email for each!

Take care, A.O.

I love my 12C. Every night I place it under my pillow and hope that it turns into a 15C.

All joking aside, I'm excited to see the 30th Anniversary Edition. The fact that the 12C has been in production for so long truly is amazing. (It also gives me hope that we'll see a Limted Edition 15C, although I'm worried about just *how* limited it will be...)

My 12c story: When my younger brother graduated with a business/accounting degree about five years ago, I got him a 12c for a graduation present. At the time, I only owned a 48G and didn't know the difference between the RPL and XYZT RPN machines. I tried to teach him how to use RPN but I didn't do a very good job of it because the stack didn't respond the way I was used to. I don't think he was particularly enthused about it. I've never seen him use it, he's never mentioned it, and I've never seen it again.

Probably not what HP wants for its "broadcast media pitch".

I think a 17bII+ is ideal for accountants. you can store all the typical accounting equations in the Solve menu. When I took accounting, I put ROE, ROA, RNOA, etc. in my calculator so I didn't have to remember the formulas.

Should I tell the one where a 12C in my pocketbook took a bullet for me on the mean streets of New York? Nah, that's too boring...

How about this thrilling one that happened just yesterday....

I was having a discussion about the 12c with one of my clients. This was prompted by his annual forgetting of how to swap the radix and thousands separator symbols that accidentally happens from time-to-time when you use a 12C every day, all day. [We get this same question on the forum at least once a month, why doens't HP put this on the back-plate of the calculator.] He's been using a 12C for 25 years at work and at home, he loves it!

He then went on to tell me that when he was shopping for home mortgages with a broker he was able to stay several seconds ahead of the broker as far as affordability calculations were concerned. He was keying in the numbers on his 12C while the broker was using a desktop PC and waiting for a response. The broker had no idea how anyone could come up with results before the computer did. And this was with an original 12C, with a 12C+ (he doens't have one yet) he'd be several seconds faster still.

-Katie

I bought a 25 in 1975, never owned a financial calc until I received a 20B at HHC2010 almost 35 years later. Finally bought a 12CPlatinum at a pawn shop yesterday.

WP34 again

*Message #1 Posted by **Paul Dale** on 21 July 2011, 3:28 a.m.*

We ran out of op-codes for commands with arguments. It turns out that 128 of these wasn't enough even though I thought it was overkill when I laid the op-codes out. Thus, I've been forced to renumber them.

This means there is no binary compatibility between older versions and the current (subversion 1268). Sorry about that, I don't like changing the op-codes.

The assembler/disassembler will handle the jump once it gets updated.

On a positive note, I've managed to squeeze a few more kilobytes out of the firmware and it seems likely that most of this will go into additional user program pages :-)

- Pauli

Re: WP34 again

*Message #2 Posted by **Cristian Arezzini** on 21 July 2011, 4:42 a.m.,*
in response to message #1 by Paul Dale

Luckily we have the assembler now so these opcode changes aren't much of a problem! :)

I have a somewhat "unrelated" question, but your menition of freed memory reminded me: some time ago I remember you asked about what constants we would like to be added. I suggested planetary masses (at least earth, moon and sun) and if possible a few other astronomical values, useful for orbit calculations. Is there any news on these constants? Were they "rejected" or is it still being thought?

Thanks, Cristian

Re: WP34 again

*Message #3 Posted by **Paul Dale** on 21 July 2011, 4:47 a.m.,*
in response to message #2 by Cristian Arezzini

Those constants can still be considered.

Give us a list of what you want and we'll likely include them. Constant names are limited to four characters. Please include values :-)

- Pauli

Edited: 21 July 2011, 4:49 a.m.

Re: WP34 again

*Message #4 Posted by **Cristian Arezzini** on 21 July 2011, 9:22 a.m.,*

in response to message #3 by Paul Dale

These are the constants I've been using more frequently, and their values:

Sun mass: 1.98892±0.00025 x 10E30 Kg Symbol: M with a subscript symbol made of a dot inside a circle. As this symbol isn't available, maybe M and subscript S would be OK.

Earth mass: 5.972245 ± 0.000082 x 10E24 kg Symbol: M with a subscript + in a circle. As above, maybe M and subscript E?

Moon mass: 7.3477 × 10E22 kg Symbol: M with subscript L

Earth mean radius: 6371.0 km Symbol: R with the same symbol as above (again, R and subscript E?)

Moon mean radius: 1737.10 km Symbol: R and subscript M

Then, the orbital semi-major axis for the moon is 384,399 km and for the Earth is 149,598,261 km but I don't know the symbols for these... :(Maybe M and E with subscript (sma)? :)

Cristian

Re: WP34 again

*Message #5 Posted by **fhub** on 21 July 2011, 11:44 a.m.,*
in response to message #4 by Cristian Arezzini

I would rather suggest 'm' for mass, 'r' for radius and 'd' for distance (which is more standard-like), and then subscripts 'S', 'M' and 'E' for sun, moon and earth.

So maybe this way:
m_E, m_M, m_S for mass
r_E, r_M, r_S for radius
d_EM, d_ES for distance (or r_EM and r_ES if you prefer)

But I must agree: having these constants is indeed a godd idea. :-)

BTW, aren't your semi-MAJOR axis values in fact MEAN values for these distances???

Franz

OK, I just said M and R because that's what I usually find in books and websites, I thought it was a "special case" symbol. Everything is OK though, as long as they're included! :)

> Quote:

> BTW, aren't your semi-MAJOR axis values in fact MEAN values for these distances???

I'm not sure I understand what you mean. As far as I know, the semi-major axis of an ellipse is the mean between the smallest and biggest distance from a focus and the ellipse... so yes, it's a sort of "average distance", during the orbit, between the central body (which sits in a focus) and the orbiting body (which is closest at one end of the major axis, and farthest at the other end of the same major axis)...

Cristian

Ok, it seems to be just a language problem. ;-)

I thought 'major' axis would be the bigger (and 'minor' the smaller) axis of the ellipse, but maybe this naming is different in English. But however we call them, your values are the usual constants used in astronomical calculations.

Well, nice to see here an other astronomy fan (like me)! :-)
My special interest are solar and lunar eclipses, and I've written a quite powerful program for eclipses - its name is 'WinSomofi' and I have worked on it for MANY years (because I've in fact done ALL calculations myself). Unfortunately the webserver of my homepage is currently unavailable again (as so often), but if you would like to try my program(s) you can check the following link in the next days (when the server is working again):
http://fhub.110mb.com/

[Edit] I just saw that my program is also available from another astronomy site:
http://www.pixelsetphotons.com/index.php?/Logiciels/Ephemerides/winsomofi.html
The download link is under the picture after 'Telechargez'!

> Quote:

> I thought 'major' axis would be the bigger (and 'minor' the smaller) axis of the ellipse,

Well, it actually is so... The semi-major axis is half of the "bigger diameter" of the ellipse. The fact is that the center body does not sit on the center of the ellipse, but on a focus; which means that the two extremes of the major axis are the periapsis and apoapsis. Thus, half of the "major diameter" is a value between the smallest and the biggest distance between the two bodies. Or at least this is how I understood it! ;)

> Quote:
>
> Well, nice to see here an other astronomy fan (like me)!

I've been an astronomy fan for years, but I've sort of "decreased" my active observations... I used to have a telescope, but I don't have enough room in my new house, so I only have a binocular now.

Now I'm actively interested in space exploration, both manned and unmanned, and I observe passing satellites. Sometimes I calculate their orbits, that's why I use the constants! :)

> Quote:
>

And it has a few nice features, but since it was just a private project for me I didn't make a good description.
There's only a short textfile (IIRC it's info.txt) describing the functions which can be accessed with different mouseclicks - it's definitely worth to look at this textfile and try out these features (especially a right mouseclick at the world map gives a globe view which can even be rotated. :-))

Ok, now I stop being off-topic any longer ... ;-) Franz

Re: WP34 again

*Message #10 Posted by **Walter B** on 21 July 2011, 3:41 p.m.,*
in response to message #6 by Cristian Arezzini

M and R or m and r or whatever you choose else are no problem at all. Subscripts, however, are limited. Please turn to page 65 of the latest edition of the manual (build 1265) to see what is featured.

Background: Though we thought 256 characters in two fonts being next to overkill for the small dot matrix provided, we've filled every little byte so far.

Walter

Well, these constants don't necessarily have to be named with subscripts - an underscore like m_E for example would also be ok (or any other good separation character).

Franz

How much is enough? Just that little bit more... ;-)

Re: WP34 again

*Message #13 Posted by **Cristian Arezzini** on 21 July 2011, 5:23 p.m.,*
in response to message #10 by Walter B

Seeing that the subscripts are limited - and that m(e) is already taken for electron mass - we can just leave the underscores as typed on the message above... Unless someone finds a more intuitive (or easier to remember) way! :)

Re: WP34 again

*Message #14 Posted by **Paul Dale** on 21 July 2011, 6:23 p.m.,*
in response to message #4 by Cristian Arezzini

Will see what we can get in and what names they'll end up with.

We've got the WGS84 diameter of the Earth constants already. They aren't quite the mean radius figure you provided, rather they are the major and minor diameters of the planet.

- Pauli

Re: WP34 again

*Message #15 Posted by **fhub** on 21 July 2011, 6:44 p.m.,*

> Quote:
>
> We've got the WGS84 diameter of the Earth constants already. They aren't quite the mean radius figure you provided, rather they are the major and minor diameters of the planet.

And rather they usually aren't used at all. In almost all calculations the 'average' value is used, which is defined as (2*major+minor)/3.

Re: WP34 again

*Message #16 Posted by **Paul Dale** on 21 July 2011, 7:01 p.m.,*
in response to message #15 by fhub

I use the WGS constants continuously in my day job, so "usually aren't used at all" certainly isn't correct. In fact I'd hazard a guess that "almost all calculations" done worldwide use the WGS constants -- how many GPS receivers are there in the world? They don't use the average.

In astronomy, things might be different of course. I'm not an astronomer.

Anyway, I said we'd try.

- Pauli

Re: WP34 again

*Message #17 Posted by **Paul Dale** on 22 July 2011, 7:14 a.m.,*
in response to message #4 by Cristian Arezzini

Cristian, do you have any references for the values you gave?

I'm finding that the numbers aren't quite matching data I find on NASA's web sites. e.g. the mass of the Earth is given as 5.97219e24 +/- 0.00060e24 (source). Likewise, the masses are out a little compared to values given in NASA's Horizons database.

I'd really like any values we include to be the best currently known.

- Pauli

Re: WP34 again

*Message #18 Posted by **Dave Shaffer (Arizona)** on 22 July 2011, 11:31 p.m.,*
in response to message #17 by Paul Dale

> Quote:
>
> best currently known.

This may well change from day to day!

You should probably adopt values from some currently recognized authority.

As an astronomer, I would push whatever the IAU (International Astronomical Union) gives as their current standard. There may well be values from the US NIST, or ISO (International Standards Organization), too.

It is generally better to use an "official" value of some sort, with proper reference - which can be corrected later, if necessary. For really precise work, it is better to know what you have done, so it can be properly undone later! You say something like "I used WGS84 values." Then everybody knows what you did.

For not so precise work, it doesn't matter very much.

Re: WP34 again

*Message #19 Posted by **Paul Dale** on 23 July 2011, 12:32 a.m.,*
in response to message #18 by Dave Shaffer (Arizona)

This is exactly what I've been trying to do.

We pulled most of the constants and conversions from NIST and I've just gone through and updated to the latest list (2010). The WGS84 constants came from that standard. However, I'm having trouble locating a canonical source for the astronomical constants that have been added. NASA or IAU seem like the obvious choices and I'd prefer to use the latter but the IAU web site isn't very forthcoming unlike NASA's.

Do you have a link to the IAU's definitions of these? Or better yet, send me a file with them :-)

- Pauli

Edited: 23 July 2011, 7:41 p.m. after one or more responses were posted

Here's a link to the IAU 2009 system of constants:

http://maia.usno.navy.mil/NSFA/IAU2009_consts.html

Note that in any such system, there are generally NO masses given for planets, etc. The value that counts for calculating things like orbits is the product of the object's mass

times the gravitational constant (capital "G") - or GM. This is because we don't really know what the mass of anything large (like the Earth) is! You get it by doing something like determining the period of an orbit, and then plugging in a value of G. G is VERY HARD to measure! You measure the actual gravitational attraction between masses, which isn't very big.

On the other hand, though, you get the product GM from the orbit period directly, which you can measure to much higher accuracy. In the IAU table, "G" is given to 6 digits, whereas GM(E) has 10 digits

Hence, serious orbit or geodetic or other scientific calculations use the product GM.

On the IAU page, you will see lots of mass ratios - gotten from orbit periods.

So, putting in an Earth mass (or for other objects), while convenient, perhaps, isn't quite right for maximum accuracy.

Masses of a celestial objects

*Message #21 Posted by **Marcus von Cube, Germany** on 23 July 2011, 3:44 p.m.,*
in response to message #20 by Dave Shaffer (Arizona)

> Quote:
>
> So, putting in an Earth mass (or for other objects), while convenient, perhaps, isn't quite right for maximum accuracy.

I'm just doing some reading about this and I agree that GM is generally the "better" value. What we can do is provide the constants for G and M with the best known accuracy and they should match. Providing the GM values might be useful, too. Since GM is given to many more digits then G, multiplying the values of G and M for a given object will result in a less accurate result for GM. Getting at the mass by dividing GM by G would lead to an artificial accuracy for the mass which we should avoid.

Isn't if funny that it's even possible to determine the mass of the sun? :-)

Re: WP34 again

*Message #22 Posted by **Paul Dale** on 23 July 2011, 7:40 p.m.,*
in response to message #20 by Dave Shaffer (Arizona)

Dave, thanks for the reference. I'll see what I can pull in. I've been grabbing data and updating our values using Nasa's Horizon database. I assume this is reputable as well :-)

Interesting that the IAU document you referenced provides three different values for GM of Earth :-(At least one of the three matches the WGD84 value I included which is the first bit of sanity I've found.

Well, there's a ig difference between 'talking' about any values (or writing them in a table (**with km added**) or using these values in a calculation! If the value recalled from the WP34S is in km, then it's definitely useless for any calculations, just because you get wrong results, point!

But do whatever you want ...

Edited: 24 July 2011, 5:27 p.m.

Franz,

I'm with you in this matter. Whatever put into our CONST catalogue, shall be in SI whenever possible.

Walter

Re: WP34 again

*Message #27 Posted by **Cristian Arezzini** on 25 July 2011, 1:50 a.m.,*
in response to message #26 by Walter B

I posted them in km because that's the unit I usually use; and that's OK with the 50g because there, units are attached to the number, and the calc takes care of the appropriate conversions. But I agree that on the 34s, which doesn't attach units to values, SI units should be used instead - just for consistency if nothing else.

By the way, I really appreciate the sun and earth symbols! Thanks! :)

Hi Pauli, Sorry for the delay in replying, I somehow missed your message. As for Earth mass determination, that value was found by Gundlach & Merkowitz in 2000, and was supposed to be the most accurate measurement, but I can't of course prove this statement; as for the other values, I used to use what I had on my university's physics books, but then I found new, and I thought more accurate, data online, and I have used those since; but I can't vouch for their accuracy in any way. If you found them in a more official page like NASA, by all means use those - I suspect a small difference in the value won't change my results by much anyway! :)

Cristian

in response to message #30 by Paul Dale

Paul;
That's about twice the memory of a CV. Maybe a lot more than twice considering how well your baby uses it's space. The only bad thing in all of this is that the bean counters at hp are going to think that all the sales of the 30b are going to business types, so maybe they need to come out with yet another business calculator instead of a scientific programmable with alpha. -That's ok. We have the 34S.

Eric;
I'm going to assume that the best guess on how many users of the 34 there are is how many faceplates you have shipped. I realize that this is a labor of love for you that entailed a large hardware investment and i hope no one here will start spouting that you make money on this. But anyway; could you tell us how many of us there are?

Gene:
Get with it man. Sleep when you're dead.

> I'm going to assume that the best guess on how many users of the 34 there are is how many faceplates [that] have shipped.

Another indicator is the download statistics at Sourceforge. Looking at June, there were 540

downloads. There was a spike of 92 downloads on 6/9 corresponding to the 2.0 beta release. Through June, there were about 20 downloads/day after that. In July, it's been about 10-15 per day and a total MTD of 198.

I haven't been able to figure out if that is only counting the main wp34s.zip or any downloads of any files from the wp34s sourceforge repository, including the SVN.

If it's just the wp34s.zip file, that would put the user population around 500 since 2.0 beta was released. If it includes SVN downloads, it probably points to about 100 - 200 users, with a few dozen that are frequently downloading new SVN builds.

It is a lot more than twice. The CV has about 2k bytes in total. We've about 4k steps plus registers. For any command that takes an argument, the CV needs 2 bytes. Whereas, the 34S only needs one step. For many of the extended commands we've got the 41cv would need to use XROM. With recall arithmetic & some other instructions, I'm finding that a lot more of the commands that I end up using have an argument.

I doubt we're even enough sales to be considered an insignificant market segment :-(

So done! Assembler now at SVN 1274 op-codes.

6 flash pages! Wow! I am going to get lost...

Re: WP34 again

*Message #38 Posted by **Paul Dale** on 21 July 2011, 6:46 a.m.,*
in response to message #37 by Neil Hamilton (Ottawa)

Actually seven pages of code, the backup region is quite usable for user programs.

I suspect we've actually surpassed the 42S in terms of programability :-) Less steps, but the 34S's are fully merged and often more powerful. Still lacking matrix operations though.

Will this allow Bessel functions to be included? (Real & Complex plz.)

Re: WP34 again

*Message #40 Posted by **Paul Dale** on 21 July 2011, 7:25 a.m.,*
in response to message #39 by Ángel Martin

I never got the complex Bessel functions working :-(Ignoring this for a moment....

Real Bessel functions are 1.7kb. Complex are going to be double that at a guess but assume there is some efficiency and they "only" take 5kb for both real and complex. We would have to reduce user flash to four pages plus the back up region to fit this in assuming we take out all the other optional things. Keeping the currently included optional functions, would reduce the user flash pages to two plus the backup.

So no, no native Bessel functions.

Enough doom and gloom. I am reasonably confident that a user program for the Bessel functions would fit into a page or two of flash which seems like a far better use of the space. User programs are short compared with native versions.

Re: WP34 again Ver 1300?

*Message #45 Posted by **Norman Dziedzic** on 24 July 2011, 3:34 p.m.,*
in response to message #1 by Paul Dale

I haven't flashed my 30b hardware in a while. I know that there have been a lot of changes.

I tried to follow the original instructions for flashing the calculator and now I'm stuck with the display saying "Erased" and a 0 in the number field. No key press does anything.

Am I missing something?

Edited: 24 July 2011, 10:27 p.m. after one or more responses were posted

Re: WP34 again Ver 3000?

*Message #46 Posted by **Norman Dziedzic** on 24 July 2011, 3:36 p.m.,*
in response to message #45 by Norman Dziedzic

After pressing reset on the back, the display says Restored and then the next keypress makes all segments come on black and I cannot adjust the contrast to see if any keypress makes a difference.

Re: WP34 again Ver 3000?

*Message #47 Posted by **Marcus von Cube, Germany** on 24 July 2011, 3:39 p.m.,*
in response to message #45 by Norman Dziedzic

Norman, probably a broken build. Try a reset. If that doesn't help, get a slightly older image until you find one that works.

Edit: The build works in principle, see next post.

It's not a broken build. I've just flashed the latest revision on my 20b and it runs. The many changes render any info which might have been stored in flash memory with an older version useless. You should use the "Erase" button on the cable to get into SAM-BA mode, just to make sure there is no residual data in flash memory.

Another hint: Check the voltage of your batteries and report the value back here, please.

Edited: 24 July 2011, 4:37 p.m.

Re: WP34 again Ver 3000?

*Message #49 Posted by **JustinM** on 24 July 2011, 4:53 p.m.,*
in response to message #48 by Marcus von Cube, Germany

Marcus, I just tried flashing from 1196 to revision 1300 and got similar results that Norman did. Something different I noticed this time was that the 'Lock region' dialog said (0 to 14) instead of the usual (0 to 15). After flashing, I got 'Erased', but the minus sign on the far left of the display was lit. If I pushed a shift key, the letter ('g' or 'h') would appear in the upper display, but repeating that shift key wouldn't clear it. The second key press would lock up the unit.

I tried reflashing and ended up locking up SAM-BA. I had to kill the process and start all over. I reflashed back to 1196 (last rev I had downloaded, and I knew it worked), and it's working again. BATT shows 2.8V.

Re: WP34 again Ver 3000?

*Message #50 Posted by **JustinM** on 24 July 2011, 5:17 p.m.,*
in response to message #48 by Marcus von Cube, Germany

Just tried to update from 1196 to 1288. I did the usual cable button sequence, and tried to send the 1288 calc.bin file. SAM-BA locked up again, the process started using 50% CPU, and nothing appeared to be sent in the log window. The pop-up that says "Please Wait" just turned into a white rectangle. I had to kill SAM-BA again.

This time, I went through the cable button presses, restarted SAM-BA and reconnected. I then executed the "Erase All Flash" script and resent the 1288 file. It sent normally this time, but still asked to lock region (0 to 14). I entered 'No' as usual.

I'm now getting some pretty weird behavior with 1288. The dot matrix display is randomly missing pixels, mostly in the second row from the top. I tried to recheck BATT but it displays -0o0'0.00" (0.00 in HMS) rather than outputting the voltage.

If I enter numbers onto the stack, they just disappear. Using Rv or R^ doesn't show anything on the stack. I'll keep working backwards and let you know what I see.

Re: WP34 again Ver 3000?

*Message #51 Posted by **Marcus von Cube, Germany** on 25 July 2011, 4:08 a.m.,*
in response to message #50 by JustinM

Can you try with fresh batteries, please? A SAM-BA lockup cannot be attributed to the file you're just downloading, it must be something different.

I changed (increased) the number of possible user flash regions. This explains why the file is shorter and the lock dialog differs.

Re: WP34 again Ver 3000?

*Message #52 Posted by **Paul Dale** on 24 July 2011, 5:09 p.m.,*
in response to message #45 by Norman Dziedzic

I suspect there is something broken in the build. My 20b took the image perfectly, my 30b is behaving as you describe -- I figured I busted the flash due to low batteries during programming but it seems too much of a coincidence for several unit to be failing the same way -- then again I said that about the old batteries last week.

Re: WP34 again Ver 3000?

*Message #53 Posted by **JustinM** on 24 July 2011, 5:51 p.m.,*
in response to message #52 by Paul Dale

I didn't mention it, but I've got a 30b also. I just tried 1286 and I'm still getting the corrupted dot matrix display. The keyboard is really sluggish and dropping keystrokes. Attempting to multiply two 6-7 digit numbers locked up the unit.

I dropped back to 1233 to a rev that looked like it was before the serial and speed changes were done. Looks like normal operation - no display corruption or keyboard issues. Let me know if you need more testing on the more recent builds to find where the regression happened. I'll try 1262 next - that looks like where Marcus released the serial I/O but before the opcode and speed changes.

Re: WP34 again Ver 3000?

*Message #54 Posted by **Paul Dale** on 24 July 2011, 5:55 p.m.,*
in response to message #53 by JustinM

I guess trying 1262 would be worthwhile to isolate the changes.

Marcus is going to have to be the one to fix this -- I've no hardware debug setup -- and he is busy at the moment.

Interesting that the 20b hardware doesn't have the problem. There must be more differences that we know about.

- Pauli

Re: WP34 again Ver 3000?

*Message #55 Posted by **JustinM** on 24 July 2011, 6:28 p.m.,*
in response to message #54 by Paul Dale

Instead of working up from 1233 I thought it would be more helpful to work backwards from 1286. I continued having the corrupted dot matrix, dropped keystrokes, and lock-ups when doing multiplication with 1283 and 1280. Reverting to 1273 cleared up all of those issues and restored normal operation. It looks like the regression occurred with 1280.

*Message #58 Posted by **Marcus von Cube, Germany** on 25 July 2011, 4:13 a.m.,*
in response to message #57 by JustinM

I'll look into this. There were some updates to the speed changing code which I later reverted manually. I may have broken something in the process.

BTW, I can only debug the 20b, my 30b doesn't have the JTAG connector modification. Debugging the power saving code is next to impossible on either unit.

Re: WP34 again Ver 3000?

*Message #59 Posted by **Paul Dale** on 25 July 2011, 4:20 a.m.,*
in response to message #58 by Marcus von Cube, Germany

I can confirm the problem on the 30b with new batteries (checked with a multimeter at 3.2V roughly). I also confirmed that the image was written correctly using the compare file option in sam-ba.

- Pauli

WP 34S 2.1 1306 is online

*Message #60 Posted by **Marcus von Cube, Germany** on 25 July 2011, 6:30 a.m.,*
in response to message #59 by Paul Dale

Hi folks!

Thanks for pointing me to the 30b hardware problems. The power saving code was the culprit. I was violating the processor specs for core voltage and flash read wait states when running at full speed. The 20b did like it better than the 30b.

In the course of the action, we've updated the version number to 2.1. There is more user flash available now (program regions 0 to 8, 9 in total). As a trade off, some of the serial commands (SOPEN, SCLOSE, SEND1, RECV1, aSEND, aRECV) are gone as are the FACTOR and MULADD commands. The remaining headroom will most probably go into bug fixing and some constants and conversions.

As soon as the documentation is up to date and Neils assembler matches the release, we'll prepare a new release package.

I have an assembler revision to SVN 1305 opcodes (backspace, backspace, backspace)... but it is already out-of-date (likely before I even checked it in!).

Wow. Wait 15 minutes and things change! :-)

So... I have an assembler revision to SVN 1309 opcodes. (I think I'll get offline before its evolution creeps and/or jerks some more :-)

IMPORTANT: See note, elsewhere, about correction to command line for building translation opcode tables for the assembler.

Cheers...

in response to message #66 by Marcus von Cube, Germany

What is the proper way to download the latest calc.bin file from SVN so that it will show the revision number? Should we use SVN from the command line? How is that different from downloading with the browser?

Re: WP 34S 2.1 1306 is online

*Message #69 Posted by **Marcus von Cube, Germany** on 25 July 2011, 12:23 p.m.,*
in response to message #68 by JustinM

> Quote:

> What is the proper way to download the latest calc.bin file from SVN so that it will show the revision number? Should we use SVN from the command line?

Not necessarily from the command line but a regular SVN client is the way to go. Tortoise SVN is a Windows client that links into Explorer. I'm using modules that extend the development environments Eclipse and Visual Studio besides a command line client. It depends on what I want to achieve.

> Quote:
>
> How is that different from downloading with the browser?

The revision number is inserted into the binary file during the download. The file stored in the repository (and accessed via the web browser) has a blank field in place of the number. The reason must be SVN internal.

One always can learn something new! :-)

Well, I won't really miss this MULADD then ...

OTOH this FACTOR command is (or better was) quite useful (I've tried it now on an older SVN build): it's very easy to get a full prime-factorization with it. So have we now to write a complete program for this task, or is there any other 34S command useful for this purpose?

Franz

*Message #76 Posted by **Paul Dale** on 25 July 2011, 8:42 a.m.,*
in response to message #75 by fhub

Think about complex operations for multiply adds.

Yes, factor will have to be written in user code. Including factor means one less page of program flash and I doubt the factor program will be that large. This lets people who don't want to factor numbers have other programs instead -- more versatile this way.

I also suspect you haven't found the thirty second plus execution times for factor :-)

- Pauli

Re: WP 34S 2.1 1306 is online

*Message #77 Posted by **Marcus von Cube, Germany** on 25 July 2011, 9:10 a.m.,*
in response to message #76 by Paul Dale

FACTOR would fit in the current build but the head room for bug fixes will diminish. If we get enough votes for either FACTOR or MULADD we may reconsider.

The user mode serial commands need 700 bytes (I've just rechecked it) which would cost us a program region. Pauli loves program regions but we might not all agree to the extent of space reserved for this. We've more than 4500 steps in flash alone at the moment. Maybe 4000 is still enough.

Another thought came up recently: We may add a special KEY label command which acts similar to the labels A to D which are bound to the hot keys. We're thinking of having a key combo starting with the right arrow and some other key to directly start a subroutine in RAM or flash. Not all keys will be available to this because they are already defined but many will do. We are coming closer to the 41C with this approach.

Since this 'voting' is already in a very deeply nested posting, it will stay at 2 I'm afraid. :-(

I'm currently writing such a 'FACTOR' code myself, and it's in fact not difficult

(or long) at all, but I guess the 'native' routine would definitely be faster.

*Message #83 Posted by **Paul Dale** on 25 July 2011, 5:48 p.m.,*
in response to message #82 by fhub

Almost at least. There are sign issues with this solution :-) Easily worked around of course.

The presence of a full precision complex multiply mostly removes the need for a separate multiply add instruction. This is the main reason I don't mind losing this one. Real multiply add takes an extra instruction or three and the integer version is just multiply then add. If we didn't have complex multiply, the multiply add instruction would be a must have.

As for factor, I'd like to see a user code

implementation before the decision to include this again is finalised. There are better algorithms than the one used in the firmware which will likely be faster for large numbers.

Multiply add and factor use 584 bytes for both. We've got about 600 bytes of head room for bug fixes. So putting them back in is possible so long as there aren't too many more bugs lurking.

Are you sure? I don't believe you ... ;-)

I guess this MULADD should return x*y+z, correct?

Well, my first entered 1 makes the 2 complex numbers y+z*i and 1+x*i, and their [CPX]* gives exactly this y*x+1*z = x*y+z as imaginary part (which is returned because of my last DROP). So I can't imagine what should be wrong with my code!?

> Quote:
>
> As for factor, I'd like to see a user code implementation before the decision to include this again is finalised.

Well, here's a quite simple (but a bit tricky) solution - optimized for length (only 19 steps) and not for speed (which is no problem with the PC-emulation):

```
ENTER
sqrt
IP
```

```
STO K
1
x<>y
DROP
2
x<y?
SKIP 01
DEC X
+
x>K?
SKIP 04
cpx ENTER
RMDR
x!=0?
BACK 11
DROP
```

Re: WP 34S 2.1 1306 is online

*Message #85 Posted by **Paul Dale** on 25 July 2011, 6:38 p.m.,*
in response to message #84 by fhub

Doh! Should have thought through the multiply better :-(Need caffeine :-)

Hugh uses a more complex & faster algorithm for the built in -- see the bottom of int.c -- I might have broken this when I reduced the small prime table in the "is prime" tester.

With a user code factor finder this small, I don't see much point including the built in.

Speed will be a problem on the emulator when you factor very large numbers. Reals store integers of sixteen digits or less exactly and integers can go well beyond that (2^64 - 1).

- Pauli

Re: WP 34S 2.1 1306 is online

> With a user code factor finder this small, I don't see much point including the built in.

Well, I haven't yet looked at your

FACTOR code but I'm sure it's much faster. I'm just trying for the factors 2 and then all odd integers (upto sqrt(x) maximum), so it will definitely be no good choice for very large integers. OTOH, for factoring such big numbers I'll certainly use my CAS instead of the WP34S ... ;-)

Re: WP 34S 2.1 1306 is online

*Message #87 Posted by **Paul Dale** on 25 July 2011, 10:23 p.m.,*
in response to message #84 by fhub

```
2
x<y?
SKIP 01
DEC X
+
```

Change be changed to:

```
2
x>=? Y
SIGN
+
```

to save a step.

Well, I think it can, I've not actually tried it.

WP 34S - Getting connected...
*Message #1 Posted by **Marcus von Cube, Germany** on 20 July 2011, 11:18 a.m.*

WP 34 Serial I/O

I've added some serial I/O stuff to the most recent WP 34S builds for Windows and the hardware. You will need the cable provided by HP or a modified 20b or 30b to make use of this. The original cable draws power from the batteries and should be disconnected while not in use.

Communication is between a 34S and another 34S. The Windows emulator counts as a valid partner so you can exchange data between your calculator and the PC. Since PCs tend to have more than one port it is necessary to tell the emulator which one to use. Create a file "wp34s.ini" in the directory where the state files reside and put the name of the port as the only line in this file. Mine says "COM9:" without the quotes. This is the very same port that SAM-BA uses to access the calculator for flashing.

Sending programs, registers or all RAM

The commands mentioned here are found in the X.FCN catalog.

The commands to send and receive have a fixed timeout of some 10 seconds for setting up the connection. After a period of inactivity "I/O Error" is shown which indicates that no communication has occurred. The timeout value is fixed and cannot be changed. If I/O Error appears in the middle of a transmission you should try again. The little "=" sign is lit while the serial port is in use. The ON/EXIT key can be used to abort a communication.

Start the command RECV on the receiving device. It will display "Wait...".

On the sender you have three choices:

SENDP will send the user program space. If all went well, the receiver will display "Program".

SENDR will send the registers 00 to 99. If all went well, the receiver will display "Register".

SENDA will send the complete 2 KB of non volatile memory. If all went well, the receiver will display "All RAM".

User program access to the serial port

We have removed this functionality for the time being.

The P.FCN catalog has commands to access the serial port to send and receive individual bytes or short strings.

SOPEN will open the port with either default parameters of 9600 baud, 8 bits, no parity and 1 stop bit, or with the settings taken from the alpha register. The default settings (empty alpha) look like this:

9600,8N1

The port used on the hardware does not support values <> 8 for the bits parameter. The number of stop bits is always set to 1. Parity may be E, O or N. The baud rate divisor is calculated from the baud rate value. Without a crystal this is not very accurate but I did not have problems with my development 20b here. You can omit parameters which have the default value. I/O Error is returned if the parameters are invalid or the port cannot be accessed (Windows).

SCLOSE disables the serial port.

The little "=" is on while the port is active. Power saving is very much disabled because the timing of the serial port depends on the clock speed. So its advisable to turn the port off with SCLOSE after the transfers are done.

SEND1 takes an integer value from X and sends the low order byte to the port.

RECV1 takes a timeout value in 0.1 second units from X and returns a byte received via the serial port. The value is -1 for timeout, -2 for transmission errors or -3 for manual abort with the ON/EXIT key.

[alpha]SEND sends the contents of the alpha register with a CR as the delimiter.

[alpha]RECV takes a timeout value from X just like RECV1 and reads data into the alpha register. A CR ands the transmission normally but timeouts or errors stop the transmission, too. You can only check the length of alpha after the transfer, no error code is returned. We may change this to return a code in X but this isn't implemented yet.

A command to send the X register might be useful as would be options to change the delimiter (CR) for string transfers.

How to ? hp41 + advantage

*Message #1 Posted by **Patrice** on 20 July 2011, 1:55 a.m.*

Hi all,

How to shift a binary value ?

How to shift 2000 of 8 bits ?

is it 2000 256 / INT

or is it a combination of bit clearing and rotate ?

Thanks Patrice

*Message #7 Posted by **Paul Dale** on 19 July 2011, 5:37 p.m.,*
in response to message #1 by gene wright

Two small factual errors in the 34S article.

There are 112 registers -- X, Y, Z, T, L, I, A, B, C, D, J, K plus the numbered ones.

There are 104 flags -- A, B, C, D in addition to the numbered ones. Of these A is linked to an annunicator and D allows dangerous returns but B and C are altered by operations in integer mode but are freely usable in real mode.

A lessor point, I started coding the design before approaching Walter for assistance with the layout. The article implies (to me at least) that the reverse occurred. I won't deny that the outward appearance is now mostly Walter's doing.

You are right :-) The story is even older: we both contributed to the doomed OpenRPN project some years earlier. And my records show I started playing with layouts in 2005 - pure vapourware at that time.

Walter

Introducing Emu71 for Windows

*Message #1 Posted by **Christoph Giesselink** on 19 July 2011, 12:27 p.m.*

I'm proud to announce a new emulator for the HP-71B calculator "Emu71 for Windows" (Emu71/Win) on my web page at http://hp.giesselink.com. The emulation core is independent from Jean-Francois Garnier's Emu71 (Emu71/DOS), the HPIL IO-processor simulation is a ported version base on the IO-processor simulation of Emu71/DOS. A big thank to Jean-Francois allowing me to use his source code.

Emu71/Win base on the sources of Emu28 and so on the source code base introduced with Emu48. So Emu71/Win inherited all advantages and also the disadvantages of the Emu48 family emulators.

Main differences to Emu71/DOS

- pure Win32 program / sources could be compiled for pure x64 program
- skins for different appearance (two included)
- multi instance / multi session ability, each session is saved in an own document
- slower than Emu71/DOS but of course a lot faster than the real calculator at calculations
- simulated graphic display with possibilty of contrast, blinking and row driver programming, but limited to the regular 22 characters
- display output is much slower than Emu71/DOS because scrolling and other relevant display output timings are controlled by the calculator firmware and so have the same speed than the original calculator
- exact simulation of the original memory layout (16KB build with 16*1KB chips)
- no limitations in RAM / ROM configuration
- diagnostic ROM works
- allowing multiple HP 82401A HP-IL Interface modules (HP 82402A Dual HP-IL Interface simulation, but not limited to only two interfaces)
- no integration of HP-IL devices, all devices must be connected over Virtual HP-IL (TCP/IP)

Hope you will enjoy this new emulator.

Christoph Giesselink, July 2011

Re: Introducing Emu71 for Windows

*Message #2 Posted by **gene wright** on 19 July 2011, 12:51 p.m.,*
in response to message #1 by Christoph Giesselink

Dumb question #1: The older 71 emulator expects the rom to be in a .bin format, rom71.bin.

The new windows script is looking for file HP71B.ROM

Same format? Different?

I've probably missed where this is explained, but it seems different than the DOS version?

There's a short description about the ROM image format at http://hp.giesselink.com/Emu71/EMU71.HTM#s3.

Emu71/Win accept two formats: packed and unpacked images, so the images from Emu71/DOS are ok. Simple rename it to HP71B.ROM at put it into the Emu71/Win installation directory.

Christoph

>
> Why?

The Saturn CPU core implementation of Emu71/DOS is completely written in 86 assembler and highly optimized to run on old and slow DOS machines, whereas the Saturn CPU core of Emu71/Win is written in C highly optimized to simulate the Saturn CPU with all it's hardware bugs as realistic as possible.

Christoph

Re: Introducing Emu71 for Windows

*Message #7 Posted by **Namir** on 19 July 2011, 9:16 p.m.,*
in response to message #1 by Christoph Giesselink

Christopher,

I cannot say thank you enough times. Running the old EMU71 has become complicated with Windows 7. I had to resort to virtual machines running Window XP. Your Windows version is a dream and I love it!!!!

Namir

Whoo hoo! I figured you might be up to something like that! Does it talk to the PIL-Box?

Re: Introducing Emu71 for Windows

*Message #10 Posted by **Howard Owen** on 20 July 2011, 12:52 a.m.,*
in response to message #9 by Howard Owen

Yes, it does work with the PIL-Box, using Christoph's HP-IL over TCP/IP. This an instant hit in my apartment!

Re: Introducing Emu71 for Windows

*Message #11 Posted by **J-F Garnier** on 20 July 2011, 3:53 a.m.,*
in response to message #1 by Christoph Giesselink

I'm very happy that Christoph released this Emu71 for Windows version. I regularly received requests to port my Emu71/DOS to Windows but was not able to do it due to 1) lack of knowledge on Windows GUI development 2) lack of time.

As usual with Christoph's emulators, the simulation is almost perfect and much closer to the original than Emu71/DOS. When I started Emu71 in 1995, my PC was using a 386 CPU, and my first targets were emulation efficiency to get a speed improvement vs the original and support for large memory modules, to have a powerful Emu71 environment so I didn't try to reproduce every low-level details especially for display/keyboard management and original memory layout.

Jean-Francois

Re: Introducing Emu71 for Windows

*Message #12 Posted by **x34** on 20 July 2011, 5:38 a.m.,*
in response to message #1 by Christoph Giesselink

Christoph, is there ready QWERTY kmi keyboard mapping file? I see only QWERTZ files.

[EDIT] Actually, they seems to be QWERTY, but i have problems with keybindings on my notebook. No way to differ + and = keys, misplaced braces etc. Where can I find info on editing KML keyboard mappings, especially SHIFTED keys?

Edited: 20 July 2011, 5:59 a.m.

Re: Introducing Emu71 for Windows

*Message #13 Posted by **Christoph Giesselink** on 20 July 2011, 6:46 a.m.,*
in response to message #12 by x34

For those which have a QWERTY keyboard, the sequence

```
Scancode 89                     # Y
        Map 89 106
End

Scancode 90                     # Z
        Map 90 301
End
```

in the file KEYB71.KMI must be changed to

```
Scancode 89                     # Y
        Map 89 301
End

Scancode 90                     # Z
        Map 90 106
End
```

A full description of the KML language script is available at http://hp.giesselink.com/Emu48/KML20R15.ZIP.

Christoph

Re: Introducing Emu71 for Windows

*Message #14 Posted by **x34** on 20 July 2011, 7:42 a.m.,*
in response to message #13 by Christoph Giesselink

Cristoph, actually Scancode 89 # Y Map 89 106 End

Scancode 90 # Z Map 90 301 End

are CORRECT for QWERTY, no need to change them. But braces (including curly), + and = keys are misplaced.

Thanks for link to KML docs.

*Message #15 Posted by **Mike (Stgt)** on 20 July 2011, 7:45 a.m.,*
in response to message #1 by Christoph Giesselink

Congratulation Christoph!

All Saturn-based calculaters I know are now covered by your emulators. Reason to open a bottle!

> Quote:
>
> Hope you will enjoy this new emulator.

Yes I do enjoy it like all the other emulators (not simulations) too. As your HP71 comes with virtual HPIL I hope that simulated IL perpherals will show up some time, like HP2225B, Video Interface, and more.

Currently I try to do a 7470 HPGL plotter in ooREXX: virtual HPIL done, HPIL interface almost done (listener works), display of graphic pending. For testing my HPIL interface I would need (in addition to Christoph's HP71) an HP41 with virtual HPIL. Alas with no knowledge of C I am not able to modifiy Nonpareil.

Once more thank you.

Ciao.....Mike

Hope this helps.

Ciao.....Mike

KMI keyboard problems

*Message #18 Posted by **x34** on 20 July 2011, 9:03 a.m.,*
in response to message #1 by Christoph Giesselink

Christoph, please consult.

If I write

```
Scancode 49
        IfFlag 1
                Map 49 403
                Map 49 311
        Else
                Map 49 311
        End
End

KMI compiler says:
63: Too many parameters for IfFlag (1 expected).
Fatal Error at line 63.

Documentation says:

        IfFlag INTEGER
                <COMMANDS>
        Else
                <COMMANDS>
        End
```

So, should I use some delimiter for COMMANDS or only one command is actually allowed? I have no errors reported, if only one command is used.

Edited: 20 July 2011, 9:04 a.m.

Re: KMI keyboard problems

*Message #19 Posted by **Howard Owen** on 20 July 2011, 10:09 a.m.,*
in response to message #18 by x34

Maybe this would work?

```
Scancode 49
        IfFlag 1
                Map 49 403
        End
        Map 49 311
End
```

Ok, what am I doing wrong? :-)

*Message #20 Posted by **gene wright** on 20 July 2011, 10:31 a.m.,*
in response to message #19 by Howard Owen

I install the windows version of Emu71 into the default folder structure it suggests.

Before running the emulator, I copy ROM71.BIN to the folder that Emu71 was just installed to and rename it to HP71B.ROM.

At that point, I double-click Emu71 and it opens a dialog box asking me to choose my KML script. It defaults to Christoph's Real HP71B for 1024x768 and the Emu71 directory location it shows is the one it just installed Emu71 into.

When I click OK, I get the following result:

Title: Christoph's Real HP71B for 1024x768

Author: Christoph Giesselink

Hardware Platform: Saturn

Calculator Model : T

Cannot open Rom HP71B.ROM.

Bitmap REAL71BL.BMP loaded.

Debug Off

This KML Script doesn't specify the ROM to use, or the ROM could not be loaded.

Press Cancel to Abort.

Thoughts?

By the way, even though I renamed the ROM71.BIN file to HP71B.ROM, Windows still shows the file type as a VLC Media File (.bin).

So, it thinks it is a movie file I think, but knows that it is a binary. Why would that matter to Emu71?

Edited: 20 July 2011, 10:34 a.m.

Re: Ok, what am I doing wrong? :-)

*Message #21 Posted by **Christoph Giesselink** on 20 July 2011, 11:09 a.m.,*
in response to message #20 by gene wright

I don't know what's really happen, but I think you created something like HP71B.ROM.BIN.

Windows with default settings normally hide the extention of a filename. Renaming files in such a configuration may cause unpredictable results.

Sorry I don't know the original English text, so I use translations of my German version

1. Open the Windows-Explorer
2. Enable the menu if neccessary (Win Vista + 7)
3. goto "Extras" "Folder Options..."
4. press tab "View"
5. in "Extended settings" disable checkbox "Hide extentions at known file types"
6. then press "ok"

Now you should see all file names with their real extention.

Christoph

Re: Ok, what am I doing wrong? :-)

in response to message #21 by Christoph Giesselink

Thank you, that fixed it.

The file was a .ROM.BIN

Re: Ok, what am I doing wrong? :-)

*Message #23 Posted by **Alexander Oestert** on 20 July 2011, 11:19 a.m.,*
in response to message #20 by gene wright

I'm sorry I'm not able to give you a solution but I can provide the following: I installed the package on two different machines under XP each, one EeePC and a desktop PC. On the netbook, everything works flawlessly, math ROM included. On the PC I get the same result as you do. On both machines I can see all file extensions.

EDIT: I now installed it a second time on the desktop PC, copied the bin files in the folder and now renamed the 71 ROM by copying the string from the post above: HP71B.ROM Before I had typed it myself. What can I say - it now works!

Edited: 20 July 2011, 11:28 a.m.

Re: KMI keyboard problems

*Message #24 Posted by **x34** on 20 July 2011, 10:57 a.m.,*
in response to message #19 by Howard Owen

It would not help for

```
Scancode 49
  IfFlag 1
     Map 49 403
     Map 49 117
  Else
     Map 49 118
  End
End
```

The problem was in caching (?) KMI files. I redefined file name in KML file, everything is OK now. many COMMANDS work, but why and who cached old KMI file is out of my understanding. I think it is some problem with Windows 7 security settings. I am not familiar with this OS, so it is my fault only. Waiting for Linux version!

I think i'll get suitable keymap in half an hour.

Question about copying source code

*Message #25 Posted by **Namir** on 20 July 2011, 11:07 a.m.,*
in response to message #1 by Christoph Giesselink

Christoph,

If I have an HP-71B source code listing in a Windows text files. How can the emulator read that file?

Namir

Re: Question about copying source code

*Message #26 Posted by **Christoph Giesselink** on 20 July 2011, 11:37 a.m.,*
in response to message #25 by Namir

> Quote:
>
> If I have an HP-71B source code listing in a Windows text files. How can the emulator read that file?

The only way is using the keyboard macro recorder in "Tools/Macro/Play...".

Therefore you have to convert a Windows text file into keyboard macro file first. Therefore use the command line tool "ASC71MAC.EXE" delivered with the installer version or available as separate tool. But the "Keyboard Macro Play" process is very very slow, and sometimes on some PC hardware Emu71/Win misses keystrokes, especially when a HPIL module is installed.

A more convenient way I suggest for larger files, import them as usual in Emu71/DOS and save the file into a floppy disk LIF image file. Then load this file with the combination of Emu71/Win and ILPer to the memory of Emu71/Win.

Another way inserting all programs saved in an independent port of Emu71/DOS is including the Emu71/DOS port file into Emu71:

Therefore:

1. shut off the emulated calculator
2. call "Edit/Port Configuration..."
3. "Add"
4. Module Type: RAM, Size: Datafile
5. enter the filename of the independent port file
6. press "Apply"
7. in the case your selected file is an independent port file, you see it in the window above
8. finally press "OK"

The difference to a ROM file is, that you really make a copy of the data in the emulator RAM, and not only a link to the original data file.

Christoph

Re: Question about copying source code

*Message #27 Posted by **Howard Owen** on 20 July 2011, 8:30 p.m.,*
in response to message #25 by Namir

Hi, Namir.

I have an extremely geeky way to get files onto my 71B using my LIFlab software. You need Perl for Windows, such as the Active Perl Community Edition Then you can grab my LIFlab software here.

This software is a bit rough, but the following process will get a 71B BASIC program in a DOS/Unix text file into a LIF image suitable for use with ILper and EMU71.

```
# First we create an empty LIF volume
hbo@quirk|501> ./lifinit.pl -v TEST.dat

# Yup, it's empty
hbo@quirk|502> ./lifdir.pl -v TEST.dat

Volume:
filename   type       size       date/time
-------------------------------------------
0 sectors used; 2382 sectors available; 2382 sectors free

# Here is our test file - a 71B basic program in a text file
hbo@quirk|503> cat BASTEST.txt

0010 ! * Trivial 71B BASIC program for testing
0100 DISP "I'm trivial. Pleased to meet you"
0200 END

# Now we encode this file as a 71/41 TEXT file.
hbo@quirk|504> ./enc.pl BASTEST.txt >BASTEST.t71

# The lifadd.pl program requires us to give the LIF type when we add a file
# to a LIF volume. Here's how to get a list of types LIFlab supports:

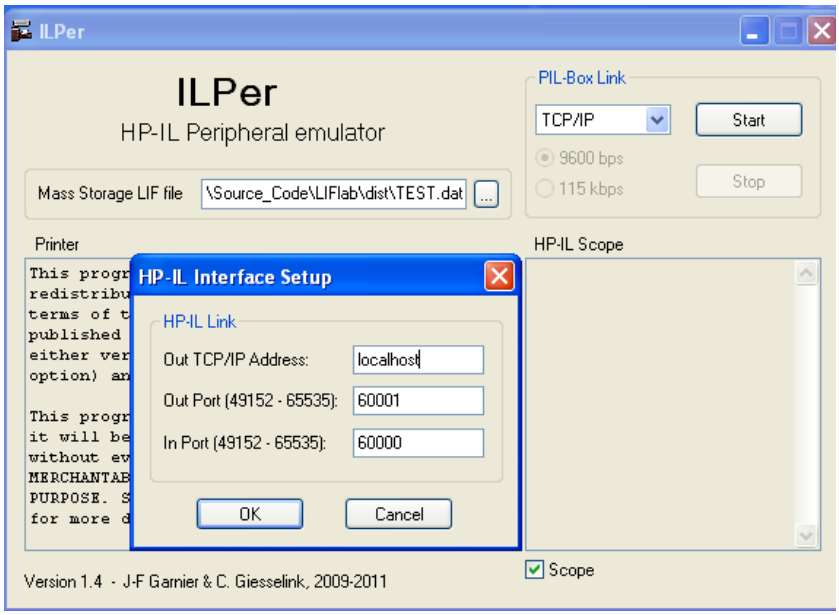
hbo@quirk|505> ./lifadd.pl -T

APPT75 BASIC71 BASIC75 BASIC85 BIN71 BPROG85 DATA71 DATA85 FORTH71 KEY41
KEY71 LEX71 LEX75 pBASIC71 pBASIC85 pBIN71 pBPROG85 pDATA85 pFORTH71
PROG41 ROM41 ROM75 sBASIC71 sBIN71 sDATA sDATA71 sFORTH71 sKEY71 sLEX71
spBASIC71 spBIN71 spFORTH71 STAT41 sTEXT TEXT TEXT75 VCALC75 WALL41

# The one we want is TEXT
hbo@quirk|506> ./lifadd.pl -t TEXT -f BASTEST.t71 -v TEST.dat
Volume:
filename   type       size       date/time
-------------------------------------------
BASTEST    TEXT       256
1 sectors used; 2382 sectors available; 2381 sectors free
```

Now that you have your LIF image, you can get at it from a real 71B, ore EMU71 using ILper. (In the former case, you would need the PIL-box, but in the latter you wouldn't .)

Here's how the configuration of ILper would look to support EMU71:



And here's how the EMU71 tcp/ip setup should look:

Note that the IN/OUT port numbers are swapped between the two.

Finally, here's the proof of the pudding: we TRANSFORM our test program from text on the virtual drive to BASIC on EMU71 and run it:

I am totally in debt to Tony Duell and his lifutils package for Linux. He distilled knowledge of LIF from several sources into succinct and readable code. My software is a bit rough, but usable. Any bugs are no doubt my fault. That leads me to warn you to make backups of your LIF image files if they have anything in them you want to save.

Regards,
Howard

Re: Emu71 SuperKeyboard-US

*Message #28 Posted by **fhub** on 20 July 2011, 1:42 p.m.,*
in response to message #1 by Christoph Giesselink

Hi,

I've made special KML and KMI files for this new Emu71B (so far only for the 1024x768 layout):

In the KML file I've included code for all shifted functions (as I've done it with my HP-50g emulator 2 weeks ago), so now you can directly access all shifted (yellow and blue) functions by clicking on their labels.
If you don't like this for the blue functions (because you have to click quite exactly on the lower half of the button), then just remove the first block of "Button 1xxx" (with a number higher than 1000) upto "Button 101".

The KMI file I've made is for US keyboards, and I've added a few special key combinations (just look into the file to see them).
One change I've made is that I have swapped the 2 following keys (which I believe is more comfortable):
the Shift-button is yellow [f] and the Ctrl-button is blue [g]

There are still 2 keys (~ and \) on US-keyboards which have no corresponding keys on the HP71B, so I've commented out these 2 keys (the are at the end of the KMI file) - make your own shortcuts for them if you want.

Here's the link for this file:
http://www.spaadyshare.net/547tgz0or8h1/HP71B-US.zip

Franz

PS, I forgot to say: many thanks to Christoph for this fantastic Emu71 program - this is really a great gift for all emulator fans like me! :-)

34s: Anyone have an instruction timing table?

*Message #1 Posted by **gene wright** on 18 July 2011, 8:13 p.m.*

This used to be done by the user community in the PPC days.

What I'm wondering is whether such a table for opcode instruction timing exists. Something like:

+ : 10 ms

- : 11 ms

etc. The reason this might be handy is if you then saw something in the table like this:

Multiply : 20 ms Divide : 500 ms

if you understand what I mean. Without such a list, there might be a few operations on the 34s that are out of kilter and MUCH slower than one would expect. If roll up takes 10x as long as roll down, then perhaps it would be best to either try optimizing the roll up code more or doing four roll down instructions.

So... anyone have something like this yet?

Re: 34s: Anyone have an instruction timing table?

*Message #2 Posted by **Paul Dale** on 18 July 2011, 8:54 p.m.,*
in response to message #1 by gene wright

Not that I'm aware of. About the only way to figure out timings would be to write a small program that looped lots. I'd also expect some variation based on arguments.

I do know that all the logarithms (and functions that use logarithms) are slow.

- Pauli

Re: 34s: Anyone have an instruction timing table? - example of a "slow" function

*Message #3 Posted by **gene wright** on 18 July 2011, 9:13 p.m.,*
in response to message #2 by Paul Dale

It appears that the ROUND function is particularly slow. Any chance :-) this function could be reviewed for some optimization? :-) And, of course, please don't take this as any criticism at all!

==========

Jake found:

If I store a long decimal value in R05 and take the little program

LBL C

RCL 05

x<>X (acting as a NOP)

Roll down

1

+

GTO C

and starting with zero in X and run it for roughly 5 seconds, it counts up to 5613.

If I then replace the x<>X with ROUND, things get interesting.

Setting the display to FIX 0, the count after ~5 seconds is 3463.

With FIX 1, it reached 3330.

With FIX 2, it reached only 47.

With FIX 5, the count reached 46.

With FIX 11, the count was about the same.... 46.

And all the ones in between 3 and 11 seemed to count only up to 45-47 each.

The ROUND function surely makes the 34S run at a much slower pace.

Re: 34s: Anyone have an instruction timing table? - example of a "slow" function

*Message #4 Posted by **Paul Dale** on 19 July 2011, 12:44 a.m.,*
in response to message #3 by gene wright

It will be fast in everything except FIX mode :-)

The reason being that it does a 10^x internally which requires logs. I'm guessing multiplication by 0 and 1 are special cased.

I might be able to do something with it to speed up the FIX case too.

- Pauli

Re: 34s: Anyone have an instruction timing table? - example of a "slow" function

*Message #5 Posted by **Paul Dale** on 19 July 2011, 12:50 a.m.,*
in response to message #3 by gene wright

And a fix is in. Should be much faster once built (rev 1256 or later) -- probably later this evening. Let me hope it works properly still :-)

x<>X isn't a good NOP here, it goes through a very different code path than ROUND. ABS or +/- are better for the NOP.

- Pauli

Edited: 19 July 2011, 8:17 a.m. after one or more responses were posted

Great! A timing table would allow focused optimization :-)

*Message #6 Posted by **gene wright** on 19 July 2011, 8:07 a.m.,*
in response to message #5 by Paul Dale

Thanks. That's great.

Perhaps some of us (yep, I know... suggest and you volunteer) should try this type of thing with other instructions?

It would help point out areas that would benefit from optimization or instructions that just seem much slower than "normal".

Will test the fix in the program shortly. Thanks again.

You be learning :-)

> Quote:
>
> It would help point out areas that would benefit from optimization or instructions that just seem much slower than "normal".

Anything involving logarithms (which includes powers) will be slow. Most other things seem to be fast enough. A quick scan over the source code will identify problematic functions easily enough.

Even if slow functions are identified, there is no guarantee that they can be sped up. Some functions just can't and others will get too much larger to avoid the problematic subroutines. This one was nice and easy -- no space gain, an acceptable portability loss and a good speed improvement.

- Pauli

Edited: 19 July 2011, 8:20 a.m.

Re: Great! A timing table would allow focused optimization :-)

*Message #8 Posted by **gene wright** on 19 July 2011, 8:54 a.m.,*
in response to message #7 by Paul Dale

I understand.

However, if we can find them through example code like the stuff for ROUND, then you may be able to adjust them. You might not, but at least it could be looked at. :-)

Re: 34s: Anyone have an instruction timing table? - example of a "slow" function

*Message #9 Posted by **Jake Schwartz** on 19 July 2011, 10:24 a.m.,*
in response to message #5 by Paul Dale

> Quote:
>
> x<>X isn't a good NOP here, it goes through a very different code path than ROUND. ABS or +/- are better for the NOP.

...yeah, well, that was what came into my head at that moment :-) I think it was a sufficient measuring method anyway, since the loop with x<>X still ran very fast as compared to ROUND. I'll use ABS next time.

Jake

The real NOP instruction?

*Message #10 Posted by **gene wright** on 19 July 2011, 5:36 p.m.,*
in response to message #9 by Jake Schwartz

Actually, why not just use NOP as the NOP?

:-)

Re: The real NOP instruction?

*Message #11 Posted by **Marcus von Cube, Germany** on 19 July 2011, 5:42 p.m.,*
in response to message #10 by gene wright

Because it is not a monadic operation like ABS or ROUND that modifies the X register and sets LastX. NOP is simply ignored by the execution engine and therefore carries considerably less overhead.

Re: The real NOP instruction?

*Message #12 Posted by **gene wright** on 19 July 2011, 6:13 p.m.,*
in response to message #11 by Marcus von Cube, Germany

I think the real thing Jake was doing with this instruction was to simply see how the loop count was affected by replacing a NOP with the ROUND instruction at various FIX settings.

X<>X worked, since it just essentially did nothing, as would NOP since it really does do nothing. :-)

The "trouble" remains that ROUND slows down considerably if FIX is much greater than 2 or 3. :-(

I understand that will stay that way if it has to call 10^x which uses the log routines which are (relatively compared to the blinding speed the 34s shows in other areas) slow.

The reason it was a concern to us in the first place is that we have gotten used to having the 34s blow away any other machine when it is running something but the little code we were testing here was SLOWER than existing machines.

We don't like the 34s to be slower. ;-)

(Again, just in case my text here is not clear... none of this is in any way meant to be critical of anything. We're all just trying to help find places to tweak for improvements!).

Re: The real NOP instruction?

*Message #13 Posted by **Paul Dale** on 19 July 2011, 6:31 p.m.,*
in response to message #12 by gene wright

> Quote:
>
> X<>X worked, since it just essentially did nothing, as would NOP since it really does do nothing. :-)

Both of these go via very different code paths than a monadic function like round. NOP takes no arguments and does nothing with last X and doesn't even call a worker routine. x<>X goes through the *commands with arguments* path which again don't bother with last X but instead decodes the argument. To get a representative idea of the timing, it will be best to use as similar a function as possible. In this case, however, ROUND is so slow it probably doesn't matter much.

As for being slower, I've not tested but I'll take your word for it. The 10^x/log is gone from the code path so that clearly wasn't the big expensive operation :-(Digging a bit deeper ends up in some code in the decimal library we're using (which I haven't been bothered to figure out how exactly it works). Unless I suddenly get motivated to fix the library (which isn't all that likely), ROUND is going to stay slow. Better slow and correct than fast and wrong.

- Pauli

Pauli, Round still seems slow.

*Message #14 Posted by **gene wright** on 19 July 2011, 11:03 a.m.,*
in response to message #5 by Paul Dale

I did Jake's test with build 1257 and it still drops from counts in the thousands at Fix < 3 or 4 down to counts of 50-60 at Fix 5 or higher.

Pauli check ROUND yourself please...

*Message #15 Posted by **gene wright** on 19 July 2011, 8:26 p.m.,*
in response to message #5 by Paul Dale

You did think a "fix" was in that should speed up the ROUND instruction.

Can you do some checks using Jake's example above?

Re: Pauli check ROUND yourself please...

*Message #16 Posted by **Paul Dale** on 19 July 2011, 11:28 p.m.,*
in response to message #15 by gene wright

I implemented what I thought would be the fix and it didn't work. This stuff happens, my idea as to where the problem was was incorrect.

I'm not planning on digging further into the underlying problem at the moment. The slowness comes from decQuantizeOp() in decNumber/decNumber.c but it isn't clear to me where.

- Pauli

Xpander article

*Message #1 Posted by **Egan Ford** on 18 July 2011, 4:38 p.m.*

http://www.evilmadscientist.com/article.php/xpander

Re: Xpander article

*Message #2 Posted by **Karl-Ludwig Butte** on 19 July 2011, 4:56 a.m.,*
in response to message #1 by Egan Ford

Hi Egan,

thanks a lot for sharing this article. I'll never understand that HP decided to cancel the Xpander project back then. Now Casio is successfull with the Classpad300 & 330 and already Casio heralded the next technical generation with the fx-CG20. Next year will be the 40th anniversary of the HP-35. This would be a perfect chance to reclaim the title "No. 1 calculator manufacturer". But to do this something really spectacular would be needed, like e.g. "Around the world of Mathematics with HP-Calculators" and should cover the whole world - not just the U.S. HP - are you listening ?

What do you fellow members of this forum think ?

Kind regards

Karl

Re: Xpander article

*Message #3 Posted by **hpnut** on 19 July 2011, 6:08 a.m.,*
in response to message #2 by Karl-Ludwig Butte

Yes, i agree. HP does not live upto to its motto "HP Invent!" :-(

at least as far as calculators go. bring back the classics!

in response to message #3 by hpnut

> Quote:
>
> bring back the classics!

I would not call this living to its motto...

Anyway, there were a few drawbacks with the Xpander. I am lucky enough to have one and the screen is a bit cracked. Don't know how it happened, I took it out of its case before my last move and it was a

bit cracked...

Re: Xpander article

*Message #5 Posted by **Tim Wessman** on 19 July 2011, 10:21 a.m.,*
in response to message #2 by Karl-Ludwig Butte

One name should explain it all - Carly.

It was days from launch, production was ramped up, they had done a ton of work with testing boards to ensure it would be allowed despite having a touchscreen and stylus, had units seeded to thousands of educators, had hosted a large educator conference to teach them about the potential, and in short was getting ready to radically change things.

But HP doesn't do education. We only sell computers. . .

TW

PS - I have one too that cyrille left me when he moved to France. I'd never really had the chance to play with it much until then. It honestly was a bit too basic and needed a lot of work to flesh out features and capabilities, but it would have been a solid first release.

Edited: 19 July 2011, 10:23 a.m.

Re: Xpander article

*Message #6 Posted by **Jake Schwartz** on 19 July 2011, 10:34 a.m.,*
in response to message #5 by Tim Wessman

At the HPCC 20th-Anniversary HP calc conference at the Imperial College in London, both Cyrille and Jean-Yves Avenard spent loads of time talking about work at the ACO "division" in Australia and the events surrounding ACO's demise, which caused the abrupt cancellation of both Xpander and the Jornada X25 PDA (along with everything else). It was very enlightening. If it hadn't been for the subsequent efforts of Fred Valdez in San Diego, the calc group might not have been in existence today.

I agree that it is a good platform for high school and could have easily evolved towards something more powerful. I love the elements table applet it has. Lots of similar things could have been made if the drive had been there.

Re: Xpander article

*Message #10 Posted by **Karl-Ludwig Butte** on 20 July 2011, 9:16 a.m.,*
in response to message #5 by Tim Wessman

Hello Tim,

thanks a lot for your answer and the information. It must've been very frustrating for all involved at that time. I find it difficult to get information about what happened to and within Hewlett-Packard after the founders retired. I read "Bill & Dave" and Dave Packard's book - better say, I devoured them. But the retreat of Bill and Dave must have had such a deep impact on the company although it took some time until the negative effects showed up. But I can only speculate. Do you have any URLs or recommended books and/or articles to better understand why things happened as they did ?

Thank you very much in advance.

Kind regards

Karl

Re: Xpander article

34s builds 1249 and 1250 crash on real hardware

*Message #1 Posted by **gene wright** on 18 July 2011, 4:14 p.m.*

I know builds are often handoffs between you guys, but just an FYI.

Both the 1249 and 1250 builds "crash".

When I run a program, the screen blanks and sits there. When I press ON, it displays "Restored"

Re: 34s builds 1249 and 1250 crash on real hardware

*Message #2 Posted by **Walter B** on 18 July 2011, 4:26 p.m.,*
in response to message #1 by gene wright

Thanks for the feedback. We'll look into it. Emulator build 1250 seems to work as usual :-)

Walter

Re: 34s builds 1249 and 1250 crash on real hardware

*Message #3 Posted by **Marcus von Cube, Germany** on 18 July 2011, 4:50 p.m.,*
in response to message #1 by gene wright

Gene I was suspecting this. Testing will start tomorrow. Have you cleared the calculator or are you trying to run what has been in the calculator before? Does the crash depend on the program you are trying to run?

Re: 34s builds 1249 and 1250 crash on real hardware

*Message #4 Posted by **gene wright** on 18 July 2011, 5:07 p.m.,*
in response to message #3 by Marcus von Cube, Germany

1) It cleared the calculator when I loaded the new firmware. Erased was displayed and memory was empty.

2) It does not matter what program is run. LBL A, +, GTO A does the same thing as a longer program.

3) When it displays "Erased" is the calculator really totally erased? Any other way to clear it completely in case some bit is floating somewhere it should not be?

and... no problem on the testing. That's what I was doing. Beta software testers have to be willing to run into problems. That's our job! :-)

Re: 34s builds 1249 and 1250 crash on real hardware

*Message #5 Posted by **Etienne Victoria** on 18 July 2011, 5:10 p.m.,*
in response to message #1 by gene wright

Same thing here with 1249 (obtained via SVN client.

However, I forgot to Erase prior but had nothing saved in Flash.

However, new operation yields errors such as:

1 2* 2* 2* 2* 2* 2* 2* 2* 2 * gives 512 --> Correct

2 * gives 100 --> Not correct

Along with very slow keyboard response including prefix keys.

Will retry after full erase as I did not follow the procedure correctly.

Etienne

Re: 34s builds 1249 and 1250 crash on real hardware

*Message #6 Posted by **Paul Dale** on 18 July 2011, 5:31 p.m.,*
in response to message #5 by Etienne Victoria

Hmmm, I just tried these exact steps and running a short looping program and neither failed on 1249 for me. However, what you are seeing is quite a bit like what I saw immediately after upgrading (and also like something I saw last week running much older firmware).

I changed the batteries and the problems went away. It would be quite a surprise if this is the cause of three people experiencing failures within a day of each other but it might be worth a try. BATT indicated 2.9 with the old batteries which should be fine.

We'll still investigate since it seems unlikely that this is the root cause.

- Pauli

Update ... SST works, R/S does not and my BATT reading

*Message #7 Posted by **gene wright** on 18 July 2011, 5:39 p.m.,*
in response to message #5 by Etienne Victoria

More info:

LBL A, +, GTO A

will work fine if you single-step through the program. Push R/S however and it goes off to la-la land.

AND

BATT indicates 2.7 on my unit. Hmm...

Edited: 18 July 2011, 5:41 p.m.

Replaced batteries. BATT now 3.1 and programs run

*Message #8 Posted by **gene wright** on 18 July 2011, 5:54 p.m.,*
in response to message #7 by gene wright

So, moral of the story... 2.7 BATT went to la la land, 3.1 batt runs.

Re: Replaced batteries. BATT now 3.1 and programs run

*Message #9 Posted by **Marcus von Cube, Germany** on 18 July 2011, 6:02 p.m.,*
in response to message #8 by gene wright

It looks like 40 MHz is too demanding. The next revision will run at about 15% less speed. I had increased the speed considerably, especially for "non crystallized" machines, in order to get good baud rate divisor values. This might have been too much for some devices.

Dumb question I'm sure...

*Message #10 Posted by **gene wright** on 18 July 2011, 6:14 p.m.,*
in response to message #9 by Marcus von Cube, Germany

Any way to set the speed value by the user?

Re: Dumb question I'm sure...

*Message #11 Posted by **Marcus von Cube, Germany** on 18 July 2011, 6:25 p.m.,*
in response to message #10 by gene wright

You can set test mode (ON+1) which emulates a low battery situation. This will set the speed to one third of what you have now.

Re: Replaced batteries. BATT now 3.1 and programs run

*Message #12 Posted by **Jim Yohe** on 18 July 2011, 6:17 p.m.,*
in response to message #8 by gene wright

I seem to remember a discussion about what the proper voltage and someone (Marcus?) said he programmed the 34s to show a low battery warning at a level different than the 30b.

Perhaps that level needs to be looked at once again to determine when it actually should show the warning so these failures don't show up unexpectedly.

Re: Replaced batteries. BATT now 3.1 and programs run

*Message #13 Posted by **Marcus von Cube, Germany** on 18 July 2011, 6:27 p.m.,*
in response to message #12 by Jim Yohe

The maximum speed was simply set too high. I'd be glad if someone will test with the most recent build and some worn out batteries.

I'll check back here tomorrow...

Re: Replaced batteries. BATT now 3.1 and programs run

*Message #14 Posted by **fhub** on 18 July 2011, 6:37 p.m.,*
in response to message #13 by Marcus von Cube, Germany

Another question:
Does the emulator also emulate the speed of the real calculator, or does it always run with the maximum speed depending on the PC?

Edited: 18 July 2011, 6:38 p.m.

Re: Replaced batteries. BATT now 3.1 and programs run

*Message #15 Posted by **Marcus von Cube, Germany** on 19 July 2011, 3:12 a.m.,*
in response to message #14 by fhub

The emulator is just a native C program which does not have an idea of the speed of the ARM processor. So it runs as fast as it can.

Re: Replaced batteries. BATT now 3.1 and programs run

*Message #16 Posted by **fhub** on 19 July 2011, 5:56 a.m.,*
in response to message #15 by Marcus von Cube, Germany

> Quote:
>
> The emulator is just a native C program ...

Ahhh, so it's rather a simulator than an emulator, correct?
(I thought it may work like some other emulators which emulate the CPU and then run the original ROM code).

And how do you then get the calculator ROM (calc.bin)?
Do you write it in original ARM code or is there just a cross-compiler (C to ARM) in the HP20b-SDK which creates this ROM?

Edited: 19 July 2011, 6:14 a.m.

Re: Replaced batteries. BATT now 3.1 and programs run

*Message #17 Posted by **Marcus von Cube, Germany** on 19 July 2011, 7:28 a.m.,*
in response to message #16 by fhub

I've two separate environments:

Microsoft Visual Studio for the emulator.

Eclipse with the Yagarto GCC cross compiler and some Unixish tools.

The command line version compiles nicely under Linux or Mac OS with the compilers provided there.

The project is just a collection of source files which may be compiled (with some conditional compilation inside) into the various incarnations of the software. It took some time to get all the right pieces together. ;-)

HP 50g - Make menus more like HP48g

*Message #1 Posted by **Brian K** on 18 July 2011, 2:40 p.m.*

I'd like my HP50g to behave more like an HP48g when it comes to things like, say, units.

Currently on my 50g I hit RSHIFT, Units, and then a menu pops up in the middle of the screen where I use the directional pad to select unit types/etc.

On my HP 48g, pressing RSHIFT and Units gives me LENG AREA VOL TIME SPEED MASS on the soft key/function key menus at the bottom of the screen.

Is there any way to make the 50g display the same way the 48g does?

Re: HP 50g - Make menus more like HP48g

*Message #2 Posted by **Brian K** on 18 July 2011, 2:43 p.m.,*
in response to message #1 by Brian K

Never mind, looks like I may have found it. System flag 117. Going to try it shortly.

edit

Excellent, that was it. I should have known it would be something simple...

/edit

Which cold shrink kit for 9810 printer platen?

*Message #1 Posted by **David Ramsey** on 18 July 2011, 1:00 p.m.*

Title says it all. Tony mentioned that I should use the "smallest" kit, but I don't know what that is.

For example, this kit:

3M 7622 Cold Shrink Wrap Kit 7622-T-110

...is shown as:

insulation OD 0.64" to 1.08"

...but I don't know if that would fit.

Re: Which cold shrink kit for 9810 printer platen?

*Message #2 Posted by **Tony Duell** on 19 July 2011, 4:06 a.m.,*
in response to message #1 by David Ramsey

I think that is much too large. It needs to fit on the metal spindle from the original platen, which IIRC is about 1/4" in diameter.

I think the kit I used as 3M 8424-8. If you send me an e-mail (ard@p850ug1.demon.co.uk), I'll send you some more information.

48GX - Silly question?

*Message #1 Posted by **mr-scorpio** on 18 July 2011, 12:13 p.m.*

Hi there, Still finding my way around the 48GX. Maybe a silly question. I remember seeing on both the TI-92+ & TI-89, that if you keyed in the factorial 100! - it calculated & displayed the whole 157 digit factorial, that you could literally scroll though. It could even calculate higher values..

Putting aside the reason for a 'need' for this... Can, or is there a way that the HP 48GX can ALSO display either the details of an exponent of large calculation OR the results to such a high degree of digits, like 100!

48GX 100! = 9.33262154439E157 TI-89 100! = All 157 digits

IF TI deemed this ability useful ... What is HP's response in like for like capability?

Many thanks Al

Re: 48GX - Silly question?

*Message #2 Posted by **Vladan Dugaric** on 18 July 2011, 12:49 p.m.,*
in response to message #1 by mr-scorpio

HP-50G gives all digits too. You just have to use Exact mode and type the number without a decimal point.

Re: 48GX - Silly question?

*Message #3 Posted by **bill platt** on 18 July 2011, 12:50 p.m.,*
in response to message #1 by mr-scorpio

You need ALG48 or Erable (I can't remember whether either will do it) or other software loaded onto the 48GX to do that. In the 49G and all later versions (49G+, 50G) HP incorporated that feature as "exact" mode.

Re: 48GX - Silly question?

*Message #4 Posted by **Mike Morrow** on 18 July 2011, 12:55 p.m.,*
in response to message #1 by mr-scorpio

> Quote:

>
> IF TI deemed this ability useful ... What is HP's response in like for like capability?

It's called the HP 49g+ and the HP 50g. (Integer calculations in EXACT vs. APPROXIMATE mode. The HP 48 series has no equivalent mode.)

Re: 48GX - Silly question?

*Message #5 Posted by **mr-scorpio** on 18 July 2011, 1:07 p.m.,*
in response to message #4 by Mike Morrow

Ah.. So it's a CAS feature. that explains things. Many thanks Al

Re: 48GX - Silly question?

*Message #6 Posted by **Alejandro Paz (Germany)** on 18 July 2011, 3:31 p.m.,*
in response to message #1 by mr-scorpio

The 48GX is from 93 and the TI-92 (the first one with such a feature) is from 95 :). That may explain why they cannot be actually compared. (I like some features from the 92 but I hardly use it).

Edited: 18 July 2011, 3:32 p.m.

Re: 48GX - Silly question?

*Message #7 Posted by **C.Ret** on 19 July 2011, 5:49 a.m.,*
in response to message #1 by mr-scorpio

Hi,

This is not a silly question, but an interessant computing challenge on both HP28 and HP48 advanced calculators.

Fortunately, and without any "Erable" add-in or any newer CAS feature, any HP-48 are able to compute and display any digits of the n! factorial by using a quite easy and not so elaborated dFACT program which was compose by myself in 1989 for the same purpose on a HP-28S.

For easy reading and printing dFACT returns all digits of the n! factorial into the stack by ten-digit numbers. Printing will be easy with print stack command PRST and storing all this stuff in a list by using DEPTH ->LIST sequence.

```
 « -> n                          @ input n from stack
   « n ->STR 33 CHR + 61 CHR +   @ put string "n!=" on top of stack
     2 'd' STO                   @ initialize dimension d
     1                           @ initialize stack with 1!
     1 n FOR k                   @ main loop n!=1*2* ... *k*...*n
        0                        @ zero carry
        2 d FOR p                @ for each of the d ten-digit-number
           p ROLL                @ p-th ten-digit from stack
           k *                   @ multiply by k
           +                     @ add carry
           1E10 MOD              @ ten-digit rest
           LAST / IP             @ set and round carry
           SWAP p ROLLD          @ roll ten-digit back in stack
        NEXT
        IF DUP                   @ test last carry
        THEN                     @ if any
           d ROLLD               @ add one more ten-digit in stack
           'd' 1 STO+            @ increase d value
        ELSE
           DROP                @  erase null carry
        END
     NEXT
   »
»
'dFACT' STO
```

Examples:

```
0 dFACT                 -->2:                "0!="
                           1:                    1
```

```
1 dFACT                 -->2:                 "1!="
                           1:                    1

5 dFACT                 -->2:                 "5!="
                           1:                  120

13 dFACT                -->2:                "13!="
                           1:           6227020800

14 dFACT                -->3:                "14!="
                           2:                    8
                           1:           7178291200

17 dFACT                -->3:                "17!="
                           2:                35568
                           1:         74280960000
```

Upto ther nothing special and results are equivalent to built-in FACT instruction.

```
23 dFACT                -->4:                "23!="
                           3:                  258
                           2:           5201673888
                           1:           4976640000

100 dFACT              --->17:               "100!="
                           16:             93326215
                           15:           4439441526
                           14:           8169923885
                           13:           6266700490
                           12:           7159682643
                           11:           8162146859
                           10:           2963895217
                           9:            5999932299
                           8:            1560894146
                           7:            3976156518
                           6:            2862536979
                           5:            2082722375
                           4:            8251185210
                           3:            9168640000
                           2:                     0
                           1:                     0
```

Main inconvenient is exponential computation time, on HP28C/S : 10! Need only 2"00, 50! nearly 11"48, 100! is about 44"94, 150! as long as 1’45"05, . . . , 400! In nearly 16’30" and at least 446! in 21 very long minutes.

> Main inconvenient is exponential computation time,

Anyway, your algorithm appears to be about three times faster than the one in the last message of this old thread, for the HP-41/HP-42S:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=108035

The author has used a LOG instruction somewhere in his program, which may have slowed it down a bit.

Thanks for sharing it.

Gerson.

HP 41C - connection missing?

*Message #1 Posted by **Alexander Oestert** on 18 July 2011, 7:53 a.m.*

Hi all,

I have a very nice looking HP 41C (squared corners display) that stopped working right in the middle of something. So I disassembled it and applied some WD-40 to several points as a solvent and as a contact enhancement. I must have put it in the wrong places. My 41C didn't wake up after reassembly. I took it apart a second time and was able to get the keyboard top utrasonically cleaned at a local optician.

When reassembling the thing I found that the row of connectors between the keyboard PC and the LCD looked like this in the top left corner:

There are three soldered connectors but it looks as if a fourth is missing, there's even solder on the two contacts on both PCs, though there is no conductive path leading away from the contact on the keyboard PC. All pictures that I could find on the i-net show only three connectors in that place. Is mine missing a connector or is it plain normal?

Edited: 18 July 2011, 9:59 a.m.

*Message #2 Posted by **Hans Brueggemann** on 18 July 2011, 3:16 p.m.,*
in response to message #1 by Alexander Oestert

alexander,
three connections are correct. maybe, somebody tried to "hack" it and connected a fourth wire just to find out, whether there were some extra features to discover.

hans

Re: HP 41C - connection missing?

*Message #3 Posted by **Alexander Oestert** on 18 July 2011, 4:16 p.m.,*
in response to message #2 by Hans Brueggemann

Besides from the case not looking pre-opened before I opened it, why would anybody solder in a connection going nowhere?

Re: HP 41C - connection missing?

*Message #4 Posted by **Geoff Quickfall** on 18 July 2011, 6:41 p.m.,*
in response to message #1 by Alexander Oestert

there were a few revisions on the LCD panel. You have a later revision due to the appearance of the epoxy caps.

I have seen four and three connections at this point including HP swaps for service. Also, the connections may be factory made with 4 contacts, and when the revision came out, three contacts were required so the forth was removed.

WD 40 is a lousy contact cleaner. It actually coats the contacts. Clean them with a lint free cloth and rubbing alcohol (enthanol) or contact cleaner. I use a fibre glass pen to clean up dirty contacts.

```
Clean the contacts on the logic pca.
Clean the contacts on the battery module bloc.
Clean the contacts on the keyboard pca.
Check the screw posts for cracks.
Check the screw post threads, ie does the screw grip the screw post or is it stripped.
```

No conspiracy on the missing contact ;-)

Geoff

in response to message #4 by Geoff Quickfall

Thanks to both of you for your kind replies.

> Quote:
>
> WD 40 is a lousy contact cleaner. It actually coats the contacts.

Yeah, I found that out the hard way... I cleaned all the contacts I could reach with isopropyl alcohol afterwards and dipped the keyboard part in an ultrasonic bath. The latter did only half the job and the machine was still acting erratically, so I took a deep breath and soaked it in warm water with dishwashing detergent for an hour and dried it over night. Tadahh! Now it's working, but still doesn't always react to the ON key at the first press. I haven't decided if I will take a deeper look into that flaw or if I will just be happy with what I've got.

> Quote:
>
> No conspiracy on the missing contact ;-)

Was there even the word *conspiracy* back in the 80's??? ;-)

Re: HP 41C - connection missing?

*Message #6 Posted by **Geoff Quickfall** on 19 July 2011, 4:07 a.m.,*
in response to message #5 by Alexander Oestert

Time to invest in some de-oxit:

deoxit site

Your local electronics shop may have it. Look for deoxit gold in a tube.

Before you do that, take a strand of copper wire from a standard house hold cord. Locate the pinhole on the reverse side of the keyboard that corresponds to the ON key bubble contact. Push it into the pinhole and move it around. Introduce some isopropanol to the hole and swish the wire around. With compressed air blow air into the pinhole. let dry.

See if that helps.

next take the tube of deoxit and press the nozzle against the hole. Squeeze a tiny amount into the hole and work the key. I have fixed many intermittant keys including the on key. As you use the key the response gets better over time.

Geoff

[Problem solved] at least looks like it ;-)

*Message #7 Posted by **Alexander Oestert** on 19 July 2011, 5:02 a.m.,*
in response to message #6 by Geoff Quickfall

Hi Geoff,

thanks for the deoxit link. As I'm located in Germany the nearest source for it seems to be UK ebay, where I found some items.

Unfortunately the ON key is not my only problem anymore. After working well for a while, the display constantly showed NULL after pressing the SUM+ key and the 41 stopped working altogether. Now I get only a row of @ in the display when I reinsert the batteries. Or parts of @ characters or some strange signs scattered all over the place.

I performed ON <- resets and ON ENTER <- resets repeatedly, taking out and reinserting batteries with no avail. I cleaned (with isopropyl alcohol, not WD-40!) and checked the pressurized connector of the battery compartment as well as the foam connectors to the CPU board. They all seem to look ok. I could even measure connectivity through the foam connector to the printed leads underneath.

I think I will let the 41 rest for a while, maybe there is still some humidity inside the keyboard causing it to act up. The funny thing about humidity is that I found this document from HP

Reset the HP41

which is about possible static electricity affecting the calculator, that says one should *increase* humidity to solve problems... ;-) So I just soak it again and try to operate it under water! ;-)

EDIT: I didn't keep my promise to let both of us rest - me and the 41. I 'screwed' with it one more time and assembled it in a way I hadn't before. When I took it apart the first time, a brown plastic rail came off and I didn't see where from. As it had the exact length of the CPU board, on reassembly I put it under it on the side of the battery compartment. This thin plastic rail also has the exact length of the LCD display, which is where I put it now: in the gap between the top of the calculator casing and the LCD. And voilà, it's working. That rail probably screwed up the connection of the CPU board and the keyboard PCB, because it wasn't meant to be there. Can anybody confirm this? TIA

Edited: 19 July 2011, 7:10 a.m.

Re: [Problem solved] at least looks like it ;-)

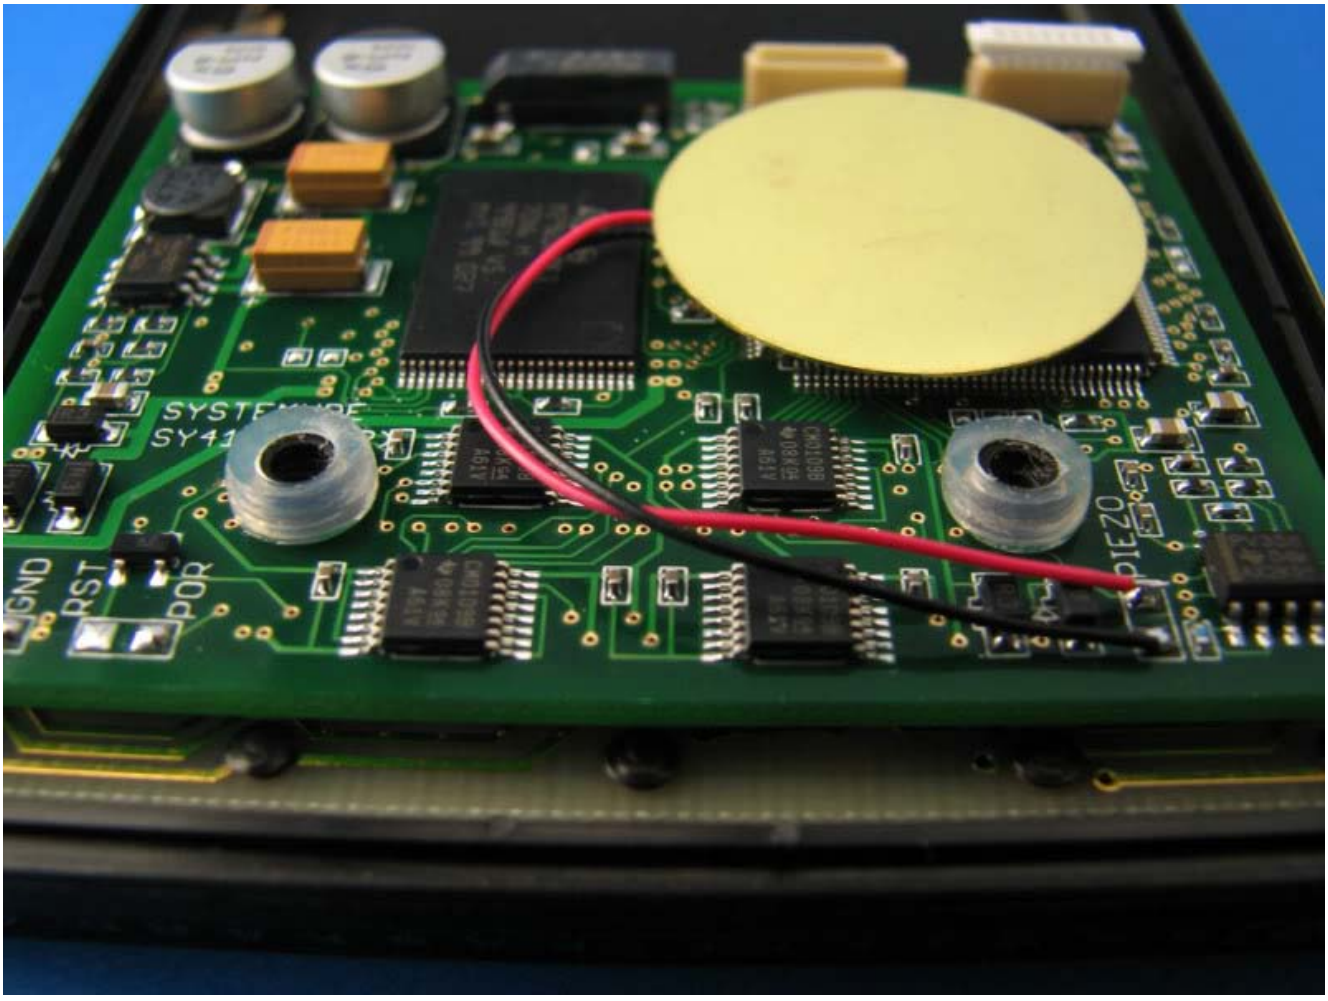
*Message #8 Posted by **Geoff Quickfall** on 19 July 2011, 2:15 p.m.,*
in response to message #7 by Alexander Oestert

The rail is a dust protector and probably something to with shock protection for the LCD. Yep it belongs at the top of the LCD panel.

This sounds like a connection problem a the CPU (logic pca) to keyboard pca. You say 41C, is the logic pca, is it attached by hex nuts or was it pressed into place by the back shell cover?

Focus on the the keyboard, logic connection. Open it up and place it in front of a fan for a couple of days. It sounds like you gave it a real soak. Did you rinse with water? If not, rinse with water to remove the soap residue, (avoid getting the LCD wet). Then place it vertically LCD panel up in front of a fan. Leave it for a couple of days just to be sure. DO NOT use a hair dryer on high (LCD damage) be patient.

If you have hex nut board attachments then the screw post that the hex nut attaches to may be stripped. If so try this:



You can substitute stryene tubing cut the same length as the screw post, that is, when added the tubing is flush or slightly proud of the screw post when the board is added. The photo is silicon tubing for use with card reader restorations.

Do you have an email? I have just finished a design for reinforcing screw posts, repairing stripped posts and cracked posts. I have to clean it up for a posting here.

Geoff

PS that is the 41CL board in place in a tall keys 1933Axxxxx serial numbered case! incase you oldtimers were wondering!!!!

Re: [Problem solved] at least looks like it ;-)

*Message #9 Posted by **Alexander Oestert** on 19 July 2011, 4:51 p.m.,*
in response to message #8 by Geoff Quickfall

Thanks a lot, again, Geoff!

It's the pressed-by-back-cover-version and my problem was entirely solved by taking away the plastic rail from underneath the CPU PCB and putting it in the right place. The screw post are ok, too. I really gave it a good soaking: 30 minutes completely under warm water, after the ultra sonic bath at the optician! And I dried it with a cold (!) blow drier and by putting it in my closed convertible in the summer sun. I'm not the patient kind of guy, you see...!!!

Added bonus: after the ultrasonic cleansing, the thing looks like new.

Serendipity

*Message #1 Posted by **Bob Patton** on 17 July 2011, 9:38 p.m.*

Bored, Sunday morning, I checked local Craig's List for the first time in many months. Searching "calculator", the first pop-up was a 32S II posted an hour earlier, at a fair but reasonable price. E-mail got an immediate response and a phone number. The fellow had two 32S IIs, a 12C and a 10B. We met a couple of hours later and consummated a package deal. The machines are beautiful. Sometimes you just get lucky. What's your latest find?

Is the Casio FX 5500L particularly valuable?

I've got one downstairs in my "old electronics" cabinet, still has the little plastic flip case that it came in.

This past week I aquired an HP-85B in a flight case. Powers up fine and although the seller said the printer paper advances, I haven't tried printing as I want to check the rubber bits first. It belonged to Prof. George Isaak, leader of the Solar Oscillations Network. Unfortunately there were no data tape carridges with it.

In the box; box still shrink wrapped from the UBC bookstore; a never opened or used HP 67.

Beside it an unused battery pack charger.

Had to open it, and found the books shrink wrapped, along with the prgramming pad and etc.

Cost:

100 Canadian Dollars ($80USd at the time) in 2007.

Re: Serendipity

*Message #17 Posted by **Mike Morrow** on 18 July 2011, 8:56 p.m.,*
in response to message #15 by Geoff Quickfall

Many university bookstores seem to lack a policy of clearing out merchandise that hasn't sold, even after years on the shelf. In 1997 at the University of Alabama at Huntsville bookstore, I found two "new" un-opened HP 42S units. They had 1993 serial numbers, and had apparently been on the shelf for four years. I bought both, paying $114 each. I thought I was very lucky because the HP 42S got very very hard to find after it was discontinued in 1995. I had been looking for one for two years. One of these two is still NIB, the other is still near perfect after 14 years of almost daily use. The HP 42S remains my favorite calculator of all time in a collection that goes back to a Bomar 901B I bought in 1972.

Then, there's that old HP-35 that I got in 1978 (with hard case and accessories) by trading a fellow engineer my new but surplus TI-58. It has an 1143Axxxxxx serial number and yes, it is a "red dot" model. I attached no particular importance to that at the time.

But Geoff, how many years had your HP-67 been on the shelf? It sounds like some sort of record for unsold merchandise.

I'm thankful for stores like my local Walmart, which cleared out its inventory of TI-89 Titanium HW 4 models last year for $42.50. I almost think the TI-89 is worth that. :-)

Found 4 HP-42S units at the UVA bookstore in '99. But a brand new 67 in 2007? Wow!

Re: Serendipity

*Message #19 Posted by **Geoff Quickfall** on 19 July 2011, 4:13 a.m.,*
in response to message #17 by Mike Morrow

An Archeology prof invited me over to his place in 2007. I had coauthored a palynology paper about some Queen Charlotte island native sites.

We were talking when i spied the 67 box sitting on a desk in the living room with some other HP accessories. My surprise was that it was still shrink wrapped with the UBC bookstore price and logo 450 Canadian.

I asked him about it and he told me he purchased, moved and forgot about it. He was writing a paper which required stat analysis so he got it down from the closet.

I explained to him what it was worth to a collector, and what problems it would have if he opened it (gummy wheel). He did not want to be bothered as his casio would do the job. WOULD I LIKE IT?

YES, but its worth quite a few dollars. He said "its yours for 50.00"

I replied, make it 100 and you have a deal. Still feel guilty about not bidding him up higher ;-)

By the way, he was 96 and finishing another Archeology article.

Amazing!

Geoff

*Message #20 Posted by **Calum Tait** on 21 July 2011, 6:19 a.m.,*
in response to message #1 by Bob Patton

Just acquired a very early HP-11C complete with the bug at very moderate cost. I count myself as lucky as it was advertised as scratched but on arrival it turned out to have no more than a few minuscule marks and a slight bump in one corner of the keyboard faceplate. I have treated it to new rubber feet as the ones on it were rather soft and also to a new case - both bought at little cost from California. With new batteries I now have rather a nice calculator.

Around year 2000 I saved for months to get a Faber Castell 2/83 slide rule from Venezuela. A month later paying at bookstore they opened a drawer and saw some slide rules. I got to an agreement and bought six 5" Faber Castell slide rules for around 12 euros. When I was leaving the owner showed up to ask if I would be interested in another big slide rule that didn't fit in the drawer, I said yes and for another 6 euros I got a new 2/83.

WP 34S - major changes!

*Message #1 Posted by **Marcus von Cube, Germany** on 17 July 2011, 3:59 p.m.*

We've made some major changes to WP 34S recently which will likely break many functions:

- The first message you'll see is "Erased". If not, you should manually force a clear.
- The assembler is no longer compatible with the current set of op-codes. (Edit: Already fixed by Neil)
- The flash image has yet to be tested.

I've added the lost flash region again. The commands to save and restore user state have changed:

STOM nn will save the user settable mode settings in register nn. The register contents may be inspected in 64 bit integer mode but shouldn't be viewed in decimal mode since it's a pure binary value. Type STO, then MODE (the CPLX key), then the destination.

RCLM nn will restore these settings from a register. The user has the sole responsibility for the validity of the restored value! Type RCL, then MODE (the CPLX key), then the destination.

I'll stop for now, it is getting late here. If the software crashes, just go back to an older release...

Edit: command names have changed.

Edit again: Walter has won the internal command naming contest. ;-)

Edited: 19 July 2011, 5:37 p.m. after one or more responses were posted

Re: WP 34S - major changes!

*Message #2 Posted by **Neil Hamilton (Ottawa)** on 17 July 2011, 5:24 p.m.,*
in response to message #1 by Marcus von Cube, Germany

> Quote:
>
> - The assembler is no longer compatible with the current set of op-codes.

Assembler is now up-to-date for SVN 1242 opcodes.

Hurray for the 4th flash page being back!

Re: WP 34S - major changes!

*Message #3 Posted by **Marcus von Cube, Germany** on 17 July 2011, 5:36 p.m.,*
in response to message #2 by Neil Hamilton (Ottawa)

Thanks for the hurray! We need testers to make sure the space savings haven't introduced more bugs then can be fixed in the limited flash space left now.

Re: WP 34S - major changes!

*Message #4 Posted by **Paul Dale** on 17 July 2011, 5:50 p.m.,*
in response to message #1 by Marcus von Cube, Germany

Another big squeeze. The things effected are commands that don't take arguments from the stack (but they are allowed to return values to the stack or not) and every command that accesses user settable state has changed (both read and write accesses).

The first saved us a kilobyte, the second about half and put back the user state save and restore commands.

> Quote:
>
> The register contents may be inspected in 64 bit integer mode but shouldn't be viewed in decimal mode since it's a pure binary value.

What Marcus failed to mention is that looking at the state value in real mode is capable of locking up the device. Something on my to do list.

- Pauli

Re: WP 34S - major changes!

*Message #5 Posted by **Marcus von Cube, Germany** on 17 July 2011, 5:59 p.m.,*
in response to message #4 by Paul Dale

Since you can store any bit pattern in a register when in integer mode or by storing Alpha, the lockup, if any, could already be produced in earlier versions of the firmware.

Re: WP 34S - major changes!

*Message #6 Posted by **Paul Dale** on 21 July 2011, 3:24 a.m.,*
in response to message #5 by Marcus von Cube, Germany

Actually, this doesn't seem to be a problem.

Look at but don't modify the value in real mode. Not that looking at it there is at all interesting.

Officially, the mode word is opaque and cannot be user modified without risking a complete lock up.

- Pauli

Re: WP 34S - major changes!

*Message #7 Posted by **Cristian Arezzini** on 17 July 2011, 11:46 p.m.,*
in response to message #1 by Marcus von Cube, Germany

I haven't followed the latest developments very closely, but if opcodes changed again that means that if I update I'll loose my programs... Is there a way to convert them? Can the assembler be used to do so?

Re: WP 34S - major changes!

*Message #8 Posted by **Paul Dale** on 17 July 2011, 11:52 p.m.,*
in response to message #7 by Cristian Arezzini

You will need to disassemble them using the version of the assembler that matches your firmware and then reassemble them with the latest.

- Pauli

Re: WP 34S - major changes!

*Message #9 Posted by **Paul Dale** on 18 July 2011, 3:18 a.m.,*
in response to message #7 by Cristian Arezzini

Updating is also optional :-) The basic functionality seems to be pretty robust & has been for a while.

- Pauli

Re: WP 34S - major changes!

in response to message #9 by Paul Dale

I know! :) In fact I haven't reflashed since 1151. But as many changes are being introduced lately, I would like to stay a bit more "current"...

Cristian

Re: WP 34S - major changes!

*Message #11 Posted by **Marcus von Cube, Germany** on 18 July 2011, 4:37 a.m.,*
in response to message #10 by Cristian Arezzini

The serial routines are in but totally untested (because I need to implement the emulator counterpart for them first.) You should wait until I do announce the new features here.

I would say updating is necessary not optional :-)

*Message #12 Posted by **gene wright** on 18 July 2011, 10:25 a.m.,*
in response to message #9 by Paul Dale

The stack changes are critical enough that updating should be a necessity.

The earlier builds do not handle the stack the way all earlier RPN HP's have done. If you wish to use any code previously written as a base and convert it to the 34s, then you really must update or debugging the code will be a nightmare.

The SST change is another reason to reflash if you ever plan to step through code to debug. Seeing the step executed and its result in the display is critical to work like previous calculators.

So, IMO, update!

Re: I would say updating is necessary not optional :-)

*Message #13 Posted by **Namir** on 18 July 2011, 10:56 a.m.,*
in response to message #12 by gene wright

URL for the latest update, please? I go to the typical URL ad get an old version.

Re: I would say updating is necessary not optional :-)

*Message #14 Posted by **gene wright** on 18 July 2011, 11:23 a.m.,*
in response to message #13 by Namir

Latest Version list

the URL above always shows the latest builds but remember - these are often NOT necessarily stable. :-)

download and use at your own risk.

*Message #15 Posted by **Namir** on 18 July 2011, 11:50 a.m.,*
in response to message #14 by gene wright

Thanks Gene! What s the URL for the emulator?

Namir

Re: I would say updating is necessary not optional :-)

*Message #16 Posted by **fhub** on 18 July 2011, 1:11 p.m.,*
in response to message #15 by Namir

> Quote:
>
> What s the URL for the emulator?

I'm using the following link:
http://wp34s.svn.sourceforge.net/viewvc/wp34s/

Here you can see immediately the current version at the top after the item "Directory revision:".
If this number is newer than your latest verison, then just click on this number and you'll get the site with ALL files changed with this revision, and you can also download the files from here.

For the emulator you need the following files (which are all in trunk\windows\bin):
wp34sgui.exe
wp34s.exe (not absolutely necessary)
emulator.dll
1 Medium 34s.skin
2 Compact 34s.skin
3 LED 34s.skin
wp34s_medium.bmp
wp34s_compact.bmp
wp34s_LED.bmp

Edited: 18 July 2011, 1:13 p.m.

Re: I would say updating is necessary not optional :-)

*Message #17 Posted by **Walter B** on 18 July 2011, 1:26 p.m.,*
in response to message #16 by fhub

... and once you've downloaded these, you will only need updating wp34sgui.exe until the layout will change.

Walter

Re: I would say updating is necessary not optional :-)

*Message #18 Posted by **fhub** on 18 July 2011, 1:32 p.m.,*
in response to message #17 by Walter B

... and sometimes also emulator.dll is updated. ;-)

(not-updated files don't even appear in the revision list)

Re: I would say updating is necessary not optional :-)

*Message #19 Posted by **Marcus von Cube, Germany** on 18 July 2011, 1:45 p.m.,*
in response to message #17 by Walter B

> Quote:
>
> ... and once you've downloaded these, you will only need updating wp34sgui.exe until the layout will change.

... or until I change the linkage between the exe and the emulator dll. That's what I had to do today. You will need emulator.dll because it contains a new function which is called by wp34s.exe.

I'd be most interested in the back side ;-)

Walter

Re: new HP15c released in Japan

*Message #6 Posted by **Gerson W. Barbosa** on 17 July 2011, 4:07 p.m.,*
in response to message #5 by Walter B

Because of the larger battery compartment cover? Hopefully the essential information will be there. Let's hope the number on the display has been keyed in or it is just the result of a keystroke sequence like [g] [pi] [g] [HYP^{-1}] [SIN] [f] [HYP] [SIN] ...

Gerson.

Re: new HP15c released in Japan

*Message #7 Posted by **marais** on 17 July 2011, 5:12 p.m.,*
in response to message #6 by Gerson W. Barbosa

The display seems to have less contrast than the original. But I'll buy 3 anyway.

Re: new HP15c released in Japan

*Message #8 Posted by **Gerson W. Barbosa** on 17 July 2011, 7:18 p.m.,*
in response to message #7 by marais

If it is as good as that of the new 12C, then it's ok. I hope to buy two of them. Looks like HP will have to make another batch :-)

Re: new HP15c released in Japan

*Message #9 Posted by **Jake Schwartz** on 17 July 2011, 5:43 p.m.,*
in response to message #2 by Lyuka

Has anybody noticed the display? When I press PI on my 15C, I get "3.141592654", rather than the last digit being "3". Perhaps the non-math person setting up that display keyed it in manually and didn't know where PI was located on the keyboard. This has me really worried about the smarts of the people in charge.

Jake

Re: new HP15c released in Japan

*Message #10 Posted by **Michael de Estrada** on 17 July 2011, 6:28 p.m.,*
in response to message #9 by Jake Schwartz

Try what Gerson said.

Re: new HP15c released in Japan

*Message #11 Posted by **Gerson W. Barbosa** on 17 July 2011, 6:49 p.m.,*
in response to message #9 by Jake Schwartz

Perhaps he/she knows pi by heart to more digits than the display can hold and just did not want to round it up. The Japanese are great memorizers, as we know. I never went beyond the rounded 12 digits, but recently I have gone a little further: 3.1415926535897932 :-)

Gerson.

Re: new HP15c released in Japan

*Message #12 Posted by **Michael de Estrada** on 17 July 2011, 6:57 p.m.,*
in response to message #11 by Gerson W. Barbosa

I've got better things to do than memorize pi to 16 digits. Like remember the names of all my relatives. :P

Re: new HP15c released in Japan

*Message #13 Posted by **Gerson W. Barbosa** on 17 July 2011, 7:08 p.m.,*
in response to message #12 by Michael de Estrada

Actually, I didn't try to. It's just that they appeared constantly in a problem I was working on that I couldn't help but memorizing them, till when I don't know. There was a time I knew about 30 phone numbers by heart, now I am glad I still know my own ones :-)

Re: new HP15c released in Japan

*Message #14 Posted by **Ángel Martin** on 18 July 2011, 1:32 a.m.,*
in response to message #11 by Gerson W. Barbosa

Maybe they changed the rounding algorithms, hey for what we know it may even have a non-lifting stack pi :-)

Sure it looks suspicious, oversight or intentional??

Re: new HP15c released in Japan

*Message #15 Posted by **gene wright** on 17 July 2011, 10:55 p.m.,*
in response to message #9 by Jake Schwartz

Oh, I would assume someone who does not know the value of PI keyed it in from a list and did not properly round to 3.141592654.

Doh!

Re: new HP15c released in Japan

*Message #16 Posted by **Ángel Martin** on 18 July 2011, 7:39 a.m.,*
in response to message #15 by gene wright

> Quote:
>
> ...value of PI keyed it in from a list and did not properly round to 3.141592654

Hmmm, this is most intriguing - or somebody is tripping us all up knowing how predictable we are.

But it could be related to the extended precision that (supposedly) the new machine has got - who knows, maybe they used a truncation to the classic 10-digit mantissa instead of a ROUNDING?

Gosh I'd hope not...

Re: new HP15c released in Japan

*Message #17 Posted by **Alejandro Paz (Germany)** on 18 July 2011, 1:20 a.m.,*

Hi Lyuka,

I still can't find the HP 15C in the shopping cart!

http://www.shopping.hp.com/can/calculator/HP/1/storefronts;HHOJSID=fZkJTkdpXq1HJsqnlKz42LX1TlxnfnGbQhGbQhtM2PkfpQzL1KV1!1516178979?jumpid=in_R329_prodexp/hhoslp/psg/lateralnav_calculators

so HP is just into releasing manuals of classics, eh? ;-)

hpnut in Malaysia

in response to message #21 by Lyuka

You do realize that the color manual is the scan from Dave's DVD set available here. The watermark "copyright MoHPC" is still on some of the pages.

look at the bottom of the third page of the pdf, there is in light grey, the text "Scan Copyright (c) MoHPC". a little odd for a manual being genuinely published by hp?

addendum: LOL, looks like katie spotted it at the same time as me!

Edited: 18 July 2011, 2:40 p.m.

Technically HP owns the copyright for the manual. I think it's a little obscene that the HP Museum tries to claim copyright.

Eric

*Message #27 Posted by **Steve Simpkin** on 18 July 2011, 4:00 p.m.,*
in response to message #26 by Eric Rechlin

From the wording, I think the HP Museum Copyright is strictly for the scanning process. AFAIK, the HP Museum had permission to scan and re-distribute these manuals. I suspect that HP also reserved the right (either implied or explicitly) to use the scanned copies from the HP Museum as

well.

Re: new HP15c released in US

*Message #28 Posted by **Eric Rechlin** on 19 July 2011, 12:45 a.m.,*
in response to message #27 by Steve Simpkin

> Quote:
>
> From the wording, I think the HP Museum Copyright is strictly for the scanning process.

I am not a lawyer, but I believe this has no legal basis. If you take a photograph of a painting, you do not own copyright of the photograph because no original work was created. I don't know if there is case law to support this, but I would imagine the exact same thing would apply to scanning a painting (or a manual or whatever).

The HP Museum does not own the copyright of the PDF manuals for this reason. HP does, however, just like they have the copyright of the original manuals. HP is completely within their rights to distribute the scanned manuals that say "Copyright MoHPC", and it is entirely possible, if not likely, the MoHPC is violating federal law by claiming copyright here.

*Message #30 Posted by **gene wright** on 19 July 2011, 9:03 a.m.,*
in response to message #29 by Jim Yohe

Hey Jim.

I think Eric's point isn't that HP did not give Dave permission to scan these old documents, but whether the Museum can claim copyright to them.

I want HP to keep it pure RPN, no AOS pls!

the recent models all have algebraic, the manuals suffer as a result of having to explain how to use the calculators in RPN and AOS modes.

p.s. heheh, having JTAG connectors is a good idea, too, to allow power users to "repurpose" the HP 15C :-)

Re: new HP15c released in Japan

Re: new HP15c released in Japan

*Message #56 Posted by **Steve Simpkin** on 18 July 2011, 1:23 p.m.,*
in response to message #48 by Michael de Estrada

Well if it is a hoax, it is a very good one.
If you go to HP's Customer Care website at "www.hp.com/cposupport/eschome.html" and type "HP-15C" (without the quotes) in the product location box, you will be sent to HP's HP-15C support page. The product picture shows the "Limited Edition" text under the name badge. Here you can also download a scanned color English copy of the HP-15C Owner's Handbook (dated June 1987).
Again if this is a hoax, it is an inside job on HP's North American and Japanese websites.

Thank you Lyuka for posting this information.

Re: new HP15c released in Japan

Re: new HP15c released in Japan

*Message #59 Posted by **Peter Murphy (Livermore)** on 18 July 2011, 1:16 p.m.,*
in response to message #1 by NateB

HP corporate switchboard told me this:

* Call HP at 1-800-752-0900.

* Ask (by voice prompt) for presales information and/or product information.

* Stay on the line and do what you must to speak to a human.

I did all that.

The human hadn't heard this news. I gave him the first of the two URLs in NateB's 17 July 2:26 p.m. message. He put me on hold for a while and returned with this:

Yes it was released in Japan yesterday 17 July. No, he has product information only, not prices, not even of US products and definitely not on this. He has no information regarding possible release in the USA.

If it becomes available in the USA, however, pricing and ordering information thereon will be at the Home Office (HO): 1-888-999-4747.

And have a great day, he says.

Of course, not yet.
It's going to be launched in the near future, you mean, right ? ;-)

Lyuka

Re: new HP15c released in Japan

*Message #67 Posted by **Martin Pinckney** on 18 July 2011, 2:09 p.m.,*
in response to message #66 by Lyuka

If you put the URL of the first site NateB cited into Google Translate, it says the web page is in the Chinese language (even though the address has ja in it).

The translation does not yield much, but at the bottom it says:

©2011 Hewlett-Packard Development Company

So I am speculating (like everyone else here except Tim) that what NateB found is some sort of internal HP site (or masquerading to be one) related to product development. Which is why it's in Chinese. {:-)

I can't read either Chinese or Japanese but I know enough about the characters used in the two languages to say that this is definitely Japanese. Chinese doesn't use katakana, which some of the characters on that page are.

I wouldn't worry too much about HP. I'm sure their sales of 12c's are about a billion times what the sales of a 15c reissue would be.

Re: new HP15c released in Japan

*Message #83 Posted by **Reth** on 18 July 2011, 7:39 p.m.,*
in response to message #81 by Ángel Martin

Exactly! Now whoever brings it on the market first, wins. I'd still buy the clone though, there is a word given ;)

Re: new HP15c released in Japan

*Message #84 Posted by **Bart (UK)** on 19 July 2011, 12:10 p.m.,*
in response to message #81 by Ángel Martin

This could be a ploy by HP to play legal cat-and-mouse, asserting their wish to still produce 15C's to have legal clout to stop the clones entering the market (e.g. considering "copyright and fair use" - would the clone impact HPs market? One could argue not if they weren't going to make any more).

Note: I am just throwing some thoughts into the midst. I am not really knowledgeable about legal issues. Just speculating.

Re: new HP15c released in Japan

*Message #85 Posted by **Bart (UK)** on 19 July 2011, 12:30 p.m.,*

*Message #93 Posted by **JustinM** on 21 July 2011, 10:16 p.m.,*
in response to message #92 by hpnut

I don't think this was a hoax. I successfully ran the page through Google Translate before it was removed. It was in Japanese. It was an incomplete product page, with sections for specs and features that were empty. It looked like a rough draft of a web page that was accidentally made accessible on the public internet.

Had the image shown up on some sketchy server or a Chinese rumor site then I'd be more inclined to think the "Limited Edition" logo was photoshopped. The fact that the image was hosted on an actual HP web site gives it a lot more credibility. The colors do look a bit off, the 'f' key is crooked, and pi is truncated instead of rounded, but it could be a prototype with a number typed into the display. As far as the display goes (including the contrast), it could easily have been simulated.

I think this (and the smaller version of this image on the US HP site) just verifies that a re-release will happen, but I wouldn't read anything into the product quality or try to predict timing yet.

in response to message #93 by JustinM

I have screen captures of the pages before they were taken down if anyone is interested. It was on HP's Japanese site. Also, Google still has the cached images available.

I also managed to dig up the spec sheet for the upcoming 30th Anniversary Edition 12c from the HP website. The part number format for the 12c (NW258AA) matches the part number format listed for the Limited Edition 15c (NW250AA). Also, the values of pi displayed on the 12c are the same as those on the 15...

The 15c and 12c are also starting to show up on vendor sites. Here is an example. List price of $85.00 :)

Tim had two choices here. 1) Say nothing (which people would usually take no response as being true) 2) Say something (which would have to tow the company line and quell any rumors, but not confirm it). I see he did that nicely ;-)

If it was on the HP Japan site, then it's true. Doesn't mean they can't can it last minute though. But if it made the site, then it's probably gone to far and is likely imminent.

> Quote:
>

Just noticed that. Can someone give me a quick low-down? I gathered it's a firmware/decal/key set to turn a 20B financial into a scientific? They keys were always the bugbear, how was that solved?

Dave.

Exactly. The sourceforge site has the code and pre-compiled binaries.

> Quote:
>

By the 30b :-) The 20b's key are unchanged. The 30b, however, has a much nicer keyboard. It really is fairly pleasant to use and it uses the same internals.

Well, things have changed since I was last on here.

I'm now a full time video blogger, so in theory I should have a lot more time to spend on projects like the uWatch2 and the uCalc.

But somehow, I haven't!

It might be this:
http://www.youtube.com/watch?v=dzrtEYmuQJQ

But you never know, that calc watch fetish might emerge again!

Dave.

Operating an e-commerce web site doesn't appear to be one of HP's core competencies. They routinely fail to have information about shipping products, or fail to allow purchasing them, but then they do have information about unannounced products.

They should outsource their web site to Amazon or something.

Re: new HP15c released in Japan

*Message #109 Posted by **Thomas Radtke** on 24 July 2011, 5:35 a.m.,*

A non-working information flow is rarely corrected by adding another components, imo. My company just introduced XML to get rid of some sources of problems :-). If anything fails, it happens where still word is used or something like web pages are manually edited. It is highly interesting how huge amounts of information can be successfully interpreted by very simple stylesheets and a few php scripts to get everything needed to put out one or two more or less new machines each day.

It takes only a handfull of technical writers to do it right. No need to outsource anything.

Re: new HP15c released in Japan

*Message #110 Posted by **Eric Smith** on 24 July 2011, 6:51 a.m.,*
in response to message #109 by Thomas Radtke

The HP web site problems don't appear to have anything to do with the technical writers.

It wouldn't be "adding another components", it would be replacing one set of components with another.

I've certainly seen plenty of outsourcing projects fail miserably, but I've also seen web and e-commerce sites outsourced to industry-leading companies with great results.

Re: new HP15c released in Japan

*Message #111 Posted by **Thomas Radtke** on 24 July 2011, 7:28 a.m.,*

> I've certainly seen plenty of outsourcing projects fail miserably, but I've also seen web and e-commerce sites outsourced to industry-leading companies with great results.

Yes, it all depends on the kind of information to present. If you offer a shop and handle annoncements, you have to connect your data source somehow to another company.

In the best case, only raw data as collected is maintained and everything is derived from it in time. You wouldn't want to provide a selective copy of your raw data to anyone, as this would mean to integrate and maintain one addition component. I'm talking about safety here.

Synchronizing general changes is another problem to be solved. It's far easier to do this in a meeting than to transport all necessary information to another party.

BTW, don't underestimate the scope of technical writers. They don't just write. Actually, sometimes they even don't write at all. The german term for it translates to 'technical editor', which is more to the point.

A question on old calculator prices

*Message #1 Posted by **Cristian Arezzini** on 17 July 2011, 4:47 a.m.*

Now, I know that for out-of-production items there isn't a "right" price, that a calculator - for example - is worth what others are willing to pay for it. But looking at prices on TAS (I'm not an "obsessed" watcher of that site, but sometimes I look around there a bit), I see something strange. Take, for example, the 48GX. I have 4 of them, and three were bought on TAS in the last years. All these used items had decent prices IMO - all of them well below 100 Euro. But I noticed there are sellers (one more than others, but there are several) selling stuff for ridiculous (for me) prices, like, close to $400 for a standard 48GX. Out of curiosity I checked their past sales and they seem to have many happy customers, who paid the "premium price" for their calcs. What I'm wondering is this: if someone who wants a 48GX can find it on TAS for <$100 or for >$300, why should they buy the more expensive ones? I could understand if someone really wants some really rare item, but what about easy-to-find (and cheap) calculators? Why would anyone accept to pay so much more for them? I just don't get it...

Re: A question on old calculator prices

*Message #2 Posted by **Marcus von Cube, Germany** on 17 July 2011, 6:00 a.m.,*
in response to message #1 by Cristian Arezzini

The GX is still in use by professionals. If their current calculator brakes down or gets flaky they just don't think much and get what they can get at the time at the price that is asked for.

Re: A question on old calculator prices

*Message #3 Posted by **Bart (UK)** on 17 July 2011, 6:29 a.m.,*
in response to message #2 by Marcus von Cube, Germany

It seems to me that many people just jump onto eBay and buy the first result that comes up. They are just too lazy to look around. There are many current HP models for sale there that are higher in price than listed on online stores. You can save money on auction sites, but it pays to search elsewhere too.

Re: A question on old calculator prices

*Message #4 Posted by **Cristian Arezzini** on 17 July 2011, 11:43 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Hm. I know it can happen with rare items, where someone wants one right now and can only find one, overpriced... But the 48GX, to keep with my example, is always readily available. One has to hunt for the "big deals", but decent prices can be found at any time. Still, looking at his feedback, that seller managed to sell several. That's what I really don't get. Sometimes maybe people are fooled by thinking that if a price is much lower than another one, it must be because the item has some problems...

Fun fact: my wife's mother has an antique furniture shop in New York. Sometimes, when she has an item that doesn't sell for a long time, before throwing it away she tries to substantially increase the price (4- or 5-fold), and then usually the item sells immediately. A few months ago she had a chair from the seventies, listed for $400, unsold for two years; she changed the price to $2500 and it sold within the week. Probably people thought, "Wow, look how expensive it is, it must be really rare"... :)

Re: A question on old calculator prices

*Message #5 Posted by **Bart (UK)** on 17 July 2011, 6:21 a.m.,*
in response to message #1 by Cristian Arezzini

Some sellers seem to want to get rich from selling old calculators. They sell them for about an order of magnitude more than they paid for them - one of them once bid on an HP I was selling and their max bid was many times lower than similar calculators (s)he had on sale.

As for the buyers, if they have that kind of money to spend and are willing to do, so be it - they are probably not willing to wait or look around (i.e. "I want it and I want it now, at any price"). I watch and wait, and recently got a 71B (very good working condition with IL port) for almost 1/10 of the BIN price of those sellers.

I think that unfortunately these high BIN/starting seller prices and the buyers that buy them do have an influence on auction prices. But as my example of the 71B testifies - patience pays off.

Re: A question on old calculator prices

*Message #6 Posted by **Michael de Estrada** on 17 July 2011, 11:04 a.m.,*
in response to message #1 by Cristian Arezzini

Just because someone lists an item at a very high selling price, doesn't mean they will get that price. There is a very notorious seller on the USA TAS site that has been listing the same overpriced items on TAS for years, and they have never sold. What I find far more amazing is that people seem willing to pay more for items on TAS that are available new in stores at MSRP for less. Recently an HP QuickCalc sold for over $10 on TAS, when I found one in my local Office Depot for $4. Typically, vintage HP calcs listed as BIN (Buy It Now) on TAS are priced at about 2X what they would normally fetch in a normal no reserve auction, however, occasionally you will find something at a good price. I found a HP-25C in perfect working and cosmetic condition for $150, whereas they almost always sell for considerably more in regular auctions. I think mostly it's inexperienced buyers who don't have a good sense of the market or even the product who overpay for items. Perhaps the buyer of the QuickCalc just saw the HP logo on the item and automatically thought it was worth more on that basis.

*Message #7 Posted by **Maximilian Hohmann** on 17 July 2011, 11:44 a.m.,*
in response to message #6 by Michael de Estrada

Hello!

> Quote:
>
> Recently an HP QuickCalc sold for over $10 on TAS, when I found one in my local Office Depot for $4.

Maybe some of the different colours are rarer than others? Who knows... I have bought three of these on eBay (three different colours, all new and boxed (or "sleeved")) and paid 1 Euro each, two of them had the shipping already included in that one Euro. But to be honest, they are worth no more than 50 Cents.

I have also been watching these calculators with outrageous buy-it-now prices over the years (one regular posters on this forum lists hundreds of these on German eBay every second weekend when eBay dosen't charge listing fees) but almost none of them ever sell. But maybe a one-in-a-thousnd sale is worth all the

effort?

Regards, max

*Message #8 Posted by **Namir** on 17 July 2011, 11:53 a.m.,*
in response to message #7 by Maximilian Hohmann

I have found a few Hungarian sellers on TAS asking for high prices for calculators. A few weeks ago one listed a TI-95 for $400!!! When I contacted him and told him the machine should start at most for $40, he told me that I was funny and I should be watching more TV. The item is still listed (as of this writing) and has not sold. Not sure it will sell for that price.

Namir

Think I know the same person. Annoying :-(Since the items are not BIN but just outrageous start prices, it's difficult to filter these "offers" out. And the seller is unconvincible though he hardly ever sells any such item. I hate calling for eBay fees, but here it seems the only cure :-/

Just my 20 m€ as usual, Walter

True, the calculator I mentioned in this thread is still for sale.(After researching the seller, it seems the price I mentioned there was because the seller was on holiday and wanted to dicourage buyers). It started at about £50 I think a year or so before *that* post. i.e. it's been on sale for over 2 years (looking at the revision history it was on sale already in June 2009). It's a generic model of which similar units (e.g. SATEK 8M) usually sell for <£2.00.

I made an offer on it and he was so upset with my price that he banned me from buying any of his products ;(

in response to message #1 by Cristian Arezzini

When I see someone listing an HP41 bar-code scanner for $489 BIN-only price, I just laugh and say, "You're an idiot!" As others have said, they keep listing them week after week and no one buys.

Re: A question on old calculator prices

*Message #12 Posted by **Martin Pinckney** on 18 July 2011, 10:40 a.m.,*
in response to message #11 by Garth Wilson

> Quote:
>
> As others have said, they keep listing them week after week and no one buys.

There is another possible explanation. eB** allows an individual to have two distinct ID's. So perhaps these sellers keep the BIN price outrageously high for one ID, to hopefully affect the market while they sell via their other ID. Then perhaps occasionally they score with the high-priced ID.

Just a thought.

Re: A question on old calculator prices

*Message #13 Posted by **David Ramsey** on 19 July 2011, 1:44 a.m.,*
in response to message #1 by Cristian Arezzini

It's hard to have a real "market" for items with as limited appeal as classic calculators, since there are so few people to whom they are worth anything. I imagine the same is true for other limited-appeal collectible items.

What this means is that any individual calculator is worth whatever someone can be convinced to pay for it. For example, I recently bought an SR-60 on TAS and paid rather a lot of money for it. Joerg Woener, who has hundreds of TI calculators, thinks I overpaid by a factor of three or so, but I'm happy, and they are so rare that Joerg's web site only lists 4 other owners (I'm sure there are many more, but still...), so who's to say what an SR-60 is "worth"?

Yeah, it frosts my lenses when I see some of these TAS yahoos' pricing...I see one infamous fellow has apparently decided that almost everything he has is worth exactly $489. But presumably you're not wishing for some central price-setting authority, so my best advice if you see something you want is "patience, grasshopper..."

Re: A question on old calculator prices

*Message #14 Posted by **Cristian Arezzini** on 19 July 2011, 2:03 a.m.,*
in response to message #13 by David Ramsey

I know that it's the collectors who make the price. Still, I can't get over how ridiculous some sellers are. Right now, for example, there is a BROKEN, non-working 48GX (it doesn't turn on) listed for $299.99. And it's a seller with almost 7000 feedbacks. Elsewhere on the same site, you can find a good, working one for $60. I can't help thinking that - free market and all - the first seller is trying to rip-off someone.

Sorry for the rant, but I just don't get it.

Cristian

Re: A question on old calculator prices

*Message #15 Posted by **Walter B** on 19 July 2011, 2:31 a.m.,*
in response to message #14 by Cristian Arezzini

For sure (s)he is trying to rip off someone - but that's only "fun" as long as somebody lets him(her)self being ripped off. That's all IMHO. No more science ;-)

41 HP-IL: How to reset?

*Message #1 Posted by **Ángel Martin** on 17 July 2011, 2:00 a.m.*

Recently two of my 41's refused to be operational on the IL loop. Only TRANSMIT ERR messages, both with the 'real' loop and the Pil-Box. Even with no device on the loop, closing both connectors together.

A third machine was working perfectly, so I knew the interface wasn't the issue.

Memory Lost brought them back to a more cooperative state, it all works fine now.

I'm a bit rusty on HP-IL operation, is there any other reset procedure that doesn't involve ML?

Also any ideas as to what caused it in the first place? I'm swapping modules very often amongst the three units, maybe some of them caused the issue...

Best, 'AM

Edited: 17 July 2011, 2:07 a.m.

Re: 41 HP-IL: How to reset?

*Message #2 Posted by **Eric Smith** on 17 July 2011, 3:16 a.m.,*
in response to message #1 by Ángel Martin

I'd try a STOPIO. If that doesn't do it, an ML may be the only option.

Re: 41 HP-IL: How to reset?

*Message #3 Posted by **Ángel Martin** on 17 July 2011, 3:26 a.m.,*
in response to message #2 by Eric Smith

STOPIO didn't respond either (same TRANSMIT ERR) but sure enough ML worked. So there's nothing to do with the IL interface, cables or any devices but with the 41 itself.

Apart from Flag 32 clear for AUTOIO, which other flags should be impacted by the loop operation? Also bits in the c(13) status reg perhaps?

ML is too dramatic a solution for this, there must be another way...

Re: 41 HP-IL: How to reset?

*Message #4 Posted by **Hans Brueggemann** on 18 July 2011, 3:33 p.m.,*
in response to message #1 by Ángel Martin

ángel,
most likely your 41 has flag 33 set. that will prevent the loop from communicating with the peripherals.
unfortunately, if you don't have the HPIL DEV module, you have to clear flag 33 via synthetic programming.

the HPIL DEV module actually has the commands CF33 and SF33 built in especially for this purpose. hope, that helps!
cheers,
hans

A simple YPOKE to the right spot will do it.

Re: 41 HP-IL: How to reset?

*Message #7 Posted by **Ángel Martin** on 19 July 2011, 1:45 a.m.,*
in response to message #5 by geoff quickfall

CCD? is that a new digital camera sensor?

:-)

Re: 41 HP-IL: How to reset?

*Message #8 Posted by **Ángel Martin** on 19 July 2011, 1:44 a.m.,*
in response to message #4 by Hans Brueggemann

Flag 33 was not the issue. I certainly have ways to clear/set any flag (Using CFX/SFX in the CCD-Modified, Toolbox and others), so I did it of course. The flag status stayed as changed, even after power-cycling the machine - yet TRANSMIT ERR continued.

And Monte, this wasn't on the CL only, but also on a "regular" CX.

It remains a mystery, now I'm almost looking forward to a new occurence to better diagnose it.

BTW this has happened before to other users, I've seen threads where the only solution was ML as well.

Edited: 19 July 2011, 1:46 a.m.

Re: 41 HP-IL: How to reset?

*Message #9 Posted by **Christoph Klug** on 21 July 2011, 2:17 p.m.,*

in response to message #8 by Ángel Martin

Dear Angel, Maybe the HP41 was in MANIO mode - than TRANSMIT ERR is the result. In this case execute AUTOIO...

34S - Problem With CLx

*Message #1 Posted by **Jake Schwartz** on 16 July 2011, 1:50 p.m.*

Hi,

While debugging a program on the 34S side-by-side with a 15C, I noticed that in the 34S, currently CLx leaves stack lift enabled, which is not the way HP calcs work. In the HP machines, the purpose of disabling stack lift with CLx was so if an erroneous number was entered, CLx would allow entering a replacement value without affecting the stack. For consistency, they kept this behavior the same while running in a program as well.

Hopefully, it makes sense to change this so it works in the 34S like all other RPN machines.

Thanks, Jake

Re: 34S - Problem With CLx

*Message #2 Posted by **gene wright** on 16 July 2011, 2:02 p.m.,*

I think this can be done. Thanks for testing.

Re: 34S - Problem With CLx

*Message #4 Posted by **Paul Dale** on 16 July 2011, 9:08 p.m.,*
in response to message #1 by Jake Schwartz

Definitely a bug, I've got two fixes. One is much cleaner, a tiny bit larger and changers many opcodes. The other is ugly.

- Pauli

Re: 34S - Problem With CLx

*Message #5 Posted by **Paul Dale** on 16 July 2011, 9:15 p.m.,*
in response to message #4 by Paul Dale

And the ugly but smaller fix is applied.

- Pauli

Re: 34S - Problem With CLx

*Message #6 Posted by **gene wright** on 16 July 2011, 9:57 p.m.,*
in response to message #5 by Paul Dale

Wow. That was fast. So the CLX + bug is fixed as well as the stack lift issue with PI or a constant?

Very nice!

Re: 34S - Problem With CLx

*Message #7 Posted by **Paul Dale** on 17 July 2011, 2:45 a.m.,*
in response to message #6 by gene wright

Hopefully they are both fixed. So are complex constants and complex RCL which were also broken by recent changes.

At least, they will be when we do a new build.

- Pauli

Goodbye!

*Message #1 Posted by **George Bailey (Bedford Falls)** on 16 July 2011, 6:08 a.m.*

I had a pleasant time here with most of the forum members. Thanks a lot for that.

Re: Goodbye!

*Message #2 Posted by **Bart (UK)** on 16 July 2011, 7:06 a.m.,*
in response to message #1 by George Bailey (Bedford Falls)

Hi,
Please reconsider. I've had some heated interchanges with another forum member, and both of us still post here.

Remember that a forum is a very limited means of communication as there are no other clues such as tone, expression and body language. Add to that different languages and cultures ....

Please take this with the kindness it is intended.
-Bart

Re: Goodbye!

*Message #3 Posted by **Eric Rechlin** on 16 July 2011, 4:30 p.m.,*
in response to message #2 by Bart (UK)

If he's so thin-skinned that the posts of one person scare him away, it's probably for the best. I don't want him having a heart attack or something if it happens again.

Re: Goodbye!

*Message #4 Posted by **Marcus von Cube, Germany** on 16 July 2011, 4:55 p.m.,*
in response to message #3 by Eric Rechlin

Eric, I hope the two opponents take the chance of discussing their case privately through the forum email and come back with a final opinion later.

Re: Goodbye!

*Message #5 Posted by **Mike Morrow** on 17 July 2011, 1:24 p.m.,*
in response to message #4 by Marcus von Cube, Germany

Re: Goodbye!

*Message #7 Posted by **Don Shepherd** on 18 July 2011, 9:59 a.m.,*
in response to message #6 by Jeff Kearns

It's here, ending at message 30. Let's hope George returns, he's a good guy.

Re: Goodbye!

*Message #8 Posted by **Mike Morrow** on 18 July 2011, 11:46 a.m.,*
in response to message #7 by Don Shepherd

Still...the contents of that thread are rather mild (very mild, in fact), compared to heated threads found here and at *all* other public forums.

Re: Goodbye!

*Message #9 Posted by **Michael de Estrada** on 18 July 2011, 12:33 p.m.,*
in response to message #8 by Mike Morrow

The problem with this forum as distinguished from many others is that there appears to be no moderator (s) to make sure that forum rules are observed. It's pretty much a free-for-all here, and sometimes you have to step back to keep from getting run over.

Still, despite some of the crap I've taken from a few members here, I find it extremely informative and interesting.

Re: Goodbye!

*Message #10 Posted by **bill platt** on 18 July 2011, 12:53 p.m.,*
in response to message #9 by Michael de Estrada

Actually it is not a free for all. Dave does moderate but he is very quiet about it.

Furthermore, this topic lends itself to a more collegial old pre-internet usenet sort of feel...

Re: Goodbye!

*Message #11 Posted by **Andrés C. Rodríguez (Argentina)** on 16 July 2011, 10:06 a.m.,*
in response to message #1 by George Bailey (Bedford Falls)

Please don't leave! From time to time some discussions may become heated, and it's difficult for some

(including me, perhaps) to find the right word or the exact tome to transmit the proper meaning in our messages. Lifestyles, languages, local culture are diverse; and these are factors of communication style.

I like myself the idea of a "34S --" and think, perhaps from lack of detailed knowledge of 34S internals, that taking some features out may be possible and may make sense. It may free resources (granted, what for?) and result in a less dense keyboard. But it may well be that this is complex to implement, and the design team surely know better.

(It seems that the most frequent word in my message seems to be "may"...)

Re: Goodbye!

*Message #12 Posted by **Jim Yohe** on 16 July 2011, 6:20 p.m.,*
in response to message #1 by George Bailey (Bedford Falls)

George the best thing to do is just not get drawn into replying to anything that "he who shall not be named" says since he can be pretty insensitive to what forum users ask or say. It won't hurt if you keep checking back for topics that interest you or some bit of information that's shared that you'll find useful. Take care.

Re: Goodbye!

*Message #13 Posted by **Martin Pinckney** on 18 July 2011, 11:16 a.m.,*
in response to message #12 by Jim Yohe

> Quote:

It's what I call a "superiority complex." When someone believes they are so much more intelligent that the rest of us, they seem to have difficulty tolerating our (to them) non-cogent utterances.

Re: Goodbye!

*Message #14 Posted by **bill platt** on 18 July 2011, 12:59 p.m.,*
in response to message #1 by George Bailey (Bedford Falls)

Let it roll off your back. It was simply "lost in translation" and don't worry about it.

Re: Goodbye!

*Message #15 Posted by **Geoff Quickfall** on 18 July 2011, 6:46 p.m.,*
in response to message #14 by bill platt

Bill "lost in translation" is exactly what this was.

Deal with it internationally every day at work. Cultural differences create confusion and that is what I saw from the outset of the postings referred to.

Try sitting beside someone from a different culture. Just the two of you with nothing in common for fifteen hours in an enclosed room. Some cultures are more aggressive, others passive, and language construct causes most of the aggravation.

Come on back George, and to bad you don't have an email address listed.

Also, George Bailey of Bedford Falls. My favourite christmas character.

Cheers, George, hope to read a post from you soon.

Geoff

Good HP calculator for middle school child?

*Message #1 Posted by **Brian K** on 15 July 2011, 2:58 p.m.*

What do you guys think of the HP 38g? It looks like a pretty good match in my opinion. They are dirt cheap on Ebay, unlikely to be the object of theft, and have pretty much all of the primary functions he'll need on un-shifted keys. The applet library on hpcalc.org looks pretty nice.

Also, if it's built anything like the HP48 series it'll last forever.

Any opinions?

There's also the Smartcalc 300s, and I suppose he could even use my HP 35s, but I'd rather he use something older and/or cheaper.

Re: Good HP calculator for middle school child?

*Message #2 Posted by **Marcus von Cube, Germany** on 15 July 2011, 4:36 p.m.,*
in response to message #1 by Brian K

I would probably prefer the most recent incarnation, a 39gs or 40gs which has more memory and is faster. A USB port doesn't harm either. You find them refurbished for very little money on eBay, too.

The applet stuff isn't bad and you can save the setup for some applet under a specific name. This is very much like the document structure of the TI calculators.

Re: Good HP calculator for middle school child?

*Message #3 Posted by **Bruce Bergman** on 15 July 2011, 4:42 p.m.,*
in response to message #1 by Brian K

The 30b might not be a bad choice. It's got far more statistics chops than needed for middle school, and it does have some advanced math. It looks great, nice keyboard and clear display. Plus, it's cheap.

Just a thought...

Re: Good HP calculator for middle school child?

*Message #4 Posted by **Chris McCormack** on 15 July 2011, 8:43 p.m.,*
in response to message #1 by Brian K

Our kids were handed an HP-33S when they needed a calculator on their school supply list. I think they first showed up in fourth grade. When they hit high school and were told to have a 'graphing calculator', the oldest got an HP-48G, the next one received an HP-49G+.

We didn't go with an HP-35S until my daughter signed up for the Fundamentals in Engineering exam.

Re: Good HP calculator for middle school child?

*Message #5 Posted by **Don Shepherd** on 15 July 2011, 9:50 p.m.,*
in response to message #1 by Brian K

From the perspective of a middle school math teacher.

Please don't force your affinity for HP calculators on your middle school math student. If his/her teacher suggests a particular calculator (which, at middle school level, is not likely), then consider that. Otherwise, my experience is that middle school kids don't really need calculators because they won't help them learn what they've got to learn.

Re: Good HP calculator for middle school child?

*Message #6 Posted by **Martin Pinckney** on 15 July 2011, 10:04 p.m.,*
in response to message #5 by Don Shepherd

I would defer to Don on this, as he has first hand experience teaching at this level, which I don't.

What's I do have experience with is the HP-38g. It's actually the second HP I bought, after the 20s, with about 10 years in between.

Taken by itself, (with nothing to compare it to) it is an excellent calculator. Has a lot of built-in math functions, and the Solver. But it is slow, and memory-limited. I obtained a 48sx later. The 48 will do everything the 38 will, and about 4x more. Yet it seems faster (except in any graphics or Equation Writer mode), and seems to not run out of memory as fast. ???

So while I prefer the straight-laced styling of the 38g, I am sure that Marcus is right that the 39/40 would be a better choice.

Re: Good HP calculator for middle school child?

*Message #7 Posted by **Brian K** on 16 July 2011, 8:14 a.m.,*
in response to message #5 by Don Shepherd

There is no calculator requirement at all, and this is strictly for home use for double-checking homework and class assignments.

I'm not particularly interested in forcing any sort of calculator affinity, but I'm not likely to come onto an HP forum and ask for advice on Casio or Texas Instruments!

The 38g doesn't seem to be a very good choice in any event, I downloaded the manual and the emulator and it doesn't seem very good at all. Ordered a smartcalc 300s and a Casio 115es online for $15 total. One of those should be fine.

Re: Good HP calculator for middle school child?

*Message #8 Posted by **Don Shepherd** on 16 July 2011, 9:15 a.m.,*
in response to message #7 by Brian K

Brian, using a calculator to double-check homework and other assignments is a good idea as long as the student knows the underlying math. For example, in middle school, especially 6th grade, we do a lot with fractions and a student has to know how to perform the 4 basic arithmetic operations with them, including finding common denominators and converting between improper fractions and mixed numbers. If a student doesn't really have mastery of these skills and tends to rely on a calculator that can handle fractions, it will become apparent during testing. Parents need to ensure that students know

the basic skills without relying on the calculator. You seem like that type of parent.

I use a fraction-equipped calculator (HP-32sii) all the time when making test answer keys. I first calculate the answers manually (sometimes in a hurry), and I use the 32sii to verify that my answers are correct. You'd be surprized (or maybe not) at how often my original answer was wrong!

Don

Re: Good HP calculator for middle school child?

*Message #9 Posted by **Mike Morrow** on 16 July 2011, 2:45 a.m.,*
in response to message #1 by Brian K

I consider the HP38G to be one of the most ill-conceived and poorly executed calculator designs (HP or otherwise) of all calculators that I've ever seen. This was NOT a successful calculator for HP. There are many reasons why it is so cheap on ebay. It's a real dog.

The LCD also is just terrible...very poor contrast and and tinged an unpleasant green.

Get the recently released and inexpensive HP10bii+ instead. That can be used until something at school specifies the TI graphing calculator that must be used.

A little brother for the WP 34s? Any need for that?

*Message #1 Posted by **George Bailey (Bedford Falls)** on 15 July 2011, 12:30 p.m.*

The last few days I got infected by the WP 34s virus, played with the simulator and skipped through the manual, planning on doing the flashing myself. Luckily or unfortunately, depending on the perspective, I was cured from the virus pretty fast. Why? Not because the WP 34s was not done well. In the contrary, I think the WP 34s is a wonderful thing! But to me it's completely overwhelming: too much on the keyboard, too many functions in the manual, too much of everything.

I realized I'm looking for a 42s kind of machine, which, at least to me, can be operated nearly intuitively. I wouldn't put one more function in my dream machine just because it can be done. Is there an interest for what I would call the little brother of the WP 34s among my fellow afficionados? Could there be a 'WP34s lite'-firmware with a corresponding keyboard overlay?

Re: A little brother for the WP 34s? Any need for that?

*Message #2 Posted by **Marcus von Cube, Germany** on 15 July 2011, 12:59 p.m.,*
in response to message #1 by George Bailey (Bedford Falls)

A 10C version ? ;-)

Re: A little brother for the WP 34s? Any need for that?

*Message #3 Posted by **George Bailey (Bedford Falls)** on 15 July 2011, 2:36 p.m.,*
in response to message #2 by Marcus von Cube, Germany

> Quote:
>
> A 10C version ? ;-)

Something like that, but more like the 11c compared to the 15c.

I like most about the 42s the uncluttered keyboard, much better than the 32s's keyboard in my eyes - and the 43s's for that matter.

Sure, there is no 'unnecessary' function in the WP 34s, but I(!) could live without most of them in my everyday life.

So, again, I wouldn't change anything in the 43s, but would like to see a lite version of it with corresponding overlay.

...

Or I will just use my 35s. Maybe that's the smart thing to do ;)

Re: A little brother for the WP 34s? Any need for that?

*Message #4 Posted by **Gerry Schultz** on 15 July 2011, 7:08 p.m.,*
in response to message #3 by George Bailey (Bedford Falls)

George, I agree with you that the 34s' keyboard layout is busy and intimidating. Many of the functions I don't understand and would probably never use but I wouldn't change it one bit! HP hasn't made a new scientific calculator since the 50G. They have produced financial calculators as that's where they make the most money. I think having Marcus, Pauli and Walter (the Gang of Three) donate their free time, step up, design and write a scientific calculator using HP's hardware is a great blessing to the whole community. I also thank both Cryille and Tim of HP with the foresight to build the 20b and 30b with field re-flashing and making an SDK available. The time and energy the Gang of Three have put into this project is staggering to me. I barely have any time to play with the 34s.

Anyway, I'm getting off my main point. With no new HP Scientific calculators on the horizon, the Gang of Three designed an all encompassing scientific calculator to satisfy most people's engineering needs; with limited flash memory and a limited LCD display. So, even though I don't understand most of the functions on this calculator, it forces me to expand my world to make use of this new tool. Or else I'll just ignore them and use what I know. One of the things that I like is that the 34s has the functions of the 16c built in so that forces me to go read the 16c manual and have a calculator to see how that works.

Given the time and energy to get the 34s to this point, will the Gang of Three want to build a lite version of the firmware? I would think they will want to finish this project first, take a month off in the south of France, and then look at the possibility of doing a lite version of the 34s. Of course, then the debate of how many different lite versions are needed, how will the functions be split up into which lite version, debugging and adding new features to fill out the subset calculator... I'd say expect these in 2015 to 2020. Oh, and lets start an escrow account so the Gang of Three can be paid since they will be working for the community and to help them justify all the time away from their family. I'm sorry that I sound sarcastic. If these guys are willing, I will try and help in my own small way.

Thank you to the whole community. See you in September in San Diego,

Gerry

Re: A little brother for the WP 34s? Any need for that?

*Message #8 Posted by **Bruce Bergman** on 15 July 2011, 1:00 p.m.,*
in response to message #1 by George Bailey (Bedford Falls)

Yeah, I was wondering when someone was going to mention that. ;-)

I was thinking the same thing back a few months ago. I'd like to see a couple variations of the WP 34S around. We already the amazing full scientific, but what about that "-lite" version? Maybe a version that does nothing but statistics? Oooh, I'd like that! It wouldn't be able to graph much, but if it had a good capability for higher level stats, that might be fun.

For that matter, what about classic emulations? A pure 25c or 34c?

There are so many possibilities! :-)

Re: A little brother for the WP 34s? Any need for that?

Just for understanding, are you asking for a machine which "only" has the functionality of the 42S, or are you asking for a machine with a 42S-like user interface? Of course, the part I enjoy the most about the UI of the 42S is the availability of a full two-line dot-matrix display and top-row soft keys. This was obviously not available due to the "hampered" (sorry Tim and Cyrille) LCD of the 20b/30b platform (and I understand why it was designed that way intentionally). Personally, I think the 42S is hampered by not having at least one more shift key and at least one additional shift-key plane of functions. As a result, lots more keystrokes are required to do things than ultimately necessary (which is bad IMO). Abandoning the keys with the slanted fronts (like the 41 series and virtually everything prior to the Pioneer-series models) forced the high clutter in those two-shift units (such as on the 21S or 32SII) which would have been less intimidating otherwise. Also the ALPHA system in the 42S pales in comparison (again, in my humble opinion) to the single-key-per-letter method of the 34S and the 41 series (not to mention the 48/49/50). If you are referring to 42S functionality, I am curious which functions you would consider to be unnecessary in the 34S? The programming capabilities of the 42 were fantastic and has no equal in either the 34S or any "native" HP pure-RPN programmable.

Thanks, Jake

Re: A little brother for the WP 34s? Any need for that?

*Message #11 Posted by **Paul Dale** on 15 July 2011, 7:56 p.m.,*
in response to message #1 by George Bailey (Bedford Falls)

If you want a 34S-lite, make it. The full source code is freely available to one and all.

You don't need to be an expert programmer to make changes, the majority of the code is straightforward. You'd likely get away with just a passing knowledge of C, again the more obscure language features aren't being used and none of the standard library is. If you can write in a structured programming language, you're well over half way already.

Personally, I'm not going to make a lite version. This one was hard enough and I find it easy and natural to use. Once you get used to the layout and get beyond the information overload stage, it really is a very nice calculator.

- Pauli

It was designed by a committee.

And I don't mean the Gang of Three, I mean the Committee of the Whole.

Re: A little brother for the WP 34s? Any need for that?

*Message #13 Posted by **Marcus von Cube, Germany** on 16 July 2011, 3:33 a.m.,*
in response to message #1 by George Bailey (Bedford Falls)

I wouldn't call it 34S lite. Since we're repeatedly running out of code space, shuffling features in and out, it may make sense to do specializations of the current function set. I would prefer a machine with more programming features and I can live without most of the high level math and statistics stuff. Others will want more math functions and don't care about programmers' dreams. Some people may want the financial stuff of the 30b back with the programmability of the 34S.

YMMV.

Re: A little brother for the WP 34s? Any need for that?

*Message #14 Posted by **George Bailey (Bedford Falls)** on 16 July 2011, 3:58 a.m.,*
in response to message #13 by Marcus von Cube, Germany

I find that a very interesting idea, if it could be combined with matching overlays. Would that even be possible?

Re: A little brother for the WP 34s? Any need for that?

Marcus or Paul; I've only followed less than half the threads on your marvelous design, so this may already have been asked. If a function is removed, is there more program or data memory?

I really like using my 34s but i must admit that i haven't printed out the manual yet. I'm waiting for the final version.

Re: A little brother for the WP 34s? Any need for that?

*Message #17 Posted by **Marcus von Cube, Germany** on 16 July 2011, 4:53 p.m.,*
in response to message #16 by db (martinez, ca.)

Program and data memory is limited to 2k due to the hardware design. The program space limit has been addressed by the library spaces which depend on the amount of flash not occupied by the firmware. So there is some dependency between the function set and the amount of space for user programs. I had to remove a program page (506 steps) because of the addition of a set of I/O functions that I believe are of enough importance.

The most recent discussions address some features which take a considerable amount of firmware space but which are of questionable use or quality. We're in a state of moving things back and forth until we're satisfied with the results. We - the developers - are a bit picky about the quality of what we are doing, so things seem to be wage for the public at the time being. I hope most of it will settle in the near future.

Re: A little brother for the WP 34s? Any need for that?

*Message #18 Posted by **db (martinez, ca.)** on 17 July 2011, 5:07 p.m.,*
in response to message #17 by Marcus von Cube, Germany

Marcus;
Thank you for the time you took in answering. I think i understand it conceptually now. This of course leads to another question, a hypothetical one only:
Lets say that someone with enough knowledge of C wants that 506 lines of program space but could do without something fairly large that he doesn't use. Might he loose the library and firmware code for something about that size (say Hyperbolics for instance), then move the I/O functions into the flash area thereby freeing up that page for program memory?
Is that a plausible course of action for someone who wants more program memory and doesn't need cosh?

Re: A little brother for the WP 34s? Any need for that?

*Message #19 Posted by **Marcus von Cube, Germany** on 17 July 2011, 5:32 p.m.,*
in response to message #18 by db (martinez, ca.)

We've only a limited amount of storage for rapidly changing data, say registers. I wouldn't consider user program space "rapidly changing" and it therefore might go to flash memory instead of SRAM. What we have now is a "make a copy of what's in RAM" functionality for our library regions but that may be changed in future versions to a "edit programs directly in flash" scheme. This is certainly evolved because we need to make sure that the flash memory isn't worn out too quickly, but it can be done.

With such a scheme, memory for registers AND user program space is vastly increased, if we can only save enough flash space by condensing the math functionality, or, as you propose, by removing some of the features. At the moment, reducing the flash footprint of the firmware can only give us more library regions which are less flexible then what I was just talking about.

Re: A little brother for the WP 34s? Any need for that?

*Message #20 Posted by **db (martinez, ca.)** on 18 July 2011, 12:04 a.m.,*
in response to message #19 by Marcus von Cube, Germany

Thanks again Marcus. You guys are way ahead of me on what i wish for on the 34. I should have known that.

I remember when i got my cx in 83. I thought 2K was e n d l e s s. That didn't last long. Then i got a 42 and put 6K of programs into it with almost 2K of data storage (that i didn't really use much) and twentysome registers for constants, azimuth, begining coordinates, scratch, etc. That was about right. Maybe i just need three WP-34Ss, with the full 2K, if that happens.

Whatever you guys end up doing though; it's almost unbelievable. Take a bow.

Re: A little brother for the WP 34s? Any need for that?

*Message #21 Posted by **Paul Dale** on 18 July 2011, 12:36 a.m.,*
in response to message #20 by db (martinez, ca.)

I think you're underestimating the 34S a bit :-)

There are 506 program steps in RAM plus another 2024 steps in flash. The latter cannot be directly modified but can be copied to RAM and back or swapped with RAM. Every step except commands using alpha labels are fully merged so that works out as being quite a bit more than the same number of bytes on the 41 or 42. Programs with alpha labels can be accessed directly from flash.

As for data registers, there are 112 in RAM (which includes the stack and last X) and the same again in flash. Individual registers can be recalled (including recall arithmetic) via the RCF commands and the entire flash register set can be recalled or saved to RAM. There is also a block register copy command (R-COPY) that can copy registers from flash to RAM (as well as RAM to RAM).

So, the 34S isn't quite as capable as a 42S but it is beyond the 41 series in programability (but nothing like it in terms of IO or expandability).

- Pauli

> "....nothing like it in terms of IO or expandability"

it never can be, but you guys aren't done yet either.

So the 34 has a bit more program memory and is more efficient with it than the 41cv or cx. I'll accept that it's not as easy, or i guess the word is "automatic", to use as the 41 is. I'm sure that John Rusch's surveying package "Xtratra" was not

the only program to use every single line of program memory the 41 had, and have to resort to local labels to save space at that. There must be a law of human nature that says: what we have is never quite enough.

*Message #26 Posted by **Walter B** on 17 July 2011, 3:19 a.m.,*
in response to message #1 by George Bailey (Bedford Falls)

At the time we set up the project - not knowing yet it will turn out as WP 34S - the majority of forumers definitively did prefer the 32sii over the 32s or 42s. I.e. our potential customers didn't want a clean keyboard then. That said and taking into account the LCD of the 20b (the 30b wasn't available yet) not allowing for menus with softkeys, Pauli and me started with one menu only (X.FCN).

There is a limited number of keys, and we strived putting maximum functionality on them. OTOH, the layout had to be as simple as possible, consistent, or - as Karl would say - well thought through.

Now, different blends are certainly feasible, bringing some function (sets) to the surface for the cost of others being pushed in menus. I admit I'm not too keen on doing this, since - as Pauli and others wrote earlier - the

WP 34S as is is the best we can imagine and make within the given limits so far. This assessment may change with time, of course. And everyone is free to take the data publicly available and make (!) something better, taking more care of his/her personal preferences.

Just my 20 m€

Walter

HP 41 battery Shield - what is it ?

*Message #1 Posted by **John Robinson** on 15 July 2011, 3:16 a.m.*

Ebay 110715485440 I have never seen one of these before, does anyone know what it's for (apart from what it says in the auction), and was it shipped with early 41c or late cx etc ?? I thought part number 82120A is the rechargeable battery pack ???

Cheers, John

Re: HP 41 battery Shield - what is it ?

*Message #2 Posted by **Klaus** on 15 July 2011, 6:10 a.m.,*
in response to message #1 by John Robinson

I had one of those (for a 41c). It has some rivets that can damage the foil in your battery compartment (it damaged mine). It is to be used with the battery holder, the text on it says "don't use with the rechargeable battery pack 82120A".

Re: HP 41 battery Shield - what is it ?

*Message #3 Posted by **Raymond Del Tondo** on 15 July 2011, 7:12 a.m.,*
in response to message #2 by Klaus

The rivets are intentional, for at least two reasons:
- Work with slightly damaged contact foils
- Do not add too much material between the contact foil and the batt poles

The battery shield as such should:
- Protect the foil from leaking batts
- Add some extra retention for the batts when not in the calc

The idea was not bad, but the pre-perforation of the contact foil is a no-go, so I would not recommend using the shield.

Online WP 34s assembler now available

*Message #1 Posted by **Bruce Bergman** on 14 July 2011, 8:02 p.m.*

I've noticed quite a lot of interest in the WP 34S assembler and disassembler in the forums lately. Personally, I think it's a great tool, so I want to help others get easier access to it.

I've created a link on the WP 34S main wiki page to an online version of the assembler. The actual assembler is located here:

Online WP 34S assembler

Basically, you don't need to install Perl, you don't have to install the EXE version of the assembler, and you can get to this anywhere that you have web access.

Go to the page, enter your email address, and paste code into the big box. Then hit the button. The source code will be compiled and emailed to you at the address you provided. Also included will be the .DAT file, a .OUT file (the output of the compile) and the original .WP34S source file that you created.

Note: **THIS IS EXPERIMENTAL!** It may have some bugs, and it may not always work perfectly, so please be patient with it. ;-)

If you have any problems with it, please email me (bruceb @ fatcity dawt com) and I'll check into it.

I'm working on getting the disassembler available online as well.

Enjoy!

Thanks,

Bruce

Re: Online WP 34s assembler now available

*Message #2 Posted by **Neil Hamilton (Ottawa)** on 15 July 2011, 6:34 a.m.,*
in response to message #1 by Bruce Bergman

Hi Bruce,

Thanks for doing this! I had some vague plans for wrapping a GUI around it some day but this seems easier -- just let you do it. :-D

You might want to put another warning on your page regarding the following:

I think we have discovered an issue between the assembler and the current ZIP bundle. The ZIP bundle is quite old now (19-June-2011?) and both its emulator and calculator binary are incompatible with the assembler.

Since the WP 34s opcode map evolves on timescales that would make a fruit fly blush, the assembler must be

mated to the version of emulator/calculator you are using. This is the most probable reason for the current issue.

The assembler takes an optional command line argument to read in a specified opcode map. Maybe you could provide an optional drop down box to select a specific revision. I (we) can supply a selection of these opcode map files if you think it is worth it. (Recall that one of the main reasons for building this tool was as an insurance policy to guard against this very opcode drift.)

Also, you might want a link to the assembler manual on your web page as it gives guidance on how to properly format the ASCII source.

I have used this tool more than anyone and I still generate and use the expanded syntax guidance table it can optionally create. Perhaps access to that generated output might be another option you can add. Email this guide file as well if you'd like -- its BIG at about 480KB!

In some ways this email output route takes me back to my card deck submission days. I would wait a while for my line printer output (several hours?) only to find out that I had missed a continuation character in column 6(?) of a Fortran card. Perhaps your script could detect if the assembler aborted and display this message right away rather than issuing an email to tell you it didn't recognize the opcode "FORBNIP".

This is a great service for those who don't want to get some grease on their hands, but I think for those who are comfortable with running a command-line operation, the actual assembler Perl script or self-contained EXE will give higher performance (no wait for an email) and access to the other command line options. Several of these command line switches are very useful. I particularly like turning the asterisks on ("-s 3", for example) so I can easily see my labels in a disassembly output.

BTW: Is it actually online yet? I have run 3 test jobs through it and have yet to get an email (1st job was about 10 hours ago).

Thanks again! I hope this widens the usage (and I guess I can expect to have to fix more bugs now :-)

Best regards...

Edited: 15 July 2011, 6:38 a.m.

Re: Online WP 34s assembler now available

*Message #3 Posted by **Bruce Bergman** on 15 July 2011, 11:24 a.m.,*
in response to message #2 by Neil Hamilton (Ottawa)

Hey Neil --

So, already we've found a bug. ;-) At the moment, the incoming mail is getting folded by the application in the wiki, so long lines are being wrapped. If this occurs, an error is thrown and the mail doesn't go out.

So that's why you've tried it a few times and haven't yet received an email. Normally you should get back a compile result within a couple of minutes MAX. Definitely let me know if you're not getting back messages and I'll investigate.

The interim workaround is make sure you don't paste in long lines (basically, comments). Anything less than 80 characters is fine and works okay. I will work on un-wrapping the lines to put them back to the original format, but for now, just avoid including comments.

Note that the mail will not be sent REGARDLESS of any errors, so if you try it today (now) with a long line, you should at least get a reply message. Of course, if you try it with something that will compile,

you'll also get the output and such too.

As for the opcode tables, yes, I was mulling that over last night when I read your other reply to Gerson regarding versions. I will definitely do that. I'll have to think of a good way to (safely) make the script handle that, but it sounds like a must.

And yes, I'll also put up a link to the PDF (should have done that anyhow).

On the next iteration of the assembler, could you please either add a header when it runs that mentions the version number of the assembler, or provide a way to get it ("--version" or something)? I'm concerned about confusing people once this matures and several versions are running around in the wild. If the version number comes out in the output, or I can include it on the wiki page, then at least we'll all know what version is being executed.

Fun stuff! :-)

Thanks!

Bruce

Re: Online WP 34s assembler now available

*Message #4 Posted by **Neil Hamilton (Ottawa)** on 15 July 2011, 11:48 a.m.,*
in response to message #3 by Bruce Bergman

Hi Bruce,

> Quote:
>
> Anything less than 80 characters is fine and works okay.

The second one I tried was to test the error output and it was a simple (albeit, purposely incorrect) 3-liner that was all short lines. I will try something again.

> Quote:
>
> As for the opcode tables, yes, I was mulling that over last night when I read your other reply to Gerson regarding versions. I will definitely do that. I'll have to think of a good way to (safely) make the script handle that, but it sounds like a must.

Let me know where, and I will supply you with a little group of these. Paul's compressed format is not that large (<30K?? each).

I have not done much (successful) CGI but I assume a dropdown box might be the answer.

Note that if you don't give it anything, it uses its internal table (usually the appropriate choice). It only goes to the external table if you request it to.

Gerson's issue is a bit more fundamental -- the current ZIP is too old to work with any version. But it did highlight the potential issue for compatible versions.

> Quote:
>
> On the next iteration of the assembler, could you please either add a header when it runs

> that mentions the version number of the assembler, or provide a way to get it ("--version" or something)? I'm concerned about confusing people once this matures and several versions are running around in the wild. If the version number comes out in the output, or I can include it on the wiki page, then at least we'll all know what version is being executed.

This is actually there now. Use the "-svn" switch. I had changed my local code (not committed yet) a few days ago to make that the default (n it you use "-no_svn" to turn it off!). With the current one and the "-svn" switch, you get something like this (again, you won't need this switch in the next bump -- but it won't hurt if its supplied):

```
$ ../trunk/tools/wp34s_asm.pl -svn 8queens.wp34s -o temp.dat
// Opcode SVN version: 1199
// CRC16: 520A
// Total words: 32
// Total steps: 31
```

As is noted in the help (or the doc -- I can't recall which), there is subtle difference in using "-o FILE" and redirection in disassembly. With the first, these statistics comments still go to the screen. With direction, they get bundled into the output. That may or may not be useful to you. (Its really a bug but I don't want to change it.)

Re: Online WP 34s assembler now available

*Message #5 Posted by **Bruce Bergman** on 15 July 2011, 2:04 p.m.,*
in response to message #4 by Neil Hamilton (Ottawa)

I've added the -svn switch to the output, so that will be helpful.

The dokuwiki plugin I use for displaying a form is somewhat limited. I tried experimenting with another plugin, but it didn't work. I'm going to create a second version of the assembler page and see if I can get that working. If so, that will make the addition of the disassembler much easier.

In any case, the aseembler should be working fine now.

thanks,

bruce

Re: Online WP 34s assembler now available

*Message #6 Posted by **Neil Hamilton (Ottawa)** on 15 July 2011, 3:00 p.m.,*
in response to message #5 by Bruce Bergman

Looking gooood!

I tried both a working sample and a purposely broken sample and got both in emails.

I am still not exactly sure why the script could not be rigged to say "Oops! That was silly of you!" when the assembler throws an error but at least it is up and running! (Likely shows my naive view on the web I/F :-)

Great job. Now I have to get the next improvements done and out the door. As far as I can see, the next improvements should be absolutely compatible from the user interface point-of-view, so no changes to your side expected.

Let me know if/when you might want some of the op-code translation maps. Just drop me a

note on the back channel.

Cheers...

Re: Online WP 34s assembler now available

*Message #7 Posted by **Bruce Bergman** on 15 July 2011, 4:45 p.m.,*
in response to message #6 by Neil Hamilton (Ottawa)

Email is a bit safer. I'm super cautious about the potential exploits of publishing scripts which run live. I'm still considering it though. ;-) With this approach (email), the results are sent to the party who needs it, there are no issues with exploits, and the turn around is pretty quick.

I may have to put up a captcha to avoid getting caught by the spam bots, but so far they're staying away. :-)

thanks,

Bruce

Oh, and I did contact you via the Museum link. Not sure if that went to the right place or not, but yes, please do send those to me. bruceb at fatcity dawt com.

It's hard to tell from the third photo, but there could be a second RAM chip soldered on top of the other with the red switch selecting one of the two.

The way to find out would be to enter a short program, set the switch to the other position and see, if it's still there. And vice-versa.
