*Message #4 Posted by **db (martinez, ca.)** on 23 Oct 2011, 11:35 a.m.,*
in response to message #1 by Peter Murphy (Livermore)

all are good. as an aside: for a new user, the manual for the C was the best, followed by the cv, with the cx manual being the least useful for the newbie. that's understandable because the cx had so much to cover.

have you bought the museum dvd yet? it has a lot more stuff for your purposes.

Re: Tools for exploring the 41cv?

*Message #5 Posted by **Peter Murphy (Livermore)** on 23 Oct 2011, 12:00 p.m.,*

in response to message #4 by db (martinez, ca.)

Thanks for the suggestion.

I don't have any Museum DVDs. It would appear that I'd need 01 and 02 at least:

HP-41C / CV Guide for the Experienced User . . . (CD 02) HP-41C / CV Owner's Handbook . . . (CD 01) HP-41C Owner's Handbook And Programming Guide Color . . . (CD 05)

Am I missing anything?

Free42 ?

*Message #1 Posted by **fhub** on 23 Oct 2011, 9:06 a.m.*

Does anyone know what's the matter with Thomas Okken?

After his last Free42 bugfix we found that there was still a bug (with complex trig functions) and he wanted to fix it. Two weeks later it was still not fixed, so I asked him again here and he said he would do it the next weekend.
But also this "next weekend" is now more than 3 weeks ago and there's still no new version ... :-(

Franz

Exactly! An unfortunate sense of entitlement is apparent.

Even if it were not free, Free42 is the finest offering of its type anywhere for any platform. The Android version is the only calculator I'd have on my smartphone. Thank you Thomas!

Only a sense of gratitude and admiration is appropriate for Thomas Okken and Free42.

*Message #10 Posted by **Thomas Okken** on 23 Oct 2011, 3:37 p.m.,*
in response to message #1 by fhub

I've had other things on my mind. Why are you even asking this on this forum? Nobody here knows me personally; in case you want to ask about my health, well, my email address is not a secret.

Just be patient. I have no intention of abandoning Free42, but I have no intention of driving myself crazy over it, either. I'm sorry if my overly optimistic estimates have caused you inconvenience, and I do recognize that I have a tendency to be overly optimistic and that life tends to foil those optimistic plans (happens all the time at work, too, unfortunately), but that's just the way it is.

Sooner or later I will find the time to get the kind of sustained in-the-zone burst of activity that is needed for programming to be both productive and fun at the same time; I don't get that feeling with Free42 as often as in, say, 2005, when the project was

still taking shape, but as you can see from the recent Android port, it does still happen occasionally. Fixing minor bugs usually does not require a big burst of activity, but even minor bugs can be harder than you think; some days I may crank out 500 lines of working code without breaking a sweat, while some other days I submit one single-line bug fix at the end of the day and go home exhausted. So it goes.

- Thomas

I think it is a matter of how things should be handled.

Maybe it would had been a good idea to send, in first place, a private message to Thomas asking politely how thing are going with the bug. Knowing him, he would have answered it promptly and you would have been updated about the issue.

Secondly, (and obviously, I am not a native) the question in your post seems to me a littler harsh. If, maybe, it had been phrased differently...

Regards,

Miguel

Re: Free42 ?

*Message #14 Posted by **Les Wright** on 24 Oct 2011, 9:28 a.m.,*
in response to message #1 by fhub

I have been a supporter of Free42 for a number of years. I have donated a modest amount to the cause (not very much, but Thomas was most thankful at the time) and cheerfully paid the modest AppStore costs for Free42 and 42s for iPhone when they first came out.

I have been friendly enough with Thomas over the years to know that Free42 is but a passionate avocation and hardly his main purpose in life. Despite this, he has at times been very responsive to my queries when I have on occasion identified some obscure irregularities.

I have noticed over the past year that Free42 has seemingly gotten less of Thomas' attention. There was a stretch of several months without any revision. I assumed only that the man had gotten busy, and that the project had to take a back seat. As a grateful admirer and fan, I thought that I was obliged to be patient.

That said, I have to say that I bristle at the tone of your query. I suspect that if your bug report is not getting addressed as quickly as you would like, there is nothing at all wrong with Thomas, as you wonder. Rather, he is likely just addressing matters of greater importance.

Free42 is offered to us at little or no cost. I have no trouble cutting the developer some slack if he cannot immediately address my every whim or complaint. I just feel blessed that the great software exists.

in response to message #15 by fhub

Franz,

I think some people on this forum forget that not everyone here is a native speaker of English (and American English at that).

The idiom "what's the matter with him?" is often used as a put-down (see the 2nd entry of [link:http://idioms.thefreedictionary.com/What's+the+matter%3F]http://idioms.thefreedictionary.com/What's+the+matter?[/link]) even though it literally does not mean that.

A more neutral idiom would be "what is up with him?"

Edited: 24 Oct 2011, 2:51 p.m.

Re: Free42 ?

*Message #20 Posted by **Dave Shaffer (Arizona)** on 24 Oct 2011, 3:03 p.m.,*
in response to message #19 by Dominic Richens

> Quote:
>

Still could be interpreted as a bit confrontational - "up with him" still could imply (at least to me) that one might be thinking that he could be deliberately not responding or hiding. In verbal communication, the tone of voice could affect the meaning of this. When writing, though, you loose that finesse.

I think even better here would be something like "I wonder if something has happened to Thomas. I haven't heard from him about a request I made a few weeks ago." And then, perhaps, describe the history, but without any real or implied expectation of (immediate or even delayed) response.

Re: Free42 ?

*Message #21 Posted by **Howard Owen** on 24 Oct 2011, 4:26 p.m.,*
in response to message #15 by fhub

> Quote:
>

In any language, that is impatient. Expressing impatience is not polite when the developer has given so many man-years to the development of a Free/Libre gift to you and everyone else who uses it. The appropriate response to frustration of this kind is either to fix the problem in source code, in a way that doesn't totally screw things up, or else to return the gift for your money back.

Re: Free42 ?

*Message #22 Posted by **Ángel Martin** on 24 Oct 2011, 4:34 p.m.,*
in response to message #21 by Howard Owen

Yes of course - but Free isn't synonym with "Libre", but with "Gratis" instead :-)

Really, it's very easy to trip yourself up when using a second language - and I don't mean to imply you did!

Yes, and that's why I finally stop posting here now - I'm tired of all those accusations just because of a simple question.

Cheers,
Franz

Re: Free42 ?

*Message #24 Posted by **Howard Owen** on 24 Oct 2011, 4:50 p.m.,*
in response to message #22 by Ángel Martin

Free/Libre is FSF terminology meant to indicate that Free (capitalized) refers to freedom and not necessarily "free as in beer." In this case, the code is libre and often gratis. (You can pay for 42S derived applications, too. My belief is that those are all GPL compliant, or else have a separate license from Mr. Okken.)

You're right that gratis may be the more important consideration when deciding whether or not to complain about the speed of development, and in what terms.

WP 34s: Trying to understand SLV

*Message #1 Posted by **Miguel Toro** on 22 Oct 2011, 11:10 p.m.*

Hi,

I am having a hard time with SLV. I wanted to transfer the 15c Cash flow analysis to the 34s (Advanced functions handbook) but, even if the routine calculating NPV gives the expected result for every example I could find, when the same routine is called through SLV to solve IRR as with the 15C, the results are just off.

Trying other examples from the 15c manual, I can see that the 34s solver sometimes should use different initial guesses to obtains result or not show a Solve failed message (page 184, section 13 on the original 15c owner handbook).

What should I consider to make SLV to give better results? I really would like to port the CFA to the 34s.

Thanks,

Miguel

Thanks

Re: WP 34s: Trying to understand SLV

*Message #2 Posted by **Paul Dale** on 22 Oct 2011, 11:17 p.m.,*
in response to message #1 by Miguel Toro

The 34S solver is a completely different implementation to the 15c. For starters, it is using a quadraticly converging approximation which should converge much faster for many functions -- you'll see this in the 2nd best estimate which is often many digits less accurate unlike the same on the 15c.

The 34S solver also solves to the display resolution -- so e.g. FIX 02 will give a very rough estimate, FIX 08 better etc. The 15c solver doesn't depend on the display settings. Conversely, the 34S integration doesn't depend on the display settings and the 15c's does.

- Pauli

Re: WP 34s: Trying to understand SLV

*Message #3 Posted by **Miguel Toro** on 23 Oct 2011, 9:11 a.m.,*
in response to message #2 by Paul Dale

Hi Pauli,

Is there a way to make this work with the 34s solver? This is an adaptation of the routine found on the 15c advanced functions handbook. The program works for NPV but, as I mentioned, the IRR does not get it right.

For IRR there are two examples on page 43 and 44 that should yield 8.04 and 10.06 respectively.

if, as written, this is not possible, is there another formula that I could use to calculate IRR?

Thanks,

Miguel

Re: WP 34s: Trying to understand SLV

*Message #4 Posted by **Dieter** on 23 Oct 2011, 11:10 a.m.,*
in response to message #3 by Miguel Toro

There are several reasons why your program does not work.

1. SLV expects the current value of the variable to solve for in X. On each function call (here label 02) it fills the stack with the interest rate and expects the routine to use this value as the currect guess for which the NPV (that should become zero) is calculated. So you have to store this value first (LBL 02 STO I) before the NPV is evaluated. Also setting the loop control number (RCL K STO J) should generally be handled here.

   In my program version I chose to hand over the interest rate as a percentage (i.e. i instead of i/100) and use the following steps at Lbl 02. This way the NPV routine may be placed directly before:

   ```
   LBL "NPV"
   "I%?"
   PROMPT
   SSIZE 4
   LBL 02
    1
   STO A
   x<>y
   ```

```
 %        ; i/100
STO I
 +        ; 1 + i/100
STO B
CLX
STO C
RCL K
STO J
LBL 03
...
```

2. SLV expects two (!) initial guesses for the interest rate in X and Y. In your program, one of them is 0,001 (i.e. 0,1%) and the other is the value that happens to be in Y before calling SLV - this is the control number stored in K. #-)

   Give SLV two decent guesses and it will work. For instance 0 and 1 for 0 and 100%. In my program (with i instead of i/100) I used 0 and 100. This will work in most (!) cases, but not in all - providing two good guesses here is a work of art since the interest rate can also be negative. ;-)

3. SLV is quite picky at judging its own results. It may throw an error even though the result is fine. This especially happens in ALL mode (or other modes displaying many digits). So use something like FIX 6 instead which will return the (decimal) IRR with six digits after the decimal point or four digits for the percentage. Finally switch back to FIX 2 or something similar. I did it this way and it worked for me:

   ```
   0        ; 1st guess = 0%
   FIX 06   ; results correct to six decimals will do
   EEX      ; 2nd guess = 100% - use 1 in your program instead
   2
   SLV 02   ; Launch Solve
   GTO 10   ; solution found? then jump to exit routine
   X~~Y?    ; check if both last results agree in displayed digits
   GTO 10   ; in this case the result is fine as well, so exit
   ERR 20   ; otherwise throw an error
   LBL 10   ; exit and display result
   FIX 02   ; reset display to usual 2 digits
   ...
   ```

   Pauli, there might be a problem with the SLV routine since I sometimes got an "solve failed" error although both final approximations agreed in all 16 digits. However, the final function value was not zero, which in these cases still was fine because the function usually returned values order of 10^6 and larger. On the other hand the returned value might be checked as mentioned above.

   Anyway, analyzing the value returned by Solve is essential here because the NPV is calculated in a way that does not ensure the best possible precision. For instance, ((1+i)^n)-1 can be evaluated much more precisely by using e^x-1 and ln(1+x) as offered by the 34s.

4. You should also take a look at the sign of the returned NPV. However, the correct IRR does not depend on this.

5. There is some room for improvement. For instance, in the entry routine simply use INC K twice instead of ISG K NOP and you can forget the clumsy initial calculation of the loop control number. And instead of your own error message you can simply throw ERR 20 (Solve failed). ;-)

Change the program accordingly and it will work. Just tried it myself - it returns the same values as those in the advanced functions handbook. ;-)

Re: WP 34s: Trying to understand SLV

*Message #6 Posted by **Dieter** on 23 Oct 2011, 4:28 p.m.,*
in response to message #5 by Miguel Toro

I think this a bit too special for an article, and all information can also be found in the manual (well, a bit hidden here and there as it relies on the reader to know how previous HPs worked ;-)). However, please note I made a final correction in the second code example, about the same time you wrote your reply. I assumed an error that in fact was not there. For the same reason point 4 (sign of returned NPV) is obsolete as well. #-)

Dieter

I think your example is a very illuminating demonstration of how SLV works. This is exactly the way that classic HP manuals explain some of the more complicated functions - take an example and implementing.

Please consider adding a section to WP34s users' guide.

cheers!

Re: WP 34s: Trying to understand SLV

*Message #8 Posted by **Dieter** on 28 Oct 2011, 7:21 a.m.,*
in response to message #5 by Miguel Toro

For the record: here is your program with a few modifications. It is the same algorithm with a numeric improvement using ln1+x and e^x-1 as well as the changes discussed before. You may use this as a basic version for your own, better and even more reliable program. ;-)

The result of the solver now is checked in three ways. Does the solver think it has found a solution? If not, do the last two guesses agree in their first six decimals? If not, is at least the

NPV for this result less than half a cent? If not, throw an error, else display the result.

Since I prefer the hotkeys A...D I used these instead of alpha labels. I also prefer to enter an interest rate and then simply press [B] instead of XEQ"NPV", then being prompted for the interest rate and finally get a result.

So here's my current, unfinished and experimental version. Use it at your own risk. BTW it's the first time I used the (dis)assembler - very nice. ;-)

Here's the example from the 15C Advanced Solutions Handbook p. 43:

```
  Keys              Display

  [A]               CF0^n0
                              0.
-80000 [ENTER] 1
  [R/S]             CF1^n1
                              0.
  -600 [ENTER] 1
  [R/S]             CF2^n2
                              0.
  6500 [ENTER] 1
  [R/S]             CF3^n3
                              0.
  8000 [ENTER] 2
  [R/S]             CF4^n4
                              0.
  7500 [ENTER] 2
  [R/S]             CF5^n5
                              0.
 91000 [ENTER] 1
  [R/S]             CF6^n6
                              0.
  [R/S]             #CF=
                              8.
```

There are 8 cashflows in total.
Now let's determine the NPV for an interest rate of 9%.

```
 9   [B]           NPV=
                      -4108.06
```

Since the NPV is negative the IRR has to be less than 9%.
What is its value?

```
     [C]           IRR%=
                         8.04
```

in response to message #8 by Dieter

Dieter, it's still a good idea to have an alpha label at the beginning of the program so that it can be found in a flash region. Look at the vectors program in the library folder for an example.

*Message #10 Posted by **Miguel Toro** on 28 Oct 2011, 12:37 p.m.,*
in response to message #9 by Marcus von Cube, Germany

Hi Marcus,

That was my original intention : to run this and other financial routines I am programing from a flash region. When they are ready, I will post them on an article, for whoever will be interested.

Thanks to Dieter, I finally got how SLV works (it is really different from was I knew with the 35s or 32sII) and I am using the new knowledge a lot. :-)

Regards,

Miguel

in response to message #4 by Dieter

Dieter, thanks for the insightful comments about this one.

> Quote:
>
> Pauli, there might be a problem with the SLV routine since I sometimes got an "solve failed" error although both final approximations agreed in all 16 digits. However, the final function value was not zero, which in these cases still was fine because the function usually returned values order of 10^6 and larger. On the other hand the returned value might be checked as mentioned above.

I know of this problem, I haven't worked out how to fix it. The error is being thrown when the two estimates are equal when rounded but the function evaluation isn't rounding to zero. At least I think this is the cause. The problem is in the keystroke wrapper so should be fixable without using lots of flash.

Re: WP 34s: Trying to understand SLV

*Message #14 Posted by **Dieter** on 28 Oct 2011, 6:47 a.m.,*
in response to message #13 by Paul Dale

I thinks this deserves a closer look. Imagine the solver has determined two successive guesses that agree in all displayed (or even all sixteen) digits. But does this also mean that the respective function result rounds to zero as well? Of course it doesn't, depending on the first derivative of the function.

Let us consider a very simple function like this in ALL mode:

```
LBL 01
x^2
7
-
RTN
```

So the solver should return sqrt(7) = 2,64...
Let's see what it comes up with:

```
2 [ENTER] 3
SLV 01
=> Solve FA1LEd
```

What happened here? The solution has a true value of 2,6457 51311 06459 05905... You see that the 16th significant digit is quite exactly right in the middle between 0 and 1. So the 16-digit result returned by the solver has to be ...064591 or maybe ...064590. It doesn't matter which of these two is returned - none of them will provide a function result that rounds to zero (which in this case I assume means "less than 5 E-17"). You either get 2 E-15 or -3 E-15. That's why solve will throw an error although in fact it has found the correct solution.

There is some simple mathematics behind this: if the solution is varied by 1 ULP = 1 E-15 the function result will vary by as much as 2 * sqrt(7) * 1 E-15 = 5,3 E-15. So chances are there simply is no 16-digit value that will return a function result close enough to zero. Try the example modified to sqrt(2), with 1 and 2 as the initial guesses, and even in FIX 4 solve thinks it was unable to find a solution.

Actually solve will almost *always* throw an error if the display mode is SCI or ENG. This seems to happen every time the function result is not exactly zero. Try the mentioned example in SCI 9 or even SCI 0 mode - you will always get an error message.

That's why I think it does not make much sense if solve checks whether the function result rounds to zero or not. Even the best possible solution may return a result that is significantly different from zero. If you want to include an additional test one might think of varying the result by 1 ULP and see if the function result can be reduced this way. In the IRR example this leads to a slightly better result (in the last digit).

*Message #15 Posted by **Paul Dale** on 28 Oct 2011, 6:49 p.m.,*
in response to message #14 by Dieter

I'm not seeing this one fail on the console emulator? What firmware revision are you using?

Probably moot now, I've take the almost zero check out of the solver code. It won't fail anymore if the guesses converge. The user will have to check that a zero was found instead of a discontinuity.

Looking at the previous and the current XROM code for the solver 'm now really confused! :-(

Here's the previous version:

```
slv_fin::               RCL Z
                        FILL
---                     x[approx]0?
---                             JMP slv_found
                        XEQ slv_fixstack
                        JMP exit

---slv_found::          XEQ slv_fixstack
---                     JMP slv_fail_common
```

In your todays change you've remove the 4 lines which I've marked with --- at the beginning.

But if I understand your previous version correctly, then if x[approx]0? it jumps to slv_found, but from there it jumps again to slv_fail_common (which gives an error). Isn't THIS the problem of the previous version?
I guess this x is the function value, but if it's almost zero then the solver didn't fail, correct?

So I would say that the only wrong thing in your old solver version was, that this condition and the jump was wrong - or IOW: why does the label slv_found jump to slv_fail_common ???

Franz

Re: WP 34s: Trying to understand SLV

*Message #17 Posted by **Paul Dale** on 29 Oct 2011, 7:19 a.m.,*
in response to message #16 by fhub

I don't know what I wrote in the old code :-(

It wasn't failing for the case Dieter presented but it wasn't correct either.

- Pauli

Re: WP 34s: Trying to understand SLV

*Message #18 Posted by **fhub** on 29 Oct 2011, 7:46 a.m.,*
in response to message #17 by Paul Dale

> Quote:
>
> I don't know what I wrote in the old code :-(

Well, first I would say that the solver should indeed test if the function value is almost zero, and if not then maybe it could give an error message (something like "Dubios accuracy" or "Possible infinity").

Then I would prefer having the solution x in X and the function value f(x) in Y, so a simple x<->y would show if the solution is correct.

And finally I think you should only change your old XROM code as follows (i.e. swap the 2 JMP lines):

```
slv_fin::               RCL Z
```

```
                          FILL
                          x[approx]0?
                                  JMP slv_found
                          XEQ slv_fixstack
                          JMP slv_fail_common

slv_found::               XEQ slv_fixstack
                          JMP exit
```

Franz

Re: WP 34s: Trying to understand SLV

*Message #19 Posted by **Dieter** on 29 Oct 2011, 12:44 p.m.,*
in response to message #15 by Paul Dale

I had used the emulator in version 2.2 1630. In the meantime the latest emulator version (wp34s-V22.zip) seems to be 2.2 1782 which I downloaded now. It returns the same results:

```
P/R
LBL 01
x^2
7
-
RTN
P/R

ALL 03

2 ENTER 3
SLV 01

Solve FA1LEd
```

As mentioned, I think a final check for a near-zero-result is not a good idea at all. Take a look at the example. The best function results a 16-digit calculator can come up with are 2E-15 or -3E-15. Is this "approximately zero"? If you think so, consider the same function multiplied with 1E15, i.e. f(x) = 10^15*(x^2-7). In this case the best possible function results are 2 resp. -3. Which sure is not "approximately zero". ;-)

BTW - the other example x^2 - 2 in FIX 4 fails as well in 2.2. 1782.

There is a way to see whether the two last converging guesses actually are a valid solution. The result may be varied by 1 ULP until a sign change occurs. This is similar to the way Solve worked on the 34C and 15C: if the last guess did not return exactly zero they returned two final estimates with opposite signs of the function result, which were returned in Z and T as well. So the user was sure the actual solution had to be somewhere inbetween.

Dieter

Re: WP 34s: Trying to understand SLV

Or do it as I suggested: make this near-zero-check, but don't let the solver fail if it's not zero, but just display a 'warning' message instead (now we even have such a MSG command).

Franz

Re: WP 34s: Trying to understand SLV

*Message #21 Posted by **Dieter** on 1 Nov 2011, 1:57 p.m.,*
in response to message #20 by fhub

Some kind of "inaccurate" flag sure is a nice idea - but where is the limit? It depends on the function resp. its first derivative and the value of the root SLV has found. So I'd say there should be no final close-to-zero test. Instead a simple trick may be used: have the user round the function result to zero, if desired.

At the same time this is a simple but efficient technique to cancel solve's iteration as soon as the desired accuracy level *of the function result* is reached. This idea was also used in the IRR example (function result < 0,005? => result ok). If the user really wants a final "approximately zero" check he may simply add X~~0? Clx as the final steps of his function.

Dieter

Re: WP 34s: Trying to understand SLV

*Message #22 Posted by **Paul Dale** on 29 Oct 2011, 7:49 p.m.,*
in response to message #19 by Dieter

The solver near zero check was been removed in 1785 so you don't have it yet :-(

In fact I'm pretty disillusioned with the approximately zero test. It seems to be almost useless -- rounding a near zero number generally doesn't change it.

I don't see two function values being documented as being returned in either the 34c or 15c manuals about solve. Unless I've missed something. They both say, best in X next best in Y and f(X) in Z.

Fine, so I'll have the modified SLV version once the emulator gets an update. ;-)

> Quote:
>
> In fact I'm pretty disillusioned with the approximately zero test. It seems to be almost useless -- rounding a near zero number generally doesn't change it.

I wonder how this test is supposed to work. Is it the same as ROUND followed by X=0? In this case it will only work in FIX mode, since in all other cases the value in X is simply rounded to its displayed number of *significant* digits. Which never will get zero - unless the unrounded value already is.

Anyway, the test may be useful in programming ...once it has been carefully documented. In FIX n it actually tests if abs(x) is less than $0{,}5 \times 10^{-n}$.

> Quote:
>
> I don't see two function values being documented as being returned in either the 34c or 15c manuals about solve. Unless I've missed something. They both say, best in X next best in Y and f(X) in Z.

You are right, I just checked both the 34C manual and the device itself. #-) However, I still think returning the two function results in Z and T is a good idea.

Dieter

Edited: 30 Oct 2011, 10:55 a.m.

Re: WP 34s: Trying to understand SLV

*Message #25 Posted by **Dieter** on 1 Nov 2011, 9:42 a.m.,*
in response to message #22 by Paul Dale

In the meantime I updated the emulator replacing wp34s.exe and wp34sgui.exe with their current versions (as of sunday evening UTC). VERS now shows 2.2 1789. Switching to program mode, 510 available steps are displayed instead of the usual 506. Is this correct?

I then tested the same example (solve x^2 - 7) on this newer version. With the same initial guesses 2 and 3 in ALL mode it still throws the same error: Solve Fa1LEd, although the result is fine and X and Y agree in all digits. In FIX 11 the

same result is returned without an error message.

Dieter

*Message #26 Posted by **Marcus von Cube, Germany** on 1 Nov 2011, 12:09 p.m.,*
in response to message #25 by Dieter

Don't rely on the current builds! I'm heavily working on the inner workings and many check-ins are just for safety or cross checking by my fellow developers.

If we are done solve and integrate can be nested to any depth, and unused program space can be used as data. Be patient!

Re: WP 34s: Trying to understand SLV

*Message #27 Posted by **Walter B** on 1 Nov 2011, 12:32 p.m.,*
in response to message #26 by Marcus von Cube, Germany

From a user's point of view, we should close v2.2 then at a build number it was sufficiently stable. Then do all the mess in an incremented version.

How true!
Today (SVN 1804) I've compiled my program with wp34s_asm.pl and got "Illegal opcode" in the emulator (also SVN 1804). Looking at the program in the flash I saw commands like GTO without any address, or XEQ 1 (single digit) ...

BTW, what's this new LOCL and 200 instead of 100 for the address range?
If you want us to test your new 'ideas' then you should really give us at least a bit of information for such new features. ;-)

in response to message #3 by Miguel Toro

Buenas tardes Miguel,

What spontaneously crossed my mind reading your original post: Why doesn't he use a financial calc for this? Honestly, we made the WP 34S (sic!) to be a scientific calc since HP's activities were a bit low in this area.

Though I admit I voted for some %-functions and also a TVM solver many weeks ago, I'm most willing to kick those out if there will be any trouble with them. If you want a financial calc, get the 30b or 17bii+ Silver and you'll be done.

Walter

Re: WP 34s: Trying to understand SLV

WP 34s: comments and a suggestion

*Message #1 Posted by **Nigel J Dowrick** on 22 Oct 2011, 5:15 p.m.*

In the past few days I have flashed my HP-20b and applied the overlay. My reactions:

1. The calculator looks fantastic! I admit that I was worried that the overlay would make it look amateurish, especially since "clumsy" is my middle name. Anyone who is holding off because they like their calculators smart should stop worrying and go ahead!

2. The firmware is astonishing! I've never seen a feature set like it on a calculator of this size. A lot of trouble has gone into making everything work well on the chosen hardware and it shows. The usability of this machine could scarcely be better. Highlights (for me) include the flexible way in which registers can be addressed, the handling of complex numbers, and the huge number of space- and step-saving programming commands. The firmware is stable (no crashes at all) even though I'm not running the latest version.

3. The manual is superb. Although it isn't aimed at new users, someone knowing roughly what to expect will find the detailed information here. The diagrams and tables are models of clarity and design - I can imagine the huge amount of effort and skill that must have gone into their creation. Too often documentation can take a back seat, but this manual is of the same high standard as the other components of the WP 34S project.

My heartfelt thanks to everyone involved. I haven't had so much fun with a calculator for a very long time, and there is still lots more to play with!

One small suggestion: the fraction separator is currently the same height as the digits 0-9. As such it doesn't (for me) clearly separate the numerator and denominator. Old Casio calculators used a separator made from the bottom and bottom-right segments: this half-height character provided a clear break in the string of digits. Would this be a possible change?

Nigel (UK)

Re: WP 34s: comments and a suggestion

in response to message #1 by Nigel J Dowrick

Nigel,

Thanks for your very kind words [blush] :-)

Regarding your suggestion, we've employed a similar looking symbol for fraction mode overflow already. Please see page 30 of the manual for an example. Though this will show up in the very left numeric position only. Additionally, looking at the fraction display from some distance, the current fraction bar looks like one while the alternative you suggested looks more like a comma. That all said, we may think about changing the symbol if a clear majority of forumers want it (quorum: at least 10 votes in favour of a change). I solemnly declare the poll stations open ;-)

Walter

Re: WP 34s: comments and a suggestion

*Message #3 Posted by **Jeroen Van Nieuwenhove** on 23 Oct 2011, 6:06 p.m.,*
in response to message #2 by Walter B

Here's my vote for a fraction separator like on ancient Casio's. In my view, the separators that occupy only one (upper or lower) half of the LCD segments stand out more clearly. This is already the case for the Â° ' " separators for HMS notation. I think the fractions would indeed stand out better if the separator would be Casio-style. Of course, this is more a question of taste.

Now, the almost invisible difference between comma and point separators on the 30b REALLY is something that drives me nuts (much worse than on the first version of the 33S), but that is a hardware problem that cannot be rectified by the WP 34s project).

Re: WP 34s: comments and a suggestion

*Message #4 Posted by **Paul Dale** on 24 Oct 2011, 4:04 a.m.,*
in response to message #2 by Walter B

Changing this symbol is very simple -- we've got a special font for the seven segment display and this is a single isolated character and I believe it is only used for this purpose.

> 2. The firmware is astonishing!

I would like to add a footnote to this observation. Just imagine how great a calculator the 33S and the 35S could have been if HP had it tested out for a year in this community. Not only would most of the bugs been discovered, but features like complex number support could have been expanded to a decent level (like on the 15C) had there been a community that advocated it. OK, I know I am daydreaming, but the WP 34s project surely shows the strength of the combination of a few dedicated and expert individuals together with a critical and knowledgeable community.

*Message #6 Posted by **Marcus von Cube, Germany** on 24 Oct 2011, 2:58 a.m.,*
in response to message #5 by Jeroen Van Nieuwenhove

I fear that the hardware of the 33s or 35s poses a restriction upon what can be implemented function wise. A 6502 programmed in C isn't the best architecture in this respect. So most probably no full complex support even with help of the community. But the bugs should have been ironed out as would have been some quirks of the 35s (think of bases other than 10, or P<>R).

Re: WP 34s: comments and a suggestion

*Message #7 Posted by **Paul Dale** on 24 Oct 2011, 4:03 a.m.,*
in response to message #6 by Marcus von Cube, Germany

128kb of rom on the 35s which is the same as the 20b. Plus lots more RAM and a decent display. I think something better could have been done.

- Pauli

Re: WP 34s: comments and a suggestion

> Quote:
>
> 128kb of rom on the 35s which is the same as the 20b.

Not quite. ARM thumb code should get more out of the ROM space as 6502 code compiled from C.

Re: WP 34s: comments and a suggestion

*Message #9 Posted by **Paul Dale** on 24 Oct 2011, 5:39 a.m.,*
in response to message #8 by Marcus von Cube, Germany

Maybe from C, but 6502 code should be a lot more compact in general...

- Pauli

FORTH on the Sharp PC-1500

*Message #1 Posted by **Ph.Théry** on 22 Oct 2011, 6:01 a.m.*

Hello,

I'm looking after a FORTH for the Sharp PC-1500.

I saw on the archive (http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv018.cgi?read=144612) that it was possible to get the forth back from the MC-12 datalogger.

Thanks, philippe

Re: FORTH on the Sharp PC-1500

*Message #2 Posted by **Bill (Smithville, NJ)** on 22 Oct 2011, 8:52 a.m.,*
in response to message #1 by Ph.Théry

Hi Philippe,

I was able to save the MC-12 Forth to a WAV file which could then be reloaded into the PC-1500. A couple of memory pokes are required to set the Basic Pointers. You'll also need a 16K memory card.

The Zipped WAV file is 7 MB. If your email program can receive large attachement, I can email it to you.

Bill

Re: FORTH on the Sharp PC-1500

*Message #3 Posted by **x34** on 22 Oct 2011, 8:51 p.m.,*
in response to message #2 by Bill (Smithville, NJ)

Is it possible to write/read WAV files without printer/tape recorder cradle?

Re: FORTH on the Sharp PC-1500

*Message #4 Posted by **Eric Smith** on 22 Oct 2011, 10:48 p.m.,*
in response to message #3 by x34

No. Without the cassette interface there is no way to read or write cassettes, or anything acting like a cassette.

Re: FORTH on the Sharp PC-1500

*Message #5 Posted by **Ph.Théry** on 23 Oct 2011, 8:41 a.m.,*
in response to message #2 by Bill (Smithville, NJ)

Hi Bill, thanks for your reply. My mail can accept file less than 20Mo, this will be enough. With the WAV

file, can you send the "couple of memory pokes" to do with. Would you have the manual ?

Thanks, philippe

Re: FORTH on the Sharp PC-1500

*Message #6 Posted by **Bill (Smithville, NJ)** on 23 Oct 2011, 1:54 p.m.,*
in response to message #5 by Ph.Théry

Pleas send me your email adress by sending me an email through the forum.

I'll then get the wav file off to you with the memory pokes that are required. I did test the wav file on several PC-1500's some time ago. But unfortunaley, I no longer have a PC-1500 to re-test it on. So hopefully, I'll get the memory pokes correct for you.

I have scanned copy of the German Manual. No English version.

Bill

WP 34S: trouble with CLSTK

*Message #1 Posted by **Miguel Toro** on 22 Oct 2011, 12:03 a.m.*

Hi, I noticed that CLSTK not only clear the stack, but also registers L and I, so LastX value is lost after performing a CLSTK. I have revision 1728 in my 34s and I am using revision 1747 on my computer. In both of them I see the same result.

Of course, other calculators as the 42s or the 35s, preserve LastX after clearing the stack.

Regards,

Miguel

Re: WP 34S: trouble with CLSTK

*Message #2 Posted by **Walter B** on 22 Oct 2011, 2:52 a.m.,*
in response to message #1 by Miguel Toro

Buenas dias Miguel,

Thank you for reporting this. I admit I didn't use CLSTK for months - I take 0 FILL instead. But anyway, you found a real bug :-) Congratulations! We will take care of it.

Walter

Re: WP 34S: trouble with CLSTK

*Message #3 Posted by **Paul Dale** on 22 Oct 2011, 3:08 a.m.,*
in response to message #2 by Walter B

More a lack of communication and inadequate command definition than a bug :-(The question being are L and I part of the stack registers or not -- they are intimately linked to them at the least.

Anyway, clear stack no longer clears I and L.

- Pauli

Edited: 22 Oct 2011, 3:09 a.m.

The FOCAL Factory proudly presents 2 new modules

*Message #1 Posted by **Geir Isene** on 21 Oct 2011, 7:31 p.m.*

TFF™ softly launches the aforementioned "avalanche" of User Library Solution modules and the kick-off was unanimously decided to be the "Business Stat/Marketing/Sales" and "Test Statistics" FOCAL Roms.

The President decided to host the .ROM and the .MOD images at the UC-41 page .

Enjoy or else.

Re: The FOCAL Factory proudly presents 2 new modules

*Message #2 Posted by **gene wright** on 21 Oct 2011, 10:18 p.m.,*
in response to message #1 by Geir Isene

Wonderful!

I *know* these are user code and some of them are dated, etc., but given that the solution book code is already written, debugged and was useful then, it *might* be useful now.

So, bravo! Please don't stop know! Build up good karma!

Re: The FOCAL Factory proudly presents 2 new modules

*Message #3 Posted by **Ángel Martin** on 22 Oct 2011, 2:28 a.m.,*
in response to message #2 by gene wright

Gene, here's my offer to you (and anyone else): should you send me the programs in RAW files I'll gladly put them together in ROM, MOD, EXCEL, PDF or any format you care (except RPL :-)

And when you do, don't forget to specify:

- XROM id#
- FAT entries sequence
- XROM vs. XEQ convention (to avoid LBL conflicts)
- etc...

Best, 'AM.

Edited: 22 Oct 2011, 4:47 a.m.

Re: The FOCAL Factory proudly presents 2 new modules

*Message #4 Posted by **Monte Dalrymple** on 21 Oct 2011, 10:52 p.m.,*
in response to message #1 by Geir Isene

Both the .rom and .mod Tests links seem to be broken...

Re: The FOCAL Factory proudly presents 2 new modules

*Message #5 Posted by **Geir Isene** on 22 Oct 2011, 5:03 a.m.,*
in response to message #4 by Monte Dalrymple

Fixed.

Re: The FOCAL Factory proudly presents 2 new modules

*Message #6 Posted by **Ángel Martin** on 22 Oct 2011, 2:26 a.m.,*
in response to message #1 by Geir Isene

TFF go travel! Yesssir, way to go :-)

And now the daunting step: what about the manuals??

Best, 'AM

Re: The FOCAL Factory proudly presents 2 new modules

*Message #7 Posted by **Geir Isene** on 22 Oct 2011, 5:04 a.m.,*
in response to message #6 by Ángel Martin

The materials are already at TOS and in the TOSdvd as pdfs.

Re: The FOCAL Factory proudly presents 2 new modules

*Message #8 Posted by **Ángel Martin** on 22 Oct 2011, 7:02 a.m.,*
in response to message #7 by Geir Isene

Any chance to get a link to that in your web site? (saves search time and effort...)

This is what I get clicking on your name at TOS:

```
Title   Date
ASTROUI ROM     Nov 22. 2010
ICEBOX ROM 1H   Jan 12, 2010
ICEBOX ROM Manual 1H    Jan 12, 2010
ISENE ROM       Oct 16, 2011
ISENE ROM Manual        Oct 16, 2011
NOV CHAP Manual 1       Jun 3, 2011
NOV CHAP rom 1          Jun 3, 2011
```

none seems to be it?

Edited: 22 Oct 2011, 7:04 a.m.

Re: The FOCAL Factory proudly presents 2 new modules

*Message #9 Posted by **Geir Isene** on 22 Oct 2011, 9:18 a.m.,*
in response to message #8 by Ángel Martin

These new modules are simply the old User Library Solutions in ROM/MOD format - but yeah, I will include the links...

...done :)

Re: The FOCAL Factory proudly presents 2 new modules

*Message #10 Posted by **Ángel Martin** on 22 Oct 2011, 2:02 p.m.,*
in response to message #9 by Geir Isene

oh, I was wrong - I thought it was your Stats-on-steroids [or was it asteroids?] :-)

BTW the MOD file doesn't have any "name", and gives errors on V41.

Best, 'AM

Re: The FOCAL Factory proudly presents 2 new modules

*Message #11 Posted by **Geir Isene** on 22 Oct 2011, 7:26 p.m.,*
in response to message #10 by Ángel Martin

Not any name? How so? On a real 41, the first FOCAL program in the FAT becomes the "name" of the module...

Edited: 22 Oct 2011, 7:31 p.m.

Re: The FOCAL Factory proudly presents 2 new modules

*Message #12 Posted by **Geir Isene** on 23 Oct 2011, 9:13 a.m.,*
in response to message #10 by Ángel Martin

I confirmed the error on the FOCAL modules on the V41. Seems V41 doesn't support using modules that have no MCODE header but where the first header is a FOCAL program. This is however no problem on an ordinary HP-41 or on the EMU41.

Any ideas on why? Or how to (very easily) solve it? The obvious solution would perhaps be to manually enter an MCODE header function as the first FAT entry, but that would defeat the purpose of letting a non-MCODE savvy person be able to create easy FOCAL roms...

Maybe just drop the MODs?

Re: The FOCAL Factory proudly presents 2 new modules

*Message #13 Posted by **Ángel Martin** on 23 Oct 2011, 11:00 a.m.,*
in response to message #12 by Geir Isene

I don't think it's a V41 limitation. If you edit the appropriate MOD file "Title" field using ml2k, then it's properly shown on V41.

Edited to add:- Also can edit the Copyright, Date, etc. fields.

Edited: 23 Oct 2011, 11:03 a.m.

Re: The FOCAL Factory proudly presents 2 new modules

*Message #14 Posted by **Geir Isene** on 23 Oct 2011, 5:08 p.m.,*
in response to message #13 by Ángel Martin

I have now fiddled with the MLDL2K for a while and managed to debug the issue. The MOD files are now correct and should run (although they do not show up on CAT2 on the V41 as they do on a real HP-41, they do work also on the V41). It would be nice if someone else could verify this.

Re: The FOCAL Factory proudly presents 2 new modules

*Message #15 Posted by **Ángel Martin** on 24 Oct 2011, 1:56 a.m.,*
in response to message #14 by Geir Isene

They work fine on my V41 w/the CCD (or OS/X) - showing the first program in the page (4k-block).

A bare 41 doesn't "see" the FAT entries unless they're longer than 7 chrs, which obviously won't be the case when copying FOCAL programs to ROM (synthetics aside).

That's why I always add a simple MCODE header to the construct. In fact I just completed the Control_Systems and Electrical_Engineering solution books, adding them to ROM/MOD. Unfortunately they can't be fit into a single 4k block together, so it's two of them right now. I can send them to your FFT library if you want.

Re: The FOCAL Factory proudly presents 2 new modules

*Message #16 Posted by **Geir Isene** on 24 Oct 2011, 2:07 a.m.,*
in response to message #15 by Ángel Martin

Please do :)

Need a new toy. 48g or 50g?

*Message #1 Posted by **JamesT** on 21 Oct 2011, 6:06 p.m.*

I 'need' a new toy to play with and am intrigued by the 48g/50g. Which should I get? I like a quality keyboard and heard that the 48g is better in this regard. Is there anything about the 50g that says I should go that direction?

Re: Need a new toy. 48g or 50g?

*Message #2 Posted by **Walter B** on 21 Oct 2011, 6:20 p.m.,*
in response to message #1 by JamesT

The 50G features a far better display than the 48G.

Re: Need a new toy. 48g or 50g?

*Message #3 Posted by **Egan Ford** on 21 Oct 2011, 6:37 p.m.,*
in response to message #1 by JamesT

50g:

1. Larger, clearer display.
2. Can run off batteries or USB power.
3. USB and Serial ports.
4. SD Card for storage.
5. Less Ugly keyboard colors, however the 48G does have the Holy Grail of calculator keys--a large Enter.
6. Can be programmed in C and ARM ASM for speed.
7. Comes with warranty.
8. Can run 41, 42, 15C, etc... emulators.
9. It's a toy and a tool.
10. No assembly required.

Do you have a 34S yet? Currently my favorite toy.

1. Smaller display.
2. Can run off batteries.
3. Serial port only, can drain batteries.
4. Some limited flash storage.
5. Does have the Holy Grail of calculator keys--a large Enter. Good color scheme.
6. Can be programmed in C and ASM for speed, but with a lot of care.
7. Comes with warranty. Sorta of.
8. Can run 41, 42, 15C, 16C, etc... RPN code with little change. It's kinda the 'Swiss Army Knife' of RPN calculators. It has a zillion functions that you'll never use. But just the knowledge that you could completely rebuild any advance civilization with it is reason enough to get one and take it everywhere you go. (Pack extra batteries).
9. It's a toy and a tool.
10. Some assembly required.

Edited: 21 Oct 2011, 6:41 p.m.

Re: Need a new toy. 48g or 50g?

*Message #4 Posted by **David Hayden** on 21 Oct 2011, 6:40 p.m.,*
in response to message #1 by JamesT

Do you mean the 48G from the 1990's, or the 48gii that they make today?

In addition to the better display, the 50g has an SD card and more memory than the 48gii.

Re: Need a new toy. 48g or 50g?

*Message #5 Posted by **NateB** on 21 Oct 2011, 6:48 p.m.,*
in response to message #1 by JamesT

The 50g has better connectivity options. If you decide that you want to start installing programs/libraries from hpcalc.org, transferring data is much easier with the 50g. For the 48 you'll need a serial cable and a computer with a serial port or USB to serial converter. Also, the 48G only has 32K RAM (128K for the 48G+/GX).

Edited: 21 Oct 2011, 6:50 p.m.

Re: Need a new toy. 48g or 50g?

*Message #6 Posted by **Gilles Carpentier** on 21 Oct 2011, 6:52 p.m.,*
in response to message #1 by JamesT

50G is far better. Bigger screen, really faster, CAS, infinite integers, USB for connection and electric power, imo better keys position ...

The less : not so 'sensual' keyboard (but it is correct), and for some people the lack of "large enter key", insuffisant paper documentation (but downloadable on HP site include advanced manuel)

Re: Need a new toy. 48g or 50g?

*Message #7 Posted by **Oliver Unter Ecker** on 21 Oct 2011, 7:47 p.m.,*
in response to message #1 by JamesT

Strangely, it's not always pointed out as the first thing, but I'm with Gilles: the 50g is a *far* more capable machine software-wise.

Re: Need a new toy. 48g or 50g?

*Message #8 Posted by **JamesT** on 21 Oct 2011, 8:14 p.m.,*
in response to message #7 by Oliver Unter Ecker

Didn't think about the display quality/size...very good point.

As for the Enter key, I felt it looked strange but didn't notice they had shrunk and moved it from its usual location.

The 50g seems to have more sheer toy potential. And seems like a deal for $100. I will be ordering one. Thanks for all the feedback!

Re: Need a new toy. 48g or 50g?

*Message #9 Posted by **bill platt** on 21 Oct 2011, 9:19 p.m.,*
in response to message #8 by JamesT

48 has joined the ranks of antiques now!

But it is a pretty awesome antique...

Re: Need a new toy. 48g or 50g?

*Message #10 Posted by **Dave Britten** on 21 Oct 2011, 9:41 p.m.,*
in response to message #1 by JamesT

I prefer the 48, personally. The keyboard and menu layouts on the 50g are awful, and I still have problems with duplicated/missed keystrokes occasionally, despite fiddling with KEYTIME. Plus the keys on the 50g are still too stiff, particularly the arrows.

My opinion is that all the extra memory, speed, and screen size are wasted if it's a pain in day to day use. And thus I keep a 48SX on my desk. :)

Re: Need a new toy. 48g or 50g?

*Message #11 Posted by **Eddie W. Shore** on 22 Oct 2011, 11:26 a.m.,*
in response to message #1 by JamesT

50g has a faster processor, can be connected by USB port, has an SD card, and has more real estate as far the screen goes.

What I like of the 48G better: bigger ENTER screen, MTH and PRG menus don't need a shift key to access it.

Despite this, my vote is for the 50g.

Edited: 22 Oct 2011, 11:29 a.m.

I can say that 48G is obviously old technology with some significant limitations such as unflashable firmware but HP-50G isn't good enough, particularly its keyboard. If I need to choose between them, I'll go for HP-50G for sure.

To be frank, no calculator made by HP after HP-48SX is good enough to fascinate me.

It's ALIVE!!!

*Message #1 Posted by **David Hayden** on 21 Oct 2011, 4:28 p.m.*

I just had to share this story. I picked up a 48SX with a broken display as a door prize at HHC2011. Not surprisingly, when I put batteries in and tried it, nothing happened.

Today I tried again, figuring that I'd try to induce a computation error and see if it would beep. Again, no luck.

I tried adjusting the contrast. Nothing.

I tried pressing the ON button harder, and many times. Suddenly it turned on!!! The display has some marks on it, but it's perfectly readable.

Then I tried to turn it off.... it wouldn't go off. Hmmmmmm.....

Then I remembered reading here that keyboard failure is common on some models and if you press under the display, it causes two contacts to come together that fix the problem. I pressed under the display, and I was able to turn it off and on at will.

So the bottom line is that the display has a few nasty marks but is otherwise okay. The real problem is just that the ON key doesn't register. That's alright, I just want to play around with the machine anyway.

Dave

Unusual non-HP RPN (red led display) to restore...

*Message #1 Posted by **Cristian Arezzini** on 21 Oct 2011, 4:07 p.m.*

A few days ago I impulse-bought a calculator on eBay. It is an "Emerson E12" calculator. There was no detailed description, but looking at the photos I noticed it was RPN so I bought it - at 14 Euro it was cheap enough. It arrived today, and it works when I power it with the included adapter. It's pure RPN, quite nice and feature-rich, made in 1975. I opened it, and it's quite clean inside, but I noticed that it's actually a re-badged Corvus 500! And I'm quite happy about that! :)

But it has a problem with the display: three segments are totally missing, and two more have a few "dots" missing. The display is made by hp (there's 1130-053 written on it). Is there something I can do to fix it? If not, is there somewhere to buy another - or a compatible replacement?

Second problem: there was some oxidation on the metal contacts for the batteries. I cleaned them the usual way, but one broke. What material should I use to rebuild it? Copper foil? Something else?

Third question (but this is unrelated): another calculator I'm restoring has (had) a foam pad between the keys and the domes. The foam has disintegrated with age. What can I use to replace it?

Fourth: right now I'm in the process of trying to restore several calculators... is it OK if I ask a lot of questions here? :)

Cristian

Re: Unusual non-HP RPN (red led display) to restore...

in response to message #1 by Cristian Arezzini

I'm certain others will chime in with more useful advice, but I've seen 2 common types of LED failures on old calculators, both relating to bad electrical contact between the LEDs and the driver.

First, if the contacts are dirty/solder joint broken/wire or trace cracked, that would do it. Solderless HP Spice series machines had issues with this, the LED module (like everything else) was held against the PCB contacts by a piece of plastic and a couple of spring clips.

Second, it's possible for chemicals from degrading batteries to get inside the LED module and eat the bonding wires. You can see this by looking closely near the segments with the unit disassembled, you should see several tiny wires running to the segments. If any of these seem broken/missing/corroded, you're probably looking at replacing the LED module.

in response to message #1 by Cristian Arezzini

Congrats on your find. This is the first time i have heard of that brand, or any rebadging of the Corvus 500. Is

it an exact copy as far as you can see?

Re your fourth question: Asking questions about repairing old calculators (especially hp & RPN) is one of the reasons for this forum's existence.

in response to message #3 by db (martinez, ca.)

As far as I can see, it's an exact copy - I only have pictures of the Corvus, but it seems an exact copy of mine. And the motherboard of mine has the Corvus logo on it, that's why I thought of a mere re-badging. And the display is an hp part! :)

*Message #5 Posted by **Michael de Estrada** on 23 Oct 2011, 10:48 a.m.,*
in response to message #4 by Cristian Arezzini

Where was it made ? My Corvus 500 was made (assembled) in Hong Kong. Also, I assume you realize that you can operate it from a universal AC adapter @ 4.5 Vdc in the event you can't repair the battery connectors. I'm using 3 x 1.5V AA alkaline cells in mine.

Re: Unusual non-HP RPN (red led display) to restore...

*Message #6 Posted by **Cristian Arezzini** on 23 Oct 2011, 11:00 a.m.,*
in response to message #5 by Michael de Estrada

It was "assembled in Hong Kong". It came with its (working) power supply, that's how I've tested it - can't use batteries until I rebuild the contacts (if I ever will)! :)

I couldn't find anything online about it... (the brand is actually "Emerson Electronics").

HP 71B Zenwand Manual

*Message #1 Posted by **Ph.Théry** on 21 Oct 2011, 3:45 p.m.*

I am looking for a copy of the HP 71B Zenwand manual. Can anyone help me?

Re: HP 71B Zenwand Manual

*Message #2 Posted by **Klaus** on 24 Oct 2011, 8:52 a.m.,*
in response to message #1 by Ph.Théry

I have a manual, but it doesn't serve to make photocopies of it. However, it is pretty easy to use the Zenwand without it, IIRC you can just use the function

```
barcode$
```

, it will automatically determine the type of barcode and return a decoded string of it.

Do you have any specific questions?

New version of 41Z - adds ZSTO Math

*Message #1 Posted by **Ángel Martin** on 21 Oct 2011, 2:21 p.m.*

just to proof that the 34S is not the only one getting constant and frequent enhancements :-)

New version (aptly labeled "9J") adds ZSTO math functions (/,-,*, and /) - as well as

- expanded all-MCODE ZGAMMA function, now supporting Re(z)<0 using analytical continuation,
- Z^3 function - with higher accuracy than Z^X
- new launcher to access the ZSTO math functions
- FOCAL program to calculate cubic equation roots, and
- FOCAL program to calculate Rieman's Zeta.
- optimized code for Bessel functions (FOCAL) - using the new ZSTO math additions, which is how this came into being.

We lost a couple of functions due to the 64-FAT entries limitation, as follows:

1. IMAGINE, it was a header function, not much of a loss there
2. Z<>V, superceded by Z<>ST with argument =3
3. Z/I, easily replaceable with Z*I, then ZNEG

All available in a meager 8k ROM...

Soon available at a TOS near you.

Best, 'AM

HP 50g: Full Command and Function Reference incorporated into the O.S.

*Message #1 Posted by **Software49g** on 21 Oct 2011, 10:38 a.m.*

Hello,

Here is a video that shows an implemented help for *all* commands integrated into the Operating System.

http://www.youtube.com/watch?v=ZPN5bTPNHFs

Features:
- integrated into the O.S.
- ultra fast
- combined text and graphic area with unlimited length
- supports algebraic and RPN presentation
- example for the command, RPN or ALG example and RPN or ALG result depending on the mode the calculator operates
- shows flag settings affecting the operation of the function or command
- hyperlinked navigation to related commands

The new "Help for all Commands" (TM) requires an installed MLP or OSE.

Enjoy,
Andreas
http://www.software49g.gmxhome.de

User RPL Question

*Message #1 Posted by **Paul Berger (Canada)** on 21 Oct 2011, 9:41 a.m.*

While playing with user RPL I have noticed that on 49G and later calculators my program that contains some nested loops performs much better if I put a decimal point after constants. On the 49G more than 4 times improvement in run time. I searched through the AUR but did not find any mention of what this does. Could someone point me to some information on what the decimal point does?

Re: User RPL Question

*Message #2 Posted by **Cristian Arezzini** on 21 Oct 2011, 9:47 a.m.,*
in response to message #1 by Paul Berger (Canada)

The HP49 and 50g have two different kinds of numbers: integers and reals. For example, "5." is a real and "5" is an integer. There are different internal algorithms depending on which one you use, and the difference in execution time can be really large, as you noticed! I had to modify all my old 48G programs, to add the "." after numbers...

Cristian

Re: User RPL Question

*Message #3 Posted by **Crawl** on 21 Oct 2011, 10:05 a.m.,*
in response to message #2 by Cristian Arezzini

Actually, if you open (for modifying) a program in approximate mode and save it, decimals will AUTOMATICALLY be added after every number.

Personally, I don't like that feature, as there is no (as far as I know) similar feature to remove all the decimals, and there have been times I accidentally added them and then needed to remove them manually.

Re: User RPL Question

I ran into that situation myself - once the program adds automatic decimal points, there is no way back.

Would you recommend that programs be entered and ran in Approx mode and if exact numbers/expressions are necessary just take a XQ or -> Q command at the end?

I just noticed that running ->Q switches the calculator from Approximate mode to Exact mode

HP-65 strange card writing error

*Message #1 Posted by **John Garza** on 21 Oct 2011, 2:56 a.m.*

I have an HP-65 that I refurbished a few yars ago (new drive roller, clutch, cleaned head & leaf switches, etc. and well lubed).

It was working perfectly until today. I can read cards fine. I can write cards and then read them back in and get a steady "0.00".

However, when I switch to W/PRGM, in addition to the normal keycode display, I see minus signs at the left and right ends of the display. And the program does not run properly, the display just flickers dimly. This strange behavior only happens with cards that I have recently written to. Standard Pac cards, and cards I recorded a month ago read and run properly and don't display the minus signs.

AFAIK, the most likely culprit with write failures is the leaf switches. But I have not read any mention of the strange display. Could the switches be "marginal" - making intermittent contanct (somehow getting out of adjustment by just sitting on a shelf)? or maybe some electronics are finally dying (caps, coils, etc.)

Anyone seen this before?

-John (3665)

Re: HP-65 strange card writing error

*Message #2 Posted by **Rik Bos** on 21 Oct 2011, 3:08 p.m.,*
in response to message #1 by John Garza

Hi John,

Did you replaced the tantalium caps next to the head amplifier circuit and on the back of the motor ? A lot of strange cardreader errors are caused by a cap with a high ESR value. Also important is the condition of your battery pack because the head amplifier gets it supply directly form the battery, if the internal resistance of the pack is getting high you also get unpredictable results. A bad battery pack also causes the a short battery life.

-Rik

Re: HP-65 strange card writing error - Caps values?

*Message #3 Posted by **AlbertTocarLoseggs** on 21 Oct 2011, 4:41 p.m.,*
in response to message #2 by Rik Bos

Hi Rik, Which are the values of these tantalum caps? Are the same for an HP-67? Thanks, Albert

Re: HP-65 strange card writing error - Caps values?

*Message #4 Posted by **Rik Bos** on 21 Oct 2011, 5:39 p.m.,*
in response to message #3 by AlbertTocarLoseggs

Hi Albert,

According to the HPCC schematics from Tony Duell they are 22uF, there is also one on the motor for supression of the commutation spikes. Keep in mind that Tony some times makes a typo so the value could also be 2.2uF, but you'll see the value when you open the calculator.

Any 9100 owners out there?

*Message #1 Posted by **David Ramsey** on 20 Oct 2011, 7:43 p.m.*

Just got a 9100B off TAS; hopefully, it's as functional as it appears to be. I'm crossing my fingers.

I'm having Larry Atherton rebuild the power supply and generally check it out; he regaled me with a half-hour lecture on how insanely complex the 9100 is; how it shouldn't even have been possible to build one with the technology of the time, and so forth.

He asked if I knew anyone else that owned one of these machines that he could talk to if need be. Well, I imagine Tony has one...anyone else?

Re: Any 9100 owners out there?

*Message #2 Posted by **Tony Duell** on 21 Oct 2011, 3:58 a.m.,*
in response to message #1 by David Ramsey

No, I don't have _one_. I have 2 :-) (both B's)

The design is simple in terms of component count, but complex in terms of how it's all intertwined. There are something like 44 flip-flops (only) in there -- 20 on each of 2 PCBs (these include the program counters for the firmware and microcode, the arithmetic digit registers, etc), 2 for the clock divider, 1 for the core memory page select and finally one for the error flag. The last is an SR, all the others are JKs.

There really is no need to 'rebuild the power supply'. In all the 9100s I've worked on, I think I've had one PSU problem (rectifiers for the main -15V line shorted, which blew the mains fuse). I've never had the regulator transistor fail. And I've never had to replace any capacitors.

You're welcome to talk to me about it. I've taken mine into rather more pieces than HP ever intended me to do, and I've traced out schematics...

Re: Any 9100 owners out there?

*Message #3 Posted by **David Ramsey** on 21 Oct 2011, 12:52 p.m.,*
in response to message #2 by Tony Duell

In the playing with ancient electronics I've done over the past year or so, I've found old capacitors to be a fairly common problem, in everything from an NEC Turbo Express hand held game to the 9835 I acquired recently.

Now, the only way *I* can tell if a cap is marginal or bad is if it's visually obvious: bulging ends or visible leakage or corrosion. But I understand they can be electrically bad, too.

That said, I have many old HP desktops with untouched power supplies that work perfectly. If my 9815 or 9825 die, they're fairly easy to replace, even today. But if the 9100 croaks, well, those are a lot harder to find!

Of course Larry Atherton knows about a zillion times more about this stuff than I do, so I'll trust his judgment.

Re: Any 9100 owners out there?

*Message #4 Posted by **Rik Bos** on 21 Oct 2011, 3:13 p.m.,*
in response to message #3 by David Ramsey

I think the Guru is Tony in this case and not Larry ;-P I never met a person with more HP(and DEC and....) related hardware knowledge. To understand what I mean look at cctalk/cctech at classiccmp.org

;-) Rik

Re: Any 9100 owners out there?

*Message #5 Posted by **Tony Duell** on 22 Oct 2011, 4:06 a.m.,*
in response to message #4 by Rik Bos

Hmmm. I am not sure I'm ever going to be a 'guru' of anything. And quite a number over on cctalk seem to object to my postings.

But anyway. I will admit I've taken a 9100 apart. Really apart, meaning I desoldered the 4 parts of the ROM assembly from each other. I do have a fair idea as to how they work.

Feel free to ask...

Re: Any 9100 owners out there?

*Message #6 Posted by **Tony Duell** on 22 Oct 2011, 4:00 a.m.,*
in response to message #3 by David Ramsey

My experience (based on a _lot_ of vintage hardware, not just HP) is that capacitors can fail, but not as often as some will have us believe, and that the 'witch hunt' on old electrolytics in power supplies is unjustified.

The other issue is : why would you have to replace an entire 9100 just because a capacitor in the PSU has failed? It's unlikely to do much (if any) more damage when it goes. So you'd _then_ replace the capacitor and get the machine running again.

Re: Any 9100 owners out there?

*Message #7 Posted by **Eric v d Wateren** on 21 Oct 2011, 7:59 a.m.,*
in response to message #1 by David Ramsey

Well done finding this unit David... it never appeared on my occasional searches, so I'll probably need to do some tweaking there.

Your 9100B looks to be in very good condition. Just be careful with the display CRT if you have to transport it, as I understand that is the only part that is pretty much impossible to find a replacement for.

Congrats and enjoy!

Re: Any 9100 owners out there?

*Message #8 Posted by **David Ramsey** on 21 Oct 2011, 3:12 p.m.,*
in response to message #7 by Eric v d Wateren

Yeah, the one thing that makes me nervous is the odd appearance of the exponent in the first line of the display. On my monitor it looks as if a piece of black tape or something is covering the bottom segments of the X register exponent and part of the last digit of the mantissa.

Re: Any 9100 owners out there?

*Message #9 Posted by **Tony Duell** on 22 Oct 2011, 4:09 a.m.,*
in response to message #8 by David Ramsey

You know, your guess of 'bad capacitors' might just be right here...

The 'display task' -- the firmware that produces the display -- is synchronised to the mains to prevent flicker. There's a resistor connected to one end of the transformer secondary winding which drives a transistor on the right sideboard in the processor section for this.

Anyway, ripple on one of the CRT electrodes will blank out part of the display and it'll be pretty stable as a result of the above. I think my schematic of the PSU board gives the voltage _and ripples_ that I measured in my working machine. Use a 'scope to check the ones in your machine.

And then check the associated smoothing capacitors, etc

Re: Any 9100 owners out there?

*Message #10 Posted by **David Ramsey** on 22 Oct 2011, 11:26 a.m.,*
in response to message #9 by Tony Duell

Thanks for the pointers, Tony! It's not clear from the one photo of the display if there's really a problem or if it's some artifact of the image, but I should know shortly.

Re: Any 9100 owners out there?

*Message #11 Posted by **Tony Duell** on 22 Oct 2011, 4:04 a.m.,*
in response to message #7 by Eric v d Wateren

I was watching it on E-bay, I didn't intend to buy it, but I wanted to see how much it went for. Way more than I could ever afford....

The CRT is impossible to find now. It was a custom part for this machine, it's an electrostatically-deflected one with a larger than normal deflection angle (I suspect this leads to some non-linearity in the display, but this doesn't matter for displaying digits).

Worse than that, the electrodes in the electron gun are supported by fragile glass rods. If these break (due to rough handling), it not only ruins the CRT but if the electrodes then short together it can apply high voltages to the logic side of the machine, taking out transistors and diodes all over the processor section. Ouch.

The HP service manual is mostly a boardswapper guide, but it's worth reading nonetheless. It has some information on the PSU and CRT circuitry, and a warning to remove and inspect the CRT if you suspect the machine may have thrown about. I do it anyway, but then I am not afraid of taking thing apart ;-)

Re: Any 9100 owners out there?

*Message #12 Posted by **paolo** on 21 Oct 2011, 5:20 p.m.,*
in response to message #1 by David Ramsey

Hi David,

I own one HP9100A recovered just before dumping by a local research lab. It had a pair of shorted rectifier diodes in the power supply that I replaced quite easily (along with the related fuse) and it is now working fine. The magnetic card reader is ok too. I too wonder how many operative such machines are around nowadays, it would be nice to set up a sort of census about that.

Regards

Paolo

Re: Any 9100 owners out there?

*Message #13 Posted by **David Ramsey** on 22 Oct 2011, 10:04 p.m.,*
in response to message #12 by paolo

Ah, so you got yours for free!

Re: Any 9100 owners out there?

*Message #14 Posted by **paolo** on 24 Oct 2011, 4:43 p.m.,*
in response to message #13 by David Ramsey

Yes, actually it was bit of luck. When I recovered it from dumping I even didn't know that the 9100A was such an interesting historical item, I simply liked the old-fashioned appearance. Then while looking for repair suggestions I discovered this forum and learned some more.

Still I would like to know how many such 9100A or B units are preserved today: I know about five or six working machines that were mentioned in the forum but I would guess there are a lot more.

Sometime I wonder how to start a census within the forum, or possibly even within a larger target including science museums and so on.

Paolo

Re: Any 9100 owners out there?

*Message #15 Posted by **David Ramsey** on 26 Oct 2011, 11:04 a.m.,*
in response to message #14 by paolo

You know, it would not be difficult to design a MySQL database schema, with a simple PHP front end input form and report module, that would allow forum members to input whatever calcs they have so that we could have some statistics.

Of course we'd need support from Dave Hicks. Is he still alive?

Re: Any 9100 owners out there?

*Message #16 Posted by **Israel Otero** on 25 Oct 2011, 1:53 p.m.,*
in response to message #1 by David Ramsey

I have an HP9100A and I look forward to know how many of us have one. I get it in 1987 from HP by a HP2000 service engineer back then and still works ok.

*Message #1 Posted by **Robin Shelton** on 20 Oct 2011, 3:54 p.m.*

Calling all awesome geeks! Calc 3 questions.

How do you graph parametric equations? I.E x(t)= 5cos(t) - cos(5t) y(t)= 5sin(t) - sin(5t)

Also how do you solve multiply equations with multiple variables? I.E. 7x+ 6y+ 9z= 0 5x+ 6y+ 20z= 0 x+ y+ z= 0

Last one! When I integrate the Sq root of [(-12sin(3x))^2+ (12cos(3x))^2 and you are integrating it from 0 to 2(pie)/3 (I have no pie symbol on the computer... awesome)I get a question mark. But when I integrate it by hand I get 8(pie). Any help would be much appreciated!

Re: graphing/solving with 50g

2 Use linear solver

Re: graphing/solving with 50g

*Message #3 Posted by **Crawl** on 20 Oct 2011, 6:08 p.m.,*
in response to message #1 by Robin Shelton

For 2, that's a homogeneous equation which means it has a trivial solution of x=y=z=0.

In general, for systems like that, I would enter them as matrices.

Eg.,

```
[7 6 9]
[5 6 20]
[1 1 1]
```

(It's easiest to enter with the Matrix writer)

Then hit 1/x.

Then enter

```
[0]
[0]
[0]
```

then multiply.

If the system of equations is not linear, you can use the command MSLV. This is an advantage the 50g has over the TI89, by the way; the TI89 has no built-in function for solving systems of nonlinear equations.

For the last one, it looks to me like the integrand is the constant value 12, so yes, 12 * 2 pi / 3 = 8 pi.

I get the question mark when I evaluate that integral, too. Two ways around it: In approximate mode, you'll get the correct numerical value. To get it exact, when the integral is in level 1 of the stack, instead of hitting EVAL, hit TSIMP. (To simplify trigonometric expressions) It immediately gives 8pi.

What would you prefer: RPN or RPL?

*Message #1 Posted by **Hugh Evans** on 20 Oct 2011, 3:18 p.m.*

Full disclosure: This is for some decision making related to OpenRPN.

The reason I have posed this question is that I'm curious if there's much real interest in a RPL based calculator. While it may not be perfect in every way, the 50g is a reasonable option for anyone needing a graphing calculator that has RPL program-ability. When I need a CAS I use a computer, and the same is true for most function plotting, running statistics on huge data sets, etc. From a personal standpoint my dream machine is what the 42s could have been if engineers weren't forced to hold back to prevent it from cannibalizing 48g sales.

One loosely proposed concept has been brought up under the title of RPN+ and serves the purpose of an extended version of what we already know. User definable or otherwise unlimited stack would be included. After the core functions are implemented, all others could be written in a scripting language (options such as python and lua have been mentioned.)

The other option is *fix, which is effectively sysRPL Forth.

If you have some other idea, please put post it. Input is needed so we can feel more confident in our choice of direction.

RPL forever :D

And HP50G specially.

Re: What would you prefer: RPN or RPL?

*Message #7 Posted by **Jeff Johnson** on 20 Oct 2011, 3:40 p.m.,*
in response to message #1 by Hugh Evans

I'm hardly a programmer any more, but I would hate to see the richness and depth of RPL lost when building an "ultimate" calculator that is to rise above the 50g. RPL is iconic in HP history. If sysRPL FORTH is truly implemented in the classical tradition of the FORTH language, where you build new objects as a combination of existing objects, it would certainly be a powerful way to build and share libraries. That would be a positive vote for *fix.

Re: What would you prefer: RPN or RPL?

*Message #8 Posted by **Hugh Evans** on 20 Oct 2011, 4:09 p.m.,*
in response to message #7 by Jeff Johnson

Everything we have considered thus far includes FORTH like ability to build commands from a core command set. No matter what, it will be possible to very easily make this hardware into any type of calculator you want. If people just want RPL, it seems that emulating saturn would be the easier route. Commands will not even be limited by the system we implement as other executables can be written.

Re: What would you prefer: RPN or RPL?

*Message #9 Posted by **Donald Williams** on 20 Oct 2011, 3:50 p.m.,*
in response to message #1 by Hugh Evans

RPN only. Take it one step at a time. If an RPN approach is ever accomplished then do RPL & Forth for those fanatics that need it.

Re: What would you prefer: RPN or RPL?

*Message #10 Posted by **Oliver Unter Ecker** on 20 Oct 2011, 3:50 p.m.,*
in response to message #1 by Hugh Evans

For your project, make the HW capable enough so it can be both: RPN+ and RPL+.

If you can, give it WiFi for really convenient sharing abilities and more.

CAS. A calc without multiple visible lines and visible data types such as arrays and infix expressions, isn't really a suitable base, I think.
So, I'd say, yes, you need an RPL-style machine if you want to offer a CAS.

I'm currently implementing a CAS for my project, ND1. It's effectively Mathematica, via use of the WolframAlpha API. How cool are Mathematica results in an RPL calc? Very...

As I mention in your project's forum, if you make this machine a suitable base, I'll work on making ND1 available for it. If you add WiFi, it will have a Mathematica-based CAS.

[EDIT: To clarify, I'm suggesting a system that's open enough to "boot" into multiple calculators. I added more thoughts to the thread in the openrpn forum.]

RPN

Re: What would you prefer: RPN or RPL?

*Message #13 Posted by **Han** on 20 Oct 2011, 4:03 p.m.,*
in response to message #1 by Hugh Evans

I guess I'm not seeing much of a difference in RPN vs RPL. I sort of see RPN as just the keystroke version of RPL (and hence a bit more limited). In fact, on the HP48 and similar systems, if you wanted to do keystroke programming, it could be done provided you start with << and end with >> -- everything in between may as well be keystrokes. The only other minor difference is how ENTER is implemented.

Yes! And second priority is a short and simple manual for me. I'm spoilt by 20+ years of Macintosh usage and really don't want to waste my time with anything that

can not be mastered intuitively. Ten pages maximum for the manual (8 of which the list of functions :-) , not more than two for using and programming) and I buy it!

Re: And a short manual please!

*Message #21 Posted by **John B. Smitherman** on 21 Oct 2011, 8:22 a.m.,*
in response to message #20 by Maximilian Hohmann

Hi Maximilian. To me the Mac user interface isn't intuitive but rather it's consistent. It works the same way from software app to software app year after year. For example, dragging a disc to the trash can to eject it isn't intuitive at all but it's worked that way for many years.

John

Re: And a short manual please!

*Message #22 Posted by **Oliver Unter Ecker** on 21 Oct 2011, 9:39 a.m.,*
in response to message #20 by Maximilian Hohmann

How much shorter than this RPL on wikipedia do you want the manual to be?

Honestly, I don't understand why people say that RPL has a steep learning curve. The language is about as easy as it gets.

Mastering the 700+ commands in a 50g (or other RPL machine) is another matter, but you don't need any of them to comprehend, and use, the language. The command set isn't there to intimidate, either. It's there for you to pick up something when you need it, and save you from wasting time on reinventing the wheel.

Re: And a short manual please!

*Message #23 Posted by **M. Joury** on 21 Oct 2011, 12:04 p.m.,*
in response to message #22 by Oliver Unter Ecker

I don't think that it is difficult so much as different. From my perspective, coming at it as a programmer, it is a relatively easy language with a lot of power. Many people seem to miss that it *is* keystroke programmable (just place your keystrokes between <<>> and you are set). Maybe the looping constructs are more involved but with that added complexity comes power. And they really are not that hard to master. However, I would still rather have FOCAL or RPN for quick and dirty solutions and RPL for more involved, fully developed, applications.

Cheers,

-Marwan

The Wikipedia article does a great job of summarizing the main commands

on RPL.

Also check out my RPL blogs on Eddie's Math and Calculator Blog for a summary of some of the main commands.

Re: What would you prefer: RPN or RPL?

*Message #25 Posted by **Han** on 21 Oct 2011, 3:10 p.m.,*
in response to message #18 by Maximilian Hohmann

You can do all that with RPL. You can also have temporary variables that span across multiple subroutines (i.e. temporary global variables) by prefixing them with the left arrow (e.g. <-p)

Quote:

```
<<
  << subprg1 >>
  << subprg2 >>
  ...
  << subprgn >>

  ->

  s1 s2 ... sn

  <<

  @ main routine goes here

  @ call a subroutine with:
  s1 EVAL

  @ do a GOTO with:
  s1 KILL

  @ pause and wait for keypress with:
  0 WAIT

  >>
>>
```

I'm not familiar with how BREAK works in RPN... does that just exit the current loop? Or does it kill the program?

Re: What would you prefer: RPN or RPL?

*Message #26 Posted by **Eddie W. Shore** on 21 Oct 2011, 3:37 p.m.,*
in response to message #25 by Han

Cool - up to now I had to store the subroutines as global variables and purge them in the end. I have to try this! Thanks!

Re: What would you prefer: RPN or RPL?

*Message #27 Posted by **Marcus von Cube, Germany** on 21 Oct 2011, 4:52 p.m.,*

in response to message #25 by Han

No need for BREAK in RPN, a GTO just does the job nicely. Cleanup of loops is just by reusing their counter register(s).

BREAK would be a nice addition to RPL because it lacks a clean way to exit a loop early if some condition becomes true. This is common practice in languages like C or Java.

Re: What would you prefer: RPN or RPL?

*Message #28 Posted by **Paul Berger (Canada)** on 21 Oct 2011, 7:19 p.m.,*
in response to message #27 by Marcus von Cube, Germany

I made a clean exit from a FOR NEXT loop by bumping up the loop counter to the exit value when I determined there was no point continuing the loop.

Re: What would you prefer: RPN or RPL?

*Message #29 Posted by **Marcus von Cube, Germany** on 22 Oct 2011, 4:54 a.m.,*
in response to message #28 by Paul Berger (Canada)

Isn't the loop index precomputed and immune against later modifications in RPL? What about a loop without an index variable?

Re: What would you prefer: RPN or RPL?

*Message #30 Posted by **Paul Berger (Canada)** on 22 Oct 2011, 3:01 p.m.,*
in response to message #29 by Marcus von Cube, Germany

From the AUR

> Quote:
>
> FOR takes xstart and xfinish as the beginning and ending values for the loop counter, then creates the local variable counter as a loop counter. Then, the loop clause is executed; **counter can be referenced or have its value changed within the loop clause.** NEXT increments counter by one, and then tests whether counter is less than or equal to xfinish. If so, the loop clause is repeated (with the new value of counter).

By loops with out an index do you mean 'while' and 'do until' loops? in both of these cases these loops execute until some logical condition meets the exit criteria. While I have not explicitly tried this in RPL I would expect you should be able to have a compound test and one of the terms can be an exit flag that you could set or clear when you determine that you wish to exit the loop early.

Re: What would you prefer: RPN or RPL?

*Message #31 Posted by **Marcus von Cube, Germany** on 22 Oct 2011,*

4:12 p.m.,
in response to message #30 by Paul Berger (Canada)

I stand corrected, RPL allows the modification of the loop counter and the increment can be taken from stack each time. There is a loop construct with no visible counter in RPL (START/NEXT). But there is also a variant with a variable increment. All these loops (except START/NEXT) can be exited early by modification of the increment or the loop counter but you still need an IF block to skip any unwanted statements in the block. BREAK would make things easier.

Re: What would you prefer: RPN or RPL?

*Message #32 Posted by **Paul Berger (Canada)** on 22 Oct 2011, 5:19 p.m.,*
in response to message #31 by Marcus von Cube, Germany

Yes but even for break you need to make some kind of decision to get to the break in my case I did the test to see if it was worth continuing and all the code for the loop was under the THEN term and under the ELSE term I bumped up the loop count for early exit. I don't see how a BREAK command would make that any better.

Re: What would you prefer: RPN or RPL?

*Message #33 Posted by **Thomas Radtke** on 23 Oct 2011, 4:59 a.m.,*
in response to message #32 by Paul Berger (Canada)

A break is convenient to immediately leave a loop w/o enclosing the remaining code in a conditional statement, as it would be necessary when bumping the counter. Of course, one can live without BREAK, but it gives more clearly arranged code when using it. Java is quite stripped down compared to C++ in some respect but contains everything one needs. It's remarkable that break has been left in and that it's widely used.

Re: What would you prefer: RPN or RPL?

*Message #34 Posted by **Marcus von Cube, Germany** on 23 Oct 2011, 8:34 a.m.,*
in response to message #33 by Thomas Radtke

In Java, break has even been extended to take a label. This way you can break out several loops at once which is otherwise a mess. The labeled break isn't a goto, you can just 'name' the loop to break.

Re: What would you prefer: RPN or RPL?

*Message #35 Posted by **fhub** on 23 Oct 2011, 8:49 a.m.,*
in response to message #34 by Marcus von Cube, Germany

> Quote:
>

I still remember the good old BASIC times ;-) where you could simply go FROM wherever you want TO wherever you want with a GOTO! Ok, many called this "Spaghetti code", but nevertheless this was quite comfortable (and BTW, every assembly code works exactly the same way) ... :-)

Franz

Re: What would you prefer: RPN or RPL?

*Message #36 Posted by **Marcus von Cube, Germany** on 23 Oct 2011, 10:10 a.m.,*

Leaving a FOR/NEXT loop this way leaves an open control structure in memory. :-(

Re: What would you prefer: RPN or RPL?

*Message #37 Posted by **fhub** on 23 Oct 2011, 10:40 a.m.,*
in response to message #36 by Marcus von Cube, Germany

> Quote:
>
> Leaving a FOR/NEXT loop this way leaves an open control structure in memory. :-(

Well, first I don't think this would be a problem at all (you'll certainly not do it thousands of times ;-)), and then you could always set the loop-variable to the endvalue and GOTO the NEXT statement.

Re: What would you prefer: RPN or RPL?

*Message #38 Posted by **Oliver Unter Ecker** on 22 Oct 2011, 5:46 a.m.,*
in response to message #28 by Paul Berger (Canada)

Plus, don't you still have to put an IF around the following code, until the NEXT/STEP?

'fraid there's no substitute to BREAK.

Re: What would you prefer: RPN or RPL?

*Message #39 Posted by **Paul Berger (Canada)** on 22 Oct 2011, 3:07 p.m.,*
in response to message #38 by Oliver Unter Ecker

Yes you do but it would seem to me that in order to determine if you should exit from a loop early, you would need to make some kind of a decision within the loop. I just don't think the lack of BREAK is such a big deal.

Re: What would you prefer: RPN or RPL?

*Message #40 Posted by **Oliver Unter Ecker** on 23 Oct 2011, 1:27 a.m.,*
in response to message #39 by Paul Berger (Canada)

Consider

```
for i:=0 to 1000
   if condition
      break
   if condition2
      ...
endloop
```

Yes, you can rewrite this to

```
for i:=0 to 1000
   if condition
      i:=1000
   if i < 1000 && condition2
      ...
endloop
```

but you have to have knowledge of the end value and you need to insert one additional IF, or condition for an existing IF, per break.

It looks bad and it introduces extra computation. What's more, if the end value should change, you have to maintain your end value update and code exclude IFs, or your code will (spuriously) fail.

This wouldn't be so bad, if breaks were rare. But running over a domain, checking for something, and doing an early exit is the life-blood of basic search algorithms, and happens all the time.

The RPL designers tried to keep things simple, and in this case maybe a little too simple.

CONTINUE is missing too...

Re: What would you prefer: RPN or RPL?

*Message #41 Posted by **Crawl** on 21 Oct 2011, 6:09 p.m.,*
in response to message #25 by Han

KILL will kill everything that's running; if a parent program calls a subprogram that

has KILL in it, both programs are killed.

People have pointed out that a language can be turing complete without GOTO, which is true; in principle, you could just be very careful about your structures. However, we are talking about hand-held calculators here, and I think for that application, it's important to be able to write programs on the fly. I've been in situations where a slight revision to a program would necessitate massive changes to the structure (adding many more IF THEN blocks throughout) when a simple goto or break would have done the job.

It is, by the way, possible to do loop breaking with error trapping / custom errors. I think this is the standard way it's done now. I think a built-in BREAK command would be more elegant.

Re: What would you prefer: RPN or RPL?

*Message #42 Posted by **Oliver Unter Ecker** on 21 Oct 2011, 7:39 p.m.,*
in response to message #41 by Crawl

Agreed. And that's why I (just recently) put it into RPL+.

Along with IFTB ("if-then-break") and CONTINUE and IFTC ("if-then-continue").

Re: What would you prefer: RPN or RPL?

*Message #43 Posted by **Eddie W. Shore** on 23 Oct 2011, 4:24 p.m.,*
in response to message #25 by Han

I tried your suggestion Han but I am having trouble getting the program to execute.

An example: The goal of this program is to give a menu of 3 options: return the principal root of a number (F1: RPN), return all the real roots of a number (F2; REAL), and return all the real and complex roots of a number (F3: ALL).

```
<<
<< 'X' PURGE SWAP ^ SWAP - X ZEROS >> -> SUB1
<< { { "PRN" << XROOT ->NUM >> }
{ "REAL" << -103 CF SUB1 EVAL >> }
{ "ALL" << -103 SF SUB1 EVAL >> } }
TMENU >>
```

I get "CF Error: Undefined Local Name" error when I try to run the REAL option.

I get "SF Error: Undefined Local Name" error when I try to run the ALL option.

Re: What would you prefer: RPN or RPL?

*Message #44 Posted by **Marcus von Cube, Germany** on 23 Oct 2011, 4:41 p.m.,*
in response to message #43 by Eddie W. Shore

It looks like the local variable SUB1 is not accessible to the routine tied to the options "REAL" or "ALL". You can try <-SUB1 as the local name. If that doesn't work you need to define a global variable for SUB1. It depends on the inner workings of TMENU. You should create a subdirectory for the variables and the program to avoid cluttering HOME.

Re: What would you prefer: RPN or RPL?

*Message #45 Posted by **Eddie W. Shore** on 23 Oct 2011, 6:14 p.m.,*
in response to message #44 by Marcus von Cube, Germany

I have been using global variables and purging them at the end:

i.e.

```
<<   <<subroutine goes here>> 'SUB1' STO
(Main program)
'SUB1' PURGE >>
```

RPN, please.

Re: What would you prefer: RPN or RPL?

*Message #53 Posted by **David Hayden** on 20 Oct 2011, 5:34 p.m.,*
in response to message #1 by Hugh Evans

RPL is a very small, very efficient programming environment. The compiler and decompiler are pretty simple, so it's easy to write programs in RPL on the calculator.

On the down-side the syntax is not very intuitive.

I think many of the design goals for RPL don't really apply any more, so I'd vote for key keystroke programmability of RPN and a more modern scripting language as you mention.

Re: What would you prefer: RPN or RPL?

in response to message #54 by x34

I very much doubt RPL is the reason HP lost the educational market.

Cost is a big one. HP was never cheap.

RPN is probably the second. When I was at school (early 1980's) the teachers had at most half a clue as to how to calculate in RPN but they really weren't sure. The fight was lost here before I finished high school -- there were only two of us with HP calculators at that stage. Everyone else used CASIO, actually I did too since my 34C was broken & I bought a 602P.

A few more at university (late 1980's) used RPN but it was still in the minority. When the 28C came out nothing really changed.

*Message #57 Posted by **Software49g** on 23 Oct 2011, 4:59 p.m.,*
in response to message #56 by Eddie W. Shore

I have several thousands pages of RPL documentation on my laptop, from deep down technical to user level and the internet is full of RPL instructions (and RPN).
So what is missing in your opinion ?

The real problem is that people/user do not read anymore. Which, as a quid pro quo, leads to declining manuals which are read even less which ...

I will be comming out with a help for *all* commands ASAP as shown here
HP 50G Full Command and Function Reference incorporated into the O.S.
which might be helpful as a short reference *but* for sure it can not overcome a lack of missing fundamentals which is the primary function of books.

Regards,
Andreas
http://www.software49g.gmxhome.de

By the way: For years I have been saying that the success of a machine targeting at professionals depends on the documentation/ease of use that comes with it.
But of cause that is contradictory to a company looking at short term profit only.

I was in high school in the late 70's. Everyone had a calculator, but most people used TI's even then. A few - perhaps 5% - used HP. So what has really changed?

I think it's the fact that the TI-83 is basically built into the textbooks now. My daughter, along with everyone else in her class, was required to buy one in 6th grade. The calculators are built into the books, and the lessons, and getting the teachers to change would be a lot of work.

I think this is actually one place where HP could very effectively leverage us, the user community. We could create HP-versions of the specific calculator lessons/exercises in specific textbooks. So if a teacher uses textbook XYZ, he or she (or the student) could go to a website and download the HP version of calculator lessons. Now if the teacher says "do the exercise on page 234," the enlightened HP student could just flip to the appropriate "translation" in their handy HP packet.

RPL - and please NO CAS :-)

I guess there are two domains:

Education: They are already gone to algebraic, no one is getting an RPN/RPL calculator - only if he/she is a rebel :-) And there are tons of calculators with CAS for them - because you are not allowed to have a computer on an exam, CAS might be good for them...

Grown-Ups: Like me, who need a calculator at work, for light calculations (some cosine here an there, perhaps some small apps for quick calculations in a meeting, etc). For everything I need more than 30sec to enter (that includes 10x10 matrices) I use a computer, as it is faster overall.

*Message #71 Posted by **Paul Dale** on 22 Oct 2011, 3:19 a.m.,*
in response to message #70 by Howard Owen

It comes from a combination and contraction of two words:

- Algae
- Braille

It refers to an ancient and little used form of written communication that lays out a thick sheet of pond scum and then glues blood sucking leeches into a variety of positions to render the letters. The writing is read by placing your finger tips onto the slimy surface and feeling the leeches bite into you.

One has to be wary however, an algebraic rendition of Tolstoy's classic *War and Peace* is very likely to render the reader unconscious, if not dead, due to blood loss.

Additionally, unscrupulous authors have been known to practice bdellotry before affixing the leeches into position, thus causing a greater level of blood loss amongst their readers.

Finally, the pond scum is very likely to infect the reader with a variety of nasty bacterial diseases.

*Message #81 Posted by **Les Bell** on 20 Oct 2011, 7:34 p.m.,*
in response to message #1 by Hugh Evans

For a calculator, definitely RPN. It's convenient for back-of-an-envelope calculations and use in meetings, which is what I want a calculator for. Keystroke programmability to automate some repetitive calculations is all I need, and GTO/GSB/ISZ/DSE will get the job done.

If the problem is complex enough to require RPL, with its highly regular but awkward syntax, I'd prefer to sit at a computer and work with GNU Octave or R or Matlab or Mathematica.

Best,

--- Les

*Message #84 Posted by **Eddie W. Shore** on 21 Oct 2011, 12:20 a.m.,*
in response to message #1 by Hugh Evans

Good question! I like RPN for simplicity, RPL for the extended set of commands. Truthfully, I'm not sure if I can be on team-RPN or team-RPL yet because I like both.

Here's how I would imagine some of the RPL commands on an RPN (keystroke) machine:

FOR Loop:

```
start
end
FOR register#
** commands **
NEXT
```

WHILE Loop:

```
y
x
WHILE Test#  (i.e. #1: x=y; #2: x>y; #3: x<y, etc)
** commands **
WEND
```

DO Loop:

```
DO
** commands **
y
x
UNTIL Test# (i.e. #1: x=y, #2: x>y, #3: x<y, etc)
```

If text is allowed - it would be handled like the 41C/42S (?):

CHOOSE - each option is presented for 2 seconds. ("1. Choice 1", "2. Choice 2", "3. Choice 3"...) - and cycles until something is chosen. Up to 9 options.

```
"text 1"
"text 2"
...
"text n"
CHOOSE
```

PROMPT - message displays for 2 seconds and then stops for input.

```
"text"
PROMPT
```

DISP n - message displays for n seconds.

```
"text" or register#
DISP n
```

If graphing functions is featured:

PLOT - plots an equation as an algebraic object.

```
'equation'
PLOT
```

XRNG and YRNG would work the same way as it would on the graphing calculators.

*Message #90 Posted by **Fred Lusk** on 22 Oct 2011, 1:47 a.m.,*
in response to message #1 by Hugh Evans

Because I started with my dad's HP-35 (while in junior high school!), RPN is ingrained and natural to me. Most of the programs I still use today for civil engineering, I wrote on an HP-41CX and an HP-42S back in the 1980s and 1990s. I still program, but not nearly as much.

I have an HP-48G+ and I have dabbled with PRL programming. There is no question that it is enormously more powerful than RPN, but it's just not natural to me and I find it frustrating. It's also a pain to edit on the machine itself. Thank goodness for HPUserEdit. In the final analysis, I greatly prefer RPN.

However, I've had this question for years: when the 48 series was designed, why didn't HP include an RPN mode? It would have provided an excellent upgrade path for HP-41 and HP-42S users. I know some engineers who still use an HP-41 because they don't like the HP-48/-49/-50 series. I still use an HP-42S as my primary machine, though I also keep my HP-48G+ in my briefcase ready for use when needed.

An "Open" letter to "DIY" and "Repurposed" calculator projects

*Message #1 Posted by **Ethan Conner** on 20 Oct 2011, 2:31 p.m.*

All puns intended. :) Just my two cents here feel free to chime in. As a potential customer for these projects some things i like or don't like about what is out there so far. First i would be willing to layout a couple hundred dollars for a low production custom calc. Second it has to exist in a completed physical form. Not interested in pictures of potential products. It also must have a base scientific configuration for the keyboard and firmware. I don't want to have to buy a new faceplate, stickers or overlays every six weeks. Also don't want to have to reflash it that often either. Third i don't want a "minivan" that's been turned into a "sports car". It's an impressive feat but it's still just a hopped up "minivan". Not to mention that even the brainiacs in this group have trouble with it which doesn't bode well for an average joe like me. Nail down your physical form and firmware and put it up for sale. These are all impressive efforts and i wish everyone of you the best.

*Message #2 Posted by **Manolo Sobrino** on 20 Oct 2011, 4:34 p.m.,*
in response to message #1 by Ethan Conner

I miss a calculator that could interact with the calculations in your computer seamlessly. For instance, copy/paste data/formulae, and some sort of session sharing, kind of mathematica notebook idea. An easy cross-compiling procedure in C would come in handy too.

The point of calculators is specificity for the task and keyboard convenience (used to be mobility, but smartphones and tablets are here to stay). There are much more powerful (and sometimes even cheaper) platforms for scientific computing. It makes little sense to dedicate a lot of work just to improve the things that something else will do better, ignoring the real strengths. Unless it's just for fun...

A calc written in an interpreted language, can be updated without re-flashing. If it has WiFi (or Bluetooth) this can even be done over the air, and it can be a matter of pressing one button.

Are you sure? It seems to me that if you need to change the calculator software, you need to reflash it, regardless of the language that the software is written in.

If I'm missing something, can you explain how this would work?

Dave

Re: An "Open" letter to "DIY" and "Repurposed" calculator projects

*Message #7 Posted by **Oliver Unter Ecker** on 21 Oct 2011, 10:34 a.m.,*
in response to message #6 by David Hayden

> Quote:
>
> If I'm missing something, can you explain how this would work?

Certainly.

The only calc I know that implements what I'm referring to is my own, so forgive me for illustrating the point with an ND1 example:

Say ND1 had no "SINH" function, or there would be an error in its implementation.

At run-time, a user can type this code

```
calculator.functions["SINH"] = function(x) { return (Math.exp(x)-Math.exp(-x))/2;
};
```

in an "Injection" text editor and save it. Subsequently, the calculator will have a system-wide "SINH" function. It will be available in normal RPN operation and in RPL programming, and it will be indistinguishable from a built-in function.

This works because (most) interpreted languages allow you to evaluate code written in their own language. It's as if C could compile C code and dynamically bind to the compiled result.

Sometimes this is used with another language feature called "introspection" that let's you discover what properties are presently associated with an object.

Besides this enabling cool things such as updating your calc (entirely, or partially) by simply re-

evaluating some code, it's really simple and elegant to code. No object IDs, method IDs, RTTI stuff as in statically compiled languages.

You can find more info about how this works in ND1 here. The same general idea would work and be supported by pretty much any interpreted language.

If you think interpreted performance sucks, know that modern implementations use JIT compilers and can achieve pretty high speeds. For JavaScript, it's currently a factor ~10x slower than C. The gap is shrinking and one could argue that performance isn't of paramount importance in a calculator.

It's not slow. I'm getting a factor 10x-100x faster RPL performance on ND1 in comparison to a 50g. And ~20x as much speed on top of that for code written in JavaScript, which, as "run-time environment", becomes the rough equivalent of SysRPL.
See the Benchmarks section at the end of this, which also lists a few HPGCC results.

[EDIT: Forgot to mention: ND1 has a "Restore Calculator" button that will fetch key definitions and any injection code from a server and re-create the calculator. This can be used to deliver a full update, fixes, new functionality, new key definitions, new menus. The process takes a second or two.]

Which is functionally equivalent to "reflashing" irrespective of the interconnect method or whether the downloaded bits are persistent.

Upon further thought, having a pocket calculator of necessity tethered to a server wouldn't be my first choice. I'd agree the feature is no doubt convenient in some scenarios but in my usage I fundamentally expect an autonomous device.

Re: An "Open" letter to "DIY" and "Repurposed" calculator projects

*Message #9 Posted by **Oliver Unter Ecker** on 21 Oct 2011, 11:33 a.m.,*
in response to message #8 by uhmgawa

Hmm. Not sure why you say that. The equivalent to reflashing would be an ordinary software update, which re-installs the binary and all resources.

The mentioned method provides a dynamic "overwrite" over unchanged code. It's not the in-place replacement that "flashing" is.

The point is, it's relatively painless to do as the binary remains the same. To fix one function you just need to communicate the source code for that function. There's no compiling,

linking. It takes one second to do versus fiddling with cables and computer connections, download of code to said computer, rebooting of the device, etc.

Of course, the calculator doesn't need to be "tethered to a server". The calc is stand-alone. If you want an update, you wander to a WiFi net and push that button.

Not mentioned before but probably obvious: networking allows you store your data and download shared data as well. Someone wrote a new set of Special functions, click on their shared folder and have it installed in your calculator a second later.

Want to work on code on both your computer and your calc? Or need that big matrix transferred from your computer? Click a button, or use an "overloaded" VISIT key that connects to your computer, retrieves the code, stores it in a local variable, and displays it in your device's editor.

Or just use your calc stand-alone and backup your data from time to time.

I think lack of networking was one of the main reasons that made people turn away from island high-end calcs.

> Quote:
>
> Hmm. Not sure why you say that. The equivalent to reflashing would be an ordinary software update, which re-installs the binary and all resources.

Not necessarily but that's certainly been the traditional connotation. It is possible to update persistent device storage on a per-byte basis if needed. The choice of whether doing so replaces the entire application image or merely adds/modifies/deletes function entries in a dictionary of primitive operations, is essentially an implementation detail.

> Quote:
>
> I think lack of networking was one of the main reasons that made people turn away from island high-end calcs.

I agree any calculator of the capability being discussed here should *never* be conceived without a bidirectional, user accessible interconnect between it and the outside world.

in response to message #11 by Paul Dale

Thanks for your note, Pauli.

Are you suggesting to use (e^x - 1/e^x)/2 instead, for higher accuracy?

If so, I'm actually getting slightly lower accuracy from that (tried x=0.00001). I must be missing something. Can you enlighten me?

Re: An "Open" letter to "DIY" and "Repurposed" calculator projects

*Message #13 Posted by **Paul Dale** on 22 Oct 2011, 3:30 a.m.,*
in response to message #12 by Oliver Unter Ecker

Nope, that has the same problems for x almost equal to 0.

There are a number of alternative encodings for this function. Most use the EXPM1 function (i.e. e^x-1).

e.g. the HP-41 maths module uses:

```
( (e^x-1) / e^x + (e^x-1) ) / 2
```

The 34S uses something a bit more complicated:

```
if (|x| < 0.5)
        t = e^x-1
        sinh = t / 2 / (t+1) * (t+2)
else
        sinh = (e^x - e^-x) / 2
```

Nice.

Thanks, Pauli! I shall consider which to adopt.

Re: An "Open" letter to "DIY" and "Repurposed" calculator projects

*Message #15 Posted by **Paul Dale** on 22 Oct 2011, 4:37 a.m.,*
in response to message #14 by Oliver Unter Ecker

Be very very careful implementing numeric functions. The obvious formulas are

often poor. I'd suggest looking up pretty much any of William Kahan's writings on numerical analysis.

Also don't implement e^x-1 the obvious way, it will produce very poor results for x close to zero and the whole purpose of this function is to produce good results there. This is the way the 34S does it:

```
u = e^x
if (u == 1)
    expm1 = x
else if ( (u-1) == -1 )
    expm1 = -1
else
    expm1 = (u-1) * x / ln(u)
```

Also beware of aggressive optimising compilers and compilers that produce code that uses varying lengths of reals. Both are very bad for numeric computations.

- Pauli

Re: An "Open" letter to "DIY" and "Repurposed" calculator projects

*Message #16 Posted by **Marcus von Cube, Germany** on 22 Oct 2011, 4:50 a.m.,*
in response to message #15 by Paul Dale

Pauli, wouldn't it be easier to compute e^x-1 by summing up the series for e^x without the constant term?

Re: An "Open" letter to "DIY" and "Repurposed" calculator projects

*Message #17 Posted by **Paul Dale** on 22 Oct 2011, 5:02 a.m.,*
in response to message #16 by Marcus von Cube, Germany

Possibly -- I suspect that unless you sum the series backwards, you'll encounter rounding issues in the low digit or three. Also, the Maclaurin series expansion converges very slowly for |x| large.

We've already got e^x as part of the decNumber library & it doesn't appear to be summing this series at all.

I see no point including a second function of similar size needlessly, especially when I can produce accurate results for e^x-1 from e^x quite easily.

- Pauli

Re: EXP and EXP-1

*Message #18 Posted by **Marcus von Cube, Germany** on 22 Oct 2011, 7:23 a.m.,*
in response to message #17 by Paul Dale

Pauli, I didn't know we are using EXP from the library. But it might

still be easier to modify this code to subtract the 1 early in the process. Using LN seems to be expensive.

Re: EXP and EXP-1

*Message #19 Posted by **Paul Dale** on 22 Oct 2011, 7:35 a.m.,*
in response to message #18 by Marcus von Cube, Germany

Yes, Ln is expensive. Always better expensive than wrong.

The decNumber exp() function actually does do the Maclaurin series expansion on a range reduced argument so this approach might be possible. It wouldn't be trivial, this function is quite complex and the accuracy guarantees it assumes won't hold if we make this change.

Definitely more thought will be required before jumping into this change.

- Pauli

Re: An "Open" letter to "DIY" and "Repurposed" calculator projects

*Message #20 Posted by **Oliver Unter Ecker** on 22 Oct 2011, 6:10 a.m.,*
in response to message #15 by Paul Dale

Oh, I love that one, thank you, Pauli!

I got the point of this function, but hadn't quickly turned up an implementation, so did it the obvious way and kept the bad feeling of knowing this was defeating the point. So, thanks for the relief!

Got the LNP1 code up?

I appreciate your comments about numerical analysis in general and will dig into the oft-cited pointer you gave. My focus has been on features and completeness before best numerical performance, which simply isn't my thing. This sure could use someone else's oversight.

A few days ago, I discovered the hard way that

```
3600 * (x - y)
```

loses accuracy in comparison to

```
3600 * x - 3600 * y
```

C'mon, IEEE 754! ;-)

in response to message #20 by Oliver Unter Ecker

> Quote:
>
> Got the LNP1 code up?

Try sourceforge -- all the 34S sources are there :) This one needs special attention to get correct -- the 34S implementation relies on the compiler not rearranging the order of expressions. Specifically the (x+1)-1 equal to zero test must not be optimised to just test x equal to zero.

> Quote:
>
> I appreciate your comments about numerical analysis in general and will dig into the oft-cited pointer you gave. My focus has been on features and completeness before best numerical performance, which simply isn't my thing.

For a calculator, the numerical accuracy and stability have to be paramount. Getting the wrong answer isn't at all helpful. This has been my goal for the 34S -- while I cannot guarantee correctly rounded for all function results since that simply isn't possible with finite precision arithmetic, I would like all functions to be accurate to plus or minus one in the final digit. At present I'm not aware of any cases when an incorrectly rounded result is produced but I'm sure some exist.

This doesn't make sense, at least at first glance (although more than that is often required in this area of mathematics). Floating point multiplication isn't associative with addition but I wouldn't expect there to be a large difference especially when multiplying by 3600 which is a fairly small integer all things considered. For x & y normalised reals, x-y can be represented exactly -- this is the entire purpose of subnormal numbers. So there shouldn't be a large difference between the two -- rounding can & will introduce a difference but it shouldn't be large for doubles.

Given the 3600 looks like a time based calculation, I suspect you're being tripped up by binary floating point numbers not being able to exactly represent what are otherwise simple decimals. Just a guess though and no real basis for it. However, if this is true you'll have to manually introduce rounding to fix the results up. The 34S code base won't help here since it uses decimal arithmetic which avoids some of these problems. The Free 42 code has addressed this I believe.

Re: An "Open" letter to "DIY" and "Repurposed" calculator projects

*Message #22 Posted by **Oliver Unter Ecker** on 22 Oct 2011, 7:38 a.m.,*
in response to message #21 by Paul Dale

Thanks, Pauli. I have another reason to look at your surely excellent code base. Wish time was more abundant.

> Quote:
>
> For a calculator, the numerical accuracy and stability have to be paramount.

While I do agree in principle, for my calculator user programmability and writing larger programs was a goal, where better numerical results than those commonly obtained from regular programming languages would be a nice-to-have, but not a must. Specifically, if speed were to suffer a lot, I'd stick to what a standard lib spits out. (I'm still special-casing periods of half pi in sin(), etc.)

Being within one ULP is nice but, as you know, breaks down anyway when errors from multiple computations accumulate.

I sometimes wish I had decNumber, but most of the time IEEE-754 and the regular math lib beat the accuracy out of a 50g, which has been my threshold target to not underperform.

> Quote:
>
> I suspect you're being tripped up by binary floating point numbers not being able to exactly represent...

It's the difference of two correctly represented numbers not being correctly represented in IEEE-754:

```
2.2-2 = 0.20000000000000018
```

Hence the greater error when multiplying this.

I'm probably not expressing myself correctly when I say the accuracy is lessened. I should probably say it's stochastically lessened, as for cases where the difference is correctly represented, the result is the same.

At any rate, the fix was to manually round, as you suggest.

Again, decNumber would be nice but I want speed, too. I'm planning to provide a BCD data type at some point in the future, and give users the choice over which tradeoff to make.

That's what I thought. You'll likely find that the two different expressions *3600 (x-y)* vs *3600 x - 3600 y* will both seem better at times depending on the input values.

I also shouldn't have written *exactly* for the result of the difference of two normalised numbers. *Correctly* is better, digit loss is always possible and thus *exact* isn't true.

> Quote:
>
> Again, decNumber would be nice but I want speed, too. I'm planning to provide a BCD data type at some point in the future, and give users the choice over which tradeoff to make.

IEEE 754 supports decimal arithmetic now -- convince your language provider to support it too :-)

Numerical Analysis

*Message #24 Posted by **Paul Dale** on 22 Oct 2011, 5:31 a.m.,*
in response to message #14 by Oliver Unter Ecker

For those interested in learning more about this kind of thing and who have digested all of Kahan's documents which I referenced above. The following books are good sleection:

- *The Algebraic Eigenvalue Problem* by *J. H. Wilkinson* -- very in-depth and a great introduction to error analysis from when it was being invented.
- *Elementary Functions* by *Jean-Michel Muller* -- a good reference on how to implement functions in many different ways. This one covers many/all of the standard algorithms -- CORDIC, series expansions, partial fractions, polynomial approximations.
- *Accuracy and Stability of Numerical Algorithms* by *Nicholas J. Higgam* -- another great book on error anlysis.
- *Matrix Computations* by *Gene H. Golub* and *Charles F. Van Loan* -- pretty

much what it says but one of the canonical texts in numerical analysis.

- *Handbook of Mathematical Functions* by *Abramowitz* & *Stegun* -- A&S is the bible for mathematical and physical functions.
- *NIST Handbook of Mathematical Functions* -- an updated version of A&S although the overlap is deliberately kept low.
- *An Atlas of Functions* by *Oldham*, *Myland* & *Spanier* -- lots of functions and their properties. Not really essential if you have A&S but easier reading.
- *Numerical Recipes* by *Press*, *Teukolsky*, *Vetterling* and *Flannery* -- doesn't get good comments from numerical analysis circles but it is easy to read and contains code that can be used with sufficient care and attention to detail.

Be prepared to pay anything from $500 - $1k for these. And yes, I've bought hard copies of all of these and more since starting the 34S project.

- Pauli

Edit: Fixed the author's name on the first book as mentioned below.

Sure, and maybe that would make things even more fun.
I trust WP34S, as is, would shine already.

There's an intimidating number of RPN apps out there, but only a handful comparable ones, I think.

You would be reaching a far greater number of users. (Though the average user will be far less engaged/supportive than the crowd here.) Esp. if you make it free.

> Don't worry i'm not sweatin' it. :)

/<rant on> This whole thread has me scratching my head, as I'm not sure its purpose. Looking back at HP calculators all the way to the HP35 in 1972, no matter how long the R&D people sweat over a product, I don't think they could ever produce a completely bug-free item. If you are waiting for one, you might as well keep waiting for the "train that will never arrive". If there is no respect for those who "put it out there" for the community to enthusiastically exercise so issues may be reported and they may be repaired in a timely fashion, then what's the point? It is obvious that we ALL would love to purchase completely finished, polished, clean, bug-free boxes which suit our every need and fit nicely in our budgets, but that is a pipe dream. Instead of us all complaining that what's out there isn't good enough for us, the community is pitching in to help improve things. /<rant off>

Jake

Re: An "Open" letter to "DIY" and "Repurposed" calculator projects

*Message #37 Posted by **Ethan Conner** on 21 Oct 2011, 12:04 p.m.,*
in response to message #36 by Jake Schwartz

Sorry if i wasn't entirely clear. My point was exactly that at some time you have to nail the whole thing down and say it is what it is. I have an R&D background in aviation and have seen a few good projects die because they suffered from "terminal developement-itis". This is why companies hire non-tech managers and accountants. Somebody has to step in and enforce a goal of product capability and time deadline. It has been my experience that a

project with no deadline never matures or reaches a completion point because things happen so fast in technology these days that there is always some new material,code etcetera than what you just incotporated 6 months ago into the design. I have seen multi-million dollar contracts cancelled because the customer wouldn't let up on the feature creap. Please let me say as i have said before i think all three of the efforts are admirable and the people involved should be proud of what they have accomplished. :) I just don't want a calculator that i have to put stickers on and overlays or sleeves because it never achieves a base configuration on the interface. (case and keys and display) If none of these projects ever gets completed i'm ok with that, there are still big companies who make high end calculators. I'm just a potential customer stating what i desire. A finished non patched up calculator.

> Sorry if i wasn't entirely clear. My point was exactly that at some time you have to nail the whole thing down and say it is what it is.. Somebody has to step in and enforce a goal of product capability and time deadline.

All very true in a commercial context. But IME the primary motivation here is really not that of commercial revenue, at least I'd hazard that's the case for most folks.

Rather it is the compelling engineering challenge of leveraging available technology to produce something superior to commercial counterparts catering to the bottom of the pyramid in their respective markets. Here "superior" will be defined by whoever has picked up the development gauntlet and is doing the measurement. While no one likely would be opposed to achieving commercial success, it isn't the actual driving force. A loose corollary might be most involved in such projects would not have the same degree of commitment and passion if this work was actually their 40h/wk job, simply due to the concessions needed in commercializing the associated technology you've cited above.

So IMHO attempting to push open collaborative efforts into a commercial model, a model which by its existence fosters the existence of open development counterparts,

may well work to extinguish them.

My experience and subjective views. I'm certain you'll find others who fall elsewhere in the spectrum.

Re: An "Open" letter to "DIY" and "Repurposed" calculator projects

*Message #41 Posted by **Ethan Conner** on 21 Oct 2011, 4:41 p.m.,*
in response to message #40 by uhmgawa

Yes if the goal is unlimited development then so be it. Truly there is nothing wrong with that. However there have been in the past decade some other highly developed projects that have succeeded in a constant state of flux while providing a stable hardware platform and code which to work with. The parallax basic stamp and arduino being a couple of examples. I certainly would not want anyone in the repurposed side feel slighted. It would just be a desire of mine to have anyone or all to be successful. Look how everyone frothed at the mouth over the 15c le. It is a perfect example of what this community is willing to go for when presented with an oppurtinity to open their wallets for a stable platform.

[WP34s] Firmware<>Layout wish

*Message #1 Posted by **Alexander Oestert** on 20 Oct 2011, 10:45 a.m.*

Dear 34s-Team,

if I've understood correctly, the process of creating a new layout has already started and there will be some kind of firmware split to accommodate users with old and new overlays alike. I do especially like this latter decision and want to explicitly thank you for it!

I'd like to make a wish nevertheless: Could the 'old' firmware be changed back to exactly match the 'old' overlays by bringing back the f- and g-shifted original behavior of the x<>y key? The 'new' behavior should be reserved for the 'new' firmware and its overlays.

In case there are other instances of firmware and overlay not matching that I have not discovered yet, my wish applies to them as well. ;)

I'm not judging the changes to be bad (or good, for that matter), it's more a question of aesthetics to me to have key presses on my dedicated "WP-34s Mark I" machine to do what is advertised on the outside.

Edited: 20 Oct 2011, 10:46 a.m.

Re: [WP34s] Firmware<>Layout wish

*Message #2 Posted by **Marcus von Cube, Germany** on 20 Oct 2011, 1:10 p.m.,*
in response to message #1 by Alexander Oestert

You can of course stick to the files in the release package but I assume your wish isn't too exotic. Let Walter and Pauli comment on it.

Re: [WP34s] Firmware<>Layout wish

*Message #3 Posted by **Walter B** on 20 Oct 2011, 1:58 p.m.,*
in response to message #1 by Alexander Oestert

v2.1 was the one distributed at HHC - it's the last official one matching the old overlays. The current v2.2 brought the matrix functions and the changed shifted x<>y. Since we'll have a major layout change in the next step (v3.0) discussed here and agreed on already, I suggested internally to stay with the old layout for the final v2.2 build. I did receive no opposing vote in some 30 hours :-) so I think that's what we're going to do.

Re: [WP34s] Firmware<>Layout wish

*Message #4 Posted by **Alexander Oestert** on 20 Oct 2011, 2:12 p.m.,*
in response to message #3 by Walter B

V2.2 staying as it is now or reverting to the V2.1 layout of the x<>y key?

Re: [WP34s] Firmware<>Layout wish

*Message #5 Posted by **Egan Ford** on 20 Oct 2011, 2:32 p.m.,*
in response to message #4 by Alexander Oestert

I 2nd this and it seems reasonable to keep x<>y the same for 2.2 and the old layout. I plan on having a 2.2 and a 3.0 machine.

Re: [WP34s] Firmware<>Layout wish

*Message #6 Posted by **Alexander Oestert** on 20 Oct 2011, 2:53 p.m.,*
in response to message #5 by Egan Ford

I have the exact same plan! :-)

Re: [WP34s] Firmware<>Layout wish

*Message #7 Posted by **Steve Simpkin** on 20 Oct 2011, 3:35 p.m.,*
in response to message #6 by Alexander Oestert

Me too.

Re: [WP34s] Firmware<>Layout wish

*Message #8 Posted by **Dominic Richens** on 20 Oct 2011, 4:15 p.m.,*
in response to message #4 by Alexander Oestert

I think if you stay with 1722 (says 2.2 1721) you are good. It's the build just before the x<>y key was changed, and yet has the HP41-style press-and-hold hints. SVN revision 1722

There was a bunch of shift and calatlog handling re-working after that, but I'm not sure it is critical.

Marcus, can you tell us if it would be worth "porting" updates such as 1730 into such a build? Are there any other bugfixes we should have in that "2.2 classic" load?

cheers!

Edited: 20 Oct 2011, 4:18 p.m.

Re: [WP34s] Firmware<>Layout wish

*Message #9 Posted by **Marcus von Cube, Germany** on 20 Oct 2011, 5:09 p.m.,*
in response to message #8 by Dominic Richens

The recent changes were:

Fix the emulator
Make room for more changes

I think, we can do a conditional compilation to reactivate the old x<>y key bindings. The team will decide upon this.

Re: [WP34s] Firmware<>Layout wish

*Message #10 Posted by **Dominic Richens** on 20 Oct 2011, 6:09 p.m.,*
in response to message #9 by Marcus von Cube, Germany

In my experience this is a time to "branch by promotion". That is create a branch for "classic" WP34s. The aim being to take the 1722 build and make no more changes to it, except to fix bugs.

Would we call this 2.2 or 2.1? Or something else?

*Message #17 Posted by **gene wright** on 20 Oct 2011, 4:25 p.m.,*
in response to message #16 by Walter B

Who am I and what do I mean by 'Who am I?'

just kidding.

Good, I like the picture layout and it can be fixed with minimal adjustments to the overlays. I'm pretty confident that Eric can rattle off just the changed key positions with little effect on everyone.

*Message #18 Posted by **Marcus von Cube, Germany** on 20 Oct 2011, 5:11 p.m.,*
in response to message #17 by gene wright

We are discussing to get rid of -> as a primary function. This would make room for another hotkey.

Re: Here it is again

*Message #19 Posted by **fhub** on 20 Oct 2011, 5:27 p.m.,*
in response to message #18 by Marcus von Cube, Germany

> Quote:
>
> We are discussing to get rid of -> as a primary function. This would make room for another hotkey.

WOW, the best idea I've read since a long time! ;-)

Then I would even update my TVM solver, because with 5 hotkeys it could have the usual "N I PV PMT FV" layout. :-)

Franz.

-> and ... ?

*Message #20 Posted by **gene wright** on 20 Oct 2011, 5:34 p.m.,*
in response to message #18 by Marcus von Cube, Germany

Could STATUS live in MODE ? Perhaps the first (or last entry)?

Just curious.

Re: -> and ... ?

*Message #21 Posted by **Marcus von Cube, Germany** on 20 Oct 2011, 5:37 p.m.,*
in response to message #20 by gene wright

STATUS isn't an executable command, more of a special state of the calculator. If it were a command, it would be alphabetically sorted-in somewhere.

Re: Here it is again

*Message #22 Posted by **Eric Rechlin** on 20 Oct 2011, 5:11 p.m.,*
in response to message #14 by Walter B

Walter,

If this is the final 3.0 layout, please give me your blessing to update my overlay design to reflect these changes, and I will then start producing overlays with the new design and replacement keys for those who might want them instead of a whole new overlay:

Eric

Re: Here it is again

*Message #23 Posted by **Marcus von Cube, Germany** on 20 Oct 2011, 5:14 p.m.,*
in response to message #22 by Eric Rechlin

Nothing is final at the moment, Eric. Please wait before you invest in any designs! If we get the chance we will change more then what you can see on Walter's layout.

Re: Here it is again

*Message #24 Posted by **Walter B** on 20 Oct 2011, 5:38 p.m.,*
in response to message #22 by Eric Rechlin

Eric,

Please wait and watch. The only thing I'm 98% sure about so far is v2.2 will use the old layout.

Walter

Re: New layout, my 2 cents

*Message #25 Posted by **Patrice** on 20 Oct 2011, 7:00 p.m.,*
in response to message #22 by Eric Rechlin

Hi all,

My late comment on the old and new layout.

./,
I think it can be moved to a MODE menu, it is the kind of thing that I set once every time I reset the calc.
For the alpha mode, the '.' can be enough to remind that it is here that you get some special chars.

FIX SCI ENG
I think they can be moved to a menu, it is the kind of thing that I set once in a while and stay for a good piece of time.

This would free some keys for more valuable things.

Patrice

Re: New layout, my 2 cents

Patrice

Re: New layout, my 2 cents

*Message #28 Posted by **Marcus von Cube, Germany** on 21 Oct 2011, 3:35 a.m.,*
in response to message #25 by Patrice

Patrice, I'm constantly voting for leaving the display mode settings on the keyboard. I agree with replacing './,' which is also available as an ON+'.' combination on the device. Maybe a good place for SHOW. It's in the same place as X which makes perfect sense.

Re: New layout, my 2 cents

*Message #29 Posted by **Patrice** on 21 Oct 2011, 1:46 p.m.,*
in response to message #28 by Marcus von Cube, Germany

Hi Marcus,

> Quote:
>

I think that both options are a little like tastes and colours.
Both options have positives and negatives aspects.

Patrice

Re: Here it is again - Overlay Versions

*Message #30 Posted by **Thomas Chrapkiewicz** on 20 Oct 2011, 7:18 p.m.,*
in response to message #22 by Eric Rechlin

Eric:

A generic recommendation (-or- A glimpse into the future):

As we are going to have multiple WP34s versions with appropriate overlays, it would be nice to have the version number printed on the overlay itself somewhere; for instance unobtrusively in one of the corners.

TomC ps: I've already got two different WP34s's and a HP20b/HP45 clone.

Re: Here it is again

*Message #31 Posted by **David Hayden** on 21 Oct 2011, 7:47 a.m.,*
in response to message #22 by Eric Rechlin

My late comments:

I've never felt a need for y<> or z<> commands. If the thinking is that these are useful in programming then I'd argue that CLP is far more common and should remain on the keyboard.

I think || is much too specialized a function to take up keyboard space. If an engineer wants it they can write a short program using one of the hot keys. BTW, I saw this as a former electrical engineering student who had this exact function programmed on a 41C and assigned to shift-+.

So I'd leave CLP at [h]EEX and put pi on [g]/, thus moving || to a menu (probably X.FCN) or maybe remove || entirely. It would actually make a nice programming example.

I love this calculator.

Dave

Re: Here it is again

*Message #32 Posted by **Egan Ford** on 21 Oct 2011, 8:36 a.m.,*
in response to message #31 by David Hayden

I 2nd all of that. I also had little use for x<>a as well outside of programming.

Re: Here it is again

*Message #33 Posted by **John Abbott (S. Africa)** on 21 Oct 2011, 10:37 a.m.,*
in response to message #31 by David Hayden

I second that. I find CLP very useful in two instances:
1. To quickly get to the beginning of RAM if debugging.
2. To quicly clear all programs in RAM.
Just my opinion of course.
John

BTW- is the idea to move CLP into the P.FCN catalogue?

Re: Here it is again

*Message #34 Posted by **Egan Ford** on 21 Oct 2011, 10:54 a.m.,*
in response to message #33 by John Abbott (S. Africa)

I 2nd that too.

Re: Here it is again

*Message #35 Posted by **Marcus von Cube, Germany** on 21 Oct 2011, 12:09 p.m.,*
in response to message #33 by John Abbott (S. Africa)

CLP will go to the CLEAR catalogue. I'm with you with keeping it easily available. The run mode function is duplicated on RTN so this is not an issue. As for clearing RAM, maybe a shift-hold combination may do as a second way to reach the command.

Re: [WP34s] Firmware<>Layout wish

*Message #36 Posted by **Andrés C. Rodríguez (Argentina)** on 20 Oct 2011, 3:13 p.m.,*
in response to message #3 by Walter B

FWIW, I would like 2.2 to keep 2.1 layout (as seen in HHC 2011), as it was difficult enough to obtain overlays just to throw them away before even applying them (I have now a 20B and a 30B to be reflashed and "re-overlayed" to 2.1 version). I understand that the MATRIX menu could still be accesed via some of the menus. I admit I should read the fine manual, but I'm having a very intense workload, so time for reading and reflashing has been scarce.

I was thinking that, if possible, layout changes would be more manageable if such changes are limited to keys and don't affect the faceplate. The latter is supposed to be very difficult to remove, and it there will also be adhesive traces that may be difficult to clean. It seems that changing the sticker over one or two keys would be much easier.

I accept that the time for suggestions expired some days ago, but this idea may just be considered. My suggestion to bring NULL to the 34S was rejected at first time, but I'm glad that NULL made its way through and is now available. So, let's hope there may be second chances...

If suggestions are still received, TONE and BEEP are my favorites and are still missing :-D

[As always, please disregard any idiomatic mistake]

Re: [WP34s] Firmware<>Layout wish

*Message #37 Posted by **Andrés C. Rodríguez (Argentina)** on 20 Oct 2011, 3:41 p.m.,*
in response to message #36 by Andrés C. Rodríguez (Argentina)

It seems that the only changes to the faceplate are below x<>y and "Show", so the idea of issuing just a few key stickers to update layout from 2.x to 3.x seems feasible. These two differences on the faceplate versions are absolutely acceptable for someone (like me) who is not very fond of the idea of faceplate peeling. We can surely live with them for a while.

OK, I can reflash my 20B with WP-34 v2.x and current overlays; and wait for a 3.x overlay to be applied in the future to the 30B. Even the original HP model numbers would be aligned with this path. But new key stickers will be needed soon!

BTW, would you consider removing the full space between the deveopers' names in the status screen; so the last "r" in Walter may appear full size? I think that

```
PauliWalter
```

would be more readable than

```
Pauli Walte^r
```

Just my AR$ 0.1

[WP34s] Bug?

*Message #1 Posted by **fhub** on 20 Oct 2011, 7:23 a.m.*

I've almost finished my Polynomial RootSolver for the WP34s, but in my final tests I've jumped into a problem: The command RTN+1 doesn't work in a program!

Now I've checked it with the following short testprogram:

```
LBL A
XEQ 00
SKIP 01
ERR 20
RTN
LBL 00
RTN+1
```

Running this program (with shortcut [A]) should always show the error message 20 because LBL 00 just returns to this ERR 20 line - or better said it should do it, but it doesn't work: no error message at all! :-(

So unless I'm misunderstanding something this RTN+1 command doesn't work as it should in a program.

Franz.

*Message #2 Posted by **Marcus von Cube, Germany** on 20 Oct 2011, 1:07 p.m.,*
in response to message #1 by fhub

I haven't tested this but if you are right it's a bug. Maybe later today Pauli or me will find the time to look at it.

Re: [WP34s] Bug?

*Message #3 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 20 Oct 2011, 5:06 p.m.,*
in response to message #1 by fhub

I think program is working the way it should. LBL A -> XEQ 00 -> LBL 00 -> RTN+1 -> SKIP01 (skipps ERR20) -> RTN (END)

If you remove the SKIP01 command

LBL A -> XEQ 00 -> LBL 00 -> RTN+1 -> ERR20 (Get "Solve FAILED")

Or if you add some other line right after SKIP01, and before ERR20, it works too.

From the 34s Manual: Skips n program steps forwards (1 <= n <= 99). So e.g. SKIP 02 skips over the next two steps,going e.g. from step 123 to step 126.

EDIT: Never mind :) you are right, after reading the RTN+1 definition more carefully, it should actually go to

the second line AFTER XEQ, skipping the one right after XEQ (SKIP01 in this case), therefore it should execute ERR20, but it lands on SKIP01.

-Kerem

Yep, it's working again, thanks!

This was indeed a very strange bug and it was pure coincidence that I had this RTN+1 at the end of my program - I guess otherwise it won't have been found for a very long time. ;-)

Franz

Re: [WP34s] Bug?

*Message #7 Posted by **Walter B** on 21 Oct 2011, 5:27 p.m.,*
in response to message #6 by fhub

That's the way bugs are found - else they would have been found earlier.

Re: [WP34s] Next Bug?

*Message #8 Posted by **fhub** on 22 Oct 2011, 12:39 p.m.,*
in response to message #1 by fhub

Ok, here's the next bug, this time in the quadratic solver SLVQ:

Solving the equation x^2-x=0 with SLVQ returns 0 (zero) for both solutions (instead of 1 an 0).
To test it: 1 ENTER 1 +/- ENTER 0 SLVQ ==> 0 in X and Y

I know that SLVQ is based on my own code I've posted some time ago here, but my code returns the correct results, so there must have gone something wrong in translating my code to the internal XROM code.

Franz

in response to message #10 by Paul Dale

> Quote:
>
> I think I've got this fixed now. It was quite a mess :-(

Without having tested it I guess your 'fix' is still not working for a*x^2=0 (i.e. when b=c=0).

Looking at your new code

```
x>0?
[cmplx]CONJ
-                   /* -b-sqrt 2c 2c 2c */
STO/ Y              /* -b-sqrt 2c/(-b-sqrt) 2c 2c */
```

I see that you've now removed the step "x[!=]0?" before the "STO/ Y",
so this division may fail if -b-sqrt=0.

And you won't have run into this 'mess' if you would just have used my code (which is working perfectly) ... ;-)
(calculating the discriminant with a "cpx *" is ok, but why change my other code?)

Franz

Edited: 23 Oct 2011, 6:22 a.m.

> (which is working perfectly) ... ;-)
> (calculating the discriminant with a "cpx *" is ok, but why change my other code?)

Using complex * changed the stack layout and I needed to preserve more on the stack and last X to call this a built in command. That's why I rearranged things.

Feel free to update your code to use complex * for the discriminant and preserve the stack semantics of the built-in and I'll happily include this instead.

Otherwise, it will have to wait until I get around to revisiting the current code which has the problem you mentioned :-(Sigh.

- Pauli

Re: [WP34s] Next Bug?

*Message #13 Posted by **fhub** on 23 Oct 2011, 6:59 a.m.,*
in response to message #12 by Paul Dale

> Quote:
>
> Feel free to update your code

No need for this because it works fine! ;-)

Your XROM code should look like this (only the 5 problematic lines):

```
x[>=]0?
[cmplx]CONJ
-
x[!=]0?
STO/ Y
```

So just change x>0? to x[>=]0? in line 1 and insert [x!=]0? again at line 4.

Franz

Re: [WP34s] Next Bug?

*Message #14 Posted by **Paul Dale** on 23 Oct 2011, 8:40 p.m.,*

Thanks. The changes are in but won't be built until someone kicks it off -- I can't at the moment.

- Pauli

Re: [WP34s] Next Bug?

*Message #15 Posted by **Dieter** on 23 Oct 2011, 9:02 a.m.,*
in response to message #9 by Marcus von Cube, Germany

> Quote:

> This one is for Pauli, I'm afraid.

And for Walter as well, I think. Currently the manual says:
"*Solves the quadratic equation $ax^2 + bx + c = 0$ with the real parameters put on the stack [c, b, a, ...], and tests the result.*"
(Version 2.2.1687 as included in the last emulator package)

The manual seems to suggest that the user enters c first, then b, finally a, and maybe even more due to the "..." following these three. In fact, the correct order seems to be a [ENTER] b [ENTER] c. The manual should state this clearly in exactly this way, and the final "..." should get deleted.

I think a simple stack diagram would be useful here:

```
    input       real solution     complex solution
T   ...         ...               ...
Z    a          discriminant      discriminant
Y    b     =>   2nd real root     |imaginary part|
X    c          1st real root     real part

L   ...         c                 c
```

Dieter

Re: [WP34s] Next Bug?

*Message #16 Posted by **fhub** on 23 Oct 2011, 9:10 a.m.,*
in response to message #15 by Dieter

I interpret [c, b, a, ...] as [X, Y, Z, ...=T] because otherwise this "..." at the end won't make any sense at all.

Edited: 23 Oct 2011, 9:10 a.m.

Re: [WP34s] Next Bug?

*Message #17 Posted by **Dieter** on 23 Oct 2011, 9:24 a.m.,*
in response to message #16 by fhub

There you are: the manual allows different interpretations, while it *should* simply state the required information unambigously.

"[c, b, a, ...]" denotes a vector with four or more components. Instead, the user should be told directly that a is expected in Z, b in Y and c in X. Preferably by a simple and graphic stack diagram, as suggested.

Dieter

Re: [WP34s] Next Bug?

*Message #18 Posted by **Dominic Richens** on 23 Oct 2011, 9:29 a.m.,*
in response to message #17 by Dieter

Dieter, Franz,

Please consider adding a section to WP34s users' guide. All the button .png files are there so you can write something in the un-ambiguous style of the classic HP manual.

cheers!

When I wrote "I interpret [c, b, a, ...]" then I meant of course that it can't be interpreted in a different way IF you're using your logic brain. ;-)

> Quote:
>
> "[c, b, a, ...]" denotes a vector with four or more components.

Come on, we're talking about a (usually 4-level) stack calculator but not about mathematics in common.
What sense should "a vector with 4 or more components" make in the WP34s context?

Franz

Re: [WP34s] Next Bug?

*Message #20 Posted by **Walter B** on 23 Oct 2011, 11:03 a.m.,*

WP 34S and 'dead' HP20B

*Message #1 Posted by **Rob Willett** on 20 Oct 2011, 6:37 a.m.*

Hi,

I've been lurking here for some time and followed the threads with great interest, it's nice to see other people with the same fascination with HP calcs. I'm a big fan of the HP landscape calcs, specifically the 16C which has earned it's weight in gold on projects. So far I have an HP11C, HP12C, HP15C, HP16C, HP41C, HP41CV, HP17B, HP20S, HP48GX (utter rubbish but that's my view). All mint with manuals and some boxes. The next purchase is an HP10C, so any good versions around let me know.

I was very interested in the WP 34S and have acquired cables, calculator, overlays etc to have a go at creating on.

I have a couple of questions though:

1. Where is the best place to ask for WP 34S support? The sourceforge home page seems light on mailing lists and forums. I don't want to clog up this forum if it's in appropriate.

2. If this is the right place to ask questions. I have one, sorry if it's a bit long but I wanted to ensure I got all the information in and I did look around an awful long time to see if somebody else has had the same problem:

I've downloaded the various WP-34S manuals, zip files docs etc and actually read them before starting work. I just (last week) got a new laptop from work with 64 bit Windows 7 to replace my Windows XP build.

I connected the cables up, loaded up the HL-340 USB/Serial adapter and eventually found a driver that seemed to work. Since I have nothing in the house that uses serial I have no way to prove that the cable and USB adapter actually works even if the Windows tells me it is.

I downloaded and installed SAM-BA 2.10 from the ALTEL website.

I then followed the instructions in the manual of pressing various reset/erase buttons and the HP-20B display went blank.

I tried to launch SAM-BA 2.10 and that went nowhere. I could choose the COM 5 port, the right board but nothing ever happened. Checked Google and not a lot of information but it appears that 64bit Windows 7 is not a likely platform for this to work with SAM-BA 2.10. Somebody suggested SAM-BA 2.6 with XP.

So my intention is to use my VMWare Fusion Windows XP session on my Mac to try and make the connection to the HP-20B and see if that works. This will be fun as the USB/Serial adapter is not recognised by the Mac so not sure what will happen in the Windows XP session. If this fails then I'll try a 32bit Linux session on Windows 7. This is getting rather complicated.

However my real problem is that the HP-20B now displays nothing after putting it into the right mode for flashing, I am assuming this is due to me having erased the memory on the thing. Have I bricked the calculator or can I simply go through the cable key press sequence again and it will be put in the right format? Since I can't see anything at all on the calc siplay, I thought that before each attempt to connect the calculator to SAM-BA I would remove the batteries for 2 minutes, then replace to know that the calculator is starting from a known off state.

Any suggestions or recommendations gratefully appreciated.

Thanks,

Rob.

*Message #3 Posted by **Bart (UK)** on 20 Oct 2011, 6:58 a.m.,*
in response to message #1 by Rob Willett

Hi,

Welcome to the forum and the WP-34s project.

Indeed by erasing the 20b flash, there is only the boot loader left and that does not communicate to the screen.

Don't worry, it is not bricked. Once you get the SAMBA and comms sorted, you should be able to go through the complete procedure and "resurrect" the calculator to a 34s!

See this thread for some tips on reviving a "dead" 20b/20b (particularly the advice on batteries and Tim's advice on the RESET and ON button presses).

Regards
-B

Re: WP 34S and 'dead' HP20B

*Message #4 Posted by **Rob Willett** on 20 Oct 2011, 7:28 a.m.,*
in response to message #3 by Bart (UK)

Thanks for the responses. The interesting thing in the articles is that somebody is using Windows Vista. Not sure if it's 64 bit but there's hope. Either way between VMware Fusion, VMware Workstation, I will find a way to get the thing flashed.

I'm reassured about not bricking the HP20B. I'll get a supply of CR2032's to make sure we hold the voltage at the right level.

And I forgot to add my HP 35S to my list of calc's, odd as it is sitting in front of me as I do some stats <doh>.

Thanks again for the prompt help, once I get it working I'm happy to help anybody in London out.

Rob

Re: WP 34S and 'dead' HP20B

*Message #6 Posted by **Bart (UK)** on 20 Oct 2011, 8:15 a.m.,*
in response to message #4 by Rob Willett

I have got SAMBA2.10 to work in Windows Vista, but it's the 32-bit version.

Re: WP 34S and 'dead' HP20B

*Message #7 Posted by **Gerry Schultz** on 20 Oct 2011, 1:05 p.m.,*
in response to message #4 by Rob Willett

I've posted this before, but with an HP laptop running Win7 Professional 64-bit using SAM-BA 2.10, I have successfully installed WP-34S images in both 20b and 30b calculators. The critical item here is an FTDI USB-to-RS232 adapter. I use an ES-U-1001-R100 I got from Newark; part number 34M8933.

As a side note Eddie Shore came by my place as he too was having problems burning a WP-34S image using Vista. With the above adapter, he successfully updated his 20b using his PC. So I think your problem is the adapter cable.

I hope this helps, Gerry

WP-34s forums (was Re: WP 34S and 'dead' HP20B

*Message #8 Posted by **Dominic Richens** on 20 Oct 2011, 9:08 a.m.,*
in response to message #1 by Rob Willett

Since Rob brought it up, is there a reason we don't use SourceForge.net: WP-34s: Open Discussion forum?

Maybe it's not as nice as this one, but at least it is searchable.

You need to have a Sourceforge account to post, but that's really not different that MoHPC. You don't have to be a member of the WP-34s project to post.

Re: WP-34s forums (was Re: WP 34S and 'dead' HP20B

*Message #9 Posted by **Martin Pinckney** on 20 Oct 2011, 9:31 a.m.,*
in response to message #8 by Dominic Richens

This was discussed at length a few weeks ago. There were differing opinions (surprised?) about whether the 34s discussions were appropriate here or not. Then the 15c LE suddenly appeared, and that dominated the forum for a few weeks. Now that has subsided and the 34s has reared its beautiful head again. Not to mention Open RPN.

Re: WP-34s forums (was Re: WP 34S and 'dead' HP20B

*Message #10 Posted by **Rob Willett** on 20 Oct 2011, 9:47 a.m.,*
in response to message #9 by Martin Pinckney

Personally speaking (and as a new lurker my vote counts for nothing), I'd like to see announcements and high level stuff on WP-34S here and the low level detailed support stuff elsewhere, e.g. SourceForge or whatever.

I think the same for OpenRPN.

I love the idea of new calculators and will happily buy into them (my other half just rolls her eyes and sighs), e.g. the HP 41CL is great, I'm hopefully on a waiting list for one. I will look at the OpenRPN stuff as well, but should everybody have to wade through idiots like me posting how they cocked up flashing the HP 20B, or which keyboard layout is optimal?

It's difficult, a museum is not necessarily about old stuff, goto the Science Museum in London and whilst it has some fabulous old steam engines, it has some remarkably modern other exhibits.

I think a balance is needed, people should be aware of what's going on, and should know how to get to find it, but should we have to wade through all the threads. Personally speaking the threads on the new HP 15C LE and possible defects is of no interest to me but I have no problem with them being there.

Just my 2p worth,

Rob,

SAM-BA.exe has issues, not only with Windows 7. You should try to get the modified MySamba.exe to work which is much quicker. You'll find it on our SF pages easily.

Re: WP 34S and 'dead' HP20B

*Message #13 Posted by **Egan Ford** on 20 Oct 2011, 1:15 p.m.,*
in response to message #1 by Rob Willett

I had similar problems, my solution is posted here: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv020.cgi?read=201249#201249

IANS, my batteries were weak from repeated failed attempts. At 2.7V I could not power up another 30b. Test your batteries. OS/X does not need to recognize your USB to Serial for Windows/XP in a VM to work. I also used XP in a VM without issue, but only after I swapped out my Keyspan USB to Serial with one that is FTDI based. I also had to start over. Just follow the process blindly from the start. I would also recommend mysamba.exe for flashing.

Re: WP 34S and 'dead' HP20B

*Message #14 Posted by **Rob Willett** on 20 Oct 2011, 3:13 p.m.,*
in response to message #13 by Egan Ford

Thanks for all the excellent responses. I feel a lot better that I'll get somewhere.

My plan tonight is to acquire a couple of new CR2032 batteries (could be difficult at 20:12 in an evening), plug the existing cable into my XP host under VMWare Fusion, download mysamba.exe and see how it goes.

When that fails, I'll order this cable, buy another set of batteries and have another go :)

Best wishes,

Rob

Re: WP 34S and 'dead' HP20B (success)

*Message #15 Posted by **Rob Willett** on 20 Oct 2011, 5:36 p.m.,*
in response to message #14 by Rob Willett

Success.

I thought I'd log exactly the hardware I used here to help the next person who has my problem.

I successfully managed to flash the HP-20B from a Mac running Lion using VMWare Fusion 3 running Windows XP SP3 (32 bit).

I have an HL-340 (super cheap) USB/Serial converter connected to the Windows XP guest. I used SAM-BA 2.10 which some people said were problematic. No issues for me.

I followed the instructions on the WP-34S website and it worked exactly as it should do. Took longer than 45 seconds to do the download but it worked fine in the end.

Now the difficult bit is putting the labels on correctly and neatly.

If anybody from London wishes a hand drop me a line at rob DOT hpcalcforum AT robertwillett DOT com.

If you can't work my e-mail address out you don't deserve to have a WP-34S.

Thanks to you for all the prompt help on this site. I'd post a picture but you know it all looks like.

*Message #16 Posted by **Marcus von Cube, Germany** on 20 Oct 2011, 5:47 p.m.,*
in response to message #15 by Rob Willett

You should still switch to MySamba.exe as it is much faster (below 20 seconds) and therefore less demanding on batteries.

Can't see anything wrong with an 11C saying 0,000 .
Or do you mean you want a decimal point instead of the comma?
If yes, turn the 11C off, press and hold the decimal point key,
press the ON key, release both.

HTH

Ray

0,0000 screen display, Nigel Peters

in response to message #1 by Nigel Peters

Hi,

After asking the same question on this forum a while back, I wasn't satisfied with the answers that I have received and made my own reasearch about his situation with the HP 11Cs.

According to "A Guide to HP Handheld Calculators and Computers" by W.A.C. Mier-Jedrzejowicz, 5th Edition there has been some early HP 11Cs produced without the "*" sign on the screen.

Some may tell you that early Voyager series may fail to detect the low battery voltage and maybe you should also take this into consideration, however, the HP 11C that I have do not have a "*" on the LCD.

Hope it helps, Onur

Re: Nigel Peters

*Message #8 Posted by **Neil Hamilton (Ottawa)** on 20 Oct 2011, 2:01 p.m.,*
in response to message #7 by Onur Ilkorur

I too heard that early units did not have the *. However, my 11C, S/N 2222Axxxxx (making it mid May '82?) has the * so yours would have to be **very** early indeed to not have it.

BTW: Are you aware that it does **not** light up when the self test is activated? AFAIK, there is no way to activate it without low batteries -- and in a calculator that is notoriously stingy on power usage, that might take a very long time indeed!

Use mine every day! :-)

Re: Nigel Peters

*Message #9 Posted by **Onur Ilkorur** on 20 Oct 2011, 2:37 p.m.,*
in response to message #8 by Neil Hamilton (Ottawa)

Yes, my first thought was to check the self test, but after reading here on the forum that the self test

does not lit the "*" sign on the LCD, I have carefully collected 3 LR44 batteries that with lit/blink the "*" on my other HP 11Cs and HP 15Cs with also sufficiently low serial numbers. They all lit/blink the "*" sign, however that one HP 11C just displayed "0,0000" and masked everything that I have typed with it. Like, if I key in "12345678" the display looks like "0,0000678".

As for everyday use I have switched to HP 15C LE, but that is another (sad) story though ...

0,0000 screen display, Nigel Peters

[WP 43S] Another newborn

*Message #1 Posted by **Jeroen Van Nieuwenhove** on 19 Oct 2011, 7:28 p.m.*

Today, a new 43s is born. Thanks, Pauli and Walter for this fantastic extreme makeover of the 20/30b. I will be busy for some weeks discovering the features of this beast. Also thanks to Gene for the cable and to Eric for the 30b and the overlays. I know that the keyboard layout is due to be changed and I look forward to having matrix support on this already terrific machine.

FYI: Flashing this unit on Windows Vista x64 with a native serial port worked flawlessly.

*Message #2 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 19 Oct 2011, 7:46 p.m.,*
in response to message #1 by Jeroen Van Nieuwenhove

Having Repurposed a 30b to a 34s very recently, I completely share your ecitement and appreciation to the WP-34s team! Enjoy!

However I beleive you meant 34s and not 43s (see what excitement does to us!)

Re: [WP 43S] Another newborn

*Message #3 Posted by **Paul Dale** on 19 Oct 2011, 7:51 p.m.,*
in response to message #1 by Jeroen Van Nieuwenhove

And please don't forget Marcus :-)

- Pauli

Re: [WP 43S] Another newborn

*Message #4 Posted by **Gerson W. Barbosa** on 19 Oct 2011, 8:04 p.m.,*
in response to message #3 by Paul Dale

I would suggest renaming it wpm-34s. Or just leave it as is until someone else with first name beginning with "D" join the team. Thus, wp turned upside down would stand for D???? and Marcus as well :-)

Re: [WP 34S] Another newborn

*Message #5 Posted by **Egan Ford** on 19 Oct 2011, 9:13 p.m.,*
in response to message #4 by Gerson W. Barbosa

Or CS 34S. Community Scientific 34S.

Re: [WP 34S] Another newborn

*Message #6 Posted by **Walter B** on 20 Oct 2011, 12:21 a.m.,*

in response to message #5 by Egan Ford

The "wp" wasn't my idea, but it simply fits the logo nicely :-) And in fact that project was 'founded' by Pauli and me in 2008, and was driven by us until this March as you can read in the archives. Since March 2011, Marcus contributes a significant fraction as you've observed and still see.

And if we still needed a proof it's a success ...

> Quote:
>
> Or CS 34S. Community Scientific 34S.

... now it's claimed the community has done the work ;-)

Re: [WP 34S] Another newborn

*Message #7 Posted by **Egan Ford** on 20 Oct 2011, 1:03 a.m.,*
in response to message #6 by Walter B

More along the lines of created for the community.

If you want to get specific about the contributions, we have HP making the HW, I think about 5 solid contributors to the software, assembler, documentation, and overlay; and countless testers, complainers, supporters, suggesters, cable shippers, evangelists, unauthorized documentors, etc...

My suggestion was not to minimize anybody's efforts or to remove any acknowledgement, but to expand the acknowledgement to the larger supporting community.

I think just calling it the 34S is great too, and I do not have any issues with WP. But I do think adding more letters is not a good idea.

Re: [WP 34S] Another newborn

*Message #8 Posted by **Walter B** on 20 Oct 2011, 1:22 a.m.,*
in response to message #7 by Egan Ford

Egan, I may have guessed what you wanted to express but that ball was too nice to let it rest there ;-) And also HP was baptized HP since they made products for H & P, wasn't it? (Hint: If you replace an argument take care of its plausibility ;-)

Re: [WP 34S] Another newborn

*Message #9 Posted by **Egan Ford** on 20 Oct 2011, 11:47 a.m.,*
in response to message #8 by Walter B

> Quote:
>
> And also HP was baptized HP since they made products for H & P, wasn't it?

I do not know enough of HP's history to argue that one way or the other. My gut tells me that HP created products to make money, not to fill a missing personal need with no intent to monetize it. IOW, I think your argument is irrelevant. Unless you are only

suggesting that once named, the name sticks.

I think the 34S is more inline with the history of Wozniak and the Apple I. Woz just wanted to make himself a computer, and then shared that with a broader community by making it open source (or free with source). Both the ROM source and the schematic for the Apple I is published in the Apple I manual.

Again, what started this thread was my followup to a statement that suggested adding letters. WP is already a mouthful since 'W', at least in English, is 3 syllables. My suggestion was to rename the letters and keep it at two. CS was the only thing I could think of that would embody the work of Marcus and others, and at the same time hint at the target audience in the same way 'scientific' is used. I would have love to have said, "Community Scientific, by the community for the community", but when less than half of the community cannot even be bothered to vote for a keyboard layout, it's clearly, "not of the community", but still for the community. To suggest, back to your original statement, that the 34S was made for W & P is a mischaracterization given the volume of support, testing, reaction to input, non-WP contributors, etc... And, I think "CS" is more inline with other projects such as OpenRPN and Free42.

Lastly, and again, I really do not have an issue with the current name, I never did. And you are clearly keen on not changing it, and that's fine too.

Hint: Follow up with, we are not going to change it and that's final. :-)

Re: [WP 34S] Another newborn

*Message #10 Posted by **Gerson W. Barbosa** on 20 Oct 2011, 1:34 p.m.,*
in response to message #9 by Egan Ford

> Quote:
>
> WP is already a mouthful since 'W', at least in English, is 3 syllables.

I should have paid attention to this before daring to suggest an even longer name... Sorry! When writing in English, I usually avoid long words whenever I can. Instead of referring to this road as a parallelepiped road, for instance, I would call it a six-faced stone road or something like that. Awkwardly, in Portuguese 'W' is a two-syllable word.

Since the name wp-34s has stuck, there's no need to change it now, INMHO. Besides, I think the other great contributor's names have already been credited in the documentation.

Gerson.

Re: [WP 34S] Another newborn

*Message #11 Posted by **Walter B** on 20 Oct 2011, 2:57 p.m.,*
in response to message #10 by Gerson W. Barbosa

Egan, Gerson, all,

We won't change the name WP 34S once it has become popular now. That's it :-)

FYI, 'W' is a one-syllable word in German - like all other letters except 'Y'. The

latter is three syllables like in Greek where we got it from. May be one reason why brands like BMW or VW grew up here.

BTW, I've got a favourite emoticon ;-) and I use it exactly for this purpose quite frequently, so please take into account some of my posts may be just meant this way. And since I was taught to care for proper spelling and grammar (some precision helps in math and physics, too) my only escape may be plain ignorance of the proper (American?) English wording. Nevertheless, I feel pretty comfortable between so many multilingual people here. Thanks for your understanding.

Fully testing HP 41

*Message #1 Posted by **Le Babou** on 19 Oct 2011, 1:53 p.m.*

Hello.

I love old hp calculators since i'm young, but too expensive for me at that time ;-)

Now, I could purchase several ones (67, 41c, 41cv, 41cx), not to store them in a shelf but to have the pleasure of using them daily :-)

For 67, it exist a program that fully test it, but I've none for 41... So my question is: is it possible to find on the market the Service Roms used to deeply test them ? Is there an alternative to this ?

Thanks a lot for your help and experience. Xavier.

Re: Fully testing HP 41

*Message #2 Posted by **Geoff Quickfall** on 19 Oct 2011, 7:51 p.m.,*
in response to message #1 by Le Babou

In the case of the 41C, 41CV and 41CX there are specific ROM modules that were used to test the functions.

There is no "blanket program" akin to the 67/97 or 65 families, or self tests such as the voyager and later families.

If you have a CLONIX and PIC programmer you can configure the clonix to be a TEST ROM.

Not to helpful, I know, so test the old fashioned way. try out functions and compare the answers to a known source.

Cheers, Geoff

Re: Fully testing HP 41

*Message #3 Posted by **Bruce Larrabee** on 20 Oct 2011, 10:11 a.m.,*
in response to message #1 by Le Babou

Hi

I know I saw somewhere that if you have the 67 test (on magnetic card) you can modify the test to run on the HP41.

I remember starting to try that once but didn't get back to it...

Re: Fully testing HP 41

*Message #4 Posted by **Paul Berger (Canada)** on 20 Oct 2011, 2:18 p.m.,*

in response to message #3 by Bruce Larrabee

The card reader for the 41 has a routine built in to convert programs from a 67/97 to run on the 41.

Re: Fully testing HP 41

*Message #5 Posted by **geoff quickfall** on 20 Oct 2011, 2:38 p.m.,*
in response to message #4 by Paul Berger (Canada)

The problem with the 67 diagnostic is that it doesn't test all the extras that the 41C has:

```
nested executes
time functions
keyboard
memory
x memory
flags
x functions
rom module connections
...
```

It does test the 67 extensiviley. Also, the error codes that arise will be on the most part meaningless as they are specific to the 67.

Cheers, Geoff

38E/C, 12C, 12CP date arithmetic bug

*Message #1 Posted by **Katie Wasserman** on 19 Oct 2011, 11:28 a.m.*

A while back a date arithmetic bug was found during beta testing that affects all the 12C, 12CP, 38E/C and 12C clone calculators ever made. It's been unreported here (or anywhere else as far as I know), it's really obscure and was apparently fixed in the Pioneer series and after.

If you're not aware of this, the 38E/C and the 12C/CP calculators compute both 365 day calendar and 360 day calendar date differences in the X and Y registers respectively. If you take a forward date difference to February 28 both values (365/360) are correct. If you take a reverse date difference the 360 day value is wrong.

For example: 12/31/2007 to 02/28/2008 returns X=59, Y=58; while 02/28/2008 to 12/31/2007 returns X=-59, Y=-57 and that -57 is wrong. Pretty clearly backwards in time should be the same number of days as forwards in time.

While this is extremely unlikely to ever occur during normal usage, it's useful as a calculator forensic. You'll find that the 12C/12CP clone calculators -- the Aurora FN1000, Compucessory CCS 28956 and Victor V12 -- have the same bug. Prior to the 38E/C, the 92 offered 365/360 date arithmetic, but that gives different answers using 360-day calculations.

-Katie

Edited to correct 3/31/2008 to 03/01/2008, but that was the wrong date too, the correct date for the example is 02/28/2008.

Edited: 19 Oct 2011, 10:05 p.m. after one or more responses were posted

> For example: 12/31/2007 to 03/31/2008 returns X=59, Y=58;

Are you sure these are correct? For me, this looks like e three month difference which should be around 90 days in any case. (90 for 360 mode, 91 for 365 mode: 31 (Jan) + 29 (Feb) + 31; if the algorithm excludes the beginning and end dates 1 less for each: 89 and 90.)

Re: 38E/C, 12C, 12CP date arithmetic bug

*Message #7 Posted by **Katie Wasserman** on 19 Oct 2011, 1:26 p.m.,*
in response to message #6 by Marcus von Cube, Germany

My typo, should have been 03/01/2008 not 03/31/2008.

Re: 38E/C, 12C, 12CP date arithmetic bug

*Message #8 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 19 Oct 2011, 1:12 p.m.,*
in response to message #1 by Katie Wasserman

Hi Katie:

If I recall correctly, there are 12C Models with ABA and ABC part numbers. ABA is what widely used in the

US, ABC (I may be incorrect) for Canada, UK, Brazil, etc. I think this difference was due to the differences in some financial algorithms used by these regions. Curious if you would get the same date answer from ABA vs ABC. May be the clones were reverse engineered after ABC instead of ABA model. Do you have more insight on the differences between ABA and ABC?

Thanks, Kerem

Re: 38E/C, 12C, 12CP date arithmetic bug

*Message #9 Posted by **Katie Wasserman** on 19 Oct 2011, 1:39 p.m.,*
in response to message #8 by Kerem Kapkin (Silicon Valley, CA)

I have no idea what the ABA vs ABC distinction is for sure, but I remember something about Canadian mortgage calculations being done differently than in the US, perhaps that's the only difference. I don't have an ABC version, it would be interesting to check for this date calculation bug.

Re: 38E/C, 12C, 12CP date arithmetic bug

*Message #10 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 19 Oct 2011, 1:49 p.m.,*
in response to message #9 by Katie Wasserman

Thanks for your response. I recently checked on HP's site and can't find any details on the differences between the two 12C models except ABC is ~$30 more expensive then ABA (long time ago I recall reading some place about the difference in algorithm, wonder what other differences are there):

MFG#F2230A#ABC

MFG#12C#ABA

*Message #11 Posted by **M. Joury** on 19 Oct 2011, 1:42 p.m.,*
in response to message #1 by Katie Wasserman

Hi Katie,

I must be missing something. I have tried to reproduce this on 7 different HP12C/12CP models and so far have been unable to do so. What am I missing?

My procedure:

```
12.312007 ENTER^ 3.312008 deltaDYS:  91 & 90
3.312008 ENTER^ 12.312007 deltaDYS:  -91 & -90
```

Am I doing this correctly?

```
Units tried:
2 * original 12C
1 * original 12CP
2 * intermediate 12CP (single 2032 cell)
1 * new 12CP
1 * 12C+
```

Thanks,

-Marwan

Re: 38E/C, 12C, 12CP date arithmetic bug

*Message #17 Posted by **BruceH** on 19 Oct 2011, 2:25 p.m.,*
in response to message #16 by M. Joury

Can someone else please check the 30B? I'm seeing 61 days in both actual and 360 mode for 12.31.2007 to 1.3.2008, likewise -61 for both going backwards.

Secondly, why is Marwan seeing 61/60 days but Katie seeing 59/58 both on the 12C?

PS: Wolfram Alpha thinks it is 61 days so I'm surprised this error hasn't been spotted sooner.

Edited: 19 Oct 2011, 2:38 p.m.

Re: 38E/C, 12C, 12CP date arithmetic bug

*Message #18 Posted by **Kiyoshi Akima** on 19 Oct 2011, 5:04 p.m.,*
in response to message #17 by BruceH

I don't have my 30b handy but do have a 20b.

```
12.312007 <->  3.012008 :  61 /  722941
 3.012008 <-> 12.312007 : -61 / -722941
```

The calculator seems to have a problem with the 31st day of a 30-day month. So let's back off a day...

```
12.302007 <->  3.012008 :  62 /  61
 3.012008 <-> 12.302007 : -62 / -61
```

*Message #20 Posted by **tony(nz)** on 19 Oct 2011, 3:36 p.m.,*
in response to message #1 by Katie Wasserman

Hi Katie that's really because the 30/360 formula (p209 in 12C manual) is asymmetric by definition and assumes the second date is after the first. Even going just one day forward from any 31st to the first will give one but going back a zero on 30/360. eg in MDY 12.312007 to 1.012008 gives 1,1 but backwards -1,0.

Cheers Tony

(corrected my spelling of asymmetric after reading Katie's reply)

Re: 38E/C, 12C, 12CP date arithmetic bug

*Message #22 Posted by **Katie Wasserman** on 19 Oct 2011, 7:25 p.m.,*
in response to message #21 by M. Joury

I agree that HP's formula is asymmetric, which is probably why the clones have this bug too. To compute this correctly you need to recognize the date order is reverse and swap the arguments before using the formula, then sign adjust after you get the result.

Can the ROMs in the clones (in the alternative devices, I mean) be easily exctracted? This would be interesting.

Re: 38E/C, 12C, 12CP date arithmetic bug

*Message #24 Posted by **M. Joury** on 19 Oct 2011, 5:24 p.m.,*
in response to message #1 by Katie Wasserman

I looked at this on the 17bii, 17bii+ Silver, 19bii, and the HP200LX Calculator application and noticed that there were 3 results offered on each of these machines. Results below were identical on all the above platforms.

```
Days = Actual number of days
360D = 360 days
365D = 365 days
```

For the dates given by Katie the 17bii returns the following:

```
12.312007 DATE1
3.012008  DATE2
```

```
Results
DAYS:  ACTUAL DAYS = 61
360D:  360 DAYS    = 61
365D:  365 DAYS    = 60

Calculation reversed...

3.012008  DATE1
12.312007 DATE2

DAYS:  ACTUAL DAYS = -61
360D:  360 DAYS    = -61
365D:  365 DAYS    = -60
```

Interesting results and maybe explained by this. But I really have not taken the time to study it.

Cheers,

-Marwan

Re: 38E/C, 12C, 12CP date arithmetic bug

*Message #25 Posted by **Katie Wasserman** on 19 Oct 2011, 7:20 p.m.,*
in response to message #24 by M. Joury

Sorry all.

I screwed this up trying to do it from memory. Now that I've got a 12C in my hands the correct test is:

12/31/2007 to 2/28/2008 vs 2/28/2008 to 12/31/2007.

I've edited the start of this thread to correct the dates.

-Katie

*Message #26 Posted by **Michael de Estrada** on 19 Oct 2011, 7:40 p.m.,*
in response to message #25 by Katie Wasserman

Just rechecked it with my new Victor V12, and like you stated above, it has the same bug.

Re: 38E/C, 12C, 12CP date arithmetic bug

*Message #27 Posted by **Miguel Toro** on 19 Oct 2011, 8:57 p.m.,*
in response to message #25 by Katie Wasserman

Well, it seems that the bug is in the formula from the manual, so, I do not know if call it a bug, since what is implemented if what is documented :-)

30/360 Day Basis

```
DAYS = f(DT2) - f(DT1)
f(DT) = 360 (yyyy) + 30mm + z

for f(DT1)
if dd1 = 31 then z = 30
```

```
if dd1 <> 31 then z = dd1

for f(DT2)
(1)if dd2 = 31 and dd1 = 30 or 31 then z = 30
(2)if dd2 = 31 and dd1 < 30 then z = dd2
(3)if dd2 < 31 then z = dd2

f(DT2) = 722,880 + 31 (2) = 722,911
f(DT1) = 722,940 + 28 = 722,968

Days = -57
```

It is also possible to remove/desolder the terminal contacts, clean the corrosion by sandblasting (vibratory/rotary tumbler should work, haven't tried) and re-plate the nickel surface. Once the plating barrier is gone the base metal (phosphor bronze, steel, etc..) is subject to substantial oxidation. Even tinning via solder is better than leaving the base metal exposed IMHO as the oxide scrubs off more readily during cell insertion.

Re: Corrosion ... best way to remove?

*Message #6 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 19 Oct 2011, 2:01 p.m.,*
in response to message #1 by gene wright

Gene:

You can use this mixture to resolve which is mostly Copper Oxide: •1/4 cup white vinegar (dilute acetic acid) •1 teaspoon salt (NaCl)

If you have any left over solution, put your old pennies in there, they will come out shiny clean too :)

HP50g - High power consumption

*Message #1 Posted by **Frido Bohn** on 19 Oct 2011, 10:09 a.m.*

Recently, I ordered an HP50g and was astounded that the LOW BAT signal turned on after one night at the desktop (turned off). First, I blamed the enclosed batteries which might have been low and installed a fresh set. However, after one night the same finding. Some surfing in the web revealed that this is not an uncommon problem of this calculator.

Some measurements of power consumption showed the following picture according to the calc's status at ~6 V (where ~ stands for "approximately" not for AC :-):
Program running: ~100 mA
Key pressed: ~68 mA
Idle: ~50 mA
Off: ~40 mA

After some back and forth with HP services I got a replacement calculator today, and the first I did was the set of measurements on that machine:

Program running: ~65 mA
Key pressed: ~28 mA
Idle: ~12 mA
Off: ~26 µA

The less power consumption of about 3 orders of magnitude in the replacement would warrant a longer battery life of 3 years or so if the calculator was not used.

HP services said that I should care of the disposal of the first machine I received. However, it appears inadequate to me to throw an otherwise fully functional calculator away. At least, it can be operated with the USB cable from which it gets its power.
Or is there some means to repair this calculator? I read speculations about a burned Zener and the like. Is there a way to exchange malfunctioning components?

Re: HP50g - High power consumption

> The less power consumption of about 3 orders of magnitude ...

Looks more like a constant ~40mA dissapearing somewhere.

> Quote:
>
> Or is there some means to repair this calculator?

Opening is easy enough. Remove the screen, see here. There are two screws on the top of the screen. Once these are removed, you can carefully pry the calculator apart. I used plastic levers from what is commonly known as "mobile phone tools" (see this example). The rest depends on how confident & equipped you are to trace the fault.

-B

A coincidence about the kilometer / mile discussion

*Message #1 Posted by **Andrés C. Rodríguez (Argentina)** on 19 Oct 2011, 8:51 a.m.*

Some days ago there was a thread about miles and kilometer conversion. I just noticed that the IEEE standards for WAVE (Wireless Access for Vehicular Environments, a.k.a. "smart cars", "car talk" and other popular nicknames) are identified as IEEE 1609.x . It seems somehow appropriate that the conversion factor between miles and meters appears in the name of these vehicular-related definitions.

wp34s low battery threshold Increased to 2.7V

*Message #1 Posted by **Jeff O.** on 19 Oct 2011, 8:33 a.m.*

I note that with build 1737, the low battery threshold was increased to 2.7 Volts. Why? What was it before? Do I need to replace my batteries when the indicator lights up?

Re: wp34s low battery threshold Increased to 2.7V

*Message #2 Posted by **Marcus von Cube, Germany** on 19 Oct 2011, 10:13 a.m.,*
in response to message #1 by Jeff O.

It had reports of strange behavior at various voltage levels, so I decided to increase the threshold. It not only displays the indicator, it also reduces the maximum speed and therefore the stress on the batteries. If I knew precisely at what voltage the problems with full speed start I could set the threshold to that point, but I have no dependable information about it.

In short: With BATT on, you can still operate your 34S safely but it will not be as fast as with new batteries.

Maybe I'll add another modification: Increase the operating speed only after a short delay so that routine stuff like data entry and simple operations will all run at 2 MHz which should be light on batteries. This will need some testing though to find the right compromise between (perceived) speed and power consumption.

Re: wp34s low battery threshold Increased to 2.7V

*Message #3 Posted by **Jeff O.** on 19 Oct 2011, 11:55 a.m.,*
in response to message #2 by Marcus von Cube, Germany

What if I am in a situation where I need to have the answer to some life or death problem (such as determining the number of pixels in a circle) as quickly as possible, yet my battery voltage is at 2.7 Volts and I have no new batteries? Would it be possible to have a flag or setting that would leave in high-speed mode regardless of battery voltage? Or maybe let me set the low battery threshold wherever I want, with the default being 2.7 Volts?

Edited: 19 Oct 2011, 11:56 a.m.

Re: wp34s low battery threshold Increased to 2.7V

*Message #4 Posted by **Marcus von Cube, Germany** on 19 Oct 2011, 12:30 p.m.,*
in response to message #3 by Jeff O.

For death or life problems you should not use WP 34S. ;-)

We have no room to store such a threshold. If anybody can give me a valid value for the threshold below which running at more then 30 MHz will cause reliability problems and above which these can be ruled out, I'm a taker.

Re: wp34s low battery threshold Increased to 2.7V

*Message #5 Posted by **Jeff O.** on 22 Oct 2011, 5:29 p.m.,*
in response to message #4 by Marcus von Cube, Germany

> Quote:
>
> If anybody can give me a valid value for the threshold below which running at more then 30 MHz will cause reliability problems and above which these can be ruled out, I'm a taker.

I will not claim to be an expert, but, in perusing the CR2032 data sheets from various manufacturers (available here), many of them mention an end point voltage of 2.0 Volts. I don't propose going that low, but if you examine the discharge curves, it looks like 2.5 Volts might be a reasonable value to use as the low-battery threshold on wp34s.

Re: wp34s low battery threshold Increased to 2.7V

*Message #6 Posted by **Marcus von Cube, Germany** on 23 Oct 2011, 3:04 a.m.,*
in response to message #5 by Jeff O.

Jeff, I did a recent updat to change it back to 2.5V. While testing a lengthy program with weak batteries which normally do not light the low battery indicator, it started flashing randomly during the computation. BATT reported 2.7V. It looks like the current draw on weak batteries has a noticeable effect on the voltage.

Re: wp34s low battery threshold Increased to 2.7V

*Message #7 Posted by **Paul Dale** on 23 Oct 2011, 3:16 a.m.,*
in response to message #6 by Marcus von Cube, Germany

Was that in SLOW mode?

What about start slow mode at 2.7 or 2.8 volts. Light the low battery indicator at 2.5?

I know confusion will occur when the device suddenly runs slower but it seems a shame to waste batteries needlessly.

- Pauli

Re: wp34s low battery threshold Increased to 2.7V

*Message #8 Posted by **Marcus von Cube, Germany** on 23 Oct 2011, 4:32 a.m.,*
in response to message #7 by Paul Dale

It wasn't in SLOW mode. I vote against an automatic but invisible speed throttle. The calculator was still working perfectly. If you want to deliberately save battery power, use SLOW as a setup command.

What I'm thinking about is a delayed speed up for manual operations so that the speed will remain at 2MHz unless an operation takes more then .2s. Maybe even a two step approach.

Re: wp34s low battery threshold Increased to 2.7V

*Message #9 Posted by **Walter B** on 20 Oct 2011, 12:37 a.m.,*
in response to message #3 by Jeff O.

Even in SLOW mode the WP 34S works faster than you can key in a problem. And please note you can keep a fire door open for several minutes by a WP 34S with battery voltage <<2.7V as well ;-)

Matrix Library

*Message #1 Posted by **John Abbott (S. Africa)** on 19 Oct 2011, 4:23 a.m.*

Hi Marcus
I have found an error (finger trouble probably) in the matrix library - namely in wp34s-1.dat.
The first 'M-' label should read 'M-0'. The real 'M-' appears further down.
For Pauli - in the 'M-y' routine you execute a [cmplx]DROP, which does not leave
a descriptor on the stack. Should this not be just a DROP?
Regards John
BTW- Thanks for these routines. The LU routine (if included) would be great :)

Edited: 19 Oct 2011, 4:25 a.m.

Re: Matrix Library

*Message #2 Posted by **Paul Dale** on 19 Oct 2011, 4:30 a.m.,*
in response to message #1 by John Abbott (S. Africa)

> Quote:
>
> I have found an error (finger trouble probably) in the matrix library - namely in wp34s-1.dat.

Won't be finger trouble -- these are generated by the assembler from the sources in the library. Still, the source only has one 'M-' label so something has gone awry.

> Quote:
>
> For Pauli - in the 'M-y' routine you execute a [cmplx]DROP, which does not leave a descriptor on the stack. Should this not be just a DROP?

The matrix descriptor is saved in L. The value on the stack isn't the descriptor anymore -- it is a loop index for ISG that has finished. Thus, complex DROP is correct here.

> Quote:
>
> BTW- Thanks for these routines. The LU routine (if included) would be great :)

The LU routine will be back if we can find enough space for the wrapper. We're working on it.

- Pauli

Re: Matrix Library

*Message #3 Posted by **John Abbott (S. Africa)** on 19 Oct 2011, 4:43 a.m.,*
in response to message #2 by Paul Dale

Thanks Pauli, should have checked L - I just looked at the comments which said the descriptor was returned in X.
Thanks for the prompt response. I am really enjoying this calculator :)
Regards John

Re: Matrix Library

*Message #4 Posted by **Paul Dale** on 19 Oct 2011, 5:27 a.m.,*
in response to message #3 by John Abbott (S. Africa)

There wasn't a comment on this routine about stack and register use????

I've added some clarification nonetheless. The documentation for these is in the doc directory.

- Pauli

>
> Still, the source only has one 'M-' label so something has gone awry.

This must have been my fault when changing names from M. to M- in the (wrong) hope that would ease the navigation of the built-in matrix commands in the catalogs. I assume it has been fixed by Pauli now.

Re: Matrix Library

*Message #7 Posted by **Walter B** on 20 Oct 2011, 12:41 a.m.,*

48G mod. after 15 years.

*Message #1 Posted by **Lyuka** on 19 Oct 2011, 3:05 a.m.*

Hi

Though I have an HP 50g, I've repaired the 15 years old 48G from a kind of sentiment and nostalgia recently. Then upgraded its memory to 128KB and additional 128KB with memory backup at port 1.

Actually, I prefer 48G's key pads than that of 50g.

Lyuka

Re: 48G mod. after 15 years.

*Message #2 Posted by **bluesun08** on 19 Oct 2011, 7:34 a.m.,*
in response to message #1 by Lyuka

Is it possible also to implement 50g-Rom?

Re: 48G mod. after 15 years.

*Message #3 Posted by **Lyuka** on 20 Oct 2011, 4:59 a.m.,*
in response to message #2 by bluesun08

AFAIK, It's impossible as the processor differs.

Re: 48G mod. after 15 years.

*Message #4 Posted by **Nacho** on 19 Oct 2011, 7:52 a.m.,*
in response to message #1 by Lyuka

As always,

fantastic work and explanation.

2 months ago I received a non working 49g , took its display and installed it into my 48G+ and changed also the cap...

full 48 working machines :)

regards

Re: 48G mod. after 15 years.

*Message #5 Posted by **Lyuka** on 20 Oct 2011, 5:07 a.m.,*

in response to message #4 by Nacho

Thanks Nacho,

I'd like to see the LCD transplantation.
It's also interesting.
Is the LCD of the 49g completely compatible to 48g?

Regards,
Lyuka

Hello Lyuka,

The display is P&P but far better with the high 49g contrast.

I will post a picture later.

Regards

*Message #7 Posted by **Ed Look** on 19 Oct 2011, 9:52 p.m.,*
in response to message #1 by Lyuka

Absolutely impressive!

Was it difficult to open the case?

And, the holes are CLEAN after you desoldered and removed the chip and capacitor! Very neat job.

I suppose this was not done with tools normally found at home, right?

Re: 48G mod. after 15 years.

*Message #8 Posted by **Lyuka** on 20 Oct 2011, 5:45 a.m.,*
in response to message #7 by Ed Look

Thanks Ed,

It's fairly easy to open the case if you use a special tool for the 'pioneer' ---

A BUTTER KNIFE! :-)

To pull out the four heat stakes behind the [1][2][3] keys,
I had used it as a leverage to make the bottom of the case apart.
FYI you'd better have its edge rounded and polished not to harm the inside part of the housing.

Regards,
Lyuka

Nice work (and documentation).

How did you remove the 32k memory? Did you use chipquik or solder braid?

Regards, TomC

Re: 48G mod. after 15 years.

*Message #10 Posted by **Lyuka** on 20 Oct 2011, 5:57 a.m.,*
in response to message #9 by Thomas Chrapkiewicz

Thanks TomC,

Exactly! I used CHIP QUIK SMD (pdf) like ultra low melting point solder to remove the SOP RAM.
FYI it's available online at DigiKey.

Regards,
Lyuka

Re: 48G mod. after 15 years.

*Message #11 Posted by **Paul Berger (Canada)** on 20 Oct 2011, 2:35 p.m.,*
in response to message #9 by Thomas Chrapkiewicz

I have removed several SOIC package chips safely and cleanly by starting at one corner and heating the pins and the lift it away from the board using something thin like a sewing needle. Usually if you remove heat simultaneous to lifting the pins, you can get away with just running the needle under the pin and by the time it drops again the solder has cooled enough that it does not stick again. Needles work well because they are thin and you can work your way down the case with it, and they don't lift the pin much so as to minimize bending. You could do the same thing with a thin blade but that doe not work so well if the chips are densely packed on the board.

*Message #4 Posted by **bill platt** on 19 Oct 2011, 7:29 p.m.,*
in response to message #3 by Liord

If you don't have an alternative UI (speedUI, Metakernel etc) I think it is simply a matter of pushing "MTH" and scrolling through commands, and then "PRG" and doing the same thing, and etc. That's what I do, anyway, with my limited facility in RPN.

Re: 48g - is there a CAT command?

*Message #5 Posted by **Pal G.** on 19 Oct 2011, 8:28 p.m.,*
in response to message #1 by Liord

> Quote:
>
> If not, is there another way to browse through the whole list of commands?

As there is *not*, a great way to browse through the whole list of commands is to read the "HP Programmer's Reference Manual".

Cheers.

Re: 48g - is there a CAT command?

*Message #6 Posted by **Chris Randle (UK)** on 20 Oct 2011, 10:29 a.m.,*
in response to message #1 by Liord

On my 48SX, you can use

```
2050 MENU
```

to get the full command set as multiple pages of menu items. It's not particularly useful because it's not in alpha order, and you can't jump to particular entries, unless you count using a page number after the menu number, e.g.

```
2050.06 MENU
```

takes you to page 6 of the full listing which begins with DDAYS.

I don't have a G/GX, but reading the HP50g AUR and using an emulator, it looks like menu number 2219 will give you the additional 48G commands.

Re: 48g - is there a CAT command?

*Message #7 Posted by **Liord** on 20 Oct 2011, 8:54 p.m.,*
in response to message #6 by Chris Randle (UK)

I hope my response is in the correct place,
anyways - Thanks guys for all the enlightening info!.
(Now I begin to realize how little I know about this HP device of wonders...)
P.S.
the- 2219 MENU (and 2050) work!, very Cool 'trick'. thanks.
P.P.S.
Someday, I fully intend to read the "HP Programmer's Reference Manual",
Alas, evil ninjas have stolen this ancient tome of knowledge from me.
So in the meantime I will seek wisdom in this wise (and friendly) forum. :)

OpenRPN Prototyping In Progress

*Message #1 Posted by **Hugh Evans** on 18 Oct 2011, 5:06 p.m.*

I will post pictures as the process goes forward, but hardware development is in full swing. Lead time is a couple of weeks for some of the parts, like deep drawn aluminum enclosures. I am working with several electronic design companies, but I really wish someone from this community would help with this instead.

The plan is to make a motherboard that can be used in any model. it will be built using SODIMM form factor. The planned CPU is ARM Cortex M3 (low power and a good enough display driver we could run a touchscreen!) running 16MB to 128MB PSRAM and as much flash as reasonable, a micro MMC slot will allow for expansion.

I'm waiting to hear back from e-ink regarding a custom display.

Since people who volunteered rapid prototyping seem to have vanished, there is a decision to make. If anyone has CNC, injection molding equipment (or mold design experience) can mill metal/other materials, rapid prototyping, etc. Please contact me. Otherwise, I can have many of the parts fabricated through emachineshop, but it will require larger runs to be feasible.

Building a hardware platform is priority number 1, if anyone is interested in partnering with me to help with financing it would be greatly appreciated. This will be a profitable venture.

I feel like I'm almost going at this alone and wish more of you would stop by openrpn.org to interact. This is not vaporware. I'm proud of the fact that I'm not afraid to try something and strike out. Last time we got a lot of useful code. I was also a less than wealthy Mechanical Engineering student when this project first started. Now I'm in a much better position to make this happen, but I would still appreciate some help (I'm sure Pauli wouldn't mind not being the lone programmer!)

As a side note: Can we please put the past behind us? For the most part OpenRPN is not the same project it once was. Effectively, this project might as well be two weeks old. So the comments of "vaporware" are uncalled for. OpenRPN is for the people in this community and other like minded individuals. Once the hardware is ready I plan to put it up for sale so people can start tinkering. The *fix core will make programming and creating new commands/menus simple. We have a lot to look forward to. I consider what we are doing to be the first calculator to advance to the 21st century. Give us a chance-- you won't be disappointed and you can help define the calculators of your dreams.

Thanks for taking the time to read this, I hope to see you on the forums at OpenRPN soon. I live near Columbus, OH... If anyone in the project is halfway near, perhaps we can meet up.

-Hugh

16MB of SRAM? Isn't that pretty expensive?

Re: OpenRPN Prototyping In Progress

*Message #3 Posted by **Hugh Evans** on 18 Oct 2011, 9:39 p.m.,*
in response to message #2 by Eric Smith

Yes, that would be... Typo, PSRAM will make much more sense. We could go up to 128MB for well under $10 a chip at low volume. Sorry for the confusion.

Re: OpenRPN Prototyping In Progress

*Message #4 Posted by **Dominic Richens** on 18 Oct 2011, 7:07 p.m.,*
in response to message #1 by Hugh Evans

Bizarre.

MicroTrend had this to say about your URL:

URL: http://www.openrpn.org/ Risk Level: Dangerous Details: Verified fraud page or threat source

Re: OpenRPN Prototyping In Progress

*Message #5 Posted by **Hugh Evans** on 18 Oct 2011, 9:44 p.m.,*
in response to message #4 by Dominic Richens

I haven't figured out MicroTrend's problem, but I know what you're taking about. My computer at work does the same thing. We just need an official website. If anyone wants to build a page for this project, I have quite a bit of artwork to help get you started. We really need to do something more than point to phpBB. However, at the time I wanted to just get back online.

The only workaround I have at the moment is to go to sourceforge, search for OpenRPN and follow the link. It will load and sourceforge will apparently stop phishing for your credit card info ;)

Re: OpenRPN Prototyping In Progress

*Message #6 Posted by **Bruce Bergman** on 18 Oct 2011, 11:29 p.m.,*

in response to message #1 by Hugh Evans

It would be great if there was a page explaining exactly what "OpenRPN" is for new members here. :)

Re: OpenRPN Prototyping In Progress

*Message #8 Posted by **Hugh Evans** on 18 Oct 2011, 10:45 p.m.,*
in response to message #7 by Brandon Poindexter

Brandon,

I'll get on that, as I've stated before the URL is just a pointer at the moment.

OpenRPN is a collaborative effort in both software and hardware to make ultra high end calculators. Since overhead is minimal, while the end products will be no more than $200 they will likely be the finest handheld calculators the world has ever seen. In a nutshell, we want to advance as HP should have. Look at the fanciest handheld calculator you can find... The technology in it is cheap, slow, and at least 15 years old rather than modern and capable of holding more in memory, interfacing with computers in a meaningful and easy manner, etc. OpenRPN is an effort from the ground up.

It uses a proprietary although open, programming language called *fix which allows all major types of input logic and programming: prefix, postfix, and infix. All command/files/menus will be visible on your computer when connected via USB. Once the *fix core has been written, all other commands will be written natively in it.

Quality of build will be second to none. The first prototypes should start to appear within the next month or so. I am anxiously awaiting samples of deep drawn shells, I have a machinist lined up to make the faceplates. To add mass and protect the electronics, the inside will be filled with two part urethane (the electronics will not be bound however.) I hope to cover the entire flaceplace with alumino silica (gorilla glass.) the entire enclosure will be surrounded with a black rubber boot, either nitrile or flurosilicone.

The processor will most likely be a ARM Cortex M3, at least 16MB of PSRAM possibly up to 128, and a big chunk of flash that can be supplemented with a micro MMC card.

Again, I will put this into writing and make it easy to find on our formal webpage. That make take a little time, because getting hardware built is my top priority. Hell, I've been off work since 5 and all I've been thinking about are calculators!

If you have any more questions, please feel free to send me a PM.

Thanks for your interest!

-Hugh

I must be missing some document describing definition of device abstract functionality, device use

case(s) and corresponding user facing GUI(s), supported firmware architecture(s), hardware topology and features, physical/mechanical requirements.

Could you provide a pointer?

> Quote:
>
> I hope to cover the entire flaceplace with alumino silica (gorilla glass.

Is this an effort rather to produce a specialized PDA or touchpad? From the above it appears a physical keypad has been eliminated.

> Quote:
>
> The processor will most likely be a ARM Cortex M3, at least 16MB of PSRAM possibly up to 128, and a big chunk of flash that can be supplemented with a micro MMC card.

Could you share the details of your power consumption analysis and resulting design budget? I'm assuming since you're onto mechanical enclosure production the details of power source, footprint, and envelope have been finalized. Actually the same should be true for the display. Could you share the details of graphic resolution, footprint, and envelope here as well?

> Quote:
>
> If you have any more questions, please feel free to send me a PM.

Any objection to keeping the discussion in an open forum? I believe doing so would be far more beneficial for a transparent, open development effort.

Re: OpenRPN Prototyping In Progress

*Message #10 Posted by **Hugh Evans** on 19 Oct 2011, 10:55 a.m.,*
in response to message #9 by uhmgawa

A public forum exists here.

You're describing this effort as if enough people have expressed interest to approach this as a full design team. While this would be nice, we simply don't have enough people to use this approach.

There is still a physical keyboard.

This is not a finalized design, and I do not understand why you continually treat me as if I am incompetent simply because I have limited resources to work with. I've said before that you sound like you have a lot to offer to this project, and rather than criticize it why not help? I don't claim to be an expert in all aspects of this project, but I'm giving everything my best shot to make it happen.

Re: OpenRPN Prototyping In Progress

*Message #11 Posted by **uhmgawa** on 19 Oct 2011, 12:25 p.m.,*
in response to message #10 by Hugh Evans

> Quote:
>
> You're describing this effort as if enough people have expressed interest to

> approach this as a full design team. While this would be nice, we simply don't have enough people to use this approach.

I can understand and appreciate the challenges such a prospective project faces. But given you indicated being at the stage of mechanical development, I would have assumed such issues were addressed to a fair degree of certainty. My questions were for my benefit as I believed I was missing something obvious.

FWIW I would hardly expect a full blown formal engineering approach here. But I also wanted to make sure the opposite wasn't true. For example, building an interesting form factor enclosure and trying to shoehorn components in later is a perilous approach.

> Quote:
>
> There is still a physical keyboard.

The above is one good example of information I was seeking. Can you share details of the design, functional layout, and mechanical construction of this keyboard? You very well may have all of this worked out in your head. But until it is documented in some form where others can read and understand the concepts and details, the substantial benefit of peer (and moreover prospective consumer) review is lost.

> Quote:
>
> This is not a finalized design, and I do not understand why you continually treat me as if I am incompetent..

I'm not sure from where that comment is originating as I believe I'd only asked similar questions of you once before. And for the same reason, namely I'm trying to assess what is being designed, where the effort is at, the execution plan, and my personal prediction of its success. I'd imagine other potential contributors have similar thoughts and concerns.

If not for asking such questions, how else can we ascertain this information?

> Quote:
>
> ..simply because I have limited resources to work with.

That is in part, the definition of engineering. No shame here that I can see.

> Quote:
>
> A public forum exists here.

I realise you are trying to seed that forum. However I think in the interim there is far greater benefit of keeping the discussion here. Even if you should endure the occasional lump or two, at least you'll gain invaluable feedback from prospective consumers of the effort.

Re: OpenRPN Prototyping In Progress

*Message #12 Posted by **Don Shepherd** on 19 Oct 2011, 1:28 p.m.,*
in response to message #11 by uhmgawa

> Quote:
>
> there is far greater benefit of keeping the discussion here

Maybe for the few who may be interested in this project, but certainly not for me and other members I know.

Please remember, this is a **museum** after all. The focus here should be on vintage HP calculators, not new development effort. New development discussions belong in SourceForge. This forum is turning into a detailed design forum for new DIY calculators, and I for one think that is inappropriate.

When I visit the Air and Space **Museum** in Washington DC, I want to see the old Apollo and Mercury capsules, not the latest offerings from Boeing. The way this forum is going recently, it's like they took all of the vintage aircraft out of the Air and Space Museum and put them in storage to make room for the Boeing 777.

Re: OpenRPN Prototyping In Progress

*Message #13 Posted by **Marcus von Cube, Germany** on 19 Oct 2011, 1:41 p.m.,*
in response to message #12 by Don Shepherd

Don, don't be too harsh! It's the forum of the museum, not the museum itself. Take, as an example, the work carried out by a museum of natural history: The associated scientific society is typically not only engaged in paleontology but in natural/environmental science in general.

Re: OpenRPN Prototyping In Progress

*Message #14 Posted by **Hugh Evans** on 19 Oct 2011, 1:42 p.m.,*
in response to message #12 by Don Shepherd

Don,

I fully agree, and this is precisely the reason I make every effort to direct people towards the forum on sourceforge. Generally, I've found that the forum here is receptive to very occasional updates. But when it comes to OpenRPN, unless I have hardware to show off it's the equivalent of asking for a beating.

This is a group I have an incredible amount of respect for and enjoy taking part in. I can bag about finding a mint 42s with case and manual for $20 on craigslist. But when it comes to my own projects, they need their own space.

If you're interested in OpenRPN, come over to sourceforge.

Re: OpenRPN Prototyping In Progress

*Message #15 Posted by **Howard Owen** on 19 Oct 2011, 2:42 p.m.,*
in response to message #12 by Don Shepherd

Let me add my vote that such discussions *not* be banned from this forum. A lot of the attendees of HHC 2011 were excited by the talks on the WP-34S *and* the SR-60 *and* the 41-CL. That runs the gamut from new to old to new/old. How do you put the latter into an excluded or included category?

Clearly there are varied interests represented here. As an enthusiast, I could care less about the HP-12C, HP45, HP80, HP18C, HP22S and many others. I hereby demand that those machines be excluded from discussion, because a real museum wouldn't show things I didn't like!

This is a community based on broadly shared interests. The community can decide what's appropriate, but nobody is going to be 100% satisfied. If I had to go elsewhere to get my calculator nerd/enthusiast fix, I would. As it stands I'm glad that the collector and enthusiast portions of my calculator obsession have a single home.

in response to message #12 by Don Shepherd

> Quote:
>
> Please remember, this is a museum after all.

It has been my impression that the reason for calling it a museum is not to commiserate about how bad we all had it 30 years ago when we didn't know better, or to give the youngsters a respect for a tragedy that they need to learn from so they don't repeat it, but rather to acknowledge the value of what HP did back then. What greater honor could we give it than to emulate it, and to do it the best we can with the greater memory and computing power resources available today. Part of the value is of course the durability, which means it will not be made like today's disposable consumer electronics that don't last; so in that, we are still keeping with the old.

I recently went to the Computer History Museum (awesome) to see vintage and historically relevant machines, however I had some great conversations about machines old and new with some of the other visitors there. Discussions about the new and how it came from the old are just as interesting.

I consider this forum the museum lobby or cafe--a place to chat about any topic with people that share a common interest.

I notice that only the HP 12 C model was posted. Other plans to include other models I find myself uninterested in the 12c but I would be interested in an hp48 reboot

Re: OpenRPN Prototyping In Progress

*Message #19 Posted by **Hugh Evans** on 18 Oct 2011, 9:56 p.m.,*
in response to message #18 by Han

I'll be posting renderings of another calculator soon. I like to think of it of as what the 42s would have been had it been designed in the modern day (by HP engineers in their heyday.) Since all of the designs use a SODIMM motherboard it will be very possible to make a 48 style machine in the future.

Due to the 15C LE, Quixote (codename for the portrait layout calculator) will likely be the first to be released. Then again, if we continue to receive generous donations, it may be easy to launch both models at the same time. A graphing model is not a top priority at the moment.

I created an account and posted something. I may have something to contribute.

I agree that active discussion should happen in the dedicated forum.

From the early stage of the discussion in the dedicated forum, I gleam that it hasn't been quite decided yet what the overarching goal of the project should be: Will it be an attempt at creating a 42C "successor", a 50g "successor", or both, or something else? On that question, input from and discussion in this forum may be appropriate and beneficial (to both the project and the community here).

Prior talk suggested a 42C "RPN" style machine. Newer discussion, and stated RAM available, seem to not exclude an "RPL"-style machine. These are two very different beats. If you aim for latter, you need to keep the app world in mind, too.

If the 50g had a half-baked CAS, you don't want to repeat that mistake. If apps can communicate via WiFi, your calculator won't be very "high-end", if it doesn't do that too. Etc., etc.

Complex Cubic Equation - 41Z Version

*Message #1 Posted by **Ángel Martin** on 18 Oct 2011, 4:00 p.m.*

Here's a corolary of this thread on solving the cubic equation using the trigonometric method.-

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv020.cgi?read=180771#180771

It picked my curiosity and wanted to try it on the 41Z. The following programs are the result, amazingly short (around 65 z-steps) and showcasing the versatility of the machine.

Input: four complex coefs in Z-stack four levels
Output: three roots in Z-Stack levels

Two versions, hyperbolic vs. circular functions.

Enjoy, 'AM

Re: Complex Cubic Equation - 41Z Version

*Message #2 Posted by **Ángel Martin** on 19 Oct 2011, 2:29 a.m.,*
in response to message #1 by Ángel Martin

In writing a version for the 42S it occurred to me that there's no way to input four complex numbers in the stack without using a data register - how can this be possible on the pinnacle of RPN development? ;-)

Re: Complex Cubic Equation - 41Z Version

*Message #3 Posted by **Thomas Klemm** on 19 Oct 2011, 3:42 p.m.,*
in response to message #2 by Ángel Martin

This was pointed out once by Valentin Albillo.

Nice extension of my program by the way.

Cheers
Thomas

Re: Complex Cubic Equation - 41Z Version

*Message #4 Posted by **Ángel Martin** on 19 Oct 2011, 4:23 p.m.,*
in response to message #3 by Thomas Klemm

Yes Thomas, thanks for the pointers to the method. Indeed I used your program as the "core", with a preamble section to prepare the depressed equation, and a provision to obtain the three roots.

You'll no doubt see the parallel between the "standard" functions and those in the 41Z, which does have a proper 4-level complex stack.

Cheers, 'AM

HP 15C LE back in stock at HP H&HO

*Message #1 Posted by **Michael de Estrada** on 18 Oct 2011, 12:44 p.m.*

Just noticed that the HP 15C LE is back in stock at the HP Home & Home Office webstore. Don't know how long this will last, so hurry up and order if you want one at MSRP. Try the SAVE15HP coupon to save $15. Good luck.

Michael

*Message #3 Posted by **Michael de Estrada** on 18 Oct 2011, 1:04 p.m.,*
in response to message #2 by Paul Gaster

Did you buy them from HP Home or HP Business ? I bought 2 from HP Home and they shipped immediately.

Edited: 18 Oct 2011, 1:05 p.m.

Re: HP 15C LE back in stock at HP H&HO

*Message #4 Posted by **Paul Gaster** on 18 Oct 2011, 1:07 p.m.,*
in response to message #3 by Michael de Estrada

Good catch. I ordered from HP Business.

Re: HP 15C LE back in stock at HP H&HO

*Message #5 Posted by **Michael de Estrada** on 18 Oct 2011, 1:11 p.m.,*
in response to message #4 by Paul Gaster

Notice that HP Business offers no indication of the stock status of their items, but that HP Home specifically states "in stock" and won't let you order unless it has an "in stock" status.

Re: HP 15C LE back in stock at HP H&HO

*Message #6 Posted by **Brandon Poindexter** on 18 Oct 2011, 3:20 p.m.,*
in response to message #4 by Paul Gaster

I ordered from the HP business website on October 11. I called HP Business customer service

yesterday (17th) and a representative told me that they will be shipping out "this week". I actually called a week ago around October 14, and they said it will be shipping out on Monday the 17th, so I have no idea when to expect my HP 15c, lol.

HP41c+ : i still prefer it

*Message #1 Posted by **Michel Beaulieu** on 17 Oct 2011, 8:37 p.m.*

I didn't have a 15C to compare. I have a 41C with time module for years with quad memory module. I recently - 1 months ago - bought a 15LE with manual.

I was thinking about the 15c as HP greatest one - I was wrong, for me. The 41c is A LOT LOT more lovable than the 15c.

- It have more memory - It have ABC capability - It have real world connectivity port - it is expandable - it have a real user keyboard mode - it have tone and beep - it have great angle on a desk - programming is greater in my opinion - you can save programs with external help acc.

I know that it is more bulky, a bit fragile and more hard on batterries. But can you tell me why it is not "bring back the 41" instead of the 15c?

Why no the 42? I think i know : It does not have expandability, that i think is the greatest feature of the 41.

Don't get me wrong : i'm really happy about the 15Cle, but what about a 41CZ instead?

Re: HP41c+ : i still prefer it

*Message #2 Posted by **Martin Pinckney** on 17 Oct 2011, 10:10 p.m.,*
in response to message #1 by Michel Beaulieu

Bringing back the 15c was relatively "easy", because it was based on the already-in-production 12c.

The 41 would be an order of magnitude more difficult and expensive.

Re: HP41c+ : i still prefer it

*Message #3 Posted by **Eric Smith** on 17 Oct 2011, 10:16 p.m.,*
in response to message #1 by Michel Beaulieu

It's unlikely that HP will bring the 41C/CV/CX back, or any other old models. The only reason that the 15C is back as a limited edition is that it took relatively little additional engineering after they had already redesigned the 12C with modern components.

On the other hand, Richard Ottosen and I have redesigned the 41CX with some improvements (high-resolution graphic display capable of showing full stack, SD slot, serial port), and demonstrated a working prototype at HHC 2011.

The unfortunate part is that the firmware and electronics is the *EASY* part of designing (or redesigning) a calculator.

How many new and improved 41CX calculators would actually sell per year, given that they would likely have to sell for at least $200/unit?

Re: HP41c+ : i still prefer it

*Message #4 Posted by **M. Joury** on 17 Oct 2011, 10:21 p.m.,*
in response to message #3 by Eric Smith

Like I said before... I'd buy! :)

Re: HP41c+ : i still prefer it

*Message #5 Posted by **Jim Creybohm** on 18 Oct 2011, 12:20 a.m.,*
in response to message #3 by Eric Smith

Put me down for a couple! I prefer the alpha keyboard to the 42s menus, and it IS friendlier to program. For me, it is the BEST calculator ever made - the addition of the modules made it more complete as an engineering tool - especially the petroleum pac.

I don't mean to belittle the efforts of those who put the 15C together - because I am certain that this was a monumental effort in a company the size of HP. I am having a blast with the 15 - I would just have rather it was a 41.

Re: HP41c+ : i still prefer it

*Message #6 Posted by **Patrice** on 18 Oct 2011, 2:29 p.m.,*
in response to message #5 by Jim Creybohm

My correction

because I am certain that this was a monumental effort in a team the size of HP Calculator division.

Patrice

Re: HP41c+ : i still prefer it

*Message #7 Posted by **M. Joury** on 17 Oct 2011, 10:20 p.m.,*
in response to message #1 by Michel Beaulieu

I for one agree with you. The nearest calculator to perfection that HP ever made was either the 41 or the 42. The 41 for it's connectivity, expandability, and off-line storage capabilities, and the 42 for its size and programming power (in many ways better than the 41). Combine the two feature sets and you have a machine that would be perfect.

I think that a lot of people would love to see a new version of the 42 with a few additional capabilities (such as time functions and USB port) added. The problem with the 42 per the experts on this forum is that it would be a lot harder to bring back. There is no current platform that could be easily repurposed with 42S capabilities (unlike the 12C+ to 15C LE effort) and it might in fact require an entire rewrite of the firmware if you wanted to offer improved capabilities.

That said, there is obvious interest in such a machine. The WP34S is inspired by many of the features of the 42S as well as other models and the OpenRPN effort (which hopefully will get restarted and see fruit at some future date) also seems to be driven by a 42S capabilities paradigm.

Cheers,

-Marwan

I think that describes the Hp rationale behind creating the HP 48S/SX/G/GX. Although not RPN machines, they combined the best of both the 41 and 42. Not counting the HP 28C/S - the awkward intermediate species between the Pinnacle of Pioneer Perfection, the Notable Nut Series and the Champion Charlemagne Family.

It still lacks HPIL though, the 41's connectivity to thousands of models of lab equipment via the HPIL-to-HPIB (IEEE-488) interface converter. This is what I bought the 41 for. It can interface to 15 such pieces of equiment *simultaneously* (the IEEE-488 fanout limit) plus a lot of HPIL devices ahead of it.

Re: HP41c+ : i still prefer it

*Message #10 Posted by **Andrés C. Rodríguez (Argentina)** on 18 Oct 2011, 10:02 a.m.,*
in response to message #7 by M. Joury

WRT rewriting the firmware, there exists Free42 by Thomas Okken. Also there were emulators that run the 42 ROM Image, but copyright issues are complex. Free42, or some initiative based upon Thomas' excellent work looks like a feasible way.

Re: HP41c+ : i still prefer it

*Message #11 Posted by **Marcus von Cube, Germany** on 18 Oct 2011, 10:30 a.m.,*
in response to message #10 by Andrés C. Rodríguez (Argentina)

Thomas has stated earlier that the software wasn't written with memory constrained devices in mind. It freely allocates memory as needed which is a problem if you must live within kilobytes instead of megabytes.

Re: HP41c+ : i still prefer it

*Message #12 Posted by **Andrés C. Rodríguez (Argentina)** on 19 Oct 2011, 12:04 a.m.,*
in response to message #11 by Marcus von Cube, Germany

Hi Marcus, you are right. But looking at Free42 may be a good starting point if you would like to recreate the 42S; the original message says something as starting from scratch, or so.

On the other hand, possibly the best thing to do these days is, of course, 34S... lets hope HP will not discontinue the 30B. And, for new initiatives, perhaps something may be derived from 34S code but with a better display. I don't know if your code can be adapted to a different display or not.

Best regards,

Andrés

*Message #14 Posted by **Andrés C. Rodríguez (Argentina)** on 19 Oct 2011, 8:40 a.m.,*
in response to message #13 by Marcus von Cube, Germany

I hope your final emoticon is the one to take into account!

Re: HP41c+ : i still prefer it

*Message #15 Posted by **Thomas Okken** on 19 Oct 2011, 5:30 a.m.,*
in response to message #11 by Marcus von Cube, Germany

Free42 is not very memory-hungry in terms of RAM requirements; it uses about twice as much memory as the HP-42S for user programs and data, plus some fairly small fixed amount for things like the stack, flags, alpha register, and some auxiliary data structures.

The part of Free42 that *does* take up a lot of memory is the code itself, about 300-500 kilobytes for the code and read-only data structures, depending on CPU architecture. An ARM-based machine with half to one megabyte of ROM and 32 kilobytes of RAM or more would make a fine HP-42S replacement. Presumably you would need those or better specs for *fix as well.

Re: HP41c+ : i still prefer it

*Message #16 Posted by **Ángel Martin** on 18 Oct 2011, 2:05 a.m.,*
in response to message #1 by Michel Beaulieu

The 41CL exists and puts the 41 series into the 21st. century - with flying colors, if I may add.

A new unit with larger display (DIY5) will be a success amongst the people in this forum.

Re: HP41c+ : i still prefer it

*Message #17 Posted by **From Hong Kong** on 18 Oct 2011, 2:54 a.m.,*
in response to message #1 by Michel Beaulieu

In my opinion, a good calculator (not a computer) should have the criteria:

(1) small footprint (2) all routine functions such as trig and log functions accessed as primary and secondary functions but not from menus (3) long life battery (4) abundant functions (5) abundant memory (6) sophisticated programmability (7) fast

What we need is a calculator. We can't expect a calculator to do anything. I think the best calculator on earth is HP-42S!

One huge drawback. Specially with all that memory. No I/O! That was what kept me from switching over from the 41 to the 42. A memory lost condition took hours to recover from on the 42, 5 minutes or less on the 41.

Cheers,

-Marwan

Please pardon the following rant. I admit I am very prejudiced on this subject.

"What we need is a calculator. We can't expect a calculator to do anything."

I can only assume that you never saw or operated an HP 41 system, because an HP 41 system "could" do "anything". And it could do "anything" "anywhere" until the batteries went dead. And once you become accustomed to a hand held device that can do that, all the other devices, before or after, become inadequate substitutes.

Actually I consider it a gross injustice to call the HP-41 a calculator or compare it to one. The HP-41 was the "System Controller" for the HP 41 System. It just happened to be an excellent stand alone calculator in addition to its primary mission.

If you had an HP-41 and you only used the device in the calculator mode, then you simply have no idea about how powerful and capable the HP-41 system was.

That HP-41 system has never been equaled, by any hand held device, by any manufacturer (including HP) ever. Period!

RPL machines - A solution to a problem that never existed, with 1 measly I/O port.

HP-42 - Sorry. That is just a crippled HP-41

HP-15LE - Mediocrity at 100x the speed. But I am glad that some people are finally able to fulfill their desire.

While it is certainly true that the 41 system has no comparison in connectivity, I submit that, except for a few die-hards, this has no value today. What would have value is a calculator with robust capabilities, robust build quality, ease of use, combined with easy I/O.

Does the 50g supply this? If so, we probably won't see anything new from HP, except for perhaps a 50g upgrade. If not, well... who knows?

I have the 71 also which does all that and is much more powerful, but is not as practical as the 41 as a calculator, so the 71 mostly sits in the drawer.

> Quote:

I'm not using the 41 to control things on the workbench much anymore, but that's partly because my work has changed somewhat. The 41's size is an advantage over a laptop though, or even an iPad, making it easier to disconnect from the equipment and go from the work bench to the office 20 feet away and back.

I would rather call HP-41C/CV/CX a handheld computer. A handheld calculator should not fall into the class of calculators.

I agree with some of you that I/O is a necessary addition to a capable calculator.

I bought a 41C in 1980, and a 41CX in 1984. I used them for many years. The system was state-of-the-art in 1979, but six years later it was just an extremely extremely slow, mediocre, rather expensive system to which a lot of other expensive items could be attached to run slowly, with output to an extremely limited display or some very limited thermal printer. Sorry...it is certainly hyperbole to claim the the HP-41C series could do anything. Only the quality and feel of the HP-41C-series keyboard is missed today (that's why I still have a 41CX in mint condition). And here's a cheap shot...it started HP on its long-lived trend producing calculators that were grossly ugly and flimsy, when compared to earlier series. (Don't you love that charger plug door cover on the 41C...if one of the legs hasn't broken off and ruined it, just wait.)

> Quote:
>
> Actually I consider it a gross injustice to call the HP-41 a calculator or compare it to one.

Get accustomed to it, because it is just a very slow calculator...always has been...even though HP tried unsuccessfully to sell it as a "handheld computer" (without providing any customer access to the machine internals and firmware) to knowledgeable and experienced technical people who would have none of that nonsense.

> Quote:
>

I suppose you must have carried around with you in every theater your HP-41C and ALL those expensive gee-gaws in your perfect unmatched "system". I have the honor to suggest that only a vanishingly small percentage of technical calculator users have ever wanted to carry anything around except a small light-weight handheld. Few will ever have need to make that device a "system controller". There have always been devices better suited for that than any handheld calculator ever made.

The HP-15C firmware mathematical function set is considerably more sophisticated and capable than that of the 41C. The kludge known as the 41C Advantage Module was a very poor attempt to provide some of the 15C's capability for the 41C. The almost universally acknowledged RPN high point, the 42S, overwhelms all mathematical function capability of all earlier *and later* RPN machines, while providing much more RAM and much greater speed, accuracy and precision in results compared to earlier models including the blessed 41C. Would it be unfair to mention also battery life? In fact the HP-41C did cripple the 42S in the sense that 42S firmware had to be designed to be compatible with the much less capable 41C.

So yes, I am familiar with the HP-41C system.

Sorry...it is certainly hyperbole to claim the the HP-41C series could do anything.

I started with the Thinkjet printer, not the thermal printer, but in the last 15 years have only used the bigger desk printers with my 41. I've also used the 80-column video monitor with it, but usually I have no need for much of a display. I recently bought the little thermal printer on TOS for $35 since it takes so little space on the workbench.

This 41cx was getting used for controlling a stack of automated test equipment in '86-'87, and I was taking it home at night for other work. It was nice that it was so much more portable than a laptop,

and faster to get programs going too. As far as execution speed goes, yes it was slow, but we replaced it with an HP-9000 series computer with a 68000 processor, and the speed was hardly double. Why? Because both controllers spent much of their time twiddling their thumbs waiting for filters to settle and readings to come back from the instruments.

> Quote:
>
> (Don't you love that charger plug door cover on the 41C...if one of the legs hasn't broken off and ruined it, just wait.)

The 41's battery life was too long to worry about using rechargeable batteries. Even when we were using it many hours a day in atomated testing, a set of alkalines went a few months. I've never used a card reader or bar-code wand. I have the tape drive but seldom used it, with the 41's extended and continuous memory which has never failed me.

> Quote:
>

IMO, style in general peaked about 1980 and has been going downhill ever since, whether it's calculators, toasters, stereos, or cars. At least HP realized that their chevron keyboard on the 49 (I think it was the 49) was a big mistake.

To be fair, Mike, I don't think anyone suggested they carried around any of the HPIL system. These were likely used in laboratory or office settings, and apparently by more than just a "vanishingly" small number of people, since there still seem to be a lot of these peripherals out there.

> Quote:

Maybe, but in its day, the 41 certainly had a huge following in many scientific, engineering, and other technical fields; hence the large number of peripherals and ROMs made for it. Someone must have put these to use, at least for a certain time period.

I missed that one the first time around. At the company where I got my start in automated testing in about 1985, we got an HP3421A data acquisition unit for evaluation, and set it up on one of the production workers' test benches for testing of VHF power transistors. I did the wiring to the power meters, RF relays, etc., and, since I didn't have my own 41 yet, had a friend who worked there come in with his, which he did very willingly since he was interested in it too, and in *20 minutes* of his lunch had the program written and working. A requisition was put in for the same equipment to automate the repetitive taking of data in the engineering lab, but the company said the 41 was too easy to steal, and approved an IBM PC and IEEE-488 card in stead. A few weeks after it was set up, the two engineers working with it were *still* having problems with the communication between the computer and the IEEE-488 card, and getting results that worked right.

I said in my previous post that at the next company I worked at, the 41 eventually got replaced with an HP-9000 68000-based computer which was made for such system control. What I neglected to say was that the 41 was easier there also for getting a program going.

If you wanted to write a test program, even to test only a few dozen of something and then dump the program, the 41 may have been the very easiest to get a program going on, in spite of lacking things like program structures.

I still have not found a calculator that replaces my 41. Yes it is slow by today's standards but...

```
1.  Easy to program
2.  Extensible
3.  All the memory you need for a keystroke programmable
3b. I have never run across a program that I would want to run on a calculator
that is too large for available memory (CV or CX)
4.  I/O so that I can save all those programs I write (and I have written
hundreds, perhaps thousands for the 41)
    offline and recover them in the event of a "MEMORY LOST" condition.  Try that
with the 15C or 42S.
5.  Use it in my astro classes one day and in my stats class or economics class
the next.  Just write a WALL card or file and
    switch out the machine's target functionality.  Again, try that on the 15C.
One could argue that the 42S with all it's
    memory can do both at the same time but lose that memory and you spend hours
recovering.
```

The 42S is a great machine but it is missing I/O and that has proven to be a deal breaker for me. The 15C still has mnemonic programming and therefor is somewhat harder to program. It also has less memory and also lacks I/O. The closest machine(s) to the 41 are the 48 series where they have all the power (and more) of the 41 as well as the I/O capabilities in regards to offline storage. The problem there is size and lack of portable offline storage (although I believe that there were some 3rd party portable solutions and you could always backup to a RAM card for some added security).

To sum it up, I still use a calculator almost daily and my calculator of choice (even after all these years) is still the HP-41.

Just my 0.02

Cheers,

-Marwan

Please, this is verging the hilarious.

- The 41 system was sold to (literally!) thousands of scientists and engineers who very well knew what they were doing. Facts before theory.

- The 15C was introduced LATER and (surprise) was way slower than the 41. Go and figure.

- If speed is the name of the game, then turn your attention to the 41CL and behold sheer amazing beauty.

-HP released the MCODE and specs way earlier than usual, where do you think all those 3rd. party accessories and peripheral came from? We're still waiting for the 42S or 48 internals to be released to the public, BTW.

Cheers, 'AM

Point taken. It's a shame it didn't have wider success then, a sign of the times it had to live in or perhaps due to its design choices (RPL et al) - we'd never know.

The truth is, few of the machines people rave about here have much value for me in an absolute sense. What you seem to be missing (or perhaps ignoring) is this is a calculator museum. I love the old machines out of nostalgia, appreciation of quality (power cover notwithstanding) and the thrill of squeezing remarkable feats out of ancient hardware and software. The HP-41 was an interesting and important milestone on the path to modern computers. It was also the device I first learned to program on. The fact that it got overtaken and surpassed doesn't affect my attitude about it in the least. I love that machine, and I'm thrilled that others who love it have been so productive in keeping it green over the years.

Others claim practical value in the pocket calculator format and I see no reason to doubt them. They have some very nice choices now, between old HP machines, newer HP models and the WP-34S. I own two of the latter, but I'm using them as fun techie toys. You may prefer Mathematica or Matlab, if your work involves obtuse mathematics on a daily or even occasional basis. I own the former, which I use - as a toy!

If you don't derive that sort of enjoyment from old machines, that's your privilege. But I get a little miffed when you try to disparage the machines that I love so well, based on feature lists and performance. I just think you are missing the point entirely.

6 years later? In 1985? What was there to challenge the HP-41 in 1985?

I would argue, as others have, that the 41 has never been bettered. Sure there are faster machines, and laptops, and mobile phones with calculator apps but is there a single device available today, or

at any time, that has the total capability of the 41 in an easily portable package? And even now, 32 years later, my HP-41 still does the job I need it for.

Just take the example of using the 41 as a instrumentation monitoring device. Sure you can setup your laptop to accomplish this but away from the office, away from a power source, that will last all of 3-8 hours depending on the laptop in question. An HP-41 can potentially run for days and weeks on a single set of batteries.

Cheers,

-Marwan

In addition to general use...

HP-41 was a critical back up computer during many space flights (used in space) for calculating mission critical paramaters in the event primary computers have failed. It was a handheld computer many scientist and engineers have bet their lives on (literaly). Can you think of another computer, you could bet your life on its accuracy, reliability and performance?

in response to message #1 by Michel Beaulieu

Okay,

Started with RPN so that is were this essay begins:

25-25C-41C-41CX-42S and now back to the 41C with the CL conversion.

lets say 'personal preference'. You start out with RPN (1975 for me)and it becomes familiar. As each RPN

generation comes to market you adapt your programs and continue.

Then comes the 41C, the ultimate, at the time, RPN machine. Yes, it ran HPIL and some of my lab equipment in the mid 80's. Mag cards, tape deck, floppy drive, plotter all in the era of the 8088. We had an 8088, never touched it, would have had to learn to do things differently while writing and researching and working. Besides the mainframe and the 41 performed flawlessly. Didn't need IO to the 8088 as I had back up galore.

Into the cockpit and it works wonderfully except for th dreaded ESD prevelant in the cockpit environment. Used it extensively in the cockpit from 1986 to 2009. Produced flight plans (1991) with it in Tapei when the typhoon grounded the flight planning computers. The F/O's laptop did not produce as accurate a flight plan as the 41 did.

In 2009 I went to the HCC2009 and was given a 42S. Wow, faster and just as easy to program EXCEPT for the lack of timing functions and a real time clock. All programs with minor rewrites worked. Never the less, once loaded and increased to 32K it worked with the IR printer but I was always concerned by a sudden 'Memory Loss' and all the work that would entail (14K of programs). So the 41CX was in the flight bag as backup.

Yes, I had a 48SX, 48G+, 48G and etc but I did not grow up with RPL. I did convert programs to RPL but was never happy with the learning curve (or my lack of ability ;-). On the other hand, had I never seen RPN and started with RPL as my first machine, then I may have another story.

Back to the 41CX, ALONG COMES MONTE with the 41CL and now the primary is the 41 again with a 42S backup. It has not suffered from ESD, nor Memory Loss at work. It is faster at some things then the 42S and as fast at others.

Here is a demo which I presented at HHC2011 showing an extended memory data base search comparison between the CL and the CX with identical 'calculator states':

cl versus cx

I guess my rambling can be condensed to this:

"You use what you are familiar with, be it the RPLs 48, 41, 50, 28 or the RPNs. For me it is the RPNs. And now with the CL board, speed is not a disability with the 41, nor is I/O or memory. I have four different fully loaded HP41CX's loaded into my single 41CL. I just switch from the Palynology computer to the flight computer with the execution of a short routine. I also have a PDA built into the memory.

I don't need graphing capability, or teaching tool and etc. It fulfils the need in the 21st century with the updated board and still works with the HPIL I have accumulated over the years.

Just saying!

Geoff

FWIW - km to miles conversion factor on a four-banger calculator

*Message #1 Posted by **Gerson W. Barbosa** on 17 Oct 2011, 7:37 p.m.*

...or when you HP lacks this conversion factor and you don't remember it (1.609344).

Enter 45 then press the SQRT key three times and *voilà*:

```
1.609353928
```

The error when converting the distance from the Earth to the Moon is than then one mile and a half.

When converting greater distances such as the Earth-Sun distance you might want to subtract 1/450 from 45 before extracting the eighth-root:

```
1.609343993
```

The error will be inferior to half a mile.

My 2 cents (every time someone uses this to convert km to miles :-)

Edited: 17 Oct 2011, 7:41 p.m.

Who wants centimeters when you can have an inch? Who wants kilometers when you can have mile? Who wants kilograms-force when you can have pound? Who wants kilograms when you can have slugs? Who wants deciliters when you can have cups? Who wants cubic decimeters when you can have pecks?

And finally, wouldn't you miss chains, rods, furlongs and leagues not necessarily in that order?

See what I mean :-)

Bill; did you realize that 10 chains equal one furlong? And that 100 links are one chain? We have the beginnings of a new metric here. All we need is something that's 6.6 feet (let's call that the basketball player), the 6,600' furlongic mile, and the micro-furlong for fine work.

We have surveyors, horse lovers, cricket players, and all those desirous of knowing just how big "hells half acre" really is - all firmly on our side. We can't loose.

It can't be any more contrived than the metric system.

I use the same factor and some tricks to convert between miles and Km in my head. Use these to make friends and get dates (well, make friends anyway... nerdly friends).

The trick is knowing that to get 0.6X you take half of X and add 1/10th X. So 0.6*52 = 26 + 5.2 = 31.2

mi->km: multiply by 1.6. So 52mi = 52+26+5.2 = 83km

km->mi: multiply by 0.6. So 52km = 31.2mi.

But I thought the definition of a four-banger was that it had only the primary four arithmetic operators. So, no square root key. :-)

About 100 lbs ago I used to run 5K and 10K races. So I always remembered 10K ~ 6.2M.

Yes but I recall there is also a clever iterative way to do square root approximations on a 4-banger. But I forget what the trick is.

And then it would have to be done 3 times. Sort of a mathematical Rube Goldberg process I suppose.

4 years and 15 kg ago I ran 2400 meters in 10m53s in a proof I had to run the distance in 11m03s at most for a perfect score. I never asked myself why exactly 2400 meters, but I realize now this is approximately one and a half mile.

Clever. In testing the conversion accuracy just for fun) with a relatively large number the nearest calculator I had to hand was a HP39gs and in running the conversion I was reminded that HP got the conversions backwards on that machine. ->MILE converts *FROM* miles to KM and ->KM converts *FROM* KM to Miles.

ROM Version 2.22.

Cheers,

-Marwan

in response to message #1 by Gerson W. Barbosa

It may seem like the long way, but the only distance conversion I've successfully commited to memory is 25.4mm=1 Inch. Being a definition, it is exact. From there, any four banger can get my any conversion I need in just a couple of steps.

Ciao Cristian,

My definition of "four-banger calculator" matches the one I've found here:

"a calculator that only does addition, subtraction, multiplication and division – sometimes with square root and percent keys added for good measure."

The greek word for table is *trapezi* (in a loose transliteration), which originally implied a "four-footed" furniture. Tables now have three, two or even only one foot, yet in Greece they keep on calling it *trapezi* :-)

*Message #33 Posted by **Jeff Kearns** on 19 Oct 2011, 10:30 a.m.,*
in response to message #1 by Gerson W. Barbosa

As a Canadian engineer raised in both English and SI/Metric systems, I find this post at once funny and coincidentally of interest.

Funny: Upon reading the post, I wondered why one would one bother remembering such complicated numbers when the 'standard' to use is 1 in equals 25.4 mm? It is easy to remember and a breeze to use on a 4-banger.

Interesting: Shortly after reading this post yesterday, I saw an el-cheapo 'scientific 180 function' calculator for $1.50 at Giant Tiger that had the conversion factors listed on the inside cover of the calculator. It said 1 in = 2.53995 cm (or something close to that...). I bought the calculator for my 7 year old and ended up getting if for free as they overcharged me by 100% at the check-out...

I have since researched the conversion factors and cannot find any reference to this bizarre conversion. Any thoughts on this? I do not have the calculator with me.

> Quote:
>
> 1 in = 2.53995 cm (or something close to that...)

You have a good memory! That's the same number that appears here and elsewhere.

The exact 2.54 conversion factor derives from the international yard, defined in 1959 as 0.9144 meters (0.9144/36 = 0.0254).

According to Wikipedia, the new international foot *"was 2 ppm shorter than the previous U.S definition and 1.7 ppm longer than the previous British definition."* However 2.54 cm is about 20 ppm *longer* than 2.5399 cm, a mistake perhaps.

I wonder if this relates in any way to the "survey foot" ?

And didn't there used to be some sort of abstruse issue with ml not equaling cubiccentimeters?

Re: FWIW - km to miles conversion factor on a four-banger calculator

*Message #38 Posted by **Martin Pinckney** on 19 Oct 2011, 3:49 p.m.,*
in response to message #37 by bill platt

Yes. The U.S. Survey Foot was based on the old definition of the meter. So when the meter definition changed, two foot definitions were needed, else all the existing base of survey work would be off.

41CL and PPC ROM

*Message #1 Posted by **Gerry Schultz** on 17 Oct 2011, 7:27 p.m.*

During the HHC2011 conference, Richard talked about the PPC ROM and what it took to get it out the door. I was a member of the PPC during that time and I remember that there were some minor bugs in the PPC ROM discovered after the ROM mask was made. Since it's now a part of the 41CL, has the PPC ROM image been patched so those bugs are no longer there? I don't remember if any subsequent 41C apps were written that depended upon the PPC bugs.

Which brings up my second question. Have the ROM images loaded into the 41CL been corrected for known bugs so that it's actually better to have the 41CL than the original ROM plug-in modules?

Gerry

Re: 41CL and PPC ROM

*Message #2 Posted by **Monte Dalrymple** on 17 Oct 2011, 7:39 p.m.,*
in response to message #1 by Gerry Schultz

I did not do any editing. But it is easy to patch things in
Flash. Beta users had to patch the CL Extra Functions several
times before everything was working right.

Monte

PPC ROM bugs?

*Message #3 Posted by **gene wright** on 17 Oct 2011, 7:53 p.m.,*
in response to message #2 by Monte Dalrymple

The *only* bug of which I was ever aware was in the BE Block Exchange routine. It ended a loop with a GTO BE global label call rather than a GTO local label number. This slowed down the exchange routine, but did not affect results.

I am not aware of *any* other bugs.

Anyone have some? :-)

Re: 41CL and PPC ROM

*Message #4 Posted by **Eric Smith** on 18 Oct 2011, 1:13 a.m.,*
in response to message #1 by Gerry Schultz

Not bugs per se, but there are problems with some of the routines if you have any "buffers" in the memory. This most commonly case occurs when using Time Module/41CX alarms, which are stored in a buffer. The buffers occupy registers just below the key assignments, and synthetic programs (including those in the PPC ROM) that manipulate the key assignments or program memory may corrupt the buffers leading to lost data or

crashes.

The reason I say that these aren't bugs is that the PPC ROM was written before there were any ROMs available that used buffers, so there was no way for the programmers to know that there would be a problem.

This is an example of why HP said that if PPC put synthetics in the ROM, that HP would not accept any responsibility for the results.

Re: 41CL and PPC ROM

*Message #5 Posted by **Ángel Martin** on 18 Oct 2011, 2:13 a.m.,*
in response to message #1 by Gerry Schultz

As much as I love the PPC ROM (being an active PPC member during its gestation I lived all the excitement) I must say it's been superseded by more capable and vastly more interesting modules. Consider for instance the CCD Module and the HEPAX - both monumental and trend-setting.

Some others also added excellent contributions to the "state of the art" back them (and even now).- think of the ground-breaking AECROM, the ZENROM and ZENROM Programmer, etc. The expandability of the 41 series matched with the ability to program MCODE made all the difference to me.

Easy to say for somebody still making new ones :-)

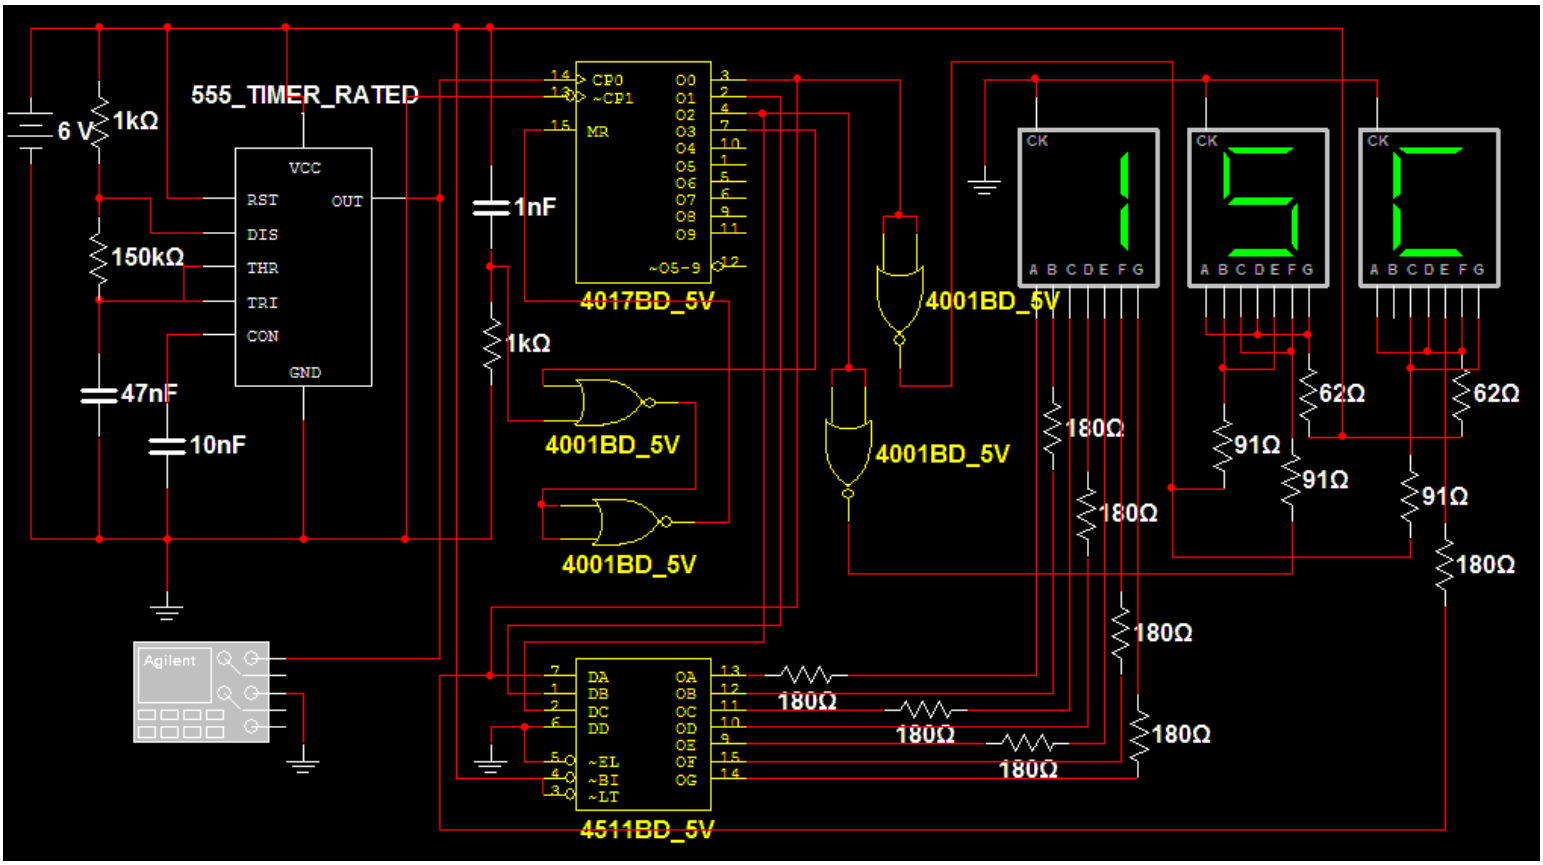
A simple (and useless) digital circuit for the fans of the HP-15C (and two other HP calculators)

*Message #1 Posted by **Gerson W. Barbosa** on 17 Oct 2011, 4:37 p.m.*

I'm back to school for lack of something better to do (I'd rather be vacationing in southern France or Tuscany :). Lots of things have changed: one of my classmates in 1986 and 1987 is now my professor of Digital Electronics, for instance, and back then we used DOS PSpice :-)

After finishing my homework exercises on digital counters I decided to design a counter to cycle through the names of my first, second and third HP calculator. My first idea was doing it with three synchronous counters, for the two digits and characters. When I was done with the first one I realized a Johnson counter would do the job more nicely. Also, the second digits and characters could be easily derived from the first digit.

My first calculator was an HP-15C, as displayed. An easy question for those in the field: what were my second and third HP calculators? Comments and improvement suggestions welcome.



Notes:

1) The 47 nF capacitor should be replaced with a 4.7 uF in the real circuit so that the clock frequency is around 1 Hz;

2) The Agilent multimeter is optional :-)

Re: A simple (and useless) digital circuit for the fans of the HP-15C (and two other HP calculators)

*Message #2 Posted by **Monte Dalrymple** on 17 Oct 2011, 4:58 p.m.,*
in response to message #1 by Gerson W. Barbosa

15C, 22S, 48S ?

Re: A simple (and useless) digital circuit for the fans of the HP-15C (and two other HP calculators)

*Message #3 Posted by **Gerson W. Barbosa** on 17 Oct 2011, 5:14 p.m.,*
in response to message #2 by Monte Dalrymple

Almost: 15C, 2?S, 4?S.

Regards,

Gerson.

When the first digit is 4 the 4017 output O2 is high, low after the inverter, which means the segments "c" and "f" in the second display are not lit. Therefore it cannot display an "8".

Have you popped it apart yet? Just curious if it has metal vs. the econo elastomer domes. If the former it may be useful for repair parts in a pinch.

I'd hazard this is a functional work-alike and not "leveraging" legacy firmware? I'm curious in either case what the speed comparison is relative to a legacy 12C. Also whether the choice of 2x AA cells was a concession to convenience or a design necessity.

Re: Am I a bad person ?

*Message #4 Posted by **Michael de Estrada** on 17 Oct 2011, 2:15 p.m.,*
in response to message #3 by uhmgawa

I don't have it yet. I don't think it has clicky keys. It uses 2 x AAA, not 2 x AA.

I'd agree.

Yet if it has flash resident firmware (doubtful) and a full voyager set of annunciators (?) it might be worth a swat to

determine weather it could be repurposed. Although that may be overly optimistic.

I don't think so - I have been curious about this clone myself. $15 though?

Re: Am I a bad person ?

*Message #15 Posted by **Michael de Estrada** on 18 Oct 2011, 9:37 a.m.,*
in response to message #14 by Eddie W. Shore

$14.98, actually. Victor V12

Re: Am I a bad person ?

*Message #16 Posted by **Katie Wasserman** on 18 Oct 2011, 10:56 a.m.,*
in response to message #15 by Michael de Estrada

If you want a disposable 12C clone, get a Compucessory 28956. They're all over the internet usually for around $10.

While the Compucessary is smaller, the Victor V12 is much more usable. The programing codes on the Compucessary make no sense becasue they ripped off the firmware and permuted the rows and columns of the keys.

Re: Am I a bad person ?

*Message #17 Posted by **M. Joury** on 18 Oct 2011, 11:26 a.m.,*
in response to message #16 by Katie Wasserman

LOL! How the heck are you supposed to read a program? Writing one may be possible but editing it a month later would prove...

Cheers,

-Marwan

Re: Am I a bad person ?

*Message #18 Posted by **Bruce Bergman** on 18 Oct 2011, 11:43 a.m.,*
in response to message #16 by Katie Wasserman

In fact, the only things good about the Compucessory are it's size (very small and flat) and the little slidey keyboard cover. ;-)

I tried one of these too, and just like Katie said, it's all wonky. The keys are moved around in different places, the colors suck, the labels are small, etc. BUT, it does do RPN and have a good pile of basic HP-like calculator functionality.

I keep that one in a folio binder because it's very small.

The Victor is much bigger (um, maybe twice as big), but has a really nice angled display. My wife actually like that quite a bit.

Thanks, Bruce

Re: Am I a bad person ?

*Message #19 Posted by **Bart (UK)** on 19 Oct 2011, 6:05 a.m.,*
in response to message #18 by Bruce Bergman

> Quote:
>
> In fact, the only things good about the Compucessory are it's size (very small and flat) and the little slidey keyboard cover. ;-)

And it has the parenthesis for ALG mode (above the X->M and M->X keys which I presume are the equivalent of STO and RCL). So where the Victor rips-off the fist 12C Paltinum (all silver), this one actually rips off the current Platinum?

Re: Am I a bad person ?

*Message #20 Posted by **Michael de Estrada** on 19 Oct 2011, 8:43 a.m.,*
in response to message #19 by Bart (UK)

I think the Compucessory "rips off" the original 12C, not the Platinum 12CP.

Re: Am I a bad person ?

*Message #21 Posted by **Bart (UK)** on 19 Oct 2011, 9:13 a.m.,*
in response to message #20 by Michael de Estrada

Ah, the original 12C does not have Algebraic mode ;-)

Re: Am I a bad person ?

*Message #22 Posted by **Michael de Estrada** on 19 Oct 2011, 9:32 a.m.,*
in response to message #21 by Bart (UK)

I looked up its specs, and the Compucessory has 99 programming steps, same as the original 12C, whereas the 12CP has 400 steps. Maybe the () are there just for decoration.

Re: Compucessoy 28956- Katie or Bruce can you shed some light on this?

*Message #23 Posted by **Bart (UK)** on 19 Oct 2011, 9:45 a.m.,*
in response to message #22 by Michael de Estrada

Interesting, it has blue shifted "RPN" and "ALG" above the "+/-" and "EXP" keys respectively - and other shifted symbols that are only on the 12C Platinum.
The specs (even on the Compucessory site) are very meagre.

As Katie and Bruce have already used one, perhaps they can shed some light on it?

Re: Compucessoy 28956- Katie or Bruce can you shed some light on this?

*Message #24 Posted by **Katie Wasserman** on 19 Oct 2011, 10:59 a.m.,*
in response to message #23 by Bart (UK)

The Compucessory adds a margin calculation function (COST/SELL/MGN) so it's not just stolen firmware. Its manual leaves out a lot of the functionality that's actually in the calculator. It's a really weird 'thing' that seems to be based on stolen 12CP source code.

They all share a common date arithmetic bug that HP introduced with the 38C/E, which is a pretty interesting tracer for common code somewhere. I'm about to write that up in a new Forum post.

Re: Compucessoy 28956- Katie or Bruce can you shed some light on this?

*Message #25 Posted by **Michael de Estrada** on 19 Oct 2011, 11:11 a.m.,*
in response to message #24 by Katie Wasserman

So, does it have 400 programming steps like the 12CP, or just 99 like the original 12C ?

Re: Compucessoy 28956- Katie or Bruce can you shed some light on this?

*Message #26 Posted by **Katie Wasserman** on 19 Oct 2011, 11:35 a.m.,*
in response to message #25 by Michael de Estrada

It's got 400 steps but only 31 cash flow registers, so it's likely based on the early model 12CP source code.

Re: Compucessoy 28956- Katie or Bruce can you shed some light on this?

*Message #27 Posted by **Bart (UK)** on 19 Oct 2011, 11:47 a.m.,*
in response to message #26 by Katie Wasserman

Which raises the question: Do the parenthesis work? (I tried on a silver 12CP and it definitely is not in the code either - i.e. it's not just an omission on the keyboard).

Re: Compucessoy 28956- Katie or Bruce can you shed some light on this?

*Message #28 Posted by **Katie Wasserman** on 19 Oct 2011, 7:34 p.m.,*
in response to message #27 by Bart (UK)

The parenthesis definitely work on the 12CP 25th AE, up to 13 levels deep. You have an early edition 12CP the one with 31 cash flows, I think. I don't have a Compucessory with me so can't check if they are working on that machine, but I think that they do. Bruce do you know?

Re: Compucessoy 28956- Katie or Bruce can you shed some light on this?

*Message #29 Posted by **Bart (UK)** on 20 Oct 2011, 4:58 a.m.,*
in response to message #28 by Katie Wasserman

The 12CP I am talking about is the first release with the silver keyboard faceplate (here is the one I have). These do not have the parenthesis printed on the keyboard.

As far as I am aware, the 25th AE and all dark keyboard faceplate 12CP have parenthesis on the STO & RCL keys.

Thus if the V12 does not have the parenthesis, it is equivalent to that first release 12CP. The question is whether the Compucessory is equivalent to the early or later 12CP. If it has the parenthesis merely printed on but not working it would be an earlier 12CP (silver key faceplate 12CP), otherwise a later (dark key faceplate) 12CP.

Edited: 20 Oct 2011, 5:06 a.m.

$10 but with $5 to $10 shipping it seems...

*Message #30 Posted by **gene wright** on 18 Oct 2011, 12:24 p.m.,*
in response to message #16 by Katie Wasserman

Haven't found one for $10-12 shipped yet. Katie, have any good leads?

in response to message #1 by Michael de Estrada

> Quote:
>
> Am I a bad person ?

Well, let's consider the fact that you purchased a calculator with an algebraic mode **that does not have parenthesis*!***.

Of course, as an RPN user you wouldn't even notice this - or probably not even care. ;-)

Re: Am I a bad person ?
*Message #35 Posted by **Michael de Estrada** on 18 Oct 2011, 11:34 a.m.,*
in response to message #34 by Bart (UK)

Heck, it doesn't even have an = sign. :)

Re: Am I a bad person ?
*Message #36 Posted by **Miguel Toro** on 18 Oct 2011, 11:46 a.m.,*
in response to message #35 by Michael de Estrada

It has, barely visible on the Enter key. It is a red key, so really dangerous :-)

Re: Am I a bad person ?
*Message #37 Posted by **Paul Gaster** on 18 Oct 2011, 12:13 p.m.,*
in response to message #34 by Bart (UK)

The first 12C Platinum, which added algebraic, did not have parenthesis either. These guys must have ripped off that design then never bothered to update it. Or maybe HP plugged the leak.

Edited: 18 Oct 2011, 12:14 p.m.

I just received a Victor V12
*Message #38 Posted by **Michael de Estrada** on 19 Oct 2011, 3:22 p.m.,*
in response to message #1 by Michael de Estrada

I just received the Victor V12 that I ordered last Sunday for $14.98 shipped, and it's brand new in its sealed package. There is no serial number that I can find so I have no idea when it was actually manufactured. It's pretty impressive for the price, decent contrast adjustable display and semi-clicky but very positive keys. I comes with a very nice magnetic clasp case and readable printed Owners Guide. The 2 x AAA batteries were not installed, so they were nice and fresh. Overall quality seems very good, the battery door fits tight and the calc sits evenly on its 4 rubber feet. It fired up in RPN mode and everything seems to work like it should. At this price I'm thinking of picking up another to keep as a spare.

Re: Am I a bad person ?

*Message #39 Posted by **Eddie W. Shore** on 19 Oct 2011, 11:20 p.m.,*
in response to message #1 by Michael de Estrada

OK, the curiousity got me - I got a Victor 12C today. It is my first non-HP RPN calculator. I'm curious to find out how good it is against the real thing.

Victor V12 x 2

*Message #40 Posted by **Michael de Estrada** on 20 Oct 2011, 11:53 p.m.,*
in response to message #39 by Eddie W. Shore

I just bought my second Victor V12 for just $14.98 shipped. How can you beat this for the cheapest RPN programmable calculator with a good keyboard and display ? And it even comes with a really nice magnetic clasp carry case.

Problems with International Shipping of HP15c LE

*Message #1 Posted by **Nick_S** on 17 Oct 2011, 11:15 a.m.*

Hi

I just joined the MoHPC forum having been reading the entries here for a while. Based in Athens, Greece, I currently use HP28S and HP48GX calculators which I have owned since new.

I thought I would purchase a couple of HP15c LE calculators, while they are available, as a portable carry around calculator and to have a slice of calculator history. So I placed an order with Samson Cables and watched them slowly make their way to Europe. Unfortunately things seem to have gone wrong along the way. Why the package ended up in French Customs (via New Caledonia) when I live in Greece is an enigma to me. It now appears to have turned around and is returning to the USA. I have contacted Samson Cables to see what they can do.

Here is the track and trace information for the USPS Express Mail International delivery:

-Addressee cannot be located, Item returned to sender, October 17, 2011, 11:18 am, FRANCE

-Customs Clearance, October 13, 2011, 10:51 am, FRANCE

-Customs Clearance, October 10, 2011, 11:35 am, FRANCE

-Processed Through Sort Facility, October 10, 2011, 11:33 am, FRANCE

-Processed Through Sort Facility, October 06, 2011, 10:50 am, NEW CALEDONIA

-Processed Through Sort Facility, September 27, 2011, 9:33 pm, ISC SAN FRANCISCO (USPS)

-Arrived at Sort Facility, September 27, 2011, 9:32 pm, ISC SAN FRANCISCO (USPS)

-Electronic Shipping Info Received, September 27, 2011

-Processed through USPS Sort Facility, September 26, 2011, 9:05 pm, SALT LAKE CITY, UT 84199

-Acceptance, September 26, 2011, 5:24 pm, DRAPER, UT 84020

The USPS seem to have messed up here.

Nick

Re: Problems with International shipping of HP15c LE

*Message #2 Posted by **Eric Rechlin** on 17 Oct 2011, 11:23 a.m.,*
in response to message #1 by Nick_S

I've noticed a definite degradation in service with the USPS lately.

I mailed two packages to Norway by Priority Mail on the same day in early September. One arrived in 10 days, which is pretty much normal. The other took a full month to arrive, spending 2 weeks sitting in Chicago.

As some of you know, the package containing the DVDs to be distributed at the HHC conference was mailed from Chicago by Priority Mail, and instead of the 2 days that would be expected (3 at worst), it took a full 7 days to arrive.

Also, some domestic letters addressed perfectly have come back marked as having an invalid address, yet sending them again causes them to go through, so there seems to be some laziness on the part of the delivery people too.

This is what happens when Congress mandates a certain level of service out of the USPS (visiting every single address in the country, six days a week) while at the same time preventing them from raising rates enough to cover costs.

Eric

*Message #3 Posted by **Paul Gaster** on 17 Oct 2011, 11:38 a.m.,*
in response to message #2 by Eric Rechlin

I live in a suburb of Chicago and agree on the degradation in service. My home mail used to be delivered roughly between 12 and 2 pm, but 2 weeks ago I saw a new mail delivery person delivering at 8 pm. Another night it was after 7 pm. They seemed to have changed all the routes and the people around. I do not know exactly what is going on but things seemed to have gone drastically downhill.

Re: Problems with International Shipping of HP15c LE

*Message #4 Posted by **Thomas Radtke** on 17 Oct 2011, 12:36 p.m.,*
in response to message #1 by Nick_S

Simple explanation: The tracking number doesn't belong to your parcel.

Another one: A french investment bank has bought Greece.

Best bet: SC mixed up your address.

Either way you'll get it - sooner or later.

Re: Problems with International Shipping of HP15c LE

*Message #5 Posted by **Martin Pinckney** on 17 Oct 2011, 1:54 p.m.,*
in response to message #1 by Nick_S

Back in the day (early 1960s, latest) my father used to get mail addressed only with his name and city, state. No street, no number, no zip.

Now if the 5-digit zip is off on the last digit only, it will get returned.

Re: Problems with International Shipping of HP15c LE

*Message #6 Posted by **Dave Shaffer (Arizona)** on 17 Oct 2011, 3:55 p.m.,*

> Back in the day (early 1960s, latest) my father used to get mail addressed only with his name and city, state. No street, no number, no zip

In the 60's, I could get mail delivered with only my ham call and ZIP:

K3NXO 16652

would get to me.

I had forwarned the local PO though!

Other than perhaps Santa Claus ("North Pole") or the "White House", I don't think you can do much better.

Re: Problems with International Shipping of HP15c LE

*Message #7 Posted by **Eric Rechlin** on 17 Oct 2011, 6:04 p.m.,*
in response to message #5 by Martin Pinckney

Actually about a year ago I got a package where the sender had the wrong ZIP code, spelled the city wrong, and had the wrong street address, and it still got to me on time. I was astonished. So sometimes the USPS does seem to care.

Another time, about 10 years ago, I got a magazine where the address label had been nearly completely torn off, showing only the following:

```
ERIC REC
6330 MAI
HOUSTON
```

Most impressive was that >200 people shared that address.

I think it's only been this year that the USPS has gone downhill. One of the clerks at my post office has expressed her exasperation to me (I've helped her out in the past, repairing their calculators and stuff). It's pretty sad what's going on there now.

Eric

*Message #9 Posted by **Gerson W. Barbosa** on 17 Oct 2011, 6:18 p.m.,*
in response to message #1 by Nick_S

Once in a while they make mistakes, reversible mistakes though. Early this year I ordered a Foxconn motherboard from China. I live in Curitiba, Brazil, in a neighborhood called São Francisco. When tracking the item I noticed the item ended up going to San Francisco California. The seller called USPS and it eventually arrived at my door one week later. My three HP-15C LE's haven't arrived yet. Last time I checked they were in São Paulo, waiting to be taxed.

Good luck!

Gerson.

Wow, the posts and threads are really moving fast these days.

Turns out this has been posted at least a couple of times already.

I recently posted a photo of my original 15c and 15c LE together. In the photo the display shows the results after running the [ON] [÷] keyboard tests on each unit. Guess even that photo got bumped to the archive already.

Thanks for posting again though, it is real easy to miss a post or even a whole thread these days.

OT weird cursor behavior

*Message #1 Posted by **Martin Pinckney** on 16 Oct 2011, 11:03 p.m.*

I asked this question before, and no one seemed to know the answer. Its driving me crazy. My cursor jumps around the page as I type, resulting in a mish-mash of mixed-up words. It's getting worse. I can't type a complete sentence now without a problem.

It happens in any program when editing text, but it seems to be worse when on line. Sometimes when typing an email or a post on this forum, a whole section of text gets highlighted on its own, then, not watching the screen, I replace it with new text. When I see what has happened, then I have to UNDO and try again.

Any ideas from you computer geeks?

Re: OT weird cursor behavior

*Message #2 Posted by **Paul Berger (Canada)** on 16 Oct 2011, 11:23 p.m.,*
in response to message #1 by Martin Pinckney

Well for starters what kind of computer? and what OS? How is the keyboard connected? wired? wireless? Do you have some alternate OS you could boot on the system to isolate if it is a hardware or a software issue? For example if you are using a x86 windows compatable system you could download and burn a linux CD Kanoppix that is designed to run off the CD and see if the behaviour is the same there.

Re: OT weird cursor behavior

*Message #3 Posted by **Lincoln R.** on 16 Oct 2011, 11:23 p.m.,*
in response to message #1 by Martin Pinckney

This is a really obvious one, but if you're on a laptop, make sure part of your hand isn't hitting the track pad. If you're on a desktop I'd suspect a faulty mouse.

Re: OT weird cursor behavior

*Message #4 Posted by **kc** on 16 Oct 2011, 11:33 p.m.,*
in response to message #3 by Lincoln R.

Yes, I happened to have similar problem with my newly bought notebook, only to find out later that it was my hand that got in touch with the track-pad while typing. Trivial problem, but real.
kc

Re: OT weird cursor behavior

*Message #5 Posted by **Bart (UK)** on 17 Oct 2011, 5:11 a.m.,*
in response to message #4 by kc

I hate touchpads, worst invention ever in my opinion. Cost me many hours of wotk. I now always attach a mouse.

Re: OT weird cursor behavior

*Message #6 Posted by **Eric Smith** on 17 Oct 2011, 5:30 a.m.,*
in response to message #5 by Bart (UK)

Some notebooks provide a button to toggle the touchpad on and off, so that you can disable it when using an external mouse. Sadly, the one I have does not, so I still have to live with the cursor jumping away if I get my thumbs or palms too close to the touchpad while typing.

Re: OT weird cursor behavior

*Message #7 Posted by **Paul Berger (Canada)** on 17 Oct 2011, 6:34 a.m.,*
in response to message #6 by Eric Smith

My Lenovo laptop has a utility to enable or disable the entire trackpad or just certain features of it. I do use the trackpad but dislike the tapping and scrolling "features" so I turn them off however periodically I discover that they get re-enabled some how.

Re: OT weird cursor behavior

*Message #8 Posted by **Katie Wasserman** on 16 Oct 2011, 11:24 p.m.,*
in response to message #1 by Martin Pinckney

Do you have a wireless keyboard and/or mouse?

If so, something is interfering with it or the battery is low. Try a new battery and if that doens't help move the USB wireless receiver to a different USB port as far from the old one as possible.

If you have a wired keyboard/mouse and this is happening you might have a virus or a broken keyboard or mouse.

Re: OT weird cursor behavior

*Message #9 Posted by **Dave Shaffer (Arizona)** on 16 Oct 2011, 11:30 p.m.,*
in response to message #1 by Martin Pinckney

Could it be your computer (in particular the keyboard/mouse)?

Does it happen if you try different PCs?

When I type on one of my my laptops, I have to be very careful to not let my palm brush the "mouse" touchpad. Otherwise, the cursor can indeed go far astray - and if I am not watching, I start typing somewhere else.

Re: OT weird cursor behavior

*Message #10 Posted by **Martin Pinckney** on 17 Oct 2011, 10:49 a.m.,*
in response to message #1 by Martin Pinckney

Sorry, I should have given more information. It's a tablet PC (HP, of course). Actually, I think generically they are called convertible, since the screen pivots so you can use it like a regular laptop, or folded like a tablet. Windows 7 Pro 32 bit. I don't use the touchpad, I use a Microsoft notebook optical mouse.

I wondered about the touchpad, but if I'm just typing, the mouse cursor is independent from the text cursor, so I am at a loss how that could be the problem.

Edited: 17 Oct 2011, 10:50 a.m.

Re: OT weird cursor behavior

*Message #11 Posted by **Paul Berger (Canada)** on 17 Oct 2011, 10:54 a.m.,*
in response to message #10 by Martin Pinckney

Well typical touchpad operation allow for moving the mouse pointer and also simulation of mouse buttons sometimes referred to as tapping, if that is enabled then it could easily move the mouse pointer and then effectively click elsewhere which i believe would move your text cursor, and could even have the same effect as click and drag. I would look in the windows setting for something to completely disable the track pad if you don't use it or at least to turn off tapping. If it is anything like the track pad on my Lenovo laptop it will also have physical buttons that you may also be inadvertently hitting.

Different keyboards on ARM 12c

*Message #1 Posted by **Jose Gonzalez Divasson** on 16 Oct 2011, 4:24 p.m.*

It seems that there are variations on the HP12c keyboard (ARM version). Does anybody have some information on it?

HP12c keyboard variations

One of my customers claims there are clear differences when it comes to key feel and key registration - so far I have not been able to find any. If anything, numbers are bigger and sharper.

The new Anniversary comes with the previous type of keyboard.

Re: Different keyboards on ARM 12c

*Message #2 Posted by **bill platt** on 16 Oct 2011, 5:46 p.m.,*
in response to message #1 by Jose Gonzalez Divasson

Wow, the text is different!

Re: Different keyboards on ARM 12c

*Message #3 Posted by **Paulo MO** on 16 Oct 2011, 6:14 p.m.,*
in response to message #1 by Jose Gonzalez Divasson

I can tell you this: Your customer's info is probably right. I just bought a new 12c+, and a 15C LE. They are supposed to have the same hardware, and, hence the same keyboard feel. Not so, by a long shot. The 15c LE keyboard is much harder and more precise. The 12c+ keyboard is much softer (even though not mushy). Additionally, is has receding keys and a defective Enter key (I'm now having the calculator replaced). The key print is exactly the same you have on the picture (the "new", "sub-par", one).

Different factory? Different assembly line? Different dome materials? I don't know. But I know this: different ball game.

Paulo

Re: Different keyboards on ARM 12c

*Message #4 Posted by **Jeff O.** on 16 Oct 2011, 7:19 p.m.,*
in response to message #3 by Paulo MO

I believe that the first 3 characters of the serial number denote the factory of manufacture (country also, but that is China in all cases.) So the calculators pictured were made in different factories, 4CY vs. CNA. My 15c LE was made in the CNA factory. Where was your 12c+ made?

Re: Different keyboards on ARM 12c

*Message #5 Posted by **Lincoln R.** on 16 Oct 2011, 9:19 p.m.,*
in response to message #4 by Jeff O.

Yes, 4CY is a different factory. I do not work for HP or either of these companies, so I am not 100% sure, but I believe that 4CY == Inventec Appliance, and CNA == Kinpo Electronics.

We know HP uses both of these manufacturers (They've admitted to using Kinpo, and some of the PDFs in the 20b SDK had engineering drawings by Inventec).

My reasoning for believing this mapping of serial number to manufacturer is as follows:

We know that Kinpo made the HP-35s, and the 35S has a "Regulatory Model Number" molded into the back that reads HSTNJ-KN01, and a serial number beginning with CNA.

My 30b has a serial number beginning with 4CY and a "Regulatory Model Number" of HSTNJ-IN07. My 12c+ looks like the 'unexpected' one and has a 4CY serial number, regulatory model number HSTNJ-IN04. Also, the 30b and 12c+ serial number stickers are the same color and same font.

My 15C LE has a CNA serial number and model number HSTNJ-KN13. Its' serial number sticker doesn't match the 30b or 12c+ ones.

And sure enough, if you look at the picture of the backs of the two 12c+es, you'll notice "HSTNJ-IN04" underneath the multilingual "Product of China" on the 4CY one, and "HSTNJ-KN05" underneath "Product of China" on the CNA one.

Re: Different keyboards on ARM 12c

*Message #6 Posted by **Miguel Toro** on 17 Oct 2011, 10:55 a.m.,*
in response to message #5 by Lincoln R.

Really interesting,

So, there are two different manufacturers for the 12c+. Is it the same for the 15C LE? Is there any non Kimpo 15C LE?

Mine is CNA13208LC and a "Regulatory Model Number" of HSTNJ-KN13, therefore a Kimpo with the two bad keys [10^x] and [GSB] that, by the way, seem to be really improving little by little with usage.

Regards,

Miguel

Re: Different keyboards on ARM 12c

*Message #7 Posted by **Paulo MO** on 17 Oct 2011, 1:52 p.m.,*
in response to message #4 by Jeff O.

My "sub-par" 12c+ (I love the use of "sub-par", when referring to a less than good financial calculator ;-)) is also a 4CY. Hence, and trying to apply a little bit of abductive reasoning (even though three or four cases are not a sufficient basis for statistical inference), it would seem that:

1. CNA is producing keyboards which are hard and precise.

2. 4CY produces keyboards with lower overall quality.

3. Both 4CY and CNA produce keyboards with ocasional bad keys (eventually at a more than acceptable rate - see the 15c LEs).

Care to build statistics to verify the hypothesis? ;-)

The ISENE.ROM

*Message #1 Posted by **Geir Isene** on 16 Oct 2011, 1:12 p.m.*

As mentioned a week ago, it is now very easy to create FOCAL rom images. With HEPAX in an HP-41CL or an HP-41 with a NoV module, you can now create your FOCAL roms with ease. Transfer the image with Juergen Keller's recipe .

First ROM out is my own - a collection of my FOCAL programs in a 4K module image.

From the UC-41 page:

"The most useful of my FOCAL programs below is now contained in one 4K ROM image - the ISENE.ROM. Here you will find the Ultimate Alarm Clock, the PDA programs NOTES and REM as well as CRYPT to encrypt and decrypt ascii files and other neat stuff for your HP-41.

Download the ISENE.ROM and the detailed manual."

Testing reports are highly appreciated.

Re: The ISENE.ROM

*Message #2 Posted by **Ángel Martin** on 16 Oct 2011, 2:48 p.m.,*
in response to message #1 by Geir Isene

nice! The avalanche has begun :-)

What about your enhanced Curve Fitting maisterwerk?

Re: The ISENE.ROM

*Message #3 Posted by **Geir Isene** on 16 Oct 2011, 4:29 p.m.,*
in response to message #2 by Ángel Martin

Yes - the curve fitting on steroids will show up later.

Re: The ISENE.ROM

*Message #4 Posted by **Ángel Martin** on 16 Oct 2011, 2:50 p.m.,*
in response to message #1 by Geir Isene

BTW, the CharterBT-Roman font doesn't seem to be available in the standard adobe setup, so there are some lines illegible (table of contents, etc.)

Re: The ISENE.ROM

*Message #5 Posted by **Geir Isene** on 16 Oct 2011, 4:13 p.m.,*
in response to message #4 by Ángel Martin

Thanks - fixed.

Nice to have you guys in my corner to correct things :)

Re: The ISENE.ROM

*Message #6 Posted by **Ángel Martin** on 17 Oct 2011, 1:15 a.m.,*
in response to message #5 by Geir Isene

Looking much better, thanks. Still the LIBHPX section contains the non-standard font, sure you can also change that.

Re: The ISENE.ROM

*Message #7 Posted by **Geir Isene** on 17 Oct 2011, 6:01 a.m.,*
in response to message #6 by Ángel Martin

Fixed.

Re: The ISENE.ROM

*Message #8 Posted by **Geir Isene** on 16 Oct 2011, 4:22 p.m.,*
in response to message #1 by Geir Isene

BTW - here's how it's done:

1. Initialize HEPAX on the CL (via the HEPCL function in CLUTILS) or use a NoV module (Diego's marvel)
2. Save the programs you want in your module (HSAVEP) in the sequence you want them to appear in the module (make a short "Header program" as the first in the list - this will show up as the "name" of your module in CAT2)
3. Use BLCAT (from CLUTILS) or similar function to check when your saved programs goes past the first 4K of HEPAX RAM
4. When you are satisfied with your new FOCAL rom, edit a few addresses in the ROM:
5. Write h300 to XFF3 (where X is the page number where your HEPAX RAM/module is located) and h000 to XFE7 and XFE8 - this signifies that this is no longer a HEPAX RAM block.
6. Go to X000 and write any number from h001 to h01F as the XROM number you want for your new module.
7. Then use the recipe linked above to transfer the module to your PC and turn it into a real .ROM file.

Re: The ISENE.ROM

*Message #9 Posted by **Namir** on 17 Oct 2011, 2:54 a.m.,*
in response to message #1 by Geir Isene

Can you post an ISENE.MOD file so many of us can easy load it to HP-41CX emulators?

Thanks,

Namir

Re: The ISENE.ROM

*Message #10 Posted by **Geir Isene** on 17 Oct 2011, 3:11 a.m.,*

in response to message #9 by Namir

Never done that. Recipe?

Re: The ISENE.ROM

*Message #11 Posted by **Ángel Martin** on 17 Oct 2011, 3:35 a.m.,*
in response to message #10 by Geir Isene

Using ML2k manager is a piece of cake.

Re: The ISENE.ROM

*Message #12 Posted by **Namir** on 17 Oct 2011, 5:13 a.m.,*
in response to message #11 by Ángel Martin

Can someone do that and share the MOD file with the rest of us?

Re: The ISENE.ROM

*Message #13 Posted by **Ángel Martin** on 17 Oct 2011, 7:33 a.m.,*
in response to message #12 by Namir

Done.- will email it to you later today.

Re: The ISENE.ROM

*Message #14 Posted by **Namir** on 17 Oct 2011, 7:41 a.m.,*
in response to message #13 by Ángel Martin

Angel, you are the man!!!!

Many thanks!!

Namir

Re: The ISENE.ROM

*Message #15 Posted by **Geir Isene** on 17 Oct 2011, 11:35 a.m.,*
in response to message #14 by Namir

Thanks to Ángel; Here's the direct link: ISENE.MOD.

And available as usual on the UC-41 page.

Splurge on it.

Re: The ISENE.ROM

*Message #16 Posted by **Ángel Martin** on 17 Oct 2011, 1:26 p.m.,*
in response to message #14 by Namir

It really is a trivial afair using ML2k manager SW - which is free and doesn't require an MLDL2k to run - so we have Meindert to thank!

Re: The ISENE.ROM

*Message #17 Posted by **Geir Isene** on 17 Oct 2011, 2:21 p.m.,*
in response to message #16 by Ángel Martin

Ah, I have thought that I needed the device itself to do this. Now I downloaded the software and got it running under WINE, so now I can churn out both ROM and MOD files.

Re: The ISENE.ROM

*Message #18 Posted by **Monte Dalrymple** on 17 Oct 2011, 10:45 a.m.,*
in response to message #12 by Namir

You need it in .ROM format for transfer to the 41CL.

Re: The ISENE.ROM

*Message #19 Posted by **Gerry Schultz** on 17 Oct 2011, 2:12 p.m.,*
in response to message #18 by Monte Dalrymple

Hi Monte. I scanned through the 41CL manual on your website yesterday. How does a user load a new ROM image into the 41CL? Is there a PC based application that can 'talk' to the 41CL through the serial port or do you use the 'Updating the 41CL Hardware' procedure in your manual?

Thanks, Gerry

Re: The ISENE.ROM

*Message #20 Posted by **Monte Dalrymple** on 17 Oct 2011, 4:42 p.m.,*
in response to message #19 by Gerry Schultz

A couple of the Beta testers stepped up here.

Antti Louko wrote python scripts for linux and
Raymond Wiker wrote a program that uses the MS .NET framework.

I'll ask them for permission to post it on my 41CL pages,
or perhaps on the 41CL wiki: http://www.wiki4hp.com/doku.php?id=41cl:replacement_cpu_board

The serial port and the YIMP function is used to import stuff.

Monte

Edited: 18 Oct 2011, 10:01 a.m. after one or more responses were posted

Re: The ISENE.ROM

*Message #21 Posted by **Geir Isene** on 17 Oct 2011, 5:08 p.m.,*
in response to message #20 by Monte Dalrymple

Or you can use a PIL BOX. Or an RS-232/IL converter (if you are into tinkering).

Re: The ISENE.ROM

*Message #22 Posted by **Gerry Schultz** on 17 Oct 2011, 6:44 p.m.,*
in response to message #21 by Geir Isene

Thanks Monte and Geir. Actually I have both the PIL Box and the RS-232/IL converter. I'm on the waiting list for the next batch of 41CL cards and it appears they will be available soon. Since I'm running Windows 7/WinXP on all my PCs, I would be interested in Raymond Wiker's program if he makes it available.

Thank you, Gerry

Re: The ISENE.ROM

*Message #23 Posted by **Monte Dalrymple** on 17 Oct 2011, 7:40 p.m.,*
in response to message #22 by Gerry Schultz

Raymond has graciously agreed to my posting it on the 41CL website, so expect to see it show up shortly.

HP17BII+ Hardware - Atmel processor?

*Message #1 Posted by **Thomas Chrapkiewicz** on 16 Oct 2011, 12:28 p.m.*

Has anyone studied the HP17BII+ hardware?

HP.com indicates that it operates on (2)CR2032, 28k memory, has a clock/calendar, infrared and beeper output.

Is this based on the ATSAM processor? If so, is it 'flash'-able?

TomC (pardon me if this has been posted before - could not find a thread.)

Re: HP17BII+ Hardware - Atmel processor?

*Message #2 Posted by **Marcus von Cube, Germany** on 16 Oct 2011, 12:52 p.m.,*
in response to message #1 by Thomas Chrapkiewicz

It's not! It's a mask programmed 6502 derived system. No way to update the firmware.

Re: HP17BII+ Hardware - Atmel processor?

*Message #3 Posted by **Thomas Chrapkiewicz** on 16 Oct 2011, 1:16 p.m.,*
in response to message #2 by Marcus von Cube, Germany

:(

Re: HP17BII+ Hardware - Atmel processor?

*Message #4 Posted by **Walter B** on 16 Oct 2011, 4:13 p.m.,*
in response to message #3 by Thomas Chrapkiewicz

I share your feelings. Indeed this question was raised several times here already. The UI of the 17bii+ Silver is simply more attractive to techies like us :-)

Re: HP17BII+ Hardware - Atmel processor?

*Message #5 Posted by **JamesT** on 16 Oct 2011, 11:32 p.m.,*
in response to message #4 by Walter B

I find the 17BII+ to be a disappointing "upgrade" to the classic model. The solver is markedly slower and there are other limitations. It does have a nice look and feel though, but alas not function.

in response to message #2 by Namir

> Quote:
>
> Your date "pointer" is corrupt!! Dennis passed away October 12.
>
> Namir

I discovered that too last week after I'd unwittingly made a reference to him elsewhere in this forum.

It seems truly unfortunate for a man whose accomplishments permeate modern technology, to have his passing go comparatively unnoticed. Steve Jobs releases a few well thought out consumer devices and is hailed as a genius. So be it, credit given where it is due. But Dennis Ritchie provided the "shoulders" the entire industry built upon for the last 30 years. I can't even think of an equivalent analogy to underscore what this man has given us.

Re: R.I.P. Denis Ritchie

*Message #4 Posted by **Namir** on 16 Oct 2011, 12:16 p.m.,*
in response to message #3 by uhmgawa

While I made a living for may years writing C++ books, C++ would not exist if C did not succeed as it did. The credit goes to Ritchie! His influence is indeed great and has gone without the credit it truly deserves.

Re: R.I.P. Denis Ritchie

*Message #5 Posted by **Thomas Radtke** on 16 Oct 2011, 12:59 p.m.,*
in response to message #4 by Namir

Mr. Gates had an article in the Scientific American in the late 80th. That was the point I knew people are valued for their business, not their thoughts.

Re: R.I.P. Denis Ritchie

*Message #6 Posted by **David Ramsey** on 16 Oct 2011, 1:05 p.m.,*
in response to message #4 by Namir

I have real trouble dealing with the concept of "credit for C++". I'd be more inclined to use the phrase "Blame for C++"...

Of course that really goes to Stroustrup, not Richie. C was actually a wonderful accomplishment for its time, before it was eaten by Cthulu and crapped out as C++.

Edited: 16 Oct 2011, 1:07 p.m.

Re: R.I.P. Denis Ritchie

*Message #7 Posted by **Namir** on 16 Oct 2011, 2:13 p.m.,*

*Message #8 Posted by **Howard Owen** on 16 Oct 2011, 3:20 p.m.,*
in response to message #7 by Namir

Now for a long chewing over the question of which OO programming language/platform/environment is better. We can also haul in the merits of design by committee, whether or not this or that language has been used to create this or that wonderful/monstrous/useful/unusable software, whether this or that language **can** be used to do those things and so forth.

Oops, didn't mean to bring Forth into the discussion. :)

Re: R.I.P. Denis Ritchie

*Message #9 Posted by **Egan Ford** on 16 Oct 2011, 5:39 p.m.,*
in response to message #8 by Howard Owen

> Quote:
>
> Now for a long chewing over the question of which OO programming language/platform/environment is better.

Better for what? Given that language/platform/environment is often intertwined, then you have to use what the platform supports. E.g. Objective-C for iOS & OS/X, C++ for GNOME/KDE, C# & C++ for Windows, Java for JVM, etc...

OO language/platform/environment sometimes feels like a chore.

C OTOH is near ubiquitous, it's small, fast, and sexy, and can scale up and down.

Re: R.I.P. Denis Ritchie

*Message #10 Posted by **Howard Owen** on 16 Oct 2011, 8:31 p.m.,*
in response to message #9 by Egan Ford

I agree with you about C, Egan. I just sensed the imminent breakout of hostilities in the holy language wars around C++. :)

Re: R.I.P. Denis Ritchie

*Message #11 Posted by **David Ramsey** on 16 Oct 2011, 9:10 p.m.,*
in response to message #7 by Namir

Well, it's an object oriented layer on top of a non-object oriented language. In fact as you know it was originally simply a preprocessor that spit out C code. Since it's not really OO at the roots, it has a number of, shall we say, problems...like the utter lack of garbage collection.

And really, any language that *needs* const_cast, reinterpret_cast, static_cast, and dynamic_cast (good quiz to see if someone really knows their C++: ask them to explain, in detail, what each of these does and when it should be used) obviously has deep architectural problems.

Basically, C++ gives you "more than enough rope". Stroustrup is not sympathetic: here's a quote from his "C++ Style and Techniques FAQ":

> Quote:
>
> How do I deal with memory leaks?
>
> By writing code that doesn't have any. (Goes on to explain C++ standard containers)

But my biggest complaint is that it's based on C. Now, I have nothing against C; it was hot stuff in the 70s. But it limits what C++ can do. For example, my gripe about no garbage collection? It's *impossible* to add to C++, because of C. Nothing you can do to C++ will prevent a programmer from writing code like:

int c[100]; c[101] = 23;

...because C arrays are just shorthand for pointer arithmetic, and a pointer can point to anything in memory, right? Fixing this would break the entire world's base of C code.

The only thing that ever made C++ bearable for me was the amazing Qt application framework. Loved that thing...

Re: R.I.P. Denis Ritchie

*Message #12 Posted by **David Hayden** on 17 Oct 2011, 8:30 a.m.,*
in response to message #11 by David Ramsey

I think one of the design goals behind C++ was to add OO capabilities without taking away the ability to write small and fast code when you want it. Garbage collection and array access checking come with a significant performance penalty.

On the other hand, they are also the cause of many MANY bugs, and as a friend once said "the biggest performance improvement is when the code goes from "not working" to "working". Put another way, if you're allowed to have bugs in the code, then it can be made to run arbitrarily fast.

Re: R.I.P. Denis Ritchie

*Message #13 Posted by **Eric Rechlin** on 16 Oct 2011, 3:58 p.m.,*
in response to message #6 by David Ramsey

Stroustrop is the reason why I try not to stray on to the A&M campus, for fear that I might do something I might regret.

*Message #16 Posted by **Borja** on 17 Oct 2011, 5:15 a.m.,*
in response to message #3 by uhmgawa

Actually both (Jobs and Ritchie) have some things in common. Even though Jobs was an entrepreneur and a businessman (not a scientist or inventor, as he has been portrayed by the unsurprisingly ignorant media) and Ritchie was a scientist.

Both took part in a revolution against undue complexity. Ritchie, with Ken Thompson, developing C and Unix while the next big thing was an operating system, MULTICS, more complicated than soviet bureaucracy. Jobs, by leading Apple towards making computers much more usable for the general public, in the case of the Mac, and, later, to launch the computer-that-is-not-a-computer, the iPad.

Both were immune to the dreadful Second System Syndrom described by Fred P. Brooks in his

awesome book, "The Mythical Man Month". Following Jobs, who, although obviously didn't "invent", "code", etc, Apple products, there is a steady improvement from the Apple II to the Mac, to the NeXT, and to the iPhone/iPad.

In the case of Ritchie, from C and Unix, and, although Plan 9 was mostly (as far as I know) Pike's and Presotto's idea, I'm sure he contributed ideas, then Inferno... Eveything I've seen coming from that research group led by Ritchie has been brilliant. From systems software to just software engineering (or I should say counter-engineering).

Both have made enormous contributions to technology. I don't think there are entrepreneurs like Hewlett, Packard or Jobs, and by looking at the sad state of software engineering in general, seems that generation of computer scientists won't get a replacement either.

I think we will miss them sorely.

C and Unix are of his legacy.

Re: R.I.P. Denis Ritchie

*Message #18 Posted by **Howard Owen** on 16 Oct 2011, 4:08 p.m.,*
in response to message #17 by Marcus von Cube, Germany

It's impossible to overstate the influence Dennis Ritchie had over my life and career. He was co-developer of Unix, inventor of C and the driving force behind rewriting the former in the latter. That marriage between Unix and C launched an interesting experimental tools development platform into dominance over academic Computer Science, and later broad commercial success as a desktop and server OS. The static linking between Unix and C carried over into even broader and more influential success in the forms of Linux and gcc. I swam in that torrent for most of my career.

Obviously computers would have changed the world without Mr Ritchie's influence. But the open nature, portability and simplicity of Unix, its encouragement of collaboration, and its wide distribution (which AT&T eventually lost control over) were key ingredients in the free-wheeling explosion of creativity that defined the astonishing computer revolution of the late 20th and early 21st centuries. That was my era, and thanks to Dennis Ritchie, in large part, it was a real joy to participate in.

Re: R.I.P. Denis Ritchie

*Message #19 Posted by **Bruce Larrabee** on 16 Oct 2011, 5:23 p.m.,*
in response to message #18 by Howard Owen

I can relate Howard, I remember programming pre-C language. I had developed a 'wish list' of things a programming language really ought to have. Then Dennis created C. Bingo! My Pascal friends all said, 'too cryptic', I just couldn't understand what they were talking about. (Strings?, too much overhead, not flexible enough. They'd screw up all my automated formatting sooner or later!) When I got a copy of SAMS 'Programming in C' all the example code compiled and ran without errors on three different computers systems with three different operating systems!! I had read a LOT of books, I had never seen ANY book that all the example code compiled and ran without errors even on the target system! But I digress...

Then there is UNIX... A rational operating system... What can one say...

It is my opinion as well that someone like Dennis Ritchie does not receive the appropriate financial compensation for the true extent of their contribution to our world. It seems sadly to indicate a perverse set of priorities in effect.

Re: R.I.P. Denis Ritchie

*Message #20 Posted by **Egan Ford** on 16 Oct 2011, 5:53 p.m.,*
in response to message #19 by Bruce Larrabee

I first heard of C and UNIX in the mid '80s while in high school. I already knew BASIC, Pascal, and a bit of 6502 ASM, but when I saw C (and UNIX) it was love at first sight. C was small, direct, and to the point. It was beautiful. *The C Programming Language* (Ed. 1, (K&R)) was the easiest programming book I had read. I truly appreciated the brevity of it. And I liked how pointers were handled.

Every computer I own runs UNIX (OS/X) or Linux. The UNIX philosophy to treat all devices as files coupled with piping and redirection has made working with UNIX very productive and powerful. In the mid '80s I also picked up *The UNIX Programming Environment* by Kernighan and Pike. This book compliments *The C Programming Language* very well. Both books served me well my career transitioned to C and UNIX.

Lastly, I have to give a shout-out to Stevens (R.I.P.). His books on UNIX programming and TCP/IP are priceless.

Denis, thanks for C and UNIX. If it wasn't for C and UNIX I would have ended up as a teacher. Not that there is anything wrong with that.

I am also a big fan of C, in the early days of PCs I had Turbo Pascal since it was one of the very early low cost compilers for PCs, but the breaking point came when I was writing a program that involved rolling lower case text to upper case, a simple matter of subtracting 0x20 for the character value, except in Pascal, that won't let you do math on characters, so I said &^%&%&* this and rewrote it in C which like unix lets you do pretty much what you what, unix and C not only will let you shoot yourself in the foot if you are not careful, it will also load and aim the gun for you..... but that freedom is also the beauty of it.

Hi Paul,

> Quote:

> I had Turbo Pascal since it was one of the very early low cost compilers for PCs, but the breaking point came when I was writing a program that involved rolling lower case text to upper case

Reading this brought back a distant memory for me. I thought I had written a Turbo Pascal program many years ago the converted lower to upper case and I didn't remember it being that difficult. Being someone who never throws away anything, not if it can be saved to a hard drive, I looked for it and found my original program "UPPER.PAS". Program is dated 1989. It's actually very easy to convert from lower to upper case as follows:

CH := UPCASE(CH);

While I have done a lot of programming in C (NOT C++), I still have a fondness for Turbo Pascal and still use it (or FEEPAS) a lot for my simple programming tasks.

Like many others here, I too studied the The C Programming Language (Ed. 1, (K&R)) and still have a copy somewhere.

Bill

The Unix environment nurtured things like grep. After I squeezed grep dry I went searching for MORE POWER.

I found SED, diabolical.

Never graduated to awk. (I believe the 'k' in awk stands for Kernighan.) If I needed that much horse power I wrote filters in C from my own filter templates. Okay I guess I've drifted off topic a bit.

Dennis with Ken again, shaking hands with someone that looks vaguely familiar? Looks like, Hugh Hefner? No that's not right...

AT&T did not actually lose control of Unix and would eventually sell it, however what happened is a number of Unix like OSes appeared the first of which is arguably BSD. In the beginning AT&T gave unix away free to educational institutions at about version 7 time AT&T was starting to think that maybe unix could be a commercial product, however they could not market computer as the result of a consent decree dating back to the late 50s. By the time System V rolled around At&T was no longer giving unix away to universities, howevr by that time USC Berkley had already finished BSD, one of the big contributors to that effort was on William Joy who created the vi editor and would go on to be the head of software at Sun. At an University across the pond in Holland noted OS professor Andrew Tanenbaum who had been using th3 AT&T unix as an example to teach operating systems created a stripped down unix like OS he christened Minix and wrote a text book about it "Operating Systems Design and Implementation" also know as "The Minix Book" a very excellent and readable text book if you are at all interested in what makes an OS tick. A little later Linus Torvalds came along with his kernel of a unix like OS called Linux, I started playing with linux almost as soon as he started distributing it, back when changing the configuration of the kernel required recompiling it. Most commercial unix systems are based on a license originally obtained from AT&T in most cases, later from Novell and SCO, which ended up with a high profile lawsuit by SCO against several unix vendor, that SCO eventually lost, and as part of that suit it was determined the trademark really belonged to Novell. Currently the trademark is owned by a company known as the Open Group. Any OS that calls itself Unix must have a valid license to use the trademark, as well as the licensed code. Most current unix vendors have added significant features to the unix base code some which are shared and some that remain proprietary. I have been involved with unix systems professionally since the mid 80s and it was love at first sight for me too. I have watched unix based system grow from workstations size machine that where used to run small businesses as well up to the the enterprise level systems we have today that rival mainframes in power and capacity.

With regard to Dennis Ritchie he created the C programming language, however unix was a creation of Ken Thompson, who had been Bell Labs representative on the multi-vendor MULTICS project that had just collapsed, the original unix was written in assembler on a PDP-7 system, Ritchie created C based on an interpreter "B' that Thompson had created for his new toy, they then worked together to rewrite the OS in C, to this day unix implementations are written in C. Another person of note involved with the development of C and unix at Bell Labs where Brian Kernighan, Brian and Dennis would author what is the standard bible of C "The C Programming Language".

*Message #26 Posted by **Andrés C. Rodríguez (Argentina)** on 16 Oct 2011, 10:14 p.m.,*
in response to message #25 by Paul Berger (Canada)

I once heard that the C language was derived from "B" and this one, in turn, derived from BCPL. As the sequence of letters of this one starts with B and C, some people supposed that the succesor of C was to be called "P". Others supposed that, in alphabetical order, after "B" and "C" the next language would be "D". But finally it was C++, as all we know.

I beg to differ. You had to buy a Unix source license from AT&T to run BSD. They absolutely tried to retain control over BSD even after the Net 2 release, which had striven to remove all AT&T copyrighted code. I knew some of the BSDI folks and had their beta release deployed running my very first firewall. AT&T certainly did lose control of the BSD variant of Unix, though the ink didn't dry until shortly after they sold the IP to Novell. That settlement later came back to haunt SCO when they attempted to claim ownership over Linux, by asserting it was derived from Unix.

15c LE thoughts

*Message #1 Posted by **kc** on 16 Oct 2011, 3:56 a.m.*

I seldom see people in this forum complain about HP 15c (not LE). Now I got my 15c LE, and I try to figure out why people like the original 15c so much. A product of 30 years old, I can feel how great it was when it was first launched: elegant, beautiful, all the necessary functions fit in a pocket, and the positive key-click feel. The best technology and quality of the time. It is like when you look back at the iphone 30 years later (sorry for those of you that are anti-iphoner). Nonetheless, it is a 30-year old product, and technology has much advanced. I consider programming the HP 15c LE quite un-userfriendly, especially when I am debugging, due to the fact that I cannot see the function. I have to slowly decipher each programme line into the corresponding function, and write it down on a paper, before I can understand and debug the programme. It makes me uninterested in writing programme on my 15c LE. For the same reason, I cannot see the actual equation when I use HP solve. Not good. Other than that, it was a nice calculator.
And the 15c LE manual. I think, for the price it charges, the manual should at least have two colours, preferrably three (black, blue, orange to match the colour of the calculator). Slight disappointed.
kc

I could say the same thing about my wife. More than 30 years old; not very friendly, when I try to program any type of useful behavior; could never debug a single thing; and never, ever, do I get to see the full equation I'm trying to solve. Lousy instruction manual, BTW. Come on... Are you really trying to rationalize love? ;-)

Paulo

Either the classic or modern HP-15C doesn't have I/O and sound capabilities and the function of entering, displaying and storing full alphabets and special symbols. In some places of the planet such as Hong Kong, only this kind of calculators is allowed in public exams or some universities.

However, the calculator is so powerful that users tend to live with this 'non-userfriendliness'.

in response to message #1 by kc

Yes, it's 30 year old technology. What were you expecting? The folks who love it, and who have been clamoring for its return, have 30-40 year careers behind them. Nostalgia is a powerful thing.

It's still a great calculator.

Re: 15c LE thoughts

*Message #7 Posted by **kc** on 16 Oct 2011, 11:11 p.m.,*
in response to message #6 by Martin Pinckney

Yes, still a great calculator. That's why people in this forum often ask for an upgrade of existing great HP calculators e.g. 43s, instead of creating new ones. The fact that the majority of folks here hate the design of 33s is also a solid example of how they treasure the old ones and have strong reservation to new designs. (No negative meaning)

The idea of HP-43S is great! I don't know why I didn't buy HP-42S when it was still in production. :(

HP-33S and HP-35S are crap, however.

Re: 15c LE thoughts

*Message #9 Posted by **Carey** on 17 Oct 2011, 12:11 a.m.,*
in response to message #1 by kc

I believe anyone's impression of the HP 15c/15c LE (or any calculator) depends largely on its intended use. If the 15c is to be used only for routine programs then I agree it can be a pain to use. However, if one's calculation or programming needs require, for example, matrices with complex elements, or contour integrals (integrating a complex function between complex limits) or ill-conditioned matrices requiring the extreme floating-point precision provided in the 15c due to the work of William Kahan, a world-class numerical analyst, then one's appreciation for the HP15c grows immensely (see the HP-15c Advanced Functions Handbook). While we have all heard the cliche that one turns to a computer, not a calculator, for advanced calculations, the reality is that the syntax learning curve for the above advanced calculations is much less for the 15c than for most software, the 15c fits in a shirt pocket and doesn't have to boot-up to use.

Regards, Carey

*Message #10 Posted by **Lincoln R.** on 17 Oct 2011, 1:36 a.m.,*
in response to message #9 by Carey

Agreed. I'm a computer engineer who primarily works with digital logic. 90% of the work I do is done on computers. However, I still keep a calculator (Usually my 32s) with me, and frequently still use paper for sketching out rough ideas. Sure, I could launch MATLAB or deal with a bunch of mouse-clicking (and algebraic mode) to use the Windows/Mac OS X/Linux/whatever calculator application, but most of the time it's quicker and easier to pull out my calculator because it's ready to go as soon as I hit the on button.

Also, random fun fact: While the Macintosh OS has featured an algebraic-only calculator since the beginning, the Apple Lisa's calculator application had an RPN mode complete with a 4 level stack named X,Y,Z, and T... could it have had something to do with several ex-HP engineers working on that project?

*Message #13 Posted by **Keith Midson** on 17 Oct 2011, 6:09 a.m.,*
in response to message #1 by kc

I think it is different to the iPhone analogy. Many users of the original 15C still have and use it regularly. There has been a lot of debate in this forum whether or not it is "the best" HP ever made, but the fact remains that it is immensely popular - it is compact and a useful shape for desktop use and it fits neatly in a pocket. Nothing has been released from HP that compared to this calculator in terms of form-factor and function - sure there have been many comparable models (more powerful, etc), but engineers are a funny breed and like familiarity and certainty. We learn how to do something and (generally) stick to it. Most younger engineers haven't had such a dependency on a handheld, but have relied on computers (Excell, etc) - the place of a calculator to this generation is more of a backup computing device.
The 12C has had a similar experience for accountants, managers, etc, but managed to stay in production over the last 30 years - HP tried to change it, but were forced by consumers to keep production running - engineers and scientists didn't have the same power over HP.
I was VERY excited about the re-release of the 15C - i've got it now and it is truly wonderful. Much faster than the original, but there is something 'cheap' about it. It has the mass produced feel that all of the modern HP's have. I just bought a 'new in box' 1986 15C and it is even more wonderful!! It is seriously like new (even the smell) - the quality is much better than the original, has a better keyboard and the delay makes you feel like it is really thinking about what you have asked it to calculate - the fact that it is umpteen times slower then the LE really doesn't make much difference to the vast majority of your calculations.
So, whilst you can argue that it is outdated technology, really when you compare it to a modern scientific calculator - you basically need the same functions, you need some sort of keyboard, you need RPL (yes you really do!), so the 15C still fits the bill. Probably the only thing you don't have is an interface between the calculator and a computer or transferable storage.
Cheers, Keith

Re: 15c LE thoughts

*Message #14 Posted by **Roger Blake** on 17 Oct 2011, 6:49 a.m.,*
in response to message #13 by Keith Midson

I can't understand why some people like the original 15C keyboard so much. Even when first buying one in the eighties I was struck by how different the keyboard felt to other HP calculators at the time. No positive feel to the keypress, and the enter key had an especially poor feel. I'll admit the keyboard worked in practice and lasted well over the years with no problems but I never liked it although loving the calculator as a whole. So I was really pleased to find the positive click on the LE. Whether keyboard build quality is worse with the LE is another matter - the current problems don't bode well, but as to the feel, I remain puzzled why some people think it worse, even when seemingly admiring other early HP keyboards with a much more postive feel ? Explanations welcomed !

*Message #17 Posted by **Paul Gaster** on 20 Oct 2011, 8:20 a.m.,*
in response to message #16 by Reth

I heard something interesting yesterday from Bach. Last month I ordered 2 from them. Early this month I called and was told that their next shipment should arrive on the 11th and that the calculators would ship right after that. Well that date came and went so I called again yesterday. I was told that HP recalled the calculators for a quality issue so that has delayed things. I asked the lady on the phone if she knew what the problem was and she said that it had something to do with the keyboard.

To be honest I am not in a huge hurry and would rather wait a bit to get a calculator that is fully checked and has a good keyboard.

Why unpacking them in the first place? ;-)

I assume TAS to work as a filter. The more often things got recycled through it, the fewer good items are on sale.

Re: 15c LE thoughts

*Message #21 Posted by **Ethan Conner** on 20 Oct 2011, 1:14 p.m.,*
in response to message #20 by Thomas Radtke

I "stocked up" not so much for reselling although that may happen. I just wanted a good chance at getting one as soon as possible. Also wanted a good chance at receiving at least one good unit. Turns out they are all perfect minus the PSE bug and if reflashing is ever offered they will be done one at a time so i always have one to use and one as a backup.

> the idea is not to produce an exact identical replacement - that would be extremely hard, and i'd say even the silver ones are obviously different from the original when subjected to any more than a casual glance.

I wouldn't outright dismiss creating a cosmetically indistinguishable replica as extremely hard. There will certainly be some preparation involved. But I think this might be a good starting point to create accurate artwork for cnc engraving.

Note there is substantial variation in the appearance of even HP manufactured logos. The above 16c has a highly reflective surface while the 15c finish has a brushed texture.

If anyone has interest in the original jpegs, feel free to PM me. Flikr insists on squashing the resolution of uploads although these seem to be of marginally usable resolution.

[WP 34S] A-D double duty suggestion

*Message #1 Posted by **Dominic Richens** on 15 Oct 2011, 8:27 p.m.*

Right now, XEQ A runs LBL A just like pressing A directly. However we can make XEQ A run LBL 11 instead by removing the NO_SHORT from

```
regA_idx, regB_idx,
regC_idx, regD_idx,
```

We would need a small change to process_key() to still allow us to enter LBL A in program mode.

if (shorthand && State2.runmode)

This gives us another 4 "quick call" labels and if we want to keep those keys as Sigma+, 1/x, y^x and sqrt(x) we can use 11-14 instead of A-D as labels.

Re: [WP 34S] A-D double duty suggestion

*Message #2 Posted by **Alexander Oestert** on 16 Oct 2011, 1:46 a.m.,*
in response to message #1 by Dominic Richens

I think XEQ A runs LBL 'A', which is different from LBL A, IIRC.

Please see "Addressing Labels" - page 24 of the manual :-)

Edited: 16 Oct 2011, 3:58 p.m. after one or more responses were posted

Re: [WP 34S] A-D double duty suggestion

*Message #4 Posted by **Marcus von Cube, Germany** on 16 Oct 2011, 12:59 p.m.,*
in response to message #3 by Walter B

Walter, read the docs (or change them if they are wrong on this)! There is absolutely no connection between labels 'A' and A and there is no shortcut to address label 'A'. To access subroutine 'A' you need to press XEQ ENTER^ A ENTER^.

XEQ A and A do the same if A is defined as a label and is not used as a digit (where f+A takes this duty).

Back to Dominc's suggestion: It will cause more grief then fun because it's unexpected behavior. If you want a shortcut to label 11 just use XEQ f A.

Re: [WP 34S] A-D double duty suggestion

*Message #5 Posted by **Walter B** on 16 Oct 2011, 3:55 p.m.,*
in response to message #4 by Marcus von Cube, Germany

:-? Marcus, you go out on a limb there. I'd recommend you read said page yourself thoroughly instead of claiming anything pointless. What you wrote is exactly what the manual says.

*Message #6 Posted by **Marcus von Cube, Germany** on 17 Oct 2011, 2:12 a.m.,*
in response to message #5 by Walter B

Sorry, I misread your comment in that you were seconding Alexander's remark. I remember that there was such a confusion in an earlier version of the manual.

Your answers are often just a bit terse: "RTFM on page xyz!" instead of citing or rephrasing a few words. So the reader never knows what the essence of your post is, except he goes to the file system, fires up Acrobat Reader with the manual, goes to page xyz, finds the corresponding text, and then returns to the forum in order to re-read and answer your post. That was just too demanding for me on a Sunday afternoon.

Re: [WP 34S] A-D double duty suggestion

*Message #7 Posted by **Walter B** on 17 Oct 2011, 4:03 a.m.,*
in response to message #6 by Marcus von Cube, Germany

In fact, I seldom write RTFM unless well deserved ;-) I think, however, that manual is written and maintained to be read. And sometimes I hate repeating what I wrote (hmmmh, maybe more than sometimes).

Well, I did also. Even after reading said manual page a couple of times now I still am confused. ;)

> what's confusing you :-)

In a word? The manual! ;)

Please don't get me wrong, I'm not complaining. I'm just a guy who needs at least a five lines code snippet to accompany every single function in the manual, every necessary keystroke written down. Without that I find myself all searching at the wrong places or the wrong keywords.

Re: [WP 34S] A-D double duty suggestion

*Message #11 Posted by **Dominic Richens** on 17 Oct 2011, 6:22 a.m.,*
in response to message #10 by Alexander Oestert

Alex,

Sounds like you should be contributing to the wiki Users Guide :-)

With Walter's pointer, I did peruse page 24 and yes, it does say it right there (in 3rd column and footnote 14).

All the information is in the manual, but sometimes it feels like that little bit you are looking for is "in the bottom of a locked filing cabinet stuck in a disused lavatory with a sign on the door saying 'Beware of the Leopard'".

Re: [WP 34S] A-D double duty suggestion

*Message #12 Posted by **Alexander Oestert** on 17 Oct 2011, 6:38 a.m.,*
in response to message #11 by Dominic Richens

As soon as I understand a topic, I might eventually try to put that in words, although I am not so sure I can do it any better.

Re-reading the manual and Walter's statement on it above, I guess I know now what got me confused: Walter's posting first said 'Correct' before he edited that out. I'm actually happy to see him confused with the manual, too. ;-)

Is this new?

In 1664 XEQ A run LBL A just like pressing A directly. XEQ ENTER A ENTER runs LBL 'A (four keys strokes)

Re: [WP 34S] A-D double duty suggestion

*Message #14 Posted by **Paul Dale** on 16 Oct 2011, 2:29 a.m.,*
in response to message #1 by Dominic Richens

I don't like this much.

How do I enter XEQ A in a program before I've defined LBL A?

Doing this also loses consistency between run and program modes. The same keystrokes should do the same thing in both.

- Pauli

Re: [WP 34S] A-D double duty suggestion

Agreed, for the first four labels - if they are used.

Edited: 16 Oct 2011, 6:19 a.m.

Re: [WP 34S] A-D double duty suggestion

*Message #16 Posted by **Dieter** on 16 Oct 2011, 7:32 a.m.,*
in response to message #14 by Paul Dale

I like the idea of four additional hotkeys in addition to A...D. Maybe because I am used to the 41C which has no less than 15 of these. So I think something like [prefix] [A] would be nice. For instance, as mentioned, [A] and [XEQ] [A].

Dieter

Re: [WP 34S] A-D double duty suggestion

*Message #17 Posted by **Marcus von Cube, Germany** on 16 Oct 2011, 1:03 p.m.,*
in response to message #16 by Dieter

A to D have functions on the shift planes which would be unaccessible if we'd allow for a prefixed A to D shortcut.

XEQ f A calls XEQ 11.

Re: [WP 34S] A-D double duty suggestion

*Message #18 Posted by **Dieter** on 16 Oct 2011, 5:33 p.m.,*
in response to message #17 by Marcus von Cube, Germany

> Quote:
>

Actually I had some other kind of prefix keys in mind. But honestly, I simply forgot the following feature:

> Quote:
>
> XEQ f A calls XEQ 11.

This will do.
At least until the h-shifted functions of A...D go to a DISP menu in favour of four new hotkeys like a...d or A'...D'. ;-)

Dieter

Re: [WP 34S] A-D double duty suggestion

*Message #19 Posted by **Dominic Richens** on 16 Oct 2011, 8:13 p.m.,*
in response to message #17 by Marcus von Cube, Germany

But that's inconsistent with the other shortcut keys, like STO, where XEQ STO call LBL 21. I was trading runtime inconsistency for programming inconsistency, favouring the one that means fewer keystrokes at runtime. It also frees up XEQ f to call LBL 24.

Re: [WP 34S] A-D double duty suggestion

*Message #20 Posted by **Marcus von Cube, Germany** on 17 Oct 2011, 2:20 a.m.,*
in response to message #19 by Dominic Richens

The f prefix allows to address any key (not only A to D) to act as a shortcut. The shifts are exempt from this feature because they never act upon themselves, only as a prefix. The rule is:

If a key has no predefined meaning in the context of label entry, it is translated to a row/column code. If it has, it can still be used this way by prefixing it with f. The prefix just disables the special meaning of the key such as the digits or '.'.

With the new feature of command display you can always control what will be executed. This has the potential to increase the confidence in what WP 34S will execute upon a given keystroke sequence.

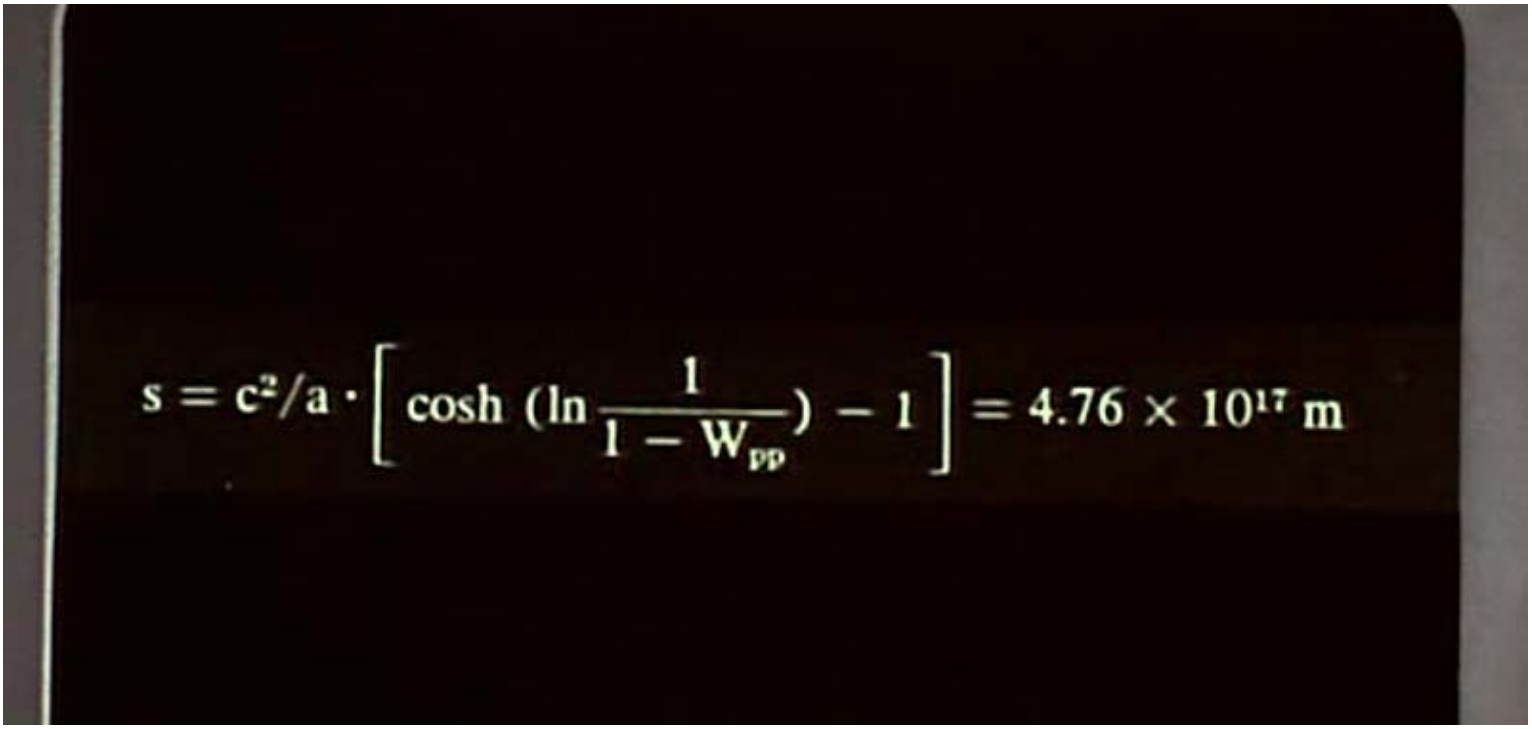
Another reference to hyperbolic functions in a movie

*Message #1 Posted by **gene wright** on 15 Oct 2011, 10:40 a.m.*

The image below is from one of my favorite TV movies from 1971, "City Beneath the Sea" by Irwin Allen.

Movie info at imdb

The circumstances of this screen being shown was discussion about firing nuclear missiles to deflect an incoming asteroid from hitting the earth. The results appear to be in meters. Anyone recognize the formula? No wonder TI put hyperbolics on most of their calculators! They were trying to save the earth! :-)



Re: Another reference to hyperbolic functions in a movie

*Message #2 Posted by **tony(nz)** on 15 Oct 2011, 3:34 p.m.,*
in response to message #1 by gene wright

Hi Gene, I remember that formula! From Special Relativity. Hyperbolic motion. It must be on wiki, yep - they show the c^2/a. That "Wpp" could be an indication of "warp" - it approaches 1 as the terminal speed approaches c. Oh I found the formula in my old text by Rindler called "Special relativity" published 1966, page 41. Thanks for the memories! Cheers, Tony

[WP-34s] alpha entry?

*Message #1 Posted by **Alexander Oestert** on 15 Oct 2011, 9:40 a.m.*

In the manual I read

[alpha] 'HEL'

I only get

[alpha] H

[alpha] E

[alpha] L

that is each character on its own line preceded by a greek alpha. How do I enter the version from the manual?

Thanks!

Re: [WP-34s] alpha entry?

*Message #2 Posted by **fhub** on 15 Oct 2011, 9:46 a.m.,*
in response to message #1 by Alexander Oestert

IIRC you have to press ENTER after starting alpha-mode, i.e.:
[f][alpha][ENTER]

Then you can enter up to 3 characters.

Re: [WP-34s] alpha entry?

*Message #3 Posted by **Alexander Oestert** on 15 Oct 2011, 9:52 a.m.,*
in response to message #2 by fhub

[enter] ends alpha mode on my machine.

I am talking about text prompts, not alpha labels that in fact are entered by pressing [enter] after shift-LBL.

Edited: 15 Oct 2011, 10:01 a.m. after one or more responses were posted

Re: [WP-34s] alpha entry?

*Message #4 Posted by **fhub** on 15 Oct 2011, 10:08 a.m.,*
in response to message #3 by Alexander Oestert

Try [f][alpha][f][alpha] and then enter your text!?

Re: [WP-34s] alpha entry?

*Message #5 Posted by **Alexander Oestert** on 15 Oct 2011, 10:20 a.m.,*
in response to message #4 by fhub

That works, although I have to clean some leftover characters from the previous entry on every new alpha program line. Strange :-(

Re: [WP-34s] alpha entry?

*Message #6 Posted by **fhub** on 15 Oct 2011, 10:34 a.m.,*
in response to message #5 by Alexander Oestert

> Quote:
>
> That works, although I have to clean some leftover characters from the previous entry on every new alpha program line. Strange :-(

Every alpha entry is **appended** to the already existing alpha content, so before each new entry you have to do a CLalpha.

Re: [WP-34s] alpha entry?

*Message #7 Posted by **Alexander Oestert** on 15 Oct 2011, 10:50 a.m.,*
in response to message #6 by fhub

Strangely it is not exactly the previous entry I have to delete before I can enter the next program line, but only the first two characters and not the third. But that is something the programmers may worry about - I don't.

Re: [WP-34s] alpha entry?

*Message #8 Posted by **Marcus von Cube, Germany** on 15 Oct 2011, 11:23 a.m.,*
in response to message #7 by Alexander Oestert

I'll check that again. Maybe I broke something lately. It works fine from the wp34s_asm tool, though.

Edit: I see the bug. Will be fixed...

*Message #10 Posted by **Marcus von Cube, Germany** on 15 Oct 2011, 11:58 a.m.,*
in response to message #9 by Alexander Oestert

Should be fixed now. It was a pretty old bug. Thank God there were some 2

bytes free in flash for the bugfix. ;-)

Re: [WP-34s] alpha entry?

*Message #11 Posted by **fhub** on 15 Oct 2011, 12:03 p.m.,*
in response to message #10 by Marcus von Cube, Germany

> Quote:
>
> Should be fixed now. It was a pretty old bug.

What exactly was this bug, Marcus?
I can't remember that I would have seen something as Alexander has described it (although I don't really know what his problem with alpha is/was).

Re: [WP-34s] alpha entry?

*Message #12 Posted by **Marcus von Cube, Germany** on 15 Oct 2011, 12:15 p.m.,*
in response to message #11 by fhub

You ended up with two characters from the previous multi character command (alpha or label) already entered when you started the multi alpha command directly after another such command.

Re: [WP-34s] alpha entry?

*Message #13 Posted by **fhub** on 15 Oct 2011, 12:27 p.m.,*
in response to message #12 by Marcus von Cube, Germany

Ok thanks, I've not run into this problem so far because I avoid (if possible) using anything that has to do with alpha-mode! ;-)
This alpha-stuff is indeed one of the WP34s things which is (sometimes) still a mystery to me.

BTW, since Pauli has fixed an error with matrix-norm in matrix.wp34s, maybe you could re-compile wp34s-1.dat again if you have some free time? I would do it myself, but since you use this precompiler-format I can't do it (because the pp doesn't work for me).

Re: [WP-34s] alpha entry?

*Message #14 Posted by **Marcus von Cube, Germany** on 15 Oct 2011, 2:26 p.m.,*
in response to message #13 by fhub

Time to install Perl on your system. ;-)

I'll fix the libraries soon.

Edit: 'soon' is now. :-)

Well, I have TinyPerl and Neil's asm is working, but unfortunately his pp not. :-(

Thanks for the update!

Re: [WP-34s] alpha entry?

*Message #16 Posted by **Neil Hamilton (Ottawa)** on 16 Oct 2011, 8:50 a.m.,*
in response to message #15 by fhub

> Quote:
>
> Time to install ***real*** Perl on your system. ;-)

Just to let everyone else know that this has been previous identified to be the failings of tiny perl, **not** my scripts.

Additionally, the EXE versions also works fine but Franz refuses to cough up 15MB of disk space. He would rather forgo the benefits of the latest features of the WP 34S rather than fix the underlying issue -- the fault interpreter in tiny perl. This is his choice.

Franz, please tell the whole story if you insist on repeating your comment that my script doesn't not work. Your comment can cause confusion among those that are just getting on board this project. AFAIK, there are no outstanding bugs in either the actual assembler or the preprocessor.

Re: [WP-34s] alpha entry?

*Message #17 Posted by **fhub** on 16 Oct 2011, 9:07 a.m.,*
in response to message #16 by Neil Hamilton (Ottawa)

> Quote:
>
> Franz, please tell the whole story if you insist on repeating your comment that my script doesn't not work.

I wrote "because the pp doesn't work **for me**" (just re-read message #13), and as long as this is true I repeat

this statement as often as I want, point!

Re: [WP-34s] alpha entry?

*Message #18 Posted by **Dominic Richens** on 15 Oct 2011, 7:45 p.m.,*
in response to message #5 by Alexander Oestert

Does anyone know if it is possible to have catalog characters as one of the 3? E.g., how would I get [alpha]'N=' for instance?

Re: [WP-34s] alpha entry?

*Message #19 Posted by **Paul Dale** on 15 Oct 2011, 8:59 p.m.,*
in response to message #18 by Dominic Richens

You can't from the keyboard. This is a limitation in the way the tricharacter alpha is implemented :-(

Using the assembler you can.

Pauli

Re: [WP-34s] alpha entry?

*Message #20 Posted by **Dominic Richens** on 15 Oct 2011, 7:42 p.m.,*
in response to message #1 by Alexander Oestert

See the wiki

Entering_and_Displaying_Alpha_Strings

If that's not what you meant, please add it :-)

Re: [WP-34s] alpha entry?

*Message #21 Posted by **Alexander Oestert** on 16 Oct 2011, 1:54 a.m.,*
in response to message #20 by Dominic Richens

Thanks, 'alpha lock mode' is what I was searching for.

Finding extremums of function with complex derivate

*Message #1 Posted by **Lukas K.** on 15 Oct 2011, 6:18 a.m.*

Given is the function I want to calculate the maximums auf this function using the FCN->EXTR function of the 50g. This fails with the message 'Bad Guess(es)', because the derivate of f is complex. Why is f' complex, whereas f only returns real values? Adding a ->NUM to the end of the Y-Var program slows down the plot and sends the calculator into an infinite loop when trying to find the maximum of f. The TI-83 fails at this, too. It finds the maximum at the guessed one. Has anyone an idea how to find the maximum of f (using the 50g)?

Re: Finding extremums of function with complex derivate

*Message #2 Posted by **Allen** on 15 Oct 2011, 8:44 a.m.,*
in response to message #1 by Lukas K.

For most values of x the function would approach 4. You can see in this function , can you use the estimation?

Edited: 15 Oct 2011, 8:56 a.m.

Re: Finding extremums of function with complex derivate

*Message #3 Posted by **Crawl** on 15 Oct 2011, 10:55 a.m.,*
in response to message #2 by Allen

I think the URL you pasted didn't work right,how about this?

Yeah, the exponential will be of the form (cos(t)+isin(t)).

So that plus 1 has a maximum absolute value when it equals 2. (when t=0, 2pi, 4pi, etc)

So you need to solve for (x+3.1e-6)/x = an integer.

Or x = 3.1e-6/(n-1), with n an integer.

I'm not sure why it seems like the derivative is complex; it shouldn't be. I'd have to check what the HP50g gives for that later.

Edited: 15 Oct 2011, 10:58 a.m. after one or more responses were posted

Re: Finding extremums of function with complex derivate

*Message #4 Posted by **Crawl** on 15 Oct 2011, 10:56 a.m.,*
in response to message #3 by Crawl

My URL didn't work either; the parentheses get lost. Oh, well.

Re: Finding extremums of function with complex derivate

*Message #5 Posted by **Lukas K.** on 15 Oct 2011, 11:20 a.m.,*
in response to message #3 by Crawl

Well, plotting and finding it's maximums did the trick. Why didn't I think of this earlier? :(

f' seems to be complex, because the derivate of |a+bi| is signum(a+bi), which returns a complex value :(

Re: Finding extremums of function with complex derivate

*Message #6 Posted by **Crawl** on 15 Oct 2011, 7:24 p.m.,*
in response to message #5 by Lukas K.

I tried playing around with the HP50g with that expression, and it can give wildly varying forms depending on what you do with it. Some of which do not contain complex numbers at all.

At least, make sure rigorous is on, so it doesn't simply return abs(x) as x.

This is probably a situation for which the TI89 gives a more straight forward result.

Edited: 15 Oct 2011, 7:25 p.m.

Re: Finding extremums of function with complex derivate

*Message #7 Posted by **Han** on 15 Oct 2011, 7:35 p.m.,*
in response to message #5 by Lukas K.

>
> f' seems to be complex, because the derivate of |a+bi| is signum(a+bi), which returns a complex value :(

Are you sure that Re(f) = |f| ? If this is true, then you can graph Re(f) and get your answer that way.

How about using the fact that |z|^2 = z * conj(z) and e^(i*t) = cos(t)+i*sin(t)?

Re: Finding extremums of function with complex derivate

*Message #8 Posted by **bunuel66** on 17 Oct 2011, 6:06 a.m.,*
in response to message #7 by Han

It seems that: Re(z)!=|z|^2 That said, max of f is 4 for x=3.1e-6/k, k being 0,1,2....

My two cents...

Regards

New HP15c LE manual - good!

*Message #1 Posted by **Jose Gonzalez Divasson** on 14 Oct 2011, 5:52 p.m.*

It is a pleaseure to see again a full manual with our calculators, included in the package. A lot of care has been clearly put into it:

HP15c Manuals compared

The more time passes, the happier I am with the HP15c LE. Thanks again!!

I have read the message from Hugh Evans where he states his preference for HP42s but at the end, he takes the 15c with him due to its size. Same happes with me. (in addition, I find easier to work with it with a single hand for most operations, joining the left hand to operate it with both thumbs for more other non-basic operations)

Re: New HP15c LE manual - good!

*Message #2 Posted by **Marcus von Cube, Germany** on 15 Oct 2011, 4:45 a.m.,*
in response to message #1 by Jose Gonzalez Divasson

AFAIK, the manual was re-edited by volunteers in this community for HP.

Re: New HP15c LE manual - good!

*Message #3 Posted by **David Hayden** on 15 Oct 2011, 9:05 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Marcus is right. The document was recreated in modern word processing software. HP provided an initial version to a group of volunteers. This was a great start but it still had perhaps 4-5 formatting or content errors on each page. It went through 4 or 5 revisions with at least two volunteers who compared it word-for-word with the original manual. Along the way volunteers rescanned every diagram in higher resolution and the keystroke font was tweaked several times.

One of the hardest parts was keeping the page numbering the same so that page references in the table of contents, index, and throughout the text would not have to change. This required small formatting tweaks on nearly every page.

I think the effort really paid off. The manual has a few errors, but most are in Appendix F which was rewritten to apply to the new hardware. For the most part it seems error-free

It's a great example of how we can help HP improve their products.

Re: New HP15c LE manual - good!

34S without Windows

*Message #1 Posted by **Egan Ford** on 14 Oct 2011, 5:42 p.m.*

For you non-Windows users out there wp34sgui works again with Wine (Unix/Linux Windows emulator).

Tips:

1. cd to ~/.wine/dosdevices and symlink your USB to Serial device. e.g.

   ```
   cd ~/.wine/dosdevices
   ln -s -f /dev/tty.usbserial-FTFTXBQO com4
   ```

   This will allow you to use wp34sgui to serial xfer stuff.

2. svn download the latest wp34s:

   ```
   svn co https://wp34s.svn.sourceforge.net/svnroot/wp34s wp34s.svn
   ```

3. Setup wp34sgui to use a com port to transfer to the physical:

   ```
   cd wp34s.svn/trunk/windows/bin
   echo com4: >wp34s.ini
   ```

4. Lastly fire it up:

   ```
   wine wp34sgui &
   ```

Issues:

1. I cannot get the 34S to send to the virtual 34S, however sending from the virtual to the physical works just fine. I'll have to investigate some more, but just having virtual to physical is a great start. No VMware and no Windows. Yeah!
2. MySamba.exe untested. Also on my list.

Re: 34S without Windows

*Message #2 Posted by **Marcus von Cube, Germany** on 14 Oct 2011, 5:50 p.m.,*
in response to message #1 by Egan Ford

Thanks for the test. Try a speed correction factor (a percentage) in X on the device before the transfer. Start with 95.

Re: 34S without Windows

*Message #3 Posted by **Egan Ford** on 14 Oct 2011, 6:06 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Worked with 90. Thanks! All is right with the universe again.

Re: 34S without Windows

*Message #4 Posted by **Egan Ford** on 14 Oct 2011, 6:09 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Question. Is there a chksum program to test RAM or parts of RAM for bad transfers? I read the docs on SHOW, but that does not address libraries (SENDL) or registers (SENDR) or entire state (SENDA).

Thanks.

Edited: 14 Oct 2011, 6:10 p.m.

Re: 34S without Windows

*Message #5 Posted by **Marcus von Cube, Germany** on 15 Oct 2011, 4:32 a.m.,*
in response to message #4 by Egan Ford

Yes, the test is automatic. All transfers are secured by a 16 bit CRC.

Re: 34S without Windows

*Message #6 Posted by **Egan Ford** on 14 Oct 2011, 5:57 p.m.,*
in response to message #1 by Egan Ford

MySamba.exe tested. It does not work. MySamba does not enumerate the COM ports. A free-form field in MySamba would be appreciated.

34S Matrix Questions

*Message #1 Posted by **Egan Ford** on 14 Oct 2011, 4:55 p.m.*

I know that this has been covered via various threads and I have not read them all or have been able to follow them until today when I got my 34S flashed (plus I have been out of the office).

Questions:

1. I understand that some of the user flash pages had to be used. Which ones? How would I determine this as a user from the 34S? It is possible to overwrite the used pages as a user?
2. MIO and other Matrix Library functions are missing, how do I add? Where do I add?
3. Other than the two pages in Walters guide is there any other Matrix documentation?

Thanks, and sorry if this has all be answered before, but I have been unable to find a central source of this information.

Re: 34S Matrix Questions

*Message #2 Posted by **gene wright** on 14 Oct 2011, 5:16 p.m.,*
in response to message #1 by Egan Ford

The library files are in a download area on the sourceforge site.

You download those files and then use Samba to load them to different locations in the 34S from the main location to flash the firmware.

Libraries 1 through 5 can go to these offsets:

```
0x11f400 - Library 1
0x11f000 - Library 2
0x11ec00 - Library 3
0x11e800 - Library 4
0x11e400 - Library 5
```

I have been intending to write this up because I could not figure out how to do this either.

I have a write up (thanks Marcus and Pauli for being so patient with my questions), but your questions confirm the need for better instructions.

The library files as they exist now can be found here:

34S Library directory on Sourceforge

Each file is named wp34s-5.dat, etc.

The order really does not matter, but if a library has the same 3 character label as another, the label in the lowest numbered library gets executed if called.

Re: 34S Matrix Questions

*Message #3 Posted by **Egan Ford** on 14 Oct 2011, 5:32 p.m.,*
in response to message #2 by gene wright

Thanks Gene, now more confused. IIRC, the *.dat in that directory should already have been append to calc.bin, correct? I ask since after flashing with the latest code X.FCN, TEST, and P.FCN have the matrix functions listed per Walters doc. However other functions discussed such as MIO are not.

And do I have to use Samba or can I use SENDL via the emulator?

Re: 34S Matrix Questions

*Message #4 Posted by **gene wright** on 14 Oct 2011, 5:35 p.m.,*
in response to message #3 by Egan Ford

I have only used Samba, so YMMV.

I don't believe the calc.bin file has the .dat files appended. You create a fullcalc.bin :-) file by doing a copy/b command and joining the .dat to the .bin files.

MIO was in a library (it is actually now replaced by a MED matrix Editor). One library has the AM1, etc. programs to load the matrices. One library has prime number functions, etc.

So the matrix commands are part of the calc.bin original file in the firmware now.

The libraries are extra to that.

Or, the cat command if you are Unix/Linux, e.g.:

```
cat calc.bin *.dat >fullcalc.bin
```

> Quote:
>
> MIO was in a library (it is actually now replaced by a MED matrix Editor).

Great, docs for MED?

MIO should still be there.

The relevant library files are available on subverion:

- Extra matrix functions. This includes the MIO routine.
- Matrix editor.

In both cases, download the latest. Having these will help understand how to use them. You could also type them in all else failed, there are less than 250 lines in total.

Re: 34S Matrix Questions

*Message #8 Posted by **Marcus von Cube, Germany** on 14 Oct 2011, 5:47 p.m.,*
in response to message #3 by Egan Ford

SENDL is up to the task if you can get the serial commands to work. This might include some experimentation with speed correction factors (see the docs).

Gene is correct with SAM-BA.exe but there should be a join.cmd file in the realbuild directory to join the libs into calc_full.bin which can be sent with MySamba.

Re: 34S Matrix Questions

*Message #9 Posted by **Egan Ford** on 14 Oct 2011, 5:54 p.m.,*
in response to message #8 by Marcus von Cube, Germany

cat works just as well as join.cmd. MySamba flashed it just fine. Thanks.

I've thought about keys with dynamic labels. Dismissed mostly because they've never been practical at least before touch screens which aren't really keys.

The idea is interesting and seems very cool and nerdy. The downside is you can't see what key does what until you've entered the appropriate "mode". E.g. which shift key do I enter for xxx?

Still a nice idea.

I would become clear if the shift key is called 'Inv'. Another one could be called 'Trig' or 'Prgm'. I imagine

it could be like going through menus.

*Message #14 Posted by **Michael Kussmaul** on 16 Oct 2011, 6:32 a.m.,*

in response to message #13 by M. Joury

Me too! I'm missing a modern RPN or RPL calculator. Those 15c, 42S are all great, but to be honest quite outdated for nowadays. Personally I'm not the guy who lives in the past, so I bought the 15c LE solely because I like the form factor and RPN is a must - there is no other calculator on the market offering this...

The WP 34S looks promising as well and all involved did a nice job on it, but we can't overcome the physical limitations of it (small LCD screen, non-native keys, low memory), so even it takes longer, I would like to see a new approach like OpenRPN.

Of course, String 'Theories' require more than a 8x8 matrix, and the 15C is a little slow for computed flow dynamics anyway.

Are you seriously using a pocketable calculator in your professional work and touch the limits of the 15C? I don't, so I'd like to know your applications or that of other users asking for a next gen calculator.

Re: Pocket Sized Vertical (Portrait) Style Calculator Interest

*Message #16 Posted by **Michael Kussmaul** on 16 Oct 2011, 8:13 a.m.,*
in response to message #15 by Thomas Radtke

I don't use my calculator for all things :-) My background is physics as well but I switched to computer science for my job.

For heavy math I use computer programs (simplifying formulas, taylor expansions, etc), so I would not enter a 8x8 matrix on a calculator, because a computer still offers much better editing capabilities.

But for smaller on-the-spot calculations a calculator is much better. E.g. for OpenGL programming you have 4x4 matrices and my calculator is useful for debugging them. I also wrote some small programs to help my work, e.g. Enter an OpenGL vector x,y,z and let it run through my transformation matrix and return the resulting vector. I also need simple trigonometry calculations all the time.

I think those are the main use cases for a calculator, I don't need fancy plotting, symbolic calculations (a computer is much better at those tasks). But I'm hooked to RPN and appreciate some simple programmable capabilities. And I like to do simple calculations with a physical device, so I don't have to switch context on my computer just to open the computer-calculator-app to compute a simple cosine...

I also have a 48G, and like it very much, but it's just to big to take with me all the time. So the 15c will fit in my already filled-up bag. I even would appreciate it the 15c would be half as thick :-)

Yes, but not much. With USER mode, data entry is a breeze :-).

> Quote:
>
> But for smaller on-the-spot calculations a calculator is much better. E.g. for OpenGL programming you have 4x4 matrices and my calculator is useful for debugging them.

And the 15C can do it!

> Quote:
>
> I even would appreciate it the 15c would be half as thick :-)

But please using a steel chassis ;-).

It is my whole point that what was useful and sufficient 30 years ago hasn't changed much. Just the opposite, more and more is done on the PC, so some calculator features even became obsolete (like, as you mentioned, CAS on the 48).

Unfortunately, one feature is lost: Reliability. And that's the most important feature of all :-(.

Re: Pocket Sized Vertical (Portrait) Style Calculator Interest

*Message #18 Posted by **Michael Kussmaul** on 16 Oct 2011, 8:47 a.m.,*
in response to message #17 by Thomas Radtke

Yes, entering a 8x8 matrix is not the problem on the 15C (ok, it is, as the 15C only support 7x7 ;-) but most of the time you need to edit them afterwards (typos, changes) and this is much easier on a computer for a matrix this large.

A steel or aluminum chassis would be good as well, but while I'm enjoying my aluminum MacBook, I'm not sure, if it is a good idea for a calculator. I also have an aluminum remote control for my tv (the one from Apple) but I dropped it to the floor many times and now has 20+ ugly dents... so its much more fragil than plastic. I think for larger devices (laptops) its ok, because you don't drop them, but for smaller things (calculators) the risk is greater to drop them...

Just to clarify: I don't touch the limit of the 15C in technical terms, more in usability terms: e.g. I'm missing

- a multi line display: so I can see the full stack (at least 2 lines, more would be even better)
- alphanumeric support: so program code is less cryptic
- menu system: aka 42S for less common functions, because I don't have the manual with me all the time and I easily forget the usage of functions
- nice typesetting: e.g. In degree mode show 10° 34' 23.34" and not aka 15c 10.342334, the same for imaginary numbers etc. bonus points if the program could also output it's own special characters, e.g. a program could output "radius: 15m" instead of simply "15". Bonus points++ if the calculator understands, that the value is still 15, so I could continue calculating with it :-)
- some sort of import/export: to store programs on computer and even editing them there, and just transfer them to the calculator, as writing programs on calculator is cumbersome... I would even be happy if calculator itself would not support editing programs, so you have to write them on computer and uploading them

Like on some Casios and Commodores, yes. But then, some function would be nice to decompose the format (just to maybe put the minutes onto the stack). Easily done on HPs with a few keystrokes :-). Come to think of it, former HP had put a lot of thoughts into the firmware. That the current HP isn't able to do good firmware anymore has been proven alone by the fact that complex numbers cannot be decomposed on the 35s.

Why requesting such features when there's no one left to implement them right?

*Message #23 Posted by **Cristian Arezzini** on 17 Oct 2011, 1:09 a.m.,*
in response to message #22 by Walter B

It is indeed, but I have to say I don't mind it. First, I really *love* the big screen, and you can't have a big screen on a small calculator. Second, the 48 lives in my work bag (and before it lived in my university backpack) so its bulkiness wasn't a problem. And I love the feeling of power and sturdiness it gives - it just looks like it means business! :) And for when I'm out and about, I always have the 34s in my small shoulder bag...

*Message #25 Posted by **Marcus von Cube, Germany** on 15 Oct 2011, 4:03 p.m.,*
in response to message #8 by deleted

The keyboard layout is the same as the 30b except that you obviously plan to put the arithmetic functions to the left ("old style"). The display area seems to be large enough for a graphical display. This would imply a menu system which would very well deserve another row of keys.

*Message #4 Posted by **Jeff O.** on 14 Oct 2011, 1:59 p.m.,*
in response to message #1 by Egan Ford

The latest version, 1726, uses the current keyboard (i.e the one for which Eric's overlay works.) It has the "41C" enhancements, i.e., the function name is displayed when you press a key and NULLs out if you hold the key down for few seconds. (This feature will help when they change the keyboard, if one decides to keep loading new versions without changing the overlay.)

The above is incorrect, version 1722 is the last version that is fully compatible with Eric's overlay. See the following posts. I never used the old functions that are gone and like the new, so I can live with the change.

Re: What is the SVN version of 34S that does NOT need a keyboard change?

*Message #5 Posted by **Dominic Richens** on 14 Oct 2011, 2:10 p.m.,*
in response to message #4 by Jeff O.

Actually I forgot about the x<>y changes in 1723. It's potentially minor but the x< and >a on the x<>y are now y<> and z<>.

So I think 1722 is the last version that exactly matches Eric's overlays.

```
svn co -r 1722 https://wp34s.svn.sourceforge.net/svnroot/wp34s/trunk/realbuild realbuild
svn co -r 1722 https://wp34s.svn.sourceforge.net/svnroot/wp34s/library library
```

Use the following link:
http://wp34s.svn.sourceforge.net/viewvc/wp34s/trunk/realbuild/

If you click on calc.bin you come to a site with a list of the last revisions, and for each revision there's a 'download' option.

Franz

Finally, 34S flashed

*Message #1 Posted by **Egan Ford** on 14 Oct 2011, 1:35 p.m.*

I think I had two issues:

1. Weak Batteries. They were new, but as I struggled to get my 34S flashed I must have worn them down. At 2.7V they would not power up my other 30b.
2. Keyspan USB to Serial. I've had this for years and never had a problem using it with OS/X or Windows (virtualized/physical) or Linux (virtualized/physical). I've also used it to flash H8 and PIC without issue. Given that FTDI-based adapters have been reported to work I ordered the cheapest one I could from Amazon.

Now I can flash via Windows XP in a VMware VM under OS/X without issue. Setup: MacBook Air, OS/X 10.6.8, VMware Fusion 3.1.3 (Windows XP SP3), USB to Serial (FDTI): $13.44US from Amazon (http://www.amazon.com/gp/product/B004ETE9GO.

HP keyboards, past and present

*Message #1 Posted by **Cristian Arezzini** on 14 Oct 2011, 10:03 a.m.*

I was playing with a few old non-HP calculators I just recently bought. They are all from the early 70's. And they all have really horrible keyboards. The keys are mushy, bouncy, in a word almost unusable; while HP keyboards from that era are really nice. But you all know this.

What I was thinking today is that the quality of even non-HP keyboards is much better these days. I sometimes play, for example, with a ultra-cheap, modern Casio fx-570. Its keyboard doesn't "rotate and click", but I find it reliable: no missed keys or bounces *ever*. True, it doesn't have the pleasant click, but it's perfectly usable. Some modern HP keyboards instead, despite having the click, aren't all that reliable. I use, for example, the HP-50g and the WP-34s (30b hardware), and with both I have to keep an eye on the display, to see if all the keys registered because they sometimes don't.

I still like HP keyboards a lot, maybe I'm just saying that the "gap" between HP and others has gone - or worse yet, has reversed...

OK, "rant" over! :)

Cristian

Re: HP keyboards, past and present

*Message #2 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 14 Oct 2011, 12:18 p.m.,*
in response to message #1 by Cristian Arezzini

I always liked the HP-41 keyboard layout for the function keys, on the left (L) side of the numbers with the order top down (-) (+) (*) (/).

Never heard the reason why HP moved the function keys to the right (R) of the numbers with the order top down (/) (*) (-) (+).

Does anyone know HP's motivation to this change?

-K2

Re: HP keyboards, past and present

*Message #3 Posted by **Martin Pinckney** on 14 Oct 2011, 1:16 p.m.,*
in response to message #2 by Kerem Kapkin (Silicon Valley, CA)

No one so far as I know has successfully answered this question.

If the premise is that the most-used keys should be closest to each other, then the four basic math operators, number keys, and Enter should be grouped together, which they basically are on all HP's.

If + and - are used more frequently, then these should be closest to Enter, as on the Classics.

Why are the Pioneers and 48's the opposite of this?

The Voyagers may offer the best arrangement, since the numbers are flanked by Enter on the left, and four basic math operators on the right, plus the order of operators, combined with the dropped down Enter key, puts all the most-used keys closest to each other.

Re: HP keyboards, past and present

*Message #4 Posted by **Thomas Radtke** on 14 Oct 2011, 1:10 p.m.,*
in response to message #1 by Cristian Arezzini

Huh, I thought the 30b had a good keyboard..? The design of the 15C LE keyboard appears to be good, however. Are these 'loose' domes in the new Voyagers a first? It's great! HP should take the good job their employees do serious and care for a likewise good manufacturing. But that won't happen, unfortunately.

BTW, all my Casios had reliable keyboards, and so did my Commodores, Corvus' and Sinclairs. The only exception were TIs and some minor calculator brands like Philips.

*Message #5 Posted by **Lincoln R.** on 14 Oct 2011, 1:34 p.m.,*
in response to message #4 by Thomas Radtke

Yeah, my fx-7000g's keyboard works fine, it's just very mushy. The molded rubber 'keys' are very flimsy and flex a lot, and there's no tactile feedback.

WP34s: number display and rounding

*Message #1 Posted by **Dieter** on 14 Oct 2011, 8:44 a.m.*

In the olden days I also used a TI58 here and there. As on most TIs, its standard display format shows all digits, similar to the original HP35 or the later ALL setting, while most HPs used a fixed decimal format - FIX 2 on earlier machines and FIX 4 on later models.

But there was another difference. HPs machines, set to a FIX format, usually switch to scientific notation if the value is so small that if would round to zero. Enter Pi, and in FIX 4 you will get 3,1416. Divide this by 10000 and you'll see 0,0003. Divide again by 10 and you will get 3,1416 E-5. While TI's machines showed the same results in the first two cases, the last value was handled differently: it was simply displayed as zero (0,0000). In other words: the HP way was a switch to scientific notation while the TIs showed the result like the one you would have got after an additional RND (which returns zero in this case as well).

I think both ways of handling this are valid options. There are cases where I actually prefer the "round to zero" way. So I would like to ask two questions:

1. Do you consider an option or a flag useful that sets either the one or the other display rounding mode?

2. Especially for Pauli: if (!) this option is considered useful, is there a chance this may find its way into the 34s?

Dieter

Re: WP34s: number display and rounding

*Message #2 Posted by **Paul Dale** on 14 Oct 2011, 10:10 a.m.,*
in response to message #1 by Dieter

I don't personally care for this. If you are in FIX mode and the display switches, the value would have displayed as zero. Sounds simple enough to me at least. We will still need the switch to exponential notation for large numbers -- I assume TI's do this even though it isn't entirely consistent to my mind.

Anyway, if enough people think it is worthwhile, we could dedicate the fabled last bit of RAM to supporting this mode. I'd have to see how much flash it consumes -- the display formatting code is horrible and making changes is more difficult & more space consuming than I'd like :-(Of course, we'd have to no think of a better use of the bit :-)

As mentioned, executing RND after the underflow to exponential notation does result in the TI answer. Is this a bug or a feature I wonder?

Re: WP34s: number display and rounding

*Message #3 Posted by **Steve Simpkin** on 14 Oct 2011, 2:44 p.m.,*
in response to message #2 by Paul Dale

I am very much against this mode. I always want to know the difference between zero and 3.1416 E-5.
I am hoping that last bit of RAM will be available for a USER mode :)

Re: WP34s: number display and rounding

*Message #4 Posted by **M. Joury** on 14 Oct 2011, 4:25 p.m.,*
in response to message #3 by Steve Simpkin

I *strongly* second this. Don't see much need for a round to zero automatically (I actually think that this is a bad idea) and am very much in favor of a user mode. Given one bit left I would *strongly* opt for a user mode if at all possible.

Just my 0.02

Cheers,

-Marwan

in response to message #1 by Eddie W. Shore

You're welcome.

Actually these weren't the proceedings. The discs were made a week before the conference, before the proceedings were made. This disc was supposed to be included with the packets at registration, but due to a total failure of the USPS (the package sent by Priority Mail took 7 days to go halfway across the country), the package with the discs didn't arrive in time.

The discs contain the current copy of my website, plus a bunch of other goodies (official HP press photographs, all the manuals from HP's website, and more).

Eric

*Message #2 Posted by **Paul Dale** on 13 Oct 2011, 11:42 p.m.,*
in response to message #1 by M. Joury

These two set the assumed change over date between the Julian and Gregorian calendars for purposes of the other date commands.

- Pauli

Re: WP34S JG1582 / JG1752

*Message #3 Posted by **M. Joury** on 14 Oct 2011, 7:00 a.m.,*
in response to message #2 by Paul Dale

Right, but shouldn't they effect what J-D and D-J return? J-D and D-J seem to return the same value for either setting in my case. How can I verify that the change in setting took place? Can't seem to find that in the manual.

Example: With Either JG mode setting and for the date 10.142011 (today US date format) they both return 2,455,849.

Thanks,

-Marwan

Re: WP34S JG1582 / JG1752

*Message #4 Posted by **Marcus von Cube, Germany** on 14 Oct 2011, 7:05 a.m.,*
in response to message #3 by M. Joury

Try a date *before* the switch-over date. The Julian day should be different only between 1582 and 1752.

Yes, and choosing JG1582 or JG1752 depends on when the Gregorian calendar was adopted in which country. Some adopted in 1582 and others only in 1752. So knowing which implementation to use depends on both the year you wish to convert and knowledge of where that date originated.

Re: WP34S JG1582 / JG1752

*Message #7 Posted by **Bart (UK)** on 14 Oct 2011, 7:17 a.m.,*
in response to message #3 by M. Joury

And so it should.

The implementations depend on finding the JD for years before 1582 and 1752, when the Gregorian Calendar was adopted, depending on country.

Perhaps the "notes" in the following reference will shed some light on the subject.Julian Date Converter

Re: WP34S JG1582 / JG1752

*Message #8 Posted by **Dieter** on 14 Oct 2011, 7:25 a.m.,*
in response to message #3 by M. Joury

Sure - you will get the same result for any date after 1752. ;-)

In 1582 pope Gregory XIII introduced the calendar we still use today - the Gregorian calendar. The official switch date was Friday, 15 October 1582 which followed directly on Thursday, 4 October. The dates inbetween are not defined.

While the new calendar was adopted in many countries (e.g. most of Europe) in 1582 or shortly after, the British Empire did not do so before September 1752. So the years between 1582 and 1752 will cause different results because the countries that had switched early already had the Gregorian calendar while in the British Empire still the old Julian calendar was valid.

Before this flag was introduced the 34s generally assumed a switch in 1752, i.e. the date valid only for the British Empire. Today at least the official (and IMHO only correct) date can be set. Users in countries that did not adopt the Gregorian calendar on these two dates will only get correct results for dates after the one their country switched.

Dieter

Re: WP34S JG1582 / JG1752

*Message #9 Posted by **M. Joury** on 14 Oct 2011, 9:12 a.m.,*

So it took them 170 years extra. Applying this to metric units, the US of A are a bit overdue, aren't they? (Sorry, couldn't resist ;-)

Re: WP34S JG1582 / JG1752

*Message #11 Posted by **M. Joury** on 14 Oct 2011, 6:48 p.m.,*
in response to message #10 by Walter B

The non-metric nature of US units drives me insane! Metric is just so much more logical. The best (sarcasm on) is having to have two sets of tools to work on European cars (which is all we own) and bicycles (that are all metric) plus all the other things around the house that are not. I wonder how much this would reduce costs for US corporations if they would just get it over with and switch over.

Cheers,

-Marwan

Re: WP34S JG1582 / JG1752

*Message #12 Posted by **Paul Dale** on 14 Oct 2011, 9:43 a.m.,*

HP-15C LE Error 5 in simple loop

*Message #1 Posted by **Eric Zoob** on 13 Oct 2011, 11:30 p.m.*

I was trying to get around the PSE issue by using R/S to stop a simple program. This simple count-down loop produces "Error 5" when you get to 3.0000

```
001 LBL A
002 1
003 0
004 STO 0
005 LBL B
006 RCL 0
007 R/S
008 DSE 0
009 GSB B
010 RTN
```

Re: HP-15C LE Error 5 in simple loop

*Message #2 Posted by **Paul Dale** on 13 Oct 2011, 11:33 p.m.,*
in response to message #1 by Eric Zoob

Try GTO B instead of GSB B on line 9. You are filling up the return stack.

- Pauli

Re: HP-15C LE Error 5 in simple loop

*Message #3 Posted by **Jan** on 14 Oct 2011, 7:51 a.m.,*

O.T. Reading computer internals

*Message #1 Posted by **designnut** on 13 Oct 2011, 10:25 p.m.*

I have a program called AIDA64 that looks deep into my dcomputer (free trial). I reads ttemperatures voltages and CPU watts in use. It is a locally built-up, not a name brand. Any idea what it uses to read all that informattion?

Re: O.T. Reading computer internals

*Message #2 Posted by **David Ramsey** on 13 Oct 2011, 11:15 p.m.,*
in response to message #1 by designnut

All modern CPUs have internal temperature sensors so that they can throttle clock speed and/or voltage to keep it within its thermal envelope.

Most current motherboards have various flavors of "super I/O" chips (Fintek makes some) that can control and report on these values. AIDA64 checks for a number of these chips and probably combines information from them with information from the CPU.

Why hp-20b more expensive than 30b?

*Message #1 Posted by **Masaki Adachi** on 13 Oct 2011, 9:32 p.m.*

Something peculiar is going on through the internet stores. If you go to amazon.com and compare the sales price of HP20b and 30b, 30b is cheaper than 20b by more than $10. HP30b comes to $32.54 including shipping. Outside of Amazon, the best price I could find on 20b was from buy.com ($28). It still comes to $35 if you add the shipping charge.

This is great for people who is thinking about flashing WP34S. keyboard is of much better quality on 30b compared to 20b.

So I did a quick calculation for the cost of ownership for flashed WP34S.

$33 for hp 30b from amazon affiliated seller (incl. shipping) $3 for flash cable from Gene $5 for overlay from Eric Total $41

retail industry does a strange thing.

Re: Why hp-20b more expensive than 30b?

And add about $20 or so for a USB-to-Serial adapter most of us would need. Still, not bad at all.

Strange about those Amazon prices. About a month ago I checked and the 30b was more expensive by about $10.

Re: Why hp-20b more expensive than 30b?

*Message #6 Posted by **Masaki Adachi** on 14 Oct 2011, 12:14 p.m.,*
in response to message #5 by Dan W

You are right about USB-serial converter. The one I used is " USB to RS-232 Serial Adapter for Windows 7 (32/64bit) FTDI Chip Pro Adapter with LED" ($18+$6.50 s&h)

Three LEDs are in blue tinted DB9 shell, power, Tx and Rx.

Quite geeky when they blink while the signal are fed into calculator.

Re: Why hp-20b more expensive than 30b?

*Message #7 Posted by **Lincoln R.** on 14 Oct 2011, 1:56 a.m.,*
in response to message #1 by Masaki Adachi

The 20b is no longer manufactured, so probably everyone who was selling them cheaply sold out, and the only vendors on Amazon who still have them in stock are the ones who want to overcharge, so nobody's buying.

You can probably find a used 30b for not too much on TAS. I got mine that way for under $20 shipped. No manual, just the opened original packaging, a 30b, and a case, but you don't need the manual if you're going to be flashing it.

At any rate, from what I've heard the 20b keyboard is atrocious, however my 30b's feels great so I'd recommend the 30b.

Re: Why hp-20b more expensive than 30b?

*Message #8 Posted by **Steve Simpkin** on 14 Oct 2011, 2:41 a.m.,*
in response to message #1 by Masaki Adachi

HP30b Calculator = $22 (New from Amazon)
WP 34s Overllay = $5 (Thanks Eric)
Programming Cable = free (Thanks Gene)
Attending HHC 2011 = Priceless!

Re: Why hp-20b more expensive than 30b?

*Message #9 Posted by **gene wright** on 14 Oct 2011, 7:37 a.m.,*
in response to message #8 by Steve Simpkin

Steve's cable was free at HHC 2011. :-)

I have now had to ask $6 to send to a US address and $10 to an overseas address. Sorry about that. Email me if you want more information and I will respond with the procedure I have adopted.

Re: Why hp-20b more expensive than 30b?

*Message #10 Posted by **megarat** on 14 Oct 2011, 12:08 p.m.,*
in response to message #1 by Masaki Adachi

While this isn't as bargain-basement as one could hope for, the 20b is currently only $27.99 (or $34.93 shipped) from buy.com. That's roughly the same price as the 30b on Amazon.

hp12C capability

*Message #1 Posted by **Todd Israels** on 13 Oct 2011, 8:48 p.m.*

Will the new 12c with arm processor take the firmware for the 15C LE? I do like the desighn of the 10 series calculators. Does the 12C+ have enough memory space to make it possible to have a 12C, 15C and 16C rom on board, so the calculator to run would be selectable? I know this would prove more complicated than it appears!

Re: hp12C capability

*Message #2 Posted by **Jeff O.** on 13 Oct 2011, 9:45 p.m.,*

Is 128 kB enough?

Re: hp12C capability

*Message #3 Posted by **uhmgawa** on 13 Oct 2011, 11:29 p.m.,*
in response to message #2 by Jeff O.

> Quote:
>
> Is 128 kB enough?

For an AVR target a KEMU config including 11c/12c/15c/16c support weighs in at:

```
/usr/bin/avr-size kemu_m1284p.elf
   text    data     bss     dec     hex filename
  51498     162    2239   53899    d28b kemu_m1284p.elf
```

Note this in on a modest 8-bit AVR core which isn't exactly the runtime architecture Dennis Ritchie had in mind. So I'd expect ARM thumb code to do considerably better. Note however the firmware occupies the lion's share of flash, thus any reduction due to use of a sane runtime architecture will be proportional to actual emulator code.

Even a 64KB sam7l would suffice if the above assumption holds. Interestingly 24-28KB of flash is more

than sufficient for a single 15c configuration, and a 12c flash footprint would further reduce that by 7.5KB. I'd expect quite a bit of elbow room could be found in the sam7l128 used in the encore 12c/15c.

RWM (bss + data above) however would need to be partitioned between the 2KB of battery backed and 4KB volatile regions. But I think that is doable. Other features such as a CLI interface and support (mapping the segment display to ascii, etc..) are included in the above image, the RWM storage for which doesn't need to be persistent over power off periods or can be deconfigured altogether.

Re: hp12C capability

*Message #4 Posted by **Neil Hamilton (Ottawa)** on 14 Oct 2011, 7:11 a.m.,*
in response to message #2 by Jeff O.

I am going to take a wild guess and say that though they look very similar, that the 12c+ and the 15c LE are actually a little bit different.

The 20b and the 30b have some minor difference that allows the 30b F/W to recognize that it is running on a 20b chassis. On the 20b chassis, HP was a bit clever here and the 30b F/W runs in a reduced "20b" mode -- none of the 30b-specific functions run.

So, given that I own neither a 12c nor a 15c LE, that if you could get ahold of the 15c LE F/W, that it would not run on the 12c chassis.

Note that this is likely a one direction limitation. We have seen that 12c F/W does run on a 15c LE just as the 30b will run the 20b F/W.

Just a guess...

Re: hp12C capability

*Message #5 Posted by **Don Shepherd** on 13 Oct 2011, 10:21 p.m.,*

I would think the annunciators would be different.

Re: hp12C capability

*Message #6 Posted by **uhmgawa** on 13 Oct 2011, 11:48 p.m.,*
in response to message #5 by Don Shepherd

> Quote:
>
> I would think the annunciators would be different.

The lcd glass used in the encore voyagers is identical to the original versions w/r/t supporting the sum of all model annunciators. However no voyager model actually uses all annunciators except for the special case of the system test which enables every software driven segment of the the display.

I found this simplification convenient, allowing use of a more comfortable font for rendering annunciators in KEMU's graphic display support as there is no reason to consume limited pixel real estate for annunciators which aren't used in a given model.

Re: hp12C capability

This is true with the exception of the 12CP, it has different annunciators and uses all of them. It has larger digits too.

Re: hp12C capability

*Message #8 Posted by **NateB** on 13 Oct 2011, 10:40 p.m.,*
in response to message #1 by Todd Israels

It has been done, with modification to the older hardware.

Video

I'd be interested in replacing the guts of an original, non-working 15c with the internals of a new 12c and flashing it with the 15c firmware.

*Message #9 Posted by **Todd Israels** on 14 Oct 2011, 12:20 a.m.,*
in response to message #1 by Todd Israels

Thanks for the knowledgeable answers so far. It would be an awesome combination and appears to be possible. Maybe the 12C re purposing project could be restarted to accomplish this

Another couple of practical speed tests for the 15c

*Message #1 Posted by **Jose Gonzalez Divasson** on 13 Oct 2011, 6:19 p.m.*

Here are another couple of practical speed tests for the 15c

Blog - practical speed tests

Re: Another couple of practical speed tests for the 15c

*Message #2 Posted by **Paul Berger (Canada)** on 13 Oct 2011, 8:49 p.m.,*
in response to message #1 by Jose Gonzalez Divasson

I wrote a program to find 4 digits numbers such that A^B * C^D = ABCD I used the same algorithm on several calculators from a 41 up to a 50G and I even plowed into sysRPL for the first time and wrote a sysRPL version of the program. When I got my 15C LE I ported the 41 version of the program over to it and the result is the program on the 15C LE is almost as fast as the sysRPL program on the 50G. Since this was my first try at sysRPL it may not be the most efficient program possible but still this says a lot for the speed of 15C LE. If anyone is interested I can post all the results. I am currently attempting to port the algorithm over to a TI-59 but it is hard going, it has been many years since I programmed a TI and there are subtle differences in the way they handle thing plus of course its not RPN.

Re: Another couple of practical speed tests for the 15c

*Message #3 Posted by **Chris Randle (UK)** on 14 Oct 2011, 5:19 a.m.,*
in response to message #2 by Paul Berger (Canada)

Interested.

I'm tinkering with sysRPL at the moment, so I'd like a benchmark timing to have something to aim for.

Re: Another couple of practical speed tests for the 15c

*Message #4 Posted by **Paul Berger (Canada)** on 14 Oct 2011, 11:09 p.m.,*
in response to message #3 by Chris Randle (UK)

My program is basically 4 nested loops, one loop for each digit in the number, with the thousands being the outer loop and units the inner loop. It is not completely brute force it eliminates any values wher the x^y would be greater than the value tested, this test is not perfect and does eliminate number that are potential candidates, however it does come up with the right answer, it also eliminate any 0^x values even though some schools of thought say 0^0 =1 but it was easier to ignore this. Even though I know there is only one number that fits the A^B*C^D=ABCD I go through all numbers from 0 to 9999 with the exception noted above.

```
The results in ascending time order are as follows:
50G    SysRPL 00:01:30
15C LE RPN    00:01:39
50G    UsrRPL 00:02:29
49G    SysRPL 00:03:28
48GX#1 UsrRPL 00:05:58
```

```
75C    Basic  00:06:21
48GX#2 UsrRPL 00:06:24
49G    UsrRPL 00:06:39
71B    Basic  00:08:57
28S    UsrRPL 00:12:40
28C    UsrRPL 00:18:20
41CV   RPN    01:36:28
```

Things I learned from this exercise:
1. It takes a lot more statements to create a SysRPL program, you would really want to have a need for the extra speed to even bother.
2. Learning curve to get started with SysRPL is even steeper than UsrRPL and it is not as well documented.
3. I found writing UsrRPL pretty straight forward and since I have some programming experience it makes sense to me.
4. The memory in the 28C really is pitifully small I could not even save the program after editing it , there seemed to be enough free space but it would tell me there was no room.
5. Having a a powered on peripheral printer attached to a 41 has a very significant impact on the run time of a program, it appears that it keep checking the state of the switches on the printer as I could start and stop trace while it was running, a HPIL attached printer had no effect.
6. I wrote a version of the program for a TI-59, after using HP calculators for several years now, and being used to how they operated, it was painful to go back to program a TI and compared to the HP41 it took almost twice as many step to accomplish the same thing, and after 02:19:51 it failed to find the answer.

Notes:
1. I listed two 48GXs as one seems to be about 6% faster than the other, it seemed like a big variation to me.
2. Timing for the 41CV, 28C, 28S and 15C LE where measured using a stop watch, timing for all others was measured by the calculators clock.

Re: Another couple of practical speed tests for the 15c

*Message #5 Posted by **Marcus von Cube, Germany** on 15 Oct 2011, 4:12 a.m.,*
in response to message #4 by Paul Berger (Canada)

This would be a nice exercise on WP 34S in integer mode. I'd assume this will be the fastest. In real mode, the 34S might be even slower then the 15C LE because logs are slow.

Re: Another couple of practical speed tests for the 15c

*Message #6 Posted by **Paul Dale** on 15 Oct 2011, 4:32 a.m.,*
in response to message #5 by Marcus von Cube, Germany

I imagine it would be much faster. Integer mode doesn't use logs for y^x. It does it in a cleverer way :-) Additionally, integer logs are fast.

- Pauli

Re: Another couple of practical speed tests for the 15c

*Message #7 Posted by **Paul Dale** on 16 Oct 2011, 1:26 a.m.,*
in response to message #6 by Paul Dale

I've quickly coded this for the 34S. In 2's complement 64 bit integer mode, it takes 8.7 seconds to iterate fully over the range of possibilities. In real mode it takes a lot longer: 451.9 seconds (7 minutes 31.9 seconds). Those logarithms are hurting us lot.

The unique result is returned in register 30 and the number of TICKS in X.

I've made no real attempt to prune the search space here so I'm confident it can be sped up some more.

- Pauli

Re: Another couple of practical speed tests for the 15c

*Message #8 Posted by **Paul Berger (Canada)** on 17 Oct 2011, 12:52 p.m.,*
in response to message #7 by Paul Dale

Taking the filter out of my 15C LE program increases the run by almost one minute to 2' 28".

Re: Another couple of practical speed tests for the 15c

*Message #9 Posted by **Kiyoshi Akima** on 20 Oct 2011, 2:49 p.m.,*
in response to message #8 by Paul Berger (Canada)

I must be doing something wrong, since my first brute-force program for the 15C+

found the solution in 1:12. A minor but possibly cheating optimization brought the time down to fifteen seconds.

UserRPL on the 50g did it in 23 seconds, down to 13 in SysRPL. The current champion is the 30b at 3 seconds.

Re: Another couple of practical speed tests for the 15c

*Message #10 Posted by **Paul Berger (Canada)** on 20 Oct 2011, 3:11 p.m.,*
in response to message #9 by Kiyoshi Akima

Impressive, I would be interested in seeing your programs.

Re: Another couple of practical speed tests for the 15c

*Message #11 Posted by **Kiyoshi Akima** on 20 Oct 2011, 3:52 p.m.,*
in response to message #10 by Paul Berger (Canada)

You have mail.

It's not ready for public consumption. Give me the weekend to polish it up and I'll post it then.

Re: Another couple of practical speed tests for the 15c

*Message #12 Posted by **Paul Berger (Canada)** on 20 Oct 2011, 7:25 p.m.,*
in response to message #9 by Kiyoshi Akima

Now that I re-read your post I see the difference your time is for finding the result. My program tests all reasonable possibilities from 0000 - 9999 except 0^x that is ignored and also when it finds A^B > AB00 it skips to the next value of B and if C^D > AB00 it skips to the next value of D. As I am writing this it occurs to me that in the first case I could skip to the next value of A right away since the value B is incrementing if A^B > AB00 then A^(B+1) will certainly be larger too, and the same thing would apply for C & D. When this problem was originally posted it was not revealed that there was only one 4 digit number that would satisfy A^B*C^D = ABCD so it was necessary to check all 4 digit numbers.

Re: Another couple of practical speed tests for the 15c

*Message #13 Posted by **Kiyoshi Akima** on 21 Oct 2011, 1:29 p.m.,*
in response to message #12 by Paul Berger (Canada)

Back to the drawing board...

Okay, I'll revise my programs to find all numbers. So far the 15C+ did it in 1:28 and the HP 50g 1:09 in SysRPL. That's brute-force, without any filtering.

Re: Another couple of practical speed tests for the 15c

*Message #14 Posted by **Paul Berger (Canada)** on 15 Oct 2011, 10:29 a.m.,*
in response to message #5 by Marcus von Cube, Germany

If you wish I could provide you with a listing of my program, I don't have a WP34S at this time, but I understand the programming model is similar to 41 and 15C.

Re: Another couple of practical speed tests for the 15c

*Message #15 Posted by **Marcus von Cube, Germany** on 15 Oct 2011, 11:09 a.m.,*
in response to message #14 by Paul Berger (Canada)

A listing would be fine. Porting shouldn't be a problem.

Re: Another couple of practical speed tests for the 15c

*Message #16 Posted by **Paul Berger (Canada)** on 15 Oct 2011, 10:31 p.m.,*
in response to message #15 by Marcus von Cube, Germany

You have mail...

Re: [WP 34S] New keyboard layout (poll)

*Message #1 Posted by **Walter B** on 13 Oct 2011, 5:57 p.m.*

After discussing back and forth, it all boils down to whether (1) we keep the present layout but with changed EXIT and x<>y keys as shown in the picture below or (2) we turn to a layout as presented here (changed keys are marked):

MATRIX shall contain the new matrix commands, and L.R. all commands related to 2D data (curve fit modes, COV, etc.).

Your votes please :-)

Walter

Re: [WP 34S] New keyboard layout (poll)

*Message #2 Posted by **Cristian Arezzini** on 13 Oct 2011, 6:19 p.m.,*
in response to message #1 by Walter B

I think I'd vote for 2. But is that layout fixed? I guess if it is we won't get same-shift "window change" keys...

Cristian

Re: [WP 34S] New keyboard layout (poll)

*Message #3 Posted by **fhub** on 13 Oct 2011, 6:24 p.m.,*
in response to message #1 by Walter B

+1 for this new layout, looks really good! :-)

What two pictures Walter? only one in this thread... ?

*Message #4 Posted by **gene wright** on 13 Oct 2011, 6:26 p.m.,*
in response to message #3 by fhub

?

Re: What two pictures Walter? only one in this thread... ?

*Message #5 Posted by **fhub** on 13 Oct 2011, 6:32 p.m.,*
in response to message #4 by gene wright

Option (1) is the current layout (as in the release version) with only the 2 keys x<>y and EXIT changed as in the posted picture (which is option (2)).

Re: What two pictures Walter? only one in this thread... ?

*Message #6 Posted by **Walter B** on 14 Oct 2011, 12:50 a.m.,*
in response to message #5 by fhub

Exactly. Thanks, Franz :-)

Re: [WP 34S] New keyboard layout (poll)

*Message #7 Posted by **Eric Rechlin** on 13 Oct 2011, 6:59 p.m.,*
in response to message #1 by Walter B

Rather than moving 4 keys around, why not just put MATRIX on [3] and pi on [EEX] and leave the [*] and [DownArrow] alone? Though if there is a good reason for moving X.FCN and STATUS I'm sure I could be convinced otherwise...

Eric

Re: [WP 34S] New keyboard layout (poll)

*Message #8 Posted by **M. Joury** on 13 Oct 2011, 7:06 p.m.,*
in response to message #7 by Eric Rechlin

My thoughts exactly. What is the logic of moving X.FCN and Status?

Cheers,

-Marwan

Re: [WP 34S] New keyboard layout (poll)

*Message #9 Posted by **Walter B** on 14 Oct 2011, 1:06 a.m.,*
in response to message #8 by M. Joury

Some reasoning:

Starting point: MATRIX just looks right at *. STATUS is moved next to TEST for obvious reasons. Then X.FCN goes to 3 next to P.FCN, driving PI to EEX. Thus CLP - which became pretty "dangerous" since it deletes all programs - is no longer on the keyboard :-) (CLP was meant to clear just the current program when placed there as discussed here earlier.)

./, has a second use in alpha mode calling a catalogue of punctuation marks :-)

Re: [WP 34S] New keyboard layout (poll)

*Message #10 Posted by **Howard Owen** on 13 Oct 2011, 7:03 p.m.,*
in response to message #1 by Walter B

I only see one layout here. It looks to me like option 2. If you have an option 1 mentioned in some other thread, could you please provide a link, or else post a picture here?

If option 1 doesn't change anything other than the unshifted key functions or the H shifted plane, then I vote for that. These changes aren't significant enough to justify the pain of replacing the whole base decal, in my opinion.

Thanks for asking. :)

Re: [WP 34S] New keyboard layout (poll)

*Message #11 Posted by **Walter B** on 14 Oct 2011, 1:11 a.m.,*
in response to message #10 by Howard Owen

Please see above or read message #1 again.

Re: [WP 34S] New keyboard layout (poll)

*Message #12 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 13 Oct 2011, 7:22 p.m.,*
in response to message #1 by Walter B

I would vote for option (2) two which adds the valuable Matrix functions on the keyboard, and Pi seems to be in a better place in addition to other changes. -K2

Re: [WP 34S] New keyboard layout (poll)

*Message #13 Posted by **Dominic Richens** on 13 Oct 2011, 9:22 p.m.,*
in response to message #1 by Walter B

I've been meaning to ask this question, what does ./, do that it deserves to be on the keyboard? Doesn't ON-. do the same thing? Isn't it on the MODE catalog? Isn't it a set once only thing?

I say do option 1 and make MATRIX the h-shifted function on the decimal key.

However, I like having that 123456 block of keys be for catalogues.

I'm not sure I "get" most of the other changes on option 2 (but that's nothing new :-)

Re: [WP 34S] New keyboard layout (poll)

*Message #14 Posted by **M. Joury** on 13 Oct 2011, 9:27 p.m.,*
in response to message #13 by Dominic Richens

Good point on ./,. That would be a perfect place for PI. Then place MATRIX where PI is currently.

Re: [WP 34S] New keyboard layout (poll)

*Message #15 Posted by **Eric Rechlin** on 13 Oct 2011, 10:44 p.m.,*
in response to message #13 by Dominic Richens

I agree. Something that you only need to set once should not be on a scarce key label on the keyboard.

Eric

Re: [WP 34S] New keyboard layout (poll)

*Message #16 Posted by **Walter B** on 14 Oct 2011, 1:16 a.m.,*
in response to message #15 by Eric Rechlin

Please see my post above. Thanks :-)

Re: [WP 34S] New keyboard layout (poll)

*Message #17 Posted by **Dominic Richens** on 14 Oct 2011, 8:25 a.m.,*
in response to message #16 by Walter B

But that key is still the "." key. So even if we make MATRIX (or something else) the h-shifted function it is still no less logical place for the punctuation alpha-catalogue.

Re: [WP 34S] New keyboard layout (poll)

*Message #20 Posted by **Alexander Oestert** on 14 Oct 2011, 2:43 a.m.,*
in response to message #1 by Walter B

I vote for option 0: leave everything as it is. The proposed changes are far to insignificant in my opinion to warrant all the hassle.

Re: [WP 34S] New keyboard layout (poll)

*Message #21 Posted by **Marcus von Cube, Germany** on 14 Oct 2011, 3:52 a.m.,*
in response to message #20 by Alexander Oestert

Option 0 is essentially option 1 with just replacing the rarely used xtoa/atox with the more useful (and brand new) y<> and z<> commands and swapping OFF and SHOW. You can certainly live with your old overlay then.

Re: [WP 34S] New keyboard layout (poll)

*Message #22 Posted by **Alexander Oestert** on 14 Oct 2011, 6:11 a.m.,*
in response to message #21 by Marcus von Cube, Germany

My old overlay is really not my concern: I will just stick to the firmware version that supports it.

But from my perspective no change in the overlay is necessary at all, the gain seems too minor to me, as that I would want to render prior overlays partly obsolete. I'd rather change only inside the catalogs, but not the interface.

Again, this is only my very, very limited "curious user" perspective which should not at all influence the poll of more professional users who really need a calculator for their productive work. BTW how many of these are here amongst WP-34s users?

Re: [WP 34S] New keyboard layout (poll)

*Message #23 Posted by **Paul Dale** on 14 Oct 2011, 6:24 a.m.,*
in response to message #22 by Alexander Oestert

*Message #24 Posted by **Alexander Oestert** on 14 Oct 2011, 6:28 a.m.,*
in response to message #23 by Paul Dale

Even if that were the case, I could easily live with that. I'm not working but only playing with the WP34s. It's a wonderful toy, though! :)

[WP 34S] Time to branch? (was New keyboard layout (poll)

*Message #25 Posted by **Dominic Richens** on 14 Oct 2011, 8:19 a.m.,*
in response to message #23 by Paul Dale

> Quote:
>
> You'll miss out on bug fixes if so & I'm sure there are plenty of bugs lurking still :-(

Time to investigate branching. I would suggest branching instead of tagging, since it implies we can still propagate bugfixes. Options:

- branch off of the last 2.1 version, or last known stable version. I have been using 2.1 1664 for a while - I took that because it was the version where FIX would get me out of integer mode.
- branch now, just before the keyboard layout changes. May not be as stable, but it has the HP-41 press-and-hold behaviour, the matrix routines plus other small enhancements and bugfixes.

Or we could also do both. But I would only volunteer to maintain one of them :-)

Re: [WP 34S] Time to branch? (was New keyboard layout (poll)

*Message #26 Posted by **Paul Dale** on 14 Oct 2011, 10:03 a.m.,*
in response to message #25 by Dominic Richens

If (and it is by no means certain) we do a major change to the keyboard, there will be subversion branches involved.

We've not decided what form they will take, first we need to decide if a branch is necessary. For option 1, it isn't.

- Pauli

> Quote:
>
> Can someone remind me of the need to swap OFF and SHOW? Is it just a preference to press h-EXIT to turn the calculator off instead of g-EXIT?

Yes, it's just a preference of one (or very few) user, but with the difference that THIS preference seems to be made whereas many others are not.

Re: [WP 34S] New keyboard layout (poll)

*Message #29 Posted by **Cristian Arezzini** on 14 Oct 2011, 9:49 a.m.,*
in response to message #28 by fhub

I seem to recall that it's a preference of *many* users - people eventually got used to the way it is, but the "other" way is perceived as more intuitive, and I agree.

Oh, and this change, unlike others, comes at zero cost, as they are already going to change the layout anyway.

Cristian

Re: [WP 34S] New keyboard layout (poll)

And switching the calculator OFF is indeed a *very* useful and *often used* feature - I am indeed using this OFF many times during my calculations! ;-)

Re: [WP 34S] New keyboard layout (poll)

*Message #31 Posted by **Dominic Richens** on 14 Oct 2011, 10:30 a.m.,*
in response to message #29 by Cristian Arezzini

I tend to turn my calculator on and off a lot so I would like it to be the h-shift function. However, I can see why people who use SHOW a lot would find this a downgrade.

On the WP-34s, to be an "h-shift" function is coveted due to the proximity of the h key to the edge of the calculator.

Overall I find the postilion of the shift keys annoying, but I think that is just because I never used anything prior to the HP15C. After that the shift keys were always a "left-thumb" keys. It was the main reason for starting the WP-32sII modifications (which, at this rate, will be done in 2015).

Re: [WP 34S] New keyboard layout (poll)

*Message #32 Posted by **John Abbott (S. Africa)** on 14 Oct 2011, 2:44 a.m.,*
in response to message #1 by Walter B

I vote for #2. If Eric can provide a "keyboard patch kit" as suggested, then this makes the change easier to manage.
BTW, thanks for the overlays Eric - really professional.
John

Re: [WP 34S] New keyboard layout (poll)

*Message #33 Posted by **Marcus von Cube, Germany** on 14 Oct 2011, 4:08 a.m.,*
in response to message #1 by Walter B

There seem to be some votes for Walter's new layout. If we go this route we should go a little further:

1. Move C/Py,x to the right and drop Phi and its inverse.
2. Move STATUS to PSE (I know Walter will object to this.)
3. Move ! to to the f-shifted position of the same key (UP)
4. Move <(and)> to h-shifted UP and DOWN

5. Now we have room for SF, CF and FS? on the vacant positions of UP and DOWN. :-)

Should look like this:

This is from an older design and lacks FS? but you see the point.

I don't like this splitting of "!" and "C P(y x)" to different keys at all - these 3 functions belong together and should stay as they are currenty.

Dropping Phi and its inverse is ok, it's really not used so often.
Removing PSE is also ok, that's definitely a programming function which should go the catalog - I would prefer having DROP on the keyboard instead (of course on an other position).

Franz

The 15C has them on 0 and +, so a bit more apart, and no-one complains. In my design they are side by side.

Well, then which 'partner' would you like to give this "[g]!"?
IOW what you put on the [f]-part of this key?
Otherwise the "!" would be quite 'lonesome' ... ;-)

So do I. I consider these two functions absolutely essential in many different sciences. At least more essential than the || function for the EE department. ;-)

I sometimes have the impression that "science" here is usually considered something that is generally done not more than 3 meters (or 10 feet) away from a workbench. But there's more science out there. ;-) In finance, economics, econometrics, statistics and many, if not most other social sciences (sic!) the normal distribution (and others) is at least as essential as P<>R in engineering. Please don't let us forget this.

There is even more space over the keys left and right of EEX, so why not even write the following 'reminder': "do not forget: LastX = RCL L" ;-)

I do as well. RCL L works, and I am not suggesting removing it. But if WP, et al really want to creating something that would be broadly accepted by RPN users then LASTx should be present.

If you create something that meets the needs of a small market, then only a small market will use it.

I guess the question is, if HP were to build the 34S, would they do it without LASTx?

Think about the 50g.

SWAP (or X<>Y or whatever your preferred nomenclature) is one of the most important keys in RPN, yet it isn't labeled on the 50g at all. You just have to know that it is on the right arrow key!

That's RPL - and therefore doesn't count in the world of pure RPN. ;-)

Dieter

Re: [WP 34S] New keyboard layout (poll)

*Message #52 Posted by **Egan Ford** on 14 Oct 2011, 12:06 p.m.,*

in response to message #50 by Eric Rechlin

50g is RPL. 50g also had to make compromises to support ALG. For a pure RPN calculator, why compromise on LASTx?

If the audience for the 34S is only this community, then apparently most do not want LASTx. So don't have it. But if you all really want to push this to a larger audience, then think about what the average RPN user would expect.

Lastly, what if WP, et al had put LASTx on the keyboard, and you put it on the overlay, and 100s of overlays have shipped. Do you think we would be having this discussion? Dumping LASTx to save a label space? Probably not. Because there are lower priority functions such as || that would be considered first.

Re: [WP 34S] New keyboard layout (poll)

*Message #55 Posted by **Dieter** on 14 Oct 2011, 8:03 a.m.,*
in response to message #1 by Walter B

I prefer the layout shown in the picture (that's option 2, if I get it right). Not only because it leaves the normal distribution on the keyboard - an essential function not only in mathematics and statistics but also for everyday use in the social sciences. The arrangement of the menus on the six digit keys is nice as well.

But there still is room for improvement. ;-) I really like the idea of the two new functions Y<> and Z<>. But if there is sufficient RAM and even keyboard space for these two, why has as dedicated LastX been rejected for the same reasons (no RAM, valuable keyboard space wasted)?

I already mentioned that the f-shifted exponential functions and the g-shifted logs feel strange to me, maybe even "wrong". The reason for this may be the fact that all earlier HP calculators with different shift keys for these functions did it exactly the other way round: Take a look at classics like the HP-25, the 65, the 67 or the 34C - they all use f ln and g e^x as well as f log and g 10^x. Maybe this is more intuitive since - just like sqrt and x^2 - the f-shifted function usually returns a result smaller than the input while g-shift returns a larger one. I think we should do it this way as well and swap f and g here. Walter, what do you think?

As others already suggested, Pi should better go to h [.] while the decimal marker can be set using the

respective command. Which usually is only done once by the user anyway, or even by the SETEUR etc. commands. Also, SHOW is a command that should be accessible as conveniently as possible. There is a reason why it has an exposed position on most HPs. So a h prefix is the obvious choice.

Suggestion for a useful and consistent layout:

h [ENTER] = SHOW
h [EEX] = CONST (yes, it will fit)
h [.] = Pi

This would also free g [EXIT] for LastX, maybe only as a shortcut for RCL L so that virtually no RAM is required.

What do you think?
Also take a look at the good old 34C. ;-)

The keyboard space these occupy wasn't well utilised (ATOX and XTOA under different names) and we'd passed around many suggestions for existing commands to put there, none of which fitted in well. These are the best we came up with without leaving the slots empty.

The way I implemented these commands actually *saved* a little flash. There is one common routine for all of these exchanges and now it adds the opcode to a base address to decide the source register instead of always taking the X register. This did cost some additional bytes of course and more in function table overheads. However, I took this chance to remove the x<>y and complex x<>y dedicated functions -- they, like LastX, aren't necessary as separate standalone commands -- this saved about a hundred bytes which offset the extra I used.

The nett result is the x<>y command doesn't display as nicely as before, we have saved a few bytes, the two difficult to fill keyboard slots are occupied consistently and we've gained some potentially useful commands.

I think this is a worthwhile exchange and others seem to agree.

The 34S is at the point of everything being a compromise :-(

Re: [WP 34S] New keyboard layout (poll)

*Message #59 Posted by **Dieter** on 14 Oct 2011, 11:36 a.m.,*
in response to message #55 by Dieter

In other words, my proposal would look like this:

If [./,] has to be saved, simply leave it on h [.] and move Pi to h [0]. PSE may go to a catalog since it is used for programming only.
In the picture g [EXIT] is not used. This space may be taken by PSE or another useful command. For instance, let's say... LSTX. :-D

Dieter

Re: [WP 34S] New keyboard layout (poll)

*Message #60 Posted by **Alexander Oestert** on 14 Oct 2011, 1:27 p.m.,*
in response to message #59 by Dieter

Why "for programming ONLY"? Programming is one of the main reasons I use the WP34s - and fast (and dirty) programming that is. As PSE is a very important function for this kind of programs to have for me, I'm absolutely happy with having it well in reach on the keyboard.

Re: [WP 34S] New keyboard layout (poll)

*Message #61 Posted by **Dieter** on 14 Oct 2011, 1:59 p.m.,*
in response to message #60 by Alexander Oestert

Quote:

> Why "for programming ONLY"?

Because PSE does not make much sense in Run mode, does it? It's useful only (in the sense of "exclusively") in Program mode.

But look, in the picture PSE still is there. ;-) The layout even has an unassigned position at g EXIT. So at least three out of four possible commands (Pi, LastX, PSE and . / ,) can be realized.

Dieter

Re: [WP 34S] New keyboard layout (poll)

*Message #62 Posted by **Walter B** on 14 Oct 2011, 4:57 p.m.,*

Please also note PSE has a second use as indicator where to find Greek PSI in alpha mode.

Re: [WP 34S] New keyboard layout (poll)

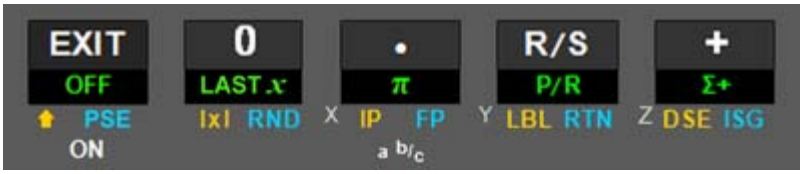
*Message #63 Posted by **Dieter** on 14 Oct 2011, 5:45 p.m.,*
in response to message #62 by Walter B

Well, the proposed layout shows just some humble improvements of your option 2 of course. ;-)

What do you think about it? I feel the swapped positions of the logarithmic and exponential functions make some sense. For me, it looks much more ..."natural" and intuitive this way.

Concerning the number of letters in key labels: if six letters like MATRIX fit on a key in a row that is five keys wide, probably five letters like CONST will fit as well in a row that's six keys wide. And if everything else fails it can also be done with four or even three letters: CONS or CNST resp. CON or CST.

Leaving PSE on the keyboard is no problem as well. Here's another option for the last row:



It even includes another function whose name shall not be mentioned here. ;-)

Where <20% increase may be tolerable, 25% may be just too much. That's the difference between "probably" and "sure" ;-) It will not fit. And BTW, I don't see any relation of CONST to EEX.

Regarding PSE, I prefer it remaining on 0 for reasons stated in the manual.

Walter

Re: [WP 34S] New keyboard layout (poll)

*Message #65 Posted by **Dieter** on 16 Oct 2011, 9:32 a.m.,*
in response to message #64 by Walter B

Walter -

you mentioned two reasons why CONST should remain on [ENTER] and Pi on [EEX]. I would like to convice you that there are other, IMHO even better reasons for the solution I suggested.

1. **"CONST is too wide for the [EEX] key"**

   I do not have a 30B here, but I assume its keys are roughly (if not exactly) the same size as those on my 35s. Here, the delete key (back arrow) has CLEAR (in capitals) printed on it. Other keys in the same row show ABS(space)N and RND(space)O. So I do not see why CONST will not fit just as well. We can even gain some space with a slightly (virtually imperceptible) condensed font.

   If there *really* was not enough space, four letters would do just as well (CONS or CNST). HP themselves did so when neccessary, even in models as similar as the 67 and 97: On the latter it's LASTX, FRAC, MERGE and PAUSE while on the 67 it says LSTX, FRC, MRG and PSE. That's perfectly okay - I do not see any problem with this either.

2. **"There is no relation between [EEX] and CONST, so Pi should stay there"**

   First of all, there is no relation between [EEX] and Pi either. ;-)

   Second, Pi is a constant, like e or Phi, the golden ratio. That's why it appears in the CONST catalog. So currently [EEX] holds the mathematical constant Pi, while I simply suggest putting *all* constants there. The constants menu on [EEX] is neither more nor less intuitive or logic than its placement on the [ENTER] key. Just as [EEX] means "enter exponent", the shifted function is "enter constant".

   Finally, Pi is a constant that is frequently used in manual calculations. So it seems natural that it should be close to the digit keys. The designers of the original 35A knew that and placed this key next to the decimal point. On most classic HPs it's a shifted function of a digit key as well, and so it is in the original 34S layout (h [3]). That's why I think it should go to h [.] or h [0].

   The latter two keys are wider than those in the upper rows, so there is another option: Use one of these for CONST. This is even very intuitive: a constant is

entered with one of the digit keys, just like any other number.

3. **"PSE must stay on [0] because in alpha mode the Greek Psi is entered [g] [0] with PSE printed below as a reminder"**

   There is no reason why this should not work with another key just as well. In my last proposal the user presses [g] [EXIT] with PSE printed below. Even if for some other reason PSE has to stay on h [0] there is no problem either:

   h [0] = PSE
   h [.] = CONST
   h [EEX] = Pi
   h [ENTER] = SHOW

   Which leaves some space for
   g {EXIT] = LastX

Walter, you did not comment on the swapped log/exp functions. So I assume you like it just as I do. I hope I also could give some good reasons for the other changes I suggested.

Dieter

Re: [WP 34S] New keyboard layout (poll)

*Message #66 Posted by **Walter B** on 14 Oct 2011, 5:13 p.m.,*
in response to message #59 by Dieter

Dieter,

Thanks for supplying a complete proposal :-) But take care: you can put more letters in that bitmap than you can read on the real calculator. No way putting CONST on one of those small keys IMHO. So PI is - again IMHO - a far better inhabitant there. Continue trying ;-)

OK, if I'd do this we'll gain three empty h-shifted locations. So what do you want to put there (a) fitting in that environment (b) better than the removed functions do? If you suggest something, please do it completely instead of only half ;-)

Re: [WP 34S] New keyboard layout (poll)

*Message #70 Posted by **Mike Mancini** on 14 Oct 2011, 1:42 p.m.,*
in response to message #1 by Walter B

Hi all, long time lurker, first time poster and recent WP 34s user.

I'd strongly recommend rethinking the colors selected, especially for the f and h labels. They don't appear to provide nearly enough contrast for a anyone with moderate to severe dichromacy (e.g. red-green or blue-yellow). Going darker with the f key (to more of an burnt orange) and lighter with the h key (to more of a mint) would be one fix. Granted, I'm going off the picture and not the overlay and things change on paper vs. screen, but I think it's important to bring up the accessibility concerns now since there's talk of changing the layout.

Re: [WP 34S] New keyboard layout (poll)

*Message #71 Posted by **Walter B** on 14 Oct 2011, 4:55 p.m.,*
in response to message #70 by Mike Mancini

Please check the colors on the overlay. It's significantly less brilliant than the emulator skin. If the problem persists, please return. TIA

Walter

So, if you stay with version 1... the MATRIX commands...

*Message #72 Posted by **gene wright** on 14 Oct 2011, 4:04 p.m.,*

in response to message #1 by Walter B

are only in X.FCN ?

Re: So, if you stay with version 1... the MATRIX commands...

*Message #73 Posted by **Walter B** on 14 Oct 2011, 4:52 p.m.,*
in response to message #72 by gene wright

No, Sir. They are distributed to X.FCN, P.FCN, and TEST. You can check this most easily employing the emulator 8-)

the MATRIX commands... and a new function T<> ?

*Message #74 Posted by **gene wright** on 14 Oct 2011, 5:11 p.m.,*
in response to message #73 by Walter B

Ah, I had found M-DET and M-INV in X.FCN, but I guess my concern is that they are in one or three :-) menus, rather than in a MATRIX menu itself. They are also out of the internal menu, it appears.

Hmm... think I'm leaning for option 2.

Another thought... although it would not be needed for stack exchange operations, T<> _ _ would be a useful function to put into the X.FCN catalog.

T exchange with X, Y or Z can be effected by doing the reverse exchange, but T exchange with a data memory cannot.

How about that as an addition to the X.FCN catalog? T<> ?

Re: the MATRIX commands... and a new function T<> ?

That's my impression either. But it's very useful for programming. Just like any other advanced stack manipulation command. So the f- and g-shifted [X<>Y] key is free for two other commands that are more useful for manual calculations. I am sure we will find some. ;-)

Please don't let us get trapped by the idea that the primary target is a layout that *looks* nice, and therefore Y<> and Z<> should get assigned to the X<>Y key since all these go so well with each other and all these exchange functions on the same key look so nice. We are talking about a tool here, and it should support the user with a well balanced set of keyboard functions. The question whether a function should be accessible on the keyboard or by browsing a menu should not be answered by design aspects but by usefulness instead.

Dieter

> Ah, I had found M-DET and M-INV in X.FCN, but I guess my concern is that they are in one or three :-) menus, rather than in a MATRIX menu itself. They are also out of the internal menu, it appears.

Something that hasn't been mentioned about the MATRIX catalogue. All the matrix commands start M-, so navigating this catalogue will require you to enter these two before the first possible distinguishing character. i.e. a standalone MATRIX catalogue will be *more* difficult to navigate to commands in than it currently is.

> Quote:
>
> Another thought... although it would not be needed for stack exchange operations, T<> _ _ would be a useful function to put into the X.FCN catalog.

:-) Way ahead here. I can add A<> B<> C<> and D<> for forty more bytes. I think we at the point of diminishing returns by then so I didn't bother.

From much of the discussions here, it seems most people are stuck on the four level stack.

As expected, it takes a conservative audience a long time to get accustomed to innovations ;-/ But I'm happy (and content) we did this step towards eight stack levels. Now let time go by ... :-)

in response to message #79 by Paul Dale

Do we have the chance of a generic register exchange and/or register move command? It would need some tuning in the input logic to input two addresses. To squeeze it into a single op-code is another treat. Maybe not worth the hassle...

Re: the MATRIX commands... and a new function T<> ?

*Message #82 Posted by **Paul Dale** on 15 Oct 2011, 4:30 a.m.,*
in response to message #81 by Marcus von Cube, Germany

It cannott be squeezed into a single opcode. We might be able to do one in a double length op-code -- actually there would be plenty of space for it.

The input logic would be a problem. Especially given the zero free bytes.

There are a whole suite of double register commands that could be useful. Arithmetic STO, conditional tests .... Sadly, no space in the 34S for these.

And just because of this the STOS/RCLS A would have been quite useful commands.
I really don't understand why you've removed them again and again, when OTOH you've put in lots of other stack commands (like all those new swaps). :-(

Re: [WP 34S] New keyboard layout (intermediate poll results)

*Message #86 Posted by **Walter B** on 15 Oct 2011, 5:26 p.m.,*
in response to message #1 by Walter B

At the bottom line so far, it's nine in favour of option 2, zero for option 1, one for an unchanged layout. Votes of ourselves are not counted. Meanwhile, however, two new stack commands were placed below of x<>y, so there is a layout change anyway now.

*Message #89 Posted by **Marcus von Cube, Germany** on 16 Oct 2011, 12:47 p.m.,*
in response to message #86 by Walter B

The sample size is very small compared to the population size. The latter should best be known to Eric who can tell to how many different people he has sold overlays. We might assume that only people which are interested in an updated layout post here. "Never believe in a statistic which you haven't forged yourself!".

Re: [WP 34S] New keyboard layout (intermediate poll results)

*Message #90 Posted by **Eric Rechlin** on 16 Oct 2011, 2:44 p.m.,*
in response to message #89 by Marcus von Cube, Germany

I've sold about 230 of them, and the average person bought 2 of them, so there are probably around 110-120 people in the population.

Must not?

Given the volume of discussion, objections, and complaints in this thread regarding the current proposals, I surmise that your *must not* directive will be undoubtedly ignored.

I predict that most that didn't vote will keep their current layout and firmware, or perhaps upgrade to the latest firmware that supports the old layout. And less than half will actually get a new 30b for a new overlay or get patches from Eric.

IMHO, there are a lot of great suggestions, even from the 34S development team, that are getting ignored. Expect objections, suggestions, criticisms, and yes complaints.

*Message #96 Posted by **Walter B** on 16 Oct 2011, 5:50 p.m.,*
in response to message #95 by Egan Ford

That was a translation of a German saying "Wer nicht zur Wahl geht, darf sich hinterher nicht über das Ergebnis beschweren." Nevertheless, I know people will complain always for any reason whatsoever. But the receiver of such complaints may think (and say): "Well, folks, you didn't vote, so ..."

Re: [WP 34S] New keyboard layout (intermediate poll results)

*Message #97 Posted by **Ángel Martin** on 17 Oct 2011, 4:24 a.m.,*
in response to message #96 by Walter B

I'm sure I'm not the best qualified to comment on German-to-English translations, but in my experience DÜRFEN and MÜSSEN are widely misused by non-native speakers when moving between both languanges.

For me it works better to associate DÜRFEN to "being allowed to", and MÜSSEN to "can" - in contexts like the one used here. Not only it's more polite, but also it doesn't sound so harsh and regimented, I mean saying you "musn't" do something has lots of connotations beyond not being allowed to.

Cheers, ÁM.

Re: [WP 34S] New keyboard layout (intermediate poll results)

in response to message #98 by Jeff O.

My reason for voting for #2 was to put the MATRIX catalog on the keyboard.

Re: [WP 34S] New keyboard layout (intermediate poll results)

*Message #100 Posted by **Marcus von Cube, Germany** on 17 Oct 2011, 8:06 a.m.,*
in response to message #99 by gene wright

This looks nicer than it actually is. If you put all matrix command in one catalog, tests and all, it's harder to find a function therein. All commands start with M- (or M., we are in a discussion about the nomenclature). To navigate, say to M-DET, you have to press 7 (for M), f, ., and finally D, to get there. This is true for the current arrangement, too, but the number of matrix commands in each catalog is smaller because they are distributed over TEST, X.FCN and P.FCN.

Re: [WP 34S] New keyboard layout (intermediate poll results)

*Message #101 Posted by **Walter B** on 17 Oct 2011, 8:30 a.m.,*

> It's just a matter of proper naming :-)

Or of having other ideas, like the following: ;-)

What if you would fill the input/keyboard buffer automatically with the 2 codes for "M" and "-" (or "." if it's changed again) when the user calls the MATRIX catalog?
Then his first 'real' keypress would bring him already to the desired function.

Franz

Re: [WP 34S] New keyboard layout (intermediate poll results)

*Message #103 Posted by **Eric Rechlin** on 17 Oct 2011, 10:12 a.m.,*
in response to message #102 by fhub

What if you change the search algorithm?

In other words, if you press a letter, but no command starts with that letter, instead jump to the first command with that letter at the earliest position in its name.

Eric

Re: [WP 34S] New keyboard layout (intermediate poll results)

*Message #104 Posted by **Marcus von Cube, Germany** on 17 Oct 2011, 10:14 a.m.,*
in response to message #103 by Eric Rechlin

What if you press the next character then? Jump to the next command or to the next better match?

Re: [WP 34S] New keyboard layout (intermediate poll results)

*Message #105 Posted by **Eric Rechlin** on 17 Oct 2011, 11:00 a.m.,*
in response to message #104 by Marcus von Cube, Germany

You could do it like the 50g and have a timeout. If the next character is typed soon (1-2 seconds or so) after the last one, it will use that. Otherwise, treat the next character as starting over.

Eric

Re: [WP 34S] New keyboard layout (intermediate poll results)

*Message #106 Posted by **Marcus von Cube, Germany** on 17 Oct 2011, 11:36 a.m.,*
in response to message #105 by Eric Rechlin

That's already there but what will happen upon a timeout? Back to square one or to square three? As long as I can't reliably mark the already selected characters I'll refrain from such an automatism.

It we had a value stored with each command to indicate the first character position to search for we might have a chance to implement such behavior consistently and globally for all catalogs, but I doubt we find the space in our tables. Pauli? Walter?

Re: [WP 34S] New keyboard layout (intermediate poll results)

*Message #107 Posted by **Walter B** on 17 Oct 2011, 1:01 p.m.,*
in response to message #106 by Marcus von Cube, Germany

KISS. As written above already. But I'm abroad right now.

Re: [WP 34S] New keyboard layout (intermediate poll results)

*Message #108 Posted by **Marcus von Cube, Germany** on 17 Oct 2011, 10:13 a.m.,*
in response to message #102 by fhub

I was thinking about this but we have no way of telling the user that we have already done part of the navigation for him. This seems a bit too surprising. We cannot properly underline the characters already selected and inverting them is too ugly. (There are more problems to solve here which are of pure technical nature but very hard to overcome: The timeout resetting the pointer to the beginning occurs while the processor is off and is only detected when the next key is pressed. This makes it impossible to reset the navigation cursor at the right time.)

Re: [WP 34S] New keyboard layout (intermediate poll results)

*Message #109 Posted by **Paul Dale** on 17 Oct 2011, 5:35 p.m.,*
in response to message #108 by Marcus von Cube, Germany

Underline is definitely out. So is inverse. We've tired both and the dot matrix portion of the screen isn't up to it.

Pre-loading the M- like we do for the complex catalogue would be possible but I doubt we've got enough code space left for this.

The old caveat applies: be care what you ask for, you just might get it :-)

HP Business Website - HP 15c

*Message #1 Posted by **Brandon Poindexter** on 13 Oct 2011, 3:57 p.m.*

So thinking that the "Business" website for HP had a "buy now" button for the HP 15c meant that it was in stock, I ordered one on the 10th. And also chose FedEx priority overnight because it was only a $5 difference from the regular shipping. In any case I still have not gotten a shipping confirmation, yet checking the status of my package on their website, a single line reads : Ship Complete - Yes. So does that mean its been shipped out? Its been like that since the day I ordered.

So has anyone who ordered from the HP business website gotten their HP 15c LE? Or is the "buy now" button more like a we-don't-have-any-but-order-anyway deal?

Re: HP Business Website - HP 15c

*Message #2 Posted by **Paul Gaster** on 13 Oct 2011, 4:53 p.m.,*
in response to message #1 by Brandon Poindexter

I think we are both in the same boat. I ordered on 9/25 and the "Cust. Quoted Delivery Date" changes each day to the current date. I also assumed they were in stock when I ordered. If not why even allow orders without at least warning people?

I think the Ship Complete means that if multiple items are in the order to wait until all items are in stock before shipping. I ordered two and I seem to remember a question about that in the order process.

Last week I did give them a call and was told that they would not get any in stock until near the end of the month.

Re: HP Business Website - HP 15c

*Message #3 Posted by **Geoffrey Wang** on 13 Oct 2011, 5:53 p.m.,*
in response to message #2 by Paul Gaster

I ordered one on 9/26 and just today I got the "order shipped" email with a tracking number. I guess they got some in stock and must be backfilling them.

Re: HP Business Website - HP 15c

*Message #4 Posted by **JamesT** on 13 Oct 2011, 7:06 p.m.,*
in response to message #3 by Geoffrey Wang

I also placed my order on 9/26, but no shipping update yet. Let's hope they're moving through the queue now....

Re: HP Business Website - HP 15c

*Message #5 Posted by **Mark R** on 13 Oct 2011, 9:03 p.m.,*
in response to message #4 by JamesT

I ordered one on 9/24 from the small biz website. When I checked the status (using the link in the order confirmation e-mail) I also saw the "Cust quoted ship date" change each day to the current date. I sent HP an e-mail to ask about the status of my order on 10/10 (again, using the link in the order confirmation e-mail). I just recieved a e-mail today stating that it has shipped. Not sure if it had anything to do with the inquiry e-mail, but it might be worth the effort to contact HP if you still haven't heard anything.

Hmm, so I suppose if your order is more than about 2 weeks you get a shipping update for your HP 15c LE. I was excited the past 2 days expecting a box to be at my front door, but I guess now I know that I have to wait a couple weeks. Ah well.

Maybe I should be glad that they cant immediately ship out, since it could mean that they are selling these REALLY well. One can only hope that this succeeds beyond it's "LE" status and turn into a full time HP model.

in response to message #7 by Brandon Poindexter

One can only hope that this succeeds beyond it's "LE" status and turn into a full time HP model.

True. There really seems to be a market for this thing, provided the quality issues will be resolved. In fact, I can barely wait for a decent new release of the 15C free of flaws and with 100+ times the speed of the original. It would be just what I always hoped HP would bring to the market, not as a collectors item but as a tool for my work. Although much numerical work nowadays is done via a PC there are many occasions (even in the course of using a numerical package) in which a handheld calculator is a pure convenience (no switching between windows etc). And with these speeds you really have some computing-power with you in your shirtpocked while not being at your desk. So: go for it HP!

Re: HP Business Website - HP 15c

in response to message #10 by Jan

> Quote:
>
> I can barely wait for a decent new release of the 15C free of flaws and with 100+ times the speed of the original.

One of the current (no pun intended) "flaws" of the 15c LE is excessive power drain on the batteries. The power drain on keypress will hopefully be an easy fix with no consequences, but the power drain during program execution is (I think, I am not one of the experts on this) directly related to the speed. So if they fix this issue, then the "100+ times the speed of the original" claim may no longer be possible. I am hoping they might implement some sort of power management that would allow high speed for brief periods, then throttle back, and maybe a selectable high-speed mode for when you really need results fast and don't care about battery life.

You can't have your cake and eat it too.

Re: HP Business Website - HP 15c

*Message #13 Posted by **Jeff O.** on 14 Oct 2011, 12:23 p.m.,*
in response to message #12 by Michael de Estrada

Depends on your definition of cake. If I want speed, why can't I have it at the expense of battery life? If you want battery life, why can't you have it at the expense of speed? Of course I have no idea if such choices would be possible to give to the user with the 15c LE platform, but we do get that choice with wp34s, for example. I am naive enough to believe it to be possible with the 15c LE.

Re: HP Business Website - HP 15c

*Message #14 Posted by **Lincoln R.** on 14 Oct 2011, 12:04 p.m.,*
in response to message #11 by Jeff O.

I think the power drain issue people were complaining about the most was that pushing buttons caused high drain (higher than current 12C+ firmware). Yes, the calculator sucks power while doing computations, but that's not much time unless you're running a large program.

Re: HP Business Website - HP 15c

*Message #15 Posted by **Jeff O.** on 14 Oct 2011, 12:24 p.m.,*
in response to message #14 by Lincoln R.

I think some strong feelings were expressed that the power drain during program execution is not acceptable.

Re: HP Business Website - HP 15c

*Message #16 Posted by **Jan** on 14 Oct 2011, 12:28 p.m.,*
in response to message #11 by Jeff O.

Interesting info. How serious are these problems actually? Maybe things will turn out not that bad in practice. After all, higher speed also means shorter running times. It will actually depend on the "mechanism" tipping the balance (the large magnitude of the current during a programrun or the shortening of the runtime itself) how things will eventually work out. Personally I would say that we have a problem in this respect only when power consumption becomes excessive in such a way that battery-life is reduced to 1 month or less upon intensive use of the calculator. In any other circumstance I would be willing to pay for speed.

WP34s and complexity

*Message #1 Posted by **Thomas Chrapkiewicz** on 13 Oct 2011, 2:43 p.m.*

Firstly, I'd like to re-iterate that the WP34s (2.1 1630)is an awesome machine. Again, my thanks and congratulations to all that are supporting it.

I am concerned about support as this machine continues to evolve. Functionality will be added to support users requirements and potential bugs will be awakened or generated.

I hope that we will maintain control of various 'stepping stones' along this development path.

For example, there are matrix functions being added to the current machine. There may be compromises in other functionality of the machine (for instance, loss of some of the 9 flash areas). Perhaps to some users, a '2.1' machine with 9 flash areas is more important than a '2.2' machine with only 5 flash areas). I hope that all documentation, source and .bin files will continue to be available for all variations.

TomC

Re: WP34s and complexity

*Message #2 Posted by **Walter B** on 13 Oct 2011, 4:05 p.m.,*
in response to message #1 by Thomas Chrapkiewicz

AFAIK, that's exactly what sourceforge and SVN is for: you can go to any build and get the files for that.

Re: WP34s and complexity

*Message #3 Posted by **Thomas Chrapkiewicz** on 13 Oct 2011, 4:20 p.m.,*
in response to message #2 by Walter B

I agree, that is what SVN is for. However, for instance, I was looking for a version 2.0 (pdf)manual. How does one find that?

Thanks TomC

Re: WP34s and complexity

*Message #4 Posted by **Dominic Richens** on 13 Oct 2011, 6:16 p.m.,*
in response to message #3 by Thomas Chrapkiewicz

Because the file was renamed, you need to search through the history of the doc directory:

http://wp34s.svn.sourceforge.net/viewvc/wp34s/doc/Manual_wp_34s_2_0.pdf?pathrev=1265

This is a typical problem with most RCS. What should be done is that the file name never changes, and create an "edition", such as a symlinks to a specific version with that verion in it's name.

Re: WP34s and complexity

*Message #5 Posted by **Thomas Chrapkiewicz** on 13 Oct 2011, 11:39 p.m.,*
in response to message #4 by Dominic Richens

Thank you Dominic; that is a help, however, I have a few pages from a DIFFERENT 2.0 version of the documentation.

I had printed part of the 2.0 manual but did not save the entire document. The version I have parts of has 34s 2.0 1099 on the front/title page and has 81 pages.

If I change the last digits of the URL you gave me to 1099, I get a manual that looks close (it also has 81 pages), but the front/title page shows 34s 2.0 1089.

How does one go about searching for these manuals in the RCS? Do they no longer exist?

in response to message #5 by Thomas Chrapkiewicz

Looking for build number 1099 of calc.bin and the respective documentation, you find it as follows:

1. Start here: http://sourceforge.net/projects/wp34s/develop
2. Clicking on "browse code" will take you here: http://wp34s.svn.sourceforge.net/viewvc/wp34s/
3. Click on trunk/ , then realbuild/ . Now you'll be here: http://wp34s.svn.sourceforge.net/viewvc/wp34s/trunk/realbuild/
4. Choose calc.bin for obvious reasons. Then scroll way (!) down until 1099.
5. Clicking on that number brings you here: http://wp34s.svn.sourceforge.net/viewvc/wp34s?view=revision&revision=1099 You can download calc.bin from one of its neighbouring sites.
6. Go to next revision twice, reaching http://wp34s.svn.sourceforge.net/viewvc/wp34s?view=revision&revision=1101 (surprise! ;-) Now you're next to the documentation you want. Just download it :-)

HTH,
Walter

in response to message #7 by Walter B

Hello Walter:

Thank you very much! That gives us a reliable method to get to any .bin file.

However, I do not understand your last step, "..go to next revision twice."

Thanks, TomC

Re: WP34s and complexity

*Message #9 Posted by **Walter B** on 16 Oct 2011, 10:14 a.m.,*
in response to message #8 by Thomas Chrapkiewicz

Being at step 5, you'll find on that site a tag "Jump to revision: ..." "Go" followed by two arrows "Previous revision" and "Next revision". Clicking twice on "Next revision" will take you from 1099 to 1101.

Re: WP34s and complexity

[WP-34S] Flashing/chaining and assembler problems

*Message #1 Posted by **Cristian Arezzini** on 13 Oct 2011, 2:41 p.m.*

I just reflashed the calc with the latest svn version to try the matrix programs, and as it is rather tedious to upload every single file (the calc.bin and the five .dat files) one by one, checking the entry point for each, I tried "chaining" them into a single file, to send it in one go - but it didn't work. I got a file that is about 131Kb in size, but when I try to send it with Samba, I get an "Out of memory" error.

Also, I tried using the assembler to re-encode my programs (calc version is 1725, and assembler opcode version is 1725 too) but I get the following error: "ERROR: Cannot recognize mnemonic at line 25 of file mySrc.wp34s: -> 023 x[<->]y <-" Has something changed? The MySrc file was created by the assembler a few weeks ago, and I didn't hand-edit it...

Cristian

Re: [WP-34S] Flashing/chaining and assembler problems

*Message #2 Posted by **Mark Hardman** on 13 Oct 2011, 2:52 p.m.,*
in response to message #1 by Cristian Arezzini

See Marcus' explaination at:

x[<->]y is now x[<->] Y

Re: [WP-34S] Flashing/chaining and assembler problems

*Message #3 Posted by **Cristian Arezzini** on 13 Oct 2011, 2:56 p.m.,*
in response to message #2 by Mark Hardman

Thank you... I had missed that. Things happen so fast that I seem to be unable to stay up-to-date with everything :(Sorry for missing that!

The other question still stands though... unless I missed something else :)

Cristian

Re: [WP-34S] Flashing/chaining and assembler problems

*Message #4 Posted by **Mark Hardman** on 13 Oct 2011, 3:12 p.m.,*
in response to message #3 by Cristian Arezzini

You might try Jeff O's method of combining the flash regions using the DOS "copy /b" command.

Flashing HP 20b for WP 34S

Re: [WP-34S] Flashing/chaining and assembler problems

*Message #5 Posted by **Cristian Arezzini** on 13 Oct 2011, 3:38 p.m.,*
in response to message #4 by Mark Hardman

I did the Linux equivalent of that, and the file I got is actually a binary concatenation of the input files. I'm wondering if the problem is that the calc.bin is smaller than the "official" 128Kb? But then, I don't see how that should cause an "out of memory".

Another question: am I right in thinking that if I transfer all the .dat files that are in the library folder, I end up with no free flash regions? If it is so, which would mean that the various .dat files given to us are just "modules" that we can install or not in whichever region we want, wouldn't it be better to name them something like "what_this_module_does.dat", so that we can choose easily what to install and where, and what region(s) we want to leave free?

Cristian

Edited: 13 Oct 2011, 3:39 p.m.

Re: [WP-34S] Flashing/chaining and assembler problems

*Message #6 Posted by **Marcus von Cube, Germany** on 13 Oct 2011, 3:49 p.m.,*
in response to message #5 by Cristian Arezzini

I accidentally merged all the .dat files into calc.bin. My fault. It will be remedied soon. Until then, use the serial commands to transfer your files from the emulator to the device. For flashing you should switch to MySamba.

SAM-BA.exe may help you to overwrite the predefined dat files directly in flash. The method is described in flash.txt and should be in Walter's manual, too. You need to send each .dat file to its associated address in flash.

Re: [WP-34S] Flashing/chaining and assembler problems

*Message #7 Posted by **Marcus von Cube, Germany** on 14 Oct 2011, 3:49 a.m.,*
in response to message #6 by Marcus von Cube, Germany

I've reworked the library stuff so that calc.bin is just the plain binary without any .dat files merged.

There are a few new files in the realbuild directory:

```
wp34s-?.dat    - copies from library for convenience
join.cmd       - A command file to merge these into calc_full.bin
```

The command file makelib.cmd in the root directory builds the .dat files. Just take a look what goes where. This is subject to frequent changes.

WP-34s Users' Guide - looking for writers/editors

*Message #1 Posted by **Dominic Richens** on 13 Oct 2011, 12:31 p.m.*

Steve Simpkin and I have put together a framework and table of contents for traditional HP-like manual for the WP-34s. Only it's Wiki based, using the same engine as wikipedia.org, MediaWiki.

This is meant to be the "dummies" Guide to Walter's detailed and technical reference manual.

For example, it took me about 1/2 hour to figure out the exact keystrokes necessary to get my program to output an "=" sign in the alpha area with the result. So I documented it in a wiki page, complete with button icons.

But Steve and myself have neither the time nor the expertise to write the whole thing, so it's a community project - it will be as good as we make it.

WP-34s Users' Guide

Click on the "Community Portal" for instructions on how to get signed up and contribute!

Note that there are tools to turn the entire wiki into a PDF book, once we have content in it.

Edited: 13 Oct 2011, 1:02 p.m.

Re: WP-34s Users' Guide - looking for writers/editors

*Message #2 Posted by **Bruce Bergman** on 13 Oct 2011, 1:53 p.m.,*
in response to message #1 by Dominic Richens

Dominic, any interest in hosting your manual on wiki4hp.com, where a lot of the discussion around the WP 34S details is already happening?

I can add a MediaWiki formatter for you, if you prefer. There are already a fair number of contributors in that wiki as it is...

thanks, bruce

Re: WP-34s Users' Guide - looking for writers/editors

*Message #3 Posted by **Dominic Richens** on 13 Oct 2011, 3:11 p.m.,*
in response to message #2 by Bruce Bergman

Hi Bruce,

That would be a good idea.

I initially passed by wiki4hp because it was dokuwiki and sourceforce was Mediawiki. However, at sourceforge we're limited to their default configuration and extensions that they supply. For instance I'd like to add the PdfBook extension so people can just print it out as a book.

So yes, if you can install MediaWiki on wiki4hp we can use that instead.

cheers!

Anyone Updated (re-flashed) a 12C 30th AE?

*Message #1 Posted by **linear** on 13 Oct 2011, 11:55 a.m.*

It seems that the 12C 30th AE is being shipped with older firmware (2009-07-02). At least, that's what my 12C 30th AE had (purchased Sept 25, from HP Home & Office).

Has anyone flashed their 12C 30th AE with newer firmware (eg 2009-11-19)? If so, did it work out OK?

Re: Anyone Updated (re-flashed) a 12C 30th AE?

*Message #2 Posted by **M. Joury** on 13 Oct 2011, 4:23 p.m.,*
in response to message #1 by linear

Katie is the first person that reported this in this forum. She is also the most likely candidate to have already flashed her machine. I am sure that she will jump in and reply when she sees your post.

But, FWIW, there should be no issues with it working with the newer firmware. To the best of my knowledge the only differences from a 12C+ are the box and the 30th AE on the front.

Cheers,

Marwan

*Message #3 Posted by **Katie Wasserman** on 13 Oct 2011, 4:41 p.m.,*
in response to message #2 by M. Joury

I'm jumping in :)

I haven't re-flashed my 12C 30th AE yet, for no good reason other than it's just a collectible for me. However, re-flashing it with the latest firmware **has to work** as Marwan said, there's nothing special about the AE other than the packaging, faceplate and back plate.

The latest firmware (I have 2009-11-19) gets rid of the SST/BST problems and some others. However: the low battery indicator does not work, there is a 2 second timeout when running the keyboard self-test, and this program locks it up (you need to turn off the calculator to stop it):

```
01 1
02 AMORT
03 GTO 01
```

Those are all the bugs in the latest firmware as far as I know.

-Katie

Re: Anyone Updated (re-flashed) a 12C 30th AE?

*Message #4 Posted by **Gerry Schultz** on 13 Oct 2011, 5:34 p.m.,*
in response to message #3 by Katie Wasserman

Last year at HHC 2010, prototype HP 15C+ calculators were passed out for testing and finding bugs. I assume that if HP issued firmware updates in the last year prior to the HP 15 LE release, then those people who did them would have experience at updating this platform.

Were there any firmware updates issued by HP for the 15C+ during the last year?

Gerry

Re: Anyone Updated (re-flashed) a 12C 30th AE?

*Message #5 Posted by **Geoff Quickfall** on 13 Oct 2011, 5:40 p.m.,*
in response to message #4 by Gerry Schultz

"Were there any firmware updates issued by HP for the 15C+ during the last year?"

Yes!

Flashing is SAMBA and the cable. Of course access to the web site and the new software was required (NDA protected).

Maybe HP will set up a public site with access and a disclaimer ;-)

Gerry, your 41 as well as Eddie's will be completed next week. I am paying back to the company my five days in a row off for HCC!

Cheers, all

How does one get access to the web site, and execute the required NDA? Is this only available to those who attended HHC2010?

Re: Anyone Updated (re-flashed) a 12C 30th AE?

*Message #8 Posted by **Geoff Quickfall** on 13 Oct 2011, 10:42 p.m.,*
in response to message #7 by linear

Hello Linear,

nice moniker; actually I was refering to the 15LE beta testing team with reference to the site. That was an NDA from 2010 and a signup page for anyone wanting to beta test.

It happens though, that the cable handed out at 2010 and 2011 and by Gene Wright is the correct cable for the 20b and 30b and 12C and 15LE.

With reference to the 12C and 15LE updates, I was commenting that I hoped the updates would be similar to the testing site, but public domain.

Cheers, Geoff

... and the 10bii+

This is a great little calculator with a fantastic display and keyboard that gets no respect from this forum. While it's native firmware has algebraic logic it would make a cheap platform to re-purpose and it has more digits and annunciators than the voyagers.

Re: Anyone Updated (re-flashed) a 12C 30th AE?

*Message #10 Posted by **Jeff O.** on 14 Oct 2011, 12:30 p.m.,*
in response to message #9 by Katie Wasserman

I picked one up as a door prize at HHC 2011. I am surprised by how much I like it. The keyboard isn't bad at all. Tim tried to explain the technology to me, but I did not really understand. I don't think there are any metal domes involved. I'm sure it would have brought howls of protest if used on the 15c LE, but it is not a bad alternative, in my opinion of course. Maybe I'll try flashing wp34s onto it and see what happens. Actually I would, except I don't have the 10bii+ firmware to flash it back.

Re: Anyone Updated (re-flashed) a 12C 30th AE?

*Message #11 Posted by **M. Joury** on 14 Oct 2011, 3:38 p.m.,*

in response to message #10 by Jeff O.

I would be beyond surprised if the WP34S firmware ran on the 10bii. The keyboard and display are just too different.

Re: Anyone Updated (re-flashed) a 12C 30th AE?

*Message #12 Posted by **Jeff O.** on 14 Oct 2011, 4:44 p.m.,*
in response to message #11 by M. Joury

I would not expect success, I would just like to see what happens. Would some keys still work? Anything sensible in the display? Probably not, but if it could be done with no harm (i.e. the original firmware could be flashed back in), it might be fun to try.

Re: Anyone Updated (re-flashed) a 12C 30th AE?

*Message #13 Posted by **M. Joury** on 14 Oct 2011, 6:44 p.m.,*
in response to message #12 by Jeff O.

Yes, I agree, if you could get it back to 10bii state it might be interesting trying it.

The French TI 84.Pocket.fr

*Message #1 Posted by **Namir** on 12 Oct 2011, 8:51 p.m.*

I am in the south of France, and I found the TI 84.pocket.fr. I got a unit. It is part of several French-version TI machines that TI launched last year. The TI 84.pocket.fr is smaller than the TI84 and has no cover. It runs on 4 AAA batteries (included) and has a USE port. The buttons are labeled in French. You can set the menu system on the LCD to be in French or English. The machine is interesting and does a lot of numerical calculations that we come to expect (no CAS support)--matrices, lists, solver. Graphics is fairly fast. So far so good!

Namir

Re: The French TI 84.Pocket.fr

The solution to the quartic equation on the HP50g, revisited

*Message #1 Posted by **Crawl** on 12 Oct 2011, 7:33 p.m.*

The last time I posted about this topic, I had a program that had the HP50g itself go through the steps to solve the equation from first principles. This took about 3 minutes (for the most general case), and the final result couldn't be displayed in pretty print.

This solution is basically just plugging into an already simplified solution. It "solves" the general case in about 10 seconds, and the result can be displayed in pretty print.

%%HP: T(3)A(R)F(.); \<< 0 0 0 0 \-> A B C D E ALPHA BETA GAMM DELTA \<< C 2 ^ 3 B D * * - 12 A E * * + 'ALPHA' STO 2 C 3 ^ * 9 B C D * * * - 27 A D 2 ^ * * + 27 B 2 ^ E * * + 72 A C E * * * - 'BETA' STO BETA 'SQUAREROOT' \v/ 'SQUAREROOT' -4 ALPHA 3 ^ * BETA 2 ^ + = SUBST + 'GAMM' STO 'SQUAREROOT' \v/ 'SQUAREROOT' B 2 ^ 4 A 2 ^ * / 2 C * 3 A * / - ALPHA 3 A GAMM 2 / 3 INV ^ * * / 1 3 A * / GAMM 2 / 3 INV ^ * + + = SUBST 'DELTA' STO B NEG 4 A * / 2 INV DELTA * - 2 INV NEG 'SQUAREROOT' \v/ 'SQUAREROOT' B 2 ^ 2 A 2 ^ * / 4 C * 3 A * / - ALPHA 3 A * GAMM 2 / 3 INV ^ * / - 3 A * INV GAMM 2 / 3 INV ^ * - B 3 ^ A 3 ^ / 4 B C * * A 2 ^ / - 8 D * A / + 4 DELTA * / + = SUBST * + \>> \>>

The solution is:

%%HP: T(3)A(R)F(.); '((-(B/(4*A)))-((1/2)*(\v/((((B^2)/(4*(A^2)))-((2*C)/(3*A)))+(((((C^2)-(3*(B*D)))+(12*(A*E)))/(3*(A*XROOT(3,((((((2*(C^3))-(9*(B*(C*D))))+(27*(A*(D^2))))+(27*((B^2)*E)))-(72*(A*(C*E))))+(\v/(((-4)*((((C^2)-(3*(B*D)))+(12*(A*E)))^3))+((((((2*(C^3))-(9*(B*(C*D))))+(27*(A*(D^2))))+(27*((B^2)*E)))-(72*(A*(C*E))))^2))))/2))))+((1/(3*A))*XROOT(3,((((((2*(C^3))-(9*(B*(C*D))))+(27*(A*(D^2))))+(27*((B^2)*E)))-(72*(A*(C*E))))+(\v/(((-4)*((((C^2)-(3*(B*D)))+(12*(A*E)))^3))+((((((2*(C^3))-(9*(B*(C*D))))+(27*(A*(D^2))))+(27*((B^2)*E)))-(72*(A*(C*E))))^2))))/2)))))-((1/2)*(\v/((((((B^2)/(2*(A^2)))-((4*C)/(3*A)))-((((C^2)-(3*(B*D)))+(12*(A*E)))/((3*A)*XROOT(3,((((((2*(C^3))-(9*(B*(C*D))))+(27*(A*(D^2))))+(27*((B^2)*E)))-(72*(A*(C*E))))+(\v/(((-4)*((((C^2)-(3*(B*D)))+(12*(A*E)))^3))+((((((2*(C^3))-(9*(B*(C*D))))+(27*(A*(D^2))))+(27*((B^2)*E)))-(72*(A*(C*E))))^2))))/2))))-((1/(3*A))*XROOT(3,((((((2*(C^3))-(9*(B*(C*D))))+(27*(A*(D^2))))+(27*((B^2)*E)))-(72*(A*(C*E))))+(\v/(((-4)*((((C^2)-(3*(B*D)))+(12*(A*E)))^3))+((((((2*(C^3))-(9*(B*(C*D))))+(27*(A*(D^2))))+(27*((B^2)*E)))-(72*(A*(C*E))))^2))))/2)))+(((((B^3)/(A^3))-((4*(B*C))/(A^2)))+((8*D)/A))/(4*(\v/((((B^2)/(4*(A^2)))-((2*C)/(3*A)))+(((((C^2)-(3*(B*D)))+(12*(A*E)))/(3*(A*XROOT(3,((((((2*(C^3))-(9*(B*(C*D))))+(27*(A*(D^2))))+(27*((B^2)*E)))-(72*(A*(C*E))))+(\v/(((-4)*((((C^2)-(3*(B*D)))+(12*(A*E)))^3))+((((((2*(C^3))-(9*(B*(C*D))))+(27*(A*(D^2))))+(27*((B^2)*E)))-(72*(A*(C*E))))^2))))/2))))+((1/(3*A))*XROOT(3,((((((2*(C^3))-(9*(B*(C*D))))+(27*(A*(D^2))))+(27*((B^2)*E)))-(72*(A*(C*E))))+(\v/(((-4)*((((C^2)-(3*(B*D)))+(12*(A*E)))^3))+((((((2*(C^3))-(9*(B*(C*D))))+(27*(A*(D^2))))+(27*((B^2)*E)))-(72*(A*(C*E))))^2))))/2)))))))))'

I've tested it with numerical inputs, and confirmed it works.

Caveats from the previous thread still apply. If you want a numerical result, you should be in approx. mode before

running the program, or the calculator might not be able to evaluate the result to a number.

I bought the book (actually a pile of paper stapled at the upper-left corner) when it was in print. It has a little bit on synthetic programming at the end.

in response to message #5 by gene wright

Do you know if you are specifically missing any parts? With a quick look, it looks like you have

everything I do, except that for some reason unknown to me, ML-24 & 25 come before ML-01 in mine. The little bit of synthetic stuff is at the end in Appendix B, pages B-1 and B-2.

Interesting, Gene, but about 25 years too late for me!

Re: TI 58 / 59 Master Library Survival Guide booklet

*Message #8 Posted by **gene wright** on 13 Oct 2011, 11:50 a.m.,*
in response to message #7 by Martin Pinckney

Nah, it isn't too late!

Improvements to documentation in the past *should* provide guidance for good documentation today.

The PPC rom manual is an excellent example. The survival guide here was another example of improving upon what the manufacturer provided. :-)

You could have been helped with the purchased the PC-100A print cradle. That option was one of the **great** advantages that the TI-59 system had over the competing HP-67. For every one for which it was possible, I printed out all the programs on the several memory modules I owned, taped the strips to paper, then xeroxed the paper to create the file copy.

I bought a TI-59 after having earlier in 1977 purchased my first HP, the HP-67. The TI-59 with the memory modules, greater speed, greater RAM, and PC-100 option was, IMHO, far more advanced in technology than the HP-67, even if its algebraic entry system was much more awkward. Programs written for the HP-67 were usually about 60 percent the number of steps required by the TI-59. My main problem with the TI-59 is that I couldn't find one that was reliable. I went through five of them between 1977 and 1980. I decided thus to use the HP-67 for all my critical programs that I used as an engineering officer on a nuclear submarine. The HP-67 suffered only one failure

after three years of use.

Interesting. I had two 59's and a 58c and the only trouble was the minor keyboard problems.

Re: TI 58 / 59 Master Library Survival Guide booklet

*Message #12 Posted by **Martin Pinckney** on 14 Oct 2011, 10:59 a.m.,*
in response to message #11 by Garth Wilson

I loved my 59. Might still be using it but for the keyboard reliability issues. I did get many years out of it, though. When it did fail, I was already using the PC for most number crunching, so I bought a TI-36 Solar. That failed after only a year or two. All the others in the company were using 11c's at the time, and I really liked the build quality. (Well, there was one guy who also had a 59, but its keyboard went bad, too).

I didn't like RPN, so when I found out about the Pioneer series, I bought a 20s. Still have it, still works fine, 20 years later. That was only the beginning of my HP interest.

15C Warranty in Canada - Resolved

*Message #1 Posted by **Jim Creybohm** on 12 Oct 2011, 1:09 p.m.*

Hello all,

After my previous and rather frustrated posting, one of the HP support staff who is a follower of this forum contacted me after reading my rant, to assure me that the warranty issue will be resolved.

Unfortunately I am unable to determine if this will be the case for the European users, but HP is standing behind their product in Canada. There appears to be some confusion on the support side about the product internally, and this is apparent.

However, Paul L. with HP support in Canada phoned and emailed me to assure me that I will receive a new HP calculator once they are received (out of backorder).

So, thanks to HP, thanks especially to Paul, and to the generousity of the users here who allowed me to vent and offered alternatives. It's great to be a (lurking) part of a community (and a company) that offers so much.

Thanks again, Paul!

in response to message #1 by DigiGal

What's your LE#?

You can see clearly the slight tint of the newer LCD. Do you have any keyboard issues?

Re: Photo of my HP 15c | 15c LE

*Message #3 Posted by **DigiGal** on 12 Oct 2011, 12:34 p.m.,*
in response to message #2 by Marcus von Cube, Germany

I posted my LE number and keyboard results earlier in the keyboard survey.

But here they are again to go with the picture. **LE # 02220 and no faulty keys.**

The photo shows the LCD display on both old/new after running the [on ÷] keyboard tests.

Had ordered my LE through Amazon third party seller as soon as they were available there $99.

So glad HP finally re-released the 15c (bugs and manual errors in all) hopefully they'll make it part of their permanent lineup after they are done producing the LE's.

The original 15c is my daily use calc that I carry with me it's still working fine after all these years and the LE is a secondary unit that stays at home next to my computer.

Eagerly awaiting an HP flash update to fix the bugs and will need to order a flash cable from <Gene?>.

WP 34S: Some testing required

*Message #1 Posted by **Marcus von Cube, Germany** on 12 Oct 2011, 10:31 a.m.*

In preparation of any upcoming keyboard changes I've modified the software to behave a little more like the 41C. It's in SVN and it's very likely buggy. I didn't test my changes thoroughly. So I ask you to download and install either the emulator or the firmware and report any bugs or strange behavior in the keyboard engine.

Before you ask: There is no hidden ASN command!

WOW, works great - congratulations Marcus! :-)
So far I've found no problems ...

One question: is it intended that SHOW now only works as long as you hold down the key?

Franz

Yes, SHOW is working again as before, but I just found that something with the f/g/h keys is seriously broken: if you press one of these shift-keys you can't undo this anymore! :-(

[f] and [g] pressed more often than once just doesn't switch off the prefix again, you can switch from g to f and from f to g, but it doesn't go away at all. And [h] is even more mysterious: pressing [h] repeatedly switches from h to f to h to f ... ;-)

Franz

> I've tried it on both the emulator and the real hardware. It works fine. Have you updated the DLL?

Yes, latest DLL 1717 from yesterday.

Now I've tried it again and I found a small difference whether I use the touchpad (instead of a mouse on my Win7 netbook) or the keyboard:
with the touchpad it works sometimes (maybe 50%) correctly when I make an extremely short touch on the pad (i.e. release the finger almost immediately), but with the keyboard it always fails.
It behaves as if the key/mouse 'release' would be interpreted by the program as if it would be a new 'press' - I guess it's a timing problem in the 'press/release' routine!?

Re: WP 34S: Some testing required - Try again!

*Message #7 Posted by **Marcus von Cube, Germany** on 13 Oct 2011, 2:16 a.m.,*

in response to message #7 by Marcus von Cube, Germany

> Quote:
>
> So it's emulator only and Win 7 related. Can you try with a mouse instead?

I can't imagine what this should have to do with Win7 or using a mouse instead of the touchpad!?
But ok, I've tried it now with a mouse and this is just as bad as with the keyboard - whenever f/g/h is activated it can't be switched off anymore with f/g/h keys.

The last version I have where this problem does not exist is 1716, so it can't suddenly be a problem of Win7 when it hasn't been so for any previous version.

Re: WP 34S: Some testing required - Try again!

*Message #9 Posted by **Marcus von Cube, Germany** on 13 Oct 2011, 4:45 a.m.,*
in response to message #8 by fhub

The reason I'm suspecting Win7 is that it works flawlessly on my XP development system. I have an idea how to fix it, though. I'll report back here when you can test again.

Re: WP 34S: Some testing required - Try again!

*Message #10 Posted by **Didier Lachieze** on 13 Oct 2011, 7:01 a.m.,*
in response to message #9 by Marcus von Cube, Germany

Hi Marcus, I've tested the latest emulator & dll version under Win7 and I have the same issue.

It's very strange. For example when I start the emulator if I click on [h] with the mouse several times the h indicator toggles as expected, however sometimes I get the f indicator on when the h indicator should be off. If I use the keyboard and press [h] to toggle the h indicator, I see h and f indicators alternatively in the display. For [g] it's similar: with the mouse the indicator generally toggles correctly but with the keyboard I keep seeing the g indicator in the display. Same for [f].

Edit: I've tried to run it with different compatibility modes (Win XP SP2, Sp3, Vista..): same behavior.

*Message #11 Posted by **Marcus von Cube, Germany** on 13 Oct 2011, 9:44 a.m.,*
in response to message #10 by Didier Lachieze

The whole GUI stuff is a bit flaky and has ever been so. It's code originally written by HP for their internal testing. There ware and most probably still are some strange pieces of code which I do not completely understand and

have modified to death. Please try the latest version of the emulator and see if I fixed the issues.

*Message #13 Posted by **Marcus von Cube, Germany** on 13 Oct 2011, 10:47 a.m.,*
in response to message #12 by Namir

Go to http://wp34s.svn.sourceforge.net/viewvc/wp34s/ and find your way to trunk/realbuild and trunk/windows/bin.

I'd prefer a real SVN client such as Tortoise SVN. You find instructions here: http://sourceforge.net/scm/?type=svn&group_id=389575

For the emulator, get the wp34s-?.dat files, emulator.dll and wp34sgui.exe.

No, the problem still exists in SVN 1725!
The only thing that has changed is that now [h] doesn't toggle between 'f' and 'h' anymore (but stays with 'h'), but in about 80% f/g/h don't switch themselves off.

Re: WP 34S: Some testing required - Try again!

*Message #16 Posted by **Marcus von Cube, Germany** on 13 Oct 2011, 3:41 p.m.,*
in response to message #15 by fhub

Franz, I don't have Win 7 and the problem does not exist on XP. So I need an idea. I ask you to explain exactly what you are doing and what happens then. I can then create custom versions with debug output built in for you to test. I fear that Win 7 does a different handling of events. Wait until Friday.

Re: WP 34S: Some testing required - Try again! (GERMAN)

*Message #17 Posted by **fhub** on 13 Oct 2011, 4:13 p.m.,*
in response to message #16 by Marcus von Cube, Germany

> Quote:
>
> I ask you to explain exactly what you are doing and what happens then.

Ok, wenn meine bisherigen (mehrmaligen) Erklärungen in Englisch nicht verständlich waren, dann also nochmals in Deutsch: ;-)

Also, bleiben wir mal bei der Tastatur:
Ich drücke [f] und 'f' erscheint im Alpha-Display. Ich drücke nochmals [f], aber die Anzeige 'f' bleibt - es gibt nur ein (sehr) kurzes Blinken so als ob ich die Taste [f] 2-mal gedrückt hätte (oder also ob sie nicht 'entprellt' wäre). Das Prefix 'f' läßt sich also nicht mehr ausschalten (beim Drücken einer anderen Taste geht das 'f' allerdings weg, und es wird auch die korrekt Shift-Funktion ausgeführt. Und bei [g] und [h] tritt exakt der gleiche Effekt auf.

Wenn ich den Emulator mit der Maus bediene, zeigt sich in etwa 80% das gleiche Verhalten, in ca. 20% klappt das Ausschalten der Shift-Funktion mit der jeweiligen Taste aber. Ich sehe allerdings kein System dahinter, ob es klappt oder nicht ist eher zufällig.

Wie gesagt tippe ich auf ein Timing-Problem, d.h. daß der Emulator irgenwie zwischen Taste drücken, loslassen und wieder drücken nicht mehr richtig unterscheiden kann, welcher Tastenzustand gerade herrscht.
Allerdings kann ich mir nicht vortstellen daß Du unter Windows diese neuen Routinen so 'systemnah' programmiert hast, daß zwischen WinXP und Win7 wirklich ein Unterschied sein sollte!?

Franz

Re: WP 34S: Some testing required - Try again! (GERMAN)

*Message #18 Posted by **fhub** on 13 Oct 2011, 5:45 p.m.,*
in response to message #17 by fhub

Hallo Marcus, hier noch eine (vielleicht nicht unwichtige) Ergänzung:
Nach weiteren Versuchen habe ich festgestellt, daß sich dieser Bug nur auf die Anzeige von f/g/h bezieht, aber nicht auf das tatsächliche Ein- und Ausschalten.

D.h. ich drücke [f], dann nochmals [f], und intern ist tatsächlich dieses f-Shift wieder korrekt ausgeschaltet, es wird aber immer noch 'f' angezeigt!
Daß es ausgeschaltet ist erkenne ich daran, daß jede nachher gedrückte Taste wieder ihre Grundfunktion (also ohne f-Shift) liefert.

Tatsächlich scheint das ganze also ein reines Anzeigeproblem dieser f/g/h-Indikatoren zu sein.

Franz

Re: WP 34S: Some testing required

*Message #19 Posted by **Jeff O.** on 13 Oct 2011, 8:42 a.m.,*
in response to message #1 by Marcus von Cube, Germany

OK, I see that the function name is displayed and NULLs out if you hold the key down. I like that, but might make the "NULL" display go away upon release of the key or after a time delay. What other features/changes are there that makes it "behave a little more like the 41C"?

Re: WP 34S: Some testing required

*Message #20 Posted by **Marcus von Cube, Germany** on 13 Oct 2011, 9:40 a.m.,*
in response to message #19 by Jeff O.

NULL not going away is a bug that should be fixed now.

Yes, it's exactly that you can see the command before it executes what makes 34S behave a little more like the 41C. This helps recognize the commands being executed, especially while you are waiting for your latest overlay from Eric. Hold down one of the hot keys A to D and see if they will execute their default function or call a label, see the actual address called by XEQ + some key, preview the next step in SST mode with the option to cancel it by keeping DOWN pressed for a second...

I did some more work an the shift key detection. I hope I could fix the strange behavior reported by Franz.

Re: WP 34S: Some testing required

*Message #21 Posted by **Dominic Richens** on 13 Oct 2011, 10:06 a.m.,*
in response to message #20 by Marcus von Cube, Germany

I like the idea! Is there a way for LBL A-D to have it display a user defined string? For example with the TVM solver, is there a way it could it display 'N=' when you press and hold A? I can never remember which program I had assigned to LBL A, B, C or D.

I modified the TVM solver to display the label like the HP-20b does _after_ they key is released, so at

least I know when I've hit the wrong key as opposed to puzzling at the wrong answer.

Re: WP 34S: Some testing required

*Message #22 Posted by **Marcus von Cube, Germany** on 13 Oct 2011, 10:41 a.m.,*
in response to message #21 by Dominic Richens

Nice idea but not possible with the current infrastructure. I can only display the text representation of an opcode after it has been decoded but before it's executed. Pressing and holding A does not execute any code, it just compiles the keyboard input to XEQ A which is then displayed.

If we ever find a way to support real assignable keys, we may associate them with descriptive strings but at the moment, we have no such plans or resources.

> > they just empty?
>
> I've added a bunch of dat files so that the file is bigger. I should have reset the calc.bin file to its original size before committing it to SVN. Just enjoy what came with it. It's stuff from the library and some testing programs such as Valentin's matrix AM3.
>
> > I tacked on my main memory back up region (wp34s.dat). The bin
> > file loaded successfully, but the programs won't run. They all
> > worked in 1722. Have there been significant opcode changes?
>
> We have reorganized the op-codes. You need to feed your dat file through the disassembler, change all occurrences of x[<->]y to x[<->] Y and feed it into the assembler again. x[<->]y is gone and is replaced by the more generic command. On the keyboard, there is no difference but old programs suffer from changed op-codes.

Binary program images need to be modified to work on the current release. There is a space before the Y in the exchange command.

WP 34S: Windows 7 copy ordered / KML anybody?

*Message #24 Posted by **Marcus von Cube, Germany** on 14 Oct 2011, 4:47 a.m.,*
in response to message #1 by Marcus von Cube, Germany

In order to fix the Win 7 problems with the emulator I've just ordered a copy of Windows 7 so I have a testing environment. I hope this will sort the bugs out.

It might be the right time to rewrite the emulator DLL based on KML. Are there any KML specialists here

willing to do it? The result should

- be HP legacy free,
- not rely on MFC and therefore on the much too expensive full Visual Studio,
- have an easier to maintain skin description file,
- provide a better visual feedback on pressed keys.

This might even be the basis of a future port to other GUIs like Mac OS, Linux, iOS or Android. I'm willing to help but I feel that others are more qualified for the job than me.

Edited: 14 Oct 2011, 5:09 a.m.

Marcus, have you ever thought about using Christoph Giesselink's EmuXX system as base?
It's source code is available, it has a very powerful KML scripting language and is used (and thus known) already to a lot of people.

I guess it shouldn't be too hard to make a connection between the EmuXX GUI code and your calculator code!?
Since my progamming language is not 'C', I couldn't do this, but I could (and would) definitely make a comfortable KML script for the "EmuWP34s" ;-) where ALL functions on the keyboard (also the shifted ones) would be directly clickable by the mouse (as I've already made for almost all other

EmuXX versions).

Franz.

[WP34s] Matrix M.xx vs. M-xx

*Message #1 Posted by **fhub** on 12 Oct 2011, 9:58 a.m.*

The matrix functions have just been renamed again from M.xxx to M-xxx

In principle that's ok, but 2 functions look a bit ugly now: M-+ and M-+* ;-)

Re: [WP34s] Matrix M.xx vs. M-xx

*Message #2 Posted by **Marcus von Cube, Germany** on 12 Oct 2011, 10:21 a.m.,*
in response to message #1 by fhub

I did that because navigating in the catalog(ue)s is harder with a '.' in the name (I keep forgetting to press f before the dot and never get where I want to.) I agree that the two functions you mention don't look pretty. Maybe we change that back to '.' or even no delimiter at all. For me, M-DET or M.DET don't look any better then MDET.

Re: [WP34s] Matrix M.xx vs. M-xx

*Message #3 Posted by **fhub** on 12 Oct 2011, 10:29 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Yes, M+ and M+* without delimiter would be better.
But for all other matrix functions I would keep the delimiter, otherwise some keywords would in fact be quite counterintuitive. And changing it only for some (e.g. MDET, MINV) won't be consistent.

hp-15c LE firmware update HOWTO?

*Message #1 Posted by **Eric Zoob** on 12 Oct 2011, 9:28 a.m.*

I purchased two of the new 15C LE calculators with firmware 2011-04-15, and have been following the posts here. If a firmware update is made available, how will it be made available? i.e., can I send my calculators to be re-flashed (to HP, or to someone who has the cables and has done this before with other HP calculators), or will I be expected to do it myself somehow? How has this worked in the past?

Edited: 12 Oct 2011, 9:39 a.m.

Re: hp-15c LE firmware update HOWTO?

*Message #2 Posted by **Katie Wasserman** on 12 Oct 2011, 11:06 a.m.,*
in response to message #1 by Eric Zoob

These are all good questions that only HP can answer.

There has been no systematic way past ARM-based HP calculators have been upgraded after purchase. Some people do it themselves by getting a cable (from HP and now via Gene) and asking HP for the latest firmware, it's not posted anywhere. The HP website/manuals don't even acknowledge that these machines can be upgraded.

Re: hp-15c LE firmware update HOWTO?

*Message #3 Posted by **Peter Murphy (Livermore)** on 12 Oct 2011, 11:16 a.m.,*
in response to message #2 by Katie Wasserman

Texas Instruments makes operating system and software updates for its handhelds a big feature. For example, see here:

http://education.ti.com/calculators/products/US/os-update/

in response to message #2 by Katie Wasserman

Katie,

there's a SDK for the 20b available from HP, containing a firmware file. I found it somewhere on HPs website and used it to update my 20b. So, some acknowledgement has been made.

Thomas

Paging Gene...

HP Calculator Communications - USB -> RS232/Serial on Win7/64?

*Message #1 Posted by **Thomas Chrapkiewicz** on 12 Oct 2011, 7:51 a.m.*

What is the recommended USB -> Serial convertor for usage with the latest Win7/64bit OS?

In the past, I've been pleased with the performance of a Belkin device as it had RX/TX indicators and drivers were immediately available. Now I find that this device is not supported by the manufacturer with Win7/64.

Thank you in advance for your advice, TomC

Re: HP Calculator Communications - USB -> RS232/Serial on Win7/64?

*Message #2 Posted by **Bart (UK)** on 12 Oct 2011, 9:04 a.m.,*
in response to message #1 by Thomas Chrapkiewicz

The FTDI converter that I referenced in article 1060 has drivers that claim Windows 7 64-bit compatability - driver list

EasySYNC ES-U-1001-R10

Re: HP Calculator Communications - USB -> RS232/Serial on Win7/64?

*Message #9 Posted by **Thomas Chrapkiewicz** on 13 Oct 2011, 12:59 p.m.,*
in response to message #8 by Jeff O.

Thank you all for your helpful assistance and recommendations.

Surprisingly enough, the Belkin device does NOT use generic (i.e. FTDI type devices; there is a hand labelled ASIC in it!). (If anayone is curious for details, email me and I can take some pics.) Surprising.

In the meantime I will pursue the FTDI devices.

Regards, TomC

Re: HP Calculator Communications - USB -> RS232/Serial on Win7/64?

*Message #10 Posted by **Lincoln R.** on 12 Oct 2011, 9:23 a.m.,*
in response to message #1 by Thomas Chrapkiewicz

If you can figure out what USB to RS232 chip your Belkin adaptor is using, you could check the chip manufacturer's website to see if Win7 64 drivers are available. Belkin doesn't really design anything themselves these days, and they certainly don't design USB to RS232 ASICs.

Re: HP Calculator Communications - USB -> RS232/Serial on Win7/64?

*Message #11 Posted by **Gerry Schultz** on 12 Oct 2011, 3:13 p.m.,*
in response to message #10 by Lincoln R.

Here's what I use and it works under Win7: FTDI - US232-100 USB to RS232 Serial Cable. Newark part number 34M8933; cost $24.

[WP34s] 0=-2*10^(-15)???

*Message #1 Posted by **Alexander Oestert** on 12 Oct 2011, 5:45 a.m.*

If this is in the manual, please forgive me and just point me in the right direction.

I'm doing the following on the WP-34s (2.1 1388)

2.5

Square root

x^2 (results in 2.5 in the display)

2

+/-

* (results in -5 in the display)

5

+

and the result is -2*10^(-15)

Why is that? Should I just update my firmware version?

Edited: 12 Oct 2011, 5:45 a.m.

Re: [WP34s] 0=-2*10^(-15)???

*Message #2 Posted by **Paul Dale** on 12 Oct 2011, 5:56 a.m.,*
in response to message #1 by Alexander Oestert

This is perfectly acceptable, normal and most likely correct behaviour.

The calculator only has a finite number of digits and the intermediate results are rounded to this number of digits (16 in the case of the 34S). This means subsequent operations are working with numbers that aren't exactly what you entered.

That is a pretty old firmware version, lots has happened in the meantime. Bug fixes and improvements.

- Pauli

Re: [WP34s] 0=-2*10^(-15)???

*Message #3 Posted by **Dominic Richens** on 12 Oct 2011, 6:14 a.m.,*
in response to message #2 by Paul Dale

though 2.1 1664 returns the same answer. But it's not really a bug and so will will probably always do that.

Re: [WP34s] 0=-2*10^(-15)???

*Message #4 Posted by **Alexander Oestert** on 12 Oct 2011, 6:23 a.m.,*
in response to message #2 by Paul Dale

> Quote:
>
> That is a pretty old firmware version, lots has happened in the meantime. Bug fixes and improvements.

I'm waiting for the final version before reflashing (and draining my batteries in the process).

Thanks!

Re: [WP34s] 0=-2*10^(-15)???

*Message #5 Posted by **Paul Dale** on 12 Oct 2011, 6:35 a.m.,*
in response to message #4 by Alexander Oestert

I wouldn't worry about an occasional reflash -- plug in flash and unplug doesn't take long and won't do much of anything to the battery life. Leaving (or forgetting) the calculator with cable plugged in will.

- Pauli

in response to message #7 by Paul Dale

Final? What final?

We may continue development almost forever. Plans are to have stable releases from time to time on which you can rely. I can't say when the next point in time will be for a release.

Re: [WP34s] 0=-2*10^(-15)???

*Message #9 Posted by **Alexander Oestert** on 12 Oct 2011, 10:06 a.m.,*
in response to message #8 by Marcus von Cube, Germany

Yeah, stable release is what I meant. I plan to get hold of one to use with my newly acquired overlays before you dare devils change them again! ;)

[WP34s] stable release and keyboard

*Message #10 Posted by **Marcus von Cube, Germany** on 12 Oct 2011, 10:14 a.m.,*
in response to message #9 by Alexander Oestert

Devilish folk are we! :-D

In fact we are discussing some keyboard changes. There are several options being discussed:

Minimalist: Just fix one or two idiosyncrasies such as having XTOA/ATOX on the keyboard which seems a bit wasteful. There are some diverging ideas concerning this approach.

Medium: Make an overhaul of the keyboard which will definitely require a new overlay. We have something up our sleeves for this approach, too.

Maximum: Complete redesign, assignable keyboard and some such... More likely to be implemented on new hardware.

Re: [WP34s] 0=-2*10^(-15)???

*Message #11 Posted by **Steve Simpkin** on 12 Oct 2011, 6:28 a.m.,*

HP45 returns 0.000000000 (at fix 9)

Re: [WP34s] 0=-2*10^(-15)???

*Message #14 Posted by **Werner** on 12 Oct 2011, 6:56 a.m.,*
in response to message #1 by Alexander Oestert

Results are rounded to 16 digits after every operation, so:

```
sqrt[2.5] = 1.581138830084189665999..
rounded to 16 digits that is 1.581138830084190

1.581138830084190^2 = 2.500000000000001 0562...
rounded to 16 digits is 2.500000000000001

and then 5 - 2 * 2.500000000000001 = -2e-15
```

Thankfully it doesn't try to decide for you that that should be zero...

Cheers, Werner

Re: [WP34s] 0=-2*10^(-15)???

*Message #15 Posted by **Alexander Oestert** on 12 Oct 2011, 7:00 a.m.,*
in response to message #14 by Werner

I'm well aware that some rounding takes place with the root and square operations. What astonishes me more is the fact that the intermediate results 2.5 and 5 thereafter **looked** like they were exact but in fact weren't.

Edited: 12 Oct 2011, 7:02 a.m.

Re: [WP34s] 0=-2*10^(-15)???

*Message #16 Posted by **Paul Dale** on 12 Oct 2011, 7:04 a.m.,*
in response to message #15 by Alexander Oestert

Use SHOW to see all the digits in the number. The display is only 12 digits long and numbers are 16 digits on the device. With a wider display, you'd have seen all the digits but that is not to be on this hardware.

- Pauli

Re: [WP34s] 0=-2*10^(-15)???

*Message #17 Posted by **Alexander Oestert** on 12 Oct 2011, 7:10 a.m.,*
in response to message #16 by Paul Dale

Maybe I'm using SHOW the wrong way or it's buggy in my firmware version, but SHOW used on 2.5 and -5 in the calculation from posting #1 will not show any more decimal places. Isn't that what you meant?

EDIT: I flashed the newest firmware and now SHOW actually shows the whole mantissa.

Edited: 12 Oct 2011, 8:41 a.m. after one or more responses were posted

Re: [WP34s] 0=-2*10^(-15)???

*Message #18 Posted by **Paul Dale** on 12 Oct 2011, 7:29 a.m.,*
in response to message #17 by Alexander Oestert

Update your firmware -- SHOW got changed a bit not too long ago.

- Pauli

Re: [WP34s] 0=-2*10^(-15)???

*Message #19 Posted by **Alexander Oestert** on 12 Oct 2011, 7:33 a.m.,*
in response to message #18 by Paul Dale

see my EDIT above.

Thanks again!

what about an indicator for hidden decimals?

*Message #20 Posted by **Alexander Oestert** on 12 Oct 2011, 8:43 a.m.,*
in response to message #18 by Paul Dale

I wonder if it wouldn't be nice to have some kind of indicator that pointed me to press SHOW. Otherwise I don't have a reason to doubt the exactitude of the result that is shown in case I get 5 with no decimal places. You know, something like the thing you do in fraction mode.

Re: [WP34s] 0=-2*10^(-15)???

*Message #21 Posted by **Derek Walker (UK)** on 12 Oct 2011, 7:22 a.m.,*
in response to message #15 by Alexander Oestert

Some results from a random collection of calculators in my desk drawer:
Casio fx-991ES, Casio fx-4800p, TI-68: all 0
HP35s: 2*10^(-11) - intermediate results were inexact
TI36X: 2*10^(-11) - intermediate results looked exact

Re: [WP34s] 0=-2*10^(-15)???

*Message #22 Posted by **Lincoln R.** on 12 Oct 2011, 8:02 a.m.,*
in response to message #21 by Derek Walker (UK)

HP 32s: 2*10^(-11)
HP 48g: 2*10^(-11)
Casio fx-7000g: 0
HP 12c: 0
HP 12c ARM (2009-11-19): 0
HP 35 (Non-Buggy, 1302A: 0
HP 28c: 2*10^(-11)

I have to say I'm a bit disappointed that an HP 35 and an old Casio seem to be more accurate than the 32s and 48g (at least in this case).

Edited: 12 Oct 2011, 8:03 a.m.

Re: [WP34s] 0=-2*10^(-15)???

*Message #23 Posted by **Paul Dale** on 12 Oct 2011, 8:10 a.m.,*
in response to message #22 by Lincoln R.

They aren't. Read Werner's post above and round the values to ten digits and you'll see why

they *appear* to be more accurate.

- Pauli

Re: [WP34s] 0=-2*10^(-15)???

*Message #24 Posted by **Lincoln R.** on 12 Oct 2011, 8:39 a.m.,*
in response to message #23 by Paul Dale

Ah. That makes sense. This is what I get for trying to carry on intelligent conversation at 7 AM.

Re: [WP34s] 0=-2*10^(-15)???

*Message #25 Posted by **Alexander Oestert** on 12 Oct 2011, 8:13 a.m.,*
in response to message #22 by Lincoln R.

I'm not a mathematician but I would say your conclusion is wrong. Those calcs that show 0 as a result might just not carry as many decimal places.

*Message #27 Posted by **Marcus von Cube, Germany** on 12 Oct 2011, 10:06 a.m.,*
in response to message #26 by Dimitri

From the results here it looks like all the 10 digit machines with correct rounding return 0.

You should get the same result if you set WP 34S to SCI 10 and press RND after the sqrt and the x^2 operations.

Re: [WP34s] 0=-2*10^(-15)???

*Message #28 Posted by **Jake Schwartz** on 12 Oct 2011, 11:25 a.m.,*

> Quote:
>
> From the results here it looks like all the 10 digit machines with correct rounding return 0.

...but of course that only applies to *this* problem and likely will not be the case for every one (or perhaps even most of them) like this....therefore, with functions in the mix which generate irrational results (like square root), it makes sense to use the 34S SHOW as a check. With this specific problem, I bet that ANY large-precision setting on the HP48/49/50 in conjunction with the LongFloat library will yield a small non-zero result (as it probably should).

Jake

Re: [WP34s] 0=-2*10^(-15)???

*Message #29 Posted by **C.Ret** on 12 Oct 2011, 3:47 p.m.,*
in response to message #28 by Jake Schwartz

It makes sense to check all digits only when in your application 2.10^{-15} is significantly different from zero.

In most of my practical applications, as soon as a result is less than a fraction of a millimeter, a millisecond, a milligram, a milliamp or a combination of theses, it's not harmful to consider it as null or negligible.

Last time I was measuring the surface of grass in my garden. I may have use the square root key to check my computations backward.

Are you serously stating that I have to use SHOW function to check that I was right at 2.10^{-15} meter precision ?

I was not attempting to count sub-atomic particles in my garden, I only have to get a rough idea of how much potting soil I have to buy !

Re: [WP34s] 0=-2*10^(-15)???

> I was not attempting to count sub-atomic particles in my garden, I only have to get a rough idea of how much potting soil I have to buy !

Going back to the beginning of the thread, there was a specific problem suggested which had nothing to do with particles or gardens.....there was no reference to anything, but the fact that the result was not exactly zero to 16 decimal places. It looked like everyone else in the thread accepted the premise that this was not necessarily a practical application related to "real-world" things such as measuring items to millimeter resolution or anything else. As a result, I would hope you would see the discussion for what it was - an exchange related purely to accuracy. No need to find fault with it, if that is what you were doing.

Jake

Swap meets at HHCs?

*Message #1 Posted by **Peter Murphy (Livermore)** on 11 Oct 2011, 6:41 p.m.*

HHC 2011 was my first. Thinking back on it, I now wonder whether time and place could be made for swapping/buying/selling calculators and related stuff at the next HHC. I'd be an eager participant. Or has the idea been tried and failed, never to be resurrected?

Re: Swap meets at HHCs?

*Message #2 Posted by **Allen** on 11 Oct 2011, 8:26 p.m.,*
in response to message #1 by Peter Murphy (Livermore)

In theory I see where that might work, I think it would be fun.

In practice, however, I think calculators make poor currency since they do not meet a critical part of Adam Smith's guidelines for a monetary system: they are indivisible.

It's also hard to agree on what constitutes a "reasonable" price.

At HHC2009 at least one presenter established a temporary booth and during break times sold some interesting items perhaps to fund the cost of the trip? Although I did not buy anything, I thought it was tastefully done and not out of place.

In HHC 2008 some attendees brought certain serial cables and other small manufactured items to sell, and in other years there has been one or two items of commercial interest, though I don't think it's ever been more than a handful of people exchanging anything.

27S display - a show stopper?

*Message #1 Posted by **Thomas Radtke** on 11 Oct 2011, 3:35 p.m.*

A colleague sold me this quite beaten up 27S today (for a very reasonable price):

While it has interesting features, I found the display to be not only problematic, but an imposition. Is it just this package with the protective cover making it almost unreadable? I know this kind of LCDs from the 18C/19B, but this one tops it all. For any viewing angle, a certain adjustment of contrast between black background and slightly readable characters has to be found.

What were your thoughts when you bought your sample (when it was new)?

Mine is fine and perfectly readable so it sounds like yours has been damaged. If you can post a picture of the screen then the knowledgeable folks here might be able to make useful suggestions.

Re: 27S display - a show stopper?

*Message #3 Posted by **Thomas Radtke** on 11 Oct 2011, 4:03 p.m.,*
in response to message #2 by BruceH

Thanks for your answer, Bruce.

Two angles, same contrast. The camera got the contrast in the top image much better than my eyes do.

[Edit: Used a flash light - under very bright light the problem appears to be less visible]

*Message #4 Posted by **Neil Hamilton (Ottawa)** on 11 Oct 2011, 5:01 p.m.,*
in response to message #3 by Thomas Radtke

Hi Thomas,

My circa '93 17bii from Singapore has this same "feature" while my 2 other 17bii's (both Indonsesia, later in the decade) do not. The later ones have a much wider field of view before "blacking out".

Interestingly, the indicators (shift, print, etc.) do not seem to be affected to nearly the same extent as the dot matrix area.

What is the date and source of the 27S?

Re: 27S display - a show stopper?

*Message #5 Posted by **Eric Smith** on 11 Oct 2011, 5:42 p.m.,*

> Quote:
>
> Interestingly, the indicators (shift, print, etc.) do not seem to be affected to nearly the same extent as the dot matrix area.

That's because the dot matrix area has a much higher multiplex factor than the annunciators.

Re: 27S display - a show stopper?

*Message #6 Posted by **bill platt** on 11 Oct 2011, 6:33 p.m.,*
in response to message #5 by Eric Smith

What does that mean? (or what is the multiplexer?)

Re: 27S display - a show stopper?

*Message #7 Posted by **Eric Smith** on 11 Oct 2011, 8:55 p.m.,*
in response to message #6 by bill platt

Segments on a dot-matrix display generally aren't driven continuously. Some fraction of them are driven at any given time. For the dot-matrix area of the 17B/17BII/27S/42S display, one row is driven at a time, which is 16:1 multiplex. The annunciators are generally driven at a lower multiplex rate, though I don't know specifically for those calculators what the rate is.

IIRC Hosoda-san (www.finetune.jp) suggested this was due to a weak/broken boost regulator for the lcd bias resulting in a low drive voltage. IME I've seen this result from too high of a drive voltage so I'm not quite certain. I think in part the lower contrast and viewing angle dependent contrast/depth is a characteristic of the lcd and controller in use. But certainly an out of spec drive voltage can be aggravating the situation. Some of my Saturn units as well have rather poor contrast and I'd been reminding myself to experiment with tightening it up.

> Quote:
>
> Interestingly, the indicators (shift, print, etc.) do not seem to be affected to nearly the same extent as the dot matrix area.

The annunciators might be multiplexed via a different rate/scheme such that the average segment "off" voltage is well below the lcd polarization threshold. Or maybe there is just less crosstalk between them given the size/spacing geometry difference relative to pixels in the matrix field.

Ah, I think I see what my confusion was above. You were describing low contrast due to insufficient lcd polarization drive resulting in a faint display vs. the low contrast inherent in this series of lcds under normal operation.

The latter problem is due to the intended "off" pixels receiving an average multiplex voltage just over their polarization potential which partially enables them, thereby reducing the contrast ratio due to saturation. AFAICT it really looks to be an issue of the controller either logically in terms of excessive multiplex ratio (or less likely analog drive) either of which results in RMS voltages (and optical polarization states) for on vs. off being too close causing readjustment of the lcd drive rail to be needed as the viewing angle changes.

This appears unrelated to a glass quality issue as the polarization level doesn't seem to visibly ghost due to crosstalk and the partial polarization is uniform. While these displays perform rather poorly by modern standards I seem to recall this being typical of matrix displays around the time these calculators were developed.

> Quote:
>
> The PCB and the LCD of the 27S is identical to that of the 42S.

The 17B I peeled open was very close except for what appeared to be a few cosmetic layout changes. Unsure whether that was model specific or a uniform change made to all models relative to manufacturing date (probably the latter).

WP34S : How many flash regions available

*Message #1 Posted by **Miguel Toro** on 11 Oct 2011, 1:53 p.m.*

Hi,

Perhaps this has been already answered. I am using version 2.2 1693. When I try to save a program in a region greater that 5, the calculator does nothing. The manual states that 9 regions are still available. Should I reflash my 34s?

Thanks,

Miguel

Re: WP34S : How many flash regions available

*Message #2 Posted by **Marcus von Cube, Germany** on 11 Oct 2011, 3:47 p.m.,*
in response to message #1 by Miguel Toro

The matrix functions have taken their share of flash memory. Walter has probably not yet updated the manual.

Re: WP34S : How many flash regions available

*Message #3 Posted by **Walter B** on 11 Oct 2011, 5:54 p.m.,*
in response to message #2 by Marcus von Cube, Germany

... since I'm still struggling with the consequences. BTW, due to frequent changes the amount of flash sectors available is probably the least reliable information in the manual. Sorry for that.

Re: WP34S : How many flash regions available

*Message #4 Posted by **Paul Dale** on 11 Oct 2011, 6:05 p.m.,*
in response to message #2 by Marcus von Cube, Germany

And Marcus said, things are very much in flux at the moment. The matrix functions have consumed about three flash partitions, we've done a bit of scraping and pulled back a bit of space and we try to find more.

- Pauli

Re: WP34S : How many flash regions available

*Message #5 Posted by **Miguel Toro** on 11 Oct 2011, 6:26 p.m.,*
in response to message #4 by Paul Dale

In my humble opinion, the matrix functions are well worth the lost space, even though the flash regions are a real nice feature to have.

This is a fascinating machine :-)

Thank you,

Miguel

Re: WP34S : How many flash regions available

*Message #6 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 11 Oct 2011, 7:17 p.m.,*
in response to message #2 by Marcus von Cube, Germany

I am sorry if this topic was addressed before, I couldn't find it searching the forum archives.

Does HP 30b use Single Layer Cell (SLC) or Multi Layer Cell (MLC) flash memory. If the flash is part of the ATMEL SOC AT91SAM7L128 CPU, OEM spec states that it is in fact SLC which is a great news for longevity and reliability.

Re: WP34S : How many flash regions available

*Message #7 Posted by **Paul Dale** on 11 Oct 2011, 7:20 p.m.,*
in response to message #6 by Kerem Kapkin (Silicon Valley, CA)

The flash is all on CPU.

> Q.E.D.

What exactly had to be shown? That it's a limited edition? We knew that. Each calculator is ;-).

BTW - There are apparently 3000 US 15C LEs. Any hints given on how many european calculator there will be? And has anyone @HP mentioned other contries? It has already shown up on the japaneese HP site.

Re: The most abused phrase "Check Back Soon"

*Message #4 Posted by **Martin Pinckney** on 11 Oct 2011, 3:51 p.m.,*
in response to message #3 by Thomas Radtke

HP calls it a Limited Edition. The constant "Sold Out" message proves it.

Re: The most abused phrase "Check Back Soon"

*Message #5 Posted by **Howard Owen** on 11 Oct 2011, 5:50 p.m.,*
in response to message #3 by Thomas Radtke

I see I must make explicit what I left as an exercise.

It is well known that

$$U_b = F_i*(A_r + V_s)^2$$

Where
U_b = urgency to buy,
F_i = impulsivity factor,
A_r = anticipated rarity,
And
V_s = verified scarcity

Since A_r and V_s are both >0, and impulsivity (among Americans) approaches infinity as long as the mortgage isn't due, we have U_b approaching infinity as well.

Since it has been widely reported in the Silly Mathematics literature that P_{eBay} is directly proportional to U_b, we have P_{eBay} > what you really ought to pay. Q.E.D.

Any logical inconsistencies or antifactual facts noted by the reader are irrelevant because I say so.

[WP34s] a) Input position and b) units and c) reminder plate

*Message #1 Posted by **Alexander Oestert** on 11 Oct 2011, 10:26 a.m.*

I just received Eric's fabulous overlays and thus started playing again with the WP34s, after having been distracted by the 15c LE. I apologize for that... ;)

Now with the overlays it's even better than it was already! Thank you again! I still came across two things that I wanted to mention:

a) Is there a reason why the input is on the left side of the display while the result is shown on the right side? I find that a bit odd and would prefer it to be in the same position, without a preference for left or right.

b) Scrolling through the constants catalog I found myself wishing to see the corresponding unit(s) in the upper display alongside the constants name. That would be a big help for my elderly brain. But I reckon it could be a question of no more RAM left over what prevents them to be squeezed in?!?

c) Coming from the 15c I could imagine a nice backplate with reminders on it in the style of Eric's overlay. Like the location of the statistical registers and such.

> a) Is there a reason why the input is on the left side of the display while the result is shown on the right side? I find that a bit odd and would prefer it to be in the same position, without a preference for left or right.

Interesting question. The Classics, Voyagers, and Pioneers do both on the left. The 48's have input on the left, results on the right. These are the only types I own.

What does the unmodified 30b do?

Re: [WP34s] a) Input position and b) units and c) reminder plate

*Message #3 Posted by **Jeff O.** on 11 Oct 2011, 12:30 p.m.,*
in response to message #2 by Martin Pinckney

Input and display on left.

Re: [WP34s] a) Input position and b) units and c) reminder plate

This is another one that bounced back and forth a few times :-) I don't remember all the reasoning. However, display on the right so you see the exponent and input on the left to distinguish it easily come to mind immediately.

- Pauli

I don't find it hard to distinguish between mantissa and exponent, if that's what you meant. Their respective sizes make that one easy.

I understand however that there are reasons for both ways. Is it possible (and easy enough to implement) to have a switch, say, in the MODE menu?

Re: [WP34s] a) Input position and b) units and c) reminder plate

*Message #6 Posted by **Paul Dale** on 12 Oct 2011, 4:15 a.m.,*
in response to message #5 by Alexander Oestert

It would be possible of course.

It would use a small amount of code space (I'm not sure how much actually) and it would use our last bit of RAM. I find it difficult to believe that there isn't a better use for this last lonely bit.

All that said, I'm not going to code it :-)

- Pauli

Re: [WP34s] a) Input position and b) units and c) reminder plate

You're the king and can leave the input on the 'wrong' side as you wish - you drive on the wrong side of the road as well down under. ;-)

BTW, what I always wanted to ask an Australian: When you describe the course of the sun during the day in a hand gesture - what do you do? While I use my right hand and describe an ascending and descending semi circle from left to right, am I right to assume that you would do the opposite?

Re: [WP34s] a) Input position and b) units and c) reminder plate

I don't use this gesture myself.

The sun still rises in the East and sets in the West. If I was looking Northish from here, I'd do it in reverse -- right to left. Not sure which hand I'd use for it but that isn't really relevant.

We're not too far from the Tropic of Capricorn, North of which the sun is can be either North or South of you depending on the time of year. How's that for added confusion. For example, when we lived in Townsville some fifteen years ago, both the North and South sides of our house received full direct sunlight at different times of the year.

- Pauli

Re: [WP34s] a) Input position and b) units and c) reminder plate

in response to message #8 by Paul Dale

Thanks for this amazing insight. This house you had must have been every realtor's dream! ;) Too bad that every house in town was just the same...

Re: [WP34s] a) Input position and b) units and c) reminder plate

*Message #10 Posted by **Paul Dale** on 12 Oct 2011, 5:58 a.m.,*
in response to message #9 by Alexander Oestert

Trust me, having sun on all four sides of your house when you in the heart of the tropics isn't a desirable selling point. Being well shadowed and breezy is far more enjoyable.

- Pauli

Re: [WP34s] a) Input position and b) units and c) reminder plate

*Message #11 Posted by **Michael Kussmaul** on 12 Oct 2011, 9:56 a.m.,*
in response to message #8 by Paul Dale

Funny :-) The first time I was in Australia the moon confused me, because ascending/descending was swapped until I realized I'm upside-down. Here in Switzerland you learn:

a: "Abnehmend" - means descending, so if you draw an "a" the first stroke resembles the shape of a descending moon, like "("

z: "Zunehmend" - means ascending, so if you draw an "z" the first stroke resembles the shape of an ascending moon, like ")"

I learned this by heart, so I had some confusing moments when it didn't work down-under :-)

Re: [WP34s] a) Input position and b) units and c) reminder plate

*Message #12 Posted by **Dieter** on 12 Oct 2011, 6:07 p.m.,*
in response to message #11 by Michael Kussmaul

Ah, yes - I also learned this rule of the moon resembling an handwritten A or Z from my grandfather. But there's another one that works very well especially in Australia. ;-) The Romans, living on the northern hemisphere, used to say *luna mentitur* - the moon lies. Simply because the descending moon looks like a C as in *crescens*, while the ascending moon resembles a D like in *decrescens*. However, while it's just the other way round north of the equator, this is exactly the way it is on the southern hemisphere, so the C/D rule works fine there. ;-)

Some 30b routines, revisited

*Message #1 Posted by **Harry Jacobson** on 11 Oct 2011, 4:13 a.m.*

In Some 30b Routines Jeff O presents 10 routines

> Quote:
>
> In the absence of a complete repurposing of the 30b, I decided to come up with a set of key reassignments and/or programs to make the 30b more easily useable (to me, at least) as a scientific calculator. I decided to implement the following functions in the 10 available program slots:
> SIN-1
> COS-1
> TAN-1
> Complex add
> Complex subtract
> Complex multiply
> Complex divide
> Complex Invert
> Polar to Rectangular Conversion
> Rectangular to Polar Conversion

Within the message thread program modifications were made so that all programs could have program labels and still fit in the 290 byte program memory of the 30b. Thomas Klemm contributed to the final set of programs.

I wondered if the programs could be shrunk further. Further shrinkage would have no practical purpose since there could be no more than 10 programs therefore no way to use the released program memory. Still, the exercise was enjoyable and successful. The shrunken programs revisited consume 272 bytes of 290 bytes of program memory.

I played with the 30b inverse trig functions sin-1, cos-1, and tan-1. I discovered whether or not the 2nd or final Input is pressed, that when followed by an arithmetic (+, -, X, /) or one-number (x^2, 1/x, e^x, etc.) function *the answer is the same.* (My calculator's SW version 4 5 2010 1.) The advantage to not pressing the 2nd or final Input is the name of the inverse trig function (sin-1, cos-1, tan-1) remains displayed. This eliminates the need for the 2nd *message XXX-1* step, a saving of 18 bytes total. Also, I made COS-1 and TAN-1 callable routines and re-numbered labels.

Here are the ten programs, revisited. Programs 3, 4, and 9 are unchanged from the original message thread.

```
Prgm 0
Program Description:    Arc Sine
bytes and checksum: 11.090
Step    function        comments
0       SH7             assign to shift-hold 7
1       message SIN-1   Program label
2       Math            execute SIN-1 function
3       Input           execute SIN-1 function
4       Down            execute SIN-1 function
5       Stop

Prgm 1
```

```
Program Description:    Arc Cosine
bytes and checksum: 14.118
Step    function        comments
0       SH8             assign to shift-hold 8
1       message COS-1   Program label
2       Lbl11           Program label for call from R->P routine
3       Math            execute COS-1 function
4       Input           execute COS-1 function
5       Up              execute COS-1 function
6       Up              execute COS-1 function
7       RTN             Return for call

Prgm 2
Program Description:    Arc Tangent
bytes and checksum: 13.189
Step    function        comments
0       SH9             assign to shift-hold 9
1       message TAN-1   Program label
2       Lbl21           Program label for call from R->P routine

Re: Some 30b routines, revisited

*Message #2 Posted by **Jeff O.** on 11 Oct 2011, 12:12 p.m.,*
in response to message #1 by Harry Jacobson

Hello Harry,
I did not exect to see that post brought up again :-) The main interest in the 30b nowadays is as a platform for wp34s.

As far as leaving out the INPUT, that does seem to work if your next action is some function. But if you want to key in a new value to operate on the result, you must remember to press INPUT first.

Re: Some 30b routines, revisited

*Message #3 Posted by **Harry Jacobson** on 11 Oct 2011, 5:41 p.m.,*
in response to message #2 by Jeff O.

Et tu Jeff?

Did you convert your 30b to a wp34s?

I do use the 30b TVM functions.

About INPUT, you'll notice I left them in program 8 after the call statements. No sweat when using the calculator having to INPUT for some calculations. Easy to remember.

It's curious there's no need to INPUT when followed by Roll Down, Swap, and +/-! The only operations I do which need INPUT are STO and the occasional entry of a new value which (to me) make them the exceptions.

Re: Some 30b routines, revisited

*Message #4 Posted by **Miguel Toro** on 11 Oct 2011, 6:42 p.m.,*
in response to message #3 by Harry Jacobson

Hi Harry, These are nice programs. May I suggest to create an article, so they are not lost in the constant flow of posts in the forum?

Regards,

Miguel

Re: Some 30b routines, revisited

*Message #5 Posted by **Jeff O.** on 11 Oct 2011, 8:20 p.m.,*
in response to message #3 by Harry Jacobson

Sorry, no betrayal was intended.

I have two 30b calculators - one is converted to wp34s, the other is to be converted, but as yet remains a 30b.

HP15c new and old - pictures

*Message #1 Posted by **Jose Gonzalez Divasson** on 10 Oct 2011, 6:33 p.m.*

Now that I have received my first 15c (waiting for the 1st European batch, due early December), I thought some that have not yet bought it might like to compare it with the original with some pictures:

HP15c new and old - some pictures (post 1 of several)

In future days we'll run deeper comparisons. Let me say for a start that it is a fantastic product and that compares very well with the old one. All keys register properly and long, complex programs run instantaneously (My IRR program with 10 years' flow runs in less than a second, compared with 1m30' for the old one)

Re: HP15c new and old - pictures

*Message #2 Posted by **Alex Mark (Greece)** on 11 Oct 2011, 5:32 a.m.,*
in response to message #1 by Jose Gonzalez Divasson

Any bugs like in the US models?

Re: HP15c new and old - pictures

*Message #3 Posted by **Dan W** on 11 Oct 2011, 10:27 a.m.,*
in response to message #1 by Jose Gonzalez Divasson

One of the first things I noticed was the LCD display. The new version has this slightly unpleasant greenish tint, where the original was grey. This shows up well on one of the last photos.

Re: HP15c new and old - pictures

*Message #4 Posted by **Roger Blake** on 11 Oct 2011, 10:39 a.m.,*
in response to message #3 by Dan W

Also the segments are spaced slightly wider within the characters on the LE, and more worryingly - although I seem to have been the only one to notice this - the new displays easily asquire fine scratches. - 35S is similar. If you hold them up to the light at a low angle you may see them. The old voyagers didn't suffer this.

Re: HP15c new and old - pictures

in response to message #3 by Dan W

i've been meaning to write up a review on the LE, but you are absolutely right. i noticed this right away and for whatever reason, although i thought i would get used to it, i still notice it and continue to be mildly annoyed by the difference. (don't know if that means if i don't adapt well to new things or if there is something inherently less pleasant with this yellow/green tint)

Re: HP15c new and old - pictures

(don't know if that means if i don't adapt well to new things or if there is something inherently less pleasant with this yellow/green tint)

It isn't just the effective color difference (although that indeed exists) but the lesser segment contrast particularly when the display is viewed increasingly away from perpendicular. The 12c+ is identical in this respect IIRC.

Re: HP15c new and old - pictures

*Message #7 Posted by **Jose Gonzalez Divasson** on 11 Oct 2011, 4:55 p.m.,*
in response to message #6 by uhmgawa

At any rate, screen contrast in either model is miles ahead of any other calculator in the Pioneer line.

And I can live happily with the greenish tint, since I have an ultra-fast calculator, and my beloved original 15c can rest safe in a box...

Re: HP15c new and old - pictures

*Message #8 Posted by **uhmgawa** on 13 Oct 2011, 5:12 p.m.,*

> At any rate, screen contrast in either model is miles ahead of any other calculator in the Pioneer line.

It is indeed, but then again Pioneer displays are a different lcd technology and even for a graphic matrix have notoriously poor contrast. The s/n 28xx <= voyagers also have reduced contrast relative to the original design due to an increased multiplexing scheme for the sake of minimizing pin count. Just shows what happens when your handiwork falls victim to the cost reduction engineering team.

So the ultimate Voyager retrofit for the uber geek is an original unit which tosses the pcb, r2d2(s), NUT cpu, and brings in a new pcb with an ARM core of your choice, new segment lcd controller, and some provision for i/o; preserving the original tactile domes, low multiplex lcd glass, case and D/S keycaps, yielding the best of both worlds. I'd half seriously considered doing so but at the time dumped it on the back burner to join the other time starved ideas.

I do have what amounts to a NUT/Voyager in-circuit emulator work in progress which coincidentally needs the discardable Voyager (ideally 15c model) portions called out above. So it appears I could justify the effort with minimal guilt and shame of bandsawing up a legacy 15c just for fluff.

Re: HP15c new and old - pictures

*Message #9 Posted by **Derek** on 11 Oct 2011, 6:40 p.m.,*
in response to message #6 by uhmgawa

ah man, i just pulled both out and there it is. you're right. i think i hadn't tried to think about what was different beyond the tint, but the off axis viewing is not as good on the LE...oh well, it's still pretty good.

solved another polynomial today...much faster than the old 15C: so the LE does have something going for it! :)

Re: HP15c new and old - pictures

*Message #10 Posted by **Derek** on 11 Oct 2011, 11:44 a.m.,*
in response to message #1 by Jose Gonzalez Divasson

wow. your original 15C looks to be in GREAT shape. has it seen lots of use? my 27 year old 15C looks battered in comparison, but is going strong!

Re: HP15c new and old - pictures

*Message #11 Posted by **Dusan Zivkovic** on 11 Oct 2011, 1:51 p.m.,*
in response to message #10 by Derek

Now this is all starting to seem to me like a great market opportunity. It would work similar to the already big market for new "relic" guitars, where new instruments are artificially distressed in custom shops and sold at a higher price than functionally identical nice glossy ones. It all started when Fender brought Keith Richards a "reissue" guitar in mid-90s and he said, "It looks too new." They took a small hammer, and soon Keith was happy. Anybody willing to join me with a small hammer and a bunch of new 15C LEs? The critics will easily spot stuff like "wrong shape of the dent on the worn R/S key" but from the other side of the office, ordinary spectators will think it is a real 1982 Voyager. ;)

Heck, they sell brand new worn-out blue jeans for more than the good ones. I could save a lot of money by going to the thrift store.

If I wore blue jeans.

Warning if you have a calculator shipped outside the US. No warranty.

*Message #1 Posted by **Jim Creybohm** on 10 Oct 2011, 6:20 p.m.*

So, after getting an HP 15 shipped from Samson Cables to Canada, one of the two I ordered has a faulty Enter key. It clicks, but does not always register. It is serious enough that the person I gave it to is actually giving it back to me in frustration. This was a gift to a customer, so you can imagine my chagrin.

Samson has said that they can't do anything. They can't get any more calculators, and that I need to go to HP direct.

So, I contact HP 1-800-DO-LITTLE customer support line, only to be told that there is NO warranty for a product out side the US that was sold only IN the US. Really? I have a US mailing address, what does it matter where the darn thing was bought or shipped to?

Can anyone help me out here? What am I supposed to do? I am really disappointed with HP's patent pending support.

Re: Warning if you have a calculator shipped outside the US. No warranty.

*Message #2 Posted by **Lincoln R.** on 10 Oct 2011, 7:44 p.m.,*
in response to message #1 by Jim Creybohm

Yeah, that sounds like an interesting bit of lawyering. Perhaps you could use your US address to file the warranty claim? A bit of a nuisance, but better than being stuck with a dead calc. Also, I'm not sure if HP is shipping replacements either, you might be better off taking your $ back if Samson will refund and waiting for more to be made.

I know none of these are great options, but they may be all you have.

Re: Warning if you have a calculator shipped outside the US. No warranty.

*Message #3 Posted by **Nicholas Winterer** on 10 Oct 2011, 8:11 p.m.,*
in response to message #1 by Jim Creybohm

I would be happy to claim your warranty for you, if you can't just call HP again without mentioning your location.

That policy is absurd.

Re: Warning if you have a calculator shipped outside the US. No warranty.

*Message #4 Posted by **Eric Rechlin** on 10 Oct 2011, 10:59 p.m.,*
in response to message #1 by Jim Creybohm

Hopefully someone from HP will chime in with an official response, but I was told by HP a couple years ago that the warranty is valid worldwide, and I know that others in Europe have had no problems getting their warranty handled even if they purchased the calculator in the US. This was not the case in the past, however.

Maybe you just got the wrong person? Maybe try calling back again and you'll get a better answer?

Eric

Re: Warning if you have a calculator shipped outside the US. No warranty.

*Message #5 Posted by **Raymond Del Tondo** on 10 Oct 2011, 11:39 p.m.,*
in response to message #4 by Eric Rechlin

Sounds like a lottery;-)

*Message #6 Posted by **Walter B** on 11 Oct 2011, 1:09 a.m.,*
in response to message #5 by Raymond Del Tondo

That lottery's called "case law" ;-)

Re: Warning if you have a calculator shipped outside the US. No warranty.

*Message #7 Posted by **Paulo MO** on 11 Oct 2011, 3:02 a.m.,*
in response to message #1 by Jim Creybohm

I recently received a 12c+ shipped from the US to Europe. It had bad keys (the Enter key among them). I had no problems whatsoever with the warranty claim. That was three/four days ago, and I'm now waiting for a replacement (with my fingers crossed, just in case).

It is true that the 12c+ is being sold in Europe, and the 15C LE is not being sold in Canada (or anywhere else, for that matter :-)). But I'm not sure if that is an issue at all. So, my advice is: try again; you may indeed get an assistant with a different "opinion".

Best of luck Paulo

Re: Warning if you have a calculator shipped outside the US. No warranty.

*Message #8 Posted by **Jim Creybohm** on 11 Oct 2011, 7:53 a.m.,*
in response to message #1 by Jim Creybohm

Thanks all.

Nicholas, I may yet take you up on your generous offer, however I am hopeful that a mechanism can be found that will eliminate this frustration for folks in Europe as well as us in Canada.

Next step: I guess I am going to have to call again. If I get the same answer then HP has definitely lost me as a customer.

I will keep everyone apprised on how this goes.

Re: Warning if you have a calculator shipped outside the US. No warranty.

*Message #9 Posted by **Eddie W. Shore** on 11 Oct 2011, 8:46 a.m.,*
in response to message #8 by Jim Creybohm

Best of luck, Jim. Hopefully HP will do the right thing and replace the calculators pronto.

Repair HP41CV. Help needed.

*Message #1 Posted by **Kees van der Sanden** on 10 Oct 2011, 2:22 p.m.*

The LCD of HP41CV will not turn on.

I measured the following behavior: When applying a battery voltage of 6 Volt, the calculator sinks 340 uA. (This current seems much too high for the sleepmode). When the ON key is pressed, the supply current goes to 1.4 mA. When the ON key is pressed, the battery current is 2.2 mA. The calculator cannot be turned back to the sleepmode by pressing the ON key. By reconnecting the battery, the sleepmode is back. The internal supply voltage is in sleepmode about the battery voltage and in active mode 6.4 Volt, regardless of the battery voltage (between 4V and 6V).

The model is a halfnut version, serial 2721Sxxxxx. Is this a known problem? Where to find service documentation for this model?

Re: Repair HP41CV. Help needed.

*Message #2 Posted by **Rik Bos** on 10 Oct 2011, 4:16 p.m.,*
in response to message #1 by Kees van der Sanden

Hi Kees,

Did you check the board connection (small gold wires or conducting rubberstrips) and did you checked the board for whiskers (small conducting parts). If you're shure it's a hard ware problem start with replacing the tantalium caps, the costs are low and the change of succes is high. If you have the diagrams from the service manual you can check the power supply with a scoop.

-Rik

Can you get a scope on the LC oscillator tank when trying any/all of the above? Check frequency, stability,

and oscillator startup time.

> Quote:

> Where to find service documentation for this model?

I've found it in various forums. However the only response to your question which apparently won't get this post censored is to recommend you buy the museum DVD.

Re: Repair HP41CV. Help needed.

*Message #4 Posted by **Kees van der Sanden** on 11 Oct 2011, 4:03 p.m.,*
in response to message #3 by uhmgawa

Thanks for you reply.

I probed with a scope on a lot of tracks. Except for DC levels I traced one repeating clock pattern close to the display pins. The clock pattern starts with 8 pulses at a frequency of about 500 Khz. Next this burst remains at a high level (about 6 Volt) for about 10 us. Finally the signal changes in a damped sine. This patterns repeats itself continuously.

I think I need the service documentation to continu.

Eric's overlays

*Message #1 Posted by **Han** on 10 Oct 2011, 2:21 p.m.*

I was wondering if it was still possible to request custom overlays of older models. I'm particularly fond of the HP48, and would like to have some nice overlays for things like JAZZ's editor, the ML debugger, etc.

If you are still considering requests, Eric, I'd like to know what the current costs would be.

Re: Eric's overlays

*Message #2 Posted by **Eric Rechlin** on 10 Oct 2011, 2:59 p.m.,*
in response to message #1 by Han

Wouldn't it be better to email me directly?

Anyway, yes, I can make overlays for the 48, but I haven't had much luck in finding good material to do it with. If you don't mind cardstock, I can do it on that. Ideally I'd want something either both more durable (like adhesive vinyl stuck to cardstock) or more stuff (like Mylar), but my current cutter is not powerful enough to cut those options.

I did make some sample SurveyPro overlays for someone who requested them, but I never heard back on how well they worked long-term.

Eric

when is a red dot a dot, and when not? and if not, then what?

*Message #1 Posted by **robert rozee** on 10 Oct 2011, 11:30 a.m.*

the discussion of "red dot" HP35's recurs again and again, with a great deal of speculation and hand waving around the authenticity of said dot. it seems that anyone can take ANY HP35 and drill a hole in the front of it to turn it into the elusive "red dot" variant. so i pose these questions:

1. what, if any, difference is there between a front casing that has been moulded with a 'red dot' hole in it, and one that has had the hole drilled later?

2. what, if any, difference is there (beyond a dot of paint) between the power switch in a "red dot" HP35 and the power switch in a later (non-dot) 35? were 'red dot' switches ever fitted (with dot not visible) to later 35's?

3. did HP ever drill "red dot" holes when carrying out repairs that required replacing a damaged front casing on an early 35?

given the large number of 35's that were reworked, outside labelling doesn't appear to be any reliable indicator of a given 35's true heritage. and if a "red dot" is so easy to 'fake', is it even a worthwhile point to base a premium price/value upon? surely the presence of the ln(2.02) bug burnt into the ROMs is a better point of distinction?

comments?

Re: when is a red dot a dot, and when not? and if not, then what?

*Message #4 Posted by **Thomas Radtke** on 10 Oct 2011, 1:23 p.m.,*
in response to message #3 by bill platt

To me, it looks more like a waste of bandwidth. You know, I'm on the EDGE here (<- great joke!).

:-/

Re: when is a red dot a dot, and when not? and if not, then what?

*Message #5 Posted by **Gerson W. Barbosa** on 10 Oct 2011, 6:05 p.m.,*
in response to message #2 by Michael de Estrada

In my computer screen these are actually about 120,176 red dots (I knew the HHC 2011 programming challenge would prove useful one day :-)

Re: when is a red dot a dot, and when not? and if not, then what?

*Message #6 Posted by **Walter B** on 11 Oct 2011, 1:14 a.m.,*
in response to message #5 by Gerson W. Barbosa

That's an undisputed advantage of SW over HW: when you've solved a problem, it's solved for all time.

Fortunately, it's not that easy.

*Message #7 Posted by **Frank Boehm (Germany)** on 11 Oct 2011, 6:28 a.m.,*
in response to message #1 by robert rozee

But please understand that I won't spill out all the secrets, as it might help fraudsters.
But: Drilling a hole will *never* turn it into a red dot. There are several details that can not be falsified.
I agree that a blurry picture might help in ripping off a buyer, but as soon as you are able to inspect the item or have good enough pictures, there is no chance to fool an expert (and there are a couple of them on this forum, they won't spill out the secrets as well...).

To answer at least one question: I don't think HP ever drilled a hole into a HP35 case :)
On a sidenote: the red dot is really pointless - the battery might be dead, but it will still show the red dot...

Re: Fortunately, it's not that easy.

what are those other details?! remember, labels and rubber feet (that can have been legitimately replaced) don't count.

what other structural difference is there that can be observed or measured? for instance, is the front casing different internally in some way?

Re: Fortunately, it's not that easy.

*Message #9 Posted by **Martin Pinckney** on 11 Oct 2011, 10:53 a.m.,*

I am not a HP 35 expert, but my guess is, the answers to your questions fall under:

> Quote:
>
> I won't spill out all the secrets, as it might help fraudsters.

Re: Fortunately, it's not that easy.

*Message #10 Posted by **David Ramsey** on 11 Oct 2011, 11:15 a.m.,*
in response to message #7 by Frank Boehm (Germany)

> Quote:
>
> But please understand that I won't spill out all the secrets, as it might help fraudsters.

C'mon, that's silly.

If we can't discuss the details of things like this here, where can we discuss them?

Is preventing fraudsters from manufacturing fake Red Dots any more important than withholding details that might allow a buyer not to be tricked?

Since some of the details "cannot be falsified", I don't see what the problem is anyway.

Re: Fortunately, it's not that easy.

*Message #11 Posted by **Martin Pinckney** on 11 Oct 2011, 1:33 p.m.,*

So what's the point of not discussing it here??? Is there a 'I know the Red Dot secrets' club that you have to join first?

Re: Fortunately, it's not that easy.

*Message #13 Posted by **Michael Eckstein** on 12 Oct 2011, 8:24 a.m.,*
in response to message #12 by Juergen Keller

AFAIK there in no secret database of unfalsifiable Red Dot details. It's rather a private investigation of the RD owners, some specific feature could be known by just one person. But there are many well known details from which could be determined, whether HP 35 is really the Red Dot. From what you see in the auction on TAS follows that the calculator is very probably a true Red Dot, but it was definitely modified either in the HP service or elsewhere since it lacks several ot those well known features.

Is this a Red Dot ?

*Message #14 Posted by **Michael de Estrada** on 12 Oct 2011, 9:22 a.m.,*
in response to message #13 by Michael Eckstein

Where is the Red Dot ?

Re: Is this a Red Dot ?

*Message #15 Posted by **Michael Eckstein** on 12 Oct 2011, 9:48 a.m.,*
in response to message #14 by Michael de Estrada

Apparently it's missing :-) and it could be for several possible reasons. But that does not mean that it had to be a fake.

Posted: A response from the seller of the red dot HP 35

*Message #16 Posted by **gene wright** on 13 Oct 2011, 1:49 p.m.,*
in response to message #14 by Michael de Estrada

The seller of this item asked me to post this for everyone. The red dot is not mine nor am I bidding on it. It appears if you have any questions he will be happy to answer them.

==========

I have the HP-35 Red Dot up for auction on TAS. We recently purchased Guy Ball's collection and this was one of the items. I personally have been dealing with these type items for years and work diligently to provide high quality, authentic items at all times. Anyone that has purchased from us knows we stand behind our products and offer a 14 day money back guarantee for any reason.

This particular calculator may have been sent back for repair of the 2.02 bug and had some label changes by the factory. It does have the correct serial label and the serial number is close to the one on Michael's site that also is missing the red color. If you have any questions please email me at sctt.reynolds@gmail.com

Regards, Scott Reynolds Vintage Calculators Inc Owner

HP-19C with a strange S/N

*Message #1 Posted by **Ernst Fueloep** on 10 Oct 2011, 11:17 a.m.*

Hi,

I have a HP-19C which has a very strange serial number:

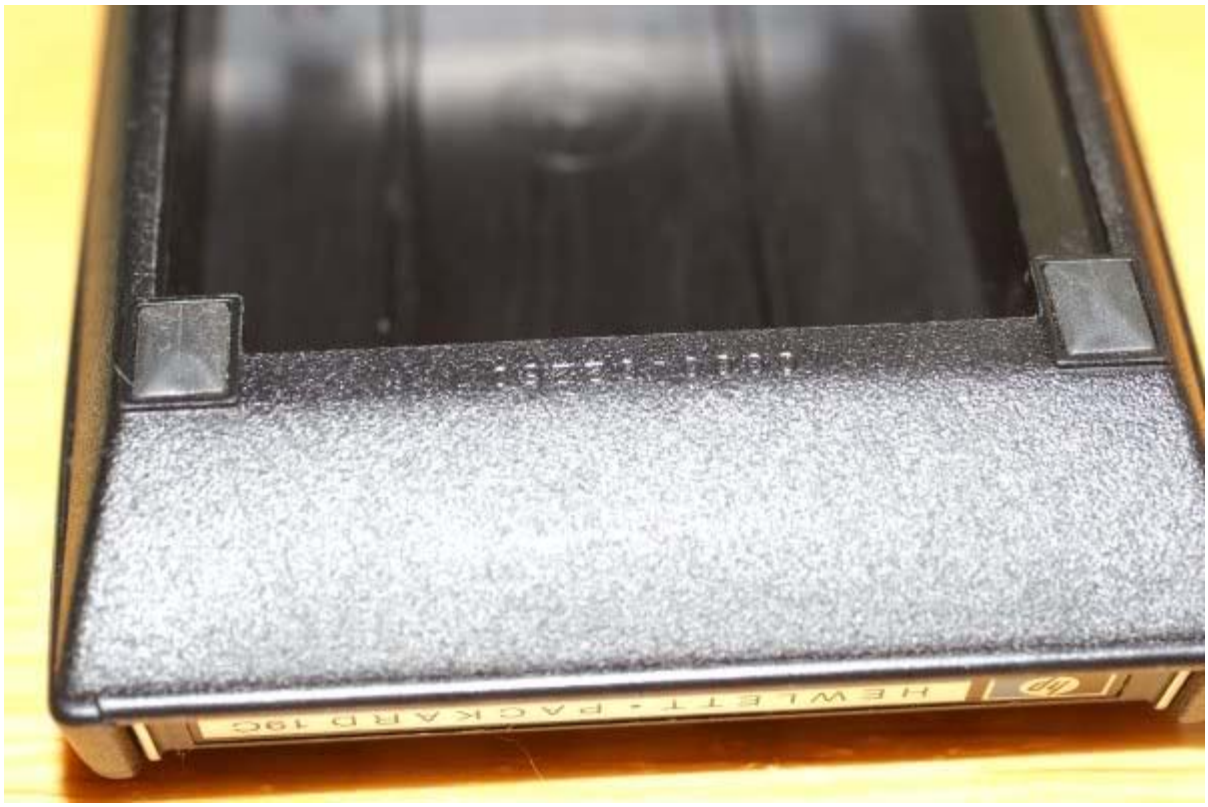
0000A02260

Has anybody seen this? What is the meaning of it?

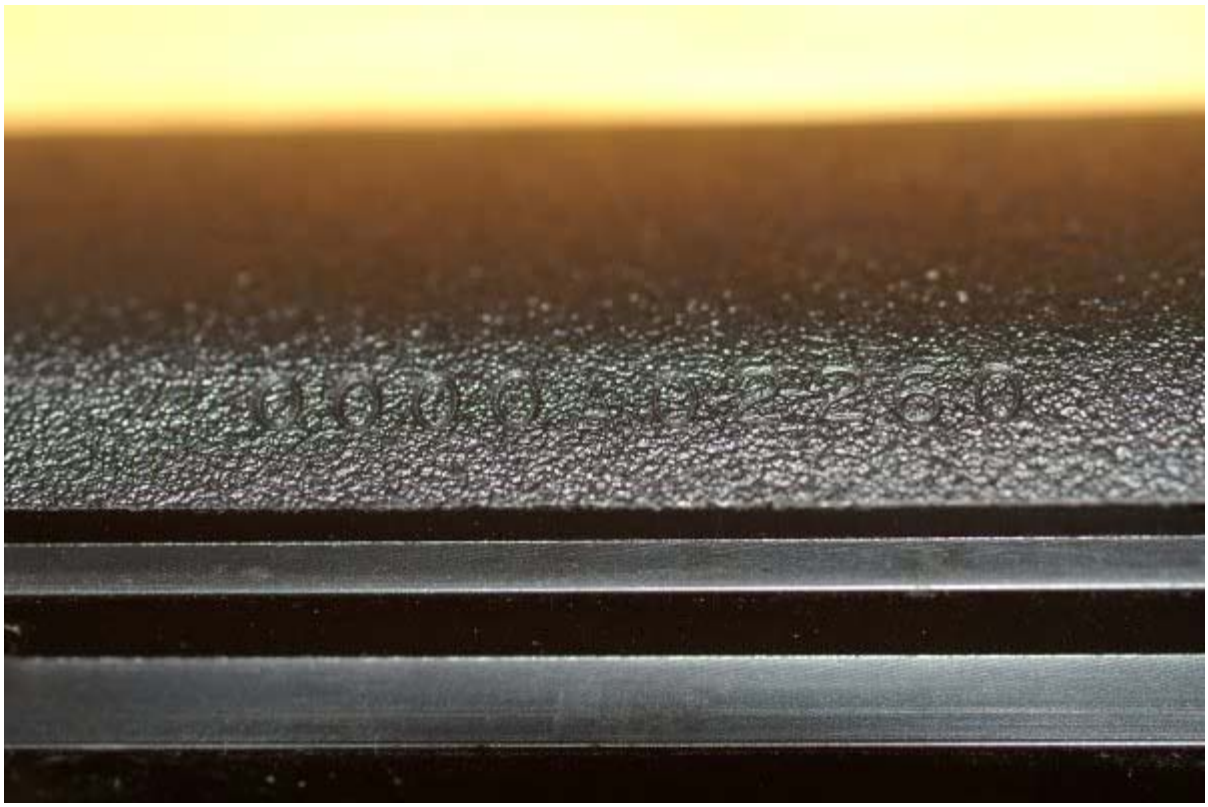
See pictures.

FIX
SCI
ENG
GSB
GTO
SST
PREFIX
PRGM
REG
ENTER
CHS
EEX
CLX
PRT PRGM
GRD
RAD
DEG
DEL
PRT Σ
STO
DSZ
INT
PRT REG
LAST x
PAUSE
PRT STK
Continuous Memory
HEWLETT-PACKARD 19C

The battery contacts are broken. I never saw this before on any HP-19C. Because of this I am currently unable to verify if this unit works or not.



Here is the serial number close up and rotated 180 degrees for easy reading. I have never seen such a serial number.



What is it? Is this some kind of prototype?

Re: HP-19C with a strange S/N

*Message #2 Posted by **Juergen Keller** on 10 Oct 2011, 2:13 p.m.,*
in response to message #1 by Ernst Fueloep

My guess is that it is a prototype. The 4 zeros are also mentioned in another thread about 71B's:

HP-71B Early Date Code

HP-35 red dot - real or fake?

*Message #1 Posted by **Keith Midson** on 10 Oct 2011, 5:52 a.m.*

There is a listing on TAS right now (item 110755350953) that claims to be a red dot 35. I always thought that a red dot had the label "Hewlett Packard", not "Hewlett Packard 35" - the "35" edition came later. Can anyone confirm this? Is this a fake, or a red dot with a new label?

Looks real.

*Message #2 Posted by **Frank Boehm (Germany)** on 10 Oct 2011, 6:28 a.m.,*
in response to message #1 by Keith Midson

However it has been serviced (front sticker and back sticker have been replaced), so it's not in original state and therefor lacks "The Bug".
Still a real red dot.

Re: HP-35 red dot - real or fake?

*Message #3 Posted by **Gerson W. Barbosa** on 10 Oct 2011, 9:12 a.m.,*
in response to message #1 by Keith Midson

Mine is real ;-)

Re: HP-35 red dot - real or fake?

*Message #5 Posted by **Sondre K. Selnes** on 10 Oct 2011, 9:39 a.m.,*
in response to message #1 by Keith Midson

In addition to the wrong label, it looks somewhat unreal to me, due the distance from the power button to the "red dot". The outlets inside the calculator are like new, indicating that this has been opened. The low starting price tag from 0.99 US$! .. I think its a fake.

something like this?

*Message #6 Posted by **Frank Boehm (Germany)** on 10 Oct 2011, 11:31 a.m.,*
in response to message #5 by Sondre K. Selnes

The position of the hole is correct.
Due to the construction of the battery pack and gold plating, corrosion on the contacts rarely ever happened. I think I've only seen one of the classics with noteworthy corrosion.

Nevertheless, the calculator has been opened before, very likely during HP service.
The seller obviously knows "something" about HP calcs, so starting at 0.99 is no real risk, but increases the possibility of a bidding war.

Edited: 10 Oct 2011, 11:32 a.m.

The "service" of HP

*Message #7 Posted by **Sondre K. Selnes** on 10 Oct 2011, 6:16 p.m.,*
in response to message #6 by Frank Boehm (Germany)

I rader have a none-working and in bad shape red dot in ordinary state, than one coming from HP service, when I see this - B A D - work.

An old calculator shall by my opinion look old, it even do not have to work.

(By the years, I have to admit there is one calculator that stands out from the crowd. I have used both HP-, TI-, Sinclair- and CASIO. Both HP-15C and TI-34 are excellent calculators, but the CASIO FX-82 (LCD) from 1983 stand out! The AA sized batteries still works and there are no corrosion, no keyboard errors, no display errors... no errors even in the year 2011.

I am a big fan of HP calculators, but have to admit that CASIO is the winner.

WP 34S matrix operations

*Message #1 Posted by **Paul Dale** on 10 Oct 2011, 5:16 a.m.*

I've added a number of matrix routines to the library/matrix.wp34s file. This along with Marcus's matrix editor is about half a flash region. We'd like to provide a full region of matrix functions if possible.

My question is then "What extra functions should go in?"

Suggestions are welcome, suggestions with code are better :-) These aren't going to be held to the same standard as the internal user code commands -- wreck the stack, use the lettered registers and flags and generally have fun.

I am aware of these functions but thought I'd see what people wanted before diving in and doing the ones I find interesting (and probably completely useless).

The existing functions in user code are:

- **M.1** - Create an identity matrix from a descriptor in X. No stack damage, L changed.
- **M.0** - Create an zero matrix from a descriptor in X. No stack damage, L changed.
- **ATR** - Return the sum of the absolute values of the matrix diagonal.
- **TR** - Return the trace of the matrix.
- **M-** - Matrix subtraction.
- **M+** - Matrix addition.
- **M.y** - Multiply matrix by scalar.
- **FNM** - Frobenius norm.
- **RNM** - Row norm.
- **CNM** - Column norm.
- **MFD** - Find element in matrix.
- **M^** - Find the maximum element in matrix.
- **Mv** - Find the minimum element in a matrix.

Yes, these need better documentation.

These are implemented internally and documented reasonably in doc/matrix.txt:

- **M.TRN** - Matrix transpose in-situ.
- **M.times** - Matrix multiply.
- **M.+times** - Matrix addition & scalar multiplication.
- **M.R<->** - Matrix row swap.
- **M.Rtimes** - Multiply row by scalar.
- **M.R+times** - Multiply a row by a scalar and add to another row.
- **M.IJ** - Convert a register index to row/column indices.
- **M.REG** - Convert row/column indices to a register index.
- **M.ALL** - Return a loop index to iterate over the entire matrix.
- **M.DIAG** - Return a loop index to iterate over the diagonal of the matrix.
- **M.ROW** - Return a loop index to iterate over a row of the matrix.
- **M.COL** - Return a loop index to iterate over a column of the matrix.

M.ROW? - Extract the row count from a matrix descriptor.
- **M.COL?** - Extract the column count from a matrix descriptor.
- **M.SQR?** - Check if a matrix descriptor is for a square matrix & execute the next step if not.
- **M.COPY** - Copy a matrix to another location.
- **M.DET** - Calculate the determinant of a matrix.
- **M.LIN** - Solve a system of linear equations.
- **M.INV** - Invert a matrix in-situ.

This seems like a fairly good selection of operations. Their names might change, but the functions are very unlikely to.

- Pauli

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #2 Posted by **Marcus von Cube, Germany** on 10 Oct 2011, 3:08 a.m.,*
in response to message #1 by Walter B

Having the windowing operations on different shift keys is not the best solution because you cannot hold a shift while tapping on UP/DOWN to move the window. I vote for moving <(and)> to g-shifted UP/DOWN.

h-shifted might be even better. Move MATRIX on h-6, leave STATUS on h-X and move ! and L.R. on the vacant f/g positions on the UP key. So no function is lost (L.R. still on the keyboard) and the function set should fit nicely (except that y^ and r are no longer together with L.R. We could just put them side by side.)

SB & CB may be disputable but they are better then x<>alpha. :-)

Edited: 10 Oct 2011, 4:16 a.m.

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #3 Posted by **Egan Ford** on 10 Oct 2011, 4:46 a.m.,*
in response to message #2 by Marcus von Cube, Germany

I completely agree. I am still arguing for LASTx to replace FILL. RCL L can still function as LASTx, but FILL should be in P.FNC.

Ceterum censeo: Walter, bring back LASTx (and if you stubbornly refuse to, the community is going to do it the old HP way).

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #4 Posted by **Paul Dale** on 10 Oct 2011, 4:53 a.m.,*
in response to message #3 by Egan Ford

What about putting a LastX label above the EEX key as a memory aide? We're not going to have a LastX command -- it will always display as RCL L. We don't have the hundred odd bytes to implement LastX as a stand alone command.

As for FILL, try working with the eight level stack -- FILL is far more useful there. If isn't *g FILL* vs *ENTER ENTER ENTER*. It is *g FILL* vs ***ENTER ENTER ENTER ENTER ENTER ENTER ENTER***.

Additionally, FILL accepts a complex prefix so it is *CPX g FILL* versus *CPX ENTER CPX ENTER CPX ENTER*.

And as always, feel free to grab the sources and do what you want :-) That is the whole point of making this open source.

- Pauli

I'll take your word for that since I have not looked at the code. Why LASTx replacing FILL would take 100s of "odd bytes" :-) is lost on me. Or why a key pointed to RCL L for that matter.

> Quote:
>
> As for FILL, try working with the eight level stack -- FILL is far more useful there. If isn't *g FILL* vs *ENTER ENTER ENTER*. It is *g FILL* vs ***ENTER ENTER ENTER ENTER ENTER ENTER ENTER***.

I think there will be two camps, those that use FILL and the majority that do not outside of programming.

> Quote:
>
> And as always, feel free to grab the sources and do what you want :-) That is the whole point of making this open source.

I plan to, once I can fix my flashing problems. I'll try to setup a build environment on OS/X or Linux or *gasp* Windows in a VM.

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #6 Posted by **Marcus von Cube, Germany** on 10 Oct 2011, 5:36 a.m.,*
in response to message #5 by Egan Ford

Egan, for the emulator, my preferred testing environment, you will need Windows anyway. Building the flash image on Mac OS shouldn't be too hard, Yagarto is available and the rest comes either with Xcode or is already there (like the Unix utilities or Perl.)

Re: [WP 34S] New keyboard suggestion (NT ;-)

in response to message #5 by Egan Ford

> Quote:
>
> Why LASTx replacing FILL would take 100s of "odd bytes"

Replacing the "FILL" slot on the keyboard with "RCL L" won't cost anything much. It wouldn't look like "LASTx" in programs, it would look like "RCL L".

Creating a command named "LASTx" will take of the order of 100 bytes.

- Pauli

Re: [WP 34S] New keyboard suggestion (NT ;-)

Yes, this is a good idea.

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #9 Posted by **Cristian Arezzini** on 10 Oct 2011, 5:00 a.m.,*
in response to message #3 by Egan Ford

I wouldn't mind a LastX key (though it's operatively redundant) but please don't remove FILL, I use it often... And I use the 8-level stack.

Edited: 10 Oct 2011, 5:01 a.m.

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #10 Posted by **Egan Ford** on 10 Oct 2011, 5:31 a.m.,*
in response to message #9 by Cristian Arezzini

How about LASTx replacing FILL and RCL L = FILL?

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #11 Posted by **Marcus von Cube, Germany** on 10 Oct 2011, 5:38 a.m.,*
in response to message #10 by Egan Ford

RCL L is just RCL of register L which serves as LastX, so there is no point in swapping the two functions. I'm discussing a user mode keyboard internally. If we get that straight, all should be fine for you.

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #12 Posted by **Paul Dale** on 10 Oct 2011, 5:42 a.m.,*
in response to message #10 by Egan Ford

How would you then support RCL+ L or STO->L ???

Special casing RCL L creates a big inconsistency in the interface.

- Pauli

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #13 Posted by **Dominic Richens** on 10 Oct 2011, 1:24 p.m.,*

please tell me you are being facetious...

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #14 Posted by **Eric Rechlin** on 10 Oct 2011, 7:18 a.m.,*
in response to message #3 by Egan Ford

I disagree with adding LASTx. When RCL-L works just as well, I can't see wasting valuable keyboard real estate just to have a command on the keyboard twice to satisfy the nomenclature preferences of some.

Eric

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #15 Posted by **Alexander Oestert** on 10 Oct 2011, 7:45 a.m.,*
in response to message #14 by Eric Rechlin

> Quote:
>
> wasting valuable keyboard real estate just to have a command on the keyboard twice

With this in mind, why not rethink the double assignment of 1/x, Sum+, x^2 and square root? I would suggest putting some of the more obscure functions on A-D that are not so terribly missed when A-D are in user mode: What about ||, %, delta% and ./, The locations could be used for something else.

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #16 Posted by **Marcus von Cube, Germany** on 10 Oct 2011, 8:42 a.m.,*
in response to message #15 by Alexander Oestert

> Quote:
>
> 1/x, Sum+, x^2 and square root?

You missed the idea behind putting these as defaults on A to D: They are all on the keyboard in some other (shifted) position and the A to D location is just an unshifted shortcut to them if no program is active.

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #17 Posted by **Alexander Oestert** on 10 Oct 2011, 8:50 a.m.,*
in response to message #16 by Marcus von Cube, Germany

I was aware of the idea behind it - and I like it. I still deem it at least worth of thinking about not having these shortcuts there but something else instead of twice the same.

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #18 Posted by **Cristian Arezzini** on 10 Oct 2011, 10:58 a.m.,*
in response to message #17 by Alexander Oestert

I tend to agree with this. There are several functions already that I never used because they're not my field, so I think that putting four "more obscure" functions there (but still having them in the catalogs of course) would free up 4 positions.

Cristian

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #19 Posted by **Dominic Richens** on 10 Oct 2011, 1:38 p.m.,*
in response to message #18 by Cristian Arezzini

Hi Cristan, Alexander

Those four functions would have to be replaced by another four functions that are currently **primary** (e.g. un-shifted) functions. There are no other primary functions anyone would want put there (STO, RCL, roll, swap, neg, EEX, XEQ, CPX, -> /, *, +. -)

If I am going to be doing a lot of calculations that need them I just PSTO n (if I

haven't already) and CLP and voila, they are back to being primary functions for A, B, C, D.

For the record, I'm fine with RCL L instead of LastX - at least I personally like it better than any of the alternatives.

BTW, why did ./, end up on the keyboard? I say put MATRIX there, make h-EXIT the OFF key and so be it.

While there are a few choices that Walter, Pauli and Marcus made that I didn't much like initially, I now find they make sense or are, at worst, inconsequential.

Edited: 10 Oct 2011, 1:39 p.m.

*Message #21 Posted by **Dominic Richens** on 10 Oct 2011, 9:07 p.m.,*
in response to message #20 by Walter B

Dear 4-year old :-) I didn't like having to f or g shift for trig and log functions - but now have gotten used to it. I glad you made that choice since it allows for programmable keys and some 60 functions on the keyboard due to 3 function keys.

What I'm trying to get across is that us users need to trust that you've thought carefully about your design decisions - even if we don't understand them initially.

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #22 Posted by **Walter B** on 11 Oct 2011, 1:21 a.m.,*
in response to message #21 by Dominic Richens

Merci bien - now I know your meaning of *in*consequential :-)

in response to message #19 by Dominic Richens

> Quote:
>
> Those four functions would have to be replaced by another four functions that are currently **primary**

I understand that they now are accessed unshifted when not in user mode. But why could they only be replaced by other primary functions? If you put a now shifted function on these keys, they would then be primary but why would that be a problem?

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #24 Posted by **Dominic Richens** on 11 Oct 2011, 7:44 a.m.,*
in response to message #23 by Alexander Oestert

because there are not any other primary functions that I would want to have to shift for when those labels are defined.

IMHO of course :-)

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #25 Posted by **Alexander Oestert** on 11 Oct 2011, 8:09 a.m.,*
in response to message #24 by Dominic Richens

I still don't understand the "primary" requirement. Why not putting there the four functions I suggested in #15 above?

*Message #26 Posted by **Dominic Richens** on 11 Oct 2011, 9:40 a.m.,*
in response to message #25 by Alexander Oestert

where are we going to move Sigma+ 1/x, y^x and sqrt to?

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #27 Posted by **Alexander Oestert** on 11 Oct 2011, 10:31 a.m.,*
in response to message #26 by Dominic Richens

> Quote:
>
> where are we going to move Sigma+ 1/x, y^x and sqrt to?

They are already there twice right now. That's the reason I came up with this idea in the first place.

Sum+ is on h/+

1/x is on f/ division key

y^x is on f/9

Square root is on f/times key

Edited: 11 Oct 2011, 11:31 a.m.

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #28 Posted by **Dominic Richens** on 11 Oct 2011, 12:07 p.m.,*
in response to message #27 by Alexander Oestert

I'm thoroughly confused.

I though you wanted to move those functions to other keys because you didn't want to shift to get Sigma+, 1/x, y^x and sqrt(x) when A-D was defined?

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #29 Posted by **Alexander Oestert** on 11 Oct 2011, 12:26 p.m.,*
in response to message #28 by Dominic Richens

No, I wanted to make room for functions that are not on the keyboard yet, instead of having four functions twice. See # 15 above.

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #30 Posted by **Walter B** on 11 Oct 2011, 2:18 p.m.,*
in response to message #29 by Alexander Oestert

The four default primary functions top left were put there since they would have deserved top places but didn't make it on keytops else. When you overwrite one of them by defining e.g. label D, you will be happy to find an easy way to SQRT (the symbol) still. You don't want to dig for it in a menu, do you?

Walter

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #31 Posted by **Alexander Oestert** on 11 Oct 2011, 3:14 p.m.,*
in response to message #30 by Walter B

That is why I did not want to get rid of them, but

get rid of the 'obscure' functions (from the keyboard, I mean) I listed in posting #15 instead.

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #32 Posted by **Walter B** on 11 Oct 2011, 6:11 p.m.,*
in response to message #31 by Alexander Oestert

Sorry, I will try to express it more clearly: The four top left default primary functions are four we are happy to feature as primary functions per default. When we'll overwrite one (or more) of them, we'll be still happy the respective (popular) function will be only two keystrokes away. IMHO we shall not put anything on this keyboard which will vanish with the first hotkey definition. YMMV.

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #33 Posted by **Dominic Richens** on 11 Oct 2011, 3:07 p.m.,*
in response to message #29 by Alexander Oestert

Oh, that's what you meant - don't know why I didn't get that.

Seems odd, though. To put the least popular functions currently on the keyboard in the most prominent place when LBL A-D are not defined.

My preference to achieve the same goal of freeing up shifted spaces on the keyboard would be to do away with the un-shifted A-D and make LBL A-D always (XEQ) shifted - kind of like the HP-15C.

I've been using the TVM solver a lot and when I go to change 'NP', 'NI' or 'I' I always forget to press XEQ first. As a result I find myself pressing XEQ for 'N', 'PMT' and 'FV'.

*Message #40 Posted by **Cristian Arezzini** on 10 Oct 2011, 4:59 a.m.,*
in response to message #2 by Marcus von Cube, Germany

I like it. But: what about swapping Mode and Const? That way Conv and Const would be near each other, and I think they're somewhat related. Also, why separate X.FCN and P.FCN? Again, I think they should be near eaach other, or even better (IMO) merged together.

I agree with Marcus about the window keys.

I like the move of OFF and the SF,CF keys.

I suppose it would be impossible to make the whole top row of keys assignable (like the first 4 are now)? That would give some more consistency to the layout, and increase the ease of use in hexadecimal mode. And I would just like to have a couple more programmable keys! And I don't use CPX or [Arrow] anyway... ;)

Cristian

Re: [WP 34S] New keyboard suggestion (NT ;-)

> I like it. But: what about swapping Mode and Const?

The letters CONST will not fit on those narrow top row keys. Otherwise I agree - perhaps we can use "CNST".

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #42 Posted by **Peter Murphy (Livermore)** on 10 Oct 2011, 9:54 p.m.,*
in response to message #41 by Dominic Richens

But the letter K will surely fit.

There's a K key on the 10B, where it represents a constant-related function.

And K for Konstante is easy to remember.

There should be minimal confusion between such a key and the letter-K alphabet key, because those are all grey-shifted.

Re: [WP 34S] New keyboard suggestion (NT ;-)

*Message #43 Posted by **Walter B** on 11 Oct 2011, 1:54 a.m.,*
in response to message #40 by Cristian Arezzini

MODE is put where it is since CPX and the two fraction labels are "setting the area" for modes there. Same reasons for ->, CONV, and R<>P on one key. And we feature a CPX CONST catalog which would give - following your suggestion - unfair advantage to Parkinson victims ;-/ We tried to avoid such double clicks.

Re: [WP 34S] New keyboard layout anybody? - The Pendulum is swinging back.

HP-50G CAS Sums problem

*Message #1 Posted by **x34** on 10 Oct 2011, 2:33 a.m.*

I do not understand some HP-50G CAS features. I was unable to find some simple sums, e.g.

sum x/n!,n=0..infinity, calculator says "?"

There is another problem - how can I fix Indep var? If I enter sum n/x^^n, n=1..infinity calc says "EVAL Error: Unsigned inf error" and changes Indep var to N.

My ROM version is 2.15.

Re: HP-50G CAS Sums problem

*Message #2 Posted by **Glenn Shields** on 11 Oct 2011, 11:31 a.m.,*
in response to message #1 by x34

Also waiting for an answer -- noted that setting approximate mode doesn't work, nor does using a variable other than x. But evaluating it as a finite series, say up to n=15, spits out "e" to full accuracy.

Re: HP-50G CAS Sums problem

*Message #3 Posted by **Crawl** on 11 Oct 2011, 1:44 p.m.,*
in response to message #2 by Glenn Shields

There really isn't an answer. The Hp50 cannot evaluate that series to e, symbolically. Series evaluation is probably based on look-up tables, and there is only so much stuff like that that can be packed into a calculator (now).

The TI89 can evaluate that series to e, but it cannot evaluate the taylor series for e^x to e^x. Nor can the TI89 evaluate the sum of the even terms to cosh(1).

It can take a bit of creativity and knowledge to coax these CAS calculators to give the answer you want, particularly when the problems are difficult, but it is still much easier to do that than to solve problems purely with pen and paper.

They do have some series stored, though. For example, both the HP50 and TI89 can sum reciprocal even powers in terms of pi.

The second series there converges to x/(x-1)^2, when it does converge. The HP50g actually can sum that one symbolically, when x has a fixed value. But in general, there is a remainder term of the form x^n. The calculator then tries to find that limit (if it isn't zero, it can't converge), but since x is undetermined it can't find the limit. (It depends on whether x's absolute value is more or less than 1)

Note that the lim function takes two arguments: The expression, and the value x tends to. It does not, in other words, take as a third argument the variable the limit applies to; it assumes the variable is the independent variable. So I presume what the calculator is doing behind the scenes is temporarily turning

the independent variable to 'n' to take the limit. Maybe it is supposed to turn the independent variable back to 'x' when it's done, but the error prevents that. In any case, if you sum over the variable x, this won't happen.

Re: HP-50G CAS Sums problem

*Message #4 Posted by **x34** on 11 Oct 2011, 2:04 p.m.,*
in response to message #3 by Crawl

Thanks for clarifications, Crawl. Do you know, where can I found any documentation on HP-50G CAS, especially Sum function? I tried reading Erable docs, but no Sum there. First I thought the Sum's functionality is equal to HP-48GX, but 48GX lacks infinity support.

So. I am feeling stumble, and want to see detailed Sum docs.

Re: HP-50G CAS Sums problem

*Message #5 Posted by **Crawl** on 12 Oct 2011, 12:45 p.m.,*
in response to message #4 by x34

There is this:

http://www-fourier.ujf-grenoble.fr/~parisse/degraeve/cas49_1.pdf

It says:

You must also understand that [sigma] is able to calculate symbolically the summations of rational fractions, and the hypergeometric series admitting a discrete primitive (starting from ROM version 1.11).

I'm not sure what a "discrete primitive" is, though, nor does Google help.

15c logos for sale..

*Message #1 Posted by **uhmgawa** on 10 Oct 2011, 12:32 a.m.*

I hesitate to point this out for fear of encouraging it. But I suppose it had to happen sooner or later:

15c "LED" logo

Can't really tell from the picture but it appears to be an impression molded copy vs. CNC cut.

Re: 15c logos for sale..

*Message #2 Posted by **Michael de Estrada** on 10 Oct 2011, 12:42 a.m.,*
in response to message #1 by uhmgawa

Doesn't seem very profitable, since most HP 15C logos have not fallen off. Mine certainly hasn't. Also, unlike rubber feet and such, which work with all Voyagers, this only works with a 15C. By the time the logo falls off, the calc is so beat up, it isn't worth spending the money for a new logo.

Re: 15c logos for sale..

*Message #3 Posted by **Marcus von Cube, Germany** on 10 Oct 2011, 2:20 a.m.,*
in response to message #2 by Michael de Estrada

Mine is in very good condition but the logo is lost. No big deal as it works like a charm but a collector might think different.

Re: 15c logos for sale..

*Message #4 Posted by **Les Wright** on 10 Oct 2011, 2:31 a.m.,*
in response to message #2 by Michael de Estrada

I paid a little too much a few years ago for an 11C that was a bit more banged up than it appeared in the TAS pic. Works great, but I have been keen to make it look better to get the feeling, perhaps illusory, that I have gotten my money's worth. I have been able the flatten the dinged bezel a bit and approximate the brushed finish with a ScotchBrite pad, but the metallic finish of the logo is long worn off. I would happily pick up a replacement if an 11C version was available.

That eBay seller also offers 11C logos in another auction;-)

Re: 15c logos for sale..

*Message #6 Posted by **robert rozee** on 10 Oct 2011, 7:30 a.m.,*

in response to message #5 by Raymond Del Tondo

looking at these badges, it occurred to me that one could fairly easily produce a close approximation using PCB fabrication methods - i'm not saying that is how these ones are made, but they inspired the following idea.

many fab houses allow you to order PCBs with a variety of different solder mask colours - red, green, blue, BLACK. further, you can specify (within reason) pretty much any routing you like, that is slots cut in the board. i once worked on a project where the boards were circular (4" across) with a 1" hole in the middle.

seems you could create your "HP 15C" (or 11C or 16C) logo as a copper pattern, with the solder mask the exact reverse of this. the result would be a slightly raised metallic logo with a sunken black background. you could specify tinplate finish (silver), none (copper coloured) or gold plate. judicious routing cuts would leave the logos with perfectly cut corners and edges, just requiring a bit of filing in two spots and application of black marker around the edges.

from a 10cm x 10cm PCB, one might end up with 100 or more badges.

just an idea...

Re: 15c logos for sale..

*Message #7 Posted by **Martin Pinckney** on 10 Oct 2011, 9:14 a.m.,*
in response to message #6 by robert rozee

Don't forget, there's a member of this forum that casts these from silver.

Re: 15c logos for sale..

in response to message #7 by Martin Pinckney

> Quote:
>
> Don't forget, there's a member of this forum that casts these from silver.

true, but the silver ones are quite expensive, being individually hand-made. a solution where 100 badges are yielded from a small PCB might only cost a dollar or so each + postage.

personally, i've got an 11C that is missing its badge. it's a 'working' calculator, so filling the gap would be nice but not essential. i've actually been looking out for a piece of scrap HP equipment (such as a printer) with a logo the right size that i could trim down to fit.

Re: 15c logos for sale..

*Message #9 Posted by **uhmgawa** on 10 Oct 2011, 11:23 p.m.,*
in response to message #8 by robert rozee

> Quote:
>
> true, but the silver ones are quite expensive, being individually hand-made.

> a solution where 100 badges are yielded from a small PCB might only cost a dollar or so each + postage.
>
> ---

I'm not sure the pcb approach will result in equivalent cosmetics without an elevation relief nor the 45* bevel cut periphery. I'm also unsure whether economical board houses will singulate a board of that size. But the last two points could be addressed if you chose to do the cutting. The black solder mask aligning exactly at the foil etch may be a challenge although I can't say I've ever tried to do so either.

My back burner voyager logo recreation project (if it ever materializes) would be to use black acrylic countertop material (marketed as Corian, Avonite, etc.. here in the US market) slabbed into thin blanks and epoxy laminated with a hard temper aluminumn sheet. Corian machines quite nicely with carbide tooling compared to say, ABS and can be had for cheap at your local kitchen counter fabricator. The tempered aluminum (flashing, beverage can) serving as the silver top surface should last longer abrasion-wise than the actual calculator to which it is attached, assuming unlike most of my 15c legacy voyagers it actually does remain attached.

Re: 15c logos for sale..

*Message #10 Posted by **Matt Fegenbush** on 11 Oct 2011, 9:52 a.m.,*
in response to message #9 by uhmgawa

If you use a similar high grade epoxy adhesive, you would have quite the time getting the logo off the calculator.

Re: 15c logos for sale..

*Message #11 Posted by **robert rozee** on 11 Oct 2011, 11:38 a.m.,*
in response to message #9 by uhmgawa

the idea is not to produce an exact identical replacement - that would be extremely hard, and i'd say even the silver ones are obviously different from the original when subjected to any more than a casual glance.

more of an idea to produce something attractive and clean to fill the gap. using thin PCB material there would be just a small protrusion, but (as you say) the edges would not be bevelled at 45 degrees, and the metal writing would be raised up just a fraction.

Re: 15c logos for sale..

*Message #12 Posted by **Derek** on 10 Oct 2011, 12:28 p.m.,*
in response to message #2 by Michael de Estrada

if it were $2, i'd probably do it for fun...but $12 is way too much if one is using their 15c and not worrying about appearance or retail value.

my circa 1984 15C is still going strong: it lost its logo in college (1988 or so), but the feet, while worn, are still in place.

it's been beat to death (i lost the case around that same time (bought a replacement a few years ago) and just threw it in the outside pouch of my backpack to get banged up with pens, pencils, and other things for several years) and used to death (i still use it almost every day*).

* i recently bought a 15C LE to potentially replace the 15C for every day use. i'm still getting used to the new tactile feedback and "sand blasted" key feel... (on a positive note, solving for a root of a polynomial the other day was lightening fast on the LE)

WP34S: An integration wrapper

*Message #1 Posted by **Miguel Toro** on 9 Oct 2011, 10:55 p.m.*

Another week-end little project.

As suggested by the WP34s team on a older post, I tried to make a wrapper to improve accuracy for the integration function.

A test with sqrt(abs(x-1)), from 0 to 2, gives:

```
WP 34s : 1.30929962
WP 34s with the wrapper (fix 5) : 1.33333672

Expected : 4/3

Using this program:

LBL 10
1
-
ABS
[sqrt]
RTN
```

Any comment to improve it as always very welcome.

Miguel

*Message #3 Posted by **Miguel Toro** on 10 Oct 2011, 7:21 a.m.,*
in response to message #2 by gene wright

Hi Gene,

Here are the results. Not so bad, I think. Function 10, takes too long, so I ran it with FIX 3. Against my own advice, the others where done with FIX 6, getting decent running times.

```
1:      3.141593
2:      0.666667
3:      0.636620
4:      -0.999984
6:      3.141594
8:      0.499995
9:      1.991321
10:     0.785399        FIX 3 (too slow otherwise)
12:     2.203347
```

in response to message #1 by Miguel Toro

Nice compact routine.

- Pauli

Re: WP34S: An integration wrapper

*Message #5 Posted by **Marcus von Cube, Germany** on 10 Oct 2011, 2:36 a.m.,*
in response to message #1 by Miguel Toro

A few minor remarks:

In your instructions, "cumulatif" should spelled "cumulative". (Neither of us is a native speaker, I assume, so we need to help each other. :-))

Why do you set the stack size to 4? I haven't checked your code but if you don't need A to D for other purposes or rely on the duplication of T just leave the setting alone. If you really need it, use STOM/RCLM to save and restore the mode.

The iteration uses the approximate comparison operator which relies on the display setting (Am I right, Pauli?). Just put a comment in that explains how this affects accuracy of the integral.

I'd like to see some // comments at the end of the lines. This would help to understand your code and it will not disturb the assembler.

Edited: 10 Oct 2011, 2:39 a.m.

Re: WP34S: An integration wrapper

Please see page 58/102. You are :-)

Re: WP34S: An integration wrapper

*Message #7 Posted by **Miguel Toro** on 10 Oct 2011, 6:54 a.m.,*
in response to message #5 by Marcus von Cube, Germany

Got it! I will do the changes.

Thanks,

Miguel

Done!

Note: The possibility of using complex instruction makes the code more compact, so i need a four register stack to take advantage of that, so I followed your advice and stored and restored modes.

Edited: 10 Oct 2011, 8:23 a.m.

Re: WP34S: An integration wrapper

*Message #8 Posted by **Marcus von Cube, Germany** on 10 Oct 2011, 8:38 a.m.,*
in response to message #7 by Miguel Toro

> Quote:
>
> so i need a four register stack to take advantage of that

Only if you rely on the duplication of z/t when doing a complex drop or an operation that drops the stack.

The way it is now it works and that's fine. You should note in the instructions that J is used for saving the mode.

Maybe a limit should be set on the number of iterations. Do you do the halving of intervals over the complete range over and over or do you have a check for each subinterval and divide only if a subinterval is outside the accuracy bounds? The latter would probably need some kind of backtracking which is obviously not possible without recursive programming.

Re: WP34S: An integration wrapper

*Message #9 Posted by **Miguel Toro** on 10 Oct 2011, 8:49 a.m.,*
in response to message #8 by Marcus von Cube, Germany

Yes. I will think about setting a limit on the number of iteration.

Thank you Marcus,

Miguel

Re: WP34S: An integration wrapper

*Message #10 Posted by **Paul Dale** on 10 Oct 2011, 4:57 p.m.,*
in response to message #9 by Miguel Toro

An iteration limit would be a good idea. I tried integrating LN(x) from 0 to 1 and gave up after my laptop had been crunching away for over half an hour. I was using ALL mode sound rounding was to 12 digits not a fixed number of decimals.

42s repair..

*Message #1 Posted by **uhmgawa** on 9 Oct 2011, 4:25 p.m.*

I have a 42s kicking around which needed some attention. As I received it the display was defunct apparently due to decompressed, contaminated, or defective zebra connectors. I took some jpegs during the repair process which I thought may be of interest/use to others so I've located them here.

I've before called the 42s "repair hostile" however I now believe the mechanical design deliberately intends to torment. For as much as folks (justifiably) gripe about the DOA rate of the 15C le, given the overall design, provision of using 9 screws to reattach the PCB, standard OTS snap domes, and a conventional sam7l in a lqfp, I'd be hard pressed to find a more maintenance and experimentation-friendly design.

Old Datamath quirk: anyone remember?

*Message #1 Posted by **Glenn Shields** on 9 Oct 2011, 12:59 p.m.*

First, thanks to all for the HHC videos, an eye-opener for sure. The TI talk reminded me (painfully) of once having a Datamath red-LED calculator, with a peculiar quirk: sometimes, when turning it on, the display would start counting up from the rightmost place, at blistering speed. No decimal point or leading zeroes, just counting up at about the rate of 500 per second, as a very rough estimate. Any explanation of this, or personal experience? Again, ouch, that unit is part of some landfill somewhere. TIA, Glenn

Re: Old Datamath quirk: anyone remember?

in response to message #1 by Glenn Shields

Hello!

> Quote:
>
> Any explanation of this, or personal experience?

Explanation? No. Personal experience? Yes. Because it works in more or less the same way with most Ti calculators! My Ti-59 still does that trick today.

Regards, max

Re: Old Datamath quirk: anyone remember?

*Message #3 Posted by **Glenn Shields** on 9 Oct 2011, 3:10 p.m.,*
in response to message #2 by Maximilian Hohmann

Thanks, I appreciate that validation. I had another TI red LED machine, also in the landfill (keeping my HP35 company). But all that reminiscing at the conference led me to see, on the Datamath site, the name "Monsanto." It said they developed the LEDs for TI (and HP also?) as well as Agent Orange. Does anyone also remember that they sponsored the Disneyland attraction "Adventure Through Inner Space?" Interesting connections. Regards, Glenn

Re: Old Datamath quirk: anyone remember?

*Message #4 Posted by **Lincoln R.** on 9 Oct 2011, 5:18 p.m.,*
in response to message #3 by Glenn Shields

I'm pretty sure HP made their own LEDs. For years, HP was one of the bigger suppliers of LED displays. This business got handed off to Agilent, who later spun it off into another company called Avago, IIRC.

Wow that's an old memory! I went on that ride as a young squirt probably back in '70 or so. Its one of the few rides I recall well.

Miracles from Molecules!

Found a very good CGI re-creation of the ride on YouTube. Don't know how they did it.

CGI Ride

calculator longevity

*Message #1 Posted by **bill platt** on 9 Oct 2011, 9:16 a.m.*

In an earlier thread (archived), Robert Rozee posted the following:

> Quote:
>
> a 2011 model 12C/15C is built using a processor with a designed materials lifespan of perhaps 10 years, keyboard (including contacts) and plastic parts that are 'just good enough'. the LCD is attached with a printed flex + glue system that is known to fail over time (several years) - though said failure will in 99% of units be safely outside of the 1-year limited warranty. and the PCB assembly uses a lead-free soldering process that is guaranteed to fail before this decade is out.

I have heard conflicting information with respect to the solder. I have heard only negatives in postings here. But in my real work, I asked about this with one expert who said it is untrue.

What is the story? On what basis is the lead-free approach deemed to be less durable long term?

Re: calculator longevity

*Message #2 Posted by **Hugh Evans** on 9 Oct 2011, 10:54 a.m.,*
in response to message #1 by bill platt

It's poorly understood at best. Many devices (highest profile is the first generation xbox 360) designed near the date of switchover had reliability problems. The wrong temperature profile was used during reflow which filled joints with microcrystals, rather than full blown cold joints. Even good joints over time are more prone to fatigue failure in my understanding. If anyone tells you they know with absolute certainty how SnAg or SAC solder will perform over time they're crazy because the data do not yet exist.

in response to message #2 by Hugh Evans

There are quite a lot of testing results comparing leaded and lead-free solders, particularly from NASA. If you really want to get into it you can read the Executive Summary it's *only* 78 pages long! I guess that NASA executives have a lot of time on their hands these days.

I agree that the results are not all in yet and won't be for many years but there is a lot that is known. The general conclusion from this study is the leaded solders are better for some things than lead-free, and vice-versa.

Have a gander at the volumes of data produced by the defense industry. I suppose those folks get a little excited by the phrase "brittle solder joints". :P

Personally I don't really care for the workability of the lead free alloys nor the required higher temperature profiles. Fortunately I'm hardly alone such that leaded solder still is accessible at reasonable cost. I expect that will eventually change but by that time I should have hoarded enough to make it a non issue.

Re: calculator longevity

*Message #5 Posted by **Paul Berger (Canada)** on 9 Oct 2011, 7:53 p.m.,*
in response to message #2 by Hugh Evans

One of the problems that the xBoxes as well as other electronic devices had was problem with Ball Grid Array (BGA) packaging. In a BGA package the interconnect between the chip package and the board it is mounted on is a tiny ball of solder. The problem occurs as the result thermal cycling of components, as the temperature rises and falls, the circuit board and the chip package expand and contract at different rates which puts stress on the joint and can lead to the joint shearing. Devices that are turned on an off frequently are more prone to suffering this kind of failure for obvious reasons. One of the ways some manufacturers got around this problem was to move to an interconnect technology known as solder column, where instead of using a ball of solder, which is very rigid, a column of solder is used, the column is flexible enough to absorb the microscopic movement. I do however know of one instance where the use of solder columns lead to a different problem, a large very dense chip that was mounted on solder columns with a big heat sink on top of it the heat sink was held against the chip by spring tension this spring tension over time, cause the solder columns to buckle with catastrophic results.

I know of devices that suffer from the shearing BGA connection problem that where manufactured before RoHS complaint manufacturing was common.

in response to message #1 by bill platt

Also, "designed" lifespan of about 10 years is probably about on par with old HPs. Many of them lasted a lot longer, but even out of those, how many have we (or some previous owners) had to repair? I don't deny that many classic HPs were better constructed than current models (But also some weren't, for instance the solderless Spice models).

I do agree about the glued on LCD ribbon cable, though. I've seen a lot of those fail on older TI graphing calculators (Although I think TI's assembly practices exacerbated this by making the cable longer than necessary and folding it into a 'Z' shape after bolting the LCD and keyboard PCBs into place. If they had waited until bolting the boards into the case, and applied the cable without all the extra length that just gets folded up and pinched by the rear case, I don't think the traces would fail nearly as easily).

Anyhow, those TIs are fixable by carefully attaching wires between the two PCBs, not sure if something similar could be done with an HP LCD ribbon.

Re: calculator longevity

*Message #7 Posted by **Eric Smith** on 9 Oct 2011, 9:10 p.m.,*

Ribbon or flex cable is exactly how the two halves of the HP-71B were connected.

Re: calculator longevity

*Message #8 Posted by **Lincoln R.** on 9 Oct 2011, 9:34 p.m.,*
in response to message #7 by Eric Smith

As well as the 28C/28S. Ribbons can work, but you have to be careful how you fold them and if you expect them to put up with stress, make them out of thicker/better material. I've seen old ribbons that were heavy plastic with decently thick metal traces, the aforementioned TI-83+ ribbon was thinner than a piece of bible paper and seemed to have painted/printed carbon traces.

Re: calculator longevity

*Message #9 Posted by **Eric Smith** on 9 Oct 2011, 9:20 p.m.,*
in response to message #1 by bill platt

Lead-free is less durable because without the lead, the tin will gradually form "whiskers" which end up shorting signals together. While some vendors have attempted to minimize this with the formulations of RoHS solder and plating, there really isn't any certain method of eliminating it. This is why military equipment and medical equipment is generally exempt from the RoHS regulations. For medical equipment the exemption doesn't do much good because the RoHS regulations have resulted in most things *only* being available in RoHS versions. For military equipment it is not uncommon for the electronic devices to be sent out to have the RoHS plating, solder balls, etc. replaced with non-RoHS, but they can only afford to do that because the military (and by extension, the legislature) doesn't care how much the taxpayers have to spend to get it done.

For example, see the National Electronis Manufacturing Center of Excellence argument for a five-year delay in RoHS requirements for electronics: Tin Whiskers and the Impending RoHS Conversion to Lead-Free. As we know, they did not get their exemption, because the issue is political, not technical. The governments don't care whether they increase the amount of electronics going into the landfill, as long as they can claim progress on lead reduction.

Our son does maintenance in a school and recently got a big box of CFLs that were supposed to last 10,000 hours. About 40% of them didn't even make it to 250 hours. Add to that that it takes them at least two minutes to come up to full brightness, they can't be used as oven lights, etc..

Re: calculator longevity

*Message #15 Posted by **Lincoln R.** on 10 Oct 2011, 1:49 a.m.,*

Heh. The maintenance people at my college once tried replacing an oven light with a CFL. Luckily we noticed before using the oven and complained about it.

Re: calculator longevity [o.t.]

*Message #16 Posted by **Nicholas Winterer** on 10 Oct 2011, 4:03 a.m.,*
in response to message #14 by Garth Wilson

Not to mention they have a completely different spectral distribution from regular incandescent bulbs. Where incandescents emit light over the entire visible spectrum (they approximate the famous planck distribution), CFLs emit only a few discrete frequencies of light, designed to trick our eyes into seeing white light. You can verify this by looking through a pair of those cardboard diffraction grating glasses for kids. Instead of rainbows, you see several narrow bands.

The problem with CFLs is that the frequency response of the cones in our eyes varies among humans. CFLs look white on average, but I imagine they could be pretty annoying for those on the edges of the bell curve. The 3500 K CFLs don't look that bad to me, but I can't stand the higher color temperature ones (they look too blue). I've talked to others who prefer the 4100 K or 5500 K CFLs and think the 3500 K look too orange.

The other problem with CFLs is color renditioning. Some objects will look really weird under a CFL. While a CFL may look white while looking straight at it or watching it reflect off a white object, it can give colored objects a weird tinge. Many pigments respond to a narrow range of wavelengths, and if the CFL does not emit that wavelength then the color of the object will appear different than it would under sunlight. In fact, some objects which would appear identical in color under sunlight could appear to be different colors under a CFL.

The regulation of light bulbs is insane considering that residential lighting (where most incandescents are used) accounts for less than 1% of the energy usage in the US. Still, our regulators will pat themselves on the back for making the world a safer place and we will be forced to buy overpriced, ugly light bulbs from a cartelized light bulb industry (who will constantly lobby for additional regulation to further restrict competition).

In my experience we get the rated lifetime if not more in any CFL we've used in our home. I replaced some 8-10 year old CFLs a few weeks ago and the newer designs seem to come up to full brightness within 15-30 seconds, some newer GE units we bought last year seem full brightness within 5-10 seconds. CFLs don't like lots of cycling (like in a hallway situation) but in our home we've put them in places were they stay on for hours and we have always gotten rated lifetimes if not better. I also like the fact that I'm not climbing on ladders to replace bulbs in hateful locations once a year anymore.

And I don't find anything odd nor objectionable about the light they give off. I've had guests in our home that would gripe about CFL color rendition. When I asked them what they thought about the lights in the room, they always something like 'Why do you ask? They're regular bulbs'. They weren't, they were plastic-covered CFL bulbs and looked like regular incandescents.

I have to wonder if the spiral shape and early problems with CFL light quality 'colors' judgement about newer designs. My limited experience with people who gripe about CFLs and the reaction I get when they're informed the light in the room is from CFLs (but disguised as incandescents) lead me to that conclusion.

Re: calculator longevity

*Message #19 Posted by **bill platt** on 10 Oct 2011, 10:21 a.m.,*

The biggest improvements are the electronic ballasts. Older fluorescents have a very noticable flicker. For me, it made reading impossible after a few minutes. I had to disable the ceiling fluorescent fixtures when I worked in an office and I couldn't read in the library at college. I would get triple vision and a headache.

I've been replacing the incandescents in my office with CFL's for several years. In my experience, they last about 2x, not the 7x or more usually claimed.

Re: calculator longevity

*Message #21 Posted by **David Ramsey** on 10 Oct 2011, 11:34 a.m.,*
in response to message #20 by Martin Pinckney

The solution is simple: use LED light bulbs. The Philips 60 watt equivalent bulbs:

http://www.homedepot.com/h_d1/N-5yc1v/R-202530170/h_d2/ProductDisplay?langId=-1&storeId=10051&catalogId=10053

...introduced last fall provide illumination that is (to me) indistinguishable from that of a good incandescent. And they output a full 850 lumens.

Yeah, they're $25 each (but they were $50 this time last year), but hey, we're saving the

planet! Or something.

I bought several last year and my office has two of them that are generally on at least 10 hours per day. No failures yet.

Re: calculator longevity

*Message #22 Posted by **bill platt** on 10 Oct 2011, 11:54 a.m.,*
in response to message #21 by David Ramsey

I call it the Candle Effect.

There was no legislation passed to ban candles. We chose the incandescent naturally.

Why are people not switching to CFL "fast enough"? Because they suck.

What is the need to convert to a transitional technology (CFL) with enormous pblic health risks (mercury) when there is a better technology already in existence and catching up?

$%#$#ing goddam politicians make me soooooo angry. They *all* suck. Suck suck suck.

LEDs have been improving in a way that is similar to the magnetic memory advances. It is called "Haitz's Law".

http://ledlightinggroupllc.com/wp-content/uploads/2010/02/Haitz-email.pdf

Re: calculator longevity

*Message #23 Posted by **Dave Shaffer (Arizona)** on 10 Oct 2011, 5:23 p.m.,*
in response to message #21 by David Ramsey

I concur on LEDs. I have one in my desk lamp, 40 W equivalent, that probably has at least 5000 hours on it. I just installed a 65 W equivalent ceiling flood light in the kitchen - it is indistinguishable from an incandescent, at 1/5 the energy.

In the meantime, I find CFLs quite acceptable - and I've lowered my electric bill by around $10 / month for the last year. I've seen maybe one infant failure out of more than a dozen.

I took my light meter to a newish CFL we have at home, and it started up at less than half final

brightness, and it took over two minutes to get there. I agree that CFLs last plenty long if they're left on for long periods. That's not the case in the hall or the hall closet or the bathroom at home like you say.

On the mercury issue, we've found that the fluorescent tubes that have slightly less mercury--supposedly to be better for the environment--have extremely short lives compared to the ones with a little more, so they're actually putting *more* mercury into the environment because you have to replace them so often. Also, our son has found a high DOA rate on those. It just doesn't pay.

Re: calculator longevity

*Message #25 Posted by **Paul Gaster** on 10 Oct 2011, 9:46 a.m.,*
in response to message #1 by bill platt

Does anyone have at least a rough date of when HP switched over to RoHS solder on their calculators? Just curious since I have a pair of 12C calculators made in China. One was made in 2002 and one in 2004. This was I think before RoHS was mandatory, but I don't know if HP switched sooner or not. You would think they would have been working on the switch over for quite some time, and well before the deadline to make sure there would be no production delays or stoppages.

Re: calculator longevity

*Message #26 Posted by **robert rozee** on 10 Oct 2011, 10:08 a.m.,*

10 years for an IC is an industry standard lifespan going back at least since the mid 80s. I started my career as an IC reliability engineer. We used 10 year lifespans, assuming continuous usage, as our long-term reliability target. ICs often last way longer than that since they are rarely used continuously.

Nothing new there, even the older 'classic' HP calcs used ICs that were likely rated for 10 years of practical life.

Re: calculator longevity

*Message #28 Posted by **bill platt** on 10 Oct 2011, 10:19 a.m.,*
in response to message #27 by Tom Mathes

That is right. However because engineering is incremental, we improve our ability to accurately predict life. So the specification is the same, but the actual outcome is vastly different because the conservatism is replaced with more accurate and therefore less conservative predictions.

Some products seem to reach a maximum quality point at somewherea around 10 years into the development of the thing. Older electric toasters last forever. New improved ones last 6 months if you are lucky. Voyagers from 1982 last forever. Spice (older) and 49g+ (newer) die. I am sure we can find tons of examples of this.

Re: calculator longevity

*Message #29 Posted by **uhmgawa** on 10 Oct 2011, 9:36 p.m.,*

> Quote:
>
> What is the story? On what basis is the lead-free approach deemed to be less durable long term?

The other consideration to keep in mind is the unique service conditions to which an average pocket calculator is subjected. Unless the design provides a substantially rigid frame the pcb will likely be subjected to bending and torsion stress in excess of that seen by other consumer devices. The wide, flat envelope and economical construction doesn't leave much room for functional beams and gussets in the design. I'm not certain whether this gives the advantage to the improved ductility of lead bearing solders or rather the increased joint stress effectively dwarfs the marginal difference between lead bearing and lead free alloys.

Sort of a timely question as I'd been puzzling why HP chose such a seemingly bizarre packaging for the 42s cpu. But it dawned on me that was probably the only way to reliably reflow a 170 pin 0.5mm pitch package onto a pcb exposed to substantial distortion in normal usage. Case in point an sram housed in a rigid epoxy flat pack adjacent to a saturn cpu yielded to the pcb stresses as can be seen here. In this case that intermittent existed before the unit was disassembled.

On a related note the conventional "disassembly procedure" of peeling apart a 42s until four pops have occurred I believe just exacerbates the problem.

WP34s: SLVQ implementation

*Message #1 Posted by **Dieter** on 9 Oct 2011, 8:27 a.m.*

I just noticed that SLVQ may return results with slight errors even in relatively simple cases:

```
-1 ENTER
-1 ENTER
 1 SLVQ

 WP34s results              correct (16 digits)

 0,61803 39887 49895 0      0,61803 39887 49894 8
 1,61803 39887 49894        1,61803 39887 49895
```

With 39 internal digits a correct 16-digit result should be no problem. So what's going on here?

Dieter

Re: WP34s: SLVQ implementation

*Message #2 Posted by **Marcus von Cube, Germany** on 9 Oct 2011, 11:16 a.m.,*
in response to message #1 by Dieter

If I'm not mistaken, SLVQ is not implemented natively but in user code (XROM). So the normal round-off errors may occur.

Re: WP34s: SLVQ implementation

*Message #3 Posted by **Paul Dale** on 9 Oct 2011, 5:31 p.m.,*
in response to message #1 by Dieter

Solve is a user code program so much work isn't carried out in high precision (some is still). It also searches at display accuracy (i.e. using the approximately equal test).

Thus, some lower order digits errors are to be expected.

HP15C- LE bad button

*Message #1 Posted by **Djj** on 9 Oct 2011, 1:11 a.m.*

I purchased 6 HP15C-LE calculators and one of them had a "4" key that would not register when pressed normally. It clicked nicely but would take a little extra pressure to register. I took it apart to find the cause.

The back is easy to remove with 6 screws. Four screws under the feet and 2 in the battery compartment. There is a tiny spring that connects the metal plates and is probably for ESD. The PCB is heat staked in place. There's a little slack under the stake heads when pressing the PCB towards the front panel.

I thought loose heat stakes might be the problem. I pressed the PCB and it did not correct the problem key. I used a large sharp drill bit to trim off the heat stakes flush with the PCB. I removed the board from the front panel. There is a rubber sheet between the plastic keys and the PCB dome switch assembly. My guess is the sheet makes the keys feel good and protects the switch assembly.

So now I have it apart and can press directly on the switch assembly. The "4" key is more reliable but still fails about 1/2 of the time. On a failed press a little extra pressure makes it register. If I lay the rubber sheet over the switch assembly and press the key the reliability goes down.

Next I peeled back the plastic that holds the dome springs in place. The dome springs lift up with the plastic sheet so I can see the PCB contacts. There are small dents in the contact pads that look like the board is tested with spring probes or a flying probe.

Near the dent on the center of the pad for the "4" key there was a very small piece of clear to white plastic. Just a flake, but I suspect it prevented the dome spring from contacting the center pad since it is positioned almost dead center. I remove the plastic flake and put back the plastic cover and the problem is gone. I have 100% reliable presses directly against the plastic and through the rubber sheet.

This seems to be the fix for my calculator however the problem could be wide spread. So HP, check for contamination under the dome switches.

in response to message #1 by Djj

Great information, thank you! Now, if only HP hadn't used heat-stakes but screws, we all could fix our problems without ending with a loose calculator... :(

Cristian

*Message #3 Posted by **Marcus von Cube, Germany** on 9 Oct 2011, 6:27 a.m.,*
in response to message #2 by Cristian Arezzini

This would explain why some units have keys that are extremely hard to press and don't click at all:

contamination with some plastic residue that blocks the path of the key.

Are there tiny holes below the domes so that we can clean the keyboard from the back without cutting the heat stakes? There was such a mention for some other calculator in the past.

in response to message #1 by Djj

Great analysis!

May I ask you, how you re-applied the heat-stakes after you "cut" them off? As I'm having the same issue as you, I'm thinking of self-repairing the calculator myself as well...

Re: HP15C- LE bad button

*Message #5 Posted by **Djj** on 9 Oct 2011, 8:39 a.m.,*
in response to message #4 by Michael Kussmaul

I plan on using thread forming screws or small machine screws to reassemble the calculator.

Keep in mind this repair is a sample size of one. Other calculators could have other issues.

Re: HP15C- LE bad button

*Message #6 Posted by **Michael Kussmaul** on 9 Oct 2011, 11:28 a.m.,*
in response to message #5 by Djj

You are correct, but if I can reassemble the calculator afterwards, at least it should not make the problem worse :-)

I have not seen the internals of the 15c LE yet, but what you think, would it also be possible to just apply some glue on the cut heat-stakes? E.g. Some good two component glue or something?

Re: HP15C- LE bad button

*Message #7 Posted by **Reth** on 10 Oct 2011, 7:09 p.m.,*

*Message #8 Posted by **John B. Smitherman** on 9 Oct 2011, 9:55 a.m.,*
in response to message #1 by Djj

Djj, now that you have seen and solved the problem do you think it would have been possible to shake the calculator hard enough to move the small piece of plastic out of the way?

John

Re: HP15C- LE bad button

*Message #9 Posted by **Gerardo Rincon** on 9 Oct 2011, 10:24 a.m.,*
in response to message #8 by John B. Smitherman

How about putting a strong vacuum cleaner hose to the key and create enough air movement inside to move the flakes out of place?

Re: HP15C- LE bad button

*Message #10 Posted by **Thomas Radtke** on 9 Oct 2011, 10:25 a.m.,*
in response to message #8 by John B. Smitherman

It would be terrible if that works. How many 'flakes' must there be to have a chance of one of them in a neuralgic position each 10th calculator? :-/

Re: HP15C- LE bad button

*Message #11 Posted by **NateB** on 9 Oct 2011, 11:15 a.m.,*
in response to message #10 by Thomas Radtke

When I purchased my 50g a few years ago I couldn't believe the amount of debris (too large to be described as dust) between the LCD and plastic cover. It was so bad I had to pull the plastic cover off and clean it out. The pieces were large enough to block contact between the snap domes and PCB.

Re: HP15C- LE bad button

*Message #12 Posted by **Djj** on 9 Oct 2011, 11:06 a.m.,*
in response to message #8 by John B. Smitherman

I doubt shaking the calculator could have dislodged the plastic. Vacuum won't work because the plastic film that holds the dome springs in place seals the assembly. I don't know if particles under the dome switches is the widespread problem. HP will have to figure that out.

Re: HP15C- LE bad button

*Message #13 Posted by **robert rozee** on 9 Oct 2011, 10:57 a.m.,*
in response to message #1 by Djj

an excellent analysis.

i worked on a product several years ago that used a very similar keyboard arrangement. there was a relatively small number of units produced per year (amounting to around 10 per day) selling to the customer for about $5k each. hence assembly was quite 'manual' orientated with many QC checks.

the white plastic sheet has adhesive applied with a stencil. there is a dot of adhesive (perhaps 3/16th of an inch across) that holds each of the domes in place, as well as adhesive in all areas well clear of the domes. in our case, a 'path' was also left clear of adhesive such that no closed air pockets were formed around keys.

as supplied to us, we received the white plastic sheet with the domes pre-applied. a waxed-paper (light blue coloured) backing sheet was also there to cover (just) the areas with exposed adhesive. the application process in the factory consisted of peeling off the blue backing sheet - being careful to not disturb the domes - and using an alignment jig to apply the white plastic sheet + attached domes to the keyboard PCB.

the possible failure modes were:

1. a dome could fall off, rendering a key completely non-functional

2. a dome could be moved out of position slightly, producing a key that would often operate ok but wouldn't 'click' due to the button pressing it other than in the dead centre

3. a stray scrap of the white plastic sheet, blue backing sheet, or a piece of loose adhesive, could get between dome and PCB during assembly, resulting in a key that would click but either not register, or only register if pressed hard.

the above three cases to seem to mirror closely the problems seen with the 12C/15C-LE.

*Message #19 Posted by **Djj** on 13 Oct 2011, 11:22 p.m.,*
in response to message #18 by DigiGal

I bought two types of screws to reassemble my HP15C-LE. The first was a small thread forming screw #00 x 3/16" and the second was a 0-80 machine screw. I was hoping the thread forming screw would fit. I tried to order the same size as the small screw from the battery compartment since it seemed to be a good fit. I didn't get the size right and ended up with screws too small. My past experience with thread forming screws is that they can be difficult to size correctly and the fit is important to prevent cracking the plastic. There is not much excess plastic to thread into or deform in the thin plastic posts.

The machine screw size was a good fit so I went forward with it even though machine screws are not typically threaded into ABS plastic. I used a bottoming tap to form threads in the plastic posts. Then I just reassembled the calculator. The LCD is a little fragile so I placed it in position then set the PCB in place. The used small plastic washers under the 0-80 machine screws. I ran the self tests and everything is good and the keyboard feels great. I know I completely voided the warranty but the problem was bugging me.

I bought the machine screws, washers, and tap from McMastercarr.com

The PN for the tap is 2522A811, the washers are 90295A313, and the 0-80 phillips machine screws are 91772A054. the total was 21.50 + shipping.

I put a few pictures on photobucket at:

http://s1093.photobucket.com/albums/i427/djj2011/

WP 34S: a litlle matrix helper to enter and review matrices

*Message #1 Posted by **Miguel Toro** on 8 Oct 2011, 9:09 p.m.*

Hi,

Nothing fancy here, just a little routine to help entering and reviewing matrice for the WP 34s, based on the MIO application of the PPC ROM.

Hope you find it useful and please, any comment to improve it, is very very welcome.

Miguel

Re: WP 34S: a litlle matrix helper to enter and review matrices

*Message #3 Posted by **Marcus von Cube, Germany** on 9 Oct 2011, 6:19 a.m.,*
in response to message #1 by Miguel Toro

Mine ('MED') doesn't allow the sequential input of all elements. You need to navigate there with the arrows, start typing, press R/S, then one of the arrows again to go to the next element. Entering a single element needs either arrow navigation or manually setting I and J as the indexes.

What I don't like with your routine, Miguel, is that you have to press the function key, then enter the matrix descriptor and then R/S. Why not just enter the descriptor and then press the function key?

Re: WP 34S: a litlle matrix helper to enter and review matrices

*Message #4 Posted by **Miguel Toro** on 9 Oct 2011, 7:12 a.m.,*
in response to message #3 by Marcus von Cube, Germany

You are correct. I will make the changes in the routine and the article.

Thank you Marcus.

Done!

Re: WP 34S: a litlle matrix helper to enter and review matrices

*Message #6 Posted by **Marcus von Cube, Germany** on 9 Oct 2011, 8:18 a.m.,*
in response to message #4 by Miguel Toro

Quote:

```
Review an individual element of a matrix
BB.RRCC // Matrix descriptor
[C]
Row number (i)
[ENTER]
Column number (j)
[R/S]
--> Element value in X

Review an individual element of a matrix
BB.RRCC // Matrix descriptor
[D]
Row number (i)
[ENTER]
Column number (j)
[R/S]
New element value [R/S]
```

If you look closely at these two, they are completely identical from the user's point of view. The only difference is that he has to enter a value and press R/S again if he wants to update the cell. So why not just ditch [D] and add a STO operation just after the last STOP in [C]? If the user just wants to see an element he does not enter any new data.

Quote:

```
014 FIX 00
015 CL[alpha]                    // shows the next element indexes
016 [alpha]RC# X
017 [alpha]RC# Y
018 FIX[->]02
```

This can be replaced by [alpha]IP which appends only the integer part. You need to add a delimiter.

Hp 97 needs to be repaired (Ciao Ignazio)

*Message #1 Posted by **aurelio** on 8 Oct 2011, 7:20 p.m.*

Hello, this message is for anyone, on this board who can help me, with his advices to repair a HP97 that I've just got in a quite pretty cosmetically conditions. Ignazio I would like to send you a private message but I can't do it, I don't know your post address.

1)The machine came with a network adapter and a battery pack maybe rebuilt, the pack doesn't hold the charge (I'm waiting for a new battery pack bouught on internet). the calculator turns on but shows sometimes an error message "-E ror -E"

2)The card reader is not working and when I tried to insert a card I got the message "error", the card i dirty from the gummy leakage: i think and I hope maybe it need just to clean it and replace whit a couple of "o rings" or , better a picece o a silicon tube.

3)The printer doesn't work properly, the card feeder run but slowely and there are no printed characters.

Edited: 9 Oct 2011, 2:43 a.m.

*Message #4 Posted by **geoff quickfall** on 9 Oct 2011, 8:54 a.m.,*
in response to message #1 by aurelio

Sounds like you have it plugged into the wall wart (ac adaptor) without the battery pack installed.

Don't ;-)

insufficient power to operate the printer and card reader regardless of the card reader being dirty (which it probalby is).

Wait for your battery pack, charge it up as per the calc specs. Then test the printer. Clean the card reader and test with a charged battery pack.

Geoff

Hello Geoff and thank-you for the answer: Unfortunately I don't know if the previous owner switched on it without the battery pack installed, hope not. I never did it because I read in the forum archives the reasons to avoid it (I don' understand why these machines were not protected at that time against this kind of problems, but far from these kind of discussions..) So I'm waiting for the battery pack then I'll try again

Re: Hp 97 needs to be repaired (Ciao Ignazio)

*Message #6 Posted by **Paul Berger (Canada)** on 9 Oct 2011, 8:02 p.m.,*
in response to message #5 by aurelio

Well The 97 is protected, however it will not function correctly it relies on the battery pack for a couple things. The first is power supply smoothing, there does not seem to be any effective power supply filter caps in the 97 that I can find. on my 97 if I plug it in without a battery pack the display flickers. The other thing is the AC input is mainly for charging the battery and cannot produce enough current to operate the printer, a charged battery is required for that.

Re: Hp 97 needs to be repaired (Ciao Ignazio)

*Message #7 Posted by **Michael de Estrada** on 9 Oct 2011, 8:13 p.m.,*
in response to message #6 by Paul Berger (Canada)

IIRC, someone on this forum has stated that operating the printer w/o a battery installed can/will damage the printer. IDK if this is true, and have never attempted to do this with any Topcat.

Manual for vintage Russian MK-61 RPN programmable calculator?

*Message #1 Posted by **Cristian Arezzini** on 8 Oct 2011, 3:22 p.m.*

Sorry if this is off-topic - it's not an HP calculator, but it's RPN and it's programmable, and it's old so it fits in a museum site! :) I have one of these beasts and it's really interesting - lots of "hidden functions", illegal opcodes and the possibility of synthetic programming... Nice for a nerd! :) Anyway, I managed to learn the basic use, but I really need a manual and I can't read Russian. I found a "functions table" in English, but no complete manual. Does anyone know if such a translation exists somewhere?

Thanks, Cristian

*Message #4 Posted by **Cristian Arezzini** on 8 Oct 2011, 6:03 p.m.,*
in response to message #3 by Bunuel66

Yes, I knew those pages, but thanks anyway because it was interesting to re-read them after a long time! :) They were very useful because they enabled me to start using the calculator; but I'd like to be able to take advantage of the (supposedly very good) full manual...

I have an MK-61 as well. Did you also get the complete electrical schematic diagram sheet with it ?

I just picked up an MK56

*Message #6 Posted by **Michael de Estrada** on 8 Oct 2011, 8:05 p.m.,*
in response to message #5 by Michael de Estrada

Shortly after my post above, I picked up a very clean looking Elektronika MK56, which is the desktop equivalent to the MK61. It also has a green VFD display and runs directly from a 220 vac mains.

Re: I just picked up an MK56

in response to message #6 by Michael de Estrada

Hehe, and I just bought a MK52, which is functionally the same but in landscape format (!) and with a "persistent memory" - supposedly the only calculator ever with an onboard EEPROM for program storage - and an expansion port. Fascinating machines! :) I love to disassemble them and see how different soviet electronics looked back then... Now they look the same as western ones, but then, now everything is made in China! :)

Mine did not come with a schematic, I don't know if it is a later build (the manual got progressively simpler and smaller with time) r if the previous owner just lost it.

Cristian

Re: I just picked up an MK56

*Message #8 Posted by **Michael de Estrada** on 9 Oct 2011, 2:02 a.m.,*
in response to message #7 by Cristian Arezzini

My MK61 came in a box with a 208 page manual, the schematic, AC adapter, soft slip case and calculator. The back is molded 92 06, so I assume it means that it was manufactured in June, 1992. Also, several pages in the back of the book are stamped and hand written 12.10.92, which suggests that it was sold on 12 October 1992.

*Message #9 Posted by **Cristian Arezzini** on 9 Oct 2011, 3:38 a.m.,*
in response to message #8 by Michael de Estrada

Mine is marked "88 10" so it's older than yours, I suppose this means the original owner just lost the schematic. But I downloaded it somewhere. Though I'm not at the point where I'd need a schematic yet... I'd be happy enough with a usable (for me) manual! :)

The Elektronika MK 52 came with a schematic at least part of the time; the one I own came with one.

My favourite Elektronika calculator has to be the MK 54, which was a clone of the B3-34 (Elektronika's first really big programmable) in a case identical to the MK 61's. Since the B3-34 only had one shift key and the MK 61 has two, this means that the MK 54 has a shift key that isn't used by any function of the calculator.

The key is not, as you might think, just not connected to anything, however. Using it before any function will give a familiar-to-any-Elektronika-user `eggog'.

The MK 52 might be the only calculator to have EEPROM storage, but the MK 54 has to be the only one that has an error button.

I'd heard about that calculator, and of its incredible "Error" button! :)

I've been experimenting a lot with my MK61, and I'm starting to wonder if maybe I have an unusual ROM revision... because some of the procedures needed to enter some of the weird, unofficial, "hacker" modes give unexpected results (while the emulator and other people's 61s work as expected). Instead of being able to enter some illegal opcodes or numbers, my calculator enters a weird, semi-unstable state which I don't understand (yet). And I have no idea why.

It's a shame that with all the huge amount of articles and documentation about these programmables published in Russian, almost nothing has been translated, or is available in any way...

Cristian

Re: I just picked up an MK56

*Message #13 Posted by **x34** on 11 Oct 2011, 5:15 a.m.,*
in response to message #11 by Cristian Arezzini

There is no unused prefix button on MK-54. If you mean blue "K" button, then it is used as indirect prefix for some functions -e.g. K ∏->x is equivalent to RCL (x). (∏ stands for Russian P, which looks like Product symbol or inverted U, so K U->x.)

Strange behaviour of MK-54 is frequently caused by unstable power (check oxidized contacts) or instability of generator. There are lot of information on Russian sites.

Interesting. Unfortunately, I can't reproduce the behaviour you describe on my MK 54. I also note that the Elektronika calculator emulator I have doesn't reproduce the behaviour you describe on the MK 54.

I'm also not sure I'm following what you're saying. In the example you give, the K shift button isn't being used as an indirect prefix. Unless I misunderstand you, you're saying that it's acting as a NOP, because the unshifted Π -> x key does what you're describing.

That might not be meaningful - I found out that the emulator is not really an emulator, but a simulator - it doesn't use the original firmware of the actual calculators. For example, it doesn't handle "Zggog" on the 61...

Nerdvana & mass production of FOCAL rom images

*Message #1 Posted by **Geir Isene** on 8 Oct 2011, 3:09 p.m.*

Firstly; Here's my latest blog post celebrating my new HP-41CL:

NERDVANA

Secondly; I realized a shortcut to easy production of FOCAL program rom images for the HP-41. With no knowledge of MCODE:

1. Load HEPAX into your CL (use the function HEPCL from the CLUTILS rom)
2. Save your favorite FOCAL programs to HEPAX RAM (use HSAVEP)
3. Transfer the 4K HEPAX RAM block to your PC using the serial connector or a PIL BOX
4. Use the conversion from LIF file to ROM file as detailed in Geoff's QRG for the 41CL

Optionally you can add an MCODE header, set the XROM# for your module and set the ROM ID and version number. This requires onl a very basic knowledge of MCODE.

With this, we could see an avalanche of new FOCAL rom images :)

Re: Nerdvana & mass production of FOCAL rom images

*Message #2 Posted by **Dwight Sturrock** on 8 Oct 2011, 11:13 p.m.,*
in response to message #1 by Geir Isene

By FOCAL do you mean RPN keystroke programming?

Re: Nerdvana & mass production of FOCAL rom images

*Message #3 Posted by **Geir Isene** on 9 Oct 2011, 6:24 a.m.,*
in response to message #2 by Dwight Sturrock

Yes, the keystroke programming of the HP-41.

Re: Nerdvana & mass production of FOCAL rom images

*Message #4 Posted by **Ángel Martin** on 9 Oct 2011, 8:23 a.m.,*
in response to message #1 by Geir Isene

> Quote:
>
> With this, we could see an avalanche of new FOCAL rom images :)

Well, looking forward to that avalanche!

Once again, the HEPAX proves to be the cornerstone of the 41 system.- I don;t know what we'd do without it.

I use a similar method on my MLDL2k, which I think is better and easier than the PILBox plus the LIF conversion. You should try it out, maybe the avalanche becomes a deluge!

on the HEPCL function - I've thought about doing a subset configuring just 8k of HEPAX RAM, instead of the 16 it does currently. Will that jive?

Best, 'AM

Re: Nerdvana & mass production of FOCAL rom images

*Message #5 Posted by **Geir Isene** on 9 Oct 2011, 8:49 a.m.,*
in response to message #4 by Ángel Martin

That will Jive - as I only use 8K of HEPAX RAM at a time (holding several sets of 8K HEPAX RAM pages to switch between)

... I don't have an MLDL:(

Suggestion for the start of the flood?

*Message #6 Posted by **gene wright** on 9 Oct 2011, 5:38 p.m.,*
in response to message #4 by Ángel Martin

I think ALL of the programs from the HP 41 solution books are prime candidates. Most of them can be barcode scanned into a 41.

Just imagine having all of *that* material available on your 41CL as well as what is already there.

Wow!

Re: Suggestion for the start of the flood?

*Message #7 Posted by **Ángel Martin** on 10 Oct 2011, 1:43 a.m.,*
in response to message #6 by gene wright

Well, I for one don't think that many of those programs would be worth the effort - besides a librarian appeal, of course. They're quite aged, most were written during the initial phase of the 41's existence and don't even use X-Functions.

There were other programs in the User's Library more worthy of this type of project, it's a shame no indexed listing remains, or no repository was made - beyond what's left on TOS and this very museum site.

Just my 2 cents, only one person's opinion.

Best, 'AM

Re: Suggestion for the start of the flood?

*Message #8 Posted by **Geir Isene** on 10 Oct 2011, 2:14 a.m.,*
in response to message #7 by Ángel Martin

Well, there are some interesting one's - like those of the User Libraries of Physics, Marketing/Sales, Games I/II...

A few (the most interesting ones) from the Games I/II are in the FUNSTUFF and ADVENTURE modules, part of your CL Libray indeed.

Re: Suggestion for the start of the flood?

*Message #10 Posted by **gene wright** on 10 Oct 2011, 9:54 a.m.,*
in response to message #9 by Ángel Martin

Couple of thoughts:

1) What's useful to you or me might not be useful to others and vice versa. Some of those programs are certainly application oriented, but having them in .rom format will preserve them and allow them to be used by doing some UPLUG and PLUG commands. :-) Please don't dismiss the idea too quickly. :-)

2) A number of HP 41 programs can be found here on David Ramsey's site:

HP documents FTP link

Re: Nerdvana & mass production of FOCAL rom images

*Message #11 Posted by **Håkan Thörngren** on 9 Oct 2011, 3:30 p.m.,*
in response to message #1 by Geir Isene

Or install NutStudio Tools on your host computer.

1. Copy the games example (from the installation) to a new work folder.
2. Copy all the RPN files (text or raw) you want in your module into the work folder.
3. Edit the Makefile to mention the RPN files.
4. Make a trivial edit to header.s to change the name of the module, XROM number and XROM ID.
5. Optionally edit games.ModDesc (XML file) to set correct MOD metadata.
6. Run 'make' and it will put together your new RPN module.

You can omit step 4 and 5 initially.

All very easy steps. NutStudio Tools have been able to do ths for a while, but no avalanche of RPN modules...

HP-46 faulty keys - to Katie

*Message #1 Posted by **Juergen Keller** on 8 Oct 2011, 1:49 p.m.*

I've got an HP-46 which is in working condition except that some keys do not work at all. In some old forum threads I found a note from Katie that the cause might be a bad filter cap which might cause all sorts of weird behavior. Katie, can you confirm this?

Re: HP-46 faulty keys - to Katie

*Message #2 Posted by **Katie Wasserman** on 8 Oct 2011, 2:25 p.m.,*
in response to message #1 by Juergen Keller

I definitely seen flaky printer output when there's bad filter capacitor, but I don't remember if I've seen flaky key functions in that case.

Re: HP-46 faulty keys

*Message #3 Posted by **Juergen Keller** on 8 Oct 2011, 4:04 p.m.,*
in response to message #2 by Katie Wasserman

Thanks for your quick response. Well, the printer works like a charm, but some keys on the left (SIN, COS, TAN, TO POL, X^2) don't respond at all. Too bad, it's in nice condition.

Re: HP-46 faulty keys

*Message #4 Posted by **Tony Duell** on 9 Oct 2011, 3:48 a.m.,*
in response to message #3 by Juergen Keller

According to the schematic, those keys are one complete electrical row (row 2) of the keyboard. I'd start by checking that there's continuity between the appropriate connections of the keyswitches and pin 8 of the Control&Timing IC. If not, check the keyboard DIL connector, cable, etc. If that's OK, I suspect the C&T IC itself.

Re: HP-46 faulty keys

*Message #5 Posted by **Juergen Keller** on 10 Oct 2011, 4:23 a.m.,*
in response to message #4 by Tony Duell

Thank you for your suggestion. I will try to isolate the problem. If the C&T IC is faulty I guess there's not much chance to repair it.

15C LE - arrived!

*Message #1 Posted by **Thomas Radtke** on 8 Oct 2011, 7:54 a.m.*

Bought from SC, paid $94,99 + $18 shipping, about 16 Euro taxes. No rattling f, g keys, all keys registering. LE-No. 2936.

Guess I'm extremly lucky - and for sure happy :-).

Re: 15C LE - arrived!

*Message #2 Posted by **Alexander Oestert** on 8 Oct 2011, 8:07 a.m.,*
in response to message #1 by Thomas Radtke

See! I told you so! ;)

Re: 15C LE - arrived!

*Message #3 Posted by **Thomas Radtke** on 8 Oct 2011, 1:07 p.m.,*
in response to message #2 by Alexander Oestert

Trusting your crystal bowl (of course!), I had a hard time nonetheless ;-).

Keys feel exactly like those of the 35s (surface and feedback on keypress), but this moment of horror went away after just a few seconds. For some instant fun, I implemented my 32SII program for the HHC2011 excercise/contest. Writing, but never reading operating instructions, I missed the x=y? test and replaced it with "- x=0?". Accidently, without actually realizing what I did, I glanced through the backplate text and found TEST 5 afterwards. Oh well...

41-MCODE Question

*Message #1 Posted by **Ángel Martin** on 8 Oct 2011, 6:13 a.m.*

Does anyone know which OS rutine is called to display a mainframe function NAME while a key is being depressed?

I've located the equivalent for an XROM function, but it doesn't seem work for mainframe ones.

Appreciate any hints that save me long & tricky trace analysis!

Best, 'AM

Re: 41-MCODE Question

*Message #2 Posted by **Eric Smith** on 9 Oct 2011, 1:07 a.m.,*
in response to message #1 by Ángel Martin

I think the routine that displays the name is PROMFC (05C7), but in the specific case you're asking about, it may be using the entry point PROMF2 (01D3), called from 0CD2 (a few lines after PARS75).

However, I haven't tried to verify any of this, so I could be completely wrong.

It doesn't look like PROMFC (or PROMF2) are usable as a subroutine from a ROM of your own, if that's what you're looking for.

Edited: 9 Oct 2011, 1:08 a.m.

> I haven't tried to verify any of this, so I could be completely wrong.

If there's something I've learned in this forum is that you're *never* completely wrong, Eric. In fact you're absolutely correct, such is the routine I was looking for.

> Quote:
>
> It doesn't look like PROMFC (or PROMF2) are usable as a subroutine from a ROM of your own, if that's what you're looking for.

I'm not sure that I get your comment: I've been able to call it form my SandMath module without issues. All it needs is the entry point of the invoked function in A[S&X], for instance that'll be 07D for SDEV,

07C for MEAN, ect. This is reading from the FNCTBL to get the location of the function.

The reason I wanted to know about this is to implement a menu-like launcher, something akin to the 42-style (and later models).

Function "-PB/STS" in the SandMath now prompts a menu in the display, and gets into a [NEXT] partial entry sequence. The allowed choices are the five top keys, SHIFT, and BackArrow (as always). SHIFT toggles the displayed menu to another 5 choices, which in this case are:

Unshifted: SD: CV: R: LR: Y:
shifted: MN: LM: GD: C: P:

here SD is for Standard Deviation, and MN is for Mean - while the others are functions from the SandMath ROM.

Pressing any of the top keys will first display the function name (if the key is kept depressed), then leave the partial entry sequence and execute the corresponding function.

It all worked great, with the exception of displaying the function names for the mainframe MEAN and SDEV.

Now that's also working. Menus are very doable, the HP-41.5 is born :-)

Thanks again, 'AM

*Message #5 Posted by **Mike Morrow** on 8 Oct 2011, 8:41 a.m.,*
in response to message #1 by Keith Midson

I seriously doubt the pictured example has seen much actual use at all. Perhaps there has been some of instances of abuse, but that's all. It is impossible to use any Voyager regularly without wear on the model "badge" becoming apparent...and this example has none.

Re: A real 15C ...

*Message #6 Posted by **Keith Midson** on 8 Oct 2011, 10:12 a.m.,*
in response to message #5 by Mike Morrow

I've uploaded a photo of the back of the calculator now - definitely lots signs of use there! Perhaps the lack of wear on the emblem is to do with not being moved in and out of the slip cover for many years?

Re: A real 15C ...

*Message #7 Posted by **Roger Blake** on 8 Oct 2011, 10:49 a.m.,*
in response to message #5 by Mike Morrow

My HP15c had LOTS of use and its badge was absolutely fine. Unfortunately the whole calculator was dropped and smashed two years ago.

In contrast my HP16C - which I still have - had far less use but lost its badge years ago and more recently the chrome panel had buckled and come loose. Works perfectly though :-)

now that raises an interesting question - what if a nice person from HP were to supply a new bezel and keyboard plate from the 15LE production line? would these brand new parts fit on an original 15C? would the parts need trimming?

perhaps TW might comment?

Re: A real 15C ...

No, I bought this for about $120 in 2009. From memory, there was little information from the seller other than something like "well used/ as is, etc". It was actually the first 15C I purchased, but I sold it later that year when I found a better one.
I am an engineer and many examples I see in engineering offices are similar to this. There is one design office that I visit for work occasionally where there are 4 x 15C's in active duty. All are very well worn, similar to my Flickr example. One has been missing its battery cover for years and is taped up with sticky tape, one is missing it's 15C emblem. I think what happens to many of these is they remain on a desk where the get knocked, bumped, dropped, etc.
Keith

Re: A real 15C ...

*Message #11 Posted by **Keith Midson** on 8 Oct 2011, 11:04 p.m.,*
in response to message #10 by Keith Midson

I should also add that the reason for posting this pic was my fascination with how a calculator (the 15C) can be used exclusively for so many years by some professionals without replacement. It is hard to imagine that happening these days (think of how often most people change their mobile phone). Even graduates these days do not seem to have the need for such a close connection to a specific calculator.
What is also amazing is that they last for so long (also the batteries). Will the 15C-LE last 30 years under daily hard working conditions? Probably not (nothing against the LE - I have 2 and praise HP for its re-release - I have one in front of me right now as i'm multitasking work and other stuff), but quality of manufacturing is just not the same in this mass-produced age.

Wow. I believe we have a new first place winner. Although the suspect corrosion experiment cited above was impressive, it was likely victim of lying derelict in a hostile environment. The unit here was simply

used to death. I suppose if there is any right way for a voyager to check out, this may be the most respectful.

HP: Please buy this from the owner and place it in your corporate museum, forever running the ON/x self test.

OT: Does anyone have access to rapid prototyping?

*Message #1 Posted by **Hugh Evans** on 7 Oct 2011, 6:31 p.m.*

With a community such as this, it's certainly worth asking. You can probably guess what this is for as well, and you would be correct in your assumption. I need two major parts with the largest measuring about 3"x5"x3/8" while the other is literally a sheet of keys. All of this will fit into a deep drawn enclosure and eventually require a rubber case for grip and shock protection.

Next: get ready for some physical hardware. I have designs in CAD and they are looking amazing. Otherwise, don't expect to hear much from OpenRPN until major developments take place. If you have any questions, feel free to shoot me an email. We are looking for a host aside from sourceforge as well. I can't wait to share what I've been working on with everyone here!

We are actively recruiting sw, hw, and documentation talent if you have skills you would like to contribute. OpenRPN is alive and underground. But the next response from the intended end users (you) is "WOW!"

Thanks! I look forward to hearing from you soon!

If you could provide some details of the project's charter it may help prospective contributors decide whether or not it is of interest to them. Otherwise such a semi-clandestine appearance begs the question whether this is indeed an open vs. commercial endeavor, either which may be attractive to folks, but from different motivations.

FWIW a major attraction for myself (and I'd hazard others as well) to contribute to an open effort is the ability to be involved in the definition phase of the design, rather than jumping in to help productize someone else's preconceived brain child.

Re: OT: Does anyone have access to rapid prototyping?

*Message #3 Posted by **Hugh Evans** on 8 Oct 2011, 12:48 a.m.,*
in response to message #2 by uhmgawa

Valid concerns, more information will be available shortly. There will be community involvement in the definition, although since this is a reboot I can already rattle off a set of specs that 99% of the people here would not complain about. Physical production is a risk I will most likely be assuming, which ultimately means that the community has more overall say over the software.

For now, I recommend staying tuned while information is made available. Messages on this board will be sparse and largely limited to major announcements of progress.

Feel free to send me an email if you have any specific questions or concerns.

Ok, could you share the above "set of specs" so I (and likely others) could assess their interest in this open project?

One point I'd offer is a device such as a calculator (I assume that's what we're discussing) is most successfully approached as an exercise in functional/UI/software/hardware/mechanical/manufacturing codesign rather than a concentration on a convenient subset of the above with the balance left as an afterthought. I have no idea where you're at in the process however from my reading above it appears the effort may not be receiving benefit of a concurrent engineering approach.

Edited: 8 Oct 2011, 12:56 p.m.

Re: OT: Does anyone have access to rapid prototyping?

*Message #5 Posted by **Hugh Evans** on 8 Oct 2011, 2:41 p.m.,*
in response to message #4 by uhmgawa

I don't want to create confusion by listing specs that are not yet set in a public forum. If you send me a PM I will be happy to discuss this at length with you. A great deal of room exists for changes right now and I am being vague and evasive only because I *want* to avoid any confusion at this stage.

A fully concurrent engineering approach would be ideal, but in my experience it is questionably feasible at best with all volunteer labor working on a specialized niche device. You sound like you're holding back on some thoughts regarding how best to approach this project, and I would appreciate it if you would share your thoughts with me. Progress will likely not be as fast as many of us would like. One important lesson I learned the first time around is that the physical components present the greatest challenge, and that is what people require proof of to generate real interest.

The end users here want a reliable scientific tool that will last a very long time. That means never cutting corners for the sake of improving margins, and going for the best quality of build that is possible. Long battery life, access to internal features/expansion similar to a development kit, keys that feel solid and provide excellent tactical feedback (go "click" every time and register), a high contrast display, and the ability to expand.

Again, if you have questions I don't think cluttering this forum is the place for it. Until there is

something to show off, I want to keep quiet.

*Message #6 Posted by **Matt Fegenbush** on 7 Oct 2011, 8:27 p.m.,*
in response to message #1 by Hugh Evans

I have own machining equipment and have the design and programming experience with making injection molds for production as well as ersatz molds for making mockup components.

Long story short, I would like to be involved.

Re: OT: Does anyone have access to rapid prototyping?

*Message #7 Posted by **Hugh Evans** on 11 Oct 2011, 10:44 p.m.,*
in response to message #6 by Matt Fegenbush

Matt,

I'm not sure if you received my e-mail. We can discuss details of the designs at OpenRPN.org and hopefully get the ball rolling. The priority is to create a physically complete hardware platform for development. Basically, we need a field to play the game and nice drawings or even simulations don't count.

Alternatively, you can respond via email through this site or direct: hugh.evans at columbus dot rr dot com.

in response to message #1 by Hugh Evans

I'm busily designing keyboards at the moment but I'd like to move on to other projects if time permits and our baby is done.

Re: OT: Does anyone have access to rapid prototyping?

*Message #10 Posted by **Hugh Evans** on 9 Oct 2011, 3:06 p.m.,*
in response to message #1 by Hugh Evans

Everyone who responded to this thread expressing interest should have received an email from me already. Please come over to the forum currently in use as the splash page at OpenRPN Forum

I have a couple of quick renderings that make use of minimal manufacturing capabilities. These are first drafts and establish only the working outside dimensions. It shows the proposed rubber boot/case that will protect an underlying deep drawn case. It's a starting point for discussion and planning.

Thanks for your interest, I look forward to working with all of you and getting some physical hardware ready from production.

Re: OT: Does anyone have access to rapid prototyping?

*Message #11 Posted by **Dave Shaffer (Arizona)** on 9 Oct 2011, 4:12 p.m.,*
in response to message #1 by Hugh Evans

Anybody got one of these 3D printers ?

$1700 if you need to buy your own, and claimed to print from CAD files.

Probably not much good for volume production, but sure looks useful for onesies and twosies.

Re: OT: Does anyone have access to rapid prototyping?

*Message #12 Posted by **Hugh Evans** on 9 Oct 2011, 6:01 p.m.,*
in response to message #11 by Dave Shaffer (Arizona)

That's essentially the point of this thread. Even using rapid prototyped plastic parts I can cast molds for low volume runs. Since the company I work for makes a lot of polymers I'm consider using a two part urethane if necessary to fabricate a small run of keys and case components. These will prove extremely useful for those designing the electronics and give us a chance to start testing snaps domes and learn how to get the best tactile response. Once the electronics are designed I've considered selling them as nice ARM development kits to increase volume and hopefully improve the pricepoint. I also want to build one or two dozen complete prototype calculators to give several major team members as thanks for their contribution and debugging of the design before fully locking it in.

After that, the tricky part will be financing. I would prefer to avoid pre orders. This is where trying a kickstarter or finding investors may come in. The goal price maximum is $200 for both the voyager and pioneer format designs. I already have several tricks up my sleeve to keep production costs low. For example: those of you joking about all aluminum: I can get it done for well under $20 per complete case with keys at quatities of around 500.

Hardware must be proven first, then everyone gets to see what wp34s can do when hardware isn't the limiting factor :)

Re: OT: Does anyone have access to rapid prototyping?

*Message #13 Posted by **Paul Dale** on 9 Oct 2011, 6:06 p.m.,*
in response to message #12 by Hugh Evans

I wasn't joking about the aluminum case. For small runs it will quite possibly be cheaper than a moulded plastic case.

Re: OT: Does anyone have access to rapid prototyping?

*Message #14 Posted by **Hugh Evans** on 9 Oct 2011, 6:47 p.m.,*
in response to message #13 by Paul Dale

Agreed, I'm giving it a good close look. Even in low quantities it can be very reasonable. The outer (back) shell wi be deep drawn. Not to mention the inherent cool factor. One idea I'm toying with is using a sheet of gorilla glass to cover the entire faceplate. Not only would it be sleek and durable, it's a great way to slip layouts underneath. If that doesn't pan out, the aluminum face would be great for etching custom labels. I'm doing a good job of selling myself on this now lol.

Lots of ideas to consider. And the improved access to fabrication this time around is very exciting. I'm hoping to have at least one prototype within 90 days and one complete with electronics within 6 months.

I missed this project. If fizzled out last time largely because I went through a very rough period in my life. Across the board I'm much better equipped to see it through this time and devote more of my energy towards it. I hope anyone who grew frustrated with OpenRPN in the past will put it behind them. This crazy project is for you. The target audience can be summed up as the members of this board. The resources are here, and I understand the burden is on me to prove this project is possible. I look forward to making a lot of people happy with the kinds of calculators they've always dreamed of.

Hmmh, a prototype without electronics? :-?

Re: OT: Does anyone have access to rapid prototyping?

*Message #16 Posted by **Hugh Evans** on 9 Oct 2011, 7:20 p.m.,*
in response to message #15 by Walter B

Absolutely, although I suppose mock-up might be a more appropriate term for that stage. I want to experiment with tactile response variables at that stage as well. I suspect solid keys will give the best feel and sound. Snap discs will require selection and manufacturers usually have specific pc board patterns they design for their own discs. If everything checks out at this stage the electronics designers have all the dimensional information they need to design.

I don't think I've seen anyone downplay use of an aluminum case. Actually I'd considered doing so in my former voyager recreation project. It is fairly easy to cast rough blanks to minimize material removal and finish machining. And the choice of Al brings in desirable strength and shielding properties. The point I paused was that of aesthetics in use. An anodized finish is subject to wear and will start looking shabby after it abrades. A textured or blasted natural finish may be a better choice from this perspective but may not have universal appeal. The thermal characteristics of a cold block of Al vs. ABS could also be a detraction for some. A elastomer boot will offset these issues but at the cost of added bulk. So there are a few things to consider here if you're targeting a premium design with a corresponding premium end user cost.

*Message #19 Posted by **Marcus von Cube, Germany** on 9 Oct 2011, 7:27 p.m.,*
in response to message #18 by uhmgawa

Have you ever worked on an all Al MacBook? The feeling is just great. The surface is very smooth, not glossy, just pleasing the skin touching it.

Re: OT: Does anyone have access to rapid prototyping?

*Message #20 Posted by **Hugh Evans** on 9 Oct 2011, 7:35 p.m.,*
in response to message #18 by uhmgawa

The SoC selection process is not far along. Ive started shopping around and am keeping in mind the consensus from the first time around. Battery life is everything and even lower end ARMs will have no problems working very fast as calculators. I nice big chunk of on board flash makes sense, potentially using USB mass storage device to interface and load files. Hopefully sufficient memory is available onboard, but its easy enough to leave pads on the pc board for expansion or as an option. More and more include LCD controllers, but these tend to be geared towards power hungry applications such as tablets and phones. Do you have something in mind?

Also... What was your voyager project?

Re: OT: Does anyone have access to rapid prototyping?

*Message #21 Posted by **Mark Hardman** on 9 Oct 2011, 7:18 p.m.,*
in response to message #1 by Hugh Evans

Hugh,

In the "TwistyPuzzles" community some of the more exotic Rubiks type puzzles are prototyped and then sold directly from a 3D printing company called Shapeways.

Here's an example of an item that I've actually purchased. I can vouch for the quality and precision of their

prototyping process.

Geared Mixup

Re: OT: Does anyone have access to rapid prototyping?

*Message #22 Posted by **Hugh Evans** on 9 Oct 2011, 11:05 p.m.,*
in response to message #21 by Mark Hardman

Mark,

I've come across that site a couple of times and I appreciate you bringing it back to my attention. It appears that they do enough work to be a viable option for short production runs, which could be very useful in a project like this. Production runs of 500 sound a lot less scary than 10,000!

HHC 2011 / O.S. Extension Pack

*Message #1 Posted by **Software49g** on 7 Oct 2011, 5:16 p.m.*

Hello,

those who have been at HHC 2011 have seen my O.S. Extension Pack for the HP 50g.

The O.S. Extension Pack is a downgraded version of the Multi Lingual Pack and contains only the English parts of it.
It is for those who do not want or need the other languages available. The O.S. Extension Pack can not be upgraded to a full Multi Lingual Pack.

The O.S. Extension Pack requires ROM 2.15 or higher and consists of

- English Language Pack (must be installed for taking over the operating system)

- TreeBrowser / Formula Browser (must be installed for viewing data sets)

- TreeBrowserBuilder / Formula Builder

- GUISLV / GUIMES

- Data set of the Equation Library

- Data set of the most common formulas of economics

- Fast CAS help system (extendable to act as a help for all commands)

More information about it is available on my website
http://www.software49g.gmxhome.de

Regards,
Andreas

P.S.
The new and fast help engine is capable of handling very large text with inline graphics.
If there is interest it could be used to bring the AUR incorporated into the O.S. thus allowing help for *all* built-in commands.
Please contact me by private mail if you would like to help with it.

Re: HHC 2011 / O.S. Extension Pack

in response to message #1 by Software49g

Hello Andreas, Thank you very much for posting this information. Unfortunately i couldn't attend to the hhc2011 but i had the chance to see your presentation on youtube (looking for hhc 2011). You did a great job!

Your piece of sw seems to be very useful and integrates very well with the hp50 os completing with Gui some programs like the Mes.

Some questions of your presentation were very interesting. I am referring to the development of os updates (new roms) and in general the development of new high end calculators. Did you have some hopes on these points? Did you have the chance to speak about these points with Hp attendees?

Btw, if you need some transaltion in italian please ask; i would be more than happy to contribute.

Thanks

Giancarlo from Italy

in response to message #3 by Bart (UK)

> Quote:
>
> I missed out on being part of the "sliderule generation" :-)

I was definitely in the slide rule era. I bought a Dietzgen N1725 (front and back), IMHO the ultimate and finest slide rule of all time. It cost me $35 new in 1969 (equivalent to $220 in 2011).

An entering engineering or science student at Georgia Tech in 1970 had a decent slide rule as the only computational device requirement.

Throughout the mid-1970s, slide rules remained a requirement in universities due to the expense of scientific calculators. That was also true of the U.S. Navy's nuclear power training program, where calculators were *not* an option. It was there I received the best training I'd ever seen on slide rule use for common engineering problems, much better than any similar training I'd received at Georgia Tech.

Looks very similar to my Post Versalog. At the time it was considered by "those in the know" as better than the ubiquitous K+E and Picketts that most of my fellow engineering students had.

I got good use out of my Post, but I secretly liked the Picketts because they were Aluminum and USA-made.

Re: Slide rule

*Message #6 Posted by **Mike Morrow** on 7 Oct 2011, 5:28 p.m.,*
in response to message #5 by Martin Pinckney

The Dietzgen N1725 was made in the USA. It was made of mahogany wood which had great dimensional stability, with teflon runners for the slide called "Microglide". Verrry smooth!

I never did like the metal slide rules. The slide always seemed to move roughly. Plus...they were yellow.

Re: Slide rule

*Message #7 Posted by **Martin Pinckney** on 7 Oct 2011, 5:41 p.m.,*
in response to message #6 by Mike Morrow

Well, of course the metal would have to be very precisely machined to be smooth, and then some type of lubrication might still be needed. Maybe I never got the chance to really test the Pickett.

I remember the K+E users lubricated them with talcum powder. The Post, you weren't supposed to put anything on them because the bamboo had natural lubrication.

Teflon sounds good. I'm sure I never tried one of those.

The Post 1460 Versalog is absolutely among the best slide rules ever made. I still have an example of its successor, the Teledyne-Post 44CA-600 Versalog II, sitting on my desk.

Apart from everything else, the bamboo Posts have all aged very well; much better than a lot of metal Picketts and plastic (sorry, `ivorite') K+Es.

in response to message #3 by Bart (UK)

> Quote:

> I love this forum, makes me feel so young - I missed out on being part of the "sliderule generation" :-)

While I'm not of the slide rule generation either, I totally recommend picking up a slide rule sometime and learning how to use it. They're they coolest things ever. I bought a slide rule on a lark a few years ago, now I have more than ten of them, and I'm always amazed at what can be accomplished with a few sliding pieces of plastic/metal/wood/bamboo.

In a way, I find slide rules to be more interesting than calculators because of the fact that more aptitude is required: that is, the quality and speed of one's answer greatly depends on their skill with the instrument. Whereas operating a calculator is so easy, and the answers are always the same.

Re: Slide rule

*Message #10 Posted by **David Hayden** on 7 Oct 2011, 4:24 p.m.,*
in response to message #2 by Thomas Chrapkiewicz

I think I was in the first generation that didn't use slide rules at all. My father tried to teach me how to use one when I was perhaps 10 or 12, but by the time I entered high school in 1977, absolutely no one (students or teachers) used them. Our math and science textbooks had tables in the back for transcendental functions, but the TI-30 cost $30 so almost everybody bought one of those (I still have mine). I quickly moved up to an HP 29C and haven't been the same since :).

Dave

> Quote:
>
> but by the time I entered high school in 1977, absolutely no one (students or teachers) used them.

I was still using one in my high-school physics class that same year. The other students thought it couldn't possibly be very accurate, but were impressed when we had to calculate the orbital period of a satelite around the earth and my answer was only four seconds different from the teacher's which he got with his TI calculator. I had a calculator--actually two--but not scientific.

Later in college I had a couple of classes in a room that had one of the huge instruction sliderules over the chalkboard as mentioned above but it was never used because everyone was using calculators by then. When a couple of men came through with a video camera making a video to promote the school, they wanted to videotape me using the sliderule because it was so unusual. I'm sure they didn't use that part in the final promotional video though since that would make it look outdated. They were just fascinated.

I got my first scientific calculator in Dec 1981, a TI-58c which cost about $100 at Jewelcor, because the slide rule was not programmable and I wanted to do some calculations that took thousands of iterations. My longest-running program ran for nearly 24 hours on the 58c.

I entered High school in 1976 with a Commodore SR4148R calculator ($65 at Sears Department Store!). Less than a year later I had enough money (and the price had gone down) to buy my HP-25 that lasted me through three years of high school, four years of college and the first two years of work. Damn that calculator was great! Of course the HP-25 begot the HP-11C which begot the HP-28C which begot the HP28S which begot the HP48SX and so on, and so on...

It's funny, the WP34s is the first HP calculator (well, the HP30b core that was made by HP) I have bought *new* in 20 years. It is that compelling.

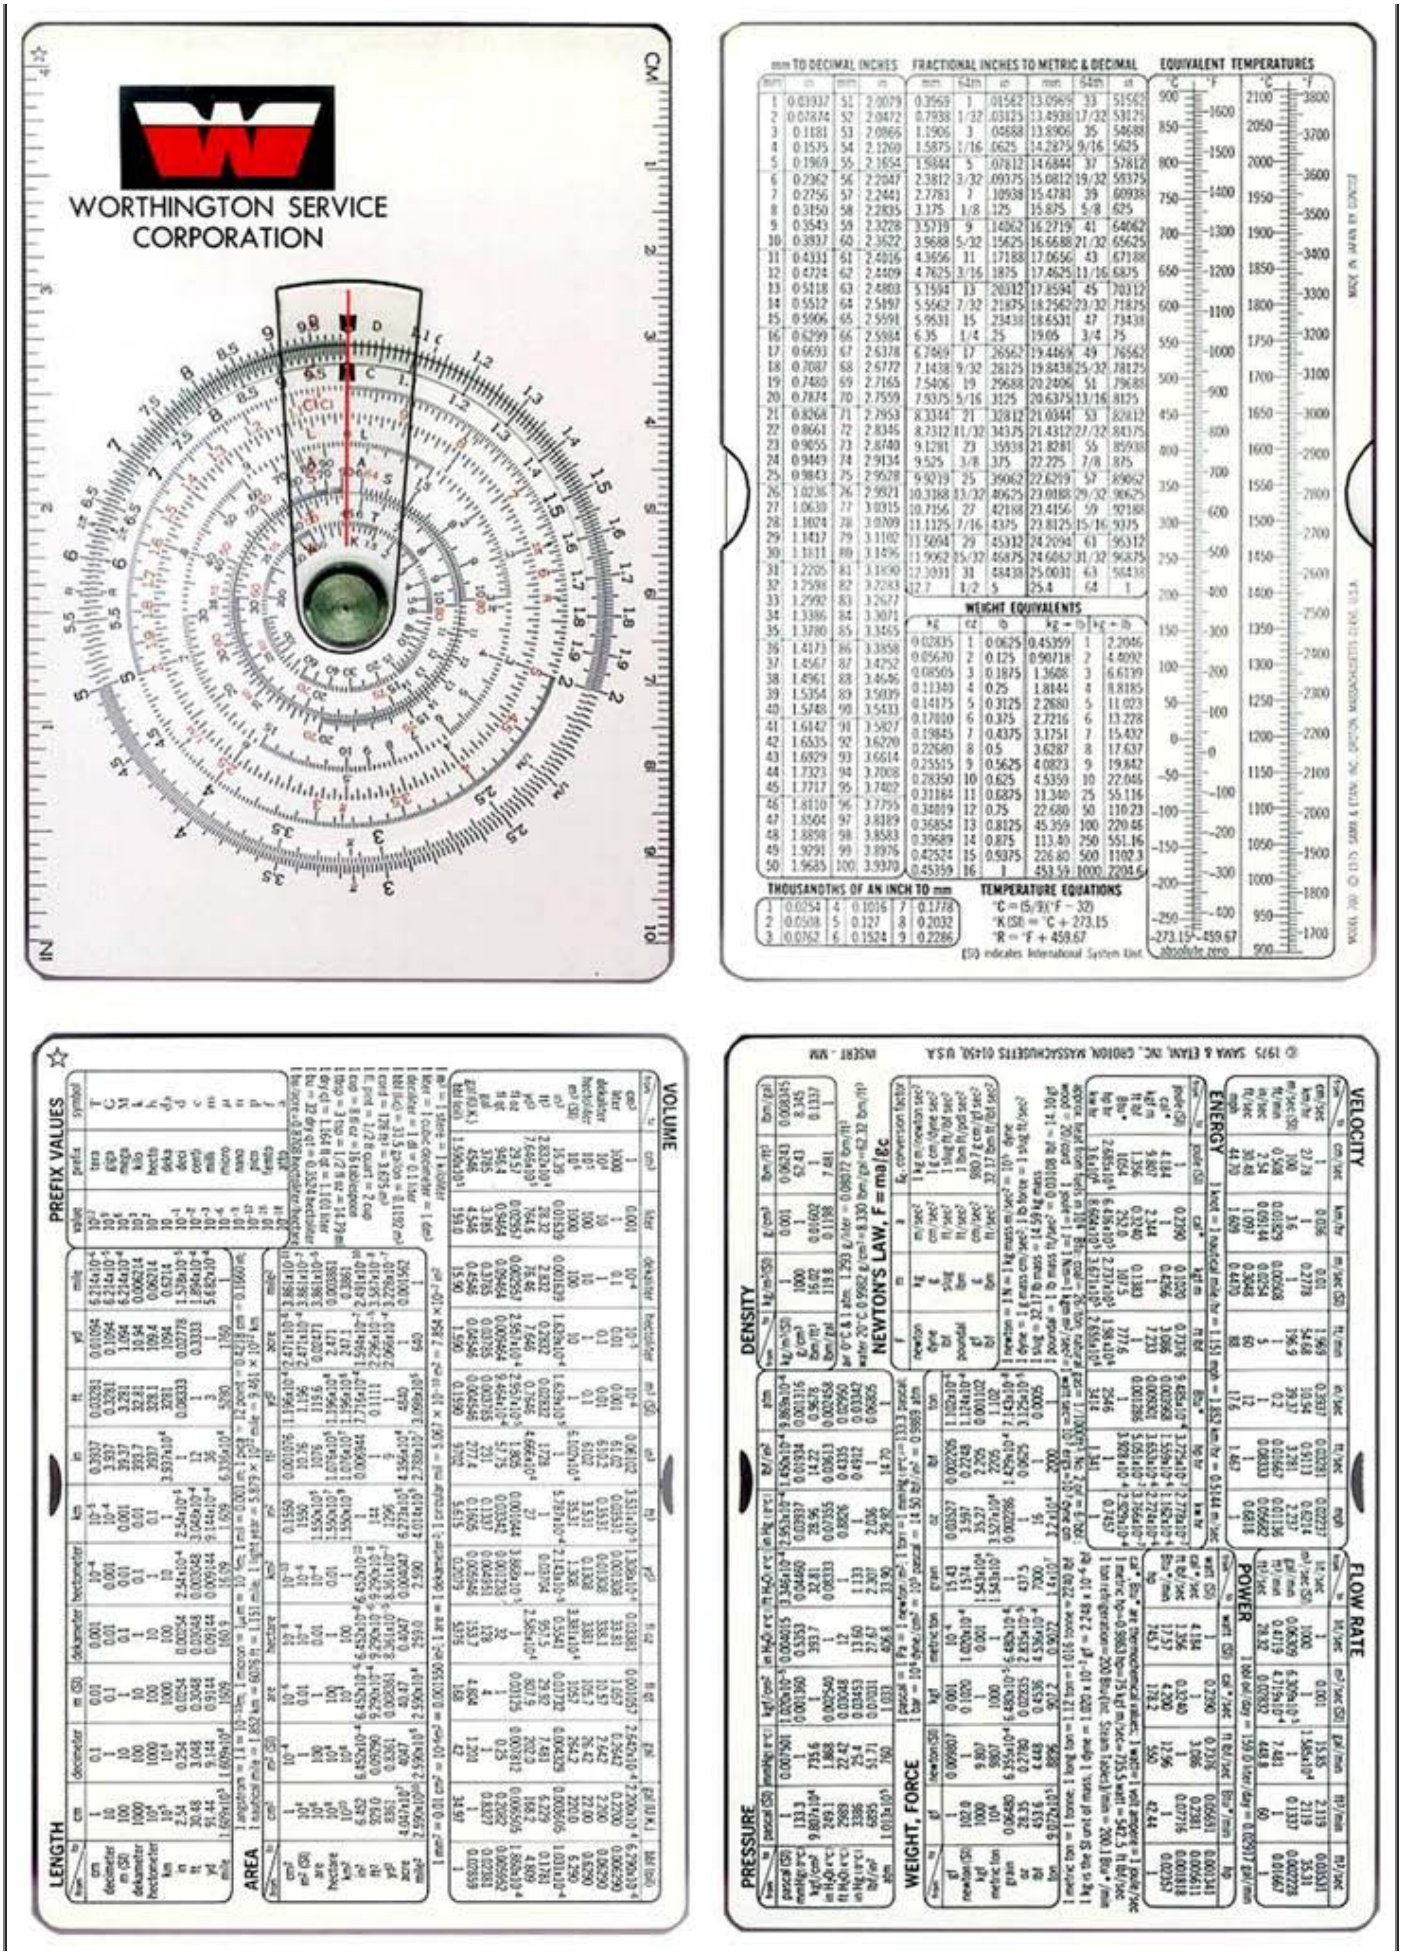
> Quote:
>
> but by the time I entered high school in 1977, absolutely no one (students or teachers) used them.

I also entered high school in '77. In 11th grade chemistry ('79-80), we were required to use slide rules -- no calculators allowed. It was the last year of that policy. I was one of only two kids in the school who had a circular slide rule.

It was a cheap promotional slide rule (Concise Model 700-MM) but I really liked it. It had an insert with lots of conversion factors with cm & inch rulers down the sides. Unfortunately, I left it on the back dash of the car once and it warped such that the numbers no longer lined up properly.

It looked like this picture, but had "Compliments of Allied Chemical Corporation."



WORTHINGTON SERVICE CORPORATION
CM
IN

Re: Slide rule

*Message #14 Posted by **Derek Walker (UK)** on 10 Oct 2011, 2:53 a.m.,*
in response to message #13 by Wes Loewer

If you want to replace it, Concise 700MM slide rules are still available new, although only a small quantity and therefore not 'cheap' any more:
http://www.sphere.bc.ca/test/circular.html#catalog
and scroll down about half way.
I bought one last year, and it's very handy to keep in a pocket for quick unit conversions - often quicker than colleagues can do them on a calculator.

in response to message #10 by David Hayden

When I was 16 on the Logarithms chapter, in the Maths book, there was a part explaining how a slide rule works, but it was skipped by the teacher. As a curiosity I read it. A year later I found a Faber Castell 67/87 slide rule and bought it for around $7. Next year at university we found another 67/87 but the size of the one on the photograph, at a warehouse room with slide projectors, mobile blackboards, and similar. Later I tried to get it but have already disappeared.

*Message #20 Posted by **Paul Berger (Canada)** on 7 Oct 2011, 2:37 p.m.,*

in response to message #19 by bill platt

In the mid 70's when I was in high school I took a class called "Strength of Materials" that involved a lot of calculations related to loads. Even though there was some early hand held calculators available we where not permitted to use them, but had to learn to use a slide rule which I still have and can still do basic calculations on it. Our instructor did not feel that calculators where reliable enough for field work.

In practical terms, not quite yet. Individuals would have been hard pressed to spend so much $ on a calculator back then. I got my first scientific calculator in 1978. At $250, it was a big purchase even then.

The HP-35 I got going into grad school would have made my K+E Log Log Duplex Decitrig obsolete if the slide rule hadn't been destroyed by fire. I used insurance money from the fire to pay for the HP-35.

I too was on the trailing edge of slide rules and was the last in my school to still use one (no battery failures for me!).

Alas, I moved over to an HP-25 and largely stopping using my Aristo-Studio No. 0968 upon entering university in '76.

BTW: Here is a virtual slide rule you can use if you can't locate your trusty old friend: here

Re: Slide rule - Sample Here...

*Message #27 Posted by **bill platt** on 7 Oct 2011, 11:06 p.m.,*
in response to message #26 by Neil Hamilton (Ottawa)

I may have been the last slide rule user in my school, too. In fall 1983, dropped my 11c and broke it. While it was in Corvallis getting repaired, I borrowed a slide rule during a physics exam.

So not only was I the only person, student or teacher, with an HP, I was also possibly the last to use a slide rule! Paradoxical! :-)

I keep getting a Fatal error with SAM-BA v.2.10

*Message #1 Posted by **Eddie W. Shore** on 7 Oct 2011, 9:05 a.m.*

I keep getting a Communication Error regardless which USB port I put the cable with the adapter.

There is no place to find SAM-BA v.2.09 on AMTEL's website.

I also can't get MySamba to "find" a connection port.

Now I probably have a dead calculator with no hope of ever bringing it back.

Edited: 7 Oct 2011, 9:06 a.m.

That's strange. Does the adapter register in Windows? Do you see it in device manager?

Re: I keep getting a Fatal error with SAM-BA v.2.10

*Message #3 Posted by **Eddie W. Shore** on 7 Oct 2011, 9:16 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Not at first. Windows recommended me a web driver which I installed. It did not work. I'll try it from the CD and see what happens.

The USB to Serial Adapter I am using an Aluratek one (AUS100)

Update: The CD was absolutely no [insert bad words here] help! I doubt the CD even had the driver to begin with. Now I am trying the Aluratek website. If that doesn't work - it's going back to Staples for a refund (if I can get one).

Update #2: After reinstalling the Aluratek driver again, I restarted the computer. Then I get an "Installing device driver software" message, and taking a long time do so, I finally get a success (COM 4). Running SAM-BA, I select com4 and nothing happens. So I try running it again, and get only com3 (which I was unsuccessful before).

I plug the cord in another port - it is COM 5. So I run SAM-BA again and nothing happens.

I am running Vista and it supposed to work on Vista.

MySamba doesn't read the port at all.

I am so frustrated - it worked when someone else does it. (The next computer I buy will be a Mac - I am getting sick of Windows)

in response to message #3 by Eddie W. Shore

> Quote:
>
> The USB to Serial Adapter I am using an Aluratek one (AUS100)

i've downloaded the drivers from the Aluratek website and can confirm they are for a Prolific PL2303 chip, driver package v130.

it is likely that ALL the problems you are seeing are related to the drivers you have downloaded and the PL2303 chip. many of these chips are chinese forgeries (it happens to be a chip that is easy to duplicate), and the current bug-free prolific drivers will detect a fake and refuse to install - hence only outdated prolific drivers will work. also, the PL2303 itself (even genuine ones) requires external level

shifters to drive RS232 correctly, which many adaptors lack.

bottom line - all hope was lost once you walked out the staples store. return the USB/serial adaptor and buy one that uses anything other than a prolific PL2303 chip.

Re: I keep getting a Fatal error with SAM-BA v.2.10

*Message #13 Posted by **Eddie W. Shore** on 7 Oct 2011, 11:14 p.m.,*
in response to message #12 by robert rozee

I noticed the PL2303 chip on the two that I bought. I'll have to go on a mission to find such a cord (maybe Fry's? Best Buy?).

Thanks, Robert.

Marcus, one way or another I am going to get the calculator to work again - I can't wait to try out those matrix functions... even if I have to buy one from you.

> Now I probably have a dead calculator with no hope of ever bringing it back.

Eddie,
I am sure that there is hope to bring it back. If worse comes to worse, I'll bet that lots of people would volunteer to re-flash it for you. I'd be happy to do so, but there is probably someone within reasonable driving distance who could do it for you. Of course, getting it to work yourself would be ideal. I have a Vista machine that I keep meaning to try it on. I bought an EasySYNC ES-U-1001-R10 USB to serial converter which is supposed to work and have drivers for Vista. I'll let you know if I have success.

Did you remove the batteries from your 30b? If I recall correctly, it runs at high power and won't shut itself off once it is erased.

Re: I keep getting a Fatal error with SAM-BA v.2.10

*Message #15 Posted by **Eddie W. Shore** on 7 Oct 2011, 10:30 a.m.,*
in response to message #14 by Jeff O.

I tried on my 20b, in the worst case scenario that it didn't work. At least I have working WP 34 on the 30b.

I will see if I can find the cord you suggested, Jeff. Pleaser let us know what happens.

And the batteries were taken out after the failed attempts.

Thanks for your help, guys. I am sorry I can't report better news.

*Message #16 Posted by **Marcus von Cube, Germany** on 7 Oct 2011, 10:50 a.m.,*

in response to message #15 by Eddie W. Shore

You should still use a DMM to check the battery voltage or swap the batteries with your 30b (after doing a ON+STO of course!)

Re: I keep getting a Fatal error with SAM-BA v.2.10

*Message #17 Posted by **Howard Owen** on 7 Oct 2011, 11:59 a.m.,*
in response to message #15 by Eddie W. Shore

You may have several layers of driver cruft from multiple installations. Try removing all the USB serial ports with device manager, rebooting and reinstalling. Vista has an XP mode too, if I remember correctly.

Having said all that, I think Marcus knows what he's talking about with respect to the chipset. In any case you should try to clean out the old ports before trying to install a new driver for the new cable.

Re: I keep getting a Fatal error with SAM-BA v.2.10

*Message #18 Posted by **Jeff O.** on 7 Oct 2011, 3:54 p.m.,*
in response to message #15 by Eddie W. Shore

Eddie,
I was able to successfully flash a 20b on my Vista PC. Here is how I did it:
1. bought an FTDI ES-U-1001-R10 USB to RS232 adapter. I bought it direct from FTDI, cost about $30 shipped. I did this several weeks ago.
2. I did not use the installation CD that came with the converter because it did not list Windows Vista (or XP) on the instruction card that came with it. It said "For other O.S. and later driver releases, go here": http://www.ftdichip.com/Drivers/VCP.htm, so I did. Then I clicked on the setup executable link over in the comments section for Windows operating systems, and let it install the drivers.
3. Then I plugged in the USB to Serial converter, and windows told me that it successfully installed the drivers for my device and told me it was COM10.
4. Went to sourceforge and downloaded the latest bin file and Marcus' new version of MySamBa
5. Connected the cable to my 20b, and did the sequence of button pushes* to get it ready for flashing.
6. Started MySamBa. Nothing in the COM port dropdown. Crap. Stopped MySamBa. Started again, same result.
7. Right-clicked on the MySamBa.exe file and chose properties, clicked on the "Compatibilities" tab, and checked the box to run it in compatibility mode for Windows XP (Service Pack 2).
8. Started MySamBa - COM10 now availalbe in the dop down. Navigated to the bin file, clicked download, and successfully donwloaded the rom to my 20b.

If I can do this, anybody can because by-and-large, computers hate me.

* - Not sure if this is the official sequence, but what always works for me is as follows-
- turn calculator on
- plug in cable
- press and hold ON key on the calculator
- press and hold the Erase button on the cable
- press and release the Reset button on the cable
- release the Erase button on the cable
- release the ON key
- press and release the ON key
- click on download in MySamBa

...

Re: I keep getting a Fatal error with SAM-BA v.2.10

*Message #19 Posted by **Gerry Schultz** on 7 Oct 2011, 6:28 p.m.,*
in response to message #18 by Jeff O.

I got an ES-U-1001-R100 USB-to-Serial adapter from Amazon and it works for me under Windows 7 without any driver installation. SAM-BA 2.10 also installed without issue for me. Perhaps this worked so easily as it's an HP laptop :-).

Gerry

Re: I keep getting a Fatal error with SAM-BA v.2.10

*Message #20 Posted by **Eddie W. Shore** on 11 Oct 2011, 8:25 a.m.,*
in response to message #19 by Gerry Schultz

I have two Easy Sync cables coming this week. Thank you so much for helping me get my 20b back to life on Sunday, Gerry!

On a side note, my laptop is in defragmenting mode - it's been a day and a half ever since Sunday at 11 PM.

Re: I keep getting a Fatal error with SAM-BA v.2.10

*Message #21 Posted by **Eddie W. Shore** on 7 Oct 2011, 10:14 p.m.,*
in response to message #18 by Jeff O.

I don't know what's wrong with me, but nothing works. I am following the steps and the suggestions but for some stupid reason I still can't get a stupid connection - not with Samba, MySamba, not with one connector, or another one I bought at the bookstore. I must have downloaded the stupid driver three or four times. I even put new batteries and not even the ON+STO combo can't bring it back to life.

I'll try it on another computer - maybe I'll have better luck.

Thanks guys for your advice. When HP fixes the PSE bug, I hope I can get HP to swap two machines for my old ones.

Edited: 7 Oct 2011, 10:24 p.m.

Re: I keep getting a Fatal error with SAM-BA v.2.10

*Message #22 Posted by **Jeff O.** on 7 Oct 2011, 10:43 p.m.,*
in response to message #21 by Eddie W. Shore

Based on all I have read here, I suspect both of your USB to serial converters. Your best bet may be to find a Windows XP machine with a real serial port if you can.

When (if?) HP fixes the PSE bug, go over to Gerry Schultz's to reflash your 15c LEs.

Re: I keep getting a Fatal error with SAM-BA v.2.10

*Message #23 Posted by **Eddie W. Shore** on 7 Oct 2011, 11:04 p.m.,*
in response to message #22 by Jeff O.

Maybe I'll try at work (if I can get away with it...). Maybe I'll luck out and find a store that

actually sells a converter that works. Or have Gerry do it for me.

==========

HP: You really need make it so that the average dumb-behinds like myself can just plug in the calculator with a regular USB port without any adapters to update the software - like the 50g.

Re: I keep getting a Fatal error with SAM-BA v.2.10

*Message #24 Posted by **Howard Owen** on 8 Oct 2011, 1:55 a.m.,*
in response to message #18 by Jeff O.

Here's my recipe using SAM-BA.

By the way, I felt had to write this because the manual refers to another document for some important steps, then directs you back to itself for some others. I found actually trying to follow this with two PDFs open, one with very nice and helpful pictures that make the steps not fit on a single PDF page, was very difficult. There needs to be a canonical list of instructions in one place.

```
connect cable to PC and calculator
on the calculator/cable:
   press and release ON/CE
   Press and hold ERASE on the cable
   press and release RESET on the cable
   press and release ON/CE
   release ERASE on the cable
   press RESET on the cable
   press ON/CE
start SAM-BA on the PC
in SAM-BA:
   choose serial port and board at91sam7l128-ek
   press connect
   browse to the calculator image (calc.bin)
   press SEND FILE
   wait for the download to finish
   say "no" to the lock regions dialog
   in the scripts area, select boot from flash
   press execute
back on the calc/cable
     press RESET on the cable
     press ON/CE machine should start
     press [H] X.FCN to get the function menu
     press the 3 (V) key to jump to the VERS command.
     Press XEQ
Compare the version number to the expected one.
Marvel at the tiny "r" in Walter's name. :)
```

Choosing an HP-48 - Thanks

*Message #1 Posted by **E.Lub_EU** on 7 Oct 2011, 9:04 a.m.*

Dear all,

Please accept my apologies for not reacting earlier to your numerous and enlighting answers. I have unfortunately been kept away from this forum by more pressing matters.

All have been useful and I am still mulling over them, but I am now in a much better position to evaluate HP offerings of the time.
Thanks again.

Etienne

Re: Choosing an HP-48 - Thanks

*Message #2 Posted by **Peter Murphy (Livermore)** on 7 Oct 2011, 11:27 a.m.,*
in response to message #1 by E.Lub_EU

Etienne,

Back in the early 1990s there was discussion of the then-new 48G/GX, and of differences between them and the 48S/SX, that went into much more detail than the Forum responses to your question.

Yesterday I found a long item, "HP48 FAQ - Last-modified: 12/12/1994," which I think may give you more information you can use:

http://www.guzu.net/hp48/docs/hp-faq.htm

I would further note that there was little or no Forum discussion of reference materials that might help you explore the 48. I'd go for the 48G myself, and I'd start with the "HP 48 G Series User's Guide" and the "HP 48G series Advanced User's Reference Manual." Those might be enough.

But several non-HP books have helped me explore the 48G: in particular, four from Grapevine Publications, starting with "An Easy Course in Using and Programming the HP 48G/GZ."

Purchased as hard copies, all those books will cost as much as a 48G; some of them are available online, however, and perhaps others on the Forum can provide links.

Finally, I would note that I have had a lot of fun exploring problems provided by Project Euler; someone on the Forum recently said that he had solved about 100 of them, which I find very impressive.

Seconded. I've only just discovered the site and I'm trying to work my way through it on a 50g. I've done the first 10 so far. It's great fun.

Re: Choosing an HP-48 - Thanks

*Message #4 Posted by **E.Lub_EU** on 7 Oct 2011, 4:01 p.m.,*
in response to message #2 by Peter Murphy (Livermore)

Thanks for the link to the faq, Peter. I haven't gone though all of it yet, of course, but it looks really promising.

On this site I found an article from megarat listing serial numbers, ROM versions, etc. Most useful in my "pre-buying" situation.

Thanks for the tip about books. I have recently found some in French on Paul Courbis' site, but will try to get a glimpse at the one you suggested. I will also try to get a machine with its hardcopy documentation.

I will check Project Euler, but that might not be for beginners...

Thanks again!
Etienne

Re: Choosing an HP-48G; connecting to a Mac Power PC G4?

*Message #5 Posted by **Peter Murphy (Livermore)** on 8 Oct 2011, 1:47 p.m.,*
in response to message #4 by E.Lub_EU

Etienne,

If I were in your position -- at least if that position were in the USA -- I'd be interested in this TAS auction (Item number: 320769824633) for a 48G, two manuals (one of them perhaps the AUMF), and a cable (perhaps the original, if one were included in the original package).

I'd wonder if the cable would allow me to connect this calculator to my Macintosh Power PC G4. Can anyone tell whether that's possible, and if so how?

Thanks.

*Message #6 Posted by **Marcus von Cube, Germany** on 8 Oct 2011, 2:55 p.m.,*
in response to message #5 by Peter Murphy (Livermore)

The 48G speaks Kermit so it should be possible to find software to connect it to your Mac. You need a serial interface but a USB to serial adapter should do. You can download an X modem server instead which should make the connection even easier. The server is part of the Conn4x package (Windows only) so it might be necessary to connect the 48G once to a Windows machine to install it.

I'm pretty sure that the HP48G has XMODEM support in ROM... I've transferred code to my HP48GX using minicom and rzsz (X/Y/Z-modem support).

in response to message #7 by Raymond Wiker

I fondly remember the "good old days" when I connected almost every day my 48G to my Commodore Amiga, using a self-built serial cable and using only the information found on the user's manual (no such thing as Internet those days) and a standard Amiga xmodem software... :)

Cristian

X-modem is available in ROM but not as a complete server, just as XSEND & XRCV (or similar) for single objects.

HP15C LE arrived today in Austria, Europe

*Message #1 Posted by **Peter HOFMANN** on 7 Oct 2011, 7:55 a.m.*

It arrived in good shape, despite it was in an envelop. Luckily it must be one of the good ones: no rattling keys, all registering properly, self-tests passed with flying colors. In sum, a great looking calculator, rivaling the original one in my book.

Very good and reliable shipment by SC (Chris) ...

I'm happy ;-)

[WP 34S] New keyboard layout anybody? - Edited

*Message #1 Posted by **Marcus von Cube, Germany** on 7 Oct 2011, 6:38 a.m.*

With the matrix functions in place, we are discussing a modified keyboard layout at the moment. This would include giving the matrix functions their own catalog(ue), moving OFF to h+EXIT and some other rearrangements.

We have not yet implemented this because I opposed to any change that would render Eric's overlays obsolete. At HHC many units have been flashed to the present layout and we would run into trouble if a user without a cable would receive a (new) overlay which no longer matches his/her software or the other way round (old overlay with current software.)

I herewith kindly ask Walter to prepare one of the bitmaps so we can discuss the changes here and hope that the community will comment on this so we can finally decide what we'll do. The ideas are good but I fear the implications may not be worth the improvements. That's why I'm asking YOU, our audience.

Marcus

Edit: Having read the answers so far I'm leaning towards changing the keyboard, but not in a hurry. Let's discuss the proposed changes with a graphic from Walter in place and we go on from there.

Re: [WP 34S] New keyboard layout anybody?

*Message #2 Posted by **Alexander Oestert** on 7 Oct 2011, 6:52 a.m.,*
in response to message #1 by Marcus von Cube, Germany

I just ordered two overlays, so I am not very keen on having to order another set in the near future. But I also don't think it wise to stop development only because there are some overlays out. In the contrary I would hate to see further improvements stalled for this reason.

Would it be possible and reasonably easy to have the firmware in two versions from here on out? One working with the old keyboard layout the other one with a possible new one.

Edited: 7 Oct 2011, 6:53 a.m.

I would if I were able to, but I'm not. So I will just stick to the latest firmware that supports the old keyboard layout.

Re: [WP 34S] New keyboard layout anybody?

*Message #5 Posted by **Dan W** on 7 Oct 2011, 10:32 a.m.,*
in response to message #2 by Alexander Oestert

I just ordered 2 overlays too, so I'm not keen on it. But I suppose if the change affects a few keys, a "patch kit" would work well. I would do this rarely and accumulate all desired changes into one drop.

The other reason I'm not that excited is because there are two sets of calculator functions I do not use. One is the statistical functions, and the other is the matrix functions. Why?

In both cases, large amounts of data need to be entered. This is a lot easier in Excel than on a calculator, especially if the calculator does not have some PC interface, which is normally where the data is anyway. It is easier on data entry, checking, and it is easier to see & document the matrix or the statistical data set.

With statistical data, I also prefer to see the data graphically before I start curve fitting or parameterizing the distributions. Much safer that way. Anscombe's quartet is a good illustration of the reasons why.

I greatly appreciate all of the hard work and creativity that has gone into this. But is isn't going to bother me if these functions are a little harder to get to.

Re: [WP 34S] New keyboard layout anybody?

*Message #6 Posted by **Forrest Switzer** on 7 Oct 2011, 3:44 p.m.,*

Re: [WP 34S] New keyboard layout anybody?

*Message #10 Posted by **Dieter** on 7 Oct 2011, 7:40 a.m.,*
in response to message #1 by Marcus von Cube, Germany

There are essentially three or four things I would like to change:

- I really miss LastX. Yes, I know it an be done by RCL L, but for the same reason x<>y could be omitted since x<> Y works just as well. My suggestion: h ENTER = LastX and g ENTER = SHOW. This is consistent with other HP calculators. Move the CONST menu to h EXIT and put FILL in a catalog - it's almost exclusively used for programming anyway, and in manual calculations 3x ENTER does it just as well.

- I can't say why, but the arrangement of the log and exponential functions somehow seems "wrong" to me. I feel they should swap their positions, i.e. ln = f-shift and e^x = g-shift. The same way as sqrt is f-shifted and x^2 is g-shifted.

- Finally, I wonder if the || function on the divide key really is so important for everyday use that it justifies a valuable position on the keyboard. I am sure there are more useful functions that deserve this place. You may say that || "fits so nicely" on the divide key because all four functions on it are ..."division related". But this should be no reason for wasting this valuable position for a relatively exotic function that most users will not need for their daily manual calculations. I would suggest to put the XROOT function there. I consider this function far more useful for the vast majority of users than ||. If XROOT had been implemented earlier I am sure it already was somewhere on the keyboard now.

- The matrix functions should go to their own menu. The respective key could be h 0 which is now reserved for PSE. Since this functions is only used in programs anyway it can be moved to one of the other menus.

Dieter

Move the CONST menu to h EXIT and put FILL in a catalog - it's almost exclusively used for programming anyway, and in manual calculations 3x ENTER does it just as well.

I strongly disagree about getting rid of x<>y. It is the most frequently used stack manipulation function and deserves its central unshifted position on the keyboard. I agree about CONST and FILL, though. Put LastX on h ENTER in place of CONST.

Sounds reasonable to me.

Re: [WP 34S] New keyboard layout anybody?

*Message #13 Posted by **M. Joury** on 7 Oct 2011, 11:40 a.m.,*
in response to message #12 by Brian Walsh

I don't think that Dieter was suggesting that we should get rid of X<>Y. He was arguing *FOR* LASTx by using X<>Y as an example of another function that is accessible via another method and still exists on the keyboard. I am with him 100% here.

Cheers,

-Marwan

Re: [WP 34S] New keyboard layout anybody?

*Message #14 Posted by **Brian Walsh** on 7 Oct 2011, 12:56 p.m.,*
in response to message #13 by M. Joury

I understood but adamantly disagree with the concept of accessing x<>y by any other means than a single keystroke. x<> Y is completely unacceptable for such a frequently used function.

Re: [WP 34S] New keyboard layout anybody?

*Message #15 Posted by **M. Joury** on 7 Oct 2011, 1:05 p.m.,*
in response to message #14 by Brian Walsh

I don't think that anyone disagrees with that. X<>Y is fundamental to RPN and should always be in the primary plane.

Keyboard efficiency... lastX and X<>Y etc

*Message #16 Posted by **gene wright** on 7 Oct 2011, 9:54 a.m.,*
in response to message #10 by Dieter

h Lastx is the same number of keystrokes as RCL L but uses up another key location. I view that as a bad tradeoff. No gain in efficiency but losing a key position. I would vote against an hLastX change (as if my vote is worth much).

X<>Y however is a different story. Changing it to use x<> Y would now require three keystrokes instead of one. That's a lot of wasted time/effort to replace a VERY commonly used RPN function. Sure, it would free up a space on the keyboard, but at the expense of 2 extra keypresses. The RCL L vs. h LastX takes away a key location but saves no steps.

That's my view of that tradeoff.

This is Walter's baby, but I personally agree strongly with the RCL L and X<>Y choices.

Re: Keyboard efficiency... lastX and X<>Y etc

*Message #17 Posted by **Marcus von Cube, Germany** on 7 Oct 2011, 10:17 a.m.,*
in response to message #16 by gene wright

Gene, you are on my side. RCL L is a perfect replacement for LastX. It just should go into a Beginner's Guide: "Are you missing LastX from your trusty HP-25? Here it is: RCL L."

Are <(and)> really needed ?

*Message #18 Posted by **gene wright** on 7 Oct 2011, 10:57 a.m.,*
in response to message #17 by Marcus von Cube, Germany

I know they append an open or close parenthesis to Alpha, but are those symbols used enough to really take up two shifted key positions on the keyboard?

I'm merely trying to figure out some way to get the matrix menu on the keyboard and these are about the ONLY places where I would have any reluctance at all with functions placed.

Is there an alternative that could be done for (and) ?

Re: Are <(and)> really needed ?

*Message #19 Posted by **Egan Ford** on 7 Oct 2011, 11:47 a.m.,*
in response to message #18 by gene wright

They are also used to scroll the display in base 2 mode.

Use the || key for the matrix functions and you'll be able to keep the symbol too.

ALL, FIX, SCI, and ENG have to somehow be redundant and could be consolidated under yet another menu. E.g. DISP.

Re: Are <(and)> really needed ?

*Message #20 Posted by **Marcus von Cube, Germany** on 7 Oct 2011, 1:05 p.m.,*
in response to message #19 by Egan Ford

> Quote:
>
> ALL, FIX, SCI, and ENG have to somehow be redundant and could be consolidated under yet another menu. E.g. DISP.

We had that already. Being able to change the display format quickly is essential in every day use.

Re: Are <(and)> really needed ?

*Message #21 Posted by **Egan Ford** on 7 Oct 2011, 1:57 p.m.,*
in response to message #20 by Marcus von Cube, Germany

Really? Do you have any data to back that up? I only ask because I rarely change it. I am curious what others think. Perhaps you already did.

Perhaps its time for a fourth function/key. Can you register a double-click? :-)

Re: Are <(and)> really needed ?

*Message #22 Posted by **M. Joury** on 7 Oct 2011, 2:08 p.m.,*
in response to message #21 by Egan Ford

Has there been a previous discussion of SHIFT+HOLD?

I am with Egan here. While I agree that ALL, FIX, SCI, ENG are pretty fundamental I don't change them often and can live with these functions in a sub-menu as long as it has just those four options for quick access. Use one of the existing keys as a menu key and save yourself 3 keys for other uses.

Cheers,

-Marwan

Edited: 7 Oct 2011, 3:09 p.m. after one or more responses were posted

Perhaps FILL is a candidate for a menu?
*Message #23 Posted by **gene wright** on 7 Oct 2011, 3:02 p.m.,*
in response to message #22 by M. Joury

giving the matrix catalog a home instead?

Re: Perhaps FILL is a candidate for a menu?
*Message #24 Posted by **Egan Ford** on 7 Oct 2011, 3:17 p.m.,*
in response to message #23 by gene wright

On ENTER? I'd put LASTx there before MATRIX.

From the manual:

> Quote:
>
> If you know how to deal with a good old HP RPN scientific calculator, you can start with your WP 34S right away.

Walter needs to append, "unless you are looking for LASTx, then continue reading this manual."

IMHO, LASTx is fundamental to all RPN calculators.

I still say, use || for matrix--no need to change overlay.

Re: Perhaps FILL is a candidate for a menu?
*Message #25 Posted by **svisvanatha** on 7 Oct 2011, 3:33 p.m.,*
in response to message #24 by Egan Ford

It seems to be consistent, a Catalog should be h-shifted.

Re: Are <(and)> really needed ?
*Message #26 Posted by **Marcus von Cube, Germany** on 7 Oct 2011, 4:21 p.m.,*
in response to message #21 by Egan Ford

Double click isn't possible. Why I change the display format? Because I prefer ALL over any FIX format but sometimes want to watch a result in a different format.

Re: Are <(and)> really needed ?
*Message #27 Posted by **David Persinger (US)** on 7 Oct 2011, 4:25 p.m.,*
in response to message #26 by Marcus von Cube, Germany

Re: Are <(and)> really needed ?
*Message #28 Posted by **Paul Dale** on 7 Oct 2011, 7:21 p.m.,*
in response to message #18 by gene wright

They scroll the display in integer mode (in any base not just binary). They are essential to have on the keyboard for integer work.

The parentheses are a bonus because the graphics turned out nicely. If they didn't, the parentheses would have ended up in one of the symbol alpha catalogues instad.

Re: Keyboard efficiency... lastX and X<>Y etc

*Message #31 Posted by **svisvanatha** on 7 Oct 2011, 10:22 a.m.,*
in response to message #16 by gene wright

I am OK with the choices as well.

I will point out that RCL L for LastX is non-intuitive (although well documented in the manual). I am not aware of any previous HP calculator that did not have a shifted key position for LastX. If the layout is being reconsidered, I would ask the Trinity to give thought to:

```
1. moving CONST to a numeric position and making h-ENTER to be LastX.
One reason Walter gave [1] for CONST being h-ENTER was that it was the only key wide enough for the
'CONST' lettering.
Seeing how STATUS occupies the h-[*] key, it certainly is possible to move CONST to say h-[0], and
move PSE to a catalog.

2. Matrix catalog could be h-[6], and move L.R. to its respective catalog.
```

No demands here! Just a few suggestions. In any case - many thanks for all your work.

Re: Keyboard efficiency... lastX and X<>Y etc

*Message #32 Posted by **Marcus von Cube, Germany** on 7 Oct 2011, 10:35 a.m.,*
in response to message #31 by svisvanatha

I don't use LastX often so I may not be the most credible person here but I'm still against duplicating RCL L on a key by itself. As already pointed out the number of key presses is identical and you will certainly have to read the manual in parts to make any use of your WP 34S so it's not asking too much for learning this once.

Re: Keyboard efficiency... lastX and X<>Y etc

*Message #33 Posted by **Dieter** on 7 Oct 2011, 10:54 a.m.,*
in response to message #16 by gene wright

For the record: the x<>y example was only for "illustration purposes". Of course I do not want to get rid of a dedicated x<>y key. But for the same reason I would prefer LastX that's called "LastX". ;-)

Re: [WP 34S] New keyboard layout anybody?

*Message #34 Posted by **E.Lub_EU** on 7 Oct 2011, 9:41 a.m.,*
in response to message #10 by Dieter

Dieter,

> Quote:

> Finally, I wonder if the || function on the divide key really is so important for everyday use that it justifies a valuable position on the keyboard

It does !!!! This is an *invaluable* function to have on the keyboard for EE's work.

Note that while doing analog design, it is used daily in keystroke mode, and is then as useful as sqrt, x^2, trig and exponential functions.

I was initially puzzled by the glyph used (||), but I was really thrilled when I discovered that it was the "parallel" function. I cannot comment for other engineering/science fields.

So, unless there is another way to keep it easily accessible, or if the trinity decides differently, I would strongly argue for it being kept on the keyboard. I am agnostic regarding its position, though.

Etienne

Re: [WP 34S] New keyboard layout anybody?

*Message #38 Posted by **M. Joury** on 7 Oct 2011, 11:12 a.m.,*
in response to message #10 by Dieter

I like these ideas. The problem is that each of us have different requirements. For example I would choose to replace || with %T (or at least find some other location for %T on the keyboard since I use it a lot). On my machine I have written a tiny program that executes %T and has the label A so it can be run directly.

Anyway, and I know that I have brought this up before, a fully implemented re-assignable keyboard would make everyone happy. Then Eric could throw in a few blank labels with his keyboards)or in my case I could simply use some leftover labels from my HP-41's) and we could all be happy. I have intended for quite some time to take a look at the code and see what it would take to implement some of the ideas I have put forward but unfortunately life continues to get in the way.

But to answer the question of what to do with all the keyboards already out there... I just ordered 4 overlays from Eric and as far as I am concerned I really don't care if I have to order another 4 or 8 or whatever it takes to get to where this calc is going. I certainly don't want to hold up improvements because of an existing base. After all, isn't this how legacy design gums up the wheels of progress?

Just my $0.02 worth.

Cheers,

-Marwan

Re: [WP 34S] New keyboard layout anybody?

*Message #39 Posted by **Paul Dale** on 7 Oct 2011, 7:29 p.m.,*
in response to message #38 by M. Joury

As assignable keyboard is out of the question. We have one single solitary *bit* of non-volatile RAM free a the moment. Key assignments are impossible in so little space.

How much space would they require? To allow an assignable keyboard, we'll need a *minimum* of two bytes for each assignable position. So 34 * 4 * 2 = 272 bytes at least. We have exactly 2048 bytes in total for all preserved state -- registers, programs, user settings, everything.

Adding an assignable keyboard will consume way too much memory for this little device.

We've discussed this possibility several times and it always comes down to not enough RAM to do it properly.

- Pauli

Re: [WP 34S] New keyboard layout anybody?

*Message #40 Posted by **Steve Simpkin** on 7 Oct 2011, 7:53 p.m.,*
in response to message #39 by Paul Dale

Just a reminder that you can use Keyboard Codes (see page 86 of the Edition 2.1 Owner's Manual) to assign many of the WP 34s keys to a program. The extra step of pressing XEQ before the key is a reasonable alternative to an assignable keyboard IMHO.

Re: [WP 34S] New keyboard layout anybody?

*Message #41 Posted by **Marcus von Cube, Germany** on 7 Oct 2011, 10:37 p.m.,*
in response to message #39 by Paul Dale

The only way to do it would be to do a specialized label search and execute a (short) program for each assigned key. The remaining bit would then be the "User Mode" toggle. The assignments may go to a library page if desired.

Re: [WP 34S] New keyboard layout anybody?

*Message #42 Posted by **M. Joury** on 7 Oct 2011, 11:04 p.m.,*
in response to message #41 by Marcus von Cube, Germany

I was thinking about just such a solution but hesitated to mention it since I have not had time to delve into the code at all. This would definitely work for me as at least a partial solution that meets most of my requirements.

Cheers,

-Marwan

Re: [WP 34S] New keyboard layout anybody?

*Message #43 Posted by **Steve Simpkin** on 8 Oct 2011, 2:00 a.m.,*
in response to message #41 by Marcus von Cube, Germany

Building on this idea... How about a USER mode where pressing a key (other than the shift keys) will perform a label search for LBL 'k[key code]'. If the label exists, execute the program, else perform the default key function. For the shift keys, on the next key pressed, perform a search for LBL 'f[key code]', 'g[key code]' or 'h[key code]', depending on the shift key that was pressed.
While not as elaborate as the HP-41C key assignment system, it produces four planes of user defined actions while only using 1 bit of RAM. Just thinking out loud.

Re: [WP 34S] New keyboard layout anybody?

*Message #44 Posted by **Marcus von Cube, Germany** on 8 Oct 2011, 7:04 a.m.,*
in response to message #43 by Steve Simpkin

This is not the worst idea one can have. The changes to the code would be minimal. We just need a USER key.

Re: [WP 34S] New keyboard layout anybody?

*Message #45 Posted by **Steve Simpkin** on 8 Oct 2011, 2:38 p.m.,*
in response to message #44 by Marcus von Cube, Germany

A USER key (non assignable of course) and an annunciator of some kind. Of the fixed symbols in the display, I don't see the small equals sign or the small down arrow being used for anything in the manual (unless I missed it).

Re: [WP 34S] New keyboard layout anybody?

*Message #46 Posted by **Marcus von Cube, Germany** on 8 Oct 2011, 2:58 p.m.,*
in response to message #45 by Steve Simpkin

You missed it. ;) Both have a use: = denotes any power eating state such as waiting for a serial connection or debug mode. Down arrow denotes alpha lower case mode. Before you ask: The large = is tied to flag D. It might be possible to display a small u in the alpha display to indicate user mode.

Re: [WP 34S] New keyboard layout anybody?

*Message #47 Posted by **Steve Simpkin** on 8 Oct 2011, 6:11 p.m.,*
in response to message #46 by Marcus von Cube, Germany

If I could remember what I had forgotten, I could have looked it up :)
If a small u in a corner of the dot matrix display would not be too complex to implement, that should suffice. For the User key, perhaps a shifted plane of the Exit key or a shifted plane of a shift key (as is being discussed in this thread) could be used?
There is not much in this little machine that you three haven't used already. I am still awestruck be the huge (and growing!) feature set.

Re: [WP 34S] New keyboard layout anybody?

Flag A :-)

> Quote:
>
> It might be possible to display a small u in the alpha display to indicate user mode.

Again this is hard that it appears -- the status line is character based not graphical. So we need a character for the symbol (which we have) and then everything needs to be realigned properly (which is painful). That is assuming there is space in the line for this -- it is pretty busy already.

Re: [WP 34S] New keyboard layout anybody?

*Message #49 Posted by **Dominic Richens** on 8 Oct 2011, 7:58 a.m.,*
in response to message #43 by Steve Simpkin

hey that's funny Steve, I was looking at the code for how to do something very similar, but I like your idea

better.

Sometimes I don't want "A" to run LBL"A", for example. I wanted to be able to turn off that feature and just do XEQ A but otherwise do Sigma+. I found the place in the code to do that top row functions regardless of the LBLs.

I was looking at adding a USERON, USEROFF to the MODE catalog and using one of those last free bits of non-volatile RAM.

Now for what you are suggesting, having something on the MODE catalog would of course impose restrictions (e.g. LBL h05 couldn't be used).

The other thing I wanted to change with the MODE catalog was adding a * or underlining the modes that are currently active.

Re: [WP 34S] New keyboard layout anybody?

That's a really hard thing to accomplish given the current code base. :-(

Re: [WP 34S] New keyboard layout anybody?

*Message #51 Posted by **Dominic Richens** on 8 Oct 2011, 1:25 p.m.,*
in response to message #50 by Marcus von Cube, Germany

I wouldn't say hard, just not elegant.

I think I counted 26 of the entries were "toggles", so I would use a function with a rather long case statement, called from catcmd(), with a case for certain op_codes and append a * depending on the appropriate UState member value.

How are we for text segment space?

Re: [WP 34S] New keyboard layout anybody?

*Message #52 Posted by **Marcus von Cube, Germany** on 8 Oct 2011, 3:01 p.m.,*
in response to message #51 by Dominic Richens

This would be *very* demanding on flash space. If you want to know how much is left look at the summary.txt file on the realbuild folder.

That is about right - 124 bytes. We're trying to reclaim some code space & have been doing so for a couple of months. All the low hanging fruit have long since been collected.

Your idea is sound and positive, it just won't fit.

The last bit actually. There is only one. We're going to have to be very very careful about using it.

All of the commands hidden by A, B, C & D are available elsewhere on the keyboard. I've almost stopped using the hot keys are shortcuts.

Re: [WP 34S] New keyboard layout anybody? And partitioning program memory.

*Message #56 Posted by **M. Joury** on 7 Oct 2011, 11:00 p.m.,*
in response to message #39 by Paul Dale

Yes, I remember that discussion. The basic HP41C has 441 bytes, the HP41CV/CX have 2,233 bytes and they make it work by allocating RAM out of available memory. I understand that the manipulation of memory adds complexity and potential bugs so all I am saying is that it is not completely unfeasible.

There are two features that I deem essential in any machine that is going to replace my 41 or my 48 series machines. In order of importance to me the first is partitioned programs whereby non-alpha labels are local within a program and the second is a fully customizable keyboard (this and the lack of I/O were the only things that kept the 42S from being the perfect calculator). I use my calculators more to write small utility programs and simple arithmetic rather than complex math. The problem with all labels being global is a big issue for me and though the WP34S has some ways to handle this that other calcs don't it will never replace my 41 and my 48 type machines until it offers local labels.

Don't get me wrong. This is a *GREAT* calculator, it just does not meet my requirements for a day-to-day workhorse in its current form. I am using it and I am enjoying it but it has not become my go-to calculator as I hoped it might.

Cheers,

-Marwan

V3, if ever being created on the same hardware, will definitely have an END statement and a more elaborate scheme of putting programs in flash.

Re: [WP 34S] New keyboard layout anybody? And partitioning program memory.

*Message #58 Posted by **Paul Dale** on 8 Oct 2011, 7:12 p.m.,*
in response to message #57 by Marcus von Cube, Germany

I would consider this very unlikely however. There is more capable hardware being developed now. E.g.

OpenRPN, DIY RPN, DM 15CC. We'd almost certainly use one of these platforms for our next project.

The 30b is fine and when we started it was really the only thing available (and in many ways it still is), however the screen is very limiting and the amount of RAM is tiny. The flash space is also becoming a limiting factor which wasn't something I thought we'd have big difficulties with.

- Pauli

Re: [WP 34S] New keyboard layout anybody? And partitioning program memory.

*Message #59 Posted by **Walter B** on 9 Oct 2011, 5:19 a.m.,*
in response to message #58 by Paul Dale

I'm with Pauli in this matter. In fact, the 20b was the only suitable repurposable calculator the time we started with the 34S. But while progressing, we found the 20b contains some very rigid limits: keyboard, display and memory. Keyboard was overcome with the 30b eventually, but the breathtaking display limits the UI most obviously still ;-) So anything going beyond the WP 34S will definitively need a more modern LCD, allowing softkeys - hey, that was possible 25 years ago already, it must be possible in 2012 as well and better!

Ceterum censeo: HP, launch a 43S (and if you stubbornly refuse to, the community is going to do it the old HP way).

Walter

in response to message #59 by Walter B

If you ever do a follow-on calculator, I hope you'll do reassignable keys and have the keys display their function briefly when held down like the 41C. This means the function executes when the key is released, not when it's pressed.

This whole thread shows the value of reassignable keys. Everyone has their favorite functions and everyone has functions that they never use. With reassignable keys, Your Favorite Functions are never more than a couple of clicks away.

No need for ASN if we delegate it to some labels in program space. Just a user mode setting (maybe a flag?) is needed.

Re: [WP 34S] New keyboard layout anybody? And partitioning program memory.

*Message #63 Posted by **M. Joury** on 10 Oct 2011, 7:08 a.m.,*
in response to message #62 by Marcus von Cube, Germany

Hi Marcus,

For now that would be a great solution but in the future (next generation?) a true ASN function would definitely be a better solution. for one thing that would allow assigned keys to be used during programming. With my HP-41 I had a keyboard layout I used for day-to-day stuff and another that I used when programming the calculator.

Cheers,

-Marwan

Re: [WP 34S] New keyboard layout anybody? And partitioning program memory.
*Message #64 Posted by **Paul Dale** on 10 Oct 2011, 7:28 a.m.,*

We effectively have an END statement at the end of each flash block (and main RAM). That's 6 - 8 programs each of which can be up to 506 steps long and they can have multiple alpha labels each. There are 100 local labels in each so every fifth statement can be a label -- that should be sufficient for most things. If it isn't we've back and skip as well.

Pauli, I'm just thinking of flash regions of arbitrary length. The internal logic would remain pretty much the same.

Re: [WP 34S] New keyboard layout anybody? And partitioning program memory.
*Message #68 Posted by **M. Joury** on 10 Oct 2011, 7:14 a.m.,*

in response to message #66 by Paul Dale

True, but the issue is that I then have to decide what programs go where when developing them and then never move them around or place two programs with the same labels in the same space. This is the real issue since for any given program or limited set of programs I can definitely assign labels accordingly. It is not the lack of labels that is the problem but the fact that any two sharing a "region" have to have different labels and with lots of small utility programs (the way I use my calculator) it is not always possible to plan ahead as to what goes where.

Cheers,

-Marwan

Re: [WP 34S] New keyboard layout anybody? And partitioning program memory.

*Message #69 Posted by **Paul Dale** on 10 Oct 2011, 7:26 a.m.,*
in response to message #68 by M. Joury

I know where you're coming from here and I too tend to use the device in a similar manner -- except when I'm editing and debugging. I've still not had a problem with clashing labels. Generally, I use a block of ten labels for each program. Worst case I switch to run mode and GTO xx to see if a label is already defined.

With the assembler, it is quite possible to off load programs and reload them with SKIP/BACK automatically added -- no labels now.

Anyway, it is very unlikely we'll implement program partitions on the device as it. I've said this many times already, it really isn't as easy as people are making it out to be. If anyone disagrees, please download the sources and implement it. Then I'll have a look and figure out where you got it wrong :-) I'd love to be shown to be mistaken here BTW.

Well Pauli, since I'm not a C-programmer I'll definitely not implement it into your sources, but I've already explained long time ago how such an END could be implemented very easy and without needing many bytes:

1) add the new statement END and a new opcode for it
2) the 'code' for this END (i.e. when a running program comes to such an END) is just the same as for RTN - you could even make it simply jump to the RTN routine, so almost no new code would be needed
3) when a program reaches a GTO nn or XEQ nn (with nn=00..99) it should just look for this LBL nn not in the complete current flash region but just down to the **next** END statement, and when the LBL nn is not found then start searching it again beginning from the **previous** END statement.
In other words: since now an END is separating different programs, the 'search-for-label' routine should just search **within** the current program instead of the complete flash region.
The only real changes which would be required for this are in this 'search-for-label' routine, and I think these changes would neither be difficult nor cost many bytes.

And with this kind of END implementation you could even simplify the command for clearing a single program - again: just clear the current program between the previous and the next END.

*Message #76 Posted by **M. Joury** on 10 Oct 2011, 9:51 a.m.,*
in response to message #73 by Paul Dale

No, I believe that I brought it up. And it was a comment on how I used the calculator. I already understood that we would not be seeing this in the current implementation. This was more than anything a future wish list to make the next generation all that it can be and so I mentioned the two features that I miss most from the HP-41.

It looks like we might get a partial implementation of one of those features and that is great but I didn't intend to start a battle over this. Being a developer myself I have heard more often than I care to count how "easy" something would be to implements without the requester having any idea about the internal complexity. My favorite (not exactly the same scenario) was when a UI "expert" told me he did not like a screen layout and that I should change it. When I asked him what he wanted he said "Just change it and I'll let you know if I like it". I threw him out of my office!

Cheers,

-Marwan

*Message #78 Posted by **Paul Gaster** on 7 Oct 2011, 7:52 a.m.,*
in response to message #1 by Marcus von Cube, Germany

I say keep moving forward and create a new layout. The overlay is only obsolete if a person wants the new firmware, which some may not. Some are/were happy as is. You also gave warning about a potential change over a week ago, maybe even longer, so this is not a huge suprise.

Re: [WP 34S] New keyboard layout anybody?

*Message #79 Posted by **Cristian Arezzini** on 7 Oct 2011, 8:46 a.m.,*
in response to message #1 by Marcus von Cube, Germany

I'd say, don't stop new ideas just because there are a few overlays around. Who flashed at HHC and doesn't have a cable will be unable to reflash the calculator anyway. Maybe Eric could stock a few of the old layouts as well as the new ones; so who has the cable and wants to be up-to-date can buy the new layout, while the others can order the older version. This seems to me much less trouble than maintaining two separate firmwares. And buying a new overlay every so often isn't a huge deal, they're rather cheap anyway...

Cristian

Since Gene was kind enough to offer me a cable, I'll offer to reflash anyone's calculator for the cost of postage.

Re: [WP 34S] New keyboard layout anybody?

*Message #81 Posted by **svisvanatha** on 7 Oct 2011, 8:46 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Well, this is a developing project, so course corrections like this are expected. I think maintaining multiple versions of the firmware is a bad idea. It is hard enough for the 34S 'Trinity' to spend the time that they do on this project. Asking for multiple versions is a a burden on their free time.

I am wondering if it is possible for Eric Rechlin to create an 'update package' for those with the current layout. It would include new key labels for those keys where the h-shifted function have changed, and small labels to be placed on the existing overlay for places where the f- and g-shifted functions have changed. This would limit the cost to existing users in migrating to the new layout. New users could then purchase the full overlay kit from him.

In the end though, I think we all have to realize that the Trinity has spent more time and money than any of us on this. I am fully willing to spend another $5 on an overlay.

Re: [WP 34S] New keyboard layout anybody?

*Message #82 Posted by **Marcus von Cube, Germany** on 7 Oct 2011, 9:09 a.m.,*
in response to message #81 by svisvanatha

Changing the keyboard layout is a lot of work, so I'm not keen on it except there are very good reasons to do so. Here are some points:

1. Walter needs to provide the actual layout in a form suitable for the manual: non-trivial mental work to get it consistent.
2. The layout has to be applied to the three BMP graphics for the emulator: tedious pixelwork.

3. Eric has to the same on his overlay file: even more tedious pixelwork.
4. The keyboard driver has to be rewritten to accommodate the new layout: non-trivial programming exercise.

I've a few more corrections in mind than what we have come up with until now, so I assume there will be discussions ahead. I vote for not changing the layout until this is all settled. Let's call it V3 then!

Re: [WP 34S] New keyboard layout anybody?

*Message #83 Posted by **Howard Owen** on 7 Oct 2011, 12:25 p.m.,*
in response to message #82 by Marcus von Cube, Germany

Changes to the keyboard will be fairly painful for those of us who have keyboards with the current layout. (I've ordered two additional overlays myself. Why is everyone doing that?) Nonetheless, WP34S is in beta. If a consensus of the developers emerges around changing the layout, in consultation with the user community, then the pain of upgrading shouldn't stand in the way.

I think it's amusing how you've opened Pandora's Box a little, Marcus. Putting the keyboard layout in play is going to be fun to watch. But this is a great exercise now. The real machine has been in tester's hands for a while. We have experience of how the actual layout works. The discussion around changing the layout will be informed by that experience. The result ought to be solid improvement to the scheme.

Regardless, changes like this shouldn't be undertaken lightly. As the tester community grows, so too will the pain of updating the keyboard layout. At some point you should declare the layout to be out of beta, even if the calculator itself stays in a testing phase. That means that trying to get the best possible layout now is really important. Taking it slow and getting it right is the correct approach, in my opinion. A long lead time will reduce the impact on Eric too. I don't know how many overlays he has in current production now.

> I don't know how many overlays he has in current production now.

About 60 went out to the first beta testers in June.

Based on feedback, I made a bunch of minor changes and made another 50 for HHC in September.

After HHC, I made another 75, and of those 75 I have fewer than 10 left.

Right now I don't know if I should make a bunch more or hold off until any changes are decided upon.

Eric

I wish you would consider taking your time with your decisions. There's a lot of user experience you could capture that might help optimise and stabilize the layout going forward.

Re: [WP 34S] New keyboard layout anybody?

*Message #87 Posted by **Eric Rechlin** on 7 Oct 2011, 9:16 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Assuming the layout changes are minor, I'd be willing to send out a "keyboard patch kit" to anywhere in the world for $2 (and add $1 for each extra patch kit desired).

I'm assuming no primary functions would change, but if they do, or if any [h] shifted functions change, it will be very easy to fix by just removing the key sticker and putting a new one on.

If [f] or [g] shifted functions change, the easiest solution would be to just apply a small sticker on top of the existing overlay. Not perfect, but it beats trying to apply a whole new one.

Eric

*Message #89 Posted by **Jim Horn** on 7 Oct 2011, 11:38 a.m.,*
in response to message #87 by Eric Rechlin

I'm delighted with both the progress of the '34S and the deliberation shown in potential key changes. My only concerns about that have been:

1) Can Eric keep up with the demand if we all want new overlays?

2) Can existing overlays be removed from the 20b and 30b to allow a clean replacement with a new overlay?

I've not had to remove my overlay - it looks nearly as good as when I put it on months ago. If it can be removed cleanly, I see no problem with replacing it.

Go, team! We're cheering you on...

*Message #90 Posted by **Morten Nygaard Åsnes** on 7 Oct 2011, 2:36 p.m.,*
in response to message #1 by Marcus von Cube, Germany

I would support changing Last X to a primary or shifted key. Maybe remove the dedicated convert key? Also I would have the key for scrolling binary numbers left and right in the display be two keys using the same shift key, as it is now using two different shift keys is very non intuitive.

(another thing that doesn't have anything to do with the layout, I would like base two numbers to only display 8 bits at a time, scrolling a binary number when 12 bits is displayed means it's impossible to quickly see which byte you are looking at)

As for removing ALL, FIX, SCI, and ENG from dedicated keys, I think a display menu is a good idea. I like how the 35s does it where you can jump to a menu item with the number keys: Display 1 => Fix, Display 2 => Sci, etc.

Re: [WP 34S] New keyboard layout anybody? - Edited

*Message #91 Posted by **Walter B** on 7 Oct 2011, 4:04 p.m.,*
in response to message #90 by Morten Nygaard Åsnes

Just two comments:

1. Any proposals of DISP menus "how the 35s does" won't work due to the excellent display of the 20b/30b ;-/ Did we mention already this is our favourite piece of hardware?
2. The odds for a label "Last x" appearing are very low for the reasons explained by Gene and others.

*Message #93 Posted by **Walter B** on 9 Oct 2011, 5:29 a.m.,*
in response to message #92 by Egan Ford

Well, LASTx is accessible via RCL L already - only two keystrokes. That's the best you can get since it won't become a primary function ever. FILL is two keystrokes now, while the alternatives - 3 or 7 times ENTER - need more work. Sufficient?

Walter

*Message #95 Posted by **Jeff O.** on 7 Oct 2011, 4:01 p.m.,*
in response to message #1 by Marcus von Cube, Germany

We seem to be rehashing a lot of the discussion about key labels and functions that we had last spring. For the moment, why not keep it simple? Put the MATRIX menu where PSE is, and put PSE in the P.FCN menu. For now, everyone can just remember this change. If it "sticks", at some point Eric can send out new labels for the 0 key.

Re: [WP 34S] New keyboard layout anybody? - Edited

*Message #96 Posted by **Marcus von Cube, Germany** on 7 Oct 2011, 4:30 p.m.,*
in response to message #95 by Jeff O.

Jeff, there are a few more inconsistencies which should be attacked. Some have been mentioned here such as having the

windowing functions for long integers on different shift keys isn't optimal. Putting OFF on h-EXIT is another consideration. And I never understood why ATOI and ITOA are on the keyboard (riddle: where?).

Re: [WP 34S] New keyboard as suggested yesterday evening

*Message #97 Posted by **Walter B** on 7 Oct 2011, 4:34 p.m.,*
in response to message #95 by Jeff O.

MATRIX goes on h-shifted '*' and pushes STATUS to h-shifted '.'
SHOW and OFF swapped as discussed earlier.
Put DECM on the keyboard due to the known H.d discussions here. H.d becomes H thus.
Introduce a catalog CLEAR in consequence.

Walter

Re: [WP 34S] New keyboard as suggested yesterday evening

*Message #98 Posted by **Howard Owen** on 7 Oct 2011, 5:07 p.m.,*
in response to message #97 by Walter B

I like the fact that the changes are all on the h plane. That makes it easy for Eric to ship patch kits to owners of the existing overlays, as he suggested.

Forgive my ignorance of previous discussion on this topic, but why wouldn't DECM be better in the MODE menu?

edit: To be CLEAR, I think that menu makes perfect sense. Perhaps you could do something else with the space?

They cancel each other.

Re: [WP 34S] New keyboard as suggested yesterday evening
*Message #105 Posted by **Alexander Oestert** on 8 Oct 2011, 8:13 a.m.,*
in response to message #104 by Marcus von Cube, Germany

If each one canceled only itself, could they then have shifted functions? Like f and h shift for g, g and h shift for f and finally f and g shift for h.

Re: [WP 34S] New keyboard as suggested yesterday evening
*Message #106 Posted by **Marcus von Cube, Germany** on 8 Oct 2011, 9:00 a.m.,*
in response to message #105 by Alexander Oestert

f cancels / replaces g, etc. This is useful if you have accidentally pressed the wrong shift. Don't tell me you never do! :-)

Re: [WP 34S] New keyboard as suggested yesterday evening
*Message #107 Posted by **gene wright** on 8 Oct 2011, 9:14 a.m.,*
in response to message #106 by Marcus von Cube, Germany

I think what they are suggesting is:

f pressed incorrectly is cancelled by pressing f again.

g pressed incorrectly is cancelled by pressing g again.

f pressed followed by g would execute whatever the f-shifted function of g was.

In other words, yes, people press shift keys, even the wrong one from time to time. But the fix is to press the wrongly pressed shift key again to turn it off.

Re: [WP 34S] New keyboard as suggested yesterday evening

> Quote:
>
> f cancels / replaces g, etc. This is useful if you have accidentally pressed the wrong shift. Don't tell me you never do! :-)

Yes but what if you press a shift key by accident when you want an unshifted function?

There must be a way to clear the shift key. The obvious way to do that is to press the same shift key again.

Shift keys have historically not had shifted functions. But is that a paradigm that, dare I say it, could be shifted?

Re: [WP 34S] New keyboard as suggested yesterday evening

*Message #110 Posted by **gene wright** on 8 Oct 2011, 12:03 p.m.,*
in response to message #109 by Dan W

In the past, HP's normal way of canceling the shift key on many models was to press the "prefix" shifted function, which cleared the prefix key.

This had the added benefit of showing the mantissa in the display.

I believe the 12c f and g keys cancel each other, but the prefix clear is the way to clear both.

That said, it might be nice to consider having some shifted functions on the other shift keys.

Re: [WP 34S] New keyboard as suggested yesterday evening

*Message #111 Posted by **Marcus von Cube, Germany** on 8 Oct 2011, 12:56 p.m.,*
in response to message #110 by gene wright

So we could have a g-shifted and an h-shifted function on f, an f-shifted and an h-shifted function on g and an f-shifted and a g-shifted function on h. We might relocate -> to both f and g as their g- and f-shifted function respectively. The conversions would then be called with f+g+DEG/RAD/GRAD respectively g+f+H.MS/H.d. CONV might then go to h+f and some other catalog(ue) on h+g.

What to put on where is now ->?

I'd like Walter, our chief design officer, to comment on this.

Oh my god, it seems you want to create the most complicated calculator keyboard ever! :-(

Have you thought about how the 4 labels for these f/g/h keys would look then? For each of the 3 keys one label must be omitted (the one of it's own function), and this would be on a different place for each key.

Could you please make a SVN build with the latest changes before such keyboard 'deformations' are done? This will then certainly be the last version I'm using ...

Franz

That's good to hear, Marcus! :-)

As for the f/g/h combinations:
The maximum I could imagine would be h-shifted functions for f and g (but not any/all other combinations) - this would make 2 new green labels for f and g which could either be used for 2 catalogs or to put the -> and CPX to these [h][f] and [h][g] positions: with this last method you could extend the 4 A-D user keys to the usual 6 A-F, which would be very comfortable for programs with more than 4 functions keys (just thinking of TVM or TRIGON for example).

Franz

Actually, you just have to replace the sticky keyboard overlay with a spiral-bound flip chart that attaches to the top of the calculator. Each sheet corresponds to one of the 27 possible key planes (f, g, and h keys unpressed, pressed, or pressed and held).

It would come with a stylus to reach through the half-inch deep hole created by the chart when you actually need to PRESS a key. Oh wait, you'd need three styluses (styli?) for the [f](hold)[g](hold)[h](hold) plane....

:)

in response to message #118 by David Hayden

The maximisation of functions on a keyboard occurs when half the keys are shifts -- I'm discounting shifted shift functionality here -- in that case every key should be a shift which is silly.

- Pauli

*Message #122 Posted by **David Hayden** on 7 Oct 2011, 5:59 p.m.,*
in response to message #1 by Marcus von Cube, Germany

Responding to the thread so far:

I agree that RCL L is fine in place of LASTx. Yes it's a little different but it's intuitive and the same number of keystrokes.

I think we can definitely move ./, to a menu. Perhaps more than anything else, that function is likely to be used once when the user gets their calculator and never ever again.

I agree that || is so specialized that it should move off the keyboard. I completely understand its importance to electrical engineering, but functions like this are the reason why A-D are assignable. Further, || is easily misunderstood as |x| for the beginner. At least it was for this beginner.... :)

If you change the keyboard, I think you should increase the revision number to 2.2. Eric could put the rev number on the labels and this would help people keep straight which keyboard layout goes with which software version.

I think PSE could move to P.FCN if the space is needed.

I'd leave "H.d" as the name of the command at [f] [RCL]. "H" is unintuitive. Also, with FIX/SCI/ENG automatically changing to DECM, I don't think we need DECM on the keyboard explicitly.

Finally, let me say NICE JOB on the keyboard layout in general. This discussion gave me a chance to really look it over, and, given the huge amount of functionality involved, it's really well done.

One last comment for Eric: in dim light, I have trouble distinguishing between the blue and green on the keyboard overlay (I have one with the clearcoat if that makes a difference). I'd prefer a brighter green if it's possible.

Dave

I'll second that. Given that all the green labels are on sloped keys I'd vote to change h to white and the labels to white. This is inline with the 34C, however the 34C had a black h with white keys, but the concept was the same.

*Message #126 Posted by **Howard Owen** on 8 Oct 2011, 12:42 a.m.,*
in response to message #125 by Egan Ford

Those keys have very steep fronts. For me, it's quite easy to separately scan the key tops and fronts. With the shallower angle of the (30|20)b keys, I think it would look more muddled. I don't actually know, since I haven't seen an example of a 34S with this scheme. It might be pretty subjective whether light green or white would work better. From a style point of view, I suspect the green would visually clash with the other colors. Of course, if you are looking for good contrast, that might be just the ticket.

I'm going to have a look for template images to try out some of these combinations.

Re: [WP 34S] New keyboard layout anybody? - Edited

*Message #127 Posted by **Howard Owen** on 8 Oct 2011, 1:21 a.m.,*
in response to message #125 by Egan Ford

The atrocious (esthetically, in my opinion) lime green on the canonical layout image strikes me as just fine for contrast's sake. Here I've replaced that green with white. This picture lacks a third dimension to show how the front slope might aid you in distinguishing the primary functions from the h-shifted ones. I think the result is pretty jumbled nonetheless. The fact that the alpha plane is off white adds to the problem.

edit: How's this?

I wouldn't mind if the alpha plane were bright green, either. The off white is dim in Eric's overlays, as well as in the template image.

Edited: 8 Oct 2011, 1:31 a.m.

I think light green would be best - to distinguish the key's primary function and h function.

What about "WP-34s I" and "WP-34s II"?

*Message #129 Posted by **Alexander Oestert** on 8 Oct 2011, 6:57 a.m.,*
in response to message #1 by Marcus von Cube, Germany

> Quote:
>
> Edit: Having read the answers so far I'm leaning towards changing the keyboard, but not in a hurry. Let's discuss the proposed changes with a graphic from Walter in place and we go on from there.

I think I will stick to the old keyboard layout and therefor to the then old software. My wish would be to have the corresponding firmware stable and bugs free and maybe in that status marked as "WP-34S I" and "final" with its own download repository.

Changes to the layout and the firmware from there on could be marked "WP-34s II" with kind of a fresh start, appealing to everyone who wants to go on and have changes made.

This is how I, as a layman, imagine programmers do things in such cases. If that is not so, I apologize. In this case I would be happy to just get a notification when the last firmware version compatible with the old keyboard layout is published. Thank you in advance.

I'd say Yes.

[WP 34S] New keyboard color scheme?

*Message #133 Posted by **Howard Owen** on 8 Oct 2011, 1:46 p.m.,*
in response to message #1 by Marcus von Cube, Germany

Problems I see with the current color scheme:

- Off white alpha labels are hard to see.
- Bright green labels somehow end up dim on Eric's overlays.
- I don't like the green from an esthetic point of view.

This scheme replaces the green with an orange color that has pretty good contrast on the PNG. The green color is used for the alpha labels. This reduces the glare from the green while enhancing visibility of the alpha labels.

- Caveat: I have no idea how this would look on a real overlay
- Caveat: Using orange here would require extensive changes to the example images in the manual.

*Message #134 Posted by **Ángel Martin** on 8 Oct 2011, 2:35 p.m.,*
in response to message #133 by Howard Owen

love it, a clear improvement.

Re: [WP 34S] New keyboard color scheme?

*Message #135 Posted by **Brian Walsh** on 8 Oct 2011, 2:49 p.m.,*
in response to message #133 by Howard Owen

While I think orange may be one of the very few other colors that work well, I also think it's getting to be too many colors. Personally I rather like the green and don't have a problem with it.

I'm more curious to get feedback from users who have partial or total colorblindness as to their preferences.

Re: [WP 34S] New keyboard color scheme?

*Message #136 Posted by **Cristian Arezzini** on 8 Oct 2011, 2:52 p.m.,*
in response to message #133 by Howard Owen

I don't know, I don't have a problem with the green - I don't know why, but I think it's perfectly legible. It's less bright than the white labels of course, but I like that because this way, the primary (white) labels stand out more... Or maybe I'm just used to it.

Cristian

Re: [WP 34S] New keyboard color scheme?

*Message #137 Posted by **Howard Owen** on 8 Oct 2011, 3:50 p.m.,*
in response to message #136 by Cristian Arezzini

The main problems this is designed to fix are the legibility of the alpha plane, and a brightening of the h plane. Aside from esthetics, I'm worried that Eric's printing system may not be able to produce a bright enough green to give good contrast. If you look at his overlays, the green is pretty dim. Despite that, his green is easier to see than the gray of the current alpha plane.

I think legibility is primary and esthetics are secondary. If Eric can produce a brighter green, then I have no problem sticking with it for the h plane. That leaves the alpha labels. Perhaps we can use orange for those, assuming Eric can produce a more legible overlay with that color.

Another consideration ought to be that the alpha plane is on the main overlay. That isn't "patchable" like the h plane is. Still, a wholesale color change of the h plane, either to orange or a brighter green, would demand a complete replacement of the key cap labels anyway. Adding the base sticker to the mix wouldn't be that much extra effort.

Re: [WP 34S] New keyboard color scheme?

*Message #138 Posted by **Eric Rechlin** on 8 Oct 2011, 4:57 p.m.,*

in response to message #137 by Howard Owen

I am open to color changes, if Walter/Pauli/Marcus agree on a new color scheme.

I might be able to brighten the green a bit, but I can't brighten it a lot due to limitations in the media and ink. All I can really do is make it whiter. The vinyl isn't a particularly bright white, and my printer's ink isn't as bright as what some printers can produce (perhaps because of its use of pigment instead of dye?).

Eric

Nothing will be very bright. I think the way it is now is still pretty legible, however; you'll see when you get your overlays, probably Monday.

Eric

Re: [WP 34S] New keyboard color scheme?

*Message #141 Posted by **Howard Owen** on 9 Oct 2011, 1:58 p.m.,*
in response to message #140 by Eric Rechlin

Except for the alpha labels, I find the overlay colors to be bright enough. The green H plane is only a problem in dim light. I actually have trouble with ordinary text under those conditions, so I know how to remedy that. :) I've voted for your overlays with my dollars twice now. Thank you for offering them.

Re: [WP 34S] New keyboard color scheme?

*Message #142 Posted by **Howard Owen** on 8 Oct 2011, 5:24 p.m.,*
in response to message #138 by Eric Rechlin

The vinyl is off-white? I wonder what you could with that as the background color.

Re: [WP 34S] New keyboard color scheme?

*Message #143 Posted by **Walter B** on 9 Oct 2011, 5:47 a.m.,*
in response to message #138 by Eric Rechlin

As an alternative to a brighter green (please see the emulator :-)) also a clear red would be viable IMO. But keep in mind that's not discussed yet within the team.

The alpha letters will stay dimmed - it's a calculator, not a typewriter, else it would feature a totally different layout.

Walter

Re: [WP 34S] New keyboard color scheme?

*Message #144 Posted by **Marcus von Cube, Germany** on 9 Oct 2011, 6:03 a.m.,*
in response to message #143 by Walter B

The problem is that on a screen the colors come out significantly different than on a printer to warrant this discussion. The former dark read on the alpha characters was almost invisible on the first overlays. I vote for a backlit keyboard ;-).

Edit: Typo.

Re: [WP 34S] New keyboard color scheme?

*Message #145 Posted by **Howard Owen** on 9 Oct 2011, 11:46 a.m.,*
in response to message #143 by Walter B

I don't want to use the 34S as a word processor, I just want to enter three character alpha labels in my XEQ, GTO and LBL instructions, as documented in the manual.

Re: [WP 34S] New keyboard color scheme?

*Message #146 Posted by **Eddie W. Shore** on 11 Oct 2011, 8:44 a.m.,*
in response to message #133 by Howard Owen

What about the alpha characters being black letters on white boxes? This would help distinguish the alpha characters from the rest of the functions.

I like it.

Re: [WP 34S] New keyboard color scheme?

*Message #149 Posted by **Paul Guertin** on 11 Oct 2011, 8:30 p.m.,*
in response to message #133 by Howard Owen

I like the new overlay, and eventually plan to buy one as soon as I have enough free time to actually start playing with a WP 34S.

I don't know if this has been discussed before, and this is a really minor point, but the fact that the "2, 8, 10, 16" base indicators are numeric bothers me a little. I'd prefer to have "BIN, OCT, DEC, HEX".

Re: [WP 34S] New keyboard color scheme?

*Message #150 Posted by **Walter B** on 12 Oct 2011, 1:52 a.m.,*
in response to message #149 by Paul Guertin

Space is very tight up there, so seven letters below a key would require a **very** tiny font :-/

Re: [WP 34S] New keyboard layout anybody? - The Pendulum is swinging back.

*Message #151 Posted by **Marcus von Cube, Germany** on 9 Oct 2011, 7:28 a.m.,*
in response to message #1 by Marcus von Cube, Germany

It looks like we have three options:

1. We leave the layout as is and live with its shortcomings. This would save us from relabeling and relearning the keyboard. It would provide a basis for making the software stable before we move on to other things.

2. We make only very minor changes such as moving L.R. to a menu to make room for the MATRIX menu. This is so minor that it can be remembered easily or changed with a single label. We may swap SHOW and OFF in the process but not more.

3. We make major changes, starting with Walter's suggestions and throwing in whatever the team and its user base thinks will make the layout better. In order not to disappoint those who do not want to change we would need to split the development to be able to fix bugs in the present version.

Please vote!

Re: [WP 34S] New keyboard layout anybody? - The Pendulum is swinging back.

*Message #152 Posted by **fhub** on 9 Oct 2011, 8:08 a.m.,*
in response to message #151 by Marcus von Cube, Germany

I would vote for point 1 or 2 (I don't see much difference between them):
Of course there should be an additional MATRIX menu (and L.R is indeed a good place), but I don't even see the need for changing SHOW and OFF!?

One thing is clear: you can never make everybody happy!
Take 50 WP34s users and you'l get 50 different keyboard layout preferences. ;-)

Of course I would also like to see a lot of keyboard changes (there are many functions I won't never need and many useful functions that I miss), but you'll never get all users "under one hat" (as we say in German ;-)), and I can really live with the current layout.

And IMO other changes (in supported functions or operations) would be much more important than moving around keyboard labels - but that's another thing of course ... ;-)

Franz

*Message #153 Posted by **Alexander Oestert** on 9 Oct 2011, 8:25 a.m.,*
in response to message #151 by Marcus von Cube, Germany

1 and 2 basically mean the project has come to its end. 3 means the fun goes on. So my vote goes to 3.

My reasoning goes like this: I don't really need a working, sophisticated calculator in my every day life - I own several that are up to the task, but I find the process of thinking, trying, flashing and all that stuff to be fun. If once the 34s will be perfected it will be boring! ;) In practice, I will flash a 30b with the last and stable version, put Eric's labels on it and then have a 20b ready for experimenting with what ever comes next!

I don't agree. If "fun goes on" only means shuffling around the keyboard labels (as point 3 suggests), then it's just a waste of time IMO.

"fun goes on" would require real improvements of the WP34s functionality, but as Pauli himself has mentioned yesterday this will certainly not happen (look at his remark about and END statement and local labels).

And so I would indeed say that the project has come to its end (despite of fixing any bugs which may still exist).

*Message #155 Posted by **Michael Kussmaul** on 9 Oct 2011, 8:45 a.m.,*
in response to message #154 by fhub

On the other hand: If the functionality comes to an end (we filled up all flash space, no additional functions can be added anymore) why not look back and re-think how the layout could be tweaked and re-arranged to make it "perfect" for the supported function-set?

I guess the layout changed organically over the time and now contains a lot of compromises, so it would not be that bad to rethink them in face of the current function-set?

I would also vote for 3 - but I don't own a 34S as of yet, so my vote should be discarded I guess :-)

Yes, you're right, but as I already said: you'll never make all users happy - that's the main problem with making a "perfect" layout. :-(

One of the things that fascinate me about WP 34S are the shortcomings of the hardware: So little RAM, so much to put in there. It has been a real challenge in the past few months to push the limits farther with each new release. The typical sequence of events was:

"Can we implement this and that?"
"No, I doesn't fit."
"I've done it, together with some other improvements."
:-)

I would really miss this if we had a platform with abundant resources. Of course we would face other challenges such as adding network support and real time 3D graphics... ;-)

*Message #165 Posted by **Cristian Arezzini** on 9 Oct 2011, 9:45 a.m.,*
in response to message #151 by Marcus von Cube, Germany

My vote would be closer to "2.5" - i.e. major changes scare me a little, but a few, well-thought changes are ok. After all I've been using this calc for just a few months, I think I still have the flexibility to re-learn a few key assignment... especially if there's a reason to change. I totally agree on adding the Matrix menu, even though I never use matrices, and on swapping Show and Off - I'm used to the way they are now, but I remember at first I really wanted OFF to be on the right-most shift.

The point is: the fact that we're used to this layout now, shouldn't prevent us from improving it.

Cristian

Re: [WP 34S] New keyboard layout anybody? - The Pendulum is swinging back.

*Message #166 Posted by **E.Lub_EU** on 9 Oct 2011, 11:07 a.m.,*
in response to message #151 by Marcus von Cube, Germany

Marcus,

From your proposition, I understand that the user mode suggested earlier would only be eventually considered in option 3.
If that's right, my preference would be for option 3.

If not, I would kindly ask it to be added to the "current" layout, as I believe it would make things easier for different "breeds" of users.
That would make the process a slightly different option 2, I guess, unless user mode can be fitted in a "1+epsilon" option (added function without layout change).

Sorry for not strictly adhering to your offer!

Etienne

Re: [WP 34S] New keyboard layout anybody? - The Pendulum is swinging back.

*Message #167 Posted by **Marcus von Cube, Germany** on 9 Oct 2011, 11:31 a.m.,*
in response to message #166 by E.Lub_EU

User mode should be independent of the keyboard layout. It will certainly rely on row/column codes which do not change. I'm a friend of the proposal with special global labels even if that would cost a few more program steps then local labels or a special KEY instruction. The label search function would need no change and the key assignment could be easily put in a library region. Rest the necessary indicator and a key position to toggle the mode. Another problem would be that some functions would be eternally hidden in user mode because we typically do not repeat functions which are on the keyboard in any catalog(ue)s.

Re: [WP 34S] New keyboard layout anybody? - The Pendulum is swinging back.

*Message #168 Posted by **Howard Owen** on 9 Oct 2011, 11:43 a.m.,*
in response to message #151 by Marcus von Cube, Germany

I think that as the installed base grows, wholesale keyboard changes will become more and more painful. At the same time there is now lots of experience among beta testers using the current layout. If you want to leverage feedback from your users, now would be a good time to do that.

Personally I can live with most of the suggestions made here. My personal concern is legibility of the actual, as opposed to conceptual keyboard. My eyes are almost 56 years old and I have trouble picking out letters with the current overlays. I should hasten to add that I think Eric's overlays are wonderful, and make the WP-34S usable. I wouldn't own one without them.

The color scheme is actually within my power to change, in principle at least. If the project wants to keep the alpha plane dim, then that's fine. I can try to pursue a better solution for my individual circumstances.

Edited: 9 Oct 2011, 11:48 a.m.

Re: [WP 34S] New keyboard layout anybody? - The Pendulum is swinging back.

*Message #169 Posted by **Jeff O.** on 9 Oct 2011, 1:19 p.m.,*
in response to message #151 by Marcus von Cube, Germany

Preferred: 2 (except leave SHOW and OFF alone. This change would require a keyboard plane change, which will either require a sticker on the overlay, or a whole new overlay.)

Second choice: 1

First four parts of the Beginner RPL Tutorial up

*Message #1 Posted by **Eddie W. Shore** on 6 Oct 2011, 11:24 p.m.*

The first four parts of the RPL Programming Tutorial is up at my blog: http://edspi31415.blogspot.com/. The tutorial covers the HP 50g and 49g+ calculators for beginner programmers who want to real what RPL is all about. Part 1 covers the structure of the program, Part 2 covers local variables, Part 3 covers the IF-THEN-ELSE-END structure, and Part 4 covers the FOR-NEXT structure.

Re: First four parts of the Beginner RPL Tutorial up

*Message #2 Posted by **bluesun08** on 7 Oct 2011, 7:29 a.m.,*
in response to message #1 by Eddie W. Shore

Is there a pdf-file available?

Re: First four parts of the Beginner RPL Tutorial up

*Message #3 Posted by **Eddie W. Shore** on 7 Oct 2011, 9:08 a.m.,*
in response to message #2 by bluesun08

Not yet - however I am thinking about putting a PDF file together once I finish the series.

Re: First four parts of the Beginner RPL Tutorial up

*Message #4 Posted by **Thomas Chrapkiewicz** on 7 Oct 2011, 9:35 a.m.,*
in response to message #1 by Eddie W. Shore

In the "Common Keyboard Commands for Hewlett Packard RPL Calculators (HP 48S/48G/50g)" section:

The 'swap' function does not require a shift key prefix on the 48/49/50. Simply keying the right arrow performs the swap operation.

TomC

Re: First four parts of the Beginner RPL Tutorial up

*Message #5 Posted by **Peter Murphy (Livermore)** on 7 Oct 2011, 12:58 p.m.,*
in response to message #4 by Thomas Chrapkiewicz

But left shift/SWAP does have a use: it swaps the contents of L1 and the command line, and leaves those contents in L1 and L2, respectively.

It's the same as ENTER SWAP under those circumstances, so it's not a necessary thing, but that's not the only instance of that in the 48.

Recent 15LE orders on hold?

*Message #1 Posted by **Scott Newell** on 6 Oct 2011, 9:37 p.m.*

I got my order in last Monday (in stock at the HP small business website) and haven't been charged or received a ship notice yet. The last few days I've checked, the online portal shows a "Cust. Quoted Delivery Date" of the current day (requested ship date is 9/26).

Has anyone received a recent order from HP? I'm starting to suspect they're not shipping until they get the keys and firmware fixed.

Re: Recent 15LE orders on hold?

*Message #2 Posted by **Michael de Estrada** on 6 Oct 2011, 10:07 p.m.,*
in response to message #1 by Scott Newell

The last two that I received from HP Home & Home Office were ordered on 9/26 and received 9/28. They both shipped from the Memphis, TN distribution center. Very shortly after I placed my orders, the website returned to out-of-stock status. All 4 that I've received have had LE numbers under 3000.

Re: Recent 15LE orders on hold?

*Message #3 Posted by **Didier Lachieze** on 7 Oct 2011, 2:19 a.m.,*
in response to message #2 by Michael de Estrada

Has anybody received a 15C with LE number above 3000?

Re: Recent 15LE orders on hold?

*Message #4 Posted by **JamesT** on 7 Oct 2011, 2:08 a.m.,*
in response to message #1 by Scott Newell

My order from the small business site is in the exact same status, ordered one day prior.

Re: Recent 15LE orders on hold?

*Message #5 Posted by **From Hong Kong** on 7 Oct 2011, 5:54 a.m.,*
in response to message #1 by Scott Newell

> Quote:
>
> I'm starting to suspect they're not shipping until they get the keys and firmware fixed.

A sensible guess! Hopefully, they're doing so.

According to all the posts about HP-15C LE here, the first 3,000 units seemed to be available online or in the US only.

I knew that HP-15C LE will arrive in Hong Kong no earlier than November. Probably, these units may have LE# higher than 3,000 with known problems fixed.

Re: Recent 15LE orders on hold?

*Message #6 Posted by **Marcus von Cube, Germany** on 7 Oct 2011, 6:25 a.m.,*
in response to message #5 by From Hong Kong

In order to tackle the keyboard issues, HP must not only stop the current production if at all possible, they need to open each package and let people perform the keyboard test to make sure that faulty units are not put to market. The y should have dine this in the first place.

I stay with my U.S. #52 but I'm hoping for a European unit from thecalculatorstore.com when it is available.

Re: Recent 15LE orders on hold?

*Message #7 Posted by **Geoffrey Wang** on 7 Oct 2011, 7:11 a.m.,*
in response to message #1 by Scott Newell

In the same boat -- ordered Sunday 9/26 from SMB and the "Cust. Quoted Delivery Date" is always the current date. Maybe the HP15CLE(fixed) will be more valuable than the first series of LE.

Re: Recent 15LE orders on hold?

*Message #8 Posted by **Paul Gaster** on 7 Oct 2011, 8:02 a.m.,*
in response to message #1 by Scott Newell

I ordered 2, and I see the same thing when I check status online. Well, at first the "Customer Quoted Delivery Date" said Oct. 5th, which to be honest is upsetting. I ordered with the assumption that they had them in stock, otherwise why did they show it in stock and take orders? Also, no emails or warnings were given that the shipping date would be Oct 5th. I ordered Sept. 25th, so I assumed that they would ship in a few days. Now, like you, the date keeps changing.

I did call the 6th and was told the calculators would ship “in a few weeks”. I am not getting a nice warm fuzzy feeling about being told to wait for a few more weeks.

Restoring silver trim: solution found >>

*Message #1 Posted by **tim m.** on 6 Oct 2011, 8:29 p.m.*

All:

I don't know if this has been mentioned, but I happened across a possible solution for restoring worn-off silver trim near the on/off switch of the Classics. Previously, I had used silver model paint, but it did not have the correct reflectivity compared to the original chrome.

At the local Michael's, I happened across a silver leafing kit. Essentially, there is a glue pen and sheets of silver leaf. One applies the glue, waits for it to dry partially, then presses on the silver leaf. Excess leaf is wiped away with a brush.

Here's a link to the product. Mods, delete if inappropriate to post a link to Amazon.

Has anyone else tried this? How durable is it?

-Tim

Re: Restoring silver trim: solution found >>

*Message #2 Posted by **Brian Walsh** on 6 Oct 2011, 8:42 p.m.,*
in response to message #1 by tim m.

Sounds promising! How about very carefully brushing on some clear fingernail polish over it?

That's a good thought! >>

*Message #3 Posted by **tim m.** on 7 Oct 2011, 12:19 a.m.,*
in response to message #2 by Brian Walsh

My only concern is if it would affect the reflectivity of the silver leaf (which is almost spot-on to the original chrome in my test case).

I was thinking a thin brushed-on coat of cyanoacrylate, but that tends to become translucent as it dries.

-Tim

OT: Hrast Programmer's Cool Music

*Message #1 Posted by **Namir** on 6 Oct 2011, 5:16 p.m.*

I just downloaded the following HrastProgrammer albums:

```
Harmony of the Machines
Industronik Programmator
Binary Concept
Kozmotronik Processor
```

The music is awesome. I wrote HrastProgrammer and told him that I had a problem deciding whether he was a better programmer or a better musician!! His music stands shoulder to shoulder with other famous European electronic music artists.

It is so nice to see folks who are part of our online community who have talents in other areas.

Namir

HP-41 barcodes... via the web browser

*Message #1 Posted by **Raymond Wiker** on 6 Oct 2011, 5:04 p.m.*

I'm working on a little program for generating program barcodes for the HP-41, in the form of a simple web page with Javascript code to parse the program and generate the bar codes.

It's beginning to look complete, but I'd like some example programs (as plain text) to test with. I would also like to know if there is a "canonical" mapping for certain HP-41 characters that are not available in USASCII (like ∑ (Sigma), ≠ (not-equal), etc)...

Any pointers to program listings or other information?

*Message #5 Posted by **Egan Ford** on 6 Oct 2011, 11:11 p.m.,*
in response to message #1 by Raymond Wiker

Have you looked at the source code to http://www.hpmuseum.org/software/41uc.htm. That should help answer your question and also provide some help with your code. I used it to generate barcodes for web pages, e.g. http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv020.cgi?read=193137#193137 (message #26).

I couldn't find the source code there, but that may not be all that important - it seems that I have everything (yeah, right) working. I'll probably implement some of the "compiler rules" described for 41uc, as they seem to make sense - and are probably used in other places, too.

Thanks!

At the bottom of http://www.hpmuseum.org/software/41uc.htm is a link to Warren Furlow's web site. There you can get the source to HP41UC and the latest version.

Or, I can email it to you. Even if you do not need it, it may be a nice to have.

"How to" for WP-34s Poisson distribution

*Message #1 Posted by **Dominic Richens** on 6 Oct 2011, 3:24 p.m.*

Have a look at this:

Users' Guide: Poisson distribution

It took me a long time to figure out the Poisson solver, mainly because the format the parameters needed to be in was not what I was used to. I assume I've got it right, since the answer is the same as this Poisson calculator.

Comments?

Re: "How to" for WP-34s Poisson distribution

*Message #2 Posted by **Paulo MO** on 6 Oct 2011, 5:10 p.m.,*
in response to message #1 by Dominic Richens

I did not loose any time over this (and maybe I should ;-)) but when the User's Guide your link is pointing to says that "Assuming call inter-arrival times follow the Poisson distribution,...", probably what is meant is "Assuming that the number of call arrivals follows a Poisson distribution,...". A Poisson inter-arrival time would be non-sensical. This will, BTW, imply that the inter-arrival time is exponentially distributed.

Who cares, right? :-)

-Paulo

Re: "How to" for WP-34s Poisson distribution

*Message #3 Posted by **Dominic Richens** on 6 Oct 2011, 6:31 p.m.,*
in response to message #2 by Paulo MO

I care! Bring it on!

yeah, it is nonesense - thanks for the correct wording.

Two other things possibly wrong with the example:

- I think the more accurate model for blocking is Erlang-B, which is Poisson pdf(x,u)/cdf(x,u)
- I'm not sure 8000 is the right number for sample size. I think the answer is correct because the number is so large. But if I enter "1" as the sample size and 200 as the mean I get "Parameter Error".

In the manual I just downloaded, there is no footnote on page 16.

Re: "How to" for WP-34s Poisson distribution

*Message #6 Posted by **Dominic Richens** on 7 Oct 2011, 6:53 a.m.,*
in response to message #4 by Walter B

Yes, read that, know that much already :-)

I'm expecting to specify the mean and have it tell me the probability of X (as the footnote on page 48 says). I don't understand the lambda = n * p0 part. What does sample size n have to do with a Poisson distribution?

In my example I used 8000 as the sample size but that's bogus - the 200 was a projection (the amount of traffic I think I'm going to have if I add more users). I could have used anything that kept the value of J =< 1 such than 200 = J * K and I get the same answer.

It works like the footnote on pg 48 if I always put p0 = 1 in J and the mean in K. I think the Remark for Poisson should say "Alternatively, Poisson's lambda = n*p0, may be in K if J = 1.

Re: "How to" for WP-34s Poisson distribution

*Message #8 Posted by **Dominic Richens** on 7 Oct 2011, 7:36 a.m.,*
in response to message #7 by Alexander Oestert

Could be page 13 - whatever page "STATISTICAL DISTRIBUTIONS, PROBABILITIES ETC. " is on in your version. I think Marcus and I are both using the new 2.2 version, not the 2.1 version in the zip file:

https://sourceforge.net/projects/wp34s/files/doc/

Re: "How to" for WP-34s Poisson distribution

*Message #9 Posted by **Alexander Oestert** on 7 Oct 2011, 8:01 a.m.,*
in response to message #8 by Dominic Richens

Thanks, it is page 13. I was already using the recommended version.

Re: "How to" for WP-34s Poisson distribution

*Message #10 Posted by **Paul Dale** on 7 Oct 2011, 8:04 a.m.,*
in response to message #6 by Dominic Richens

I thought this might cause a bit of confusion eventually.

I wanted a single parameter lambda for the Poisson distribution. Walter wanted the two parameters.

- Pauli

Re: "How to" for WP-34s Poisson distribution

*Message #11 Posted by **Dieter** on 7 Oct 2011, 8:29 a.m.,*
in response to message #10 by Paul Dale

I assume Walter had some *very* convincing reasons for this. But at the moment I simply cannot see which. ;-)

I am a big fan of POLA and KISS. Using two parameters for the Poisson distribution sure is possible, but not what I would consider consistent with the mentioned *policy of least astonishment*. Please, let's do it the way most users would expect and as also stated on the Wolfram Mathworld website on this subject. Especially the part between equations (8) and (9): *"Note that the sample size N has completely dropped out of the probability function, which has the same functional form for all values of nu"* (resp. lambda, since nu or lambda = N*p).

Finally: if really two values p0 and n are given, pressing [x] returns the usual single parameter lambda. On the other hand, splitting a given lambda into n and a 1 that has be be stored in a separate register is awkward and an additional effort for most users who expect the usual single-parameter Poisson distribution.

Dieter

Re: "How to" for WP-34s Poisson distribution

in response to message #11 by Dieter

> Quote:
>
> I assume Walter had some *very* convincing reasons for this. But at the moment I simply cannot see which. ;-)

I don't remember the reasons, long long past now. Set p = 1 and n becomes lambda which didn't seem such a hardship to provide both view points.

- Pauli

Re: "How to" for WP-34s Poisson distribution

*Message #13 Posted by **Dominic Richens** on 7 Oct 2011, 10:11 p.m.,*
in response to message #12 by Paul Dale

Okay - so that's how I'm documenting it in the Users' Guide. I think the comment in the Owner's Manual should be changed to say p0 = 1 the mean can be put in K.

Re: "How to" for WP-34s Poisson distribution

*Message #14 Posted by **Paulo MO** on 7 Oct 2011, 4:37 p.m.,*
in response to message #6 by Dominic Richens

This lambda= n*p0 is probably a left-over of the binomial distribution. The thing is: when you have a bunch of n repeated experiments, each with p0 probability of success (aka Bernoulli trials), then the mean number of successes is of course, n*p0, and the probability of k successes is given by the binomial distribution. Now, for cases where n is unknown but large, instead of using the CORRECT binomial distribution, we may use a Poisson, which is a fine approximation to the real thing, since this Poisson is the mathematical limit of the binomial when the number of experiments goes to infinity, but MAINTAINING the same mean n*p0. The parameter of this Poisson distribution will then be precisely the very same value of n*p0 of the original binomial. But n (sample size) or p0 (prob of individual success) will have no meaning or expression in the Poisson world. Only their product n*p0 (the mean number of successes) remains, as THE Poisson parameter.. The advantage of using the Poisson is huge. For example, in these traffic problems, we have no notion of n (the number of costumers who may or may not call), nor can we reliably estimate p0 (the probability that one of them decides to call). No way we can use a proper binomial, thus. BUT it is very easy to estimate the mean number of calls arriving per hour (just count them), which is all we need to go ahead and solve the problem via a Poisson approximation.

Hurra for Poisson (who would have been a medical doctor, if he had been an obedient son)

Best -Paulo

Re: "How to" for WP-34s Poisson distribution

*Message #15 Posted by **Dieter** on 8 Oct 2011, 1:29 p.m.,*
in response to message #14 by Paulo MO

I think you wrote a very nice and convincing explanation why the Poisson distribution on the 34s should be changed to the usual single-parameter definition. ;-) It's simply the way most users will expect this distribution to work, and you explained the mathematical background behind this.

Dieter

Re: "How to" for WP-34s Poisson distribution

*Message #16 Posted by **Paulo MO** on 8 Oct 2011, 4:47 p.m.,*
in response to message #15 by Dieter

I totally agree with you, Dieter. Single parameter is the way to go. In a Poisson process, if someone forces us to state what N and p0 are, the only mathematically consistent answer is: N=infinity, p0=0. Having to, for example, put p0=1 in the 34s to make the thing work, would be a source of constant and unbearable mental agony :-)

But hey, if that is the price to have a 34s, it's a small price; Long live the 34s team! ;-)

Paulo

Re: "How to" for WP-34s Poisson distribution

*Message #17 Posted by **Dieter** on 9 Oct 2011, 8:13 a.m.,*
in response to message #16 by Paulo MO

They may live even a bit longer after this oddity has been corrected - it will give peace to their minds. ;-)
This is one of the advantages of such a project with the user community involved: there is no need to stop at the second best solution: we can go for the best. :-)

Dieter

Re: "How to" for WP-34s Poisson distribution

*Message #18 Posted by **Walter B** on 9 Oct 2011, 10:48 a.m.,*
in response to message #14 by Paulo MO

Exactly that's the way it is described on page 48 of the manual. The parameters used for the binomial distribution may remain unchanged in J and K for Poisson as well. Alternatively, you may use the canonical Poisson's parameter in J while you store 1 in K.

HTH
Walter

Re: "How to" for WP-34s Poisson distribution

*Message #19 Posted by **Dominic Richens** on 9 Oct 2011, 1:17 p.m.,*
in response to message #18 by Walter B

But it's actually the other way around. The 1 goes into **J** and the mean goes into K because anything greater than 1.0 in J causes "Invalid Parameter".

Re: "How to" for WP-34s Poisson distribution

*Message #20 Posted by **Walter B** on 9 Oct 2011, 6:10 p.m.,*
in response to message #19 by Dominic Richens

Bonsoir Dominic,

Looks like there's a mismatch between documentation and firmware. We'll get that settled. Thanks for pointing that out.

Walter

Edit: Changed the manual. Not committed yet.

HP 15C LE....It's a calculator.....not a finger massager

*Message #1 Posted by **Ethan Conner** on 6 Oct 2011, 1:53 p.m.*

After reading the previous thread about a negative review and tech support i decided to check out the reviews on the HP website. In the business listing for the 15C LE someone left a one star review for "tactile feedback" not being good. This to me is an over reaction. Being someone who uses calculators at home and p.o.s. (credit/debit card devices at stores) plus tools at work with numeric keypads they are all complete mush compared to the 15C LE. I understand writing a negative review for a unit with a malfunctioning key. To write a one star review on a calculator that IMHO still puts everything else out there to shame in the key department that is new manufacture.....come on..... that wasn't necessary.

Re: HP 15C LE....It's a calculator.....not a finger massager

*Message #2 Posted by **jonathan G harris** on 6 Oct 2011, 2:39 p.m.,*

Not that my opinion counts(even though I have bought 6 15cLEs...), but I concur Mr. Conner.

Re: HP 15C LE....It's a calculator.....not a finger massager

*Message #3 Posted by **Ángel Martin** on 6 Oct 2011, 3:51 p.m.,*
in response to message #1 by Ethan Conner

Well, against all odds and when I had lost all hope, my unit surfaced at the customs office (in a town that will remain unnamed) - so finally I got mine (only bought ONE, that suffices as I'm not interested in speculative auctioning :-) - ordered back in early July, from the supplier that sells international - that's a while ago.

It arrived in good shape, despite it was in an envelop (no cardboard box). Luckily it must be one of the good ones: no rattling keys, all registering properly, self-tests passed with flying colors. In sum, a great looking calculator, rivaling the original one in my book.

I'm happy ;-)

That must refer to the *new* self-tests, not the original 15C self tests. The old 'ON plus *' and 'ON plus +' self tests always fail on the 15C-LE, and corrupt program memory.

Re: HP 15C LE....It's a calculator.....not a finger massager

*Message #5 Posted by **Tim Wessman** on 6 Oct 2011, 5:20 p.m.,*

*Message #6 Posted by **Mike Morrow** on 6 Oct 2011, 6:04 p.m.,*
in response to message #5 by Tim Wessman

Tim, I'm sure you must be joking!

I replied to a post alleging *"...self-tests passed with flying colors"* (some rather pertinent information missing!) with:

"That must refer to the new self-tests, not the original 15C self tests."

Do you contest my statement? If so, what is inaccurate?

I then continued:

*"The old 'ON plus *' and 'ON plus +' self tests always fail on the 15C-LE, and corrupt program memory."*

Do you contest my statement? If so, what is inaccurate?

Your response was *"No, it correctly emulates the 15c which also corrupts memory when it fails the self test."*

You use "No" in your response with an apparently novel sense of meaning, one with which I am not familiar. :-)

What remains unacknowledged within your response is the fact that the 15C-LE **always fails** these tests. This is a 'feature' that, I have the honor to point out, the original 15C does *not* possess.

It seems fabulous that all those months of beta testing did not reveal this fault. Eliminating reference to the old self tests in version 2.4 of the Owner's Handbook does *not* make this fault go away, even if some would like to believe that's all it takes.

I have to agree. This is so engrained in the synapses of the captive market for this device, dismissing it as a documentation footnote feels at least a little sacrilegious. Same for rotate-22 which deserves recognition in its own right and is effectively trivial to support.

*Message #10 Posted by **Lincoln R.** on 6 Oct 2011, 7:22 p.m.,*
in response to message #6 by Mike Morrow

Uh, emulators are hard. Trying to make a program work on a new architecture when you have *NO SOURCE CODE* is hard. While it might make you feel all nostalgic to see the 'original' self tests working on your 15C LE, I'd imagine most of us would rather have the PSE bug and power consumption issues gone. If we could have both, that would be great, but I imagine the calculator division's programmers (who may consist solely of Cyrille) have things to work on besides the 15C.

Re: HP 15C LE....It's a calculator.....not a finger massager

*Message #11 Posted by **Michael de Estrada** on 6 Oct 2011, 7:35 p.m.,*
in response to message #10 by Lincoln R.

From my POV, the thing that bothers me most are the large percentage of keyboard failures. I'm fortunate that the 4 units I bought were good with no hard/bad keys, and had there been any, it would have been a simple matter to return them for refund/replacement, since I live in the USA. I can only imagine what it must be like for someone living outside the USA, waiting for weeks and paying high shipping costs and customs fees, only to discover that the calc is faulty. It's this poor physical quality control that I find to be unforgivable. I hope that HP has the good sense to hold up distribution of the remaining units, until all of the faulty units are identified and scrapped.

Nostalgia has nothing to do with it. Correcting a condition that can be executed from the keyboard and that always corrupts program memory is the *really important* point, but one upon which it seems little significance is being attached.

> Quote:
>
> ...I'd imagine most of us would rather have the PSE bug and power consumption issues gone.

Certainly, the PSE bug noted here a month ago is the most urgent problem, followed closely by the power management problems...though emulation is always a grand waste of battery energy even under the best of circumstances.

> Quote:
>
> ...I imagine the calculator division's programmers (who may consist solely of Cyrille) have things to work on besides the 15C.

However, at about $100 (-25/+100 percent), the HP 15C-LE is **very** expensive for what it offers. One can easily argue that a $13 Casio fx-115/991ES, though non-programmable, is more sophisticated in many areas. The HP 50G for a 25 percent premium is several orders of

magnitude a better value than a 15C-LE. In any evaluation, the price of the 15C-LE justifies expectations of better firmware emulation, better alpha- and beta-testing, and an Owner's Handbook with fewer errors (including all those still in the most recent Edition 2.4).

I can't understand why HP wastes effort with inferior emulation of 30-year-old products. The HP 12C and the HP 15C are part of old old history, long since replaced by far more capable machines. Why isn't HP development effort being directed to producing something as or more capable and the same size as the never-equaled 23-year-old HP 42S? Let's climb above the standards of 1988.

I probably wasn't clear. Compatibility rather than nostalgia is the concern. Allowing a new user to pick up a 15c le and run the 30 year familiar voyager legacy self test, resulting in both error and subtle data corruption, isn't in anyone's best interest.

Furthermore given the precedent of the 12c+ supporting both system and keyboard tests as did the original 12c, an expectation is setup for the encore 15c le to behave functionally equivalent to its predecessor.

*Message #18 Posted by **Marcus von Cube, Germany** on 7 Oct 2011, 4:11 a.m.,*
in response to message #6 by Mike Morrow

The question is "Can HP make the self tests work?" or "What makes them fail?". It must be an inconsistency in the emulation layer that may or may not be avoidable. If it's inevitable and patching the original ROM isn't an option then the best way to deal with the issue would be to trap the key combinations in the emulation layer and redirect them to the new self tests. This way, the old code has no chance to be ever executed which would eliminate the problem once and for all.

I'm sure its in the development pipe as it isn't that hard to support. It was actually one of the first snags I encountered with KEMU which I wanted to accommodate as it does validate basic NUT/ram/rom integrity. It isn't however exhaustive and the level of test attempted could in large part be accomplished by statically validating the NUT instruction emulation accuracy. I had several bugs due to my misinterpretation of the HP NOMAS holy scroll documents which weren't caught by the system self test. Other dark corners such as ptr == 13 scenarios aren't addressed at all, which isn't surprising.

> If it's inevitable and patching the original ROM isn't an option then the best way to deal with the issue would be to trap the key combinations in the emulation layer and redirect them to the new self tests. This way, the old code has no chance to be ever executed which would eliminate the problem once and for all.

I think that's more work than just accommodating the self test in the first place. Doing so also has the desirable scaling property of functioning as the user most likely expects and eliminating the ongoing tech support burden needed to explain why the 15c le behaves differently.

only bought ONE, that suffices as I'm not interested in speculative auctioning :-)

Don't worry, all 6 are for me and mine. #1 is in my shirt pocket right now, #2 is on my friend's desk at the training nuclear reactor that he helps run. #3 is a spare for me if/when my first stringer fails... #4 is going to be a christmas present for an old engineer that i know that absolutely cherishes his original HP 15C (that he still uses and is on his desk EVERYDAY). #5 May go to my girlfriend if she can prove to me that she will use it (damned civil engineer...) and #6 is the only one that i have found to not be able to pass the self test and will be sent back to HP probably over the weekend. :(

When I try to run the self test or any other operation it will work fine for the first 1-10 keypresses but after the battery and components heat up it will really start screwing up. Normally it will begin missing segments of numbers or whole numbers all together in the display. Very wierd!!! If it has been off for awhile I can complete a self test and it will display the "15" at the end but try it again after 5 minutes of on time and it begins missing segments badly...

Also the first thing I did when I got my 6 HP 15c LEs was run all three self tests then promptly remove the batteries (except for the one i keep in my shirt pocket and gave away to my nerdy nuclear friend...). I think that this is the only calculator that I have purchased that came with the batteries already in the device.

I didn't mean to imply that everybody buying multiple units would be doing speculative auctioning - but certainly you'd agree with me that such cases have occurred?

Also I didn't specify which tests were passing with flying colors because there was NO NEED for it -

we all know by now about that, it's been repeated to death. So I disagree with the comment *'pertinent information missing'* - or would it be possible that they were the old ones? No, right.

Cheers, 'AM

Honestly, I don't see the problem with the old self-tests such a big issue. Simply avoid them, that's one of the benefits of reading this forum so we all know about the glitch and also know how to invoke the new ones.

Yes for sure the information in the manual should be amended, but here again it'd've bothered me much more if the unit had loose keyes or non-reliable registering.

The PAUSE bug is much worse, IMHO. That and the battery beating with the current draw sure is claiming for a firmware update. Coincidentally I also got the cable from Gene yesterday (thanks mate!) so I'm all set... waiting for the bits of course.

That would be an absolutely disastrous attitude for *any* company to adopt for *any* product! (Of course, HP has a history of such, even back in the 'good old days'. I hope they fired those responsible for the sheer incompetency of Woodstock battery/charger design, 36 years ago.)

> Quote:
>
> ...that's one of the benefits of reading this forum so we all know about the glitch and also know how to invoke the new ones.

What percentage of 15C-LE users read this forum? Unfair question? Well then let's extend the time and ask what percentage of 15C-LE users five years from now will have read this forum at just the right time to have been exposed to these issues? Any company hanging its hope on an unofficial and somewhat obscure web forum to convey information to a customer five years from now would be woefully delusional. (Then there's the issue of how difficult it is to actually search old postings here, even if you know it's here somewhere.)

>
> Undoubtedly too high by at least an order of magnitude. In fact, I think 0.9 percent would be an even better estimate.

Probably somewhere inbetween, perhaps towards the low end:

How many folks here on the forum have bought a 15C LE?

A lower limit would be the number reporting to the keyboard survey taken a week or two ago. Without looking it up, I recollect that around 50 people may have responded. Let's assume a comparable number didn't report (probably because their keyboard is fine - thereby skewing the "bad keyboard" fraction, by the way), so around 100.

This group collectively certainly bought an average of more than one calculator. Let's guess 2 or 3. So, forum members probably bought 200-300 new calculators.

If the original lot now being distributed is 3000, as surmised here several times, that leaves more than 2500 calculators to be ultimately bought by others (i.e. not counting the mass purchases by ebay speculators). Almost certainly these buyers will not purchase many more than 1 per person on average. (Many of these buyers may have spotted the calculator on ebay, from the resellers.)

So, around 100 buyers here, and around 2500 buyers elsewhere, or

around 4% of buyers are forum members (probably within a factor of 2 to 4)

This is to astronomical accuracy: a joke amongst astronomers goes "We feel good if we get the significant figures in the exponent correct!"

HP 15C LE Error 9, does it exist?

*Message #1 Posted by **Michael de Estrada** on 6 Oct 2011, 9:16 a.m.*

I was reading the reviews for the HP 15C LE on the HP Home & Home Office site, and came across another negative review, due in part to another misinformed tech support person:

"Try the self diagnostic. Error 9 every time. Called technical support. Was told this was normal for this new calculator. Nice job whoever wrote the new manual."

Although the revised Owner's Handbook (Edition 2.4, Sep 2011) has corrected the self-test information on page 261, it still lists "Error 9, Service" on page 207 with the description "Self-test discovered circuitry problem, or wrong key pressed during key test."

Clearly, this is no longer valid, yet it still appears in the manual and tech support is still oblivious to the whole situation. This is the second instance of a bad review that is the result of incompetent tech support. Frankly, tech support should be instructed to read the following text when asked any technical question regarding the HP 15C LE:

"I am a clueless minimum wage cretin who can't give you any useful information on this product. What did you expect from a company that hired a former eB** head as its CEO?"

Re: HP 15C LE Error 9, does it exist?

*Message #3 Posted by **Mike Morrow** on 6 Oct 2011, 11:37 a.m.,*
in response to message #1 by Michael de Estrada

That assessment of tech support and the personal attacks on the people there is really, bizarrely, *out-of-line*.

Are you expecting that tech support people individually research the internet to find information that is not even on HP web sites, then evaluate the accuracy of those second- and third-party reports, then create a personal database for customer response? And then, do that for *every* HP product, current and past, for which inquiries might be received? That won't happen on any planet I know!

What has been reported as tech support failure is simply the complete failure of the HP organization behind

their tech support to provide the information and tools that *any* tech support person requires about *any* product to perform the job. This includes failure of effective and timely communication of customer-discovered faults by the management associated with particular products.

I doubt any of us could do better than the people at HP tech support when the corporate organization ignores its responsibilities. **It's a defect of HP management, not of the poor fellow who answers the phone.**

*Message #6 Posted by **Mike Morrow** on 6 Oct 2011, 1:25 p.m.,*
in response to message #5 by Michael de Estrada

Even the latest 15C-LE manual (available only electronically here) *still* has problems with respect to self-test issues, and *has corrected none of the several other errata that have been noted here*. Manual reading may be of little corrective value when customers call about inconsistent machine performance based on bad information from the manual, when the tech support rep will likely be referring to that same or similar erroneous manual as well.

Once again, **that's not the fault of the tech support rep**.

*Message #9 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 6 Oct 2011, 1:48 p.m.,*
in response to message #1 by Michael de Estrada

Besides the user manual, there is an error in the HP 15C LE specifications indicating that the calculator has 12 Digit Display.

When I spoke with HP Customer and HP Technical services, they insisted that it is correct and 12 digits despite even the photo shows 10. It feels like HP Customer Service Reps don't have much degree of freedom to make any decisions or communicate bi-directional between the customer and HP. Their responses indicate that they have to stick with the script. This is one way to ensure consistent customer service for a large company, therefore either it is consistently correct or incorrect, not much room for creative response.

*Message #10 Posted by **Marcus von Cube, Germany** on 7 Oct 2011, 4:01 a.m.,*
in response to message #9 by Kerem Kapkin (Silicon Valley, CA)

The error might stem from the 12C Platinum which in fact has 12 digits despite the display shows just 10.

Matrix operations -- WP 34S

*Message #1 Posted by **Paul Dale** on 6 Oct 2011, 5:03 a.m.*

The matrix support operations are slowly of converging. There might be a few changes from here but most are now finalised.

I've swapped out the LU decomposition wrapper for the row operations. Does anyone want the explicit LU decomposition? Speak now or it is invisible forever -- I'm not aware of a use of the LU decomposition apart from finding determinants, inverses and solving linear equations (all of which we have).

I've updated the matrix multiply so that the result can replace or overlap the source matrices. This means you can square a 10x10 matrix safely. However, I'm at a loss as to how to do something similar for the generalised addition A = A + k B. Any suggestions? Should I split the constant multiple of a matrix from the matrix addition?

The loop index generating functions will probably stay as they are as will the register to I, J index and the reverse.

The matrix row operations are likely to stay but this is not yet not definite. For RREF they are useful. Beyond that? ??

The row and column query count functions might disappear... Anyone need a nicely behaved version of these instead of a user code version? The difference is lastX and the stack damage. These function are not much more than multiply by 100 and IP.

As for creating & initialising a matrix -- identity & zero are in user code now but they are mostly well behaved -- they damage L & nothing else. Marcus has done a matrix editor which should cover the rest pretty well.

What about a matrix copy? User code with stack damage or C and well behaved?

I would say let it in!
The LU code is there (I guess you use it for DET/INV/LIN), so why not let the user have access to it? It would cost just a few bytes for this one additional opcode, right?

> Quote:

> Should I split the constant multiple of a matrix from the matrix addition?

I would prefer separated A+B and k*A.

> Quote:
>
> The matrix row operations are likely to stay but this is not yet not definite. For RREF they are useful. Beyond that???

Well, if **you** implement M.RREF then you could remove these row operations. ;-)
But like for M.LU: they already exist, so why hide it from the user?

> Quote:
>
> What about a matrix copy? User code with stack damage or C and well behaved?

I don't think this will be needed very often, and moreover it's just a register-copy, so user code would be ok.

A few more matrix functions come into my mind (trace, rank, charpoly, eigenvalues/vectors), but I guess you want the users to code some things by themselves!? :-)

All just my (humble) opinion of course ... ;-)

It ends up consuming a few hundred bytes of space for this. The routine needs to error check everything and to return the pivot values in a useful format. So the original question should have been what else is the LU decomposition useful for?

> Quote:
>
> Well, if you implement M.RREF then you could remove these row operations. ;-)
> But like for M.LU: they already exist, so why hide it from the user?

The row operations are stand alone. I don't need them for the LU decomposition which has the code it requires internally -- it isn't doing full row operations, only partial ones.

I'm not planing a M.RREF at the moment, the row operations are more useful I feel. You can apply them to the base matrix and the adjoint components separately e.g.

> Quote:

> A few more matrix functions come into my mind (trace, rank, charpoly, eigenvalues/vectors), but I guess you want the users to code some things by themselves!? :-)

User code for these unless there is a pressing reason to do them internally -- flash is too full already. Trace is easy & in the library. The rest aren't there. Of course code donations are welcome :-)

in response to message #3 by Paul Dale

> Quote:
>
> It ends up consuming a few hundred bytes of space for this.

Well, then it's indeed a bit too much overkill. I just thought you would use this LU code for the other operations (DET/INV/LIN) so I saw no reason to have the code included but not making it available.

> Quote:
>
> I'm not planing a M.RREF at the moment, the row operations are more useful I feel. You can apply them to the base matrix and the adjoint components separately e.g.

Yes, I just remembered another usage where the row operations would be quite useful: solving linear optimization problems (by the Simplex method). Long time ago I've written such a simplex program for the HP-48 (and TI-92+), but since it also covers and calculates multiple solutions it is quite complex, and so I doubt I would like to ever code this program for the WP34s. ;-)

And for the other operations: you're right - there must still be something left to do for the users. ;-)

What you've implemented so far wrt. matrix operations is more than enough (and in fact very useful), many thanks for this!

Franz

I vote for leaving them in because they know about defaults (rr=cc) which would otherwise be a bit tricky in user code. They are used in the MED routine which would need a rewrite then.

M.CPY can simply be coded with R.CPY so I don't see a need for this.

Re: Matrix operations -- WP 34S

*Message #6 Posted by **Paul Dale** on 6 Oct 2011, 5:47 p.m.,*
in response to message #5 by Marcus von Cube, Germany

Check the older revisions of matrix.wp34s on subversion for user code equivalents. They consume three stack levels which makes using them a bit annoying but the number of keystroke steps required wasn't large.

I am sad the man has passed and do have several apple product in the house. But some of the lauding is just way beyond my understanding.

Here is a post from a friend of mine that puts things in perspective for me:

Others have noted how remarkable it is that most of us feel comfortable calling Mr. Jobs "Steve." Lots of theories have been advanced to explain this. I just think it's down to how he made you feel he was listening to you, and that he shared your enthusiasms. You get both messages loud and clear when using the products he conceived.

I saw Steve Jobs face-to-face just once. He was at a SunWorld conference plugging NeXTStep. (It must have been in 1993, because that's when NeXTStep 3.1 was shipped, which featured Sun SPARC/Solaris support.) He gave a dazzling keynote speech regarding the technology. It was the best dog-and-pony show I've ever seen. Later, I wandered near him in the exhibits. I wish I had spoken to him then. I didn't partly because I had some old resentments. I was a starving student when the Macintosh came out. I owned an Apple //e which I bought on time with my father cosigning the loan. I had no prospect of owning a Mac, so that colored my thinking about them. I felt put upon that the price of a Mac was so high. I ended up with an Amiga because I hated PCs too, but that's another story. I was also down on NeXT since my University admin days. They tended to be hard to centrally manage despite the wonderful tools available to do so. It was a political thing. NeXT workstations were bought by professors who wanted out of central system management, but who nonetheless expected support. None of that was NeXT's fault. I certainly wanted one myself. Nonetheless, those thoughts colored my perception of Steve Jobs at that conference.I had irrational reasons to resent him. Alas, I'm not always rational. (I flatter myself that irrationality was a symptom of inexperienced youth and that I'm better now. My rational mind tells me that's probably not so true as I'd like. :) The other reason I didn't speak up was that I was starstruck. But I did get a chance to watch him dazzle suits and geeks without slipping a gear. The breadth of his repertoire was astounding. His interactions were fluid and intuitive. He left people smiling because he understood them. He took that understanding and used it to paint a picture of the future that was challenging, fascinating and, above all, *cool.*

I think the traits that made him one of the most potent salesmen of the 20th *and* 21st centuries were the same ones that lead us to call him "Steve" now. The unalloyed vision that speaks so loudly from Apple's products challenges and fascinates us. Those products are personal, intimate even. They track our enthusiasms and lead us on to better ones. They are, above all else, *cool.* Looking under the hood a bit reveals some troubling aspects of Steve Job's vision and approach, to me at least. But it's sad the voice behind those visions is now quiet. The world won't have quite as much cool post-Steve. Someone else, or many someone elses, will have to carry it on.

I purchased my first Apple product a couple of years ago. Now there are two in my house. They aren't a good fit for me but I respect the accomplishment, credit due in large part to Steve Jobs, which made them possible.

Personally while I never spoke with him, from my perspective he wanted to be "Steve" rather than "Mr. Jobs" or "The Steve Jobs". He was part of the billionaire club but perhaps one of its most normal members. No walled compound, no gated community, not even a private road. He lived in a normal house, on a public street, in a normal neighborhood where the neighborhood children would come trick-or-treat at his house.

Goodbye Steve. I'll miss you.

Memory lane: A 1976-1977 catalog with calculators from Olympic Sales Company

*Message #1 Posted by **gene wright** on 5 Oct 2011, 12:46 p.m.*

The PDF in the dropbox link below is the result of a gift from TomC at the recent HHC.

Wonderful snapshot of calculators from this time period.

Olympic Sales Company

Enjoy and Thanks Tom!

P.S. The reason I wanted this for so long was that I remember having this catalog back in 1976 in the 8th grade and distinctly remember seeing the commodore page showing the 4 pre-programmed scientifics. Playing around with functions like permutations, linear regression, etc. long before I knew what they were certainly exposed me to the joy of learning, which I believe influenced many later interests.

Fascinating! Interesting that the 65 was nearly twice the price of the 67 and selling at the same time. I figured they would have immediately dropped the price of the 65.

Joerg,

Yes indeed! I've got one of these in my collection of sexist calculators. The others are:

TI - Lady 1200

Royal - Countess

Adler - Lady

Adler - Sir (the only "man's" calculator I know of)

and my favorite:

Qualitron - La Femme

-Katie

HP users have their 95c. TI collectors, the 88. For National Semiconductor aficionados it's the 7100.

Or maybe it's: TI attempted the 88, National tried the 7100, HP built and sold three million 41s.

*Message #14 Posted by **gene wright** on 6 Oct 2011, 4:24 p.m.,*
in response to message #13 by x34

That PDF includes all the pages for the calculators in the catalog.

The other pages are for food processors, typewriters, etc. which for fairly obvious reasons :-) I have not scanned (yet).

No other calculators in this catalog - I scanned all the relevant pages.

Matrix functions on the WP 34s Build 1685: in a word "incredible"

*Message #1 Posted by **gene wright** on 5 Oct 2011, 12:19 p.m.*

I have been encouraging the smart people on the 34S to give us great matrix functionality in the machine. It's here.

A couple of years ago, Valentin gave us some simple-looking matrices of two digit integers whose determinants equaled 1. The inverses of the matrices were also composed of integers and the determinant of the inverses were exactly equal to 1.

AM3 was the most difficult matrix that Valentin generated and you can read about it here:

Valentin's AM1, AM2 and AM3 thread

I have just run the matrix determinant on AM3.

It comes out to exactly 1 with no Tiny Element flag, no "Hey the matrix has integers so the determinant must be an integer" adjustments. It is simply 1 to the entire precision of the result displayed.

Then, I computed the inverse of AM3 and the determinant of the resulting inverse.

The result?

1 to the entire precision of the result.

Incredible. Valentin needs to come back and get himself a WP-34S!

P.S. By the way, the determinants, inverses, etc are computed as near to instantly as I can see.

Edited: 5 Oct 2011, 12:33 p.m.

Page 24 of Kahan's paper "Mathematics Written in Sand" proposed a difficult problem. namely the inversion of a modified 8x8 Hilbert matrix where the elements are defined by A(i,j) = 360360/(i + j - 1). The inverse correct to 12 significant figures is

```
 1.77600177600E-4       -5.59440559441E-3        5.59440559441E-2       -0.256410256410
0.615384615385     .....

-5.59440559441E-3        0.234965034965         -2.64335664336          12.9230769231          .....

 5.59440559441E-2       -2.64335664336          31.7202797203          -161.538461538          .....

*Message #6 Posted by **Paul Dale** on 6 Oct 2011, 12:27 a.m.,*
in response to message #5 by Palmer O. Hanson, Jr.

The 34S seems to be getting 16 digit accuracy for this example assuming I've done things properly:

```
001  LBL A
002  .
003  0
004  8
005  STO K
006  M.ALL
007  STO I
008  LBL 00
009  3
010  6
011  0
012  3
013  6
014  0
015  RCL I
016  RCL K
017  M.IJ
018  +
019  1
020  -
021  /
022  STO[->]I
023  ISG I
024  GTO 00
025  RTN
```

Then .08 M.INV to get the inverse.

- Pauli

Re: Matrix functions on the WP 34s Build 1685: in a word "incredible"

*Message #7 Posted by **Rodger Rosenbaum** on 9 Oct 2011, 4:23 p.m.,*
in response to message #6 by Paul Dale

Valentin gave a matrix with an even higher condition number in this thread: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=84694#84694

He didn't call it AM7 in that thread, but in this document:

http://membres.multimania.fr/albillo/calc/pdf/DatafileVA014.pdf

he identifies it as AM7.

Valentin's AM7 determinant on the WP 34S

*Message #8 Posted by **gene wright** on 9 Oct 2011, 5:27 p.m.,*
in response to message #7 by Rodger Rosenbaum

is 1.0000... to the limits of precision of the machine.

The determinant of the inverse of this AM7 matrix is also 1.000... to the limits of the precision of the machine.

Amazing!

P.S. the timing is as near to instantaneous as I can imagine for the determinant and the display barely has time to flash "Wait..." or such before the inverse is computed. The determinant of the inverse is instantaneous.

Edited: 9 Oct 2011, 5:32 p.m.

Re: Valentin's AM7 determinant on the WP 34S

in response to message #11 by fhub

> Quote:
>
> But does this still hold for a 10x10 matrix?

Who knows ... try this one and see how it fares:

Albillo Matrix #10 (AM#10):

```
  29   23   40   37   30   32   66   48   38   44
  24   22   45   49   16   39   65   72   38   56
  67   44   92   37   66   20   69   14   14   37
  37   28   63   70   36   35   52   43   26   72
  21   10   19   20   23   16   27   12   13   21
```

```
  49   65   93   71   65   39   83   57   42   77
  36   26   60   68   35   33   46   38   22   69
  51   42   63   39   71   16   57   13   15   40
  31   19   43   39   22   22   53   36   35   43
  57   28   76   38   37   23   89   45   38   44

Determinant :

   1
```

The HP-71B gives DET(AM#10) as **59.9605462429** instead of 1 so it's losing *all* significant digits and then some.

You can quickly check whether you've inputted it correctly by computing its Frobenius norm, which should give:

```
    FNORM(AM#10) ->  466.407547109
```

Best regards from V.

Since a lot of us use Excel these days, I took several of these ill conditioned matrices and tried them in Excel (version 2007, on a Windows 7 PC). The determinants are:

AM1 0.99999986183

AM2 0.99999977967

AM3 1.00000101670

AM10 1.00096388386

> Well, the mystery is still there, det(AM10) on HP39gs gives...1 exactly. Even doing the trick (det(AM10)-1)*10000 gives 0!

I suggest people with a WP 34S (and other calcs as well) should try (in non-exact mode) these two nifty 10x10 matrices I've concocted for the occasion

#AM 11:

```
  65    66   -58    74    -3   -46    28    29    11     6
 -19    33    67     6    56    -6    25    20    57    49
  72    19    85   -20    46    14    39    -4    52    43
 -52    -4   -37    95    39    32    79    90     4    -4
 -16    29    71     2    60     3    30    17    61    52
 -39    24   -23    88    23   -12    63    57     4    -1
  63    82    42    28    20   -71    57    49    -7   -12
 -61   -26    47    30    77    63    77    27    26    16
  26   -43    45   -39    47    97    57   -29    43    32
  60    19    34    23    33    10    81     8   -12   -20
```

True determinant = 1

```
HP-71B determinant = 754557.820054
Frobenius norm     = 461.055311215
Row norm           = 458
Column norm        = 536
Sum of elements    = 2540
```

#AM 12:

```
 -19   33   56   -6  -23   44   25   49   57   20
  26  -43   47   97  -32   13   57   32   43  -29
 -39   24   23  -12   77   54   63   -1    4   57
  65   66   -3  -46   97   39   28    6   11   29
 -52   -4   39   32   84   47   79   -4    4   90
  72   19   46   14  -33   52   39   43   52   -4
 -61  -26   77   63  -10   37   77   16   26   27
  63   82   20  -71   19   61   57  -12   -7   49
 -16   29   60    3  -26   45   30   52   61   17
  60   19   33   10   19   53   81  -20  -12    8
```

True determinant = 1

```
HP-71B determinant = 683755.24004
Frobenius norm     = 452.653288953
Row norm           = 441
```

```
Column norm        = 536
Sum of elements    = 2597
```

Despite the very small (2-digit or less) integer elements I expect non-exact calc algorithms to lose **20-23** significant digits while computing the determinant. The norms and sum of elements are included to check correct input.

Best regards from V.

Re: Valentin's AM7 determinant on the WP 34S

*Message #20 Posted by **Paul Dale** on 14 Oct 2011, 8:39 p.m.,*
in response to message #19 by Valentin Albillo

Valentin, your guess as to the accuracy loss is spot on...

```
Matrix  Returned result       Internal result
 AM11   1.000000000000000     1.000000000000000048037082578075789975 96
 AM12   1.000000000000000     1.000000000000000057647815638165551436 05
                                                          ^ 17th digit
```

On more lost digit and the 34S will get the answer wrong. No that isn't a challenge, I'm sure it is possible.

- Pauli

*Message #21 Posted by **gene wright** on 14 Oct 2011, 8:48 p.m.,*
in response to message #20 by Paul Dale

Of course, at one point you were computing internally with more than 39 digits... but at a VERY large expense of memory, which would *not* be worth it at all.

The real point (to me) is that the 34S matrix commands seem to be more accurate by far than anything we've ever had that was calculator-portable and *ought* to handle most anything that gets thrown at them.

Great job, and someone get Valentin a 34S !!

Re: Valentin's AM7 determinant on the WP 34S

*Message #22 Posted by **Paul Dale** on 14 Oct 2011, 8:51 p.m.,*
in response to message #21 by gene wright

Currently, I'm doing the LU decomposition using temporaries of 34 digits and the multiply/accumulate calculations to 39. We're just fitting into the volatile RAM at the moment which is perfect.

- Pauli

Re: Valentin's AM7 determinant on the WP 34S

*Message #23 Posted by **Paul Dale** on 14 Oct 2011, 9:20 p.m.,*
in response to message #22 by Paul Dale

Only two calculations are done to more than the internal 39 digits, they aren't used by the matrix code.

- Pauli

Here are the results in Excel 2007 for comparison. AM12 is really tough!

AM1 0.99999986183

AM2 0.99999977967

AM3 1.00000101670

AM10 1.00096388386

AM12 4.49647974387

Re: Valentin's AM7 determinant on the WP 34S

*Message #25 Posted by **Marcus von Cube, Germany** on 15 Oct 2011, 2:29 p.m.,*
in response to message #24 by Dan W

WP 34S does an LU decomposition to 34 digits with pivoting and then computes the determinant from the diagonal. This seems to be quite stable.

Pauli, correct me, if have misread your code.

Re: Valentin's AM7 determinant on the WP 34S

*Message #26 Posted by **Paul Dale** on 15 Oct 2011, 5:50 p.m.,*
in response to message #25 by Marcus von Cube, Germany

This is correct. I'm using Dolittle's algorithm like the 15C. This is stable but not the fastest.

The only extra thing to note is that the multiply/subtract steps used in the calculation of the lower triangular matrix are done using 39 digits which could help avoid a little extra cancellation if we're lucky.

- Pauli

Re: Valentin's AM7 determinant on the WP 34S

*Message #27 Posted by **Valentin Albillo** on 16 Oct 2011, 11:27 a.m.,*
in response to message #20 by Paul Dale

> Quote:
>
> One more lost digit and the 34S will get the answer wrong. No that isn't a challenge, I'm sure it is possible.

Indeed it is. Enter **AM#13**, another one of my 10x10 matrices entirely consisting in very small (2-3 digit) integer elements:

AM #13:

```
   34    33   195   -18   213   238   -66    13    24   -56
   39   148   -51    95  -388   -11    28    31   -35    49
 -125   124  -129   130    86   -99   156   -31   -53   181
  248   -65   -44   128   107    28    71    84  -119   -10
   87   201    40   291   -25    40   -68   268   176    31
   28  -148   147    75    89   139   187  -146  -156   -22
  175    69   140   178  -143   306   182   -51  -108  -129
 -113   101  -126    97   165  -112   127    36    45   123
 -127   202   148   356   277   224   258    24    63    98
   52  -116   173    93    38   -14  -188   132    76    19
```

True determinant = 1

```
HP-71B determinant = 288,676,439,828
Frobenius norm     = 1387.86490697
Row norm           = 1777
Column norm        = 1531
Sum of elements    = 5167
```

Despite its simplicity I expect non-exact calc algorithms to lose **25-28** digits while computing its determinant.

This will surely make the final 16-digit 34S result *inexact in its last 4 or 5 digits*. Less capable calcs or computing software (say Excel) will probably lose *all* their digits, as seen in the result given above for the HP-71B Math ROM's **DET** function.

Best regards from V.

*Message #28 Posted by **Walter B** on 16 Oct 2011, 4:10 p.m.,*
in response to message #27 by Valentin Albillo

Buenas tardes Valentin,

please forgive me if my following question is mathematically trivial. But are there any smaller matrices of similar "nastyness" like AM#13? E.g. an 8x8 matrix? I'd estimate the probability for somebody keying in a 10x10 matrix into a pocket calculator being <0.01 even in an high math environment like this forum, and <1e-5 elsewhere.

TIA for your response,
Walter

Re: Valentin's AM7 determinant on the WP 34S

*Message #29 Posted by **Werner** on 17 Oct 2011, 3:08 a.m.,*
in response to message #28 by Walter B

There's no need to go even that far.

Take a 2x2 matrix

```
[[  a   a-1 ]
 [ a+1   a  ]]
```

its determinant is 1.
Now, for decimal machines, take a=2^39 = 549'755'813'888, and compute the determinant.
12-digit machines return 0. Free42 with its 25 decimal digits of precision returns

```
0.956630091747
```

The condition number of this 2x2 matrix is 1e24, even greater than Valentins 10x10 - of course, not with the same small elements.
The 34S carries 16 digits normally, so try a=2^50.
The condition number is (2*a+1)^2 or about 5e30, you'll get maybe 4 digits correct in the determinant.

Cheers, Werner

Re: Valentin's AM7 determinant on the WP 34S

*Message #30 Posted by **Paul Dale** on 17 Oct 2011, 3:20 a.m.,*
in response to message #29 by Werner

Try calculating this via:

```
5
0
2^x
FILL
DEC T
INC Y
cmplx *
```

:-)

The matrix determinant code isn't as good.

- Pauli

Re: Valentin's AM7 determinant on the WP 34S

*Message #31 Posted by **Werner** on 17 Oct 2011, 3:41 a.m.,*
in response to message #30 by Paul Dale

On the 42S I had to create the equivalent 3x3 matrix

```
[[  a  a-1  0 ]
 [ a+1  a   0 ]
 [  0   0   1 ]]
```

to bypass what you just demonstrated, because it uses the straightforward formula a*b-c*d to calculate 2x2 determinants. Here (as in the 34S) the matrix code must resort to

```
   a
( --- * a - (a-1))*(a+1)
  a+1
```

to calculate the determinant, and the first division introduces the small roundoff error.
There's nothing to be done about that, that's my point.

Cheers, Werner

Hi, Walter:

> Quote:
>
> [...] are there any smaller matrices of similar "nastyness" like AM#13? E.g. an 8x8 matrix?

Certainly. Have a look at this 8x8 matrix o'mine. Not as nasty as it sticks to small (2-3 digit) integer elements but still pretty nasty nevertheless:

AM#8:

```
  -65   153  -222   257   306   520  -121   461
  131    13   184   -69  -202    13   253  -121
   11    27   -81    88    92    44   -71    99
  347   320   267   171  -328   577   463    88
   87   237   -21   277    55   336   107   104
 -354  -223  -337  -563   548   333    63   323
  208   306    73   243  -115   563   196   215
  165   243    19   112    61   566   453   109

True determinant =  1
```

Go and try your favourite calculator against it and see how it fares and how many digits are lost.

0.9999999999999997

Which displays as 1 of course :-)

- Pauli

Re: Valentin's AM7 determinant on the WP 34S

*Message #36 Posted by **Paul Dale** on 16 Oct 2011, 5:47 p.m.,*
in response to message #27 by Valentin Albillo

Yep, that does it.

The returned value is 0.9999999999908109 instead of 1.

- Pauli

Re: Valentin's AM7 determinant on the WP 34S

*Message #37 Posted by **Marcus von Cube, Germany** on 17 Oct 2011, 2:03 a.m.,*
in response to message #36 by Paul Dale

Still slightly better then the 71B. ;)

There are 11 nines in the result so rounded to 10 digits it will still return a 1.

Walter, Pauli has committed a .wp34s source file that inputs the matrix. No need to type it in. :-)

Re: Valentin's AM7 determinant on the WP 34S

*Message #38 Posted by **Werner** on 17 Oct 2011, 2:32 a.m.,*
in response to message #36 by Paul Dale

condition nr of AM13 is (about) 4e23, so you get 11 digits correct with 34-digit arithmetic.
Free42 Decimal uses 25 digits and returns 1.01769242024 as determinant, so indeed 2 correct digits, and I guess I'm that one out of a hundred that did key in the matrix ;-)
An 8x8 matrix with a similar condition number is possible, but then the individual elements will have to be larger.
And that's my point: 34-digit arithmetic for 10x10 matrices is a bit of overkill. There will always be a matrix that returns completely wrong results. It would be better to return an estimate of the condition number instead, so that you know how many digits of the result can be trusted. If too many digits are lost, then the matrix is the problem (and the way it was obtained), not the algorithm or the number of digits the calculator uses.

Cheers, Werner

How about a M-COND command?

*Message #39 Posted by **gene wright** on 17 Oct 2011, 7:52 a.m.,*
in response to message #38 by Werner

that returns the condition number of a matrix?

Re: How about a M-COND command?

*Message #40 Posted by **Werner** on 17 Oct 2011, 8:49 a.m.,*
in response to message #39 by gene wright

a short and easy way would be what I use on a 42S: (it lacks CNRM, so I have to use row norm on the transpose)

```
TRAN
RNRM
LASTX
INVRT
RNRM
*
```

but of course, that implies inverting the matrix..
Another option would be to estimate it the way they do in LAPACK (SGECON), but that would be quite a lengthy routine, and as I've come to understand, life is short and flash is full - to paraphrase Bill Wickes.

Cheers, Werner

Re: How about a M-COND command?

*Message #41 Posted by **fhub** on 17 Oct 2011, 8:55 a.m.,*
in response to message #39 by gene wright

> Quote:
>
> that returns the condition number of a matrix?

That leads me to the following question: HOW do you compute this condition number of a matrix???

Since I didn't know its exact definition I searched a bit and found that cond(A)=norm(A)*norm(A^-1).

Well, now I have a problem with this definition: if A is ill-conditioned then computing A^-1 will give a quite inaccurate result, so also norm(A^-1) and thus cond(A) will be inaccurate.
This is what we call in German "the cat biting its own tail".

So again my question: what's the usual way to compute this cond(A)?

Franz

Re: How about a M-COND command?

*Message #42 Posted by **Werner** on 17 Oct 2011, 10:11 a.m.,*
in response to message #41 by fhub

The condition number does not have to be calculated to any great accuracy to be useful. If it is in the order of magnitude of 10^a, then we can expect to lose 'a' digits when calculating the determinant or solving a system of equations. If a is near the number of digits carried by your calculator, the matrix is said to be singular to working precision.

Cheers, Werner

Re: How about a M-COND command?

*Message #43 Posted by **Marcus von Cube, Germany** on 17 Oct 2011, 10:17 a.m.,*
in response to message #42 by Werner

Then it would be more appropriate to compute the $\log_{10}$ of the condition number as an integer.

Re: How about a M-COND command?

> The condition number does not have to be calculated to any great accuracy to be useful.

Well, that doesn't change the principle problem at all! :-(

If you have to calculate A^-1 to get cond(A), then this A^-1 could already be SO wrong for a VERY-ill-conditioned matrix (just see some DET results in this thread!), that the computed cond(A) with this wrong A^-1 would not only be of "no great accuracy" but even completely wrong.

It's the same as if you would try to measure the precision of any measuring instrument with this (unprecise) instrument itself.

Franz

FWIW, this is one of the easiest jobs d:-) The solution won't help you in the matrix problem, however ...

You're absolutely correct that this is kinda chicken-and-egg problem, you need the inverse to compute the condition number and if the matrix is very ill-conditioned your computed inverse will be practically useless.

The way out of this annoying conundrum is to simply estimate the necessary norm of the inverse as economically as possible without actually computing the inverse proper. You may want to have a look at this paper for a feasible approach:

http:/www.math.ufl.edu/~hager/papers/condition.pdf

Best regards from V.

Thanks Valentin!

A short look at this paper tells me that it isn't worth the troubles. ;-)

I've also found some other estimation algorithms on the internet, quite a few of them use the LU-decomposition of the matrix A. This M-LU is already coded in WP34s, so bringing it back to the user might not be the worst idea. :-)

Franz

*Message #52 Posted by **Paul Dale** on 17 Oct 2011, 5:45 p.m.,*
in response to message #39 by gene wright

The condition number is one I'd like to have included. We're out of flash again and scraping any back is getting much harder so it is unlikely to ever go native.

The reason I've not done this is as Franz has already pointed out: I don't

know how without suffering the effects of any ill-conditioning.

Valentin's link looks interesting.

How many people want M-LU exposed again? Assuming we can squeeze it back in.

I'm about the last person to be qualified to have a say on this but I would hazard that the LU decomposition should *always* be exposed (i.e., available) to end users, as it's pretty useful for many advanced matrix processing.

On the M-COND command, computing it reliably is not practical and a decent estimate (plus or minus one order of magnitude) is about the best that can be done within reasonable time and memory limits. However, on the other hand we should remember that what's important is the *final* goal and the condition number *isn't* it.

The final goal is to get a decent estimation on the number of digits lost in the final result when computing the matrix determinant. Abour three years ago I wrote a full 16-page article discussing and implementing a novel idea I came up with in order to achieve this goal, with worked examples aplenty and intended for its immediate publication in **HPCC Datafile** magazine (together with four or five other very worthwhile articles, even though I say so myself) but most regrettably things went South then and there through no fault of my own and the articles never saw the light.

They wanted both my articles *and* my money, though they had next to none of the former and simply way too much of the latter. They got neither.

Best regards from V.

I'd have said quite the opposite. When it comes to hard core mathematics, I value your opinion quite highly. I'll try hard to squeeze the exposed LU decomposition back in again.

Maybe not in the upcoming release, but the one after...

Re: Valentin's AM7 determinant on the WP 34S

*Message #55 Posted by **Rodger Rosenbaum** on 19 Oct 2011, 5:55 a.m.,*
in response to message #38 by Werner

AM#8 has a condition number of about 5E19 according to Mathematica, but my HP50 says the condition number is about 5E15. If the goal is to determine the true condition number, then arithmetic with many more digits than the 15 digits internally in the HP50 would be necessary.

However, if one's goal is to solve some system using the given matrix, knowing that the condition number is at least 5E15 is enough to know that any solution derived from that matrix is likely to have no correct digits (on an HP50)--we don't need to know that the true condition number is 5E19.

Testing the COND function on the HP50, I have been unable to find a matrix with a true condition number greater than E12 which was inaccurately calculated to have a smaller condition number. The calculator doesn't seem to ever seriously underestimate the condition number.

Using a column matrix of: b=[1289 202 209 1905 1182 -210 1689 1728]T along with A=AM#8, we have a linear system Ax=b. The HP50 solution of this system, using the / key, is:

x=[-85.97057 -1328.61068 452.27432 61.401457 1570.67801 1770.08111 2566.08833 471.67052]T

but, the exact solution is:

[1 1 1 1 1 1 1 1]T

We can see that the high condition number makes for no correct digits in the solution.

Using the LSQ function to solve the system rather than the / key method gives much better results on the HP50--showing the first 4 digits of the results:

[.7876 1.181 .7576 1.015 .7726 .8039 1.211 1.212]T

This shows the advantage of orthogonal methods of solution rather than the Gaussian method.

Re: Valentin's AM7 determinant on the WP 34S

*Message #56 Posted by **Werner** on 22 Oct 2011, 1:43 p.m.,*
in response to message #55 by Rodger Rosenbaum

Hi, Rodger! Long time no hear.

> Quote:
>
> This shows the advantage of orthogonal methods of solution rather than the Gaussian method

But LSQ performs a rank determination, and will probably deem the matrix rank 7 (which, in 15-digit arithmetic, it is). Orthogonal transformations on the 8x8 matrix would not yield better results. I think ;-) (but I will be sure to verify)

Cheers, Werner

Re: Valentin's AM7 determinant on the WP 34S

*Message #57 Posted by **Valentin Albillo** on 17 Oct 2011, 4:09 p.m.,*
in response to message #36 by Paul Dale

Hi, Pauli:

> Quote:
>
> *(the underlining is mine)* Yep, that does it.
>
> The returned value is 0.999999999908109 instead of 1.

So the last 5 digits are lost as well, just as predicted ... :D

Now it's quite simple to concoct a 10x10 matrix with integer elements, still relatively small (6 digits or less), which should make the 34S result lose ***all its digits*** (and about 10 more if they were available !) and there's no need to painstakingly key in the 100 elements.

You simply use **AM#13** *squared*, i.e., form a new matrix **AM^2#13** by multiplying **AM#13** times itself. You'll get:

AM^2#13:

```
 -20180   47048    7076   98251   41242   14030   64203   13262   -3203   47956
  11359  -73359  -11370  -94757  -41339   -5116   15477  -82406  -79528  -19197
 100607   -2350   18324   54227 -118108   11778  -46780   68188    6781  -32421
  70760   -7344   40129   10754   58137   61653  -23236   33140   -2354  -34295
  13986   62051  -18247  135133   83179   15409   97207   39458  -19488   67225
  74931  -41113   32420   12012    -678   57658   21586  -20364  -55150  -41049
  76033  -51699   37581    2730    3139  107847  114841  -98712 -138280  -36810
  69960   46252   16119  100837  -72889   21405  -18475   86423   35487  -10128
 143252   65026   33559  263485  -53355   94084  133288   73613  -61885   21603
 -54883   23173  -39308   40609  149155  -56851   20293   30429   26420   71570
```

True determinant = 1

```
HP-71B determinant = -5.1369256228 E32 (!)
Frobenius norm     = 661395.105928
Row norm           = 943150
Column norm        = 812795
Sum of elements    = 1928143
```

If I'm correct you should lose **45-50** digits at the very least so completely ruining the 34S result (let alone other models' !).

Of course it is possible to produce a 10x10 matrix with smaller integer elements and similarly high condition number but it would be necessary to key it in which would be a pain in the *derriere*.

Best regards from V.

I think you can do this ad nauseam. Squaring an ill conditioned matrix should

roughly square its condition number thus doubling the number of lost digits. Still interesting that you can do this with such harmless looking integers.

*Message #69 Posted by **Werner** on 10 Oct 2011, 2:41 a.m.,*
in response to message #67 by Paul Dale

The condition number of AM10 is about 3e14, so you can expect to lose at least 14 digits, that's about right then.
Interestingly, even trying to estimate the condition number on a real 42S gives the wrong result since there, it loses all digits and the column norm of the inverse matrix is off by an order of magnitude... had to use Free42 ;-)

Werner

*Message #76 Posted by **Crawl** on 5 Oct 2011, 11:05 p.m.,*
in response to message #1 by gene wright

Of course, if you did expansion in minors (iteratively), you should get the exact result as well ... right? Because then it's just multiplication and addition of integers, no division.

This would probably not be true for finding the determinant of the inverse, though, because in that case, the entries are so big that multiplying them out would lead to truncation error.

Re: Matrix functions on the WP 34s Build 1685: in a word "incredible"

*Message #77 Posted by **Paul Dale** on 5 Oct 2011, 11:13 p.m.,*
in response to message #76 by Crawl

Expansion by minors is O(n!) time. The algorithm I've used is $O(n^3)$ time.

For a 10x10 matrix this is likely to be significant. For small matrices there is no real difference. For the 7x7 examples here, I've no real feeling what the speed differential would be.

Expansion by minors is also going to be at a great risk of bad cancellation if the intermediate results get truncated.

- Pauli

For what it's worth, if you replace the 1,1 entry in matrix 1 (58) with 58+x, the determinant is

1+96360245x

For matrix 2, it would be

1+193969587x

and for matrix 3,

1+294228951x

giving some hint as to why these three matrices are "ill conditioned".

What to do with mushy voyager snap domes?

*Message #1 Posted by **Nicholas Winterer** on 4 Oct 2011, 7:38 p.m.*

I have a 12C and 16C, each with one mushy key. I opened the 12C today (I'm using my 12C for practice and will crack open the 16C later if everything goes well) and un-staked the PCB, expecting to find a puncture in the little rubber pad between the back of the keys and the snap domes. The rubber pad turned out to be fine, but the snap dome behind the FV key feels weird. It doesn't have as pronounced of a snap as the other domes, but otherwise it looks fine.

What would cause a snap dome to go mushy and is there anything I can do to fix it? If there's no simple fix for the bad dome, I was thinking about trying to cut the bad dome out and switch it with the pristine dome at the bottom of the enter key. Are the domes simply taped above the proper spot on the PCB?

I would really appreciate any advice on how to proceed here.

Thank you!

Which key(s) out of curiosity?

> Quote:
>
> What would cause a snap dome to go mushy and is there anything I can do to fix it?

Fatigue of the dome due to normal cycling or improper/defective actuating probe in the keycap. Domes are stamped to precise geometries and when worn out need to be replaced.

> Quote:
>
> Are the domes simply taped above the proper spot on the PCB?

The domes used in a voyager are unique IME as they are packaged as 5 domes on a carrier strip which happens to correspond to a key matrix scan row. Electrically the carrier is redundant and likely exists just to ease dome placement during assembly as the carrier strip mates with adjacent heat stakes. But a 8.5~9mm isolated dome will work as well. Conventional snap domes are normally mounted to a pcb with no more than an overall polyester adhesive sheet.

Re: What to do with mushy voyager snap domes?

*Message #3 Posted by **robert rozee** on 5 Oct 2011, 12:37 a.m.,*
in response to message #2 by uhmgawa

i'd be inclined to swap a whole strip of 5 domes from a beyond-repair donor 12C (completely dead, broken screen or damaged case), which can likely be purchased on ebay for very little. although the strip joining groups of 5 domes together serves no electrical purpose, my gut feeling is that it does help stabilize the dome location - perhaps contributing to the exceptional lifespan of the original voyagers.

Re: What to do with mushy voyager snap domes?

*Message #4 Posted by **Nicholas Winterer** on 6 Oct 2011, 3:18 p.m.,*
in response to message #3 by robert rozee

My current 12C could become the donor for my 16C (I have a 12C+ so I hardly ever use the original anyway), but first I want to see how solid it feels once I get it back together. If it's really bad I will probably just live with the mushy 5 on my 16C.

FV on the 12C and *5* on the 16C.

By the way, uhmgawa, was it you who posted dissembled 12C+ pics in another thread? I remember seeing them recently but couldn't find them again when I went to look. I'm wondering if adding one of those rubber pads from an old voyager could improve the key feel on the 12C+/15C LE (seems like it could dampen the hard click).

Re: What to do with mushy voyager snap domes?

Interesting. Not keys I'd expect to see high cycle usage.

> Quote:
>
> By the way, uhmgawa, was it you who posted dissembled 12C+ pics in another thread? I remember seeing them recently but couldn't find them again when I went to look.

Yes, they are here hp12c_plus_teardown but I've also copied them to flickr.com which I found to be a bit more linux usage friendly.

The more pronounced click in the sam7l voyagers is due to use of a cut, 4 legged dome. Perhaps to ease pcb routing or perhaps it was thought to be an improvement. It isn't IMHO but they are selling just fine anyway. Actually the primary motivation for the dismembered 12c+ above was upon first acquiring one I puzzled what HP did to the keypad which resulted in such a hollow, economical tactile feel.

Note the 12c+ does have a rubber pad over the dome's adhesive sheet.

Re: What to do with mushy voyager snap domes?

*Message #7 Posted by **John Robinson** on 5 Oct 2011, 1:24 a.m.,*
in response to message #1 by Nicholas Winterer

I've done successful dome swaps on 41c calcs, so I presume the voyagers are similar. On the 41c, a sheet of sticky plastic film covers the domes, I simply peel it back, replace the dome with one from a donor calc, and put the sticky plastic back.

Cheers, John

56 HP-41CX's Sold At Government Auction

*Message #1 Posted by **John M (Ottawa)** on 4 Oct 2011, 6:14 p.m.*

A lot of fifty-six (56) HP-41CX's sold recently at Canadian Government surplus auction (called Crown Asset Distribution).

Link to HP-41CX Auction

It will be interesting to see if this will affect the overheated HP-41CX market on TAS. It depends on how the buyer will disperse his trove of 56 calculators.

Footnote: At least one of the HP-41CX's is actually an HP-67.

Re: 56 HP-41CX's Sold At Government Auction

*Message #2 Posted by **hpnut** on 4 Oct 2011, 6:42 p.m.,*
in response to message #1 by John M (Ottawa)

wow! they were sold at $30 Canadian a piece!

Re: 56 HP-41CX's Sold At Government Auction

*Message #3 Posted by **Raymond Del Tondo** on 4 Oct 2011, 6:55 p.m.,*
in response to message #2 by hpnut

But look at the boxes! If the calcs were handled like the retail boxes, it's more than likely that there's a certain amount of waste in the box, including broken calcs...

Re: 56 HP-41CX's Sold At Government Auction

*Message #4 Posted by **Howard Owen** on 4 Oct 2011, 8:03 p.m.,*
in response to message #3 by Raymond Del Tondo

But at least you've got plenty of spare parts. :)

Scalpers. HP 15C old is now cheap and rare..

*Message #1 Posted by **bill platt** on 4 Oct 2011, 4:21 p.m.*

I never thought that this would turn out this way! Obviously most of the HP 15C LE machines ahve been bought by scalpers. These are being turned on Ebay for measurable premium.

Meanwhile, real 15C machines are at a lower average price and are practically drowned out in the completed listings.

Original HP 15C machines, hammer prices:

```
250
260
710
209
167
295
99
117
325
169
165
125
100
191
210
110
180
100
129
```

Average = $206 Lowest = $99 Highest - $710 (a new record1?)

Compare this to the prices for the new 15C LE: Average close: $220 Lowest: $147 Highest: $447

Edited: 4 Oct 2011, 4:47 p.m.

Crystal to my 30b

*Message #1 Posted by **robertoataulfo** on 4 Oct 2011, 4:06 p.m.*

```
To make the time functions accurate, it requires adding a crystal to my 30b.
Has anyone compiled a parts list and where to put them in a 30b?
Can I use this crystal for this purpose?

http://commerce.hpcalc.org/20bkit.php
```

Edited: 4 Oct 2011, 4:07 p.m.

Re: Crystal to my 30b

*Message #2 Posted by **Walter B** on 4 Oct 2011, 4:44 p.m.,*
in response to message #1 by robertoataulfo

Marcus is our soldering expert here. He will tell you :-)

Re: Crystal to my 30b

*Message #3 Posted by **Marcus von Cube, Germany** on 4 Oct 2011, 4:44 p.m.,*
in response to message #1 by robertoataulfo

You just need the crystal and the two capacitors for the modification. Be prepared for some frustration while trying to solder the tiny parts to the barely appropriate solder pads. But its worth the effort and makes the serial interface much more reliable.

Re: Crystal to my 30b

*Message #4 Posted by **Gerry Schultz** on 4 Oct 2011, 5:17 p.m.,*
in response to message #3 by Marcus von Cube, Germany

Hey Marcus, I asked Eric Rechlin of Hpcalc.org at the end of the HHC conference about this and he says he will be putting together a kit of parts needed to add a crystal to a 30b sometime before the end of the year. I too am interested in adding the crystal and capacitors to my 30b and if I had the values for the parts I could order them myself. But being a lazy person, having Eric put together the parts is good too.

Gerry

Re: Crystal to my 30b

Marcus are these items?

http://commerce.hpcalc.org/20bkit.php
```

Re: Crystal to my 30b

*Message #6 Posted by **Marcus von Cube, Germany** on 5 Oct 2011, 1:52 a.m.,*
in response to message #5 by robertoataulfo

Yes, but you just need:

- 18 pF 0603 capacitors (quantity 2)
- 32.768 kHz clock crystal (quantity 1)

Re: Crystal to my 30b

*Message #7 Posted by **E.Lub_EU** on 7 Oct 2011, 10:49 a.m.,*
in response to message #5 by robertoataulfo

Roberto,

As Marcus mentionned in his reply, you only need a crystal and 2 capacitors to add to your 30b. One caveat is that the crystal has to be "compatible" with the capacitors chosen. Eric will have taken care of that in his kit.

If you do not get the kit through Eric, please verify that you order a crystal that is specified for a 12pF capacitive load (this parameter is often designated as "CL" in the specification sheet).

Hope this helps.

Good luck!
Etienne

wp34s decals?

*Message #1 Posted by **Evan Gates** on 4 Oct 2011, 2:51 p.m.*

I'm interested in trying water slide decals instead of the normal stickers for the wp34s. Has anyone tried this? Is anyone knowledgeable on the subject of decals? I haven't used them since my last pinewood derby car back in cub scouts...

Just tossing around an idea, -Evan

Re: wp34s decals?

*Message #2 Posted by **David Ramsey** on 4 Oct 2011, 3:01 p.m.,*
in response to message #1 by Evan Gates

I think they'd be much (much) less durable than the thick vinyl adhesive decals.

Re: wp34s decals?

*Message #3 Posted by **Evan Gates** on 4 Oct 2011, 3:13 p.m.,*
in response to message #2 by David Ramsey

I'd definitely clear coat it. Not owning the 20b or 30b yet, is it easy/possible to take off the front plate and keys? If not this may be impossible (well, extremely difficult).

-Evan

Re: wp34s decals?

*Message #4 Posted by **Marcus von Cube, Germany** on 4 Oct 2011, 3:43 p.m.,*
in response to message #3 by Evan Gates

Depending on model you have to open a number of heat stakes (more on the 30b then on the 20b).

Re: wp34s decals?

*Message #5 Posted by **Eric Rechlin** on 4 Oct 2011, 5:21 p.m.,*
in response to message #1 by Evan Gates

I've got everything necessary to make them but I haven't had the chance to try it out yet. The problem is contrast on the silver background (obviously it won't work so well on the keys, since you can't print white ink). Also it seems like a lot of work to install.

Eric

update 12C ?

*Message #1 Posted by **robertoataulfo** on 4 Oct 2011, 10:02 a.m.*

There is an update to HP-12C? Thanks

Re: update 12C ?

*Message #2 Posted by **Paulo MO** on 4 Oct 2011, 10:53 a.m.,*
in response to message #1 by robertoataulfo

?? I don't think so, unless you're referring to the "new" ARM architecture (aka 12c+) as an update (it certainly is faster ;-))

Cheers Paulo

Re: update 12C ?

*Message #3 Posted by **Jeff O.** on 4 Oct 2011, 12:20 p.m.,*
in response to message #1 by robertoataulfo

Do you mean an updated rom for the 12c+? (12c+ being the unofficial name of the current 12c architecture with two 2032 batteries and the ARM processor.) If so, the answer is maybe. As I understand things (as discussed here, for example), the latest rom for the 12C+ is dated 2009-11-19 (as shown by menu no. 2 of the ON+g+ENTER self tests.) It was developed in a give and take primarily between Katie Wasserman and Cyrille de Brébisson soon after the 12c+ appeared.

...

Re: update 12C ?

*Message #4 Posted by **robertoataulfo** on 4 Oct 2011, 12:44 p.m.,*
in response to message #3 by Jeff O.

```
How does this new rom?
How do I get it?
The procedure for installing it is equal to WP34S?
```

Re: update 12C ?

Yes, identical procedure.

..

Re: update 12C ?

*Message #6 Posted by **Marcus von Cube, Germany** on 4 Oct 2011, 3:25 p.m.,*
in response to message #5 by Jeff O.

You should go to http://sourceforge.net/projects/wp34s/files/FlashTool/ and download the most recent Version of MySamBa. It is much faster then SAM-BA.exe. It works for all images, not only for WP 34S.

Re: update 12C ?

*Message #7 Posted by **Jeff O.** on 4 Oct 2011, 4:26 p.m.,*
in response to message #6 by Marcus von Cube, Germany

Marcus,
What is the compatibility of the new $\text{MySamba}_{\text{Marcus}}$ with Windows XP/Vista/7 etc.? How about serial to USB converter issues? Seems like these were major issues with SAM-BA, does $\text{MySamba}_{\text{Marcus}}$ ameliorate them?

Re: update 12C ?

*Message #8 Posted by **Marcus von Cube, Germany** on 4 Oct 2011, 4:40 p.m.,*
in response to message #7 by Jeff O.

In effect $\text{MySamBa}_{\text{Marcus}}$ == $\text{MySamBa}_{\text{Cyrille}}$ with very minor modifcations. I cannot comment on compatibility with different brands of adapters of different versions of Windows but I assume that is has less issues then SAM-BA.exe. I'm hoping for feedback.

Re: update 12C ?

*Message #9 Posted by **Jeff O.** on 5 Oct 2011, 12:23 p.m.,*
in response to message #8 by Marcus von Cube, Germany

Can you remind me of the advantage(s) of $\text{MySamba}_{\text{M}}$ over $\text{MySamba}_{\text{C}}$? In a previous post you mention that it is faster than Sam-Ba, are there other changes? Perhaps it can load a less than 128 kB bin file into a 20b/30b?

I have a PC running Windows Vista with no serial port, and have purchased an FTDI USB to serial converter which claims to have drivers for Vista. I'll give $\text{MySamba}_{\text{M}}$ a try and see how it works.

Re: update 12C ?

*Message #10 Posted by **Marcus von Cube, Germany** on 5 Oct 2011, 2:15 p.m.,*
in response to message #9 by Jeff O.

Cyrille's version does not work with flash images that are shorter then 128KB.

Re: update 12C ?

*Message #11 Posted by **Tim Wessman** on 5 Oct 2011, 3:49 p.m.,*
in response to message #10 by Marcus von Cube, Germany

It also appears to correctly identify COM ports on Win7. Previously none would show up. :-)

This means you can now use this program on any version of windows (just tested it) and I can trash my XP VM that was wasting quite a bit of space on my SSD. :-)

TW

Re: update 12C ?

*Message #12 Posted by **Marcus von Cube, Germany** on 5 Oct 2011, 4:36 p.m.,*
in response to message #11 by Tim Wessman

If Cyrille's version did not do this correctly than it's a matter of the compiler (Delphi 2005) and the library (I use Indy 7). My changes to the code are minor, only dealing with the length of the file.

Modified Flash Tool for WP 34S

*Message #1 Posted by **Marcus von Cube, Germany** on 4 Oct 2011, 4:37 a.m.*

I've uploaded a modified version of Cyrille's MySamBa download tool to SF. Please try it out on your machines and report back here.

Re: Modified Flash Tool for WP 34S

*Message #2 Posted by **Marcus von Cube, Germany** on 4 Oct 2011, 6:07 a.m.,*
in response to message #1 by Marcus von Cube, Germany

First Impression: I works just once. :-(

It seems that the software write protects the flash after updating it which makes it impossible to burn another image once the tool has been used. You need to do a full erase first. I will investigate this further.

Re: Modified Flash Tool for WP 34S

*Message #3 Posted by **Namir** on 4 Oct 2011, 9:12 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Marcus,

That does not sound too user friendly!!!!

Namir

Re: Modified Flash Tool for WP 34S

*Message #4 Posted by **Marcus von Cube, Germany** on 4 Oct 2011, 9:56 a.m.,*
in response to message #3 by Namir

The problem is that I need to disassemble and modify ARM assembly code which exists as a hex dump only in the program. I have an idea but this will need some testing.

Cyrille talked about doing the disassembly with an HP 50g. Is anybody here with enough knowledge to help me? I can post the hex dump here if needed.

Edit: here it is:

```

I turned out that the routine assumed a clear memory which can be simply written without erase (command #1) at address 200c28. I changed that to #3 (erase and write) and this should have done

the trick. I was able to replace the 34S image with the original 20b ROM and back to WP 34S.

I'm uploading the modified version on SF.

Re: Modified Flash Tool for WP 34S

*Message #6 Posted by **Marcus von Cube, Germany** on 4 Oct 2011, 12:17 p.m.,*
in response to message #5 by Marcus von Cube, Germany

```
200B48 E3A01C02 MOV     r1, #1<<9
```

If you look at this instruction you can see that r1 is loaded with the number of flash pages. r1 is later used to stop the download, set the boot bit and reset the calculator. I'd like to replace it with an instruction that loads an arbitrary constant (the number of flash pages in the current bin file). The number is <= 512. Any ARM specialist who can help me out? Is there an instruction that allows this? We can assume that the size is a multiple of 4 so something like MOV r1, #n<<2 should do the trick and I just need to fill #n with the correct value (<=128) before I send the code to the calculator.

Could wp34s influence HP to offer 30b in different firmwares?

*Message #1 Posted by **Harry Jacobson** on 4 Oct 2011, 4:00 a.m.*

This is not meant to take away from all the work and enthusiasm about the WP34s. What if HP joined in the fun this way:

What if HP were to offer something like the 30b in three versions: (1) the HP business professional version, (2) the HP scientific version, and (3) entrepreneur generated special versions, all with catchier marketable names and keyboard overlays. The point being HP recognize - for profit - the same hardware platform be used to satisfy more than one market niche? Might that reduce HP's development cost and garner more features and benefits to the community?

Instead of software modules the *entire calculator* could be performance tuned for different purposes, e.g., surveying, construction, celestial navigation (kidding). An entrepreneur preferring the key layout of the 12C might put out a version with a re-organized key layout. Schools could maintain a collection of firmwares and overlays for different coursework. The imagination takes flight.

It's almost 4am and my eyes are burning. I've read through a ton of entertaining threads tonight. I love this forum!

Harry

Re: Could wp34s influence HP to offer 30b in different firmwares?

*Message #2 Posted by **Marcus von Cube, Germany** on 4 Oct 2011, 5:02 a.m.,*
in response to message #1 by Harry Jacobson

Key labeling is the point. The current hardware isn't friendly to legends above or below the keys. It's a matter of case production (HP told me they will never ever use the same case molding technique again.)

The current WP 34S firmware will not be flashed into a commercial product. The license (GPL) needs to be adhered to (easy, just put the source code on a CD and sell the calculator together with the cable) but the firmware isn't "production friendly" because it does not contain a self-test, may still be buggy, depletes the batteries, etc., etc.

Writing custom solutions is possible but the effort is huge as can be seen with our project. Cyrille's SDK could be a base for this and was conceived with just this idea in mind.

Re: Could wp34s influence HP to offer 30b in different firmwares?

*Message #3 Posted by **Paul Dale** on 4 Oct 2011, 5:15 a.m.,*
in response to message #2 by Marcus von Cube, Germany

The 34S doesn't use HP's maths library which seemed to be an issue when I raised the possibility a while back. RPN only might be one as well.

The GPL license isn't necessarily a sticking point. We, the authors, are quite at liberty to license the software under different terms as well. I would be very attentive to an approach by someone wanting to put the device into commercial production.

The "production friendly" comments are definitely applicable. I expect we could work around these if required. For example, preloaded keystroke programs or a factory test image that ends up reflashing the device via serial with the real image.

Finally, the effort to write firmware can be greatly reduced if a sensible calculator framework is already written and debugged. e.g. have the power management, the keyboard state machine, the display driver and fonts all written. Add in a number of common numeric functions and the function dispatching and stack management code. The custom solution then ends up more of an exercise in tweaking the keyboard and screen code and adding missing pieces of functionality. However, even given all this it is still going to be a lot of work getting things just right.

Re: Could wp34s influence HP to offer 30b in different firmwares?

*Message #4 Posted by **Masaki Adachi** on 4 Oct 2011, 11:31 a.m.,*
in response to message #2 by Marcus von Cube, Germany

I was actually wondering if HP could provide the hp20b/30b ingredients in a kit form, like good old Heathkit or Japan's Gaekken kits (http://www.makershed.com/SearchResults.asp?Cat=65) HP can certainly write a most complete assembly instruction book I am sure.

PCB assembly with LCD already attached keypad(s) Overlay(s) top case bottom case programming cable CD with firmware a thick instruction manual. batteries included

Re: Could wp34s influence HP to offer 30b in different firmwares?

*Message #5 Posted by **Walter B** on 4 Oct 2011, 3:35 p.m.,*
in response to message #4 by Masaki Adachi

I don't know for sure, but according to my observations the times of such kinds of assembly kits are gone. Most members of the target market seem to have more money than time nowadays. Add that's it not hip or cool (or whatever term you prefer) for many people anymore to assemble their own equipment - so called "professional solutions" sell better, though their quality may not justify it in every case. Thus I doubt there will be something like a set of assembly kits you describe.

Just my 20m€

Walter

Sandmath-II and 41Z - questions to Angel

*Message #1 Posted by **Vincent Weber** on 4 Oct 2011, 3:34 a.m.*

Hi Angel if you are reading,

I am getting confused over the versions and usage of your wonderful modules...

For Sandmath-II, is it a replacement for the 8K Sanndmath module ? it seems that no 12K version is available any more on TOS, does it mean we need to use the ALGEBRA module instead ?

For 41Z, I downloaded the latest version, and I am getting confused over the key assignements. When I execute ZK?YN and press Y, the "SIGMA+" key, which used to prompt "Z" for Z commandes, now displays "-HP 41Z". Is it normal ?

Also, be it with V41 or i41CX+, CAT 2 does not display the whole 41Z catalog (only the ZMATH and ZVECTOR "subdirs")... unless the CCD module is plugged in, in which case everything is ok... ?

it would be nice if you could post a summary about with are the current versions of all your modules, so that no confusion exists ;)

Many thanks and best regards,

Vincent

Re: Sandmath-II and 41Z - questions to Angel

*Message #2 Posted by **Ángel Martin** on 4 Oct 2011, 4:23 a.m.,*
in response to message #1 by Vincent Weber

Hi Vincent, yes I'm reading :-)

First off, you're not alone in this confusion - I myself need to have a roadmap to keep track of all the different versions and releases of these two modules - in particular the SandMath saga - so I can't imagine what's like for the casual user.

So let me try to do a summary recap. The 41Z is easier, let's tackle it first.

Because of the different addiditons and enhancements made to it, the FAT function order has slightly changed from some older revisions to the current one (9H). This explains why your key assignments can be mixed up, if they were made using a previous version of the module. The internal "ZY?YN" function is supposed to be alright whichever revision, in other words consistent with the changes made. Revision 9H assigns "ZKBRD" to the SIGMA+ key, but it's possible that the one you're using has some glitches.

I typically use only ZKBRD and not the complete USER keyboard, as that gives me better compatibility with the standard functions (i.e. for real numbers) and with the SadnMath launchers - Also it doesn't take up so many KA registers.

As to the CAT2 listings - you're correct, because of the length of the "header" functions being less than 7 they don't show up in the standard CATALOG - only the CCD-style. I did it this way to allow direct execution of the functions using "XEQ, ALPHA, fcn_name". Since I always have the AOSX module plugged in (the 4k subset of the CCD) it's a non-issue to me, but I could change it of course.

BTW, revision 9H is not released yet . I just finished making big changes to the launchers code, replacing an old pedestrian scheme with a MCODE-table based new one. This has resulted in huge space savings, more than 256 bytes freed up so I could "squeeze" in the wonderful ZZETA program - adapted from JM Baillard's original one.

I'm leaving the SandMath for later, this is getting kinda long. Thanks again for your interest in these modules.

Best, ÁM

Re: Sandmath-II and 41Z - questions to Angel

*Message #3 Posted by **Vincent Weber** on 4 Oct 2011, 4:44 a.m.,*
in response to message #2 by Ángel Martin

Hey Angel, Many thanks for your fast and detailed answer ! I shall wait for the Sandmath saga then ;) Just a few clarifications about 41Z: I am using 9F, the latest available on TOS. Starting fresh with a clear memory, using ZK?YN does NOT assign ZBRD properly. But the previous version (supplied with V41) does ! Also, with 9F, clearing memory trying leaves the calc in a state when nothing can be done - compley bricked until your remove the module, on both V41 and i41CX+. Is it normal ?

Thanks and cheers,

Vincent

Well, it's a bug - so it's not "normal". I changed the code to make use of the CPU M register not realizing that the [RESIZE] routine overwrites it. A previous version was using register Q(9), but I consolidated the two interrupts (Memory_Lost and CALC_ON) and that's when it got broken.

Anyway it's also fixed in version 9H, if you tell your email I'll be glad to send it to you.

Cheers, ÁM

Sandmath Modules Roadmap

*Message #6 Posted by **Ángel Martin** on 4 Oct 2011, 7:25 a.m.,*
in response to message #1 by Vincent Weber

In the beginning the SandMath was available in two flavors, the 8k version and the 12k version - with the latter just adding a Matrix/Polynomial section on top of the 8k version, and thus a real superset.

The 12k footprint has some obvious issues that made me reconsider that arrangement. Besides, more Matrix routines were competing for the same space, and there was no available room in the 12k version to accomodate for them. The straw that broke the camel's back was my new "Matrix Editor" mode, which required substantial room to code and would never fit in the 12k - so it was time for a new approach.

That's when I rolled the 8k version into the "SandMath-II", as a direct replacement, and when I released the ALGEBRA module. This one is a self-contained ROM, that does not have any dependencies on the SandMath-II - so they can be used independently.

So far so good, but there are a few side frills that make the story more interesting :-).

Shortly after this (or it may have been simultaneously, not sure anymore) I decided to put together a Matrix add-on to the SandMath-II. This is available as the MATRIX ROM, a 4k module that only works in combination with the SandMath-II. Its contents is basically the same as the matrix-related stuff in the ALGEBRA module - but of course it lacks everyting else. The 4k-MATRIX ROM is a subset of the ALGEBRA Module.

But wait, the plot thickens:- As both the 8k-ALGEBRA and the 4k-MATRIX rely on the ADVANTAGE Pack (all those wonderful MCODE Array functions from the CCD being there), it occurred to me that the ultimate MATRIX module should be a page-switched, 12-k construct occupying just 8k, with (at least) the same contents as the MATRIX rom plus all the Matrix functionality of the Advantage Pack.

And that's the ADVANCED_MATRIX Pac - which BTW also retains both SOLVE and INTEG just to make things more complicated :-) In truth, this was motivated by the page-switching design, and also due to the fact that one of the 4k blocks doesn't have a FAT (obviously). SOLVE and INTEG are monster routines, filling up 3/4th.s of a block, so they lend themselves splendidly to this usage.

In case you wonder, the ADVANCED-MATRIX Pack does not require the SandMath-II module either, so there's some inevitable redundancy but the dependencies are removed. However it does not have the Polynomial programs of the ALGEBRA ROM, so alas, it's not a superset of it.

The obvious missing piece in all this jigsaw puzzle would be a 4k-Polynomial ROM, to use on top of the ADVANCED_MATRIX Pac to come up with a real superset of the ALGEBRA Module with the Advantage Pack power into it. Are we lost yet? I am, somebody please draw a sketch! ... "-)

Which ones to use? Your choice, depends on what you're more likely to do or need at a given point.

PS. In case you got this, let me throw another couple of logs to the bonfire:- Another two modules that are very closely related to the ones described above are the "BESSEL ROM" and the "POLYNOMIAL_ROM", done in collaboration with Jean-Marc Baillard. Those two are also self-contained, and treat the subjects with a deeper/wider reach. Not for the faint of heart, but a wonder for the adventurous.

Hope this helps, and again thanks for your interest in all those roms.

Best, ÁM

Re: Sandmath Modules Roadmap

*Message #7 Posted by **Geir Isene** on 4 Oct 2011, 8:33 a.m.,*
in response to message #6 by Ángel Martin

Would it help to move all the reusable code into it's own 4K MATHLIB module and then have the other modules as pure 4K modules calling MATHLIB when needed? More modular methinks.

Re: Sandmath Modules Roadmap

*Message #8 Posted by **Ángel Martin** on 4 Oct 2011, 10:25 a.m.,*
in response to message #7 by Geir Isene

Yes methinkstoo - albeit it's easier to say it than to do it. At the end of the day it's all about footprint and there's only 32k that can be actively mapped at a time. Add to that the other system constraints (limited FAT entries, XROM id# conflicts) and you'll have a nice challenge in your hands.

On the other hand, work to get port #4 as a silent library is already in progress... just not only with a MATH focus though.

Re: Sandmath Modules Roadmap

*Message #9 Posted by **Eric Smith** on 4 Oct 2011, 11:11 a.m.,*
in response to message #8 by Ángel Martin

Remember that using block 4 will be incompatible with the HP-IL module when the printer enable switch on the latter is turned off. The switch moves the printer ROM from page 6 to page 4.

Re: Sandmath Modules Roadmap

*Message #10 Posted by **Geir Isene** on 4 Oct 2011, 12:57 p.m.,*
in response to message #9 by Eric Smith

Why turn it off, though?

Re: Sandmath Modules Roadmap

*Message #11 Posted by **Ángel Martin** on 4 Oct 2011, 2:21 p.m.,*
in response to message #10 by Geir Isene

because you may:

a) use the IR printer, and the IR module takes page #6
b) not have any printer and want to spare the CAT2 searches
c) none of the above :)

Re: Sandmath Modules Roadmap

*Message #12 Posted by **Eric Smith** on 4 Oct 2011, 6:01 p.m.,*
in response to message #11 by Ángel Martin

Or because you have the 82143A printer.

Re: Sandmath Modules Roadmap

*Message #13 Posted by **Vincent Weber** on 4 Oct 2011, 9:04 a.m.,*
in response to message #6 by Ángel Martin

Thanks Angel for the detailed explanation ! Just to add to the confusion: I noticed you also did a curve fitting module. How is it compared to the ADVANTAGE CFIT or with the one in AEC ? i noticed that you left the SILOOP routine in your advanced matrix pac and that you have some linear régression routines in Sandmath, how is all this related ? Thanks and cheers Vincent

Re: Sandmath Modules Roadmap

*Message #14 Posted by **Ángel Martin** on 4 Oct 2011, 9:59 a.m.,*
in response to message #13 by Vincent Weber

The CurveFitting Module is a compendium of all the related techniques from the other modules, as follows:

1. includes the AECrom functions and programs - impressive!
2. includes the Advantage Pack CFIT
3. includes W. Kolb's seminal CF program
4. throws in the Standard pack CFIT just for kicks
5. plus a selection of statistical and probability functions, among which you've seen the Linear regression (also in the SandMath)

Pfeeww....

PS. SILOOP and SIRTN must remain in the ADVANCED_MATRIX as they're an integral component of SOLVE / INTEG. A real wonderful implementation, worth spending some time studying...

Angel, favor ? And the Curvefit is a .mod not a .rom !

*Message #15 Posted by **gene wright** on 4 Oct 2011, 10:12 a.m.,*
in response to message #14 by Ángel Martin

Angel...

So many modules, so confusing to most of us. :-)

Favor?

Please give us a short list of the modules you presently have on TOS along with a short explanation of what is in them. 2 sentences perhaps. Please indicate which roms are "obsolete"

I think it would also help if you could indicate which roms are in the 41CL and what the 4 letter rom abbreviation is in the 41CL.

This is not a criticism! I LIKE your rom enthusiasm but it is difficult to keep them straight! :-)

And, any chance we can get a curvefit .rom format? Our 41CL units are waiting. ;-)

Edited: 4 Oct 2011, 10:28 a.m.

Great, now which of yours in this list are obsolete?

(My CLUTILs version did not have that function - hopefully in a week or two it will)

There are a couple of errors in this table.

The mnemonic for the Mainframes Labels is "MLBL"

The mnemonic for the Multiprecision Library is "MLTI"
and it is a 4k ROM.

Remember that mnemonics must use unique first and last
characters to be parsed correctly.

HP15C LE Keyboard Issues (...and 3.5 Years Ago)

*Message #1 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 4 Oct 2011, 1:38 a.m.*

Significant amount of keyboard issues with number of HP 15C LE out there. I recalled an article finally located it in EE Times early 2008.

EE Times Article 2/1/2008

Back then Director of Product Development group of HP Calculators Sam Kim has said about about the keyboard design on HP 35s which has 25 screws!! (BTW HP 35s cost 1/2 of HP15C LE)

"I really wanted to design something for the old-time calculator user while also attracting new customers."

(it's held together by 25 screws. Kim explains, "The keyboard is the most important part of a calculator. It must work year after year. Those 25 screws hold it down rock solid. The keyboard will never get loose and this thing will last forever. It costs us more, but it demonstrates the attention to detail we've put in.")

Article goes on quoting that "HP claims that it performs a one-million key press-test on the keyboard. This means that the keyboard will survive at least a million key presses. Putting that in perspective, it's unlikely that a user will ever reach that number of key presses."

Why weren't these standards applied to new HP 15C LE? What Did Change in 3.5 Years!!

Companies produce great products when Employees take pride of their work.

I'm afraid that I can't find the logic behind the above assertion. The one million key presses don't mean that the keyboard can survive another one million key presses.

in response to message #2 by From Hong Kong

That probably isn't a test HP did on each production calculator, but rather a test ran on random units from

production for quality assurance.

in response to message #4 by From Hong Kong

If I had to guess, I'd say not unless someone at the factory goofed. I don't know anything about HP or their contractors' manufacturing practices but I'd assume from what I've seen of other companies manufacturing processes that the calculators that get used for keyboard testing also get used for other tests that are likely destructive (How much weight can you drop on the LCD before it breaks, what kind of overvoltage the CPU can stand, etc.).

Re: HP15C LE Keyboard Issues (...and 3.5 Years Ago)

*Message #6 Posted by **Lincoln R.** on 4 Oct 2011, 2:05 a.m.,*
in response to message #1 by Kerem Kapkin (Silicon Valley, CA)

For what it's worth, the 35s's "25 screw" keyboard had hollow heat stakes with screws screwed into the heat stakes. They're still melted over, so you can't unscrew it and take the keyboard out. Also, several people have apparently had issues with 35s keyboards. Once again I'm not a mechanical engineer, but I can't see those screws doing too much other than possibly holding the top of the heat stake on if it cracks off (or on the negative side making the heat stake crack down the sides from having the screw inside it).

Anyhow, I see the calculator division's recent work as gradual improvement. The 49g+ had a lot of keyboard issues, the 50g seems to have mostly solved that. The 35s had buggy firmware and a decent, but not ideal (and according to some prone to wear-out) keyboard but started to look like a classic HP again (Orange and Blue shift keys, big enter key, etc.)

The 20b and 12c+ were cool hacker platforms, and the 12c+ was more fuel for the "bring back the 15c" fire, but the 20b had a not-so-great keyboard and the 12c+ was (to those other than finance types) teasing those who wanted 15c and 16c reissues.

The 30b is a lot like the 20b, just as hacker-friendly, but has a much better keyboard (perhaps the best in HP's modern lineup).

And now we finally have that 15c people have been wanting, but the excitement has been at least slightly diminished by a manufacturing screw-up (or heatstake-up as it might be more accurately called) and some repairable firmware bugs.

I recall first hearing that interview quip and at some point later opening up a 35s. I realized even if that intention was earnest, it certainly wasn't achieved. Some screws were cockeyed, others had broken/stripped studs -- it appeared the screws were a bandaid after someone had a tried their hand heat staking with a clothes iron. Removal of the pcb still requires severing the deformed stake head after the screw is extracted. I'm not quite sure where they were headed with that engineering feat.

IMHO a sentence with both "attention to detail" and the "35s" needs a negative in there somewhere to be taken seriously in this context.

Re: HP15C LE Keyboard Issues (...and 3.5 Years Ago)

*Message #8 Posted by **Reth** on 4 Oct 2011, 3:58 a.m.,*
in response to message #7 by uhmgawa

IMHO the 25 screws only make the 35S slightly (but not enough) heavier to mimic "solid" feel (HP48 - like), but unsuccessfully.

That keyboard practically is a joke no matter what the intentions were.

And it was not meant to be "collectible" as some suggested for the 15C LE either.

Re: HP15C LE Keyboard Issues (...and 3.5 Years Ago)

*Message #9 Posted by **Paul Gaster** on 4 Oct 2011, 5:45 a.m.,*
in response to message #8 by Reth

In the 15C LE pictures I have seen, it seems to have a metal plate in the bottom of the back part of the housing. I am guessing this is for weight. I think HP learned that this was a better option vs using a ton of screws.

Re: HP15C LE Keyboard Issues (...and 3.5 Years Ago)

*Message #10 Posted by **Bart (UK)** on 4 Oct 2011, 6:19 a.m.,*
in response to message #1 by Kerem Kapkin (Silicon Valley, CA)

I fail to see how the screws help (other than if a user takes one apart it's easer to put back together) as the 28S, 48 SX series and 48GX series were all heatstaked only and worked well for many years.

Edit: what i'm getting at: don't blame the technology when it's the application (or mis-application) of the technology that's the problem.

missing segments on 20b running 34s

*Message #1 Posted by **db (martinez, ca.)** on 4 Oct 2011, 12:50 a.m.*

No complaint here, this is a question.

Has anyone else noticed missing segments that fail and then come back during another use? The ones that fail seem to be the lower segments of both lines, but as i said, it is an intermittent electrical problem. It's as if hp has subcontracted Lucas to make the display.

New batteries did not cure the problem.

Re: missing segments on 20b running 34s

*Message #2 Posted by **Paul Dale** on 4 Oct 2011, 12:56 a.m.,*
in response to message #1 by db (martinez, ca.)

Sounds like a hardware problem to me. I've not noticed anything like this on either my 20b or 30b.

Test WP34S (Hardware)?

*Message #1 Posted by **robertoataulfo** on 4 Oct 2011, 12:27 a.m.*

How do I test the keyboard, display, etc. (I used ON + PMT)

Re: Test WP34S (Hardware)?

*Message #2 Posted by **Paul Dale** on 4 Oct 2011, 12:54 a.m.,*
in response to message #1 by robertoataulfo

You don't. The 34S firmware has no self test capability.

Reflash back to the 30b or 20b and use the self test there if you must have one.

hp15c LE firmware problem, keys rough

*Message #1 Posted by **Brackett** on 3 Oct 2011, 10:17 p.m.*

I got a new 15c LE Friday. There were a couple disappointments I have with it. One is the firmware seems to have a problem, the other is with the keys.

Has anyone else noticed that a repeated 'PSE' instruction during a running program will not display the data? Only the initial 'PSE' is displayed. Try the example on page 114, Display Format Control. If you stop the program the display flashes and is only cleared with CF9. Resuming the program then it will display one more 'PSE' and goes blank until the end of the program regardless of any additional 'PSE'. After running the program there is no indication of a register overflow (flashing display).

My original 15c has nice shiny, smooth keys. The LE keys are rough. I'm used to running my fingers over the keys to operate the calc. The other 'key' issue is the top legends are 'tampo' (printed) not sublimation (multi injection molding) as on the original 15c. That means the legends will wear off from use as the top of the keys get the most abrasion. I might be tempted to find a busted old 15 with good keys and swap them (might not work).

btw, mine fails the self test on page 261: hold ON, hold X, release ON, release X. Error 9 every time. I'm not sure I trust my LE.

Re: hp15c LE firmware problem, keys rough

*Message #2 Posted by **Jeff O.** on 3 Oct 2011, 10:37 p.m.,*
in response to message #1 by Brackett

There has been ***a lot*** discussion about all of your issues in the past month or so. For the complete story, go to the most recent archive and start reading around September 1. Brief comments as follows:

> Quote:
>
> Has anyone else noticed that a repeated 'PSE' instruction during a running program will not display the data?

That was found very early on by Mike Morrow. It is a bug in the emulation layer. The calculator will produce correct results, you just **can't** see multiple pauses.

> Quote:
>
> My original 15c has nice shiny, smooth keys. The LE keys are rough.

Several reviews noted this. Most users don't seem to mind. You do, which is up to you, of course.

> Quote:
>
> The other 'key' issue is the top legends are 'tampo' (printed) not sublimation (multi injection molding) as on the original 15c.

> Double injection-molded keys went away a long time ago. It would be nice if the 15c LE had them, but no real reason to expect their return now.
>
> > Quote:
> >
> > ...mine fails the self test on page 261...
>
> The original self tests have no meaning with regard to the functioning of the 15c LE. They were supposed to be disabled, and reference to them was supposed to be removed from the manual. The ON - X test corrupts program memory (another emulation layer bug), so don't do it if you have a program in memory.
>
> sorry if the above sounds terse, it was not intended to, I just wrote it in a hurry... Please join the discussion.
>
> Also edited to correct typo in bold

in response to message #2 by Jeff O.

Hi Jeff,

I hadn't looked far enough back in the archives to see the issues I raised.

Thanks for the summary!

Best regards,

Mike

Re: hp15c LE firmware problem, keys rough

*Message #4 Posted by **Bart (UK)** on 4 Oct 2011, 6:06 a.m.,*
in response to message #3 by Brackett

No problem, all the regulars here know that there isn't a good search facility for this forum and Google doesn't link correctly to messages recently moved to the archives (which most of the recent messages will suffer as there is much activity at the moment causing messages to be moved to the archives quite quickly).

The criteria for moving messages to the archives is based on number, the limit is 501 messages in the "active" forum thereafter the next oldest message gets moved to the archives. In this manner, threads and threads of threads can get fragmented until the complete thread is in the archive. Also a message moving out of the forum does not appear in the archive immediately. Even though I've been around here for over two years and gained a reasonable understanding of the forum and archives, and use several techniques for searhing the archives, I still sometimes struggle to find a particular thread.

Re: hp15c LE firmware problem, keys rough

*Message #5 Posted by **Jeff O.** on 4 Oct 2011, 8:10 a.m.,*
in response to message #3 by Brackett

You are welcome.

Regarding your idea to swap out the keys with those from a non-working original 15C, there were some good tear down pictures of a 12c (physically identical to the 15c LE) posted recently (yesterday, I think) which show the keys and their construction. All except the f and g key are on a common framework, while the 15C has 39 individual keys. Instead of swapping keys, how about tearing your 15c LE down an spraying the keys with a few coats of clear gloss lacquer? That should also help prevent the legends from wearing off.

HP DO SOMETHING and do it fast!

*Message #6 Posted by **Alexander Oestert** on 4 Oct 2011, 8:33 a.m.,*
in response to message #1 by Brackett

Why, oh, why does HP not address this issue on their homepage in a manner that is easy to find? And why are they not contacting the LE buyers by mail via the resellers?

I really fear that if HP does not do something in the very, very near future (i.e. NOW!) they will destroy the goodwill that came with the 15c LE re-launch and eventually even ruin the perfect reputation of the original 15c. I reckon new buyers who are not properly informed about the nature of the problems might imagine it to be a problem with the 15c as such and not only the emulator.

Edited: 4 Oct 2011, 10:10 a.m.

*Message #8 Posted by **Alexander Oestert** on 4 Oct 2011, 3:15 p.m.,*
in response to message #7 by Reth

They should do something more obvious than having us read between the lines. Besides, what do you read there?

Re: HP DO SOMETHING and do it fast!

*Message #9 Posted by **Reth** on 4 Oct 2011, 4:00 p.m.,*
in response to message #8 by Alexander Oestert

"You are on your own, mate, don't bother trying to contact us" - that's what I read.

What they should do is simple - put here or on HP web site an email address where owners of faulty calculators can disclose their problems and get solutions or at least some information about what's been happening. As simple as that.

Re: HP DO SOMETHING and do it fast!

*Message #10 Posted by **Gerry Schultz** on 4 Oct 2011, 4:57 p.m.,*
in response to message #9 by Reth

Reth, I disagree. I believe it means to stop send me anymore emails. These keyboard issues have been discovered recently and when we (a small group of us) first talked to Tim about the keyboard reports on the 15C LE at the HHC conference, he wasn't sure what was going on as he had not seen one yet. I had my 15C LEs with the bad keys at the conference and when there was a break for Tim to look at them, he did and I could tell that he was disappointed by what he felt when pushing on the bad keys. He asked me if he could evaluate them and I left them with him.

I'm sure since then, Tim has been inundated with email queries and offers from customers to send in their 15c LEs for evaluation. As the 'HP point man' for our community, everyone wants to help with this issue. So, he's getting bombarded from us and probably from his superiors to figure out and fix both the firmware and hardware issues. In that light, his statement of do not email me makes sense.

I too work for a LARGE corporation and it takes a while to fix or change something, so I think we just need to be patient and let HP work through these issues. IMHO the reason we haven't heard anything is that the calculator group can't say anything until this situation has been figured out, a solution has been assembled and tested, and finally, that Legal has authorized an official HP spokesman to convey what is being done. The quickest way to get fired is to act as a company spokesman without your employer's permission.

Finally, I want to mention that even though Tim is a HP employee, he is a part of our community and cares about the calculators he helps build as much as we do. Just because we don't hear anything doesn't mean nothing is happening.

Now if I don't hear anything in a few months, then I will as curious as the rest of you about what's going on. I want this resolved ASAP but I don't want a firmware upgrade that introduces new bugs or have the keyboard problems fixed but then have displays start failing prematurely. The people I'm concerned about are those who have purchased 15c LEs and don't have any recourse but HP Customer Service. I've had some recent experiences with them and was not impressed. At least we here in the community can pool our knowledge and experience to make educated guesses about what's going on with this situation.

When I hear anything about my calculators I will let everyone know what happened.

Thanks, Gerry

Re: HP DO SOMETHING and do it fast!

*Message #13 Posted by **E Walsh** on 4 Oct 2011, 5:50 p.m.,*
in response to message #12 by Gerry Schultz

First, I want to say that I appreciate HP addressing our desire to get the 15C back into production (Thanks Tim, Glenn, et al.!). My unit came through with no key problems. In fact, the keys feel great and register correctly every time. Since the rate of units with one or more defective keys hovers around 10-12% from what I've read, it appears that 88-90% of us will be satisfied with a firmware update, and the remaining with an exchange. If HP has suspended production pending revisions to the manufacturing process, then perhaps these solutions can happen.

Re: HP DO SOMETHING and do it fast!

*Message #14 Posted by **Reth** on 4 Oct 2011, 5:58 p.m.,*
in response to message #10 by Gerry Schultz

Well I might be wrong with what the message implies, but I can remember not too far back what happened with the crappy HP49+ keyboard. Absolutely nothing official, latter fix for new production but nothing for the early birds with faulty units. I still have one of them and the answer from the official Australian dealer was - HP has not formally recognized any keyboard issues so no replacement and go away.

Then I think we don't ask for more than some info for the time being. **(Thanks, Glenn!)**

BTW I have a problem with the way warranty is being handled. The enclosed piece of paper

states there is a warranty form in the box for some countries (?) and if not so, this form could be downloaded from HP website which turns out to be dead end - no such calculator there hence no form. The only way apparently is to write a letter to HP :-/ all this happening in 21st century?

I see no reason to be very optimistic with this issue. Hope you are right and I'm wrong.

Cheers,

_____

HP 12cP25thAE Self-Test Result?

*Message #1 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 3 Oct 2011, 10:05 p.m.*

I was wondering if anyone who has a HP12cP25thAE could run this test and verify what I am seeing.

When I used to run a self test on my 12cP25thAE by pressing {g}+{ENTER}+{ON} sequence and then pressing on [2] for the "C" option, I used to just get the Checksum message "ChE--564Ah", then press [ENTER] the copyrigth message "C 2004 hP".

Now I am getting "UEr 02" after the checksum and before the copyright message. I don't recall seeing this before. Does anyone have an idea?

Re: HP 12cP25thAE Self-Test Result?

*Message #2 Posted by **Katie Wasserman** on 3 Oct 2011, 10:49 p.m.,*
in response to message #1 by Kerem Kapkin (Silicon Valley, CA)

This is normal, it's always been there on the 12CP 25th AE. It's not like the 12C+ or the 15C LE.

Re: HP 12cP25thAE Self-Test Result?

*Message #3 Posted by **Miguel Toro** on 3 Oct 2011, 11:47 p.m.,*
in response to message #2 by Katie Wasserman

Hi Katie,

Could you tell me what the fourth item on the menu ("4.CPU") is for?

When chosen, the information presented in my unit is : 3999310 h2

Thanks,

Miguel

Re: HP 12cP25thAE Self-Test Result?

*Message #4 Posted by **Katie Wasserman** on 4 Oct 2011, 12:29 a.m.,*
in response to message #3 by Miguel Toro

I wish I could but it's a mystery to me too. Another person here pointed out that this number changes each time you press 4 from the 1.2.3.4 menu. Actually I find that it doesn't change each time, but most.

.....

I just did a little testing and think it's a clock speed indication of some kind. As the calculator warms up (hold in in your hands for a while) this number gets smaller. As it cools down (put in the in refrigerator for a minute) this number get larger. You need to be patient with this becasue it takes a while for the

heat to penetrate into the chip, but simply CPU clocks are usually very temperature dependent just like this.

Anyone else want to hazard a guess?

Re: HP 12cP25thAE Self-Test Result?

*Message #5 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 4 Oct 2011, 4:09 p.m.,*
in response to message #4 by Katie Wasserman

Thanks Katie for the response. I wonder what does "UEr 2" means in that message, User 2? U Error 2? wild guess.

Also about the 4.CPU option, i think you are correct. It seem to correlate to what it seem like a CPU speed. I also confirmed that hot makes it go lower, cold higher. Alhtough I beleive 12cPAE had a Sunplus 6502 processor which was running at 1MHZ. I wish there were more information on these messages and how to read the self test results, you may remember TW commented that on the checksum FF=FF is good which is not the case for the 12cPAE.

Re: HP 12cP25thAE Self-Test Result?

*Message #6 Posted by **Katie Wasserman** on 4 Oct 2011, 5:37 p.m.,*
in response to message #5 by Kerem Kapkin (Silicon Valley, CA)

"UEr 2" - I read that as "Version 2".

Yes, the checksum is totally different on the 12CP 25th AE.

I don't understand the need to show some sort of clock speed indication unless it's possible to run at different speeds. But the "h2" on the right side of the display might be a clue as to the meaning.

More talk of cults at HP

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 3 Oct 2011, 9:55 p.m.*

The article "The trouble with superheroes" on page 74 of the October 1 issue of The Economist states in part

> Quote:
>
> ... HP has fallen victim to the cult of the corporate saviour. It keeps reaching outside its ranks to hire a superstar as CEO. This is something HP never did during its glory days. And it never seems to work. ...

A later paragraph heading is "Corporate culture matters more than stars." These days it seems that the HP board doesn't believe that.

Re: More talk of cults at HP

*Message #2 Posted by **Walter B** on 4 Oct 2011, 1:30 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

IMHO, there's enough written about that board in earlier threads. It's a pity HP has it.

Re: More talk of cults at HP

*Message #3 Posted by **Eddie W. Shore** on 6 Oct 2011, 12:37 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Hiring a superstar "savior" in hopes that he/she will solve everything has proven to be a guaranteed mistake. I see this all the time in sports - a team signs this great big hyped superstar who turns out to be not worth the hype. (Manny Ramirez anyone?) I certainly hope HP doesn't expect Meg Whitman to be the company's "savior".

15c LE production

*Message #1 Posted by **Peter Kim** on 3 Oct 2011, 8:30 p.m.*

How many of you think HP is pushing back the next batch of 15c LE production to address the faulty keyboard issue? (hpcalc.org says that their 15c LE has been backordered to 10/28)

On an unrelated note, does anybody else also think that another kind of old HP calculator revival like the 15c LE is simply not possible? 15c LE was only an incremental jump from the 12c, which is already in production. If you want to revive something like the 42s, they'll have to set up the production line to make that kind of device from scratch again. I just can't see HP engaging in that kind of business especially with the current business environment (new CEO, etc).

Re: 15c LE production

*Message #2 Posted by **Martin Pinckney** on 3 Oct 2011, 8:40 p.m.,*
in response to message #1 by Peter Kim

Probably extremely unlikely that HP would re-introduce a Pioneer in the original form factor, for the reasons you cite. I had thought they *could* produce a 42s on the 17bii+ platform, But I've been informed that is impossible.

However, perhaps they could produce a "42s-like" calculator on a modern platform, much as they produced the 35s based in part on the 32sii/33s.

Whether there is or will be any incentive to do so is another matter.

Re: 15c LE production

*Message #3 Posted by **Paul Gaster** on 3 Oct 2011, 8:52 p.m.,*
in response to message #2 by Martin Pinckney

The 30b has the same number of keys as a 42S, and the same configuration if you look at them side by side. Even many of the labels are the same. Shift, up and down arrows, backspace/clear, big enter key, on/off. The screen is the big difference. Swap out the 30b screen to something better and you would almost be there. If I was at HP I would use a 30b with a better screen to re-introduce the 42S. It wouldn't be that hard. The 34S team has done a great job with the 30b considering the screen limitations. I can't even imagine what they could do if had a better screen.

Re: 15c LE production

*Message #4 Posted by **Marcus von Cube, Germany** on 4 Oct 2011, 2:35 a.m.,*
in response to message #3 by Paul Gaster

Paul, the 42s not only had a better screen, it had more memory and a printer interface. If you wanted to put this in the 30b package, a new board with a completely different chip would be needed. Given the late discussions about battery depletion, a new case design to support larger batteries would be needed, too.

So don't hold your breath!

Re: 15c LE production

*Message #5 Posted by **svisvanatha** on 3 Oct 2011, 8:42 p.m.,*
in response to message #1 by Peter Kim

Well, a HP-designed 42S+ is possible if the current 17Bii+ is updated with the same ARM processor as the 12C+.

Re: 15c LE production

*Message #6 Posted by **Dave Britten** on 3 Oct 2011, 9:02 p.m.,*
in response to message #1 by Peter Kim

Just put a bare-metal ARM port of Free42 into 30b hardware with a 17bii+ LCD, add some I/O and display driver code, and you'd have an awfully good start.

Re: 15c LE production

*Message #7 Posted by **Eric Smith** on 3 Oct 2011, 9:48 p.m.,*
in response to message #6 by Dave Britten

The 30b hardware isn't capable of driving the 17bii+ LCD, or anywhere close to it. The Atmel chip can drive a maximum of 400 segments (or pixels), and the 17bii+ display has over 2100.

A "bare-metal ARM port of Free42" isn't trivial, either. I tried to do that a few years back, and it was taking a *lot* of work to rewrite all of the memory management. Obviously it can be done, but it isn't a small project.

Re: 15c LE production

*Message #8 Posted by **Marcus von Cube, Germany** on 4 Oct 2011, 2:39 a.m.,*
in response to message #7 by Eric Smith

Connecting a different LCD isn't impossible but you can't just take a bare LCD, it needs it's own controller. There are enough pins on the Atmel chip to drive such a device. The internal LCD controller would then be disabled and the pins reused for I/O.

What you can't overcome are the memory restrictions. You would need some external memory chip connected to the device.

Re: 15c LE production

*Message #9 Posted by **Eric Smith** on 4 Oct 2011, 2:49 a.m.,*
in response to message #8 by Marcus von Cube, Germany

Not going to happen in a low-cost HP product. In OEM quantities, LCD modules with controllers are *much* more expensive than bare LCDs.

Re: 15c LE production

*Message #10 Posted by **Marcus von Cube, Germany** on 4 Oct 2011, 4:48 a.m.,*
in response to message #9 by Eric Smith

I agree. HP having chosen a system-on-a-chip design has been cost driven from the beginning and would be foiled by adding expensive external components to overcome its limitations.

Re: 15c LE production

I don't doubt that. It would certainly be a better prospect than hacking new features into the existing 42s ROM binaries, though.

Emulating old calculators like the 30-year-old 15C and the 23-year-old 42S is a really bad idea. Emulation on a fast processor winds up wasting the vast majority of available battery energy, compared to doing the same thing in some version of C+ that generates native code for the host processor. In that latter case, program run times are a small fraction of those in an emulated version.

The HP 30b has the same number of keys and key arrangement as the original 42S. There is no emulation layer on the 30b and it is the fastest handheld that HP has ever made by large margin (ten times faster than the HP 50G, eight times faster than the 15C-LE, both with emulation layers). The 30b is also a more attractive and sturdy package than the original 42S. The best solution would be an HP 42S equivalent in a HP 30b package, using something other than CR2032 cells. But something other than an AT91SAM7L128 would be required to handle the display requirements and other issues.

It need not unconditionally be so. The sam7l voyager product was chosen to run at the maximum clock frequency for some perceived (I expect primarily marketing) benefit. For a pocket calculator otherwise wildly successful at a fraction of this throughput, doing so was arguably a little heavy handed to force as a non-negotiable default.

> Quote:
>
> ..compared to doing the same thing in some version of C+ that generates native code for the host processor. In that latter case, program run times are a small fraction of those in an emulated version.

I don't think that is a foregone conclusion. In both cases you are drawing upon some set of routines to implement the abstract model functionality. In the pure c implementation case, we define the model. In the emulation case the model has been defined and we're making a best effort attempt to map into an efficient implementation. An area in which emulation falls short is where features exist in the abstract model which are inefficient to support relative to the host architecture, or features in the host architecture (eg, native multiply) which aren't defined in the base model. I'd give emulation the upper hand in terms of code density vs. the pure c implementation equivalent where we're creating more memory consuming function call invocations vs. encoding operation semantics in terse instruction data. Doing so as a hybrid approach to reduce memory footprint in a c implementation swings us back closer to emulation where we're interpreting some form of optimized intermediate code.

Re: 15c LE production

*Message #14 Posted by **Eric Rechlin** on 3 Oct 2011, 9:53 p.m.,*
in response to message #1 by Peter Kim

10/28 is a guesstimate. I only put that so as not to disappoint people. If my supplier is right (though they have been known to be wrong in the past, hence the 10/28 guesstimate) I should get another shipment on 10/12.

From what has been posted here in the past, I would say you shouldn't expect anything different about these 15c calculators.

Eric

Re: 15c LE production

> On an unrelated note, does anybody else also think that another kind of old HP calculator revival like the 15c LE is simply not possible?

I'd never say such a thing. A year ago, everyone who didn't go to HHC 2010 thought a new 15C was flatly impossible. I thought the 15C LE was a gift to the community, but looking at the reaction of buyers, as reflected in eBay auctions, it's clear they are selling very well. Obviously HP thought they could make a profit

on this device. I doubt it was this simple, but maybe they looked at the robust sales of original 15Cs, did some math and went for it. It looks to me like they have a hit on their hands, despite all the defects Katie and others have turned up.

There's another calculator that sells very well on eBay, though it's in shorter supply than the 15C, so sales volume is necessarily low. I'm wondering if a reloaded 42S might not sell well. I was reminded in this thread that it would need a more expensive display. The engineering work to make that happen would boost their non-recurring expenses. But if they could sell enough machines it might cost out. If they went for a new machine in the spirit of the 42S instead, that would require a lot more engineering time and expense up front. I suspect one reason the 15C got a green light was the fact that very little time needed to be spent on the emulated 15C image, as opposed to the emulator itself.

I still think it's highly unlikely anything will emerge from the calculator division along those lines, but I've been wrong before. :)

*Message #16 Posted by **Katie Wasserman** on 4 Oct 2011, 12:35 a.m.,*
in response to message #15 by Howard Owen

The 16C re-sells really well too. Once the bugs are worked out of the 15C LE with (hopefully) a new firmware release the 16C should be a whole lot easier than a 42s reissue.

No doubt about that - however being a dedicated machine, its potential interest and appeal to the user community is substantially less.

I own two 16C and they're fast enough for what I used them. So speed increase alone isn't worth so much. My 2 cents.

Not so. Research the archives. For the last couple of years there were several of us predicting it would happen who had no inside knowledge. In particular, DaveJ was outspoken in this opinion.

Clearly "everyone" was a gross generalization. :) My apologies for painting with too broad a brush.

Re: 15c LE production

*Message #20 Posted by **Jeff O.** on 4 Oct 2011, 8:57 a.m.,*
in response to message #15 by Howard Owen

At HHC 2010, we were given a survey along the lines of "Which calculator would you like to see re-issued." (I'm pretty sure we took the survey before the pre-production 15c+ calculators were handed out.) I don't recall if there was a list of choices or if it was a write-in, but the 42S was certainly a candidate. I used to be a huge 42S fan, having replaced my 15C with one in 1988 and then using it for about 15 years on a daily basis, but, I voted for the 15C. The reason I gave was that the 15C could be brought back with no functional changes and serve an identifiable niche - a very powerful, small calculator that can be operated easily, programmable to do some complex things if you want, with a useful amount of memory but not so much that you cry if you lose it. The 42S, on the other hand, was a near miss at a truly fantastic calculator. If it was brought back as-is today, its shortcomings would really stand out. What we really want is the 43s, of course :-)

For the record, to make the 42s near-perfect in my opinion, it needs more memory (no problem today) some form of I/O, and complex number support as described here, for example. I'd also like to see a larger screen, to give better graphing support but mostly to display the stack, Last x, and the date and time (ala the one Eric showed for DIY5). But now I am heading into feature-creep territory.

Re: 15c LE production

*Message #21 Posted by **Mike Morrow** on 4 Oct 2011, 10:48 a.m.,*
in response to message #20 by Jeff O.

> Quote:
>
> For the record, to make the 42s near-perfect in my opinion, it needs more memory (no problem today) some form of I/O, ...

At this point, it becomes almost mandatory that the calculator becomes large enough to carry at least two AAA cells. Button and coin sized cells can not support much I/O, especially if one of the most desirable methods (micro SD) were employed. I would like to see a design that used coin or button cells for compactness, had micro SD and USB, but only allowed writes to the micro SD when external power through the USB connector was present.

> Quote:
>
> ...and complex number support as described here, for example.

Your reference doesn't really describe complex number support, just complex number entry method, which IMHO just scratches the surface of complex support. Complex number support in depth and detail means any function that the machine performs which is defined for the complex domain as input

or output is performed naturally by the machine. In that respect, the 42S overwhelms the capability of any other handheld made by anyone ever, except the RPL machines. There are a few omissions, such as lack of a complex gamma function. I'm quite happy with the current 42S complex number entry method, and I am unconvinced of any real advantage for other approaches.

> Quote:
>
> I'd also like to see a larger screen, to give better graphing support but mostly to display the stack, Last x, and the date and time (ala the one Eric showed for DIY5). But now I am heading into feature-creep territory.

I would like to see an HP 42S replacement that, in addition to the micro SD and USB external power source mentioned above, is the same size (accepting the limitation that places on power source), faster, and has real time clock, calendar, and financial programming of the 17bii. And...one that isn't "orange on brown/dark brown" ugly.

Re: 15c LE production

in response to message #21 by Mike Morrow

> Quote:
>
> Your reference doesn't really describe complex number support, just complex number entry method...

Yes, I guess I should have said complex number “entry, display and manipulation" instead of “support.” I concur with your desire for full support for any function defined for the complex domain.

> Quote:
>
> I'm quite happy with the current 42S complex number entry method, and I am unconvinced of any real advantage for other approaches.

```
You are OK with:

key in real component
press ENTER
key in imaginary component
press shift
press STO (for shifted COMPLEX function)

vs.

key in real component
press "i"
key in imaginary component?
```

Can you cite any disadvantage to the entry method I proposed? (Other than needing an "i" key and so requiring some change to the keyboard.) In addition to the extra keystrokes required for entry, the 42S method has the disadvantage of pushing T off the top of the stack when you want to enter a complex number.

> Quote:

> I would like to see an HP 42S replacement that, in addition to...

Replacement for HP15c LE with problematic key?

*Message #1 Posted by **Jesse Dodd** on 3 Oct 2011, 4:57 p.m.*

First off, I don't want anyone to misinterpret this post. I'm extremely grateful to the very limited HP staff for bringing back the hp 15c, and I understand that there are going to be some birthing pains. I'm just looking for some information to try and clarify what's happening.

I purchased two HP 15c LE calculators from buy.com and unfortunately one of the calculators has a defective square root key that will very often click without registering. As soon as Tim Wessman found out that a percentage of these calculators had keyboard problems he posted a note that we should email him in order for HP to capture these machines for analysis. I sent Tim an email as instructed and received a reply from a Paul Littrell on behalf of HP Calculator Technical Support on September 20th. Oddly enough the content of this email in a bitmap image of text which is very pixilated, small and difficult to read. Because it is an image (and I can't simply copy and paste) I'm going to retype the email here:

Hello,

It has come to our attention that you are experiencing an issue with the keypad on you HP 15c Calculator. HP would be interested in investigating your issue further, Unfortunately we do not currently have a case open for your issue.

[What] We would like you [to] do is contact our Calculator Support at (800) 474-6836 to open a case on your issue. Once you have created a case with your name, addresses,[sic] and serial number of the calculator, please inform the agent that you have been requested to have your case escalated to Paul Littrell.

Once the case has been escalated to me, I will then be able to make arrangements to capture your unit for replacement. HP is interested in capturing this unit for further evaluation.

We appreciate your assistance in this matter.

Thank you, Paul Littrell

On Behalf of HP Calculator Technical Support

end of email

On September 21st I called the telephone number and gave the needed information to the very polite man on the telephone and informed him that the case needed to be escalated to Paul Littrell. He assured me that he had received the memo about this issue and I would hear back from HP shortly. He then gave me a service ticket number (which I assume is the same as a case number), and then I waited.

So far, so good.

The next thing to happen was Tim posted another message saying that HP had enough defective calculators to analyze, and requested that we not send anymore in. At this point I had still not heard from HP yet, so today I gave them a call. After speaking to a robot and a gentleman with a heavy accent I was redirected to Calculator Support. The person there had received a new memo that read that HP was out of 15c calculators and that my best bet was to

try to receive an exchange from the original vendor (Buy.com). He did not have an estimate as to when HP would have additional calculators available for exchange.

So my questions are:

Did anyone else attempt to send an HP 15c LE calculator with a bad key(s) into Paul Littrell?

Did you then subsequently receive instructions on how to send it in?

If so did you receive a replacement calculator?

Thank you for any information.

Jesse

Re: Replacement for HP15c LE with problematic key?

*Message #2 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 3 Oct 2011, 5:28 p.m.,*
in response to message #1 by Jesse Dodd

I ordered mine from HP Direct EPP program. Received it on Friday last week with defective [7] key CNA132093F LE#00253. Immediately sent out an e-mail to customer support, not yet received a response. Then called the same number you have at customer support, CS said it will be replaced with another one, after being on hold for about 10 minutes, I was told that, 15c was out of stock and an exchange based on backorder was not possible. So HP CS told me that my only option was to get a refund and e-mailed me a FedEx label for the return. I shipped the defective unit back to HP today. So far I haven't been unable to find another 15c to purchase on HP shopping sites.

Re: Replacement for HP15c LE with problematic key?

*Message #3 Posted by **Howard Owen** on 3 Oct 2011, 6:57 p.m.,*
in response to message #2 by Kerem Kapkin (Silicon Valley, CA)

As crappy as these are turning out, I'm reading between the lines that they are selling well. Not being able to exchange the machine for future stock suggests that HP may have stopped making them.

See what sort of trouble I can get into when I don't rein in my imagination?

At the conference, there was a discussion about when more HP 15C LEs would be arriving and I remember it being said that there were two shipments, one by plane and one by boat. The boat shipment should be here in early October, like today! So I think we'll see more stock show up in the next week.

Re: Replacement for HP15c LE with problematic key?

*Message #5 Posted by **Jeff Kearns** on 3 Oct 2011, 8:29 p.m.,*
in response to message #4 by Gerry Schultz

After reading this topic, I decided to 'just now' conduct the Self Test (ON X) on my recently acquired 15C LE and I get Error 9. That means my unit needs servicing... I own three original 15C's and they all work flawlessly.

What should I do? I get the impression that if i send it back (to whom? Samson Cables? HP?) that I will never see another one...

Not impressed! Didn't they spare exchange units? QC is a fail.

Jeff K.

in response to message #5 by Jeff Kearns

I think this has been addressed many a times before, but the original S.T. can only work when the user very quickly key's in the old S.T. I had downloaded the HP 15c LE manual from a few days ago, and on page 261 it describes the self test and is different than from the original S.T.

On a related note, does that mean the online manual for the HP 15c LE has been updated?

Re: Replacement for HP15c LE with problematic key?

*Message #7 Posted by **Gerry Schultz** on 3 Oct 2011, 9:08 p.m.,*
in response to message #5 by Jeff Kearns

As Eric said this morning in another thread: "The self-tests for the original 15C were not supposed to be in the 15C LE or its manual. Getting an error from them doesn't signify that anything is wrong."

Here's the 15C Limited Edition self test that I know of:

Turn the calc. off Press and hold 'g' and 'ENTER' While still holding down 'g' and 'ENTER' press the 'ON' key Release 'ON', followed by 'g' and 'ENTER'

The test screen will display ' 1.L 2.C 3.H ' Press 1 to perform the LCD test Press 2 to display the Copyright/Checksum message Press 3 to perform the keyboard test

Press ON to exit the self-test.

The keyboard test requires you to push all the keys, one at a time. With each push, something should be removed from the LCD display. When you have completed pushing all the buttons, there should be nothing remaining on the display.

I found this on-line.

in response to message #1 by Jesse Dodd

Jesse, I have exactly the same story as you. Purchased from buy.com, email to Tim, reply from Littrell, called the 800 number and spoke with Paul Lapansee, emailed POP and invoice to Lapansee as requested on 9/20. After a week of hearing nothing, I emailed Lapansee on 9/27 and got the following response:

"There is no ETA when you will get a replacement. We are waiting to get some in stock. So if possible try to replace it through the reseller first. If you are not able to then we will replace it when it comes in stock."

According to the buy.com website, they have a 45 day return policy. I think I will wait a few more days to see if any stock shows up on their website. I would rather get a replacement than a refund.

WP34s: new build with Matrix functions?

*Message #1 Posted by **fhub** on 3 Oct 2011, 12:05 p.m.*

I just wanted to try the Matrix functions which are in the new build 2.2, but I can't find any of these functions in any catalog!?
They appear in the opcode table (wp34s.op), I find them in the EXE but don't see them listed in any catalog (in the emulator)?

So my (maybe) dumb question: how to get these new matrix functions???

Franz

100!

*Message #1 Posted by **Walter B** on 3 Oct 2011, 5:08 a.m.*

Due to some more introductory remarks, the WP 34S Owner's Manual now contains 100 pages for the first time. I didn't expect that amount when we started :-/ Frankly, I doubt I tackled that task if I'd have seen that then.

But now it's slowly moving in the direction of software, where it's said "20% of the code is for what the SW shall do, and 80% is for error prevention and recovery - if the user does something a knowledgeable user shouldn't do". Seems such is life.

FWIW, Walter

Re: 100!

Since you mention matrix support:
I see you're just working on M.LIN and M.INV - can you say what else is planned to be built-in wrt. matrix functions?

M.RREF would be very nice (could also be used for linear equation systems), and also eigenvalues/vectors would be great. :-)

Franz

Re: 100!

*Message #9 Posted by **Paul Dale** on 3 Oct 2011, 8:24 a.m.,*
in response to message #8 by fhub

I wasn't planning a RREF command. We're really tight on flash and the commonest uses for RREF that I remember are inverting a matrix and solving linear equations. Both of these are available already via the LU decomposition.

I'd like to include eigenvalues and vectors. Again, space is tight and these might have to be done via

user code. Another one which would be good to get in would be one of the SVD algorithms. Good for least squares solutions, finding the Moore–Penrose pseudoinverse and many other things. I've often said that any problem in linear algebra starts either with the SVD or the eigenvectors -- not strictly true but not that far off the mark :-)

- Pauli

Re: 100!

in response to message #9 by Paul Dale

> Quote:
>
> ...and the commonest uses for RREF that I remember are inverting a matrix and solving linear equations. Both of these are available already via the LU decomposition.

You're right, but RREF is quite useful if you have more or less equations than variables, or if some equations are linear dependent. What does your M.LIN implementation do in such cases?

Re: 100!

*Message #11 Posted by **Paul Dale** on 3 Oct 2011, 8:31 a.m.,*
in response to message #10 by fhub

It errors out with a dimension mismatch or a singular matrix. I guess this isn't as good :-(

The generalised inverse solves part of these problems, but I've not done that at this stage.

- Pauli

Re: 100!

*Message #12 Posted by **fhub** on 3 Oct 2011, 8:39 a.m.,*
in response to message #11 by Paul Dale

> Quote:
>
> It errors out with a dimension mismatch or a singular matrix. I guess this isn't as good :-(

No, not really. ;-)
And that's exactly the reason why I would like such a RREF command, because it solves all these problems.

About your "Matrix?" question: I would be happy also with 5 user pages - builtin matrix functions are always more comfortable than having to code them by yourself (not to forget the problems with only 3-letter labels).

Franz

Matrix?

*Message #13 Posted by **Paul Dale** on 3 Oct 2011, 8:30 a.m.,*

in response to message #7 by Paul Dale

A question for the folks here.

Implementing the matrix functions will force us to reclaim some of the user flash pages. Currently, matrix support has required three pages and a fourth is very likely.

How many pages of user flash is matrix support worth?

At the moment there are seven program flash pages. One is part of the device backup region which leaves six pages (506 steps each or 3036 steps in total) for whatever the user wants. This will likely drop to five pages (2530 steps).

- Pauli

Re: Matrix?

*Message #14 Posted by **David Persinger (US)** on 3 Oct 2011, 9:09 a.m.,*
in response to message #13 by Paul Dale

Is this something that can be implemented as programs that need not be installed?

I personally won't have a large need for matrix operations, but this is certainly a huge addition for some folks.

At the same time, I won't be using all of the user pages either. So for me it is not a problem to use additional pages for matrices.

I just thought it might be possible to make this an option for each person to choose, but I don't know the mechanics around this and if it is possible.

David

Re: Matrix?

*Message #15 Posted by **Paul Dale** on 3 Oct 2011, 6:04 p.m.,*
in response to message #14 by David Persinger (US)

> Quote:
>
> Is this something that can be implemented as programs that need not be installed?

Not the way it has been done. It would be possible to write user code programs to support matrix operations and they'd be smaller, slower, less accurate and more difficult to use but functional.

> Quote:
>
> I just thought it might be possible to make this an option for each person to choose, but I don't know the mechanics around this and if it is possible.

Not without two different firmware images which I'd like to avoid.

Another alternative would be to drop some of the esoteric functionality in favour of matrix support. e.g. zeta and Bernoulli numbers are largish as are some of the complex functions.

- Pauli

Re: Matrix?

*Message #16 Posted by **fhub** on 4 Oct 2011, 5:03 a.m.,*
in response to message #15 by Paul Dale

> Quote:
>
> Another alternative would be to drop some of the esoteric functionality in favour of matrix support. e.g. zeta and Bernoulli numbers are largish as are some of the complex functions.

+1 for this idea! :-)

I'd say matrix functions (e.g. M.RREF or the already existing but commented out row-operations) are more important than such special functions which almost nobody will ever need or use.

Franz

Re: Matrix?

*Message #17 Posted by **Marcus von Cube, Germany** on 4 Oct 2011, 5:13 a.m.,*
in response to message #16 by fhub

The question is what can be easily redone in user code without sacrificing too much accuracy. User code can go into libraries and thus swapped in and out. We have no provisions of putting native code into user flash regions to make them installable objects. This would require a major rewrite.

Re: Matrix?

*Message #18 Posted by **fhub** on 4 Oct 2011, 5:22 a.m.,*
in response to message #17 by Marcus von Cube, Germany

> Quote:
>
> The question is what can be easily redone in user code without sacrificing too much accuracy.

Yes, that's ONE point - the other is which functions are used much more frequently than others. And I'm sure this point would definitely go to matrix operations in favour of such exotic functions Pauli mentioned (at least I myself have never needed or used any of them in my almost 30 years as mathematician ;-)).

Franz

Re: Matrix?

*Message #19 Posted by **gene wright** on 3 Oct 2011, 10:30 a.m.,*
in response to message #13 by Paul Dale

Argh.

As much as I would love a wonderful set of matrix functions, that is a lot of space. :-(

The RRM programs take about 350 program steps of one user flash area and give results that are VERY respectable and fast as well.

I know these will be even faster and a lot more accurate, but at a trade off.

The AM1 7x7 determinant takes 2 seconds using the RRM program and returns a result of 0.999997 which is awfully close to the real result of 1.

I have seen the result the new functions provide, which rounded to 15-16 digits really is equal to 1. lol

While that's wonderful and I certainly would love such abilities, it would be taking flash from everyone - and I can't make that call.

Re: Matrix?

*Message #20 Posted by **Paul Dale** on 3 Oct 2011, 5:51 p.m.,*
in response to message #19 by gene wright

There is a lot more to matrix support than the five PPC routines and RRM routine :-)

Matrix addition and multiplication? Transpose?

Also the routines I've coded do things in-situ and without altering the source matrix or doing anything untoward to the stack. i.e. they are much easier to use.

I guess the question comes down to how many programming steps are required on the 34S?

- Pauli

Re: Matrix?

*Message #21 Posted by **gene wright** on 3 Oct 2011, 5:57 p.m.,*
in response to message #20 by Paul Dale

50,000 !

:-)

Seriously, as you said, there is more functionality to be had than the RRM/PPC ROM stuff and to add that is a trade-off to program space.

Still, since pages of flash can be loaded by combining files at upload from a PC, having all 9 flash spaces open is very tempting!

Tough choice. Perhaps you should start a feedback thread with a compelling title to get the feeling here?

Re: Matrix?

*Message #22 Posted by **Gerry Schultz** on 3 Oct 2011, 7:27 p.m.,*
in response to message #21 by gene wright

It is a tough choice. Given that the 34S is still a moving target firmware wise, the community hasn't had a lot of time to develop complete user apps and get an idea of how

much space is needed for user-friendly programs. Also goes the corollary that any user program will fill up all the user space. So, does it really matter what a survey reveals? In the end, no matter how much programming is made available to the user, it will be filled up and we will cry for more.

The HP-41C was built with more memory than was ever seen before in an HP calculator, with a price tag to match. Now with the 41CL we have multiple pages to store complete 41 memory images, including extended memory.

Given the physical hardware limitations of the calculators,I vote for two different firmware images, one with matrix functions and one without. Then I can burn a couple of HP 20B/30Bs with the functionality I want and programming space I need. But that makes firmware development more complex. Now we are experiencing some of the design trade-offs HP has had to make in the past. CRAP!

I WANT IT ALL IN MY 34S and I WANT IT NOW!

Re: 100!
*Message #30 Posted by **Brian Walsh** on 3 Oct 2011, 9:57 a.m.,*
in response to message #1 by Walter B

100 pages barely scratches the surface. It deserves to be, and users deserve, several times that much, not so much to say "mine is bigger than yours" but because clear explanations *and examples* take that much. The PPC ROM manual is a shining example of good documentation.

It's that much more reason to take advantage of Gene and Jake's generous offer to fully document the WP 34S, especially including beginner info. Doing so will free you to do other things. Thank you for everything you have done thus far.

Re: 100!
*Message #31 Posted by **David Hayden** on 3 Oct 2011, 1:41 p.m.,*

in response to message #30 by Brian Walsh

I agree with Brian. The original 15C Owners Handbook was 300 pages. Given the huge addition of functionality, I think a 34S manual with similar detail would be 800-1,000 pages.

Re: 100!

*Message #32 Posted by **Jake Schwartz** on 4 Oct 2011, 11:44 a.m.,*
in response to message #31 by David Hayden

> Quote:

...and since the 34S computes 100! to be 9.332621544394415 E157, we have our work cut out for us :-)

Jake

Re: 100? Why not a thousand flowers?

*Message #33 Posted by **Peter Murphy (Livermore)** on 3 Oct 2011, 11:46 a.m.,*
in response to message #1 by Walter B

The HP 48G/GX had its User's Guide (which underwent at least eight editions) and its Advanced User's Reference Manual (three). They're exactly what one would call the FM: read it and you'll find everything, or nearly so.

HP left it at that.

Then others wrote books on using the 48G/GX. Grapevine Publications put out four books and a Pocket Guide, and Thomas Adams wrote or cowrote two more. Some books, written for the 48S/SX, are pertinent to the 48G/GX as well. There may be others of which I am not aware. They all have their place alongside the FM.

I would think that 100! pages by a principal in the 34S project would qualify, after minor fixes, as the FM. Rather than setting up a wiki within which to make the FM satisfy everyone -- an impossible project -- might it not be better for anyone with a Grapevine-like idea just to do it?

By all means read and proofread the FM, and suggest fixes to the author. Then let the FM be, and let a thousand flowers bloom.

Re: *sigh*

*Message #4 Posted by **Howard Owen** on 3 Oct 2011, 12:26 a.m.,*
in response to message #3 by bill platt

I'm conflicted about this. On the one hand it's amazing to see so many folks getting, not to put too fine a point on it, [screwed, not only by the sellers, but through getting potentially defective units. On the other it's nice to see a revived 15C selling so well. It may mean HP will actually spend the dough to implement in a reasonable way the fixes Cyrille and Tim come up with. Of course, in my dreams, brisk sales could even lead to a not limited edition 15C, or even consideration of the idea to designing new calcs along the lines of the "42S plus II glory hallelujah."

Like I said: *sigh*. :)

HP IP for sale

*Message #1 Posted by **hpnut** on 2 Oct 2011, 10:50 p.m.*

I was wondering if this is part of HP's strategy to sell off PC manufacturing.

http://h20229.www2.hp.com/hpvps/OnlinePatentSales.html

talk about selling off the family's silver ;-)

Calculator Division next?

Re: HP IP for sale

*Message #2 Posted by **Katie Wasserman** on 3 Oct 2011, 1:39 a.m.,*
in response to message #1 by hpnut

I don't know how to judge this.

The purchase and sale of IP is a gigantic business these days. It might be that HP felt these groups of patents don't enhance its portfolio at all and don't threaten it either if they were held by a competitor. So it made good sense to sell them.

Or, like you suggest, selling these patents (one of the 2 examples came from the EDS acquisition) is a prelude to getting out of the PC business.

Re: HP IP for sale

*Message #3 Posted by **Lincoln R.** on 3 Oct 2011, 10:57 a.m.,*
in response to message #2 by Katie Wasserman

These patents don't seem *that* exciting. Not to mention, there are almost certainly terms and conditions in the sales contract, one of which may very well be "You agree to grant HP an indefinite, irrevocable, royalty-free license to use this patent." Given the proliferation of patent trolls in today's world I'd almost bet money that's in there somewhere, HP really doesn't want to get sued by someone who bought one of their own patents.

Re: HP IP for sale

*Message #4 Posted by **Lincoln R.** on 3 Oct 2011, 11:05 a.m.,*
in response to message #3 by Lincoln R.

Yup.

SpeedUI 11.10 available

*Message #1 Posted by **Raymond Del Tondo** on 2 Oct 2011, 10:30 p.m.*

Hello all,

here's an important update for SpeedUI.

SpeedUI 11.10 fixes some serious bugs. See RelNotes.txt for details.

For installation/uninstallation, please take a look into StartHere.pdf supplied with the latest SpeedUI archive.

The new version is available here: http://www.hpmuseum.org/guest/deltondo/speedui.pdf (Walkthrough PDF)

http://www.hpmuseum.org/guest/deltondo/sui_1110.zip (SpeedUI zip archive)

and on www.hpcalc.org once the site will be updated.

Have fun:-)

Raymond

How does it do this?

*Message #2 Posted by **snaggs** on 3 Oct 2011, 5:14 a.m.,*
in response to message #1 by Raymond Del Tondo

I have a 48G+ which I havnt learnt yet. Does this UI make it different from the manuals or does it just speed it up?

Daniel

Re: How does it do this?

*Message #3 Posted by **Raymond Del Tondo** on 3 Oct 2011, 8:30 a.m.,*
in response to message #2 by snaggs

It's a bit of both. The main intention is speed while staying compatible to the standard HP-48G L&F , but there are some extensions and enhancements which will make usage more comfortable.

For more details please take a look into the walkthrough (speedui.pdf) which is linked in the initial post;-)

WP-34S build problems on Linux

*Message #1 Posted by **Eric Smith** on 2 Oct 2011, 10:22 p.m.*

When I try to build WP-34S on a 64-bit Linux platform (Fedora 14) using the CodeSourcery toolchain, I get several errors. The first ones are in post_process.c:

```
printf( "sizeof(struct argcmd) = %d\n", sizeof(struct argcmd) );
```

The sizeof() macro returns a value of type size_t, which may not fit in an int. The correct conversion (according to the ISO C standard) for printf is "%zu" rather than "%d".

The rest of the problems in that file are all like:

```
post_process.c:72:2: error: cast from pointer to integer of different size
```

Resulting from source lines like:

```
ADJUST( p_monfuncs,     monfunc );
```

The ADJUST macro is defined as:

```
#define ADJUST(p,type) (info->p = (struct type *) BUFF(info->p))
```

I haven't yet figured out how to fix this. It appears to me that the code does an fread() of data intended for the target machine (ARM) into a buffer, and depends on the pointer size and endianness of the build host matching that of the target, which is not a good assumption.

I used a workaround for that, and got another two more errors:

```
In file included from asone.c:26:0:
main.c: In function 'main':
keys.c:428:15: error: 'runmode' may be used uninitialized in this function
keys.c:429:15: error: 'alphas' may be used uninitialized in this function
```

I removed -Werror to try to get past that, and the linker tells me:

```
region `flash' overflowed by 520 bytes
```

Is there any feature I can easily remove/disable that is likely to reduce the ROM size by at least 520 bytes?

Is this the right place to discuss such problems? It didn't appear that the tracker on Sourceforge is being used.

Thanks!

Eric

```
printf( "sizeof(struct argcmd) = %d\n", sizeof(struct argcmd) );
```

The sizeof() macro returns a value of type size_t, which may not fit in an int. The correct conversion (according to the ISO C standard) for printf is "%zu" rather than "%d".

I think the better fix would be casting the sizeof result to int which I'll commit soon. We build on machines with somewhat stupid compilers and I very much doubt they support %zu.

Quote:

The rest of the problems in that file are all like:

```
post_process.c:72:2: error: cast from pointer to integer of different size
```

...

I haven't yet figured out how to fix this. It appears to me that the code does an fread() of data intended for the target machine (ARM) into a buffer, and depends on the pointer size and endianness of the build host matching that of the target, which is not a good assumption.

This is one for Marcus. The post processor is packing pointers into flash into sixteen bits (128kb of flash where code must be even byte aligned means sixteen bits is sufficient for a function pointer). This is quite a hack but it saves more than a bit of flash :-)

Quote:

I used a workaround for that, and got another two more errors:

```
In file included from asone.c:26:0:
main.c: In function 'main':
keys.c:428:15: error: 'runmode' may be used uninitialized in this function
keys.c:429:15: error: 'alphas' may be used uninitialized in this function
```

These aren't errors fortunately. The compiler isn't clever enough to see that :-(I think I can fix this in a clean enough manner by avoiding the conditional assignment -- might save a couple of bytes too.

Quote:

I removed -Werror to try to get past that, and the linker tells me:

```
region `flash' overflowed by 520 bytes
```

Is there any feature I can easily remove/disable that is likely to reduce the ROM size by at least 520 bytes?

Try reducing the number of flash segment in the features.h header (NUMBER_OF_FLASH_REGIONS) or by turning off some functionality there. Matrix support is largish as are the zeta/Bernoulli pair. I've been adding

more than a bit of matrix code recently.

*Message #3 Posted by **Eric Smith** on 3 Oct 2011, 12:33 a.m.,*
in response to message #2 by Paul Dale

Got a binary built, thanks! I suppose I'll try flashing one of your premade ones first, to make sure the process works, before trying the image I just built.

Re: WP-34S build problems on Linux

*Message #4 Posted by **Marcus von Cube, Germany** on 3 Oct 2011, 12:35 a.m.,*
in response to message #2 by Paul Dale

We've had a bad with the CodeSourcery compiler: It produced a hang in the firmware due to a compiler (code generation or optimization) error. Don't hope it will do the job.

post_process.c was designed to run on a Windows build machine. It relies on a structure output by the linker after the actual image where it finds the actual 32 bit addresses of the functions and the addresses of the function tables themselves. It makes some assumptions about the endianess and alignment of the host compiler as you already found out.

Re: WP-34S build problems on Linux

*Message #5 Posted by **Eric Smith** on 3 Oct 2011, 1:02 a.m.,*
in response to message #4 by Marcus von Cube, Germany

So it's not currently possible to build on Linux?

Re: WP-34S build problems on Linux

*Message #6 Posted by **Marcus von Cube, Germany** on 3 Oct 2011, 1:27 a.m.,*
in response to message #5 by Eric Smith

Check if Yagarto.de has a Linux build of GCC 4.6. Set the options in the Makefile for HOSTCC to force a 32bit build. If you compile under Linux with the same options as the build from us the binaries should be identical (except for the revision number).

WP-34S Revision 1653 Feedback

*Message #1 Posted by **svisvanatha** on 2 Oct 2011, 9:49 p.m.*

I just flashed the Rev 1653 firmware. A few observations:

1. The previous discussion of FIX, SCI, ENG, ALL, setting DECM mode while in Integer mode has been realized.

2. Some good descriptions have been added to the manual - I assume this is Walter's work. Many thanks!

3. With respect to returning to DECM mode. Page 22 of the manual says that [->][H.MS] will return to DECM. However, when I try this from Integer mode, I get the error: "Bad Mode Error". My key presses for [->][H.MS] are: [->] [f] [STO]. Am I misunderstanding what is intended here?

Many thanks, and this new revision is looking great (especially the additions to the manual)!

Re: WP-34S Revision 1653 Feedback

*Message #2 Posted by **Paul Dale** on 2 Oct 2011, 9:57 p.m.,*
in response to message #1 by svisvanatha

> Quote:

> 3. With respect to returning to DECM mode. Page 22 of the manual says that [->][H.MS] will return to DECM. However, when I try this from Integer mode, I get the error: "Bad Mode Error". My key presses for [->][H.MS] are: [->] [f] [STO]. Am I misunderstanding what is intended here?

A documentation error I suspect. No [->] is required as far as I was aware.

- Pauli

Re: WP-34S Revision 1653 Feedback

*Message #3 Posted by **svisvanatha** on 2 Oct 2011, 10:42 p.m.,*
in response to message #2 by Paul Dale

Thanks for the clarification.

Re: WP-34S Revision 1653 Feedback

*Message #4 Posted by **svisvanatha** on 2 Oct 2011, 11:31 p.m.,*
in response to message #1 by svisvanatha

4. Running a simple SOLVE to compare against the 15C LE:

```
LBL A
x^2
5
-
```

```
RTN
```

On the 15C LE, this yields 2.2361 with intial guess of 0 and 10 in the Y and X registers, respectively.

On the WP-34S, I initially get the "Solve Failed" message, but after clearing the message with EXIT, the correct result is displayed in X.

Re: WP-34S Revision 1653 Feedback

*Message #5 Posted by **Paul Dale** on 2 Oct 2011, 11:41 p.m.,*
in response to message #4 by svisvanatha

This stems from the error estimate in Z not being approximately zero. Try again in e.g. FIX 04 and it will work properly.

Seems that check is a bit too aggressive.

- Pauli

WP34-S Flashing Cable Repair?

*Message #1 Posted by **svisvanatha** on 2 Oct 2011, 7:01 p.m.*

Hello,

Unfortunately, the serial flashing cable that I use for WP-34S has suffered an issue. One of the 6 male pins that connect to the backside of the calculator appears missing. There is a retaining ring at the bottom of the pin, where it connects to the black connector housing. That ring appears to have been opened, likely leading to the pin falling out. I guess I was not careful in inserting/removing the cable at some point, leading to the retaining ring failure :(

I have a new cable lying around, so I am not in an immediate need of repairing this. I just like the comfort of knowing that a backup exists.

So, I was wondering if this is repairable?

Re: WP34-S Flashing Cable Repair?

*Message #2 Posted by **Brian Walsh** on 2 Oct 2011, 7:08 p.m.,*
in response to message #1 by svisvanatha

Silly question, I suppose, but why do you *need* more than one cable? Nobody else I know of, except Gene Wright and perhaps a few other key contributors to the repurposing project, has more than one. And please remember, these cables are a gift to the user community from HP, which they have authorized Gene to distribute. It's generous of them to do so, and it's not as if you paid anything more than postage for them.

Re: WP34-S Flashing Cable Repair?

*Message #3 Posted by **svisvanatha** on 2 Oct 2011, 7:33 p.m.,*
in response to message #2 by Brian Walsh

Correct. I do not *need* more than one cable. Back in January of this year, when I purchased the 30B, and was inquiring about flashing it, I was offered a cable. I accepted that gracious offer, and was stunned to see two cables show up from that individual (incidentally, the individual was not Gene, however Gene appears to be a generous individual himself!).

It has been a few months since then, and I actually forgot about the extra cable that came in that package. It was not until today that it crossed my mind when I noticed my first cable was broken.

I value the gesture from that individual for sending me the cables, I realize how precious they are, and naturally came here for some constructive help in repairing the broken cable. Innocent enough (I think).

Re: WP34-S Flashing Cable Repair?

*Message #4 Posted by **Marcus von Cube, Germany** on 3 Oct 2011, 12:27 a.m.,*
in response to message #3 by svisvanatha

HP used to send them in packs of two. I gave my spare to Walter.

>
> I was wondering if this is repairable?

Cannot answer the repairable question...

The pins are called "pogo pins" or "spring loaded contact pins". I've seen them on ebay, but they are also available from electronics suppliers such as Mouser or Allied. They come in different sizes, don't know right off what size the HP plug uses.

*Message #5 Posted by **Jim Johnson** on 3 Oct 2011, 6:53 a.m.,*
in response to message #4 by Joerg Woerner

I traded email with the swiss designer before HP actually introduced the HP15cLE (in fact he used my quote in his web posting). I mentioned that his market for an exact HP15C clone would collapse if HP reintroduce the HP15C and he said he would likely move forward with plans to produce the HP15C credit card version.

15c LE box -- just for the record

*Message #1 Posted by **John S. Miller** on 2 Oct 2011, 1:16 p.m.*

There have been some mentions here and other places about the "leather" box the LE comes in. That black reptilian-textured surface is not leather, but embossed paper. Just sayin'.

Re: 15c LE box -- just for the record

HP calculator cases and even slip cases have also been erroneously identified as leather when they are really made from the hide of the Nuaga.

and just for the record; I have bought NEW an 11c, 12c (as a gift), 41cx, 71(hated it & sold it), 42 (sold it), 32sii, 48 sx & gx, 30b (for the 34s) and the new 15. The box for the 15cle is the nicest package any of my calcs ever came in. I doubt that hp claimed to have killed endangered species to make them.

HP 30b firmware

*Message #1 Posted by **Miguel Toro** on 2 Oct 2011, 9:35 a.m.*

Hi,

if it not inconvenient, does someone have the HP 30b original firmware to share? I received a 30b to repurpose as a 34s, so to have, finally, a better keyboard, but I would like to be able to reflash it back, just in case.

Thanks and regards,

Miguel

Re: HP 30b firmware

*Message #2 Posted by **Alexander Oestert** on 2 Oct 2011, 10:26 a.m.,*
in response to message #1 by Miguel Toro

Contact Gene Wright via forum mail.

I'm not offering to send it, not knowing if there is some kind of copyright issue. Gene seems to be the official HP contact person for this.

Edited: 2 Oct 2011, 10:36 a.m.

Re: HP 30b firmware

*Message #3 Posted by **Mike Maiorana** on 3 Oct 2011, 7:38 a.m.,*
in response to message #1 by Miguel Toro

Perhaps there is a way to download the existing code before flashing on the new code. That would eliminate any copyright issues with providing the code to another. However, I'm not sure how to do it.

Re: HP 30b firmware

*Message #4 Posted by **Marcus von Cube, Germany** on 3 Oct 2011, 10:05 a.m.,*
in response to message #3 by Mike Maiorana

There is no way to do that. Getting into SAM-BA mode requires clearing a bit in the processor. The existing firmware has no provisions for this (34S has!). The consequence: Only a full erase allows access to the flash memory but then it's already too late.

Re: HP 30b firmware

*Message #5 Posted by **Bart (UK)** on 3 Oct 2011, 11:46 a.m.,*
in response to message #4 by Marcus von Cube, Germany

> Quote:

> ... requires clearing a bit in the processor.

Would that be a "flash read-protect" bit? Something that has been present on PGA's, ROM's, EPROM's etc. etc. etc. for decades and which any sensible OEM would use to protect their IP :-)

I decided to particularly buy a second 30b for a 34s reprogramming.

Re: HP 30b firmware

*Message #6 Posted by **Marcus von Cube, Germany** on 3 Oct 2011, 1:02 p.m.,*
in response to message #5 by Bart (UK)

There are two such bits: One to decide which ROM area to boot: SAM-BA or the image in flash; and one to protect the flash from reading through the JTAG port. For SAM-BA to work, the boot bit needs to be reset. Alas, that requires a full flash erase operation of which it is a (desired) side effect.

Another HP-15C LE bug?

*Message #1 Posted by **Benoit Maag** on 2 Oct 2011, 3:23 a.m.*

While testing the HP-15 LE for speed by using the Taylor series of Arctan(1) to get an estimate of pi (pi/4= 1-1/3+1/5-1/7...), I seem to have stumbled into an unusual, unpredictable and potential annoying bug. After an ON/- reset, I entered the following:

LBL A 4 STO 0 3 STO 1 1 CHS STO 2 1 EEX 4 STO 3 LBL 0 4 RCL 1 / <= altered code (see below) RCL 2 * STO+ 0 2 STO+ 1 1 CHS STO* 2 DSE 3 GTO 0 RCL 0 RTN

At some point, the program stops with ERROR 0 Checking further, RCL 1 (where it says altered code above) is changed to RCL 5, and since R5 contains zero, there is a divide by zero error.

Bottom line, the program was modified during execution !!!

Additionally: - The R3 value when this occurs is never the same. - The problem does not seem to occur if you enter EEX 4 instead of 1 EEX 4. - I also tried a few other values for the number of cycles and did not see this problem.

Does anyone find the same on their machine? Any clue on the cause, and fix? Does this happen on the original HP-15C?

Re: Another HP-15C LE bug?

*Message #2 Posted by **Les Bell** on 2 Oct 2011, 4:31 a.m.,*
in response to message #1 by Benoit Maag

I just tried your program, very quickly, on my 15CLE. I didn't do an ON/- reset - I just did an f CLEAR PRGM and then entered it. The first time, I used a loop count of 1 EEX 2, just to check what was going on. Then I went in and edited the 2 to a 4, and ran the program three times, successfully. No ERROR 0, and no program corruption.

I suspect this is related to the ON/- reset.

Best,

--- Les

*Message #3 Posted by **Alexander Oestert** on 2 Oct 2011, 8:54 a.m.,*
in response to message #1 by Benoit Maag

Even after an ON/- reset it works on my LE.

Re: Another HP-15C LE bug?

*Message #4 Posted by **BobVA** on 2 Oct 2011, 10:13 a.m.,*
in response to message #1 by Benoit Maag

Just a quick test here as well - it seemed to work properly for three runs on mine. Also worked after an ON/- reset.

Kind of a long shot, but do you have all the settings at default? (Display mode, trig mode, flags, register allocation, etc.?) just in case that's got something to do with it?

Bob

PS Looks like the line feeds in your code listing got eaten by the editor - I took the liberty of putting them back in and adding line numbers. (Hopefully without introducing any errors of my own!)

```
[1] LBL A

*Message #5 Posted by **Benoit Maag** on 2 Oct 2011, 10:48 a.m.,*
in response to message #4 by BobVA

Les, Alexander, Bob,

Thank you for your feedback.

The purpose of the ON/- reset was to get the machine into a standard state before the test.

This being said, I tried this morning and could not reproduce the problem for a while. Then edited the program (changed 1 EEX 4 to 1 EEX 2), and edited back again, and the problem came back in the exact same way (RCL 1 changed to RCL 5). Fixed the RCL 1 and tried again, and it worked... odd

Re: Another HP-15C LE bug?

*Message #6 Posted by **BobVA** on 2 Oct 2011, 10:51 a.m.,*
in response to message #5 by Benoit Maag

There is a chance it's a hardware fault. You might try re-entering a second copy of your code (with different labels) without deleting the original version and see if the new copy works correctly. If it does, then do a clear program memory and re-enter the code once with the new labels. If that misbehaves I'd strongly suspect bad memory (i.e. step 15 is being stored in a flaky cell).

Cheers, Bob

Re: Another HP-15C LE bug?

*Message #7 Posted by **Benoit Maag** on 2 Oct 2011, 11:31 a.m.,*
in response to message #6 by BobVA

Bob,

Thank you for the suggestion. I have tried as you suggested and the 2nd copy did not crash so far. I tried also a small program that cycles infinitely with RCL 1 in cell 15 - no program corruption after quite a while - so I am really at a loss at what is happening...

Hi Benoit:

Did that happen straight away? That is, right after the edit? Or after editing it and then running it?

Bob

Re: Another HP-15C LE bug?

*Message #9 Posted by **Katie Wasserman** on 2 Oct 2011, 12:38 p.m.,*
in response to message #8 by BobVA

I tried to reproduce this, doing the editing and rerunning as you suggest, with no errors or program corruption. If possible I suggest that you measure the voltages on the two batteries in your calculator.

It might be that a low voltage -- which will occur when running a long program -- is corrupting memory before the brown out detection kicks in. Brown out detection shuts down the ARM chip before voltage becomes too low to sustain memory, this voltage threshold is settable in firmware and might be too low. This would be really bad news so I hope that's not the issue, but I'm going to try testing that just the same.....

Re: Another HP-15C LE bug?

*Message #10 Posted by **Benoit Maag** on 2 Oct 2011, 1:34 p.m.,*
in response to message #9 by Katie Wasserman

The machine has been turned off for ~ 30 minutes. I took out the batteries - both measured 2.92 V on my digital voltmeter (I just measured a AAA new battery with it at 1.59~1.60V, so it probably does not give a low measurement).

What is the min voltage for an ARM processor?

Re: Another HP-15C LE bug?

*Message #11 Posted by **Katie Wasserman** on 2 Oct 2011, 1:57 p.m.,*
in response to message #10 by Benoit Maag

2.92 is actually pretty low for unloaded 2032 cells. If you can put a resistor across them and test the voltage under a simulated calculator load you'll know what the calculator is seeing. Try a 300 ohm resistor (or 330, that's easier to find) across just one cell.

I don't know what the brown out voltage is set to, you'd need see the source code to tell for sure. I'll try some tests later today to see if I can determine if whatever it's set to is working as it should.

Re: Another HP-15C LE bug?

*Message #12 Posted by **Benoit Maag** on 2 Oct 2011, 9:10 p.m.,*
in response to message #11 by Katie Wasserman

Katie,

With a 330 Ohm resistor, the voltage drops to 2.82V.

I just bought 2 new batteries, and without load, the voltage is 3.27~3.28 V (vs 2.92 V for the original batteries).

So the original batteries in the HP-15C I bought were either bad from the beginning, or got depleted extremely quickly (I barely used the machine before the problem started to occur).

So far, no error with the new batteries. Your idea is probably correct, which would mean the 'low bat' detection may need a review.

Thank you

Edit and Run

Re: Another HP-15C LE bug?

*Message #14 Posted by **BobVA** on 2 Oct 2011, 4:21 p.m.,*
in response to message #13 by Benoit Maag

> Quote:
>
> Edit and Run

Interesting - so it may be something in the 15c edit routine that's tripping up the emulator code? And there's still the possibility it's a hardware problem on your 15C LE, particularly since no one else can reproduce it.

Katie: I was thinking about a low-battery related problem as well, but you'd think the errors would be more randomly distributed. Benoit's problem seems to crop up with particular key strokes and, maybe, a particular location in memory. Maybe it's both? If he's got a duff byte in memory that's more sensitive to voltage than it should be, when the edit routine tries to manipulate it, it fails. It's interesting that he always gets the same error. Maybe a sticky "4" bit?

Benoit: Could you try changing your code to swap your use of registers 1 and 2? If the error then changes to "2" becoming "6" that would seem to indicate a bit flip issue, likely in hardware.

Also, do you have any fresh batteries? Might be interesting to see if the problem goes away.

Thanks for trying all this. Barring some freak battery problem I'm guessing that you'll need to return your calculator, but it would be good document the problem here in case it crops up again.

Re: Another HP-15C LE bug?

*Message #15 Posted by **Marcus von Cube, Germany** on 2 Oct 2011, 4:44 p.m.,*
in response to message #14 by BobVA

The bug which modifies a memory location when a self-test is executed may be related to this one. Try if an ON+/ sequence or similar causes the same program space corruptions.

Re: Another HP-15C LE bug?

*Message #16 Posted by **Benoit Maag** on 2 Oct 2011, 4:58 p.m.,*
in response to message #15 by Marcus von Cube, Germany

Marcus,

I presume you mean turning off the machine, then pressing ON and + together, then releasing +, then releasing ON?

I get ERROR 9

Re: Another HP-15C LE bug?

*Message #17 Posted by **Michael de Estrada** on 2 Oct 2011, 10:13 p.m.,*
in response to message #16 by Benoit Maag

Error 9 is the hardware error message for the original HP-15C and other Voyagers. It appears that your unit is faulty.

I hazard that isn't the case. Furthermore my earlier suspicion of HP having a bug in their Voyager/NUT emulator where the failing self test can't corrupt memory I now believe is incorrect. The original 15c firmware (perhaps others in the series as well) do indeed modify/corrupt memory in the case the system test fails.

I'd inadvertently backed out the patch in KEMU which supports self test on the 15c, and found the self test to then fail which corrupted an existing program. So that's apparently been the behavior of the firmware all along, but with a legacy 15c doing so was a non issue.

Re: Another HP-15C LE bug?

*Message #22 Posted by **Benoit Maag** on 2 Oct 2011, 4:55 p.m.,*
in response to message #14 by BobVA

Bob, Katie,

RCL 2 did turn into RCL 6, so the hypothesis of a weak bit impacted by a weak battery seems the most likely...

Re: Another HP-15C LE bug?

in response to message #22 by Benoit Maag

It'll be interesting to see if the problem is resolved after replacing the batteries.

John

Re: Another HP-15C LE bug? --> serious power management bug

*Message #24 Posted by **Katie Wasserman** on 2 Oct 2011, 9:35 p.m.,*
in response to message #23 by John B. Smitherman

Bad news. I did some testing and if there is a brown out detection level set it's not working. When battery voltage drops below around 2 volts or if the batteries can't supply the needed 20ma of current (when running) you will lose all memory and possibly corrupt memory before that happens. I haven't seen any low battery indication warning before this happens either.

This is a serious bug.

The 12C+ seems to have the same problem, BTW.

Edited: 2 Oct 2011, 9:36 p.m.

Re: Another HP-15C LE bug? --> serious power management bug

*Message #26 Posted by **Benoit Maag** on 2 Oct 2011, 9:52 p.m.,*
in response to message #24 by Katie Wasserman

Katie,

I am afraid you are right.

I run a few additional tests: after running the PI calculation program just 4~5 times (total run time < 10 minutes), I checked the brand new batteries (3.27~3.28 V unloaded before use) and they showed 2.95 V unloaded. Half an hour later, machine OFF, they had barely recovered to 3.0V. So the batteries really take a beating - makes me wonder whether you can run long programs without errors, and whether you need to change batteries all the time... (the 2 new CR 2032 cost me $10...)

What's next? Is HP reading this? Can we expect a firmware fix? What do you think?

Re: Another HP-15C LE bug? --> serious power management bug

*Message #27 Posted by **BobVA** on 2 Oct 2011, 11:15 p.m.,*
in response to message #26 by Benoit Maag

Hi Benoit: Did it work OK with the new batteries? At least initially?

Katie: Ugh - that's *not* good news, but I'm still thinking Benoit has a unique issue (or perhaps a unique manifestation of the brown out issue) with his 15C LE...thoughts?

Bob

Re: Another HP-15C LE bug? --> serious power management bug

*Message #28 Posted by **Benoit Maag** on 2 Oct 2011, 11:44 p.m.,*
in response to message #27 by BobVA

Hi Bob,

It did so far but the batteries seem to deplete very quickly.

I probably have a sensitive machine, but from what Katie found, I suspect that the same phenomenon will appear, without warning, on all machines as their battery wear out.

Re: Another HP-15C LE bug? --> serious power management bug

*Message #29 Posted by **Katie Wasserman** on 3 Oct 2011, 2:11 a.m.,*
in response to message #27 by BobVA

> Quote:
>
> I'm still thinking Benoit has a unique issue (or perhaps a unique manifestation of the brown out issue) with his 15C LE...thoughts?

I agree, there's probably a weak bit in memory, or maybe several ones. But if the BOD (brown out detection) was working properly he likely would have never have known this. Probably his tests were causing the battery voltage to sink below the minimum memory retention voltage and he's seeing the one bit die as an early warning sign.

Re: Another HP-15C LE bug? --> serious power management bug

*Message #30 Posted by **BobVA** on 3 Oct 2011, 9:41 p.m.,*
in response to message #29 by Katie Wasserman

Katie: Yep - that's probably what's happening. Benoit's calculator

might be out in the statistical tail and consequently he was the first to notice the problem.

Benoit: Your calculator seems to have a unique issue no one can reproduce, so you might want to think about a return.

I remember that too, although it might have been in conjunction with the 20b/30b not the 12C+.

However I just torture tested my 15C LE and no matter what I do, no matter how many keystrokes I press, no mater how slowly the voltage decreases, I have yet to see the low battery indicator come on (outside of the self tests).

When the voltage gets low enough or the batteries can't supply the needed current memory is lost.

Furthermore, even if the low battery light comes on the ARM chip should go into brown out mode and protect its memory, and it's clearly not doing that. So running a long program will not only kill the batteries it will clear memory.

Re: Another HP-15C LE bug? --> serious power management bug

*Message #35 Posted by **Marcus von Cube, Germany** on 3 Oct 2011, 2:27 a.m.,*
in response to message #34 by Katie Wasserman

Katie, can you test this with a 12C+. It's a volume model which might cause error corrections getting a higher priority.

Re: Another HP-15C LE bug? --> serious power management bug

*Message #36 Posted by **Katie Wasserman** on 3 Oct 2011, 3:04 a.m.,*
in response to message #35 by Marcus von Cube, Germany

I just tested my 12C+ with firmware dated 2009-11-19, which should be the latest but might not be what's in the majority of calculators in production, there are several versions out there now.

Anyway, I get exactly the same results as I found with the 15C LE. The low battery indicator never comes on and memory is lost when the battery voltage gets low enough.

This is really bad, but not as bad as the in the 15C LE: there's less memory to lose in the 12C+, most users have probably never entered a program, it doens't have the key-down 20ma current draw problem (therefore much better battery life) so this issue will not surface as often.

Re: Another HP-15C LE bug? --> serious power management bug

*Message #37 Posted by **Marcus von Cube, Germany** on 3 Oct 2011, 3:07 a.m.,*
in response to message #36 by Katie Wasserman

This should get the attention of Cyrille and Tim, I hope.

Is it a firmware bug, or is it a hardware problem?

I think to remember s.o. (you?) wrote that in an earlier firmware version for the same hardware (12c+, 15c LE) the battery drain problem wasn't there.

If the drain problem wasn't there and the PSE bug wasn't there on that said earlier firmeare version: would one of the beta testers care to share that version here? Please :)

Re: Another HP-15C LE bug? --> serious power management bug

*Message #41 Posted by **Katie Wasserman** on 3 Oct 2011, 1:51 a.m.,*
in response to message #39 by Raymond Del Tondo

I wrote that the battery drain was not a problem on the 12C+ when keys were held down. On the current release of the 15C LE, the current draw when pressing and/or holding down a key is the same as running a program, 20ma.

in response to message #41 by Katie Wasserman

Just another plea for new HP 15C LE new firmware.

As long as running a program or keeping keys pressed may cause loss of memory contents, the new calculator doesn't deserve a "C" symbol after the "15". And, sadly, it may also be said that the "limited" word in the "limited edition" string has little to do with the number of units manufactured...

Let's hope that a new firmware revision will correct this situation... and the PAUSE bug too!

I really like to have my new 15C, and I congratulate the people pushing it

into reality in a less-than-optimum context... I just expect these issues to be solved soon.

in response to message #41 by Katie Wasserman

have just been looking over datasheets for various brands of CR2032 cells. to cut a long story short, the MAXIMUM continuous current draw allowed by any manufacturer seems to be 3mA. given two cells in parallel, this translates to a MAXIMUM of 6mA total current draw by the 12C or 15C calculator.

at 3mA from each cell, the normal CR2032 capacity of 210mAh will be reduced 150mAh at an operating temperature is 23 degrees C. so one would expect a 'running' time of 50 hours [based upon CR2032 datasheet from Mitsubishi]

up at the 20mA level - 10mA per cell - the storage capacity of the cell will (based upon projecting up from lower current drain characteristics) will be almost nothing. that is, if the cell is empty within minutes is will be due to NO fault of the cell manufacturer nor any cell design fault. quite simply, this discharge rate is outside of operating specs (the closet i can find is a pulse discharge of 15mA for 15 seconds, with no ratings provided below a 2.6v terminal voltage - this is perhaps why low voltage sensing is turned off in the firmware!!).

as i follow the unfolding of other's follies, i hear a mantra playing in the background:

THERE ARE NO FREE LUNCHES. THERE ARE NO FREE LUNCHES. THERE ARE NO FREE LUNCHES. THERE ARE NO FREE LUNCHES. THERE ARE NO FREE LUNCHES. THERE ARE NO FREE LUNCHES. THERE ARE NO FREE LUNCHES. THERE ARE NO FREE LUNCHES. THERE ARE NO FREE LUNCHES.

the candle that burns brighter burns out proportionately quicker. in that case, it burns out even quicker still. the only sane engineering solution is for HP to release firmware for the new 12C and 15C calculators that limits speed such that current drain remains below 3mA per cell (6mA in total). it would be prudent to limit the current drain even further.

this would, of course, mean that your shiny 'new' calculator is only a paltry 10x faster than the old one - but at least it then might give accurate numeric results...

This sort of issue is one of many that will deny the 15C-LE status as a *bona fide* re-issue of the 15C. No one ever picked up an extremely I/O and memory limited device like the original 15C and wondered "What limitless possibilities could be explored if only the 15C were one hundred times faster?" Instead, the much greater quality and battery life of the original 15C assures that the original 15C will always be the *ultimate* Voyager.

The re-issue of any old calculator through emulation on a much faster processor system *grossly* aggravates the battery energy depletion issue. The Savage Benchmark run on the HP 30b (not emulated), compared to the same benchmark run on the HP 15C-LE, performs it with a results *error that is 55 times smaller in one-eighth the time*. Problems that can be performed on both machines will use eight times more battery energy on the 15C-LE, compared to the 30b. All one can say good about emulation is that it is valuable if that is the **only way** machine performance can be upgraded, such as that emulated HP 49g known as the HP 50g.

Emulation should be abandoned for all future products. The original programmers were smart enough to program within the limits of the available hardware 30 years ago...why should that not be expected for current programmers and the hardware available today?

Edited to correct 49g+ to 49g.

a nearly 30 year old 15C has a fairly good chance of still being fully functional today. the IC fabrication technology was optimized with extra internal layers to promote long life. the keyboard was engineered with materials far exceeding the design requirements. the plastics chosen and moulding methods used stood the test of time. the original machine was built to the mantra: ONE calculator to last the LIFETIME of the owner.

a 2011 model 12C/15C is built using a processor with a designed materials lifespan of perhaps 10 years, keyboard (including contacts) and plastic parts that are 'just good enough'. the LCD is attached with a printed flex + glue system that is known to fail over time (several years) - though said failure will in 99% of units be safely outside of the 1-year limited warranty. and the PCB assembly uses a lead-free soldering process that is guaranteed to

fail before this decade is out.

the technology all round is a compromise that (a) minimizes cost, (b) maximizes shareholder revenue, while (c) producing a product that will just adequately fulfil the expectations of a 21st century consumer that is used to a disposable calculator that will need to be replaced after a few years because of irreparable failure.

not wanting to criticize the modern 12C/15C design team - they have done a great job (ignoring keyboard failures in one batch and power-hungry firmware) to fulfil the modern design specifications - but the modern 12C/15C is as much a collectable 'design classic' as a $1 plastic flower pot painted up to look like a ming dynasty vase.

Agreed. Except for raw calculation speed, IMHO the legacy voyagers are superior in every way, no qualifiers needed, end of conversation.

But it is even more staggering considering they were designed back in 1980-81. As one example for benefit of perspective, have a look at the PPC/museum holy scrolls of the NUT cpu instruction documents banged out on what appears to be an IBM mainframe class line printer. This level of engineering achievement despite arguable rock and stick tooling is beyond impressive.

> Quote:
>
> All one can say good about emulation is that it is valuable if that is the **only way** machine performance can be upgraded..

Well it allows leveraging legacy technology which is otherwise prohibitively expensive to re-engineer for a given application. The 15c le would never be here otherwise.

> Quote:
>
> Emulation should be abandoned for all future products.

I believe I've also reached that conclusion. Yet there is something quite seductive about seeing 30 year old firmware spring into life in the context of your handiwork. But unless the associated firmware can reasonably survive as a black box, it will soon be beyond the point of diminishing engineering return.

> Quote:
>

I do indeed sympathize with the emotional outcry. But to be fair it isn't at all a programmer/programming skill limitation. The prospective market in 2011 just won't sustain a business model developing pie-in-the-sky, clean slate pocket calculator products as was possible in 1982.

The datasheet for Energizer CR2032 cells shows the anticipated capacity for several pulse load scenarios including up to 23mA (brief) current pulses per cell. There is even data showing the effects on output voltage of a 30mA pulse for two seconds on a cell. I believe the data from this manufacturer suggests that a pair of CR2032 cells in parallel is at least a viable power source for these calculators provided there is some provision for limiting the duration of the 20mA pulse and correctly determining the brownout voltage in order to prevent corrupting RAM data. Here is the data sheet.

Re: Another HP-15C LE bug? --> serious power management bug

*Message #53 Posted by **Katie Wasserman** on 3 Oct 2011, 3:39 p.m.,*
in response to message #52 by Steve Simpkin

There's nothing on this sheet that comes even close to the load the 15C LE put on the cells. Just pressing a key is a 20ma pulse lasting around 100mSec (depending on the user). The 23ma spec is for "1mSec ON / 14mSec OFF". So just entering a number exceeds this spec by a factor of 100.

I think the spec sheet was totally ignored in the power design of this machine. The firmware needs a total revamp in this regard.

OK, my head is spinning with all this power demand technical stuff.

But what does this mean vis-a-vis HP's stated battery life (1 year normal use)? Is that a complete fabrication? Should I go out and buy a bulk pack?

Has anyone had their cells fail yet (normal usage)?

Re: Another HP-15C LE bug? --> serious power management bug

*Message #55 Posted by **Katie Wasserman** on 3 Oct 2011, 4:24 p.m.,*
in response to message #54 by Martin Pinckney

If "normal use" was defined somewhere I could tell you.

I just did a little calculation/guesstimate (on the 15C LE of course!) that resulted in a 1 year battery life if all you did

were 50 simple additions of two 5-digit numbers every day. The major assumptions I made where: that you spend 1/10 second pressing a key down, that battery life is degraded by a factor of 5 from the spec due to the excessive 20ma current pulses, that you have new Energizer CR2032 cells to start with. I think that these are reasonable assumptions.

But this calculator was made to run programs and invert matrices and more substantial, power hungry things. So battery life is gong to be less if you use it a lot, maybe a lot less.

across several manufacturers there are some limited specifications for drawing 10mA for 15 seconds. but the drop in terminal voltage is the killer at this high a current, and in most cases a long recovery time is mentioned (10 pulses/day for one manufacturer).

i suspect the 10mA/15sec figures are included specifically for applications where two CR2032 cells in series are being used to drive a white LED. in such applications nobody cares too much about cell capacity, or indeed wrecking the cells.

in response to message #52 by Steve Simpkin

> Quote:
>
> The datasheet for Energizer CR2032 [...]

unfortunately one can not guarantee the user will always use Energizer brand cells. from a design perspective it is necessary to select a power scheme that respects the specifications of at least most middle-of-the-road average-quality cell brands. assuming it is not acceptable (or practical) to have a calculator that runs at full-throttle for the first 2 seconds before slowing down, one has to select a current draw while 'running' that is sustainable on a continuous basis.

at the current 10mA/cell the terminal voltage will dip down below

the nominal low-battery level specified by most every manufacturer after just a few seconds. it is, therefore, impossible to detect low-battery voltage while a program is 'running' at the currently implemented speed. this is a simple fact.

given the demonstrated memory corruption, it can therefore be concluded that one can not with any certainty guarantee correct calculator operation (more specifically, numeric results). i would suspect that any historic reliability of the original 12C/15C binary code (often mentioned) is completely swamped by this failure of the modern hardware/firmware.

I really don't know much about the CR2032 "coin" cells, but my experience with using "button" cells like the formerly ubiquitous LR44/357 for many years, is that all name-brand cells of a given chemistry perform similarly, and the cheap Chinese brands are junk.

Re: Another HP-15C LE bug? --> serious power management bug

*Message #59 Posted by **Steve Simpkin** on 3 Oct 2011, 5:26 p.m.,*
in response to message #57 by robert rozee

Unfortunately I could not always find pulse load data on various manufacturer's CR2032 datasheets (that should be a red flag). As you suggested earlier, "the only sane engineering solution is for HP to release firmware for the new 12C and 15C calculators that limits speed such that current drain remains below 3mA per cell (6mA in total)." And fix the bug that causes the high current draw while a key is pressed. Of course they could no longer advertise the 15-CLE being up to 100x faster than before.

The HP20b and HP30b have the same potential issues. Cyrille

did mention (on 14 Apr 2010) for the HP20b that "The latest version of the SW only uses high speed when needed, and only for a short period, after that, it drops back to more manageable levels for the battery. since most calculation that will finish in any reasonable time will finish before the speed drops, it seems to work well." That probably still does not address the issue of momentarily drawing current beyond what the cells are rated for.

In the case of my WP-34s (it was a HP30b in a previous life), I now run it in SLOW mode to save battery life. I did this after noticing the low battery indicator flashing on and off when I was running a program in a tight loop. Using the batteries that came with the unit, the battery voltage (as measured by the BATT command) was around 2.6V after a few seconds of my program. New batteries were much better (for now).
By the way, I really love this WP34s calculator.

HP15C LE arrives in Singapore

*Message #1 Posted by **Prabhu Bhooplapur** on 2 Oct 2011, 1:03 a.m.*

Hi, HP has not released HP15C LE in Singapore yet. However, I managed to get one from the USA.

Limited edition number 01791. Serial number CNA132088S.

Pretty good design. Key board is fine. I would have appreciated a multi-colour manual hard copy together with advanced functions manual.

Singapore used to be the home of HP calculator production for years but now I have to get these from overseas.

Prabhu

Facebook page created for Hewlett Packard Calculators

*Message #1 Posted by **gene wright** on 2 Oct 2011, 12:29 a.m.*

Simply search for "Hewlett Packard Calculators" and the page should come up.

If you already have a facebook account, please consider finding the page and "liking" it or become a fan. The TI page has way too many fans already, so HP needs to be catching up. The content is sparse at the moment, but I expect it to grow.

If you don't have a facebook account, considering signing up for one. There are other benefits beyond the Hewlett Packard Calculator page.

Hopefully, the page will have a good amount of content directed to it by a wide variety of people from a variety of sources. The potential number of people who might FIND this page through exposure of facebook friends who like the page is incredible.

Who knows? Perhaps not only will a student find an answer to how to solve a problem the night before a test from this page, but perhaps some will become real fans of Hewlett Packard Calculators.

Are people still really so naive about the internet as a whole? Do you really not know that many sites do this? At one stage I was receiving emails for products resembling Google searches I had made not too long before, and I hadn't even signed up for any Google related accounts at the time. Generally I don't care who tracks me where, but when I do I make sure my cookies history (and other browsing history for that matter) is cleared.

In general, yes. That is why FB and others can get away with violating your privacy. FB is frequently labeled as one of the largest offenders. I know that they need to make a buck and will continue to push the limits of data mining--and they will get caught.

> Quote:
>
> Do you really not know that many sites do this?

Uncountable. But not like the article above describes. Howard did an excellent job of breaking it down.

> Quote:

> Generally I don't care who tracks me where...

Most don't, but some do. My beef is that they do it in secret as much as possible. E.g The FB iPhone app without even asking scanned my address book and harvested any phone numbers that matched any of my FB friends.

> Quote:
>
> ...but when I do I make sure my cookies history (and other browsing history for that matter) is cleared.

I try to do the same, however there are cookies that I do not want cleared and having to manually track down offending cookies can be a pain.

For now when I have to use FB (like Howard due to peer and family pressure) I start a new browser in privacy mode.

Re: Facebook page created for Hewlett Packard Calculators

*Message #10 Posted by **Howard Owen** on 2 Oct 2011, 1:44 p.m.,*
in response to message #7 by Egan Ford

Tracking cookies are a normal part of the Internet now. (Sometimes "normal" describes behavior or facts that suck.) Tracking cookies are set by sites like doubleclick.net (Google's ad network) when you get shown one of their ads. The ads are served up by doubleclick.net servers, so the next time you load an ad the cookies the first one set get sent back to doubleclick.net. Doubleclick uses this to create a "click trail" that tells them what ads you have looked at. If you subsequently buy something an ad promoted, this information is used to prove to the advertiser that the ad "worked." Thus it is the basis for measuring ad effectiveness. It's also used to serve you ads targeted to your interests as revealed by your click trail.

This is normal, though creepy. However the big deal here was that one of the cookies that Facebook left on your browser after logout contained your user ID. Doubleclick and other ad networks are not supposed to associate your click trail with your actual identity. They don't need to do that in order to figure out your preferences or measure your buying behavior. But your Facebook user ID can absolutely be used to identify you. The Facebook "like" and comment buttons you see everywhere are served from Facebook directly, so whenever you load a page that has one, every FB cookie you have is sent back to the Facebook server, including that one, whether you are logged in or not.

As often happens when Facebook is made aware of an issue, meaning when they are caught such that a problem becomes widely known, they have responded to the problem by issuing a fix that deletes the cookie with your user id when you log out. This is what should have happened in the first place. Indeed, several other cookies associated with your logged in session are deleted when you log out. Facebook claims that the cookie in question was mistakenly left on your machine after logout. They also claim that the behavior the blogger described, where a fake account he created was somehow tied to his real account, could not have been due to this cookie since it was never used that way by Facebook. They ask you to trust them when they say that's they way it was supposed to work.

Facebook can be trusted to try to increase the amount of information you reveal to your friends and to others because that information is valuable. Facebook doesn't sell that information directly to others. They make it possible for others to access it if you let them. Facebook applications can get at a lot of that information, depending on how your privacy settings are configured. Each time you sign up for an application, you get a permission dialog that asks you to allow the app to access this information. If you

set your privacy settings to be restrictive, and you avoid using Facebook applications, you can eliminate or at least minimize the information about you that is given to third parties. But events like this one undermine trust in the platform.

Personally, I think Facebook is evil, but I participate anyway. Many of my friends are there. Significant things are shared that I want to know about. It's not just what movies people are watching or what trip they are taking. My friends frequently share what they believe, how they think, how they feel and so forth. This stuff is part of the substance of friendship. I also get access to information my friends are interested in. Links to websites enlighten or annoy me. They can make me laugh or make me angry. I also share what I'm doing, thinking and feeling with them. My friends list is small enough that I can do that comfortably. When Facebook is caught doing something like this, it undermines that comfortable feeling. But I carry on because my friends are there. That fact is important and relevant to my everyday life. It's not that I couldn't stay in touch with some of my friends without Facebook. But I couldn't keep up with all of them. And many of my younger friends use Facebook as a primary means of communicating with me. That's worth the privacy risk, though I often wish it weren't.

With Ghostery, AbBlock, dedicated spam filter etc. I have more than enough to do to keep spy networks out of my digital world. Getting back into it while keeping safety high just to press a silly button would not be reasonable, taking into account an expected positive effect on HP's popularity of around zero percent ;-).

On a second thought, imo HP didn't deserve something like 'Like it' since quite some time.

- unreliable 35s
- 20b with terrible keyboard
- new Voyagers with 10% failure rate

All credits earned in the past have been burned to ashes. Hope they go bancrupt soon and someone catches the calculator division. Just dreaming...

Doesn't matter. According to Leo, you can't make enough money from selling hardware for the shareholders anyway. Even before him, HP didn't sold competitive harware but a competitive brand. This has to end at some point when HP becomes a synonym for 'problematic but nonetheless expensive hardware'. Leo might have anticipated this and reckoned that repairing what cost cutting beyond any reasonable limit has damaged is no option. He's probably right.

Unfortunately, the old ingenious UI to calculators, be it RPN, RPL/HP Solve, is tied to HP hardware and coding. This must end. It isn't just working anymore since, surprisingly, two people (my guess) coding everything and the cheapest manufacturing plant you can find on earth cannot grant for usable calculators.

HP-71B Card Reader 82400A

*Message #1 Posted by **aj04062** on 1 Oct 2011, 9:08 p.m.*

I have the reader and the box. Does anyone have pictures or scans of the remaining items (QREF, manual, packing)?

Edited: 1 Oct 2011, 9:45 p.m. after one or more responses were posted

Re: HP-71B Card Reader 82400B

*Message #2 Posted by **Raymond Del Tondo** on 1 Oct 2011, 9:29 p.m.,*
in response to message #1 by aj04062

Are you sure you have a "B" revision?

For the packaging: The unit is centered in the cardboard box, and the are two papers only,
one of them being a short note that instructions will be found in the user manual,
a leaflet about accessories, and a tube containing a few mag cards and a cleaning card...

For scans: Have you checked the hpmuseum DVD?

Edited: 1 Oct 2011, 9:30 p.m.

in response to message #4 by robertoataulfo

I don't understand

Re: HP-71B Card Reader 82400A

*Message #6 Posted by **Raymond Del Tondo** on 1 Oct 2011, 11:04 p.m.,*
in response to message #4 by robertoataulfo

Unfortunately the version is on the box only. It should be embossed on the housing of the unit. Since the card reader doesn't respond to VER$, there is no better resolution;-)

Edited: 1 Oct 2011, 11:08 p.m.

Re: HP-71B Card Reader 82400A

*Message #7 Posted by **Eric Smith** on 2 Oct 2011, 12:48 a.m.,*
in response to message #6 by Raymond Del Tondo

The 71B card reader doesn't have a ROM. It doesn't have a version. The "A" at the end of "82400A" is part of the model number, not a version per se.

For example, the 41C card reader was always model 82104A, even though there were versions 1D, 1E, 1F, and 1G of its ROM.

When a product with a model number ending in A was replaced by a model number ending in B, generally that signified more significant changes to the product than just a ROM code change. For example, the 82240A/B printers and the 9114A/B disk drives had significant physical differences.

Re: HP-71B Card Reader 82400A

*Message #8 Posted by **Etienne Victoria** on 2 Oct 2011, 3:51 a.m.,*
in response to message #1 by aj04062

The 71B Card Reader has neither specific manual nor QREF.

The Card Reader Use is documented in a specific section of the Hp-71B user manual...right at the end IIRC.

Etienne

Re: HP-71B Card Reader 82400A

*Message #9 Posted by **aj04062** on 2 Oct 2011, 1:54 p.m.,*
in response to message #8 by Etienne Victoria

so why is the box so long & wide? I presume the length to store the cards (are these the same as the 75C cards?) but it still seems wider that it needs to be.

I'm just looking to identify what I need to cobble together through copying or making to complete the item

Re: HP-71B Card Reader 82400A

*Message #10 Posted by **Etienne Victoria** on 2 Oct 2011, 4:08 p.m.,*
in response to message #9 by aj04062

Yes, the cards are the same as the 75C cards.

I have never seen a card reader box so I cannot help on this one.

The 71B Box is long and wide to store side by side:

- The 71B itself in a cardboard frame,

- The 2 hefty manuals

- The QRG

- The soft case

- The blank overlay

- The accessories leaflet

Etienne

HP-15C LE : fastest selling ever ?

*Message #1 Posted by **Donald Ingram** on 1 Oct 2011, 6:32 p.m.*

It seems that HP cannot keep the 15C LE in stock on their own webstore for more than a few hours.

Does this runaway success make the 15C their fastest selling calculator ever ?

Re: HP-15C LE : fastest selling ever ?

*Message #2 Posted by **Michael de Estrada** on 1 Oct 2011, 6:54 p.m.,*
in response to message #1 by Donald Ingram

I don't think HP has ever brought a calc to market in quite the bizarre manner of the HP 15C LE, which might explain the initial sales frenzy. Ultimately, sales will level out and will probably reach a finite asymtote representative of the true demand.

The "Gompertz Curve Trend Analysis" program on p.48 ff. of the HP-41 "Business Stat/Marketing/Sales" User's Library Solutions book should do the trick. ;)

Best,

--- Les

*Message #2 Posted by **Katie Wasserman** on 1 Oct 2011, 8:19 p.m.,*
in response to message #1 by Harry Jacobson

Is there nothing online that lists the HP-30b/20-b self tests? Gee, I thought that Gene would have done that if not HP. At any rate they are:

- Screen Test, press INPUT to start and press to cyle through the 12 different displays

- Keyboard Test, press each key at least once in any order. Once they have all been pressed the test ends.

- Checksum, the number of the left side of the decimal point should equal the number on the right side of the decimal point.

- Battery Test, this is the voltage of the batteries. They are in parallel so it's sort of an average.

- Software Version, date of the firmware.

- Copyright message (also shows the amount of non-volitile RAM used by the firmware, should always be 2048, I think).

- Test System, pressing INPUT will toggle the test system on/off. The test system was used in development but when on will run the calculator somewhat faster and burn through batteries at lightning speed.

- Slow Clock, you can adjust the clock speed a little bit. I forget if this had a noticeable effect.

- Serial, I'm not sure. I think that this allows debugging of the serial interface that's used in the Test System.

Some of the above are guesses, please correct me if you know better.

Anyone want an XServe?

*Message #1 Posted by **David Ramsey** on 1 Oct 2011, 4:59 p.m.*

Dual dual-core 2.0GHz Xeons, 9GB memory, standard Apple 80G boot drive. Includes one extra drive carrier that will accept any standard SATA 3.5" hard drive, original box, manuals, disks, cords, etc. as well as one unlimited-license copy of OS X Leopard Server.

I'd sell this cheap, guys. Really cheap. Like "one good 41CL-upgradable HP41 and shipping" cheap.

Lemme know.

Use HP serial interface to save/restore programs?

*Message #1 Posted by **Harry Jacobson** on 1 Oct 2011, 3:57 p.m.*

I searched the forum for this without success, so:

Can the HP serial interface cable be used to save/restore programs on the HP 30b without harming the existing firmware?

Thank you in advance,

Harry

Re: Use HP serial interface to save/restore programs?

*Message #2 Posted by **Marcus von Cube, Germany** on 1 Oct 2011, 4:43 p.m.,*
in response to message #1 by Harry Jacobson

No, you can only do this with the 34S firmware in place, not the original from HP.

There are provisions for supporting the serial I/O port in the firmware but this is not documented for the general user. It's more of a testing environment for HP. I'm pretty sure you cannot get to the programs or registers from the outside this way.

Once you press the Erase button on the cable the firmware is toast. Sam-Ba.exe has the nasty habit of clearing the RAM, too, so all your data is lost if you use this button.

Edited: 1 Oct 2011, 4:45 p.m.

Re: Use HP serial interface to save/restore programs?

*Message #3 Posted by **bill platt** on 2 Oct 2011, 7:51 p.m.,*
in response to message #2 by Marcus von Cube, Germany

So then you really want to turn a 30b into a 34s as soon as you get one? Then you can do all the cool stuff?

Re: Use HP serial interface to save/restore programs?

*Message #4 Posted by **Marcus von Cube, Germany** on 3 Oct 2011, 12:12 a.m.,*

Cool stuff indeed. :-)

Re: Use HP serial interface to save/restore programs?

*Message #5 Posted by **Walter B** on 3 Oct 2011, 2:28 a.m.,*
in response to message #3 by bill platt

That was the reason why we made it :-)

Re: Use HP serial interface to save/restore programs?

*Message #6 Posted by **Harry Jacobson** on 4 Oct 2011, 12:59 a.m.,*
in response to message #3 by bill platt

Cool stuff aside, for the original 30b firmware there's the desire to offload programs to maintain a program library greater than the amount of memory available. That is, without having to continually erase and tediously key in.

If the 30b had a USB port or an SD slot..... but it doesn't.

HP 15C LE Manual corrections

*Message #1 Posted by **Marcus von Cube, Germany** on 1 Oct 2011, 1:47 p.m.*

Is there a place where we can collect any errors found while reading the new manual? Here are some:

P.20: *Note: Decimal digits from the mantissa that spill into the exponent field will disappear from the display when you press ", but will be retained internally.*

The stray quotation marks are the problem.

P.35: *12.9 [+] 22.2481 Oops! The wrong divisor.*

The plus symbol should be the division symbol.

Page 62: *If the calculator is turned off, Continuous Memory will be preserved for a short period while the batteries are removed. Data and programs are preserved longer than other aspects of calculator status. Refer to appendix F for instructions on changing batteries.*

I doubt these facts are true. If you remove both batteries the memory will be cleared. There is no technical reason why the status and data should have a different retention behavior. This was the case when data memory and status were stored in different physical chips on the original hardware but on the Atmel its all in one chip.

Edit: Added page 62.

Edited: 1 Oct 2011, 5:15 p.m.

I am currently collecting the errata reported in the forum. Next week I will post the collected list as an article in the museum.

Felix

Re: HP 15C LE Manual corrections

*Message #4 Posted by **Michael Kussmaul** on 7 Oct 2011, 10:53 a.m.,*

in response to message #3 by Felix Gross

I worked through the manual (It's my first 15c :-) and found these bugs:

- Page 61: ON / . 12.345,6700 (instead of 12.345.6700)
- Minor: Especially in Complex-Matrix-Section there are some super-scripts (like Tilde) misaligned
- Minor: Most i in Matrices are overlapping with text (e.g. page 169, example or 171 in the middle of page)
- Page 104: First letter on page should be bold as well
- Page 110: Brackets on top show the wrong part of 0. 050 02
- Minor: Page 139: 2 ENTER 1 f DIM B: B is on new line, in original manual, all is on one line
- Minor Page 140: f MATRIX 0: there are missing spaces before and after the MATRIX key (anyway spacing is not consistent across document :-)
- Minor Page 170: 4 ENTER 1 f DIM B: B is on new line, in original manual, all is on one line
- Minor Page 216: 19 f DIM (i): (i) is on new line, in original manual, all is on one line
- Page 261: Self-Test...
- Page 262: No blank line before I-Key description
- Page 269: MEM section is written twice (repeatedly)

All in all, this one of the best manuals I have read :-)

HP 15c LE Display timing issues?

*Message #1 Posted by **Michael Kussmaul** on 1 Oct 2011, 12:09 p.m.*

I'm aware of the PSE bug in the current 15c LE firmware, but I'm wondering if the following issue is also present in the original 15c:

As written on page 144 in the manual, if you store/reclall a value on a matrix you can just hold the button "about 3 seconds" to cancel assignment - the calculator will display "null".

Now it looks like on my 15c LE this is rather 2 seconds or even less - also in general if the calculator does show status messages (e.g. The current row/column in matrix entering mode) they are shown so short and quickly I have hard time reading them. Is this also the same on the original 15c?

Re: HP 15c LE Display timing issues?

*Message #2 Posted by **Paulo MO** on 1 Oct 2011, 3:36 p.m.,*
in response to message #1 by Michael Kussmaul

The thing is just fast, and slowing it down is not flawless. IMHO, lack of speed was the weakness of the original breed (only noticeable, of course, when using the most complex functionalities) and the increased mips are, thus, most welcome. Therefore, no complains here. :-)

Cheers Paulo

Re: HP 15c LE Display timing issues?

*Message #3 Posted by **Katie Wasserman** on 1 Oct 2011, 3:39 p.m.,*
in response to message #1 by Michael Kussmaul

I noticed the quicker time to "null" as well. While it's a lot less than the documented 3 seconds I think it's just about right for regular use. The better fix in my view is the change the documentation to "about 1 second".

Re: HP 15c LE Display timing issues?

*Message #4 Posted by **Dieter** on 2 Oct 2011, 9:23 a.m.,*
in response to message #3 by Katie Wasserman

I would consider this an improvement. The 41-series nulls after about 1.5 seconds, and I think that's just right. IMHO it's better a bit shorter (operation may get cancelled) than too long (key accidently released before timeout => matrix overwritten).

Dieter

Re: HP 15c LE Display timing issues?

*Message #5 Posted by **Mike Fikes** on 2 Oct 2011, 10:55 a.m.,*
in response to message #1 by Michael Kussmaul

With respect to Michael's question:

On the original 15C, the current row/column status message (when in matrix entering mode) is only shown for as long as you hold down the target matrix key (for example, while holding down the "A" key in the sequence STO A). (Unless, of course, 3 seconds elapse, resulting in cancellation / null.)

So, even on the original 15C, if you hit STO A and don't hold down the "A" key but simply press and release, you won't have time to read the status message, and may only see it briefly flash on the display.

Re: HP 15c LE Display timing issues?

*Message #6 Posted by **Michael Kussmaul** on 2 Oct 2011, 12:07 p.m.,*
in response to message #5 by Mike Fikes

Ok, many thanks for checking! So it works as advertised :-)

34S SUM PROD change request ccccc >= fff

*Message #1 Posted by **Egan Ford** on 1 Oct 2011, 11:53 a.m.*

Could you please change "ccccc > fff" to "ccccc >= fff" so that ccccc can count down to and include 0.

Thanks.

Re: 34S SUM PROD change request ccccc >= fff

*Message #2 Posted by **Paul Dale** on 1 Oct 2011, 8:14 p.m.,*
in response to message #1 by Egan Ford

This is somewhat limited by the definition of DSE unfortunately.

Here is the sum and product code as it currently exists in the firmware image. It is just a plain old keystroke program. Feel free to submit a patch :-)

The stack will always be four levels deep when this code is run and registers 0-4 and flags 0-14 are freely available.

Then again, I could look into adding DSL and ISE as instructions.

- Pauli

Pauli, what is the reasoning behind the complicated summation. It must have to do with increasing accuracy but how does it work?

If you want to make the code shorter, the two loops may easily be merged and the operation selected by a flag inside the loop.

Re: 34S SUM PROD change request ccccc >= fff

*Message #6 Posted by **Paul Dale** on 2 Oct 2011, 7:47 a.m.,*
in response to message #5 by Marcus von Cube, Germany

The summation is indeed an attempt to improve precision. The algorithm used is known as the Kahan sum.

Essentially, it maintains the sum and some of the digits lost off the end in two registers. The lost digits act as a correction term as each new item is added in.

Yes, the two loops could be merged. I didn't investigate this option since neither is very large.

- Pauli

What is your holy grail?

*Message #1 Posted by **Keith Midson** on 1 Oct 2011, 3:20 a.m.*

I've got a decent sized collection of HP's, but there is always something elusive that you have to have, but can't find. For me it's a clear case 12c. I've got a few clear cases (28s, 19bii, 30b, 71b, 17b & 67), but a clear cased 12c would really complete my 12c part of my collection.
What is your holy grail? Cheers, Keith

*Message #2 Posted by **Ángel Martin** on 1 Oct 2011, 4:20 a.m.,*
in response to message #1 by Keith Midson

Since I'm not a collector it's quite simple: the 41CL.

If I was a dedicated collector (admitedly I have a modest gathering of gear) I'd say a 41CY, or the slippery-elusive 3421 Control Module with soft-pad overlays... sigh.

Re: What is your holy grail?

*Message #3 Posted by **Garth Wilson** on 1 Oct 2011, 6:41 a.m.,*

> Quote:
>
> or the slippery-elusive 3421 Control Module with soft-pad overlays... sigh.

If it's just for a matter of collecting, that's one thing; but the 3421 definitely does not require the accompanying module in order to make full use of it.

For myself, I might say 41CL also, otherwise a Clonix-41, NoVRAM, or MLDL2000 or something like that. I'd like to see a concise comparison of them all. I expect the 41CL is the fastest, although few things are really so speed-critical

in response to message #1 by Keith Midson

I wish I had back ones that I no longer own due to failure:

- HP15c was my first, what I used in college until I broke it by (horrors) setting the foot of my chair on it, shattering the display.

- HP71b with card reader: just stopped working.

- H32s: bezzel around display was bent into display, I broke display trying to pry it up.

These were all done in my foolish younger years.

Glad I still have my 48sx w/eqn. library card, 35s, 50g and WP-34s...

in response to message #1 by Keith Midson

For me it would be a HP-67 CX. Was there any attempt to build one in the past ?

Regards

Karl

Re: What is your holy grail? (maybe a tad long)

*Message #27 Posted by **Dale Reed** on 1 Oct 2011, 1:45 p.m.,*
in response to message #1 by Keith Midson

As for a "collection" -- mine is mostly Voyagers. They're not particularly minty (except 15C LE, 12C AE, of course), but I like the ones I have. I mostly need to fill in on missing manuals (10C owner's handbook and the various advanced functions manuals).

But my holy grail is to be able to build my own calculator -- to gain the skills/tools in programming, part selection, PCB layout, case design/construction, etc., to make a calculator that does what **I** want.

I 'grew up' with an HP-25, but I like the continuous memory, the feel, the layout and the functions of the 11C, 15C, 16C. When I saw the 35S, I thought 'Great, HP is doing a CALCULATOR!' It's nice, but it's not a 15C.

I've also read here about folks wanting the 35S to have USB or SD Card, or some means of upload/download. I've read about the WP34S and using the tools for flashing a 20b or 30b (or 12C+ / AE or 15C LE). Got a 30b and a cable (thanks, Gene!) and will be loading it up over my vacation....

I read about the 41 series, including the blanknut.

I recently built my own sound-effects box (a display-less MP3 player with a LOUD speaker amp on board and files on an SD Card), so I've got a little bit of microcontroller programming and PCB design under my belt. Just a little.

So my RPN calculator is my next project.

I like the landscape layout of the Voyagers, and I look at my cellphone with a slide-out QWERTY (QWERTZ or AZERTY for some of you) keyboard.

If I were going to make a "blank" keyboard Voyager (or buy one, say a NW250AA#ABA OPT 001?), it would have the ENTER key horizontal (like my beloved HP-25) in the center of the bottom row, the spacebar position. Now I could use the keyboard / display of my "calculator" in an alpha mode for other things that need alpha input. And it would have USB and/or MicroSD, maybe a lithium-ion battery charged by the USB port. The holy grail of BYOC (build your own calc) hardware....

So I am following the discussions of the WP34S firmware with interest. Likewise the DIY5 hardware discussions, and the comments on various LCD displays. Thank you all for "teaching" me -- without really trying.

If I 'finalize' my candidate keyboard layout, I'll post it here. I've followed several recent discussions about which keys should be primary vs. shifted, and I think I've got a good layout FOR ME based on how I would use it.

For those who are interested, I'm currently working with a 4-line 20-character display and a Freescale MCF51JM128 (plenty of SPIs and has USB OTG). Just because I'm familiar with it.

With BYOC hardware, you can do yer own dang layout! And a lot more, if you've got USB, MicroSD, MP3 codec or whatever...

Sorry this is a bit long. But 'you asked'!

Dale

*Message #32 Posted by **Dan W** on 1 Oct 2011, 7:04 p.m.,*
in response to message #1 by Keith Midson

I really only collect the Classic series, up thru the 67 and 97; mainly because I know them well and I can repair and restore them. Of those I'm only missing the HP-70.

As an engineer I've had less interest in the financials, and the HP-70 can be rather expensive.

For modern use, an HP-42S-LE would be my most desirable calculator. I hope one day it will be produced.

Re: What is your holy grail?

*Message #33 Posted by **Pal G.** on 1 Oct 2011, 7:28 p.m.,*
in response to message #1 by Keith Midson

A late HP 49G+, with serial number above CNA6XXXXXXX. Reportedly HP made a batch of "good" 49G+'s before switching to the 50G.

The 49G+ was my first HP calculator (mine is dead) and I prefer its looks compared to my 50G with its Darth Vader color scheme.

And a 42S.

in response to message #34 by hpnut

I don't have any clear case machines but have a blue (think Smurfs) 41 case, which might be one of a kind.

Outside of HP or former HP employees, these unusual cases are rare. Clear is the most common.

Re: What is your holy grail?

*Message #39 Posted by **Jim Horn** on 2 Oct 2011, 8:39 p.m.,*
in response to message #1 by Keith Midson

A long wish of mine - that HP would sell a custom ROM version of Casio's DataBank calculator watch as an RPN scientific calculator watch. Casio's scientific calculator watches of the 1980s, like many HP calculators, sell for many times their list price on the used market. An RPN version would be great!

Yes, today's smartphones reduce the need for this - but I'd still like to have one...

Re: What is your holy grail?

*Message #40 Posted by **Juergen Keller** on 3 Oct 2011, 1:41 p.m.,*
in response to message #1 by Keith Midson

The problem with HP calculators/computers is that there is not a single Holy Grail, there are many :-)

My top favorites are: 41CL, 41CY, 9100A, 9845C, 65, 85, and from a collector's point of view a 95C.

Re: What is your holy grail?

*Message #41 Posted by **Keith Midson** on 3 Oct 2011, 10:15 p.m.,*
in response to message #40 by Juergen Keller

That is true Juergen. What I have to have at any one time can change without warning too! My holy grail non-HP right now would be an Elektronika MK90 - I haven't seen one listed on TAS for a few years now. Cheers, Keith

HP-15C LE Serial # vs. LE

*Message #1 Posted by **Steve28** on 1 Oct 2011, 3:16 a.m.*

I ordered two HP-15C LEs a week apart. One from Samson Cables and one from HP directly. I noticed that one of the has Serial Number: CNA1310KS7 with a Limited Edition Number of 02048. The other one has a Serial Number of CNA13207TG and an LE Number of 01xxx - I don't have that one at home right now.

My understanding of the Serial Number scheme is the first three letters indicate the country of manufacture the next digit is the year and the next two are the week of the year. That means:

CNA1310KS7 = 31st week of 2011 (LE # 02048)

CNA13207TG = 32nd week of 2011 (LE # 01xxx)

This seems to indicate the LE numbers aren't being "issued" sequentially and/or they made/make the aluminum back plate separate from the the calculator and by the time the two meet... it's semi-random which unit gets which LE #.

Just wondering if anyone else who purchased multiple units noticed something similar.

Steve

Edited: 1 Oct 2011, 3:17 a.m.

Re: HP-15C LE Serial # vs. LE

*Message #2 Posted by **Marcus von Cube, Germany** on 1 Oct 2011, 4:41 a.m.,*
in response to message #1 by Steve28

I can only add my own unit to the list:

CNA13208GF (week 32/2011) LE# 00052.

Re: HP-15C LE Serial # vs. LE

*Message #3 Posted by **Paul Berger (Canada)** on 1 Oct 2011, 7:32 a.m.,*
in response to message #1 by Steve28

CNA13208YW LE01957 looks pretty random, assuming they are using all letter combinations my serial

number would be 485 away from Marcus's, however there is a difference of 1905 in the LE number.

Re: HP-15C LE Serial # vs. LE

*Message #4 Posted by **Jeroen Van Nieuwenhove** on 1 Oct 2011, 7:46 a.m.,*
in response to message #1 by Steve28

> Quote:
>
> CNA13207TG = 32nd week of 2011 (LE # 01xxx)

Mine is CNA13207TH (!) = 32nd week of 2011 (LE # 00726).

I think it is most likely that the batch of aluminium back plates was either mixed or split up along different production lines.

Re: HP-15C LE Serial # vs. LE

*Message #5 Posted by **Steve28** on 1 Oct 2011, 12:11 p.m.,*
in response to message #4 by Jeroen Van Nieuwenhove

in response to message #5 by Steve28

I've looked at about 20 pairs of numbers and couldn't deduce a method to the LE# numbering madness.

Re: HP-15C LE Serial # vs. LE

*Message #7 Posted by **Derek Walker (UK)** on 3 Oct 2011, 3:23 a.m.,*
in response to message #6 by Geoffrey Wang

Thinking of the production logistics, I suspect that the LE number would be printed at the same time as the rest of the backplate, well in advance of its fitting to the calculator, and probably at a different location (assuming aluminium trim production may be subcontracted to a metal manufacturer). In that case a batch of backplates would be available at the calculator production line and would be applied in random order as they were taken from the box.
An interesting point if this is correct, is that all the LE numbers reported here have been in the range 0 - 3000, suggesting that is the total size of the first production batch (rather than the ones supplied so far being the first 3000 of a larger production run).

HP12c 30th AE keyboard

*Message #1 Posted by **Paulo MO** on 30 Sept 2011, 8:11 p.m.*

Hi

Does anyone know if the keyboard of the12c 30th AE is of the same type of the 15 LE, with that new hard feedback (which I love), or if it is the very same keyboard of the regular 12c+ (of which I just bought a new calculator and am now stuck with some receding keys and a semi-working Enter key)? :-(

Thanks. Paulo

Re: HP12c 30th AE keyboard

*Message #2 Posted by **M. Joury** on 30 Sept 2011, 8:24 p.m.,*
in response to message #1 by Paulo MO

All three have the same keyboard. They are all physically the same machine the only difference being the firmware and key labeling. If you got a bad 12C+ send it back to HP. I once saw one in a store that was quite obviously bad but my own 12C+'s have been flawless with exactly the same key feel as my 15C LE's.

Cheers,

-Marwan

Re: HP12c 30th AE keyboard

*Message #4 Posted by **linear** on 30 Sept 2011, 8:24 p.m.,*
in response to message #1 by Paulo MO

The HP12c 30th AE seems to have the same keyboard as the 15c LE, including, unfortunately, the possibility of getting one with "flakey" keys.

My 12c AE has a flakey "CHS" key, one of my 15c's has a flakey "SST" key and the other a flakey Z+ key. Otherwise, the keyboards feel "good", IMHO.

Re: HP12c 30th AE keyboard

*Message #5 Posted by **Paulo MO** on 1 Oct 2011, 3:26 a.m.,*
in response to message #4 by linear

Sorry for your flakey keys. But is't always nice to know that "I'm not the only one" with a new "bad" 12c. :-)

In my case, and even not considering the bad keys, the overall keyboard does not have nearly the same feel of the 15 LE, by a loooong shot. It just seems to be a totally different design of the feedback mechanism (even though I now know otherwise, thanks to all of you).

Best Paulo

On a similar thought, does any sort of a synopsis of the event exist? I haven't attended an HCC event thus far and regrettably my plan to be on the left coast last weekend didn't pan out.

I'd just tried rummaging through hpmuseum.org for clues from the past week, but have never understood where posts wander off to when they age out of the 4-5 day recent post window.

You could look at the conference schedule to view the list of talks. But to really get the flavor of the conference I recommend contacting Jake Schwartz to get DVDs of past conferences. It will be a good while till he has the recent one ready, but there are many hours to view as it is. Jake does the Herculean task of editing in addition to videotaping, and we all owe him a depth of gratitude for it.

HP 15C and 15C LE not the same dimensions?

*Message #1 Posted by **Derek** on 30 Sept 2011, 3:55 p.m.*

not sure if this has been raised before but...

i just received my 15C LE, and i was struck by the fact that it is a smidge larger in all three dimensions than my circa 1984 15C. (most notable to me was that it felt thick in my hand before even comparing the two units side by side)

no time for a full review right now, but i'm unsure how i feel about the keyboard. i see why some might like it, but it's not the same as my old 15C nor an older 12C i also own. it will take some getting used to.

Re: HP 15C and 15C LE not the same dimensions?

Can anyone else confirm this? What about the modern 12c's - are they larger than the 1980's ones? If so, when did they "grow"? If not, I wonder why the factory would not use the same molds for both the modern 12c's and the 15c LE.

Re: HP 15C and 15C LE not the same dimensions?

*Message #3 Posted by **M. Joury** on 30 Sept 2011, 4:48 p.m.,*
in response to message #2 by Martin Pinckney

Yes. Not sure about length and width but it is certainly a tad thicker. Also perhaps a very slightly different shape in the beveling along the top edge. Seems to match the 12C+ exactly.

Re: HP 15C and 15C LE not the same dimensions?

*Message #4 Posted by **Michael de Estrada** on 30 Sept 2011, 4:58 p.m.,*
in response to message #3 by M. Joury

It's 5 grams heavier.

Re: HP 15C and 15C LE not the same dimensions?

*Message #5 Posted by **Jeroen Van Nieuwenhove** on 30 Sept 2011, 5:04 p.m.,*
in response to message #2 by Martin Pinckney

It struck me as well when I was comparing my 11C and the new 15C LE. The size differences are very minimal though. The 15C fits smoothly in the 11C pouch and vice versa.

I keep wondering why the new voyagers have dual CR2032 cells and not dual AAA-size cells. I think they would fit inside the case. Wouldn't AAA-size cells last longer?

Re: HP 15C and 15C LE not the same dimensions?

*Message #6 Posted by **Marcus von Cube, Germany** on 30 Sept 2011, 5:12 p.m.,*
in response to message #5 by Jeroen Van Nieuwenhove

You wouldn't be able to change one cell at a time without losing memory contents because AAA cells would need to be wired in series instead of in parallel.

Re: HP 15C and 15C LE not the same dimensions?

*Message #7 Posted by **Dwight Sturrock** on 30 Sept 2011, 11:40 p.m.,*
in response to message #6 by Marcus von Cube, Germany

Being able to change one cell at a time really is a nice feature. Better than rushing to change the cells in series so you don't lose all memory!

Re: HP 15C and 15C LE not the same dimensions?

*Message #8 Posted by **robert rozee** on 1 Oct 2011, 1:03 a.m.,*
in response to message #7 by Dwight Sturrock

one could easily provide space for two AAA cells along with a small backup coin cell - assuming here that the AAA's would themselves fit in the available space.

Re: HP 15C and 15C LE not the same dimensions?

*Message #9 Posted by **Andrés C. Rodríguez (Argentina)** on 2 Oct 2011, 8:18 p.m.,*
in response to message #6 by Marcus von Cube, Germany

A capacitor may be designed in so to supply a minimum current, allowing to keep the memory contents for a short time (say, less than a minute) while batteries are changed. That's the way it worked in many old models such as the 25C, 41C, Voyagers, Pioneers, etc. Parallel cells schemes are rather new for HP calcs and, with due respect, not the best solution around.

Re: HP 15C and 15C LE not the same dimensions?

*Message #10 Posted by **Katie Wasserman** on 1 Oct 2011, 3:05 a.m.,*
in response to message #5 by Jeroen Van Nieuwenhove

> Quote:
>
> Wouldn't AAA-size cells last longer?

Yes! Many, times longer because the 2032 cells are destroyed by the 20ma current load that the 15CLE has when running any function or even holding a key down. I'd estimate that you'd get less than 4 hours of program run time out of the CR2032 cells, while you'd get close to 50 hours with AAA cells.

Powering all the HP ARM-based calculators with 2032 cells is a huge engineering mistake in my view. The current load of the ARM running at more than a few MHz is too high for these size cells.

Re: HP 15C and 15C LE not the same dimensions?

*Message #11 Posted by **Bart (UK)** on 1 Oct 2011, 3:32 a.m.,*
in response to message #10 by Katie Wasserman

If thickness is a worry, what about AAAA cells, they're about 8.3mm dia. (AAA ~10.5mm dia.), have at least twice the capacity of CR2032, however only around 1% of the internal resistance - so can cope much better with the peak current drains and probably see several times the life.

(Note, I have referenced the Energizer data sheets for info only - I have no specific like or dislike towards them).

Re: HP 15C and 15C LE not the same dimensions?

*Message #12 Posted by **Katie Wasserman** on 1 Oct 2011, 4:55 a.m.,*
in response to message #11 by Bart (UK)

AAAA cells would be a good choice, but they are hard to find in stores. You could buy a 9V alkaline battery and rip it open to get at the 6 cells inside there (very close in size to AAAA), but how many people would know to do that?

Edited: 1 Oct 2011, 4:58 a.m.

I'd estimate that you'd get less than 4 hours of program run time out of the CR2032 cells, while you'd get close to 50 hours with AAA cells.

Some time ago I'd considered exactly that, namely designing a modified voyager housing with the same external envelope. Accommodating 2x AA cells would require the vertical depth to increase as it would compete for that space with the lcd glass. I seem to recall an anecdote to the effect the original voyager housing depth was extended to its current form when a third LR44 was added to the design.

> Quote:

I'm not quite sure why HP didn't initially use a more conservative clock frequency such that the current draw would be on a more realistic point in the CR2023's discharge curve. Clocking the sam7 at its maximum design frequency doesn't really make much sense given the expected usage of the device. At least some user configurable clock frequency would have been a more flexible approach.

Re: HP 15C and 15C LE not the same dimensions?

*Message #15 Posted by **John S. Miller** on 30 Sept 2011, 4:52 p.m.,*
in response to message #2 by Martin Pinckney

I made a quick-and-dirty comparison of the 15c LE with a made-in-USA 12c, using a digital caliper. The 15c is approximately 0.025" longer and thicker, and the height is close to "no difference."

Re: HP 15C and 15C LE not the same dimensions?

*Message #16 Posted by **Paul Berger (Canada)** on 30 Sept 2011, 5:13 p.m.,*
in response to message #1 by Derek

I held my LE up against my 1982 vintage 16C and I could not see any difference so I measured them both with vernier calipers and for the LE I get 12.89cm x 7.99cm x 1.5cm at its thickest point the 16C measures 12.84cm x 7.98cm x 1.45cm so in my case the variation is insignificant.

Re: HP 15C and 15C LE not the same dimensions?

*Message #17 Posted by **Derek** on 30 Sept 2011, 5:33 p.m.,*
in response to message #16 by Paul Berger (Canada)

ah, yes. the biggest difference is the thickness, and your calipers are consistent with what i felt in my hand. by eye, i don't think the length and width are noticeable, but in my hand, i immediately thought it was thicker. i guess my hands are ultra sensitive or that's just how well i know my hands know my 27 year old calculator that i've used exclusively over all that time for school (HS, college, grad) and work.

*Message #4 Posted by **Eric Smith** on 30 Sept 2011, 9:56 p.m.,*
in response to message #2 by Han

Just looking for a high-resolution photo or scan of the circuit board.

Thanks! Eric

Re: wanted: high-resolution photo of 50g internals

*Message #5 Posted by **Han** on 3 Oct 2011, 12:15 a.m.,*
in response to message #4 by Eric Smith

I just found my tools to re-open my broken HP50G (bought it for $5.00 on TAS). If you're hoping for some clues on how the traces are connected, you may be pretty disappointed. It's a multilayer PCB with very few traces visible from the front and back sides. The only exception is the LCD daughter board -- well, at least the portion not covered by the glass...

Anyway, I can take some photos tomorrow during daylight. My camera does a pretty poor job inside with the typical yellow lightbulbs

Re: wanted: high-resolution photo of 50g internals

*Message #6 Posted by **Eric Smith** on 3 Oct 2011, 1:06 a.m.,*
in response to message #5 by Han

I'm not concerned about traces that aren't exposed.

Thanks!
Eric

Re: wanted: high-resolution photo of 50g internals

Can you set the "white balance"? That makes a big difference.

Re: wanted: high-resolution photo of 50g internals

*Message #8 Posted by **Han** on 3 Oct 2011, 3:02 p.m.,*
in response to message #7 by Dave Shaffer (Arizona)

Yes, but indoor incandescent lighting is just weak compared to natural lighting. Although I can set the white balance, the picture is grainy from indoor lights (unless you have lots of lights and flood the room).

Anyway, if you're looking for the photos, I posted a link in a later thread since this one was getting buried:

Link to the thread

Link to the photos

Re: wanted: high-resolution photo of 50g internals

*Message #9 Posted by **Dave Shaffer (Arizona)** on 3 Oct 2011, 5:28 p.m.,*
in response to message #8 by Han

Your "grainy" is probably from using a high ISO (sensitivity). Use the lowest ISO your camera has (looks like 80 or 100 for your A2200; DON'T set "auto"), and just make a longer exposure (there's no reciprocity failure for digital sensors!). You may need a tripod, too, though. Also, use the self-timer to avoid motion/shake when you press the shutter button.

Re: wanted: high-resolution photo of 50g internals

*Message #10 Posted by **Marcus von Cube, Germany** on 4 Oct 2011, 2:08 a.m.,*
in response to message #9 by Dave Shaffer (Arizona)

When I take photos of my gear I use a big flash with a diffuser. The reflector is aimed against the ceiling. This results in enough light and does not cause any flares or reflections.

Determinants of the AM1 matrix

*Message #1 Posted by **gene wright** on 30 Sept 2011, 3:29 p.m.*

AM1 Matrix

This is one of Valentin's matrices to test accuracy in computing a determinant. We have talked about it before. The exact determinant should be 1. Let's gather a list of results for various NON-exact mode machines, non-TINY ELEMENT flag machines as an article for accuracy.

```
WP 34S                  0.999997119354
HP-28S                  0.970960198039
HP-15C                  1.080204421
HP-35s                  1.00282960115
HP-71B                  0.97095056196
HP-48G                  0.999945522778
Casio FX-9860G Slim     1.0000000369657
```

Here are some starting values.

Re: Determinants of the AM1 matrix

*Message #2 Posted by **Bunuel66** on 30 Sept 2011, 3:50 p.m.,*
in response to message #1 by gene wright

TI82stats: 0.9996468043

Re: Determinants of the AM1 matrix

*Message #3 Posted by **Crawl** on 30 Sept 2011, 5:02 p.m.,*
in response to message #1 by gene wright

HP50g (with flags set as stated) gives the same answer as the HP48g.

The TI89 in approx mode gives 0.999718361859.

Re: Determinants of the AM1 matrix

*Message #5 Posted by **Peter Murphy (Livermore)** on 30 Sept 2011, 6:53 p.m.,*
in response to message #1 by gene wright

My shiny 39g+, acquired at HHC 2011, yields 1 exactly for AM1, suggesting that it's running in exact mode.

Does the 39g+ have a non-exact option, or am I stuck with exactness even if I don't want it? The user's guide appears not to discuss the subject.

Re: Determinants of the AM1 matrix

*Message #6 Posted by **Crawl** on 30 Sept 2011, 8:13 p.m.,*
in response to message #5 by Peter Murphy (Livermore)

For the 50g, to not get 1 exactly, not only do you need to turn off exact mode but you also have to set the "retain small element" flag.

Re: Determinants of the AM1 matrix

*Message #7 Posted by **Peter Murphy (Livermore)** on 30 Sept 2011, 9:17 p.m.,*
in response to message #6 by Crawl

The 39g+ appears to be an unflagged calculator.

Changing the (7,7) element of AM1 to 69.0 didn't trick the calculator: the determinant is still 1.

Re: Determinants of the AM1 matrix

*Message #8 Posted by **Crawl** on 30 Sept 2011, 10:14 p.m.,*
in response to message #7 by Peter Murphy (Livermore)

I skimmed through the 39g+ manual; it doesn't seem to have an exact mode.

My best guess is that it may be in fraction mode, so it's rounding 0.999.. to the fraction 1. You should be able to check in the Mode menu, under number format.

Re: Determinants of the AM1 matrix

*Message #9 Posted by **Bunuel66** on 1 Oct 2011, 6:04 a.m.,*
in response to message #8 by Crawl

HP39GS: 1.0000000000E0 quite instantaneously.

If I get some time, I'll experiment a bit with the sensitivity of the determinant computation to coefficients of the matrix.

Regards

Re: Determinants of the AM1 matrix

*Message #11 Posted by **Ángel Martin** on 1 Oct 2011, 4:32 a.m.,*
in response to message #10 by Les Bell

Same result (but of course) but instantaneous on the CL.

Edit: it gave me a good opportunity to put my PMTM method to test, a real breeze inputing all those matrix elements "in a row"

Edited: 1 Oct 2011, 5:15 a.m.

Re: Determinants of the AM1 matrix

*Message #12 Posted by **Palmer O. Hanson, Jr.** on 30 Sept 2011, 10:46 p.m.,*
in response to message #1 by gene wright

Gene:

I suggest that you should go back and look at all the work that we did with this matrix back in 2005. A good place to start would be with the thread "More Matrix Results on HP and TI Machines" at http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=72366 . One of the inputs that you will find there is your submission "TI CC-40 beats the HP-71B" which gives the CC-40 result as 1.00282671. The thread also includes the result for the TI-95 and other machines.

Palmer

Re: Determinants of the AM1 matrix

*Message #13 Posted by **gene wright** on 30 Sept 2011, 11:19 p.m.,*
in response to message #12 by Palmer O. Hanson, Jr.

Thanks, Palmer!

I had already grabbed those results and put them into a spreadsheet to keep up with all of this. The best results on this matrix so far are:

```
Casio FX-9860G Slim              1.000000036966
WP 34S                           0.999997119354
```

Quite amazed at the FX-9860G.

The next thing that you might want to explore could be the results with AM2 and AM3 which are even more difficult.

Palmer

AM3 determinant on the new 34s firmware

*Message #26 Posted by **gene wright** on 4 Oct 2011, 10:25 p.m.,*
in response to message #25 by Palmer O. Hanson, Jr.

works out to 1.000 ... to the limits of returned precision.

The internal precision was (according to Pauli):

1.000000000000000000000000004678227405010

Amazing.

However, it did turn out a lock-up error trying to take the inverse of the AM3 matrix, which is being worked on.

Palmer, we need to get you a 34s. Email me!

Re: Interim table of results for determinant of the AM1 matrix -- should = 1 ... get your models in now!

*Message #27 Posted by **Paul Dale** on 5 Oct 2011, 4:13 a.m.,*
in response to message #16 by gene wright

In case anyone is interested, I've added a matrixtest.wp34s file to the library that contains the AM1, AM2 and AM3 matrices. In each case the 49 elements are stored from register 20 and the

determinant is taken. The matrix descriptor for all three is 20.07.

Just assemble and install in the emulator or on the real hardware.

> to fix the memory issues with the inverse function?

Not only this!

Now there's a little confusion about the SVN updates:
4 hours ago Pauli made changes to SVN 1683 removing M.LU and re-introducing the matrix-row-operations (there was a new wp34s.op).
Now Marcus has made a new build SVN 1685 where these last changes are NOT valid (i.e. M.LU is back and row-ops not included).
And there should be also a M.DIAG (which is used in the new matrix.wp34s), but it doesn't exist in the current build.

Slowly it's going to be a mess ...

Franz

Re: Interim table of results for determinant of the AM1 matrix -- should = 1 ... get your models in now!

*Message #37 Posted by **Gerson W. Barbosa** on 6 Oct 2011, 4:41 p.m.,*
in response to message #36 by Bunuel66

Something like this, perhaps?

Re: Interim table of results for determinant of the AM1 matrix -- should = 1 ... get your models in now!

*Message #38 Posted by **gene wright** on 6 Oct 2011, 5:26 p.m.,*
in response to message #37 by Gerson W. Barbosa

Yes, perhaps. I have worked with the 39g+ and 39gs and simply have no reason to think they have a better way to handle numbers like this than the 49g+ or 50g have / had.

I'm not disputing it returns a 1, but perhaps it always does things that are flag selectable

on the 50g - such as the tiny element flag and noting that the matrix had integers so the determinant must be an integer.

That's cheating. :-) At least from an accuracy perspective. After all, the actual result might work out to be 48.4802 and it rounds it to 48 because of such things. An integer, yes, but still wrong because the math inside was so bad.

Re: Interim table of results for determinant of the AM1 matrix -- should = 1 ... get your models in now!

*Message #39 Posted by **Paul Dale** on 6 Oct 2011, 5:58 p.m.,*
in response to message #38 by gene wright

As Crawl wrote on the other thread, change the first element of AM1 to 58.1 and see what happens. The correct answer is 9636025.5. This should bypass the everything is an integer check.

- Pauli

Re: Interim table of results for determinant of the AM1 matrix -- should = 1 ... get your models in now!

*Message #40 Posted by **Bunuel66** on 7 Oct 2011, 2:16 p.m.,*
in response to message #39 by Paul Dale

Checking HP39gs with 58.1 gives det=9636025.49994, not that bad ;-)

Re: Determinants of the AM1 matrix

*Message #41 Posted by **Paul Dale** on 30 Sept 2011, 11:14 p.m.,*
in response to message #1 by gene wright

The 34S might get an accuracy boost if I ever get time to finish the matrix code. All the new row operations will be performed in higher precision with correct rounding.

Unfortunately, I don't think there is enough RAM to unpack the matrix and do a LU decomposition completely at the higher precision. I'll have a think though.

- Pauli

Re: Determinants of the AM1 matrix

*Message #42 Posted by **Marcus von Cube, Germany** on 1 Oct 2011, 4:22 a.m.,*
in response to message #41 by Paul Dale

Not regarding any pivoting, an LU decomposition should be doable in place so RAM isn't an issue here. Adding pivoting might get tricky because you need the information about row or column swaps somewhere. Maybe in a condensed format in a register (using binary)?

Re: Determinants of the AM1 matrix

*Message #43 Posted by **Paul Dale** on 1 Oct 2011, 4:40 a.m.,*
in response to message #42 by Marcus von Cube, Germany

I know that an LU decomposition can be done in place (if you don't mind overwriting the matrix itself) and the code I've written can do this. However, I was talking about unpacking the matrix registers into the higher precision internal format and doing the decomposition on these instead. The big advantage is greatly increased precision.

I am pretty sure there isn't enough volatile RAM to do this. 3600 bytes would be required just to store the unpacked matrix.

The space for the pivots is small -- ten integers and these can be packed into one register easily. The largest matrix that can be decomposed on the device is 10x10.

- Pauli

Re: Determinants of the AM1 matrix

*Message #44 Posted by **Werner** on 2 Oct 2011, 4:45 a.m.,*
in response to message #43 by Paul Dale

3600 bytes for 49 elements? That would amount to 70+ bytes per number, that is one hell of a precision.
Standard quadruple precision is only 16 bytes, delivering about 35 decimal digits of precision.
Why does it take so much memory?

Cheers, Werner

Re: Determinants of the AM1 matrix

*Message #45 Posted by **Paul Dale** on 2 Oct 2011, 5:19 a.m.,*
in response to message #44 by Werner

3,600 bytes is for 100 numbers (a 10x10 matrix). They are 36 bytes each in a not well packed decimal format.

The unpacked format I'm using internally is not terribly space efficient three digits in two bytes plus some overhead. All arithmetic is done in this format so any space saving measures will require packing and unpacking to operate on them.

We're running 39 digits internally. Quadruple precision reals are available and they consume 16 bytes and give 34 digits but require packing and unpacking into the internal format I'm already using. I'd rather not pay the flash space cost for these pack/unpack routines for just this function.

- Pauli

Re: Determinants of the AM1 matrix

*Message #46 Posted by **Paul Dale** on 1 Oct 2011, 2:52 a.m.,*
in response to message #1 by gene wright

WP 34S using the determinant command I just finished coding:

```
1.000000084391072
```

This also means I've coded the Doolittle algorithm for the LU decomposition and I should be able to use this for solving equations and find a matrix inverse in place :-)

Assuming this fits into the stack space available on the hardware. If it doesn't the answer will still be the same, but the matrix will be modified (like the 15C does).

in response to message #48 by Paul Dale

That is a great improvement. It has almost caught up with the 9860G result. The three leaders now are:

Calc	Value	Error	Ratio of error to best
Casio FX-9860G Slim	1.00000003696570	0.00000003696570	
WP 34S New Pauli firmware	1.00000008439107	0.00000008439107	2.28
WP 34S RRM	0.99999711935400	0.00000288064600	77.93

Re: Determinants of the AM1 matrix

*Message #50 Posted by **Paul Dale** on 1 Oct 2011, 8:29 p.m.,*
in response to message #49 by gene wright

You missed the highly accurate recoding which returns 1 exactly :-) We're checking if it is going to fit into available RAM or not. One solution here is to not allow 10x10 determinants and inverses -- limit it to 9x9 or 8x8 instead. I'm not too keen on this. What do folks here think about limiting the maximum invertible matrix size?

I'm sure the RRM program can be modified to achieve the same accuracy as the firmware you mention. The multiply-adds need to be recoded using complex multiplication which will take a bit of stack shuffling and a few extra steps.

- Pauli

Re: Determinants of the AM1 matrix

*Message #51 Posted by **Walter B** on 2 Oct 2011, 2:41 a.m.,*
in response to message #50 by Paul Dale

I can live with 9x9 as well :-)

Re: Determinants of the AM1 matrix

*Message #52 Posted by **Paul Dale** on 2 Oct 2011, 5:32 a.m.,*
in response to message #50 by Paul Dale

Actually, the high precision determinant is calculated as
1.000000000000000000000000000000396321014

This rounds to exactly 1 when reduced to the 16 digits stored in registers.

- Pauli

Re: Determinants of the AM1 matrix

*Message #53 Posted by **gene wright** on 2 Oct 2011, 7:16 a.m.,*
in response to message #52 by Paul Dale

I saw the highly accurate result. Just was not going to update the table until it was in a published flash.

9x9 ought to be good enough for anyone - Bill Gates

Re: Determinants of the AM1 matrix

*Message #54 Posted by **Paul Dale** on 2 Oct 2011, 7:49 a.m.,*
in response to message #53 by gene wright

Yeah, getting it to fit into RAM looks difficult to impossible. However, I've had an idea which might just work and give only slightly worse results. I'll try to code something up tomorrow and see how it turns out.

- Pauli

Re: Determinants of the AM1 matrix

*Message #55 Posted by **Marcus von Cube, Germany** on 2 Oct 2011, 12:49 p.m.,*
in response to message #54 by Paul Dale

I did some coding. The software still supports a 10x10 LU decomposition without disturbing the original matrix but the accuracy isn't the full 39 digits. I had to reduce it to 21 digits to make it fit. We are working on a better solution.

Re: Determinants of the AM1 matrix

*Message #56 Posted by **Paul Dale** on 3 Oct 2011, 5:45 a.m.,*
in response to message #53 by gene wright

Gene, time to update the 34S's determinant result, we have an image :-)

- Pauli

Re: Determinants of the AM1 matrix

*Message #57 Posted by **Paul Dale** on 2 Oct 2011, 7:00 p.m.,*

in response to message #52 by Paul Dale

I managed to get the high precision determinant fitting into RAM and giving a result of 1.00000000000000000000000008048808860320 which rounds to 1 exactly when returned to the stack.

Now to see how much flash this is costing us...

- Pauli

Re: Determinants of the AM1 matrix

*Message #58 Posted by **Ángel Martin** on 4 Oct 2011, 4:36 a.m.,*
in response to message #50 by Paul Dale

I don't know, probably as soon as you limit the size to 9x9 you'll get users needing support of higher dimensions, even if not such a precise result.

It's a trade-off, but you guys know what you're doing.

Re: Determinants of the AM1 matrix

*Message #59 Posted by **Marcus von Cube, Germany** on 4 Oct 2011, 4:41 a.m.,*
in response to message #58 by Ángel Martin

It's all set. Pauli managed to do an LU decomposition to 33 digits in available volatile memory for up to 10x10 elements. The trick was using the decimal128 packed format for the data.

More then 10x10 will not be possible with just 100 registers.

Re: Determinants of the AM1 matrix

*Message #60 Posted by **Paul Dale** on 4 Oct 2011, 4:47 a.m.,*
in response to message #59 by Marcus von Cube, Germany

There are 34 digits in a decimal128 actually. Instead of the 39 we usually use internally and the 16 in a decimal64 (our register format).

The calculated results are:

```
full precision: 1.000000000000000000000000000396321014
decimal128:     1.000000000000000000000008048808860320
decimal64:      1.000000084391072
```

The first two round to exactly 1 of course.

The reason there are 39 digits in the decimal128 result is that I'm still doing the accumulations and multiplications using the 39 digit numbers. The 34 digit ones are just for storing the LU decomposition of the matrix as it is being calculated.

- Pauli

Re: Determinants of the AM1 matrix

*Message #61 Posted by **Werner** on 4 Oct 2011, 5:54 a.m.,*
in response to message #60 by Paul Dale

I would say even 16 digits (and 39 for the inner products, reminiscent of 'floating-2') is plenty for solving 10x10 systems.
It is better to get an indication that your matrix condition is bad than to get a too-good-to-be-true result...

Cheers, Werner

Re: Determinants of the AM1 matrix

*Message #62 Posted by **Paul Dale** on 1 Oct 2011, 5:37 a.m.,*
in response to message #46 by Paul Dale

I've tried the same problem converting the matrix to internal precision and performing all operations at this precision. The determinant calculation gives a result of 1.000000000000000 when rounded back to register precision. Now to see if we can squeeze this version of the code into the hardware constraints -- I'm not confident it is possible.

- Pauli

Re: Determinants of the AM1 matrix

*Message #63 Posted by **Dieter** on 2 Oct 2011, 9:39 a.m.,*
in response to message #1 by gene wright

Very interesting - please take a closer look at this:

> Quote:
>
> ```
> HP-15C                  1.080204421
> HP-35s                  1.00282960115
> ```

The 15C uses its internal 13-digit precision and (supposedly) a state-of-the-art algorithm. Nevertheless, the better result here comes from the 35s which has to rely on the 12 digits available for user programs. Either the 35s matrix algorithm is absolutely great or this result is a positive exception and the 35s is otherwise outperformed by the 15C. What do you think?

Dieter

The TI-59 and TI-95 both use 13 digit precision but the TI-59 truncates rather than rounds to the 13th digit. In addition, the TI-59 has the multiplication anomaly. But, both machines beat the HP-15C result. Kahan's "Mathematics Written in Sand" paper gave yhe following illustration of the capability of the HP-15C:

> Quote:
>
> ... For example, let E be a multiple of the notorious Hilbert matrix E(i,j) = 360360/(i+j-1) for 1<= i,j <= 8. The constant 360360 ensures that every element of E is an integer, hence exact, and 8x8 is as large a matrix as fits in the calculator. In under 90 seconds it gets the inverse of E correct to roughly three sig. dec., three more than are expected ... ... This extra accuracy is no accident with ill-conditioned matries like E, prone to systemic concellation, but is due to the extra-precise accumulation of scalar products to 13 sig. dec. during matrix operations.

My recollection (I will have to search for the results) is that the ML-02 program in the TI-59 Master Library module returns an inverse which is correct to approximately five significant digits. What do you think of that?

Re: Determinants of the AM1 matrix

*Message #65 Posted by **Werner** on 3 Oct 2011, 2:11 a.m.,*
in response to message #64 by Palmer O. Hanson, Jr.

The condition number for AM1 is about 9e10, meaning you stand to lose 11 digits and thus can't trust your result at all on a 10-digit calculator.
Depending on the algorithm used, however, you might get lucky.
LU-factorisation can be performed resulting in either a unit lower triangular matrix L or a unit upper triangular matrix U. The 42S does the former. If you calculate the determinant of AM1 on a 42S, you get:

```
0.970960198039
```

By no means an exceptional result, seeing that it uses 12 digits and accumulates dot products with the 15 digit internal precision. It indeed loses 11 digits in the process. Now calculate the determinant of TRANS(AM1), which amounts to simulating the L*unitU factorisation:

```
0.999403205613
```

All of a sudden, we have a result that is 2 digits better. That's what happened in the 15C as well, I gather. It uses 10-digit arithmetic with 13-digit inner products, but uses a different order of operations. Anyone willing to calculate DET(TRANS(AM1)) on a 15C and post the results?

Cheers, Werner

Which program do you use the most

*Message #1 Posted by **David Persinger (US)** on 30 Sept 2011, 2:55 p.m.*

I am curious, which program or programs do you get the most value out of having on your handheld: games, extended functionality? Be specific please.

As for myself, I write small routines that apply to my work. I am in the eyeglass manufacturing industry, so I write routines for cylinder transposition, radius to diopter conversions, etc. None of these are very sophisticated, but just make things easier.

Re: Which program do you use the most

*Message #2 Posted by **Ed Look** on 30 Sept 2011, 3:36 p.m.,*
in response to message #1 by David Persinger (US)

I do research in and teach chemistry and physics; I got tired of converting from eV to nm or Å, and so I just wrote a short routine to do this for me. Also, HP calculator constant libraries generally list R, the gas constant in the proper, SI term of joules; and since I often need the ancient, but still oft-used l-atm, there's a little program for that. And then, there's a suite of four that I use often for calculating average, median, mode, maximum, and minimum of a set of data. The mode program is, I guess in today's terminology, still under construction; maybe I'll try to fix it one of these nights now that baseball season is over (although it's been several baseball seasons now!)

Other ones:

one to calculate the Miller Indices (in the Museum program archives!) of planes in cubic crystals from their 2-theta reflections (not for me myself, but I use it generally to make sure students don't pull a fast one). This one took a while to complete (and cubic is EASY); I'm not sure I want to contemplate routines for less symmetric unit cells.

*Message #4 Posted by **Martin Pinckney** on 1 Oct 2011, 12:20 a.m.,*
in response to message #3 by Martin Pinckney

Some specific examples:

Very simple formulas like the Rational one for calculating peak discharge from a small watershed.

Or the ACI formula for determining minimum steel in a concrete beam.

Or a formula for determining screw anchor capacity for a bulkhead.

Sometimes a more complicted one that uses nested IF's on the 27s, to follow Florida rule for calculating onsite waste flow based on floor area.

Like others have said, I often write quick short ad hoc routines that are later discarded.

in response to message #1 by David Persinger (US)

I do not have a technical job, but I am an avid runner. In the past, I created routines (mostly on my 11C, later on a few RPL calcs) to calculate speed/distance information, lap times, race time prediction on different distances, and (drum roll) a routine that combines distance, speed and heart rate into an overall indication of fitness.

Re: Which program do you use the most

*Message #8 Posted by **Crawl** on 30 Sept 2011, 5:24 p.m.,*
in response to message #1 by David Persinger (US)

I don't know which one I use the *most*, but I can give an example of something I did with programming not too long ago.

I was trying to calculate the transmission of light through a film as a function of wavelength given the film's index of refraction. The formula for it, in the appendix of this paper, is incredibly complicated. I was using Excel and getting wrong answers.

So I went back to first principles and calculated the formulas myself on my HP50g. This is easy, much easier than entering the formulas in Excel. The starting point for the formulas are not so complicated if you allow n to be complex, which the HP50g can do, and the HP50g can do the algebra of the derivations (it involves working with symbolic matrices, another forte of the HP50g). So not only is it easy, it's almost impossible to make a mistake. Then I loaded in n as a function of wavelength through the SD card in a CSV file, calculated the transmission, wrote that as a CSV file on the SD card, and loaded it back into Excel. Then I went through my Excel file until I found my transcription errors and the Excel result matched my calculator result.

*Message #18 Posted by **Les Bell** on 1 Oct 2011, 9:11 p.m.,*
in response to message #1 by David Persinger (US)

I also mostly use my calcs for short routines to help me figure out the stuff I'm working on. I'm currently a Comp. Sci. PhD candidate, working on computational trust, and most recently I've been working on the use of utility functions to model risk aversion in intelligent agents. A few keystrokes on the 41CX and I can have a routine which will let me play with the numbers and figure out which of various candidate functions seems most appropriate.

The 48GX was handy for plotting the functions, at least for the simple cases. However, when it comes to more complex 3D plots, I found it easier to whip up some Java code using the jzy3d library (especially since I'm doing a lot of simulation work in Java anyway).

I've also made heavy use of the 41CX for basic statistical number crunching, particularly calculating mean values across multiple simulations in my early experiments. Hopefully the 15CLE will be able to take over some of that load. . .

Best,

--- Les

Most of my programs are extended functionality or frequently made calculations. For reference, I work in the field of statistics and data analysis.

Probably my most frequently used program is something that calculates the standard deviation of a binomial distribution using the normal (Gaussian) approximation.

For a long while I was doing a specific datemath calculation and whipped up a program on my 15c to handle it for me. I was using that all the time for benchmarking an analysis routine I was running, but as that project has since moved on, so has the program.

*Message #2 Posted by **Pal G.** on 30 Sept 2011, 12:33 p.m.,*
in response to message #1 by Tim Wessman

Thanks, Tim and HP, for immediately addressing the keyboard issue - even with the HHC2011 event occurring during the HP 15C LE roll out.

Re: 15C Keyboard Issues [UPDATE- DO NOT EMAIL ME]

*Message #3 Posted by **Reth** on 1 Oct 2011, 7:00 a.m.,*
in response to message #2 by Pal G.

And what exactly was addressed? I thought contacting support people was the only option anyway and nothing has been added. I see no official confirmation/admittance that the keyboard has issues.

Wouldn't be better if the support team disclosed their findings?

With 12% failure rating I think HP should be a lot more specific about the problem.

Re: 15C Keyboard Issues [UPDATE- DO NOT EMAIL ME]

*Message #4 Posted by **Lincoln R.** on 1 Oct 2011, 10:36 a.m.,*
in response to message #3 by Reth

> Quote:
>
> The support team now has received enough units to analyze.

Tim said they had enough units to analyze, not that they were done analyzing them. While this may seem like a "simple" problem, nothing is simple in industry. They'll probably have to disassemble a bunch of calculators, try to figure out why the keyboards don't work, figure out how to correct that, and then deal with the factory to make sure future units don't have this problem. I think I have a pretty good idea of what the issue is, but I'm not a mechanical engineer, nor do I know anything about HP's keyboard design so what I noticed could just be a coincidence or one isolated case.

Re: 15C Keyboard Issues [UPDATE- DO NOT EMAIL ME]

Would you speculate on this a bit?

Re: 15C Keyboard Issues [UPDATE- DO NOT EMAIL ME]

*Message #6 Posted by **Lincoln R.** on 1 Oct 2011, 11:27 a.m.,*
in response to message #5 by Reth

I had a 15C with a bad divide key. It clicked, but didn't register unless you pushed it hard. I decided to open the back since they're not too hard to disassemble and discovered that if you held the PCB and the front case together, the key worked fine. Closer examination seemed to show that the heat stake closest to that key wasn't melted down far enough.

Re: 15C Keyboard Issues [UPDATE- DO NOT EMAIL ME]

*Message #7 Posted by **Reth** on 1 Oct 2011, 12:05 p.m.,*
in response to message #6 by Lincoln R.

That's interesting, thanks for sharing. But is there such a heat stake close to the "." key (my case) and could you fix the problem yourself?

Cheers,

Re: 15C Keyboard Issues [UPDATE- DO NOT EMAIL ME]

*Message #8 Posted by **Lincoln R.** on 1 Oct 2011, 12:28 p.m.,*
in response to message #7 by Reth

Unfortunately I do not remember. It could be possible to carefully remelt the heat stake yourself, but I really wouldn't recommend it on something this new under warranty and with a known defect.

*Message #10 Posted by **robert rozee** on 1 Oct 2011, 12:55 p.m.,*
in response to message #8 by Lincoln R.

the trick would probably be to make up a jig to hold down the PCB firmly, then place a drop of 2-part 24hr epoxy resin glue over the faulty stake, such that it would run down and around, and fill in the gap.

BTW, has anyone got photos of a disassembled 2xCR2032 HP-12C showing the actual keyboard construction/design. had a bit of a look with google, found various comments from 'experts' but no actual photos.

Re: 15C Keyboard Issues [UPDATE- DO NOT EMAIL ME]

Heat stakes are no one's friend and are mainly a concession to cost reduced assembly. A malformed stake might just be a sign from above to rid the calc of them altogether and secure the pcb to the housing with screws. Doing so results in a serviceable keyboard and more flexibility in modifying the pcb.

Assuming the 15c le stakes voids are identical to the 12c+, an M1.2 screw is about the correct size to self thread the core. For a 12c+ stake cut flush with the pcb surface the resulting core void depth is about 4.5mm IIRC. Add to that the thickness of a plastic washer and a 4~5mm screw length should work. Appropriate screws are available as a service item for cell phone, etc.. repair (try Evilbay). Washers are easier to make than find and can be cut out of plastic stock with a paper punch.

> Have you modified your 12C+ as you describe, replacing the heat stakes with screws? If so, did you have any problem with cracked cores?

Not yet as I'm still waiting on the M1.2 screws. I thought to grind a parallel slot partially through the threads of a single screw and use it as a poor-man's tap to thread each stake in advance. Although I suspect that is overkill.

Concerning the potential to crack a stake, I'd actually thought to slice through the stakes with a very thin kerf saw such that the screw when driven would freely expand the stake until it wedged in the pcb hole. That as well seems excessive.

M1.2 is almost a little undersize and I'm wondering if there will be sufficient mating wall depth to thread. M1.3 is probably ideal but there isn't much of an economical choice with this microscopic hardware.

If there is general interest I'd be happy to report the results.

> Maybe heating the screw is an option?

Mounting a jeweler's cross bit in a temperature controlled iron had crossed my mind. However I've had mixed results in the past trying to so. Eg, controlling both iron temperature and heat transfer to the screw such that the plastic isn't overheated. In this case the stakes are a low, fairly isolated mass and if they should overheat and distort it could make for a really bad day. The other potential is to have the ABS reflow so well it seizes the screw in the stake with similar consequences.

Although one scenario where this may be worth a shot would be

if the screw threads should strip out of the stake from repeated insertions/withdraw cycles. Touching an iron to the head of the screw in cautious doses can reflow the sheared ABS sufficiently to reestablish functional threads. This may be useful in my case as I'm concerned M1.2 diameter may be undersize.

I came across some jpegs I took a while back of 12c+ internals. Unsure whether others here have already done so but on the chance they may be useful to someone I've located them here.

No 15c le pictures yet but the current lqfp package makes a compelling case for pcb trace out and capture of the schematic. I don't expect anything surprising as it appears to be functionally identical to the 12c+ which AFAICT is largely the Atmel reference design. However it would be a useful reference for a plethora of lost time projects. Maybe after the "limited" marketing campaign is over and the "recoup the NRE" phase begins I'll pick up a second 15c le from my local MalWart.

I just uploaded some -- see above post in this thread.

Note the choice of legged snap dome was functional as the dome-side pcb routing takes advantage of this. So if you'd like to get the tactile feel of a legacy voyager you could cover the center contact trace exit with a strip of kapton tape and substitute a full circular dome. The original voyager domes are 9mm with a 150~170g actuation force. I forget what I'd measured the 4 legged domes on the 12c+ (and presumably 15c le) to be, but I'll recheck.

Added:

The 4 legged domes in the 12c specimen I have at hand are 8.36mm in diameter with an approximate 220g inflection force. Assuming this is representative of average production, the force needed to actuate a 12c dome is substantially greater than legacy voyager counterparts. Cut/legged domes also have a sharper transition compared to the full domes of the same diameter, which is likely the cause of the tactile difference.

HP 15c LE - Extended PSE Functionality?

*Message #1 Posted by **Alexander Oestert** on 30 Sept 2011, 9:44 a.m.*

Dear HP!

I'm sure you're busy fixing the PSE bug. While you're at it, might you consider to extend the functionality of the PSE command by making it possible to add a number afterwards to specify the length of the pause?

Example:

PSE - original behaviour, so old programs will still work

PSE 2 - 2 seconds pause

PSE 3 - 3 seconds pause and so on

I'll be happier to see the PSE command to accept keyboard input and so I can use it to write more HP-15C games! :)

Re: HP 15c LE - Extended PSE Functionality?

*Message #3 Posted by **Marcus von Cube, Germany** on 30 Sept 2011, 10:00 a.m.,*
in response to message #2 by From Hong Kong

None of this will ever happen but you can still use the WP 34S where the behavior is implemented (taking

an argument in tenth of seconds and being interruptible by keyboard input).

The 15C is based on the original firmware running in an emulated environment. So any changes to the firmware are restricted to the interface between emulation and original hardware layer. The PSE bug was introduced by a speed optimization of the emulation of the R2D2 LCD driver chip which sped up the integrator considerably (intended outcome) but broke the reliable update of the physical display when a program is running (unintended side-effect).

Re: HP 15c LE - Extended PSE Functionality?

*Message #4 Posted by **Eddie W. Shore** on 30 Sept 2011, 10:02 a.m.,*
in response to message #3 by Marcus von Cube, Germany

It would be nice to see the PSE work as intended on the 15C LE (maybe internally force the calculator to wait a second?). Personally, I almost never use PSE - I use R/S instead because it gives you time to write the answer down.

Re: HP 15c LE - Extended PSE Functionality?

*Message #5 Posted by **Dave Britten** on 30 Sept 2011, 10:31 a.m.,*
in response to message #4 by Eddie W. Shore

Same here. Either you want the program to run fast and unattended, in which case PSE will just slow it down, or you want to get a series of intermediate results, in which case PSE will be too rushed. It might be handy for debugging, but R/S and SST are probably better options.

Just use this instead of PSE:

F? 7
R/S

Then if you have flag 7 set, your program will stop to show you intermediate results, otherwise it will just keep going. If you want to get really fancy, you could have it optionally put all the sequential results into a matrix, or series of registers so you can go back to them afterward. Maybe I'll do this to my prime factors program.

Re: HP 15c LE - Extended PSE Functionality?

*Message #6 Posted by **Mike Morrow** on 30 Sept 2011, 10:48 a.m.,*
in response to message #5 by Dave Britten

If you set flag 9 on the HP 15C/15C LE, the display blinks until the calculator is turned off or flag 9 is cleared. Flag 9 is one of two system flags, and is set by overflow conditions or set manually. See page 100 of the Owner's Handbook.

Re: HP 15c LE - Extended PSE Functionality?

*Message #7 Posted by **Dave Britten** on 30 Sept 2011, 10:51 a.m.,*
in response to message #6 by Mike Morrow

Yeah, slipped my mind. Just use 7 instead.

Re: HP 15c LE - Extended PSE Functionality?

*Message #8 Posted by **Jeff O.** on 30 Sept 2011, 12:30 p.m.,*
in response to message #7 by Dave Britten

I thought you used Flag 9 on purpose. That way the display would be flashing when it stopped, reminding you that you needed to do something. Of course then it keeps flashing while you enter a number or whatever, so you'd have manually clear flag 9, or have a CF 9 be the next instruction. Perhaps not as useful as I first thought.

> I'm looking forward to someone commenting on my suggestion and not on what they'd rather like or why they don't use PSE at all. :-)

As I've already pointed out, the 15C will never see your improvements. It is likely impossible to add any more instructions or modify the existing ones due to limitations in the op-code space even if the source code were available.

Re: HP 15c LE - Extended PSE Functionality?

*Message #13 Posted by **Martin Pinckney** on 30 Sept 2011, 11:00 a.m.,*
in response to message #12 by Marcus von Cube, Germany

Besides, TW has already said HP does not have the source code, and editing the binary seems too much like asking for more bugs.

Re: HP 15c LE - Extended PSE Functionality?

*Message #14 Posted by **Alexander Oestert** on 30 Sept 2011, 11:06 a.m.,*
in response to message #12 by Marcus von Cube, Germany

Sorry, I thought you commented on From Hong Kong's idea.

Still, if HP would not release the original firmware, wouldn't that be a shame? :(In that case the flashing connector would merely serve to fix emulator bugs and nothing more...

Edit: They don' have the code? I'm learning the strangest things nowadays! ;(

*Message #15 Posted by **Marcus von Cube, Germany** on 30 Sept 2011, 11:14 a.m.,*
in response to message #14 by Alexander Oestert

You still do not seem to understand: HP has full control over the 15C LE software but part of it is just a hex dump of the original 15C code. The source code of the latter is simply lost. :-(

They could, of course, write a completely new firmware which behaves the same as the original 15C did but is a native reimplementation of the functionality. Since there is no I/O, the internal representation of op-codes doesn't matter and additions may be made to the original code set.

If HP has no intentions to do this, the community may chime in...

Re: HP 15c LE - Extended PSE Functionality?

I'd like to see it get found again by a community effort something like this (message #1 last paragraph).

> Quote:
>
> They could, of course, write a completely new firmware which behaves the same as the original 15C did but is a native reimplementation of the functionality.
>
> If HP has no intentions to do this, the community may chime in...

That's really where this should lead, and having annotated NUT source is the starting point. Perhaps the 15c le will result in enough interest to have such an effort attain traction even in light of the fact the end result would still export a 7 segment user interface.

Edited: 2 Oct 2011, 10:04 p.m.

> I'm looking forward to someone commenting on my suggestion and not on what they'd rather like or why they don't use PSE at all. :-)

OK...here goes. I don't like your idea. What you want to do is very simply accomplished by adding another PSE command after the first (in a 15C-LE with the PSE bug fixed, of course).

I don't like anyone's ideas for tweaking and "improving" the 15C-LE programming model in *any manner* beyond the *30-year-old standard* established by the original HP-15C. It will be sufficient when or if that ever takes place for the 15C-LE.

Sorry.

Re: HP 15c LE - Extended PSE Functionality?

*Message #19 Posted by **Alexander Oestert** on 30 Sept 2011, 11:13 a.m.,*
in response to message #18 by Mike Morrow

It can be done with stringing PSEs, but wouldn't my idea save memory? And it wouldn't have to be an official HP thing that everybody needed to flash on his machine. Just the possibility to decide which version to take would be nice.

But it's moot without the firmware available.

*Message #3 Posted by **Eric Smith** on 30 Sept 2011, 10:31 a.m.,*
in response to message #1 by Bruce Larrabee

That's for use with the HP SDS (Software Development System), which uses an HP-85 to develop ROM modules for the HP-41.

The HP-41 connector should have a cable wired to an otherwise empty HP-41 module.

I'm not sure what the HP-85 interface is. Possibly to an 82940A GPIO card, but that's only a guess.

The real trick will be finding the SDS software.

SIMULATOR?

*Message #6 Posted by **Håkan Thörngren** on 30 Sept 2011, 4:08 p.m.,*
in response to message #5 by Marcus von Cube, Germany

Yes, but the HP-41 VASM listing indicate that a cross compiler on a HP64000 was used, at least initally. The HP-85 was not not really available at that time.

I also wonder about the box, it looks kind of like a real product, but they must have used less pretty hand built hardware internally?

It is also just a ROM emulator, surely they must have had a simulation environment as well?

Re: Anyone know anything about this HP41C RAM / EPROM ROM SIMULATOR?

*Message #7 Posted by **Eric Smith** on 30 Sept 2011, 9:59 p.m.,*
in response to message #6 by Håkan Thörngren

The HP64000 assembler for the Nut came about long after the 41 was designed and its ROMs written. There were earlier ROM emulators that were used for debugging.

The SDS was for development of third-party application modules, and did require the HP-85. Originally it did not support the development of microcode, though eventually they added the ability to use some HP-supplied microcode functions.

Not neccessarily, I have worked for big companies where such low volume or even one-off items were mounted in a nice box and had a custom vinyl or anodised aluminium face plate made.
(When I was a student on a 2 month "vacation work" assignment I was tasked to put such an item together).

HP48 - WHY where were they made so difficult to open up?

*Message #1 Posted by **mr-scorpio** on 30 Sept 2011, 4:52 a.m.*

As any HP 48 owner will know. These machines are practically welded together, & literally require peeling off metal face plates & cutting or drilling through plastic to open them up & dismantle them.

Now whilst i acknowledge the: 'why would you want to open it up' brigade. That argument goes for most other devices anyway/ But most other devices have had & still use SCREWS!!! Why didn't HP make these calcs easier to open for maintenance purposes? Surely considering the original sale price, they didn't deem these calcs 'throw' away? - Meaning a replacement would be cheaper than opening it up..

Your thoughts...

Edited: 30 Sept 2011, 5:19 a.m.

Re: HP48 - WHY where were they made so difficult to open up?

*Message #2 Posted by **Frido Bohn** on 30 Sept 2011, 5:38 a.m.,*
in response to message #1 by mr-scorpio

In comparison to, let's say, the HP35s or the HP50G, the HP 48 is easy to open: I use tire irons, one of those made of plastic, to get into the groove at the side between the LCD and the function keys where the top latches are. As soon as you got the first tire iron into it and succeeded to manage a breach you may put the second tire iron into the breach and move it downwards (where the + or ON key is) to separate both halves. You will have to apply some force to get the rivets out of their holes and will hear a seemingly unpleasant crack but you won't have to damage the bezel or drill holes into the calc.

But anyway, I suppose you did not want to hear the 1000th description of how to open an HP 48. From a more philosophical viewpoint I would conclude that the cases of HP calculators that contain screws to easyly acces the interiors were made by engineers whereas the other ones were produced by designers. Because designers don't care about the interiors whereas engineers always want to keep a path open to them.

*Message #5 Posted by **Mike Morrow** on 30 Sept 2011, 12:59 p.m.,*
in response to message #4 by Martin Pinckney

I prefer dynamite blasting caps...with the dynamite if possible. That gets rid of one more of these dogs. :-)

The Clamshells are even more resistant to opening. I recommend double the blasting caps used for the 48-series.

HP in the post-Pioneer era has at least returned to case closures like that used on the HP 50G...extremely easy and non-damaging to open and close.

It's about time...even the extremely capable, extremely un-repairable (epoxy blob internals), extremely inexpensive Casio fx-115ES is, yes, extremely easy to open and close. HP in the 48S/G, Clamshell, and Pioneer eras had its head up its butt in many areas, not the least being deliberate construction to discourage repair outside of replacement, even by HP!

Re: HP48 - WHY where were they made so difficult to open up?

*Message #6 Posted by **Lincoln R.** on 30 Sept 2011, 9:30 a.m.,*
in response to message #1 by mr-scorpio

I think HP considered them sufficiently durable to not need to be opened. Also, if HP was interested in repairing them, the plastic cases and keyboard mechanisms were probably seen as cheap enough to not be worth reusing.

Re: HP48 - WHY where were they made so difficult to open up?

*Message #7 Posted by **Thomas Chrapkiewicz** on 30 Sept 2011, 9:37 a.m.,*
in response to message #1 by mr-scorpio

Design for Manufacturability versus Design for Maintenance can have conflicting requirements.

For many reasons, within the last several decades (in many markets - electronics, vehicles) there has been a dramatic shift to Design for Manufacture.

Witness the fact that on some modern cars, it requires about $100.00 just to replace a headlight lamp (because it requires over an hour of effort). Again, the vehicle was easily and quickly assembled, with less attention paid to the maintenance cost.

The HP48 series were designed to be simple/easy/cheap to manufacture; not necessarily to be serviced.

TomC

Actually, it is possible to open the HP48 series calculators with nothing other than a nail clipper, a toenail clipper, and patience. And you can open the HP48 and close it and have the calculator looking as it did before you opened the calculator.

I guess my webpage for the instructions have been removed. They used to be at http://www.math.uiuc.edu/~handuong/hp48/open. I have long since graduated from there, and they've finally decided to remove my files.

Photo of Voyager and HP 35s

*Message #1 Posted by **Brandon Poindexter** on 29 Sept 2011, 11:04 p.m.*

Does anyone have a side by side shot of the HP 35s and HP 15/12c/etc? I've actually never seen an HP 12c in person, so im wondering how large or small it is in comparison to the 35s, and to see if it would fit in a pocket.

Thanks in advance!

Re: Photo of Voyager and HP 35s

*Message #2 Posted by **bill platt** on 29 Sept 2011, 11:16 p.m.,*
in response to message #1 by Brandon Poindexter

Significantly smaller, but still a little bit big for a front trouser pocket.

Re: Photo of Voyager and HP 35s

*Message #3 Posted by **Mike Morrow** on 29 Sept 2011, 11:23 p.m.,*
in response to message #2 by bill platt

I carried one of my HP-15C units in my front right trouser pocket for years in complete comfort. I never did that with the HP 42S that replaced the 15C, because I didn't want to chance damage to the 42S.

Re: Photo of Voyager and HP 35s

*Message #4 Posted by **bill platt** on 30 Sept 2011, 12:21 a.m.,*
in response to message #3 by Mike Morrow

I've carried both the voyagers and pioneers that way since the beginning (1982). But they are just a tad bigger than comfortable for me. Still workable though!

Re: Photo of Voyager and HP 35s

*Message #5 Posted by **Michael de Estrada** on 29 Sept 2011, 11:19 p.m.,*
in response to message #1 by Brandon Poindexter

Turned sideways a Voyager is about the same width as a 35s and about 1 1/8" less tall. It's uniformly thick, whereas the 35s gets thicker at the top and is about the same thickness as the 35s near its bottom. It will fit easily in a normal dress shirt pocket without sticking out at the top.

Re: Photo of Voyager and HP 35s

*Message #6 Posted by **NateB** on 29 Sept 2011, 11:47 p.m.,*

hp-12c from HP.com arrives with dead batteries

*Message #1 Posted by **Masaki Adachi** on 29 Sept 2011, 5:18 p.m.*

I did not feel like I should buy more of the hp-15C LEs so I decided to fulfill my long desire of owning a 12C. So I ordered an usual (not AE) model from hp.com and it has arrived today. Only thing was it did not turn on out of the box. I replaced batteries and the machine is back to life. I checked the cell voltage and they were 2.3 and 2.6 volts without any load. Firmware date is 2008.6.28 and serial # is 4CY1150D5T.

I am not sure how long this was on the shelf, but I am wondering what is my odds of having received a unit with internal short.

Re: hp-12c from HP.com arrives with dead batteries

*Message #2 Posted by **Katie Wasserman** on 29 Sept 2011, 8:05 p.m.,*
in response to message #1 by Masaki Adachi

The off state current is only a few microamps. That should take many years to discharge the 2032 cells if the calculator shut down properly. You might indeed have unit with a bad CPU or other components that allow for current leakage. However it could be just one bad cell. Since the cells are in parallel a single bad will will drain the other good cell.

Since you're able to measure the cell voltage, you likely have a DMM and that can likely measure current. Put the current meter in series with 3 volts powering the calculator. (2 AA batteries in a holder is easy to find if you don't have an external DC supply.) You should measure around 20ma when running a tight program loop, around .05 ma (IIRC) when on and idle and at most .005 ma when off.

Re: hp-12c from HP.com arrives with dead batteries

*Message #3 Posted by **Michael de Estrada** on 29 Sept 2011, 8:12 p.m.,*
in response to message #2 by Katie Wasserman

Since the batteries are in parallel, do you simply connect the power supply with 3 vdc to any one of the two battery terminals for testing ?

Re: hp-12c from HP.com arrives with dead batteries

*Message #4 Posted by **Katie Wasserman** on 29 Sept 2011, 8:15 p.m.,*
in response to message #3 by Michael de Estrada

Yes.

Re: hp-12c from HP.com arrives with dead batteries

*Message #5 Posted by **Masaki Adachi** on 30 Sept 2011, 5:25 p.m.,*
in response to message #2 by Katie Wasserman

Katie Thank you very much for your advice. I measured these current levels and all fall in the range that

you have identified. (except for the off current.. My RadioShack DMM can't detect micro amps) Maybe it was a bad cell. I feel much better now.

HP 11C low battery indicator

*Message #1 Posted by **Onur Ilkorur** on 29 Sept 2011, 12:58 p.m.*

Hello,

I have recently received a HP 11C with almost flat batteries. When I turned the calculator on, the display was "0.0000". When I started typing in numbers, I have noticed that the numbers that I've typed were masked with "0.0000".

For example: If I want to type in "12345678.0", the calculator displays: "0.0000678" therefore the first 5 digits are replaced by the "0.0000" mask.

I took the batteries from HP 11C and placed them in my HP 15C. On the HP 15C side, the asterisk sign at the lower left hand corner of the screen started blinking. However, there was no blinking asterisk on the HP 11C side.

I would like to know if there is a version of HP 11C without the low battery indicator or is my HP 11C acting strange?

Thanks in advance, Onur

in response to message #1 by Onur Ilkorur

My personal experience is that many of the old voyagers don't detect a low battery condition properly if at all. However, this is mitigated by the fact that they can go for 20 years without needing new batteries.

Is the shelf life of alkaline, mercury or silver oxide batteries in excess of even 10 years?

> Is the shelf life of alkaline, mercury or silver oxide batteries in excess of even 10 years?

The silver oxide (Energizer) is specked at about 7.5 years at 20 degrees C to be at 85% of capacity. It's linear, so after 20 years is should have just enough power to run the calculator. I can't find a spec for the alkaline cells, but it has to be substantially less.

There was a PX675 mercury cell with the same dimensions as the 357/LR44 cell it's voltage is 1.35. The would mean that the calculator would run at about 1 volt below nominal which would have been just ok. These had a shelf life of longer then the silver oxide cells, 10 years to 85% I think but they stopped making them around 20 years ago. Mercury cells have a very flat discharge voltage curve and so would stay at 1.35 volts until the instant they die. Not a good choice for use in a calculator CMOS memory. The only calculator I have that used mercury cells originally is the Sinclair Sovereign.

*Message #5 Posted by **Michael de Estrada** on 30 Sept 2011, 9:12 a.m.,*
in response to message #4 by Katie Wasserman

I have a Sharp PC-1211 Pocket Computer (same as Tandy TRS-80 PC-1) with CMOS memory that uses MR44, 1.35V mercury batteries. It uses 4 batteries and is rated at 5.4 V (4x1.35). These batteries are still available for hearing aids.

Re: HP 11C low battery indicator

*Message #6 Posted by **Katie Wasserman** on 30 Sept 2011, 9:22 p.m.,*
in response to message #5 by Michael de Estrada

Oh yeah. I've got one of those too in the form of a PC-1 and they did use 1.35 volt mercury cells, I forgot I had that. But all mercury cells have been illegal to manufacture for many years, although they still might be available on the internet. The hearing aid batteries that you refer too have been replaced with zinc-air ones. They are 1.35 volts too, but have a much, much shorter shelf life once you activate them. Most hearing aid batteries last 1 month or less once you pull off the little tab blocking the air vent. Some have been engineered to last up to 1 year after activation.

Edited: 30 Sept 2011, 9:46 p.m.

Re: HP 11C low battery indicator

*Message #7 Posted by **Dwight Sturrock** on 30 Sept 2011, 11:37 p.m.,*
in response to message #6 by Katie Wasserman

I tried zinc-air on my rapacious HP42s' and usually got 2-3 months in heavy usage.

Re: HP 11C low battery indicator

*Message #8 Posted by **Dwight Sturrock** on 30 Sept 2011, 11:34 p.m.,*
in response to message #4 by Katie Wasserman

Amazing. So silver oxide is the way to go. Eveready now has 675 hearing aid batteries which it claims have the longest life, (the package says almost as good as mercury)3-4 years. It does not say what the chemistry is.

I know I burned through a ton of these batteries with my (3) HP42s, so I usually ended up stealing them from my 15C!

Battery life on the 42s was usually less than 6 months with heavy usage- programs, infrared, etc.

Re: HP 11C low battery indicator

*Message #9 Posted by **Katie Wasserman** on 1 Oct 2011, 3:17 a.m.,*
in response to message #8 by Dwight Sturrock

The (modern) 675 cells are zinc-air. Zinc-air has an extremely high energy density about 4 times that of silver oxide. The downside is the very high self discharge. If you need run long programs and use your calculator to do so every day they are a much better deal than silver oxide. However, if you mostly let your calculator sit in a draw, silver oxide is defiantly the way to go. Alkaline is a compromise, lower cost than silver oxide but less shelf life.

Flashing HP 20b for WP 34S

*Message #1 Posted by **Steve Brenton** on 29 Sept 2011, 7:22 p.m.*

I use MySamba/download (10-25-2010) to download calc.bin 118KB in 14 seconds. At this point nothing I try will bring the calculator to life. The download application window is still open. The cable is still connected. The 20b appears lifeless. What now ???

Re: Flashing HP 20b for WP 34S

*Message #2 Posted by **Eric Rechlin** on 29 Sept 2011, 8:18 p.m.,*
in response to message #1 by Steve Brenton

MySamba does the same thing for me. I suggest you use SAM-BA 2.10 instead.

Eric

*Message #7 Posted by **Jeff O.** on 29 Sept 2011, 10:32 p.m.,*
in response to message #2 by Eric Rechlin

You cannot flash just the 118 kB rom with Mysamba. It seems to need a full 128 kB file. You can create a full 128 kB file by concatenating the rom bin file with the various flash regions, which you can create with the emulator. The process is discussed in the manual, summarized as follows:

Open DOS window
change directory to where your files are
execute command:
copy /b wp34s.bin+wp34s-1.dat+wp34s-2.dat+wp34s-3.dat+wp34s-4.dat+wp34s-5.dat+wp34s-6.dat+wp34s-7.dat+wp34s-8.dat+wp34s.dat wp34s128.bin

Then load the wp34s128.bin file into the calcualtor with Mysamba.

You can use the same flash region over and over if you want, and they don't have to have any programs in them. The above is for a rom size of 118kB; the size changes occasionally as flash regions are consumed or freed up by changes. The wp34s-1, -2 etc. flash files are 1 kB each, the wp34s.dat file is 2 kB, just make sure to add enough flash region files with the 2kB file at the end to make the whole file 128 kB.

edited to add info on the process

Edited: 30 Sept 2011, 7:49 a.m.

*Message #11 Posted by **Marcus von Cube, Germany** on 30 Sept 2011, 9:03 a.m.,*

in response to message #10 by Paul Dale

Delphi is required, even if not the most recent version, I assume. I may have a copy lying around somewhere. Just rewriting the PC part of it in C might be easier then porting to a different Pascal environment. A command line version will suffice.

Advance handbook 15C

*Message #1 Posted by **Michel Beaulieu** on 29 Sept 2011, 6:31 p.m.*

So now that i have a 15C (LE) for learning his programming, the manual refer to an "advanced functions handbook for the 15C" that can be bought at HP.

Well, i search the net for this one but not able to find it on HP site. Where is it?

Re: Advance handbook 15C

*Message #2 Posted by **Steve Fennell** on 29 Sept 2011, 6:34 p.m.,*
in response to message #1 by Michel Beaulieu

It's on the CD that comes with the 15C LE. You need to install the emulator first.

Re: Advance handbook 15C

*Message #3 Posted by **Michael de Estrada** on 29 Sept 2011, 6:34 p.m.,*
in response to message #1 by Michel Beaulieu

You can access it from the PC emulator Help menu.

HPGCC questions

*Message #1 Posted by **Steve Fennell** on 29 Sept 2011, 5:07 p.m.*

I'm interested in learning to use C/C++ on the 50g and porting some small programs I've written over the years. Both HPGCC 2.0SP2 and HPGCC3 are available. Which one should I start with? Are there any advantages and disadvantages to using one version over the other? They seem to have different origins, or at least HPGCC3 is a rewrite with a revised license if I understood correctly.

Re: HPGCC questions

*Message #2 Posted by **David Hayden** on 29 Sept 2011, 9:53 p.m.,*
in response to message #1 by Steve Fennell

I believe that HPGCC3 creates stand-alone programs, which is an improvement over HPGCC 2.0 which requires a library on the 50g. The lib can convert the program to stand-alone, or it can launch the program itself.

I think I also heard that HPGCC3 has a more extensive library.

On the plus side for HPGCC 2.0, it's been around longer so it may be more stable. Also, to make a shameless plug, my HPObjects library currently only works with HPGCC 1.1 and 2.0. The library lets you easily access and convert HP calculator objects (numbers, integers, lists, strings etc) into C equivalents, and back again. The library that comes with HPGCC 2.0 comes with some of this functionality, but the interfaces are inconsistent and only a few objects are supported.

Here are some handy links:

Egan Ford's excellent HPGCC 2 tutorial.

My HPObjects library

Good luck! I think you'll find it quite rewarding. HPGCC programs typically run 100 times faster than User RPL programs. On the other hand, they are typically about 100 times larger. On the third hand, you can always copy the actual program to an SD card, and replace it on the calculator with a small stub program that recalls it from the card and runs it. This saves you the space in HOME, but it still takes a large amount of RAM to run.

Feel free to contact me for help with HPGCC 2 programming.

Dave

HPGCC 3 requires a custom ROM on the 50g. This is not a problem unless you plan to redistribute your code. At that is not a problem if all target machines have the custom ROM. Whereas HPGCC 2 will run on unmodified machines.

HPGCC 3 is faster, or at least the beta versions were that I tested a while ago. I wrote some pretty fast factorization programs with HPGCC 3. I could overclock the processor to 192 MHz.

I'd start with HPGCC 3 since that is the current supported version from the developers and fallback to HPGCC 2 if you want to leave your 50g with the HP blessed ROM.

P.S. I've had the HPGCC 3 ROMs on my 50g for years without any issues and I could still run HPGCC 2 code.

34S suggestions

*Message #1 Posted by **David Hayden** on 29 Sept 2011, 3:52 p.m.*

I flashed a 20b to a 34S last night and I'm really enjoying it. When my 30b arrives from Eric, I'll apply the keyboard overlay and flash that one too.

I'm running version 2.11630 (as shown by the VERS command) and I have two suggestions.

First, when I press any key, the RPN annunciator flashes off and then back on. It would be nice if it stayed on.

Second is a usability thing for new users. I was playing around with it last night without the manual and I accidentally got into integer mode. It took me a good 10 minutes to figure how to get out of integer mode - I eventually stumbled onto H.d to do it. This was rather frustrating and I think for a new user it would be really annoying. So my suggestion is to change FIX, SCI, and ENG to change the calculator back to real mode if it's in integer mode. Even new users will probably know how to change the display using these functions and if you change the display mode, you probably want to start using real mode anyway.

Congratulations to everyone who put this together. It's a wonderful accomplishment.

Can't be true. Must be 2.1 1630.

> Quote:
>
> First, when I press any key, the RPN annunciator flashes off and then back on. It would be nice if it stayed on.

This is by purpose and was meant to give at least some value to that annunciator. We're in RPN always, so it's only not lit as long as the WP 34S is busy.

What about reversing it (i.e. only light it when the calc is busy)? That would declutter the display a bit...

Re. how to exit integer mode, now of course it is instinctive to me after many months, but I remember the first time I used the 34s I had the very same problem - at last I resorted to resetting the calc. I don't remember right now if the manual is clear on how to enter/exit integer mode, but I remember that at the time it wasn't... I also suggested changing the key label to say "real" or something like that, but apparently that's exactly what ".d" means! :)

Dieter

Re: 34S suggestions

*Message #6 Posted by **Marcus von Cube, Germany** on 29 Sept 2011, 6:31 p.m.,*
in response to message #4 by Paul Dale

Doesn't work Pauli: The RPN annunciator is only lit when the calc accepts RPN input. It's turned off for temporary displays (such as VIEW) to indicate it is safe to press <- without disturbing X.

So RPN does what is says: You can enter RPN data and commands.

Re: 34S suggestions

The "R" part (read) is easy and I did read it. It's the other "R" (remember) that was the problem.... :) I didn't have the manual handy at the time. By the way, the manual on page 22 shows the command as "[.d]" while the keyboard graphic shows it as "[H .d]"

Obviously the functionality is there. My only point is that finding it isn't intuitive and I offered a possible

change that would, IMHO, be more intuitive. Usability matters. I haven't looked at the code yet so I don't know if this would be hard to implement, or if there are reasons why it shouldn't work as I suggest.

Dave

Re: 34S suggestions

*Message #11 Posted by **Paul Dale** on 29 Sept 2011, 6:20 p.m.,*
in response to message #10 by David Hayden

> Quote:
>
> I haven't looked at the code yet so I don't know if this would be hard to implement, or if there are reasons why it shouldn't work as I suggest.

It wouldn't be at all difficult to implement. The function for ALL, FIX, SCI, ENG and DISP is:

```
void cmddisp(unsigned int arg, enum rarg op) {
        UState.dispdigs = arg;
        if (op != RARG_DISP)
                UState.dispmode = (op - RARG_STD) + MODE_STD;
        UState.fract = 0;
}
```

Replacing the *UState.fract = 0;* line with *op_float(NULL, NULL, OP_FLOAT);* will do the mode switch and convert the stack properly. Had you considered this being required?

As always, there are other issues to consider:

- Do all these five commands need to switch out of integer mode? Should they?
- Is making these functions have such a side effect a good thing or not? Simple functions are almost universally better than double barreled ones.
- What other side effects will happen here? One I know of is that H.MS display will be lost.

Changes like this usually have subtle side effects which aren't obvious.

- Pauli

Re: 34S suggestions

*Message #12 Posted by **gene wright** on 29 Sept 2011, 5:25 p.m.,*
in response to message #2 by Walter B

<rant on>

One could always suggest writing a manual that even advanced users don't find cryptic. The manual as-is might contain the information, but then again, an SD card might contain a lot of information but is not easily accessible unless you have an SD card reader.

C'mon Walter - there are probably 10-20 basic things that could be added to a "Common Questions" section at the end that would be helpful. We're talking about people who have written programs for HP calculators for 20+ years not being able to find fairly basic things in the documentation.

Jake and I are really toying with doing a new, readable manual that doesn't assume an advanced CS degree... but I would ask your forbearance with those who can't find things in your reference manual -

which is what it is and will remain given the level at which it is written.

If we do, I will predict our readable manual will be used a great deal more often than the one that exists now - because we won't assume that section 4, paragraph 3, line 6, fifth word is a sufficient explanation of where an important piece of information resides.

My 2 cents, but RTM is getting to be a tiresome response when the overwhelming majority of people here and at HHC find it much too difficult to find basic things in said manual.

</rant off>

One of the beauties of the German language is its ability to express subtle differences with a vast number of expressions to choose from. This is also true for the English word "manual". Among many others, two possible options here are "Gebrauchsanweisung" and "Benutzerhandbuch". The first one contains the word "Anweisung" (order, command), so here the idea is to tell the user how to use the device: press this button, get that result. On the other hand, the second term means something more like "user's guide" - a handbook that is intended to be a helpful companion to the user, making him familiar with the machine so that he will be able so solve his everyday problems.

I think the current version of the manual is a tiny bit more on the "Gebrauchsanweisung" side, while your idea sounds more like a "Benutzerhandbuch". ;-)

Sooner or later I am sure there will be something that comes closer to your idea of a manual. And since this forum is full of native speakers of many different languages, there even is a chance there will be decent non-English versions as well. ;-)

Hmmh, we are talking about modes, aren't we? There's a chapter called "Display and Modes" in said manual. Sounds promising, doesn't it? On its very first page (22), in the very first table, is exactly the information you were looking for. Easy IMHO. YMMV.

Asking an innocent question here.

Since you mention Page 22, my English as a First Language tells me that the description of "Cleared by..." does indicate that [FIX], [SCI], [ENG], [H.MS], TIME, and [->][H.MS} will set DECM. That description indicates that the OP's observation/wish is actually how the 'manual' indicates the WP-34S will behave. In practice, however, the WP-34S does not behave like this.

If I have misunderstood, I apologize. I did read the manual.

Re: 34S suggestions

*Message #16 Posted by **Egan Ford** on 29 Sept 2011, 8:35 p.m.,*
in response to message #14 by Walter B

Walter,

You are missing an opportunity here. Instead of "RTFM" or "read page ##", how about asking yourself "why?" some struggle with and without the docs? And perhaps use that feedback to improve the documentation so that we can cultivate a larger and stronger community. Perhaps we just need a QR card. You're never going to escape excited users that skip through the ~100 page manual.

The more I use the 34S the more I wish someone would make it. I travel frequently (sometimes weekly) and I never carry a calculator anymore because of space and weight, so I suffer with emulation on my iPhone. Well that changed on this trip. When I packed my bags this morning I took my 34S. I want others to have the same great experience I have had and to feel the same way.

My $0.02US (I'd give you Euros if I had them):

".d" is neither clever nor obvious. On the 16C it's "FLOAT". Given the lack of space "FP" may have worked too.

I had the exact same problem as the OP. Since I could understand all the other symbols, ".d" did occur to me as a possible way to return back to FLOAT, however the leading "H" lead me to believe that it was the inverse of H.MS, and so it is.

That all said. The documentation *is* awesome, and the fact that we have any quality documentation is largely or solely due to your effort, and I thank you for that. And yes, if you RTFM (Read The *Fine* Manual) you will find all your answers, except "why?" :-) Please keep up the great work.

Thank you.

P.S. I know that writing docs sucks, and I'd wager that you spend more time on docs than the sum of all the coding time. Your efforts are appreciated. Thanks again.

>
> Jake and I are really toying with doing a new, readable manual that doesn't assume an advanced CS degree... but I would ask your forbearance with those who can't find things in your reference manual - which is what it is and will remain given the level at which it is written.
>
> If we do, I will predict our readable manual will be used a great deal more often than the one that exists now - because we won't assume that section 4, paragraph 3, line 6, fifth word is a sufficient explanation of where an important piece of information resides.

Right on! Users don't need their hands held, but something beyond the terse descriptions is much needed, not to mention examples and as you suggest a FAQ.

You don't see open source software documentation held closely to the vest, and considering how much you and others are willing to pitch in and help, I suggest that it is in everyone's best interests, including the software team especially, to make the documentation produced up to now available in whatever format is requested, not just as PDFs. To do anything else is, in my opinion, selfish, unproductive, and uncooperative. Further, in the absence of said documentation being made available I am confident the user community, namely those contributing to the project, *will* find a way to accomplish their objectives.

> Quote:
>
> My 2 cents, but RTM is getting to be a tiresome response when the overwhelming majority of people here and at HHC find it much too difficult to find basic things in said manual.

It wasn't just RTM, it was RTFM, which in this forum where people are hopefully trying to help each other I find unacceptable.

*Message #19 Posted by **Bruce Bergman** on 30 Sept 2011, 12:12 a.m.,*
in response to message #12 by gene wright

Here, here!

I remember when I was working for the Red Cross as a disaster services officer, teaching Shelter Management. One of the questions on the final test was:

"Your shelter has been in operation fairly well for a few days now. The kitchen staff report some food stuffs missing each night. You watch and find two kids taking food out of the refrigerator in the middle of the night and eating it before going to bed. What is your response and what should you do?"

Almost always, the first answer is "punish the offenders". The proper answer is "ask if the problem is

that they are unable to get enough food during mealtimes, and if so, increase the amount of food each person can get".

I don't want to start any debate on shelter management, but the point should be obvious: if a lot of people are complaining about something, there's probably a good chance there is a legitimate reason for it.

In more simple terms, if it walks like a duck, quacks like a duck and looks like a duck, then it's probably a duck.

I heard a lot of comments at the HHC conference that people LOVED the calculator, but the manual was daunting, oppressive, complex, confused and other words. To me, that shouts out for help.

Gene, if you and Jake embark on a better manual, I think you will have a LOT of positive support and comments from the user base. I whole heartedly support it.

My $0.02 anyhow. :-)

thanks,

Bruce

> Quote:
>
> Here, here!

Again :-/ Are you sure you meant what you wrote here?

Anyway, you're right with your example. Though I wasn't up to "punish" anybody - I just sometimes wonder. And then I remember what a former senior colleague told me years ago (for the US: no offense intended, the following sentence is a literal translation of this person's advise, but please continue reading thereafter):

"If you write a manual every idiot could use, only an idiot will use it."

(For the US again: No, I know this characterisation doesn't apply to anybody here, of course. The quoted sentence is just indicating a trend, and it's another nice example of the German way of telling the truth directly without a lot of flowers and pampering around - and politically incorrect for sure. Please also note, here you don't see "Objects in this mirror appear smaller than they really are" etched in side mirrors of cars, nor "May contain hot beverages" printed on paper cups, nor anything alike. When we read such stuff, we shake our heads and wonder about foreign habits, education, and everything. BTW, this whole paragraph could be omitted in a German forum :-) just to give you an idea of the easy communication here.)

That said, I am aware of the challenge of writing a manual for people with different cultural background. And "H .d" has a longer history than you can know - but you don't have to, it's my job to guide you to the right keys. Just compare the manual editions 1.12 and 2.1, and I'm confident you see a positive trend.

Anyway,I'll think about a better way to get the DECM message transmitted.

O dear, this post got longer than thought. But I hope it helps a little bit.

Walter

While I agree in principal, in practice this can be difficult, especially when using Word. I've had nothing but problems with collaborative Word projects.

XML vs compat mode docs, markup, and merge do not work as cleanly as one would like. I've lost so much time due to Word bugs that I now hand merge in changes.

If new works are going to be generated from Walters work that is one thing, but if others are going to contribute to Walters document then some standards need to be set in place first, and I'd expect Walter to be spending a lot of time proofreading and not documenting.

sf.net supports Wikis. If there is going to be a community documentation project that may be a good place to start. All changes are tracked. Wikis do not generate very good printed documentation however. But that can be addresses after this project stabilizes.

What you describe is exactly what I experienced also for many years in my professional life. Documents and structures, carefully assembled by few, then corrupted by (usually some more) people of good will but no clue - having fun, as Brian wrote. I'm not very keen on mending such a mess again.

Way back in April, there was a prominent member of this forum asking for my manual data file. He claimed he was planning some nice extensions of it. I offered him he may write whatever he thinks being appropriate straight ahead, send it to me, we'd discuss it and I'd insert it in the manual at a location we agree on, in a decently formatted way. No, that wasn't the way he wanted. He kept asking for data, and I eventually sent him my entire WORD file. Apparently then he or his mailbox wasn't prepared for it - I found out several weeks later by asking myself - I sent it again - then he complained these were old data etc. etc. Making a long story short, I never got back a single byte from there so far.

Despite this very frustrating experience, I am willing to offer such a collaboration once more. But please, don't you cry you want to have all and want it now. One basis of our WP 34S project turning out successfully is both of us, Pauli and me, have a common vision, we committed and delivered, each of us in his area of expertise, and we discussed the open points until we both could agree. We needed some time sometimes, and we also had some hard discussions, but I never felt our business lost balance, it was always a give and take. We then integrated two more people, and each of them brought his area of

expertise which wasn't covered sufficiently in our team before.

The manual was published quite early, together with the invitation for constructive critics, as you find in the archives. And IIRC, we've listened to almost every reasonable proposal and remark and took them into account. So it went pretty well, though the amount of active "beta reader" turned out being a bit less than I expected.

After all, now we've got a product, and I get the feeling all kind of folks are trying to hopp on the bandwagon now. Come on, contribute something useful yourself if you want to join late. All the tools and information are readily available. But don't claim you *will* do something, provided you get 100 pages for free first.

Personally, I'm not ready yet to sacrifice our work achieved so far to the cro..., hmmmh, community. I see this opinion is not popular, maybe out of time, but that's the way I think it's right - and that's how we reached this result. If you can't stand that, feel free to start your own project. I wish you good luck, may offer some support if you like and am looking forward to *your* results.

Ok, so now I will be grilled for that :-(

Re: 34S suggestions (a bit long)

*Message #30 Posted by **Marcus von Cube, Germany** on 30 Sept 2011, 5:18 p.m.,*
in response to message #29 by Walter B

Not grilled, just asked over and over again.

Putting up your work and its support files on SF would have the added benefit of creating a safe backup of the files. And authors of additional documentation would have a much better start, regarding formatting and style.

Re: 34S suggestions (a bit long) - wikis

*Message #31 Posted by **Dominic Richens** on 30 Sept 2011, 6:28 p.m.,*
in response to message #29 by Walter B

No grilling from me. Been there, done that.

I like the current reference manual the way it is.

I do think a separate, distinct, user guide would be nice. Everything is in the current manual, somewhere, just for us regular dummies it takes a bit more effort than we're used to, to find it and understand it.

We're all used to HP manuals which pretty much spell it out for you with nice pretty "button" icons along the left and explanation down the left.

I'm a big fan of wikis - my past and present employers have used these successfully for "HowTo" type stuff. There are many wiki

engines, some better than others: [ul]

- wiki4hp.com (DokuWiki) is on the primitive side.
- Twiki is better and
- Confluence ($$) has pretty good wiki to document publishing.
- MediaWiki (wikipedia) is also free and has a "create a book" thing.
- SourceForge Wiki - haven't looked at it.

Ultimately someone or a small group of editors has to keep stuff consistent, not only an army of contributors.

Want me to look at the sourceforge wiki?

Anyway this label made it to the front page of the manual yesterday already. HTH.

WP 34s Users' Guide Wiki

*Message #37 Posted by **Dominic Richens** on 2 Oct 2011, 8:12 a.m.,*
in response to message #31 by Dominic Richens

Sourceforge's wiki is MediaWiki - which is good.

Pauli created the wiki and added me to the editor group so I moved my toung-in-cheek user's guide to the WP-34s project wiki.

I started on a guidelines page and added a (blank) Todo page. If you want to contribute signup and get added to the editors group.

First items of business is to come up with an outline (table of contents) and upload all the nice little graphics (keys) that Walter and Pauli created for the reference manual.

I have an HP48SX and HP-15C manual, as well as PDFs of the HP32sII, HP-33s and HP-35s to use as style examples.

The last page is useful but I'm pretty sure (though not 100%) that the last page doesn't list *all* the changes; and anyway, if you skip updating for a few revisions, you definitely don't get all the changes. A simple changefile, updated rev by rev with what was changed in the latest rev, would be nice, again IMO.

Cristian

Re: 34S suggestions

*Message #44 Posted by **Dominic Richens** on 1 Oct 2011, 11:56 a.m.,*
in response to message #43 by Cristian Arezzini

it can be almost as much work to keep the changelog updated as it is to do the update. That's why we're moved to wikis for a lot of our design documentation where I work. You want to know what Fred changed when he did that update 3 months ago, just click on the record in the history.

You can do the same thing with Word, but it's a lot more work to implement and is usually geared to reviewing.

Re: 34S suggestions

in response to message #20 by Walter B

> Quote:
>
> "Objects in this mirror appear smaller than they really are"

From memory I think it's backwards:
"objects in mirrow are closer than they appear"

since the intent of the message it not to warn about the size of the object, but of the apparent sense of proximity - which is falsely interpreted by the person looking at the mirror.

What does this have to do with the posts, you may wonder? I think it's all a matter of perspective. I wrote the 41Z manual knowing that nobody would read it, yet I wanted to capture all possible information about the functionallity - not only the strict command description and staccatto instructions. Being a reference document makes it much more useful than a QRG or a dire enumeration of capabilities (and let it be clear that I'm not saying that's what the 34S manual is!).

I've read most of it even if I don't have any 34S yet - just because I wanted to learn more not about the machine, but about the project.

User manual vs. owners handbook - same precisions here in English...

in response to message #45 by Ángel Martin

Angél, writing documentation when one is involved in a project or even is the only person working on it is an integral part of the work because you have to rethink everything twice when you try to describe it in detail.

In our case the manual is not in the same hands as is the implementation which complicates thinks at times. Possible outcomes are changes to the code, changes to the documentation, or both.

Re: 34S suggestions

Hmmm....

In a small project like this, having the creators write the manual is probably inevitable.

However, I have a theory that manuals SHOULD NOT BE WRITTEN by the programmers, the makers, etc. of whatever - they are too close to the project, and may well assume too much. Even "thinking twice" may not be enough. A manual should be written by an outside, even naive, user. He'll need the insiders to help, of course, but he is more likely to stumble over the same problems that other new users will.

Similarly, software should be tested by somebody other than the programmer. That's why there are beta testers.

Guess a manual needs have beta readers!

Re: 34S suggestions

*Message #48 Posted by **Marcus von Cube, Germany** on 30 Sept 2011, 4:02 p.m.,*
in response to message #47 by Dave Shaffer (Arizona)

Dave, I disagree. You may be right for a Beginner's Guide but creating a reference at the same time you are creating the function is very helpful in rethinking what the function really does.

Re: 34S suggestions

*Message #49 Posted by **Dave Shaffer (Arizona)** on 30 Sept 2011, 4:18 p.m.,*
in response to message #48 by Marcus von Cube, Germany

I'll agree on the reference manual, but I think a users/beginners manual will benefit from being written by the user/beginner (under supervision!).

in response to message #50 by Paul Dale

I feel honored! (and suddenly worried about the inaccuracies that no doubt plage the document...)

I very much doubt you had any need to steal any algorithm, let alone those I used. But you may be interested to know that after a long procrastinating time, I finally re-wrote the function launchers within the 41Z using MCODE tables - instead of the pedestrian code I'd used until now.

The relevance of this is that I freed-up 265 bytes, which immediately I filled-up with a complex ZETA function (yes, using Borwein - plagiarized from JM Baillard, only with the 41Z complex stack twist). Still on the testing bench, but looking great!

Best, 'AM.

in response to message #20 by Walter B

I would hazard a guess that most Americans think the hot liquid warning is stupid. But then only in America would a plaintiff win a lawsuit because she got burned by said hot liquids. Blame the lawyers.

A former girlfriend of mine was in insurance and they got a monthly circular on litigation that was won and lost. One case involved several people trying to start a car. They could not get it started by pushing it so they had the brilliant idea to have two people sit on the hood of one car

with their feet on the trunk of the other while one drove that car and a fourth sat in the dead car and tried to start it when it got up to speed. The cars separated, bounced, whatever, and the two people on the hood fell in between the two vehicles and had their legs crushed. They were suing the auto companies because there was no warning on the vehicle specifically suggesting that this was a bad idea. This would have been laughed out of court in any other country in the world if it even got that far.

Some Americans are always looking for the fast buck. A way to get something for nothing and lawyers are always happy to help.

I have had that experience myself. Many years ago I was involved in a car accident when I was rear ended on the highway. Within 24 hours I had received 10 calls from lawyers wanting to take my case. This is considered ambulance chasing and I believe that most states have laws against it but it didn't stop them. I was fine except for a stiff back for a few days so of course I didn't sue.

I used to race bicycles and a friend of mine had a terrible accident during a race and was never the same again. Even though we all knew the risks involved and had signed waivers (generally not worth the cost of the ink used) lawsuits started flying. Every cycling organization involved in putting on the race was sued including the president of the club personally (the driver of the car involved and the police--those that should have had the biggest share of the blame--were *NOT* sued) and during pretrial information gathering I was contacted by a lawyer trying to get me to say that racing was unacceptably dangerous and that it was the fault of the organizers. I told her that, yes, I had been scared on occasion during races. That charging along at 30+ MPH (50+ KPH) in a pack with inches to spare on all sides with many people that you had never met before in your life was sometimes scary and that anyone who didn't feel that way was an idiot but that this was *not* the fault of the organizers it was just the name of the game, so to speak. At any rate she quickly lost interest in me and I never received another call. The point is that some people refuse to accept responsibility for the own actions and decisions and so the legal climate is such that you see silly warnings on coffee cups. I will say that my friend was not the one suing since at this point he was still in a coma and later, much later, had to relearn how to tie his shoes. BTW, just as an aside, after this event and the lawsuits, road racing was almost killed off in Dallas, TX and the surrounding area for a number of years with all racing being relegated to criterium style closed courses because of the fear of lawsuits and the inability to get insurance coverage for events.

Cheers,

-Marwan

*Message #56 Posted by **M. Joury** on 30 Sept 2011, 2:58 p.m.,*
in response to message #55 by Ángel Martin

Perhaps. But here in the US there are two things working against us. The number of lawyers and laws that allow said lawyers to bring (often) baseless cases without fear of retaliatory action. From the point of view of the lawyer it is often just way too easy to sue--the only loss is usually time. Also huge judgments make the practice very lucrative for some while costing the society as a whole.

Re: 34S suggestions

*Message #57 Posted by **Ángel Martin** on 1 Oct 2011, 4:51 a.m.,*
in response to message #56 by M. Joury

I totally share your point of view - but again, those "permissive" laws and opportunistic lawyers are just basking on people's wishes to either get even, or better yet obtain benefits from a certain adverse situation (in which they may or may have not been led by others). Lest not mention greed as another leiv-motif...

There are of course genuine cases of misconduct or abuse, and the law has always tried to protect subjects exposed to those. So I guess it's a balance, that it's now totally abused because (as you say) "there's nothing to lose, just sue and see if we win". If the plaintiff had to pay the full cost of a lost trial, I'm sure they'll think it twice, or thrice, or even more times.

In the old days we were told that with freedom comes responsibility, and that "you're responsible for your own mistakes", which implies don't put the blame (or liability) on others, or their omissions to provide a fool-proof environment where mistakes aren't possible. The way things are going - providing disclaimers and warnings for every feasible contingency one can foresee - will certainly lead to a paralysis in society, amongst a very uncomfortable enviroment to live on (namley: no freedom!)

My 0,00000000002 cents.

Edited to add: apologies for hijacking the original 34S thread :)

*Message #60 Posted by **Dominic Richens** on 30 Sept 2011, 9:48 a.m.,*
in response to message #59 by Dominic Richens

In xeq.c cmddisp() I added add a call to op_float(NULL,NULL,OP_FLOAT) and my wp34s now resets to float mode when I enter any one of ALL, FIX, SCI or ENG.

I haven't yet figured out if there are any undesirable side effects as I don't use integer mode very much. Any ideas where I need to focus my testing? I'm very much a newbie with this code.

At least you were able to set-up a compiler environment. Have you done the emulator compile and the firmware compile? I'd be interested to know of any obstacles you had to pass during the installation of the tools. A short write-up of your way through it would be helpful for many here.

Re: 34S suggestions

*Message #62 Posted by **Dominic Richens** on 30 Sept 2011, 10:25 a.m.,*
in response to message #61 by Marcus von Cube, Germany

Windows environment was pretty simple - would have been even easier if I had seen your HHC slides before hand :-). I documented it here: wiki4help - howto build emulator

Attaching the debugger to wp34sgui_d and setting a break point to xeq() was a piece of cake.

I do not yet have a cable but once I do I will figure out and document the MinGW and Yagarto installation. When I said "my wp34s" I was referring to the windows emulator, which has become my favorite virtual calculator, replacing Free42 and Bill Menees RPNCalc.

Fortunately I still have a WinXP laptop with a serial port.

I don't think this is one of those cases though.

If the calculator is in integer mode and the user hits FIX 4, it means they want to do H.d, FIX 4. In cases like this where it is unambiguous the calculator should automatically do the intermediate step (if there is time and memory space to do it).

in response to message #63 by Paul Dale

It seems that executing SCI ENG or FIX in Integer mode does cause that display mode to take effect once you return to DECIMAL mode. Is that how the 16C functions as well? My only other reference is the 48sx, but that accomodates reals and integers on the stack simultaneously.

I think we are missing a key :-)

*Message #66 Posted by **Norman Dziedzic** on 29 Sept 2011, 6:57 p.m.,*

Hmmmmmm Description of H.d:

> Quote:
>
> Takes x as hours or degrees in the format hhhh.mmssdd and converts them into a decimal time or angle.

Says nothing about changing the display or mode.

A while back we changed FIX to switch from fraction display back to decimal display. I don't see a problem or contradiction using it to leave integer or any other base back to decimal.

>
> * What other side effects will happen here? One I know of is that H.MS display will be lost.
>
> Changes like this usually have subtle side effects which aren't obvious.

and

> Quote:
>
> As a rule, we've tried to shy away from functions that do multiple things. The function does what it does and nothing more.

These are very valid points. A change like this could break programs that don't expect the side effect. It would have to thought through carefully.

At the same time, I think I've found another argument for making SCI, FIX and ENG change to decimal mode: the BASE function changes the integer base *and switches to integer mode*. I think one could argue that changing the integer base is somewhat analagous to changing the decimal display format, and thus all such functions should change the mode or none of them should.

Gene's "rant" (his word) about the manual is valid to a point. Clearly the documentation isn't what a "normal" calculator user would expect, but I don't fault Pauli or Walter for that at all. In fact, I'd encourage them to continue to produce this sort of terse-but-accurate reference guide. Frankly, I'd much rather have them working on the code than on the documentation. To me, it makes sense for someone (or a group) of other people to create a more user-friendly manual. I'd hope that the development team would allow this by releasing the keyboard font, but I don't think they really need to do more than this. Again, let them concentrate on the code. By the way, I have a Microsoft Word document that contains many of the elements of the Voyager series manuals. It would make a nice jumping off point for a 34C manual.

Egan writes:

> Quote:
>
> ".d" is neither clever nor obvious. On the 16C it's "FLOAT". Given the lack of space "FP" may have worked too.

For better or worse, I believe that the keyboard is practically set in stone at this point for the simple reason that many people have already purchased and applied Eric's overlays.

Brian Walsh writes:

> Quote:
>
> [Pauli's response to the original post] wasn't just RTM, it was RTFM, which in this forum where people are hopefully trying to help each other I find unacceptable.

For what it's worth, I'd just like to say that I wasn't at all offended by Pauli's response. I'm from New Jersey where hurling insults is considered casual banter. :)

Dave

> Quote:
>
> For what it's worth, I'd just like to say that I wasn't at all offended by Pauli's response. I'm from New Jersey where hurling insults is considered casual banter. :)

It was Walter not me who wrote that. I rarely if ever use that abbreviation. Please attribute things correctly :-)

BASE doesn't just change to integer mode. Read the manual :-) It can also change to floating point and fractions mode. More a side effect of the way commands with arguments are implemented than anything else but that is what it does.

Further food for thought: what about WSIZE or the four sign mode commands? Shouldn't these also cause a change to integer mode if executed? What about DEG/RAD/GRAD? Should they switch to real mode? D.MY, Y.MD and M.DY? They mandate reals as input, is a mode switch here in order? The complex prefix? SIN, COS, TAN? SL, SR, RRC? I'll stop myself at this point but I'm sure there are plenty more commands that could be defined as causing a mode switch and things would be a right mess if we did so for all of them.

Finally, to clarify what seems to be a misconception or lack of knowledge of the project's history, I was originally responsible for all of the code. Walter is in charge of the layout and the manual. I wrote originally because others have joined in on the coding side of things (Marcus predominately). I do, however, agree that a more user friendly manual would be nice.

*Message #71 Posted by **Marcus von Cube, Germany** on 30 Sept 2011, 7:27 a.m.,*
in response to message #70 by Paul Dale

H.d and H.ms have a history, they were originally conceived as counterparts: Switch to H.ms mode and back. We eventually got rid of the only half heartedly implemented H.ms mode which left H.d a bit orphaned on the keyboard.

I think it's a good idea to let ALL, FIX, SCI and ENG return the calculator to DECM mode. At least it's what I tried first until I figured out about H.d.

Pauli has explained how the coding had been done for the most time of the project: just by him. When I started digging into his work I discovered many places where I would have done things differently. In the meantime I've had the chance to implement some of my suggestions myself but not without starting a discussion among us whether my changes (mostly keyboard related) were a good idea or not. It's a matter of "Let go!" to your baby when it grows up. (The same may hold for the documentation.)

HP-15c data storage

*Message #1 Posted by **Michel Beaulieu** on 29 Sept 2011, 1:26 p.m.*

Hi, i'm new to the 15C. I read the manual i receive with my new 15cLE about data storage. I am able to change the memory allocation and add, say 25 extra data storage, but when using STO 0 to 9 or .0 to .9 you can only access 20 data; how can i access the other data i allocate in memory?

I tried, like on my 41CV, STO-22, but the 15c only accept one digit for data storage; what am i missing?

Re: HP-15c data storage

*Message #2 Posted by **Dave Britten** on 29 Sept 2011, 1:38 p.m.,*
in response to message #1 by Michel Beaulieu

Indirect addressing. Store the number of the register you want to access in I (which is on the TAN key), e.g. "30 STO I". Then if you do "STO (i)" or "RCL (i)" (which is on the COS key), you'll access the register according to the number stored in I. There are also some branching and formatting tricks you can do with I.

The other option would be to dimension a matrix and have a two-dimensional array that you index with R0 and R1.

Re: HP-15c data storage

*Message #3 Posted by **M. Joury** on 29 Sept 2011, 1:40 p.m.,*
in response to message #1 by Michel Beaulieu

Use indirect addressing through the I register. For example if you have 30 registers allocated you can store 25 in I (25 STO I) and access the 25th register (26th actually since it starts at 0) via STO (i) or RCL (i).

Cheers,

-Marwan

EDIT: Dave beat me to it <g>.

Edited: 29 Sept 2011, 1:41 p.m.

Re: HP-15c data storage

*Message #4 Posted by **Michael de Estrada** on 29 Sept 2011, 1:41 p.m.,*
in response to message #1 by Michel Beaulieu

You can access storage registers 20 through 65 indirectly by placing the register number in the I register and using the command STO (i) or RCL (i). For example, to access register number 30, store 30 in register I.

Edited: 29 Sept 2011, 1:42 p.m.

Re: HP-15c data storage

*Message #6 Posted by **Martin Pinckney** on 29 Sept 2011, 4:12 p.m.,*
in response to message #5 by Mike Morrow

This happens to me a lot. All three responses were recorded between 1:38 and 1:41 PM. So the respondents, like me, apparently type so slow that by the time my message is posted, others may have beat me to it.

Re: HP-15c data storage

*Message #7 Posted by **M. Joury** on 29 Sept 2011, 5:00 p.m.,*
in response to message #6 by Martin Pinckney

Actually it was not slow typing as much as having forgotten how to change the memory allocation. I'm actually a 41/42 user more than a 15C user. Love my 15C though!

I was in the middle of my response and then thought to myself: Better make sure this works the way I think it does and I had to go to the manual to look up the memory allocation function.

Cheers,

-Marwan

HP 15C LE in Berlin (Germany)

*Message #1 Posted by **Frido Bohn** on 29 Sept 2011, 11:28 a.m.*

HP 15C LE in Berlin (Germany)

Finally, my copy of the HP 15C made its way to Berlin (Europe! not Texas or equivalent).
Today in the morning I went to customs to get it from there. A notice from the parcel service arrived yesterday stating that the invoice was not accessible from outside of the parcel. However, I saw that it was clearly visible and suppose hat the parcel service (DHL) was too lazy to manage customs for me.
It has been a long time since I have ordered the calc at Samson Cables (16 Sep). I spent $99.99 for the machine and $40 for the delivery. For this kind of service German customs wanted 19% sales tax, i.e. $26.60 (what I can calculate easily with the 15C now :-), interestingly the transport costs were added to the costs of the item itself (luckily no additional fees for items below EURO 150).
This makes a total sum of $139.19 for the HP 15C LE getting from the Americas to my home.

Regards
Frido

Re: HP 15C LE in Berlin (Germany)

*Message #2 Posted by **Thomas Radtke** on 29 Sept 2011, 12:09 p.m.,*
in response to message #1 by Frido Bohn

Hallo Frido,

taxes include shipping from US to Europe, but not transport to the customs! If you file an objection, you'll get some money back (look up this matter on TSS).

Thomas

P.S.: I consider my parcel lost. It's not trackable on the DHL site and last USPS status update is from 9/16. Sent by SC as a 'letter'. Consider youself lucky, Frido ;-(.

Re: HP 15C LE in Berlin (Germany)

*Message #3 Posted by **Ángel Martin** on 30 Sept 2011, 8:11 a.m.,*
in response to message #2 by Thomas Radtke

Afraid mine is also MIA - same situation as yours. :-(

I was hopping it was hostage at customs but I've given up the idea - simply too much time has passed now.

Re: HP 15C LE in Berlin (Germany)

*Message #4 Posted by **Thomas Radtke** on 30 Sept 2011, 11:36 a.m.,*
in response to message #3 by Ángel Martin

I don't know how serious such reports are, but USPS is quite well known for lost packages in Germany. Never had any problems receiving something from Singapore or China, but then, quite some parcels successfully arrived from the US. All in all this is the 2nd lost parcel in my whole life - and the most expensive. Darn.

As an interesting note, USPS cannot be easily contacted by email as a non residential customer. I chose deliberately a wrong option to get at least heard, but aren't sure they will respond. Will wait for another week and then try my limited english knowlegde on the phone, but probably just to make a complete fool out of me. Oh well...

Re: HP 15C LE in Berlin (Germany)

*Message #5 Posted by **Michael de Estrada** on 30 Sept 2011, 12:19 p.m.,*
in response to message #4 by Thomas Radtke

Thomas,

I have never shipped to Germany, but I did ship once to Italy via USPS priority mail, and it took almost a full month to arrive. By contrast, I recently shipped the same way to Singapore, and it only took 6 days. Also, I always buy insurance so that a claim can be filed if the parcel is lost. Did SC buy insurance ? If so, I would contact them and let them make the claim for you.

Michael

Re: HP 15C LE in Berlin (Germany)

*Message #6 Posted by **Thomas Radtke** on 30 Sept 2011, 1:44 p.m.,*
in response to message #5 by Michael de Estrada

Michael,

it's not isured. When I preordered, I had no other choice than Priority Mail, so I wonder how others did the trick to get the express service, which is apparently insured. But then, I don't know if I had chosen it, for $18 I paid was quite a good deal as it seemd ;-(.

I drew my conclusions about the parcel being lost from the last sign of life from the US west coast, sorting station, on 9/16. I'd rather expected it to get to the east coast. Second, it was declared as 'letter', which is what I don't understand, and third, we've had lots of reports of successful deliveries to Germany (also Priority Mail, some after one week), and just one other person is also waiting for it.

Maybe it got homesick and took the next junk across the Pacific to China, don't know.

Thomas

*Message #7 Posted by **Alexander Oestert** on 30 Sept 2011, 2:18 p.m.,*
in response to message #6 by Thomas Radtke

Don't worry - yet. If for some reason it was send as a letter, which your tracking number indicates, there is no tracking available beyond the US border. A letter takes considerably longer to deliver, I had one seemingly lost for six weeks before I finally got it from the Deutsche Post letterwoman - not the DHL truck. Mine came also via West coast, as a parcel. 'Letter' may have the bonus of skipping the customs inspection... ;) So, keep your fingers

crossed for a little longer!

*Message #9 Posted by **Michael de Estrada** on 30 Sept 2011, 2:26 p.m.,*
in response to message #6 by Thomas Radtke

Thomas,

Insurance is an available option for a USPS Priority Mail Medium Flat Rate Box, and the cost to Germany would be $50 USD including insurance for $200 USD. It sounds like it was never actually shipped as it could not possibly be a letter or cost only $18. SC has made mistakes with other orders, such as shipping only one unit when two were ordered and showing two on the invoice and customs form. If you bought from SC, I would demand a refund and buy from someone else.

Michael

Re: HP 15C LE in Berlin (Germany)

*Message #10 Posted by **Thomas Radtke** on 1 Oct 2011, 4:52 a.m.,*
in response to message #9 by Michael de Estrada

If it was rejected by USPS, it would show up on their status page, right? Could be as well that the tracking number SC gave me doesn't belong to my order.

Of course, I contacted SC and Chris ensured me it would arrive. We'll see.

*Message #12 Posted by **Michael de Estrada** on 30 Sept 2011, 6:35 p.m.,*
in response to message #11 by Alexander Oestert

I don't undertand how a parcel that size can be sent as a "letter." A padded envelope is not considered a letter, but is classified as a parcel, just the same as if it had been packaged in a rigid box. The $18 fee seems low considering the size and weight of the

package. Anyway, I hope I'm wrong on this and Thomas receives his calculator, but it doesn't sound right to me.

To Thomas:

> Quote:
>
> taxes include shipping from US to Europe, but not transport to the customs! If you file an objection, you'll get some money back (look up this matter on TSS).

According to this site, taxes are accounted to price of item + transport + fees. Anyway, it would make a difference of +/- 5 Euros, and I think is it not worth the time you spend to get some bucks back.

Too bad that your 15C apparently got lost. Maybe you receive it on Christmas then ;-)

To Andreas:

> Quote:
>
> at which custom office (Kufsteiner Str.?) you pick up your 15c? How long you had to wait?

Yes ,it was there and it took about 2 hours to get my parcel :-(

To Joerg:

> Quote:

> $139.19

Well, you are completely right: it should have been $166.59.
I re-calculated this with the fingers of my 4-years old and got the correct answer :-)

To Frank:

> Quote:
>
> my 15c (also from SC) for 99 USD + 24+8 USD shiping + 46 USD swedish tax + handling fee, makes 178 USD in total.

Sweden is (in)famous for its taxes, isn't it? There is how you delivered a good example. Wasn't it Astrid Lindgren who claimed in the 1970ies to pay income taxes of about 103%?
Well, at least the transportation company seemed to be merciful with you as it was not as costly as for Germany. Or could it be that Sweden is closer to the States? ;-)

Regards
Frido

Hi Frido,

I was also today there and picked up my 15c with the nice LE number of 00142. I had to wait only for round about 90 minutes to pay my Taxes.

Andreas

From time to time I hear these stories and find them quite baffling.

Re: HP 15C LE in Berlin (Germany)

*Message #19 Posted by **Jeroen Van Nieuwenhove** on 29 Sept 2011, 6:43 p.m.,*
in response to message #16 by Frido Bohn

This waiting time at the local customs office really baffles me. In Belgium, where I live, I can pay the VAT charged by the customs office directly to the postman or at the post office (when I am not at home when the postman tried to deliver the package). I only had to pay 10 euros, quite reasonable for a sale price of $99.99.
I have had my personal experiences (back when I was studying in Germany) with the stubborness of German administration, but this is really outreageous. Does this mean that for every purchase of goods in the US (e.g. books through amazon.com), you have to go through this ordeal?
OTOH, Andreas, your LE number of 142 more than makes up for this. Mine is 726 ;-)

For books and CDs I ordered from the U.S. the intervention of customs was not perceptible. May be, because you won't have to pay taxes for items below 22 Euros.
Years ago, I purchased a multimeter from the U.S. (value ~$200) and customs was managed by the transportation company. The argument of the company sending the HP 15C LE was that the invoice was not attached outside the parcel. As they were not allowed to open the parcel to search for an invoice they had no idea which taxed should be raised and therefore I had to pick up my parcel

personally. However, I could not follow that argument as there was a receipt form in which the price of the item was listed. Possibly, the parcel service (UPS + DHL) not willing to manage customs and refused to demand the taxes afterwards.

Other question in this general context: are there any signs that HP will distribute HP 15C LE to Europe?

BTW: my copy has LEN no. 01587, so there is room for 99999 calcs?

Re: HP 15C LE in Berlin (Germany)

Yes, they will be available in Europe from january most probably, at SRP of €129.99. In case you need more information, send me a quick email. :)

in response to message #22 by Klaas (NL)

130 Euros - that is pretty steep - is that before or after VAT. I paid an absolute fortune to ship two from Samson by express UPS, but even so it was not so much more than that ! (It was less without the customs at this end)

130 Euros is $174 (Sorry I have no idea how to get a Euro symbol !)

in response to message #23 by Roger Blake

If you are using a standard UK keyboard simply try [AltGr] + [4].
Otherwise EUR, GBP and USD are fine as well. ;-)

Regarding prices: I do not know anything about the situation in other countries, but at least here in Germany all pricing information that addresses regular consumers has to include VAT. From what you write I see that even 129 Euros would be slightly less than the price you finally paid for your own US-import. Doesn't sound all too bad to me. ;-) IMHO the major problem is time: three more months... #-\

Dieter

Thanks - the [AltGr]+[4} worked.

>>Doesn't sound all too bad to me. ;-)

But considering HP's shipping costs from China to Europe will be similar to those to the USA, before VAT is considered, we're being asked to pay about $145 against $99 in the USA. 'fraid I consider that a rip-off for European customers if that suggested price turns out to be correct :-(

Is it a known fact that HP calculators for the european market are coming straight from China, not from the US? There's probably no european stock for this small market, but I have no clue about this.

For a LE calculator, I'd understand a different price. For each a couple of hundert calcs a translation of the manual into spanish, french, italian, german, BE(?) *g* and so on has to be made, adding to the costs.

>>There's probably no european stock for this small market.

Huh ! The market's twice as big as the USA ! And HP will be shipping other stuff to Europe anyway, so will hardly be specially routing the HP15C/LE to the States and back !

And the manuals have already been translated apart from a few minor changes.

'Market' doesn't just mean the number of citizens, but the number of potential customers. This (germany) is Casio/TI land, and I suspect it's no different in other european countries.

> Quote:
>
> And the manuals have already been translated apart from a few minor changes.

If you have no translation memory system-and all chaos I see in HPs documentation work indicates this-everything has to be done from scratch. From my own experience, a professional translation of one of the manuals is likely around $3000 - $5000. From the 10,000 15C LE, given most of them (to be) sold in the USA, how much do you think will go to any of the other countries? Cannot be more than a few hundred each. Put localization costs and support documentation on every calculator sold outside the US and you likely end up with the any reasonable price HP could take below self costs.

Hmmm - perhaps I should concede this ! I just found this table attempting to prove my point, but unfortunately it doesn't ! :-(

http://hp15c.org/Countries.php

I must admit to being surprised at the low number of requests from the UK - 500 by 361 people, but greater surprise at differences in the number requested per person:

China 164.4/ea (are these web retailers I wonder ?) Australia: 48.0/ea UK: 1.4/ea USA 2.5/ea Angola 500/ea !!!! (2 individuals)

Australian total is about 80% American total ! I guess HP might have been a bit dubious about some of these figures !

And maybe you're right - taking UK requests these should have been at least 10x higher based solely on population numbers, although I would have originally thought HP would be just as popular (or not) over here as in USA.

Trouble is we have no way of knowing how much these figures have been skewed by large reseller requests, or even daft mistakes.

361-500 for the UK. Not a surprise for me. I've recently had my 12C recognised at work for the first time in 3 years... By an American boss. And I happen to work for a leading investment bank in the UK. I can't even use my HP calcs to improve my arch-geek status at work - a contraption like 15C LE on my desk would easily go unnoticed. "An old calculator, big deal." And I am not talking about shiny happy young bank employees who wouldn't recognise a PlayStation 2 if they saw it, as it was "before their time". I am talking about a large team of diverse 40-to-50-somethings from the UK and the rest of the world, seasoned IT and financial professionals, who should at least be able to tell a 12C. Nope. So it goes. UK, probably not a good place for retro HP calc stuff.

Are you sure there will be localized versions, i.e. containing a printed non-English manual? As of today I only know there will be a different item number for the European 15C LE, but the item itself will be the same - including the handbook. At least that's what I understand from previous posts. Looking at my "German" 35s manual I even think that's a good idea. ;-)

On the other hand there are EU regulations requiring a manual in the language of the country where the item is sold. So I assume there will be at least something like a localized quick reference guide.

Maybe "someone in the know" can shed a bit of light on this ?-)

Exactly. In Germany, this regulation is reflected by the new 'Produktsicherheitsgesetz'. Ignore it and you're in for a fine of up to 100,000 EUR. Aren't we nice? ;-).

I was also thinking about call centers, placement on the Website and so on. A lot of things have to be done to bring a product to a specific country. Usually it wouldn't pay for just a few calculators imo.

I agree. For instance, the HP 35s manual exists in Dutch, which perhaps explains why I paid 78.95 euros for it in a local retail store. The quality of the translation is reasonable.

Transport via US Postal Service Priority Mail 24 USD plus 8 USD box upgrade.

The tax in Sweden is high if you are wealthy. The direct income tax depends on where you live, use to be around 33%. The sales tax is 25%. But the income tax increases once you pass a certain income limit. I don´t belong to this group :-(

Astrid Lindgren was then. I don´t think a tax of >100% is possible anymore. But this fine old lady will be put on new banknotes as a kind of compensation.

Spain:

I preordered on July from Samson for $94.99.

In Spain you have to pay VAT, a couple of small fees (1 euro each or so) and 21 euro to have the paperwork done for you. The Spanish Post service, Correos, has really done an effort to do it better, and, even though they delayed processing for a week, I just had to answer a couple of emails sending a copy of the bill, accept a pro forma invoice and do send a bank transfer.

Total:

$94.99 + $40 shipping = $134.99

in euros, that's 99.

To that I have to add 18% VAT, 3.2% customs tariff -> 120 euros

And, the charge for the custom processing service, which is 21.80 (subject to VAT) -> 25.70

Total: 145 euro.

Seems the European Union has taken a hard stance on overseas purchases. I understand, of course, but the cost is rather hefty. Fortunately, at least in Spain I don't need to visit the customs.

Re: HP 15C LE in Berlin (Germany)

*Message #37 Posted by **Derek Walker (UK)** on 30 Sept 2011, 7:35 a.m.,*

I ordered from Samson at $99.99 + $40 for USPS tracked shipping. At this end, VAT was GBP15.97, and customs handling fee GBP13.50, so my total was just over GBP120, about $185. At least collection and customs payment at our local parcel depot only took a few minutes.

And all well worth it to finally have a new 15C in my hands after years of coveting one.

I'm likely to buy one or maybe two more if/when European sales finally start (November?) - but I wonder if they'll be much cheaper?

When the good old British middle man goes in, I doubt we'll see 15C (LE or otherwise) for less than Â£200 online, if indeed it ever arrives to these shores. My 15C LE (00927, keyboard 1:0), which I ordered from SC some two weeks ago (thanks, SC!) arrived yesterday, after I paid online the VAT and a mysterious handling fee to Parcel Force, a fee which my wife eloquently described as "a small fee for providing the fee collection service". Then again, who am I to complain about the proverbial middle man and his mysterious fees? Without the middle man culture and abundance of such jobs in the UK, I wouldn't be here, let alone be able to afford to buy a totally unnecessary but oh-so-desired 15C :)

The handling fee is astounding. Here in Germany you just pay for the VAT.

Re: HP 15C LE in Wehrheim (Germany)

*Message #43 Posted by **Marcus von Cube, Germany** on 30 Sept 2011, 7:49 a.m.,*
in response to message #1 by Frido Bohn

Same here (Wehrheim). I got the exact same message about the missing customs declaration on the front of the box (not a bubble envelope) and I payed the same taxes. All in, the calculator cost me around 120€.

The customs pickup is in Oberursel. I've been there for numerous occasions. From time to time, a package arrives without any duties or the customs are handled by the Deutsche Post. It seems to depend more on the weather than on anything else I can imagine.

Edit: Typo in title.

Yes, here in the UK the Revenue services state that the value of the item(s) alone is used to determine if VAT payment is required (no VAT only if <£18), if it is then the transport costs are included in the calculation.

Re: HP 15C LE in Berlin (Germany)

Mine are in the UK! Received a notice from the local Parcelforce office. Nice printed notice detailing what I have to pay - exactly as I had calculated: 20% VAT on price + shipping, and an 8 pound "clearance fee" (AKA: what we charge you for taking your tax money and sending it to HMRC).

Re: HP 15C LE in Berlin (Germany)

*Message #46 Posted by **Bart (UK)** on 1 Oct 2011, 3:58 a.m.,*
in response to message #45 by Bart (UK)

Well, I have them now! a 15C LE # 01225 and 12C AE # 07362
Samson Cable price $99.99 each (ordered on 01 Sept '11), $35.00 combined shipping.

Charged to card = GBP 153.50 (includes bank fees) + GBP 36.51 (VAT + handling fees) = GBP 190.01 or GBP 95.005 each (I'll take a hacksaw to that penny ;-)).

I could have paid Parcelforce on the internet and they would have delivered, however I was impatient and went to get it in person. Took all of 5 mins at the depot to pay and collect.

For those interested, this is the import tax invoice from ParcelForce.

Choosing an HP-48

*Message #1 Posted by **E.Lub_EU** on 29 Sept 2011, 9:52 a.m.*

Hello all,

I am looking for a not-collectible, not pristine HP-48, as a "discovery machine" for this generation of calculators. [Is RPL *that evil*? :-)].

I looked on this site for a comparison table between S(x) and G(x) series, but as you know, the 48S are the last covered. (Nice tool anyway, thanks David)

The Gs are naturally more expensive, and I wonder if you could share your experiences with either/both series.

In no particular order, here are some basic interrogations

- is one series sturdier than the other? (they seem difficult to open/refurbish/repair)
- are 32k RAM useable, or should I target a 128k machine (SX+extRAM or G+ or GX), or should I expect to need even more?
- are -X versions that useful, since cards seem extinct?
- are the S- "fast enough", given the "typical" problem you throw at them?

I realize that for most of these, the short answer is "it depends"... I would appreciate personnal experience / typical cases reports, as I can't really relate the technical specifications to any real world experience.

Thanks for your help!

Etienne (Still waiting for bits & pieces to set up my WP34S "flashing station")

Re: Choosing an HP-48

Hi Etienne, I'm going to try to answer your question - all is strictly "in my humble opinion" of course! :)

> Quote:
>
> I am looking for a not-collectible, not pristine HP-48, as a "discovery machine" for this generation of calculators. [Is RPL *that evil*? :-)].

I think they're great machines. I have never shared the "negative feelings" about the 48 series' complexity or unfriendliness, and I've always loved RPL - to the point that I just "put up" with RPN because I can't get RPL on a smaller machine! ;)

> Quote:
>
> The Gs are naturally more expensive, and I wonder if you could share your experiences with

> either/both series.

If you find a well-used one (see my recent post) the price difference isn't much. It all depends on the condition and on the seller's choices, but a good GX can be had for less than many sellers ask for a S/SX.

> Quote:
>
> - is one series sturdier than the other? (they seem difficult to open/refurbish/repair)

They *are* very difficult to open. It can be done, and I've done it several times, but especially the first time it's difficult to end up with a machine that looks (and especially feels) like new. And it's time consuming. Apart from that, as far as I can tell the build quality is exactly the same (though the later Gs, made in Indonesia, have painted keys instead of molded).

> Quote:
>
> - are 32k RAM useable, or should I target a 128k machine (SX+extRAM or G+ or GX), or should I expect to need even more?

32KB are not much. I started out with a G, and I found myself constantly moving things between the computer and the calculator. And most downloadable libraries (i.e. the wonderful speedui) simply *need* 128KB. So I'd say go for a GX, even though you'll probably never use the cards. If you buy a G, it's rather easy to replace its memory chip with a 128KB chip, turning it into a GX without the expansion ports, but again, you'd have to open it and you have to be good with a soldering iron.

> Quote:
>
> - are the S- "fast enough", given the "typical" problem you throw at them?

I honestly find the S series too slow. Not just in programs or complex calculations: all the UI is much much slower and unresponsive. And the G/GX also have added features and commands. I'd say, if you're not going to collect but use it, go for the G series.

So all in all, I'd just find a good, non-pristine GX or an expanded G if you can find it. Hope that helps, Cristian

*Message #3 Posted by **aj04062** on 29 Sept 2011, 12:38 p.m.,*
in response to message #2 by Cristian Arezzini

With the right tools and technique I don't think these are hard to open.

I've repaired about 20 bad keyboard contact S, SX, G & GX's over the years. For sure the first one or two were butchered but after that I can barely tell they were opened.

Re: Choosing an HP-48

*Message #4 Posted by **Cristian Arezzini** on 29 Sept 2011, 12:47 p.m.,*
in response to message #3 by aj04062

I know, I too have done that, but the point is exactly that the first couple don't look that good after the procedure. And I don't think the OP wants to sacrifice a few 48's, he just wants to buy one and he would like to know which one... :)

Cristian

Re: Choosing an HP-48

*Message #5 Posted by **Lyuka** on 29 Sept 2011, 2:51 p.m.,*
in response to message #4 by Cristian Arezzini

Hi,

I happen to have repaired an HP-48G, which has intermittent key problem, yesterday.
It took half an hour to open the case, and another half an hour to fix the contacts and to replace a RAM and an electrolytic capacitor.

Though I have a 50g which have much RAM, I rather prefer 48G's look and feel.
However, 32KB of RAM of the 48G is too small to install some libraries, so I replaced the RAM with a 128KB chip.

Lyuka

Have you considered the "HP48G+" it has 128K ram but no card slots. I have found that to be a good mix. For some extra money you could get a 48GX and 128KB ram card and Merge Page 0 with main memory. That works nicely too once you have all the libraries configured the way you want.

Of the units I own, I find that the SX feels sturdier than the G or GX. Either way, it's almost impossible to open one without causing significant cosmetic damage (and possibly functional damage as well).

You can get by with 32 KB, but it's awfully tight if you plan to do any substantial programming, and you can forget about installing any large libraries. Even adding just a 32 KB card to an SX is a huge improvement. A GX with an extra 128 KB card is more than enough if you don't plan to run the heavy-weights like Alg, Erable, Metakernel, etc.

For the SX, the only difference over the S is the addition of the card slots. If you never want to track down cards, then it won't make a difference. For the GX, you get card slots plus 128 KB internal RAM vs 32 KB in the G, but the GX is just a hair slower than the G because it has to do more bank-switching to accommodate the extra RAM. You can still find secondhand RAM cards, but they rarely come cheap.

If you're doing just typical calculation, the S/SX is fine in terms of speed. It's visibly sluggish, mostly in the areas of display updating, but it makes excellent use of a keyboard buffer, so you don't need to be concerned with typing "too fast" for the machine. You can type ahead, and it will wait to update the display until it's finished working. I keep one on my desk for day-to-day use, and have no issues with it. Honestly, the G and GX are still fairly pokey as well.

Also worth mentioning is that there is a library for the S/SX called simply "GX" which adds a lot of the new functions from the GX (mostly list-based stuff). It's just under 2.5 KB.

Re: Choosing an HP-48

in response to message #7 by Dave Britten

Oh, one important thing I forgot to mention about the G/GX, if you choose to get one:

NEVER, EVER TURN OFF LAST ARG.

Whoever designed the keyboard layout was apparently hopped up on cold medicines on the day that they decided where to put PURGE. It was moved to a key adjacent to EDIT, and both are left-shifted functions. It's very, very easy to accidentally delete a program/whatever that you intended to edit. Fortunately, if LAST ARG is enabled, you can *immediately* press ARG, STO to undelete.

On an S/SX, this isn't an issue, since VISIT is right-shifted, and PURGE is left-shifted, plus they are two keys away.

Re: Choosing an HP-48

*Message #9 Posted by **Peter Murphy (Livermore)** on 29 Sept 2011, 2:00 p.m.,*
in response to message #8 by Dave Britten

If I wanted to turn off LASTARG, how would I do that?

How could I check whether LASTARG was turned on or not?

And, for someone using a 48G for exploration (as the OP intends), where is all that information accessible?

Thanks.

Re: Choosing an HP-48

*Message #10 Posted by **Dave Britten** on 29 Sept 2011, 2:27 p.m.,*
in response to message #9 by Peter Murphy (Livermore)

It should be on by default, I think. If LAST ARG is enabled, flag -55 will be cleared. You can also press right-shift MODES, FLAG and scroll to 55. Make sure there's no check mark next to it. There are a bunch of other options in there you can change, too.

in response to message #1 by E.Lub_EU

I have a real HP-48SX at my desk, where it stays. I find it plenty fast enough for what I use it, but I agree, for plotting and solving, it's reeeaaaally slow.

I have installed Emu48, which allows you to load either SX or GX - I have in the past used the Emu48GX for its TVM solver - which is nearly instant even when running in slow mode.

I would suggest you install Emu48 and compare the two, from a speed and functionality point of view, to decided it you want to spend the extra on the GX.

Yesterday, on craigslist, I saw a 48G in Santa Fe, NM, for $30! Posting was Sept 9.

Also, a few of my own observations (I own an SX and (2) Gs):

- The display on the G is lightyears better than the SX.
- The G is a bit faster than the GX.
- I cannot tell a difference in build quality between any of the above.
- The SX is very slow. Don't waste your time, literally.
- I bought both of my Gs for under $35 each.

in response to message #12 by Pal G.

I would agree that the GX display contrast is generally better than the SX, but the SX has one advantage. Something about the design of the GX LCD causes the darkened pixels to cast shadows on the screen itself. You don't see this when viewing straight-on, but if you're at a shallow angle (such as with the calculator resting on a desk), you'll see a double-image that makes it very difficult to read. The SX has a definite advantage in readability in this regard.

You also don't see this shadowing effect on the 28C and 28S, but those two are excruciatingly slow, and in the case of the 28C, laughably ill-equipped with memory.

That's true only if you have one of the last 48G-series models ever made...the black display versions. Most 48G-series and all 48S-series have the poorest quality LCDs that *anyone* ever put on a calculator.

I have one HP 48SX and two HP 48GX units, all with various HP memory expansion cards installed, all purchased by me at retail cost and used for years. I was very happy to dump these dogs to basement storage when I got the HP 49G+, followed by the HP 50G. The **only** positive attribute of the 48S/G-series is the keyboard...and that's certainly not enough to make them worthwhile unless one can get them very very cheap, and can tolerate the many faults and limitations which were corrected with the HP 50G.

Check the saginaw Michigan craigslist site for an SX for $10.

Re: Choosing an HP-48

*Message #16 Posted by **megarat** on 29 Sept 2011, 2:39 p.m.,*
in response to message #1 by E.Lub_EU

I'll add my own US$0.02:

-- 32k is really tight. I highly recommend getting more memory than this, just for the sake of trying out programs that require more memory.

-- Of all the 48-series models, my preference is the 48SX. In part these are for superficial reasons, e.g., I prefer the color scheme and the domestic build quality. Add me to the list: I believe the S-series feels more solid (although not in a way that is easy to qualify) than any of the G-series units I've owned.

-- Yes, the S-series is slow, although I this is mostly an issue with display-intensive operations (equation editor, matrix writer, plotting). For regular calculations and short programs, I'm content with the SX's speed (these are 20-year-old calculating devices, after all).

-- IMHO, the displays between the S-series and the G-series aren't that different, except the later G-series units that have the black LCD, which are very nice. (The units with these displays, alas, are in the minority.)

-- One difference that I haven't seen mentioned yet: battery life. The 3xAAA cells in an S-series calculator will last several times longer than those in a G-series calculator.

in response to message #16 by megarat

FWIW, I find megarat's summary to be the closest to my own experience and preferences. I have never quite understood the complaints about the 48SX display. It's very readable to me. I have compared it to a black screen GX, and find I prefer the SX screen.

*Message #18 Posted by **Cristian Arezzini** on 29 Sept 2011, 5:01 p.m.,*
in response to message #17 by Martin Pinckney

This makes me wonder if maybe all my 48s/sx's are duds... All of them have a display that is much

much worse than any of my G/GX's. By worse, I mean that the contrast is much more marginal: the difference between an on-pixel and an off-pixel is small. If I increase the contrast, the numbers are nice and dark but the background is darkish too; if I lower the contrast to get a "invisible" background, then also the numbers look very "washed out". I may try taking some pictures tomorrow if someone is interested.

in response to message #18 by Cristian Arezzini

I agree my late production 48S (1992 vintage has a Yorke processor rather than the Clark) does not have the same display as any of my 48G and GX models. If I compare the displays with power off the 48S display is a darker shade of blue green than any of the Gs, and I too find the Gs display to be much improved, even though they are still the blue text screens. It seems both are made by Epson and are model LD-F8845A the 48S one has -22 on the end and the 48G one has -23. Maybe the difference is just a filter on the front that make it look different. I am tempted to swap the LCD from a dead G into the S while I have it apart and see what happens.

*Message #20 Posted by **Eddie W. Shore** on 29 Sept 2011, 11:36 p.m.,*
in response to message #1 by E.Lub_EU

Go for as much memory as you can. 32K can be filled quickly if you do a lot of programming. Get a 48GX or 48SX.

The 48G series is faster and performs better despite the 48S having the better colors (IHMO - I am fan of the blue/orange with the a brown background).

RPL is not evil - just slightly different from RPN. For instance, the stack is infinite, so the roll commands are modified a bit. Also, ENTER only terminates number (or object) entry, there is no automatic duplication.

My first HP calculator was an HP48GX - got it in 2001.

Take a G+/GX with B/W LCD

*Message #21 Posted by **Raymond Del Tondo** on 30 Sept 2011, 3:56 a.m.,*
in response to message #1 by E.Lub_EU

All those people who are not sure about the LCD contrast differences between the different HP-48 types, please read the following archived thread, and take a look at the pics.

HP-48 LCD contrast comparison

The SX and older GX displays have very low contrast, but the GX displays have more contrast than those of the SX.
The late production GX displays have _much_ more contrast than both predecessors, period.

However Han showed that even the SX can be equipped with the high contrast LCD.
Just sacrifice one of those worthless 39g/40g units...

And about performance: A GX loaded with SpeedUI will make the unit much nicer to use, since nearly all user interface elements react much faster than the original ones.

Sorry, couldn't resist;-) But hey, SpeedUI is free of charge, so just try it.

*Message #23 Posted by **Frido Bohn** on 30 Sept 2011, 5:04 a.m.,*
in response to message #1 by E.Lub_EU

If you want to play around a little bit with RPL on a real piece of hardware an HP 48G will fit most situations.

However, as soon as you want to start with all those fine libraries stated above in this thread you have no chance with the memory shortcomings of a 32 kB HP 48G - you will have to upgrade to a 128 kB GX. But even then, some applications (e.g. SpeedUI) come with a bundle of libraries that will reduce the memory considerably.
Then you have to search for a 128 kB card which is in fact rare and may cost more than the HP 48GX itself. And if you want to expand the calc beyond the 256 kB threshold, you have to get expansion cards which are almost impossible to get. (Or you will have to be a master of the soldering iron and a PCB virtuoso to compose your own cards.)

What I highly recommend is the use of EMU48 (already mentioned somewhere above). This great emulator comes with different skins (KML Scripts, of which I like most Jemac's GX because of its quite realistic display of the HP 48G) and can be "upgraded" to any memory configuration that is possible for the original hardware. You can fill it with any available library and save different configurations, just as you like.
Over the serial port you can connect EMU48 to a flesh-and-blood HP 48 and transfer programs you developed in the emulator (given that you purchaded the calculator together with a transfer cable). The great advantage of the emulator is that you can save its current state and restore it easily in case of crashes. A crash in a real calculator is really annoying as it may take seemingly endless time to get it back to the previous condition because you have to load all back with 9600 bauds on the serial line (given that you made an backup beforehand).

But before getting too enthusiastic about EMU48 I will come back to my initial statement: for a little RPL, an

HP 48G is perfect. The programs you may develop initially won't put the memory reserves in danger.
At TAS they are usually sold in a decent condition at moderate prices.

HP 15C LE - a personal review

*Message #1 Posted by **Alexander Oestert** on 29 Sept 2011, 8:52 a.m.*

I just want to share what my personal feelings and experiences are from one day of playing with the 15C LE. Others may see that differently, it's just my point of view.

+ The leather skin box is really looking and feeling great.

- The plastic bed in which the calculator sits is a pain. I needed three hands to get it out. Because I like the box I would like to place the calculator in it after every use, but that is near impossible without damaging the plastic inlay or the calc. So the way to go would be to get rid of the plastic thingy - which would render the window in the box useless, since you can't view the calculator through it anymore or only on the bottom of the box. Grrr!

+ The build quality of the calculator is superb. The keys feel absolutely great, way better than on my old original 15C. The f and g key are the exact same color as the original! **One of the two machines I bought will therefor be my daily-used calculator. I love it!**

- The protective sleeve is not what I want to put a "Limited Edition" in. I'm going to use a replacement. That could have been avoided by putting a real leather pouch in the package. And I would have gladly paid more for it.

+ The manual is nicely printed and although it has some flaws it is a nice companion to the 15C.

- Had the manual been spiral bound it would be 100% perfect. The original cover layout would have been nice, too.

- Had the Advanced Functions Handbook been included in a printed version I would have easily payed 20 bucks more. I find it to be a shame that it is not included. I remember reading from Tim that it was not up to some quality expectations and therefor not printed. That was a bad decision. A down-loadable flawless pdf copy does not make up for a printed manual even if it has some problems. Please, HP. make a printed version available!

- The PSE bug is bad. Imagining I were not a forum member sitting in front of my newly purchased 15C and couldn't get many of the manual's examples to work I would be deeply annoyed and thinking about returning the thing. This bug should be addressed as quick as possible. I'm sure HP will do that but in the meantime they should ask vendors to distribute an email to their customers explaining what the problem is and how HP aims to fix it. I assume most of 15C LE buyers up to now have bought their machine(s) via Internet and have left an email address. It should be easy to ask sellers for assistance.

- HP could use the same contact path to send a manual addendum out concerning the self test mess up.

- I don't fancy the silver plate on the back, I had liked it to be dark. But that's a minor point.

Overall I'm very happy with the 15C LE. But had it been announced only in 2012 but without any bugs and with both printed manuals and a leather pouch I would be even happier!

in response to message #1 by Alexander Oestert

> Quote:
>
> + The leather skin box is really looking and feeling great.

I consider the elaborate packaging used for the HP 15C-LE to be a *complete waste* of material and money. One suspects that a significant portion of the production cost was squandered on what is of no value whatsoever. I'd have preferred a simple cheap package such as the Pioneer models used.

> Quote:
>
> + The build quality of the calculator is superb. The keys feel absolutely great, way better than on my old original 15C.

I disagree. I have several old Voyagers, including a couple of HP-15C units. There are absolutely no positive attributes to 15C-LE construction, compared to the original 15C (especially the more robust single-PCB 15C version).

Having said that, I find the 15C-LE construction quality to be acceptable

> Quote:
>
> - The PSE bug is bad.

I think what is bad is that changes were made in the firmware six months ago that are alleged to have introduced the bug, yet there was no minimal testing protocol executed following a firmware change of *any* sort that would have detected this type of problem, nor was there effective beta testing to detect it before production. I found the bug within an hour's use of the 15C-LE because I wanted to see how *anything* that involved timing performed on the emulated 15C. That sort of test should have been part of *any* minimum post-revision firmware testing protocol.

> Quote:
>
> Overall I'm very happy with the 15C LE. But had it been announced only in 2012 but without any bugs and with both printed manuals and a leather pouch I would be even happier!

The original Voyagers didn't use leather covers, why should the less expensive, lower quality 15C-LE? The thin cover that is included is entirely appropriate.

I agree about the value of delay in introduction. It would have been far better to have a *Limited Edition* introduced with some further delay, if such delay would have allowed time to find and correct the several consequential problems that were easily identified within a couple of days after gamma testers first got their machines. Since these are Limited Edition machines, I fear that the temptation will be to let the whole LE batch go to market, then be done with any further development.

Re: HP 15C LE - a personal review

*Message #3 Posted by **M. Joury** on 29 Sept 2011, 2:34 p.m.,*
in response to message #2 by Mike Morrow

While I can't comment on overall construction (I have never opened either the original or the new LE) I

can say that I do agree with Alexander on the keyboard. I have felt this way for quite some time--that the keyboard response of the new calculators is very nice and actually an improvement on the old. This, of course, is just personal preference but I just like the feel of the keys. As to whether they will hold up over time like the old ones did I can't answer yet. I guess if I had not been so lucky with my 12C+'s, 12C Plat's, and 15C LE's in that I have had no keyboard problems whatsoever I probably would not feel the way I do.

Cheers,

-Marwan

*Message #4 Posted by **Paul Berger (Canada)** on 29 Sept 2011, 6:52 p.m.,*
in response to message #3 by M. Joury

I too find the keyboard quite nice and all the keys respond to the same amount of pressure, and for the most part feel much the same as my early production 16C, except on the 16C the enter key takes considerably more force than the other keys, on the 15LE it is the same as all the others. When i got it I tried my best to make a key fail to register but I was unable to do that. The shift keys do move a little on it, but then they also move around a little on the 16C. The case it came with is almost identical in material and construction as the case that came with my 16C, I hope they used a better material to line it, one that does not disintegrate into black dust like the one that came with the 16C. I got a little surprise when I got the LE, coincidentally the LE number on it is the same as the year I was born.

That sort of test should have been part of any minimum post-revision firmware testing protocol.

Tim did say that the people who were given 15C prototypes last year at HHC were allowed access to a special forum where they could talk about the calculator and report issues. There had been a new firmware, yes, and the people with the calculators were allowed to download and flash the firmware. Supposedly many did flash the new firmware but did not report any issues or problems for over 4 months so HP went ahead into production.

What does this mean with respect to the Owner's Handbook? Nothing in the Handbook causes the PSE bug!

The programs in the Handbook *should* work. The existence of the PSE bug has no adverse reflection on the Handbook, unless one thinks that the Handbook should have been revised to work around a bug that was not known to exist when the Handbook was last edited. Personally, I'd prefer that the bug got fixed in the firmware. :-)

Which quadratic formula is use?

*Message #1 Posted by **Michel Beaulieu** on 29 Sept 2011, 8:47 a.m.*

I'm amaze by the fact that this quadratic formula is so short :

001- LBL E 002- ENTER 003- R^ 004- / 005- R^ 006- LSTx 007- / 008- 2 009- CHS 010- / 011- ENTER 012- ENTER 013- x^2 014- R^ 015- - 016- SQRT 017- - 018- x<>y 019- LSTx 020- + 021- RTN

I found this on a museum's archive 17 :

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=114345

My shortest program have 30 step. I realize that the formula use for this program is not the same old one we learn at high school.

I'm still learning the RPN stack and programming on the 15C. What is the "modified" formula use?

Thanks

Re: Which quadratic formula is use?

*Message #2 Posted by **Dave Britten** on 29 Sept 2011, 9:08 a.m.,*
in response to message #1 by Michel Beaulieu

It's probably the same formula in the end, it's just using a ton of RPN tricks to cram the computation into as short a program as possible.

Re: Which quadratic formula is use?

*Message #3 Posted by **Gerson W. Barbosa** on 29 Sept 2011, 9:47 a.m.,*
in response to message #1 by Michel Beaulieu

Here it is, courtesy of Allen:

$$x_{1/2} = -\frac{b}{2a} \pm \sqrt{\frac{b^2}{4a^2} - \frac{c}{a}}$$

On the HP-42S, 15 steps suffice:

```
00 { 28-Byte Prgm }
01 LBL "Q"
```

```
02 RCL/ ST Z
03 X<> ST Z
04 /
05 -2
06 /
07 STO ST Z
08 x^2
09 X<>Y
10 -
11 SQRT
12 RCL+ ST Y
13 X<>Y
14 RCL- ST L
15 END
```

Edited: 29 Sept 2011, 9:54 a.m.

Re: Which quadratic formula is use?

*Message #4 Posted by **Jeff O.** on 29 Sept 2011, 10:12 a.m.,*
in response to message #1 by Michel Beaulieu

Definitely the standard quadratic formula with optimum use of stack to provide both answers in x and y, as shown in the following listing which shows the stack contents after each function:

```
Step    Function             Stack Contents
-------------------------------------------------------
                         T:      --
                         Z:      A
                         Y:      B
1        LBL E           X:      C
-------------------------------------------------------
                         T:      A
                         Z:      B
                         Y:      C
2        ENTER           X:      C
-------------------------------------------------------
                         T:      B
                         Z:      C
                         Y:      C
3        R^              X:      A
-------------------------------------------------------
                         T:      B
                         Z:      B
                         Y:      C
4        /               X:      C/A
-------------------------------------------------------
                         T:      B
                         Z:      C
                         Y:      C/A
5        R^              X:      B
-------------------------------------------------------

in response to message #4 by Jeff O.

Very impressive use of the stack! I will study it tonight after work...

Re: Which quadratic formula is use?

*Message #6 Posted by **Jeff O.** on 29 Sept 2011, 1:57 p.m.,*
in response to message #5 by Michel Beaulieu

Agreed. I have edited the listing to hopefully make it easier to read. In case it is not clear, the stack contents on each line are as they will be after the function on that line is executed.

16    SQRT        -b/2a                      -b/2a                       -b/2a
SQRT(b²/4a²-c/a)          b²/4a²-c/a
17    -           -b/2a                      -b/2a                       -b/2a   -
b/2a-SQRT(b²/4a²-c/a)   SQRT(b²/4a²-c/a)
18    x<>y        -b/2a                      -b/2a    -b/2a-SQRT(b²/4a²-c/a)
-b/2a
19    LSTx        -b/2a   -b/2a-SQRT(b²/4a²-c/a)                       -b/2a
SQRT(b²/4a²-c/a)
20    +           -b/2a                      -b/2a    -b/2a-SQRT(b²/4a²-c/a)   -
b/2a+SQRT(b²/4a²-c/a)   SQRT(b²/4a²-c/a)
21    RTN                                                                 x1
x2
----- --------   ------   ----------------------   ----------------------   ----
------------------             ------
```

where x_1 and x_2 are the real roots of equation $a.x^2+b.x+c=0$

Exemple :
Type 2 [ENTER] 10 [CHS][ENTER] 12 [GSB][E] to solve $2.x^2 - 10.x + 12=0$ and get $x_1 = 2$ and $x_2 = 3$

The calculator first display x_2, you have to press [x<->y]key to get x_1.

But you will be in trouble solving $2.x^2 - 8.x + 26=0$!

Note that on HP-15c, this code needs very few modifications to also produce real or complex solution(s) to any $a.x^2 + b.x + c = 0$ equation with real or complex coefficients *a*, *b* and *c*.

```
Step  Func
----- --------
01    LBL E
02    ENTER
03    R^
04    /
05    R^
06    LSTx
07    /
08    2
09    CHS
10    /
11    ENTER
12    ENTER
13    x^2
14    R^
15    -
16    TEST 2      @  ( x<=0 ? )
17    SF 8        @  (Complex mode ON)
18    SQRT
19    -
20    x<>y
21    LSTx
22    +
23    RTN
----- --------
```

To solve quadratic equation $2.x^2 - 8.x + 26 = 0$, y have to type :
[g][CF][8] to set complex mode OFF in order to enter real coefficients :
[2][ENTER^][8][CHS][ENTER^][2][6] to type in respectively $a=2$, $b=-8$ and $c=26$.
[GSB][E] to run code.

Note that the 'C' enunciator indicates complex solutions $z_1 = 2-3i$ and $z_2 = 2+3i$. Imaginary parts have to be displayed using [f][Re<->I] switchs or by holding [f][(i)] key.

To enter complex coefficients, simply enter *a*, *b* and *c* as complex using [f][I] or [f][Re<->Im] method.

Amazing HP-15c!

Edited: 29 Sept 2011, 4:54 p.m.

Re: Which quadratic formula is use?

*Message #8 Posted by **Jeff O.** on 29 Sept 2011, 10:17 p.m.,*
in response to message #7 by C.Ret

Thanks.
I considered laying the stack contents out horizontally. But I seem to visualize the stack in a vertical layout and find it easier to follow and/or develop how the contents move around if I present it that way. I'll have to do a layout for the complex version tomorrow to see how it works.

Which quadratic formula is use?

WP34s bugfix

*Message #1 Posted by **fhub** on 29 Sept 2011, 5:57 a.m.*

I see a bugfix ("Fix ISG/DSE in integer mode") in SVN 1635 from **yesterday** but still no integration build ... :-(

Re: WP34s bugfix

*Message #2 Posted by **Paul Dale** on 29 Sept 2011, 6:18 a.m.,*
in response to message #1 by fhub

These two really aren't very useful in integer mode so there isn't a rush to get a fixed build out. Plus I didn't have access to the build machine when I made the change.

- Pauli

Re: WP34s bugfix

*Message #3 Posted by **Paul Dale** on 29 Sept 2011, 6:25 a.m.,*
in response to message #1 by fhub

Built now for what its worth.

I'd be interested in seeing a program where integer mode ISG is useful and ISZ isn't.

- Pauli

Thanks!
And "for what its worth"? Well, a fixed bug is one bug less! ;-)
And a not correctly working loop command is indeed a critical bug IMO.

I'm a programmer myself and I really hate all kinds of bugs, so for me it's a must to fix every bug as soon as I'm aware of it, no matter how serious it is or not.

> Quote:
>
> I'd be interested in seeing a program where integer mode ISG is useful and ISZ isn't.

Well, if this command isn't useful then I'm wondering why you've implemented it at all. ;-)

Franz

Re: WP34s bugfix

*Message #5 Posted by **Paul Dale** on 29 Sept 2011, 5:27 p.m.,*
in response to message #4 by fhub

I implemented it because we had to have it in real mode where it is very useful. I supported it in integer mode also for consistency -- there are several commands where either the integer or real mode version isn't all that useful but supported nonetheless. I'm yet to see an example where these loop commands are *better* in integer mode than the alternatives. However, since I could reasonably define what they did and it was slightly different to the other available commands so they got supported.

BTW, I did fix the bug as soon as I heard of it, I just didn't kick off a build -- partly because I couldn't at the time and partly because the problem that was addressed didn't seem all that important -- YMMV of course. Anyway, fixed and happy now.

- Pauli

OpenRPN and the 41CL

*Message #1 Posted by **snaggs** on 29 Sept 2011, 2:03 a.m.*

I posted a question a while ago about whether a calculator could be made like those from "the old days".

Given someone has already gone to the trouble of developing the NEWT processor with the full set of ROMS etc, why not make a case for it and start there?

I found this;

http://www.instrument.com/60.html

Which is an industrial "human interface" which even has a RS-232 port on the back. They say they can supply it with whatever labels you like on the keys etc. It has a 2x40 screen, which can even be backlit.

What this be suitable for gutting? i.e.

CTM300 + NEWT + cloned HP-IL RS232 adapter internally wired to RS-232 port

= nearly a calculator?

Daniel.

Re: OpenRPN and the 41CL

*Message #2 Posted by **Monte Dalrymple** on 29 Sept 2011, 10:05 a.m.,*
in response to message #1 by snaggs

The issue with putting the 41CL hardware into anything other
than a 41C body is going to be the display driver.

Re: OpenRPN and the 41CL

*Message #3 Posted by **Ángel Martin** on 29 Sept 2011, 10:25 a.m.,*
in response to message #2 by Monte Dalrymple

Does "Anything other that a 41C body" include the "DIY5"? Rethorical question since I guess at this point only Eric has that information?

Re: OpenRPN and the 41CL

*Message #4 Posted by **Monte Dalrymple** on 29 Sept 2011, 10:57 a.m.,*
in response to message #3 by Ángel Martin

Yes. The display driver is not on the 41CL board, and any new display will require an interface that looks like the one in the 41C as far as signals and timing are concerned.

41CL and DIY4X/DIY5

*Message #5 Posted by **Eric Smith** on 29 Sept 2011, 11:48 a.m.,*
in response to message #3 by Ángel Martin

> Quote:
>
> Does "Anything other that a 41C body" include the "DIY5"?

The DIY4X already a high-performance 41-equivalent calculator. There would be no point to trying to put a 41CL board into a DIY4X or DIY5; it would take a huge amount of new engineering, and the result would be slower than the DIY5.

Currently the DIY4X at 14 MHz is 6-14x faster than the original 41, depending on the specific functions used, and at 28 MHz is about 10-20x faster. Doubling the clock frequency doesn't double the performance because it introduces a wait state on the flash memory, and because some overhead such as display updating does not get faster.

I haven't yet done any code optimization, and I think there will be at least 2x performance gain from that, and probably much more than that.

The DIY5 hardware will be able to run at 48 MHz, with two wait states on the flash memory. I have some plans for reducing the performance degradation caused by the wait states.

If someone wants to support engineering a *really* fast 41 replacement, I have a design for an FPGA datapath that runs more than 5000x faster than that of the 41. The idea is similar to Monte's NEWT processor in the 41CL, but is implemented as a 56-bit parallel data path rather than bit-serial. Some work is needed to finish the control portion. The actual speed would not be 5000x, just as the 41CL in Turbo50 mode isn't actually 50x faster than the original 41. It would also drain batteries much faster than the 41CL.

I designed that FPGA data path about ten years ago to satisfy my own curiosity as to how fast a Nut processor implemented in hardware could be. In an ASIC, it could easily be another factor of ten faster than the FPGA. I had no intention of using it in a product. However, once I have tooling for a DIY5 case, there is no reason why I couldn't at relatively low additional expense make a limited edition 41CMMMMM with the FPGA.

The great thing about the 41CL is that it fits in a comfortable, familiar and well loved case. Your project is a brand new calculator, which has different design goals.

> Quote:

With that sort of tech, how about a massively parallel Nut consisting of hundreds of cores running multiple 41C images? Prime factorization might benefit from that.

Only 0.5 kidding. :)

edit: change radix to US standard.

Edited: 29 Sept 2011, 3:50 p.m.

Which doesn't contradict my point that it would make no sense to put a 41CL board into a DIY5 case.

Re: 41CL and DIY4X/DIY5

*Message #8 Posted by **snaggs** on 29 Sept 2011, 5:49 p.m.,*
in response to message #5 by Eric Smith

I hadnt heard of this! Are they available?

Daniel.

Re: 41CL and DIY4X/DIY5

*Message #9 Posted by **Eric Smith** on 29 Sept 2011, 8:17 p.m.,*
in response to message #8 by snaggs

Are what available?

Certainly the DIY4X, DIY5, and the entirely hypothetical calculator with a parallel data path in an FPGA are not available. The DIY5 might be available in the future if we can figure out a way to produce it without losing money.

Re: OpenRPN and the 41CL

*Message #10 Posted by **Hugh Evans** on 29 Sept 2011, 1:15 p.m.,*
in response to message #1 by snaggs

Please refrain from referencing OpenRPN in posts such as this. Especially since I'm considering a reboot of the project, and even maintain ownership of the domain, the name represents more than a concept.

This form factor doesn't make sense: it measures 5"x9"x1.5" which is a lot more space than my 48gx takes up.

The needs and desires I identified while managing the OpenRPN project are for pocket sized calculators of high build quality that are reliable, easy to use, maximize battery life, and nearly indestructible.

Before I formally announce a relaunch, I want to have at least one physical prototype (enclosure, clicky keys that work, and LCD) to show off. From there specs can be given for electronic hardware to be designed. $200 is the maximum price point I'm designing for. But one thing I specifically want to avoid this time is to start with a need for a platform. Hardware comes first, perhaps running ported code from WP34s, before any major public announcements are planned.

Solving a cubic equation using trigonometry, but with a2 term?

*Message #1 Posted by **snaggs** on 29 Sept 2011, 1:44 a.m.*

Hi,

I read and entered this program here, after finding his Quadratic solver using ACOSH nice to use.

"Solving a cubic equation using trigonometry" by *Thomas Klemm*
http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv020.cgi?read=180771

A general cubic equation can be transformed to the following form using a substitution;

$$x^3 + px + q = 0$$

However, it doesn't work if you have an a2 term, unless I've made a typo. Having to do substitution before using the program seems to defeat the purpose.

Daniel.

Re: Solving a cubic equation using trigonometry, but with a2 term?

*Message #2 Posted by **Dieter** on 29 Sept 2011, 7:19 a.m.,*
in response to message #1 by snaggs

Sure there is no a2 term: That's why it says "A general cubic equation can be *transformed to* the following form using a substitution". ;-) For more details see below.

There are well-known standard methods for solving cubic equations. Just take a look at de.wikipedia.org - as well as the last link ("Leitfaden") on that page for a step-by-step solution. The entry on en.wikipedia.org is has some more details on the numerics.

Having read all this you may finally proceed to the actual algorithm. ;-) For instance by using Cardano's method as described on de.wikipedia.org. This is the method you will probably use.

Edit 1: Oops, I was a bit too fast. ;-) I didn't notice you're *not* Thomas so you probably don't read German. However, the mentioned Cardano method first reduces the cubic equation to a simplified form without "a2 term" and then this reduced equation is solved. The latter part is already done by the program you got. So you just have to provide the initial reduction (or transformation, as Thomas said) the way it is described in the wikipedia articles. The rest is already there.

Edit 2: All this has already been discussed in the thread you mentioned. Please read messages 3 - 5 there. ;-)

Dieter

WP34S overlay

*Message #1 Posted by **Masaki Adachi** on 29 Sept 2011, 12:41 a.m.*

I seem to recall there was a overlay for wp34s without keyboard "caps" (i.e., everything was printed on the overlay) shown sometime ago. Is there a graphics available for that version? I would like to print out something until Eric can restock his overlay for sale again.

Edited: 29 Sept 2011, 12:42 a.m.

Re: WP34S overlay

*Message #2 Posted by **Walter B** on 29 Sept 2011, 12:52 a.m.,*
in response to message #1 by Masaki Adachi

Please look at sourceforge in directory named "artwork".

Re: WP34S overlay

*Message #3 Posted by **Marcus von Cube, Germany** on 29 Sept 2011, 6:46 a.m.,*
in response to message #2 by Walter B

Or in the ZIP file in the real directory. The "no_keys" file was originally used by me to label my first machines.

Re: WP34S overlay

*Message #9 Posted by **Paul Gaster** on 2 Oct 2011, 9:28 a.m.,*
in response to message #6 by Walter B

I have heard talk of adding matrix functions to the 34S. I know this isn't done yet, but would adding that functionality change the overlay? Just trying to decide if I want to get an overlay now or wait a bit.

Re: To Eric Rechlin

*Message #10 Posted by **Marcus von Cube, Germany** on 2 Oct 2011, 9:36 a.m.,*
in response to message #9 by Paul Gaster

No, it's all in the catalogs.

Re: To Eric Rechlin

*Message #11 Posted by **Walter B** on 2 Oct 2011, 9:46 a.m.,*
in response to message #9 by Paul Gaster

The overlay has to change when the keyboard changes. It was mentioned in another thread already we have at least one other keyboard modification waiting. And I know one of the trinity isn't quite happy with another assignment. At the bottom line, I'd say: yes, probability for a keyboard change is elevated, but don't hold your breath.

Don't know whether this helps you, however.

Walter

Spiral Binding

*Message #1 Posted by **db (martinez, ca.)** on 28 Sept 2011, 11:36 p.m.*

Someone here mentioned that the 15CLE manual is not spiral bound and that HP should have made it that way. I went to the Fed Ex copy place (formerly Kinko's). They cut the glued binding off and spiral bound my manual for about six and a half bucks.

Re: Spiral Binding

*Message #2 Posted by **Jim Yohe** on 29 Sept 2011, 2:17 a.m.,*
in response to message #1 by db (martinez, ca.)

Did you take another previously spiral "HP" bound manual to them so they could match it?

Re: Spiral Binding

*Message #3 Posted by **Michael Kussmaul** on 29 Sept 2011, 5:14 a.m.,*
in response to message #1 by db (martinez, ca.)

It's a bit of a mystery to me, why HP not just shipped a scanned version of the original manual (I guess only scanning would work, because at that time there was no digital-version of the manual).

This way a lot of typos in the new manual would have been ruled out. They could just have added a leaflet with additional information (e.g. broken self-test, regulatory terms, etc).

Re: Spiral Binding

*Message #4 Posted by **Lincoln R.** on 29 Sept 2011, 9:17 a.m.,*
in response to message #3 by Michael Kussmaul

If they shipped a scan people would complain about the image quality or something. Because they shipped it the way they did, people are complaining about typos. It would seem that for a lot of these issues, HP just can't win.

Re: Spiral Binding

*Message #5 Posted by **Paul Gaster** on 29 Sept 2011, 1:32 p.m.,*
in response to message #4 by Lincoln R.

Also you cannot search a scanned version of the manual to find things quickly.

I see HP now has the 15C manual for download: link

15C support page: link

Hope the Advanced Functions Handbook will follow soon.

Why spoil all the fun of googling it yourself? ;)

Seriously, I posted from my iPhone 3G and found it quicker to write down the search terms than to copy the URL, that's all!

But what I'm asking myself is: would it really have been that much more expensive to print the new 15c LE handbook in black and *blue* like the newly released pdf is instead of only black?

Re: Spiral Binding

*Message #9 Posted by **David Hayden** on 29 Sept 2011, 3:43 p.m.,*

Yes. apparently printing any color at all is substantially more expensive than plain black & white. The original Owners Handbook had blue on every page (in the header and footer).

I suppose a nice compromise might have been to change the headers and footers to black and then printed just the pages with images in color.

Dave

Re: Spiral Binding

*Message #10 Posted by **Katie Wasserman** on 29 Sept 2011, 8:13 p.m.,*
in response to message #9 by David Hayden

More than lack of color is the paper quality of the manual. The paper in 15C LE manaul is just a step above newsprint. The orignal 15C manual had very nice quality paper.

Re: Spiral Binding

*Message #11 Posted by **Jeroen Van Nieuwenhove** on 29 Sept 2011, 3:35 p.m.,*
in response to message #5 by Paul Gaster

The Advanced Functions Handbook is also included in the emulator. See Help > Advanced Functions Handbook. It is the same scan as the one on hp15c.org and the one on the HP Museum DVD.

Re: Spiral Binding

*Message #12 Posted by **Paul Gaster** on 29 Sept 2011, 4:11 p.m.,*
in response to message #11 by Jeroen Van Nieuwenhove

I think I should have been more clear. I hope they release a new Advanced Functions Handbook that is searchable and not a scan. I had seen the scanned version before, but there are times when it's nice to be able to search. HP would need to redo the whole thing for this to be possible though, so I am not sure it will happen.

Re: Spiral Binding

*Message #13 Posted by **Steve Simpkin** on 29 Sept 2011, 4:50 p.m.,*
in response to message #12 by Paul Gaster

> Quote:

*Message #14 Posted by **Marcus von Cube, Germany** on 1 Oct 2011, 4:09 a.m.,*
in response to message #13 by Steve Simpkin

Both manuals are, as far as I know, a community effort conducted together with HP. Give them the time they need and you will get your Advanced Functions Manual. Then let it print and bind in a print shop for small money and you are lucky.

HP Solve list

A few remarks and questions re. Solve #25

*Message #4 Posted by **Dieter** on 1 Oct 2011, 1:18 p.m.,*
in response to message #3 by gene wright

So, finally I have read through (almost) the complete last issue of HP Solve - this time with no less than 75 pages. Much information, many topics... and some thoughts and remarks I would like to discuss. ;-)

Page 7 has a picture showing a 15C LE in space being *"back by popular demand"* - in five different languages. According to the comment on the next page I assume this ad will be used internationally as a part of the "15c PR campaign". I cannot comment on the French, Spanish and Dutch version of "bring it back", but I can say that the German version has three errors in its three words: it's not "Bringe es zuruck!" but "Bringt ihn zurück!". Which leads to the question if there really is not a single person at HP that is familiar with these languages. I would also like to ask this because my German HP35s manual does not compare favorably with the ones I got with my 34C and 41C back then.

Page 26: *"The HP-41 SIGN function was “defined” differently, and they had to add two steps for each time it was used in the routines. (...) It makes you wonder what the HP-41 developers were thinking. Was there some hardware restriction?"*

There is no secret why the '41 has its sign-function implemented this way. The reason is found in the manual and it also has been discussed here a few weeks ago: a zero result is reserved for x containing alpha data. This way the '41 can distinguish between numeric and alpha values: "ABC" ASTO X SIGN returns 0.

Page 61: "Calculator Forensics". *"The idea is that the function-inverse is supposed to return the input, in this case 9 degrees. Supposedly the more accurate calculator (overall?) is the one that is closest to 9"*. But is this really true?

Even a perfect calculator with 10, 12 or 16 digits will not return the original input in simple cases like [9] [ln] [e^x] - the result will be "off" by several ULPs. And that's fine because this is the only correct answer. So there is a characteristic perfect result for the operation sequence used in the "calculator forensics" test, and this result usually is *not* 9... unless the calculator uses at least five additional guard digits it doesn't display. ;-)

For a 10-digit device the perfect result is 9,00 041 740 3 - and that's exactly what most 10-digit HPs will return.

For a 12-digit machine it's 8,99 999 864 267 as returned by the 32s, 42s and others. The 35s here returns 8,99 999 986 001 which is closer to 9 (BTW, the deviation is just 1,4 E-**7**). But in fact the accuracy is not better than that in the 32s/42s result, actually it is even slightly *worse* - the problem here is the inverse tangent where the correct result is 0,999 996 272 743 53... which should be rounded up to ...744 while instead the 35s rounds it down to ...743.

In other words: closer to 9 is not always better. It may be worse just as well. The actual accuracy can only be judged by comparing the result to a certain characteristic value for a n-digit machine (which usually is not exactly 9). This point is also mentioned by the "inventor" of the calculator forensics test himself: Mike clearly sees that after the cosine calculation there is always a loss of about five significant digits, which is independent of the calculator. So it's clear the perfect result usually is not 9. Okay, it can be 9 if the calculator uses at least five guard digits throughout the whole calculation. ;-)

Page 67: *"For 10 digit calculators the guard digits are usually two"*. As far as I know (except some early mid-seventies models) it's usually three digits for the 10-digit machines as well. The reason why only 12 digits of Pi are displayed simply is its 13th (rounded) digit which is zero: Pi ~= 3,14 159 265 359 0. ;-)

What I would like to ask here is this: on the one hand there is a limited number of digits the calculator works with. In most 10-digit machines that's 13 internal digits. On the other hand there is a certain number of digits of Pi stored internally, which may be 13, 24 or even 31 digits. How does this affect the accuracy of the trig functions? Why does sin(3,141592653) on a classic 10-digit HP return just 5,90 E-10? Does the internal algorithm simply evaluate Pi - x ? And, if the 35s actually uses 24 internal digits of Pi, why does it only return 6 digits for sin(3,14159265) = 3,58 979 E-7. Add just one more digit to the argument to get a full precision result: sin(3,141592653) = 5,89 793 238 463 E-10. Why?

Final question: the WP34s internally uses 39 digits, 16 digits are returned and usually 12 digits are visible in the display. How many guard digits does it have? ;-)

Dieter

Re: A few remarks and questions re. Solve #25

*Message #5 Posted by **Marcus von Cube, Germany** on 1 Oct 2011, 4:55 p.m.,*
in response to message #4 by Dieter

> Quote:
>
> Final question: the WP34s internally uses 39 digits, 16 digits are returned and usually 12 digits are visible in the display. How many guard digits does it have? ;-)

The answer is 4. Guard digits are available to the user but not shown in the display. The internal precision is independent from this. The 41C has no guard digits but can compute to more digits (13?) internally.

Re: A few remarks and questions re. Solve #25

*Message #6 Posted by **Dieter** on 2 Oct 2011, 10:09 a.m.,*
in response to message #5 by Marcus von Cube, Germany

If guard digits are available to the user but not shown in the display, most HPs do not use guard digits at all. This does not match the usual definition by HP who claim that (most of) their calculators use three "guard digits". Which definition now is correct? And why? ;-)

Dieter

Re: A few remarks and questions re. Solve #25

I would also like to ask this because my German HP35s manual does not compare favorably with the ones I got with my 34C and 41C back then.

The French version is also wrong, and actually hilarious! "Retourné" means "turned over" (tarte Tatin anyone?); What it should have been is "De retour".

Funnies aside, this is a bit poor. If anyone should use "foreign" languages, they could at least check that it's correct. Oh well, at least they got the "é" right on "retourné", and it made me smile ;-)

HP15C LE Keyboard Survey Results

*Message #1 Posted by **M. Joury** on 28 Sept 2011, 9:32 p.m.*

Thanks to all the forum members that have so far responded to this survey. The results are as follows:

```
104 respondents
188 calculators
22 with keyboard issues
"failure" rate: 11.70%
```

I was asked to keep the survey open until European buyers had access to the units. The individual that requested this appears to have actually received his units and responded. However, if people want to continue providing data I will continue to assimilate it.

As always, please provide the total number of units purchased and the number that have keyboard issues. Loose and/or rattly f and g function keys do not constitute a problem as long as the keys register correctly.

As an example 2 units purchased with 1 having a problem would be listed as: 2:1.

Cheers,

-Marwan

Re: HP15C LE Keyboard Survey Results

*Message #2 Posted by **Marcus von Cube, Germany** on 30 Sept 2011, 8:16 a.m.,*
in response to message #1 by M. Joury

My 15C LE has a very minor issue with the [times] key which clicks but not always registers. I need to watch the display or press slightly harder then on the other keys to make it register. Since it is an imported item I don't think the normal warranty channels will be of any help.

#00052, maybe one of the lower numbered calcs here. :-)

Re: HP15C LE Keyboard Survey Results

*Message #3 Posted by **Reth** on 2 Oct 2011, 7:42 a.m.,*
in response to message #2 by Marcus von Cube, Germany

> Quote:

> ... Since it is an imported item I don't think the normal warranty channels will be of any help.

And why so? Doesn't that defect make the calculator useless?

BTW warranty information (application form) is missing on the accompanying CD contrary to what the enclosed sheet of paper indicates...

Can anyone shed some light on that e.g. are any warranty channels available?

Re: HP15C LE Keyboard Survey Results

*Message #4 Posted by **Thomas Radtke** on 2 Oct 2011, 8:20 a.m.,*
in response to message #3 by Reth

> Quote:
>
> Doesn't that defect make the calculator useless?

HP certainly knew why they advertized the 15C LE as a gift. With that nice display box where the calculator is difficult to get out, I conclude that it was never meant to be used. And so, it is *a very minor issue*.

Re: HP15C LE Keyboard Survey Results

*Message #5 Posted by **Reth** on 2 Oct 2011, 8:38 a.m.,*
in response to message #4 by Thomas Radtke

:) I take this as a joke ;)

Re: HP15C LE Keyboard Survey Results

*Message #6 Posted by **Marcus von Cube, Germany** on 2 Oct 2011, 9:01 a.m.,*
in response to message #3 by Reth

The defect is really minor. I applied some contact cleaner which made it even less noticeable. I'll stay with #52.

At HHC I saw (and tried) a much worth sample which was later collected by Tim for inspection. I wouldn't have kept this one.

Re: HP15C LE Keyboard Survey Results

*Message #7 Posted by **Reth** on 2 Oct 2011, 9:09 a.m.,*
in response to message #6 by Marcus von Cube, Germany

To me click without registering is a show stopper when talking about HP calculator, period.

I'm still curious what all the rest of us will do with their faulty LE calcs.

Re: HP15C LE Keyboard Survey Results

*Message #8 Posted by **Marcus von Cube, Germany** on 2 Oct 2011, 10:04 a.m.,*
in response to message #7 by Reth

> Quote:
>
> To me click without registering is a show stopper when talking about HP calculator, period.

I had the problem with my first 17bll+ but since it came from a German distributor there was no problem to send it back for replacement. With the 15C LE it's a different story:

If I send it back to SC for repair or replacement I have to pay the shipment in advance. On the way back I can most certainly assume that I'm charged customs a second time. The whole thing will cost me money despite of the warranty, will get me a different serial number (I'm happy with #52), and will not assure that the unit I get is really better than mine.

Re: HP15C LE Keyboard Survey Results

*Message #9 Posted by **Reth** on 2 Oct 2011, 10:21 a.m.,*
in response to message #8 by Marcus von Cube, Germany

I wouldn't be surprised if HP refuse all keyboard related claims based on the fact that they never said officially that "click = registered" ;)

If they are about to resolve the issue, they should come up with official acknowledgement of the problem, which is yet to be seen and I strongly doubt this will ever happen.

Re: HP15C LE Keyboard Survey Results

*Message #10 Posted by **Marcus von Cube, Germany** on 2 Oct 2011, 12:59 p.m.,*
in response to message #9 by Reth

I can assure you that Tim and Cyrille really care. If they have any influence, the issue will be resolved.

Re: HP15C LE Keyboard Survey Results

*Message #11 Posted by **Reth** on 3 Oct 2011, 6:53 a.m.,*
in response to message #10 by Marcus von Cube, Germany

I'm sure they do care, but it's hardly up to them...

It is sad, but most probably my HP-15C LE will head off to the TAS. Hopefully there are folks out there who don't care about such *marginal issues* as keys clicking but not registering ;)

Re: HP15C LE Keyboard Survey Results

*Message #12 Posted by **Michael Kussmaul** on 2 Oct 2011, 9:56 a.m.,*
in response to message #2 by Marcus von Cube, Germany

BTW how are you planning to "bring" your calculator over to HP support? I'm living in Europe (from your forum name I guess you are frm Germany :-) and I'm not sure if HP supports international warranty, so I guess we have to send them back to the U.S.?

Or does anybody know if I should just contact HP support in my country (Switzerland) - I doubt they have heard anything about the 15c LE yet, as it is not avail. yet...

Re: HP15C LE Keyboard Survey Results

*Message #13 Posted by **Nick R** on 30 Sept 2011, 3:29 p.m.,*
in response to message #1 by M. Joury

That would seem to be a high level of unreliability. I'd be interested to know if those calculators that were reported to have no initial key press problems will have developed them after a few months of use.

Re: HP15C LE Keyboard Survey Results

*Message #14 Posted by **M. Joury** on 30 Sept 2011, 3:45 p.m.,*
in response to message #13 by Nick R

That is exactly my concern. Although, given that the HP12C+ has the same keyboard and that problem has not been seen on those cals (to the best of my knowledge), I am hoping that failure will not occur with use.

Cheers,

-Marwan

Re: HP15C LE Keyboard Survey Results

*Message #15 Posted by **Marcus von Cube, Germany** on 30 Sept 2011, 4:05 p.m.,*
in response to message #14 by M. Joury

Maybe it's the until know undetected cause of the financial crisis.

;-)

Re: HP15C LE Keyboard Survey Results

*Message #16 Posted by **Michael de Estrada** on 30 Sept 2011, 4:14 p.m.,*
in response to message #14 by M. Joury

My experience with keys on vintage calcs that require harder than normal pressure to register has been oxidation or contaminants on either the key or circuit board contact that results in high resistance to current flow. Cleaning the contacts usually solves the problem. Perhaps during the manufacture and assembly process the contacts were contaminated in same way that has caused the reported problems.

Edited: 30 Sept 2011, 4:15 p.m.

Contacts? Contacts!

Thanks, Michael! Your post and Contact Cleaner 60 just fixed my 4-year old problem with R/S key on HP-35S :) I just spayed a tiny bit of it, and IT WORKS without any problem, while I had to press the key with triple force to register out of the box.

in response to message #17 by x34

Will this help with my 15C LE? Where to spray it?

Re: Contacts? Contacts!

*Message #19 Posted by **x34** on 1 Oct 2011, 5:56 a.m.,*
in response to message #18 by Marcus von Cube, Germany

I sprayed just above the key, aiming straw to the slot, while sliding key down (opposite display, not like usual press) to make widest slot. The correct name of the spray is Kontakt 60.

Case for 20b/30b/34S?

*Message #1 Posted by **David Hayden** on 28 Sept 2011, 9:16 p.m.*

I have a 20b (now a 34S) that came without a protective case. Looking on the web I haven't been able to find a source of them. Does anyone know where I might get one? I suspect that there are others who might want them too.

Dave

Re: Case for 20b/30b/34S?

*Message #2 Posted by **Walter B** on 29 Sept 2011, 3:41 p.m.,*
in response to message #1 by David Hayden

Dave,

Besides the standard protective flap coming with the 30b, according to my experience the WP 34S fits very well into the case of the 17bii+ Silver. Old Pioneer *leather* cases are suitable as well, while the standard black fake leather sleeves are too wide.

HTH,
Walter

Why does solver "iterate" when using S() function?

*Message #1 Posted by **JamesT** on 28 Sept 2011, 6:42 p.m.*

Hi All,

I have a simple unit conversion formulas that I use on my HP17BII /HP17BII+ and decided to consolodate 3 of these into a single menu using the S() function. I have 2 nested IF(S(nnn)... functions, with a total of 3 equations:

LENGTH: IF(S(MM) OR S(INCH): MM * 0.03937007874 – IN: IF(S(M) OR S(FEET):M * 3.280839895 – FT : KM * 1.609344 - MILE))

The equation on the left most runs instantiously (mm-inch), while the two on the right iterate though the solution for some reason! On the 17BII, you get calculating, and the 17BII+ shows the min max iterations.

Run as stand-alone equations, they run instantly. Any ideas on how to fix this behavior?

Re: Why does solver "iterate" when using S() function?

*Message #2 Posted by **Don Shepherd** on 28 Sept 2011, 8:35 p.m.,*
in response to message #1 by JamesT

Shouldn't IN be INCH and FT be FEET in your formula? I think the KM/Mile conversion factor should be 0.621371192 (per Google anyhow).

The 17bii+ solver is going to use the iterative solver in situations where the 17b or 17bii solver would use the direct solver. I think Cyrille told me one time that that is due to memory constraints in the 17bii+. The 17bii does say CALCULATING but it derives a solution within a second or two; the plusses and the iterative solver take several seconds generally.

Edited: 28 Sept 2011, 8:50 p.m.

Re: Why does solver "iterate" when using S() function?

*Message #3 Posted by **JamesT** on 28 Sept 2011, 9:37 p.m.,*
in response to message #2 by Don Shepherd

You're right...I had fixed that after keying. The miles->km formula is calculating the reverse factor as it's keyed, so it works.

Disappointing that the plus is SO much slower than the older unit. Oh well. It does validate the equation faster, so not all is bad.

[edited] from the HHC email list, what is the proper answer to 8 ENTER 3 divide 2 divide on 10 digit calc

*Message #1 Posted by **gene wright** on 28 Sept 2011, 4:08 p.m.*

[EDITED]

The email thread is going wild, but consider this:

8 ENTER 3 divide

shows 2.666666667 in the X register.

Now do a 2 divide.

What should be shown in FIX 9?

1.333333334 or 1.333333333 ?

Older generation calculators such as the 15c, 41c, etc. and calculators without guard digits give a 4 at the end. Isn't that as it should be?

After all, the calculator does not know you are really trying to get 1/3 --- all it knows is it has 2.666666667 in X and you divide by 2.

Thoughts?

Edited: 28 Sept 2011, 4:40 p.m. after one or more responses were posted

Edited: 28 Sept 2011, 4:15 p.m.

Re: Ok, from the HHC email list, what is the proper answer to 8 ENTER 2 divide 2 divide on 10 digit calc

*Message #3 Posted by **Werner** on 28 Sept 2011, 4:36 p.m.,*
in response to message #1 by gene wright

On a 10-digit calc without guard digits,

(1) 2.666666667 divided by 2 should yield 1.333333334
(2) as should 2.666666669 divided by 2 ...
round to even, and no 'cosmetic rounding', please.
of course, the 41C does not do (2). But the 42S does (with 12 digits)

Cheers, Werner

Re: [edited] from the HHC email list, what is the proper answer to 8 ENTER 2 divide 2 divide on 10 digit calc

*Message #4 Posted by **Steve Simpkin** on 28 Sept 2011, 4:50 p.m.,*
in response to message #1 by gene wright

Gene,
As you stated in the HHC Digest emails, 1.333333334 is the correct answer "given the architecture being used". Other calculators have used guard digits to reduce this limitation but HP chose not to, at least in their typical classic BCD designs. The WP34S displays a 12 digit answer of 1.33333333333. Pressing "SHOW" displays the full 16 digit internal answer of 1333333333333334.

Re: [edited] from the HHC email list, what is the proper answer to 8 ENTER 2 divide 2 divide on 10 digit calc

*Message #5 Posted by **Dieter** on 28 Sept 2011, 5:05 p.m.,*
in response to message #4 by Steve Simpkin

The result returned by the 34s depends from which of the seven rounding modes you chose. ;-)

Its default setting (RM 0) is "round 0.5 to even", so 1/3 divided by 2 will return 0,16...666, like most newer HP calculators.
Set it to "round 0.5 up" (RM 1) and it will return 0,16...667 like most classic HPs.

Dieter

Re: [edited] from the HHC email list, what is the proper answer to 8 ENTER 2 divide 2 divide on 10 digit calc

in response to message #5 by Dieter

Wow! I did not know about those options. I never cease to be amazed by what the WP34S can do.

Re: Ok, from the HHC email list, what is the proper answer to 8 ENTER 2 divide 2 divide on 10 digit calc

*Message #7 Posted by **Dieter** on 28 Sept 2011, 4:55 p.m.,*
in response to message #1 by gene wright

Let's assume you first want to divide 8 by 3, not 2. ;-)

First of all, the calculator does not return 8/3 - instead it displays the rounded first ten digits of this result. This is what you said in your last sentence - the result is not 8/3 but 2,6666 66667 - the last digit is correctly rounded up.

So the next step does *not* divide 8/3 by 2. It divides 2,6666 66667 by two. The correct answer here is

1,3333 33333 5. Whether this result is rounded up or down depends on the rounding method implemented in the calculator. If it rounds to the closest digit, the usual approach is to round a 5 up to the next digit, i.e. ...334.

However, there are also strategies like "round to even" or "round to odd" for cases like this where the digits following the displayed result are exactly ...500. In this case the calculator rounds to the next even resp. next odd digit, resulting in ...334 resp. ...333. The idea behind this is to avoid error accumulation.

Anyway, I prefer the "classic" rounding strategy: 0 to 4 are rounded down, 5 to 9 are rounded up. At least that's what I would expect. I admit I was a bit puzzled when I found out that my (then) brand new 35s seemed to round to even: divide 1/3 by 2 and you'll see it round down to 0,16666 66666 66 instead of ...67.

Dieter

*Message #8 Posted by **C.Ret** on 29 Sept 2011, 5:59 p.m.,*
in response to message #7 by Dieter

Hello,

I don't know any things about internal mecanics of the calculators.

What really surprise me is that I get on my old 10-digits HP-41C different numeric approximations for the same computation.

The quantity 8/3/2 or (8/3)/2 or (8/2)/3 or 8/6 are all exactly 4/3. What is really surprising is that the way we drive the computation on your calculator give different numeric résults. I don't know any think about calculators internal macanis. I only understand that cascading numeric approximation (due to a limited number of digits used) lead to the different round-off results.

```
8[ENTER^] 3 [ / ] 2 [ / ]           returns    1.333333334
2[ENTER^] 3 [ x ][1/x] 8 [ x ]      returns    1.333333334
8[ENTER^] 3 [1/x][ x ] 2 [ / ]      returns    1.333333333
8[ENTER^] 3 [1/x][ x ] 2 [1/x][ x ] returns    1.333333333
8[ENTER^] 2 [ / ] 3 [ / ]           returns    1.333333333
8[ENTER^] 3 [ENTER^] 2 [ x ][ / ]   returns    1.333333333
3[ENTER^] 8 [ / ] 2 [ x ][1/x]      returns    1.333333333
Etc.
```

So the correct answer for a 10-digits calculator is 1.333...; It is the same for 12- 14- 24- 500-digits calculators.

Edited: 30 Sept 2011, 4:40 p.m. after one or more responses were posted

Re: Ok, from the HHC email list, what is the proper answer to 8 ENTER 2 divide 2 divide on 10 digit calc

*Message #9 Posted by **Dieter** on 29 Sept 2011, 6:45 p.m.,*
in response to message #8 by C.Ret

The results you get are completely correct and that's also what I would have expected here:

```
8 [ENTER^] 3 [ / ] 2 [ / ]          returns    1.333333334
```

Sure. The first result is 2,6666666667, and 1/2 of that is 1,3333 33333 5 which is correctly rounded to ...334.

```
2 [ENTER^] 3 [ x ][1/8] 8 [ x ]      returns    1.333333334
```

I assume that's [1/x]. ;-)
Again, the result after this operation is 0,16666 66667 (correct) and 8x that is 1,3333 33333 6 which again is rounded correctly to ...334.

```
8 [ENTER^] 3 [1/x][ x ] 2 [ / ]      returns    1.333333333
```

Here you are multiplying 8 with 0,33333 33333 giving 2,6666 66666 4. Which then is correctly rounded to ..666, resp. ...333 after the final division by 2.

There is always the same basic idea: 8 [ENTER] 3 [÷] does not return 8/3. It returns *the first ten rounded digits* of this value. Every result of a single operation is correct (in its first ten significant digits), but in a series of numeric operations the rounding error will accumulate.

You may also try this:

```
2 [sqrt] 2 [÷]    => 0,7071067810
2 [sqrt] [1/x]    => 0,7071067814
0,5 [sqrt]        => 0,7071067812
[DEG]
45 [sin]          => 0,7071067812
45 [cos]          => 0,7071067812
[RAD]
[Pi] 4 [÷] [sin]  => 0,7071067813
[Pi] 4 [÷] [cos]  => 0,7071067811
```

Only the three results ending in ...812 show the expected value of sqrt(2)/2. In these three cases the *exact* argument is given. It is *exactly* 0,5 resp. *exactly* 45 degrees.

In all other cases, however, the argument was only an *approximation* - Pi/4 is *not* exactly 0,7853981635 and sqrt(2) is *not* exactly 1,414213562. That's where the different (yet correct) results come from. And that's why there are guard digits - but not for us users who only see the rounded 10-digit result. ;-)

Dieter

> (...)
> ...only the final two computations differing from the others by one count in the 16th place. I am impressed

I am afraid I have to pour some water into the wine. ;-)

While I really appreciate the accuracy of the results returned by the WP34s, the reason for its good results here (and the differences in the 10-digit results) mainly is the input value itself: Both sqrt(2), Pi and by the way also e happen to round very well to 16 digits, while on the other hand the error is quite large in 10 digit precision. Simply take a look at the correct values (blanks inserted after 10th, 12th and 16th significant digit):

```
sqrt(2) =  1,414213562 37 3095 048...
   Pi   =  3,141592653 58 9793 238...
   e    =  2,718281828 45 9045 235...
```

You see, rounding to 10 digits always causes an error of roughly 0,4 ULP, that's almost the worst case possible. On the other hand the rounded 16 digit value is only half that (roughly 0,2 ULP) or even merely 0,05 ULP for sqrt(2). Rounding to 12 digits also gives good results,

especially for Pi and e (less than 0,1 ULP).

It even gets better: Set the 34s rounding mode to RM 1 (i.e. round 0.5 up, like most classic HPs), and this happens:

```
  [Pi] 4 [÷] =  1/4 of 3,1415926535897932
             =  0,78539 81633 97448 25  exactly
             =  0,78539 81633 97448 2   in RM 0 (newer HPs)
             =  0,78539 81633 97448 3   in RM 1 (classic HPs)
```

which agrees to the exact value...

```
      Pi/4   =  0,78539 81633 97448 309...
```

...with an error of less than 0,1 ULP, i.e. less than 1 unit in the 17th (!) digit.

In other words, setting RM 1 (like the classic HPs) will even remove that last "inconsistency" in the (radians) trig functions:

```
  [rad]
  [Pi] 4 [÷] [sin]  =>  0,70710 67811 86547 5
  [Pi] 4 [÷] [cos]  =>  0,70710 67811 86547 5
```

By the way - as shown above, Pi/4 rounds very well to 10 digits (error less than 0,03 ULP). So you can do this in a classic 10-digit machine:

```
  [rad]
  45 [D->R] [sin]   =>  0,70710 67812
  45 [D->R] [cos]   =>  0,70710 67812
```

q.e.d. ;-)

Dieter

15c LE - PSE works and doesn't! Please explain!

*Message #1 Posted by **Alexander Oestert** on 28 Sept 2011, 2:48 p.m.*

Entering the PSE in a DSE loop yields the bug. The program from page 89 of the new handbook works just fine. Can someone explain?

Re: 15c LE - PSE works and doesn't! Please explain!

*Message #2 Posted by **Michael de Estrada** on 28 Sept 2011, 2:57 p.m.,*
in response to message #1 by Alexander Oestert

That is probably because you don't execute another instruction between the consecutive pauses. If you try the example on pages 114-115, the display will only show the first result in the loop before ending the program. The bug will occur even if you don't use a DSE or ISG loop, for example 1 PSE 2 PSE 3 R/S will only display 1 and 3.

Edited: 28 Sept 2011, 3:04 p.m.

Re: 15c LE - PSE works and doesn't! Please explain!

*Message #3 Posted by **Alexander Oestert** on 28 Sept 2011, 3:05 p.m.,*
in response to message #2 by Michael de Estrada

Unfortunately entering a second PSE in the page 114 progtam doesn't make it work. So there must be more to it than just two consecutive PSEs. I have already tested some different cases that don't work. But why DOES it work in the cited case?

Edited: 28 Sept 2011, 3:08 p.m.

Re: 15c LE - PSE works and doesn't! Please explain!

*Message #4 Posted by **Michael de Estrada** on 28 Sept 2011, 3:20 p.m.,*
in response to message #3 by Alexander Oestert

Because, like I said, you are not executing the pause more that once, you are just extending it. Try 1 PSE PSE 2 PSE 3 R/S. You will still get the first pause and see 1 followed by 3.

Re: 15c LE - PSE works and doesn't! Please explain!

*Message #5 Posted by **Mike Morrow** on 28 Sept 2011, 3:33 p.m.,*
in response to message #4 by Michael de Estrada

The bug problem is *always* present and *apparent* when two or more PSE commands are executed. It does not matter if the PSE commands are consecutive or separated by thousands of other executed instructions (i.e., a loop).

With 1 PSE PSE 2 PSE 3 R/S, the 15C-LE yields:

1 in display for one second (first PSE) (Everything is OK so far),
blank display for one second (second PSE) (BUG: 1 should still be in display),
blank display for one second (third PSE) (BUG: 2 should now be in display),
3 in display after program terminates.

Two consecutive PSE commands are two distinct executions of the PSE command. The second does not extend the first. The bug becomes apparent immediately with the execution of the second and subsequent PSE commands, until the program terminates.

Edited: 28 Sept 2011, 3:40 p.m.

Re: 15c LE - PSE works and doesn't! Please explain!

*Message #6 Posted by **Mike Morrow** on 28 Sept 2011, 3:16 p.m.,*
in response to message #1 by Alexander Oestert

The program on page 89 is very definitely **not** working as it should, i.e., as it would on an original HP-15C.

After entering 45 in Y and 50 in X, then executing f A, the value 38.2683 should be displayed for the length of **two** pauses (about two seconds), after which the program terminates shortly showing 39.2699.

Instead, the PSE bug in the 15C-LE causes the following: After executing f A, the value 38.2683 is displayed for the length of the **first** pause (about one second), then the display blanks for the length of the **second** pause (about one second), after which the program terminates showing 39.2699. Bad!

This PSE bug that I reported here on September 10 only becomes apparent after *more than one* PSE is encountered in the program runstream, as it is in this program. The first PSE works OK, but subsequent PSE commands disrupt the LCD. It is immaterial whether the PSE commands are in any sort of loop, DSE or otherwise.

Re: 15c LE - PSE works and doesn't! Please explain!

*Message #7 Posted by **Alexander Oestert** on 28 Sept 2011, 3:23 p.m.,*
in response to message #6 by Mike Morrow

Ah, I didn't realize the 2-PSE-requirement for the bug to appear. Thanks for clarifying.

Problem with too-pristine calcs...

*Message #1 Posted by **Cristian Arezzini** on 28 Sept 2011, 12:27 p.m.*

I just realised a few days ago that, though I love most HP calcs, and though in my small bag I always carry a wp34s... the calculator I still love most is the 48G/GX. And I have several, of many variants - G, GX, G expanded, and so on. But the problem is they're all in pristine, near-mint conditions... and I don't really want to take them with me at work every day. And most 48's you find on TAS these days, are all near-mint and quite expensive. So my question is: where do you think I could source a perfectly working but "well-used" 48 in Europe - something I wouldn't feel bad "banging around" - and how much could it be worth?

Cristian

Re: Problem with too-pristine calcs...

*Message #2 Posted by **Martin Pinckney** on 28 Sept 2011, 2:01 p.m.,*
in response to message #1 by Cristian Arezzini

I think you are confused. Calculators were meant to be used. They were all pristine when they started life, right? If it bothers you, keep using them and sooner or later they won't be pristine anymore.

Re: Problem with too-pristine calcs...

*Message #3 Posted by **megarat** on 29 Sept 2011, 2:19 p.m.,*
in response to message #2 by Martin Pinckney

I relate to both sides of this fence: yes, calculators are tools, and tools are meant to be used. But now these vintage critters have become collectors' items, so when you have one in lovely cosmetic condition, that introduces the fear that by worsening its cosmetic condition, you somehow make it "less useful".

I had a beautiful, cherry, absolutely fresh-out-of-the-box 16c that I wanted to use regularly, but because it was so pristine I couldn't build up the nerve. I figured that a collector would value its pristineness more than I, so I found a buyer via TAS, then picked up a visibly used 16c via TAS for half the price. Win win!

My advice, w/r/t the 48 series ... heaps of engineering undergrads bought these calculators for a handful of classes and never used them again. Which is why the used market sees such a large number of these units in good condition. Since it sounds like you have multiple pristine units, designate the one in the least-best condition to be used as your daily carry, and keep the others pampered. If it gets any blemishes, you'll get over it soon enough.

Re: Problem with too-pristine calcs...

*Message #4 Posted by **Håkan Thörngren** on 28 Sept 2011, 2:29 p.m.,*
in response to message #1 by Cristian Arezzini

Do not worry, use them, that is what they are for.

My HP48GX is not perfect, I even ran it over with my scooter (130kg in total), it was an accident. It took sort of care of that problem, it squeaks a bit more when I push on it and it looks slightly more used, otherwise it is fine and that was >10 years ago..

I have an unused spare since I feared there would be no more decent calculator with proper ENTER key from HP. With that and a couple of HP-41s and Voyagers I think I will do fine for the rest of my life.

Re: Problem with too-pristine calcs...

*Message #5 Posted by **Cristian Arezzini** on 28 Sept 2011, 2:43 p.m.,*
in response to message #4 by Håkan Thörngren

I know they're meant to be used. I used my original 48GX very much, and it showed, and I was OK with that - then it was stolen. Now I've bought several more, and they're all so beautiful and new that I feel bad scratching and banging them... after all, there will be always less and less of them... you know, it would feel like scratching and denting a vintage-but-mint car... :D

Cristian

I'd suggest using a currently-made machine that is less expensive, far far more capable, has an easy firmware upgrade process, and has a display that is greatly superior. Of course, that can only be the HP 50G.

I was very happy to relegate my two NOS HP 48GX units with their nasty oddball battery-backed limited-capacity memory expansion cards to basement storage after obtaining the HP 50G five years ago. It's not perfect, but it's the best that's available right now. And rather inexpensive.

Re: Problem with too-pristine calcs...

*Message #8 Posted by **Cristian Arezzini** on 28 Sept 2011, 4:54 p.m.,*
in response to message #7 by Mike Morrow

I know, the 50g is what's in my work bag now. And I use it a lot, and I like it. But there's something with the 48's keyboard and its sturdy feel and beautiful looks, that the 50g just doesn't have... :) I wouldn't choose anything but the 50g for programming, but for simple tasks, I like the 48...

Cristian

*Message #9 Posted by **Jean-Michel** on 28 Sept 2011, 5:42 p.m.,*
in response to message #8 by Cristian Arezzini

Hello Cristian

There are quite often nice 48 G/GX for about 15 to 20€ on LeBonCoin.fr. Give it a try. Shipping to Italy may not be that expensive.

Kind regards.

JM

Re: Problem with too-pristine calcs...

*Message #10 Posted by **Dave Britten** on 28 Sept 2011, 9:12 p.m.,*
in response to message #8 by Cristian Arezzini

I keep a 48SX (with 32kb RAM card) on my desk precisely for the reason that the keyboard layout and build quality are so much better than the 50g. I even put up with the much slower program editing because of this. If I need a bit more speed for something large, I pull out the 48GX.

And the 15c LE is qute the speed demon, with a nice keyboard too. :)

Re: Problem with too-pristine calcs...

*Message #11 Posted by **Les Wright** on 28 Sept 2011, 10:17 p.m.,*
in response to message #1 by Cristian Arezzini

I am an impatient bidder at TAS (or at least I used to be) and ended up with a too expensive but near mint 15C a few years back. Indeed, the only blemish is that the protective coating over the LCD plastic seems to be thinning just a touch. I have been afraid to worsen it by usage, and as such this grand-daddy of HPs has seen little use.

I got my 15C LE at a fraction of the cost of that original, and even though I am a little dainty with it I am actually using the machine and chagrined that I let the original sit on my shelf for such a long time without getting played with.

So now I am on the "calculators should be used" team. I don't collect as much any more, but I went through an acquisitive phase a few years back and I don't use most of the pieces now.

WP-34S Battery Questions

*Message #1 Posted by **svisvanatha** on 27 Sept 2011, 11:15 p.m.*

Hello,

I have a few questions on the batteries for the WP-34S.

1. At what BATT value (X.FCN->BATT) should the batteries be replaced at? I seem to be getting random resets of the calculator when BATT < 2.7.

2. Can the LIR2032 rechargaeble coin cells be used in place of the CR2032? The voltage per cell is 3.6V versus the 3V of the CR2032. Is there some limiter within the hardware which prevents damage from occuring with higher than spec voltage?

As an aside, I used the Serial I/O for the first time today, and was impressed by its functionality!

Edited: 28 Sept 2011, 6:39 a.m. after one or more responses were posted

Re: WP-34S Battery Questions

*Message #2 Posted by **Marcus von Cube, Germany** on 28 Sept 2011, 1:51 a.m.,*
in response to message #1 by svisvanatha

The 3.6V might be too much as the power goes directly to the processor.

The crashes worry me. Try the SLOW command which reduces the speed. I might need to adopt a different approach at the low battery detection thresholds.

Re: WP-34S Battery Questions

*Message #3 Posted by **svisvanatha** on 28 Sept 2011, 6:41 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Yes, the SLOW command seems to prevent the resets from occurring. There does appear to be something going on at the lower battery levels. Let me know if I can assist in any way.

Re: WP-34S Battery Questions

*Message #4 Posted by **Paul Dale** on 28 Sept 2011, 7:32 a.m.,*
in response to message #3 by svisvanatha

My guess would be that we've not yet done enough calibration of the clock rates to the lower battery voltages. At some point we switch the 34S to slow mode. This point would seem to be too aggressive still.

The power management is Marcus's baby so I'm loathe to change much here.

- Pauli

Re: WP-34S Battery Questions

*Message #5 Posted by **E.Lub_EU** on 28 Sept 2011, 10:15 a.m.,*
in response to message #3 by svisvanatha

Hello again,

May I ask which activity caused the reset? (running a program, saving to flash, etc.)

And also: - what is the brand of your batteries?
- have you experienced the problem with other batteries?

Because the HP platform current draw at full speed is so much out of the specified region of these batteries, I suspect that there might be significant variations between brands.

Regards,
Etienne

Re: WP-34S Battery Questions

*Message #6 Posted by **svisvanatha** on 28 Sept 2011, 11:06 a.m.,*
in response to message #5 by E.Lub_EU

I was executing math operations with the top row. The batteries are Sony's, but I have seen it with Duracell as well at similar voltage levels. New batteries report BATT=3.0 or so, and no issues.

Re: WP-34S Battery Questions

*Message #7 Posted by **Bart (UK)** on 28 Sept 2011, 8:45 a.m.,*
in response to message #2 by Marcus von Cube, Germany

AT91SAM7L128 supply voltages spec:
Normal operating range: 1.8V to 3.6V
Maximum operating: 4.0V

The ususal note from the data sheet:
Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

I do not know what other components there are and their operating limits (LCD voltage should be regulated by the AT91SAM7L128).

-Bart

Re: WP-34S Battery Questions

*Message #8 Posted by **E.Lub_EU** on 28 Sept 2011, 4:53 a.m.,*
in response to message #1 by svisvanatha

Hello,

In response to your battery question:

Looking for a datasheet, I found a source Here .

The only conclusion is that I would strongly advise aginst it!

These are standard Lithium-Ion chemistry, which means that they are charged at 4.2V. So a fresh battery will expose your calculator to a little less than 4.2V, and will only decrease to a safer level of around 3.6V after having used 80% of its capacity (see figs. 7.1 & 7.2). I believe there is a strong risk of damaging your calculator, even after only a single try.

Moreover, to protect the LIR batteries against overdischarge, you would have to monitor "manually" their voltage quite regularly and take them out of the calc as soon as they reach 3V. Note that this is nearly the fresh voltage of a CR2032, so the software will not warn you at that point. Overdischarging these cells will ruin them very fast, and might even be a real hazard.

You can also see that their capacity is quite modest (approx. 1/6 of the CR2032).
OTOH, they woud not suffer from the 20mA load from the calculator.

I would like to see what would be achievable with an LiFePO technology. That should be voltage-compatible, but might offer an even slightly lower capacity.

Regards, Etienne [edit] clarifications

*Message #10 Posted by **E.Lub_EU** on 28 Sept 2011, 7:26 a.m.,*
in response to message #9 by svisvanatha

You're welcome.

You have been misleaded by the claim "rechargeable alternative to CRnnnn".
While looking for the technical data, I've encountered a lot of sites claiming the same, in several languages.
To me, that's almost a lie, as many devices could be damaged.

Happy calculating with your WP34S!

Who Needs TAS When We Have Samson Cables?

*Message #1 Posted by **Les Wright** on 27 Sept 2011, 10:23 p.m.*

My 15C LE finally arrived and so far I am so impressed I want another to squirrel away as a collectible.

So I go back to the trusty Samson site, and not only is item back-ordered, BUT the seller has the cheekiness to pump the price up 20% over MSRP!

Ain't capitalism grand?

Maybe this demand will keep the unit in production as an HP standard?

Les

Re: Who Needs TAS When We Have Samson Cables?

*Message #2 Posted by **Michael de Estrada** on 27 Sept 2011, 11:14 p.m.,*
in response to message #1 by Les Wright

The reason they are OOS at their home website is that they are selling all their existing stock on TAS for 50% over MSRP.

Re: Who Needs TAS When We Have Samson Cables?

*Message #3 Posted by **Bruce Bergman** on 27 Sept 2011, 11:50 p.m.,*
in response to message #1 by Les Wright

Yeah, I have to say, I've lost a LOT of my respect for them. They used to be pretty much the last best calculator sales place (dedicated calculator sales), but lately they've taken to reaming the community for as much as they can get. Their prices vary day to day on the 15cLE, based on stock and demand. And over even the HP SMB price. Then, they resell for Buy.com (who is OOS also) at an even higher price.

Not cool, Samson. I doubt I will buy from you ever again.

:-(

Re: Who Needs TAS When We Have Samson Cables?

*Message #4 Posted by **Cristian Arezzini** on 28 Sept 2011, 4:53 a.m.,*
in response to message #3 by Bruce Bergman

Hmmm... I agree that it's frustrating (I wish I could buy them before the price increased), but isn't this just the essence of capitalism? As in, if people are willing to pay an higher price, why should they sell for less? :(

Re: Who Needs TAS When We Have Samson Cables?

*Message #5 Posted by **Michael de Estrada** on 28 Sept 2011, 8:45 a.m.,*
in response to message #4 by Cristian Arezzini

No, this isn't capitalism, which requires competition to set prices. SC has cornered the international market as the only "dealer" that can/will ship outside the USA. They are the only dealer that has charged over MSRP. Even Buy.com sold all their initial stock below MSRP, both through their website and on TAS. HP SMB initially charged above current MSRP, but agreed to credit customers who overpaid. IOW, everyone except SC has shown good business ethics. But, there's and old expression, "what goes around comes around," so short term profits may be offset by long term ill will.

Re: Who Needs TAS When We Have Samson Cables?

in response to message #5 by Michael de Estrada

> Quote:
>
> But, there's and old expression, "what goes around comes around," so short term profits may be offset by long term ill will.

You are absolutely correct. Being a retailer myself (high end home audio) I am very sensitive to this. The HP handheld enthusiast community is small, so it doesn't take much to fall out of favor. The Golden Rule is a good guideline to follow.

Re: Who Needs TAS When We Have Samson Cables?

*Message #9 Posted by **Steve Fennell** on 28 Sept 2011, 8:03 p.m.,*

in response to message #5 by Michael de Estrada

Samson Cables took preorders for the 15C LE and charged $95 which is below MSRP. I do not know their reasons for charging higher prices except that is what the market would bear, or they assumed there were no additional shipments of the calculator.

buy.com also raised their prices from $79 to $85 shortly after it became available. Not a big increase, but still taking advantage of higher demand for a product in short supply.

Re: Who Needs TAS When We Have Samson Cables?

*Message #10 Posted by **Michael de Estrada** on 28 Sept 2011, 8:17 p.m.,*
in response to message #9 by Steve Fennell

Buy.com never went above $90 and shipped for free. They sold out their entire stock on both their website and on TAS at that price. I also bought from CostCentral in a pre-order for $80.52, back when the projected MSRP was $129. Meanwhile, SC has been as high as $200 + shipping. Frankly, if SC wants to price gouge, then so be it, but it seems like a very short-sighted business model. The 15C LE is already starting to flood TAS and prices are coming down significantly, so people now have other choices. It looks like so far only a small number of these have actually reached the market (highest LE# is less than 3000), and once HP gets them in stock with more consistency all this nonsense will be over.

Re: Who Needs TAS When We Have Samson Cables?

*Message #11 Posted by **Steve Fennell** on 28 Sept 2011, 8:55 p.m.,*
in response to message #10 by Michael de Estrada

Is this confirmed that HP is shipping more? I thought I read an earlier post that the question was posed at the HHC meeting and HP marketing would not confirm how many they planned to produce.

Re: Who Needs TAS When We Have Samson Cables?

*Message #12 Posted by **Michael de Estrada** on 28 Sept 2011, 9:02 p.m.,*
in response to message #11 by Steve Fennell

I'm just saying that it appears that so far no more than 3000 have shipped to distribution centers in the USA, and one can infer that at least 10000 units were planned based on past informal statements. The ones here now probably arrived in small shipments by air freight, and there may some yet to arrive by sea. I'm just doing some reasoning here, because I'm certainly on the outside. Anyway, I think it will clearer over the next couple of months.

Re: Who Needs TAS When We Have Samson Cables?

*Message #13 Posted by **Lincoln R.** on 28 Sept 2011, 10:01 p.m.,*
in response to message #12 by Michael de Estrada

HP said that some were destined for Europe. I imagine they may have put a hold on manufacturing while they're trying to deal with the keyboard/firmware issues.

"Smooth Scaled Deciduous Trees of the Southern Nordic Countries"

*Message #1 Posted by **Geoff Quickfall** on 27 Sept 2011, 7:53 p.m.*

Hello all and a special thanks to the attendees that sat through my 10 pm presentation.

The first day (Thursday) involved driving with Wlodek from Los Angeles to Guy Ball's house to see his collection and discuss book publishing. Wlodek also had to pick up copies of his book which has been revised to include the 12 Anniversary and 15C LE which were available to the attendees.

Guy is one interesting guy! Unfortunately we were three weeks to late to see the collection as it was sold in its entirety!

Then on to San Diego arriving at midnight thirty!

Friday stuffing proceedings envelopes with Günter Schink. Günter introduced me to "Weizen" beer during our stuffing break. Later in the evening there was more beer call as others arrived.

Hello Namir, Gene, Richard, Wlodek, Joe and his brother Jim and, well check out the list at:

attendees list

As for Saturday, excluding NDA topics, the WP34S with both Niel and Marcus stole the show. Then Erics demo and discussion on the overlay. Now for me, the more complex and CLUTTERED the keyboard the more I like it. The WP34S is a work of art and for me, the clutter discourages any one from borrowing it in the cockpit.

Andreas Möller talk HP 49G+ / 50G - O.S. Extension Pack is simply amazing. What Andreas has single handedly created with help menus and language modules on the 49G... is incredible.

For everyone out there, Joe Horns presentations are as informative as they are entertaining. No wonder he won the best speaker award, and no, it was not because he tallied the votes ;-)

Patrice again wowed us with his prowess in programming with his talk on "HP-15C Benchmark: The Devil is in the Details".

Eric Smiths DIY was simply amazing. I got to hold it and was allowed to turn it on. Of course being a 41C I felt right at home but was totally blown away by the LCD display. It looked so sharp you would have thought it was printed on a clear vinyl overlay and applied to the LCD panel!

Richard entertained us with his time keeping abilities and the discussion on the PPC ROM which turns out to relevant after 30 years. Appearing in the CL ROM library and the matrix routines form the base of the WP34S matrix solutions.

Jake Schwartz filled us in on the matrix/PPC ROM aspect of the WP34S mentioned above!

Yes DAVE, you are one lucky guy, and I don't mean your TI! HOWEVER the TI is fantastic, what a display to cart around from Reno! Yes bring the others, I may bring the 9825A with the chicklet keys if I can. By the way, I am looking into those glasses, who cares if you look like a muggle (Potter).

Wlodek and Dennis harms discussed the 12C and Wlodek brought and displayed his multiple variations of the 12C since its inception.

As far as the HP crew goes, Cyrille and Tim, many many thanks and I did not think I would learn so much MORE about trees, especially since my background is Botany/Forestry! Who knew.

There were more talkers but I have to refer to my notes which are still packed. Download some photos and etc.

Here is a youtube video I just uploaded. It was part of my talk and is relevant to a thread below about benchmarks and speeds vis a vis the 41CL.

Short explanation of what you are seeing:

There is a requirement to convert metric altitudes in various countries to foot altitudes for use in the cockpit. The standard slope has been arbitrarily altered to maintain aircraft separation at altitude. The two slopes can be regressed with a test as to which slope the metric altitude input belongs. Also a subroutine to round correctly so that three significant digits are used.

ex.

13,100 meters should convert to 43,000 feet. You can see simply multiplying by the conversion "1 meter = 3.2808399 feet" does not give the correct result. An alternative approach as a thinking exercise is to create a data base where the metric is paired with the feet measure. Search for the metric and display the associated feet.

Yes I know it is cumbersome but this is just for demo purposes and it works perfectly in the CL due to its speed.

CL to CX speed comparison on data base search in extended memory.

More posting to follow!

Cheers, Geoff

Now this is extremely exciting! I think I'm very much out of the loop, maybe Eric has posted about this already, but I don't remember seeing it. Has he tooled up a 41C-style case for his DIY calculator? Does it look like a 41C?

Do tell more!

Re: "Smooth Scaled Deciduous Trees of the Southern Nordic Countries"

*Message #3 Posted by **Eric Smith** on 27 Sept 2011, 10:07 p.m.,*

in response to message #2 by Seth Morabito

It's effectively a 41Cx with a display that can (optionally) show all four stack levels, in a nice high-resolution font. That makes it longer than a normal 41CX, though slightly shorter than a 41CX with a card reader.

I haven't had time to write up anything or take photos or video. I'll post something once I find the time.

Re: "Smooth Scaled Deciduous Trees of the Southern Nordic Countries"

*Message #4 Posted by **Ángel Martin** on 28 Sept 2011, 2:19 a.m.,*
in response to message #3 by Eric Smith

Very much looking forward to that! Do you have plans to produce it (however scale) or will it remain a DIY project for your own enjoyment?

DIY5 production plans

*Message #5 Posted by **Eric Smith** on 28 Sept 2011, 2:57 a.m.,*
in response to message #4 by Ángel Martin

We're trying to come up with a way that we can manufacture and sell the DIY5 without losing our shirts. The problem is that they will likely be fairly expensive, because we expect that we can only amortize the NRE over a relatively small number of units. How many people today would want to buy an improved -41 if it cost more than a new 50g? Not many, I would think.

On the other hand, Monte is apparently able to sell some 41CL boards for $235, and that is an upgrade rather than a complete calculator. And the 15C LE sells for almost as much as a 50g.

On the gripping hand, we can leverage the same design as a hardware platform for a derivative of Free42, or other community-developed firmware (similar to WP-34S project), so it isn't necessarily just an improved -41.

Re: DIY5 production plans

I of course don't know the answer to that question, but sure enough the 50g price isn't that high to me for such a wonderful project. How much more is too much is the tricky part, and even that is relative.

But sure you didn't mean that price would be for a complete DIY5 calculator, but only the enhanced display? Not having seen the unit at HHC I'm clueless about your implementation, sorry.

On reflection I guess this won't be an upgrade - which would be hard if not impossible. I read your other post where you indicate 41CX+HEPAX capability into the unit, will it also be "upgradable" so that you could install the CL board to it?

Re: DIY5 production plans

*Message #7 Posted by **Eric Smith** on 28 Sept 2011, 2:30 p.m.,*
in response to message #6 by Ángel Martin

I only meant that the selling price of a DIY5 calculator is going to be more than the price of an HP 50g. Most likely a *lot* more, possibly more than double, but I don't really know at this point.

I expect that there is only a tiny market for calculators that cost more than the most expensive HP, TI, and Casio models. If there was actually a non-trivial market for $250 calculators, HP, TI, and Casio would be selling some.

If we could sell 10,000 units, it might be possible to sell them at a retail price under $130 each.

If we only sold direct, and not through wholesalers/distributors/retailers, we could price it lower at the same production quantity (or the same price at a lower production quantity) since the price only would need to include a margin for us, and not for the middlemen. That would work fine to sell to people here in the forum, but would we get sales from anywhere else?

There's somewhere between $25K and $100K of NRE for industrial design, mold tooling, and FCC testing that has to be amortized over the production run. If the production run is small, that's a *lot* of cost per unit.

And of course that NRE doesn't include paying us *anything* for the ten years of (part-time) effort we've already invested into the development of the electronics and software. If we had to amortize that over a small production run also, the calculator would be far too expensive even for the hard-core enthusiasts here. Fortunately that is a sunk cost that we don't expect to recoup.

I'm looking into CNC machining aluminum molds myself. That has the potential to reduce the NRE substantially, but since I don't have experience doing that it will take a long time with many attempts, and could ultimately end up costing more than paying a mold designer.

I hope you respond to my email requesting more information. Since you have substantial time and money invested I will be more than happy to sign a NDA if necessary, but I can definitely help. For example: I know a bit about mold making and can get fabricate CNC aluminum for the cost of machine time ($35/hr.) The market for expensive calculators is out there, but build quality must be top notch.

I think some machined cases would be fun as an option. Not to mention, once the tooling is set for CNC the cost is materials plus machine time. Want an extra nice case? I don't think I'm the only one around here who would throw in an extra $50 for it.

Without experience in injection molding you should not try to create your own mold. The plastic needs not only to be injected into the form at very high pressure to reach all corners, straps and edges, it must also be cooled down in a controlled manner and later removed from the mold by mechanical means. Then you need to prepare for shrinking which depends on the temperatures and thickness of the material. The results wouldn't be very appealing.

Maybe a mold for vacuum forming is a better option but the available shapes are restricted compared to injection molding.

Pauli's idea sounds interesting, though. :-)

The "other hand" and "gripping hand" construct was frequently used by Jerry Pournelle in his "User's Column" in Byte Magazine, the column was renamed as "Computing at Chaos Manor" at some point in time, IIRC.

BTW, during the 90's I worked at a PC hardware supplier in Buenos Aires and was invited to write a short, technical feature in the local Novell Users monthly newsletter. I decided to use "Vendor's Row" as a title, intending a low-quality wordplay with "User's Column" and similar titles. Of course, some knowledge of matrices was needed for this pun to acquire the desired meaning.

While Pournelle used to mention Larry Niven's books and also their joint projects, the only one I read was "Inferno". Those were "pre-Amazon" and "pre-Internet for all" times (Pournelle made us envy with his frequent references to his ARPANet account and so); and that was the only one of their books I managed to find during one of my trips to the USA (BTW, HHC 2011 was my 32th visit to the USA).

I once mentined the "gripping hand" expression to my English instructor here. As knowledgeable as he indeed is, this particular expression was not familiar for him.

Hi Eric, I LOVE the large display, the only exception being the typeface used for the zero with the dot in the middle which brings back painful memories of slaving away punching cards for the IBM mainframe on campus. How about prepending X: Y: Z: and T: in front of the stack register displays, and can you display LastX as well?

With the large display, would it be possible to emulate the printer with the upper part of the display, perhaps based on flags 21 and 55 status? The 41 app for the iPhone might serve as a

model.

I would certainly consider buying your 41-like machine, if it's comfortable in the hand. It has to be somewhat affordable, too.

Take your time and get it right.

Re: DIY5 production plans

*Message #24 Posted by **Eric Smith** on 28 Sept 2011, 3:35 p.m.,*
in response to message #23 by Brian Walsh

The font I used is "DejaVu Sans Mono" font, which is based on the Bitstream Vera fonts. I used this only because it was close at hand, and I had few other monospaced fonts available. I wrote a program to render bitmaps of the characters, and added a few HP-41 characters by manually creating editing the bitmaps.

I wanted some obvious distinction between the letter O and the numeral 0. The dot in the middle is just what that font happened to have; I probably would have preferred a slashed zero, which is what the actual -41 used.

There is no reason why a different font couldn't be used, and the source font doesn't have to be a monospaced font as long as you bear in mind that it will wind up monospaced on the calculator display. I plan to make it possible for the user to install different fonts. The current requirement for the bitmap font is that the character cell is exactly 32 pixels wide, which has to include the character, punctuation (period, comma, or colon) and inter-character spacing. I could change the font display code to allow for character cells less than 32 pixels wide.

I'll probably provide a 14-segment font for users that want the actual -41 display appearance.

I could prepend the stack level identifiers. I'll probably use another flag to enable that. The identifier will be in a much smaller font.

I didn't expect anyone to want to also display lastx, but certainly I could do it. I'll add a flag 57 for that as well. Do you want that shown above T, or below X?

I think I might like to use a smaller font for the Y, Z, T, and L displays than is used for X. Maybe another selectable option.

Printer emulation is certainly possible, but at the moment it's a low priority.

Affordable is the biggest challenge. What's your upper bound on affordable?

Re: DIY5 production plans

*Message #25 Posted by **David Ramsey** on 28 Sept 2011, 4:06 p.m.,*
in response to message #24 by Eric Smith

I thought the digit spacing was a bit wide, too, but I assume that's easily adjustable.

What's my upper bound on affordable? Quite high, actually, but I'm not a good demographic. Probably about what I'll pay you to fix my 9830 tape drive if I can't.

Re: DIY5 production plans

*Message #26 Posted by **Eric Smith** on 28 Sept 2011, 8:18 p.m.,*
in response to message #25 by David Ramsey

The character spacing has to allow for the period/comma/colon to fit between the characters.

Re: DIY5 production plans

*Message #27 Posted by **gene wright** on 28 Sept 2011, 4:10 p.m.,*
in response to message #24 by Eric Smith

I would think L above T would be less intrusive and allow for changes to the display behavior without having the X value jump around. My 2 cents, although I would pay more. ;-)

Please stick with monospaced fonts. My quibble with the zero having a dot in the middle probably isn't worth worrying about. It just brings back the pain of re-typing punch cards ad infinitum for my freshman Fortran 66 class. Having survived that, it's been all downhill from there :-)

> Quote:

Hmm. Less than the cost of a 10" tablet?

DIY5 (41-equivalent) fonts

*Message #29 Posted by **Eric Smith** on 28 Sept 2011, 8:38 p.m.,*
in response to message #28 by Brian Walsh

The display will definitely be monospaced. My point was that the font used doesn't have to be designed to be monospaced, though it will always be rendered into a fixed-width cell. In other words, if you want to use Times Roman, you could do it, but the character size should be chosen such that the widest character (probably an upper-case W) would fit in the character cell.

A font designed for monospaced use will usually end up looking better, but there are relatively few monospaced fonts to choose from. I looked through the entire Adobe font library and didn't really find any monospaced font that I like.

If there are good font designers hanging around here, maybe they would care to try their hand a creating or modifying a font.

The calculator uses bitmap fonts in a custom format. I can convert them from BDF format. My preference is to use Opentype, Truetype, or Adobe Type 1 fonts, which I can render into the right size in BDF format. I've assigned code points for the special

41 characters from one of the "private use" regions of Unicode.

DIY5 price (upper bound)

*Message #30 Posted by **Eric Smith** on 28 Sept 2011, 8:53 p.m.,*
in response to message #28 by Brian Walsh

> Quote:
>
> Less than the cost of a 10" tablet?

According to Google, those start at $139 for an off-brand Chinese tablet. The iPad 2 has a 9.7 inch display, and pricing starts at $499.

Making a few assumptions:

- NRE of $50K
- CoGS of $70
- direct sales at $140 (same as cheap Chinese 10-inch tablet)

the minimum sales to break even would be 714 units.

At the opposite end of the spectrum, high price and low volume, the assumptions are:

- NRE of $50K
- CoGS of $100 (higher due to low volume)
- direct sales at $500 (same as iPad 2)

the minimum sales to break even would be 125 units.

Neither scenario includes making any profit or recouping any of the investment already made in development. I don't think I can actually sell 125 $500 calculators. The big question is whether there is somewhere between those scenarios that is viable.

Re: DIY5 price (upper bound)

*Message #31 Posted by **M. Joury** on 28 Sept 2011, 10:31 p.m.,*
in response to message #30 by Eric Smith

My 2 pennies is keep it south of $250. For me that is pretty close to the break point. At $250 or less I would buy two. Between that and $500 I would buy one. Any higher and I'm priced out of the market.

Again, just my 2 cents.

Cheers,

-Marwan

*Message #32 Posted by **Howard Owen** on 28 Sept 2011, 11:01 p.m.,*
in response to message #30 by Eric Smith

I'd think you should watch 15C LE sales as close as you can.

I'm dying to know how many of those sales are satisfying demand from people like us and how many are being bought by technical users who might not be enthusiasts to the degree common around here. Demand from the latter group ought to drop off sharply as the price goes up. Demand by the former group might be less elastic.

Re: DIY5 price (upper bound)

*Message #33 Posted by **Brian Walsh** on 28 Sept 2011, 11:45 p.m.,*
in response to message #30 by Eric Smith

I think at $500 you will have very few sales. At $140 or so you will sell a fair number, but would you sell over 700 of them? Some quick calculations indicate you would need to sell about 330 machines at $250 to break even, 250 machines at $300, or 500 machines at $200. The figures are at zero profit and no safety margin, which are unrealistic.

You have to be a little conservative and make a modest profit as well. I know you would be fair and don't think anyone expects you to work for free, especially considering the effort and expense you have already gone to.

Free42S - Android 3.2 Scaled to full screen

*Message #1 Posted by **Bill (Smithville, NJ)** on 27 Sept 2011, 1:06 p.m.*

My Android tablet just updated to 3.2 software last night. I just ran Free42S for the first time after the update and was pleasanty surprised to see that it auto scaled to the full screen and looks really nice.

I now have 5.5 by 8.5 inch oversized HP-42S. I like it - very easy to use the oversized keyboard.

Portrait mode looks good - landscape mode pixelates a little too much for my taste. I haven't tried all the skins, so some may look better than others when stretched.

Is HP tech support clueless ?

*Message #1 Posted by **Michael de Estrada** on 27 Sept 2011, 11:50 a.m.*

I read this customer review of the HP 15C LE on the HP Home & Home Office webstore, and really have to wonder about the competence of HP tech support:

"Manufactured without a SELF TEST

boy finally a HP-15c..... everything seems great until I run the self test described in the manual for the limited edition. After an incredibly long ordeal on the phone with countless "customer service" people, I finally got a tech support guy who seemed to know what he was talking about and he said he had knowledge of several of the Limited Editions 15c calculators that did not have any of the self tests."

BTW, this customer gave the calc a 1 out of 5 rating because of this bad info from the tech support person.

Edited: 27 Sept 2011, 11:50 a.m.

Re: Is HP tech support clueless ?

Re: Is HP tech support clueless ?

*Message #4 Posted by **Eric Rechlin** on 27 Sept 2011, 12:31 p.m.,*
in response to message #3 by Michael de Estrada

That's true, but I'm just pointing out that the customer overreacted.

From what I've heard, the HP calculator support people are actually a lot more competent than most support people. It wouldn't surprise me if the 50g is one of the most complicated products, if not the most complicated product, that HP sells, and while the 15C is certainly simpler, it's still vastly more complicated than most HP products. So they got a minor detail about the self tests wrong. That's just a training issue, compounded by a mistake in the manual and a hidden function that wasn't perfectly implemented, and none of it has anything to do with the normal operation of the calculator.

Eric

Re: Is HP tech support clueless ?

*Message #5 Posted by **Mike Morrow** on 27 Sept 2011, 2:07 p.m.,*
in response to message #4 by Eric Rechlin

> Quote:
>
> That's true, but I'm just pointing out that the customer overreacted.

Certainly true.

However, I wonder if any HP website to which a customer might refer for problems with the 15C-LE contains a listing of the bugs that were quickly found several weeks ago, like this 'old self-test' issue. The answer right now seems to be 'no', and the question becomes "why not...what is HP waiting on?" These problems will not magically go away with the passage of time.

> Quote:
>
> So they got a minor detail about the self tests wrong. That's just a training issue, compounded by a mistake in the manual and a hidden function that wasn't perfectly implemented, ...

I reported the self-test failures here on Friday, September 9. Apparently, that was the first report of such. The HP calculator support staff should have been advised of this by Monday, September 12 **at the very latest** in order to be able to respond intelligently to the customer questions that **were absolutely certain** to be arriving shortly when customers attempted the self-tests described in the manual on their new 15C-LEs. The fact that this notification did not occur displays an organizational attitude that is at best half-assed, and certainly non-professional.

> Quote:
>
> ...and none of it has anything to do with the normal operation of the calculator.

I'm going to disagree. I also reported on September 9 that 'ON plus *' or 'ON plus +' always fail **and corrupt program memory**. It is not improbable that someone familiar with the old Voyagers might pick up a 15C-LE and try one of these self-tests, and in the process disrupt subsequent normal operation of the calculator by corrupting program contents. *There should be nothing that the user can do from the keyboard, intentionally or inadvertently, that causes this type of un-publicized pathological behavior.* I suspect that HP calculator support hasn't been advised of this 'feature' either, nor of the other bugs that have been identified here.

Another issue is the old 'ON plus -' Pr Error reset. It apparently works OK, clearing the calculator completely. If the Owner's Handbook is simply revised to eliminate all mention of these old key

sequences that would still actually exist, one might clear his 15C-LE by inadvertent actuation of that key sequence.

It is not comforting that old self-test issues are being treated as of negligible importance. I would like to see the 15C-LE respond in a manner similar to the 12C+ for both the old and new self-tests. There's no valid reason for there to be a difference.

As long as these firmware problems exist, regardless of text modifications to the Owner's Handbook, normal calculator operation can be affected. I hope HP's solution (if there is to be one) to 15C-LE firmware issues will not be limited to revision of the documentation.

Methinks you're not quite as aware of how big HP really is to think that a problem reported here on 9/9 would be in the HP tech people's materials by 9/12.

I believe we are lucky that HP support people speak English.

As an example, even a company with such usual glowing reports as Ap*le computer will have people reporting problems in their forum that are not even officially recognized for quite some time.

While I would like for things to work the way you suggest, I'm not certain in a complex world with such large complex systems that it is likely.

Otherwise, the US Military would not buy $500 toilet seats.

> Quote:
>
> Methinks you're not quite as aware of how big HP really is...

Maybe not HP...I was once a senior engineer for a small firm called General Electric.

I think the 15C-LE is a pretty good product.

But obvious problems within its firmware and its Owner's Handbook guarantee customer support will be talking to customers. The manual says "try these self tests" and the calculator says "Error 9" (and corrupts any programming). It's a "what could we do to assure there will be calls to customer support?" situation. How can the support people do their job? Those unfortunate people can do nothing without organizational support advising them *promptly* of issues discovered by gamma testers (early paying customers) of this or any other new product. How hard can that be? I hear there's something called e-mail now-a-days. :-)

And what about the Support section of HP calculator sales websites? Three weeks

afterwards...still no illuminating information anywhere unless one goes to hpmuseum.org before forum posts of problem discoveries have scrolled away.

I have great sympathy for the support staff, and the inquiring customer. Both are completely betrayed when known problem areas are not promptly communicated.

Certainly this must be true. And I fail to see how either the bigness of the company, or the insignificance of the product (from a revenue standpoint), is an excuse for not having a mechanism for dealing with such issues, or failing to use it.

An old TI guy suggests that H-P with RPN has religious cult appeal that algebraic logic can't penetrate.

Yep.

Look at how short-lived the 27s was. That was a great design!

Imagine what a powerhouse it would have been if they had taken that design one step further and implemented a complete robust algebraic programming paradigm and complete advanced maths support (complex, matrices etc) in addition to the equations. IT would have blown everything away including the 42s, and it might have actually stolen TI buyers, maybe.

Looking back at the early HP computers that Dave describes on this website, one of them was Algebraic at the UI but stack-based internally, fully compiling from the algebraic inputs. Pretty sweet!

That sounds like the HP 9820A. Any algebraic logic machine, even a $1 calculator, must compile the entered values and operations into a internal stack representation as part of the execution process.

As far as the big machines go, the 1961 Burroughs B5000 was the ultimate stack machine, accessed using ALGOL-60. The old HP 3000 is also a stack machine.

in response to message #1 by Michael de Estrada

The manual error is minor compared to the support lapse. Unfortunately, that degree of tech support cluelessness is standard today. To be fair, in the 15C LE we have a product that

1. is brand new (to tech support).
2. contains a bug that doesn't prevent most users from using the machine.
3. is used by a tiny fraction of a tiny minority of a marginalized subgroup of customers. (OK, maybe not marginalized. :)

Despite all that, nobody can be happy about losing a customer like that. It's a classic case of people doing what they feel like doing, rather than doing what you think they should. A Google search for "15C LE self test bug" yields this as the second link. The first link (starred!) points to the live forum index, which will at least get somebody plugged in to a group that can answer the question.)

Re: Is HP tech support clueless ?

*Message #15 Posted by **Tom Mathes** on 27 Sept 2011, 1:33 p.m.,*
in response to message #14 by Howard Owen

There's still no product support page for the 15C LE outside of a short description on the small business product pages. That part surprises me. A lot of ill will can be avoided by the company having a support page up and running when the product hits the shelves (or soon thereafter).

*Message #16 Posted by **Gerry Schultz** on 27 Sept 2011, 3:37 p.m.,*
in response to message #15 by Tom Mathes

I'm sorry to say that my recent experiences with HP Tech support have not been great either. I bought an HP laptop a few months ago and ran into problems with Tech support. It's not that their hardware is bad, it's the ability of their staff to handle customer problems in a timely manner.

Now, when I bought four 15C LEs and two of them had keyboard problems, I was lucky enough to be able to show them to Tim at the HHC conference and he has them for evaluation. I know that HP will resolve these HP 15C LE hardware and software issues, but from my experience, it will take a while for them to get the kinks worked out. The real question is when the software problems are resolved, will there be any new problems? I'm sure our group here will bang on them and find out real fast!

I should also mention that during one of the HP Q&As at the conference it was mentioned that if you have a 15C LE with keyboard issues, please contact HP's tech support to get the problem resolved. All I can say is Good Luck!

but is it really true? are there units of the 15c LE that DOES NOT have a self test? or that merely, the self-test

described in the manual (ON-/) is just broken, and that a *real* self test exists (ON-g-ENTER)?

Re: Is HP tech support clueless ?

*Message #18 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 27 Sept 2011, 4:23 p.m.,*
in response to message #17 by troy

troy,

I don't think there is a real self test on HP 15c LE. Ideally a real self test, tests CPU, RAM and other internal circuit components. If you have to watch the LCD to determine if a pixel is missing is NOT a self test, it is just a test.

As far as I can tell, HP 15C does NOT have a SELF test for checking RAM, CPU and other internal circuits, it only comes with a keyboard and LCD test. Also if you read other posts, there is a memory corruption reported by other users during this test.

Turn the calc. off Press and hold 'g' and 'ENTER' While still holding down 'g' and 'ENTER' press the 'ON' key Release 'ON', followed by 'g' and 'ENTER'

The test screen will display ' 1.L 2.C 3.H '

Press 1 to perform the LCD test

Press 2 to display the Copyright/Checksum message (I don't think this checksum real either, (ChE-FFFFh)looks like a pre-recorded number and not a result of a self-test calculated checksum)

Press 3 to perform the keyboard test

Press ON to exit the test.

Actually, it does... before you get displayed with the 1, 2, 3 menu, the memory and important parts of the CPU are tested (timers, speed, 6KB of RAM, ROM checksum...)...

it just happen that you do not see it as it does not err...

Cyrille

Re: Is HP tech support clueless ?

*Message #20 Posted by **Michael de Estrada** on 28 Sept 2011, 9:15 a.m.,*
in response to message #19 by cyrille de brebisson

Thanks for the info. So, basically, the calc does a silent POST prior to displaying the "test" menu.

On a separate issue, what is the cause of the Pause command problem, and how easily can it be fixed?

Also, assuming there is a future firmware revision, could a stopwatch/timer feature be added?

Re: Is HP tech support clueless ?

*Message #21 Posted by **Katie Wasserman** on 28 Sept 2011, 12:31 p.m.,*
in response to message #20 by Michael de Estrada

Equal in importance to the pause issue, are the memory corrupting self tests and the 20ma continuous current drain when a key is pressed.

> Curious.. What do we see if it does err?

That's a question I asked too. The **new** Voyager self tests are described *only* at the HP website for HP 12C support. There's nothing for the HP 15C-LE specifically.

That website contains this statement: **If the calculator detects an error at any point, it will display an error message.**

I would like to see a revised HP 15C-LE manual that describes:
1. What is actually tested when the new self-tests are executed.
2. What error messages can be generated.

This may have little *real* value to the customer, but the oddball customer base for the anachronistic HP 15C-LE would doubtless appreciate such information.

Re: Is HP tech support clueless ?

*Message #24 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 28 Sept 2011, 4:56 p.m.,*
in response to message #19 by cyrille de brebisson

Hi Cyrille,

I am not convinced that 15C LE is performing a self-test right before entering that menu: My reasons are following: 1- HP 12C P25AE also provides the menu and does not begin the test until #2 is pressed which takes about 25 seconds. On HP 15C LE the answers seems to be instant, no "running" display, etc. 2- Following a self-test with "running" display, HP 12C P25AE reports a check sum what seems like a number which has been calculated during the self-test. HP 15C reports FFFFh instantly. What are the odds having the checksum FFFFh as the very last bit in a 4 digit hex (next would be 10000h).

> Quote:
>
> I am not convinced that 15C LE is performing a self-test right before entering that menu...HP 15C reports FFFFh instantly. What are the odds having the checksum FFFFh as the very last bit in a 4 digit hex ...

The time that it takes to perform any self testing on a HP 12C Platinum model, using a Sunplus 6502-based processor, would likely take much longer than equivalent self testing in the HP 12C+ or HP 15C-LE, which use the much much faster Atmel AT91SAM7L128 processor.

Last week I asked the question about what appears to me to be a fake checksum result (FFFFh) on the 15C-LE. I didn't get an authoritative response. Add me to the list of those doubting the validity of the firmware checksum reported by the 15C-LE. Related to that is whether the 15C-LE actually calculates a checksum, or is the checksum reported only a value that was stored during the firmware load process.

Re: Is HP tech support clueless ?

*Message #26 Posted by **Tim Wessman** on 28 Sept 2011, 8:48 p.m.,*
in response to message #25 by Mike Morrow

It is actually a 2 digit checksum value of 0-255. The first two should match the second two. FF==FF is good.

We have never seen any flashing issue or "bad" loads into the chip.

TW

Tim, HP 12CP 25AE gives a checksum "ChE--564Ah" so based on your description 56h(86d) <> 4Ah(74d) and therefore it is bad?

Re: Is HP tech support clueless ?

*Message #28 Posted by **Katie Wasserman** on 28 Sept 2011, 11:52 p.m.,*
in response to message #27 by Kerem Kapkin (Silicon Valley, CA)

This is confusing, I wonder if TW and company switched to a different checksum method at some point (around July 2009 ?). The old firmware (that the 12C 30th AE has) does not seem to follow the 2-byte checksum methodology nor does the 12CP 25th AE from years earlier.

BTW the 12CP 25th AE has a 4th "CPU" self test that returns a mysteries result, "3929188 h2". What's that?

Re: Is HP tech support clueless ?

Yes, I was wondering about that too, everytime you run it, you get a different result, a lower one. Almost like an internal timer counting down.

Re: Is HP tech support clueless ?

*Message #30 Posted by **Tim Wessman** on 29 Sept 2011, 12:42 a.m.,*
in response to message #27 by Kerem Kapkin (Silicon Valley, CA)

Well, I assumed it worked the same way as on the 10bII+, 20/30b. Looks like I was wrong. Don't know what is going on there then.

TW

Re: Is HP tech support clueless ?

*Message #31 Posted by **Tim Wessman** on 29 Sept 2011, 2:45 p.m.,*
in response to message #30 by Tim Wessman

Ok, I misread what was written earlier. My statement was correct.

On any ARM based calc (10bII+,20/30b,12c,15c) it is a 1 byte checksum. The 15c correctly comes out with FF==FF. You only have 255 options for the checksum there, so it isn't completely unexpected. Flash is very reliable. The more reliable the medium, the less critical the checksum. In every unit HP has

ever built we have yet to see an issue with the flash.

The 12cp uses some other completely different method and it shouldn't be compared with any other unit.

That TI thing is cool! As far as correct HP partisanship, the fact that it's so difficult to keep running makes me feel comfortable enough. :)

I'd love to see more of your desktop collection!

Re: HHC 2011 was an absolute blast!

*Message #5 Posted by **Richard J Nelson** on 27 Sept 2011, 1:42 p.m.,*
in response to message #1 by Eddie W. Shore

The Conference was a sucess and very intense. We had so much to talk about and plan for the future. HP was very much involved and I believe we greatly increased the number of WP 34S machines because everyone was able to (at least) repurpose an HP 20b at the minimum. Eric had overlays and gave a great presentaton on how

they evolved and even showed how to best apply them. He continues to research materials and they just keep getting better and better. We worked hard to convince Cyrille and Tim the importance of having future machines overlay friendly.

I think we broke a record on the sheer number of presentations. I have collected the presentations and Joseph will be adding them to the website as soon as I build the file.

The future looks very good for HP Calculators even thougth such a "small" part of the business doesn't seem to be on Managements radar just yet. It is important to remember that what ever happens to calcualtors the HP Name may be licensed. Everyone agrees that to remove "HP" from calculators means THE END.

HP41 Battery Holder, made by additive manufacturing

*Message #1 Posted by **Ian Phillips** on 27 Sept 2011, 6:45 a.m.*

Some time ago a forum member (Jean-Michel Lecointre) lovingly created a model of his HP41 calculator using Solidworks. He posted a picture of it here in June 2007.

I had been looking for a battery holder for some time when a good friend mentioned that the company he works has there own 3D printing capability. I contacted Jean-Michel via his website and he very kindly sent me the file for the battery holder and gave me permission to use it.

The resulting battery holder function perfectly. I cobbled together my own version of the contact springs and also two anti-rattle shims. At the moment the holder is in white but I am sure it will be easy to apply some colour to the surface.

There is a picture of the part at, http://www.flickr.com/photos/55711638@N05/6188031129/in/photostream

The small website he created is at, http://xeq-41c.monsite-orange.fr/

Ian Phillips

RPN FLOOR and CEIL

*Message #1 Posted by **Werner** on 27 Sept 2011, 5:37 a.m.*

easy, short, no tests, valid for positive and negative arguments

```
1.using only FRC

    CEIL(x)  = x - FRC(FRC(x) - 1)
    FLOOR(x) = x - FRC(FRC(x) + 1)

(written 41C style, but easily portable)

*LBL"CEIL"
 ENTER
 FRC
 1
 -
 FRC
 -
 RTN

*LBL"FLOOR"
 ENTER
 FRC
 1
 +
 FRC
 -
 RTN

2.using MOD: (1 byte shorter for FLOOR..)

*LBL"CEIL"
 RCL X            (or ENTER ENTER)
 -1
 MOD
 -
 RTN

*LBL"FLOOR"
 RCL X
 1
 MOD
 -
 RTN
```

Cheers, Werner

Re: RPN FLOOR and CEIL

*Message #2 Posted by **Dieter** on 27 Sept 2011, 8:28 a.m.,*
in response to message #1 by Werner

Yes, as mentioned earlier, MOD can provide an elegant solution here. I especially like the idea with this

double FRC since it can be used on virtually all RPN machines, but there is one caveat: There is a numeric pitfall for arguments close to zero.

For values so small that numerically 1 ± x = 1 the method will simply return x. For instance, x = 1E-10 will return the correct result (1) on a 12-digit machine, but a 10-digit machine will return 1E-10. Otherwise your idea works well.

Dieter

Re: RPN FLOOR and CEIL

*Message #3 Posted by **Werner** on 27 Sept 2011, 9:28 a.m.,*
in response to message #2 by Dieter

smack on the head

You're absolutely right of course. Back to square one.

Werner

Re: RPN FLOOR and CEIL

*Message #4 Posted by **Dieter** on 28 Sept 2011, 7:58 a.m.,*
in response to message #3 by Werner

The FRC method is fine for the programming contest since for r =< 5000 there will be no fractional part less than frac(sqrt(4901)) = 0,00714. ;-)

For the record, here's another way to implement a CEIL resp. FLOOR function. It requires the same 7 bytes as yours, works for any argument and uses just two stack registers. However, SIGN is required. Or any other function that turns 0 < x < 1 into something between 1 and (less than) 2.

```
INT
LastX
FRC
X>0?     ; use X>0? for CEIL  or  X<0? for FLOOR
SIGN
INT
+
```

BTW - the test before the SIGN function is *not* required because of the special way the HP-41 evaluates this function. ;-)

Dieter

Re: RPN FLOOR and CEIL

*Message #5 Posted by **Werner** on 28 Sept 2011, 8:18 a.m.,*
in response to message #4 by Dieter

yes, that's what I used in my 41C program (found in another part of the forum - and lacking the second INT which is not needed for positive args.)

Some more CEIL stuff:

```
perfect function (i.e. LASTX contains X, no stack level used)
*LBL"CEIL"
 INT
 RUP
 X<> L
```

```
 X>Y?
 ISG Y
 LBL 00   (NOP)
 X<> L
 RDN
 END

and if we're not so picky:
*LBL"CEIL"
 ENTER
 INT
 X<Y?
 ISG X
 END

if you put the code inline, you need a NOP after ISG X of course.
(I tend to use LBL 00)
BTW these work for all arguments.
```

Cheers, Werner

41CL Version of HP15C+ muscle-flexing exercise

*Message #1 Posted by **Ángel Martin** on 27 Sept 2011, 4:16 a.m.*

It occurred to me that all this (justified) attention and praise to the 15C_LE is having some side effects - namely the other fantastic news - like the 41CL - are not being covered in just measure. So here's one sweet and short note for your enjoyment.

Reference to Gene's article on the 15C+ "crazy" program to demonstrate both the 15C capabilities and the LE superior execution speed (no PSE lines in there :)

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv020.cgi?read=195013#195013

I keyed in the following program on my CL, conveniently equipped with the SandMath and the Advantage (they're all included in the CL module library).

For comparison purposes, the code mimics Gene's for the 15C+, including the shortcomings listed at the end of his pdf.
Execution time is about 2.60 sec, or about 3x faster than the 15C+ (yes, I'm biased).

The result is (no surprisingly) identical. Use function VMANT to see the full mantissa.

I wonder how does the "production" LE compare to the pre-production 15C+. Probably just the same? My ordered LE is entangled in the customs cobwebs - anybody cares to complete the chart?

*Message #3 Posted by **gene wright** on 27 Sept 2011, 7:51 a.m.,*
in response to message #2 by Paul Dale

I believe it was a display blinking problem that was seen on the 15c+ while running the crazy test program that pointed out an issue with the display update routines.

That's the base cause of the 15c+ run times being slower than the production 15c LE times (again, I believe). However, the fix that sped up the run times appears to have contributed to the pause problems.

But, Angel...how long does a 15c equivalent of this HP 41 program take?

LBL A

Well, it'll take forever - I am no 15C expert but I struggle to know how you type "HI" in it?

On the other hand, it's easy enough to find out how long it takes on the CL if you use the Time_Module to do the time keeping :-)

But can you time it on the 15C_LE ???

Gene,

This is really quite easy.

```
LBL A
14
RTN
```

The run time is pretty much instantaneous but it was a bit tricky trying to measure it while standing on my head.

;-)

Re: 41CL Version of HP15C+ muscle-flexing exercise

*Message #8 Posted by **gene wright** on 28 Sept 2011, 2:37 p.m.,*
in response to message #7 by BruceH

Ok, how about:

LBL A

"SMACK BRUCE"

RTN

? :-)

How good is the 41CL?

*Message #9 Posted by **snaggs** on 27 Sept 2011, 7:40 a.m.,*
in response to message #1 by Ángel Martin

Compared to a 42s, how does a 41CL stand-up? Are the keys on the 41 superior? With all the modules included the feature set should be good?What about speed?

Daniel.

Re: How good is the 41CL?

As always, it's a matter of personal taste. To me the keys are definitely superior, and no soft-Alpha thank God.

> Quote:
>
> With all the modules included the feature set should be good?

It's as close to perfect as you can imagine.

> Quote:
>
> What about speed?

As fast as I need it to be, a joy. See benchmarking article at:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=1002

(BTW it'll be good to have all that data in a chart format, right Gene??? :-)

In my experience the real-life calculations are a better measure, but FWIW here are the results:

```
The NEWT 41CL logic board upgrade for the HP 41. Code: LBL 00 + GTO 00
1X mode: 1,055
2X Turbo mode: 1,913
5X Turbo mode: 4,153
10X Turbo mode: 6,538
20X Turbo mode: 9,179
50X Turbo mode: 12,022

HP-42s FAST MODE S/N 2849A with goose disabled
Count: 6,485

HP-42S with "goose" disabled. Non-fast mode.
```

```
Count: 3,067

HP-42S
Count: 2,115
Code: LBL 00 + GTO 00
```

Edited: added 42S data

Edited: 27 Sept 2011, 9:18 a.m.

Re: How good is the 41CL?

*Message #11 Posted by **Ángel Martin** on 27 Sept 2011, 9:27 a.m.,*
in response to message #10 by Ángel Martin

alright, so after I looked at the 42S different "configurations" data points I went ahead and performed the test on a goose-disabled 41CL - comparing apples to apples, as it should be.

Code: CLA AVIEW 1 LBL_00 + GTO_00

The TURBO-50 figure increases to 27,417 - more than double!

Time for an updated chart!

Re: How good is the 41CL?

*Message #12 Posted by **Juergen Keller** on 27 Sept 2011, 9:47 a.m.,*
in response to message #10 by Ángel Martin

I did another 41CL benchmark, and this article (sorry, in German).

1.5 or 2.6 sec makes not much difference to me, both is muuuch faster than the original calcs :-)

Re: How good is the 41CL?

*Message #13 Posted by **Ángel Martin** on 27 Sept 2011, 10:07 a.m.,*
in response to message #12 by Juergen Keller

wow!, fantastic article - amazingly exhaustive and authoritative! Definitely the definitive reference - and I agree, we're in the realms of hair-splitting and fringe-wandering.

You can write NUT assembler on the 41CL?

*Message #14 Posted by **snaggs** on 27 Sept 2011, 6:41 p.m.,*
in response to message #12 by Juergen Keller

Surely thats a big advantage if you have something complicated to implement.

Daniel.

Re: You can write NUT assembler on the 41CL?

*Message #15 Posted by **Ángel Martin** on 28 Sept 2011, 2:23 a.m.,*
in response to message #14 by snaggs

Yes you can - just use any of the available editors from all the modules included in its library (HEPAX, DAVID-ASM, ZENROM...) and the Quasi-RAM blocks also available there.

How does 41CL battery life compare to 12C and 15LE's?

*Message #16 Posted by **snaggs** on 28 Sept 2011, 11:49 p.m.,*
in response to message #12 by Juergen Keller

It states its standby (off) draw as 110 vs 10 of the original. So, its ten times worse, but then with a modern set of lithium AA's, that would probably compensate.

How does it compare to emulating on an ARM chip?

Is the battery usage a side effect of FPGA?

Daniel.

Re: How does 41CL battery life compare to 12C and 15LE's?

*Message #17 Posted by **Monte Dalrymple** on 29 Sept 2011, 10:03 a.m.,*
in response to message #16 by snaggs

The FPGA is powered down during sleep. But the CPLD, which contains the logic that must always remain active, draws over half of that sleep current. The RAM only requires about 2uA. The RS232 driver and 6V level shifter are about 5uA each, and the various power supplies and reference divider take the rest.

Re: How good is the 41CL?

*Message #18 Posted by **Howard Owen** on 27 Sept 2011, 12:53 p.m.,*
in response to message #9 by snaggs

The keys on the 41C set my personal standard for keyboard quality. They may or may not be the absolute best HP ever produced, but they are the ones my fingers got to know in my early days as a programmer. The 42S keys are quite good, but they just don't match my personal prejudice for "best."

*Message #4 Posted by **E.Lub_EU** on 27 Sept 2011, 9:19 a.m.,*
in response to message #1 by Howard Owen

Howard,

Atmel provides also a SAM-BA patch for Atmel SAM7 series that was last revised on Aug 11th:

SAM7 Patch for SAM-BA® 2.10
(77 KB, revision 1.0, updated 8/11)
This patch fixes SAM7 flash programming issue in SAM-BA® 2.10.

I haven't seen it mentionned recently on the forum, and have not installed SAM-BA yet, so I can not tell how critical this is. I have seen in the archives that some have mentionned difficulties with SAM-BA, I wonder if this patch would improve things.

Can anyone comment?

Regards, Etienne

HHC2011 News

*Message #1 Posted by **Namir** on 26 Sept 2011, 8:28 p.m.*

Hello All,

The HHC2011 was a real success. HP, through the effort of Tim and Cyril, was generous and hosted our meeting, providing us with refreshments and meals.

It was really nice to see old friends and make a few new ones. The fellowship was absolutely lovely, funny, and fun!

The talks ere very nice and informative. Joe Horn won best speaker for his subject about rounding number (presented as continuous fractions) I gave my talk about comparing the speeds of the HP-15C vintage and the new HP-15C LE. Speakers like Denis Harms were very informative. He was the team leader for the HP-12C. There was also a panel of HP marketing people. I recognized one member from her YouTube video that introduced the HP-12C.

The door prizes were very nice. HP contributed several prizes. We got some extra new HP-20b that Cyril had obtained from the first production run.

The talks by Marcus von Cube and Neil Hamilton about the WP34S were very interesting. Many HP-20b and HP-30b machines were flashed into the latest version of the WP34S.

The last item we discussed was HHC2012 which definitely will be happening.

If you missed it, contact Jake Schwartz through his web site and buy the conference videos!!!

Edited: 26 Sept 2011, 8:32 p.m.

in response to message #14 by Howard Owen

There is an East Coast, too, ya know.

About 200 miles east of Yosemite, isn't it?

This reminds me of the early 1960's when I was working out on Long Island. I discovered that to most New Yorkers "out west" wasn't Pittsburg and beyond. It was the other side of the Hudson River.

In the 1980's I was in a conference in Boston when an Easterner couldn't remember whether a state that he was referring to was Ohio or Iowa and said "One of those states with too many vowels."

Re: HHC2011 News

I took as my guide those wall posters that show a New Yorker's view of the world. New Jersey barely registers, let alone California.

> Quote:

Eddie, I'm guessing you're a Southsider :-) But CHIP is pretty neutral when it comes to that sort of thing. The conference location would likely be Ace Metal in Bensenville, just west of O'Hare airport.

Re: HHC2011 News

*Message #19 Posted by **Jake Schwartz** on 27 Sept 2011, 11:07 a.m.,*

When Brian Walsh suggested that Chicago be considered, he was talking about the fact that we've had several past conferences at ACE Metal Crafts' facility in Franklin Park, IL, which is within a mile of the O'Hare airport. That would be northwest of the city. Those conferences have all been great, by the way.

Martin Pinckney wrote:

> Quote:
>
> There is an East Coast, too, ya know.

These conferences, having been held since 1979, are put on by volunteers (...now I'm beginning to sound like Walter <grin>) who do all the hard work "in their back yards" or elsewhere to organize them and make them happen. When locations for next year were discussed, they were considered based on people who would be willing to investigate getting things organized in their own areas. For instance, John Caddick talked about doing it near Dallas, where he lives. Gene Wright is near Nashville and he talked about looking there. Geoff Quickfall entertained the possibility of doing it near his home town of Vancouver BC, and so on. There have been a handful of them in the East in the past (Brian Walsh did the one in Atlanta in '85, Bill Kolb organized one in Rockville, MD in '81, Irv Weiner and his Rhode Island PPC chapter sponsored one in 1983 in Providence and I did conferences in the Philly area in '82 and '92, plus there was one in Orlando in '83). It takes a ton of work. Are you volunteering to organize one where you want it to be?

Jake

Re: HHC2011 News

*Message #20 Posted by **David Ramsey** on 27 Sept 2011, 12:33 p.m.,*

in response to message #19 by Jake Schwartz

I vote for Reno. And not just because I live there.

The nicest hotel in town, the Grand Sierra Resort, is 1/2 mile from the airport. It was *designed* for conventions like this and there's almost always one going on. There must be a dozen or more restaurants inside the hotel, ranging from fast food like Johnny Rockets to the typical Reno buffets to high-end stuff if you win big at the slots.

Lots of meeting rooms, of course, in any size we'd need.

Re: HHC2011 News

How about 15C-LE issue correction? New firmware coming soon?

Re: HHC2011 News

*Message #24 Posted by **Jim Horn** on 27 Sept 2011, 12:14 p.m.,*
in response to message #23 by Ángel Martin

As I understand their description of this, the 15CLE firmware bug apparently was introduced late in the game and caught them by surprise. They already know what is likely needed to fix it without introducing more. They are working to impliment the changes and test them thoroughly before releasing them.

In short, no release date for the firmware fix but stay tuned...

By the way, I continue to be impressed even more as time goes by with the skills, expertise, enthusiasm and quality of Cyrille, Tim and the rest of the HP Calculator team. Meeting them again in San Diego was an honor and a treat!

Re: HHC2011 News

*Message #25 Posted by **Tom Mathes** on 27 Sept 2011, 1:36 p.m.,*
in response to message #24 by Jim Horn

Any clues as how the fix will be distributed? Most of us don't have the special cable to re-flash the calc.

Re: HHC2011 News

*Message #26 Posted by **Brian Walsh** on 27 Sept 2011, 3:01 p.m.,*
in response to message #25 by Tom Mathes

I would anticipate the cables will be available (Gene Wright has been instrumental and a stalwart in this regard) and that the user community will come forward to help re-flash machines. Although the WP 34S is new to me, now that I have two of them as well as a 30th Anniv. 12C I will make an effort to get up to speed with re-flashing machines and be available to do it for people attending CHIP meetings, for instance, including released updates for the 15C LE.

Updates and cables...

*Message #27 Posted by **gene wright** on 27 Sept 2011, 4:42 p.m.,*
in response to message #26 by Brian Walsh

Lest anyone go "gaga" over Brian's comment, he meant updates for the 15c LE once they are available, which is not true yet.

Regarding cables, I now have more, but am reluctantly going to raise the price I ask to mail them out. I talked with people at HHC 2011 and when I told them what I did and how much time it was taking to fill out the forms, buy the mailing materials, etc., they pretty much all agreed with what I had been thinking.

I must ask for a bit more to mail out the cables. So, here we go:

To ship a cable to a USA address, I am now asking $6 and to a non-USA address, I am asking for $10.

Paypal is the preferred method.

I am sorry about this, but having mailed out 30 cables in the last month, it was beginning to impact the time I needed for other things for just barely covering my costs. :-(

Re: Updates and cables...

*Message #28 Posted by **Brian Walsh** on 28 Sept 2011, 12:04 a.m.,*
in response to message #27 by gene wright

Spot on regarding what I meant to say, Gene. I agree, charge what you need to on the cables.

Re: HHC2011 News

*Message #29 Posted by **Namir** on 27 Sept 2011, 11:17 a.m.,*
in response to message #1 by Namir

Also to mention:

1. Richard Nelson gave a talk Saturday night about the 30th anniversary of the PPC ROM. He explained the Herculean efforts done to track the orders and payments (especially overseas one) create each page of the manual, print the manuals, assemble the packages for each customer, and ship the packages.

I think the PPC ROM is but one special fruit of the genius of Richard as a User Community leader. He makes each HHC meeting seem easy to do. In reality there is a lot of work involved.

2. (father) Joe Horn won best speaker. I thought is was a bit unfair since as a priest he gets to practice public speaking (each Sunday and at special occasion) much more frequently and thus has perfected the art of public speaking and winning his audiences' attention, respect, and admiration. Oh well, life is not always fair. Of course he talk was very nice.

More reason to get the videos from Jake Schwartz.

Eric's latest DIY HP-41 calculator demo was amazing. The new high resolution display looked fantastic and the power used by the entire calculator when it was on was so shockingly low, even the HP engineers did a double take. He and his team did an incredible amount of work in a short time to have this prototype available for HHC2011. I hope he updates his site soon to show everyone their latest creation.

in response to message #31 by Steve Simpkin

The location of HHC 2012 is one of the most difficult in terms of the hundreds of decisons that need to be made. The date, however, is easy. Just start with September 15 and consider the next weekend. If there is a major religious conflict pick the next weekend. For 2012 it is tenatively September 23 & 24.

The facilities decision is based on the total cost to the attendee such as: Travel costs, Hotel room costs, meal costs, meeting room costs, HP support costs (e.g. at an HP facility near zero).

This Conference was "overloaded" with presentations and fellowship time is always an important consideration. Starting at noon on Friday was suggested. For sure we willl have a Committee member present at the hotel in the future. We were 6 Commettee, 4 HP people, plus the HP Facilites crew - 14 total - and still it was a challenge to get everything set up in time.

The HHC List is the media we use for HHC's. http://lists.brouhaha.com/mailman/listinfo/hhc Sign up if you are interested.

in response to message #32 by Richard J. Nelson

NO NO NO NO!!

The date is NOT easy. You keep holding it in September and you keep annoying those in the educational community who cannot attend during term time.

Anyone considering venues, PLEASE ask for costs for August as well, and perhaps we can finally put the canard of "it's cheaper out of season" to bed. That may have been true two or three decades ago but not now. Just find a business rather than tourist hotel and they will be short of customers in August.

For some reason I have to pay 2x as much for a room in NY after US Labor Day (Sept 5th this year). So I do not believe that after August is always cheaper.

Something to consider is what KFest (think HHC for Apple II users) does. Some

universities rent out their dorms + conference facilities for less than $100/person/day in the summertime. Cheaper if you double up in the dorm rooms. No cars or hotel needed.

in response to message #34 by BruceH

You can get resort rooms ($300-$400 in season = well after September) for ~$100 in Phoenix in August. The only problem - it's >110 F most days!! Of course, this crowd would all be in the meeting till 11 PM, at which point it may have cooled off to below 100.

Thanks for looking into it Brian, 11-12th August would be fine.

DIY4X, or Scaled Reptiles of the Nordic Countries.

*Message #39 Posted by **Eric Smith** on 27 Sept 2011, 5:16 p.m.,*
in response to message #31 by Steve Simpkin

Richard Ottosen and I have been working on this project for over ten years now. Last year at HHC2010 I showed our fifth-generation hardware, called DIY4, which uses ARM processor vs. the Microchip PIC microcontrollers we used in the earlier generations. However, at HHC2010 the DIY4 was only running a hardware diagnostic program, and was not functioning as a calculator.

We finally got the DIY4 working as a 41C-compatible calculator in mid August. However, at about the same time we discovered a new, significantly better LCD display, which is 2.7" diagonal with 400x240 pixels (173 dpi), with excellent contrast and very low power consumption. We kludged the new display onto on of our prototypes, and barely got it working in time to show at HHC2011 this past weekend. We call this version DIY4X.

Unfortunately in the mad rush to get the DIY4X working, I did not have time to prepare any slides for my presentation or a paper for the proceedings. I do hope to write up some information for a web page, and take some photos and videos, but school has me really busy, so it will take me a while. I'll certainly post a link here when I do.

The title of my presentation, "Scaled Reptiles of the Nordic Countries", was inspired by the titles of HP's presentations, including "Deciduous Trees of North America" and "Deciduous Trees of Europe". The microcontroller in the DIY4X is an EFM32G "Gecko" made by Energy Micro in Norway.

Geoff Quickfall took that one step further and titled his talk "Smooth Scaled Deciduous Trees of the Southern Nordic Countries".

That display is *awesome!* Your talk about the "Super Gecko" was exciting too. The prospect of double digit car insurance discounts guarantees that I will be back for HHC 2012.

:)

Re: DIY4X, or Scaled Reptiles of the Nordic Countries.

*Message #41 Posted by **Eric Smith** on 27 Sept 2011, 7:55 p.m.,*
in response to message #40 by Howard Owen

You're referring to the "Giant Gecko".

The DIY4X uses the EFM32**G**280F**128** "Gecko" with 128 KB of flash and 16 KB of RAM. The DIY4X already uses nearly all of that memory, so there currently isn't enough room for four -41 ROM modules, HEPAX support, and other features I want to provide.

The DIY5 will use the EFM32**GG**380F**1024** "Giant Gecko" part, which has 1 MB of flash and 128 KB of RAM. The Giant Gecko also adds USB support.

The Giant Gecko parts are said to be sampling now. I've requested a few samples for development but have not received them yet. We should be able to test a Giant Gecko (except for USB) on the DIY4X with a few cuts and jumps.

Regrettably we will not be able to arrange the car insurance discount for you. You'll have to negotiate that with your insurer.

I wonder what "Limited Edition" means

*Message #1 Posted by **j beede** on 26 Sept 2011, 8:28 p.m.*

Does anyone know of any evidence that the HP 15C Limited Edition is actually a limited production calculator? I am talking about evidence other than anecdotal evidence based on numbering or rumors, etc. Maybe I missed the memo or the press release.

When do we start petitioning for the HP-16C Limited Edition :)

*Message #3 Posted by **Steve Fennell** on 26 Sept 2011, 10:23 p.m.,*
in response to message #1 by j beede

The earliest mention I could find on this site was in March. The number 10000 was mentioned but I have not seen anything official to back that up. If the 15C is successful it may become less limited, but given HP's corporate gyrations there is every reason to believe this may be the only chance to get one.

Re: I wonder what "Limited Edition" means

*Message #4 Posted by **Lincoln R.** on 27 Sept 2011, 1:21 a.m.,*
in response to message #3 by Steve Fennell

Honestly, HP not admitting how many they made/will make may be a good thing for us. Not announcing the limit of the 'Limited' Edition may very well mean "We reserve the right to produce as many as we want." This means more 15Cs for everyone, and if enough of the things flood the market the TAS insanity should start cooling off.

Re: I wonder what "Limited Edition" means

"Limited Edition" can mean a lot of things. Here in the United States, we have many "collectable" items offered on late night TV. These are all described as "only a limited quanty produced", or "the mold will be destroyed". What they usually mean is "We will produce them until no one else wants to buy them". Limited to the amount that can be sold.

We can only hope that HP will limit it to the amount that can be sold.

Bill

Re: I wonder what "Limited Edition" means

*Message #7 Posted by **j beede** on 27 Sept 2011, 3:27 p.m.,*
in response to message #6 by Bill (Smithville, NJ)

The reason I ask is that on their web site, HP says:

"HP 15c Scientific Calculator 4.0 out of 5 stars (6 reviews) • Limited collector's edition • Perfect gift for scientists and engineers on the go • Up to 100x faster than original edition • 120+ built-in functions with RPN"

I see people here claiming to have bought multiples of these calculators... speculating on RPN calculators? Imagine that!

I believe in a free economy but claiming that a product has limited availability when the truth is that the item is not limited at all seems unethical, or at least more typical of fast food marketeers--"at participating stores for a limited time only".

That said, I was pleased to buy a new HP-15C LE for way less than I paid for my "real" HP-15C ~30 years ago! Using the coupon I got a 15C LE from HP's on-line store for $85 with free shipping. Nice.

> Quote:
>
> I believe in a free economy but claiming that a product has limited availability when the truth is that the item is not limited at all seems unethical

There is always a limit.

If by some violation of the laws of physics an infinite quantity of new 15C's were to be planned, if nothing else the LE markings could be removed for all future production.

Re: I wonder what "Limited Edition" means

*Message #9 Posted by **Glenn Dowdy** on 27 Sept 2011, 5:24 p.m.,*
in response to message #6 by Bill (Smithville, NJ)

For any definitions of "Limited Edition", I can only admit to Tim and Cyrille being "Limited Editions". The molds were definitely broken after those two were born.

Re: I wonder what "Limited Edition" means

*Message #10 Posted by **C.Ret** on 27 Sept 2011, 5:58 p.m.,*
in response to message #9 by Glenn Dowdy

How to remove it ?

In the case of an infinite production of it, better add an "Un", to get the HP-15c "UnLimited Edition" label.

Re: I wonder what "Limited Edition" means

*Message #11 Posted by **Howard Owen** on 27 Sept 2011, 10:29 p.m.,*

Perhaps the 15C LE production is "finite but unbounded."

Re: I wonder what "Limited Edition" means

*Message #12 Posted by **Eric Smith** on 27 Sept 2011, 5:43 p.m.,*
in response to message #1 by j beede

It means absolutely nothing whatsoever.

At HHC 2011, someone asked the HP marketing people how many will be made, and they said that they were not willing to provide that information.

Normally when a company sells a numbered limited edition of something, they tell the public how many there are, so that the public can decide what value they place on "limited". Since HP has failed to conform to this standard practice for limited editions, in my opinion it is effectively not limited at all, since they can just keep making them and marking them "Limited Edition" as long as they like.

I think this is an example of a "marketing breakthrough". :-(

Re: I wonder what "Limited Edition" means

*Message #13 Posted by **Katie Wasserman** on 27 Sept 2011, 6:07 p.m.,*
in response to message #12 by Eric Smith

I agree that calling something a "limited edition" without saying how many will be made is meaningless. While the number of digits in the limited edition number seems to imply a maximum or 100,000 units even this does not have to be the limit -- letters in place of numbers could be used or numbers could be repeated.

Calling this the "15C LE" without saying what the "LE" means seems like the way to go.

The only thing we know for sure, is that "Limited Edition" means that a) it says that on the front, and 2) it has a "Limited Edition Number" on the back, separate from the normal serial number.

The 12c Platinum "25th Anniversary Edition" became the re-styled Platinum, sans any special edition marking, after a few months of marketing.

And a/3) we know that the packaging on this thing is more expensive than the fiendish razor proof sealed plastic that they usually use. If they are going to continue production, they'd likely change that, at least.

Re: I wonder what "Limited Edition" means

*Message #16 Posted by **bill platt** on 28 Sept 2011, 9:51 a.m.,*
in response to message #15 by Howard Owen

The only reason for the razor-proof is for retail stores. If they continue without any intention of stores, then they won't bother with that.

This 15C LE is a direct marketing initiative from a massively bloated Multinational Corporation. In a way, it is rather remarkable!

Re: I wonder what "Limited Edition" means

and they number the items in sequence (i.e., 5 of 100) and give a letter of Authenticity. I have several items that meet this criteria. My favorite is:

A hand colored water color of the World Trade Center as seen from the Statue of Liberty. It was done by a well know artist that specializes in Architectural Etchings of Historic Buildings in New York. Signed by the Artist, Numbered and has a letter from the Artist.

I bought it many years ago. Since I used to work on the 92nd floor of Tower Two, I wouldn't take any amount of money for it and it proudly hangs in our living room and srvers as a rememberance of all the brave souls that were lost on that tragic day.

Bill

One wonders why HP wants to keep the production number a secret, since, at least HP in their own sales sites doesn't seem to be taking advantage of the buying frenzy by jacking up prices.

Perhaps the real reason HP won't divulge is that at this time there is no specified limit.

Or it could just be corporate policy not to divulge any production figures.

Re: I wonder what "Limited Edition" means

*Message #20 Posted by **Ethan Conner** on 28 Sept 2011, 12:56 p.m.,*
in response to message #19 by Martin Pinckney

HP is not completely stupid. If their first run sells quickly they leave the door open to crank out some more. Now whether they come in fancy boxes with printed manuals remains to be seen. As tough as the customers in this forum are i don't blame them for not saying the amount produced.

Re: I wonder what "Limited Edition" means

The old HP (ca. 15 years ago, yet maybe the practice continues still) would often price products at intro based upon expected but not yet realized component cost reductions.

In other words, if the first 100,000 cost $300/ea but the next 1,000,000 only cost $200/ea then the intro price would be based on the $200/ea cost. If costs dropped below the $200/ea the price might be reduced after intro.

Another order of 15c LE for me!

*Message #1 Posted by **jonathan G harris** on 26 Sept 2011, 8:14 p.m.*

I bought (3) HP 15C LE from Buy.com several weeks ago, back when there were posts that Buy.com had them in-stock on sale for 80 bucks. I just placed a new order with HP.com for 3 more (also for 80ish bucks... These calculators are not perfect, but they are pretty close with only trivial problems mentioned (trivial in my eyes...) with the exception of the current draw during keypresses. I ran self tests on all 3 of my current ones and I hope that the 3 new ones will also be of high quality. I am amazed and pleasantly surprised by the handsome display box that it comes in. I have bought many calculators in my time (finished school in 2006, EE) and everyone of them required nothing short of a light-saber/surgeon's scalpel to open. My "first string" 15c LE has been in my shirt pocket since they arrived. Hell it is in my shirt pocket right now along with my pentel 0.5 mechanical pencil and parker pen.

I am very happy that they decided to bring this calculator back and am more happy that it is selling so well! I've seen posts of folks buying 5-10 calculators. Hopefully they aren't trying to sell them on TAS and do the price gouging that I have heard about.

On a slightly different subject, I thought I remembered seeing (maybe back in 2004-2009???) on the HP site or a link they had for some very fancy calculator cases for the HP10C-16C. They had slipcases made of alligator, snakeskin, etc. Plus I think they did embroidery for a personalized touch... Does anyone remember this or am I just remembering a dream...

Hmm, doesn't seem to work from non-US addresses:-(

Re: HP 15C LE back in stock at HP Home Store

*Message #3 Posted by **Michael de Estrada** on 26 Sept 2011, 5:50 p.m.,*
in response to message #2 by Raymond Del Tondo

Unfortunately, I don't think any of the HP online stores in the USA will ship internationally, which is one of the reasons why outfits like SC can get away with their price gouging.

Re: HP 15C LE back in stock at HP Home Store

*Message #4 Posted by **bill platt** on 26 Sept 2011, 6:51 p.m.,*
in response to message #3 by Michael de Estrada

I'm not so sure I'd call it gouging. I am amazed he can make any money at all.

Re: HP 15C LE back in stock at HP Home Store

*Message #5 Posted by **Michael de Estrada** on 26 Sept 2011, 7:04 p.m.,*
in response to message #4 by bill platt

He's currently selling them for $199.99 + shipping and I'm sure he paid a lot less than retail for his stock, so sounds like gouging to me.

Re: HP 15C LE back in stock at HP Home Store

*Message #6 Posted by **bill platt** on 26 Sept 2011, 7:55 p.m.,*
in response to message #5 by Michael de Estrada

So he makes $100. After all the hassle and high maintenance to get them to market, he won't make a dime. It is a business not a hobby...

Re: HP 15C LE back in stock at HP Home Store

*Message #7 Posted by **Michael de Estrada** on 26 Sept 2011, 8:10 p.m.,*

in response to message #6 by bill platt

He should make a lot more than that, and it's pretty simple to run that type of business. There are plenty of other internet resellers that can manage to make out very well without making a >100% profit per unit. By buying up a lot of initial stock, he prevented buyers from getting them at lower pricers from other less greedy resellers. Heck, I could have bought 20 or so and turned them for a handsome profit. Throwing them in boxes and shipping them is pretty easy.

Re: HP 15C LE back in stock at HP Home Store

*Message #8 Posted by **bill platt** on 26 Sept 2011, 9:25 p.m.,*
in response to message #7 by Michael de Estrada

"easy" but time consuming. I like to make $100 for an hour's labor, not $10...

That's what I mean by this.

in response to message #12 by Michael de Estrada

Quote:

> Sounds like California state sales tax is the same as Texas, namely 8.25%.

think of us poor Brits - after all the hassle of having it shipped from USA we are stung for 20% tax + a few extra quid for handling fees !

Even if the HP-15C/LE eventually appeared over here we'd still be paying that extra 20% :-(

Re: HP 15C LE back in stock at HP Home Store

Is that your VAT ? Whenever I ship a calc to someone in Europe, I always show it as a "gift" on the customs form with a value of $0.

> > Is that your VAT ? Whenever I ship a calc to someone in Europe, I always show it as a "gift" on the customs form with a value of $0.

Please don't do that without talking to your buyer first! Our customs officers are not stupid! Whenever I collect parcels from overseas at customs, they ask to be shown either printouts of eBay transactions, invoices, credit card slips, or PayPal invoices. If I can't produce any of these of if they have any doubt about them, they will determine the value of the goods by themselves. Usually much higher than what I actually paid.

Declaring something as "gift" does not help at all because taxation on gifts is exactly the same as for purchased items. For customs and taxation, it does not matter at all who paid for the item in the first place! And if the value declared on the parcel is lower than the actual value (like your 0$ statement) they may actually accuse me of attempted tax fraud which is a serious criminal offence.

Another good reason for declaring the real value is the package insurace. If ever something gets lost (has not happened to me yet) you will be reimbursed the declared value. 0$ does not really help.

And regarding that "awful" VAT: For me, this is one of the best and fairest taxes. A direct tax on consumation. People who can afford more expensive goods and services pay more than those who can't. No loopholes for the rich and smart. In return for these taxes, we (at least here in Germany) pay nothing to send our children to school, college and university, have roads with very few potholes, get excellent medical services at moderate cost (for everybody!) and so on. I rather pay VAT on my toys than heaps of money for all these things!

Regards, max

> Quote:
>
> think of us poor Brits - after all the hassle of having it shipped from USA we are stung for 20% tax + a few extra quid for handling fees !

Poor Brits? That's because you don't know the outrageous Brazilian taxes. As an example, in April I received two serial cables from HP with an enclosed no charge invoice. The declared value had been $4.00 ($2.00 each). There was a notice on the bottom of the invoice that read "NO CHARGE INVOICE: Value for Customs purpose only". Despite of this, that's what I've been charged:

```
Declared value: US$  4.00
    Import tax: US$  2.40   (60 %)
    ICMS (VAT): U$$  0.72   (18 %)
          GNRE: U$$  0.68
  Customs fees: U$$ 15.00
         Total: U$$ 18.80
```

Items are charged over the declared value even they are declared as gifts. I was lucky once, when I received a $150.00 HP-50g from Samson Cables and wasn't charged anything. I guess there was an important soccer game going on when it arrived at Customs :-)

*Message #17 Posted by **Artur-Brazil** on 27 Sept 2011, 8:38 a.m.,*
in response to message #16 by Gerson W. Barbosa

Hi, Gerson

In Brazil, our Customs do this: - by sampling they add the shipping costs to the items value and apply just 60% over the total - this is the Federal tax; - so, they apply another 22% (I believe this is the correct percentual) over the total added to the Federal tax; so, once more the same percentual over all;

At the final, you will pay 94% of Federal and local tax; and more something on your Credit Card international transaction, completing almost exact 100% !!!!

Very nice, don't you agree?

Wow ! Looks like the profiteers were watching. Well, I guess we'll be seeing a bunch more TAS listings. -(

Re: HP 15C LE back in stock at HP Home Store

*Message #23 Posted by **Jim Johnson** on 27 Sept 2011, 1:06 p.m.,*
in response to message #22 by Michael de Estrada

As noted before the HP-15cLE is "Out Of Stock" at the HP Home site (but is curiously available on their business site for $99.99). This seems to be rather insane. HP receives stock. Within a few days (or 24 hours) sells out. The OOS message goes up for a week or two. Then more stock arrives and the same cycle repeats itself. I'm curious about why the Chinese contract manufacturer is having difficulty keeping these in stock since they seem to be "selling like hotcak.."...er, HP calculators!

It still seems a bit unfair that some "entreprenuers" are profitting purely from the fact that HP's Chinese CM can't simply deliver about 500,000 of these calculators to about 10 distributors.

Re: HP 15C LE back in stock at HP Home Store

*Message #24 Posted by **Michael de Estrada** on 27 Sept 2011, 1:20 p.m.,*

in response to message #23 by Jim Johnson

They might not be available at the business site, but not indicate this until you attempt to complete checkout. Also, the business site does not offer free shipping, and coupons don't always work unless you are a "partner". I'm not quite sure what's going on with this on again off again business at the home site, but I suspect that more are on the way and perhaps in another month there will be sufficient stock to prevent this problem. Anyways, the prices are already starting to come down on TAS as it's been getting flooded with listings lately.

Re: HP 15C LE back in stock at HP Home Store

*Message #25 Posted by **Geoffrey Wang** on 27 Sept 2011, 10:55 p.m.,*
in response to message #24 by Michael de Estrada

I bought one from SMB a couple of days ago and shipped the next day. More expensive than the Home site by $15-$20 out the door, but at least they have it available.

Re: HP 15C LE back in stock at HP Home Store

*Message #26 Posted by **Michael de Estrada** on 27 Sept 2011, 11:06 p.m.,*
in response to message #25 by Geoffrey Wang

The two that I ordered yesterday with free shipping are already in my city and due to be delivered tomorrow. They were drop shipped from the same distribution centers in Memphis, TN and Olive Branch, MS as all the other online stores. So, I think they come from common stock, and when they are OOS for one store they are probably OOS for all others. It's probably a FIFO stocking system.

[WP34S] HP cable vs USB adapters compatibility question

*Message #1 Posted by **E.Lub_EU** on 26 Sept 2011, 4:10 p.m.*

Hello all,

I am looking for suitable USB-serial cable/adapters for the 20b/30b.

Looking at the photo of the DE9 pinout on page 2 in the document "Interfacing to the HP20b V3", I am surprised to see the Gnd (labeled Gnd2) on pin 9, where I expect a signal: RI (Ring Indicator).

The FTDI cables & adapters feature a Gnd connection on pin 5. I have checked the following documentations at FTDI:

Adapter: USB-COM232-PLUS1

Cables UC232R, UT232R-200(500) US232R-10(R-100/500)

I would like to know
- Can people using one of these confirm that they work,
- Can somebody with a HP serial cable confirm the cabling on the RS232 side ?

Thanks in advance

Regards, Etienne

(Edit) changed title

Edited: 26 Sept 2011, 6:34 p.m.

Re: [WP34S] HP cable vs USB adapters compatibility question

*Message #2 Posted by **Marcus von Cube, Germany** on 26 Sept 2011, 7:58 p.m.,*
in response to message #1 by E.Lub_EU

There are several possible solutions:

1.) Straightforward: Get an FTDI equipped USB / Serial dongle with a 9 pin male D-type connector and connect the HP programming cable to it. This should work out of the box.

2.) Make your own, bypassing the current drawing level-shifters:

a) Get an FTDI TTL-232R-3V3 cable which ends in an 8pin connector or just 8 wires. See this page: http://www.ftdichip.com/Products/Cables/USBTTLSerial.htm

b) Open the HP flashing cable, remove the RS232 cable from it (the side with the 9 pin D-connector) and attach the corresponding wires of your FTDI cable to the far end (directly to the cable going to the calculator.) You should disconnect the power from the level shifter IC or desolder it completely. The ERASE switch needs the 3V connection because the erase input is active high so you need to cut the trace at the right position. I

plan to do this myself and will document it when it's working.

Re: [WP34S] HP cable vs USB adapters compatibility question

*Message #3 Posted by **E.Lub_EU** on 27 Sept 2011, 6:00 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Hello Marcus,

Thanks for your elaborate response.

I have come exactly to the same conclusion, and am preparing an order from FTDI on the same line: - one "plain" USB-RS232 to use with an unmodified HP cable, - one USB-"3V-TTL-serial" with an open end cable.

I had come to the same implementation idea (cutting the wide trace between the switch and the level shifter), cabling direct from the FTDI cable to the calculator side of the HP cable. Big advantage is that there is no need for another PCB inside the HP "button box".

Some possible caveats could be:

- the 3V3 signals from the FTDI chip will exceed hte Vih spec, being above the Vbat level.
Probably just ok with fresh batteries, unless the 20mA drain causes them to sag significantly. Has this been measured already?
With partly depleted batteries, one would actually offset the SAM7 internal Vdd plane value through the Vddio (bit of speculation here, as the internals of the SAM7 are not that detailed), I believe that keeping this condition for a long time might even damage the chip.
There might also be a problem with the reverse (charging) current spec of the batteries, like when leaving the calc in low-power state with the cable connected (USB powered)

This does leave the calculator running from ts own batteries, and it was mentionned here that they drain fast under these conditions.

So I was toying with the idea of actually powering the calc through the cable (same work on the cable PCB, plus connect Vbat to the 3V3 from FTDI).

This implies some constraints on the user:

- removing both batteries before plugging in the cable, so saving RAM to flash is mandatory befor starting a serial session,

- same before exiting the serial session, as the cable has to be disconnected before any battery can go in,

- a slight risk of losing power to the usb if/when the PC goes into standby. Aprat from changing the PC settings, this can be avoided easily by powering the USB cable through a powered hub.

This solution might appeal more to a developper (long sessions with a PC connection), that an "normal" WP34S user.

Sorry for the lenth of this repliy!
I am still puzzled by the Gnd on pin 9 in the mentionned document though. Will check when I get mine.

Thanks for your help, Etienne

Re: [WP34S] HP cable vs USB adapters compatibility question

*Message #4 Posted by **Marcus von Cube, Germany** on 27 Sept 2011, 6:17 p.m.,*
in response to message #3 by E.Lub_EU

According to my measurements, the FTDI output is always below 3V3, more around 3V. You can add a small resistor on the transmit line. Powering the calc through the cable will definitely be an option for my development device.

Re: [WP34S][Solved] HP cable vs USB adapters compatibility question

*Message #5 Posted by **E.Lub_EU** on 27 Sept 2011, 11:18 a.m.,*
in response to message #1 by E.Lub_EU

Hi all,

I just tested the cables I received from Gene today. They are naturally compatible with the standard 9pin serial pinout.

Anybody interested in these details, please amend your copy of the pdf document "Interfacing to the HP20b V3". On page 2, look for the photo of the connector (bottom right) and change the Gnd indication so that it points to pin 5 (top row, leftmost).

Hope this helps!

Regards, Etienne

HP 15C LE Price Reduction at HP S&M Business

*Message #1 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 26 Sept 2011, 2:10 p.m.*

This morning HP reduced their list price for HP 15C LE from $129.99 to $99.99 on their Small and Medium Business Web Store.I think it was an error in the first place when they asked for $129.99, but seems like took almost three weeks to correct it.

Re: HP 15C LE Price Reduction at HP S&M Business

*Message #2 Posted by **gonzalo fernandez** on 26 Sept 2011, 3:21 p.m.,*
in response to message #1 by Kerem Kapkin (Silicon Valley, CA)

In TAS it sells for 4.5X more, seelink

Hope HP will not sell calculators in auction format, with $1 starting price (the HP CEO was the CEO of TAS), because HP15C LE prices would escalate to $300-$500

Re: HP 15C LE Price Reduction at HP S&M Business

*Message #3 Posted by **Martin Pinckney** on 26 Sept 2011, 3:33 p.m.,*
in response to message #2 by gonzalo fernandez

digits displayed by HP 15c LE

*Message #1 Posted by **Masao Kinoshita** on 26 Sept 2011, 1:25 p.m.*

I apologize if this has been discussed already. I am wondering how many digits the HP 15c LE's LCD really displays. The reason that I ask is because the picture of an HP 15c LE at www.shopping.hp.com shows 10 digits, but the spec sheet at the same site says that the display size is 12 digits. Thank you in advance.

Re: # digits displayed by HP 15c LE

*Message #2 Posted by **Kerem Kapkin (Silicon Valley, CA)** on 26 Sept 2011, 2:16 p.m.,*
in response to message #1 by Masao Kinoshita

Interesting question. Answer first, it is 10 digits. I noticed the same thing, contacted HP sales and tech support, spoke with two different people at each site, and all four insisted that spec was correct and display digits were 12 despite I reminded them the photos, manual as well as the specs for the original HP 15C.

I received my 15C LE a few days ago and I do confirm it is 10 digits. HP seriously needs to examine their customer service, portfolio, product development, product introduction, etc.

Re: # digits displayed by HP 15c LE

*Message #3 Posted by **Martin Pinckney** on 26 Sept 2011, 2:34 p.m.,*
in response to message #2 by Kerem Kapkin (Silicon Valley, CA)

> Quote:
>
> HP seriously needs to examine their customer service, portfolio, product development, product introduction, etc.

Wishful thinking, I'm afraid. There just doesn't seem to be much incentive for large companies to "get things right" with mass-produced consumer goods. Sad state of affairs.

Re: # digits displayed by HP 15c LE

*Message #4 Posted by **bill platt** on 26 Sept 2011, 3:48 p.m.,*
in response to message #3 by Martin Pinckney

Have you noticed that nowadays we buy from them because we have to rather than because we want to...

Re: # digits displayed by HP 15c LE

*Message #5 Posted by **Sondre K. Selnes** on 26 Sept 2011, 4:20 p.m.,*
in response to message #1 by Masao Kinoshita

My original HP-15C from 1984 has 10 digits in the display.

Re: # digits displayed by HP 15c LE

*Message #6 Posted by **Marcus von Cube, Germany** on 26 Sept 2011, 9:40 p.m.,*
in response to message #5 by Sondre K. Selnes

The new one is running the same firmware as the old so the precision is the same.

Re: # digits displayed by HP 15c LE

*Message #7 Posted by **Paul Gaster** on 27 Sept 2011, 9:05 a.m.,*
in response to message #1 by Masao Kinoshita

It is just a typo. An unfortunate one that should not happen, but still a typo only. That typo is in many places I see, so that makes it even worse:

home shopping site says 12

small business says 12

The full data sheet from this page is correct and says 10:

data sheet link is to the right of the price, and it is in PDF format

I did not check the rest of the data sheet for accuracy, but at least it got the number of display characters correct.

HP's "Calculator Club"

*Message #1 Posted by **megarat** on 26 Sept 2011, 1:25 p.m.*

So, what is HP's new (?) "HP Calculator Club"?

http://h30248.www3.hp.com/calcclub/

Is it actually worth signing up for?

Re: HP's "Calculator Club"

*Message #2 Posted by **Roger Blake** on 26 Sept 2011, 2:08 p.m.,*
in response to message #1 by megarat

Probably not ! you get a bundle of "calculator ttf fonts" (keys and suchlike) which seem pretty naff, and some unexciting special offers of no use to most people. The forum seems to have disappeared into a reorganisation of HP support forums - I can't find it, but wouldn't have thought it's got anything that this one hasn't)

Re: HP's "Calculator Club"

*Message #3 Posted by **megarat** on 26 Sept 2011, 4:18 p.m.,*
in response to message #2 by Roger Blake

Do you know how old the Calculator Club is? This is the first I've heard of it, but I'm also not that plugged in.

I wonder if HP uses the Calculator Club as a method for collecting data w/r/t decision support. E.g., if all of us signed up, just seeing the large headcount might encourage them to invest more in R&D.

Re: HP's "Calculator Club"

*Message #4 Posted by **Howard Owen** on 26 Sept 2011, 5:57 p.m.,*
in response to message #3 by megarat

I think that a more effective message could be sent by buying up 15C LEs by the handful :)

The engineers responsible for calculator design at HP read this forum and are more our less sympathetic to concerns expressed here. But decisions about what sort of machine to produce are made on the basis of sales figures, projected or actual. Even if the 15C is not your ideal calculator, if you like keystroke programmable RPN calculators, buying a 15C could send a louder message than all the entreaties you might make on a calculator forum.

Re: HP's "Calculator Club"

*Message #5 Posted by **Eric Rechlin** on 26 Sept 2011, 6:00 p.m.,*
in response to message #3 by megarat

Not sure exactly, but I think it's been around for at least a few years.

Eric

Profit and TAS

*Message #1 Posted by **Joerg Woerner** on 26 Sept 2011, 1:00 p.m.*

Yes, I'm selling a HP 15c on eBay under my nick name Datamath-Calculator-Museum.

No, it is NOT for the profit.

Please let me share some facts with you:

The Datamath Calculator Museum is not for profit, it is a hobby. But it is not a cheap hobby, every collector knows that the last 10 items you are looking for are pretty expensive.

I decided long time ago to avoid any Google Ads or similar advertisements on my website and to make all scanned and PDF'd manuals available for free download.

I'm on eBay since 1999 and changed my ID in 2007 to built up a good reputation in selling calculators to COLLECTORS (not bargain hunters). In the past 12 years of buying calculators on eBay, I received a lot of crap. I could easily sell dozens of boxes of 25 trash calculators, each.

Each USED calculator I sell is tested and cleaned twice: The day I receive it and when I take the pictures for the auction. I describe every flaw I notice and take crisp pictures of each calculator. I accept returns and the rate is far less than 1%. The last one was an ADLER with a non-working [4] key. No idea how I could miss this...

I received from other "Pro" calculator sellers multiple requests in the past two years:

1) Sell only for a (high) BUY-IT-NOW price 2) Let's agree on minimum prices for some "rare" calculators

I still sell my calculators auction style - but changed recently the minimum price from $9 to $19. I had a lot of calculators ending up at $9.50 or so averaging my "profit" (w/o eBay fees!) around an hourly rate LESS than MINIMUM WAGE in Upstate NY!

I received a lot of emails from buyers, too:

3) Can you make a BUY-IT-NOW for this calculator?

Answer is always the same: NO - and a few names are already blocked from my auctions for this reason.

And the HP 15c you might ask now?

Four of my international collector friends asked me for some assistance in purchasing HP 12c and 15c's and SHIP them. I simply purchased two each, more - expecting some change for my next great purchase of either the Exactra 100 prototype (asking price is two grands!!!) or a TI-88 in the transparent housing (no asking price so far).

Thanks for your time reading through this message.

Best regards, Joerg

Re: Profit and TAS

*Message #2 Posted by **Geoffrey Wang** on 26 Sept 2011, 1:30 p.m.,*
in response to message #1 by Joerg Woerner

Great post!

I really don't understand the TAS bashing going on in this forum, especially regarding sellers. I too have considered reselling some of my extra HP15CLE's for some profit, but just haven't. Would that make me a bad guy?

IMHO, Joerg's success with unique inventory, great photos, accurate descriptions, and stellar track record INCREASES his final prices as the best calculator seller on TAS.

Although I have never bought anything from Joerg, I would not think twice about doing so.

Geoffrey

in response to message #2 by Geoffrey Wang

Thanks - makes you a good guy!!!

Multiple calculator collectors asked me to sell THEIR calculators under MY name.

I never did. Makes me a good guy? Probably not, but a stupid one'

Real life: I am an engineer, not in sales...

Cheers, Joerg

BTW: Top bidders on the two 12c and 15c auction are from France, Israel and Brazil. All but one are returning customers!

Re: Profit and TAS

*Message #4 Posted by **Philippe Lasnier** on 27 Sept 2011, 7:47 p.m.,*
in response to message #2 by Geoffrey Wang

I'd like to add my voice to Geoffrey's (and everybody else's), and come to the defence of Joerg. I have bought a few things from Joerg over the years, and I have always received excellent service, above and beyond. Before I did, and outside of TAS, Joerg has always been helpful, and has a good sense of humour. Because he is well-known, and trusted, his calculators would indeed go for higher prices, but that's worth paying for (I wish that when I trim my collection I get as good prices as he does).

As for the re-selling of his surplus HP-15C LE (and HP-12C 30A), I bet he was as surprised as I was to see them go at such a premium!

Why so much? I don't know for sure, but I would hazard that quite a few people are not aware of Samson Cables or the very few other people who would currently ship these calculators outside of the USA, and go to TAS simply because that's the best place they would know.

Carry on Joerg! (oh, and can I have a discount next time ;-))

Philippe

*Message #6 Posted by **Howard Owen** on 26 Sept 2011, 6:42 p.m.,*
in response to message #1 by Joerg Woerner

I don't like the idea of buyers being victimized by people like Coburlin, *but you don't do that!*. As long as the item is fairly described, then how could I possibly object to an open auction? I think I even stand on dubious ground when I criticize Coburlin, though I just can't get a bad taste out of my mouth with him. I think the problem is that he's obviously not an aficionado and he's taking advantage of people who might be aficionados. Just as obviously, it's clear that you *are* an aficionado. You fairly describe and document what you sell. If your auctions go higher than what I would pay, it's none of my business.

And good for you for not agreeing to collusion on prices. We who haven't filled the last 50 slots in out collections appreciate it. :)

Best of luck,
Howard

Re: 34s: TVM problem?

*Message #1 Posted by **Dominic Richens** on 26 Sept 2011, 12:40 p.m.*

I actually had a need to do TVM so I thought I would try out the wp34s library routine.

I believe it is broken by the fact that LBL 00 is used twice in segment 1, step 15 for TVM and 368 as part of the vector functions.

It doesn't seem to matter if I load that segment into RAM or try to run it from the XROM.

I can get it work if I delete step 368 after the PRCL 1

Re: 34s: TVM problem?

*Message #2 Posted by **Marcus von Cube, Germany** on 26 Sept 2011, 1:59 p.m.,*
in response to message #1 by Dominic Richens

Ma fault. You can rebuild the libraries yourself if you have the cable. I'll change the label in one of the functions or use Niel's assembler for this. Stay tuned.

Re: 34s: TVM problem?

*Message #3 Posted by **Dominic Richens** on 26 Sept 2011, 7:47 p.m.,*
in response to message #2 by Marcus von Cube, Germany

oh good, I'm not crazy :-)

I only just got my 20b - when Neil gets back to Ottawa I'm going to borrow his cable (unless he got me my own) to flash this puppy.

Is the cableless alternative to change the 2nd LBL00 and calls to it to something else and then save the RAM back to segment 1?

Re: 34s: TVM problem?

*Message #4 Posted by **Paul Dale** on 26 Sept 2011, 7:58 p.m.,*
in response to message #3 by Dominic Richens

You should be able to PRCL 1 to copy the flash segment to RAM, edit it there and PSTO to write it back to flash.

Praise for the 34S

*Message #1 Posted by **Egan Ford** on 26 Sept 2011, 12:19 p.m.*

Hi,

I've been a 34S user for about 24 hours. I've had lukewarm interest in the 34S from that start because it didn't fulfill any of my needs. I often asked myself, "why?" Anyway, I took my freebie skinless 30b beta unit to the conference and had it flashed so that I could see what all the excitement was about. Then I ignored it.

Saturday night I completed my 15C "Legacy Edition" solution for the RPN programming contest. It was slow--too slow. Any RPN was permitted, but only speed was considered. I had no choice. I had to use the 34S.

Sunday morning I sat down with my blank-faced 34S, and using the excellent docs on my iPad I started to port over my 15C program. CEIL was there! Woo hoo! I think what impressed me the most was that even without Eric's designer labels I was able to quickly enter the program because much of the layout was conventional or perhaps commonsense. I found myself looking at the iPad rendered PDF less and less.

Later I scored a proper 34S at the conference (GA level 30b with Eric's handiwork performed by Eric himself!) and spent the evening reading the manual. This machine is awesome and I will be building at least two backups.

After 27 years of using my 15C I think I can safely retire it. I thought I could retire my 15C with the 42S, but I always preferred overloaded keys and stuck with the 15C (although Free42 is my default iPhone 4-banger).

I cannot stress enough how awesome the 34S is. Get two while you can. And, if you are lazy like me, you can order them pre-built and skinned from Eric (http://www.hpcalc.org).

Thanks team 34S!

in response to message #1 by Egan Ford

The WP 34S was the most discussed topic on HHC and you may get an idea why, now.

Re: Praise for the 34S

*Message #3 Posted by **Walter B** on 26 Sept 2011, 4:53 p.m.,*
in response to message #1 by Egan Ford

Thanks, Egan, for your kind words. We wouldn't have made it, however, if HP hadn't teased us repeatedly by launching only financial calcs (now we know why they need them ;-) but we couldn't imagine then). So we wanted to show we can adequately fill a sector HP was once famous for but apparently didn't (doesn't?) want to anymore. Knowing this is a very critical audience here discussing a lot (which are *positive* values where I was educated), we are simply happy you enjoy the WP 34S :-)

There is, of course, still space for improvement - but some people will probably kill us when/if we change the keyboard labels once more [:-(

Thanks again d:-)

Walter

I know I shouldn't look a gift horse in the mouth, but if you ever decide to make some improvement don't forget to change [g] [OFF] to [h] [OFF]. This is my only complaint regarding the keyboard layout. I am still using mine without an overlay, so no problem here :-)

Gerson.

Re: Praise for the 34S

*Message #6 Posted by **Paul Dale** on 26 Sept 2011, 7:19 p.m.,*
in response to message #4 by Gerson W. Barbosa

That change is the first on the list of pending changes for the keyboard. The difficulty being the number of overlays that are already in the wild. We'd prefer to not waste all that effort.

- Pauli

Re: Praise for the 34S

*Message #7 Posted by **E.Lub_EU** on 27 Sept 2011, 7:40 a.m.,*
in response to message #6 by Paul Dale

This might be a silly question, as I do not have a large HP calculators culture, and have not practised a lot writing math.
I am curious about the choice of key presses for the reciprocal (or should I say inverse?) hyperbolic trig functions, i.e.:

{HYP^{-1}} {SIN}

as opposed to

{HYP} {SIN^{-1}}

which would free the {g-shift}{A} position on the keyboard.

Legacy from the past HP machines, maths "standard" or developpers' preferences?

Edited: 27 Sept 2011, 7:40 a.m.

Re: Praise for the 34S

*Message #8 Posted by **Paul Dale** on 27 Sept 2011, 7:45 a.m.,*
in response to message #7 by E.Lub_EU

g HYP^{-1} SIN is three key presses.

f HYP g SIN is four.

The second also requires two different shift keys to be pressed which is something we've (mostly) avoided.

- Pauli

Re: Praise for the 34S

*Message #9 Posted by **E.Lub_EU** on 27 Sept 2011, 9:30 a.m.,*
in response to message #8 by Paul Dale

Ah, Right.

I had overlooked the fact that SIN would not need the f-prefix, when used after the HYP. Back to re-re-re-reading that fine manual....

Thanks, Paul

Re: Praise for the 34S

*Message #10 Posted by **Marcus von Cube, Germany** on 27 Sept 2011, 5:58 p.m.,*
in response to message #9 by E.Lub_EU

Both combinations work. So if you press f HYP and then decide you need the inverse, g will switch to HYP^-1 and f will switch back. :-)

Re: Praise for the 34S

*Message #11 Posted by **Walter B** on 27 Sept 2011, 6:19 p.m.,*
in response to message #10 by Marcus von Cube, Germany

I won't say that's as advertised. But since we all grow older I may call it "focussed to our customers"? Oooh, shall I take the inverse or its inverse? So hard to decide ... ;-)

Re: Praise for the 34S

*Message #12 Posted by **Paul Dale** on 27 Sept 2011, 6:46 p.m.,*

> The difficulty being the number of overlays that are already in the wild. We'd prefer to not waste all that effort.

If you ever do change it, the longer you wait, the more there will be. The first ~60 that I sent out in June were arguably of prototype quality, so those could largely be discounted. The new ones I made for HHC 2011 (close to 50) are definitely better, but only time will tell if they are good for long term use.

I will be making a bunch more soon, though, so we probably are coming close to reaching the point where too many are out there.

Eric

Re: Praise for the 34S

*Message #14 Posted by **Didier Lachieze** on 27 Sept 2011, 11:32 a.m.,*
in response to message #13 by Eric Rechlin

I got one of these early overlays for my wp-34s and I can say they are great! However, after 3 months of usage I've noticed some key wear out, specially on the [h] key which seems to be used a lot more than the other ones. How difficult would it be to replace this overlay with a new one? Or do I need to consider a new 30b to go with the new overlay?

Re: Praise for the 34S

*Message #15 Posted by **Eric Rechlin** on 28 Sept 2011, 2:10 p.m.,*
in response to message #14 by Didier Lachieze

I'm now putting a clear spray on the overlays in the hope of making them more durable. Time will tell whether that actually helps.

Eric

Re: Praise for the 34S

*Message #16 Posted by **Cristian Arezzini** on 28 Sept 2011, 3:45 p.m.,*
in response to message #15 by Eric Rechlin

Is it a matte or shiny spray? If it's shiny, I'm a little concerned about the reflections...

Cristian

Re: Praise for the 34S

*Message #17 Posted by **Eric Rechlin** on 28 Sept 2011, 3:58 p.m.,*
in response to message #16 by Cristian Arezzini

I'm concerned about reflections, too.

It's satin with a thin coat, or glossy with a heavy coat. I am trying a thin coat for now to see how well that works.

Eric

Re: Praise for the 34S

*Message #18 Posted by **Paul Dale** on 26 Sept 2011, 5:53 p.m.,*
in response to message #1 by Egan Ford

Thank you very much for the very kind words.

You are correct about the keyboard layout, that is the bit I'm most happy with on the 34S. Everything is logically arranged. Once you get over the initial clutter, it is easy to find almost every function quickly. Walter is mostly to blame for this :-)

- Pauli

Can't this forum's outdated format be updated?

*Message #1 Posted by **mr-scorpio** on 26 Sept 2011, 11:37 a.m.*

Where each Thread starter is permanently shown & any replies are merely noted as a number etc, UNTIL you actually enter the thread & see the replies properly.

All this zig-zagging is very wasteful & inefficient? It also means that a thread that would still otherwise be a few lines down from the top, gets shoved off the bottom of the screen, thus potentially being 'out of sight, out of mind', to anyone who might have replied, but no longer sees the thread, and thus forgets about it.

How much effort might be involved in migrating this Forum (& its archive) to a current style Bulletin Board system, say phpBB for example?

Please do not view this thread as a 'moan', but more as a constructive critisism in potentially kick-starting ideas for positive change.

Re: Can't this forum's outdated format be updated?

*Message #2 Posted by **Randy** on 26 Sept 2011, 12:18 p.m.,*
in response to message #1 by mr-scorpio

I like the format, far less visual noise than phpBB. IMO, the paging needed with long threads in phpBB is very annoying.

Re: Can't this forum's outdated format be updated?

I'm a moderator on 6502.org's phpBB forum. One of the few things I don't like about phpBB is that for example if you do a search and your search term appears only in page 6 of a 10-page topic, it won't put on on page 6. You have to still go through that pages until you find the one where it exists and is highlighted.

Re: Can't this forum's outdated format be updated?

*Message #4 Posted by **Jonathan Eisch** on 26 Sept 2011, 12:45 p.m.,*
in response to message #1 by mr-scorpio

While I like the format, and find it very intuitive, but I can see how others might want to see it any number of other ways.

Fortunately, the html is very clean (just nested lists) so it would be relatively simple to just parse it with HTMLParser in python or something similar, and make your own version.

I would assume you could use greasemonkey or similar to add your own css and a little javascript to collapse it down, but I don't know so much about that.

-Jonathan

Re: Can't this forum's outdated format be updated?

*Message #5 Posted by **Dominic Richens** on 26 Sept 2011, 12:52 p.m.,*
in response to message #1 by mr-scorpio

I quite like the current forum for just browsing - I like the context of new article with the old. However it does fall quite short when it comes to looking for information.

The search function doesn't really work - at least I can never get it to work, especially with anything older than a couple of weeks.

Also, once you find that old article, you can't post a follow-up, you need to start a new thread.

Not sure how easy it would be to import all old articles into something more modern like phpBB or WordPress "mingle"

Re: Can't this forum's outdated format be updated?

*Message #6 Posted by **Garth Wilson** on 26 Sept 2011, 3:21 p.m.,*

Ditto here. I've gone to using the web search engine (ixquick.com, not Google, but it works the same).

> Quote:
>
> Also, once you find that old article, you can't post a follow-up, you need to start a new thread.

Some people think you shouldn't dig up old ones and post new material on them. As a moderator on another forum, I encourage people to do just that. It makes it more difficult if the old is separated from the new and background or answers already given have to be repeated, and even then, some of the value in the old is lost. Keep it all together! This goes especially for cases where our projects may go years, even going dormant for a period when life gets in the way.

Re: Can't this forum's outdated format be updated?

*Message #7 Posted by **Marcus von Cube, Germany** on 26 Sept 2011, 2:15 p.m.,*
in response to message #1 by mr-scorpio

You can set-up the layout to different formats from the search page. What I don't like is:

1. The information about new articles (the date of the last visit) is stored on the browsing machine, not in the database per user.
2. The limit of 500 active messages is a bit on the low side at times.
3. The JavaScript (buttons below the reply window) does not apply formatting to the currently selected text, id always adds the tags at the end and scrolls the input window back to top.
4. If you edit an older post, you cannot preview it.

Otherwise I like it very much being here.

Re: Can't this forum's outdated format be updated?

*Message #8 Posted by **Garth Wilson** on 26 Sept 2011, 3:24 p.m.,*

Yes, it absolutely drives me nuts!! I do not write from beginning to end.

Re: Can't this forum's outdated format be updated?

*Message #9 Posted by **Michael Kussmaul** on 26 Sept 2011, 5:38 p.m.,*
in response to message #1 by mr-scorpio

I don't mind the formatting, I just have one thing I would change:

Because I access the forum by using multiple computers (Mac, iPad, iPhone, ...) it seems my read count is not shared across the computers - even when I log in using my username... It seems the read-count is just saved as a cookie and is not stored server side.

It would be great to store the read-count on the server side, so I could continue reading on whatever computer I'm currently logged in :-)

Re: Can't this forum's outdated format be updated?

*Message #10 Posted by **Howard Owen** on 26 Sept 2011, 7:58 p.m.,*
in response to message #1 by mr-scorpio

I agree with every point (so far) raised here. But I also know that the forum ticks along quite well with a single admin, and he's the guy that would have to transition to something new, and to live with supporting it. I also don't mind playing with outdated technology. :)

Re: Can't this forum's outdated format be updated?

*Message #11 Posted by **Kevin Brown** on 27 Sept 2011, 12:04 p.m.,*
in response to message #1 by mr-scorpio

The biggest deficiency I see is the archiving mechanism. It causes threads which should be continuous to be broken up. This makes it significantly more difficult to see the context of some of the responses to a thread than it should be, because the context lives in an archive while the active part of the thread does not.

Other than that, I like the way the forum displays threads.

Nothing says I Love You like a 15C LE!

*Message #1 Posted by **Todd Garabedian** on 26 Sept 2011, 10:52 a.m.*

Received my two 15C LE units on Saturday. One was for me and the other was a gift for my wife who is a college professor. She has an original 15C she purchased as an undergrad in 1982, but its keyboard has been having problems for the last few years (sometimes numbers get entered and sometimes they do not). It got to a point where the original 15C just sat in a drawer most of the time. I got her a 32SII back in the late 90s... she uses it, but wasn't thrilled with it.

Well, she was very happy to receive the new 15C LE. She loves the keyboard layout, and since she is familiar with all the functions and where they are located, she can speed through calculations much faster. She says I did good!

Re: Nothing says I Love You like a 15C LE!

*Message #2 Posted by **Eddie W. Shore** on 26 Sept 2011, 11:20 a.m.,*

are the keys of the HP15C LE molded?

*Message #1 Posted by **Gonzalo Fernandez (Spain)** on 26 Sept 2011, 10:18 a.m.*

Are the keys of the new HP 15C LE made of molding two plastics of different colors or painted? The first HP calculator that went from molded keys to painted keys was the HP48G line made in Indonesia. I have seen prices of HP15C LE in the TAS ridiculous (more than $400, see link) Is not forbidden by law to sell one new product more than the MSRP price? HP can put a claim to TAS for selling his products 4x its value?

Re: are the keys of the HP15C LE molded?

*Message #2 Posted by **Michael de Estrada** on 26 Sept 2011, 10:36 a.m.,*
in response to message #1 by Gonzalo Fernandez (Spain)

There is no law preventing resellers to chose any price they wish. A manufacturer has no control over the price that a private citizen can choose to sell their products. The only control that a manufacturer may have is over the price chosen by a primary distributor or retail outlet, and even then it's not a legal issue. Products are rarely sold at MSRP, although the retail price is usually below MSRP. TAS is a completely open marketplace, and people are free to be complete idiots by paying absurd prices if they so desire. BTW, the high bidder on the auction you have linked is not in the USA, and probably European.

Re: are the keys of the HP15C LE molded?

Hey, as a seller on "TAS", I like those folks! :)

Re: are the keys of the HP15C LE molded?

*Message #4 Posted by **Todd Garabedian** on 26 Sept 2011, 10:37 a.m.,*
in response to message #1 by Gonzalo Fernandez (Spain)

I don't believe there are any laws on this, but apparently HP doesn't have any policy about its authorized resellers selling for a certain amount. Buy.com and Sampson are selling the 15C LE for significantly more than the price on the HP website.

As for end user/purchasors, they can sell their goods for whatever they want. If some dolt wants to spend $400 on a calculator they can buy elsewhere for $99, I say let them. That's the free market, baby!

Re: are the keys of the HP15C LE molded?

*Message #5 Posted by **Michael de Estrada** on 26 Sept 2011, 10:41 a.m.,*
in response to message #4 by Todd Garabedian

It's not Buy.com that's selling the 15C LE for a high price, but Samson Innovations, which is the same outfit as Samson Cables. Buy.com is sold out of the 15C LE, and never sold it for more than $89.99. I got mine for only $73.99 from them with a $5 coupon. :).

> I don't believe there are any laws on this, but apparently HP doesn't have any policy about its authorized resellers selling for a certain amount.

There are laws (or at least court precedents) that *prohibit* HP from controlling the final selling prices. It's called "restraint of trade" in the U.S.

Long gone are the days when manufacturers set retail prices, and sanctioned retailers who didn't tow the line. That's why you'll see MSRP listed, with the emphasis on "Suggested."

Re: are the keys of the HP15C LE molded?

*Message #7 Posted by **Roger Blake** on 26 Sept 2011, 10:52 a.m.,*
in response to message #1 by Gonzalo Fernandez (Spain)

> Quote:
>
> Are the keys of the new HP 15C LE made of molding two plastics of different colors or painted? The first HP calculator that went from molded keys to painted keys was the HP48G line made in Indonesia.

I've just had a look under a microscope and the original has very sharp edges to the lettering. The letters are also bigger and wider than on the LE. The LE has fuzzy outlines as do the blue and yellow labels on both old and new, so I reckon the LE has painted keys :-(

Re: are the keys of the HP15C LE molded?

*Message #8 Posted by **gonzalo fernandez (spain)** on 26 Sept 2011, 10:58 a.m.,*
in response to message #7 by Roger Blake

So the keys of the old HP calculators were better made? What a pity, it seems to me that the last HP calculator with best manufacturing quality (keys, materials) was the HP48G models. From there on, quality was worse (HP49g, 50g,,)

Re: are the keys of the HP15C LE molded?

*Message #9 Posted by **megarat** on 26 Sept 2011, 12:04 p.m.,*
in response to message #8 by gonzalo fernandez (spain)

Some might disagree w/you about this point as well, as I think all (or at least some) of the 48G* line had painted keys, and the calculators were no longer being manufactured domestically. (The domestic-

to-abroad transition happened during the middle of the 48S* line.)

Re: are the keys of the HP15C LE molded?

*Message #10 Posted by **Jose Poyan** on 26 Sept 2011, 1:48 p.m.,*
in response to message #8 by gonzalo fernandez (spain)

I totally agree that it's a pitty that the keys are painted. In the HP48G series I could clearly see the difference between the molded Singapore made keys and the painted Indonesia made keys. They felt the same but they certainly didnt look the same and, in my case, I didnt need glasses to see the difference. This was much more noticeable with the Pioneer series. The keys looked like fake cheap ones, and even the plastic was different comparing Sing and Ind made units. I hope the HP 15C LE is made in high quality plastic. I can not wait for them to buid more, and start distributing them in Europe.

I hope they decide the LE was a "selling succede" and they start producing the standard 15C again.

Re: are the keys of the HP15C LE molded?

*Message #11 Posted by **Hugh Evans** on 26 Sept 2011, 12:35 p.m.,*
in response to message #1 by Gonzalo Fernandez (Spain)

Usually, the problem is minimum advertised pricing (MAP) out of concern that distributors will have trouble competing with companies who can survive short term losses. However, there is no legal upper limit and "You will never go broke underestimating the intelligence of the American public."

[WP34S] [Manual] Date - Day functions

*Message #1 Posted by **E.Lub_EU** on 26 Sept 2011, 9:45 a.m.*

Hello all,

Browsing through the manual specifically to understand the date manipulation functions, I have stumbled on something that I find strange:

- p. 34, I found the DAY function. At that time, still wondering about its output content (expecting day of the month, in numéric form). Just above and and below, the DATE and DAYS+ cases seem quite clear (really need to get the other calcs manuals to understand the nitty-gritty).

- p. 53, WDAY description seems perfect. Makes me think that, in contrast, DAY would probably return the day of the month.

But

- p. 27, the example display 10. shows the output of the DAY function with the data and in the format that I expect for the WDAY function.

Unless I did miss something, I would suggest that - p27 shows the WDAY function, - the description of the DAY function would be clearer if modified as "... and extracts the day of the month."

Nothing being mentionned about stack changes for DAY, MONTH & YEAR, I assume there is none. Is that correct?

Thanks again for your nice manual!

Regards, Etienne

PS. I nearly forgot, I believe that the footer 3) on page 11 refers to a page 8 that could have morphed into a page 10 (the Greek alpha keyboard)

Re: [WP34S] [Manual] Date - Day functions

*Message #2 Posted by **Walter B** on 26 Sept 2011, 3:39 p.m.,*
in response to message #1 by E.Lub_EU

Bonsoir Etienne,

merci pour votres observations. You're right, there's an error in the documentation on page 27: it should refer to WDAY. With respect to DAY, MONTH, and YEAR: each of these three extracts the respective part of an arbitrary date, so for today DAY returns 26, MONTH 9, and year 2011. All these are one-number functions as described on page 12, replacing the date in x by the value they return.

And also your observation concerning the footnote on page 11 is correct.

Both items are corrected now and will be committed with an updated manual soon.

Merci encore une fois,

Walter

Re: [WP34S] [Manual] Date - Day functions

*Message #3 Posted by **E.Lub_EU** on 26 Sept 2011, 5:04 p.m.,*
in response to message #2 by Walter B

Guten Abend Walter,

Thanks for your quick answer. I can see the consistency of DAY - MONTH - YEAR operations now, probably as you do, as a group. It was less obvious for a newbie, discovering the alphabetical organisation of the function list, to isolate the DAY function from its neighbours.

Sorry for not realizing that they were obvious one argument operations (I had read it though!), I am still in the information overload period.

The more I read, the more I am in awe of the quality of your work.

Chapeau bas, gentlemen!

Regards, Etienne

H to HMS Bug in HP 15C LE?

*Message #1 Posted by **Eddie W. Shore** on 26 Sept 2011, 9:43 a.m.*

```
My apologizes if this has been talked about before:

HP 15C LE in Radians Mode:
Converting sqrt(5) to HMS gives 2.140984472  (2°14'9.84472")
Going back to H gives 2.400188825  [I believe this is wrong]

HP 15C LE in Degrees Mode:
Converting sqrt(5) to HMS gives 2.140984472
Going back to H gives 2.236067978
```

Not a bug!

*Message #2 Posted by **Namir** on 26 Sept 2011, 9:52 a.m.,*
in response to message #1 by Eddie W. Shore

Eddie,

My machine does these calculations correctly!

If you execute conversion to H TWICE, back from 2.14098, you get 2.40019!!! That is,

2.23607 ->H gives 2.40019

Namir

Edited: 26 Sept 2011, 10:06 a.m.

15C LE arrivals in Europe?

*Message #1 Posted by **Thomas Radtke** on 26 Sept 2011, 7:09 a.m.*

Ordered from SC via USPS priority, sent 9/13, last sign of live 9/16 as per tracking information. I know it takes time, but I'm getting nervous.

Anyone here in EU got his 15C LE already except by express mail?

Thanks,

Thomas

Re: 15C LE arrivals in Europe?

*Message #2 Posted by **Michael Kussmaul** on 26 Sept 2011, 7:13 a.m.,*
in response to message #1 by Thomas Radtke

I live in Switzerland and ordered by Samson - I received mine last Friday, I think it was shipped by Sep 16 and arrived Sep 22. I used standard shipping (+ $8 for a box) with no tracking.

Re: 15C LE arrivals in Europe?

*Message #3 Posted by **Didier Lachieze** on 26 Sept 2011, 7:41 a.m.,*
in response to message #1 by Thomas Radtke

Mine was ordered also from SC via USPS Priority mail, sent 9/13, delivered 9/23 (last Friday) in France.
I paid $24 for the shipment without tracking, but was not offered the possibility to add $8 for a box, so my 15C LE was send in a bubble bag. Fortunately it arrived in good shape...
All in all for $123.99 (no custom fees) and no keyboard issue excepted the f and g keys a bit loose I'm pretty happy with my new 15C LE :-)

Edited: 26 Sept 2011, 7:45 a.m.

*Message #7 Posted by **Dusan Zivkovic** on 26 Sept 2011, 8:17 a.m.,*
in response to message #1 by Thomas Radtke

My parcel from Samson is waiting for me to pay the customs duty and pick it up at the notorious North West London Parcel Force depot. Who knows when I will have time to get there during their working hours. Probably only on Saturday. Grrr.

Re: 15C LE arrivals in Europe?

*Message #8 Posted by **Vladan Dugaric** on 26 Sept 2011, 8:33 a.m.,*
in response to message #1 by Thomas Radtke

My SC parcel was sent on 9/13 and I am still waiting for it. I presume it is in a depot waiting for customs clearance, but I haven't got a card to tell me to pick it up yet.

Vladan

Re: 15C LE arrivals in Europe?

*Message #9 Posted by **Dusan Zivkovic** on 26 Sept 2011, 8:44 a.m.,*
in response to message #8 by Vladan Dugaric

You won't get the card; they can't be asked. Parcel Force are awful. I worked out that it was in their depot through the US tracking number which Samson gave me. Now the question is - which depot is your local one? Good luck.

Re: 15C LE arrivals in Europe?

*Message #10 Posted by **Bart (UK)** on 26 Sept 2011, 9:19 a.m.,*
in response to message #9 by Dusan Zivkovic

My depot usually sends a card, it's just a question of when they feel like sending the card. I expect I will have to pay 20% VAT + the £8 for "admin costs" of them collecting the VAT and sending it to HMRC.

Re: 15C LE arrivals in Europe?

*Message #11 Posted by **hpnut** on 26 Sept 2011, 10:07 a.m.,*
in response to message #10 by Bart (UK)

I sympathise with you Europeans, your governments seem to be collecting tax at every opportunity.

Government of Malaysia does not collect tax on computer products, so my packages from SC arrived in about 7-11 days. they opened one for inspection though, but the contents were intact.

hpnut in Malaysia

Re: 15C LE arrivals in Europe?

*Message #12 Posted by **Bart (UK)** on 26 Sept 2011, 9:18 a.m.,*
in response to message #1 by Thomas Radtke

SC posted mine on 13 Sept. too. I ordered 1x 15C-LE and 1x 12C AE, using the cheaper USPS Priority, and it hasn't arrived yet. I expect it is in the depot. I was not asked about a box either, so I expect it will be in bubble wrap or similar - hope it will be undamaged.

Re: 15C LE arrivals in Europe?

*Message #13 Posted by **Derek Walker (UK)** on 26 Sept 2011, 9:20 a.m.,*
in response to message #1 by Thomas Radtke

Ordered from SC on Sep 12, dispatched via USPS Express (with tracking) on Sep 14, arrived in UK Sep 16, approx 1 week taken up by UK customs processing, arrived at local Parcelforce depot Sep 23 and collected today. Sent in cardboard outer box which didn't seem to have suffered any ill effects in transit.

Re: 15C LE arrivals in Europe?

*Message #14 Posted by **Alexander Oestert** on 26 Sept 2011, 7:26 a.m.,*
in response to message #1 by Thomas Radtke

Copy and paste your USPS tracking code to the DHL tracking site. You will most certainly learn that your parcel has been handed over to German customs in the destination town on Saturday. It might now take another fortnight due to some ingenious plot that all deliveries from overseas have to be shipped to a central customs office in Leipzig... :-(

Re: 15C LE arrivals in Europe?

*Message #15 Posted by **Thomas Radtke** on 26 Sept 2011, 10:22 a.m.,*
in response to message #14 by Alexander Oestert

I learned that DHL doesn't know about the number.

Highly strange is that it's recorded to be a *letter*:

Priority Mail International Parcels
Processed through Sort Facility
September 16, 2011, 1:54 pm
LOS ANGELES, CA 90009
International Letter

Re: 15C LE arrivals in Europe?

*Message #16 Posted by **Alexander Oestert** on 26 Sept 2011, 1:39 p.m.,*
in response to message #15 by Thomas Radtke

Quote:

> I learned that DHL doesn't know about the number.

Strange! Mine is also Priority Mail International - but 'Parcel'. Tracking number starts with CJ and ends in US. From the moment on that it arrived in Frankfurt Airport, DHL tracking showed it in all details.

Re: 15C LE arrivals in Europe?

*Message #17 Posted by **Thomas Radtke** on 26 Sept 2011, 2:26 p.m.,*
in response to message #16 by Alexander Oestert

I was given this number: LN840122429US. Guess it's not needed to keep this secret.

Re: 15C LE arrivals in Europe?

*Message #18 Posted by **Lutz Jacob** on 26 Sept 2011, 11:57 a.m.,*
in response to message #1 by Thomas Radtke

Same here, sent from SC on 9/13 and still no sign of it. But I think 2..3 weeks are usual for USPS shipment to Germany.

Re: 15C LE arrivals in Europe?

*Message #19 Posted by **Thomas Radtke** on 26 Sept 2011, 12:05 p.m.,*
in response to message #18 by Lutz Jacob

I had some hope since I've recently read about deliveries in 4 to 7 days but obviously that doesn't take into account german customs.

Few days to travel thousands of miles, two weeks of waiting for a german officer to wake up.

Re: 15C LE arrivals in Europe?

*Message #20 Posted by **Hubert Weikert** on 26 Sept 2011, 12:41 p.m.,*
in response to message #1 by Thomas Radtke

I live in Munich, Germany. My 15C LE arrived Friday last week at customs, I picked it up this morning. Had to pay the VAT. Samson cables shipped it Sept 13th, so it took 10 days to cross the pond. Standard USPS shipping, in a bubble envelope. No damage.

Hubert

Edited: 26 Sept 2011, 12:46 p.m.

Re: 15C LE arrivals in Europe?

*Message #21 Posted by **Borja** on 27 Sept 2011, 5:11 a.m.,*
in response to message #20 by Hubert Weikert

I preordered two from Samson Cables on July 27th. It has just gone through customs and I expect it this week.

Samson shipped them on Sept 13th, but Spanish customs are a pain in the ass lately.

Re: 15C LE arrivals in Europe?

*Message #22 Posted by **poehsve** on 28 Sept 2011, 4:05 a.m.,*
in response to message #20 by Hubert Weikert

Same here for my two units in Berlin, Germany. Had to pay VAT to be glad, what I am now for sure.

Sven

Re: 15C LE arrivals in Europe?

*Message #23 Posted by **Borja** on 28 Sept 2011, 6:23 a.m.,*
in response to message #22 by poehsve

Here they are, finally! (I ordered two).

I have no problem to pay my taxes, I'm a law abiding citizen, but the delay has been intolerable for an express shipping.

Re: 15C LE arrivals in Europe?

*Message #24 Posted by **Andreas Haack** on 28 Sept 2011, 10:21 a.m.,*
in response to message #22 by poehsve

Hi Sven,

was your order with USPS Priority Mail or Express ?

Thanks, Andreas Berlin-Germany

Re: 15C LE arrivals in Europe?

*Message #25 Posted by **Borja** on 28 Sept 2011, 11:15 a.m.,*
in response to message #24 by Andreas Haack

Express. Took just 5 days to reach customs, several days for clearance.

Re: 15C LE arrivals in Europe?

*Message #26 Posted by **poehsve** on 28 Sept 2011, 11:40 a.m.,*
in response to message #24 by Andreas Haack

IIRC, it was just USPS Priority Mail from samsoncables. I paid $ 35 for shipping the two units, that were packaged in a quite solid box.

regards Sven

PS: made my whole office crazy with my new toy and everyone was very excited.

Re: 15C LE arrivals in Europe?

*Message #27 Posted by **Jeroen Van Nieuwenhove** on 28 Sept 2011, 4:09 a.m.,*

in response to message #1 by Thomas Radtke

Mine arrived Monday Sept. 26. Standard USPS shipping in a bubble envelope, luckily no damage. Had to pay the VAT (10 euros) in addition to the $123.99 I paid to SC. I think that whenever this calculator appears in European retail stores, it will be more expensive than what I paid now.

Re: 15C LE arrivals in Europe?

*Message #28 Posted by **Borja** on 28 Sept 2011, 6:33 a.m.,*
in response to message #27 by Jeroen Van Nieuwenhove

Amazing. They have sent JUST ONE!

BILLED TWO. SENT THE PARCEL WITH AN INVOICE FOR TWO CALCULATORS

WHICH MEANS I HAVE PAYED TAX FOR TWO

NOW, IF THEY SEND A REPLACEMENT IT WILL BE IMPOSSIBLE TO CONVINCE SPANISH CUSTOMS THAT I ALREADY PAID FOR THE IMPORT DUTIES AND TAX!

Re: 15C LE arrivals in Europe?

*Message #29 Posted by **Borja** on 28 Sept 2011, 6:44 a.m.,*
in response to message #28 by Borja

So, to summarize:

Placed an order on 26th July for TWO units, USPS express shipping.

The unit price was $94.99. Total for two, $189.98

Shipping: $40

Total: $229.

On Sept. 13th they charged 173.78 euro to my VISA card (229 dollars).

The package that has arrived contains just one, it hasn't been stolen from the box, as it's a small box with the exact size of the box, and the shipping manifesto declares just one calculator with a declared value of $94.99 plus $45.08 in postage and fees.

I declared two calculators to customs, of course, as I didn't have a clue it contained just one, so I have paid a 18% VAT for two, plus import taxes, etc, which totals 60 euro.

As I said, amazing job, Samson. Now let's see how you fix it.

Re: 15C LE arrivals in Europe?

*Message #30 Posted by **Ethan Conner** on 28 Sept 2011, 12:37 p.m.,*
in response to message #29 by Borja

This is surprising. Due to Samson giving a vague response on my first preorder i placed another one. They initially sent two tracking numbers and then right away cancelled one. However the package did arrive with two calculators. In my case they realized two seperate orders going to the same address and combined them.

Re: 15C LE arrivals in Europe?

*Message #31 Posted by **Borja** on 28 Sept 2011, 1:00 p.m.,*
in response to message #30 by Ethan Conner

They have answered (I sent a complaint once I opened the box, obviously) and they will send a replacement.

However, I'm afraid that Spanish customs will want to charge $40 in VAT and import duties again unless I'm willing to waste about 10 hours in paperwork and arguing.

Re: 15C LE arrivals in Europe?

*Message #32 Posted by **Ethan Conner** on 28 Sept 2011, 1:10 p.m.,*
in response to message #31 by Borja

Do you know someone who knows somebody in customs? When i lived in southern Louisiana i never paid a ticket,fine or a deposit without first checking to see if a coworker knew someone who could "take care of it".

Re: 15C LE arrivals in Europe?

*Message #33 Posted by **Eric Rechlin** on 28 Sept 2011, 2:09 p.m.,*
in response to message #32 by Ethan Conner

That's just the sad state of corruption in Louisiana, a third world country stuck inside the US. The rest of the US, and most of the first world, do not work that way.

Eric

Re: 15C LE arrivals in Europe?

*Message #34 Posted by **Borja** on 29 Sept 2011, 5:35 a.m.,*
in response to message #33 by Eric Rechlin

I pay my taxes, so that's not an option.

For now I've sent a polite email to customs, and they have told me to present all the documentation when the next package arrives. We will see... And I told Samson Cables to specify that it's a replacement unit on the customs manifest.

We'll see.

HHC 2011 Programming Puzzle SPOILERS

*Message #1 Posted by **Paul Dale** on 26 Sept 2011, 2:14 a.m.*

Since the conference is well and truly over, I thought I'd post my solutions and see what other people have come up with and what other improvements are possible.

Let the discussions and optimisations begin :-)

- Pauli

Re: HHC 2011 Programming Puzzle SPOILERS

*Message #2 Posted by **Paul Dale** on 26 Sept 2011, 2:15 a.m.,*
in response to message #1 by Paul Dale

For the WP 34S.

A basic routine that runs over each value of X in the positive quadrant and solves the circle equation to get the number of pixels set in that column.

```
001  [cmplx]DROP     Ignore centre
002  0               Accumulator
003  RCL Y
004  STO[times] Z    Keep r^2
005  LBL 00
006  DEC X
007  x<0?
008  GTO 01          Check for loop finish
009  ENTER[^]
010  x[^2]
011  RCL- T
012  +/-
013  [sqrt]          sqrt(r^2 - x^2)
014  CEIL
015  STO+ Z          Accumulated
016  DROP
017  GTO 00
018  LBL 01          Exit code -- multiply by 4
019  DROP
020  4
021  [times]
```

This program takes 6.5 seconds for a radius of 999. For a radius of 5,000 it takes 32.7 seconds. Execution time is is linear in the radius. It might be possible to tweak this a bit more and save a few fractions of a second, however the execution time will remain linear in the radius.

- Pauli

Edited: 26 Sept 2011, 2:17 a.m.

Re: HHC 2011 Programming Puzzle SPOILERS

*Message #3 Posted by **Paul Dale** on 26 Sept 2011, 2:15 a.m.,*
in response to message #1 by Paul Dale

For the WP 34S.

Again running of the value of x and solving the circle equation but in integer mode results in a faster program.

```
001  [cmplx]DROP     Ignore centre
002  BASE 10
003  0               Accumulator
004  RCL Y
005  STO[times] Z    Keep r^2
006  LBL 00
007  DEC X
008  x<0?
009  GTO 01          Check for loop finish
010  ENTER[^]
```

```
011  x[^2]
012  RCL- T
013  +/-
014  [sqrt]          sqrt(r^2 - x^2)
015  FS? C
016  INC X
017  STO+ Z          Accumulated
018  DROP
019  GTO 00
020  LBL 01          Exit code -- multiply by 4
021  DROP
022  SL 02
023  DECM
```

Timings in this case are 7.6 seconds for a radius of 5,000 and 1.4 seconds for a radius 999. Again, these timings are linear in the radius of the circle.

One problem here. The integer square root code is incorrectly rounding for some input values. Since a new firmware image was not permitted by the rules of the contest, this solution is invalid. A fixed firmware image has been committed but not yet moved into a release package.

It should be possible to rectify the problem with the square root by squaring the result and comparing against the initial value. The error only occurs when the square root isn't exact and it only seems to round the result up. Even with the extra steps involved, this method would likely be faster than the floating point equivalent.

- Pauli

Edited: 26 Sept 2011, 2:29 a.m.

Re: HHC 2011 Programming Puzzle SPOILERS

*Message #4 Posted by **Paul Dale** on 26 Sept 2011, 2:15 a.m.,*
in response to message #1 by Paul Dale

For the WP 34S.

Rather than solving the circle equation each time, an incremental approach is also possible. Bresenham's circle algorithm manages to generate the outer points on a circle using only integer shifts and additions. The following program implements Bresenham's circle algorithm, however the results are slightly off because it is using the pixel centre points rather than their extremes. This error is almost certainly correctable without introducing a performance loss.

```
001  [cmplx]DROP     Ignore centre
002  BASE 10         Integer mode

009  LBL 00
010  RCL 00
011  x<? 01          Check for loop termination
012  GTO 01
013  STO+ J          Accumulate column
014  RCL 01          Update Y coordinate
015  SL 01
016  STO+ I          Error = Error + 2 Y + 1
017  INC I
018  INC 01          Y = Y + 1
019  RCL I
020  x<0?            Check for change in X
021  GTO 00
022  DEC 00          X = X - 1
023  RCL 00
024  SL 01           Error = Error â&#128;&#147; 2 X
025  STO- I
026  GTO 00
027  LBL 01          Finish up
028  RCL J           Area in octant
029  SL 01           Area in quadrant plus duplicated overlap
030  RCL 01
031  x[^2]           Correct the duplicated overlap
032  -
033  SL 02           Quadruple to full circle
034  DECM            Switch mode back
```

Running time for a radius of 999 is 0.9 seconds, for a radius of 5,000 it is 4.7 seconds. Again this approach will give time linear in the radius but each iteration is very fast.

- Pauli

Re: HHC 2011 Programming Puzzle SPOILERS

*Message #5 Posted by **Gerson W. Barbosa** on 26 Sept 2011, 3:37 p.m.,*
in response to message #4 by Paul Dale

Paul,

I was aware of this method. It was used in the Microsoft BASIC in my old MSX 8-bit computer. Great to see an implementation, even if the results are slightly diffent.

Gerson.

From the MSX Red Book:

```
------------------------------------------------------------------------------

    Address... 5BBDH

    This is the circle mainloop. Because of the high degree of
symmetry in a circle it is only necessary to compute the
coordinates of the arc from zero to forty-five degrees. The
other seven segments are produced by rotation and reflection of
these points. The parametric equation for a unit circle, with T
the angle from zero to PI/4, is:

        X=COS(T)
        Y=SIN(T)

    Direct computation using this equation, or the corresponding
functional form X=SQR(1-Y^2), is too slow, instead the first
derivative is used:

         dx
        ---- = -Y/X
         dy

    Given that the starting position is known (X=RADIUS,Y=0), the X
coordinate change for each unit Y coordinate change may be
computed using the derivative. Furthermore, because graphics
resolution is limited to one pixel, it is only necessary to
know when the sum of the X coordinate changes reaches unity and
then to decrement the X coordinate. Therefore:

        Decrement X when (Y1/X)+(Y2/X)+(Y3/X)+... => 1
        Therefore decrement when (Y1+Y2+Y3+...)/X => 1
        Therefore decrement when     Y1+Y2+Y3+... => X

    All that is required to identify an X coordinate change is to
totalize the Y coordinate values from each step until the X

- 150 -

5. ROM BASIC INTERPRETER

coordinate value is exceeded. The circle mainloop holds the X
coordinate in register pair HL, the Y coordinate in register
pair DE and the running total in CRCSUM. An equivalent BASIC
program for a circle of arbitrary radius 160 pixels is:

        10 SCREEN 2
        20 X=160:Y=0:CRCSUM=0
        30 PSET(X,191-Y)
        40 CRCSUM=CRCSUM+Y :Y=Y+1
        50 IF CRCSUM<X THEN 30
        60 CRCSUM=CRCSUM-X:X=X-1
        70 IF X>Y THEN 30
        80 CIRCLE(0,191),155
        90 GOTO 90

    The coordinate pairs generated by the mainloop are those of a
"virtual" circle, such tasks as axial reflection, elliptic
squash and centre translation are handled at a lower level
(5C06H).
------------------------------------------------------------------------------
```

I'm sure the algorithm can be corrected to give the correct results. It is a matter of reworking the maths and changing the update part of the loop. I might do this if I get really keen, but I've already spent more time than I can afford on this interesting little challenge.

That was not a criticism. Actually, the way the circles are drawn have been simplified to make the challenge easier, as Walter has noticed. I guess both algorithms produce smoother circles, therefore no need to change them. The point is the existence of such algorithms, which were created in a time when speed really mattered.

Gerson.

in response to message #7 by Gerson W. Barbosa

No criticism was taken :-)

Definitely stick to integer mode and avoiding expensive operations is a win although a lot less so that when these algorithms were first discovered.

- Pauli

Some other semi-random comments.

- I couldn't identify an explicit formula for the result. Such a formula will almost certainly be fastest.
- I tried using the integration command. It isn't very accurate on the 34S but it is very very fast. On a 15C LE, it took ages.

- Pauli

Re: HHC 2011 Programming Puzzle SPOILERS

*Message #10 Posted by **C.Ret** on 26 Sept 2011, 3:38 a.m.,*
in response to message #9 by Paul Dale

HI,

I come first to an algorithm real close to your code.

Here is a version for HP-41C:

```
01 LBL"HHC2011  13 -            25 +
02 0            14 SQRT         26 ST+ 00
03 *            15 RCL Z        27 CLx
04 *            16 *            28 1
05 STO 00       17 INT          29 +
06 LBL 00       18 LASTx        30 x<y?
07 ENTER^       19 FRC          31 GTO 00
08 R^           20 x=0?         32 4
09 /            21 GTO 01       33 RCL 00
10 x^2          22 CLx          34 *
11 1            23 1            35 END
12 x<->y        24 LBL 01
```

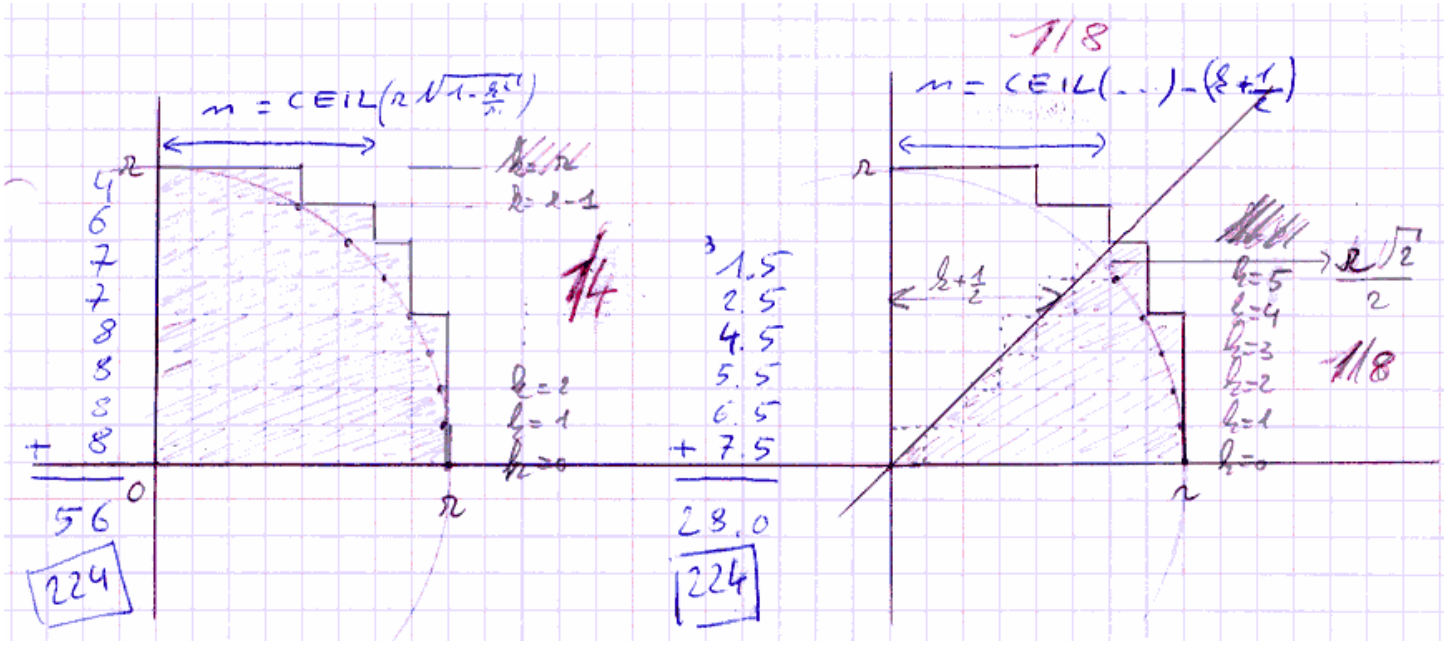
Some detail perhaps needs an optimization.

For RPL user, here a version for HP-28S calculator, which is basic enough to be used with out modification on any RPL system.

```
« ->  r x y                 @ input three arguments as specified
   « 0                      @ initiate number of pixel in circle
     0 r 1 - FOR k          @ main loop k=0 to r-1
        1                   @ 1^2 is 1 !
        k r / SQ - SQRT     @ x = sqrt(1 -(k/r)^2)
        r * CEIL            @ n = CEIL(x.r) at row where y=k/r
        +                   @ add to number of pixel
     NEXT
     4 *                    @ multiply by 4 to get full cricle
   »
»
'HHC2011' STO
```

Only one quadrant of the circle is investigated, total number of pixels is 4 times the quadrant count.

I may suggest that a version using only an half-quadrant may speed up the process and is coherent with symmetry. The total number of pixels will be 8 times one half-quadrant count.



```
                            @ version 2.0
« ->  r x y                 @ input three arguments as specified
   « 0                      @ initiate number of pixel in circle
     0 r 2 SQRT / FOR k     @ main loop k=0 to r/SQRT(2)
        1                   @ 1^2 is 1 !
        k r / SQ - SQRT     @ x = sqrt(1 -(k/r)^2)
        r * CEIL            @ n = CEIL(x.r) at row where y=k/r
        .5 k + -            @ remove (k+0.5) pixels
        +                   @ add to number of pixel
     NEXT
     8 *                    @ multiply by 8 to get full cricle
   »
»
'HHC2011b' STO
```

Here a proposed code for HP-15C and any other great classic HP calculators.

```
# ------------------------------------------
# Tcl/Tk HEWLETT·PACKARD 15C Simulator program

Interesting. I did do just an octant for the Bresenham approach. This algorithm generates just an octant of a circle and relies on symmetry to get the rest of the points on the circumference.

Rather than keeping track of the diagonal, I accumulated the total area under the octant, doubled this and removed the duplicate area which is a perfect square. This allowed everything to be kept in integer mode.

Hi C.Ret,

> Quote:
>
> I come first to an algorithm real close to your code.
> Here is a version for HP-41C:
> (... 35 step program ...) Some detail perhaps needs an optimization.

At least it can be done shorter and faster. ;-)

Here's basically the same algorithm with some improvements. R was moved under the root and a more elegant CEIL emulation was used. For positive arguments, ceil(x) equals int(x + sign(frc(x)). Due to the special sign-implemenation in the 41-series an additional test for non-zero x was required. All this makes the program shorter and faster. Add a label and rtn if you prefer. ;-)

```
  01 RDN
  02 RDN
  03 STO 00
  04 STO 01
  05 DSE 00
  06 GTO 01
  07 GTO 02
  08 LBL 01
  09 RCL 01
  10 x^2
  11 RCL 00
  12 x^2
  13 -
  14 SQRT
  15 ENTER
  16 FRC
  17 x>0?
```

```
18 SIGN
19 +
20 INT
21 +
22 DSE 00
23 GTO 01
24 LBL 02
25 4
26 *
```

For r > 1 steps 06, 07 and 24 can be omitted.

The next improvement is an update of the user instructions, telling the user not to enter the center coordinates but just the radius. This would save two more steps. ;-)

Dieter

Re: HHC 2011 Programming Puzzle SPOILERS

*Message #13 Posted by **C.Ret** on 26 Sept 2011, 9:45 a.m.,*
in response to message #12 by Dieter

Hello

Thank you for the much more elegant CEIL way :

```
n INT Lastx FRAC SIGN +
```

(will run whith any classic except special cas of SIGN of HP-41).

I was trying to adapt my code for Hp-15c, but I was unable to lacate any SIGN function.

May the sequence be used instead :

```
FIX 0 n RND
```

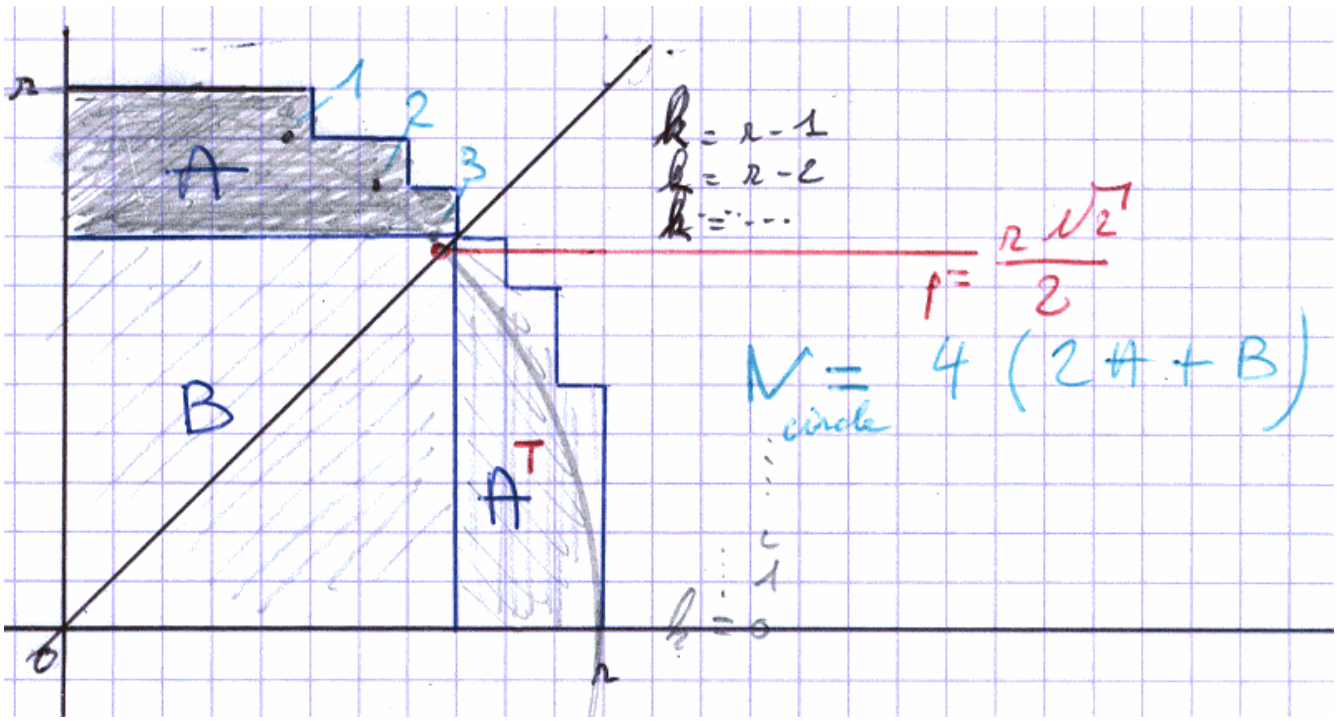
?

I will try it later and spare steps in HP-15 listing as you demonstre it to me.

Considering only a quadrant was a good idea.
Considering only an octrant will be a good one toot, if I had not made thinks the worst way. By scaning from 0 to r/sqrt(2), I spare about 30% of running time.

But, I only realize that it is possible to spare 70% of the loops by scanning k from (r-1) to r/sqrt(2) !
And using symetry to count this small octrand part two time and adding the "common" square.

A picture better than words :



```
« ->  r x y                    @ input three arguments
   « r 2 SQRT / CEIL -> p      @ compute upper limit p
      « 0                      @ initiate number of pixel in octant
        p  r 1 -  FOR k        @ main loop k from r-1 downto p
           1                   @ 1^2 is 1 !
           k r / SQ - SQRT     @ x = sqrt(1 -(k/r)^2)
           r * CEIL            @ n = CEIL(x.r) at row where y=k/r
           +                   @ add to number of pixels (in region A)
        NEXT
        2 *                    @ add symetric/transpose part (region A')
        p SQ +                 @ add inside square of p.p pixels (region B)
        4 *                    @ multiply by 4 to get full cricle
      »
   »
»
'HHC2011c' STO
```

I hope this last approache will be the more efficient, especially for large circles, concerning number of loops.
Now 5000,0,0 HHC2011c returns result in less than 1'25" on HP-28S

I still using a complex computation at each step, the solution propose by *Paul Dale* based on a Bresemhan method trigger me. Have to found a way to spare operations and tests. Using an 'error' or 'indicator' counter is already tracked.

Well, the 41 was the first HP (pocket) calculator I know of that featured a SIGN function.
So none of the classics (and many later models as well) offered that function and this approach cannot be used there.

> Quote:
>
> I was trying to adapt my code for Hp-15c, but I was unable to lacate any SIGN function.

There you are. ;-)

> Quote:
>
> May the sequence be used instead :
>
> FIX 0 n RND
>
> ?

No, this won't work. It simply rounds the argument to the next higher or lower (!) integer. CEIL always rounds up.
But since sign(x) = x / abs(x) for x<>0, it could be accomplished this way:

```
ENTER
FRC
ENTER
ABS
x=0?
+
x<>0?
/
+
INT
```

This works for x >= 0.

And finally, a more tricky version:

```
ENTER
FRC
x<>0?
e^x
SQRT
INT
+
INT
```

This also works for negative x.

Ah, those were the good old days where calculators were so slow that using transcendental functions didn't matter much. ;-)

*Message #15 Posted by **Eamonn** on 27 Sept 2011, 1:32 a.m.,*
in response to message #13 by C.Ret

Hi C.Ret,

My solution for the HP-15C also used the optimization that you posted, where it is only necessary to find the number of pixels in ~30% of the lines. The total number of pixels is then 4 * (s1 + 2 * s2) where s1 = (INT(r/sqrt(2)+1))^2 and s2 is the number sum of the number of pixels on each line above the square on the main diagonal as shown in your picture.

Lines 29 to 34 are yet another variant on the CEIL function.

For the radius=5000 case on the HP-15C LE the program below computes the number of pixels in 16 seconds.

Best regards,

Eamonn.

*Message #17 Posted by **Olivier De Smet** on 27 Sept 2011, 3:35 a.m.,*
in response to message #16 by Olivier De Smet

A faster one (shorter loop no R=1 special case, R still in X)

```
01  *LBL'Y (53 bytes)
02   ENTER^
03   STO 00
04   STO 01
05   STOx 01
06   2
07   SQRT
08   /
09   INT
10   LASTX
11   FRC
12   X#0?
13   SIGN
14   +
15   X^2
16   LASTX
17   RCL Z
18   -
19   X<>Y
20  *LBL 00
21   RCL 00
22   RCL Z
23   +
24   X^2
25   RCL 01
26   -
27   CHS
28   SQRT
29   INT
30   LASTX
31   FRC
32   X#0?
33   SIGN
34   +
35   STO+ X
36   +
37   ISG Y
38   GTO 00
39   4
40   *
41   END

Some timings   50 ->     8024 in  8 sec
              100 ->    31796 in 16 sec
              540 ->   918168 in 82 sec
             1000 ->  3145520 in 150 sec
             5000 -> 78559640 in 750 sec (should be 30 sec with a CL ...)
```

HP42S one, better use of stack and recall arithmetic

```
01  *LBL"Y"
02   ENTER
03   STO 00
```

```
04   STO 01
05   STOx 01

35  END
```

Re: HHC 2011 Programming Puzzle SPOILERS

*Message #21 Posted by **Wes Loewer** on 26 Sept 2011, 8:23 a.m.,*
in response to message #10 by C.Ret

I haven't written a program for the 41 since 1987 when I got my 28C, but I can't pass up a good contest. I dusted off my calculator and manual and here's what I came up with:

```
01 LBL"PC   Program Contest
02 RDN      drop center values
03 RDN
04 STO 00   radius -> 00
04 STO 01   loop index -> 01
06 X^2
07 STO 02   r^2 -> 02 for faster loop
08 0        sum on stack
09 LBL 00
10 RCL 02   r^2
11 RCL 01   r^2, i+1
12 1        r^2, i+1, 1
13 -        r^2, i
14 X^2      r^2, i^2
15 -        r^2-i^2
16 SQRT     sqrt(r^2-i^2)
17 INT      17-24 is my CEIL function
18 LASTX
19 FRC
20 CHS
21 SIGN
22 X>0?
23 CLX
24 -        end of CEIL function
25 +        add to running total
26 DSE 01
27 GTO 00
28 4        times 4 quadrants
29 *
30 END
```

(Surely there's a better way to do the CEILING function. ???)

This program would have been even more interesting if we did not assume that the circle fit on the display panel. Also, about the idea of only counting pixels that are at least 50% covered, is there an easy way to do that without integrals?

-Wes L

> (Surely there's a better way to do the CEILING function. ???)

At least there's another option (as well as that using SIGN mentioned in other posts). ;-)
The '41 features a MOD function, so a true CEIL function can be setup like this:

```
ENTER
ENTER
-1
MOD
-
```

That -1 may be stored somewhere beforehand to increase execution speed.

Once again, tricks like these are not required on the 35s since it features an INTG function (equivalent to FLOOR elsewhere):

CEIL(x) = -INTG(-x).

```
+/-
INTG
+/-
```

In our case, instead of adding CEIL(x) we can simply subtract INTG(-x):

```
...
+/-
INTG
-
...
```

Dieter

Re: HHC 2011 Programming Puzzle SPOILERS

*Message #23 Posted by **Gilles Carpentier** on 28 Sept 2011, 5:37 p.m.,*
in response to message #10 by C.Ret

Another RPL solution :

```
« DROP2 -> r '4*Sum(n=0,r-1,CEIL(Sqrt(1-(n/r)^2)*r))' »
```

DROP2 is just to ignore x and y. Sum and Sqrt are the special symbols for

Very simple but takes ~ 75s. for 5000 radius in aprox mode

Re: HHC 2011 Programming Puzzle SPOILERS

*Message #24 Posted by **C.Ret** on 29 Sept 2011, 5:31 p.m.,*
in response to message #23 by Gilles Carpentier

Salut Gilles,

A better solution :

```
« DROP2 -> r
   « r 2 SQRT / CEIL -> p '4*Sum(k=p,r-1,p*p+2*CEIL(Sqrt(1-(k/r)^2)*r))'
    »
»
```

This version spare execution time for large radious r. For explanations see posts HHC 2011 Programming Pulzze - Spoiler -

Re: HHC 2011 Programming Puzzle SPOILERS

*Message #25 Posted by **Gerson W. Barbosa** on 26 Sept 2011, 8:35 a.m.,*
in response to message #9 by Paul Dale

> Quote:
>
> - I couldn't identify an explicit formula for the result. Such a formula will almost certainly be fastest.

Re: HHC 2011 Programming Puzzle SPOILERS

*Message #26 Posted by **Paul Dale** on 26 Sept 2011, 5:03 p.m.,*
in response to message #25 by Gerson W. Barbosa

I also figured out a couple of approximations but they aren't good enough :-(

On the 34S using integrate results in a very fast and approximate answer:

```
001  [cmplx]DROP
002  x^2
003  STO 00
004  0
005  RCL L
006  [integrate] 00
007  4
008  *
009  RTN
010  LBL 00
011  x^2
012  RCL- 00
013  +/-
014  [sqrt]
015  CEIL
```

An equivalent program on the 15C LE caused the integrator to run for ages -- I gave up after quite a few minutes.

40 bytes for Hp 42S (or HP 41) and 2 registers, rouding ok

```
01 * LBL "Z"
02   RCL ST Z
03   STO 00
04   STO 01
05   STOx 01
06   DSE 00
07   GTO 00            ***
08   GTO 01            ***
09  *LBL 00
10   RCL 01
11   RCL 00
12   X^2
13   -
14   SQRT
15   INT
16   LAST X
17   FRC
18   X#0?                 new rounding
19   SIGN
20   +
21   +
22   DSE 00
23   GTO 00
24  *LBL 01            ***
25   4
26   x
27   END
```

Steps with *** can be removed for r > 1

Less register for 42 bytes, HP 42 or 41, rounding ok

```
01 * LBL "Z"
02   RCL ST Z
03   ENTER
04   ENTER
05   STO 00
06   STOx 00
07   DSE ST Y
08   GTO 00    ***
09   GTO 01    ***
10  *LBL 00
11   RCL 00
12   RCL ST Z
13   X^2
14   -
15   SQRT
16   INT
```

```
17   LAST X
18   FRC
19   X#0?                new rounding
20   SIGN
21   +
22   +
23   DSE ST Y
24   GTO 00
25  *LBL 01    ***
26   4
27   x
28   END
```

Only stack !!! only for HP 42 and 44 bytes (if we count a reg as 7 bytes it's a winner: now the rounding is correct :))

```
01 * LBL "Z"
02   Rv
03   Rv
04   ENTER
05   ENTER
06   ENTER
07   STOx ST Z
08   DSE ST Y
09   GTO 00    ***
10   GTO 01    ***
11  *LBL 00
12   RCL ST Y
13   RCLx ST Z
14   RCL- ST T
15   +/-
16   SQRT
17   +
18   IP
19   LAST X
20   FP
21   X#0?                new rounding
22   SIGN
23   +
24   DSE ST Y
25   GTO 00
26  *LBL 01    ***
27   4
28   x
29   END
```

(FIX 00 RND doesn't work :(need to work a bit more harder. But I have no stack left ... see later)

Rounding for the 2 first programs is ok now :)

And for the third also :)

Olivier

Re: HHC 2011 Programming Puzzle SPOILERS

*Message #29 Posted by **Dieter** on 26 Sept 2011, 2:21 p.m.,*
in response to message #28 by Olivier De Smet

The first two versions will not work correctly. The CEIL function here was implemented by adding 0,5 and rounding to the next integer. This is basically the same as a simple 1 + INT. That's why the routine causes as error if the argument of the CEIL function is an integer. For instance, for r = 5 there are two points where the sqrt is exactly 3 resp. 4. At that point adding 0,5 will cause the value to get rounded up to 4 resp. 5 (instead of leaving it at 3 resp. 4). So the returned result is not 88 (correct), but 96 instead.

Dieter

Re: HHC 2011 Programming Puzzle SPOILERS

*Message #30 Posted by **Olivier De Smet** on 26 Sept 2011, 3:21 p.m.,*
in response to message #29 by Dieter

You were right, I see the bug just after posting.

The correction is now done for the three programs :)

Olivier

Re: HHC 2011 Programming Puzzle SPOILERS

*Message #31 Posted by **Dieter** on 27 Sept 2011, 8:02 a.m.,*
in response to message #28 by Olivier De Smet

The basic approach is similar to my suggestion for the '41, so both can be improved this way: Instead of starting the loop with x = r - 1 (which is done by the first DSE) let's begin with x = r. This will not change the result since the first loop will add sqrt(r^2 - r^2), i.e. a plain zero. But it can handle the case r = 1 without any additional code, thus saving four steps, while on the other hand one more loop has no perceivable effect on execution time. It even handles r = 0 correctly. ;-)

Here are two versions of this algorithm. It's very basic and for sure not optimized for speed, but I like it for its compact code and readability. Especially the 35s version. ;-)

```
  HP-41/42                    HP35s

01 LBL "HHC"                H001 LBL H
02 STO 00                   H002 STO R
03 x^2                      H003 STOx R
04 STO Z (42s: STO ST Z)    H004 STO X
05 LastX                    H005 RCL R
06 LBL 01                   H006 RCL X
07 R^                       H007 x^2
08 RCL 00                   H008 -
09 x^2                      H009 sqrt
10 -                        H010 +/-
11 SQRT                     H011 INTG
12 ENTER^                   H012 -
13 FRC                      H013 DSE X
14 X#0?                     H014 GTO H005
15 SIGN                     H015 4
16 +                        H016 x
17 INT                      H017 RTN
18 +
19 DSE 00
20 GTO 01
21 4
22 *
23 END
```

R is assumed in to be entered X. Add 2x RDN if you want to do it according to the original rules.

Dieter

I move the center of the circle to (r,r) and consider only the quadrant where x,y <= r.
Then a pixel (x,y) is *dark* when it is below the arc, or:

    y <= r - sqrt(x*(2*r-x))
```

```
The number of dark pixels below the arc for a given x is:

    n(x) = INT(r - sqrt(x*(2*r-x)))

And I'm finally rid of that pesky CEIL ;-)
I determine s = sum of all n(x) till n<x, then the total number of dark pixels in the quadrant is:

    2*s - (x-1)^2
```

Well Gene, that was a good one. Endless fun.
Cheers, Werner

015 CEIL
016 STO+ Z
017 STO+ Z
018 DROP
019 DSE X
020 BACK 09
021 4
022 RCLx Z
```

Instead of using y=sqrt(r^2-x^2), I moved the center of the circle to 0,r and used y=sqrt(x*(2r-x)). This made it easier to use DSE to catch the edge between the y-axis and the r/sqrt(2) square. I have not read all the other solutions, so this may have been covered.

> Same idea, but less steps, and all stack (and I think a bit faster)

Very nice! It's a bit faster indeed:

```
  540    R/S ->     918,168       (* 1.1 s )
 5000    R/S ->  78,559,640       (* 8.2 s )
```

(*) with a chronometer

Or, using the built-in TICKS command, 8 and 71 ticks, respectively, which multiplied by my unit's correction factor 1/9 gives 0.9 s and 7.9 s. Mine takes 8 and 75 ticks, respectively. A built-in quartz would be handy.

```
001 LBL A
002 TICKS
003 STO 00
004 x<>y
005 XEQ C (your program)
006 TICKS

008 x<>y
009 RTN
```

> Quote:
>
> I have not read all the other solutions,

Same here, except for Werner's solution, from which I borrowed the idea of checking r*(1 - 1/sqrt(2)) columns instead of r/sqrt(2). I wrote my first draft as soon as I saw Gene's post and stuck to my first idea. I've computed the dark pixels too, so I never needed the CEIL function.

Gerson.

On a crystal unit, it would be 7.1 s.

TICKS remains constant regardless of the correction factor. The time, however, doesn't unless a crystal is installed.

I tried to create a BASE 10 version, but got some errors, perhaps it is the SQRT bug you mentioned. Perhaps you can give it a try. It should run in about 1s.

Re: HHC 2011 Programming Puzzle SPOILERS, nothing but stack!

*Message #42 Posted by **Paul Dale** on 29 Sept 2011, 10:37 p.m.,*
in response to message #41 by Egan Ford

I've not reflashed my 34S for ages so it still has the sqrt bug.

The bug, when it occurs, gives a result 1 too high and only when carry is set. So a sequence that checks carry and if it is set squares the number and compares against the original...

Or reflash with the latest from the sourceforge site and get a working integer SQRT.

- Pauli

> TICKS remains constant regardless of the correction factor. The time, however, doesn't unless a crystal is installed.

RTFS (Read The Fine Sources): In a non crystal equipped calculator, the PLL runs at a higher multiplication factor and the interrupts are scaled up slightly to compensate for a slower R/C clock:

```
if ( Xtal ) {
        /*
         *  Schedule the next one so that there are 50 calls in 5 seconds
         *  We need to skip 3 ticks in 128 cycles
         */
        if ( Heartbeats ==  40 || Heartbeats ==  81 || Heartbeats == 122 ) {
                UserHeartbeatCountDown = 6;
        }
        else {
                UserHeartbeatCountDown = 5;
        }
}
else {
        /*
         *  Without a crystal a less accurate timing is good enough
         */
        UserHeartbeatCountDown = Heartbeats & 1 ? 4 : 5;
}
```

The code is executed from the LCD refresh interrupt occurring every 640 slow clock cycles (roughly 50 Hz). TICKS are counted when the UserHeartbeatCountDown value reaches zero. In a R/C environment, the frequency is assumed to be about 15% slower.

Why all this? The slow clock outputs a 32KHz nominal clock but the rate is typically 15 to 20% less then that without the crystal. The PLL multiplies this value to derive the processor clock. I use higher values for the PLL when no crystal is installed. The periodic interrupt is not controlled by the PLL but directly by the 32KHz oscillator through the LCD controller and needs a separate correction algorithm.

In short: The TICKS results should be similar with or without a crystal but they typically don't exactly match. Also the resulting execution speed should be roughly the same between devices with or without the crystal.

Next to last, I mean :-)

Nothing but the stack. Well, it looks like Egan's, only somewhat less efficient. Currently I cannot experiment with CLx (which perhaps could be useful inside the loop) because it does not disable stack lift (outdated firmware here).

*Message #48 Posted by **Olivier De Smet** on 4 Oct 2011, 2:50 a.m.,*
in response to message #47 by Gerson W. Barbosa

Stack only but for a real HP made by HP (software too) ;)

```
00 {48 BYTES}
01>LBL'Y
02 RCL ST X
03 RCL ST X
04 2
05 SQRT
06 /
07 -
08 IP
     X=0?
     SF 00
09 ENTER
10 X^2
11 R^
12 X^2
13 +
14 2
15 /
     FS?C 00
     GTO 01
16>LBL 00
17 RCL ST Z
18 RCL+ ST T
19 RCL- ST Z
20 RCL* ST Z
21 SQRT
22 RCL- ST T
23 IP
24 +
25 DSE ST Y
26 GTO 00
     LBL 01
27 8
28 *
29 END
```

non working for R=1,2,3 correction in steps not numbered (add some step, but don't slow the inner loop)

The trick was not to use CEIL but INT (see other posts, counting 'black' dots)

*Message #49 Posted by **Werner** on 4 Oct 2011, 3:42 a.m.,*
in response to message #48 by Olivier De Smet

some remarks:

1.replace

```
 RCL ST X
 RCL ST X
```

by

```
 ENTER
 STO ST Z
```

saving a byte

2.you need a CF 00 instruction at the beginning, of course, bringing the byte count to 10 to cater for the exceptions.

3.replace

```
 RCL ST Z
 RCL+ ST T
```

with (shorter by one byte):

```
 RCL ST Z
 STO+ ST X
```

Here's my 41C version, with only 8 bytes overhead (but a bit more stack handling as the 41 does not have register recall arithmetic)

```
*LBL"PIXELS"
 ENTER
 STO Z          r       r       r
 2
 SQRT
 /
```

```
 -
 INT             x       r       r       r
 ENTER

in response to message #48 by Olivier De Smet

RPL stack only (HP-50g):

```
%%HP: T(3)A(D)F(,);
\<< DUP DUP 2, \v/ / CEIL - DUP2 - SQ 2, / UNROT
  WHILE DUP
  REPEAT DUP2 - PICK3 SWAP + LASTARG - * \v/ CEIL 4, ROLL + UNROT 1, -
  END DROP2 8, *
\>>

22.76 seconds, for r=5000 (timed with TEVAL)
```

It uses the same formula in my *last* wp34s program above, probably not the best one in this case, both speedwise and sizewise.

> Quote:
>
> non working for R=1,2,3 correction in steps not numbered (add some step, but don't slow the inner loop)

In order to fix the same problem in the first version of the RPL program above, I simply moved the test to the beginning of the loop, by replacing DO UNTIL with WHILE REPEAT.

"Endless fun", as Werner already said.

Gerson.

*Message #52 Posted by **Jeff O.** on 5 Oct 2011, 1:16 p.m.,*
in response to message #51 by Gerson W. Barbosa

I have been fooling around with the challenge since Sept. 25. I think I have reached the point of diminishing returns, or at least should stop spending time on it. So I'll present some results, maybe that will stop the obsessive tweaking.

Using the inscribed square reduction depicted here (which I did develop on my own on Sept. 26 before looking at any of the solutions), the following listing is about the best I can come up with for wp34s. It returns 78,528,204 for a radius of 4999 in about 8.20 seconds.

```
001     LBL B
002     RCL Z           Recall stack Z, since radius is there per rules
003     ENTER           Get another copy of the radius on the stack
004     STO 08          Store radius for future use
005     STO + 08        double the stored value of the radius for future use
006     x^2             square the radius
007     2               enter 2 to compute area of square inscribed in a quarter
circle
008     /               divide 2 into radius squared to determine area of square
inscribed in quarter circle
009     SQRT            take square root to determine side length of square
inscribed in quarter circle
010     CEIL            go up to next whole pixel
011     STO 06          store side length in register that will accumulate area
012     STO x 06        multiply side length by stored side length to compute
area of inscribed square in whole pixels
013     -               subtract size of square from radius to determine how
many remaining columns must be summed
014     STO I           store in register I for looping to compute height of
remaining columns
015     RCL 8           Recall twice the radius
016     RCL - I         Recall index and subtract from twice the radius
017     RCL x I         Recall I, multiply times above to form 2xRadiusxIndex-
Index^2
018     SQRT            square root to compute square root of 2xRadiusxIndex-
Index^2
019     CEIL            compute height of row in full pixels if any part is
touched by a circle of the given radius
020     STO + 06        add to summation of area
021     STO + 06        add again for area of upper wedge
022     DSE I           decrement index, skip when less than zero
023     BACK 8          loop back if more columns
024     4               enter 4
025     RCL x 06        multiply times 4 to compute the area of the full circle
in whole
                        pixels if any part of a pixel is within the circle of
the given radius
026     STOP            done
```

Summing the area in the stack appears to be a popular option, so I created the listing below. It is one step longer, and also seems to run ever-so-slightly slower, returning the result for 4999 in about 8.35 seconds.

```
001     LBL B
002     RCL Z           Recall stack Z, since radius is there per rules
003     ENTER           Get another copy of the radius on the stack
004     STO 08          Store radius for future use
005     STO + 08        double the stored value of the radius for future use
006     x^2             square the radius
007     2               enter 2 to compute area of inscribed square
008     /               divide 2 into radius squared to determine area of square
inscribed in quarter circle
009     SQRT            take square root to determine side length of square
inscribed in quarter circle
010     CEIL            go up to next whole pixel
011     x^2             square side length to compute area of inscribed square in
whole pixels
012     x<>y            swap to get radius
013     RCL - L         subtract size of square from radius to determine how
many remaining columns must be summed
014     STO I           store in register I for looping to compute height of
remaining columns
015     x<>y            swap to get area of square to stack X for area sum start
016     RCL 8           Recall twice the radius
017     RCL - I         Recall index and subtract from twice the radius, forms
2xRadius-Index
018     RCL x I         Recall I, multiply times above to form 2xRadiusxIndex-
Index^2
019     SQRT            square root to compute square root of 2xRadiusxIndex-
Index^2
020     CEIL            compute height of row in full pixels if any part is
touched by a circle of the given radius
021     +               add to summation of column heights
022     RCL + L         add again for area of upper wedge
023     DSE I           decrement index, skip when less than zero
024     BACK 08         loop back if more columns
```

```
025     4               enter 4
026     x               multiply times 4 to compute the area of the full circle
in whole
                        pixels if any part of a pixel is within the circle of
the given radius
027     STOP            done
```

Observations - I don't claim the above to be the best possible, just likely the best I can do with reasonable effort.

I have of course also worked on versions for the 15c LE, the latest of which returns the answer for 4999 in about 19 seconds. I may have to keep working on that one...

*Message #53 Posted by **Egan Ford** on 5 Oct 2011, 3:05 p.m.,*
in response to message #52 by Jeff O.

I posted this a while back, but it has be archived:

```
001 RCL Z
002 FILL
003 STO+ Z
004 2
005 SQRT
006 /
007 CEIL
008 STO Z
009 STOx Z
010 -
011 RCL T
012 RCL- Y
013 RCLx Y
014 SQRT
015 CEIL
016 STO+ Z
017 STO+ Z
018 DROP
019 DSE X
020 BACK 09
021 4
022 RCLx Z
```

Gerson has been building on it and timing it, but I think it runs in less than 8 s for r=5000. To make the programing smaller and to also deal with small r I moved the circle origin to r,0 and then used y=sqrt(x*(2r-x)). That with a bit of gym*stack*tics help reduce the number of instructions and the use of x^2. I would like to get it down to 1 sec with the use of integer mode, however my firmware still has the isqrt bug and I cannot flash (tried 3 different machines and 3 different OSes) until I get a machine with a real serial port.

Edited: 7 Oct 2011, 10:12 a.m.: Changed 0,r to r,0 in description

> I posted this a while back, but it has be archived:

I recall seeing it, but did not study it closely. Not much fun to use somebody else's idea(s) to improve your own program, after all.

> Quote:
>
> Gerson has been building on it and timing it, but I think it runs in less than 8 s for r=5000

I get about 8.2 seconds, which is virtually the same as my versions. Not too surprising, since even though your method is more elegant, it still requires the same number of loops.

> Quote:
>
> I moved the circle origin to 0,r and then used y=sqrt(x*(2r-x)).

Are you sure that you did not move the origin to r,0? Either way, a clever approach.

> Quote:
>
> I would like to get it down to 1 sec with the use of integer mode,

I am running v2.2 1674. In BASE10 integer mode, when I take the square root of a non-perfect square, it returns the square root of the largest perfect square less than the original argument. Is this the behavior you are after? I tried a kludgy modification to your code to use this, and it returns 78,528,204 for a radius of 4999 in about 1.9 seconds. Unfortunately, it also returns the wrong answers for radii that produce perfect squares at certain points in the process, so it needs work. But it is fast!

Try checking the carry flag (C). This is cleared if the square root was of a perfect square and set otherwise -- a very handy feature of integer mode.

- Pauli

but stack!
*Message #58 Posted by **Marcus von Cube, Germany** on 6 Oct 2011, 2:17 a.m.,*
in response to message #57 by Egan Ford

I have a useful modification in mind: CEIL in integer mode should add the carry and clear it thereafter. Pauli, any ideas?

Re: HHC 2011 Programming Puzzle SPOILERS, nothing but stack!
*Message #59 Posted by **Paul Dale** on 6 Oct 2011, 2:51 a.m.,*
in response to message #58 by Marcus von Cube, Germany

An interesting idea. CEIL is already defined in integer mode but doesn't do anything very interesting.

I'm not sure CEIL is the right command for this. A pair of *add carry* and *subtract carry* instructions would be more general and meaningful I think.

We'd really do best by having *add with carry* and *subtract with borrow* instructions.

- Pauli

Re: HHC 2011 Programming Puzzle SPOILERS, nothing but stack!
*Message #60 Posted by **Marcus von Cube, Germany** on 6 Oct 2011, 3:37 a.m.,*
in response to message #59 by Paul Dale

My idea was to make CEIL behaving similarly in DECM and integer modes. If all functions that would normally return a non integer result (such as 1 ENTER 2 /) set the carry, CEIL would be working the same in both environments.

ADC and SBB seem natural for integer mode. I will have to learn ARM assembly to port this stuff to native ARM code.

I believe most operations that can return a fractional result do set carry appropriately. If any don't (and the 16C did), please let me know.

The problem here is that there are plenty of other ways to set it. Addition and subtraction set it for overflow & borrow and shifts and rotates set it as well.

As things stand CEIL does work the same in both integer and floating point modes -- it rounds up to the nearest integer. In

integer mode this means the number doesn't change which is correct.

> Quote:
>
> ADC and SBB seem natural for integer mode. I will have to learn ARM assembly to port this stuff to native ARM code.

Do this and we'll save more than a bit of space in the integer support -- simulating the CPU flags in C is a huge consumer of code space. My ARM assembly is passable but not great.

Re: HHC 2011 Programming Puzzle SPOILERS, nothing but stack!

*Message #62 Posted by **Jeff O.** on 6 Oct 2011, 7:45 a.m.,*
in response to message #57 by Egan Ford

Yes, that is what I did for the second use of SQRT. For the first, I think you need to change:

```
2
SQRT
/
CEIL
```

to:

```
RCLx X (or x^2)
2
/
SQRT
INC X
```

Your program, with the above changes, now looks like this:

```
001 BASE 10
002 RCL Z
003 FILL
004 STO+ Z
005 RCLx X
006 2
007 /
008 SQRT
009 INC X
010 STO Z
011 STOx Z
012 -
013 RCL T
014 RCL- Y
015 RCLx Y
016 SQRT
017 FS? C
018 INC X
019 STO+ Z
020 STO+ Z
021 DROP
022 DSE X
023 BACK 10
024 4
025 RCLx Z
026 DECM
```

The above clocks in at right about 2 seconds for 4999.

in response to message #63 by Egan Ford

Shifts are faster than addition or multiplication in integer mode. Dealing with carry and overflow consumes lots of cycles.

The 2 / sequence could be replaced with SR 01 which is shorter and faster.

- Pauli

Re: HHC 2011 Programming Puzzle SPOILERS, nothing but stack!

*Message #66 Posted by **Jeff O.** on 7 Oct 2011, 10:07 a.m.,*
in response to message #65 by Paul Dale

Pauli,
Although I would not expect a measurable improvement in execution time in this particular instance (since the 2 / sequence is executed only once), shorter is better so I made the change. But, since the SR 01 function divides by 2 in-situ, it messes with Egan's clever gym*stack*tics, so the program returns incorrect answers if only that change is made. Some other change(s) would have to be made, for example following the SR 01 with ENTER DROP. Of course that takes more steps than are saved by the SR 01 instruction. Probably possible to use SR 01 and save the step, but I will leave that as an exercise for the reader.

You can use the built-in TICKS command instead of a chronometer. The latter adds about a 200 ms delay, no matter how fast you think you are (most likely your program takes 8 seconds or less for r=5000 as well). For times in seconds, you have to find the correction factor unless your wp34s has a built-in crystal. Or simply compare the number of TICKS returned by program A to determine which program is faster.

```

C is Egan Ford's original program, except for the first step, which has been
suppressed.
D is a slightly modified version of his program, no significant gain however.
```

I wasn't able to time your programs because my wp34s lacks DSL (it needs a firmware update).

Gerson.

With a crystal installed, taking the difference of two TICKS calls should be fairly accurate.

Without a crystal, the difference of two TICKS calls will still returns the same duration, it just won't necessarily match with real time so well.

- Pauli

The way it's implemented the two scenarios might differ. I tried to get TICKS right in either environment but the accuracy is dependent on the actual R/C frequency.

in response to message #1 by Paul Dale

These are all great, and I thank all of you for your interest in this problem.

I plan to write-up the winning entries from the conference as well as including the entries here. I will need a bit of time to key them in and time them with my sample input values for comparison to the conference results.

For what it is worth, this contest was open to all RPN machines.

I now have a solution running on the HP 67. :-)

It is a bit slow...

And the HP *67* (not 65) gets the correct answer...

*Message #72 Posted by **gene wright** on 26 Sept 2011, 11:12 p.m.,*
in response to message #71 by gene wright

to a radius of 4999 in about 1.4 hours. :-)

78,528,204.

What about the HP-33C? Under half an hour, even less if the loop is optimized to use the stack whenever possible.

Gerson.

*Message #77 Posted by **Egan Ford** on 28 Sept 2011, 7:03 p.m.,*
in response to message #1 by Paul Dale

My solutions:

15C:

```
001 -        33  Rv
002 -        33  Rv
003 - 42, 7, 0  FIX 0
004 -    44  1  STO 1
005 - 42, 5, 1  DSE 1
006 -    22  2  GTO 2
007 -    22  3  GTO 3
008 - 42,21, 2  LBL 2
009 -    44  0  STO 0
010 -    43 11  x^2
011 -    44  2  STO 2
012 - 42,21, 1  LBL 1
013 -    45  2  RCL 2
014 -    45  1  RCL 1
015 -    43 11  x^2
016 -        30  -
017 -        11  SQRT
018 -        36  ENTER
019 -    43 44  INT
020 - 44,40, 0  STO+ 0
021 - 43,30, 6  TEST 6
022 - 42, 6, 0  ISG 0
023 -    43  7  DEG
024 - 42, 5, 1  DSE 1
025 -    22  1  GTO 1
026 -    45  0  RCL 0
027 - 42,21, 3  LBL 3
028 -         4  4
029 -        20  x
```

34S (as submitted at HHC2011. NOTE: I was in a hurry and directly ported over my 15C program with the exception of using CEIL.):

```
001 Rv
002 Rv
003 STO 01
004 DSE 01
005 GTO 02
006 GTO 03
007 LBL 02
008 STO 00
009 X^2
010 STO 02
011 LBL 01
012 RCL 02
013 RCL 01
014 X^2
015 -
016 SQRT
017 CEIL
018 STO+00
019 DSE 01
020 GTO 01
021 RCL 00
022 LBL 03
023 4
024 x
```

34S do-over after talking to Marcus, Ari, and reading the manual a bit more:

```
001 RCL Z
002 STO 00
003 STO 01
004 x^2
005 STO 02
006 SKIP 07
007 RCL 02
008 RCL 01
009 x^2
010 -
011 SQRT
012 CEIL
013 STO+ 00
014 DSE 01
015 BACK 08
016 RCL 00
017 4
018 x
```

The 34S is a remarkably fun machine. The SKIP and BACK functions rock.

Re: New Calculator Newsletter Up on hp.com

*Message #2 Posted by **Paul Dale** on 25 Sept 2011, 11:15 p.m.,*
in response to message #1 by Norman Dziedzic

There is a mistake in the 34S's PI value in the Calculating PI article (sorry Richard).

PI SIN in radians mode gives: 2.384626433832795 E -16. Adding these 16 digits to the 16 from PI gives 32 correct digits, not the 28 mentioned. Use SHOW to see them all. In fact the 33rd digit is correct too since it is a zero. To get 28 correct, I suspect a 12 digit value of PI was entered.

The 34S has 450 decimal places of 2 * PI internally for the modulo reduction step for trig operations in radians. For degrees and grads, the modulo reduction is done before conversion to radians.

I don't know of a way to extract these however.

- Pauli

*Message #5 Posted by **x34** on 26 Sept 2011, 7:46 a.m.,*
in response to message #1 by Norman Dziedzic

HP-12C article by Gene Wright and Richard J. Nelson says (in the notes): "Early HP-12Cs used 3 Lithium or Silver button cells." But in the same article they say that it used Alkaline or Silver. I wonder if Lithium cells were widely available in 1981. I think that it should say Alkaline instead of Lithium in the notes' picture boxes.

Re: New Calculator Newsletter Up on hp.com - HP-12C batteries

*Message #6 Posted by **Katie Wasserman** on 26 Sept 2011, 8:57 a.m.,*
in response to message #5 by x34

Then as now, there was/is no such thing as 1.5 volt lithium button cells (equivalent to the 357 silver oxide). It definitely should say "alkaline".

Re: New Calculator Newsletter Up on hp.com - HP-12C batteries

*Message #7 Posted by **Gene wright** on 26 Sept 2011, 11:01 a.m.,*
in response to message #6 by Katie Wasserman

Well I am certainly guilty of typos from time to time but 98% of that article is Richards and he kindly added my name for the programs shown. :-)

Those are not the best 12c games but the author of the best ones was adamant a few years ago that they only appear in Datafile, which (sadly) limits their distribution quite a bit. Oh well.

Re: New Calculator Newsletter Up on hp.com - HP-12C batteries

*Message #8 Posted by **Dieter** on 26 Sept 2011, 11:19 a.m.,*
in response to message #5 by x34

The original 12C used three button cells known as LR44, SR44, A76, V76PX, S76, 357, AG13, V13GA, LR1154 and many others. These cells are approx. 11,6 mm (d) x 5,4 mm (h). They are available as alkaline, silver oxide and mercury oxide cells (now banned in most countries of the western world). There are also zink-air cells, but these don't make much sense here. All these button cells have a common nominal voltage of 1,35...1,55 Volts.

On the other hand, lithium button cells usually are $LiMnO_2$ cells with a nominal voltage of 3 Volts or even slightly more. Therefore they are usually not available in the same size as other batteries with half that voltage. I never heard of a A76-sized 3 V lithium cell.

So it's alkaline and (preferably) silver oxide cells that are used in the 12C.

Dieter

HP15C LE Keyboard Survey Take 3 (last round)

*Message #1 Posted by **M. Joury** on 25 Sept 2011, 7:08 p.m.*

All,

So far I have gotten responses for 147 calculators. Of those 18 have been reported as having keyboard problems. So at this moment we have a "failure" rate of 12.24%.

For those that have not responded to this survey and would care to do so please let me know how many HP-15C LE's you have purchased and how many of those (if any) have bad keys. Loose or "rattly" f and g keys don't qualify as bad keys for the purposed of this survey as long as they register correctly when pressed.

So, for example, if you have 3 calcs and 1 is bad please respond with: 3:1.

Thanks to everyone that has responded so far!

Cheers,

-Marwan

Marwan,

I think I may have sent you this information via direct e-mail (so please don't duplicate), but I'll post here for everyone's benefit.

3:1 LE#02173 (good), LE#02196 (good), LE#02198 (bad divide key, doesn't register with a "normal" click, registers with a "forceful" click).

I also got one 12C 30thAE with keyboard OK.

I was able to contact HP calculators support (by phone) and register a case number. If I remember correctly what was said, I am to expect a package from HP with a replacement unit and a box for mailing in the defective unit so they can diagnose.

At least that's what I am expecting.... ;-) I'll let all know what actually happens!

Dale

48GX Erable etc ever to be updated /revised etc?

*Message #1 Posted by **mr-scorpio** on 25 Sept 2011, 5:25 p.m.*

Hi there, Given that the last version of Erable for the 48GX dates from the late 90's, after which it was updated & integrated into the 49 & 50 calcs.

Might we ever see an updated version of Erable or something similar (CAS48 perhaps) to refresh/renew the 48GX?

Or perhaps might there be someone out there creating a whole new CAS system for the 48 from scratch? :-)

Re: 48GX Erable etc ever to be updated /revised etc?

*Message #2 Posted by **bill platt** on 25 Sept 2011, 5:32 p.m.,*
in response to message #1 by mr-scorpio

Look up Raymond del Tondo's speed UI. I dont know about the CAS aspect but the UI he's the man...

Re: 48GX Erable etc ever to be updated /revised etc?

*Message #3 Posted by **mr-scorpio** on 25 Sept 2011, 5:36 p.m.,*
in response to message #2 by bill platt

Yes, i've heard of that. Speaking of which.. Which is best? - MetaKernal or Speed UI? I understand that MK 'does' implement a better symbolic entry capability? that SUI has yet to do? or is this incorrect? - But MK is dated as well, along with Erable?

Still as i originally posted.. An updated & optimised CAS for the 48 would be great?

Re: 48GX Erable etc ever to be updated /revised etc?

*Message #4 Posted by **Martin Pinckney** on 25 Sept 2011, 6:19 p.m.,*
in response to message #3 by mr-scorpio

Like you, I wish for updates to the 48, but I am still stuck on the SX! Frankly, I doubt we will see much activity, even on the 48GX front, since these machines are so dated now. Just my opinion.

If HP releases an updated 50G, even I may bite on that one.

Re: 48GX Erable etc ever to be updated /revised etc?

*Message #5 Posted by **mr-scorpio** on 25 Sept 2011, 6:25 p.m.,*
in response to message #4 by Martin Pinckney

"If HP releases an updated 50G, even I may bite on that one."

It's possibly overdue that they did.. Both Casio & TI have brought our machines with higher res screens, that are not only colour, but back lit as well. - But whilst complete in their capabilities, are

aimed at the education market.

Re: 48GX Erable etc ever to be updated /revised etc?

*Message #6 Posted by **Martin Pinckney** on 25 Sept 2011, 6:44 p.m.,*
in response to message #5 by mr-scorpio

Based on the questions and comments from Mr. Wessman, I think HP has certainly considered backlit color, but perhaps has also dismissed it because of power factors.

Since "leaks" about a restyled 39gii with higher resolution screen appeared, I think it is likely that is the direction HP will go in - if they do anything at all regarding the 50g.

Edited: 25 Sept 2011, 8:22 p.m.

Re: 48GX Erable etc ever to be updated /revised etc?

*Message #7 Posted by **Raymond Del Tondo** on 26 Sept 2011, 4:17 a.m.,*
in response to message #3 by mr-scorpio

The latest version of SpeedUI supports RainEQ, an extremely fast EquationWriter replacement.
"Pretty Print" support (show expressions and matrices grapically on the stack) is in SpeedUI for years;-)

Erable and Alg48 are math-oriented applications with more or less specialized UI (if at all).
SpeedUI accelerates all the general UI stuff, but has no influence on closed applications.
Most well-behaved applications should run w/o problems with SpeedUI active,
but I have to confess I didn't try Erable or Alg48 so far;-)

I didn't follow the Erable development, but I think the Erable
updates for the FHB were mainly related to exact mode support.

And while we're at updates: I'm just preparing a new version of SpeedUI, with some bug fixes and optimisations.
Hopefully it will be released during the next 1 or 2 weeks.

Ray

Re: 48GX Erable etc ever to be updated /revised etc?

*Message #8 Posted by **mr-scorpio** on 26 Sept 2011, 4:54 a.m.,*
in response to message #7 by Raymond Del Tondo

Hi Ray, Many thanks for the response, & excellent news on the new version of Speed UI.

Regarding CAS's ... Would you consider/be able to create a completely new CAS for the 48GX yourself, where your ability to create obviously excellent & efficient code would work well - Possibly some of the CAS logic could be taken from an existing system like CAS48 by Jaime Fernando Meza with his permission... (If still contactable, as his last version was in 2001) (CAS48: 10 years old. Erable: 13 years old)

My thinking is that a single packaged install that was the combination of Speed UI with a CAS, would be fantastic, tidy & efficient?

Re: 48GX Erable etc ever to be updated /revised etc?

*Message #9 Posted by **Raymond Del Tondo** on 27 Sept 2011, 3:30 a.m.,*
in response to message #8 by mr-scorpio

I wouldn't want to write a new CAS from scratch, since my interests are in other areas.
But I'll check if it's possible to interface between one of the existing CAS's and SpeedUI, and if related changes to the CAS are needed at all.
After all it's a matter of time and motivation, so it may take some time until I can make a statement regarding the above;-)

Re: 48GX Erable etc ever to be updated /revised etc?

*Message #10 Posted by **mr-scorpio** on 27 Sept 2011, 4:33 a.m.,*
in response to message #9 by Raymond Del Tondo

HI, Understand completely the rationale for not wanting to write a CAS from scratch. But also very pleased that you think there might be some merit in cross interfacing with an existing CAS via SpeedUI - Could be an exciting proposition. As i mentioned above, the other CAS to Erable appears to be CAS48 .. which seems to still be a fairly trim but powerful CAS system. However there doesn't seem to be anywhere a direct assessment / comparison between CAS48 & Erable though. I'm thinking of conducting a feature by feature check list, so as to offer such a comparison..

HP 12C 30th Anniversary Bugs?

*Message #1 Posted by **Kevin Kitts** on 25 Sept 2011, 12:32 p.m.*

Does the 12c 30th Anniversary have the same PSE and other bugs that the 15c Limited Edition has or is it relatively bug free?

Also, in terms of key-click feel and functionality which of the available 12c releases is "the best". What about the 12c Platinum - is it as fast as the 12c Anniversary? Of course... the 12c Platinum color scheme may be a bit of an acquired taste... ;-) but it has more programmable steps, right?

Kevin

Re: HP 12C 30th Anniversary Bugs?

*Message #2 Posted by **Katie Wasserman** on 25 Sept 2011, 12:54 p.m.,*
in response to message #1 by Kevin Kitts

The 12c 30th AE was mistakenly released with old firmware (2009-07-02) that does have some bugs. There is newer, mostly bug-free, firmware but apparently this didn't make it into production. The most obvious bug is that SST won't show you the instruction when it's held down in run mode. Also, SST and BST won't auto repeat in program mode.

I'm interested in this, more info please.

- Thanks

Re: 15C LE: Emulator runs on Mac, too! :-)

*Message #3 Posted by **Juergen Keller** on 25 Sept 2011, 2:16 p.m.,*
in response to message #2 by DigiGal

Well, not much more to say, check http://www.codeweavers.com/products/crossover/ or the non-commercial version http://www.winehq.org/.

From their web site:

> Quote:
>
> CrossOver allows you to install many popular Windows applications on your Mac or Linux computer. You can think of it as an emulator, but it's different, because there's no Windows OS license required. Your applications integrate seamlessly in OS X or Linux; just click and run. No rebooting, no switching to a virtual machine, and no Windows Operating System license required!

I would try Wine first, as it is free.

Re: 15C LE: Emulator runs on Mac, too! :-)

*Message #4 Posted by **DigiGal** on 25 Sept 2011, 5:13 p.m.,*
in response to message #3 by Juergen Keller

Thanks, just never heard of it or even needed such a program before.

in response to message #1 by Juergen Keller

A very nice picture of a very good looking calc :-) At the bottom line the only thing spoiling the party is the 30 year old display ...

Re: My small tribute to the HP-15C LE

*Message #3 Posted by **Roger Blake** on 25 Sept 2011, 12:27 p.m.,*
in response to message #2 by Walter B

Nice picture. Nice calculator ! IMO the display is much better than any modern dot matrix display. It's very readable and all you need. To be honest I find all the advanced functions of the HP-15C now a bit of a gimmick - very nice at the time but all I want now is a fast readable scientific with limited programmability for the occasional times it's useful, and a decent keyboard. Anything else I'd use a computer these days. Maybe the odd complex calc, or matrix determinant but that's about it. The hp-15c scores over the 35S in its nice convenient size and layout, and the display !

Re: My small tribute to the HP-15C LE

*Message #4 Posted by **Thomas Radtke** on 25 Sept 2011, 12:36 p.m.,*
in response to message #1 by Juergen Keller

That's a picture of one of the prototypes? I learned today the actual version on sale has no special 'on' key.

I wish we could pull that from the archives. Some really bad ideas in there.

1) *Never* use cyanoacrylates for plastic repair on HP's, especially on screw posts. Styrene plastic welding solvent only. Replace 1/4" screws with 3/8" screws on the lower posts. #2 sheet metal screws work okay, tri-lobular plastic screws are best but very hard to find in small quantities. #2 metal screws are available in hobby shops.

2) *Never* use the described method to attach the logic board to keyboard. You might as well just throw it

away now if that is your plan.

Re: Repairing HP 41C screw posts

*Message #5 Posted by **bill platt** on 25 Sept 2011, 7:32 p.m.,*
in response to message #4 by Randy

Hi Randy,

Maybe Dave can let you put red pen glosses on it:-)

It is a probem--propagation of bad ideas.

Maybe an edited version should be entered in the Archives.

Re: Repairing HP 41C screw posts

*Message #6 Posted by **Paul Berger (Canada)** on 25 Sept 2011, 10:48 a.m.,*
in response to message #1 by Fouad M. Kaadou

I just repaired one replacing the broken post on the CPU end with a metal standoff. I cut off the broken post near the back of the keyboard and threaded the standoff into the remaining hole. I then chucked the standoff in a drill and filed it down to fit the hole in the CPU board, and adjusted the length of the screw on the bottom and the height of the standoff. Result another great working CX. I have also read that others have glued in metal posts using epoxy.

Re: Repairing HP 41C screw posts

*Message #7 Posted by **db (martinez, ca.)** on 25 Sept 2011, 12:30 p.m.,*
in response to message #1 by Fouad M. Kaadou

I got great results by slipping a spring over the split post to keep it together and usable. This has the added advantage of being able to slip the coil connector (and spring) off in the future. The glue and wire-wrap method works fine though.

Re: Repairing HP 41C screw posts

*Message #8 Posted by **Randy** on 25 Sept 2011, 8:19 p.m.,*
in response to message #7 by db (martinez, ca.)

While the wire-wrap method works, a card-reader o-ring makes a great clamp while the solvent cures.

That said, I really don't understand all the angst over cracked posts as longer screws (3/8") fix 95% of the issues with lower posts on the 41. We beat this to death, IIRC, back in 2003/4. A cracked post is no big deal if the 1/4" screw is discarded and replaced with 3/8". HP did this as a production change in about 1983 and on all 41's that were received for service.

A post that has sheared off can usually be repaired with little drama if all the pieces are there. Styrene plastic welding solvent puts it back together, leave overnight to cure and a 3/8" screw completes the job.

RPN Tutorial

*Message #1 Posted by **Eddie W. Shore** on 25 Sept 2011, 1:49 a.m.*

RPN Tutorial (basic)

In light of the HP 15C LE, it is my hope that there are new users of RPN calculators, either through the HP 15C, or by an Andriod (sp?) or iPhone/iPad app. This is a short "do by example" tutorial on basic RPN that I posted on my blog. It is not towards any specific calculator in hopes that newbies can learn from it whatever RPN machines/emulators they have.

I am thinking of doing a basic keystroke programming tutorial (15C, 12C, or if anyone has a request, I'll try cater to that calculator instead - note my 41C is in repairs, I don't have a 42 (but I have Free42), and I don't have an Andriod device). Please check out the blog and me know what you think.

Eddie

Hello Eddie,

Nice. You may include this graph: RPN STACK PERMUTATIONS

See this thread: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv020.cgi?read=184373

Regards.

Re: RPN Tutorial

in response to message #1 by Eddie W. Shore

Hi Eddie,

I think it's a good idea to familiarize others with the benefits of RPN. However, some errors should be removed:

RPN uses **one** stack that consists of (usually) four **registers** X, Y, Z and T.
Your text however says:
*"Typically, RPN calculators uses **four** stacks, named X, Y, **Y, and Z**."*
Instead, it should read:
"Typically, RPN calculators use a stack consisting of four registers, named X, Y, Z, and T."

So, X, Y, Z and T are four *registers* (not stacks), each register stacked on top of the other. That's why the whole arrangement is called a stack.

Maybe an RPN novice will get the idea behind the stack more quickly if the examples show intermediate results. For instance like this (example #5):

```
2  [1/x]            0,5000
3 [ENTER] 7 [÷]     0,4286
[+]                 0,9286
25 [ENTER] 64 [÷]   0,3906
[sqrt]              0,6250  ; use the symbol instead - there is no key labelled "sqrt"
[-]                 0,3036  ; do not omit the leading zero - it's displayed
```

Re. Enter: about 30 years ago I had a book on RPN that described the idea behind the ENTER key in two-argument calculations this way: ENTER is required to tell the calculator that you have completed number entry. So 5 ENTER 3 enters two numbers five and three instead of a 53, thus separating the 5 from the 3. This also means that an ENTER is *not* required before or after a numeric operation, before or after a STO or RCL, before or after Pi, etc.: in all these cases it's clear that the current number resp. result is complete, and everything keyed in next will belong to a new number. So the first ENTER in your example #5 is obsolete since after 1/x the calculator knows that the result (1/2) is complete and the following 3 belongs to a new number.

This idea was very helpful for me in the first weeks after I aquired my brand new 34C back then. Maybe you will find it useful as well. I really like the idea to help new RPN users the way you intended. That's why I suggest these improvements. :-)

Dieter

in response to message #3 by Dieter

Thanks Dieter and Xaiver not only for the suggestions but also finding the errors. Xaiver, I want to study the diagram closer so I can understand it.

RPN Tutorial Take 2

Re: RPN Tutorial

*Message #5 Posted by **Walter B** on 26 Sept 2011, 1:54 a.m.,*
in response to message #4 by Eddie W. Shore

Nice work :-) For the example with the square root of the sum of squares, however, I'd prefer

```
3
ENTER
x
4
ENTER
x
+
[sqrt]
```

instead of using y^x.

Re: RPN Tutorial

*Message #6 Posted by **Marcus von Cube, Germany** on 27 Sept 2011, 12:15 a.m.,*
in response to message #5 by Walter B

... which will not work on the 20b or 30b in RPN mode.

Re: RPN Tutorial

*Message #7 Posted by **Walter B** on 27 Sept 2011, 1:50 a.m.,*
in response to message #6 by Marcus von Cube, Germany

One more reason why I dislike RP**L**, also camouflaged.

Re: RPN Tutorial

*Message #8 Posted by **Eddie W. Shore** on 27 Sept 2011, 9:34 a.m.,*
in response to message #7 by Walter B

However, the above method (3 ENTER X etc...) works on the WP-34S.

Re: RPN Tutorial

*Message #9 Posted by **Walter B** on 27 Sept 2011, 2:43 p.m.,*
in response to message #8 by Eddie W. Shore

Since we did our best to make it RP**N** :-)

Re: RPN Tutorial

*Message #10 Posted by **Dieter** on 27 Sept 2011, 11:11 a.m.,*
in response to message #5 by Walter B

Eight keystrokes!!! That's way too complicated, Walter. ;-)
In cases like these I usually type

```
3 ENTER 4  R-P
```

or even

```
  3 i 4  ABS
```

Both suggested methods also provide better precision than a manual calculation. So this rectangular-polar conversion stuff (which I don't use at all otherwise) finally makes some sense to me. ;-)

Dieter

Re: RPN Tutorial

*Message #11 Posted by **Walter B** on 27 Sept 2011, 2:49 p.m.,*
in response to message #10 by Dieter

You're right absolutely, Dieter :-) Please compare, however, also with the ten keystrokes in Eddie's original tutorial, take 2. After all, your solution is the best :-)

More 15C LEs appearing on TAS

*Message #1 Posted by **Lincoln R.** on 25 Sept 2011, 1:30 a.m.*

Several more 15C LEs are appearing from different sellers. There are some expensive Buy It Nows but a few people actually auctioning them off. Should be interesting to see what this does to prices, or if the ridiculous bidding frenzy is still on.

Re: More 15C LEs appearing on TAS

*Message #2 Posted by **Geoffrey Wang** on 25 Sept 2011, 10:29 a.m.,*
in response to message #1 by Lincoln R.

What's interesting is the 15C LE currently at $350 from datamth-calculator-museum (who runs a great TI calculator website -- no forum though).

Re: More 15C LEs appearing on TAS

*Message #3 Posted by **Michael de Estrada** on 25 Sept 2011, 11:00 a.m.,*
in response to message #1 by Lincoln R.

One seller has 3 separate auctions going, the one finishing soonest has already been bid to $300. The listings have photos of the calc back showing very low LE numbers. It looks like a lot of people bought a bunch of the early ones at cheap pricing with the sole intent of reselling them at a big profit. This makes me think that less than half of the total "limited" production has even reached the USA and that there will still be an opportunity to buy these at normal retail price. Currently, you can buy the 15C LE from the HP business online site for $99.99 + shipping and sales tax.

Are you sure? We have an account with HP and last week I tried to secure two for a friend in Germany (hi Michi) but we couldn't check out. I ended up on Amazon ;-;

Re: More 15C LEs appearing on TAS

*Message #5 Posted by **Michael de Estrada** on 25 Sept 2011, 11:39 a.m.,*
in response to message #4 by joerg Woerner

I'm not sure, since I didn't attempt to complete the checkout process. I only tested it by placing one in my basket and estimating the shipping and sales tax amounts. All I know is that the price has been lowered from $129.00 to $99.99.

Here

Re: More 15C LEs appearing on TAS

*Message #6 Posted by **Kevin Kitts** on 25 Sept 2011, 12:15 p.m.,*
in response to message #5 by Michael de Estrada

I actually purchased from the link above at the $99.00 price and it did go through. Also, I used a coupon code of "HPSAVE10" and got $10 off the $99.00 price. So the price I paid was $89.00 plus shipping and taxes.

It seems silly to buy from eBay when you can get it for $89.00 directly from HP. I placed my order last night so I have not yet received it.

*Message #7 Posted by **Roger Blake** on 25 Sept 2011, 12:38 p.m.,*
in response to message #6 by Kevin Kitts

Samson Cables price has now gone up from $149.99 to $199.99 ! I paid $99.99/ea for two ten days ago, which I received last Monday. Glad I didn't delay ordering ...

HP home user site still won't let you order one. No sign of them to order in Europe yet either, although they have been promised us.

Re: More 15C LEs appearing on TAS

*Message #8 Posted by **Michael de Estrada** on 25 Sept 2011, 12:46 p.m.,*
in response to message #7 by Roger Blake

The home site won't, but the business site apparently will for the same $99.99 price.

Re: More 15C LEs appearing on TAS

*Message #9 Posted by **M. Joury** on 25 Sept 2011, 7:13 p.m.,*
in response to message #7 by Roger Blake

I have to say that I am *VERY* disappointed at how Samson cables is handling this. I will *NEVER* purchase from them after this episode.

Just my 2 pennies...

Cheers,

-Marwan

Re: More 15C LEs appearing on TAS

*Message #10 Posted by **Michael de Estrada** on 25 Sept 2011, 12:44 p.m.,*
in response to message #6 by Kevin Kitts

I think the vast majority of buyers on TAS are oblivious to the HP business site. Also, some buyers are outside the USA, and the HP site only ships domestically. Only some of the TAS sellers ship internationally. For example, the high bidder here appears to be outside the USA.

Re: More 15C LEs appearing on TAS

*Message #11 Posted by **Geoffrey Wang** on 25 Sept 2011, 1:03 p.m.,*
in response to message #5 by Michael de Estrada

Just ordered one that way for $99 + shipping + tax. I guess HP Home/Home Office is run separately than HP Small/Medium Business.

You have to wonder if the HP15C LE will continue on forever like the HP12C which will drop the perceived value of the HP15C.

*Message #13 Posted by **bill platt** on 25 Sept 2011, 12:55 p.m.,*
in response to message #3 by Michael de Estrada

I don't understand why anyone would pay all that money for one. It is still in production!

Totally bizarre.

Re: More 15C LEs appearing on TAS

*Message #14 Posted by **bill platt** on 25 Sept 2011, 12:54 p.m.,*
in response to message #1 by Lincoln R.

Maybe I was stoooopid not to buy a dozen or more. I could have paid off my kids college education with the scalped profits from turning them!

I stood back like a dunce and didn't buy one becasue I already have two 15c and over $1000 worth of different old HPs.

Re: More 15C LEs appearing on TAS

*Message #15 Posted by **Michael de Estrada** on 25 Sept 2011, 12:58 p.m.,*
in response to message #14 by bill platt

You only have $1000 worth of old HPs ?

Yes, I have about 20 of them. I got to that point and said, "WT%^$% am I *doing*!!!"

:-)

Re: More 15C LEs appearing on TAS

*Message #17 Posted by **Michael de Estrada** on 25 Sept 2011, 2:37 p.m.,*
in response to message #16 by bill platt

My collection is much more extensive, and nearly half are non-HP. About 30% of my RPN calcs are non-HP. Currently, my HP "collection" is complete, and most of my collecting at this point is rare non-HP RPN calcs. Unless HP comes out with something interesting in the future, it's doubtful I will buy any more, and will probably sell a few duplicates as well.

Re: More 15C LEs appearing on TAS

*Message #18 Posted by **Don Shepherd** on 25 Sept 2011, 2:42 p.m.,*
in response to message #14 by bill platt

I wouldn't shoot myself for failing to buy a new calculator with bugs present right out of the box. Anyone who bought these as investment vehicles will, I predict, be sadly disappointed.

A year from now they may be finally available from HP for $50. EBay prices probably much less than that.
